SITE CONDITIONS

The two site trips in May 2015 represent early-spring conditions and the spring freshet period. The majority of snow and ice around the Mount Nansen site had melted since the April 2015 trip. During the first May trip, additional sites and stations had begun flowing since April 2015, with increased water levels, but peak freshet flows had not been reached. DES provided daily photos in May from several locations around the Mount Nansen Site to assist with freshet trip planning. The second May trip was scheduled one week later to capture higher flows during the freshet period. Peak freshet flows occurred during the evening of May 10, 2015 (based on continuous discharge and stage data for Victoria Creek). Back Creek had multiple, braided channels flowing overland and entering Victoria Creek at multiple locations upstream of the regular confluence (including above H/WQ-VC-U).

METEOROLOGY

Meteorological data was collected at the ATM-ROAD station throughout the month of May. Northern Avcom informed AAM that the station's modem was deactivated on April 21, 2015 and that a new telemetry system will be installed likely mid-June. In the meantime, AAM continues to download the data manually when on site. As of the writing of this report, data was available up to June 11, 2015. EDI conducted a preliminary QA/QC review of the May 2015 data and all sensors appear to be functioning as expected. Meteorological data will also be summarized and analyzed following the completion of the open-water season, in the October 2015 Monthly Report. This will include data from April 1, 2015 to October 15, 2015 with plots and tables.

HYDROLOGY

Discharge measurements were collected at all stations with suitable conditions, and several continuous stations were re-installed for the open-water period. Significant ice and snow melt allowed for the first measurements of the spring season at H/WQ-DC-DC+105 and H-VC-UMN during the first May trip and H-DC-M and H-DC-R during the second May trip. Hydrology measurements could not be completed at the following stations in May 2015: H-DC-D1b due to ice and snow coverage and at H-BC due to ice conditions and multiple braided channels in the vicinity of the station.

The following re-installations were completed during the first May trip:

- A stilling well, staff gauge and continuous logger were re-established at H-DC-B at the location of the old well (well is pulled during the winter season due to ice build-up in the channel and frequent channel maintenance).
- New continuous data loggers were installed at the existing stilling well locations at H-VC-UMN, H-VC-DBC and H-VC-R.

During the second May trip, re-installations were completed at:

- A hydrometric station was re-established at H-DC-R, consisting of a stilling well, staff gauge and continuous logger (similar to H-DC-B, this well is pulled during the winter due to ice-build up in the channel).
- A new hydrometric station was installed at H-VC-U, approximately 5 m upstream of the 2014/2015 location. The station was re-located due to large amount of sediment accumulation at the previous well location.
- New continuous data loggers were installed at the existing stilling well locations at H-PC-DSP and H-DC-M WP.

The current stilling well location at H-VC-R is under review. During the end of the 2014/2015 program, EDI recommended that this station be relocated to a suitable site downstream of the current location, based on changes to the channel geometry at the station (sediment deposition from the 2014 freshet) and unfavourable ice conditions during the winter period that impact the quality of the continuous logger record. During both of the May 2015 trips, significant flows were occurring in five secondary channels and a new location could not be readily identified. The existing location remains suitable for the current open water period; however, discussions and investigations should continue for consideration of a more suitable location prior to winter.

For the month of May, continuous logger records are available for four stations: H-DC-M WP, H-VC-DBC, H-VC-UMN and H-VC-R. Partial continuous logger records are available at H-DC-B (installed May 5, 2015), H-VC-U (installed May 13, 2015), H-DC-R (installed May 13, 2015) and H-PC-DSP (installed May 12, 2015). See attached data tables for a summary of conditions and hydrometric monitoring tasks completed at each station and for a summary of discharge measurement results for the May 4 - 6, 2015 and May 12 – 14, 2015 periods. Noteworthy observations are included in the subsection below. Quality control and quality assurance for the hydrometric data was conducted on the instantaneous and continuous data.

Noteworthy Observations:

- For both May 2015 trips, discharge measurements were collected with an ADV at all four Victoria Creek stations. During the first site trip, discharge values ranged from 0.317 to 0.450 m^3/s. For the second site trip, discharge values increased significantly, ranging from 1.163 to 2.328 m^3/s. Both site trips represent flow conditions much higher than the April 2015 trip when discharge results ranged from 0.130 – 0.192 m^3/s.
- During the first May trip, discharge measurements were made using salt tracer tests at H-DC-B with an estimated flow rate of 0.032 m^3/s.
- During the second May trip, discharge measurements were made using salt tracer tests throughout Dome Creek at H-DC-B, H-DC-M WP, H-DC-DX+105 and H-DC-R, with flows ranging from 0.003 to 0.118 m^3/s.

