2018 ANNUAL REPORT

Version 2019-01

MARCH 2019

THIS PAGE INTENTIONALLY LEFT BLANK

TABLE OF CONTENTS

1 Introduction 1

2 Site Activities 4

2.1 Overview of Construction 4

2.1.1 Summary of Construction Activities 4

2.1.1.1 Mine Equipment Assembly 8

2.1.1.2 Camp Complex Phase 2 8

2.1.1.3 Water Management Infrastructure 9

2.1.1.4 Erosion and Sediment Control 10

2.1.1.5 Site Road and Pads 11

2.1.1.6 Process Plant Area 11

2.1.1.7 Crushing Circuit 14

2.1.1.8 Overland Conveyor 20

2.1.1.9 Explosives Storage Area 21

2.1.1.10 Heap Leach Facility 22

2.1.1.11 Access Road Upgrades 25

2.1.1.12 Power Supply 27

2.1.1.13 Ancillary Facilities 29

2.2 Overview of Mining 34

2.2.1 Ore, Waste and Gold Production 34

2.2.2 Reserve and Mine Life Update 36

2.3 Proposed Development & Production in 2019 38

2.3.1 Construction 38

2.3.2 Commissioning and Operation 43

2.4 Description of Water Use and Deposit of Waste 44

2.4.1 Description of Water Use 44

2.4.2 Deposit of Waste 46

3 Environmental Monitoring 47

3.1 Surface Water Hydrology 47

3.1.1 Surface Water Hydrology Monitoring 49

3.1.2 Site QA/QC Programs 51

3.1.2.1 Stage Measurements and Corrections 51

3.1.2.2 Rating Curve Error 51

3.1.3 Adaptive Management 52

3.2 Surface Water Quality 52

3.2.1 Surface Water Quality Monitoring 52

3.2.1.1 2018 Construction Monitoring Program 53
3.2.2 Water Quality Results 54
3.2.2.1 TSS 55
3.2.2.2 Trace Elements 56
3.2.2.3 Dublin Gulch Drainage 56
3.2.2.4 Eagle Creek 63
3.2.2.5 Haggart Creek 67
3.2.2.6 Lynx Creek and South McQuesten River 72
3.2.3 Quality Assurance and Quality Control Program 77
3.2.3.1 Field Blanks 77
3.2.3.2 Travel Blanks 78
3.2.3.3 Field Duplicates 78
3.2.3.4 Analytical QA/QC - Elemental Analysis Quality 78
3.2.4 Discharge Compliance - Water Quality 78
3.2.5 Water Balance and Water Quality Modeling 78
3.2.5.1 HLF Water Balance Model Integration 81
3.2.5.2 Results 81
3.3 Groundwater 82
3.3.1 Groundwater Quantity Monitoring 84
3.3.2 Groundwater Quality Monitoring 86
3.3.3 Well Decommissioning 92
3.3.4 Adaptive Management 92
3.4 Geochemical Monitoring 94
3.4.1 Geochemical Barrel Testing 94
3.4.2 Waste Rock / Acid-Base Accounting 95
3.4.3 Construction Material Testing 95
3.5 Aquatic Environment 96
3.5.1 Stream Sediment 96
3.5.2 Benthic Macroinvertebrates 100
3.5.3 Fish and Fish Habitat 100
3.7 Meteorology and Air Quality Monitoring 103
3.7.1 Climate Monitoring 103
3.7.2 Air Quality Monitoring 103
3.8 Terrestrial 104
3.8.1 Vegetation Monitoring Program 104
3.8.2 Soils 105
3.8.3 Wildlife 106
3.8.3.1 Pre-Clearing Wildlife Surveys 106

3.8.3.2 Wildlife Incidents 106
3.8.3.3 Annual Moose Survey 106
3.9 Noise 108
3.9.1 Sounds Levels Related to Blasting 108
3.10 Spills and Accidents 108
3.10.1 Spill Contingency Plan Review 108
3.10.2 Reportable Summary 109
3.11 Traffic and Access, Upcoming Maintenance 110
3.11.1 Level of Traffic 110
3.11.2 Access Control Issues 110
3.11.3 Incidents 110
3.11.4 Planned Access Road Work 111

4 Physical Monitoring 112
4.1 Stability Incidents 112
4.2 Engineer's Physical Stability Annual Inspection 114
4.3 Permafrost 117
4.3.1 Data Analysis 117
4.4 Open Pit 120
4.5 Material Storage And Stockpile Management Areas 120
4.7 Heap Leach And Process Facilities 122

5 Cyanide Management 123

6 Reclamation & Closure 124
6.1 Reclamation Research 124

7 Socio-Economic Monitoring 125

1 INTRODUCTION

StrataGold Corporation (SGC), a directly held-wholly owned subsidiary of Victoria Gold Corp., has proposed to construct, operate, close and reclaim a gold mine in central Yukon. The Eagle Gold Project ('the Project') is located 85 km from Mayo Yukon using existing highway and access roads (Figure 1.1-1). The Project will involve open pit mining and gold extraction using a three-stage crushing process, heap leaching, and a carbon adsorption, desorption, and recovery system over the mine life (Figure 1.1-2).

The Project is being operated in accordance with the terms of the Type A Water Use Licence (WUL) QZ14-041 and the Quartz Mining License (QML) QML-0011. The reporting period for this Annual Report is from January 1 to December 31, 2018 and serves to report on both WUL and QML conditions and associated management plans. The specific requirements for the Annual Report as outlined in the respective licences are summarized in Appendix A.

On July 14, 2017, SGC provided written notice of its intent to commence works on Phase I of the Project construction program on August 15, 2017, as required by Clause 23 of the WUL, and Paragraph 3.2 of the QML. Construction work continued through 2018, including:

- Partial Lower Dublin South Pond construction including completing embankment, spillway and installing liner;
- Project access road upgrades to improve safety;
- Advancement of Project engineering and design;
- Enlargement of camp to full construction phase capacity.
- Continued clearing, grubbing and grading for site infrastructure.
- Upgrade of existing site roads by widening and grading to provide access to construction areas, and construction of temporary construction trails and site roads.
- Transmission line work from Silver Trail tap point (the South McQuesten Substation) to site including clearing and grubbing of right of way (RoW), assembly and installation of structures, and stringing the 69kV conductor.
- Beginning construction of the site sub-station and the site electrical distribution system.
- Heap Leach Facility (HLF) Phase I Construction, including development of the HLF confining embankment, Phase 1 liner placement and heap leach piping installation.
- Partial erections of buildings including crushing and screening plant, Adsorption, Desorption and Recovery (ADR) Plant and the Overland Conveying System.

2 SITE ACTIVITIES

Work on the Project during the period of this report included facility construction only. No activities related to Production or the Production Phase of the Project were undertaken. The general arrangement of the Project relative to drone imagery captured in late October 2018 is provided in Figure 2.1-1. Appendix B provides as built designs, status reports, and quality assurance and quality control records for the facilities discussed within this Section 2.

2.1 OVERVIEW OF CONSTRUCTION

2.1.1 Summary of Construction Activities

By the end of 2018 mine construction was estimated at 60% complete and remained on track for delivery of first gold in H2 2019. Earthworks required for the first year of mining in 2019 were substantially complete, concrete works were 93% complete, structural steel was 32% complete, and mechanical contractors were mobilized to site to support installation activities in the ADR Plant and in the secondary and tertiary crushing facility. Approximately 950,000 construction hours were expended during 2018. Table 2.1-1 depicts specific construction activities conducted during each month of 2018.

2.1.1.1 Mine Equipment Assembly

Primary mobile mining equipment required for the Production Phase of the Project was delivered to site in Q3 2018. Two CAT 6040 front shovels, 11 CAT 785 haul trucks and the two 200mm rotary drills were assembled and commissioned.

2.1.1.2 Camp Complex Phase 2

All major components of the camp complex required for the full construction team were installed and made operational in 2018. The work undertaken included the mobilization and connection of additional dorm units, drilling and commissioning of a backup potable water supply well, installation and commissioning of the potable water treatment plant, expansion of the septic system, and the installation of the Emergency Response Team foldaway building. The only remaining activity related to the camp complex is the installation of the mine dry to support the Production Phase team.

The arrangement of the Camp Complex at October 15, 2018 is provided in Photo 2.1-1.

Photo 2.1-1: Camp Complex at October 15, 2018

2.1.1.3 Water Management Infrastructure

Construction activities related to the Lower Dublin South Pond (LDSP) and Ditches A and B continued in 2018. Ditches A and B excavation and rip rap armoring installation began. Final ditch completion, including construction of the inlets into the LDSP is scheduled for March 2019. To support water management for the Production Phase of the Project, HDPE pipe was procured with fusing and installation planned for Q1 2019. The work will include final completion and tie-in of the ditches to the LDSP. The status of the LDSP in early fall 2018 is depicted in Photo 2.1-2, and the construction of a lower reach of Ditch A during late October 2018 is shown in Photo 2.1-3.

Photo 2.1-2: Lower Dublin South Pond at September 28, 2018

Photo 2.1-3: Ditch A Excavation - October 30, 2018

2.1.1.4 Erosion and Sediment Control

Through 2018, earthworks and construction activities were supported by the implementation of sediment and erosion control measures. Measures taken were in accordance with Section 6.2 of the Project's *Construction and Operations Water Management Plan*, and included:

- Proper staging of construction activities to mitigate erosion and the potential entrainment of sediment.
- Slope stabilization and channel protection as necessary in the sediment basins, ditches, and unstable disturbed slopes and surfaces.
- Installation of silt fences downslope of construction areas and/or material stockpiles to prevent sediment migration downslope.
- Construction of sediment basins and exfiltration basins in key areas to accept collected runoff and groundwater seepage as needed.
- Construction of diversion ditches on site to channel non-contact water away from the construction areas.
- Daily monitoring of construction activities by environmental department staff and EPCM contractors, with a focus on recently disturbed sites following precipitation events; and
- Maintenance and repair of erosion and sediment control infrastructure as required.

Figure 2.1-2 depicts the locations of site infrastructure used to control runoff and erosion and provide for sediment control.

2.1.1.5 Site Road and Pads

Clearing, grubbing and grading for site roads and pads to support construction work areas continued in 2018. Site roads for accessing the HLF, Events Pond, ADR Plant, crushing facilities, reclamation stockpiles, waste management facility, substation, open pit and explosives storage areas were completed during the year. Laydown pads were primarily completed in 2017 with minor additional work undertaken in 2018 to maintain the existing areas. Figure 2.1-1 provides an overview of all site construction infrastructure and facilities including site roads and pads.

Laydown and facility pads were largely completed in 2018 with the exception of the Production Phase explosives storage area pads.

2.1.1.6 Process Plant Area

The ADR plant pad was fully cleared and excavated to final grades in mid-2018 (Photo 2.1-4). In the immediate location of the ADR Plant, the HDPE liner was installed and backfilled which then allowed for concrete installations and the erection of the pre-engineered building (Photos 2.1-5, 2.1-6 and 2.1-7).

By the end of the reporting period, wall and roof cladding, the overhead cranes, structural steel, utility supports, carbon columns and screens, and interior architecture were completed (Photo 2.1-8).

Photo 2.1-7: ADR Plant Exterior Cladding at October 13, 2018

Photo 2.1-8: ADR Pad and Building at November 15, 2018

2.1.1.7 Crushing Circuit

During the period described in this report, substantial progress was made on the crushing circuit with facility pad development, concrete installations, structural steel and mechanical rough setting all taking place. Photos 2.1-9 to 2.1-19 depict the crushing facility construction stages through 2018, beginning with initial clearing and grubbing, pad development, concrete foundation pouring to building erection.

Photo 2.1-9: Primary Crusher Pad Clear and Grub at April 16, 2018

Photo 2.1-19: Primary Crusher Progress - December 7, 2018

2.1.1.8 Overland Conveyor

The area of the overland conveyor was cleared grubbed and graded in preparation for structure installations in early 2019 (Photos 2.1-20 to 2.1-22).

Photo 2.1-20: Clearing and Grubbing for Overland Conveyor and Ore Preparation Pad - August 30, 2018

Photo 2.1-21: Overland Conveyor Grading - October 9, 2018

Photo 2.1-22: Overland Conveyor Grading - November 12, 2018

2.1.1.9 Explosives Storage Area

In the later part of 2018, clearing, grubbing and preliminary grading was undertaken of the service road to the proposed ammonium nitrate and emulsion storage area and the service road to this location (Photo 2.1-23).

Photo 2.1-23: AN Road Development - October 2, 2018

2.1.1.10 Heap Leach Facility

Clearing and grubbing in the area of the HLF embankment, In-Heap pond area and Events Pond continued in 2018 to support final construction and operation of these facilities in H2 2019 (Photos 2.1-24 and 2.1-25). The program continued with foundation preparation activities (including installation of the underdrain system) and advanced to foundation works for the embankment and fill placement (Photos 2.1-26 to 2.1-29). Liner placement was undertaken within certain areas of the HLF.

Photo 2.1-29: HLF West Bank Clearing - December 12, 2018

2.1.1.11 Access Road Upgrades

General maintenance and upgrade activities on the site access road continued during the period of this report. The major works undertaken during 2018 was the replacement of the culvert crossing at Swede Creek. The

culvert replacement began in late April (Photo 2.1-30) and was completed in early May (Photos 2.1-31 and 2.1-32).

Photo 2.1-31: Rip Rap Placement on Swede Creek - May 3, 2018

Photo 2.1-32: Swede Creek Culvert Inlet - May 10, 2018

2.1.1.12 Power Supply

Construction of the transmission line was substantially completed in 2018 with vegetation clearing, foundation and civil work, assembly and installation or structures and stringing of the 69kV line undertaken during the reporting period (Photos 2.1-33 to 2.1-36).

Final works to prepare the line for energizations are expected to be finalized in Q1 2019.

Photo 2.1-35: Transmission Right of Way Vegetation Management - October 24, 2018

Photo 2.1-36: H-Frame Structure at South McQuesten River - January 1, 2019

2.1.1.13 Ancillary Facilities

Various ancillary facilities and structures were constructed during the period of this report including warehouses (Photos 2.1-37 and 2.1-38), fuel storage and distribution, and waste management facilities (Photos 2.1-39 and 2.1-40).

Photo 2.1-37: Warehouse Installation - September 5, 2018

2.2 OVERVIEW OF MINING

No mining or production activities authorized by the Type A WUL QZ14-041 nor the QML-0011 has taken place. Mining or production activities are scheduled to commence in 2019.

During operations, the open pit will be developed using standard drill and blast technology. Ore will be transported from the open pit by haul truck and delivered to the first stage crushing plant (the primary crusher), situated on the north side of the open pit rim. Waste rock will be removed from the open pit by haul truck and delivered to one of two WRSAs (Platinum Gulch or Eagle Pup WRSAs) or will be used as haul road and infrastructure construction material.

Ore will be crushed to a passing 80 percent (P80) particle size of 6.4 mm in a 3-stage crushing process. All three crushing stages will be located north of the open pit. Ore will be conveyed between the primary crushing station and the secondary and tertiary crushing stations by covered conveyor or enclosed conveyor gallery. After the tertiary crushing stage, ore will be transported by covered conveyor to the HLF area where the ore will be stacked on the heap leach pad via a series of portable conveyors and finally a radial stacking conveyor.

Gold extraction will utilize cyanide heap leaching technology. Process solution containing cyanide will be applied to the ore to extract gold and will then be collected by the HLF leachate collection and recovery system.

Gold-bearing “pregnant” solution (pregnant leach solution [PLS]) will be pumped from the HLF to the gold recovery plant. Gold will be recovered from the PLS by activated carbon adsorption and desorption, followed by electro-winning onto steel cathodes, and on-site smelting to gold doré. This process is referred to as the adsorption, desorption, and recovery (ADR) process. The gold-barren leach solution that remains after passing through the carbon columns will be re-circulated back to the HLF.

2.2.1 Ore, Waste and Gold Production

For the reporting period, no material has been removed from the proposed open pit and no gold production has occurred. The total amount of ore and waste to be removed from the open pit over the life of the Project is approximately 86 Mt and 90 Mt, respectively (Table 2.2-1). Figure 2.2-1 shows ore and waste scheduled to be removed from the open pit by year.

Upon the commencement of open pit development, waste rock is scheduled to go to one of two areas:

- Platinum Gulch WRSA: The Platinum Gulch WRSA will be filled within the first three years of production and contain approximately 21.2 Mt.
- Eagle Pup Waste WRSA: The Eagle Pup WRSA will contain the remaining life of mine waste rock.

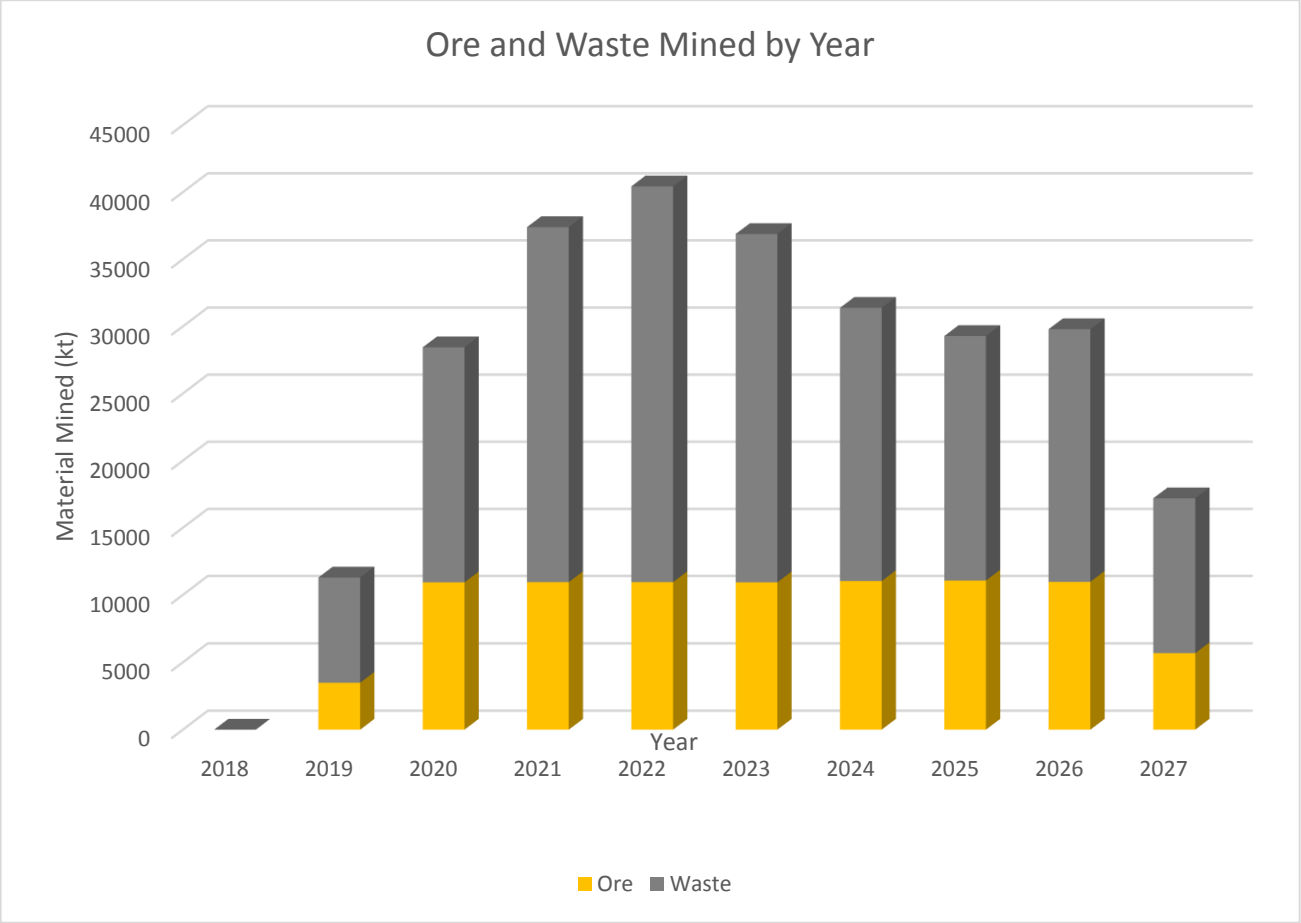

Figure 2.2-1: Ore and Waste Mined by Year Reserves and Mine Life Update

2.2.2 Reserve and Mine Life Update

A mineral resource and reserve estimate for the Eagle Pit was prepared in 2016 and publicly disclosed in the "NI 43-101 Feasibility Study Technical Report for the Eagle Project, Yukon Territory, Canada" (FS) prepared by JDS Energy & Mining Inc. (JDS), published September 12, 2016. The mineral resource estimate has been classified as "Measured", "Indicated" and Inferred" according to the Canadian Institute of Mining and Metallurgy (CIM) "CIM Standards on Mineral Resources and Reserves: Definitions and Guidelines" (May 2014). The current Eagle mineral resources (Table 2.2-1) are reported as in-pit resources at a cut-off grade of 0.15 g/t Au.

Table 2.2-2: Constrained Eagle Deposit Mineral Resources Estimate

Classification	Quantity (Mt)	In situ Gold Grade (g/t)	Contained Gold (koz)
Measured	29.4	0.81	761
Indicated	151.3	0.59	2,870
Combined	**180.7**	**0.63**	**3,631**

Classification	Quantity (Mt)	In situ Gold Grade (g/t)	Contained Gold (koz)
Inferred	17.4	0.49	276

Source: JDS 2016.

NOTES:

1. Eagle Deposit Mineral Resources estimate only
2. Mineral Resources are estimated at a cut-off of 0.15 g/t Au
3. Gold price used for this estimate was US$1,700/oz
4. High-grade caps were applied as per the text of JDS 2016
5. Specific gravity was estimated for each block based on measurements taken from core specimens
6. Resources are In-pit resources as defined by pit parameters described in the text of JDS 2016
7. Mineral Resources are not Mineral Reserves and do not have demonstrated economic viability. There is no certainty that all or any part of the Mineral Resources estimated will be converted into Mineral Reserves. The estimate of Mineral Resources may be materially affected by environmental, permitting, legal, title, taxation, socio-political, marketing, or other relevant issues
8. The quantity and grade of reported Inferred Resources in this estimation are uncertain in nature and there has been insufficient exploration to define these Inferred Resources as an Indicated or Measured Mineral Resource and it is uncertain if further exploration will result in upgrading them to an Indicated or Measured Mineral Resource category

Mineral reserve estimates (Table 2.2-3) are based on the mineral resource estimate, and developed by determining the optimum and practical mining method. Cut-off grades were then determined based on appropriate design criteria and the adopted mining method (JDS 2016).

Table 2.2-3: Eagle Deposit Mineral Reserve Estimate

Classification	Quantity (Mt)	Diluted Gold Grade(g/t)	Contained Gold (koz)
Proven	27	0.80	685
Probable	90	0.62	1,778
Total	**116**	**0.66**	**2,463**

Source: JDS 2016.

NOTES:

1. Eagle Deposit Mineral Resources estimate only
2. Mineral Reserves are included within Mineral Resources

The reserve and mine life update since the FS discussed herein has not been presented to any regulatory body for formal consideration within the context of any regulatory approval. The discussion below has been provided to comply with the annual reporting requirements of the existing licenses for the Project.

On December 5, 2018 an update to the Eagle Gold mineral resource was undertaken by the company with the assistance of Independent Qualified Person Marc Jutras, P.Eng., M.A.Sc., Principal, Ginto Consulting Inc. The resource update resulted in a 12.4% increase in Measured and indicated gold ounces as well as a 2.4% increase in gold grade. The resource update includes all Eagle and Eagle proximal drilling completed after the 2016 FS–discussed above. The first principles re-estimation of the Eagle gold domain and grade validates the Eagle model and resulted in increased gold grade, tonnage and total gold ounces. The resource increased 450,000 oz gold in the Measured and Indicated categories. Gold grade remains consistent with the 2016 Resource Estimate published in the FS. Table 2.2- provides the 2018 Eagle Mineral Resource Estimate.

Table 2.2-4: Eagle Mineral Resource* Estimate at a 0.15 g/t Au Cut-Off - Effective November 16, 2018 - Inclusive of Mineral Reserves

Classification	Quantity (t)	Average Gold Grade (g/t)	Contained Gold (oz)
Measured	36,061,386	0.715	828,971
Indicated	162,658,881	0.622	3,252,813
Combined (Measured + Indicated)	**198,720,267**	**0.639**	**4,082,573**
Inferred	**12,780,597**	**0.498**	**204,631**

* Mineral resources are not mineral reserves and do not have demonstrated economic viability. There is no certainty that all or any part of the mineral resources estimated will be converted into mineral reserves. The estimate of mineral resources may be materially affected by environmental, permitting, legal, title, taxation, socio-political, marketing, or other relevant issues. The CIM definitions were followed for the classification of indicated and inferred mineral resources. The quantity and grade of reported inferred mineral resources in this estimation are uncertain in nature and there has been insufficient exploration to define these inferred mineral resources as an indicated mineral resource and it is uncertain if further exploration will result in upgrading them to an indicated mineral resource category. The updated Resource was constrained in the 2016 FS Resource pit

2.3 PROPOSED DEVELOPMENT & PRODUCTION IN 2019

2.3.1 Construction

Construction activities in 2019 are intended to support the start of the Production Phase with a goal of producing first goal in H2 2019. A detailed schedule of 2019 construction activities is provided in Table 2.3-1. The current schedule is subject to contractor and material availability, regulatory approvals and ongoing consideration of workforce loading and capital deployment.

2.3.2 Commissioning and Operation

In 2019, the Project will be transitioned from construction to operations. To support transitioning from construction to the commissioning phase a formal handover process commences. The handover includes the provision of construction area turnover packages that include all QA/QC, verification and testing documents developed to date. The handover from construction to commissioning follows a certification process as listed below:

- Construction release (C1 Certification)
- System testing of equipment (C2 Certification)
- Wet commissioning (C3 Certification Process Systems Only)
- Site wide integration test run with ore/leach solution (C4 - all Systems)
- Ramp up to sustainable operation (C5)

The certification process is shown below in Figure 2.3-1.

Function		Construction Release	Pre-Commissioning		Commissioning	Ramp-Up
Stage	Commissioning Planning and Setup	C1: Construction Release	C2: System Testing of Equipment	C3: Wet Commissioning	C4: Systems Integration Test Run/Ore Commissioning	C5: Ramp-Up to Sustainable Operations
Activity		Equipment Inspection (Construction Checksheets)	Equipment inspection and testing	System testing	Process start up and testing	Ramp-up
Conditions		Non-energized equipment	Equipment and PCS Energized	Inert materials (water, air)	Process materials (Ore, reagents)	Process materials (Ore, reagents)
Example Tasks		Wiring point to point, cable insulation tests	Loop Tests	Interlock check	Run systems with process materials	Increase throughput to design rate
		Pressure Pipe Tests	Valve Tests	Energize water and air headers	Run complete plant to stability	Complete Performance Testing
			Motor Function Tests and Run-ins	Pumping system tests with water		
Responsible Person		Construction Manager	Commissioning Manager		Project Manager / Commissioning Manager	
Responsible Team		Construction Team	Commissioning Team		Operations Team / Commissioning Team	
Completion Milestone		Mechanical Completion	System ready for Wet Commissioning	Systems are Ready for Ore/Tie-in	Systems ready for performance testing	Sustainable Operations Achieved

Figure 2.3-1: Certification Process

Specific requirements for each stage in the certification process must be met for the Project site in general to ensure that equipment and process functionality have been achieved.

2.4 DESCRIPTION OF WATER USE AND DEPOSIT OF WASTE

2.4.1 Description of Water Use

During 2018, groundwater was required for camp operations between March 15 and December 31. Water to supply the camp was sourced from the existing groundwater well located immediately north of the main camp.

The daily volume of water withdrawn from the camp supply well is shown in Figure 2.4-1, and remained below the QZ16-016 daily limit of 157 m^3/day.

