    - Where embankments may pose a barrier or filter to wildlife movement, (e.g., > 2 m high and steep slope in areas of known wildlife movement), wildlife crossings will be constructed with the following characteristics:
        - 10 to 100 m in length
        - The embankment has a gradual grade (e.g., 5 horizontal to 1 vertical, compared to a standard 2:1 or 3:1)
        - Surfaces will be relatively smooth, compacted, and constructed of finer fill material (crushed rock minus 100 mm) to prevent leg entrapment
        - Crossing areas will be placed in areas of greater wildlife movement based on observational data and caribou collar data
        - Truck operators will be made aware of all high-use wildlife crossing areas and will be required to report any wildlife observations

4.1.3 Minimize Wildlife Incidents and Mortality Risk

CMC will conduct the following to minimize wildlife incidents and mortality risks:

- Design mine buildings to discourage use by animals:
    - Skirt all buildings and stair landings to the ground.
- Design mine buildings to prevent human-wildlife conflicts:
    - Avoid blind spots where possible around buildings.
    - Provide windows where practical on all exits.
- Design roads with clear lines of sight in areas of high wildlife interaction potential.
- Support YG Environment and affected First Nations wildlife harvest management initiatives in the Project area.

4.1.4 Wildlife Awareness and Sensitivity Training

Project personnel (employee and contractor) awareness programs will help to mitigate potential effects on wildlife by increasing personnel awareness of CMC's commitment to wildlife and habitat protection in the Project area. Personnel will receive an orientation on basic wildlife ecology relevant to the Project. Those personnel that are road users will receive training specifically focused on wildlife use of the road corridor, potential wildlife mortality risks, and road and traffic operation procedures that are established to mitigate effects on wildlife. Project personnel will be expected to comply with the direction provided by mine management and there will be enforcement of Project-specific wildlife provisions.

CMC commits to incorporating a wildlife awareness component to the on-site employee orientation program. The wildlife awareness component will include a presentation on the importance of wildlife protection around the Project and in the region. Training components will include:

- Introduction to regional wildlife and wildlife issues.
- Wildlife have the right-of-way policy.
- Bear awareness, garbage management and review of CMC's Waste and Hazardous Materials Management Plan.
- No feeding or harassing wildlife policy.
- Wildlife encounter directives.
- Incidental wildlife observation protocol.
- Awareness training regarding the importance of avoiding known and reporting new mineral licks, nest sites, and other sensitive habitat features.
- Road driving directives: speed limits, driving at winter, expected areas of wildlife occurrences.
- Wildlife reporting requirements.
- Notification of enforcement measures (e.g., tracking truck speeds through sensitive areas).

4.2 CONSTRUCTION MITIGATION

Construction is likely the most disruptive Project phase for wildlife and wildlife habitat. Wildlife habitat is actively removed (e.g. mine, temporary camps, road, and borrow site construction), more humans will be present in the area, and large, noisy equipment will be required to construct and haul Project infrastructure — a level of activity that will be unprecedented in the area. Construction mitigation actions aim to reduce or remove potential effects to wildlife and wildlife habitat during this time, and will include:

- Not putting construction camps inside identified Klaza caribou late-winter range.
- Whenever practical and not causing a human safety issue, implement a stop work policy when wildlife in the area may be endangered (i.e., risk of physical injury or death) by the work being carried out.
- Avoid construction in sensitive habitats and/or during sensitive times, which will include:
    - Avoidance of new clearing during the breeding bird nesting season (1 May to 31 July in Yukon), or conducting nest surveys immediately prior to clearing activities.
    - Late-winter (1 February to 30 April) is considered the most sensitive time for caribou and moose. For caribou, this generally means avoiding the initiation of new construction activities during this period between km 98 and km 130 on the Freegold Road extension.
    - Sensitive habitat features (e.g., mineral licks, raptor nests, dens, and bat roosts) identified during pre-clearing surveys will be addressed on a case-by-case basis.
    - Avoiding blasting within 500 m of sensitive habitat features (e.g., mineral licks, raptor nests, dens, and bat roosts) when wildlife are likely to be present, which will include:
        - Dens — active or re-used dens will be avoided from October through to May, where they are known to occur. This would include grizzly and black bears, wolverine, coyotes, and foxes.
        - Mineral licks — two mineral licks were identified during baseline studies that will be considered in construction monitoring (locations are not available for public distribution).
        - Raptor nests — any known raptor nests within the PDA will be avoided where possible, and nest management plans may be developed for specific nests.
- If clearing must occur during the bird nesting season, CMC commits to conducting active migratory bird nest surveys prior to clearing.
    - Survey methods will follow best practices implemented to date for other Yukon projects. Some aspects of those surveys included:
        - Survey teams are led by qualified individuals.
        - Surveys extend beyond the Project footprint the distance of the identified setbacks, where suitable habitat exists.
        - A no-disturbance buffer around active nests is established until chicks have fledged or the nest is determined to have been predated or abandoned. Recommended setback distances are listed in Table 4.2-1. Other set-back distance guidelines may be considered should they be made publicly available.
        - A 7-day window for clearing activities to be completed once the survey is conducted (if no nests are found).
        - Communication of survey results and overview of protected nests with clearing contractors or on-site construction supervisor.
        - Updates provided as part of the annual reporting to the working group.
    - Pre-clearing surveys will also include assessing for potential bat roosts.

- If bat roosts are detected, site-specific avoidance measures and a mitigation plan will be developed.

Table 4.2-1. Recommended Setback Distances for Construction Activity near Bird Nests

Species Group	Recommended Setback Distances (m)	Exceptions/Comments
Ground and tree-nesting birds	10	
Cliff-nesting and large stick-nesting raptors	500	Develop nest-specific management plans for potentially disturbed nests. Includes short-eared owl and common nighthawk.

Sensory disturbances that reduce habitat effectiveness within a Zone of Influence (ZOI) can only be partially mitigated. Caribou, moose, bears, and other wildlife will find some Project activities disturbing, and the degree to which animals will adapt or habituate to those disturbances is not known. Mitigation measures that will minimize the likelihood of reduced habitat effectiveness for wildlife include limiting sensory disturbances where possible throughout the year. This will be realized by developing a blasting program to minimize effects on wildlife including, but not limited to, the restriction of blasting when caribou or other sensitive wildlife (e.g. nesting raptors) may be present.

4.3 OPERATION MITIGATION

The operations phase is the longest Project phase, with regular mining activities occurring throughout the life of the Project. During this phase, the following mitigation measures will be implemented:

- To avoid unnecessary disturbances to wildlife, there will be no stopping or loitering in sensitive wildlife areas or during sensitive wildlife periods:
    - No stopping areas will have signs posted along Project roads (similar to “No Stopping, Avalanche Zone” road signs). These signs will be posted along road sections identified in the Project Proposal, or as deemed appropriate by the working group where sensitive wildlife areas have been identified.
    - Identification of and the reasons for no stopping zones as part of the employee education program (Section 4.1).
- To reduce the Project-related effects on mortality risk, wildlife near misses and collisions will be investigated to determine the root cause and identify corrective actions:
    - Near misses are when wildlife mortality could have occurred if immediate corrective actions were not taken.
    - Investigations will follow a standard procedure of employee interviews, scene investigation, recording time, date, incident details.
    - Corrective actions will be identified and are specific to the situation (e.g., reduce speed, improved lighting, roadside vegetation clearing).
- Minimize fugitive dust dispersal by using dust suppression methods, and thereby minimizing the Project’s zone of influence.
- CMC acknowledges the potential for an increase in the number of predators as a result of human activity in the area. To minimize the potential for increasing densities of bird nest predators (e.g., foxes, gulls), CMC will:

- Implement strict waste management procedures as outlined in the Waste Management Plan. Audits will be carried out periodically to assess the effectiveness of waste management practices.
- Conduct regular surveillance of Project facilities and waste disposal sites to ensure that predator control measures are effective.

- Incorporating Best Management Practices for food, waste and fuel management into the design on the Project. CMC has developed at Waste and Hazardous Materials Management Plan to ensure proper waste management practices are implemented. These practices may include:
  - Storing and incinerating garbage in an enclosed area surrounded by electric fencing. The gate will remain closed at all times.
  - Installing a stack scrubber in all kitchen vents to reduce food odour during cooking.
  - Storing all food and waste inside buildings or within an enclosed, bear proof area, unless field crews are working remotely. Field crew lunches will be sealed in airtight containers and all garbage will be pack out and properly disposed of.
  - Burning all food and kitchen waste in an incinerator.
  - Adding lime and dirt to latrines on a regular basis to reduce odour.
  - Storing all fuel in airtight containers in areas inaccessible to bears (i.e., fuel shed or fenced enclosure).
  - Training all workers in wildlife management protocols, including garbage management, bear encounter protocols (Section 4.1.4)

4.3.1 Road Operations and Access Management

CMC is aware that public access to the road may lead to unanticipated indirect effects on wildlife from collisions and harvest. To address that concern, CMC has developed a Road Use Plan, the key elements with respect to mitigating effects on wildlife include:

- No public access (access by permit only)
  - Chartered aircraft transportation to and from the Project site will be provided for Project staff.
- Controlled, gated, manned access (located at the new bridge over Big Creek — or as otherwise agreed).

Key elements of the Road Use Plan for wildlife include the following commitments – details of which are discussed elsewhere in this document:

- “No Hunting” in game management zones along access road (continuation of existing hunting ban in some areas, extended to include entire length of access corridor).
- Special management provisions for Klaza caribou that include long-term and increased active monitoring (currently underway), and other measures as agreed (Section 5).
- Identification of ‘wildlife crossing’ areas along route, that may include active monitoring (Section 4.1.2), snow clearing berm management in late-winter, travel speed reductions and restrictions as defined and agreed in the management plan.

To mitigate the Project’s direct effects on wildlife as a result of road operations by Project personnel, CMC commits to the following actions:

- Implement a “Wildlife have the Right-of-Way” policy to avoid potential collision or unnecessary disturbances to wildlife:

  - Vehicle operators will be vigilant and watch for wildlife near roads, and take all reasonable actions to avoid wildlife collisions.
  - Traffic will stop when wildlife are observed on the road.
  - To allow small groups (<10) or individual wildlife standing on the road to move off the road unalarmed, trucks will stop for 15 minutes, then proceed slowly (<20 km/hr) if wildlife have not moved within that 15 minute period.

- Implement compulsory speed limits through late winter caribou habitat to reduce the potential for wildlife collision and to reduce sensory disturbances along the road:
  - The speed limit will be established based on safe stopping distances and line of sight in areas of potential caribou encounters.
- Direct operators to include wildlife reports in their radio communications:
  - Truck-to-truck communication reporting wildlife presence by kilometer (e.g. "*two caribou north of road at kilometer 97*") will keep operators informed of potential hazard areas.
- Manage snow clearing so that caribou and other wildlife can easily cross the road without being deterred by steep and high snow banks:
  - Snow banks will be kept less than 1 metre high.
- If wildlife mortality were to occur as a direct result of Project-related collisions, increased traffic controls will be implemented. Timing and duration of increased controls is dependent on wildlife presence.
- CMC will have a wildlife monitor patrolling the road when there is a high likelihood of wildlife encounters and there is a risk of collision:
  - High likelihood of encounters can be based on increasing frequency of wildlife sightings.
  - During years of high interaction with the road, caribou numbers in the vicinity of the road will be re-evaluated on an every second day basis using light vehicles, aerial surveys, collar data, or other technologies available for the monitoring effort.
- Removal of carcasses from transportation corridors to discourage further collisions (e.g., scavengers on road).

An operational decision tree matrix for drivers dealing with wildlife sightings near roads is provided in Figure 2.1-1.

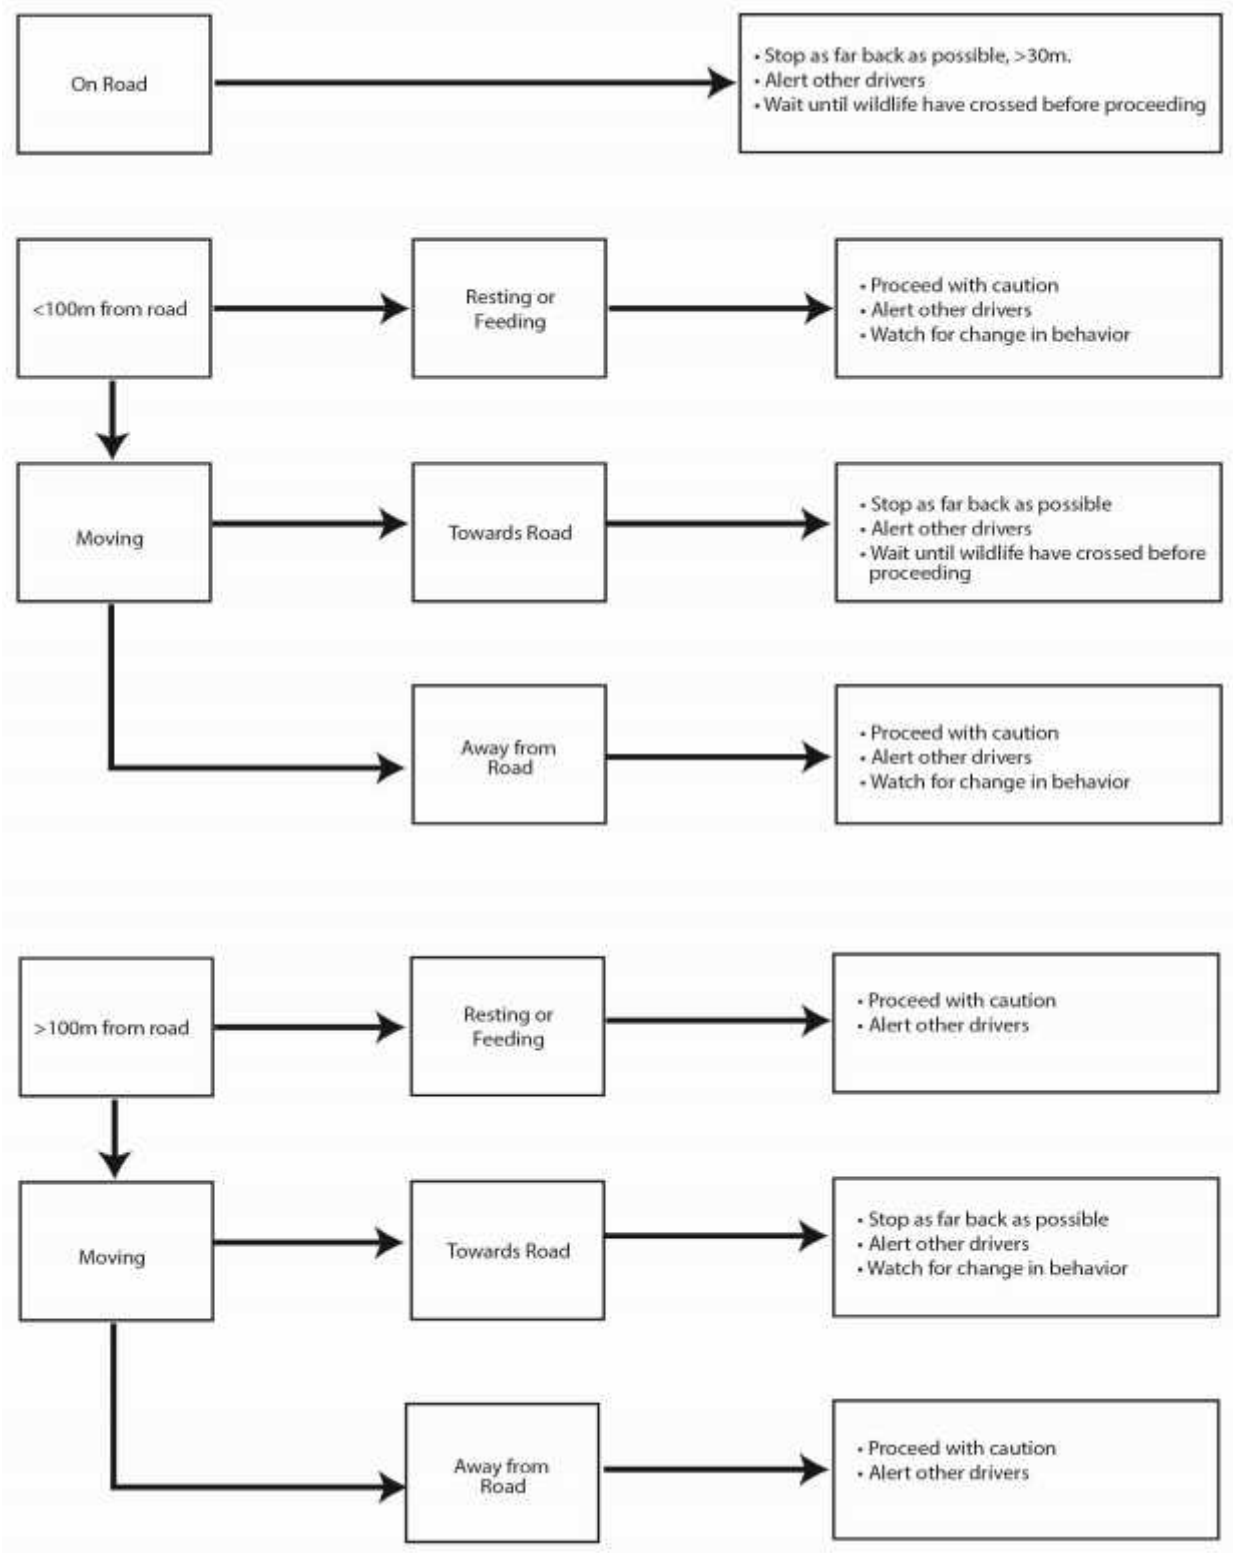

Figure 4.3-1 Wildlife and Road Operation Decision Matrix

4.3.2 Problem Wildlife Management

The goal of problem wildlife management is to reduce the potential for wildlife-human interactions at the Project. A problem wildlife protocol will help to ensure employee safety and minimize potential mortality due to threats to life or property. CMC will implement a problem wildlife protocol that includes:

- Employees will be required to report wildlife sightings near Project facilities.
- Warning signs will be posted in areas of frequent wildlife encounters on a seasonal basis or otherwise as required.
- Area closures will be used until proper control measures are in place or have been activated.
- If wildlife becomes a concern, Yukon Conservation Officer Services will be contacted for advice on appropriate actions.
- With prior approval of local Conservation Officer(s), adverse conditioning actions will be applied to problem wildlife to reverse habituation behaviours.
- CMC will identify appropriate personnel to monitor, manage and evaluate human-wildlife conflicts.

The decision matrix for managing CMC's response to problem wildlife is presented in Table 4.3-1.

Table 4.3-1. Problem Wildlife Encounter Management Matrix

Type of interaction	CMC Management Response					
	Monitor	**Post warning**	**Area closure**	**Contact Conservation Officer Services**	**Hazing actions***	**Relocate***
Animal sighting reported	•					
Animal showing normal feeding behaviour	•	•				
Animal reacting defensively	•	•	•			
Animal tolerates human disturbance and ignores people and facilities	•	•	•			
Animal shows repeated interest in people and facilities that will likely lead to habituation	•	•	•	•	•	
Animal is clearly habituated to humans and facility	•	•	•	•	•	•
Animal displays aggressive behaviour and is an immediate threat to human safety			•	•		•

* Hazing and relocation actions to be conducted only in accordance with advice from Conservation Officer Services.

4.3.3 TMF Wildlife Management

CMC expects that there will be some waterfowl and wildlife exposure to water in the Tailings Management Facility (TMF) during the Project's operation phase. It is not economically feasible, nor is it necessarily desirable to restrict all wildlife access to the TMF area when risks to animal health and mortality are relatively low — depending on constituents of potential concern (COPCs), ingestion rates, animal residency times, and individual health conditions. There is little evidence to predict what level of effect exposure to water in the TMF may have on wildlife, or the ultimate result of that exposure. Therefore, depending on animal responses to the TMF, the

following mitigation options may be considered to control wildlife presence at the TMF if deemed by CMC and/or regulators to be necessary:

- CMC will use wildlife deterrence measures in portions of the TMF that are identified as high risk areas to wildlife health.
- Deterrence measures can include wildlife fencing to keep wildlife out, scare crows, cannons, or any other proven methods at the time the risk is identified.

4.3.4 Cliff-nesting Raptor Mitigation

The Project area has cliff-nesting raptors that are known to breed in the PDA, and although the assessment concluded that the Project will have no population-level impacts, the potential to disturb and disrupt individuals is possible and proper mitigation procedures will be implemented to minimize unforeseen effects. General mitigation measures applied in all areas of the Project footprint will mitigate effects to cliff-nesting raptors. Additionally, nest-specific management plans will be developed for any cliff nests identified within 500 m of the PDA. Where possible, a site-specific no-disturbance or no stopping buffer (approximately 500 m) will be used for both Project personnel and equipment around the nests during the nesting period (1 April to 31 August for raptors).

4.4 CLOSURE AND POST CLOSURE

CMC expects that after Project operations are complete and mine facilities are decommissioned that mitigation for wildlife will be passive, and will include the following:

- As directed in the Road Use Plan, the Freegold Road extension will be decommissioned such that passage of vehicles will not be possible. Following decommissioning, no further mitigation activities for wildlife are expected to be implemented.
- As detailed in the closure plan, the TMF will include the construction of a wetland, creating a large littoral zone and wetland habitat where no wetlands currently exist. It is expected that wetland-associated wildlife will be attracted to and use the area after the mine has closed and the wetland has become established. There are no toxicological effects expected from use of the wetland and no further mitigation for wildlife is expected; however, if water quality monitoring results exceed acceptable standards, wildlife monitoring in the vicinity of TMF will be conducted.

5 - MONITORING FRAMEWORK

Monitoring effects on wildlife must be relevant to the Project and to the possible effects which the Project will have on the environment. The Casino Project's monitoring framework will inform adaptive management measures that can be effectively applied. The objectives of the monitoring framework are to:

- Develop a comprehensive and integrated environmental monitoring program.
- Incorporate an ecosystem-based approach for monitoring and management of Project related environmental effects.
- Integrate traditional knowledge, when possible and available, into the development and implementation of the environmental monitoring programs.
- Include the meaningful participation of stakeholders in all aspects of the environmental monitoring program in all phases of the development, including the decommissioning and reclamation.
- Report in an effective and timely manner on the environmental monitoring program and its results in ways that are meaningful to stakeholders.

Monitoring efforts will focus on a variety of spatial and temporal scales, depending on the focal species. Most local monitoring efforts will focus studies at the scale of the Project footprint (e.g. wildlife mortality monitoring), while others will focus on larger scales to adequately quantify and/or qualify effects (e.g. wildlife distribution).

5.1 MONITORING PRINCIPLES

The monitoring framework is based on the following principles:

- Monitor and verify potential effects related to the Project
- Ensure monitoring efforts are able to detect natural and Project-related changes to the environment.
- Monitor and evaluate the effectiveness of mitigation measures
- Identify unanticipated effects
- Monitor effects where predictions were based on weak data
- Provide an early warning of undesirable change in the environment
- Inform adaptive management measures

5.2 MONITORING FRAMEWORK OVERVIEW

The monitoring framework is based on three categories of study related to monitoring and follow-up of Project-related effects (adapted from Voisy's Bay EEM 2006):

1. **Baseline Research** — background studies intended to establish need for, or parameters of, an environmental effects management program. Research studies could address issues such as natural variability of a measurable parameter or monitoring target, or examine the nature, extent, or duration of a potential Project-focal species interaction.
2. **Surveillance** — programs to produce information about the pattern of occurrence of focal species.
3. **Monitoring** — programs to address and quantify effects mechanisms between Project activities and components of the receiving environment.

Table 5.2-1 defines the key considerations for each monitoring plan component. Monitoring is focused on measureable parameters of indicators. Monitoring will occur on and in areas adjacent to the Project footprint (Facilities Monitoring), and focal species monitoring will occur within the Regional Study Area (Focal Species

Monitoring). If stakeholders are interested or concerned about broader regional-level wildlife issues, a collaborative approach and participation by CMC can be considered for monitoring outside of the RSA.

Table 5.2-1. Monitoring Framework Overview

VC	Valued Component (e.g., Wildlife, Birds, Vegetation)
Indicator	The species or relevant feature selected to represent the VC (e.g., caribou)
Monitoring category	One of three categories – Research, Surveillance, Monitoring
Design	e.g., Before-After-Control-Impact (BACI), Opportunistic
Measurable parameter	A quantifiable feature used to assess potential effects on an indicator (e.g., movement)
Key project interactions	Identification of key project features that result in residual effects on the Indicator and Measurable Parameter (e.g., Freegold Road extension as a filter to caribou (Indicator) movement (Measureable Parameter))
Goal	Statement of the expected residual effect of the Project (e.g., the Project will have a not significant effect on caribou movements across Project infrastructure)
Objective	Evaluate a potential response specific to the mine and operations (e.g., evaluate movement patterns of caribou as they approach or cross the road)
Threshold	Early warning indicator (note: usually about an order of magnitude lower than the significance criteria used in the effects assessment)
Scope of monitoring work	Brief overview of key components of a monitoring program including note of temporal and spatial scale, frequency, and duration. It will also indicate if the monitoring is to occur in relation to direct project effects relative to day-to-day operations (facility-specific), or is intended to address broader-scale effects on a focal species: • **PDA/Facility-specific** monitoring will be a regularly occurring task for the on-site environmental staff focusing on wildlife interactions with Project infrastructure and facilities. • **Focal species** monitoring generally will occur at a broader scale with an emphasis on focal species abundance and distribution within the broader Project area, including monitoring of wildlife response to Project-related disturbances and predicted impacts and wildlife distribution in a broader Regional Study Area.
Agency/partner participation	Identification of agencies or key partners in the monitoring programs (e.g., YG Environment, RRCs)
Mitigation measures	A list of measures used to reduce or remove project related effects (e.g., project design elements, adjustments to operations)
Project Terms and Conditions	Indicates the Project Terms and Conditions (to be determined) that are being addressed by this monitoring plan component

5.3 PDA/FACILITY-SPECIFIC MONITORING

Project facilities, structures, and the Freegold Road extension (facilities within the PDA) pose potential risks to wildlife and obstacles to wildlife movement. The Project facilities will be monitored on a frequent basis to determine whether effects are occurring and if mitigation is adequate. Project components that will be monitored for wildlife effects include the following:

- The Freegold Road extension and other site roads for road traffic interaction and snow bank management.
- Traffic volume on all Project roads will be monitored to determine if volumes are exceeding expected levels.
- Access to the Freegold Road extension will be monitored to determine how many non-Project-related, but permitted people are accessing the road (e.g. First Nations, placer miners, trappers).
- The Yukon River water pipeline to determine if it is acting as a barrier to wildlife movement and effectiveness of mitigation actions.
- The Tailings Management Facility (TMF) to determine wildlife attraction, an assessment of the risks if wildlife are using it, and need for deterrence measures (if required).
- Project buildings as a potential haven for nest predators and problem wildlife.
- Waste management facilities as a potential attractant of problem wildlife.

PDA/Facility-specific monitoring will be conducted by CMC's on-site environmental management staff, wildlife monitors, and specialists as required. The on-site staff will be familiar with the Project's effects assessment and Project conditions related to wildlife, commitments made to mitigate effects on wildlife, and understand the adaptive management process used to manage responses to mitigation actions.

Results of PDA/Facility monitoring will be reported annually within the WMMP monitoring report. Successive reports will include a review of previous years' data to detect trends in wildlife occurrences and results of mitigation actions. Key features of the annual PDA/Facility monitoring report will include the following activities (Table 5.3-1):

- Project footprint monitoring — measures of the area(s) physically disturbed for construction and operations. Comparisons will be made between the planned footprint in the Project description and the actual footprint mapped using a GPS.
- Project activity — a summary of human presence (e.g., man days), general traffic statistics, construction activities, blasting activities, etc.
- Summary of a wildlife sightings log as an indication of wildlife presence in the immediate Project area. Data includes location, date, time, species, activity, etc.
- Summary of wildlife mitigation activities, including results of active migratory bird nest surveys (if required), deterrence actions, problem wildlife kills, etc.
- Summary of vehicle/wildlife collisions and results of investigations and corrective actions taken.
- Summary of non-Project related activities in the Project area (e.g., other land users, placer miners).
- Summary of regulator consultation for dealing with on-site wildlife issues.

There are no toxicological effects expected from use of the wetland and no further mitigation for wildlife is expected; however, if water quality monitoring results exceed acceptable standards, then wildlife monitoring in the vicinity of TMF will be triggered and additional mitigation measures will be implemented.

Table 5.3-1 Summary of PDA/Facility-Specific Monitoring Programs by Project Phase

PDA/Facility Monitoring	Construction	Operations	Closure/ Post-closure
Footprint assessment — measure the evolving Project footprint and compare the area prediction in the Project description	Annual	Annual	As needed to monitor reclamation
Building assessment — observe use of buildings for use by nest predators, nesting structures, or as a haven for potential problem wildlife.	Monthly	Monthly	n/a
Road monitoring — Reported observations of wildlife along the road, report on mitigations required. Report on follow-up investigations to wildlife-vehicle collisions and management actions. Report on traffic volumes and public access.	Ongoing	Ongoing	Ongoing to decommissioning of road
Nest monitoring			
Raptor nests adjacent to PDA	As required when adjacent nest sites are occupied	As required when adjacent nest sites are occupied	n/a
Active migratory bird nest surveys – survey areas that must be cleared 01 May to 31 July	As required prior to disturbance	n/a	n/a
Incidental human activity reporting — record of non-Project-related human activity in project area that may have interacted with wildlife. Data includes location, date, time, type of activity, number of people.	Ongoing	Ongoing	To coincide with TMF monitoring as required post-closure
Incidental wildlife reporting — Observation sheets placed throughout Project facilities encouraging personnel to record wildlife sightings. Data includes location, date, time, species, activity, etc.	Ongoing	Ongoing	To coincide with TMF monitoring as required post-closure
Waste area/TMF monitoring — Observations of wildlife use and mitigation actions taken to deter wildlife use.	Weekly	Weekly	To coincide with TMF monitoring as required post-closure
Exotic invasive plant species — Monitor methods used to reduce potential, and observations within PDA through life of Project.	Monitor washing of trucks and equipment prior to entering RSA	Annual botany surveys in PDA	As needed to monitor reclamation success

5.4 INDICATOR MONITORING PROGRAM

Monitoring will continue to be conducted to enhance baseline information, as a surveillance of occurrence in the Project area, and as ongoing monitoring efforts to validate Project effect predictions. General monitoring will enhance broader knowledge on multiple effects or species. The findings of the general monitoring may trigger additional focal species/effect monitoring if the results suggest an effect that exceeds the Project effect predictions or documents an unanticipated effect. Focal species/effect monitoring will refine the knowledge of the animals or issues in the local or regional study areas. The focal monitoring will assist with adaptive effects management, if needed, but will also increase knowledge base of human effects on wildlife in Yukon. The following will be included in focal species/effect monitoring (Sections 5.4.2 to 5.4.7):

- Plant invasive species — presence within and immediately adjacent to Project footprint
- Metals in plant tissue — an indicator of potential effects on animal health
- Cliff-nesting raptors — occupancy and productivity

- Klaza caribou herd — distribution and habitat use in the Project area (10 km radius of mine and road)
- Moose — distribution and habitat use in the Project area (10 km radius of mine and road)
- Grizzly bear, black bear, wolverine and wolf dens — activities relative to distance from the PDA
- Collared pika — continued presence in the Project area

Table summaries of suggested monitoring programs are provided below.

5.4.1 General Monitoring

To ensure that Project effects on all wildlife species are minimized, CMC will monitor and annually review the amount of direct habitat loss resulting from the Project footprint (Table 5.4-1). CMC will also track incidental observations of wildlife made by truck drivers and all Project personnel within and adjacent to the Project footprint, as well as all Project-related mortalities (Table 5.4-2 and Table 5.4-3). CMC will monitor wildlife use of known sensitive habitat features; and additional sensitive habitat features may be identified during the construction phase (Table 5.4-4).

Table 5.4-1 Wildlife Monitoring: Direct Habitat Loss

Indicator	All species
Monitoring category	Surveillance
Design type	Footprint survey
Measurable parameter	Project footprint
Key project interactions	Direct habitat loss within the footprint of the Project (either temporary or permanent)
Objective	Quantify direct habitat loss in the Project footprint
Threshold	Habitat loss limited to the amount identified in the Project description
Scope of monitoring work	Local monitoring: Measure area of Project disturbance on an annual basis using a GPS and GIS
Agency/partner participation	None required
Project terms and conditions	TBD

Table 5.4-2 Wildlife Monitoring: Incidental Observations

Indicator	All species
Monitoring category	Surveillance
Design type	Opportunistic
Measurable parameter	Wildlife presence in the Project area
Key project interactions	Wildlife using habitat adjacent to or within Project infrastructure
Objective	Track wildlife observations within and adjacent to the Project footprint
Threshold	None
Scope of monitoring work	Local monitoring: Log of wildlife observations within the RSA
Agency/partner participation	None required
Project terms and conditions	TBD

Table 5.4-3 Wildlife Monitoring: Project-Related Mortality

Indicator	All species
Monitoring category	Surveillance
Design type	Opportunistic
Measurable parameter	Wildlife mortality
Key project interactions	Wildlife mortality due to Project activities or infrastructure
Objective	Track Project-related mortality within and adjacent to the Project footprint
Threshold	Project-related caribou or moose mortalities will be reviewed to determine if further action is needed. Other species dealt with on a species-by-species basis.
Scope of monitoring work	Local monitoring: Record of near misses, collisions, and all other observed wildlife mortalities within the RSA
Agency/partner participation	None required
Project terms and conditions	TBD

Table 5.4-4 Wildlife Monitoring: Sensitive Habitat Features

Indicator	Habitat features: mineral licks, den sites, wetlands, bat roosts and reused bird nest sites
Monitoring category	Surveillance
Design type	Focussed surveys
Measurable parameter	Use of habitat features within the LSA
Key project interactions	The Project has the potential to affect animal use of habitat features within the LSA
Objective	Document use of habitat features within the LSA
Threshold	None
Scope of monitoring work	Local monitoring: Quantify the use of habitat features that could be affected by the Project within the LSA
Agency/partner participation	None required
Project terms and conditions	TBD

5.4.2 Vegetation

Vegetation will be monitored during Project construction, operation, and closure. Monitoring will occur every five years and will focus on invasive species and vegetation health in the vicinity of the Project and at control sites within the RSA for comparison.

Invasive species monitoring will occur within the Project footprint and adjacent habitats to ensure that no invasive species are introduced to the environment by the Project. Surveys for invasive plants will be conducted every five years, and additional surveys may be triggered by observations of plant invasive species. If any invasive species are found, these will be destroyed and, if the pathway of entry can be determined, changes will be made to reduce the possibility of further introduction of invasive species. See Table 5.4-5 and the Invasive Species Management Plan (Appendix A.22D) for more details on invasive species monitoring.

Vegetation health monitoring will be conducted through permanent monitoring plots in a variety of habitat types (minimum two plots per habitat type) near Project infrastructure and in control areas within the RSA. Plots in the vicinity of the Project infrastructure will be situated at varying distances from infrastructure to determine the extent of air quality impacts (the exact distance will be determined by the air quality monitoring program). Within each of the plots, species composition will be documented, and the percent cover of each species will be estimated.

Lichen and willow samples will be collected adjacent to the plots and sent to accredited laboratories for chemical analysis (Table 5.4-6).

Table 5.4-5 Vegetation Monitoring: Invasive Species

Indicator	Plant invasive species
Monitoring category	Surveillance
Design type	Footprint and adjacent habitat surveys
Measurable parameter	Occurrence of plant invasive species
Key project interactions	Introduction of plant invasive species (unnatural forage)
Goal	The Project will not introduce invasive plant species to the RSA
Objective	To quantify the occurrence of plant invasive species
Threshold	No introduction of plant invasive species as a result of Project activities
Scope of monitoring work	Local monitoring: Surveillance of Project footprint and adjacent habitat, at minimum, surveys to be conducted every 5 years or triggered by observations of plant invasive species
Agency/partner participation	None required
Project terms and conditions	TBD

Table 5.4-6 Vegetation Monitoring: Vegetation Health

Indicator	Vegetation Health
Monitoring category	Surveillance and Monitoring
Design type	Before-After-Control-Impact (BACI)
Measurable parameter	Vegetation class composition, biomass, and contaminant levels in lichen and willows
Key project interactions	Effluent, dust, and air emissions released into the environment have the potential to impact vegetation health. Dust and other contaminants may affect the survival of plant species (leading to changes in plant composition and biomass) and if contaminants are absorbed by plants then they may be ingested by wildlife or humans, which may have an effect on the health of individuals.
Goal	The Project will have a not significant effect on metal uptake in vegetation
Objective	Quantify through continued monitoring throughout the duration of the Project: - metals levels in lichen (caribou forage) - metals levels in willow (moose forage)
Threshold	Project activities resulting in >10% change in vegetation accumulation of contaminants in lichen and willow beyond acceptable threshold levels for wildlife and human health
Scope of monitoring work	Regional monitoring: Assess baseline vegetation class composition and contaminant levels in lichen and willow and re-assess every 5 years. Air quality monitoring program led by CMC.
Agency/partner participation	None required
Project terms and conditions	TBD

5.4.3 Birds

One monitoring program for birds will be implemented by CMC over the course of the construction, operation, closure, and post-closure phases to increase the available baseline data, to detect possible changes to cliff-

nesting raptors in the RSA, to assess the magnitude of these changes, and to determine whether these changes are naturally occurring variations or Project-related impacts.

Monitoring of cliff-nesting raptors (peregrine falcon, gyrfalcon, and golden eagle) will occur on an annual basis within the RSA to quantify occupancy and ensure that the Project is having a not significant effect on cliff-nesting raptors. This may involve up to four aerial surveys annually — one early in the nesting period, and one just before fledging for each species, and one for each of occupancy and productivity. Survey results for nests in close proximity to the PDA will be compared with results from other portions of the RSA and with baseline findings to determine whether the Project is affecting cliff-nesting species (Table 5.4-7).

Table 5.4-7 Cliff-nesting Raptors: Occupancy and Productivity

Indicator	Cliff-nesting raptors
Monitoring category	Baseline Research and Surveillance
Design type	Baseline research; Before-After-Control-Impact (BACI)
Measurable parameter	Occupancy and productivity
Key project interactions	Sensory disturbances generated from various Project activities
Goal	The Project will have a not significant effect on cliff-nesting raptor occupancy and productivity
Objective	To quantify cliff nesting raptor occupancy and productivity within the RSA
Threshold	Less than a 10% difference in near-site and far-site occupancy and productivity averaged over three consecutive years
Scope of monitoring work	Local monitoring: Annual territory surveys to determine occupancy and productivity of cliff-nesting raptors (total of four surveys – early and late season occupancy and early and late season productivity).
Agency/partner participation	Local monitoring: CMC, YG Environment
Project terms and conditions	TBD

5.4.4 Caribou

The Project interacts with the Klaza and Forty-mile caribou herds, and most importantly with late-winter habitat for the Klaza herd, and may present an increased risk of mortality (direct and indirect), and facilities may act as a barrier or filter to caribou movement. Project-related mortality on caribou will be tracked along with other wildlife species as part of the general wildlife monitoring (Table 5.4-3).

Monitoring of caribou habitat use will involve two monitoring objectives: the first assessing indirect habitat loss (resulting from sensory disturbances) and the second looking at caribou distribution within the RSA. Monitoring of both indirect habitat loss and habitat use during the late-winter season will occur at the local level by tracking incidental observations of caribou by Project employees, and at the regional level through aerial surveys. Long-term distribution patterns will also be identified by a YG-sponsored caribou satellite collaring program(s), but collared caribou do not represent the distribution of the entire Klaza caribou herd. Table 5.4-8 provides further details on the monitoring of indirect habitat loss and habitat use during the late-winter season. Monitoring will focus on aerial surveys during construction and initial years of operation to document occurrence, while local monitoring will continue throughout the life of the Project. Collar data from the YG-sponsored caribou satellite collaring program will inform regional late-winter distribution patterns. Additionally, periodic consultation will be conducted with local RRCs to provide information on the relative abundance of caribou in and around the RSA.

Table 5.4-8 Caribou Monitoring: Indirect Habitat Loss and Habitat Use During Late-Winter

Indicator	Caribou
Monitoring category	Baseline Research, Monitoring, and Surveillance
Design type	Observational (aerial surveys) and opportunistic
Measurable parameter	Distribution within RSA and late-winter habitat use
Key project interactions	Indirect habitat loss from Project activities that create sensory disturbances and/or temporarily reduce the effectiveness (usefulness) of habitats adjacent to the Project footprint, resulting in changed distribution.
Goal	The Project will have a not significant effect on distribution of caribou in the late winter (caribou use of late winter habitat was observed in baseline studies)
Objective	Evaluate trends in moose distribution in the ZOI and within late-winter habitat
Threshold	Caribou occurrence within the ZOI equivalent to the prediction made in the Project impact assessment
Scope of monitoring work	Local monitoring: Continuous log of caribou observations from CMC personnel to document occurrence near Project facilities. Regional monitoring: An annual aerial survey within a 10 km radius of Project infrastructure (as per 2013 late-winter survey; Figure 4.1, Appendix 12-A) will be implemented to document relative abundance and distribution of caribou relative to Project infrastructure. These surveys will be conducted during the first 3–5 years of road operation. Long-term distribution patterns as identified by a YG-sponsored caribou satellite collaring program. Collar data will inform regional late-winter habitat distribution.
Agency/partner participation	Local monitoring: CMC, RRCs; Regional monitoring: CMC, YG Environment
Project terms and conditions	TBD

Additionally, caribou monitoring will include a program looking at Project effects on caribou movement within the Zone of Influence (ZOI). Specifically, the program will monitor the effects of road infrastructure and operations on caribou movements through seasonal track surveys for the first 3–5 years of operation in key late-winter habitat, and remote motion-sensing cameras set up at select trails that cross or approach the road. If deemed necessary, additional monitoring of caribou movements could involve having wildlife monitors visit sections of the road that interact with caribou late-winter habitat on a regular basis (e.g., twice weekly) to document recent use (to determine if caribou are crossing the transportation infrastructure), and/or having wildlife monitors drive Project roads once a month to count the number of caribou in the area.

Table 5.4-9 Caribou Monitoring: Movement

Indicator	Caribou
Monitoring category	Baseline research and Surveillance
Design type	Observational
Measurable parameter	Movement in the ZOI
Key project interactions	Freegold Road structure and operations may be a filter of or barrier to movement of caribou through the RSA
Goal	The Project will have a not significant effect on caribou movements across Project infrastructure
Objective	Evaluate movement patterns of caribou as they approach or cross the road and other Project infrastructure
Threshold	Less than 10% deflection of approaches to road and infrastructure
Scope of monitoring work	Local monitoring: Seasonal caribou track surveys in key movement areas where existing trails were detected within the ZOI. These can be ground-based (snow machine) to observe movement during late winter. These surveys will be conducted during the first 3–5 years of road operation. Trail monitoring using remote motion-sensing cameras and documenting fresh tracks at select trails that cross or approach the road. Regional monitoring: Long-term movement patterns as identified by a YG-sponsored caribou satellite collaring program. This is a longer-term approach that requires analyses at a regional scale. These analyses are expected to be conducted by YG Environment.
Agency/partner participation	Local monitoring: CMC; Regional monitoring: YG Environment
Project terms and conditions	TBD

5.4.5 Moose

The Project interacts with moose, most importantly with late-winter habitat, and may result in an increased risk of mortality (direct and indirect), and facilities may act as a barrier or filter to moose movement. Project-related mortality on moose will be tracked along with other wildlife species as part of the general wildlife monitoring (Table 5.4-3).

Monitoring of moose habitat use will involve two monitoring objectives: the first assessing indirect habitat loss (resulting from sensory disturbances) and the second looking at moose distribution within the RSA. Monitoring of both indirect habitat loss and habitat use during the late-winter season will occur at the local level by tracking incidental observations of moose by Project employees, and at the regional level through aerial surveys. See Table 5.4-10 for further details on the monitoring of indirect habitat loss and habitat use during the late-winter season. Monitoring will focus on aerial surveys during construction and initial years of operation to document occurrence, while local monitoring will continue throughout the life of the Project. Additionally, periodic consultation will be conducted with local RRCs to provide information on the relative abundance of moose in and around the RSA.

Table 5.4-10 Moose Monitoring: Indirect Habitat Loss and Habitat Use During Late-Winter

Indicator	Moose
Monitoring category	Baseline Research, Monitoring, and Surveillance
Design type	Observational (aerial surveys) and opportunistic
Measurable parameter	Distribution within RSA and late-winter habitat use
Key project interactions	Indirect habitat loss from Project activities that create sensory disturbances and/or temporarily reduce the effectiveness (usefulness) of habitats adjacent to the Project footprint, resulting in changed distribution.
Goal	The Project will have a not significant effect on distribution of moose in the late winter Moose to use late winter habitat as was observed in baseline studies)
Objective	Evaluate trends in moose distribution in the ZOI and within late-winter habitat
Threshold	Moose occurrence within the ZOI equivalent to the prediction made in the Project impact assessment (50% fewer within 300 m of PDA)
Scope of monitoring work	Local monitoring: Continuous log of moose observations from CMC personnel to document occurrence near Project facilities. Regional monitoring: An annual aerial survey within a 10 km radius of Project infrastructure (as per 2013 late-winter survey, including near the mineral licks; Figure 4.1, Appendix 12-A) will be implemented to document relative abundance and distribution of moose relative to Project infrastructure. These surveys will be conducted during the first 3–5 years of road operation.
Agency/partner participation	Local monitoring: CMC personnel, RRCs Regional monitoring: CMC, YG Environment
Project terms and conditions	TBD

Table 5.4-11 Moose Monitoring: Movement

Indicator	Moose
Monitoring category	Baseline research and Surveillance
Design type	Observational
Measurable parameter	Movement in the ZOI
Key project interactions	Freegold Road structure and operations may be a filter of or barrier to moose movement through the Regional Study Area
Goal	The Project will have a not significant effect on moose movements across Project infrastructure
Objective	Evaluate movement patterns of moose as they approach or cross the road and other Project infrastructure
Threshold	Less than 10% deflection of approaches to road and infrastructure
Scope of monitoring work	Local monitoring: Seasonal moose track surveys in key movement areas where existing trails were detected within the ZOI. These can be ground-based (snow machine) to observe movement during late winter. These surveys will be conducted during the first 3–5 years of road operation. Trail monitoring using remote motion-sensing cameras and documenting fresh tracks at select trails that cross or approach the road.
Agency/partner participation	Local monitoring: CMC
Project terms and conditions	TBD

5.4.6 Den Sites

Dens are sensitive features that warrant monitoring. Although bears only re-use dens occasionally, they more often re-use denning areas. Wolves are known to re-use dens and denning areas for generations. Wolverine natal dens may get used during subsequent years, or may occur in similar areas. Consequently, monitoring efforts will aim to identify and maintain these areas throughout the life of the Project.

Table 5.4-12 Den Monitoring: Habitat and Use

Indicator	Grizzly bear, black bear, wolverine, and wolves
Monitoring category	Baseline research and Surveillance
Design type	Observational (aerial surveys) and opportunistic
Measurable parameter	Dens within 5 km of PDA
Key project interactions	Project footprint in known denning habitats
Goal	The Project will have a not significant effect on den sites
Objective	Allow carnivores to den undisturbed within the RSA
Threshold	Not a quantifiable threshold
Scope of monitoring work	Local monitoring: Aerial surveys within first 3-5 years of operation, of known den sites within a 5 km radius of the PDA, opportunistic documentation of other den sites. Regional monitoring: Maintain/add to long-term regional den site database in cooperation with YG Environment and support any regional programs targeting bears or wolves.
Agency/partner participation	Local monitoring: CMC, RRCs, YG Environment; Regional monitoring: YG Environment
Project terms and conditions	TBD

5.4.7 Collared Pika

Collared pika are present within the Project area — primarily located near the mine site in alpine felsenmeer habitats. The Project interacts with suitable pika habitat near the proposed mine site. Monitoring of pika will involve one monitoring objective: to assess pika presence within 1 km of the PDA. Monitoring will occur at the local level by conducting presence/ not detected surveys for the first 3–5 years of operation.

Table 5.4-13 Collared Pika Monitoring: Presence

Indicator	Collared pika
Monitoring category	Baseline Research and Surveillance
Design type	Observational (ground-based surveys) and opportunistic
Measurable parameter	Pika presence within 1 km of PDA
Key project interactions	Project footprint in suitable pika habitats
Goal	The Project will have a not significant effect on pika presence
Objective	Allow pika to use suitable habitat undisturbed
Threshold	Not a quantifiable threshold
Scope of monitoring work	Local monitoring: Ground-based surveys within first 3-5 years of operation, of suitable habitat within a 1 km radius of the PDA, opportunistic documentation of other sightings.
Agency/partner participation	Local monitoring: CMC
Project terms and conditions	TBD

6 - WILDLIFE RESEARCH SUPPORT

CMC recognizes that there are information and knowledge gaps about wildlife, vegetation, habitat, and industrial disturbance that are not addressed by the Project-specific mitigation actions and monitoring program identified in this document. There may be broader wildlife and terrestrial environmental science needs to help improve mining mitigation, First Nations knowledge, or general regional knowledge gaps. Although the information may not be specific to the Casino Project, CMC recognizes the need to develop partnerships to improve regional ecological knowledge that will help to improve understanding and future decision making.

FORWARD

This document summarizes terrestrial wildlife baseline information related to the proposed Casino Project area and was prepared in support of the environmental effects assessment. As part of the assessment process, the information submitted with the proposal was reviewed by regulators to determine the adequacy of the information needed for an environmental effects assessment. As part of the review process, this document has been updated with edits to specific sections based on new information and comments from reviewers. Those general edits are described below.

Baseline Section	Changes from November 2013 (Version 1) Document	Requester
3.1 Caribou Distribution	Update of caribou distribution model; addition of new late winter survey observations	YG
3.2 Caribou Winter Habitat Suitability Model	Removal of details, updated model provided in separate document	YG
4.1 Moose Distribution	Addition of new late winter survey observations	YG
4.2 Moose Winter Habitat Suitability Model	Removal of details, updated model provided in separate document	YG
5 Dall's Sheep	Map edits: removal sheep locations and inclusion of new distribution polygons	YG
12 Collared Pika	Addition of new information	SFN, YESAB's consultant, YG
13 Bats	Addition of new information	SFN, YESAB's consultant, YG
15 Mineral Licks	Addition of new information	None
16 Yukon River Water Pipeline Survey	Addition of new information	None

EXECUTIVE SUMMARY

The Casino Project (the Project) is a proposed copper-molybdenum-gold mine located in the Boreal Cordillera Ecozone of the Yukon Territory, approximately 300 km northwest of Whitehorse. In 2010, Casino Mining Corporation (CMC) requested that Environmental Dynamics Inc. (EDI) collect and summarize terrestrial wildlife data for the Project area.

Caribou (*Rangifer tarandus caribou*) and moose (*Alces alces*) dominate the landscape in this region and also play an integral role in the region's culture by providing sustenance and resource opportunities. Woodland caribou herds within the region include the Klaza, Aishihik, and Forty Mile herds; however, the Project interacts primarily with the Klaza herd. Woodland caribou from the Klaza herd are present within the Project's Regional Study Area (RSA) year-round, with parts of the herd's annual range overlapping with the proposed Freegold Road upgrade and extension. The Klaza herd has experienced a population increase since the early 1990s. The herd, once numbering approximately 440 animals is now estimated at 1,179 animals. Moose are the largest ungulate within the RSA and are considered the primary harvest species for resident hunters. Moose are distributed throughout the RSA, likely selecting available burned and treed riparian areas. Moose densities in the area are considered low for the Yukon.

Other ungulates present within the RSA include Dall's sheep (*Ovis dalli*), wood bison (*Bison bison athabascae*; Aishihik herd), and mule deer (*Odocoileus heminonus*). Dall's sheep are known to use traditional seasonal ranges in three main areas in the RSA. Wood bison are only sporadically present in the very southern section of the RSA, and mule deer are occasionally observed on south-facing slopes near the Yukon River (western RSA).

The dominant carnivores in the RSA include grizzly (*Ursus arctos horribilis*) and black bears (*Ursus americanus*), wolves (*Canis lupus*), and wolverine (*Gulo gulo*), which occur at relatively low densities; however, little is known about these species in the region. Lynx (*Lynx canadensis*), American marten (*Martes americana*), coyote (*Canis latrans)*, and red fox (*Vulpes vulpes*) are also present. Collared pika (*Ochotona collaris*) are known to inhabit alpine areas close to the proposed mine site.

This report summarizes and integrates the history of regional government surveys and studies, harvest data, habitat use, and Project-specific wildlife studies to provide a robust account of baseline conditions within the proposed Project area.

ACKNOWLEDGEMENTS

The information summarized in this report reflects a large amount of effort and resources from a number of people and organizations. This report would not be possible without them. CMC commissioned Project specific baseline studies since 2006. This work is included and referenced in this report and the results were helpful for planning further studies.

The Government of Yukon funded and staffed much of the data summarized in this report. Mark O'Donoghue (Biologist, Northern Tutchone Region) and Troy Hegel (Ungulate Biologist) designed, coordinated, and implemented the recent studies on the Klaza caribou herd, moose, and Dall's sheep. They provided data, advice, and comments. Joe Bellmore (Fish and Wildlife Technician) and Kyle Russell (Program Technician, Caribou/Sheep/Goat) participated in CMC funded surveys in 2012 and 2013, respectively. Their time and effort are greatly appreciated.

Local Carmacks residents who assisted with surveys include Willis Allen, Troy Fairclough, Terry Hanlon, Lauren Skookum, Gill Tulk, and Gary Wheeler. Their patience during weather delays, vigilance during long hours of work, and companionship were greatly appreciated and we look forward to working with them again in the near future. Rick Farnell (consulting wildlife biologist) provided perspective and knowledge that supplemented his original work on the Klaza caribou herd. His knowledge of caribou ecology was very helpful. Finally, we would like to thank Jesse Duke (Casino Mining Corporation) who considered and supported our suggestions. Without his confidence in EDI biologists, we could not have completed this work.

AUTHORSHIP

This report was prepared by EDI Environmental Dynamics Inc. EDI staff who contributed to this project include:

Laura Grieve, B.Sc. ..... Map preparation

Brett Pagacz, B.Sc., AIT. ..... Author

Graeme Pelchat, P. Biol., M.Sc. ..... Project coordinator, technical editor, author

Lea Pigage, R.P.Bio. ..... Grizzly bear models, author, editor

1 INTRODUCTION

1.1 PROJECT DETAILS

Casino Mining Corporation (CMC) is proposing to develop the Casino Project (the Project), a copper-molybdenum-gold mine at their Casino Mine property located at latitude 62° 44' N and longitude 138° 50' W, approximately 300 km northwest of Whitehorse, Yukon (Figure 1.1). The proposed Project will have a mine life of 34 years comprised of four phases: construction (4 years), operation (22 years), closure and decommissioning (3 years), and post closure (5 years).

The primary components of the Project, as shown in Figure 1.1, are:

- Mine site — includes open pit; stockpiles for low grade ore, gold ore, topsoil and topsoil/overburden; a plant site; heap leach facility;
- Tailings management facility;
- Extension and upgrade of the Freegold Road (previously referred to as the Casino Trail) — the Freegold Road will be upgraded and extended to connect the mine site to Carmacks, Yukon. The existing 70 km of the Freegold Road will require upgrading and route adjustments to meet design standards. The final road will be approximately 200 km long and maintained as an all-season gravel road suitable for ore and fuel transport;
- Construction and operation of a new airstrip; and
- Access road and water pipeline to the Yukon River.

All proceeding figures in this report display the Potential Disturbance Area (PDA) — an estimate of the amount of disturbance the Casino Project components and activities are likely to cause based on current available information. The PDA is a conservative estimate used to represent the maximum potential loss of habitat from the Project footprint and encompasses an 80.57 km^2 area.

The Project expects to process 120,000 tonnes of material per day; equivalent to 43.8 million tonnes per year. Anticipated volumes of metals produced over the life of the mine are:

- Gold: 5.72 million ounces
- Silver: 30.26 million ounces
- Copper: 3.58 billion pounds; and
- Molybdenum: 325 million pounds

Since the 1950s the Dawson Range has been a focal point for mineral resource exploration (Spencer Environmental Management Services Ltd. 1985; Pearse and Weinstein 1988; Jingfors 1989; Casino Trail Local Resource Group 1990). The proposed Freegold Road (previously called the Casino Trail) project was first introduced in the early 1960s — an idea that lay dormant until 1980 when mineral interest in the area redeveloped. In 1985 a formal proposal from the Yukon Chamber of Mines requested an all-weather road be built from Carmacks to the Casino mine property. The Government of Yukon began construction of the

Freegold Road in 1986, but ended construction in 1988 prior to completing the road. Several concerns were raised during construction, particularly by the Selkirk First Nations (SFN) and Little Salmon Carmacks First Nations (LSCFN) who were negotiating land claims at the time. Concerns were that the road would allow public access and increase hunting pressure on their traditional lands.

Terrestrial wildlife baseline work began on this Project in the late 1980s. Recent work funded by CMC started in 2006 and has continued through 2014. Preliminary wildlife surveys completed during the initial stages of environmental baseline studies were conducted by the Government of Yukon and a number of consultants, more recently AECOM at the mine site and Summit Environmental Consultants Inc. along the road. Information in this report relies heavily on publicly available information from the Government of Yukon.

EDI Environmental Dynamics Inc. (EDI) was retained by CMC in 2010 to complete the wildlife baseline studies and prepare a terrestrial wildlife baseline report in support of the eventual Project Proposal submission to the Yukon Environmental and Socio-Economic Assessment Board (YESAB). This report summarizes existing information on terrestrial wildlife in the Project area.

1.2 OBJECTIVES

To obtain the required regulatory approvals to proceed, the Project must be assessed under the *Yukon Environmental and Socio-economic Assessment Act* (YESAA). During this process, potential effects that the Project many have on environment and socio-economic valued components are identified, and where possible, mitigation measures are developed to reduce or eliminate those effects. To properly assess potential effects, a thorough understanding of baseline conditions is required.

YESAB's Proponents Guide of Information and Requirements for Executive Committee Project Proposal Submissions (YESAB 2005) recommends that for wildlife, Project Proposals should:

- Describe abundance and distribution characteristics of major wildlife species within the project area and vicinity. Include information on mammals, amphibians, birds, and reptiles (including rare and endangered species);
- Describe the habitat classifications used in the project area, and any implications concerning the distribution and abundance of habitat types that may influence the project; and
- Identify and describe transportation corridors and critical, sensitive and key habitats, including periods of habitat use in the project area and vicinity.

Specific objectives of the wildlife baseline report are to:

- Summarize available wildlife information in the study area, including abundance and distribution of key species; and identification of critical and sensitive habitats and transportation corridors; and
- Complete a baseline inventory of wildlife species in the study area to gain an understanding of regional wildlife ecology as a basis for assessing and mitigating potential Project effects on wildlife.

1.3 STUDY AREA

A wildlife Regional Study Area (RSA) was selected to include an area that is biologically relevant, consistent with wildlife management boundaries, and provides a regional context for Project-related effects at the population level. The Klaza caribou herd (KCH) has a relatively discrete and well defined range that intersects the Project and many species that occur within the RSA are managed as big game species within designated Game Management Subzones (GMSs; e.g., caribou, moose and grizzly bear); therefore, the RSA was delineated to include the 2012 KCH range and the GMSs that intersect the Project footprint (Figure 1.1). The total area of the RSA is 10,786 km². Species-specific study areas are discussed further in the species sections of this report. Generally, these species-specific study areas include the areas where the species is expected to interact with the Project infrastructure or associated activities. More detailed surveys and inventories were conducted for some species at smaller scales; for example, bear den surveys were conducted within 5 km of the proposed access road and snow track surveys for small animals were conducted along the proposed access road.

The LSA includes the length of the Freegold Road extension plus a roughly 1 km buffer on either side of the road alignment. The 1 km buffer was used to delineate terrestrial ecosystem mapping. All terrain polygons within the 1 km buffer were mapped and vegetation types assigned to the polygon's extent, often outside of the 1 km buffer. Surrounding the mine site, the LSA encompasses the watersheds of Britannia Creek and its tributary Canadian Creek, as well as upper Dip Creek and its tributary Casino Creek. The Yukon River defines the northern boundary of the LSA. The LSA encompasses an area that is approximately 886.4 km². Only collared pika (Section 12) is examined at the scale of the LSA.

1.3.1 Ecological Description

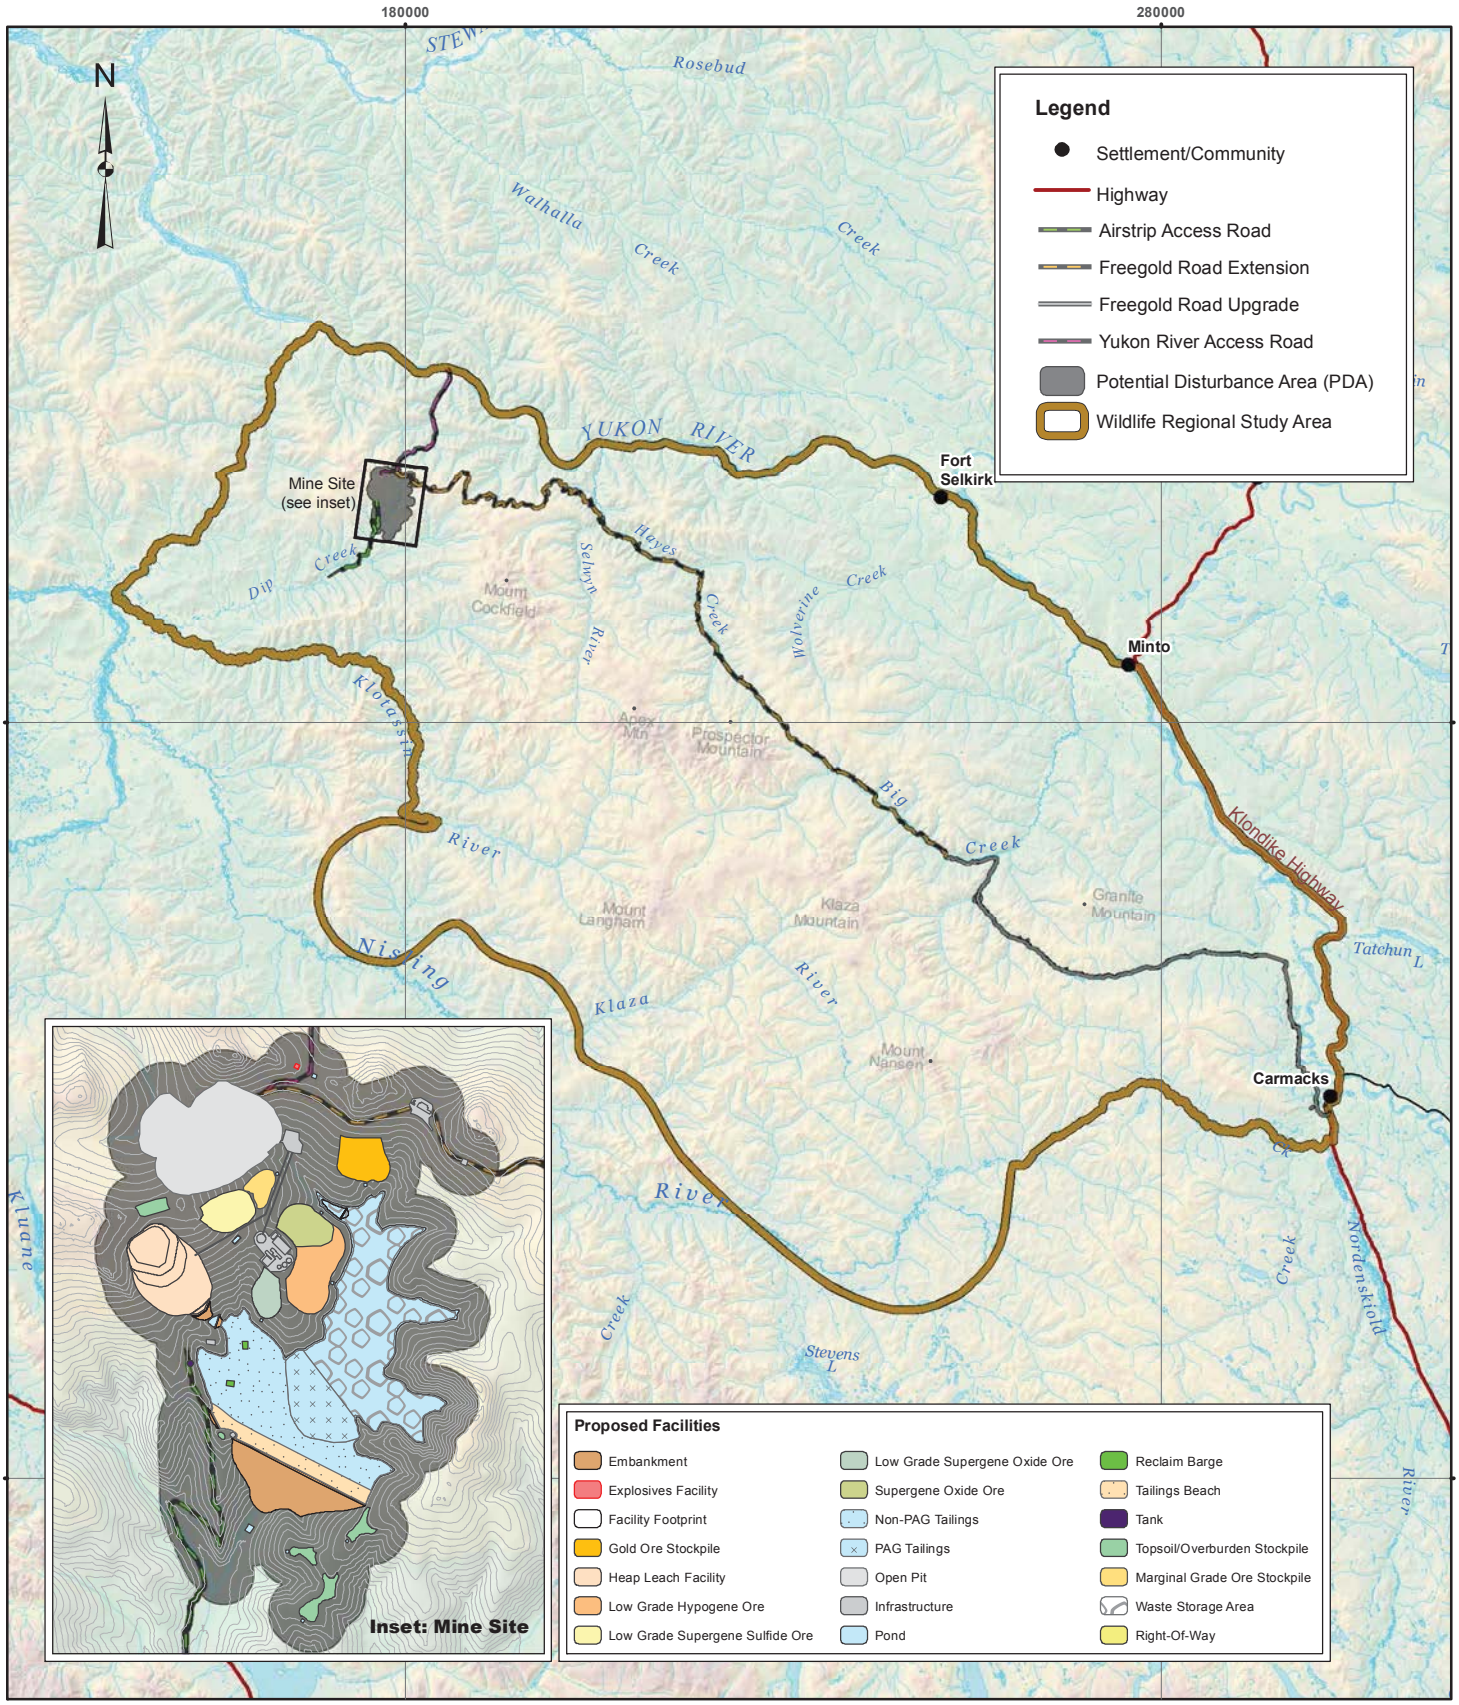
The Project is located in the Boreal Cordillera Ecozone within the Klondike Plateau and Yukon Plateau-Central Ecoregions (Figure 1.2). The following ecological description of the Boreal Cordillera Ecozone is largely adapted from Smith et al. (2004). Descriptions of the Klondike Plateau and Yukon Plateau-Central Ecoregions are adapted from the Yukon Ecoregions Working Group (YEWG 2004 in Smith et al. 2004) unless otherwise noted.

The Boreal Cordillera Ecozone is characterized by long, cold winters and short, warm summers. Mean temperatures range from below -27°C in winter to 15°C in summer. Mean annual precipitation ranges from 30 mm in the west to 1,000 mm in the east over the interior ranges and is greater at higher elevations.

Klondike Plateau Ecoregion

The Project is mostly located in the Klondike Plateau Ecoregion with the deposit situated at Patton Hill. The region has an estimated mean annual temperature of -2.7°C, with January being the coldest month at -18.1°C and July the warmest at 11.1°C. Mean annual precipitation is estimated to be 500 mm with most precipitation falling in July. Although the Dawson Range is mostly unglaciated there is evidence of minor glaciation in the subalpine. Permafrost is sporadic and discontinuous on north-facing slopes with less

consistency on south-facing slopes. Soil development ranges from coarse talus and immature soil horizons at higher elevations to mature soils with thick organic matter accumulating in valleys.



The topography of the ecoregion is typical of unglaciated terrain with rounded, rolling hills, V-shaped valleys, and sparsely vegetated alpine tundra hill tops. There is a high frequency of forest fires in the area and the dominant forest type is pure and mixed stands of white (*Picea glauca*) and black spruce (*Picea mariana*). Balsam poplar (*Populus balsamifera*) is typical of floodplains, while black spruce and paper birch (*Betula papyrifera*) are found in permafrost areas. Scrub birch (*Betula nana*) and willow (*Salix* spp.) stands extend from valley bottoms to subalpine. Understory communities vary across aspect and slope position with warmer south-facing slopes supporting ground shrubs, diverse forbs and feather mosses, while poorly drained depressions and upland sites include sphagnum mosses (*Sphagnum* spp.), tussock grass, sedges (*Carex* spp.), shrubs, and lichens (e.g. *Cladina* spp.).

Yukon Plateau-Central Ecoregion

The Yukon Plateau-Central Ecoregion has a strong continental climate with annual precipitation ranging from 250 to 300 mm. In the west, the ecoregion is dry as a result of being located in the rainshadow of the coastal ranges. The western boundary of this ecoregion coincides with the limit of Cordilleran Pleistocene glaciation. Glacial activity in the area has produced rounded and rolling hills, plateaus, and broad shaping valleys with high mountain ranges.

Permafrost is widespread and intermittently discontinuous in the ecoregion. Plateaus are too low for alpine permafrost, therefore ice-rich ground is typically found in valleys. Dominant soils in the ecoregion include Brunisolic (i.e., immature soils with a brownish B horizon) and Cryosolic soils (i.e., those affected by permafrost-related processes; Canadian Agricultural Services Coordinating Committee 1998). Unique to the ecoregion and formed in association with Pleistocene glacial drift are paleosol soils that are found nowhere else in Canada.

This ecoregion is dominated by the boreal forest zone. The boreal zone is modified within the cordillera by strong gradients of elevation, temperature, and precipitation. Dominant tree species are white spruce, black spruce, lodgepole pine (*Pinus contorta* var. *latifolia*), subalpine fir (*Abies lasiocarpa*), trembling aspen (*Populus tremuloides*), balsam poplar, and paper birch with climax communities typically of white and black spruce forests. Lower slopes are dominated by white spruce with a range of understory species including feather mosses, red bearberry (*Arctostaphylos rubra*), grasses, lichens, roses (*Rosa* spp.), horsetails (*Equisetum* spp.), willows and alders (*Alnus* spp.). Higher elevation areas are mostly subalpine fir and white spruce with an understory of scrub birch, willow, blueberry (*Vaccinium membranaceum*), crowberry (*Empetrum nigrum*), Labrador tea (*Ledum groenlandicum*), moss and lichen. Forest fires are common, resulting in a predominance of lodgepole pine and trembling aspen at lower elevations. On dry sites understory communities are commonly lichen, kinnikinnick (*Arctostaphylos uva-ursi*) and grass matrix, whereas moister sites contain alder, willow, lingonberry (*Vaccinium vitis-idaea*), soapberry (*Shepherdia canadensis*), and mosses. Floodplains are colonized by balsam poplar, horsetail, and willow. Extensive grassland communities are found on south and west-facing slopes.

2 EXISTING INFORMATION

In response to local concerns and because there was very little documented information on wildlife in the Dawson Range, the Government of Yukon conducted the initial wildlife baseline studies in the region in the late 1980s. Government biologist completed the first inventory of the Klaza caribou herd, estimated the local moose density, identified sheep distribution and conducted raptor nest surveys. That information was supplemented by additional surveys during the following three decades up to and including the present work.

More recent baseline surveys conducted to generate data on wildlife presence, abundance, distribution, and habitat use within the RSA concentrated on focal wildlife — details of which are described in each species' section. Focal species for wildlife baseline studies are species that are known to occur in the RSA and are of local or cultural value, or of conservation concern.

Wildlife species that have cultural or economic value are species harvested by subsistence and trophy hunters, and local trappers. Subsistence hunters primarily target large ungulates, such as moose and caribou. Hunters that harvest for subsistence in the RSA are primarily from Carmacks and Pelly Crossing, and residents of Whitehorse. One outfitter is active in the area, Mervyn's Yukon Outfitting Ltd. Several traplines intersect the RSA; some are active.

Species of conservation concern in the Yukon, assessed by the Committee on the Status of Endangered Wildlife in Canada (COSEWIC) and/or listed on the *Species at Risk Act* (SARA), that are known to occur in the RSA include woodland caribou (Special Concern), wood bison (Threatened), grizzly bear (Special Concern), wolverine (Special Concern), and collared pika (Special Concern).

Characteristic wildlife species that are known or have the potential to occur in the RSA include woodland caribou, moose, thinhorn sheep (Dall's sheep), wood bison, mule deer, grizzly bear, black bear, grey wolf, coyote, red fox, wolverine, lynx, American marten, weasels (*Mustela* spp.), porcupine (*Erethizone dorsatum*), Arctic ground squirrel (*Spermophilus parryii*), red squirrel (*Tamiasciurus hudsonicus*), snowshoe hare (*Lepus americanus*), and collared pika. A number of other mammals are likely present in the RSA, including Canada beaver (*Castor canadensis*), muskrat (*Ondatra zibethicus*), hoary marmot (*Marmota caligata*), river otter (*Lontra canadensis*), and other small rodents. The area is also home to a number of bird species; however, birds are described in a separate baseline report.

3 CARIBOU

Caribou occur throughout Canada's forest and arctic ecosystems. The Canadian population of caribou is composed of five subspecies: Peary (*Rangifer tarandus pearyi)*, barren-ground (*R. t. groenlandicus)*, Dolphin and Union (*R. t. groenlandicus* x *pearyi*), Grant's caribou, (*R. t. granti*), and woodland caribou (*R. t. caribou*) (COSEWIC 2011a; Festa-Bianchet et al. 2011). Grant's and woodland caribou are the only subspecies that occur in the Yukon. There are five populations of woodland caribou that currently occupy regions of Canada: boreal, southern mountain, northern mountain, Newfoundland, and Atlantic-Gaspésie populations (Thomas and Gray 2002; COSEWIC 2011a). A sixth population known as the Queen Charlotte Islands population is now extinct. Woodland caribou are found in all jurisdictions in Canada except Nova Scotia, New Brunswick, Prince Edward Island and Nunavut. The total estimate of woodland caribou across Canada is roughly 184,000 (Thomas and Gray 2002). Throughout their range they occupy diverse habitats including mature and old-growth coniferous forests, alpine tundra, peatlands, marshes, and bogs (Environment Canada 2012; Thomas and Gray 2002).

The northern mountain population (NMP) of woodland caribou is distributed across the Yukon, western Northwest Territories, and northwestern British Columbia with an approximate area of occurrence of 308,000 km^2 (Thomas and Gray 2002; Environment Canada 2012). The NMP was assessed as a species of Special Concern by COSEWIC, and in 2005 was listed on Schedule 1 of the federal government's *Species at Risk Act* (SARA). The listing provides protection of the population under SARA and a management plan was developed to ensure that the population's conservation status is not elevated to Threatened. The conservation status determination was based on declines within specific herds of the population from habitat degradation, hunting pressure, disturbance by humans (e.g., fragmentation by roads), fire, and predation (e.g., wolves, bears, and coyotes; Environment Canada 2012). Also, there is some uncertainty in the population trends of some herds within the NMP; trends for 22 of the herds are unknown, seven are considered stable, four are increasing, and three are decreasing (Environment Canada 2012). The latest population estimate for the NMP in 2008 was of about 45,000 animals, which increased from 35,000 animals in 2002 (Environment Canada 2012).

The Project occurs within the historic range of the Forty Mile caribou herd and the current range of the Klaza caribou herd (KCH), formerly known as the Klotassin herd (Jingfors 1989). Archived written records and local knowledge indicate that the area was historically occupied by the Forty Mile caribou herd. Forty Mile caribou are currently absent from this area; the last documented occurrence of Forty Mile caribou in the study area was in 1941 (McDonald and Cooley 2004). The KCH is the main caribou herd that currently interacts with the Project (Figure 3.1). The KCH range is centered on and includes much of the Dawson Range mountains (Figure 3.2), and as of 2007 the size of the KCH range was estimated at 6,200 km^2 (Environment Yukon 2012). The northern extent of the Aishihik caribou herd's range slightly overlaps with the southern portion of the Klaza herd's range (Yukon Department of Environment 2012; Figure 3.2). Interaction between the Aishihik herd and the Project is expected to be limited to infrequent individual interactions.

The first formal study of the KCH was the 1987–1990 Klaza caribou inventory program that was initiated by the construction of the "Casino Trail" (Farnell et al. 1991). At the time, the road was being constructed by the Government of Yukon to provide access to the Casino mine site and other mineral resources in the area. Construction of the road ended in 1988 prior to being completed. The 1987–1990 studies included collaring of 17 cow caribou fitted with very high frequency collars (VHF; Table 3.1). By the end of the study, 12 collars remained active; two caribou cast the collars soon after capture, two caribou died, and one collar failed (Farnell et al. 1991). Relocation surveys were conducted 19 times during the study to document the seasonal distribution of caribou. After the completion of the inventory program, additional VHF collars were deployed and monitored until 2000 as part of an intensive study of the Aishihik caribou herd (Hayes et al. 2003). The KCH was monitored as part of the Aishihik study because a small portion of the two herds' ranges overlap in the southern portion of the KCH's range (Figure 3.2). The Government of Yukon initiated another collar study of the KCH in 2012 in response to renewed interest in the Casino Project and other exploration in the region. The study included collaring 30 female caribou (Hegel 2013a; Photo 1; Table 3.1) and is described further in the following sections.

Photo 1. A female caribou collared by the Government of Yukon in 2012 (second from back), along with four other Klaza caribou.

The first documented aerial survey of the KCH was completed during the summer of 1985 to document the distribution of the KCH. Inventories of the KCH started in 1987, with the collaring of 17 female caribou, described above, and continued through 1989. The inventory included composition surveys (i.e., rut counts) in 1987 and 1988, and a population census conducted during the late winter in 1989. Following the 1989 survey, the KCH was not surveyed again until 1993. The commencement of surveys in 1993 coincided with

the Aishihik wolf control program (Hayes et al. 2003). Regular composition surveys and irregular summer and late winter surveys, were conducted from 1993–2003.

With an increase in mineral exploration activity and renewed interest in the Casino Project, yearly late winter (March) surveys were conducted during early March 2011–2014. The objective of the surveys was to document regional distribution of ungulates (moose, caribou, and sheep) during the late winter. The survey area was defined by the KCH range and all GMSs that intersect the Casino mine site and access road footprints. At the time of the 2011 and 2012 surveys, the access road alignment had not been finalized and other road options were being explored; the large survey area was expected to include all access road options. The final road alignment was selected in early 2013, so the 2013 survey area was reduced to a 10 km buffer of the Casino project footprint (Figure 3.3) and was repeated in 2014.

The survey area was sampled using survey blocks to guide effort. Each block was sized at 5 minutes longitude by 2 minutes latitude (approximately 4 km x 4 km at the survey latitude), and four passes were flown through each block, which is roughly equivalent to 1 km transect spacing (Figure 3.3). Passes were flown within the blocks following terrain to maximize sightability of animals. In 2011 and 2012, two fixed-wing aircraft were required to survey the entire 11,371 km² survey area within a reasonable amount of time; however, in 2013 and 2014, only one plane was required to survey the reduced 4,247 km² survey area. All wildlife sightings and tracks were recorded as waypoints, with sex (cow, bull) and age class (adult, yearling, or calf) noted when possible. All surveys were flown around 100–300 m above ground level at approximately 150 km/h, depending on terrain and weather conditions. Composition and population surveys were conducted in the fall of 2012 (Hegel 2013a). Table 3.2 summarizes the 29 year period (1985–2013) of available caribou observations.

Ground-based surveys for snow tracks and range condition were conducted within the range of the KCH. These surveys were conducted twice in 2012 (15–19 February and 19–21 March) and once in 2013 (18–21 February). A second track survey was planned for March 2013, but snow cover was insufficient and the survey was cancelled. The primary objective of the work was to document the occurrence of species along the Freegold Road upgrade and extension that are not easily observed during aerial surveys. Each survey consisted of travelling the proposed Freegold Road upgrade and extension by snow machine as far as conditions permitted and recording the presence of animal tracks, summed within 1 km intervals (Figure 3.4).

The different survey methods sample different segments of the population, with the collars sampling only adult cow caribou, and the observational surveys and track counts sampling all age and sex cohorts within the population.

Table 3.1 Number of collar location data points for the Klaza caribou herd.

3.1 DISTRIBUTION

Detailed descriptions of caribou distribution are provided below. The information is described for five biologically timeframes:

- Home range (annual data)
- Spring/calving and summer (1 May–31 July)
- Fall/rut (1 August–31 October)
- Early winter (1 November–31 January)
- Late winter (1 February–30 April)

The Government of Yukon's 2012 KCH range was developed using data collect during the original collaring program and aerial surveys; however, the newer GPS collar data provide more detailed information on KCH distribution so we delineated an updated annual herd range. Seasonal ranges were delineated to visualize patterns of use within the annual range. The annual ranges were estimated by considering a variety of data sources and analyses, while the seasonal ranges were estimated based entirely on modern collar relocation data collected during 2012–2014. VHF and GPS collar relocation data are not compatible, so the historical VHF collar relocations were excluded from the analysis.

Annual and seasonal ranges were estimated by creating utilization distributions (UD) for individual caribou developed using the 'tlocoh' package (Lyons et al 2013) in R version 3.01 (R Core Team 2013). T-LoCoH (Time Local Convex Hulls) is an improvement to a previous home range estimation tool (LoCoH, see Getz et al. 2007). Briefly, the method creates local convex hulls for each point based on a set of nearest neighbours, sorts hulls based on density, cumulatively merges the hulls together from smallest to largest, and estimates the UD based on the percent of points contained in the cumulative hulls. Individual caribou annual and seasonal home ranges were estimated by using the *a*-method (adaptive). Two user defined values are required to create the UD: *s* and *a*. The *s*-value determines the contribution of time to the estimate of distance between points, which allows the user to reduce the amount of influence observations (i.e., collar relocations) that occur at different times have on the estimate of use; for example, caribou collar relocations can be used to generate UD within a season allowing the exclusion of points that may overlap in space but not time, so should not necessarily be considered neighbours. The *a*-value is the cumulative distance to all points used to select the neighbourhood of points that define a local convex hull in distance units. Distance units are time-scaled if the s-value is greater than zero or map units if the s-value is equal to zero. When the s-value is equal to zero, then the method is equivalent to the LoCoH algorithm.

Values used to create the annual and seasonal UD were dependent on the availability of collar relocations, the fix rate of a collar, and the differences in individual caribou movements. The s-values were selected based on the particulars purpose of the output. Where applicable we selected s-values that balanced the influence of time and space on the selection of nearest neighbours. The annual range was estimated without considering the time (s=0) because the purpose of the output was to define the caribou's use of the landscape. The seasonal ranges were estimated by using *s*-values which allowed all relocations within year to be used to create local hulls but relocations among years would not be considered neighbours.

The annual range, or home range, was delineated using the following spatially referenced information: 95% UD for all caribou, waterbodies (the Yukon River), alpine and subalpine habitats defined by the bioclimate zones, survey observations, and VHF collar relocations. Layers were visually assessed to determine where continuity of the subalpine existed in relation to the UD and point data. Available survey observations and collar relocations not used to create the UD were inspected to ensure that they were contained within the polygon. Once complete, the final iteration was smoothed; this process smoothed out the angular corners of the polygon. The tool simplifies the edge and interpolates the perimeter using a Bezier algorithm. A maximum allowable offset of 100 m was used to ensure the smoothing effect did not offset the perimeter too far away from its original position, thus roughly adhering to the original delineation.

Data were screened prior to delineating the ranges to exclude problem data. Some caribou were excluded from the annual and/or seasonal analysis because they were not relocated enough within the timeframe to generate reasonable model outputs (e.g., mortality early within a season).

3.1.1 Home Range

The updated home range is a considerable increase in size compared to the 2012 KCH range (Figure 3.6). The size of the updated home range is 8,838 km², an increase in area of 2,638 km². Most of the increase is from the expansion of the northwest portion of the range. The KCH home range now includes most of the Dawson Range, and is characterized by abundant alpine and subalpine terrain. KCH caribou spend the majority of the year using alpine and subalpine habitats (Figure 3.5). Approximately 3,515 km² (40%) of the updated KCH home range is above 1,175 masl, the estimated treeline in the region.

Most of Yukon's woodland caribou exhibit seasonal elevational movements between winter and growing season ranges. Caribou tend to use habitat at lower elevation in winter because of easier access to terrestrial lichen, while during summers caribou move to higher elevation terrain to avoid predators and insects. KCH caribou show seasonal elevational movements consistent with the behaviour of other northern mountain population caribou herds (Figure 3.5). The herd tends to be above treeline during the growing season and use lower elevation habitat during the winter.

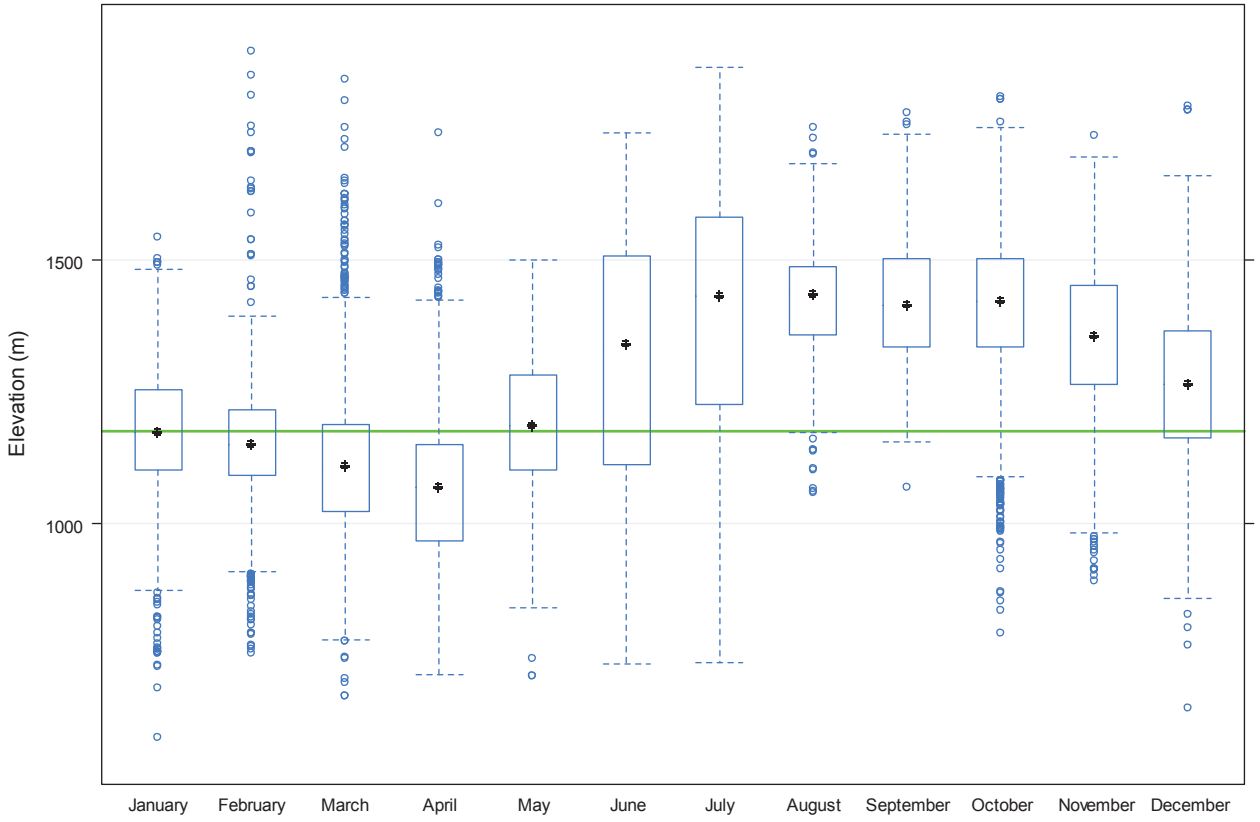

Figure 3.5 **Boxplot of caribou observations by elevation and month using all available location data (1987–2013; 464 caribou observations, 18,171 collar locations).**
The green line represents the average treeline estimate at 1,175 masl.

3.1.2 Spring/Calving and Summer

During the spring/calving and summer, woodland caribou cows disperse from their wintering habitats to higher elevation terrain as a predator avoidance tactic. Woodland caribou cows do not exhibit traditional use of calving areas commonly observed in migratory caribou herds. Parturient (i.e., about to give birth) female ungulates isolate themselves from larger groups, possibly to reduce encounter rates with predators and reducing offspring mortality risk (Farnell et al. 1996; Hebblewhite and Pletscher 2002). Higher elevation terrain reduces predation risk for caribou and their calves through spatial segregation from potential predators that tend to occur at lower elevations (Bergerud et al. 1984; Bergerud and Page 1987).

Distribution surveys have limited success during the calving season because parturient caribou are dispersed throughout higher elevation habitat and patchy snow makes spotting caribou difficult. The best available information on KCH spring and calving distribution is from collared cow caribou. Collar location data for parturient caribou collected during eight years between 1987 and 2012 indicate that the majority of caribou are using habitat above treeline (Figure 3.5); 64% of female caribou locations were above treeline (251 of 393 locations). The data also show that caribou are distributed broadly throughout their range during the

spring/calving season (Figure 3.6). Observations from the Casino wildlife log during the spring/calving season include 19 caribou from 2010–2013.

Summers are a time of the year when adult caribou recover from winter and replenish body fat. For lactating cow caribou the summer is important for milk production required to grow their young. Calves must grow quickly during the summer to survive their first winter. Consequently, summer range can be an important factor limiting population growth of large caribou herds that may be able to overgraze their summer range (e.g., George River caribou herd; Messier et al. 1988).

Yukon's northern mountain caribou herds, including the KCH, use higher elevation alpine and sub-alpine habitats during summers (Oosenbrug and Theberge 1980; Farnell et al. 1991; Quayle and Kershaw 1996). Higher elevation habitat provides relief from insects and high temperatures that are known to affect caribou behaviour (Toupin et al. 1996; Mörschel and Klein 1997; Wilson et al. 2012). Caribou use snow patches for cooling during hot days (Kuzyk et al. 1999b). KCH caribou are distributed throughout most of the high elevation terrain within their range (Farnell et al. 1991); 92% of caribou observations are above treeline (45 of 49) and the majority caribou collar relocations are above treeline (Figure 3.5). Small concentrations of caribou collar relocations occur throughout the herd's range (Figure 3.7) and those concentrations mostly reflect the individual collared caribou as opposed to multiple collared caribou (compare with winter distribution). Observations from the Casino wildlife log during the summer season include 260 caribou from 2008–2013.

3.1.3 Fall/Rut

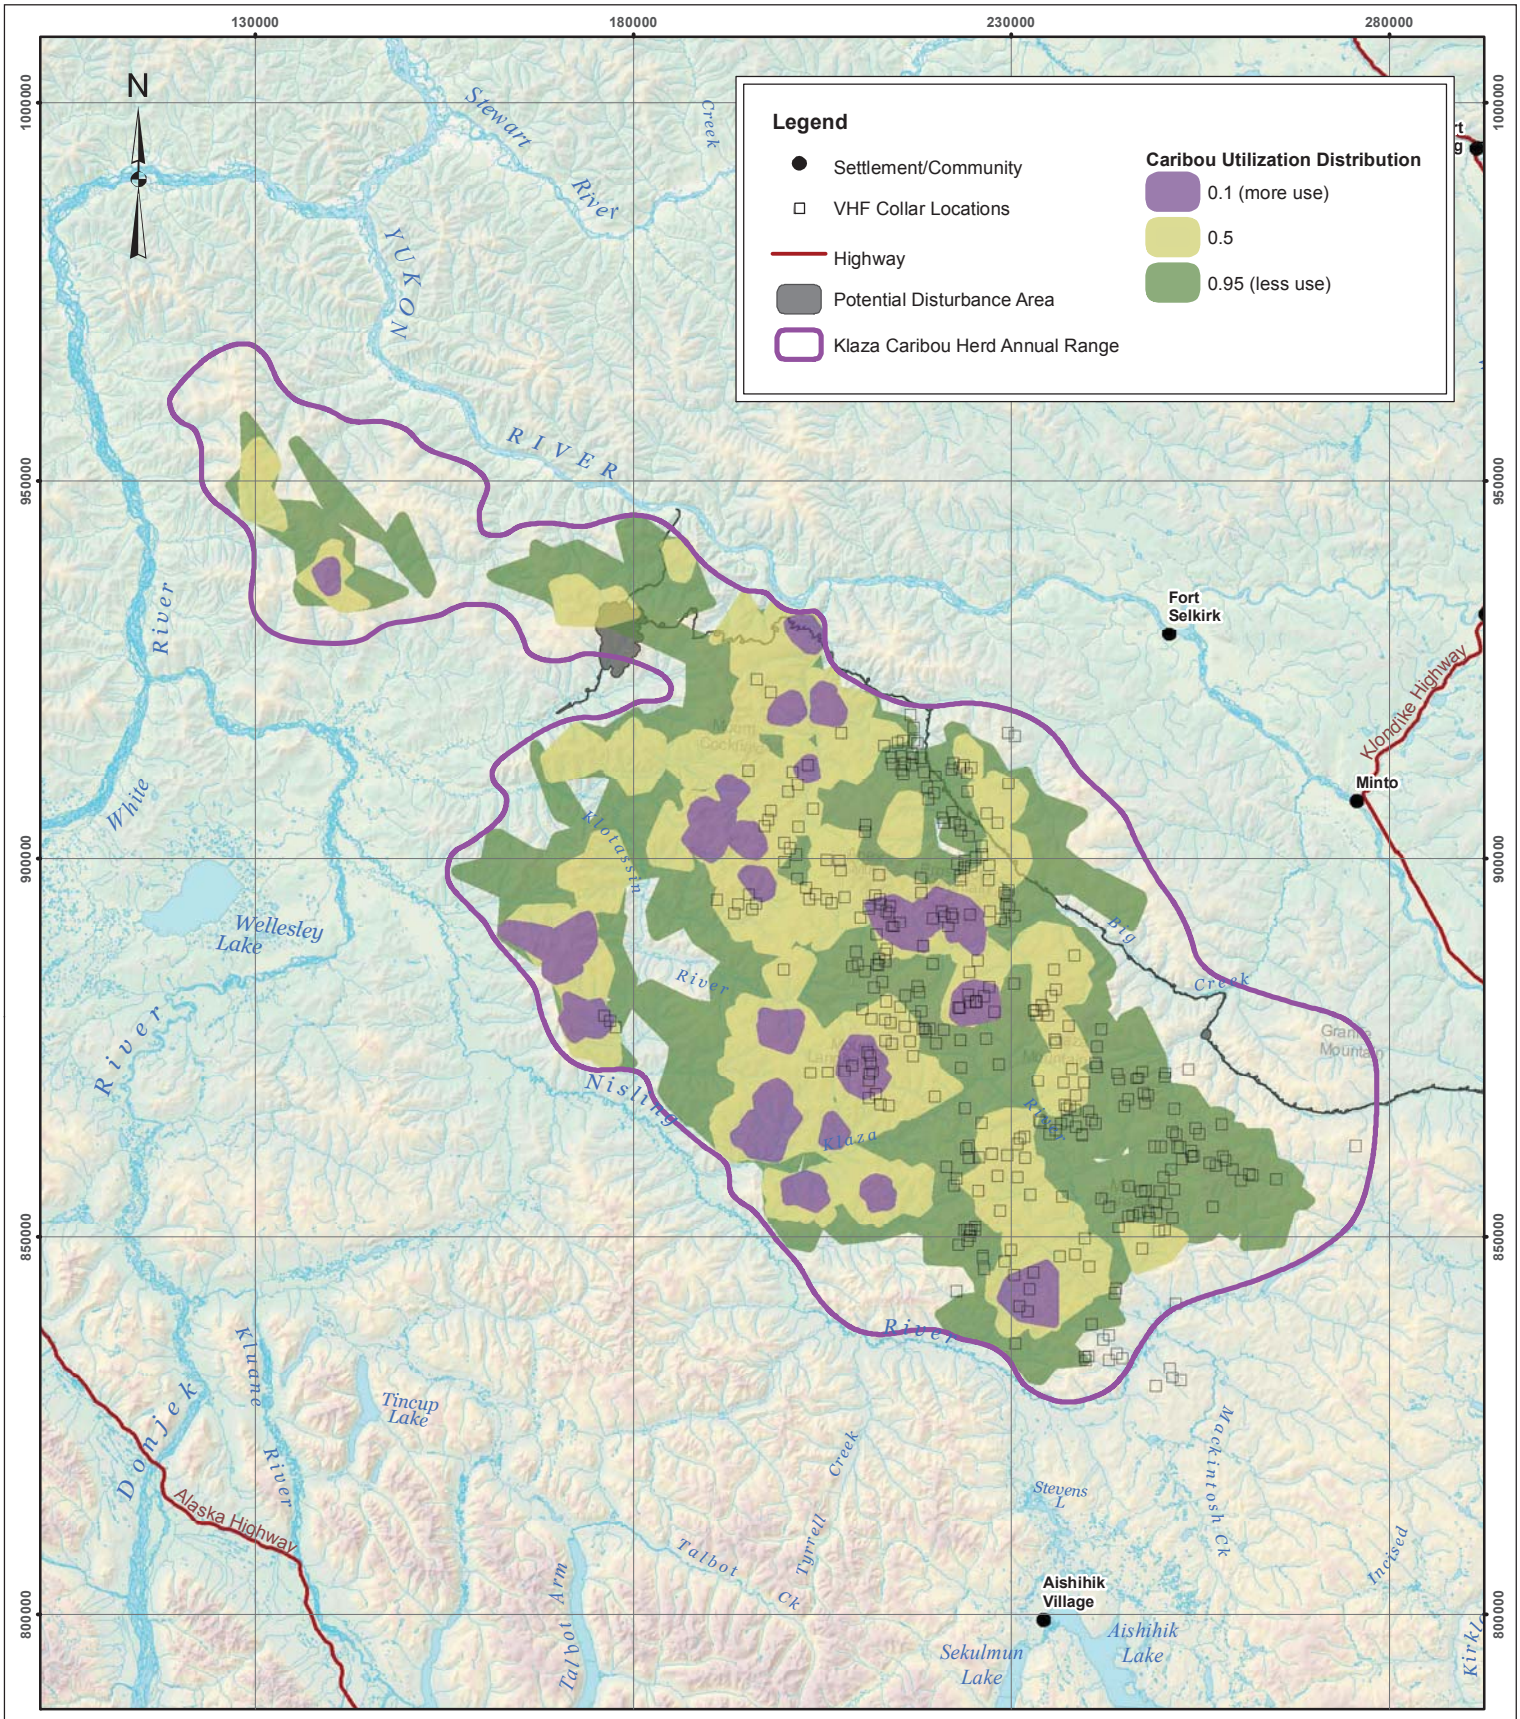
Caribou aggregate in the alpine and subalpine during the fall, including during the rut (breeding season). The fall is the final opportunity for caribou to acquire the necessary fat reserves to survive the coming winter. The rut occurs in late-September to early October. Bulls move through their range in search of breeding opportunities with estrous cows.

Large groups of caribou were observed throughout the herd's range during 13 years of rut surveys conducted between 1987 and 2012 (mean group size=21, max group size=224). Caribou collar data and observations indicate that caribou occupy the alpine and subalpine habitat throughout their range during the fall and rut, focused primarily on the central and eastern portions of the range (Figure 3.8); 90% of caribou observations are above treeline (260 of 288).

3.1.4 Early and Late winter

Winter is the most limiting time of the year for woodland caribou. Forage is poorer quality and is less abundant because it is covered in snow. Animals spend more energy moving and cratering for forage during winters, and greater snow depth increases energy expenditure. Consequently, caribou select areas that have shallower snow. Habitat attributes such as presence of trees, wind exposure, slope, aspect and elevation are factors that contribute to local snow conditions. For example, forest canopies intercept snow and wind can scour snow from particular aspects. At coarser scales, large geologic formations may determine caribou

distribution in winter. The Dawson Range, which includes the KCH herd range, receives relatively less snow compared to many other parts of the Yukon because it is in a snow-shadow of the St. Elias Mountains (Table 3.3; Kuzyk et al. 1999a). Long-term weather stations managed by the Government of Yukon exist within the RSA (Figure 3.9 and Figure 3.10). Snow depths were also collected along the Freegold Road upgrade and extension during the 2013 snow track surveys; the data indicate an average snow depth of 53 cm (n=15, sd=5.5). A snow survey was also conducted in 1990 as part of the KCH inventory study. The survey found relatively shallow (mean=48 cm, n=85, sd=19.2) and uniform snow depths across the KCH's range (Farnell et al. 1991). Caribou tracks were observed intermittently between km 107 and 129, a 22 kilometre section of road, during 2012 snow track surveys. No caribou tracks were observed during the 2013 survey. Caribou distribution during early winter is throughout the central portion of the annual range (Figure 3.9). Higher intensity use occurs in the vicinity of the Nansen, Klaza, Prospector and Cockfield mountains, and parts of the Hayes Creek and Selwyn River watersheds. By late winter the central and eastern portions of the home range are largely devoid of caribou as animals move into habitat adjacent to Nisling, Klotassin and Selwyn rivers, and Hayes Creek (Figure 3.10). The KCH starts the winter at relatively high elevation, then occupy decreasing elevation as the winter progress; caribou occur at the lowest elevation during the late winter, particularly in April (Figure 3.5). Collared caribou locations from the original baseline studies show that caribou were generally observed within the current late winter range, though the most concentrated locations were in the Hayes Creek area (Figure 3.10). The changes observed in caribou locations from the 1980s to present are likely due to habitat changes and the methods for data collection. The current collaring technology provides a much more detailed understanding of the KCH seasonal and annual range use.



The KCH winter range conditions were determined to be relatively good in the late 1980s, as the caribou late winter diet was composed of 78% lichen and contained very little low quality forage, particularly moss (Farnell et al. 1991). Moss is not easily digestible so is ingested incidentally when caribou are feeding on other forage. If range conditions are poor and caribou are required to search for smaller patches of lichen, then moss content in their diet tends to increase (Farnell pers. comm. 2013). To begin assessing current range conditions, caribou fecal pellets were collected on 20 March 2013 from four sample locations to describe caribou late winter diet. The sample locations were based on the most recent collar location data provide by Environment Yukon and were chosen to cover the latitudinal extent of KCH range. Samples were collected from discrete pellet groups and kept frozen until they could be dried. The diet analysis was not available at the time of reporting because of a nine month sample backlog at the laboratory.

Table 3.3 Snow measurements in March at snow stations within or near the RSA.

Weather Station	Years of data	Measurement	Average (Range)	Coefficient of variation	2013
Casino	1977–2013	Snow depth	66.4 cm (43–99)	18.0%	60.9 cm
		Water equivalent	123.0 mm (68–225)	27.8%	109 mm
Nansen	1976–2013	Snow depth	45.6 cm (26–63)	20.5%	58.7 cm
		Water equivalent	79.5 mm (42–158)	30.4%	105 mm
Williams Creek	1995–2013	Snow depth	49.8 cm (27–70)	21.5%	59.0 cm
		Water equivalent	93.9 mm (43–146)	29.3%	110 mm

3.2 CARIBOU WINTER HABITAT SUITABILITY MODEL

Given the importance of the winter habitat to woodland caribou herds in Yukon (Farnell 1991, Kuzyk 1999a, Florkiewicz et al. 2007), habitat selection was modeled using GPS-collared female caribou relocations for the early and late winter seasons using the resource selection function method (RSF). RSFs are commonly used when GPS collar relocation data are available. The model was provided in the first version of the baseline report. Recently Environment Yukon developed a winter habitat model for the KCH using an additional year of collar data, new land cover variables and an improved method. The new model provides the most current baseline information describing KCH winter habitat use. The model output and documentation was not available prior to the submission of this version of the baseline report.

3.3 ABUNDANCE

The 2012 population estimate for the KCH was 1,179 caribou (95% CI = 952–1461; Hegel 2013a). The current population estimate represents a 70% increase compared to the 2000 minimum count (700 caribou; Hegel 2013a). Population estimates from 1989–2012 suggest that the herd has increased; however, the actual amount of change in the herd size cannot be determined because survey methods and boundaries differ among study years (Hegel 2013a). The southern portion of the herd's range was not included in the 1989 inventory (441 caribou; Farnell et al. 1991). The population estimate from 2000 is a minimum count and is likely an underestimate of the number of caribou in the herd at the time. The objective of the 2000 survey was to collect fall composition data; however, a large number of observations lead to a minimum population estimate (Hegel 2013a).

Data from the fall 2012 herd composition survey found low calf recruitment (14 calves/100 cows) and adult sex ratio (27 bulls/100 cows). These results suggest a declining population that is experiencing heavy hunting pressure, but are inconsistent with other data and the accuracy of the composition data is suspect (Hegel 2013a). The 2012 calf recruitment is the lowest calf to cow ratio ever reported for the KCH. Past recruitment surveys have averaged about 25 calves/100 cows (range 17–47; Hegel 2013a). Boreal caribou recruitment rates that indicate positive population growth are 26–29 calves/100 cows (Environment Canada 2008); however, a review of the demography of Yukon's NMP herds indicates that the threshold for positive population growth is 20–25 calves/100 cows (Hegel 2013a). The most recent data suggest that the herd has been increasing in size since 2000, and the harvest data indicates that the herd experiences little harvest pressure (Table 3.4). The timing of the 2012 composition survey was consistent with other composition surveys, but the fall of 2012 was abnormally warmer than usual (up to 20°C) and the caribou groups may not have adequately mixed prior to the survey (Hegel pers. comm.); consequently, these data should be interpreted with caution. Another fall composition survey is planned for fall 2013 to estimate the sex and calf ratios.

3.4 HARVEST

There are no data available describing current First Nation people's harvest practices within the RSA. Caribou are an important subsistence species for some First Nations in the Yukon. Subsistence hunting in

the Casino area was believed to be low during the original road construction (Spencer Environmental Management Services Ltd. 1985). The Freegold Road area was not being used regularly by local First Nations for subsistence hunting of caribou during the 1980s (Spencer Environmental Management Services Ltd. 1985, Pearse and Weinsten 1988), likely because access to the area was difficult. The local First Nations have not relied on caribou in the Dawson Range for subsistence hunting since the late 1940s when the Forty Mile caribou herd was extirpated from the region (Pearse and Weinsten 1988).

Caribou licensed harvest data are available 1979 to present in most Yukon GMSs. The 2013/2014 regulations restrict caribou harvest in all GMSs that intersect the Project footprint (Figure 3.12): GMSs 509 and 510 are closed to caribou hunting, and licensed hunters are required to enter a permit hunt lottery to harvest caribou in the GMSs 511 and 522 to 526 (Table 3.4). The majority of licensed harvest of the KCH in the last ten years (2002–2012) was concentrated in GMSs 523 and 526 (Table 3.4 and Figure 3.11). Resident harvest is mostly from GMS 526 likely because of access to caribou along the Mount Nansen Road. Non-resident harvest pressure is mostly within GMS 523, presumably from guided hunters accessing more remote areas with aircraft.

The Government of Yukon considers a sustainable harvest rate on woodland caribou to be between 2–3% of the population estimate. Based on the current population estimate, a sustainable harvest rate for the KCH is 24–35 caribou per year. Harvest from licensed hunters during the previous ten years has been 7–8 caribou per year, which is equivalent to 0.6–0.7% of the 2012 population estimate. Any First Nation harvest would be additive to these values.

Table 3.4 Summary of the latest ten years (2002–2012) of caribou harvest in GMSs that overlap with the Casino Project footprint.

GMS	Harvest regulation (2013/14)	Total harvest		Mean yearly harvest	
		Resident	Non-resident	Resident	Non-resident
509	Closed	0	0	0	0
510	Closed	0	0	0	0
511	Lottery Permit Hunt, 1 bull	0	0	0	0
522	Lottery Permit Hunt, 1 bull	2	0	1	0
523	Lottery Permit Hunt, 1 bull	5	35	0.5	3.5
524	Lottery Permit Hunt, 1 bull	1	0	0.1	0
526	Lottery Permit Hunt, 1 bull	37	0	3.7	0
TOTAL		**45**	**35**	**4.5**	**3.5**

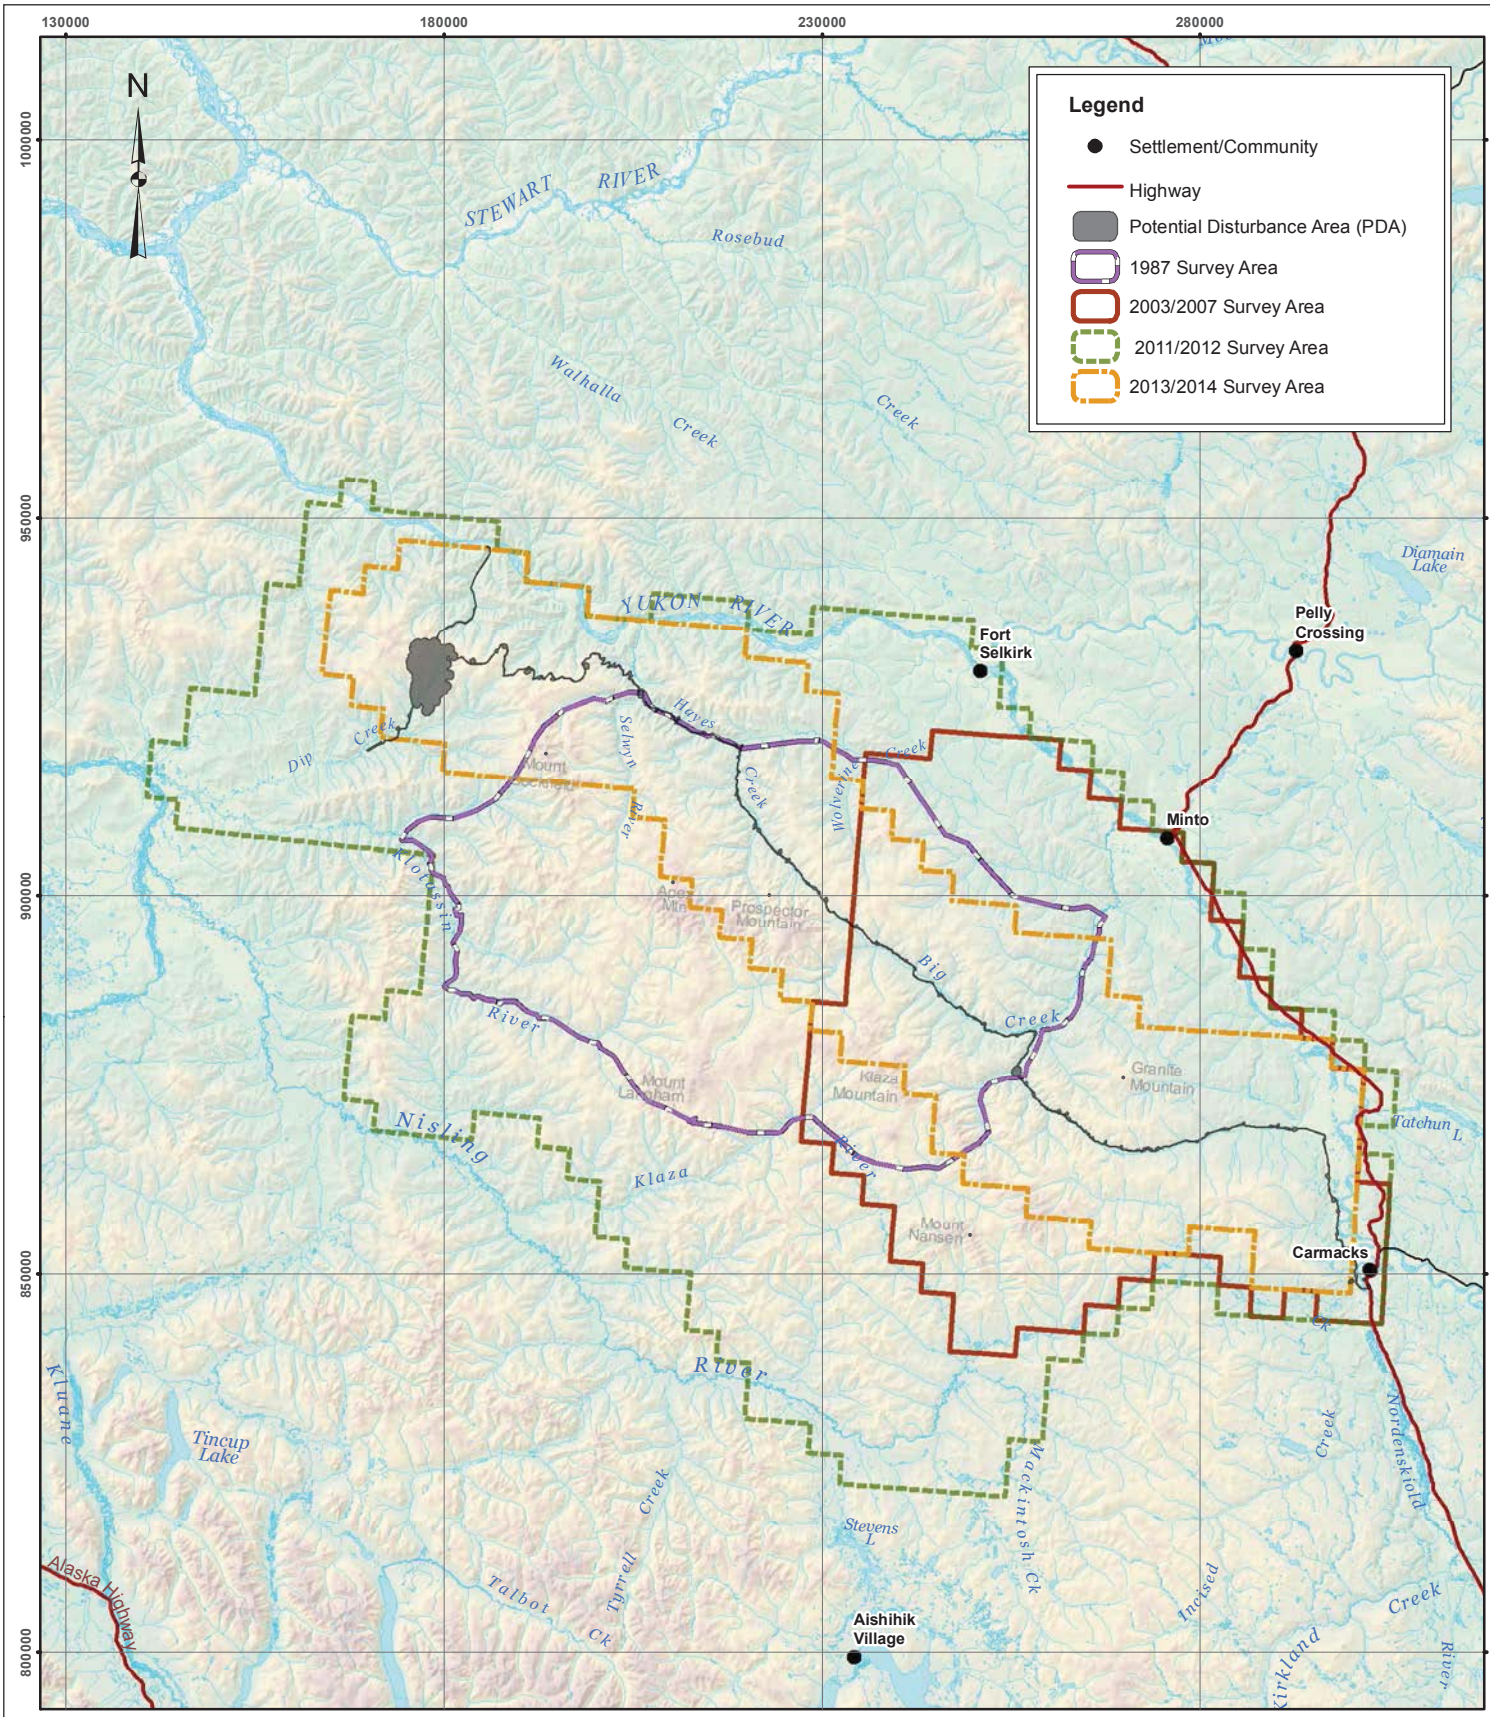
3.5 NATURAL MORTALITY

The natural mortality rate of the KCH was roughly 5% in the late 1980s (Farnell et al. 1991). Predation by wolves is likely the primary factor limiting population growth of the KCH (Hayes et al. 2003); however, wolverine can be an important predator of caribou calves during the first month after birth (Gustine et al. 2006). The amount of predation on the KCH is largely unknown. Previously, wolf numbers in the region were believed to be low due to the low density of prey in the region (Baer and Hayes 1987; Jingfors 1989). Wolves generally target alternative prey species that are more abundant and/or provide greater rewards. Caribou segregate themselves from wolves by using habitats where alternative prey (i.e., moose) are less abundant (James et al. 2004). The segregation of caribou from wolves may be an important tactic reducing predation rates.

Severe weather events (e.g., deep snow) have been suggested as a source of natural mortality for caribou. During the winter, forage availability is limited to ground-lichen and caribou must access the lichen under the snow, resulting in greater energy expenditure from digging craters (Bradshaw et al. 1998). Snow depths greater than 74 cm are considered adverse to caribou for digging craters to access forage (Farnell et al. 1991). Snow conditions can further limit the availability of forage based on snow depth, density, and hardness. Snow conditions do not seem to be a factor affecting population growth of the KCH, because snow depth in this herd's range rarely exceeds thresholds that are considered limiting to caribou (Farnell et al. 1991).



4 MOOSE

Moose is a highly valued harvest species in the Yukon and is considered the primary harvest species in the Project region. In the Yukon, moose management is defined by Moose Management Units (MMU), which were developed for consistent long-term monitoring and management of moose (O'Donoghue 2008a). The Carmacks West MMU overlaps primarily with the eastern half of the RSA (Figure 4.1). The Carmacks West MMU, along with GMSs intersecting Project components helped to guide the delineation of study areas for baseline moose surveys.

Baseline studies of moose in the Casino area began in the late 1980s and have included population censuses, composition, early winter and late winter distribution surveys, and incidental observations (Table 4.1; Markel and Larsen 1988; Jingfors 1989; O'Donoghue et al. 2008a, 2008b; O'Donoghue and Bellmore 2011). Results of these surveys provide information on the distribution and abundance of moose in the RSA. The study areas for moose are illustrated in Figure 4.1.

Table 4.1 History of moose surveys conducted in the Casino area from 1987–2013.

Date	Type of survey	Survey area	Survey Team
November 1987	Population census	Casino Trail area	YG Environment
November–December 2003	Population census	Carmacks West Moose Management Unit; KCH range; GMSs 524, 526, and parts of 522 and 523	YG Environment
November–December 2007	Population census	Same as 2003	YG Environment
March 2011	Late winter distribution	Extension of 2003 and 2007 survey area to include the mine site and all GMSs that spatially overlap with the Project	YG Environment and CMC

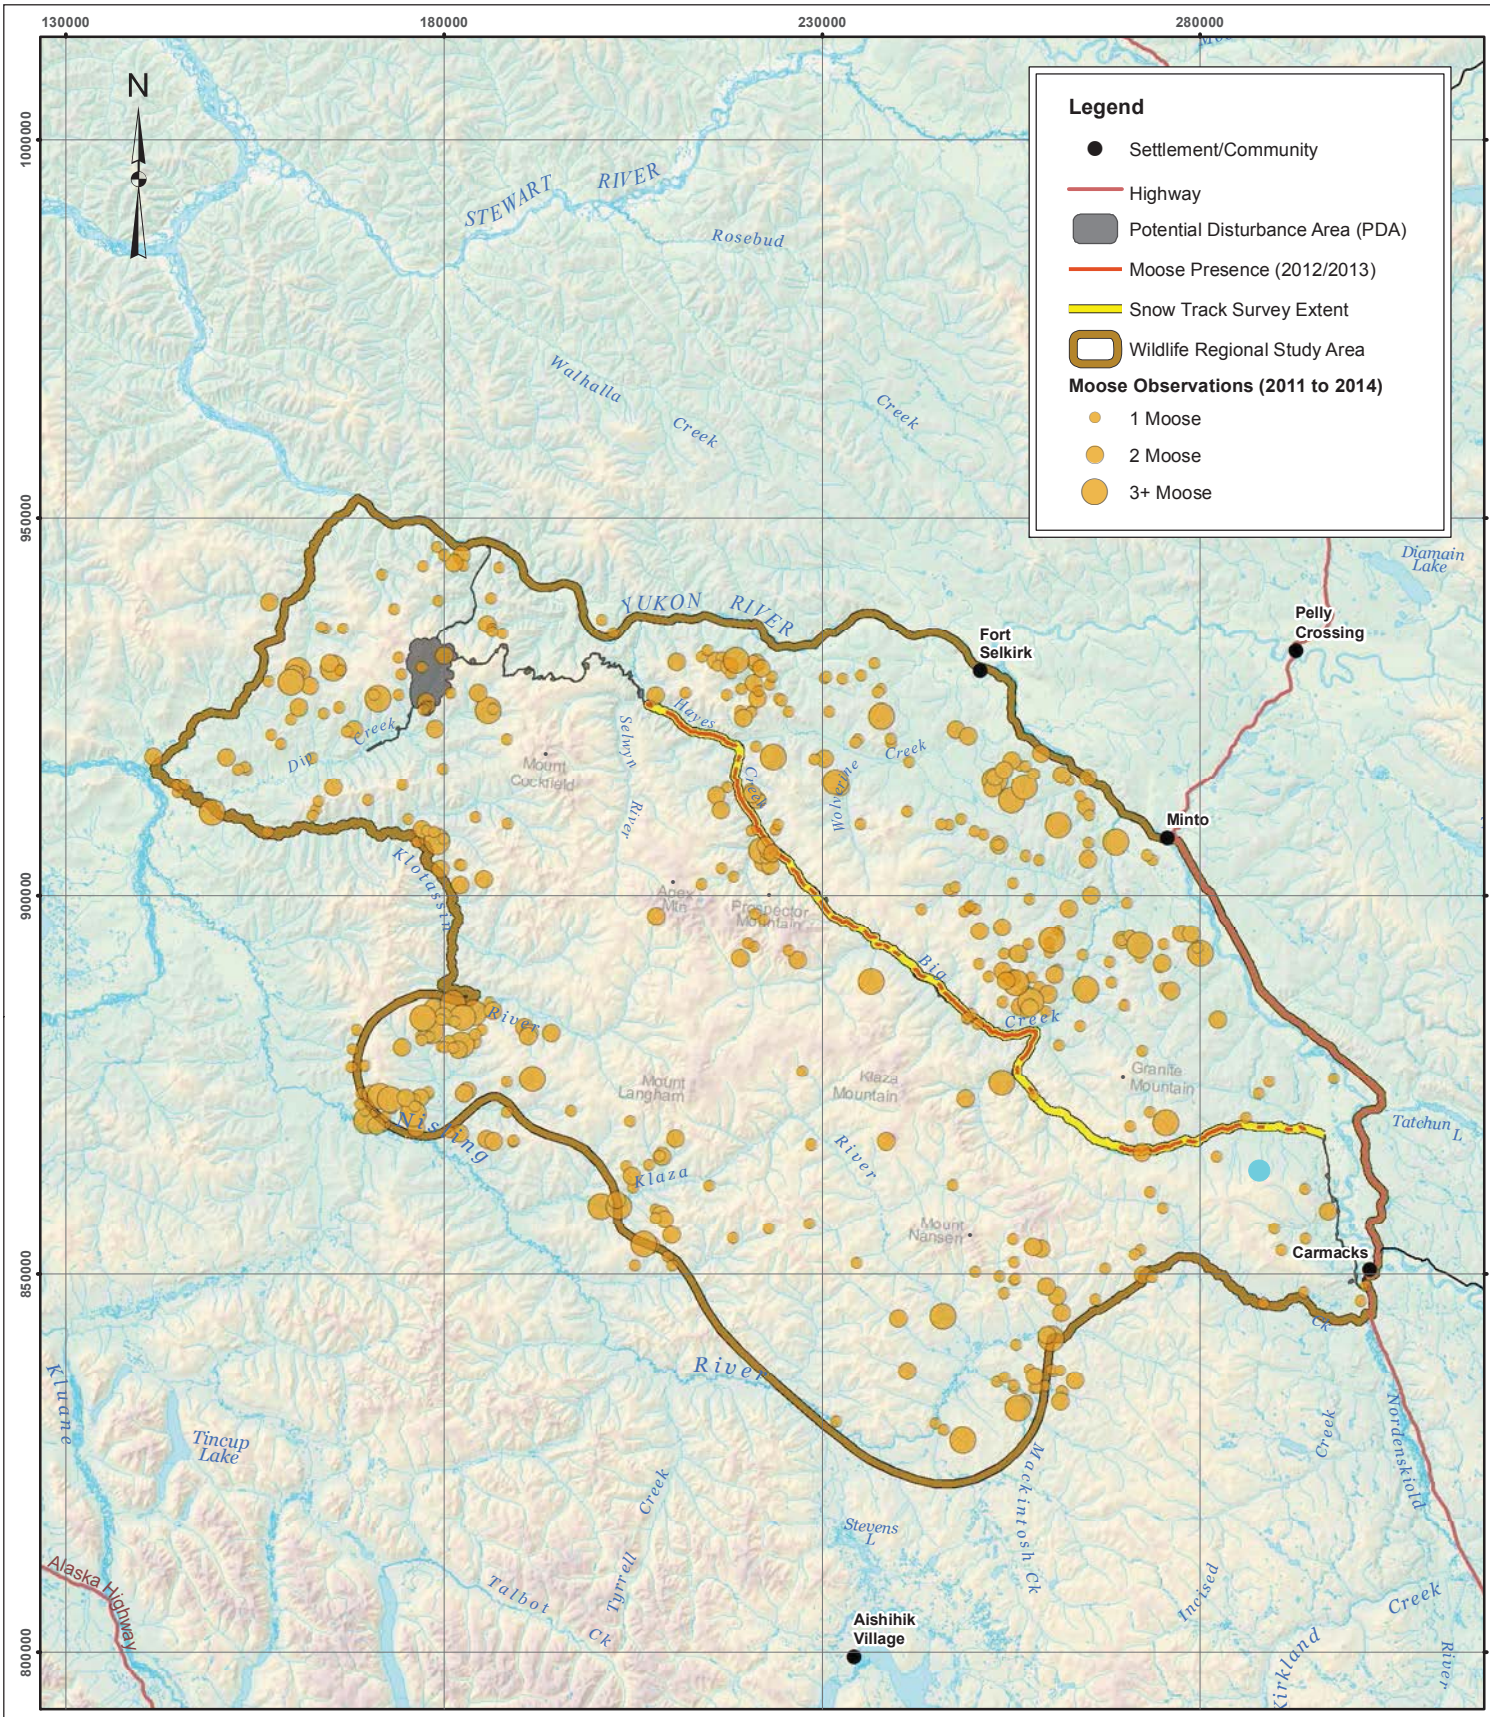
4.1 DISTRIBUTION

Moose naturally occur in all Canadian provinces and territories, except Prince Edward Island and with introduced populations in Newfoundland (Geist et al. 2008). Moose are generally abundant across their range and populations are not at risk. In some areas, such as the southern boreal forest and the eastern Canadian provinces (e.g., Nova Scotia), moose range has decreased since the turn of the century; however, in other regions their range has expanded (e.g., coastal rainforests of BC; Geist et al. 2008). In the Yukon, moose are considered Secure (CESCC 2011) with a population of approximately 70,000 animals (Government of Yukon 2013a). Moose are distributed throughout the territory except Hershel Island, with unevenly high densities in southern Yukon, which represents only 15 percent of the land area (Government of Yukon 2010a).

Throughout their range moose prefer a mosaic of riparian and subalpine habitats, openings, and recent burn areas where they feed on tree leaves, woody and dwarf shrubs, herbs, and aquatic plants (Geist et al. 2008). Generally, moose select for habitats that provide abundant browse and foraging opportunities, thermal cover and protection from predators (Hamilton et al. 1980; Blood 2000). In an effort to better understand moose habitat use in the Dawson Land Use Planning Area, Morrison and Wong (2013) created late winter habitat selection models for adult moose and cows with young (one or more calves) to determine which areas moose selected and which were avoided. The models were based on moose late winter aerial survey data from surveys conducted in the Dawson Land use Planning Area in 2008–2010 and 2012. Adult moose selected areas close to forest, treed riparian areas, wide linear disturbances (>8 m wide), and 11–25 year old burned areas of intermediate elevation, on north-facing slopes, and with a high abundance of riparian forest (Morrison and Wong 2013). Cows with calves selected similar habitat, but did not select for wide linear disturbances or areas close to forest. Both adult moose and cows with calves avoided areas with a high proportion of wetlands, shrub cover, conifer forest, and mixed-wood forest, while only adult moose avoided areas close to recent burns (<10 years old; Morrison and Wong 2013). The avoidance of areas with high proportions of wetlands, shrub cover, conifer forest, and mixed-wood forest was unexpected, considering the requirements for shelter and forage (Morrison and Wong 2013). The avoidance of these habitats may have been a result of pooling all ages of vegetation types (i.e. young forest stands with little to no cover pooled with older, sheltering stands), misclassification error, or moose may have selected multiple vegetation types and avoided individual types (Morrison and Wong 2013).

In the RSA, previous examination of aerial photographs and helicopter reconnaissance led Spencer Environmental Management Services Ltd. (1985) to believe that higher elevation areas are not suitable habitat for moose during early spring and summer, whereas lower elevation areas (e.g., Big Creek) provide good habitat for feeding, thermoregulation, predator protection, and calving opportunities. Low elevation valleys and creeks provide abundant aquatic vegetation that moose highly prefer (MacCracken et al. 1993). Frequent moose sightings have been reported in both the Casino Creek and Britannia/Canadian Creek watersheds in late summer and early fall (Knight Piésold Limited 1997). These findings highlight the importance of low elevation forested valleys and waterways for moose, where they can be found browsing new buds and fresh growth such as willow and birch (Government of Yukon 2000; USDA Forest Service



2010). In fall, during the rut, moose congregate in subalpine willow flats and creek draws where there is abundant willow. Observations of moose during fall and early winter surveys noted moose using subalpine areas, feeding on willow and shrub birch where snow depths remain shallow enough until mid-winter (Markel and Larsen 1988; Jingfors 1989; O'Donoghue and Bellmore 2011).

