SITE CONDITIONS

The September 2016 trip was reflective of late-summer conditions. Water levels were moderate at most sites and stations, similar to levels observed during the August 2016 trip. The weather on September 6 consisted of temperature up to 8°C with rain showers beginning late in the evening. September 7 and 8 were overcast with calm to moderate winds and a high of 8°C. All watercourses scheduled for sampling were flowing, except for seepage site WQ-NW-SEEP-02 where the flowrate was insufficient to fill all sample bottles. Placer mining construction works continue to operate along Pony Creek upstream of H-PC-DSP/ WQ-PC-U, with heavy equipment operating at the time of sampling.

METEOROLOGY

Meteorological data was collected at the ATM-ROAD station throughout September 2016. EDI conducted a QA/QC review of the September 2016 data and all sensors appear to be functioning properly. Meteorological data will be summarized and analyzed at the end of the open-water season, in the October 2016 Monthly Report.

HYDROLOGY

All hydrometric stations provided suitable conditions for discharge measurements during the September 2016 trip. A total of 12 discharge measurements were collected at the Mount Nansen site. Flow rates were higher at all sites in September than during the August 2016 visit. Continuous water level logger records are available for the following seven stations: H-DC-B, H-DC-R, H-VC-U, H-BC, H-VC-DBC, H-VC-UMN and H-VC-R+290. A preliminary review of the continuous hydrometric and barometric data files indicates that all sensors are functioning properly.

Surface water conditions and hydrometric monitoring tasks completed at each station in September 2016 are summarized in Attachment 3. Quality control and quality assurance for the hydrometric data was conducted on both the instantaneous and continuous datasets.

Field Results

- Discharge measurements were collected with a Sontek FlowTracker acoustic Doppler velocimeter (ADV) using the velocity-area mid-section method at the four Victoria Creek stations: H-VC-U, H-VC-DBC, H-VC-UMN, and H-VC-R+290. September discharge values

along Victoria Creek ranged from 0.583 to 0.719 m^3/s. The September discharges represent higher flow conditions than during the August 1–3 trip.

- Flows increased in the downstream direction along Victoria Creek as the contributing watershed area increased, with the exception of a 0.026 m^3/s flow loss between H-VC-UMN and the downstream station H-VC-R+290. A description of the discharge patterns along Victoria Creek will be completed at the end of the open water season when the complete dataset is compiled.
- Discharge measurements were collected at the five stations along Dome Creek. Salt dilution gauging was used to measure the discharge at three stations: H-DC-B, H-DC-M WP and H-DC-R. Volumetric methods were used at H-DC-DX+105 and H-DC-D1b. September discharge values ranged from 0.003 to 0.023 m^3/s.
- The discharge at the Pony Creek station, H-PC-DSP, was measured using volumetric techniques and calculated to be 0.007 m^3/s.
- A discharge measurement was collected at the Back Creek station, H-BC, using salt dilution gauging methods with a discharge value of 0.075 m^3/s, which represents a higher discharge than the August measurement.
- The H-SEEP volumetric discharge measurement on September 7, 2016 (0.003 m^3/s) was identical to the flow rate observed at the pump in the seepage pond shack (0.003 m^3/s).
- At H-DC-M WP, a negligible amount of water was flowing under the V-notch weir plate. The sandbags along the right downstream side continue to stop water from flowing around the weir, as intended. Accumulated sediment from within the weir pond was excavated for approximately 45 minutes.
- Placer mining operations along Pony Creek were underway during the September 2016 visit. Large earthworks using heavy equipment were observed and two sluice boxes were running at the time of sampling. Placer activity continues to produce non-representative hydrological conditions along Pony Creek.
- Placer mining operations along Back Creek, upstream of H/WQ-BC, are contributing to highly turbid water in the creek.

WATER QUALITY

Water quality samples and in-situ data were collected at all planned sites with flowing water during the September 2016 trip. A total of 18 sites were sampled (Attachment 4). The drinking water sample, including a bacteriological sample, was collected from the pumphouse well (WQ-PW) on September 8, 2016. All samples were submitted for analysis through ALS Laboratories under chain of custody documentation, except for the bacteriological sample which was submitted to Yukon Government – Health and Social Services for analysis.

Site conditions were noted and a record of the samples collected were compiled (Attachment 4). In-situ and laboratory results summary tables as well as the lab certificates of analysis are attached (Attachment 4 and Attachment 5). Parameters that exceeded the Canadian Council of Ministers of the Environment Freshwater Aquatic Life (CCME-AL) guidelines and/or the Mount Nansen Effluent Quality Standards (EQS) criteria

are highlighted in Attachment 4 and discussed below. Many results reflect typical late summer conditions at Mount Nansen when water levels were moderate.