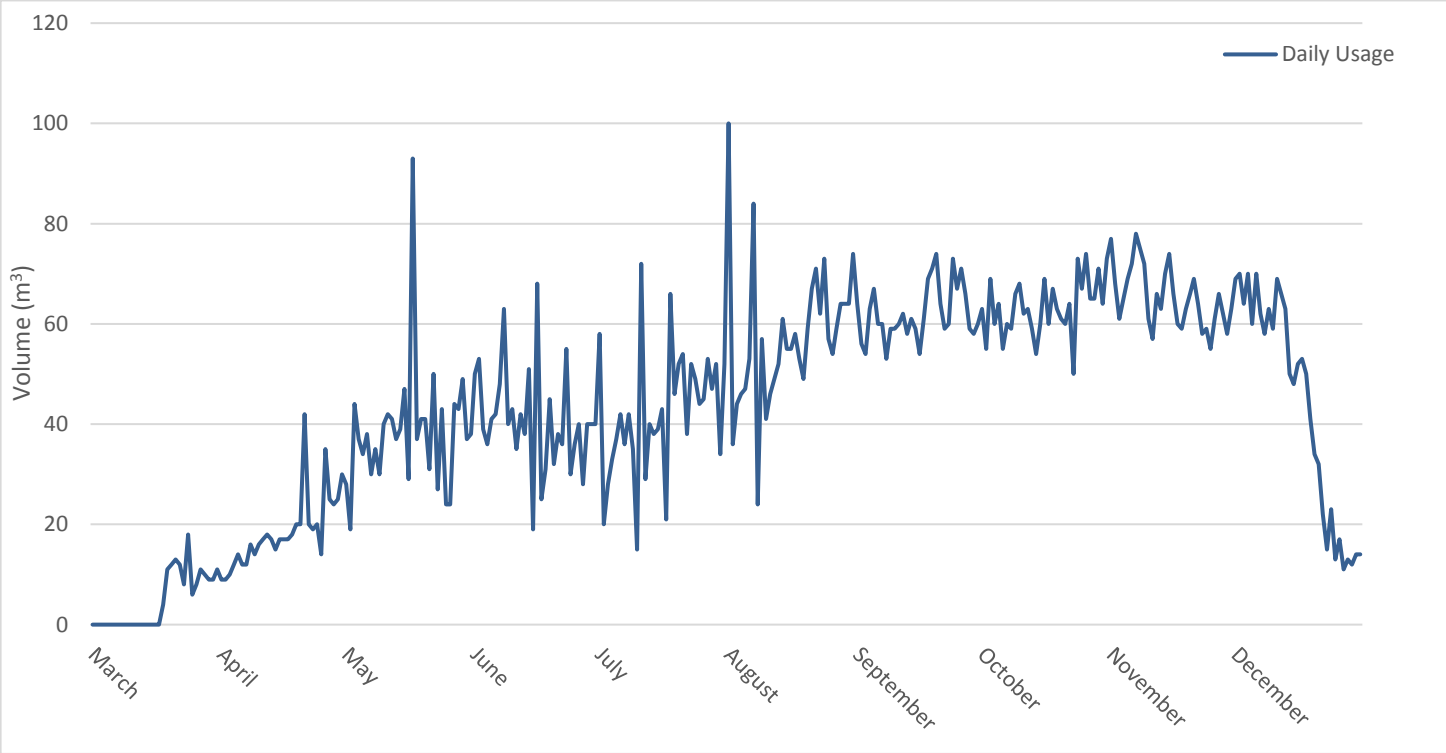

Figure 2.4-1: Daily Camp Water Usage

Water was also used for dust suppression and concrete (Figure 2.4-2). Water for dust suppression was sourced from the LDSP between June 20 and October 4, 2018. Water from the LDSP and groundwater was used for concrete production between August 1 and December 14, 2018. There was no water required for process solution or gold elution. Water use remained below the QZ14-014 daily limit of 4,432 m^3

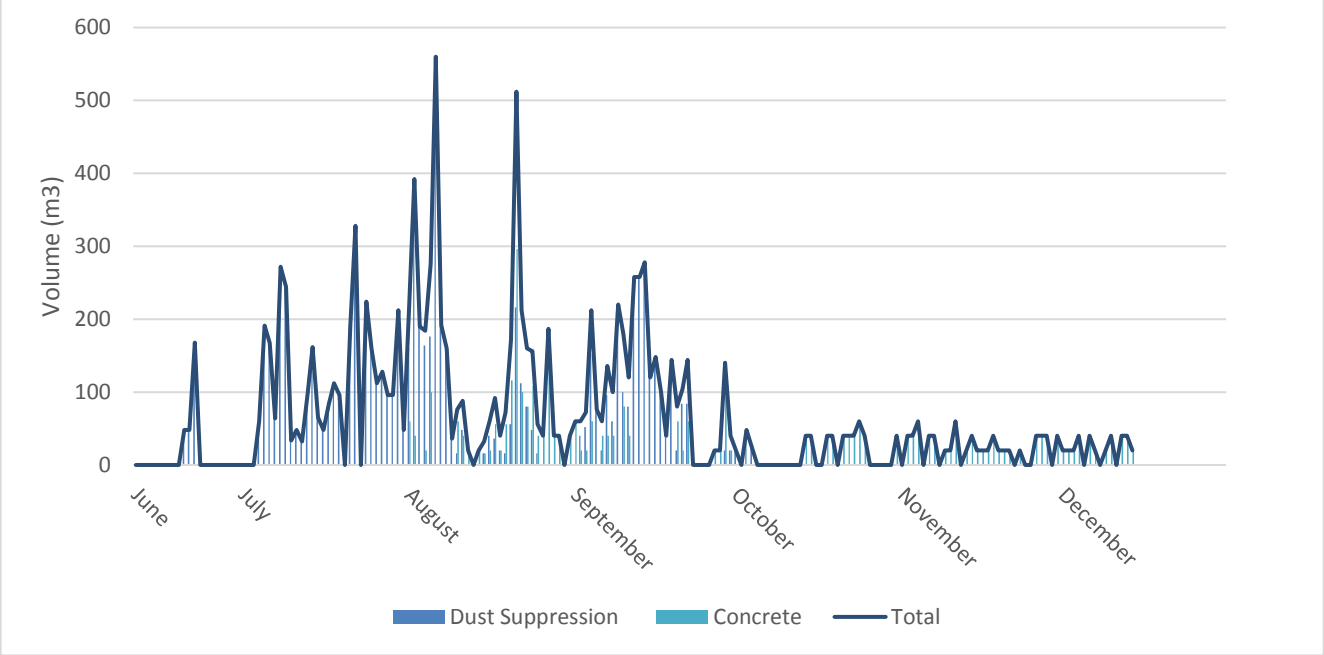

Figure 2.4-2: Daily Dust Suppression and Concrete Water Usage

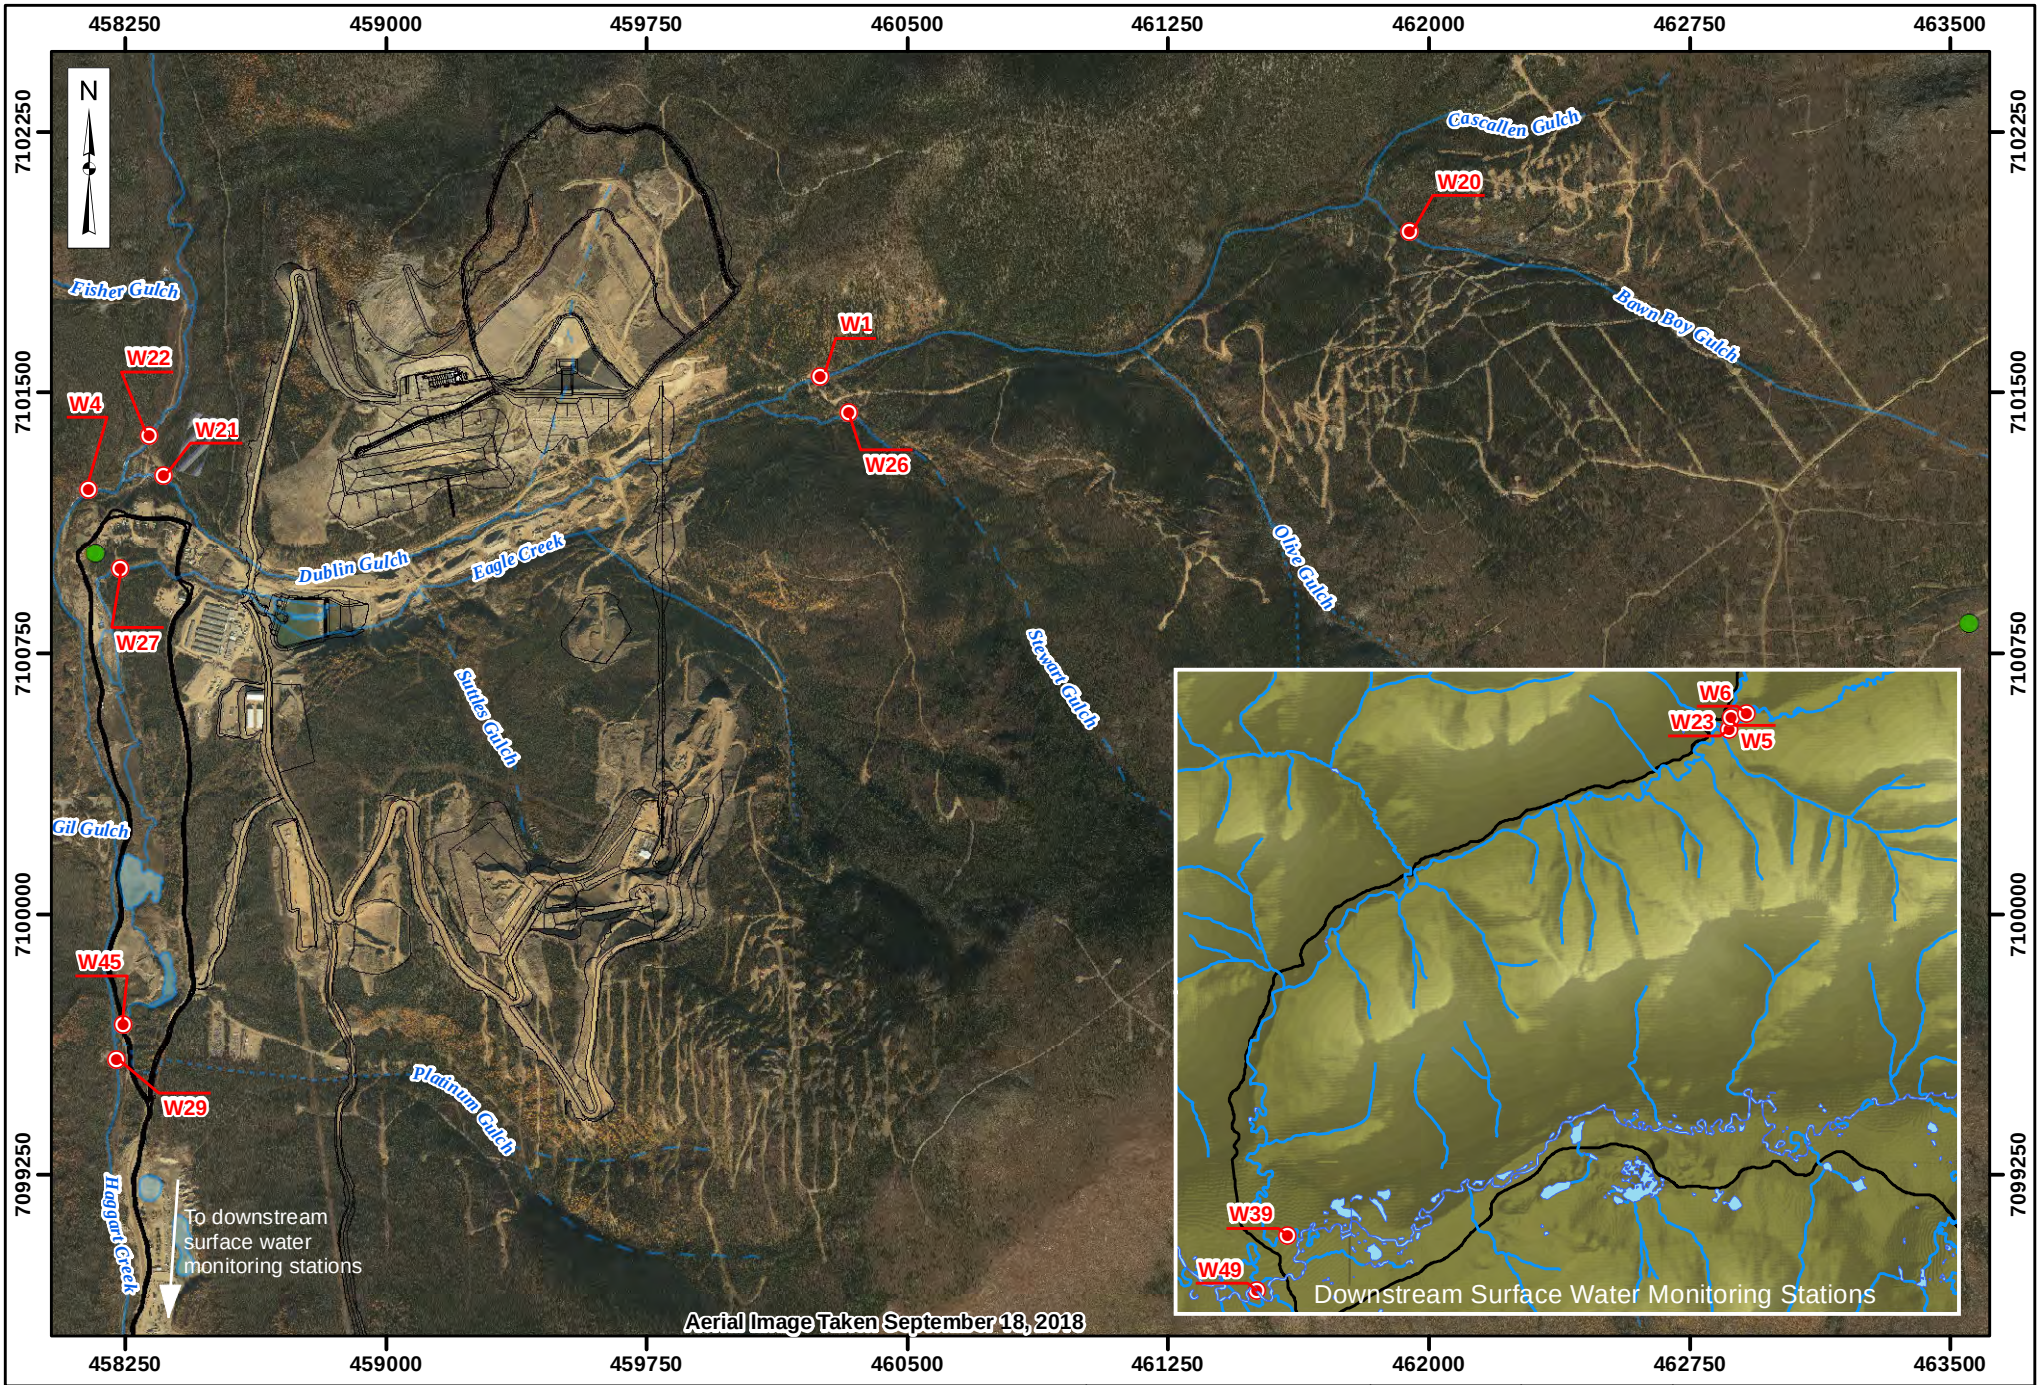
2.4.2 Deposit of Waste

There was no deposit of a waste, as defined by the licence, during the construction phase of the Project. All sediment-laden water during the 2018 program has been managed with a combination of exfiltration basins and sediment and erosion control measures such as silt fences.

3 ENVIRONMENTAL MONITORING



3.1 SURFACE WATER HYDROLOGY

The *Streamflow Monitoring Report - 2018 Update* included as Appendix C presents a summary of baseline streamflow data collected for the Project since August 2007, including hydrometric information summarized in previous reports (Stantec 2012; Knight Piésold 2013 and Lorax 2016) and data collected in 2018. Figure 3.1-1 shows the locations of Project hydrometric stations monitored and Table 3.1-1 presents station monitoring records and drainage information for automated stations (stations collecting continuous water level data).

Table 3.1-1: Automated Project Hydrology Stations Records and Drainage

Station	Station Name	Record Period	Drainage Area (km^2)[a]	Median Basin Elevation (m)[a]	Notes
W1	Dublin Gulch above Stewart Gulch	2007 – 2018	6.8	1,303	Continuous discharge time-series
W4	Haggart Creek below Dublin Gulch	2007 – 2018	76.9	1,125	Continuous discharge time-series
W5	Haggart Creek above Lynx Creek	2007 – 2018	97.5	1,091	Continuous discharge time-series
W6	Lynx Creek above Haggart Creek	2007 – 2018	100.9	1,049	Continuous discharge time-series
W21	Dublin Gulch below Event Ponds	2018	10.1	1,216	Continuous discharge time-series
W22	Haggart Creek above Dublin Gulch	2007 – 2018	66.8	1,113	Continuous discharge time-series
W26	Stewart Gulch	2007 – 2018	1.3	1,183	Continuous discharge time-series Manual data only for 2007–2009, 2011
W27	Eagle Creek near Camp	2007 – 2018	2.7	1,037	Continuous discharge time-series Manual data only for 2007
W29[b]	Haggart Creek below Eagle Creek	2010 – 2015	86.1	1,112	Manual measurements for 2010 Continuous data thereafter
W45	Eagle Creek at Mouth	2010 – 2015	86.1	1,112	Continuous discharge time-series

NOTES:
a. Source of drainage area and median basin elevation: Knight-Piésold, 2013
b. No continuous water level data are available for this station for 2016-2017

Projection: NAD 83 UTM Zone 8N	Drawn By: JK	**EAGLE GOLD PROJECT YUKON TERRITORY**	
Date: 2019/04/01	Figure: 3.1-1	**2018 Construction Surface Water Monitoring Stations**	

3.1.1 Surface Water Hydrology Monitoring

Streamflow data for the nine stations listed in Table 3.1-1 are presented in Appendix C in the following formats:

- Monthly tables showing average, maximum and minimum 15-minute discharge values (m^3/s);
- Monthly tables showing average discharge (m^3/s), average unit yields ($L/s/km^2$) and total runoff (mm);
- Time-series plots of continuous average daily discharge (m^3/s) and spot flow measurements (m^3/s), and;
- Time series plots of average daily unit yields ($L/s/km^2$), by year.

Station W45 only has a water level record for 2018. A preliminary rating curve and continuous discharge could not be developed due to changes that occurred in the vicinity of the station which affected the stage/discharge relationship. The station will be re-installed in 2019.

Issues were encountered with the stage records for 2018 at W27 (flume, water level record issue) and W29 (datalogger failed). Technical issues with W27 flume condition (installed in 2011) due to slow degradation of flume condition (due to recurring icings) and questionable datalogger data (sediment infilling stilling well) resulted in the loss of continuous water level data for 2018. Therefore, only manual measurements are available for this year. Further, there are now three consecutive years with no continuous water level at W29. This station is located in a highly mobile channel that has not reached equilibrium yet, following historical placer mining disturbances, and is therefore challenging to gauge. This streamflow gaging station will be relocated farther downstream in 2019.

Tables 3.1-2 to 3.1-10 below compare the complied streamflow summary statistics (average, minimum and maximum flows) for 2018 to the same statistics compiled over the full period of baseline record. All values are in m^3/s. For all stations except W27, flows fall within the normal range of flows for minimums, maximums and average flows. For W27, all measured flows are low and close to but above recorded minimum flows for each month. The reduced flows are directly associated with the diversion of the upper watershed (primarily Eagle Pup) into lower Dublin Gulch to facilitate work in and around the LDSP.

3.1.2 Site QA/QC Programs

3.1.2.1 Stage Measurements and Corrections

All automated stations are instrumented with metric staff gauges, mounted to vertical angle iron in the stream channel, and regularly surveyed to nearby benchmarks. Continuously recording HOBO pressure transducers are installed in stilling wells and set to record water level every 15 minutes. These readings were corrected for fluctuations in barometric pressure in a post-processing step. During each site visit, water level was noted on the staff gauge. These readings form the basis for the continuous water level records, which were adjusted to match the manual stage readings. Level surveys determine the staff gauge zero datum and water level, and were used to correct the station records for changes due to shifts in the channel bed (i.e., aggradation or scour), frost-jacking or station relocation following a high-magnitude flood event.

3.1.2.2 Rating Curve Error

The overall quality of the discharge record can be assessed by reviewing the average and standard errors calculated from the differences between the measured discharges, and those estimated from the rating equation.

A positive rating curve error is defined where the discharge calculated from the rating curve overestimates the value when compared to the measured discharge, and vice-versa for a negative error.

A summary of the error metrics for all stations and rating curve control percentages are presented in Table 3.1-12. Rating curve control values indicate the percent of time that a continuously recorded observation (15-minute intervals) falls between the highest and lowest manually recorded measurements for each monitoring station. Overall, the rating curves provide reasonable estimates of discharge across a wide range of flows at most of the Project stations. Average errors are relatively low, ranging from -5% to 2%. The standard error, or the degree of variability about the average error values varies more between stations. After examining the 2018 data, no adjustments to the rating curves developed in 2017 were necessary and the same curves were applied to the 2018 continuous water level data.

Table 3.1-12: Rating Curve Error Summary for Project Hydrometric Stations

Station	Measurements (n)	Average Error (%)	Standard Error (%)	Rating Curve Control
W1	36	-5%	25%	98%
W4	41	-1%	14%	98%
W5	35	2%	12%	97%
W6	31	-1%	10%	96%
W21	4	0%	7%	79%
W22	35	0%	16%	100%
W26	26	--	--	100%
W27	47	--	--	100%
W29	18	-2%	10%	95%
Average	34	-1%	14%	97%

NOTES:
Stations W26 and W27 currently have Parshall flumes installed, and therefore rating curves have not been developed for these sites as part of this baseline streamflow update

3.1.3 Adaptive Management

Streamflows measured during the development phase in 2018 remained within the range of the long-term minimums and maximums at locations monitored and no thresholds were reached as per the adaptive management plan. As such, adaptive management responses were not required.

3.2 SURFACE WATER QUALITY

3.2.1 Surface Water Quality Monitoring

Surface water quality monitoring programs are outlined in the Environmental Monitoring, Surveillance and Adaptive Management Plan (EMSAMP). Surface water quality monitoring in 2018 consisted of monitoring those sites as identified for construction phase monitoring in the EMSAMP (Table 3.2-1) which includes all receiving environment locations specified in the regulatory approvals for the Project. Where possible, the 2018 results have been compared to historical results to identify trends and compare 2018 values with previous values.

3.2.1.1 2018 Construction Monitoring Program

The 2018 construction monitoring program included continuing the surveillance of watercourses monitored during baseline studies, and included those locations downstream of the Project where water quality objectives must be met. The program is designed to meet the following objectives:

- Continue to collect water quality data in the receiving environment as the Project transitions from construction to operations at stations upstream and downstream of Project influences.
- Collect water quality data to verify compliance with the discharge criteria specified in QZ14-041.
- Provide a comprehensive water quality database to support adaptive management strategies that are designed to meet water quality compliance criteria and protect aquatic life.

Surface water quality monitoring has two main focuses: effluent quality monitoring and environmental effects monitoring. Effluent quality monitoring is focused on sampling compliance (or discharge) points to verify criteria are met. Environmental effects monitoring focuses on collecting data to evaluate whether water quality objectives are being achieved in the following watersheds:

- Haggart Creek
- Dublin Gulch
- Eagle Creek
- Lynx Creek and
- South McQuesten (at the confluence of Haggart Creek).

The water quality monitoring program is not intended to be a static program; stations will be added or removed according to the conditions and adaptive management as required.

Eleven monthly and three quarterly surface water quality monitoring stations were monitored in 2018 in accordance with the EMSAMP and the regulatory approvals for the Project. An attempt to sample was made each month or quarter at each station as per the licence schedule outlined in Table 3.2-1, however due to frozen conditions or unsafe ice conditions it was not always possible to obtain a sample. These instances were noted and recorded. Complete analytical datasets for all sampled locations for the reporting period are included as Appendix D. During the reporting period there was no discharge of contact water to surface water from any facility thus no development effluent discharge points were established.

Table 3.2-1: Surface Water Quality Monitoring Locations and Frequency – Construction

3.2.2 Water Quality Results

This section discusses water quality for key selected stations in Dublin Gulch (W1, W20, W26 and W21), Eagle Creek (W9 and W27), Haggart Creek (W22, W29, W5 and W23) watersheds including the reference basin of Lynx Creek (W6). Specifically, arsenic, copper, lead, nickel, zinc and total suspended solids (TSS) results are discussed. In the tables below, values in bold are below detection limits.

3.2.2.1 TSS

Instantaneous total suspended sediment (TSS) concentrations were measured upstream and downstream of the Project and within the receiving environment during 2018 (Table 3.2-2). As expected TSS in 2018, for all stations monitored, rose during the freshet period (April and May), declined during June and then returned to values reflective of lower flow conditions. For many locations and sampling periods outside of the freshet period, TSS values were generally below detection limit (3.0 mg/L). Of note are the elevated levels of TSS above the Project influence at W20 (Bawn Boy Gulch), which had an effect on elevating the TSS at stations W1 and W21 farther downstream. Because these all represent instantaneous conditions, they likely do not represent peak flows during snowmelt or rain events, nor do they reflect low-flow conditions throughout each month, thus it is likely that both higher and lower TSS values (than those listed in Table 3.2-2) occurred at any given time, except for those times when at the lab detection limit.

The higher levels of TSS during freshet in Haggart Creek are influenced by Dublin Gulch and Eagle Creek, as the reference site W22 (upstream of the confluence of Haggart Creek with Dublin Gulch) generally had lower concentrations compared to W4 and W29. Further downstream in Haggart Creek, the TSS levels were lower due primarily to the effect of increasing catchment size and the mixing of watercourses with lower TSS. While the influence of Dublin Gulch and Eagle Creek on Haggart Creek is consistent with the patterns observed during baseline data collection prior to the commencement of construction of the Project (i.e., the effect of many years of exploration and placer mining in the district), some of the measured maximum TSS values recorded in 2018 are somewhat higher for specific stations. This is likely reflective of an increased overall sample coverage and frequency during 2018 than in previous years during the development of the baseline period. This is supported by the observation that, except for W21, the 2018 median values are approximately the same as the baseline (2007-2017) median values. Further, the median value for any particular stream was generally lower than the average value, indicating the positive skewness of the sample sets, and that high TSS is event driven and not the normal condition.

3.2.2.2 Trace Elements

3.2.2.3 Dublin Gulch Drainage

Surface water quality from streams in the Dublin Gulch watershed is characterized using monitoring data from stations W20, W1, W26 and W21. Data from the upstream reference site W20 at Bawn Boy Gulch has a significant effect on metals concentrations throughout the stream. Samples could not always be collected during the winter at station W26 (Stewart Gulch) as the ice was frozen to the channel bottom (not measurable water flow). In general, average and median monthly concentrations of total and dissolved trace elements were low, except during freshet. Higher concentrations of arsenic, copper, lead, nickel and zinc were observed during peak flow months and are typically associated with elevated TSS levels. The direct of effect of TSS on total metal concentrations was well established prior to construction during the baseline period (2007-2017). Because of the affect of increased TSS on increasing metals concentrations and that high TSS concentrations are event driven, in many cases the median values are significantly lower than the average values. There are some exceptions, most notably with arsenic in W20, which is discussed below.

Further, during all of 2018, upper Eagle Creek basin (which primarily included Eagle Pup and Suttles Gulch) was diverted into Dublin Gulch above W21 (the natural condition prior to placer mining activities). In all cases, the median concentrations of TSS and metals were higher at W21 than W1, and in some cases had higher maximum TSS and metals concentrations than W1. Thus, W21 values reflect the influence of upper Eagle Creek in addition to W20, W26 and W1.

