INTRODUCTION

The closure of the Clinton Creek Mine was forecasted to occur sometime in mid to late 1978. Peter Steen, President of Cassiar Asbestos Corporation Limited (CAC), announced in the spring of 1977 that the company would be willing to donate certain historical records to the Yukon Archives.

In 1978 an appraisal of the records was undertaken by Diane Chisholm, an Archivist with the Yukon Archives. Following her visit to the Clinton Creek Mine offices, Ms. Chisholm submitted a report recommending that 107 linear meters (350 linear feet) of a possible 335 linear meters (1,100 linear feet) of files maintained at Clinton Creek be acquired by the Yukon Archives for research purposes. A copy of this report is located within this collection. (COR 899 f. 1)

In 1981, three years after the mine closed, David Acaon, the former Administration Manager, was given the responsibility by the mine of selecting which files would be sent to the Yukon Archives. He selected a representative sample of all areas of the total operation except for from the Mine Manager's group of records which were retained by the company. There is no clear indication exactly what criteria he used in selecting files. Consequently the records in this collection are not all the records that Ms. Chisholm's report recommended the archives acquire from the mine site. Most functions of the mine operation are represented; however, the files are incomplete in that not every year is represented nor the whole of the year.

The material found in this collection is comprised of textual records, photographs, maps, drawings, published material and miscellaneous objects. The collection covers the period of 1957 to 1978. The extent of the collection is 6.24 meters.

A review of the files was carried out in early 1991 to determine the historical significance of the records. It was decided to keep the entire collection due to the fact that only a small portion (one fifty-fourth) of all the mine records were received from the mine and the Archives did not wish to further sample a sample. The original order of the files was maintained wherever possible.

The Clinton Creek Mine records form an important corporate collection within the Yukon Archives. They document a mining operation which made a significant contribution to the economic development of the Territory.

Funding for the description of this collection and the compilation of the finding aid was provided by the Canadian Council of Archives and the Yukon Archives under C.C.A.'s Arrangement and Description Backlog Reduction Cost Shared Cooperative Program. The project was completed by David Porter in 1991.

HISTORY

An asbestos deposit had been discovered near Dawson City by prospectors at the turn of the century while searching for gold. Not until 1957 when Art Anderson, a local fur trapper, presented some fibres found on his trapline to Fred Caley of Dawson did the presence of the asbestos become of interest to developers. Caley, a long time Dawson merchant and avid prospector, sent samples to his contacts with Conwest Exploration. The Toronto-based firm expressed an interest in the potential of the area so on the advice of Caley, Anderson returned to the area of the asbestos deposit and staked eight claims. A year later Cassiar Asbestos Corporation Limited (CAC) acquired the claimed properties and began an exploratory program of geological mapping, surface trenching and underground adit development. CAC was established in 1952 to develop and operate an asbestos mine in Cassiar, British Columbia. This mine in Cassiar is still in operation.

The Clinton Creek asbestos deposit is located in the hills adjacent to Clinton Creek approximately eight miles from the Yukon-Alaskan border and thirty miles northwest of Dawson City. Clinton Creek flows into the Forty Mile River, a tributary of the Yukon River. The orebody lies in an area unglaciated during the last ice age and occurs within a tectonic sliver of serpentinite. These rocks were once part of an oceanic crust that has since been moved from their point of origin along a series of thrust faults. Water has been introduced forming the asbestos. Located 140 miles (224 km.) south of the Arctic Circle, the Clinton Creek mine was Canada's most northerly open pit mining operation.

The earliest exploration of the Clinton Creek area occurred in 1958 when adits were driven into Snowshoe and Porcupine hills. Bulk muck samples were removed and milled at the company's Cassiar mill. (A Muck sample is the rubble or material loosened by blasting.) Based on the fibre recovery statistics and the current market conditions further activity was suspended until 1963.

Magnetometer surveys and drilling work determined that an estimated twenty-four million tons of ore were present in the Clinton Creek area. The ore reserve measured approximately 80 to 250 feet wide, 800 feet deep and 4,500 feet long. These reserves were then probed in 1964 and tested in 1965. The results indicated that the ore samples contained five and one-half percent recoverable chrysolite asbestos fibre. Chrysolite fibre is one of the three major kinds of asbestos. Much of the chrysolite fibre found at Clinton Creek was of a cement grade. With these recovery statistics and an improving world market, the company decided to develop the mine site and begin production.

