CONCRETE REINFORCEMENT PRE POUR

Rev 01 August 25, 2018

SUBCONTRACTOR: Ultimate Reinforcing // McNish	INSPECTION DATE: Nov 2 2018
SUBCONTRACTOR CONTACT PERSON: GARRY DAHL	PROJ. POUR DATE:
INSPECTOR(S): GARRY DAHL / JDS	
LOCATION: CV 13 Bents 182 & Take UP	
DRAWING REV: 0	DRAWING NO.(S): 3210-231-260-0009
SPEC SECTION(S): S03 20 00 – Concrete Reinforcing Steel	

ITEM	ITEMS TO BE CHECKED	PASS	FAIL	N/A
1.0	Grade (400W unless otherwise noted) and type of steel delivered and installed as required by approved drawings.	☑	☐	☐
2.0	Inspect rebar distribution, spacing and cover per design/project requirements.	☑	☐	☐
3.0	Length of splices as specified	☑	☐	☐
4.0	Staggered splices as specified	☑	☐	☐
5.0	Any mechanical splices have been approved by the owner prior to install	☐	☐	☑
6.0	Bars cleaned and free of material that may reduce bond including loose rust, scale, oil, structural defects and that they are uncoated and unpainted.	☑	☐	☐
7.0	Dowels at wall ends, construction joints, and openings as specified (length, location, size, etc.)	☑	☐	☐
8.0	No unauthorized field bent bars including hooks installed	☑	☐	☐
9.0	Resolve conflicts between embedded items and reinforcement	☑	☐	☐
10.0	When authorized, field bends done without heat and inspected for fissures or cracks.	☐	☐	☑

ITEM	ITEMS TO BE CHECKED	PASS	FAIL	N/A
11.0	Bars tied and supported to prevent displacement	☑	☐	☐
12.0	Spacers, tie wire and chairs as required	☑	☐	☐
13.0	Conduits at design location and minimum separation from rebar as specified	☐	☐	☑
14.0	No contact of bars is made with dissimilar metals as per CSA A23.1	☑	☐	☐
15.0	Bars, nails or tie wire not sticking out from surfaces that allow rusting/corrosion	☑	☐	☐
16.0	Rebar welds are inspected by qualified inspectors certified to CSA W178.2	☐	☐	☑
17.0	No rebar congestion or other obstruction for deposit of concrete	☑	☐	☐
18.0	Adjustments required for interfering items (piping, inserts, sleeves, etc.) have been submitted and approved by owner.	☐	☐	☑
19.0	Rebar was stored off ground to prevent damage/corrosion	☑	☐	☐
20.0	Review drawings for anchors, piping, sleeves, boxes	☑	☐	☐

FOUNDATION NOTES:

2.1 ALL CONCRETE FOUNDATION SUBGRADE SHALL BE EITHER ROCK OR 38 mm MINUS NFS STRUCTURAL BACKFILL DOWN TO 3 METERS BELOW THE FINISH GRADE COMPACTED TO 95% MODIFIED PROCTOR.
2.2 ALL BACKFILL AROUND AND ABOVE CONCRETE FOUNDATIONS, PEDESTALS AND PADS SHALL BE 38 mm MINUS NFS STRUCTURAL BACKFILL.
2.3. ALL FOUNDATION SUBGRADE SHALL BE INSPECTED AND APPROVED BY THE GEOTECHNICAL ENGINEER PRIOR TO PLACEMENT OF CONCRETE.
2.4 THE PREPARED FOOTING SUBGRADE SHALL BE PROTECTED FROM WATER INGRESS AND SOFTENING BY PROVIDING ADEQUATE DRAINAGE OR PLACING A LEAN CONCRETE MUD SLAB.

GENERAL NOTES;

1.1 READ THESE DRAWINGS IN CONJUNCTION WITH ALL OTHER PERTINENT CONTRACT DOCUMENTS.
1.2 FOR CONCRETE TYPICAL DETAILS DRAWING SET AND GENERAL NOTES, SEE DRAWINGS 354138-3000-231-294-0001 TO -0007.
1.3 REFER TO MECHANICAL, PROCESS AND ELECTRICAL DRAWINGS FOR LOCATIONS AND DIMENSIONS OF OPENINGS, SLEEVES AND OTHER BUILDING COMPONENTS NOT SHOWN ON STRUCTURAL DRAWINGS. REPORT DISCREPENCIES TO THE OWNER OR HIS REPRESENTATIVE PRIOR TO PROCEEDING WITH THE WORK.
1.4 FOR GENERAL SITE LOCATION AND WORK POINT COORDINATES, SEE DRAWING H354138-2120-220-290-0001.
1.5 HIGH ENERGY COMPACTION EQUIPMENT SUCH AS LARGE ROLLERS MUST NOT BE USED FOR COMPACTING BACKFILL WITHIN 1 METER OF THE EDGE OF THE WALLS.
1.6 FOR GROUNDING LOOP SEE ELECTRICAL DRAWING H354138-3210-260-272-1000-0001. FOR GROUNDING INSTALLATION DETAILS SEE DRAWING SET H354138-3210-260-290-0001-0001 TO -0015.
1.7 FOR CAST-IN PLACE CONCRETE, SEE SPECIFICATION SECTION H354138-5032000.
1.8 FOR CONCRETE FORMWORK, SEE SPECIFICATION SECTION H354138-5031000.
1.9 FOR CONCRETE REINFORCEMENT, SEE SPECIFICATION SECTION H354138-5033000.
1.10 FOR GROUTING, SEE SPECIFICATION SECTION H354138-5036000.
1.11 CONSTRUCTION JOINTS NOT SHOWN ON THE DRAWINGS MUST BE APPROVED BY THE CONTRUCTION MANAGER.
1.12 IN CASE OF ANY DISCREPANCIES, INFORM THE CONSTRUCTION MANAGER BEFORE COMMENCING WORK.
1.13 ALL DIMENSIONS ARE IN MILLIMETERS AND ELEVATIONS ARE IN METERS.
1.14 PROVIDE 19mm X 19mm CHAMFER AT ALL EXPOSED CONCRETE CORNERS AND EDGES ABOVE GRADE LEVEL.
1.15 THE DRAWINGS SHOULD BE READ IN CONJUNCTION WITH THE PROJECT CIVIL DESIGN CRITERIA H354138-0000-220-210-0001.
1.16 FOR FURTHER GEOTECH INFORMATION, SEE "2011 GEOTECHNICAL INVESTIGATION FOR MINE SITE INFRASTRUCTURE FOUNDATION REPORT" BY BGC ENGINEERING DATED JAN 31, 2012.
1.17 SET ANCHOR RODS USING TEMPLATES WHICH MUST BE LEFT IN PLACE UNTIL THE CONCRETE HAS SET. ANCHOR RODS SHALL BE PLUMBED AND SECURED FROM MOVEMENT PRIOR TO CASTING CONCRETE.

CONCRETE REINFORCEMENT PRE POUR

Rev 01 August 25, 2018

SUBCONTRACTOR: Ultimate Reinforcing // McNish	INSPECTION DATE: NOVEMBER 17, 2018
SUBCONTRACTOR CONTACT PERSON: CLAYTON	PROJ. POUR DATE: NOVEMBER 17, 2018
INSPECTOR(S): Ryan deMilliano, DAN Pelletier, Matt Coverdale (3DS)	
LOCATION: 3210 CU003 / PEDESTALS (x6)	
DRAWING REV:	DRAWING NO.(S): SPEC SECTION(S): S03 20 00 – Concrete Reinforcing Steel

ITEM	ITEMS TO BE CHECKED	PASS	FAIL	N/A
1.0	Grade (400W unless otherwise noted) and type of steel delivered and installed as required by approved drawings.	☑	☐	☐
2.0	Inspect rebar distribution, spacing and cover per design/project requirements.	☑	☐	☐
3.0	Length of splices as specified	☑	☐	☑
4.0	Staggered splices as specified	☑	☐	☑
5.0	Any mechanical splices have been approved by the owner prior to install	☐	☐	☑
6.0	Bars cleaned and free of material that may reduce bond including loose rust, scale, oil, structural defects and that they are uncoated and unpainted.	☑	☐	☐
7.0	Dowels at wall ends, construction joints, and openings as specified (length, location, size, etc.)	☑	☐	☐
8.0	No unauthorized field bent bars including hooks installed	☑	☐	☐
9.0	Resolve conflicts between embedded items and reinforcement	☑	☐	☐
10.0	When authorized, field bends done without heat and inspected for fissures or cracks.	☐	☐	☑

ITEM	ITEMS TO BE CHECKED	PASS	FAIL	N/A
11.0	Bars tied and supported to prevent displacement	☑	☐	☐
12.0	Spacers, tie wire and chairs as required	☑	☐	☐
13.0	Conduits at design location and minimum separation from rebar as specified	☐	☐	☑
14.0	No contact of bars is made with dissimilar metals as per CSA A23.1	☑	☐	☐
15.0	Bars, nails or tie wire not sticking out from surfaces that allow rusting/corrosion	☑	☐	☐
16.0	Rebar welds are inspected by qualified inspectors certified to CSA W178.2	☐	☐	☑
17.0	No rebar congestion or other obstruction for deposit of concrete	☑	☐	☐
18.0	Adjustments required for interfering items (piping, inserts, sleeves, etc.) have been submitted and approved by owner.	☑	☐	☐
19.0	Rebar was stored off ground to prevent damage/corrosion	☑	☐	☐
20.0	Review drawings for anchors, piping, sleeves, boxes	☑	☐	☐

COMMENTS:

RFI 114 created to confirm it will be acceptable to have 150mm cover at SW pedestal from top of dowels to TOC.

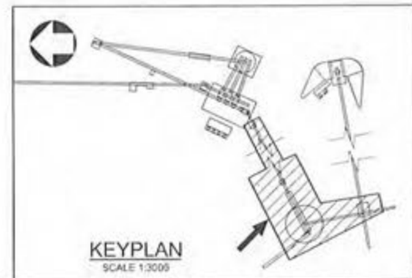
FOUNDATION NOTES:



2.1 ALL CONCRETE FOUNDATION SUBGRADE SHALL BE EITHER ROCK OR 38 mm MINUS NFS STRUCTURAL BACKFILL DOWN TO 3 METERS BELOW THE FINISH GRADE COMPACTED TO 95% MODIFIED PROCTOR.
2.2 ALL BACKFILL AROUND AND ABOVE CONCRETE FOUNDATIONS, PEDESTALS AND PADS SHALL BE 38 mm MINUS NFS STRUCTURAL BACKFILL.
2.3 ALL FOUNDATION SUBGRADE SHALL BE INSPECTED AND APPROVED BY THE GEOTECHNICAL ENGINEER PRIOR TO PLACEMENT OF CONCRETE.
2.4 THE PREPARED FOOTING SUBGRADE SHALL BE PROTECTED FROM WATER INGRESS AND SOFTENING BY PROVIDING ADEQUATE DRAINAGE OR PLACING A LEAN CONCRETE MUD SLAB.

GENERAL NOTES:

1.1 READ THESE DRAWINGS IN CONJUNCTION WITH ALL OTHER PERTINENT CONTRACT DOCUMENTS.
1.2 FOR CONCRETE TYPICAL DETAILS DRAWING SET AND GENERAL NOTES, SEE DRAWINGS 354138-0000-231-264-0001 TO -0007.
1.3 REFER TO MECHANICAL, PROCESS AND ELECTRICAL DRAWINGS FOR LOCATIONS AND DIMENSIONS OF OPENINGS, SLEEVES AND OTHER BUILDING COMPONENTS NOT SHOWN ON STRUCTURAL DRAWINGS. REPORT DISCREPENCIES TO THE OWNER OR HIS REPRESENTATIVE PRIOR TO PROCEEDING WITH THE WORK.
1.4 FOR GENERAL SITE LOCATION AND WORK POINT COORDINATES, SEE DRAWING H354138-2120-220-290-0001.
1.5 HIGH ENERGY COMPACTION EQUIPMENT SUCH AS LARGE ROLLERS MUST NOT BE USED FOR COMPACTING BACKFILL WITHIN 1 METER OF THE EDGE OF THE WALLS.
1.6 FOR GROUNDING LOOP SEE ELECTRICAL DRAWING H354138-3210-260-272-1000-0001, FOR GROUNDING INSTALLATION DETAILS SEE DRAWING SET H354138-3210-260-290-0001-0001 TO -0015.
1.7 FOR CAST-IN PLACE CONCRETE, SEE SPECIFICATION SECTION H354138-S032000.
1.8 FOR CONCRETE FORMWORK, SEE SPECIFICATION SECTION H354138-S031000.
1.9 FOR CONCRETE REINFORCEMENT, SEE SPECIFICATION SECTION H354138-S033000.
1.10 FOR GROUTING, SEE SPECIFICATION SECTION H354138-S035000.
1.11 CONSTRUCTION JOINTS NOT SHOWN ON THE DRAWINGS MUST BE APPROVED BY THE CONTRUCTION MANAGER.
1.12 IN CASE OF ANY DISCREPANCIES, INFORM THE CONSTRUCTION MANAGER BEFORE COMMENCING WORK.
1.13 ALL DIMENSIONS ARE IN MILLIMETERS AND ELEVATIONS ARE IN METERS.
1.14 PROVIDE 19mm X 19mm CHAMFER AT ALL EXPOSED CONCRETE CORNERS AND EDGES ABOVE GRADE LEVEL.
1.15 THE DRAWINGS SHOULD BE READ IN CONJUNCTION WITH THE PROJECT CIVIL DESIGN CRITERIA H354138-0000-220-210-0001.
1.16 FOR FURTHER GEOTECH INFORMATION, SEE "2011 GEOTECHNICAL INVESTIGATION FOR MINE SITE INFRASTRUCTURE FOUNDATION REPORT" BY BGC ENGINEERING DATED JAN 31, 2012.
1.17 SET ANCHOR RODS USING TEMPLATES WHICH MUST BE LEFT IN PLACE UNTIL THE CONCRETE HAS SET. ANCHOR RODS SHALL BE PLUMBED AND SECURED FROM MOVEMENT PRIOR TO CASTING CONCRETE.

CONCRETE REINFORCEMENT PRE POUR

Rev 01 August 25, 2018

SUBCONTRACTOR: Ultimate Reinforcing // McNish	INSPECTION DATE: November 20, 2018
SUBCONTRACTOR CONTACT PERSON: Clayton	PROJ. POUR DATE: November 21, 2018
INSPECTOR(S): Ryan deMilliano, Dan Pelletier, Matt Coverdale (JDS)	
LOCATION: 3210 CV002 - Pedestals at Truss Support and Tail Pulley.	
DRAWING REV: 00 / DRAWING NO.(S): 3210-231-260-0003	SPEC SECTION(S): S03 20 00 – Concrete Reinforcing Steel

ITEM	ITEMS TO BE CHECKED	PASS	FAIL	N/A
1.0	Grade (400W unless otherwise noted) and type of steel delivered and installed as required by approved drawings.	☒	☐	☐
2.0	Inspect rebar distribution, spacing and cover per design/project requirements.	☒	☐	☐
3.0	Length of splices as specified	☒	☐	☐
4.0	Staggered splices as specified	☐	☐	☒
5.0	Any mechanical splices have been approved by the owner prior to install	☐	☐	☒
6.0	Bars cleaned and free of material that may reduce bond including loose rust, scale, oil, structural defects and that they are uncoated and unpainted.	☒	☐	☐
7.0	Dowels at wall ends, construction joints, and openings as specified (length, location, size, etc.)	☒	☐	☐
8.0	No unauthorized field bent bars including hooks installed	☒	☐	☐
9.0	Resolve conflicts between embedded items and reinforcement	☒	☐	☐
10.0	When authorized, field bends done without heat and inspected for fissures or cracks.	☐	☐	☒

ITEM	ITEMS TO BE CHECKED	PASS	FAIL	N/A
11.0	Bars tied and supported to prevent displacement	☒	☐	☐
12.0	Spacers, tie wire and chairs as required	☒	☐	☐
13.0	Conduits at design location and minimum separation from rebar as specified	☐	☐	☒
14.0	No contact of bars is made with dissimilar metals as per CSA A23.1	☒	☐	☐
15.0	Bars, nails or tie wire not sticking out from surfaces that allow rusting/corrosion	☒	☐	☐
16.0	Rebar welds are inspected by qualified inspectors certified to CSA W178.2	☐	☐	☒
17.0	No rebar congestion or other obstruction for deposit of concrete	☒	☐	☐
18.0	Adjustments required for interfering items (piping, inserts, sleeves, etc.) have been submitted and approved by owner.	☒	☐	☐
19.0	Rebar was stored off ground to prevent damage/corrosion	☒	☐	☐
20.0	Review drawings for anchors, piping, sleeves, boxes	☒	☐	☐

COMMENTS:

	ATTACHMENT(S):
Heating to be applied to hoarding prior to pour to reach temp.	DWG (Highlighted)

DEFICIENCIES NOTES:

- Stirrups at tail pulley pedestals to be covered past the shear key to allow proper cover.

CONCRETE REINFORCEMENT PRE POUR

Rev 01 August 25, 2018

SUBCONTRACTOR: Ultimate Reinforcing // McNish	INSPECTION DATE: DECEMBER 7, 2018 (AM)
SUBCONTRACTOR CONTACT PERSON: CLAYTON	PROJ. POUR DATE: DECEMBER 7, 2018 (PM)
INSPECTOR(S): Ryan deMilliano, Jerry C. (3DS)	
LOCATION: 3210 CV002 BENT 7 PEDESTALS (x2) // CV013 MAG TWR PEDS (x4)	
DRAWING REV: 00	DRAWING NO.(S): 3210/0012R0; 0003R0
	SPEC SECTION(S): S03 20 00 – Concrete Reinforcing Steel

ITEM	ITEMS TO BE CHECKED	PASS	FAIL	N/A
1.0	Grade (400W unless otherwise noted) and type of steel delivered and installed as required by approved drawings.	☑	☐	☐
2.0	Inspect rebar distribution, spacing and cover per design/project requirements.	☑	☐	☐
3.0	Length of splices as specified	☑	☐	☐
4.0	Staggered splices as specified	☐	☐	☑
5.0	Any mechanical splices have been approved by the owner prior to install	☐	☐	☑
6.0	Bars cleaned and free of material that may reduce bond including loose rust, scale, oil, structural defects and that they are uncoated and unpainted.	☑	☐	☐
7.0	Dowels at wall ends, construction joints, and openings as specified (length, location, size, etc.)	☐	☐	☑
8.0	No unauthorized field bent bars including hooks installed	☑	☐	☐
9.0	Resolve conflicts between embedded items and reinforcement	☑	☐	☐
10.0	When authorized, field bends done without heat and inspected for fissures or cracks.	☐	☐	☑

ITEM	ITEMS TO BE CHECKED	PASS	FAIL	N/A
11.0	Bars tied and supported to prevent displacement	☑	☐	☐
12.0	Spacers, tie wire and chairs as required	☑	☐	☐
13.0	Conduits at design location and minimum separation from rebar as specified	☐	☐	☑
14.0	No contact of bars is made with dissimilar metals as per CSA A23.1	☑	☐	☐
15.0	Bars, nails or tie wire not sticking out from surfaces that allow rusting/corrosion	☑	☐	☐
16.0	Rebar welds are inspected by qualified inspectors certified to CSA W178.2	☐	☐	☑
17.0	No rebar congestion or other obstruction for deposit of concrete	☑	☐	☐
18.0	Adjustments required for interfering items (piping, inserts, sleeves, etc.) have been submitted and approved by owner.	☑	☐	☐
19.0	Rebar was stored off ground to prevent damage/corrosion	☑	☐	☐
20.0	Review drawings for anchors, piping, sleeves, boxes	☑	☐	☐

Pre-Delivery Inspection Report

Date of Inspection	December 8, 2018
Inspected By	Peter Nice
Date of Delivery	December 8, 2018
Delivered By	Peter Nice, Peter deMilliano
Unit Model	HR30 TT4 / CWT PEDESTALS (x20)
Unit Serial #	2020
Engine Serial #	13380 / 0003 80005
Hour Meter Reading	5883 - 10 - 00

	Item	Yes	No	N/A
1	Is the unit free of damage?	☑	☐	☐
2	Are all fluid levels correct?	☑	☐	☐
3	Are all guards in place and secure?	☑	☐	☐
4	Are all belts properly tensioned?	☑	☐	☐
5	Are all electrical connections tight?	☑	☐	☐
6	Are all hydraulic connections tight?	☑	☐	☐
7	Are all hydraulic hoses free of damage?	☑	☐	☐
8	Are all hydraulic hoses properly routed?	☑	☐	☐
9	Are all hydraulic hoses properly secured?	☑	☐	☐
10	Are all hydraulic hoses free of rubbing?	☑	☐	☐
11	Are all hydraulic hoses free of kinking?	☑	☐	☐
12	Are all hydraulic hoses free of twisting?	☑	☐	☐
13	Are all hydraulic hoses free of pinching?	☑	☐	☐
14	Are all hydraulic hoses free of abrasion?	☑	☐	☐
15	Are all hydraulic hoses free of leaks?	☑	☐	☐
16	Are all hydraulic hoses free of damage?	☑	☐	☐
17	Are all hydraulic hoses free of wear?	☑	☐	☐
18	Are all hydraulic hoses free of corrosion?	☑	☐	☐
19	Are all hydraulic hoses free of contamination?	☑	☐	☐
20	Are all hydraulic hoses free of air?	☑	☐	☐
21	Are all hydraulic hoses free of water?	☑	☐	☐
22	Are all hydraulic hoses free of debris?	☑	☐	☐
23	Are all hydraulic hoses free of foreign objects?	☑	☐	☐
24	Are all hydraulic hoses free of damage?	☑	☐	☐
25	Are all hydraulic hoses free of wear?	☑	☐	☐
26	Are all hydraulic hoses free of corrosion?	☑	☐	☐

CONCRETE REINFORCEMENT PRE POUR

Rev 01 August 25, 2018

SUBCONTRACTOR: Ultimate Reinforcing // McNish	INSPECTION DATE: DECEMBER 13, 2018
SUBCONTRACTOR CONTACT PERSON: CLAYTON	PROJ. POUR DATE: DECEMBER 13, 2018
INSPECTOR(S): Ryan deMilliano	
LOCATION: 3210 RECLAIM TUNNEL P2 PEDESTALS (x2)	
DRAWING REV: 05 / DRAWING NO.(S): 3210-0010	SPEC SECTION(S): S03 20 00 – Concrete Reinforcing Steel

ITEM	ITEMS TO BE CHECKED	PASS	FAIL	N/A
1.0	Grade (400W unless otherwise noted) and type of steel delivered and installed as required by approved drawings.	☑	☐	☐
2.0	Inspect rebar distribution, spacing and cover per design/project requirements.	☑	☐	☐
3.0	Length of splices as specified	☑	☐	☐
4.0	Staggered splices as specified	☑	☐	☐
5.0	Any mechanical splices have been approved by the owner prior to install	☐	☐	☑
6.0	Bars cleaned and free of material that may reduce bond including loose rust, scale, oil, structural defects and that they are uncoated and unpainted.	☑	☐	☐
7.0	Dowels at wall ends, construction joints, and openings as specified (length, location, size, etc.)	☑	☐	☐
8.0	No unauthorized field bent bars including hooks installed	☑	☐	☐
9.0	Resolve conflicts between embedded items and reinforcement	☑	☐	☐
10.0	When authorized, field bends done without heat and inspected for fissures or cracks.	☐	☐	☑

ITEM	ITEMS TO BE CHECKED	PASS	FAIL	N/A
11.0	Bars tied and supported to prevent displacement	☑	☐	☐
12.0	Spacers, tie wire and chairs as required	☑	☐	☐
13.0	Conduits at design location and minimum separation from rebar as specified	☐	☐	☑
14.0	No contact of bars is made with dissimilar metals as per CSA A23.1	☑	☐	☐
15.0	Bars, nails or tie wire not sticking out from surfaces that allow rusting/corrosion	☑	☐	☐
16.0	Rebar welds are inspected by qualified inspectors certified to CSA W178.2	☐	☐	☑
17.0	No rebar congestion or other obstruction for deposit of concrete	☑	☐	☐
18.0	Adjustments required for interfering items (piping, inserts, sleeves, etc.) have been submitted and approved by owner.	☑	☐	☐
19.0	Rebar was stored off ground to prevent damage/corrosion	☑	☐	☐
20.0	Review drawings for anchors, piping, sleeves, boxes	☑	☐	☐

FORMWORK & FALSEWORK PRE POUR | QA INSPECTION

Rev 01 August 25, 2018

CONTRACTOR: Clark Builders	INSPECTION DATE: December 13, 2018
CONTRACTOR CONTACT PERSON: PETER NICE	DATE OF POUR: DECEMBER 13, 2018
INSPECTOR(S): Ryan deMilliano.	
LOCATION: 3210 RECLAIM TUNNEL P2 PEDESTALS (x2)	
DRAWING REV: 05 / DRAWING NO.(S): 3210-0010	SPEC SECTION(S): S03 1000

ITEM	ITEMS TO BE CHECKED	PASS	FAIL	N/A
1.0	Location, survey, dimension and grades as required	☑	☐	☐
2.0	Plumbness and Flatness verified	☑	☐	☐
3.0	Joints are aligned and watertight.	☑	☐	☐
4.0	Formwork shop drawings are Engineered and reviewed	☐	☐	☑
5.0	Re-used formwork reconditioned and treated	☑	☐	☐
6.0	Formwork and ties according to finishing requirements. Confirm no holes in the concrete surface are greater than 25mm in diameter or expose steel at less than 25mm from surface. As per spec.	☑	☐	☐
7.0	Installation of embeds are located and secured	☐	☐	☑
8.0	Chamfer requirements checked. 25mm chamfers required for all exterior corners and edges exposed to view including horizontal edges of pads.	☑	☐	☐
9.0	Key ways and/or other provisions according to design are provided in construction joints	☐	☐	☑

ITEM	ITEMS TO BE CHECKED	PASS	FAIL	N/A
10.0	Inspect types of form spacers, ties and bracing.	☑	☐	☐
11.0	Spacing of ties to be set to a pattern	☑	☐	☐
12.0	Expansion, construction, contraction joints as required & located as coordinated with structural Engineer	☑	☐	☐
13.0	Forms secured against movement during placing	☑	☐	☐
14.0	Forms are braced for alignment and blow out	☑	☐	☐
15.0	Forms are cleaned of all debris, and dry, prior to concrete placement including standing water.	☑	☐	☐
16.0	Openings in formwork permit inspection and cleaning, placing and compaction of concrete, and forming and processing of construction joints.	☑	☐	☐
17.0	Formwork has been coated with release agent prior to rebar placement.	☑	☐	☐
18.0	Anchor Bolts and Embeds are secured to formwork.	☐	☐	☑

COMMENTS:

- P2 PEDESTAL DIMENSIONS WIDENED TO PROVIDE REQUIRED COVER
  - RFI TO BE SUBMITTED TO CONFIRM THIS IS ACCEPTABLE.

CONCRETE POST POUR INSPECTION

Rev 00 May 4, 2018

INSPECTOR(S): Ryan deMilvano (CB)	SPEC SECTION(S): S03 30 00 – Cast-In-Place
TYPE OF FINISH: F1 Below Grade.	DATE OF INSPECTION: August 27, 2018 (MDW)
AREA AND LOCATION(S): Secondary Crusher: Footings and Pilasters Prior to Concrete and Backfill.	

GENERAL REQUIREMENTS	PASS	FAIL	N/A	REMARKS
Curing compounds not used on any surface against which additional concrete or materials are to be bonded.	☒	☐	☐	
Fresh concrete barricaded/ protected from mechanical disturbance.	☒	☐	☐	As req'd.
Where concrete is used for filling, the chipped opening shall not be less than 75mm in depth.	☐	☐	☒	
Patches exposed to view shall blend with surrounding surfaces.	☒	☐	☐	
Contractor shall clean all exposed concrete surfaces of all encrustations of cement, mortar, or grout and shall remove unsightly stains.	☒	☐	☐	
Concrete appears proper and devoid of any honeycomb, cold joints, droppings or other defects	☒	☐	☐	
Removal of all concrete rubble and dispose of at an appropriate location.	☒	☐	☐	
Surface of concrete finished against forms has a smooth, dense finish free from cracks, free from projections, pits, and honeycomb and in proper alignment.	☒	☐	☐	
COLD WEATHER REQUIREMENTS (WHEN AMB. TEMP < 5°C)	PASS	FAIL	N/A	REMARKS
Protection in place until 70% of the 28-day strength has been reached.	☐	☐	☒	
Cold weather protection provided by means of heated enclosures, coverings, insulation, or a suitable approved combination of these methods during complete curing period.	☐	☐	☒	
Water not sitting in recesses, shear pockets, groves, bolt sleeves during heat and Hoarding period.	☐	☐	☒

PROJECT #: CB201 | 18502

CONCRETE POST POUR INSPECTION

Rev 00 May 4, 2018

INSPECTOR(S): Ryan deMillard (CB) // D'Arcy Comeford (JDS)	SPEC SECTION(S): S03 30 00 – Cast-In-Place
TYPE OF FINISH: F1 (BELOW GRADE)	DATE OF INSPECTION: SEPT 10, 2018
AREA AND LOCATION(s): 3310/3320 SECONDARY MAT FOUNDATION / FOOTINGS. GL A-C GL 1-7	

GENERAL REQUIREMENTS	PASS	FAIL	N/A	REMARKS
Curing compounds not used on any surface against which additional concrete or materials are to be bonded.	☒	☐	☐	
Fresh concrete barricaded/ protected from mechanical disturbance.	☒	☐	☐	
Where concrete is used for filling, the chipped opening shall not be less than 75mm in depth.	☐	☐	☒	
Patches exposed to view shall blend with surrounding surfaces.	☒	☐	☐	
Contractor shall clean all exposed concrete surfaces of all encrustations of cement, mortar, or grout and shall remove unsightly stains.	☒	☐	☐	
Concrete appears proper and devoid of any honeycomb, cold joints, droppings or other defects	☒	☒	☐	SEE COMMENTS (2018.09.10) *REINSPECTION REQUIRED.
Removal of all concrete rubble and dispose of at an appropriate location.	☒	☐	☐	
Surface of concrete finished against forms has a smooth, dense finish free from cracks, free from projections, pits, and honeycomb and in proper alignment.	☒	☐	☐	

COLD WEATHER REQUIREMENTS (WHEN AMB. TEMP < 5°C)	PASS	FAIL	N/A	REMARKS
Protection in place until 70% of the 28-day strength has been reached.	☐	☐	☒	
Cold weather protection provided by means of heated enclosures, coverings, insulation, or a suitable approved combination of these methods during complete curing period.	☐	☐	☒	
Water not sitting in recesses, shear pockets, groves, bolt sleeves during heat and Hoarding period.	☐	☐	☒	

COMMENTS: SEE ATTACHED DWG.

(2018.09.10) - CHIPPED CONCRETE FOUND, NOTIFIED DALE DELORME TO FIX PRIOR TO BACKFILL
- TIE ROD EXPOSED AT MULTIPLE LOCATIONS ON FOOTING (MAT) AND CORNER REAR PILASTER (SE)

ITEMS HAVE BEEN FIXED AND REPAIRED / PHOTOS TAKEN

CONCRETE REINFORCEMENT PRE POUR

Rev 01 August 25, 2018

SUBCONTRACTOR: Ultimate Reinforcing // McNish	INSPECTION DATE: September 10, 2018
SUBCONTRACTOR CONTACT PERSON: ~~Derek Savoie~~ Jimmy	PROJ. POUR DATE: September 11, 2018
INSPECTOR(S): Ryan deMilliano (CB) ; D'Arcy Comerford	
LOCATION: 3320 Secondary - 2x Type 7 Portals Between GL 6-7 GL B.8-C.5	
DRAWING REV: 01 / DRAWING NO.(S): H354138-3320-231-260-0006	SPEC SECTION(S): S03 20 00 – Concrete Reinforcing Steel

ITEM	ITEMS TO BE CHECKED	PASS	FAIL	N/A
1.0	Grade (400W unless otherwise noted) and type of steel delivered and installed as required by approved drawings.	X		
2.0	Inspect rebar distribution, spacing and cover per design/project requirements.	X		
3.0	Length of splices as specified	X		
4.0	Staggered splices as specified			X
5.0	Any mechanical splices have been approved by the owner prior to install			X
6.0	Bars cleaned and free of material that may reduce bond including loose rust, scale, oil, structural defects and that they are uncoated and unpainted.	X		
7.0	Dowels at wall ends, construction joints, and openings as specified (length, location, size, etc.)	X		
8.0	No unauthorized field bent bars including hooks installed	X		
9.0	Resolve conflicts between embedded items and reinforcement	X		
10.0	When authorized, field bends done without heat and inspected for fissures or cracks.			X

ITEM	ITEMS TO BE CHECKED	PASS	FAIL	N/A
11.0	Bars tied and supported to prevent displacement	X		
12.0	Spacers, tie wire and chairs as required	X		
13.0	Conduits at design location and minimum separation from rebar as specified			X
14.0	No contact of bars is made with dissimilar metals as per CSA A23.1	X		
15.0	Bars, nails or tie wire not sticking out from surfaces that allow rusting/corrosion	X		
16.0	Rebar is welds inspected by qualified inspectors certified to CSA W178.2			X
17.0	No rebar congestion or other obstruction for deposit of concrete	X		
18.0	Adjustments required for interfering items (piping, inserts, sleeves, etc.) have been submitted and approved by owner. RFI 62	X		
19.0	Rebar was stored off ground to prevent damage/corrosion	X		
20.0	Review drawings for anchors, piping, sleeves, boxes	X		

COMMENTS:

2018 SEPT 10

RFI 62 SUBMITTED (Pending Response) - Request was to modify Anchor bolt Plates for cone bolts and Modify Stirrups.
→ Approved By Hatch

FORMWORK & FALSEWORK PRE POUR | QA INSPECTION

Rev 01 August 25, 2018

CONTRACTOR: Clark Builders	INSPECTION DATE: SEPTEMBER 10, 2018
CONTRACTOR CONTACT PERSON: DAVE DELORME	DATE OF POUR: SEPTEMBER 11, 2018
INSPECTOR(S): Ryan deMilliano	
LOCATION: 3320 SECONDARY - 2x TYPE 7 DED BEAMS. BETWEEN GL 6-7 & GL B.8-C.5	
DRAWING REV: 01	DRAWING NO.(S): #354138-3320-231-260-0006 / SPEC SECTION(S): 503 10 00

ITEM	ITEMS TO BE CHECKED	PASS	FAIL	N/A
1.0	Location, survey, dimension and grades as required	X		
2.0	Plumbness and Flatness verified	X		
3.0	Joints are aligned and watertight.	X		
4.0	Formwork shop drawings are Engineered and reviewed	X		
5.0	Re-used formwork reconditioned and treated	X		
6.0	Formwork and ties according to finishing requirements. Confirm no holes in the concrete surface are greater than 25mm in diameter or expose steel at less than 25mm from surface. As per spec.	X		
7.0	Installation of embeds are located and secured			X
8.0	Chamfer requirements checked. 25mm chamfers required for all exterior corners and edges exposed to view including horizontal edges of pads.	X		
9.0	Key ways and/or other provisions according to design are provided in construction joints			X

ITEM	ITEMS TO BE CHECKED	PASS	FAIL	N/A
10.0	Inspect types of form spacers, ties and bracing.	X		
11.0	Spacing of ties to be set to a pattern	X		
12.0	Expansion, construction, contraction joints as required & located as coordinated with structural Engineer	X		
13.0	Forms secured against movement during placing	X		
14.0	Forms are braced for alignment and blow out	X		
15.0	Forms are cleaned of all debris, and dry, prior to concrete placement including standing water.	X		
16.0	Openings in formwork permit inspection and cleaning, placing and compaction of concrete, and forming and processing of construction joints.	X		
17.0	Formwork has been coated with release agent prior to rebar placement.	X		
18.0	Anchor Bolts and Embeds are secured to formwork.	X		

COMMENTS:

Small bits of tie wire in forms, cleaned during inspection.

ELECTRICAL GROUNDING SYSTEMS INSPECTION FORM

Rev 00 May 4, 2018

SUBCONTRACTOR: Clark Builders	DATE OF INSPECTION: Sept 10/18
WEATHER/ AMBIENT TEMP (°C): 10°	DATE INSTALLATION: Sept 7/18
INSPECTOR(S): Ryan McIlwaine, Gabby Daigle, D'Arcy Comerford (JDS)	
LOCATION: Secondary Crusher Main Perimeter Grounding	
DRAWING REV:	DRAWING NO.(S): SPEC SECTION(S):

GROUNDING SYSTEMS REQUIREMENT	PASS	FAIL	N/A	REMARKS
Installation matches drawings and specifications.	☒	☐	☐	
Conductor sizes and types.	☒	☐	☐	
Burial depth (record minimum in inches)	☒	☐	☐	
Ground rod and well locations.	☐	☐	☒	300x300 PLATES ONLY.
Connections checked (torqueing, no cold joints, burnouts or protection)	☒	☐	☐	
System resistance to earth value (record in Ω)	☒	☐	☐	
Ground mats.	☐	☐	☒	PLATES USED.
CSA Certified or equivalent.	☒	☐	☐	

MANUFACTURER	DESCRIPTION	RANGE	ID. No.	CALIBRATION DUE DATE (YYYY.MM.DD)

CONCRETE REINFORCEMENT PRE POUR

Rev 01 August 25, 2018

SUBCONTRACTOR: Ultimate Reinforcing // McNish	INSPECTION DATE: September 17, 2018
SUBCONTRACTOR CONTACT PERSON: ~~Derek Savoie~~ JIMMY	PROJ. POUR DATE: September 17, 2018
INSPECTOR(S): Ryan deMilliano	
LOCATION: 3310 Secondary SOG GL 5-7 (A-E)	
DRAWING REV:	DRAWING NO.(S): SPEC SECTION(S): S03 20 00 – Concrete Reinforcing Steel

ITEM	ITEMS TO BE CHECKED	PASS	FAIL	N/A
1.0	Grade (400W unless otherwise noted) and type of steel delivered and installed as required by approved drawings.	X		
2.0	Inspect rebar distribution, spacing and cover per design/project requirements.	X		
3.0	Length of splices as specified	X		
4.0	Staggered splices as specified	X		
5.0	Any mechanical splices have been approved by the owner prior to install			X
6.0	Bars cleaned and free of material that may reduce bond including loose rust, scale, oil, structural defects and that they are uncoated and unpainted.	X		
7.0	Dowels at wall ends, construction joints, and openings as specified (length, location, size, etc.)	X		
8.0	No unauthorized field bent bars including hooks installed	X		
9.0	Resolve conflicts between embedded items and reinforcement	X		
10.0	When authorized, field bends done without heat and inspected for fissures or cracks.			X

ITEM	ITEMS TO BE CHECKED	PASS	FAIL	N/A
11.0	Bars tied and supported to prevent displacement	X		
12.0	Spacers, tie wire and chairs as required	X		
13.0	Conduits at design location and minimum separation from rebar as specified	X		
14.0	No contact of bars is made with dissimilar metals as per CSA A23.1	X		
15.0	Bars, nails or tie wire not sticking out from surfaces that allow rusting/corrosion	X		
16.0	Rebar is welds inspected by qualified inspectors certified to CSA W178.2			X
17.0	No rebar congestion or other obstruction for deposit of concrete	X		
18.0	Adjustments required for interfering items (piping, inserts, sleeves, etc.) have been submitted and approved by owner.			X
19.0	Rebar was stored off ground to prevent damage/corrosion	X		
20.0	Review drawings for anchors, piping, sleeves, boxes	X		

COMMENTS:

Temp at time of pour prior to pour = +9°C – +23°C Good day
All angle bars at corners in place, some needed more ties to secure. Done

ATTACHMENT(S):

Photos.

DEFICIENCIES NOTES:

Dowels at wall ends, construction joints, and openings as specified (length, location, size, etc.)

FORMWORK & FALSEWORK PRE POUR | QA INSPECTION

Rev 01 August 25, 2018

CONTRACTOR: Clark Builders	INSPECTION DATE: Oct 23, 2018
CONTRACTOR CONTACT PERSON: DAN PELLETIER	DATE OF POUR: Oct 23/24, 2018
INSPECTOR(S): PETER NICE (CB), LEHAN (JDS), NATI C (JDS)	
LOCATION: 3320 SECONDARY // West Aprons, East Apron, Motor Pad 1 & 2	
DRAWING REV:	DRAWING NO.(S): SPEC SECTION(S):

ITEM	ITEMS TO BE CHECKED	PASS	FAIL	N/A
1.0	Location, survey, dimension and grades as required	☑	☐	☐
2.0	Plumbness and Flatness verified	☑	☐	☐
3.0	Joints are aligned and watertight.	☑	☐	☐
4.0	Formwork shop drawings are Engineered and reviewed	☑	☐	☐
5.0	Re-used formwork reconditioned and treated	☑	☐	☐
6.0	Formwork and ties according to finishing requirements. Confirm no holes in the concrete surface are greater than 25mm in diameter or expose steel at less than 25mm from surface. As per spec.	☑	☐	☐
7.0	Installation of embeds are located and secured	☑	☐	☐
8.0	Chamfer requirements checked. 25mm chamfers required for all exterior corners and edges exposed to view including horizontal edges of pads.	☑	☐	☐
9.0	Key ways and/or other provisions according to design are provided in construction joints	☐	☐	☑
10.0	Inspect types of form spacers, ties and bracing.	☑	☐	☐
11.0	Spacing of ties to be set to a pattern	☑	☐	☐
12.0	Expansion, construction, contraction joints as required & located as coordinated with structural Engineer	☑	☐	☐
13.0	Forms secured against movement during placing	☑	☐	☐
14.0	Forms are braced for alignment and blow out	☑	☐	☐
15.0	Forms are cleaned of all debris, and dry, prior to concrete placement including standing water.	☑	☐	☐
16.0	Openings in formwork permit inspection and cleaning, placing and compaction of concrete, and forming and processing of construction joints.	☑	☐	☐
17.0	Formwork has been coated with release agent prior to rebar placement.	☑	☐	☐
18.0	Anchor Bolts and Embeds are secured to formwork.	☑	☐	N/A

COMMENTS:

COMMENTS:

ATTACHMENT(S):

DEFICIENCIES NOTES:

(1) Prior to pouring crusher bases reinforcing to be cleared of any remaining material that could reduce bond.

(2) Once material removed from bars, bottom of forms will be vacuumed and loose reinforcing fixed.

CONCRETE REINFORCEMENT PRE POUR

Rev 01 August 25, 2018

SUBCONTRACTOR: Ultimate Reinforcing // McNish	INSPECTION DATE: November 10, 2018
SUBCONTRACTOR CONTACT PERSON: Jimmy M.	PROJ. POUR DATE: November 10, 2018
INSPECTOR(S):	
LOCATION: 3400 // CUO22 Bents. 2,3,4,5	
DRAWING REV: 01 / DRAWING NO.(S): 3400-0002	SPEC SECTION(S): ~~503~~ 20 00 – Concrete Reinforcing Steel

ITEM	ITEMS TO BE CHECKED	PASS	FAIL	N/A
1.0	Grade (400W unless otherwise noted) and type of steel delivered and installed as required by approved drawings.	☑	☐	☐
2.0	Inspect rebar distribution, spacing and cover per design/project requirements.	☑	☐	☐
3.0	Length of splices as specified	☑	☐	☐
4.0	Staggered splices as specified	☑	☐	☐
5.0	Any mechanical splices have been approved by the owner prior to install	☐	☐	☑
6.0	Bars cleaned and free of material that may reduce bond including loose rust, scale, oil, structural defects and that they are uncoated and unpainted.	☑	☐	☐
7.0	Dowels at wall ends, construction joints, and openings as specified (length, location, size, etc.)	☐	☐	☑
8.0	No unauthorized field bent bars including hooks installed	☑	☐	☐
9.0	Resolve conflicts between embedded items and reinforcement	☑	☐	☐
10.0	When authorized, field bends done without heat and inspected for fissures or cracks.	☐	☐	☑

ITEM	ITEMS TO BE CHECKED	PASS	FAIL	N/A
11.0	Bars tied and supported to prevent displacement	☑	☐	☐
12.0	Spacers, tie wire and chairs as required	☑	☐	☐
13.0	Conduits at design location and minimum separation from rebar as specified	☐	☐	☑
14.0	No contact of bars is made with dissimilar metals as per CSA A23.1	☑	☐	☐
15.0	Bars, nails or tie wire not sticking out from surfaces that allow rusting/corrosion	☑	☐	☐
16.0	Rebar welds are inspected by qualified inspectors certified to CSA W178.2	☑	☐	☑
17.0	No rebar congestion or other obstruction for deposit of concrete	☑	☐	☐
18.0	Adjustments required for interfering items (piping, inserts, sleeves, etc.) have been submitted and approved by owner.	☑	☐	☐
19.0	Rebar was stored off ground to prevent damage/corrosion	☑	☐	☐
20.0	Review drawings for anchors, piping, sleeves, boxes	☑	☐	☐

Introduction

This report summarizes the work that was performed by the Metso Field Service Representative during a Metso Field Service Visit.

Details of the day-to-day functions can be found in Appendix A (Time Sheets). Data taken on site during the visit is included in Appendix B (Data Sheets).

To arrange a Metso Field Service Visit or for any questions regarding this report, please use the following address:

Metso Minerals Canada, Field Service Department

795 George V, Lachine, QC H8S 2R9

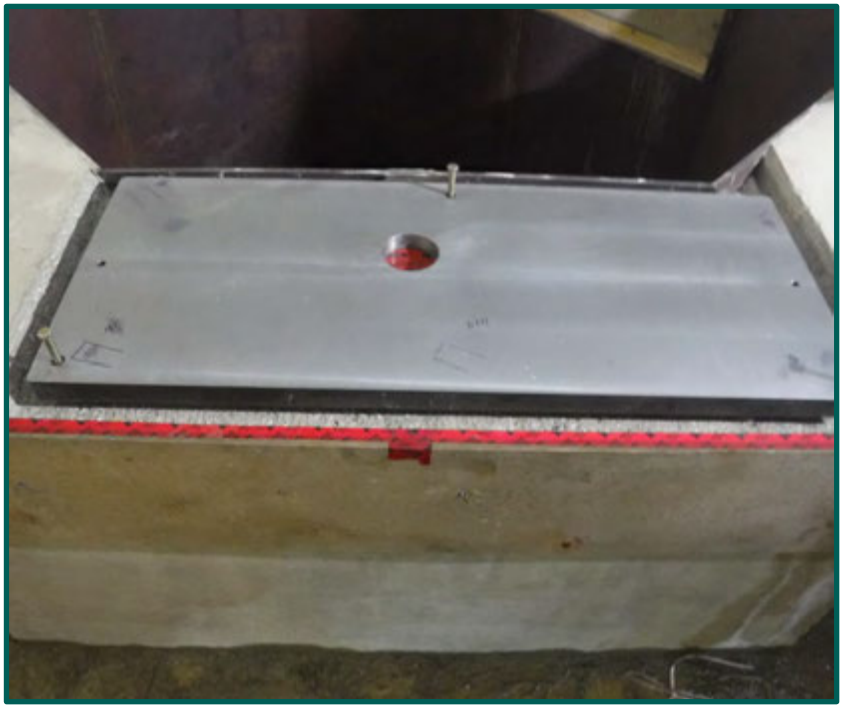
Tel: 514-485-4134

e-mail: francois.chabot@metso.com

Purpose of visit

- To perform the installation of the sole plate and main frame on crusher base.

History and scope of work

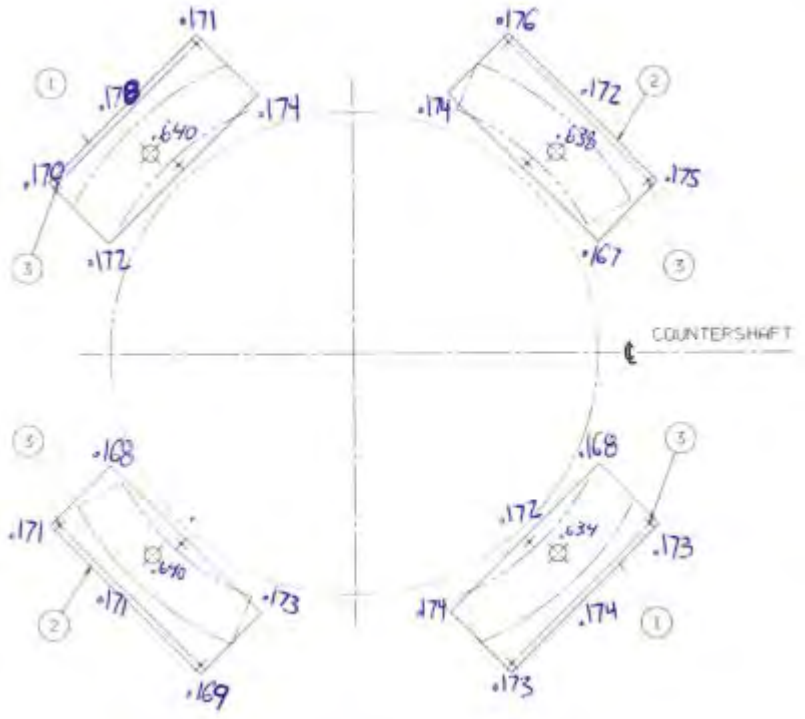


- Installation of sole plates
- Grouting of sole plates
- Installation of main frame
- Installation of adjustment ring

Visit details and findings – special findings

- Some of the sole plates were found to be out of specifications.
- Even after machining most sole plate were still banana shaped.

Installation



When I arrived on site, the BPC team already had the sole plates for 3 crushers set in place and leveled. BPC had concerns about some of the sole plates since some of them were banana shaped and some were pretty rough on the top machine surface. We started by reviewing the secondary crusher sole plates and overall they were still within Metso tolerances of 0.010”.

metso

Secondary crusher sole plates

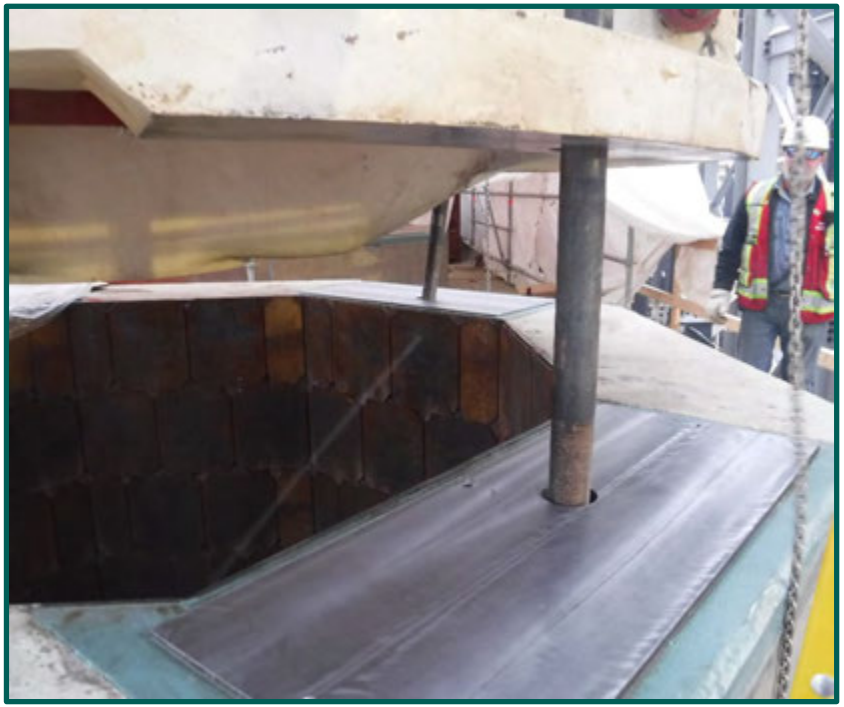
The elevations were recorded on the sole plate drawing for records. As we can see the sole plates were still under the 0.010" elevation tolerances. 0.009" was the best we could do here since the flatness of the machining varies a lot from corner to corner of every sole plates. It was found that most of the sole plates were curled up on each side making it very difficult to properly set them within the tolerances. Even knowing that the manifest says these sole plate came with the Metso Package, the way they look made me doubt. Metso sole plate is normally machined to a flatness of 0.004" and the part number is stamped on the top surface. 6 of the plates were very rough on the top side and none of the plates have Metso part number stamped on them.

Grouting of sole plates

The grout was poured once the concrete was up to temperature. A grout form was filled out to ensure that all the parameters of the grout and preparation were met before grout was poured. Once ready, the grout was mixed and poured in multiple stages since this product only allows us to pour 1.5” at a time.

metso

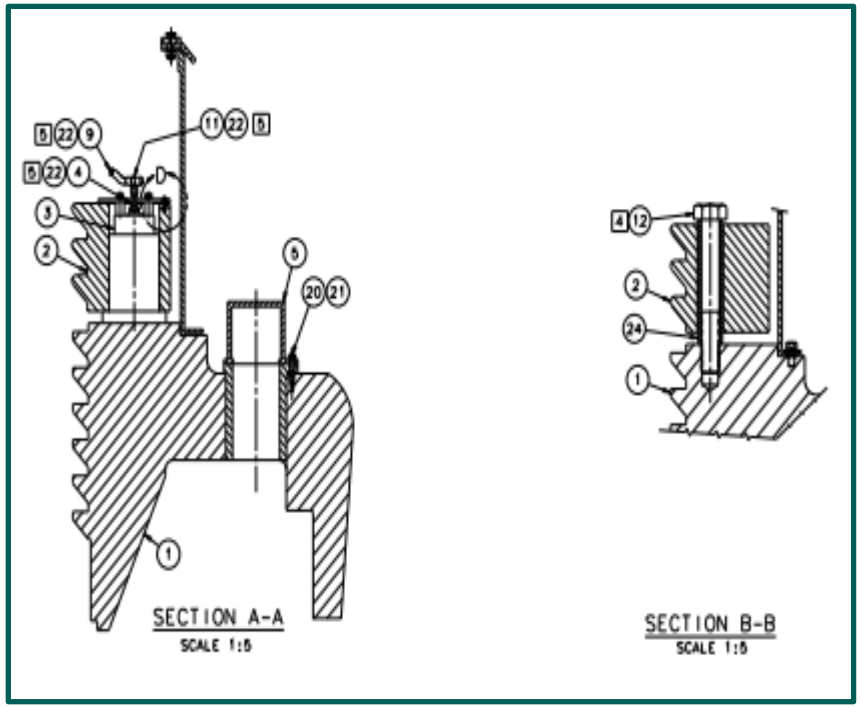
Final recording



Once the grout had cured for 3 days, the test pours were broken at 15 125 PSI which is acceptable for the placement of the main frame onto the sole plates. Before the main frame was installed, the elevation of every sole plate was recorded. After the measurements were recorded, we notice that most of the number had changed and the plate warped. The difference between the highest point to the lowest point was now of 0.016'' which is out of our tolerances. It seems the stress that was already in the plates reacted with the heat generated from the grout when curing. When curing, the grout reached a temperature of 220ºF which is very high for a Epoxy grout. Once the frame is installed on the sole plate a feeler gauge test will be done to see if any soft foot can be detected. This will indicate if shims must be used to correct the elevation difference.

metso

Main frame installation



The night before the main frame was installed, it was cleaned from the rust protective agent and loaded on the truck ready to be transported to the secondary crusher area. After a pre-lift meeting was conducted, the frame was lifted and once it was close above the sole plates, the anchor bolts were engaged in their hole to help guide the main frame in position. Before the main frame was set on the sole plates, it was lowered on wooden blocks 12 inches away from the sole plates. The sole plates and crusher machined pads were once more cleaned from any debris and the crusher was set on the sole plates.

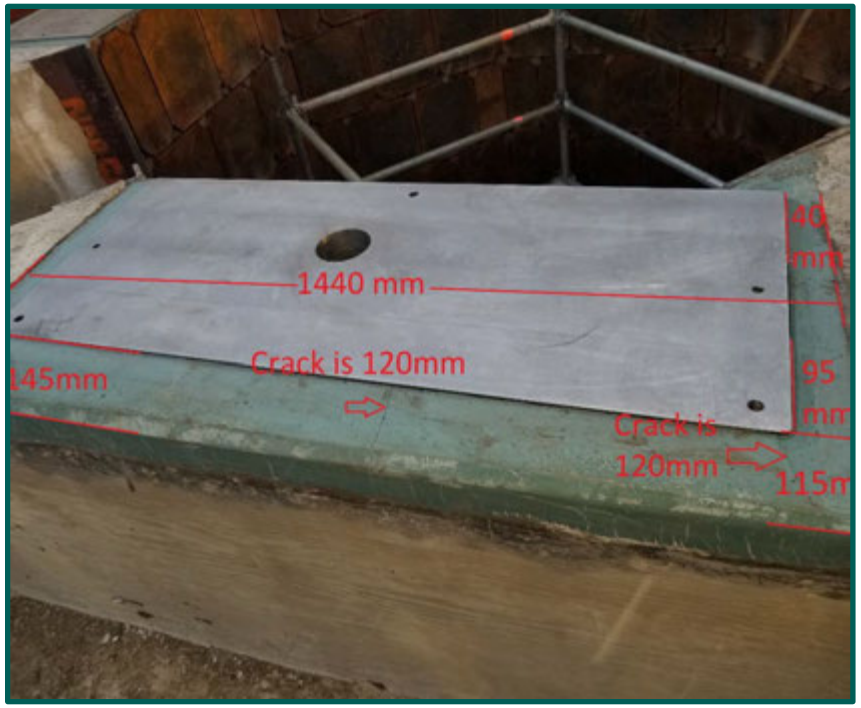
metso

Adjustment ring assembly

Prior to my arrival on site, all the adjustment ring and clamping ring were assembled. In order to assemble both rings, all the clamping cylinders were installed along with the hoses. Once the clamping ring is assembled, 8 bolts with spacer tubes were installed to secure the clamping ring on the adjustment ring. The bolts are going to be torqued to specification later on during the assembly of the crusher.

metso

Adjustment ring



Once the crusher was set on the sole plates, the main frame seat liner were greased with a 3% Moly base grease before the adjustment ring was installed. The adjustment ring was lifted from the same location as the main frame. Once the adjustment ring was on top of the crusher it was properly aligned with the crusher main frame and set on the main frame seat liners.

metso

Grout after cure

The secondary crusher was installed on the sole plates 5 days after the grout was poured. Cracks were first found on the secondary crusher sole plate grout. Some of the cracks were found before the crusher was installed, some after. We discussed with the grout supplier later, after we found those cracks. He reviewed our pocket dimensions, preparation and pour parameters. After the review, he assured us it was not uncommon and could be fixed. The structural integrity of the grout was not compromised. The cracks will be repaired as per supplier recommendation when the ambient temperature and conditions can be controlled.

Conclusion and recommendations

- Sole could not be set properly due to unknown factor that made them warped during the grout curing process
- Cracks in grout will have to be repaired as per supplier recommendation when environment can be controlled.

metso

Future work

- Clamping ring bolt still needs to be torqued
- Setting up soft foot and assembly of the crusher

metso

JOURNAL QUOTIDIEN - PROGRÈS: / DAILY LOG - PROGRESS:

Lundi / Monday	Travelled to the airport, flight was delayed 2 times before it was cancelled. Rebooked for the next day and travelled back home.
Mardi / Tuesday	Travelled from home to Whitehorse
Mercredi / Wednesday	Travelled from Whitehorse to Mayo, Chris Gardner picked me up and the airport and we drove to site. Arrived on site I meet up with JDS and went over the crusher so look at the sole plates. The secondary crusher sole plates elevation was reviewed along with #1 tertiary crusher. The machining of some sole plates was not up to our specification and will be sent to get machined. Most of the sole plates are banana shaped.
Jeudi / Thursday	Oversee machining of sole plates.
Vendredi / Friday	Machine shop in Whitehorse finished 3 sole plates before the end of their shift, loaded the sole plates on the truck.
Samedi / Saturday	Drove back to mine site, installed sole plates for tertiary crusher #3 and level them up.
Dimanche / Sunday	The sole plates and concrete temperature was normalized when we arrive at the beginning of the shift, we proceeded to the final levelling of the sole plates and poured the grout, the main frame of the secondary crusher was cleaned and prepared for transportation.

Introduction

This report summarizes the work that was performed by the Metso Field Service Representative during a Metso Field Service Visit.

Details of the day-to-day functions can be found in Appendix A (Time Sheets). Data taken on site during the visit is included in Appendix B (Data Sheets).

To arrange a Metso Field Service Visit or for any questions regarding this report, please use the following address:

Metso Minerals Canada, Field Service Department

795 George V, Lachine, QC H8S 2R9

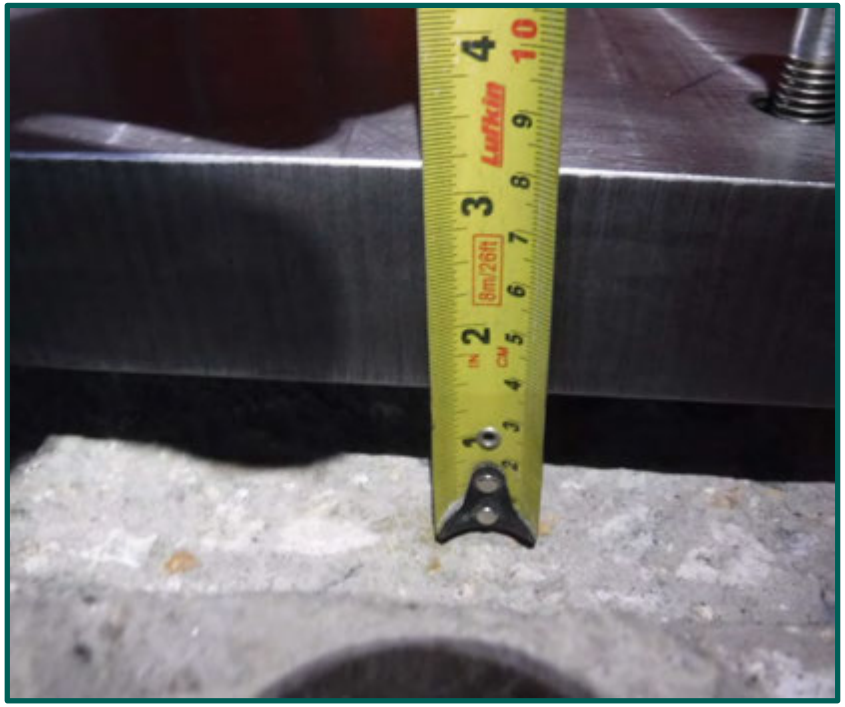
Tel: 514-485-4134

e-mail: francois.chabot@metso.com

Purpose of visit

- To perform the installation of the sole plate and main frame on crusher base.