- Ice conditions and high flows in Back Creek triggered avulsions and five significant braided channels and waterfalls upstream of the H-BC station. Flow from Back Creek enters Victoria Creek upstream of H-VC-U at multiple locations.
- Ponded water in the parking area near the H-VC-R station was present during the first May trip and water was entering the main channel at the stilling well location. By the time of the second May trip, water in the parking area had receded. Multiple secondary channels were active during both May trips and a new stilling well location is under consideration.
- A large quantity of sediment has accumulated in the weir pond at H-DC-M WP.

WATER QUALITY

Water quality samples and data were collected at all scheduled sites during the May 2015 trips; this included sites specifically scheduled for sampling during the spring freshet including opportunistic sampling of seeps along the mill site and waste rock pile. The pit lake was not scheduled for sampling during the May 2015 trips due to safety concerns associated with the ice break-up at this time of year. The WQ-SEEP LC50 sample scheduled for May 2015, was collected on the second May trip, and the drinking water sample for May 2015 was collected during the first May trip.

See attached data tables for a summary of conditions at each site and a record of where samples were collected during each trip. In situ and laboratory results summary tables are also attached. Parameters that exceeded CCME-AL guidelines and/or the Mount Nansen EQS criteria are highlighted. The lab certificates of analysis are also attached. Many results reflect typical conditions for this time of year when there is increased surface runoff and sediment introduction with the higher flows from snow and ice melt. This often results in elevated concentrations of many total metals at this time of year. Noteworthy observations and comments on sample QA/QC are included in the subsections below.

Noteworthy Observations:

- Back Creek was contributing water to Victoria Creek at multiple locations upstream of the regular confluence (which is downstream of WQ-VC-U). There was a higher incidence of total metals concentrations exceeding the CCME-AL and Mount Nansen EQS criteria during the second May trip (when flows and turbidity were higher) – including aluminum, arsenic, cadmium, chromium, copper, iron, lead, manganese, mercury, silver and zinc.
- All samples from Victoria Creek during the first May trip exceeded the CCME-AL guidelines for total aluminum and iron, while samples from WQ-VC-DBC and WQ-VC-R+150 also exceeded the guideline for total copper. During the second May trip there was an increase in the number of total metals concentrations that exceeded the CCME-AL guidelines due to increased flows and higher turbidity, including aluminum, arsenic, cadmium copper, iron, lead, mercury (only WQ-VC-DBC, WQ-VC-R+150), silver (only WQ-VC-U, WQ-VC-DBC) and zinc (only WQ-VC-DBC). All samples also had total suspended solids above the Mount Nansen EQS. Some

results for WQ-VC-U may be attributed to water from Back Creek entering Victoria Creek upstream of the regular confluence (and upstream of the WQ-VC-U location).

- The upstream and downstream Pony Creek sites had samples that exceeded many parameters including aluminum, arsenic, cadmium (only WQ-PC-D), copper, iron, lead, silver (only WQ-PC-D) and zinc (only WQ-PC-D). The opportunistic seep that was sampled from the Pony Creek waste rock (WQ-PC-WR; detected on May 14, 2015) had a similar list of parameters that exceeded guidelines and/or standards to the WQ-PC-D sample. Of note the WQ-PC-WR samples had much higher metals concentrations than the WQ-PC-D samples, which is to be expected as it was flowing directly out of the waste rock dump at the site.
- Total zinc concentrations in the WQ-SEEP samples no longer exceed the CCME-AL guideline, with a values of 0.0123 mg/L on May 5 and 0.0189 mg/L on May 13 (down from 0.0627 mg/L from the April 2015 trip).
- Three mill seeps were sampled during the May 2015 trips (WQ-MS-S-03, WQ-MS-S-08, WQ-MS-S-A). All had similar parameters that exceeded guideline and/or standard criteria (including aluminum, arsenic, cadmium, copper, iron, lead, manganese, silver and zinc).
- Up to three waste rock seeps were sampled (WQ-WR-SEEP-A, B, C) during the two May 2015 trips. WQ-WR-SEEP-A and –B were sampled on May 6, 2015 and they both had acidic pH, high total suspended solids, and very high concentrations of total and dissolved metals (including total zinc of 23.8 mg/L and 22.0 mg/L) – the most of any sample from the Mount Nansen Site. WQ-WR-SEEP-C (sampled on May 14, 2015) exceeded many of the same guidelines, but at a much lower concentration.
- Of the two lysimeter sampled (WQ-L1 and WQ-L2), the L1 site had higher concentrations of zinc and cadmium, while the L2 site had higher concentrations of aluminum, arsenic, iron, lead, and silver.
- Both the WQ-ADIT-SEEP and WQ-LW-SEEP-01 were dry during both May 2015 trips.

