

**Figure 61.** View south-southeast from the ridge east of upper Starr Creek where the McNeil fault (McN) cuts the Ragged Peak thrust (RPT). The Ragged Peak thrust has similar relations to the Porcupine thrust. Here it brings volcanic rocks of the Cloutier formation (K) above intermediate volcanics and black slate of the Seagull group (S). The McNeil thrust (McN) offsets the Ragged Peak thrust. The view is oblique to regional strike, and strata dip to the right.