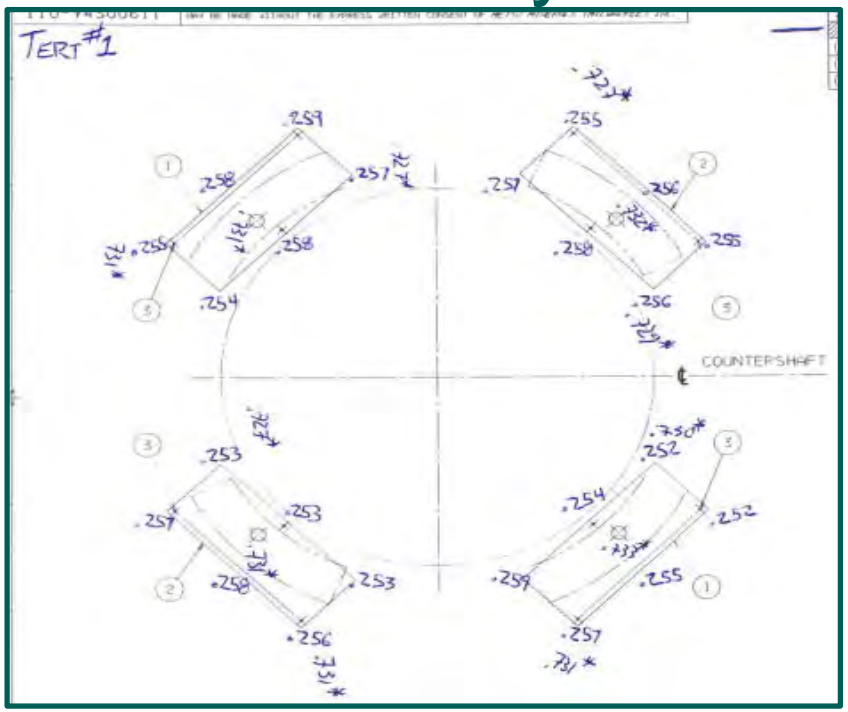
History and scope of work



- Installation of sole plates
- Grouting of sole plates
- Installation of main frame
- Installation of adjustment ring

Visit details and findings – special findings

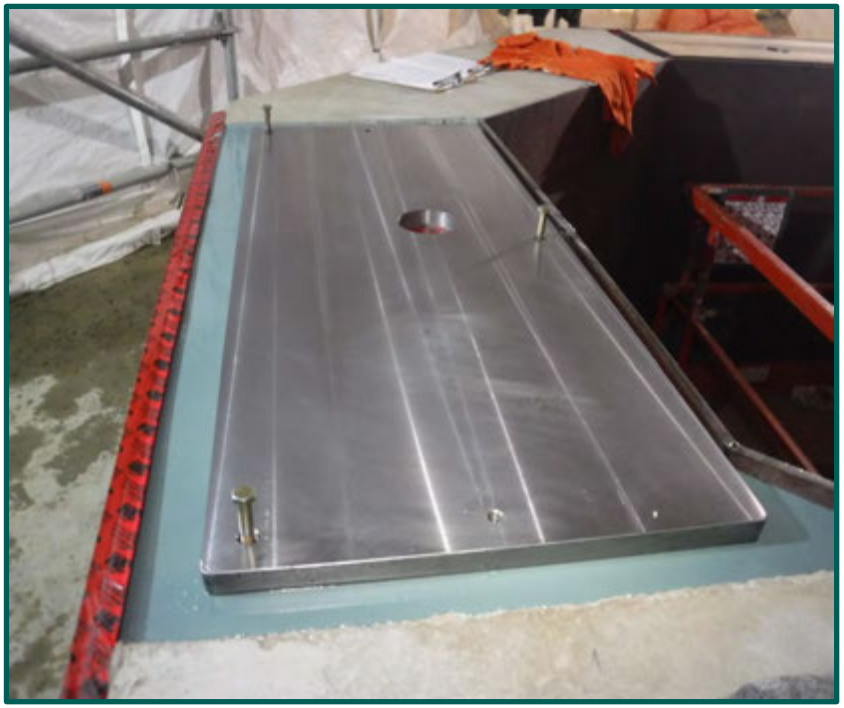
- Some of the sole plates were found to be out of specifications.
- Even after machining most sole plate were still banana shaped.



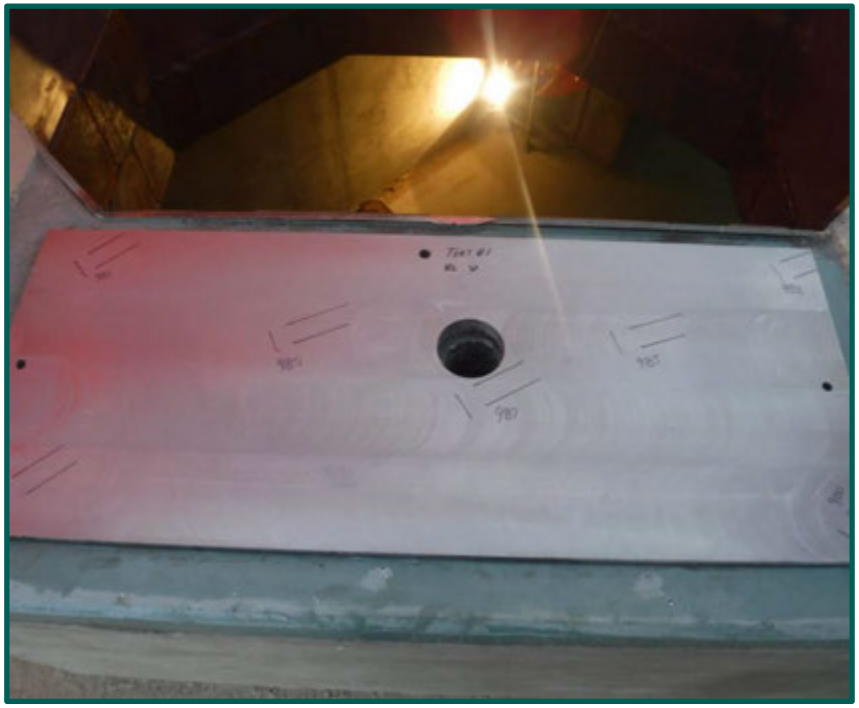
Installation

When I arrived on site, the BPC team already had the sole plates for 3 crushers set in place and leveled. BPC had concerns about some of the sole plates since some of them were banana shaped and some were pretty rough on the top machine surface. The second crusher to be reviewed was #1 tertiary crusher. The sole plates were set within tolerances at 0.007” of elevation difference. All the grout specification related to preparation to gout was verified and respected.

Tertiary #1 crusher sole plates



The elevations were recorded on the sole plate drawing for records. As we can see, the sole plates were still under the 0.010'' elevation tolerances. 0.007'' was the best we could do here since the flatness of the machining varies a lot from corner to corner of every sole plate. It was found that most of the sole plates were curled up on each side making it very difficult to properly set them within the tolerances. Even knowing that the manifest says these sole plate came with the Metso Package, the way they looks made me doubt. Metso sole plates are normally machined to a flatness of 0.004'' and the part number is stamped on the top surface. 6 of the plates were very rough on the top side and none of the plates have Metso part number stamped on them.** Note: Only the number starting with .25** should be taken in consideration on the LHS picture**



Grouting of sole plates

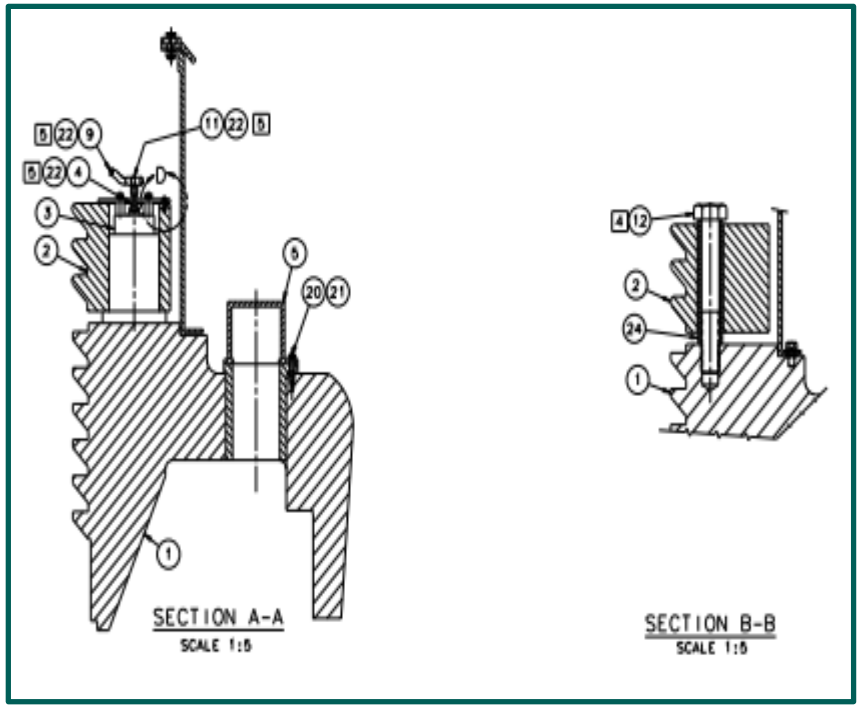
The grout was poured once the concrete was up to temperature. A grout form was filled out to ensure that all the parameters of the grout and preparation were respected before grout was poured. Once ready, the grout was mixed and poured in multiple stages since this product only allow us to pour 1.5'' at a time.

Final recording

Once the grout had cured for 3 days, the test pours were broken at 15 125 PSI which is acceptable for the placement of the main frame onto the sole plates. Before the main frame was installed, the elevation of every sole plate was recorded. After the measurements were recorded, we noticed that most of the numbers had changed and the plates warped. The difference between the highest point to the lowest point was now of 0.016'' which is out of our tolerances. It seems that the stress that was already in the plates reacted with the heat generated from the grout when curing. When curing, the grout reached a temperature of 220ºF which is very high for a Epoxy grout. Once the frame is installed on the sole plate, a feeler gauge test will be done to see if any soft foot can be noticed. This will indicate if shims must be used to correct the elevation difference.

metso

Main frame installation



While the secondary crusher main frame was getting installed, #1 tertiary crusher main frame was cleaned from the rust protective agent and loaded on the truck ready to be transported to the secondary crusher area. After a pre-lift meeting was conducted, the frame was lifted and once it was close above the sole plates, the anchor bolts were engaged in their hole to help guide the main frame in position. Before the main frame was set on the sole plates, it was lowered on wooden blocks 12 inches away from the sole plates. The sole plates and crusher machined pads were once more cleaned from any debris and the crusher was set on the sole plates.

metso

Adjustment ring assembly

Prior to my arrival on site, all the adjustment ring and clamping ring were assembled. In order to assemble both rings, all the clamping cylinders were installed along with the hoses. Once the clamping ring is assembled, 8 bolts with spacer tubes were installed to secure the clamping ring on the adjustment ring. The bolts are going to be torqued to specification later on during the assembly of the crusher.

Adjustment ring

Once the crusher was set on the sole plates, the main frame seat liner were greased with a 3% Moly base grease before the adjustment ring was installed. The adjustment ring was lifted from the same location as the main frame. Once the adjustment ring was on top of the crusher, it was properly aligned with the crusher main frame and set on the main frame seat liners.

metso

Grout after cure

As mentioned in the secondary crusher service report cracks were also found in tertiary crusher #1 grout. The cracks will be repaired as per supplier recommendation when the ambient temperature and conditions can be controlled.

metso

Conclusion and recommendations

- Sole could not be set properly due to unknown factor that made them warped during the grout curing process.
- Cracks in grout will have to be repaired as per supplier recommendation when environment can be controlled.

metso

Future work

- Clamping ring bolt still needs to be torqued.
- Setting up soft foot and assembly of the crusher.

metso

Lundi / Monday	Travelled to the airport, flight was delayed 2 times before it was cancelled. Rebooked for the next day and travelled back home.
Mardi / Tuesday	Travelled from home to Whitehorse
Mercredi / Wednesday	Travelled from Whitehorse to Mayo, Chris Gardner picked me up and the airport and we drove to site. Arrived on site I meet up with JDS and went over the crusher so look at the sole plates. The secondary crusher sole plates elevation was reviewed along with #1 tertiary crusher. The machining of some sole plates was not up to our specification and will be sent to get machined. Most of the sole plates are banana shaped.
Jeudi / Thursday	Oversee machining of sole plates.
Vendredi / Friday	Machine shop in Whitehorse finished 3 sole plates before the end of their shift, loaded the sole plates on the truck.
Samedi / Saturday	Drove back to mine site, installed sole plates for tertiary crusher #3 and level them up.
Dimanche / Sunday	The sole plates and concrete temperature was normalized when we arrive at the beginning of the shift, we proceeded to the final levelling of the sole plates and poured the grout, the main frame of the secondary crusher was cleaned and prepared for transportation.

Introduction

This report summarizes the work that was performed by the Metso Field Service Representative during a Metso Field Service Visit.

Details of the day-to-day functions can be found in Appendix A (Time Sheets). Data taken on site during the visit is included in Appendix B (Data Sheets).

To arrange a Metso Field Service Visit or for any questions regarding this report, please use the following address:

Metso Minerals Canada, Field Service Department

795 George V, Lachine, QC H8S 2R9

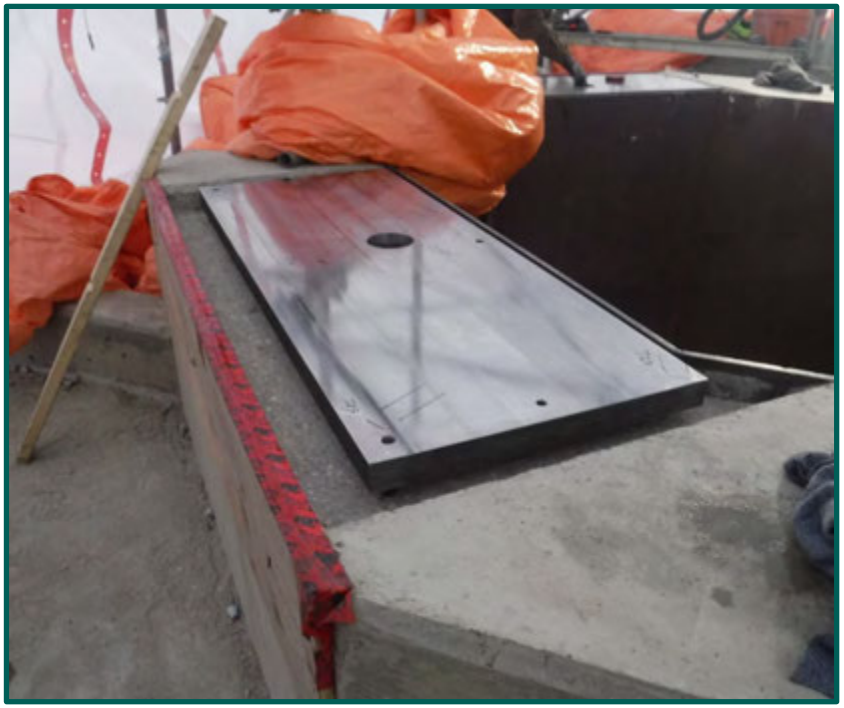
Tel: 514-485-4134

e-mail: francois.chabot@metso.com

Purpose of visit

- To perform the installation of the sole plate and main frame on crusher base.

History and scope of work



- Installation of sole plates
- Grouting of sole plates
- Installation of main frame
- Installation of adjustment ring

Visit details and findings – special findings

- Some of the sole plates were found to be out of specifications.
- Even after machining, most sole plates were still banana shaped.

Installation

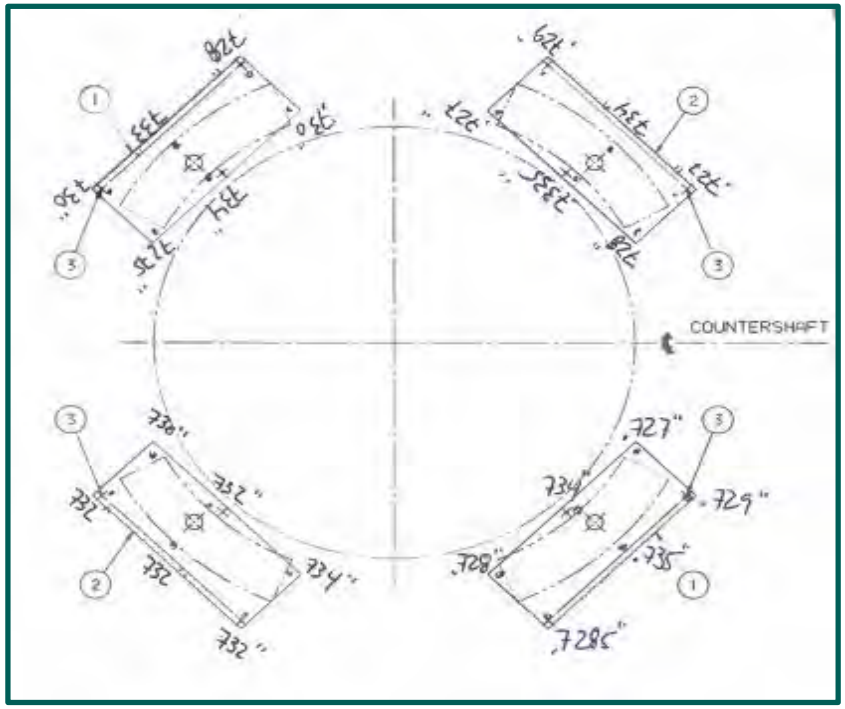
The surface flatness of 3 of the 4 sole plates on #2 tertiary crusher was not acceptable. A total of 6 sole plates were sent to the machine shop to be machined. Once 3 sole plates were back from the machine shop, they were installed with the remaining sole plate.

metso

Sole plates

1.1

1.2



1.3

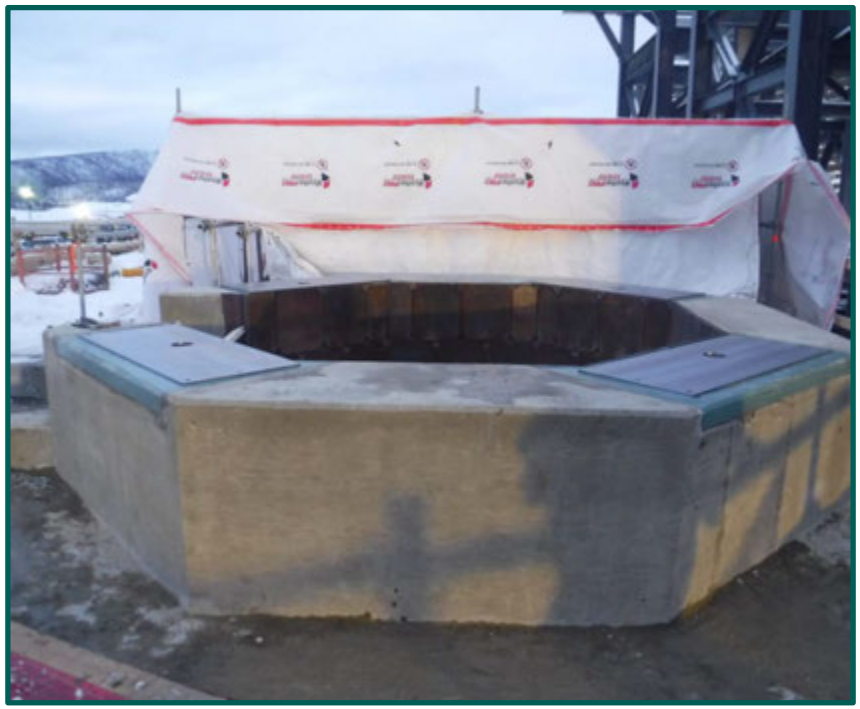
Pictures 1.1 and 1.2 shows the condition of the sole plates before they were sent to the machine shop. The ridge between the cutting tool passes were up to 0.009” thick. Picture 1.3 is the result after they were machined at Quantum Machining Work in Whitehorse.

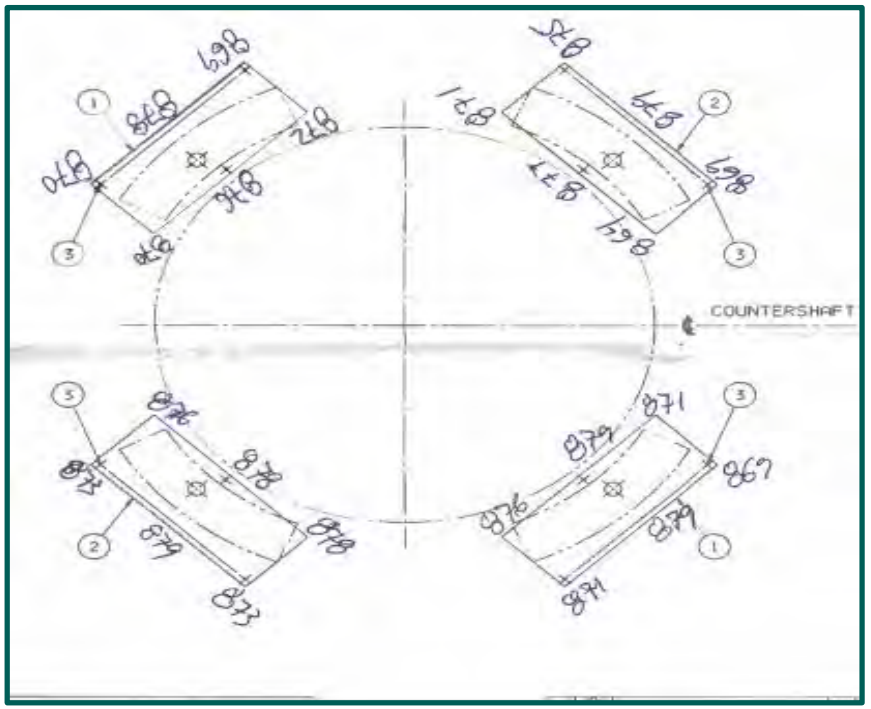
metso

Tertiary #2 crusher sole plates

The elevation was recorded on the sole plate drawing for records. As we can see, the sole plates were still under the 0.010” elevation tolerances. 0.008” was the best we could do, it seems that with the temperature change from transportation from Whitehorse to site caused the plate to deform like the other 2 sets of sole plates.

Grouting of sole plates





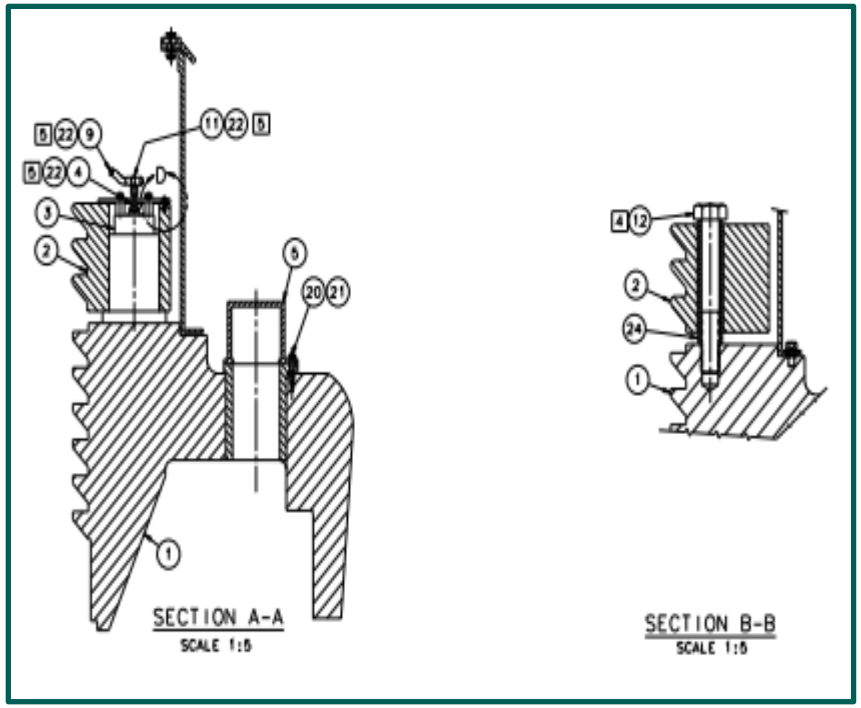
The grout was poured once the concrete was up to temperature. A grout form was filled to ensure that all the parameters of the grout and preparation were respected before grout was poured. Once ready, the grout was mixed and poured in multiple stages since this product only allow us to pour 1.5” at a time.

metso

Final recording

Once the grout had cure for 3 days, the elevation measurements were confirmed and showed that the sole plates have once again deformed during the curing process of the gout. The difference in elevation from the lowest to the highest point is now of 0.015”. Once the frame is placed on the sole plates, it will be adjusted if needed.

Main frame installation



Before the main frame was installed, it was cleaned from the rust protective agent and loaded on the truck ready to be transported to the secondary crusher area. After a pre-lift meeting was conducted, the frame was lifted and once it was close above the sole plates, the anchor bolts were engaged in their hole to help guide the main frame in position. Before the main frame was set on the sole plates, it was lowered on wooden blocks 12 inches away from the sole plates. The sole plates and crusher machined pads were once more cleaned from any debris and the crusher was set on the sole plates.

metso

Adjustment ring assembly

Prior to my arrival on site, the adjustment ring and clamping ring were assembled. In order to assemble both rings, all the clamping cylinders were installed along with the hoses. Once the clamping ring is assembled, 8 bolts with spacer tubes were installed to secure the clamping ring on the adjustment ring. The bolts are going to be torqued to specification later on during the assembly of the crusher.

metso

Adjustment ring

Once the crusher was set on the sole plates, the main frame seat liner were greased with a 3% Moly base grease before the adjustment ring was installed. The adjustment ring was lifted from the same location as the main frame. Once the adjustment ring was on top of the crusher, it was properly aligned with the crusher main frame and set on the main frame seat liners.

metso

Grout after cure

As per mention in the secondary crusher service report, cracks were also found in tertiary crusher #1 grout. The cracks will be repaired as per supplier recommendation when the ambient temperature and conditions can be controlled. Cracks were covered with tape to prevent water infiltration.

metso

Conclusion and recommendations

- Sole plates could not be set properly due to unknown factor that made them warp during the grout curing process.
- Cracks in grout will have to be repaired as per supplier recommendation when environment can be controlled.

metso

Future work

- Clamping ring bolt still needs to be torqued.
- Setting up soft foot and assembly of the crusher.

JOURNAL QUOTIDIEN - PROGRÈS: / DAILY LOG - PROGRESS:

Lundi / Monday	Travelled to the airport, flight was delayed 2 times before it was cancelled. Rebooked for the next day and travelled back home.
Mardi / Tuesday	Travelled from home to Whitehorse
Mercredi / Wednesday	Travelled from Whitehorse to Mayo, Chris Gardner picked me up and the airport and we drove to site. Arrived on site I meet up with JDS and went over the crusher so look at the sole plates. The secondary crusher sole plates elevation was reviewed along with #1 tertiary crusher. The machining of some sole plates was not up to our specification and will be sent to get machined. Most of the sole plates are banana shaped.
Jeudi / Thursday	Oversee machining of sole plates.
Vendredi / Friday	Machine shop in Whitehorse finished 3 sole plates before the end of their shift, loaded the sole plates on the truck.
Samedi / Saturday	Drove back to mine site, installed sole plates for tertiary crusher #3 and level them up.
Dimanche / Sunday	The sole plates and concrete temperature was normalized when we arrive at the beginning of the shift, we proceeded to the final levelling of the sole plates and poured the grout, the main frame of the secondary crusher was cleaned and prepared for transportation.

Introduction

This report summarizes the work that was performed by the Metso Field Service Representative during a Metso Field Service Visit.

Details of the day-to-day functions can be found in Appendix A (Time Sheets). Data taken on site during the visit is included in Appendix B (Data Sheets).

To arrange a Metso Field Service Visit or for any questions regarding this report, please use the following address:

Metso Minerals Canada, Field Service Department

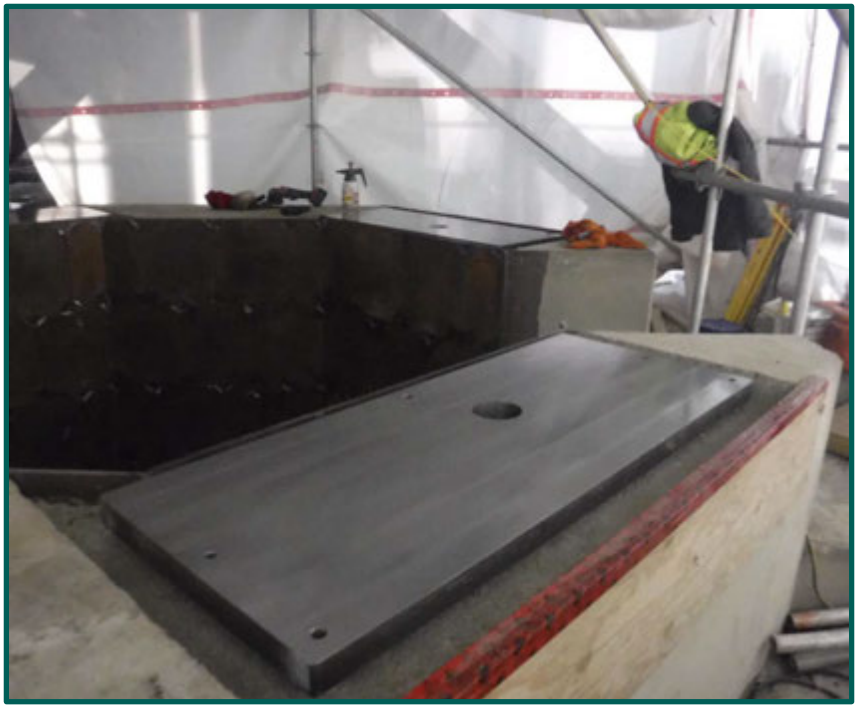
795 George V, Lachine, QC H8S 2R9

Tel: 514-485-4134

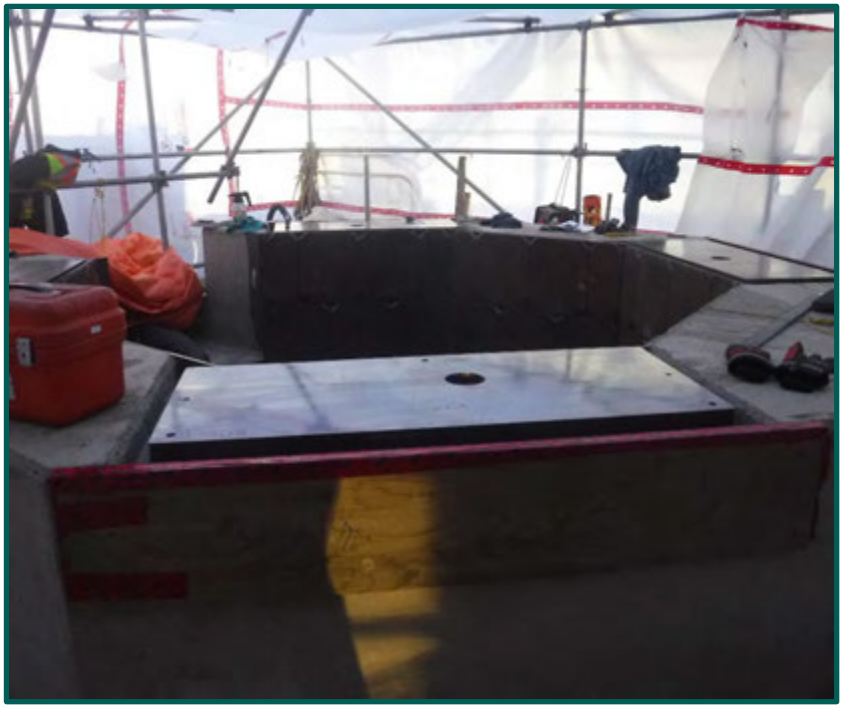
e-mail: francois.chabot@metso.com

Purpose of visit

- To perform the installation of the sole plate and main frame on crusher base.



History and scope of work



- Installation of sole plates
- Grouting of sole plates
- Installation of main frame
- Installation of adjustment ring

Visit details and findings – special findings

- Some of the sole plates were found to be out of specifications.
- Even after machining, most sole plates were still banana shaped.

Installation

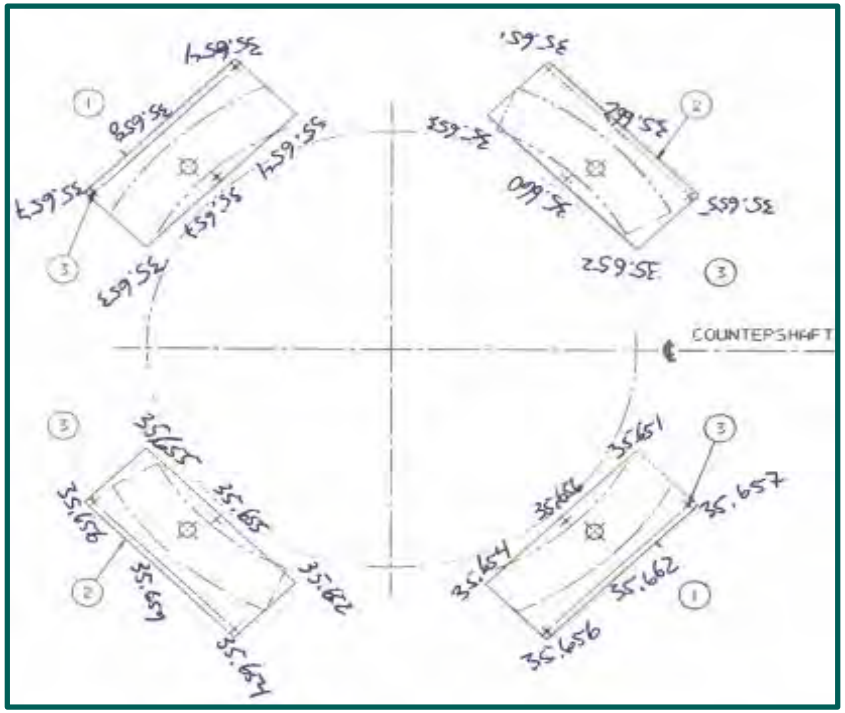
The surface flatness of 3 of the 4 sole plates on #3 tertiary crusher was not acceptable. A total of 6 sole plates were sent to the machine shop to be machined. Once 3 sole plates were back from the machine shop, they were installed with the remaining sole plate.

metso

Sole plates

1.1

1.2



1.3

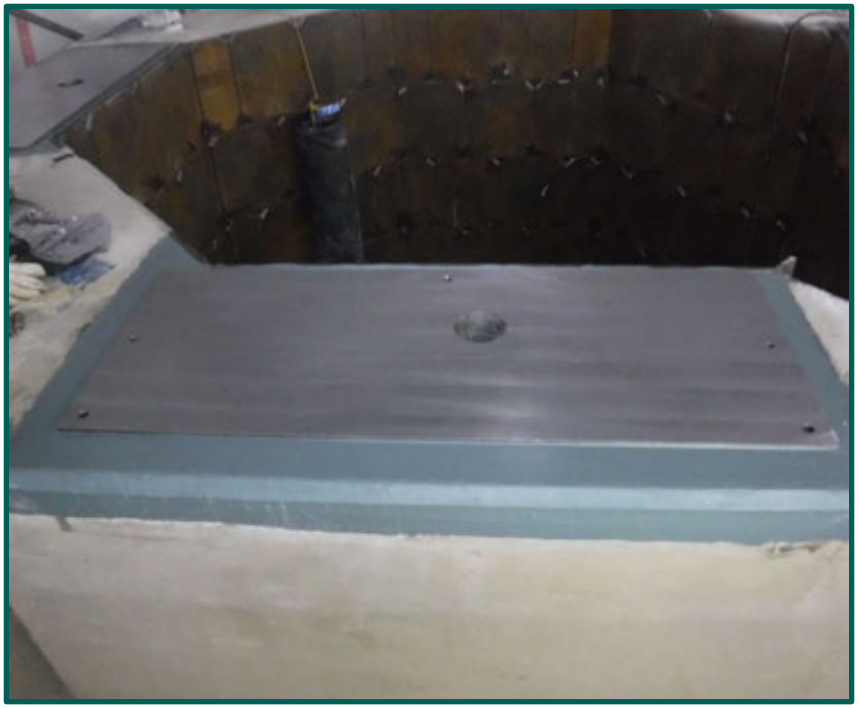
Pictures 1.1 and 1.2 shows the condition of the sole plates before they were sent to the machine shop. The ridge between the cutting tool passes were up to 0.009” thick. Picture 1.3 is the result after they were machined at Quantum Machining Work in Whitehorse.

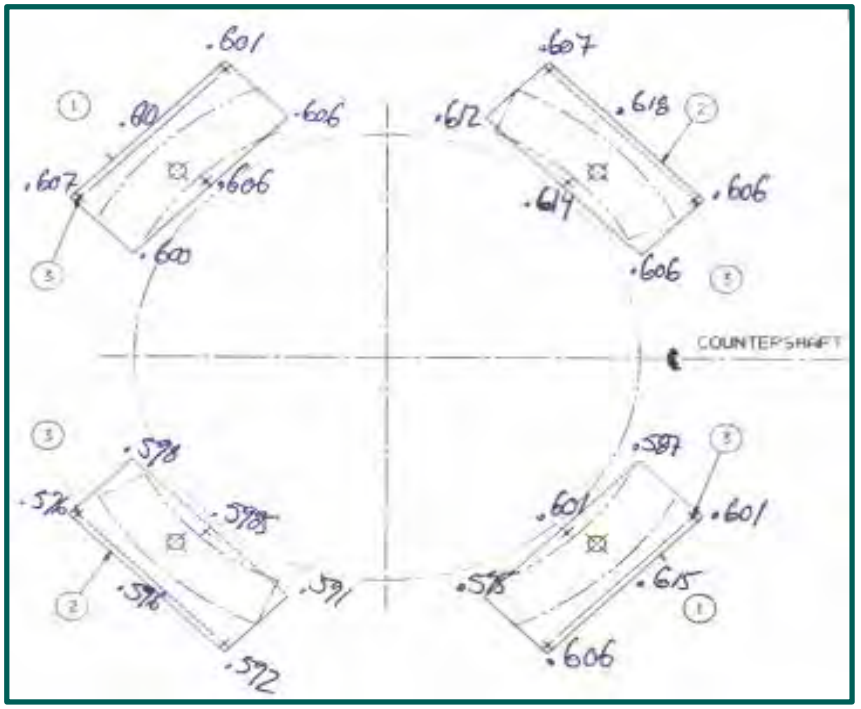
metso

Tertiary crusher sole plates

The elevations were recorded on the sole plate drawing for records. As we can see, the sole plates were 0.001” over the 0.010” elevation tolerances. 0.011” was the best we could do, it seems that with the temperature change from transportation from Whitehorse to site caused the plate to deform like the other 2 sets of sole plates.

Grouting of sole plates





The grout was poured once the concrete was up to temperature. A grout form was filled to ensure that all the parameters of the grout and preparation were respected before grout was poured. Once ready the grout was mixed and poured in multiple stages since this product only allow us to pour 1.5” at a time.

.606

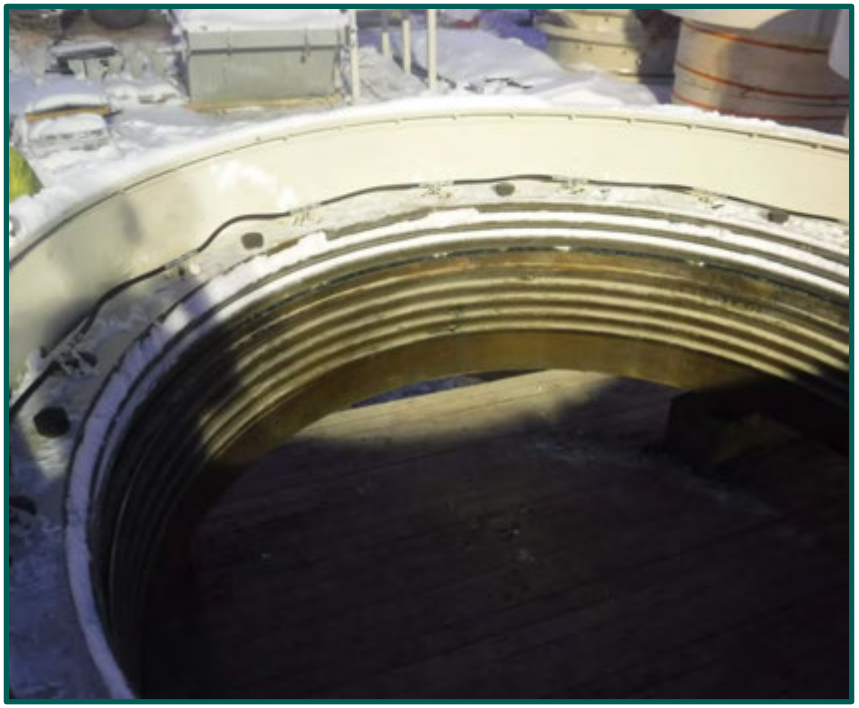
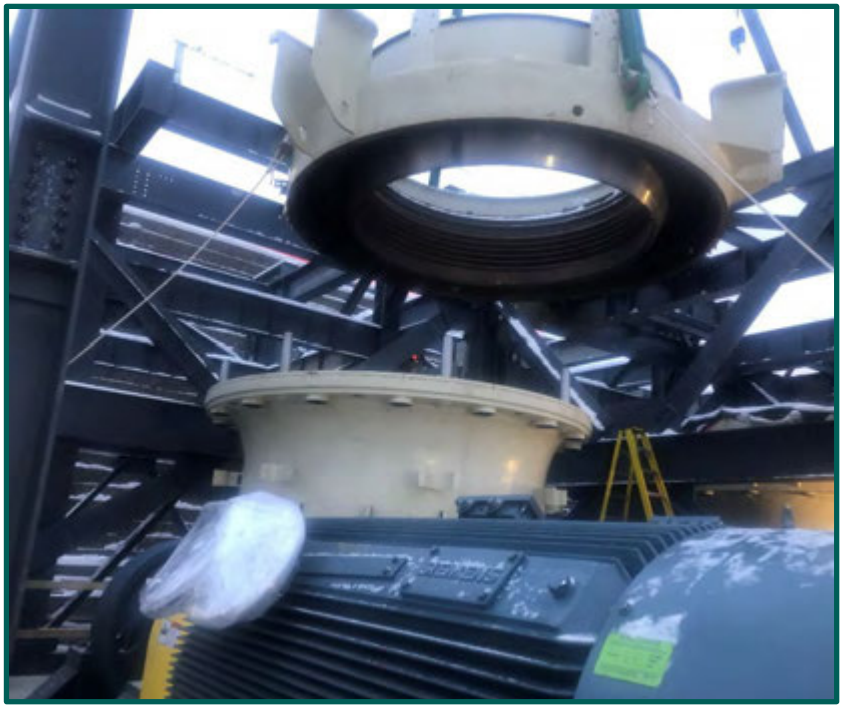
Main frame installation



Before the main frame was installed, it was cleaned from the rust protective agent and loaded on the truck ready to be transported to the secondary crusher area. After a pre-lift meeting was conducted, the frame was lifted and once it was close above the sole plates, the anchor bolts were engaged in their holes to help guide the main frame in position. Before the main frame was set on the sole plates, it was lowered on wooden blocks 12 inches away from the sole plates. The sole plates and crusher machined pads were once more cleaned from any debris and the crusher was set on the sole plates.

metso

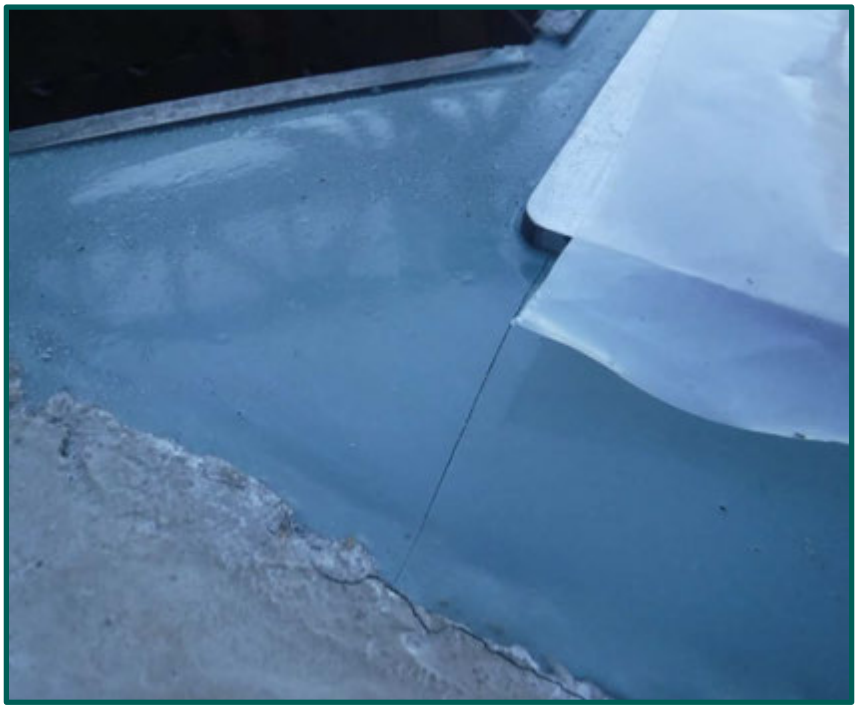
Adjustment ring assembly

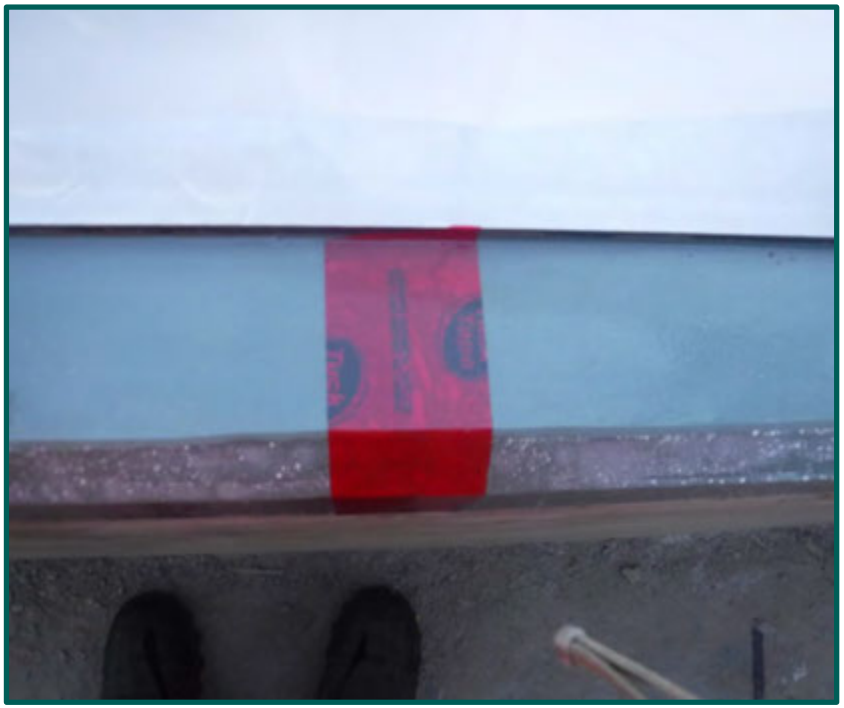


While the grout was curing, both clamping rings and adjustment ring were clean and assembled. In order to assemble both rings, the clamping cylinders were installed along with the hoses. Once the clamping ring is assembled, 8 bolts with spacer tubes were installed to secure the clamping ring on the adjustment ring. The bolts are going to be torqued to specification later on during the assembly of the crusher.

metso

Adjustment ring





Once the crusher was set on the sole plates, the main frame seat liner were greased with a 3% Moly base grease before the adjustment ring was installed. The adjustment ring was lifted from the same location as the main frame. Once the adjustment ring was on top of the crusher, it was properly aligned with the crusher main frame and set on the main frame seat liners.

metso

Grout after cure

As per mention in the secondary crusher service report, cracks were also found in tertiary crusher #1 grout. The cracks will be repaired as per supplier recommendation when the ambient temperature and conditions can be controlled. Cracks were covered with tape to prevent water infiltration.

metso

Conclusion and recommendations

- Sole plates could not be set properly due to unknown factor that made them warp during the grout curing process
- Cracks in grout will have to be repaired as per supplier recommendation when environment can be controlled.

metso

Future work

- Clamping ring bolt still needs to be torqued.
- Setting up soft foot and assembly of the crusher.

BUILDING FOUNDATION NOTES:

2.1 BUILDING FOUNDATION SUBGRADE SHALL CONSIST OF SOUND BEDROCK.
2.2 THE PREPARED FOOTING SUBGRADE SHALL BE PROTECTED FROM WATER INGRESS AND SOFTENING BY PROVIDING ADEQUATE DRAINAGE OR PLACING A LEAN CONCRETE MUD SLAB.
2.3 ALL FOUNDATION SUBGRADE SHALL BE INSPECTED AND APPROVED BY THE GEOTECHNICAL ENGINEER PRIOR TO PLACEMENT OF CONCRETE.
2.4 ALL STRUCTURAL BACKFILL UNDER AND AROUND THE BUILDING FOUNDATIONS AND SLAB ON GRADE SHALL BE "NFS STRUCTURAL FILL" AS DESCRIBED IN H354138-0000-220-210-0001 CIVIL DESIGN CRITERIA TABLE 4-1.
2.5 FOR BUILDING FOUNDATION EXCAVATION AND LINER SEE DRAWING H354138-2150-220-260-0002.

GENERAL NOTES:

1.1 READ THESE DRAWINGS IN CONJUNCTION WITH ALL OTHER PERTINENT CONTRACT DOCUMENTS.
1.2 FOR CONCRETE TYPICAL DETAILS DRAWING SET AND GENERAL NOTES, SEE DRAWINGS 354138-0000-231-294-0001 TO -0007.
1.3 REFER TO MECHANICAL, PROCESS AND ELECTRICAL DRAWINGS FOR LOCATIONS AND DIMENSIONS OF OPENINGS, SLEEVES AND OTHER BUILDING COMPONENTS NOT SHOWN ON STRUCTURAL DRAWINGS. REPORT DISCREPENCIES TO THE OWNER OR HIS REPRESENTATIVE PRIOR TO PROCEEDING WITH THE WORK.
1.4 FOR GENERAL SITE LOCATION AND WORK POINT COORDINATES, SEE DRAWING H354138-2000-220-270-0002.
1.5 HIGH ENERGY COMPACTION EQUIPMENT SUCH AS LARGE ROLLERS MUST NOT BE USED FOR COMPACTING BACKFILL WITHIN 1 METER OF THE EDGE OF THE WALLS.
1.6 FOR GROUNDING LOOP SEE ELECTRICAL DRAWING H354138-8000-260-272-1000-0001 TO 0003. FOR GROUNDING INSTALLATION DETAILS SEE DRAWING SET H354138-0000-260-294-0001-0009 AND 0010.
1.7 FOR FINISHED GRADING PLAN SEE DRAWING H354138-2150-220-290-0001.
1.8 FOR CAST-IN PLACE CONCRETE, SEE SPECIFICATION SECTION H354138-5032000.
1.9 FOR CONCRETE FORMWORK, SEE SPECIFICATION SECTION H354138-5031000.
1.10 FOR CONCRETE REINFORCEMENT, SEE SPECIFICATION SECTION H354138-5033000.
1.11 FOR GROUTING, SEE SPECIFICATION SECTION H354138-5039000.
1.12 CONSTRUCTION JOINTS NOT SHOWN ON THE DRAWINGS MUST BE APPROVED BY THE CONTRUCTION MANAGER.
1.13 IN CASE OF ANY DISCREPANCIES, INFORM THE CONSTRUCTION MANAGER BEFORE COMMENCING WORK.
1.14 ALL DIMENSIONS ARE IN MILLIMETERS AND ELEVATIONS ARE IN METERS.
1.15 PROVIDE 19mm X 19mm CHAMFER AT ALL EXPOSED CONCRETE CORNERS AND EDGES ABOVE GRADE LEVEL, EXCEPT TOP OF ALL THE PEDESTALS, GRADE BEAMS AND CURBS, WHERE WALL CLADDING TO BE CONNECTED.
1.16 THE DRAWINGS SHOULD BE READ IN CONJUNCTION WITH THE PROJECT CIVIL DESIGN CRITERIA H354138-0000-220-210-0001.
1.17 FOR FURTHER GEOTECH INFORMATION, SEE "2011 GEOTECHNICAL INVESTIGATION FOR MINE SITE INFRASTRUCTURE FOUNDATION REPORT" BY BGC ENGINEERING DATED JAN 31, 2012.
1.18 SET ANCHOR RODS USING TEMPLATES WHICH MUST BE LEFT IN PLACE UNTIL THE CONCRETE HAS SET. ANCHOR RODS SHALL BE PLUMBED AND SECURED FROM MOVEMENT PRIOR TO CASTING CONCRETE.

GENERAL NOTES ON REINFORCEMENT

THE FOLLOWING NOTES SHALL APPLY TO ALL REINFORCEMENT SHOWN ON THE DRAWINGS UNLESS OTHERWISE NOTED.

DIMENSIONS:
DIMENSIONS TO REINFORCEMENT ARE TO CENTRE LINES OF BARS, EXCEPT WHERE CONCRETE COVER OR CLEARANCE BETWEEN BARS IS SHOWN.

COVER:
SEE SUBSTRUCTURE ENGINEER TYPICAL NOTES FOR ALL COVER SPECIFICATIONS

SPACING:
UNLESS OTHERWISE SHOWN, THE FIRST AND LAST BARS IN SLABS AND WALLS, STIRRUPS IN BEAMS SHALL BE PLACED AT MAXIMUM OF HALF THE SPECIFIED SPACING OF ADJACENT BARS FROM THE END OF THE MEMBER.

STEEL SPECIFICATIONS:
STEEL REINFORCEMENT SHALL BE DEFORMED BARS OF GRADE 400 CONFORMING TO CSA STANDARDS G30.12 BILLET-STEEL BARS FOR CONCRETE REINFORCEMENT.

WELDING:
WELDING OF REINFORCEMENT SHALL NOT BE PERMITTED.

SPLICES AND EMBEDMENTS:
UNLESS OTHERWISE SPECIFIED, ALL EMBEDMENTS SHALL BE TREATED AS TENSION EMBEDMENTS AND ALL LAP SPLICES SHALL BE CONSIDERED AS TENSION LAP SPLICES.

WHEN REINFORCING BARS OF DIFFERENT SIZE ARE TO BE SPLICED, THE LENGTH OF THE LAP SHALL BE BASED ON THE DIAMETER OF THE SMALLER BAR.

SPLICES ARE TO BE MADE SO THAT THE OTHER CLEAR DISTANCE CRITERIA WILL BE MAINTAINED.

LAP LENGTHS UNLESS SHOWN OTHERWISE:

	NORTH	CORNER
10M	520	480
15M	775	585
20M	1030	780
25M	1675	1240
30M	1940	1480
35M		

PLACEMENT:
PLACE REINFORCING STEEL IN ACCORDANCE WITH CSA CAN/S-A23.1-M.

REINFORCEMENT MAY BE DISPLACED TO CLEAR PIPES, RECESSES, EMBEDDED METAL WORKS AND CONDUITS.

A MINIMUM CLEARANCE OF 1" SHALL BE MAINTAINED BETWEEN REINFORCEMENT AND EMBEDDED MATERIALS. THE MINIMUM CLEARANCE BETWEEN REINFORCEMENT

REINFORCEMENT SHALL BE ACCURATELY PLACED IN ACCORDANCE WITH THE DRAWINGS AND SHALL BE ADEQUATELY SECURED AGAINST DISPLACEMENT BY USING ANNEALED IRON WIRE AT INTERSECTIONS AND SHALL BE SUPPORTED BY APPROVED CONCRETE OR METAL SUPPORTS, SPACERS OR METAL HANGERS EXCEPT AT SURFACES EXPOSED TO THE GROUND OR TO THE WEATHER WHERE SUPPORTS SHALL BE APPROVED. ALL METAL ACCESSORIES ARE TO BE GALVANIZED.

THE FULL INTENT AND PURPOSE OF THESE DRAWINGS IS PLACING OF REINFORCING STEEL BARS ONLY. IT IS NOT TO BE USED AS A MEANS OF COMMUNICATION BETWEEN THE ARCHITECT, ENGINEER, CONTRACTOR OR ANY OTHER SUBTRADE.

20M	1400	790
25M	1625	1240
30M	1940	1485
35M		

PLACEMENT:
PLACE REINFORCING STEEL IN ACCORDANCE WITH CSA CAN3-A23.1-M.

REINFORCEMENT MAY BE DISPLACED TO CLEAR PIPES, RECESSES, EMBEDDED METAL WORKS AND CONDUITS.

A MINIMUM CLEARANCE OF 1" SHALL BE MAINTAINED BETWEEN REINFORCEMENT AND EMBEDDED MATERIALS. THE MINIMUM CLEARANCE BETWEEN REINFORCEMENT

REINFORCEMENT SHALL BE ACCURATELY PLACED IN ACCORDANCE WITH THE DRAWING AND SHALL BE ADEQUATELY SECURED AGAINST DISPLACEMENT BY USING MANEALED IRON WIRE AT INTERSECTIONS AND SHALL BE SUPPORTED BY APPROVED CONCRETE OR METAL SUPPORTS, SPACERS OR METAL HANGERS EXCEPT AT SURFACES EXPOSED TO THE GROUND OR TO THE WEATHER WHERE SUPPORTS SHALL BE APPROVED. ALL METAL ACCESSORIES ARE TO BE GALVANIZED.

THE FULL INTENT AND PURPOSE OF THESE DRAWINGS IS PLACING OF REINFORCING STEEL BARS ONLY. IT IS NOT TO BE USED AS A MEANS OF COMMUNICATION BETWEEN THE ARCHITECT, ENGINEER, CONTRACTOR OR ANY OTHER SUBTRADE.

ORIENTATION

TYPICAL W.W.P.

(FIELD CUT TO SUIT AS REQUIRED)

GENERAL NOTES ON REINFORCEMENT

THE FOLLOWING NOTES SHALL APPLY TO ALL REINFORCEMENT SHOWN ON THE DRAWINGS UNLESS OTHERWISE NOTED.

DIMENSIONS:
DIMENSIONS TO REINFORCEMENT ARE TO CENTRE LINES OF BARS. EXCEPT WHERE CONCRETE COVER OR CLEARANCE BETWEEN BARS IS SHOWN.

COVER:
SEE STRUCTURAL ENGINEER TYPICAL NOTES FOR ALL OTHER SPECIFICATIONS

SPACING:
UNLESS OTHERWISE SHOWN, THE FIRST AND LAST BARS IN SLABS AND WALLS, STIRRUPS IN BEAMS SHALL BE PLACED AT A MINIMUM OF HALF THE SPECIFIED SPACING OF REMAINING BARS FROM THE END OF THE MEMBER.

STEEL SPECIFICATIONS:
STEEL REINFORCEMENT SHALL BE DEFORMED BARS OF GRADE 400 CONFORMING TO CSA STANDARDS G30.12 BILLET-STEEL BARS FOR CONCRETE REINFORCEMENT.

WELDING:
WELDING OF REINFORCEMENT SHALL NOT BE PERMITTED.

SPLICES AND EMBEDMENTS:
UNLESS OTHERWISE SPECIFIED, ALL EMBEDMENTS SHALL BE TREATED AS TENSION EMBEDMENTS AND ALL LAP SPLICES SHALL BE CONSIDERED AS TENSION LAP SPLICES.

WHEN REINFORCING BARS OF DIFFERENT SIZE ARE TO BE SPLICED, THE LENGTH OF THE LAP SHALL BE BASED ON THE DIAMETER OF THE SMALLER BAR.

SPLICES ARE TO BE MADE SO THAT THE GIVEN CLEAR DISTANCE COVER WILL BE MAINTAINED.

LAP LENGTHS UNLESS SHOWN OTHERWISE:

	HSR3	OTHER
10M	525	408

Package Engineer: Name, signature and date
ESKA AGINCI, EA, Aug 20, 2018

Reviewed only for general conformity with the specifications. Acceptance by the engineer does not warrant or represent that the information contained on this drawing/document is either accurate or complete. The sole responsibility for correct design, details & dimensions shall remain with the party submitting the drawing/document.

GENERAL NOTES ON REINFORCEMENT

THE FOLLOWING NOTES SHALL APPLY TO ALL REINFORCEMENT SHOWN ON THE DRAWINGS UNLESS OTHERWISE NOTED.

DIMENSIONS:
DIMENSIONS TO REINFORCEMENT ARE TO CENTRE LINES OF BARS, EXCEPT WHERE CONCRETE COVER OR CLEARANCE BETWEEN BARS IS SHOWN.

COVER:
SEE STRUCTURAL ENGINEER TYPICAL NOTES FOR ALL COVER SPECIFICATIONS.

SPACING:
UNLESS DIMENSIONS SHOWN, THE FIRST AND LAST BARS IN SLABS AND WALLS, STIRRUPS IN BEAMS SHALL BE PLACED AT A MAXIMUM OF HALF THE SPECIFIED SPACING OF ADJACENT BARS FROM THE END OF THE MEMBER.

STEEL SPECIFICATIONS:
STEEL REINFORCEMENT SHALL BE DEFORMED BARS OF GRADE 400R CONFORMING TO CSA STANDARD G30.18 BILLET-STEEL BARS FOR CONCRETE REINFORCEMENT.

WELDING:
WELDING OF REINFORCEMENT SHALL NOT BE PERMITTED.

SPLICES AND EMBEDMENTS:
UNLESS OTHERWISE SPECIFIED, ALL EMBEDMENTS SHALL BE TREATED AS TENSION EMBEDMENTS AND ALL LAP SPLICES SHALL BE CONSIDERED AS TENSION LAP SPLICES.

WHEN REINFORCING BARS OF DIFFERENT SIZE ARE TO BE SPLICED, THE LENGTH OF THE LAP SHALL BE BASED ON THE DIAMETER OF THE SMALLER BAR.

SPLICES ARE TO BE MADE SO THAT THE GIVEN CLEAR DISTANCE COVER WILL BE MAINTAINED.

LAP LENGTHS UNLESS SHOWN OTHERWISE:

	HORIZ	OTHER
10M	300	400
15M	375	525
20M	1050	750
25M	1675	1240
30M	1940	1485
35M		

PLACEMENT:
PLACE REINFORCING STEEL IN ACCORDANCE WITH CSA A23.1-M-94.

REINFORCEMENT MAY BE DISPLACED TO CLEAR PIPES, RECESSES, EMBEDDED METAL WORKS AND CONDUITS.

A MINIMUM CLEARANCE OF 1" SHALL BE MAINTAINED BETWEEN REINFORCEMENT AND EMBEDDED MATERIALS. THE MINIMUM CLEARANCE BETWEEN REINFORCEMENT

REINFORCEMENT SHALL BE ACCURATELY PLACED IN ACCORDANCE WITH THE DRAWINGS AND SHALL BE ADEQUATELY SECURED AGAINST DISPLACEMENT BY USING WIRE TIES OR WIRE AT INTERSECTIONS AND SHALL BE SUPPORTED BY APPROVED CONCRETE OR METAL SUPPORTS. SPACERS OR METAL HANGERS EXCEPT AT SURFACES EXPOSED TO THE GROUND OR TO THE WEATHER WHERE SUPPORTS SHALL BE APPROVED. ALL METAL ACCESSORIES ARE TO BE GALVANIZED.

THE FULL INTENT AND PURPOSE OF THESE DRAWINGS IS PLACING OF REINFORCING STEEL BARS ONLY. IT IS NOT TO BE USED AS A MEANS OF COMMUNICATION BETWEEN THE ARCHITECT, ENGINEER, CONTRACTOR OR ANY OTHER SUBTRADE.

THE FOLLOWING NOTES SHALL APPLY TO ALL REINFORCEMENT SHOWN ON THE DRAWINGS UNLESS OTHERWISE NOTED.

DIMENSIONS:
DIMENSIONS TO REINFORCEMENT ARE TO CENTRE LINES OF BARS, EXCEPT WHERE CONCRETE COVER OR CLEARANCE BETWEEN BARS IS SHOWN.

COVER:
SEE STRUCTURAL ENGINEER TYPICAL NOTES FOR ALL COVER SPECIFICATIONS

SPACING:
UNLESS OTHERWISE SHOWN, THE FIRST AND LAST BARS IN SLABS AND WALLS, STIRRUPS IN BEAMS SHALL BE PLACED AT A MAXIMUM OF HALF THE SPECIFIED SPACING OF ADJACENT BARS FROM THE END OF THE MEMBER.

STEEL SPECIFICATIONS:
STEEL REINFORCEMENT SHALL BE DEFORMED BARS OF GRADE 400 CONFORMING TO CSA STANDARDS G30.18 BILLET-STEEL BARS FOR CONCRETE REINFORCEMENT.

WELDING:
WELDING OF REINFORCEMENT SHALL NOT BE PERMITTED.

SPLICES AND EMBEDMENTS:
UNLESS OTHERWISE SPECIFIED, ALL EMBEDMENTS SHALL BE TREATED AS TENSION EMBEDMENTS AND ALL LAP SPLICES SHALL BE CONSIDERED AS TENSION LAP SPLICES.

WHEN REINFORCING BARS OF DIFFERENT SIZE ARE TO BE SPLICED, THE LENGTH OF THE LAP SHALL BE BASED ON THE DIAMETER OF THE SMALLER BAR.

SPLICES ARE TO BE MADE SO THAT THE MINIMUM CLEAR DISTANCE COVER WILL BE MAINTAINED.