Winter can be a critical season for moose survival due to reduced forage availability and the energetic cost of moving through deep snow (Pierce and Peek 1984; Markel and Larsen 1988; Poole and Smith 2006; USDA Forest Service 2010). Key winter ranges for moose in mid to late winter are low elevation forested valleys where tree canopy cover intercepts snow, resulting in shallower snow conditions, lower energy costs, greater forage availability, and cover from predators (Government of Yukon 2010a). Willows generally make up the bulk of moose winter diet; therefore, areas with extensive shrubs and saplings provide good winter habitat, such as riparian areas, subalpine plateaus, shrub dominated draws, and early-successional forests (Government of Yukon 2010a). Lightning strikes causing wildfires are common in the Casino area (YEWG 2004), which benefit moose by providing high quality vegetative forage in recent burn areas. The most recent forest fire was in 2013, just west of the Freegold Road near Carmacks, and the most expansive fires occurred in 1994 and 1995 (O'Donoghue and Bellmore 2011).

During the 2011–2014 surveys, moose were widely distributed across the survey areas along creeks, open forest, and willow-rich habitats in previously burned or disturbed areas (e.g., near placer mine operations; Photo 2; Figure 4.2). In 2011, large concentrations of moose were observed in the northern and western portions of the survey area in open spruce forests and lower valleys along Klotassin River, Dip Creek, and Coffee Creek. In 2012, high concentrations of moose were observed in burned areas and river valleys; however, they were evenly distributed throughout the survey area. The study area in 2013 and 2014 was restricted to survey blocks 10 km or less from the existing Freegold Road and the proposed extension. Moose sightings in 2013 were distributed throughout the survey area, with minor concentrations noted north of the road alignment, between the Yukon River and Hayes Creek, and in the Big Creek area. In 2014, moose observations (tracks and sightings) were distributed throughout the survey area, with concentrations north of Big Creek, Hayes Creek, and the proposed mine site; the majority of moose sightings were in burned forests and on relatively high elevation slopes, which is somewhat atypical of moose during the late winter. Survey observations of moose distribution in late winter corresponded with known suitable winter habitats, especially areas that were likely to receive less snowfall and provided adequate winter browse. In general, observations from 2011–2014 were concentrated east of the proposed Freegold Road extension, in the Dip Creek area, and in the Nisling River valley (Figure 4.2). Observations from the Casino wildlife log include 76 moose from 2008 to 2013.

Photo 2. Three moose observed browsing on willow in disturbed habitat (cleared area near a placer mine) along the proposed Freegold Road extension during snow track surveys, 2013.

4.2 MOOSE WINTER HABITAT SUITABILITY MODEL

In consideration of the energetic costs to moose during winter, a late winter habitat suitability model was developed within the moose RSA. Habitat suitability indices (HSI) were created for habitat variables based on a review of literature, moose observations during baseline studies and professional experience. The detailed methods and results are presented in a separate technical report.

4.3 ABUNDANCE

The first moose survey conducted near the RSA was part of a larger study in 1975 covering Game Management Zone 5 and found relatively low densities of moose (Hoefs and Lortie 1975). The first survey targeting moose in the Casino area was conducted by the Government of Yukon in 1987 in response to the growing concern surrounding the potential impacts of the Freegold Road extension on moose and other wildlife populations (Markel and Larsen 1988). The Government of Yukon continued to conduct surveys in the Casino area in 2003, 2007, and 2011; however, the 2003 survey was only partially completed due to poor weather conditions (Table 4.2).

Moose densities in the RSA are relatively low, but may be increasing (Table 4.3); difference in survey timing and study area size confound rigorous trend analysis. Density estimates from 2003 are low and likely biased because of poor survey conditions, thus the apparent upward population trend from 2003 to 2007 may be somewhat unfounded (O'Donoghue et al. 2008b); however, there is a considerable increase in density from 1987 to 2007. Moose densities in the RSA are lower than the Yukon average, which generally ranges between 150 and 249 moose/1,000 km² (Yukon Fish and Wildlife Management Board 1996).

An estimate of moose composition could not be determined in 1987 and 2003 due to low sample size (O'Donoghue et al. 2008a). Estimates from 2007 and 2011 suggest that recruitment was relatively low in the RSA, below what is considered necessary for maintaining stable moose populations and lower in comparison to late winter distribution surveys done elsewhere in the Yukon (O'Donoghue et al. 2008b; O'Donoghue and Bellmore 2011). In general, moose populations in areas with typical mortality rates require about 25–30 calves per 100 adult cows to maintain stable moose populations (O'Donoghue et al. 2008b). Likewise, about 10–20 yearlings per 100 adults are necessary for maintaining stable moose populations. The number of mature bulls to adult cows (75 bulls per 100 cows) was slightly higher than the Yukon average (67 bulls per 100 cows) at the time of the survey and above the minimum target level of 30 bulls per 100 cows (Yukon Fish and Wildlife Board 1996).

In 2011, the observed number of calves in the population (4%) was low, suggesting low calf survival; however, this composition index is likely biased because the survey was aimed at determining moose distribution in the survey area (O'Donoghue and Bellmore 2011). Regardless, moose composition can be compared with results from similar late winter surveys done elsewhere in the Yukon, which suggests that calf survival in the study area was low in 2011.

Table 4.2 Results of moose surveys conducted in or near the Casino area, 1987–2013.

Year of survey	Type of survey	Abundance/# Moose Observed	Density[1]
1987	Early winter population census	137 ± 59% (90% CI)	40 moose/1,000 km²
2003[2]	Early winter population census	215 ± 48% (90% CI)	53 moose/1,000 km²
2007	Early winter population census	520 ± 21% (90% CI)	127 moose/1,000 km²
2011	Late winter distribution	278 individuals	n/a
2012	Late winter distribution	272 individuals	n/a
2013[3]	Late winter distribution	54 individuals	n/a
2014[3]	Late winter distribution	62 individuals	n/a

Notes:

[1]Density is based on moose observed in suitable habitat only (does not include entire study area).

[2]Results of this survey are biased low due to poor weather conditions.

[3]The number of moose observed in 2013 and 2014 reflects the reduced survey area size (Figure 4.1).

Table 4.3 Moose densities in GMSs that interact with the Project, based on early winter census survey results and discussion with regional biologists.

Game Management Subzone	# Moose/1,000 km²	Total Moose
509	200	205
510	200	142
511	100	47
522	125	252
523	145	319
524	100	117
526	125	166

Notes:

Rows in grey are not based on census data from that GMS. Within these GMSs, moose density is estimated from nearby censuses (Beaver Creek and or Casino Trail early winter surveys) and discussions with the Regional Biologist.

Data source: Government of Yukon 2012, unpublished data

4.4 HARVEST

Moose is a highly valued wildlife species in central and southern Yukon for recreational and trophy hunting and as subsistence food for First Nations (Spencer Environmental Management Services Ltd. 1985). Hunter questionnaire results from 1985 found that the demand for moose by resident hunters (licensed and unlicensed) was higher than all other big game species (Larsen et al. 1985). Although unlicensed (i.e., First Nation) harvest cannot be directly quantified, interviews with LSCFN and SFN members suggest that the Casino area is not highly used for subsistence hunting (Pearse and Weinstein 1988); however, this may have changed since that information was collected. Historical harvest data for moose are limited and harvest

estimates do not include unlicensed harvest. Harvest records from the LSCFN and SFN are voluntary; therefore, total harvest is unknown and can only be speculated based on personal communication or interviews with First Nation hunters.

Historically, moose numbers were found to be low in the Casino area and susceptible to overharvest (Spencer Environmental Management Services Ltd. 1985; Markel and Larsen 1988; Jingfors 1989; O'Donoghue et al. 2008a). Harvest data from 1979 to 2012 covers GMSs 510, 511, 522, and 523, with most harvest in the last ten years (2002–2012) from licensed resident users in GMS 509 (Table 4.4), corresponding with access from the Yukon River. Peak harvest was reported in 1984, and by 1987 GMSs 522–524 and 526 were closed to licensed hunting due to low moose numbers (Jingfors 1989; O'Donoghue et al. 2008a). In the RSA, these GMSs overlap with the Carmack West MMU, which has been closed to licensed hunting since 1987. However, First Nation harvest is unrestricted. At the time of writing this report, GMSs 522–524 and 526 are still closed, while 509–511 are open for the 2013–2014 hunting season, subject to a bag limit of one moose (Table 4.4).

Table 4.4 Summary of the latest ten years (2002–2012) of moose harvest data in GMSs that interact with the Project.

GMS	Harvest regulations (2013–2014 season)	Total harvest			Mean yearly harvest		
		Resident	Non-resident	Special Guided	Resident	Non-resident	Special Guided
509	Open; Bag limit 1	11	1	1	1.1	0.1	0.1

TOTAL		**18**	**7**	**1**	**1.8**	**0.7**	**0.1**

Note: Government of Yukon, unpublished data

4.5 NATURAL MORTALITY

The main source of natural mortality for moose in the RSA is likely predation by grizzly bears on newborn calves, followed by wolf predation on calves and adults (Larsen et al 1989). Predation levels are unknown in the Casino area, but studies from southern Yukon and east central Alaska strongly suggest that predation by grizzly bears limits moose population growth (Boertje et al. 1987; Markel and Larsen 1988; Jingfors 1989; Larsen et al. 1989).

Grizzly bear densities in the RSA are unknown, but likely range from 10–16 bears/1,000 km², based on studies southwest of Whitehorse and north of Tok, Alaska (Markel and Larsen 1988; Jingfors 1989; Larsen

and Markel 1989). In spring, grizzly bears are in the subalpine, which exposes moose and newborn calves to predation (Government of Yukon 2000). Grizzly bear mortality on moose tends to occur during the calving season before calves reach eight weeks of age, when they are weak and can be easily preyed upon (Larsen et al. 1989; Government of Yukon 2000). In late June, grizzly bears prey less on moose calves and wolves become the dominant predator during the remainder of the year and through winter (Larsen et al. 1989).

Another factor affecting natural mortality for moose in northern ecosystems is snow depth (Markel and Larsen 1988; Ballard et al. 1996). Snow depth is an important factor that influences forage availability and the energetic cost of moving across the landscape; however, moose may still select winter habitats primarily based on the overall availability of food (Serrouya and D'Eon 2002; Poole and Smith 2006). In the RSA, moose have been observed feeding on willow in areas of high snow depths (60–74 cm), suggesting that forage preference might be more important than snow depth in terms of habitat selection (O'Donoghue and Bellmore 2011). Although moose have evolved long legs to tolerate deep snow conditions, depths of 65–75 cm are known to restrict movements of cows and calves, and depths of 70–80 cm are considered critical to survival (Pierce and Peek 1984; Markel and Larsen 1988; Larsen et al. 1989). Generally, the average annual snowfall in the Yukon is not high enough to be a significant cause of natural mortality in moose (Government of Yukon 2010a).

5 DALL'S SHEEP

There are two subspecies of thinhorn sheep in Canada: Stone's sheep (*Ovis dalli stonei*) and Dall's sheep (*Ovis dalli dalli*). There is also a colour morph referred to as Fannin's sheep, which is a result of cross-breeding between Dall's and Stone's sheep (Worley et al. 2004; Government of Yukon 2010b). Dall's sheep occur throughout Canada's northwest including northern British Columbia, Yukon, Northwest Territories, and in Alaska (Loehr et al. 2006; Festa-Bianchet 2008) and are the only subspecies that exists within the RSA. They are distributed throughout the Yukon, extending as far north as the Arctic coast (Barichello et al. 1989a; Government of Yukon 2000b) with scattered pockets that extend across the territory in a broad band that follows the mountain ranges (Government of Yukon 1996, 2000b).

Few sheep-specific surveys have been conducted in or near RSA (Table 5.1); however, due to the traditional use of seasonal ranges by sheep, the existing historical information provides valuable data that are still relevant today.

Table 5.1 History of Dall's sheep surveys, including incidental sightings in or near the RSA from 1974–2013.

Year of survey	Type of survey	Location
1974	Population census	Dawson Range
1986	Population census	Dawson Range/Casino Trail area
2011	Moose late winter distribution	Carmacks West Moose Management Unit
2012	KCH re-sight survey	Klaza caribou herd range
2013	Late winter	Dawson Range

5.1 DISTRIBUTION

Sheep typically have a clustered distribution in traditionally used areas due to reliance on key habitats for seasonal life functions (e.g., winter range, lambing areas, and mineral licks; Heimer 1973; Festa-Bianchet 2008; Loehr et al. 2006). Dall's sheep are not migratory and their home ranges are usually not large (Spencer Environmental Management Services Ltd. 1985; Government of Yukon 1996; Geist 1999; Worley et al. 2004), and they can inhabit distinct seasonal ranges that are as little as a few kilometers apart (Government of Yukon 2000, 2010b). Adult male sheep may occupy as many as six seasonal ranges including pre-rutting, fall rutting, mid-winter, late winter, spring, salt lick, and summer ranges; whereas adult females typically have four seasonal ranges including winter, spring, lambing, and summer (Bowyer and Leslie 1992; Valdez and Krausman 1999). Lambing areas are re-used annually as an important source of suitable forage and protection from predators.

Dall's sheep inhabit dry mountainous regions where there is access to subalpine meadows, shrublands, and terrain with rocky slopes, ridges, and cliffs to help avoid predation and provide safe lambing grounds (Bowyer and Leslie 1992; Festa-Bianchet 2008). Nearby grasslands and meadows provide habitat for feeding

on grasses, sedges, and the leaves and buds of forbs and shrubs (Bowyer and Leslie 1992; Government of Yukon 2010b).

In summer (July/August), Dall's sheep can be found in alpine meadows where there is suitable forage and steep terrain for predator avoidance (Government of Yukon 2000). In fall (August/September), they move to winter ranges on wind-swept, south-facing alpine or subalpine slopes where snow is shallow and strong winds improve access to forage (Bowyer and Leslie 1992; Government of Yukon 2000, 2010b; Festa-Bianchet 2008). Winter ranges consist of scree slopes and broken cliffs located near prime lambing grounds, providing security from predators when the spring lambing season approaches (May/June; Valdez and Krausman 1999). A late winter habitat selection model for sheep in the Dawson region found that areas with high elevation, high convexity, high ruggedness, and a southerly aspect were selected by sheep, while areas distant from escape terrain with northerly aspects were avoided (Barker 2012).

Mineral licks are an important habitat feature for sheep because they provide a source of minerals. Dall's sheep diet mostly consists of graminoids (46.3%), forbs (36.8%), and browse (16.1%) (Bowyer and Leslie 1992).

The first survey to identify Dall's sheep wintering areas within the Dawson Range was in 1974, as part of a survey covering the greater area of GMZ 5 (Hoefs and Lortie 1975). In June and July 1986, the Government of Yukon conducted the first sheep surveys in the Casino area, focusing on the Freegold Road extension and in search of key habitat features (i.e., winter ranges; Jingfors 1989). Wintering areas in the Dawson Range were determined from direct observations and sporadic indirect sign (e.g., tracks, pellets, mineral licks). These surveys resulted in the definition of two separate "western" and "eastern" populations in the Dawson Range. The western population was located on a low mountain range between the Klotassin and Nisling Rivers (Jingfors 1989). The eastern population was found primarily on the mountains facing Klaza Creek, which are connected by alpine habitat to Apex, Prospector, and Klaza Mountains — areas that were believed to be used on a seasonal basis (Jingfors 1989). Winter range and suspected lambing areas for the eastern population were also located on the Klaza River — the same area that sheep were located in the 1974 survey (Hoefs and Lortie 1975; Jingfors 1989). In late winter 2013, a sheep survey conducted by the Government of Yukon in the Dawson Range found sheep winter range on Mount Langham, Apex Mountain, and near Klaza Mountain (O'Donoghue, pers. comm. 2013; Figure 5.1), suggesting that sheep distribution in the Casino area has likely experienced little change since the mid-1970s.

Sheep have been regularly observed during wildlife surveys that include suitable sheep habitat within the RSA. During aerial ungulate surveys in 2011 and the Klaza caribou herd re-sight surveys in 2012, Dall's sheep were observed on Mount Langham, Prospector Mountain, and Klaza Mountain). This is consistent with historical observations.

5.2 ABUNDANCE

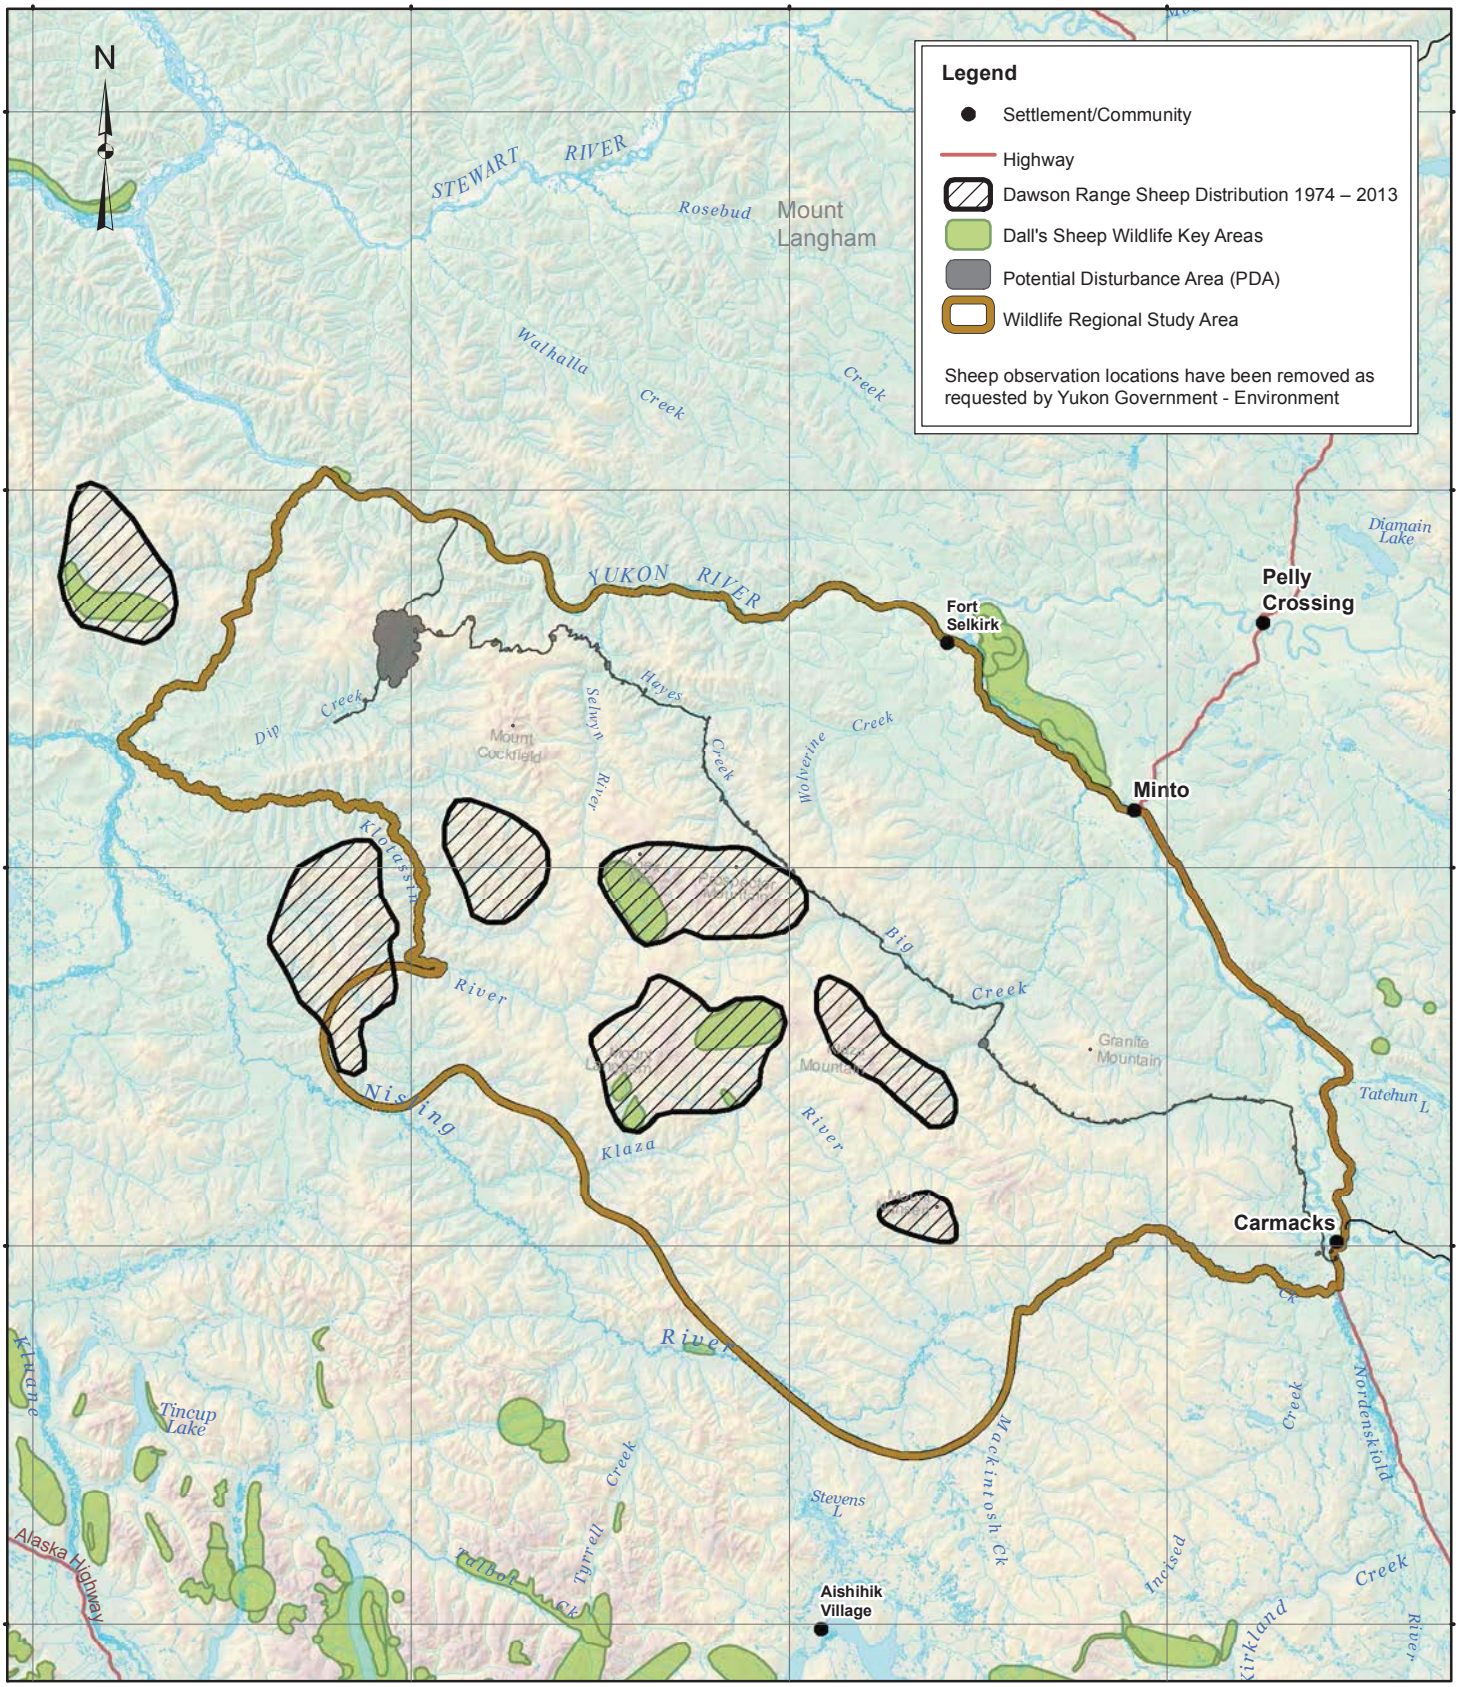
In the Yukon, population estimates of all thinhorn sheep subspecies were made in 1974 and 1983, and totaled about 22,000 sheep in both years (Hoefs and Barichello 1985). Of this, 19,000 were Dall's sheep and 3,000 were Stone's sheep. This estimate is believed to have remained relatively stable through the 1970s and

1980s, based on repeated surveys of certain populations. The current population estimates for Dall's sheep in the Yukon is 20,000 (Government of Yukon 2013b).

Wolves, coyotes, golden eagles, wolverine, lynx, and grizzly bear are known predators of Dall's sheep (Hoefs and Cowan 1980; Stephenson et al. 1991; Arthur 2003); however, sheep are believed to be a minor part of most predators' diets. Wolves may limit populations when alternative prey is not available; however, in the Yukon, Dall's sheep populations are not known to be strongly influenced by wolf predation (Barichello et al. 1989b; Hayes et al. 2003).

Severe winter conditions (e.g., deep snow, icing events), high population density, low-quality forage, disease and over hunting have the potential to influence the productivity and/or carry capacity of sheep populations (Geist 1971; Bower and Leslie 1992; Government of Yukon 1996). Pregnant ewes typically experience a negative energy balance during the winter from high energy expenditures and/or low quality forage, potentially resulting in miscarriage if too much weight is lost (Geist 1971; Hoefs and Barichello 1985). Likewise, severe weather and poor forage quality during spring lambing can increase lamb mortality. The number of lambs entering the population is believed to be the driving force in sheep population dynamics, rather than the number of animals leaving the population through predation or hunting.

There are a number of diseases that are known to occur in sheep populations (Bower and Leslie 1992; Hoefs and Bunch 2001). High rates of a mandibular disease, known as lumpy jaw, have been found in Dall's sheep populations in the Yukon, with southern populations having a higher frequency and severity of infection than northern populations (Barichello et al. 1989c; Hoefs and Bunch 2001). Lumpy jaw disease may lower life expectancy of adult rams from the abnormal wearing of the teeth, loss of teeth, infection by oral bacteria, and subsequent impaired nutrient uptake; however, there is no evidence that it increases mortality (Barichello et al. 1989c).



5.3 HARVEST

Dall's sheep are considered a valued sport-hunting resource in the Yukon. Hunters usually target old, large trophy rams. Historically, there were few harvest reports of Dall's sheep in the Dawson Range and harvest since 1979 has been limited to GMSs 523, 524, and 526, with the majority of reports coming from guided non-resident hunts (Table 5.2; Jingfors 1989; Government of Yukon, unpublished data). Sheep hunting remains open across the GMSs overlapping with the RSA; however, harvest in the last ten years has been limited to GMS 523 only (Table 5.2). Licensed hunters are restricted to one full curl ram per year. First Nation harvest statistics are unknown.

Table 5.2 Summary of the latest ten years (2002–2012) of sheep harvest data in GMSs associated with the Project.

6 WOOD BISON

Historically, the distribution of wood bison covered northeastern BC, northern Alberta, northwestern Saskatchewan, Yukon, southwestern Northwest Territories, and much of Alaska (Carbyn and Trottier 1988; Gates et al. 2001), with an estimated 168,000 animals in the early 1800s (Government of Yukon 2012). Due to heavy human exploitation, wood bison declined dramatically to a few hundred animals by the late 19th century, leading to extirpation in the Yukon in the early 20th century. In 1978 wood bison became a Species at Risk in Canada and were designated by COSEWIC as Endangered, leading to the creation of the National Wood Bison Recovery Program and a recovery goal of four free-ranging populations of at least 400 individuals (the number needed to support a minimal viable population; Gates et al. 2001). As part of this fulfillment, 170 bison were introduced to the Yukon between 1986 and 1992 (Gates et al. 2001; Government of Yukon 1998, 2012). These recovery efforts led COSEWIC to upgrade wood bison status to Threatened with legal protection under the federal *SARA*'s Schedule 1 (Government of Canada 2012).

Presently, wood bison inhabit BC, Alberta, Yukon, southwestern Northwest Territories, and Manitoba (Gates et al. 2001). In 2006 the Canadian population was estimated at 3,536 animals with 2,828 free-roaming (comprising six wild herds), 708 in captivity (comprising four captive herds), and with only two wild herds exceeding the minimum viable population threshold of 400 animals (Government of Canada 2012).

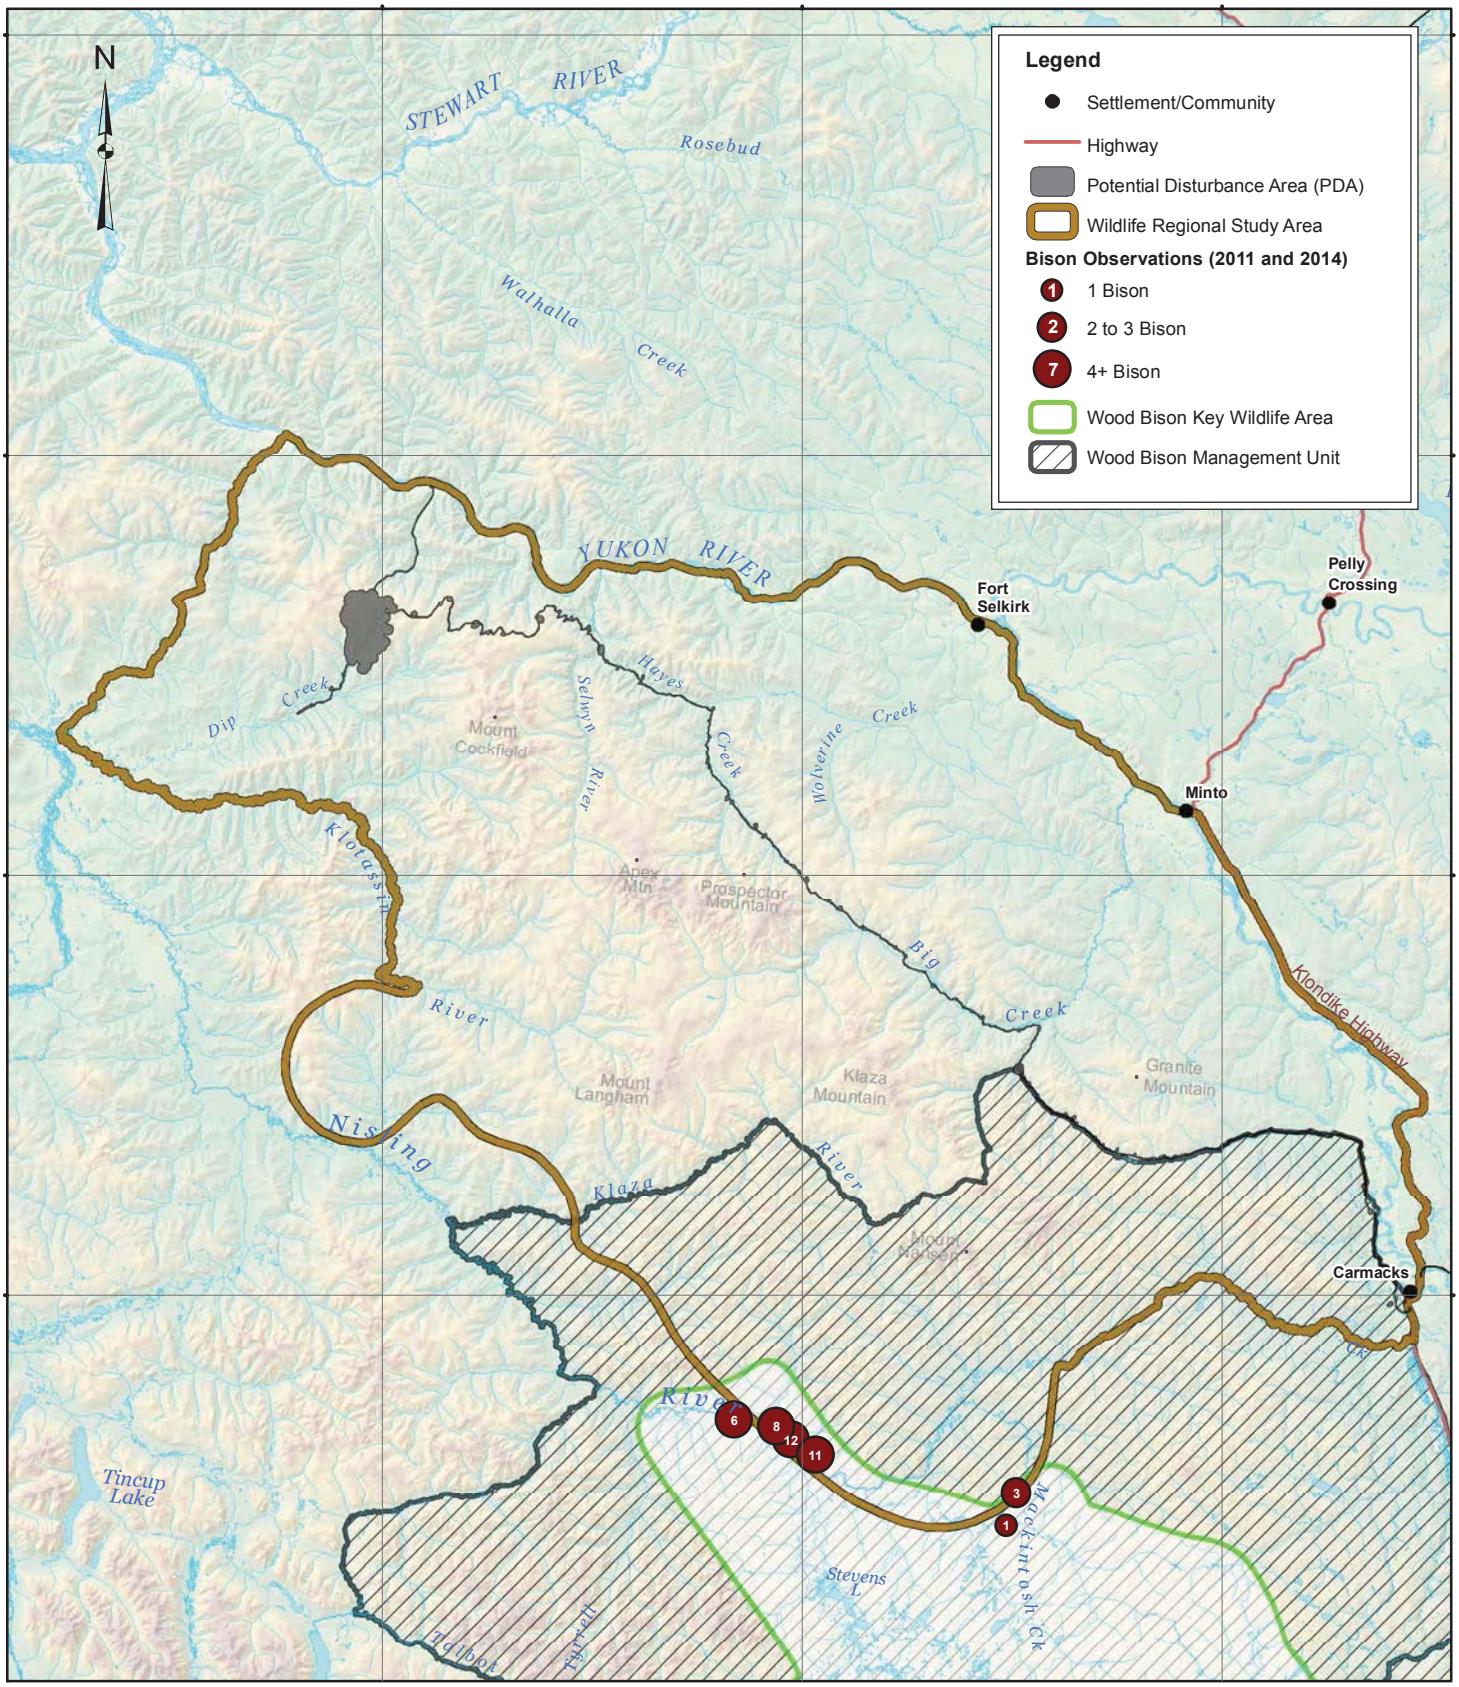
Yukon's wood bison were introduced to the Nisling River valley and have now extended their range south into the Aishihik, Sekulmun, and Hutshi Lakes watersheds (Government of Yukon 1998, 2012). Wood bison are not considered a migratory species; however, they do migrate locally between summer and winter ranges (Larter and Gates 1991; Gates et al. 2001; Government of Yukon 2012). The Aishihik herd's early and late winter range extends north of Aishihik Lake, along the North Klondike Highway, to approximately 30 km south of Carmacks (Figure 6.1; Government of Yukon 2012) with the herd's core range encompassing the area from the Nisling River valley eastward to the North Klondike Highway, lying largely south of the RSA.

Wood bison generally prefer open boreal and aspen forests, with a variety of habitat preferences which vary by herd and season (Reynolds et al. 1978; Larter and Gates 1991; Gates et al. 2001; Gardner and DeGange 2003). The diet of wood bison varies by herd, but generally consists of a variety of grasses, sedges, and willow with seasonal variation (Larter and Gates 1991; Reynolds et al. 1978; Gardner and DeGange 2003). In winter, sedges (*Carex* spp.) make up most of the diet, whereas a mix of grasses (e.g., *Calamagrostis* spp.), sedges, and willows (*Salix* spp.) comprises summer diet. For some herds, lichen (e.g., *Cladina mitis*) is the main forage component in the fall (Larter and Gates 1991).

A population census of the Yukon's Aishihik bison herd is typically conducted every two years, with the first survey in 1998 estimating close to 500 animals and the latest survey in 2011 estimating 1,230 animals. Two other transboundary herds occur seasonally in southeastern Yukon, known as the Nahanni and Nordquist herds (Government of Yukon 2012).

Following extirpation and subsequent reintroduction of wood bison into the Yukon, hunting was prohibited to promote population growth. In 1998, the requirement of a minimum viable population of 400 animals was fulfilled, allowing for their addition to the Yukon *Wildlife Act* as a harvestable species. The 2013–2014 hunting season is open to permit (non-lottery) hunting of wood bison across all GMSs, subject to a bag limit of one. Harvest data since 2002 for total and mean yearly bison harvest within the GMSs associated with the Project demonstrates that harvest is quite low and is concentrated primarily in GMS 526 (Table 6.1).

Table 6.1 Summary of the latest ten years (2002–2012) of wood bison harvest data in GMSs associated with the Project.



GMS	Harvest regulations (2013–2014 season)	Total harvest	Mean yearly harvest
		Resident	Resident
509	Permit required; Bag limit 1	0	0
510	Permit required; Bag limit 1	0	0
511	Permit required; Bag limit 1	0	0
522	Permit required; Bag limit 1	0	0
523	Permit required; Bag limit 1	1	0.1
524	Permit required; Bag limit 1	0	0
526	Permit required; Bag limit 1	4	0.4
TOTAL		**5**	**0.5**

Note: Government of Yukon, unpublished data

Grizzly bears and wolves are known to prey on wood bison; however, they are not considered the primary prey for either predator (Gardner and DeGange 2003) and in Yukon predation on bison is considered rare (Jung 2011). Wolf and wood bison have a history of predator-prey interactions and in some isolated herds wolves can limit bison populations (Carbyn and Trottier 1988; Gates et al. 2001; Gardner and DeGange 2003). The first record of a wolf-killed Aishihik bison occurred in 2007, with few other accounts after this (Government of Yukon 2011).

Other mortality factors include vehicle collisions (Hayes 1992) and disease. Three diseases are a problem for free-ranging wood bison populations in northern Canada, including tuberculosis (*Mycobacterium bovis*), brucellosis (*Brucella abortus*), and anthrax (caused by the bacterium *Bachillus anthracis*; Gates et al. 2001; Joly and Messier 2004; Government of Canada 2012). The Aishihik herd is considered disease-free and protecting the herd from disease is one of the main management objectives (Government of Yukon 2012).

Wood bison are expected to occur in the southern sections of the RSA only, due to limited suitable habitat. During the 2011 aerial ungulate survey, 18 bison, in two groups, were observed on the south edge of the RSA in their winter range on the edge of their core range. During the 2012 late winter survey, 23 bison in four groups were observed in the southern section of the study area, located in river valleys or on snow-free south-facing slopes (Figure 6.1).

7 MULE DEER

Mule deer are distributed throughout most of western North America, naturally occurring in most provinces across Canada (Mule Deer Working Group 2004; Sanchez and Tessaro 2008). In the Yukon, mule deer are designated as Sensitive (CESCC 2011), mostly due to the suspected small population size.

Mule deer range has been expanding north into the territory for the past few decades, with reported sightings dating back to the 1930s (Hoefs 2001). It is believed the Yukon represents the northern extent of their range, with some sightings as far north as Dawson City and the Dempster Highway by the 1980s (Hoefs 2001). White-tailed deer have also been reported in the southern Yukon, but they are considered very rare. They were first observed at Tagish Lake near the British Columbia border in 1975, and as far north as Moose Creek on the North Klondike Highway in 1998 (Hoefs 2001). Mule deer occur in the RSA, likely concentrated in areas providing high quality habitat (e.g. open, south-facing slopes). During a moose survey in 2007, a mule deer and many mule deer tracks were observed on open ridges overlooking the Yukon River near Carmacks (O'Donoghue et al. 2008b) and two mule deer were observed on open ridges overlooking the Yukon River during baseline aerial ungulate surveys in 2011 and 2012.

Mule deer migrate locally within mountainous areas moving seasonally from high elevation summer ranges in alpine and subalpine habitats to low elevation forested winter ranges in valleys (Schoen and Kirchoff 1990; Hayden et al. 2008). They have been known to disperse distances of 100–200 km (Anderson and Wallmo 1984) and occupy areas as little as 30–40 hectares (Chapman and Feldhamer 1982).

Typical mule deer habitat in the Yukon consists of open, grassy areas and south-facing slopes bordered by aspen, where sunlight and high wind help expose forage and promote early green-up (Hoefs 2001; Government of Yukon 2013c). Mule deer can also be found along roadsides and highways feeding on grasses, forbs, foliage, and twigs (Government of Yukon 2013c). Their slender legs are not well suited for efficient travel in deep snow, making south-facing slopes and wind-swept areas prime habitat in the winter (Government of Yukon 2013c).

There is no population estimate of mule deer in the Yukon; however, their abundance is expected to be much lower than neighboring provinces and territories, but increasing. Due to their small population, mule deer harvest is by permit hunt only for all GMSs and is subject to a bag limit of one (Government of Yukon 2013d). There are no records of mule deer being harvested in the RSA. Natural predators of mule deer in the Yukon include bears, wolves, cougars, and coyotes (Government of Yukon 2013c). Other important factors influencing population dynamics includes habitat alterations, human-use patterns, forage availability and quality, weather, and disease. In northern climates, mule deer can be limited by cold and deep snow conditions (Mule Deer Working Group 2004; Sanchez and Tessaro 2008).

8 GRIZZLY BEAR

In the Yukon, there are an estimated 6,000 to 7,000 grizzly bears (COSEWIC 2012) that range across the territory from the BC border to the Beaufort Sea. Yukon's grizzly bear population represents about 25% of Canada's grizzly bear population (COSEWIC 2012). In Canada, grizzly bears are assessed as Special Concern because of threats from human-caused mortalities, including hunting, poaching, defense of life and/or property, and accidental mortality; incursions into grizzly bear habitat; and habitat loss (COSEWIC 2002).

Grizzly bears are opportunistic omnivores (Ross 2002), primarily feeding on vegetation but opportunistically preying on animals. Their diet and behaviour are dependent on local habitat and are highly variable. In Yukon, grizzly bears are the primary predator of moose calves each spring (Larsen et al. 1989). Other spring vegetation includes roots, the previous year's berries, and other old vegetation. Once new vegetation is available, grizzly bear forage switches primarily to grasses and then berries (Government of Yukon 2010c).

8.1 DISTRIBUTION AND ABUNDANCE

There is limited available information on grizzly bear distribution or abundance in the Project area. Grizzly bear densities for the project area are unknown; however, Markel and Larsen (1989) estimated densities between 10 to 16 bears/1,000 km^2, based on studies completed in nearby areas. The working estimate for the two ecoregions that overlap the study area is 15 grizzly bears/1,000 km^2 (Maraj pers. comm.). Grizzly bears are assumed to use the entire RSA as they have been harvested from all GMSs that intersect the Project footprint, with the exception of GMS 510. In the last ten years of available harvest data, a total of 11 bears were taken in GMSs 522–524 and 526 (Table 8.1).

To determine grizzly bear habitat use and distribution within the Project, a grizzly bear study area, herein referred to in Section 8 as the study area, was delineated (Figure 8.1). The study area encompasses all GMSs that overlap with the Project (GMSs 509, 510, 511, 522, 523, 524, and 526; Figure 8.2) and has a total size of 8,921 km^2. This study area was then used for the grizzly bear habitat modeling. A focal survey area around the proposed Project facilities was delineated for the bear den surveys (Figure 8.1).

During baseline studies conducted between 2010 and 2013, 15 grizzly bears have been observed in the RSA. These observations include one grizzly bear observed during the den surveys, photos of two grizzly bears taken by a game camera near Dip Creek and 12 bears observed as incidental observations during the baseline studies. In addition to the observations during the baseline studies, 25 grizzly bear observations were recorded by Project staff in the Casino wildlife log between August 2008 and August 2013.

Table 8.1 Summary of the latest ten years (2002–2012) of grizzly bear harvest data in GMSs associated with the Project.

GMS	Harvest regulations (2013–2014)	Total harvest		Mean yearly harvest	
		Resident	Non-resident	Resident	Non-resident

8.2 DEN SURVEYS

Grizzly bear den surveys were conducted during the spring of 2012 to document bear dens within close proximity to the Casino project. Using the denning spatial analysis (see Section 8.3.4), a survey area was defined as a 5 km buffer surrounding the footprint of the proposed Project, including the Freegold Road upgrade and extension (Figure 8.1). This survey area was then divided into 313 blocks, each 6.25 km² in size. Each block was then stratified into high, moderate or low probability den habitat by summing the number of 30 m pixels that contained suitable denning habitat (see Section 8.3.4) within each block. The high and low probability blocks were the upper and lower 25% of the blocks, respectively; while the moderate probability habitat was the middle 50% of the blocks.

All blocks classified as high probability denning habitat were surveyed during at least one of the surveys, while other classes were covered as much as flight time allowed. Surveys were conducted by fixed-wing aircraft (Alpine Aviation, Maule M-7), flying as low to the ground as possible. Four surveys were attempted between 20 April and 12 May 2012, but the 2 May survey was cancelled mid-survey due to extreme winds. Total survey time was 12.3 hours. The surveys were scheduled to coincide with the emergence of bears; however, the area receives relatively little snow and an early spring melt resulted in no snow at the time of the first survey. The presence of snow assists in locating active dens.

Nine dens were observed during the three 1-day surveys (Figure 8.1). Dens were primarily observed in higher probability habitat along Hayes Creek and Big Creek. All dens were excavated on relatively steep south facing slope, usually in the middle to upper parts of the slope. One den, observed west of the proposed Casino mine site was excavated under the embankment of an old mining road. Due to the lack of snow, it could not be determined if any of these dens were active during the winter of 2011/2012. No ground-truthing was done as part of this survey.

The survey area is dominated by forested slopes that make spotting dens difficult and the lack of spring snow in the area further reduces the probability of detecting dens. Consequently, observations of dens on open south facing slopes could be because bears use these habitat types, and because these are the only areas where survey crews get a good view of the ground.

8.3 GRIZZLY BEAR HABITAT MODELS

To determine the amount of effective seasonal grizzly bear habitat within the study area, the following models were developed and are summarized in this report:

- Habitat effectiveness model;
- Security areas model;
- Linkage zones model, and
- Denning habitat spatial analysis.

These models are often included as components of a grizzly bear cumulative effects assessment (CEA) and are used as tools to review the potential effects that a project may have on grizzly bears. Although this baseline report does not include an effects assessment, the habitat effectiveness, security areas and linkage zone models and the denning habitat spatial analysis have been used to assess the quality and quantity of grizzly bear habitat currently within the study area.

The CEA for grizzly bear was originally developed by the US Department of Agriculture (USDA 1990). The Geographic Information System (GIS) based methods used in this report are based on the work conducted by Purves and Doering (1998) and by Gibeau et al. (1996).

8.3.1 Habitat Effectiveness Model

The habitat effectiveness model examines habitat quality and human activities to estimate the overall effectiveness of grizzly bear habitat. This model is used to quantify the area's potential ability to support bears (Gibeau 1998). The inputs for the habitat effectiveness model are habitat type and disturbance. The habitat component (HC) is a qualitative assessment of the spatial and temporal distribution of potential habitat for grizzly bear foraging. The disturbance component (DC) is a quantitative assessment of human disturbance.

Habitat Component (HC) — Vegetation and land cover data for the study area were limited. EOSD data were available for portions of the study area but there were significant gaps in imagery due to cloud cover. Only broad-level vegetation data were available for the entire study area, so bioclimate zone data prepared by the Ecological and Landscape Classification Technical Working Group (ELC TWG 2012) was used for the habitat component. Bioclimate zones that occur in the study area include: alpine, subalpine, boreal highland and boreal lowland (Table 8.2). Definitions for the bioclimate zones that occur in the project area are (YECMWG 2003 and EBA 2003):

- **Alpine** — High elevations associated with mountainous conditions throughout Yukon. Dwarf shrubs, herb/cryptograms and low-growing and scattered krummholtz trees are the predominant vegetation condition. In very high elevation areas, bare rock, colluvium or ice/snow may be the dominant conditions.

- **Subalpine** — Sparsely forested areas at moderate to higher elevations on steep slopes above the boreal high. Subalpine areas form a transitional zone between forested boreal and the higher elevation non-forested, alpine bioclimate zones. Open canopy conifer forests (tree cover <20%) and tall shrub communities are characteristic vegetation conditions. Subalpine fir is the predominant tree species. Winters are long and cold, while summers are short, cool and moist.
- **Boreal High** — Middle to upper elevations of forested areas in all mountain valley and plateau ecoregions of southern and central Yukon. Found above the boreal low in large valleys. Characterized by steep slopes in southern mountainous ecoregions and gentle rolling plateaus in the central ecoregions. Summers are brief, cool and moist, with long cold winters. Forests are dominated by white spruce, lodgepole pine, and subalpine fir.
- **Boreal Low** — Continuously forested areas at low to middle elevations, below the boreal high of all mountain valley and plateau ecoregions of southern and central Yukon. Landscapes are generally wide valleys. Winters are long and cold, with short, cool and dry summers. Forests are generally mixedwood (lodgepole pine, white spruce and aspen) with moderately[1] developed understories. Wetlands are common.

The study area was divided into twelve bear management units (BMUs; Figure 8.2). Where possible, BMUs included entire drainage basins and their subordinate drainages, extending from the hydrological divide down to the valley bottom. The size of each BMU is based on the average home range size for a female grizzly bear. In the Kluane Region, Maraj (2007) noted that the weighted average multi-annual female home range size was 305 km². In the Mackenzie Mountains, the average home range size of six adult females was estimated to be 265 km² (Miller et al. 1982). The BMUs for this study range in size from 301 km² to 698 km².

Ecological Land Classification (ELC) mapping was completed during the vegetation baseline studies for the vegetation LSA. Bear foraging habitat within each bioclimate zone was inferred from the vegetation communities identified by the ELC mapping (Table 8.2). To reflect the spatial and temporal importance of food, a value between 0 and 1 was assigned for each bioclimate zone within each BMU, by season. A rating of 0 was used for bioclimate zones with no value to grizzly bears and a rating of 1 was used for the areas with the best possible habitat available.

Three seasons were used in this analysis: spring (late March through May), summer (June to mid-August) and fall (mid-August through October). The habitat ratings are summarized in Table 8.3. Habitat use during the winter/denning period (November to mid-March) was evaluated separately in the Denning Spatial Analysis (Section 8.3.4). The output from this analysis is the habitat rating component for the habitat effectiveness model (Purves and Doering 1998).

[1] Some publications consider the understory of boreal low to be "well" developed. This is a relative term that will become more explicit as Yukon vegetation classification is established.

Table 8.2 Bioclimatic zones and vegetation communities and their importance to grizzly bear

Bioclimate zone	Vegetation communities	Importance to grizzly bear
Alpine	Tors; Dryas-Sparse Herb; Felsenmeer	Provides suitable habitat for denning. Includes forage species such as mountain cranberry, crowberry, *Hedysarum*, sedges and grasses; Provides habitat for prey, including thinhorn sheep, woodland caribou, marmots and ground squirrels; Carcasses from winter kills
Subalpine	Mid to High Elevation Dry Shrub; Subalpine Moist Shrub; Tall Shrub; Mid to High Elevation Wet Shrub	Provides suitable habitat for denning. Includes forage species such as mountain cranberry, bog blueberry, common bearberry, *Hedysarum*, sedges and grasses. Provides habitat for prey, particularly calves of woodland caribou and moose; marmots; and ground squirrels. Carcasses from winter kills
Boreal High	Sloping Grassland; Dry Broadleaf Forest; Moist Broadleaf Forest; Coniferous Forest; Mixedwood Forest; Sparse Coniferous Forest; Riparian Shrub; Riparian Broadleaf; Riparian Coniferous; Coniferous Treed Bog; Shrubby Fen	Provides security habitat. Includes forage species such as rosehips, mountain cranberry, low bush cranberry, currants, grasses, sedges, horsetails. Provides habitat for prey species such as moose and caribou calves
Boreal Low	Riparian Shrub; Riparian Broadleaf; Riparian Coniferous; Coniferous Treed Bog; Shrubby Fen	Provides security habitat. Includes forage species such as rosehips, mountain cranberry, low bush cranberry, grasses, sedges, horsetails. Provides habitat for prey species such as moose and caribou calves

Table 8.3 Grizzly bear habitat ratings for each bioclimate zone by season

Season	Boreal High	Boreal Low	Sub-alpine	Alpine	Notes
Spring	1.0	1.0	0.5	0	Boreal high and boreal low spring/early summer, over-wintered berries, sedges, roots; riparian areas important. Little habitat available in alpine until snow melts (except winter kills).
Summer	1.0	1.0	1.0	1.0	Alpine and subalpine important; berries available in all bioclimate zones; spawning salmon in boreal high and low.
Fall	1.0	1.0	0.5	0.5	During the early fall, subalpine and alpine used; berries important.

Disturbance Component (DC) — The disturbance component of the habitat effectiveness model is based on human activity. Each activity is assigned a disturbance coefficient (DC) and zone of influence. DCs range from 0 to 1; a DC of 0 implies total displacement and a DC of 1 implies no displacement (Purves and Doering 1998).

Areas of disturbance were identified using various sources, including YESAB's online registry (2013) and Google Earth with imagery collected by Landsat (4/9/2013). Larger known projects in the area that are assumed to cause >100 disturbance events per month, including the existing Casino exploration work, were delineated using the Landsat imagery. A disturbance coefficient of 0.16 and 800 m zone of influence was assigned to each disturbance used in this analysis, including access roads, infrastructure, etc. (Purves and Doering 1998).

The cumulative DC for each BMU is the sum of each individual disturbance within that BMU. The potential habitat value is combined with the cumulative disturbance coefficient to calculate the realized habitat. The realized habitat measures the ability of grizzly bears to continue using the habitat when human disturbance is considered. A BMU with a realized habitat rating of 0 is interpreted as having no value to grizzly bears, while a realized habitat rating of 1 is interpreted as having high value to bears.

Habitat Effectiveness — Habitat effectiveness assesses an area's actual ability to support grizzly bears and it compares the potential habitat with the realized habitat, once disturbance has been accounted for (Gibeau 1998). The analysis of the habitat and disturbance components provides habitat effectiveness values for each BMU that represent the percentage of potential habitat available for that season. The habitat effectiveness value calculated for each BMU is the percentage of the habitat available once an account was made for human disturbance.

Assumptions — The modeling for all components was conducted using available data sets. Limitations of the data were identified and assumptions were required to complete the modeling, which include:

- Due to the lack of detailed site-specific habitat and vegetation data, TEM mapping data from the mine site collected in 2010 was used as a surrogate for vegetation communities within each bioclimate zone.
- Detailed disturbance mapping was not available for the study area; however, existing data was mapped using the Landsat imagery; assumptions were made about the type and amount of disturbance.
- Assumptions, such as frequency of use and zone of influence, were made on the effects of human use intensity and linear feature buffers on habitat use by grizzly bear.
- No ground truthing was completed as part of this modeling exercise.
- Habitat effectiveness, security areas and linkage zone models cannot predict the future. These models are based on the existing information available at the time of the analysis.
- These models quantify concerns about the viability of grizzly bear populations in the study area, but do not confirm them.
- As with most modeling efforts, it is challenging to simulate the effects of a highly complex environment in which cumulative effects of environmental, social, and individual variations on habitat use are not well understood. Very little grizzly bear information was available for the study area, so other projects in other parts of the Yukon, Alberta, and BC were used as reference for these models.

The habitat component provides a measure of inherent potential or productivity of the landscape for grizzly bears during the spring, summer and fall seasons. The disturbance component then addresses habitat productivity when human influences are considered. The habitat effectiveness value quantifies the extent of the landscape that is available to bears when human influences are considered (Gibeau 1998). Table 8.4 shows the habitat effectiveness values for each BMU.

Table 8.4 Grizzly bear habitat effectiveness for each BMU

BMU	Habitat effectiveness (HE)		
	Spring	Summer	Fall
1	89%	100%	90%
2	92%	100%	92%
3	91%	100%	91%
4	82%	100%	83%
5	53%	100%	58%
6	75%	100%	78%
7	100%	100%	100%
8	92%	100%	92%
9	73%	100%	75%
10	58%	100%	62%
11	60%	99%	65%
12	94%	100%	94%
13	97%	97%	97%
14	51%	100%	58%
15	55%	100%	59%
16	93%	100%	93%
17	75%	99%	76%
18	64%	99%	67%
19	72%	100%	73%
20	92%	100%	92%

8.3.2 Security Areas Model

Secure areas, away from human disturbance, allow bears to remain in areas for longer periods. This is an important factor for minimizing potential human-bear interactions and conflict. The habitat effectiveness model described above does not take habitat security into account. The security areas model identifies areas where a female grizzly bear can forage for 24 to 48 hours without human disturbance (Purves and Doering 1998). Security area models are run in conjunction with habitat effectiveness models because habitat effectiveness models (1) do not address habitat security; and (2) do not address the areas between zones of

human influence that are considered to be too small to provide secure habitat for bears (Gibeau et al., 2001). The security model developed for the Casino project uses the methods summarized in Purves and Doering (1998) and Gibeau (2001).

In this model, security areas are defined as:

1. Areas below 2,300 masl and vegetated;
2. Areas greater than 800 m from human activity where activity use is greater than 100 disturbance events per month, and
3. Contiguous areas greater than 9 km².

The following data sets were used in the security areas model:

- **Elevation** — Derived from the National Topographic Series 1:250,000 contour data;
- **Bear Management Units** — Described above;
- **Vegetation cover** — Bioclimate data from the Ecological and Landscape Classification Technical Working Group (2012), and
- **Human activity** — A variety of sources were used to determine anthropogenic activity in the study area. The majority of this activity is from mining exploration and placer mining (YESAB online registry 2013). One quartz mine is currently operating (the Minto Mine; Capstone Mining Corp 2013) and one quartz mine (Mt. Nansen) is currently undergoing remediation and closure work (Assessment and Abandoned Mines 2012). Other activity is likely ongoing in the project area, but specific locations of these sites were not available. It was assumed that other activity, not included in this analysis, occurs less than 100 times per month, and is therefore not considered. Areas with human activity were mapped as existing disturbed areas, such as existing camp locations, roads, and other activity using publically available Landsat imagery.

To calculate the amount of secure habitat within each BMU, and in the overall study area, areas that are not considered to be secure habitat for grizzly bear were removed:

- Areas >2,300 masl;
- Areas within the zone of influence (within 800 m of human activity), and
- Areas smaller than 9 km².

The remaining area is considered to provide secure habitat for grizzly bear. Typically non-vegetated areas, such as rock and ice, are also removed from this analysis; however, these data were not available for the study area. Table 8.5 provides the results of the security areas modeling based on the parameters listed above. Figure 8.3 depicts the four non-security areas in the study area. Within the entire study area, 8,566 km² (96%) is considered to be secure and 355 km² (4%) is considered to be not secure either from human activity or size (i.e., the patch is <9 km²).

Table 8.5 Grizzly bear security ratings for each BMU

BMU	Total area (km²)	Secure habitat

8.3.3 Linkage Zone Prediction Model

Linkage zones are areas that provide foraging habitat, connectivity between home ranges and avenues of dispersal (Riddell 2005). Linkage zones are also important for maintaining genetic diversity (Ruediger 2000). Maintaining linkage zones is especially important in heavily fragmented landscapes (Riddell 2005). The Linkage Zone Prediction Model assesses a combination of landscape factors that affect wildlife movement through areas impacted by human activity (Purves and Doering 1998). It also identifies potential movement corridors in areas within intense human activity that still support high quality grizzly bear habitat. The output of this model is a scored map identifying four danger levels from human disturbance: minimal danger, low danger, moderate danger and high danger. Areas with a low danger rating represent potential linkage zones.

For the linkage zone prediction model, methods were based on Purves and Doering (1998). Their method used four inputs: access route density; intensity to developed sites; presence or lack of hiding cover; and proximity to riparian areas. The model developed by Purves and Doering (1998) assesses grizzly bear habitat in areas with intense human activity. With less than 4% of the area disturbed, the study area is considered to have minimal intense human activity. The latter two variables (presence or lack of hiding cover and proximity to riparian areas) were removed since grizzly bears can and will travel through areas that lack cover and are outside the riparian zone when they are not influenced by human disturbance. However, it is recognized that cover and riparian areas are extremely important for linkage zones in fragmented landscapes.

Access Route Density — Two sources of data were used to depict access features: National Road Layer v.9.0 and Google Earth imagery. Features not part of the National Road Layer, such as major access routes to mines (placer and quartz), were digitized using Google Earth. Features were merged into one file and converted to a raster file using ArcGIS Conversion tool; Polyline to Raster.

The Polyline to Raster conversion resulted in a raster file made up of 10 m x 10 m pixels following the access routes within the study area. Once the raster was created, spatial analysis was performed to obtain a density of access in units of km/km² using ArcGIS Spatial Analyst Tool: Focal Statistics. The neighborhood was set to *circular* with a radius of 564 which represents the radius (in metres) of 1 km². The lengths of the access within each cell were summed to get a total density. Finally, the final step to creating the access route density layer involved a reclassification of the densities into four classes:

- 0 km/km² Class 2
- 0–0.625 km/km² Class 3
- 0.625–1.250 km/km² Class 4
- >1.250 km/km² Class 5

Intensity of Developed Human Sites — Existing human disturbance (i.e., active mine sites, mining exploration, access roads) was represented by points and was obtained from various sources (YESAB 2012; YG Geomatics Yukon 2013). Points that were considered to have use-levels of <100 disturbance events per month or less were buffered by 120 m. For activities that are considered to have >100 disturbances per month, such as Fort Selkirk and the Minto, Carmacks Copper, and Mount Nansen mine sites, the areal extents were digitized and then a 240 m buffer was applied. These areas were considered high use-level sites. Digitizing the perimeter of these locations was completed in Google Earth.

All buffered features were merged into one file. The Euclidian distance tool was applied to the buffered feature dataset. The resulting raster file contained distances from each feature. The raster was then reclassified to represent a danger classification as follows:

- Within Influence Zone Class 6
- Within 100 m of Influence Zone Class 5
- Within 100–200 m of Influence Zone Class 4
- Beyond 200 m of Influence Zone Class 2

The sum of the two layers used in this analysis (access route density and intensity of developed human sites) provides a single combined danger score ranging from 4 to 11. High danger scores (i.e., danger score of 10 to 11) were given to areas with high human influence that are of greater danger to grizzly bears. Low danger scores (4–5) were given to areas with little to no human disturbance. The linkage zone model identified four danger score categories: minimal danger, low danger, moderate danger, and high danger. Table 8.6 provides the linkage zone results for each BMU. Linkage zones are shown in Figure 8.4.

Table 8.6 Grizzly bear habitat linkage zone model results by BMU

8.3.4 Denning Spatial Analysis

Bears require dens, and consequently suitable denning habitat, to survive winters. Grizzly bear denning habitat is generally located in alpine and sub-alpine habitats. Bears typically select denning locations with deeper soils and vegetation that keeps den roofs from caving in. Denning habitats tend to be 20-40° slopes, and are most likely to be found on south facing slopes (Pearson 1975). Permafrost and increased soil moisture reduces suitability of potential den sites.

The objective of the denning spatial analysis was twofold:

1. To increase efficiency of the denning survey and increase probability of locating dens; and

2. To determine the amount of suitable denning habitat available in the study area.

Denning habitat was identified using GIS and available spatial data for the entire grizzly bear study area. Landscape and vegetation characteristics were used to determine suitable denning habitat within the study area. Criteria used to determine suitable denning habitat were based on the experience and professional opinion of Government of Yukon biologists who conducted similar surveys in other areas of the Yukon (Maraj pers. comm.). These criteria included:

- 20–45 degree slopes;
- 600 to 1,200 m elevation, and
- Exclude wet habitat types.

Spatial data describing high and low probability denning habitat were generated by applying the criteria above to data generated from a 30 m resolution digital elevation model (DEM) downloaded from Environment Yukon. Potential denning habitat was assigned a score of 1 and the remaining areas were assigned a score of 0. The resulting raster layer identified suitable denning habitat within the study area (Figure 8.5).

The denning spatial analysis identified areas suitable for grizzly bears to den. A total of 1672 km², or 23% of the study area was identified as suitable denning habitat for grizzly bears. Table 8.7 summarizes the size of suitable denning habitat within each BMU.

Table 8.7 Grizzly bear denning habitat suitability within the study area

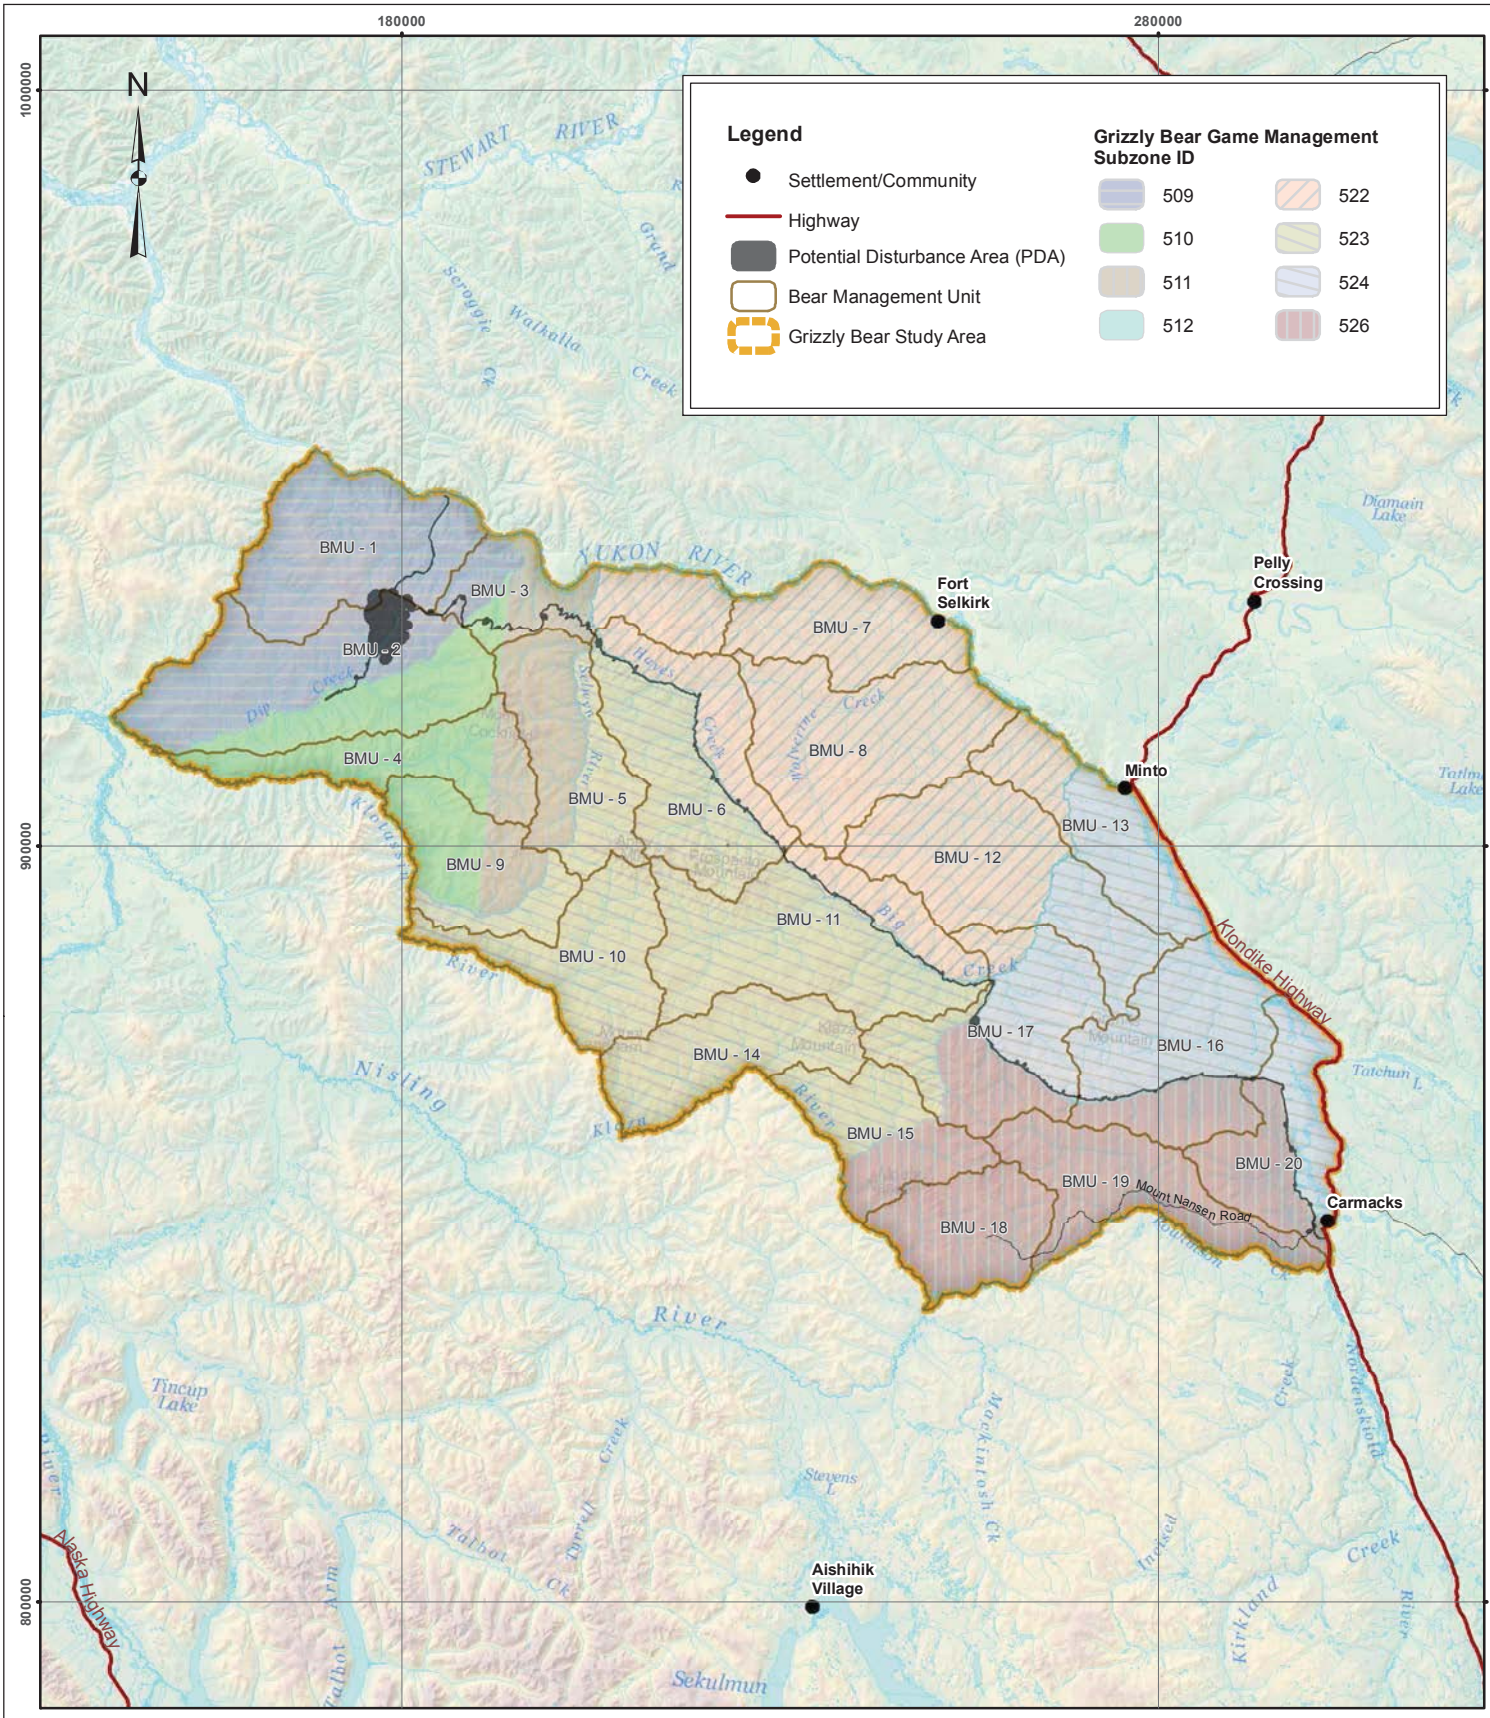
8.3.5 Grizzly Bear Habitat Model Summary



Results of the four models developed for the grizzly bear study area (habitat effectiveness, security areas, linkage zones and denning habitat) were developed to determine existing pressure on grizzly bears. Table 8.8 summarizes the results of the habitat effectiveness, security areas and linkage zone models.

During the summer period, all BMUs have a high percentage (i.e., >97%) of habitat available during the highest period of anticipated disturbance from activity within the study area. It is also important to note that the majority of the BMUs have a high percentage of secure areas and of linkage zones identified as having minimal danger. This indicates that there are currently extensive, safe travel corridors and secure feeding areas throughout the majority of the study area. Some disturbance currently exists, particularly in BMUs 1, 13, and 16 to 20. The majority of this disturbance is from existing access roads and mining, including exploration, operational and historic work.

Table 8.8 Grizzly bear BMU habitat effectiveness, secure areas and linkage zones summaries

9 BLACK BEAR

Within the Yukon, the black bear is distributed from the southern border with B.C. to the Old Crow Flats; however, the highest densities are in the southern Yukon (Government of Yukon 2010d). Black bear was assessed by COSEWIC in 1998 and 1999 and was designated as Not at Risk (COSEWIC 2002). Within the Yukon, black bear is considered Secure (CESCC 2011), with an approximate population of 10,000 bears (Government of Yukon 2010d).

Black bears are omnivorous with plants (including berries) comprising up to 95% of their diet (MacHutchon 1989). Black bears typically den in mixed forest stands of aspen and spruce, or mature spruce stands, and excavate beneath the ground or under root masses (Tietje and Ruff 1980). Male bears generally emerge first from their dens, while females with cubs will emerge last and remain near the den for up to three weeks (Tietje and Ruff 1980).

Black bears are managed as a big game species in the Yukon, with all subzones open to spring and fall harvest and a bag limit of two bears per license year. Black bears are actively harvested in the subzones that interact with the Project, with subzones 509, 522, 524, and 526 reporting the greatest harvest (Table 9.1).

Between 2010 and 2013, a total of 13 black bears were observed in the RSA during the baseline programs. Of these, six black bears were observed during the den surveys, one was photographed by a remote wildlife camera and six were observed incidentally during other baseline surveys. A total of 66 black bear observations were recorded between August 2008 and August 2013 in the Casino Project wildlife log.

Table 9.1 Summary of the latest ten years (2002–2012) of black bear harvest data in GMSs associated with the Project.

GMS	Harvest regulations (2013–2014)	Total harvest		Mean yearly harvest	
		Resident	Non-resident	Resident	Non-resident
509	Open; Bag limit 2	2	0	0.2	0
510	Open; Bag limit 2	0	0	0	0

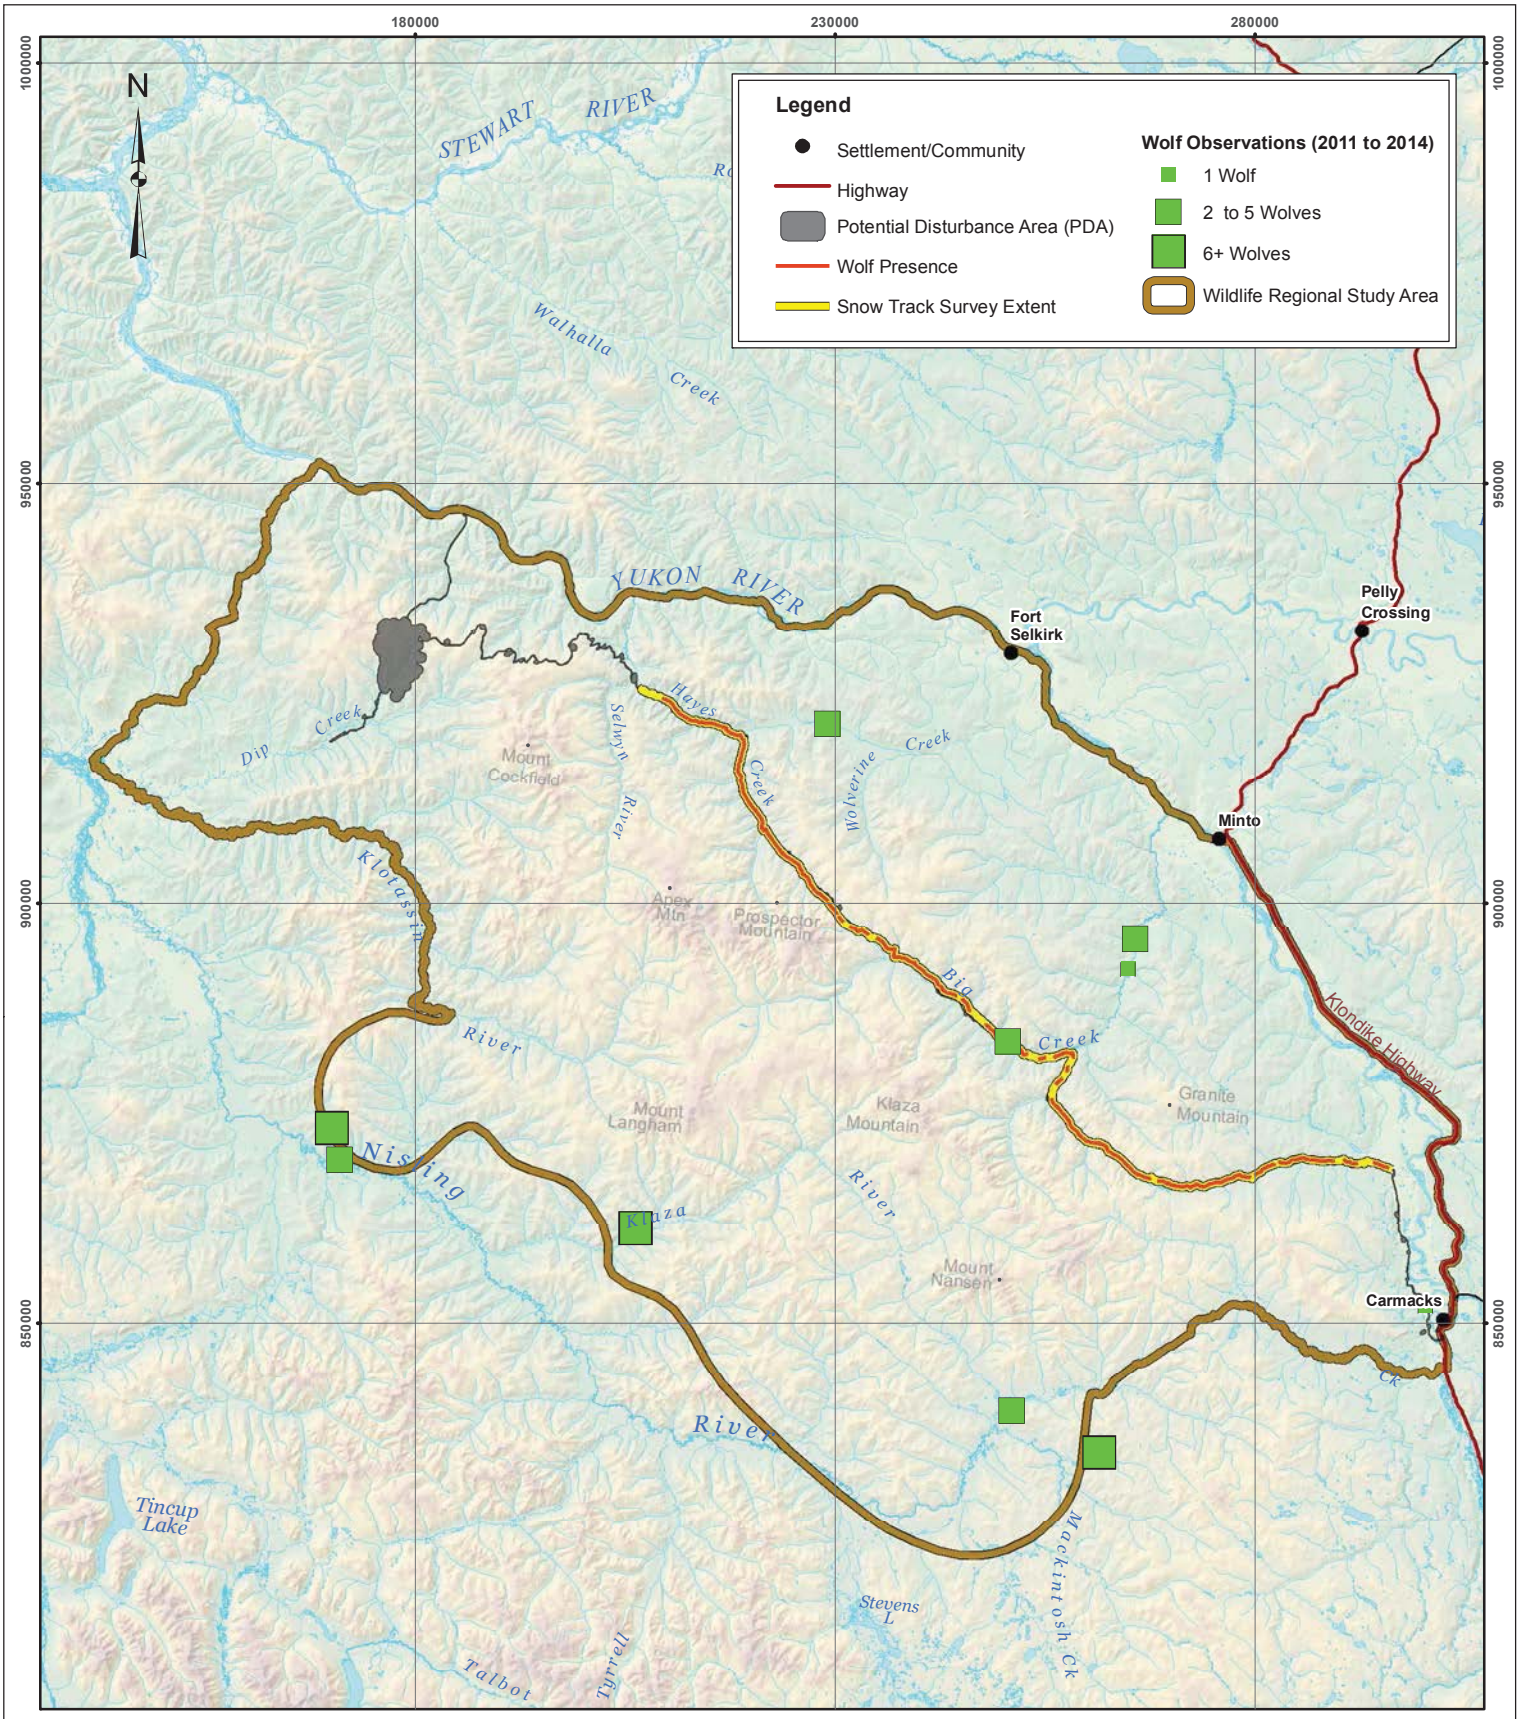
10 WOLF



Wolf was once one of the most globally distributed species; however their range is has been considerably reduced (Mech and Boitani 2010). Currently, it is estimated that there are 4,500 to 5,000 grey wolves in Yukon, distributed throughout the territory (Yukon Wolf Conservation and Management Plan Review Committee 2011). Wolf numbers and distribution are largely dependent on the abundance of their primary prey species in the region — moose and caribou. In winter, wolves group together in packs to improve hunting success, and ultimately, winter survival. In summer, wolves are often solitary on the landscape.

A wolf population inventory was conducted in the Nisling River area (just south of the Casino study area) in 1986. The inventory study area included the upper reaches of the Klaza River and was bounded by Klaza Mountain and Rowlinson Creek to the north. Four wolf packs, with an estimated density of 3.2 wolves/1,000 km^2 were found. This was a comparatively low density of wolves, likely resulting from low ungulate densities or unreported harvest (Baer and Hayes 1987).

Currently, wolves are managed as both a big games species and a trapped furbearer in the Yukon, with an average of 60 wolves hunted and 155 wolves trapped each year in the territory (Yukon Wolf Conservation and Management Plan Review Committee 2011). According to trapline data from 1980–2010 (described in Section 11), a total of 38 wolves have been harvested on the ten registered trapline concessions (RTC) that interact with the Project (Government of Yukon data). Hunting for wolves in the Yukon (all subzones) is open, with a bag limit of seven for residents and two for non-residents. There are no records of wolves being hunted in the GMSs that interact with the Project.

During the 2011 late winter ungulate survey, 24 wolves were observed in six groups throughout the survey area. In 2012, 32 wolves were observed in three groups throughout the survey area, and no wolves were observed in the reduced 2013 survey area (Figure 10.1). One pack of 13 wolves was observed on a kill near the Klaza River, and another large pack of 16 was observed in the south end of the survey area traveling along a snowmobile track. Wolves were often observed near higher density moose areas and their tracks were noted in valleys or along creeks and rivers. The pack sizes observed are notably larger than mean pack sizes recorded in neighbouring regions (e.g., <4–5.6 wolves/pack in the Aishihik area and 6.1 wolves in the Mayo area; Hayes et al. 2003). This result could be a function of the higher visibility of larger packs; however, it is difficult to interpret these results as the surveys were not targeting wolves and sample sizes were small.

Snow tracking surveys (described in Section 11) detected wolves along the entire length of the surveyed section of the Freegold Road and Casino Road extension (Figure 10.1). It appeared wolves were using the road/trail to travel along, as most tracks followed the road/trail as opposed to crossing it. The Casino camp's wildlife log also recorded 22 wolves in the Project area from 2008 to 2013.

11 FURBEARERS

Furbearing species present in the RSA include wolf, wolverine, lynx, marten, coyote, and red fox. Other mammals considered furbearers and which are likely present in the RSA, but are not described further include red squirrel, mink, muskrat, otter, weasel, and beaver. It is unlikely that fisher or Arctic fox occur in the Project RSA.

The Government of Yukon maintains records of mammals harvested from registered traplines. Ten registered trapline concessions (RTCs) intersect with the Project RSA, including RTCs 116, 121, 122, 131, 145, 146, 148, 149, and 150 (Figure 11.1). Harvest statistics for individual RTCs are considered private, thus trapline data provided by the Government of Yukon represents a partial view of total furbearer harvest in the RSA (Table 11.1).

Furbearer data in the Project area are primarily limited to harvest and/or trapline data, with some incidental sightings recorded during baseline or other regional studies. This was identified as an information gap, and late winter snow tracking surveys were conducted to address it.

Snow tracking surveys were designed to examine the distribution of small mammals and/or furbearers; however, caribou and moose tracks were recorded whenever observed. The proposed Freegold Road upgrade and extension was used as the primary transect for the survey, which was conducted by snowmobile. Tracking surveys were conducted in February and March 2012 and in February 2013. These track surveys covered between km 101 and 133 along the proposed Freegold Road upgrade and extension (Figure 10.1). The road was surveyed in 1 km segments and a tally of the number and type of tracks (i.e., wolverine, marten, hare, etc.) entering or crossing the trail (including suspected re-crossings) was recorded (Thompson et al. 1989). Tracks for small mammals (snowshoe hare, marten, porcupine, and red fox), were counted only when the tracks were fresh (i.e., 1 day since last snowfall), whereas tracks of larger furbearers (wolverine and lynx) were recorded regardless of age. Presence/absence data was recorded for caribou, moose, and wolf.

The entire length of the proposed Casino Road extension was not surveyed each time as it became inaccessible due to open water conditions, overflow, and other terrain constraints. Track observations included those of moose, caribou, wolf, wolverine, lynx, porcupine, otter, marten, snowshoe hare, weasel, and red squirrel.

Table 11.1 Sum of furbearers harvested from 1980 to 2010 on registered trapline concessions 116, 121, 122, 131, and 145–150.

Animal	Total harvest	Mean annual harvest rate
Beaver	334	15.9
Coyote	30	1.4
Red fox	217	10.3
Arctic fox	1	<0.1
Lynx	801	38.1
Squirrel	15,981	761.0
Marten	1,538	73.2
Mink	99	4.7
Muskrat	67	3.2
Otter	5	0.2
Weasel	378	18.0
Wolf	38	1.8
Wolverine	133	6.3

11.1 WOLVERINE

Wolverines are solitary carnivores that have a circumpolar distribution from Russia and Scandinavia to Alaska, throughout Canada, and south to California (Abramov et al. 2009). Within Canada, wolverines generally follow the extent of the boreal forest, with lower relative densities in the eastern provinces (COSEWIC 2003). Wolverines occur throughout the Yukon, typically in large areas of intact wilderness including forests, alpine and subalpine areas, and the Arctic tundra.

Wolverine was designated as Special Concern in 1982, and was reassessed in 2014 and re-designated as Special Concern (COSEWIC 2014). The COSEWIC designation largely reflects concerns regarding a lack of information, a history of extirpation from regions of Canada, and a decline is abundance in the southern Canada, though populations seem to be growing or recovering in Northwest Territories, Nunavut, Manitoba and Ontario (COSEWIC 2014). Yukon's wolverine trends are unknown because of limited population inventories and monitoring. The primary threat to wolverine is harvest, but habitat disturbance from forestry, hydroelectric developments, oil and gas and mineral exploration and development, and transportation corridors contribute to permanent, temporary or functional habitat loss that may reduce long-term viability of populations.

Canada's population is estimated at more than 10,000 mature individuals (COSEWIC 2014), with an estimated 3,500–4,500 occurring within the Yukon (Slough 2007). The Yukon's wolverine population is monitored using fur harvest data, winter track counts, and an annual trapper questionnaire, resulting in

population estimates of 5.65/1,000 km² (in variable, unsaturated habitat) and 10.75/1,000 km² (in continuous, saturated habitat; Banci and Harestad 2006).

Primarily a scavenger, wolverine habitat use is less defined by geographic or vegetative features, than the presence and availability of ungulates and/or carrion, such as within undisturbed mountainous areas. Denning habitat is relatively specific, requiring security and thermal cover under boulders, felled trees, or snow tunnels (COSEWIC 2003).

Only one wolverine was observed during baseline studies; it was observed on a kill in the southern section of the study area during the 2012 aerial ungulate survey. Snow tracking surveys detected wolverines sporadically along the proposed Freegold Road extension and upgrade (Figure 11.2). Similar to wolves, wolverine tracks were most often observed following the road/trail as opposed to crossing it. One wolverine was also recorded by Casino staff in their wildlife log (July 2009). Although not one of the most commonly trapped species in the region (Table 11.1), wolverine pelts are the most highly valued of Yukon furbearer species (Government of Yukon, unpublished data).

11.2 LYNX

Lynx are present in forested regions across Canada, some parts of the northern United States, and Alaska (Hatler et al. 2008). In the Yukon, lynx are distributed throughout the territory, but, being primarily a forest species, they are not present on the Arctic coastal plain.

Numbers have declined in parts of its southern range, especially in New Brunswick and Nova Scotia; however, the overall Canadian population is considered Not at Risk by COSEWIC (Poole 2001). Lynx population density typically follows 8 to 11 year cycles; demonstrating a 1 to 2 year lag following the cyclical abundance of its primary prey — snowshoe hare. Dens are typically constructed under deadfall or blow-down debris, mature or shrub subalpine fir, or willow thickets (Slough 1999).

During snow tracking surveys in 2012 and 2013, lynx tracks were recorded along most of the surveyed area (Figure 11.1). Hare tracks from snow-tracking surveys show that lynx were almost exclusively present where snowshoe hare were present (Figure 11.3). Lynx are also one of the most commonly trapped furbearers in the region (Table 11.1).

11.3 AMERICAN MARTEN

American marten are distributed across Canada and some of the northern United States (Reid and Helgen 2008); however, the subspecies that inhabits Yukon, Northwest Territories, and Alaska is much larger than those found in more southern regions (Government of Yukon 2010e). Marten has not been assessed by COSEWIC or listed under SARA, with the exception of the Newfoundland subspecies *Martes americana atrata,* which was listed as Threatened in 2007 (COSEWIC 2007).

Marten are typically found in mature coniferous forests, which provide adequate cover, but they are also found moving through other, more open habitats such as alpine areas or burns (Slough 1989). Their diet

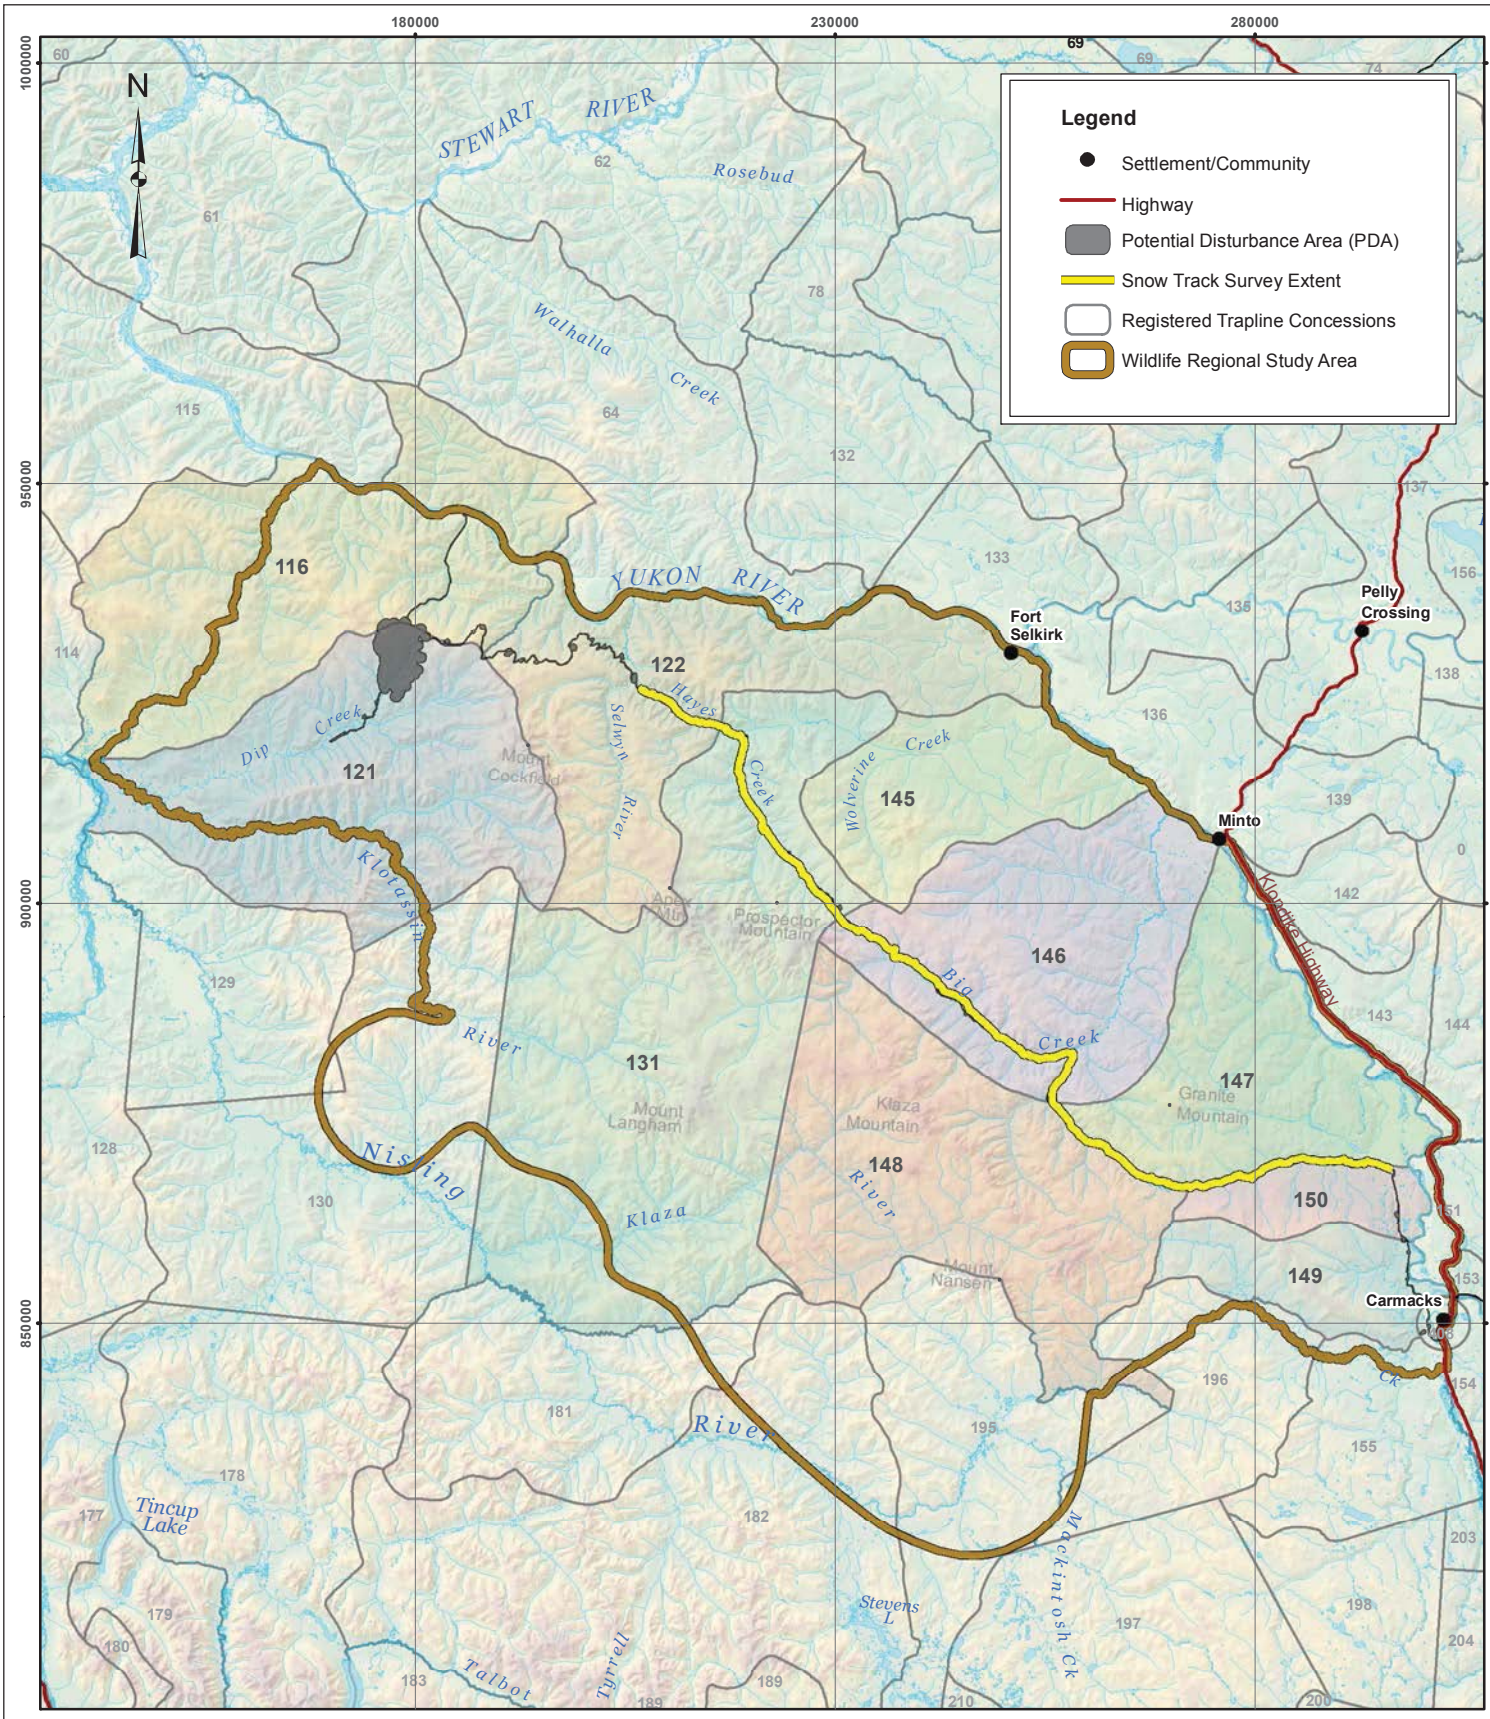
consists primarily of microtine species (e.g., voles), but hunt and forage opportunistically, often feeding on berries (e.g., crowberry), birds, and snowshoe hare (Slough et al. 1989; Poole and Graf 1996). Denning habitat is usually an enclosed feature such as a hollow downed tree, tree cavity, burrow, rock pile, or slash/brush pile (Hatler et al. 2008).

Marten are a highly valued furbearer in the Yukon and were the second most commonly trapped furbearer in the Project region (Table 11.1). Marten tracks were consistently observed in multiple habitat types along the Freegold Road and extension during snow tracking surveys in 2012 and 2013 (Figure 11.4).

11.4 COYOTE

Coyotes are continentally distributed across North America, occurring as far south as Central America (Hatler et al. 1998). Coyotes are present in many habitat types including urban settings, and are primarily limited in areas with deep snow and high densities of grey wolves (Hatler et al. 2008). Coyotes have not been assessed by COSEWIC or listed under SARA.

Coyotes are ubiquitous throughout the landscape, with a preference for open spaces (Hatler et al. 2008). Their diet consists of a variety of small mammals such as voles and hare, but they are also known to eat ungulate calves, birds, plant material, livestock, and garbage (Hatler et al. 2008). Dens are often dug into the sides of hills or banks, or under other covering structures such as caves, tree root hollows, or downed trees (Hatler et al. 2008).



Coyote tracks were not observed along the Freegold Road extension during snow track surveys; however, based on their broad distribution and existing trapping records from RTCs in the area (Table 11.1) they are expected to occur at low densities in the area.

11.5 RED FOX

From Europe and Asia to North America, red fox is the most widely distributed global carnivore (Hatler et al. 2008). Red fox occurs throughout the Yukon, extending far north into the Arctic tundra. Red fox have not been assessed by COSEWIC.

Foxes feed upon many small mammals including voles, mice, ground squirrels, muskrats, and snowshoe hare. They also feed on birds, eggs, and some vegetation. Denning habitat is similar to that of coyotes; burrowing into the side of hills, under downed wood, caves, root hollows, or other animals' burrows (Hatler et al. 2008).

Red fox tracks were not observed along the Freegold Road extension during snow track surveys; however, based on their broad distribution and existing trapping records from RTCs in the area (Table 11.1) it is expected that they occur in the area.

12 COLLARED PIKA

Within Canada, the collared pika is limited to alpine areas in BC, NT, and Yukon. In 2011, COSEWIC designated collared pika as a species of 'Special Concern' (COSEWIC 2011b). The main threat for the species is believed to be habitat alteration due to climate change (COSEWIC 2011b). Studies of pika in the Yukon have found recent population declines which have been attributed to climatic variability such as lower winter snow depths (less insulation), freeze-thaw events, freezing rain, and late winter snowfall (Morrison and Hik 2007, 2008).

The collared pika is primarily found on talus alpine slopes, interspersed with meadows or forest patches (Morrison and Hik 2008). Pikas spend the summer months collecting forbs and grasses to store them in a haypile cache for winter (Smith and Johnston 2008). Pikas typically live in small sub-populations in a single alpine or sub-alpine valley (Morrison and Hik 2007).

12.1 PIKA SURVEYS

A preliminary survey for pikas was conducted in the summer of 2013 at four locations near the proposed mine site to document the presence of pikas within the study area. Two biologists searched for pikas using binoculars and listening for calls during one hour at each location. No pika activity was detected during these surveys; however, 11 pikas were incidentally observed during bird and vegetation baseline work near the proposed mine site. Pikas were observed primarily in alpine habitats where they were located in small boulder fields (felsenmeer) on moderately steep slopes, adjacent to areas of herbaceous alpine vegetation (Photo 3; Figure 12.1).

A subsequent collared pika occupancy survey was conducted during the summer of 2014. The collared pika occupancy surveys were conducted during two day field trips in July and August 2014. Collared pikas are easily detected in late summer, particularly in August when they are actively hoarding their winter food in haypiles. The objective of this survey was to determine collared pika occupancy and distribution within the Casino Mine Site footprint. In order to be consistent with other programs in the Yukon, the methods used for the Casino pika occupancy surveys were based on the 2011 Tombstone Territorial Park Collared Pika Monitoring Protocol. Survey sites were pre-selected based on habitat suitability mapping and the resulting collared pika habitat polygons (see Section 12.2). Survey sites were accessed via ATV or helicopter, and then on foot. As per the monitoring protocol, all sites were surveyed at least twice. This was accomplished by two observers independently surveying patches during site visits.

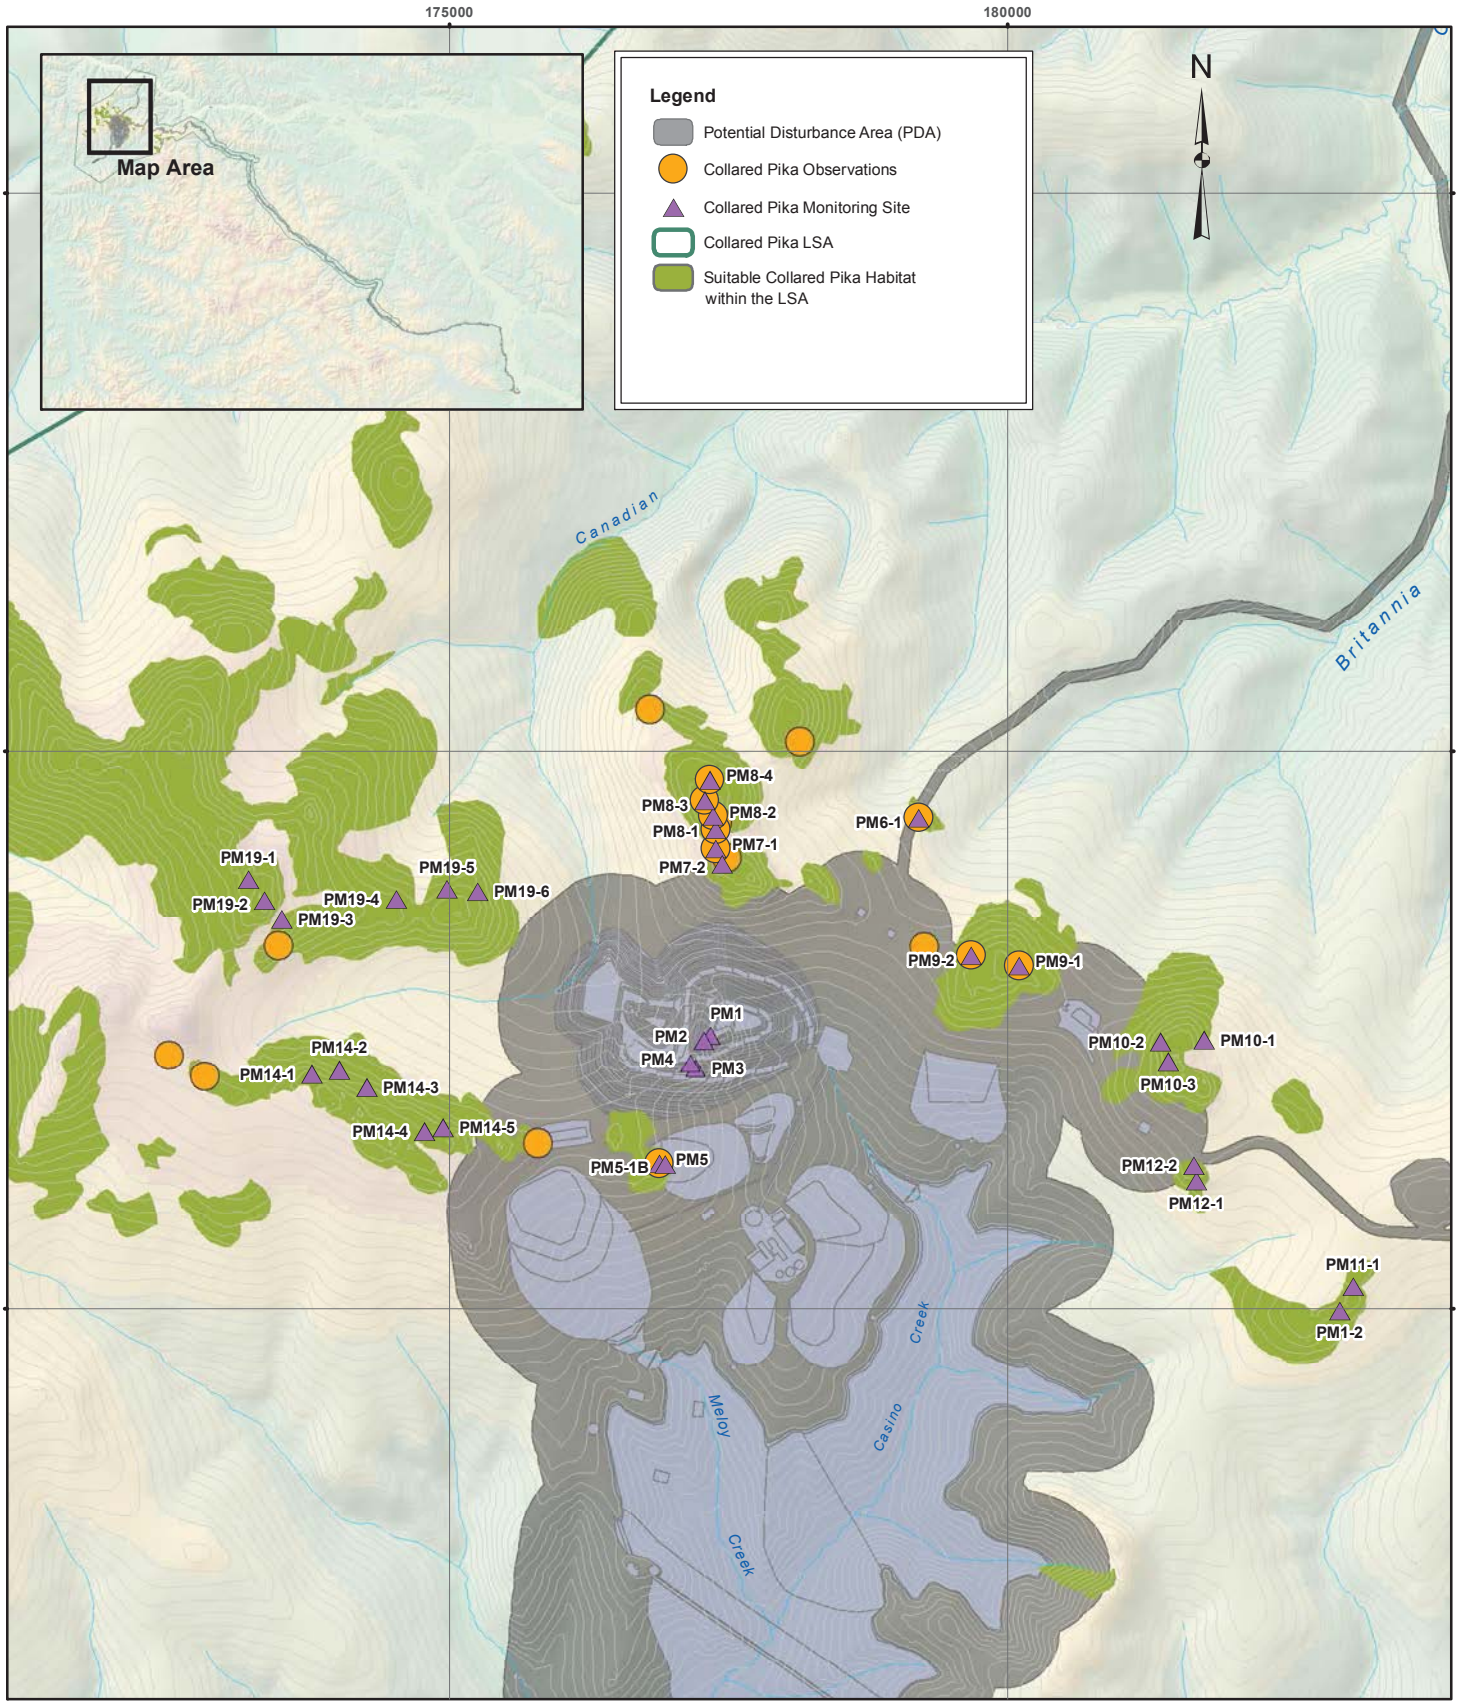
The collared pika habitat polygons closest to the Casino Mine Site footprint were targeted. Once the pika habitat polygon was reached, the observers established a site and slowly walked the area to look and listen for pika. At each site, the observers also chose a vantage point to observe collared pika habitat for a minimum of 10 minutes. Each survey site was assessed for pika presence, including: haypiles, pika sightings, and pika calls. One to four sites were established in each polygon depending on the habitat patch size. The date, time, coordinates, photograph numbers, a unique site number, and surveyor names were also recorded.

Twelve polygons and 27 sites were surveyed during the two field visits. Nine sites were visited in July; some sightings and calls were observed, but there were no signs of haypiles. In August, 27 sites were visited, including revisits to the 9 sites surveyed in July. Sighting, calls and haypiles were all recorded.

Pika presence was detected in 20 of the surveyed sites (Figure 12.1). Of the 12 polygons surveyed, 6 contained collared pika. Of the 20 survey sites where collared pikas were recorded, three sites had only one of the two surveyors finding sign of collared pika. Individual collared pika numbers are difficult to determine since many of the observations were based on calls.

12.2 COLLARED PIKA HABITAT SUITABILITY MODEL

In consideration of the naturally fragmented and geographically limited area of pika habitat, a simplified habitat suitability model was developed for the LSA. Habitat suitability values were assigned to habitat variables based on a review of literature (Nagorsen 2005; Morrison and Hik 2007; COSEWIC 2011). Based on the accessed information, two variables were initially selected to qualify pika habitat: bioclimate zone (e.g., alpine) and proximity to boulder fields (i.e., felsenmeer); however, the bioclimate zone data had to be excluded as its resolution (90 m) was not suitable for the scale of the model. Consequently, only the proximity to felsenmeer land cover class (boulder fields) was used.



A Boolean approach was used to model suitable and unsuitable pika habitat. Suitable habitat were define as the felsenmeer land cover class buffered by 10 m, while unsuitable habitat was all areas beyond 10 m of the felsenmeer land cover class. The model indicates that the LSA may contain approximately 31 km² of suitable pika habitat, which is about 3.5% of the LSA (Table 12.1). All but one pika observations where within suitable habitats, though not all suitable habitat was occupied by pikas (Figure 12.1).

Table 12.1 Availability of suitable and unsuitable pika habitat within the LSA.

Habitat	Baseline area (km²)	% of total available
Suitable	31	3.5
Unsuitable	855	96.5

13 LITTLE BROWN BAT

Little brown bat (*Myotis lucifugus*), or little brown myotis, ranges through much of subarctic North America (Arroyo-Cabrales and Álvarez-Castañeda 2008). The Yukon population of little brown bat is thought to migrate to the coast, spending the winter in Alaska, and summers (April to September) in the Yukon (Government of Yukon 2014). The exact size of the Yukon population is still unknown (Government of Yukon 2014).

The little brown bat is a nocturnal insectivore, mostly foraging for flying insects over open water or along the edges of lakes and streams (Alaska Natural Heritage Program 2014). The short summer nights in the Yukon limit feeding time to only 1–2 hours each night (Government of Yukon 2014). Summer roost sites are usually dead tree hollows or buildings (Randall 2011).

The little brown bat and northern myotis (*Myotis septentrionalis*) have recently experienced drastic declines in its population (COSEWIC 2013). The little brown bat designation was changed to 'endangered' by COSEWIC in 2013 after an emergency assessment. The assessment and the species' designation are the result of a white-nose syndrome epizootic originating in eastern North America. The syndrome is a highly contagious fungal disease. Transmission occurs in hibernacula. It has spread quickly since being detected in North America and is expected to reach western North America in the next two decades. White-nose syndrome has devastating effects on exposed population of bats; more than 99% of some little brown bat populations in the northeastern United States have been lost solely because of the syndrome (COSEWIC 2013).

Surveys to assess the presence of the little brown bat at the proposed mine site were conducted during July 2014. Two EDI biologists surveyed potential roosting habitat at the proposed Casino mine site for signs of bat use. Since most of the area is above treeline, the only potential habitat identified was the camp buildings. Each building was visually assessed for bat presence. No signs of bats were found in the camp buildings.

A bat detector was also set up to monitor and record any ultrasonic echolocation calls of bats. The bat detector was an Anabat SD1 system, made by Titley Scientific, and is based on frequency division (Corben 2004). The detectors were attached to a cable microphone with the microphone set in a protective PVC tube sleeve. The microphones were angled down over a reflective plexi-glass plate, mounted at 45° to horizontal, resulting in the microphone sampling an area parallel to the ground. The Anabat detector was installed on the top of a silo approximately 10 m above the ground. This site was chosen since it is slightly lower in elevation then the camp, and closer to treeline and wetter habitat. It was also the only free standing infrastructure suitable for unobstructed bat monitoring. The anabat detector recorded ultrasonic acoustic detections for a total of six days. No bat calls where recorded in this time.

Two other species are known to occur in the Yukon but their current range does not overlap with the Project. Northern myotis, also known as northern bat, has been observed in the southeast Yukon (Government of Yukon 2014).

14 AMPHIBIANS

Only four species of amphibians are known to occur in the Yukon: wood frog (*Lithobates sylvaticus*), western toad (*Anaxyrus boreas*), Columbia spotted frog (*Rana luteiventris*), and boreal chorus frog (*Pseudacris maculate*). The only species expected to occur in the RSA is the wood frog. The range of the latter three species extends north only into the southeast corner of the Yukon (Government of Yukon 2013e).

The wood frog is the most widespread amphibian species that occurs in the Yukon, with its range extending from the BC border north to Old Crow Flats. The wood frog occupies a variety of habitats, including habitats located away from water. Breeding occurs in clear shallow ponds from late April through June (Government of Yukon 2013e). The wood frog is assumed to occur throughout the RSA in the appropriate habitats. Although wood frog habitat is limited in the Project area, suitable habitat does occur.

No amphibian surveys were conducted as part of the Casino baseline surveys. However, both tadpoles and adult frogs were observed along the Freegold Road near Big Creek, during the rare plants survey conducted in 2012.

15 MINERAL LICKS

Mineral licks used by moose are typically located in moist, muddy areas and are often identified by the presence of a worn trail or concentrated tracks in an area (Rea et al. 2004). Mineral licks not only provide mineral nutrients and water to moose, but also aid in digestion (by consuming soil) and are known as social gathering areas (Rea et al. 2004). During baseline studies, two mineral licks were identified — one near Dip Creek in the northern part of the RSA (west of the mine site) and one near Hayes Creek. Remote motion sensing cameras were placed at each site as a preliminary monitoring effort to quantify and qualify wildlife use of these licks. The cameras were placed at the licks 20 June 2013 and collected 25 August 2013.

The cameras documented the occurrence of moose, wolves, red fox, grizzly bears, black bear, and lynx. The majority of observations at both licks were of moose, including lone cows and bulls, as well as cow/calf groups. The camera at the Hayes Creek mineral lick was only active for eleven days because the camera was set to an aggressive setting and the digital camera memory card was filled entirely by one moose revisiting the site (Photo 4). The Dip Creek mineral lick recorded observations of moose, wolves (Photo 5), red fox, grizzly bears, one black bear, and one lynx. The camera was active for 66 days, and recorded 111 separate visits by wildlife. Thirteen individual moose (or moose groups) were recorded at this site including two bulls, eight cows, and three cow/calf groups (Photo 6). Grizzly bears were recorded on 11 July 2013 and 5 August 2013 (Photo 7).

Two cameras were installed on 3 March 2014 at each of the Dip Creek and the Hayes Creek mineral licks and removed on 22 July 2014. The cameras were active for 142 days. Moose, black bear, grizzly bear and wolf were recorded at both mineral licks. The majority of the observations at both licks continue to be moose (Table 15.1). Several individuals appear to revisit the mineral licks on a regular basis. Black bears and wolves occasionally visited the mineral licks. One grizzly bear was recorded at each of the mineral licks. No caribou were recorded.

Table 15.1 Summary of the number of days each species was photographed at the Dip Creek and Hayes Creek mineral licks, 3 March 2014 to 22 July 2014.

Mineral Lick	Camera #	Moose	Caribou	Black Bear	Grizzly Bear	Wolf
Dip Creek	1	23	0	1	0	5

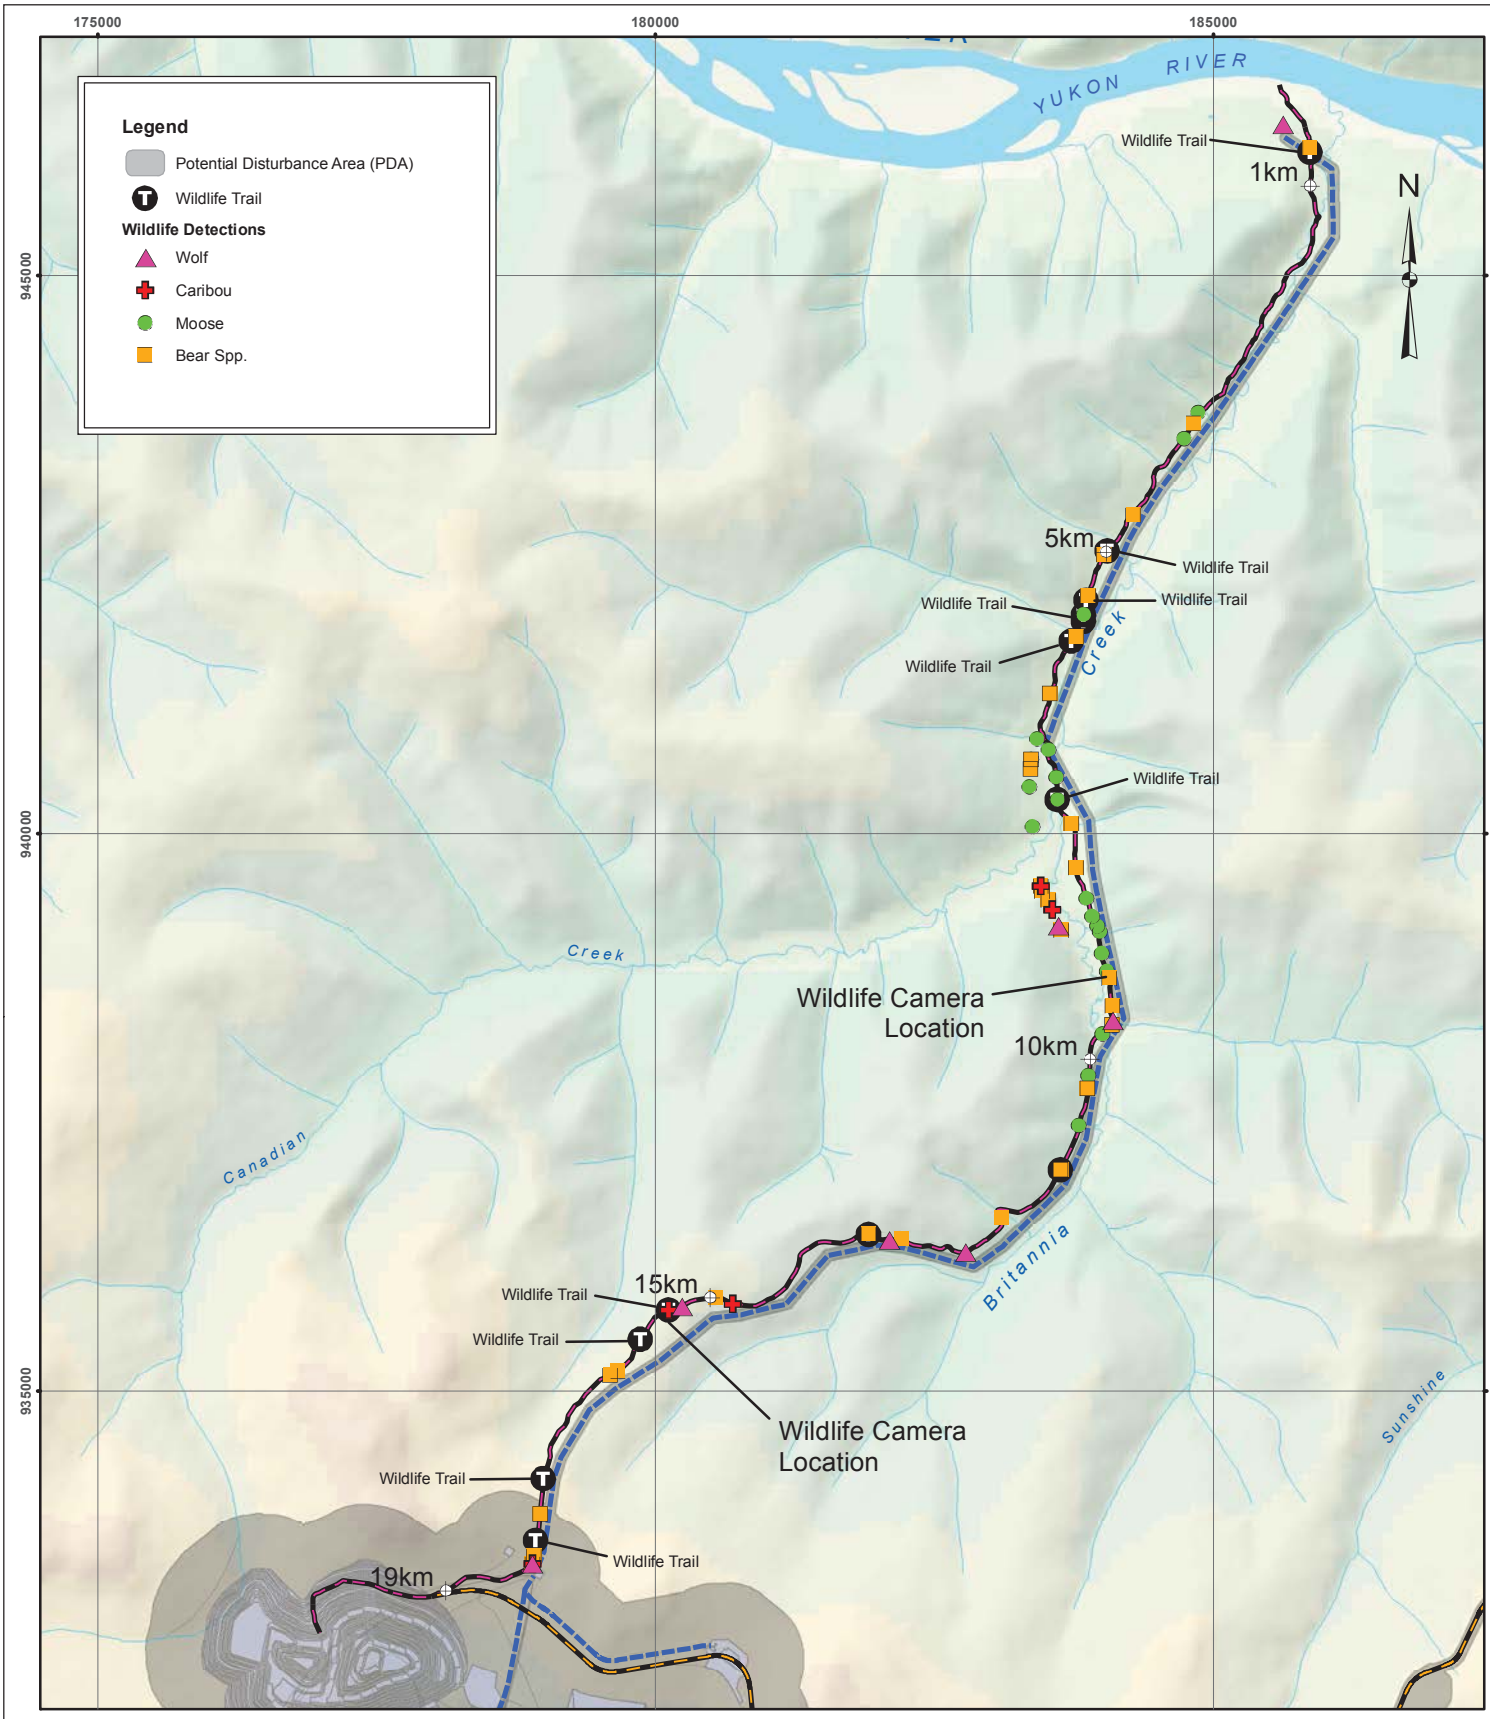
16 YUKON RIVER WATER PIPELINE SURVEY

To establish the potential of the project's interaction with wildlife along the proposed Yukon River water pipeline, two biologists traveled the entire length of the road looking for signs of wildlife use. The proposed water pipeline occurs within the range and habitat of most animals that occur in the region, so the purpose was to document the presence of wildlife features such as mineral licks, concentration of track, trails, or other features.



Two EDI biologists travelled the current access road 23 July 2014 on ATVs. The majority of the proposed pipeline alignment follows the road developed during Casino's exploration phase which accesses the proposed mine site from the Yukon River. One section of the proposed pipeline route follows the old road along Britannia Creek. The surveys drove along the route at approximately 10 km/h and watched for any sign of wildlife. The survey covered approximately 19 km between the deposit and Yukon River. Biologists travelled slowly along the route and recorded the location and description of all wildlife use observations. In addition, motion triggered cameras placed at two locations where wildlife trails were observed. The cameras collected images 23 July to 22 August 2014.

In total, 62 detections of wildlife sign were made (Table 16.1). Species observed included caribou, moose, bear (black and grizzly were grouped), and wolf. The most common wildlife sign observed was for bear species; a total of 23 observations of scat and tracks were made. Twenty signs of moose, 8 signs of wolf, and 5 signs of caribou scat and tracks were detected. In addition to the species specific observations, 14 wildlife trails were also observed, either crossing the proposed pipeline route, or running parallel to it.

In addition to the surveys, two wildlife cameras were set up at two sites along the proposed water pipeline route near observed wildlife trails (Figure 16.1). The cameras were set up on 23 July 2014 and were active for 30 days. The camera at km 15 of the road alignment did not record any animals, while the camera at km 9 along the road adjacent to Britannia Creek recorded a black bear sow with a cub on 25 July 2014.