Extensive construction began in February 1966 on the pre-production phase such as: the construction of road access; a bridge over the Forty Mile River; a mill site; and because of the remote location of the mine, a townsite.

A twenty-six mile access road was built to connect the mine site with the Dawson Boundary road. A five hundred foot steel bridge over the Forty Mile River was completed by the end of March, despite -60 °F temperatures. Following the completion of the bridge, CAC was able to haul in twenty-eight Atco prefab houses and a kitchen and wash trailer for a temporary camp. This would be used while the processing plant was being constructed. Development of the mine site required that a million tons of overburden (loose or consolidated rock material that overlies a mineral deposit) be removed before mining of the ore could begin. The work was contracted to General Enterprises of Whitehorse. In October 1967 the mine began processing small quantities of ore. The production of asbestos fibre began officially on April 1, 1968. Capital investment required for the pre-production phase of this project totaled \$36.5 million dollars, consisting of \$8.5 million for pre-production and development, \$23.6 million for plant and equipment, and \$3.7 million for automotive and heavy duty mobile equipment. For more detail on the responsibilities of each section and an overview of the mine's organization, refer to Diane Chisholm's report found in COR 899, f. 1.

The ore from the open pit went to the primary crushing plant located near the mine site where it was reduced to roughly two inches in diameter. The ore was then transported by a mile-long tram system to the mill located on Trace Hill. The material was then further screened and crushed and subsequently processed in the mill. The asbestos fibres were graded, packed in bundles weighing 100-lb. each and palletized in one ton lots ready for shipment.

The fibre from the mine site was carried to Whitehorse by tractor-trailer units that were provided by the Transport Division of the company. Each unit could carry twenty-three tons of asbestos. Crossing the Yukon River at Dawson during the summer was by a federally operated ferry. In the winter the territorial government maintained an ice bridge across the river. During freeze-up and breakup of the ice on the river the fibre was carried across the river by an aerial tramline known as the 'Skyline'. The White Pass and Yukon Route took the asbestos fibre by rail from Whitehorse to Skagway where it was loaded onto either the M.V. "Frank H. Brown" or the "Klondike", container ships bound for the Cassiar Asbestos dock at North Vancouver. The asbestos was sold to forty countries on five continents.

While the mine site was being prepared a townsite was constructed eight miles east of the mine site on the Forty Mile River three miles upstream from the Yukon River. The town was equipped with a cafeteria, store, post office, bank, saloon, fire hall, curling rink, skating rink; all built by CAC. In addition, sewage, water, electricity, utilities, powerhouse and an airstrip were provided by the corporation. Most of the housing in town was owned by the Corporation and leased to the employees. Through a company purchase plan some of the houses were made available to employees for purchasing. A four room public school up to grade eight and a four bed medical clinic were built by the Yukon Territorial Government.

Population of the townsite fluctuated during its lifetime. It peaked at 860 in 1974 but averaged around 450. As an example, in 1974 the personnel working for CAC numbered 317: 81 worked in administration and services, 111 in maintenance, 51 in the mine and 74 at the mill. By 1977, prior to the departure of many of the Clinton Creek residents a variety of interest groups had been established to provide a sense of community for the residents.

By 1969 the mill machinery was producing 60,000 tons of fibre a year. Within three years fibre production output was in excess of 100,000 tons.

The following table provides the figures for the mine's output for the amount of ore mined, the amount of material fed through the mill and the amount of fibre refined in the mill. The last column indicates the amount of ore reserves estimated to be available each season. The unit measure for this table is ton.