Arsenic

Dublin Gulch is characterized by elevated total and dissolved As concentrations throughout its reaches during all flow levels (Table 3.2-3). In all cases in Dublin Gulch, total arsenic levels are directly related to high TSS concentrations (Table 3.2-2) and one of the primary sources of As in Dublin Gulch is Bawn Boy Gulch (monitored

at station W20 upstream of Project influence) (Figure 3.2-1). As an example, average and median total As concentrations were highest at W20 (0.322 mg/L), and were lower in downstream stations.

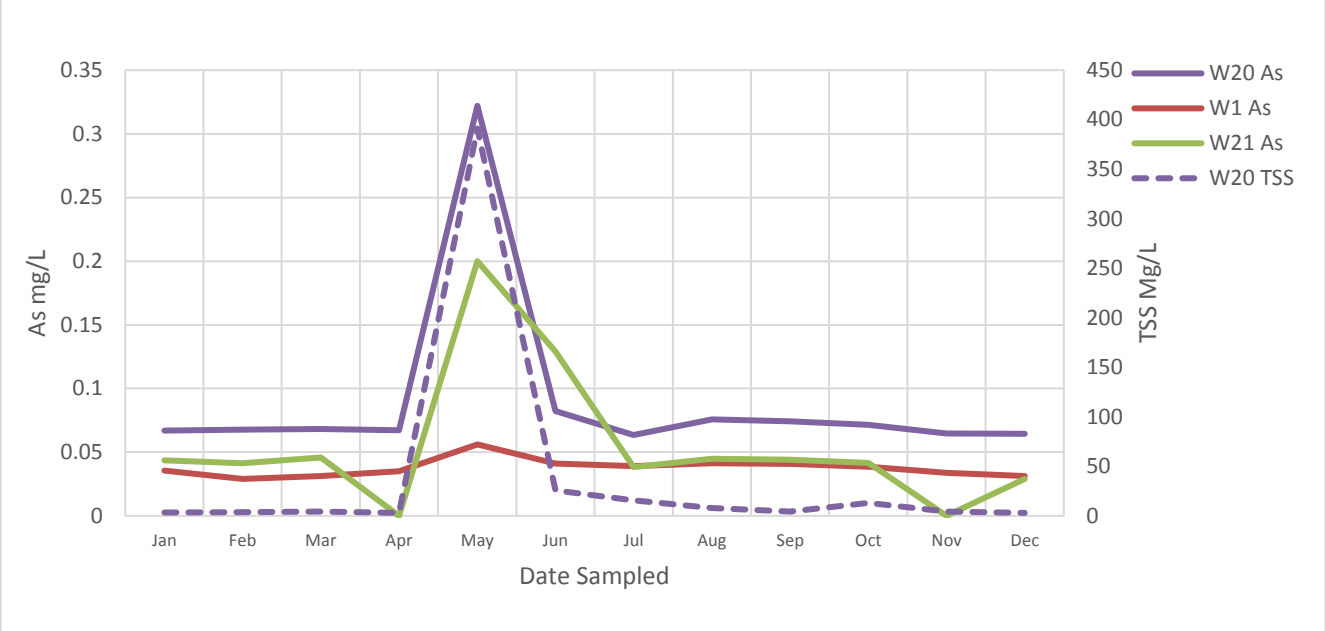

Figure 3.2-1: TSS and Total Arsenic in Dublin Gulch 2018

Copper

Copper was generally below detection in W20 and W1 except during freshet, but was measurable in W21 and W26 throughout the year. Copper concentrations at W21 ranged from below the detection limit of 0.0005 mg/L in December to 0.0181 mg/L in May (Table 3.2-4). Copper concentrations are compared to upstream TSS concentrations in Figure 3.2-2.

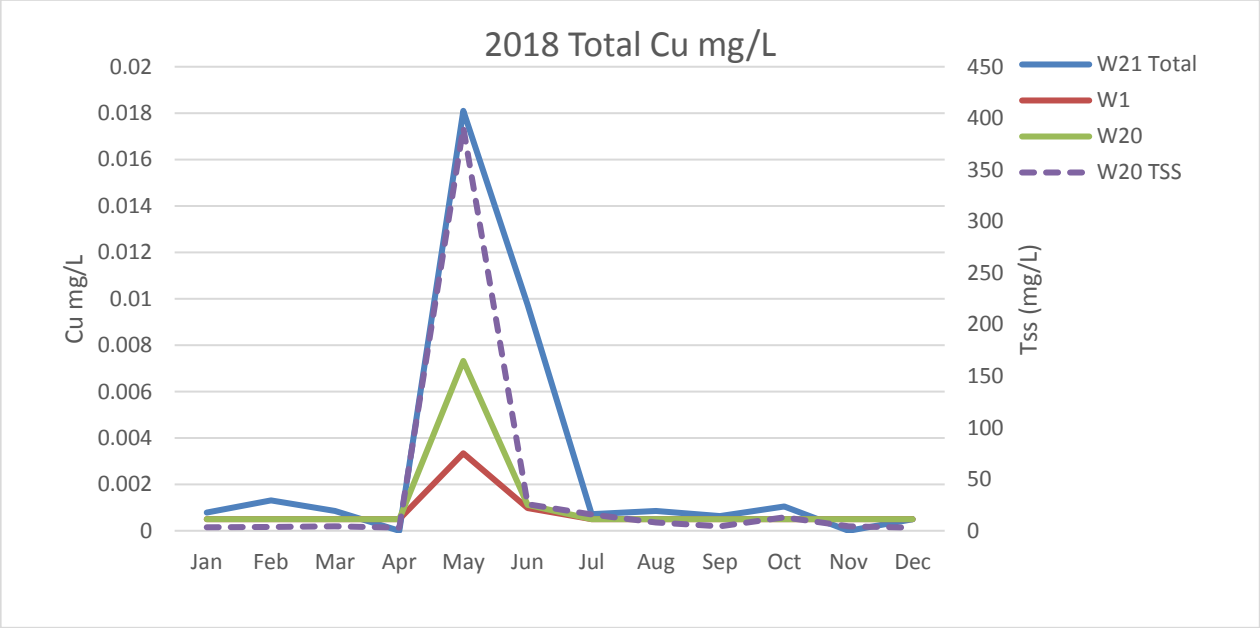

Figure 3.2-2: Total Copper values at W21 in 2018

Lead

Lead concentrations were relatively low, peaking during freshet at W20, W1 and W21, and were generally below detection at W26 (Table 3.2-5). The highest concentration was recorded during freshet in May at W21 at 0.0162 mg/L; this measurement was likely influenced by the headwaters at W20 where the concentration was 0.0143 mg/L (Figure 3.2-3).

Zinc

Zinc concentrations were below detection at W20 and W1 throughout the year except during freshet during high TSS events, and measurable in trace amounts throughout the year at W21. Table 3.2-7 shows measured concentrations of Zinc in 2018 with comparisons to the baseline period.

3.2.2.4 Eagle Creek

Stations in Eagle Creek that were monitored in 2018 include W27 which is midway down Eagle Creek, below project influence, and W45 which is below project influence above the confluence with Haggart Creek. Data from station W27 during the baseline period reflects influences primarily from Eagle Pup and Suttles Gulch, and W45 represents the Eagle Creek drainage before it discharges into Haggart. As with Dublin Gulch, higher concentrations of trace elements were seen to coincide with spring melt and elevated TSS values. During all of 2018, upper Eagle Creek was diverted into Dublin Gulch. Thus, with the absence of influence from Suttles Gulch and Eagle Pup, the maximum, average and median TSS and metals concentrations in lower Eagle Creek during 2018 are lower than that recorded during the baseline period.

Arsenic

Arsenic was seen in measurable amounts throughout the year at W27 and W45. The highest level was seen at W45 at 0.387 mg/L. Table 3.2-8 shows total arsenic levels and summary statistics from Eagle Creek

3.2.2.5 Haggart Creek

Haggart Creek is monitored at stations W22 upstream of all potential project activities; W4 immediately downstream of the confluence with Dublin Gulch; W29 downstream of Dublin Gulch, Eagle Creek, Gil Gulch and Platinum Gulch confluences; and at W5 and W23 immediately upstream and downstream, respectively of the confluence with Lynx Creek.

TSS concentrations in Haggart Creek at W29 are higher than those observed at W22 during the peak flow periods and reflect the higher TSS loadings associated with Dublin Gulch and Eagle Creek. At most other flow periods of the year, TSS values are generally below the analytical detection limit of 3.0 mg/L.

In general, total metals were low throughout Haggart Creek. As demonstrated during the baseline period, water quality in Dublin Gulch and Eagle Creek significantly influence water quality conditions in Haggart Creek at W29, with high TSS loadings occurring in Eagle Creek and Dublin Gulch particularly during freshet conditions, coinciding with higher concentrations of total trace elements in Haggart Creek.

Arsenic

Patterns characterized during baseline were similar in 2018, with low levels of arsenic in the upper reaches (W22) of Haggart Creek, and higher arsenic concentrations at W4 downstream of the confluence of Dublin Gulch due to natural arsenic loadings from the upper reaches of the Dublin Gulch drainage (W20), Eagle Pup and Suttles Gulch. The highest level of arsenic was seen in April at W29 (0.202 mg/L) Table 3.2-13 compares summary statistics for total As in Haggart Creek in 2018 with the baseline period.

Nickel

Haggart Creek had measurable amounts of nickel throughout the year which stemmed from the headwaters upstream of W22, levels were consistent throughout the year at downstream stations. The highest recorded nickel

value was at W29 during freshet (0.0169 mg/L). W23 saw the lowest levels of nickel throughout the year, with an average of 0.0012 mg/L. Table 3.2-14 shows total nickel throughout Haggart Creek and summary statistics for 2018 and the baseline period.

3.2.2.6 Lynx Creek and South McQuesten River

The Lynx Creek catchment drains into Haggart Creek downstream of the Project area. Monitoring of Lynx Creek as a reference site occurred at station W6 (immediately prior to entering Haggart Creek) in 2018. The South McQuesten River (just downstream of the confluence with Haggart Creek) is also monitored at station W49. Sampling results and summary statistics are provided in Table 3.2-18 to Table 3.2-23. As is evident in these tables, while all the TSS and metals concentrations were low in 2018 and have been historically low during the baseline period, it is important to recognize that there are generally less data points for W6 and W49 due to the quarterly monitoring period, and it is also less likely that a high freshet or rainfall event has been sampled.

As demonstrated during the baseline period, high median concentrations of arsenic occur in certain streams throughout the project and regional area. Relatively high median arsenic concentrations from each tributary (W21,

W45 and W6) result in an increase in the mainstream of Haggart Creek (Table 3.2-24). Of note, despite the arsenic loadings from Dublin Gulch and Eagle Creek, the median concentrations and total loading from Lynx Creek (an undeveloped drainage basin), are greater than the median concentrations and total loading from Haggart Creek at their confluence. Further, the median arsenic concentrations at Haggart Creek at the mouth are less than the median arsenic concentrations of the South McQuesten River at their confluence. This indicates that there are additional arsenic sources outside of the Haggart Creek basin.

Table 3.2-24: Total Arsenic Median Concentrations in the Project and Regional Area

Station	Description	Baseline	2018
		As (mg/L)	
W22	Haggart Creek above Project	0.00080	0.00077
W21	Tributary - Dublin Gulch at mouth	-	-
W4	Haggart Creek downstream of Dublin	0.00404	0.00601
W45	Tributary - Eagle Creek at mouth	-	-
W29	Haggart Creek downstream of Eagle	0.00460	0.00515
W5	Haggart Creek above Lynx	0.00363	0.00483
W6	Tributary - Lynx Creek at mouth	0.00630	0.00590
W23	Haggart Creek downstream of Lynx	0.00493	0.00510
W39	Haggart Creek at mouth	0.00367	0.00334
W49	South McQuesten River downstream of Haggart	0.00460	0.00420

The presence of arsenic in drainage waters indicates that natural arsenic mineralization in the broader area is prevalent and not limited to the Dublin Gulch catchment.

3.2.3 Quality Assurance and Quality Control Program

The Quality Assurance/Quality Control (QA/QC) program was designed to provide reliable data by preventing sampling error and cross contamination of the collected samples. Nitrile gloves were used during sample collection and replaced at each new site, samples were collected from downstream to upstream to avoid substrate disturbance and sample contamination. Field, travel blanks and laboratory duplicates were also included in the elemental analysis. Laboratory results were reviewed upon arrival to evaluate compliance with laboratory data quality objectives (DQO). Overall, reported data are considered of good quality and met laboratory DQO. All generated tables, summary statistics and graphs were checked for unit conversions, formulas and transcription errors with original data files.

This program is intended to validate the monitoring data, and to identify any potential methodological and/or analytical errors in the data set that might require modifications to the program and or laboratory analyses. The following section provides a summary of the QA/QC program with respect to field quality, analytical data processing and internal laboratory procedures.

3.2.3.1 Field Blanks

Field blank samples are analyte-free reagent water samples used to assess the purity of chemical preservatives and potential contamination sources at the sampling location due to the collection method, handling, preservation, and exposure to the environment. Blank samples are generated by pouring de-ionized (DI) water into clean

sample bottles in the same environment in which actual samples are collected, and then proceed with the elemental analysis as is routinely performed in the remaining collected samples.

3.2.3.2 Travel Blanks

Travel blanks are provided by the analytical laboratory and are used during field surveys to identify potential contamination during storage and transport. These blanks are kept sealed and transported with water collected samples. Concentrations in these blanks are generally below detection limits, however if any measured parameter is detected above detection limit this may suggest a potential contamination during sample handling and transport.

3.2.3.3 Field Duplicates

The British Columbia Field Sampling Manual (Clark 2013) specifies that a relative percent difference (RPD) greater than 20 percent indicates a possible sample contamination. An RPD greater than 50 percent indicates a definite sample integrity problem; however, it is not unusual to find high variability for the field duplicates, especially if the water is turbid (total suspended solids [TSS] greater than 25 mg/L). Field duplicate samples are generally collected at the same location and time at a site sample to assess the natural variability of the site. For the purpose of this analysis, originals and duplicates are considered paired replicates collected from the same location sequentially in time and were used to calculate the RPD.

3.2.3.4 Analytical QA/QC - Elemental Analysis Quality

All analytical analyses were performed by ALS laboratories (Burnaby, BC) a member of the Canadian Association for Laboratory Accreditation Inc. (CALA). The laboratory QA/QC program included analysis of certified reference materials, laboratory control samples, laboratory duplicates, method blanks and matrix spikes to determine accuracy and precision of instrumentation and methods. The majority of reported data met the laboratory data quality objectives (DQOs). However, in some instances, method recovery was not accurately calculated due to matrix interferences; thus, detection limits were adjusted to prevent any influence on analytical results. Overall, reported data were of good quality and met the laboratory QA/QC objective.

3.2.4 Discharge Compliance - Water Quality

During the period of this report no development effluent compliance points were established and no discharge of contact water to surface water occurred.

3.2.5 Water Balance and Water Quality Modeling

The Eagle Gold Mine water balance and water quality model (WBQM) was updated following changes to the water management plan and water management assumptions around the heap leach facility (Appendix E).

The WBQM fully integrates the following:

- Description of the water management plan as described in: Eagle Gold Project Construction and Operations Water Management Plan;
- Revisions to the heap leach facility water balance modeling as described in: Weekly Water Balance Modeling for the Eagle Gold Mine Heap Leach Pad Facility. Report prepared by The Mines Group, October 2018;

- Baseline climate and hydrology data collected since 2007 and inclusive of data collected in 2018;
- Updated baseline surface water quality monitoring data collected from 2007 to 2017 prior to initiation of construction in August 2017; and
- Geochemical source term data collected from active field bins of waste rock and leached ore materials, with consideration of data collected up through September 2018 ice-free season.

The revisions to the operations water management plan are reflected in the updated schematic (Figure 3.2-4). Water quality from mine discharge during operations is driven by the contact water reporting to the Lower Dublin South Pond. Contact water from the Eagle Pup and Platinum Gulch WRSAs, the temporary ore stockpile, and the sump water from the open pit all report to the LDSP at some point during operations. Excess water from the LDSP is treated through the MWTP to meet the discharge criteria and discharged to Haggart Creek upstream of W4 (Figure 3.2-4).

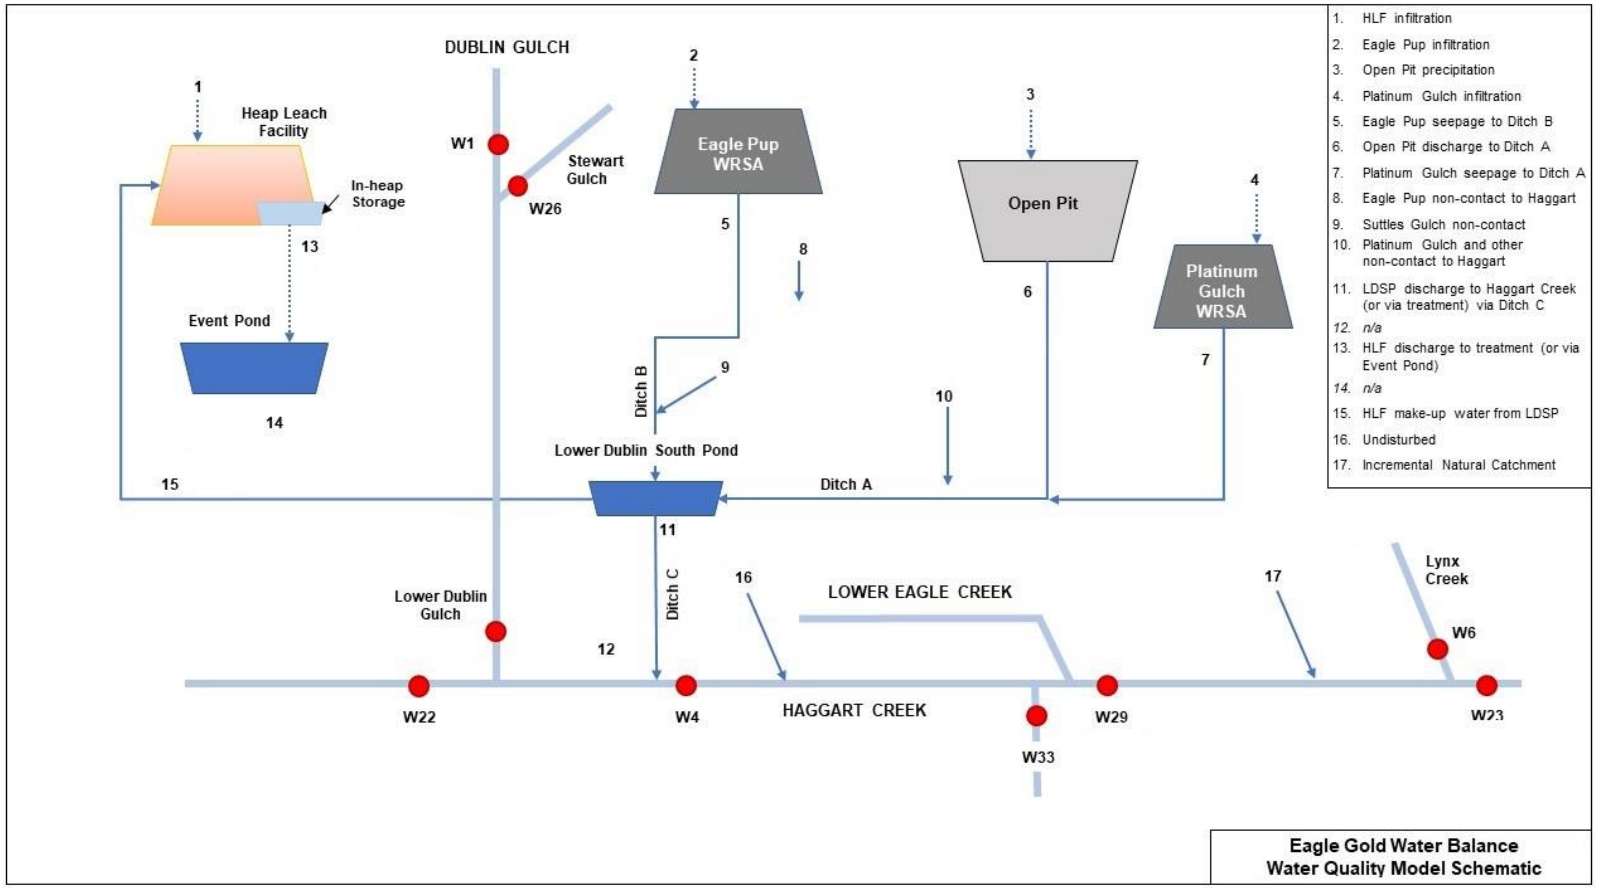

Figure 3.2-4 Water Balance Model Schematic - Overview

3.2.5.1 HLF Water Balance Model Integration

The Eagle Gold WBWQM is a GoldSim-based integrated water balance and quality model that was developed in two parts. The water quality component was developed by Lorax Environmental Services Ltd. (Lorax) and integrated within the WBM to combine source concentrations of potential contaminants of concern with contact and non-contact flows to track contaminant loading throughout the mine site and into the receiving waters of Haggart Creek. The WBQM integrates logic and assumptions from the Weekly Water Balance Modeling for the Eagle Gold Mine Heap Leach Pad Facility (HLF WBM - prepared by The Mines Group, October 2018); which includes a drain-down subroutine. The HLF WBM provides analysis of the solution stored within the HLF as described by the Mines Group. The SWBM also incorporates groundwater baseflow and recharge rates estimated by the groundwater model, as well as provides inputs to the water quality model. Figure 3.2-5 illustrates the integration of the water balance with the HLF WBM, groundwater model and water quality model.

