

# figures

## Summary

The figures library is a portfolio of 62 high-resolution line drawings and photos used to document key geological relationships described in the Overview (GSC Bulletin 481) and Fieldguide (GSC Open File 2940) manuscripts. The portfolio includes a wide range of geologic maps, stratigraphic sections, crustal profiles and correlation charts that highlight specific geologic features and themes relating to the geologic framework and tectonic evolution of the southern Coast Belt orogen. Figures are dynamically linked to thumbnail images in the Regional Geology and Fieldguide manuscripts, and can be browsed from listings of figure captions, or by using Library search and query tools provided as part of the Acrobat interface.