Table 16.1 Summary of observations of wildlife sign by species along the proposed water pipeline route

Species	Tracks	Scat	Camera 1	Camera 2
Bear sp.	7	23	0	1 (+cub)
Caribou	2	3	0	0
Moose	14	6	0	0
Wolf	3	5	0	1

1 PART 1: HABITAT MODEL

1.1 Introduction

A moose habitat model was determined necessary in order to quantitatively assess the potential effect of the proposed Casino Mine Project on moose habitat availability. A model was developed and submitted with the Casino Mine Project proposal to YESAB in early 2014. Comments from the Yukon Government and newly available land cover information provided an opportunity to develop a new model of moose late winter habitat.

Habitat suitability index (HSI) models are simple models of habitat quality based on ranking species-habitat relationships. These models can be based on one suitability index or the combination of multiple suitability indices to quantify the quality of habitat for the focal species (Dijak and Rittenhouse 2009). Expert or local knowledge and results of detailed habitat selection studies are generally used as inputs to create suitability indices. The combination of all suitability inputs creates the HSI. The models are most accurate when animals have very specific habitat requirements and those habitat types are easily mapped. Animals that do not exhibit clear habitat selection, like moose, are more difficult to model accurately. Models of habitat use at the scale of large landscapes is particularly challenging because the availability of spatially explicit data is often missing or coarse.

In consideration of the increased energetic costs to moose during winter and that late winter is the most habitat–limited season for moose, a late winter habitat suitability index model was developed for the moose in the area around the proposed Casino Mine Project. The late winter moose HSI was developed using available spatially explicit terrain and land cover information. Suitability values were standardized for all variables input into the model, with a 0 value representing unsuitable habitat and a 1 representing suitable habitat.

1.2 Habitat selection background

Moose have been described selecting habitat based on three criteria: predator avoidance, food availability, and snow conditions (Dussault et al. 2005). Wolves, the primary predator of moose, are distributed throughout the region and Yukon. Wolves limit moose population growth and density (Hayes et al. 2003); consequently, moose are likely to avoid habitat types that increase the likelihood of detection by wolves (Dussault et al. 2005). Taller and denser vegetation land covers likely provide protection from wolf predation during winter. Habitat types that provide cover from predators may also contain taller trees that intercept snow reducing snow depth and, consequently, reducing the cost of movement. Willows are the primary winter food for moose. Rosenhoover (1989) found that willows accounted for more than 94% of the winter diet of moose in Denali National Park and Preserve. Moose were commonly observed foraging in areas that contain abundant willow during the Casino baseline surveys. As willow is an early succession species, the shrub is most abundant in disturbed areas such as stream riparian, human disturbed areas (e.g., placer mines and exploration camps) and burns. Moose have been reported selecting previously burned habitats that are 10-30 years old (Maier et al. 2005) and less than 40 years old (Wasser et al. 2011). Moose

have also been documented selecting areas within 100 m of streams and waterbodies (Wasser et al. 2011). Consequently, forest fires, fluvial processes, and placer mining, and other disturbances in the region provide higher quality moose habitat. Snow depth likely does not limit moose movement in the region because the area receives relatively little snow (Farnell et al. 1991); although snow depth and hardness at high elevations is likely to limit moose movement. Furthermore, land cover types, though related to snow conditions, can be a stronger predictor of winter habitat selection than snow conditions for moose (Kittle et al. 2008).

Terrain, particularly in mountainous areas, is a characteristic that restricts habitat availability for moose. The only information available describing moose winter habitat selection in similar terrain was a report on late winter habitat selection by moose in the Dawson land use planning region (Morrison and Wong 2013); however, the model results were determined to be inappropriate to inform this modelling exercise. Based on professional opinion, two terrain features are considered for the habitat suitability model: elevation and slope. Elevation is likely suitable as a proxy for vegetation availability and snow cover habitat limitations. The land cover dataset identified abundant shrub cover within the alpine and subalpine. Moose were rarely observed in the alpine and subalpine during baseline surveys, so the elevation dataset was used to exclude high elevation habitat as potentially suitable. Moose are typically observed occurring at all elevations below treeline, though information collected within the region indicates that moose may use the mid elevation slopes more frequently (EDI unpublished snow track data). Mid elevation may allow moose to avoid wolf packs that travel using the larger streams in the area and/or select elevations that have more comfortable temperatures, as temperature inversions are common in the area during winters. Slope likely restricts moose habitat availability as steep terrain is simply unavailable for moose. Moose were assumed to use flatter terrain more than steep terrain.

1.3 Methods

To model moose late winter habitat suitability, which is based on forage availability, predator avoidance and terrain restrictions, we developed a HSI by combining available datasets with suitable coverage to generate and validate the HSI (Table 1).

1.3.1 Study area

The moose late winter HSI was developed for the moose regional study area (RSA). The RSA is defined by all game management areas (GMAs) that intersect the proposed Casino Mine Project. Major landscape features in the RSA include Dawson Range and the Yukon River. The study area contains no notable lakes and wetlands. Climate in the area is characterized by long cold winters and short warm summers; and relatively little precipitation during any season (Smith et al. 2004). The region has an active wildland fire regime and has experienced a number of large burns since 1990.

The region has a long history of mineral exploration and development. The moose study area encompasses an operating hard rock mine, a number of active placer mines, one abandoned mine and a number of hard rock exploration properties. Access to the region is primarily from the Nansen Road, Minto Road, Freegold Road and Casino Trail. Other access infrastructure includes several maintained airstrips. The history of

human land use has resulted in a number of abandoned/inactive road and trails, mostly as spur roads from the existing roads.

Baseline studies conducted for the proposed Casino Project included several surveys for moose and caribou; parts of the study area have been surveyed for late winter ungulate distribution annually 2011–2014. Because moose and caribou were often surveyed simultaneously, an ungulate survey area was defined during baseline surveys to include the GMAs that intersect the Casino Mine Project and the entire range of the Klaza Caribou Herd (i.e. the survey area extends beyond the boundaries of the moose RSA in some areas). The entire area was surveyed during late winter in 2011 and 2012. In 2013, the Freegold Road extension was selected as the preferred access route for the Project and the 2013 and 2014 surveys were reduced in extent to a 10 km buffer of the preferred access route. Moose were the most common species observed during all surveys.

1.3.2 Data preparation

Available data used to create the late winter habitat suitability model was limited to datasets that covered the entire study area (Table 1). Land cover layers (Table 1) were merged because the 2014 land cover extent did not include the southeastern portion of the study area. The merged land cover dataset required resampling the EOSD data using the nearest method to increase cell size from 25 m to 30 m. The Yukon Fire history dataset was converted from vector to raster data with fire age as the cell values. A digital elevation model (DEM) was used to develop the steepness and elevation datasets.

We used fuzzy membership functions with a linear transformation between the suitable and unsuitable attributes to create suitability indices for the continuous variables. Boolean functions were used to create a suitability index for the categorical land cover variable.

All analyses were completed using the NAD83 geodetic reference system and the Yukon Albers projected coordinate system. All analyses and management of spatial data were completed using ArcGIS Desktop 10.2 with the Spatial Analyst extension (ESRI 2013).

Table 1. Spatial databases used in the development of the late winter moose HSI.

Dataset	Source	Description
Digital Elevation Model (DEM)	Geomatics Yukon, Yukon Government	Raster database 30 m cell size Developed 2002

Land Cover, EOSD	Canadian Forest Service, Pacific Forestry Centre	Raster database 25 m cell size Imagery: circa 2000 Developed 2006
Moose late winter locations	Project acquired data	Vector database Acquired 2011–2014

Elevation

Elevation within the study area is represented by the DEM. The elevation dataset was treated as a continuous variable in the habitat model. A fuzzy membership function was created to identify an elevation suitability index for late winter moose habitat using expert opinion. Elevation below treeline was considered suitable as moose late winter habitat, while elevation above treeline was considered unsuitable. Treeline was estimated at 1,175 m during baseline studies (EDI 2014). Treeline is not solid boundary between forested and alpine ecosystems and varies within landscapes; consequently, we created a 100 m altitudinal buffer for a linear transition from suitable to unsuitable habitat (Figure 1). The fuzzy membership model rates terrain up to 1,075 m as suitable habitat, followed by a linear transition to unsuitable habitat at 1,275 m (Figure 1, Equation 1).

Equation 1:
$$f(x) = \begin{cases} 0, & x \geq 1275 \\ \left(\frac{x-1275}{1075-1275}\right), & 1275 > x > 1075 \\ 1, & x \leq 1075 \end{cases} \qquad x \in X$$

Terrain steepness

The steepness of terrain within the study area was estimated by creating a slope dataset from the DEM. The slope database provides steepness in degrees and was treated as a continuous variable in the habitat model. A fuzzy membership function was created to identify a steepness suitability index for late winter moose habitat using the expert opinion. Terrain with less than or equal to a 20 degree slope was assumed to be suitable as moose winter habitat and slope greater than 70 degrees was assumed to be unsuitable (i.e., unavailable). Slopes in between the criteria were assumed to decrease in suitability with increasing slope (Figure 1, Equation 2).

Equation 2: $$f(x) = \begin{cases} 0, & x \geq 70 \\ \left(\frac{x-70}{20-70}\right), & 70 > x > 20 \\ 1, & x \leq 20 \end{cases} \qquad x \in X$$

Fire History

The burn age raster dataset was treated as a continuous variable in the habitat model. A fuzzy membership function was created to identify a suitability index for late winter moose habitat using published information. Fires less than or equal to 30 years old were considered suitable, followed by a linear transition to unsuitable habitat at 40 years old (Figure 1, Equation 3).

Equation 3: $$f(x) = \begin{cases} 0, & x \geq 40 \\ \left(\frac{x-40}{30-40}\right), & 40 > x > 30 \\ 1, & x \leq 30 \end{cases} \qquad x \in X$$

Land cover

The merged land cover dataset was grouped into broader habitat types based on dominant forest types. An accuracy assessment of the land cover dataset provided by YG revealed that the data poorly mapped most land covers types, but more accurately reflected broader land cover categories (ASL 2014). A Boolean membership function was used to identify a suitability index for moose late winter habitat. All land cover types were rated as suitable (1) or unsuitable (0) for moose foraging and predator avoidance value (Table 2). Conifer without a shrub component, unvegetated, and herb or lichen dominated land cover types were assumed to be unsuitable foraging late winter habitat for moose. All other land cover types were assumed to have the potential to contain forage species and were considered suitable foraging cover types. Unvegetated and herb or lichen dominated land cover types were assumed to be unsuitable predator avoidance cover types. All other land covers were assumed to have some potential value for predator avoidance. We combined values to create the land cover suitability index by taking the smallest forage or predation rating (i.e., product).

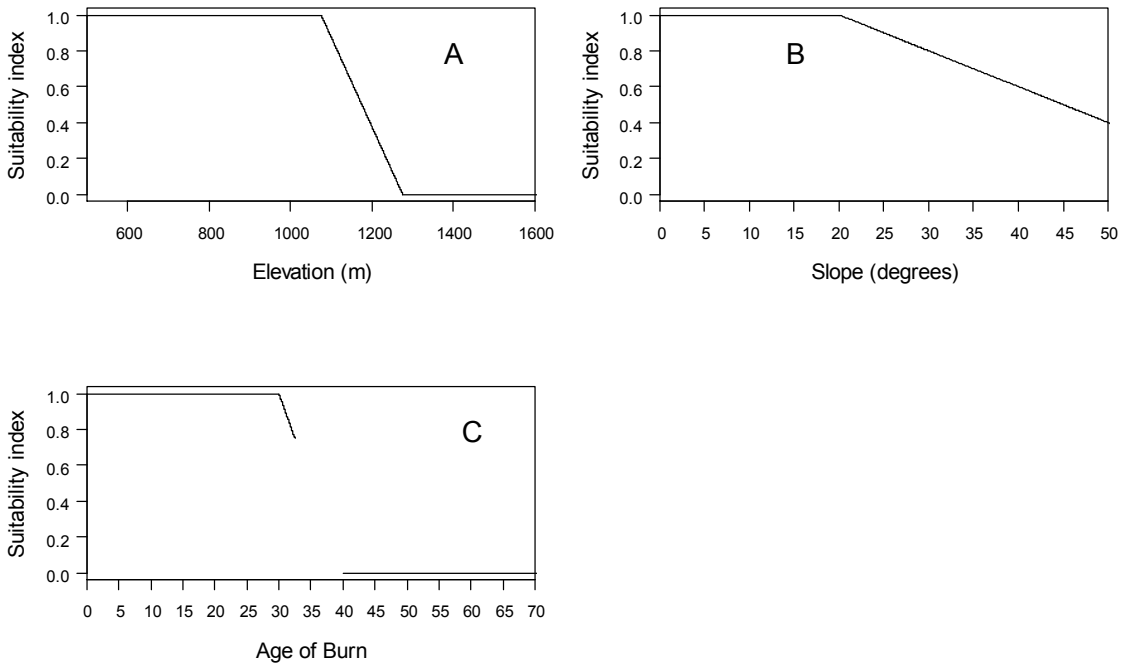

Figure 1. The suitability of moose late winter habitat as a function of elevation (A), slope/steepness (B) and age of burn (C). The x-axis approximately reflects the range of values that exist within the study area datasets.

Table 2. The suitability of moose late winter habitat as a function of land cover types.

Land Cover Code	Land Cover Type	Forage Rating	Predation Rating	Suitability Index
11, 12	Cloud or Shadow	NA	NA	NA
20, 31-33	Unvegetated	0	0	0
50	Shrub dominated	1	1	1
81-83	Wetlands	1	1	1
100, 101, 41-43	Herb or lichen dominated	0	0	0
211-215, 217-218, 240-241	Conifer without shrub	0	1	0
216, 219	Conifer with shrub	1	1	1
221-229	Broadleaf Dense	1	1	1
231-239	Mixed-wood Dense	1	1	1
232-239	Mixed-wood Open	1	1	1

1.3.3 Model Development

The HSI was developed by overlaying the terrain and land cover variables to create a model of moose late winter habitat quality. The steepness and elevation suitability indices were combined using an 'AND' overlay, which retains the minimum cell value of the combined datasets. The overlay is appropriate in this case because these steepness or elevation terrain attributes were assumed to be limiting for moose. For example, steep terrain at suitable elevation was still considered less suitable late winter habitat for moose. The land cover and burn age suitability indices were combined using an 'OR' overlay, which retains the maximum cell value of the combined datasets. The overlay is appropriate in this case because both datasets were assumed to contain some error so we identified the maximum area of potentially suitable land cover types. Furthermore, the land cover data are not as current as the fire history dataset.

The final moose habitat suitability model was created by combining the terrain and the land cover into one layer using a "PRODUCT" overlay. The overlay is appropriate in this case because it is a decreasive operation where a combination of values is considered less important than values from the inputs. The purpose in using this function was to ensure that values representing no or poor suitability from either input layer was maintained; for example, if an individual pixel in the terrain layer represented poor habitat, then that rating was maintained regardless of the value of the land cover. The resulting output layer represented the final moose habitat suitability model.

In consideration of the scale that moose select habitat, we used a focal statistics tool with a 1 km search radius (Oehlers et al. 2011). The focal statistics is also a method of smoothing raster datasets and is appropriate when there is uncertainty in the exact observation location. Moose observations were acquired during aerial surveys so the accuracy of the observation is likely ±100 m. Figure 2 is a graphical representation of the model development.

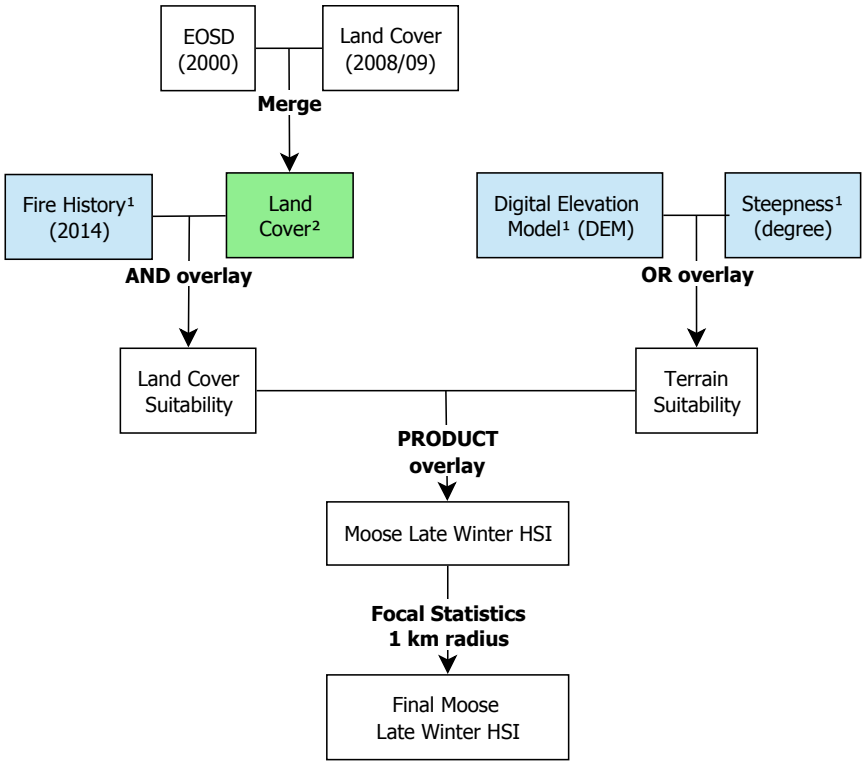

Figure 2. Moose late winter habitat suitability modelling workflow. The blue[1] and green[2] boxes identify the fuzzy and Boolean membership functions, respectively.

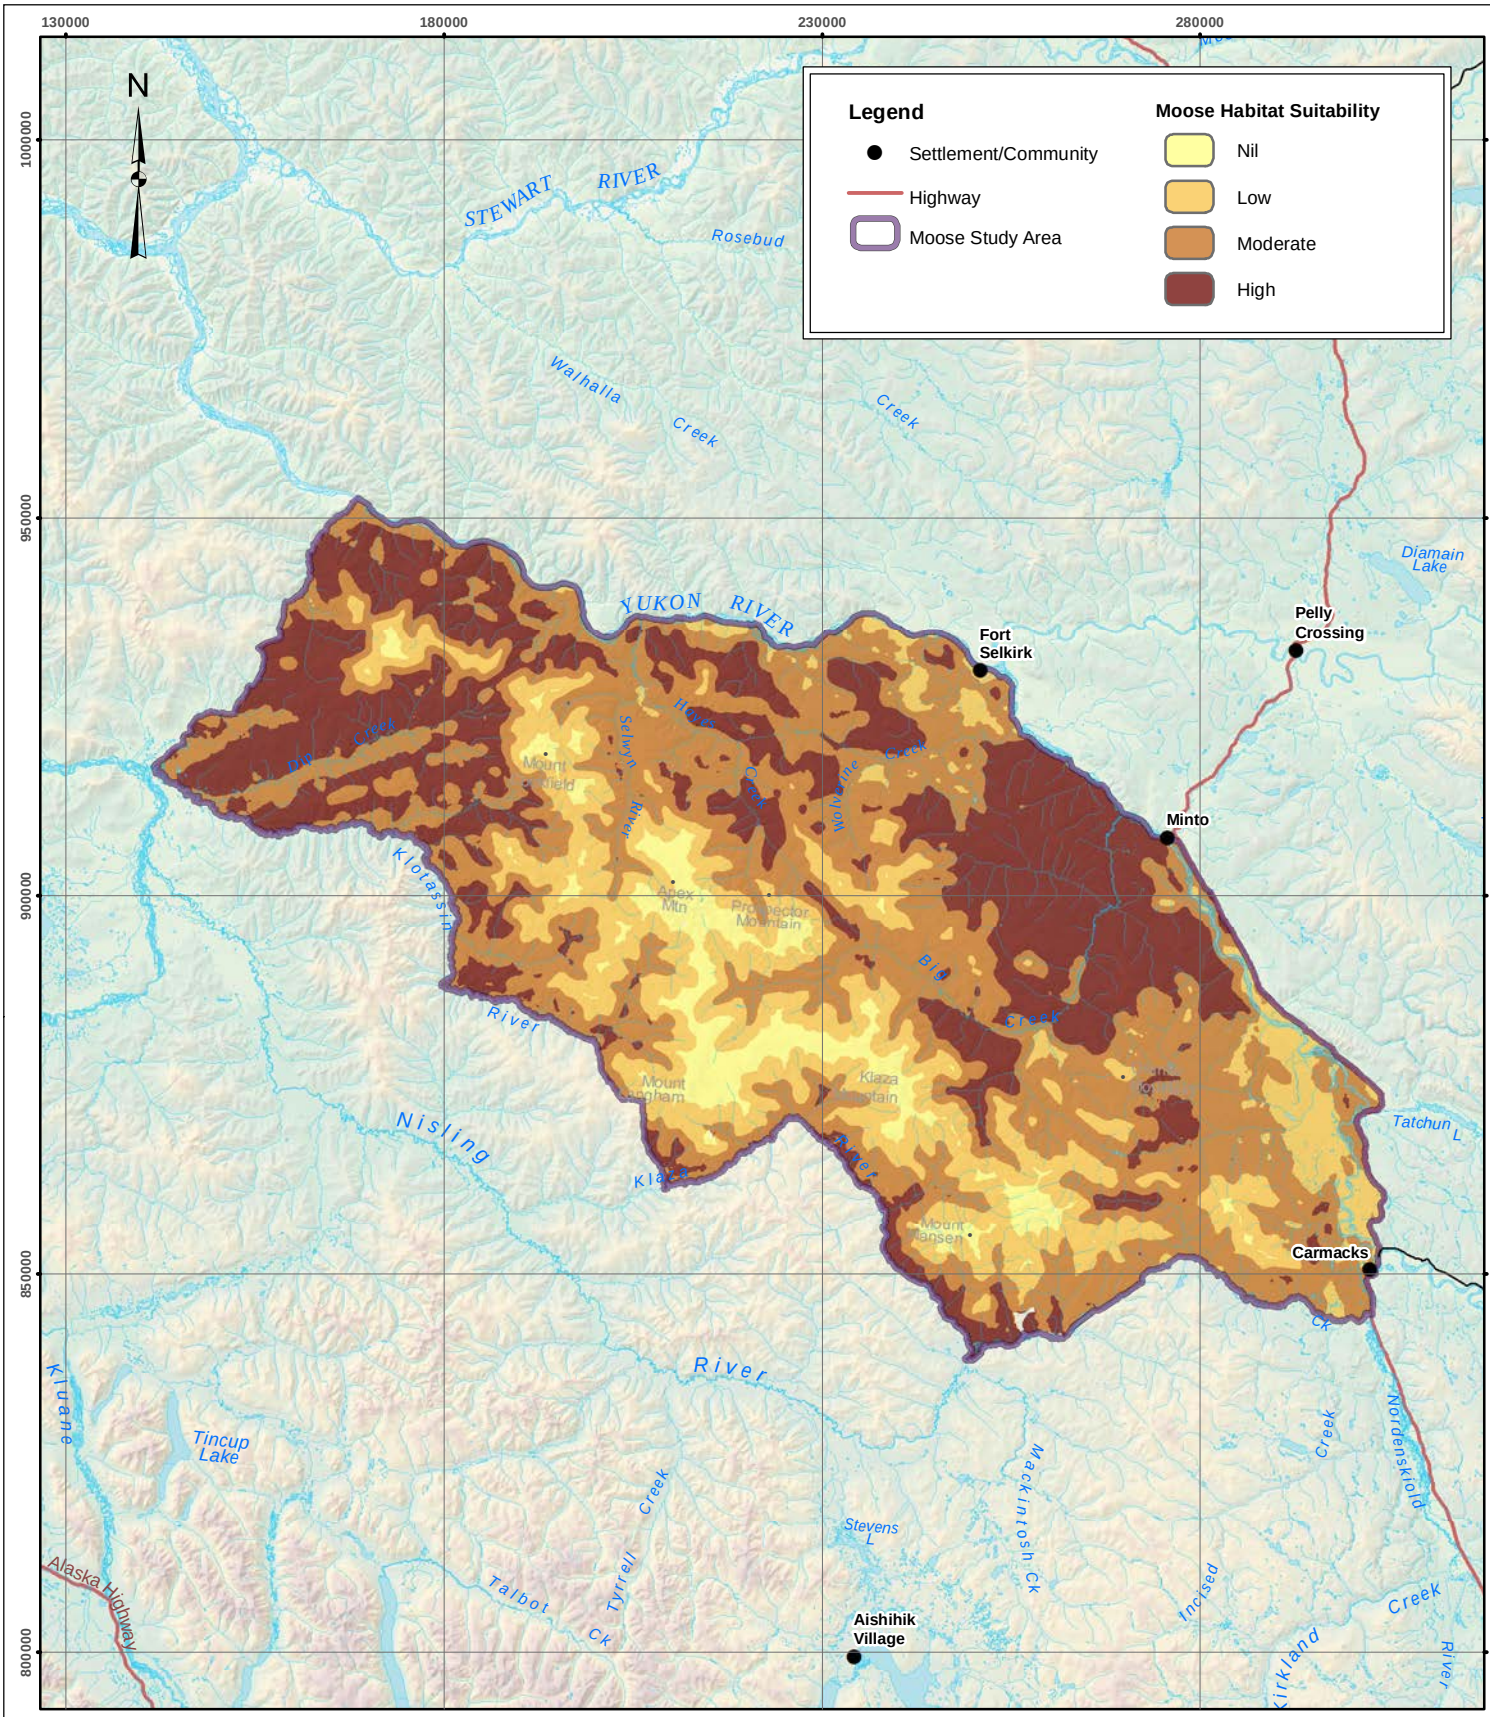
1.3.4 Statistical Validation

We grouped cells into suitable or unsuitable habitat. Habitat suitability values greater or equal to 0.5 are defined as suitable and values less than 0.5 are unsuitable. We used a simple one-sample proportions test with continuity correction to compare the observed proportion of moose observations within suitable habitat to the proportion of available suitable habitat within the study area. Used habitat was determined based on 248 moose observations within the habitat modelling area collected during the 2011 and 2012 late winter surveys. Observation collected during subsequent surveys in 2013 and 2014 were not used because the survey extent for those years was reduced, thus observations did not cover the entire habitat modelling area. Using the 2013 and 2014 moose locations could bias the validation results. The expected proportion of suitable habitat in the study area was determined by calculating the proportion of pixels identified as suitable habitat within the study area. Statistical tests were conducted using R version 3.1.2 (R Core Team 2014).

1.4 Results



Moose were observed in areas identified as suitable habitat (HSI value ≥0.5) more often than unsuitable habitat. There is a statistically significant difference in the proportion of moose observations in suitable habitat (X-squared = 117.11, df = 1, $p<2.2e-16$). The results indicate that the model did a better job at predicting moose locations than random as 88% (95% confidence interval = 83–91) of moose observations

occurred within suitable habitat. If moose were randomly distributed across the RSA we would expect 53% of the observations to occur within suitable habitat.

The model indicates that the greatest concentrations of high quality late winter moose habitat in the RSA occur northeast of the Freegold Road extension near the Minto Mine and east near the Casino Mine Site infrastructure (Figure 3). The area east of the Freegold Road extension has experienced a number of wildland fires since 1990; consequently, the habitat in a large part of that area is presumed to be suitable habitat as it likely contains abundant willow. The area around the proposed Casino Mine site contains large gently sloping hills that contain abundant mixedwood forest types and broad valley bottoms that include wetlands and riparian habitats.

1.5 Limitations

The HSI is a knowledge–based model; consequently, biases in the knowledge and opinions of the author are reflected in the model. The HSI model validation is simplistic and based on presence only data and alternative models were not tested. Land cover variables included are correlated with one or both of the terrain inputs. However, the terrain variables were mostly used to restrict the more extreme terrain, so would not change substantially affect the suitability of habitats within the range of what is considered reasonable terrain for moose.

2 PART 2: EFFECTS ASSESSMENT

The following text updates the assessment of Project effects on moose habitat availability within Section 12.3.4 of the Project Proposal.

2.1 Potential Project Interactions with Moose

Habitat availability can be reduced as direct loss within the PDA, or as indirect loss from Project activities or infrastructure that create sensory disturbances and temporarily reduce the effectiveness (usefulness) of adjacent habitats, or by filtering movement (i.e., barrier or filter effect) between habitat patches. Moose are present in the RSA throughout the year in a variety of habitat types. Moose use habitat differently depending on season and life stage (i.e., adult versus cow/calf group), thus it is important to consider these factors when evaluating potential Project interactions with moose. Winter can be a critical time for moose, as snow depth creates greater energetic costs and forage quantity and availability are reduced. Cow/calf groups tend to use habitat differently than lone adults, as the risk of predation and energetic needs are greater.

During construction, loss of suitable habitat will occur as a result of clearing at the Mine Site, Airstrip Road, Yukon River Access Road, and along the Freegold Road upgrade and extension. For moose, the creation of roads could eventually be beneficial, as disturbed areas promote early successional vegetation growth and create refuges from predators (Beyer et al. 2013). Moose have been found to select disturbed areas (e.g., near towns or river margins) likely due to the availability of high-quality forage (e.g., willows; Maier et al. 2005). This is consistent with observations during baseline snow tracking surveys, where the highest densities of moose tracks and browse were found around existing placer mine operations along the Freegold Road. North of the RSA in the Dawson Land Use Planning Region, moose late winter habitat was examined using habitat suitability models (Morrison and Wong 2013). Disturbance features examined included distance to burns, areal disturbances and linear disturbances. Cow/calf groups selected habitat close to small roads, whereas adult moose tended to use wider linear features (>8 m), suggesting both groups did not avoid linear features and may in fact use them to reduce energetic costs in winter (Morrison and Wong 2013).

Moose may also experience reduced habitat effectiveness as a result of sensory disturbances from Project activities. Moose have been found to avoid active roads, humans, and other mechanical stimuli between 100 m and 3 km (Andersen et al. 1996; Burson III et al. 2000; Yost and Wright 2001; Jiang et al. 2009). All Project components are expected to result in temporary sensory disturbances to moose.

2.2 Effects Assessment Methods for Moose

2.2.1 Spatial and Temporal Boundaries

As described in Section 12.1.4 of the Project Proposal, the RSA was chosen to represent wildlife and habitat at an ecologically relevant scale. Since moose do not move in discrete units such as herds, but use a relatively large expanse of habitat annually, the most appropriate scale to assess the potential Project effects on moose is Game Management Subzones (GMSs). GMSs that overlap with proposed or existing Project

infrastructure were included in the assessment area (509–511, 522–524 and 526). Moose are present within the RSA year-round, thus Project activities during the construction, operations, closure and reclamation, and post-closure monitoring and inspection phases have the potential to affect moose.

2.2.2 Criteria for Significance

There are no prescribed thresholds for evaluating the Project effects on available moose habitat. For most bird and mammal species, evidence suggests that with less than 10–30% of remaining suitable habitat, habitat fragmentation compounds the effects of habitat loss on population size (Andrén 1994; Swift and Hannon 2010). Similar to the habitat thresholds for caribou, these values largely consider the population viability or persistence of a species, which is not considered to be a conservative approach to effects assessment. Persistence and viability suggests that population decline is acceptable as long as the defined population persists. These thresholds can provide a parameter for evaluating the magnitude of the Project's effects to habitat; however, they must be adjusted to reflect a more conservative approach. In consideration of this evidence and to reflect the inherent variability in these values (e.g., differences between species, landscapes, and population status) a reduction of greater than 15% from baseline to maximum disturbance (i.e. <85% residual habitat) is considered a high magnitude effect (Table 3). This threshold reflects a conservative approach to the assessment.

Table 3. Thresholds for Project Effects on Moose Late Winter Habitat

Magnitude of Effect	Total Range Disturbance Threshold
Low	0–10%
Moderate	10–15%
High	>15%

2.2.3 Habitat Effects Methods

To assess potential Project effects on moose habitat, direct habitat loss was quantified by calculating the area lost to the PDA, while reduced habitat effectiveness was quantified using a ZOI approach. It was assumed habitat within the PDA will become unavailable to moose. The ZOI defines the area beyond the PDA in which effects from Project infrastructure or activities could result in reduced habitat effectiveness. These effects, as described above, manifest as sensory disturbances (e.g., noise, lights, smells, human presence). Overall Project effects on habitat availability were assessed using a quantitative analysis of the change in the available area of low, moderate, or high value late winter habitat from baseline conditions. Effects to habitat availability will begin at the construction phase and continue throughout the life of the Project.

The size of the ZOI was based on multiple sources which provided information regarding the sensitivity of moose to certain Project components (Table 4). In Alaska, Yost and Wright (2001) found significantly fewer (55% less) groups of moose than expected within 300 m of a paved road through Denali National Park; however, they suspected these results were largely influenced by the spatial pattern of preferred forage and cover. Similarly, Burson III et al. (2000) found proportionally fewer moose within 100 m of the Denali Park road between 1972 and 1997; however, similar to Yost and Wright's (2001) findings, the mechanism for the

decline may have been related to poorer visibility of moose near the road due to vegetation growth. In Norway, Andersen et al. (1996) found moose were more responsive to human stimuli (e.g., people walking or skiing) than to mechanical stimuli (e.g., jet overflights), fleeing from human stimuli at distances of 200 to 400 m. Moose in northeastern China were found to avoid roads at a distance of up to 3 km; however, the authors state that the influences on moose decision-making in China is a result of many decades of disturbance from high density road networks and is likely quite different for moose in Canada (Jiang et al. 2009).

In consideration of these findings, precedence from similar mining projects in the Yukon and British Columbia (Table 4) and in an effort to maintain a conservative approach to Project effects, a 300 m ZOI was originally selected as an appropriate ZOI for assessing potential indirect effects on late winter moose habitat. However, the ZOI was increased to 500 m at the request of the Yukon Government. There is very limited existing information that quantifies the magnitude of moose avoidance of human disturbance. The indirect effect of the Project was quantified by reducing the HSI values within the ZOI. We assumed a linear relationship in the reduction of moose late winter habitat quality. The overall indirect effect within the ZOI is equivalent to a 50% reduction in habitat effectiveness, but the amount of reduction at any location within the ZOI was a function of distance to the PDA. The suitability of habitat outside the ZOI remained unchanged. The difference between the baseline HSI and predicted effect HSI values are used to assess project effects on moose late winter habitat (Table 5).

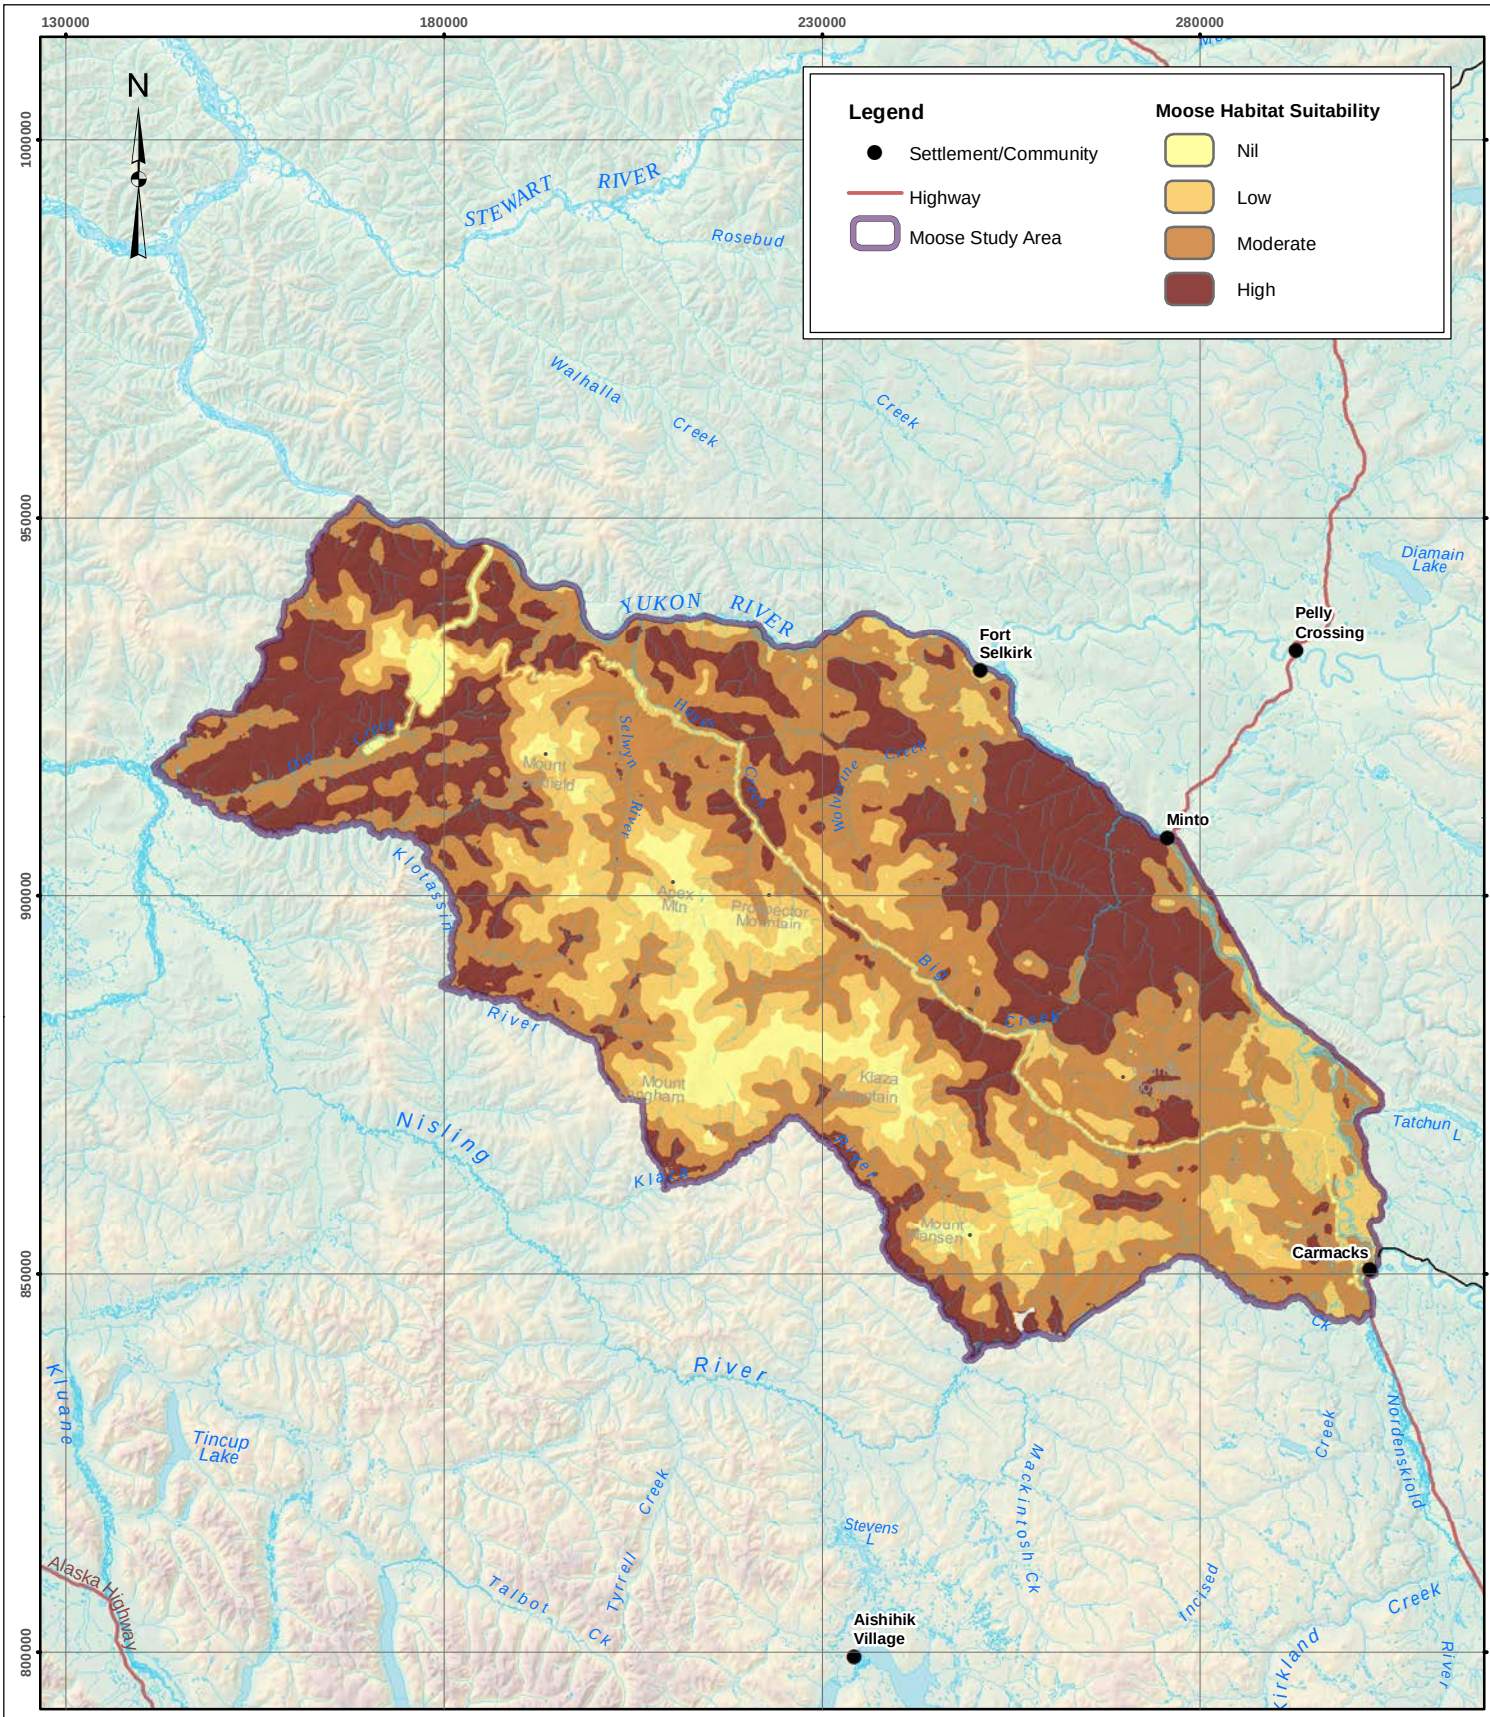
Table 5. Change in moose late winter habitat quality due to project effects in the RSA

Habitat Quality	Baseline (km²)	Loss to PDA (km²)	Change in Effectiveness within ZOI (km²)	Maximum Disturbance (km²)[1]	Change (%)[2]
Nil	472	<-0.1	89	560	18.76%
Low	1,937	-15	101	2,023	4.46%
Moderate	3,906	-39	-49	3,818	-2.25%
High	2,639	-34	-53	2,552	-3.30%
Total	8,953	-89	89	8,953	NA
Sum HSI Values	**5,065,791**	**-58,016**	**-131,858**	**4,933,933**	**-2.60%**

Notes:
[1]Maximum disturbance represents the remaining habitat once habitat loss to PDA and reduced effectiveness in the ZOI is accounted.
[2]Percent change is the difference in habitat conditions at maximum disturbance from baseline conditions.

2.2.4 Habitat Residual Effects

The direct loss of 88.5 km² of late winter habitat within the PDA will result in a residual effect because the habitat will not be reclaimed within one generation of moose (Table 5). Additionally, the amount of high and moderate quality late winter habitat may be effectively reduced by 3.3% and 2.3%, respectively (Table 5); however, the effect of the ZOI is not permanent and will cease as soon as operations are complete and sensory disturbances are diminished. Considering the value of all habitat classes combined, there is a maximum overall reduction of 2.6% of the late winter habitat quality within the RSA (Sum HSI values; Table 5). An illustration of the Project effects on moose late winter habitat, considering habitat loss within the PDA, reduced effectiveness within the ZOI, and the winter range HSI is found in Figure 3. Project effects on habitat quality within the ZOI may be overestimated — in some cleared areas such as the Freegold Road Upgrade and extension, moose could be drawn to the roadside as the growth of willow is often promoted by disturbance (Maier et al. 2005).



2.2.5 Significance of Effect on Habitat

Project-related effects to moose habitat availability will occur; however, due to the conservative approach taken throughout the assessment, the reduction of late winter habitat effectiveness is likely over-estimated. By minimizing the Project footprint, actively managing for sensory disturbances, and minimizing impacts to moose movement, effects to habitat availability can be minimized. Upon mine closure, the effectiveness of habitat within the ZOI will return to baseline levels.

Residual effects of the Project on moose habitat availability are quantified in Table 5. The area of late winter habitat within the moose RSA that will be directly lost totals 88.5 km². High quality late winter habitat lost because of direct overlap with the Project footprint is 34 km², while high quality late winter habitat lost due to indirect effects of human disturbance within the 500 m ZOI is 53 km². In total, the Project is anticipated to reduce the availability of high quality winter habitat by 87 km², which is equivalent to a 3.3% reduction in

available high quality winter habitat within the RSA. The overall loss of moose late winter habitat due to direct and indirect effects of the Project is 2.6%.

The effect of the Project on late winter moose habitat availability is not significant at the scale of the moose RSA, as the loss is within the range of the identified low threshold (Table 3). In consideration of uncertainty due to natural regimes (e.g., forest fires), the confidence in this prediction is moderate.

Appendix A – Economic Impact Modeling Assumptions 20

1. EXECUTIVE SUMMARY

This report examines the economic impacts that may be realized by Yukon communities, residents and governments as a result of the development and operation of the Casino Mining Corporation's ("CMC") Casino project. CMC is a wholly-owned subsidiary of Western Copper and Gold Corporation ("WCGC").

MNP LLP's ("MNP") original economic impact study of the Casino project, based on the 2011 Pre-Feasibility Study, was issued in January 2012.[1] This updated economic impact assessment is based on the recently published Feasibility Study.[2]

Construction Impacts of the Casino Project

The construction of the Casino project is expected to occur over four years and to cost a total of $2.5 billion in capital expenditures.[3] The following table summarizes the economic impacts that are estimated to occur in Yukon and Canada through development of the mine. As indicated, we estimate GDP generated in Yukon by the construction of the Casino project at $363 million[4] (the equivalent of 13.6% of the Territory's 2011 nominal GDP of $2.7 billion).[5] Combining the impacts generated in Yukon and the rest of Canada, we estimate the construction of the Casino project to contribute $1,976 million to GDP throughout Canada. We also estimate the development of the mine to create total employment of 22,601 FTEs and to generate $1.1 billion in wages and salaries across Canada. Additionally, we estimate the mine's construction to generate $407 million in taxes to federal, provincial/territorial and municipal governments.

Total Projected Construction Impacts of the Casino Project

Total Construction Impacts (Direct, Indirect and Induced)	Output (millions)	GDP (million)	Employment (FTEs)	Wages and Salaries (millions)[6]	Federal Tax (millions)	Yukon Territorial and Provincial Tax (millions)	Other Tax (millions)
Total Yukon Impacts	$779	$363	5,091	$195	$33	$22	$7
Rest of Canada	$4,359	$1,613	17,509	$928	$201	$134	$10
All of Canada **Total**	**$5,138**	**$1,976**	**22,601**	**$1,123**	**$234**	**$156**	**$17**

Operation Impacts of the Casino Project

Operation of the Casino project is expected to generate economic benefits to Yukon and Canada through expenditures on goods and services, the creation of employment opportunities and the generation of tax revenues for local, territorial and federal governments. The following table summarizes the economic impacts that are estimated to occur in Yukon and Canada. We estimate the annual GDP generated in

[1] MNP. *Economic Impacts of the Casino Mine Project*. [Issued January 2012].
[2] M3 Engineering & Technology Corp. *Casino Project: Technical Report Feasibility Study.* [Published January 2013].
[3] M3 Engineering & Technology Corp. *Casino Project: Technical Report Feasibility Study.* [Published January 2013].
[4] Please note that economic impacts were derived using Statistics Canada's 2008 Input Output Model. In our previous report, we derived the economic impacts of the proposed Casino mine using Statistics Canada's 2007 Input Output Model.
[5] Statistics Canada, CANSIM, table 384-0038. *Gross Domestic Product, Expenditure-Based, Provincial And Territorial At Current Prices, 2011.* Available: http://www.statcan.gc.ca/tables-tableaux/sum-som/l01/cst01/econ15-eng.htm [Last Modified 2012-11-19].
[6] Please note that throughout the report, estimated wage and salary impacts do not include employers' contributions or payments to benefit plans for the health and financial well-being of employees and their families.

Yukon by the operation of the Casino project at $274 million (equivalent to 10.3% of the Territory's 2011 nominal GDP of $2.7 billion).[7] Combining the impacts generated in Yukon and the rest of Canada, we estimate the annual operation of the mine to contribute $350 million to GDP in Canada. We also estimate the operation of the mine to create total employment of 1,308 FTEs and to generate $61 million in wages and salaries across Canada in each year of operation.

Total Projected Annual Operating Impacts of the Casino Project

Total Operating Impacts (Direct, Indirect and Induced)	Output (millions)	GDP (million)	Employment (FTEs)	Wages and Salaries (millions)	Federal Tax (millions)	Yukon Territorial Tax and Royalties and Provincial Tax (millions)	Other Tax (millions)
Total Yukon Impacts	$342	$274	855	$43	$20	$81	$1
Rest of Canada	$138	$76	453	$19	$12	$10	$0
All of Canada **Total**	**$480**	**$350**	**1,308**	**$61**	**$32**	**$92**	**$2**

Government Revenue

Our economic model estimates that $81 million in new annual tax revenues and royalties will accrue to the Yukon Government as a result of operation of CMC's proposed Casino mine. Of that amount, $25 million is attributable to direct income taxation sources (Personal Income Tax and Corporate Income Tax) and the other $56 million[8] is an estimate of annual resource royalty revenues.[9]

Total Impacts of the Casino Project

The Casino project will produce significant and extensive economic impacts for Yukon Territory and other provinces and territories across Canada. The following table summarizes the economic impacts that are estimated to occur in Yukon and Canada over the projected four years of construction and the 22 years of operation of the Casino mine. We estimate the Casino project to contribute a total of $6.4 billion to GDP in Yukon Territory. Combining the impacts generated in Yukon and the rest of Canada, we estimate the Casino project to contribute a total of $9.7 billion to GDP in Canada. Also, we estimate the Casino project to create overall employment of 51,373 FTEs and to generate a total of $2.5 billion in wages and salaries in Canada. In addition to these impacts, we estimate the Casino project to generate $3.1 billion in taxes to federal, provincial/territorial and municipal governments across the country during the life of the mine.

[7] Statistics Canada, CANSIM, table 384-0038. *Gross Domestic Product, Expenditure-Based, Provincial And Territorial At Current Prices, 2011.* Available: http://www.statcan.gc.ca/tables-tableaux/sum-som/l01/cst01/econ15-eng.htm [Last Modified 2012-11-19].
[8] Yukon Mining Royalties are assumed to be over a 24 year period.
[9] Please note that estimates on new annual tax revenue and royalties generated to the Yukon Government as a result of the proposed Casino mine are before any federal financial agreement offsets.

Total Projected Impacts of the Casino project Construction and Operation

Total Projected Life Impacts- 4 years of construction and 22 years of operation (Direct, Indirect and Induced)	Output (millions)	GDP (million)	Employment (FTEs)	Wages and Salaries (millions)	Federal Tax (millions)	Yukon Territorial Tax and Royalties and Provincial Tax (millions)	Other Tax (millions)
Total Yukon Impacts	$8,308	$6,402	23,893	$1,131	$464	$1,810	$36
Rest of Canada	$7,388	$3,275	27,480	$1,338	$472	$359	$16
All of Canada **Total**	**$15,696**	**$9,678**	**51,373**	**$2,469**	**$936**	**$2,169**	**$52**

Other Economic Benefits

In contrast to economic impacts, economic benefits include long-term or downstream activity that would not normally be captured in economic impacts. Some of the economic benefits that are expected to be realized through the development of the Casino project include:

- Training opportunities
- Joint ventures
- Support for local developments or infrastructure

Social and Community Impacts

Social impacts are not easily quantified, but may have far reaching impacts on individuals, communities and the environment. Some of the social and community impacts that may occur through the development of the Casino project include impacts to:

- Population
- Local infrastructure, social services and community services
- Housing

Please see *Section 6* for more detail on the economic and social considerations related to the Casino project.

2. BACKGROUND AND STUDY PURPOSE

2.1 INTRODUCTION

Casino Mining Corporation's ("CMC") Casino project is a proposed open pit mine located in west central Yukon. The property is approximately 300 km northwest of the territorial capital of Whitehorse and is located on Crown land administered by Yukon Government. The property is located within the Selkirk First Nation traditional territory and neighbours on the Tr'ondek Hwechin First Nation traditional territory that lies to the north. The road access falls within Selkirk First Nation and Little Salmon/Carmacks First Nation traditional territories.

In 2013, a Feasibility study on the Casino project assessed that the project could be economically developed. Four metals are planned to be produced at the proposed open pit mine: copper, gold, silver and molybdenum. With a projected mine life of 22 years, the mine is expected to produce 3.6 billion pounds of copper, 325 million pounds of molybdenum, 30.3 million ounces of silver and 5.7 million ounces of gold.[10]

The Casino project is expected to be a major contributor to growth in the Yukon mining sector and is expected to provide economic benefits to both Yukon and the rest of Canada.

2.2 STUDY PURPOSE

In this report we examine the economic impacts that may be realized by Yukon communities, residents and governments as a result of the development and operation of the Casino mine.

2.3 DATA COLLECTION, AVAILABILITY AND RELIABILITY

Data for economic impact modelling were obtained from CMC, Statistics Canada and Yukon Government sources (e.g. Yukon Economic Development). Additional material was collected through the review of publicly available statistics, articles and reports. Estimates of economic impacts were derived from Statistics Canada's 2008 input/output model. When estimating future operational and capital spending, assumptions and approaches were selected in cooperation with CMC representatives. Additional material was collected through the review of publicly available statistics, articles and reports.

In addition, as part of MNP LLP's (MNP's) original economic impact study we also conducted face to face interviews with sixteen representatives from relevant organizations including Yukon Energy Corporation, Yukon Economic Development, the Yukon Chamber of Mines, Yukon Bureau of Statistics, the Whitehorse and Yukon Chamber of Commerce, the Tourism Industry Association of Yukon and Yukon Finance. Interview sessions focused on the Yukon economy and its ability to meet the demand of a mining project such as Casino.

2.4 ORGANIZATION OF THE REPORT

The remaining sections of the report are organized as follows:

- Section 3 provides an overview of the Casino project.
- Section 4 provides a description of the economic impact methodology and provides the aggregate results for the economic impact associated with construction and operation of the mine.
- Section 5 describes the implications for government revenue at the federal, territorial and local level.
- Section 6 describes other economic benefits that might be associated with the mine.
- Section 7 provides a description of the social impacts that might be associated with the mine.

[10] M3 Engineering & Technology Corp. *Casino Project: Technical Report Feasibility Study.* [Published January 2013].

2.5 REPORT LIMITATIONS

This report is not intended for general circulation, nor is it to be published in whole or in part without the prior written consent of MNP LLP. The report is provided for information purposes and is intended for general guidance only. It should not be regarded as comprehensive or a substitute for personalized, professional advice. We have relied upon the completeness, accuracy and fair presentation of all information and data obtained from CMC and public sources, believed to be reliable. The accuracy and reliability of the findings and opinions expressed in the report are conditional upon the completeness, accuracy and fair presentation of the information underlying them. As a result, we caution readers not to rely upon any findings or opinions expressed as accurate or complete and disclaim any liability to any party who relies upon them as such.

Additionally, the findings and opinions expressed in the report constitute judgments as of the date of the report, and are subject to change without notice. MNP is under no obligation to advise of any change brought to its attention which would alter those findings or opinions.

Finally, the reader must understand that our analysis is based upon projections, founded on past events giving an expectation of certain future events. Future events are not guaranteed to follow past patterns and results may vary, even significantly. Accordingly, we express no assurance as to whether the projections underlying the economic and financial analysis will be achieved.

3. OVERVIEW OF THE CASINO MINE PROJECT

3.1 YUKON ECONOMY AND MINING INDUSTRY

The Yukon economy, and in particular the mining sector, has experienced significant growth over the last couple of years. Yukon's real GDP has increased 7% from $2.2 billion in 2010 to $2.4 billion in 2011.[11] Statistics Canada real GDP by industry release also noted a gain of 6.5% in Yukon's real GDP.[12] According to Statistics Canada, the Mining, Quarrying and Oil and Gas Extraction sector was the primary contributor to total real GDP growth in 2011, accounting for over 80% of all estimated gains in 2011.[13] The economic growth in the Yukon mining sector can be attributed to a variety of factors, including the permitting and operation of three new mines (Minto Mine, Bellekeno Mine and Wolverine Mine), the continuation of high mineral exploration, development expenditures and utility construction.

Even though there is uncertainty on the level of construction activity, mining project development, and exploration expenditures that will take place in the Yukon in 2013. It is expected for the Yukon's real GDP in 2013 to grow for a tenth consecutive year, but likely below levels recorded in recent years.[14]

3.2 OVERVIEW OF THE CASINO MINE PROJECT

The Casino property has had a long exploration history dating from the first mineral claims dating in 1917. In 1936, discoveries of silver, lead and zinc were made, leading to focused exploration of the property for lead and silver through to 1967. From 1968 to 1995 the property was explored for its copper and molybdenum porphyry deposits (porphyry deposits are the world's most plentiful and important sources of copper and molybdenum).[15] In 2006, CMC acquired the Casino deposit and conducted several evaluations of the property. A Pre-Feasibility Study was conducted in 2008, and updated in 2011. The final Feasibility Study was released in January, 2013.[16]

The Casino property is located in south-western Yukon in the Dawson Range Mountains, where the terrain is characterized by rounded and rolling topography with moderate to deep valleys. The Yukon River flows to the west and is about 16 km north of the site. The property is situated about 300 km northwest of Whitehorse and 560 km from the year-round port in Skagway, Alaska. The area around the Casino project has been subject to increasing staking and exploration activities with over 100 mining companies now actively working in the general region.[17]

An extensive amount of infrastructure, both on-site and off-site, will be required to support mine operations and the transport of people, supplies and extracted metals. On site infrastructure is planned to include a power generation plant fuelled by Liquefied Natural Gas (LNG). CMC has recently determined the best alternative is to construct a fit-for-purpose LNG liquefaction facility in the vicinity of Fort Nelson, BC and to truck LNG to the Yukon from this facility. The estimated cost of supplying LNG from BC is consistent with the costs used as the basis for the Feasibility Study released in 2013. Other on-site infrastructure will include construction of process buildings, a truck shop with service bays, accommodation and dining facilities, ancillary buildings such as an administrative building and warehouse, and sewage facilities.

The off-site infrastructure required for the transport of people, supplies and extracted metals is planned to include development of a new 1,600 metre airstrip for employee transport to and from the site and construction of a new 132 km all-weather access road to service the plant. The access road will link to the existing Freegold Road, which will also undergo improvements.

Significant amounts of construction labour will be required to build the Casino mine. At its peak, construction labour is estimated to total approximately 980 people. Initial capital costs associated with construction of the mine (including items such as an electricity generation plant, mine facilities and engineering activities) are estimated at $2.5 billion.[18]

The life of the Casino mine is expected to be 22 years, during which time significant amounts of operations labour will be required. Annual operations labour requirements are expected to total of approximately 600 to 700 permanent mining personnel and 100 to 200 contracting support staff, with annual operating costs expected to average $447 million.[19]

3.3 MINE VALUE CHAIN

A value chain can be defined as a chain of activities that combine to create products within specific sectors. Products pass through the chain gaining value at each activity. These activities can range from research and development, to production and manufacturing and marketing. When applied to the extraction of natural resources, the value chain describes the steps from the extraction of natural resources to their processing and sale.

For development, operation and reclamation of a mine the size of Casino, direct impacts arise through the major activities associated with each stage while the indirect and induced activities arise from the linkages that exist with suppliers and other sectors. Such linkages are illustrated in the diagram on the following page.

4. ECONOMIC IMPACT ANALYSIS

4.1 METHODOLOGY

To estimate the economic impacts of the Casino project, we utilized an input-output methodology using economic multipliers published by Statistics Canada.[20] Input-output modeling is a widely-used and widely-accepted approach, making it recognizable by many different stakeholders and audiences. The structure of the approach also facilitates easy comparisons between reported results for different projects and facilities.

In general, economic impacts are viewed as being restricted to quantitative, well-established measures of economic activity. The most commonly used of these measures are output, GDP, government tax revenue and employment:

- **Output** is the total gross value of goods and services produced by a given company or industry measured by the price paid to the producer. This is the broadest measure of economic activity.
- **Gross Domestic Product (GDP)**, or value added refers to the additional value of a good or service over the cost of inputs used to produce it from the previous stage of production. Thus GDP is equal to net output, or the difference between revenues and expenses on intermediate inputs. It is the incremental value created through labour or mechanical processing. Total GDP is a more meaningful measure of economic impact, as it avoids double counting during each round of impacts.
- **Government Tax Revenues** arise from personal income taxes, indirect taxes less subsidies, corporate income taxes and natural resource royalties.
- **Employment** is the number of additional jobs created. Employment is measured in terms of full-time equivalents (FTE).

Economic impacts may be estimated at the direct, indirect, and induced levels.

- **Direct impacts** are changes that occur in "front-end" businesses that would initially receive expenditures and operating revenue as a direct consequence of the operations and activities of a facility.
- **Indirect impacts** arise from changes in activity for suppliers of the "front-end" businesses.
- **Induced impacts** arise from shifts in spending on goods and services as a consequence of changes to the payroll of the directly and indirectly affected businesses.

4.2 CONSTRUCTION AND DEVELOPMENT IMPACTS

Construction of the Casino project is expected to generate economic impacts throughout Yukon. Detailed cost estimates associated with the construction of the mine were provided to us by CMC. In addition, CMC was able to provide us with estimates related to the proportion of spending expected to occur within Yukon and the proportion of expenditures expected to occur elsewhere in Canada.

Using the projected construction costs and the related assumptions, we estimate GDP generated by the construction of the Casino project at $363 million (the equivalent of 13.6% of the Territory's $2.7 billion nominal GDP in 2011).[21] We also estimate the construction of the mine to create employment of 5,091 full-time equivalents (FTEs) and to generate $195 million in wages and salaries. In addition, the Casino project's construction is expected to generate $62 million in revenues to the federal, territorial and local governments.

[20] Please note that economic impacts were derived using Statistics Canada's 2008 Input Output Model. In our previous report, we derived the economic impacts of the proposed Casino mine using Statistics Canada's 2007 Input Output Model.
[21] Statistics Canada, CANSIM, table 384-0038. *Gross Domestic Product, Expenditure-Based, Provincial And Territorial At Current Prices, 2011.* Available: http://www.statcan.gc.ca/tables-tableaux/sum-som/l01/cst01/econ15-eng.htm [Last Modified 2012-11-19].

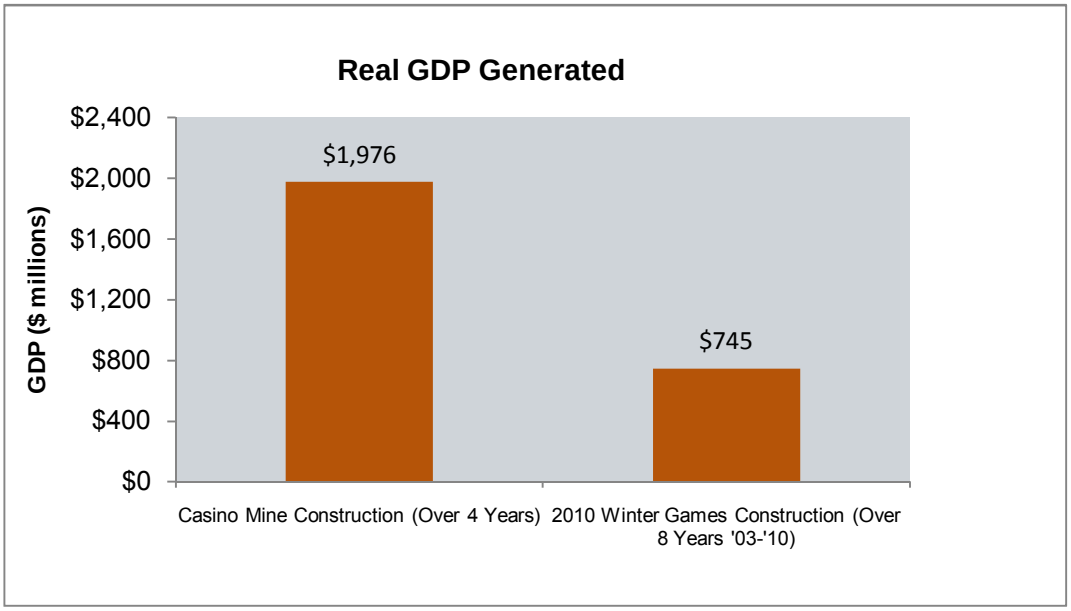
Table 1: Projected Construction Impacts of the Casino project to Yukon Territory

Total Construction Impacts	Output (millions)	GDP (million)	Employment (FTEs)	Wages and Salaries (millions)[22]	Federal Tax (millions)	Yukon Territorial and Provincial Tax (millions)	Other Tax (millions)
Direct	$576	$261	3,275	$137	$24	$16	$5
Indirect & Induced	$204	$102	1,817	$58	$10	$6	$2
Total (Direct, Indirect and Induced)	**$779**	**$363**	**5,091**	**$195**	**$33**	**$22**	**$7**

In addition to the impacts generated in Yukon, economic impacts are created throughout the rest of Canada. As indicated in the table below, the construction of the Casino project is estimated to contribute an additional $1.6 billion to GDP outside of Yukon. We also estimate the construction of the mine to create employment of 17,509 FTEs and to generate $928 million in wages and salaries in Canadian regions outside of Yukon. Furthermore, we estimate the construction of the mine to generate $345 million in tax revenues to various levels of government outside of the Yukon.

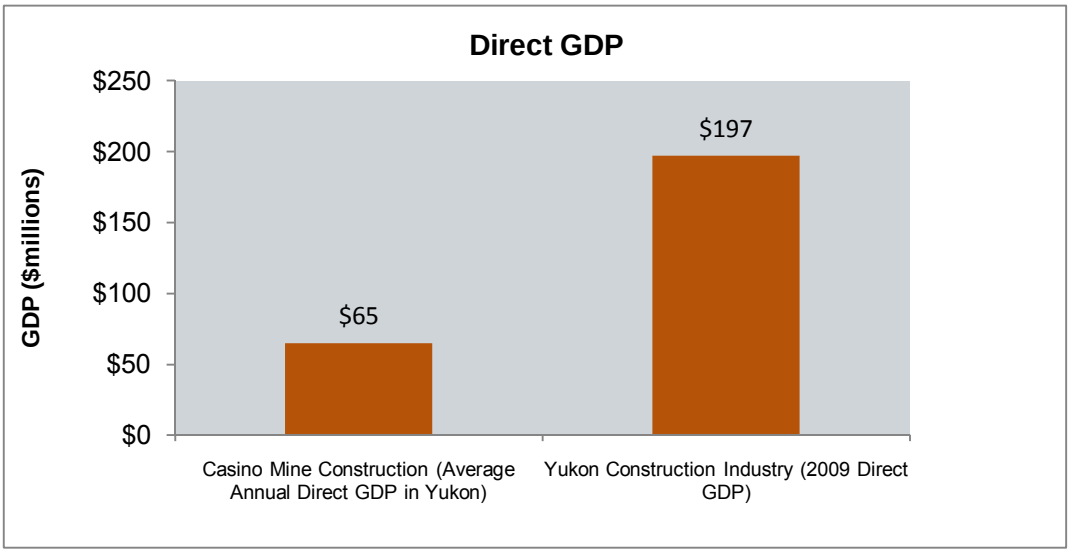
Table 2: Projected Construction Impacts of the Casino project to the Rest of Canada

Total Construction Impacts	Output (millions)	GDP (million)	Employment (FTEs)	Wages and Salaries (millions)	Federal Tax (millions)	Yukon Territorial and Provincial Tax (millions)	Other Tax (millions)
Rest of Canada **Total (Direct, Indirect and Induced)**	$4,359	$1,613	17,509	$928	$201	$134	$10



Combining the impacts generated in Yukon and the rest of Canada, we estimate the construction of the Casino project to contribute $2.0 billion to GDP in Canada. We also estimate the development of the mine to create employment of 22,601 FTEs and to generate $1.1 billion in wages and salaries in Canada. We estimate the mine's construction to generate $407 million in taxes to federal, provincial/territorial and municipal governments.

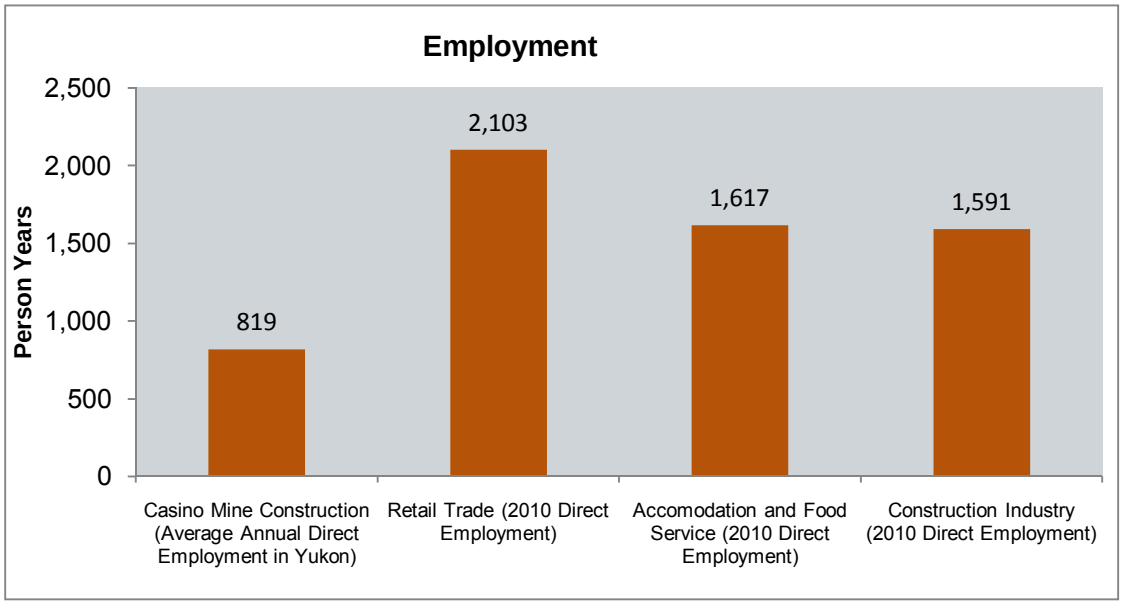
Table 3: Total Projected Construction Impacts of the Casino Project



Total Construction Impacts	Output (millions)	GDP (million)	Employment (FTEs)	Wages and Salaries (millions)	Federal Tax (millions)	Yukon Territorial and Provincial Tax (millions)	Other Tax (millions)
All of Canada **Total (Direct, Indirect and Induced)**	$5,138	$1,976	22,601	$1,123	$234	$156	$17

[22] Please note throughout the report, estimated wage and salary impacts do not include employers' contributions or payments to benefit plans for the health and financial well-being of employees and their families.

To provide some perspective on the size of the Casino mine construction impacts it is illustrative to compare those impacts to ones produced by other projects and industries. As shown in the graph below, the total GDP (direct, indirect and induced) generated within Canada during the four years of mine construction are estimated to be close to three times as large as the total GDP generated by the eight years of construction activity related to the 2010 Winter Olympic and Paralympic Games in Vancouver.[23]



As shown in the graph below, the average annual direct GDP generated in Yukon by the construction of the Casino mine would be about 34% of the current annual GDP of the Yukon construction industry. [24]

[23] PWC. *The Games Effect Summary Report*. [Published October 2011]. Available: http://www.fin.gov.bc.ca/reports/PwC_The_Games_Effect_Summary_Report_7_2010_EN_FINAL.PDF
[24] Statistics Canada, CANSIM, table 379-0030. Gross Domestic Product (GDP) At Basic Prices, By North American Industry Classification System (NAICS), Provinces And Territories At Current Prices, 2009. Available: http://www5.statcan.gc.ca/cansim/a47.

The average annual direct employment produced in Yukon by the construction of the Casino mine would be between about 39% to 51% of the annual direct employment in major Yukon sectors, including the retail sector, the accommodation and food sector and the construction sector.[25]

[25] Yukon Bureau of Statistics. *Yukon Business Survey 2010.* Available: http://www.eco.gov.yk.ca/stats/pdf/2010_Business_Survey_Report.pdf.

4.3 ANNUAL OPERATIONS IMPACTS

The operations of the Casino project are expected to impact Yukon's economy through expenditures on goods and services, the creation of employment opportunities and the generation of tax revenues for local, territorial and federal governments. CMC believes that roughly 69% of operational spending will occur in Yukon. Using that percentage, together with projected annual operational spending data provided by CMC, we estimate the annual GDP generated in Yukon by the operation of the Casino project at $274 million. This is equivalent to 10.3% of the Territory's 2011 nominal GDP of $2.7 billion.[26] We also estimate the operation of the mine to create annual employment of 855 FTEs and to generate $43 million in annual wages and salaries.

Table 4: Projected Annual Operating Impacts of the Casino project to Yukon Territory

Operating Impacts	Output (millions)	GDP (million)	Employment (FTEs)	Wages and Salaries (millions)	Federal Tax (millions)	Yukon Territorial Tax and Royalties and Provincial Tax (millions)	Other Tax (millions)
Direct	$307	$232	542	$32	$16	$78	$1
Indirect and Induced	$36	$42	313	$11	$3	$3	$0.2
Total (Direct, Indirect and Induced)	**$342**	**$274**	**855**	**$43**	**$20**	**$81**	**$1**

In addition to the impacts generated in Yukon, Casino mine operations will generate economic impacts in other regions of Canada. Operations at the Casino project are estimated to contribute $76 million annually to GDP in other regions of Canada. We also estimate the projected operating expenditures of the mine to create annual employment of 453 FTEs and to generate $19 million in annual wages and salaries in regions outside of Yukon Territory. In addition, we estimate the operation of Casino project to generate $23 million in annual tax revenues to various levels of government.

Table 5: Projected Annual Operating Impacts of the Casino Project to the Rest of Canada

Operating Impacts	Output (millions)	GDP (million)	Employment (FTEs)	Wages and Salaries (millions)	Federal Tax (millions)	Yukon Territorial and Provincial Tax (millions)	Other Tax (millions)
Rest of Canada **Total (Direct, Indirect and Induced)**	$138	$76	453	$19	$12	$10	$0.3

[26] Statistics Canada, CANSIM, table 384-0038. *Gross Domestic Product, Expenditure-Based, Provincial And Territorial At Current Prices, 2011*. Available: http://www.statcan.gc.ca/tables-tableaux/sum-som/l01/cst01/econ15-eng.htm [Last Modified 2012-11-19].

As shown in Table 6, we estimate the operations of the Casino project to contribute a total of $350 million annually to GDP in Canada (Yukon plus the remainder of Canada). Also, we estimate the operations of the mine to create total annual employment of 1,308 FTEs and to generate a total of $61 million in annual wages and salaries. In addition to these impacts, we estimate annual operations of the mine to generate $125 million in taxes to federal, provincial/territorial and municipal governments across the country.[27]

Table 6: Total Projected Annual Operating Impacts of the Casino project

Operating Impacts	Output (millions)	GDP (million)	Employment (FTEs)	Wages and Salaries (millions)	Federal Tax (millions)	Yukon Territorial Tax and Royalties and Provincial Tax (millions)	Other Tax (millions)
All of Canada **Total (Direct, Indirect and Induced)**	$480	$350	1,308	$61	$32	$92	$2

5. IMPLICATIONS FOR GOVERNMENT REVENUE

As described above, the construction of the Casino project is expected to generate tax revenues for federal, territorial and municipal governments. This section summarizes the impacts for these governments.

5.1 FEDERAL

Using the projected construction costs and related assumptions provided by CMC, we estimate the construction of the Casino project to generate (through direct, indirect and induced effects) $234 million in tax revenues to the federal government.

The operations of the Casino project are also expected to generate tax revenues to the Government of Canada. We estimate the operation of the mine to generate $32 million in annual tax revenues to the federal government.

[27] Figures may not add up due to rounding.

5.2 TERRITORIAL

The Casino project's construction is expected to generate tax impacts throughout Yukon. Using the projected construction costs and the related assumptions, we estimate the mine's construction to generate $22 million in revenues to Yukon Government.

Table 7: Projected Tax Impacts of the Casino Project Construction to Yukon Territory

Total Construction Impacts	Output (millions)	Yukon Territorial Tax (millions)
Direct	$576	$16
Indirect and Induced	$204	$6
Total	**$779**	**$22**

*Average Effective tax rates provided by Natural Resources Canada

The operations of the Casino project also impact Yukon's economy through the generation of tax revenues and royalties for the Yukon Government. Using estimated operational spending data provided by CMC (and assuming 69% of this spending occurs in Yukon), we estimate the operation of the mine to generate $81 million in annual tax revenues and royalties to Yukon Government.

Table 8: Projected Annual Tax Impacts of the Casino Project Operation to Yukon Territory

Operating Impacts	Output (millions)	Yukon Territorial Tax and Royalties (millions)
Direct	$307	$78
Indirect and Induced	$36	$3
Total	**$342**	**$81**

Please note that estimates from our economic impact model on the projected tax revenues and royalties that will accrue to the Yukon Government as a result of CMC's proposed Casino mine operations are before any federal financial agreement offsets (e.g. Territorial Formula Funding (TFF) and Resources Revenue Sharing (RRS) agreements). In the earlier MNP Economic Impact Assessment of the Casino mine, we estimated that, as a result of the provisions that were contained in the Yukon fiscal arrangement agreements with Canada, the Yukon Government would retain 78% of the annual tax and royalty amounts.[28]

[28] It is our understanding that this percentage may now be higher as a result of recent changes in the resource revenue arrangements between the government of Canada and Yukon. For more information on these changes please refer to http://www.gov.yk.ca/news/get-thefacts_dta.html.

6. OTHER ECONOMIC BENEFITS

In contrast to economic impacts, economic benefits include measures that are broader in scope, and may include both activity-based and outcome-based measures. These benefits may also describe long-term or downstream activity that would not normally be captured in economic impacts. While economic impacts utilize standard measures that can be estimated for nearly any type of project, economic benefits and their accompanying measures may vary greatly from project to project. The following section illustrates some of the economic benefits that are expected to be realized through the development of the Casino project.

6.1 TRAINING OPPORTUNITIES

It is our understanding that CMC is committed to providing training to local First Nations and other Yukon residents. While the specific training programs will not be created until the mine is in development, training opportunities are expected to include on the job training for mine employees and contractors, training on equipment and procedures and training for apprentices.

There may also be opportunities for literacy programs, completion of secondary school general equivalency degrees, pre-trades programs, community-based training, life-skills training, drug and alcohol awareness and rehabilitation and management development programs. It is our understanding that CMC is interested in opportunities to partner with local communities, government and others to provide community-based training.

6.2 SUPPORT FOR LOCAL DEVELOPMENTS OR INFRASTRUCTURE

The construction and operation of the Casino project will require significant infrastructure developments including a new all-weather access road (approximately 132 km), construction of a new airstrip, upgrades to the Freegold Road and construction of an electrical power generation plant. Legacy infrastructure related to road and energy development may provide surrounding communities with opportunities to utilize the infrastructure in the future. For example, the existence of an airstrip may create opportunities to fly in tourists to surrounding areas.

During interviews with the Yukon Chamber of Mines and other Yukon organizations, representatives noted that legacy infrastructure may provide economic benefits to area communities. Respondents suggested the infrastructure created through the development and operation of Casino mine could provide communities with future access to power generation opportunities, roads and other transportation routes.

There is a strong interest among exploration companies in the Freegold Road region generally. Therefore the legacy infrastructure may also be viewed as advantageous to other resource development in this region.

6.3 JOINT VENTURES

It is our understanding that CMC is committed to finding opportunities to partner with local First Nations and other local businesses. These joint ventures may provide an avenue for expanding local business capacity to prepare for and take advantage of business opportunities related to the Casino project's construction and operation.

Joint ventures offer an opportunity for two or more people to contribute goods, services or capital to a business enterprise. In the mining sector, joint ventures can be negotiated throughout the stages of a mine and offer opportunities for local communities to take advantage of the economic opportunities offered through construction and operation of a mine like Casino. Examples of joint ventures might include, catering, camp construction, equipment supply, sampling, fuel hauling or expediting. Typically business opportunities increase as a project moves through the stages of mine development.

7. SOCIAL AND COMMUNITY IMPACTS

Impacts generated from the development and operation of the Casino project also include impacts to communities. Social impacts are not easily quantified, but may have far reaching impacts on individuals, communities and the environment. The following section illustrates some of the social and community impacts that may occur through the development of the Casino project.

7.1 POPULATION AND INFRASTRUCTURE IMPACTS

Yukon's average annual population increased by 2% from 2011 to 36,101 in 2012.29 This marked the tenth consecutive year of population growth in the territory. Both direct and indirect employment associated with the Casino project will most likely result in significant, additional population growth in the Territory. The types of population changes that may occur with the Casino project can have implications for surrounding communities. Large increases to population may require additional local infrastructure, social services and community services.

Operation of Casino may impact labour supply in Yukon. Demand for labour at the mine and the associated high wages may increase competition for available labour. During interviews with various Yukon representatives, respondents noted they were concerned about the potential labour shortages that might occur with development and operation of Casino mine. The attractive salaries associated with a mine like Casino, may draw employees from other jobs thus creating shortages in other, lower paying industries.

The activity associated with the Casino project may have implications for health care and other related services in the Territory. Territorial health systems are currently facing shortages in the availability of family physicians, hospitals and specialists. This is of particular concern outside of Whitehorse. The size of Yukon coupled with a sparse population result in many patients being medically transported to health facilities in other parts of Canada. The 2008 Yukon Health Care Review noted that Yukon is facing strains within its health care system that raise concerns about the sustainability of the health care system.30

In interviews with Yukon Government representatives, respondents noted that development and operation of the Casino project may result in infrastructure impacts to roads, education, social services, and daycare. The additional demand on related infrastructure may represent costs to government.

7.2 HOUSING

Development and operation of the Casino project may have indirect impacts on the availability and cost of accommodations in the Territory. In some regions, mining activity has contributed to increased costs for rent or real estate. The influx of workers can result in housing shortages, inflated house prices or rents and low vacancy rates.

Housing or the lack thereof, appears to be an existing concern in the Territory, with homelessness and housing inadequacy having been identified by governments as an issue. Recent estimates place the rental vacancy rate in Whitehorse at 1.3%.31 In 2010, the Whitehorse Housing Adequacy Study found that 58% of respondents noted that it is difficult to find affordable rental accommodations and vacancies.32

During interviews with City of Whitehorse representatives, respondents suggested that the city was experiencing a housing crisis that may be exacerbated by development and operation of the Casino project. The project may place additional stress on the Yukon housing market leading to social and economic pressures on local residents who may not be directly benefiting from the resource development.

8. CONCLUSION

The Casino project will produce significant economic impacts for Yukon Territory. In addition, considerable and extensive economic impacts would be realized for provinces and territories across Canada.

The overall life of the Casino project is estimated to contribute significantly to the Yukon economy. As shown in Table 9, the construction and operation of the Casino project over its 22 year life is estimated to generate $6.4 billion (expressed in 2011 dollars) to GDP in Yukon. We also estimate the Casino project to create overall employment of 23,893 FTEs and to generate $1.1 billion in total wages and salaries in Yukon. In addition, we estimate the Casino project to generate $2.3 billion in tax revenues to various levels of governments over the project life.

Table 9: Total Projected Impacts of Casino project Construction and Operation to Yukon Territory

Total Project Life Impacts (combined construction and operations)	Output (millions)	GDP (million)	Employment (FTEs)	Wages and Salaries (millions)	Federal Tax (millions)	Yukon Territorial Tax and Royalties and Provincial Tax (millions)	Other Tax (millions)
Direct	$7,321	$5,373	15,199	$832	$386	$1,729	$30
Indirect and Induced	$988	$1,029	8,694	$299	$78	$80	$6
Total (Direct, Indirect and Induced)	**$8,308**	**$6,402**	**23,893**	**$1,131**	**$464**	**$1,810**	**$36**

In addition to the impacts generated in Yukon, the Casino project will generate considerable economic impacts in other regions of Canada. The Casino project is estimated to contribute a total of $3.3 billion (expressed in 2011 dollars) to GDP in other regions of Canada. We also estimate the Casino project to create overall employment of 27,480 FTEs and to generate $1.3 billion in total wages and salaries in regions outside of Yukon Territory. Furthermore, we estimate the Casino project to generate $848 million in overall tax revenues to various levels of government in regions outside of Yukon.

Table 10: Total Projected Impacts of Casino project Construction and Operation to the Rest of Canada

Total Project Life Impacts (combined construction and operations)	Output (millions)	GDP (million)	Employment (FTEs)	Wages and Salaries (millions)	Federal Tax (millions)	Yukon Territorial and Provincial Tax (millions)	Other Tax (millions)
Rest of Canada **Total (Direct, Indirect and Induced)**	$7,388	$3,275	27,480	$1,338	$472	$359	$16

As shown in Table 11, we estimate the Casino project to contribute a total of $9.7 billion to GDP in Canada (Yukon plus the remainder of Canada). Also, we estimate the Casino project to create overall employment of 51,373 FTEs and to generate close to $2.5 billion in wages and salaries in Canada. In addition to these impacts, we estimate the life of the Casino project to generate $3.1 billion in taxes to federal, provincial/territorial and municipal governments across the country.

Table 11: Total Projected Impacts of the Casino project Construction and Operation

Total Project Life Impacts (combined construction and operations)	Output (millions)	GDP (million)	Employment (FTEs)	Wages and Salaries (millions)	Federal Tax (millions)	Yukon Territorial Tax and Royalties and Provincial Tax (millions)	Other Tax (millions)
All of Canada **Total (Direct, Indirect & Induced)**	$15,696	$9,678	51,373	$2,469	$936	$2,169	$52

In addition to the economic impacts that would be realized for Yukon Territory and Canada as a whole, economic benefits and social and community impacts may result from the Casino project. Some of the additional economic benefits that may be realized through the development of the Casino project include training opportunities, joint ventures and support for local developments or infrastructure. In addition, social and community impacts to population, housing, local infrastructure, social services and community services may also result from the development of the Casino project.

APPENDIX A – ECONOMIC IMPACT MODELING ASSUMPTIONS

Economic Impact Calculations

Data for the economic impact modelling were obtained from CMC, Statistics Canada, and Yukon Government sources (e.g. Yukon Economic Development). Additional material was collected through the review of publicly available statistics, articles and reports. Estimates of economic impacts were derived from Statistics Canada's input/output model. When estimating future operational and capital spending, assumptions and approaches were selected in cooperation with CMC representatives. Additional material was collected through the review of publicly available statistics, articles and reports.

Analysis Approach

The economic impacts were estimated using Statistics Canada's interprovincial 2008 input-output model. The model was used to estimate the number of jobs, output, GDP and wages and salaries supported by proposed spending related to construction and operation of the Casino project. Tax impacts were also estimated based on model output.

Statistics Canada's interprovincial input-output model does not report induced multipliers. MNP estimated induced multipliers using the following procedure:

1. A portion of wages and salaries are directed towards consumption within the Yukon.
2. Wages and salaries are assumed to be spent in a pattern consistent with that reported in Statistics Canada's 2009 Yukon Survey of Household Spending (SHS).
3. Data from the SHS is matched with their respective industry (direct and indirect) Statistics Canada multipliers for output, GDP, employment and wages and salaries.
4. Using the above matching of industry multipliers to the SHS, estimate the first round of induced impacts. For example, if a worker is paid $1000 and has $700 remaining after taxes and savings, we distribute that $700 across consumer goods and services and apply relevant industry multipliers to estimate a first round of induced impacts. That first round of consumer spending will, in turn, generate further incremental wages, a portion of which will be consumed in the Yukon economy. That spending will create a further amount of incremental wages and this will continue until the successive rounds of impacts converges to zero. The sum total of all of these rounds of spending is then totalled.
5. Using the results from steps 1 to 4, together with the Statistics Canada direct and indirect multipliers we then construct a set induced multipliers for each NAICS code which can then be used to estimate induced impacts associated with a particular increase or decrease in a particular industry's output.

As a check, we have compared the induced multipliers for BC produced using this approach with the induced multipliers for BC reported by BC Stats. We found that the induced multipliers produced using this approach are very similar to those reported by BC Stats.

Main Assumptions

The analysis presented in this report is based on a number of assumptions. The main assumptions are:

- Dollar impacts are expressed in 2011 Canadian Dollars.
- Rest of Canada impacts were estimated using a blended multiplier constructed using Yukon import data:

Region	Percent of Impact
Ontario	29%
Alberta	25%
BC	30%
Rest of Canada	16%
Total	**100%**

- Based on information provided by CMC, the following assumptions regarding spending were used:

Percent of household spending in Yukon	70%
Percent of Mine Operations spending in Yukon	69%
Percent of Mine Construction spending in Yukon	26%
Percent of Workforce sourced from Yukon	70% (average over the life of mine)

- Economic impact analysis assumes that Yukon's economy can accommodate the resource allocation required to operate the mine including labour, capital and other materials.
- The tax assumptions used for the economic impact analysis are presented in the following table. Firms are assumed to pay statutory corporate income tax rates on estimated operating surplus. NRCan's recent tax modelling exercise has revealed that, for Yukon, average effective tax rates, which take into account the effect of delayed tax payments, were about only two-thirds of the statutory corporate rates. Hence, we used the effective tax rates corresponding to the statutory corporate rates for Yukon. It is our understanding that using effective tax rates of 6% for the federal corporate income tax and 10% for the Yukon corporate income tax better approximates the expected income tax generated from the project.

Tax Assumptions	
Average Personal Income Tax Rate	18.5%
Federal	12.7%
Provincial	5.8%
Corporate Income Tax Rate	
Federal	6.0%
Yukon	10.0%

- Based on data provided by CMC, the Average Annual Yukon Mining Royalty was assumed to be $56 million[33]. Yukon mining royalties are based on 12% of revenues less operating expenses, depreciation (no more than 15% of the initial capital cost balance at the beginning of the year) and taxes paid. The estimate is based on profitability and does not take into account changes that may affect profitability such as commodity prices. The baseline commodity price assumptions, including exchange rates, can be found in the Feasibility Study.[34]

[33] Yukon Mining Royalties are assumed to be over a 24 year period.

ACKNOWLEDGMENTS

Ecofor Consulting Ltd. (Ecofor) prepared this report on behalf of Casino Mining Corporation.

James Mooney and Kevin Wilson (Owner) would like to thank Casino Mining Corporation for the opportunity to conduct this project and for providing us with assistance.

Ecofor is solely responsible for any errors evident in this report. The opinions and/or recommendations presented herein are ours and do not necessarily reflect those held by the Heritage Branch of the Yukon Government. Previous resource management recommendations made by other private consultants, and others by staff from the Yukon Heritage Resources Unit, are listed within this summary and identified by author. The authors would like to thank Ruth Gotthardt of the Heritage Branch for assistance in providing reports and clarification as needed.

MANAGEMENT SUMMARY

Cultural resources staff of Ecofor Consulting Ltd., (Ecofor) completed this desktop summary in 2014, at the request of Casino Mining Corporation in relation to their submittal to the Yukon Environmental and Socio-economic Assessment Board (YESAB). This report is intended to be a summary document for YESAB to clearly identify what heritage assessment and mitigation work, remains to be completed, and when it should be completed. There are three tasks remaining to be completed. These consist of: 1) remaining heritage impact assessment work; 2) management of impacts to heritage resources (such as avoiding sites, monitoring construction, and mitigating negative impacts where needed through detailed data recovery excavations); and 3) managing chance heritage finds during construction. The first two tasks must be completed after final engineering designs are prepared but prior to construction efforts.

The first steps are to identify all remaining areas where heritage resource impact assessments were not previously completed; and to summarize the management recommendations for archaeological sites and historic resources that may be impacted by the development of the proposed Casino Mine Site and ancillary facilities. These footprints include the upgrades to Freegold Road, the road upgrades from the mine area to the Yukon River, and construction of a road from the mine site to the proposed airstrip and the proposed airstrip itself. These combined footprints also include proposed borrow pits and access roads to the borrow pits, and the mine site and tailings facility. Previous heritage impact assessment work for the proposed extension of Freegold Road was completed and reported under permits 88-03ASR (Gotthardt 1988), 94-09ASR (Handly, Merchant, and Rousseau 1994), 94-22ASR (Handly and Rousseau 1995), 95-01ASR (Gotthardt 1995), 95-02ASR (Hammer 1995), 09-09ASR (Soucey et al 2010a), 10-04ASR (Soucey et al 2010b), 11-04ASR (Mooney 2011), 13-06ASR (de Guzman et al 2014), 13-07ASR (Mooney 2013a), and 13-18ASR (Mooney 2013b). Additional permitted work along the proposed Freegold Road includes 11-13ASR (Mooney 2012), and 12-03ASR (Mooney 2013c). This summary reviews each of these previous efforts and combines them for reference.

The results of this heritage resources summary are presented in the following sections:

1) Areas remaining to be assessed (17 proposed borrow pits and approximately 7.45 km of ROW);
2) Thirty-three (33) archaeological sites to be managed along the proposed upgrading of Freegold Road;
3) Thirty-one (31) historic structures and resources to be managed along the Freegold Road;
4) Seventeen (17) archaeological sites to be managed near the mine site, the proposed airstrip, the road to the airstrip, and the road to the Yukon River;
5) Sixteen (16) historic structures and resources to be managed near the mine site, the proposed airstrip, the road to the airstrip, and the road to the Yukon River;
6) Ten (10) previously noted First Nation use sites along the Freegold Road.

If this project moves forward it is possible that further revisions in the road and ancillary components will be made. It is recommended that any areas of potential ground disturbing impact not previously assessed are reviewed and assessed in the field prior to impacts. Impacts to recorded historic and prehistoric resources should be avoided were possible, or mitigation efforts should be completed prior to construction impacts. Site by site recommendations are presented below. Future ground disturbances associated with the proposed mine and ancillary components are also guided by the Casino Mine Interim Heritage Resources Management Plan (Mooney 2013b).

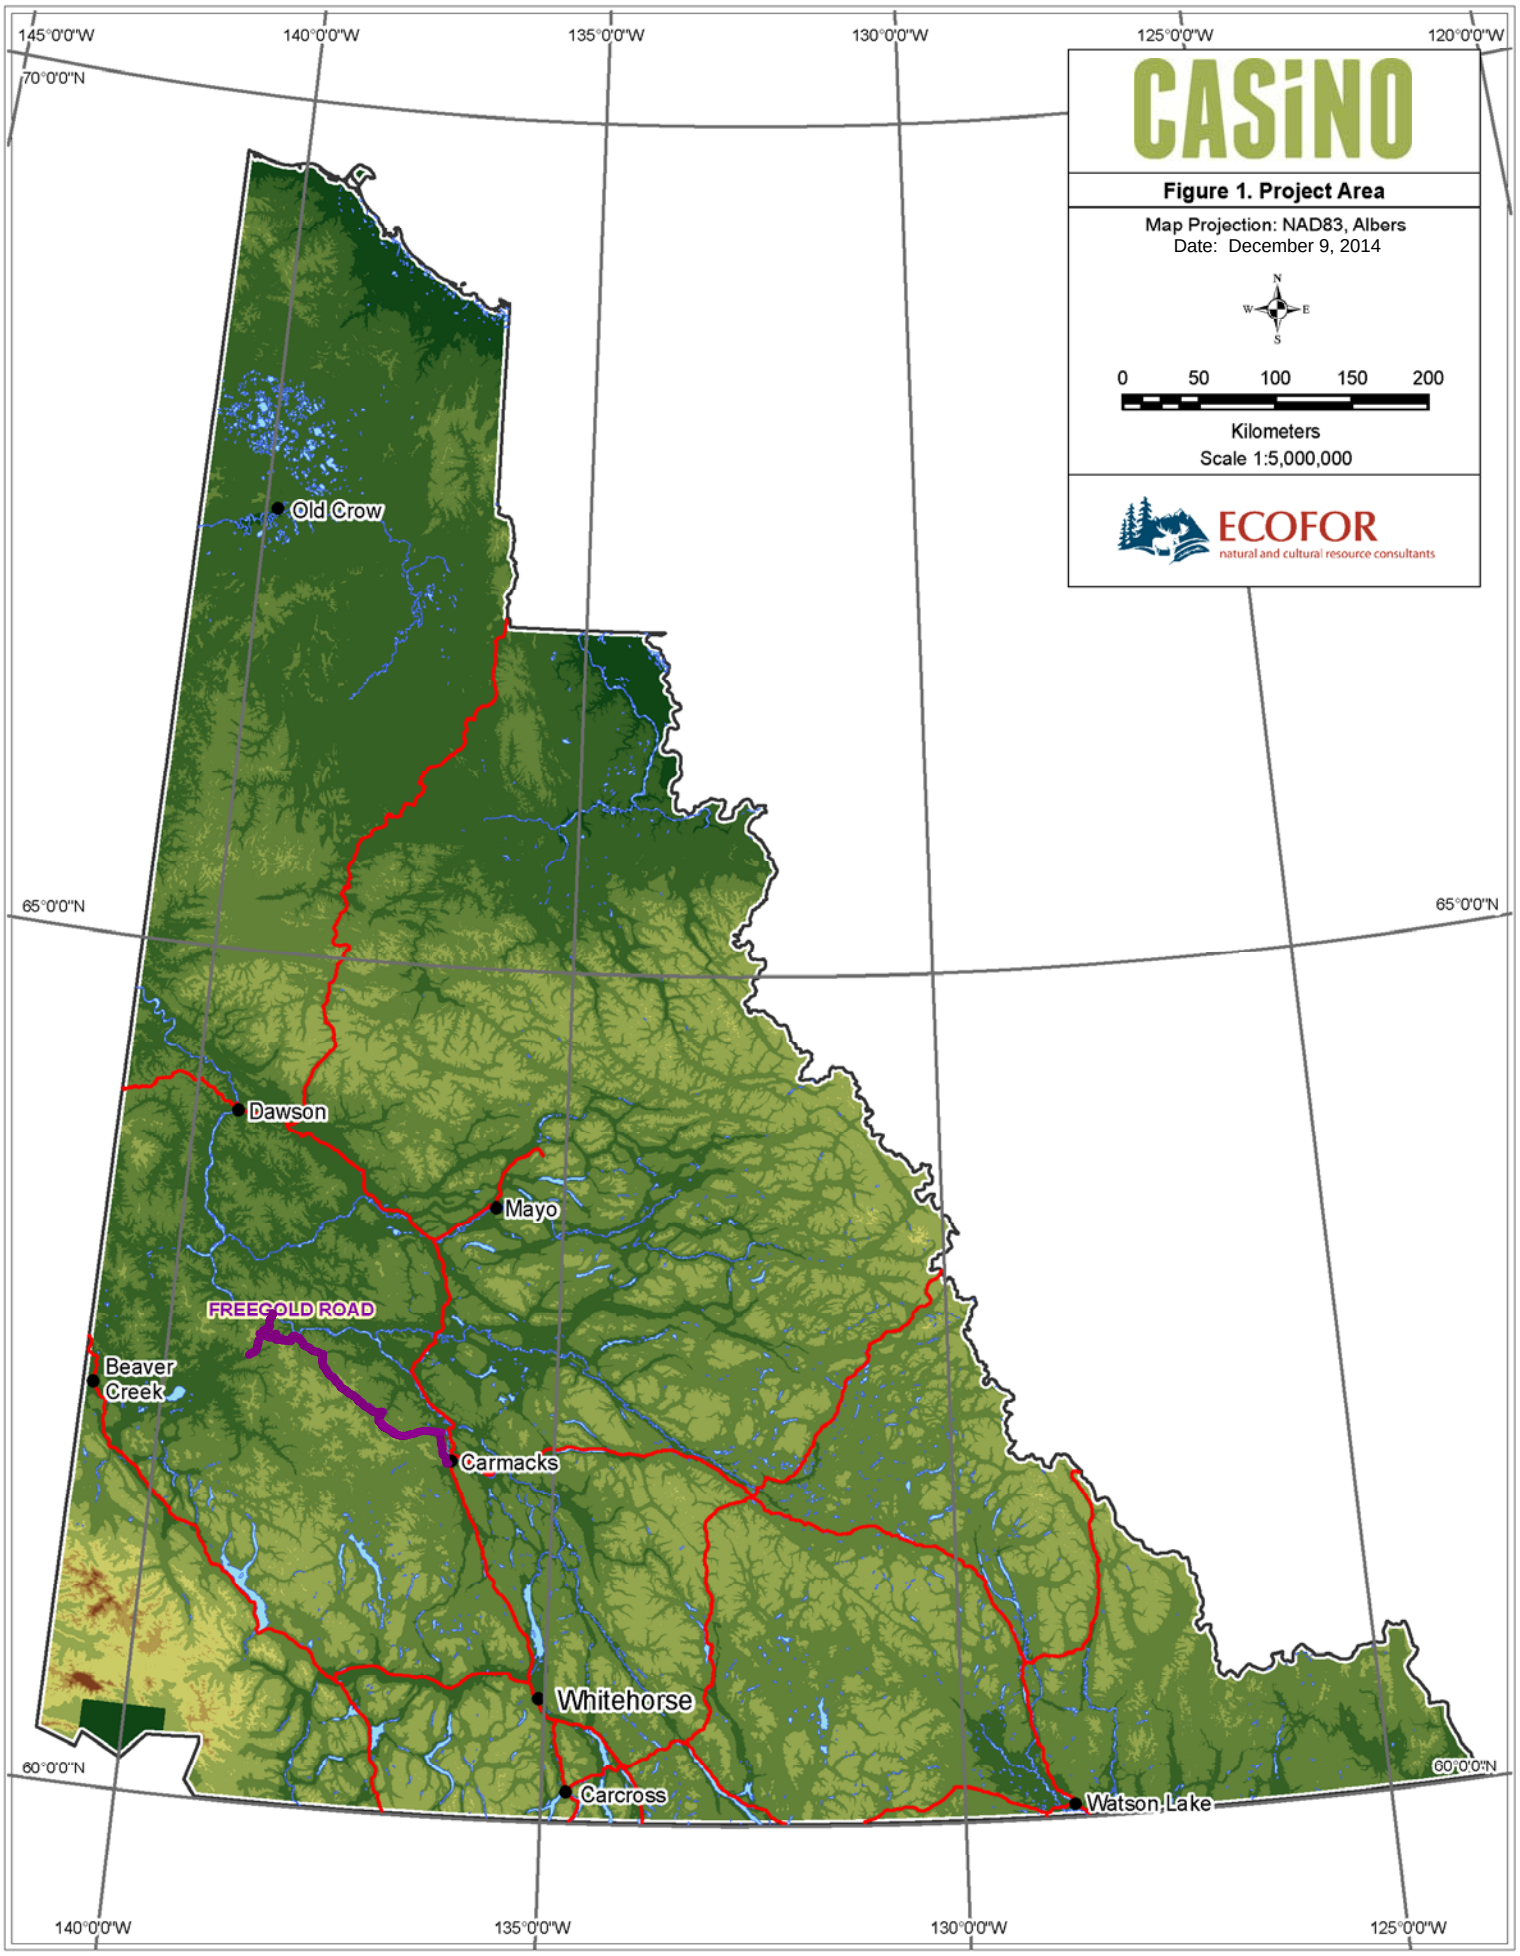
1.0 INTRODUCTION



1.1 Scope of Project

The Casino Property is a proposed open-pit Gold, Copper, and Molybdenum mine. The property is located in south-western Yukon, near the Yukon River in the Klondike Plateau and Central Yukon Plateau. At present the property is only accessible by air or by boat via the Yukon River. Plans are being made by Casino Mining Corporation to build a road to connect Casino Property to Carmacks and the Yukon Highway systems. In addition, an airstrip and access road are also proposed southwest of the Casino Camp to accommodate larger aircraft. Previous heritage impact assessment work for the proposed extension of Freegold Road was completed and reported under permits 88-03ASR (Gotthardt 1988), 94-09ASR (Handly, Merchant, and Rousseau 1994), 94-22ASR (Handly and Rousseau 1995), 95-01ASR (Gotthardt 1995), 95-02ASR (Hammer 1995), 09-09ASR (Soucey et al 2010a), 10-04ASR (Soucey et al 2010b), 11-04ASR (Mooney 2011), 13-06ASR (de Guzman et al 2014), 13-07ASR (Mooney 2013a), and 13-18ASR (Mooney 2013b). Additional permitted work along the proposed Freegold Road includes 11-13ASR (Mooney 2012), and 12-03ASR (Mooney 2013c). This summary reviews each of these previous efforts and combines them for reference.

The Casino name may have first been used in this region in 1915, when prospectors Jack O'Hara and Frank Farnan, discovered gold in a tributary to Dip Creek and named it after their favourite card game (Coutts 2003). The Casino Trail has been referred to as a planned mining access road from the end of the Freegold Road to the near the upper Hayes Creek area in the Dawson Range, ever since the existing Freegold Road was built. The Freegold Road itself was built in 1949 by N.A. Timmons mining interests in order to explore and develop the LaForma Gold mine on Mount Freegold. The Casino Trail is said to run northwest of the end of the Freegold Road towards Casino Creek. Parts of the proposed Casino Trail follows previously used travel corridors which were linked to trails to important copper sources in the White River area, and a section of the old Chilkat trail from Fort Selkirk (the west branch of the Dalton Trail). This travel corridor provided connectivity in pre-contact times and since the early 1900s was known by the Casino name. Since then, this travel corridor provided access for multiple uses of trapping, hunting, fishing, mineral exploration, and other collection activities, as seen in the archaeological and historic resources left behind.

1.2 Report Format

Section 2 describes areas remaining to be assessed. Section 3 summarizes the archaeological sites to be managed along the proposed upgrading of Freegold Road. Section 4 historic structures and resources to be managed along the proposed upgrading of Freegold Road. Section 5 presents archaeological sites to be managed near the mine site, road to the Yukon River, the proposed airstrip, and a road to the airstrip. Section 6 summarizes the historic structures and resources to be managed near the mine site, the road to the Yukon River, and the proposed airstrip. Section 7 lists some previously noted First Nation use sites along the proposed upgrading of the Freegold Road. Two appendices are included at the end of this report. Appendix I contains the project mapping, Appendix II contains a detailed table of remaining areas to be assessed, the archaeology sites to be managed, the historic structures and resources to be managed, and some previously noted First Nation use sites along the proposed Freegold Road upgrade.

2.0 AREAS REMAINING TO BE ASSESSED

After detailed review, the remaining areas and footprints remaining to be assessed, fall into two groups; currently planned impact areas, and future revision areas. The currently planned impact areas have been reviewed and these are broken down further into linear right-of-way (ROW) segments along the proposed ROW upgrades, and planned borrow pits (including access to each borrow pit).

2.1 Proposed Upgrading of the Freegold Road Right-of-Way (ROW)

The areas of the currently proposed ROW that have not been fully assessed in the past are segments km 0+550 to approximately km 5+100 (all km markings are listed with 0+000 at the starting point from the Klondike Highway on the south side of Carmacks). This segment includes the east bank of the Nordenskiold River and continues to where it joins the existing Freegold Road on the west side of Carmacks.

The second segment requiring additional survey is km 14+100 to approximately km 17+000. A portion of this area was assessed by Handley and Rousseau in 1994 but not the entire segment. The currently proposed impacts in this area also includes proposed borrow pits which are listed below.

2.2 Proposed Borrow Pits and Access to the Borrow Pits

Between km 0+000 and km 32+000 there are seventeen (17) proposed borrow pits which have not been assessed. These require assessment and if they are used, the access roads to each pit also require assessment.

These proposed borrow pits and the proposed segments of the ROW remaining to be assessed are presented in Appendix I (mapping) and Appendix II (table summary by km and UTMs).

The remaining proposed borrow pits from km 32+000 all the way to the proposed mine site and road to the proposed airstrip have been assessed. However, in the cases where the proposed borrow pit does not lie adjacent to the proposed road ROW, an access road to the borrow pit needs to be proposed, and accessed for impacts to heritage resources. In some cases an estimated route to the borrow pit has been assessed in the field but these must be reviewed on a case by case basis as the planned borrow pits move forward in the selection process. Some of the currently planned borrow pits may be dropped from planning while others may be added. If any borrow pits are added to the project they must also be the subject of a heritage resource impact assessment.

3.0 ARCHAEOLOGICAL SITES ALONG UPGRADE OF FREEGOLD ROAD

Only the previously recorded sites near or within the impact area of the proposed upgrades to the Freegold ROW are discussed below. If a site is not listed, it is not in danger of being impacted by the project. Some sites are listed that are very close to planned footprints and could be impacted if plans change slightly. Other sites are close to proposed impacts and these should be monitored to ensure impacts are avoided. Many of the sites have had their boundary's flagged with 1" wide, yellow ribboning with "No Work Zone" printed in black. The sites near the proposed mine site, the road to the Yukon River, and the road to the proposed air strip, have also been signed with white plastic signs with black lettering "No Disturbance Zone". However not all of the sites along the proposed Freegold Road and extension have been flagged or signed, and some or all of the flagging or signage may be weathered or removed by natural forces. Each site is presented below (by the most relevant reports cited) with a brief summary and management recommendation. Management recommendations are listed by previous author. Where no previous recommendation was made, or current recommendations have been added, these are made by the current authors. Sites are listed in order of appearance travelling from Carmacks heading northwest to the proposed mine site. These summaries are also presented in Appendix I by mapping, and by Appendix II in table format.

3.1 KM 0 TO KM 33

KaVa-17/Mount Nansen Road Cemetery (No permit report just site form): The site is located on the southern end of a glacial moraine to the south of the First Nation cemetery on the Mount Nansen Road (Mount Nansen Road Cemetery). The site was found when a research team headed by Dawn Charlie of Carmacks was inspecting historic features around the grave yard and noted the presence of flakes.
Scope of Possible Impacts from Casino Project: This site and cemetery are not currently planned for impacts and are located upslope and to the east of the proposed ROW.
Management Recommendations: Avoidance of this site and the cemetery are recommended.

KaVa-3 (Handly and Rousseau 1995): A pre-contact site with surface and subsurface lithic scatter previously recorded by VanDyke in 1978. Situated near where the Freehold Road crosses the Nordenskiold River, northwest of Carmacks. Situated near the Freegold Project ROW (at time of 1995 report). Extensive disturbance from previous road construction, power lines, cemetery construction and gravel quarry. Remaining intact cultural deposits only apparent along terrace edge margins and road cutbanks. Debitage and bone recovered. Interpreted as a large campsite. A First Nations elder stated that Champagne-Aishihik peoples would camp in this area while trading with the Little Salmon Carmacks peoples. Presence of a contemporary community cemetery within portions of the site boundary may indicate the presence of precontact and/or historic First Nations and/or European burials along the terrace.
Scope of Possible Impacts from Casino Project: This site is not currently planned for impacts.
Management Recommendations:.Handly and Rousseau "strongly recommend that a detailed, systematic, archaeological data recovery program (i.e., mitigative excavations) be undertaken prior to the commencement of any further land-altering activities, including replacement of the bailey bridge. This would involve excavating 1m^2 excavation units dug in 5 cm-thick arbitrary levels" (1995:49). They estimated that 10 units would be required for a representative sample of remaining cultural materials and

could be accomplished by a crew of 4 experienced archaeologists assisted by 2 Band members in 3 working days.

KaVb-2 (Gotthardt 1995): Located on a high terrace of the Yukon River at the south end of the terrace. Location of the Dominion Land Surveys 1948 benchmark T397. Flakes and fire cracked rock recovered over 30 m area along terrace. Old foot trail that leads to Carmacks is visible on the edge of the terrace on the site.
Scope of Possible Impacts from Casino Project: This site is outside of the impact zone of the Freegold Road upgrade.
Management Recommendations: Site avoidance is recommended (Gotthardt 1995). If avoidance is not possible then data recovery mitigations are recommended. This site is not planned to be impacted by 2013 footprint.

KaVb-1 (Hammer 1995; Handly and Rousseau 1995): Handly and Rousseau first identified this site in 1994 as a medium sized, pre-contact subsurface lithic scatter site. Hammer (1995) reassessed the site through survey and conducted limited shovel tests, recovering a small number of lithics and fire cracked rock. The site sits on a ridge overlooking a small pond east of the Freegold Road and a portion of the eastern bank of the Yukon River to the east.
Scope of Possible Impacts from Casino Project: This site is located within a proposed borrow pit and the proposed ROW.
Management Recommendations: In developing the borrow pit, impacts to the south edge of the terrace should be avoided and it is recommended to maintain 30 m buffer along the terrace edge. Additionally, the borrow pit access road should be routed along north side of the terrace (Hammer 1995). If impacts cannot be avoided then data recovery excavations are recommended.

KbVb-2 (Hammer 1995; Handly and Rousseau 1995): Handly and Rousseau identified this site as a medium sized, precontact subsurface lithic scatter site. There was previous bulldozer disturbance to KbVb-2. Debitage from below White River Ash stratum (pre-1,250 BP). KbVb-2 recovered chert debitage and a unifacially flaked scraper. The site was interpreted as medium sized, short term campsite or possible game monitoring stations where tool production was occurring. Handly and Rousseau (1995) identified the preferred management option would be to avoid this site but if not a feasible option they recommended a detailed, systematic, archaeological data recovery program prior to any further land-altering activities. Hammer (1995) did a salvage excavation of the site over 6 days. They concluded that KBVb-2 was a small prehistoric campsite occupied during the Northern Archaic Tradition (4,500 – 1,250 BP). They recovered over 4,600 lithics, fire cracked rock, bone fragments, and recorded several features.
Scope of Possible Impacts from Casino Project: What remains of this site is within the 2013 planned ROW.
Management Recommendations: Hammer (1995) recommended that during construction for the upgrading of the Freegold Road, the surface soil (0-30 cm below surface) be removed in the vicinity of KbVb-2 and stockpiled so possible remaining cultural materials may be salvaged at a future date.

KbVb-4 (Gotthardt 1995): Small site on a low terrace on the north side of Crossing Creek. May have been a fishing camp as well as stop on the trail. Multiple occupations of the site are indicated which span from the mid-Holocene to within the last 1000 years. Site has been impacted by an old cat trail but intact portions remain.
Scope of Possible Impacts from Casino Project: This site is within the 2013 planned ROW.
Management Recommendations: Archaeological data recovery is recommended prior to upgrading the Freegold Road through the area.

3.2 KM 33 TO THE CASINO MINE SITE AREA

KbVb-3 (Gotthardt 1995): Site is interpreted as small and possibly a single occupation site. The old cat trail along the terrace edge has almost completely destroyed the site.
Scope of Possible Impacts from Casino Project: This site is within the 2013 planned ROW.
Management Recommendations: No further work.

KcVd-3 (Mooney 2013a): This site is located on the east end of a rounded ridge overlooking the confluence of Seymour and Big Creeks. This ridge point provides a significant view of both Seymour Creek and Big Creek Valleys. This landform likely contains a low to moderate density of lithic materials and likely represents a small sized temporary campsite, or lithic reduction workshop. No cultural diagnostic materials were identified, however all of these lithic materials were directly under a thick deposit of White River Tephra.
Scope of Possible Impacts from Casino Project: The site is located on the north edge of a proposed borrow pit and is also upslope from the proposed extension of Freegold Road. This site will be directly impacted by borrow pit use.
Management Recommendations: Avoidance of the site is recommended. If avoidance is not possible then data recovery work is recommended. Data recovery should include additional shovel testing to better determine artifact distribution and density followed by 1 x 1 m block excavation. Approximately 14 - 18 square meters of excavation would be recommended based on existing data.

KcVe-4 (Mooney 2011): This prehistoric site is located on a terrace within the proposed Freegold Road Extension. The terrace overlooks the confluence of Burgis Creek and Big Creek. The cultural materials were all found below the White River ash along the southeast facing terrace edge. This lithic scatter likely represents a temporary campsite or lithic reduction workshop.
Scope of Possible Impacts from Casino Project: The site is located very close to the proposed extension of Freegold Road and may be directly impacted by the proposed road alignment.
Management Recommendations: Avoidance of the site is recommended. If avoidance is not possible then data recovery work is recommended to include in-fill shovel testing to better determine artifact densities followed by a series of 1 x 1 m unit block excavations in relationship to the size and distribution of the site.

KcVf-2 (Mooney 2013a)**:** This site is located on a terrace and likely represents a temporary campsite or lithic reduction workshop; which included the use of microblades during the Little Arm Phase.

Scope of Possible Impacts from Casino Project: The site is located on the edge of a proposed borrow pit of the Freegold Road extension and would be directly impacted by the proposed developments.
Management Recommendations: Avoidance of the site is recommended. If avoidance is not possible then data recovery work is recommended. Data recovery should include additional shovel testing to determine artifact distribution and density, followed by 1 x 1 m block excavation. Approximately 12 - 15 square meters of excavation would be recommended based on existing data.

KcVf-3 (Mooney 2013a): This site is located on an s-shaped terrace overlooking the head waters of Hayes Creek likely represents a temporary campsite(s) or lithic reduction workshop(s). No culturally diagnostic materials were identified and it is uncertain when these materials were deposited.
Scope of Possible Impacts from Casino Project: The site is located within a proposed borrow pit of the Freegold Road extension and would be directly impacted by the proposed developments.
Management Recommendations: Avoidance of the site is recommended. If avoidance is not possible then data recovery work is recommended. Data recovery should include additional shovel testing to determine artifact distribution and density, followed by 1 x 1 m block excavation. Approximately 12 - 15 square meters of excavation would be recommended based on existing data.

KeVf-1 (Mooney 2011): This site is on a southwest facing bench located approximately 500 m NE and high above the headwaters to the tributaries to Hayes Creek. The lithic scatter likely represents a temporary campsite or lithic reduction workshop.
Scope of Possible Impacts from Casino Project: The site is located within a proposed borrow pit and will be directly impacted by 2013 designs.
Management Recommendations: If avoidance is not possible then data recovery work is recommended. Data recovery should include additional shovel testing to determine artifact distribution and density, followed by 1 x 1 m block excavation. Approximately 12 - 15 square meters of excavation would be recommended based on existing data.

KdVf-4 (Gotthardt 1988; Mooney 2011): The site is located on the south-eastern bench of a series of benches. This bench was found to contain lithics by Gotthardt in the 1980s. Gotthardt discussed the likelihood that this area was on, or near, an overland trail that was the traditional Chilkat return trail from Fort Selkirk to Dyea via Aishihik, was crossed by then proposed Casino Trail route in the upper Hayes Creek area. A section of (the 1988) proposed Casino Trail route in the drainages of Big Creek, North Big Creek, and Hayes Creek in fact parallels a traditional foot trail which leads ultimately to the important copper sources and trade rendezvous on the White River via the Klotassin River (Gotthardt 1988). The lithic scatter likely represents a temporary campsite or lithic reduction workshop overlooking the wide valley near the drainage divided between Big Creek to the southeast and Hayes to the northwest.
Scope of Possible Impacts from Casino Project: The site was located within a proposed borrow pit (now dropped from planning in 2013) and is located above the proposed extension of Freegold Road. This site would not be directly impacted.
Management Recommendations: Avoidance of the site is recommended. If avoidance is not possible then data recovery work is recommended to include in-fill shovel testing to better determine artifact densities, followed by a series of 1x1m unit block excavations in relationship to the size and distribution of the site.

KdVf-13 (Mooney 2011): This prehistoric lithic site is located on the south-eastern corner of a terrace overlooking the confluence of a small tributary to Hayes Creek. The site has a lower section and a slightly higher section and both were found to contain prehistoric materials, over a significant area. The lithic scatter likely represents a moderate density, medium sized, temporary campsite or lithic reduction workshop overlooking the wide valley at the head of the Hayes Creek valley.
Scope of Possible Impacts from Casino Project: The site is located within a proposed borrow pit and is located above the proposed extension of Freegold Road. This site would be directly impacted by the proposed borrow pit.
Management Recommendations: Avoidance of the site is recommended. If avoidance is not possible then data recovery work is recommended to include in-fill shovel testing to better determine artifact densities, followed by a series of 1 x 1 m unit block excavations in relationship to the size and distribution of the site.

KdVf-7 (Mooney 2011): This multi-component site was likely used during the Northwest Microblade Tradition and the Proto-historic (post A.D. 1667) period. Located on the Freegold Road Extension and approximately NE of the road alignment on a lower bench on the south-eastern corner of a terrace approximately NE of a tributary to Hayes Creek. This lithic scatter likely represents a moderate density small sized temporary campsite or lithic reduction workshop overlooking the wide valley at the head of the Hayes Creek valley. A Chinese coin was discovered during shovel testing. The Chinese coin was minted in China under the rule of Qing (Ch'ing) dynasty Emperor Sheng Zu (1662-1722 AD). One possible use of the coin may have been as a supplement to Tlingit warriors' armour. Another possibility is that this coin was curated and traded for many years as a token or amulet and deposited in the project area by Chinese placer miners.
Scope of Possible Impacts from Casino Project: The site is located within a proposed borrow pit and very close to the current proposed alignment of the road. This site may be directly impacted by the road construction.
Recommendations: Avoidance of the site is recommended. If avoidance is not possible then data recovery work is recommended to include in-fill shovel testing to better determine artifact densities followed by a series of 1 x 1 m unit block excavations in relationship to the size and distribution of the site. Additional historical research in regards to possible Chinese placer mining in the project area is also recommended.

KdVf-6 (Mooney 2011): The site is located on the Freegold Road Extension and approximately NE of the road alignment along a banana shaped raised ridge in the Hayes Creek valley overlooking Hayes Creek. This prehistoric site contains lithics, including a project point fragment, and a possible cultural pit or cache feature. The lithic scatter likely represents a moderate density, medium sized, temporary campsite or lithic reduction workshop.
Scope of Possible Impacts from Casino Project: The site is located with the proposed extension of Freegold Road and potential borrow pits. This site will be directly impacted by the road construction.
Management Recommendations: Avoidance of the site is recommended. If avoidance is not possible then data recovery work is recommended to include in-fill shovel testing to better determine artifact

densities followed by a series of 1 x 1 m unit block excavations in relationship to the size and distribution of the site.

KdVf-5 (Mooney 2011): This lithic site is located along a low bench above a tributary to Hayes Creek. Located approximately NE of the small tributary on the Freegold Road Extension. This small low landform provides a level camp site near water. A small area tested positive for a relatively dense scatter of prehistoric materials. The site is generally limited to the corner of the landform. The lithic scatter likely represents a moderate to high density, small sized, temporary campsite or lithic reduction workshop.
Scope of Possible Impacts from Casino Project: The site is located within the proposed extension of Freegold Road and a previously planned borrow pit. The borrow pit has been dropped but the site will be directly impacted by the road construction.
Management Recommendations: Avoidance of the site is recommended. If avoidance is not possible then data recovery work is recommended to include in-fill shovel testing to better determine artifact densities followed by a series of 1 x 1 m unit block excavations in relationship to the size and distribution of the site.

KdVf-8 (Mooney 2011): This site is located near the road alignment on a level bench along a descending ridge line, overlooking Hayes Creek. This lithic site is represented by a single flake. The lithic isolate likely represents a low density, small sized temporary campsite, vista, or lithic reduction workshop.
Scope of Possible Impacts from Casino Project: The site was located upslope of a proposed borrow pit which in turn is upslope from the proposed extension of Freegold Road. This site will not be directly impacted by the road construction or borrow pit use.
Management Recommendations: No further work is recommended. However, if borrow pit construction impacts lead to upslope erosion then avoidance of the site is recommended. If avoidance is not possible then data recovery work is recommended.

KdVf-10 (Mooney 2011): This prehistoric lithic site located near the road proposed road alignment. This site is on a small knoll at the top of a descending ridge line approximately NE of a small tributary of Hayes Creek. This site is a small knoll and site limits are likely limited by the landform. The lithic scatter likely represents a low density small sized temporary campsite, vista, or lithic reduction workshop.
Scope of Possible Impacts from Casino Project: The site was located upslope of a proposed borrow pit which in turn is upslope from the proposed extension of Freegold Road. This site will not be directly impacted by the road construction or borrow pit use.
Management Recommendations: No further work is recommended. However, if borrow pit construction impacts lead to upslope erosion then avoidance of the site is recommended. If avoidance is not possible then data recovery work is recommended.

KdVf-11 (Mooney 2011): This prehistoric lithic site is near the proposed road alignment. It is on a small knoll near the bottom of a descending ridge line approximately NE of a small tributary of Hayes Creek. Artifacts recovered include 2 flakes.

Scope of Possible Impacts from Casino Project: The site was located upslope of a proposed borrow pit which in turn is upslope from the proposed extension of Freegold Road. This site will not be directly impacted by the road construction or borrow pit use.
Management Recommendations: No further work is recommended. However, if borrow pit construction impacts lead to upslope erosion then avoidance of the site is recommended. If avoidance is not possible then data recovery work is recommended.

KdVf-9 (Mooney 2011): This prehistoric lithic site is located near the Freegold Road Extension road alignment. It is located on the corner of a bench overlooking the valley approximately SW of a small tributary of Hayes Creek. This lithic scatter is likely limited by the landform but contains a moderate density of lithic materials. This lithic scatter likely represents a low to moderate density small sized temporary campsite, vista, or lithic reduction workshop with a potential ground cache.
Scope of Possible Impacts from Casino Project: The site was located within a proposed borrow pit which was dropped from planning but it is also within the proposed extension of Freegold Road. This site will be directly impacted by the road construction.
Management Recommendations: Avoidance of the site is recommended. If avoidance is not possible then data recovery work is recommended to include in-fill shovel testing to better determine artifact densities followed by a series of 1 x 1 m unit block excavations in relationship to the size and distribution of the site.

KdVf-14/KdVf-1 (Mooney 2013a): This area was previously noted to include a possible spirit house and grave and was recorded as site KdVf-1 (Gotthardt 1988). Although this area is not currently planned to be impacted by the proposed project, the area was revisited in an attempt to confirm the presence of a spirit house or possible grave for further heritage management. No structural remains or human remains were identified in either area. This rocky knoll along the ridge was briefly tested and found to contain prehistoric lithic materials. The lithic scatter likely represents a temporary campsite or lithic reduction workshop overlooking the Hayes Creek valley.
Scope of Possible Impacts from Casino Project: This site is not located within any planned project impacts.
Management Recommendations: Avoidance of the site is recommended. If this area is planned for any future impacts then additional efforts are recommended to confirm possible grave or spirit house locations with First Nation representatives. A heritage management/data recovery plan should include additional traditional use/traditional knowledge efforts as well as additional shovel testing and possible block excavation.

KdVf-12 (Mooney 2011): This lithic site is located on a narrow point that overlooks the Hayes Creek valley, approximately SW of a small tributary of Hayes Creek. This sloping landform provides a view of the valley and close access to water. This lithic scatter is limited by the landform and contains a low density of lithic materials. It likely represents a low to moderate density small sized temporary campsite, vista, or lithic reduction workshop. Diagnostic materials include a possible microblade core and chalcedony shatter suggesting cultural affiliation with the Northwest Microblade Tradition.
Scope of Possible Impacts from Casino Project: The site appears to be located within the proposed extension of Freegold Road and will be directly impacted by the road construction.

Management Recommendations: Avoidance of the site is recommended. If avoidance is not possible then data recovery work is recommended to include in-fill shovel testing to better determine artifact densities followed by a series of 1 x 1 m unit block excavations in relationship to the size and distribution of the site.

KeVf-3 (Mooney 2013a): This site is located on a narrow rocky ascending ridge line with a higher and slightly wider, east end. The lithic scatter was identified across the ridge with two pockets of higher concentrations in the middle and east end. The ridge line overlooks the confluence of Selkirk Creek and Hayes Creek and provides a significant vista across the combined valleys. The lithic scatter likely represents multiple moderate to high density small sized temporary campsite(s) or lithic reduction workshop(s). Culturally diagnostic materials consisted of a microblade and a microblade core.
Scope of Possible Impacts from Casino Project: The site is located within a proposed borrow pit for the construction of the proposed extension of Freegold Road and would be directly impacted by these developments.
Management Recommendations: Avoidance of the site is recommended. If avoidance is not possible then data recovery work is recommended. Data recovery should include additional shovel testing to better determine artifact distribution and density followed by separate loci of 1 x 1 m block excavation. Approximately 20 – 28 square meters of excavation would be recommended based on existing data.

KeVg-5 (Mooney 2011): The lithic site is located on a bench near the proposed Freegold Road Extension. It is on a rounded bench at the bottom of a southeast facing descending ridge which overlooks a tributary to Hayes Creek. This point is also west of the historic steamers/upright boilers site (YHSI 115J/09/002) and was likely along a trail connecting the steamers placer mining site with previously recorded historic cabins at Site KeVg-1. This landform contains a low to moderate density of lithic materials and likely represents a small sized temporary campsite or lithic reduction workshop.
Scope of Possible Impacts from Casino Project: The site was located within a proposed borrow pit and the proposed extension of Freegold Road, however the borrow pit has since been dropped from planning. This site will be directly impacted by road construction.
Management Recommendations: Avoidance of the site is recommended. If avoidance is not possible then data recovery work is recommended to include in-fill shovel testing to better determine artifact densities followed by a series of 1 x 1 m unit block excavations in relationship to the size and distribution of the site.

KeVg-4 (Mooney 2011): The site is located on a ridge near the proposed Freegold Road Extension. It is on a long southeast facing descending ridge which overlooks a tributary to Hayes Creek. This sloping landform provides good southern exposure and close access to water. This lithic scatter is limited by the landform and contains a moderate density of lithic materials and burned bone. This lithic scatter likely represents a moderate density, medium sized, temporary campsite, vista, or lithic reduction workshop.
Scope of Possible Impacts from Casino Project: The site was located within a proposed borrow pit and upslope of the proposed extension of Freegold Road, however the borrow pit has since been dropped from planning. This site will be upslope, and adjacent to the proposed road construction.
Management Recommendations: Avoidance of the site is recommended. If avoidance is not possible then data recovery work is recommended to include in-fill shovel testing to better determine artifact

densities followed by a series of 1 x 1 m unit block excavations in relationship to the size and distribution of the site.

KeVg-9 (Mooney 2013a): The site is located on the east facing side of a north-south descending ridge overlooking the confluence of a tributary to Hayes Creek. This site has a lower section and a slightly higher section, both were found to contain prehistoric materials. What appears to be a historic cultural depression is located at the north end of the down slope ridge. A shovel test inside the center of the depression was negative. This depression may have been associated with placer mining activities. The lithic scatter likely represents a low density, medium sized, temporary campsite(s) or lithic reduction workshop(s). No culturally diagnostic materials were identified and it is uncertain when these materials were deposited.
Scope of Possible Impacts from Casino Project: The site is located within the proposed extension of Freegold Road. This site would be directly impacted by road construction.
Management Recommendations: Avoidance of the site is recommended. If avoidance is not possible then data recovery work is recommended. Data recovery should include additional shovel testing to determine artifact distribution and density followed by 1 x 1 m block excavation. Approximately 8 - 10 square meters of excavation would be recommended based on existing data.

KeVg-7 (Mooney 2011): This lithic site is located on a rounded ridge, within a previously proposed borrow pit of the Freegold Road Extension. The southeast facing corner overlooks both the Selwyn River and Hayes Creek, about 750 m SW of the site. Location provides southern exposure, access to water, and an approximately 300 degree vista. This landform contains a low to moderate density of lithic materials and likely represents a small sized, temporary campsite, and/or vista, or lithic reduction workshop.
Scope of Possible Impacts from Casino Project: The site was located within a proposed borrow pit and upslope from the proposed extension of Freegold Road. The borrow pit has since been dropped from planning, however this site may be impacted by road construction.
Management Recommendations: Avoidance of the site is recommended. If avoidance is not possible then data recovery work is recommended to include in-fill shovel testing to better determine artifact densities followed by a series of 1x1m unit block excavations in relationship to the size and distribution of the site.