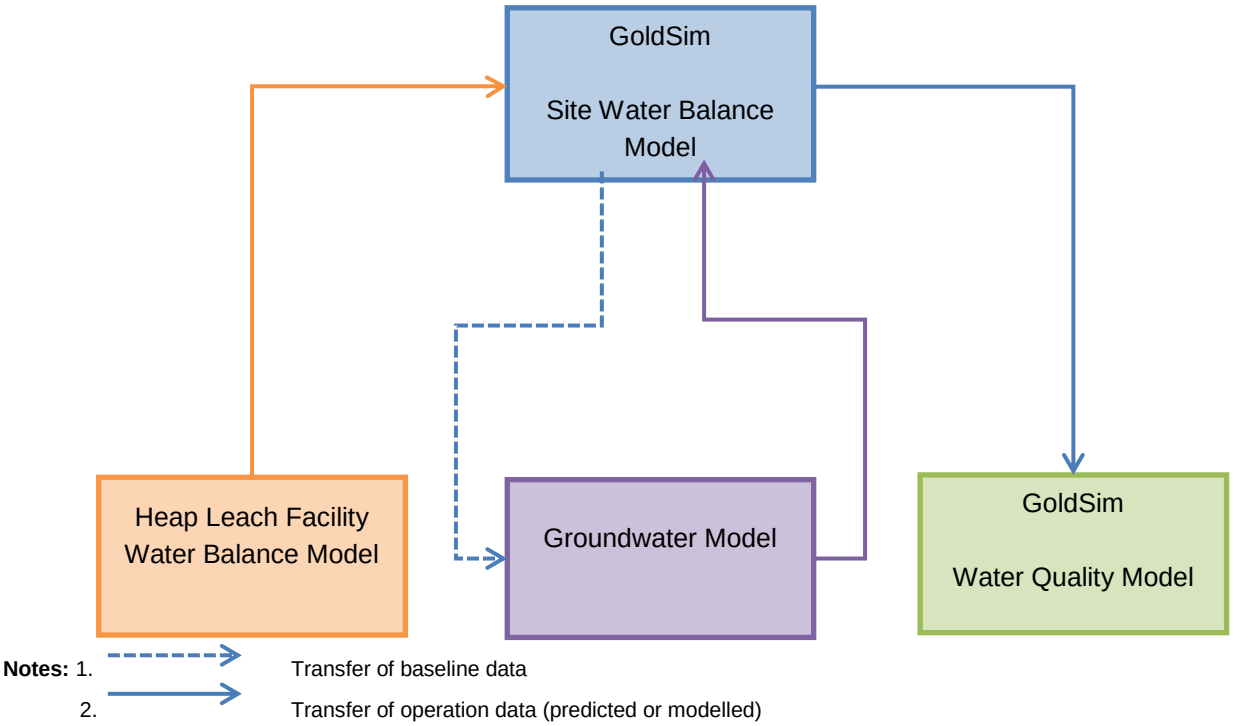

Figure 3.2-5 Water Balance Model Integration

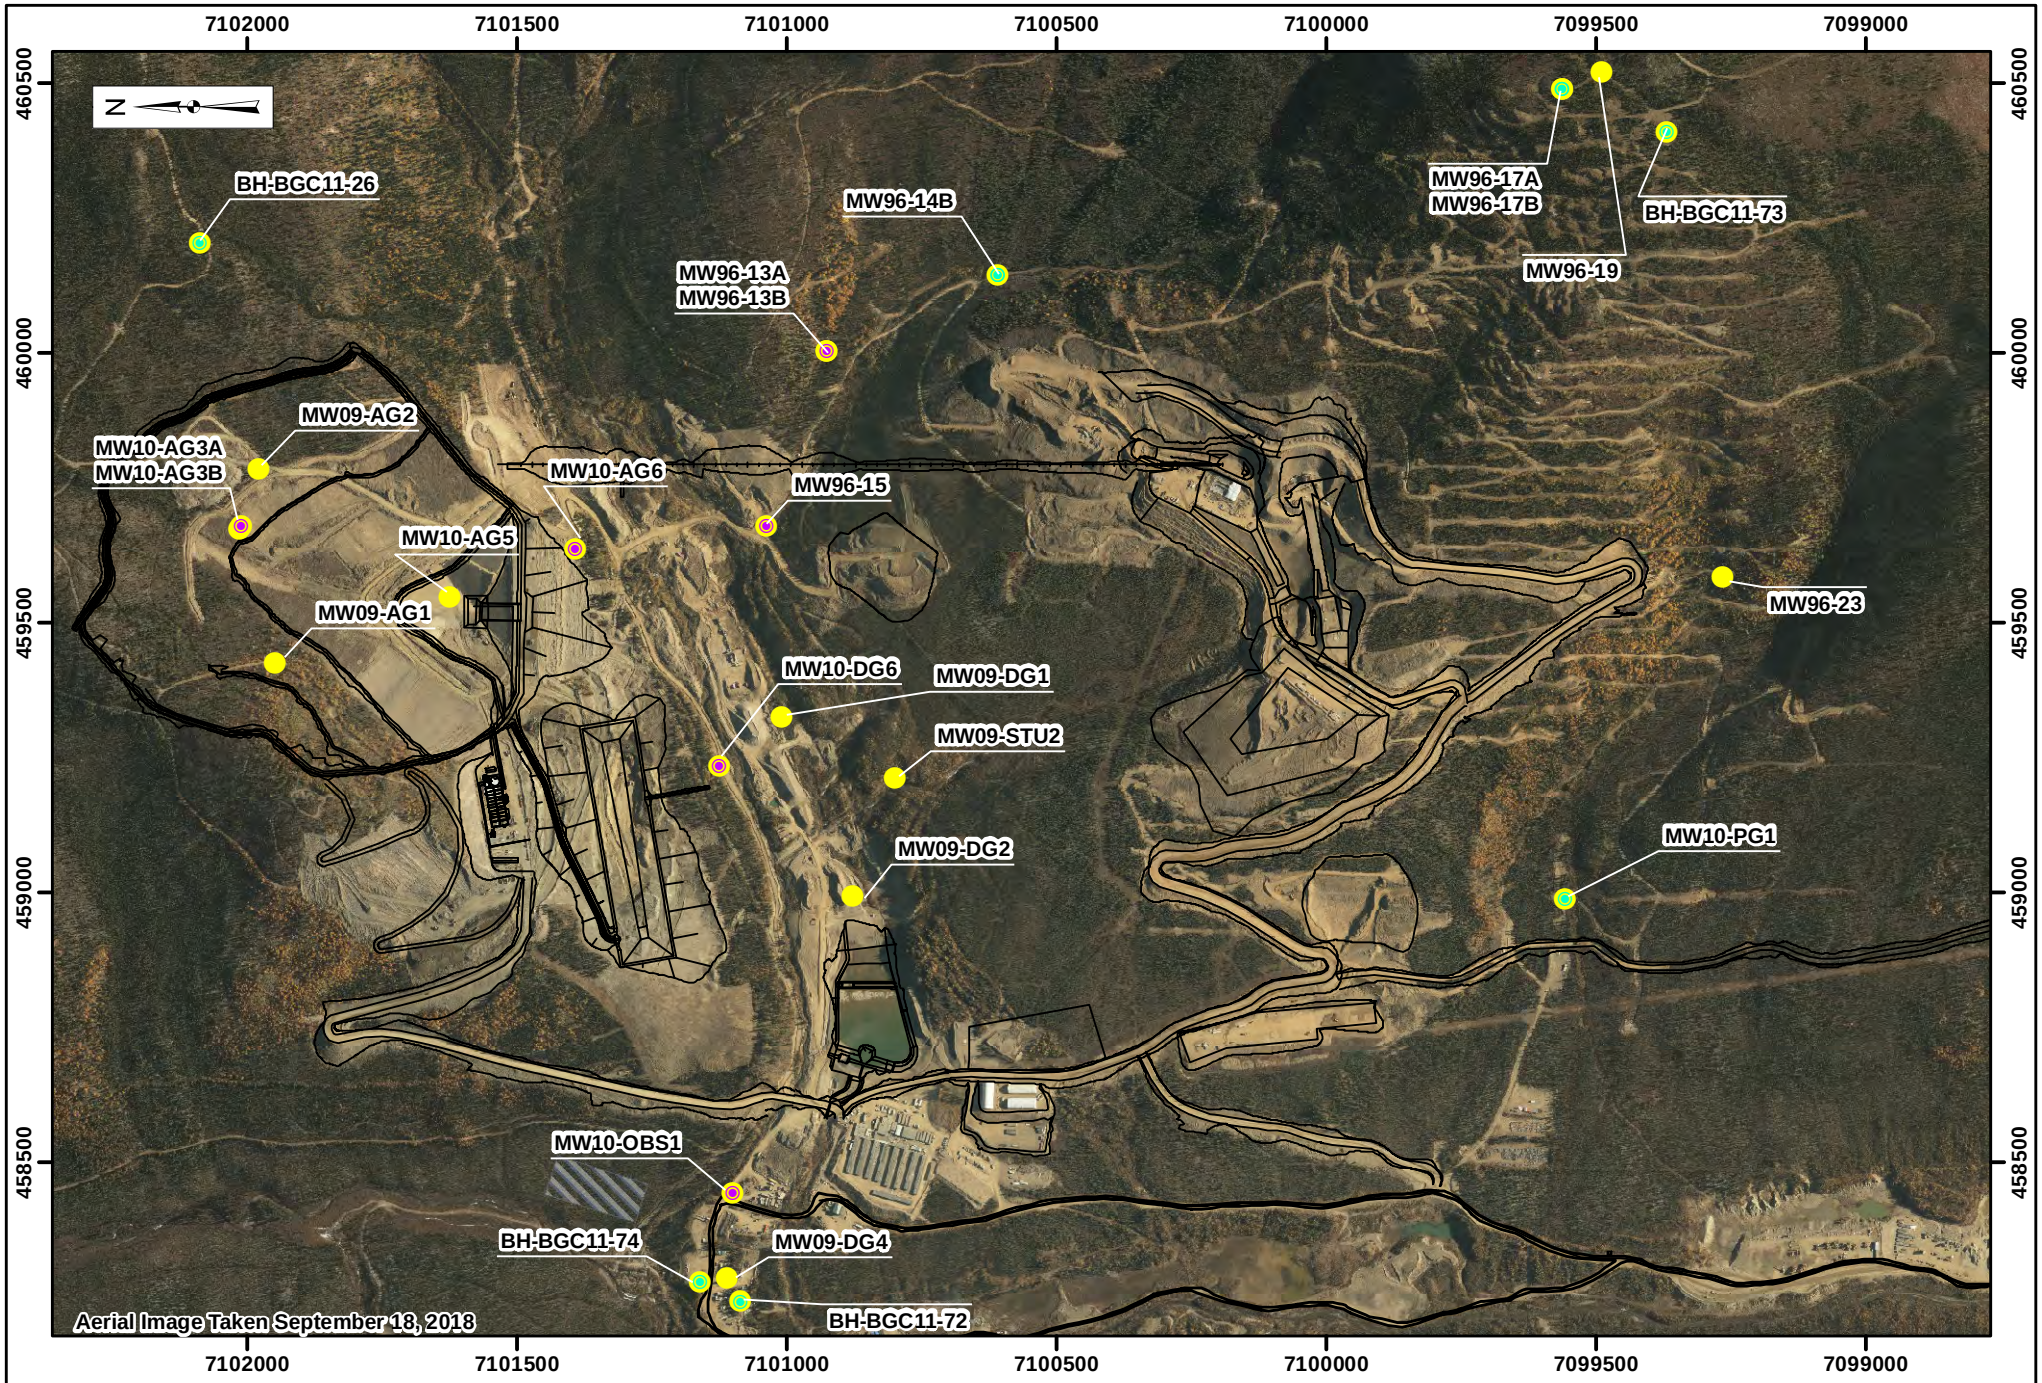

3.2.5.2 Results

The results of the updated models are provided in the Eagle Gold Project 2019 Water Quality Model Update Report provided as Appendix E. The model utilizes the updated mine plan and considers the receiving environment water quality objectives developed during the QZ14-041 Type A WUL hearing, the effluent quality standards mandated by QZ14-041, and updated data collected under the Environmental Monitoring, Surveillance and Adaptive Management Plan.

3.3 GROUNDWATER

The majority of the Project is situated within the Dublin Gulch basin, which is part of the Haggart Creek basin. The hydrogeologic zones used to characterize groundwater in the Project area include Eagle Pup and the Ann, Suttles, Olive, Bawn Boy, Platinum and Dublin gulches. The groundwater monitoring program in 2018 during construction consisted of continuing the general baseline data collection program that focused on specific spatial zones where facilities were constructed to help monitor potential Project effects on the groundwater flow system. The zones monitored during 2018 are depicted in Figure 3.3-1 and include the following areas:

- Heap Leach Facility (Ann Gulch catchment) and the Events Pond,
- Eagle Pup Waste Rock Storage Area (Eagle Pup catchment),
- Platinum Gulch Waste Rock Storage Area (Platinum Gulch catchment),
- Open Pit (Upper Suttles and Platinum Gulch catchments)
- Olive and Bawn Boy Gulches (Upper Dublin Gulch catchment), and
- Lower Dublin South Pond (Lower Dublin Gulch valley).

2018 Construction Groundwater Monitoring Network

3.3.1 Groundwater Quantity Monitoring

The objectives of the groundwater quantity monitoring program during 2018 were to provide continuous and spot level groundwater level measurements to monitor potential Project effects on the occurrence and quantity of groundwater during the second year of construction.

Groundwater level data have been collected since 2009 from the 27 monitoring wells/piezometers listed in Table 3.3-1 and shown in Figure 3.3-1. Seventeen of these wells were installed with continuous recording dataloggers at some time during the monitoring period (i.e., since 2009 or later). Upon initiation of the Development phase, and as per the EMSAMP, quarterly sampling and water level monitoring was conducted during 2018 at the locations listed in Table 3.3-2 and shown in Figure 3.3-1.

Appendix F is a compilation of hydrograph plots that were produced for each monitoring well listed in Table 3.3-1. The figure depicts groundwater elevation, air temperature and precipitation through time for each of the monitoring locations.

As described in previous reports (BGC 2014, BGC 2013 and Stantec 2012), the hydrographs demonstrate a large range in seasonal variability (since 2009) throughout the well network, with some wells (e.g., MW10-AG3a in the construction area for Phase 1 of the heap leach pad) experiencing only a meter change over the period of record, while others in the upper open pit area (e.g., BH-BGC11-73 and MW96-19) showed much larger ranges (over 10 meters). These trends were also observed in the seventeen wells listed in Table 3.3-2 that were monitored in 2018. The data indicate that for the wells monitored, the construction activities had no effect on the natural observed range of groundwater levels that have been since observations began in 2009. The lone exception was MW10-DG6, a well installed in bedrock and located on the north side of lower Dublin Gulch valley downgradient of the HLF embankment where some dewatering activities were occurring to facilitate foundation work. 2018 water levels were about 0.2 to 0.5 m lower than all previous measurements. However, this data is suspect in that the well casing was accidently hit by an excavator; the well was tilted slightly and now does not purge cleanly. Plans are to replace this well in spring 2019.

3.3.2 Groundwater Quality Monitoring

Table 3.3-3 lists and Figure 3.3-1 depicts the locations of the six groundwater monitoring wells that were sampled for water quality in 2018. These wells represent Ann Gulch and the HLF area (MW10-AG3a and MW10-AG6), Dublin Gulch valley (MW10-OBS1, MW10-DG6) and Eagle Pup (MW96-13a and MW96-15). Five of these wells have a long-term data records extending back to either 2009 (MW96-13a, MW96-15) or 2010 (MW10-AG3a, MW10-AG6, MW10-DG6). Sampling in MW10-OBS1 began in 2017. Concentration plots of four select parameters of interest for the project (total and dissolved solids for aluminum, arsenic, iron and selenium) are depicted in Figure 3.3-2 to Figure 3.3-5. Data used to create these plots is included as Appendix G.

Figure 3.3-2a depicts the concentrations of total aluminum observed in the six wells since 2009, and indicates that a wide range in concentration (between two and three orders of magnitude) is evident when considering each of the six wells. Also, there is quite a large range in variability in each well. Of the five wells with longer term records, data from three wells (MW10-AG3a, MW10-DG6 and MW96-15) suggest an increase in aluminum over time. The increasing trends were evident prior to construction activities.

Figure 3.3-2b depicts the concentrations of dissolved aluminum in the six wells. In general, dissolved aluminum concentrations are relatively low (less than 0.1 mg/L), as much as two orders of magnitude lower than total aluminum. There are a few excursions above 0.1 mg/L in three separate wells, but no discernible increasing or decreasing trends over time.

Figure 3.3-3a depicts the concentrations of total arsenic observed in the six wells since 2009, and indicates that a wide range in concentration (over three orders of magnitude) is evident when considering all six wells, while each well has a fairly confined range (within one order of magnitude). Of the five wells with longer term records, only one well (in MW96-15 in Eagle Pup) exhibits an increase in arsenic over time. The increasing trend was evident prior to construction activities.

Figure 3.3-3b depicts the concentrations of dissolved arsenic in the six wells. In general, and similar to total arsenic, there is a wide range in concentrations (four orders of magnitude) evident when considering all six wells, while all but one well (MW96-13a), varies within only one order of magnitude. In some cases, variability is much less than one order of magnitude (MW10-DG6, MW10-AG6 and MW96-15). When considering total versus dissolved arsenic concentration for each well, some wells exhibit very similar concentrations (MW10-DG6), while

others (MW96-15, MW96-13a, MW10-OBS1) exhibit up to three orders of magnitude difference between total and dissolved. These characteristics reflect baseline conditions prior to and after construction began.

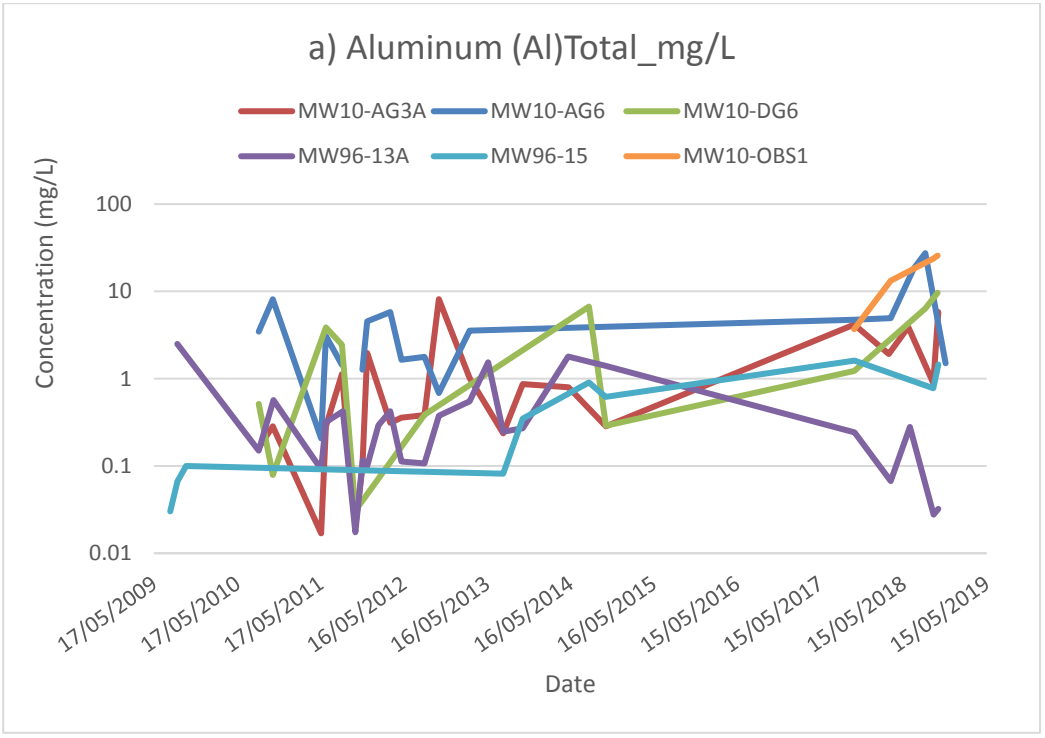

Figure 3.3-4a depicts the concentrations of total iron observed in the six wells since 2009, and indicates that a wide range in concentration (between two and three orders of magnitude) is evident when considering all six wells, but there is less overall variability in each well. Of the five wells with longer term records, two wells (MW10-AG3a and MW96-15) also suggest an increase in iron over time. The increasing trends were evident prior to construction activities.

Figure 3.3-4b depicts the concentrations of dissolved iron observed in the six wells. In general, dissolved iron ranges over three orders of magnitude when considering all the wells, but varies less than two orders of magnitude per well. In one case (MW10-DG6), dissolved iron remained relatively high and constant over time (~10 mg/L), while the other six wells vary considerably more, however, there are no discernible increasing or decreasing trends in dissolved iron concentration over time.

Figure 3.3-5a depicts the concentrations of total selenium observed in the six wells since 2009, and indicates that a relatively small range in concentration (less than two orders of magnitude) is evident when considering all six wells, and each well has an even smaller confined range (within one order of magnitude), often at the method detection limits. There are no long term increasing or decreasing trends evident with selenium. The two that suggest a decrease (MW10-3a and MW96-13a) are due to lowered detection limits.

Figure 3.3-5b depicts the concentrations of dissolved selenium observed in the six wells. In general, total and dissolved selenium concentrations are very similar for all the wells, and no increasing or decreasing trends are evident.

When considering each well, and total and dissolved concentrations for all four parameters, it is clear that some of the wells exhibit higher overall concentrations than other wells. For example, MW96-15 exhibits relatively high arsenic, selenium and iron, MW10-DG6 exhibits relatively high arsenic, iron and aluminum, MW96-13a exhibits relatively high arsenic and aluminum, and MW10-OBS1 exhibits relatively high iron and aluminum. Nevertheless, there does not appear to be any obvious or consistent spatial connection or temporal association to explain these characteristics.