LAP LENGTHS UNLESS SHOWN OTHERWISE:

	HOOK	STRAIGHT
10M	320	480
15M	470	705
20M	630	945
25M	785	1180
30M	940	1405
35M		

PLACEMENT:
PLACE REINFORCING STEEL IN ACCORDANCE WITH CSA CAN3-A23.1-M.

REINFORCEMENT MAY BE DISPLACED TO CLEAR PIPES, RECESSES, EMBEDDED METAL WORKS AND CONDUITS.

A MINIMUM CLEARANCE OF 1" SHALL BE MAINTAINED BETWEEN REINFORCEMENT AND EMBEDDED MATERIALS. THE MINIMUM CLEARANCE BETWEEN REINFORCEMENT

REINFORCEMENT SHALL BE ACCURATELY PLACED IN ACCORDANCE WITH THE DRAWINGS AND SHALL BE ADEQUATELY SECURED AGAINST DISPLACEMENT BY USING ANNEALED IRON WIRE AT INTERSECTIONS. AND SHALL BE SUPPORTED BY APPROVED CONCRETE OR METAL SUPPORTS. SPACERS OR METAL HANGERS EXCEPT AT SURFACES EXPOSED TO THE WEATHER WHERE SUPPORTS SHALL BE APPROVED. ALL METAL ACCESSORIES ARE TO BE GALVANIZED.

THE FULL INTENT AND PURPOSE OF THESE DRAWINGS IS PLACING OF REINFORCING STEEL BARS ONLY. IT IS NOT TO BE USED AS A MEANS OF COMMUNICATION BETWEEN THE ARCHITECT, ENGINEER, CONTRACTOR OR ANY OTHER SUBTRADE.

GENERAL NOTES ON REINFORCEMENT

THE FOLLOWING NOTES SHALL APPLY TO ALL REINFORCEMENT SHOWN ON THE DRAWINGS UNLESS OTHERWISE NOTED.

DIMENSIONS:
DIMENSIONS TO REINFORCEMENT ARE TO CENTRE LINES OF BARS, EXCEPT WHERE CONCRETE COVER OR CLEARANCE BETWEEN BARS IS SHOWN.

COVER:
SEE STRUCTURAL ENGINEER TYPICAL NOTES FOR ALL COVER SPECIFICATIONS

SPACING:
UNLESS OTHERWISE SHOWN, THE FIRST AND LAST BARS IN SLABS AND WALLS, STIRRUPS IN BEAMS SHALL BE PLACED AT A MAXIMUM OF HALF THE SPECIFIED SPACING OF ADJACENT BARS FROM THE END OF THE MEMBER.

STEEL SPECIFICATIONS:
STEEL REINFORCEMENT SHALL BE DEFORMED BARS OF GRADE 400 CONFORMING TO CSA STANDARDS G30.12 BILLET-STEEL BARS FOR CONCRETE REINFORCEMENT.

WELDING:
WELDING OF REINFORCEMENT SHALL NOT BE PERMITTED.

SPLICES AND EMBEDMENTS:
UNLESS OTHERWISE SPECIFIED, ALL EMBEDMENTS SHALL BE TREATED AS TENSION EMBEDMENTS AND ALL LAP SPLICES SHALL BE CONSIDERED AS TENSION LAP SPLICES.

WHEN REINFORCING BARS OF DIFFERENT SIZE ARE TO BE SPLICED, THE LENGTH OF THE LAP SHALL BE BASED ON THE DIAMETER OF THE SMALLER BAR.

SPLICES ARE TO BE MADE SO THAT THE GIVEN CLEAR DISTANCE COVER WILL BE MAINTAINED.

LAP LENGTHS UNLESS SHOWN OTHERWISE:

	15M	20M/25
30M	525	400
25M	975	595
20M	1300	790
15M	1975	1240
10M	1940	1485
25M		

PLACEMENT:
PLACE REINFORCING STEEL IN ACCORDANCE WITH CSA CAN3-A23.1-M.

REINFORCEMENT MAY BE DISPLACED TO CLEAR PIPES, RECESSES, EMBEDDED METAL WORKS AND CONDUITS.

A MINIMUM CLEARANCE OF 1" SHALL BE MAINTAINED BETWEEN REINFORCEMENT AND EMBEDDED MATERIALS. THE MINIMUM CLEARANCE BETWEEN REINFORCEMENT .

REINFORCEMENT SHALL BE ACCURATELY PLACED IN ACCORDANCE WITH THE DRAWING AND SHALL BE ADEQUATELY SECURED AGAINST DISPLACEMENT BY USING ANNEALED IRON WIRE AT INTERSECTIONS. BAR SHALL BE SUPPORTED BY APPROVED CONCRETE OR METAL SUPPORTS, SPACERS OR METAL HANGERS EXCEPT AT SURFACES EXPOSED TO THE GROUND OR TO THE WEATHER WHERE SUPPORTS SHALL BE APPROVED. ALL METAL ACCESSORIES ARE TO BE GALVANIZED.

THE FULL INTENT AND PURPOSE OF THESE DRAWINGS IS PLACING OF REINFORCING STEEL BARS ONLY. IT IS NOT TO BE USED AS A MEANS OF COMMUNICATION BETWEEN THE ARCHITECT, ENGINEER, CONTRACTOR OR ANY OTHER SURFACE.

GENERAL NOTES ON REINFORCEMENT

THE FOLLOWING NOTES SHALL APPLY TO ALL REINFORCEMENT SHOWN ON THE DRAWINGS UNLESS OTHERWISE NOTED.

DIMENSIONS:
DIMENSIONS TO REINFORCEMENT ARE TO CENTRE LINES OF BARS, EXCEPT WHERE CONCRETE COVER OR CLEARANCE BETWEEN BARS IS SHOWN.

COVER:
SEE STRUCTURAL ENGINEER TYPICAL NOTES FOR ALL COVER SPECIFICATIONS

SPACING:
UNLESS OTHERWISE SHOWN, THE FIRST AND LAST BARS IN SLABS AND WALLS, STIRRUPS IN BEAMS SHALL BE PLACED AT MAXIMUM OF HALF THE SPECIFIED SPACING OF ADJACENT BARS FROM THE END OF THE MEMBER.

STEEL SPECIFICATIONS:
STEEL REINFORCEMENT SHALL BE DEFORMED BARS OF GRADE 400 CONFORMING TO CSA STANDARDS G30.12 BILLET-STEEL BARS FOR CONCRETE REINFORCEMENT.

WELDING:
WELDING OF REINFORCEMENT SHALL NOT BE PERMITTED.

SPLICES AND EMBEDMENTS:
UNLESS OTHERWISE SPECIFIED, ALL EMBEDMENTS SHALL BE TREATED AS TENSION EMBEDMENTS AND ALL LAP SPLICES SHALL BE CONSIDERED AS TENSION LAP SPLICES.

WHEN REINFORCING BARS OF DIFFERENT SIZE ARE TO BE SPLICED, THE LENGTH OF THE LAP SHALL BE BASED ON THE DIAMETER OF THE SMALLER BAR.

SPLICES ARE TO BE MADE SO THAT THE EITHER CLEAR DISTANCE COVER WILL BE MAINTAINED.

LAP LENGTHS UNLESS SHOWN OTHERWISE:

	HORZ	OTHER
10M	520	400
15M	775	595
20M	1030	790
25M	1570	1240
30M	1940	1485
35M		

PLACEMENT:
PLACE REINFORCING STEEL IN ACCORDANCE WITH CSA A23.1-04.

REINFORCEMENT MAY BE DISPLACED TO CLEAR PIPES, RECESSES, EMBEDDED METAL ARMS AND CONDUITS.

A MINIMUM CLEARANCE OF 1" SHALL BE MAINTAINED BETWEEN REINFORCEMENT AND EMBEDDED MATERIALS. THE MINIMUM CLEARANCE BETWEEN REINFORCEMENT

REINFORCEMENT SHALL BE ACCURATELY PLACED IN ACCORDANCE WITH THE DRAWING AND SHALL BE ADEQUATELY SECURED AGAINST DISPLACEMENT BY USING ANNEALED IRON WIRE AT INTERSECTIONS AND SHALL BE SUPPORTED BY APPROVED CONCRETE OR METAL SUPPORTS. SPACERS OR METAL HANGERS EXCEPT AT SURFACES EXPOSED TO THE GROUND OR TO THE WEATHER WHERE SUPPORTS SHALL BE APPROVED. ALL METAL ACCESSORIES ARE TO BE GALVANIZED.

THE FULL INTENT AND PURPOSE OF THESE DRAWINGS IS PLACING OF REINFORCING STEEL BARS ONLY. IT IS NOT TO BE USED AS A MEANS OF COMMUNICATION BETWEEN THE ARCHITECT, ENGINEER, CONTRACTOR OR ANY OTHER SUBTRADE.

GENERAL NOTES ON REINFORCEMENT

THE FOLLOWING NOTES SHALL APPLY TO ALL REINFORCEMENT SHOWN ON THE DRAWINGS UNLESS OTHERWISE NOTED.

DIMENSIONS:
DIMENSIONS TO REINFORCEMENT ARE TO CENTRE LINES OF BARS. EXCEPT WHERE CONCRETE COVER OR CLEARANCE BETWEEN BARS IS SHOWN.

COVER:
SEE STRUCTURAL ENGINEER TYPICAL NOTES FOR ALL COVER SPECIFICATIONS

SPACING:
UNLESS OTHERWISE SHOWN, THE FIRST AND LAST BARS IN SLABS AND WALLS, STIRRUPS IN BEAMS SHALL BE PLACED AT MAXIMUM OF HALF THE SPECIFIED SPACING OF ADJACENT BARS FROM THE END OF THE MEMBER.

STEEL SPECIFICATIONS:
STEEL REINFORCEMENT SHALL BE DEFORMED BARS OF GRADE 400 CONFORMING TO CSA STANDARDS G30.12 BILLET-STEEL BARS FOR CONCRETE REINFORCEMENT.

WELDING:
WELDING OF REINFORCEMENT SHALL NOT BE PERMITTED.

SPLICES AND EMBEDMENTS:
UNLESS OTHERWISE SPECIFIED, ALL EMBEDMENTS SHALL BE TREATED AS TENSION EMBEDMENTS AND ALL LAP SPLICES SHALL BE CONSIDERED AS TENSION LAP SPLICES.

WHEN REINFORCING BARS OF DIFFERENT SIZE ARE TO BE SPLICED, THE LENGTH OF THE LAP SHALL BE BASED ON THE DIAMETER OF THE SMALLER BAR.

SPLICES ARE TO BE MADE SO THAT THE GIVEN CLEAR DISTANCE COVER WILL BE MAINTAINED.

LAP LENGTHS UNLESS SHOWN OTHERWISE:

	HORZ	OTHER
10M	520	400
15M	775	595
20M	1030	790
25M	1615	1240
30M	1940	1485
35M		

PLACEMENT:
PLACE REINFORCING STEEL IN ACCORDANCE WITH CSA CAN3-A23.1-M.

REINFORCEMENT MAY BE DISPLACE TO CLEAR PIPES, RECESSES, EMBEDDED METAL WORKS AND CONDUITS.

A MINIMUM CLEARANCE OF 1" SHALL BE MAINTAINED BETWEEN REINFORCEMENT AND EMBEDDED MATERIALS. THE MINIMUM CLEARANCE BETWEEN REINFORCEMENT

REINFORCEMENT SHALL BE ACCURATELY PLACED IN ACCORDANCE WITH THE DRAWING AND SHALL BE ADEQUATELY SECURED AGAINST DISPLACEMENT BY USING ANNEALED IRON WIRE AT INTERSECTIONS AND SHALL BE SUPPORTED BY APPROVED CONCRETE OR METAL SUPPORTS. SPACERS OR METAL HANGERS EXCEPT AT SURFACES EXPOSED TO THE GROUND OR TO THE WEATHER WHERE SUPPORTS SHALL BE APPROVED. ALL METAL ACCESSORIES ARE TO BE GALVANIZED.

THE FULL INTENT AND PURPOSE OF THESE DRAWINGS IS PLACING OF REINFORCING STEEL BARS ONLY. IT IS NOT TO BE USED AS A MEANS OF COMMUNICATION BETWEEN THE ARCHITECT, ENGINEER, CONTRACTOR OR ANY OTHER SUBTRADE.

GENERAL NOTES ON REINFORCEMENT

THE FOLLOWING NOTES SHALL APPLY TO ALL REINFORCEMENT SHOWN ON THE DRAWINGS UNLESS OTHERWISE NOTED.

DIMENSIONS:
DIMENSIONS TO REINFORCEMENT ARE TO CENTRE LINES OF BARS. EXCEPT WHERE CONCRETE COVER OR CLEARANCE BETWEEN BARS IS SHOWN.

COVER:
SEE STRUCTURAL ENGINEER TYPICAL NOTES FOR ALL COVER SPECIFICATIONS

SPACING:
UNLESS OTHERWISE SHOWN, THE FIRST AND LAST BARS IN SLABS AND WALLS, STIRRUPS IN BEAMS SHALL BE PLACED AT MAXIMUM OF HALF THE SPECIFIED SPACING OF ADJACENT BARS FROM THE END OF THE MEMBER.

STEEL SPECIFICATIONS:
STEEL REINFORCEMENT SHALL BE DEFORMED BARS OF GRADE 400 CONFORMING TO CSA STANDARDS G30.12 BILLET-STEEL BARS FOR CONCRETE REINFORCEMENT.

WELDING:
WELDING OF REINFORCEMENT SHALL NOT BE PERMITTED.

SPLICES AND EMBEDMENTS:
UNLESS OTHERWISE SPECIFIED, ALL EMBEDMENTS SHALL BE TREATED AS TENSION EMBEDMENTS AND ALL LAP SPLICES SHALL BE CONSIDERED AS TENSION LAP SPLICES.

WHEN REINFORCING BARS OF DIFFERENT SIZE ARE TO BE SPLICED, THE LENGTH OF THE LAP SHALL BE BASED ON THE DIAMETER OF THE SMALLER BAR.

SPLICES ARE TO BE MADE SO THAT THE GIVEN CLEAR DISTANCE COVER WILL BE MAINTAINED.

LAP LENGTHS UNLESS SHOWN OTHERWISE:

	HORZ	OTHER
10M	520	400
15M	775	595
20M	1030	790
25M	1615	1240
30M	1940	1485
35M		

PLACEMENT:
PLACE REINFORCING STEEL IN ACCORDANCE WITH CSA CAN3-A23.1-M.

REINFORCEMENT MAY BE DISPLACE TO CLEAR PIPES, RECESSES, EMBEDDED METAL WORKS AND CONDUITS.

A MINIMUM CLEARANCE OF 1" SHALL BE MAINTAINED BETWEEN REINFORCEMENT AND EMBEDDED MATERIALS. THE MINIMUM CLEARANCE BETWEEN REINFORCEMENT

REINFORCEMENT SHALL BE ACCURATELY PLACED IN ACCORDANCE WITH THE DRAWING AND SHALL BE ADEQUATELY SECURED AGAINST DISPLACEMENT BY USING ANNEALED IRON WIRE AT INTERSECTIONS AND SHALL BE SUPPORTED BY APPROVED CONCRETE OR METAL SUPPORTS. SPACERS OR METAL HANGERS EXCEPT AT SURFACES EXPOSED TO THE GROUND OR TO THE WEATHER WHERE SUPPORTS SHALL BE APPROVED. ALL METAL ACCESSORIES ARE TO BE GALVANIZED.

THE FULL INTENT AND PURPOSE OF THESE DRAWINGS IS PLACING OF REINFORCING STEEL BARS ONLY. IT IS NOT TO BE USED AS A MEANS OF COMMUNICATION BETWEEN THE ARCHITECT, ENGINEER, CONTRACTOR OR ANY OTHER SUBTRADE.

GENERAL NOTES ON REINFORCEMENT

THE FOLLOWING NOTES SHALL APPLY TO ALL REINFORCEMENT SHOWN ON THE DRAWINGS UNLESS OTHERWISE NOTED.

DIMENSIONS:
DIMENSIONS TO REINFORCEMENT ARE TO CENTRE LINES OF BARS, EXCEPT WHERE CONCRETE COVER OR CLEARANCE BETWEEN BARS IS SHOWN.

COVER:
SEE STRUCTURAL ENGINEER TYPICAL NOTES FOR ALL COVER SPECIFICATIONS

SPACING:
UNLESS OTHERWISE SHOWN, THE FIRST AND LAST BARS IN SLABS AND WALLS, STIRRUPS IN BEAMS SHALL BE PLACED AT A MAXIMUM OF HALF THE SPECIFIED SPACING OF ADJACENT BARS FROM THE END OF THE MEMBER.

STEEL SPECIFICATIONS:
STEEL REINFORCEMENT SHALL BE DEFORMED BARS OF GRADE 400R CONFORMING TO CSA STANDARD G30.18 BILLET-STEEL BARS FOR CONCRETE REINFORCEMENT.

WELDING:
WELDING OF REINFORCEMENT SHALL NOT BE PERMITTED.

SPLICES AND EMBEDMENTS:
UNLESS OTHERWISE SPECIFIED, ALL EMBEDMENTS SHALL BE TREATED AS TENSION EMBEDMENTS AND ALL LAP SPLICES SHALL BE CONSIDERED AS TENSION LAP SPLICES.

WHEN REINFORCING BARS OF DIFFERENT SIZE ARE TO BE SPLICED, THE LENGTH OF THE LAP SHALL BE BASED ON THE DIAMETER OF THE SMALLER BAR.

SPLICES ARE TO BE MADE SO THAT THE GIVEN CLEAR DISTANCE COVER WILL BE MAINTAINED.

LAP LENGTHS UNLESS SHOWN OTHERWISE:

	HORIZ	OTHER
10M	530	400
15M	775	585
20M	1000	755
25M	1415	1240
30M	1940	1485
35M		

PLACEMENT:
PLACE REINFORCING BARS IN ACCORDANCE WITH CSA A23.1-04.

REINFORCEMENT MAY BE DISPLACED TO CLEAR PIPES, RECESSES, EMBEDDED METAL NORMS AND CONDUITS.

A MINIMUM CLEARANCE OF 1" SHALL BE MAINTAINED BETWEEN REINFORCEMENT AND EMBEDDED MATERIALS. THE MINIMUM CLEARANCE BETWEEN REINFORCEMENT

REINFORCEMENT SHALL BE ACCURATELY PLACED IN ACCORDANCE WITH THE DRAWING AND SHALL BE ADEQUATELY SECURED AGAINST DISPLACEMENT BY USING APPROVED TIES FROM BARS AT INTERSECTIONS AND SHALL BE SUPPORTED BY APPROVED CONCRETE OR METAL SUPPORTS. SPACERS OF METAL HANGERS SUPPS AT SURFACES EXPOSED TO THE GROUND OR TO THE WEATHER WHERE SUPPORTS SHALL BE APPROVED. ALL METAL ACCESSORIES ARE TO BE GALVANIZED.

THE FULL INTENT AND PURPOSE OF THESE DRAWINGS IS PLACING OF REINFORCING STEEL BARS ONLY. IT IS NOT TO BE HELD AS A MEANS OF COMMUNICATION BETWEEN THE ARCHITECT, ENGINEER, CONTRACTOR OR ANY OTHER SUBTRADE.

Question from Ryan de Milliano (Clark Builders - Edmonton) at 09:23 AM on 01/08/2018

Drawing number H354138-5710-231-260-0008 identifies a 900mm long 28” diameter pipe on the south wall of the Barren Solution Sump Tank. The prime contract, SOW Concrete Installations (Part 3.2), allowed for embedded pipe sleeves, but not for this type of process pipe fittings.

Please clarify whether or not this embedded process pipe with flange will be provided by others or if Clark Builders will be responsible for acquiring the pipe and flange assembly. If Clark Builders is required to provide, provide weld details for the slip on flanges.

Awaiting an Official Response

All Replies:

Please provide and install the 28" diameter pipe on the south wall of the Barren Solution Sump Tank.
Follow the detail below for welding the flanges to the pipe

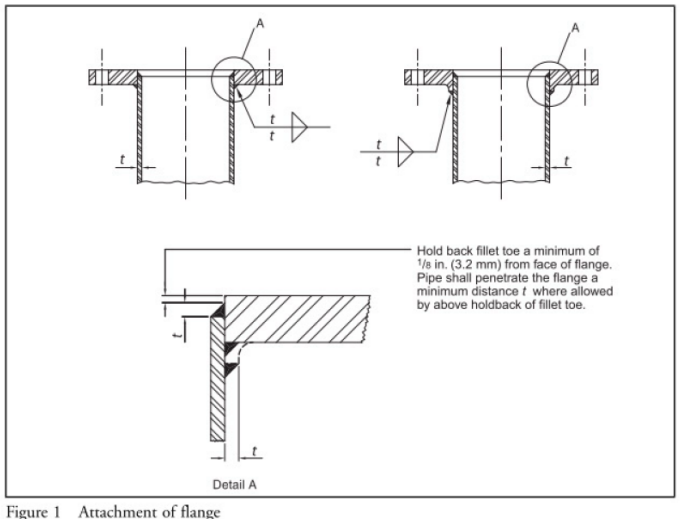

Figure 1 Attachment of flange

Question from Ryan de Milliano (Clark Builders - Edmonton) at 02:14 PM on 02/08/2018

RFI Details:
Our steel fabricator has been able to acquire a small length of pipe that matches what is required for the contract document. Since this material has been salvaged, it is non-certified. Our fabricator has noted that, due to US tariffs, it will be very difficult to acquire this size of pipe from their regular suppliers and may require sourcing from overseas which could have an impact on schedule.

Request:
Clark Builders is requesting permission to proceed with the non-certified pipe acquired from out fabricator. We can complete a positive material identification test to determine chemical composition and grade of steel, if required. Since we are beginning to form walls next week for this tank, this is a high priority RFI.

Related Clark Builders RFI:
RFI #20 ADR Barren Solution Sump Tank – 28” Pipe Clarification

Awaiting an Official Response

All Replies:

Request is approved.

Please complete a material identification test.

Question from Jackson Wenger (Clark Builders - Edmonton) at 08:49 PM on 03/08/2018

Please confirm that octagonal tank base footing shown in attached snapshot from drawing H354138-5710-231-260-0007 at grid lines C & D/ 4-5 do not require anchor bolts (or anchors for these pads are field-set hilti type anchors by equipment installer).

Attachments:
1533350257217.931885_tempImage.jpeg

Awaiting an Official Response

All Replies:

Confirmed.

Marked up tanks do not require any embedded anchors, they will be anchored down by the mechanical installer using Hilti type anchors.

Question from Jackson Wenger (Clark Builders - Edmonton) at 09:43 AM on 06/08/2018

Current joint layout for 5710 sump pits in footings will make forming and finishing sump pits difficult. Clark Builders is requesting an additional construction joint, with additional waterstop, so the sump pit base can be cast prior to footing installation. Please see attached drawing snapshot for details.

Question from Ryan de Milliano (Clark Builders - Edmonton) at 05:57 PM on 18/08/2018

The AB-T4 anchor bolts for tank footing, located at GL B-5, had a specified projection of 430mm from the top of concrete. Currently they are as built with a projection from TOC of 250mm.

Option 1: Leave as is.
Option 2: If 250mm of projection is not sufficient for design, would it be possible to use a threaded coupler, additional steel and tack weld the coupler in place to achieve required 430mm projection.

Attachments:
IMG_0093.PNG IMG_0094.PNG

Awaiting an Official Response

All Replies:

Threaded couplers and threaded anchor rods for extension need to be supplied. But do not weld them at this point. Couplers need to be installed after the tank is placed due to the chairs. Please see Section K-K on the attached tank dwg.

Question from Ryan de Milliano (Clark Builders - Edmonton) at 10:09 AM on 23/08/2018

At the two octagon tank footing, on GL 7 between A and C, the projecting Z bar dowels place the horizontal mat with a cover of 150mm to TOC.

Our proposed solutions are:
1. Add 2x30M horizontals on to the top of hooks, then replace mat onto the 30M bars and flip the mat and place/ tie to the 30M bars.
2. Field bend 20M straight bars to match Z bars installed. Then splice the new 20M's with hooks to each projecting Z bar. Then re0ave mat on the newly spliced 20M bars to active the correct cover.

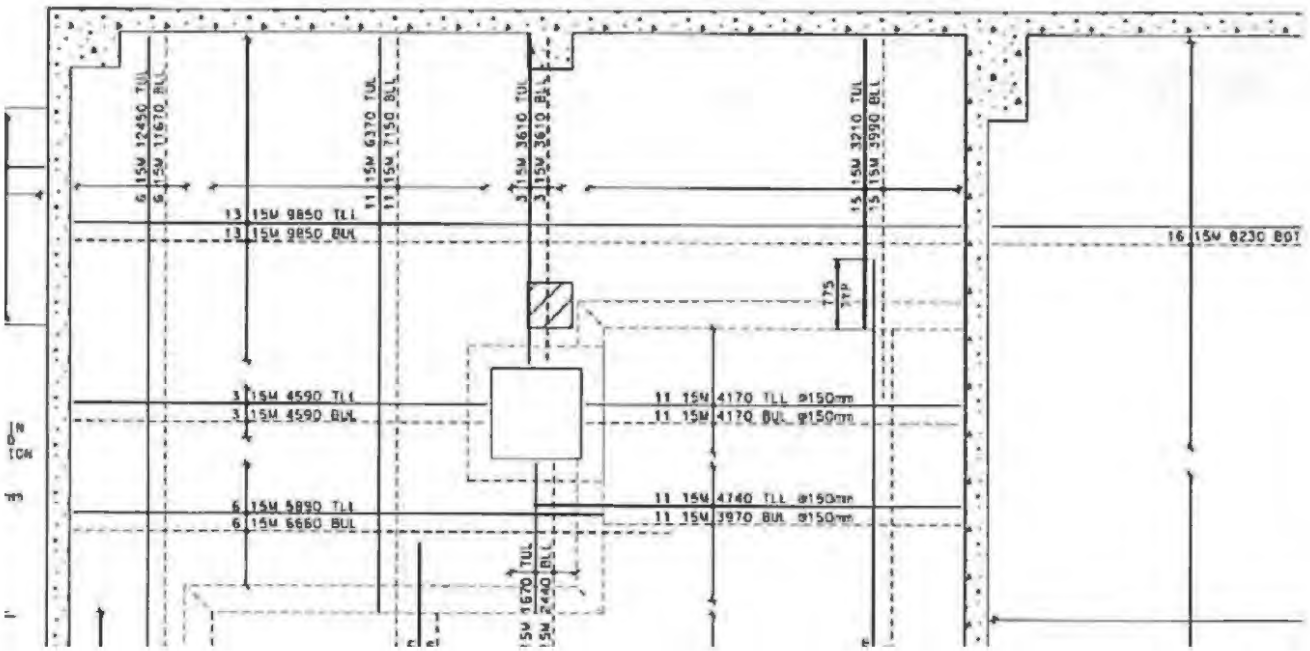
RFI #52- ADR Slab on Grade Gridlines A-B/1-3

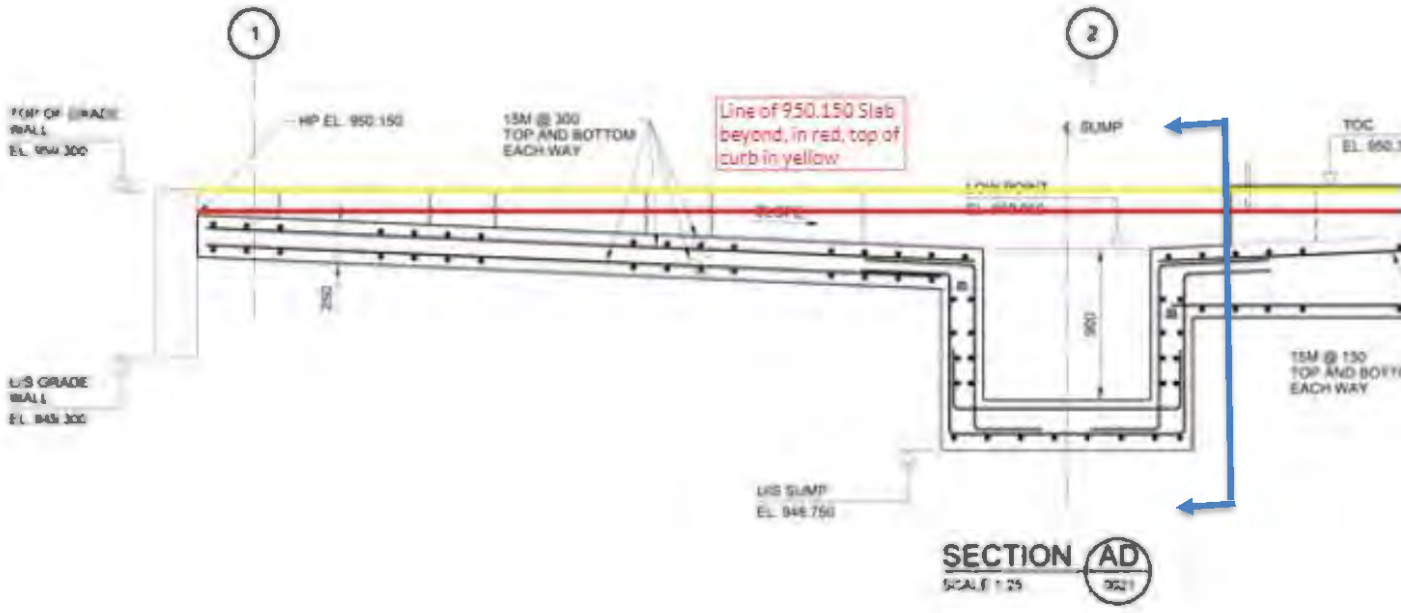
Project: Eagle Gold Project

Reinforcing detailing/fabrication for ADR plant SOG between gridlines A-B/1-3 has been detailed showing a continuous top and bottom mat running north-south through the curb at GL1-3, north of the electrowinning pumps.



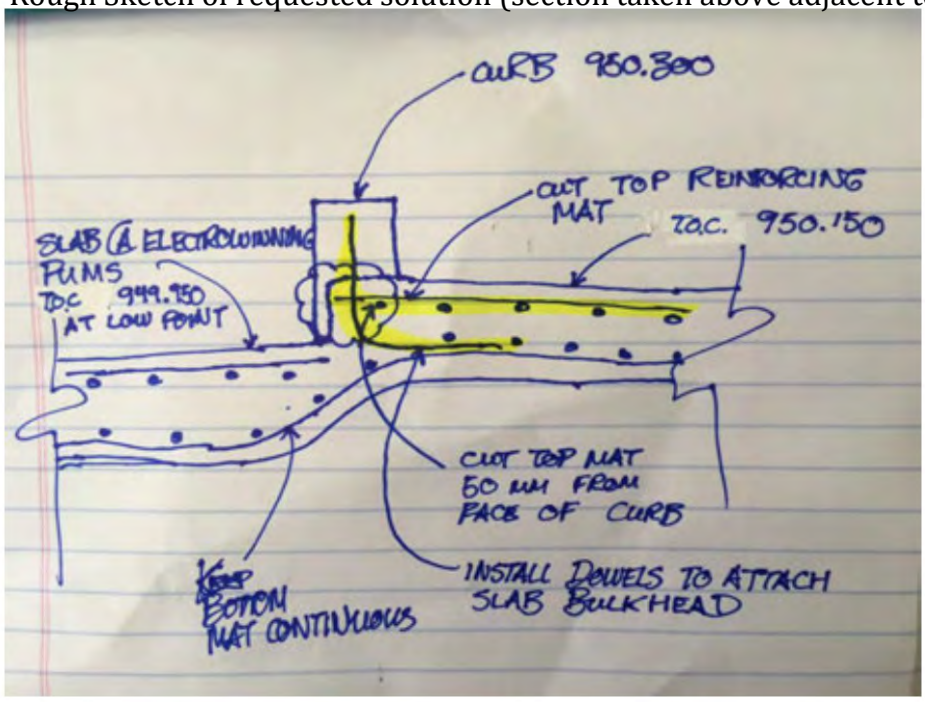
Slab north of curb is elevation 950.150, and slab on south side of curb slopes towards central sump (low point 949.950).

Clark Builders is requesting to cut top mat reinforcing 50 mm from south face of curb, while keeping bottom mat continuous, with additional L-dowels for affixing a bulkhead, so both slabs can be poured at the same time.



Please see sketches below.

Thank You,



Current Reinforcing Shop Drawing Screenshot

Section AD from drawing 5710231-260-0021, with curb and slab highlighted.

Rough Sketch of requested solution (section taken above adjacent to sump)

Question from Jackson Wenger (Clark Builders - Edmonton) at 02:02 PM on 01/09/2018

Please provide/confirm the opening location at the north wall on the ADR transformer pad. Location of opening for cable is currently shown as hold item on H354138-5710-231-260-0032 Rev 2. Reinforcing drawings for ADR transformer pads have been submitted and do not show the opening; reinforcement will be field cut to suit w/reinforcing around opening per typical detail.

Attachments:
1535831940328.268066_tempImage.jpeg

Awaiting an Official Response

All Replies:

Opening sizes and locations on ADR Transformer North Wall are expected to be given by the Electrical Group next week.

But if the rebars need to be prepared urgently as per the pour schedule, please provide straight bars to be cut around the openings on Site and also provide corner bars to be located around the corners of the opening as per the standard Detail 31 on Dwg H354138-231-294-0004

Question from Ryan de Milliano (Clark Builders - Edmonton) at 11:30 AM on 07/09/2018

A total of 16 projecting 20M bars at 2 x ‘PED. TYPE P14’ locations require modification. Projecting dowels will not have the required cover. Proposed solution: Cut required dowel down and drill/epoxy new dowels beside, in correct location. Embedment depth for new drilled 20M dowels will be minimum 6”.

Awaiting an Official Response

All Replies:

Please do not cut the dowels.

Instead add 50mm clear cover to one side of the pedestal to increase the pedetal width from 300mm to 350mm. But keep the anchor bolt locations same as before, aligning with the other pedestals and being 150mm from one side and 200mm from the other side.

Question from Ryan de Milliano (Clark Builders - Edmonton) at 10:59 PM on 28/09/2018

Equipment pad, located near GL 2-B for the Electrowinning Return Pump, was poured as per revision 00 at an TOC EL 950.310, not the TOC EL 950.265 as noted in revision 01. The concrete is therefore 45mm higher.

In order to avoid cover issues with the reinforcement, please confirm it be acceptable to leave the equipment pad at the current TOC EL.

Attachments:
file-14.png file1-5.png

Awaiting an Official Response

All Replies:

Please grind 30mm of concrete to bring the TOC down to El. 950.280 so that there will be apprx. 15mm of clear cover left which is acceptable for this particular case, as it would be more difficult to change the elevation of the pump together with all the piping and the tank it is connected to.

FIELD REVIEW REPORT

ISSUED FOR REVIEW

To:	R. Bilobrowka; C. Goldschmidt; C. Abel; I. Fechter	**Date:**	July 15, 2018
c:		**Memo No.:**	001
From:	J. Buyck; C. Cowan	**File:**	704-ENG.WARC03532-05
Subject:	ADR Process Plant and Laydown Foundation Pad Proof Roll Testing		

This 'Issued for Review' document is provided solely for the purpose of client review and presents our interim findings and recommendations to date. Our usable findings and recommendations are provided only through an 'Issued for Use' document, which will be issued subsequent to this review. Final design should not be undertaken based on the interim recommendations made herein. Once our report is issued for use, the 'Issued for Review' document should be either returned to Tetra Tech Canada Inc. (Tetra Tech) or destroyed.

1.0 INTRODUCTION

Tetra Tech Canada Inc. (Tetra Tech) was requested to supervise proof-roll of the Non-Frost Susceptible (NFS) structural fill placed within the ADR Plant and Laydown Pad Foundation. The following summarizes the objectives and results of the work performed.

The bases for conducting the proof-roll was to provide additional means of ensuring the pad foundation is prepared to specification. Because of the coarseness of the 150 mm minus NFS structural fill material specified, results of the field density (compaction) testing with a Nuclear densometer showed enough inconsistencies. This is fairly typical and not unexpected when testing material of this type. The proof-roll is considered a supplementary measure to the compaction testing. The total thickness of NFS structural fill placed is about 0.9 m.

2.0 SCOPE

The objective of the proof roll was to reveal any soft or yielding material, and to supplement the field density (compaction) testing completed throughout the three lifts of the Non-Frost Susceptible (NFS) material placed, moisture-conditioned and compacted throughout the ADR site.

3.0 WORK PERFORMED

On July 15, 2018, a fully-loaded Volvo A40F Series Articulated dump truck was used to slowly drive (less than 5 km/h) throughout the area to be proof-rolled. It is understood that a single axel load of 18,000 lbs (80kN) would have been sufficient; however, because of availability, the larger articulated truck was used.

As required, observations were made from a point where visual contact could be maintained with the operator, and 2 to 3 m distance and at an approximate 45° angle from the tires. The truck made subsequent passes parallel to the previous lane until sufficient coverage of the site had been observed to assess the general subgrade condition.

Tel 867.668.3068 Fax 867.668.4349

4.0 RESULTS

The observations of the proof-roll were made, as required, and the amount of deflection and rutting were found to be negligible (0 – 5 mm). throughout the entire area.

As mentioned above, compaction testing was also performed. This was completed for each three lifts of the NFS material placed, as well as the sand bedding the liner. The results of the testing are provided in a separate report.

5.0 LIMITATIONS OF REPORT

This report and its contents are intended for the sole use of JDS Energy & Mining and their agents. Tetra Tech Canada Inc. (Tetra Tech) does not accept any responsibility for the accuracy of any of the data, the analysis, or the recommendations contained or referenced in the report when the report is used or relied upon by any Party other than JDS Energy & Mining, or for any Project other than the proposed development at the subject site. Any such unauthorized use of this report is at the sole risk of the user. Use of this document is subject to the Limitations on the Use of this Document attached in the Appendix or Contractual Terms and Conditions executed by both parties.

6.0 CLOSURE

We trust this technical memo meets your present requirements. If you have any questions or comments, please contact the undersigned.

Respectfully submitted,
Tetra Tech Canada Inc.

Elevations are orthometric.

Point	Northing	Easting	Elevation
4432	101535.445	59141.579	949.800
4433	101550.358	59226.308	949.222
WP 13	101550.931	59148.983	

Coordinate methodology

Control points are originally UTM NAD83 (CSRS) coordinates.
Control points are scaled to ground distances from WP13 at a CSF of 1.000529.
Control points are truncated to differentiate from UTM coordinates.
Scaled UTM Northing - 7,000,000 = Ground Northing
Scaled UTM Easting - 400,000 = Ground Easting

CONTRACTOR/INTERDISCIPLINE RELEASE FORM

Project:	Eagle Gold Project	**Revision No.**	0
Contractor:	Clark Builders	**Contract No:**	CB201
Area:	5710 – ADR E House Transformer Base		

Date *(mm/dd/yy)*:	08/31/2018	**Drawing No:**	H354138-5710-231-260-0032
Discipline:	Civil/Subgrade		

The following: **Area** ☒ **Equipment** ☐ **System** ☐ **Other** ☐

(Provide complete description of area item, equipment system and Tag Numbers where applicable):

Subgrade preparation to 949.850 m

Subject: RE: IDR - 5710 ADR Transformers

Hi Ishan:

Our surveyor has laid out the coordinates below, and has proposed some minor adjustments to align the transformer base with the ADR building, and square the corners. Adjustments are attached.

Please confirm that this is acceptable, and we can proceed.

Thank You,

JDS Mining
Suite 900, 999 West Hastings Street
Vancouver, BC V6C 2W2

Attention: Mr. Calvin Goldschmidt

Subject: Aggregate Analysis
20 mm Coarse Aggregate – Sample L-1
Fine Aggregate – Sample L-2
Mayo Area, Yukon

Pursuant to your request, Tetra Tech Canada Inc. (Tetra Tech), has completed testing on the samples submitted by JDS Mining. The samples were identified as being produced at the Mayo Area, Yukon, and received by Tetra Tech on November 27, 2017. The results are enclosed and summarized below.

Summary of Test Results

Test	Specifications	L-1 20 mm	L-2 Concrete Sand
Material Finer than 80 µm (CSA A23.2-5A)	CSA A23.1-14, Table 12, Maximum material finer than 80 µm % by mass of total sample: coarse – 1.0, fine – 3.0	2.3	13.2
Relative Density and Absorption of Coarse and Fine Aggregate (CSA A23.2-6A, 12A)	Bulk relative density	2.63	2.55
	Bulk relative density (saturated surface-dry)	2.65	2.67
	Apparent relative density	2.71	2.72
	Absorption (percentage)	1.1	1.0
Los Angeles Abrasion of Small Size Coarse Aggregate CSA A 23.2-16A	CSA A23.1 Table 12, Maximum Abrasion loss 50% by mass of sample	22.6	--
Micro-Deval Test (CSA A23.2-23A, 29A)	CSA A23.1-14, Table 12, Maximum Micro-Deval loss % by mass of total sample: coarse – 17, fine – 20	--	15
Colour Plate (CSA A23.3-7A)	CSA A23.1-14, Clause 4.2.3.3.2, Maximum 3	--	1
Fineness Modulus	Table 10, Minimum 2.3, Maximum 3.1 (FA1)	--	3.02

Tetra Tech Canada Inc.

Tel 403.203.3355 Fax 403.203.3301

The petrographic analysis was performed in accordance with Canadian Standards Association (CSA) A23.2-15A, petrographic examination of aggregates. The summary of the petrographic analysis of the aggregate, the 20 mm coarse aggregate L-1, is presented in the enclosed Table 1. The material is composed predominantly of gneiss/granite, with some quartzite/quartz, amphibolite and skarn, and a trace of slate and petrified wood. The petrographic number (PN) is 109.

The summary of the petrographic analysis of the fine aggregate L-2 is presented in the enclosed Table 2. The material is composed predominantly of gneiss/granite and quartzite/quartz, with some skarn and amphibolite, and a trace of slate and petrified wood.

CSA suggested PN limit (CSA 23.2-14, Table A2.1) for concrete Classes C1, C2, and F1 is a maximum of 125, and for all other concrete, the PN limit is 140. Alberta Transportation specifies a maximum PN of 130. Alberta Transportation specifies a maximum ironstone content of 0.8% for coarse aggregates, and 1.5% (retained on the 2.5 mm sieve) for fine aggregates.

The petrographic analysis is not related to the potential for alkali-aggregate reactivity (AAR) of this aggregate when used in Portland cement concrete. AAR potential must be separately assessed.

TETRA TECH

LIMITATIONS ON USE OF THIS DOCUMENT

CONSTRUCTION MATERIALS ENGINEERING AND TESTING

1.1 USE OF DOCUMENT AND OWNERSHIP

This document pertains to a specific site, a specific development, and a specific scope of work. The document may include plans, drawings, profiles and other supporting documents that collectively constitute the document (the "Professional Document").

The Professional Document is intended for the sole use of TETRA TECH's Client (the "Client") as specifically identified in the TETRA TECH Services Agreement or other Contractual Agreement entered into with the Client (either of which is termed the "Contract" herein). TETRA TECH does not accept any responsibility for the accuracy of any of the data, analyses, recommendations or other contents of the Professional Document when it is used or relied upon by any party other than the Client, unless authorized in writing by TETRA TECH.

Any unauthorized use of the Professional Document is at the sole risk of the user. TETRA TECH accepts no responsibility whatsoever for any loss or damage where such loss or damage is alleged to be or, is in fact, caused by the unauthorized use of the Professional Document.

Where TETRA TECH has expressly authorized the use of the Professional Document by a third party (an "Authorized Party"), consideration for such authorization is the Authorized Party's acceptance of these Limitations on Use of this Document as well as any limitations on liability contained in the Contract with the Client (all of which is collectively termed the "Limitations on Liability"). The Authorized Party should carefully review both these Limitations on Use of this Document and the Contract prior to making any use of the Professional Document. Any use made of the Professional Document by an Authorized Party constitutes the Authorized Party's express acceptance of, and agreement to, the Limitations on Liability.

The Professional Document and any other form or type of data or documents generated by TETRA TECH during the performance of the work are TETRA TECH's professional work product and shall remain the copyright property of TETRA TECH.

The Professional Document is subject to copyright and shall not be reproduced either wholly or in part without the prior, written permission of TETRA TECH. Additional copies of the Document, if required, may be obtained upon request.

1.2 ALTERNATIVE DOCUMENT FORMAT

Where TETRA TECH submits electronic file and/or hard copy versions of the Professional Document or any drawings or other project-related documents and deliverables (collectively termed TETRA TECH's "Instruments of Professional Service"), only the signed and/or sealed versions shall be considered final. The original signed and/or sealed electronic file and/or hard copy version archived by TETRA TECH shall be deemed to be the original. TETRA TECH will archive a protected digital copy of the original signed and/or sealed version for a period of 10 years.

Both electronic file and/or hard copy versions of TETRA TECH's Instruments of Professional Service shall not, under any circumstances, be altered by any party except TETRA TECH. TETRA TECH's Instruments of Professional Service will be used only and exactly as submitted by TETRA TECH.

Electronic files submitted by TETRA TECH have been prepared and submitted using specific software and hardware systems. TETRA TECH makes no representation about the compatibility of these files with the Client's current or future software and hardware systems.

1.3 STANDARD OF CARE

Services performed by TETRA TECH for the Professional Document have been conducted in accordance with the Contract, in a manner consistent with the level of skill ordinarily exercised by members of the profession currently practicing under similar conditions in the jurisdiction in which the services are provided. Professional judgment has been applied in developing the conclusions and/or recommendations provided in this Professional Document. No warranty or guarantee, express or implied, is made concerning the test results, comments, recommendations, or any other portion of the Professional Document.

If any error or omission is detected by the Client or an Authorized Party, the error or omission must be immediately brought to the attention of TETRA TECH.

1.4 DISCLOSURE OF INFORMATION BY CLIENT

The Client acknowledges that it has fully cooperated with TETRA TECH with respect to the provision of all available information on the past, present, and proposed conditions on the site, including historical information respecting the use of the site. The Client further acknowledges that in order for TETRA TECH to properly provide the services contracted for in the Contract, TETRA TECH has relied upon the Client with respect to both the full disclosure and accuracy of any such information.

1.5 INFORMATION PROVIDED TO TETRA TECH BY OTHERS

During the performance of the work and the preparation of this Professional Document, TETRA TECH may have relied on information provided by persons other than the Client.

While TETRA TECH endeavours to verify the accuracy of such information, TETRA TECH accepts no responsibility for the accuracy or the reliability of such information even where inaccurate or unreliable information impacts any recommendations, design or other deliverables and causes the Client or an Authorized Party loss or damage.

1.6 GENERAL LIMITATIONS OF DOCUMENT

This Professional Document is based solely on the conditions presented and the data available to TETRA TECH at the time the data were collected in the field or gathered from available databases.

The Client, and any Authorized Party, acknowledges that the Professional Document is based on limited data and that the conclusions, opinions, and recommendations contained in the Professional Document are the result of the application of professional judgment to such limited data.

The Professional Document is not applicable to any other sites, nor should it be relied upon for types of development other than those to which it refers. Any variation from the site conditions present, or variation in assumed conditions which might form the basis of design or recommendations as outlined in this report, at or on the development proposed as of the date of the Professional Document requires a supplementary investigation and assessment.

TETRA TECH is neither qualified to, nor is it making, any recommendations with respect to the purchase, sale, investment or development of the property, the decisions on which are the sole responsibility of the Client.

1.7 ENVIRONMENTAL AND REGULATORY ISSUES

Unless stipulated in the report, TETRA TECH has not been retained to investigate, address or consider and has not investigated, addressed or considered any environmental, regulatory, or sediment and erosion issues associated with construction on the subject site.

1.8 VARIATION OF MATERIAL CHARACTERISTICS AND CONDITIONS

Observations and standardized sampling, inspection and testing procedures employed by TETRA TECH will indicate conditions of materials and construction activities only at the precise location and time where and when Services were performed. The Client recognizes that conditions of materials and construction activities at other locations may vary from those measured or observed, and that conditions at one location and time do not necessarily indicate the conditions of apparently identical material(s) at other locations and/or times.

Services of TETRA TECH, even if performed on a continuous basis, should not be interpreted to mean that TETRA TECH is observing, verifying, testing or inspecting all materials on the Project. TETRA TECH is responsible only for those data, interpretations, and recommendations regarding the actual materials and construction activities observed, sampled, inspected or tested, and is not responsible for other parties' interpretations or use of the information developed. TETRA TECH may make certain inferences based upon the information derived from these procedures to formulate professional opinions regarding conditions in other areas.

1.9 SAMPLING, OBSERVATION & TEST LOCATIONS

Unless specifically stated otherwisa, the Scope of Services does not include surveying the Site or precisely identifying sampling, observation or test locations, depths or elevations. Sampling, observation and test locations, depths and elevations will be based on field estimates and information furnished by the Client and its representatives. Unless steted otherwise in the report, such locations, depths and elevations provided are approximate.

1.10 CONTRACTOR'S PERFORMANCE

TETRA TECH is not responsibla for Contractor's means, methods, techniques or sequences during the performance of its Work. TETRA TECH will not supervise or direct Contractor's Work, nor be liable for any failure of Contractor to complete its Work in accordence with the Project's plans, spacifications and applicable codes, laws and regulations. The Client understands and agrees that Contractor, not TETRA TECH, has sole responsibility for the safety of persons and property at the Project Site.

1.11 NOTIFICATION AND LEVEL OF SERVICE

Unless the Client requests or the building code requires full-time services, the Client understands that services provided by TETRA TECH are on an "On-Call" basis. The Client shall assume responsibility for adequate notification and scheduling of TETRA TECH services. TETRA TECH will make every reasonable effort to meet the Client's schedule, but will not guarentee service availabilify without direct confirmation from with the Client or their agent.

1.12 CERTIFICATIONS

The Client will not require TETRA TECH to execute any certification regarding Services performed or the Work tested or observed unless: 1) TETRA TECH believes that it has performed sufficient Services to provide e sufficient basis to issue the certification; 2) TETRA TECH believes that the Services performed and Work tested or observed meet the criteria of the certification; and 3) TETRA TECH has reviewed and approved in writing the exact form of such certification prior to execution of the Service Agreement. Any certification by TETRA TECH is limited to the expression of a professional opinion based upon the Services performed by TETRA TECH, and does not constitute a warranty or guarantee, either express or implied.

1.13 WEATHER AND PROTECTION OF MATERIALS

Performance of the Services by TETRA TECH and/or its designated subcontractor may be delayed or excused when such performance is commercially impossible or impracticable as a result of weather events, strikes, shortages or other causes beyond their reasonable control which may also impact cost estimates.

Excavation and construction operations expose materials to climatic elements (freeze/thaw, wet/dry) and/or mechanical disturbance which can cause severe deterioration. Unless otherwise specifically indicated in this report, the walls and floors of excavations, and stockpiles, must be protected from the elements, particularly moisture, desiccation, frost action and construction activities.

1.14 CALCULATIONS AND DESIGN

Where TETRA TECH has undertaken design calculations and has prepared project specific designs in accordance with terms of reference that were previously set out in consultation with, and agreement of, TETRA TECH's client. These designs have been prepared to a standard that is consistent with industry practice. Notwithstanding, if any error or omission is detected by TETRA TECH's Client or any perty that is euthorized to use the Design Report, the error or omission should be immediately drawn to the attention of TETRA TECH.

1.15 INFLUENCE OF CONSTRUCTION ACTIVITY

There is a direct corralation between construction activity and structural performance of adjacent buildings and other installations. The influence of all anticipated construction activities should be considered by the contractor, owner, architect and prime engineer in consultation with a geotechnical engineer when the finel design and construction techniques are known.

1.16 SAMPLES

The Client will provide samples for testing (at the Client's expense). TETRA TECH will retain unused portions of samples only until such time as internal review is accomplished for intended purpose. Further storage or transfer of samples can be made at the Client's expense upon written request, otherwise semples will be discarded. The duration of sample retention must be discussed in advance.

1.17 GEOTECHNICAL CONDITIONS

A Geotechnical Report is commonly the basis upon which the specific project design or testing has been completed. It is incumbent upon TETRA TECH's Client, and eny other authorized party, to be knowledgeable of the level of risk that has been incorporated into the project design, in consideration of the level of the geotechnical information that was reasonably acquired to facilitate completion of the design.

If a Geotechnical Report was prepared for the project by TETRA TECH or others, it will be referenced in the Construction Materials or Materials Design Report. The Geotechnical Report contains Generel Conditions that should be read in conjunction with these General Conditions for this Report.

Attention: Mr. Calvin Goldschmidt

Subject: Mitigated Accelerated Alkali-Aggregate Reactivity
Coarse Fraction with 25% Genesee Fly Ash – L-1
Fine Fraction with 25% Genesee Fly Ash – L-2
Mayo Area, Yukon

As requested, Tetra Tech Canada Inc. (Tetra Tech), has completed testing of coarse fraction (L-1) and fine fraction (L-2) for mitigated accelerated alkali-aggregate reactivity. The samples were obtained from Eagle Gold Property and were received by Tetra Tech in Calgary laboratory on November 27, 2017.

The testing is done in accordance with Canadian Standards Association (CSA) A23.2-25A, the test method for detection of alkali-silica reactive aggregate by accelerated expansion of mortar bars and A23.2-28A the test method for effectiveness of supplementary cementing materials to prevent alkali-silica reaction in mortar bars.

The enclosed results represent the expansion of the mortar bars after 14 days of testing (Figure 1). The results are summarized in Table 1 below.

Table 1: Aggregate Analysis

Source	Aggregate Tested	14 Day Results (% Expansion and Remarks)
Mayo Area, Yukon	Coarse fraction with 25% Genesee fly ash	0.030 – Mitigated (Figure 1)
Mayo Area, Yukon	Fine fraction with 25% Genesee fly ash	0.031 – Mitigated (Figure 2)

Holcim Mississauga Type GU hydraulic cement with the total alkali content of 0.90% was used in the concrete mixes, and the mortar bars were placed in a 1N NaOH solution at 80°C for 14 days (CSA A23.2-25A).

As a means of qualifying the testing laboratory and validating the testing process, Spratt aggregate is tested on a regular basis. According to Clause 11.2 of CSA 23.2-09-25A, the expansion of mortar bars using Spratt aggregate shall fall between 0.30% and 0.55% after 14 days. The results from our laboratory testing fall within these limits and are presented on Figure 3.

This letter report and its contents are intended for the sole use of JDS Mining and their agents. Tetra Tech Canada Inc. does not accept any responsibility for the accuracy of any of the data, the analysis, or the recommendations contained or referenced in the letter report when the letter report is used or relied upon by any party other JDS Mining or for any project other than the proposed development at the subject site. Any such unauthorized use of this letter report is at the sole risk of the user. Use of this document is subject to the Limitations on the Use of This Document and is provided with this letter report or the Contractual Terms and Conditions executed by both parties.

Office: Calgary, AB **Reviewed By:** _____ P.Geol.

Data presented herein is for the sole use of the stipulated client. Tetra Tech is not responsible, nor can be held liable, for use made of this report by any other party, with or without the knowledge of Tetra Tech. The testing services reported herein have been performed to recognized industry standards, unless noted. No other warranty is made. These data do not include or represent any interpretation or opinion of specification compliance or material suitability. Should engineering interpretation be required, Tetra Tech will provide it upon written request.

TETRA TECH

LIMITATIONS ON USE OF THIS DOCUMENT

CONSTRUCTION MATERIALS ENGINEERING AND TESTING

1.1 USE OF DOCUMENT AND OWNERSHIP

This document pertains to a specific site, a specific development, and a specific scope of work. The document may include plans, drawings, profiles and other supporting documents that collectively constitute the document (the "Professional Document").

The Professional Document is intended for the sole use of TETRA TECH's Client (the "Client") as specifically identified in the TETRA TECH Services Agreement or other Contractual Agreement entered into with the Client (either of which is termed the "Contract" herein). TETRA TECH does not accept any responsibility for the accuracy of any of the data, analyses, recommendations or other contents of the Professional Document when it is used or relied upon by any party other than the Client, unless authorized in writing by TETRA TECH.

Any unauthorized use of the Professional Document is at the sole risk of the user. TETRA TECH accepts no responsibility whatsoever for any loss or damage where such loss or damage is alleged to be or, is in fact, caused by the unauthorized use of the Professional Document.

Where TETRA TECH has expressly authorized the use of the Professional Document by a third party (an "Authorized Party"), consideration for such authorization is the Authorized Party's acceptance of these Limitations on Use of this Document as well as any limitations on liability contained in the Contract with the Client (all of which is collectively termed the "Limitations on Liability"). The Authorized Party should carefully review both these Limitations on Use of this Document and the Contract prior to making any use of the Professional Document. Any use made of the Professional Document by an Authorized Party constitutes the Authorized Party's express acceptance of, and agreement to, the Limitations on Liability.

The Professional Document and any other form or type of data or documents generated by TETRA TECH during the performance of the work are TETRA TECH's professional work product and shall remain the copyright property of TETRA TECH.

The Professional Document is subject to copyright and shall not be reproduced either wholly or in part without the prior, written permission of TETRA TECH. Additional copies of the Document, if required, may be obtained upon request.

1.2 ALTERNATIVE DOCUMENT FORMAT

Where TETRA TECH submits electronic file and/or hard copy versions of the Professional Document or any drawings or other project-related documents and deliverables (collectively termed TETRA TECH's "Instruments of Professional Service"), only the signed and/or sealed versions shall be considered final. The original signed and/or sealed electronic file and/or hard copy version archived by TETRA TECH shall be deemed to be the original. TETRA TECH will archive a protected digital copy of the original signed and/or sealed version for a period of 10 years.

Both electronic file and/or hard copy versions of TETRA TECH's Instruments of Professional Service shall not, under any circumstances, be altered by any party except TETRA TECH. TETRA TECH's Instruments of Professional Service will be used only and exactly as submitted by TETRA TECH.

Electronic files submitted by TETRA TECH have bean prepared and submitted using specific software and hardware systems. TETRA TECH makes no representation about the compatibility of these files with the Client's current or future software and hardware systems.

1.3 STANDARD OF CARE

Services performed by TETRA TECH for the Professional Document have been conducted in accordance with the Contract, in a manner consistent with the level of skill ordinarily exercised by members of the profession currently practicing under similar conditions in the jurisdiction in which the services are provided. Professional judgment has been applied in developing the conclusions and/or recommendations provided in this Professional Document. No warranty or guarantee, express or implied, is made concerning the test results, comments, recommendations, or any other portion of the Professional Document.

If any error or omission is detected by the Client or an Authorized Party, the error or omission must be immediately brought to the attention of TETRA TECH.

1.4 DISCLOSURE OF INFORMATION BY CLIENT

The Client acknowledges that it has fully cooperated with TETRA TECH with respect to the provision of all available information on the past, present, and proposed conditions on the site, including historical information respecting the use of the site. The Client further acknowledges that in order for TETRA TECH to properly provide the services contracted for in the Contract, TETRA TECH has relied upon the Client with respect to both the full disclosure and accuracy of any such information.

1.5 INFORMATION PROVIDED TO TETRA TECH BY OTHERS

During the performance of the work and the preparation of this Professional Document, TETRA TECH may have relied on information provided by persons other than the Client.

While TETRA TECH endeavours to verify the accuracy of such information, TETRA TECH accepts no responsibility for the accuracy or the reliability of such information even where inaccurate or unreliable information impacts any recommendations, design or other deliverables and causes the Client or an Authorized Party loss or damage.

1.6 GENERAL LIMITATIONS OF DOCUMENT

This Professional Document is based solely on the conditions presented and the data available to TETRA TECH at the time the data were collected in the field or gathered from available databases.

The Client, and any Authorized Party, acknowledges that tha Professional Document is based on limited data and that the conclusions, opinions, and recommendations contained in the Professional Document are the result of the application of professional judgment to such limited data.

The Professional Document is not applicable to any other sites, nor should it be relied upon for types of development other than those to which it refers. Any variation from the site conditions present, or variation in assumed conditions which might form the basis of design or recommendations as outlined in this report, at or on the development proposed as of the date of the Professional Document requires a supplementary investigation and assessment.

TETRA TECH is neither qualified to, nor is it making, any recommendations with respect to tha purchase, sale, investment or development of the property, the decisions on which are the sole responsibility of the Client.

1.7 ENVIRONMENTAL AND REGULATORY ISSUES

Unless stipulated in the report, TETRA TECH has not been retained to investigate, address or consider and has not investigated, addressed or considered any environmental, regulatory, or sediment and erosion issues associated with construction on the subject site.

1.8 VARIATION OF MATERIAL CHARACTERISTICS AND CONDITIONS

Observations and standardized sampling, inspection and testing procedures employed by TETRA TECH will indicate conditions of materials and construction activities only at the precise location and time where and when Services were performed. The Client recognizes that conditions of materials and construction activities at other locations may vary from those measured or observed, and that conditions at one location and time do not necessarily indicate the conditions of apparently identical material(s) at other locations and/or times.

Services of TETRA TECH, even if performed on a continuous basis, should not be interpreted to mean that TETRA TECH is observing, verifying, testing or inspecting all materials on the Project. TETRA TECH is responsible only for those data, interpretations, and recommendations regarding the actual materials and construction activities observed, sampled, inspected or tested, and is not responsible for other parties' interpretations or use of the informetion developed. TETRA TECH may make certain inferences based upon the information derived from these procedures to formulate professional opinions regarding conditions in other areas.

1.9 SAMPLING, OBSERVATION & TEST LOCATIONS

Unless specifically stated otherwise, the Scope of Services does not include surveying the Site or precisely identifying sampling, observation or test locations, depths or elevations. Sampling, observation and test locations, depths and elevations will be based on field estimates and information furnished by the Client and its representatives. Unless stated otherwise in the report, such locations, depths and elevations provided are approximate.

1.10 CONTRACTOR'S PERFORMANCE

TETRA TECH is not responsible for Contractor's means, methods, techniques or sequences during the performance of its Work. TETRA TECH will not supervise or direct Contractor's Work, nor be liable for any failure of Contractor to complete its Work in accordance with the Project's plans, specifications and applicable codes, laws and regulations. The Client understands and agrees that Contractor, not TETRA TECH, has sole responsibility for the safety of persons and property at the Project Site.

1.11 NOTIFICATION AND LEVEL OF SERVICE

Unless the Client requests or the building code requires full-time services, the Client understands that services provided by TETRA TECH are on an "On-Call" basis. The Client shall assume responsibility for adequate notification and scheduling of TETRA TECH services. TETRA TECH will make every reasonable effort to meet the Client's schedule, but will not guarantee service availability without direct confirmation from with the Client or their agent.

1.12 CERTIFICATIONS

The Client will not require TETRA TECH to execute any certification regarding Services performed or the Work tested or observed unless: 1) TETRA TECH believes that it has performed sufficient Services to provide a sufficient basis to issue the certification; 2) TETRA TECH believes that the Services performed and Work tested or observed meet the criteria of the certification; and 3) TETRA TECH has reviewed and approved in writing the exact form of such certification prior to execution of the Service Agreement. Any certification by TETRA TECH is limited to the expression of a professional opinion based upon the Services performed by TETRA TECH, and does not constitute a warranty or guarantee, either express or implied.

1.13 WEATHER AND PROTECTION OF MATERIALS

Performance of the Services by TETRA TECH and/or its designated subcontractor may be delayed or excused when such performance is commercially impossible or impracticable as a result of weather events, strikes, shortages or other causes beyond their reasonable control which may also impact cost estimates.

Excavation and construction operations expose materials to climatic elements (freeze/thaw, wet/dry) and/or mechanical disturbance which can cause severe deterioration. Unless otherwise specifically indicated in this report, the walls and floors of excavations, and stockpiles, must be protected from the elements, particularly moisture, desiccation, frost action and construction activities.

1.14 CALCULATIONS AND DESIGN

Where TETRA TECH has undertaken design calculations and has prepared project specific designs in accordance with terms of reference that were previously set out in consultation with, and agreement of, TETRA TECH's client. These designs have been prepared to a standard that is consistent with industry practice. Notwithstanding, if any error or omission is detected by TETRA TECH's Client or any party that is authorized to use the Design Report, the error or omission should be immediately drawn to the attention of TETRA TECH.