QA/QC Samples

May 4-6, 2015 Trip

Travel Blank Sample – had a sulfate concentration above detection limit, this can occur when samples provided by lab are dated (no contamination is suspected from actual transport or storage). All other parameters were below detection limits.

Field Blank Sample – had a dissolved zinc concentration above detection limit, suggesting potential field sampling contamination (potentially from an improperly tightened lid, dust or wind during sampling, etc.). Looking at other concentrations for zinc during the program, results appear normal and no other sample contamination is suspected. All other parameters were below detection limits – no contamination suspected from sample handling or processing.

Replicate Sample(s) – the average RPD of the replicate sample WQ-VC-UMN-r was 6% with an average difference of 3% for dissolved and 9% for total metals. Total aluminum and chromium had RPD >20%, indicating intrinsically high sample variability. The average RPD of the replicate sample WQ-VC-R+150-r was 5% with an average difference of 2% for dissolved and 6% for total metals. Alkalinity (total and bicarbonate) had RPD>20% (indicating intrinsically high variability within samples). The average RPD of the replicate sample WQ-DC-r was 6% with an average difference of 4% for dissolved and 9% for total metals. Alkalinity (total and bicarbonate) and dissolved cadmium had RPD>20% (indicating intrinsically high sample variability).

May 12-14, 2015 Trip

Travel Blank Sample – had an ammonia concentration above detection limit, this can occur when samples provided by lab are dated. All other parameters were below detection limits (no contamination suspected from travel or storage).

Field Blank Sample – had a chromium concentration that was above detection limit, suggestion some potential field contamination (improperly tightened lid, dust or wind during sampling, etc.). All other parameters were below detection limits (no contamination suspected from sample handling or processing).

Replicate Sample(s) – the average RPD of the replicate sample WQ-PC-D-r was 7% with an average difference of 6% for dissolved and 9% for total metals. Total titanium and lead had RPD >20%, indicating some imprecision in lab analysis or intrinsically high sample variability. Based on the time of year (freshet) with higher flows and runoff, it is likely the latter reason for the higher differences in RPD. The average RPD of the replicate sample WQ-VC-DBC-r was 7% with an average difference of 6% for dissolved and 6% for total metals. Alkalinity (total and bicarbonate) had RPD>20% (indicating intrinsically high variability within samples), and total mercury and dissolved zinc had RPD>50% suggesting errors in lab precision or highly variable conditions. The average RPD of the replicate sample WQ-DC-D1b-r was 3% with an average difference of 2% for dissolved and 3% for total metals. All individual RPD values were below 20% and are considered adequately precise.

PROGRAM RECOMMENDATIONS

- Continue to monitor sediment build-up in the weir pond over the course of the open-water season. Maintenance of the H-DC-M WP weir pond was recommended following the May 2015 trips. AAM has since cleaned out the sediment behind the weir pond (June 11, 2015).
- Discuss and investigate a more suitable location for the H-VC-R continuous station prior to winter.
- Continue to note any channels from Back Creek entering upstream of the regular confluence – as this occurrence would have implications for water quality at WQ-VC-U and hydrology at H-VC-U.
- Continue to monitor the WQ-SEEP (regular standard sampling package monthly and LC50 every second month). Conditions are improving.

- Continue to monitor the WQ-LW-SEEP-01 and WQ-ADIT-SEEP during subsequent summer and fall trips, in order to collect opportunistic samples if flowing (both sites were dry during the May 2015 trips).