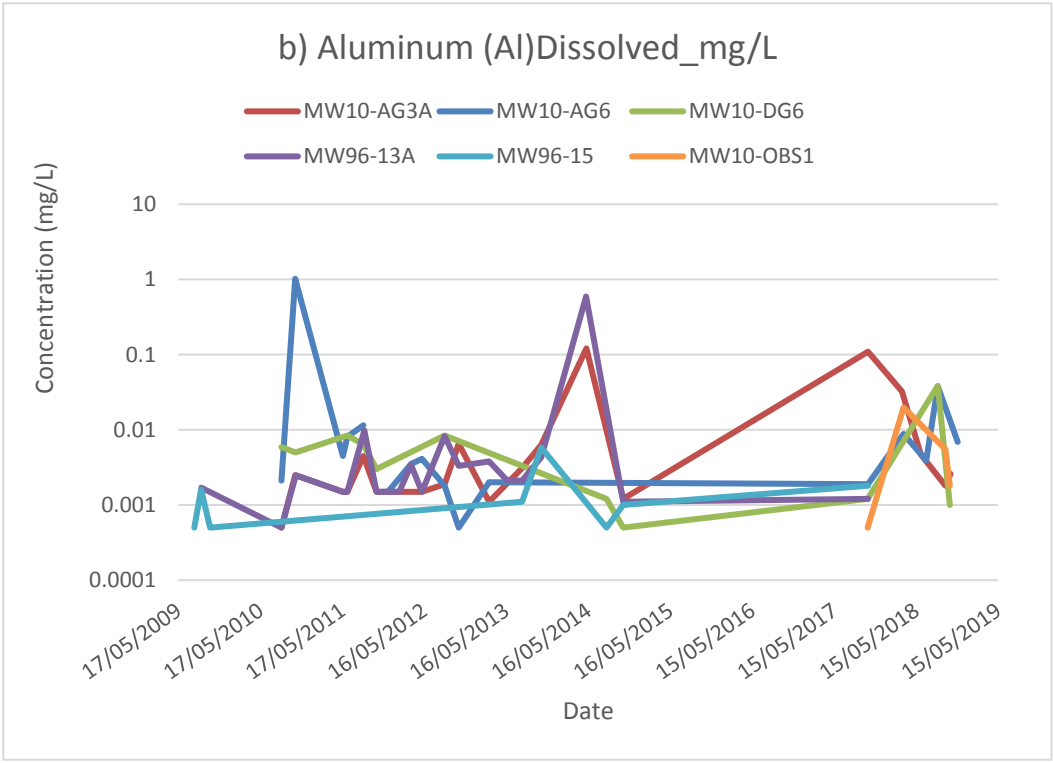

Figure 3.3-2: Concentrations of Total (a) and Dissolved (b) Aluminum since 2009

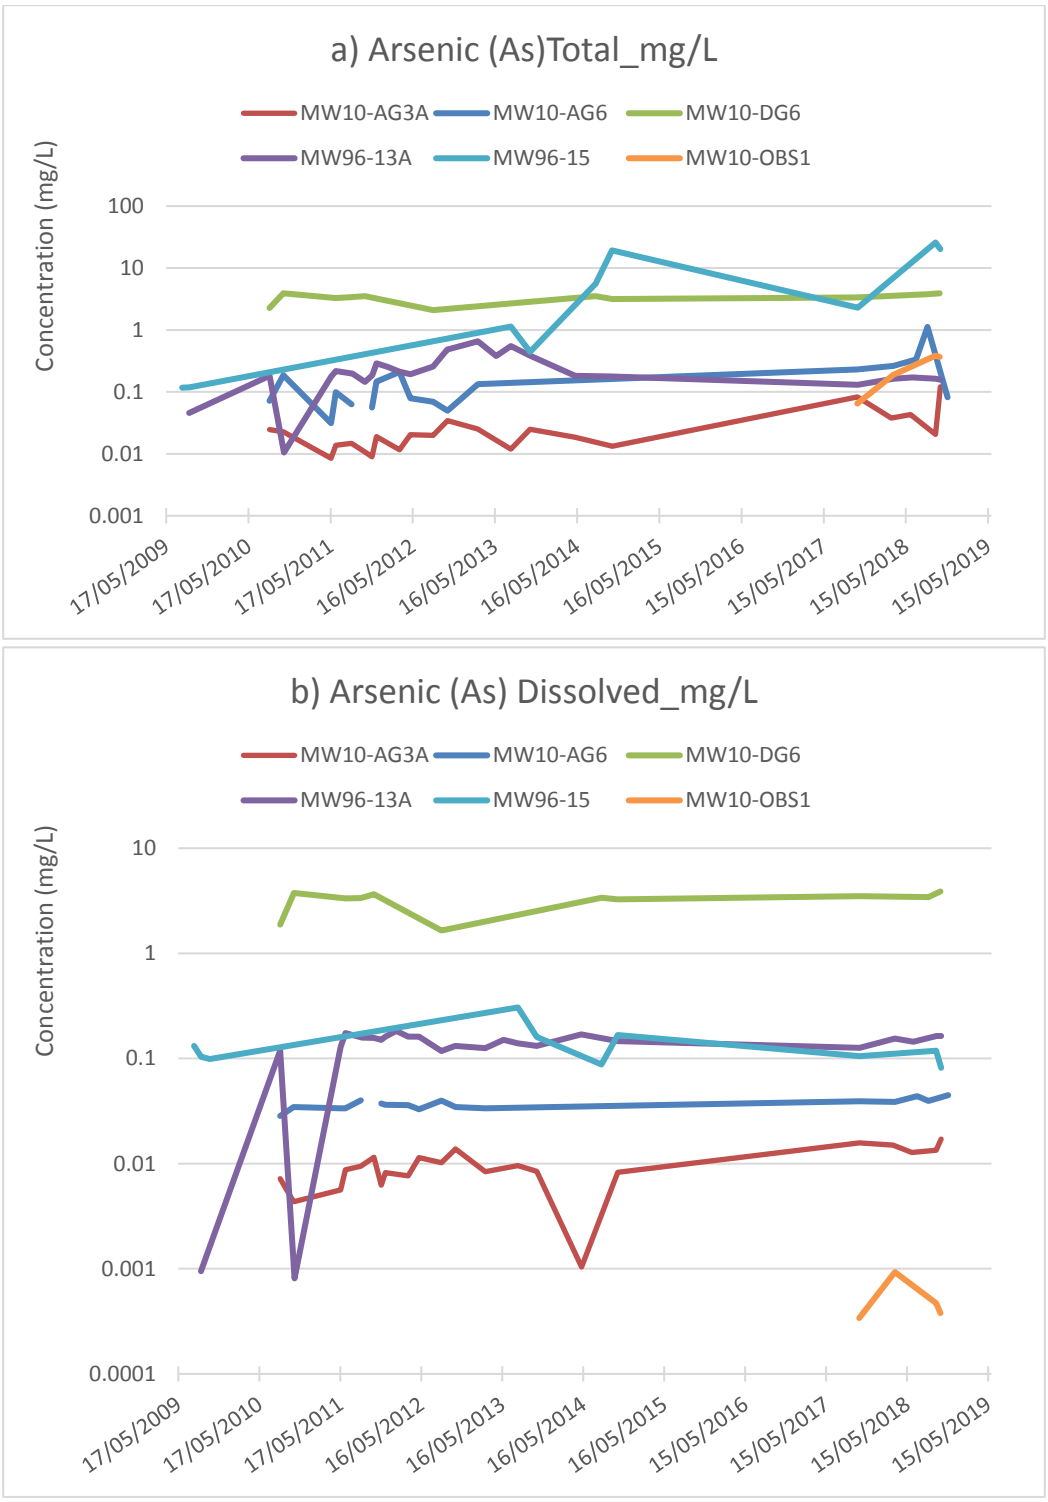

Figure 3.3-3: Concentrations of Total (a) and Dissolved (b) Arsenic since 2009

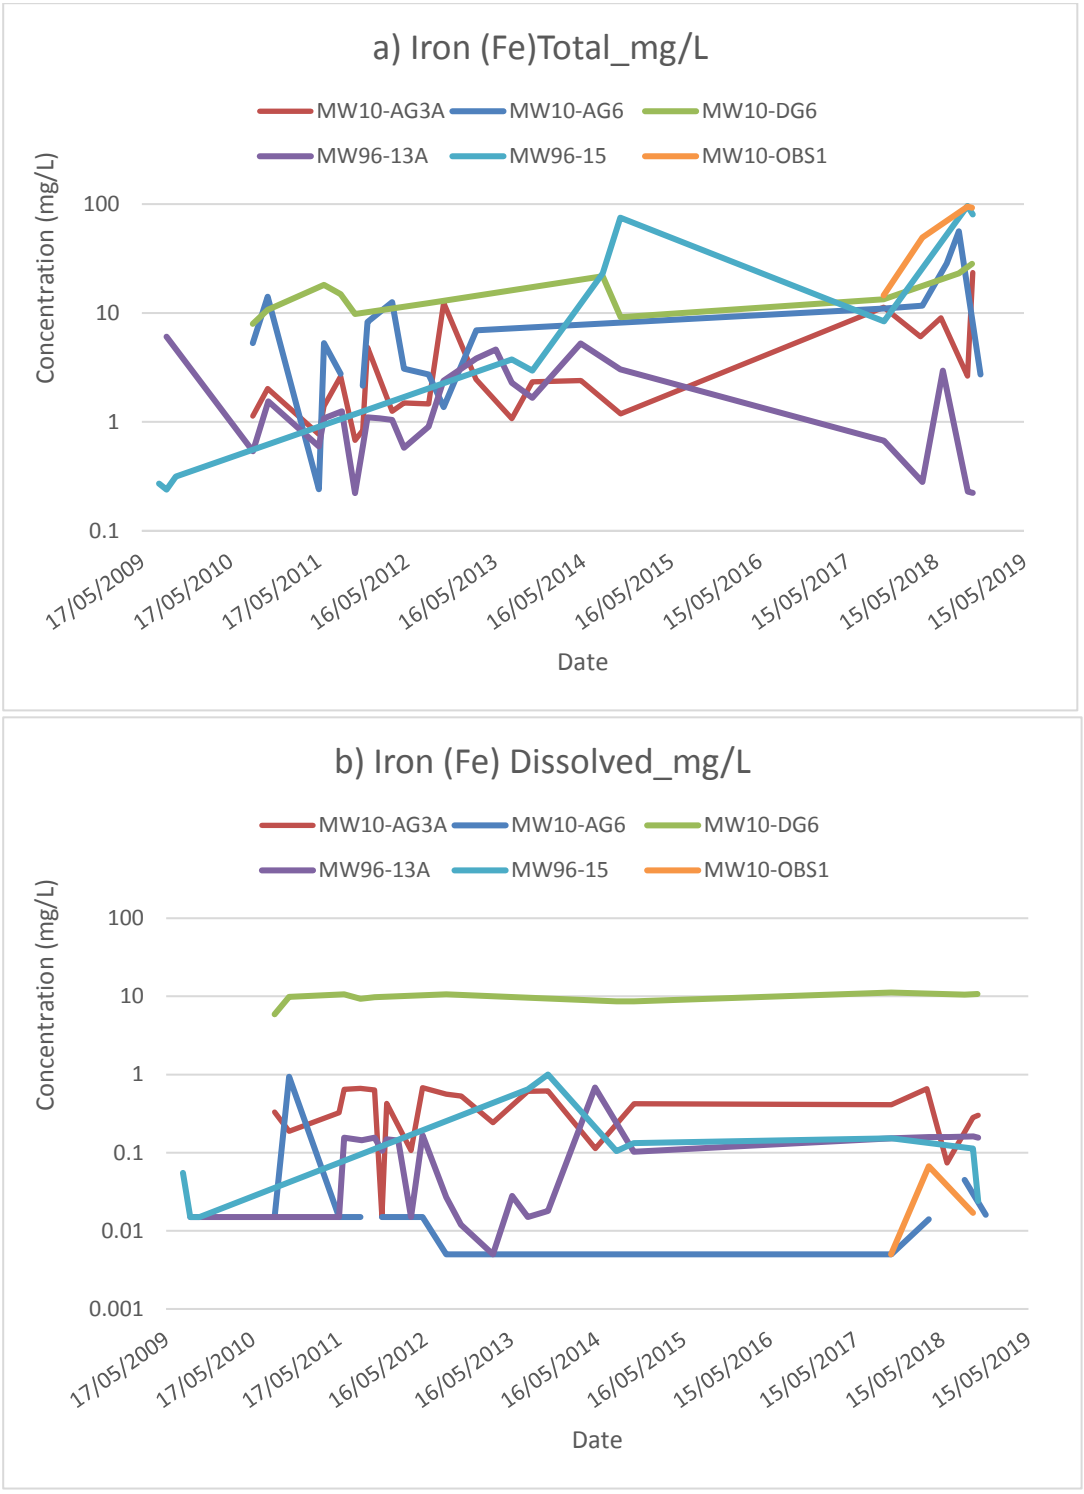

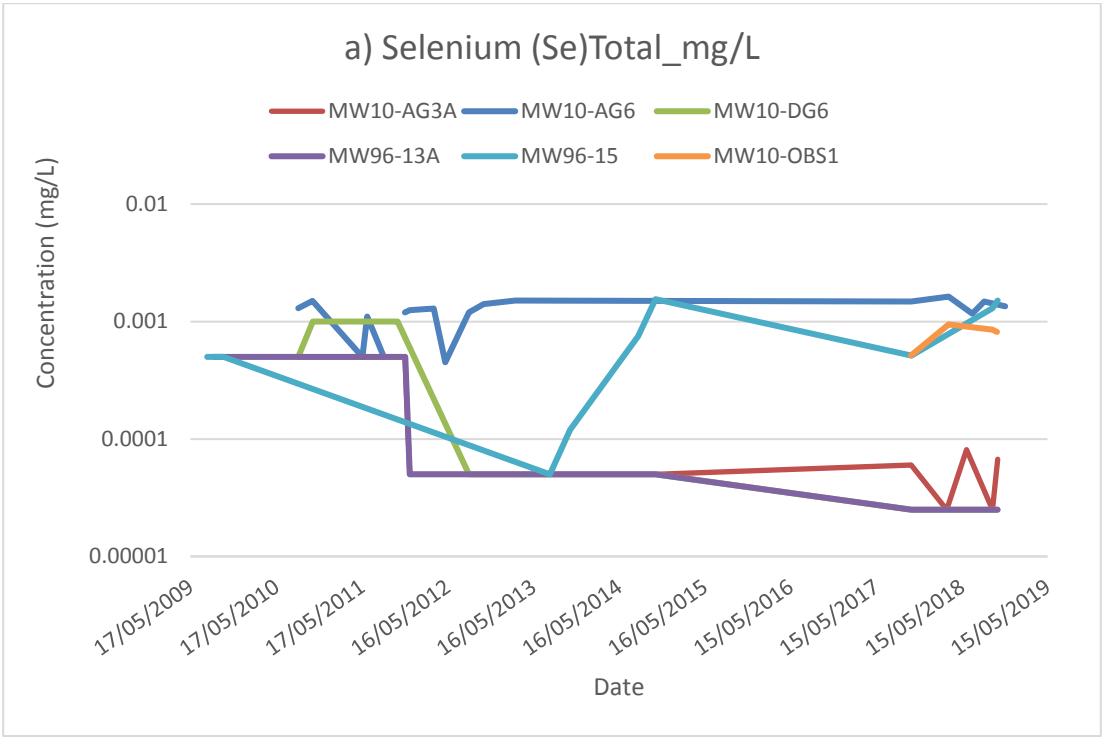

Figure 3.3-4: Concentrations of Total (a) and Dissolved (b) Iron since 2009

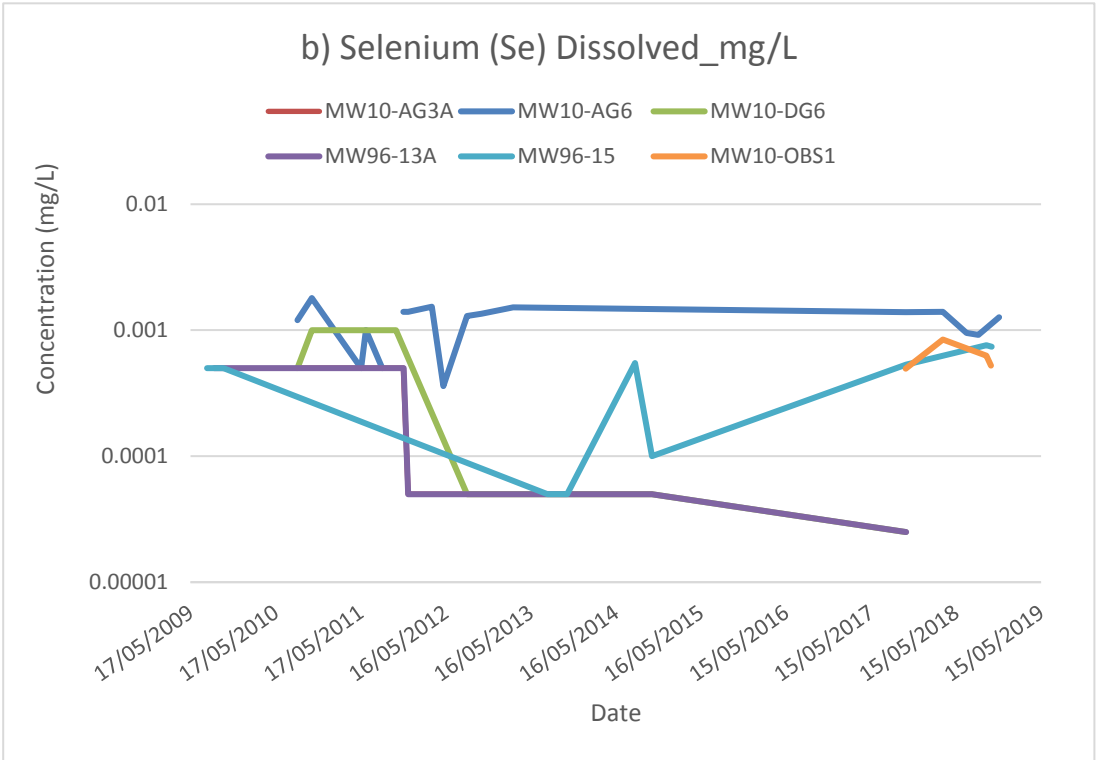

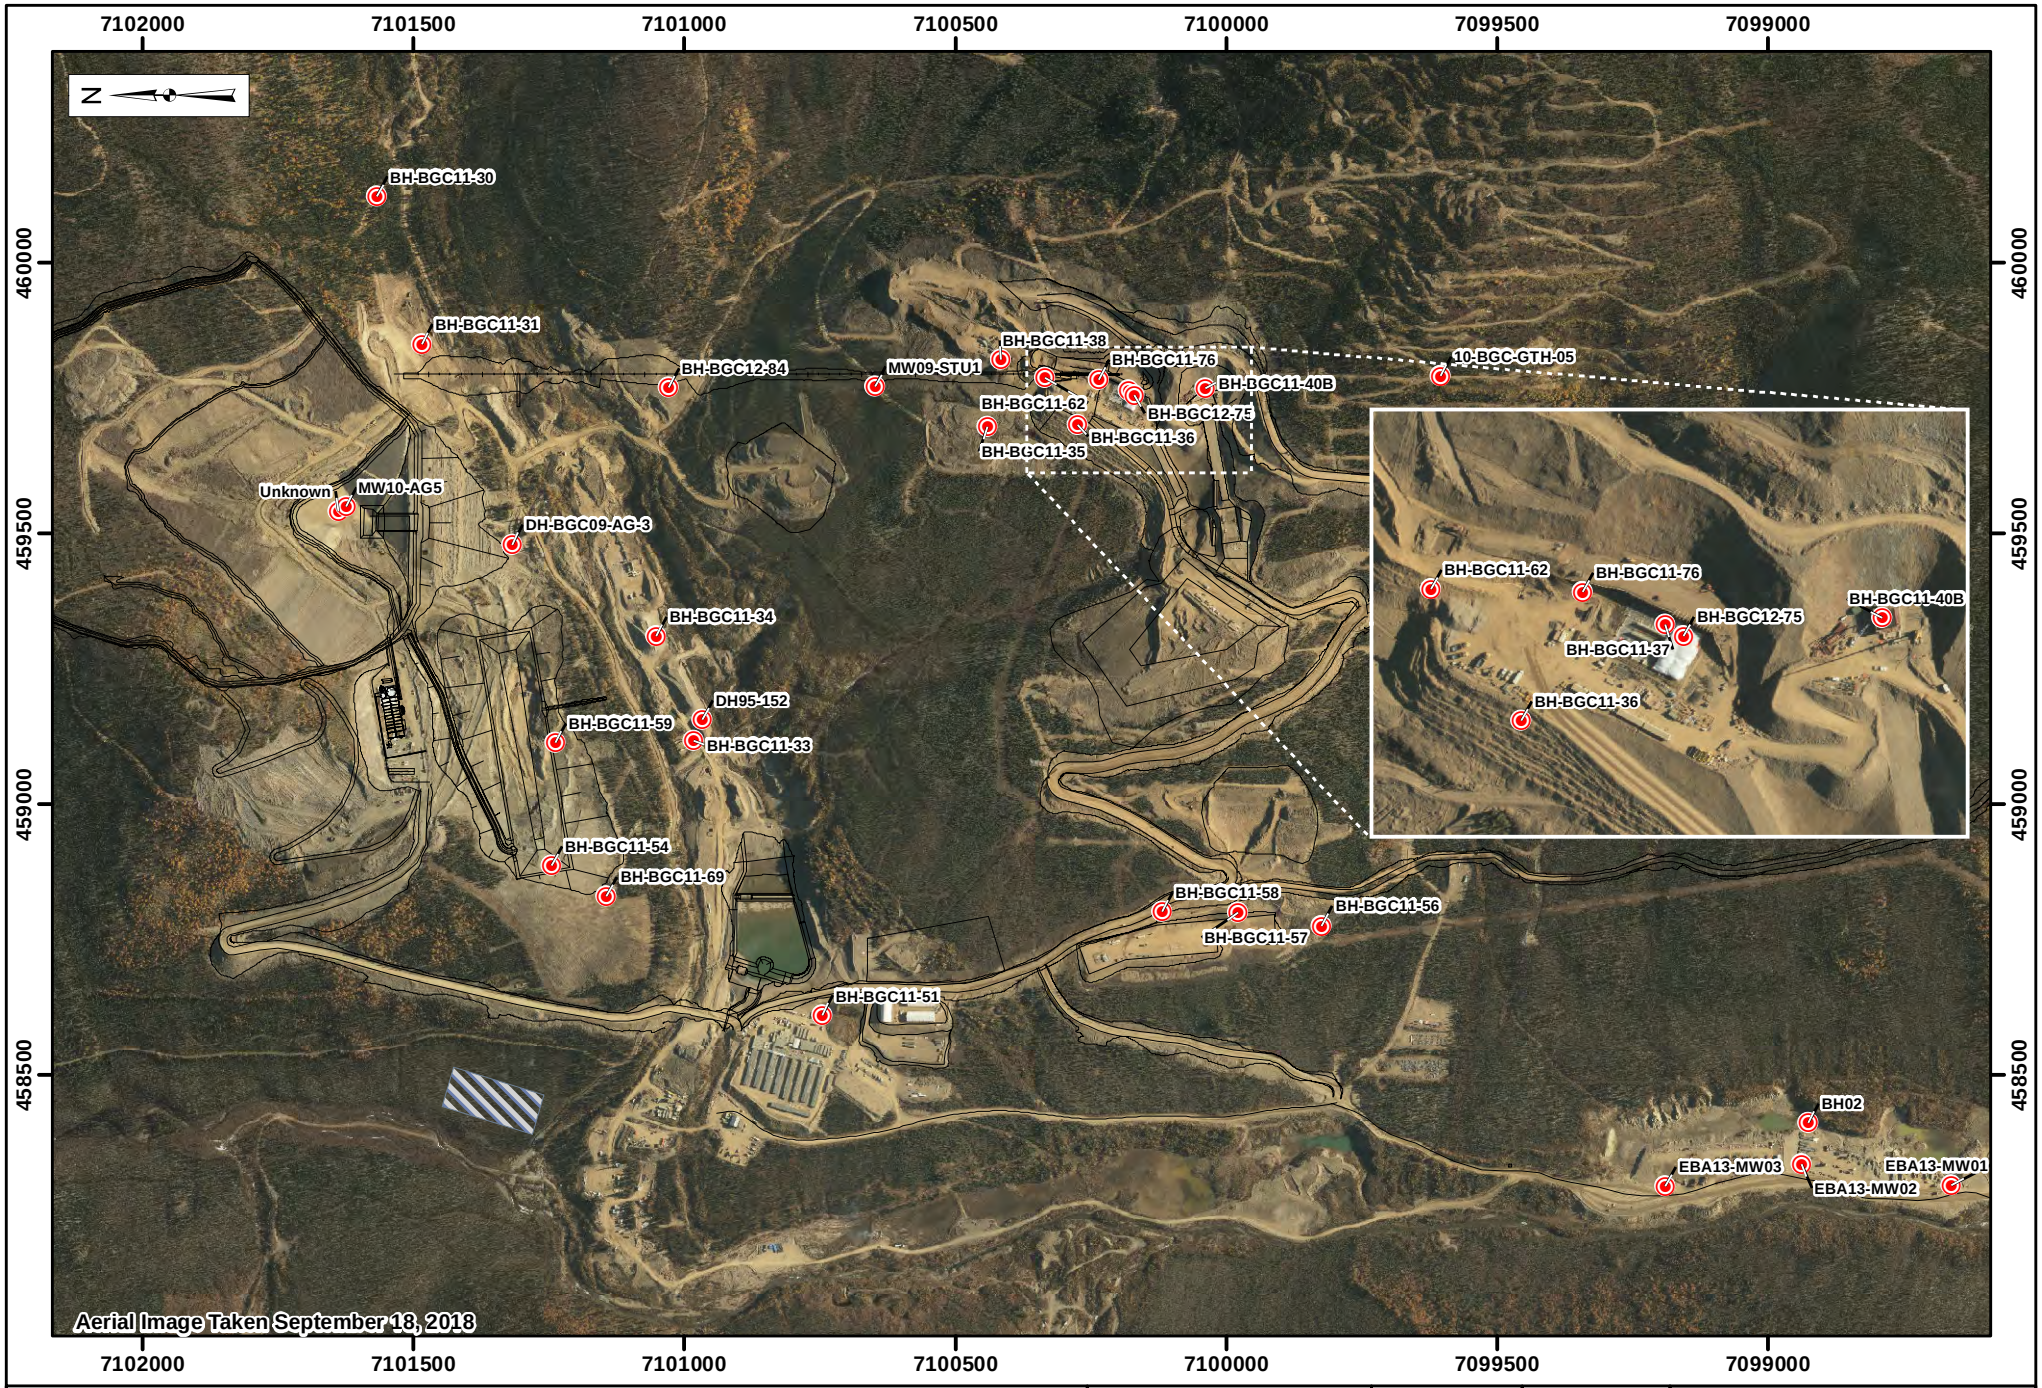

Figure 3.3-5: Concentrations of Total (a) and Dissolved (b)Selenium since 2009

3.3.3 Well Decommissioning

Table 3.3-4 lists and Figure 3.3-6 depicts the 30 environmental and geotechnical monitoring wells, piezometers and thermistors that were decommissioned in 2018.

3.3.4 Adaptive Management

When comparing groundwater level and water quality data collected during the baseline period (up to August 2017) and since construction, there are no discernible increasing or decreasing trends that can be attributed to construction activities, except for the one downward trend in groundwater level observed in MW10-DG6. While the well was damaged slightly, the decrease is expected and consistent with the dewatering activity in the HLF embankment area occurring just upgradient from the well. No adaptive management mitigations were necessary.

3.4 GEOCHEMICAL MONITORING

The geochemical monitoring program is intended to provide on-going characterization of rock encountered during the construction and operation of the Project. The geochemical monitoring program for construction rock has been designed to:

- Assess the potential for metal leaching and acidic drainage from excavated rock to determine if it is suitable for construction material;
- Verify geochemical predictions made during the mine planning phase;
- Assess the level of weathering-driven reaction products and their potential to migrate; and
- Evaluate the effectiveness of measures to prevent and control metal leaching and acidic drainage (if applicable).

3.4.1 Geochemical Barrel Testing

In 2012, a field kinetic test program with eight field barrels (Photo 3.4-1), each containing ~225 kg of rock representative of the Project, was initiated to support the development of water quality predictions that reflects geochemical and hydrogeological processes occurring at the Project. The geochemistry of field bin leachates collected during 2018 (Appendix H) were reviewed by Lorax. and the potential effects of the additional data on the source term model were assessed (Appendix H). In summary, Lorax determined that the source term predictions previously developed are still valid and do not require updating based on the additional data collected in 2018; however, SGC continues the sampling and analysis of the leachates on a monthly basis during non-freezing conditions.

Photo 3.4-1: Geochemical Field Barrel Test Site

3.4.2 Waste Rock / Acid-Base Accounting

No waste rock was generated during 2018 construction activities.

3.4.3 Construction Material Testing

In 2018, 26 samples were collected from various borrow locations to determine if the materials met the geochemical criteria established by the regulatory approvals for use in Project construction. Samples were sent to ALS Laboratories for analysis and the results are included in Appendix I.

All samples collected met the criteria required for construction or fill purposes, with a pH of at least 5.0, an NP:AP ratio of at least 3:1, and a total sulphide sulphur content of no greater than 0.3%. Samples ranged in pH from 6.6 to 9.0, with a median of 8.1, with Sulphur content ranging from non-detect at < 0.01% to 22% and a median of 0.02. (Table 3.4-1).

3.5 AQUATIC ENVIRONMENT

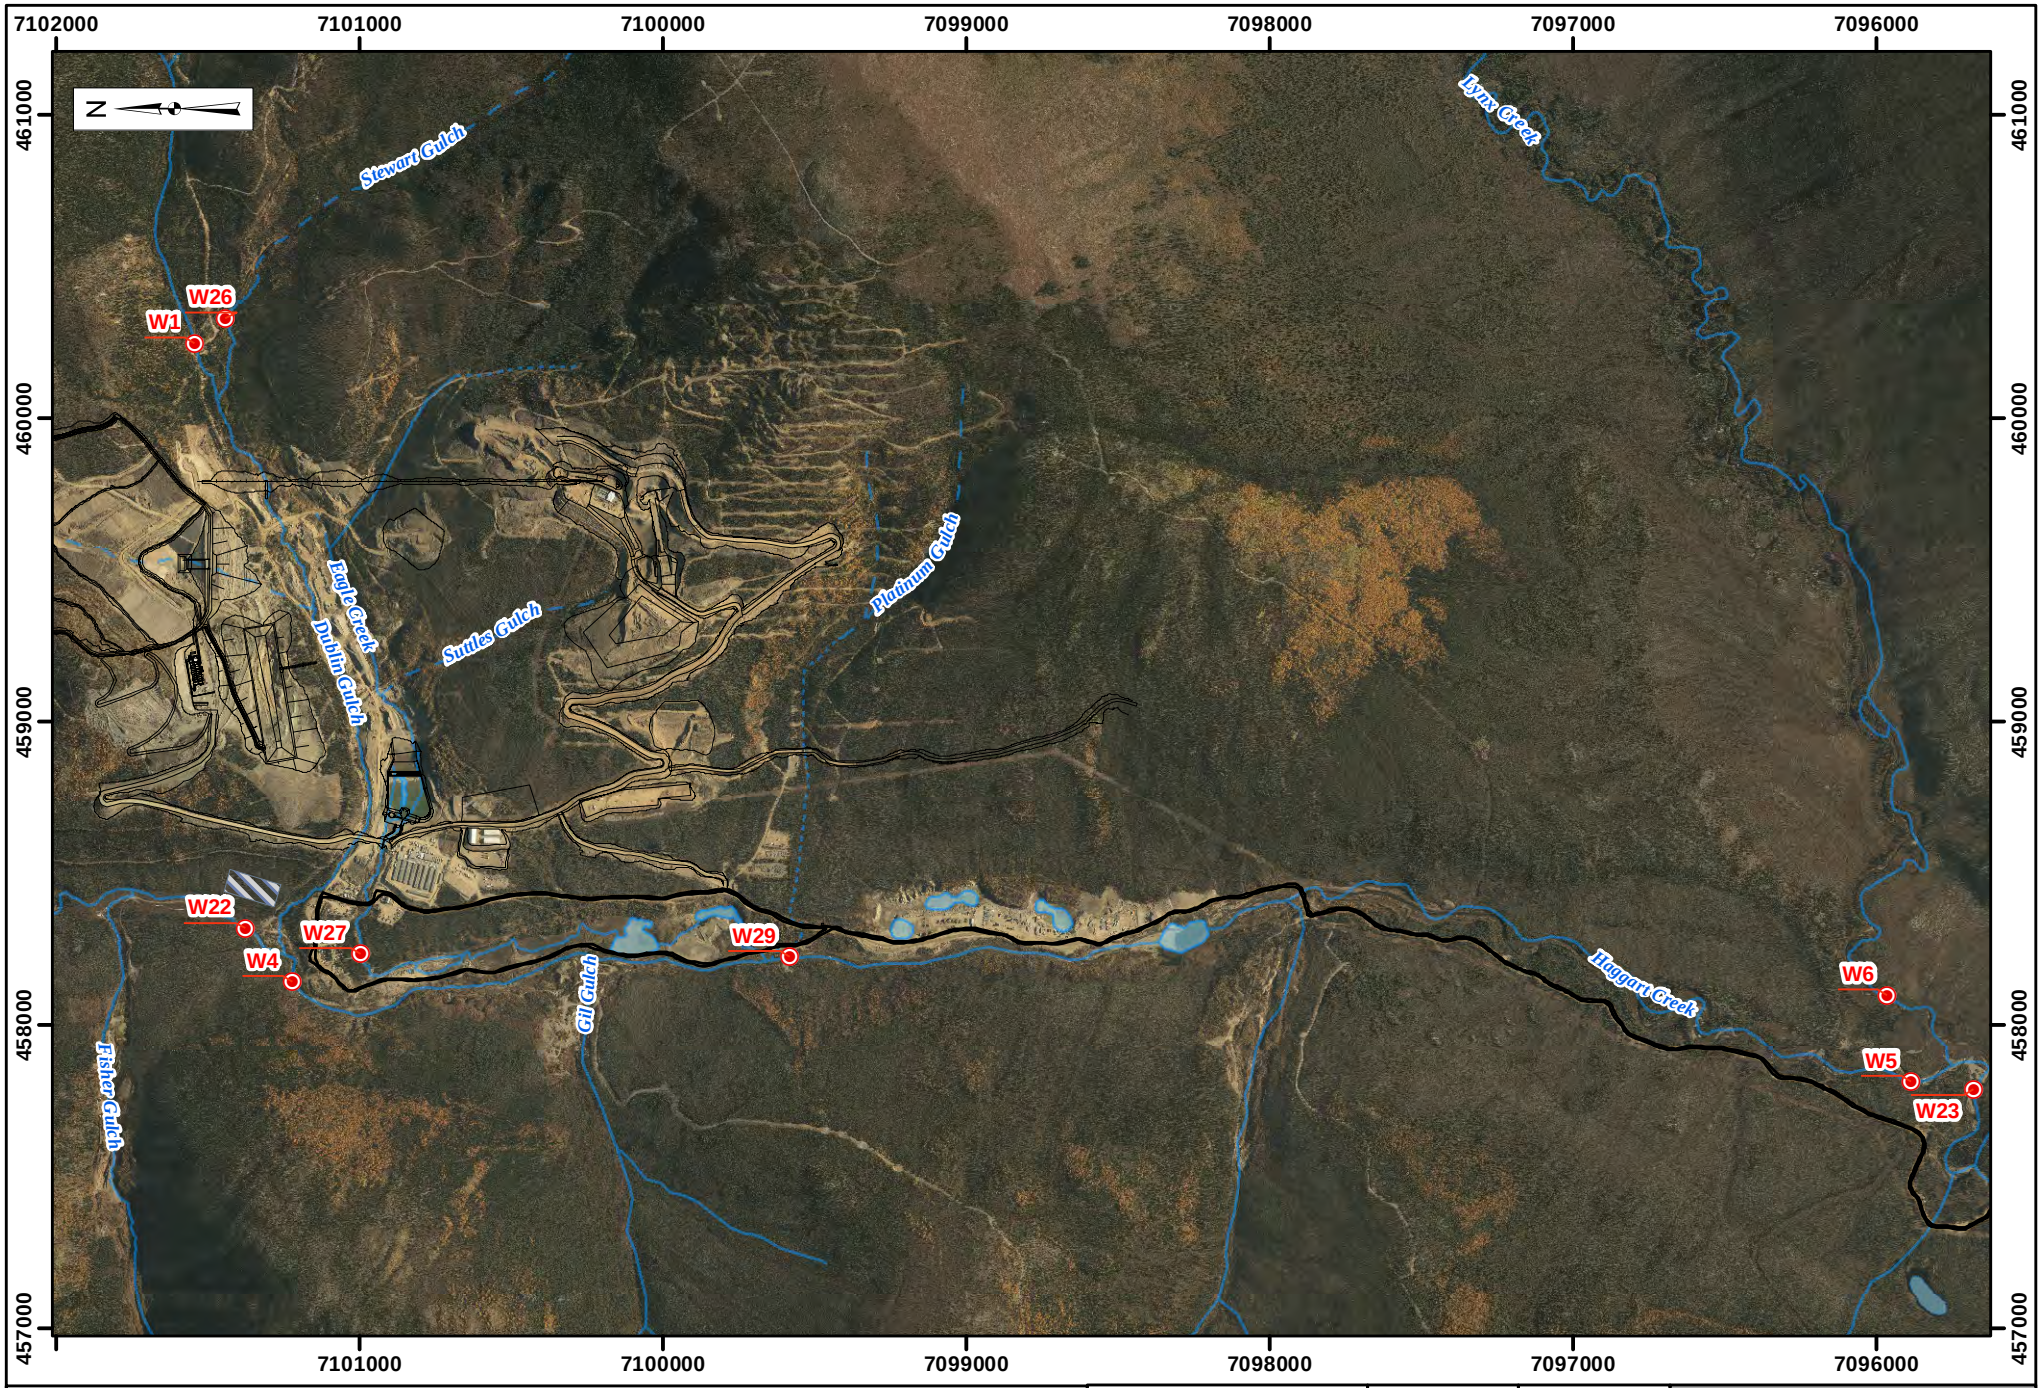
This section describes the stream sediment, benthic macroinvertebrate and fish and fish habitat monitoring conducted on the Project site in 2018. Sample sites for all programs are included in Figure 3.5-1. Benthic macroinvertebrate, stream sediment and water quality programs were performed concurrently to support a more robust characterization of the existing conditions.

3.5.1 Stream Sediment

The stream sediment monitoring program is designed to obtain data on the stream sediment quality in watercourses of the study area to help evaluate possible effects associated with the project. Annual sampling for stream sediment was conducted at nine sites in September 2018 (Figure 3.5-1) representing the four principal drainages (Eagle Creek, Dublin Gulch, Haggart Creek and Lynx Creek) in the Project area. A detailed report is included as Appendix J.

Samples were analyzed for soil pH, total organic carbon and a suite of 32 metals. These parameters are relevant to toxicity and physical habitat requirements for benthos, fish eggs and juvenile fish. The average result of ten selected metals at each site is presented in Table 3.5-2. These elements were chosen for closer examination as they may be present locally in the Project area. Since there are no Canadian Environmental Quality Guidelines established for nickel, selenium and silver, Table 3.5-1 lists the British Columbia Working Sediment Quality Guidelines (BCWSG) instead. Concentrations that exceeded the Interim Sediment Quality Guidelines (ISQG) are displayed in bold and gray highlighted. The ISQG guideline represents where adverse biological effects may only rarely occur. Concentrations that exceeded the Probable Effects Level (PEL) are displayed in bold and highlighted in orange. While the probable effects levels are based on studies in other regions that show a 50% incidence of creating adverse biological effects, they are used here for reference only as they may not be representative of actual effects levels in the Project region.