KeVg-8 (Mooney 2013a): This contained a site single lithic flake fragment found along a narrow ascending ridge running southeast up to the northwest. Significant shovel testing along the ridge to the north and south failed to identify any other cultural materials. This ridge drops quickly to the southeast but provides a good southern exposure and a vista to the southeast over Selwyn Creek. This lithic isolate likely represents a low density, small sized, temporary campsite or lithic reduction workshop. No cultural diagnostic materials were identified however this lithic isolate was identified above the White River Tephra and likely represents an Aishihik Phase use of the landform.
Scope of Possible Impacts from Casino Project: This site is located within a proposed borrow pit which in turn is upslope from the proposed extension of Freegold Road. This site will be directly impacted by the borrow pit development.

Management Recommendations: Due to the amount of testing along this landform and in the area of the isolated lithic it is unlikely that additional efforts will add significantly to the understanding of the past use of this landform. No further heritage work for this site is recommended.

KeVg-3 (Mooney 2011): This site is now located within a proposed borrow pit of the Freegold Road Extension. It previously was not in planned 2011 impacts, however since then a proposed borrow covers this area. The site is on a high knoll approximately 1.5 km NW of the confluence between Hayes Creek and the Selwyn River, SW of the Selwyn River. This site is directly below KeVg-6 but unlike that site this landform provides a more protected bench with a rock wall at its back. This slightly raised area of bench contains a moderate to high density of lithic materials dispersed in pockets of level ground, and likely represents a small sized, temporary vista and lithic reduction workshop. The presence of microblade fragments suggests a Northwest Microblade Tradition cultural affiliation.
Scope of Possible Impacts from Casino Project: This site is within a proposed borrow pit and the proposed extension of Freegold Road. This site will be directly impacted by borrow pit use.
Management Recommendations: Avoidance of the site is recommended. If avoidance is not possible then data recovery work is recommended to include in-fill shovel testing to better determine artifact densities followed by a series of 1 x 1 m unit block excavations in relationship to the size and distribution of the site.

KeVg-6 (Mooney 2011): This prehistoric lithic site is located within a proposed borrow pit north of the proposed Freegold Road Extension. It was previously not within planned impacts in 2011, but since then a proposed borrow covers this area. It is NW of the confluence between Hayes Creek and the Selwyn River. This prehistoric lithic site is located on a narrow ridge with an east-southeast facing aspect which overlooks the Selwyn River far below. This ridge provides southern exposure and a great vista. This landform contains a moderate to high density of lithic materials dispersed in pockets of level ground and likely represents a small sized temporary vista and lithic reduction workshop. Microblade fragments suggest a Northwest Microbade Tradition cultural affiliation.
Scope of Possible Impacts from Casino Project: The site is located within a proposed borrow pit and will be directly impacted by borrow pit use.
Management Recommendations: Avoidance of the site is recommended. If avoidance is not possible then data recovery work is recommended to include in-fill shovel testing to better determine artifact densities followed by a series of 1x1m unit block excavations in relationship to the size and distribution of the site.

KeVh-3 (Mooney 2011): This site is located near the proposed road alignment of the Freegold Road Extension. It is on the southwest side of a rock outcrop high above the Yukon River between the headwaters of Mascot and Idaho Creeks. This rock outcrop would have provided a break from the wind and weather and a significant vista. This rock outcrop area contains a low density of lithic materials dispersed in pockets of level ground and likely represents a small sized, temporary vista and lithic reduction workshop.
Scope of Possible Impacts from Casino Project: The site appears to be just north of the proposed extension of Freegold Road. This site will not be directly impacted.

Management Recommendations: Avoidance of the site is recommended. If avoidance is not possible then data recovery work is recommended to include in-fill shovel testing to better determine artifact densities followed by a series of 1x1m unit block excavations in relationship to the size and distribution of the site.

KeVh-4 (Mooney 2013a): This lithic isolate was found on a high elevation stepped rocky bench and outcrop that overlooks the Idaho Creek drainage. This lithic scatter likely represents a low density, small sized temporary campsite, or lithic reduction workshop. No cultural diagnostic materials were identified.
Scope of Possible Impacts from Casino Project: This site is located within a proposed borrow pit for the proposed extension of Freegold Road. This site will be directly impacted by the borrow pit development.
Management Recommendations: Due to the amount of testing along this landform and in the area of the isolated lithic it is unlikely that additional efforts will add significantly to the understanding of the past use of this landform. No further heritage work for this site is recommended.

4.0 HISTORIC STRUCTURES AND RESOURCES ALONG UPGRADE OF FREEGOLD ROAD

This resources were noted in a variety of reports and recorded in a variety of ways. Some were noted as historic roads and trails, while others were recorded as archaeological sites, or recorded as historic resources and recorded with the Yukon Historic Sites Inventory (YHSI). These historic structures and historic resources are presented in order by location along and near the proposed Freegold Road upgrade from Carmacks in the southeast to the proposed mine site in the northwest.

H1 Whitehorse-Dawson Winter Road (Handly and Rousseau 1995): Road was used after the turn of the century as an overland stage coach route for transporting goods and people from Dawson City to Whitehorse. The majority of the Freegold Road follows the old road but is outside of the proposed impact zone but a 2 km section appears to be within the ROW.
Scope of Possible Impacts from Casino Project: Sections of the Whitehorse-Dawson Winter Road are located within the proposed impact zone associated with the Freegold Project. These sections have already been significantly disturbed and/or destroyed during construction of the present Freegold Road. Remaining intact sections of the Winter Road are situated outside of the Freegold Project ROW impact zone. The use of heavy equipment in these areas, and subsequent land-altering activities, such as grading or the ground surface, and tree and ground-cover removal, could potentially impose a threat of adverse impact to these sections of the Whitehorse-Dawson Winter Road.
Management Recommendations: No further mitigation actions required.

H2 Log Structure (Handly and Rousseau 1995): A large almost completely intact log structure located on the alluvial terrace below precontact site KaVa-3. George and Hazel Mack Browns, owners of the Carmacks Roadhouse lived here from 1922-1942.
Scope of Possible Impacts from Casino Project: There are no impacts planned for this structure due to the road realignment around Carmacks.
Management Recommendations: Preferred management option would be to see the site avoided during land altering activities associated with the Freegold Road. If not feasible, Handly and Rousseau "strongly recommend that consultation between Community and Transportation Services and the Village of Carmacks be undertaken prior to the Freegold Project being developed, to determine the historical significance of Site H2 and define the appropriate mitigation procedures that should be implemented." (Handly and Rousseau 1995:52).

H3 Mink/Fox Fur Farm (Handly and Rousseau 1995): A completely destroyed mink/fox fur farm consisting mainly of metal cages and burned wood. Dated to early 20th Century. Completely destroyed from Freegold Road construction.
Scope of Possible Impacts from Casino Project: No impacts are planned for this area due to the road realignment around Carmacks.
Management Recommendations: No further mitigation actions required.

H4 Dalton Trail (Handly and Rousseau 1995): Originally a First Nations trail over the Chilkat Pass to the Yukon River, then became a toll road from 1896-1906. Used to transport cattle, horses, sheep and people from Skagway to Yukon Crossing and then by barge to Dawson City. A small section of the Dalton Trail was noted on a very steep slope on the east side of the Freegold Project impact zone north of Three Mile Lake.
Scope of Possible Impacts from Casino Project: There are no planned impacts to this section of the trail.
Management Recommendations: No further mitigation actions required.

H5 Place Mine Trench (Handly and Rousseau 1995): On the west side of the Freegold Road ROW, where it crosses Murray Creek, there was evidence of very recent placer mining activity. A small placer mine trench and sluice box where located outside the Freegold Project impact zone.
Scope of Possible Impacts from Casino Project: These remains were located outside the proposed impacts to Freegold Road.
Management Recommendations: No further mitigation actions required.

H6 Morrison Road House (Handly and Rousseau 1995): Two completely collapsed log structure along an access road leading from Freegold Road to Stanley Jonathan's fish camp on the Yukon River.
Scope of Possible Impacts from Casino Project: These remains are located outside the proposed impacts to Freegold Road.
Management Recommendations: No further mitigation actions required.

Tricker Cabin (Gotthardt 1995): Al and Ann Tricker's trapline cabin is located at about km 25 of the Freegold Road, about 20 - 30 m south of the Road. The cabin is situated on the north bank of Crossing Creek about 20 m of the creek and about 2 m above the water level. The cabin appears to have been constructed in the 1970's, based on the earliest entry in the journal/guest book left in the cabin: May 1974. The cabin is built from green balsam poplar, and measures about 10 x 12 feet.
Scope of Possible Impacts from Casino Project: The Tricker cabin is about 20 m south of the planned Freegold Road realignment and should escape road construction impacts.
Management Recommendations: Avoidance. No further mitigation actions required (Gotthardt 1995). It is uncertain what impacts the project will have on this cabin, avoidance is recommended.

Fallen Cache Cabin (YHSI 115I/03/002) (Mooney 2013a): These remains consist of a small one course high log cabin outline. These cabin remains are located between the Freegold Road and Seymour Creek. The cabin is approximately 110 m from the creek and can almost be seen from the current roadside. There are no roads or trails that lead directly to or from the cabin. It is unclear it is was unfinished or simply a base for a less permanent structure. There is a fallen high cache located nearby as well as two log lined pits and appears to have been used circa post 1940 AD.
Scope of Possible Impacts from Casino Project: Only the pit features and fallen cache feature of the Fallen Cache Cabin are within the proposed road realignment.
Management Recommendations: It is recommended that construction impacts to these historic structures are avoided, where possible. If these resources are not avoided then additional documentation is recommended prior to construction impacts. This additional documentation should include additional

on-site recording including site mapping and photo-documentation, as well as interviews with First Nation informants and other stakeholders to better document the history and use of the structures.

Dog House Cabin (YHSI 115I/06/012) (Mooney 2013a): The cabin is located between the Freegold Road and Seymour Creek. The cabin is approximately 80 m from the creek just east of a small unnamed tributary. There are no roads or trails that lead directly to or from the cabin. The structure, possible dog house or cache, and outhouse are all in fairly poor condition and appears to have been used circa post 1940 AD.
Scope of Possible Impacts from Casino Project: This cabin is within the planned road realignment and would be directly impacted.
Management Recommendations: It is recommended that construction impacts to these historic structures are avoided, where possible. If these resources are not avoided then additional documentation is recommended prior to construction impacts. This additional documentation should include additional on-site recording including site mapping and photo-documentation, as well as interviews with First Nation informants and other stakeholders to better document the history and use of the structures.

Gas Can Cabin (YHSI 115I/06/010) (Mooney 2013a): The cabin is located between the Freegold Road and Seymour Creek. The cabin is approximately 50 m from the creek and is located directly beside another smaller cabin (Melmac Cabin 115I/06/11). There are no roads or trails that lead directly to or from the cabin. A portion of the gas can roof is fallen in. The rest of the structure seems to be in fairly good condition and appears to have been used circa post 1940 AD.
Scope of Possible Impacts from Casino Project: Appears to be within the planned road realignment and would be directly impacted.
Management Recommendations: It is recommended that construction impacts to these historic structures are avoided, where possible. If these resources are not avoided then additional documentation is recommended prior to construction impacts. This additional documentation should include additional on-site recording including site mapping and photo-documentation, as well as interviews with First Nation informants and other stakeholders to better document the history and use of the structures.

Melmac Cabin (YHSI115I/06/011) (Mooney 2013a): The cabin is located between the Freegold Road and Seymour Creek. The cabin is approximately 50 m from the creek and is located directly beside another larger cabin (Gas Can Cabin 115/I/06/10). There are no roads or trails that deal directly to or from the cabin. The roof is almost completely collapsed and appears to have been used circa post 1940 AD.
Scope of Possible Impacts from Casino Project: Appears to be within the planned road realignment and would be directly impacted.
Management Recommendations: It is recommended that construction impacts to these historic structures are avoided, where possible. If these resources are not avoided then additional documentation is recommended prior to construction impacts. This additional documentation should include additional on-site recording including site mapping and photo-documentation, as well as interviews with First Nation informants and other stakeholders to better document the history and use of the structures.

Ketchup Cabin (YHSI 115I/06/009) (Mooney 2013a): The cabin is located between the current Freegold Road and Seymour Creek. The cabin has a small trail leading towards and away from it, however it is not connected to any currently used roadway. The cabin is approximately 100 m north of Seymour Creek and there are a number of large tree stumps in the surrounding area. The entire cabin is falling apart and only portions of the walls remain and appears to have been used circa post 1940 AD.
Scope of Possible Impacts from Casino Project: Appears to be within the planned road realignment and would be directly impacted.
Management Recommendations: It is recommended that construction impacts to these historic structures are avoided, where possible. If these resources are not avoided then additional documentation is recommended prior to construction impacts. This additional documentation should include additional on-site recording including site mapping and photo-documentation, as well as interviews with First Nation informants and other stakeholders to better document the history and use of the structures.

Three Room Cabin (YHSI 115J/06/013) (Mooney 2013a): The cabin is located between the Freegold Road and Seymour Creek. The cabin is approximately 100 m from the creek and there is a previous placer road that leads directly to the cabin, however it is no longer driveable. The cabin is fully standing and in fairly good condition. The floor is quite unstable but still fairly good and appears to have been used circa post 1940 AD.
Scope of Possible Impacts from Casino Project: Appears to be within the planned road realignment and would be directly impacted.
Management Recommendations: It is recommended that construction impacts to these historic structures are avoided, where possible. If these resources are not avoided then additional documentation is recommended prior to construction impacts. This additional documentation should include additional on-site recording including site mapping and photo-documentation, as well as interviews with First Nation informants and other stakeholders to better document the history and use of the structures.

The Frenchman Cabin (YHSI 115I/06/005) (Mooney 2011, 2012, 2013c): An historic sod roof log cabin. It is associated with a man known locally as "The Frenchman". The cabin has a packed dirt floor and a sod gable roof. The cabin is 13 courses of logs high on the front and back, all logs have been stripped of their bark. Constructed with saddle notched logs and moss chinking. The door is on the south wall and windows are located on the north and west walls. There is a hole in the south wall for a chimney and a cot made out of branches inside. There are names and dates written and inscribed inside the cabin from past use, from 1950 forward.
Scope of Possible Impacts from Casino Project: Near planned road construction but may not be directly impacted.
Management Recommendations: Avoidance, and if not possible, relocation of structure.

Bow Creek Cabins (Mooney 2011, 2012, 2013c): These three cabins were likely constructed in or after the 1970s and they were not recorded with YHSI forms.
Scope of Possible Impacts from Casino Project: Near planned road construction but should not be directly impacted.
Management Recommendations: Avoidance, and if not possible, relocation of structure.

KcVd-2 (possible Harry Baum trapline cabin) (Gotthardt1988): This old trapline cabin belonging to Harry Baum is located just west of confluence of Big Creek and Seymour Creek. The locality is bypassed by the road right-of-way, and was not visited in this survey (Gotthardt 1988).
Scope of Possible Impacts from Casino Project: Said to be located north of approximately km 77+000. Unknown exact location north of planned road construction but will not be directly impacted.
Management Recommendations: No further work required.

KcVd-1 (possible Tommy McGinty trapline cabin) (Gotthardt1988): Old trapline cabin belonging to Tommy McGinty is shown on map compiled by T. Pearse on the left bank of Big Creek, about 2 km above its confluence with Seymour Creek. The locality is outside the road right-of-way and was not visited in this survey (Gotthardt 1988).
Scope of Possible Impacts from Casino Project: Said to be located north of approximately km 78+000. Unknown exact location north of planned road construction but will not be directly impacted.
Management Recommendations: No further work required.

Five Course Cabin (YHSI 115I/06/001) (Mooney 2011, 2012, 2013c): Historic structure appears to be either an incomplete cabin or base structure for a wall tent. The remains of an outhouse are also present.
Scope of Possible Impacts from Casino Project: Near planned road construction but should not be directly impacted.
Management Recommendations: If these resources are not avoided then a limited amount of additional documentation is recommended prior to construction impacts.

Garage by Big Creek (Mooney 2011, 2012, 2013c): This log structure located on the north side of the existing Freegold Road may have been a garage and/or workshop for previous mining efforts and may have been constructed in or after the 1950s. They were not recorded with YHSI forms.
Scope of Possible Impacts from Casino Project: Near planned road construction but should not be directly impacted.
Management Recommendations: If these resources are not avoided then a limited amount of additional documentation is recommended prior to construction impacts.

High Cache Cabin (Mooney 2011, 2012, 2013c): This log cabin and high cache structure are located on the south side of the existing Freegold Road and were not recorded with YHSI forms.
Scope of Possible Impacts from Casino Project: Near planned road construction but should not be directly impacted.
Management Recommendations: If these resources are not avoided then a limited amount of additional documentation is recommended prior to construction impacts, or possible relocation of structure.

Burl Cabin (Mooney 2011, 2012, 2013c): This private cabin is located south of the proposed Freegold Road upgrade and was not recorded with YHSI forms.
Scope of Possible Impacts from Casino Project: Near planned road construction but should not be directly impacted.

Management Recommendations: If these resources are not avoided then a limited amount of additional documentation is recommended prior to construction impacts, or possible relocation of structure.

KcVe-3 (Gotthardt 1988): Reported to be an old grave site approximately in the area of the Casino Trail, just west of a small creek flowing into Big Creek from the north. A grave site was not found although there is an old brush camp adjacent to the proposed road. An old foot trail was also observed. Gotthardt suggests that the likely location for the grave site is on the small hill overlooking Big Creek, most of which has been removed by road construction. Local informant says the graves may belong to Mr. McGinty's grandfather (Chief Joseph McGinty) and another chief.
Scope of Possible Impacts from Casino Project: No impacts are currently planned for this site location and the current ROW is on the opposite (south) side of Big Creek.
Management Recommendations: Traditional and prehistoric sites in the road corridor should be avoided by adjustments to the road alignment if possible. Signs should be developed in consultation wth the Selkirk and Little Salmon/Carmacks First Nations and placed in appropriate locations on the Casino Trail to inform travellers of the history of the country and of its traditional importance to Selkirk people (Gotthardt 1988). Since the current alignment does not come near this location no further work is required.

KcVe-1 (Gotthardt 1988): This is an old grave site previously identified by the Selkirk Band (Land Claims Site S56). Although the site was not visited in the course of the present survey, it is likely located on top of the hill overlooking Big Creek on the north side (Gotthardt 1988).
Scope of Possible Impacts from Casino Project: No impacts are currently planned for this site location.
Management Recommendations: Avoidance of the area, likely location is west of proposed ROW.

KcVe-2 (Gotthardt 1988): This is an old trapline cabin belonging to Stanley Jonathan. This site was not visited during the present survey; judging from the location on the map (complied by T. Pearse and M. Weinstein in interviews with Mr. Jonathan, May 1988), the cabin is on Big Creek, just below the confluence of North Big Creek (Gotthardt 1988).
Scope of Possible Impacts from Casino Project: No impacts are currently planned for this site location.
Management Recommendations: Avoidance of the area, likely location is west of proposed ROW.

KdVf-3 (possible Jimmy Robert's trapline cabin) (Gotthardt 1988): This old trapline cabin is located on a lower bench of a side hill in the upper Hayes Creek area, near the proposed Casino Trail route. The cabin is constructed exclusively of axe cut logs, which suggest it was probably made in the early decades of the twentieth century. In overall dimensions, I would estimate the cabin is about 5 x 5 m, and was probably about 2 m high. Although the walls of the cabin are still intact, the roof has since collapsed into the cabin interior. Associated with the cabin was a mooseskin scraping pole. The pole, which is now charred, is a sharpened stake, about 1 m long, fixed in the ground. It is located about 10 m north of the cabin. About 5 m west of the cabin is a 'dog house' - essentially a small brush camp made for a dog. The trapper using this cabin did not have a dog team, and used his single dog for packing. No cache was observed associated with the cabin; Mr. Wilfred Charlie suggested that the cabin was used only on a temporary basis and otherwise served as a cache when the owners were travelling elsewhere. The old

foot trail to Wellesley Lake and White river was noted about 10 m on below the cabin on a lower bench of the side hill (Gotthardt 1988).
Scope of Possible Impacts from Casino Project: Said to be located east of approximately km 123+500. Unknown exact location east of planned road construction but, may be close to a proposed borrow pit or possible borrow pit access road.
Management Recommendations: The cabin is recommended to be relocated and flagged for avoidance. If avoidance of possible borrow pit or access road is not feasible then additional documentation is recommended.

KdVf-2 (possible log structure, cabin or spirit house) (Gotthardt1988): Attempts to relocated an old log structure reported by survey crew at near the proposed Casino Trail route (Percival 1988:34) were unsuccessful. The structure is located at the toe of a hill and across the stream (on the east side) from Site A. Percival has suggested that the structure may be a cabin or spirit house. The latter interpretation implies the structure is fairly small; I would propose as an alternative interpretation that the log structure is a ground cache, used for storing meat and furs by trappers exploiting the region in the historic period (Gotthardt 1988).
Scope of Possible Impacts from Casino Project: Said to be located east of approximately km 127+600. Unknown exact location east of planned road construction but will not be directly impacted.
Management Recommendations: No further work required.

Steamers/Upright Boilers Site (YHSI 115J/09/002) (Mooney 2011): Historic site consists of two Metal Steamers, two log ladders, eight+ placer pits and cribbed shafts. The boilers are situated in what appears to be an old placer mining site with shafts and open cuts nearby. Dates from 1906 to 1965. According to Mooney (2011), the Upright Boilers Site is very likely associated with the Hayes Creek Cabins (KeVg-1) and are likely connected by a trail system along the west side of the Hayes Creek Valley as mentioned in Soucey et al 2010a.
Scope of Possible Impacts from Casino Project: Now these resources appear to be within the planned ROW and previously they were within a planned borrow pit.
Management Recommendations: Avoidance is recommended. If these resources are not avoided then a limited amount of additional documentation is recommended prior to construction impacts. Relocation of some of these resources may be possible.

Hayes Creek Cabins (YHSI 115J/09/001) aka KeVg-1 (Mooney 2011, 2013a): Located approximately SW of Hayes Creek, SE from the confluence of Hayes and Selwyn Creeks previously recorded as KeVg-1. According to Mooney (2011), the Upright Boilers Site is very likely associated with the Hayes Creek Cabins (KeVg-1) and are likely connected by a trail system along the west side of the Hayes Creek Valley as mentioned in Soucey et al 2010a. Three structures were identified: two single story collapsed log cabins and a smaller log structure that could be a cache. There is a blazed trail that leads to the two cabins from a nearby stream. The cabins are in poor condition and date between 1906 and 1967.
Scope of Possible Impacts from Casino Project: The remains of Hayes Creek Cabins appear to be near, but just outside, the proposed alignment and borrow pit locations. As such these should not be directly impacted by road construction and no further work is recommended.

Management Recommendations: If avoidance is not possible then additional research and documentation is recommended.

AY09-19 Ethnohistoric trail (Mooney 2013; Soucey et al 2010a): A 2 m wide foot trail that traverses northwest-southeast across the northeast facing slope at the confluence of Hayes Creek and the Selwyn River. Extends for a minimum 600 m and is marked by a blazed tree. Historic site KeVg-1 is adjacent to this trail and it may join with AY-09-18.
Scope of Possible Impacts from Casino Project: Portion of trail to potentially be impacted was flagged by Ecofor (2013) with white CMT tape.
Management Recommendations: Impacts to the previously recorded ethno-historic trails are recommended to be avoided and/or minimized where possible. If impacts to these ethno-historic trails can't be avoided then additional background research, on-site recording, and informant interviews to document use of the trails is recommended.

AY-09-18 Ethnohistoric trail (Mooney 2013; Soucey et al 2010a): A 2 m wide foot trail aligned roughly north-south across the northeast facing slope at the confluence of Hayes Creek and the Selwyn River. May be part of the Tutchone Trail followed by Schwatka in 1891 (Soucey et al 2010a). Selkirk First Nation Elders suggested it may be a “Grandfather Trail”, a traditionally used inter-regional trail (Soucey et al 2010a).
Scope of Possible Impacts from Casino Project: Portion of trail to potentially be impacted was flagged by Ecofor (2013) with white CMT tape.
Management Recommendations: Impacts to the previously recorded ethno-historic trails are recommended to be avoided and/or minimized where possible. If impacts to these ethno-historic trails can't be avoided then additional background research, on-site recording, and informant interviews to document use of the trails is recommended.

KeVg-2 (Soucey et al 2010b; Mooney 2013a): A historic culturally modified tree (CMT) site consisting of a modified tree stump on the eastern bank of the Selwyn River. It is on level terrain less than 5 m from the river. The tree appears to have been cut by an adze rather than an axe.
Scope of Possible Impacts from Casino Project: The site is located outside of the project area.
Management Recommendations: No further work is recommended.

5.0 ARCHAEOLOGICAL SITES NEAR PROPOSED MINE SITE, ROAD TO YUKON RIVER, AND ROAD TO AIRSTRIP

Archaeological sites near the proposed mine site, the road to the Yukon River, and the road to the proposed airstrip are listed below.

KeVi-1 (Handly et al 1994; Mooney 2013a; Soucey et al 2010a): Originally recorded by Handly and Martin as a very small prehistoric lithic scatter site, KeVi-1 was revisited by Soucey et al in 2009 and was reported as having been destroyed by trail building activities. It is located on a colluvial ridge above the confluence of Meloy and Casino Creeks and below an access road. Both KeVi-1 and KeVi-2 are located on the same colluvial ridge.
Scope of Possible Impacts from Casino Project: This site was located with the proposed tailings management facility footprint (aka supernatant pond) and has been previously destroyed.
Management Recommendations: No further work is required.

KeVi-2 (Handly et al 1994; Mooney 2013a; Soucey et al 2010a): Originally recorded by Handly and Martin as a very small lithic scatter site, KeVi-1 was revisited by Soucey et al in 2009 and was reported as having been destroyed by trail building activities. It is located on a colluvial ridge approximately above the confluence of Meloy and Casino Creeks and below an access road. Both KeVi-1 and KeVi-2 are located on the same colluvial ridge.
Scope of Possible Impacts from Casino Project: This site was located with the proposed tailings management facility footprint and has been previously destroyed.
Management Recommendations: No further work is required.

KeVi-3 (Handly et al 1994; Mooney 2013a; Soucey et al 2010a): An archaeological site consisting of an isolated surface find (biface fragment) on an existing road. Shovel tests by Handly et al failed to find any other artifacts and a detailed inspection of the site by Soucey et al in 2009 found no other evidence of cultural activity.
Scope of Possible Impacts from Casino Project: This isolated find was located within the proposed mine site footprint.
Management Recommendations: No further work is required.

KeVi-6 (de Guzman et al 2014; Soucey et al 2010a): A prehistoric lithic site consisting of lithics and faunal material. The size of the assemblage and the diversity of material types suggest that KeVi-6 is a small, short-term campsite. The presence of a microblade core rejuvenation flake indicates that microblades were being manufactured at the site. Further testing at the site included two 1 x 1 units in 2013 leading to the recovery of a large number of lithics including microblades and one lancelate projectile point. The assemblage indicates that the site dates to the Little Arm Phase of Early Prehistoric Time Period dating it to between 8, 000 B.P. and 4, 500 B.P.
Scope of Possible Impacts from Casino Project: This site is located outside of planned project impacts.
Management Recommendations KeVi-6 is considered to be adequately sampled relative to the size of the landform and the site boundaries assessed in 2009. No further work is recommended.

KeVi-12 (Mooney 2013a): This prehistoric lithic site is located on a long, very narrow, south descending ridge near the proposed access road to the proposed airstrip. Ridge overlooks Casino Creek Valley at confluence with Brynelson Creek. This rocky ridge likely contains a low density of lithic materials dispersed in pockets of level ground and likely represents a small sized temporary vista and lithic reduction workshop.
Please Note: This Borden number was mistakenly assigned to two sites. This lithic site and an adze cut stump (Soucey et al 2010b). The stump is now part of Site KeVi-9 (Gotthardt personal communication 2014).
Scope of Possible Impacts from Casino Project: The site appears to be within approximately 50 m the proposed access road to the airstrip. This site will not be directly impacted.
Management Recommendations: No further work is recommended.

KeVi-13 (Mooney 2013a): This lithic isolate was found on a high elevation stepped rocky bench and outcrop that overlooks the Casino Creek drainage. This lithic scatter likely represents a low density small sized temporary campsite, lithic reduction workshop. No cultural diagnostic materials were identified.
Scope of Possible Impacts from Casino Project: This site is located within a proposed borrow pit for the proposed construction of the tailings management facility. This site will be directly impacted by the borrow pit development.
Management Recommendations: Due to the amount of testing along this landform and in the area of the isolated lithic it is unlikely that additional efforts will add significantly to the understanding of the past use of this landform. No further heritage work for this site is recommended.

KeVi-14 (Mooney 2013a): Site is located on a high elevation stepped rocky outcrop that overlooks the Casino Creek drainage. This lithic scatter likely represents a medium density small sized temporary campsite, lithic reduction workshop. The biface base shows evidence of basal thinning and edge grinding and appears to have been hafted. It is unlikely that the point base can be used to determine cultural affiliation. Therefore no culturally diagnostic materials were identified.
Scope of Possible Impacts from Casino Project: The site is located just on the north edge of a proposed borrow pit for the proposed construction of the tailings management facility. This site may be directly impacted by borrow pit use and/or access road construction.
Management Recommendations: Avoidance of the site is recommended. If avoidance is not possible then data recovery work is recommended. Data recovery should include additional shovel testing to better determine artifact distribution and density followed by 1 x 1 m block excavation. Approximately 4 - 6 square meters of excavation would be recommended based on existing data.

KeVi-15 (Mooney 2013a): This site is located on the south-facing edge of a small bench which overlooks Casino Creek valley. The lithic scatter likely represents a moderate to low density small sized temporary campsite or lithic reduction workshop. No culturally diagnostic materials were identified and it is uncertain when these materials were deposited.
Scope of Possible Impacts from Casino Project: The site is located within a proposed borrow pit northeast of the proposed airstrip and would be directly impacted by these developments.

Management Recommendations: Avoidance of the site is recommended. If avoidance is not possible then data recovery work is recommended. Data recovery should include additional shovel testing to better determine artifact distribution and density followed by 1 x 1 m block excavation. Approximately 4 - 6 square meters of excavation would be recommended based on existing data.

KdVi-1 (de Guzman et al 2014; Handly et al 1994; Mooney 2013a; Soucey et al 2010a): Located at the confluence of Casino Creek and one of its tributaries, this subsurface prehistoric lithic site is interpreted as a small to medium sized, temporary or short-term use, camp site measuring an area of about 50 m x 10 m. A radiocarbon date (3,390 +/- 60 B.P.) from a bone sample places occupation to the Taye Lake Phase of the Northern Archaic Time Period. Handly et al (1994) identified the site as being within or directly adjacent to the proposed impact zones relating to the tailings impoundment areas. In 2013, Altamira (de Guzman et al 2014) conducted excavations and shovel testing expanding the site boundaries and found a high ratio of tools relative to debitage. They identified KdVi-1 to be a highly significant historic resource.
Scope of Possible Impacts from Casino Project: Parts of this site are located within a proposed borrow pit west of the proposed road to the airstrip.
Management Recommendations: Soucey et al (2010a) recommend that the excavation needed to produce a reasonable recovery should be large. Given the high ratio of tools recovered from the southern activity area and the expansion of the northwest activity area, further excavation (up to 20 1-x-1 m units) at KdVi-1 is recommended (de Guzman et al 2014).

KdVi-2 (Mooney 2013a): This site is located along the north-south climbing ridge overlooking the confluence of Casino and Dip Creeks. This large site was found to contain a wide distribution of lithic materials but the lower section appears to hold the greatest concentration of materials, including microblades. The lithic scatter likely represents a large site use area but moderate density temporary campsite(s) or lithic reduction workshop(s) overlooking the valley at the confluence of the creeks. This landform may have been used repeatedly, however; thus far the only culturally diagnostic materials identified consist of microblades, which represent the Little Arm Phase.
Scope of Possible Impacts from Casino Project: The site is located within a proposed borrow pit northeast of the proposed airstrip and would be directly impacted by these developments.
Management Recommendations: Avoidance of the site is recommended. If avoidance is not possible then data recovery work is recommended. Data recovery should include additional shovel testing to better determine artifact distribution and density followed by separate loci of 1 x 1 m block excavation. Approximately 20 - 28 square meters of excavation would be recommended based on existing data.

KdVi-3 (Mooney 2013a): This site is located at the southwest end of an ascending ridgeline overlooking the confluence of Casino and Dip Creeks. The cultural materials were found on a small level area that provides a significant vista over the valley below. The single positive shovel test contained a significant amount of lithic materials which likely represents a moderate density small sized temporary campsite or lithic reduction workshop. No culturally diagnostic materials were identified and it is uncertain when these materials were deposited.

Scope of Possible Impacts from Casino Project: This small site is located within a proposed borrow pit northeast of the airstrip and would be directly impacted by these developments.
Management Recommendations: Avoidance of the site is recommended. If avoidance is not possible then data recovery work is recommended. Data recovery should include additional shovel testing to better determine artifact distribution and density followed by 1 x 1 m block excavation. Approximately 4 - 6 square meters of excavation would be recommended based on existing data.

KdVi-4 (Mooney 2013a): This site is situated on a rocky undulating ridge top overlooking the confluence of Dip and Casino Creeks. This landform provides small sections of level ground and a significant vista over the valley area. The lithic scatter likely represents a moderate to low density small sized temporary campsite(s) or lithic reduction workshop(s). No culturally diagnostic materials were identified and it is uncertain when these materials were deposited.
Scope of Possible Impacts from Casino Project: The site is located within a proposed borrow pit northeast of the airstrip and would be directly impacted by these developments.
Management Recommendations: Avoidance of the site is recommended. If avoidance is not possible then data recovery work is recommended. Data recovery should include additional shovel testing to better determine artifact distribution and density followed by 1 x 1 m block excavation. Approximately 8 - 10 square meters of excavation would be recommended based on existing data.

KdVi-5 (Mooney 2013a): This site is located on a somewhat level ridge top overlooking the confluence of Dip and Casino Creeks. The lithic scatter likely represents a moderate to low density small sized temporary campsite(s) or lithic reduction workshop(s). No culturally diagnostic materials were identified and it is uncertain when these materials were deposited.
Scope of Possible Impacts from Casino Project: The site is located within a proposed borrow pit northeast of the airstrip and would be directly impacted by these developments.
Management Recommendations: Avoidance of the site is recommended. If avoidance is not possible then data recovery work is recommended. Data recovery should include additional shovel testing to better determine artifact distribution and density followed by 1 x 1 m block excavation. Approximately 6 - 8 square meters of excavation would be recommended based on existing data.

KfVi-2 (de Guzman et al 2014, Soucey et al 2010a): KfVi-2 is an archaeological site located west of the eastern project boundary and south of the Yukon River. It is situated on a flat terrace, on the lowest terrace of the southern bank of the Yukon River, east of the confluence of Britannia Creek and the Yukon River. It consists of fire cracked rock (FCR) and faunal remains and hearth features. The landform has been modified by a 2 m wide road cut or trail that traverses north-south across the landform. The road cut lies 20 m to the west of KfVi-2. In 2014, Altamira completely excavated the hearth feature and noted the disturbance the area receives annually from frost heave and fluvial movements.
Scope of Possible Impacts from Casino Project: This site is located outside project impacts.
Management Recommendations: De Guzman et al (2014) recommend no further work because of the small number of artifacts recovered during the 2013 excavations at KfVi-2. They say that the site is considered to have been adequately sampled and mitigated through the excavations conducted in both 2010 and 2013 (De Guzman et al 2014).

KfVi-3 (de Guzman et al 2014; Soucey et al 2010a): A multi-component site consisting of archaeological and historic components. The historic component includes a poorly preserved wooden structure with an associated depression and scatter of Historic period artifacts. KfVi-3 is estimated to span an area of 1,375 square metres. According to de Guzman et al (2014) the recovered assemblage of the prehistoric component is typical of long-term and repeated occupation, spanning thousands of years: "Radiocarbon dating analysis places occupation to at least three different time periods, in addition to the Historic period occupation identified at the eastern extent of the site. Prehistoric occupation is dated to 1,170 to 1,260 cal BP, 4,650 to 4,830 calBP, and approximately 13,000 cal BP. Therefore, KfVi-3 likely represents continuous and/or repeated occupation that spans 13,000 years, extending throughout various phases and complexes in the Prehistoric period." (de Guzman et al 2014: 104). De Guzman et al consider the site rare, because of the size and extent and the variety of material recovered. They state that many questions remain unanswered because of the small amount of sampling done here.
Scope of Possible Impacts from Casino Project: There are no planned impacts for this site.
Management Recommendations: Continued avoidance of KfVi-3 is recommended. If avoidance is not feasible, Stage 1 excavations of at least a 15% sample are recommended at KfVi-3; this would entail hand excavation of an additional 190 1-x-1 m units. If artifact recovery is limited, excavation could be halted upon discussion with the Heritage Resources Unit.

KfVi-4 (de Guzman et al 2014; Soucey et al 2010a): This site is a small campsite located on a pre-Reid glacio-fluvial terrace on the eastern Britannia Creek valley wall. First identified through shovel testing in 2009, the small prehistoric site yielded a small number of lithic and faunal material. It was reassessed in 2013 through two 1 x 1 m units and additional tests yielded no additional material. It is interpreted as a short-term occupation site.
Scope of Possible Impacts from Casino Project: There are no planned impacts for this site.
Management Recommendations: De Guzman et al (2014) recommend no further work.

KfVi-5 (de Guzman et al 2014; Soucey et al 2010a; Mooney 2013b, 2014): A prehistoric lithic site. The diversity in raw materials suggests the possibility that the site was occupied on multiple occasions as a short-term workshop. Artifacts recovered in 2009 included a microblade fragment and lithic debitage. The microblade fragment suggests a site occupation age during the Little Arm Phase, which dates from 8, 000 B.P. to 4, 500 B.P. Further testing by Altamira in 2013 resulted in recovery of an adze (de Guzman et al 2014). Further archaeological mitigation efforts were conducted by Ecofor under permit 13-18ASR (Mooney 2013b).
Scope of Possible Impacts from Casino Project: There are no planned impacts for this site.
Management Recommendations: Mooney (2013b, 2014) recommends no further work and continued avoidance.

6.0 HISTORIC STRUCTURES AND RESOURCES NEAR PROPOSED MINE SITE, ROAD TO YUKON RIVER, AND ROAD TO AIRSTRIP

The following structures and resources are listed in and around the proposed mine site, the road to the Yukon River and the road to the proposed airstrip.

KeVi-4 (Hanley et al 1994, Soucey et al 2010a): An historic site that was described by Handly et al in 1994 as being demolished or partly obliterated log cabin associated with Euro-Canadian or Historic Native hunting and trapping and dating between 1910 and the early 1940's. Located on a knoll on the east bank of Casino Creek, 8.2 km along an access road leading from the main Casino Exploration Camp, through Dam Site 1 to Heap Leach Site 1. Survey during 2009 by Soucey et al failed to relocate the site.
Scope of Possible Impacts from Casino Project: These partially collapsed remains are located within the proposed tailings management facility footprint.
Management Recommendations: Handly et al recommend no further work if avoidance is not feasible. Soucey et al recommend additional survey and data collection to determine the age and ownership of the cabin.

KeVi-5 (Handly et al 1994; Soucey et al 2010a): An historic cabin located on a flat alluvial terrace above the west bank of Casino Creek and west of where the bulldozer crosses the creek. Cabin is partially collapsed. It dates to before 1936. It is located two kilometres southeast of the recorded location for KeVi-4 (Handly et al 1994). The site was revisited by Soucey et al in 2009 and was found to consist of the remains of a cabin structure.
Scope of Possible Impacts from Casino Project: These partially collapsed remains are located within the proposed tailings management facility footprint.
Management Recommendations: Handly et al (1994) recommend no further work if avoidance is not feasible. Soucey et al (2010a) recommend that in the event that it is determined that site disturbance is likely to occur, it is recommended that additional research and test excavation be carried out.

KeVi-7 (Soucey et al 2010a): A historic cabin that dates to urban development period of the historic era. Located south of the confluence of Canadian Creek and Brittania Creek and east of the western project boundary. The cabin is constructed with axe cut and hand sawn horizontal logs. The maximum height of the surviving walls is 15 logs in height. The cans and the tree cores date use of the cabin to the early 20th century. Given the presence close proximity of the cabin to two possible placer mine pits, it was likely occupied by a placer miner of European descent.
Scope of Possible Impacts from Casino Project: There are no planned impacts for this site.
Management Recommendations: Avoidance is recommended by the current authors. Additional testing at the site is recommended to augment the current knowledge of its placement and use within the historic time period.

KeVi-8 (Soucey et al 2010a): A partially collapsed, historic cabin situated on the south facing slope above Casino Creek. Site consists of one corner of a log cabin. The ownership, age and use of the cabin

are unknown but it likely dates to the late 19th to early 20th century. Located on the east side of Casino Creek, northeast of the confluence of Casino and Nelson Creeks.
Scope of Possible Impacts from Casino Project: This site is located near the tailings storage facility footprint and may be impacted by construction.
Management Recommendations: Avoidance is recommended by the current authors. In the event that it is determined that site disturbance is likely to occur, it is recommended that additional research and test excavation be carried out.

KeVi-9 (Soucey et al 2010a): Is a historic CMT site consisting of a black spruce tree that has been tied into a knot. It is located at the base of a large knoll. KeVi-6 is located on the top of the knoll. The site is thought to represent a marker on a trail that cuts a route between Britannia and Canadian Creeks. The site is dated to 1946 from a dendro-chronological sample. This site number now also includes what Altamira previously recorded as Site KeVi-12 (a possible adze cut stump). This possible adze cut stump was located fairly close to the above noted KeVi-9 CMT.
Please Note: The Borden site number KeVi-12 was also assigned to a small lithic site recorded by Ecofor. After consultation with Ruth Gotthardt the possible adze cut stump has been added to Site KeVi-9, and the lithic site will remain as site KeVi-12 (Gotthardt personal communication 2014).
Scope of Possible Impacts from Casino Project: There are no planned impacts for this site KeVi-9.
Management Recommendations: Avoidance is recommended by the current authors. In the event that it is determined that site disturbance is likely to occur, additional consideration and research is warranted to determine site value. Further consultation and research with local informants could provide additional information about the site and its association with an existing trail.

KeVi-10 (Soucey et al 2010a): A historic site consisting of a collapsed wooden framework found at the base of a spruce tree. It may have served as a platform or hunting blind. A small piece of plywood was near the framework. The site is on the west side of a quad trail paralleling Canadian Creek.
Scope of Possible Impacts from Casino Project: There are no planned impacts for this site.
Management Recommendations: Avoidance is recommended by the current authors. Site is located within the Canadian Creek valley, an area that may be impacted during project developments. In the event that it is determined that site disturbance is likely to occur, additional consideration and research is warranted to determine site value.

KeVi-11 (Soucey et al 2010a): An historic period site consisting of an ethno-historic hide working frame piece found on the north side of Nelson Creek.
Scope of Possible Impacts from Casino Project: There are no planned impacts for this site.
Management Recommendations: Avoidance is recommended by the current authors. Site is located within the Nelson Creek valley, an area that may be impacted during project developments. In the event that it is determined that site disturbance is likely to occur, additional consideration and research is warranted to determine site value.

KfVi-6 (Soucey et al 2010a): An historic cabin located on a bench overlooking the Yukon River to the north. It is located south of the Yukon River east of the current barge landing. It has been preliminarily associated with a known early inhabitant of the study area.
Scope of Possible Impacts from Casino Project: There are no planned impacts for this site.
Management Recommendations: Avoidance is recommended by the current authors. There is potential for additional materials to be recovered and additional research may confirm the cabin's owner(s). Additional investigation is warranted for this historic era site.

KfVi-7 (Soucey et al 2010a): An archaeological site that consists of an isolated modified ungulate metatarsal. The metatarsal shows evidence that it was used as an end scraper. The end scraper was found in a context next to the river; it is possible it may have been deposited during a flood event. It is possible that this site is associated with an ethno-historic site (KfVi-10) located nearby.
Scope of Possible Impacts from Casino Project: There are no planned impacts for this site.
Management Recommendations: Avoidance is recommended by the current authors. There is potential for additional information to be recovered from the site area. Thus, additional archaeological investigation of the two site area is warranted.

KfVi-8 (Soucey et al 2010a): An historic period site consisting of the remains of a tent campsite that may be associated with placer mining. The site is located directly east of Britannia Creek.
Scope of Possible Impacts from Casino Project: There are no planned impacts for this site.
Management Recommendations: Avoidance is recommended by the current authors. In the event that it is determined that site disturbance is likely to occur, additional consideration and research is warranted to determine site value and specific mitigation options. Further research and consultation with local informants could provide additional information about the site and its association with placer mining activities in the valley.

KfVi-9 (Soucey et al 2010a): An historic period site consisting of a partially buried wooden object. Located on the south bank of the Yukon River and east of the project boundary. The origin, date and use of the wooden object have are unknown. Preliminary interpretations suggest an association with human burial remains.
Scope of Possible Impacts from Casino Project: There are no planned impacts for this site.
Management Recommendations: Avoidance is recommended by the current authors. In the event that it is determined that site disturbance is likely to occur, additional consideration and research is warranted to determine site value and specific mitigation options. Further research and consultation with local informants is warranted to establish its origin, use and possible cultural relationship.

KfVi-10 (Soucey et al 2010a): An historic site consisting of a single item, a hide-working frame that was found on the south bank of the Yukon River and east of the western project boundary.
Scope of Possible Impacts from Casino Project: There are no planned impacts for this site.
Management Recommendations: Avoidance is recommended by the current authors. No management recommendations were given except that additional consideration and research could determine its value in terms of ownership and relationship to other sites or cultural activities in the area.

KfVi-11 (Soucey et al 2010a): A CMT site consisting of tree stump and pole that were used for hide-working. It has been identified as ethnohistoric. Site is located on a glacio-fluvial terrace above Britannia Creek. The site is west of the east project boundary east of archaeology site KfVi-4.
Scope of Possible Impacts from Casino Project: There are no planned impacts for this site.
Management Recommendations: Avoidance is recommended by the current authors. No management recommendations were given except that additional consideration and research is warranted to determine its value in terms of ownership and relationship to other sites or cultural activities in the area.

KfVi-12 (Soucey et al 2010b): The site consists of a birch tree that has had bark stripped for traditional use activities. The birch tree measures 1.5 m in height and 15 cm in diameter. The tree is dead and the top has broken off. The site is evidence for traditional use activities along the Yukon River near Britannia Creek. No date has been assigned to the tree.
Scope of Possible Impacts from Casino Project: There are no planned impacts for this site.
Management Recommendations: Avoidance is recommended by the current authors. Further research and consultation is recommended (Soucey et al 2010b).

KfVi-13 (Soucey et al 2010b): The site consists of a birch tree that has had bark stripped for traditional use activities. The birch tree is still living and only a small, 25 cm wide swatch of bark has been removed from the mid-lower portion of the tree. The site is evidence for traditional use activities along the Yukon River near Britannia Creek. No date has been assigned to the tree.
Scope of Possible Impacts from Casino Project: There are no planned impacts for this site.
Management Recommendations: Avoidance is recommended by the current authors. Further research and consultation is recommended (Soucey et al 2010b).

KfVi-14 (Soucey et al 2010b): The site consists of a spruce tree that has had a cambium strip removed. The strip is 50 cm high by 15 cm wide and the scar is 10 cm deep. Two shallow cut marks were noted at the top of the scar. A core sample was taken from the tree, however several large knots were cored through; therefore, it was not possible to determine when the cambium stripping took place. The site is evidence for traditional use activities along the Yukon River near Britannia Creek. No date has been assigned to the tree.
Scope of Possible Impacts from Casino Project: There are no planned impacts for this site.
Management Recommendations: Avoidance is recommended by the current authors. Further research and consultation is recommended (Soucey et al 2010b).

7.0 PREVIOUSLY NOTED FIRST NATION USE SITES ALONG FREEGOLD ROAD

Handly and Rousseau collected information regarding these First Nation use sites (abbreviated FN's) while conducting assessment along the previously identified planned upgrade to the Freegold Road (Handly and Rousseau 1995). This are listed below in order from Carmacks heading northwest towards the proposed mine site.

FN1: May Roberts indicated that a First Nation Traditional Brush Camp was located at the northern end of Three Mile Lake, approximately west of present Freegold Road.
Scope of Possible Impacts from Casino Project: There are no planned impacts for this site.
Management Recommendations: No further work required, but perhaps keep access to area open from Freegold Road.

FN2: At the head of a narrow valley past Three Mile Lake, LSCFN peoples used to stop at a spring for water on their way to, or from fishing and hunting camps.
Scope of Possible Impacts from Casino Project: This camp is located near the proposed ROW but there are no planned impacts for this site.
Management Recommendations: No further work required, but perhaps keep access to area open from Freegold Road.

FN3: May Roberts indicated that there was a traditional First Nations trail which began at km 5.0 on the present Freegold Road. It continued behind Mount Miller to several lakes, and from there to approximately km 24.0 on the Freegold Road. The trail was recently upgraded by several members of the LSCFN. An information plaque had been erected on the present Freegold Road, but at the time of our survey, the plaque had been knocked over. This 'bypass trail' joined the Agate Trail (FN 8 below), providing access to lithic raw material source areas, as well as access to fall hunting campsites at several lakes along the trail. The trail is situated 1 to 2 km west of the present Freegold Road.
Scope of Possible Impacts from Casino Project: There are no planned impacts for this site.
Management Recommendations: No further work required, but perhaps keep access to area open from Freegold Road.

FN4: May Roberts stated that a prominent knoll, situated near the proposed Freegold Road Project ROW, was used as a caribou monitoring station. The knoll overlooks a bend in the Yukon River where the Forty Mile Caribou Herd previously forded the Yukon River. When the caribou herds were sighted, hunters would descend to the river, get into their canoes, and kill caribou as they swam across the river. FN 4 is situated outside the proposed Freegold Project impact zone.
Scope of Possible Impacts from Casino Project: This knoll is likely within a proposed borrow pit.
Management Recommendations: If it is within the proposed borrow pit, it would be required to be assessed prior to impacts.

FN5: May Roberts Fish Camp is located at km 7.1 of the Freegold Road ROW. This large site (20 m N/S by 20 m E/W) consists of four walled tent-frame structures and two large, covered fish drying racks 5 to 10 m back from the banks of the Yukon River.
Scope of Possible Impacts from Casino Project: There no planned impacts for this site.
Management Recommendations: No further work required, but perhaps keep access to area open from Freegold Road.

FN6: Stanley Jonathan's Fish Camp is a medium sized (15 m N/S by 10 m , Chinook salmon fishing camp was identified by May Roberts at km 9.8 on the Freegold Road.
Scope of Possible Impacts from Casino Project: There no planned impacts for this site.
Management Recommendations: No further work required, but perhaps keep access to area open from Freegold Road.

FN7: The start of the Agate Trail (Mount Miller Gem and Mineral Trail) is located at km 13.7 on the present Freegold Road.
Scope of Possible Impacts from Casino Project: There no planned impacts for this site.
Management Recommendations: No further work required, but perhaps keep access to area open from Freegold Road.

FN8: A small (3 m N/S by 3 m W/E), First Nations traditional hunting and trapping camp was located at km 13.7, approximately 5 m to the east of the proposed Freegold Road Project ROW, where the Agate Trail and present Freegold Road intersect. May Roberts said this used to be Jessie Wolf's hunting and trapping camp.
Scope of Possible Impacts from Casino Project: There no planned impacts for this site.
Management Recommendations: We strongly recommend that the First Nation traditional cultural material remaining at this site be systematically collected by representatives of the LSCFN prior to construction of the proposed Freegold Road (Handly and Rousseau 1995 - may no longer exist).

FN9: The remains of a small (2 m N/S by 2 m N/S), First Nation traditional bush camp was observed around the base of a large, White Spruce tree that had been felled within the Proposed Project ROW at km 15.8. The camp was noted late in the afternoon on October 5, but by morning of the next day the White Spruce tree had been felled by workmen clearing the Freegold Road impact zone.
Scope of Possible Impacts from Casino Project: This camp area was adjacent to the proposed Freegold Road ROW.
Management Recommendations: No further work recommended.

FN10: A medium sized (10 m N/S by 6 m W/E) First Nations traditional fur trappers camp was noted at km 19.9), approximately 5 m outside the western edge of the proposed Freegold Project ROW. A brush lean-to, and a collapsed, rectangular tent-frame structure were noted, as well as four stoves and associated stovepipes, assorted hide stretchers, sawhorses, boots, saws, files, pots, pans, firewood and scattered

refuse. May Roberts indicated that this was originally Edward Charlie's trapping camp, but that now it was within Larry Tricker's (#150) trapline territory.
Scope of Possible Impacts from Casino Project: This camp area was adjacent to the proposed Freegold Road ROW.
Management Recommendations: We strongly recommend that the First Nation traditional cultural material remaining at this site be systematically collected by representatives of the LSCFN prior to construction of the proposed Freegold Road (Handly and Rousseau 1995 - may no longer exist).

Previous field efforts also recorded an additional modern cabin, and five trap trees near the existing Freegold Road (Mooney 2013a). These modern resources are noted here due to expected interests of current stakeholders. The modern cabin is located just above the existing Freegold Road and on the edge of a proposed borrow pit at what was previously known as "Mile 40" and currently at about 62 km on current project mapping. Due to the relatively modern age of this cabin it was not recorded with YHSI.

This cabin was constructed of milled lumber with a plywood exterior and a metal roof. This cabin is not anticipated to be impacted by borrow pit or road realignment but it is on the south edge of a proposed borrow pit and access to the cabin may be affected during construction.

Figure 2. Modern cabin looking southeast and a sample trap tree south of Freegold Road.

Five trap trees were noted along the south side of the existing Freegold Road between approximately 37 and 50 km of the current 2013 project mapping. Only a sample of them is shown above and not all will be impacted by the proposed realignments of Freegold Road.

No further heritage work is recommended for these moveable traps but consultation with the trapline holder(s) is recommended.

8.0 SUMMARY AND CONCLUSIONS

The proposed Casino Mine project and ancillary facilities consist of: proposed upgrades to the Freegold Road from the Klondike Highway to the mine site (including the proposed by-pass around Carmacks); road and infrastructure improvements from the mine site to the Yukon River; and road and airport construction to the southwest of the mine site. This summary presents what heritage resource impact assessment work remains to be completed, and which heritage resources are to be managed prior to and during construction. Overall there are fifty (50) known archaeological sites and forty-seven (47) known historic structures or historic resources that must be managed in relation to this project. These totals are further broken down by location along the proposed Freegold Road from the Klondike Highway to the proposed mine site, and from the mine site itself and access roads to the Yukon River and to the proposed airstrip. These are in addition to ten (10) previously recorded First Nation use sites. These are summarized below.

The heritage resource impact assessment remaining to be completed consists of seventeen (17) proposed borrow pits and approximately 7.45 km of ROW between the Klondike Highway and km 33+000, as well as, access roads to borrow pits, and any future additions of borrow pits or other ancillary components, or road re-alignments.

Some borrow pits are directly adjacent to the proposed ROW and do not require a separate access road to move borrow materials to the construction ROW. Other proposed borrow pits are not adjacent to the ROW, and will require access roads between the borrow pit and the ROW. No access roads for borrow pits have been specifically assessed (only in a few cases have approximate location of access roads been assessed). Each of the proposed borrow pits, that require an access road, will have to have their respective access road assessed.

There are thirty-three (33) known archaeological sites to be managed between the Klondike Highway and the mine site, along the proposed Freegold Road upgrade. These sites from Carmacks to mine site consist of: KaVb-17, KaVa-3, KaVb-1, KaVb-2, KbVb-2, KbVb-4, KbVb-3, KcVd-3, KcVe-4, KcVf-2, KcVf-3, KeVf-1, KdVf-4, KdVf-13, KdVf-7, KdVf-6, KdVf-5, KdVf-8, KdVf-10, KdVf-11, KdVf-9, KdVf-14 (a.k.a. KdVf-1), KdVf-12, KeVf-3, KeVg-5, KeVg-4, KeVg-9, KeVg-7, KeVg-8, KeVg-3, KeVg-6, KeVh-3, and KeVh-4. Each of these sites must be managed on a site by site basis. This management effort will ensure that the site boundaries are clearly marked. Management options range from avoiding impacts, minimizing impacts, to mitigating impacts with detailed data recovery excavations. Where engineering plans changes, these sites must be reviewed for possible impacts as per the Heritage Resource Management Plan (Mooney 2013b).

There are thirty-one (31) historic structures and/or historic resources to be managed along the proposed Freegold Road upgrade. From Carmacks to the mine site these include: H1 Whitehorse-Dawson Winter Road, H2 log structure, H3 mink fox farm, H4 Dalton Trail, H5 Place Mine, H6 Morrison Road House, Tricker Cabin, Fallen Cache Cabin, Dog House Cabin, Gas Can Cabin, Melmac Cabin, Ketchup Cabin, Three Room Cabin, Frenchman Cabin, Bow Creek Cabins, KcVd-2, KcVd-1, Five Course Cabin, Garage by Big Creek, High Cache Cabin, Burl Cabin, KcVe-3, KcVe-1, KcVe-2, KdVf-3, KdVf-2, Steamers/Upright Boilers, KeVg-1 (a.k.a. Hayes Creek Cabins), trail AY09-19, trail AY09-18, and KeVg-2. Specific recommendations vary on a resource by resource basis but where possible flagging and

avoidance is the first recommendation. Additional documentation and research is recommended for some resources, and if possible relocation of some resources is recommended. Where engineering plans changes, these sites must be reviewed for possible impacts as per the Heritage Resource Management Plan (Mooney 2013b).

There are seventeen (17) known archaeological sites to be managed near the mine site, road to the Yukon River, and road and airstrip to the southwest. These sites are KeVi-1, KeVi-2, KeVi-3, KeVi-6, KeVi-12 (lithic only CMT was reassigned to site KeVi-9), KeVi-13, KeVi-14, KeVi-15, KdVi-1, KdVi-2, KdVi-3, KdVi-4, KdVi-5, KfVi-2, KfVi-3, KfVi-4, and KfVi-5. Each of these sites must be managed on a site by site basis. This management effort will ensure that the site boundaries are clearly marked. Management options range from avoiding impacts, minimizing impacts, to mitigating impacts with detailed data recovery excavations. Where engineering plans changes, these sites must be reviewed for possible impacts as per the Heritage Resource Management Plan (Mooney 2013b).

There are sixteen (16) historic structures and/or historic resources to be managed near the mine site, road to the Yukon River, and road and airstrip to the southwest. These are: KeVi-4, KeVi-5, KeVi-7, KeVi-8, KeVi-9, KeVi-10, KeVi-11, KfVi-6, KfV-7, KfVi-8, KfVi-9, KfVi-10, KfVi-11, KfVi-12, KfVi-13, and KfVi-14. Specific recommendations vary on a resource by resource basis but where possible flagging and avoidance is the first recommendation. Additional documentation and research is recommended for some resources, and if possible relocation of some resources is recommended. Where engineering plans change, these sites must be reviewed for possible impacts as per the Heritage Resource Management Plan (Mooney 2013b).

There are ten (10) previously recorded First Nation use sites along the Freegold Road. These sites consist of FN 1 brush camp, FN 2 natural spring, FN 3 traditional trail, FN 4 look out site, FN 5 May Robert's fish camp, FN 6 Stanley Jonathan's fish camp, FN 7 Agate Trail, FN 8 small hunting and trapping camp, FN 9 small bush camp, and FN 10 trappers camp. Individual recommendations are provided on a site by site basis.

Along with these modern resources, there was also another cabin identified at approximately 62 km on current project mapping. Due to the relatively modern age of this cabin it was not recorded with YHSI. There were also five trap trees recorded along the existing Freegold Road. No further heritage work is recommended for these moveable traps but consultation with the trapline holder(s) is recommended.

Archaeological Sites to be Managed Along Proposed Freegold Road Upgrade								
KaVa-17	prehistoric site; and cemetery	surface scatter (lithic)	Slighlty disturbed by dirt track and vehicle traffic.	This site and cemetery are not currently planned for impacts and are located upslope and to the east of the proposed ROW.	No	Avoidance of this site and cemetery are recommended.	N/A no permit just site form	Just KaVb-17 Site form YG Heritage Branch 2012
KaVa-3	prehistoric	surface scatter (lithic) and subsurface scatter (lithic and faunal)	disturbed	None planned	No	Avoidance (preferred) or mitigative excavations. If the existing bridge over the Nordenskiold River was upgraded and or replaced as part of the Freegold Project reconstruction, adverse impacts could be placed on the remaining buried cultural materials.	94-22ASR (Antiquus)	Handly and Rousseau 1995
KaVb-2	prehistoric	surface scatter (lithic) and subsurface scatter (lithic)	intact (1995)	Outside of the zone of impact of Freegold Project ROW.	No	Site avoidance.	95-1ASR (Yukon Govt)	Gotthardt 1995
KaVb-1	prehistoric	subsurface scatter (lithic).	disturbed	Within the proposed Freegold Project ROW, and proposed borrow pit.	No	Avoidance (preferred) or Mitigative Excavations(Handly and Rousseau); avoid impacts to the south edge of the terrace and maintain 30 m buffer along terrace edge. Access road should be routed along north side of the terrace (Hammer 1995).	94-22ASR (Antiquus); 95-2ASR (Hammerstone)	Hammer 1995; Handly and Rousseau 1995
KbVb-2	prehistoric	subsurface scatter (lithic)	excavated in 1995	Within proposed Freegold Project ROW.	No	Recommended that during construction for the upgrading of the Freegold Road, the surface soil (0-30 cm below surface) be removed in the vicinity of KbVb-2 and stockpiled so possible remaining cultural materials may be salvaged at a future date.	94-22ASR (Antiquus), 95-2ASR (Hammerstone)	Hammer 1995; Handly and Rousseau 1995
KbVb-4	prehistoric	subsurface scatter (lithic and faunal bone)	some intact portions of site remain	Within Freegold Project ROW.	No	Mitigative Excavations	95-1ASR (Yukon Govt)	Gotthardt 1995
KbVb-3	prehistoric	scatter (lithic)	No Evidence of Site Remains	Within Freegold Project ROW.	No	None required.	95-1ASR (Yukon Govt)	Gotthardt 1995

Borden Number or Temp Site #	Class	Features	Current Status of Site	Scope of Possible Impacts from Casino Project	Site Boundary Clearly Flagged	Management Recommendations and Proposed Mitigation Strategy	Report/ Permit number and Authors	Bibliographic Reference
KcVd-3	prehistoric	subsurface scatter (lithic)	intact	Within Freegold Project proposed borrow pit.	Yes	If avoidance is not possible then data recovery work under is recommended. Data recovery should include additional shovel testing to better determine artifact distribution and density followed by 1 x 1 m block excavation. Approximately 14 - 18 square meters of excavation would be recommended.	13-07ASR (Ecofor)	Mooney 2013a
KcVe-4	prehistoric	subsurface scatter (lithic)	intact	Very close to the proposed extension of Freegold Road.	Yes	Avoidance of the site is recommended. If avoidance is not possible then data recovery work is recommended to include in-fill shovel testing to better determine artifact densities followed by a series of 1 x 1 m unit block excavations in relation to the size and distribution of the site.	11-04ASR (Ecofor)	Mooney 2011
KcVf-2	prehistoric	subsurface scatter (lithic)	intact	On edge of Freegold Project proposed borrow pit.	Yes	If avoidance is not possible then data recovery work is recommended. Data recovery should include additional shovel testing to determine artifact distribution and density followed by 1 x 1 m block excavation. Approximately 12 - 15 square meters of excavation would be recommended.	13-07ASR (Ecofor)	Mooney 2013a
KcVf-3	prehistoric	subsurface scatter (lithic)	intact	Within Freegold Project proposed borrow pit.	Yes	If avoidance is not possible then data recovery work under is recommended. Data recovery should include additional shovel testing to determine artifact distribution and density followed by 1 x 1 m block excavation. Approximately 12 - 15 square meters of excavation would be recommended.	13-07ASR (Ecofor)	Mooney 2013a

Borden Number or Temp Site #	Class	Features	Current Status of Site	Scope of Possible Impacts from Casino Project	Site Boundary Clearly Flagged	Management Recommendations and Proposed Mitigation Strategy	Report/ Permit number and Authors	Bibliographic Reference
KeVf-1	prehistoric	subsurface scatter (lithic)	intact	Within Freegold Project proposed borrow pit as of 2013 (previously not in planned impacts 2011).	Yes	If avoidance is not possible then data recovery work under is recommended. Data recovery should include additional shovel testing to determine artifact distribution and density followed by 1 x 1 m block excavation. Approximately 12 - 15 square meters of excavation would be recommended.	11-04ASR (Ecofor)	Mooney 2011
KdVf-4	prehistoric	surface and subsurface scatter (lithic)	intact	Was planned to be impacted by the proposed borrow pit (2011) but now is not planned for impacts (2013).	Yes	Avoidance of the site is recommended. If avoidance is not possible then data recovery work is recommended to include in-fill shovel testing to better determine artifact densities followed by a series of 1x1m unit block excavations in relationship to the relation to the size and distribution of the site.	88-3ASR (Gotthardt); 11-04ASR (Ecofor)	Gotthardt 1988; Mooney 2011
KdVf-13	prehistoric	subsurface scatter (lithic)	intact	Will be directly impacted by the proposed borrow pit.	Yes	Avoidance of the site is recommended. If avoidance is not possible then data recovery work is recommended to include in-fill shovel testing to better determine artifact densities followed by a series of 1x1m unit block excavations in relationship to the size and distribution of the site.	11-04ASR (Ecofor)	Mooney 2011

Borden Number or Temp Site #	Class	Features	Current Status of Site	Scope of Possible Impacts from Casino Project	Site Boundary Clearly Flagged	Management Recommendations and Proposed Mitigation Strategy	Report/ Permit number and Authors	Bibliographic Reference
KdVf-7	Multi-component: Prehistoric and Proto-historic	subsurface scatter (lithic and Chinese coin)*	intact	The site is located within a proposed borrow pit and very close to the current proposed alignment of the road. This site may be directly impacted by the road construction.	Yes	Avoidance of the site is recommended. If avoidance is not possible then data recovery work is recommended to include in-fill shovel testing to better determine artifact densities followed by a series of 1x1m unit block excavations in relationship to the size and distribution of the site. Additional historical research in regards to possible Chinese placer mining in the project area is recommended.	11-04ASR (Ecofor)	Mooney 2011
KdVf-6	prehistoric	subsurface scatter (lithic) and possible cache	intact	Within the proposed extension of Freegold Road and potential borrow pits.	Yes	Avoidance of the site is recommended. If avoidance is not possible then data recovery work is recommended to include in-fill shovel testing to better determine artifact densities followed by a series of 1x1m unit block excavations in relationship to the size and distribution of the site.	11-04ASR (Ecofor)	Mooney 2011
KdVf-5	prehistoric	subsurface scatter (lithic)	intact	Was planned to be impacted by the proposed borrow pit (2011) but now borrow pit is dropped but site is within planned ROW impacts (2013).	Yes	Avoidance of the site is recommended. If avoidance is not possible then data recovery work is recommended to include in-fill shovel testing to better determine artifact densities followed by a series of 1x1m unit block excavations in relationship to the size and distribution of the site.	11-04ASR (Ecofor)	Mooney 2011
KdVf-8	prehistoric	subsurface scatter (lithic)	intact	This site will not be directly impacted by the road construction or borrow pit use.	Yes	No further work is recommended. However, if borrow pit construction impacts lead to upslope erosion then avoidance of the site is recommended. If avoidance is not possible then data recovery work under is recommended.	11-04ASR (Ecofor)	Mooney 2011

Borden Number or Temp Site #	Class	Features	Current Status of Site	Scope of Possible Impacts from Casino Project	Site Boundary Clearly Flagged	Management Recommendations and Proposed Mitigation Strategy	Report/ Permit number and Authors	Bibliographic Reference
KdVf-10	prehistoric	subsurface scatter (lithic)	intact	This site will not be directly impacted by the road construction or borrow pit use.	Yes	No further work is recommended. However, if borrow pit construction impacts lead to upslope erosion then avoidance of the site is recommended. If avoidance is not possible then data recovery work under is recommended.	11-04ASR (Ecofor)	Mooney 2011
KdVf-11	prehistoric	subsurface scatter (lithic)	intact	This site will not be directly impacted by the road construction or borrow pit use.	Yes	No further work is recommended. However, if borrow pit construction impacts lead to upslope erosion then avoidance of the site is recommended. If avoidance is not possible then data recovery work is recommended.	11-04ASR (Ecofor)	Mooney 2011
KdVf-9	prehistoric	subsurface scatter (lthic) and possible cache	intact	This site will be directly impacted by the road construction.	Yes	Avoidance of the site is recommended. If avoidance is not possible then data recovery work is recommended to include in-fill shovel testing to better determine artifact densities followed by a series of 1x1m unit block excavations in relationship to the size and distribution of each site.	11-04ASR (Ecofor)	Mooney 2011
KdVf-14 (aka KdVf-1)	prehistoric	subsurface scatter (lithic) and possible spirit house and grave site	intact	Outside of the zone of impact of Freegold Project ROW.	Yes	Avoidance of the site is recommended. If this area is planned for any future impacts then additional efforts are recommended to confirm possible grave or spirit house locations with First Nation representatives	88-3ASR (Gotthardt); 11-04ASR (Ecofor); 13-07ASR (Ecofor)	Gotthardt 1988; Mooney 2011, 2013a
KdVf-12	prehistoric	subsurface scatter (lithic)	intact	This site will be directly impacted by the Freegold road construction.	Yes	Avoidance of the site is recommended. If avoidance is not possible then data recovery work is recommended to include in-fill shovel testing to better determine artifact densities followed by a series of 1x1m unit block excavations in relationship to the size and distribution of the site.	11-04ASR (Ecofor)	Mooney 2011

Garage by Big Creek	historic	cabin	intact	Near planned road construction but should not be impacted.	Yes	If these resources are not avoided then a limited amount of additional documentation is recommended prior to construction impacts.	11-04ASR (Ecofor)	Mooney 2011
High Cache Cabin	historic	cabin	intact	Near planned road construction but should not be impacted.	Yes	If these resources are not avoided then a limited amount of additional documentation is recommended prior to construction impacts, or possible relocation of structure.	11-04ASR (Ecofor)	Mooney 2011
Burl Cabin	historic	cabin	intact	Near planned road construction but should not be impacted.	Yes	If these resources are not avoided then a limited amount of additional documentation is recommended prior to construction impacts, or possible relocation of structure.	11-04ASR (Ecofor)	Mooney 2011
KcVe-3	historic/prehistoric	brush camp and possible grave site	unknown	None	No	No further work required.	88-3ASR (Gotthardt);	Gotthardt 1988
KcVe-1	possible grave		unknown	None	no	Avoidance of area	88-3ASR (Gotthardt);	Gotthardt 1988
KcVe-2	historic cabin		unknown	None	no	Avoidance of area.	88-3ASR (Gotthardt);	Gotthardt 1988
KdVf-3	historic	cabin	unknown	May be located near proposed borrow pit of borrow pit access road.	No	This cabin is recommended to be relocated and flagged for avoidance. If avoidance of possible borrow pit or access road is not feasible then additional documentation is recommended.	11-04ASR (Gotthardt); Mooney 2013 (Ecofor)	Gotthardt 1988; Mooney 2013
KdVf-2	historic	possible cache or cabin	unknown	Outside of the zone of impact of Freegold Project ROW.	No	No further work required.	88-3ASR (Gotthardt); 11-04ASR (Ecofor)	Gotthardt 1988; Mooney 2013a

Borden Number or Temp Site #	Class	Features	Current Status of Site	Scope of Possible Impacts from Casino Project	Site Boundary Clearly Flagged	Management Recommendations and Proposed Mitigation Strategy	Report/ Permit number and Authors	Bibliographic Reference
Steamers/Upright Boilers Site (YHSI 115J/09/002)	historic	boilers, pits, ladders	intact	Within the proposed alignment of Freegold Road (2013) previously listed within a proposed borrow pit (2011).	Yes	Avoidance and if not possible, relocation of resources where possible and additional documentation.	11-04ASR (Ecofor)	Mooney 2011
KeVg-1 (see YHSI 115J/09/001) AKA Hayes Creek Cabins	historic	two cabins & cache and trail AY09-19	poor	Outside of the zone of impact of Freegold Project ROW.	Yes	Avoidance. No further work is recommended. If planned impacts change then additional documentation.	09-09ASR (Altamira); 11-04ASR (Ecofor); 13-07ASR (Ecofor)	Mooney 2011; Soucey et al 2010a; Mooney 2013
AY09-19	ethnohistoric	trail	intact	Portions within Freegold Road ROW.	Yes - white CMT flagging	Impacts to the previously recorded ethno-historic trails are recommended to be avoided and/or minimized where possible. If impacts to these ethno-historic trails can't be avoided then additional background research, on-site recording, and informant interviews to document use of the trails is recommended.	09-09ASR (Altamira); 13-07ASR (Ecofor)	Mooney 2013a; Soucey et al 2010a
AY09-18	ethnohistoric	trail	intact	Portions within Freegold Road ROW.	Yes - white CMT flagging	Impacts to the previously recorded ethno-historic trails are recommended to be avoided and/or minimized where possible. If impacts to these ethno-historic trails can't be avoided then additional background research, on-site recording, and informant interviews to document use of the trails is recommended.	09-09ASR (Altamira); 13-07ASR (Ecofor)	Mooney 2013a; Soucey et al 2010a
KeVg-2	historic	adze-cut stump	intact	Outside of the zone of impact of Freegold Project ROW.	No	None Recommended	09-09ASR (Altamira); 13-07ASR (Ecofor)	Mooney 2013a; Soucey et al 2010b

Historic Structures and Resources to be Managed Near the Proposed Mine Site, Road to the Yukon River, and Road to Proposed Airstrip								
KeVi-4	historic	cabin remains	partially collapsed	Within Tailings Management Facility. Mine Site Developments - within impact zone of Heap Leach Site #1.	Yes general area flagged	Additional survey and data collection is warranted to determine the age and ownership of the cabin (Soucey et al 2010a). Handly et al (1994) say avoidance if possible otherwise, no further work is recommended.	94-9ASR (Antiquus); 09-09ASR (Altamira); 13-07ASR (Ecofor)	Handly et al 1994; Mooney 2013a; Soucey et al 2010a
KeVi-5	historic	cabin remains	partially collapsed	Within Tailings Management Facility.	Yes	If site disturbance is likely to occur, it is recommended that additional research and test excavation be carried out (cabin is pre-1936) (Soucey et al 2010a). Handly et al (1994) recommend the site be avoided but if not feasible then no further work is recommended.	94-9ASR (Antiquus); 09-09ASR (Altamira)	Handly et al 1994; Soucey et al 2010a
KeVi-7	historic	cabin (log) depression	intact	No planned impacts for this site.	Yes	Avoidance. Additional testing at the site is recommended to augment the current knowledge of its placement and use within the Historic Time Period.	09-09ASR (Altamira)	Soucey et al 2010a
KeVi-8	historic	cabin (foundation)	partially collapsed	Mine Site Developments - possible impact.	Yes	Avoidance. If site disturbance is likely to occur, it is recommended that additional research and test excavation be carried out.	09-09ASR (Altamira)	Soucey et al 2010a
KeVi-9	indigenous historic	Culturally Modified Tree (knot); and possible adze cut stump formerly recorded by Altamira as KeVi-12 (Gotthardt personal communication 2014).	intact	No planned impacts for this site.	Yes	Avoidance. If site disturbance is likely to occur, additional consideration and research is warranted. Further consultation and research with local informants could provide additional information about the site and its association with an existing trail.	09-09ASR (Altamira); 11-04ASR (Ecofor); 10-4ASR (Altamira)	Soucey et al 2010a; Mooney 2011; Soucey et al 2010b

Borden Number or Temp Site #	Class	Features	Current Status of Site	Scope of Possible Impacts from Casino Project	Site Boundary Clearly Flagged	Management Recommendations and Proposed Mitigation Strategy	Report/ Permit number and Authors	Bibliographic Reference

Previoulsy Noted First Nation Use Sites along the Proposed Upgrades to Freegold Road								
FN 1	indigenous historic	Brush Camp	unknown	No planned impacts for this site.	No	Keep access to area from old Freegold Road.	94-22ASR (Antiquus)	Handly and Rousseau 1995
FN 2	indigenous historic	natural spring	previously impacted	Adjacent to proposed ROW.	No	Keep access to area from old Freegold Road.	94-22ASR (Antiquus)	Handly and Rousseau 1995
FN 3	indigenous historic	trail	unknown	No planned impacts for this site.	No	Keep access to area from old Freegold Road.	94-22ASR (Antiquus)	Handly and Rousseau 1995
FN 4	indigenous historic	Caribou lookout	unknown	May be within a proposed borrow pit	No	Requires Heritage Assessment if in possible borrow pit	94-22ASR (Antiquus)	Handly and Rousseau 1995
FN 5	indigenous historic	fish camp	unknown	No planned impacts for this site.	No	Keep access to area.	94-22ASR (Antiquus)	Handly and Rousseau 1995
FN 6	indigenous historic	fish camp	unknown	None	No	Keep access to area.	94-22ASR (Antiquus)	Handly and Rousseau 1995
FN 7	indigenous historic	trail	unknown	Outside area of impact.	No	Keep access to area.	94-22ASR (Antiquus)	Handly and Rousseau 1995
FN 8	indigenous historic	hunting and trapping camp	unknown	Outside area of impact.	No	We strongly recommend that the First Nation traditional cultural material remaining at this site be systematically collected by representatives of the LSCFN prior to construction of the proposed Freegold Road.	94-22ASR (Antiquus)	Handly and Rousseau 1995
FN 9	indigenous historic	bush camp	previously impacted	Adjacent to proposed ROW.	No	No further work recommended.	94-22ASR (Antiquus)	Handly and Rousseau 1995
FN 10	indigenous historic	trappers camp	unknown	Adjacent to proposed ROW.	No	We strongly recommend that the First Nation traditional cultural material remaining at this site be systematically collected by representatives of the LSCFN prior to construction of the proposed Freegold Road (1995). Materials may no longer exist.	94-22ASR (Antiquus)	Handly and Rousseau 1995

APPENDIX A.18B: Heritage Sites Summary

Appendix A.18B
Heritage Sites Summary

Borden Number or Temp Site #	Class	Features	Current Status of Site	Scope of Possible Impacts from Casino Project	Site Boundary Clearly Flagged	Management Recommendations and Proposed Mitigation Strategy	Report/ Permit number and Authors	Bibliographic Reference
Archaeological Sites to be Managed Along Proposed Freegold Road								
KaVa-3	prehistoric	surface scatter (lithic) and subsurface scatter (lithic and faunal).	disturbed	None planned	No	Avoidance (preferred) or mitigative excavations. If the existing bridge over the Nordenskiold River was upgraded and or replaced as part of the Freegold Project reconstruction, adverse impacts could be placed on the remaining buried cultural materials.	94-22ASR (Antiquus)	Handly and Rousseau 1995
KaVb-2	prehistoric	surface scatter (lithic) and subsurface scatter (lithic)	intact (1995)	Outside of the zone of impact of Freegold Project ROW.	No	Site avoidance.	95-1ASR (Yukon Govt)	Gotthardt 1995
KaVb-1	prehistoric	subsurface scatter (lithic).	disturbed	Within the proposed Freegold Project ROW, and proposed borrow pit.	No	Avoidance (preferred) or Mitigative Excavations(Handly and Rousseau); avoid impacts to the south edge of the terrace and maintain 30 m buffer along terrace edge. Access road should be routed along north side of the terrace (Hammer 1995).	94-22ASR (Antiquus); 95-2ASR (Hammerstone)	Hammer 1995; Handly and Rousseau 1995
KbVb-2	prehistoric	subsurface scatter (lithic)	excavated in 1995	Within proposed Freegold Project ROW.	No	Recommended that during construction for the upgrading of the Freegold Road, the surface soil (0-30 cm below surface) be removed in the vicinity of KbVb-2 and stockpiled so possible remaining cultural materials may be salvaged at a future date.	94-22ASR (Antiquus), 95-2ASR (Hammerstone)	Hammer 1995; Handly and Rousseau 1995
KbVb-4	prehistoric	subsurface scatter (lithic and faunal bone)	some intact portions of site remain	Within Freegold Project ROW	No	Mitigative Excavations	95-1ASR (Yukon Govt)	Gotthardt 1995
KbVb-3	prehistoric	scatter (lithic)	No Evidence of Site Remains	Within Freegold Project ROW.	No	None required.	95-1ASR (Yukon Govt)	Gotthardt 1995
KcVd-3	prehistoric	subsurface scatter (lithic)	intact	Within Freegold Project proposed borrow pit	Yes	If avoidance is not possible then data recovery work under is recommended. Data recovery should include additional shovel testing to better determine artifact distribution and density followed by 1 x 1 m block excavation. Approximately 14 - 18 square meters of excavation would be recommended.	13-07ASR (Ecofor)	Mooney 2013a
KcVe-4	prehistoric	subsurface scatter (lithic)	intact	Very close to the proposed extension of Freegold Road.	Yes	Avoidance of the site is recommended. If avoidance is not possible then data recovery work is recommended to include in-fill shovel testing to better determine artifact densities followed by a series of 1 x 1 m unit block excavations in relation to the size and distribution of the site.	11-04ASR (Ecofor)	Mooney 2011
KcVf-2	prehistoric	subsurface scatter (lithic)	intact	Within Freegold Project proposed borrow pit	Yes	If avoidance is not possible then data recovery work is recommended. Data recovery should include additional shovel testing to determine artifact distribution and density followed by 1 x 1 m block excavation. Approximately 12 - 15 square meters of excavation would be recommended.	13-07ASR (Ecofor)	Mooney 2013a

Appendix A.18B
Heritage Sites Summary

Borden Number or Temp Site #	Class	Features	Current Status of Site	Scope of Possible Impacts from Casino Project	Site Boundary Clearly Flagged	Management Recommendations and Proposed Mitigation Strategy	Report/ Permit number and Authors	Bibliographic Reference
KcVf-3	prehistoric	subsurface scatter (lithic)	intact	Within Freegold Project proposed borrow pit	Yes	If avoidance is not possible then data recovery work under is recommended. Data recovery should include additional shovel testing to determine artifact distribution and density followed by 1 x 1 m block excavation. Approximately 12 - 15 square meters of excavation would be recommended.	13-07ASR (Ecofor)	Mooney 2013a
KeVf-1	prehistoric	subsurface scatter (lithic)	intact	Within Freegold Project proposed borrow pit as of 2013 (previously not in planned impacts 2011).	Yes	If avoidance is not possible then data recovery work under is recommended. Data recovery should include additional shovel testing to determine artifact distribution and density followed by 1 x 1 m block excavation. Approximately 12 - 15 square meters of excavation would be recommended.	11-04ASR (Ecofor)	Mooney 2011
KdVf-4	prehistoric	surface and subsurface scatter (lithic)	intact	Was planned to be impacted by the proposed borrow pit (2011) but now is not planned for impacts (2013).	Yes	Avoidance of the site is recommended. If avoidance is not possible then data recovery work is recommended to include in-fill shovel testing to better determine artifact densities followed by a series of 1x1m unit block excavations in relationship to the relation to the size and distribution of the site.	88-3ASR (Gotthardt); 11-04ASR (Ecofor)	Gotthardt 1988; Mooney 2011
KdVf-13	prehistoric	subsurface scatter (lithic)	intact	Will be directly impacted by the proposed borrow pit.	Yes	Avoidance of the site is recommended. If avoidance is not possible then data recovery work is recommended to include in-fill shovel testing to better determine artifact densities followed by a series of 1x1m unit block excavations in relationship to the size and distribution of the site.	11-04ASR (Ecofor)	Mooney 2011
KdVf-7	Multi-component: Prehistoric and Proto-historic	subsurface scatter (lithic and Chinese coin)*	intact	The site is located within a proposed borrow pit and very close to the current proposed alignment of the road. This site may be directly impacted by the road construction.	Yes	Avoidance of the site is recommended. If avoidance is not possible then data recovery work is recommended to include in-fill shovel testing to better determine artifact densities followed by a series of 1x1m unit block excavations in relationship to the size and distribution of the site. Additional historical research in regards to possible Chinese placer mining in the project area is recommended.	11-04ASR (Ecofor)	Mooney 2011
KdVf-6	prehistoric	subsurface scatter (lithic) and possible cache	intact	Within the proposed extension of Freegold Road and potential borrow pits.	Yes	Avoidance of the site is recommended. If avoidance is not possible then data recovery work is recommended to include in-fill shovel testing to better determine artifact densities followed by a series of 1x1m unit block excavations in relationship to the size and distribution of the site.	11-04ASR (Ecofor)	Mooney 2011

Appendix A.18B
Heritage Sites Summary

Borden Number or Temp Site #	Class	Features	Current Status of Site	Scope of Possible Impacts from Casino Project	Site Boundary Clearly Flagged	Management Recommendations and Proposed Mitigation Strategy	Report/ Permit number and Authors	Bibliographic Reference
KdVf-5	prehistoric	subsurface scatter (lithic)	intact	Was planned to be impacted by the proposed borrow pit (2011) but now borrow pit is dropped but site is within planned ROW impacts (2013).	Yes	Avoidance of the site is recommended. If avoidance is not possible then data recovery work is recommended to include in-fill shovel testing to better determine artifact densities followed by a series of 1x1m unit block excavations in relationship to the size and distribution of the site.	11-04ASR (Ecofor)	Mooney 2011
KdVf-8	prehistoric	subsurface scatter (lithic)	intact	This site will not be directly impacted by the road construction or borrow pit use.	Yes	No further work is recommended. However, if borrow pit construction impacts lead to upslope erosion then avoidance of the site is recommended. If avoidance is not possible then data recovery work under is recommended.	11-04ASR (Ecofor)	Mooney 2011
KdVf-10	prehistoric	subsurface scatter (lithic)	intact	This site will not be directly impacted by the road construction or borrow pit use.	Yes	No further work is recommended. However, if borrow pit construction impacts lead to upslope erosion then avoidance of the site is recommended. If avoidance is not possible then data recovery work under is recommended.	11-04ASR (Ecofor)	Mooney 2011
KdVf-11	prehistoric	subsurface scatter (lithic)	intact	This site will not be directly impacted by the road construction or borrow pit use.	Yes	No further work is recommended. However, if borrow pit construction impacts lead to upslope erosion then avoidance of the site is recommended. If avoidance is not possible then data recovery work is recommended.	11-04ASR (Ecofor)	Mooney 2011
KdVf-9	prehistoric	subsurface scatter (lthic) and possible cache	intact	This site will be directly impacted by the road construction and borrow pit use.	Yes	Avoidance of the site is recommended. If avoidance is not possible then data recovery work is recommended to include in-fill shovel testing to better determine artifact densities followed by a series of 1x1m unit block excavations in relationship to the size and distribution of each site.	11-04ASR (Ecofor)	Mooney 2011
KdVf-14 (aka KdVf-1)	prehistoric	subsurface scatter (lithic) and possible spirit house and grave site	intact	Outside of the zone of impact of Freegold Project ROW.	Yes	Avoidance of the site is recommended. If this area is planned for any future impacts then additional efforts are recommended to confirm possible grave or spirit house locations with First Nation representatives	88-3ASR (Gotthardt); 11-04ASR (Ecofor); 13-07ASR (Ecofor)	Gotthardt 1988; Mooney 2011, 2013a
KdVf-12	prehistoric	subsurface scatter (lithic)	intact	This site will be directly impacted by the Freegold road construction.	Yes	Avoidance of the site is recommended. If avoidance is not possible then data recovery work is recommended to include in-fill shovel testing to better determine artifact densities followed by a series of 1x1m unit block excavations in relationship to the size and distribution of the site.	11-04ASR (Ecofor)	Mooney 2011
KeVf-3	prehistoric	subsurface scatter (lithic)	intact	Inside the zone of impact of a proposed borrow pit.	Yes	If avoidance is not possible then data recovery work under is recommended. Data recovery should include additional shovel testing to better determine artifact distribution and density followed by separate loci of 1 x 1 m block excavation. Approximately 20 – 28 square meters of excavation would be recommended.	13-07ASR (Ecofor)	Mooney 2013a

Appendix A.18B

Heritage Sites Summary

Borden Number or Temp Site #	Class	Features	Current Status of Site	Scope of Possible Impacts from Casino Project	Site Boundary Clearly Flagged	Management Recommendations and Proposed Mitigation Strategy	Report/ Permit number and Authors	Bibliographic Reference
Archaeological Sites to be Managed Near Proposed Mine Site, Road to Yukon River, and Road to Proposed Airstrip								
KeVi-1	prehistoric	scatter (lithic) scatter (bone)	Destroyed (Soucey et al 2010a)	Supernatant pond area of Mine Site.	Yes	None Required (Handley et al 1994, Mooney 2013)	94-9ASR (Antiquus); 09-09ASR (Altamira); 13-07ASR (Ecofor)	Handly et al 1994 ; Mooney 2013a; Soucey et al 2010a
KeVi-2	prehistoric	scatter (lithic)	Destroyed (Soucey et al 2010a)	Supernatant pond area of Mine Site.	Yes	None Required (Handly et al 1994, Mooney 2013)	94-9ASR (Antiquus); 09-09ASR (Altamira); 13-07ASR (Ecofor)	Handly et al 1994; Mooney 2013; Soucey et al 2010a
KeVi-3	prehistoric	isolated lithic find	No Evidence of Site Remains	Mine Site Developments - within impact zone of Mine Site.	No - N/A	None Required (Mooney 2013)	94-9ASR (Antiquus); 09-09ASR (Altamira); 13-07ASR (Ecofor)	Handly et al 1994 ; Mooney 2013a; Soucey et al 2010a
KeVi-6	prehistoric	subsurface scatter (bone) subsurface scatter (lithic)	intact	Outside proposed project area.	Yes	No further work is recommended.	09-09ASR (Altamira); 13-06ASR (Altamira)	de Guzman et al 2014; Soucey et al 2010a
KeVi-12 Note: This Borden number was mistakenly assigned to two sites. This lithic site and an adze cut stump (Soucey et al 2010b). The stump is now part of Site KeVi-9 (Gotthardt personal	prehistoric	subsurface scatter (lithic) (Mooney 2011)	intact	Located within 50 m of the current proposed alignment of the road, not directly impacted.	Yes	Avoidance. The site appears to be within approximately 50 m the proposed access road to the airstrip. This site will not be directly impacted. No further work is recommended .	11-04ASR (Ecofor); 10-4ASR (Altamira)	Mooney 2011; Soucey et al 2010b
KeVi-13	prehistoric	subsurface scatter (lithic)	intact	Mine Site Developments	Yes	No further work is recommended.	13-07ASR (Ecofor)	Mooney 2013a
KeVi-14	prehistoric	subsurface scatter (lithic)	intact	Mine Site Developments	Yes	If avoidance is not possible then data recovery work under is recommended. Data recovery should include additional shovel testing to better determine artifact distribution and density followed by 1 x 1 m block excavation. Approximately 4 - 6 square meters of excavation would be recommended.	13-07ASR (Ecofor)	Mooney 2013a
KeVi-15	prehistoric	subsurface scatter (lithic)	intact	Mine Site Developments	Yes	If avoidance is not possible then data recovery work under is recommended. Data recovery should include additional shovel testing to better determine artifact distribution and density followed by 1 x 1 m block excavation. Approximately 4 - 6 square meters of excavation would be recommended.	13-07ASR (Ecofor)	Mooney 2013

Heritage Sites Summary

Borden Number or Temp Site #	Class	Features	Current Status of Site	Scope of Possible Impacts from Casino Project	Site Boundary Clearly Flagged	Management Recommendations and Proposed Mitigation Strategy	Report/ Permit number and Authors	Bibliographic Reference
KdVi-1	prehistoric	surface and subsurface scatter (lithic)	intact - abundance and density of the remains appears low	Near Proposed Borrow Pit west of road to Proposed Airstrip.	Yes	Avoidance if possible. If not possible, then further excavation (up to 20 1-x-1 m units) at KdVi-1 is recommended (de Guzman et al 2014).	94-9ASR (Antiquus) 09-09ASR (Altamira); 13-06ASR (Altamira); 13-07ASR (Ecofor); 13-06ASR (Altamira)	de Guzman et al 2014; Handly et al 1994; Mooney 2013; Soucey et al 2010a; de Guzman 2014
KdVi-2	prehistoric	subsurface scatter (lithic)	intact	Mine Site Developments	Yes	If avoidance is not possible then data recovery work under is recommended. Data recovery should include additional shovel testing to better determine artifact distribution and density followed by separate loci of 1 x 1 m block excavation. Approximately 20 - 28 square meters of excavation would be recommended.	13-07ASR (Ecofor)	Mooney 2013a
KdVi-3	prehistoric	subsurface scatter (lithic)	intact	Mine Site Developments	Yes	If avoidance is not possible then data recovery work under is recommended. Data recovery should include additional shovel testing to better determine artifact distribution and density followed by 1 x 1 m block excavation. Approximately 4 - 6 square meters of excavation would be recommended.	13-07ASR (Ecofor)	Mooney 2013a
KdVi-4	prehistoric	subsurface scatter (lithic)	intact	Mine Site Developments	Yes	If avoidance is not possible then data recovery work under is recommended. Data recovery should include additional shovel testing to better determine artifact distribution and density followed by 1 x 1 m block excavation. Approximately 8 - 10 square meters of excavation would be recommended.	13-07ASR (Ecofor)	Mooney 2013a
KdVi-5	prehistoric	subsurface scatter (lithic)	intact	Mine Site Developments	Yes	If avoidance is not possible then data recovery work under is recommended. Data recovery should include additional shovel testing to better determine artifact distribution and density followed by 1 x 1 m block excavation. Approximately 6 - 8 square meters of excavation would be recommended.	13-07ASR (Ecofor)	Mooney 2013a
KfVi-2	undetermined	subsurface hearth scatter (bone) scatter (fire cracked rock)	intact	Outside of the proposed project area.	Yes	No further work is recommended.	09-09ASR (Altamira); 13-06ASR (Altamira)	de Guzman et al 2014; Soucey et al 2010a
KfVi-3	historic/prehistoric	house (building, outline) scatter (lithic)	intact	Mine Site Developments - possible impact.	Yes	Continued avoidance of KfVi-3 is recommended. If avoidance is not feasible, Stage 1 excavations of at least a 15% sample are recommended at KfVi-3; this would entail hand excavation of an additional 190 1-x-1 m units. If artifact recovery is limited, excavation could be halted upon discussion with the Heritage Resources Unit.	09-09ASR (Altamira); 13-06ASR (Altamira)	de Guzman et al 2014; Soucey et al 2010a

Historic Structures and Resources to be Managed Along Proposed Freegold Road Upgrades								
H1: Whitehorse-Dawson Winter Road	historic	overland stage coach route	good	Outside of proposed ROW impact zone.	No - N/A	None Required	94-22ASR (Antiquus)	Handly and Rousseau 1995
H2: Log structure	historic	log structure	good	Possibly no impact due to road realignment around Carmacks.	No	Avoidance. Consultation between Community, Village of Carmacks, Community and Transportation Service prior to Project to determine historical significance and appropriate mitigation procedure.	94-22ASR (Antiquus)	Handly and Rousseau 1995
H3: Mink/Fox Fur Farm	historic	metal cages and burnt wood	highly disturbed	Possibly no impact due to road realignment around Carmacks.	No - N/A	None Required	94-22ASR (Antiquus)	Handly and Rousseau 1995
H4: Dalton Trail	historic	road/trail	disturbed	Outside of proposed ROW impact zone.	No - N/A	None Required	94-22ASR (Antiquus)	Handly and Rousseau 1995
H6: Morrison Road House	historic	log structures	highly disturbed	Outside of proposed ROW impact zone.	No - N/A	None Required	94-22ASR (Antiquus)	Handly and Rousseau 1995
Tricker Cabin	historic cabin	log structure	unknown	To be determined	No	To be determined	95-1ASR (Yukon Govt)	Gotthardt 1995
Fallen Cache Cabin (YHSI 115I/03/002)	historic	cabin and two log pit features	poor	Within the proposed road realignment.	Yes	If these resources are not avoided then additional documentation is recommended prior to construction impacts. This should include additional on-site recording including site mapping and photodocumentationand interviews with First Nation informants and other stakeholders to better document the history and use of the structures.	13-07ASR (Ecofor)	Mooney 2013a
Dog House Cabin (YHSI 115I/06/012)	historic	cabin	poor - mostly collapsed	Within the proposed road realignment.	Yes	If these resources are not avoided then additional documentation is recommended prior to construction impacts. This should include additional on-site recording including site mapping and photodocumentationand interviews with First Nation informants and other stakeholders to better document the history and use of the structures.	13-07ASR (Ecofor)	Mooney 2013a
Gas Can Cabin (YHSI 115I/06/010)	historic	cabin	Fair to Good	Within the proposed road realignment.	Yes	If these resources are not avoided then additional documentation is recommended prior to construction impacts. This should include additional on-site recording including site mapping and photodocumentationand interviews with First Nation informants and other stakeholders to better document the history and use of the structures.	13-07ASR (Ecofor)	Mooney 2013a

APPENDIX A.22A: Waste and hazardous Materials Management Plan

CASINO PROJECT

SOLID WASTE AND HAZARDOUS MATERIALS MANAGEMENT PLAN

PRELIMINARY DRAFT

Prepared by:
Casino Mining Corporation
March 2015

EXECUTIVE SUMMARY

The Casino Mine Project is an approximately 22 year mine project owned and operated by Casino Mining Corporation, that will produce copper and molybdenum concentrates, and gold dore bars via flotation milling and heap leach processing, respectively. The proposed project includes a four year construction period and a 90 year post-closure period. Key project components include the open pit, tailings management facility and waste rock storage area, heap leach facility, mill and associated infrastructure, ore stockpiles, liquefied natural gas power generating infrastructure, and office and accommodation buildings. The project also requires a 120 km access road from the town of Carmacks, YT, and concentrate will be trucked to the port at Skagway, Alaska.

The objective of the Solid Waste and Hazardous Materials Management Plan (the Plan) is to ensure that the handling, storage, transportation, and disposal of all wastes and hazardous materials (solids, liquids, special wastes) generated by the Project are conducted in such a manner as to reduce potential adverse environmental effects. This is a preliminary plan to describe the type of waste generated and related management strategies to responsibly handle, store, transport, and dispose of waste. The Plan will also describe the transportation, storage, use, and handling of hazardous materials to ensure protection of the environment and human health and safety, both of mine employees and members of the public. The Plan will be updated as the project is refined, and has been derived from Plan Requirement Guidance for Quartz Mining Projects. The final Plan will update the descriptions of methods used to manage all domestic and industrial solid, liquid, special wastes and hazardous materials for all phases of the Project. The final Plan will include a table of proponent commitments made during the environmental assessment process and permit and licence conditions relevant to waste management, and indicate how the plan addresses the commitments.

1 – INTRODUCTION

The Casino Mine Project (the Project) is a proposed 22 year mine project owned and operated by Casino Mining Corporation (CMC), that will produce copper and molybdenum concentrates, and gold dore bars via flotation milling and heap leach processing, respectively. The proposed Project includes a four year construction period and an approximately 90 year post-closure period, during which time the open pit will fill with water. The location of the Casino Project is shown on Figure 1-1. Key project components include the open pit, tailings management facility and waste rock storage area, heap leach facility, mill and associated infrastructure, ore stockpiles, liquefied natural gas power generating infrastructure, and office and accommodation buildings. The project also requires a 120 km access road from the town of Carmacks, YT, and concentrate will be trucked to the port at Skagway, Alaska.

The objective of the Solid Waste and Hazardous Materials Management Plan (the Plan) is to ensure that the handling, storage, transportation, and disposal of all wastes (solids, liquids, special wastes) generated by the Project are conducted in such a manner as to reduce potential adverse environmental effects associated with waste materials. The Plan is preliminary and aims to describe the type of waste generated and related management strategies to responsibly handle, store, transport, and dispose of solid waste and hazardous materials, based on feasibility level design details. To achieve this, CMC will:

- Comply with all applicable territorial and federal waste management regulations;
- Minimize waste generation;
- Select products that are less harmful to the environment;
- Reuse and/or recycle materials;
- Transfer wastes in a safe and responsible manner; and
- Train staff and contractors on policies and operations.

The Plan will also describe the transportation, storage, use, and handling of hazardous materials to ensure protection of the environment and human health and safety, both of mine employees and members of the public. The major sources of waste from the Project will likely include:

- Hazardous waste: used reagent containers, batteries, paint;
- Non-hazardous solid waste: domestic camp waste (food, plastics, paper), and inert bulk wastes (rubber belts, drywall, etc.);
- Fuels and lubricants (petroleum products and oils); and
- Sewage (human sewage and gray water).

Details pertaining to the management of hazardous materials include:

- Hazardous material transport methods, routes, frequency, driver qualifications, spill kit requirements;
- Volumes and amounts of each material used, storage locations, containment measures (segregation, secondary containment, etc.), Material Safety Data Sheets;

- Employee training programs (e.g., Workplace Hazardous Materials Information System) related to proper handling techniques, use of personal protective equipment, and familiarity with the site layout and emergency stations;
- Site and substance-specific operating procedures describing unloading, mixing, plant operations, entry into confined spaces, and maintenance for reagents, including cyanide, to minimize risk to health and safety of mine personnel;
- Communication procedures between on-site and off-site personnel (suppliers, contractors, receivers);
- Inspection measures and frequency;
- Monitoring and reporting requirements;
- Location of copies of the *Spill Contingency Plan and Emergency Response Plan* and how the plans will be implemented as needed as they relate to hazardous materials; and
- Waste disposal methods.

The Plan will be updated as the project is refined, and has been derived from *Plan Requirement Guidance for Quartz Mining Projects* (Government of Yukon, 2013). The final Plan will describe the methods used to manage all domestic and industrial solid, liquid, special wastes and hazardous materials for all phases of the Project, and will include a table of proponent commitments made during the environmental assessment process relevant to waste management, and indicate how the plan addresses the commitments. Terms and conditions of any applicable licences, permits and approvals required for the Project operations will also be included, once acquired.

1.1 PERMIT REQUIREMENTS

The handling, storage, transportation, disposal, and treatment of hazardous and non-hazardous waste, excluding sewage, are regulated under the *Environment Act* and its associated regulations. The *Environment Act* also governs the incineration or burial of waste materials, and the identification and management of contaminated waste. The management of sewage and sewage disposal and treatment systems are regulated under the *Public Health and Safety Act*. The management of hazardous materials is governed by the *Dangerous Goods Transportation Act* as well as the Special Wastes Regulation and Storage Tank Regulations of the *Environment Act*. The use, storage, and handling of hazardous substances are also governed by the Occupational Health Regulations and the Workplace Hazardous Materials Information System Regulations of the *Occupational Health and Safety Act*.

As part of the regulating *Acts*, there are a variety of permits and licences required for the generation, storage, management and disposal of solid and hazardous wastes and materials at the Casino Project, as summarized in Table 1-1. The Air Emissions permit, Special Waste permit and Storage Tank permits are consolidated into a single Environment Act permit, issued jointly by the Government of Yukon, Department of Environment, Environmental Programs Branch and the Department of Community Services, Protective Services Branch, Fire Marshal's Office.

Table 1-1 Required Solid Waste and Hazardous Materials Management Permits

Legislation		Permit/Licence	Requirement	Government Agency
Quartz Mine Act		Quartz Mine Licence	Description of a plan that describes methods to manage solid and liquid wastes	Yukon Energy, Mines and Resources
***Environment Act* Consolidated Permit**	*Environment Act, Air Emissions Regulation*	Air Emissions Permit	Release of air pollutants	Yukon Environment, Environmental Programs
	Environment Act, Special Waste Regulation	Special Waste Permit	Handling, disposal, generation or storage of special (hazardous) wastes	
	Environment Act, Storage Tank Regulation	Storage Tanks Systems Permit	Storage and handling of petroleum products	Community Services, Protective Services, Fire Marshal's Office
		Application for Operation, Closure, Abandonment or Renovations to Storage Tanks	Use of storage tanks containing petroleum and allied petroleum products	
Environment Act, Contaminated Sites Regulation		Relocation permit	Relocation of contaminated material	Yukon Environment, Environmental Programs
		Land Treatment Facility Permit	Operation of land treatment facility for contaminated soils	
Environment Act, Solid Waste Regulation		Solid Waste or Waste Management Permit	Solid waste disposal facility or commercial dump	Yukon Environment, Environmental Programs
Explosives Act		Explosives Magazine Permit	Explosives storage	Yukon Workers' Compensation Health and Safety Board
Occupational Health and Safety Regulations		Underground and Surface authorization to conduct blasting in Yukon	Blasting – underground or surface	Yukon Workers' Compensation Health and Safety Board
Transportation of Dangerous Goods Act		Permit/certificate for Transport of Dangerous Goods	Transportation of hazardous materials including special wastes	Transport Canada
Public Health and Safety Act		Permit to Install a Sewage Disposal System	Installation and operation of construction phase septic tanks and sewage holding tanks	Yukon Health and Social Services
Nuclear Safety and Control Act		Nuclear Substances and Radiation Devices licence	Possess, use, store, transfer, import, export, service and abandon nuclear substances and radiation devices	Canadian Nuclear Safety Commission

1.2 DEFINITIONS

For consistency in interpretation with the contents herein, the following terms are defined:

Bear-proof container: a container sealed to prevent the escape of attractant odours and strong enough to exclude a bear from the contents.

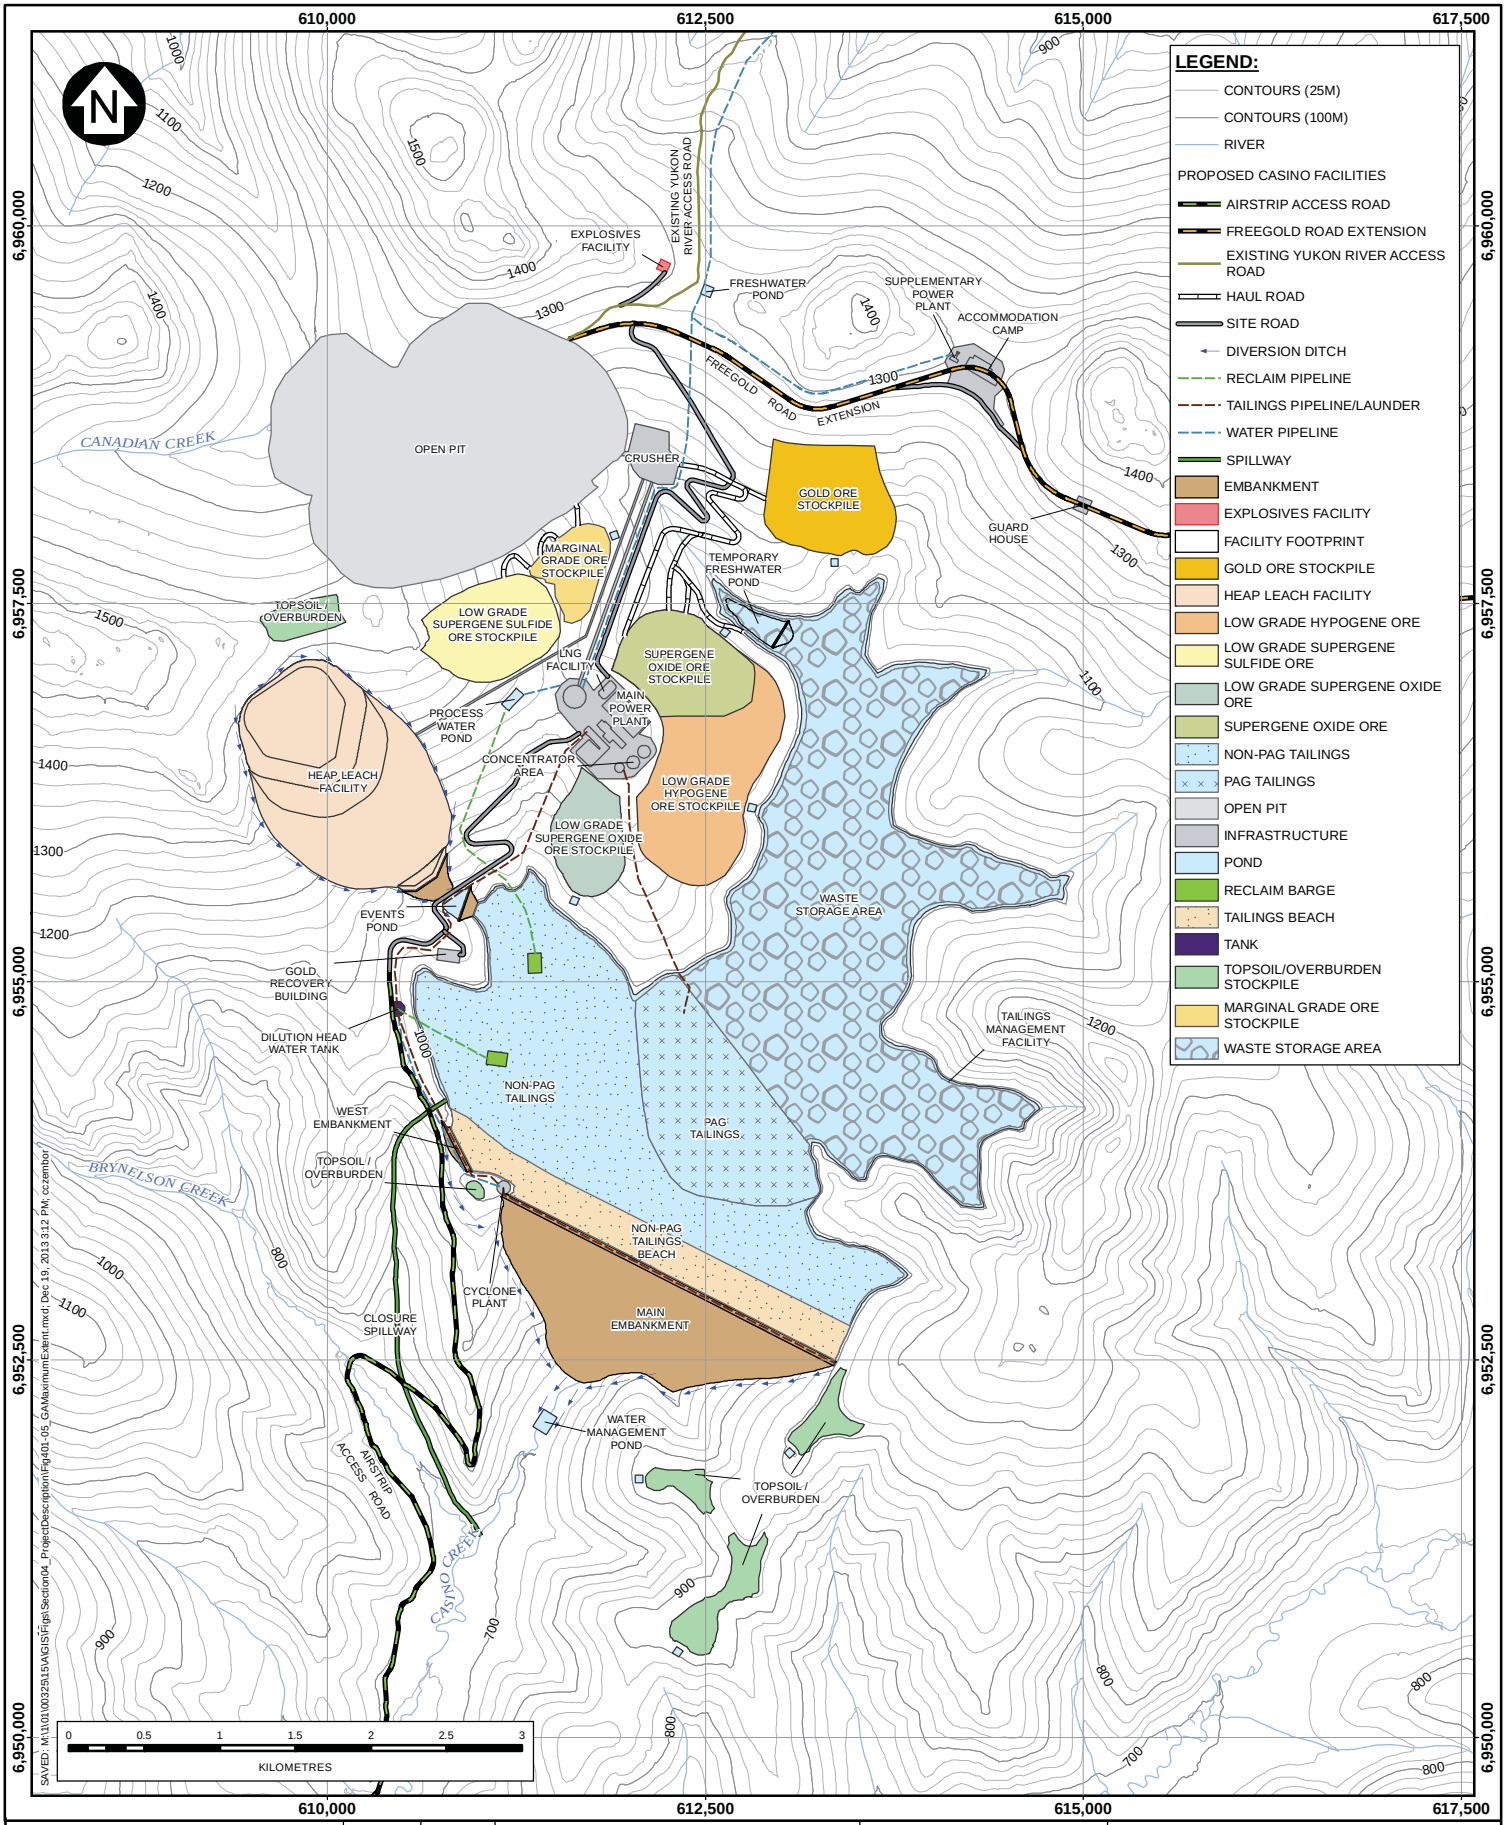
Contaminated material: any soil, snow, sediment, or water that has one or more parameters in excess of applicable standards in the *Contaminated Sites Regulation*.

Modified transfer station: a waste disposal facility where most types of garbage are transferred to another facility for final disposal (usually by burial or incineration); the only exception is that construction and demolition wastes may be buried on-site.

MSDS: Material Safety Data Sheet.

Non-putrescible Waste: any waste that contains no more than trivial amounts of putrescible materials. Putrescible waste contains organic matter that is capable of being decomposed and may be capable of attracting or providing food for wildlife.

Open Burning: combustion of material without control of emitted products of combustion to the atmosphere.



Putrescible Waste: waste that contains organic matter and is capable of decomposition. Putrescible waste may attract or provide food for wildlife (e.g., kitchen waste).

Solid Waste: waste that originates from residential, commercial, industrial or institutional sources, from the demolition or construction of buildings or other structures or is specified in a solid waste management plan to be solid waste.

Special or Hazardous Waste: any waste requiring special handling, storage, or destruction and prescribed as special waste by Yukon Special Waste Regulations, whether or not the waste has any commercial value or is capable of being used for a useful purpose (e.g., waste oil). For the purposes of this plan, special wastes and hazardous wastes are used interchangeably.

Waste: includes solid and special waste.

WHMIS: Workplace Hazardous Materials Information System.

P/A VA101-325/15

2 – WASTE INFRASTRUCTURE

A permanent waste management facility will be established at the Casino site during the construction phase. The waste management facility will serve as a central depot where wastes will be managed, processed, packaged, labelled, inventoried, secured and stored for either off-site transport or on site disposal. Non-hazardous solid waste will be separated into putrescible and non-putrescible wastes, and non-putrescible wastes will subsequently be separated into recyclables, burnables and non-burnable materials. The waste management facility will have an electric fence, which will be required to be operational from May 31 to October 31 to discourage wildlife interactions.

The permanent waste management facility will be constructed in accordance with the guidelines for modified transfer stations (Yukon Environment, 2014), which must meet one of the following three construction criteria as follows:

1. The facility must be constructed on a natural or constructed substrate that will support natural attenuation of landfill leachate. Modeling must be conducted to demonstrate that leachate will attenuate to the extent that all contaminants will be below the applicable standards in the Contaminated Sites Regulation at the points of contact with all relevant receptors. If a natural or constructed substrate to support natural attenuation of landfill leachate is not available, the facility must be constructed with a leachate collection system that must have a minimum permeability of 1 x 10-3 cm/s and must be of an appropriate thickness and design, with piping as needed to facilitate the movement of leachate to a collection point. Where the facility is constructed with a double liner, a leachate collection system must be installed above each liner; or
2. Establish a setback of 1.5 km from the nearest drinking water source and 1 km from the nearest surface water used by aquatic life; or
3. Implement a groundwater monitoring program to detect contaminant migration and, if exceedances of the applicable standards in the Contaminated Sites Regulation are detected, submit and implement an adaptive management plan to address those exceedances.

Following detailed engineering, the storage area locations, including type of storage area and foundation properties, will be provided. The waste management facility will have separate areas for recycle/reuse, hazardous waste storage, and a removal area that will contain waste that will be disposed of in an on-site facility. The waste in the waste management area will be segregated and stored using accepted management practices including the following:

- Fire prevention systems that are adequately designed for the materials being stored will be used;
- Spill kits, protective equipment, and other necessary equipment to clean and mitigate spills will be used;
- Only containers in good condition will be used to store items;
- Containers and liner materials will be compatible with the waste being disposed;
- Containers and drums will be labelled to identify the waste content and initial date of storage;
- Sufficient storage space will be left between containers to allow for safe access and handling of containers; and
- Incompatible waste will not be stored in the same containers and will be stored at a safe distance from each other.

3 – WASTE DISPOSAL

Disposal of waste generated at the Casino Project will be via landfill, incineration, open burning or burning for the purposes of heat generation (waste oil burner). The preliminary details for the proposed waste disposal infrastructure are summarized below.

3.1 LANDFILL

Non-putrescible, non-hazardous waste not incinerated, recycled or open burned will be disposed of in an on-site landfill. The landfill operational parameters and conditions for use will be detailed in the consolidated *Environment Act* permit (Table 1-1). The landfill location will be determined during detailed design, and information updated in this section will include the soil and hydrogeological characteristics (depth to groundwater, etc.); design permeability of the liner; access restrictions, and closure methods (e.g., over material stockpile locations). Construction requirements will include the following (from Yukon Environment, 2014):

- No facility is to be constructed on a site with greater than a 6% slope.
- All facilities must be constructed with berms and/or ditches as required to prevent surface water from flowing onto or off of the active portion of the facility, accommodating the larger of a 1 in 25 year storm event or snowmelt event.
- Organic overburden must be removed from each cell location, stockpiled, and retained for the life of the cell for use in restoration and re-vegetation during closure.
- A hydrogeological assessment must be conducted by a qualified professional in order to determine depth to groundwater, flow direction, gradients, and estimated travel times to potential receptors and to establish baseline groundwater quality.
- A groundwater monitoring system must be installed with a sufficient number of wells at locations and depths that yield samples representative of the shallowest aquifer both upgradient and downgradient of the facility, as determined by the hydrogeological assessment. Downgradient wells shall be positioned, where possible, between the facility and downgradient receptors.

The landfill at the Casino Project will be rated a “Class 2” facility, which is a public waste disposal site where waste is buried and/or incinerated and which serves a population of less than 13,000 people (Yukon Environment, 2014). Therefore, the landfill must be constructed to one of the two following specifications:

1. The facility must be constructed on a natural or constructed substrate that will support natural attenuation of landfill leachate. Modeling must be conducted to demonstrate that leachate will attenuate to the extent that all contaminants will be below the applicable standards in the Contaminated Sites Regulation at the points of contact with all relevant receptors.
2. If a natural or constructed substrate to support natural attenuation of landfill leachate is not available, the facility must be constructed with a leachate collection system that must have a minimum permeability of 1×10^{-3} cm/s and must be of an appropriate thickness and design, with piping as needed to facilitate the movement of leachate to a collection point.

3.2 GARBAGE INCINERATOR

Incineration is the preferred method of disposal for putrescible wastes (e.g., food and kitchen wastes, office waste), to ensure complete removal of animal attractants. Putrescible materials will be stored in bear-proof

containers outside of the kitchen and office areas, and waste will be collected twice daily. Putrescible materials will be incinerated daily, and will not be stored for longer than seven days prior to incineration. A dual chambered industrial incinerator will be installed at the waste management facility.

The maximum amount of waste permitted to be incinerated per day will be dictated by the incinerator model and by the *Environment Act* permit. The exact incinerator model will be determined during the purchasing and procurement phase of the Casino Project, however, example model specifications are provided in Appendix A. Ash resulting from the incineration activities will be stored adjacent to the incinerator and will be disposed of in the landfill (see Section 3.1). The incinerator will be inspected and maintained by trained employees familiar with the incinerator operating manual. The following standard operating procedures will be employed when using the incinerator:

- Complete the incinerator pre-operational inspection and checklist;
- Ensure that the integral components of the incinerator including the burners, gauges, valves, lines, walls, doors and exhaust components, are maintained in accordance with the manufacturer's specifications and in such a manner as to provide optimum control of contaminant emissions during all operating periods;
- Ensure all waste is completely reduced to ash during incineration before completion;
- Ensure that all hydrocarbon-contaminated absorbent pads are drip dried or wrung out to ensure that no excess hydrocarbons will leak during incinerator loading;
- Complete an Incinerator Log for all incineration activities; and
- Incinerator Log sheets will be provided to the Environmental department weekly.

3.3 OPEN BURN EQUIPMENT

Open burning is permissible under the *Solid Waste Regulations*, however, to burn waste generated by a commercial activity a Solid Waste Permit is required, and an Air Emissions Permit is required to burn more than 5 kg of solid waste per day. These permits are both incorporated into the Environment Act consolidated permit. The timing windows for open burning and maximum volumes of solid waste that can be open burned will be dictated by these permits. Open burning will be conducted for cardboard and scrap wood and the following precautions will be taken (from Yukon Environment, 2007):

- Burning of only weeds, untreated wood (except for waste plywood and particle board), brush and leaves. Burning of petroleum products, plastics, rubber, or anything else that causes excessive smoke or toxic fumes will not be undertaken;
- Avoid burning during winter thermal inversions because the smoke may settle and accumulate;
- Avoid burning on foggy or snowy days because the smoke will not disperse properly and may concentrate in one area;
- Burn only when wind conditions will disperse the smoke away;
- Do not burn during high winds or when the wind direction is frequently changing as fire can spread quickly;
- Keep fires an adequate distance from buildings;
- Ensure a quick, hot and complete burn by turning or aerating smouldering materials;

- Avoid burning rain-soaked garbage unless there is a risk of attracting wildlife;
- Make every reasonable effort to prevent runoff water from entering the burning area; and
- Burn in small manageable piles.

The Casino Project may also be permitted to open burn waste reagent bags as incinerating them poses some risk to incinerator operator safety. Ash generated from open burning will be disposed of in the landfill (Section 3.1).

3.4 WASTE OIL BURNER

Waste oil burners will be purchased from reliable suppliers to provide heat for smaller buildings located away from the power plant (e.g., airstrip facilities) through the incineration of waste oil produced from the maintenance of the vehicle fleet. Waste oil will be stored in storage tanks during the summer, when heat production is not required, and consumed in the winter to heat the buildings. The exact waste oil burner model will be determined during the purchasing and procurement phase of the Casino Project, however, example model specifications are provided in Appendix A.

3.5 USED TIRES

Tires present a significant environmental challenge in the Yukon. They do not break down in the natural environment and so can accumulate indefinitely. They take up valuable landfill space, provide a perfect breeding ground for mosquitoes, and are a serious fire hazard when stored in piles above ground (Yukon Environment, 2013). Used tires will be collected and stored at the waste management facility. Tires not used for the purpose of protection barriers or other on site uses will be hauled off site and disposed of in accordance with the Yukon Used Tire Management Program. Tires will be kept reasonably clean and not buried or burned, with the exception of tires with rim size greater than 24.5”, which are buried at the landfill.

To minimize the potential fire hazard created by tire stockpiles, the *National Fire Code* sets out the rules for both outdoor and indoor storage of rubber tires, as follows:

- The size and clearance limits for rubber tires storage areas are:
  - Maximum base area: 1,000 m^2
  - Maximum height of storage: 3 m
  - Minimum clear space around each storage area: 15m
  - The minimum clear space requirement above may be waived if an ISA has a base area not greater than 5 m^2.
- There must also be a clear space of not less than:
  - 30 m between stored products and brush or forested areas; and
  - 6 m between stored products and uncontrolled grass or weeds.
- An outdoor storage area shall be surrounded by a firmly anchored fence that is:
  - substantially constructed to discourage climbing and unauthorized entry;
  - not less than 1.8m high; and
  - provided with gates that shall be locked when the storage area is not staffed.

4 – WASTE TREATMENT

To minimize the amount of waste material shipped off-site, and prevent potential spills during transportation, wherever possible contaminated materials will be treated at the Casino Project and, once remediated, returned to the environment or used in industrial activities. Waste treatment infrastructure that may be implemented at the Casino Project includes a land treatment facility for the remediation of hydrocarbon and glycol contaminated soil, an oil/water separator for the treatment of hydrocarbon contaminated water and a sewage treatment system for the treatment of black and grey water produced by domestic activities. These proposed systems are detailed below.

4.1 LAND TREATMENT FACILITY

A land treatment facility (LTF) is usually required at a mine site to accept and treat contaminated soil generated from the day-to-day activities that may result in minor contamination of soil, water, snow or ice by hydrocarbons (e.g., diesel, waste oil, hydraulic oil), antifreeze, solvents or lubricants. An LTF is a specially constructed facility for bioremediating soil contaminated with petroleum hydrocarbons utilizing naturally occurring microbes to degrade hydrocarbon constituents (Yukon Environment, 2011). For microbes to function effectively, the contaminated material must have the correct moisture, oxygen, nutrient and pH conditions. Land treatment facilities are regulated under the *Contaminated Sites Regulations* and a permit for construction and operation is required from Yukon Government, Department of Environment, Environmental Programs Branch.

The location of a LTF will be determined during detailed design of the Casino Project. Construction of the LTF will be conducted in accordance with the guidelines in the *Contaminated Sites Regulations*, as follows (from Yukon Environment, 2011):

- The LTF will be located in an area large enough to accommodate the soil spread out into layers less than 0.5 metres in thickness, or placed in spaced rows of piles no higher than 4 metres.
- The native soil where the facility is to be built will be sufficiently fine-grained (silt or clay textured) to act as a semi-impermeable barrier to the movement of liquids. If the native soil is too porous, an artificial liner will need to be used.
- Natural liners will be a minimum of one metre thick throughout each LTF cell. The maximum permeability will be 10^{-5} cm/sec.
- Artificial liners must be resistant to petroleum hydrocarbons, and will be at minimum 30 mil (30 thousandths of an inch) thick. An artificial liner that is not UV-resistant will be covered at all times to prevent degradation. The liner will be installed as per the manufacturer's specifications, with a sufficient barrier layer to prevent punctures due to equipment traffic, etc. The liner will be installed by a qualified person according to the manufacturer's specifications and will be firmly anchored in the berms on each side of the cell.

The LTF will not be constructed on any land where:

- The slope is greater than 6 %;
- The seasonal high water table is less than 3 metres below the surface;
- The Facility would be within 100 metres of a surface water body; or
- The land is identified as being within a 25-year floodplain.

Each LTF cell will be surrounded by berms of sufficient size to contain the contaminated soil and prevent runoff from entering or escaping from the facility. These berms will be made of low-permeability soil or if an artificial liner is used, the liner will pass over or through the berms and will be securely anchored to prevent runoff from passing through.

Access ramps will be constructed over the berms to allow equipment to access the treatment cells.

Signs will be posted identifying the site as a land treatment facility and indicating that the facility contains contaminated material.

4.2 OIL/WATER SEPARATOR

Oil/water separators may be used to partition petroleum products from runoff generated during washing of equipment serviced at the mine site. Equipment services in the truck shop or maintenance building may have traces of oil, grease, hydraulic fluid or fuel that is rinsed off, and will collect in sumps or floor drains. Final locations of oil/water separators will be detailed during detailed engineering of the Casino Project.

An oil/water separator may be installed to remove contaminants prior to discharge of the water to the TMF. The oil/water separator will be installed, maintained and operated in accordance with the manufacturer's specifications. Generally, an oil/water separator is a tank used to collect runoff, sized to 1.85 m^2 of surface area per 1000 m^2 of drainage area to allow the petroleum to remain on the surface (BC EMPR, 2006). Settleable solids must be removed from the stormwater stream before it reaches the oil/water or the separator will become filled with sediment.

Weekly inspections will ensure the oil/water separators are functioning propersly, and allow for periodc removal of debris (if necessary). For outdoor facilities, inspections should be conducted after any rain totalling 13 mm or more in 24 hours. Oil products may be removed from the separator by absorbent pads, as the oil will float on the top of the water. The absorbent pads may then be incinerated in the on-site incinerator.

4.3 SEWAGE TREATMENT SYSTEMS

Sewage disposal systems in the Yukon are regulated under the *Public Health and Safety, Sewage Disposal Systems Regulation*. Sewage treatment for construction camps may consist of sewage holding tanks and septic fields, or portable sewage treatment plants (rotating biological contactors or similar units) which will discharge to a tile field more than 100 m from the high water mark. The selection of treatment system will depend on the location of the construction camp, and the availability of an acceptable septic field. Sewage holding tanks and septic fields will be constructed in accordance with the Yukon *Design Specifications for Sewage Disposal Systems* (Yukon Health and Social Services, 2014), and a permit acquired from Yukon Health and Social Services prior to operation of the system. Sewage holding tanks and septic fields will also be constructed to treat black and grey water generated at the each of the stand-alone facilities, such as the process plant, truck shop, and ADR/SART facility, located to distant from the accommodations camp to facilitate piping to the stand alone sewage treatment plant.

During operations, a sewage treatment plant will be installed to accept and treat all grey and black water generated from the kitchen, accommodations camp and dry facilities. The sewage treatment plant will be a stand-alone, pre-packaged system and treated effluent will be pumped to the TMF. Sludge will also be disposed of in the TMF. All the components of the system will be factory assembled, inspected, tested and delivered to the site in major assemblies for final installation and commissioning on site.

Typical sewage treatment systems incorporate flow equalization tanks and digestion in anoxic tanks. Anaerobic treatment is followed by aerobic treatment and subsequent filtration through a membrane reactor. The membrane reactor utilizes a fixed growth bacteria process whereby bacteria are grown on a media surface that is rotated into and out of the wastewater. The treated wastewater flows through separate zones each with a progressively higher standard of treatment. The media on which bacteria grow are engineered plastic disks made from grid extruded medium density polyethylene material with UV light inhibitors. The grid pattern promotes oxygen transfer into the wastewater. The system digests sludge efficiently as a result of the process design. The sludge remains in the primary settling tank during normal operation and will be pumped out every six to nine months depending on the influent total suspended solids level. Digested sludge from the facility will be disposed of in the tailings facility, or hauled offsite for disposal at an approved facility. The system is not prone to upsets and can be operated with varying flows.

5 – WASTE MANAGEMENT

Solid waste management at the Casino Project will include initial waste minimization, and if unavoidable, the disposal of solid waste primarily through off-site recycling, burning of putrescible wastes in a permitted incinerator, open burning of wood waste, and finally disposal of non-putrescible, non-burnable wastes in an on-site landfill. Generally solid waste generated at the Casino Project can be categorized as domestic waste, industrial waste, or contaminated material. The management of each of these types of materials is described below. Special waste disposal is detailed in Section 6.