ADDITIONAL TRIP INFORMATION

Any changes to project scope (i.e. additional sites sampled):	All sampling and monitoring was conducted within scope.
Any alterations to sample scheduling:	None.
Any events resulting in changes to budget:	None.
Additional Comments:	Site conditions during the two site trips were representative of early-spring and spring freshet, respectively. Water levels were significantly higher on both trips with the majority of ice and snow has now melted at the Mount Nansen site.
Wildlife Sightings:	A black bear was seen during the drive from Carmacks to Mount Nansen site during the first site trip.
Site concerns (safety):	A caribou leg (bait) was discovered during the second trip at the access point to the trail for WQ/H-VC-UMN off the Mount Nansen road. The bait was wired to the base of a tree several meters from a trap line sign and appears to be left from winter. May be a wildlife attractant.

WQ-ADIT-SEEP	N	12-May-15	No flow or water observed at site.
WQ-BC	Y	05-May-15	Still ice covered at regular sample location. However, creek was found flowing just upstream of regular site, towards and into Victoria Creek upstream of the normal confluence – sample was collected from flowing portion of stream.
WQ-BC	Y	13-May-15	Flow is braided throughout the area due to high flows and continued presence of ice (up to 30 cm thick) that remains in the Back Creek channel. Sample collected from open water lead next to regular sample site.
WQ-CH-P-13-01	Y	06-May-15	Small trickle of water present at sample site– suitable for collection. Similar quantity flow to WQ-DESS-01.
WQ-CH-P-13-01	Y	13-May-15	Flow at this site was moderate/high; the flow volume was not confined, and therefore could not be estimated.

ALS Test Code	Matrix	Test Description	Method Reference**
ALK-PCT-VA	Water	Alkalinity by Auto. Titration	APHA 2320 "Alkalinity"
This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.			
ALK-PCT-VA	Water	Alkalinity by Auto. Titration	APHA 2320 Alkalinity

HARDNESS-CALC-VA Water Hardness APHA 2340B

Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation.

HG-D-CVAA-VA Water Diss. Mercury in Water by CVAAS or CVAFS APHA 3030B/EPA 1631E (mod)

HG-T-CVAA-VA Water Total Mercury in Water by CVAAS or CVAFS EPA 1631E (mod)

Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.

IONBALANCE-VA Water Ion Balance Calculation APHA 1030E

Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero.

Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as:

Ion Balance (%) = [Cation Sum-Anion Sum] / [Cation Sum+Anion Sum]

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedures may involve preliminary sample treatment by acid digestion, using either hotblock or microwave oven (EPA Method 3005A). Instrumental analysis is by inductively coupled plasma - optical emission spectrophotometry (EPA Method 6010B).

NH3-F-VA Water Ammonia in Water by Fluorescence APHA 4500 NH3-NITROGEN (AMMONIA)

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NH3-F-VA Water Ammonia in Water by Fluorescence J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NO2-L-IC-N-WR Water Nitrite in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO3-L-IC-N-WR Water Nitrate in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H "pH Value"

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

Reference Information

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

S-DIS-ICP-VA Water Dissolved Sulfur in Water by ICPOES EPA SW-846 3005A/6010B

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedures may involve preliminary sample treatment by acid digestion, using either hotblock or microwave oven, or filtration (EPA Method 3005A). Instrumental analysis is by inductively coupled plasma - optical emission spectrophotometry (EPA Method 6010B).

Method Limitation: This method will not give total sulfur results for all samples. Sulfide or other volatile forms of sulfur that may be present in submitted samples, is often lost during the sampling, preservation and analysis process. The data reported as total and/or dissolved sulfur represents all non-volatile forms of sulfur present in a particular sample.

S-TOT-ICP-VA Water Total Sulfur in Water by ICPOES EPA SW-846 3005A/6010B

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedures may involve preliminary sample treatment by acid digestion, using either hotblock or microwave oven, or filtration (EPA Method 3005A). Instrumental analysis is by inductively coupled plasma - optical emission spectrophotometry (EPA Method 6010B).

Method Limitation: This method will not give total sulfur results for all samples. Sulfide or other volatile forms of sulfur that may be present in submitted samples, is often lost during the sampling, preservation and analysis process. The data reported as total and/or dissolved sulfur represents all non-volatile forms of sulfur present in a particular sample.

SO4-IC-N-WR Water Sulfate in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

TDS-CALC-VA Water TDS (Calculated) APHA 1030E (20TH EDITION)

This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses".