1.15 INFLUENCE OF CONSTRUCTION ACTIVITY

There is a direct correlation between construction activity and structural performance of adjacent buildings and other installations. The influence of all anticipated construction activities should be considered by the contractor, owner, architect and prime engineer in consultation with a geotechnical engineer when the final design and construction techniques are known.

1.16 SAMPLES

The Client will provide samples for testing (at the Client's expense). TETRA TECH will retain unused portions of samples only until such time as internal review is accomplished for intended purpose. Further storage or transfer of samples can be made at the Client's expense upon written request, otherwise samples will be discarded. The duration of sample retention must be discussed in advance.

1.17 GEOTECHNICAL CONDITIONS

A Geotechnical Report is commonly the basis upon which the specific project design or testing has been completed. It is incumbent upon TETRA TECH's Client, and any other authorized party, to be knowledgeable of the level of risk that has been incorporated into the project design, in consideration of the level of the geotechnical information that was reasonably acquired to facilitate completion of the design.

If a Geotechnical Report was prepared for the project by TETRA TECH or others, it will be referenced in the Construction Materials or Materials Design Report. The Geotechnical Report contains General Conditions that should be read in conjunction with these General Conditions for this Report.

Vancouver, BC V6C 2W2

Attention: Mr. Calvin Goldschmidt

Subject: 30 MPa Structural and 10 MPa Fillcrete Concrete Mix Designs
Eagle Gold Property – Near Mayo, Yukon

1.0 INTRODUCTION

As requested by JDS Mining, Tetra Tech Canada Inc. (Tetra Tech) has prepared theoretical concrete mix designs for the 30 MPa structural and 10 MPa fillcrete concrete to be used on the Eagle Gold project near Mayo, Yukon.

Authorization to proceed was received in the form of an email from Mr. Calvin Goldschmidt dated August 11, 2017.

This report has been completed in accordance with generally accepted Materials Engineering practices. For additional conditions regarding the use of this report, please refer to the Limitations On Use Of This Document in Appendix A.

2.0 CEMENTING MATERIALS

2.1 Portland Cement

It is assumed that all concrete will be produced using Type GU Portland cement supplied by Lafarge North America. Once the concrete supply contract has been awarded, the contractor should be asked to supply a current mill sheet for the cement being considered for use on this project.

2.2 Fly Ash

Fly ash will be required for all concrete produced using the aggregates proposed. Both the 30 MPa structural and 10 MPa fillcrete mix designs have been based on the use of 25% fly ash (by total cementitious materials) to mitigate the potential for damage caused by Alkali-Aggregate Reactivity. As with the cement, once the concrete supply contract has been awarded, the contractor should be asked to supply a current mill sheet for the fly ash being considered for use on this project.

The addition of fly ash to the cementitious materials blend can be accomplished by having separate silos for both the cement and the flay ash or purchasing a blended cement/fly ash product. This will eliminate the need for a second silo.

Tetra Tech Canada Inc.
61 Wasson Place
Whitehorse, YT Y1A 0H7 CANADA
Tel 867.668.3068 Fax 867.668.4349

3.0 ADMIXTURES

The lab trails for the two theoretical mix designs presented in this report were completed using SIKA admixture products. BASF and GRACE also produce admixtures that will satisfy the objectives of these mix designs. It is recommended that the successful contractor supply technical documentation for the admixtures that they are proposing for use.

4.0 MIXING WATER FOR CONCRETE PRODUCTION

It has been confirmed that mixing water used on this project will be from an on-site water source. Previously performed water quality testing by ALS has confirmed that the water is not considered potable so additional assessment has been completed on the ALS analytical test data to evaluate potential for use as mixing water. The assessment completed is summarized in the Technical Memo presented in Appendix B of this report and concludes that the proposed water source is acceptable for use during the batching of concrete.

5.0 AGGREGATE PROPERTIES

The concrete aggregates to be used on this project are from aggregate source(s) located on the Eagle Gold property. During the production of the 20 mm coarse aggregate and the 14 mm fillcrete aggregate, Tetra Tech provided QC testing (sieve analysis and natural moisture content testing).

The results were quite variable but an approximate average of the aggregate gradings has been used to develop a suitable aggregate blend for the production of 30 MPa structural concrete (the fillcrete will be produced from the 14 mm aggregate stockpile). The proposed aggregate blend is discuyssed below.

5.1 Aggregate Grading

The theoretical split used for the development of the 30 MPa mix design is based on 56% coarse aggregate and 44% fillcrete aggregate. Based on the testing completed, theoretical splits have been completed so that the material retained on the 5 mm sieve can be compared the CSA A23.1 Table 11 grading requirements for coarse concrete aggregates and CSA A23.1 Table 10 grading requirements for fine aggregates. Results are presented in Tables 1 and 2, below.

As summarized in Table 1, the theoretical grading of the coarse aggregate fraction (material retained on the 5 mm sieve) is slightly coarser than the CSA A23.1 Table 11 grading requirements for 20-5 mm coarse aggregate (on the 10 mm sieve size).

Table 1: Coarse Aggregate Grading (theoretical + 5 mm fraction) (percent passing by mass)

Aggregate	Sieve Size (mm)						
	28	20	14	10	5	2.5	0.080
20-5 mm	**100**	**92.4**	**53.5**	**23.3**	**0.0**	**0.0**	**0.0**
CSA Min.	100	85	50	25	0	0	0
CSA Max.	100	100	90	60	10	5	1
Pass/Fail	Pass	Pass	Pass	Fail	Pass	Pass	Pass

As summarized in Table 2, the fine aggregate fraction is siltier than the CSA 23.1 Table 10 grading requirements for FA1 fine aggregate.

Table 2: Fine Aggregate Grading (percent passing by mass)

Aggregate	Sieve Size (mm)								
	10	**5**	**2.5**	**1.25**	**0.630**	**0.315**	**0.160**	**0.080**	**FM**
Concrete Sand	**100**	**100**	**74.7**	**55.1**	**39.8**	**28.8**	**22.5**	**16.3**	**2.79**
Specified Min.	100	95	80	50	25	10	0	0	2.2
Specified Max.	100	100	100	90	65	35	10	3	3.1
Pass/Fail	Pass	Pass	Fail	Pass	Pass	Pass	Fail	Fail	Pass

Due to excess fines in the fillcrete aggregate stockpile, the fine fraction of the theoretical aggregate blend is considered non-compliant by CSA A23.1 standards.

5.2 Additional Aggregate Testing

To properly assess the potential of the aggregates proposed for use on the Eagle Gold project, additional testing was performed on both the coarse and fillcrete aggregates. The results of this testing are presented in Appendix C of this report.

Many of the tests completed were to assess aggregate durability. Results for the Petrographic Analysis of coarse and fine aggregates; L.A. Abrasion testing of the coarse aggregates; and Micro Deval testing of the fine aggregates all suggest that the aggregates can be considered for use in concrete production.

However, since there are excessive fines (passing the 80 micron screen size) in the fillcrete aggregate stockpile, a hydrometer was also performed to determine the clay content of the fine aggregate fraction. CSA A23.1 – Table 12 considers 1% clay content (in the overall aggregate blend) acceptable but testing has determined that there is 2% clay. This may prove problematic in batching, placing and finishing.

Alkali - Aggregate Reactivity must be assessed for all new concrete aggregate sources. This test, performed in accordance with CSA A23.2 – 14A is a 52 week test and assesses the need for fly ash or other cementitious materials to mitigate potential for damage to the concrete caused by reactivity. In the absence of the 52 week test results, 25% cement replacement with fly ash was chosen based on experience from other projects and used for developing the mix designs presented in this report. Mitigated and accelerated testing completed in accordance to CSA A23.2 – 25A and 28A was completed and test results suggest that 25% fly ash replacement satisfies project objectives. The results and interpretation of the reactivity testing performed is presented in Appendix D.

6.0 LAB TRIALS

Lab trials of the 30 MPa structural and 10 MPa fillcrete mix designs were performed on December 16, 2017. The 28 day compressive strengths for both mixes met project objectives.

Compressive strength results are presented in Appendix E.

7.0 BATCH WEIGHTS

Batch weights for the 30 MPa structural concrete and the 10 MPa fillcrete mixes are presented below:

Table 3: Theoretical Batch Weights

Material	30 MPa with 25% Fly Ash	10 MPa with 25% Fly Ash (Fillcrete)
Target Water / Cementing Materials Ratio	0.40	0.60
Water (kg/m^3)	140	150
Cement (kg/m^3)	300	200
Fly Ash (kg/m^3)	100	70
Coarse Aggregate (kg/m^3)	995	n/a
Fine Aggregate (kg/m^3)	840	1995
Air Entrainment: SIKA AER (mL/m^3)	60	100
Plasticizer: SIKA VISCOCRETE (mL/m3)	700	900
Theoretical Yield (kg/m^3)	1.002	1.002

Notes: Concrete produced using silty aggregates have additional challenges. Consider the following:

- Water demand can be quite variable depending on how much silt is in the aggregate blend. On-going slump adjustments will be necessary. As well, extra mixing time should be implemented to wash fines off the coarse aggregate at the start of the mixing sequence.
- Finer silt particles may be similar in size and shape to the cement and fly ash particles. This makes air entrainment dosage rates difficult to determine. Plant trials will be required.
- Concrete finishers must be made aware of the high fines content so they can adjust their placing and finishing techniques.

8.0 LIMITATIONS OF REPORT

This report and its contents are intended for the sole use of JDS Mining and their agents. Tetra Tech Canada Inc. does not accept any responsibility for the accuracy of any of the data, the analysis, or the recommendations contained or referenced in the report when the report is used or relied upon by any Party other than JDS Mining, or for any Project other than the proposed development at the subject site. Any such unauthorized use of this report is at the sole risk of the user. Use of this report is subject to the terms and conditions stated in Tetra Tech's Services Agreement. Tetra Tech's Limitations On Use Of This Document are attached.

Construction Walk Down Deficiency Sheet

"A" items To be completed before Acceptance.
"BSU" Items To be completed before startup.
"BCC" Items To be completed before contract closure.
"C" Items is Not in Scope.

Project Name: CB201/ 18502 StrataGold Eagle Gold Project

System Description: Concrete Installations

Walkdown Attendees: Clark Builders: Ryan de Milliano, Jackson Wenger
JDS Mining: Ishan Fechter, Matt Coverdale

Responsible Contractor: Clark Builders Energy & Resources

Item No.	Date: (YYYY.MM.DD)	Area/ Location	Description	Discipline	Catagory (Dropdown)	Responsibility	Vendor (Dropdown)
11	2018.10.28	ADR Building	GL. 2/A.5 Anchor Bolt to be threaded down to correct location. Current extra washers installed to support the bolts.	Anhor Bolts	BCC	Clark Builders	No
12	2018.10.28	ADR Building	As per RFI 74, Pad poured 45mm too high required to be chipped down 30mm.	Concrete Structure	BCC	Clark Builders	No
13	2018.10.28	ADR Building	Air pockets in concrete, general, to be patched.	Concrete Finishes	BCC	Clark Builders	No

LOAD TEST PROCEDURE

Customer	ADR Process	Equipment #	5100-CN-002	Date	Nov 14 2018
Capacity	10 Tonne	Inspector	Chris Shakeshaft	WO #	64853
Hoist Mfg.	R&M	Bridge Mfg.	CRS Crane	Serial #	3322

- ✓ Prior to testing crane, check commissioning report to confirm safe operation of crane
- ✓ Confirm safety procedures are in place
- ✓ Advise that area is to be cleared prior to test

1) **Test** With no load, confirm the operation of all:

a) Motions	✓	d) Indicators	✓	g) Interlocks	✓
b) Speeds	✓	e) Circuits	✓	h) Sequence of operation	✓
c) Limits switches	✓	f) Controls	✓	i) Emergency stop function	✓

Disconnect overweight protection if possible and proceed with next step.

2) **100% Operation Test** Lift 100% of rated load and check operation of the crane to prove itself capable of dealing with the load without difficulty. This involves confirming proper operation of all motions and speeds, the holding brake, travel brakes, and hook. It should not be done over live equipment without a lift study. Trolley/bridge travel over the entire area.

Load	22000 Kg./Lbs.

Comments/Observations: NO ISSUES

3) **100% Hoist Load Brake Test** Raise the load to clear the floor and measure distance to the floor. Take a second measurement after 10 minutes and confirm the load has not dropped.

Comments/Observations: NO drift of Load hook

Brake Test All brakes shall be tested under full load conditions, from maximum speed to rest, three times in quick succession without over heating.

Comments/Observations: Hoist only VFD Bridge & trolley

4) **100% Deflection Load Test** There are 2 different locations the hoist will be tested. Lift study to be completed if done over live equipment.

a) The first is with the bridge end trucks located over a column for maximum support and the trolley in the center of the bridge. The object is to measure the bridge deflection.

Comments/Observations: NO ISSUES

Total Deflection: 19 mm

b) The second position is the trolley on one side of the bridge end truck with the bridge end trucks centered between the two columns. The object is to measure runway deflection.

Comments/Observations: NO ISSUES

5) **125% Operation Test** Lift 125% of rated load and check operation of the crane to prove itself capable of dealing with the load without difficulty. This involves confirming proper operation of all motions, the holding brake, travel brakes, and hook. High speeds need not be attained, but the overload condition shall see one full rotation of all geared members to confirm every gear sees the overload condition. This test should be done in a very confined location. The overload protection may have to be bypassed to allow this test.

Load	24500 Kg./Lbs.	27,500 lbs

Comments/Observations:

6) **Overload Test** The intent of this procedure is to set the overloads. Adjust the overload protection to prevent the lifting of the load by applying a load ranging from 110-125%. Check the crane operation to allow the load to be lowered in the event of an overload.

Load	24900 Kg./Lbs.

COMMISSION FORM

Congratulations on your purchase of a new crane from CRS CraneSystems Inc. Your warranty period begins as of the date below and we certify that the following field installations checks have been performed making the crane ready for service.

Customer: Strata Gold Date: Nov 13 2015

Crane: 3822 By CRS CraneSystems Inc. ✓ By Others _____

Check #	Check Point	Accepted
1	Check bolts for tightness	CWS
2	Confirm voltage	CWS
3	Remove all shipping oil plugs / protection	CWS
4	Check phase rotations on all speeds	CWS
5	Confirm operation of motor brakes	CWS
6	Set and test all limits	CWS
7	Check all approaches	CWS
8	Check all clearances	CWS
9	Check festoon stack up	CWS
10	Check power bar travel at both ends	CWS
11	Check reeving and dead end complete with clip	CWS
12	Check direction markings to pendant / radio	CWS
13	Confirm all speeds / motors are operating	CWS
14	Final lube on ropes / open gear / chain	CWS
15	Touch up paint / housekeeping Too cold for paint.	
16	Check end stops / bumpers	CWS
17	Check anti-collision devices	N/A
18	Confirm span / wheel tread	CWS
19	On board disconnect	CWS

Runway: _____ By CRS CraneSystems Inc. _____ By Others Ficcity steel

Check #	Check Point	Accepted
1	Check welds / bolts on runway beams	CWS
2	Check rail alignment / fastening / level	CWS
3	Check end stops	CWS
4	Check tie plates / bolts	CWS
5	Check span	CWS
6	Check power bar is installed correctly	CWS
7	Disconnect marked and at eye level Temp Power	

Columns/Corbels: _____ By CRS CraneSystems Inc. _____ By Others Ficcity steel

Check #	Check Point	Accepted
1	Check welds / bolts	CWS
2	Check alignment / level	CWS

ENVIRONMENTAL CONTAINMENT

CERTIFICATE OF INSPECTION OF SOIL SUBGRADE SURFACE

PROJECT NAME: Victoria Gold ADR Pad
PROJECT NUMBER: CT001020
OWNER/CONTRACTOR: Victoria Gold / Pelly Construction.
LOCATION: Victoria Gold Mine YT

I, the undersigned, a duly appointed representative of Layfield Canada Ltd. (Layfield), have visually observed the soil subgrade surface described below, and:

- ☑ *found it to be an acceptable surface on which to install geomembrane; OR*
- ☐ *found it to be an Unacceptable surface on which to install geomembrane*

Area Inspected (☐ Partial or ☑ Complete): Entire ADR Pad has been inspected
Dimensions of Subgrade Inspection: 740m x 40m. Plus SW corner Approx 3500m2
Anchor Trench Dimensions: N/A
Comments: Ditch to Heapleach pad to be completed later.

This certification is based on observations of the surface of the subgrade only. No subterranean inspections or tests have been performed by Layfield and Layfield makes no representations or warranties regarding conditions which may exist below the surface of the subgrade. Layfield accepts no responsibility for conformance of the subgrade to this project's specifications.

The soil subgrade inspected on this date refers to its present condition. Any changes in the subgrade condition that result from the effects of inclement weather and/or other forces beyond the control of Layfield and remedial work to correct the resulting deficiencies, will be the direct responsibility of the General Contractor.

LAYFIELD REPRESENTATIVE:

Date: 06/28/18
Signature:
Name: Chad Messervey
Title: Project Supervisor

OWNERS REPRESENTATIVE:

I, the undersigned, a duly appointed representative of the Owner, hereby understand the soil subgrade surface inspection described above and authorize Layfield to proceed with deployment of geosynthetics on the subgrade provided.

ENVIRONMENTAL CONTAINMENT

CERTIFICATE OF FINAL INSPECTION AND ACCEPTANCE

PROJECT NAME: Victoria Gold Mine ADR Pad.
PROJECT NUMBER: CT001020 **DATE:** 07/01/18
OWNER: Victoria Gold / Pelly Construction
LOCATION: Victoria Gold Mine, YT

Scope of Installation(s): THE WORK
Area/Layer: Primary Containment Liner Area Inspected: ☐ Partial or ☑ Complete
Dimensions: 41m x 80m + Ditch liner and entry ramps. Approximate 4200m2. Layfield has completed installation of EL 6160 containment Liner for ADR Pad. All QA. testing has been completed. Scope of Work complete

Part 1 – LAYFIELD CANADA LTD.

I, Chad Messervey, a duly appointed representative of Layfield Canada Ltd. (Layfield), have visually observed the installations (as outlined above), and have found the Work to be complete and free of defects and declare that the Work was completed in accordance with the project specifications, Layfield's QC program and the terms and conditions of the contract.

Layfield Representative:

Name: Chad Messervey
Title: Project Supervisor
Date: 07/01/18 **Signature:**

Part 2 – OWNER (or Representative)

I, Declan McGovern, a duly appointed representative of Pelly Construction Ltd.
Grand Foreman, do hereby take over and accept the installation(s) described above, and confirm that the work has been completed in accordance with the project specifications and the terms of the conditions of the contract.

I have evaluated and measured the work together with the Layfield representative, and agree that the measurements shown are both true and correct, and that the installation has met our approval.

Owners Representative:

Name: Declan McGovern
Title: General Foreman.
Company: Pelly Construction. Ltd.
Date: July 8/18 **Signature:**

Comments: Ditch Liner only Partially complete as per Client request. QA. Package to follow.

INSTALLATION WARRANTY

Layfield Reference No. : (Job #) CT001020

LAYFIELD CANADA LTD. (LAYFIELD) hereby warrants to Pelly Construction , (the Customer) that the work performed by LAYFIELD on the Installation described as ADR Pad will:

1. Meet the field seam specifications set out in the contract between LAYFIELD and the Customer (as amended by LAYFIELD's quotation), all workmanship to meet the requirements of LAYFIELD's Field Installation Quality Assurance program, and be free of defects at the time of completion of the installation; and

2. Be free of installation defects from the date of the completion of the installation (July 1, 2018), for a period of One year so long as the completed Installation is used for the purposes and in the manner for which the Installation was designed.

Should damage or defects within the scope of the aforesaid warranties occur, LAYFIELD shall repair the damage or defects, PROVIDED THAT the area to be repaired must first be made ready by the Customer and be in a clean, dry, unencumbered condition, free from all water, soil, sludge, residuals, and liquids of any kind.

To enable LAYFIELD to investigate and determine the cause of any alleged damage or defect, notice and details of any claim hereunder must be presented in writing to LAYFIELD within thirty (30) days after the alleged damage or defect was first noticed or observed. Failure to provide such notice and details shall invalidate all warranties provided hereunder.

The liability of LAYFIELD under the aforesaid warranties are subject to the following conditions:

a. LAYFIELD's only obligation shall be to repair or replace any defective workmanship and in no event shall LAYFIELD be liable for any amount in excess of the cost of the Installation;

b. No allowance will be made for repairs, replacements or alterations made by the Customer unless with the prior written consent of LAYFIELD;

c. The warranties hereunder extend only to the Customer and are not transferable;

d. The warranties hereunder shall not apply to any damage or defects resulting from misuse, mechanical abuse by machinery, equipment or persons, excessive pressures or stresses, exposure of the completed Installation of harmful chemicals, unusual weather conditions, casualty catastrophe such as (but not limited to) earthquake, flood, hail, tornado, or any other act of God;

e. Under no circumstances shall LAYFIELD be liable for any special, direct, indirect, or consequential damages including the loss of use of the Installation howsoever caused;

f. The warranties hereunder are given in lieu of all other warranties, express, implied, statutory, or otherwise, and the Customer expressly waives all other warranties and claims whatsoever except those specifically given herein, and the Customer acknowledges that the warranties hereunder are accepted in preference to and to the exclusion of any or all other warranties; and

g. An Installation Warranty will not be provided for lining projects unless the installation is completed by LAYFIELD personnel or designated LAYFIELD subcontractors.

CERTIFICATE OF INSPECTION OF SOIL SUBGRADE SURFACE

PROJECT NAME: Victor Gold ADF Pad
PROJECT NUMBER: [illegible]
OWNER/CONTRACTOR: Victor Gold / Kelly Construction
LOCATION: Victor Gold Mine AT

I, the undersigned, a duly appointed representative of Layfield Canada Ltd. (Layfield), have visually observed the soil subgrade surface described below, and:

☑ *found it to be an acceptable surface on which to install geomembrane; OR*

☐ *found it to be an Unacceptable surface on which to install geomembrane*

Area Inspected (☐Partial or ☑Complete): Entire ADF Pad has been inspected
Dimensions of Subgrade Inspection: 740m x 400m Plus SW Corner Approx 350m x 350m
Anchor Trench Dimensions: N/A
Comments: Due to a plant pad to be completed later

This certification is based on observations of the surface of the subgrade only. No subterranean inspections or tests have been performed by Layfield and Layfield makes no representations or warranties regarding conditions which may exist below the surface of the subgrade. Layfield accepts no responsibility for conformance of the subgrade to this project's specifications.

The soil subgrade inspected on this date refers to its present condition. Any changes in the subgrade condition that result from the effects of inclement weather and/or other forces beyond the control of Layfield and remedial work to correct the resulting deficiencies, will be the direct responsibility of the General Contractor.

LAYFIELD REPRESENTATIVE:

Date: 06/28/18
Signature: [signature]
Name: Chad Mossing
Title: Project Supervisor

OWNERS REPRESENTATIVE:

I, the undersigned, a duly appointed representative of the Owner, hereby understand the soil subgrade surface inspection described above and authorize Layfield to proceed with deployment of geosynthetics on the subgrade provided.

Date: 06/28/18
Signature: [signature]
Name: [illegible]
Title: [illegible]
Company: Kelly Construction Ltd.

LAYFIELD
ENVIRONMENTAL CONTAINMENT

CERTIFICATE OF FINAL INSPECTION AND ACCEPTANCE

PROJECT NAME: Victoria Gold Mine ADR Rd
PROJECT NUMBER: 0190120 **DATE:** 07/01/18
OWNER: Victoria Gold / Peltly construction
LOCATION: Victoria Gold Mine YT

Scope of Installation(s): **THE WORK**
Area/Layer: Primary containment Liner Area Inspected: ☐ Partial or ☑ Complete
Dimensions: 40m x 80m + Ditch liner and utility camps
Approximately 4200m² Layfield has completed installation of CL6160 containment liner for ADR Rd. All QA testing has been completed. Scope of work complete

Part 1 – LAYFIELD CANADA LTD.

I, Chad Messervey, a duly appointed representative of Layfield Canada Ltd. (Layfield), have visually observed the installations (as outlined above), and have found the Work to be complete and free of defects and declare that the Work was completed in accordance with the project specifications, Layfield's QC program and the terms and conditions of the contract.

Layfield Representative:

Name: Chad Messervey
Title: Project Supervisor
Date: 07/01/18 **Signature:**

Part 2 – OWNER (or Representative)

I, Declan McGovern, a duly appointed representative of Peltly Construction Ltd / Capital Paving, do hereby take over and accept the installation(s) described above, and confirm that the work has been completed in accordance with the project specifications and the terms of the conditions of the contract.

I have evaluated and measured the work together with the Layfield representative, and agree that the measurements shown are both true and correct, and that the installation has met our approval.

Owners Representative:

Name: Declan McGovern

SUBCONTRACTOR: Clark Builders	INSPECTION DATE: July 25 2018
SUBCONTRACTOR CONTACT PERSON: James Meadahl	ACTION BY:
INSPECTOR(S): James Meadahl	
LOCATION: ADR LINE A-10-12, B12-E-12	
DRAWING REV: 0 / DRAWING NO.(S): 260-002	SPEC SECTION(S): 03 20 00

ITEM	ITEMS TO BE CHECKED	PASS	FAIL	N/A
1.0	Grade (400W unless otherwise noted) and type of steel delivered and installed as required by approved drawings.	☑	☐	☐
2.0	Inspect rebar distribution, spacing and cover per design/project requirements.	☑	☐	☐
3.0	Length of splices as specified	☑	☐	☐
4.0	Staggered splices as specified	☑	☐	☐
5.0	Any mechanical splices have been approved by the owner prior to install	☐	☐	☑
6.0	Bars cleaned and free of material that may reduce bond including loose rust, scale, oil, structural defects and that they are uncoated and unpainted.	☑	☐	☐
7.0	Dowels at wall ends, construction joints, and openings as specified (length, location, size, etc.)	☐	☐	☑
8.0	No unauthorized field bent bars including hooks installed	☐	☐	☑
	Resolve conflicts between embedded items and reinforcement			✓
9.0	When authorized, field bends done without heat and inspected for fissures or cracks.	☐	☐	☑

ITEM	ITEMS TO BE CHECKED	PASS	FAIL	N/A
10.0	Bars tied and supported to prevent displacement	☑	☐	☐
11.0	Spacers, tie wire and chairs as required	☑	☐	☐
12.0	Conduits at design location and minimum separation from rebar as specified	☐	☐	☑
13.0	No contact of bars is made with dissimilar metals as per CSA A23.1	☑	☐	☐
14.0	Bars, nails or tie wire not sticking out from surfaces that allow rusting/corrosion	☑	☐	☐
15.0	Rebar is welds inspected by qualified inspectors certified to CSA W178.2	☐	☐	☑
16.0	No rebar congestion or other obstruction for deposit of concrete	☑	☐	☐
17.0	Adjustments required for interfering items (piping, inserts, sleeves, etc.) have been submitted and approved by owner.	☐	☐	☑
18.0	Rebar was stored off ground to prevent damage/corrosion	✓		
19.0	Review drawings for anchors, piping, sleeves, boxes	☐	☐	☑

FORMWORK & FALSEWORK PRE POUR | QA INSPECTION

Rev 00 May 4, 2018

SUBCONTRACTOR: CLARK BUILDERS	INSPECTION DATE: July 26 2018
SUBCONTRACTOR CONTACT PERSON: JAMES MEADAHL	DATE OF POUR: July 27 2018
INSPECTOR(S): JACKSON WENGER	
LOCATION: ADR – GL A 4-11,	
DRAWING REV: 0	DRAWING NO.(S): H354138-5710-231-260-002
	SPEC SECTION(S): 03 10 00

ITEM	ITEMS TO BE CHECKED	PASS	FAIL	N/A
1.0	Location, survey, dimension and grades as required	☑	☐	☐
2.0	Plumbness and Flatness verified	☑	☐	☐
3.0	Joints are aligned and watertight.	☑	☐	☑
4.0	Formwork shop drawings are Engineered and reviewed	☐	☐	☑
5.0	Re-used formwork reconditioned and treated	☑	☐	☑
6.0	Formwork and ties according to finishing requirements. Confirm no holes in the concrete surface are greater than 25mm in diameter or expose steel at less than 25mm from surface. As per spec.	☑	☐	☐
7.0	Installation of embeds are located and secured	☐	☐	☑
8.0	Chamfer requirements checked. 25mm chamfers required for all exterior corners and edges exposed to view including horizontal edges of pads.	☐	☐	☑
9.0	Key ways and/or other provisions according to design are provided in construction joints	☑	☐	☐
10.0	Inspect types of form spacers, ties and bracing.	☑	☐	☐
11.0	Spacing of ties to be set to a pattern	☑	☐	☐
12.0	Expansion, construction, contraction joints as required & located as coordinated with structural Engineer	☐	☐	☑
13.0	Forms secured against movement during placing	☑	☐	☐
14.0	Forms are braced for alignment and blow out	☑	☐	☐
15.0	Forms are cleaned of all debris, and dry, prior to concrete placement including standing water.	☑	☐	☐
16.0	Openings in formwork permit inspection and cleaning, placing and compaction of concrete, and forming and processing of construction joints.	☑	☐	☐
17.0	Formwork has been coated with release agent prior to rebar placement.	☑	☐	☐
		☐	☐	☐

Question from Ryan de Milliano (Clark Builders - Edmonton) at 01:52 PM on 17/08/2018

There is an 8" gap between the placed Cone Crusher strip footing and the Type F7 footing to be placed at the ADR. Please confirm it is acceptable to pour the additional the south side of the footing with the Pour.

Awaiting an Official Response

All Replies:

8" gap between the mat foundation and the building foundation can be filled with concrete while pouring of the mat, provided that an isolation joint is created at the face of the building foundation by pre-molded joint filler as shown on Dwg H354138-0000-231-294-0003 - Detail24

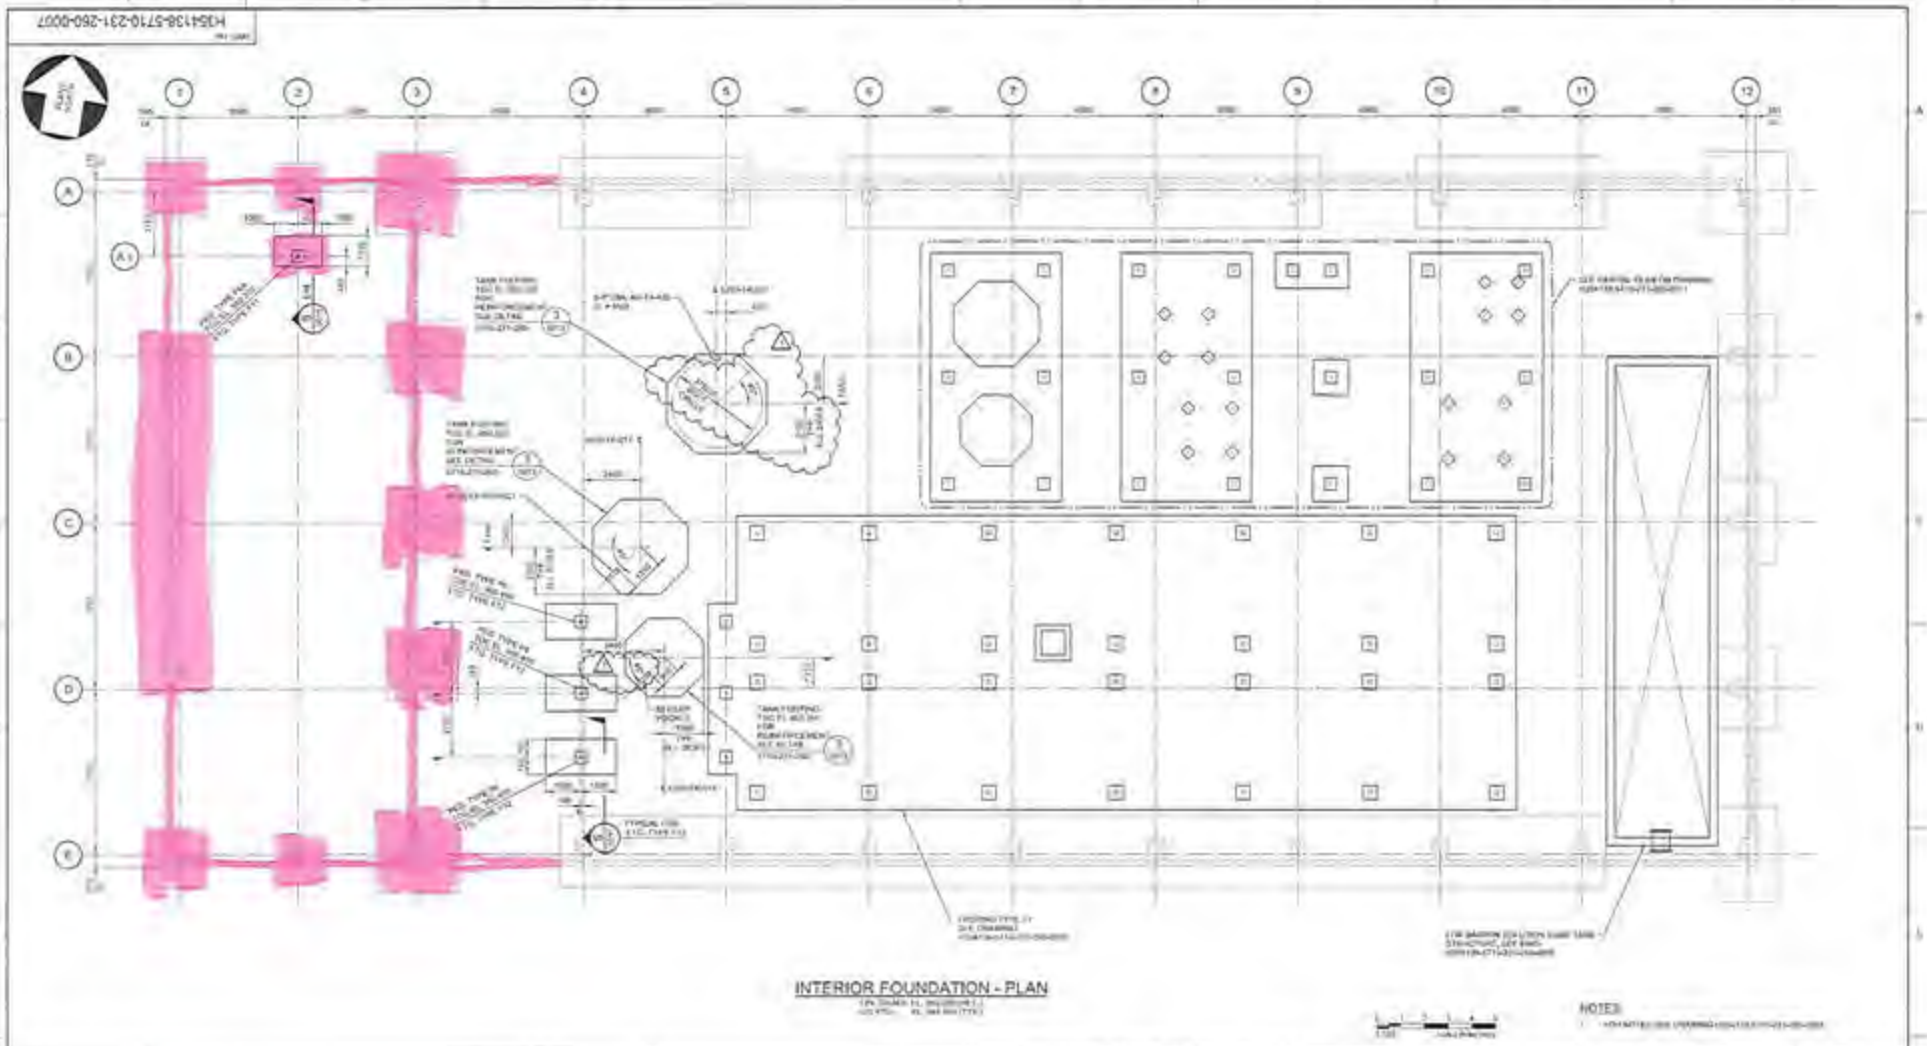
CONCRETE POST POUR INSPECTION

Rev 00 May 4, 2018

INSPECTOR(S): Ryan deMillard / James Meadmore (Contractor)
SPEC SECTION(S): S03 30 00 – Cast-In-Place
TYPE OF FINISH: F1 - Non-Exposed.
DATE OF INSPECTION: August 24 2018
AREA AND LOCATION(s): Area 5710 ADR II GL 1-6 (A-E): • Footings • Pedestals • Grade Beams • Tank Footings



GENERAL REQUIREMENTS	PASS	FAIL	N/A	REMARKS
Curing compounds not used on any surface against which additional concrete or materials are to be bonded.	☒	☐	☐	
Fresh concrete barricaded/ protected from mechanical disturbance.	☒	☐	☐	
Where concrete is used for filling, the chipped opening shall not be less than 75mm in depth.	☒	☐	☐	
Patches exposed to view shall blend with surrounding surfaces.	☒	☐	☐	
Contractor shall clean all exposed concrete surfaces of all encrustations of cement, mortar, or grout and shall remove unsightly stains.	☒	☐	☐	Small amount to be cleaned. Done.
Concrete appears proper and devoid of any honeycomb, cold joints, droppings or other defects	☒	☐	☐	
Removal of all concrete rubble and dispose of at an appropriate location.	☒	☐	☐	
Surface of concrete finished against forms has a smooth, dense finish free from cracks, free from projections, pits, and honeycomb and in proper alignment.	☒	☐	☐	
COLD WEATHER REQUIREMENTS (WHEN AMB. TEMP < 5°C)	PASS	FAIL	N/A	REMARKS
Protection in place until 70% of the 28-day strength has been reached.	☐	☐	☒	
Cold weather protection provided by means of heated enclosures, coverings, insulation, or a suitable approved combination of these methods during complete curing period.	☐	☐	☒	
Water not sitting in recesses, shear pockets, groves, bolt sleeves during heat and Hoarding period.	☐	☐	☒	

COMMENTS: Backfill in area to begin August 25, 2018. Tetratech notified.

CONCRETE POST POUR INSPECTION

Rev 00 May 4, 2018

INSPECTOR(S): Ryan deMillano / P'Arcy (JDS)	SPEC SECTION(S): 503 30 00 – Cast-In-Place
TYPE OF FINISH: F1	DATE OF INSPECTION: August 25, 2018
AREA AND LOCATION(s): AREA 5710 FOOTINGS & FLOORS. GL 3-12 (A-C) + GL 3-5 (A-F) SEE ATTACHED SKETCH.	

GENERAL REQUIREMENTS	PASS	FAIL	N/A	REMARKS
Curing compounds not used on any surface against which additional concrete or materials are to be bonded.	☒	☐	☐	
Fresh concrete barricaded/ protected from mechanical disturbance.	☒	☐	☐	
Where concrete is used for filling, the chipped opening shall not be less than 75mm in depth.	☐	☐	☒	
Patches exposed to view shall blend with surrounding surfaces.	☒	☐	☐	
Contractor shall clean all exposed concrete surfaces of all encrustations of cement, mortar, or grout and shall remove unsightly stains.	☒	☐	☐	Some removal required. Done at end of inspection
Concrete appears proper and devoid of any honeycomb, cold joints, droppings or other defects	☒	☐	☐	
Removal of all concrete rubble and dispose of at an appropriate location.	☒	☐	☐	
Surface of concrete finished against forms has a smooth, dense finish free from cracks, free from projections, pits, and honeycomb and in proper alignment.	☒	☐	☐	
COLD WEATHER REQUIREMENTS (WHEN AMB. TEMP < 5°C)	PASS	FAIL	N/A	REMARKS
Protection in place until 70% of the 28-day strength has been reached.	☐	☐	☒	
Cold weather protection provided by means of heated enclosures, coverings, insulation, or a suitable approved combination of these methods during complete curing period.	☐	☐	☒	
Water not sitting in recesses, shear pockets, groves, bolt sleeves during heat and Hoarding period.	☐	☐	☒

COMPACTION DENSITY TEST SUMMARY REPORT

ASTM Designation D6938

Project: Eagle Gold Project — **Test Apparatus:** Nuclear — **Troxler No:** 60841

QC Inspection & Testing — **Specified Compaction:** 95 % Mod. Proctor Max. Dry Density

Project No.: WARC.03235-05 — **Specified Moisture (MC):** As Below

Client: JDS Energy & Mining/Hatch — **Temperature** **Air:** 8 °C **Soil:** °C

Attention: — **Date Tested:** 8/28/2018 **By:** AS

Contractor: Cobalt/Clark Construction — **Construction Period:** DAYSHIFT

Soil Description: GRAVEL, Sandy, trace silt

Material Usage/Zone: 38mm minus ODF

Date mm/dd/yyyy	Test No. / Probe (mm)	Location:	El.	Dry Density (kg/m³)	MC %	Max. Dry Density	Opt. MC %	Comp % MPD
8/28/2018	33 / 300	Gridlines 1,B 2nd lift	n/a	2206	6.8	2250	6.0	**98.0**
8/28/2018	34 / 300	Gridlines 2,B 2nd lift	n/a	2250	5.9	2250	6.0	**100.0**
8/28/2018	35 / 300	Gridlines 2,C 2nd lift	n/a	2259	5.4	2250	6.0	**100.4**

Remarks: Issued for Review

CONCRETE POST POUR INSPECTION

Rev 00 May 4, 2018

INSPECTOR(S): JACKSON WENGER	SPEC SECTION(S): S03 30 00 – Cast-In-Place
TYPE OF FINISH: FACE OF FORM/FLOAT	DATE OF INSPECTION: SEPT. 2/2018

AREA AND LOCATION(s): ADR (5110) FT FOOTING, BARREN SOLUTION TANK EXT, GB-GL 12, GB E/4-12

GENERAL REQUIREMENTS	PASS	FAIL	N/A	REMARKS
Curing compounds not used on any surface against which additional concrete or materials are to be bonded.	☑	☐	☐	
Fresh concrete barricaded/ protected from mechanical disturbance.	☑	☐	☐	
Where concrete is used for filling, the chipped opening shall not be less than 75mm in depth.	☑	☐	☐	
Patches exposed to view shall blend with surrounding surfaces.	☑	☐	☐	
Contractor shall clean all exposed concrete surfaces of all encrustations of cement, mortar, or grout and shall remove unsightly stains.	☑	☐	☐	
Concrete appears proper and devoid of any honeycomb, cold joints, droppings or other defects	☑	☐	☐	
Removal of all concrete rubble and dispose of at an appropriate location.	☑	☐	☐	
Surface of concrete finished against forms has a smooth, dense finish free from cracks, free from projections, pits, and honeycomb and in proper alignment.	☑	☐	☐	
COLD WEATHER REQUIREMENTS (WHEN AMB. TEMP < 5°C)	**PASS**	**FAIL**	**N/A**	**REMARKS**
Protection in place until 70% of the 28-day strength has been reached.	☐	☐	☐	
Cold weather protection provided by means of heated enclosures, coverings, insulation, or a suitable approved combination of these methods during complete curing period.	☐	☐	☐	
Water not sitting in recesses, shear pockets, groves, bolt sleeves during heat and Hoarding period.	☐	☐	☐

INSPECTOR(S):	
LOCATION: ADR Slab Lift 1 to 3	
DRAWING REV:	DRAWING NO.(S): 231-260-0022 SPEC SECTION(S): 0

ITEM	ITEMS TO BE CHECKED	PASS	FAIL	N/A
1.0	Grade (400W unless otherwise noted) and type of steel delivered and installed as required by approved drawings.	☑	☐	☐
2.0	Inspect rebar distribution, spacing and cover per design/project requirements.	☑	☐	☐
3.0	Length of splices as specified	☑	☐	☐
4.0	Staggered splices as specified	☑	☐	☐
5.0	Any mechanical splices have been approved by the owner prior to install	☑	☐	☐
6.0	Bars cleaned and free of material that may reduce bond including loose rust, scale, oil, structural defects and that they are uncoated and unpainted.	☑	☐	☐
7.0	Dowels at wall ends, construction joints, and openings as specified (length, location, size, etc.)	☑	☐	☐
8.0	No unauthorized field bent bars including hooks installed	☐	☐	☑
	Resolve conflicts between embedded items and reinforcement			
9.0	When authorized, field bends done without heat and inspected for fissures or cracks.	☑	☐	☐

ITEM	ITEMS TO BE CHECKED	PASS	FAIL	N/A
10.0	Bars tied and supported to prevent displacement	☑	☐	☐
11.0	Spacers, tie wire and chairs as required	☑	☐	☐
12.0	Conduits at design location and minimum separation from rebar as specified	☐	☐	☑
13.0	No contact of bars is made with dissimilar metals as per CSA A23.1	☐	☐	☑
14.0	Bars, nails or tie wire not sticking out from surfaces that allow rusting/corrosion	☑	☐	☐
15.0	Rebar is welds inspected by qualified inspectors certified to CSA W178.2	☐	☐	☑
16.0	No rebar congestion or other obstruction for deposit of concrete	☑	☐	☐
17.0	Adjustments required for interfering items (piping, inserts, sleeves, etc.) have been submitted and approved by owner.	☐	☐	☑
18.0	Rebar was stored off ground to prevent damage/corrosion	/		
19.0	Review drawings for anchors, piping, sleeves, boxes	☑	☐	☐

COMMENTS:

Follow RFI accepted for slab transition zone.

CONCRETE POST POUR INSPECTION

Rev 03 May 4, 2018

INSPECTOR(S): Ryan deMichaud	SPEC SECTION(S): 503 30 00 – Cast-In-Place
TYPE OF FINISH: FI BELOW GRADE	DATE OF INSPECTION: Sept. 6, 2018

AREA AND LOCATION(s): ADR REMAINING PEDESTALS, FOOTINGS AND PILASTERS PRIOR TO BACKFILL.

GENERAL REQUIREMENTS	PASS	FAIL	N/A	REMARKS
Curing compounds not used on any surface against which additional concrete or materials are to be bonded.	☒	☐	☐	
Fresh concrete barricaded/ protected from mechanical disturbance.	☒	☐	☐	
Where concrete is used for filling, the chipped opening shall not be less than 75mm in depth.	☐	☐	☒	~~GROUT~~ / CRETE USED TO PATCH.
Patches exposed to view shall blend with surrounding surfaces.	☒	☐	☐	
Contractor shall clean all exposed concrete surfaces of all encrustations of cement, mortar, or grout and shall remove unsightly stains.	☒	☐	☐	
Concrete appears proper and devoid of any honeycomb, cold joints, droppings or other defects	☒	☐	☐	
Removal of all concrete rubble and dispose of at an appropriate location.	☒	☐	☐	
Surface of concrete finished against forms has a smooth, dense finish free from cracks, free from projections, pits, and honeycomb and in proper alignment.	☒	☐	☐	
COLD WEATHER REQUIREMENTS (WHEN AMB. TEMP < 5°C)	**PASS**	**FAIL**	**N/A**	**REMARKS**
Protection in place until 70% of the 28-day strength has been reached.	☐	☐	☒	
Cold weather protection provided by means of heated enclosures, coverings, insulation, or a suitable approved combination of these methods during complete curing period.	☐	☐	☒	
Water not sitting in recesses, shear pockets, groves, bolt sleeves during heat and Hoarding period.	☒	☐	☐	

COMMENTS: SOME BACKFILL IN PLACE AT TIME OF INSPECTION. PLANS REVIEWED BY RD FROM DATES PRECEEDING BACKFILL. AS WELL RD REQUESTED 2 RANDOM SPOTS BE DUG BACK TO CONFIRM FINISH WAS ACCEPTABLE AND ALL REQUIRED PATCHING COMPLETED.

CONFIRMATION OF REPAIR | Liner at 5710 ADR

Project: 5710 ADR Eagle Gold Project

This letter is to confirm that Clark Builders has completed the required repair of the liner that was damaged by Clark Builders at the ADR. Liner damage was located on the west side of the ADR footprint between GL B-C (See attached Photos and marked up drawing).

This letter confirms the turnover of patched area to JDS and Layfield from Clark Builders.

Regards,

Clark Builders

CONCRETE POST POUR INSPECTION

Rev 03 May 4, 2018

INSPECTOR(S): JACKSON WENGER	SPEC SECTION(S): 503 30 00 – Cast-In-Place
TYPE OF FINISH: BACK RUBS	DATE OF INSPECTION: OCT. 13 2018
AREA AND LOCATION(s): S/W BARREN SOL. TANK	

GENERAL REQUIREMENTS	PASS	FAIL	N/A	REMARKS
Curing compounds not used on any surface against which additional concrete or materials are to be bonded.	☑	☐	☐	
Fresh concrete barricaded/ protected from mechanical disturbance.	☑	☐	☐	
Where concrete is used for filling, the chipped opening shall not be less than 75mm in depth.	☑	☐	☐	
Patches exposed to view shall blend with surrounding surfaces.	☑	☐	☐	
Contractor shall clean all exposed concrete surfaces of all encrustations of cement, mortar, or grout and shall remove unsightly stains.	☑	☐	☐	
Concrete appears proper and devoid of any honeycomb, cold joints, droppings or other defects	☑	☐	☐	
Removal of all concrete rubble and dispose of at an appropriate location.	☑	☐	☐	
Surface of concrete finished against forms has a smooth, dense finish free from cracks, free from projections, pits, and honeycomb and in proper alignment.	☑	☐	☐	
OLD WEATHER REQUIREMENTS (WHEN AMB. TEMP < 5°C)	PASS	FAIL	N/A	REMARKS
Protection in place until 70% of the 28-day strength has been reached.	☑	☐	☐	
Cold weather protection provided by means of heated enclosures, coverings, insulation, or a suitable approved combination of these methods during complete curing period.	☑	☐	☐	
Water not sitting in recesses, shear pockets, groves, bolt sleeves during heat and Hoarding period.	☑	☐	☐

3	2018.10.28	ADR Building	Electrical Grounding conduit to be repaired and aligned properly for connection to building.	Electrical Grounding	C	JDS	No
4	2018.10.28	ADR Building	Remaining saw cut caulking required. (Once Building envelope is installed and interior is heated properly.	Caulking	BCC	Clark Builders	No
5	2018.10.28	ADR Building	GL 7.3/B Blow-off column Equip. pad Type 1 forming to be stripped and finished as required.	Concrete Finishes	BCC	Clark Builders	No
6	2018.10.28	ADR Building	GL A.5/6 Stair faces to be finished.	Concrete Finishes	BCC	Clark Builders	No
7	2018.10.28	ADR Building	General site slag removal at bases of formed structures (i.e. curbs, pedestals, walls, stairs, etc.)	Concrete Finishes	BCC	Clark Builders	No
8	2018.10.28	ADR Building	Induction furnace plate requires lifting hook to be removed and ground down to smooth surface.	Steel	BCC	Clark Builders	No
9	2018.10.28	ADR Building	Induction furnace corner not flush with concrete, concrete to be flush with the plate.	Concrete Finishes	BCC	Clark Builders	No
10	2018.10.28	ADR Building	Induction furnace channel between pads to be patched.	Concrete Finishes	BCC	Clark Builders	No

Construction Walk Down Deficiency Sheet

"A" items To be completed before Acceptance.
"BSU" Items To be completed before startup.
"BCC" Items To be completed before contract closure.
"C" Items is Not in Scope.

Project Name: CB201/ 18502 StrataGold Eagle Gold Project

System Description: Concrete Installations

Walkdown Attendees: Clark Builders: Ryan de Milliano, Jackson Wenger
JDS Mining: Ishan Fechter, Matt Coverdale

Responsible Contractor: Clark Builders Energy & Resources

Item No.	Date: (YYYY.MM.DD)	Area/ Location	Description	Discipline	Catagory (Dropdown)	Responsibility	Vendor (Dropdown)
11	2018.10.28	ADR Building	GL. 2/A.5 Anchor Bolt to be threaded down to correct location. Current extra washers installed to support the bolts.	Anhor Bolts	BCC	Clark Builders	No
12	2018.10.28	ADR Building	As per RFI 74, Pad poured 45mm too high required to be chipped down 30mm.	Concrete Structure	BCC	Clark Builders	No
13	2018.10.28	ADR Building	Air pockets in concrete, general, to be patched.	Concrete Finishes	BCC	Clark Builders	No

StrataGold Eagle Gold Project

System/ Area Construction Completion Certificate

Project No.: 18502 / CB201	**Contractor Name:** Clark Builders Energy & Resources	**PARTIAL:** ☐ **FINAL:** ☒
System No.: N/A	**T/O Package No.:** 01	

System/Component/Area Description:
5710 ADR Process Plant Building Concrete Installations for Building Foundation
5710 ADR Transformer Foundation Concrete Installations

Punch list Items: (Attached)
5710 ADR Process Plant Building and Transformer Foundation Concrete Installations.

We the Area Works Subcontractor assures that the above mentioned System/Area has been constructed inspected, tested and punch listed in accordance with the applicable drawings and specifications and is considered Construction Complete. All supporting drawings and documents have been reviewed, acceptable, and ready for handing over. Punch List Items may be completed after acceptance of the System/Area.

Turnover Package Punch List Attached: **Yes:** ☒ **No:** ☐

ATTACHMENT A

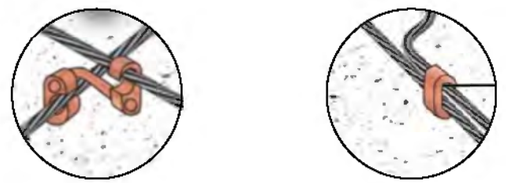
Record Drawings

SUBSTATION and DIESEL POWER PLANT SUBGRADE ASB October 26 2018

GENERAL NOTES

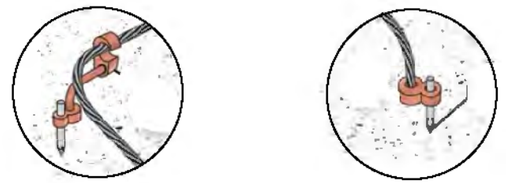
1) THE DRAWINGS AND THESE NOTES AND SPECIFICATIONS DEFINE THE REQUIREMENTS FOR THE SUPPLY, INSTALLATION AND TESTING WITH RESPECT TO THE SUBSTATION AND POWER STATION GROUNDING SYSTEM. FOR A LISTING OF APPLICABLE DRAWINGS REFER TO DRAWING No. 001-2700-E-6531.
2) THE ENTIRE INSTALLATION SHALL COMPLY WITH THE YUKON QUARTZ MINING ACT AND REGULATIONS, IN PARTICULAR PART 15 - SURFACE AND UNDERGROUND MINES OR PROJECTS.
3) THE ENTIRE INSTALLATION SHALL BE IN ACCORDANCE WITH THE CANADIAN ELECTRICAL CODE C22.1-18 (THE C.E.C) AS ADOPTED FOR USE IN THE YUKON.
4) THE INSTALLATION SHALL COMPLY WITH THE REQUIREMENTS OF CSA STANDARD M421 THE USE OF ELECTRICITY IN MINES.
5) THE CONTRACTOR SHALL SUPPLY AND INSTALL ALL MATERIAL AND EQUIPMENT IN ACCORDANCE WITH THE CANADIAN ELECTRICAL CODE, WHETHER OR NOT ALL DETAILS ARE SPECIFIED OR SHOWN ON THE DRAWINGS. THE CONTRACTOR SHALL, AS AN INTEGRAL PART OF THE CONTRACT, PROVIDE AN INSTALLATION THAT IS FULLY IN COMPLIANCE WITH THE C.E.C. THIS INCLUDES THE SUPPLY AND INSTALLATION OF ALL NECESSARY SMALL MATERIALS INCLUDING CONNECTORS, ETC. NOT NECESSARILY SHOWN ON THE DRAWINGS OR SPECIFIED HEREIN.
6) ALL GROUNDING MATERIAL AND EQUIPMENT SHALL BE CSA APPROVED AND SHALL CONFORM TO CSA STANDARD C22.2 No. 41 GROUNDING AND BONDING & EQUIPMENT.
7) PROVIDE ADDITIONAL (MECHANICAL) PROTECTION FOR GROUND CONDUCTORS WHERE EXPOSED TO DAMAGE, AS MAY BE REQUIRED BY THE C.E.C.

SPECIFIC GROUNDING NOTES & SPECIFICATIONS



1) UNDERGROUND (BELOW GRADE) GROUNDING CONNECTIONS SHALL BE MADE USING CADWELD (EXOTHERMIC WELDING) OR CSA APPROVED GROUNDING COMPRESSION CONNECTORS.
2) WHEN EXOTHERMIC WELDING IS USED, IT MUST BE CARRIED OUT IN ACCORDANCE WITH THE MANUFACTURER'S INSTRUCTIONS. ABOVE GRADE CONNECTIONS MAY BE BOLTED USING CSA APPROVED GROUNDING CONNECTORS.
3) COMPRESSION CONNECTORS SHALL BE COPPER, AS MANUFACTURED BY BURNDY, T&B, OR OTHER APPROVED MANUFACTURER (APPROVED IN WRITING). COMPRESSION CONNECTOR INSTALLATION SHALL BE CARRIED OUT IN ACCORDANCE WITH THE MANUFACTURER'S INSTRUCTIONS, INCLUDING THE USE OF APPROPRIATE TOOLS, JOINT COMPOUND WHERE RECOMMENDED, ETC. FOR BONDING TO REBAR, SELECT CONNECTORS OF APPROPRIATE SIZE.
4) UNLESS SHOWN OTHERWISE, ALL GROUND WIRE SHALL BE BARE, STRANDED, 2/0 AWG SOFT OR MEDIUM HARD DRAWN COPPER GROUND WIRE.
5) INSTALL 1/2 OR 3/4 INCH PVC CONDUIT SLEEVE FOR MECHANICAL PROTECTION OF GROUND LEADS WHERE THEY EXIT TOP OF FOUNDATION. FILL WITH RTV SILICONE TO MAKE WATERTIGHT.
6) THE MAIN GROUND GRID SHALL BE INSTALLED AS SHOWN ON THE DRAWINGS AND SHALL GENERALLY BE BETWEEN 500 AND 600 mm BELOW FINISHED GRADE. FINISHED GRADE IS DEFINED AS THE TOP OF THE\ STRUCTURAL PADS OR THE TOP OF THE YARD AREA, IN BOTH CASES BEFORE THE 150 mm LAYER OF OF CRUSHED ROCK IS INSTALLED. NOTE, THE FOREGOING MEANS THE GROUND GRID WILL BE AT VARYING ELEVATIONS ACROSS THE YARD. REFER TO THE WORK-POINTS AND DIMENSIONS ON THE DRAWINGS. RODS AND GROUND CONDUCTORS SHALL BE LOCATED EXACTLY IN THE LOCATIONS SHOWN ON THE DRAWINGS AS YARD TOUCH AND STEP POTENTIALS HAVE BEEN CALCULATED BASED ON THE LAYOUT AS SHOWN ON THE DRAWINGS. NEATLY COIL UP GROUNDING TAILS AND MARK THE LOCATION WITH WOODEN STAKES DRIVEN INTO THE GROUND (IN CASE IT SNOWS BEOFRE FINAL CONNECTIONS ARE MADE).
7) THE 150 mm LAYER OF WASHED, CRUSHED, HIGH RESISTANCE ROCK WILL BE PLACED BY THE SUBSTATION CONTRACTOR, AFTER THE MAJORITY OF THE SUBSTATION INSTALLATION WORK IS COMPLETE.
8) MAKE CONNECTIONS TO THE GROUNDING CONDUCTORS INSTALLED WITHIN THE CONCRETE FOUNDATIONS
9) THE SUBSTATION FENCE AND FENCE GROUNDING WILL BE INSTALLED BY THE SUBSTATION CONTRACTOR, AFTER THE MAJORITY OF THE SUBSTATION WORK IS REQUIRED. HOWEVER, THIS CONTRACTOR SHALL LEAVE MINIMUM 3 M GROUND WIRE TAILS AS SHOWN ON THE DRAWINGS FOR CONNECTION (BY OTHERS) TO THE FENCE.
10) GROUNDING CONNECTIONS TO TRANSFORMERS, CIRCUIT SWITCHERS, CAPACITOR BANK MODULE AND POWER-PLANT MODULES WILL BE BY THE SUBSTATION CONTRACTOR. HOWEVER, THIS CONTRACTOR SHALL LEAVE 3 m GROUND WIRE TAILS TO FACILITATE THESE FUTURE CONNECTIONS.
11) GROUNDING CONNECTIONS TO THE 4 POLE STRUCTURE, 2 POLE STRUCTURE, INCOMING LINE DEAD-END STRUCTURE, THE 4 LIGHTNING MAST POLES AND THE TWO GUY ANCHORS IN THE SUBSTATION YARD WILL BE BY THE MAIN SUBSTATION CONTRACTOR, BUT THIS CONTRACTOR SHALL LEAVE GROUND WIRE TAILS AS SHOWN ON THE DRAWINGS TO FACILITATE THESE CONNECTIONS.
12) 2/0 AWG BARE COPPER GROUND LEADS SHALL BE RUN TO EDGE OF THE PLANT AREA, FOR CONNECTION BY OTHERS TO THE FUEL TANK AREA . 2/0 AWG GROUND WIRE SHALL ALSO BE RUN NEXT TO THE CONDUITS FOR THE PLANT 13.8 KV FEEDER CABLES, AS SHOWN ON THE DRAWINGS.
13) GROUND RODS SHALL BE COPPER CLAD STEEL, SECTIONAL TYPE, 6 M LONG. ALL RODS SHALL BE DRIVEN TO TO FULL DEPTH. AS THE STATION IS BUILT ON GRANULAR FILL, THIS IS BELIEVED TO BE ENTIRELY POSSIBLE. HOWEVER, IF A ROD CANNOT BE DRIVEN, PERHAPS BECAUSE IT HIT A ROCK, IT'S LOCATION SHALL BE MOVED SLIGHTLY AND IT SHALL BE DRIVEN IN THE NEW LOCATION. NOTE, THE 6 M LENGTH IS REQUIRED TO ENSURE THE RODS EXTEND BELOW THE FROST LEVEL.
14) ALL GROUND RODS AND THE GROUND GRID SHALL BE INSTALLED IN LOCATIONS MEASURED EXACTLY AS PER THE DRAWINGS. ANY EXCEPTIONS SHALL BE APPROVED IN WRITING BY THE WN BRAZIER ASSOCIATES INC., OTHERWISE RESPONSIBILITY AS THE ENGINEER OF RECORD WILL NOT BE POSSIBLE. THE TOP OF THE GROUND RODS SHALL BE AT THE SAME ELEVATION AS THE GROUND GRID.
15) A 150 mm LAYER OF WASHED, CRUSHED ROCK (AS PER SPEC.) WILL BE PLACED OVER THE ENTIRE SUBSTATION AND POWER-PLANT AREA BY THE SUBSTATION CONTRACTOR, AFTER THE MAIN CONSTRUCTION WORK IS COMPLETE.
16) SUPPLY AND INSTALL 2 INCH, 4 INCH AND 6 INCH (AS SHOWN) SCHED. 40 PVC CONDUIT WITH 90° SWEEP 90, 36 INCH RADIUS AS SHOWN. THESE CONDUITS GO BELOW THE GROUND GRID LEVEL. INSTALL SUITABLE PULL CORDS. INSTALL WARNING TAPE ABOVE CONDUITS. COMPACT TRENCH BACKFILL AS PER ORIGINAL CIVIL SPECIFICATIONS.
17) SUPPLY AND INSTALL CONCRETE PULL BOXES AS SHOWN (FOR THE PLANT FEEDER CABLES).