5.1 WASTE MINIMIZATION

Waste minimization at the Casino Project will consist of, in preferential order, prevention, minimization, reuse, recycling and energy recovery. Waste prevention and minimization may be achieved through consolidation of shipments to the site, bulk purchases to minimize packaging and selection of suppliers that use a minimum amount of packaging. Additionally, efficient purchasing practices will ensure that orders of perishable consumables do not exceed usage rates and generate unnecessary waste, and accurate tracking of on-site equipment and materials will ensure that the proper stores are maintained and unnecessary shipments minimized.

Material reuse and recycling activities includes reuse of materials and products in their original form or recovering materials that can be processed into new products. At a mine site, generally materials reuse is in the form of using salvaged material (e.g., re-bar, coper wiring, wood products, metal drums, etc.) from primary construction activities for secondary construction or maintenance activities. Other materials may be “downcycled” for other uses (e.g., waste tires as traffic control/safety structures, re-use of metal or plastic drums to store waste). Stockpiles of salvageable materials will be kept at the waste management facility.

Incineration of waste products for energy will also be conducted to minimize disposal requirements for waste oil. Waste oil burners will be purchased from reliable suppliers to provide heat for smaller buildings (e.g., truck shops) through the incineration of waste oil produced from the maintenance of the vehicle fleet. Waste oil will be stored in storage tanks during the summer, when heat production is not required, and consumed in the winter to heat the buildings.

5.2 WASTE GENERATION

Both non-hazardous and hazardous (or special) waste will be generated by the Casino Project activities. A summary of the waste projected to be generated, treatment methods and disposal areas is provided in Table 5-1. Non-hazardous wastes include materials such as domestic garbage, food waste, paper materials, aluminum cans, glass, plastics, inert bulk waste, etc. Domestic waste will include putrescible food waste, recyclable containers (cans and bottles), packaging, inert non-combustible domestic waste, and paper products. Hazardous waste includes materials such as waste oil, laboratory chemicals and solvents, lead-acid batteries, oil filters, and used oily rags and absorbent pads. Hazardous waste requires special handling and training procedures. All employees, contractors, and sub-contractors who are handling hazardous waste will be provided with Workplace Hazardous Materials Information System training or will be required under contract to have that training, so they can identify hazardous waste and know how to handle it appropriately. Transportation of Dangerous Goods training will be provided, or required of employees, contractors, and sub-contractors who are receiving, off-loading, and storing potentially hazardous materials, or involved in the storage and shipment off-site of hazardous waste.

Table 5-1 Types, Treatment and Disposal Areas for Waste Generated at the Casino Project

Type of Waste	Treatment	Waste Disposal Area
Non-Hazardous Waste		
Inert Solid Waste		
Paper and corrugated cardboard	• Reuse • Incineration	Incinerator
Plastics	• Reuse • Recycle • Incinerator	• Waste management facility • Incinerator
Tires and conveyor belts	• Reuse • Disposal	• Waste management facility • Landfill
Vehicles	• Reuse • Disposal	• Waste management facility • Landfill
Scrap metal	• Reuse • Off-site recycling	Waste management facility
Waste lumber	• Recycling • Open burning	• Waste management facility • Open burn pit
Electrical equipment	Off-site recycling	Waste management facility
Solid Domestic Waste		
Food waste	Incineration	Incinerator
General camp waste	Incineration	Incinerator
Sewage		
Black and grey water	Treatment	• Sewage treatment plant • Sewage treatment systems
Sewage sludge	Disposal	TMF
Sewage effluent	Disposal	TMF
Special/Hazardous Waste		
Waste Oil and Diesel Fuel	Incineration	Waste oil burner
Waste Anti-Freeze	Store in labelled drums	Off-site disposal
Waste Solvents and Lubricants	Store in labelled drums	Off-site disposal
Used Lead-Acid Batteries	Store in covered pallets	Off-site disposal

Type of Waste	Treatment	Waste Disposal Area
Biomedical Wastes	Incineration	Incinerator
Used Aerosol Containers	Punctured with can puncturing machine	Off-site disposal
Waste Processing Reagents and Containers	Store in labelled drums	Off-site disposal
Laboratory Wastes	Incineration	Incinerator

5.3 RECYCLABLE MATERIAL

Beverage containers and tins produced in the kitchen facilities can be recycled at designated off-site recycling facilities. Recyclables will be washed prior to storage to minimize wildlife attractants, and will be stored at the waste management facility in designated bear-proof recycling bins until they are transported off-site. Refundable recyclable materials include:

- Aluminum and tin pop/juice cans;
- Plastic beverage containers;
- Glass beverage containers;
- Tetra packs; and
- Waxed cardboard juice containers.

Other mine sites in the Yukon have established programs with a local recycling company (Raven Recycling) and local charities to collect the recycling directly from the mine site and donate the revenue from the refund directly to the local charities. It is foreseen that the Casino Project will establish a similar program for recyclable materials. Materials that can be recycled are summarized in Table 5-2. Metal waste recycling may also be conducted following the construction phase, with the proceeds from the metal recycling going towards paying for the off-site disposal.

Table 5-2 Recyclable materials and proposed disposal strategies

Recyclable Material	Proposed Disposal Method
Dry cell alkaline batteries (e.g., AA, AAA, C, D, 6V, 9V, etc.)	Off-site shipment for recycling
Ink cartridges	Returned to supplier for recycling
Lithium batteries	Off-site shipment for recycling
Metal drums (used 205 L)	Returned to supplier for re-use/recycle
Non-ferrous metals	Aluminum, tin, etc. can be returned to Raven Recycling
Recyclable computers and electronics	Off-site shipment to Raven Recycling: LCD, flat screens, laptops and desktops = fee for disposal keyboards and mice, power cables, adaptors and powerbars, network cables and backup power unit = free disposal CRT monitors, scanners, laser printers and inkjet printers = not accepted
Refundable recyclables	Off-site shipment to Raven Recycling; proceeds donated to local charities.
Single use plastic reagent drums (used 205 L), cleaned and drained	Off-site shipment to Raven Recycling

5.4 OFF-SITE TRANSFER

Generally, is it desirable to dispose of solid waste on site to minimize risks to the environment during shipment. Often vehicles will come to the mine site with a full load of materials and may have an empty truck returning to the supplier. Empty return vehicles provide an opportunity for the removal of solid wastes and special wastes from the mine site. Pelly Crossing and Braeburn (south of Carmacks on the Alaska Highway towards Whitehorse) each have transfer stations that accept construction waste, appliances, and recycling, and the Pelly Crossing transfer station accepts special wastes. The landfill in Carmacks does not accept waste from industrial users, however, the Faro, Watson Lake and Whitehorse landfills will accept waste from industrial users. Therefore, depending on the route the vehicle is taking, solid waste can be transported to one of the landfills in the territory, or disposed of at the transfer station. The Watson Lake and Whitehorse landfills accept special waste, appliances, metals and recycling.

Hazardous waste will be transferred to an approved hazardous waste facility that will issue a certificate of destruction. Periodic audits of this facility to ensure proper handling and destruction of hazardous waste will be considered. All hazardous materials and dangerous goods will be stored in clearly labelled containers or vessels and handled in accordance with regulations appropriate to their hazard characteristics. Reputable certified transportation contractors will be used for the transport of goods and materials to and from the site. Project personnel will periodically inspect the transporters' performance and compliance with transport regulations, contract requirements, and overall performance. The transportation of special waste requires a permit for transportation issued by Yukon Government, Department of Environment and will involve a list of special wastes commonly carried and a spill response plan that addresses those special wastes (Yukon Environment, 2013).

Potential materials that will be transferred off site for recycling or disposal include:

- Recyclables for refund
- Scrap metals for refund
- Special wastes:
- Aerosol cans
- Appliances (with refrigeration)
- Contaminated flammable liquids (e.g., Jet B, gasoline)
- Fuel filters
- Lead acid batteries
- Oil filters
- Plastic oil pails and oil containers (20 L)
- Process facility chemicals
- Rubber tires (rim size < 24.5")
- Single use oil and glycol plastic drums
- Used florescent light ballasts/light tubes
- Waste antifreeze/glycol
- Contaminated waste oil (motor oil, diesel, hydraulic oil, etc.)

5.5 BURIAL

Materials that may be disposed of in the landfill include:

- Air filters;
- Conveyor belting rubber and miscellaneous rubber;
- Empty paints and coatings containers;
- Glass;
- Incinerator/open burning ash;
- Miscellaneous inert wastes (e.g., windshield glass, insulation, Portland cement, construction plastics, drywall, bentonite, sand, small, scrap non-recyclable materials, Styrofoam, etc.);
- Non-recyclable computers and electronics (CRT monitors, scanners, laser printers and inkjet printers);
- Reagent bags;
- Scrap piping (poly, ABS, PVC); and
- Tires (rim size >24.5").

Separate storage will be provided at the landfill for scrap metal, which may be removed from site for recycling (including structural steel, copper and brass).

5.6 OPEN BURNING

Open burning will only be conducted for cardboard, untreated wood and paper products.

5.7 INCINERATION

Incineration is the preferred method of disposal for putrescible wastes (e.g., food and kitchen wastes, office waste), to ensure complete removal of animal attractants. Incineration will be conducted for the following types of waste:

- Food waste and kitchen waste;

- Household/office waste;
- Light plastics;
- Oil absorbent materials and oil/grease rags; and
- Bio-hazardous materials (e.g., bandages, sharps, etc.).

5.8 INSPECTIONS AND RECORD KEEPING

A waste monitoring and auditing program will be established for the Casino Project, with the purpose of:

- Providing baseline data to enable continuous improvement of waste avoidance, reduction and management measures throughout the Project; and
- Assessing actual waste results and comparing with predicted results.

Off-site and on-site disposal will be documented by tracking waste type, volume, method of disposal, and location. Tracking of the waste streams by each department will show where changes can be made to further improve the waste management system over the life of the Project. Tracking will also alert management to areas or departments that may require new procedures or particular attention. A summary of the tracking will be reported annually by each department to the Environmental Department, along with an analysis of the effectiveness of the existing systems and any proposed improvements.

An audit program is required to alert management when enforcement is necessary to ensure compliance with the waste management plan and procedures. The Mine Manager will appoint a small audit team. Responsibilities of the audit team may include the following:

- Inspection of Project facilities for proper waste segregation, storage, and disposal. Waste streams and methods of disposal will be inspected and analyzed periodically to ensure compliance;
- Inspection of the waste management facility to ensure proper waste segregation, storage, and disposal;
- Perform periodic reviews of the waste management facility including procedures, training, equipment, records, and employee awareness; and
- Review the inspection findings with area supervisors, operation personnel, transporters, and contractors to correct deficiencies, improve procedures, maintain awareness and communication, and recognize positive or negative performance.

5.8.1 Incinerator Inspections and Record Keeping

Incinerator inspections include daily equipment checks, weekly blower checks and monthly inspections to check for changes in the equipment. Periodic emissions monitoring is also required as defined in the *Air Emissions Regulations*. Incinerator logs are maintained to track the amount of waste incinerated, the kind of waste incinerated and the frequency of incineration. An example Incinerator Log sheet is provided in Appendix B. Inspection forms will be created in accordance with the manufacturers requirements.

Equipment checks and logs are performed in accordance with the manufacturer's specifications. Daily checks include integral physical components such as thermocouples, contact switches, refractory in primary chamber, gaskets and seals, and general housekeeping. Weekly inspections consist of checking the incinerator blowers (primary, secondary and flame port blowers) to ensure they are working properly. Monthly inspections consist of

checking the external surfaces of the incinerators, more specifically checking for 'spotty' discolouration on surfaces.

The pre-operational inspections will be conducted to ensure the incinerator is ready and safe prior to use. The inspection must be performed by a qualified operator designated to use the equipment prior to operation. Operators are to inform the Site Manager if equipment deficiencies are discovered prior to use. The Site Manager will arrange for maintenance as required. The inspection checklist will include verification of the following items:

- The appropriate Personal Protective Equipment (PPE) is used;
- Ash bin is empty;
- Burner chamber is clean without presence of hot ambers or flames;
- The door to burner chamber is in working order and the seal around the door frame is without rips, tears or absent sections;
- The blower safety relay switch is not stuck and the retract spring is in good working order;
- The fire extinguisher is present and operational;
- The fuel shut off is free moving;
- All fuel lines are inspected for leaks or abrasions; and
- No flammable material is in the immediate area outside of the incinerator.

Periodic air emissions monitoring ensures that emissions from the incinerator do not contain contaminants in excess of the following concentrations derived from the Canada-Wide Standards for the noted contaminants:

- 20 µg mercury /Rm^3 air
- 50 mg hydrogen chloride /Rm^3 air;
- 57 mg carbon monoxide /Rm^3 air (4-hour average);
- 80 pg I-TEQ dioxins and furans /Rm^3 air;
- 50 mg particles /Rm^3 air (rated capacity less than 1 tonne per hour); and
- 20 mg particles /Rm^3 air (rated capacity equal to or greater than 1 tonne per hour).

To enable comparison with these standards, sample results must be corrected to 11% oxygen content and 0% moisture content and expressed in terms of reference cubic metres (Rm3, which is one cubic metre of air at a temperature of 25°C and a pressure of 101.3 kPa). In addition, bottom ash and fly ash from the incinerator must be individually sampled and analyzed for total metals and, using a TCLP test, for all inorganic substances for which a standard exists. Initial sampling involves the collection of one eight-hour composite sample per day for five consecutive operating days. After that, one eight-hour composite sample is collected twice per year. Eight-hour composite samples are created by taking a sample from the ash discharge once each hour for eight operating hours and combining the samples. The samples are crushed during sample preparation to pass a 3/8" (9.5 mm) screen prior to analysis.

5.8.2 Land Treatment Facility Inspections

Inspections of the LTF will be dictated by the relevant permit, but will likely include the following (from Yukon Environment, 2011):

- Inspections every two weeks during the operational season.
- If any irregularities are detected, they must be addressed immediately, and the Environmental Programs Branch must be notified.
- Implement a regular monitoring program for all soil being treated in order to monitor the progress of remediation. Samples must be representative of the soil being characterized by combining several grab samples from throughout the volume of soil to be represented, in accordance with *Protocol 11: Sampling Procedures for Land Treatment Facilities*.
- LTF operators must submit an annual report to the Environmental Programs Branch by March 31 of each year which provides information about the operation of the facility during the previous calendar year. Each facility's permit includes a detailed list of the specific information to be included in the annual report, but this list generally includes the following:
    - the origin of all contaminated material being treated, the volume of material accepted from each source, and the total volume being treated;
    - a figure showing the layout of the facility and the location of each stockpile of contaminated material;
    - laboratory analytical results for materials added or removed from the facility in that year (unless previously submitted in support of a permit or removal request), as well as results of any other sampling conducted;
    - data from groundwater monitoring, if applicable;
    - the volume of soil removed from the facility and the locations of the receiving sites;
    - operational details, such as how the contaminated material was tilled or turned and whether nutrients were added to help remediation; and
    - a sampling and analysis plan for the following year.

5.8.3 Landfill Monitoring and Inspections

Landfill monitoring and inspections will be dictated by the relevant permit, but may include the following (from Yukon Environment, 2014):

If installed, all groundwater monitoring wells must be checked for water levels and sampled twice each year, at the high and low water points, for the following parameters:

- Major ions (Calcium, Magnesium, Sodium, Potassium, Chloride, Sulphate, Nitrate Nitrogen, Nitrite Nitrogen, Phosphate)
- Dissolved metals
- Mercury
- pH and hardness
- Alkalinity
- Carbonate
- Bicarbonate
- Total dissolved solids
- Ammonia
- Dissolved organic carbon
- Volatile organic compounds
- Chemical oxygen demand
- Total Kjeldahl nitrogen
- EPH_{W10-19}
- VH_{W6-10}

Surface water samples must be collected from all downgradient surface water bodies within 1 km of the facility that are identified in the hydrogeological assessment as being potentially impacted by the facility. Where appropriate, a sample should also be taken from surface water upgradient of the facility for comparison. Surface water samples must be analyzed for the parameters listed above for groundwater, substituting total metals for dissolved metals, removing volatile organic compounds, and adding biochemical oxygen demand.

For facilities at which leachate collection is required, leachate samples are to be collected concurrently with each groundwater sampling event, and analyzed for the parameters listed above for groundwater. The monitoring report should include an analysis of groundwater quality in comparison to leachate quality to aid in determining if leachate may be impacting the groundwater. Landfill gas monitoring may also be required at large engineered facilities or cells, in which case landfill gas probes capable of monitoring the levels of all gases of concern would be installed in the most permeable strata between the waste disposal areas and each property boundary, as well as between the waste disposal areas and any structures where landfill gas could accumulate. Monitoring and alarm devices for methane and oxygen should also be installed within, beneath, and immediately adjacent to all on-site structures. Combustible gas concentrations may not exceed 25% of the lower explosive limit at any monitoring point.

6 – SPECIAL WASTE MANAGEMENT

Special wastes (or hazardous wastes) can include used oil, used fuel, used batteries, used antifreeze (glycol), used solvents and lab chemicals. Special wastes projected to be generated at the Casino Project are summarized in Table 6-1, as well as the proposed disposal method. A special waste permit is required under the *Special Waste Regulation* for any user that generates, stores, handles, mixes, transports, disposes or releases special wastes. The Yukon Government also offers an annual Special Waste Collection Program, up to a maximum of $2,500, which industrial users are able to participate in. Following detailed design of the Casino Project, this section will be updated with the design of the special waste collection and storage areas, including any secondary containment or monitoring systems. Handling and personal protective equipment or special precautions required for the various types of special waste are detailed in the material safety data sheets (MSDS) for each material, which will be provided by the manufacturer, and will be stored at the waste management facility, in the special waste management area.

Table 6-1 Special Wastes Generated at the Casino Project

Special Waste	Proposed Disposal Method
Aerosol cans	Punctured with can puncturing machine and shipped off-site for disposal.
Appliances (with refrigeration)	Off-site disposal
Contaminated flammable liquids (e.g., Jet B, gasoline)	Off-site disposal
Fuel filters	Store in drums or totes; off-site shipment to registered facility
Lead acid batteries	Off-site disposal at approved facility
Oil filters	Spent oil filters are drained of residual oil and crushed in a filter crusher. Shipped off-site for disposal.
Plastic oil pails and oil containers (20 L)	20 L pails: off-site disposal 1 L and 5 L containers: incinerated
Process facility chemicals	Off-site disposal
Rubber tires (rim size < 24.5”)	Off-site disposal
Single use oil and glycol plastic drums	Off-site disposal
Used florescent light ballasts/light tubes	Off-site disposal
Waste antifreeze/glycol	Stored in 205 L drums and shipped off-site for disposal at approved facility
Waste oil (motor oil, diesel, hydraulic oil, etc.)	Used crankcase, ATF, hydraulic, #2, #4 and #5 fuel oils can be burned in a waste oil burner. Waste oil contaminated with water or glycol must be stored and shipped off-site for disposal.

6.1 SPECIAL WASTE MANAGEMENT

CMC will handle and store special waste separately from solid waste to the extent practicable, and in the following manner to prevent endangering human and wildlife health and the environment:

- Waste oil from piston aircraft will not be mixed with other waste oil.
- Special waste will not be mixed with any other material unless authorized by the Yukon Environment Branch as an acceptable treatment/disposal option.
- All drums, and any other portable containers containing special wastes, will be covered to prevent container degradation from the sun or contamination by water from snow or rain. They will also be stored off the ground to prevent container degradation by ground moisture.
- Incompatible substances will be stored separately to prevent contamination, fires, explosions, gaseous emissions, leaching or other discharges, or other dangerous conditions. Refer to the MSDS for more information. Master copy MSDS binders for all hazardous substances are available at where products are used and stored. MSDS copies for area specific hazardous substances will be located in the process plant and assay lab.
- The contents of all storage containers will be clearly marked. Containers used for storage of special waste will be made of materials that will not adversely react with the special waste.
- The residue at the bottom of any container used for the storage of special wastes will not be drained to the environment. Such residue will be segregated and treated as a special waste until proven otherwise.
- During storage or transport of any special waste, the container will be closed at all times and will not be opened, handled or stored in a manner which may cause it to leak. Any special waste stored in leaking containers will be immediately removed or transferred to intact containers.
- Every closed container that:
    - has a capacity of more than 230 litres;
    - is designed to be installed in a fixed location; and
    - will contain special waste, will be certified by a testing agency recognized by the Standards Council of Canada prior to putting special waste in the container.

CMC will transport and transport special waste in the following manner:

- No special wastes will be transported by CMC other than within the Mine site;
- All special wastes transported off-site will be in accordance with applicable transport laws, to a facility permitted in the Yukon or other jurisdiction to receive them, by a carrier permitted in the Yukon or another jurisdiction to receive and transport special wastes. If the facility is in the Yukon, both the facility and the carrier must be permitted in the Yukon according to the *Transportation of Dangerous Goods Regulations*;
- A movement control document (manifest) will be completed to document each shipment of special waste (including volume), as per *TDG Regulations* noted above;
- All special wastes will be transported and transferred in such a manner as to prevent their release into the environment; and
- All vehicles carrying any special waste will be secured to prevent access to unauthorized personnel.

6.2 SPILL PREVENTION AND RESPONSE

The storage and disposal of special waste will be done in accordance with best management practices. Should a spill occur, refer to the *Casino Project Spill Contingency Management Plan* and the *Emergency Response Plan*. Spill cleanup requirements are provided within the MSDS for each material.

6.3 INSPECTIONS AND RECORD KEEPING

Storage facilities for special wastes will be inspected regularly for leaks or non-compliance with policies, plans, and procedures. Inspections will include tanks, pipelines, connections, valves, gauges and meters, sumps and separators, and inventory records. Inspections will be recorded and filed with the Mine Manager. Inspections of the special waste management area will be conducted monthly, and will include:

- Inventory of special wastes received, stored, used and disposed of;
- Details of disposal of all special wastes; and
- Records of collection from hazardous waste collection services.

7 – HAZARDOUS MATERIALS

Dangerous goods and hazardous materials will be required at the Casino Project throughout the Project, and typical dangerous goods and hazardous materials, their uses and storage locations are summarized in Table 7-1. Hazardous materials that will be used for the Casino Project include fuels (diesel and liquefied natural gas (LNG)), lubricants, solvents, antifreeze, explosives, and processing reagents, including cyanide. A separate *Cyanide Management Plan* will be developed and implemented in recognition of the higher level of public concern associated with this substance. Material Safety Data Sheets (MSDSs) will be required for each of these products prior to their delivery to the Mine Site. These products will be imported to the Project site and used throughout the Project facilities, including the sulphide and oxide ore processing plants (including the SART and ADR facilities), truck shops, accommodation camp, and the airstrip. Most of the products will be consumed on site, but some (e.g., hydraulic fluid and batteries) will require disposal after use as per Section 6. Below are summarized the requirements for transportation of these products to and from the Project site, and their proper and safe storage, use, and disposal on site.

Table 7-1 Typical Dangerous Goods and Hazardous Materials

Product	Use	Storage
Batteries	Vehicle maintenance	Truck shop
Diesel fuel	Throughout	Double-wall tanks or 205 L barrels
Domestic products	Camp and kitchen for cleaning	In accommodation camp
Ethylene glycol (anti-freeze)	Vehicle maintenance	Truck shop
Explosives	Blasting	Explosives magazine
Gasoline	Throughout	Double-wall tanks or 205 L barrels
H_2SO_4	Process plant reagent	Stored in framed 1 m^3 totes
Hydraulic fluid	Vehicle maintenance	Truck shop
Jet A and Jet B fuel	Helicopters and planes	Airstrip
Laboratory chemicals	Preservatives for environmental samples, reagents for laboratory analyses	Stored in 1 L and 5 L containers
Liquid natural gas (LNG)	Power generation	Power plant
Lubricants and greases	Vehicle maintenance	Truck shop
Lubricating oil	Vehicle maintenance	Truck shop
Oxygen	First aid for cyanide exposure	Camp medical facility

Product	Use	Storage
Process plant reagents	Used in sulphide ore processing facility and concentrate production	Dry reagents will be stored in bulk bags up to 1 tonne size. Liquids will be stored in tanks
Propane	Samp and other facilities for space heating	Portable and permanent tanks/cylinders
Smelting fluxes	Use during smelting (10% borax , 80% flouspar, 5% $NaCO_3$, 5% sodium nitrate)	ADR facility
Sodium cyanide (NaCN)	Gold extraction from ore	ADR facility leaching circuit reagent storage area
Sodium hydroxide (NaOH)	Used for the desorption of gold from the activated carbon	ADR facility leaching circuit reagent storage area, in supplier packaging
Solvents	Vehicle maintenance	Truck shop; 205 L barrels with secondary containment
Windshield washer fluid	Vehicle maintenance	Truck shop

7.1 HAZARDOUS MATERIAL MANAGEMENT PRACTICES

The management of hazardous materials is governed by the Dangerous Goods Transportation Act as well as the Special Wastes Regulation and Storage Tank Regulations of the Environment Act. In addition, the Occupational Health and Safety Act applies to hazardous waste material management, including the following sections:

- Employers must ensure that workers are aware of any hazard in the work and in the handling, storage, use, disposal, and transport of any article, device, or equipment, or of a biological, chemical, or physical agent (Section 3(2) (a));
- Employers must ensure that workers are informed of their rights, responsibilities, and duties under this Act (Section 3(2) (c));
- Duties of supervisors include proper instruction of workers and ensuring that work is performed without undue risk; ensuring that workers use applicable personal protective equipment; advising the worker of any known danger associated with the work; and providing written instructions on measures and procedures to be followed for the protection of the worker (Section 7);
- A worker has a right to refuse to do work that is believed to pose an undue hazard (Section 15); and
- Injuries and accidents include accidental release of a controlled product (Section 30(1) (i)).

Therefore, CMC will implement actions to avoid, control and mitigate the risks from dangerous goods handling, storage and disposal.

An inventory of dangerous goods and hazardous materials will be maintained and will list all chemicals on site, and will include MSDS and WHMIS information on the products to ensure that Project personnel have all the necessary information for their safe transportation, use, and disposal. Before any chemical is brought to the site,

the supplier or contractor will supply an MSDS for the product. Minimizing the risk of safety infractions and/or environmental damage from accidental releases of hazardous materials includes the following practices:

- Knowing which hazardous materials are on site through the maintenance of an inventory system;
- Allocating clear responsibility for managing hazardous materials;
- Understanding the actual or potential hazards and environmental impacts associated with the storage and handling of these materials;
- Minimizing the use and/or generation of hazardous materials;
- Constructing storage facilities that safely contain the materials in all foreseeable circumstances;
- Implementing physical controls and procedures to ensure that no materials escape during routine operation as well as in upset conditions;
- Having emergency response plans in place to ensure immediate action to minimize the environmental effects should accidental or unplanned releases occur;
- Monitoring all discharges and reporting unplanned discharges if they occur; and
- Keeping records to avoid reoccurring safety and environmental problems.

Materials will be stored in appropriate containers within suitably contained areas. All the process reagents will be prepared in a separate reagent preparation and storage facility in a containment area. The reagent storage tanks will be equipped with level indicators and instrumentation to ensure that spills do not occur during operation. Appropriate ventilation and fire and safety protection will be provided.

The following actions will be implemented to avoid, control, and mitigate risk:

- Manufacturers will provide safe packaging and labelling for packaged materials, as a condition of purchase agreements;
- Storage areas will be appropriately climate-controlled, dry, and well-ventilated;
- Containers holding the materials will remain sealed to prevent accidental leakage and/or spillage;
- Incompatible chemicals will be stored separately in order to prevent deleterious chemical reactions and cross contamination;
- Chemical storage areas will be designated as non-smoking areas and are located away from food storage areas;
- All personnel handling dangerous goods will be trained and provided with appropriate personal protective equipment; and
- All bulk chemical storage sites will be outfitted with concrete or lined floors and walls capable of containing 110% of the volume of the largest vessel in the area or as stipulated by appropriate legislation or permits.

Additional information on response plans in the event of any spills of hazardous materials is provided in the *Casino Project Spill Contingency Management Plan*.

7.1.1 Petroleum Products

The materials with the highest risk potential for a spill or accidental release are petroleum products, due to their frequency of use. Light natural gas (LNG) and diesel will be the most consumed materials, as well as smaller volumes of gasoline, Jet A and Jet B and vehicle maintenance fluids such as lubricating oil, ethelyne glycol (anti-freeze), hydraulic fluid, oil and grease. During operation, LNG will be shipped to site at an average of 11 trucks per day, whereupon the LNG will be pumped to the LNG storage tank. LNG is then pumped to the conversion plant, where it is converted to natural gas for use in the power plant and in the vehicle fleet.

Fuel handing, transportation, and storage facilities and activities will be consistent with British Columbia's *Health, Safety and Reclamation Code* (BC MEMPR, 2008) and the *Fuel Storage and Handling Guidebook* (Mineral Resources, 2002). All fuel storage vessels will include secondary containment, and all transfer stations will have concrete spill pads complete with oil/water separators during operation. Tanks and sumps will have high-level alarms. All transfers from tanker trucks to tanks will be done using enclosed lines, hoses, and pumps. All storage and transfer locations will also be equipped with appropriate spill kits. An inspection schedule will be developed for each fuel storage site, taking into account the volume of fuel stored at each site and the respective risks related to that storage. Inspections will include tanks, pipelines, connections, valves, gauges and meters, sumps and separators, and inventory records. Inspections will be recorded and filed.

Fuel transfer procedures will include management practices to ensure no overtopping of tanks or spillage. All spills or accidents will be reported immediately. Employees and contractors responsible for transporting or storing hydrocarbons or fueling vehicles will receive training in proper operating procedures and emergency response. Most mobile equipment, including mine haul trucks, will be fuelled from mobile fueling equipment. Mobile equipment, such as tracked dozers, will be serviced by a fleet of fuel/lube trucks. These vehicles will be equipped with spill kits. Hydrocarbon spills will be collected, and contaminated soils and overburden materials will be hauled to the land treatment facility.

Oils, lubricants degreasers, solvents, and other petroleum-based products will be delivered to the site in drums by truck (the drums will often be palletized). These will be unloaded using a fork lift and then stored in a secure area. The lubricants will be dispensed using hose reels and barrel pumps in the truck shop.

7.1.2 Reagents

Metal concentrates are produced at the Casino Project through both a sulphide ore flotation process and an oxide ore heap leaching process, both of which require substantial reagent inputs. Reagents used in the sulphide ore process include sodium-diisobutyl dithiophosphinate (Aerophine 2418A), sodium diethyl dithiophosphate/sodium disecondary butyl dithiophosphate (Aerofloat 208), methyl isobutyl carbinol (MIBC), pebble lime (CaO), sodium hydrosulfide (NaHS), flomin d-910 (sodium dithiophosphate), flocculant, potassium amyl xanthate (PAX). Reagents used in the oxide ore process include sodium cyanide (NaCN), caustic soda (sodium hydroxide, NaOH), pebble lime (CaO), hydrochloric acid (HCl), sodium hydrosulphide (NaHS), sulphuric acid (H2SO4), activated carbon, antiscalant, flocculant

All the reagents will be prepared in a separate reagent preparation and storage facility with containment. The reagent storage tanks will be equipped with level indicators and instrumentation to ensure that spills do not occur during operation. Reagents will be clearly labelled, and MSDSs will be readily available. An inventory will be maintained showing deliveries and consumption. All relevant staff will be trained regarding risks related to each reagent and the measures required for the safe handling, use, storage, and disposal of the reagents, including emergency and spill cleanup procedures. Appropriate ventilation and fire and safety protection, including personal protection equipment, will be provided at the facility.

The liquid reagents (including fuel oil, A208, 2418A, MIBC, HCl, H2SO4, and antiscalant) will be added in their undiluted form to various process circuits via individual metering pumps. Dry reagents will be packaged in large 1 tonne bulk bags. They will be trucked to the site in conventional transport trucks, and unloaded at the Process Plant into the reagent storage and makeup area. The bags will then be emptied into mix tanks for subsequent pumping and distribution to the appropriate area in the Process Plant. All the solid type reagents (including PAX, NaOH, and NaCN) will be mixed with freshwater to solution strength in the respective mixing tank and then stored in separate holding tanks before being added to various addition points by metering pumps. Cyanide transportation, storage, and use will be consistent with the International Cyanide Management Code, and is detailed in the *Casino Project Cyanide Management Plan*.

7.1.3 Nuclear Equipment Handling and Disposal Plan

Radioactive sources may exist at the Casino Project for use in such tasks as process monitoring (e.g., density gauges), exploration (e.g., down-hole logging), monitoring (e.g., neutron moisture gauges), geo-technical assessment (e.g., Troxler soil compaction meters), and research (e.g., for tracer studies).

All aspects of the purchase, handling, use, storage, and disposal of nuclear equipment are regulated in Canada under the *Nuclear Safety and Control Act* and its regulations. CMC and contractors will comply with all applicable regulations, including requirements for licensing. Radioactive materials at industrial facilities requires proper management of the potential human health hazard (both occupational and public), as radioactive contamination may not be detected in conventional occupational, environmental, or process stream monitoring. Periodic checks of radioactive sources will be undertaken to ensure that there has been no significant loss of integrity of the source container that could result in leakage or contamination. All radioactive materials will be appropriately labelled, and the labels will always be visible. Radioactive sources no longer being used will be stored in appropriate containers in secure storage buildings on site. Whenever possible, purchase agreements will be established with suppliers to take back the units being taken out of service, or other disposal agreements will be arranged. Specific requirements for storage, use and disposal will be detailed during the application for a Nuclear Substances and Radiation Devices licence.

7.1.4 Transport of Dangerous Goods and Materials

Transportation of dangerous goods and materials to the Casino Project will be contracted out to a certified transporter in compliance with the *Transportation of Dangerous Goods Act and Regulations*. Transportation of dangerous goods is regulated under the *Dangerous Goods Transportation Act*, which requires transporters to have a certified contract and a spill response plan for all goods to be transported. The transporter will be required to:

- MSDSs accompany all goods and materials.
- Non-compatible materials will be transported in a separate shipment.
- Fire extinguisher and fire prevention materials will be adequate and appropriate for the material being transported.
- Containers will be appropriate for the material being shipped.
- Containers will be properly secured.
- Containers and trucks will be properly marked, labelled, and placarded.
- Manifests will be maintained in accordance with federal and provincial regulations.

- Spill response materials will be adequate and appropriate for the materials being transported.
- Drivers will be adequately trained and equipped for spill first response, containment, and communication.

To the extent possible, the transportation of hazardous materials will only take place when road conditions are suitable. During winter months transport may be curtailed during periods when the roads are not safe for trucks due to ice or snow related hazards. When road conditions are uncertain for the transportation of hazardous materials, the vehicle or truck will be accompanied by an escort vehicle along the access road. The access road will be maintained to provide a safe and effective transportation route for all hazardous materials required on site.

7.2 MATERIAL SAFETY DATA SHEETS

Material safety data sheets (MSDSs) provides information primarily aimed at worker health and safety, with some secondary information related to environmental impacts and remedial action in the event of spillage typically provided; and commitment to train employees regarding transportation, storage, and use of dangerous goods and hazardous materials.

Current Material Safety Data Sheets (MSDS) provided by the manufacturer will be available to all personnel. The MSDS documentation will be available at every location where hazardous materials are stored; in addition all MSDS documentation will be retained in a central file at the on-site construction office during construction, and in the first aid building and administration building during operations. Hazardous materials storage areas will include signage using standard WHMIS symbols and descriptions of materials stored in each area. MSDS sheets will be replaced if necessary once final selection and procurement of hazardous materials has been completed.

8 – CONTAMINATED MATERIALS

Contaminated material may result from on-site spills of hydrocarbons (i.e., diesel, waste oil, and hydraulic oil), antifreeze, solvents and lubricants. These items each have specific disposal methods as follows:

- Hydrocarbon contaminated soil and snow will be excavated and transported to the land treatment facility (LTF);
- Hydrocarbon-contaminated absorbent pads will be incinerated;
- Antifreeze contaminated soil and snow will excavated and transported to the Land Treatment Facility;
- Antifreeze contaminated absorbent pads will be incinerated; and
- Solvents and lubricants have specific disposal requirements as per the MSDS sheets.

Below are the details of the assessment, treatment and confirmatory sampling for material disposed of the in LTF. Methods of assessment and treatment described below are as per the *Contaminated Sites Regulations* (Government of Yukon, 2002) and the protocols established under it.

8.1 ASSESSMENT

Soils and snow contaminated with hydrocarbons and glycol may be disposed of in a LTF. Material able to be treated in the LTF is immediately placed in the LTF to prevent further contamination and undergoes initial characterization. Initial material characterization requires in situ sampling during the excavation of contaminated materials, of both the materials excavated and the material left behind, to ensure that all contaminated materials are excavated. Sampling is done at a rate of one composite for every 50 m^3 of material, except where there is reason to believe that Petroleum Hydrocarbons (PHC) may be at Special Waste levels (30,000ppm or 3% and above), in which case a sample must be taken for every 10 m^3 of material. Note that 3% is the level at which pools of free product can be expected to form in many matrix types.

For soil sampling, a 250ml glass jar with a Teflon cap liner is filled with sample, and analyzed for BTEX group (Benzene, Toluene, Ethylbenzene and Xylene), TEPH, LEPH, HEPH (Total, Light and Heavy Extractable Petroleum Hydrocarbons), PAH (Polycyclic Aromatic Hydrocarbons), Styrene, chlorinated and non-chlorinated phenols and pH. Analytical results are compared to Contaminated Sites Regulations Schedules 1 and 2.

8.2 TREATMENT

Treatment of hydrocarbon contaminated soil is via microbes, that, under appropriate conditions break down long chain hydrocarbons into their less volatile counterparts. LTF operational requirements will be dictated by the terms of the Land Treatment Facility Permit, however, the following operation guidelines will be followed (from Yukon Environment, 2011):

If soil is placed in the facility to a depth of greater than 15 cm, the soil should be tilled or turned at least twice yearly. Tilling aerates the soil, which provides microbes with the oxygen they need to break down petroleum hydrocarbons. Tilling more frequently will allow the soil to remediate more quickly, and the Environmental Program Branch recommends that soil be tilled at least once per month.

In order to ensure that the microbes in the soil can process hydrocarbons efficiently, the pH of the soil should be maintained between 6.5 and 8.5.

The addition of fertilizer may be beneficial, or even necessary to ensure that the soil is remediated in a timely manner. Treatability studies can help to determine if fertilizer or other amendments would be helpful. Some commercial laboratories offer these tests.

Care should be taken to ensure that the soil in an LTF does not become saturated with water. Water saturation will slow or halt the remediation process by reducing the amount of oxygen available to microbes in the soil. Large land treatment facilities and those that do not undergo frequent tilling are particularly vulnerable to saturation. Depending on local climactic conditions, it may be beneficial to incorporate a sump into the design of the facility to collect runoff water in one location. This also allows collected water to be easily sprayed back onto the top of the soil piles, maintaining an even level of moisture that may encourage remediation.

Materials from different locations or containing different levels of contamination must be kept separate within the facility unless otherwise authorized by a permit.

8.3 CONFIRMATORY SAMPLING

Confirmatory sampling is conducted once interim samples indicate that the soil has been remediated to below *Contaminated Sites Regulations* (Government of Yukon, 2002) standards. Confirmatory sampling is conducted at a rate of one sample per 100 m^3 of soil using composite sampling techniques outlined in Protocol 11 of the *Regulations*. Each composite is to be composed of soil from the deeper horizons of the treatment cell where remediation rates are lowest. Once remediated material meets the *Contaminated Sites Regulations* standards, an application to the Yukon Government Environmental Programs Branch is sent to request permission to remove the soil from the treatment facility. If the treated material exceeds any of the standards in the Contaminated Sites Regulation, a Relocation Permit will be required to move the material from the LTF to an off-site receiving location. If all contaminant levels are below the most stringent standards, or if the material will not leave the property, no Relocation Permit will be required, but the Environmental Programs Branch must still authorize the removal of the material from the facility. Remediated materials are only used for the application under which they were approved by the Environmental Programs Branch (i.e., industrial use).

9 – EMPLOYEE TRAINING

All persons at the Project will be made aware of the waste management and hazardous materials program and of how to direct waste to the correct waste stream through an orientation and training program on domestic and industrial waste procedures. Permanent employees will receive regular retraining and updates when new procedures or changes are introduced. Employees charged with handling hazardous materials will also be provided with WHMIS and TDG training, as described below.

9.1 WORKPLACE HAZARDOUS MATERIALS INFORMATION SYSTEM (WHMIS)

Workplace Hazardous Materials Information System (WHMIS) training will be mandatory for CMC personnel that transport, use or dispose of hazardous materials. Personnel will undertake WHMIS training immediately upon commencing employment as part of an induction program. Personnel will be re-certified every 3 years. WHMIS will be implemented on site by the Health & Safety Manager by requiring:

- Communication between hazardous material suppliers prior to dispatching of materials;
- Adequate storage infrastructure in line with industry standards;
- The prominent display of valid MSDS and WHMIS signage on hazardous material storage areas;
- Regular inspection of containers and storage areas;
- Availability and use of appropriate personal protective equipment;
- Provision of emergency preparedness equipment such as fire extinguishers, eye flushing points, and first aid supplies;
- Availability of appropriate spill kits for all hazardous materials;
- Training of personnel handling hazardous materials;
- Ensuring that safe and secure storage of hazardous materials is implemented to avoid potentially dangerous chemical interactions; and
- The implementation of monitoring systems for hazardous material storage and handling areas, such as monitoring of HCN gas in cyanide storage areas.

9.2 TRANSPORTATION OF DANGEROUS GOODS

Personnel involved in the transportation of dangerous goods will be given certified training in WHMIS and Transportation of Dangerous Goods (TDG). Training will be per Transport Canada training requirements including:

- The nine classifications of hazardous materials;
- Documentation requirements for transportation of hazardous materials;
- Understanding safety marks, labels and placards required for transportation of hazardous materials;
- Safety requirements for Transportation of Dangerous Goods; and
- Spill response procedures for transportation of hazardous materials.

CMC will ensure that personnel required to oversee and be involved with the transportation of dangerous goods will hold valid certificates of competency during any time in which they transport dangerous goods.

DOUBLE CHAMBER CYCLONATOR INCINERATOR

SERIES CY2000

- **Built In Safety Features**
- **Readily Transportable**
- **Economical Operation**
- **Clean Burning**

CY-2050-FA "D"

Designed for Petroleum, Mining, and Lumber Industries

Capacity
1.4 m^3, 90 kg per hour.
Type No. 1, 2, & 3 waste.

Power Requirements
115 volts 60 cycle single phase.

Stack
Stainless Steel
- 14 gauge.
- 38cm diameter.
- 3m high.
- c/w stainless steel spark arrester.
- a hinged base plate for moving.

Casing
12 gauge steel.
Lining: high heat duty castable refractory over high temperature insulation.

Hearth
Refractory hearth over 6.35mm steel base.

Doors
6.35-cm steel plate c/w heavy-duty blade latch.
Charging:
- 61cm-x 71cm clear opening
- Refractory lined over steel plate.

Ash:
- 61cm x 40cm clear opening
- Refractory lined over steel plate

Air Supply
Forced air fan c/w duct to primary airs jets and to secondary over-fire air jets.

Timers
Cycle timer interconnected to air supply fan and gun type burner enclosed in burner housing.

Burners
650,000 BTU gun type primary burner.
Gun burner enclosed in protective plate steel housing.
450,000 BTU in secondary chamber.

Fuel Supply: Oil Fired Unit Only
1350-liter fuel storage tank c/w filter and flexible hose type connection.

Transporter
Incinerator and fuel storage mounted on skid type frame 4.27m long x 1.83m wide.
Height: 3.2m tall, with stack folded.
Constructed of W150 I-Beam c/w bumper posts.

Weight
5000 kg.

Options
* LPG Fired burner.
* Diesel fired burner.
* 2.3m Electric power cord.
* Stack winch.
* Cold climate assembly.

APPENDIX A.22B: Spill Contingency Management Plan

CASINO PROJECT

SPILL CONTINGENCY MANAGEMENT PLAN

PRELIMINARY DRAFT

Prepared by:
Casino Mining Corporation
March 2015

Executive Summary

The Casino Mine Project is an approximately 22 year mine project that will produce copper and molybdenum concentrates, and gold dore bars via flotation milling and heap leach processing, respectively. The proposed project includes a four year construction period and a 26 year post-closure period. A key component of the Casino Project is the upgrade and extension to the existing Freegold road, jointly called the Casino Mine Access Road. The Freegold Road is an existing 80 km long gravel resource road owned and operated by the Yukon Government. Casino Mining Corporation (CMC) proposes to upgrade the existing Freegold Road, including the addition of a bypass road around the town of Carmacks, and extend the road a further 120 km to the Casino Mine Site. Both the upgrade and the extension would be two-lane, gravel resource roads designed for all weather use by haul trucks with highway legal loads. The roads will be designed to BC Ministry of Forest guidelines, with a 70 km/hr design speed, with some short 50 km/hr sections where road geometry is limited by the terrain. The road will be 8.2 m wide with maximum grades of 8%.

The Casino Project will require the transportation of various materials for operation and construction of the mine, including up to eleven tanker trucks per day for LNG transportation from Fort Nelson. Additionally, the milling processes will require shipment of reagents, including cyanide based reagents for the leaching of gold in the heap leach facility.

This Spill Contingency Management Plan (SCMP) is a preliminary plan to outline the precautions and spill response procedures for the proposed Casino Project. The SCMP will be updated as the project is refined, and has been derived from guidance in the Plan Requirements Guidance for Quartz Mining Projects (Government of Yukon, 2013), *Guidelines for Preparing Contingency Plans for Carriers of Hazardous Waste* (Ministry of Environment, 2011), and from the *Land Transportation Emergency Response Guideline for Petroleum Spills* (Canadian Petroleum Products Institute, 2008).

The SCMP contains information on the identification of the potential spills that may occur at the Casino Mine, and outlines spill response procedures for specific types of spills.

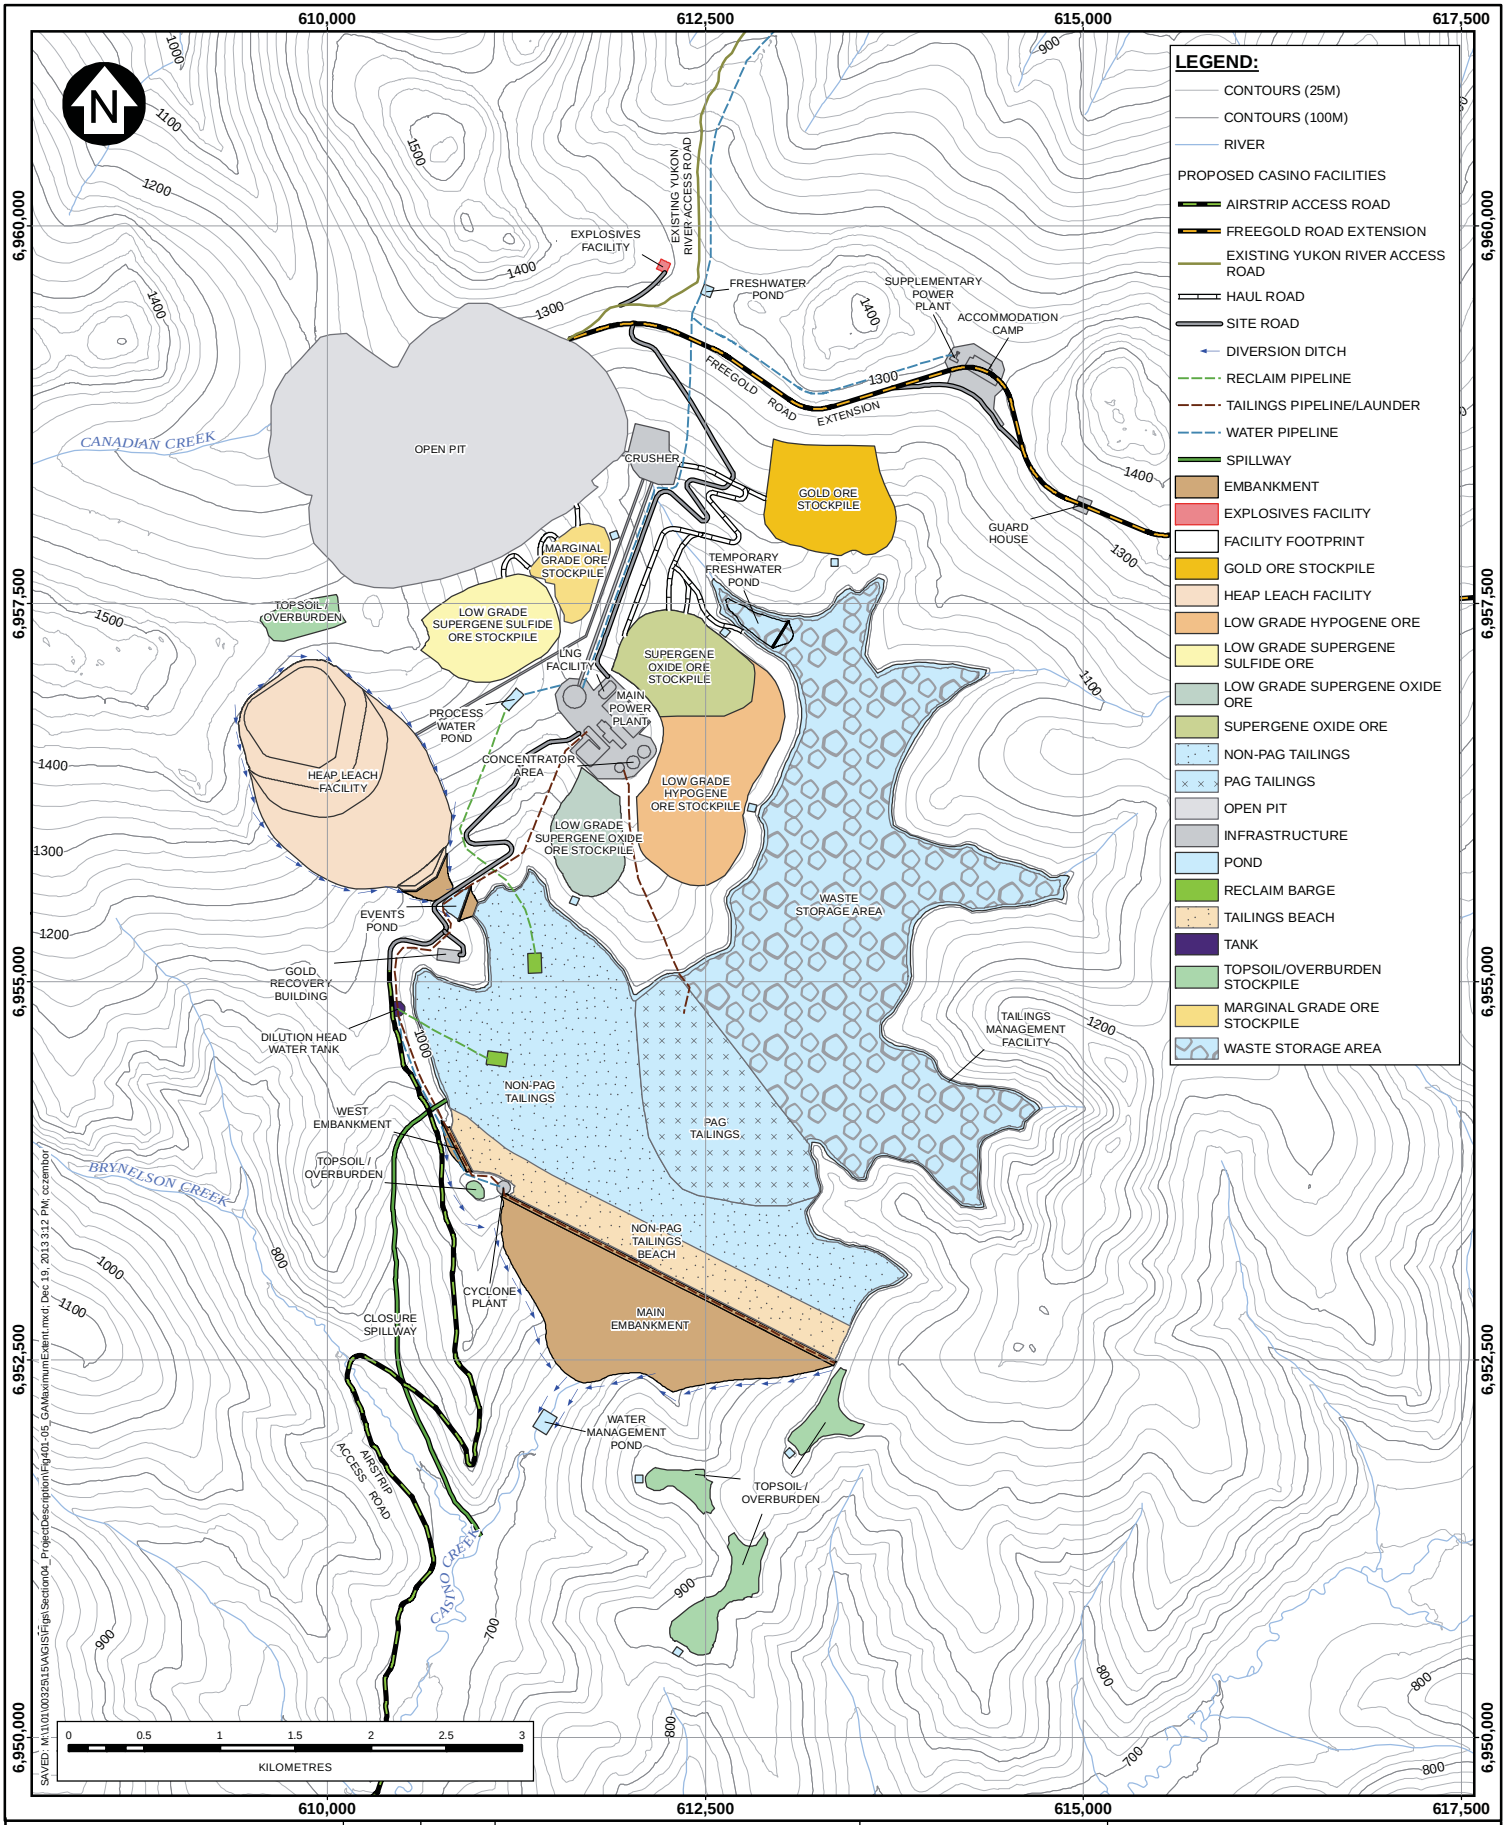
1 - INTRODUCTION

The Casino Mine Project is an approximately 22 year mine project owned and operated by Casino Mining Corporation (CMC), that will produce copper and molybdenum concentrates, and gold dore bars via flotation milling and heap leach processing, respectively. The proposed project includes a four year construction period and a 26 year post-closure period. The location of the Casino Project is shown on Figure 1-1. Key project components include the open pit, tailings management facility and waste rock storage area, heap leach facility, mill and associated infrastructure, ore stockpiles, liquefied natural gas power generating infrastructure, and office and accommodation buildings. The project also requires a 120 km access road from the town of Carmacks, YT, and concentrate will be trucked to the port at Skagway, Alaska.

The objective of the Spill Contingency Management Plan (the SCMP) is to minimize the potential effects of any spills associated with the Casino Project. While CMC will take all reasonable measures to prevent spills while undertaking the construction, operation and closure of the Casino Project, it is unlikely that all physical operations can attain zero risk. Unforeseen events, accidents and malfunctions can occur from time to time that may result in a spill. To minimize the effect of a spill and to prevent such spills from leaving the site, design features, background planning and diligent operational procedures are required.

The SCMP has been derived from guidance in the *Plan Requirement Guideance for Quartz Mining Project* (Government of Yukon, 2013), the *Guidelines for Preparing Contingency Plans for Carriers of Hazardous Waste* (Ministry of Environment, 2011), and from the *Land Transportation Emergency Response Guideline for Petroleum Spills* (Canadian Petroleum Products Institute, 2008). The SCMP has been written to provide clarity on spill response activities at the Casino Project, specifically with regards to spill prevention measures, and spill response activities. This preliminary SCMP should not be taken as a final spill response plan, but as one that will provide the framework for future plans, once project details are confirmed. The SCMP will be amended or updated as required, to accommodate change in construction, operational procedures, regulations and guidelines. A plan for spill response is required for both a Quartz Mining License and a Water Use License.

A spill is defined under Section 132 of the *Yukon Environment Act* (Government of Yukon, 2002) as "*a release of a substance into the natural environment; from or out of a structure, vehicle or other container; and that is abnormal in quantity or quality in light of all the circumstances of the release; or in excess of an amount specified in the regulations*". Where a substance is defined as "*a hazardous substance, pesticide, contaminant or special waste*".



The purpose of the SCMP is to provide background planning and operational procedures for spills response to minimize:

- Danger to persons;
- Pollution of land and water;
- Size of the affected area;
- Degree of disturbance to plants, fish and animals; and

- Degree of disturbance during cleanup.

The SCMP identifies the types of spills that may occur at the Casino mine site, and provides procedures to respond to such emergencies. The purpose of the plan is to initiate an immediate response with trained personnel and equipment to clean any accidental spill and ensure minimal impact to the land or aquatic environment in the immediate and surrounding area. The SCMP includes procedures for cleanup, containment, disposal, and monitoring, including details regarding equipment and personnel allocations. The SCMP should be read in conjunction with the *Casino Project Emergency Response Plan*, and details of waste management and hazardous waste management are provided in the *Casino Project Waste Management Plan* and the *Casino Project Hazardous Materials Management Plan*, respectively.

The final SCMP will outline applicable commitments made during environmental assessment, the decision documents terms and conditions and conditions in the Quartz Mining and Water Use Licenses, and where these terms are addressed in the plan.

2 - HAZARDOUS MATERIAL IDENTIFICATION

The Casino Mine will use large volumes of diesel fuel, gasoline, oils, LNG, and hazardous chemical substances, that all have the potential to spill as they are transported to and around the mine site. Locations of fuels, chemicals and other materials at the mine site will be determined during detailed design prior to construction; however, general storage locations are likely to include the following, as described in Table 2-1 and shown on Figure 1-1:

Table 2-1 Hazardous Material Locations

Hazardous Material	Storage Area
Diesel fuels, gasoline, liquified natural gas	main power plant adjacent to LNG facility
Reagents, other process chemicals	Warehouse[1.], smaller volumes in mill building
Hazardous waste (e.g., used oils, contaminated materials)	Warehouse[1.]
Oils, glycol, fuels for machinery maintenance	Truck shop[2.]
Concentrate	Concentrate loadout building[2.]
Explosives	Explosives facility
Propane, natural gas	Adjacent to accommodation camp
Tailings facility effluent	Tailings management facility
Sediment laden water	Not stored on-site, but may result from construction activities

1. Location to be determined, but likely within mill complex near concentrator area
2. Location to be determined

Mitigation measures, as implemented though design and planning for the Project, will minimize the risk of a spill occurring and limit the extent of the environmental impact. However, these measures cannot completely prevent all risks from spills. The Access Road will be used for year-round hauling of materials into and out of the Casino mine site during operations. There will be 18 major bridge crossings located along the route, which include crossings of Bow Creek, Big Creek, Hayes Creek, and Selwyn River, and 71 major culvert crossings. Spills of any substance to water at any of the watercourse crossings along the transport route are of particular concern.

Accidental release of hazardous materials could result in contamination of soil, air or water; cause vegetation damage; and be toxic to wildlife or humans. Consequences of any spill depend on the magnitude and extent of the spill; the material, quantity, location, and duration of the spill; and environmental conditions at the time. The following components of the Casino Project have the potential to generate a spill:

- The transfer, storage, and shipment of fuels (primarily diesel and LNG), waste, and other hazardous liquids;
- The storage, mixing, and distribution of chemical reagents associated with the heap leach facility;

- Release of water from the TMF; and
- Offsite release of sediment laden water from a construction zone.

Hazardous materials associated with the Project can be grouped into three categories, and are described further below:

- Petroleum products and lubricants (e.g., LNG, diesel, oils and degreasers);
- Sulfide and oxide ore processing reagents (listed in Appendix A); and
- Contaminated effluent (e.g., tailings pond effluent or sediment laden water).

2.1 LNG

LNG spills completely evaporate, leaving no residue that could harm soil or groundwater (Drube, Haukoos, Thompson, & Williams, 2012). Liquefied natural gas evaporates at -162°C (it's normal boiling point) at atmospheric pressure and forms a visible cloud which is initially heavier than air until the methane vapour warms to -108°C; at this point the natural gas becomes lighter than air and therefore dissipates (Drube et al, 2012). If spilled to water, LNG is lighter than water and boils on top until it evaporates (Drube et al, 2012). Natural gas is also non-toxic; therefore, no impacts to water or sediment quality or fish and fish habitat are expected.

2.2 DIESEL

Diesel spills to water could result in direct mortality of fish and invertebrates, since diesel is considered to be one of the most acutely toxic oil types (National Oceanic and Atmospheric Administration, 2014). Because of its low viscosity it is readily dispersed in the water column; this oil could then adhere to fine-grained suspended sediments which would settle out and result in sediment contamination (National Oceanic and Atmospheric Administration, 2014). Lytle and Peckarsky (2001) assessed the effects of a diesel fuel spill on stream macroinvertebrates over a 15 month period and found that the spill significantly reduced invertebrate density and taxonomic richness in the area immediately below the spill. Schein et al (2009) concluded that diesel toxicity could impair the health of fish populations, depending on the extent of chemical or mechanical dispersion (naturally caused by fast-flowing, turbulent rivers) and life stage of the fish. Dispersion of diesel increases the bioavailability and apparent toxicity to fish embryos - dispersion was reported to cause acute lethality to juvenile trout between 40 mg/L and 200 mg/L (Schein et al 2009). Best practices will be followed when siting and using the mobile refuelers and two portable fueling stations (e.g., ensuring that they are more than 30 m from any watercourse).

2.3 REAGENTS

Potential process reagents are listed in Appendix A. The volume, form, transportation logistics and storage locations of the reagents listed will be determined during detail design engineering of the Casino Project. In the event that a transport truck carrying reagents or concentrate is involved in a collision or accident, the effects of a reagent or concentrate spill will depend on the volume released, which will be primarily determined by the containment methods used. Environmental effects could range from

negligible to moderate, depending on the location of the spill (to land or water) and the characteristics of the product. The following materials released to water could result in impacts to fish and fish habitat:

- Sodium-diisobutyl dithiophosphinate: at high concentrations acutely toxic to aquatic life
- Pebble Lime (CaO), because of the high pH, would be expected to be toxic to aquatic organisms and aquatic systems;
- Sodium Hydrosulfide (NaHS): strongly alkaline
- Potassium amyl xanthate: may persist for several days in water; highly toxic to aquatic life and may increase metal uptake in fish
- Sodium Cyanide (NaCN): highly toxic to fish, amphibians, aquatic insects and aquatic vegetation; cyanide is acutely toxic to most species of fish at concentrations greater than 200 µg/L (see Section 2.4).

2.4 CYANIDE

Oxide gold ore from the Casino Project will be processed by stacking crushed ore in lifts onto a heap leach pile and irrigating the pile with a sodium cyanide solution (barren process solution). The heap leach pad will consist of liners and a low-permeability soil overliner. Ore will be layered in eight lifts onto the pad and the barren process solution will be applied to ore lots with drip emitters to minimize evaporation losses. Pregnant solution from the ore heap will be collected in a network of pipes placed in the overliner material and directed to an in-heap collection area. The pregnant solution will then be pumped to the carbon-in-column (CIC) / Sulphidization, Acidification, Recycling and Thickening (SART) circuit for recovery of gold and copper. When the last process leach cycle is completed on the last ore lift, the ore heap will be rinsed with fresh water to recover the remaining gold and rinse the residue. Following operations, the heap leachate solution will be detoxified using a SO_2 / Air cyanide destruction process.

Prior to the start of operation, a comprehensive Cyanide Management Plan for the Casino Project will be developed to ensure worker safety and to prevent release of cyanide to the environment. The Cyanide Management Plan will be developed in consideration of the principles and standards of practice of the International Cyanide Management Code (Cyanide Code). Guidelines for transport, handling, storage and use of sodium cyanide at the Casino Project are summarized below.

To ensure the protection of communities and the environment during transport of cyanide to the Casino Project, the following Cyanide Code standards of practice will be followed:

- Responsibility for safety, security, release prevention, training, and emergency response will be established in written agreements with producers, distributors and transporters; and
- Emergency response plans and management measures will be implemented by cyanide transporters.

Casino Mining Corporation will require that contractors retained for delivery of cyanide to the Project will develop and implement a Cyanide Transportation Plan that is consistent with the Cyanide Code, as well as the Casino Cyanide Management Plan and component plans of the Environmental Management Plan.

The following industry best management practices will be described and implemented:

- Vehicles used for transportation of the cyanide and all containers and packaging comply with all applicable prescribed safety standards and display all applicable prescribed safety marks in accordance with the Dangerous Goods Transportation Act.
- Chain of custody documentation (including Material Safety Data Sheets) to track inventory and movement of cyanide.
- Methods to minimize the potential for contact of solid cyanide with water (e.g., covered trucks, sealed containers).
- Use of escort vehicles or convoys for cyanide shipments as necessary (e.g., inclement weather, change in road conditions).
- Regular maintenance of transportation equipment including containers, vehicles, loading and unloading machinery and storage systems.
- Training of all personnel operating cyanide handling and transport equipment.
- Emergency response plans for potential cyanide releases during transportation including:
    - Designate appropriate response personnel and commit necessary resources for emergency response.
    - Emergency response training of appropriate personnel.
    - Descriptions of the specific emergency response duties and personnel responsibilities.
    - A detailed list of all emergency response equipment available during transport or along the transportation route.
    - A detailed list of all emergency response and personal protective equipment during transport including self-contained breathing apparatus and oxygen gas.
    - Initial and periodic refresher training in emergency response procedures including implementation of the Emergency Response Plan and Spill Contingency Plan.
    - Develop procedures for internal and external emergency notification and reporting.
    - Periodically evaluate response procedures and capabilities and revise them as needed.

The final Cyanide Transportation Plan developed by the contractor responsible for transportation of cyanide the mine site will include a risk assessment of the transportation route that will consider water crossings, population centres, road characteristics, weather characteristics, and public infrastructure.

Measures implemented during cyanide handling, storage, and use at the Casino Project will be in accordance with the following principles of the Cyanide Code:

- Protect workers and the environment during cyanide handling and storage; and
- Manage cyanide process solutions and waste streams to protect human health and the environment.

The following Cyanide Code standards of practice will be implemented for cyanide handling, storage and use:

- Design and construct unloading, storage and mixing facilities consistent with sound, accepted engineering practices and quality control and quality assurance procedures, spill prevention and spill containment measures
- Operate unloading, storage and mixing facilities using inspections, preventive maintenance and contingency plans to prevent or contain releases and control and respond to worker exposures.
- Implement measures to protect birds and other wildlife from adverse effects of cyanide process solutions.
- Implement measures to protect fish and wildlife from direct and indirect discharges of cyanide process solutions to surface water.
- Implement measures designed to manage seepage from cyanide facilities to protect the beneficial uses of ground water.
- Provide spill prevention or containment measures for process tanks and pipelines.

Delivery and unloading of cyanide on site will take place in a covered, concrete-bounded area located away from general work areas and incompatible reagents. Portable pumps will be provided within the processing area for the pumping of spills within the bounded areas back to the storage tanks or emergency holding tanks. Ventilation will be provided to prevent build-up of hydrogen cyanide gas in storage and mixing areas.

The unloading and storage area will be designed to allow safe manoeuvring of forklifts, trucks, and trailers. Sodium cyanide containers will be offloaded to concrete pads with concrete curbing that provide a minimum of 110% containment of the largest sized container.

Unloading and storage area design drawings will be prepared for construction of the facilities as required by the Yukon Water Use License and Yukon Quartz Mining License applications. These designs will include:

- Details on use of level indicators and alarms.
- Foundation characteristics (e.g., seepage prevention).
- Details on methods to separate the cyanide from incompatible materials such as acids, strong oxidizers, etc.
- Employee safe-handling training and PPE.
- Fire suppression equipment.
- Waste disposal methods (empty cyanide containers).

2.5 CONTAMINATED EFFLUENT

Under the Yukon *Waters Act* and the *Waters Regulation* and the *Metal Mine Effluent Regulations* (MMER), mine operators are permitted to discharge effluent so long as the conditions outlined in the Water Use Licences are met, and the effluent concentrations are less than those outlined in the MMER Schedule 4 at prescribed locations. Should effluent be discharged outside of the normal course of events, or in exceedance of the prescribed limits, it is considered an “unauthorized discharge” and must be reported similar to a spill. Events that may results in an unauthorized discharge include earth moving activities during construction or operation of the Casino Project resulting in sedimentation of watercourses (exceedances of total suspended solids concentrations) or accidental release of mill tailings or tailings pond water.

Earth moving activities during construction or operations of the Casino Project that may result in erosion or sedimentation include:

- Land clearing and topsoil stripping;
- Stockpiling of topsoil and ice-rich materials;
- Pit excavation, site grading, and land filling;
- Construction of roads, bridges, and culverts; and
- Construction of the TMF, waste rock dumps, and heap leach facility.

Potential adverse effects from erosion and sedimentation can be minimized through project planning, following BMPs, and providing site specific controls that are commensurate with the potential risks to the natural environment. The *Casino Project Erosion and Sediment Control Management Plan* will provide a detailed description of the methods of sedimentation and erosion prevention and control that will be used, the specific situations that they will be used in, and the implementation procedures that will be followed to minimize spills of sediment laden water to the receiving environment.

Tailings pond effluent spills may result from problems with pipelines or valves, in particular, winter operations may result in ice formation which could impact reclaim barge stability and operation or result in

blockage of pipelines. Therefore, monitoring of civil and mechanical operational components of the tailings management facility will be a daily/shift requirement to ensure that systems are functioning correctly. Tailings pond effluent contains a number of contaminants, including metals, cyanide, and ammonia, due to the influence of mine waste and chemical reagents used in ore processing. Contaminant concentrations are generally close to drinking water standards, but exceed the guidelines for protection of aquatic life, therefore, it is desirable to contain the tailings effluent and pond water at all times.

3 - SPILL PREVENTION AND TRAINING

Comprehensive spill response training will be provided for all employees responsible for chemical handling, and all personnel visiting the site will be given basic spill prevention training. Specific details for the access road and mine site are provided in Sections 3.1 and 3.2, below.

3.1 ACCESS ROAD

Transportation of goods and materials will be in accordance with all applicable regulations and legislation, as well as the Explosives and Hazardous Materials Transport Permit required for the Project. All carriers and suppliers to the Casino Project will be certified under Transport Canada, and, as required, under the Transportation of Dangerous Goods Act. It is expected that external carriers and suppliers will have their own emergency response plans and training for their personnel, as they will be transporting supplies in their own vehicles with their own drivers.

Transportation of cyanide (as sodium cyanide) will be conducted in a manner to protect communities and the environment in accordance with the International Cyanide Management Code (International Cyanide Management Institute, 2012). Additionally, preventative maintenance along the access route will include regular maintenance and inspections for safe operation of vehicles, snow clearing, and the application of dust suppressants as required.

Shipping documents travel with hazardous materials, and are kept in the cab of the motor vehicle. Shipping documents provide vital information regarding the hazardous materials/dangerous goods to initiate protective actions, as per the Emergency Response Guidebook (Transport Canada, 2012). An example of information provided in the Emergency Response Guidebook is provided in Appendix B for sodium cyanide and LNG.

3.2 MINE SITE

Hazardous materials will be handled, stored and used in a manner that minimizes spills. Regular monitoring and inspections will ensure that small spills are avoided, and if they occur identified and cleaned up as soon as possible. CMC will ensure that its staff and contractors have basic emergency training as appropriate, such as standard first aid and Workplace Hazardous Material Information System (WHMIS), and are aware of CMC health and safety policies. Members of the Emergency Response Team require more vigorous and continual training. This training will focus on specific elements of the Casino mine site and will cover but not be limited to:

- Advanced First Aid and CPR;
- Surface Mine Rescue;
- Fire Response;
- Spill Response;
- Hazardous Materials Handling; and

- WHMIS.

Routine practice drills will occur to maintain Emergency Response Team member skills and test the ERP system and process.

4 - SPILL REPORTING

In addition to the definition in Section 1, spills are further defined by whether they are *reportable* (to an Environmental Protection Officer), or *non-reportable*. A reportable spill is one defined by the Yukon Spills Regulation (Government of Yukon, 1996) to be equal to, or to exceed the thresholds outlined in Table 4-1. Additionally, ANY spill onto a watercourse is considered a reportable spill under the Yukon Spills Regulation. Spills of any size will be reported to the environmental department, and a spill report will be completed and filed or submitted (Appendix C), as required.

Table 4-1 Reportable Spill Thresholds

Product	TDG[1] Code	Threshold Quantity
All petroleum products		> 200 liters
Explosives	1	Any amount
Flammable gases	2.1	> 100 liters
Non-flammable gases	2.2	> 100 liters
Non-poisonous gases	2.2	> 100 liters
Corrosive gases	2.4	Any amount
Non-corrosive gases	2.2	> 100 liters
Flammable liquids	3	> 200 liters
Flammable solids	4	> 25 kg
Spontaneously combustibles	4	> 25 kg
Dangerous when wet	4	> 25 kg
Oxidizers	5.1	> 50 kg or 50 liters
Organic peroxides	5.2	> 1 kg or 1 liter
Poisonous substances	6.1	> 5 kg or 5 liters
Corrosive materials	8	> 5 kg or 5 liters
Miscellaneous Dangerous Goods	9.1	> 50 kg
“Hazardous to Environment” material		> 1 kg
Dangerous wastes	9.3	> 5 kg or 5 liters

1. TDG = Transportation of Dangerous Good Regulations (Government of Canada, 1985)

Senior Project Managers are responsible for reporting spills. Under federal and territorial regulations, Managers are required to *immediately* notify the 24-hour Yukon Spill Report line should a reportable spill occur (see Table 4-2). Notification via email should also be sent to Yukon Government and Selkirk First Nations’ Lands Director at the emails provided in Table 4-2. The following information should be provided to the 24-Hour Spill Report line:

- Name
- Phone number
- Product spilled
- Quantity spilled
- Quality of product (thin, viscous etc.)
- Location of spill
- Distance to water
- Distance to drinking water wells
- What happened
- Responsible party
- Actions to contain the spill
- Obtain the Environment Yukon Spill Reporting Number and first/last name of the person whom the report has been made to (in the event of a reporting discrepancy it's always good to know this information).

Spill reports (provided in Appendix C) are to be filled out for all spills, regardless of quantity. Spill reports for reportable spills (i.e., in quantities in exceedance of Table 4-1) should be provided in the email notifications to the parties listed below. All spills entering a watercourse must be immediately reported to the Yukon Authorization Officer (Director, Environmental Protection Operations Division).

Table 4-2 Contact Information for Spill Reporting

5 - EMERGENCY RESPONSE COMMUNICATION

Preliminary emergency organization and reporting chain of command is presented in section 5.1 and the external reporting procedures are provided in sections 5.2.

5.1 EMERGENCY ORGANIZATION AND RESPONSIBILITIES

The Emergency Response Team will be made up of CMC personnel who will be responsible for managing emergency situations. CMC will ensure that sufficient trained emergency response personnel are on site at all times.

The Incident Commander or designate will assume responsibility for each incident in consultation with senior management, the Emergency Response Coordinator, and relevant Governmental Agencies. The Incident Commander is the primary decision-maker for assessing and responding to incidents at the Project site. The incident response organizational structure is depicted in Figure 5-1.

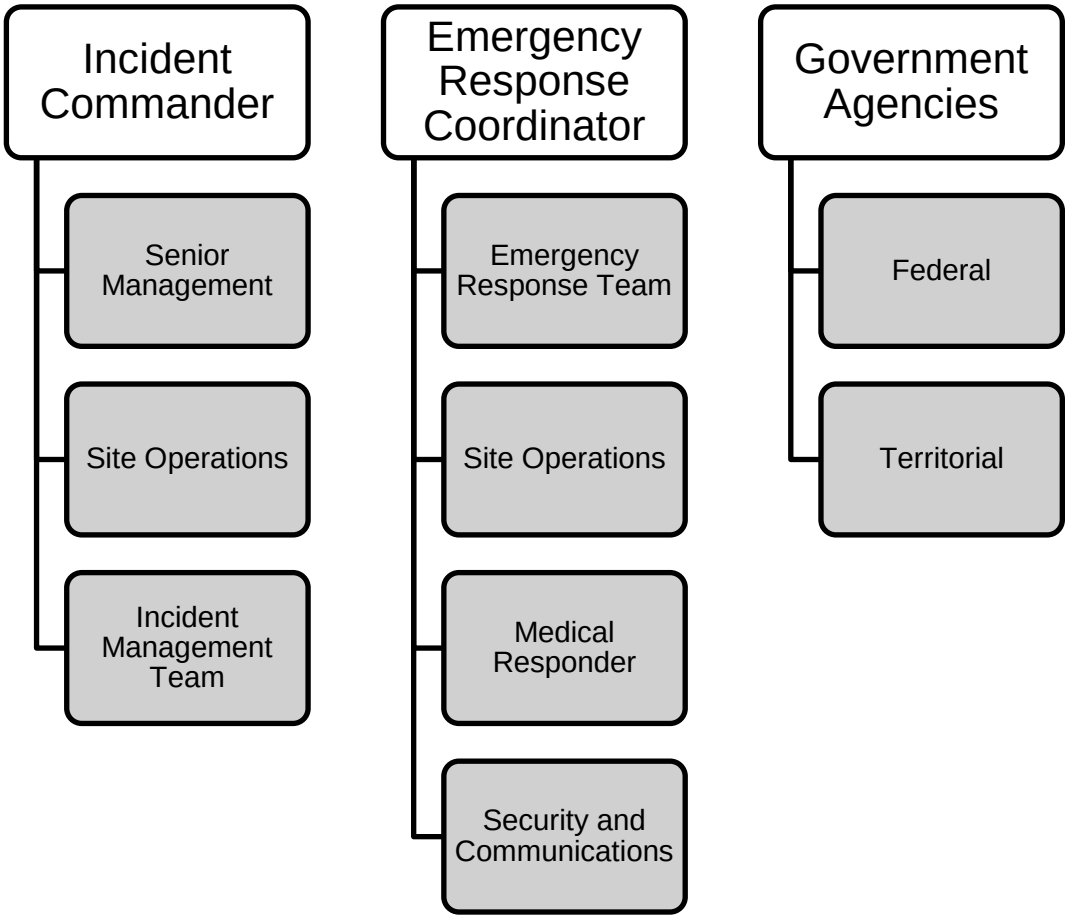

Figure 5-1 Emergency Response Organizational Chart

5.2 EXTERNAL NOTIFICATION

Key external emergency contacts are provided in Table 5-1. This list is not intended to be all inclusive at this stage and will be updated prior to beginning the construction phase of the Project. An emergency response responsibility matrix will also be created for definition and quick reference.

Table 5-1 External Emergency Contact List

Contact Name	Contact Number
Health Care Providers	
Whitehorse Regional Hospital	(867) 393–8700
Carmacks Health Centre	(867) 863-4444
Pelly Crossing Health Centre	(867) 537-4444
Emergency Responders	
Fire Department – Pelly (Emergency)	(867) 537-3000
Fire Department – Whitehorse	(867) 668-8699 or (867) 668-2462
Police – Pelly	(867) 537-5555
Police – Whitehorse	(867) 667-5555

Fixed Wing Service Providers	
Alkan Air	(867) 668-7725

6 - EMERGENCY RESPONSE TO SPILLS

The three levels of emergencies are identified as follows:

- LEVEL I: includes minor spills requiring an on-site worker to respond and take necessary corrective actions.
- LEVEL II: includes intermediate level spills requiring response by on-site or off-site trained staff but posing no danger to the public.
- LEVEL III: includes a major incident beyond the resources of a single facility, where there are subsidiary problems to complicate the situation such as fire, explosion, toxic compounds, and threat to life, property and the environment. Assistance will be required from local, regional, and/or territorial organizations.

Incident detection, information gathering and action decisions are the first steps in responding to an emergency incident. All these steps may occur over a short or extended time period depending on the circumstances and magnitude of the incident.

6.1 GENERAL EMERGENCY RESPONSE

Every emergency situation will be different depending upon the nature, location and cause of the incident. The following general course of action should be taken in all situations in combination with the incident-specific emergency response procedures described below:

1. Ensure your own safety as you approach the scene by making sure there is no hazard to you.
2. Where it is safe to do so, remove all personnel from the dangers posed by the emergency.
3. Contact the Emergency Response Coordinator. Describe the incident and take steps as instructed by the Emergency Response Coordinator to stop, slow or reduce the severity of the incident.
4. Report the details of the incident to the appropriate CMC staff and government agencies as per section 4.
5. Follow the response procedures in the Emergency Response Guidebook (Transport Canada, 2012):

RESIST RUSHING IN!

Approach cautiously from upwind, uphill or upstream:

- Stay clear of vapor, fumes, smoke and spills
- Keep vehicle at a safe distance from the scene

Secure the scene:

- Isolate the area and protect yourself and others

Identify the hazards using any of the following:

- Placards
- Container labels
- Shipping documents
- Rail car and road trailer identification chart
- Material safety data sheets (MSDS - Appendix A)
- Knowledge of persons on scene
- Consult applicable guide page (Transport Canada, 2012)

Assess the situation:

- Is there a fire, a spill or a leak?
- What are the weather conditions?
- What is the terrain like?
- Who/what is at risk: people, property or the environment?
- What actions should be taken – evacuation, shelter in-place or dike?
- What resources (human and equipment) are required?
- What can be done immediately?

Obtain help:

- Advise your headquarters to notify responsible agencies and call for assistance from qualified personnel

Respond:

- Enter only when wearing appropriate protective gear
- Rescue attempts and protecting property must be weighed against you becoming part of the problem

- Establish a command post and lines of communication
- Continually reassess the situation and modify response accordingly
- Consider safety of people in the immediate area first, including your own safety

Above all: do not assume that gases or vapors are harmless because of lack of a smell. Odorless gases or vapors may be harmful. Use caution when handling empty containers because they may still present hazards until they are cleaned and purged of all residues.

6.2 RESPONSE ACTION AND CONTAINMENT

In the event of a spill, the following priority sequence of spills response will be followed:

1. **Ensure Safety** – The implementation of spill containment measures and site cleanup and remediation will only be undertaken when it is safe to do so. If the nature of the spill hazard cannot be determined, it is to be assumed dangerous. Use appropriate Personal Protective Equipment (PPE). If the substance is flammable, remove all ignition sources.

2. **Administer First Aid** – If the spill has resulted in injured persons, and it is safe to do so, first aid should be administered through following the steps of the Medical Emergency ERP.

3. **Stop the Source** – Turn off valves, pumps or plug holes to stop to reduce flow from the source.

4. **Notify the Emergency Response Coordinator** – The Emergency Response Coordinator will be responsible for mobilizing the Emergency Response Team and notifying the appropriate CMC personnel and external agencies.

5. **Secure the Area** – Take steps to limit access to the spill area.

6. **Contain the Release** – Limit the extent of the spill through the use of spill response equipment (e.g., sorbent pads, socks or pillows) and by blocking drains and accesses to waterways through the use of dams, dykes, or drain covers.

7. **Clean-Up the Spill** – Clean-up and restore the affected area under direction of the Environmental Manager.

8. **Report the Spill** – The Emergency Response Coordinator will be responsible for reporting the details of the spill and the response actions to CMC and regulatory agencies.

9. **Conduct an Incident Investigation** – Understand the events that caused the spill and make modifications to site procedures, training, or emergency response planning to minimize the chance of a reoccurrence.

6.2.1 Spill Response Equipment

Spill response equipment will be stationed along the access road and around the mine site at appropriate intervals and in areas where hazardous materials are stored (e.g., warehouse, truck shop, processing buildings, accommodation buildings, power plant). Spill kits typically contain oil sorbents (pads, socks, and granular), shovels, and protective equipment including gloves, goggles and protective suits. Heavy equipment, such as front-end loaders and haul trucks will be available for larger spills, and pumps, suction hoses and portable storage tanks or drums will also be located at the mine site to assist with spill recovery and cleanup.

6.2.2 Containment and Cleanup

Many materials will be used at the Casino Mine, including petroleum products, liquefied natural gas (LNG), reagents used in the milling process, and copper and molybdenum concentrates. A spill will typically be in the form of a liquid or powder and can be contained. An exception is propane, which is a gas and therefore, containment should not be attempted. Also, LNG is a highly volatalizable liquid, and containment is unnecessary, as the liquid will evaporate with time whether the spill is to land or water. Sodium cyanide (a reagent used in the heap leaching process) has specific precautions that must be taken should a spill occur. Generally, spill responders should be familiar with the requirements in the *Emergency Response Guidebook* (Transport Canada, 2012).

Below are summarized specific actions for the different types of spills that can occur along the Casino Access Road, including:

- Spills to land;
- Spills to water;
- Spills to ice or snow;
- Chemical spills; and
- Gaseous releases.

6.2.3 Spills to Land

The following techniques should be followed to contain a spill to land, and a guide to selecting containment techniques for spills on land is provided in Table 6-1:

- Block entry into waterways by building a berm or trench (see Table 6-1).
- Do not flush into ditches or drainage systems that lead to water.
- Contain with earth dam or other barrier.
- Capture minor spills with appropriate sorbent pads.

- Recover large spills with pumps or vacuum equipment.

Table 6-1 Guide to Selecting Containment Techniques for Spills on Land

Technique	Primary Use	Controlling Variables	Resources Required
Earth Dike	Best suited for spills on relatively flat areas	• Sufficient earth may not be available, depending on location and season • Crew of four can create dike at 5 m/hr	• Earth moving machine or excavating equipment • Sandbags, liner material, sand or gravel • Work crew and foreman
Sorbent Dike	Can provide temporary containment and cleanup Applicable in all seasons	• Requires sufficient sorbent material • May become impractical for large spill volume	• Sorbent materials • Temporary storage or incinerator to burn used sorbents • Work crew
Snow/Ice Dike	Best suited on relatively flat areas in winter	• Requires sufficient snow or ice • Only applicable when ice is >1m thick • A crew of four with a bulldozer can create dike at 10 m/hr	• Earth moving machine • Ice chain saws • Equipment to spray water onto snow • Work crew and foreman
Land Trench	Best on relatively flat areas	• During the winter, frozen earth may be too difficult to excavate • In some areas, soil may be too thin to create trench • Can excavate 30 m/hr of trench per machine in summer, half that in winter	• Excavating equipment (backhoe or shovels) • Work crew and foreman • An oil recovery unit (pump)
Excavation by Bulldozer, Front-end Loader, or Backhoe	Heavy equipment has site access	• Disturbs surface of soil • Removes organics • Can lead to erosion or surface instability • Vegetation is slow to recover • Difficult in frozen soil	• Machine, fuel and operator • Work crew and foreman • Method to handle or dispose of excavated material
Manual Removal	Best suited for areas lightly contaminated or where equipment	• Some surface disturbance and removal of shallow organisms and vegetation	• Hand tools (rakes, shovels, wheelbarrows) • Work crew

Technique	Primary Use	Controlling Variables	Resources Required
	access is unavailable Labour intensive and time consuming	• More rapid repopulation of organisms than other excavation techniques	• Disposal facilities
Sorbent Application	Best suited for areas lightly contaminated or where equipment access is unavailable	• Require adequate supply of sorbents • Relatively little damage except surface disturbance of foot traffic	• Sorbents • Work crew • Disposal facility for used sorbents

6.2.4 Spills to Water

A spill on or into open water is very difficult to contain and every effort should be made to prevent the contaminant from entering the water. Some products (hydrocarbons such as gasoline and diesel) float, and therefore immediate deployment of surface booms can be used to effectively mitigate further spread of the spill. The following techniques should be followed to contain a spill to water, and a guide to selecting containment techniques for spills on water is provided in Table 6-2:

- Contain spill as close to release point as possible.
- Use spill containment boom to concentrate slicks for recovery.
- Protection (diversionary) booming using sorbent booms could be deployed to deflect slicks from nearby intakes or other sensitive areas.
- On small spills, recover using appropriate sorbent pads.
- Do not use sorbent booms/pads in fast currents and turbulent water.
- Intercept moving slicks in quiet areas using sorbent booms.

Table 6-2 Guide to Selecting Containment Techniques for Spills on Water

Technique	Primary Use	Resources Required
Containment Boom	Best at location where spill enters water	• Booms totalling 1.5 to 2 times the diameter of the slick • Labourer
Sorbent Boom	Best across small ditches	• Disposal containers or incinerator for used sorbents • Chicken wire and supports to make “fence” • Earth moving or excavation equipment • Labourer
Earth Berm	Best across shallow ditches	• Boom and an oil recovery unit (pump) • May also require sandbags, liner material, sheets of metal or wood • Labourer

6.2.5 Spills to Ice or Snow

Spills to snow and ice are generally easily contained and cleaned up, as snow is extremely absorbent and liquid spills are easily trapped within the snow, which can then be recovered for disposal. Snow can also be used to construct berms. For spills on ice, if the ice is safe to work on, then the methods of containment are similar to those on land. Where the spill has penetrated the ice, the methods of containment are similar to those on open water. The following techniques should be followed to contain a spill to land, and a guide to selecting containment techniques for spills on ice or snow:

- Block entry into waterways and contain with snow berm or other barrier.
- Trench or ditch to intercept or contain fuel on snow, where feasible.
- Compact the snow around the outside perimeter of the spill area.
- Construct a berm with snow, either manually or with shovels or heavy equipment such as graders and dozers where available.
- Contain or collect contaminated snow.
- Use synthetic liners to contain on site if feasible.
- Recover minor spills with appropriate sorbent pads or snow.

6.2.6 Chemical Spills

The Casino Project will use many chemicals required for mineral processing. Chemical spill response is dependent on the type of chemical, and the whether the spill is to land, water or ice and snow. Therefore, the *Emergency Response Guidebook* (Transport Canada, 2012) should be used to determine the appropriate response to each chemical based on the information provided in the shipping documents that will accompany each shipment along the Casino Project Access Road.

Cyanide (as sodium cyanide) is a primary reagent in the leaching process for extraction of metals in the heap leaching facility. A Cyanide Management Plan for the Casino Project will be developed prior to the start of operations and will be developed in consideration of the principles and standards of practice of the International Cyanide Management Code (International Cyanide Management Institute, 2012).

The response to a cyanide spill should follow the guidelines as provided in the Emergency Response Guidebook (Appendix B). Cyanide is a toxic and corrosive substance, and is non-combustible and water sensitive. Reaction with water or moist air may release toxic, corrosive or flammable gases. When spilled in water potassium cyanide and sodium cyanide produce hydrogen cyanide toxic-by-inhalation gas. The following techniques should be followed to contain a cyanide spill:

- Wear positive pressure self-contained breathing apparatus.
- Wear chemical protective clothing that is specifically recommended by the manufacturer.
- Eliminate ALL ignition sources.
- All equipment used when handling the produce must be grounded.
- Do not touch damaged containers or spilled material unless wearing appropriate protective clothing.
- Stop leak if you can do it without risk.
- A vapor suppressing foam may be used to reduce vapors.
- DO NOT GET WATER INSIDE CONTAINERS.
- Use water spray to reduce vapors or divert vapor cloud drift. Avoid allowing water runoff to contact spilled material.
- Prevent entry into waterways, sewers or confined areas.
- **Small spills to land:**
    - Cover with DRY earth, DRY sand or other non-combustible material followed with plastic sheet to minimize spreading or contact with rain.

- Use clean non-sparking tools to collect material and place it into loosely covered plastic containers for later disposal.

- **Small spills to water (from a small package or small leak from a large package):**
  - First ISOLAGE 30 m in all directions.
  - Then PROTECT persons downwind 1. During the day 0.1 km; 2. During night 0.2 km.

- **Large spills to water (from a large package or many small packages):**
  - First ISOLAGE 100 m in all directions.
  - Then PROTECT persons downwind 1. During the day 0.4 km; 2. During night 1.4 km.

6.2.7 Gaseous Releases

Gases that may be used at the Casino Mine site include propane, acetylene and oxygen, which are typically transported in cylinders. Should an incident occur that results in the spillage of these products, the following procedures should be followed:

- Wear insulated gloves, safety glasses, and, if in a confined space, a respirator.
- If safe to do so, shut off flow and remove ignition sources.
- Evacuate area.
- Gases will disperse with time.
- Consult supplier if container needs disposal.

Liquefied natural gas (LNG) will be shipped to the Casino Project for vaporization into natural gas for use at the on-site power plants. The LNG will be shipped via double wall vacuum tanker trucks at -162 °C and 1+ atmospheric pressure. LNG spills completely evaporate, leaving no residue that could harm soil or groundwater. If spilled to water, LNG is lighter than water and boils on top until it evaporates (Drube et al 2012). Natural gas is also non-toxic; therefore, no impacts to water or sediment quality or fish and fish habitat are expected. The Emergency Response Guidelines for LNG are provided in Appendix B.

6.3 DISPOSAL OF CONTAMINATED MATERIAL

Contaminated materials collected from the clean-up of petroleum hydrocarbon spills along the Access Road could be disposed of by the following methods:

- Incineration in the on-site incinerator;
- In an on-site Land Treatment Facility, if required, constructed as per the Yukon Contaminated Sites Regulation (2002); or

- Removal from site to a licensed disposal facility.

Chemical spills will be disposed of as per the Emergency Response Guidelines for each specific material.

6.4 SITE RESTORATION/REMEDIATION

Characterization of contaminated material will be done in accordance with the *Protocol No.3: Soil Sampling Procedures at Contaminated Sites*, under the Contaminated Sites Regulation (Yukon Environment, 2012). Sampling frequency for stockpiles created in emergency response situations include one sample for every 50 m^3 of contaminated material. Once excavation of contaminated material has been conducted a minimum of 5 samples should be taken from the faces of the excavation: one from each wall and one from the excavation floor. For shallow excavations not exceeding 0.2 m in depth, step out samples should be taken adjacent to each excavation boundary, at a frequency of one sample per 10 m running length to determine the extent of contamination. Should laboratory results indicate that contamination extends beyond the previously excavated material, more material should be excavated and the area re-sampled. Soil samples are required to comply with the generic numerical soil standards in Schedule 1 of the Contaminated Sites Regulation (Government of Yukon, 2002).

7 - PLAN UPDATES

This SCMP is controlled by Casino Mining Corporation. Casino Mining Corporation is responsible for training staff on methods and procedures, and implementing the SCMP in accordance with relevant legislation and permits, and will be responsible for regular review and updating of the SCMP to ensure that it is up-to-date with current practices and legislation.

A copy of the SCMP plan will be provided to all emergency responders, and the contents of the plan communicated to employees and visitors upon arrival at the site, during orientation. Copies of the SCMP will also be kept at the following mine locations:

- Project Office;
- Safety Office;
- Emergency Response Coordinator's Office;
- Environmental Manager's Office;
- First Aid room(s);
- Common areas and near telephones; and
- CMC corporate office.

APPENDIX A

PROPOSED CHEMICALS FOR USE AT THE CASINO MINE PROJECT AND MSDS

Chemical	Description/Typical Material Safety Data Sheet Information
Sulphide Ore Process Reagents	
Sodium-diisobutyl dithiophosphinate (Aerophine 3418A Promoter)	Colorless to light yellow, odorless, mobile liquid; slightly alkaline; auto-ignition temperature 437°C; completely soluble in water; LC50: Bluegill, 96-hour: 375 mg/l Daphnia, 48-hour: 149 mg/L
Sodium diethyl dithiophosphate/sodium disecondary butyl dithiophosphate (Aerofloat 208 Promoter)	Slight fire hazard when exposed to heat or flame; acid may react with metals to produce hydrogen, a highly flammable and explosive gas; heating may cause expansion or decomposition leading to violent rupture of rigid containers; may emit acrid smoke and corrosive fumes.
Methyl Isobutyl Carbinol (MIBC, frother)	Clear liquid with a “sweet” odour; Flammable liquid and vapour. Vapours are heavier than air and may travel across the ground and reach remote ignition sources causing a flashback fire danger. Low toxicity: LD50 >2000 mg/kg for rat and rabbit.
Pebble Lime (CaO, pH modifier)	White or gray, odorless lumps, granules, or powder. Not combustible or flammable but reacts with water to form calcium hydroxide while generating heat, which could ignite combustible materials. Not explosive but reaction with water or other incompatible materials causes material to swell and may rupture containers. High pH therefore toxic to aquatic organisms and aquatic systems.
Fuel Oil (#2 Diesel fuel, moly collector)	Colourless to straw or red oily liquid with kerosene like odour. Combustion may produce CO, CO2 and reactive hydrocarbons.
Sodium Hydrosulfide (NaHS, copper mineral depressant)	High pH therefore toxic to aquatic organisms and aquatic systems (pH 11). Auto-ignition temperature 120°C; releases highly toxic and highly flammable hydrogen sulfide gas if mixed with an acid or if exposed to excessive heat. Toxic to terrestrial vertebrates.
Flomin D-910 (Sodium dithiophosphate)	Prepared by the reaction of phosphorus pentasulfide with sodium hydroxide; commonly called “Nokes reagent”
Flocculant	Typical flocculant like Anionic Polyacrylamide is a colourless of white granular powder with a pH of 6.0. Flammable, dust explosions may occur if material is dispersed in

Chemical	Description/Typical Material Safety Data Sheet Information
	air. Flammability may be enhanced by presence of strong oxidizers.
Potassium amyl xanthate (PAX – pyrite flotation)	May spontaneously ignite on exposure to moist air; flammable gas (carbon disulfide) when wet; highly toxic gases (carbon disulfide, hydrogen sulfide) if heated to decomposition. If discharged to waterways, xanthates may persist for several days; highly toxic to aquatic life - may form complexes with heavy metals.
Oxide Ore Process	
Sodium Cyanide (NaCN)	Solid white substance with a faint “bitter almond” odour; soluble in water. Decomposes on heating, emitting toxic fumes, including those of hydrogen cyanide, and ammonia; toxic to animals in comparatively low concentrations. Known to cause bird kills in tailings dams.
Caustic Soda (sodium hydroxide, NaOH)	Odourless white solid; highly reactive with metals; reactive with oxidizing agents, reducing agents, acids, alkalis, moisture.
Pebble Lime (CaO)	White or gray, odorless lumps, granules, or powder. Not combustible or flammable but reacts with water to form calcium hydroxide while generating heat, which could ignite combustible materials. Not explosive but reaction with water or other incompatible materials causes material to swell and may rupture containers. High pH - toxic to aquatic organisms and aquatic systems.
Hydrochloric Acid (HCl)	Liquid with a pungent odour; colourless to light yellow. Reacts violently with water, especially when water is added to the product; absorption of gaseous hydrogen chloride on mercuric sulfate becomes violent at 125°C; sodium reacts very violently with gaseous hydrogen chloride; reacts with oxidizers releasing chlorine gas. Incompatible with, alkali metals, carbides, borides, metal oxides, vinyl acetate, acetylides, sulphides, phosphides, cyanides, carbonates; reacts with most metals to produce flammable hydrogen gas.

Chemical	Description/Typical Material Safety Data Sheet Information
Sodium Hydrosulphide (NaHS)	High pH therefore toxic to aquatic organisms and aquatic systems (pH 11). Auto-ignition temperature 120°C; releases highly toxic and highly flammable hydrogen sulfide gas if mixed with an acid or if exposed to excessive heat. Toxic to terrestrial vertebrates.
Sulphuric acid (H_2SO_4)	Clear, colourless to dark brown, odourless; dense, oily liquid; hygroscopic. Will not burn but can decompose at high temperatures, forming toxic gases such as sulphur oxides. Contact with combustible materials may cause fire; highly reactive. Contact with many organic and inorganic chemicals may cause fire or explosion; contact with metals liberates flammable hydrogen gas; reacts violently with water; reacts with most metals, especially when diluted with water; this reaction produces highly flammable hydrogen gas that may explode if ignited.
Activated Carbon	Black, odourless, pelletized powder; insoluble in water;
Antiscalant	Typical antiscalants such as -1,1 Diphosphonic Acid 1-hydroxyethane may produce Cox, POx and phosphine on combustion.
Flocculant	Typical flocculant like Anionic Polyacrylamide is a colourless white granular powder with a pH of 6.0. Flammable, dust explosions may occur if material is dispersed in air. Flammability may be enhanced by presence of strong oxidizers.

CYTEC MATERIAL SAFETY DATA

Date: 10/14/97
MSDS No: 1787
Supersedes: 07/01/97
CAS No: 013360-78-6

1. CHEMICAL PRODUCT AND COMPANY IDENTIFICATION

PRODUCT NAME: **AEROPHINE ® 3418A Promoter**
SYNONYMS: Sodium diisobutyldithiophosphinate, 50% aqueous solution
CHEMICAL FAMILY: Dithiophosphinate
MOLECULAR FORMULA: C8H18PS2.Na
MOLECULAR WGT: 232
CYTEC INDUSTRIES INC., FIVE GARRET MOUNTAIN PLAZA, WEST PATERSON, NEW JERSEY 07424, USA
For Product Information call 1-800/652-6013. Outside the USA and Canada call 973/357-3193.
EMERGENCY PHONE: For emergency involving spill, leak, fire, exposure or accident call CHEMTREC: 1-800/424-9300. Outside the USA and Canada call 703/527-3887.

2. COMPOSITION / INFORMATION ON INGREDIENTS

OSHA REGULATED COMPONENTS

COMPONENT	CAS. NO.	%	TWA/CEILING	REFERENCE
Sodium diisobutyldi-Thiophosphinate	013360-78-6	50-52	not established	

3. HAZARDS IDENTIFICATION

EMERGENCY OVERVIEW

APPEARANCE AND ODOR: Colorless to light yellow mobile liquid; odorless
STATEMENTS OF HAZARD:

WARNING! CAUSES EYE IRRITATION
MAY CAUSE SKIN IRRITATION

POTENTIAL HEALTH EFFECTS

EFFECTS OF OVEREXPOSURE:
The acute oral (rat) and acute dermal (rabbit) LD50 values for this material are 3.35 g/kg and greater than5.0 g/kg, respectively. Mild skin and moderate eye irritation were produced during primary irritation studies in rabbits. Skin irritation was increased after repeated exposures in rabbit studies.

4. FIRST AID MEASURES

In case of skin contact, immediately wash affected areas with soap and plenty of water. Remove contaminated clothing and shoes. Obtain medical attention. Destroy or thoroughly clean shoes before reuse. Do not reuse contaminated clothing without laundering.
In case of eye contact, immediately irrigate with plenty of water for 15 minutes. Obtain medical attention if irritation persists.
Material is not expected to be harmful if inhaled. If inhaled, remove to fresh air.

5. FIRE FIGHTING MEASURES

FLAMMABLE PROPERTIES

FLASH POINT: >200 F; 93 C
METHOD: Pensky-Martens Closed Cup

FLAMMABLE LIMITS (% BY VOL): Not applicable
AUTOIGNITION TEMP: 819 F; 437 C
DECOMPOSITION TEMP: >662 F; 350C

EXTINGUISHING MEDIA AND FIRE FIGHTING INSTRUCTIONS

Use water spray, carbon dioxide or dry chemical to extinguish fires. Use water to keep containers cool. Wear self-contained, positive pressure breathing apparatus and full fire-fighting protective clothing. See Section 8 (Exposure Controls/Personal Protection) for special protective clothing.

6. ACCIDENTAL RELEASE MEASURES

STEPS TO BE TAKEN IN CASE MATERIAL IS RELEASED OR SPILLED
Where exposure level is not known, wear NIOSH approved, positive pressure, self-contained respirator. Where exposure level is known, wear NIOSH approved respirator suitable for level of exposure. In addition to the protective clothing/equipment in Section 8 (Exposure Controls/Personal Protection), wear impervious boots.
Cover spills with some inert absorbent material; sweep up and place in a waste disposal container. Flush area with water.

7. HANDLING AND STORAGE

Avoid contact with eyes, skin, and clothing. Wash thoroughly after handling.

8. EXPOSURE CONTROLS / PERSONAL PROTECTION

ENGINEERING CONTROLS AND PERSONAL PROTECTIVE EQUIPMENT (PPE)
Where this material is not used in a closed system, good enclosure and local exhaust ventilation should be provided to control exposure. Food, beverages, and tobacco products should not be carried, stored, or consumed where this material is in use. Before eating, drinking, or smoking, wash face and hands with soap and water. Avoid skin contact. Protective clothing such as impervious gloves, apron, workpants, long sleeve work shirt, or disposable coveralls are recommended to prevent skin contact. For operations where eye or face contact can occur, wear eye protection such as chemical splash proof goggles or face shield. Eyewash equipment and safety shower should be provided in areas of potential exposure. For operations where inhalation exposure can occur, a NIOSH approved respirator recommended by an industrial hygienist may be necessary. A full facepiece respirator also provides eye and face protection.

9. PHYSICAL AND CHEMICAL PROPERTIES

APPEARANCE AND ODOR: Colorless to light yellow mobile liquid; odorless
BOILING POINT: 223 F; 106 C
MELTING POINT: 23-32 F; -5-0 C; (crystallization point)
VAPOR PRESSURE: 17.5 mm Hg @ 20 C; (value for water)
SPECIFIC GRAVITY: 1.14 @ 24 C
VAPOR DENSITY: Not applicable
% VOLATILE (BY WT): ~50; (water)
pH: Slightly alkaline
SATURATION IN AIR (% BY VOL): Not applicable
EVAPORATION RATE: Not applicable
SOLUBILITY IN WATER: Complete

10. STABILITY AND REACTIVITY

STABILITY: Stable
CONDITIONS TO AVOID: None known
POLYMERIZATION: Will Not Occur
CONDITIONS TO AVOID: None known
INCOMPATIBLE MATERIALS: Strong mineral acids and strong oxidizing agents.
HAZARDOUS DECOMPOSITION PRODUCTS: oxides of carbon; oxides of phosphorus; oxides of sulfur (includes sulfur di and tri oxides)

11. TOXICOLOGICAL INFORMATION

Toxicological information for the product is found under Section 3. HAZARDS IDENTIFICATION.
Toxicological information on the OSHA regulated components of this product is as follows:
Sodium diisobutyldithiophosphinate causes moderate eye and skin irritation.

12. ECOLOGICAL INFORMATION

Algae (Selenastrum capricornutum), 96 hr EbC50 = 35.1 mg/L; 96 hr ErC50 = 115 mg/L

LC50

BLUEGILL, 96 HOUR: 375 mg/L
DAPHNIA, 48 HOUR: 149 mg/L

BOD

28 Day: 78.8 %
OCTANOL/H_2O PARTITION COEF.: Not applicable

13. DISPOSAL CONSIDERATIONS

The information on RCRA waste classification and disposal methodology provided below applies only to the Cytec product, as supplied. If the material has been altered or contaminated, or it has exceeded its recommended shelf life, the guidance may be inapplicable. Hazardous waste classification under federal regulations (40 CFR Part 261 et seq) is dependent upon whether a material is a RCRA "listed hazardous waste" or has any of the four RCRA "hazardous waste characteristics." Refer to 40 CFR Part 261.33 to determine if a given material to be disposed of is a RCRA "listed hazardous waste"; information contained in Section 15 of this MSDS is not intended to indicated if the product is a "listed hazardous waste." RCRA Hazardous Waste Characteristic. There are four characteristics defined in 40 CFR Section 261.21-61.24: Ignitability, Corrosivity, Reactivity, and Toxicity. To determine Ignitability, see Section 5 of this MSDS (flash point). For Corrosivity, see Sections 9 and 14 (pH and DOT corrosivity). For Reactivity, see Section 10 (incompatible materials). For Toxicity, see Section 2 (composition). Federal regulations are subject to change. State and local requirements, which may differ from or be more stringent than the federal regulations, may also apply to the classification of the material if it is to be disposed. Cytec encourages the recycle, recovery and reuse of materials, where permitted, as an alternate to disposal as a waste. Cytec recommends that organic materials classified as RCRA hazardous wastes be disposed of by thermal treatment or incineration at EPA approved facilities. Cytec has provided the foregoing for information only; the person generating the waste is responsible for determining the waste classification and disposal method.

14. TRANSPORT INFORMATION

This section provides basic shipping classification information. Refer to appropriate transportation regulations for specific requirements.

15. REGULATORY INFORMATION

INVENTORY INFORMATION

US TSCA: This product is manufactured in compliance with all provisions of the Toxic Substances Control Act, 15 U.S.C. 2601 et. seq.
CANADA DSL: Components of this product have been reported to Environment Canada in accordance with subsection 25 of the Canadian Environmental Protection Act and are included on the Domestic Substances List.

EEC EINECS: All components of this product are included in the European Inventory of Existing Chemical Substances (EINECS) in compliance with Council Directive 67/548/EEC and its amendments.

OTHER ENVIRONMENTAL INFORMATION

The following components of this product may be subject to reporting requirements pursuant to Section 313 of CERCLA (40 CFR 372), Section 12(b) of TSCA, or may be subject to release reporting requirements (40 CFR 307, 40 CFR 311, etc.) See Section 13 for information on waste classification and waste disposal of this product.

COMPONENT	CAS. NO.	%	TPQ(lbs)	RQ(lbs)	S313	TSCA 12B

This product does not contain any components regulated under these sections of the EPA

PRODUCT CLASSIFICATION UNDER SECTION 311 OF SARA
ACUTE (Y) CHRONIC (N) FIRE (N) REACTIVE (N) PRESSURE (N)

16. OTHER INFORMATION

NFPA HAZARD RATING (National Fire Protection Association)

Fire1
Health 2
Reactivity 0
Special —

FIRE: Materials that must be preheated before ignition can occur.
HEALTH: Materials which on intense or continued exposure could cause temporary incapacitation or possible residual injury unless prompt medical treatment is given
REACTIVITY: Materials which in themselves are normally stable, even under fire exposure conditions, and which are not reactive with water.

REASON FOR ISSUE:

Revised Sections 2, 3, 9 & 10

Randy Deskin, Ph.D., DABT

Material Safety Data Sheet

Ammonium Nitrate

MSDS Number 004 (Revised April 23, 2013) 9 Pages

1. CHEMICAL PRODUCT and EMERGENCY TELEPHONE CONTACT

Product Name:.....	Ammonium Nitrate
Trade Name.....	Amtrate
Chemical Family:	Inorganic Salt
Synonyms:.....	AN, Ammonium Saltpeter, Nitric Acid, Ammonium Salt
Formula:.....	NH_4NO_3
Product Uses:	Fertilizers

EMERGENCY TELEPHONE NUMBERS

CHEMTREC (U.S.):	800-424-9300
CANUTEC (Canada):.....	613-996-6666

2. COMPOSITION/INFORMATION ON INGREDIENTS

Component Name	Percentage by Weight	CAS Number
Ammonium Nitrate	98 - 100 %	6484-52-2
Conditioning Agent	0 – 0.2%	

Exposure Limits for Components

Component	TWA	STEL	PEL	IDLH
Ammonia	25 ppm	35 ppm	50 ppm	300 ppm

3. HAZARDS IDENTIFICATION

EMERGENCY OVERVIEW

Strong oxidizer. Contact with combustible material will increase fire hazard. May undergo detonation if heated under confinement causing pressure buildup or if subjected to strong shocks. Solid AN when sensitized or during decomposition may become unstable and/or explosive. When AN is heated to decomposition it may produce vapors which contain nitrogen oxides (NO_X). **AN is an oxidizer** and as such may increase the flammability and/or explosiveness of other substances. Use water to control fires involving AN, if water is compatible with burning material. AN itself is non-flammable. AN can cause irritation to eyes and skin and may be an inhalation discomfort in confined locations.

NFPA Hazard Classification

Health Hazard (Blue)…….. 1
Flammability (Red)…….. 0
Reactivity (Yellow)…….. 3
Other ……OX

POTENTIAL HEALTH EFFECTS

Primary Routes of Entry: Skin contact/absorption and eye contact.

General Acute Exposure: AN is a mild skin, eye, and respiratory irritant, possible allergen, and methemoglobin inducer. Because it can form methemoglobin, it may have irreversible effects which can be life threatening.

General Chronic Exposure: By analogy with nitrobenzene, AN is in Class A+ as a reproductive hazard. It is important to remember that this hazard is due to its association and there is no direct evidence for adverse reproductive effects. Nevertheless, it would be prudent for pregnant women not to be exposed to AN.

Carcinogenicity:
NTP:.....Not Listed
IARC:.....Not Listed
OSHA: .....Not Regulated

Medical Conditions Aggravated by Exposure: No test data available.

4. FIRST AID MEASURES

First Aid for Eyes: Immediately flush eyes with copious amounts of tepid water for at least 15 minutes. If irritation, pain, swelling, excessive tearing, or light sensitivity persists, the patient should be seen in a health care facility.

First Aid for Skin: Immediately flush exposed area with copious amounts of tepid water for at least 15 minutes followed by washing area thoroughly with soap and water. The patient should be seen in a health care facility if irritation or pain persists.

First Aid for Inhalation: Generally not considered an inhalation hazard. If irritation develops move patient to fresh air and monitor. If cough or difficulty in breathing develops, evaluate for respiratory tract irritation. If trained to do so, administer supplemental oxygen if needed. If irritation, coughing, or difficulty in breathing persists the patient should be seen in a health care facility.

First Aid for Ingestion: If conscious, give the patient large quantities of milk or water to drink immediately. Do not induce vomiting. Seek medical attention.

Symptoms of Overexposure

Acute: Cyanosis, nausea , vertigo, collapse, vomiting/abdominal pain, and tachycardia (rapid heartbeat), tachypnea (rapid breathing), coma, convulsions, and death can occur.

Chronic: Small repeated doses may lead to weakness, general depression, headache and mental impairment.

5. FIRE FIGHTING MEASURES

Firefighting Procedures
Flood burning ammonium nitrate fertilizer with large volumes of low pressure water. Do not use salt water, carbon dioxide, dry chemicals or foam extinguishers. Never attempt to smother fire, such as by sealing off, closing a compartment or building doors when fire occurs. Do not add steam. Ammonium nitrate fertilizer does not have the property of spontaneous combustion. Fire fighters should wear approved self-contained breathing apparatus to protect themselves from the toxic fumes of decomposing ammonium nitrate, and protective clothing to guard against molten nitrate splashes should also be worn.

Unusual Fire and Explosive Hazards
Nitrogen oxide gases emitted on decomposition are extremely toxic. Contamination of ammonium nitrate with oil, diesel fuel, charcoal, sulfur, metal fines or other combustible substances could possibly cause an explosion. If an explosion is expected, surrounding area should be evacuated.

Extinguishing Media: Use water only to extinguish a fire involving AN if water is compatible with the burning material. Do not use dry chemicals, CO_2, Halogens or foam.

Special Fire Fighting Procedures:

a. Flood fire area with water from a distance.
b. Move containers from the fire area if you can do it without risk. Do not move cargo or vehicle if cargo has been exposed to heat.
c. Fight fire from maximum distance or use unmanned hose holders or monitor nozzles.
d. Apply cooling water to sides of containers that are exposed to flames until well after fire is out. Stay away from ends of tanks due to exploding potential when tanks are involved in a fire.
e. For massive fire, use unmanned hose holders or monitor nozzles; if this is impossible, withdraw from area and let fire burn.
f. Positive pressure self-contained breathing apparatus (SCBA) should be used when there is a potential for inhalation of vapors and/or fumes.
g. Structural firefighters' protective clothing will only provide limited protection.

Evacuation: If tank, rail car or truck is involved in a fire, isolate for 1/2 mile in all directions; also, consider initial evacuation for 1/2 mile in all directions.

Caution:

a. Runoff from fire control or dilution water may cause pollution.
b. AN solution pumps operated with blocked discharge have been known to detonate.
c. Avoid welding or burning on pipes, valves, or tanks, which have contained AN solution until they have been thoroughly washed out. Residual solidified AN may explode under conditions of confinement and high temperature.

6. ACCIDENTAL RELEASE MEASURES

Spill or Leak Measures: Keep combustibles (wood, paper, oil, etc.) away from spilled material. Do not touch damaged containers or spilled material unless wearing appropriate protective clothing. Stop leak if you can do so without risk. Do not get water inside containers.

Small Spill:

a. Stop leak if you can do so without risk.
b. With a clean shovel, place material into a clean , dry container and cover loosely; move containers from spill area.
c. Keep combustibles (wood, paper, oil, etc.) away from spilled material.
d. Wash contaminated areas with large volumes of water, if approved by local, state, and federal environmental agencies.
e. Runoff may cause pollution.

Large Spill:

a. Dike ahead of liquid spill for later recovery of usable product and proper disposal of any residue.
b. Stop leak if you can do so without risk.
c. Wash contaminated areas with large volumes of water, if approved by local, state, and federal environmental agencies.
d. Runoff may cause pollution.

Environmental Impact: Ammonium nitrate fertilizer is a plant nutrient, however, large spills can kill vegetation. If water courses are contaminated it may promote eutrophication and cause fish kills. If drinking water is contaminated beyond 10 mg of nitrate nitrogen per liter by ammonium nitrate fertilizer, it should be reported to the proper authorities.

Precautions if Spilled or Released: Spilled ammonium nitrate fertilizer can be reused if kept dry and uncontaminated. After cleanup, contaminated area should be washed down with water. Do not allow wash water to enter drinking water supplies. In the event of spill or wash water entering sewer or waterway, notify sewer authorities or other appropriate agencies.

Spills that have become contaminated with organic matter or other combustible material may present a fire and explosion hazard. Such material should be shoveled into drums and dissolved in water to obtain at least 50 percent water solution. Depending upon the amount of toxicity of the contaminated material, the solution can be reused as a fertilizer or disposed of.

7. HANDLING AND STORAGE

See NFPA 400 Hazardous Materials Code (2013 Edition)

Store in well-ventilated area away from acute fire hazards and easily oxidizable materials. Do not store near dynamite, blasting caps or other explosives. Avoid contamination. Floor drains and recesses should be plugged or eliminated to prevent entrapment of flowing, molten nitrate during fire.

Storage construction should be of non-combustible materials and preferably equipped with an automatic sprinkler system. Storage should be designed for safe release of pressure in emergency. Bagged ammonium nitrate fertilizer is subject to storage, stacking and quantity regulations. Follow federal, state and local regulations. See CFR 1910.109 regulations.

Handling Precautions: Keep away from open flames, hot surfaces and sources of ignition. Avoid contact with skin, eyes and clothing. Remove and wash contaminated clothing before re-use. Use only in area provided with appropriate exhaust ventilation. Avoid dust formation. Product is mildly corrosive to concrete and steel structures. Avoid materials made of copper and bronze in storage and handling equipment.

8. EXPOSURE CONTROLS, PERSONAL PROTECTION

Respiratory Protection Requirements:

a. AN itself does not pose an inhalation hazard.
b. Decomposition of AN may produce nitrogen oxides (NO_X vapors) and ammonia. Use fresh air supply systems to protect against NO_X vapors.
c. If user operations generate dust, fume, or mist, use ventilation to keep exposure to airborne contaminants below the exposure limit.
d. For conditions of use where exposure to dust or mist is apparent and engineering controls are not feasible, a particulate respirator (NIOSH type N95 or better filters) may be worn.

If necessary to enter a confined area which contains AN, monitor for ammonia vapors. If ammonia vapors are present protect as follows:

<25 ppm:	No protection required.
25 to 35 ppm:	Protection required if the daily TWA is exceeded.
35 to 50 ppm:	Protection required if exposed for more than 15 minutes.
50 to 250 ppm:	Minimum of an air-purifying respirator equipped with ammonia canister(s) or cartridge(s).
250 to 300 ppm:	Minimum of a full-face air-purifying respirator equipped with ammonia canister(s) or cartridge(s).
>300 ppm:	A fresh air supply system must be used (i.e. positive pressure self contained breathing apparatus).

Skin Protection Requirements:
Skin contact should be avoided. Wear gloves and clean body protective covering. Gloves and protective clothing made from rubber should be impervious under conditions of use. Other products such as viton or neoprene may be impervious to AN. All protective equipment should be tested for compatibility before use.

Eye Protection Requirements:
It is recommended that if there is a potential for AN to contact eyes that safety glasses/face shield and/or chemical goggles be used.

Other Protective Equipment:
Safety shower and eyewash fountain or at least 5 gallons of accessible clean water should be provided in an AN handling area

9. PHYSICAL AND CHEMICAL PROPERTIES

Physical Form:	Solid prills or granules (deliquescent solid)
Color:	White
Odor:	Odorless
Boiling Point:	Decomposition temperature 410ºF
Melting point:	311º F - 337º F
pH:	(10% solution) 6-7
Solubility:	By Wt. 66.4% @ 70ºF. Highly Soluble.
Specific Gravity:	1.72 @ 70ºF
Vapor Density:	No test results
Vapor Pressure:	No test results
% Volatile by Volume:	No test results
Molecular Weight:	80.05
Critical Temperature:	No test results
Critical Pressure:	No test results

10. REACTIVITY

Stability: ..... This is a stable material.
Hazardous Polymerization: ..... Will not occur.
Decomposition: AN starts to dissociate and decompose at temperatures above 410º F. Upon decomposition it emits nitrogen oxide (NO_X) and water vapors and may explode if confined. Hazardous decomposition products can include ammonia, oxides of nitrogen and nitric acid. If the product has been contaminated with another substance the decomposition temperature and effects of the decomposition may be varied. See Incompatibilities.

Incompatibilities: AN is incompatible with the following substances: Acetic Acid, Acetic Anhydride, Alkali Metals, Aluminum + Calcium Nitrate, Aluminum, Ammonium Chloride, Ammonium Dichromate, Ammonium Phosphate + Potassium, Antimony, Barium Chloride, Bismuth, Brass, Cadmium, Charcoal + Metal Oxides, Chloride Salts, Chromium, Cobalt, Copper Iron II Sulfide, Copper, Cyanoguanidine, Hydrocarbon Oils, Iron, Lead, Magnesium, Manganese, Nickel, Organic Fuels, Potassium Chromate, Potassium Dichromate, Potassium Nitrate, Potassium Nitrite, Potassium Permanganate, Sawdust, Sodium Chloride, Sodium Perchlorate, Sugar, Sulfide Ores, Sulfur, Tin, Titanium, Trinitroanisole, and Zinc.

NOTE: The incompatibilities above is a partial list taken from books by SAX & Lewis: "Dangerous Properties of Industrial Materials", 7th. ed., 1989 and "Hawley's Condensed Chemical Dictionary", 11th. ed. 1987, both published by Van Nostrand Reinhold Company, New York and other sources. It is recommended that if additional information is needed, refer to these and other published information. Incompatibility varies with AN concentration and not all forms of the above listed substances are incompatible.

11. TOXICOLOGICAL INFORMATION

Toxicity

Acute Oral Toxicity
LD_{50} Rat ..... 2,800 mg/kg bw (OECD 401)
Acute Inhalation Toxicity
LC_{50} Rat ..... > 88.8 mg/L (4 hrs)
Acute Dermal Toxicity
LD_{50} Rat ..... > 5,000 mg/kg (OECD 402)
Acute Toxicity, Other Routes
Minimum lethal dose Rat……..0.065 mg NH_4NO_3-N
Corrosiveness / Irritation
Skin irritation Rabbit……Moderately irritating
Eye irritation Rabbit……No data available
Repeated Dose
NOAEL Inhalation Rat……185 mg/m^3 (2 weeks)
NOAEL Inhalation Rat……1 mg/m^3 (4 weeks)
Genetic Toxicity *in vitro*
Salmonella typhimurium…….Negative (Bacterial reverse mutation assay)
Development Toxicity / Teratogenicity
NOEL Rat……..> 57 mg/kg/day

Ecotoxicity

Acute Toxicity to Fish
LC_{50} *Cyprinus carpio L*……1.15 – 1.72 mg unionized NH_3/L (48 hrs)
LC_{50} Many species……420 – 1,360 mg NO_3/L (96 hrs)
Acute Toxicity to Aquatic Invertebrates
EC_{50} *Daphnia magna*……555 mg/L
Toxicity to Aquatic Plants (Algae)
EC_{50} *Scenedesmus quadricauda*……83 mg/L
Chronic Toxicity to Aquatic Invertebrates
NOEC *Bullia digitalis*……300 mg/L (Up to 7 days)

Source: TFI Product Testing Program April 2003.

12. ECOLOGICAL INFORMATION

Notify local health and wildlife officials and operators of any nearby water intakes of contamination or discharge into or leading to waterways. Fertilizers containing AN can cause poisoning in livestock and poultry. AN can be toxic to aquatic life and spills may cause algae blooms in static waters. Nitrate ions are assimilated by growing plants. AN will also be taken up by bacteria. In anaerobic soils, nitrate ions may be converted to nitrite, molecular nitrogen, nitrous oxide, or ammonium ions.

Note: See Ecotoxicity information in section 11.

13. DISPOSAL CONSIDERATIONS

Consult state/provincial and local environmental agencies for acceptable disposal methods. Recover product for use as a fertilizer if possible

.

14. TRANSPORTATION INFORMATION

U.S. DOT and Canadian TDG Act
Shipping Name:.....Ammonium nitrate
Hazard Class: .....Class 5.1
Product Identification Number (PIN):.....UN1942
DOT Placard: .....Oxidizer 5.1, color: yellow
RQ (Reportable Quantity):.....No RQ established
STCC Number:.....4918311

15. REGULATORY INFORMATION

OSHA: This product is considered a hazardous material under criteria of the Federal OSHA Hazard Communication Standard 29 CFR 1910.1200.

SARA TITLE III:

a. EHS (Extremely Hazardous Substances) List: Not Listed (EPA, 1992a)
b. EHS RQ (Reportable Quantity): No RQ established.
c. TPQ (Threshold Planning Quantity): None
d. As distributed by CF Industries Sales, LLC, this product contains no compounds subject to reporting under Section 313 of SARA III and 40 CFR 372; however, these federal regulations do contain reporting requirements regarding water solutions of ammonia and nitrates. Additionally, the following federal environmental statutes apply to this product: SARA Title III, Sections 311 & 312 (40 CFR 370).

CERCLA Hazardous Substances List: Not listed

TSCA Inventory:

a. Listed (RTECS, 1993)

Security:

This product is listed as a Chemical of Interest (COI) by the Department of Homeland Security (DHS) for theft. DHS 6 CFR part 27 Appendix A, Chemical Facility Anti-Terrorism Standards.

16. OTHER INFORMATION

Aug. 21, 2008	The MSDS was reformatted and additional sections populated to comply with ANSI Standard Z400.1-1993. Toxicity information from the TFI Product Testing Program April 2003 was added. Reviewed and updated as necessary.
Jan. 25, 2011	Reviewed and revised for logo change.
Dec. 11, 2012	Revised for company name change. Reviewed product specifications.
April 23, 2013	Revised to update NFPA reference.

CF believes the information contained herein is accurate; however, CF makes no guarantees or warranties with respect to such accuracy and assumes no liability in connection with the use of the information contained herein by any party. The provision of the information contained herein by CF is not intended to be and should not be construed as legal advice or as ensuring compliance by other parties. Judgments as to the suitability of the information contained herein for the party's own use or purposes are solely the responsibility of that party. Any party handling, transferring, transporting, storing, applying or otherwise using this product should review thoroughly all applicable laws, rules, regulations, standards and good engineering practices. Such thorough review should occur before the party handles, transfers, transports, stores, applies or otherwise uses this product.

Material Safety Data Sheet

DIESEL FUEL

1 . Product and company identification

Product name : DIESEL FUEL

Synonym : Seasonal Diesel, #1 Diesel, #2 Heating Oil, #1 Heating Oil, D50, D60, P40, P50, Arctic Diesel, Farm Diesel, Marine Diesel, Low Sulphur Diesel, LSD, Ultra Low Sulphur Diesel, ULSD, Mining Diesel, Naval Distillate, Dyed Diesel, Marked Diesel, Coloured Diesel, Furnace special, Biodiesel blend, B1, B2, B5, Diesel Low Cloud (LC), Marine Gas Oil.

Code : W104, W293

Material uses : Diesel fuels are distillate fuels suitable for use in high and medium speed internal combustion engines of the compression ignition type. Mining diesels, marine diesels, MDO and naval distillates may have a higher flash point requirement.

Manufacturer : PETRO-CANADA
P.O. Box 2844
150 – 6th Avenue South-West
Calgary, Alberta
T2P 3E3

In case of emergency : Petro-Canada: 403-296-3000
Canutec Transportation: 613-996-6666
Poison Control Centre: Consult local telephone directory for emergency number(s).

2 . Hazards identification

Physical state : Bright oily liquid.

Odour : Mild petroleum oil like.

WHMIS (Canada) :

Class B-3: Combustible liquid with a flash point between 37.8°C (100°F) and 93.3°C (200°F).
Class D-2A: Material causing other toxic effects (Very toxic).
Class D-2B: Material causing other toxic effects (Toxic).

OSHA/HCS status : This material is considered hazardous by the OSHA Hazard Communication Standard (29 CFR 1910.1200).

Emergency overview : WARNING!

COMBUSTIBLE LIQUID AND VAPOUR. CAUSES EYE AND SKIN IRRITATION.

Combustible liquid. Severely irritating to the skin. Irritating to eyes. Keep away from heat, sparks and flame. Do not get in eyes. Avoid breathing vapour or mist. Avoid contact with skin and clothing. Use only with adequate ventilation. Wash thoroughly after handling.

Routes of entry : Dermal contact. Eye contact. Inhalation. Ingestion.

Potential acute health effects

Inhalation : Inhalation of this product may cause respiratory tract irritation and Central Nervous System (CNS) Depression, symptoms of which may include; weakness, dizziness, slurred speech, drowsiness, unconsciousness and in cases of severe overexposure; coma and death.

Ingestion : Ingestion of this product may cause gastro-intestinal irritation. Aspiration of this product may result in severe irritation or burns to the respiratory tract.

Skin : Severely irritating to the skin.

Eyes : Irritating to eyes.

Potential chronic health effects

Chronic effects : No known significant effects or critical hazards.

Carcinogenicity : Diesel engine exhaust particulate is probably carcinogenic to humans (IARC Group 2A).

Mutagenicity : No known significant effects or critical hazards.

Teratogenicity : No known significant effects or critical hazards.

™ Trademark of Suncor Energy Inc. Used under licence.

2 . Hazards identification

Developmental effects : No known significant effects or critical hazards.

Fertility effects : No known significant effects or critical hazards.

Medical conditions aggravated by over-exposure : Avoid prolonged or repeated skin contact to diesel fuels which can lead to dermal irritation and may be associated with an increased risk of skin cancer.

See toxicological information (Section 11)

3 . Composition/information on ingredients

Name	CAS number	%
Hydrotreated Renewable Diesel/ Fuels, diesel/ Fuel Oil No. 1/ Fuel Oil No. 2	64742-81-0/ 68334-30-5/ 8008-20-6/ 68476-30-2	95 - 100
Alkanes, C10 – 20 Branched and Linear (R100)	928771-01-1	10 - 20
Fatty acids methyl esters	61788-61-2 / 67784-80-9 / 73891-99-3	0 - 5

There are no additional ingredients present which, within the current knowledge of the supplier and in the concentrations applicable, are classified as hazardous to health or the environment and hence require reporting in this section.

4 . First-aid measures

Eye contact : Check for and remove any contact lenses. Immediately flush eyes with plenty of water for at least 15 minutes, occasionally lifting the upper and lower eyelids. Get medical attention immediately.

Skin contact : In case of contact, immediately flush skin with plenty of water for at least 15 minutes while removing contaminated clothing and shoes. Wash skin thoroughly with soap and water or use recognised skin cleanser. Wash clothing before reuse. Clean shoes thoroughly before reuse. Get medical attention immediately.

Inhalation : Move exposed person to fresh air. If not breathing, if breathing is irregular or if respiratory arrest occurs, provide artificial respiration or oxygen by trained personnel. Loosen tight clothing such as a collar, tie, belt or waistband. Get medical attention immediately.