TSS-MAN-WR Water Total Suspended Solids by Gravimetric APHA 2540 D

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids are determined by filtering a sample through a glass fibre filter and drying the filter at 104 degrees celsius.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

QC Samples with Qualifiers & Comments:

QC Type Description	Parameter	Qualifier	Applies to Sample Number(s)
Matrix Spike	Calcium (Ca)-Total	MS-B	L1608687-1

Qualifiers for Individual Parameters Listed:

Qualifier	Description
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
ALK-COL-VA	Water	Alkalinity by Colourimetric (Automated)	EPA 310.2

This analysis is carried out using procedures adapted from EPA Method 310.2 "Alkalinity". Total Alkalinity is determined using the methyl orange colourimetric method.

CL-IC-N-WR	Water	Chloride in Water by IC	EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

COLOUR-TRUE-VA	Water	Colour (True) by Spectrometer	BCMOE Colour Single Wavelength

This analysis is carried out using procedures adapted from British Columbia Environmental Manual "Colour- Single Wavelength." Colour (True Colour) is determined by filtering a sample through a 0.45 micron membrane filter followed by analysis of the filtrate using the platinum-cobalt colourimetric method.
Colour measurements can be highly pH dependent, and apply to the pH of the sample as received (at time of testing), without pH adjustment. Concurrent measurement of sample pH is recommended.

EC-MAN-WR	Water	Conductivity by Meter	APHA 2510 (B)

This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using an electrode.

F-IC-N-WR	Water	Fluoride in Water by IC	EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

HARDNESS-CALC-VA	Water	Hardness	APHA 2340B

Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation.

HG-TOT-CVAFS-VA	Water	Total Mercury in Water by CVAFS	EPA 245.7

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedure involves a cold-oxidation of the acidified sample using bromine monochloride prior to reduction of the sample with stannous chloride. Instrumental analysis is by cold vapour atomic fluorescence spectrophotometry or atomic absorption spectrophotometry (EPA Method 245.7).

IONBALANCE-VA	Water	Ion Balance Calculation	APHA 1030E

Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero.

Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as:

Ion Balance (%) = [Cation Sum-Anion Sum] / [Cation Sum+Anion Sum]

MET-TOT-ICP-VA	Water	Total Metals in Water by ICPOES	EPA SW-846 3005A/6010B

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedures may involve preliminary sample treatment by acid digestion, using either hotblock or microwave oven (EPA Method 3005A). Instrumental analysis is by inductively coupled plasma - optical emission spectrophotometry (EPA Method 6010B).

MET-TOT-LOW-MS-VA	Water	Total Metals in Water by ICPMS(Low)	EPA SW-846 3005A/6020A

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedures may involve preliminary sample treatment by acid digestion, using either hotblock or microwave oven, or filtration (EPA Method 3005A). Instrumental analysis is by inductively coupled plasma - mass spectrometry (EPA Method 6020A).

NO2-L-IC-N-WR	Water	Nitrite in Water by IC (Low Level)	EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO3-L-IC-N-WR	Water	Nitrate in Water by IC (Low Level)	EPA 300.1 (mod)

Reference Information

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

PH-MAN-WR	Water	pH by Meter	APHA 4500-H (B)

"This analysis is carried out using procedures adapted from APHA Method 4500-H ""pH Value"". The pH is determined in the laboratory using a pH electrode."

SO4-IC-N-WR	Water	Sulfate in Water by IC	EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

TDS-CALC-VA	Water	TDS (Calculated)	APHA 1030E (20TH EDITION)

This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses".

TURBIDITY-VA	Water	Turbidity by Meter	APHA 2130 "Turbidity"

This analysis is carried out using procedures adapted from APHA Method 2130 "Turbidity". Turbidity is determined by the nephelometric method.

TURBIDITY-VA	Water	Turbidity by Meter	APHA 2130 Turbidity

This analysis is carried out using procedures adapted from APHA Method 2130 "Turbidity". Turbidity is determined by the nephelometric method.

Ion Balance (%) = [Cation Sum-Anion Sum] / [Cation Sum+Anion Sum]

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.
mg/kg - milligrams per kilogram based on dry weight of sample.
mg/kg wwt - milligrams per kilogram based on wet weight of sample.
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.
mg/L - milligrams per litre.
< - Less than.
D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

Table 1. Results for the 96-h rainbow trout acute toxicity test.

L1612705-1 (0146-150513)	May 13, 2015 @ N/A	>100

The sample was received on May 19, 2015, outside of the 5-day holding time required under EPS 1/RM/13 test protocol. The client was contacted upon sample receipt for confirmation to proceed with testing.

The test met control performance criterion and there were no other deviations, other than the sample holding time exceedance, from the test method. The results relate only to the sample tested.