GROUNDING QUALITY CONTROL AND TESTING



1) INSPECT THE GROUNDING AND BONDING SYSTEM CONDUCTORS AND CONNECTIONS AND RODS AFTER INSTALLATION TO CONFIRM PROPER INSTALLATION LOCATION AND DEPTH, CONNECTION INTEGRITY AND, IN GENERAL, TO CONFIRM PROPER INSTALLATION AS PER THE DRAWING, GOOD INDUSTRIAL PRACTICE AND FOR COMPLIANCE WITH THE SPECIFICATIONS. CONFIRM GRID CONDUCTORS AND RODS ARE INSTALLED IN LOCATIONS AS SHOWN ON THE DRAWINGS. CONFIRM GROUND WIRE TAILS ARE LEFT AS REQUIRED FOR FOR LATER CONNECTION BY OTHERS. PROVIDE SUITABLE DOCUMENTATION FOR RECORD PURPOSES INCLUDING PHOTOGRAPHS.
2) CARRY OUT A GROUND RESISTANCE TEST ON THE COMPLETED GRID, AFTER BACKFILLING TO FINISHED GRADE. THE TESTING SHALL BE DONE BY AN EXPERIENCED TESTING COMPANY ACCEPTABLE TO THE OWNER. THE TEST SHALL NOT BE CARRIED OUT ON A RAINY DAY. THE TEST SHALL BE CARRIED OUT ON THE GRID BEFORE CONNECTION TO THE FUEL TANK AREA, THE FEEDER CABLES, OR THE GROUNDING SYSTEM ON THE INCOMING 69 KV POWER LINE.
3) GROUND TESTING SHALL BE BY THE "FALL OF POTENTIAL MRTHOD" IN ACCORDANCE WITH IEEE STANDARD 81-2012: "GUIDE FOR MEASURING EARTH RESISTIVITY, GROUND IMPEDANCE, AND EARTH SURFACE POTENTIALS OF A GROUND SYSTEM." THE TEST SHALL BE BY A RECOGNIZED TESTING FIRM. A TEST REPORT SHALL BE PROVIDED, SIGNED AND SEALED BY A PROFESSIONAL ELECTRICAL ENGINEER REGISTERED IN THE YUKON.
3) PROVIDE ONE SET OF MARKED UP "AS BUILT" DRAWINGS TO WN BRAZIER ASSOCIATES INC. AFTER COMPLETION OF THE PROJECT.
4) PROVIDE COPIES OF ALL QA/QC DOCUMENTATION.

DRAWN:	WNB	DATE:	AUG /2018	
CHECKED:	WNB	DATE:	AUG /2018	
APPROVED:	WNB	DATE:	AUG /2018	
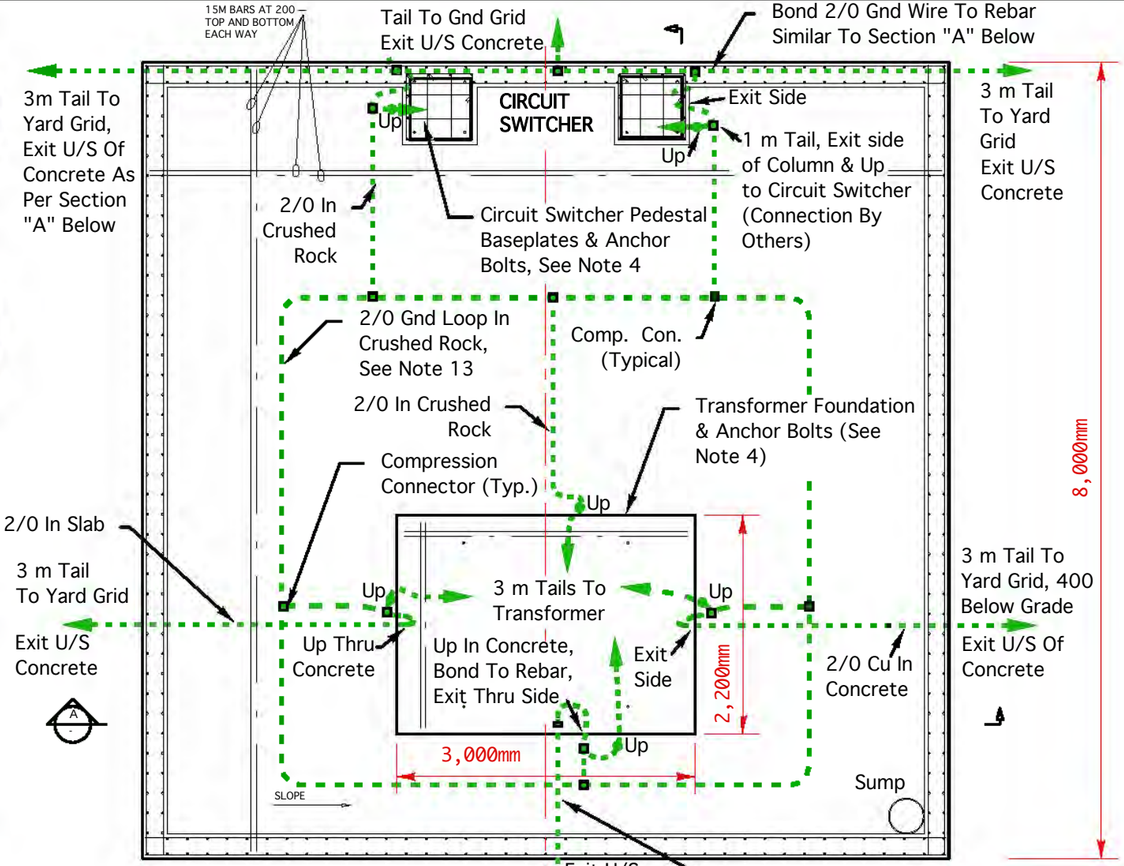
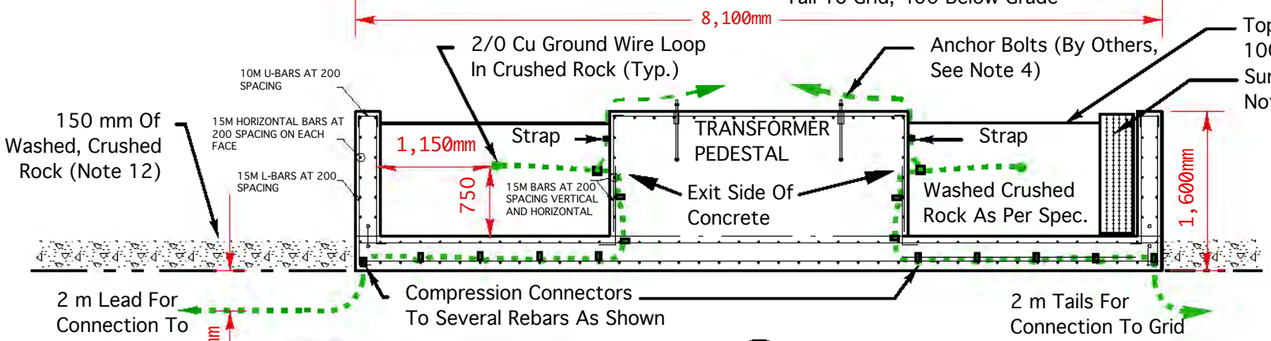
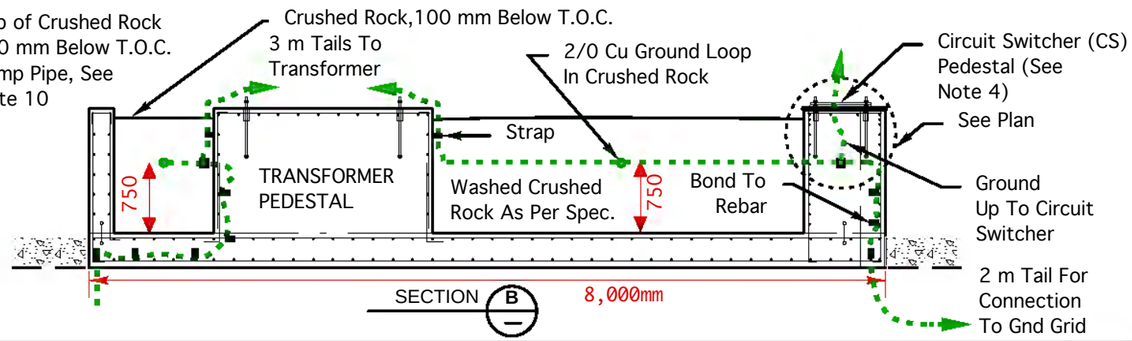
DRAWING NO:	001 - 27OO - E - 6531			0



Typical Compression Connections To Rebar



Typical Ground Wire Connections



GROUNDING NOTES

1) FOR GENERAL NOTES REFER TO DRAWING No. 001-2700-E-6537.
2) FOR CONCRETE FOUNDATION DETAILS REFER TO DRAWING No. 1407.2 - C - 3016. FOR THE STRUCTURAL PAD GRADING PLAN SEE DRAWING No. 1407.2 - C - 2015. FOR CONCRETE FOUNDATION (LOCATION) PLAN SEE DRAWING No. 1407.2 - C - 2016. FOR CS3 FOUNDATION GROUNDING SEE DRAWING No. 001-2700-E-6537. FOR STATION GROUND GRID REFER TO DRAWING No. 001-2700-E-6531.
3) THIS DRAWING SHOWS EMBEDDED GROUND LEADS THROUGH THE FOUNDATION TO THE EQUIPMENT AND INCLUDES REBAR GROUNDING. AS THE C.E.C. DOES NOT SPECIFICALLY REQUIRE REBAR GROUNDING, BOND GROUND WIRE TO REBAR AT SEVERAL LOCATIONS AS SHOWN. USE APPROVED COMPRESSION CONNECTORS OF SUITABLE SIZE.
4) AS THE CIRCUIT SWITCHERS AND TRANSFORMERS, ETC. WILL BE GROUNDED AS SHOWN ON OTHER DRAWINGS, GROUNDING OF ANCHOR BOLTS IS NOT INCLUDED ON THIS DRAWING AS THEY WILL BE GROUNDED BY VIRTUE OF THE FACT THE ASSOCIATED ELECTRICAL EQUIPMENT WILL BE SOLIDLY GROUNDED.
5) GROUND CONNECTIONS MAY BE MADE USING CSA APPROVED COMPRESSION CONNECTORS OR EXOTHERMIC WELDING AS SHOWN.
6) WHEN EXOTHERMIC WELDING IS USED, IT MUST BE CARRIED OUT IN ACCORDANCE WITH THE MANUFACTURER'S INSTRUCTIONS.
7) COMPRESSION CONNECTORS SHALL BE COPPER, AS MANUFACTURED BY BURNDY, T&B, OR OTHER APPROVED MANUFACTURER (APPROVED IN WRITING). COMPRESSION CONNECTOR INSTALLATION SHALL BE CARRIED OUT IN ACCORDANCE WITH THE MANUFACTURER'S INSTRUCTIONS, INCLUDING THE USE OF APPROPRIATE TOOLS, JOINT COMPOUND WHERE RECOMMENDED, ETC. FOR BONDING TO REBAR SELECT CONNECTORS OF APPROPRIATE SIZE.
8) UNLESS SHOWN OTHERWISE, ALL GROUND WIRE SHALL BE BARE, STRANDED, 2/0 AWG SOFT OR MEDIUM HARD DRAWN COPPER GROUND WIRE.
9) INSTALL 1/2 OR 3/4 INCH PVC CONDUIT SLEEVE FOR MECHANICAL PROTECTION OF GROUND LEADS WHERE THEY EXIT TOP OF SLAB. FILL WITH RTV SILICONE TO MAKE WATERTIGHT.
10) IF SUMP PIPE IS STEEL, BOND TO GROUND.
11) THIS DRAWING IS TYPICAL FOR TWO FOUNDATIONS, TRANSFORMER T1 & CIRCUIT SWITCHER CS1 AND ALSO FOR TRANSFORMER T2 & CIRCUIT SWITCHER CS2. SEE DRAWING 1407.2 - C - 2016. NOTE, EACH FOUNDATION CIRCUIT SWITCHER END POINTS TOWARD THE 4 POLE STRUCTURE.
12) A 150 mm LAYER OF WASHED, CRUSHED ROCK (AS PER SPEC.) WILL BE PLACED OVER THE ENTIRE SUBSTATION AND POWERPLANT AREA BY THE SUBSTATION CONTRACTOR, AFTER THE MAIN CONSTRUCTION WORK IS COMPLETE.
13) RUN A LOOP OF 2/0 AWG GROUND WIRE IN SUMP CRUSHED ROCK 400 mm BELOW SURFACE.

EAGLE GOLD PROJECT
MAIN SUBSTATION & POWERPLANT
FOUNDAT'N GROUNDING - T1, CS1, T2, CS2

DRAWING NO: 001-2700 - E - 6535 REV. 0

DETAIL 2

GENERAL NOTES

1) THE ENTIRE INSTALLATION SHALL BE IN ACCORDANCE WITH THE CANADIAN ELECTRICAL CODE C22.1-18 (THE C.E.C).THE CONTRACTOR SHALL SUPPLY AND INSTALL EQUIPMENT ALL IN ACCORDANCE WITH THIS STANDARD, WHETHER OR NOT ALL DETAILS ARE SPECIFIED OR SHOWN ON THE DRAWINGS. THE CONTRACTOR SHALL AS AN INTEGRAL PART OF THE CONTRACT, PROVIDE AN INSTALLATION FULLY IN COMPLIANCE WITH THE C.E.C. THIS INCLUDES THE SUPPLY AND INSTALLATION OF ALL NECESSARY SMALL MATERIALS, NOT NECESSARILY SHOWN ON THE DRAWINGS.
2) ALL GROUNDING MATERIAL AND EQUIPMENT SHALL BE CSA APPROVED AND SHALL CONFORM TO CSA STANDARD C22.2 No. 41 GROUNDING AND BONDING & EQUIPMENT.
3) PROVIDE ADDITIONAL (MECHANICAL) PROTECTION OF GROUND CONDUCTORS AS MAY BE REQUIRED BY THE C.E.C.

FOUNDATION REBAR GROUNDING NOTES

1) FOR CONCRETE FOUNDATION DETAILS REFER TO DRAWING No. 1407.2 - C - 3025. FOR THE STRUCTURAL PAD GRADING PLAN SEE DRAWING No. 1407.2 - C - 2015. FOR CONCRETE FOUNDATION (LOCATION) PLAN SEE DRAWING No. 1407.2 - C - 2016. FOR TRANSFORMER FOUNDATION GROUNDING SEE DRAWING No. 001-2700-E-6535. FOR STATION GROUND GRID REFER TO DRAWING No. 001-2700-E-6531.
2) THIS DRAWING SHOWS EMBEDDED GROUND LEADS THROUGH THE FOUNDATION TO THE EQUIPMENT (CS3) AND INCLUDES REBAR GROUNDING. AS THE C.E.C. DOES NOT SPECIFICALLY REQUIRE REBAR GROUNDING, BOND GROUND WIRE TO REBAR AT SEVERAL LOCATIONS AS SHOWN. USE APPROVED COMPRESSION CONNECTORS OF SUITABLE SIZE.
3) AS THE CIRCUIT SWITCHERS AND TRANSFORMERS, ETC. WILL BE GROUNDED AS SHOWN ON OTHER DRAWINGS, GROUNDING OF ANCHOR BOLTS IS NOT INCLUDED ON THIS DRAWING AS THEY WILL BE GROUNDED BY VIRTUE OF THE FACT THE ASSOCIATED ELECTRICAL EQUIPMENT WILL BE SOLIDLY GROUNDED.
4) GROUND CONNECTIONS MAY BE MADE USING CSA APPROVED COMPRESSION CONNECTORS. OR EXOTHERMIC WELDING AS SHOWN.
5) WHEN EXOTHERMIC WELDING IS USED, IT MUST BE CARRIED OUT IN ACCORDANCE WITH THE MANUFACTURER'S INSTRUCTIONS.
6) COMPRESSION CONNECTORS SHALL BE COPPER, AS MANUFACTURED BY BURNDY, T&B, OR OTHER APPROVED MANUFACTURER (APPROVED IN WRITING). COMPRESSION CONNECTOR INSTALLATION SHALL BE CARRIED OUT IN ACCORDANCE WITH THE MANUFACTURER'S INSTRUCTIONS, INCLUDING THE USE OF APPROPRIATE TOOLS, JOINT COMPOUND WHERE RECOMMENDED, ETC. FOR BONDING TO REBAR, SELECT CONNECTORS OF APPROPRIATE SIZE.
7) UNLESS SHOWN OTHERWISE, ALL GROUND WIRE SHALL BE BARE, STRANDED, 2/0 AWG SOFT OR MEDIUM HARD DRAWN COPPER GROUND WIRE.
8) INSTALL 1/2 OR 3/4 INCH PVC CONDUIT SLEEVE FOR MECHANICAL PROTECTION OF GROUND LEADS WHERE THEY EXIT TOP OF FOUNDATION. FILL WITH RTV SILICONE TO MAKE WATERTIGHT.
9) A 150 mm LAYER OF WASHED, CRUSHED ROCK (AS PER SPEC.) WILL BE PLACED OVER THE ENTIRE SUBSTATION AND POWERPLANT AREA BY THE SUBSTATION CONTRACTOR, AFTER THE MAIN CONSTRUCTION WORK IS COMPLETE.
10) EMBED 4 INCH SCHED. 40 PVC CONDUIT WITH 90° SWEEP 90, 36 INCH RADIUS AS SHOWN. NOTE, THIS IS ONLY ON THE LOWER SECTION A, NOT THE TO SECTION. INSTALL BEFORE FORMING FOUNDATION. DUCTWORK IN YARD MUST BE MIN. 600 BELOW GRADE BUT SWEEP 90 WILL REQUIRE GREATER BURIAL DEPTH.

Reviewed only for general conformity with the specifications. Acceptance by the engineer does not warrant or represent that the information contained on this drawing/document is either accurate or complete. The sole responsibility for correct design, details & dimensions shall remain with the party submitting the drawing/document.

NOT IN HATCH SCOPE

GENERAL NOTES ON REINFORCEMENT

THE FOLLOWING NOTES SHALL APPLY TO ALL REINFORCEMENT SHOWN ON THE DRAWINGS UNLESS OTHERWISE NOTED.

DIMENSIONS:
DIMENSIONS TO REINFORCEMENT ARE TO CENTRE LINES OF BARS, UNLESS WHERE CONCRETE COVER OR CLEARANCE BETWEEN BARS IS SHOWN.

COVER:
SEE CONSTRUCTION ENGINEER TYPICAL NOTES FOR ALL COVER SPECIFICATIONS

SPACING:
UNLESS OTHERWISE SHOWN, THE FIRST AND LAST BARS IN SLABS AND WALLS, STIRRUPS IN BEAMS SHALL BE PLACED AT MAXIMUM OF HALF THE SPECIFIED SPACING OF ADJACENT BARS FROM THE END OF THE MEMBER.

STEEL SPECIFICATIONS:
STEEL REINFORCEMENT SHALL BE DEFORMED BARS OF GRADE 400 CONFORMING TO CSA STANDARDS G30.18 M1987-400R BARS FOR CONCRETE REINFORCEMENT.

WELDING:
WELDING OF REINFORCEMENT SHALL NOT BE PERMITTED.

SPLICES AND EMBEDMENTS:
UNLESS OTHERWISE SPECIFIED, ALL EMBEDMENTS SHALL BE TREATED AS TENSION EMBEDMENTS AND ALL LAP SPLICES SHALL BE CONSIDERED AS TENSION LAP SPLICES.

WHEN REINFORCING BARS OF DIFFERENT SIZE ARE TO BE SPLICED, THE LENGTH OF THE LAP SHALL BE BASED ON THE DIAMETER OF THE SMALLER BAR.

SPLICES ARE TO BE MADE SO THAT THE GIVEN CLEAR DISTANCE COVER WILL BE MAINTAINED.

LAP LENGTHS UNLESS SHOWN OTHERWISE:

	HOOK	STRAIGHT
10M	320	400
15M	375	500
20M	1000	700
25M	1675	1240
30M	1940	1495
35M		

PLACEMENT:
PLACE REINFORCING STEEL IN ACCORDANCE WITH CSA CAN3-A23.1-M8.

REINFORCEMENT MAY BE DISPLACED TO CLEAR PIPES, RECESSES, EMBEDDED METAL WORKS AND CONDUITS.

A MINIMUM CLEARANCE OF 1" SHALL BE MAINTAINED BETWEEN REINFORCEMENT AND EMBEDDED MATERIALS. THE MINIMUM CLEARANCE BETWEEN REINFORCEMENT

REINFORCEMENT SHALL BE ACCURATELY PLACED IN ACCORDANCE WITH THE DRAWING AND SHALL BE ADEQUATELY SECURED AGAINST DISPLACEMENT BY USING ANNEALED IRON WIRE AT INTERSECTIONS AND SHALL BE SUPPORTED BY APPROVED CONCRETE OR METAL SUPPORTS, SPACERS OR METAL HANGERS EXCEPT AT SURFACES EXPOSED TO THE GROUND OR TO THE WEATHER WHERE SUPPORTS SHALL BE APPROVED. ALL METAL ACCESSORIES ARE TO BE GALVANIZED.

THE FULL INTENT AND PURPOSE OF THESE DRAWINGS IS PLACING OF REINFORCING STEEL BARS ONLY. IT IS NOT TO BE USED AS A MEANS OF COMMUNICATION BETWEEN THE ARCHITECT, ENGINEER, CONTRACTOR OR ANY OTHER SUBTRADE.

5. EXCAVATE TO REMOVE VEGETATION, TOPSOIL, ORGANICS, AND ICE-RICH PERMAFROST, EXPOSING UNFROZEN OR NON-ICE-RICH MINERAL SOIL.
6. CUT OUT SOFT AREAS OF SUBGRADE NOT CAPABLE OF COMPACTION IN PLACE. BACKFILL WITH FILL AND COMPACT TO DENSITY EQUAL TO OR GREATER THAN REQUIREMENTS FOR SUBSEQUENT FILL MATERIAL.
7. SCARIFY AND PROOF ROLL SUBGRADE SURFACE TO A DEPTH INDICATED TO IDENTIFY SOFT SPOTS; FILL AND COMPACT TO DENSITY EQUAL TO OR GREATER THAN REQUIREMENTS FOR SUBSEQUENT FILL MATERIAL.
8. ENSURE THERE IS NO ICE RICH MATERIAL BELOW PLANNED FILL AREA. ALL ICE RICH MATERIAL SHOULD BE REMOVED PRIOR TO FILL PLACEMENT AND THE ADJACENT GROUND ALLOWED SUFFICIENT TIME TO THAW, DRAIN AND DRY AS APPLICABLE.
9. THE OWNER'S GEOTECHNICAL ENGINEER MAY PRESCRIBE THE USE OF GEOTEXTILE FOLLOWING REVIEW OF SUBGRADE CONDITIONS.
10. A GEOTECHNICAL ENGINEER MUST CONFIRM SUITABILITY OF SUBGRADE PRIOR TO PLACEMENT OF NEW FILL SECTIONS.
11. PLACE AND COMPACT MATERIAL IN EQUAL CONTINUOUS LAYERS NOT EXCEEDING 200 mm LOOSE THICKNESS.
12. COMPACT FILL TO WITHIN THE BOUNDS OF 98% STANDARD PROCTOR DRY DENSITY WITH A DEGREE OF SATURATION OF ±2% OF OPTIMUM.
13. EMPLOY A PLACEMENT METHOD THAT DOES NOT DISTURB OR DAMAGE OTHER WORK.
14. MAINTAIN OPTIMUM MOISTURE CONTENT (±2%) OF BACKFILL MATERIALS TO ATTAIN REQUIRED COMPACTION DENSITY.
15. MAKE GRADUAL GRADE CHANGES. BLEND SLOPE INTO LEVEL AREAS.
16. THE SUBGRADE PREPARATION MUST EXTEND TO OUTER LIMITS OF FILL SLOPE.
17. STRUCTURAL FILL PADS TO BE A MINIMUM OF 300mm THICK SUBEXCAVATE AS REQUIRED TO ACHIEVE MINIMUM THICKNESS.
18. STRUCTURAL FILL PAD ELEVATIONS TO BE WITHIN ±25mm TOLERANCE OF ELEVATIONS SHOWN WITH A MAXIMUM TOTAL ELEVATION DIFFERENCE <25mm BETWEEN CORNERS ON DIAGONAL.
19. ALL FILL SLOPES FROM STRUCTURAL PADS TO BE VERY GRADUAL SUCH THAT INSULATING AGGREGATE WILL NO SLUFF. 4H:1V MINIMUM.
20. PROVIDE APPROXIMATELY 3m³ STOCKPILE OF STRUCTURAL FILL MATERIAL FOR USE BY EQUIPMENT INSTALLATION CONTRACTOR TO FILL ANY VOIDS UNDER EQUIPMENT SKIDS OR RIG MAT SUPPORTS.

PROFESSIONAL ENGINEER YUKON TERRITORY MATTHEW OBEE 5 Oct 2018

EAGLE GOLD PROJECT
69 kV SUBSTATION AND DIESEL POWER PLANT
CAPACITOR BANK CONCRETE FOUNDATION

PROJECT No. 1407.2
DRAWING No. 1407.2-C-3030
REV. 0

THIS DRAWING IS PROVIDED BY CONSULTANT AND CLIENT AS REFERENCE & MAY BE USED EXCEPT BY WRITTEN PERMISSION OF CLEAN ENERGY CONSULTING INC.

GROUNDING NOTES:

1) FOR GENERAL GROUNDING NOTES REFER TO DRAWING No. 001-2700-E-6537.
2) FOR CONCRETE FOUNDATION DETAILS REFER TO DRAWING No. 1407.1 - C - 2530. FOR THE STRUCTURAL PAD GRADING PLAN SEE DRAWING No. 1407.2 - C - 2012. FOR CONCRETE FOUNDATION LOCATION PLAN SEE DRAWING No. 1407.2 - C - 2016. FOR SUBSTATION GROUND GRID REFER TO DRAWING No. 001-2700-E-6535.
3) THIS DRAWING SHOWS EMBEDDED GROUND LEADS THROUGH THE FOUNDATION TO THE EQUIPMENT MOUNTING CHANNELS AND INCLUDES REBAR GROUNDING. AS THE C.E.C. DOES NOT SPECIFICALLY REQUIRE REBAR GROUNDING, IT IS ONLY NECESSARY TO BOND TO REBAR AT SEVERAL LOCATIONS AS SHOWN. USE APPROVED COMPRESSION CONNECTORS OF SUITABLE SIZE. BOND EACH EQUIPMENT MOUNTING CHANNEL TO GROUND VIA CONNECTING THE GROUND WIRE TO AT LEAST ONE SUPPORT BOLT ON EACH CHANNEL, BY USING A SUITABLY SIZED COMPRESSION CONNECTOR SIMILAR TO THOSE USED FOR REBAR.
4) AS THE CAPACITOR BANK WILL BE GROUNDED AS SHOWN ON OTHER DRAWINGS, GROUNDING OF THE ANCHOR BOLTS (TO BE DRILLED LATER) IS NOT INCLUDED NOR REQUIRED AS THEY WILL BE GROUNDED BY VIRTUE OF THE FACT THE ASSOCIATED ELECTRICAL EQUIPMENT WILL BE SOLIDLY GROUNDED.
5) GROUND CONNECTIONS TO BE MADE USING CSA APPROVED COMPRESSION CONNECTORS.
6) COMPRESSION CONNECTORS SHALL BE COPPER, AS MANUFACTURED BY BURNDY TEE OR OTHER APPROVED MANUFACTURER (APPROVED IN WRITING). COMPRESSION CONNECTOR INSTALLATION SHALL BE CARRIED OUT IN ACCORDANCE WITH THE MANUFACTURER'S INSTRUCTIONS, INCLUDING THE USE OF APPROPRIATE TOOLS, JOINT COMPOUND WHERE RECOMMENDED, ETC., FOR BONDING TO REBAR SELECT CONNECTORS AND TOOLS OF APPROPRIATE SIZE.
7) UNLESS SHOWN OTHERWISE, ALL GROUND WIRE SHALL BE BARE STRANDED 2/0 AWG SOFT OR MEDIUM HARD DRAWN COPPER GROUND WIRE.
8) A 150 MM LAYER OF WASHED, CRUSHED ROCK (AS PER SPEC.) WILL BE PLACED OVER THE ENTIRE SUBSTATION AND POWERPLANT AREA BY THE SUBSTATION CONTRACTOR, AFTER THE MAIN CONSTRUCTION WORK IS COMPLETE.
9) AS SHOWN LEAVE GROUND TAILS FOR NOT ONLY CONNECTION TO THE GROUND GRID BUT ALSO FOR CONNECTION TO THE CAPACITOR BANK ENCLOSURE AND THE GRADIENT CONTROL MAT IN FRONT OF THE DISCONNECT SWITCH CUBICLE (MAT AND TAIL CONNECTIONS BY MAIN SUBSTATION CONTRACTOR).

- 3/4 INCH 6 METRE COPPERCLAD STEEL SECTIONAL GROUND ROD
- GROUNDING COMPRESSION CONNECTOR AS PER DRAWING 001-E-2700-6530
- 2/0 AWG COPPER GROUND WIRE
- 2/0 GROUNDING TAIL

ISSUED FOR CONSTRUCTION

NOTES

1) FOR GENERAL NOTES AND SPECIFICATIONS REFER TO DRAWING No. 001-2700-E-6530.
2) FOR KEY PLAN AND DIMENSIONS REFER TO DRAWING No. 001-2700-E-6531.
3) FOR TRANSFORMER T1 AND CIRCUIT SWITCHER CS1 AND TRANSFORMER T2 AND CIRCUIT SWITCHER CS2 GROUNDING REFER TO DRAWING No. 001-2700-E-6535.
4) FOR INCOMING CIRCUIT SWITCHER CS3 GROUNDING REFER TO DRAWING No. 001-2700-E-6537.
5) THE GROUND GRID SHALL BE INSTALLED AT THE LOCATIONS SHOWN SO THAT LATER POLE HOLES MISS THE GRID. NOTE, POLE STRUCTURES AND OTHER INSTALLATION WORK WILL BE CARRIED OUT AFTER THE GRID IS INSTALLED, SO THE ACCURATE LOCATION OF THE GROUND GRID IS CRITICAL. NOTE, THE GROUND RODS ARE GENERALLY PLACED AT THE EDGES OF THE GRID AS THEY ARE MORE EFFECTIVE THERE.
6) THE GROUND GRID SHALL BE INSTALLED BETWEEN 500 AND 600 BELOW FINISHED GRADE WHERE FINISHED GRAD IS THE TOP OF THE STRUCTURAL PADS OR GENERAL YARD AREA, BEFORE THE FINAL PLACING OF THE 150 mm DEEP LAYER OF CRUSHED, WASHED, INSULATING ROCK. UNDER NO CIRCUMSTANCES SHALL THE GROUND GRID (AND TOP OF THE GROUND RODS) BE OUTSIDE THESE ELEVATION LIMITS.
7) THE SPACING OF THE GROUND GRID CONDUCTORS NEAR THE EDGES OF THE PAD ARE PURPOSELY CLOSER TOGETHER IN ORDER TO REDUCE TOUCH POTENTIALS DURING A 69 KV SYSTEM GROUND FAULT.
8) GROUND RODS SHALL BE 3/4 OR 1 INCH SECTIONAL TYPE, 6 METRES LONG DRIVEN TO FULL DEPTH, TO ENSURE THE ROD EXTENDS DOWN BELOW THE WINTER FROST LINE. WHERE RODS ARE SHOWN ON THE GRID CONDUCTORS, USE CONNECTORS AS PER THE DETAILS ON DRAWING 001-2700-E-6530.
9) LOOP CONDUCTORS AROUND POLE LOCATIONS SO THAT THEY ARE NOT DAMAGED BY LATER POLE INSTALLATION WORK. STAKE EXACT POLE LOCATIONS BEFORE GRID INSTALLATION WORK BEGINS, AS THE CONCRETE FOUNDATIONS WILL BE POURED LATER AFTER MORE BACKFILL IS PLACED. RUN GROUND GRID UNDERNEATH FOUNDATIONS. SEE DWG 1407.2-C-2016.
10) LEAVE TYPICALLY 3 m (OR AS SHOWN) GROUND WIRE TAILS FOR CONNECTION BY MAIN SUBSTATION CONTRACTOR. MARK EACH WITH A WOODEN POST. NOTE, THE TRANSFORMERS, CIRCUIT SWITCHERS, CAPACITOR BANK, ETC. WILL BE INSTALLED LATER BY THE MAIN SUBSTATION CONTRACTOR, WHO WILL MAKE THE FINAL GROUNDING CONNECTIONS.
11) THE SUBSTATION FENCE AND FENCE GROUNDING WILL BE BY THE MAIN SUBSTATION CONTRACTOR. LEAVE GROUND TAILS FOR CONNECTION TO FENCE AND GATES BY OTHERS. LEAVE MINIMUM 1 METRE TAILS FOR FENCE GROUNDING (FOR CONNECTION BY THE MAIN SUBST. CONTRACTOR). SEE DWG 1407.2-C-2016
12) INSTALL 2 INCH SCHED. 40 PVC CONDUIT FOR FIBRE FROM TRANSMISSION LINE. BRING UP NEAR H FRAME POLE. USE SWEEP 90s. MARK/SUPPORT WITH A TEMPORARY WOOD POST. THE CONDUIT (FOR FIBRE) MAY BE PLACED UNDER OR OVER THE GROUND GRID (AT THE APPROX. SAME ELEVATION). LEAVE A PULL CORD, COMPACT BACKFILL AND INSTALL MARKER TAPE.
13) INSTALL 4 INCH PVC SCHED. 40 CONDUIT TO JOIN WITH CONDUIT IN CS3 FOUNDATION, FOR LOW VOLTAGE POWER AND CONTROL CABLES. USE SWEEP 90 FOR VERTICAL AT TRANSFORMER FOUNDATION. (THE CABLES BY MAIN SUBSTATION CONTRACTOR WILL EXIT TO CABLE TRAY TO E-HOUSE.) INSTALL PULL CORD, SUPPORT AT TRANSFORMER WITH A TEMPORARY WOOD STAKE. LV CONDUIT MAY BE INSTALLED JUST BELLOW GROUND GRID LEVEL. COMPACT BACKFILL AND INSTALL MARKER TAPE.
14) INSTALL 4 INCH PVC SCHED. 40 CONDUIT TO THE "TWO POLE STRUCTURE" FOR CABLES FROM 69 KV COMBINED PT'S AND CT'S (INSTALLED AND WIRED BY THE MAIN SUBSTATION CONTRACTOR). LEAVE PULL CORD AND SUPPORT WITH TEMPORARY WOOD STAKES AT BOTH ENDS. COMPACT BACK-FILL AND INSTALL MARKER TAPE

1 SCOPE

This Specification covers the technical requirements for the supply of All-Dielectric Self-Supporting fibre optic communication cable (ADSS) for use on AC overhead transmission lines.

2 DEFINITIONS

Item Drawings
Drawings showing specific dimensional and strength information for an item shall be provided by the Contractor with bid submission.

Drawings
Assembly drawings showing general dimensional and strength requirements for items shall be provided by the Owner with the bid package.

Owner
StrataGold Corporation.

Contractor
The party tendering on the requirements of this Specification.

3 CODES AND STANDARDS

3.1 Abbreviations

CSA - Canadian Standards Association
ISO - International Organization for Standards
RUS – Rural Utilities Service
IEEE – Institute of Electrical and Electronics Engineers

3.2 Codes and Standards

Codes, standards, or other documents referred to in this Specification shall be considered as part of this Specification. Reference to the following standards shall be considered to refer to the latest editions and revisions thereto, unless otherwise indicated. The following codes and standards are referenced:

3.2.1 Canadian Standards Association (CSA)

CAN/CSA-ISO 9001-16	Quality Management Systems – Requirements

3.2.2 Rural Utilities Service (RUS)

RUS BULLETIN 1753F-601a	Single mode aerial self-supporting cable

3.2.3 Institute of Electrical and Electronics Engineers (IEEE)

IEEE 1222:2011	Testing and Performance For All-Dielectric Self-Supporting (ADSS) Fiber Optic Cable For Use On Electric Utility Power Lines.

3.2.4 International Electrotechnical Commission (IEC)

IEC 60794	Optical Fibre Cables - Basic Optical Cable Test Procedures

3.3 Conflict Between this Specification, Drawings, and Referenced Documents

In the event of conflict between this Specification and the above referenced documents, the requirements of this Specification shall take precedence. In the case of conflict between several referenced documents, the more stringent requirement shall be followed. If a conflict exists between this Specification or the referenced documents and the attached Drawings, the attached Drawings shall be followed. If clarification is necessary, contact the Owner.

4 GENERAL REQUIREMENTS

The fibre optic cable shall generally comply with the technical requirements of RUS BULLETIN 1753F-601a for single mode aerial self-supporting cable.

4.1 Cable Specification

The fibre optic cable shall be as specified below:

- 24 fibre cable: ADSS: ZTT type OFC – 24 G.652D – FASA – S1 (200m) Span.

The details of this cable are outlined in Figure 1. Factory splices are not allowed. The cable shall be suitable for service down to at least minus 50°C.

G.652D Fiber

Category	Description	Specifications	
		Before cabling	After cabling
Optical Specifications	Attenuation @1310 nm	≤0.34 dB/km	≤0.35 dB/km
	Attenuation @1550 nm	≤0.20 dB/km	≤0.25 dB/km
	Zero Dispersion Wavelength	1300~1324 nm	
	Zero Dispersion Slope	≤0.092 ps/nm^2·km	
	PMD (Polarization Mode Dispersion)	≤0.2 ps/√km	
	Cable Cutoff Wavelength (λ_{cc})	≤1260 nm	
	Macro bending Loss (100 turns; Φ50 mm) @1550 nm (100 turns; Φ50 mm) @1625 nm	 ≤ 0.05 dB ≤ 0.10 dB	
	Mode Field Diameter @1310 nm	9.2±0.4μm	
Dimensional Specifications	Cladding Diameter	125 ±1μm	
	Core/clad concentricity error	≤0.6μm	
	Cladding Non-Circularity	≤1.0%	
Mechanical Specifications	Proof stress	≥0.69Gpa	

Figure 1 - ADSS Cable Specifications (OFC – 24 G.652D – FASA – S1)

4.2 Cable Supplier

This cable is available from:
Company:
ZTT

Address:
No.5, Zhongtian road, Nantong economic and technological development zone, Jiangsu Province, China, Zip code: 226010,

5 TESTING

5.1 General

ADSS cable shall be factory tested in accordance with IEEE Standard 1222:2011 "Testing And Performance For All-Dielectric Self-Supporting (ADSS) Fiber Optic Cable For Use On Electric Utility Power Lines." In particular, refer to section 6 "Tests and Requirements". All 24 fibres shall be tested.

Refer also to IEC Standard 60794 (or latest edition) "Basic Optical Cable Test Procedure" for factory testing requirements.

5.2 Factory Tests

The Contractor shall provide certified copies of cable factory type tests and factory production tests.

6 QUALITY CONTROL

The manufacturer shall have a proven successful record in the design and manufacture of the ADSS cable supplied.

The manufacturer shall have a currently implemented Quality Assurance Program. The design function shall be certified by an accredited auditor to CAN/CSA-ISO 9001. The manufacturer may be asked to submit a copy of their Quality Assurance Manual, detailing the requirements of their program thirty (30) days after award of the contract.

The manufacturer shall provide access to, and when requested, copies of inspection and test results, production records, process control charts, and other records compiled during the Work.

The manufacturer shall submit a Test and Inspection Plan at least thirty (30) days prior to commencing production of the ADSS cable.

The Contractor shall submit three (3) certified copies of the final quality assurance reports certifying compliance of the work to this specification within 14 days of completion of final inspection and testing. The final quality assurance report shall be a bound collection of QA documents or may be in electronic

form. The documents compiled during manufacturing and the documents compiled during delivery of the Work, include but are not limited to:

- Subcontractor inspection reports
- Receiving inspection reports
- Mill test certificates
- Material qualification test reports
- Component dimensional inspection data reports
- Instrument and gauge calibration certificates and records
- Component test reports
- Accepted non-conformance reports
- Certified test report in accordance with standards
- Shipping quality reports
- Inspection and test plans and test procedures

Each document within the final quality assurance report shall be referenced to the actual components of the work to which they apply.

7 GENERAL

Inspection shall be carried out in accordance with CAN/CSA-ISO 9001 and the requirements of this specification.

7.1 Location of Tests

7.1.1 Test Location and Accessibility

All tests and inspections shall be made at the manufacturer's plant prior to shipment unless otherwise agreed between the manufacturer and the Owner at the time of purchase and shall be conducted to avoid unnecessary interference with the manufacturer's operations. The manufacturer shall afford the Owner’s inspector all reasonable facilities without charge to satisfy him that the material is being furnished in accordance with this specification. The inspector shall have full access to all processes and data required for the performance of his duties.

7.1.2 Reporting Timeline

All tests shall be made within 10 days after notice has been given to the Contractor that the material is ready for testing and the material shall be accepted or rejected at the manufacturer's plant. If the Contractor does not have a representative present at the manufacturer's plant to test the material at the expiration of 10 days, the manufacturer shall perform the tests and provide the Contractor with certified copies of the results. The Contractor shall accept or reject material in accordance with the results of such tests.

7.2 Acceptance or Rejection

7.2.1 Rejection Criteria

Failure of a test specimen to comply with any of the requirements of this specification shall constitute grounds for rejection of the lot represented by the specimen.

7.2.2 Retesting

If a lot is rejected, the manufacturer shall have the option to test every individual coil of wire or drum of complete ADSS cable in the lot at their own cost. Those individual coils or drums which successfully pass the test shall be deemed to meet the requirements.

8 PACKAGING AND HANDLING

8.1 Protection of ADSS Cable

a) The outer layer of the ADSS cable on the drum shall be protected by wood lagging or a hardboard wrapping. Such protective cover shall not be placed less than 1 inch (25.4 mm) away from the drum rim and shall be held symmetrically in place by two steel bands.
b) The protective cover shall provide adequate protection to prevent the ADSS cable underneath from being damaged.
c) No absorbent material shall be used for the protective cover.

8.2 Handling

When handling the ADSS cable during transport, all loads shall be applied to the drum. No load shall be applied to the ADSS cable directly.

9 IDENTIFICATION

9.1 Drum Production Number

Drum Production Numbers shall start with "1" and shall be assigned consecutively as the ADSS cable is being manufactured. The series shall correspond to the duration of the Purchase Order.

The Drum Production Number shall be shown twice in large figures painted on the hardboard wrapping or wood lagging, 180° apart for easier stock reference.

9.2 Drum Number

The Contractor's Permanent Drum Number shall be marked or fastened securely on the spokes on the outside of the drum and on the drum.

9.3 Tagging of Drums

The following information shall be stamped in raised or indented letters on a metal label securely attached to the side of the drum.

a) Manufacturer’s name and address
b) Contract / Purchase Order Number
c) Type of the cable
d) Gross weight of the cable and drum
e) Weight of empty drum with lagging
f) Net weight of the cable
g) Length of the cable
h) Drum and lot number
i) Name and address of the consignee
j) Month and year of manufacture

10 SHIPPING INFORMATION

10.1 Packing Slips

Packing lists shall be included with each and every shipment. The packing lists shall contain the following information:

a) Owner address
a) Owner Purchase Order Number
b) Owner Work Order Number
c) Type of ADSS cable
d) Quantity of drums
e) For each drum:
   - Length of ADSS cable in metres
   - Net and gross mass of drum in kilograms
   - Drum Production Number
f) Total mass of the shipment in kilograms

10.2 Notification of Shipment

The Contractor shall notify the Owner not less than 2 working days prior to the actual arrival of each shipment at the delivery point.

The Contractor shall, on the date of each dispatch, provide the Owner through e-mail the following information:

a) Purchase Order number
b) Items and quantities of the shipment
c) Carrier's name
d) Bill off-loading number
e) Estimated date of arrival at the destination

11 RESPONSIBILITY OF CONTRACTORS

a) The Contractor shall assume full responsibility for the manufacture of the ADSS cable specified and for any work performed by sub-Contractors.

b) The Contractor shall correct at his own expense, any defects in material or workmanship which may appear in the final product.

c) Inspection performed by the Owner, or such other delegate appointed by the Owner, shall not relieve the Contractor of his responsibility.

d) The Contractor, as part of the bid submission, shall clearly acknowledge that the product will be in full compliance with the required CSA and RUS standards.

e) Any deviations from the Specification requirements shall be submitted at the time of bid for consideration by the Owner. Unless approval in writing is granted, the work shall be performed in accordance with the "Specification."

f) The Contractor shall provide a proposed production schedule to the Owner and a monthly progress report subsequently. These schedule and progress reports shall be in the form of a bar-chart showing the progress of:

- Material procurement
- Manufacturing
- Testing
- Shipping

12 INFORMATION TO BE PROVIDED BY THE CONTRACTOR

12.1 Information to be Provided with the Tender Submittal

In addition to requirements specified elsewhere in the Contract Documents, the following technical submissions are required with the Contractor's tender submittal:

- Test and Inspection Plan as per Section 6 of this Specification
- Item Drawings detailing the dimensions and mechanical properties of the material supplied
- Quantity of material to be supplied
- Schedule reflecting critical dates, milestones, and deliveries
- Drum dimensions, proposed length of ADSS cable on drums in metres, and gross shipping mass of drums in kilograms

12.2 Supply of Schedule

The Contractor shall provide to the Owner, within twenty (20) days of the Effective Date of Contract, a detailed Schedule for the work.

The Schedule shall indicate the commencement and completion dates for the principal activities of the work, including but not limited to:

- Submittal of Quality Control and Procedures Manual
- Design Submittal for review (the Owner shall complete this review within 15 business days)
- Placement of orders for material
- Receipt of material
- Manufacture, testing, and shipment of hardware
- Test results (if required) submittal to the Owner
- First shipment and arrival at destination
- Last shipment and arrival at destination

12.2.1 Conformance with Schedule

All activities required for completion of the work shall be carried out in accordance with the sequence and times shown on the Schedule or subsequent revisions as approved by the Owner.

12.2.2 Changes to Schedule

If the Contractor believes it necessary or advantageous to change the sequence of events shown on the Schedule, the Contractor shall submit a proposed revision to the Owner for approval. No change shall be made in the order in which the work activities are being performed until the Owner approves the revised Schedule.

1 SCOPE

This Specification covers the technical requirements for the design, manufacture, inspection, testing, and supply of toughened glass suspension type insulators used on AC overhead transmission lines. This Specification does not include composite line post insulators.

2 DEFINITIONS

Item Drawings
Drawings showing specific dimensional and strength information for an item shall be provided by the Contractor with bid submission.

Drawings
Assembly drawings showing general dimensional and strength requirements for items shall be provided by the Owner with the bid package.

Owner
StrataGold Corporation.

Contractor
The party tendering on the requirements of this Specification.

Unless otherwise indicated, definitions of the technical terms in this Specification shall have their meaning assigned in CAN/CSA-C411.1-10, AC Suspension Insulators.

3 CODES AND STANDARDS

3.1 Abbreviations

CSA - Canadian Standards Association
ISO - International Organization for Standards
ASTM - American Society for Testing and Materials

3.2 Codes and Standards

Codes, standards, or other documents referred to in this Specification shall be considered as part of this Specification. Reference to the following standards shall be considered to refer to the latest editions and revisions thereto, unless otherwise indicated. The following codes and standards are referenced:

3.2.1 Canadian Standards Association (CSA)

CAN/CSA-C83-17	Communications and Power Line Hardware
CAN/CSA-C411.1-16	AC suspension insulators
CAN/CSA-ISO 9001:16	Quality Management System – Requirements

3.2.2 American Society for Testing and Materials (ASTM)

A370–17	Standard Test Methods and Definitions for Mechanical Testing of Steel Products

E23–16b	Standard Test Methods for Notched Bar Impact Testing of Metallic Materials

3.3 Conflict Between this Specification, Drawings, and Referenced Documents

In the event of conflict between this Specification and the above referenced documents, the requirements of this Specification shall take precedence. In the case of conflict between several referenced documents, the more stringent requirement shall be followed. If a conflict exists between this Specification or the referenced documents and the Drawings, the Drawings shall be followed. If clarification is necessary, contact the Owner.

4 GENERAL REQUIREMENTS

4.1 Design, Materials, Manufacture

4.1.1 Insulator Type

All insulators supplied to this Specification shall be ball-and-socket type and shall be furnished with a positive locking device of the split cotter key style conforming to the requirements of CAN/CSA C411.1 Clause 4.

4.1.2 Head Design

"Dovetail" head designs are not acceptable.

4.1.3 Dimensions and Mechanical Characteristics

Physical dimensions and mechanical characteristics of the insulators shall be in accordance with CAN/CSA-C411.1 designations CS-3 and CS-5.

4.2 Inspection and Testing

4.2.1 Type Tests

Schedule B Type Tests shall be performed as part of the prequalification process on any insulators submitted by a Contractor for the Owner approval. The tests are intended to verify the main electrical and mechanical characteristics of an insulator unit.

Type Tests shall also be repeated if dimensions or material described on the manufacturer's Item Drawings are modified or if manufacturing processes have changed. When the change affects only certain characteristics, subject to agreement between the Owner and the Contractor, only the tests relevant to those characteristics need be repeated.

All insulators covered by this specification shall comply with the requirements of the Schedule B Type Tests specified in CSA C411.1-16 Clause 6. The number of samples selected for each test shall be in accordance with CSA C411.1-16 Clause 6.2.4.2.

4.2.2 Sample Tests and Routine Tests

Insulators covered by this specification shall be subjected to the Sample Tests and Routine Tests as specified in CAN/CSA-C411.1-16.

In addition, the Owner may, at its sole discretion, require one or more of the Type Tests as specified in CAN/CSA C411.1-16 to be completed on insulators selected from the production quantity at any time. Failure of any test will constitute failure of the entire order.

a) Sample Tests

The Contractor shall provide Sample Test reports consisting of detailed test data verifying that all the Sampling tests have been performed in accordance with CAN/CSA-C411.1 Clause 7.

Sample Tests shall be performed on randomly selected insulators from each manufactured batch as specified in CAN/CSA-C411.1 Clause 7. The Owner reserves the right to select specific insulators for sample testing.

Exception to Clause 7.11 Retesting Procedure in CAN/CSA-C411.1
The retesting specified in Clause 7.11.1 shall not apply if any sample insulator fails any of the specified sample tests. In this case the entire batch shall be rejected. In addition to the Sample Tests specified above, Charpy impact tests shall be completed on one randomly selected pin from each heat treatment lot before assembling insulators in accordance with the requirements of ASTM A370 and ASTM E23. The material must also provide a minimum of 27 J at -30°C as specified in CSA C83, Section 7.2.4. No failure is permitted for any heat lot of pins.

b) Routine Tests

Each Insulator shall be subjected to the Routine Tests specified in CAN/CSA-C411.1, Clause 8, to eliminate insulators with manufacturing defects.

4.2.3 Quality Control

a) Responsibility for Quality Control

Quality control is the responsibility of the Contractor.

b) Submission of Quality Control Procedures

The Contractor shall provide and maintain an independently audited quality verification program in accordance with CAN/CSA-ISO 9001. Within thirty (30) days of the Effective Date of Contract, the Contractor shall furnish to the Owner two (2) copies of their complete Quality Control and Procedures Manual, and description of the organization to be used on this contract.

c) Submission of Test and Inspection Plan

The Contractor shall submit a test and inspection plan in accordance with CAN/CSA-ISO 9001 for approval by the Owner. This test and inspection plan shall be submitted with the tender documents.

d) Monitoring and Verification

Throughout the period of the contract, the Owner or other authorized representatives of the Owner, may monitor the Contractor's methods, procedures, and processes in all phases of the work for compliance with the Quality Control and Procedures Manual and the Test and Inspection Plan submitted by the Contractor.

e) Single Point of Contact
Before beginning the work, the Contractor shall designate to the Owner, in writing, one employee or member of their organization who shall have authority to act in all matters relative to the quality control provisions of the contract.

f) Conformance to Quality Control Procedures and Inspection Plan
Failure by the Contractor to maintain the quality control procedures committed to in their Quality Control and Procedures Manual and Test and Inspection Plan will be considered a failure to meet the requirements of this Specification.

4.3 Shipping

4.3.1 Shipping Containers

Insulators shall be supplied in weatherproof shipping containers constructed to ensure acceptance and safe delivery by common or other carrier to the destination specified in the purchasing documents.

4.3.2 Container Marking

Each shipping container (if used) shall bear a weather-resistant marking or a weather-resistant tag clearly showing, at a minimum, the following information:

- Manufacturer's name or trademark
- Name of the item
- Purchase order number
- Work order number (if applicable)
- Destination
- Gross weight of the container and insulators
- Number of insulators in the container (by type, where the container holds more than one type)

4.3.3 Insulator Packaging

- Insulators shall be pre-assembled in strings of 5 units.
- All insulator crates and/or pallets shall be wrapped to prevent contamination due to dust, dirt collected, and/or road salt on insulators during shipping and storage.

4.3.4 Insulator Marking

Insulators shall be permanently marked on the metal fittings with the following information. Markings shall be durable and legible.

- Manufacturer's name or trademark
- Electromechanical Failing Load Rating in kN, identified by the symbol "M&E"
- Tension Proof -Test Load in kN, identified by the word "TEST"
- Date code or year of manufacture

5 INFORMATION TO BE PROVIDED BY THE SUPPLIER

5.1 Information to be Provided with the Tender Submittal

In addition to requirements specified elsewhere in the Contract Documents, the following technical submissions are required with the Contractor's tender submittal:

- A copy of the current CAN/CSA-ISO-9001 certificate.
- Test and Inspection Plan as per Clause 4.2.3 of this Specification.
- Item Drawings detailing the electrical and mechanical properties of the insulators to be supplied, including dimensions, strengths, flashover, puncture voltage, and other information required by this Specification.
- Certified Type Test reports for all insulator types included in the bid submission.
- Schedule reflecting critical dates, milestones, and deliveries.
- Details of all manufacturing plant locations to be used in production of the order, including a list of orders supplied in the past three years to major Canadian electrical utilities from each plant.
- The Owner reserves the right, at its sole discretion, to limit supply to manufacturing plants of its choice, should they feel an individual manufacturing plant does not meet acceptable quality standards.

5.2 Supply of Schedule

The Contractor shall provide to the Owner, within twenty (20) days of the Effective Date of Contract, a detailed Schedule for the work.

The Schedule shall indicate the commencement and completion dates for the principal activities of the work, including but not limited to:

- Submittal of Quality Control and Procedures Manual
- Design Submittal for review (the Owner shall complete this review within 15 business days)
- Placement of orders for material
- Receipt of material
- Type Tests, if required (including proposed location of tests)
- Manufacture, testing, and shipment of insulators
- Sample Test and Routine Test results submittal to the Owner
- Manufacture of production
- First shipment and arrival at destination
- Last shipment and arrival at destination

5.2.1 Conformance with Schedule

The Schedule is expected to match and provide additional detail for the Timing Schedule submitted with the Contractor's tender. All activities required for completion of the work shall be carried out in accordance with the sequence and times shown on the Schedule or subsequent revisions as approved by the Owner.

5.2.2 Changes to Schedule

If the Contractor believes it necessary or advantageous to change the sequence of events shown on the Schedule, the Contractor shall submit a proposed revision to the Owner for approval. No change shall be made in the order in which the work activities are being performed until the Owner's approval for the revised Schedule has been obtained.

5.3 Units of Measure

All drawings and information shall be in the SI dimensional system only and the English language.

5.4 Sample Test and Routine Test Results Submittal

Following completion of Sample Tests and Routine Tests the Contractor shall submit a package to the Owner containing a complete report of all test results and showing that the insulators have been tested in accordance with the requirements of this Specification. These test results and certificates shall be signed by a qualified party recognized in North America. The report will also provide detailed descriptions of the nature of any failures, including photographs and a description of the failed sample(s) and mitigation steps taken to avoid future failures.

1 SCOPE

This Specification covers the technical requirements for the design, manufacture, inspection, testing, and supply of galvanized steel hardware used on AC overhead transmission lines. Conductor hardware is not included in this Specification.

2 DEFINITIONS

Item Drawings
Drawings showing specific dimensional and strength information for an item shall be provided by the Contractor with bid submission.

Drawings
Assembly drawings showing general dimensional and strength requirements for items shall be provided by the Owner with the bid package.

Owner
StrataGold Corporation.

Contractor
The party tendering on the requirements of this Specification.

3 CODES AND STANDARDS

3.1 Abbreviations

CSA - Canadian Standards Association
ISO - International Organization for Standards
ASTM - America Society for Testing and Materials
ASME - America Society for Mechanical Engineers

3.2 Codes and Standards

Codes, standards, or other documents referred to in this Specification shall be considered as part of this Specification. Reference to the following standards shall be considered to refer to the latest editions and revisions thereto, unless otherwise indicated. The following codes and standards are referenced:

3.2.1 Canadian Standards Association (CSA)

CAN/CSA-C83-17	Communications and Power Line Hardware
CAN/CSA C411.1-16	AC Suspension Insulators
CAN/CSA G40.20-13/G40.21-13	General Requirements for Rolled or Welded Structural Quality Steel/Structural Quality Steel
CAN/CSA G12-14	Zinc-Coated Steel Wire Strand
CAN/CSA C108.3.1-M84 (R2014)	Limits and Measurement Methods of Electromagnetic Noise from AC Power Systems, 0.15 – 30 MHz
CAN/CSA G164-92(R2003)	Hot Dip Galvanizing of Irregularly Shaped Articles
CAN/CSA W59-13	Welded Steel Construction (Metal-Arc Welding)

CAN/CSA ISO 9001:16	Quality Management System - Requirements

3.2.2 American Society for Testing and Materials (ASTM)

A153/A153M-16a	Standard Specification for Zinc Coating (Hot-Dip) on Iron and Steel Hardware
A307-14E1	Standard Specification for Carbon Steel Bolts, Studs, and Threaded Rod 60000 PSI Tensile Strength
A275/A275M-15	Standard Test Method for Magnetic Particle Examination of Steel Forgings
A276/A276M-17	Standard Specification for Stainless Steel Bars and Shapes
A370-17	Standard Test Methods and Definitions for Mechanical Testing of Steel Products
A563-15	Standard Specification for Carbon and Alloy Steel Nuts
E23–16b	Notched Bar Impact Testing of Metallic Materials
E165/E165M-12	Standard Test Method for Liquid Penetrant Examination
E709–15	Standard Guide for Magnetic Particle Examination
F436–16	Standard Specification for Hardened Steel Washers
F568M–07	Carbon and Alloy Steel Externally Threaded Metric Fasteners (Withdrawn)

3.2.3 American Society of Mechanical Engineers (ASME)

B1.1-03 (R2008)	Unified Inch Screw Threads
B18.2.1-12	Square and Hex Bolts and Screws (inch series)
B18.2.3.5M	Metric Hex Bolts
B18.2.4.1M	Metric Hex Nuts, Style 1
B18.2.4.2M	Metric Hex Nuts, Style 2
B18.2.4.5M	Metric Hex Jam Nuts – Errata
B18.21.1	Lock Washers (inch series)

3.3 Conflict Between this Specification, Drawings, and Referenced Documents

In the event of conflict between this Specification and the above referenced documents, the requirements of this Specification shall take precedence. In the case of conflict between several referenced documents, the more stringent requirement shall be followed. If a conflict exists between this Specification or the referenced documents and the Drawings, the Drawings shall be followed. If clarification is necessary, contact the Owner.

4 GENERAL REQUIREMENTS

4.1 Design and Materials

4.1.1 Structural Steels

Hardware fabricated from structural steel shall use material in accordance with the requirements of CSA Standards CAN/CSA G40.20/G40.21 unless otherwise specified on the Drawings. All structural steel to be Grade WT, Category 4 (-45°C).

4.1.2 Structural Bolts

Structural bolts are those bolts which do not require CSA Standard CAN/CSA C83 compliance, either by their description or by the Drawings. Unless otherwise specified on the Drawings, structural bolts and nuts may be provided to CSA or ASTM specifications as follows:

a) Bolts shall meet the requirements of ASTM Standard A325. Nuts shall conform to Grade A of ASTM Standard A563. Washers shall conform to ASTM Standard F436.

b) Steel bolts and nuts shall be hot dip galvanized in accordance with ASTM Standards A153/A153M.

c) The country of origin of all bolts shall be identified by the Contractor and is subject to approval by the Owner.

4.1.3 Lock Washers

Unless otherwise specified on the Drawings, lock washers may be provided to either of the following Standards:

a) CSA Standard Lock Washers
Spring lock washer shall be in accordance with CSA Standard CAN/CSA C83.34.

b) ASME Standard Lock Washers
Spring lock washers shall conform to ASME Standard B18.21.1 for regular helical spring lock washers.

4.1.4 Line Hardware

a) Bolts and Washers
Other than items covered by Clause 4.1.2 of this Specification, all steel bolts, nuts, and washers shall be provided in accordance with CSA Standards CAN/CSA C83; or ASME Standards B1.1, B18.2.1 Tables 1 and 4, B18.2.3.5M, B18.2.4.1M, B18.2.4.2M and B18.2.4.5M.

All bolts shall be secured by means of a nut and cotter pin. Bolts or pins secured with cotter keys alone are not acceptable.

The country of origin of all bolts shall be identified by the Contractor and is subject to approval by the Owner.

b) Cotter Pins
Cotter pins shall conform to CSA Standard CAN/CSA C83.42, and the material is to be stainless steel.

c) Cotter Keys
Cotter keys in sockets to be attached to insulators shall conform to CSA Standard CAN/CSA C83.124 Style 1.

d) Stainless Steel Components

Unless otherwise specified, all stainless steel components shall meet the requirements of ASTM Standard A276/A276M or equivalent.

e) Impact Properties

The Eagle Gold 69 kV transmission Line will be built in an area with medium to heavy weather conditions, including wet snow, icing combined with wind, and extreme cold. Hardware components should be manufactured from materials having the capability of providing good low temperature impact properties and the components should, in general, be produced using good commercial manufacturing techniques that will ensure the required properties are created.

Following the above objectives, materials such as ductile iron and malleable iron shall not be used.

The basic requirement for energy absorption (low temperature impact properties) for all ferrous components is Level 1.5 from CSA Standard CAN/CSA C83.

The specific requirement is a minimum of 27 J at -30°C for three standard Charpy V-notch bars tested in accordance with CSA Standard CAN/CSA-G40.20. Three bars are required to be tested from each heat-treated lot of components. Where practical, samples shall be taken from the finished part after all heat and mechanical treatments. The samples shall be taken prior to galvanizing.

Components manufactured from structural steel are to be tested to the requirements of G40.20/G40.21. For forged steel components, including bolts, the testing is to be done in accordance with the requirements of ASTM A370 and ASTM E23. The impact tests shall be performed on specimens from sample forgings or castings, where possible. If test samples are made from the basic forging material, then they shall have the identical heat treatment processing as used for the finished component.

Impact properties will not be required for nuts and washers. The Contractor shall clearly identify in its bid submission each item that does not meet the impact requirements indicated above. Failure to do so may result in rejection of the entire bid.

Certified test reports to confirm the impact properties of any hardware item which the Contractor claims to be in compliance with the above requirements shall be submitted. Failure to provide the reports may result in rejection of the Contractor's bid, in whole or in part.

f) Torque Strength

Threaded portions of hardware which can reasonably be reused, such as clamping devices, shall have minimum reusability and failure torque values as shown in CAN/CSA C83, unless otherwise specified in the CAN/CSA C83 item standards, or in this Specification. Fasteners shall have a "finger free" fit after being tightened and backed off four times using the re-usability torques specified.

4.1.5 Unit Conversions and Equivalents

a) Imperial Bolts

In the absence of metric size bolts, Imperial size bolts specified in Table 1 will be accepted as equivalent unless specifically noted otherwise on the Drawings. Individual assemblies shall not mix metric and imperial sizes.

Table 1: Imperial Equivalents for Metric Bolts

Metric		Imperial	
Nominal Diameter (mm)	Hole Size (mm)	Nominal Diameter (in)	Hole Size (in)
6	8	1/4	5/16
12	14	1/2	9/16
16	18	5/8	11/16
20	22	3/4	13/16
24	26	1	1-1/16

b) Steel Plate Thickness

For steel plate, the conversions shown in Table 2 will be accepted as equivalent when substituting Imperial sizes for metric-specified dimensions, unless specifically noted otherwise on the Drawings.

Table 2: Imperial Equivalents for Metric Plate

Metric		Imperial	
Plate Thickness (mm)	Clevis Spread (mm)	Plate Thickness (in)	Clevis Spread (in)
12	14	1/2	9/16
16	18	5/8	11/16
20	22	3/4	13/16
25	28	1	1-1/16

c) Conversions of Other Dimensions

For other dimensions, the conversions shown in Table 3 are generally acceptable.