Ingestion : Wash out mouth with water. Do not induce vomiting unless directed to do so by medical personnel. Never give anything by mouth to an unconscious person. Get medical attention immediately.

Protection of first-aiders : No action shall be taken involving any personal risk or without suitable training. It may be dangerous to the person providing aid to give mouth-to-mouth resuscitation.

Notes to physician : No specific treatment. Treat symptomatically. Contact poison treatment specialist immediately if large quantities have been ingested or inhaled.

5 . Fire-fighting measures

Flammability of the product : Combustible liquid

Extinguishing media

Suitable : Use dry chemical, CO_2, water spray (fog) or foam.

Not suitable : Do not use water jet.

Special exposure hazards : Promptly isolate the scene by removing all persons from the vicinity of the incident if there is a fire. No action shall be taken involving any personal risk or without suitable training. Move containers from fire area if this can be done without risk. Use water spray to keep fire-exposed containers cool.

Products of combustion : Carbon oxides (CO, CO2), nitrogen oxides (NOx), sulphur oxides (SOx), sulphur compounds (H2S), smoke and irritating vapours as products of incomplete combustion.

Special protective equipment for fire-fighters : Fire-fighters should wear appropriate protective equipment and self-contained breathing apparatus (SCBA) with a full face-piece operated in positive pressure mode.

Petro-Canada is a Suncor Energy business ™ Trademark of Suncor Energy Inc. Used under licence.

5 . Fire-fighting measures

Special remarks on fire hazards : Flammable in presence of open flames, sparks and heat. Vapours are heavier than air and may travel considerable distance to sources of ignition and flash back. This product can accumulate static charge and ignite.

Special remarks on explosion hazards : Do not pressurise, cut, weld, braze, solder, drill, grind or expose containers to heat or sources of ignition. Runoff to sewer may create fire or explosion hazard.

6 . Accidental release measures

Personal precautions : No action shall be taken involving any personal risk or without suitable training. Evacuate surrounding areas. Keep unnecessary and unprotected personnel from entering. Do not touch or walk through spilt material. Shut off all ignition sources. No flares, smoking or flames in hazard area. Avoid breathing vapour or mist. Provide adequate ventilation. Wear appropriate respirator when ventilation is inadequate. Put on appropriate personal protective equipment (see Section 8).

Environmental precautions : Avoid dispersal of spilt material and runoff and contact with soil, waterways, drains and sewers. Inform the relevant authorities if the product has caused environmental pollution (sewers, waterways, soil or air).

Methods for cleaning up

Small spill : Stop leak if without risk. Move containers from spill area. Dilute with water and mop up if water-soluble. Alternatively, or if water-insoluble, absorb with an inert dry material and place in an appropriate waste disposal container. Use spark-proof tools and explosion-proof equipment. Dispose of via a licensed waste disposal contractor.

Large spill : Stop leak if without risk. Move containers from spill area. Approach the release from upwind. Prevent entry into sewers, water courses, basements or confined areas. Wash spillages into an effluent treatment plant or proceed as follows. Contain and collect spillage with non-combustible, absorbent material e.g. sand, earth, vermiculite or diatomaceous earth and place in container for disposal according to local regulations (see section 13). Use spark-proof tools and explosion-proof equipment. Dispose of via a licensed waste disposal contractor. Contaminated absorbent material may pose the same hazard as the spilt product. Note: see section 1 for emergency contact information and section 13 for waste disposal.

7 . Handling and storage

Handling : Put on appropriate personal protective equipment (see Section 8). Eating, drinking and smoking should be prohibited in areas where this material is handled, stored and processed. Workers should wash hands and face before eating, drinking and smoking. Remove contaminated clothing and protective equipment before entering eating areas. Do not ingest. Avoid contact with eyes, skin and clothing. Avoid breathing vapour or mist. Use only with adequate ventilation. Wear appropriate respirator when ventilation is inadequate. Do not enter storage areas and confined spaces unless adequately ventilated. Keep in the original container or an approved alternative made from a compatible material, kept tightly closed when not in use. Store and use away from heat, sparks, open flame or any other ignition source. Use explosion-proof electrical (ventilating, lighting and material handling) equipment. Use non-sparking tools. Take precautionary measures against electrostatic discharges. To avoid fire or explosion, dissipate static electricity during transfer by earthing and bonding containers and equipment before transferring material. Empty containers retain product residue and can be hazardous. Do not reuse container.

Storage : Store in accordance with local regulations. Store in a segregated and approved area. Store in original container protected from direct sunlight in a dry, cool and well-ventilated area, away from incompatible materials (see section 10) and food and drink. Eliminate all ignition sources. Separate from oxidizing materials. Keep container tightly closed and sealed until ready for use. Containers that have been opened must be carefully resealed and kept upright to prevent leakage. Do not store in unlabelled containers. Use appropriate containment to avoid environmental contamination. Ensure the storage containers are grounded/bonded.

™ Trademark of Suncor Energy Inc. Used under licence.

8 . Exposure controls/personal protection

Ingredient	Exposure limits
Fuels, diesel	**ACGIH TLV (United States). Absorbed through skin.** TWA: 100 mg/m³, (Inhalable fraction and vapour) 8 hour(s).
Fuel oil No. 2	**ACGIH TLV (United States). Absorbed through skin.** TWA: 100 mg/m³, (Inhalable fraction and vapour) 8 hour(s).
Hydrotreated Renewable Diesel	**ACGIH TLV (United States). Absorbed through skin.** TWA: 200 mg/m³ 8 hour(s).
Fuel oil No. 1	**ACGIH TLV (United States). Absorbed through skin.** TWA: 200 mg/m³ 8 hour(s).

Consult local authorities for acceptable exposure limits.

Recommended monitoring procedures : If this product contains ingredients with exposure limits, personal, workplace atmosphere or biological monitoring may be required to determine the effectiveness of the ventilation or other control measures and/or the necessity to use respiratory protective equipment.

Engineering measures : Use only with adequate ventilation. Use process enclosures, local exhaust ventilation or other engineering controls to keep worker exposure to airborne contaminants below any recommended or statutory limits. The engineering controls also need to keep gas, vapour or dust concentrations below any lower explosive limits. Use explosion-proof ventilation equipment.

Hygiene measures : Wash hands, forearms and face thoroughly after handling chemical products, before eating, smoking and using the lavatory and at the end of the working period. Appropriate techniques should be used to remove potentially contaminated clothing. Wash contaminated clothing before reusing. Ensure that eyewash stations and safety showers are close to the workstation location.

Personal protection

Respiratory : Use a properly fitted, air-purifying or air-fed respirator complying with an approved standard if a risk assessment indicates this is necessary. Respirator selection must be based on known or anticipated exposure levels, the hazards of the product and the safe working limits of the selected respirator. Recommended: organic vapour cartridge or canister may be permissible under certain circumstances where airborne concentrations are expected to exceed exposure limits. Protection provided by air-purifying respirators is limited. Use a positive-pressure, air-supplied respirator if there is any potential for uncontrolled release, exposure levels are unknown, or any other circumstances where air-purifying respirators may not provide adequate protection.

Hands : Chemical-resistant, impervious gloves complying with an approved standard should be worn at all times when handling chemical products if a risk assessment indicates this is necessary.
Recommended: nitrile, neoprene, polyvinyl alcohol (PVA), Viton®. Consult your PPE provider for breakthrough times and the specific glove that is best for you based on your use patterns. It should be realized that eventually any material regardless of their imperviousness, will get permeated by chemicals. Therefore, protective gloves should be regularly checked for wear and tear. At the first signs of hardening and cracks, they should be changed.

Eyes : Safety eyewear complying with an approved standard should be used when a risk assessment indicates this is necessary to avoid exposure to liquid splashes, mists or dusts.

Skin : Personal protective equipment for the body should be selected based on the task being performed and the risks involved and should be approved by a specialist before handling this product.

Environmental exposure controls : Emissions from ventilation or work process equipment should be checked to ensure they comply with the requirements of environmental protection legislation. In some cases, fume scrubbers, filters or engineering modifications to the process equipment will be necessary to reduce emissions to acceptable levels.

™ Trademark of Suncor Energy Inc. Used under licence.

9 . Physical and chemical properties

Physical state : Bright oily liquid.

Flash point : Diesel fuel and other distillate fuels: Closed cup: ≥40°C (≥104°F)
Marine Diesel/MDO/Naval Distillate: Closed Cup: ≥60°C (≥140°F)
Mining Diesel: Closed Cup: ≥52°C (≥126°F)

Auto-ignition temperature : 225°C (437°F)

Flammable limits : Lower: 0.7%
Upper: 6%

Colour : Clear to yellow (This product may be dyed red for taxation purposes).

Odour : Mild petroleum oil like.

Odour threshold : Not available.

pH : Not available.

Boiling/condensation point : 150 to 371°C (302 to 699.8°F)

Melting/freezing point : Not available.

Relative density : 0.80 to 0.88 kg/L @ 15°C (59°F)

Vapour pressure : 1 kPa (7.5 mm Hg) @ 20°C (68ºF).

Vapour density : 4.5 [Air = 1]

Volatility : Not available.

Evaporation rate : Not available.

Viscosity : Diesel fuel: 1.3 - 4.1 cSt @ 40°C (104°F)
Marine Diesel Fuel: 1.3 - 4.4 cSt @ 40°C (104°F)

Pour point : Not available.

Solubility : Insoluble in cold water, soluble in non-polar hydrocarbon solvents.

10 . Stability and reactivity

Chemical stability : The product is stable.

Hazardous polymerisation : Under normal conditions of storage and use, hazardous polymerisation will not occur.

Materials to avoid : Reactive with oxidising agents and acids.

Hazardous decomposition products : May release COx, NOx, SOx, H_2S, smoke and irritating vapours when heated to decomposition.

11 . Toxicological information

Acute toxicity

Product/ingredient name	Result	Species	Dose	Exposure
Fuels, diesel	LD50 Dermal	Mouse	24500 mg/kg	-
	LD50 Oral	Rat	7500 mg/kg	-
Fuel oil No. 2	LD50 Oral	Rat	12000 mg/kg	-
Fuel oil No. 1	LD50 Dermal	Rabbit	>2000 mg/kg	-
	LD50 Oral	Rat	>5000 mg/kg	-
	LC50 Inhalation Vapour	Rat	>5000 mg/m³	4 hours
Hydrotreated Renewable Diesel	LD50 Dermal	Rabbit	>2000 mg/kg	-
	LD50 Oral	Rat	>5000 mg/kg	-
	LC50 Inhalation Vapour	Rat	>5200 mg/m³	4 hours

Conclusion/Summary : Not available.

Chronic toxicity

Conclusion/Summary : Not available.

11 . Toxicological information

Conclusion/Summary : Not available.

Carcinogenicity

Conclusion/Summary : Diesel engine exhaust particulate is probably carcinogenic to humans (IARC Group 2A).

Classification

Product/ingredient name	ACGIH	IARC	EPA	NIOSH	NTP	OSHA
Fuels, diesel	A3	3	-	-	-	-
Fuel oil No. 1	A3	3	-	-	-	-
Fuel oil No. 2	A3	3	-	-	-	-
Hydrotreated Renewable Diesel	A3	3	-	-	-	-

Mutagenicity

Conclusion/Summary : Not available.

Teratogenicity

Conclusion/Summary : Not available.

Reproductive toxicity

Conclusion/Summary : Not available.

12 . Ecological information

Environmental effects : No known significant effects or critical hazards.

Aquatic ecotoxicity

Conclusion/Summary : Not available.

Biodegradability

Conclusion/Summary : Not available.

13 . Disposal considerations

Waste disposal : The generation of waste should be avoided or minimised wherever possible. Significant quantities of waste product residues should not be disposed of via the foul sewer but processed in a suitable effluent treatment plant. Dispose of surplus and non-recyclable products via a licensed waste disposal contractor. Disposal of this product, solutions and any by-products should at all times comply with the requirements of environmental protection and waste disposal legislation and any regional local authority requirements. Waste packaging should be recycled. Incineration or landfill should only be considered when recycling is not feasible. This material and its container must be disposed of in a safe way. Care should be taken when handling emptied containers that have not been cleaned or rinsed out. Empty containers or liners may retain some product residues. Vapor from product residues may create a highly flammable or explosive atmosphere inside the container. Do not cut, weld or grind used containers unless they have been cleaned thoroughly internally. Avoid dispersal of spilt material and runoff and contact with soil, waterways, drains and sewers.

Disposal should be in accordance with applicable regional, national and local laws and regulations.

Refer to Section 7: HANDLING AND STORAGE and Section 8: EXPOSURE CONTROLS/PERSONAL PROTECTION for additional handling information and protection of employees.

Section 2: Composition and Information on Ingredients

Composition:

Name	CAS #	% by Weight
Hydrogen chloride	7647-01-0	20-38
Water	7732-18-5	62-80

Toxicological Data on Ingredients: Hydrogen chloride: GAS (LC50): Acute: 4701 ppm 0.5 hours [Rat].

Section 3: Hazards Identification

Potential Acute Health Effects:
Very hazardous in case of skin contact (corrosive, irritant, permeator), of eye contact (irritant, corrosive), of ingestion, . Slightly hazardous in case of inhalation (lung sensitizer). Non-corrosive for lungs. Liquid or spray mist may produce tissue damage particularly on mucous membranes of eyes, mouth and respiratory tract. Skin contact may produce burns. Inhalation of the spray mist may produce severe irritation of respiratory tract, characterized by coughing, choking, or shortness of breath. Severe over-exposure can result in death. Inflammation of the eye is characterized by redness, watering, and itching. Skin inflammation is characterized by itching, scaling, reddening, or, occasionally, blistering.

Potential Chronic Health Effects:
Slightly hazardous in case of skin contact (sensitizer). CARCINOGENIC EFFECTS: Classified 3 (Not classifiable for human.) by IARC [Hydrochloric acid]. MUTAGENIC EFFECTS: Not available. TERATOGENIC EFFECTS: Not available. DEVELOPMENTAL TOXICITY: Not available. The substance may be toxic to kidneys, liver, mucous membranes, upper respiratory tract, skin, eyes, Circulatory System, teeth. Repeated or prolonged exposure to the substance can produce target

organs damage. Repeated or prolonged contact with spray mist may produce chronic eye irritation and severe skin irritation. Repeated or prolonged exposure to spray mist may produce respiratory tract irritation leading to frequent attacks of bronchial infection. Repeated exposure to a highly toxic material may produce general deterioration of health by an accumulation in one or many human organs.

Section 4: First Aid Measures

Eye Contact:
Check for and remove any contact lenses. In case of contact, immediately flush eyes with plenty of water for at least 15 minutes. Cold water may be used. Get medical attention immediately.

Skin Contact:
In case of contact, immediately flush skin with plenty of water for at least 15 minutes while removing contaminated clothing and shoes. Cover the irritated skin with an emollient. Cold water may be used.Wash clothing before reuse. Thoroughly clean shoes before reuse. Get medical attention immediately.

Serious Skin Contact:
Wash with a disinfectant soap and cover the contaminated skin with an anti-bacterial cream. Seek immediate medical attention.

Inhalation:
If inhaled, remove to fresh air. If not breathing, give artificial respiration. If breathing is difficult, give oxygen. Get medical attention immediately.

Serious Inhalation:
Evacuate the victim to a safe area as soon as possible. Loosen tight clothing such as a collar, tie, belt or waistband. If breathing is difficult, administer oxygen. If the victim is not breathing, perform mouth-to-mouth resuscitation. WARNING: It may be hazardous to the person providing aid to give mouth-to-mouth resuscitation when the inhaled material is toxic, infectious or corrosive. Seek immediate medical attention.

Ingestion:
If swallowed, do not induce vomiting unless directed to do so by medical personnel. Never give anything by mouth to an unconscious person. Loosen tight clothing such as a collar, tie, belt or waistband. Get medical attention immediately.

Serious Ingestion: Not available.

Section 5: Fire and Explosion Data

Flammability of the Product: Non-flammable.

Auto-Ignition Temperature: Not applicable.

Flash Points: Not applicable.

Flammable Limits: Not applicable.

Products of Combustion: Not available.

Fire Hazards in Presence of Various Substances: of metals

Explosion Hazards in Presence of Various Substances: Non-explosive in presence of open flames and sparks, of shocks.

Fire Fighting Media and Instructions: Not applicable.

Special Remarks on Fire Hazards:
Non combustible. Calcium carbide reacts with hydrogen chloride gas with incandescence. Uranium phosphide reacts with hydrochloric acid to release spontaneously flammable phosphine. Rubidium acetylene carbides burns with slightly warm hydrochloric acid. Lithium silicide in contact with hydrogen chloride becomes incandescent. When dilute hydrochloric acid is used, gas spontaneously flammable in air is evolved. Magnesium boride treated with concentrated hydrochloric acid produces spontaneously flammble gas. Cesium acetylene carbide burns hydrogen chloride gas. Cesium carbide ignites in contact with hydrochloric acid unless acid is dilute. Reacts with most metals to produce flammable Hydrodgen gas.

Special Remarks on Explosion Hazards:

Hydrogen chloride in contact with the following can cause an explosion, ignition on contact, or other violent/vigorous reaction: Acetic anhydride AgClO + CCl4 Alcohols + hydrogen cyanide, Aluminum Aluminum-titanium alloys (with HCl vapor), 2-Amino ethanol, Ammonium hydroxide, Calcium carbide Ca3P2 Chlorine + dinitroanilines (evolves gas), Chlorosulfonic acid Cesium carbide Cesium acetylene carbide, 1,1-Difluoroethylene Ethylene diamine Ethylene imine, Fluorine, HClO4 Hexalithium disilicide H2SO4 Metal acetylides or carbides, Magnesium boride, Mercuric sulfate, Oleum, Potassium permanganate, beta-Propiolactone Propylene oxide Rubidium carbide, Rubidium, acetylene carbide Sodium (with aqueous HCl), Sodium hydroxide Sodium tetraselenium, Sulfonic acid, Tetraselenium tetranitride, U3P4 , Vinyl acetate. Silver perchlorate with carbon tetrachloride in the presence of hydrochloric acid produces trichloromethyl perchlorate which detonates at 40 deg. C.

Section 6: Accidental Release Measures

Small Spill:
Dilute with water and mop up, or absorb with an inert dry material and place in an appropriate waste disposal container. If necessary: Neutralize the residue with a dilute solution of sodium carbonate.

Large Spill:
Corrosive liquid. Poisonous liquid. Stop leak if without risk. Absorb with DRY earth, sand or other non-combustible material. Do not get water inside container. Do not touch spilled material. Use water spray curtain to divert vapor drift. Use water spray to reduce vapors. Prevent entry into sewers, basements or confined areas; dike if needed. Call for assistance on disposal. Neutralize the residue with a dilute solution of sodium carbonate. Be careful that the product is not present at a concentration level above TLV. Check TLV on the MSDS and with local authorities.

Section 7: Handling and Storage

Precautions:
Keep locked up.. Keep container dry. Do not ingest. Do not breathe gas/fumes/ vapor/spray. Never add water to this product. In case of insufficient ventilation, wear suitable respiratory equipment. If ingested, seek medical advice immediately and show the container or the label. Avoid contact with skin and eyes. Keep away from incompatibles such as oxidizing agents, organic materials, metals, alkalis, moisture. May corrode metallic surfaces. Store in a metallic or coated fiberboard drum using a strong polyethylene inner package.

Storage: Keep container tightly closed. Keep container in a cool, well-ventilated area.

Section 8: Exposure Controls/Personal Protection

Engineering Controls:
Provide exhaust ventilation or other engineering controls to keep the airborne concentrations of vapors below their respective threshold limit value. Ensure that eyewash stations and safety showers are proximal to the work-station location.

Personal Protection:
Face shield. Full suit. Vapor respirator. Be sure to use an approved/certified respirator or equivalent. Gloves. Boots.

Personal Protection in Case of a Large Spill:
Splash goggles. Full suit. Vapor respirator. Boots. Gloves. A self contained breathing apparatus should be used to avoid inhalation of the product. Suggested protective clothing might not be sufficient; consult a specialist BEFORE handling this product.

Exposure Limits:
CEIL: 5 (ppm) from OSHA (PEL) [United States] CEIL: 7 (mg/m3) from OSHA (PEL) [United States] CEIL: 5 from NIOSH CEIL: 7 (mg/m3) from NIOSH TWA: 1 STEL: 5 (ppm) [United Kingdom (UK)] TWA: 2 STEL: 8 (mg/m3) [United Kingdom (UK)]Consult local authorities for acceptable exposure limits.

Section 9: Physical and Chemical Properties

Physical state and appearance: Liquid.

Odor: Pungent. Irritating (Strong.)

Taste: Not available.

Molecular Weight: Not applicable.

Color: Colorless to light yellow.

pH (1% soln/water): Acidic.

Boiling Point:
108.58 C @ 760 mm Hg (for 20.22% HCl in water) 83 C @ 760 mm Hg (for 31% HCl in water) 50.5 C (for 37% HCl in water)

Melting Point:
-62.25°C (-80°F) (20.69% HCl in water) -46.2 C (31.24% HCl in water) -25.4 C (39.17% HCl in water)

Critical Temperature: Not available.

Specific Gravity:
1.1- 1.19 (Water = 1) 1.10 (20%and 22% HCl solutions) 1.12 (24% HCl solution) 1.15 (29.57% HCl solution) 1.16 (32% HCl solution) 1.19 (37% and 38%HCl solutions)

Vapor Pressure: 16 kPa (@ 20°C) average

Vapor Density: 1.267 (Air = 1)

Volatility: Not available.

Odor Threshold: 0.25 to 10 ppm

Water/Oil Dist. Coeff.: Not available.

Ionicity (in Water): Not available.

Dispersion Properties: See solubility in water, diethyl ether.

Solubility: Soluble in cold water, hot water, diethyl ether.

Section 10: Stability and Reactivity Data

Stability: The product is stable.

Instability Temperature: Not available.

Conditions of Instability: Incompatible materials, water

Incompatibility with various substances:
Highly reactive with metals. Reactive with oxidizing agents, organic materials, alkalis, water.

Corrosivity:
Extremely corrosive in presence of aluminum, of copper, of stainless steel(304), of stainless steel(316). Non-corrosive in presence of glass.

Special Remarks on Reactivity:
Reacts with water especially when water is added to the product. Absorption of gaseous hydrogen chloride on mercuric sulfate becomes violent @ 125 deg. C. Sodium reacts very violently with gaseous hydrogen chloride. Calcium phosphide and hydrochloric acid undergo very energetic reaction. It reacts with oxidizers releasing chlorine gas. Incompatible with, alkali metals, carbides, borides, metal oxides, vinyl acetate, acetylides, sulphides, phosphides, cyanides, carbonates. Reacts with most metals to produce flammable Hydrogen gas. Reacts violently (moderate reaction with heat of evolution) with water especially when water is added to the product. Isolate hydrogen chloride from heat, direct sunlight, alkalies (reacts vigorously), organic materials, and oxidizers (especially nitric acid and chlorates), amines, metals, copper and alloys (e.g. brass), hydroxides, zinc (galvanized materials), lithium silicide (incandescence), sulfuric acid(increase in temperature and pressure) Hydrogen chloride gas is emitted when this product is in contact with sulfuric acid. Adsorption of Hydrochloric Acid onto silicon dioxide results in exothmeric reaction. Hydrogen chloride causes aldehydes and epoxides to violently polymerize. Hydrogen chloride or Hydrochloric Acid in contact with the folloiwng can cause explosion or ignition on contact or

Special Remarks on Corrosivity:

Highly corrosive. Incompatible with copper and copper alloys. It attacks nearly all metals (mercury, gold, platinium, tantalum, silver, and certain alloys are exceptions). It is one of the most corrosive of the nonoxidizing acids in contact with copper alloys. No corrosivity data on zinc, steel. Severe Corrosive effect on brass and bronze

Polymerization: Will not occur.

Section 11: Toxicological Information

Routes of Entry: Absorbed through skin. Dermal contact. Eye contact. Inhalation.

Toxicity to Animals:
Acute oral toxicity (LD50): 900 mg/kg [Rabbit]. Acute toxicity of the vapor (LC50): 1108 ppm, 1 hours [Mouse]. Acute toxicity of the vapor (LC50): 3124 ppm, 1 hours [Rat].

Chronic Effects on Humans:
CARCINOGENIC EFFECTS: Classified 3 (Not classifiable for human.) by IARC [Hydrochloric acid]. May cause damage to the following organs: kidneys, liver, mucous membranes, upper respiratory tract, skin, eyes, Circulatory System, teeth.

Other Toxic Effects on Humans:
Very hazardous in case of skin contact (corrosive, irritant, permeator), of ingestion, . Hazardous in case of eye contact (corrosive), of inhalation (lung corrosive).

Special Remarks on Toxicity to Animals:
Lowest Published Lethal Doses (LDL/LCL) LDL [Man] -Route: Oral; 2857 ug/kg LCL [Human] - Route: Inhalation; Dose: 1300 ppm/30M LCL [Rabbit] - Route: Inhalation; Dose: 4413 ppm/30M

Special Remarks on Chronic Effects on Humans:
May cause adverse reproductive effects (fetoxicity). May affect genetic material.

Special Remarks on other Toxic Effects on Humans:
Acute Potential Health Effects: Skin: Corrosive. Causes severe skin irritation and burns. Eyes: Corrosive. Causes severe eye irritation/conjuntivitis, burns, corneal necrosis. Inhalation: May be fatal if inhaled. Material is extremely destructive to tissue of the mucous membranes and upper respiratory tract. Inhalation of hydrochloric acid fumes produces nose, throat, and larryngeal burning, and irritation, pain and inflammation, coughing, sneezing, choking sensation, hoarseness, laryngeal spasms, upper respiratory tract edema, chest pains, as well has headache, and palpitations. Inhalation of high concentrations can result in corrosive burns, necrosis of bronchial epithelium, constriction of the larynx and bronchi, nasospetal perforation, glottal closure, occur, particularly if exposure is prolonged. May affect the liver. Ingestion: May be fatal if swallowed. Causes irritation and burning, ulceration, or perforation of the gastrointestinal tract and resultant peritonitis, gastric hemorrhage and infection. Can also cause nausea, vomitting (with "coffee ground" emesis), diarrhea, thirst, difficulty swallowing, salivation, chills, fever, uneasiness, shock, strictures and stenosis (esophogeal, gastric, pyloric). May affect behavior (excitement), the cardiovascular system (weak rapid pulse, tachycardia), respiration (shallow respiration), and urinary system (kidneys- renal failure, nephritis). Acute exposure via inhalation or ingestion can also cause erosion of tooth enamel. Chronic Potential Health Effects: dyspnea, bronchitis. Chemical pneumonitis and pulmonary edema can also

Section 12: Ecological Information

Ecotoxicity: Not available.

BOD5 and COD: Not available.

Products of Biodegradation:
Possibly hazardous short term degradation products are not likely. However, long term degradation products may arise.

Toxicity of the Products of Biodegradation: The products of degradation are less toxic than the product itself.

Special Remarks on the Products of Biodegradation: Not available.

Section 13: Disposal Considerations

Waste Disposal:

Waste must be disposed of in accordance with federal, state and local environmental control regulations.

Section 14: Transport Information

DOT Classification: Class 8: Corrosive material

Identification: : Hydrochloric acid, solution UNNA: 1789 PG: II

Special Provisions for Transport: Not available.

Section 15: Other Regulatory Information

Federal and State Regulations:
Connecticut hazardous material survey.: Hydrochloric acid Illinois toxic substances disclosure to employee act: Hydrochloric acid Illinois chemical safety act: Hydrochloric acid New York release reporting list: Hydrochloric acid Rhode Island RTK hazardous substances: Hydrochloric acid Pennsylvania RTK: Hydrochloric acid Minnesota: Hydrochloric acid Massachusetts RTK: Hydrochloric acid Massachusetts spill list: Hydrochloric acid New Jersey: Hydrochloric acid New Jersey spill list: Hydrochloric acid Louisiana RTK reporting list: Hydrochloric acid Louisiana spill reporting: Hydrochloric acid California Director's List of Hazardous Substances: Hydrochloric acid TSCA 8(b) inventory: Hydrochloric acid TSCA 4(a) proposed test rules: Hydrochloric acid SARA 302/304/311/312 extremely hazardous substances: Hydrochloric acid SARA 313 toxic chemical notification and release reporting: Hydrochloric acid CERCLA: Hazardous substances.: Hydrochloric acid: 5000 lbs. (2268 kg)

Other Regulations:
OSHA: Hazardous by definition of Hazard Communication Standard (29 CFR 1910.1200). EINECS: This product is on the European Inventory of Existing Commercial Chemical Substances.

Other Classifications:

WHMIS (Canada):
CLASS D-2A: Material causing other toxic effects (VERY TOXIC). CLASS E: Corrosive liquid.

DSCL (EEC):
R34- Causes burns. R37- Irritating to respiratory system. S26- In case of contact with eyes, rinse immediately with plenty of water and seek medical advice. S45- In case of accident or if you feel unwell, seek medical advice immediately (show the label where possible).

HMIS (U.S.A.):

Health Hazard: 3

Fire Hazard: 0

Reactivity: 1

Personal Protection:

National Fire Protection Association (U.S.A.):

Health: 3

Flammability: 0

Reactivity: 1

Specific hazard:

Protective Equipment:
Gloves. Full suit. Vapor respirator. Be sure to use an approved/certified respirator or equivalent. Wear appropriate respirator when ventilation is inadequate. Face shield.

Material Safety Data Sheet (Canada)
Liquefied Natural Gas

Section 1 – Material Identification and Use

Material Name: LIQUEFIED NATURAL GAS (CRYOGENIC LIQUID)
Use: Vehicle Fuel Gas
WHMIS Classification: Class A; Class B, Div. 1
TDG: **UN**: 1972 **Class:** 2.1 **Packing Group:** N.Av.
Shipping Name: LIQUEFIED NATURAL GAS (CRYOGENIC LIQUID)
Manufacturer/Supplier: ENCANA SERVICES COMPANY LTD.
500 Centre Street SE
CALGARY, ALBERTA, T2P 2S5
Emergency Telephone: CANUTEC: 1-613-996-6666
Chemical Family: Liquefied aliphatic paraffinic hydrocarbon

Section 2 – Hazardous Ingredients of Materials

Hazardous Ingredients	Approximate Concentrations %	C.A.S. Nos.	LD50/LC50 Specify Species & Route	Exposure Limits
Methane	>97%	74-82-8	N.Av.	1000 ppm (BC)
Ethane	2-3%	74-84-0	N.Av.	1000 ppm (AB & BC)

All exposure levels are 8-hour time-weighted exposure limits unless otherwise indicated.

Section 3 – Physical Data for Material

Physical State: Liquefied Gas
Specific Gravity: 0.422 to 0.546
Vapour Density (air=1): 0.55 to 1.1
Percent Volatiles, by volume: 100
pH: N.App.
Coefficient of Water/Oil Distribution: <0.1
(N.AV. = not available N.App. = not applicable)

Vapour Pressure (mmHg): N.App.
Odour Threshold (ppm): N.Av.
Evaporation Rate: N.Av.
Boiling Pt. (deg.C): -88.15
Freezing Pt. (deg.C): -172.15
Odour & Appearance: colourless, odourless or mercaptan odour

Section 4 – Fire and Explosion

Flammability: Yes **Conditions**: Material may ignite at normal temperatures.
Means of Extinction: Foam, CO_2, dry chemical. Explosive accumulations can build up in areas of poor ventilation.
Special Procedures: Use water spray to cool fire-exposed containers, and to disperse gas if leak has not ignited. Do not direct water at spill or source of leak. If safe to do so, cut off fuel and allow flame to burn out. If flames are accidentally extinguished, explosive re-ignition may occur.
Flash Point (deg.C): -187.78 to -135.15
Upper Explosive Limit (% by vol.): 15.0
Lower Explosive Limit (% by vol.): 3.0
Auto-Ignition Temp. (deg.C): 530

Sensitivity to Impact: No
Sensitivity to Static Discharge: Yes, may ignite
TDG Flammability Classification: 2.1

Hazardous Combustion Products: Carbon monoxide and carbon dioxide.

Section 5 – Reactivity Data

Chemical Stability: Yes **Conditions**: N.App.
Incompatibility: Yes **Substances**: Chlorine and other strong oxidizing agents.
Reactivity: Yes **Conditions**: Heat, strong sunlight
Hazardous Decomposition Products: Carbon dioxide and carbon monoxide

Section 6 – Toxicological Properties of Product

Routes of Entry:
Skin Absorption: Yes **Skin Contact**: Yes (liquid) **Eye Contact**: Yes
Inhalation: **Acute**: Yes **Chronic**: No **Ingestion**: No
Effects of Acute Exposure: Inhalation can cause headache, disorientation, dizziness, drowsiness and possibly unconsciousness at concentrations that cause oxygen deficiency and asphyxiation. Rapidly expanding gas or vaporized liquid may cause frostbite to skin and eyes.
Effects of Chronic Exposure: N.Av.
Sensitization to Product: No
Irritancy: N.Av.
Synergistic Materials: None reported
Carcinogenicity: N.Av. **Reproductive Effects**: N.Av. **Teratogenicity**: N.Av. **Mutagenicity**: N.Av.

Section 7 – Preventative Measures

Personal Protective Equipment: Use a NIOSH approved positive pressure self-contained breathing apparatus or supplied air breathing apparatus when concentrations may exceed exposure limits. Use approved gas detectors.
Gloves: Insulated gloves (e.g.: cryogenic)
Eye: Splash goggles and face shield or equivalent.
Footwear: Covered footwear such as steel-toed boots.
Clothing: Fire retardant garments that meet NFPA 2112. For situations or activities involving elevated risk of fluid contact, wear an insulated apron or smock.
Respiratory Protection: SCBA or SABA
Engineering Controls: Use only in well ventilated areas. Mechanical ventilation recommended in confined areas. Equipment must be explosion proof.
Leaks & Spills: If safe to do so, stop liquid flow. Remove all ignition sources. Provide explosion-proof clearing ventilation if possible. Prevent from entering confined spaces. Use personal protective equipment.
Waste Disposal: Controlled burning or venting in accordance with regulatory requirements.
Handling Procedures & Equipment: Avoid contact with liquid or liquid cooled equipment. Avoid inhalation. Bond and ground all transfers. Avoid sparking conditions.
Storage Requirements: Store in a cool, dry, well ventilated area away from heat, strong sunlight, and ignition sources.
Special Shipping Information: N.Av.

Section 8 – First aid Measures

Skin: If freeze burn occurs, gently bathe affected area in warm water (38 – 43 deg. C). Do not rub. Get medical attention. Seek immediate medical attention if blistering, tissue freezing or frost bite has occurred.
Eye: Immediately flush with large amounts of luke warm water for 15 minutes, lifting upper and lower lids at intervals. Seek medical attention if irritation persists.
Inhalation: Remove to fresh air. Give oxygen, artificial respiration, or CPR if needed. Seek medical attention.
Ingestion: Ingestion of liquid causes freeze burns to mouth, throat, esophagus and lungs. Get immediate medical attention.

Section 9 – Preparation Date of MSDS

Prepared By: Encana Environment, Health and Safety (EH&S)
Phone Number: (403) 645-2000 Preparation Date: July 1, 2014 Expiry Date: July1, 2017

Material Safety Data Sheet

1. IDENTIFICATION OF THE SUBSTANCE/PREPARATION AND COMPANY/UNDERTAKING

Material Name	:	**Methyl Isobutyl Carbinol**
Uses	:	Use as a solvent only in industrial manufacturing processes.
Product Code	:	S1216
Manufacturer/Supplier	:	**Shell Chemicals Europe B.V.** PO Box 8610 3009 AP Rotterdam Netherlands
Telephone	:	+31 (0)10 231 7000
Fax	:	+31 (0)10 231 7180
Emergency Telephone Number	:	+31 (0)10 431 3233

2. COMPOSITION/INFORMATION ON INGREDIENTS

Material Formal Name	:	4-methylpentan-2-ol
Synonyms	:	1,3-dimethyl 1-butanol MIBC Methyl Amyl Alcohol
CAS No.	:	108-11-2
INDEX No.	:	603-008-00-8
EINECS No.	:	203-551-7

3. HAZARDS IDENTIFICATION

Health Hazards	:	Irritating to respiratory system. Vapours may cause drowsiness and dizziness. May cause moderate irritation to skin. Repeated exposure may cause skin dryness or cracking. Moderately irritating to eyes.
Signs and Symptoms	:	Respiratory irritation signs and symptoms may include a temporary burning sensation of the nose and throat, coughing, and/or difficulty breathing. Skin irritation signs and symptoms may include a burning sensation, redness, swelling, and/or blisters. Eye irritation signs and symptoms may include a burning sensation, redness, swelling, and/or blurred vision. Other signs and symptoms of central nervous system (CNS) depression may include headache, nausea, and lack of coordination.
Aggravated Medical Condition	:	Pre-existing medical conditions of the following organ(s) or organ system(s) may be aggravated by exposure to this material: Respiratory system. Central nervous system (CNS). Skin. Eyes.
Safety Hazards	:	Flammable liquid and vapour. Vapours are heavier than air.

Vapours may travel across the ground and reach remote ignition sources causing a flashback fire danger.

4. FIRST AID MEASURES

Inhalation	:	Remove to fresh air. If rapid recovery does not occur, transport to nearest medical facility for additional treatment.
Skin Contact	:	Remove contaminated clothing. Flush exposed area with water and follow by washing with soap if available.
Eye Contact	:	Immediately flush eyes with large amounts of water for at least 15 minutes while holding eyelids open. Transport to the nearest medical facility for additional treatment.
Ingestion	:	If swallowed, do not induce vomiting: transport to nearest medical facility for additional treatment. If vomiting occurs spontaneously, keep head below hips to prevent aspiration.
Advice to Physician	:	Causes central nervous system depression. Call a doctor or poison control center for guidance.

5. FIRE FIGHTING MEASURES

Clear fire area of all non-emergency personnel.

Specific Hazards	:	Carbon monoxide may be evolved if incomplete combustion occurs. Will float and can be reignited on surface water. The vapour is heavier than air, spreads along the ground and distant ignition is possible.
Extinguishing Media	:	Foam, water spray or fog. Dry chemical powder, carbon dioxide, sand or earth may be used for small fires only. Do not discharge extinguishing waters into the aquatic environment.
Unsuitable Extinguishing Media	:	Do not use water in a jet.
Protective Equipment for Firefighters	:	Wear full protective clothing and self-contained breathing apparatus.
Additional Advice	:	Keep adjacent containers cool by spraying with water.

6. ACCIDENTAL RELEASE MEASURES

Observe all relevant local and international regulations.

Protective measures	:	Avoid contact with spilled or released material. Immediately remove all contaminated clothing. For guidance on selection of personal protective equipment see Chapter 8 of this Material Safety Data Sheet. For guidance on disposal of spilled material see Chapter 13 of this Material Safety Data Sheet. Shut off leaks, if possible without personal risks. Remove all possible sources of ignition in the surrounding area. Use appropriate containment (of product and fire fighting water) to avoid environmental contamination. Prevent from spreading or entering drains, ditches or rivers by using sand, earth, or other appropriate barriers. Attempt to disperse the vapour or to direct its flow to a safe location for example by using fog sprays. Take precautionary measures against static discharge. Ensure electrical continuity by bonding and grounding (earthing) all

		equipment. Monitor area with combustible gas indicator.
Clean Up Methods	:	For large liquid spills (> 1 drum), transfer by mechanical means such as vacuum truck to a salvage tank for recovery or safe disposal. Do not flush away residues with water. Retain as contaminated waste. Allow residues to evaporate or soak up with an appropriate absorbent material and dispose of safely. Remove contaminated soil and dispose of safely. For small liquid spills (< 1 drum), transfer by mechanical means to a labelled, sealable container for product recovery or safe disposal. Allow residues to evaporate or soak up with an appropriate absorbent material and dispose of safely. Remove contaminated soil and dispose of safely.
Additional Advice	:	See Chapter 13 for information on disposal. Notify authorities if any exposure to the general public or the environment occurs or is likely to occur. Vapour may form an explosive mixture with air.

7. HANDLING AND STORAGE

General Precautions	:	Avoid breathing vapours or contact with material. Only use in well ventilated areas. Wash thoroughly after handling. For guidance on selection of personal protective equipment see Chapter 8 of this Material Safety Data Sheet. Use the information in this data sheet as input to a risk assessment of local circumstances to help determine appropriate controls for safe handling, storage and disposal of this material.
Handling	:	Electrostatic charges may be generated during pumping. Electrostatic discharge may cause fire. Ensure electrical continuity by bonding and grounding (earthing) all equipment. Restrict line velocity during pumping in order to avoid generation of electrostatic discharge (<= 10 m/sec). Avoid splash filling. Do NOT use compressed air for filling, discharging, or handling operations. Extinguish any naked flames. Do not smoke. Remove ignition sources. Avoid sparks. Handling Temperature: Ambient.
Storage	:	Keep away from aerosols, flammables, oxidizing agents, corrosives and from products harmful or toxic to man or to the environment. Must be stored in a well-ventilated area, away from sunlight, ignition sources and other sources of heat. Storage Temperature: Ambient.
Product Transfer	:	Keep containers closed when not in use. Do not use compressed air for filling, discharging or handling.
Recommended Materials	:	For container paints, use epoxy paint, zinc silicate paint. For containers, or container linings use mild steel.
Unsuitable Materials	:	Aluminium if > 50 °C. Most plastics.
Container Advice	:	Containers, even those that have been emptied, can contain explosive vapours. Do not cut, drill, grind, weld or perform similar operations on or near containers.
Additional Information	:	Ensure that all local regulations regarding handling and storage facilities are followed.

8. EXPOSURE CONTROLS/PERSONAL PROTECTION

Occupational Exposure Limits

Material	Source	Type	ppm	mg/m3	Notation
Methyl Isobutyl Carbinol	ACGIH	TWA	25 ppm		
	ACGIH	STEL	40 ppm		
	ACGIH	SKIN_DES			Can be absorbed through the skin.

Additional Information : Skin notation means that significant exposure can also occur by absorption of liquid through the skin and of vapour through the eyes or mucous membranes. Wash hands before eating, drinking, smoking and using the toilet.

Exposure Controls : The level of protection and types of controls necessary will vary depending upon potential exposure conditions. Select controls based on a risk assessment of local circumstances. Appropriate measures include: Adequate explosion-proof ventilation to control airborne concentrations below the exposure guidelines/limits. Eye washes and showers for emergency use.

Personal Protective Equipment : Personal protective equipment (PPE) should meet recommended national standards. Check with PPE suppliers.

Respiratory Protection : If engineering controls do not maintain airborne concentrations to a level which is adequate to protect worker health, select respiratory protection equipment suitable for the specific conditions of use and meeting relevant legislation. Check with respiratory protective equipment suppliers. Where air-filtering respirators are suitable, select an appropriate combination of mask and filter. Select a filter suitable for organic gases and vapours [boiling point >65 °C (149 °F)] meeting EN141. Where air-filtering respirators are unsuitable (e.g., airborne concentrations are high, risk of oxygen deficiency, confined space) use appropriate positive pressure breathing apparatus.

Hand Protection : Where hand contact with the product may occur the use of gloves approved to relevant standards (e.g. Europe: EN374, US: F739, AS/NZS:2161) made from the following materials may provide suitable chemical protection:
Longer term protection: Butyl rubber. Incidental contact/Splash protection: Neoprene rubber. Nitrile rubber. Viton. Suitability and durability of a glove is dependent on usage, e.g. frequency and duration of contact, chemical resistance of glove material, glove thickness, dexterity. Always seek advice from glove suppliers. Contaminated gloves should be replaced.
Personal hygiene is a key element of effective hand care. Gloves must only be worn on clean hands. After using gloves, hands should be washed and dried thoroughly. Application of a non-perfumed moisturizer is recommended.

Eye Protection : Chemical splash goggles (chemical monogoggles).

		Monogoggles (EN166)
Protective Clothing	:	Use protective clothing which is chemical resistant to this material. Safety shoes and boots should also be chemical resistant.
Monitoring Methods	:	Monitoring of the concentration of substances in the breathing zone of workers or in the general workplace may be required to confirm compliance with an OEL and adequacy of exposure controls. For some substances biological monitoring may also be appropriate. Examples of sources of recommended air monitoring methods are given below or contact supplier. Further national methods may be available. National Institute of Occupational Safety and Health (NIOSH), USA: Manual of Analytical Methods, http://www.cdc.gov/niosh/nmam/nmammenu.html. Occupational Safety and Health Administration (OSHA), USA: Sampling and Analytical Methods, http://www.osha-slc.gov/dts/sltc/methods/toc.html. Health and Safety Executive (HSE), UK: Methods for the Determination of Hazardous Substances, http://www.hsl.gov.uk/search.htm.
Environmental Exposure Controls	:	Local guidelines on emission limits for volatile substances must be observed for the discharge of exhaust air containing vapour.

9. PHYSICAL AND CHEMICAL PROPERTIES

Appearance	:	Clear. Liquid.
Odour	:	Sweet.
Boiling point	:	130 - 133 °C / 266 - 271 °F
Flash point	:	41 °C / 106 °F (IP 170)
Explosion / Flammability limits in air	:	1 - 5.5 %(V)
Auto-ignition temperature	:	305 °C / 581 °F (ASTM E-659)
Vapour pressure	:	420 Pa at 20 °C / 68 °F
Specific gravity	:	0.81 at 20 °C / 68 °F
Density	:	806 - 808 kg/m3 at 20 °C / 68 °F (ASTM D-4052)
Water solubility	:	16 g/l at 20 °C / 68 °F
Vapour density (air=1)	:	3.5
Volatile organic carbon content	:	70.6 % (EC/1999/13)
Evaporation rate (nBuAc=1)	:	0.3 (ASTM D 3539, nBuAc=1)

10. STABILITY AND REACTIVITY

Stability	:	Stable under normal conditions of use. Reacts with strong oxidising agents. Reacts with strong acids.
Conditions to Avoid	:	Avoid heat, sparks, open flames and other ignition sources.
Materials to Avoid	:	Strong oxidising agents. Strong acids.
Hazardous Decomposition Products	:	Thermal decomposition is highly dependent on conditions. A complex mixture of airborne solids, liquids and gases, including carbon monoxide, carbon dioxide and other organic compounds will be evolved when this material undergoes combustion or thermal or oxidative degradation.

11. TOXICOLOGICAL INFORMATION

Basis for Assessment	:	Information given is based on product testing.
Acute Oral Toxicity	:	Low toxicity: LD50 >2000 mg/kg , Rat
Acute Dermal Toxicity	:	Low toxicity: LD50 >2000 mg/kg , Rabbit
Acute Inhalation Toxicity	:	Low toxicity: LC50 greater than near-saturated vapour concentration. / 4 hours, Rat High concentrations may cause central nervous system depression resulting in headaches, dizziness and nausea; continued inhalation may result in unconsciousness and/or death.
Skin Irritation	:	May cause moderate skin irritation (but insufficient to classify). Prolonged/repeated contact may cause defatting of the skin which can lead to dermatitis.
Eye Irritation	:	Moderately irritating to eyes (but insufficient to classify).
Respiratory Irritation	:	Inhalation of vapours or mists may cause irritation to the respiratory system.
Sensitisation	:	Not expected to be a skin sensitiser.
Repeated Dose Toxicity	:	Kidney: caused kidney effects in male rats which are not considered relevant to humans
Mutagenicity	:	No evidence of mutagenic activity.
Carcinogenicity	:	Not expected to be carcinogenic.
Reproductive and Developmental Toxicity	:	Data not available.

12. ECOLOGICAL INFORMATION

Acute Toxicity		
Fish	:	Low toxicity: LC/EC/IC50 > 100 mg/l
Aquatic Invertebrates	:	Expected to have low toxicity: LC/EC/IC50 > 100 mg/l
Microorganisms	:	Expected to have low toxicity: LC/EC/IC50 > 100 mg/l
Mobility	:	Floats on water. If product enters soil, it will be highly mobile and may contaminate groundwater.
Persistence/degradability	:	Readily biodegradable meeting the 10 day window criterion. Oxidises rapidly by photo-chemical reactions in air.
Bioaccumulation	:	Not expected to bioaccumulate significantly.

13. DISPOSAL CONSIDERATIONS

Material Disposal	:	Recover or recycle if possible. It is the responsibility of the waste generator to determine the toxicity and physical properties of the material generated to determine the proper waste classification and disposal methods in compliance with applicable regulations. Do not dispose into the environment, in drains or in water courses. Waste product should not be allowed to contaminate soil or water.
Container Disposal	:	Drain container thoroughly. After draining, vent in a safe place away from sparks and fire. Residues may cause an explosion hazard. Do not puncture, cut or weld uncleaned drums. Send to drum recoverer or metal reclaimer.

Local Legislation	:	Disposal should be in accordance with applicable regional, national, and local laws and regulations. Local regulations may be more stringent than regional or national requirements and must be complied with.

14. TRANSPORT INFORMATION

ADR

Class	:	3
Packing group	:	III
Classification code	:	F1
Hazard indentification no.	:	30

OE_HPV	:	Listed.	

16. OTHER INFORMATION

R-phrase(s)

R10	Flammable.
R37	Irritating to respiratory system.

MSDS Version Number : 1.3

MSDS Effective Date : 22.04.2009

MSDS Revisions : A vertical bar (|) in the left margin indicates an amendment from the previous version.

Uses and Restrictions : Use as a solvent only in industrial manufacturing processes.

MSDS Distribution : The information in this document should be made available to all who may handle the product

Disclaimer : This information is based on our current knowledge and is intended to describe the product for the purposes of health, safety and environmental requirements only. It should not therefore be construed as guaranteeing any specific property of the product.

Revision Date: 11/07/2013

SODIUM HYDROSULFIDE - FLAKES 70-72 %

1. PRODUCT AND COMPANY IDENTIFICATION

1.1. Identification of the substance or mixture

Product name	:	SODIUM HYDROSULFIDE - FLAKES 70-72 %
Product grade(s)	:	SODIUM HYDROSULFIDE - (Solid 70-72 % - Crystallization water >= 25%)
Chemical Name	:	Sodium hydrosulfide
Molecular formula	:	NaHS xH2O; x >= 0,93
Molecular weight	:	72.81 g/mol

1.2. Use of the Substance/Mixture

Recommended use :
- Chemical industry
- Waste treatment
- Water treatment
- De-hairing agent
- Textile industry
- Pulp and paper

1.3. Company/Undertaking Identification

Address : SOLVAY FLUORIDES, LLC
3333 RICHMOND AVENUE
HOUSTON TX 77098-3099
United States

1.4. Emergency and contact telephone numbers

Emergency telephone number	:	**1 (800) 424-9300 CHEMTREC ® (USA & Canada)** **01-800-00-214-00 (MEX. REPUBLIC)**
Contact telephone number (product information):	:	**US: +1-800-765-8292 (Product information)** **US: +1-713-525-6500 (Product information)**

2. HAZARDS IDENTIFICATION

2.1. Emergency Overview:

NFPA	:	H= 2 F= 1 I= 2 S= None
HMIS	:	H= 2 F= 1 R= 2 PPE = Supplied by User; dependent on local conditions

General Information

Appearance	:	flakes
Colour	:	yellow

Copyright 2013, SOLVAY FLUORIDES, LLC
All Rights Reserved
www.solvay.com

SOLVAY
asking more from chemistry®

Odour : odourless, slight, rotten-egg like

2.2. Potential Health Effects:

Inhalation
- No hazards to be specially mentioned.
- (in case of higher concentration): slight irritation.

Eye contact
- May cause irreversible eye damage.
- May cause blindness.
- Symptoms: Redness, Lachrymation, Swelling of tissue, Burn.

Skin contact
- Corrosive
- Symptoms: Redness, Swelling of tissue, Burn.

Ingestion
- If ingested, severe burns of the mouth and throat, as well as a danger of perforation of the oesophagus and the stomach.
- Symptoms: Nausea, Abdominal pain, Bloody vomiting, Diarrhoea, Suffocation, Cough, Severe shortness of breath.

Other toxicity effects
- See section 11: Toxicological Information

2.3. Environmental Effects:
- See section 12: Ecological Information

3. COMPOSITION/INFORMATION ON INGREDIENTS

Sodium hydrogensulfide (hydrate)
CAS-No. : 207683-19-0
Concentration : **>= 84.0 - <= 95.5 %**

Disodium sulfide (hydrate)
CAS-No. : 27610-45-3
Concentration : **<= 13.5 %**

Sodium carbonate
CAS-No. : 497-19-8
Concentration : **<= 1.0 %**

4. FIRST AID MEASURES

4.1. Inhalation
- Move to fresh air.
- Oxygen or artificial respiration if needed.
- Victim to lie down in the recovery position, cover and keep him warm.
- Call a physician immediately.

Copyright 2013, SOLVAY FLUORIDES, LLC
All Rights Reserved
www.solvay.com

SOLVAY
asking more from chemistry®

4.2. Eye contact

- Call a physician or poison control centre immediately.
- Rinse immediately with plenty of water, also under the eyelids, for at least 15 minutes.
- In the case of difficulty of opening the lids, administer an analgesic eye wash (oxybuprocaine).
- Take victim immediately to hospital.

4.3. Skin contact

- Take off contaminated clothing and shoes immediately.
- Wash off immediately with plenty of water.
- Keep warm and in a quiet place.
- Call a physician or poison control centre immediately.
- Wash contaminated clothing before re-use.

4.4. Ingestion

- Call a physician or poison control centre immediately.
- Take victim immediately to hospital.
- If swallowed, rinse mouth with water (only if the person is conscious).
- Do NOT induce vomiting.
- Artificial respiration and/or oxygen may be necessary.

4.5. Notes to physician

Exposure to decomposition products :

- Take victim immediately to hospital.
- Immediate medical attention is required.

Exposure to decomposition products :

- Medical supervision for minimum 48 hours.

5. FIREFIGHTING MEASURES

5.1. Suitable extinguishing media

- Foam
- powder

5.2. Extinguishing media which shall not be used for safety reasons

- Water
- Carbon dioxide (CO2)

5.3. Special exposure hazards in a fire

- Not combustible.
- Hazardous decomposition products

5.4. Hazardous decomposition products

- Sulphur oxides

5.5. Special protective equipment for firefighters

- Exposure to decomposition products may be a hazard to health.
- In the event of fire, wear self-contained breathing apparatus.
- Use personal protective equipment.
- Wear chemical resistant oversuit

6. ACCIDENTAL RELEASE MEASURES

6.1. Personal precautions, protective equipment and emergency procedures

6.1.1. Advice for non-emergency personnel

- Sweep up to prevent slipping hazard.
- Avoid dust formation.
- Prevent further leakage or spillage if safe to do so.

6.1.2. Advice for emergency responders

- Isolate the area.
- Wear self-contained breathing apparatus and protective suit.

6.2. Environmental precautions

- Discharge into the environment must be avoided.
- Do not flush into surface water or sanitary sewer system.
- In case of accidental release or spill, immediately notify the appropriate authorities if required by Federal, State/Provincial and local laws and regulations.

6.3. Methods and materials for containment and cleaning up

- Pick up and arrange disposal without creating dust.
- Keep in suitable, closed containers for disposal.

6.4. Reference to other sections

- Refer to protective measures listed in sections 7 and 8.

7. HANDLING AND STORAGE

7.1. Handling

- Use product only in closed system.
- Ensure adequate ventilation.
- Keep away from heat.
- Keep away from Incompatible products.

7.2. Storage

- Store in original container.
- Keep in a well-ventilated place.
- Keep in a dry place.
- Keep in properly labelled containers.
- Keep container closed.
- Keep away from heat.
- Avoid dust formation.
- Keep away from Incompatible products.

7.3. Packaging material

- Steel drum
- Polyethylene

8. EXPOSURE CONTROLS/PERSONAL PROTECTION

8.1. Exposure Limit Values

Sodium hydrogensulfide (hydrate)

- US. ACGIH Threshold Limit Values
  Remarks: none established

Disodium sulfide (hydrate)

- US. ACGIH Threshold Limit Values
  Remarks: none established

Sodium carbonate

- SAEL (Solvay Acceptable Exposure Limit) 2007
  TWA = 10 mg/m3

ACGIH® and TLV® are registered trademarks of the American Conference of Governmental Industrial Hygienists.
SAEL = Solvay Acceptable Exposure Limit, Time Weighted Average for 8 hour workdays. No Specific TLV STEL (Short Term Exposure Level) has been set. Excursions in exposure level may exceed 3 times the TLV TWA for no more than a total of 30 minutes during a workday and under no circumstances should they exceed 5 times the TLV TWA.

8.2. Engineering controls

- Provide appropriate exhaust ventilation at places where dust is formed.
- Apply technical measures to comply with the occupational exposure limits.

8.3. Personal protective equipment

8.3.1. Respiratory protection

- In case of insufficient ventilation, wear suitable respiratory equipment.
- When workers are facing concentrations above the exposure limit they must use appropriate certified respirators.
- In case of decomposition (see section 10), face mask with combined type B-P3 cartridge.
- Recommended Filter type:: P3

8.3.2. Hand protection

- chemical resistant gloves
- Suitable material: PVC, Neoprene, Natural Rubber

8.3.3. Eye protection

- Goggles

8.3.4. Skin and body protection

- Dust impervious protective suit
- Apron
- Boots
- PVC
- Neoprene

8.3.5. Hygiene measures

- Eye wash bottles or eye wash stations in compliance with applicable standards.
- When using, do not eat, drink or smoke.
- Handle in accordance with good industrial hygiene and safety practice.

9. PHYSICAL AND CHEMICAL PROPERTIES

9.1. General Information

Appearance	:	flakes
Colour	:	yellow
Odour	:	odourless, slight, rotten-egg like

9.2. Important health safety and environmental information

pH	:	11.2 (1 % solution) : 12.1 (saturated aqueous solution)
Boiling point/boiling range	:	*Remarks*: not applicable
Flash point	:	( ) (inorganic) *Remarks*: not applicable
Flammability	:	*Remarks*: not applicable
Explosive properties	:	*Explosion danger*: *Remarks*: Not explosive
Oxidizing properties	:	*Remarks*: Non oxidizer
Vapour pressure	:	(inorganic) *Remarks*: not applicable
Relative density / Density	:	1.55
Solubility(ies)	:	548 g/l *Temperature*: 20 °C (68 °F)
Partition coefficient: n-octanol/water	:	*log Pow*: (inorganic) *Remarks*: not applicable
Viscosity	:	*Remarks*: not applicable
Vapour density	:	(inorganic) *Remarks*: not applicable
Evaporation rate	:	(inorganic) *Remarks*: not applicable

9.3. Other data

Melting point/range	:	44 - 48 °C (111 - 118 °F)
Auto-flammability	:	> 150 °C (302 °F)
Granulometry	:	7000 µm *Remarks*: d 50

Decomposition temperature : *Remarks*: not applicable

10. STABILITY AND REACTIVITY

10.1. Stability
- Stable under recommended storage conditions.

10.2. Conditions to avoid
- Keep away from flames and hot surfaces.
- Exposure to moisture.

10.3. Materials to avoid
- Carbon dioxide (CO2), Acids, Oxidizing agents, Metals

10.4. Hazardous decomposition products
- Sulphur oxides: Hydrogen sulphide

11. TOXICOLOGICAL INFORMATION

Toxicological data

Acute oral toxicity
- LD50, rat, 72 - 105 mg/kg

Acute inhalation toxicity
- , Remarks: no data available

Acute dermal irritation/corrosion
- Remarks: study scientifically unjustified

Skin irritation
- Corrosive

Eye irritation
- Corrosive

Chronic toxicity
- Inhalation, 90-day, rat, (Hydrogen sulphide), Remarks: NOAEC

Carcinogenicity
- Remarks: no data available

Reproductive toxicity
- no data available

Remarks
- no data available
- In vitro tests did not show mutagenic effects
- In vivo tests did not show mutagenic effects

12. ECOLOGICAL INFORMATION

Copyright 2013, SOLVAY FLUORIDES, LLC
All Rights Reserved
www.solvay.com

SOLVAY
asking more from chemistry®

12.1. Ecotoxicity effects

Acute toxicity

- Fishes, LC50, 96 h, 0.0027 mg/l (Hydrogen sulphide)
- Fishes, Lepomis macrochirus, NOEC, 826 Days, 0.0046 mg/l (Hydrogen sulphide)
- Crustaceans, EC50, 96 h, 0.02 mg/l (Fresh water) (Hydrogen sulphide)
- Crustaceans, EC50, 96 h, 0.032 mg/l (Marine water) (Hydrogen sulphide)

Chronic toxicity

- Amphipod (Eohaustorius estuarius), LOEC, 48 h, 1.92 mg/l (Hydrogen sulphide)
- Amphipod (Eohaustorius estuarius), LC50, 3.32 mg/l (Hydrogen sulphide)
- Algae, Nitszcheria linearis, EC50, 120 h, 1,900 mg/l (Sodium sulfate)
  Remarks: fresh water
- Algae, Skeletonema costatum, EC50, 4 h, 0.104 mg/l (Sodium sulfide)
  Remarks: salt water

12.2. Mobility

- Air
  Remarks: mobility as solid aerosols
- Water/soil
  Remarks: considerable solubility and mobility

12.3. Persistence and degradability

Abiotic degradation

- Air, indirect photo-oxidation, Chemical degradation 0.6 - 2 %, from 1 h (hydrogen sulphide)
  Conditions: sensitizer: OH/O3 radicals
  Degradation products: Sulphur dioxide / sulfates / Sulphides
- Water/soil
  Result: complexation/precipitation of inorganic and organic materials
- Water/soil
  Result: oxidation
  Degradation products: sulfates

Biodegradation

- aerobic, Tested according to: oxidation (Sulphides)
  Degradation products: sulfites / sulfates
- anaerobic, Tested according to: biodegradation by sulforeduction (sulfates)
  Degradation products: hydrogen sulphide
- anaerobic, Tested according to: methanogenesis (sulfates)
  Remarks: inhibitory action

12.4. Bioaccumulative potential

- Result: Does not bioaccumulate.

12.5. Other adverse effects

- no data available

12.6. Remarks

13. DISPOSAL CONSIDERATIONS

Copyright 2013, SOLVAY FLUORIDES, LLC
All Rights Reserved
www.solvay.com

SOLVAY
asking more from chemistry®

13.1. Waste from residues / unused products

- In accordance with local and national regulations.
- Where possible recycling is preferred to disposal or incineration.
- Use an FeCl3 solution to precipitate FeS.
- Filtrate the product and send the cake to a landfill for industrial waste.

13.2. Packaging treatment

- The empty and clean containers are to be reused in conformity with regulations.
- Uncleaned empty packaging
- Dispose of as unused product.

13.3. RCRA Hazardous Waste

- Listed RCRA Hazardous Waste (40 CFR 302) - No
- Unlisted RCRA Hazardous Waste (40 CFR 302) - Yes
- D002 (corrosive waste)
- D003 (reactive waste)

14. TRANSPORT INFORMATION

IATA-DGR

UN number	UN 2949
Class	8
Packing group	II
ICAO-Labels	8 - Corrosive

BRENNTAG

MATERIAL SAFETY DATA SHEET

POTASSIUM AMYL XANTHATE, SOLID

1. CHEMICAL PRODUCT AND COMPANY IDENTIFICATION

Brenntag Canada Inc.
43 Jutland Rd.
Toronto, ON
M8Z 2G6
(416) 259-8231

Website: http:\\www.brenntag.ca

WHMIS#:	00060600
Index:	HCI0065/09B
Effective Date:	2009 June 17
Date of Revision:	2009 June 17

EMERGENCY TELEPHONE NUMBERS (FOR EMERGENCIES INVOLVING CHEMICAL SPILLS OR RELEASE)

Toronto, ON (416) 226-6117	Montreal, QC (514) 861-1211	Winnipeg, MB (204) 943-8827
Edmonton, AB (780) 424-1754	Calgary, AB (403) 263-8660	Vancouver, BC (604) 685-5036

PRODUCT IDENTIFICATION

Product Name:	Potassium Amyl Xanthate, Solid.
Chemical Name:	Dithiocarbonic Acid, Amyl Ester, Potassium Salt.
Synonyms:	Potassium Amyl Xanthate; KAX 51; Potassium Pentyl Xanthate; Potassium Pentyl Xanthogenate.
Chemical Family:	Salts of carbonic acid dithio esters.
Molecular Formula:	C6H11OS2. K.
Product Use:	Flotation agent.

WHMIS Classification / Symbol:

B-6: Reactive Flammable Material
D-1B: Toxic (acute effects)
D-2B: Toxic (skin and eye irritant)

READ THE ENTIRE MSDS FOR THE COMPLETE HAZARD EVALUATION OF THIS PRODUCT.

2. COMPOSITION, INFORMATION ON INGREDIENTS (Not Intended As Specifications)

Ingredient	*CAS#*	*ACGIH TLV*	*% Concentration*
Potassium Amyl Xanthate	2720-73-2	---	60 - 100
Potassium Hydroxide	1310-58-3	—	1 - 5
Isoamyl alcohol	123-51-3	100 ppm	1 - 5
Decomposition Product: Carbon disulfide	75-15-0	10 ppm (Skin)	

Skin Notation: Contact with skin, eyes and mucous membranes can contribute to the overall exposure and may invalidate the TLV. Consider measures to prevent absorption by these routes.

3. HAZARDS IDENTIFICATION

EMERGENCY OVERVIEW: May be fatal if swallowed. Harmful if inhaled. Causes skin and eye irritation. Dust is irritating to respiratory tract. See "Other Health Effects" Section. Heating of solid xanthate or aging or heating of solutions will cause formation of Carbon Bisulfide. Upon exposure of solid xanthates to moisture and/or heat, decomposition results and spontaneous combustion can occur. Contact of solid xanthate with moist air has resulted in ignition. (4) Emits a flammable gas upon contact with water or water vapour. Can decompose at high temperatures forming toxic gases. Powdered material may form explosive dust-air mixtures. Contents may develop pressure on prolonged exposure to heat.

POTENTIAL HEALTH EFFECTS

Inhalation:	Excessive contact with powder may cause drying of mucous membranes of nose and throat due to absorption of moisture and oils. Product may cause severe irritation of the nose, throat and respiratory tract. Repeated and/or prolonged exposures may cause productive cough, running nose, bronchopneumonia, pulmonary oedema (fluid build-up in lungs), and reduction of pulmonary function. Irritation of mucous membranes and respiratory tract is possible following exposure to the decomposition product. (3) See "Other Health Effects" Section.
Skin Contact:	Brief contact with the dust causes irritation. Greater exposure causes severe burns. In the presence of moisture (perspiration, humidity, tears), the dust dissolves to form a corrosive solution which may cause burns. (3) Potassium Amyl Xanthate may cause symptoms of skin irritation such as reddening, swelling, rash, scaling, or blistering. May cause defatting, drying and cracking of the skin.
Skin Absorption:	May be absorbed through intact skin. See Section 11, "Other Studies Relevant to Material".
Eye Contact:	This product may cause irritation, redness and possible damage due to abrasiveness. Brief contact with the dust causes irritation. Greater exposure causes severe burns. In the presence of moisture (perspiration, humidity, tears), the dust dissolves to form a corrosive solution which may cause burns. (3) Irritation of the eyes is possible following exposure to the decomposition product. (3)
Ingestion:	Ingestion is not a likely route of exposure. This product causes irritation, a burning sensation of the mouth and throat and abdominal pain.
Other Health Effects:	Effects (irritancy) on the skin and eyes may be delayed, and damage may occur without the sensation or onset of pain. Strict adherence to first aid measures following any exposure is essential. May cause cardiovascular effects, liver damage, peripheral nervous system (PNS) effects or central nervous system (CNS) depression. CNS depression is characterized by headache, dizziness, drowsiness, nausea, vomiting and incoordination. Severe overexposures may lead to coma and possible death due to respiratory failure. Peripheral Neuropathy is a progressive disorder of the nervous system characterized by sensory and motor abnormalities, muscle spasms, weakness and pain in the arms and legs, numbness and tingling of the fingers and toes and paralysis. Liver damage is characterized by the loss of appetite, jaundice (yellowish skin colour), and occasional pain in the upper left-hand side of the abdomen. Potassium Amyl Xanthate: Symptoms of potassium poisoning may occur. These include slow heartbeat, accelerated breathing, muscle weakness and, in severe cases, paralysis. Vapours of the decomposition products of Xanthates (Carbon Bisulphide) can cause severe disturbances of mood and behaviour, including excitation, anger and violent dreams. High concentrations of vapours can cause death. (4) Carbon Bisulphide: Contact with moisture in the body by inhalation may yield sodium hydroxide (corrosive) and 2-mercaptobenzothiazole, an irritant. (4) Contact with acids will liberate carbon disulphide. (3) Exposure to carbon disulphide (500 to 1000 ppm) may cause severe mood and personality disturbances, including excitability, confusion, irritability, uncontrollable anger, bizarre dreams, insomnia, psychosis and suicide. Exposure to carbon disulphide at 4800 ppm for thirty minutes results in coma and may be fatal. Carbon disulphide is readily absorbed through intact skin. Chronic exposure to carbon disulphide produces central and peripheral nervous system, cardiovascular, gastrointestinal, kidney, endocrine and eye disorders. (4) Potassium Hydroxide: Exposure to very low doses, even for a short period of time, has produced extensive damage to the esophagus, stomach and intestine extending into surrounding tissues, as well as hyperexcitability followed by apathy and weakness. In some cases, death has resulted from hemorrhage, adhesions or perforation. Following esophageal damage, strictures have frequently developed in surviving animals. (4)

4. FIRST AID MEASURES

FIRST AID PROCEDURES

Inhalation:	Move victim to fresh air. Give artificial respiration ONLY if breathing has stopped. Give cardiopulmonary resuscitation (CPR) if there is no breathing AND no pulse. Obtain medical advice IMMEDIATELY.
Skin Contact:	Prompt removal of the material from the skin is essential. Remove all contaminated clothing and immediately wash the exposed areas with copious amounts of soap and water for a minimum of 30 minutes or up to 60 minutes for critical body areas. Immerse the exposed part immediately in ice water to relieve pain and to prevent swelling and blistering. Place cold packs, ice or wet cloths on the burned area if immersion is not possible. Cover the exposed part with a clean, preferably sterile, lint-free dressing. Obtain medical attention IMMEDIATELY and monitor breathing and treat for shock for severe exposure.
Eye Contact:	Immediately flush eyes with running water for a minimum of 20 minutes. Hold eyelids open during flushing. If irritation persists, repeat flushing. Obtain medical attention IMMEDIATELY.

Ingestion:	Do not attempt to give anything by mouth to an unconscious person. If victim is alert and not convulsing, rinse mouth out and give 1/2 to 1 glass of water to dilute material. IMMEDIATELY contact local Poison Control Centre. Vomiting should only be induced under the direction of a physician or a poison control centre. If spontaneous vomiting occurs, have victim lean forward with head down to avoid breathing in of vomitus, rinse mouth and administer more water. IMMEDIATELY transport victim to an emergency facility.
Note to Physicians:	Treat symptomatically. Medical conditions that may be aggravated by exposure to this product include neurological and cardiovascular disorders, diseases of the skin, eyes or respiratory tract, preexisting liver and kidney disorders.

5. FIRE-FIGHTING MEASURES

Flashpoint (°C)	***AutoIgnition Temperature (°C)***	**Flammability Limits in Air (%):** ***LEL***	***UEL***
-30. (Carbon Disulphide)	90.1 (Carbon Disulphide)	1.25. (Carbon Disulphide)	50. (Carbon Disulphide)

Flammability Class (WHMIS):	B-6: Reactive Flammable Material
Hazardous Combustion Products:	Thermal decomposition products are toxic and may include Carbon Disulphide, Potassium sulphide, carbonyl sulphide, Amyl Alcohols, oxides of carbon, sulphur, potassium and irritating gases.
Unusual Fire or Explosion Hazards:	This product may be capable of forming flammable dust clouds in air. Avoid accumulation and dispersion of dust to reduce explosion potential. Spilled material may cause floors and contact surfaces to become slippery. Heating of solid xanthate or aging or heating of solutions will cause formation of Carbon Bisulfide. Upon exposure of solid xanthates to moisture and/or heat, decomposition results and spontaneous combustion can occur. Contact of solid xanthate with moist air has resulted in ignition. (4) Vapours from this product are heavier than air, and may "travel" to a source of ignition (eg. pilot lights, heaters, electric motors) some distance away, and then "flash back" to the point of product discharge causing an explosion and fire. Enforce NO SMOKING rules.
Sensitivity to Mechanical Impact:	Not expected to be sensitive to mechanical impact.
Rate of Burning:	Not available.
Explosive Power:	Not available.
Sensitivity to Static Discharge:	If product has come into contact with moisture and Carbon Bisulphide gas has evolved, then Carbon Bisulphide is expected to be sensitive to static discharge if vapours are present between the lower and upper explosive limits. (3) High voltage static electricity build-up is possible when significant quantities of dust are present.
EXTINGUISHING MEDIA	
Fire Extinguishing Media:	Use carbon dioxide or dry chemical media for small fires. If only water is available, use it in the form of a fog. Cool containers with flooding quantities of water until well after the fire is out. Exposure to heat and moisture may cause the decomposition of xanthates to release flammable, explosive and poisonous Carbon Bisulphide vapours. (3)
FIRE FIGHTING INSTRUCTIONS	
Instructions to the Fire Fighters:	Use water spray to cool fire-exposed containers or structures. Use water spray to disperse vapours; re-ignition is possible. Clean up immediately to eliminate slipping hazard. Do not allow to enter sewers or watercourses. Avoid accumulation and dispersion of dust to reduce explosion potential.
Fire Fighting Protective Equipment:	Use self-contained breathing apparatus and protective clothing.

6. ACCIDENTAL RELEASE MEASURES

Information in this section is for responding to spills, leaks or releases in order to prevent or minimize the adverse effects on persons, property and the environment. There may be specific reporting requirements associated with spills, leaks or releases, which change from region to region.

Containment and Clean-Up Procedures:	In all cases of leak or spill contact vendor at Emergency Number shown on the front page of this MSDS. Avoid accumulation and dispersion of dust to reduce explosion potential. Wear respirator, protective clothing and gloves. Spilled material may cause floors and contact surfaces to become slippery. Any recovered product can be used for the usual purpose, depending on the extent and kind of contamination. Where a package (drum or bag) is damaged and / or leaking, repair it, or place it into an over-pack drum immediately so as to avoid or minimize material loss and contamination of surrounding environment. Replace damaged containers immediately to avoid loss of material and contamination of surrounding atmosphere. Avoid dry sweeping. Do not use compressed air to clean surfaces. Vacuuming or wet sweeping is preferred. Return all material possible to container for proper disposal. Do not flush with water as aqueous solutions or powders that become wet render surfaces extremely slippery. Eliminate all sources of ignition. Collect product for recovery or disposal. For release to land, or storm water runoff, contain discharge by constructing dykes or applying inert absorbent; for release to water, utilize damming and/or water diversion to minimize the spread of contamination. Ventilate enclosed spaces. Notify applicable government authority if release is reportable or could adversely affect the environment.

7. HANDLING AND STORAGE

HANDLING

Handling Practices:	Avoid accumulation and dispersion of dust to reduce explosion potential. Ground and bond equipment and containers to prevent a static charge buildup. Use spark-resistant tools. Use normal "good" industrial hygiene and housekeeping practices. Clean up immediately to eliminate slipping hazard. Enforce NO SMOKING rules in area of use.
Ventilation Requirements:	See Section 8, "Engineering Controls".
Other Precautions:	Use only with adequate ventilation and avoid breathing dusts (aerosols, vapours or mists). Avoid contact with eyes, skin or clothing. Wash thoroughly with soap and water after handling. Wash contaminated clothing thoroughly before re-use. Do not use cutting or welding torches on empty drums that contained this material/product. Absorption via contact with skin, eyes and mucous membranes can contribute to the overall exposure. Consider measures to prevent absorption by these routes.

STORAGE

Storage Temperature (°C):	See below.
Ventilation Requirements:	Ventilation should be explosion proof.
Storage Requirements:	Store solid Xanthates under cool, dark, dry conditions. Liquid products must be kept cool and used as quickly as possible. (3) Store in a cool, well-ventilated area. Keep away from heat, sparks and flames. Keep containers closed. Do not expose sealed containers to temperatures above 40° C. Avoid moisture contamination. Prolonged storage may result in lumping or caking.
Special Materials to be Used for Packaging or Containers:	Materials of construction for storing the product include: carbon steel. Copper and its alloys should not be used in equipment for storage, handling or transportation. Attacks some types of rubber, plastics and coatings. Confirm suitability of any material before using.

8. EXPOSURE CONTROLS / PERSONAL PROTECTION

Recommendations listed in this section indicate the type of equipment, which will provide protection against overexposure to this product. Conditions of use, adequacy of engineering or other control measures, and actual exposures will dictate the need for specific protective devices at your workplace.

ENGINEERING CONTROLS

Engineering Controls:	Local exhaust ventilation required. Ventilation should be explosion proof. Make up air should be supplied to balance air that is removed by local or general exhaust ventilation. Avoid accumulation and dispersion of dust to reduce explosion potential. Ventilate low lying areas such as sumps or pits where dense dust may collect. Enforce NO SMOKING rules.

PERSONAL PROTECTIVE EQUIPMENT (PPE)

Eye Protection:	Use chemical safety goggles when there is potential for eye contact. Use full face-shield and chemical safety goggles when there is potential for contact.
Skin Protection:	Gloves and protective clothing made from neoprene, PVC, polyethylene, rubber or plastic should be impervious under conditions of use. Attacks some types of rubber, plastics and coatings. Prior to use, user should confirm impermeability. Discard contaminated gloves.
Respiratory Protection:	No specific guidelines available. A NIOSH/MSHA-approved air-purifying respirator equipped with dust, mist, fume cartridges for concentrations up to 2 mg/m^3 Potassium Hydroxide. An air-supplied respirator if concentrations are higher or unknown.

Other Personal Protective Equipment:	Avoid accumulation and dispersion of dust to reduce explosion potential. Wear an impermeable apron and boots. Locate safety shower and eyewash station close to chemical handling area. Take all precautions to avoid personal contact. Clothing and footwear that is fire retardant and dissipates static electrical charges should be worn when handling flammable materials. Natural fibers (cotton, wool, leather and linen) should be selected in favour of synthetic materials (rayon, nylon and polyester). Skin Notation: Contact with skin, eyes and mucous membranes can contribute to the overall exposure and may invalidate the TLV. Consider measures to prevent absorption by these routes.

EXPOSURE GUIDELINES

SUBSTANCE	***ACGIH TLV***	***OSHA PEL***		***NIOSH REL***	
	(STEL)	***(TWA)***	***(STEL)***	***(TWA)***	***(STEL)***
Potassium Hydroxide	2 mg/m³ (Ceiling)	---	---	---	2 mg/m³ (Ceiling)
Isoamyl alcohol	125 ppm	100 ppm	---	100 ppm	125 ppm
Decomposition Product: Carbon disulfide	—	20 ppm (Skin)	30 ppm (Skin)	1 ppm (Skin)	3 ppm (Skin)

9. PHYSICAL AND CHEMICAL PROPERTIES (Not intended as Specifications)

Physical State:	Solid.
Appearance:	Yellow to yellow-green pellets.
Odour:	Strong, disagreeable sulphur odour.
Odour Threshold (ppm):	0.02 - 0.21(Carbon Disulphide)
Boiling Range (°C):	Not available.
Melting/Freezing Point (°C):	255 - 280 (decomposes). (3)
Vapour Pressure (mm Hg at 20° C):	Not applicable.
Vapour Density (Air = 1.0):	Not applicable.
Relative Density (g/cc):	0.7. (4)
Bulk Density:	Not applicable.
Viscosity:	Not applicable.
Evaporation Rate (Butyl Acetate = 1.0):	Not applicable.
Solubility:	Soluble in water. Hygroscopic (readily absorbs water).
% Volatile by Volume:	< 20. (3)
pH:	10.5 (10 % solution). (3)
Coefficient of Water/Oil Distribution:	Not available.
Volatile Organic Compounds (VOC):	Not applicable.
Flashpoint (°C):	-30. (Carbon Disulphide)

10. STABILITY AND REACTIVITY

CHEMICAL STABILITY

Under Normal Conditions:	Unstable. Solid Xanthates are stable when kept cool and dry. Exposure to heat causes decomposition. Acids and oxidizing agents accelerate aging. In solution, Xanthates will decompose slowly even at room temperature. (3)
Under Fire Conditions:	Flammable. This product may be capable of forming flammable dust clouds in air.
Hazardous Polymerization:	Will not occur.
Conditions to Avoid:	High temperatures, sparks, open flames and all other sources of ignition. Avoid accumulation and dispersion of dust to reduce explosion potential. Exposure to heat and moisture may cause the decomposition of xanthates to release flammable, explosive and poisonous Carbon Bisulphide vapours. (3)
Materials to Avoid:	Strong oxidizers. Lewis or mineral acids. Metal Salts. Copper and its alloys.. Contact with acids will liberate Carbon Bisulphide. Avoid moisture contamination. Contact with water or moisture will liberate Carbon Bisulphide. Mixtures or reactions of alcohols with the following materials may cause explosions: barium perchlorate, chlorine, hypochlorous acid, ethylene oxide, hexamethylene diisocyanate and other isocyanates, nitrogen tetroxide, permonosulfuric acid and tri-isobutyl aluminum. (4) Attacks some types of rubber, plastics and coatings.

Decomposition or Combustion Products:	Thermal decomposition products are toxic and may include Carbon Bisulphide, Potassium sulphide, carbonyl sulphide, Amyl Alcohols, oxides of carbon, sulphur, potassium and irritating gases.

11. TOXICOLOGICAL INFORMATION

TOXICOLOGICAL DATA:

SUBSTANCE	*LD50 (Oral, Rat)*	*LD50 (Dermal, Rabbit)*	*LC50 (Inhalation, Rat, 4h)*
Potassium Amyl Xanthate	1 000 mg/kg (3)	---	---
Potassium Hydroxide	214 - 365 mg/kg (1,3)	1 260 mg/kg (3)	---
Isoamyl alcohol	1 300 mg/kg (1)	3 216 mg/kg (1)	---
Decomposition Product: Carbon disulfide	1 200 mg/kg (1)	---	12 500 mg/m3 (1)

Carcinogenicity Data:	The ingredient(s) of this product is (are) not classed as carcinogenic by ACGIH, IARC, OSHA or NTP.
Reproductive Data:	This product: No adverse reproductive effects are anticipated.
Mutagenicity Data:	No adverse mutagenic effects are anticipated.
Teratogenicity Data:	No adverse teratogenic effects are anticipated.
Respiratory / Skin Sensitization Data:	None known.
Synergistic Materials:	Alcohols may interact synergistically with chlorinated solvents (example - carbon tetrachloride, chloroform, bromotrichloromethane), dithiocarbamates (example - disulfiram), dimethylnitrosamine and thioacetamide. (4) Carbon Bisulphide: The toxic effects of Carbon Bisulphide, particularly on the nervous system, can be intensified by consumption of alcohol, alcoholism, treatment with disulfiram (Antibuse), and exposure to Hydrogen Sulphide. (4) In animal studies the toxicity of Carbon Bisulphide was intensified by chemicals such as resperine and amphetamine which act on the nervous system. (4)
Other Studies Relevant to Material:	None known.

12. ECOLOGICAL INFORMATION

Ecotoxicity:	Not available. May be harmful to aquatic life.
Environmental Fate:	Not available. Product has an unaesthetic appearance and can be a nuisance. Can be dangerous if allowed to enter drinking water intakes. Do not contaminate domestic or irrigation water supplies, lakes, streams, ponds, or rivers.

13. DISPOSAL CONSIDERATIONS

Deactivating Chemicals:	Not available.
Waste Disposal Methods:	This information applies to the material as manufactured. Reevaluation of the product may be required by the user at the time of disposal since the product uses, transformations, mixtures and processes may influence waste classification. Dispose of waste material at an approved (hazardous) waste treatment/disposal facility in accordance with applicable local, provincial and federal regulations. Do not dispose of waste with normal garbage, or to sewer systems.
Safe Handling of Residues:	See "Waste Disposal Methods".
Disposal of Packaging:	Empty containers retain product residue and can be dangerous. Treat package in the same manner as the product.

14. TRANSPORTATION INFORMATION

CANADIAN TDG ACT SHIPPING DESCRIPTION:

XANTHATES, Class 4.2, UN3342, PG III.

Label(s): Substances Liable To Spontaneous Combustion. Placard: Substances Liable To Spontaneous Combustion.

ERAP Index: -----. Exemptions: None known.

US DOT CLASSIFICATION (49CFR 172.101, 172.102):

XANTHATES, Class 4.2, UN3342, PG III.

Label(s): Spontaneously Combustible. Placard: Spontaneously Combustible.

CERCLA-RQ: Not available. Exemptions: None known.

15. REGULATORY INFORMATION

CANADA

CEPA - NSNR: All constituents of this product are included on the DSL.

CEPA - NPRI: Not included.

Controlled Products Regulations Classification (WHMIS):

B-6: Reactive Flammable Material
D-1B: Toxic (acute effects)
D-2B: Toxic (skin and eye irritant)

USA

Environmental Protection Act: All constituents of this product are included on the TSCA inventory.

OSHA HCS (29CFR 1910.1200): Flammable Solid. Toxic. Skin and Eye Irritant.

NFPA: 3 Health, 4 Fire, 0 Reactivity (6)

HMIS: Health, Fire, Reactivity (Not available.)

INTERNATIONAL

Not available.

Material Safety Data Sheet
Calcium oxide

MSDS# 04030

Section 1 - Chemical Product and Company Identification

MSDS Name:	Calcium oxide
Catalog Numbers:	AC196910000, AC196910010, AC196910025, AC403895000, AC422830000, AC422830010 AC422830010, C114-3, C114-50, C117-500
Synonyms:	Lime; Quicklime; Burnt lime; Calx; Unslaked lime; Fluxing lime; Calcia; Pebble lime.

Company Identification:	Fisher Scientific One Reagent Lane Fair Lawn, NJ 07410
For information in the US, call:	201-796-7100
Emergency Number US:	201-796-7100
CHEMTREC Phone Number, US:	800-424-9300

Section 2 - Composition, Information on Ingredients

CAS#:	1305-78-8
Chemical Name:	Calcium oxide
%:	96+
EINECS#:	215-138-9

Hazard Symbols: C

Risk Phrases: 14 22 35

Section 3 - Hazards Identification

EMERGENCY OVERVIEW

Danger! Harmful if swallowed. Causes burns by all exposure routes. Reacts violently with water. Target Organs: Respiratory system, gastrointestinal system, eyes, skin.

Potential Health Effects

Eye: Causes eye burns.

Skin: Causes skin burns. May be harmful if absorbed through the skin.

Ingestion: Harmful if swallowed. Causes gastrointestinal tract burns.

Inhalation: Causes chemical burns to the respiratory tract. May be harmful if inhaled.

Chronic: Prolonged or repeated skin contact may cause dermatitis. Chronic inhalation may cause nasal septum ulceration and perforation.

Section 4 - First Aid Measures

Eyes: Immediately flush eyes with plenty of water for at least 15 minutes, occasionally lifting the upper and lower eyelids. Get medical aid immediately.

Skin: Get medical aid immediately. Immediately flush skin with plenty of water for at least 15 minutes while removing contaminated clothing and shoes.

Ingestion: Do not induce vomiting. Get medical aid immediately. Call a poison control center.

Inhalation: Get medical aid immediately. Remove from exposure and move to fresh air immediately. If breathing is difficult, give oxygen. Do not use mouth-to-mouth resuscitation if victim ingested or inhaled the substance; induce artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper

respiratory medical device.

Notes to Physician: Treat symptomatically and supportively.

Section 5 - Fire Fighting Measures

General Information: As in any fire, wear a self-contained breathing apparatus in pressure-demand, MSHA/NIOSH (approved or equivalent), and full protective gear. Water reactive. Material will react with water and may release a flammable and/or toxic gas.

Extinguishing Media: Use foam, dry chemical, or carbon dioxide. DO NOT USE WATER!

Autoignition Temperature: Not available.

Flash Point: Not applicable.

Explosion Limits: Lower: Not available

Explosion Limits: Upper: Not available

NFPA Rating: ; Special Hazard: -W-

Section 6 - Accidental Release Measures

General Information: Use proper personal protective equipment as indicated in Section 8.

Spills/Leaks: Vacuum or sweep up material and place into a suitable disposal container. Wear a self contained breathing apparatus and appropriate personal protection. (See Exposure Controls, Personal Protection section). Avoid generating dusty conditions. Provide ventilation. Do not expose spill to water. Do not get water inside containers. Do not let this chemical enter the environment.

Section 7 - Handling and Storage

Handling: Do not allow water to get into the container because of violent reaction. Minimize dust generation and accumulation. Do not get in eyes, on skin, or on clothing. Do not ingest or inhale. Do not allow contact with water. Use only in a chemical fume hood.

Storage: Store in a cool, dry place. Store in a tightly closed container. Corrosives area. Store protected from moisture. Store under an inert atmosphere.

Section 8 - Exposure Controls, Personal Protection

Chemical Name	ACGIH	NIOSH	OSHA - Final PELs
Calcium oxide	2 mg/m3	2 mg/m3 TWA 25 mg/m3 IDLH	5 mg/m3 TWA

OSHA Vacated PELs: Calcium oxide: 5 mg/m3 TWA (not in effect as a result of reconsideration)

Engineering Controls:

Facilities storing or utilizing this material should be equipped with an eyewash facility and a safety shower. Use only under a chemical fume hood.

Exposure Limits

Personal Protective Equipment

Eyes: Wear appropriate protective eyeglasses or chemical safety goggles as described by OSHA's eye and face protection regulations in 29 CFR 1910.133 or European Standard EN166.

Skin: Wear appropriate protective gloves to prevent skin exposure.

Clothing: Wear appropriate protective clothing to prevent skin exposure.

Respirators: Follow the OSHA respirator regulations found in 29 CFR 1910.134 or European Standard EN 149. Use a NIOSH/MSHA or European Standard EN 149 approved respirator if exposure limits are exceeded or if irritation or other symptoms are experienced.

Section 9 - Physical and Chemical Properties

Physical State: Powder

Color:	white to light yellow - very slightly beige
Odor:	Odorless.
pH:	12.5 (1.65 g/L aq sol)
Vapor Pressure:	Negligible.
Vapor Density:	Not available
Evaporation Rate:	Negligible.
Viscosity:	Not available
Boiling Point:	2850 deg C @ 760 mmHg (5,162.00°F)
Freezing/Melting Point:	2570 deg C (4,658.00°F)
Decomposition Temperature:	Not available
Solubility in water:	Reacts
Specific Gravity/Density:	Not available.
Molecular Formula:	CaO
Molecular Weight:	56.08

Section 10 - Stability and Reactivity

Chemical Stability:	Air sensitive. Reacts violently with water. Moisture sensitive.
Conditions to Avoid:	Incompatible materials, dust generation, exposure to air, exposure to moist air or water.
Incompatibilities with Other Materials	Strong oxidizing agents, acids, carbon dioxide, chlorine trifluoride, fluorine, halogens, phosphorus pentoxide, calcium chloride, metal halides, hydrofluoric acid, hydrogen fluoride, ethanol, boron trifluoride.
Hazardous Decomposition Products	Calcium hydroxide.
Hazardous Polymerization	Has not been reported.

Section 11 - Toxicological Information

RTECS#:	CAS# 1305-78-8: EW3100000
LD50/LC50:	RTECS: Not available.
Carcinogenicity:	Calcium oxide - Not listed as a carcinogen by ACGIH, IARC, NTP, or CA Prop 65.
Other:	See actual entry in RTECS for complete information.

Section 12 - Ecological Information

Other: Do not empty into drains.

Section 13 - Disposal Considerations

Dispose of in a manner consistent with federal, state, and local regulations.

Section 14 - Transport Information

US DOT
Shipping Name: CALCIUM OXIDE
Hazard Class: 8
UN Number: UN1910
Packing Group: III
Canada TDG
Shipping Name: CALCIUM OXIDE
Hazard Class: 8
UN Number: UN1910
Packing Group: III

Section 15 - Regulatory Information

European/International Regulations

European Labeling in Accordance with EC Directives

Hazard Symbols: C

Risk Phrases:

R 14 Reacts violently with water.

R 22 Harmful if swallowed.

R 35 Causes severe burns.

Safety Phrases:

S 25 Avoid contact with eyes.

S 36/37/39 Wear suitable protective clothing, gloves and eye/face protection.

S 45 In case of accident or if you feel unwell, seek medical advice immediately (show the label where possible).

WGK (Water Danger/Protection)

CAS# 1305-78-8: 1

Canada

CAS# 1305-78-8 is listed on Canada's DSL List

Canadian WHMIS Classifications: E, F, D1B

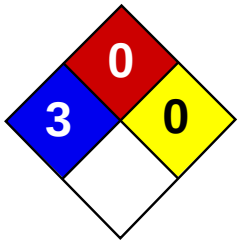
This product has been classified in accordance with the hazard criteria of the Controlled Products Regulations and the MSDS contains all of the information required by those regulations.

CAS# 1305-78-8 is listed on Canada's Ingredient Disclosure List

US Federal

TSCA

CAS# 1305-78-8 is listed on the TSCA Inventory.



Section 16 - Other Information

MSDS Creation Date: 12/12/1997

Revision #13 Date 7/20/2009

The information above is believed to be accurate and represents the best information currently available to us. However, we make no warranty of merchantibility or any other warranty, express or implied, with respect to such information, and we assume no liability resulting from its use. Users should make their own investigations to determine the suitability of the information for their particular purposes. In no event shall the company be liable for any claims, losses, or damages of any third party or for lost profits or any special, indirect, incidental, consequential, or exemplary damages howsoever arising, even if the company has been advised of the possibility of such damages.

Material Safety Data Sheet
Sodium Cyanide MSDS

Section 1: Chemical Product and Company Identification

Product Name: Sodium Cyanide

Catalog Codes: SLS2314, SLS3736

CAS#: 143-33-9

RTECS: VZ7525000

TSCA: TSCA 8(b) inventory: Sodium Cyanide

CI#: Not available.

International CHEMTREC, call: 1-703-527-3887

For non-emergency assistance, call: 1-281-441-4400

Section 2: Composition and Information on Ingredients

Composition:

Name	CAS #	% by Weight
Sodium Cyanide	143-33-9	100

Toxicological Data on Ingredients: Sodium Cyanide: ORAL (LD50): Acute: 6.44 mg/kg [Rat]. DERMAL (LD50): Acute: 10.4 mg/kg [Rabbit].

Section 3: Hazards Identification

Potential Acute Health Effects:
Very hazardous in case of skin contact (irritant), of eye contact (irritant), of ingestion, of inhalation. Hazardous in case of skin contact (permeator). Corrosive to eyes and skin. The amount of tissue damage depends on length of contact. Eye contact can result in corneal damage or blindness. Skin contact can produce inflammation and blistering. Inhalation of dust will produce irritation to gastro-intestinal or respiratory tract, characterized by burning, sneezing and coughing. Severe over-exposure can produce lung damage, choking, unconsciousness or death. Inflammation of the eye is characterized by redness, watering, and itching. Skin inflammation is characterized by itching, scaling, reddening, or, occasionally, blistering.

Potential Chronic Health Effects:
CARCINOGENIC EFFECTS: Not available. MUTAGENIC EFFECTS: Not available. TERATOGENIC EFFECTS: Not available. DEVELOPMENTAL TOXICITY: Not available. The substance may be toxic to skin, eyes, central nervous system (CNS). Repeated or prolonged exposure to the substance can produce target organs damage. Repeated exposure of the eyes to a low level of dust can produce eye irritation. Repeated skin exposure can produce local skin destruction, or dermatitis. Repeated inhalation of dust can produce varying degree of respiratory irritation or lung damage. Repeated exposure to a highly toxic material may produce general deterioration of health by an accumulation in one or many human organs.

Section 4: First Aid Measures

Eye Contact:
Check for and remove any contact lenses. In case of contact, immediately flush eyes with plenty of water for at least 15 minutes. Cold water may be used. Get medical attention immediately.

Skin Contact:
In case of contact, immediately flush skin with plenty of water for at least 15 minutes while removing contaminated clothing and shoes. Cover the irritated skin with an emollient. Cold water may be used.Wash clothing before reuse. Thoroughly clean shoes before reuse. Get medical attention immediately.

Serious Skin Contact:
Wash with a disinfectant soap and cover the contaminated skin with an anti-bacterial cream. Seek immediate medical attention.

Inhalation:
If inhaled, remove to fresh air. If not breathing, give artificial respiration. If breathing is difficult, give oxygen. Get medical attention.

Serious Inhalation:
Evacuate the victim to a safe area as soon as possible. Loosen tight clothing such as a collar, tie, belt or waistband. If breathing is difficult, administer oxygen. If the victim is not breathing, perform mouth-to-mouth resuscitation. WARNING: It may be hazardous to the person providing aid to give mouth-to-mouth resuscitation when the inhaled material is toxic, infectious or corrosive. Seek immediate medical attention.

Ingestion:
If swallowed, do not induce vomiting unless directed to do so by medical personnel. Never give anything by mouth to an unconscious person. Loosen tight clothing such as a collar, tie, belt or waistband. Get medical attention immediately.

Serious Ingestion: Not available.

Section 5: Fire and Explosion Data

Flammability of the Product: May be combustible at high temperature.

Auto-Ignition Temperature: Not available.

Flash Points: Not available.

Flammable Limits: Not available.

Products of Combustion: Some metallic oxides.

Fire Hazards in Presence of Various Substances: Slightly flammable to flammable in presence of acids, of moisture.

Explosion Hazards in Presence of Various Substances:
Risks of explosion of the product in presence of mechanical impact: Not available. Risks of explosion of the product in presence of static discharge: Not available.

Fire Fighting Media and Instructions:
SMALL FIRE: Use DRY chemical powder. LARGE FIRE: Use water spray, fog or foam. Do not use water jet.

Special Remarks on Fire Hazards:
Dangerous on contact with acids, acid fumes, water or stream. It will produce toxic and flammable vapors of CN-H and sodium oxide. Contact with acids and acid salts causes immediate formation of toxic and flammable hydrogen cyanide gas. When heated to decomposition it emits toxic fumes hydgrogen cyanide and oxides of nitrogen

Special Remarks on Explosion Hazards: Fusion mixtures of metal cyanides with metal chlorates, perchlorated or nitrates causes a violent explosion

Section 6: Accidental Release Measures

Small Spill: Use appropriate tools to put the spilled solid in a convenient waste disposal container.

Large Spill:
Corrosive solid. Poisonous solid. Stop leak if without risk. Do not get water inside container. Do not touch spilled material. Use water spray to reduce vapors. Prevent entry into sewers, basements or confined areas; dike if needed. Eliminate all ignition sources. Call for assistance on disposal. Be careful that the product is not present at a concentration level above TLV. Check TLV on the MSDS and with local authorities.

Section 7: Handling and Storage

Precautions:
Keep locked up.. Keep container dry. Keep away from heat. Keep away from sources of ignition. Empty containers pose a fire risk, evaporate the residue under a fume hood. Ground all equipment containing material. Do not ingest. Do not breathe dust. Never add water to this product. In case of insufficient ventilation, wear suitable respiratory equipment. If ingested, seek medical advice immediately and show the container or the label. Avoid contact with skin and eyes. Keep away from incompatibles such as oxidizing agents, acids, moisture.

Storage: Keep container tightly closed. Keep container in a cool, well-ventilated area. Do not store above 24°C (75.2°F).

Section 8: Exposure Controls/Personal Protection

Engineering Controls:
Use process enclosures, local exhaust ventilation, or other engineering controls to keep airborne levels below recommended exposure limits. If user operations generate dust, fume or mist, use ventilation to keep exposure to airborne contaminants below the exposure limit.

Personal Protection:
Splash goggles. Synthetic apron. Vapor and dust respirator. Be sure to use an approved/certified respirator or equivalent. Gloves.

Personal Protection in Case of a Large Spill:
Splash goggles. Full suit. Vapor and dust respirator. Boots. Gloves. A self contained breathing apparatus should be used to avoid inhalation of the product. Suggested protective clothing might not be sufficient; consult a specialist BEFORE handling this product.

Exposure Limits:
STEL: 5 (mg/m3) from ACGIH (TLV) [United States] SKIN CEIL: 4.7 from NIOSH CEIL: 5 (mg/m3) from NIOSHConsult local authorities for acceptable exposure limits.

Section 9: Physical and Chemical Properties

Physical state and appearance: Solid. (Granular solid. Flakes solid.)

Odor:
Faint almond-like odor. Odorless when perfectly dry. Emits odor of hydrogen cyanide when damp.

Taste: Not available.

Molecular Weight: 49.01 g/mole

Color: White.

pH (1% soln/water): Not available.

Boiling Point: 1496°C (2724.8°F)

Melting Point: 563°C (1045.4°F)

Critical Temperature: Not available.

Specific Gravity: 1.595 (Water = 1)

Vapor Pressure: Not applicable.

Vapor Density: Vapor Density of Hydrogen Cyanide gas: 0.941

Volatility: Not available.

Odor Threshold: Not available.

Water/Oil Dist. Coeff.: Not available.

Ionicity (in Water): Not available.

Dispersion Properties: See solubility in water.

Solubility:
Soluble in cold water. Slightly soluble in Ethanol

Section 10: Stability and Reactivity Data

Stability: The product is stable.

Instability Temperature: Not available.

Conditions of Instability: Excess heat, moisture, incompatibles.

Incompatibility with various substances: Reactive with oxidizing agents, acids, moisture.

Corrosivity:
Corrosive in presence of aluminum. Non-corrosive in presence of glass.

Special Remarks on Reactivity:
Violent reaction with fluorine gas, magnesium, nitrates, nitric acid. Dangerous on contact with acids, acid fumes, water or stream. It wil produce toxic and flammable vapors of CN-H and sodium oxide. Cyanide may react with CO2 in ordinary air to form toxic hydrogen cyanide gas. Strong oxidizers such as acids, acid salts, chlorates, and nitrates. Contact with acids and acid salts causes immediate formation of toxic and flammable hydrogen cyanide gas.

Special Remarks on Corrosivity: Corrosive to aluminum

Polymerization: Will not occur.

Section 11: Toxicological Information

Routes of Entry: Absorbed through skin. Dermal contact. Eye contact. Inhalation. Ingestion.

Toxicity to Animals:
Acute oral toxicity (LD50): 6.44 mg/kg [Rat]. Acute dermal toxicity (LD50): 10.4 mg/kg [Rabbit].

Chronic Effects on Humans: May cause damage to the following organs: skin, eyes, central nervous system (CNS).

Other Toxic Effects on Humans:
Very hazardous in case of skin contact (irritant), of ingestion, of inhalation. Hazardous in case of skin contact (permeator).

Special Remarks on Toxicity to Animals: Not available.

Special Remarks on Chronic Effects on Humans: May cause adverse reproductive effects (maternal and paternal fertility) based on animal data.

Special Remarks on other Toxic Effects on Humans:
Acute Potential Health effects: Skin: May cause itching and irritation. May be fatal if absorbed through injured skin with symtpoms similar to those noted for inhalation and ingestion. Eyes: May cause eye irritation and eye damage. Inhalation: May cause respiratory tract irritation. May be fatal if inhaled. The substance inhibits cellular respiration causing metabolic asphyxiation. May cause headache, weakness, dizziness, labored breathing, nausea, vomiting. May be followed by cardiovascular effects, unconciousness, convulsions, coma, and death Ingestion: May be fatal if swallowed. May cause

gastrointestinal tract irritation with nausea, vomiting. May affect behavior and nervous systems(seizures, convulsions, change in motor activity, headache, dizziness, confusion, weakness stupor, aniexity, agitation, tremors), cardiovascular system, respiration (hyperventilation, pulmonary edema, breathing difficulty, respiratory failure), cardiovascular system (palpitations, rapid heart beat, hypertension, hypotension). Massive doses by produce sudden loss of conciousness and prompt death from respiratory arrest. Smaller but still lethal doses on the breath or vomitus. Chronic Potential Health Effects: Central Nervous system effects (headaches, vertigo, insomnia, memory loss, tremors, fatigue), fatigue, metabolic effects (poor appetite), cardiovascular effects (chest discomfort, palpitations), nerve damage to the eyes, or dermatitis, respiratory tract irritation, eye irritation, or death can occur. may prolong the illness for 1 or more hours. A bitter almond odor may be noted

Section 12: Ecological Information

Ecotoxicity: Not available.

BOD5 and COD: Not available.

Products of Biodegradation:
Possibly hazardous short term degradation products are not likely. However, long term degradation products may arise.

Toxicity of the Products of Biodegradation: The products of degradation are less toxic than the product itself.

Special Remarks on the Products of Biodegradation: Not available.

Section 13: Disposal Considerations

Waste Disposal:
Waste must be disposed of in accordance with federal, state and local environmental control regulations.

Section 14: Transport Information

DOT Classification: CLASS 6.1: Poisonous material.

Identification: : Sodium cyanide UNNA: 1689 PG: I

Special Provisions for Transport: Marine Pollutant

Section 15: Other Regulatory Information

Federal and State Regulations:
Connecticut carcinogen reporting list.: Sodium Cyanide Illinois chemical safety act: Sodium Cyanide New York release reporting list: Sodium Cyanide Rhode Island RTK hazardous substances: Sodium Cyanide Pennsylvania RTK: Sodium Cyanide Minnesota: Sodium Cyanide Massachusetts RTK: Sodium Cyanide Massachusetts spill list: Sodium Cyanide New Jersey: Sodium Cyanide New Jersey spill list: Sodium Cyanide Louisiana RTK reporting list: Sodium Cyanide Louisiana spill reporting: Sodium Cyanide California Director's List of Hazardous Substances: Sodium Cyanide TSCA 8(b) inventory: Sodium Cyanide TSCA 4(a) final test rules: Sodium Cyanide TSCA 8(a) PAIR: Sodium Cyanide TSCA 8(d) H and S data reporting: Sodium Cyanide TSCA 12(b) one time export: Sodium Cyanide SARA 302/304/311/312 extremely hazardous substances: Sodium Cyanide CERCLA: Hazardous substances.: Sodium Cyanide: 10 lbs. (4.536 kg)

Other Regulations:
OSHA: Hazardous by definition of Hazard Communication Standard (29 CFR 1910.1200). EINECS: This product is on the European Inventory of Existing Commercial Chemical Substances.

Other Classifications:

WHMIS (Canada):
CLASS B-6: Reactive and very flammable material. CLASS D-1A: Material causing immediate and serious toxic effects (VERY TOXIC). CLASS E: Corrosive solid.

DSCL (EEC):
R27/28- Very toxic in contact with skin and if swallowed. R41- Risk of serious damage to eyes. S1/2- Keep locked up and out of the reach of children. S26- In case of contact with eyes, rinse immediately with plenty of water and seek medical advice. S28- After contact with skin, wash immediately with plenty of water S36/37- Wear suitable protective clothing and gloves. S39- Wear eye/face protection. S45- In case of accident or if you feel unwell, seek medical advice immediately (show the label where possible). S46- If swallowed, seek medical advice immediately and show this container or label.

Section 2: Composition and Information on Ingredients

Composition:

Name	CAS #	% by Weight
Sodium hydroxide	1310-73-2	100

Toxicological Data on Ingredients: Sodium hydroxide LD50: Not available. LC50: Not available.

Section 3: Hazards Identification

Potential Acute Health Effects:
Very hazardous in case of skin contact (corrosive, irritant, permeator), of eye contact (irritant, corrosive), of ingestion, of inhalation. The amount of tissue damage depends on length of contact. Eye contact can result in corneal damage or blindness. Skin contact can produce inflammation and blistering. Inhalation of dust will produce irritation to gastro-intestinal or respiratory tract, characterized by burning, sneezing and coughing. Severe over-exposure can produce lung damage, choking, unconsciousness or death. Inflammation of the eye is characterized by redness, watering, and itching. Skin inflammation is characterized by itching, scaling, reddening, or, occasionally, blistering.

Potential Chronic Health Effects:
CARCINOGENIC EFFECTS: Not available. MUTAGENIC EFFECTS: Mutagenic for mammalian somatic cells. TERATOGENIC EFFECTS: Not available. DEVELOPMENTAL TOXICITY: Not available. The substance may be toxic to mucous membranes, upper respiratory tract, skin, eyes. Repeated or prolonged exposure to the substance can produce target organs damage. Repeated exposure of the eyes to a low level of dust can produce eye irritation. Repeated skin exposure can produce local skin destruction, or dermatitis. Repeated inhalation of dust can produce varying degree of respiratory irritation or lung damage.

Section 4: First Aid Measures

Eye Contact:
Check for and remove any contact lenses. In case of contact, immediately flush eyes with plenty of water for at least 15 minutes. Cold water may be used. Get medical attention immediately.

Skin Contact:
In case of contact, immediately flush skin with plenty of water for at least 15 minutes while removing contaminated clothing and shoes. Cover the irritated skin with an emollient. Cold water may be used.Wash clothing before reuse. Thoroughly clean shoes before reuse. Get medical attention immediately.

Serious Skin Contact:
Wash with a disinfectant soap and cover the contaminated skin with an anti-bacterial cream. Seek medical attention.

Inhalation:
If inhaled, remove to fresh air. If not breathing, give artificial respiration. If breathing is difficult, give oxygen. Get medical attention immediately.

Serious Inhalation:
Evacuate the victim to a safe area as soon as possible. Loosen tight clothing such as a collar, tie, belt or waistband. If breathing is difficult, administer oxygen. If the victim is not breathing, perform mouth-to-mouth resuscitation. WARNING: It may be hazardous to the person providing aid to give mouth-to-mouth resuscitation when the inhaled material is toxic, infectious or corrosive. Seek immediate medical attention.

Ingestion:
Do NOT induce vomiting unless directed to do so by medical personnel. Never give anything by mouth to an unconscious person. If large quantities of this material are swallowed, call a physician immediately. Loosen tight clothing such as a collar, tie, belt or waistband.

Serious Ingestion: Not available.

Section 5: Fire and Explosion Data

Flammability of the Product: Non-flammable.

Auto-Ignition Temperature: Not applicable.

Flash Points: Not applicable.

Flammable Limits: Not applicable.

Products of Combustion: Not available.

Fire Hazards in Presence of Various Substances: metals

Explosion Hazards in Presence of Various Substances:
Risks of explosion of the product in presence of mechanical impact: Not available. Risks of explosion of the product in presence of static discharge: Not available. Slightly explosive in presence of heat.

Fire Fighting Media and Instructions: Not available

Special Remarks on Fire Hazards:
sodium hydroxide + zinc metal dust causes ignition of the latter. Under proper conditions of temperature, pressure and state of division, it can ignite or react violently with acetaldehyde, ally alcohol, allyl chloride, benzene-1,4-diol, chlorine trifluoride, 1,2 dichlorethylene, nitroethane, nitromethane, nitroparaffins, nitropropane, cinnamaldehyde, 2,2-dichloro-3,3-dimethylbutane. Sodium hydroxide in contact with water may generate enough heat to ignite adjacent combustible materials. Phosphorous boiled with NaOH yields mixed phosphines which may ignite spontanously in air. sodium hydroxide and cinnamaldehyde + heat may cause ignition. Reaction with certain metals releases flammable and explosive hydrogen gas.

Special Remarks on Explosion Hazards:
Sodium hydroxide reacts to form explosive products with ammonia + silver nitrate. Benzene extract of allyl benzenesulfonate prepared from allyl alcohol, and benzene sulfonyl chloride in presence of aquesous sodium hydroxide, under vacuum distillation, residue darkened and exploded. Sodium Hydroxde + impure tetrahydrofuran, which can contain peroxides, can

cause serious explosions. Dry mixtures of sodium hydroxide and sodium tetrahydroborate liberate hydrogen explosively at 230-270 deg. C. Sodium Hydroxide reacts with sodium salt of trichlorophenol + methyl alcohol + trichlorobenzene + heat to cause an explosion.

Section 6: Accidental Release Measures

Small Spill:
Use appropriate tools to put the spilled solid in a convenient waste disposal container. If necessary: Neutralize the residue with a dilute solution of acetic acid.

Large Spill:
Corrosive solid. Stop leak if without risk. Do not get water inside container. Do not touch spilled material. Use water spray to reduce vapors. Prevent entry into sewers, basements or confined areas; dike if needed. Call for assistance on disposal. Neutralize the residue with a dilute solution of acetic acid. Be careful that the product is not present at a concentration level above TLV. Check TLV on the MSDS and with local authorities.

Section 7: Handling and Storage

Precautions:
Keep container dry. Do not breathe dust. Never add water to this product. In case of insufficient ventilation, wear suitable respiratory equipment. If you feel unwell, seek medical attention and show the label when possible. Avoid contact with skin and eyes. Keep away from incompatibles such as oxidizing agents, reducing agents, metals, acids, alkalis, moisture.

Storage: Keep container tightly closed. Keep container in a cool, well-ventilated area. Hygroscopic. Deliquescent.

Section 8: Exposure Controls/Personal Protection

Engineering Controls:
Use process enclosures, local exhaust ventilation, or other engineering controls to keep airborne levels below recommended exposure limits. If user operations generate dust, fume or mist, use ventilation to keep exposure to airborne contaminants below the exposure limit.

Personal Protection:
Splash goggles. Synthetic apron. Vapor and dust respirator. Be sure to use an approved/certified respirator or equivalent. Gloves.

Personal Protection in Case of a Large Spill:
Splash goggles. Full suit. Vapor and dust respirator. Boots. Gloves. A self contained breathing apparatus should be used to avoid inhalation of the product. Suggested protective clothing might not be sufficient; consult a specialist BEFORE handling this product.

Exposure Limits:
STEL: 2 (mg/m3) from ACGIH (TLV) [United States] TWA: 2 CEIL: 2 (mg/m3) from OSHA (PEL) [United States] CEIL: 2 (mg/m3) from NIOSHConsult local authorities for acceptable exposure limits.

Section 9: Physical and Chemical Properties

Physical state and appearance: Solid. (Deliquescent solid.)

Odor: Odorless.

Taste: Not available.

Molecular Weight: 40 g/mole

Color: White.

pH (1% soln/water): 13.5 [Basic.]

Boiling Point: 1388°C (2530.4°F)

Melting Point: 323°C (613.4°F)

Critical Temperature: Not available.

Specific Gravity: 2.13 (Water = 1)

Vapor Pressure: Not applicable.

Vapor Density: Not available.

Volatility: Not available.

Odor Threshold: Not available.

Water/Oil Dist. Coeff.: Not available.

Ionicity (in Water): Not available.

Dispersion Properties: See solubility in water.

Solubility: Easily soluble in cold water.

Section 10: Stability and Reactivity Data

Stability: The product is stable.

Instability Temperature: Not available.

Conditions of Instability: Incompatible materials, moisture, moist air

Incompatibility with various substances:
Highly reactive with metals. Reactive with oxidizing agents, reducing agents, acids, alkalis, moisture.

Corrosivity: Not available.

Special Remarks on Reactivity:
Hygroscopic. Much heat is evolved when solid material is dissolved in water. Therefore cold water and caution must be used for this process. Sodium hydroxide solution and octanol + diborane during a work-up of a reaction mixture of oxime and diborane in tetrahyrofuran is very exothermic, a mild explosion being noted on one occassion. Reactive with water, acids (mineral, non-oxidizing, e.g. hydrochloric, hydrofluoric acid, muriatic acid, phosphoric), acids (mineral, oxidizing e.g. chromic acid, hypochlorous acid, nitric acid, sulfuric acid), acids (organic e.g. acetic acid, benzoic acid, formic acid, methanoic acid, oxalic acid), aldehydes (e.g. acetaldehyde, acrolein, chloral hydrate, foraldehyde), carbamates (e.g. carbanolate, carbofuran), esters (e.g. butyl acetate, ethyl acetate, propyl formate), halogenated organics (dibromoethane, hexachlorobenzene, methyl chloride, trichloroethylene), isocyanates (e.g. methyl isocyanate), ketones (acetone, acetophenone, MEK, MIBK), acid chlorides, strong bases, strong oxidizing agents, strong reducing agents, flammable liquids, powdered metals and metals (i.e aluminum, tin, zinc, hafnium, raney nickel), metals (alkali and alkaline e.g. cesium, potassium, sodium), metal compounds (toxic e.g. berylium, lead acetate, nickel carbonyl, tetraethyl lead), mitrides (e.g. potassium nitride, sodium nitride), nitriles (e.g. acetonitrile, methyl cyanide), nitro compounds (organic e.g. nitrobenzene, nitromethane), acetic anhydride, chlorohydrin, chlorosulfonic acid, ethylene cyanohydrin, glyoxal, hydrosulfuric acid, oleum, propiolactone, acylonitrile, phorosous pentoxide, chloroethanol, chloroform-methanol, tetrahydroborate, cyanogen azide, 1,2,4,5 tetrachlorobenzene, cinnamaldehyde. Reacts with formaldehyde hydroxide to yield formic acid, and hydrogen.

Special Remarks on Corrosivity: Very caustic to aluminum and other metals in presence of moisture.

Polymerization: Will not occur.

Section 11: Toxicological Information

Routes of Entry: Absorbed through skin. Dermal contact. Eye contact. Inhalation. Ingestion.

Toxicity to Animals:
LD50: Not available. LC50: Not available.

Chronic Effects on Humans:
MUTAGENIC EFFECTS: Mutagenic for mammalian somatic cells. May cause damage to the following organs: mucous membranes, upper respiratory tract, skin, eyes.

Other Toxic Effects on Humans:
Extremely hazardous in case of inhalation (lung corrosive). Very hazardous in case of skin contact (corrosive, irritant, permeator), of eye contact (corrosive), of ingestion, .

Special Remarks on Toxicity to Animals:
Lowest Published Lethal Dose: LDL [Rabbit] - Route: Oral; Dose: 500 mg/kg

Special Remarks on Chronic Effects on Humans: May affect genetic material. Investigation as a mutagen (cytogenetic analysis)

Special Remarks on other Toxic Effects on Humans:

Section 12: Ecological Information

Ecotoxicity: Not available.

BOD5 and COD: Not available.

Products of Biodegradation:
Possibly hazardous short term degradation products are not likely. However, long term degradation products may arise.

Toxicity of the Products of Biodegradation: The product itself and its products of degradation are not toxic.

Special Remarks on the Products of Biodegradation: Not available.

Section 13: Disposal Considerations

Waste Disposal:
Waste must be disposed of in accordance with federal, state and local environmental control regulations.

Section 14: Transport Information

DOT Classification: Class 8: Corrosive material

Identification: : Sodium hydroxide, solid UNNA: 1823 PG: II

Special Provisions for Transport: Not available.

Section 15: Other Regulatory Information

Federal and State Regulations:
Illinois toxic substances disclosure to employee act: Sodium hydroxide Illinois chemical safety act: Sodium hydroxide New York release reporting list: Sodium hydroxide Rhode Island RTK hazardous substances: Sodium hydroxide Pennsylvania RTK: Sodium hydroxide Minnesota: Sodium hydroxide Massachusetts RTK: Sodium hydroxide New Jersey: Sodium hydroxide Louisiana spill reporting: Sodium hydroxide California Director's List of Hazardous Substances: Sodium hydroxide TSCA 8(b) inventory: Sodium hydroxide CERCLA: Hazardous substances.: Sodium hydroxide: 1000 lbs. (453.6 kg)

Other Regulations:
OSHA: Hazardous by definition of Hazard Communication Standard (29 CFR 1910.1200). EINECS: This product is on the European Inventory of Existing Commercial Chemical Substances.

Other Classifications:

WHMIS (Canada): CLASS E: Corrosive solid.

DSCL (EEC):
R35- Causes severe burns. S26- In case of contact with eyes, rinse immediately with plenty of water and seek medical advice. S37/39- Wear suitable gloves and eye/face protection. S45- In case of accident or if you feel unwell, seek medical advice immediately (show the label where possible).

Material Safety Data Sheet
Sulfuric acid MSDS

Section 1: Chemical Product and Company Identification

Product Name: Sulfuric acid

Catalog Codes: SLS2539, SLS1741, SLS3166, SLS2371, SLS3793

CAS#: 7664-93-9

RTECS: WS5600000

TSCA: TSCA 8(b) inventory: Sulfuric acid

CI#: Not applicable.

Synonym: Oil of Vitriol; Sulfuric Acid

Chemical Name: Hydrogen sulfate

Chemical Formula: H2-SO4

Contact Information:

Sciencelab.com, Inc.
14025 Smith Rd.
Houston, Texas 77396

US Sales: **1-800-901-7247**
International Sales: **1-281-441-4400**

Order Online: ScienceLab.com

CHEMTREC (24HR Emergency Telephone), call: 1-800-424-9300

International CHEMTREC, call: 1-703-527-3887

For non-emergency assistance, call: 1-281-441-4400

Section 2: Composition and Information on Ingredients

Composition:

Name	CAS #	% by Weight
Sulfuric acid	7664-93-9	95 - 98

Toxicological Data on Ingredients: Sulfuric acid: ORAL (LD50): Acute: 2140 mg/kg [Rat.]. VAPOR (LC50): Acute: 510 mg/m 2 hours [Rat]. 320 mg/m 2 hours [Mouse].

Section 3: Hazards Identification

Potential Acute Health Effects:
Very hazardous in case of skin contact (corrosive, irritant, permeator), of eye contact (irritant, corrosive), of ingestion, of inhalation. Liquid or spray mist may produce tissue damage particularly on mucous membranes of eyes, mouth and respiratory tract. Skin contact may produce burns. Inhalation of the spray mist may produce severe irritation of respiratory tract, characterized by coughing, choking, or shortness of breath. Severe over-exposure can result in death. Inflammation of the eye is characterized by redness, watering, and itching. Skin inflammation is characterized by itching, scaling, reddening, or, occasionally, blistering.

Potential Chronic Health Effects:
CARCINOGENIC EFFECTS: Classified 1 (Proven for human.) by IARC, + (Proven.) by OSHA. Classified A2 (Suspected for human.) by ACGIH. MUTAGENIC EFFECTS: Not available. TERATOGENIC EFFECTS: Not available. DEVELOPMENTAL TOXICITY: Not available. The substance may be toxic to kidneys, lungs, heart, cardiovascular system, upper respiratory tract, eyes, teeth. Repeated or prolonged exposure to the substance can produce target organs damage. Repeated or prolonged

contact with spray mist may produce chronic eye irritation and severe skin irritation. Repeated or prolonged exposure to spray mist may produce respiratory tract irritation leading to frequent attacks of bronchial infection. Repeated exposure to a highly toxic material may produce general deterioration of health by an accumulation in one or many human organs.

Section 4: First Aid Measures

Eye Contact:
Check for and remove any contact lenses. In case of contact, immediately flush eyes with plenty of water for at least 15 minutes. Cold water may be used. Get medical attention immediately.

Skin Contact:
In case of contact, immediately flush skin with plenty of water for at least 15 minutes while removing contaminated clothing and shoes. Cover the irritated skin with an emollient. Cold water may be used.Wash clothing before reuse. Thoroughly clean shoes before reuse. Get medical attention immediately.

Serious Skin Contact:
Wash with a disinfectant soap and cover the contaminated skin with an anti-bacterial cream. Seek immediate medical attention.

Inhalation:
If inhaled, remove to fresh air. If not breathing, give artificial respiration. If breathing is difficult, give oxygen. Get medical attention immediately.

Serious Inhalation:
Evacuate the victim to a safe area as soon as possible. Loosen tight clothing such as a collar, tie, belt or waistband. If breathing is difficult, administer oxygen. If the victim is not breathing, perform mouth-to-mouth resuscitation. WARNING: It may be hazardous to the person providing aid to give mouth-to-mouth resuscitation when the inhaled material is toxic, infectious or corrosive. Seek immediate medical attention.

Ingestion:
Do NOT induce vomiting unless directed to do so by medical personnel. Never give anything by mouth to an unconscious person. Loosen tight clothing such as a collar, tie, belt or waistband. Get medical attention if symptoms appear.

Serious Ingestion: Not available.

Section 5: Fire and Explosion Data

Flammability of the Product: Non-flammable.

Auto-Ignition Temperature: Not applicable.

Flash Points: Not applicable.

Flammable Limits: Not applicable.

Products of Combustion:
Products of combustion are not available since material is non-flammable. However, products of decompostion include fumes of oxides of sulfur. Will react with water or steam to produce toxic and corrosive fumes. Reacts with carbonates to generate carbon dioxide gas. Reacts with cyanides and sulfides to form poisonous hydrogen cyanide and hydrogen sulfide respectively.

Fire Hazards in Presence of Various Substances: Combustible materials

Explosion Hazards in Presence of Various Substances:
Risks of explosion of the product in presence of mechanical impact: Not available. Risks of explosion of the product in presence of static discharge: Not available. Slightly explosive in presence of oxidizing materials.

Fire Fighting Media and Instructions: Not applicable.

Special Remarks on Fire Hazards:
Metal acetylides (Monocesium and Monorubidium), and carbides ignite with concentrated sulfuric acid. White Phosphorous + boiling Sulfuric acid or its vapor ignites on contact. May ignite other combustible materials. May cause fire when sulfuric acid is mixed with Cyclopentadiene, cyclopentanone oxime, nitroaryl amines, hexalithium disilicide, phorphorous (III) oxide, and oxidizing agents such as chlorates, halogens, permanganates.

Special Remarks on Explosion Hazards:
Mixturesofsulfuricacidandanyofthefollowingcanexplode:p-nitrotoluene,pentasilver trihydroxydiaminophosphate, perchlorates, alcohols with strong hydrogen peroxide, ammonium tetraperoxychromate, mercuric nitrite, potassium chlorate, potassium permanganate with potassium chloride, carbides, nitro compounds, nitrates, carbides, phosphorous, iodides, picratres, fulminats, dienes, alcohols (when heated) Nitramide decomposes explosively on contact with concentrated sulfuric acid. 1,3,5-Trinitrosohexahydro-1,3,5-triazine + sulfuric acid causes explosive decompositon.

Section 6: Accidental Release Measures

Small Spill:
Dilute with water and mop up, or absorb with an inert dry material and place in an appropriate waste disposal container. If necessary: Neutralize the residue with a dilute solution of sodium carbonate.

Large Spill:
Corrosive liquid. Poisonous liquid. Stop leak if without risk. Absorb with DRY earth, sand or other non-combustible material. Do not get water inside container. Do not touch spilled material. Use water spray curtain to divert vapor drift. Use water spray to reduce vapors. Prevent entry into sewers, basements or confined areas; dike if needed. Call for assistance on disposal. Neutralize the residue with a dilute solution of sodium carbonate. Be careful that the product is not present at a concentration level above TLV. Check TLV on the MSDS and with local authorities.

Section 7: Handling and Storage

Precautions:
Keep locked up.. Keep container dry. Do not ingest. Do not breathe gas/fumes/ vapor/spray. Never add water to this product. In case of insufficient ventilation, wear suitable respiratory equipment. If ingested, seek medical advice immediately and show the container or the label. Avoid contact with skin and eyes. Keep away from incompatibles such as oxidizing agents, reducing agents, combustible materials, organic materials, metals, acids, alkalis, moisture. May corrode metallic surfaces. Store in a metallic or coated fiberboard drum using a strong polyethylene inner package.

Storage:
Hygroscopic. Reacts. violently with water. Keep container tightly closed. Keep container in a cool, well-ventilated area. Do not store above 23°C (73.4°F).

Section 8: Exposure Controls/Personal Protection

Engineering Controls:
Provide exhaust ventilation or other engineering controls to keep the airborne concentrations of vapors below their respective threshold limit value. Ensure that eyewash stations and safety showers are proximal to the work-station location.

Personal Protection:
Face shield. Full suit. Vapor respirator. Be sure to use an approved/certified respirator or equivalent. Gloves. Boots.

Personal Protection in Case of a Large Spill:
Splash goggles. Full suit. Vapor respirator. Boots. Gloves. A self contained breathing apparatus should be used to avoid inhalation of the product. Suggested protective clothing might not be sufficient; consult a specialist BEFORE handling this product.

Exposure Limits:
TWA: 1 STEL: 3 (mg/m3) [Australia] Inhalation TWA: 1 (mg/m3) from OSHA (PEL) [United States] Inhalation TWA: 1 STEL: 3 (mg/m3) from ACGIH (TLV) [United States] [1999] Inhalation TWA: 1 (mg/m3) from NIOSH [United States] Inhalation TWA: 1 (mg/m3) [United Kingdom (UK)]Consult local authorities for acceptable exposure limits.

Section 9: Physical and Chemical Properties

Physical state and appearance: Liquid. (Thick oily liquid.)

Odor: Odorless, but has a choking odor when hot.

Taste: Marked acid taste. (Strong.)

Molecular Weight: 98.08 g/mole

Color: Colorless.

pH (1% soln/water): Acidic.

Boiling Point:
270°C (518°F) - 340 deg. C Decomposes at 340 deg. C

Melting Point: -35°C (-31°F) to 10.36 deg. C (93% to 100% purity)

Critical Temperature: Not available.

Specific Gravity: 1.84 (Water = 1)

Vapor Pressure: Not available.

Vapor Density: 3.4 (Air = 1)

Volatility: Not available.

Odor Threshold: Not available.

Water/Oil Dist. Coeff.: Not available.

Ionicity (in Water): Not available.

Dispersion Properties: See solubility in water.

Solubility:
Easily soluble in cold water. Sulfuric is soluble in water with liberation of much heat. Soluble in ethyl alcohol.

Section 10: Stability and Reactivity Data

Stability: The product is stable.

Instability Temperature: Not available.

Conditions of Instability:
Conditions to Avoid: Incompatible materials, excess heat, combustible material materials, organic materials, exposure to moist air or water, oxidizers, amines, bases. Always add the acid to water, never the reverse.

Incompatibility with various substances:
Reactive with oxidizing agents, reducing agents, combustible materials, organic materials, metals, acids, alkalis, moisture.

Corrosivity:
Extremely corrosive in presence of aluminum, of copper, of stainless steel(316). Highly corrosive in presence of stainless steel(304). Non-corrosive in presence of glass.

Special Remarks on Reactivity:
Hygroscopic. Strong oxidizer. Reacts violently with water and alcohol especially when water is added to the product. Incompatible (can react explosively or dangerously) with the following: ACETIC ACID, ACRYLIC ACID, AMMONIUM HYDROXIDE, CRESOL, CUMENE, DICHLOROETHYL ETHER, ETHYLENE CYANOHYDRIN, ETHYLENEIMINE, NITRIC ACID, 2-NITROPROPANE, PROPYLENE OXIDE, SULFOLANE, VINYLIDENE CHLORIDE, DIETHYLENE GLYCOL MONOMETHYL ETHER, ETHYL ACETATE, ETHYLENE CYANOHYDRIN, ETHYLENE GLYCOL MONOETHYL ETHER ACETATE, GLYOXAL, METHYL ETHYL KETONE, dehydrating agents, organic materials, moisture (water), Acetic anhydride, Acetone, cyanohydrin, Acetone+nitric acid, Acetone + potassium dichromate, Acetonitrile, Acrolein, Acrylonitrile, Acrylonitrile +water, Alcohols + hydrogen peroxide, ally compounds such as Allyl alcohol, and Allyl Chloride, 2-Aminoethanol, Ammonium hydroxide, Ammonium triperchromate, Aniline, Bromate + metals, Bromine pentafluoride, n-Butyraldehyde, Carbides, Cesium acetylene carbide, Chlorates, Cyclopentanone oxime, chlorinates, Chlorates + metals, Chlorine trifluoride, Chlorosulfonic acid, 2-cyano-4-nitrobenzenediazonium hydrogen sulfate, Cuprous nitride, p-chloronitrobenzene, 1,5-Dinitronaphthlene +

sulfur, Diisobutylene, p-dimethylaminobenzaldehyde, 1,3-Diazidobenzene, Dimethylbenzylcarbinol + hydrogen peroxide, Epichlorohydrin, Ethyl alcohol + hydrogen peroxide, Ethylene diamine, Ethylene glycol and other glycols, , Ethylenimine, Fulminates, hydrogen peroxide, Hydrochloric acid, Hydrofluoric acid, Iodine heptafluoride, Indane + nitric acid, Iron, Isoprene, Lithium silicide, Mercuric nitride, Mesityl oxide, Mercury nitride, Metals (powdered), Nitromethane, Nitric acid + glycerides, p-Nitrotoluene, Pentasilver trihydroxydiaminophosphate, Perchlorates, Perchloric acid, Permanganates + benzene, 1-Phenyl-2-methylpropyl alcohol + hydrogen peroxide, Phosphorus, Phosphorus isocyanate, Picrates, Potassium tert-butoxide, Potassium chlorate, Potassium Permanganate and other permanganates, halogens, amines, Potassium Permanganate + Potassium chloride, Potassium Permanganate + water, Propiolactone (beta)-, Pyridine, Rubidium aceteylene carbide, Silver permanganate, Sodium, Sodium carbonate, sodium hydroxide, Steel, styrene monomer, toluene + nitric acid, Vinyl acetate, Thalium (I) azidodithiocarbonate, Zinc chlorate, Zinc Iodide, azides, carbonates, cyanides, sulfides, sulfites, alkali hydrides, carboxylic acid anhydrides, nitriles, olefinic organics, aqueous acids, cyclopentadiene, cyano-alcohols, metal acetylides, Hydrogen gas is generated by the action of the acid on most metals (i.e. lead, copper, tin, zinc, aluminum, etc.). Concentrated sulfuric acid oxidizes, dehydrates, or sulfonates most organic compounds.

