OVERVIEW

A total of 357 archival conodont samples from the northern part of the Stikine terrane have been re-examined as part of the Geological Survey of Canada's GEM 2 program, to provide biostratigraphic context for the development of an updated regional geologic framework for this terrane (Fig. 1; Table 1). The samples utilized as part of this study have been collected over the course of the past 40 years by numerous Geological Survey of Canada regional mappers and external collaborators, and define a unique dataset that has previously only been available from largely unpublished paleontological reports. This contribution complements the previous compilation of microfossil samples made for the northern Cache Creek terrane (Golding et al., 2016).

Samples from the northern Stikine terrane have been collected from the Laberge (105 E), Whitehorse (105 D), Teslin (105 C), Skagway (104 M), Atlin (104 N), Tulsequah (104 K), Dease Lake (104 J), Cry Lake (104 I), Telegraph Creek (104 G), Spatsizi River (104 H), Iskut River (104 B), and Bowser Lake (104 A) map sheets of northwestern British Columbia and southwestern Yukon. These samples are derived from the Stikine Assemblage, the Stuhini Group, and the Lewes River Group, and range in age from Mississippian to Triassic. Some of the samples have previously been referenced in publications (Table 1); however, many have only been described in internal paleontological reports (herein prefaced MJO- or OF-) and lab processing records.

This compilation reflects the current state of knowledge of conodont palaeontology in this area, and serves as a baseline for ongoing and future work in these regions. Additional samples were collected from the northern Stikine terrane during the summer of 2016, and analysis of these collections is underway. Data obtained from these new samples will be presented in a future publication.

RESEARCH HIGHLIGHTS

Table 1 collates the reported conodont faunas and stratigraphic ages from the northern Stikine terrane, divided into time intervals and subsequently arranged by Geological Survey of Canada sample number. Re-examination of the conodont samples has in many instances necessitated the revision of species identifications and stratigraphic age assignments, reflecting developments in conodont taxonomy and biostratigraphy since the time of writing of the original paleontological reports by M.J. Orchard (reports prefixed OF-, MJO-). The revised conodont faunas and stratigraphic ages are also recorded in Table 1.

None of the revised stratigraphic ages are contrary to previous estimates for the ages of the Stikine Assemblage, the Stuhini Group or the Lewes River Group. Research on these archival collections is ongoing; however, there are some initial observations that are worthy of note:

- In the Late Carboniferous, Kasimovian and Gzhelian (Late Pennsylvanian) conodonts have been definitively recorded from the Stikine Assemblage for the first time.
- In the Permian, Kungurian (late Cisuralian) and Roadian (early Guadalupian) conodonts have been definitively recorded from the Stikine Assemblage for the first time.
- A number of samples from the Late Triassic of the Lewes River and Stuhini groups that were previously assigned to the undifferentiated late Norian can now be assigned to the Rhaetian; this stage name was not in use at the time many of the paleontological reports were written.
- There remains a dearth of latest Permian and earliest Triassic ages recorded from the Stikine terrane, with only one sample recognised whose age may extend from Changsinghian (late Lopingian) into the Griesbachian or Dienerian (Induan).

- A number of species have been recognised in the Stikine terrane for the first time, including *Lochriea costata* and *Lochriea mononodosa*, which are rare in the Late Mississippian to Early Pennsylvanian of North America; the Permian species *Mesogondolella* n. sp. A, which has previously only been recorded from the Quesnel terrane in the Cordillera; and *Mosherella newpassensis*, which is reported from an exotic terrane for the first time, previously having been recorded from only the parautochthonous Cassiar terrane and the North American miogeocline during the Carnian (Late Triassic). The significance of these discoveries will be expanded on in a future publication.
- New species recently described from Black Bear Ridge in the Western Canada Sedimentary Basin, and used to define the Carnian-Norian boundary interval (Orchard 2014), have now been recognised in the northern Stikine terrane. This confirms their utility in discerning this boundary beyond the basin where they were first described, and a more detailed publication identifying the Carnian-Norian boundary in the Intermontane terranes of the Cordillera is currently in progress.

ACKNOWLEDGEMENTS

We acknowledge the efforts of the workers responsible for making the collections summarized herein, without which this contribution would not have been possible. These include: R.G. Anderson; J. Beekman; J.A. Bradford; J. Britton; D.A. Brown; R.L. Brown; C.J. Dodds; J.R. Drobe; D. Elsby; S.P. Gordey; C. Greig; M.H. Gunning; J.L. Hammack; C. Hart; J.L. Jackson; G.K. Jacobs; V.M. Koyanagi; J. Logan; G. Lowey; M. Maclean; D. Mathison; M. Mihalynuk; D.P. Moynihan; I. Neill; J. Nelson; J.F. Psutka; P.B. Read; M.T. Smith; R. Stevens; D.J. Tempelman-Kluit; D. Thorkelson; J. Timmerman; H.W. Tipper; E.T. Tozer; and G. Viehweger. Additional thanks are due to H. Taylor, for assisting with compiling data from the Geological Survey of Canada databases. Financial support for this study was provided by the Geological Survey of Canada GEM 2 program.