Table 3: Commonly Accepted Metric/Imperial Dimension Conversions

Metric (mm)	Imperial (in)	Metric (mm)	Imperial (in)
25	1	75	3
32	1-1/4	80	3-1/4
38	1-1/2	90	3-1/2
45	1-3/4	95	3-3/4
50	2	100	4
60	2-1/4	110	4-1/4
65	2-1/2	115	4-1/2
70	2-3/4	120	4-3/4
75	3	130	5

d) Strength Conversions

For strength requirements, the conversions shown in Table 4 may be used when substituting Imperial rated product for metric strengths unless specifically noted otherwise on the Drawings.

Table 4: Commonly Accepted Metric – Imperial Strength Conversions

Metric Strength (kN)	Soft Conversion (kN)	Imperial (Kips)
45	44	10
70	67	15
90	90	20
120	111	25
140	135	30
150	147	33
160	160	36
220	222	50

4.2 Manufacture

4.2.1 General

In general, the requirements of CAN/CSA C83 apply to the manufacture of transmission line hardware.

4.2.2 Bending

a) Hot Bending

Forming and bending shall be performed hot unless otherwise approved by the Owner.

b) Cold Forming

Where cold forming and bending has been approved by the Owner, the component shall be normalized after the product has assumed its final shape. Normalizing shall be performed prior to galvanizing.

c) Warm Bending

Warm bending at temperatures between 150 °C (302 °F) and 375 °C (707 °F) shall not be permitted.

4.2.3 Ductility

Embrittlement or loss of ductility caused by stress concentration, strain hardening, or quenching shall be avoided.

Hardware produced from steel bar shall be sufficiently ductile that the unthreaded parts may be bent cold 180° about a mandrel of three times the bar diameter without fracture.

4.2.4 Galvanizing

All ferrous material shall be galvanized in accordance with ASTM Standards A153/A153M or CAN/CSA G164. All sharp edges, forging or welding flashes and burrs shall be removed prior to galvanizing. All hardware shall be in its final shape before galvanizing.

4.2.5 Welding

Welding shall be in accordance with CSA Standard CAN/CSA W59.

4.3 Item- Specific Requirements

4.3.1 Shackles

a) Shackles intended to be used in conjunction with ball-eye units shall have, at the pin eye, dimensions that will accommodate an oval eye opening of 24 mm by 45 mm.

b) For Y-clevises, the entire depth shall be accessible to a pin having a diameter 2 mm less than the specified spread. The pin, when located in the Y-clevis crotch, shall be at right angles to the shackle pin.

4.3.2 Live Line Hardware

Where applicable, hardware intended for live line maintenance operation shall have collars or lugs with the same strength rating as that of the product itself, suitable for “hot line” tools. Unless otherwise specified on the Drawings, the hardware shall be fabricated for use with A.B. Chance hot line tools.

4.3.3 Guy Wire

All zinc coated steel strand guy wire shall conform to CSA Standard CAN/CSA G12-14.

4.4 Drawings

4.4.1 Dimensions

a) The dimensions shown on Drawings are the general requirement and are typical values commonly adopted by manufacturers. Some dimensions may vary subject to the prior written approval of the Owner. Where no dimension or “not applicable” (N/A) are shown, or there are no Drawings for a given item, there is no specific dimensional requirement.

b) Dimensions not specified are to be proposed by the Contractor and are subject to the Owner written approval.

c) Bending radius will vary in accordance with the manufacturing process. Dimensions provided are for general reference only, unless indicated otherwise.

4.4.2 Dimensional Tolerances

a) Tolerances for Fasteners

Unless otherwise specified by the Owner, no tolerance other than standard industrial practice is permissible for the following:

- Pin or Bolt Sizes
- Bar or Rod Sizes

The tolerances for hole diameters for fasteners and pins shall be as per Table 1 in CAN/CSA C83.

b) Units covered by CAN/CSA C83 item standards shall have the dimensional tolerances in accordance with the item standard.

c) For units not covered by CAN/CSA C83 item standards, the following dimensional tolerances shall apply:

i) Tolerances for Minimum Requirement
Unless otherwise indicated, the Item Drawings specify dimensions for the following items as the minimum requirement. The respective maximum tolerances are as follows (by product type):

Spread of Clevis	Maximum tolerance is +3 mm
Depth of Clevis	Maximum tolerance is subject to the Owner approval
Length of Item	Maximum tolerance is subject to the Owner approval

ii) Tolerances for Maximum Requirement
Unless otherwise indicated, the Item Drawings specify dimensions for the following items as the maximum requirement. The respective minimum tolerances are as follows:

Plate thickness	Minimum tolerance is - 1 mm
Tongue thickness	Minimum tolerance is - 2 mm

4.4.3 Strength Ratings

Strength ratings specified are the minimum requirement unless otherwise indicated on the Drawings.

4.5 Inspection and Testing

4.5.1 Inspection and Testing Reports

All material supplied shall be accompanied by test or inspection reports, signed by a qualified party recognised in North America, as specified in this Section.

a) Mill test certificate or other documents detailing the origin and nature of the material used for the manufacture of the hardware shall be provided upon request.

b) Test reports of the yield and ultimate strength, based on a valid test arrangement, shall be provided upon request.

c) Results of Charpy 'V' notch impact tests based on CAN/CSA G40.20/G40.21 for structural steel and ASTM Standard A370; and E23 for forged steel components shall be provided upon request.

d) For forged steel components and bent bars, inspection reports for magnetic particle tests based on ASTM Standard A275/A275M shall be provided upon request.

e) For welding, reports for magnetic particle inspection based on ASTM Standard E709 or liquid penetrant methods based on ASTM Standard E165/E165M shall be provided upon request.

f) Test reports for socket hardware in accordance with CSA Standards CAN/CSA C83.120 and CAN/CSA C83.121 shall be provided upon request.

g) The Contractor shall furnish to the Owner the test reports indicated in the approved Test and Inspection Plan submitted with their bid. All testing shall utilize sampling procedures in accordance with Appendix A of CAN/CSA C83.120 and satisfy the requirements of this Specification.

4.5.2 Other Tests

The Owner shall have the option to request other reasonable tests not described in this Specification at no additional cost, where such tests are required to confirm that the material being supplied conforms fully to the requirements of this Specification.

4.5.3 Inspection

The Owner reserves the right to inspect all aspects of the production facilities and to retain a qualified inspector for this purpose. Inspection performed by the Owner and its agents shall in no way relieve the Contractor's product from conforming to the appropriate Standards and this Specification.

4.5.4 Quality Control

a) Responsibility for Quality Control
Quality control is the responsibility of the Contractor.

b) Submission of Quality Control Procedures
The Contractor shall provide and maintain an independently audited quality verification program in accordance with CAN/CSA ISO 9001. Within thirty (30) days of the Effective Date of Contract the Contractor shall furnish to the Owner two (2) copies of their complete Quality Control and Procedures Manual, and description of the organization to be used on this contract.

c) Submission of Test and Inspection Plan
The Contractor shall submit a test and inspection plan in accordance with CAN/CSA-ISO 9001 for approval by the Owner. This Test and Inspection Plan shall be submitted with the tender documents. Proposed sampling procedures shall be in accordance with Appendix A of CAN/CSA C83.

d) Monitoring and Verification
Throughout the period of the contract, the Owner or other authorized representatives of the Owner may monitor the Contractor's methods, procedures, and processes in all phases of the work for compliance with the Quality Control and Procedures Manual and the Test and Inspection Plan submitted by the Contractor.

e) Single Point of Contact
Before beginning the work, the Contractor shall designate to the Owner, in writing, one employee or member of their organization who shall have authority to act in all matters relative to the quality control provisions of the contract.

f) Conformance to Quality Control Procedures and Inspection Plan
Failure by the Contractor to maintain the quality control procedures committed in their Quality Control and Procedures Manual and Test and Inspection Plan will be considered a failure of the work to conform to this Specification.

4.6 Shipping

4.6.1 Shipping Containers

Hardware shall be supplied in weatherproof shipping containers or other durable packaging constructed to ensure acceptance and safe delivery by common or other carrier to the destination specified in the purchasing documents.

4.6.2 Container Marking

Each shipping container (if used) shall bear a weather-resistant marking or a weather-resistant tag clearly showing, at a minimum, the following information:

- Manufacturer's name or trademark
- Name of the item
- Quantity in container
- Purchase order number
- Work order number (if applicable)
- Destination
- Gross weight of the container and hardware

All markings shall be made of waterproof paint or stamped metal tag securely attached to the container. All identification marks shall appear on the side and on the top of each container.

4.6.3 Hardware Packaging

Hardware shall be packaged in weather-resistant, crush resistant containers. The packaging used shall be approved by the Owner. Cardboard boxes are not acceptable.

All hardware crates and/or pallets shall be wrapped to prevent contamination due to dust, dirt, road salt, or brine collected on hardware during shipping and storage.

4.6.4 Hardware Marking

The product identification mark shall include the Contractor’s marking, strength rating, and range of conductor sizes (where applicable).

For hardware including balls and/or sockets, the type of coupling based on CSA Standard CAN/CSA C411.1 shall be included in the product identification mark.

The ASTM Standard F 568M markings shall be provided for all bolts, in accordance with their grades.

All product identification marks shall be permanent and easily readable on the finished products.

5 INFORMATION TO BE PROVIDED BY THE CONTRACTOR

5.1 Information to be Provided with the Tender Submittal

In addition to requirements specified elsewhere in the Contract Documents, the following technical submissions are required with the Contractor's tender submittal:

- CAN/CSA ISO 9001 certificate
- Test and Inspection Plan as per Clause 4.5.4 of this Specification
- Item Drawings detailing the dimensions and mechanical properties of the hardware to be supplied and other information required by this Specification
- Schedule reflecting critical dates, milestones, and deliveries
- Details of all manufacturing plant locations to be used in production of the order, including a list of orders supplied in the past three years to major Canadian electrical utilities from each plant

The Owner reserves the right, at its sole discretion, to limit supply to manufacturing plants of its choice, should they feel an individual manufacturing plant does not meet acceptable quality standards.

5.2 Supply of Schedule

The Contractor shall provide to the Owner, within twenty (20) days of the Effective Date of Contract, a detailed Schedule for the work.

The Schedule shall indicate the commencement and completion dates for the principal activities of the work, including but not limited to:

- Submittal of Quality Control and Procedures Manual
- Design Submittal for review (the Owner shall complete this review within 15 business days)
- Placement of orders for material
- Receipt of material
- Manufacture, testing, and shipment of hardware
- Test results (if required) submittal to the Owner
- Manufacture of production
- First shipment and arrival at destination
- Last shipment and arrival at destination

5.2.1 Conformance with Schedule

All activities required for completion of the work shall be carried out in accordance with the sequence and times shown on the Schedule or subsequent revisions as approved by the Owner.

5.2.2 Changes to Schedule

If the Contractor believes it necessary or advantageous to change the sequence of events shown on the Schedule, the Contractor shall submit a proposed revision to the Owner for approval. No change shall be made in the order in which the work activities are being performed until the Owner's approval for the revised Schedule has been obtained.

5.3 Units of Measure

All drawings and information shall be in the SI dimensional system only and the English Language. Information on acceptable unit conversions and equivalents is given in Clause 4.1.5 of this Specification.

1 SCOPE

This Specification covers the technical requirements for the purchase of CSA A1/S1A conductor (Aluminum Conductor Steel Reinforced - "ACSR") to be supplied for use on AC overhead transmission lines and as overhead shield wire.

2 DEFINITIONS

Item Drawings
Drawings showing specific dimensional and strength information for an item shall be provided by the Contractor with bid submission.

Drawings
Assembly drawings showing general dimensional and strength requirements for items shall be provided by the Owner with the bid package.

Owner
StrataGold Corporation.

Contractor
The party tendering on the requirements of this Specification.

3 CODES AND STANDARDS

3.1 Abbreviations

CSA - Canadian Standards Association
ISO - International Organization for Standards

3.2 Codes and Standards

Codes, standards, or other documents referred to in this Specification shall be considered as part of this Specification. Reference to the following standards shall be considered to refer to the latest editions and revisions thereto, unless otherwise indicated. The following codes and standards are referenced:

3.2.1 Canadian Standards Association (CSA)

CAN/CSA-C60888-03	Zinc-coated steel wires for stranded conductors
CAN/CSA-C60889-03	Hard-drawn aluminum wire for overhead line conductors
CAN/CSA-C61089-11	Round wire concentric lay overhead electrical stranded conductors
CAN/CSA-ISO 9001-16	Quality Management Systems – Requirements

3.3 Conflict Between this Specification, Drawings, and Referenced Documents

In the event of conflict between this Specification and the above referenced documents, the requirements of this Specification shall take precedence. In the case of conflict between several referenced documents, the more stringent requirement shall be followed. If a conflict exists between this Specification or the referenced documents and the attached Drawings, the attached Drawings shall be followed. If clarification is necessary, contact the Owner.

4 GENERAL REQUIREMENTS

4.1 Requirements for Aluminum and Steel Wires

4.1.1 Aluminum Wires

The round 1350-H19 wires shall meet all the requirements of CSA Standard CAN/CSA-C60889-03.

4.1.2 Zinc-Coated Steel Wires

The round, hard-drawn steel core wires used in ACSR conductor shall meet all the requirements of CSA Standard CAN/CSA-C60888-03.

4.1.3 Tensile Testing

When requested by the Owner, tensile tests shall be made by the Contractor on representative samples of semi- finished wires containing joints of a type selected by the Contractor to satisfy the Owner that the tensile properties shall meet with the requirements of CSA Standards CAN/CSA-C60888-03 Clause 7 and C60889-03 Clause 7.

4.1.4 Galvanizing

The mass of zinc coating shall be Class A in accordance with CSA Standard CAN/CSA-60888-03.

4.2 Requirements for Complete ACSR

4.2.1 General

The complete conductor shall conform to CSA Standard CAN/CSA-C61089-11. The CSA conductor and shield wire designation is 135-A1/S1A-26/7, “Partridge”, as shown in Table D.10 of CAN/CSA-C61089-11.

During stranding, the temperature of all wires shall be the same (± 10° C) and the tensions on all bobbins shall be balanced to prevent loose stranding.

The tolerance for conductor length per reel shall be minus 0 metres to plus 10 metres.

4.2.2 Workmanship

Conductor manufacture shall be in accordance with good commercial practice.

The surface of the conductor shall be free from burrs, sharp edges, and abrasions resulting in projections in excess of 0.05 mm, and shall be free from dirt, oil, or other foreign deposits. A very light film of residual lubricant from the drawing process shall be acceptable.

4.2.3 Joints

a) Joining of aluminum wires broken during the stranding operation shall conform to CSA Standard CAN/CSA-C61089-03 Clause 5.5.
b) Joints in the outer conductor layer shall be clearly indicated with a 12.7 mm (112 inch) wide stripe on each side of the weld area.

4.2.4 Conductor Strength

a) Tensile strength of the complete conductor shall conform to CSA Standard CAN/CSA-C61089-11 Clause 5.7.

b) Tests for breaking strength must satisfy CSA Standard CAN/CSA-C61089-11, Clause 6.5.3. This requirement may be waived by the Owner if recent test records for the same conductor are provided, and clearly demonstrate conformance with the above CSA clauses.

5 TEST AND TEST METHODS

All type and sample tests of the conductor and its components shall be in accordance with CSA Standards CAN/CSA-C60888-03, CAN/CSA-C60889-03, and CAN/CSA-C61089-11.

When the conductor is cut, the unrestrained ends of any aluminum wire layers and steel cores having diameters larger than 7.62 mm (0.3 inch) shall remain in proper position or be readily replaced by hand and then remain in position.

6 QUALITY CONTROL

The manufacturer shall have a proven successful record in the design and manufacture of the conductor and shield wire supplied.

The manufacturer shall have a currently implemented Quality Assurance Program. The design function shall be certified by an accredited auditor to CAN/CSA-ISO 9001. The manufacturer may be asked to submit a copy of their Quality Assurance Manual, detailing the requirements of their program thirty (30) days after award of the contract.

The manufacturer shall provide access to, and when requested, copies of inspection and test results, production records, process control charts, and other records compiled during the Work.

The manufacturer shall submit an Test and Inspection Plan at least thirty (30) days prior to commencing production of the conductor and shield wire.

The Contractor shall submit three (3) certified copies of the final quality assurance reports certifying compliance of the work to this specification within 14 days of completion of final inspection and testing. The final quality assurance report shall be a bound collection of QA documents or may be in electronic form. The documents compiled during manufacturing and the documents compiled during delivery of the Work, include but are not limited to:

- Subcontractor inspection reports
- Receiving inspection reports
- Mill test certificates
- Material qualification test reports
- Component dimensional inspection data reports
- Instrument and gauge calibration certificates and records
- Component test reports
- Accepted non-conformance reports
- Certified test report in accordance with standards

- Shipping quality reports
- Inspection and test plans and test procedures

Each document within the final quality assurance report shall be referenced to the actual components of the work to which they apply.

7 GENERAL

Inspection shall be carried out in accordance with CAN/CSA-ISO 9001 and the requirements of this specification.

7.1 Location of Tests

7.1.1 Test Location and Accessibility

All tests and inspections shall be made at the manufacturer's plant prior to shipment unless otherwise agreed between the manufacturer and the Owner at the time of purchase and shall be conducted to avoid unnecessary interference with the manufacturer's operations. The manufacturer shall afford the Owner’s inspector all reasonable facilities without charge to satisfy him that the material is being furnished in accordance with this specification. The inspector shall have full access to all processes and data required for the performance of his duties.

7.1.2 Reporting Timeline

All tests shall be made within 10 days after notice has been given to the Contractor that the material is ready for testing and the material shall be accepted or rejected at the manufacturer's plant. If the Contractor does not have a representative present at the manufacturer's plant to test the material at the expiration of 10 days, the manufacturer shall perform the tests and provide the Contractor with certified copies of the results. The Contractor shall accept or reject material in accordance with the results of such tests.

7.2 Acceptance or Rejection

7.2.1 Rejection Criteria

Failure of a test specimen to comply with any of the requirements of this specification shall constitute grounds for rejection of the lot represented by the specimen.

7.2.2 Retesting

If a lot is rejected, the manufacturer shall have the option to test every individual coil of wire or reel of complete conductor and shield wire in the lot at their own cost. Those individual coils or reels which successfully pass the test shall be deemed to meet the requirements.

8 PACKAGING

8.1 Reel Construction, Dimensions, and Weight

a) The reels shall be metal returnable reels, in accordance with the dimensions provided in the Contractor’s tender submittal. All reel construction shall be suitable for rolling short distances on their rims. The rim of the reel shall provide adequate support to prevent the conductor and shield wire from being damaged.

b) A bore hole shall be provided at the centre of the rim.

c) Two drive pin holes shall be provided, one on each side of the centre bore hole. The centers of the three holes shall be on the same straight line.

d) The length of the conductor and shield wire shall be as specified in the Contractor's tender submittal at time of shipping.

e) The gross mass of the reel shall mean the sum of the mass of the reel, the protective cover, linings, and the conductor and shield wire on the reel.

f) The manufacturer shall provide the Owner with the following reel dimensions:
- Flange outside diameter (inside traverse)
- Overall width
- Drum outside diameter
- Bore hole diameter

g) The maximum length of the conductor and shield wire on any one reel shall not exceed that of any other reel within the same lot by more than 33 ft. (10.058 m).

h) The length of conductor and shield wire on each reel shall be as specified in clause 4.2.1.

i) The number of reels to be shipped in a lot shall be in accordance with construction requirements and shall be as indicated in the Contractor's tender submittal.

j) Unless advance written approval is obtained from the Owner, reels with conductor and shield wire length other than that specified in in the Contractor's tender submittal will not be accepted.

8.2 Protection of Conductor and Shield Wire

a) The outer layer of the conductor and shield wire on the reel shall be protected by wood lagging or a hardboard wrapping. Such protective cover shall not be placed less than 1 inch (25.4 mm) away from the reel rim and shall be held symmetrically in place by two steel bands.

b) The protective cover shall provide adequate protection to prevent the conductor and shield wire underneath from being damaged.

c) No absorbent material shall be used for the protective cover.

8.3 Conductor and Shield Wire End Preparation

a) The inner end of the conductor and shield wire on the reel shall be taped and anchored. The taping and anchoring shall be sufficient to prevent the conductor and shield wire wires from unravelling, and causing damage to the next layer.

b) At the pulling end, the conductor and shield wire shall be properly taped and secured to the inside of the reel flange by any means such that the strand ends of the conductor and shield wire are prevented from unravelling during transportation and in storage

8.4 Handling

When handling the conductor and shield wire during transport, all loads shall be applied to the reel. No load shall be applied to the conductor and shield wire directly.

9 IDENTIFICATION

9.1 Reel Production Number

Reel Production Numbers shall start with "1" and shall be assigned consecutively as the conductor and shield wire is being manufactured. The series shall correspond to the duration of the Purchase Order.

The Reel Production Number shall be shown twice in large figures painted on the hardboard wrapping or wood lagging, 180° apart for easier stock reference.

9.2 Reel Number

The Contractor's Permanent Reel Number shall be marked or fastened securely on the spokes on the outside of the reel and on the drum.

9.3 Tagging of Reels

The following information shall be stamped in raised or indented letters on a metal label securely attached to the side of the reel.

a) Contractor's name
b) Owner Purchase Order Number
c) Owner Work Order Number
d) Size, type, and stranding of conductor and shield wire, including conductor code word as per Table D.10 of CSA Standard CAN/CSA-C61089-11
e) Length of conductor and shield wire on reel in metres
f) Gross shipping mass of reel in kilograms
g) Reel Production Number (Clause 9.1)
h) Permanent Reel Number (Clause 9.2)
i) Date of manufacture

10 SHIPPING INFORMATION

10.1 Packing Slips

Packing lists shall be included with each and every shipment. The packing lists shall contain the following information:

a) Owner address
b) Owner Purchase Order Number
c) Owner Work Order Number
d) Type of conductor and shield wire, including conductor code word as per Table D.10 of CSA Standard CAN/CSA-C61089-11
e) Quantity of reels

f) For each reel:

- Length of conductor and shield wire in metres
- Net and gross mass of reel in kilograms
- Reel Production Number

g) Total mass of the shipment in kilograms

10.2 Notification of Shipment

The Contractor shall notify the Owner not less than 2 working days prior to the actual arrival of each shipment at the delivery point.

The Contractor shall, on the date of each dispatch, provide the Owner through e-mail the following information:

a) Purchase Order Number
b) Items and quantities of the shipment
c) Carrier's name
d) Bill off-loading number
e) Estimated date of arrival at the destination

11 RESPONSIBILITY OF CONTRACTORS

a) The Contractor shall assume full responsibility for the manufacture of the conductor specified, and for any work performed by sub-Contractors.

b) The Contractor shall correct at his own expense, any defects in material or workmanship which may appear in the final product.

c) Inspection performed by the Owner, or such other delegate appointed by the Owner, shall not relieve the Contractor of his responsibility.

d) The Contractor, as part of the bid submission, shall clearly acknowledge that the product will be in full compliance with the required CSA standards.

e) Any deviations from the Specification requirements shall be submitted at the time of bid for consideration by the Owner. Unless approval in writing is granted, the work shall be performed in accordance with the "Specification."

f) The Contractor shall provide a proposed production schedule to the Owner and a monthly progress report subsequently. These schedule and progress reports shall be in the form of a bar-chart showing the progress of:

- Material procurement
- Manufacturing
- Testing
- Shipping

12 INFORMATION TO BE PROVIDED BY THE CONTRACTOR

12.1 Information to be Provided with the Tender Submittal

In addition to requirements specified elsewhere in the Contract Documents, the following technical submissions are required with the Contractor's tender submittal:

- Test and Inspection Plan as per Section 6 of this Specification
- Item Drawings detailing the dimensions and mechanical properties of the material supplied
- The quantity of material to be supplied
- Schedule reflecting critical dates, milestones, and deliveries
- Reel dimensions, proposed length of conductor and shield wire on reels in metres, and gross shipping mass of reels in kilograms

12.2 Supply of Schedule

The Contractor shall provide to the Owner, within twenty (20) days of the Effective Date of Contract, a detailed Schedule for the work.

The Schedule shall indicate the commencement and completion dates for the principal activities of the work, including but not limited to:

- Submittal of Quality Control and Procedures Manual
- Design Submittal for review (the Owner shall complete this review within 15 business days)
- Placement of orders for material
- Receipt of material
- Manufacture, testing, and shipment of hardware
- Test results (if required) submittal to the Owner
- First shipment and arrival at destination
- Last shipment and arrival at destination

12.2.1 Conformance with Schedule

All activities required for completion of the work shall be carried out in accordance with the sequence and times shown on the Schedule or subsequent revisions as approved by the Owner.

12.2.2 Changes to Schedule

If the Contractor believes it necessary or advantageous to change the sequence of events shown on the Schedule, the Contractor shall submit a proposed revision to the Owner for approval. No change shall be made in the order in which the work activities are being performed until the Owner approves the revised Schedule.

1 SCOPE

This Specification covers the technical requirements for the design, manufacture, inspection, testing, and supply of conductor and shield wire hardware used on AC overhead transmission lines.

Conductor and shield wire hardware includes items in direct contact with the energized conductors. The conductor and shield wire will be standard CSA A1/S1A (ACSR) construction. Details of wire characteristics relative to specific bid requests will be included with the bid documents.

Typical conductor hardware items include, but are not limited to, the following:

- Suspension clamps for tangent and running angle applications
- Bolted strain clamps for dead-end applications
- Compression splices for conductor and shield wire

Galvanized pole line hardware is not included in this Specification.

2 DEFINITIONS

Item Drawings
Drawings showing specific dimensional and strength information for an item shall be provided by the Contractor with bid submission.

Drawings
Assembly drawings showing general dimensional and strength requirements for items shall be provided by the Owner with the bid package.

Clamping Unit
A hardware component or unit that supports the wire and provides a means to attach wire to the structure, either directly or indirectly.

Compression Unit
A hardware component or unit installed using compressive force, either by means of a hydraulic press or explosives.

Full Tension Unit
A hardware component or unit designed to withstand the maximum wire tension, or rated breaking strength, of the wire on which it is installed.

RTS
Rated Tensile Strength of the conductor or shield wire; as specified in CAN/CSA-C61089-11, and taken as the breaking strength of the wire.

Unit
The complete item, including all hardware and bolts required for installation, as delivered by the Contractor.

Component
Individual part of the Unit.

Owner
StrataGold Corporation.

Contractor
The party tendering on the requirements of this Specification.

3 CODES AND STANDARDS

3.1 Abbreviations

CSA - Canadian Standards Association
ISO - International Organization for Standards
ASTM - American Society for Testing and Materials
ASME - American Society of Mechanical Engineers
ANSI – American National Standards Institute

3.2 Codes and Standards

Codes, standards, or other documents referred to in this Specification shall be considered as part of this Specification. Reference to the following standards shall be considered to refer to the latest editions and revisions thereto, unless otherwise indicated. The following codes and standards are referenced:

3.2.1 Canadian Standards Association (CSA)

CAN/CSA-C83-17	Communications and Power Line Hardware
CANCSA-C57-16	Electric Power Connectors for Use in Overhead Line Conductors
CAN/CSA-C411.1-16	AC suspension insulators
CAN/CSA G40.20-13/G40.21-13	General Requirements for Rolled or Welded Structural Quality Steel/Structural Quality Steel
CAN/CSA-G164-92(R2003)	Hot Dip Galvanizing of Irregularly Shaped Articles
CAN/CSA-W59-13	Welded Steel Construction (Metal – Arc Welding)
CAN/CSA-C108.3.1-84 (R2014)	Limits and Measurement Methods of Electromagnetic Noise from AC Power Systems, 0.15 – 30 MHz
CAN/CSA ISO 9001:16	Quality Management System - Requirements

3.2.2 American Society for Testing and Materials (ASTM)

A275/A275M-15	Standard Test Method for Magnetic Particle Examination of Steel Forgings
A370–17	Standard Test Methods and Definitions for Mechanical Testing of Steel Products
E23–16b	Notched Bar Impact Testing of Metallic Materials
E165/E165M-12	Standard Practice for Liquid Penetrant Examination for General Industry

E709–15	Standard Guide for Magnetic Particle Testing
F568M–07	Standard Specification for Carbon and Alloy Steel Externally Threaded Metric Fasteners
G50-10 (R2015)	Standard Practice for Conducting Atmospheric Corrosion Tests on Metals

3.2.3 American Society of Mechanical Engineers (ASME)

B1.1-03 (R2008)	Unified Inch Screw Threads
B18.2.1-12	Square and Hex Bolts and Screws (inch series)

3.2.4 The Institute of Electrical and Electronics Engineers, Inc. (IEEE)

C135.61-97 (R2006)	Standard for the Testing of Overhead Transmission and Distribution Line Hardware
738-12	Standard for Calculating the Current-Temperature Relationship of Bare Overhead Conductors

3.3 Conflict Between this Specification, Drawings, and Referenced Documents

In the event of conflict between this Specification and the above referenced documents, the requirements of this Specification shall take precedence. In the case of conflict between several referenced documents, the more stringent requirement shall be followed. If a conflict exists between this Specification or the referenced documents and the attached Drawings, the attached Drawings shall be followed. If clarification is necessary, contact the Owner.

4 GENERAL REQUIREMENTS

4.1 Design and Materials

4.1.1 Component Material

Unless specifically indicated otherwise, all hardware components shall be manufactured from materials that meet the requirements of CSA C83 Clause 6.

4.1.2 Unacceptable Material and Components

Use of cast iron is not acceptable for conductor and shield wire hardware components. Aluminum fastening devices that can be over-torqued are not acceptable.

4.1.3 Fiberglass, Plastic, Rubber, Silicone, and Other Non-Metallic Materials

Conductor and shield wire hardware components shall not contain fiberglass or plastics.

4.1.4 Bolts and Washers

All steel bolts, nuts, and washers shall be provided in accordance with CSA C83-17 or ASME B1.1 and B18.2.1 Tables 1 and 4. All bolts shall be secured by means of a nut and cotter pin. Bolts or pins secured with cotter keys alone are not acceptable. The country of origin of all bolts shall be identified by the Contractor and is subject to approval by the Owner.

4.1.5 Cotter Pins

Cotter pins shall conform to CSA C83.42-96, and the material is to be stainless steel.

4.1.6 Cotter Keys

Cotter keys in sockets to be attached to insulators shall conform to CSA C83.124-96 Style 1.

4.1.7 Impact Properties

The Eagle Gold 69 kV transmission line will be built in an area with medium to heavy weather conditions, including wet snow and icing combined with wind. Hardware components shall be manufactured from materials having the capability of providing good low temperature impact properties and the components shall, in general, be produced using good commercial manufacturing techniques that will ensure the required properties are created. Following from the above objectives, materials such as ductile iron and malleable iron are not acceptable.

The basic requirement for energy absorption (low temperature impact properties) for all ferrous components is Charpy Level 1.5 from CSA Standard CAN/CSA C83-17.

The specific requirement is a minimum of 27 J at -30°C for three standard Charpy V-notch bars tested in accordance with CSA Standard CAN/CSA-G40.20. Three bars are required to be tested from each heat-treated lot of components. Where practical, samples shall be taken from the finished part after all heat and mechanical treatments. The samples shall be taken prior to galvanizing.

Nuts and washers are not required to meet these impact requirements. The Contractor shall clearly identify in their bid submission each item that does not meet the impact requirements indicated above.

Certified test reports to confirm the impact properties of any hardware item which the Contractor claims to be in compliance with the above requirements shall be submitted.

4.1.8 Torque Strength

Threaded portions of hardware which can reasonably be reused, such as clamping devices, shall have minimum reusability and failure torque values as shown in CAN/CSA C83-17 Table 2, unless otherwise specified in the CAN/CSA C83-17 item standards or in this Specification. Fasteners shall have a “finger free” fit after being tightened and backed off four times using the re-usability torques specified.

4.1.9 Breaking Strength, Pullout Strength, and Clamping Strength

Units that will be used in insulator assemblies shall generally meet the design rationale as outlined in CAN/CSA C83-17, Appendix G. Units that connect directly to insulator strings shall have a minimum yield strength at least equal to the rating of the insulator couplers, as shown in Table 1, or as otherwise specified.

Table 1: Strength Rating of Insulator Couplers

Ball-Socket Class		Strength		
CSA	**ANSI**	**C29.2**	**kN**	**Lbs**
CS-3	52-3	Type B	70	15,000
CS-5	52-5	Type J	120	25,000

Units that do not connect directly to insulator strings shall have minimum breaking strength values as indicated on the Drawings or elsewhere. Where strength values are not specified by the Designer, strength values shall be specified on the Item Drawings.

Full Tension Units shall have a yield strength at least equal to the RTS of the wire for which they are designed.

Compression Units shall have a minimum pullout strength greater than 95% of the wire RTS (Class 1 Mechanical Duty) as per CSA C57-16, Clause 4.4.

Conductor and shield wire strain clamps shall have a minimum holding strength greater than 75% of the conductor/shield wire RTS.

4.1.10 Corona Performance and Radio Interference Voltage (RIV)

Hardware components that may be energized at the potential of the phase conductors shall be designed and tested to meet the following requirements:

a) Radio influence voltage (RIV) shall not exceed the limits specified in Table B1 of CSA C108.3.1. For phase-to-phase voltages in the range of 38 kV to 138 kV, RIV shall not exceed 44 dB above 1 µV, at 1 MHz, with voltage at 10% above maximum operating value. Testing shall be in accordance with the Appendix B of CSA C108.3.1.

b) Hardware shall not generate positive polarity corona discharges at voltage levels up to and including 130% of the specified nominal phase to phase voltage. Corona testing shall be conducted in accordance with the requirements of Appendix E of CSA C83-17.

Where testing has not been conducted at voltages equivalent to those of this Project, the Owner may require the necessary testing to be completed at no additional cost to the Project. If required, testing shall be carried out with hardware assemblies identical to those to be used on the line.

4.1.11 Other Electrical Performance Requirements

Compression Units for use on conductors shall be designed and tested for Electrical Duty Class A performance in accordance with CSA C57-16, Clause 4.2.

Hardware components that may be energized at the potential of the phase conductors shall be capable of operating at 115% of the specified nominal voltage.

Hardware units in direct contact with conductors shall have a thermal rating of 125°C and an Emergency Thermal Rating (two hours) of 150°C at the ampacity of the largest conductor, rated as per IEEE 738.

4.1.12 Environmental Performance

Units shall be designed to have an expected life of at least 50 years under the reasonably anticipated service conditions.

Units shall be rated for use in an Industrial Atmosphere as per ASTM G50 for the expected life of the units.

4.1.13 Requirements Specific to Suspension Clamps

Tangent suspension clamps shall be designed for wire departure angles of up to 15° and angle suspension clamps for wire departure angles up to 38°.

Suspension and angle suspension clamps for conductor will utilize armour rods. Tangent and angle suspension clamps for shield wire will not utilize armour rods.

Suspension clamps shall be designed to allow articulation between the clamp seat and socket.

4.1.14 Other Design Requirements

Clamping Units shall create a minimum distortion of conductor and shield wire strands when installed and after removal.

Compounds used to protect conducting surfaces and as fillers for Compression Units shall be inert to copper, aluminum, zinc, tin, cadmium steel, and neoprene rubber and shall be stable within storage and installation temperature ranges (typical -50 °C to 40 °C). Filler materials shall be suitable for operation at temperatures up to 125 °C.

Compression Units designed to be installed with hydraulic presses and dies shall be designed such that the compression tooling, including die cavities, conforms to CSA C57-16, Appendix A.

4.1.15 Unit Conversions and Equivalents

a) Imperial Bolts

In the absence of metric size bolts, Imperial size bolts specified in Table 2 will be accepted as equivalent unless specifically noted otherwise on the Drawings. Individual assemblies shall not mix metric and imperial sizes.

Table 2: Imperial Equivalents for Metric Bolts

Metric		Imperial	
Nominal Diameter (mm)	**Hole Size (mm)**	**Nominal Diameter (in)**	**Hole Size (in)**
6	8	1/4	5/16
12	14	1/2	9/16
16	18	5/8	11/16
20	22	3/4	13/16
24	26	1	1-1/16

b) Conversions of Other Dimensions

For other dimensions, the conversions shown in

Table 3 are generally acceptable.

Table 3: Commonly Accepted Metric/Imperial Dimension Conversions

Metric (mm)	Imperial (in)	Metric (mm)	Imperial (in)
25	1	75	3
32	1-1/4	80	3-1/4
38	1-1/2	90	3-1/2
45	1-3/4	95	3-3/4
50	2	100	4
60	2-1/4	110	4-1/4
65	2-1/2	115	4-1/2
70	2-3/4	120	4-3/4
75	3	130	5

c) Strength Conversions

For strength requirements, the conversions shown in Table 4 may be used when substituting Imperial rated product for metric strengths unless specifically noted otherwise on the Drawings.

Table 4: Commonly Accepted Metric – Imperial Strength Conversions

Metric Strength (kN)	Soft Conversion (kN)	Imperial (Kips)
45	44	10
70	67	15
90	90	20
120	111	25
140	135	30
150	147	33
160	160	36
220	222	50

4.2 Manufacture

4.2.1 General

In general, the requirements of C83-17 apply to the manufacture of conductor hardware.

4.2.2 Ductility

Embrittlement or loss of ductility caused by stress concentration, strain hardening, or quenching shall be avoided.

Hardware produced from steel bar shall be sufficiently ductile that the unthreaded parts may be bent cold 180 ° about a mandrel of three times the bar diameter without fracture.

4.2.3 Galvanizing

a) All ferrous material shall be galvanized in accordance with CAN/CSA C83-17, Clause 7.1.
b) All sharp edges, forging or welding flashes, and burrs shall be removed prior to galvanizing.
c) All hardware shall be in its final shape before galvanizing.

4.2.4 Welding

Welding shall be in accordance with CAN/CSA-W59-03.

4.3 Item Specific Requirements

4.3.1 Balls and Sockets

a) All balls and sockets shall be manufactured in accordance with CAN/CSA C411.1-16.
b) All sockets shall be provided with a cotter key in accordance with Clause 5.1.4 of this Specification.
c) All socket eye and socket clevis fittings shall meet the strength test requirements of CSA C83.120-96 and C83.121-96, respectively. The yield load in the strength test tables shall be interpreted to mean that the hardware will withstand the specified load without any permanent deformation.
d) Ball and Socket coupling shall follow the “GO” and “NO-GO” procedure as specified in CSA C411.1-16.

4.3.2 Live Line Hardware

Where applicable, hardware intended for live line maintenance operation shall have collars or lugs with the same strength rating as that of the product itself, suitable for “hot line” tools. Unless otherwise specified on the Drawings, the hardware shall be fabricated for use with A.B. Chance hot line tools.

4.3.3 Compression Units

Compression Units shall have the barrel end(s) plugged and prefilled with inhibitor compound (if required). Any tapers shall be coated with a strippable protective coating.

4.3.4 NEMA Pad Connectors

NEMA pad connectors shall have a removable cover to seal and protect the electrical contact surfaces from oxidation and damage to the surface.

4.4 Drawings

4.4.1 Drawing Dimensions

a) The dimensions shown on the Drawings are the general requirement and are typical values commonly adopted by the manufacturers. Some dimensions may vary subject to the prior written approval of the Owner. Where no dimension or “not applicable” (N/A) are shown, or there are no Drawings for a given item, there is no specific dimensional requirement.

b) Dimensions not specified must be proposed by the Contractor and are subject to the Owner's written approval.
c) Bending radius will vary in accordance with the manufacturing process. Dimensions provided are for general reference only, unless indicated otherwise.

4.4.2 Dimensional Tolerances

a) Unless otherwise specified by the Owner, no tolerance other than standard industrial practice is permissible for the following:
   - Pin or bolt sizes
   - Bar or rod sizes

   The tolerances for hole diameters for fasteners and pins shall be as per Table 1 in CAN/CSA C83-17.

b) Units covered by CAN/CSA C83-17 item standards shall have dimensional tolerances in accordance with the item standard.

c) For units not covered by CAN/CSA C83-17 item standards, the following dimensional tolerances shall apply:

   i. Tolerances for Minimum Requirement
   Unless otherwise indicated, the Item Drawings specify dimensions for the following items as the minimum requirement. The respective maximum tolerances are as follows (by product type):

Spread of Clevis:	Maximum tolerance is +3 mm
Depth of Clevis:	Maximum tolerance is subject to the Owner approval
Length of Item:	Maximum tolerance is subject to the Owner approval

   ii. Tolerances for Maximum Requirement
   Unless otherwise indicated, the Item Drawings specify dimensions for the following items as the maximum requirement. The respective minimum tolerances are as follows:

   Tongue thickness minimum tolerance is - 2 mm.

4.4.3 Strength Ratings

Strength ratings specified are the minimum requirement unless otherwise indicated on the Drawings.

4.5 Inspections and Testing Reports

4.5.1 Inspection and Testing Reports

The Contractor shall furnish to the Owner test or inspection reports signed by a qualified party recognised in North America as specified in this Section.

a) Mill test certificate or other documents detailing the origin and nature of the material used for the manufacture of the hardware shall be provided upon material order.

b) Test reports of the yield and ultimate strength, based on a valid test arrangement, shall be provided upon material order.

c) Results of Charpy 'V' notch impact tests based on CSA G40.20-13/G40.21-13 for structural steel, and ASTM A370–17 and E23-16c for forged steel components shall be provided upon material order.

d) For forged steel components and bent bars, inspection reports for magnetic particle tests based on ASTM A275/A275M–17 shall be provided upon request.

e) For welding, reports for magnetic particle inspection based on ASTM E709–15 or liquid penetrant methods based on ASTM E165/E165M-12 shall be provided upon material order.

f) Test reports for socket hardware in accordance with CAN/CSA C83.120-96 and CAN/C83.121-96 shall be provided upon material order.

g) The Contractor shall furnish all testing and reporting in accordance with the agreed Inspect and Test Plan. Statistical evidence in accordance with Appendix A of CSA C83 shall be clearly evident such that products supplied meet the requirements of this Specification.

4.5.2 Other Tests

The Owner shall have the option to request other reasonable tests not described in this Specification at no additional cost to the Owner, where such tests are required to confirm that the material being supplied conforms fully to the requirements of this Specification.

4.5.3 Inspection

The Owner reserves the right to inspect all aspects of the production facilities and to retain a qualified inspector for this purpose. Inspection performed by the Owner and its agents shall in no way relieve the Contractor's product from conforming to the appropriate Standards and this Specification.

4.5.4 Quality Control

a) Responsibility for Quality Control
Quality control is the responsibility of the Contractor.

b) Submission of Quality Control Procedures
The Contractor shall provide and maintain an independently audited quality verification program in accordance with CAN/CSA ISO 9001:16. Within thirty (30) days of the Effective Date of Contract the Contractor shall furnish to the Owner two (2) copies of their complete Quality Control and Procedures Manual, and description of the organization to be used on this contract.

c) Submission of Test and Inspection Plan
The Contractor shall submit a test and inspection plan in accordance with CAN/CSA ISO 9001:16 for approval by the Owner. This Test and Inspection Plan shall be

submitted with the tender documents. Proposed sampling procedures shall be in accordance with Appendix A of CAN/CSA C83-17.

d) Monitoring and Verification
Throughout the period of the contract, the Owner or other authorized representatives of the Owner may monitor the Contractor's methods, procedures, and processes in all phases of the work for compliance with the Quality Control and Procedures Manual and the Test and Inspection Plan submitted by the Contractor.

e) Single Point of Contact
Before beginning the work, the Contractor shall designate to the Owner, in writing, one employee or member of their organization who shall have authority to act in all matters relative to the quality control provisions of the contract.

f) Conformance to Quality Control Procedures and Inspection Plan
Failure by the Contractor to maintain the quality control procedures committed in their Quality Control and Procedures Manual and Test and Inspection Plan will be considered a failure of the work to conform to this Specification.

4.6 Shipping

4.6.1 Shipping Containers

Hardware shall be supplied in weatherproof shipping containers or other durable packaging constructed to ensure acceptance and safe delivery by common or other carrier to the destination specified in the purchasing documents.

4.6.2 Container Marking

Each shipping container (if used) shall bear a weather-resistant marking or a weather-resistant tag clearly showing, at a minimum, the following information:

- Manufacturer's name or trademark
- Name of the item
- Quantity in container
- Purchase order number
- Work order number (if applicable)
- Destination
- Gross weight of the container and hardware

All markings shall be made of waterproof paint or stamped metal tag securely attached to the container. All identification marks shall appear on the side and on the top of each container.

4.6.3 Hardware Packaging

Hardware shall be packaged in weather-resistant, crush resistant containers. The packaging used shall be approved by the Owner. Cardboard boxes are not acceptable. All hardware crates and/or pallets shall be wrapped to prevent contamination due to dust, dirt, road salt, or brine collected on hardware during shipping and storage.

4.6.4 Hardware Marking

The product identification mark shall include the Contractor's marking, strength rating, and range of conductor and shield wire sizes (where applicable). For hardware including balls and/or sockets, the type of coupling based on CAN/CSA C411.1-16 shall be included in the product identification mark.

The ASTM F568M–07 markings shall be provided for all bolts, in accordance with their grades.

All product identification marks shall be permanent and easily readable on the finished products.

5 INFORMATION TO BE PROVIDED BY THE CONTRACTOR

5.1 Information to be Provided with the Tender Submittal

In addition to requirements specified elsewhere in the Contract Documents, the following technical submissions are required with the Contractor's tender submittal:

- CAN/CSA ISO 9001:16 certificate
- Item Drawings showing specific dimensional and strength information for each item supplied
- Test and Inspection Plan as per Clause 4.5.4 of this Specification
- Details of the dimensions and mechanical properties of the hardware to be supplied and other information required by this Specification
- Schedule reflecting critical dates, milestones, and deliveries
- Details of all manufacturing plant locations to be used in production of the order, including a list of orders supplied in the past three years to major Canadian electrical utilities from each plant

The Owner reserves the right, at its sole discretion, to limit supply to manufacturing plants of its choice, should they feel an individual manufacturing plant does not meet acceptable quality standards.

5.2 Supply of Schedule

The Contractor shall provide to the Owner, within twenty (20) days of the Effective Date of Contract, a detailed Schedule for the work.

The Schedule shall indicate the commencement and completion dates for the principal activities of the work, including but not limited to:

- Submittal of Quality Control and Procedures Manual
- Design Submittal for review (the Owner shall complete this review within 15 business days)
- Placement of orders for material
- Receipt of material
- Manufacture, testing, and shipment of hardware
- Test results (if required) submittal to the Owner
- Manufacture of production
- First shipment and arrival at destination
- Last shipment and arrival at destination

5.2.1 Conformance with Schedule

All activities required for completion of the work shall be carried out in accordance with the sequence and times shown on the Schedule or subsequent revisions as approved by the Owner.

5.2.2 Changes to Schedule

If the Contractor believes it necessary or advantageous to change the sequence of events shown on the Schedule, the Contractor shall submit a proposed revision to the Owner for approval. No change shall be made in the order in which the work activities are being performed until the Owner's approval for the revised Schedule has been obtained.

5.3 Units of Measure

All drawings and information shall be in the SI dimensional system only and the English Language. Information on acceptable unit conversions and equivalents is given in Section 4.1.16 of this Specification.

1 SCOPE

This Specification covers the technical requirements for the design, manufacture, inspection, testing, and supply of composite line post type insulators used on AC overhead transmission lines.

2 DEFINITIONS

Item Drawings
Drawings showing specific dimensional and strength information for an item shall be provided by the Contractor with bid submission.

Drawings
Assembly drawings showing general dimensional and strength requirements for items shall be provided by the Owner with the bid package.

Owner
StrataGold Corporation.

Contractor
The party tendering on the requirements of this Specification.

Unless otherwise indicated, definitions of the technical terms in this Specification shall have their meaning assigned in ANSI/NEMA C29.17-2013, Composite Line Post Insulators.

3 CODES AND STANDARDS

3.1 Abbreviations

CSA - Canadian Standards Association
ISO - International Organization for Standards
ASTM - American Society for Testing and Materials
ANSI - American National Standards Institute

3.2 Codes and Standards

Codes, standards, or other documents referred to in this Specification shall be considered as part of this Specification. Reference to the following standards shall be considered to refer to the latest editions and revisions thereto, unless otherwise indicated. The following codes and standards are referenced:

3.2.1 Canadian Standards Association (CSA)

CAN/CSA-C83-17	Communications and Power Line Hardware
CAN/CSA-C411.6-16	Line post composite insulators for overhead distribution lines ≤ 75 kV
CAN/CSA-ISO 9001:16	Quality Management System – Requirements
ANSI/NEMA C29.17-2013	For Composite Insulators – Transmission Line Post Type

3.2.2 American Society for Testing and Materials (ASTM)

A370-17	Standard Test Methods and Definitions for Mechanical Testing of Steel Products
E23-16b	Standard Test Methods for Notched Bar Impact Testing of Metallic Materials

3.2.3 American National Standards Institute (ANSI)

ANSI/NEMA C29.17-2013	American National Standard for Composite Insulators – Transmission Line Post Type

3.3 Conflict Between this Specification, Drawings, and Referenced Documents

In the event of conflict between this Specification and the above referenced documents, the requirements of this Specification shall take precedence. In the case of conflict between several referenced documents, the more stringent requirement shall be followed. If a conflict exists between this Specification or the referenced documents and the Drawings, the Drawings shall be followed. If clarification is necessary, contact the Owner.

4 GENERAL REQUIREMENTS

4.1 Design, Materials, Manufacture

4.1.1 Insulator Type

Line post insulators not used for bracing purposes shall be supplied in accordance with Insulator Class "LP 69M" as per CAN/CSA-C411.6-16. The following insulators shall be supplied:

- Vertical posts (NGK-Locke part #: L2-SN181-47):
  - Trunnion fitting at the energized end
  - A ¾" stud base per NEMA/ANSI C29.18-2013 at the ground end
  - Maximum design cantilever load shall be 9.5 kN or greater
- Horizontal posts (NGK-Locke part #: L2-SN181-23):
  - Trunnion fitting at the energized end
  - Bendable curved base at the ground end suitable for mounting on a wood pole
  - Maximum design cantilever load shall be 10.9 kN or greater

4.1.2 Insulator Class

An insulator is considered in the same class as a test specimen if it possesses all of the following characteristics:

- Core and weathersheds in the same materials and method of manufacture
- End fittings of the same design, materials, and methods of attachment to the core
- Same or greater housing thickness
- Same or smaller ratio of SML to the smallest core radial cross-sectional area between end fittings
- Same core diameter

4.1.3 Dimensions

Physical dimensions of the line post insulators, not used for bracing, shall meet the requirements of Insulator Class LP 69M (Table 2) of CAN/CSA-C411.6-16.

4.1.4 Steel Components

Prior to attachment to the insulator rod, ferrous components of insulators or insulator assemblies shall be Charpy 'V' impact tested in accordance with the requirements of ASTM A370-17 and ASTM E23-16b. The material must provide a minimum of 27 J at -30°C as

specified in the Charpy Level 1.5 requirement of CSA C83, Section 6.2.4. No failure is permitted for any heat lot of components.

4.2 Inspection and Testing

4.2.1 Prototype Tests (ANSI Units) / Design Tests (CSA Units)

ANSI Prototype / CSA Design tests verify the suitability of the manufacturer's design, materials, manufacturing process and technology. When an insulator is submitted to these tests, the results shall be considered valid for all insulators of the same design that are represented by one test.

The ANSI Prototype / CSA Design tests are performed once for each class of insulator. Each test may be performed independently on new test specimens where appropriate. The test specimens shall be taken from the production runs. Where there is a choice of valid test methods, the choice will be at the discretion of the manufacturer.

The ANSI Prototype / CSA Design test portion of the report shall include a drawing of the insulator tested, with dimensions. These dimensions shall at a minimum include those dimensions that define a class. ANSI Prototype tests and CSA Design tests for composite line post and composite suspension insulators shall be as per ANSI/NEMA C29.17-2013 (Section 7), or CAN/CSA-C411.6-16 (Clause 5).

ANSI Prototype / CSA Design tests shall be submitted as a part of Contractor tender submission.

4.2.2 Design Tests (ANSI Units) / Type Tests (CSA Units)

ANSI Design / CSA Type tests verify the main characteristics of the insulator, which depend mainly on its shape and size. They shall be repeated when the design, shape, or size of the insulator changes. These tests shall be as per ANSI/NEMA 29.17-2013 (Section 8), CAN/CSA-C411.5-16 (Clause 6) or CAN/CSA-C411.6-16 (Clause 6), as appropriate.

ANSI Design / CSA Type Test results shall be considered valid for all insulators of the same design. Each test shall be performed once. Each test may be performed independently on new test specimens where appropriate. The test specimens shall be taken from production runs.

ANSI Design / CSA Type tests shall be repeated if dimensions or material described on the manufacturer’s item drawings are modified, or if manufacturing processes have changed. When the change affects only certain characteristics, subject to agreement between the Owner and the Contractor, only the tests relevant to those characteristics need be repeated (as per ANSI Table 2 or CSA Table 1).

ANSI Design / CSA Type Test results shall be submitted as a part of Contractor tender submission.

4.2.3 Sample Tests and Routine Tests

Insulators covered by this specification shall be subjected to the Sample Tests and Routine Tests outlined in the applicable referenced ANSI and CSA standards. In addition, the Owner

may, at its sole discretion, require one or more of the ANSI Design / CSA Type Tests to be completed on insulators selected from the production quantity at any time. Failure of any test will constitute failure of the entire order.

a) Sample Tests
The Contractor shall provide Sample Test reports consisting of detailed test data verifying that all the Sampling Tests have been performed in accordance with ANSI/NEMA 29.17-2013 (Section 9), CAN/CSA-C411.5-16 (Clause 7) or CAN/CSA-C411.6-16 (Clause 7), as applicable.

The Owner reserves the right to select specific insulators for sample testing. The type of tests, the number of samples to be tested, and the acceptance criteria shall be as specified in ANSI/NEMA 29.17-2013 (Section 9), CAN/CSA-C411.5-16 (Clause 7) or CAN/CSA-C411.6-16 (Clause 7). Failure of sample-tested insulators will cause rejection of the entire batch.

b) Routine Tests
Each Insulator shall be subjected to Routine Tests to eliminate insulators with manufacturing defects. The type of Routine Tests and acceptance criteria shall be as specified in ANSI/NEMA 29.17-2013 (Section 10), CAN/CSA-C411.5-16 (Clause 8) or CAN/CSA-C411.6-16 (Clause 8).

4.2.4 Quality Control

a) Responsibility for Quality Control
Quality control is the responsibility of the Contractor.

b) Submission of Quality Control Procedures
The Contractor shall provide and maintain an independently audited quality verification program in accordance with ISO 9001:16. Within thirty (30) days of the Effective Date of Contract the Contractor shall furnish to the Owner two (2) copies of their complete Quality Control and Procedures Manual, and description of the organization to be used on this contract.

c) Submission of Test and Inspection Plan
The Contractor shall submit a test and inspection plan in accordance with CAN/CSA ISO 9001:16 for approval by the Owner. This Test and Inspection Plan shall be submitted with the tender documents.

d) Monitoring and Verification
Throughout the period of the contract, the Owner or other authorized representatives of the Owner may monitor the Contractor's methods, procedures, and processes in all phases of the work for compliance with the Quality Control and Procedures Manual and the Test and Inspection Plan submitted by the Contractor.

e) Single Point of Contact
Before beginning the work, the Contractor shall designate to the Owner, in writing, one employee or member of their organization who shall have authority to act in all matters relative to the quality control provisions of the contract.

f) Conformance to Quality Control Procedures and Inspection Plan
Failure by the Contractor to maintain the quality control procedures in their Quality Control and Procedures Manual and Test and Inspection Plan will be considered a failure of the work to conform to this Specification.

4.3 Shipping

4.3.1 Shipping Containers

Insulators shall be supplied in weatherproof shipping containers constructed to ensure acceptance and safe delivery by common or other carrier to the destination specified in the purchasing documents.

4.3.2 Container Marking

Each shipping container shall bear a weather-resistant marking or a weather-resistant tag clearly showing, at a minimum, the following information:

- Manufacturer's name or trademark
- Name of the item
- Purchase order number
- Work order number (if applicable)
- Destination
- Gross weight of the container and insulators
- Number of insulators in the container (by type, where the container holds more than one type)

4.3.3 Insulator Packaging

Each insulator shall be packaged in a weather-resistant, crush-resistant container. The packaging used shall be approved by the Owner. All insulator crates and/or pallets shall be wrapped to prevent contamination due to dust and/or dirt collected on insulators during shipping and storage.

4.3.4 Insulator Marking

Insulators shall be permanently marked on the metal fittings with the following information. Markings shall be durable and legible. CSA based units shall be marked in accordance with Clause 10 or CAN/CSA-C411.5-16 and CAN/CSA-C411.6-16. ANSI based units shall be marked in accordance with the following:

- Manufacturer's name or trademark
- Specified cantilever load (SCL)
- Date of manufacture

5 INFORMATION TO BE PROVIDED BY THE CONTRACTOR

5.1 Information to be Provided with the Tender Submittal

In addition to requirements specified elsewhere in the Contract Documents, the following technical submissions are required with the Contractor's tender submittal:

- Copy of CAN/CSA ISO-9001:16 certificate
- Test and Inspection Plan as per Clause 4.2.4 of this Specification

- Item Drawings detailing the electrical and mechanical properties of the insulators to be supplied, including dimensions, strengths, flashover, puncture voltage, and other information required by this Specification; ANSI Design/CSA Type Test reports for all insulator types included in the bid submission
- ANSI Prototype/CSA Design test reports for all insulator types included in the bid submission
- A Timing Schedule reflecting critical dates, milestones, and deliveries
- Details of all manufacturing plant locations to be used in production of the order, including a list of orders supplied in the past three years to major Canadian electrical utilities from each plant

The Owner reserves the right, at its sole discretion, to limit supply to manufacturing plants of its choice, should they feel an individual manufacturing plant does not meet acceptable quality standards.

5.2 Supply of Schedule

The Contractor shall provide to the Owner, within twenty (20) days of the Effective Date of Contract, a detailed Schedule for the work. The Schedule shall indicate the commencement and completion dates for the principal activities of the work, including but not limited to:

- Submittal of Quality Control and Procedures Manual
- Design Submittal for review (the Owner shall complete this review within 15 business days)
- Placement of orders for material
- Receipt of material
- ANSI Prototype/CSA Design Tests, if required (including proposed location of tests)
- Manufacture, testing, and shipment of insulators
- Sample Test and Routine Test results submittal to the Owner
- Manufacture of production
- First shipment and arrival at destination
- Last shipment and arrival at destination

5.2.1 Conformance with Schedule

The Schedule is expected to match and provide additional detail for the Timing Schedule submitted with the Contractor's tender. All activities required for completion of the work shall be carried out in accordance with the sequence and times shown on the Schedule or subsequent revisions as approved by the Owner.

5.2.2 Changes to Schedule

If the Contractor believes it necessary or advantageous to change the sequence of events shown on the Schedule, the Contractor shall submit a proposed revision to the Owner for approval. No change shall be made in the order in which the work activities are being performed until the Owner's approval for the revised Schedule has been obtained.

5.3 Units of Measure

All drawings and information shall be in the SI dimensional system only and the English Language.

5.4 Sample Test and Routine Test Results Submittal

Following completion of Sample Tests and Routine Tests the Contractor shall submit a package to the Owner containing a complete reporting of all test results and showing that the insulators have been

tested in accordance with the requirements of this Specification. These test results and certificates shall be signed by a qualified party recognized in North America. The report shall also provide detailed descriptions of the nature of any failures, including photographs and a description of the failed sample(s), and remedial actions taken to ensure future failures do not occur.

1 GENERAL

1.1 Definitions

Owner
StrataGold Corporation.

Owner's Representative
The party appointed by the Owner to oversee the overall development of the Work.

Contractor
The successful bidder for this project, responsible for constructing all Work described in this package.

Work
The material, labour, services, and equipment required to complete the project.

Contract Documents
The drawings, specifications, and documents that define the project scope of work.

1.2 Codes and Standards

1.2.1 Canadian Standards Association CSA:

- CSA C22.3 No. 1-15 Overhead Systems - Canadian Electrical Code, CSA Standard C22.1
- CSA C22.3 No. 60826-10 Design Criteria of Overhead Transmission Lines
- CSA C83-17 – Communication and Power Line Hardware.
- CSA-C57 – 98 (R2006) - Electric Power Connectors for Use in Overhead Line Conductors.
- CSA C411.1-M89 (Reaffirmed 2004) - AC Suspension Insulators
- CSA C61089:03 - Round wire concentric lay overhead electrical stranded conductors
- CSA C60104:03 - Aluminum-magnesium-silicon alloy wire for overhead line conductors
- CSA C60888:03 - Zinc-coated steel wire for stranded conductors
- CSA C60889:03 - Hard-drawn aluminum wire for overhead line conductors
- CSA G12-92 (Reaffirmed 2002) - Zinc-coated Steel Wire Strand
- CSA C71-1 - Insulation Coordination-Part 1: Definitions, principles and Rules
- CSA C71-2 - Insulation Coordination-Part 2: Application Guide
- CSA G40.20-04/G40.21-04 (R2009) - General Requirements for Rolled or Welded Structural Quality Steel/ Structural Quality Steels
- CSA-W59 – 2003 - Welded Steel Construction (Metal – Arc Welding)
- CSA G164 - Hot Dip Galvanizing of Irregularly Shaped Articles
- CSA W47 - Certification of Companies for Fusion Welding of Steel

1.2.2 Institute of Electrical and Electronics Engineers (IEEE):

- IEEE 524 – Installation of Overhead Transmission Lines
- IEEE 977 – Guide for Foundation Installation for Transmission Lines
- IEEE 1222 - Testing and Performance for All-Dielectric Self-Supporting (ADSS) Fiber Optic Cable For Use On Electric Utility Power Lines
- IEEE 1441 - Guide for Inspection of Overhead Transmission Line Construction

1.2.3 Other:

- IEC 60794 - Optical Fibre Cables - Basic Optical Cable Test Procedures
- Yukon workers Compensation Health and Safety Board, Occupational Health and Safety Act and Regulations, in particular Part 9: Electrical Safety, Part 10: Construction and Building Safety and Part 14: Blasting Regulations

1.3 Scope of Work (the Work)

1.3.1 Summary

StrataGold is undertaking the installation of a new 43 km, 69 kV Eagle Gold transmission line in the Yukon Territory, which will supply power to the proposed Eagle Gold mine. The new circuit will connect to the proposed Yukon Energy Corporation (YEC) McQuesten Substation. The Eagle Gold 69 kV circuit will terminate at the new Eagle Gold 69 kV/13.8 kV substation. This new line will be numbered L251 in the YEC system but will not be owned by YEC.

The Work to be carried out under this Contract is for the construction of a new 43 km long 69 kV wood pole transmission line, including all right-of-way (ROW) clearing, access as required for construction, and wood pole line installation and commissioning. The line starts at proposed Yukon Energy Corporation (YEC) McQuesten Substation, adjacent to the intersection of Highway 11 (Silver Trail) and South McQuesten Road. The line heads north along South McQuesten Road, which then becomes Haggart Creek Road, and then terminates at the proposed Eagle Gold mine 69 kV/13.8 kV substation. The location of the route is shown on the Drawings.

The transmission line predominantly consists of single wood pole structures, with 2-pole (H-frame) structures only used selectively. The line is a 43 km, 3-phase, 69 kV line with underbuilt ADSS cable strung from structure 0/10A to Eagle Gold Substation. The ADSS will be undergrounded from within McQuesten Substation to structure 0/10A. The approximate location of the undergrounded section is shown in the Drawings.

A ground wire will be undergrounded from within McQuesten Substation out to structure 0/10A. The line will be strung with overhead shield wire from structure 0/10A to structure 1/2 and from structure 41/6 to Eagle Gold Substation. This shield wire is primarily to provide additional grounding for the two substations.

Generally, the line route follows the South McQuesten and Haggart Creek roads, with limited sections where it deviates from the road alignment. The route crosses a mixture of Crown land and mineral claims. The land parcels are identified on the Drawings. Discontinuous permafrost is expected to be encountered along the line route.