Special Remarks on Corrosivity:
Non-corrosive to lead and mild steel, but dillute acid attacks most metals. Attacks many metals releasing hydrogen. Minor corrosive effect on bronze. No corrosion data on brass or zinc.

Polymerization: Will not occur.

Section 11: Toxicological Information

Routes of Entry: Absorbed through skin. Dermal contact. Eye contact. Inhalation. Ingestion.

Toxicity to Animals:
WARNING: THE LC50 VALUES HEREUNDER ARE ESTIMATED ON THE BASIS OF A 4-HOUR EXPOSURE. Acute oral toxicity (LD50): 2140 mg/kg [Rat.]. Acute toxicity of the vapor (LC50): 320 mg/m3 2 hours [Mouse].

Chronic Effects on Humans:
CARCINOGENIC EFFECTS: Classified 1 (Proven for human.) by IARC, + (Proven.) by OSHA. Classified A2 (Suspected for human.) by ACGIH. May cause damage to the following organs: kidneys, lungs, heart, cardiovascular system, upper respiratory tract, eyes, teeth.

Other Toxic Effects on Humans:
Extremely hazardous in case of inhalation (lung corrosive). Very hazardous in case of skin contact (corrosive, irritant, permeator), of eye contact (corrosive), of ingestion, .

Special Remarks on Toxicity to Animals: Not available.

Special Remarks on Chronic Effects on Humans:
Mutagenicity: Cytogenetic Analysis: Hamster, ovary = 4mmol/L Reproductive effects: May cause adverse reproductive effects based on animal data. Developmental abnormalities (musculoskeletal) in rabbits at a dose of 20 mg/m3 for 7 hrs.(RTECS) Teratogenecity: neither embryotoxic, fetoxic, nor teratogenetic in mice or rabbits at inhaled doses producing some maternal toxicity

Special Remarks on other Toxic Effects on Humans:
Acute Potential Health Effects: Skin: Causes severe skin irritation and burns. Continued contact can cause tissue necrosis. Eye: Causes severe eye irritation and burns. May cause irreversible eye injury. Ingestion: Harmful if swallowed. May cause permanent damage to the digestive tract. Causes gastrointestial tract burns. May cause perforation of the stomach, GI bleeding, edema of the glottis, necrosis and scarring, and sudden circulatory collapse(similar to acute inhalation). It may also cause systemic toxicity with acidosis. Inhalation: May cause severe irritation of the respiratory tract and mucous membranes with sore throat, coughing, shortness of breath, and delayed lung edema. Causes chemical burns to the repiratory tract. Inhalation may be fatal as a result of spasm, inflammation, edema of the larynx and bronchi, chemical pneumonitis, and pulmonary edema. Cause corrosive action on mucous membranes. May affect cardiovascular system (hypotension, depressed cardiac output, bradycardia). Circulatory collapse with clammy skin, weak and rapid pulse, shallow respiration, and scanty urine may follow. Circulatory shock is often the immediate cause of death. May also affect teeth(changes in teeth and supporting structures - erosion, discoloration). Chronic Potential Health Effects: Inhalation: Prolonged or repeated inhalation may affect behavior (muscle contraction or spasticity), urinary system (kidney damage), and cardiovascular system, heart (ischemic heart leisons), and respiratory system/lungs(pulmonary edema, lung damage), teeth (dental discoloration, erosion). Skin: Prolonged or repeated skin contact may cause dermatitis, an allergic skin reaction.

Section 12: Ecological Information

Ecotoxicity: Ecotoxicity in water (LC50): 49 mg/l 48 hours [bluegill/sunfish].

BOD5 and COD: Not available.

Products of Biodegradation:
Possibly hazardous short term degradation products are not likely. However, long term degradation products may arise.

Toxicity of the Products of Biodegradation: The products of degradation are less toxic than the product itself.

Special Remarks on the Products of Biodegradation: Not available.

Section 13: Disposal Considerations

Waste Disposal:
Sulfuric acid may be placed in sealed container or absorbed in vermiculite, dry sand, earth, or a similar material. It may also be diluted and neutralized. Be sure to consult with local or regional authorities (waste regulators) prior to any disposal. Waste must be disposed of in accordance with federal, state and local environmental control regulations.

Section 14: Transport Information

DOT Classification: Class 8: Corrosive material

Identification: : Sulfuric acid UNNA: 1830 PG: II

Special Provisions for Transport: Not available.

Section 15: Other Regulatory Information

Federal and State Regulations:
Illinois toxic substances disclosure to employee act: Sulfuric acid New York release reporting list: Sulfuric acid Rhode Island RTK hazardous substances: Sulfuric acid Pennsylvania RTK: Sulfuric acid Minnesota: Sulfuric acid Massachusetts RTK: Sulfuric acid New Jersey: Sulfuric acid California Director's List of Hazardous Substances (8 CCR 339): Sulfuric acid Tennessee RTK: Sulfuric acid TSCA 8(b) inventory: Sulfuric acid SARA 302/304/311/312 extremely hazardous substances: Sulfuric acid SARA 313 toxic chemical notification and release reporting: Sulfuric acid CERCLA: Hazardous substances.: Sulfuric acid: 1000 lbs. (453.6 kg)

Other Regulations:
OSHA: Hazardous by definition of Hazard Communication Standard (29 CFR 1910.1200). EINECS: This product is on the European Inventory of Existing Commercial Chemical Substances.

Other Classifications:

WHMIS (Canada):
CLASS D-1A: Material causing immediate and serious toxic effects (VERY TOXIC). CLASS E: Corrosive liquid.

DSCL (EEC):
R35- Causes severe burns. S2- Keep out of the reach of children. S26- In case of contact with eyes, rinse immediately with plenty of water and seek medical advice. S30- Never add water to this product. S45- In case of accident or if you feel unwell, seek medical advice immediately (show the label where possible).

HMIS (U.S.A.):

Health Hazard: 3

Fire Hazard: 0

Reactivity: 2

Personal Protection:

National Fire Protection Association (U.S.A.):

Health: 3

Flammability: 0

Reactivity: 2

Specific hazard:

Protective Equipment:
Gloves. Full suit. Vapor respirator. Be sure to use an approved/certified respirator or equivalent. Wear appropriate respirator when ventilation is inadequate. Face shield.

Section 16: Other Information

APPENDIX B

SODIUM CYANIDE AND LNG EMERGENCY RESPONSE GUIDELINES (TRANSPORT CANADA, 2012)

POTENTIAL HAZARDS

FIRE OR EXPLOSION

- **EXTREMELY FLAMMABLE.**
- Will be easily ignited by heat, sparks or flames.
- Will form explosive mixtures with air.
- Vapors from liquefied gas are initially heavier than air and spread along ground.

CAUTION: Hydrogen (UN1049), Deuterium (UN1957), Hydrogen, refrigerated liquid (UN1966) and Methane (UN1971) are lighter than air and will rise. Hydrogen and Deuterium fires are difficult to detect since they burn with an invisible flame. Use an alternate method of detection (thermal camera, broom handle, etc.)

- Vapors may travel to source of ignition and flash back.
- Cylinders exposed to fire may vent and release flammable gas through pressure relief devices.
- Containers may explode when heated.
- Ruptured cylinders may rocket.

HEALTH

- Vapors may cause dizziness or asphyxiation without warning.
- Some may be irritating if inhaled at high concentrations.
- Contact with gas or liquefied gas may cause burns, severe injury and/or frostbite.
- Fire may produce irritating and/or toxic gases.

PUBLIC SAFETY

- **CALL EMERGENCY RESPONSE Telephone Number on Shipping Paper first. If Shipping Paper not available or no answer, refer to appropriate telephone number listed on the inside back cover.**
- As an immediate precautionary measure, isolate spill or leak area for at least 100 meters (330 feet) in all directions.
- Keep unauthorized personnel away.
- Stay upwind.
- Many gases are heavier than air and will spread along ground and collect in low or confined areas (sewers, basements, tanks).
- Keep out of low areas.

PROTECTIVE CLOTHING

- Wear positive pressure self-contained breathing apparatus (SCBA).
- Structural firefighters' protective clothing will only provide limited protection.
- Always wear thermal protective clothing when handling refrigerated/cryogenic liquids.

EVACUATION

Large Spill

- Consider initial downwind evacuation for at least 800 meters (1/2 mile).

Fire

- If tank, rail car or tank truck is involved in a fire, ISOLATE for 1600 meters (1 mile) in all directions; also, consider initial evacuation for 1600 meters (1 mile) in all directions.

EMERGENCY RESPONSE

FIRE

- **DO NOT EXTINGUISH A LEAKING GAS FIRE UNLESS LEAK CAN BE STOPPED.**

CAUTION: Hydrogen (UN1049), Deuterium (UN1957) and Hydrogen, refrigerated liquid (UN1966) burn with an invisible flame. Hydrogen and Methane mixture, compressed (UN2034) may burn with an invisible flame.

Small Fire

- Dry chemical or CO_2.

Large Fire

- Water spray or fog.
- Move containers from fire area if you can do it without risk.

Fire involving Tanks

- Fight fire from maximum distance or use unmanned hose holders or monitor nozzles.
- Cool containers with flooding quantities of water until well after fire is out.
- Do not direct water at source of leak or safety devices; icing may occur.
- Withdraw immediately in case of rising sound from venting safety devices or discoloration of tank.
- ALWAYS stay away from tanks engulfed in fire.
- For massive fire, use unmanned hose holders or monitor nozzles; if this is impossible, withdraw from area and let fire burn.

SPILL OR LEAK

- ELIMINATE all ignition sources (no smoking, flares, sparks or flames in immediate area).
- All equipment used when handling the product must be grounded.
- Do not touch or walk through spilled material.
- Stop leak if you can do it without risk.
- If possible, turn leaking containers so that gas escapes rather than liquid.
- Use water spray to reduce vapors or divert vapor cloud drift. Avoid allowing water runoff to contact spilled material.
- Do not direct water at spill or source of leak.
- Prevent spreading of vapors through sewers, ventilation systems and confined areas.
- Isolate area until gas has dispersed.

CAUTION: When in contact with refrigerated/cryogenic liquids, many materials become brittle and are likely to break without warning.

FIRST AID

- Move victim to fresh air.
- Call 911 or emergency medical service.
- Give artificial respiration if victim is not breathing.
- Administer oxygen if breathing is difficult.
- Remove and isolate contaminated clothing and shoes.
- Clothing frozen to the skin should be thawed before being removed.
- In case of contact with liquefied gas, thaw frosted parts with lukewarm water.
- In case of burns, immediately cool affected skin for as long as possible with cold water. Do not remove clothing if adhering to skin.
- Keep victim warm and quiet.
- Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves.

POTENTIAL HAZARDS

HEALTH

- **TOXIC**; inhalation, ingestion or contact (skin, eyes) with vapors, dusts or substance may cause severe injury, burns or death.
- Reaction with water or moist air may release toxic, corrosive or flammable gases.
- Reaction with water may generate much heat that will increase the concentration of fumes in the air.
- Fire will produce irritating, corrosive and/or toxic gases.
- Runoff from fire control or dilution water may be corrosive and/or toxic and cause pollution.

FIRE OR EXPLOSION

- Non-combustible, substance itself does not burn but may decompose upon heating to produce corrosive and/or toxic fumes.
- For UN1796, UN1826, UN2031 at high concentrations and for UN2032, these may act as oxidizers, also consult GUIDE 140.
- Vapors may accumulate in confined areas (basement, tanks, hopper/tank cars etc.).
- Substance may react with water (some violently), releasing corrosive and/or toxic gases and runoff.
- Contact with metals may evolve flammable hydrogen gas.
- Containers may explode when heated or if contaminated with water.

PUBLIC SAFETY

- **CALL EMERGENCY RESPONSE Telephone Number on Shipping Paper first. If Shipping Paper not available or no answer, refer to appropriate telephone number listed on the inside back cover.**
- As an immediate precautionary measure, isolate spill or leak area in all directions for at least 50 meters (150 feet) for liquids and at least 25 meters (75 feet) for solids.
- Keep unauthorized personnel away.
- Stay upwind.
- Keep out of low areas.
- Ventilate enclosed areas.

PROTECTIVE CLOTHING

- Wear positive pressure self-contained breathing apparatus (SCBA).
- Wear chemical protective clothing that is specifically recommended by the manufacturer. It may provide little or no thermal protection.
- Structural firefighters' protective clothing provides limited protection in fire situations ONLY; it is not effective in spill situations where direct contact with the substance is possible.

EVACUATION

Spill

- See Table 1 - Initial Isolation and Protective Action Distances for highlighted materials. For non-highlighted materials, increase, in the downwind direction, as necessary, the isolation distance shown under “PUBLIC SAFETY”.

Fire

- If tank, rail car or tank truck is involved in a fire, ISOLATE for 800 meters (1/2 mile) in all directions; also, consider initial evacuation for 800 meters (1/2 mile) in all directions.

EMERGENCY RESPONSE

FIRE

- Note: Some foams will react with the material and release corrosive/toxic gases.

Small Fire

- CO_2 (except for Cyanides), dry chemical, dry sand, alcohol-resistant foam.

Large Fire

- Water spray, fog or alcohol-resistant foam.
- Move containers from fire area if you can do it without risk.
- Use water spray or fog; do not use straight streams.
- Dike fire-control water for later disposal; do not scatter the material.

Fire involving Tanks or Car/Trailer Loads

- Fight fire from maximum distance or use unmanned hose holders or monitor nozzles.
- Do not get water inside containers.
- Cool containers with flooding quantities of water until well after fire is out.
- Withdraw immediately in case of rising sound from venting safety devices or discoloration of tank.
- ALWAYS stay away from tanks engulfed in fire.

SPILL OR LEAK

- ELIMINATE all ignition sources (no smoking, flares, sparks or flames in immediate area).
- All equipment used when handling the product must be grounded.
- Do not touch damaged containers or spilled material unless wearing appropriate protective clothing.
- Stop leak if you can do it without risk.
- A vapor suppressing foam may be used to reduce vapors.
- DO NOT GET WATER INSIDE CONTAINERS.
- Use water spray to reduce vapors or divert vapor cloud drift. Avoid allowing water runoff to contact spilled material.
- Prevent entry into waterways, sewers, basements or confined areas.

Small Spill

- Cover with DRY earth, DRY sand or other non-combustible material followed with plastic sheet to minimize spreading or contact with rain.
- Use clean non-sparking tools to collect material and place it into loosely covered plastic containers for later disposal.

FIRST AID

- Move victim to fresh air. • Call 911 or emergency medical service.
- Give artificial respiration if victim is not breathing.
- **Do not use mouth-to-mouth method if victim ingested or inhaled the substance; give artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device.**
- Administer oxygen if breathing is difficult.
- Remove and isolate contaminated clothing and shoes.
- In case of contact with substance, immediately flush skin or eyes with running water for at least 20 minutes.
- **In case of contact with Hydrofluoric acid (UN1790)**, flush skin and eyes with water for 5 minutes; then, for skin exposures rub on a calcium/gel combination; for eyes flush with a water/calcium solution if available, otherwise continue with water for 15 minutes.
- For minor skin contact, avoid spreading material on unaffected skin.
- Keep victim warm and quiet.
- Effects of exposure (inhalation, ingestion or skin contact) to substance may be delayed.
- Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves.

TABLE 1 - INITIAL ISOLATION AND PROTECTIVE ACTION DISTANCES

ID No.	Guide	NAME OF MATERIAL	SMALL SPILLS (From a small package or small leak from a large package) First ISOLATE in all Directions Meters	(Feet)	Then PROTECT persons Downwind during- DAY Kilometers	(Miles)	NIGHT Kilometers	(Miles)	LARGE SPILLS (From a large package or from many small packages) First ISOLATE in all Directions Meters	(Feet)	Then PROTECT persons Downwind during- DAY Kilometers	(Miles)	NIGHT Kilometers	(Miles)
1680	**157**	Potassium cyanide **(when spilled in water)**	30 m	(100 ft)	0.1 km	(0.1 mi)	0.2 km	(0.1 mi)	100 m	(300 ft)	0.3 km	(0.2 mi)	1.2 km	(0.8 mi)

APPENDIX A.22C: Sediment and Erosion Control Management Plan

Supplementary Information Report A

to the Proposal for the Casino Project

submitted by Casino Mining Corporation

on January 3, 2014

Pursuant to the
Yukon Environmental and Socio-economic Assessment Act

March 2015

A.22C – SEDIMENT AND EROSION CONTROL MANAGEMENT PLAN

The Casino Mine Project is an approximately 22 year mine project owned and operated by Casino Mining Corporation (CMC), that will produce copper and molybdenum concentrates, and gold dore bars via flotation milling and heap leach processing, respectively. The proposed project includes a four year construction period and a 90 year post-closure period. Key project components include the open pit, tailings management facility and waste rock storage area, heap leach facility, mill and associated infrastructure, ore stockpiles, liquefied natural gas power generating infrastructure, and office and accommodation buildings. The project also requires a 120 km access road from the town of Carmacks, YT, and concentrate will be trucked to the port at Skagway, Alaska.

The objective of the Sediment and Erosion Control Management Plan (the Plan) is to control run-off, minimize erosion on exposed slopes and substrates, and prevent inputs of silt or sediment into watercourses during all phases of the Project. Erosion control measures are those designed to prevent exposed soil particles from becoming detached and transported by water or wind. Best management practices will be the primary tool used to mitigate erosion and sedimentation risks. The Plan will provide specific details on what types of erosion and sedimentation control measures will be used and where and when they will be applied. It will describe the requirements for inspection, cleaning, repair and ultimately removal of the erosion and sediment control measures.

The Plan contained herein is a preliminary draft, which will be updated as the project is refined, and has been derived from *Plan Requirement Guidance for Quartz Mining Projects*. The final Plan will provide an overview of the project, described the areas where erosion may be a concern, and provide specific monitoring and management strategies for addressing the areas of concern.

Preliminary draft	January 2015	Updated to provide more details, as requested by reviewers in the YESAB adequacy review	CMC

A.22C.1 INTRODUCTION

The Casino Mine Project is a proposed 22 year mine project owned and operated by Casino Mining Corporation (CMC), that will produce copper and molybdenum concentrates, and gold dore bars via flotation milling and heap leach processing, respectively. The proposed project includes a four year construction period and an approximately 7 year post-closure period. The location of the Project is shown on Figure A.22C.1-1. Key project components include the open pit, tailings management facility and waste rock storage area, heap leach facility, mill and associated infrastructure, ore stockpiles, liquefied natural gas power generating infrastructure, and office and accommodation buildings. The project also requires a 120 km access road from the town of Carmacks, YT, and concentrate will be trucked to the port at Skagway, Alaska.

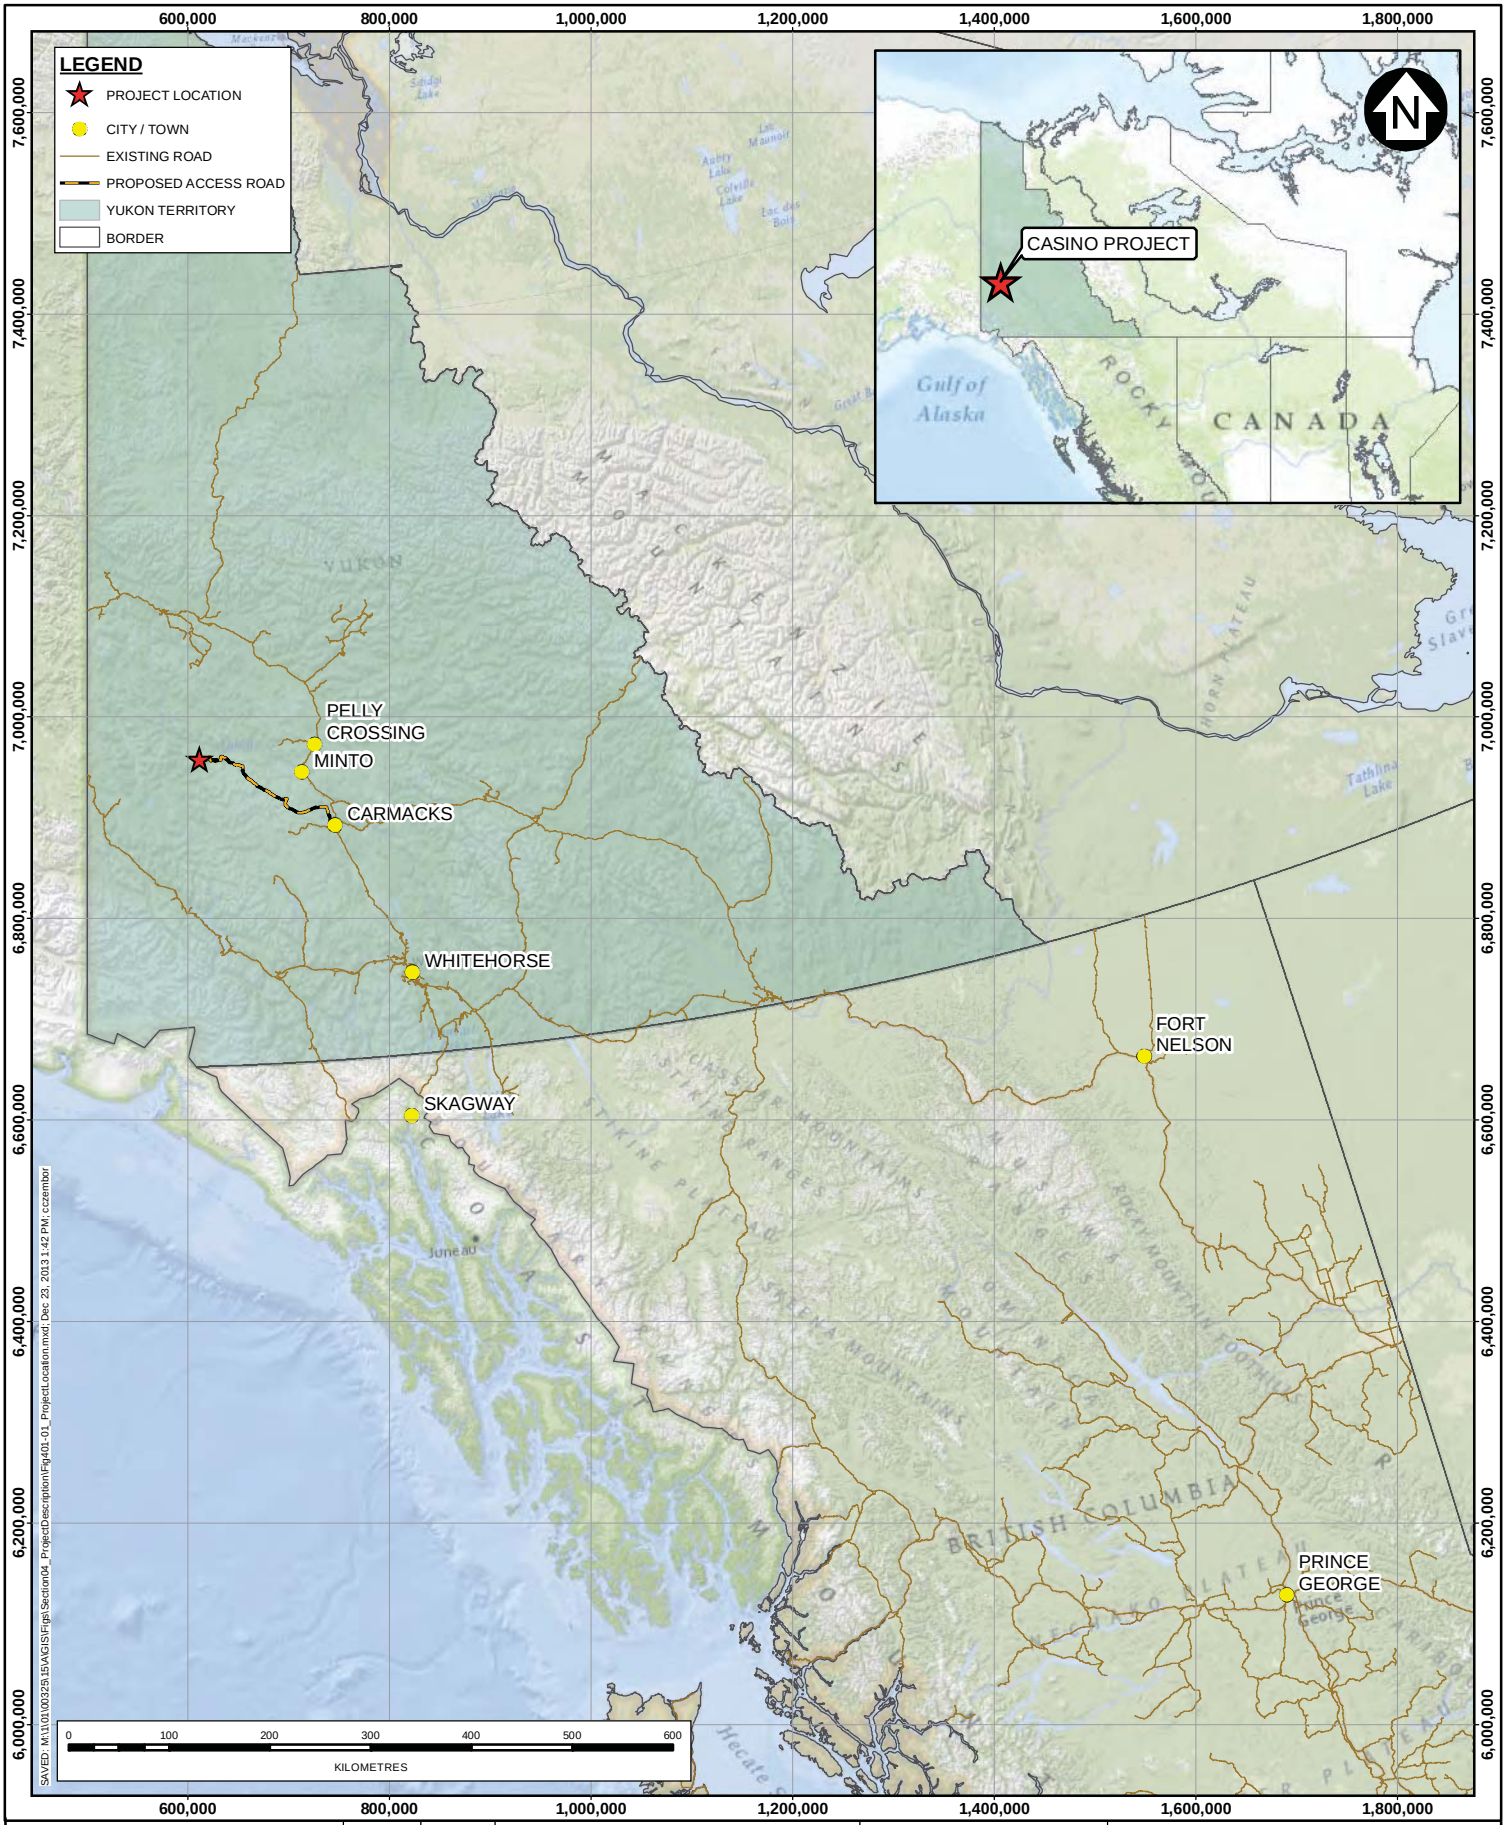
The objective of the Sediment and Erosion Control Management Plan (the Plan) is to control run-off, minimize erosion on exposed slopes and substrates, and prevent inputs of silt or sediment into watercourses during all phases of the Project. Erosion control measures are those designed to prevent exposed soil particles from becoming detached and transported by water or wind. Sediment is comprised of soil particles resulting from erosion; sedimentation is the deposition of the transported sediment. Best management practices will be the primary tool used to mitigate erosion and sedimentation risks. The Plan will provide specific details on what types of erosion and sedimentation control measures will be used and where and when they will be applied. It will describe the requirements for inspection, cleaning, repair and ultimately removal of the erosion and sediment control measures.

The final Plan will describe the measures to be undertaken to manage erosion and sedimentation during all phases of the Project. To achieve these objectives, CMC will:

- Comply with applicable federal and territorial legislation, Project permits, licences and approvals;
- Understand the potential for erosion to occur by identifying all potential erosion and sediment sources prior to undertaking any activities that will disturb ground;
- Adopt a multi-barrier approach for erosion and sedimentation control measures; and
- Inspect and maintain sedimentation control equipment and infrastructure, and remove once work is complete.

The protection of the natural environment and management of environmental risk from erosion and sedimentation in the Yukon is governed by the *Quartz Mining Act*, *Waters Act*, *Lands Act and Territorial Lands Act,* and the *Environment Act*. Additionally, sediment and sediment laden water can be considered a deleterious substance under Section 34 of the federal *Fisheries Act*.

Guidance documents relevant to the topic include:



- Environmental Code of Practice for Metal Mines. Environment Canada. 2009;
- Canadian Environmental Quality Guidelines. Canadian Council of Ministers of the Environment (Guidelines for Canadian Drinking Water Quality, Recreational Water Quality, Protection of Aquatic Life, Agricultural Water Uses, as applicable); and
- Best Management Practices for Works Affecting Water in Yukon (Yukon Environment 2011).

Potential adverse effects from erosion and sedimentation can be minimized through project planning, following BMPs, and providing site specific controls that are commensurate with the potential risks to the natural environment. The Plan will provide a detailed description of the methods of sedimentation and

erosion prevention and control that will be used, the specific situations that they will be used in, and the implementation procedures that will be followed. The Plan will include details regarding:

- The appropriate location of control measures;
- The timing of installation, inspection and maintenance of control measures; and
- The responsible parties for implementation, operation, modification, inspection and maintenance control measures.

The Plan contained herein is a preliminary draft, which will be updated as the project is refined, and has been derived from *Plan Requirement Guidance for Quartz Mining Projects* (Government of Yukon, 2013). The final Plan will provide an overview of the project, described the areas where erosion may be a concern, and provide specific monitoring and management strategies for addressing the areas of concern. The final Plan will include a table of proponent commitments made during the environmental assessment process relevant to erosion and sedimentation management, and indicate how the Plan addresses the commitments. Terms and conditions of any applicable licences, permits and approvals required for the Project operations will also be included, once acquired.

A.22C.2 MONITORING STRATEGIES

Monitoring of relevant water quality and sediment parameters in any receiving environment is included as a component of the *Casino Environmental Monitoring, Surveillance and Reporting Plan*. The frequency of erosion and sedimentation control monitoring and receiving environment monitoring will be established following Project permitting in consultation with regulatory agencies.

Monitoring will generally comprise of regular monitoring of key areas identified to be at high risk for erosion or sedimentation and follow up monitoring of installed mitigation measures. Periods of high flows (e.g., during spring melt/freshet periods, or high precipitation events) will also require monitoring of implemented best management practices (described in Section 4 -). Frequent and proper maintenance will allow for prolonged use instead of allowing the measures to be destroyed and in need of full replacement.

Silt fences, sediment traps/basins, ditches, culverts, exfiltration areas, and water management ponds will be visually inspected for the following:

- Excess sediment build-up;
- Structural/physical integrity; and
- Anticipated wear and tear.

Sediment removal and proper disposal shall be conducted as required.

A.22C.3 EROSION AND SEDIMENT SOURCES

While risks of erosion or sedimentation at the Project are greatest during the construction phase of the project, there are also operational considerations to be monitored to minimize the erosion and sedimentation potential of constructed infrastructure. Areas where erosion or sedimentation may be a concern during all phases of the Project are summarized in Table A.22C.3-1. Operational phases include construction (years -4 to -1), operations (years 1 to 22), post-closure (years 23 – 30) and closure (years 31+).

Generally, areas most at risk for erosion and sediment transport include steep slopes with high potential for wind and water induced erosion, exposed permafrost areas or areas where the vegetative mat has been removed resulting in thaw and fluidized movement of soils and overburden, and heavily trafficked areas.

Potential effects from the above activities in the absence of planned mitigation measures include:

- Increased surface erosion from disturbed and rehabilitated areas;
- Increased sediment load entering the natural water system; and
- Siltation or erosion of ditches and watercourses.

Table A.22C.3-1Potential Erosion and Sedimentation Sources

Erosion and Sedimentation Sources	Operational Period			
	Construction	Operations	Post-Closure	Closure
Land clearing and topsoil stripping	X	X		
Stockpiling of topsoil and ice-rick materials	X	X		
Ground disturbance to build access road	X			
Pit excavation, site grading and land filling	X	X		
Construction of roads, bridges, and culverts	X	X		
Construction of the TMF, waste rock dumps, and heap leach facility	X	X		
Ground disturbance during decommissioning of mine site infrastructure and access roads			X	
Particulate matter deposition caused by vehicle traffic within the mine site area and along the access roads	X	X	X	
Runoff from ore and topsoil stockpiles	X	X	X	

A.22C.4 EROSION AND SEDIMENT CONTROL MEASURES

Potential adverse effects from erosion and sedimentation can be minimized through project planning, following best management practices (BMPs), and providing site specific controls that are commensurate with the potential risks to the natural environment. The following BMPs will be followed:

- Ensure contractors and staff understand the objectives of the Sediment and Erosion Control Management Plan;
- Make the Sediment and Erosion Control Management Plan flexible and adaptable to different project areas, phases and risks;
- Adopt a multi-barrier approach to provide erosion and sediment control;
- Maintain a vegetated buffer between construction and any waterbodies where possible;
- Retain existing vegetation and stabilize exposed soils with vegetation where possible;
- Limit the duration of soil exposure and phase construction when possible;
- Limit the extent of disturbed areas by minimizing nonessential clearing and grading;
- Minimize slope length and gradient of disturbed areas;
- Stabilizing and re-vegetating disturbed areas following construction, as appropriate;
- Delineate areas that are susceptible to erosion (e.g., silty soils, long steep slopes);
- Stockpile topsoil away from watercourses, drainage features, and tops of steep slopes;
- Designing appropriate sediment settling ponds that conform to BC MELP (2001) guidelines;
- Designing appropriate diversion ditch systems to minimize contact water;
- Designing appropriate collection ditch systems to collect contact water;
- Assess all erosion and sedimentation control measures before and after all significant rainfall and snowmelt events to ensure they are functioning as designed;
- Monitoring of TSS and turbidity during construction to ensure compliance with regulatory guidelines (<25 mg/L increase if background levels are less than 250 mg/L, <10% increase if background levels are greater than 250 mg/L; (CCME, 2002)); and
- Using dust suppressants and enforcing traffic speed limits along all access roads.

The main methods for erosion and sedimentation control include prevention, through water management, and control, through various sediment control techniques, as discussed below.

A.22C.4.1 PREVENTION

The primary method of preventing erosion and preventing sediment laden water from entering watercourses is to limit the footprint near waterbodies and to maintain a vegetated buffer between construction activities and the watercourse. This method also protects riparian vegetation and aquatic habitat.

The water management objective during construction is to safely convey and/or detain the respective design storm event at each facility, while maintaining water quality at background levels or meeting water quality standards in the receiving environment. The primary means of achieving this objective will require the diversion of non-contact runoff, and erosion source control (i.e., minimizing total suspended sediment levels in runoff from construction areas). Water will be controlled in a manner that minimizes erosion in areas disturbed by construction activities and prevents the release of construction water which could adversely affect the quality of receiving waters.

Water will be controlled in a manner that minimizes erosion in areas disturbed by construction activities and prevents the release of sediment laden water to the receiving environment. Design criteria for the various sediment control elements will be based on industry standard guidance documents (BC MELP, 2001; BC Ministry of Energy and Mines, 1998). Sediment mobilization and erosion will be managed throughout the site by installing sediment controls (see Section 4.2) prior to construction activities, limiting the disturbance as much as possible and reducing water velocity across the ground, particularly on exposed surfaces and in areas where flow tends to concentrate. During operations, diversion ditches will be established and disturbed land surfaces will be stabilized to minimize erosion. This will be achieved by implementing progressive rehabilitation of disturbed land, construction drainage controls to improve stability, promoting infiltration, constructing appropriate sediment control devices and restricting access to rehabilitated areas.

Numerous design elements that have been included in the Project design include:

- **Maintaining vegetated buffers**: Wherever possible, vegetated buffers will be maintained between construction activities and waterbodies. Buffers may range from 10 m to 30 m, depending on the size and nature of the waterbody. The Project footprint near waterbodies will also be limited to the extent possible.
- **Coffer dams and pumping systems:** A coffer dam will be constructed with the TMF starter footprint to capture all runoff from the upstream areas and route it to the sediment pond downstream.
- **Sediment and erosion control elements and BMPs:** Typical BMPs that will be used at the project are maintaining vegetated buffers, runoff collection ditches, energy dissipaters, sediment traps, slope drains, surface roughening, filter bags, water bars, diversion structures, silt fences, sediment basins, temporary seeding, and mulching.
- **Sediment settling and water collection ponds:** Temporary sediment settling ponds will be constructed downstream of all construction activities to treat sediment laden water and discharge to existing channels via energy dissipating structures. Collection ponds will also be constructed at the toe of all stockpiles.
- **Water management pond:** This pond will collect surface runoff and seepage from the TMF embankments during operations and pump the water back to the TMF.
- **Winter seepage mitigation pond:** This pond will function as a mitigation measure at closure to store seepage from the TMF during the winter months (December to April) when there is no dilution from surface water runoff in Casino Creek.

A.22C.4.2 CONTROL

Erosion control BMPs reduce erosion potential by stabilizing exposed soil or reducing surface runoff flow velocities. There are generally two types of erosion control BMPs that are used:

- Source control BMPs for protection of exposed surfaces; and
- Conveyance BMPs for control of runoff.

Experience and adaptive management are integral to the successful selection of the appropriate BMPs and the design and implementation of an overall erosion and sediment control plan. Erosion control BMPs will be implemented prior to and during construction to minimize erosion and sediment discharge into surrounding areas. Typical BMPs that will be used at the project are:

• Runoff collection ditches	• Water bars
• Energy dissipaters	• Diversion structures
• Sediment traps	• Silt fences
• Slope drains	• Sediment basins
• Surface roughening	• Temporary seeding
• Filter bags	• Mulching

A.22C.4.2.1 Collection Ditches

A runoff collection ditch intercepts construction water runoff and diverts it to a stabilized area where it can be effectively managed. Collection ditches are used within construction areas to collect runoff and convey it to appropriate sediment control measures. General locations and conditions may include:

- Below disturbed slopes to divert sediment-laden water to control facilities;
- At or near the perimeter of the construction area to prevent sediment-laden runoff from leaving the site; and
- Below disturbed areas to prevent erosion before stabilization is achieved.

Collection ditches may be either temporary or permanent structures. Temporary collection ditches for construction will be sized to convey the runoff from a 10 year return period 24-hour storm event assuming that the entire footprint area has been disturbed and contributes sediment laden runoff to the sediment control and water management ponds. Collection ditches will be inspected and maintained regularly to remove any blockages to flow (accumulated sediment, debris, etc.) that may occur.

A.22C.4.2.2 Energy Dissipators

Energy dissipators are typically riprap lined plunge pools used to dissipate the energy of fast flowing water and prevent erosion of natural stream channels downstream. These structures are used in conjunction with diversion and collection ditches, and are typically located upstream of the receiving waterbody (e.g. stream, pond, lake, etc.). Energy dissipators will be inspected and maintained regularly to remove any blockages to flow (accumulated sediment, debris, etc.) that may occur.

A.22C.4.2.3 Sediment Traps

Sediment traps are typically constructed within collection ditches to detain sediment-laden runoff long enough to allow the majority of the sediment to settle out. The exact locations and final geometry of each trap will be field fitted to integrate with the terrain to minimize disturbance. Water from sediment traps will flow to holding ponds, sediment basins or other BMP structures. The sediment traps will be inspected regularly for sediment accumulation. Maintenance will include the removal of sediment if the sediment trap has accumulated sediment to one half of the wet storage. If the sediment trap is clogged by sediment and/or debris, the trap will be removed and cleaned, or replaced.

A.22C.4.2.4 Slope Drains

Slope drains consist of flexible tubing or conduit and are required to convey concentrated runoff into the appropriate BMP structure when ditches are deemed impractical. Slope drains shall be sized according to estimates of peak flows, which are dependent on contributing drainage area. Slope drains will be inspected and maintained regularly and any blocked or damaged parts will be cleaned, repaired, or removed and replaced.

A.22C.4.2.5 Surface Roughening

Cut and fill slopes will be roughened with tracked machinery where appropriate to reduce runoff velocity and erosion, increase infiltration, and aid in the establishment of vegetative cover with seeding. The roughening will be carried out by a tracked machine moving up and down the slope surfaces, creating undulations on the soil surface. This procedure is simple and inexpensive, and it provides immediate short-term erosion control for bare soil where vegetative cover is not yet established. A rough soil surface provides favorable moisture conditions that will aid in seed germination.

A.22C.4.2.6 Filter Bags

Filter bags are generally constructed from a sturdy non-woven geotextile capable of filtering particles larger than 150 microns. Filter bags are to be installed at the discharge end of pumped diversion pipelines, via fabric flange fittings, to remove fine grained materials such as silt before discharging water to the environment. Filter bags should be installed on flat, stable, non-erodible foundations, or in well vegetated areas. The pumping rate shall be no greater than specified by the manufacturer. Discharge from filter bags will be routed to minimize erosion. A smaller variety of filter bags, referred to as filter socks, can be installed on the discharge ends of gravity flow pipes, such as slope drains, to filter silt particles before discharging water to the environment.

A.22C.4.2.7 Waterbars

Waterbars serve to reduce sheet flow and surface erosion of areas of exposed soil and/or roads by diverting runoff towards a stable vegetated area or collection ditch. Spacing of waterbars will be field fitted based on the slope grade and general erodibility of the surface. Waterbars must not direct runoff into a ditch that will channel water toward the watercourse unless the ditch is adequately prepared with check dams and armouring, where appropriate. Waterbars may require regular maintenance when subjected to frequent traffic crossings.

A.22C.4.2.8 Diversion Structures

A temporary diversion structure consists of sandbags stacked in a pyramid formation with a polyethylene sheet placed diagonally in between the bags. Temporary diversion structures are useful for diverting concentrated overland flows to an appropriate sediment basin or other BMP structure where it can be effectively managed.

A.22C.4.2.9 Silt Fences

Silt fences are typically sheets of geotextile material installed downslope of erosion-susceptible terrain to prevent sediment-laden sheet flow from entering receiving waters. Drainage pools that form along the uphill side of the fence promote sediment settling. Drainage in contact with the fence is filtered through the geotextile. The small pores of the silt fence will filter coarse particles and restrict water exfiltration rates. Barrier locations are informally chosen based on site features and conditions (e.g. soil types, climate, terrain features, sensitive areas, etc.), design plans, existing and anticipated drainage courses, and other available erosion and sediment controls. Typical barrier sites are catch points beyond the toe of fill material, or on side slopes above waterways or drainage channels. Silt fences are not recommended for wide low-flow, low-velocity drainage ways, for concentrated flows, in continuous flow streams, for flow diversion, or as check dams. Silt fences should be inspected for damage, tears, clogging, or erosion of the surrounding areas. Damaged sections will be repaired or replaced to maintain functionality.

A.22C.4.2.10 Sediment Basins

A sediment basin is a temporary structure that is used to detain runoff from small drainage areas so that sediment can settle out. Sediment basins are generally located in areas where access can be maintained for sediment removal and proper disposal. Sediment basins are typically constructed at the end of collection ditches to detain sediment-laden runoff long enough to allow the majority of the sediment to settle out. A sediment basin can be created by excavating a basin, utilizing an existing depression, or constructing a dam on a slight slope downward from the work area. Sediment-laden runoff from the disturbed site is conveyed to the basin via ditches, slope drains, or diversion structures. The basin is a temporary measure, with a nominal design life of approximately six months, and is to be maintained until the site is permanently protected against erosion by vegetation and/or structures. The size of the temporary sediment basin is dependent on the size of the drainage area. The exact location and final geometry of each basin should be field fitted to integrate with the terrain to minimize disturbance.

A.22C.4.2.11 Temporary Seeding

Exposed slopes and other disturbed areas will be seeded to establish vegetative cover utilising native grass species. The purpose of temporary seeding is to stabilize the soil and reduce damage from wind and/or water until permanent stabilization is accomplished. Seeding is applicable to areas that are exposed and subject to erosion for more than 30 days, and is usually accompanied by surface preparation, fertilizer, and mulch; however, the timing of seeding is weather and season dependent and consequently this method is not applicable at all times. Temporary seeding may be accomplished by hand or mechanical methods, or by hydraulic application (hydroseeding), which incorporates seed, water, fertilizer, and mulch into a homogeneous mixture (slurry) that is sprayed onto the soil.

A.22C.4.2.12 Mulching

Mulching is the application of a uniform protective layer of straw, wood fiber, wood chips, or other acceptable material on or incorporated into the soil surface of a seeded area to allow for the immediate protection of the seed bed. The purpose of mulching is to protect the soil surface from the forces of raindrop impact and overland flow, foster the growth of vegetation, increase infiltration, reduce evaporation, insulate the soil, and suppress weed growth. Mulching helps to hold fertilizer, seed, and topsoil in place in the presence of wind, rain, and runoff, and reduces the need for watering. Mulching may be utilized in areas that have been seeded either for temporary or permanent cover.

There are two basic types of mulches: organic mulches and chemical mulches. Organic mulches likely to be used include straw, hay, wood fiber, wood chips, and bark chips. This type of mulch is usually spread by hand or by machine (mulch blower) after seed, water, and fertilizer have been applied. Chemical mulches, also known as soil binders or tackifiers, are composed of a variety of synthetic materials, including emulsions or dispersions of vinyl compounds, rubber, asphalt, or plastics mixed with water. Chemical mulches are usually mixed with organic mulches as a tacking agent to aid in the stabilization process, and are not used as mulch alone, except in cases where temporary dust and erosion control is required. The choice of materials for mulching should be based on soil conditions, season, type of vegetation, and the size of the area. One example is rolled erosion control blankets woven with degradable or poly netting with straw or coconut mulch, which can be used on steep slopes to provide a permanent or semi-permanent cover.

A.22C.4.3 IMPLEMENTATION SEQUENCE

Specific implementation sequences for water management and erosion and sedimentation control activities will be detailed during detailed engineering of the Project. At that time, this plan will be updated with the sequence of activities that will conducted to minimize erosion and sedimentation of the receiving environment during construction, operations and closure phases of the Project. For example, during construction of the tailings dam, a staged surface dual-ditch system has been designed to collect surface runoff from the embankment in an upslope ditch, and a downslope ditch diverts clean surface runoff. The ditches will be lined with scour protection to prevent erosion of the ditch channels. The exact sequence of ditch construction and lining will be outlined in the updated plan. The sequence of sedimentation basin, diversion ditches, energy dissipaters, sediment traps, etc., will also be detailed in the updated plan, once the exact construction requirements are known.

A.22D – INVASIVE SPECIES MANAGEMENT PLAN

The Casino Mine Project is a copper-gold open pit mine Project that will produce copper and molybdenum concentrates, and gold dore bars via flotation milling and heap leach processing, respectively. The proposed Project has a 22 year mine life, with an additional four year construction period and a 25 year closure period. Baseline monitoring at the site has been conducted since 1993, with comprehensive baseline studies conducted from 2008 through present. Environmental baseline studies and monitoring at the site include surface and ground water quality and hydrology; aquatic monitoring including sediment, benthic invertebrates, periphyton and fish studies; rare plant, ecosystem classification, and vegetation health; as well as extensive wildlife monitoring studies.

The preliminary Invasive Species Management Plan presented herein summarizes the management and monitoring proposed to prevent the introduction and propagation of invasive plant species at the Casino Project. Detailed closure monitoring will be provided in the *Casino Project Closure and Reclamation Plan*.

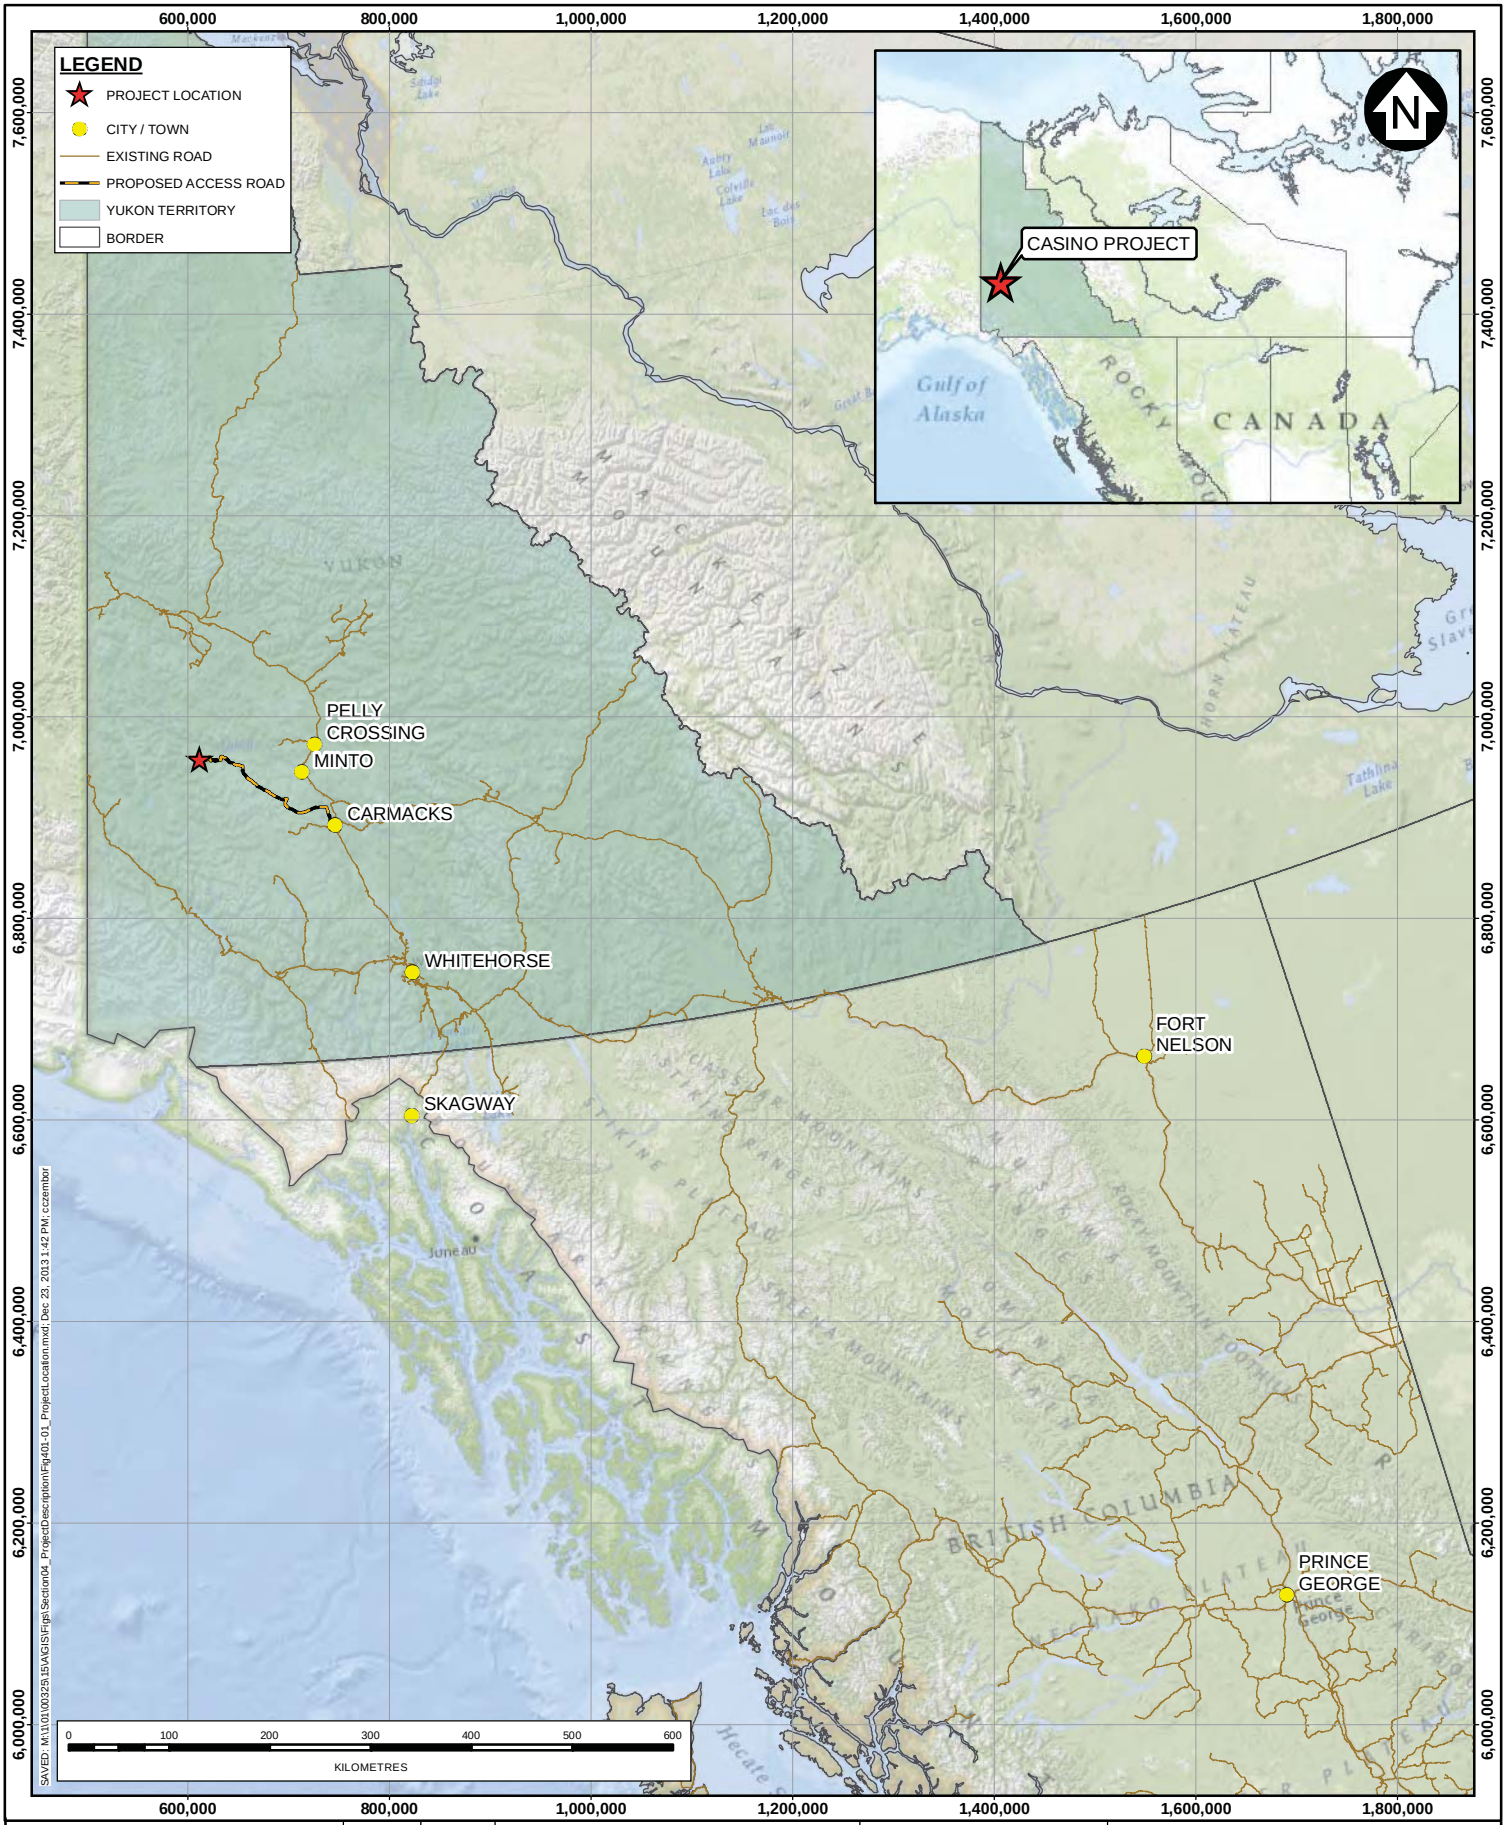
REVISION SUMMARY

Version	Date	Revision notes	Revision authors
Preliminary Draft	January 2015	Produced for YESAB assessment process	CMC: M.Mioska



A.22D.1 INTRODUCTION

The Casino Project is a proposed copper-gold open pit mine located 150 km northwest of Carmacks and 300 km from Whitehorse (Figure A.22D.1-1). The Project is designed to process approximately 120,000 t/d of copper and gold ore over a 22 year mine life. Processing of the sulphide ore is via conventional flotation to produce copper and molybdenum mineral concentrates. Processing of oxide ore is via heap leaching and carbon adsorption technology that will produce gold and silver doré bars. Mining waste rock and flotation tailings will be stored sub-aqueously in a tailings management facility (TMF). The TMF will also function as a water storage pond to collect surface runoff and seepage from around the mine site, and provide process water to the ore processing facilities. Supplemental freshwater for processing and camp activities will be provided by a pipeline from the Yukon River. No effluent discharge is proposed for the construction and operations phase of the Casino Project; however, open pit overflow and TMF pond water will be treated with engineered wetlands during the closure phase of the Project. Access to the Project is via the 200 km Freegold Road from Carmacks, of which 80 km is a public use road maintained by the Yukon Government, and the remaining 120 km extension will be a private access road. Major Project infrastructure at the maximum extent of development is shown in Figure 1-2.

The *Casino Project Invasive Species Management Plan* (the Plan) has been developed to support the environmental assessment process, and the Quartz Mining Licence application. Details in this Plan are provided in support of the information provided by the Yukon Invasive Species Council (YISC). It is expected that this plan will evolve as Project permitting advances. The primary objectives of this Plan are to:

1. Develop a management plan to prevent the introduction and propagation of invasive plant species at the Casino Project;
2. Identify invasive plant species, if they establish, through consistent monitoring; and
3. Participate in the Yukon wide early detection and rapid response protocol set forth by the Yukon Invasive Species Council through reporting of identified invasive plants at the mine site.

This preliminary Plan is guided by the Project proposal currently under review with the Yukon Environmental and Socio-economic Assessment Board (YESAB), whereas the ultimate Plan will also be driven by requirements in the Quartz Mining Licence and Type A Water Use Licence required prior to the commencement of mining activities at the Casino Project.

A.22D.2 INVASIVE SPECIES

Invasive species generally refer to introduced species that have “negative effects on our economy, our environment, or our health” (YISC, 2014). While there are 154 introduced plant species in the Yukon, only 20 are considered invasive. Invasive plants can negatively impact the environment through competition with native plant species, increased erosion and sedimentation and the reduction of forage quality and quantity for animals (YISC, 2014). It is well known that disturbed areas, such as a mine site, can lead to the introduction of invasive plants through transportation mechanisms (i.e., vehicles traveling to the site from other areas) and through re-vegetation (if contaminated or non-native seed mixtures are used for reclamation activities). Consequently, this plan focuses on the management and mitigation of invasive plant species within the Casino Project area.

Within Yukon, there are relatively few invasive species compared to neighbouring jurisdictions, such as British Columbia (BC) and Alaska. Areas with the highest distribution of invasive species are along major highways and at rest stops, campgrounds, gravel pits and disturbed areas adjacent major roadways (Line *et al.,* 2008). A 2007 baseline evaluation of sweetclover (*Melilotus officinalis*) along major highways in Yukon found sweetclover along a number of highways and communities from ranging from Watson Lake north to Dawson City, including major river systems (Line *et al.,* 2008). As shown in Figure 2-1 and Figure 2-2, sweetclover and other non-native plants are found along major roadways that will be used to access the Casino Project (Klondike Highway and Alaska Highway).

The introduction, establishment and spread of invasive species can reduce biodiversity, change ecosystem processes and functions, alter wildlife habitat, accelerate soil erosion, stream sedimentation and reduce productivity and compete with and replace native vegetation, including rare and endangered species (YISC, 2014). Invasive species can be introduced in soil; as seed mixes or erosion control mixes; or from plant products (YISC, 2014). Seeds and viable plant parts can be distributed on equipment, trucks, all-terrain vehicles, boats and in bilge waters (YISC, 2014).

Invasive species have the potential to establish and spread quickly within the Project area and along the Freegold Road. The Project area will be exposed to anthropogenic activities associated with development and resource extraction which could introduce seeds from invasive species. Currently, there is no legislation to manage invasive species in Yukon. BC and Alaska are legislated under the *Weed Control Act* and *Plant Protection Act*, respectively, which places a duty on land occupiers to control designated noxious plants. CMC will exhibit due-diligence to prevent further spread of invasive species in Yukon and will mitigate and monitor areas within the Project area. Activities proposed to prevent, mitigate and monitor for invasive species for the Casino Project are summarized below.

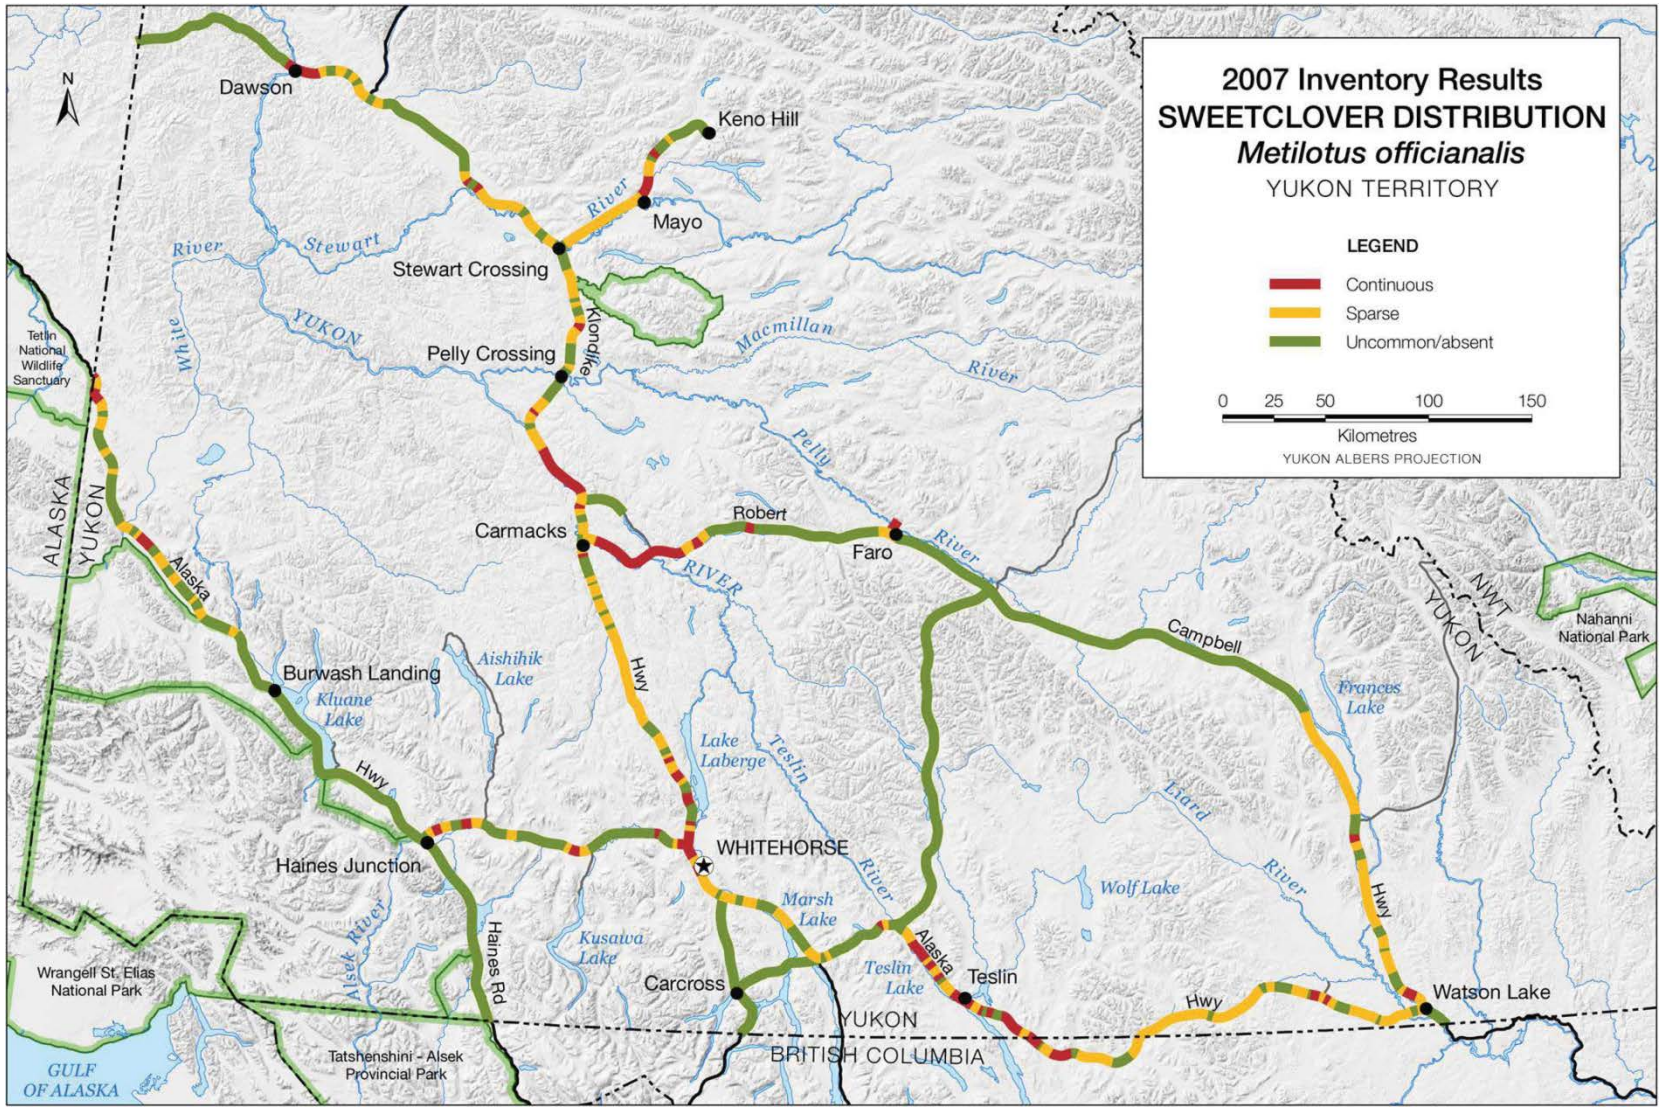

Figure A.22D.2-1 2007 Sweetclover distribution along major Yukon Highways (From Line, et. al., 2008)

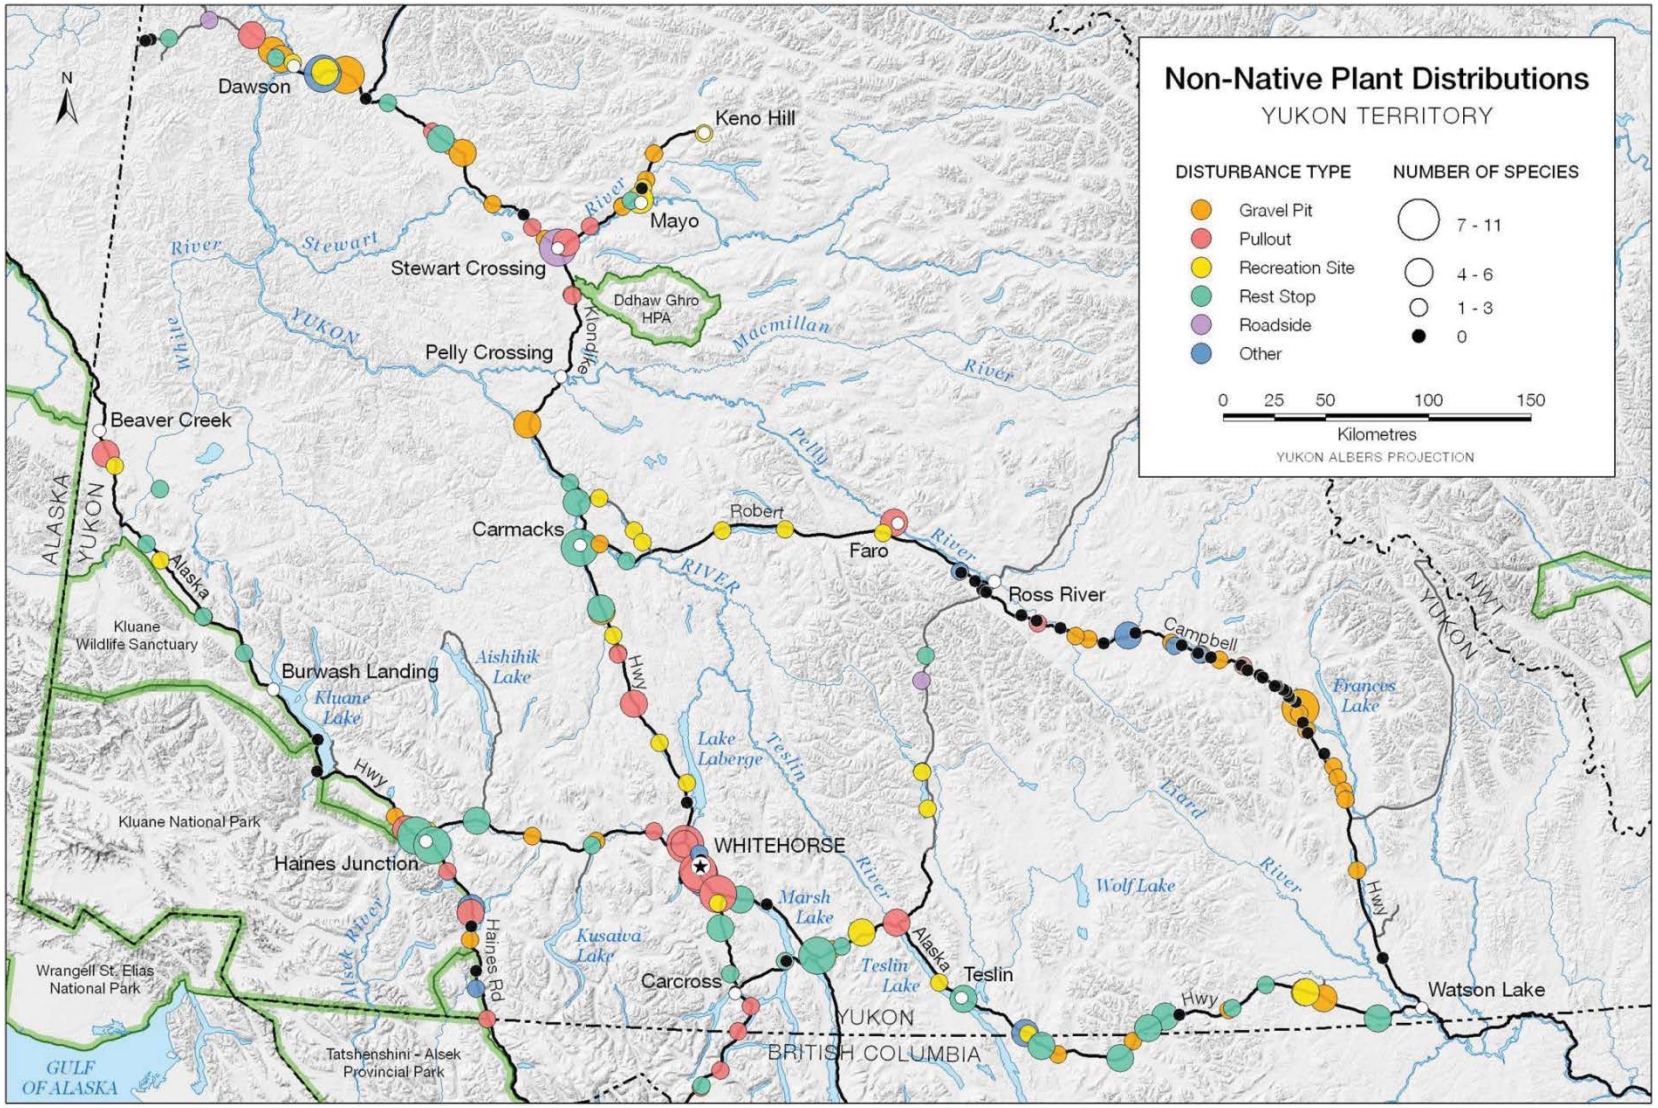

Figure A.22D.2-2 2007 non-native plant distribution along major Yukon Highways (From Line, *et al*., 2008)

A.22D.1.1 Prevention

Prevention is the most cost effective means of controlling invasive species (YISC, 2014). The Casino Project will implement the following measures:

- Minimize disturbance of the natural vegetation and exposure of soils.
- Avoid unnecessary compaction of soils by limiting the use of heavy equipment or vehicles directly after a rain event. Soil compaction issues are lowest when the soil is dry or frozen.
- Wherever possible, vehicle use (including ATVs) will be restricted to roads and existing pathways to limit additional disturbance to ecosystems and plants, and reduce the potential for introduction of invasive species.
- Wherever possible, vehicles entering site will be clean (e.g., no large obvious clods of mud) to limit the spread of invasive plant propagules. This will be monitored as part of the walk around inspection done prior to site access.
- Soil salvage to promote successful reclamation of the natural seed bank, including segregation of topsoil and woody overburden during soil striping. Salvaged soil will be used during reclamation.
- Disturbed and reclaimed areas will be allowed to re-vegetate naturally to reduce the risk of introducing invasive plant species to the region.
- Transplant woody species (e.g. cuttings or entire plant) on exposed surfaces to establish ground cover and reduce the likelihood of invasive plants colonization. Fertilizers may be considered to help the re-establishment of native species.
- Ensure that reclamation/re-vegetation equipment is clean and is not acting as a carrier for invasive plant seeds.
- If the transportation of aggregates is required, avoid sources where invasive species are growing (e.g., gravel from borrow pits with sweetclover colonization).

A.22D.1.2 Monitoring Program

Generally, the introduction of invasive species will be minimized by implementing the above prevention measures. In addition, monitoring efforts will encourage the early detection and rapid response (EDRR) of invasive species to track known populations and direct management efforts. Monitoring of invasive plant species will be done in conjunction with rare plant species monitoring, as detailed in the *Casino Project Environmental Monitoring, Surveillance and Reporting Plan*, although identification of invasive plants should be conducted at the same time as any other environmental monitoring program and during daily tasks around the mine site and access road.

Invasive species monitoring will occur within the Project footprint and adjacent areas to ensure that no invasive species are introduced to the region by the Project. Surveys for invasive plants will be conducted every five years by qualified personnel experienced in plant identification. Additional surveys may be triggered by observations of invasive plant species. Surveys will follow a standardized protocol that will be developed prior to construction. All monitoring efforts will be recorded. If any invasive species are found, management actions will be taken to reduce the distribution of the infestation, which may include

destroying the plant. Prior to construction, the YISC will be consulted for the appropriate actions in the event that invasive species are found, since management actions are species and population specific. The control methods listed for each species in YISC's Yukon Invasives Overview documents will also be consulted. If the pathway of entry can be determined, changes will be made to reduce the possibility of further introduction of invasive species.

The full list of invasive species in the Yukon is provided in Appendix A.22D A and the eight key invasive species are described in Appendix A.22D B (Yukon Government, 2007). If an invasive plant species is identified, then following information will be recorded:

- GPS location
- Species name
- Health and size of the plant
- Pictures (with reference point)
- Percent coverage of the area

A.22D.1.3 Reporting

If invasive plant species are found at the mine site, management actions will be taken, which may include removing and destroying plants using best practices recommended by YISC (867-393-3394). Additionally, reporting to the YISC will be essential to participating in the overall early detection and rapid response protocol required by YISC (YISC, 2014). Should invasive species be identified at the Casino Project, the following activities are to be completed:

1. Report invasive species to the Yukon Invasive Species Council (867-393-3394).
2. Ask for guidelines for collection and disposal of invasive plant material.
3. Record findings in an internal working database for the life of the mine.

APPENDIX A.22D A

YUKON INVASIVE PLANTS (FROM YISC, 2014)

Invasiveness Rank
1 - highly invasive - may displace or replace native ecosystems
2 - aggressive - widespread, persistent, but may not replace native species or change ecosystem function
3 - taxa present in the territory that area not known to be invasive here - but have been found to be invasive in other jurisdictions
4 - has been reported in the territory. Has not been shown to be problematic, may not persist
5 - species that likely don't persist
6 - false reports
7 - native and introduced populations exist

General Abundance
C common - widespread established
F falsely reported,
P possible but not yet documented
R rare known from only 1 or two localities,
U unknown
X possibly not persistent,
? possibly native,

Persistence
1=widespread
2=local
3=not persistent,
4=falsely reported

Alaska Invasiveness Rank
not ranked
<40 = Very Weakly Invasive
40-49 = Weakly Invasive
50-59 = Modestly Invasive
60-69 = Moderately Invasive
70-79 = Highly Invasive
>80 = Extremely Invasive
Ranking from: Matthew L. Carlson, Irina V. Lapina, Michael Shephard, Jeffery S. Conn, Roseann Densmore, Page Spencer, Jeff Heys, Julie Riley, and Jamie Nielsen. 2008.
Invasiveness Ranking System for non-native plants if Alaska. USDA Forest Service Alaska Region R10-TP-143 http://www.fs.fed.us/r10/spf/fhp/invasive/invasiveness%20ranking%20report.pdf

APPENDIX A.22D B

YUKON INVADERS: YUKON INVASIVE PLANT SPECIES (YUKON GOVERNMENT, 2014)

YUKON INVADERS

Help Reduce the Spread of Invasive Plants in Yukon

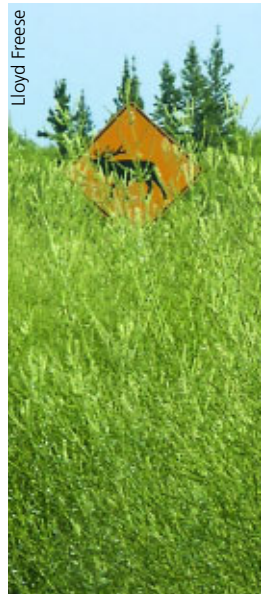
Yukon Government

City of Whitehorse

Invasive Plants

Invasive plants and animals are the second greatest threat to biodiversity after habitat loss. The economics of controlling invasive species damage can be considerable. In 2004-05, the British Columbia government spent $8 million to protect valuable forest and range land from the effects of non-native plants and weeds.

There are 140 introduced plant species in Yukon. Forty-four are persistent and widespread; 59 are persistent but not widespread; and most of the remaining 37 are casual introductions that may not persist.



Many of these plants are responsible for habitat damage, loss of subsistence resources, and economic loss in other North American jurisdictions. Yukoners are in the enviable position of preventing plant infestations before they become so widespread that control is costly and eradication impossible.

Everyone can help reduce the spread of those already established. Keeping invasive species from becoming established in the territory should be everyone's responsibility.

This booklet highlights eight of the worst invaders.

White Sweetclover *(Melilotus alba)*

Sweetclover is a biennial, occasionally annual plant in the pea family that can attain a height of 2 m but is usually less than 1 m. It rapidly colonizes gravelly well-drained soils such as roadsides, waste areas and river banks and bars. A single plant can produce 300,000 seeds and the seeds remain viable in the soil for many years (80% survival after 30 years). This is likely Yukon's most invasive and problematic species.

Lloyd Freese

Range in Yukon: Widespread throughout the southern Yukon. It is known along much of the Alaska, Robert Campbell, Top-of-the-World highways and 20 km up the Dempster Highway. It has proved to be highly invasive along the LaBiche River. The only site so far reported on the Yukon River in Yukon is in Whitehorse; although it is a serious problem on Alaskan waterways including tributaries of the Yukon River.

Perennial Sow-thistle
(Sonchus arvensis)

Despite the name, sow-thistles more closely resemble giant dandelions than true thistles. Sow thistle is considered a noxious weed throughout most of its range. This is a highly invasive species able to spread long distances by wind-blown seed. It is perennial with rhizomes that grow up to 3 m deep are very difficult to remove by hand. It is particularly a problem for agricultural producers.

Irina Lapina

Range in Yukon: primarily in the Whitehorse area as far north as Carmacks but has been reported from Destruction Bay, Johnson's Crossing and the Kotaneelee gas plant; found commonly along highway corridors.

Canada Thistle *(Cirsium arvense)*

Though named Canada thistle, this species is native to Europe, Asia and Africa where it is called Creeping Thistle. It is one of the most invasive species in North America and is a noxious weed in most jurisdictions throughout Canada and the USA including Alaska.

The seeds of thistle and knapweed continue to mature after pulling. You may put plants into black garbage bags and then leave them in the sun to kill off the plants and roast the seeds. Herbicide control may be required.

Range in Yukon: known from just south of Haines Junction and observed in the LaBiche River Valley.

Irina Lapina

Spotted Knapweed
(Centaurea biebersteinii)

Knapweeds resemble thistles but differ in their lack of spiny leaves. They are biennial or short-lived perennials. This species reproduces entirely by seed. Large plants can produce over 20,000 seeds. It has not been known to be a problem in the north, but to date it has not had a chance to get established. Alaska has an active program of eradication.

Range in Yukon: It is presently not known in the Yukon but was removed from Haines Junction after several years of effort. It can be found in Atlin, BC.

Michael Rasy

Greater Butter-and-eggs
(Linaria vulgaris)

This very attractive plant resembles a yellow perennial snap-dragon. It is widely found in gardens and invading roadsides in Whitehorse. It is usually less than 50 cm tall. The plant is mildly toxic, persistent, and is known to alter local pollination ecology. It is a restricted noxious weed in Alaska.

Irina Lapina

Range in Yukon: Greater butter-and-eggs has been found throughout the Whitehorse area, South Canol Road in the Quiet Lake area, Watson Lake and Haines Junction. It is mainly spread through yard waste.

Foxtail Barley *(Hordeum jubatum)*

Foxtail barley is a perennial tufted plant that is native to North America including Yukon. It has feathery looking awns that many find attractive but are barbed and can work their way into the eyes, nose, gums and throats of animals, both domestic and wild. It is potentially invasive especially in the dry alkaline soil of the southern Yukon where it is problematic to agricultural producers.

Range in Yukon: known throughout the territory south of and including the Porcupine and Peel river drainages.

Brian Bell

Common Tansy *(Tanacetum vulgare)*

Common Tansy is a robust perennial plant that grows in clusters and forms flat-topped heads of bright yellow, button-like flowers. The plant emits a strong pungent smell when crushed. It is mildly toxic. It likes growing in full sun usually in disturbed sites such as roadsides, riverbanks and beaches. It is considered as a noxious weed in some areas of BC and Washington.

Range in Yukon: presently known from Whitehorse, Marsh Lake, Kathleen Lake and the Alaska and Robert Campbell highways. It is beginning to be used as a hardy garden plant.

Lloyd Freese

Altai Wild Rye
(Leymus angustus)

Altai wild rye is an Asian dune grass found throughout Mongolia, Siberia and China. In Canada it was previously only known to occur out of cultivation in Saskatchewan. This is a tall (1 m) coarse grass that reproduces mainly by seed and forms dense tussocks from short rhizomes. This is a dune stabilizing grass that could be a threat to the Carcross Dunes and the animals and plants that depend on the ecosystem. It may have already entered the Yukon River system.

Range in Yukon: known only from Carcross where it was first reported in 1998.

Yukon Government

Definitions

annual: completing its life history in one year
biennial: requiring two years to complete its life history
perennial: lasting many years (example: roses)
native: originating, growing, or produced in a certain place or region; indigenous
noxious: plant species that have been designated "noxious" by law. Harmful to living things; injurious to health
persistent: existing or remaining in the same state for an indefinitely long time; enduring
rhizome: a horizontal, usually underground stem that often sends out roots and shoots from its nodes. Also called rootstalk
taproot: the main, descending root of a plant that has a single, dominant main stem.
tussock: a clump or tuft, as of growing grass
weed: considered undesirable, unattractive, or troublesome, especially one growing where it is not wanted, as in a garden.

You can help by:

Careful gardening – many of the plants are attractive and are used to beautify homes and offices. Care must be taken when selecting which plants to grow and how to handle yard waste.

Keeping it clean – invasive species can be transported on vehicles, heavy equipment, footwear and clothing. All of these should be inspected and/or cleaned before entering or being used in the territory. Vehicle wheel-wells and CAT tracks are especially likely to hide invasive species and should be cleaned thoroughly.

Requesting and using only weed-free soil, hay, straw, mulch and certified seed.

Becoming aware – learn about invasive species that may be found in your area and report new findings. Learn about new ways to reclaim disturbed land. Seeding may not always be necessary.

Picking and carefully disposing of small infestations encountered, and reporting larger ones.

Spreading the word – Yukon is in a unique position to remain pristine, but the spread of invasive species and the costs and damages associated can only be prevented through vigilance and cooperation.

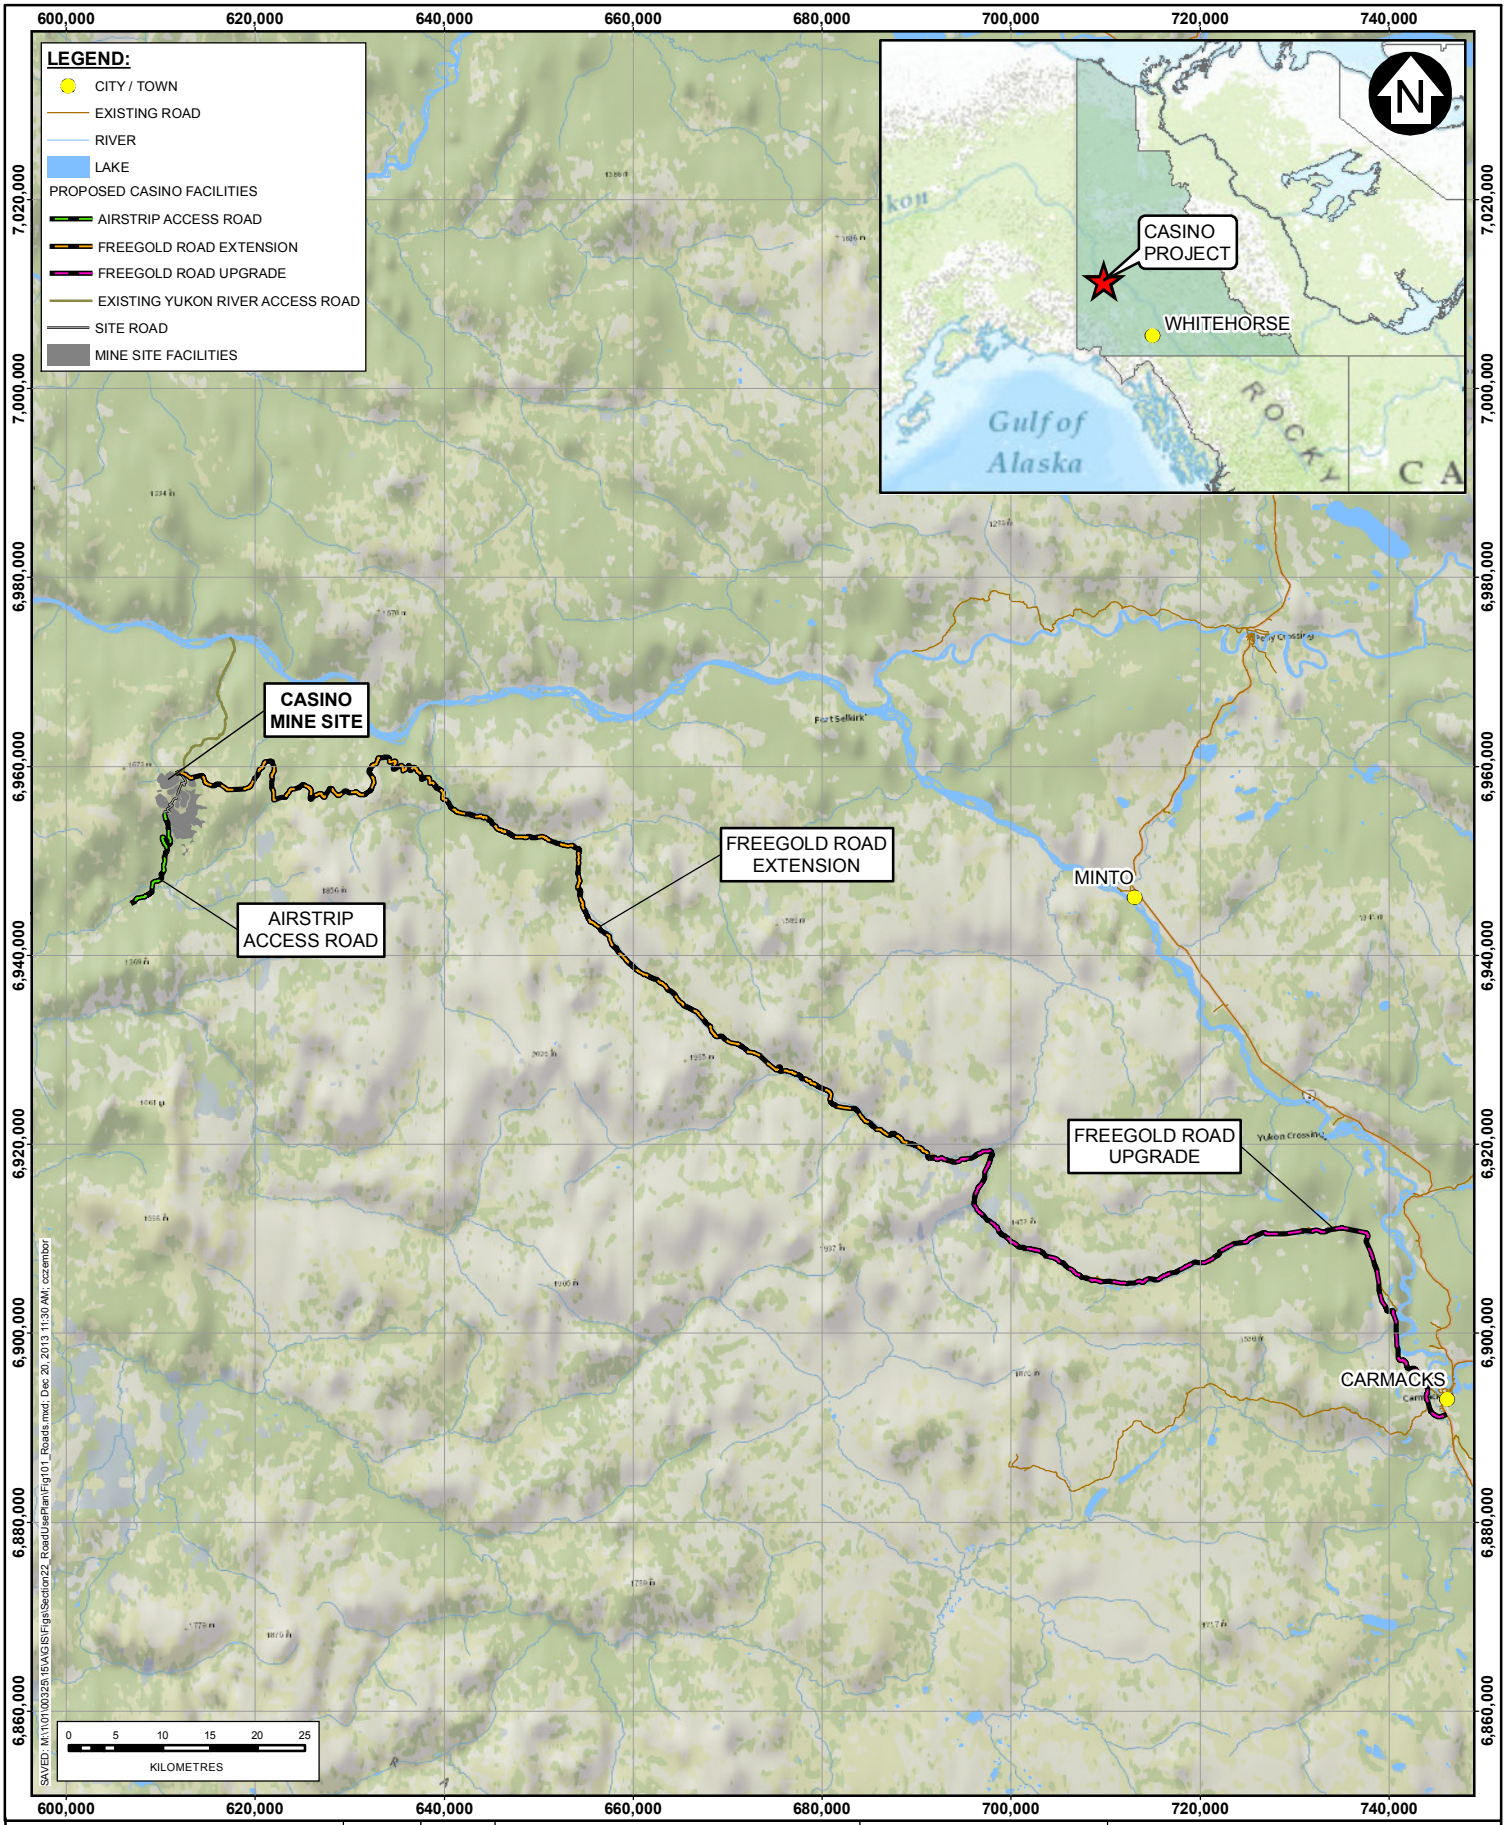
1 INTRODUCTION



Casino Mining Corporation (CMC) proposes to construct, operate and decommission the Casino Project (the Project) located at latitude 62° 44'N and longitude 138° 50'W (NTS map sheet 115J/10), in west central Yukon, in the northwest trending Dawson Range mountains approximately 300 km northwest of Whitehorse. The Project will be a copper, gold, silver, and molybdenum open pit mine that is anticipated to process on average 120,000 t/d or 43.8 million t/y of material over 22 years of full production.

Road access to the Casino mine site during the life of the Project will be by the Freegold Road Extension and Freegold Road Upgrade, as shown on Figure 1.1.

A network of existing paved highways currently provides year-round access to the village of Carmacks from the Port of Skagway, northern British Columbia and Whitehorse. It will be necessary to construct an all-weather access road linking the Casino mine site to existing highway infrastructure in order to construct and operate the Project. Suitable paved roads currently exist up to the village of Carmacks where an existing limited access road, the Freegold Road, begins and extends approximately 83 km northwest towards the Casino mine site. The existing limited access Freegold Road is owned and operated by the Yukon Government and will require upgrades. CMC proposes to develop a continuous all season access road to the Casino mine site by constructing a new 120 km resource road, the Freegold Road Extension, which will generally follow the existing historic Casino Trail and will be owned and operated by CMC for the life of the Project. In addition, construction of a new by-pass around the village of Carmacks and a new bridge over the Nordenskiold River will be required to keep mine traffic away from the village.

The proposed roadways are primarily on lands administered by the Yukon Government. CMC will seek authorization from the Yukon Government to manage the new roads and to develop them as required in support of the Casino Project. A section of the proposed Freegold Road Upgrade will transit through the Little Salmon/Carmacks First Nation settlement land. Additionally, a section of the proposed Freegold Road Extension will transit through Selkirk First Nation settlement land, a portion of which has an existing right-of-way. Figure 1.2 presents the proposed road alignment in relation to the settlement lands of the Little Salmon/Carmacks First Nation and the Selkirk First Nation.

This is a conceptual Road Use Plan that outlines the proposed road operations and mine site access management measures that will be implemented during construction, operation, and closure and decommissioning. Based on the Yukon Environmental and Socio-economic Assessment Board (YESAB) Decision Document, the Road Use Plan will be updated periodically to include further details.

CASINO PROJECT

ROAD ALIGNMENT IN RELATION TO SETTLEMENT LANDS

FIGURE 1.2

REF 1

P/A VA101-325/15

2 LEGAL FRAMEWORK

The proposed roadways are primarily on lands administered by the Yukon Government. CMC proposes to seek authorization from the Yukon Government to manage the Freegold Road Extension for the duration of the life of the Project, from construction into closure. A section of the proposed Freegold Road Upgrade will transit through the Little Salmon/Carmacks First Nation settlement land. Additionally, a section of the proposed Freegold Road Extension will transit through Selkirk First Nation settlement land, a portion of which has an existing right-of-way. CMC proposes to seek authorisation from First Nation governments for the proposed access across settlement land as part of the licensing process. CMC expects that the First Nation governments and the Yukon Government will proceed with developing an agreement for road management and use of these roadways. CMC will participate.

2.1 FIRST NATIONS GOVERNMENT ACCESS AGREEMENT

A section of the proposed Freegold Road Upgrade will transit through the Little Salmon/Carmacks First Nation settlement land. Additionally, a section of the proposed Freegold Road Extension will transit through Selkirk First Nation settlement land, a portion of which has an existing right-of-way. The Selkirk First Nation and Little Salmon/Carmacks First Nation have the statutory authority to enact laws and enter into agreements with respect to settlement lands through the authority provided in the Yukon First Nations Self-Government Act (Self-Government Act). Specifically in relation to settlement land, each of the First Nations have the authority under s. 11(1) and s. 1 of Part III of the Self-Government Act to enact laws in relation to, among other things, the “use, management, administration, control and protection of settlement land”. There are similar provisions in the Final Agreement for each of the First Nations. Within the agreements of the settlement lands, the First Nations governments also have the opportunity to impose conditions on the agreements, including requirements for a management plan.

2.2 TERRITORIAL LANDS (YUKON) ACT

CMC understands that the Yukon Government is developing a new regulation pursuant to the Territorial Lands (Yukon) Act to manage the construction, operation, maintenance, decommissioning and reclamation of access roads over the life of a project (McDowell, 2013). The new regulation is expected to update current regulations to address three key issues:

- Ability to tie the life of a permit to the life of the main project
- Remove the maximum financial security requirement so that it can be determined consistent with other policy direction (i.e., mine site reclamation policy); and
- Offer complete control of access.

It is also expected to include an ability to authorize multiple permit holders and facilitate agreements for multi-use as may be allowed under a management plan.

2.3 ROAD TENURE

CMC will pursue the appropriate tenure for the construction, operations and decommissioning of the Freegold Road Extension. The road tenure agreement will be developed between the Yukon Government and the First Nation Governments as appropriate.

2.3.1 Freegold Road Extension

CMC will obtain appropriate tenure for construction, operation and decommissioning of the Freegold Extension Road. In consultation with the Yukon Government, the following steps may be required:

- Current legislation provides a mechanism, by application, for Yukon Government to grant a long-term surface lease for all portions of the road route on Crown Land from the Big Creek crossing (approximately Km 83) to the proposed Casino mine site, including sufficient area to accommodate construction activities and related facilities; to allow for the construction, operation and maintenance of a private access road;
- CMC may apply for and receive a permit under a new regulation (under development) pursuant to the Territorial Lands (Yukon) Act under development by Yukon Government to construct, operate and decommission the road (McDowell, 2013); and
- Initiate a formal request to Little Salmon/Carmacks First Nation and Selkirk First Nations to allow certain sections along the existing right-of-way to be rerouted onto settlement land for safety, environmental, and cost reasons. A “land swap” under the land claims agreements may be pursued that would see the proposed right-of-way become crown land with the First Nation selecting another parcel of land as settlement land in exchange. Alternatively, the proponent may enter into an Access Agreement and/or Lease Agreement directly with the First Nation.

2.3.2 Freegold Road Upgrade

CMC will discuss details relating to the upgrading the existing Freegold Road, the construction of the Carmacks by-pass and the Nordenskold Bridge with the Yukon Government such that they will be developed on a schedule consistent with the overall construction schedule for the Casino Project. The ownership of these road sections lies with the Yukon Government, and will remain as such.

3 PROJECT ACCESS DESCRIPTION

3.1 FREEGOLD ROAD

3.1.1 Freegold Road Upgrade — Klondike Highway to Big Creek

A bypass of the village of Carmacks will be constructed from the Klondike Highway to the intersection of Mt. Nansen Road and the existing start of the Freegold Road. This approximately 5 km-long section of road will cross the Nordenskiold River. A preliminary design of this section of the road has been undertaken by CMC consistent with work already perform the Yukon Government. This section of road will become the first 5 km of the Freegold Road Upgrade.

The existing Freegold Road, which is part of the proposed Freegold Road Upgrade, begins at Mt. Nansen Road in the village of Carmacks and proceeds north and west to the confluence of Seymour and Bow Creeks. This section of road is used primarily to access mineral properties along its length, as well as by recreational users. The roadway is owned and managed by the Yukon Government.

In the mid-1990s, the Yukon Government completed substantial fieldwork and a design for the upgrade and realignment of the existing Freegold Road from its start to just beyond Km 32. The design was prepared to a rural collector, undivided road classification with a design speed of 80 km/hr (RCU80). Based on the engineering work completed to date, CMC has confirmed that the proposed road upgrades will meet the required design criteria for the Project. This section of roadway will form part of the proposed Freegold Road Upgrade.

The existing Freegold Road from approximately Km 32 to approximately Km 83 (at Big Creek crossing) will be upgraded to meet the 70 km/hr design speed with an 8.2 m wide gravel surface; the maximum grade in the design upgrade is 8%. The existing Freegold Road is generally located on the north side slopes of the Seymour Creek Valley. The proposed realignment for this section of the Freegold Road Upgrade is generally downslope of the existing road in order to achieve the design criteria and minimize earthworks quantities.

Settlement land belonging to the Little Salmon/Carmacks First Nation is located on the south side of the existing right-of-way (at approximately Km 48), close the confluence of Seymour and Bow Creeks. To address constraints pertaining to design criteria, CMC proposes that the road be realigned through the settlement lands from approximately Km 49 to approximately Km 63. Further realignment is proposed from approximately Km 68 to approximately Km 70 to meet the design criteria and the location of a proposed bridge. This section of roadway will also form part of the proposed Freegold Road Upgrade.

3.1.2 Freegold Road Extension — Big Creek to Mine Site

CMC has completed preliminary engineering design for the Freegold Road Extension from approximately Km 83 (at Big Creek crossing) to approximately Km 203 (at the Casino Mine Site). The Freegold Road Extension approximately follows the alignment of the Casino trail corridor. A manned gate is proposed at the Big Creek Bridge to control access to the Freegold Road Extension, as the Freegold Road Extension is expected to be listed as a private resource road under the new regulation pursuant to the Territorial Lands (Yukon) Act.

The Freegold Road Extension is designed to be a two-lane, gravel resource road suitable for all weather use by transport trucks with highway legal loads. The road design criteria complies with the BC Ministry of Forests and Range Forest Road Engineering Guidebook (2nd Edition, 2002) for a 70 km/h design speed, with some short 50 km/h sections where road geometry is limited by the terrain. The road will be approximately 8 m wide with maximum grades of 8%. Vertical profiles are designed to allow adequate stopping sight distance for drivers to identify wildlife or other hazards on the road.

The Casino Trail corridor runs through the parcel area of Selkirk First Nation R-9A, which are Category A Settlement Lands designated under the Selkirk Final Agreement. This is an encumbering right under the Selkirk First Nation Final Agreement and the right of way for the road is administered by the Government as though located on Crown Land. There are certain limited sections of the road that CMC proposes to build on settlement lands, since current access right-of-way through Selkirk First Nation R-9A managed by Yukon Government is not suitable to support the design criteria for the roadway.

The Freegold Road Extension will be used by CMC during the construction, operation and closure of the Project. After the active phase of closure is complete, the Freegold Road Extension will be decommissioned. The watercourse crossings will be removed and the road will be scarified to promote re-vegetation. Further decommissioning details will be developed with project planning.

4 TRAFFIC PROJECTIONS

The preliminary design for the Freegold Road Extension and Freegold Road Upgrade is complete and traffic projections for the life of the Project have been generated as part of the YESAB Proposal. Historical and existing traffic data does not exist for the Freegold Road Extension because the Freegold Road Extension has not yet been constructed. Limited traffic currently exists for a portion of the existing Freegold Road that will become the Freegold Road Upgrade, through this is assumed to be negligible.

4.1 CONSTRUCTION PHASE

Traffic on the Freegold Road Extension and Freegold Road Upgrade during the construction phase of the Project will include both heavy construction equipment and light vehicular traffic. The average daily traffic projections for the four years of construction are shown in **Error! Reference source not found.**.

Table 4.1 Construction Phase Traffic Projections

Construction Year	Avg./Day "Heavy" Traffic	Avg./Day "Light" Traffic	Avg./Day Total
Year -4	3	1	4
Year -3	10	8	18
Year -2	14	14	28
Year -1	10	16	26

Source: Excerpted from Access Overview for Submission to YESAB, November 2013, Appendix 04B
Note:

Light vehicles include autos and trucks up to 10 tonne capacity.
Heavy traffic includes vehicles greater than 10 tonne capacity.
Year -4 is the first year of construction related activities.
The figures represent averages and may be more or less on any given day,

4.2 OPERATION PHASE

Vehicle traffic on the Freegold Road Extension and the Freegold Road Upgrade are expected to increase when the Project is in the operations phase. The peak number of outbound trips from the Casino Mine Site during operations is projected to be on average 72, as indicated in Table 4.2. It is noted that the traffic on the roadway will vary seasonally and daily and is dependent on the mine operations requirements.

Table 4.2 Operation Phase Traffic Projections

Freight	**Avg./Day "Heavy" Traffic** (Freight)	**Avg./Day "Light" Traffic** (buses, vans)	**Avg./Day Total**
Inbound (Avg./Day)	36	20	56
Outbound (Avg./Day)	48	20	68
Peak Outbound (Avg./Day)	52	20	72

Source: Excerpted from Access Overview for Submission to YESAB, November 2013, Appendix 04B

Notes:

Daily and seasonal variations will occur.
Peak outbound results from years of higher than life of mine average copper concentrate production.

4.3 DECOMMISSIONING AND CLOSURE PHASE

The Freegold Road Extension will be used during Project decommissioning and closure, however, the anticipated traffic will diminish from the operation phase projections substantially. When the active closure phase is complete, the Freegold Road Extension will be decommissioned and traffic will cease.

5 ROAD OPERATIONS

5.1 ACCESS

CMC is committed to maintaining the Freegold Road Extension as a resource road with controlled access throughout the life of the Project. Specific permissions for individuals, outside of CMC, will be determined by the Freegold Road Extension access agreement. A manned gate is proposed at Big Creek (approximately Km 83), the beginning of the Freegold Road Extension. At the gate, CMC staff will confirm that all vehicles are travelling with an appropriate two-way radio, the appropriate frequency is set correctly and CMC will communicate with the driver to identify any specific roadway conditions (i.e. known icy patches, wildlife migration progress, etc.) both at the gate and during the transit time.

5.2 USE PRIORITIES

The Freegold Road Extension will to be utilized by a variety of traffic accessing the Casino Mine Site, ranging in size from transport trucks to pick-up vehicles. A standard protocol will be included in the final Road Use Plan to inform drivers who has the right-of-way when vehicles meet on the Freegold Road Extension. The preliminary road use priorities are:

1. Emergency vehicles, when lights are flashing;
2. Trucks transporting dangerous goods;
3. Transport trucks (from large to small);
4. Heavy equipment (from large to small); and
5. All other vehicles.

In general, other road use priorities are:

- Vehicles that are loaded will take priority on the roadway to vehicles travelling empty;
- If two vehicles with the same characterization meet, the blind-side vehicle will have the right-of-way; and
- If clear sight lines are available, speeds are regulated, and radio contact is confirmed between the vehicle operators, passing will be permitted.

5.3 RADIO USE

The Freegold Road Extension will be managed through radio control and radio frequencies will be implemented. CMC will enforce radio use with its employees and visitors to maintain safety and communication along the Freegold Road Extension. Drivers will be informed of the appropriate radio frequencies and call procedures at the manned gate (located at Big Creek) when entering the Freegold Road Extension All vehicles will be expected to adhere to the radio call procedures.

5.4 SIGNAGE

CMC will be responsible for monitoring and confirming that signs are legible and relevant to the season for the Freegold Road Extension. Signage, which is intended to be included on the roadway, will include, but not be limited to, the following:

Kilometer Markings

Kilometer marking signs will be placed at 1 kilometer intervals on the right side of the road for both travel directions. The signs will be critical for the vehicle call out protocols. Regular checks of the roadway will be completed by CMC to ensure the signs are visible, as they will have the opportunity to be obscured by snow or vegetation.

Radio Frequencies

Signs indicating the radio frequencies for road control will be posted at the entrance to the Freegold Road Extension and the Casino Mine Site. The appropriate frequencies will be pre-set on any radios that are distributed from the manned gate.

Speed Limits

Speed limit signs will be placed along the roadway for each traffic direction. Speed reductions will also be noted by signage along with cautionary signage indicating major corners, grades, etc.

Wildlife Crossings

Wildlife crossings along the Freegold Road Extension will be indicated with signage throughout the year. Intermittent wildlife hazards, such as presence of caribou, will be indicated through signage and travel speed reductions and restrictions as may be appropriate to reduce the risk of wildlife collisions will be implemented and communicated through appropriate signage. Updated details on mitigation specific to wildlife are provided in the Wildlife Mitigation and Monitoring Plan.

5.5 RADIO CALLING PROTOCOL

A major component of the CMC safety protocol for travel along the private Freegold Road Extension is the radio calling protocol for all vehicles. All vehicles travelling the Freegold Road Extension will be outfitted with a radio; the presence and operation of the radio will be confirmed at the Big Creek manned gate. The operational protocols will be defined in the final Road Use Plan; a preliminary radio calling protocol is proposed below:

Direction of Travel

The direction of travel will be called as “Up” or “Down,” consistent with the kilometer markings on the roadside; “Up” will be called by vehicles heading towards the Casino Mine Site and “Down” will be called by those departing the Casino Mine Site.

Identification

The general vehicle type will be required as identification (i.e. grader, pick-up, etc.).

Frequency

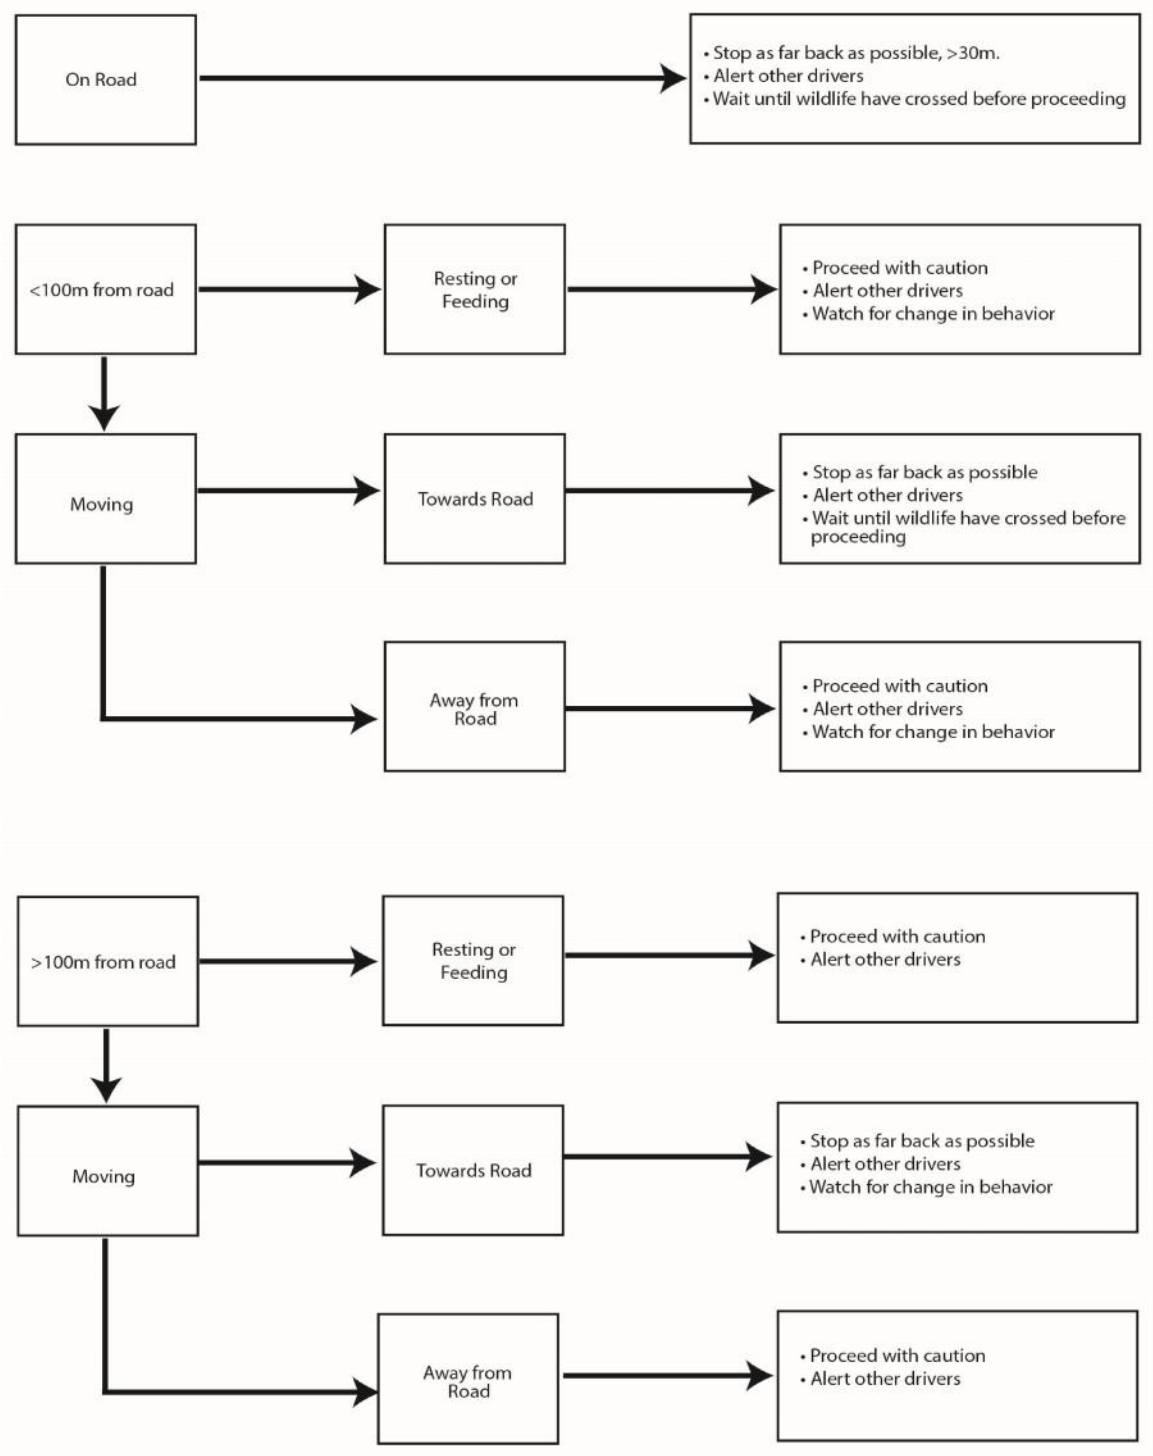
All vehicles will be required to call when travelling on the Freegold Road Extension. All vehicles travelling the Freegold Road Extension will be required to call at every 5 km marking.

The typical call over the radio for a vehicle will be, for example, “Pick-up 105 Down” for a light vehicle leaving the site or “Grader 165 Up” for a grader approaching the Casino Mine Site.

Must-Call

Must-call conditions will also be implemented for the following scenarios:

- Entering or leaving the Freegold Road Extension;
- Stopping and resuming travel along the roadway;
- Encountering a vehicle accident;
- Encountering large wildlife on or near the roadway (e.g. “two caribou north of road at kilometer 97”);
- Encountering a vehicle not calling; and
- Passing another vehicle.



5.6 WILDLIFE ENCOUNTERS

Wildlife is a noted hazard on the Freegold Road Extension. CMC will implement a “Wildlife has the Right-of-Way” policy, if appropriate and if it does not compromise driver safety, to avoid potential collisions between wildlife and vehicles or unnecessary disturbances to wildlife. Vehicle operators will adhere to the following protocols:

- Be vigilant and watch for wildlife near roads, particularly in times of low light, and take all reasonable actions to avoid wildlife collisions;
- Stop when wildlife are observed on the road; and
- Allow small groups of animals (<10 individuals) standing on the road to move off the road unalarmed. Vehicles will stop for 15 minutes, then proceed slowly (<20 km/hr) if wildlife have not moved within that 15 minute period.

The safety procedures shown on Figure 5.1 will be followed by vehicle operators when wildlife is encountered, in accordance with the *Wildlife Mitigation and Monitoring Plan* (Appendix 23A of the Casino Proposal).

Figure 5.1 Wildlife and Road Operation Decision Matrix

Source: Wildlife Monitoring and Mitigation Plan, YESAB Proposal, Appendix 23A

5.7 MAINTENANCE

CMC is committed to maintaining the Freegold Road Extension for the life of the Project. The Freegold Road Extension will be maintained to ensure traffic can travel during all seasons and general maintenance will be completed seasonally, as required.

During winter months, snow clearing will be completed regularly, as required. Snow banks will be maintained to be less than 1 m high so that caribou and other wildlife can cross the Freegold Road Extension easily as per the *Wildlife Mitigation and Monitoring Plan* (Appendix 23A).

Debris on the road surface will be removed by CMC promptly. Vehicle operators encountering road debris will be required to report the location and material type on the roadway through the radio to CMC personnel. Any carcasses located on the road will be removed promptly to discourage further collisions.

Dust issues on the roadway will be abated using water sprays or suppressants, as necessary, to maintain safe driving conditions. It is expected that issues related to dust will be relayed to CMC personnel by vehicle operators travelling the roadway.

6 SAFETY

CMC recognizes the potential exists for vehicle collisions, malfunctions, spills, or wildlife encounters that could adversely affect the natural environment or cause an injury on the Freegold Road Extension. The operations protocols including speed limits, use priorities, radio use and signage, will be adhered to by all users of the road at all times to prevent incidents. Any incidents that occur will be managed by CMC in accordance with the *Emergency Response Plan (*Appendix 22B of the Casino Proposal).

The Freegold Road Extension will be monitored frequently to ensure that the road is safe and well kept. Radio communication will be available along all roads to allow for rapid communication with drivers and reporting of incidents. Personnel at the Big Creek manned gate will inform incoming traffic of any known safety concerns at the time of their travel.

Wildlife is a noted hazard along the Freegold Road Extension; a “Wildlife has the Right-of-Way” policy will be adopted to mitigate potential collisions between vehicles and wildlife or unnecessary disturbance to wildlife. Specific wildlife conditions will be communicated to incoming traffic when entering the site at the manned gate and radio communication will inform travellers of wildlife sightings.

Staff transporting goods to and from the Casino Mine Site will be trained according to Yukon Department of Transportation requirements and also have training in spills response, hazardous materials safety, and CMC’s environmental and transportation policies. CMC will ensure that its staff and contractors have basic emergency training as appropriate, such as standard first aid, and are aware of CMC health and safety policies. Routine practice drills will occur to maintain Emergency Response Team member skills and test the Emergency Response Plan system and processes.

In the event of an incident, available personnel are to contact the Casino Mine Site and relay all the pertinent details. The level of emergency will be determined in accordance with the Emergency Reponses Plan and appropriate Emergency Response Team members will be dispatched to the incident location. Road closures or delays will be relayed via radio to all travelling vehicles.

7 REPORTING

7.1 COMMUNICATION MANAGEMENT

CMC may be contacted to request access, submit general enquires or comments regarding the Freegold Road Extension. All comments relayed to CMC regarding the roadways and its users will be documented and noted for follow-up, as required. Complaints regarding particular vehicles on the roadway will be forwarded to the relevant CMC representative as well as documented within CMC's database. The following information will be recorded for each of the comments received:

- Date and time of the comment;
- Method of comment receipt;
- Details of the individual making the comments;
- Contents of the comment;
- Action taken for the comment (including further contact with the contact or no action, as relevant); and
- Reasons for action (or no action).

Comments received will be reported monthly to CMC Management and summarized in an annual report.

8 MANAGEMENT PLANNING

A final Road Use Plan will be developed when the road use agreement is in place with the Yukon Government and First Nation Governments; it will be the primary document that CMC will use to implement measures to manage controlled access on the Freegold Road Extension. The *Wildlife Mitigation and Monitoring Plan* is the primary document that will promote the protection of wildlife. It will include a monitoring and reporting requirement that allows adjustments to be made to the Road Use Plan to ensure an appropriate level of wildlife protection is achieved.

The final Road Use Plan for the Project will include a discussion of the potential impacts of mine site roads, haul roads and access roads (including the Freegold Road Extension) and implement mitigation measures to avoid or minimize adverse effects on watercourses, wildlife, and the public. The final Road Use Plan will overlap with other management plans and monitoring programs; where relevant the plans will be referenced (e.g., *Wildlife Mitigation and Monitoring Plan*, *Emergency Response Plan*, *Occupational Health and Safety Management Plan*).

The final Road Use Plan will capture the key mitigation measures for the protection of wildlife and for road use as suggested by CMC in the Project Proposal, and as reaffirmed and established in a YESAB Decision Document for the Project.

REVISION SUMMARY

Version	Date	Revision notes	Revision authors
Preliminary Draft	January 2015	Produced for YESAB assessment process	CMC

A.22F – SOCIO-ECONOMIC MANAGEMENT PLAN

A.22F.1 INTRODUCTION

The purpose of the Socio-Economic Management Plan (SEMP) is to manage the socio-economic effects of the Casino Mine Project (the Project) on potentially affected First Nations and communities. The SEMP describes commitments and policies that Casino Mine Corporation (CMC) will undertake to encourage and promote positive socio-economic development to improve quality of life and well-being for those that live in neighbouring communities. The Plan is intended to maximize the Project opportunities for the benefit of First Nations and Yukoners that will be implemented during all stages of the Project consistent with Mining Association of Canada's Guiding Principles of "Towards Sustainable Mining" (2014), and will ensure that CMC:

- Protects the health and safety of employees, contractors, and communities;
- Practices continuous improvement through the application of new technology, innovation and best practices in all facets of operations; and
- Is responsive to community priorities, needs and interests through all stages of mining exploration, development, operations and closure.

CMC commits to the policies outlined in the SEMP that include a number of best practices to meet the following objectives:

- Provide long-term benefits to all employees and communities;
- Involve First Nation governments and stakeholders in staff hiring and business opportunities;
- Establish a relationship between the communities and stakeholders from the beginning of the Project based on mutual respect, understanding, and management of expectations;
- Engage and communicate with all groups to encourage and promote dialogue between communities and CMC on issues and concerns related to the management and procedures of the Project; and
- Establish a complaints/grievance mechanism which involves submission of local concerns and suggestions on Project operations; and
- Establish monitoring programs to track changes in socio-economic conditions of the communities and evaluate effectiveness of mitigation measures.

Mitigation of Project-specific socio-economic effects assessed by the Yukon Environmental and Socio-economic Assessment Board (YESAB) has been incorporated into, and will continue to feed into, the SEMP. CMC expects that the SEMP will be iterative and will evolve over the course of the environmental assessment, regulatory reviews, and development stages of the Project throughout the life of the Project. As the Project advances through the development stages and new ways to manage socio-economic effects are identified, the SEMP will be updated with the new mitigation measures. Suggestions and recommendations from the communities will be incorporated into the SEMP.

A.22F.2 EMPLOYMENT PLAN

The Casino Project is a major mining development project with potential to provide significant wealth in job creation and employment opportunities. This section outlines recruitment commitments, education and skills training commitments and employment commitments to be detailed in the final SEMP.

A.22F.2.1 Recruitment Commitments

CMC is committed to recruiting and hiring as many Yukoners as possible during the Construction and Operation Phases of the Project. Special emphasis will be placed on pre-employment training and employment of Aboriginal

persons who live in or originate from the communities of Pelly Crossing and Carmacks. Casino will also recruit for pre-employment training and employment in Whitehorse and other communities in the Yukon. Additionally, CMC will work with community leaders to address employment barriers for women and people with disabilities.

CMC will hire according to the following priorities, in order:

1. Hiring of First Nations;
2. Hiring of Yukoners who have been continuous resident in the Yukon Territory at least six months prior to being hired;
3. Hiring of Northerners residents in northern British Columbia and Northwest Territories; and
4. Hiring of Canadians across Canada.

Subject to the availability of Yukoners with the required skills, training and experience, CMC will work toward, and will take all reasonable steps, to meet the following goals:

- Meet a target employment of Yukoners in the Construction Phase of 63%;
- Meet a target employment of Yukoners in the Operations Phase of 78%;
- Encourage employment of First Nations by Contractors throughout the Project life; and
- Pursue recruitment and employment opportunities that meet the negotiated cooperation agreements between CMC and the First Nations governments.

CMC will maintain or consider various measures to meet these goals and assist employees who reside in the North. The company will, at its sole discretion, implement various measures related to qualifications for employment, terms of employment, wages, salaries, benefits, allowances, skills, training experience, work schedules, qualifications for training, terms of training, and promotion. CMC will work to:

- Establish a minimum of Grade school level as a standard for trainable positions;
- Develop work schedules compatible with the traditional pursuits of First Nations when possible;
- Fund and co-fund community research projects directed at gathering information and addressing barriers to successful employment;
- Actively promote and encourage careers in the mining industry to the youths in the Yukon;
- Promote and encourage partnerships with local schools for work experience and job placement programs as well as summer employment opportunities that allow students to gain experience while continuing to complete their education; and
- Provide opportunities for summer employment to Yukon post-secondary students during project operation.

A.22F.2.2 Education and Skills Training Commitments

CMC will collaborate with Yukon Government, Yukon College and Yukon Mine Training Association (YMTA) to provide education and skills training to increase the number of apprenticeships and positions to be filled for the Project. Apprentices, where reasonable, will be hired by CMC upon successful completion of apprenticeships.

Education and skills training programs will focus on:

- Providing pre-employment opportunities for training in accordance with the hiring priorities;
- Enabling Yukoners to gain access to jobs;
- Giving special emphasis on training opportunities in the communities of Pelly Crossing and Carmacks;
- Facilitating employment advancement for Yukoners;
- Enabling Yukoners to fill apprenticeships, technical, technological, supervisory, managerial, and professional occupations;
- Requiring all Contractors to adhere to the goal of maximizing the employment of Yukoners; and

- Collaboration with Yukon Government in the development of pre-employment preparation, skill development training, on-the-job training, and re-training programs to better enable Yukoners to take advantage of employment opportunities from the Project.

CMC agrees to:

- Collaborate with First Nations to encourage development and delivery of training programs based on cultural value systems which include a cultural component that would introduce new employees to rotation employment and the intricacies of scheduled work;
- Continue “on-the-job” training throughout the life of the Project;
- Initiate a pre-employment training program;
- Upgrade and train its Yukon employees so that they are able to accept positions of greater responsibility within CMC;
- Support programs that encourage careers in technology, science, and engineering, working in cooperation with the Yukon Government, YMTA, Yukon College and First Nations governments;
- Supplement existing training programs with “on the job” training as much as possible;
- Participate in regional career fairs;
- Organize and implement training programs so that employees completing the training will be able to use the skills acquired and time spent as credit towards certification or status;
- Support non-mining training and entrepreneurial initiatives in local communities;
- After Project production, CMC will assist employees to enhance their employability and find new employment in the mining industry; and
- Develop and implement training programs in accordance to the Yukon Government Apprentice Training Act.

A.22F.2.3 Employment Commitments

The company will provide employees with free work-related round-trip transportation to the mine site from the communities of Pelly Crossing, Carmacks, and Whitehorse. The company will also work with Yukon Government and Yukon College to enhance employment opportunities from other communities.

CMC will introduce and maintain measures to assist First Nation and non-First Nation employees to perform well in their jobs and to help their local communities with any potential effect of the Project, and will:

- Conduct cultural awareness training for all employees and contractors working at the mine site;
- Ensure that at least one Employee Relations Personnel will be able to communicate in Northern Tutchone language;
- Support efforts to revitalize Northern Tutchone language and incorporate Northern Tutchone language into mine signage;
- In cooperation with First Nation Governments, provide and maintain reading and video materials using the Northern Tutchone language on site;
- Address cultural sensitivity and cross-cultural awareness in all orientation training;
- Provide shifts to accommodate subsistence harvesting and participation in cultural activities / events;
- Fund cross-cultural training programs as may be agreed upon by CMC and First Nations Governments;
- Provide communication links to home communities;
- Permit periodic spousal tours of the work site;
- Develop an Assistance Program with personnel providing services and seminars in the field of counselling, addiction and rehabilitation, family adjustment, and savings plan for all employees;
- Provide space at the mine site for spiritual ceremonies for First Nations;

- Provide flexible work rotation schedules, where practical, that could accommodate the needs of local hires and industry practices;
- Enforce a sexual harassment policy at the mine site, and an alcohol-and drug-free workplace policy for the possession or use of any alcohol or illegal drugs at the Project; and
- Work with other mining companies to attract local workers set to be laid-off as other mines cease operations.

A.22F.3 LOCAL PROCUREMENT PLAN

CMC will establish local procurement policies to encourage and promote local businesses and contracting opportunities generated by Project operations. Whenever practicable, and consistent with procurement management, CMC will implement policies that are intended to maximize business opportunities and capacity building for local and Yukon businesses. CMC will purchase as many goods and services in the Yukon as possible.

CMC will take all reasonable steps to work toward the following objectives:

- Maximise the purchase of goods and services from local and Yukon businesses during the Construction Phase.
- Maximise the purchase of goods and services from local and Yukon businesses during the Operation Phase.
- Priority will be given to qualified businesses for procurement bids and opportunities in the following order:
  1. First Nation businesses;
  2. Yukon businesses; and
  3. Other businesses outside the territory.
- Special emphasis will be placed on developing business opportunities with the communities of Pelly Crossing, Carmacks and Whitehorse, and other communities where there is an expression of interest.

The criteria used for evaluating and awarding contracts for the Project shall include, but not limited to, the following:

- Quality;
- Ability to supply and deliver the goods and services;
- Timely delivery;
- Safety and environmental record; and
- Number of Yukon and First Nation staff and degree of participation by both groups.