Table 3.5-1: Summary of Mean Stream Sediment Concentrations, September 2018



Drainage	Haggart Creek					Dublin Gulch		Eagle Creek	Lynx Creek	CEQG Guidelines

NOTES:
Source: Appendix J
* British Columbia Working Sediment Quality Guidelines
na = not applicable
bold and gray highlight = concentrations that exceeded the Interim Sediment Quality Guidelines (ISQG)
bold and orange highlight = concentrations that exceeded the Probable Effects Level (PEL)

As demonstrated in 2017 and in baseline studies done in previous years prior to construction, several guidelines were exceeded for the protection of freshwater aquatic life. The PEL for arsenic, 17 mg/kg, was exceeded by substantial amounts at all of the sites, and ranged from 79.5 mg/kg at W6 to 383.0 mg/kg at W1. Also, the concentration of nickel exceeded the BCWSG low level effect guideline (16 mg/kg) in the stream sediments at all of the sites and ranged from 25.0 mg/kg at W29 to 53.2 at W22. The ISQG was exceeded for copper at W27. The ISQG for cadmium was exceeded at W6 and W22, both of which are background (outside of Project influence) sites.

Periodic exceedances of guidelines of other metals have been reported in previous studies. In 2018, the ISQG was exceeded for chromium at W26, for lead at W27, and for zinc at W22. Guidelines were met in the study area for mercury, selenium and silver. Nickel concentrations remained relatively similar across the study area in 2018, similar to previous studies.

Arsenic is prevalent in the stream sediments throughout the study area and has been previously reported above the PEL on all sampling occasions. Arsenic is typically associated with the mineralogy of gold. The high concentrations documented upstream of Project activities (W1, W26 and W22) and an undisturbed reference site (W6) indicate that arsenic levels are naturally elevated throughout the Project area.

EAGLE GOLD PROJECT
YUKON TERRITORY

2018 Sediment and Benthic Monitoring Locations

3.5.2 Benthic Macroinvertebrates

Annual sampling for benthic invertebrates was conducted in September 2018 and represents the second survey completed during the construction phase of the Project. Benthic samples and water quality samples were collected at sites shown in Figure 3.5-1. A detailed report is included as Appendix K.

Data from the survey was subjected to several metrics and indices to describe the benthic populations. Table 3.5-2 provides a summary of benthic community statistics.

Table 3.5-2: Summary of General Statistics on Benthic Communities, September 2018

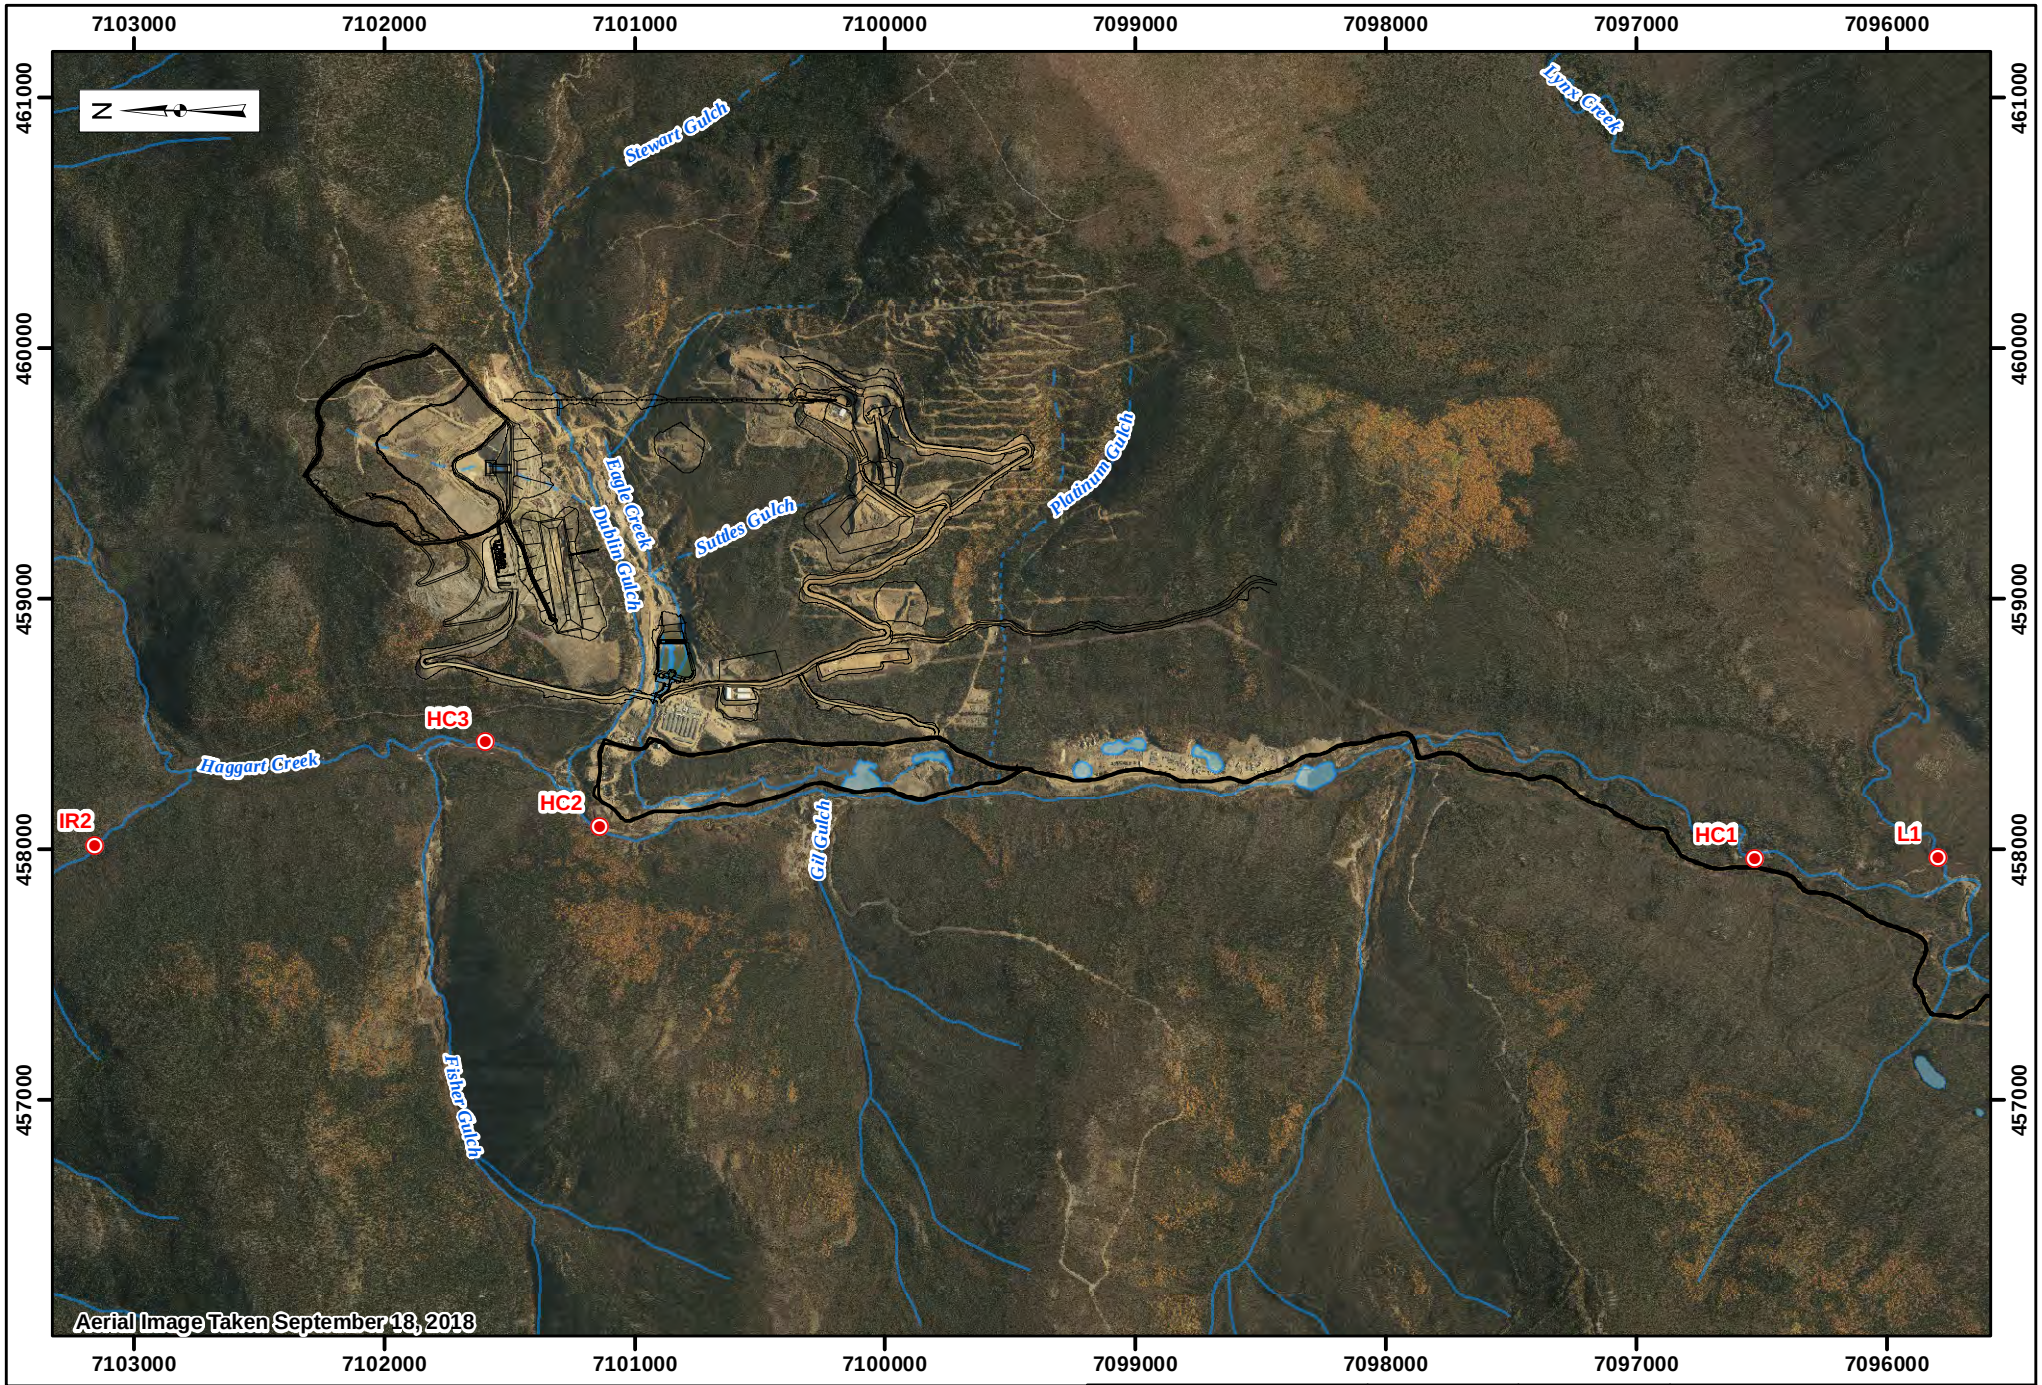
Drainage	Site	Abundance (organisms/site)	Density (organisms/m^3)	Taxonomic Richness/site	Simpson's Index of Diversity/site
Haggart Creek	W22	731	2,623	60	0.93
	W4	336	1,206	50	0.94
	W29	933	3,348	55	0.91
	W5	519	1,862	57	0.91
	W23	1039	3,728	65	0.91
Dublin Gulch	W1	849	3,046	43	0.87
	W26	2196	7,879	38	0.86
Eagle Creek	W27	709	2,544	43	0.87
Lynx Creek	W6	2429	8,715	52	0.88

Abundance was determined by summing all of the individuals present in a known sample area. Abundance per site was calculated as density (organisms/m^3) to allow comparisons with previous surveys. Taxonomic richness is a simple measure of diversity where each type of invertebrate is counted per site. The Simpson's Diversity Index was also applied as a measure of diversity. This index takes into account the number of species present as well as the relative abundance of each species, and ranges from 0 to 1, with numbers approaching 1 representing greater diversity. This method shows that communities at all sites were very diverse.

When comparing, for example, a site on Haggart Creek upstream of the project (W22) with a site downstream of the project (W23), the densities and diversities are very similar, suggesting that little if any, impact to Haggart Creek benthic populations has occurred despite over 100 years of human activities within the study area. Further discussion is provided in Appendix K.

When examined against previous surveys, the 2018 data indicates habitat conditions have not measurably changed and they continue to support stable and healthy benthic populations at all sites with good representation of the major groups of organisms that are typically present in lotic waters.

3.5.3 Fish and Fish Habitat



Annual inventory, sampling and documenting of fish and fish habitat was conducted in September 2018 at the five established background monitoring locations (on Ironrust, Haggart, and Lynx Creeks) shown in Figure 3.5-2. A detailed report is provided as Appendix L.

The composition of the catch from this annual study was represented by three fish species: slimy sculpin, Arctic grayling, and burbot (Table 3.5-3). Biophysical characteristics observed and fish species found at each of the five

monitoring sites in September 2018 were similar to previous surveys. Species composition showed consistency and was indicative of a stable fish community. Overall fish captures at all of the sites were generally lower in 2018 compared to 2017. It is believed that the colder water temperatures measured during the study combined with the abundance of frazil ice that had recently formed in the stream, likely had an unfavorable effect on fish catch totals.

Table 3.5-3: 2018 Fish Capture Methods and Results

Site	Capture Method	Catch			Observed
		Artic Grayling	Burbot	Slimy Sculpin

3.7 METEOROLOGY AND AIR QUALITY MONITORING

3.7.1 Climate Monitoring

Climate monitoring continued at the Project in 2018 from two onsite climate stations; the Potato Hills station, an ONSET Hobo operating system (1,420 meters above sea level (masl)), and the Camp station, a Campbell Scientific CR800 datalogger (782 masl). Temperature, rainfall, wind speed and direction, relative humidity, barometric pressure and solar radiation all continue to be measured at 15-minute intervals at the Camp climate station.

The Potato Hills climate station measured temperature, rainfall, wind speed and direction, relative humidity and barometric pressure at 60-minute intervals until August 5, 2018 when the system was removed from the station due to ongoing power failures. On September 22 the ONSET system was replaced at the station logging at 15-minute intervals. On October 16 it was confirmed that the wind direction sensor was failing and was disabled. The station collected continuous data for the remainder of 2018.

Snow course surveys as contemplated in the EMSAP were also completed in 2018.

Appendix M provides an updated climate data report based on all data compiled for the Project.

3.7.2 Air Quality Monitoring

Visual daily air quality monitoring throughout the site took place during periods when the roadways were not frozen or wetted. The goal of the visual monitoring program was to identify areas where fugitive dust emissions from roadways and construction sites were prevalent. Fugitive dust events observed during the reporting period were minor and addressed through the application of water in heavy traffic areas.

Beta-Attenuation Particulate Monitors (EBAMs) were installed at site, below the expanded camp in late August. The EBAM system includes real time data transmission that can be monitored remotely with daily summaries automatically generated by the associated software platform. In addition to this site personnel complete routine checks and monthly maintenance. Routine measurements are taken on 15-minute intervals for Total Suspended Particulate (TSP), Fine Particulate Matter ($PM_{2.5}$) and Coarse Particulate Matter (PM_{10}). Appendix N provides minimum, maximum, and mean daily values (24hr).

Daily recorded air quality results are compared to the Yukon Ambient Air Quality Standards (YAAQS) in Table 3.7-1. Annual averages are calculated from the date of installation (August 22) until December 31, 2018. All measured air quality particulates were below the annual average outlined by the YAAQS. There were six occurrences of TSP exceeding the 24hr standard, five of the occurrences took place between October 5 and 12. PM_{10} results were above the 24hr YAAQS from October 6 to 10. Air Quality results remained below the averages outside of these time periods. Fine particulate ($PM_{2.5}$) did not exceed the 24hr YAAQS in 2018.

Exceedances are thought to be related to the cessation of dust suppression in early October. Water use for dust suppressions was stopped on October 4 once day time temperatures remained consistently below freezing and dust suppression became unsafe for vehicles. There was elevated dust throughout the week until it snowed on October 11th and dust levels were once again lowered below the 24hr standards.

Table 3.7-1: Daily Air Quality Results Compared to the Yukon Ambient Air Quality Standards

Contaminant	Annual Ambient Air Quality Objectives (µg/m³)	Results			24hr Ambient Air (µg/m³)	No. of Exceedances
		Min	Max	Mean		
TSP	60	0	273.4	21.36	120	6
$PM_{2.5}$	10	0	12.71	1.19	28	0
PM_{10}	*	4.99	174.48	7.91	50	4

NOTE: *No Annual Ambient Air Quality Objectives outlined in the Yukon Standard.

Additionally, dust fall stations were installed on August 23, 2018 at the locations described in Table 3.7-2 alongside the four permanent vegetation plots described in Section 3.8, below. Dustfall container samples are collected and submitted for laboratory analysis on a monthly basis.

Table 3.7-2: Dustfall Monitoring Locations

Plot	Easting	Northing
D 1	463559	7100818
D 2	458240	7101022
D 3	460583	7099088
D 4	458436	7097951

3.8 TERRESTRIAL

3.8.1 Vegetation Monitoring Program

As outlined in the EMSAMP, four permanent vegetation plots described in Table 3.8-1 were established in 2018 to monitor changes in vegetation during the construction phase of the Project. The vegetation monitoring baseline program was completed by Laberge Environmental and consists of two sites in the Subalpine Zone with elevations greater than 1225 masl and two sites at lower elevation in Forested areas. These vegetation plots will be monitored once a year during the growing season to provide data to specifically address potential changes associated with metals in and on plant tissue.

Table 3.8-1: Location and Description of Vegetation Monitoring Plots

Plot #	NAD 83 Zone 8N		Aspect	Elevation (m)	Site Description
	Easting	Northing			
D1	463550	7100803	Level	1417	Potato Hills near climate station
D2	458251	7101150	West	834	Upslope of the air quality station and the camp climate station
D3	460598	7099079	South west	1356	Top of Eagle Pup near the over-the-top road
D4	458450	7097945	Level	757	On the west side of the access road just upstream of the Haggart Creek culverts.

NOTE: Source Laberge (2019; Appendix O)

Each site is accessible by road and has been delineated with rebar. The four sites contain plot areas with a transect expanding outward in cardinal direction 10 m from the center.

Vegetation samples were collected for species found within each of the sites five plots, the Table 3.8-2 list the species and sites where the sample biomass was large enough to run analyses. Willow (*Salix* sp.) was the only species found at all for sites with enough biomass for analysis. Samples were analyzed for a suite of 34 metals including mercury. The focus of the analysis was on metals that potentially may be emitted as a result of the gold recovery processes (arsenic, cadmium, chromium, lead, and mercury) and as outlined in Table 3.8-2.

Table 3.8-2: Results of Vegetation Monitoring Metal Analysis

Plot	Tissue Type	N	Selected Metal Concentrations (mg.kg) per Tissue Type				
			Arsenic	Cadmium	Chromium	Lead	Mercury
D4	Bluejoint	1	2.27	0.0224	0.181	0.438	ND
D1	Festuca	5	0.113	0.055	0.073	0.108	ND
D4	Sedge	4	2.608	0.103	0.327	0.593	ND
D1	Dwarf Birch Leaves	5	0.178	0.187	ND	0.055	0.0054
D2	Dwarf Birch Leaves	5	2.128	0.255	0.205	0.395	0.0060
D3	Dwarf Birch Leaves	5	0.410	0.188	ND	0.066	0.0054
D1	Willow Leaves	5	0.187	1.758	ND	0.082	0.0066

D2	Willow Twigs	1	0.135	1.948	ND	0.154	ND
D3	Willow Twigs	4	0.612	2.490	0.00	0.188	ND
D1	Willow Twigs	1	0.311	1.03	0.068	0.102	ND
D2	Willow Twigs	5	1.848	1.501	0.225	0.429	ND

NOTE: Source Laberge (2019; Appendix O); ND=not detected.

The highest concentrations of the five metals of interest were documented in the tissue samples collected from D4, however levels are not considered toxic. Full results of the 2018 Vegetation Monitoring program can be found in Appendix O.

3.8.2 Soils

The Soils monitoring program was designed to provide data to determine changes to metal and nutrient levels in soils adjacent to the mine as a result of dust deposition occurring during Project activities. As outlined in the EMSAMP soil sampling locations were picked in conjunction with the vegetation monitoring program and the baseline study completed by Laberge Environmental (see Table 3.8-1, above).

Initial findings from the baseline study indicate that the soils at the Project are nutrient poor and have a pH somewhat acidic to near neutral. The pH at the four sites ranged from 4.62 to 6.42 and soil samples were collected and analyzed for 36 metals. With the exception of arsenic all metals were below CCME guidelines. Results from the baseline study can be found in Appendix P. Arsenic is often associated with gold bearing anomalies in the

region and these baseline concentrations reflect the natural mineralization of the Project area. The full report can be found in Appendix P.

3.8.3 Wildlife

As part of site orientation, all site personnel receive bear awareness training, company policies training, and are required to report wildlife observations and incidences. Personnel record wildlife sightings and encounters on wildlife observation cards available at a variety of locations throughout the site. Wildlife observation cards are a tool used to track and evaluate the frequency of animal encounters; these cards are used to monitor species at risk, nuisance wildlife and to notify site personnel of potentially dangerous animals around work areas. Observations of wildlife and indicators of wildlife such as tracks, scat or auditory observations may also be recorded (even in the absence of visual confirmation). Wildlife observations recorded through 2018 are provided in Appendix Q.

3.8.3.1 Pre-Clearing Wildlife Surveys

Prior to clearing throughout the year, areas were surveyed for mineral licks, nest trees, snags, rocky outcrops, small ponds and seepage. No animals or notable features were found during these surveys. For 2018 construction activities that took place within the breeding bird window (May-September) pre-clearing bird surveys were completed. A total of twelve bird pre-clearing surveys took place from May to September 2018.

3.8.3.2 Wildlife Incidents

On November 20, 2018 an injured red fox was noticed on site and was suspected to have a broken back, but the cause of the injury was unknown. It was live trapped by Site Services personnel; shortly after this the decision was made to euthanize the animal. The Environment Department contacted the Conservation Officer in Whitehorse for further instruction. The fox carcass was eventually retrieved by the Mayo Conservation Officer.

A Grizzly bear was observed May 13, 2018 at the top of the ADR road at 1:00am by a night shift worker and reported to the Environmental Department through the wildlife observation card. The animal was foraging and no human/wildlife conflict occurred. Another Grizzly was observed walking close to camp on June 11, 2018 and in response a site wide bulletin was sent to all contractors and discussed in morning toolbox meetings. No further incidents occurred.

3.8.3.3 Annual Moose Survey

Moose are the most common ungulate species in the region and occur in the Project area during all seasons. The Project area is recognized as containing high quality early successional space and has been identified as important moose habitat by local residents. Environmental Dynamics Inc. (EDI) was contracted to conduct a late-winter moose distribution survey on behalf of SGC. The survey area included a 10 km radius around the Project area and the survey was completed with help from EDI, Victoria Gold and FNNND employees.

Three surveys were completed during pre-construction and are considered as a baseline (2011-2013). The 2018 survey is the first of two late-winter surveys to be conducted during the construction phase and a final survey will be completed once the Project is in production. Depending on results from the late-winter surveys, the frequency of subsequent aerial surveys will be determined.

The 2018 aerial survey was conducted on March 5th and 6th. The primary objective was to document the distribution and abundance of moose during the late-winter season. This in turn will inform adaptive management strategies designed to mitigate any effects from the Project on moose in the region. The conditions in 2018 were ideal; weather was consistent, winds calm, clouds high and fresh snow had fallen prior to the survey (Table 3.8-1).

Table 3.8-1: Survey Conditions during Late-Winter Moose Distribution

Survey Conditions	2011	2012	2013	2018
Date	7-9 March	7-8 March	4-6 March	5-6 March
Snow Conditions	Old (>2 weeks)	Lots of fresh snow prior to survey	10 days old	Some fresh snow prior to survey and on morning of March 6
Cloud Cover	Clear in morning changing to overcast by late afternoon on all days	Clear to slightly overcast on 8 March	Clear	Clear on 5 March; clear in morning changing to slightly overcast by mid-afternoon on 6 March
Light	Bright in the morning to flat by late afternoon	Bright	Bright	Bright
Wind	Light to moderate	Calm	Calm	Calm
Temperature	-35°C to -17°C	-30°C to -10°C	-27°C to -10°C	-20°C to -10°C
Comment	Old snow and flat afternoon light made it difficult to sight moose	Considerable snowfall in days prior to survey	Delayed both mornings due to low fog	Light snow and low ceiling delayed start of survey on second day

Observations from the 2018 survey had a higher number of moose than in previous years (Table 3.8-2). Potential factors for the variation in moose numbers could include: observer bias, seasonal variability, characteristics of snow (such as depth hardness), and predation. The majority of moose observed were found on moderate and higher elevation burned plateaus on the eastern side of the survey area.

Table 3.8-2: Survey Intensity and Moose Observations within the Study Area

Year	Survey Intensity (min/km^2)	Moose Observations within the Study Area (10 km buffer)
2011	0.53	26
2012	0.52	48
2013	0.50	39
2018	0.49	75

Moose densities of 0 moose per 100 km^2 were observed within 1 km of the Project footprint along the Haggart Creek Access Road and camp in 2018. This compares to 11.2 moose per 100 km^2 in both 2012 and 2013 and 6.1 moose per 100 km^2 in 2011. Although this area has high quality late winter browse and cover, usage appears to be highly variable between years. Construction activities in 2018 were only beginning to ramp after a winter hiatus in early-March when surveys took place and as such, did not influence moose distribution at the time of the survey. The full report completed by EDI can be found in Appendix R.

3.9 NOISE

3.9.1 Sounds Levels Related to Blasting

Blasting activities took place at the Project beginning May 2 and ending on December 19, 2018. Blasting was completed by Pelly Construction.

Noise monitoring was conducted at kilometer 42 on the Haggart Creek Access Road using a 3M SoundPro Sound Level Meter. The first attempt to record sound levels on May 31, 2018 revealed an instrument malfunction and the measurement failed. On July 20, 2018 sound levels were successfully recorded during a routine blast at the crusher infrastructure area. Peak sound level during the blast at the monitoring location was 100.6 dB. This is below the 120 dB cautionary maximum peak sound level for blasting and the guidance threshold of 110 dB. Results of the sound levels monitoring is provided in Appendix S. No additional monitoring occurred in 2018.

No noise complaints were received related to Project activities.

3.10 SPILLS AND ACCIDENTS

3.10.1 Spill Contingency Plan Review

An update to the Spill Contingency Plan is required as part of the Annual Report in accordance with Clause 8 of QZ14-041 and Paragraph 2.5 of Schedule C, Part 2 of QML-0011. SGC has reviewed and updated the Spill Contingency Plan (provided in Appendix T). Updates completed are described in Table 3.10-1.

Table 3.10-1: Spill Response Plan Version 2019-01 Revisions

Section	Revision/Rationale
Section 2.2 Reportable Spills	▪ Updated the description of site personnel roles and responsibilities for reporting spills.
Table 2.2-1 Reportable Spill Thresholds	▪ Updated to indicate that any amount of antifreeze released into a water course is reportable.
Section 2.3 Non-Reportable Spills	▪ Updated to include reference to the Spill report Form used to track both reportable and non-reportable spills and describe roles and responsibilities of site personnel.
Section 3.0	▪ Updated to differentiate between small and large spill response and site personnel roles and responsibilities.
Section 3.1 Spill Response Equipment	▪ Updated to describe roles and responsibilities of site personnel.
Table 3.2-1 Position and Responsibilities of Personnel Involved in Spill Response	▪ Updated to include responsibility for additional external reporting, if required.
Section 3.6	▪ Updated description of the land treatment facility
Section 4.0	▪ Updating external reporting responsibilities to include reporting to the Yukon Water Board Waterline online registry and FNNND (if required)

Section	Revision/Rationale
Internal and External Reporting	
Appendix B	▪ Updated Spill Report Form.