<u>Year</u>	<u>Ore Mined</u>	<u>Mill Feed</u>	<u>Fibre</u>	<u>Reserve</u>
1968	1,056,633	709,003	64,279	24,000,000
1969	1,012,937	952,889	87,820	N/A
1970	1,480,522	1,335,087	104,386	N/A
1971	1,731,805	1,447,863	92,960	N/A
1972	1,788,976	1,267,178	102,347	N/A
1973	1,744,794	1,216,800	100,147	N/A

1975	1,947,078	1,385,648	113,928	4,773,409
1976	1,866,619	1,390,525	113,559	3,848,000
1977	1,978,318	1,331,466	105,224	770,000
1978	N/A	N/A	N/A	N/A

In the 1975 Annual Report the company forecasted that the mine would close sometime in 1978 when ore reserves would be depleted. Again in 1976 the report states that reserves would be depleted in 1978. This was confirmed in the 1977 report which stated that the mineable ore reserves were drastically reduced. The Porcupine orebody could no longer be mined due to the deterioration and subsequent instability of the pit walls. It was anticipated that the mineable ore in the Clinton Creek mine would be exhausted by mid-year in 1978. An asbestos deposit on nearby Bear Creek when tested revealed an estimated 7.5 million tons of grade ore. However, the ore-to-waste ratio for this reserve would be 1 to 9 compared to the ratio of 1 to 4 at the Porcupine Hill orebody. Such a low recovery of saleable asbestos from the Bear Creek ore reserve was not a good investment of time and money. The closing of the Clinton Creek mine in the summer of 1978 marked the end of asbestos mining for the present in the Yukon.

With knowledge of the impending closure of the mine site, CAC signed, in the fall of 1976, a tri-partite contract with Local 1 of The Canadian Mine Workers Union and Canada Manpower Consultative Services to provide a relocation and retraining agenda for the workers at the mine. The agreement called for training programs to include instruction and upgrading of trade skills and language instruction for new Canadians working at the mine. A cost-sharing relocation program was agreed upon with Canada Manpower. Some employees were absorbed into the operation at Cassiar. An equitable severance package was offered to the employees not placed at other CAC operations.

The equipment and machinery was shipped out for use elsewhere. Some of the houses from the town were sold by auction and moved out; others were moved to Cassiar. Clinton Creek quickly became a ghost town.

For more information on the history of the start-up of the mine at Clinton Creek see COR 947 f. 2.

Beyond the Forty Mile (The Story of the Clinton Mine) was a film produced by Jack Chisholm Productions Limited in 1969 for Cassiar Asbestos Corporation Limited that recounts the history of the development of the Clinton Creek Mine site and describes in detail the extraction and milling processes involved in producing asbestos. A copy of this film is available in video format and is listed as V-86 in the Yukon Archives Film/Video listings.

There are records in the Yukon Archives holdings which reflect the organization and community aspect of life in Clinton Creek. They are:

CR 78/72	Petticoat Circle	62-78
CR 79/26-1	Clinton Creek Arts & Craft Guild	75-78
CR 79/26-2	Clinton Creek Community Club	65-78
CR 79/62	Canadian Mine Workers	71-79
CR 80/122-1	Rock Fluff - local newspaper	68-78
CR 87/41	Clinton Creek Badminton Club	n.d.
CR 87/42-1	Clinton Creek Arena Assoc.	71-74
CR 87/43-1	Clinton Creek Curling Club	69-78
CR 87/50	Clinton Creek Outdoor Club	70-78

SERIES I

INITIAL DEVELOPMENT STAGE

Outside Dates: 1957 - 1975

Bulk Dates: 1958 - 1966

Extent: 2.4 meters

Volumes: COR 899 - 917 f. 9

The records in Series I date from 1957, the year the claims were initially staked, to 1968. These records document the activity that occurred during the testing and evaluation stage of the mine's history. Series I is divided into the following sub-series: Administration; Development Data; Estimates & Evaluations; Proposals & Planning and Reports. However due to the manner in which this collection came to be donated to the Archives, the series does not include all the files for the years 1957 to 1968 inclusive. There are a few records that post date 1968 but these are related to weather records and have nothing to do with the actual setup of the mine operation. There are files listed in Series II which overlap this exploratory period, such as diamond drilling records and fibre counts. The original file numbers have been retained when they existed and are listed in brackets beside each file title. At the Mine a number of maps were kept within the files. However, for archival purposes they have been transferred to flat storage. Refer to Series IV of this finding aid for a complete listing of these maps.

1. **ADMINISTRATION** 1957-1978 .23 meters

The Administrative files for this period of the mine's history are incomplete. They include a copy of the original letter discussing potential of an asbestos find near Dawson, information on improving the road access to the proposed mine site area, contracts for the stripping of the mine site area, contracts for the construction of the bridge across the Forty Mile River, a nearly complete record of the weather conditions at Clinton Creek, water records of Clinton Creek for one year, and stream profiles of the Yukon River at Dawson City.