To perform the work the Contractor shall:

- Provide all labour, materials, equipment, tools and supervision to mobilize, provide access, clear, construct, pre-commission and undertake all required environmental controls as required by this Work
- Supply, maintain, and operate all mobile equipment and vehicles required for this Work
- Provide qualified management, administration and coordination staff to support the Work

- Supply all rigging & hoisting equipment required, all hand tools and power tools, all temporary support structures and safety equipment as required for the performance of the Work
- Procure, expedite, and manage materials on site to execute this Work
- Comply with the quality requirements outlined in the Drawings and Specifications

1.3.2 Clearing and Access

1) The Contractor will undertake all survey necessary for the clearing and access work and for demarcating and maintaining the ROW and License of Occupation (LOO) boundary for the duration of the project. Refer to Section 5 herein.
2) The Contractor will carry out all clearing in the ROW, all clearing as required for access road/track construction and the removal of all "danger" trees located inside and outside of the ROW.
3) Construction of new access roads required to access the ROW and to make safe the convenient construction of the transmission line.
4) Remediation and timber removal as required and in accordance with environmental and regulatory requirements. The Owner will be responsible for slash burning.

1.3.3 Transmission Line Installation

1) Procure, receive, transport, handle, and store all materials required for completion of the works as outlined in the Work. All material supplied by contractor must be accompanied by the applicable Quality Control Documentation as outlined in the project material supply specifications.
2) Provide all survey required for construction of the transmission line, including but not limited to centerline and structure staking. Refer to Section 5 herein.
3) Provide as-built survey of completed works as outlined in Section 5 herein.
4) Install 515 wood pole structures and associated guy anchors, in accordance with the project drawings. This includes all parts required for 69 kV, ADSS, and OHSW and includes supply and installation of guy anchors and pole foundations which are appropriate for the encountered ground conditions.
5) Installation of grounding at 24 structures which have overhead shield wire as specified in the Drawings. Installation of grounding at structures with steel crossarms.
6) Supply and installation of foundation GCMP liners where required, in accordance with the Drawings.
7) Installation of 3-phase single 69 kV conductor for approximately 43 km, starting from structure 0/10A to Eagle Gold Substation, including the installation of insulator and insulator hardware, conductor hardware, sagging, splicing, dead-ending, and installation of jumpers.
8) Installation of all-dielectric self-supporting (ADSS) cable for approximately 43 km, from 0/10A to Eagle Gold Substation. This includes the installation of ADSS attachment hardware, cable hardware, downleads and splice boxes, sagging, splicing, dead-ending, and testing.
9) Installation of single overhead shield wire (OHSW) for approximately 1.8 km in two sections: 1) from structure 0/10A to structure 1/2 (0.5 km), and 2) from structure 41/6 to Eagle Gold Substation (1.3 km), including one additional OHSW from structure 42/7 to Eagle Gold Substation. This work includes the installation of OHSW hardware, sagging, splicing, dead-ending, and installation of jumpers.
10) Installation of structure number signs on 515 wood pole structures.

11) Leave approximately 110 m of ADSS coiled at structure 0/10A for others to run underground in to Substation.
12) Leave approximately 110 m of OHSW coiled at structure 0/10A for others to run in to the Substation.
13) Maintenance of a robust quality control program during execution. Files and records are to be maintained in such a manner that the Owner can perform periodic audits of the contractor quality control documents throughout project execution at their discretion.
14) Measured confirmation of all road crossings.
15) Final clean-up and restoration of the Work Sites, including seeding of all disturbed areas.
16) Provide a final turnover package of all QA/QC documentation, drawing redlines, any applicable instruction manuals, data sheets, and as-built records in a digital format within 14 days of completion of the works.

1.3.4 Miscellaneous Components

1) Supply all working and equipment grounds required to complete the Work.
2) Setting of all survey control hubs, stakes, benchmarks, and references necessary.
3) Provide and maintain all construction compounds or laydown areas required to complete the works, including security.
4) Provide all facilities such as washrooms, lunchrooms, etc. which are required to satisfy local regulation. For further details, refer to project special conditions.
5) Providing stringing set up plans, including sequencing with road crossings dates and coordination with all invested stakeholders.
6) Provide flagging and traffic management as required by the special conditions and works permits.
7) The Owner shall obtain any works permits required for works permits on or near roads under control of the Yukon Government; however the contractor is required to communicate their needs to the Owner in a timely fashion to allow such permitting to by organized and in place without when required.
8) Installation of all temporary works required for the construction methods employed by the Contractor.
9) Supply of helicopter support as required for construction methods employed by contractor.
10) Confirm that the length shield conductor at end is properly grounded at each pole and using fall of potential method, measure the combined structure group grounds (to absolute earth), and issue certified report.

The Contractor shall furnish all supervision, labour, material, construction equipment, transportation, tools, supplies, equipment, and expendables required to accomplish the Work in accordance with the Contract Documents.

1.4 Work by Others

1) Installation of terminal 69 kV span from McQuesten Substation gantry to structure 0/10A, approximately 50 m.
2) Installation of underground conduit run, ADSS and ground wire from structure 0/10A in to McQuesten Substation; approximately 50 m.
3) Modification to the existing L250 69 kV transmission line near McQuesten Substation and the installation of the proposed L250 cut-in and bypass lines.

4) Owner to provide Qualified Personnel, as may be required, to undertake bird and wildlife surveys along the transmission line corridor to ensure compliance with environmental regulations and Owner management plans and to provide recommendations to the Contractor to ensure compliance with all regulations in regard to bird and wildlife protection.
5) Final As-Built Legal ROW Survey will be undertaken by the Owner following completion of the work.

1.5 Schedule of the Work

The Contractor shall complete the Work by the milestone dates and completion date as specified in the Part 2.2, Special Conditions, Section 6.4.2 - Contract Baseline Schedule.

1.6 Schedule and Coordination Constraints

Contract Key dates are included in the Contract Special Conditions and shall be adhered to by the Contractor.

1.7 Public Convenience and Service Systems

The locations of highways, powerlines, and other known service systems, crossed by the ROW are shown on the Drawings.

The Contractor shall:

6) Before commencing any part of the Work that may interfere with the security of or free passage on any:
   - Road or highway
   - Other service systems

   Give sufficient notice to the owner or other person having control of the service system, and not less than 5 Days, to permit measures to be taken to prevent or minimize such interference.
7) Ensure the security of all overhead lines, underground lines, and above ground and buried pipelines and the safety of all personnel and plant near and adjacent to these lines. In accordance with Yukon Workers' Compensation Health and Safety Board WCB regulations, the Contractor is responsible for locating underground facilities before excavation. The Contractor shall notify the Owner's Representative immediately of any conflict between underground facilities and proposed excavation sites.
8) Assume that all overhead lines are energized.
9) Submit a Traffic Management Plan (TMP) to the Owner's Representative for acceptance and their coordination with the Ministry of Transportation (Yukon Highways and Public Works) and any applicable local governing agency for acceptance. The TMP shall include details of any road closures.

The Contractor shall be responsible for carrying out all such measures and shall be responsible for any damage to any service system arising out of the Work.

Specific crossings of public convenience and service systems within the Work Site are, but not limited to, those shown in Table 1.

Table 1 – Crossings

#	Start Str.	End Str.	Crossing Obstacle	Notes
~~1~~	~~0/2~~	~~0/3~~	~~69 kV line~~	~~Eagle Gold line crosses above YEC 69 kV L250 line.~~
~~2~~	~~0/4~~	~~0/5~~	~~Highway~~	~~Silver Trail (Yukon Highway 11)~~
3	1/2	1/3	Road	South McQuesten Road
4	1/5	1/6	Road	South McQuesten Road
5	2/7	2/8	Road	South McQuesten Road
6	7/3	7/4	Water	Haldane Creek/Youth Creek
7	8/3	8/4	Road	South McQuesten Road
8	8/13	9/1	Road	South McQuesten Road
9	10/8	10/9	Road	South McQuesten Road
10	11/5	11/6	Road	South McQuesten Road
11	14/8	14/9	Road	South McQuesten Road
12	21/2A	21/3	Road	South McQuesten Road
13	22/1	22/2	Road	South McQuesten Road
14	22/2	22/3	Water	South McQuesten River
15	28/8	28/9	Water	Lynx Creek
16	31/7A	31/8	Side road	Placer miner road
17	31/8	31/10	Water	Swede Creek
18	31/11B	32/1	Road	Haggart Creek Road
19	32/8	32/9	Road	Haggart Creek Road
20	35/2	35/3	Road	Haggart Creek Road
21	35/3	35/4	Road	Alternative Haggart Creek Road winter route
22	35/7	35/8	Road	Haggart Creek Road
23	40/3	40/4	Road	Side road "Rex Road"
24	40/4	40/5	Road	Haggart Creek Road
25	40/5	40/6	Water	Haggart Creek
26	42/2	42/4	Road	Road within Eagle Gold mine site

1.7.1 Existing Overhead Lines

The existing YEC L250 line will be modified by others to permit the installation of the McQuesten Substation. ~~These modifications are not in the scope of the Work. The L251 line will cross over the L250 69 kV, the L250 69 kV bypass line, or both (depending on construction dates) between L251 structures 0/2 and 0/3. For all other crossings, refer to Table 1.~~ The Contractor shall liaise with the L250 transmission/substation contractor when working near the L250 transmission line and McQuesten Substation construction.

1.8 Supply of Engineering Data

The Owner's Representative shall take all reasonable steps to provide complete engineering data to the Contractor prior to the commencement of Work. Should the delay of engineering data prevent adherence to the construction schedule in the opinion of the Owner's Representative, then an appropriate extension will be given to the Contractor.

1.9 Mobile Equipment

Contractors equipment supplied to site will be in excellent working order and maintained as required

to ensure safe and continuous operation. All inspections or certifications required will be made available to the Owner upon request along with any maintenance history.

For specific communication requirements, refer to the Part 2.2 Special Conditions, Section 7.

1.10 General Requirements and Information for Construction

Detailed information on the general requirements of construction are outlined in Part 2.2 Special Conditions and its Appendices. For reference, the Special Conditions Appendices are listed here:

- Appendix A – Health Safety and Environment
  - A.1 Project Specific Safety Plan
  - A.2 Risk Matrix
  - A.3 JDS H&S Manual
  - A.4 JDS Safe Operating Procedures
  - A.5 Contractors Guide to Environmental Compliance
- Appendix B – Labour Relations
  - B.1 FN and Local Opportunity Policy
- Appendix C – Quality Management
  - C.1 Site Quality Management Plan
- Appendix D – Confidential Information
  - D.1 Camera Policy
- Appendix E – Reporting
  - E.1 Three-Week Look Ahead Schedule
  - E.2 Daily Report Example
  - E.3 Cost and Quantity Report
  - E.4 Safety Statistics Report
  - E.5 Manpower Curve
  - E.6 Camp Forecast
  - E.7 ESI Report
- Appendix F – Contract Administration
  - F.1 Request for Information
  - F.2 LEM Summary
  - F.3 FEM Report
  - F.4 Material Request Form
  - F.5 Site Instruction
  - F.6 Contract Notice
  - F.7 Change Order Request
  - F.8 Change Directive
  - F.9 Contract Change Order
  - F.10 Progress Payment Request
  - F.11 Invoicing Instructions
- Appendix G – Services and Facilities
  - G.1 Access Road Policy
  - G.2 Site Vehicle Pass Request
  - G.3 Camp Services
  - G.4 Camp Booking Procedure

- G.5 Site Radio Frequencies
- G.6 Site Vehicle Requirements
- G.7 Contractor Logistics Information

1.10.1 Management, Administration, and Coordination

Part 2.2 Special Conditions outlines the management, administration, and coordination requirements of the Contract.

1.10.2 Health & Safety Requirements

Part of the Work will be carried out in or adjacent to energized substations and transmission lines. It is the responsibility of the Contractor to establish and use work procedures which ensure safety against hazards related to general construction, shock, improper grounding techniques, and induced currents and voltages. The Contractor shall supply appropriately sized safety grounds. All grounds shall be in good repair and tested annually with test records available for review. The test records shall show the test date, test equipment, test results, test agency, and any other relevant information.

In addition to the above, refer to Part 2.2 Special Conditions Appendix A.1, “Project Specific Safety Plan” and Part 2 Appendix A.4, “Safe Operating Procedures”.

For more information, refer to Part 2.2, Special Conditions, Section 2.1 – Health and Safety Requirements.

1.10.3 Coordination of Work

The Contractor shall coordinate the Work between surveyors, subcontractors, etc. so that the Work is completed properly and safely in accordance with the Contract Documents. The Contractor is also responsible to coordinate their work with all stakeholders that may be impacted by the execution of this scope of work.

1.10.4 Meetings

Refer to Part 2.2, Special Conditions, Section 8.8 for the major scheduled meetings related to the Contract. The following section outlines the requirements for the progress meetings.

1.10.4.1 On-Site Progress Meetings

On-site progress meetings attended by the Contractor and Owner’s Representative shall be held every week during the Work. The Contractor shall provide a written report at this meeting which includes:

- Written description of Work completed in the previous week, including equipment and labour records
- Detailed description of the Contractor’s assumptions and methods for the subsequent week of Work
- Detailed description of the Contractor’s equipment and labour requirements for the subsequent week of Work
- Environmental impact assessment for the subsequent week of Work with site-specific work procedures to mitigate all identified impacts
- Safety and hazard assessment for the subsequent week of Work with site specific work procedures to mitigate all identified hazards

- List any future anticipated work which the contractor believes may constitute an 'Extra' to the contract
- List any and all claims for extra work to date and certify that no other claims exist

1.10.5 Mobilization

Prior to mobilization, all of the following requirements shall be met:

1) Acceptance by the Owner's Representative of the Contractor's schedule and site arrangement plans.
2) Development of a traffic management plan in accordance with the document titled "StrataGold Corporation, Eagle Gold Project, Traffic Management Plan," Version 2017-01.
3) Development of the Contractor's Access Plan, satisfactory to the Owner's Representative.
4) Submission of a site-specific safety management plan. Refer to Part 2.2, Special Conditions, Section 2.0 – Health, Safety and the Environment for all requirements.
5) Acceptance by Owner's Representative of Contractor Quality Assurance Manual and Inspection and Test Plan.
6) Compliance with all terms and conditions of the Contract.

1.10.6 Protection of Materials, Equipment, and the Site

In addition to the responsibilities outlined in Part 2.1 General Terms and Conditions, for care of plant and materials, the Contractor shall:

1) Throughout the execution of the Work, protect equipment and materials against theft and damage from all causes including storing equipment or materials appropriately or as directed by the Owner's Representative.
2) Protect from damage, as a result of the Contractor's operations, all Work performed by others, the facilities of others such as Work Sites and related improvements thereto, the Owner's property, and/or private property.
3) Immediately notify the Owner's Representative of damage to the Work of others, facilities of others, the Owner's property and/or private property which results from the Contractor's operations.
4) Immediately correct any condition resulting from the Contractor's Work that constitutes a hazard.

1.10.7 Preparation and Restoration of the Site

1) The Contractor shall undertake clearing as per Section 3 herein, as necessary and accepted by the Owner's Representative, to prepare the Site for his operations; however, note that acceptance of the work by the Owner's Representative shall in no way be interpreted to mean that the clearing is sufficient for the construction of the transmission line nor that select "danger trees" will not have to be removed following line construction.
2) The Contractor shall prepare access roads and tracks per Section 4 of this specification.
3) The Contractor shall direct any surface drainage away from any new or existing structures and guy anchors and shall ensure that existing drainage paths are maintained.

4) Prior to completion of the Work, the Contractor shall restore the Site to a presentable and stable condition which includes Work outlined in Part 2.2, Special Conditions, plus the following:
    a) Round all slopes of roads, grades, benches and related Site Work which are to be retained and were installed by the Contractor
    b) Flatten all berms along roads, grades, benches, and related Site Work which are to be retained and were installed by the Contractor
    c) Clean out and stabilize all inlets of culverts which are to be retained and were installed by the Contractor to preclude sloughing in of inlets from road fill and sedimentation
    d) Cleared and slashed material shall be prepared for removal or burning following completion of works by others following completion of works.
5) The above Work shall be completed in a manner acceptable to Owner's Representative not later than 20 Days after completion of the Work at the Site.

1.10.8 Access and Construction Roads

The Contractor shall create minimum interference and inconvenience to others while using any road or property. The Contractor shall plan and schedule around restrictions and limitations on project road use.

For further information, refer to the document titled "StrataGold Corporation, Eagle Gold Project, Traffic Management Plan, Version 2017-01" and Part 2.2 Special Conditions, Appendix G.1 "Access Road Policy".

1.10.8.1 Mine Access Road

South McQuesten Road and Haggart Creek roads are public roads that form the Eagle Gold mine access road but also service other interests in the area. The Contractor will limit inconvenience to others using this road in execution of the Work. The Contractor will:

- Use proper signage, barricades, and flag persons as necessary.
- If road closures are required, they will only be performed after receiving approval from the Owner's Representative and regulators to do so.

The Contractor will be make road repairs for any areas where their activities have impacted the road.

The Owner will perform regular maintenance along Mine Access Road (McQuesten and Haggart Creek roads) including sanding, snow removal etc.

1.10.8.2 Access from Existing Roads

Any new access from existing access roads to the transmission line ROW and/or transmission line structure locations is to be provided by the Contractor. The Contractor shall notify the Owner's Representative 21 days in advance and obtain written approval prior to construction of any new road, off-road access, or alteration to existing access.

1.10.9 Construction Facility Requirements

1.10.9.1 First Aid Facilities

The Contractor shall provide first aid facilities suitable for the total work force, including two members of the Owner's work force, that conform to Yukon Workers' Compensation Health and Safety Board requirements.

For further information, refer to Part 2.2 Special Conditions section 2.0 – Health, Safety, & Environment and Appendix A.

1.11 Quality Management Plan

The Contractor is required to submit a Quality Management Plan as outlined in Part 2.2 Special Conditions, Section 4.0 Quality Assurance and Quality Control. The Contractor's Quality Management Manual and generic Quality Management Plans are a requirement for submission with the tender documents. Detailed, project-specific Quality Management Plans must be submitted to the Owner's Representative and agreed to prior to mobilization to site. The Quality Management Plan must as a minimum include the following items:

- Inspection Test Plan (ITP)
- Special fabrication, installation, construction, or test procedures, if any
- Subcontractor inspection reports
- Material acceptance and procurement records
- Material receiving and inspection records
- Field survey records
- Mill test certificates, if any
- Tradesmen's TQ certificates, licenses, or permits
- Welding quality assurance program, if any
- Welding completion record, if any
- Civil work execution and completion records
- Overhead conductor QA and acceptance test records
- Pole hardware installation and completion records
- Conductor and ADSS Sag and Tension Installation and completion records
- Foundation installation and completion records
- Anchor Grouting and Pull Testing Records
- Fibre optic cable splice and OTDR completion and testing check
- Instrument and gauge calibration certificates and records
- Non-conformance reports
- Paint inspection records, if required
- Site QA reports covering all aspects of the work
- Warranty certificate

Where relevant, each document within the Contractors completion QA report shall be referenced to the actual components of the Work to which they apply.

2 MATERIALS

2.1 General

The Contractor is solely responsible for supplying, receiving, checking, sorting, and handling of all materials. The Contractor shall be responsible for the loading, transportation, care, and custody of all material from the time it leaves the laydown yard until project completion.

As a part of the Contractor's quality management plan, quality control documentation indicating the conformance of all materials used on site to the project specifications shall be provided to the Owner's Representative for review upon material receipt. Any construction undertaken using material without proper quality documentation will be deemed a non-conformance and replaced at the sole cost of the Contractor.

2.2 Schedule of Availability

The Contractor shall provide a material schedule of availability to the Owner's Representative for review prior to commencing material delivery.

2.3 Supply Points

Supply points are the responsibility of the Contractor, however; the Contractor shall advise the Owner's Representative of selected locations.

2.4 Material Lists and Quantities

Material lists may be issued to the Contractor for reference. However, any quantities shown on such material lists are approximate and do not account for extras, overages, or spares. Determining final material quantities is the responsibility of the Contractor.

2.5 Material Specifications

Refer to the following documents for material specifications:

- 1407-T-9005 - Eagle Gold Composite Line Post Insulator Specification
- 1407-T-9010 - Eagle Gold Conductor and Shield Wire Hardware Specification
- 1407-T-9015 - Eagle Gold Conductor and Shield Wire Specification
- 1407-T-9020 - Eagle Gold Hardware Specification
- 1407-T-9025 - Eagle Gold Glass Suspension Insulator Specification
- 1407-T-9035 - Eagle Gold ADSS Fibre Optic Cable Specification

2.6 Packaging

All material shall be packaged as per the project material specifications.

2.7 Wood Poles

Poles shall be in conformance with CSA O15-15. Wood poles used for this project will meet the minimum Coastal Douglas Fir (D.Fir) pole dimensions as published in standard CAN/CSA-O15-15. All wood poles will be treated with pentachlorophenol (penta) in accordance with CSA O80.4 and ground line drilled in accordance with project wood pole specifications. Material type, class, and length of poles are specified in the Contract Documents.

2.8 Receipt of Materials

Purchasing and receipt of materials shall be the responsibility of the Contractor. However, the Contractor shall keep the Owner's Representative apprised of the location and quantities of all materials and provide quality control documentation to the Owner's Representative for all materials as part of the Contractor's quality management plan.

2.9 Handling and Damage

All materials shall be handled carefully at all times. Damage shall be reported to the Owner's Representative, where such damage may impact schedule. Damaged materials shall not be incorporated into the works.

2.10 Fabrication Errors

Fabrication errors in material supplied by the Contractor shall be reported to the Owner's Representative who will determine whether the parts may be corrected in the field or replaced.

2.11 Return of Materials

All materials not incorporated into the Work and not damaged shall be offered to the Owner as spares at the contract rates. If the Owner refuses acceptance of spares, the Contractor shall remove them from site at no cost to the Owner.

All damaged material shall be recorded and removed from the site by the Contractor at no cost to the Owner. Empty reels and lagging shall be removed from the site unless otherwise approved by the Owner's Representative.

3 ECOLOGICAL AND ENVIRONMENTAL REQUIREMENTS

3.1 General

Specific project requirements will be provided to the Contractor by the Owner. For further information refer to Part 2.2 Special Conditions, Appendix A.5, "Contractors Guide to Enviro Compliance".

The Contractor shall avoid unnecessary disturbance or damage to the land and correct any damage or disturbance to the satisfaction of the Owner's Representative.

The Contractor shall not block any road, ditch, or watercourse except where necessary for a short period to correct a hazardous situation or in an emergency. Blocking roads, ditches, or watercourses through normal activities is not permitted unless approved by the Owner's Representative.

Prior to commencing construction, the Contractor shall prepare a work plan describing how construction activities will meet the environmental requirements of the Owner.

Hunting, fishing, trapping, harvesting, or harassment of wildlife is strictly forbidden.

Putrescible waste and other waste that will attract wildlife will be stored or disposed of in such a way to minimize wildlife encounters and at the direction of the Owner's Representative.

Any piled snow or cleared vegetation will be stockpiled in such a way that wildlife movement is not impeded at the direction of the Owner's Representative.

The contractor shall comply with the Land Use Permit (LUP).

3.2 Vehicle and Equipment Use

The Contractor shall:

1) Service or refuel vehicles and equipment a minimum of 30 m from any water body, watercourse or wetland and in such a way that contaminants do not enter any water body, watercourse, or wetland.
2) Inspect all vehicles and equipment daily for leaks, immediately remove any leaking equipment, and repair leaking equipment before further use.
3) Power wash any equipment expected to be working in water or a temporarily dewatered area, and examine the equipment for fluid leaks prior to commencing work. All scheduled equipment maintenance, and when possible emergency maintenance, shall be carried out within accepted locations at least 30 m from any natural water body, ditch, or drain.
4) Report, contain, and clean any spills and immediately report all spills of hazardous fluids to the Owner's Representative.
5) Refer to "StrataGold, Eagle Gold Project, Spill Response Plan", Version 2017-02.

3.3 Heritage Resources

The Contractor shall cease work and immediately inform the Owner's Representative upon discovery of potential heritage resources that are encountered. Any heritage resources found in Yukon are protected under the "Historic Resources Act" and Yukon Archaeological Site Regulations. No artifact can be removed from historic or archaeological sites without a permit. It is also important to note that "Artifacts" are defined as an object of historical or archaeological interest that is older than 45 years and has been abandoned. Thus, a large range of objects are covered.

The definition of heritage resources is sites or objects that are the evidence of past human presence in the area. These include, according to Yukon Government publications:

- Historical sites generally date to the time of written history (the past 100 to 150 years in Yukon) and typically contain examples of built heritage.
- Archaeological sites and objects that are historic in age or may date to before European contact. These resources most often consist of the remains of ancient camps, hearths, stone tools, and debris.
- Palaeontological resources are also protected as heritage resources under Yukon legislation. These are fossil and other remains of extinct or prehistoric plants and animals, including tusks of woolly mammoths, bones of ancient horse, bison and other ice age fauna, as well as fossil remains and traces of plants, vertebrate, and invertebrate animals.

The Contractor shall also take any action directed by the Owner's Representative to protect, preserve, or dispose of any historic remains or artifacts and take all reasonable precautions to prevent their damage or unauthorized removal by the Contractor's employees or other persons.

For identified historical sites, refer to the report titled "Archaeological and Historic Sites Impact Assessment, Dublin Gulch Mine Property, Final Report", Hallam Knight Piesold, October 1995. Prior to the commencement of the Work, the Owner's Representative will inform the Contractor of the location of known historical sites in the general area of the transmission line.

For further information, refer to the document titled "StrataGold, Eagle Gold Project, Heritage Resource Protection Plan", Version 2017-01.

3.4 Landscape Preservation and Restoration

The Contractor shall preserve the natural landscape where clearing is required and permitted by the Owner's Representative in writing, and conduct operations and equipment so that the destruction, scarring, or defacing of trees and natural surroundings is kept to a minimum.

In the event that the Contractor's operations result in the destruction, scarring, damage, or defacing of trees, shrubbery, or landscape outside the limits of the Contractor's working areas, the Contractor shall remove all affected trees or shrubbery and restore and re-seed the landscape with the natural vegetation as soon as possible to the satisfaction of the Owner's Representative.

To the greatest extent practical, the Contractor shall avoid any wildlife habitat features (e.g., mineral licks, dens, nest trees, snags, rocky outcrops, small ponds/seepages) encountered during the Work.

3.5 Dust Abatement

The Contractor shall furnish all labour, equipment, and materials required to reduce dust nuisance and prevent dust from becoming a nuisance in any work areas. The Contractor is not permitted to use oil or calcium chloride for such purposes.

3.6 Soil Disturbance and Erosion Prevention

The Contractor shall:

1) Avoid disturbance of topsoil wherever practical
2) Avoid disturbance to the permafrost soil layer wherever practical
3) Minimize grading, benching, and scarification
4) Take reasonable care to avoid damage to graded and/or seeded areas
5) Use vehicles and equipment in a manner which, in the opinion of the Owner's Representative, will not cause unnecessary damage or increase the possibility of erosion
6) Restore, to the equivalent of its original condition, soil or ground which has eroded or become unstable as a result of work activities to the satisfaction of the Owner's Representative

3.7 Wildlife Records Program

The Contractor shall report all wildlife observations and wildlife incidents to the Owner's Representative.

4 CLEARING AND ACCESS

These specifications are modified in accordance with the RFIs as issued to the contractor.

4.1 Clearing and Access Work Summary

4.1.1 General

The work specified herein includes all ROW clearing and access track construction as required for the construction of the Eagle Gold transmission line. It is the Contractor's responsibility to ascertain and carry out all such work as part of the overall contract.

The ROW is 60 m wide and is approximately 43 km long. The ROW includes the 30 m wide clearing area, referred to herein as the 30 m clearing zone, and has an area of approximately 130 ha.

The Contractor is responsible for carrying out:

1) All survey associated with clearing and access work; refer to Section 5 herein
2) All clearing in the ROW as specified herein and as required to complete his transmission construction work.
3) All clearing as required for access road/track construction; refer to the Drawings
4) All clearing as required for structure installation; refer to the drawings for number and location of structures (poles)
5) Removal of all "danger" trees located outside of the 30 m clearing zone

The Contractor is responsible for providing, as part of the work, all access roads and tracks additional to those existing, as required for the transmission line construction.

4.1.1.1 Site Survey

The Contractor will provide site surveying for setting out the clearing and access construction Work in accordance with the scope of work and all specifications and drawings.

Refer to Section 5 herein.

4.1.1.2 Local and First Nations Involvement

Every opportunity shall be taken to employ First Nations labour in the clearing activities. Details of such work shall be included in the Tenderer's proposal and the participation of First Nations Citizens will be a factor in Tender evaluation. Tenderers shall refer to the following documents: JDS Appendix B.1, "FN and Local Opportunities Policy" and JDS EPCM Agreement, Schedule 1, Attachment A5, "Local and Aboriginal Opportunities and Involvement."

4.1.1.3 Breeding Bird Window

It is required that, as far as practical, the ROW clearing will take place in winter, before the breeding bird window which is approximately May 1 to July 31, 2018. If this is not possible due to scheduling issues, the Owner will put appropriate protocols in place – refer to Section 1.1. The Owner must give permission for clearing during the breeding bird window. Where it is not practical to conduct ROW clearing outside of the breeding bird window, the Contractor will consult with the Owner's Representative prior to any ROW clearing taking place.

These requirements and protocols shall apply to not only to nesting of birds in trees but also birds nesting on, and near, ground level.

The contractor is to expect and allow for some disruption in the work due to bird nesting.

4.1.1.4 Seasonal Guidance

All work must be performed to minimize environmental impact. All work in wetland areas must be performed in the winter season.

Should the Work require roads or tracks across any water course, it will only be performed after approval from and as directed by the Owner. Generally, it is expected

that only existing road crossings (bridges/culverts etc.) will be utilized by the Contractor to execute the Work.

Any structures located in “wetlands” must be installed when the ground is frozen. Structure 22/2 is in a known wetland and is likely to be subject to this criteria.

4.1.1.5 Heritage Resource Protection

Contractor will be familiar with the Heritage Resource Protection Plan. Refer to Clause 3.3 herein. The Contractor shall:

- Report to the Owner any Heritage Resource encountered during execution of the Work.
- Protect the heritage site immediately by safely stopping all work and establishing an marking a 30 m buffer zone around the heritage site.

The locations of existing known heritage sites are referenced in Section 3.3, herein.

4.1.2 Clearing Work Included

4.1.2.1 Clearing of ROW

Clearing shall be carried out as required for the contractor to:

- Safely and conveniently construct the transmission line.
- Ensure safe clearances between line conductors and vegetation without any additional clearing for at least 5 years and as otherwise specified herein.
- As required to construct access tracks and to ensure safe use of said access tracks during construction.
- Provide clear structure sites including grounding (trees and shrubs are to be removed around structure locations to facilitate safe and convenient construction, and safe line operation and maintenance).
- Refer to the LUP for additional requirements

The contractor shall carry out all clearing as required to construct the transmission line, as specified elsewhere in this document and as may be shown on the drawings.

4.1.2.2 Access Road (Track) Clearing

Clearing shall be included as required for access track/road construction and safe use thereof.

4.1.2.3 Danger Trees

These “danger trees” are those that, in falling, would either strike the conductor or pass within the minimum conductor clearances as shown on the Drawings. Clear danger trees as required and as specified elsewhere herein and/or as shown on the drawings. Refer specifically to drawings 1407-T-5010 and 5015.

4.1.3 Clearing Work Not Included

The clearing work does not include clearing of the:

- Substation sites
- Slash burning

4.1.4 Access Track Work Included

It shall be the Contractor's responsibility to determine and allow for all access roads and tracks. The transmission line will be generally constructed adjacent to the existing road from near the McQuesten switching station to the Eagle Gold main mine site substation. The line is, generally, adjacent to the South McQuesten Road and the Haggart Creek Road. However, as shown on the drawings, the transmission line route deviates from the road route in several locations including at the beginning, centre, and end of the line. The access road/track construction work includes the following:

- Access to individual structure sites from the main access road, as required.
- Construction of a ROW access centre line road/track where the line deviates significantly from being immediately parallel to the existing roads, and access to each structure site along these tracks.
- Provision of all access roads and tracks as necessary for the transmission line construction as required in addition to the access proved by the existing roads. It shall be the Contractor's responsibility to determine and allow for access requirements. For permitting purposes, the Construction drawings included a general indication of the tracks to be constructed, but this is not to be interpreted as complete and all inclusive.
- The subject access tracks shall be suitable for traffic by pneumatic tired conventional two-wheel drive vehicles and articulated vehicles, etc. as used in construction.
- At structure positions, the access track shall divide to allow vehicles to drive each side of the structure to allow for construction and maintenance activities.
- Provide matting (rig mats or similar) at any locations as may be necessary for crossing soft or wet ground to avoid environmental damage.
- All access work as may be specified elsewhere in this document and/or as may be shown on the drawings.

4.1.5 Access Work Not Included

Maintenance of the main South McQuesten and the Haggart Creek roads is undertaken by others, unless required due to the actions of this Contractor.

4.2 Area to Be Cleared

The actual route to be cleared is shown on the Construction Drawings. It is the Contractor's responsibility to accurately survey and mark the extent of the clearing in the field. Over-clearing will not be paid for and may contravene government permits and regulations the results of which will be the responsibility of the Contractor with any associated costs including fines to the Contractor's account. Refer to the Drawings for ROW details.

The 30 m clearing zone is 30 m wide by 42,800 m long which represents an area of 128.4 ha. An additional vegetation management zone of 15 m on each side of the 30 m clearing zone, representing a total width of 60 m, shall be cleared of "danger" trees. On uphill slopes, it is possible there may be danger trees that must be removed by this Contractor that are outside the vegetation management zone.

Additional clearing around anchors is required. A 10 m cleared radius from location of anchor head at ground level is required for construction and maintenance.

4.2.1 Clearing Permits

Permits for clearing have been obtained by the Owner as part of the ROW application / land use permit.

4.2.2 Clearing Classes

This document designates clearing as Class 1, Class 2, and Class 3.

4.2.2.1 Class 1 Clearing: Complete

This is complete clearing as typically seen under many transmission lines. This type of clearing is required for access roads, the immediate area around the actual transmission line structures and other selected areas, such as the occasional hilltop and/or in the centre of spans where clearance to the transmission line conductors may be critical.

4.2.2.2 Class 2 Clearing: Selective

This is selective clearing limited to taking out tall trees that would in the near-term approach too close to conductors or would hinder line construction. It allows low-growing trees to remain in addition to small high-growing species, following the principle that these would take many years to grow to a hazardous height and this can be handled by ongoing line ROW maintenance. Outside the conductor path, low growing trees and shrubs several metres in height, depending on the location, would remain. Even in the conductor path certain species of low-growing vegetation not exceeding 2 or 3 metres in height are allowed to remain. This method of clearing minimizes soil disturbance.

4.2.2.3 Class 3 Clearing: Danger Trees

This applies along the boundaries of the 30 m clearing zone and would only involve selective removal of tall “danger” trees. By limiting the level of clearing, the ground disturbance is consequently limited. There may also be areas of no clearing such as at the bottoms of steep ravines.

4.2.3 Clearing Concepts

Clearing shall employ selective vegetation removal and maximize retention of existing vegetation. These measures will minimize soil disturbance, limit future erosion, limit visual impact, and continue to provide wildlife habitant.

In general, as specified herein, low-growing species that do not reach significant heights (e.g. willows) and that are not in the way of construction and maintenance activities do not need to be removed. However, all trees and brush shall be removed from access roads, work locations, or near structures, as required and/or described under Class 2 clearing.

The Contractor shall confine their construction activities to the ROW, designated access roads/tracks, and any designated ancillary sites, thus additional areas are not to be cleared.

In summary, clearing shall be limited within the ROW to that required for access and to maintain safe line clearances. A “clear-it-all” approach shall not be used. This limited clearing concept will limit soil disturbance. Limiting clearing will require more ongoing vegetation management during the life of the project, but reduces unneeded vegetation removal.

4.2.4 Clearing Requirements and Methods

4.2.4.1 General

- Clearing can be of two types:
    1) Mechanical clearing: use mechanical equipment when access and land allow it.
    2) Manual clearing: conventional method that uses manual equipment. This reduces environmental impact.
- Mechanical clearing using machinery that minimizes soil disturbance such as slashers, mega-mulchers, tree-grabs, and groomers is encouraged. The use of one or more bulldozers fitted with a tree pushing attachment, hydraulically operated stick rake interchangeable with a standard front mounted blade where permitted, and rippers may be warranted in some situations. The type of equipment to be used for clearing should be appropriate for the conditions of the site and shall be approved in writing by the Owner's Representative before commencement of work.
- Areas containing suitable stands of salvageable timber (>150 mm diameter at breast height) will be identified and flagged prior to clearing. Clearing of these areas will be conducted in a manner that is conducive to consumption and at the direction of the Owner's Representative.
- Hand falling must be used in riparian areas unless otherwise agreed to by the Owner's Representative.
- Clearing shall employ selective vegetation removal and maximize retention of existing vegetation.
- The overriding principle is to reduce the extent of bare earth and topsoil disturbance and to encourage low growing vegetation that does not impact on line clearances and access areas. Clearing by chain saw or other means that minimize soil disturbance are preferred.
- Stumps are to be removed where specified, but in no case, shall stumps be removed from:
    - Near the banks of watercourses
    - On terrain which is too steep or inaccessible for Machine Clearing
    - In areas subject to erosion or where danger of erosion exists
- Where practical, all large loose stones, rocks, or boulders shall be moved to the edge of the cleared area, or to specific positions within the cleared area as directed by the Owner's Representative.

4.2.4.2 30 m Clearing Zone

- In the 30 m clearing zone, the work consists of felling all trees and shrubs higher than three (3) metres. Trees and shrubs are to be cut, where cutting is required, at approximately a height of 150 mm (6 inches), measured from the highest soil level. If stumps are to be removed, the trees may be cut higher.
- No sub-surface ground-disturbing equipment or stump-removal equipment will be used by construction forces except on access roads or at the actual structure sites, where only foundation excavation locations and controlled run-off diversions shall be created that disturb the soil. All other areas of ground cover

or in-place stumps and roots shall remain in place to the maximum extent possible.

- The Contractor shall exercise care to, as far as possible, preserve the natural landscape outside the immediate construction area.
- Directional falling away from watercourses shall be employed. Falling next to water courses shall be limited to tall trees that would have unsafe approach distances to the line conductors.

4.2.4.3 Structure Sites

- In general, complete clearing is required at structure sites and anchor locations, as required for construction.
- Where leveling is necessary at structure sites, it will be implemented by means that provide for continuous gentle, controlled, overland flow, or percolation of water.
- Fill all large holes and other damage to the ground surface created by the clearing activities with soil from the adjacent disturbed area and leave the surface generally in such condition as to present no hazard to livestock, wildlife, vehicles, or horsemen.
- Machine clearing shall not be undertaken within a zone of 10 m from the banks of any watercourse. Within such zones, hand-clearing procedures shall be adopted and trees felled at stump height. All fallen timber is to be snigged or winched above the flood zone. Pushing or falling of trees and debris into a watercourse is prohibited.
- Clear only the minimum amount of vegetation required below the banks of any watercourse. Only vegetation that has the potential to breach safe electrical clearances shall be removed, as direct by the Owner's Representative.
- Areas subject to erosion or inaccessible for machine clearing, including a 10 m perimeter, shall be cleared by hand clearing procedures and trees felled at stump height. Every endeavour shall be made to fell all timber into a position that will not concentrate the flow of runoff. The Owner's Representative shall direct the extent of any additional erosion prevention measures or techniques required.
- Vegetation cleared by hand is to be cut as close as possible to the ground (<150 mm). Higher stumps may be retained if required by the landholder. Felling of trees at stump height shall be by axe or saw, without sharp protrusions being left on stumps.
- Where land slopes steeply across the route of the line (greater than 15 degrees) and no instruction is given on the plans, the Owner's Representative may direct that the clearing width be displaced towards the higher side of the centreline and the Contractor shall then clear the full displaced width; or the clearing width is displaced towards the higher side of the centreline and selective clearing be employed on the lower side of the centreline.
- In areas such as deep gullies and valleys where the line conductors will be high above the tops of mature trees, only a portion of the gully may require clearing or no clearing may be required.

4.2.4.4 Danger Trees

Danger Trees are those trees outside the 30 m clearing zone that, in falling, would either strike the conductor or pass within the minimum conductor clearance safe distance (as shown on the Drawings). Therefore, to ensure line safety and reliability, vegetation management operations must selectively extend to trees located outside the 30 m clearing zone. Thus, additional tall trees, located outside of the initially cleared areas may need to be selectively removed or pruned to maintain the required safe clearances

Generally, it is expected that these trees would be cleared using manual methods to the maximum extent possible. Removal of danger trees shall meet the approval, given in writing, of the Owner's Representative.

Refer to drawings 1407-T-5010 and 5015 for a general indication of what represents a danger tree and thus for what is to be removed.

After the line stringing is complete, the Contractor shall carry out a final Danger Tree review and remove any remaining danger trees, as part of the Contract Work.

4.2.5 Environmental Impact

The Contractor will be specifically required to plan and control all clearing activities to prevent environmental degradation caused by:

- soil or water contamination
- soil erosion and landscape instability
- blockage of drainage or impoundment of water

The Contractor shall employ appropriate mitigation measures when required.

The contractor shall implement all necessary measures to minimize the environmental effects of line clearing. Measures shall include:

- Use low-impact tree clearing means and methods to remove forested vegetation. Low-impact tree clearing incorporates a variety of approaches, techniques, and equipment to minimize site disturbance and to protect wetlands, watercourses, soils, threatened and endangered species and their habitats, and cultural resources. These measures shall include:
    - Consider soil and weather conditions when scheduling vegetation removal activities.
    - Fell trees directionally (parallel to and within the ROW) to minimize impacts to residual vegetation, where practical.
    - Use a variety of tree clearing equipment, as appropriate to minimize impacts to the extent practicable.
    - Cut trees close to the ground, leaving root systems and stumps where permitted and where practical, to provide additional soil stability.

4.2.5.1 Soil Protection

The Contractor shall make every effort to protect ground cover and soils.

The following guidelines for soil protection and ROW restoration will be enforced:

- Exercise care to preserve the condition of cleared soils by avoiding as much compacting and deep scarring as possible.
- On steep slopes and other areas where sensitive soils have been identified, these areas shall receive special attention. Use shall be made of erosion mats, silt fences, etc. as required. Equipment movement will be limited to slash disposal and hand work or work with small equipment will be utilized.
- Avoid over-stripping of topsoil during clearing.
- Where applicable, electively salvage and store all topsoil for future replacement and separate spoil materials from stored topsoil.
- Proper drainage control and associated erosion protection will be enforced which will, in turn, limit soil damage.
- The Contractor shall not unnecessarily remove stumps, unless a stump is where a structure or new access track is to be located or will interfere with stringing activities, etc. This will help to preserve the soil conditions and minimize ground disturbance.
- Prevent erosion and ensure seepage management. Exposed soils shall not be left for extended periods (after snow melt) un-seeded or un-armoured.
- If possible, soils should be re-spread within 2 to 3 months of the first disturbance for foundation construction. In many cases, this would logically occur after structure erection.

4.3 Handling of Cleared and Waste Material

4.3.1 Trees to Be Provided for Local Use

StrataGold is required to offer larger timber to the First Nations and local communities. This includes any trees larger than 15 cm at a 1.2 m height. All such timber shall be cut, limbed, and neatly piled adjacent to the road for their pick up if requested.

The project is located within the McQuesten Timber Harvest Plan area. The Yukon Forest Management Branch (FMB) encourages salvage of timber harvested incidentally to mining uses on crown land, as it is a valuable resource and should not be wasted. The Contractor shall follow these general requirements.

The timber to be salvaged for local use shall include all logs defined by the FMB. Their definition is a merchantable log is as a minimum of 2.5 m in length, a minimum of 12.5 cm diameter at breast height (dbh), 8 cm in diameter at the top, and contains 50% sound wood.

In order to facilitate transport and use by local citizens, the Contractor must cut the salvaged logs, in no longer than 8 ft. lengths to facilitate easy salvage. The logs shall be made available for public use by stacking adjacent to the road, in designated and mutually agreed locations.

4.3.2 Small Timber, Slash, and Brush Disposal

The Contractor shall dispose of all cleared material in accordance with the statutory regulation and as specified herein. For timber and brush, in addition to the timber to be provided for local use as covered in the above clause, the following disposal requirements shall apply:

4.3.2.1 General Procedures

The procedure and equipment used should minimize disturbance to both the ROW soil cover and to the vegetation that is to remain on the ROW, specifically:

- Where mechanical clearing is used, wheeled or tracked vehicles shall be equipped with brush rakes or forks with teeth protruding at least 8" below any bar or cutting edge. The use of bulldozer blades to handle slash or timber shall not be permitted.
- Tracked vehicles shall be equipped with grouser pads and operable winches with at least 50' of cable.
- All vehicles shall be equipped with cabs, to protect the operator from falling limbs and trees and to ensure the vehicle can withstand rolling accidents.
- All felled trees, logs, slash, brush, and chips shall be removed beyond any designated flood areas with minimal disturbance to the soil and remaining tree roots. Chips, where brush and small trees are chipped, should be evenly spread. Every effort should be made to see that marketable wood is salvaged, and at least moved beyond normal flood areas. (See clause above titled “Trees to Be Provided for Local Use.”)
- All disposal operations shall closely follow clearing operations to keep work confined to one area and to prevent unsightly and unsafe conditions.

4.3.2.2 Piling

- All timber shall be placed in neat piles along the edge ROW. Refer to the clause covering timber to be saved for local use.
- Locate heaped material clear of power lines and at least 10 m clear of all drains and watercourses or their flood banks, to prevent obstruction to water flow.
- Pile away from areas of preserved compatible vegetation.
- Small trees (i.e. slash not saved for local use) shall be stacked in tree length piles unless otherwise specified, in piles not greater in length than the longest tree length. A separation of at least 3 m shall be provided on either side of each pile.
- Small tree/slash piles shall be dressed of excessively protruding limbs and compacted to keep visual obstruction to a minimum. Generally, they should not exceed 2 m in height, except where site conditions are such that higher piles are acceptable (e.g., depressions, rough terrain in remote areas). Compaction of piles may be facilitated by use of equipment employed in the associated clearing operation.
- All access roads, trails, and streams (including their banks) shall be kept clear.

4.3.2.3 Burning

As a minimum, the following shall apply:

- Only burn when / as directed by the Owner’s Representative.
- Only burn when safe to do so and when permitted by the Government of the Yukon and obtain all necessary permits and provide all necessary notifications. If burning conditions deteriorate, burning operations shall cease.
- Notify the Owner’s Representative in writing a minimum of 5 days prior to any planned burning.
- The Contractor is responsible for any and all damage or injury resulting from burning operations

- Provide adequate fire-fighting equipment and water at the site of any burning activity.
- Provide continuous patrolling (day and night) if the fire danger is high and hot embers exist in any of the burn piles.
- When a fire is reduced to charcoal and ash, it shall be raked open to prevent hot embers from remaining in the ash piles. This shall only be done when fire danger is low.
- Immediately report to the Owner's Representative and Yukon Government Departments as may be required, any fire which burns beyond the ROW limits.

4.3.2.4 Chipping

Use may be made of mechanical chippers, but chipping is not specifically required herein. Where chipping is employed, the Owner's Representative should be consulted on disposal of chips.

4.3.2.5 Vegetation Disposal and Cleanup

- Haul chips (if applicable) to acceptable disposal sites as specified by the Owner's Representative where they are not to be spread.
- Clean up and reinstatement as necessary to the satisfaction of the Owner's representative.
- Refer to RFP addendum #4 the LUP for any additional requirements

4.4 Access Roads / Tracks

The following requirements apply:

- The contractor shall be responsible for the design, construction, and maintenance of all access tracks as required for the transmission line construction work.
- The contractor shall be responsible for the decommissioning of access tracks/roads where this is required by Yukon Government regulations.
- Only construct/use access tracks as marked on the approved ROW mapping, unless approval in writing is obtained from the Owner's representative. Thus, excessive clearing and soil impact will be avoided. The contractor shall provide surfacing as appropriate and required.
- Take the necessary safety precautions to prevent injury to human life or damage to property and shall carry on his operations with a minimum of interference to traffic or inconvenience to the public.
- Comply with all pertinent provisions of the Owner's transmission line ROW, Land Use Permit, Right to Work within a road ROW permit, and all other applicable Yukon Government Regulations.
- Access tracks/roads along the ROW, were required separate from the existing road, shall stay as close to the centerline as possible to minimize construction footprint.
- Access tracks/roads shall attempt to avoid springs, seeps, or other bodies of water found along the ROW.
- Access tracks not shown on the right-of-way drawings as submitted with this Tender and for the LUP, will require permitting (by the Owner). Refer to Addendum #4. When scheduling his work the contractor shall allow appropriate time for permitting and shall provide all required assistance to the Owner, in order to obtain the permits.

4.4.1 Road Safety and Traffic

Much of the line, as can be seen from the drawings, follows the South McQuesten Road and the Haggart Creek roads. These are public roads, used by many others in addition to the Eagle Gold project traffic.

The contractor shall:

- Limit to an absolute minimum any inconvenience to others caused by his work. The use of signage, barricades, flag persons, and similar shall be employed to ensure the safety of all during clearing activities.
- Follow the requirements outlined in the document titled "StrataGold Corp., Eagle Gold Project, Traffic management Plan, Version 2017-01."
- Comply with all applicable Yukon Government regulations.

4.4.2 Access Across Water Courses

It is believed that this contractor is not required to build roads or tracks across water courses as the existing roads and bridges are available. However, if any water course must be crossed, not using the existing roads and bridges, this shall be as directed by the Owner's representative. All directives as presented by said representative must be followed.

4.5 General Safety Requirements

Clearing and Access activities shall be in compliance with the general Eagle Gold project safety requirements and, of course, all applicable Yukon Workers' Compensation Health and Safety Board Regulations and requirements.

Refer to and follow the below listed Contract Documents for detailed requirements and expectations of Contractors safety program.

- Part 2.2 Special Conditions Appendix A.1, "Project Specific Safety Plan"
- Part 2.2 Special Conditions Appendix A.2, "Risk Matrix"
- Part 2.2 Special Conditions Appendix A.3, "JDS Health and Safety Manual"
- Part 2.2 Special Conditions Appendix A.4, "Safe Operating Procedures"

4.6 General Environmental Requirements

All of the work specified herein shall, in addition to the environmental requirements specified elsewhere and other Yukon Government regulations, the Contractor shall:

- Avoid all spills of fuel, oil, hydraulic fluid, antifreeze, and similar.
- Follow all Yukon Government laws and regulations including spill reporting and spill mitigation measures.
- Follow the requirements of the document titled "StrataGold Corp., Eagle Gold Project, Spill Response Plan, Version 2017-02.
- Follow the requirements of the document titled "StrataGold Corp., Eagle Gold Project, Environmental Monitoring, Surveillance and Adaptive Management Plan, Version 2017-01."
- Follow the requirements of the document titled "StrataGold Corp., Eagle Gold Project, Construction and Operations water Management Plan, Version 2017-01.

A basic concept of this transmission line project focusses on reducing clearing impacts. The contractor shall limit the impact of clearing and access track construction to soil, shrub, and other ground cover resulting from this work. The primary work to be monitored in this regard are:

- Access road and track construction
- Clearing and leveling sites for structures
- General ROW clearing activities

To limit impacts, particularly in wetland areas, winter clearing of transmission line ROW is preferred.

It is generally believed that little clearing is required in wetland areas. Nonetheless, if any vegetation removal is required in wetland areas then this must be done in winter.

4.6.1 Birds and Other Wildlife

It is essential that bird nesting not be interfered with. The nesting season starts on May 1 and the concept is to complete clearing as far as possible, before this date. If clearing schedules overlap with bird breeding the Owner's Representative will provide direction to the Contractor on how to proceed. Refer to Section 1.1 above.

The Contractor shall follow all Yukon Government laws and regulations, and follow the requirements of the document titled "StrataGold Corp., Eagle Gold Project, Wildlife Protection Plan, Version 2017-01."

Refer also to the requirements in the above section "Ecological and Environmental Requirements".

4.6.2 Heritage Resources

As per the Yukon Government, if a heritage site is discovered during clearing activities, all operations at that location must cease and the area must not be disturbed. A buffer of 30 m is required to protect the site. Refer to Section 3.3, for more information.

The Contractor shall follow all Yukon Government laws and regulations, and follow the requirements of the document titled "StrataGold Corp., Eagle Gold Project, Heritage Resources Protection Plan, Version 2017-01."

4.7 Permission

The Owner's Representative will provide permission to access sites for the Work. The Contractor shall notify the Owner's Representative 7 days prior to planned operations at any site. The Contractor shall not construct any new road or off-road access or alter existing access without notifying the Owner's Representative 21 days in advance and obtaining written approval from the Owner's Representative.

5 SURVEY

The Contractor is responsible to undertake all survey required to complete the survey as outlined below.

The contractor is responsible to establish and maintain survey control as required for their work for the duration of transmission line construction.

The project coordinate system is UTM NAD83 Zone 8N.

Survey equipment selection shall be at the discretion of the Contractor, provided that a minimum level of accuracy of ±10 cm in any direction is guaranteed, unless noted below.

5.1 Clearing and Access Survey

The Contractor shall undertake all survey required for the clearing of the ROW and for the layout and construction of the access roads.

This includes, but is not limited to all flagging of License of Occupation (LOO) boundaries, riparian setbacks, clearing boundaries, and danger tree identification as required to execute the work.

Survey equipment selection for clearing and access shall be at the discretion of the Contractor, provided that a minimum level of accuracy of ±1 m in any direction is guaranteed.

5.2 Structure Staking

The Contractor shall survey and stake the transmission line centerline, structure hubs, structure, and anchor setting out as required to facilitate construction works.

5.3 As-Built Survey

The Contractor shall undertake as-built survey of the completed transmission line, and shall undertake any additional survey as directed by the Owner's Representative. As-built survey shall include as a minimum:

- Pole base coordinates
- Anchor coordinates
- Pole top coordinates
- Conductor survey points over roadways
    - Conductor survey shall include ambient air temperature, windspeed and direction, and date and time that the survey was captured. Survey must be captured when winds are below 10 km/hr.

5.4 Legal Survey

Legal survey of the final ROW will be undertaken by the Owner following completion of construction and is not a requirement of the Contractor.

6 WOOD POLE STRUCTURES AND ASSOCIATED GUY ANCHORS

6.1 General

Structures, guy assemblies, anchor assemblies, and structure number sign installation details are shown in the Contract Documents.

6.2 Pole Types and Quantities

Table 2 outlines the structure types and quantities along the line. For more information, refer to the Drawings.

Table 2 - Structure Types and Quantities

Structure Type	Structure Code	Qty.
Post Tangent Structure (0° - 3°)	PT	285
Post Tangent Guyed Structure (3° - 15°)	PTG	65
Post Tangent Roll Structure (0° - 3°)	PTR	70
Vertical Medium Angle Structure (15° - 30°)	VMA	29
Double Arm Flat Dead-end Structure (0° - 45°)	FDE	7
Vertical Deadend Heavy Angle Structure (45° - 90°)	VDEHA	8
Vertical Deadend Medium Angle Structure (25° - 45°)	VDEMA	12
Vertical Deadend Heavy Angle with OHSW Structure (45° - 90°)	VDEHAO	2
Vertical Deadend Medium Angle with OHSW Structure (25° - 45°)	VDEMAO	2
Single steel arm H-frame Structure (0° - 3°)	SAH	15
Post vertical with OHSW Structure (0° - 3°)	PVO	15
Single steel arm H-frame Structure with OHSW (0° - 3°)	SAHO	3
Double steel arm H-frame Deadend with OHSW Structure (0° - 3°)	DAHDEO	2
	Total:	**515**

6.3 Structures in Permafrost

Preliminary studies estimate that approximately 19% of structures are located in areas of potential permafrost. This equates to approximately 101 structures, 75 of which are tangents. All tangent structures in permafrost require installation of transverse guying and anchors to improve stability against seasonal ground movements. For more information, refer to the Drawings.

6.4 Excavated Material

Excavated material is defined as follows:

Rock: is solid or ledge rock which, in the opinion of the Owner's Representative, cannot be removed until loosened by blasting and includes all detached pieces of solid rock more than 0.5 m^3 in volume.

Earth: is material other than rock as defined above, including, but nor restricted to earth, sand, gravel, hardpan, and soft or disintegrated rock.

Overburden: is earth which is removed from above a rock hole for a pole or anchor foundation.

Permafrost/Ice-Rich Material: is perennially frozen ground which, upon thawing, will experience significant thaw settlement and suffer loss of strength to a value significantly lower than that for similar material in an unfrozen condition.

6.5 Excavation

All excavation, drilling, blasting, slashing, shoring, and dewatering at each structure site shall be performed as required for proper installation of poles and guy anchors.

Excavations in unstable soils such as clay or silty material shall not be left open unless protected from weather, water, and sloughing.

Open excavations shall not be left unattended without suitable covers, fences, or barricades around the perimeter.

Where suitable material at the base of an excavation has deteriorated to an unsatisfactory condition, it shall be removed and replaced with suitable material.

Excavation materials shall not be allowed to enter any watercourse.

All practical efforts shall be made to minimize disturbance to permafrost.

Pole holes shall be excavated with mechanical auger, by hand digging methods, or by blasting. In free-draining predominantly gravel soils which can be compacted adequately when backfilling, a backhoe or similar equipment may be used to excavate trenches provided:

1) The trench is parallel to the longitudinal axis of the transmission line.
2) The walls of the trenches are nearly vertical.
3) Trenches for any one structure are dug from the same side of that structure and have a near vertical end.
4) If the backhoe method is used at adjacent structures, the trenches are dug from the opposite side of the two structures.
5) Rock anchors are installed in accordance with the detailed drawings.
6) Anchor log and steel plate anchor trenches shall be dug perpendicular to the guy.

Galvanized Corrugated Metal Pipe (GCMP) may be used to prevent pole holes from caving. Unless specified on the Drawings, or required for structural stability, the use of GCMP liners is at the discretion of the Contractor and any material costs are the responsibility of the contractor. The GCMP liners shall have a diameter at least 200 mm greater than the diameter of the butt of the pole to provide sufficient space for backfill compaction.

To the extent possible, care shall be taken to protect the integrity of permafrost ground elements outside of the local footprint of construction.

Refer to 6.12 Backfill.

6.6 Dewatering

Excavations shall be free of water when setting poles, installing guy anchors, or placing and compacting backfill. The water level in excavations and drill holes shall be kept below the foundation underside during the placement of liners, barrels, culverts, wood poles, guy anchors, backfill, concrete, or grout.

If effective dewatering cannot be accomplished by pumping from within the excavation, then well-points should be used to maintain the water level below the bottom of the excavation at least until placement of compacted material has been completed. If de-watering is not practical, acceptance by the Owner's Representative for an alternative procedure shall be obtained.

6.7 Blasting

Prior to commencing any blasting Work, the Contractor shall:

1) Obtain permits from the appropriate authorities
2) Provide the Owner's Representative with copies of any such permits

3) Follow all general Eagle Gold Project blasting procedures

Detailed blast plans shall be submitted to the Owner's Representative at least 3 days prior to the scheduled start of blasting. Blasting shall not commence until receipt of written approval by the Owner's Representative. Blasting shall be carefully controlled to preserve the soundness of the rock beyond the required excavation. All blasting shall be completed by a certified blasting technician in accordance with the Owner's accepted blasting plan. The technician must have a Yukon Blasting Certificate. Credentials shall be supplied to the Owner's Representative prior to blasting.

6.8 Poles, Timbers, and Anchor Logs

The Contractor shall install a date nail 1.3 m above ground for all installed poles. All poles are butt-gained. Cutting off the tops of a treated pole will not be permitted. Douglas Fir anchor logs shall be drilled and treated with Pentachlorophenol (Penta).

6.9 Crossarms and Braces

Any steel crossarms which require field drilling shall be coated with an approved zinc paint after drilling to protect against corrosion.

6.10 Handling and Damage

Material shall be handled and installed carefully to avoid damage. Poles, timbers, and anchor logs shall be handled such that the treated wood is fully protected at all times. Wire slings shall not be used on poles, timbers, or anchor logs.

Butt sections of any pole shall not be trimmed to facilitate setting in a pole hole, steel liner, or any other reason. Poles shall not be dragged along the ground unless approved protection is provided. Poles, crossarms, crossbraces, or timbers, shall not be dropped during any process of handling or erection.

Poles and timbers which have been damaged or cut after leaving the treatment plant shall have the damaged or cut surface coated with Contractor-supplied preservative.

Field bored holes in the poles shall be saturated with preservative immediately after drilling. All unused holes shall be filled with preservative and both ends closed off with treated Contractor-supplied plugs.

Where minor damage to galvanizing occurs, the exposed bare steel shall be painted by the Contractor with two coats of Contractor supplied zinc-rich paint.

6.11 Setting

All poles shall be set within competent material. If other conditions are encountered, the Owner's Representative shall be notified for further direction.

An active layer and a frost penetration depth of 2.0 m is assumed across the site. All foundations must extend to a depth of greater than 2.0 m.

Poles set in bedrock must be embedded to a depth of 10%H + 2' unless precision blasting techniques are employed to provide straight and neat bearing surfaces and a maximum 200 mm space around pole butt. Excavations in rock will be either drilled or blasted, with over-blasting limited as much as

possible. Blast rock is not acceptable as fill material. All backfill for rock set poles shall be non-frost susceptible 20 mm minus gravel per the project specifications.

Poles erected in augered or drilled holes or set in GCMP liners shall be set at the center to allow material compaction around the pole. Poles erected in trenches excavated by a backhoe or similar equipment shall be set with their butts in firm contact with the vertical wall at the end of the trench.

Poles and guy anchor rods shall be set within the following tolerances:

1) **Structure Position**: structure centreline shall be within 150 mm of the centreline hub, unless otherwise specified by the Owner's Representative.
2) **Structure Rotation**: pole centres at ground-line elevation shall not deviate from the bisector of the line angle by more than 75 mm.
3) **Pole Spacing**: the horizontal distance at ground-line elevation between adjacent poles in a multi-pole structure shall be within 75 mm of the specified distances.
4) **Pole Plumb**: a pole is plumb when the centres of the pole at ground-line elevation and at pole top are in the same vertical plane.
    a) All poles shall be within 75 mm of longitudinal plumb measured from the top to ground-line. At multi-pole structures, the 75 mm tolerance applies only in the same direction.
    a) All tangent and small line angle poles and structures shall be within 75 mm of transverse plumb. Poles of medium and heavy line angle structures shall be raked up to 300 mm +/-75 mm towards the outside of the line angle as directed by the Owner's Representative.
5) **Pole Setting Depths:** poles shall be set within 75 mm of the depths shown in the Contract Documents. Where pole excavation depth exceeds the specified pole setting depth, the over-excavated portion shall be refilled and compacted prior to installing the pole at the expense of the Contractor.
6) **Guy Anchors**: guy anchor assemblies shall be within 75 mm of the specified location and shall be set within the tolerances shown in the Contract Documents.

6.12 Backfill

a) **Backfill Material**

All backfill material shall be non-frost susceptible unless specifically stated otherwise on design drawings.

The Owner will be able to provide suitable material to use as backfill from stockpiles of waste placer mining tailings located at the mine site. Material testing is required to verify conformance to specifications prior to use.

Clean Sand: sand free of deleterious material such as clay, topsoil, peat, or ice, all of which passes through a 9.5 mm sieve, and not more than 8% of which passes through a 75 µm sieve.

Structural Backfill: use non-frost-susceptible gravel fills as per Table 3 or approved equivalent.

Native Backfill: material from the foundation excavation or available within a 25 m radius of the excavation.

Local Backfill: material available outside a 25 m radius but within a 150 m radius of the excavation.

Non-Frost-Susceptible Gravel Fills: Table 3 outlines the typical gradations for non-frost susceptible gravel fills as per the Whitehorse Service Standards Manual.