The following measures will be taken to maximize Project related business opportunities for Yukon businesses:

- Work closely with Yukon Government to identify goods and services that will present the best opportunities for supply by Yukon businesses and to identify publicly available economic development programs in matching Project related business opportunities with new entrepreneurs and existing business capabilities;
- Work closely with First Nation and business groups to plan for and maximize participation of First Nation and Yukon businesses;
- Work closely with local communities to create long-term business and employment opportunities and increase business capacity;
- Develop clear guidelines and schedules regarding what resources the company will commit to Project-related business opportunity developments;
- Provide Yukon businesses with business opportunities forecast and other information relating to CMC's procurement needs; and
- Facilitate subcontracting opportunities for First Nation and Yukon businesses.

A.22F.4 SOCIAL AND CULTURAL WELL-BEING

The health and wellness of CMC's employees, their families, and local communities are the core foundation of a successful Project. CMC understands that while Project activities will have both positive and negative impacts, companies are increasingly expected to operate responsibly and to be committed to their employees and the communities in which the Project operates in. An important consideration is the expectation that businesses will foster and deliver sustainable benefits that enhances social and cultural well-being of all First Nations and community stakeholders. The success of the Project depends on the support of employees and communities.

To promote a healthy, stable and vibrant workforce and community support, CMC will work with employees to be successful in their jobs and careers and work collaboratively with communities to address and prevent negative impacts of the Project. CMC will work with agencies and parties to address the following social well-being issues for its employees and the communities:

- Support local and regional initiatives and programs to address alcohol and substance abuse problems;
- Establish partnerships to effectively address issues such as substance abuse, family violence, domestic abuse and provide programs for its employees, family members and the communities;
- Undertake prevention and awareness programs on-site and work with social service agencies such as Yukon Government Health and Social Services (HSS);
- Work with HSS and other social service agencies to assist with and deliver prevention and awareness programs on alcohol and substance abuse, family violence, and domestic abuse issues in the communities;
- Collaborate with HSS and other social service agencies to provide family counselling services in the communities for mine employees and their families that include family and relationship counselling, stress management, anger management, support services for women and single mothers, child care services, and parent training; and
- Encourage and promote use of support services in the communities by providing information on-site on the available programs and services in the communities.

CMC will also implement the following activities and initiatives:

- Hire a community liaison staff that is a First Nation member who will work with the local communities on community well-being matters;
- Help facilitate money management training in the communities to CMC's employees and their spouses as a mandatory requirement within the first six months of all newly hired employees;
- Work with First Nations and communities on ways to disseminate materials and information to employees and communities related to substance abuse awareness and prevention training;
- Establish a sexual harassment policy and an alcohol-free and drug-free workplace policy at the mine-site;
- Ensure that foods provided at the mine-site promote healthy living, and are appropriate for employees who are at risk for developing diabetes; and
- Provide recreation facilities and equipment on-site.

CMC will actively engage with and encourage Yukon Government to promote the well-being of its employees and the communities in the following ways:

- Facilitate the planning and delivery of community-based mental health and addictions programs and wellness programs;
- Collaborate with First Nations governments in the design of community mental health and addiction programs and wellness programs;
- Meet with Yukon Government to discuss program and service delivery plans and identify areas for collaboration.

Cultural preservation and protection of traditional activities is essential to the cultural well-being of First Nations. To promote and ensure that First Nations' cultural and traditional way-of-life are maintained and protected, CMC shall:

- Support the promotion of traditional cultural practices of the Aboriginal Authorities;
- Work with the community, governments and educational institutions to promote use of resources in local schools that are culturally appropriate to First Nations;
- Develop and implement a cultural exchange program to provide non-Aboriginal site employees with the opportunity to spend up to three days with a First Nation employee pursuing traditional activities;
- Provide cross-cultural training to all on-site staff;
- Provide mine site visits for employees' families; and
- Provide traditional foods on site when available.

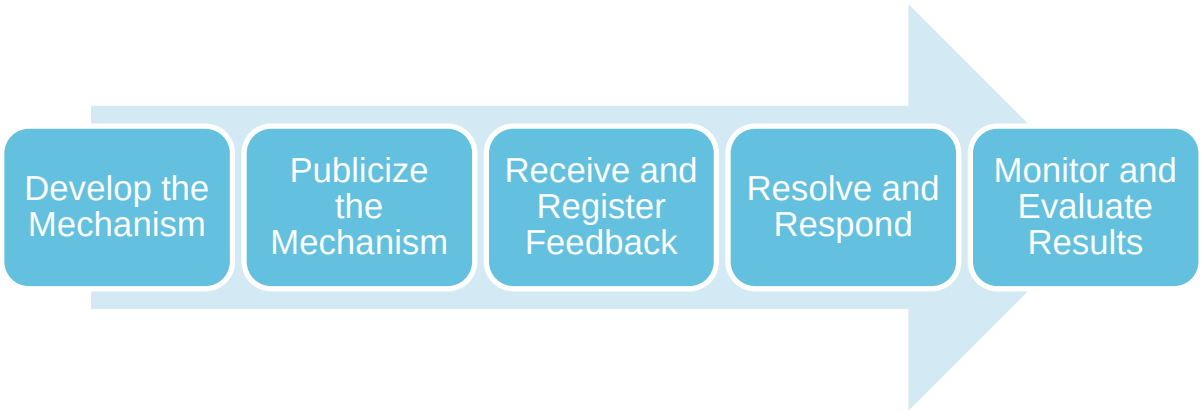
A.22F.5 CASINO RESOURCE FUND

Mining provides tremendous social and economic opportunities to communities through employment, business opportunities, and the payment of taxes and royalties. In addition, benefits and opportunities can be realized through "social investment" where funds available from royalties and taxation are spent on cultural, economic, and social development projects. Investment funds can be established that are channelled back to communities and spent on projects that support community development goals. Specific criteria for expenditure of the monies can be established with proposals for the use of the fund will need to identify projects that provide social, economic and cultural benefits to the local communities.

Resouce Revenue Sharing arrangements between First Nations Governments, the Federal Government and the Yukon Government will provide a significant source of funds. Further discussions with First Nations Governments and other governments are required to determine an appropriate and effective approach to funding mechanisms to meet the needs of the communities.

A.22F.6 STAKEHOLDER ENGAGEMENT / COMMUNICATION PLAN

CMC is committed to ongoing engagement and communication with First Nations, local communities, regulatory agencies, and other stakeholders and land users. For communities to benefit from the Project, transparent and ongoing communication is needed so that governments, communities, and stakeholders are engaged and informed about the mine, mining activities and schedule, as well as opportunities such as jobs and employment, skills training, and business procurement for goods and services. Prior to mine development, CMC plans to hire a community liaison staff to work with the communities on Project opportunities (i.e. jobs and employment opportunities, contract/business opportunities) as well as socio-economic issues related to the mine. The community liaison will be responsible for engaging and consulting with First Nations, agencies and stakeholders outlined below.



- First Nations Governments:
  - Selkirk First Nation
  - Little Salmon / Carmacks First Nation
  - Tr'ondëk Hwëch'in First Nation
- Municipal Governments:
  - Village of Carmacks
  - City of Whitehorse
- Yukon and Federal Government departments that interact with the communities.

To foster a collaborative and cooperative relationship with identified stakeholders, the objectives of the Stakeholder Engagement/Communication Plan are to:

- Promote engagement between the communities, the company and various levels of First Nations and Yukon Governments;
- Establish and maintain a relationship based on mutual respect and trust between CMC and the local communities;
- Encourage and promote dialogue from all stakeholders on issues and concerns related to the Project;
- Promote participation of communities, governments and other stakeholders in local initiatives and programs;
- Help to build trust and respect between CMC, First Nations, local communities, regulatory agencies, and other stakeholders and land users; and
- Establish a framework for engagement over the life of the Project.

Effective and open communication is also important in ensuring all parties' interests are considered. The company will establish a formal process of engagement and dialogue with First Nation governments and stakeholders to ensure dialogue and feedback are considered in the company's decision-making processes during all phases of the Project from construction to closure. Methods for engaging and communicating with affected parties will be developed collaboratively with the interest groups.

CMC will establish a Complaints/Grievance Management procedure for receiving complaints, grievances, suggestions, and recommendations from all parties. A formal grievance procedure provides the company and stakeholders an opportunity to improve overall management and operations of the Project. Submission of complaints and grievances can be filed in person, online through company website, letters, phone calls, and/or email, and an internal review process will subsequently be conducted. CMC will work toward establishing a procedure prior to the development of the mine, as summarized in the diagram below.

A.22F.7 MONITORING AND MITIGATION

CMC will work with affected First Nations and Yukon Government to monitor the activities of the Project to avoid or minimize adverse socio-economic effects on community health and well-being, and to enhance benefits where applicable.

CMC, in collaboration with government departments and affected First Nations, will work to establish a program to monitor the socio-economic effects of the Project during construction, operations, and closure phases in order to accomplish the following objectives:

- Collect and document data related to socio-economic conditions of affected communities;
- Work with local agencies to monitor Project socio-economic effects;

- Confirm and verify the predicted socio-economic effects of the Project;
- Identify unforeseen socio-economic effects of the Project;
- Monitor employment and skills training programs by CMC and other institutions such as Yukon College and YMTA;
- Evaluate the effectiveness of mitigation measures in managing socio-economic effects; and
- Revise, and where appropriate, develop new mitigation measures to manage unforeseen socio-economic effects.

This monitoring program will lay out the commitment and framework for monitoring the effects predicted through the environmental assessment under Yukon Environmental and Socio-economic Board (YESAB). Final selection of socio-economic valued components will occur following assessment of the Project through the YESAB process. Annual reports will be generated to summarize the monitoring program results and will include data on the socio-economic predicted effects in order to track the changes from pre-Project conditions through operations.

Monitoring and mitigation of socio-economic effects will also inform development of adaptive management plans in consultation with local and regional institutions and government agencies to determine effectiveness of adaptive and mitigation measures.

Where CMC deems applicable, CMC will not be required to report or disclose information considered to be of a proprietary or commercially sensitive nature, or that may infringe the personal privacy of its employees.

APPENDIX A.22G: Liquid Natural Gas Management Plan

CASINO PROJECT

LNG MANAGEMENT PLAN

PRELIMINARY DRAFT

Prepared by:
Casino Mining Corporation
November 2014

EXECUTIVE SUMMARY

The Casino Mine Project is an approximately 22 year mine project owned and operated by Casino Mining Corporation (CMC), that will produce copper and molybdenum concentrates, and gold dore bars via flotation milling and heap leach processing, respectively. The proposed project includes a four year construction period and a 90 year post-closure period. Key project components include the open pit, tailings management facility and waste rock storage area, heap leach facility, mill and associated infrastructure, ore stockpiles, liquefied natural gas power generating infrastructure, and office and accommodation buildings. The project also requires a 120 km access road from the town of Carmacks, YT, and concentrate will be trucked to the port at Skagway, Alaska.

The Casino Mine Project is a proposed 22 year mine project owned and operated by Casino Mining Corporation (CMC), that will produce copper and molybdenum concentrates, and gold dore bars via flotation milling and heap leach processing, respectively. The location of the Casino Project is shown on Figure 1 1. Key project components include the open pit, tailings management facility and waste rock storage area, heap leach facility, mill and associated infrastructure, ore stockpiles, liquefied natural gas power generating infrastructure, and office and accommodation buildings. The project also requires a 120 km access road from the town of Carmacks, YT, and concentrate will be trucked to the port at Skagway, Alaska.

LNG is proposed as the primary fuel supply for power generation and other ancillary uses at the Casino Project. All LNG deliveries to the mine will be by truck transport that will ramp up to an estimated 900 m3/day LNG when at full production. LNG storage is required at the mine to stockpile sufficient inventory to supply natural gas fuel needs during the period where road access is limited due to weather.

A management plan for toxic or hazardous substances is required by the Canadian Environmental Protection Act (CEPA) and through the Environmental Management Act (EMA) Hazardous Waste Regulation. Prior to the start of operation, a comprehensive LNG Management Plan for the Casino Project will be developed to ensure worker safety and to prevent uncontrolled releases to the environment. The LNG Management Plan will be developed in consideration of the principles and standards of practice of the Canadian Standards Association (CSA) standards CSA-Z276, CSA-Z731 and the National Fire Protection Association (NFPA) codes NFPA 59A, as well as other principles and standards of practice related to transportation, handling and storage/use and worker safety and emergency response.

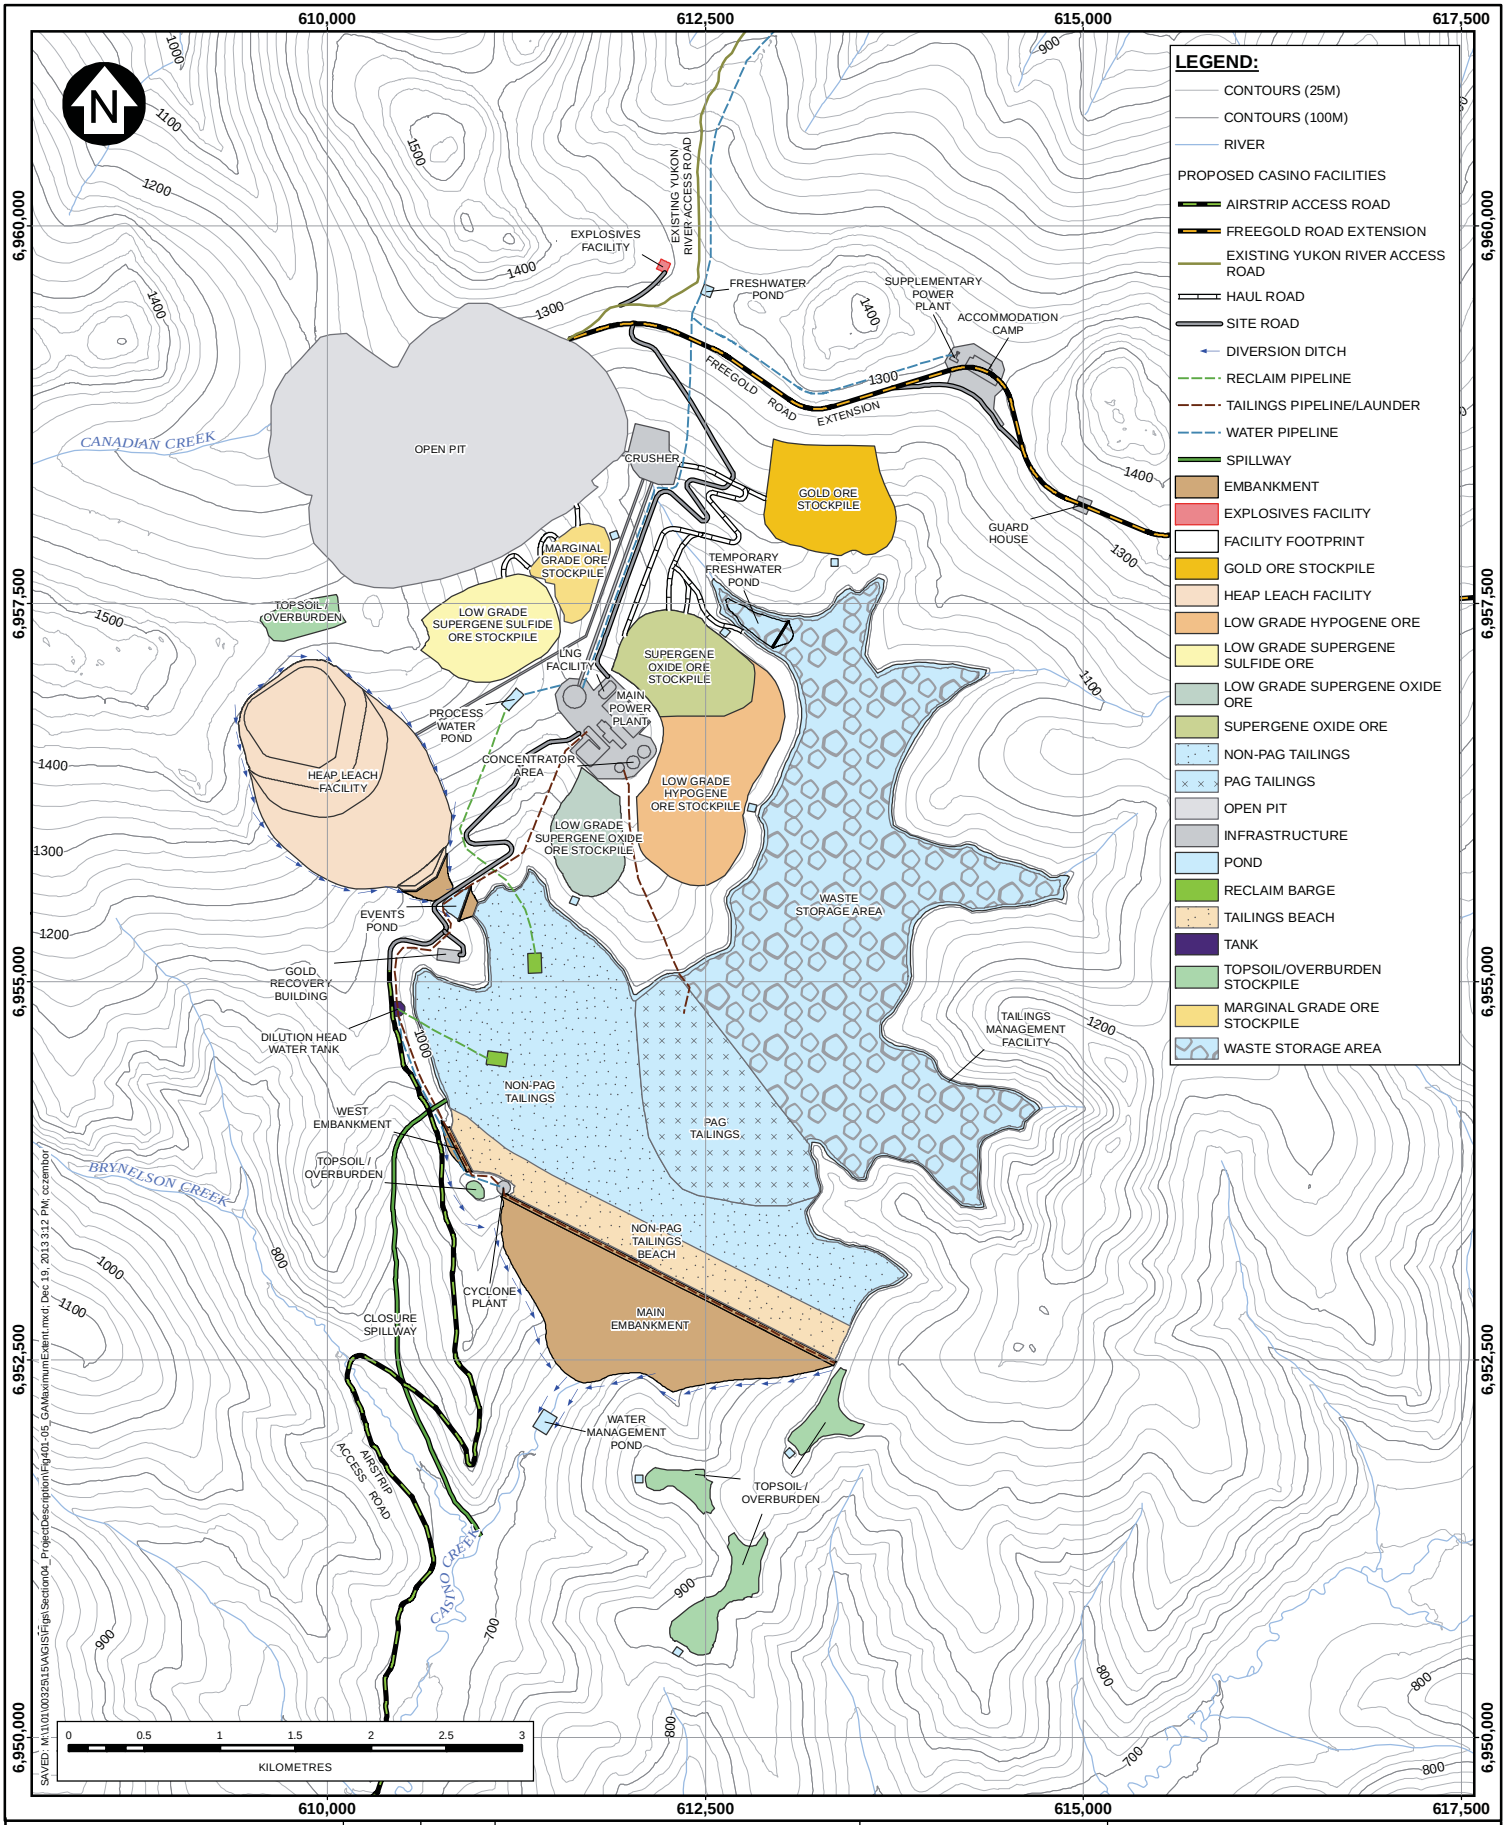
1 – INTRODUCTION

The Casino Mine Project is a proposed 22 year mine project owned and operated by Casino Mining Corporation (CMC), that will produce copper and molybdenum concentrates, and gold dore bars via flotation milling and heap leach processing, respectively. The location of the Casino Project is shown on Figure 1-1. Key project components include the open pit, tailings management facility and waste rock storage area, heap leach facility, mill and associated infrastructure, ore stockpiles, liquefied natural gas (LNG) power generating infrastructure, and office and accommodation buildings. The project also requires a 120 km access road from the town of Carmacks, YT, and concentrate will be trucked to the port at Skagway, Alaska.

LNG is proposed as the primary fuel supply for power generation and other ancillary uses at the Casino Project. All LNG deliveries to the mine will be by truck transport that will ramp up to an estimated 900 m^3/day LNG when at full production. LNG storage is required at the mine to stockpile sufficient inventory to supply natural gas fuel needs during the period where road access is limited due to weather.

A management plan for toxic or hazardous substances is required by the *Canadian Environmental Protection Act* (CEPA) and through the *Environmental Management Act* (EMA) Hazardous Waste Regulation. Prior to the start of operation, a comprehensive LNG Management Plan for the Casino Project will be developed to ensure worker safety and to prevent uncontrolled releases to the environment. However, a preliminary plan is provided herein to satisfy the requirements of the Yukon Environmental and Socio-Economic Assessment Board (YESAB).



The following subsections provide a preliminary LNG Management Plan, outlining the information and the level of detail that will be provided in the final plan. The plan will include all applicable mitigation and management measures developed through the process and committed to by Casino Mining Corporation.

The LNG Management Plan will be developed in consideration of the principles and standards of practice of the Canadian Standards Association (CSA) standards CSA-Z276, CSA-Z731 and the National Fire Protection Association (NFPA) codes NFPA 59A, as well as other principles and standards of practice related to the following:

- Transportation;
- Handling and storage/use; and
- Worker safety and emergency response.

The LNG Management Plan will be integrated with other relevant Management Plans (e.g., Emergency Response Plan, Spill Contingency Plan) to ensure that worker/public health and safety as well as the environment are protected.

The Plan will be updated as the project is refined, and further details are acquired with regards to the management of LNG at the Casino Project. The final Plan will include a table of proponent commitments made during the environmental assessment process relevant to LNG management, and indicate how the plan addresses the commitments. Terms and conditions of any applicable licences, permits and approvals required for the Project operations will also be included, once acquired.

2 – TRANSPORTATION

The final LNG Management Plan will be based on best practices in transporting LNG on public roads, driver communications, vehicle location tracking, maintaining mobile equipment, maintenance record keeping, personnel records, regulatory & enforcement coordination, and to demonstrate compliance to national and local regulations on a long-term, and sustainable basis. The purpose of the plan is to establish standards that all transportation participants will be trained in and measured for conformity.

To ensure the protection of communities and the environment during transport of LNG to the Casino Project, the general guidelines below will be followed:

- Responsibility for safety, security, release prevention, training, and emergency response will be established in written agreements with producers, distributors and transporters.
- Emergency response plans and management measures will be implemented by LNG transporters.

The following practices from CSA-Z276 will be followed in the development of the more detailed transportation plan:

CSA-Z276

13.3.8 Transportation of LNG

13.3.8.1: The driver of each tank vehicle, or the shipper's representative accompanying the driver, shall have readily available written procedures regarding general operating precautions, manual venting, and emergency procedures, including names, addresses, and telephone numbers of individuals to be contacted in an emergency.

13.3.8.2: Stopovers of tank vehicles may occur at safe locations. Under no circumstances shall a tank vehicle be left unattended on a public highway.

13.3.8.3: It can be necessary to blowdown a tank at a remote and safe location. The driver or shipper's representative shall be trained to identify a suitable location and be trained in blowdown procedures.

13.3.8.4: The driver or the shipper's representative accompanying the driver shall be trained in the handling of LNG.

2.1 REQUIREMENTS AND GUIDELINES FOR TRANSPORTATION CONTRACTORS

Casino Mining Corporation will require contractors retained for LNG deliveries to the Project will develop and implement a LNG Transportation Plan that is consistent with the LNG standards mentioned above, and should be integrated with the overall LNG management plan as well as with related management plans (i.e. the Environmental Management Plan). Each contracting firm will be requested to prepare their approach and to submit their proposal based on the following:

- A staffing plan that will support the functional for the LNG trucking fleet. The staffing plan should include general management, drivers, mechanics, and other maintenance and shop personnel, dispatchers, road supervisors, quality assurance staff to handle issues that arise, training including operator and safety training, and office and administrative personnel. Their staffing plan will be used as one of the elements in

evaluating their capabilities and space requirements for the proposed LNG unloading and unloading facilities. Driver qualifications and training records are required.

- Trucks, trailers, and other components to be provided in the contract. Trucks and trailers to be a current model, new and unused, under standard production by the manufacturer, and of which parts are stocked at one or more locations in Western Canada. The requirement for parts to be stocked may be waived if the bidder provides an acceptable parts availability plan. All parts utilized on the unit should be new and unused.
- Queuing space allocations at the LNG unloading and unloading facilities for trucks be fueled (either LNG or diesel), LNG transfer to unload tankers, have consumable fluids checked and topped off as necessary, and the interiors cleaned without having to be moved. Bays are to be canopied, and designed to be pull-through able to be accessed at any time regardless of weather conditions.
- Transportation schedules and quantities.
- Carrier should furnish copies of Carrier's permits or authority to transport the products as issued by state or federal regulatory agencies.

The following practices will be described and implemented:

- Vehicles used for the transportation of LNG as well as the associated containers comply with the prescribed safety standards and display all applicable prescribed safety marks in accordance with CSA-Z276.
- Chain of custody documentation including MSDS (Material Safety Data Sheets) to track inventory and LNG movement.
- Use of escort vehicles or convoys for LNG shipments as necessary due to inclement weather and road conditions.
- Regular maintenance of transportation equipment including containers, trucks, loading and unloading machinery, and storage systems.
- Training of all personnel operating LNG handling and transport equipment.
- Emergency Response plans for a potential LNG release during transportation including:
    - Designate appropriate response personnel and commit necessary resources for emergency response;
    - Emergency response training of involved personnel;
    - Descriptions of the specific emergency response duties and personnel responsibilities;
    - A detailed list of all emergency response equipment available during transport or along the transportation route;
    - A detailed list of all emergency response and personal protective equipment during transportation;
    - Initial and periodic refresher training in emergency response procedures;
    - Develop procedures for internal and external emergency notification and reporting; and
    - Periodically evaluate response procedures and capabilities and revise if needed.

During operations, contractors as a minimum will need to provide evidence of compliance to the following:

- On a real time basis, identify limitations, risks and restrictions of conditions that might be encountered along the specific routes to be followed for driver awareness, and prescribed measures to be taken when they occur. Examples include:
  - Highway weight & dimensional limits;
  - Posted speed zones;
  - Bridge regulations;
  - Known traffic hazards;
  - Temporary road hazards;
  - Seasonal and climate related hazards; and
  - Highway impasse due to vehicle accidents, road obstructions, weather;
- Compliance to *LNG Transport Emergency Response Plan* for LNG highway transport operations:
  - Accidents involving LNG transport vehicles (no leaks or spills);
  - Accidents involving LNG transport vehicles (with leaks or spills);
  - LNG transport trailer rollover;
  - Leaks and spills;
  - Fire;
  - Weather related incidents; and
  - Coordination with local, provincial and federal authorities depending on the severity of the accident.
- Personnel policies and training (see Section 2.2).
- A system for real-time communications with drivers in transit.
- A system for tracking the location of vehicles in transit.
- A system to ensure all equipment used is appropriate for the products to be handled and transported. All equipment must comply with the requirements and standards. Equipment must be maintained in good condition and “fit for purpose”.
- A system to capture and report vehicle maintenance:
  - Preventative maintenance;
  - Maintenance problems and defective equipment;
  - Parts and procedures in performing maintenance and repairs;
  - Plan, schedule and record vehicle maintenance history;
  - Demonstrate the vehicle is maintained per the manufacturer recommendations; and
  - Specify tire types, use on specific axle as a minimum, and rules regarding repair and re-treading.

- A system for standard vehicle checklist prior to travel on a daily basis including:
  - A tire policy, tire inspection procedure, tire change and replacement frequency;
  - Regulations of tire pressures;
  - Fluids; and
  - Wiper blades, belts, hoses, etc.

2.2 PERSONNEL POLICIES AND TRAINING

Contractors who are evaluated for LNG transportation services will be requested to develop a training plan to ensure that training needs and effectiveness are reviewed on a regular basis. A training matrix should be prepared to determine what training will be delivered, by whom, and what frequency, etc. Training must take account of any statutory regulations, and should also reflect industry codes or standards relevant to the work. A designated person within the transportation services company is to coordinate and manage the provision of training and maintain appropriated training records. For employee qualification, training, and certification, detailed classroom study, testing, and safety training. Safety training that is expected to be included in the training syllabus matrix includes:

- Induction and Orientation
- Properties of LNG and Natural Gas
- LNG Transfer (unloading and loading) Operations
- LNG Fueling
- Fatigue & Tiredness
- Drug & Alcohol Abuse
- Vehicle Roll Over Awareness Training
- Personnel Protective Equipment
- Fire Prevention and Suppression
- Management Planning for the Specific Route
- Checklists, Logs, and Documentation
- Near Miss and Incident Reporting
- Tire inspections
- Journey Risks, Transportation Routes and Consideration of the Constraints and Risks Associated with the Routes
- Approved Rest Areas and Prominent Land Marks Along The Routes
- Emergency Response Plan

3 – HANDLING, STORAGE AND USE

The proposed LNG facility, storage and secondary containment infrastructure is shown in Figure 3-1. Delivery and unloading of LNG on site will take place at the LNG storage and receiving facility. The storage tank will include 110% secondary containment. The unloading and storage areas will be designed to allow safe maneuvering of plant vehicles. The LNG containment areas will be designed at 110% of the total volume held in the delivery container.

Measures implemented during LNG handling, storage, and use at the Casino project will be in accordance with the principles of CSA-Z276 – mainly to protect workers and the environment during LNG handling and storage. The relevant CSA-Z276 guidelines are summarized below.

CSA-Z276

13.3.9 LNG transfer

13.3.9.1: Where making bulk transfers into stationary storage containers,

(a) the LNG being transferred shall be compatible in composition and temperature or in density with the LNG already in the container; or

(b) means shall be employed to manage stratification and to prevent rollover and an excessive rate of vapor evolution where the compositions and temperatures or the densities are not compatible. If a mixing nozzle or agitation system is provided, it shall be designed to have sufficient energy to accomplish its purpose.

7.1.4 Basic design considerations

7.1.4.1: Those parts of LNG containers that normally are in contact with LNG and all materials used that are in contact with LNG or cold LNG vapor (vapor at a temperature below –29 °C [–20°F]) shall be physically and chemically compatible with LNG and intended for service at –168 °C (–270°F).

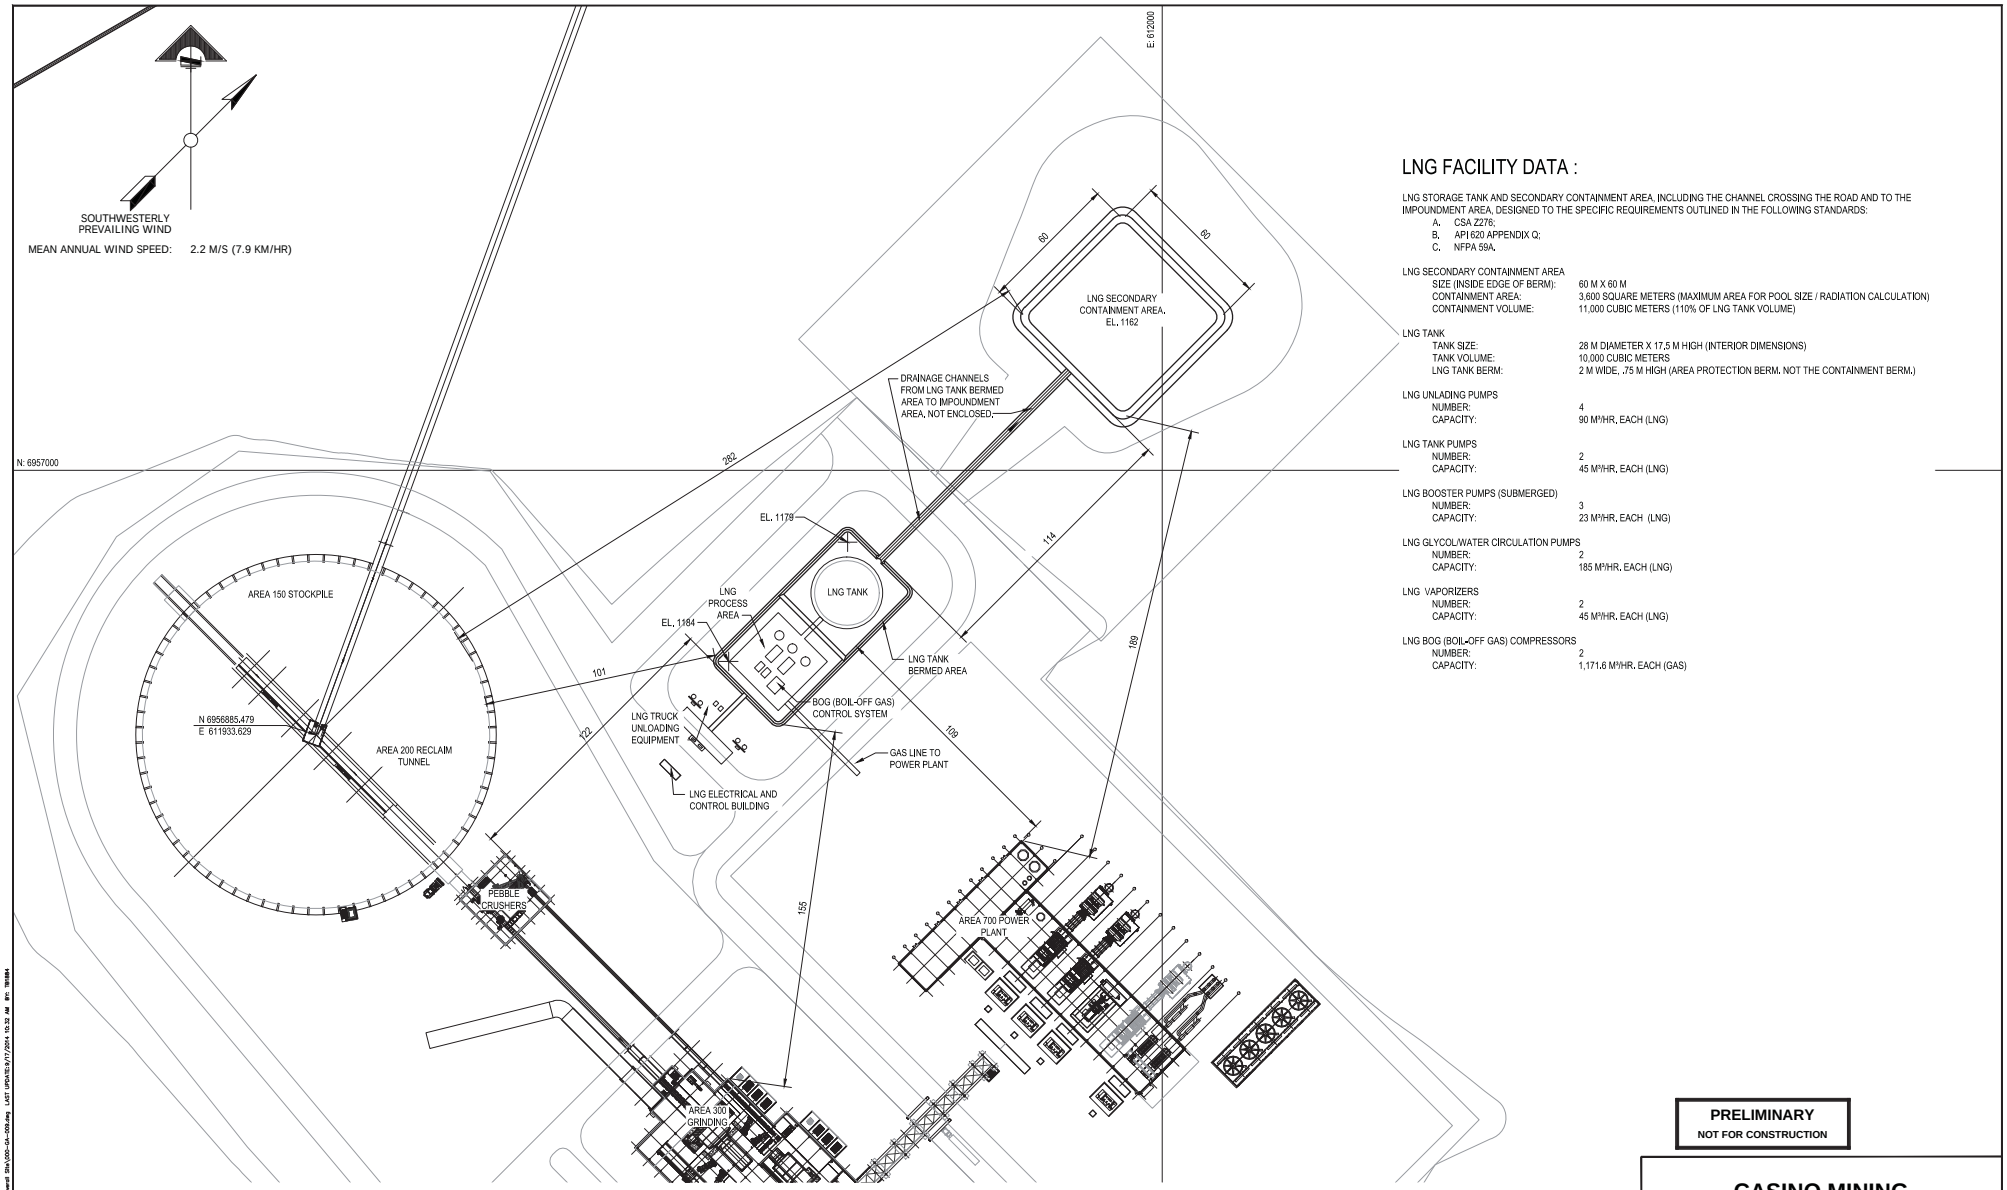
7.1.4.3: All LNG tank systems shall be designed to accommodate both top and bottom filling, unless other positive means are provided to prevent stratification.

7.1.4.4: Any portion of the outer surface area of an LNG container and any external members whose failure could result in loss of containment from accidental exposure to low temperatures resulting from leakage of LNG or cold vapor from flanges, valves, seals, or other non-welded connections shall be designed to withstand such temperatures or otherwise protected from the effects of such exposure.

7.1.4.5: Where two or more containers are situated in a common dike, the container foundations shall be capable of withstanding contact with LNG or shall be protected against contact with an accumulation of LNG that could endanger their structural integrity.

7.1.4.6 The density of the liquid shall be assumed to be the actual mass per unit volume at the minimum storage temperature; however, the assumed density shall not be less than 470 kg/m3 (29.3 lb/ft3).

Handling, storage and use of the LNG at the Casino Project will comply with the following best management practices:



- Design and construct unloading and storage facilities consistent with sound, accepted engineering practices and quality control/assurance procedures, spill prevention and spill containment measures.
- Operate unloading and storage facilities using inspections, preventive maintenance and contingency plans to prevent or contain releases, and control and respond to worker exposures.
- Provide spill prevention or containment measures for associated tanks, pipelines, and associated process equipment.

3.1 LNG TRANSFER OPERATIONS

LNG transfer, storage and process equipment is a closed loop system such that during normal operations there should be no routine or significant releases to the atmosphere from plant equipment and processes. The exceptions are for extremely small releases during truck loading arm connection and disconnection operations. Operating procedures require that piping and transfer arms or hoses are to be purged with nitrogen prior to opening to the atmosphere to prevent an internal flammable mixture from occurring. The design, operating procedures, and are intended to eliminate the potential for:

- Unplanned or unsafe release of LNG or flammable vapors to the atmosphere;
- Flammable mixtures with air in piping, containers and other enclosed spaces;
- Hazards to personnel and equipment from improper valve isolations; or
- Hazards from improper cooldown and warm-up of LNG liquid and vapor lines.

Releases of flammable gas to the atmosphere may occur during certain planned maintenance activities, emergencies and abnormal operating conditions. “Hot Work” permits are required during truck loading/loading, arm/hose connection and disconnection operations where a potential for release of their contents to the atmosphere is possible. Transfer operations will comply with CSA Z276.

LNG FACILITY LAYOUT

SCALE: 1:1000

LNG FACILITY DATA :

LNG STORAGE TANK AND SECONDARY CONTAINMENT AREA, INCLUDING THE CHANNEL CROSSING THE ROAD AND TO THE IMPOUNDMENT AREA, DESIGNED TO THE SPECIFIC REQUIREMENTS OUTLINED IN THE FOLLOWING STANDARDS:

A. CSA Z276;
B. API 620 APPENDIX Q;
C. NFPA 59A.

LNG SECONDARY CONTAINMENT AREA

SIZE (INSIDE EDGE OF BERM):	60 M X 60 M
CONTAINMENT AREA:	3,600 SQUARE METERS (MAXIMUM AREA FOR POOL SIZE / RADIATION CALCULATION)
CONTAINMENT VOLUME:	11,000 CUBIC METERS (110% OF LNG TANK VOLUME)

LNG TANK

TANK SIZE:	28 M DIAMETER X 17,5 M HIGH (INTERIOR DIMENSIONS)
TANK VOLUME:	10,000 CUBIC METERS
LNG TANK BERM:	2 M WIDE, .75 M HIGH (AREA PROTECTION BERM, NOT THE CONTAINMENT BERM.)

LNG UNLADING PUMPS

3.1.1 LNG Truck Loading and Unloading

LNG supply to truck loading is from the LNG supplier's LNG tank transfer pumps. LNG unloading is from the highway trailer to the LNG storage tank using stationary LNG unloading transfer pumps. There is a common 'cold retention' liquid recirculation line for the two truck loading bays to retain LNG temperature in piping between LNG truck loadings. 'Cold retention' recirculation LNG is returned to the LNG tank zero send-out recirculation line.

For LNG code compliance for secondary containment, the loading and unloading bays are provided with a spill collection system to lead spills to an impoundment basin sized for 10 minute spill at max loading rate. A drain pot is provided to drain the LNG arms/hoses on completion of loading (for coupling disconnection, ease of handling and prevention of ice build-up during periods of no loading). Drained liquid is returned to the LNG recirculation line with nitrogen pressure.

Truck Loading and Unloading Bay Components:

- LNG unloading manifold
- LNG supply piping manifold
- Vapor return piping manifold
- Canopied Cover for loading bay and weighbridge (weather protection)
- Driver shelter
- Man-machine interface (MMI) for "load recognition and verification"
- Weighbridge
- Articulated liquid and vapor arms or hoses to connect Terminal piping to truck (arms or hoses will be determined during detailed engineering)
- Drain vessel for draining articulated arms/hoses
- Nitrogen supply for arms/hoses blow-down and drain-vessel blow-casing

Hazard detection, CCTV monitoring, and automatic and manual emergency shutdown is included in the truck loading design and includes the following truck loading and unloading area emergency shutdown initiators:

- ESD Hand Switch - Truck loading/unloading
- ESD Hand Switch - Truck loading/unloading perimeter (15m from bays)
- ESD Hand Switch– Main control room
- ESD (Automatic) truck loading fire, gas, spill hazard detection
- Instrument Air pressure: low-low, close truck loading ESDV's
- LNG tanker high liquid level (Alarm)
- LNG tanker high-high liquid level (ESD)

To contain potential LNG releases from loading/unloading areas and transfer piping, secondary containment curbs and transfer trenches will be installed in process areas and adjacent to LNG pipe racks to drain potential releases of LNG to impoundment basin.

Truck access to the Terminal Site is via an automatic gate. Only trucks and drivers with advance authorization and valid ID are admitted onto the Terminal Site. The truck loading operation is performed by trained truck drivers, who will remain in attendance throughout the loading procedure.

3.1.2 LNG Highway Tanker Loading Operational Steps

LNG highway tanker loading/unloading is accomplished by performing a sequence of operational steps:

1. Trucks access the facility via an automatic gate. Only approved trucks and drivers with valid ID are admitted.
2. The truck/tanker parks on the weighbridge
3. The driver secures the truck, chalk wheels, and steps away from the weighbridge
4. Driver identity, Truck/tanker identity, and weight are validated as accurate
5. The truck loading/unloading operation is performed by trained drivers who will remain in attendance throughout the loading procedure.
6. An umbilical cord is connected to LNG highway tanker to monitor truck/tanker safety systems and provide earthen grounding to the tanker.
7. Truck keys are removed and secured
8. LNG loading and vapor hoses are connected between the tanker and the loading manifold
9. Vapor pressure is equalized between the tanker and facility vapor system
10. The LNG loading valve is opened to provide cooldown of the LNG loading arm/hose
11. The LNG facility loading or unloading pump is started that provides the drive force for transfer of LNG from storage tanks to highway tankers (loading) or from highway tankers to the LNG storage tank (unloading).
12. LNG loading/unloading continues until the tanker is near 90% full of liquid, and 10% or more vapor space is retained (loading) or until the tanker is near empty of liquid (unloading). A suction drum is located before the LNG transfer pump that has a liquid level indicator that automatically stops the unloading pump when liquid level drops below the setpoint in the suction drum. By design, a small heel of LNG is retained in the highway tanker to keep the tank cold for the return trip.
13. Vapor and LNG valves on the loading manifold are closed.
14. Hoses are depressurized, and purged of LNG and flammable vapor to the LNG drain vessel.
15. Hoses/arms are disconnected
16. The umbilical cord is disconnected
17. The LNG tanker loaded/unloaded quantity validation is completed in the facility measurement system
18. The driver departs with the LNG tanker load and vapor space pressure of approximately 2 psig.

3.1.3 LNG Highway Tanker Loading Safety Features

The LNG highway tanker loading/unloading facility will incorporate a number of safety features to prevent unsafe conditions:

- Hazard detectors will be installed in the LNG highway tanker loading area where potential of LNG spills, gas leaks, flame, excess heat and cryogenic temperature indicate unsafe conditions. Logic in hazard detection control systems will automatically trigger an emergency shutdown (ESD) for specific events.
- Manual ESD activation hand-switches are provided at multiple locations in the tanker loading area.
- Emergency manual call points are provided, as well as sirens and beacons to alert personnel of emergency situations.
- A terminal-to-truck umbilical cable is connected to the LNG highway tanker that ensures that truck engine is off, LNG highway tanker is earthed, and truck & tanker braking systems are set before loading is permitted. Loading and vapor return hoses are vulnerable to “drive-off” with hoses connected. Cryogenic hoses are not provided with breakaway couplings to provide a “weak point” and to be avoided as a serious incident.
- Barriers protect pipe work from truck impact as practical.
- Fire suppression and firewater with remote activation and control in the event of fire is provided.

Note that operators will be trained to know when to apply fire water. Fire water is not an appropriate response for all fires.

3.1.4 LNG Highway Tanker Weighing During Loading/Unloading

A weighbridge is provided for each of the two LNG highway tanker loading and unloading bays. The truck and highway tanker is parked on the weighbridge the entire duration of loading and serves three primary purposes during loading:

1. Overfill protection is provided where the tanker has a maximum weight that when reached will stop loading. If exceeded, there will be an overfill alarm on high level. For high-high level, a safety interlock trip will stop loading. For high-high-high level, an ESD trip will stop loading.
2. For custody transfer measurement, loaded LNG quantities are automatically recorded in the LNG facility measurement system and based on the weight of LNG loaded. This is determined from the difference in starting weight to ending weight when loading is complete.
3. Prior to loading, a weight trip (pre-loaded set point for all truck/tanker) prevents the tanker from being loaded if not within expected weight range. The truck/tanker should weigh the same prior to the start of loading as the truck/tanker weighed after truck/tanker loading at Casino, less truck fuel consumed, or added en-route. A management override is required to document and explain any discrepancies.

And two primary purposes during unloading:

1. For custody transfer measurement, unloaded LNG quantities are automatically recorded in the LNG facility measurement system and based on the weight of LNG unloaded. This is determined from the difference in starting weight to ending weight when unloading is complete.
2. Prior to unloading, a weight trip (pre-unloaded set point for all truck/tanker) prevents the tanker from being unloaded if not within expected weight range. The truck/tanker should weigh the same prior to the start of unloading as the truck/tanker weighed after truck/tanker loading in Fort Nelson, less truck fuel consumed, or added en-route. A management override is required to document and explain any discrepancies.

4 – WORKER SAFETY AND EMERGENCY RESPONSE

The following principles for worker safety are of the utmost importance and must be followed at all times:

- Protect workers' health and safety from exposure to LNG/natural gas evaporating from the LNG.
- Protect communities and the environment through the development of emergency response strategies and capabilities.
- Train workers and emergency response personnel to manage LNG in a safe and environmentally protective manner.

This section of the LNG Management Plan will be implemented in conjunction with the Occupational Health and Safety Management Plan as well as with the Emergency Response Plan. The relevant CSA-Z276 safety and emergency response guidelines include:

CSA-Z276

4.5 Safety and loss management system

4.5.1: For each LNG facility, the operating company shall develop, implement, and maintain a documented safety and loss management system that provides for the protection of people, the environment, and property.

4.5.2: The safety and loss management system shall include the following elements:

(a) clearly articulated policy;

(b) leadership commitment;

(c) a suitable organizational structure with well-defined responsibilities and authorities;

(d)a process for the management of resources, including the establishment of competency requirements and an effective training program;

12.8 Personnel safety

12.8.1: Protective clothing that provides protection against the effects of exposure to LNG shall be available and readily accessible at the facility. Note: Protective clothing for normal liquid transfer operations should include cryogenic gloves, safety glasses, face shields, and coveralls or long-sleeve shirts.

12.8.2: Those employees who are involved in emergency activities, as determined in accordance with Clause 12.1.2, shall be equipped with the necessary protective clothing and equipment and shall be qualified in accordance with NFPA 600.

12.8.3: Written practices and procedures shall be developed to protect employees from the hazards of entry into confined or hazardous spaces. Note: Information concerning confined entry practices and procedures can be found in the U.S. Code of Federal Regulations, Title 29, Subtitle B, Chapter XVII, Part 1910.46, the Canada Labour Code, Part II, and any local, state, or provincial/territorial regulations and standards that apply.

12.8.4: At least three portable flammable-gas indicators shall be readily available. Note: Natural gas, LNG, and hydrocarbon refrigerants within the process equipment are usually not odorized, and the sense of smell cannot be relied upon to detect their presence. Two portable detectors should be available for monitoring when required, with a third detector for backup. This provides a spare detector in the event of failure of one of the primary detectors and also allows verification if the two primary detectors provide different readings.

13.3.3 Emergency procedures

13.3.3.1: The types of emergencies referred to in Clause 13.3.2(k) shall include, at a minimum, emergencies that arise from an operating malfunction, structural collapse of part of the LNG plant, personnel error, forces of nature, and activities carried out adjacent to the plant. Emergency procedures shall include:

(a) procedures for responding to controllable emergencies, including notifying personnel, the use of equipment that is appropriate for handling of the emergency, the shutdown or isolation of various portions of the plant, and other applicable steps to ensure that the escape of gas or liquid is promptly cut off or reduced as much as possible;

(b) procedures for recognizing an uncontrollable emergency and for taking action that will

(i) minimize harm to the personnel at the LNG plant and to the public; and

(ii) provide prompt notification of the emergency to the appropriate local officials, including notification of the possible need to evacuate persons from the vicinity of the LNG plant; and

(c) procedures for coordinating with the appropriate local officials an emergency evacuation plan that sets forth the steps necessary to protect the public in the event of an emergency.

13.3.3.2: The procedures and steps in Clause 13.3.3.1(c) shall include methods of advising the appropriate local officials of the

(a) quantity and location of fire equipment throughout the LNG plant;

(b) potential hazards at the LNG plant;

(c) communication and emergency control capabilities of the LNG plant; and

(d) status of each emergency.

13.3.3.3: Normally, gas fires (including LNG fires) should not be extinguished until the fuel source has been shut off, unless the fire would create more of a hazard than the gas dispersion.

The following principles will be implemented to meet the CSA-Z276 code requirements:

- Identify potential LNG spill scenarios and measures necessary to eliminate, mitigate and control, and minimize worker exposure. The scenarios will include vapor dispersion/thermal radiation from potential spills, and the layers of protection associated (i.e. a spill impoundment).

- Prepare detailed emergency response plans for potential LNG spills as they may cause fires if not contained. The plans will outline the potential scenarios and specific response actions including clearing the site, personnel, and the public as necessary.
- Develop and implement emergency response plans to respond to worker exposure to LNG/natural gas.
- Involve site personnel and stakeholders in the planning process.
- Periodically evaluate response procedures and capabilities and revise them as needed.
- Train appropriate personnel to operate the LNG receiving and unloading facility according to systems and procedures that protect human health, the community, and environment.
- Train workers to understand the hazards associated with LNG/natural gas.
- Train workers and personnel to respond to LNG/natural gas exposure and environmental releases, including use of first aid measures.
- Designate personnel and commit equipment and resources for emergency response as necessary.
- Develop internal and external procedures for emergency notification and reporting.

4.1 GENERAL HAZARDS

General hazards from the handling, storage and transportation of LNG include potential hazards during loading and unloading, during transit and during storage and from day-to-day operations. These hazards are discussed further below. Fire hazards from LNG and from the gasified natural gas are also outlined.

4.1.1 Hazards of LNG and Natural Gas

LNG liquid itself is not flammable – only the vapors emanating from the liquid can be lit. Natural gas and LNG vapor fires in the open atmosphere may flash and burn hot, but are not explosive because the flame propagation speed is much less than required to have an explosive pressure wave when the ignition is not within an enclosed space. In an unconfined space, the flame propagation speed of natural gas and LNG vapor increases with the temperature of the gas, but is significantly lower than other flammable hydrocarbons such as propane or gasoline vapors which can explode in an unconfined space.

Potential hazards from LNG, natural gas, explosion and from improper handling techniques are summarized below.

4.1.1.1 Hazards from LNG

The design, operations and maintenance procedures for handling, storage, and transfer of LNG are intended to eliminate the potential for LNG liquid from being released in the atmosphere or on the ground at all times. General hazards from LNG include:

- LNG vapor is flammable when in a 5 to 15% concentration in air. Please note that this is a fairly narrow concentration range in comparison to other hydrocarbons.
- Skin exposure by personnel to LNG (or bare metal surfaces chilled by LNG) will cause external dermal frost burns also called cryogenic “burns” or frostbite due to the -161 °C temperature of LNG. Cryogenic burns can cause serious skin injury in the form of skin discoloration, loss of skin layers and blistering dependent on the quantity and duration of exposure that requires immediate medical attention.

- If inhaled, LNG vapor is non-toxic to breathe the same as nitrogen or carbon dioxide but can act as an asphyxiate by displacing oxygen in the air.
- If inhaled, LNG vapor may be very cold and cause internal frost burns to the throat and lungs and may require immediate medical attention.
- When LNG liquid is confined in a pipe, container, or tank, the LNG will begin to absorb heat from the atmosphere that initiates vapor creation (boiling) of the LNG with a 1-to-615 of liquid (at atmospheric pressure) to vapor expansion ratio. Unless the pressure is released at an equal or greater rate, the container could be exposed to rapid and/or extremely high internal pressure buildup. The potential pressure buildup due to this effect could quickly exceed the containment pressure design rating that could cause a sudden failure of the container or other serious failures that may or may not include ignition.
- LNG vapor can be lighter or heavier than air based on the LNG vapor temperature with a specific gravity range of 1.7 when cold to 0.55 when warmed to ambient temperature. This characteristic results in the vapor having potential to collect in low places when cold, and high place when warm.
- LNG is an odorless, colorless, non-corrosive, and non-toxic clear liquid, where the presence of LNG or LNG vapor is not necessarily apparent to the human senses of smell and sight. When exposed to the atmosphere LNG produces a visible vapor cloud (fog) as moisture in the air condenses. Once the gas vapor temperature equalizes with the surrounding atmosphere, the vapor cloud fades away. Instruments for gas detection are to be relied upon for detecting the presence of natural gas and LNG vapor.
- LNG is very cold and therefore materials selected for storage and transfer of LNG need to be fully considered to be sure they are suitable for the application. Materials such as plastic and carbon steel become very brittle and will fail if exposed to the cryogenic temperatures of LNG liquid where stainless steel and aluminum materials retain their strength properties at cryogenic temperature.
- LNG is very cold that results in materials LNG comes into contact with to become smaller (contract) due to thermal contraction and expand upon warm-up. This effect needs to be considered to allow for movement where expansion and contraction occurs.

4.1.1.2 Hazards from Natural Gas

The design, operations and maintenance procedures for handling, storage, and transfer of natural gas are intended to eliminate the potential for natural gas from being released in the atmosphere at all times. General hazards from natural gas include:

- Natural gas is flammable when mixed with air and ignited.
- Natural gas is explosive when mixed with air and ignited in an enclosed space.
- Exposure of personnel to natural gas vented at high velocity can cause serious skin and eye injury that requires immediate medical attention.
- If inhaled, natural gas can act as an asphyxiate by displacing oxygen but is non-toxic to breathe the same as nitrogen or carbon dioxide.
- Natural gas is lighter than air and can collect in high place if confined.
- Natural gas is an odorless, colorless, non-corrosive, and non-toxic clear gas where the presence of natural gas is not necessarily apparent to the human senses of smell and sight. Instruments for gas detection are to be relied upon for detecting the presence of natural gas and LNG vapor.

4.1.1.3 Explosion Hazard Description of Natural Gas and LNG Vapors

Natural gas and LNG vapors are not explosive in an open space, and volatility of ignition decreases with colder ambient temperature. When natural gas and LNG vapor are ignited in a flammable mixture with air in an open space, the flame propagation speed is well below the speed of sound. When ignited, natural gas and LNG vapor will produce a flame and heat until the fuel is consumed, but no meaningful pressure wave will occur. Lower ambient temperature will further reduce the volatility of natural gas and LNG vapor where the intensity of the initial ignition is further reduced.

An explosion can occur with natural gas and LNG vapor, but only when combined with air in an enclosed space (pipe, containers, tanks, and buildings) and ignited. This is a far more serious hazard than fire in the open atmosphere. In addition to the effects of the fire, an explosion can be generated that has considerably more destructive power from the combined effects of fire and rapidly expanding vapor within an enclosed space structure. An explosion is caused when the initial ignition and fire causes a pressurization impulse wave that is initially contained by the enclosed space that further compresses the confined gases which also increases the gas temperature. The ignited gas burns behind a shockwave and releases energy that supports supersonic (faster than the speed of sound) shock propagation. This self-sustained detonation wave is different than an open fire as this can propagate at a supersonic speed and high temperature causing a significant and sudden pressure change and flashback (sonic boom). Because detonations generate rapid pressure changes and higher temperature they are generally much more destructive than subsonic fires. In all cases, an explosion will exceed the pressure containment rating of the enclosed space (pipe, containers, tanks, sumps and buildings) that results in complete loss of containment and failure of the enclosure and structure that further amplifies the destructive power of the blast. Other potential effects include flash fire, high temperature, supersonic pressure waves, domino failures, flying projectiles, burns, debilitating injury-death, hearing loss, asphyxiation, etc.

4.1.1.4 Hazards from Improper Purge, Isolation, and Ignition Sources

Hazards created by improper purge, improper isolations, the presence of ignition sources, and improper cooldown can be serious events. The following procedures will be included in the final LNG Management Plan to prevent such occurrences:

- Hazards from Improper Purge, Isolation, and Ignition Sources
- Purging
    - Purge-Into-Service
    - Leak Check and Pressurization Into Service
    - Purging-Out-of-Service
- Isolations for LNG and Natural Gas
- Cooldown-Into-Service
- Cooldown of LNG Piping
- Warm-up of LNG Piping and Containers

4.1.2 Potential Hazards at an LNG Loading / Unloading Facility

Hazards listed below are identified as potential safety hazards that will be addressed and managed in detail during facility design and development of safe operating procedures for LNG transfer operations of an LNG

highway tanker at an LNG loading/unloading facility. The transfer phase of operations includes arrival at the LNG transfer facility, arm/hose connection, preparing for the LNG transfer, LNG transfer operations, arm/hose disconnection, and departure from the LNG transfer facility. Hazards during LNG transfer operations of an LNG highway tanker include:

- Unconstrained flammable gases in the atmosphere;
- Accidental spills or releases involving LNG liquid or vapor;
- Arms or hoses beyond their safe operating limits due to LNG tanker movement during transfer operations. (arms or hoses will be determined during detailed engineering) This could be caused by improper wheel chalking or improper drive off;
- Overfill the tanker with LNG during loading;
- Overpressure the LNG tanker;
- Vacuum pressure the LNG tanker;
- Accidents caused by vehicle movement in the transfer area;
- Fire in the transfer area;
- Flammable mixtures in piping, containers and other enclosed spaces;
- Hazards to personnel and equipment from improper isolations;
- Hazards from fueling the transit vehicle;
- Potential ignition sources for accidental ignitions of unconfined flammable gases in the atmosphere;
- Potential hazards from improper cooldown and warm-up of LNG liquid and vapor lines;
- Slips and falls by drivers during LNG transfer and fueling in inclement winter weather; and
- Personnel exposure to lightning hazards during storms.

By design, during normal LNG transfer operations, there should be no flammable gas or LNG in the atmosphere from transfer equipment and processes except small releases during trailer arm/hose connection and disconnection processes when the arms/hoses are purged and inerted. Releases to the atmosphere may also occur during certain planned maintenance activities, emergencies and abnormal operating conditions. Maintenance should be avoided during transfer operations, however, if necessary, “Hot Work” permits are required for maintenance during transfer operations, and when the arms are purged and inerted and planned maintenance activities during which flammable gases may be present. The design of the transfer facility includes operability, potential ignition source management, maintainability requirements, and mitigations to all potential hazards listed above.

4.1.3 Potential Hazards of LNG during Transit

Hazards listed below are identified as potential safety hazards that will be addressed and managed in detail during LNG transit operating procedures development, LNG transportation contractor selection, LNG driver training, and routine operations for safe LNG transit operations of an LNG highway tanker. This phase of operations includes all the activities during the roundtrip transit after departing an LNG transfer facility to arrival at an LNG transfer facility. Hazards during LNG transit operations of an LNG highway tanker include:

- Driver fatigue or inattention;
- Vehicle accident during transit;
- Driver unsafe driving practices;
- Accidental spills or releases involving LNG liquid or vapor resulting in unconstrained flammable gases in the atmosphere;
- Overpressure the LNG tanker due to boil-off gas buildup;
- Vehicle fire during transit;
- Potential ignition sources from the transit vehicle, other vehicles, other activities en-route that present sources of accidental ignitions of unconstrained flammable gases in the atmosphere; and
- Slips and falls due to LNG transfer during inclement winter weather.

An LNG tanker trailer is a tight, double wall insulated tank, where all LNG tank interfaces are valved off and capped, except for pressure relief valves. During normal LNG transit operations there should be no ignitable flammable gas or LNG vapors in the atmosphere from the tanker or vehicle fuel system. Pressure in the LNG tank vapor space is normally maintained at low pressure, and significantly below the pressure relief valve setpoint. Releases to the atmosphere during transit are an exception, and considered an abnormal or emergency operating condition.

4.2 ACCIDENTS AND MALFUNCTIONS

All facilities, including LNG facilities, will be designed and constructed in accordance with applicable Federal and Territorial codes and regulations. Applicable permits will also be obtained prior to operation of the facility to fulfil compliance.

Incident scenarios involving uncontrolled release from vaporization, process pipework, and fuel gas systems may include an abnormal temperature or pressure. Potential releases will be prevented by following engineering best practices for LNG and requirements from CSA Z276. By design, during normal LNG facility operations, there should be no flammable gas or LNG in the atmosphere from process equipment, storage and transfer areas except small releases during trailer arm/hose connection and disconnection when the arms/hoses are purged and inerted. Releases that could cause flammable gas mixture build-up in a congested region of the plant are considered an abnormal and potentially emergency condition. Gas, fire, and LNG spill detection are provided as the first line of defense in detecting unsafe releases, and will provide audible alarms, and in some cases, an automatic process shutdown.

Mitigation measures have been incorporated into the design of the LNG and natural gas facility and distribution network. Mitigation measures implemented to avoid impacts from the environment on the project (e.g., seismic events, extreme weather, wildfire) are summarized in Table 4-1.

Table 4-1 Mitigation Measures to Avoid Disturbance from Environmental Events

Environmental Event	Mitigation Measure
Earthquake or seismic event	The LNG storage tank will be designed for MDE corresponding to 1 in 2,500 year earthquake with a mean PGA of 0.13g and a design earthquake magnitude of 8.0.
Terrain stability	The LNG tank is expected to be founded on bedrock with no possibility of permafrost being present. There is no prospect of terrain instability where these facilities are to be located.
Extreme weather (e.g., snow, wind, etc.)	The LNG tank and related facilities will be designed to withstand all site conditions including snow, wind, etc. as required by code and sound engineering practice.
Unstable areas	Detailed geotechnical studies and seismic analysis will be performed during detailed engineering to confirm the stability of the LNG tank soil conditions, and areas in proximity of the LNG facility that could potentially be unstable.
Wildfire	The LNG storage and related facilities are isolated from other site facilities and activities to preclude potential ignition sources for the LNG impoundment area.

Additionally, a hazard detection system for the facility will serve as the first line of defense for detection of gas, LNG releases and fire. The system is based on the following strategies:

- Continuous monitoring of areas that store, transfer, process flammable fluids by remote hazard detectors (flame, gas, and low temperature);
- Manual local emergency hand switches at strategic locations to manually activate the Hazard Detection System;
- Remote visual monitoring through closed circuit television (CCTV);
- Hazard detection system audible alarms and visual beacons to alert personnel of a potential hazard and abnormal operations in the immediate area of the detection and in the local & Main Control Room;
- Automatic trips of ESD system zones for certain events.

A fire suppression system may be employed which will detect, extinguish, and control the flame.

4.2.1 Seismic Events

The process equipment and piping will be designed to comply with the CSA-Z276 standards for site specific seismic conditions. The LNG storage tank will be designed for MDE corresponding to 1 in 2,500 year earthquake with a mean PGA of 0.13g and a design earthquake magnitude of 8.0. Table 4-2 describes the potential consequences if a foundation or structural failure occurs for various associated piping and equipment.

Table 4-2 Potential effects of seismic events on the LNG storage tank, other equipment, and pipelines carrying natural gas

Equipment	Seismic Event	Potential Effect
LNG Storage Tank	Foundation Failure/Structural Failure	Failure of the LNG storage tank foundation can affect the integrity of the LNG container, the impounding system and system components required to isolate the LNG container. An LNG spill can occur and if a source of ignition is present a pool fire can occur which can lead to a vapor cloud ignition.
Natural Gas Pipeline	Foundation Failure/Structural Failure	This can lead to a leak or rupture of the pipeline. If this occurs there is a potential for a flash fire if an ignition source is present. This can cause damage to other pieces of nearby equipment (i.e. BOG compressor) and personnel can suffer thermal injuries and fatalities. External incidents can occur from the flash fire as other pieces of nearby equipment may become compromised.
LNG Vaporizers	Foundation Failure/Structural Failure	This can lead to an accumulation of flammable products of combustion. If the accumulated gas is near an ignition source and there is between 5-15% of air in the mixture, an ignition will occur causing severe property damage and potential for personnel injury.
LNG Pumps	Foundation Failure/Structural Failure	This can lead to overstressed material which can fatigue or rupture the pump. The pump seal can fail and the LNG can vaporize through the seal and if it reaches an ignition source, can cause a flash fire or vapor cloud ignition.
Booster Pumps	Foundation Failure/Structural Failure	This can lead to overstressed material which can fatigue or rupture the pump. The pump seal can fail and the natural gas can leak through the seal and if it reaches an ignition source, can cause a flash fire or vapor cloud ignition
BOG Compressors	Foundation Failure/Structural Failure	This can lead to potential overpressure, vibration, and seal leakage. The gas leakage can lead to a flash fire or vapor cloud ignition
Heat Exchanger Gas/Glycol Water	Foundation Failure/Structural Failure	This can lead to potential overpressure and overheating of the gas. This hot gas can leak if the exchanger has been ruptured and reach an ignition source. As a result a vapor cloud ignition.

4.2.2 LNG Tank Rupture

A catastrophic failure of an LNG storage tank although unlikely, has the ability to create a long range flammable gas cloud, which will flash, but not explode as it reaches an ignition source. The consequences to personnel and the facility will be severe as there will be property damage and potential injuries and fatalities. LNG liquid itself is not flammable – only the vapors emanating from the liquid can be lit. Natural gas and LNG vapor fires in the open atmosphere may flash and burn hot, but are not explosive because the flame propagation speed is much less than required to have an explosive pressure wave when the ignition is not within an enclosed space.

If there is an uncontrolled release, a pool of LNG can form between the primary and secondary containment. If an ignition source is reached, the combustion of the material evaporating from the pool of liquid can occur. The larger the evaporative vapor cloud from the pool of LNG is, the more severe the potential damages could be to the facility and personnel. This is why it is important to use materials with low density, heat capacity, and thermal conductivity in order to minimize the vaporization rate, which determines the size of the vapor cloud.

Although both of these events are unlikely, the consequences of these events occurring are severe and must be treated with high importance. During detailed design a pool fire model will be created utilizing the programs approved by CSA-Z276 and NFPA 59A.

4.2.3 Uncontrolled Release

Uncontrolled releases may occur from process pipework, or from the LNG storage tank. These two scenarios are discussed below.

4.2.3.1 Uncontrolled Release from Process Pipework

Uncontrolled release from process pipework will be prevented as a primary design consideration to prevent unsafe conditions. LNG and vapor pipework will be designed and installed to meet or exceed LNG design standards. Hoop stress, thermal stress caused by expansion and contraction, corrosion potential, thermal shock cooling and heating, and location specific conditions will be considered during detailed design to apply and demonstrate best engineering practices. Non-destructive testing and pressure tests will be utilized to confirm and record the integrity of installed systems fit for purpose, and compliance to LNG regulations.

4.2.3.2 Uncontrolled release from LNG storage tank

The design standard that is the primary guideline is CSA-Z276. The particular sections that discuss the process instrumentation and controls for the prevention and monitoring of uncontrolled releases from the storage tank are shown below. This includes a variety of scenarios to prevent LNG overflow and uncontrolled release of LNG from the tank:

- LNG tank overfill;
- LNG tank overpressure;
- Leaks or releases from process piping associated with the LNG tank; and
- LNG tank integrity impacts from external forces, wind, snow, and seismic.

A combination of redundant high integrity liquid level devices, alarms if the set points are reached, and automatic shutdown for flow device, and operator monitoring will be employed in order to prevent and monitor tank LNG releases and other unsafe conditions.

LNG tank overpressure could cause uncontrolled release of LNG vapor from LNG tank pressure relief valves on the tank roof as an overpressure protection of last resort. Overpressure and relief valve discharge will be prevented by process controls, facility BOG recovery systems, and continuous monitoring to respond in advance to conditions that could create high tank pressure and avoid them before they occur. For overfill/flow scenarios for LNG tank the following alarms/trips are used:

- Liquid Level High Alarm;
- Liquid Level High-High Trip;

- Redundant Mechanical Liquid Level High-High Trip;
- LNG Tanker Unloading Trip;
- Unloading Pumps Trip; and
- Secondary Containment for LNG Tank Spills and Releases.

4.2.4 Downwind Ignition Sources

The design and layout of the LNG facility considers minimizing controllable ignition sources within proximity of the facility. During detailed engineering, an electrical hazardous area drawing will be prepared to designate hazardous areas, and electrical area classifications. Buffer zones will be created and designated by the LNG security fence. Isolating downwind ignition sources – other ignition sources which may be downwind of the facility include high temperature sources (flames), electrical sources, and physical sources such as compression energy. There are unlikely to be chemical sources as there are no chemical reactions that will occur at this facility. Recommendations to minimize ignition sources through isolation include:

- Electrical area classification (NEC 70);
- Reducing the combustible concentration by isolation; and
- Detecting and eliminating ignition sources.

Finally, trucks and other LNG transfer vehicles must remain at least 15 m away from equipment containing LNG and natural gas. In addition, these vehicles must not enter the impoundment area, unless authorized and under constant supervision.

4.3 EMERGENCY RESPONSE

A detailed emergency response plan will be developed during the detailed design phase of the project; however, a preliminary emergency response plan is provided herein. The Casino LNG receiving facility uses a closed loop process where the release of LNG to the environment is not expected, and considered an abnormal operating condition. Best practices are followed, and the use of flanged joints has been kept to an absolute minimum and all welded piping is used whenever possible to avoid potential leak sources.

General guidelines for cryogenic burns, vapor cloud ignition/explosions, jet fires, flash fires, pool fires and boiling liquid expansion are provided below for LNG and natural gas. The mitigation measures detailed below will be employed at all times during the transportation, handling and storage of LNG and natural gas.

4.3.1 Cryogenic Burns

Mitigation Measures: Proper Personal Protective Equipment (PPE) should be worn at all times when in close proximity to cryogenic equipment. This should consist of special cryogenic gloves, long sleeve shirts, long pants, leather steel toed boots, and a face shield to protect the face from any splashing liquid.

Emergency Response Procedures: Exposure to LNG or direct contact with metal at cryogenic temperatures can damage skin tissue more rapidly than when exposed to vapor. It is also possible for personnel to move away from the cold gas before injury. In addition, moist skin coming in contact with cryogenic parts will freeze instantly and may adhere to the part. If this occurs, treat the burned or frostbitten skin by flushing or immersing the affected area(s) in lukewarm water. Do not rub the area or remove clothing that may have adhered to the area from freezing. After sensation to the affected area has returned, keep the skin warm, dry, and clean. If blistering of the skin occurs, apply a sterile dressing. Seek medical attention as soon as possible.

4.3.2 Vapor-Cloud Ignition/Explosion

The Casino LNG receiving facility design includes strict guidelines to prevent potential ignition sources within the LNG facility boundaries, and safety setbacks from non-LNG operations in accordance with CSA Z276 section 13.3.4.

Mitigation Measures: In order to be ignited, LNG must first be vaporized and mixed with air between 5-15% concentration, and an ignition source must be present. Only the outer area of the LNG vapor cloud is ignitable. LNG, LNG vapor, and natural gas will not explode, provided the release is in an open environment. For an explosion to occur, LNG needs to vaporize, mix with 5-15% air, collect in a confined space, and be ignited. The design of the Casino LNG facility excludes confined space within the LNG facility area, except for buildings, which are monitored and protected to prevent migration of gas indoors at doors and fresh air intakes. Mitigation measures need to prevent the above conditions from occurring, and hence prevent the explosion itself. The suppression system will include:

- *Detection* – using flammable gas detectors, LNG spill detectors, or optical flame detectors that are configured to perform automatic shutdown of equipment.
- *Extinguishment* – high rate discharge containers with the suppressing agent for Type B and C fires (flammable gas, liquids, electrical fires). Extinguishing agents can be dry chemical formulations or foam. Firewater is not recommended for a polar climate, and for suppression of LNG and natural gas fires.
- *Control and supervision* – continue to monitor the appropriate detection monitors as the extinguishing agent is released until normal levels have been reached.
- *Isolation* – Emergency shutdown valves will isolate the plant sections to minimize quantities released.

Emergency Response Procedures:

1. *Assess the situation* – determine the wind direction and park vehicles in an upwind position. Eliminate sources of ignition such as cars and trucks (i.e. do not leave engines running or start stalled engines).
2. *Protect the area* – secure the area around the leak to limit non-essential personnel to a safe distance from the leak. Enter with caution, erect barricades, and evacuate people if needed. Establish a command site at the area to ensure proper communications between emergency response personnel. Try to prevent the spread of the fire itself. Avoid forced ventilation of structures and excavations as that can increase the likelihood of a flammable atmosphere.
3. *Contact Emergency Responders* – to secure the area.
4. *Work together* – ensure that the local, the operator, and emergency responders have proper communications and are working to resolving the emergency.

4.3.3 Jet Fire Following a Leak from Piping

Mitigation Measures: Piping will be designed using practices from ASME B31.3 for natural gas process facilities. The mitigation strategy should be incorporated to prevent a leak at a pipe joint and the rupture or loss of containment during a fire of surrounding piping systems. As a result, piping design will incorporate the following best practices:

- The pipe will exceed minimum code requirements and will meet the criteria of material compatibility, pressure, and temperature pertinent to that particular pipe. Relevant standards include API 607, FM-

7440, and BS-6755-2. Pipe will be welded as much as possible, and the use of flanged joints will be minimized.

- Fire safe rated valves meeting the requirements of API 607 will be designed, tested, and used to assure the prevention of fluid leakage internally along the valve flow path, and externally through the steam packing and seals.
- The basic design conditions will incorporate the following in order to remove natural gas from the pipeline: remote shut-off of the flow supply line; sealing of the flow path at the drain and vent valves; and ensuring the external path through the stem packing as well as the body seals remain intact during a fire.

Emergency Response Procedures: A jet fire is typically associated with the release of natural gas and is dependent upon the diameter of the pipe as well as the leak size. A jet fire occurs if a pipeline has a leak at a certain point in its path AND if an ignition source is present. An alarm should be activated, notifying personnel that there is a fire and the area should be evacuated. After the evacuation, emergency response teams should isolate the fuel source by closing the pipe as close to the leak as possible. The fire will be extinguished by removing the fuel source, and if needed, through the use of extinguishing agents such as dry chemical formulations.

4.3.4 Flash Fire Following a Release

Mitigation Measures: These measures are the same as for the vapor cloud ignitions (Section 4.3.2) in terms of equipment design, but additional mitigation measures should include the use of fire-retardant PPE to reduce and prevent thermal injury. Normal clothing will provide partial protection, but thermal injuries can still occur.

Emergency Response Procedures: A flash fire occurs due to a sudden intense fire caused by ignition of flammable materials. It is characterized by high temperature, short duration, a rapidly moving flame front, and considerable shock waves. This type of fire occurs due to a leak rather than a rupture. According to NFPA 2113, a flash fire may have a heat flux of up to 84 kW/m^2 for short periods of time (<3 seconds). If there is no confinement, a flash back will burn back towards the source relatively quickly. As flash fire flames spread at subsonic velocity, the overpressure damage is negligible and most of the damage is a result of thermal radiation and secondary fires. Therefore, the emergency response procedures are the same as for the vapor cloud fires (Section 4.3.2).

4.3.5 Pool Fire in the Secondary Containment Following a Release

Mitigation Measures: The main goal during a pool fire is to limit the distance of the ½ LFL vapor cloud and thermal radiation impacts if ignited. The liquid normally spills on concrete between the tank wall and secondary containment. Therefore, the concrete mixture selected should have a low density, low heat capacity, and low thermal conductivity, in order to shorten the cloud and potentially reduce the chance of the cloud reaching an ignition source.

Emergency Response Procedures: A pool fire in this case can occur if a flammable liquid (LNG) spills and forms a pool over a surface AND an ignition source is present. Specifically, if there is a leak and ignition occurs in the area between the tank wall and the secondary containment. The emergency response procedures are the same as for a vapor cloud (Section 4.3.2), as LNG will evaporate from the pool and if the vapor reaches an ignition source, there is potential for a vapor cloud ignition.

4.3.6 Boiling Liquid Expanding Vapor Explosion (BLEVE)

Mitigation Measures: The main goal to eliminate the possibility of a BLEVE:

- Eliminate conditions where a fire could occur in proximity to a storage vessel containing flammable fluids.
- Insulated LNG tanks provide inherent protection from a BLEVE by reducing heat transfer to the vessel contents.
- Install properly sized pressure relief valves (PRVs) in order to release pressure fast enough so that the pressure of the vessel is does not exceed its design pressure. If this is sized appropriately, the liquid inside the tank will boil off slowly, maintaining a constant pressure in the vessel until all the liquid has boiled off. This prevents the rapid phase transition of the liquid to vapor, and prevents the tank from pressurizing above its design limits such that a vapor BLEVE does not occur.
- To provide fire suppression to extinguish a fire if it occurs near a storage container.

Emergency Response Procedures: A BLEVE occurs when a vessel containing flammable liquid is exposed to an external fire, heat is transferred to the vessel contents, and temperature of the contents rises rapidly above its normal boiling point, and relief valves are unable to relieve the vapor pressure with enough capacity such that the vessel fails from high internal vapor pressure in a hot vessel causing a sudden catastrophic failure (rupture). As a result, a rapid, near instantaneous phase transition occurs where there is a massive energy release and a large fireball usually accompanies this if the material is flammable. The emergency response procedures are based on avoidance of conditions that support this from occurring in the first place.

5 – DECOMMISSIONING

Decommissioning of LNG equipment is guided by API standard 376. Disposal of materials generated from the decommissioning of the plant will be detailed in the *Casino Project Reclamation and Closure Plan*, and the *Casino Project Waste Management Plan*. Generally, it is expected that solid waste associated with LNG storage, secondary containment and distribution will be disposed of in conjunction with other material at the mine site.

Certain infrastructure will require specific decommissioning steps. The decommissioning procedures for the LNG facilities and associated infrastructure will be defined during detailed design of the facilities, however, decommissioning of the LNG storage tank is summarized below for example purposes.

5.1 LNG STORAGE TANK

The following steps must be followed to properly decommission the LNG storage tank. Once complete, the tank may be dismantled and is no longer considered contaminated.

1. **Pump-out:** Pump out all recoverable liquid LNG to a storage tank truck. Assisted pump-out may be required is the existing pump capacity is insufficient.
2. **Boil-off:** Once the pump-out is complete, there may be some residual liquid remaining in the tank. Residual liquid can be boiled off by leaking heat into the tank. Assisted boil-off (the addition of hot natural gas) may be used in increase the rate of boil off. The hot gas should be around ambient temperature to prevent temperature profiling within the tank. The boil-off gas can be flared or recovered.
3. **Warm-up:** After the gas has been boiled off, the tank should be warmed up at a maximum rate of 3 °C/hour to avoid thermal stresses. This process can be natural or assisted (via hot gas). The displaced gas from the warm up process would be routed to the flare system. The tank should continue warming at the rate until the temperature reaches -20 °C.
4. **Gas freeing:** Once the warm-up is complete, the gas remaining in the tank from the warm-up process must be removed from the tank via inert gas (nitrogen) introduction. The inert gas is introduced at the bottom of the tank (using the purge line) in order to vent the gas through a pipe on the roof of the tank. The gas can either be sent to the flare system or vented to the atmosphere a safe distance away from the tank roof. Through this process, the inner tank and dome space are gas free.
5. **Inert Gas Freezing:** The inert gas must be displaced by air to allow the space to be breathable. This is accomplished by venting the inert gas to the atmosphere. An oil-free compressor can be used to introduce air into the tank. A double block and bleed isolation is necessary to reduce the potential creation of an internal flammable environment. It is recommended that the tank is physically isolated as well, as this is essential for personnel to enter the tank.
6. **Preparation for Entry:** The tank should be physically isolated from all process and utility systems and air quality confirmed to be safe by oxygen detectors.

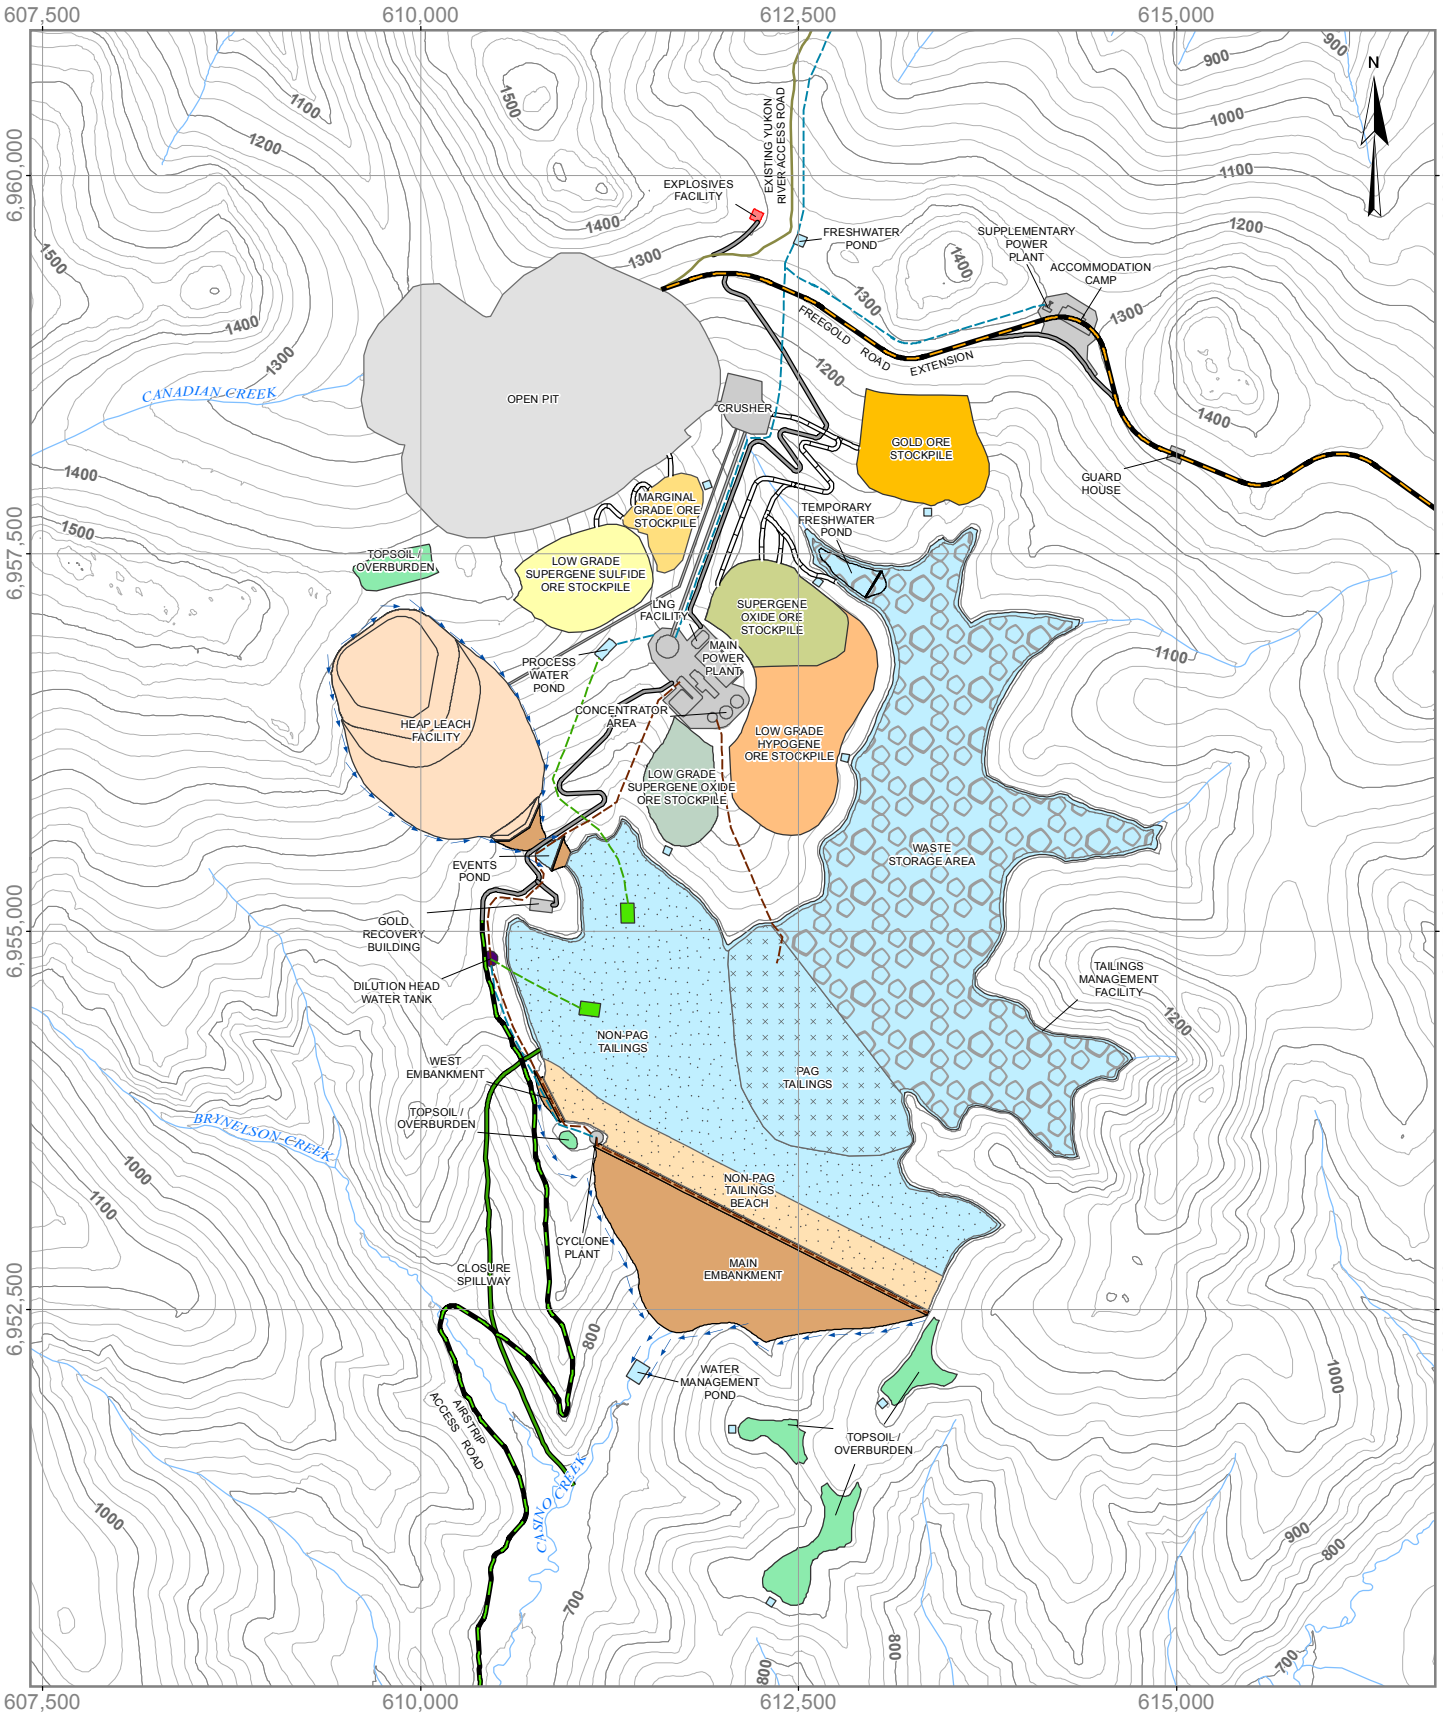
1. Introduction

CASINO
COPPER AND GOLD



1. Introduction

The Casino Copper-Gold Project is located in the Dawson Range Mountains of the Klondike Plateau approximately 300 km north west of the City of Whitehorse. The deposit will be mined using open pit methods with a nominal daily mill throughput of approximately 120,000 tonnes of ore over a 22 year operating life. A total of 965 Mt of mill ore will be mined and 157.5 Mt of oxide ore will be leached on a heap leach facility (HLF). A tailings management facility (TMF) has been designed to store mine waste under saturated conditions including 956 Mt of tailings and embankment sands as well as 649 Mt of waste rock and overburden.

The waste rock, ore and tailings that will be produced by the Casino Project will require management to limit the effects of metal leaching and acid rock drainage (ML/ARD) on the receiving environment. The ML/ARD mine waste management plan describes the methods that will be used to manage these waste products and provides information regarding the storage, handling and placement of these wastes. A ML/ARD mine waste monitoring plan is also presented that describes how the materials will be assessed to identify potentially acid generating (PAG) material and non-PAG (NPAG) material and to track the performance and effects of the waste management plan's implementation.

The Casino Mining Corporation (CMC) commissioned Lorax Environmental Services Ltd. (Lorax) to compile the ML/ARD management and monitoring plan for the Casino Project (the Plan). ML/ARD management plans have been developed for handling ore and waste from the open pit and each of the major mine waste storage facilities including the heap leach facility (HLF), gold ore stockpile, mill ore stockpiles, waste rock and tailings in the flooded tailings management facility (TMF) (Figure 1-1). An ML/ARD monitoring plan has been developed for the open pit and includes confirmatory monitoring.

The contents of this plan are derived from the *Plan Requirement Guidance for Quartz Mining Projects* (Government of Yukon, 2013), and this plan will be updated as the Project is refined. The final Plan will describe the types of overburden and rock that will be encountered on site and how these materials will be characterized, segregated and stored to ensure long-term chemical and physical stability of the site. This draft plan has been produced for the purposes of meeting requirements of the Yukon Environmental and Socio-Economic Assessment Act (YESAA), and the final plan will include terms and conditions of any applicable licences, permits and approvals required for Project operations.

2. ML/ARD Management Plan for Mine Site

CASINO
COPPER AND GOLD

2. ML/ARD Management Plan for Mine Site

ML/ARD management during operations will be focused on segregation of ore, waste rock and soil and overburden. Ore will also be additionally segregated based on ore type and destination (*i.e.*, mill or heap leach facility). Preliminary ML/ARD management plans for gold ore, low grade ore, waste rock and soil and overburden are provided below. These plans will be refined as the Project geology and mine plan are further understood and engineered.

2.1 Gold Ore Stockpile and Heap Leach Facility Management

2.1.1 Gold Ore Stockpile Management

Gold ore will be mined and either temporarily placed on the gold ore stockpile or placed directly in the HLF where it will be permanently stored. The ore placement schedule is presented in Table 2-1 (from KP, 2012a and 2012b). A total of 157,454 kt of gold ore will be mined and placed on the HLF through Year 15 of mine operations. Not all mined ore can be immediately placed on the HLF, in Year -2 through Year 3 and Year 8 through Year 10 of the mine schedule, gold ore will be stockpiled temporarily before being placed on the HLF. However, by Year 15 all gold ore will have been moved from the stockpile and placed on the HLF (Table 2-1).

The gold ore is exclusively derived from the Oxide Cap (CAP) mineralization zone, hence, the ore typically has low neutralization potential and secondary sulphate and oxide minerals rather than sulphide minerals are the major source of acidity and metal leaching from CAP ore. The CAP ore overlies the Supergene Oxide zone (SOX) and the boundary between the SOX and the CAP is gradational. In contrast to the overlying CAP ore, SOX material contains sulphide minerals which will interfere with gold recovery and may lead to degradation of drainage quality after mine closure. Therefore differentiation of CAP ore from SOX rock needs to be determined operationally to allow for the two rock types to be segregated during mining and ensure that they are sent to the appropriate processing or storage facility.

Table 2-1:
Heap Leach Facility Gold Ore Schedule

	Leach Pad Stacking	Pit Production	Direct to Crusher	Gold Ore Stockpile	Stockpile Reclaim
Year	(kt)	(kt)	(kt)	(kt)	(kt)
-3	6,580	6,580	6,580		
-2	9,125	14,197	9,125	5,072	
-1	9,125	21,654	9,125	12,529	
1	9,125	18,667	9,125	9,542	
2	9,125	17,579	9,125	8,454	
3	9,125	12,879	9,125	3,754	
4	9,125	7,809	7,809		1,316
5	9,125	495	495		8,630
6	9,125	1,072	1,072		8,053
7	9,125	8,773	8,773		352
8	9,125	13,111	9,125	3,986	
9	9,125	13,352	9,125	4,227	
10	9,125	18,235	9,125	9,110	
11	9,125	1,263	1,263		7,862
12	9,125	625	625		8,500
13	9,125	925	925		8,200
14	9,125	238	238		8,887
15	4,874				4,874
TOTAL	157,454	157,454	100,780	56,674	56,674

The location of the CAP / SOX boundary within the open pit has been included in the block model. This boundary has been established from existing geologic logging and assay data. The assay data indicates that CAP is an Au enriched and Cu depleted oxide zone. The location of the boundary will refined during operations by continual tracking of operational ore grade sampling and in-pit mapping.

Gold Ore ML/ARD Management Objectives:

- Segregation of CAP ore from SOX ore by operational monitoring used to refine the boundary between these two mineralization zones in the block model.

Gold Ore ML/ARD Management Methodology:

- During Operations typical procedures examining blast hole cuttings will be used to differentiate between ore and waste.

- Differentiation criteria will be subject to revision due to changing mining costs and market conditions.
- Blast hole sample analysis will be conducted at the on-site assay lab (Section 4).
- Ore management details will be provided in the *Mill Development and Operations Plan*, required by the Quartz Mining Licence (Government of Yukon, 2013).

2.1.2 Heap Leach Facility Management

Mitigation of potential effects from the HLF will be maintained primarily through water management, liner systems, rinsing and active water treatment during the operation and closure phases. During the post-closure phase, potential effects will be mitigation through restriction of infiltration into the heap and passive treatment of drain-down in a bioreactor.

Preliminary reports indicate that ML/ARD management in the HLF will be achieved through the addition of lime to ore as it is conveyed and placed on the HLF. Lime addition to the ore facilitates the maintenance of alkaline conditions in the HLF during active leaching of the ore. The residual lime also assists in the maintenance of pH-neutral conditions during the drain-down phase and into the post closure period. Lime will be added to the ore on the conveyor belt system used to convey the ore to the final placement location in the HLF. The quantity of lime added to the ore is based on the residual acidity of the oxide CAP rock and the necessary excess to maintain alkaline conditions during active leaching of the pile.

Heap Leach Facility ML/ARD Management Objectives:

- Determine the required lime additions to maintain pH-neutral conditions during leaching and drain-down phases of HLF prior to the placement of the reclamation cover.

Heap Leach Facility ML/ARD Management Methodology:

- Lime consumption rates will be determined through metallurgical testwork prior to the commencement of operation of the HLF.
- Operational monitoring will follow general standards.
- HLF management details will be provided in the *Mill Development and Operations Plan*, required by the Quartz Mining Licence (Government of Yukon, 2013).

2.2 Low Grade Ore Stockpile and Tailings Management

2.2.1 Low Grade Ore Management

Ore that will be milled and processed in the flotation plant will be derived from Hypogene (HYP), SOX and Supergene Sulfide (SUS) zones. The ore production schedule from the

open pit listed in Table 2-2 (from M3, 2013) indicates that the majority of the mined ore will be derived from HYP zone. Although the HYP ore is predominantly PAG, the HYP ore typically contains neutralization potential (NP) ranging from 7 $kgCaCO_3/t$ to 65 $kgCaCO_3/t$. This quantity of NP is capable of maintaining pH-neutral conditions for several years to decades while stockpiled on surface (Lorax, 2013a). Conversely, ore from the SOX and SUS zones contains less NP than the HYP and approximately half of the Supergene ore is expected to have acidic paste pH when it is mined. However, portions of the Supergene ore will also contain neutralization potential in the form of carbonate minerals.

Table 2-2:
Ore Production Schedule (kt)

The ML/ARD ore management plan incorporates the construction of stockpiles segregated by ore mineralization type (*i.e*. CAP, SOX, SUS and HYP). In-pit operations will segregate ore from the major mineralization zones and allow the distinct ore types to be placed into their respective stockpile. ML/ARD management includes the implementation water management strategies for seepage and runoff from the stockpiles that have the highest ML/ARD risk. The geochemical characterization studies have established that rock derived from both the SUS and SOX zones have a higher immediate ML/ARD risk than HYP due to limited NP content and reactive sulphide mineral assemblage comprised of both secondary and primary sulphide minerals. Stockpiles constructed of SUS have a high ML/ARD potential and water management considerations have been proposed to limit the impact on the downstream receiving environment.

Low grade ore will be segregated into stockpiles by mineralization type as illustrated on Figure 1-1. Contact runoff from the ore stockpiles will be collected in ponds and pumped to the TMF pond. In addition, an infiltration suppression system will be established beneath the Low Grade Supergene Sulfide Ore Stockpile to minimize infiltration to groundwater, as the drainage from the SUS Stockpile is predicted to have the greatest metal leaching potential. The Marginal Grade Stockpile contains SUS and is positioned near the perimeter of the open pit. Due to its location, seepage from this pile will discharge to the pit and be collected by the pit dewatering system that will be directed to the process plant. Segregation of the stockpiled ore will be based primarily on mineralization zone and grade rather than ML/ARD static test characterization due to the consistent key geochemical characteristics of the Casino ore within an individual zone and the temporary nature of the ore stockpiles.

In order to facilitate the segregation of ore into stockpiles based on the grade and mineralization during operations, in-pit identification of grade and mineralization type will be required. The boundaries between the SOX, SUS and HYP mineralization zones have been established by exploration drilling in the resource block model. Although the boundary between the SUS and HYP zones is visually distinct, the boundaries between the CAP, SOX and SUS zones are often gradational and not distinct. As a result, operational monitoring and management during mining of the material will be required in conjunction with the block model results to ensure that the ore is directed to the appropriate pile as per the general procedure outlined in Table 2-3. When mining SUS waste through Year 4 of the mine life, blast hole chip samples from the SUS Zone that does not have ore grade will also undergo a pH measurement to determine if the waste should report to the waste rock storage in the TMF or the Marginal Grade Stockpile.

Table 2-3:
Ore Stockpile Management

Ore Stockpile	Mineralization Zone	Segregation Method
Low Grade SOX	SOX	Alert based on block model CAP/SOX boundary Blast hole cutting samples (grade)
SOX Ore	SOX	Alert based on block model CAP/SOX boundary Blast hole cutting samples (grade)
Low Grade SUS	SUS	Blast hole cutting sampling (grade)
Marginal Grade Ore	SUS	Blast hole cutting sampling (grade, PpH)
Low Grade Hypogene	HYP	Alert based on block model SUS/HYP boundary Visual delineation in pit

Low Grade Ore ML/ARD Management Objectives:

- Segregate ore into stockpiles based on the grade and mineralization.

Low Grade Ore ML/ARD Management Methodology:

- Segregation of various types of ore.
- During Operations typical procedures examining blast hole cuttings will be used to differentiate between types of ore.
- Differentiation will likely be dependent on various parameters, such as Cu equivalent, Cu, Au concentrations, *etc*.
- Blast hole sample analysis will be conducted at the on-site assay lab (Section 4).
- Ore management details will be provided in the *Mill Development and Operations Plan*, required by the Quartz Mining Licence (Government of Yukon, 2013).
- Runoff management will be conducted to intercept runoff from the stockpiles and pump it to the TMF.
- Seepage interception from the Low Grade Supergene Sulfide Ore Stockpile, and re-directing to the TMF.

2.2.2 Tailings Management

Tailings and waste rock will be disposed of in the TMF, which has been designed to provide permanent, secure and total confinement of these solid waste materials. Construction of the TMF embankment will use cyclones to generate a clean tailings sand from the bulk NPAG tailings. The tailings ML/ARD management plan incorporates a pyrite floatation process to produce NPAG tailings that will be exposed in the TMF embankment and TMF beaches. However, the ore processing plant will produce both PAG and NPAG tailings. Non-ore sulphide minerals, predominately pyrite, will be concentrated into a PAG tailings stream that will be deposited and maintained under saturated conditions in the central

portion of the TMF. The residual low-sulphur tailings will be processed in single stage cyclones to produce a NPAG cyclone underflow sand that will be used to construct the TMF embankment. Embankment sand construction and NPAG slimes deposition will proceed for approximately 9 months of the year while climatic conditions permit. During the 3 month period when embankment sands are not being produced, NPAG bulk tailings will be discharged into the TMF on a tailings beach that separates the embankment from the upstream waste rock storage portion of the TMF.

Desulphurization criteria will vary relative to the NP of the ore feed from which the tailings will be derived. The ore processing schedule listed in Table 2-4 (from M3, 2013) indicates that the majority of the milled ore will be derived from the HYP zone. Based on the range of NP observed in the HYP ore and pyrite flotation metallurgical test results, a pyrite flotation circuit can reduce sulphur content sufficiently low in a NPAG bulk pyrite rougher tailings with a NP/AP > 2.0. A CaNP/AP > 2.0 criterion to define NPAG tailings is very conservative and a CaNP/AP = 1.5 is likely more appropriate for the low-sulphur desulphurized tailings as supported by the low sulphide oxidation rates in the tailings kinetic tests and liberation of carbonate minerals in the finely-ground well-mixed tailings.

Table 2-4:
Mill Processing Schedule (kt)

Year	Total	Supergene Oxide	Supergene Sulfide	Hypogene
1	34,500	0	31,156	3,344

20	45,055	1,570	13,081	30,404
21	44,983	4,429	8,377	32,177
22	22,874	7,033	12,149	3,692
TOTAL	965,206	60,010	255,864	649,332

Unlike the range of NP content in the HYP ore, NP content is more variable in Supergene ore and in many instances Supergene ore will be devoid of NP. The sulphur content required to achieve the CaNP/AP > 2.0 criterion for the range of NP present in the various milled ore types are listed in Table 2-5. Estimates of the target S content required to maintain a NPAG tailings a range from 1.4 %S to 0.15 %S for time periods when predominantly HYP is being processed, and from 0.58 %S to 0.01 %S when predominantly Supergene ore is being processed. The table indicates that NPAG tailings with S content within the range obtained from lock cycle testing and pilot tests can be routinely derived from HYP ore. However, only a portion of the Supergene ore could be used to derive NPAG tailings.

Table 2-5:
Sulphide Sulphur requirements to maintain CaNP/AP > 2.0 based on Ore Feed carbonate content

CaNP	SOX		SUS		HYP	
Percentile	**CaNP**	**%S**	**CaNP**	**%S**	**CaNP**	**%S**
90th	16	**0.26**	27	**0.43**	65	**1.04**
75th	6	**0.10**	12.5	**0.20**	51	**0.82**
Med	2	**0.03**	3	**0.05**	27	**0.43**
10th	0.4	**0.01**	0.5	**0.01**	7	**0.11**

Bench scale and pilot flotation testing on supergene ore indicated that sulphur content could be reduced to < 0.1 %S and < 0.25 %S, respectively. Although tests indicate a sulphur content < 0.1 %S can be achieved from the SOX and SUS ore, at this stage of ML/ARD management planning it is conservatively assumed that the sulphur content of the depyritized tailings would remain in the range of 0.2 %S. Based on the above assumption and the current inventory of Supergene Ore samples, it is estimated that 25% of the processed Supergene Ore would produce NPAG pyrite rougher tailings. In order for Supergene Ore to be used to produce NPAG tailings, an in-pit monitoring plan would be required to identify areas in the supergene ore where sufficient NP exists that could produce NPAG tailings.

Tailings ML/ARD Management Objectives:

- Determine amount of NP in Supergene ore to maintain NPAG tailings sands. Confirm that pyrite flotation circuit achieves low sulphur content to produce NPAG embankment sands and bulk tailings.

Low Grade Ore ML/ARD Management Methodology:

- Refinement of the block model to identify areas in the Supergene ore that meet the sulphide sulphur requirements to maintain CaNP/AP>2.0.
- Analyze sulphide sulphur and paste pH content of tailings routinely to confirm predictions.
- Deposition of all tailings with CaNP/AP<2.0 in the TMF.
- Tailings management details will be provided in the *Mill Development and Operations Plan*, required by the Quartz Mining Licence (Government of Yukon, 2013).

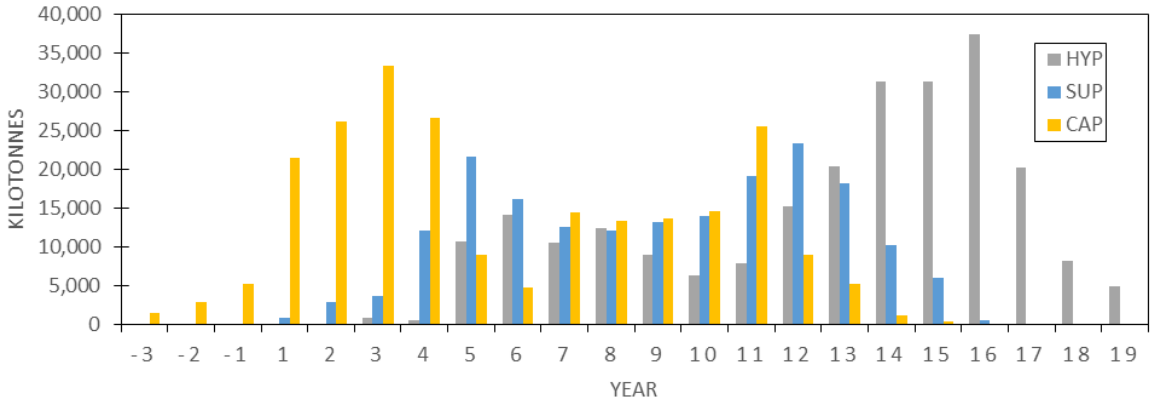
2.3 Waste Rock Management

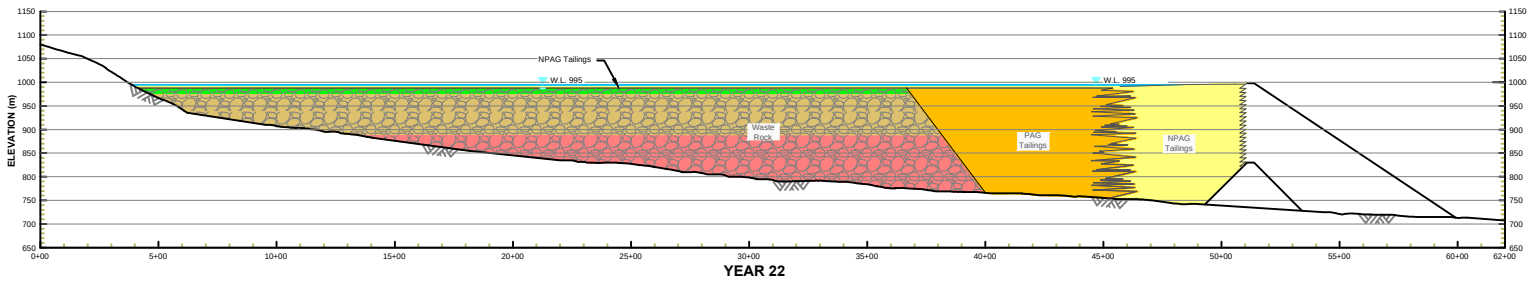
Waste rock and overburden produced from the open pit will be deposited into the TMF, then flooded and stored sub-aqueously at closure to limit potential ML/ARD production from sulphide oxidation and mineral weathering reactions.

In general, the waste placement strategy is to locate the most reactive material in areas of the TMF where the lowest flow rates are expected, and the relatively non-reactive tailings where the highest seepage rates are expected. Waste rock is relatively reactive compared to the tailings in the TMF owing to the presence of partially weathered CAP, SOX and SUS. Therefore, waste rock is placed in the upstream section of the TMF, where hydrologic head gradients are generally expected to be lower than in the downstream portion of the facility where the tailings are deposited. In the final years of mine life, a layer of de-pyritized tailings will be placed over the waste rock.

During placement of waste rock, the crest elevation of the waste rock will be maintained several metres higher than the tailings and supernatant pond to provide a dry, stable surface for access and placement of waste rock by haul trucks. Waste rock placed in the TMF will remain unsaturated for an average of three years before saturation.

The quantity of SUP, HYP and CAP waste rock produced during the mine life is presented in Figure 2-1. For the first four years of operation, waste production will be dominated by CAP rock. Between Years 5 to 15 a mix of the mineralization types will be produced. After Year 15, HYP will be the dominant rock type being placed in the facility.





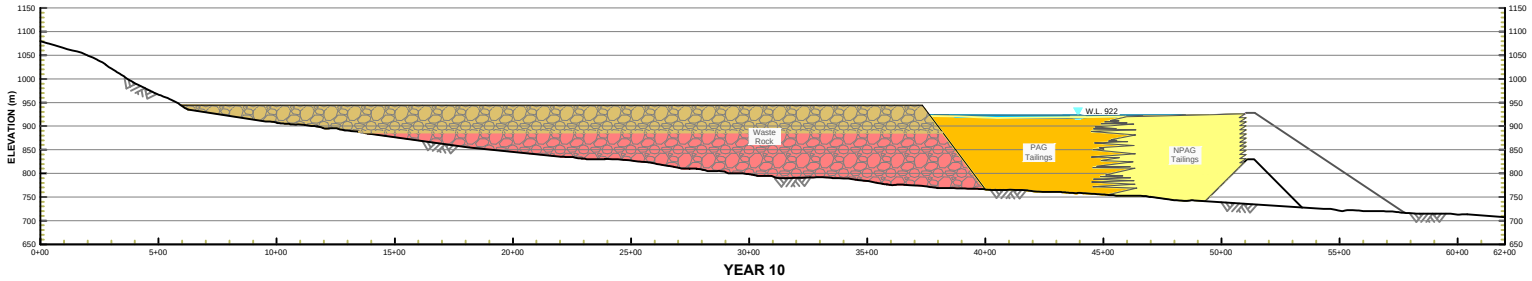


Figure 2-1: Annual waste rock mass and mineralization type placed in the TMF

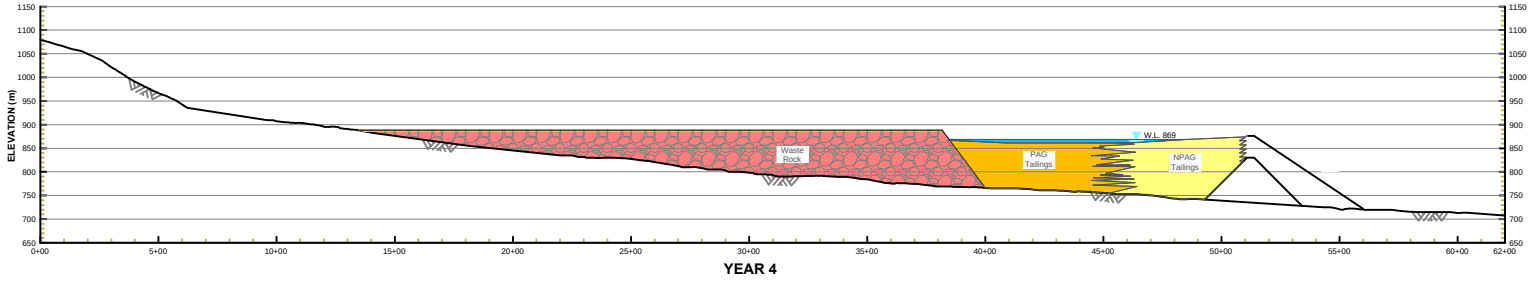

The timing of waste rock production will result in vertical stratification of rock types in the waste rock storage area. The elevation of these three different areas of the downstream waste rock zone is illustrated in Figure 2-2. Geochemical characterization data indicates that SUP and HYP are PAG rock units, with only minor amounts of NPAG. In fact, a portion of the SUP waste rock placed in the waste rock storage zone will be NP deplete, and may become acidic prior to being flooded. Although the HYP is PAG it contains sufficient NP to remain pH-neutral for the relatively brief period it will be exposed in the TMF prior to flooding. The management plan calls for the NP-deplete SUP rock to be blended with the high-NP HYP rock in the mixed waste rock zone that will be constructed in Years 5 through 15. Layering these two rock types will limit the severity of potential acid generation during the relatively brief time period that the waste rock is exposed before subaqueous disposal. In addition, the layering configuration will allow alkalinity addition into porewaters along the flow path through the flooded wastes prior to discharge into the TMF pond or foundation.

PROJECT:

Casino ML/ARD Mangement and Monitoring Plan

TITLE:

Waste Rock Placement in TMF

PROJECT #:	FIGURE:
J862-6	2-2

P:\J862 (Casino)\Lorax Drafting\Drawings\Schematic of final Casino impoundment design_20150211_V2.dwg

Implementation of the waste rock management plan will require special monitoring and handling requirements at different phases of the project:

- Pre-production - Identification of pH-neutral CAP rock to segregate sufficient material to be used for the construction of the starter embankment of the TMF. In-pit monitoring for grade, paste pH and total S.
- Operation Years 1 through 4 – Identification of acidic SUS waste rock for placement in the Marginal Grade Ore Stockpile. Identification of mineralization type and confirmation of waste grade will be required to segregate acidic SUS for placement in the Marginal Grade Ore Stockpile. In-pit monitoring for grade, paste pH and total S.
- Operation Years 5 through 15 – Identification of HYP waste and acidic SUS for placement of layered rock in the TMF to achieve mixing criteria for waste rock deposition. All HYP will be sent to TMF, no segregation is required for this unit. In-pit monitoring of HYP for grade. All SUP will be handled as PAG and flooded in the facility. However, a portion of the PAG SUP has an acidic in-situ pH and will need to be layered with the HYP rock to limit ARD. This unit will be segregated by in-situ pH. In-pit monitoring of SUS for grade, paste pH and total S.
- Operation Years 1 to 5 - CAP waste rock has little or no sulphide content, therefore it is not considered PAG, however, it has a mildly acidic in-situ pH and the unit has an intermediate metal leaching potential. All CAP waste rock will be sent to the TMF. No segregation is planned for this unit.

2.4 Soil and Overburden Management

Soil and overburden borrow materials will utilized during construction and reclamation. Borrow will be used for the construction of the TMF starter embankment, roads, aggregate for concrete, bedding sand and drainage rock. Reclamation borrow will be used to establish covers on the HLF, TMF Embankment, stockpiles and infrastructure footprints (Table 2-6 from BCL, 2013).

Table 2-6:
Soil Requirements for Closure Covers

Facility	Volume (Mm^3)
Ore Stockpiles	2.0
Ore Processing Complex	1.7
Heap Leach Facility	0.8
TMF Embankment	1.0
Total	5.5

Soils and terrain mapping has identified that the open pit, stockpiles and associated infrastructure will be located over colluvium and weathered bedrock. The preliminary ML/ARD evaluation of potential borrow in the area indicates that although overburden outside the Casino open pit has a low ML/ARD potential, portions of the soil and overburden inside the open pit footprint may have ML/ARD potential (Lorax, 2014). These finding are consistent with the colluvial materials retaining some of the ML/ARD characteristics of the underlying parent material from which it is derived. The mineralization in the open pit has resulted in portions of the colluvial overburden in this area having ML/ARD potential. Conversely, in areas near the TMF Embankment, HLF and ore stockpiles where the underlying bedrock has weak or no mineralization, the overlying colluvial material does not have ML/ARD potential.

ML/ARD management for soil and overburden will require the implementation of an operational monitoring plan to identify PAG material. The frequency of monitoring will be dependent of the risk posed at each borrow source. Soil and overburden that has an unacceptable ML/ARD potential that is removed from the foundation of the proposed mine components such as the stockpiles, TMF Embankment or open pit will be placed in the waste rock storage area of the TMF. The TMF waste rock storage area has been designed to store 17.5 Mt of overburden.

3. ML/ARD Monitoring for the Mine Site

CASiNO
COPPER AND GOLD

3. ML/ARD Monitoring for the Mine Site

The ML/ARD Monitoring Plan is designed to characterize mine waste during the implementation of the ML/ARD Management Plan. Although specific objectives and procedures of the monitoring plan vary slightly between the facilities, the primary objectives shared for all facilities are:

- provide sufficient characterization to effectively implement the operational management plan objectives; and
- provide sufficient characterization to document the geochemical characteristics of the rock in each storage facility as a result of the ML/ARD management activities.

The necessary in-pit monitoring and subsequent confirmatory monitoring is presented in the following sections.

3.1 In-Pit Monitoring

In-pit monitoring will be required for a number of purposes.

- Ore Identification and Management:
    - Identified by block model, confirmed visually by site geologist and assays on blast hole drill cuttings.
    - Confirm NP of Supergene mill ore to verify desulphurization criteria requirement.
    - Confirm that sulphidic material is not going to the CAP ore stockpile.
- Segregation of Low Grade Ore and marginal grade ore:
    - HYP and SUP segregated visually.
    - SUP segregated into SOX, SUS and MGO based on sulphur assays and paste pH.
- Waste Rock Identification:
    - Mineralization zones identified visually.
    - Paste pH and NP values will be measured in drill cuttings from blast hole drilling in Supergene waste.

When necessary, the monitoring program will be developed and implemented as described below. Procedures will vary depending on the specific requirements and capabilities of the Casino assay lab, however, the below are typical procedures and analysis usually performed at open pit mine sites.

In-Pit Sampling Procedures

1. Samples of cuttings from blast holes are collected for grade control purposes.
2. Cuttings samples are split into aliquots for grade control and for determination of the appropriate ABA parameter.
3. Samples sent to on-site laboratory for sample preparation and analysis (S_{TOT}, C_{TOT} and paste pH) are the ABA parameters that the laboratory can measure.
4. Test results are imported into the mine's grade control software for processing by the mine geologists.
5. ABA or necessary grade/mineralization types are plotted for each blast pattern, and mine geologists use the mine's grade control software to define polygons outlining contiguous zones of waste and ore types.
6. Ore grade polygons are drawn for material above the mine's operational cut-off grade, with the result being that all material in a blast is classified as:
   - Direct mill HYP ore;
   - CAP ore;
   - Low Grade SOX, SUS or HYP ore;
   - SOX and SUS ore NP < 13 $kgCaCO_3/t$ not suitable for embankment sand production;
   - CAP waste rock PpH > 7.1 and S_{TOT} < 0.1 % suitable for starter embankment;
   - HYP waste rock; or
   - SUS waste rock with PpH < 5.5 to be layered with HYP or placed in Marginal Grade Ore stockpile.
7. A map of the final ore and waste classifications is provided to the pit operations team to guide the dispatching of all rock released from the pit.

Segregation Procedures

1. The pit operations team will use blast classification maps to stake out the boundaries of each ore and waste class. Each class is represented by stakes in different colours. The maps are also used to communicate the shift's plans with equipment operators and supervisors at the beginning of each shift.
2. Haul trucks are loaded by a loader or excavator, the operator of which is responsible for knowing the material class being excavated and for communicating the class of each load to the haul truck operator.

3. The haul truck driver then delivers the load to the crusher or to the appropriate stockpile (if ore) or waste storage facility (if waste).

3.2 Confirmatory Monitoring

Confirmatory monitoring will be conducted for all waste that is placed in its final storage location, SUS to the Marginal Grade Stockpile and borrow material stockpiled for reclamation. The primary objective of this monitoring is to confirm that the ML/ARD Management Plan was implemented effectively. In order to achieve this, the proposed sampling frequency and ABA parameters are listed in Table 3-1. Duplicate samples that have been analysed at the onsite laboratory will be sent to an external lab for confirmatory testing.

Samples for waste rock, heap leach ore and reclamation overburden/soil will be collected from the storage facility during construction. The time and location that each sample was taken will be recorded. The results of the confirmatory sampling will be reviewed as they become available and the ML/ARD Management Plan updated should any concerns arise from the monitoring program.

Table 3-1:
Confirmatory Sample Analyses and Frequency

Facility	On-Site Analyses		External Analyses	
	Analyses	Frequency	Analyses	Frequency
CAP Waste Rock	PpH, S_{TOT}, S_{HCL}	100,000 t	S_{TOT}, S_{HCL}, Mod NP, C_{TOT}, Aqua-Regia metal	1,000,000 t
SOX & SUS Waste Rock	PpH, S_{TOT}, $S_{HCL,}$ C_{TOT}	100,000 t	S_{TOT}, S_{HCL}, Mod NP, C_{TOT}, Aqua-Regia metal	1,000,000 t
HYP Waste Rock	PpH, S_{TOT}, $S_{HCL,}$ C_{TOT}	100,000 t	S_{TOT}, S_{HCL}, Mod NP, C_{TOT}, Aqua-Regia metal	1,000,000 t
Embankment Sand	PpH, S_{TOT}, $S_{HCL,}$ C_{TOT}	Daily	S_{TOT}, S_{HCL}, Mod NP, C_{TOT}, Aqua-Regia metal	Monthly
Slimes or Rougher Tailing	PpH, S_{TOT}, $S_{HCL,}$ C_{TOT}	Weekly	S_{TOT}, S_{HCL}, Mod NP, C_{TOT}, Aqua-Regia metal	Monthly
PAG Tailings	PpH, S_{TOT}, $S_{HCL,}$ C_{TOT}	Weekly	S_{TOT}, S_{HCL}, Mod NP, C_{TOT}, Aqua-Regia metal	Semi-Annual
Heap Leach	PpH, S_{TOT}, $S_{HCL,}$ C_{TOT}	100,000	S_{TOT}, S_{HCL}, Mod NP, C_{TOT}, Aqua-Regia metal	500,000 t
Reclamation Stockpiles	PpH, S_{TOT}, $S_{HCL,}$ C_{TOT}	25,000 t	S_{TOT}, S_{HCL}, Mod NP, C_{TOT}, Aqua-Regia metal	100,000 t

4. Onsite Laboratory

CASINO
COPPER AND GOLD

4. Onsite Laboratory

An onsite laboratory will be commissioned in order to facilitate the rapid analysis of samples collected to during the implementation of the ML/ARD Monitoring Plan. The laboratory will be located centrally on the site near the ore processing facility. The laboratory will have standard ore assay and sample preparation capabilities in addition to a selected set of ML/ARD specific tests.

ML/ARD test requirements include the following parameters:

- Total sulphur
- HCl soluble sulphur
- Total carbon
- Paste pH

5. Road Construction ML/ARD Management

CASINO
COPPER AND GOLD

5. Road Construction ML/ARD Management

The access road to the Casino Project includes the Freegold Road Upgrade that extends 82 km from Carmacks and new construction of the Freegold Road Extension that extends an additional 120 km to the Casino Project Site. A risk based approach to evaluate ML/ARD potential associated with the Freegold Road Extension was reported in *Casino Road: Preliminary Risk Assessment Metal Leaching and Acid Rock Drainage* (Lorax, 2012) and the *Freegold Road Upgrade in the Site Access Road ML/ARD Risk Assessment – Update* (Lorax, 2013b). The reports identified areas of potential ML/ARD risk that will require additional sampling and evaluation in order to fully understand the ML/ARD risk posed by road construction. The additional characterization and risk assessment will be conducted in advance of detailed road design and the results of the analysis will be used to inform the design of the road and selection of quarry sites.

The primary purpose of the ML/ARD Risk Assessment for the road is to identify areas that would have an unacceptable risk to impact water quality and aquatic life. The preferred method to mitigate potential effects is via road design. Mitigation by design is accomplished by avoidance or minimizing disturbance of materials with a high ML/ARD potential. The management plan presented here identifies and lists preliminary management options that are available to minimize the potential environmental effects of ML/ARD along the Casino access road. This summary identifies the basic, conceptual options, and is intended to serve as the basis for further discussion and ongoing refinement, as the project progresses.

Various mitigation options for controlling and/or treating ML/ARD have been identified and evaluated over the past several decades. Research and practical experience is limited, but is adequate to provide a general indication of the options that are available, and the advantages and disadvantages of each. A total of five options have been identified that could be implemented should distinct sections of the road pose high risk of ML/ARD (Table 5-1).

Table 5-1:
Summary of ML/ARD Management Options

Decision Criteria	MANAGEMENT OPTIONS				
	Prevention and Control			Water Treatment	
	1 - Blending	2 - Dry Cover	3 - Water Cover	4 - Passive Treatment	5 - Active Treatment
Description	Potentially acid generating and acid consuming waste (limestone or other) can theoretically be blended or layered to produce a geochemically benign composite.	The purpose of a dry cover is to minimize water/oxygen ingress into underlying sulphide-rich rock. The cover forms a barrier to limit infiltration, or stores and releases stormwater, while maintaining saturated conditions under the cover.	Dispose sulphide-rich rock under water (subaqueous disposal) to inhibit oxidation. Laboratory and field studies indicate that flooding sulphide minerals is the most successful method presently known for preventing and controlling ARD.	Passive treatment systems use natural chemical, biological or physical processes to modify water that has been impacted by ML/ARD. Examples include anoxic limestone drains and constructed wetlands.	Active treatment systems may use chemical, physical (membrane) or biological processes to raise pH and extract metals from water affected by ML/ARD.
Limitations	Achieving adequate mixing to reduce sulphide oxidation rates is not considered feasible at field scale (requires adequate mixing to affect pore water chemistry).	Dry covers may limit the volume of drainage generated, however the reduced drainage volume may still contain high metal concentrations. Maintaining long-term performance of covers may be challenging.	Does not control oxidation that occurs prior to submergence, requires maintenance of water cover in perpetuity, does not immobilize all metals, any discharge may still require treatment.	Canadian climate and aquatic environments pose challenges, especially for biologically-driven systems. Passive treatment systems must be able to operate effectively in cold temperatures, drought, large storm events, and spring "freshet".	High capital and operating cost. It may not be practical to reduce pH and all metal concentrations to meet regulatory requirements or relevant guidelines. Sludge management, disposal and storage capacity may require careful consideration.
Residual Uncertainty	Moderate to High – Blending may delay the onset of acidic effluent, and reduce acid and/or metal loadings by providing attenuation for drainage, but is unlikely to eliminate metal leaching.	Moderate to High - The long-term durability of dry covers is uncertain. It has been suggested that cover systems should be designed to "fail" over geologic time such that the natural environment can withstand the incremental "failure".	Moderate – "…fundamental understanding of many phenomena influencing their performance is unknown, and the minimum depth of water required cannot be confidently determined"	Moderate – the long-term performance of passive treatment systems through climatic and weather extremes may be difficult to maintain.	Low to Moderate – Effluent quality can generally be maintained within a predictable range in the short to medium term. Long-term commitment to operate and maintain treatment system may be difficult to ensure.
Further Work Required to Reduce Uncertainty	Field tests to evaluate degree of blending that can be achieved and blending methodology, and to evaluate geochemical behaviour of blended material. Ongoing monitoring is required to characterize receiving environment and evaluate attenuation capacity.	Define cover performance criteria, evaluate options and select cover design. Predict long-term performance. Ongoing monitoring of both cover performance and environmental effects.	Identification of suitable site. Evaluation of chemical and physical design considerations. Ongoing monitoring of outfall, and to characterize receiving environment and attenuation capacity.	Define quality of influent and performance objectives. Research and design treatment system. Undertake sensitivity analysis and predict long-term performance. Define maintenance requirements. Water management system to collect and convey water.	Define quality of influent and performance objectives. Research and design treatment system. Determine method for sludge disposal. Water management system to collect and convey water to treatment system, and effluent to natural channel.
Capital Cost	Moderate – intensive re-handling required to excavate, mix and replace road base	Low to Moderate – depending on whether material can be covered in place or must be relocated.	Moderate – removal and replacement of road bed, preparation and deposition in impoundment	Low – limited to construction of passive system, including site grading, planting, *etc*.	High – cost to design and construct treatment plant may be considerable (average $7.5M, high $40M).
Operating Cost	Low – ongoing water quality monitoring	Low to Moderate – depending on cover monitoring requirement.	Low- ongoing water quality monitoring	Low – minor maintenance and monitoring.	High – average cost to operate treatment plant is $1.50 / m^3

6. Closure

This report provides the preliminary ML/ARD Management and Monitoring Plan for the Casino Project for the YESAA review process. The report was prepared by the Lorax technical personnel listed below.

Sincerely,

LORAX ENVIRONMENTAL SERVICES LTD.

Bruce Mattson, M.Sc., P.Geo.
Principal Environmental Geoscientist