2. **DEVELOPMENT DATA** 1956 - 1968 1.4 meters

This sub-series contains information related to the actual testing and test results used to determine the viability of mining the asbestos from the hill around Clinton Creek. The records included are assays and assay plans, claims and assessments, geology of the area, sampling data, topo surveys and mapping, wall readings, geophysics, diamond drilling activity, and foundation testing.

3. **ESTIMATES & EVALUATIONS** 1958 - 1968 12 meters

The files in this sub-series include summaries and estimates of the initial work completed in 1958. There are estimates for the type of equipment needed, operation of a mill plant, daily production requirements. In 1963 a new strategy for evaluation was proposed and a new series of tests were implemented. The test results are included.

4. **PROPOSALS & PLANNING** 1957 - 1968 .19 meters

This section contains files related to the planning and budgeting process of the mine site development following the initial testing. The files also pertain to the next period of testing from 1963 to 1966 which led to the eventual decision to go with developing the mine site. In these files are the estimates and forecasts of operational requirements of the project. The plans address the following types of requirements: operating expenses; freighting costs; power supply; water source; sewage; mill location and operation; and housing options, to name a few.

SERIES II GEOLOGY DEPARTMENT

Outside Dates: 1962 - 1978

Bulk Dates: 1964 - 1973

Extent: 1.53 meters

Volumes: COR 917 - 931

The records in Series II date from 1962 through to 1978. In this series are the following sub-series: Mine Geology & Engineering; Diamond Drilling; Claims and Correspondence, Personnel & Budget. An original file plan exists for these records; however only a selection of the files came to the Archives. See COR 899 f. 1 for a copy of the original file plan of the Geology Department. A

number of maps from the files in this series have been transferred to flat storage. Refer to Series IV of this finding aid for a complete listing of maps.

The Geology Department reported to the Production Superintendent. The staff geologists would determine pit geology and probable ore reserves for use in long range production planning. The reserves were identified through diamond drilling, sampling and geophysical surveys. The Engineering section within the department was responsible for surveying, drafting, compiling production statistics, construction, inspection and maintenance of environmental and weather records.

1. **MINE GEOLOGY & ENGINEERING** 1962-1978
 .61 meters

This sub-series contains files related to Pit Geology, Ore Control Data & Reports, Production Drill Hole Typing, Engineering Reports, Mining Schedules, Pit Planning & Reserve/Grade Calculations, and Research - Quality & Ore Control Methods.

SERIES III ADMINISTRATION - PRODUCTION PHASE

Outside Dates: 1965 - 1978

Bulk Dates: 1968-1975

Extent: 1.84 meters

Volumes: COR 931 - COR 947

The records in Series III came with minimal identification by file number or title. A provisional filing system was assigned by Archives staff. It appears as though most correspondence, financial records and reports had been pulled as individual items from larger files. This series is arranged in the following groupings: purchase orders and accounts; personnel files; training and safety

files; cottage hospital records; engineering; mine production; mill reports; plant maintenance; and townsite administration.

1. **PURCHASE ORDERS & ACCOUNTS** 1957 - 1978
1.2 meters

The purchase orders are filed in alphabetical order according to supplier's name. They include more than the records of mining equipment purchases. Items for some of the community clubs and activities are contained in these files. The accounts files include paid invoices, policy and procedures for purchasing, journal vouchers, fibre prices, inventories of equipment and supplies. Accounting files have been arranged alphabetically.

4. **COTTAGE HOSPITAL** 1978 .01 meters

The Cottage Hospital records were divided into three categories: the administrative/statistical files, the medical charts, and x-rays.

This sub-series contains one file which is a final report of the hospital to Yukon Hospital Insurance Service.

<u>Volume</u>	<u>File</u>	<u>Title/Description</u>	<u>Date</u>
COR 943	11	Report to Yukon Hospital Insurance Service	1978

5. **ENGINEERING** 1973 .01 meters

This sub-series contains an isolated file of production statistics and survey readings.

<u>Volume</u>	<u>File</u>	<u>Title/Description</u>	<u>Date</u>
COR 943	12	(9126/12//02) Mining Program	1965,73

6. **MINE PRODUCTION** 1964-78 .02 meters

Production files were kept by the Mine Superintendent and these are foremen's notes, equipment availability, equipment reports and explosive ledgers.