Water Quality Results Summary

- The WQ-SEEP samples exceeded CCME-AL guidelines for ammonia, total and dissolved arsenic, iron and zinc. Total iron and manganese exceeded Mount Nansen EQS.
- Tailings Pond (WQ-TP) samples exceeded CCME-AL guidelines for fluoride, total and dissolved arsenic, cadmium, copper, as well as for total lead and zinc.
- On Dome Creek, CCME-AL guidelines were exceeded for the following parameters and sites: fluoride (WQ-DC-DX+105), total aluminum (WQ-DC-D1B, WQ-DC-B, WQ-DC-U), total and dissolved arsenic (all sites from WQ-DC-DX to WQ-DC-R), total cadmium (WQ-DC-DX+105, WQ-DC-D1B), dissolved cadmium (WQ-DC-DX+105), total copper (WQ-DC-D1B, WQ-DC-B, WQ-DC-U), total iron (all sites from WQ-DC-DX to WQ-DC-R), dissolved iron (WQ-DC-DX, WQ-DC-B, WQ-DC-U, WQ-DC-R), total lead (WQ-DC-D1B), total zinc (WQ-DC-DX+105, WQ-DC-D1B, WQ-DC-B, WQ-DC-U), dissolved zinc (WQ-DC-DX+105, WQ-DC-D1B). Total iron exceeded Mount Nansen EQS for WQ-DC-DX, WQ-DC-D1B, WQ-DC-B, WQ-DC-U and WQ-DC-R. Total manganese exceeded Mount Nansen EQS for WQ-DC-DX+105, WQ-DC-D1B and WQ-DC-U. Total zinc exceeded Mount Nansen EQS for WQ-DC-DX+105 and WQ-DC-D1B. Total suspended solids also exceeded Mount Nansen EQS for WQ-DC-D1B, WQ-DC-B and WQ-DC-U.
- On Victoria Creek CCME-AL guidelines were exceeded for the following parameters and sites: total aluminum (WQ-VC-DBC, WQ-VC-UMN and WQ-VC-R), total copper (WQ-VC-DBC) and total iron (WQ-VC-DBC, WQ-VC-R).
- Back Creek (WQ-BC) samples exceeded CCME-AL guidelines for total aluminum, arsenic, cadmium, chromium, copper, iron, lead, mercury, silver and zinc. Total iron, manganese, and suspended solids also exceeded Mount Nansen EQS. Placer mining activity upstream of the sampling site is producing highly turbid water within Back Creek.
- The upstream (WQ-PC-U) and downstream (WQ-PC-D) Pony Creek sites had samples that exceeded CCME-AL guidelines for total ammonia, aluminum, arsenic, cadmium, chromium, copper, iron, lead, mercury, silver and zinc. Dissolved arsenic also exceeded CCME-AL guidelines at both sites. Total suspended solids, total iron and manganese also exceeded Mount Nansen EQS at both sites. Placer mining activity was ongoing on Pony Creek upstream of the two water quality sites, thus samples are not considered representative of typical results for the creek.
- The upwelling seep above WQ-CH-P-13-01 exceeded CCME-AL guidelines for total and dissolved aluminum, cadmium and zinc. Total zinc also exceeded Mount Nansen EQS.
- A partial sample only was collected at WQ-NW-SEEP-02 because of a very low flow rate from the seepage pipe. The total metals container was filled and preserved on site and half of the general parameters bottle was filled. The laboratory was able to use water from the general

parameters sample to complete all analyses, including dissolved metals, except for the mercury parameters. Therefore, for this site only, the dissolved metals parameters were not field filtered and preserved. The sample exceeded CCME-AL guidelines for fluoride, total aluminum, arsenic, cadmium, copper, iron and zinc, as well as for dissolved arsenic and copper.

- The bacteriological sample collected at WQ-PW on September 8, 2016 was absent of total coliforms and E. coli. All other sampling results for WQ-PW did not exceed CCME-AL guidelines.

QA/QC Samples

Travel Blank Sample – did not have any parameters above detection limit. No contamination from storage or transport is suspected.

Field Blank Sample – did not have any parameters above detection limits. No contamination from field sampling methodology is suspected.

Replicate Sample(s) – the average RPD of the replicate sample WQ-DC-U-r was 6% with an average difference of 9% for total and 5% for dissolved metals. Total titanium and total silver had RPD>20%.

The average RPD of the replicate sample WQ-VC-UMN-r was 11% with an average difference of 17% for total and 3% for dissolved metals. Alkalinity (bicarbonate), nitrate, sulfate, total aluminum, total arsenic and total manganese had RPD>20%. While these RPD values are higher than normally found, they are still within acceptable ranges. Some of the variation is likely associated with a laboratory sample logging error that resulted in the September samples being analysed as three separate batches, rather than combined; specifically, the WQ-VC-UMN sample and replicate were analyzed as parts of two different batches and on separate days.

PROGRAM RECOMMENDATIONS

- Conduct concurrent velocity-area and salt tracer discharge measurements at all hydrometric stations during the open water season, where possible, to continue to validate the salt tracer method.

Data flag for Detection Limit Adjustment --> Please refer to the lab COA report and lab excel report for more info
QA/QC Codes: RPD - Relative Percent Difference, <DL - below detection limit, and <2XDL - less than two times the detection limit.

Notes:

QA/QC Comments:

The **Travel Blank** sample did not have any parameters above detection limit. No contamination from storage or transport is suspected.

The **Field Blank** did not have any parameters above detection limits. No contamination from field sampling methodology is suspected.

QA/QC Replicate Analysis -

The average RPD of the replicate sample WQ-DC-U-r was 6% with an average difference of 9% for total and 5% for dissolved metals. Total titanium had RPD>20%.

The average RPD of the replicate sample WQ-VC-UMN-r was 11% with an average difference of 17% for total and 3% for dissolved metals. Alkalinity (bicarbonate), nitrate, sulfate, total aluminum, total arsenic and total manganese had RPD>20%.

IONBALANCE-VA Water Ion Balance Calculation APHA 1030E

Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero.

Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as:

Ion Balance (%) = [Cation Sum-Anion Sum] / [Cation Sum+Anion Sum]
