Date: February 13, 2008-02-13
Re: **Update of Surface Water Quality Assessment for United Keno Hill Mine Complex.**

Minnow Environmental Inc. (Minnow) was retained by Access Consulting Group to undertake an assessment of the existing water quality data for the United Keno Hill Mine Complex (United Keno, Galena and Sourdough Hill). The objective of this assessment was to identify parameters and locations of concern within the downstream waters relative to established guidelines and background. This information, combined with toxicity data and watershed use objectives may then be combined to develop an approach for considering the development of Site Specific Water Quality Objectives (SSWQO) for various parameters and locations.

In order to meet the study objectives, a progressive assessment of the available water quality data was undertaken which included the following steps;

- Screen all data to identify outliers (i.e., those greater than 3 standard deviations from the mean) and remove these data.
- Establish the background concentration for each parameter based the upper limit of background data distribution (mean + t S.D.) for the combined data from KV-1 and KV-37.

- Identify parameters with high method detection limits relative to guidelines which preclude determination of whether concentrations exceed the guideline.
- Identify background concentrations which exceed the Canadian Water Quality Guidelines (CWQG).
- Determine the median, mean, minimum and maximum concentration for each parameter at each location.
- Determine which locations exceed background and/or CWQG at measurable (10%) and substantial (50%) frequencies.
- Identify the parameters and locations where concentrations are highest (i.e. median value was 5 times greater than CWQG or background, whichever is higher).
- Assess trends over time to anticipate if concentrations are increasing or decreasing relative to CWQG and/or background.
- Consider modifying factors and toxicity literature (basis for guideline development) to assess the opportunity for SSWQO development following the CCME guidelines.

Most of the above tasks are now complete with the exception of the last two bullets. A summary of our preliminary findings is provided below with supporting data (frequency, median, minimum and maximum) for each parameter provided in Appendix A.

Based on the data review, the following parameters have method detection limits (MDL) above the CWQG at some stations (Appendix A), confounding data assessment:

- | | |
|--|--|
| <ul style="list-style-type: none">• arsenic• cadmium• cobalt• copper• lead• iron• mercury• nitrite• phosphorus | <ul style="list-style-type: none">• selenium• silver• thallium• uranium• zirconium• lead• iron |
|--|--|

The stations where sample MDLs have been elevated above CWQG in > 50% of samples are underlined on the summary tables (Tables 2 - 5). Some consideration

should be given to consistently achieving MDLs below guidelines for these parameters in future samples.

Background concentrations of several parameters exceed the CWQG (or provincial regulatory guideline, if no CWQG exists) suggesting that concentrations of these parameters (aluminum, barium, cadmium, cobalt, copper, iron, phosphorus, sulphate and zinc) are naturally elevated (Table 1).

Contaminant concentrations of numerous parameters measured at mine-exposed stations exceeded both background and water quality guidelines (if both available) or just background (if no guideline available) in more than 10% of samples (Table 2). However, many of these parameters do not have a federal or provincial water quality guideline because they are generally of less concern from a toxicological perspective (e.g. conductivity). When only those parameters for which a guideline exists are considered, most stations still have numerous parameters which exceed both background levels and CWQG in at least 10% of the samples collected (Table 3). The list of parameters for which the median value (i.e., 50% of samples) still exceeds background and CWQG was much smaller, and pertained primarily to stations in Christal Creek, No Cash Creek and the upper portion of the Lightning Creek and Flat Creek watersheds (Table 4). Furthermore, only a few locations had parameters for which the median value exceeded background and CWQG by 5 times or more (Table 5) although it is was not uncommon to find maximum values for many parameters greater than 5 times background and CWQG at numerous stations (Appendix A). It should be noted that high maximum values may be the result of elevated MDLs although this is still being evaluated.

Based on this assessment, the key locations of concern are KV-40, KV-29, KV-21 and KV-47 with the following parameters frequently (50%) and substantially (median value > 5 times) found above background and CWQG:

- Aluminum (most problematic at KV-21).
- Cadmium (most problematic at KV-39, KV-29, KV-21 and KV-47).
- Selenium (most problematic at KV-47).
- Sulphate (most problematic at KV-29).
- Silver (most problematic at KV-47).
- Zinc (most problematic at KV-29 and KV-21).

While background concentrations are elevated for aluminum, barium, cadmium, cobalt, copper, iron, phosphorus, sulphate and zinc it is important to note that even these higher background concentrations are exceeded in more than 10% of samples in Christal Creek, No Cash Creek and portions of Lightning Creek, Flat Creek and the South McQuesten River (although less so in the later). Furthermore, at some stations the median concentrations are more than 5 times higher than these elevated background values (i.e. values may still exceed a future SSWQO at these stations). Thus it is likely that a two tiered approach to SSWQO may be required which permits higher concentrations in some selected near-field areas but provides a higher level of protection for more sensitive downstream areas (i.e. the South McQuesten River).

Should you have any questions or comments with respect to the above summary, please do not hesitate to contact me.

Table 1: Parameters for which Background Concentrations Exceed Established Criteria (Values Shaded in Green).