<u>Volume</u>	<u>File</u>	<u>Title/Description</u>	<u>Date</u>
COR 944	1	Daily Log Books	1964,72
	2	Ore Haul	1978

7. **MILL REPORTS**

1968-78

.24 meters

Mill reports were part of the production records and the responsibility of the Mill Superintendent who reported to the Production Superintendent. The Mill Superintendent was responsible for supervision of the mill operation and maintenance of statistical records on the crushing, drying, milling, shipping and quality control processes.

SERIES IV PHOTOGRAPHS

The photographic material in the Clinton Creek Collection is comprised of the following:

3 x 5, 4 x 5 colour prints
3 x 5 B/W prints, 8 x 10 B/W,
colour slides
post cards

Photographs #1-38 came from an album of photographs taken by David Acason.

Photographs #135 - 171 were taken by George Allen Aerial Photos Ltd.

Square brackets in the Title/Description column indicates the description was assigned by an Archivist.

Slides #179-254 are of Core Samples taken from drill holes CS-6, TH-1, 2 & 3. Slides #255-277 are of Core Samples but it is not known from which drill holes. Photographer unknown.

Slides #278-428 are of Core Samples, with the exception of three shots. It is not known from which drill holes these Samples were taken. The photographer was Grant Smith, Mine Geologist at the Clinton Creek Mine.

In addition to the above collection are several panoramas of the mine pit. These were created by joining together a series of photographs. The panoramas are located

SERIES V MAPS

The maps are arranged in two parts. The first part is comprised of maps that were originally kept on files but these were transferred to flat storage for archival preservation purposes. In the file folders will be found 'Map Transfer' forms which will indicate the map file number needed to retrieve that particular map. In the file list that follows, the Map Number is given along with the title of the map and the Yukon Archive file number from which it was taken.

The second part of the map collection is comprised of a group of rolled maps. This is how they were stored in Clinton Creek. There are eighty-five bundles of rolled maps and the bundles are numbered 1-49 and I - XXXVI. A map file list can be found in COR 899 f. 1. Not all of the maps on the map file list were turned over to the Yukon Archives.

SERIES VI IMPRINT

1. Annual Reports

The CAC annual reports (containing summaries of Clinton Creek mine) were transferred from the files and can be retrieved under Annual Reports: Cassiar Asbestos Corporation Limited.

2. Pamphlets

Printed material of under fifty pages, was assigned a number in the Pamphlet section of the Archives' holdings. These include articles from B.C. Mining Industry News; reports to CAC shareholders; handbooks with information about the mine and town for new arrivals to Clinton Creek; and technical and engineering reports.

The following is a list of these pamphlets:

1951-22	1956-44	1964-68
1966-93	1967-129	1969-136
1970-175	1970-176	1971-165
1971-166	1971-167	1971-168
1974-209	1974-210	1976-273
1977-351	1977-352	1978-338
1978-339	[1978-340]	n.d.-362 c.2
n.d.-638	n.d.-639	

3. Poster

Two posters were found within the files and were transferred to flat storage.

<u>Location</u>	<u>Title/Description</u>	<u>Date</u>
P-356	Forty Mile Players presents "The Forty Milers" or "Hanging Was Too Good For Him"	1971
P-357	Klondike Night - Games of Chance in the {Clinton Creek} Arena Lounge Proceeds for Community Projects Sponsored by the Lions Club Saturday Nov. 8th - 8 pm - 4 am	[1975]

SERIES VII MISCELLANEOUS

This series contains objects found with the material that was acquired from CAC.

<u>Location</u>	<u>Title/Description</u>	<u>Date</u>
-----------------	--------------------------	-------------

M-46	[Sample Box showing different grades of Asbestos fibre produced at Clinton Creek; accompanied by a six page description of fibre types , mining and milling. Fibre types: CT80, CY90, CP, CT, C7 and solid ore.	
M-47	Commemorative Medallion marking the eleven year life span of CAC's mine at success.	1967-78 Clinton Creek and honourin
M-48	Matchbooks - Miner's Cash 'N' Carry Yukon's Most Northern Department Store	1970
M-49	Scale Model of Clinton Creek open pit mine, complete with cut-away hills.