Table 3 - Non-Frost Susceptible Gravel Fills

80 mm Pit Run		20 mm Crushed Gravel	
Particle Size (mm)	**% Passing (by weight)**	**Particle Size (mm)**	**% Passing (by weight)**
80	100	-	-
25	55 – 100	20	100
12.5	42 – 84	12.5	64 – 100
5.0	26 – 65	5.0	36 – 72
1.25	11 – 47	1.25	12 – 42
0.315	3 – 30	0.315	4 – 22
0.080	0 – 8	0.080	3 – 6

Native material must not be used to backfill anchor and pole excavations unless a Qualified Person is on site at the time of excavation and determines that it is suitable for the application.

Wet clay which cannot be compacted to satisfy the requirements of sub-clause (c) shall not be used as backfill.

a) Backfill Selection

In general, non-frost susceptible 20 mm crushed gravel is to be used as structural backfill at all pole and anchor foundations.

When approved by a Qualified Person, native and local fill may be substituted.

Placer tailings stockpiles located at the mine site may be suitable and available for use as backfill. Testing of available to material to confirm suitability shall be undertaken prior to mobilization to site.

b) Placing Typical Backfill

The following precautions shall be followed during backfill placement:

1) Excavations shall be kept free of water.
2) Poles and anchor assemblies shall not be damaged.
3) The location of guys and anchors shall be maintained within tolerance.
4) Backfill shall be mounded 300 mm above the general ground level over the full extent of the excavation with the exception of anchor rods, which shall project 150 mm above the backfill. The mounded backfill shall not contain particles larger than 75 mm. A drainage outlet shall be provided to prevent pooling of water.

5) Backfill shall not be placed over frozen soil. Frozen material shall not be used for backfill.

c) Compacting Backfill

Backfill shall be compacted using mechanical tampers except where hand-operated equipment is approved by the Owner's Representative.

Backfill material shall contain sufficient moisture for effective compaction. Water shall be added when necessary to increase moisture content. Backfill shall be compacted in horizontal layers not exceeding 300 mm in thickness in the loose un-compacted condition. Each layer shall be compacted with at least three passes of an approved vibratory tamper to achieve the following degree of compaction:

1) Non-cohesive soils, i.e. sand, gravel, and cobbles shall be compacted to a "dense" condition. This "dense" condition is reached if it is not possible for a man of average weight to push a wooden picket more than 40 mm into the soil. This picket shall be 50 mm x 50 mm with the penetration end beveled at 45^{o} on all four sides.

After initial backfilling, additional native backfill material shall be placed and compacted to form a mound 0.3 m above surrounding grade to redirect surface drainage away from poles or anchors.

6.13 Waste Material

Imported waste or debris material shall be removed from site. Excavated waste material shall be spread or removed.

6.14 Structure Framing

All wood poles are butt gained. Cutting off the top of a treated pole in order to equalize the height of the poles above the crossarm is not permitted.

The teeth of timber gains shall be fully embedded into the wood by an approved hydraulic press. Wood poles shall be properly aligned to ensure appropriate alignment of climbing lugs, ground lugs and crossarm and brace connections.

Steel crossarms are drilled and galvanized.

Crossarms, crossbraces, and all hardware assemblies shall be installed within 25 mm of the specified location.

Splices are not permitted in guy strand. Guy grips may only be taken off and re-installed a maximum of one time. Guy grips removed and re-installed more than one time shall be replaced. Replaced guy grips shall be destroyed to prevent re-use.

Guys shall be tensioned to 2 to 5 percent of the guy strand rated tensile strength.

6.15 Structure Number Signs

Structure number signs shall be installed on each structure as shown on the structure drawings or as specified by the Owner's Representative.

6.16 Guys

Guys shall be installed as shown on the drawings. Guy guards shall be installed with all new guys. All new guys shall be either Size 10 Grade 1300 or Size 12 Grade 1300, as specified on the drawings.

6.17 Anchors

A mix of earth anchors and grouted rock anchors are anticipated.

All earth anchors shall extend beyond the frost penetration depth of 2.0 m. General anchor arrangements, material specifications, layout, and design loads are included in the design package. Anchor rod extensions shall be installed as shown on the drawings.

If the Contractor wishes to propose an alternate means of anchoring, such as helical piles, this will be considered by the Owner's Representative provided the Contractor provides design calculations, drawings and details certified by a Qualified Professional in the Yukon verifying the proposed alternative is sufficient for the intended application.

The type of anchor utilized, whether earth or rock, should be confirmed by the Contractor and accepted by the Owner's Representative after inspection of anchor locations by the Contractor to determine ground conditions.

Anchors shall provide sufficient capacity to resist the loads indicated on the drawings. Prior to installation, the anchor installation procedure, and test plan shall be submitted to the Owner for approval. Anchor installation records shall be included in the Contractor's QC and as-built documentation.

A minimum 10% of all rock anchors across a minimum of 25% of all structures with rock anchors, shall be pull tested in both rock and soil. Test locations may be requested by the Owner's Representative based on field conditions. A pull testing plan and procedure shall be submitted to the Owner's Representative and the engineer prior to installation.

Pull testing shall be in conformance with the Post Tensioning Institute's guidelines for grouted anchor testing.

6.18 Drilling and Grouting

Holes for guy anchors in rock shall be drilled to provide the minimum embedment of grouted guy anchor rod in sound rock as shown on the drawings.

All holes drilled in rock shall be cleaned out by air jetting immediately prior to placing bolts and anchor rods. The embedded anchor rod length shall be grouted in place using a premixed non-shrink grout product in accordance with the manufacturer's recommendations. Examples of accepted products include based on the substrate temperature:

- Substrate temperature is between -10°C and +4°C:
  - Sikagrout "Arctic 100"
  - Multicrete "Sub Zero"
- Substrate temperature is between +4°C and 29°C:
  - Sikagrout "212"

Alternatives grouts shall be approved by the Owner prior to use. Grout cube samples shall be taken at the time of installation as required in the installation QA/QC record and shall provide a minimum compressive strength of 25 MPa at 28 days.

Grout shall be placed into the bottom of the hole either by pumping or gravity flow. At the start of placing, the lower end of the grouting hose shall be within 150 mm of the bottom of the hole. As placement proceeds, the hose may be withdrawn so that the end of the hose is at least 600 mm below the level of the grout until the required amount of grout has been placed. Metallic grouting pipes may be left in place provided they are completely filled with grout and acceptance has been obtained from the Owner's Representative. The quantity of grout placed in each hole shall be recorded and the record given to the Owner's Representative.

The Contractor shall provide the Owner's Representative with 24 hours notice prior to placing grout. Specialist grouting procedures and materials for low rock and soil temperatures shall be employed and discussed with Owner's Representative as a part of the quality management plan. When the air temperature is above or is expected to rise above 27°C, precautions shall be taken so that the grout does not set too quickly or become so stiff that it cannot be properly placed. Grouted anchor rods shall remain undisturbed for at least 2 days.

6.19 Tools and Bolting

Tools, bolting, and tightening specifications are shown in the Contract Documents. Nuts on all connection bolts shall be installed in accordance with the manufacturer's recommendations. As a minimum, all nuts shall be installed snug tight. "Snug tight" is defined as the tightness attained by a few impacts of an impact wrench or the full effort of a worker using an ordinary spud wrench. Some bolted connections will require additional tightening of the nuts. All bolts in an assembly shall be inserted before any nut in such assembly is fully tightened.

When joining assemblies or components, previously tightened bolts shall be loosened as necessary to allow joining and to obtain proper alignment.

On all steel-to-steel connections, a helical spring washer shall be installed on the inside of every nut. On all steel-to-wood connections, a pal nut shall be installed on the outside of every nut.

6.20 Structure Bonding

Structure bonding shall be installed in accordance with the Drawings. Specifically, refer to the General Construction Notes, 1407-T-1300 and the Structure Drawings. Where there is shield wire grounding present on the structure, the bonding shall be connected to the ground wire.

6.21 Structure Grounding

Structure grounding shall be installed in accordance with the Drawings. Structure grounding must be installed at all 24 structures that have overhead shield wires. There are two different types of grounding to be employed at structures:

- Groundwells – 9 structure locations
- Driven ground rods – 15 structure locations

In addition to structures where overhead shield wire is used, all structures with steel crossarms and/or crossbraces should be grounded to achieve a minimum resistance of 25 ohms.

Refer specifically to the General Construction Notes (1407-T-1300), grounding details drawing (1407-T-4450) and the structure data sheet (1407-T-1400) for structure locations.

7 CONDUCTOR INSTALLATION

7.1 General

All conductors shall be strung using sighted sag stringing methods. Unless otherwise specified, conductor stringing shall be conducted in accordance with IEEE Standard 524 - Guide to the Installation of Overhead Transmission Line Conductor.

Cable suppliers shall be consulted prior to installation for any additional care, handling, or stringing requirements not outlined in this specification.

7.2 Conductor Data and Applications

The cables used on this project are listed below. The sag and tension drawings shall be referenced for specific sag and tension values.

- Conductor: 266.8 Partridge ACSR
- ADSS: 24-fibre ZTT OFC-24 G.652D-FASA-S1 (200m span)
- OHSW: 266.8 Partridge ACSR

7.3 Construction Equipment

All operations shall be performed using equipment and tools which will not damage the conductor, hardware, or other materials.

a) Stringing Sheaves

The minimum root diameter (MRD) of stringing sheaves shall be calculated as follows:

- For conductor angle changes up to 25° => MRD = 15 x Conductor Diameter
- For conductor angle changes over 25° => MRD = 20 x Conductor Diameter (one sheave) OR 15 x Conductor Diameter (two sheaves)

Conductor angles are the combination of horizontal line angle and vertical conductor dip.

All sheave wheels shall be marked with the manufacturer's safe working loads. All sheaves shall have elastomer lined grooved and be carefully cleaned and lubricated so that they remain free running. If any sheaves are not free running or are not suitable for any reason, they shall be removed from the site. Installation sheaves shall not be relied on to ground the conductor or pulling ropes.

b) Torque Wrenches

Calibrated torque wrenches shall be used to tighten bolts on the insulator and conductor hardware.

c) Pullers, Tensioners, and Reel Trailers

Stringing equipment shall have the capacity to provide the tensions listed in the stringing data. All tensioner grooves, conductor guides, and fairleads shall be coated with a neoprene, urethane, elastomer, or equivalent protective covering which shall be maintained in good condition during the work.

Tensioner frames and carriers as well as reel trailers shall be provided with protection to prevent damage to conductor during threading or during periods when the conductor may become slack.

d) Grips and Swivels

Grips and swivels shall be used for the specific types and sizes of conductor and maintained in a clean, undamaged condition.

e) Compressing Equipment

Compression splicing of conductor shall be completed by hydraulic press or implosive sleeves. Implosion sleeves are the preferred method of compression splicing. Presses shall be maintained in good working order and capable of operating steadily at the required pressure. The presses shall be compatible with the dies and shall close fully so that the matching die faces bear uniformly on one another during the extrusion process. Dies shall be in good condition, in matched sets, and properly labeled.

f) Rigging

All construction lines, slings, shackles, and similar equipment shall satisfy applicable safety standards.

g) Thermometers

All sagging thermometers shall be accurately calibrated for the full range of sagging temperatures.

h) Insulator Lifters

Lifters specifically designed and built for the type of insulators being installed shall be used for handling insulator strings up to the structures. During the handling process, the top insulator shall be secured to the lifeline to prevent excessive movement.

7.4 Cable Care

Prior to pulling conductor, the inside edge of conductor reels shall be inspected for surface irregularities. Rough edges shall be smoothed out to prevent conductor damage. The conductor shall not contact the ground or abrasive surfaces. The conductor shall be suitably protected adjacent to snubbing clamps and rigging cables. Free ends behind the snubbing clamps shall be neatly coiled and placed on protective matting. Particular care should be exercised at all times to ensure that the conductor does not become kinked, twisted, abraded, or damaged in any way. Jumper conductors, especially when coiled, shall not contact the ground or other abrasive surfaces.

7.5 Conductor Damage and Repair

Any damage to the conductor shall be reported immediately to the Owner's Representative who will decide whether the conductor shall be repaired or replaced. All repairs or replacement of damaged conductor shall be made as follows:

1) **Minor Damage**: Any minor scratches, marks, and indentation in outer strands. Correction: light hand smoothing with a polishing agent approved by the Owner's Representative.

2) **Moderate Damage**: Any damage which is more than 3 m from any conductor fitting and which is too severe or occurs over too great a length to be repaired by hand finishing, or which reduces the strength of the outer layer of conductor by an amount equivalent to not more than

three broken strands. Any strand which has lost more than 50 percent of its cross-sectional area is considered equivalent to a broken strand. Conductor fittings include but are not restricted to strain clamps, suspension clamps, and compression sleeves for splices, hold-down weights, armour rods, and patch rods. Correction: hand-smooth the damage area to remove projections and apply preformed patch rods.

3) **Severe Damage**: Damage to inner layers, more than the equivalent of three damaged or broken outer strands, or damage within 3 m of conductor fittings or other repairs. Correction: cut out damaged portion and replace with new conductor and compression splice sleeves.

Conductor, compression joints, and patch rods to repair or replace damaged conductor shall be supplied by the Contractor.

7.6 Insulators, Insulator Hardware, and Conductor Hardware

Insulators shall not be uncrated until they are ready to be installed at each structure site. Insulators shall be thoroughly cleaned immediately prior to installation. Mud, grime, oily films, and other foreign material shall be completely removed from all surfaces.

The type of insulator assembly and the number and position of hold-down weights at each structure is shown in Contract Documents.

Insulators with any of the following defects shall be rejected.

1) Glass Insulators: chips in the insulator skirts, cracks, or top surface chips with sharp edges.
2) All Insulators: damage to metal caps or loose or damaged grout.
3) Composite Insulators: rips, tears, and punctures of the sheds, exposed rod, any breakdown of the weather protective system, rough handling, choking during lifting, bending, and over stressing.

7.7 Dampers

1) Vibration Dampers are not required on conductors or OHSW.
2) ADSS shall have spiral vibration dampers (SVD) installed according to the Drawings and the manufacturer's installation specifications.
    a) ZTT (SVD) part number: FLP-1310

7.8 Compression Joints and Splices

Compression joints shall be installed in accordance with the Contract Documents. Conductor joints shall be of the compression or implosion type. The Contractor shall provide the proposed method for installation and quality control for both compression and implosive joints. The number of joints shall be kept to a minimum. Joints shall be located at least 10 m from suspension clamps or dead-end fittings.

The pressing of compression fittings shall only be completed in the presence of the Owner's Representative. Unsatisfactory joints shall be cut out and replaced. During the pressing of compression joints, the conductor shall be protected from damage by the use of suitable ground sheets, preformed plastic line guards, or both.

The Contractor shall provide and use a "go-no go" gauge for each size of dies to check at least one press on each compression joint.

Compression joints shall be made to maintain a straight alignment. Joints may be pulled though sheaves, but a joint will be rejected if it deviates from a straight line by more than the diameter of the conductor. No straightening of compression joints is permitted. Subsequent operations which may cause bending are not permitted except as approved by the Owner's Representative.

Implosive joints shall be installed in accordance with the manufacturer's specific installation procedure supplied for each type of implosive connector. After an implosion operation, any joint with visible damage will be deemed unacceptable. Marks made during conductor end preparation shall be at the conductor end within 10 mm.

Explosive operations are subject to all relevant federal, provincial, and municipal regulations respecting the transportation, storage, handling, and use of explosives. Further, the Owner's Representative shall be advised of the intention to use explosives/implosives at least 5 working days before such work is commenced.

The use of "Automatic" splices is strictly prohibited.

7.9 Stringing

The Owner's Representative shall provide sag and tension data which includes span lengths, sags, and tensions in five-degree increments.

The Contractor shall provide the Owner's Representative with the location of any temporary stringing dead-ends. The location of temporary dead-ends is subject to the acceptance of the Owner's Representative.

During stringing, the sag of the conductor in any span shall not be less than the sighted sag in sheaves specified in the sag data for the span and the tension shall not exceed the tension specified in the tension data.

Stringing operations shall be performed during daylight hours only unless otherwise approved by the Owner's Representative.

If stringing is stopped for an extended period, the snubbed-off conductors and ADSS will be permitted at permanent dead-end structures only, unless otherwise accepted by the Owner's Representative. All temporary snub points shall be at least 75 m away from the structure and at no time may the slope at the structure of the snubbing guy form an angle with the horizontal greater than 20° at transmission structures and 10° at station terminal structures. Temporary guys and anchors shall be removed after use and disposed of by the Contractor.

When reeving the bullwheels of a tensioner with the conductor entering and leaving the wheel from the top and facing in the direction of pull, the conductor shall enter from the left and leave from the right for right-hand lay (standard for ASC, ACSR, and AACSR).

As a minimum precaution, the conductor shall have running grounds at the first and last sheave of a pull. The Contractor's safety management program shall address these preparations in detail. In addition, the Contractor shall have safety watcher(s) assigned during the stringing operation to maintain line of sight.

7.10 Sagging

a) General

Sagging shall be completed only after the entire length of conductor has been pulled through a section. Sagging shall be done progressively from one end of the section towards the opposite end to work the conductor slack back to one end and recover as much conductor as possible. Therefore, each span shall be sagged and hardware applied before the Contractor may sag the adjacent span. The Contractor should note the following:

1) Sag data will be supplied to the Contractor within 14 days after the receipt of his written request. Sag data sheets will contain the following information: structure number and type, span length, mid span sag, and conductor stringing tension. The sag data will be supplied for stringing temperatures in increments of 5 ^{o}C unless otherwise agreed to by the Owner's Representative. Each request shall include a tabulation of the proposed stringing sections, sag sections, the location of snub points, temporary dead-ends, and temperatures.
2) The sags provided on the sag data sheets are based on sagging the entire section between dead-end structures in one operation.
3) The conductor shall be sagged in accordance with the values shown on the sag data sheets if the sagging operation is done within 5 hours of the completion of stringing. If the conductor shall be left in sheaves for more than 5 hours, a creep correction shall be made.
4) Sag data is based on structure centreline span lengths. Where there are large line angles which result in longer or shorter span lengths for the outer conductors, the sag of the outer conductors shall be calculated as follows:

$$\text{Outer conductor sags} = \left(\frac{\text{Outer conductor span length}}{\text{Centreline span length}}\right)^2 \text{x Centre phase sag}$$

Under special circumstances, the Owner's Representative may issue sag data for all three phases, and where standard sagging methods cannot be applied, special sag data will be supplied.

1) The length of conductor sagged in one operation shall be limited to the length that the Owner's Representative agrees can be sagged satisfactorily.
2) Sagging shall not be performed when, in the opinion of the Owner's Representative, the weather may prevent satisfactory results.
3) Dead-end structures will deflect when conductors are attached only to one side. Because of this, the Contractor shall, prior to making cuts or attaching dead-ends, correct the sags in spans adjacent to dead-end structures after the conductors have been temporarily attached to both sides.

b) Sag Control Spans

The control spans shall be as close as possible to the average span as per IEEE-524. The selection of control spans for sag measurements shall be approved by the Owner's Representative. The minimum number of control spans is:

Length of Sag Section	Minimum Control Spans
1 to 3 spans	1
4 to 6 spans	2
7 to 14 spans	3
15 to 26 spans	4

c) Sag Tolerances

Unless otherwise approved by the Owner's Representative, the difference between the specified sag and the actual sag shall not exceed plus or minus 100 mm.

d) Sag Report Forms

On completion of sagging of a section, the Contractor shall submit the measured sags of each control span to the Owner's Representative. These forms shall be submitted within 72 hours of completing the sag operations.

e) Marking

Immediately after sagging a section within tolerance, the Contractor shall clearly mark all conductors to show their intersection with a plumb plane through the transverse centreline of the structure.

7.11 Clipping-In

1) 14 days prior to the commencement of clipping-in, the Contractor shall submit details of the proposed methods and equipment to the Owner's Representative for approval.
2) After clipping-in, insulator strings shall be within 150 mm of plumb measured at the conductor level under the centreline of the suspension clamp. The plumb plane is through the transverse centreline of the structure or crossarm, whichever is applicable.
3) Where the conductor is temporarily snubbed-off, conductor tensions between successive sagging operations shall be equalized by the use of back snubs so that insulator suspension assemblies will assume a vertical position when the entire section is clipped-in.
4) Conductors shall not be clipped-in at structures where the conductor is temporarily snubbed-off.
5) The insulators shall be protected from contact with metal including metal ladders. Ladders used for clipping-in shall hang free of the insulators. Alternatively, non-metallic protective devices may be used to prevent direct contact.
6) After clipping-in, hold-down weights may be required at specific structures as specified on the structure data sheet (1407-T-1400). Hold-down weights are in 45 kg units and shall be installed in 90 kg total units (two weights) equalizing the load on either side of the suspension clamp to a maximum of 270 kg total units (six weights).
7) Approval by the Owner's Representative of a section will not be given until a section has been clipped-in and determined to be within the specified sag tolerances. A section of line is between two dead-end structures.

7.12 Jumpers

Details of the jumper requirements are shown on the Drawings. To limit induced voltages and for safety at ground snub locations, jumpers shall not be connected until all conductors have been installed and authorization to close jumpers is provided in writing by the Owner's Representative.

7.13 Phasing

Phasing shall follow the phasing drawings. The Contractor shall confirm the phasing of existing circuits before connecting to them.

8 ADSS INSTALLATION

8.1 Scope

Fibre optic cable will run on the 69 kV transmission line from the Northwestel equipment in the McQuesten Substation to the Northwestel equipment mounted in the Eagle Gold Substation. This contractor will supply and install the fibre optic cable, as specified herein, on the Eagle Gold 69 kV transmission line between the McQuesten Substation to the Eagle Gold Substation.

- This contractor shall terminate the fibre optic cable inside the Eagle Gold Substation E-House in a terminating panel supplied by this contractor. Northwestel will make the final connection to their equipment.
- To facilitate running the fibre into the Eagle Gold mine site substation E-House, the Eagle Gold Substation contractor will run 2 inch PVC conduit underground, with pull boxes as appropriate, from the E-House to the wood pole terminal structure ahead of the substation main incoming circuit breaker (circuit switcher). This Contractor shall install a terminal box on this structure and pull the fibre from this point into the E-House. Whereas a loop of extra cable is to be left on the structure it is believed there is no need to have splices at this point, if sufficient cable is left to pull into the E-House.
- At the McQuesten Substation, the fibre will be installed and tested from the local Northwestel microwave tower up to the point where it connects to the Eagle Gold fibre on the first pole of the outgoing 69 kV transmission line by others. The McQuesten Substation contractor will run fibre in PVC conduit from the substation control building to the splice box on the first transmission line structure, 0/10A (outside the substation yard) as referenced above. This contractor will splice the cable at that point. The fibre optic cable coming out of the McQuesten Substation will be 24 fibre, single mode ZTT ADSS type "OFC–24 G.652D–FASA–S1".
- For arrangement of equipment at the McQuesten Substation, refer to ATCO Electric drawing No. S258-D-E400 – 1 "S258 McQuesten Substation, Electrical Equipment and drawing No. S258-D-E402 – 1 "S258 McQuesten Substation, Control Building, Equipment Layout. (These drawings will be supplied upon request.)
- As detailed under testing, this contractor shall not only test the cable from the Eagle Gold Substation up to the terminal box on the first transmission line structure outside the McQuesten Substation, but shall also test the entire run from the terminating panel in the Eagle Gold mine site substation E-House to the end of the run in the source McQuesten Substation E-House fibre panel.
- Unless otherwise specifically specified otherwise herein, the Contractor shall provide all necessary equipment, labour, material, and testing services as required to provide a complete and operable fibre optic cable system in accordance with these specifications.

- An experienced subcontractor shall be employed for all fibre splicing and testing. This subcontractor shall be named in the Tender and shall meet the approval of the Owner's Representative.

8.2 Methods and Materials

8.2.1 Fittings and Hardware

- Fittings and hardware shall be provided as shown on the drawings and specified herein.
- Terminal and suspension clamps shall be designed to prevent damage to the cable under the most expected severe loading. Suspension clamps shall allow a limited amount of slip if there is a significant amount of differential loading.
- ADSS dampers shall be provided to counteract aeolian vibration as / where shown on the drawings.

8.2.2 Installation Methods

- Two basic installation methods are allowed being:
    1) Moving Drum Method where the cable is pulled directly from the cable drum mounted on a moving vehicle as it drives along the pole line. The cable drum must be mounted on a proper support to allow easy cable pay off.
    2) Stationary Drum Method where the cable is pulled along the cable route through temporary support hardware installed for this purpose.
- In either method, the proper measuring of tension is critical for a safe, damage free, installation of the aerial cable.
- For installation work, temporary support hardware must be selected and placed so as to maintain the cable's minimum bend radius throughout the route and to prevent the cable's entanglement on obstructions in the ROW, etc.
- Note, when long lengths of cable need to be unreeled, there is a danger that the weight of the coils may damage the cable at the bottom. This can be prevented by spreading the cable out into several figure-eight coils.
- The minimum bend radii for both tensioned and un-tensioned conditions shall be as per the cable manufacturer's specification sheet. However, note as a general rule, the minimum bend radius for a cable is as follows (bend radii shall be as per the cable vendor but in no case less than):
    - Cable under load - 20 times the nominal outside diameter of the cable
    - Cable under no load -10 times the nominal outside diameter of the cable

8.2.3 Splices

- Splices shall be made in splice boxes.
- Splice locations shall be placed to allow for the longest possible continuous cable spans and a minimum number of splices. On the other hand, the splice locations should be reasonably accessible. The Contractor shall mark the proposed splice locations on the transmission line drawings and obtain approval from the Owner's Representative before proceeding.
- Splice boxes conforming to IP 55 shall be mounted into the poles approximately 5 m above the ground. The cable shall be suitably fastened to the poles. In each splicing location at least 10 m of free cable must be included for future splicing.

- Splice boxes shall be fitted with suitable cable clamping glands at its base for cable strain relief. Cable entries shall be located on the underside of the splice box and shall be easily removable to ground level. All cable entries used or unused, shall be weather proof and sealed but still accessible for future use and weatherproof sealing. The box shall be suitably dimensioned to accommodate the excess loops of optical fibre associated with each splice.
- All fibre splices shall be of the fusion type. Fusion splicing shall be carried by trained personnel using automatic fusion splicing equipment designed for the fibre type. The accurate alignment of fibre cores, prior to splicing, shall be verified using a technique that monitors the optical power transmitted across the splice interface.
- Fibre splicing shall cause a minimum increase in attenuation. The fibre splicing shall be carried out using arc fusion welding techniques. Each splice shall be inspected and tested, after installation, within the splice housing but before the housing is closed and sealed. Fusion splice optical losses shall average not more than 0.1 dB per splices. No single splice loss shall exceed 0.15 dB.
- Each optical fibre for identification shall be colour coded corresponding to sequential numbering which shall be recorded on as built drawings.
- Fibre length between splices shall be not less than 5 km, so as to avoid undue splice losses.

8.3 Testing

ADSS cable shall be tested in accordance with IEEE Standard 1222:2011 “Testing And Performance For All-Dielectric Self-Supporting (ADSS) Fiber Optic Cable For Use On Electric Utility Power Lines”. Refer to section 6 “Tests and Requirements”. All 24 fibres shall be tested.

Refer also to IEC Standard 60794 (or latest edition) “Basic Optical Cable Test Procedure”.

8.3.1 Field Tests

Field tests shall include:

- Visual inspection of all splices
- Clean and microscope inspection of all connectors
- Measure the optical power (db) loss in each fibre of the cable using a laser source
- Field (acceptance) tests shall be carried out in accordance with the referenced standards
- Field acceptance tests shall also be in accordance with RUS Bulletin 1753-601a “Acceptance Testing” starting on page 38 (bulletin available upon request)

Complete, signed, tests reports shall be provided to the Owner prior to the testing subcontractor leaving site. Electronic and hard copies of the reports shall be provided.

8.4 ADSS Commissioning

The fibre optic cable must be terminated and tested by a specialist company, approved by the Owner.

9 COMMISSIONING

Prior to energization of the transmission line, the Contractor must submit to the Owner’s Representative their commissioning plans for the transmission line.

9.1 Pre-Commissioning

The pre-commissioning work includes all necessary testing and inspection necessary to confirm the line is complete and ready for energization.

The contractor shall:

- Provide final certified copies of all QA / QC documentation including test results.
- Confirm that the length shield conductor at end is properly grounded at each pole and using fall of potential method, measure the combined structure group grounds (to absolute earth) and issue certified report.
- Provide accurate measurements of all as built highway and road crossing clearances, with temperature when each measurement was made.
- Confirm conformance with the requirements of IEEE 1441 *Guide for Inspection of overhead Transmission Line Construction*.
- Patrol line and confirm it is ready and safe for energization and that all phase conductor grounds have been removed.
- With open disconnects at each end of the line, megger (a) each phase of the line phase to ground and (b) between all three phases, with a minimum 5 kV megger and issue report. Certify no grounds on the line and confirm that that the three measurements phase to ground are similar and the three measurements phase to phase are similar.
- Carry out all necessary work as required to ensure the safe energization and operation of the 69 kV line.

The Owner's Representative, shall have the right and opportunity to be present and observe the pre-commissioning Inspections and Tests. Provide adequate notice.

The Contractor shall correct all deficiencies at his cost.

9.2 Commissioning

The line commissioning covers the actual energization of the 69 kV line.

The contractor shall include an allowance in his tender for 2 qualified and certified (in the Yukon) linemen for a total of 40 person hours (20 hours each) to assist the Owner in commissioning. Quote optional per diem rates if additional time required and also quote optional per diem rates for travel time and expenses to the Eagle Gold site, applicable in the event the final commissioning work is to be carried out after substantial completion of the line.

The Contractor's personnel shall:

- Review draft line commissioning switching procedures provided by the Owner's Representative and agree on final procedures. All personnel involved in commissioning to sign off.
- Participate in review of YEC operating orders for the Eagle Gold 69 kV line.
- Agree on lockout procedures for commissioning.
- Agree on communication procedures for commissioning.
- Participate in Job Hazard Analysis (JHA).
- Review and confirm that the McQuesten supply substation and the Eagle Gold receiving substation have both been signed off as complete for ready for line the transmission line commissioning.

9.3 Substantial Completion

Substantial completion occurs when:

- The Project is mechanically, electrically, and structurally constructed in accordance with the drawings and the applicable codes and standards.
- The Project is functionally complete to the extent necessary for initial operation, adjustment, and testing.
- Contractor has provided to Owner all Contractor Deliverables including any and all specified spare materials.
- Clearing is complete and all “danger tress” have been removed.
- The Owner’s Representative has confirmed that any outstanding deficiencies are minor in nature and may be safely completed after “substantial completion” with the line energized.
- Pre-commissioning work is complete.

Although not preferred, Substantial Completion of the fibre optic system may be separated from that of the transmission line and occur at a later date due to coordination and scheduling of connection at station ends and testing with other stakeholders. Contractors should allow for this in their tender pricing.

69 kV TRANSMISSION LINE

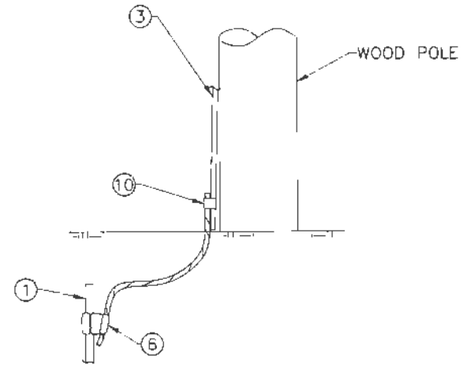
RIGHT OF WAY CROSS SECTION – NEW 69 kV PT STRUCTURE TYPICAL



PROJECT No.	DRAWING No.	REV.
1407	1407-T-5000	0

NOTES:

1. ALL DIMENSIONS ARE IN MILLIMETRES (mm) UNLESS OTHERWISE NOTED.
2. IN HIGHLY CORROSIVE SOILS, ALTERNATIVE GROUNDING SHALL BE SPECIFIED.
3. GROUND WIRE (ITEM 2) SHOULD BE BURIED A MINIMUM OF 300 mm.
4. AFTER THE INSTALLATION OF THE SPECIFIED GROUNDING, THE CONTRACTOR WILL MEASURE THE RESISTANCE-TO-GROUND (THE GROUNDING MUST BE DISCONNECTED FROM THE OVERHEAD SHIELD WIRE). THE GROUNDING ARRANGEMENT AT EACH STRUCTURE SHOULD HAVE A MEASURED SUMMER RESISTANCE OF LESS THAN 35Ω PRIOR TO CONNECTION TO THE OVERHEAD SHIELD WIRE. IF THIS CANNOT BE ACHIEVED, ADDITIONAL COUNTERPOISE OR RODS MAY BE REQUIRED, REFER TO THE ENGINEER Tower footing resistance at McQuesten substation shall be 13 ohms. All 4 ground rods with groundwells are required at each structure at the McQuesten end of the line (RFI-037 rev01)
5. BLASTING IS NOT PERMITTED FOR THE INSTALLATION OF GROUNDING.
6. ALL GROUNDING INSTALLATIONS SHALL BE WITHIN THE BOUNDARY OF THE RIGHT-OF-WAY AND NOT LESS THAN 22 m FROM THE GROUNDING FACILITIES OF THE OTHER CIRCUITS. ANY EXCEPTION REQUIRES PRIOR AUTHORIZATION FROM THE ENGINEER.
7. DO NOT DISTURB SPECIAL STRUCTURE DRAINAGE SYSTEMS IF THEY EXIST.
8. FOR GROUTING GROUND RODS USE SAE CONDUCRETE, ERICO GEM OR EQUIVALENT MIXED IN ACCORDANCE WITH MANUFACTURER'S INSTRUCTIONS.
9. AFTER GROUNDING IS COMPLETED, INSTALL ITEM 7 WITH LOWER EDGE AT GROUND SURFACE. PROVIDE 10 ft (3048 mm) OF CABLE COVER OVER GROUND WIRE.
10. GROUNDWELLS ARE ONLY TO BE INSTALLED AS REQUIRED. REFER TO THE STRUCTURE DATA SHEET FOR GROUNDING TYPE. IF GROUNDWELLS ARE NOT REQUIRED:
    - THE GROUND RODS SHALL BE DRIVEN INTO EARTH SO THAT TOP OF ROD IS AT LEAST 300 mm BELOW GROUND LEVEL, OR,
    - WHERE ROCK IS ENCOUNTERED, REFER TO DETAIL 4.
11. GROUNDWELL INSTALLATION:
    - OPTIONAL 4" (100 mm) DIAMETER STEEL CASING PIPE MAY BE USED TO AUGER OUT THE INTERIOR SOIL/ROCKS, PREVENT CAVE-IN AND PUMP OUT THE UNDERGROUND WATER.
    - ENSURE THE REQUIRED DEPTH IS REACHED. PUMP OUT ANY UNDERGROUND WATER BEFORE INSTALLATION AND BACKFILLING.
    - INSERT THE GROUND ROD CONNECTED WITH THE GROUND WIRE TO THE BOTTOM OF THE HOLE.
    - ONCE THE ROD WITH THE CONNECTED GROUND WIRE IS AT THE REQUIRED DEPTH, POUR IN THE PRE-MIXED SAE CONDUCRETE, ERICO GEM OR SIMILAR (WITH LESS THAN 0.1Ω-m RESISTIVITY) AS PER THE MANUFACTURER'S INSTALLATION INSTRUCTIONS.
12. SINGLE GROUND ROD (SGR) INSTALLATION TO BE INSTALLED AT H-FRAME STRUCTURES WITH STEEL CROSSARMS AND CROSSBRACES WHICH DO NOT HAVE OVERHEAD SHIELD WIRE.

DETAIL 1
MULTIPLE GROUND ROD (MGR)

DETAIL 2
SINGLE GROUND ROD (SGR)

EAGLE GOLD PROJECT
69 kV TRANSMISSION LINE
STANDARD GROUNDING DETAILS (SHEET 2 OF 2)

PROJECT No. 1407
DRAWING No. 1407-T-4450-2
REV. 0

THIS DRAWING IS PROTECTED BY COPYRIGHT LAW AND CANNOT BE REPRODUCED IN ANY MANNER EXCEPT BY WRITTEN PERMISSION OF CLEAN ENERGY CONSULTING INC.

NOTES:

1. ALL DIMENSIONS ARE IN MILLIMETRES (mm) UNLESS OTHERWISE NOTED.
2. IN HIGHLY CORROSIVE SOILS, ALTERNATIVE GROUNDING SHALL BE SPECIFIED.
3. GROUND WIRE (ITEM 2) SHOULD BE BURIED A MINIMUM OF 300 mm.
4. AFTER THE INSTALLATION OF THE SPECIFIED GROUNDING, THE CONTRACTOR WILL MEASURE THE RESISTANCE-TO-GROUND (THE GROUNDING MUST BE DISCONNECTED FROM THE OVERHEAD SHIELD WIRE). THE GROUNDING ARRANGEMENT AT EACH STRUCTURE SHOULD HAVE A MEASURED SUMMER RESISTANCE OF LESS THAN 35Ω PRIOR TO CONNECTION TO THE OVERHEAD SHIELD WIRE. IF THIS CANNOT BE ACHIEVED, ADDITIONAL COUNTERPOISE OR RODS MAY BE REQUIRED, REFER TO THE ENGINEER Tower footing resistance at McQuesten substation shall be 13 ohms. All 4 ground rods with groundwells are required at each structure at the McQuesten end of the line (RFI-037 rev01)
5. BLASTING IS NOT PERMITTED FOR THE INSTALLATION OF GROUNDING.
6. ALL GROUNDING INSTALLATIONS SHALL BE WITHIN THE BOUNDARY OF THE RIGHT-OF-WAY AND NOT LESS THAN 22 m FROM THE GROUNDING FACILITIES OF THE OTHER CIRCUITS. ANY EXCEPTION REQUIRES PRIOR AUTHORIZATION FROM THE ENGINEER.
7. DO NOT DISTURB SPECIAL STRUCTURE DRAINAGE SYSTEMS IF THEY EXIST.
8. FOR GROUTING GROUND RODS USE SAE CONDUCRETE, ERICO GEM OR EQUIVALENT MIXED IN ACCORDANCE WITH MANUFACTURER'S INSTRUCTIONS.
9. AFTER GROUNDING IS COMPLETED, INSTALL ITEM 7 WITH LOWER EDGE AT GROUND SURFACE. PROVIDE 10 ft (3048 mm) OF CABLE COVER OVER GROUND WIRE.
10. GROUNDWELLS ARE ONLY TO BE INSTALLED AS REQUIRED. REFER TO THE STRUCTURE DATA SHEET FOR GROUNDING TYPE. IF GROUNDWELLS ARE NOT REQUIRED:
    - THE GROUND RODS SHALL BE DRIVEN INTO EARTH SO THAT TOP OF ROD IS AT LEAST 300 mm BELOW GROUND LEVEL, OR,
    - WHERE ROCK IS ENCOUNTERED, REFER TO DETAIL 4.
11. GROUNDWELL INSTALLATION:
    - OPTIONAL 4" (100 mm) DIAMETER STEEL CASING PIPE MAY BE USED TO AUGER OUT THE INTERIOR SOIL/ROCKS, PREVENT CAVE-IN AND PUMP OUT THE UNDERGROUND WATER.
    - ENSURE THE REQUIRED DEPTH IS REACHED. PUMP OUT ANY UNDERGROUND WATER BEFORE INSTALLATION AND BACKFILLING.
    - INSERT THE GROUND ROD CONNECTED WITH THE GROUND WIRE TO THE BOTTOM OF THE HOLE.
    - ONCE THE ROD WITH THE CONNECTED GROUND WIRE IS AT THE REQUIRED DEPTH, POUR IN THE PRE-MIXED SAE CONDUCRETE, ERICO GEM OR SIMILAR (WITH LESS THAN 0.1Ω-m RESISTIVITY) AS PER THE MANUFACTURER'S INSTALLATION INSTRUCTIONS.
12. SINGLE GROUND ROD (SGR) INSTALLATION TO BE INSTALLED AT H-FRAME STRUCTURES WITH STEEL CROSSARMS AND CROSSBRACES WHICH DO NOT HAVE OVERHEAD SHIELD WIRE.

EAGLE GOLD PROJECT

69 kV TRANSMISSION LINE

REVERSED INSULATOR DEADEND ASSEMBLY HARDWARE – 70 kN

PROJECT No.	DRAWING No.	REV.
14D7	1407-T-4106	0

BILL OF MATERIAL FOR ONE ASSEMBLY

	ITEM	QTY	UNIT	STOCK NO	DESCRIPTION
	1	1	EA	63186-E6 (SLCN)	SHACKLE, ANCHOR, 19 ø, 27 OPEN, 89 LG, 3/4" ø BOLT 160 kN
63868-E6	2	1	EA	~~63868-E6~~ (SLCN)	CLEVIS, BALL, Y-TYPE, 685 LG, 3/4" ø BOLT, 120 kN
	3	5	EA	N70/146 (SVR)	INSULATOR, SUSPENSION, GLASS, 146 x 254, 70 kN (ANSI-52-3)
SD70S-BNK (HBL)	4	1	EA	~~ASL24-5-BC (MPS)~~	CLAMP, STRAIN ASSEMBLY, c/w SOCKET EYE, 120 kN
	5	1	EA	602046-9 (TYC)	SPLICE, AMPACT
69338-1	6	1	EA	~~69338-1~~ (TYC)	CARTRIDGE, AMPACT, BLUE

NOTES:

1. ALL DIMENSIONS ARE IN MILLIMETRES (mm) UNLESS NOTED OTHERWISE.
2. FOR GENERAL CONSTRUCTION NOTES SEE DWG. NO. 1407-T-1300.
3. STRAIN CLAMP U-BOLT TO BE TIGHTENED TO THE FOLLOWING TORQUES UNLESS OTHERWISE STATED BY THE MANUFACTURER:

   1/2" ø = 50 N.m
   5/8" ø = 100 N.m
4. TAIL MUST BE ORIENTED TOWARDS THE JUMPER CLAMP OR THE NEXT CLAMP.
5. APPROXIMATE ASSEMBLY MASS = 28 kg.
6. ALL FERROUS METAL COMPONENTS SHALL SATISFY CHARPY LEVEL 2 REQUIREMENTS PER CSA C96.3.

19	1	EA	–	GROUNDING DETAILS (DWG. 1407–T–4450)

NOTES:

1. ALL DIMENSIONS ARE IN MILLIMETRES (mm) UNLESS NOTED OTHERWISE.
2. FOR GENERAL CONSTRUCTION NOTES SEE DWG. NO. 1407–T–1300.
3. FOR GUY AND ANCHOR QUANTITIES AND CONFIGURATION SEE STRUCTURE DATA SHEET.
4. FOR SITE–SPECIFIC ADSS SPACING SEE STRUCTURE DATA SHEET.
5. FOR STRUCTURES WITH LINE ANGLES LESS THAN 45°, USE VDEMAO POST INSULATOR ARRANGEMENT (DWG. 1407–T–3056).
6. STRUCTURE TYPE DESIGNATION CODES:

   VDEHAO – VERTICAL DEADEND HEAVY ANGLE WITH OHSW, 45°–90°
7. CONTRACTOR TO CONFIRM BOLT LENGTHS PRIOR TO PROCUREMENT AND CONSTRUCTION. BOLT LENGTHS SHOWN ARE FOR CLASS 1 POLES. FOR H1 AND H2 POLES ADD 2".
8. CABLE COVER TO BE INSTALLED ON POLE AS PER DWG. 1407–T–4450.
9. PARTRIDGE ACSR GROUND WIRE TO BE INSTALLED DOWN TO BASE OF POLE WITH STAPLES.

J7340 (MPS) 1	A.R.	EA	~~64537 (SLCN)~~	ROD, ANCHOR, TRIPLE EYE, 1" Ø x 3050 LG w/ SQUARE NUT (150 kN)
J3524 (MPS) 2	A.R.	EA	~~X246 (NBL)~~	PLATE ANCHOR

AS-BUILT

CHANGES REQUIRED YES ☐ NO ☐

Name (Print) _____

Signature _____

Date _____

NOTES:

1. ALL DIMENSIONS ARE IN MILLIMETRES (mm) UNLESS OTHERWISE NOTED.
2. ANCHOR ROD MUST BE ALIGNED WITH GUY (TOLERANCE ±3°) AND SHALL BE PLACED IN MINIMUM WIDTH SLOTTED TRENCH.
3. ALL BACKFILL MATERIAL TO BE NON-FROST SUSCEPTIBLE 20 mm CRUSHED GRAVEL PER CONSTRUCTION SPECIFICATIONS UNLESS QUALIFIED PERSON ON SITE DICTATES NATIVE BACKFILL.
4. BACKFILL TO BE PLACED IN MAXIMUM 300 mm LIFTS AND COMPACTED BY MECHANICAL MEANS.
5. FILL SHALL BE COMPACTED TO A "DENSE" CONDITION. THIS "DENSE" CONDITION IS REACHED IF IT IS NOT POSSIBLE FOR A MAN OF AVERAGE WEIGHT TO PUSH A WOODEN PICKET MORE THAN 40 MM IN TO THE SOIL. THE PICKET SHALL BE 50 MM x 50 MM WITH THE PENETRATION END BEVELED AT 45° ON ALL FOUR SIDES.
6. BACKFILL GRADATION AND INSTALLATION RECORDS MUST BE MAINTAINED AND PROVIDED BY THE INSTALLATION CONTRACTOR AS A PART OF QUALITY CONTROL DOCUMENTATION.

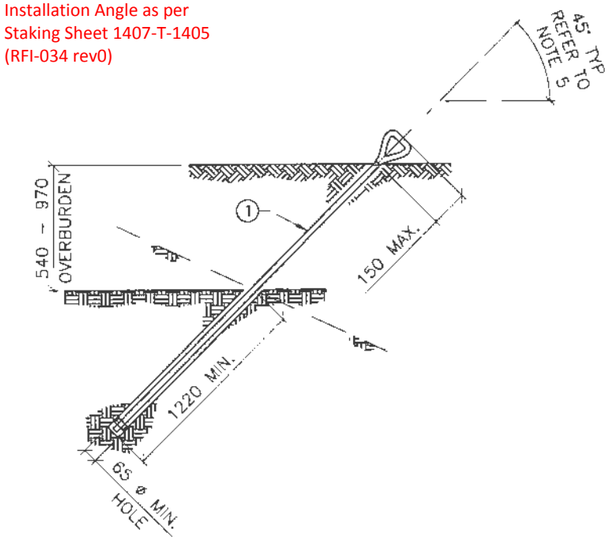
BILL OF MATERIAL FOR ONE ASSEMBLY

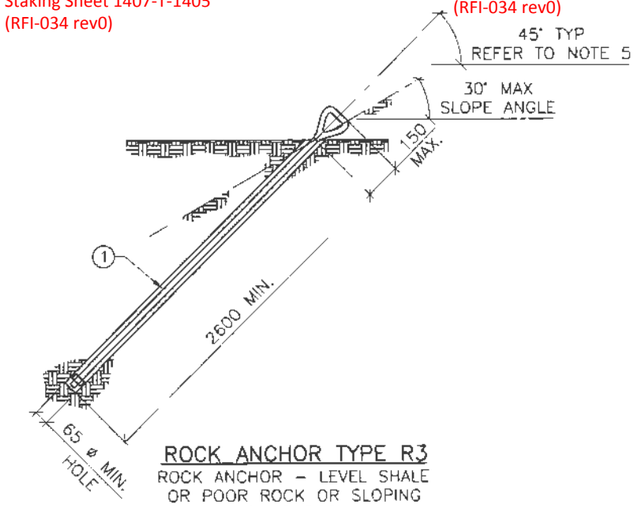
ITEM	QTY	UNIT	STOCK NO	DESCRIPTION
1	A.R.	EA	~~64536 (SLCA)~~ J7340 (MPS)	ROD, ANCHOR, TRIPLE EYE, 1" Ø x 2750 LG w/ NUT (160 kN)
2	A.R.	EA	990417GR94R (TDR)	ROD, ANCHOR, TRIPLE EYE, 1" Ø x 1370 LG w/ NUT (160 kN)



NOTES:

1. ALL DIMENSIONS ARE IN MILLIMETRES (mm) UNLESS OTHERWISE NOTED.
2. ALL ROCK ANCHORS SHALL BE GROUTED USING AN APPROVED NON-SHRINK GROUT MIXED, PLACED, AND CURED IN ACCORDANCE WITH MANUFACTURER'S INSTRUCTIONS AND SHALL HAVE A MINIMUM COMPRESSIVE STRENGTH OF 25 MPa AT 28 DAYS.
3. COLD WEATHER GROUTING PROCEDURES SHALL BE SUBMITTED FOR ENGINEERS APPROVAL PRIOR TO APPLICATION.
4. ROCK ANCHOR TYPE R1 AND R2 ARE SUITABLE FOR A SAFE WORKING LOAD OF 56 kN (12,500 lbs) AT 45°. ROCK ANCHOR TYPE R3 IS SUITABLE FOR A SAFE WORKING LOAD OF 80 kN (18,000 lbs) AT 45°.
5. MAXIMUM GROUND SLOPE FOR ONE EXTENSION IS 21°, AND 30° FOR TWO EXTENSIONS.
6. ROCK ANCHOR EMBEDMENT LENGTH TO BE INCREASED WHERE REQUIRED SO ANCHOR ROD PROJECTION IS NO MORE THAN 150 mm FROM THE SOIL SURFACE AFTER BACKFILL.
7. ALL MULTI-GUY ANCHORS TO BE TYPE R3.

ROCK ANCHOR TYPE R1
ROCK ANCHOR – LEVEL ROCK OR SLOPED AS SHOWN.



Installation Angle as per Staking Sheet 1407-T-1405 (RFI-034 rev0)

ROCK ANCHOR TYPE R2
ROCK ANCHOR WITH OVERBURDEN
LEVEL ROCK OR SLOPED AS SHOWN.

Installation Angle as per Staking Sheet 1407-T-1405 (RFI-034 rev0)

Installation Angle as per Staking Sheet 1407-T-1405 (RFI-034 rev0)

ROCK ANCHOR TYPE R3
ROCK ANCHOR – LEVEL SHALE OR POOR ROCK OR SLOPING SOUND ROCK.

	5	A.R.	2247P (HBL)	COUPLER, ANCHOR ROD, 1" ø (160 kN)

STANDARD LOG ANCHOR
TYPE E1

Installation Angle as per Staking Sheet 1407-T-1405 (RFI-034 rev0)

NOTES:

1. ALL DIMENSIONS ARE IN MILLIMETRES (mm) UNLESS OTHERWISE NOTED.
2. ANCHOR LOGS SHALL BE SET HORIZONTALLY WITH THEIR AXIS PERPENDICULAR TO THE GUY DIRECTION.
3. ANCHOR ROD SHALL BE ALIGNED WITH GUY (TOLERANCE ±3°) AND, FOR EARTH ANCHOR, SHALL BE PLACED IN MINIMUM WIDTH SLOTTED TRENCH.
4. ALL BACKFILL MATERIAL TO BE NON-FROST SUSCEPTIBLE 20 mm CRUSHED GRAVEL PER CONSTRUCTION SPECIFICATIONS UNLESS QUALIFIED PERSON ON SITE DICTATES NATIVE BACKFILL IS ACCEPTABLE.
5. BACKFILL SHALL BE PLACED IN 300 mm LIFTS AND SHALL BE COMPACTED BETWEEN LIFTS WITH A MINIMUM OF 2 PASSES WITH A MECHANICAL TAMPER.
6. LOG ANCHORS ARE SUITABLE FOR A WORKING LOAD OF 80 kN (18,000 LBS.) AT 45°.
7. FOR A GUY ANGLE OF LESS THAN 45°, THE EARTH ANCHOR IS TO BE BURIED DEEPER SO THAT THE ANCHOR ROD PROTRUDES NO MORE THAN 150 mm FROM THE SOIL SURFACE.
8. FILL SHALL BE COMPACTED TO A "DENSE" CONDITION. THIS "DENSE" CONDITION IS REACHED IF IT IS NOT POSSIBLE FOR A MAN OF AVERAGE WEIGHT TO PUSH A WOODEN PICKET MORE THAN 40 MM IN TO THE SOIL. THE PICKET SHALL BE 50 MM x 50 MM WITH THE PENETRATION END BEVELED AT 45° ON ALL FOUR SIDES.

BILL OF MATERIAL FOR ONE STRUCTURE

ITEM	QTY	HU	STOCK NO.	DESCRIPTION
1	EA	EA	AS PER DATA SHEET	POLE BEARING PLATE ASSEMBLY

NOTES:

1. ALL DIMENSIONS ARE IN MILLIMETRES (mm) UNLESS OTHERWISE NOTED.
2. GCMP BACKFILL MATERIAL TO BE NON–FROST SUSCEPTABLE 20 mm CRUSHED GRAVEL MATERIAL AS PER PROJECT CONSTRUCTION SPECIFICATIONS. ALTERNATE MATERIALS ARE SUBJECT TO ENGINEERS APPROVAL.
3. BACKFILL TO BE PLACED IN MAXIMUM 300 mm LIFTS AND COMPACTED BY MECHANICAL MEANS.
4. FILL SHALL BE COMPACTED TO A "DENSE" CONDITION. THIS "DENSE" CONDITION IS REACHED IF IT IS NOT POSSIBLE FOR A MAN OF AVERAGE WEIGHT TO PUSH A WOODEN PICKET MORE THAN 40 MM IN TO THE SOIL. THE PIOKET SHALL BE 50 MM x 50 MM WITH THE PENETRATION END BEVELED AT 45° ON ALL FOUR SIDES.
5. BACKFILL GRADATION AND INSTALLATION RECORDS MUST BE MAINTAINED AND PROVIDED BY THE INSTALLATION CONTRACTOR AS A PART OF QUALITY CONTROL DOCUMENTATION.
6. ALL STRUCTURES SET IN PERMAFROST SHOULD BE INSPECTED ANNUALLY AS A MINIMUM. STRUCTURES MAY REQUIRE STRAIGHTENING AND/OR ANCHOR TENSIONS ADJUSTED AS A RESULT OF SEASONAL GROUND MOVEMENTS.
7. PRIOR TO USING THIS DETAIL, CONTRACTOR MUST RECEIVE APPROVAL FROM DESIGN ENGINEER AT EACH LOCATION.
8. STRUCTURES IN SWAMPY OR WETLAND AREAS MUST BE INSTALLED WHEN GROUND IS FROZEN.
9. OWNER'S REPRESENTATIVE TO BE PRESENT DURING GCMP INSTALLATION. FINAL SETTING DEPTH TO BE REVIEWED PRIOR TO PROCEEDING WITH POLE INSTALLATION TO ENSURE THAT MINIMUM GROUND CLEARANCES ARE ACHIEVED.

NOTES:

1. ALL DIMENSIONS ARE IN METRES (m) UNLESS OTHERWISE NOTED.
2. FOR ROCK HOLE WITH OVERBURDEN ADD DEPTH OF OVERBURDEN (B) TO ROCK (R2) FOR TOTAL SETTING DEPTH.
3. IN ROCK THE MINIMUM DIAMETER OF THE HOLE IS POLE BUTT DIAMETER + 200 mm AND THE MAXIMUM IS POLE BUTT DIAMETER x 2. IF THE HOLE DIAMETER IS MORE THAN THE MAXIMUM, USE THE EARTH SETTING DEPTH.
4. DEPTH OF HOLE IN SLOPING GROUND SHALL BE MEASURED FROM LOWER SIDE OF HOLE.
5. ANY DEVIATIONS TO SPECIFIC STRUCTURE POLE SETTING DEPTHS WILL BE INDICATED ON PROJECT STRUCTURE DATA SHEETS.

POLE SET IN EARTH (E) OR ROCK (R1)

POLE SET IN ROCK (R2) WITH OVERBURDEN (B)

PROFESSIONAL ENGINEER — TERRITORY OF YUKON — A. P.N. CLARK — 22-Nov-2018

NOTES

1. All spans must be installed to the sag values provided. Tension values are provided as a reference only.
2. Sag and tension values shown are for new conductor under initial conditions based on the ruling span method.
3. For conductors left hanging in sheaves for longer than 3 hours between initial stringing and final sag, a creep correction factor must be applied.
4. All span lengths and sag values are provided in metres unless otherwise noted.
5. Conductors and cables:
   - Overhead Shieldwire (OHSW): Partridge ACSR
   - 69kV Transmission Line: Partridge ACSR
   - ADSS: OFC-24G.652D-FASA-S1
6. The minimum ambient temperature for pulling ADSS cable is -30°C. ADSS cable shall not be pulled at temperatures below this minimum temperature.

SAG AND TENSION

CIRCUIT	VICTORIA GOLD 69kV
DOCUMENT	1407-T-1450
DATE	22-Nov-18
REVISION	1
ISSUED FOR	CONSTRUCTION
PREPARED BY	MP
CHECKED BY	PC
APPROVED BY	PC

ENGINEER'S SEAL
PROFESSIONAL ENGINEER YUKON A. P. N. CLARK TERRITORY 22-Nov-2018

NOTES
1. All spans must be installed to the sag values provided. Tension values are provided as a reference only.
2. Sag and tension values shown are for new conductor under initial conditions based on the ruling span method.
3. For conductors left hanging in sheaves for longer than 3 hours between initial stringing and final sag, a creep correction factor must be applied.
4. All span lengths and sag values are provided in metres unless otherwise noted.
5. Conductors and cables:
   - Overhead Shieldwire (OHSW): Partridge ACSR
   - 69kV Transmission Line: Partridge ACSR
   - ADSS: OFC-24G.652D-FASA-S1
6. The minimum ambient temperature for pulling ADSS cable is -30°C. ADSS cable shall not be pulled at temperatures below this minimum temperature.

SAG AND TENSION

CIRCUIT	VICTORIA GOLD 69kV
DOCUMENT	1407-T-1450
DATE	22-Nov-18
REVISION	1
ISSUED FOR	CONSTRUCTION
PREPARED BY	MP
CHECKED BY	PC
APPROVED BY	PC

ENGINEER'S SEAL

PROFESSIONAL ENGINEER YUKON A. P. N. CLARK TERRITORIAL

22-Nov-2018

NOTES

1. All spans must be installed to the sag values provided. Tension values are provided as a reference only.
2. Sag and tension values shown are for new conductor under initial conditions based on the ruling span method.
3. For conductors left hanging in sheaves for longer than 3 hours between initial stringing and final sag, a creep correction factor must be applied.
4. All span lengths and sag values are provided in metres unless otherwise noted.
5. Conductors and cables:
   - Overhead Shieldwire (OHSW): Partridge ACSR
   - 69kV Transmission Line: Partridge ACSR
   - ADSS: OFC-24G.652D-FASA-S1
6. The minimum ambient temperature for pulling ADSS cable is -30°C. ADSS cable shall not be pulled at temperatures below this minimum temperature.

APPROVED BY	PC

ENGINEER'S SEAL

PROFESSIONAL ENGINEER — P. N. CLARK — TERRITORY OF YUKON — 22-Nov-2018

NOTES

1. All spans must be installed to the sag values provided. Tension values are provided as a reference only.
2. Sag and tension values shown are for new conductor under initial conditions based on the ruling span method.
3. For conductors left hanging in sheaves for longer than 3 hours between initial stringing and final sag, a creep correction factor must be applied
4. All span lengths and sag values are provided in metres unless otherwise noted.
5. Conductors and cables:
   - Overhead Shieldwire (OHSW): Partridge ACSR
   - 69kV Transmission Line: Partridge ACSR
   - ADSS: OFC-24G.652D-FASA-S1
6. The minimum ambient temperature for pulling ADSS cable is -30°C. ADSS cable shall not be pulled at temperatures below this minimum temperature.

SAG AND TENSION

CIRCUIT	VICTORIA GOLD 69kV
DOCUMENT	1407-T-1450
DATE	22-Nov-18
REVISION	1
ISSUED FOR	CONSTRUCTION
PREPARED BY	MP
CHECKED BY	PC
APPROVED BY	PC

ENGINEER'S SEAL
PROFESSIONAL ENGINEER YUKON A. P. N. CLARK TERRITORY
22-Nov-2018

NOTES
1. All spans must be installed to the sag values provided. Tension values are provided as a reference only.
2. Sag and tension values shown are for new conductor under initial conditions based on the ruling span method.
3. For conductors left hanging in sheaves for longer than 3 hours between initial stringing and final sag, a creep correction factor must be applied.
4. All span lengths and sag values are provided in metres unless otherwise noted.
5. Conductors and cables:
   - Overhead Shieldwire (OHSW): Partridge ACSR
   - 69kV Transmission Line: Partridge ACSR
   - ADSS: OFC-24G.652D-FASA-S1
6. The minimum ambient temperature for pulling ADSS cable is -30°C. ADSS cable shall not be pulled at temperatures below this minimum temperature.

ENGINEER'S SEAL

PROFESSIONAL ENGINEER YUKON A. P. N. CLARK TERRITORY 22-Nov-2018

NOTES
1. All spans must be installed to the sag values provided. Tension values are provided as a reference only.
2. Sag and tension values shown are for new conductor under initial conditions based on the ruling span method.
3. For conductors left hanging in sheaves for longer than 3 hours between initial stringing and final sag, a creep correction factor must be applied.
4. All span lengths and sag values are provided in metres unless otherwise noted.
5. Conductors and cables:
   - Overhead Shieldwire (OHSW): Partridge ACSR
   - 69kV Transmission Line: Partridge ACSR
   - ADSS: OFC-24G.652D-FASA-S1
6. The minimum ambient temperature for pulling ADSS cable is -30°C. ADSS cable shall not be pulled at temperatures below this minimum temperature.

Clean Energy CONSULTING INC

A. P. N. CLARK
TERRITORY
22-Nov-2018

NOTES
1. All spans must be installed to the sag values provided. Tension values are provided as a reference only.
2. Sag and tension values shown are for new conductor under initial conditions based on the ruling span method.
3. For conductors left hanging in sheaves for longer than 3 hours between initial stringing and final sag, a creep correction factor must be applied.
4. All span lengths and sag values are provided in metres unless otherwise noted.
5. Conductors and cables:
   - Overhead Shieldwire (OHSW): Partridge ACSR
   - 69kV Transmission Line: Partridge ACSR
   - ADSS: OFC-24G.6S2D-FASA-S1
6. The minimum ambient temperature for pulling ADSS cable is -30°C. ADSS cable shall not be pulled at temperatures below this minimum temperature.

SAG AND TENSION

CIRCUIT	VICTORIA GOLD 69kV
DOCUMENT	1407-T-1450
DATE	22-Nov-18
REVISION	1
ISSUED FOR	CONSTRUCTION
PREPARED BY	MP
CHECKED BY	PC
APPROVED BY	PC

ENGINEER'S SEAL
PROFESSIONAL ENGINEER
YUKON
A. P. N. CLARK
TERRITORY
22-Nov-2018

NOTES
1. All spans must be installed to the sag values provided. Tension values are provided as a reference only.
2. Sag and tension values shown are for new conductor under initial conditions based on the ruling span method.
3. For conductors left hanging in sheaves for longer than 3 hours between initial stringing and final sag, a creep correction factor must be applied.
4. All span lengths and sag values are provided in metres unless otherwise noted.
5. Conductors and cables:
   - Overhead Shieldwire (OHSW): Partridge ACSR
   - 69kV Transmission Line: Partridge ACSR
   - ADSS: OFC-24G.652D-FASA-S1
6. The minimum ambient temperature for pulling ADSS cable is -30°C. ADSS cable shall not be pulled at temperatures below this minimum temperature.

SAG AND TENSION

CIRCUIT	VICTORIA GOLD 69kV
DOCUMENT	1407-T-1450
DATE	22-Nov-18
REVISION	1
ISSUED FOR	CONSTRUCTION
PREPARED BY	MP
CHECKED BY	PC
APPROVED BY	PC

ENGINEER'S SEAL

NOTES
1. All spans must be installed to the sag values provided. Tension values are provided as a reference only.
2. Sag and tension values shown are for new conductor under initial conditions based on the ruling span method.
3. For conductors left hanging in sheaves for longer than 3 hours between initial stringing and final sag, a creep correction factor must be applied.
4. All span lengths and sag values are provided in metres unless otherwise noted.
5. Conductors and cables:
   - Overhead Shieldwire (OHSW): Partridge ACSR
   - 69kV Transmission Line: Partridge ACSR
   - ADSS: OFC-24G.652D-FASA-S1
6. The minimum ambient temperature for pulling ADSS cable is -30°C. ADSS cable shall not be pulled at temperatures below this minimum temperature.