3.10.2 Reportable Summary

During the period of this report, 12 reportable spills occurred at the Project site (Table 3.9-1). Spills described in Table 3.10-2 were reported to the Yukon Spill Report Line as required by the *Spills Regulations* of the *Yukon Environment Act* and recovery efforts were undertaken on the site. When spills occurred on site, they were cleaned up as per guidelines stipulated by personnel at the Yukon Spill Report Line. Additionally, non-reportable spills were tracked internally. Spill Response Forms and photos for each of the reportable spills is provided in Appendix U.

Construction of a land treatment facility is planned for 2019 at which time suitable hydrocarbon contaminated material will be remediated on site.

Table 3.10-2: Reportable Spills

Date	Volume (L)	Substance	Cause and Remediation Measures Taken
23-Mar-18	**150**	**Septic**	Broken heat trace line caused septic pipe to freeze and break. A vacuum truck was used to collect blackwater that was contained within depression around lift station, contaminated snow and ice was collected and deposited back into septic discharge system. Heat trace line was fixed and an audit of all heat trace lines was completed.
4-Apr-18	**1**	**Septic**	Frozen septic line cracked and leaked. Pipe was replaced, spill was removed as ice and snow and disposed of in temporary storage septic tank between dorms A and B.
26-Apr-18	**100**	**Septic**	Septic waste was added to the system in excess of what the system could accommodate. This over pressured the system and lead to the failure of a flexible coupling. Contaminated soils were collected and placed in the new septic field construction area and additional clean fill material was placed over to cover. Pumping protocol was reviewed with staff.
5-May-18	**1**	**Septic**	Rain/snowmelt entered empty storage tank through standpipe and collected in base of tank - 1 litre escaped from outlet with warming temperatures. All soils were collected and placed within the new septic field construction area, covered with clean fill materials. Tank was removed from site.
7-Jun-18	**20**	**Septic**	Pipe cracked releasing sewage into the septic field. The spill was contained within the hole that was dug in the septic field, the pipe was repaired and material was buried in the septic field.
17-Jun-18	**15**	**Septic**	Lift station high level alarm pump shut off malfunctioned. Deployed vacuum truck to suck up the contaminated water and soil, bleach was then sprayed on site. Black water was then deposited into the septic field construction area.
27-Jun-18	**20**	**Coolant**	Radiator hose failure. Truck engine immediately shut off, spill pads deployed. Spill pads and impacted roadbed material collected and placed into large, yellow, hazardous waste bags and taken to the hazardous waste storage area by the shop
6-Aug-18	**15**	**Septic**	Clogged toilet/ toilet installation. The hydro-vac truck was used to suck up water, area was sanitized with bleach solution
26-Aug-18	**5**	**Septic**	Bleach was sprayed over the area and contaminated soils were put in a pail for storage. The wash cart was fixed immediately and the pipe was re-attached.

Date	Volume (L)	Substance	Cause and Remediation Measures Taken
13-Sep-18	**100**	**Septic**	Pump failure caused an overflow of grey water. Pipe was sealed and the cleaning schedule has been increased to allow for earlier identification.
21-Sep-18	**80**	**Coolant**	Leaking seals. Trays and pads deployed. Ground is hard packed (touch of frost). Limited absorption. Area will be monitored, and pads replenished until repairs are complete. At that time the soils will be picked up and disposed of.
8-Dec-18	**40**	**Coolant**	Failed heater hose on an excavator. Equipment was repaired and then used in cleanup. Contaminated snow and soil were placed in super sacs, labelled and removed to LTF staging

3.11 TRAFFIC AND ACCESS, UPCOMING MAINTENANCE

3.11.1 Level of Traffic

From Mayo, access to the Project site is along approximately 85 km of existing paved and gravel roads. Roads from Mayo to the site include the Silver Trail (Highway 11) and via the existing South McQuesten Road and the Haggart Creek Road. All but the Haggart Creek Road are government-maintained roads. During the period between March 2018 and December 2018, one-way trips along the access roads are estimated at approximately 1,367 heavy vehicle trips and approximately 3,548 light vehicle trips.

3.11.2 Access Control Issues

No access control issues were experienced during the period of this report.

3.11.3 Incidents

In 2018, the Project experienced 6 minor incidents along the access roads. Incidents did not result in injury or lost time, however minor property damage occurred.

- May 26, 2018 - the driver of a grader along the access road backed up into a tractor trailer, making contact which caused minor damage to the tractor trailer.
- June 26, 2018 - the driver of a light vehicle drove off the access road while inbound from Mayo airport, resulting in minor damage to the vehicle.
- July 10, 2018 - an employee noticed and subsequently reported damage to the Haldane Bridge. Cause of the damage was unknown, and bridge deck repairs were made by SGC.
- Sept 29, 2018 - two vehicles made contact while passing each other on a narrow area of the access road resulting in minor damage to both vehicles.
- November 16, 2018 – the driver a pick-up truck was backing up off a snowbank and hit the left fender of another pick-up truck resulting in minor damage to the vehicle.
- December 7, 2018 - a truck slid into the ditch along the access road causing minor damage to the vehicle.

To respond to incidents on site and along the access roads, the Project maintains a current Emergency Response Plan supported by a complement of emergency response personnel trained and certified in advanced first aid,

firefighting and mine rescue along with equipment required for all response types. In addition, reporting and investigation of incidents is standard practice at the site.

During the reporting period, there were no wildlife-traffic or access incidents reported. Wildlife observations, including those made along the access roads, are included in Appendix Q.

3.11.4 Planned Access Road Work

To ensure the continued safety of visitors, employees and contractors to the site through 2019, SGC plans on conducting routine snow clearing along the South McQuesten and Haggart Creek Roads from the Silver Trail (Yukon Highway 11) to the Eagle Gold camp; conducting routine maintenance along Haggart Creek Road (e.g., maintaining culverts and ditches, repairing pot holes, etc.). Ongoing maintenance and roadway improvements will be in accordance with SGC's current Work within a Right of Way Permit issued by HPW and Land Use Permit issued by Yukon Energy, Mines and Resources.

4 PHYSICAL MONITORING

4.1 STABILITY INCIDENTS

On May 30 and 31, 2019, three separate bench-scale slope instabilities occurred in the crusher excavation area. Two of the instabilities occurred along the slope above the WRSA haul road (A & B in Photo 4.1-1) and one occurred in the secondary crusher slope (C in Photo 4.1-1). A fourth, smaller area (D in Photo 4.1-1) was noted as potentially unstable during excavation and scaled clean at that time.

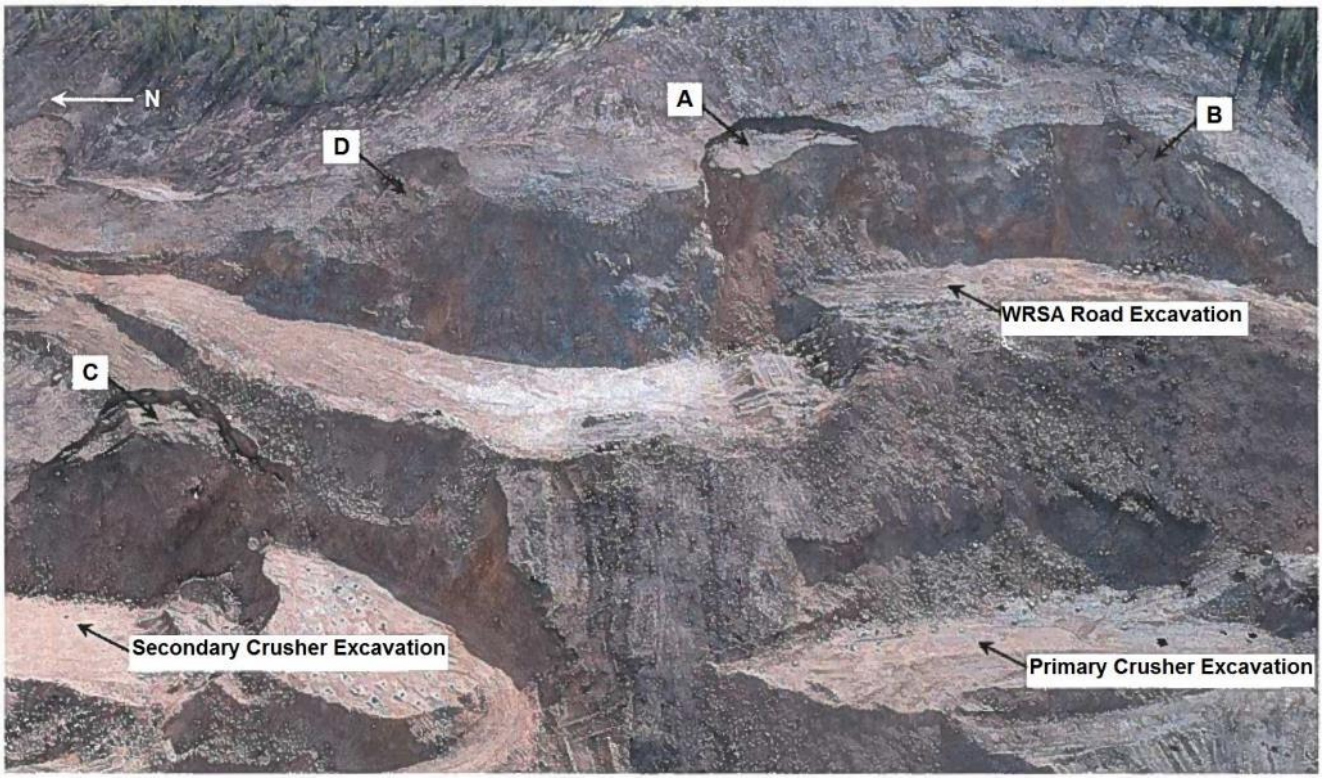

Photo 4.1-1: Location of Excavations and Failures

The slope heights and slope angles proposed initially were approximately 20 to 25 m high and 1:1 (H:V) respectively. The failures occurred rapidly without obvious warning signs leading up to their release. The failures appeared to be triggered by excavation of toe materials and not blast vibrations. The masses generally represented large blocks of competent rock defined by geologic structures (bedding/foliation planes and joints) and did not have long run-out distances.

A site visit was made by a geotechnical engineer on June 1 and 2, 2018 to assess the cause of the failures and provide recommendations. Geotechnical mapping was completed at each of the locations to understand the ground conditions and mode(s) of displacement.

Structurally, the rock mass appears consistent across the crusher area consisting of the following dominant trends:

- Moderately, west dipping bedding/foliation joints (dipping directly out of slope);

- Sub-vertical, persistent northeast trending joints (oblique to slope);
- Shorter, more variable cross-joints between bedding/foliation planes (parallel to slope); and,
- North-northwest moderate to steep dipping faults.

The location of various faults and tension cracks identified during the geotechnical mapping are shown in Photo 4.1-2.

Photo 4.1-2: Bedding Parallel Scarps/Tension Cracks and Faults

When confined, the rock mass is 'Fair' to 'Good' quality according to Bieniawski's (1989) rock mass rating classification system which should be stable at a 1:1 slope angle. However, at low confinement such as near the slope face, the rock mass strength is highly anisotropic due to the ubiquitous, weaker foliation/bedding planes. The rock mass is significantly weaker in the direction parallel to these weak planes compared to the strength perpendicular to, or across the weak planes. Due to the orientation of the foliation/bedding planes striking parallel and dipping out of the slope, blocks are able to translate (move downslope) when the dip of the bedding exceeds the friction angle of the discontinuity (~30 to 45^{o}).

In addition to the adverse orientation of the foliation/bedding planes, weaker, thinly bedded, shaley siltstones or schist are also present. These materials were physically identified during mapping at the base of failures A, B and D. The base of failure C could not be safely accessed.

Crests of the slopes were inspected during the visit and no additional tension cracks were noted; however, a small crack parallel to the slope face was previously noted behind the crest in the area between failures A and B. While there were no obvious signs of additional instabilities noted, areas of potential concern were identified between failures A and B as well as the large knob created between failures A and D.

Revised slope angles were considered to address the geotechnical conditions at the crusher area however the decision was made to construct a mechanically stabilized earth (MSE) wall between the Tertiary Stockpile and the Secondary/Tertiary Crusher building.

Construction of the MSE wall was reviewed by a geotechnical engineer and work was completed in 2018.

4.2 ENGINEER'S PHYSICAL STABILITY ANNUAL INSPECTION

As required by Section 13.2 of QML-0011, a physical stability assessment of all engineered structures, works and installations at the Project was undertaken by an independent engineer between September 25th and 27th. The findings of the assessment are provided in Appendix V.

The assessment undertaken in 2018 included the following structures:

- Lower Dublin South Pond and outfall
- Stockpile B
- Stockpile A
- 90 Day Stockpile
- Heap Leach Facility
- Cut and fill slopes of the primary and secondary crushers including MSE walls
- Cut and fill slopes of the ADR Plant

The recommendations section of the report included 11 specific areas that in the opinion of the independent engineer required further consideration. The 11 recommendations and the completed or planned response area provided below in Table 4.2-1.

Table 4.2-1: Recommendations from Independent Engineer and Site Response

Independent Engineers Recommendations	Response	Schedule to Complete
12.1 VGC (Victoria Gold Corp.) should assign a qualified, on site, individual to be responsible for monitoring and documentation of any mass earth structures that have significant risks in the case of a failure. The individual should develop a standard operating procedure for the monitoring and risk management of these structures. This individual should be responsible for coordination with a qualified professional to review monitoring data for concerns and trends, if they are not qualified themselves.	As part of construction work to date and planned for 2019, the EPCM team have engaged a qualified Geotechnical Engineer for all civil structures on site. The HLF and Event pond are being constructed under the supervision of qualified personnel provided to the engineering firm responsible for the design of those facilities (BGC Engineering). All inspections have been documented. BGC provides daily reports for their QA work. A civil testing firm (TetraTech) have kept daily construction reports to corroborate that engineered structures have been built to design. These daily reports are provided with the turnover documentation. SOPs will be developed for long term monitoring based on the recommendations of the Engineer of Record for each facility.	Ongoing
12.1 All stockpiles, material storage areas, and other mass earth structures should all have formal foundation and construction designs completed by a qualified professional. Design and base preparation have been completed and documented for much of the work in progress. VGC should continue to assign individuals to document and be responsible for the monitoring and construction review to determine if such structures are constructed in accordance with design. Any variations between design documents and final construction should be included in final record drawings.	Formal foundation and construction designs are part of EPCM's work for turnover to VGC. All turnover documentation will specifically identify minor modifications from the issued for construction design and the final constructed facility.	Jun-19
12.1 Any finalized construction of mass earth structures should include a final construction report that includes any operational and maintenance requirements (if any) to ensure stability of the structure.	Formal foundation and construction designs are part of EPCM's work for turnover to VGC. All turnover documentation will specifically identify minor modifications from the issued for construction design and the final constructed facility.	Jun-19
12.1 VGC should consider a monitoring program to assist in early warning and detection of any movements in mass earth structures. Such a program might use permanent survey points, slope inclinometers, piezometers, or other tools to measure internal/external movements and pore water pressures. Such a monitoring program should be developed with the assistance of and be implemented with the oversight of a qualified professional.	These recommendations would be part of the responsibility of Geotechnical Engineer. In the case of the HLF, certain stability measurement devices are being installed as part of the construction requirements. Additionally, a physical stability monitoring program is considered in the SGC EMSAMP. Physical stability monitoring is also contemplated within specific design and construction documents for major facilities.	Ongoing
12.2 – LDSP Extend the existing berm along the south side of the pond further to the east to direct water into the fore bay / siltation pond, where there is no liner to disturb and where the facility is designed to capture eroded material.	Ditch A is being fully constructed now and will mitigate this issue upon completion.	Apr-19

Independent Engineers Recommendations	Response	Schedule to Complete
12.5 – 90 Day Mitigate risks associated with perched rocks throughout the slope. Boulders should be removed in a controlled manner, or have a machine press (or bury) the boulders into the existing fill so they have a more stable base, and are less likely to become dislodged. Care should be taken during this work to ensure that critical infrastructure, workers and equipment are restricted from the fallout path, or other appropriate mitigation measures are put in place.	The 90-day stockpile had only undergone preliminary clearing and earthworks at the time of the annual physical stability assessment. Stability analyses for this facility have been completed (post assessment) and provide recommendations for suitable foundation conditions for the 90-day stockpile to ensure that the required factors of safety are achieved.	Completed
12.6 – ADR Reduce the outside slope of material in the stockpile above the ADR Access Road. The stockpile West Northwest of the ADR Building is composed of a mix of several materials with unknown compaction and possibly over steepened outside slopes. It is recommended that the stockpile be shaped within geotechnical design specifications, or that the location of the pile is adjusted so that there is a bench between the crest of the adjacent slope, and the toe of the stockpile. If the stockpile is to remain long term, the structure should have a design completed by a qualified professional.	The over-steepening of the crest area was addressed when an access road adjacent to the area was developed. Slopes above the ADR access road will be addressed as part of final area handover. Post completion a Geotechnical Engineer will conduct a further review of the installation and provide recommendations for additional mitigations as necessary.	Jun-19
12.6 – ADR At the time of inspection, there appeared to be over-steepened temporary cut slopes created adjacent to short term haul roads used for construction access in the area. Cut back slopes adjacent to haul roads that do not meet geotechnical specifications for the site, or have recommendations in place for temporary slopes during construction.	The area adjacent to the ADR pad continues to be used for construction purposes. The interior area has been utilized as a storage area for unsuitable materials backhauled from local cut areas which has been used as backfill to mitigate this concern.	Completed
12.10 – Stockpile B This stockpile should be graded on top to eliminate or seal tension cracking.	Grading has taken place to stabilize the location identified.	Completed
12.10 – Stockpile B The extent (volume and location) of ice and other frozen materials in the stockpile should be determined based on-site records and information from site staff available. A record of the resulting instability should be noted.	Stockpile B will be reviewed post assessment by a Geotechnical Engineer. Any recommendations made (reshaping etc.) will be performed prior to handing over to VGC at completion. A material tracking sheet showing what was hauled to this location has been maintained during construction activities but was inadvertently not made available during the assessment.	Jun-19
12.10 – Stockpile B Have a qualified professional determine if ice and other frozen materials are an acceptable material for construction of a mass earth structure, and if they are, how they should be placed or incorporated in an overall stockpile design to ensure that there are no localized failures as a result.	Stockpile B will be reviewed post assessment by a Geotechnical Engineer. Any recommendations that made (reshaping etc.) will be performed prior to handing over to VGC at completion.	Jun-19

4.3 PERMAFROST

Permafrost monitoring at the project site in 2018 consisted of quarterly subsurface temperature monitoring via thermistors at the locations in Figure 4.3-1. A total of thirteen thermistor strings were installed in test holes around the site between 2009 and 2012. During 2017 construction activities, five thermistors were removed from the monitoring program. Thermistor BH-BGC11-51 was removed in May 2018, leaving seven monitoring locations from the baseline network.

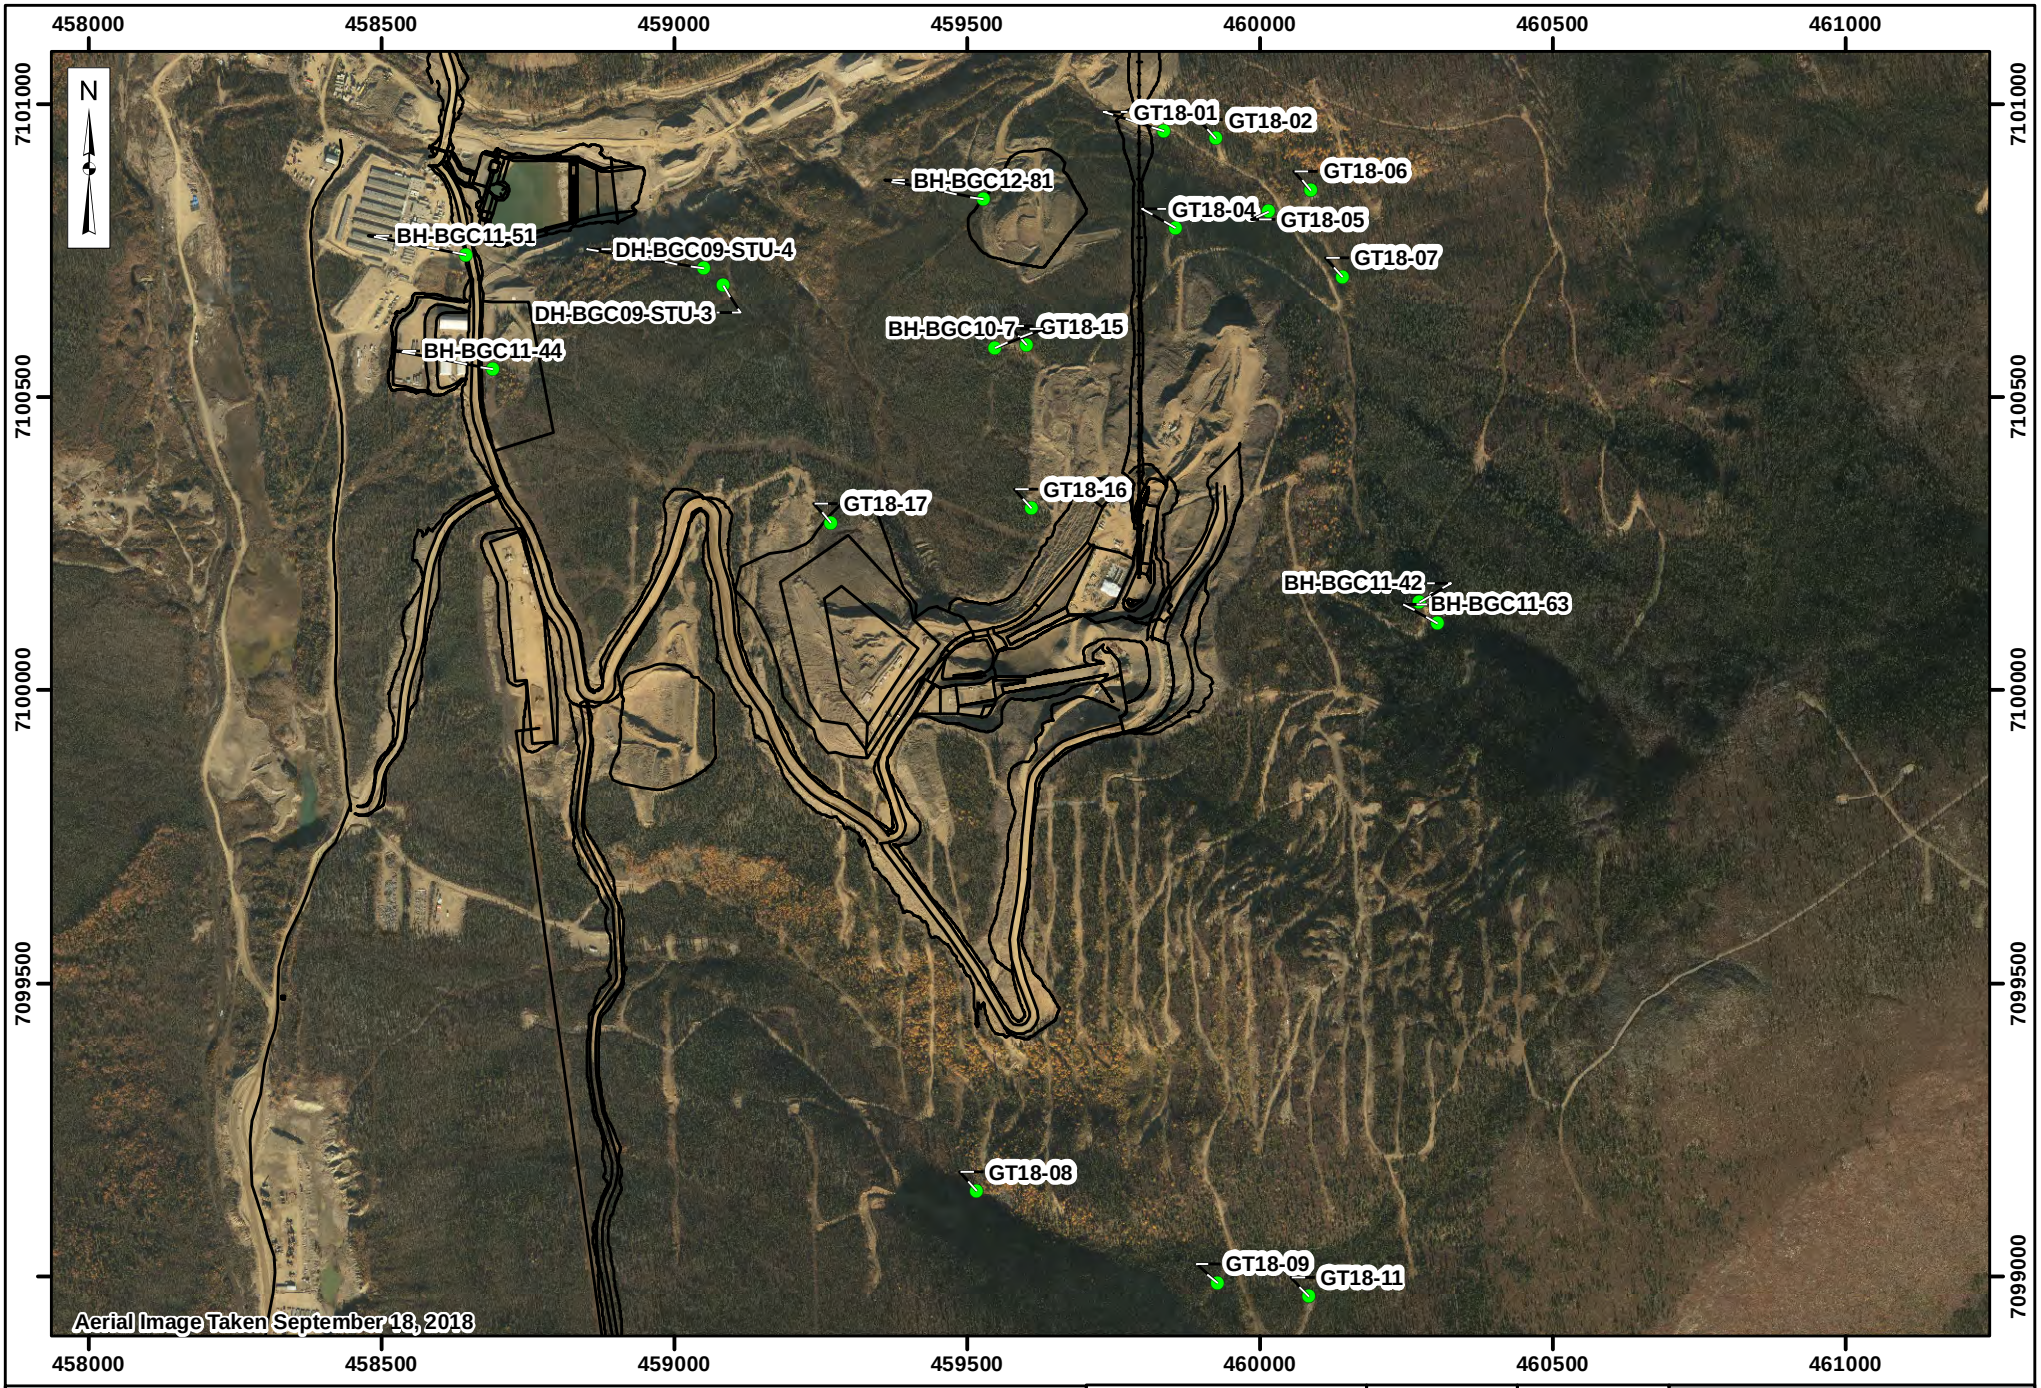
In April 2018, 13 new thermistor strings were installed and added to the monitoring program as part of geotechnical investigation to support Project activities. Locations were selected in the vicinity of the EP WRSA, PG WRSA, the 90 Day Storage Area and a potential Stockpile Area. Detailed results including characterization of permafrost conditions and active layer thickness are provided in the 2018 Geotechnical Investigation Report (Appendix W).

4.3.1 Data Analysis

Of the 13 new installations in 2018, five thermistors were installed in permafrost (Table 4.3-1). These locations will be added to the Physical Monitoring Program in 2019.

Table 4.3-1: New Permafrost Monitoring Locations for Physical Monitoring Program

Thermistor	Facility	Coordinates (Zone 8)	
		North	East
GT18-8	Platinum Gulch WRSA	7099141	459517
GT18-10	Platinum Gulch WRSA	7098851	459968
GT18-11	Platinum Gulch WRSA	7098964	460080
GT18-15	Potential Stockpile Area	7100583	459597
GT18-17	90 Day Storage Area	7100290	459263



Ground temperature data collected at the single bead thermistors installed in April 2018 are provided in Table 4.3-2. Ground temperature data at multi-bead thermistors and plotted temperature profiles for locations installed in 2018 are provided in Appendix X.

Ground temperatures from the 2018 installations where frozen ground is evident measured between 0ºC and -0.65ºC throughout the year. Depth to permafrost ranged from 5.2 to 10.0 meters below grade (mbg). Frozen ground temperatures in the baseline network thermistors ranged from 0ºC to -0.75ºC. Permafrost temperatures collected in 2018 at all sites are within the same range reported from 2010 to 2017. Depth to permafrost in the baseline network thermistors also remains consistent with previous years. No ground temperature trends were identified that could indicate warming or need for more frequent monitoring.

Table 4.3-2: Ground Temperatures at Single Bead Thermistors Installed April 2018

4.4 OPEN PIT

No open pit development activities took place in 2018.

4.5 MATERIAL STORAGE AND STOCKPILE MANAGEMENT AREAS

During construction activities to date, various material types have been encountered that have not met construction specifications but would likely prove suitable for cover materials for facility closure. These materials have been either relocated to dedicated topsoil and overburden storage areas or have been stored locally to support future reclamation activities. The location and volumes of these materials are depicted in Figure 4.5-1.

4.7 HEAP LEACH AND PROCESS FACILITIES

Constructions activities associated with the Heap Leach Facility and process areas were conducted under the supervision of geotechnical engineers and other qualified personnel from BGC Engineering. The results of the QA/QC program for the construction completed during the year of this report are provided in Appendix B.

5 CYANIDE MANAGEMENT

No cyanide-related transport, storage, handling, use or disposal, was conducted in 2018.

In 2018, SGC established a long-term supply contract with Cyanco Canada Inc., an experienced, ICMC-certified, North American supplier and began developing operating procedures for cyanide-related tasks in preparation for receipt of cyanide planned for 2019.

6 RECLAMATION & CLOSURE

SGC submitted an updated Reclamation and Closure Plan (RCP) for review and approval as required by Section 7.2 of QML-0011 and Clause 171 of QZ14-041 on October 1, 2018.

Updates to the RCP through 2018 were to address conditions in Schedule C section 4.1 of QML-0011 as well as feedback from the YWB review and approval process of the 2016 RCP under QZ14-041. Additionally, updates through 2018 included revisions to align the RCP with the optimized Project, the Water Management Plan, and preliminary comments received from the YWB, which were submitted to the Yukon Water Board for their consideration during the amendment application process required for QZ14-041. The updated RCPs included a refined reclamation cost estimates to satisfy Clauses 191 to 193 of QZ14-041.

At the time of preparing this annual report, the review and approval of the RCP pursuant to QML-0011 and QZ11-041-1 amendment application process was ongoing.

6.1 RECLAMATION RESEARCH

SGC continues to support research for reclamation and closure planning. Revegetation trials were established at the Peso Mine site, which had been last actively mined in the 1960's. Laberge Environmental Services has been conducting vegetation field trials at Peso Mine site on behalf of SGC since 2012 and completed the field portion of the project July 31st, 2018.

In 2012, six trial areas were selected by SGC, three in areas where trenching was present and three in areas of waste rock. Each trial area consisted of five 1 m quadrats with various amendments, including biochar, compost, leonardite, and dolomite. The plots were then assessed annually from 2013 to 2018. The percentage of vegetative cover, species composition and overall health were observed for each plot. Photos taken to document the growth and success of each plot are included in Appendix Y.

In 2018, soil samples, foliar tissue samples and measurements on rooting length and depth were also undertaken. All sites had low soil pH and low nutrient content. Plots with the different amendments sustained various levels of growth over time. Generally, the shrubs growing at the treated plots were healthy and alder were reproducing in the final year (2018) as seed cones were observed on several of the plants. Many plots also supported healthy volunteer shrubs – willows, dwarf birch, Labrador tea etc. Based on preliminary results, a combination of biochar and compost (fertilizer) is recommended as a soil amendment to help initiate the re-establishment of vegetation on these disturbed sites. An interim technical memo can be found in Appendix Z and the full report is expected in April 2019 which will help guide the SGC Reclamation and Closure planning.

7 SOCIO-ECONOMIC MONITORING

The focus of socio-economic work in 2018 was primarily on ensuring that contracts for the construction and operation of the Project were right scaled to allow for the involvement of Yukon and First Nations businesses to the greatest extent practicable.

Construction to date has involved over 25 contractors, several of which are Yukon-based companies and Yukon First Nation-partnered businesses that has resulted in a high level of local hiring. Of the total $361 million in contracts committed to, $144 million have been awarded to Yukon companies including $77 million to company joint ventures with the First Nation of Nacho Nyak Dun Development Corp.

The CBA Committee, formed under the Comprehensive Cooperation and Benefits Agreement (CBA) between Victoria Gold Corp. and the First Nation of Nacho Nyak Dun (FNNND), continued to monitor the socio-economic effects of the Project by reviewing data reports and statistics on employment, training and social and economic benefits associated with the mine's construction and operation. At the time of this report, the information gathered and developed under the CBA Committee was not available. In 2019, the Victoria Gold CBA Committee members will work to develop a specific socio-economic monitoring plan, which will be based on the socio-economic indicators highlighted during the 2013 Yukon Environmental and Socio-economic Assessment Board review of the Eagle Gold Project.

Victoria Gold continue to track the number of FNNND and local community employees the company hires. This information will be utilized with ongoing human resource management to develop an appropriate tracking system to communicate training opportunities and provide this information to the CBA committee upon its request.

Under the Victoria Gold NND CBA Scholarship Program, approximately $9,500 was disbursed to 16 recipients in 2018. Since the establishment of this program, 91 scholarships have been awarded to NNND students for a total disbursement totaling over $70,000.

The company also continued its community involvement and was a proud supporter of the following local organizations and events in 2018:

- YFNCC – Round Up sponsorship
- Kwanlin Dun First Nation/Taan Kwachan – Millennial Town Hall
- Yukon Fire Fit
- Yukon Indian Hockey Association – Yukon Native Hockey Tournament
- Mayo Curling Club – Irene Hutton Bonspiel
- Association of Yukon Communities meeting
- Mayo Seniors / Elders Advisory Association
- Klondike Road Relay
- Northern Latitudes Mining Reclamation Workshop
- Geoscience Forum

- Yukon Hospital Association – Festival of Trees, and Teddy Bear Clinic
- Tahltan Strong Benefit Concert
- Yukon Imagination Library – Mayo Roaming Reader Event
- Whitehorse Minor Hockey Assoc.
- River Bend Hockey Team
- McBride Museum of Yukon History
- Canadian Mining Hall of Fame: Kate Carmacks Recognition
- Every Student, Every Day

Assessment, Licence and Permit Requirements for Annual Reporting

THIS PAGE INTENTIONALLY LEFT BLANK

Document, License or Permit	Section/ Clause	Paragraph/ Sub-clause/	Requirement	Annual Report Section
QZ14-041	8		The Licensee shall apply the relevant procedures in the Spill Contingency Plan. The Licensee shall review the Spill Contingency Plan annually and shall provide a summary of that review, including any revisions to the plan, as a component of the annual report	Section 3.10
QZ14-041	10		The Licensee shall include a summary of all spills or unauthorized discharges that occurred during the year reported, as part of the annual report	Section 3.10
QZ14-041	16		The Licensee shall submit an Annual Report to the Board not later than March 31 of each year starting in 2017. The reporting period for the Annual Reports shall be from the effective date of this licence until December 31, 2016 for the first report, and from January I to December 31 of each year for all subsequent reports. The report shall include the information required by the Regulation, but not necessarily limited to:	All
QZ14-041	16	a	A description of the water use and waste deposition carried out during the year reported including but not limited to: i. detailed data on the volume of water (including measurements) collected at, conveyed through, transferred between, or released to the environment from the Engineered Structures and any water source used by the project (groundwater wells, water courses); ii. variation of the water volume inventories in water storage facilities (HLF, water storage ponds, sediment control ponds); iii. records of fluid management within the HLF including irrigation completed, process water recovered, any leakage into the leakage detection and recovery system (LDRS), quality and quantity of water collected within the foundation drainage systems, variation of fluid levels in the in heap pond, and records of any water accumulation in or discharge to the Events Pond;	n/a
QZ14-041	16	b	An annual construction report for each Engineered Structure built or modified in the reporting year;	Appendix B
QZ14-041	16	c	A summary report, reviewed and stamped by a Professional Engineer, on the performance	Section 4.1 and 4.2

Document, License or Permit	Section/ Clause	Paragraph/ Sub-clause/	Requirement	Annual Report Section
			of Engineered Structures in service during the reporting year including but not limited to: i. Any operational deficiencies or failures to achieve operational requirements; ii. records of any leakage into the LDRS of the HLF; iii. a detailed record of any major maintenance work carried out including but not limited to; 1. any work required to physically stabilize structures; 2. reporting on ice or snow accumulation and removal conducted within water conveyance channels; 3. reporting on sediment removal from sediment control ponds or water management ponds; 4. repair of any damaged liner or armouring materials; and 5. repair or replacement of any damaged or faulty monitoring or control instrumentation or equipment; iv. Plans to conduct major maintenance work for the following year; v. Status report on any backup equipment and supplies for emergency management of the HLF (generators, pumps, fuel caches. etc.) including records of exercising such equipment;	
QZ14-041	16	d	A summary of mining and production activities concluded in the reporting year including but not limited to: i. the mass/volume of excavation from the Eagle Zone Pit; ii. the mass/volume and nature of materials placed in WRSA's including location of any overburden placed in WRSA's; iii. the monthly mass/volume of ore in storage in the 100 day ore stockpile; iv. the mass/volume and end of year configuration of ore lifts placed in HLF with the identification of any	n/a, see Section 2.0

Document, License or Permit	Section/ Clause	Paragraph/ Sub-clause/	Requirement	Annual Report Section
			final benches or slopes as may have been achieved during the year; v. records on the management of excavated overburden including ice rich overburden; vi. records of ore properties for ore placed on the heap (summary of gradation and other characteristic properties as may be collected) and records of any of agglomeration conducted; vii. report on metallurgical performance of the FILE; viii. analysis of whether Mine Plan activities completed in the reporting year are consistent with the Mine Plan and analysis of the effect of any deviations from the plan including but not limited to: 1. changes to the pit excavation designs (slopes, volumes) and indication of whether a change to the expected volume of waste rock to be removed has been identified: 2. changes to construction of WRSAs; 3. deviations in production rates for mining and processing of ore: 4. changes to heap loading, ore density and porosity, and irrigation schedules;	
QZ14-041		e	Records of monitoring conducted as part of the EMSAMP including but not limited to: i. summaries of all data generated as a result of the monitoring requirements of this licence: ii. analysis and interpretation of collected data by a qualified individual or firm and a discussion of any variances from baseline conditions, from the previous years' data, or from expected performance, or variances from expected conditions; iii. results and interpretations of QA/QC Programs completed as part of monitoring or part of construction;	Section 3.0
QZ14-041		f	Reporting on monitoring according to Cyanide Management Plan;	n/a, see Section 5.0

Document, License or Permit	Section/ Clause	Paragraph/ Sub-clause/	Requirement	Annual Report Section
QZ14-041		g	A description of reclamation or reclamation research activities carried out during the year and commentary on whether the annual activities are consistent with the schedule of the RCP; and	Section 6.0
QZ14-041		h	Any other reports which are required by this licence	All
QZ14-041	17		The Licensee shall provide to the Board one unbound, single-sided, paper copy of all reports required by this licence. All reports must be reproducible by standard photocopier.	All
QZ14-041	18		The Licensee shall upload electronic copies of all reports required by this licence to the Yukon Water Board's online licensing registry, Waterline. Electronic copies shall be submitted in one of the following formats: MS Word. MS Excel, or Adobe .pdf format. Water quality results uploaded to Waterline must be presented in MS Excel.	All
QZ14-041	56		Where site conditions require Minor Modifications to submitted final designs during construction, the modifications shall be approved by a Professional Engineer and a record of the modification along with the rationale for the modification shall be submitted to the Board with a copy to the Inspector as part of the annual construction report for the affected Engineered Structure	see Section 2.0 and Appendix B
QZ14-041	57	a	For all Engineered Structures authorized by this Licence, the Licensee shall produce a construction report detailing the construction of the infrastructure. The construction report shall include: As-built drawings of completed structures;	see Section 2.0 and Appendix B
QZ14-041	57	b	Results of quality control and quality assurance activities associated with the completed works;	Appendix B
QZ14-041	57	c	Records of any minor or substantive modifications from submitted final designs; and	Appendix B
QZ14-041	57	d	Certification by a Professional Engineer that the completed works have been constructed in compliance with final designs and construction specifications inclusive of any approved minor or substantive modifications and in compliance with any relevant terms of this licence	Appendix B
QZ14-041	58		The construction report in clause 57 shall be submitted annually with the annual report required by this licence and shall include all	Appendix B

Document, License or Permit	Section/ Clause	Paragraph/ Sub-clause/	Requirement	Annual Report Section
			structures completed during the year covered by the annual report.	
QZ14-041	105		The Licensee shall comply with the monitoring programs and studies required by this licence and, unless otherwise specified, shall submit the data that is compiled as a result of these programs and studies as a component of the required annual reports	Section 3.0
QZ14-041	111		The Licensee shall comply with the EMSAMP and Schedules I and 2 of this Licence. The findings of the programs included in the EMSAMP, including any recommendations, shall be submitted as part of the Annual Report. Any changes should be submitted to the Board.	Section 3.0
QZ14-041	112		The Licensee shall update the EMSAMP to reflect the continuation of the collection of baseline data until the initiation of the Development Phase of the Project.	Section 3.0
QZ14-041	113	a	Baseline data to be collected shall include: Meteorological data by the Camp and Potato Hills climate stations;	Appendix J
QZ14-041	113	b	Flow monitoring at stations identified in Table 2.2-I of Exhibit 1.13.1	Section 3.0
QZ14-041	113	c	Sampling and monitoring of field barrels at the project site; and	Section 3.4
QZ14-041	113	d	Snow courses.	Appendix M
QZ14-041	123	g	An annual review of the AMP which shall include: i. A summary of the monthly reviews; ii. Assessment of the adequacy and appropriateness of the various components of the AMP (thresholds, indicator and monitoring requirements); and iii. Recommendations for modifications.	n/a
QZ14-041	124	a	Metal Mining Effluent Regulations Monitoring Programs: The Licensee shall conduct the following Environmental Effects Monitoring Studies in accordance with MMER Schedule 5: Effluent and Water Quality Monitoring Studies; and	n/a
QZ14-041	124	b	Biological Monitoring Studies.	n/a
QZ14-041	125		The results of these studies and programs in clause 124 shall be submitted to the Board as part of the Annual Report along with any additional studies or revisions to studies required under the MMER.	n/a

Document, License or Permit	Section/ Clause	Paragraph/ Sub-clause/	Requirement	Annual Report Section
QZ14-041	130		A summary of activities carried out under any approved plan shall be submitted to the Board as part of the annual report.	Section 3.0, 4.0 and 5.0
QZ14-041	132		Cyanide Management Plan: The Licensee shall submit to the Board for Review and Approval, an updated CMP which includes an annual independent third-party audit, consistent with the ICMC, of the cyanide management plan and its execution.	n/a, see Section 5.0
QZ14-041	133		Storage and use of cyanide at the site must not occur until receipt of notice of approval of the updated CMP from the Board.	n/a, see Section 5.0
QZ14-041	157	a	Surface Water Balance and Water Quality Models Updates: The Licensee shall submit to the Board updated Surface Water Balance and Water Quality Models as part of each Annual Report. The updated models shall include, but not be limited to, the following: Updated site data collected as per the EMSAMP;	Section 3.2.6
QZ14-041	157	b	Updated input from any updates to the HLF Water Balance Model; and	Section 3.2.6
QZ14-041	157	c	Updated predictions for operations and closure including discussion of any variances identified and implications on site water management	Appendix E
QZ14-041	178	f	Reclamation and Closure Research Program The Licensee shall submit to the Board, an update to the Reclamation and Closure Research Program provided in Exhibit 1.7.1, Section 10 with the RCP updates described in clause 171. The updated plan shall be implemented once approved and must include, but not necessarily be limited to, the following: Annual reporting on research activities.	Section 6.0
QZ14-041	190		The Licensee shall report in the annual report on whether, based on information available at the time of report including actual progress on execution of the Mine Plan and the best judgement of mine management, the current liability for closure of the mine exceeds or does not exceed the security held at the end of the year for which the annual report has been prepared.	Section 6.0
QML-0011	13.9		On or before March 31st of each year of the term of this License, the Licensee must submit an annual report, in writing, in accordance with Schedule D and any written direction of the	All

Document, License or Permit	Section/ Clause	Paragraph/ Sub-clause/	Requirement	Annual Report Section
			Director, covering the period of January 1 to December 31 of the prior year.	
QML-0011	Schedule C	2.5	**Spill Contingency**: "Spill Response Plan, Version 2014-01" dated June 2014 and prepared by StrataGold Corporation. Subject to the following conditions: (a) an update to the Spill Contingency Plan must be provided in the 2016 Annual Report, this updated plan must include the following information i. an update to section 2.2 and Appendix C of the Plan to include all reportable thresholds for special wastes substances consistent with section 3(1)(b) of the Special Waste Regulations; ii. spill response steps for each category of material that may be spilled; and iii. an update to the reporting requirements to include the requirement to report all spills on site.	Section 3.10
QML-0011	Schedule D, **Site Activities**	a	a summary of construction activities associated with the Undertaking;	Section 2.1
QML-0011	Schedule D, **Site Activities**	b	a summary of mining activities;	Section 2.3
QML-0011	Schedule D, **Site Activities**	c	a summary of proposed development and production for the coming year;	Section 2.3
QML-0011	Schedule D, **Site Activities**	d	a map showing the status of all structures, works, and installations associated with the Undertaking;	Figure 2.1-1
QML-0011	Schedule D, **Site Activities**	e	the total amount of ore and waste removed from the open pit for the year and for the life of the Undertaking;	n/a, see Section 2.3.1
QML-0011	Schedule D, **Site Activities**	f	the total amount of gold produced and removed from the undertaking;	n/a, see Section 4.4
QML-0011	Schedule D, **Site Activities**	g	the total amount of waste rock removed from the Undertaking and deposited into each deposit location;	n/a, see Section 4.4

Document, License or Permit	Section/ Clause	Paragraph/ Sub-clause/	Requirement	Annual Report Section
QML-0011	Schedule D, **Site Activities**	h	the total amount of waste rock stored in each waste rock storage facility;	n/a, see Section 4.4
QML-0011	Schedule D, **Site Activities**	i	details respecting any action taken as a result of the recommendations made by the engineer in relation to the inspection referred to in 13.2 of QML-0011;	Section 4.2
QML-0011	Schedule D, **Site Activities**	j	a summary of any update to estimates of ore reserves and the life of the mine, including reserve category, tonnage and grade;	Section 2.2
QML-0011	Schedule D, **Site Activities**	k	the total amount and the average grade of ore stockpiled;	n/a
QML-0011	Schedule D, **Site Activities**	l	the remaining reserve life of the mine;	Section 2.2
QML-0011	Schedule D, **Site Activities**	m	results and interpretation from all QA/QC programs for the site;	See Appendices
QML-0011	Schedule D, **Site Activities**	n	a summary of heap leach facility construction including: i. the total amount and the average head grade of ore placed on the heap leach pad for the year and the life of the Undertaking; ii. the mass/volume and end of year configuration of ore lifts placed in the heap leach facility with the identification of any final benches or slopes achieved during the year; iii. the records of ore properties for ore placed on the heap and records of any of agglomeration conducted; and iv. report on metallurgical performance of the heap leach facility	n/a
QML-0011	Schedule D, **Environmental Monitoring**	a	a summary of the programs undertaken for environmental monitoring and surveillance as outlined in the Environmental Monitoring, Surveillance and Adaptive Management Plan and the Wildlife Protection Plan, including an analysis of these data and any action taken or adaptive management strategies implemented	Section 3.0

Document, License or Permit	Section/ Clause	Paragraph/ Sub-clause/	Requirement	Annual Report Section
			to monitor or address any changes in environmental performance;	
QML-0011	Schedule D, **Environmental Monitoring**	b	a summary of operating procedures for cyanide-related tasks and their implementation, including the review of proposed process and operational changes and modifications deemed necessary for potential impacts on personnel health and safety and the incorporation of personnel protection measures;	n/a
QML-0011	Schedule D, **Environmental Monitoring**	c	a summary of all safety measures taken (signs, etc.) to identify the presences of cyanide to all personnel;	n/a
QML-0011	Schedule D, **Environmental Monitoring**	d	a summary of all tests and calibration records for HCN monitoring equipment;	n/a
QML-0011	Schedule D, **Environmental Monitoring**	e	a summary of the results of the waste rock quality assurance/quality control monitoring for the past year;	n/a
QML-0011	Schedule D, **Environmental Monitoring**	f	a summary of invasive plants that have been identified on site and measures taken to control or remove invasive plants;	n/a
QML-0011	Schedule D, **Environmental Monitoring**	g	a summary of ambient air quality monitoring and modelling (which includes emissions related to the gold recovery process) and mitigation measures taken;	n/a, see Section 3.7
QML-0011	Schedule D, **Environmental Monitoring**	h	a summary of spills and accidents that occurred at the site and measures taken respond to any spills or accidents;	Section 3.10
QML-0011	Schedule D, **Environmental Monitoring**	i	a summary of the level of traffic, access control issues, wildlife incidents and other accidents, and any upgrade or maintenance work planned for the upcoming year;	Section 3.11
QML-0011	Schedule D, **Environmental Monitoring**	j	a summary of sound-levels associated with blasting activities;	Section 3.9
QML-0011	Schedule D, **Environmental Monitoring**	k	a summary of any site improvements undertaken to address sediment and erosion control;	Section 2.1.1.3
QML-0011	Schedule D, **Environmental Monitoring**	l	a summary and interpretation of humidity cell or other geochemical tests undertaken on materials on site, including a. geochemical characterization of the expanded open pit, including kinetic testing to predict metal leaching potential; b. assumptions and conclusions of geochemical predictions and the effectiveness of mitigation measures;	Section 3.4

Document, License or Permit	Section/ Clause	Paragraph/ Sub-clause/	Requirement	Annual Report Section
			c. the segregation of waste rock based on metal leaching potential; and d. results of long-term column tests to study the effects to stability and permeability of the heap leach facility;	
QML-0011	Schedule D, **Environmental Monitoring**	m	a summary of cyanide release or exposure that occurred at the Undertaking, including: i) any hospitalization or fatality related to cyanide; ii) the nature of release and the response or remediation required; and iii) any exceedances to cyanide limits in permits or authorizations	n/a
QML-0011	Schedule D, **Physical Monitoring**	a	a summary of any heap leach, waste rock, or open pit stability incidents;	n/a
QML-0011	Schedule D, **Physical Monitoring**	b	a summary of data collected to date as part of the Physical Monitoring Program;	n/a, see section 4.0
QML-0011	Schedule D, **Physical Monitoring**	c	details of results, including data collected, for the Physical Monitoring Program;	Section 4.0
QML-0011	Schedule D, **Physical Monitoring**	d	a summary report on the performance of Engineered structures in service during the reporting year including but not limited to: a. any operational deficiencies or failures to achieve operational requirements; b. records of any leakage into the LDRS of the HLF; c. a detailed record of any major maintenance work carried out; d. plans to conduct major maintenance work for the following year; and e. status report on any backup equipment and supplies for emergency management of the heap leach facility including records of exercising such equipment.	n/a
QML-0011	Schedule D, **Reclamation and Closure**	a	any temporary closure or permanent closure that has occurred during the year;	n/a
QML-0011	Schedule D, **Reclamation and Closure**	b	a summary of activities related to care and maintenance of the Undertaking, including any temporary closure activities if applicable;	n/a
QML-0011	Schedule D, **Reclamation and Closure**	c	a summary of progressive and ongoing reclamation activities;	n/a

Document, License or Permit	Section/ Clause	Paragraph/ Sub-clause/	Requirement	Annual Report Section
QML-0011	Schedule D, **Reclamation and Closure**	d	a summary of proposed development and production and reclamation activities for the coming year; and.	Section 2.4
QML-0011	Schedule D, **Reclamation and Closure**	e	a summary of reclamation research and results	Section 5.0
QML-0011	Schedule D, **Socio-economic Monitoring**	a	a summary of action taken by the Licensee with respect to development and implementation of a joint committee that will confirm socio-economic indicators, reporting and responding to monitoring results.	Section 6.0

Summary of Design and Field Review Requirements

(Initial applicable discipline below and cross out and initial only those items not applicable to the project)

J.M **Architectural**

1.1 Fire resisting assemblies
1.2 *Fire separations* and their continuity
1.3 *Closures*, including tightness and operation
1.4 Interior and exterior finishes, including exterior glazing
1.5 Egress systems, including *access to exit* within *suites* and *floor areas*
1.6 Performance and physical safety features (guardrails, handrails, etc.)
1.7 Structural capacity of architectural components, anchorage & seismic restraint
1.8 Roofing and flashings
1.9 Wall cladding systems
1.10 Dampproofing and/or waterproofing of walls & slabs below grade
1.11 Thermal insulation systems, including condensation control & cavity ventilation
1.12 Sound control
1.13 Landscaping, screening and site grading
1.14 Provisions for fire fighting access
1.15 Access requirements for persons with disabilities
1.16 Elevating devices
1.17 Coordination of testing of fire emergency systems & maintenance programs
1.18 Development permit and conditions therein
1.19 Local building and plumbing bylaw requirements
1.20 Interior signage, including acceptable materials, dimensions & locations
J.M 1.21 ~~Energy Efficiency Part 9.36 requirements~~ N/A
J.M 1.22 ~~Construction safety measures~~ N/A
1.23 Review of all applicable shop drawings

~~**Structural**~~

~~2.1 Structural capacity of the *building*, including anchorage & seismic restraint~~
~~2.2 Structural capacity of a *post-disaster building*, anchorage & seismic restraint~~
~~2.3 Structural aspects of *deep foundations*~~
~~2.4 Qualification of structural welder~~
~~2.5 Excavation & shoring~~
~~2.6 Underpinning~~
~~2.7 Backfill~~
~~2.8 Review of all Applicable Shop Drawings~~

J.M

J.M **Mechanical**

3.1 HVAC systems & devices, including high *building* requirements where applicable
3.2 *Fire dampers* at required *fire separations*
3.3 Continuity of fire separations at HVAC penetrations
3.4 All environmental separation requirements
J.M ~~3.5 Energy Efficiency Part 9.36 requirements~~ N/A
3.6 Functional testing of mechanically related (i.e. sprinkler systems) fire emergency systems & devices
3.7 Maintenance manuals for mechanical systems
3.8 Structural capacity of mechanical components, anchorage & seismic restraint
3.9 Review of all applicable shop drawings

J.M **Commissioning of life safety and fire protection systems**

4.1 Commissioning of life safety and fire protection systems

Summary of Design and Field Review Requirements, continued

Plumbing

~~5.1 *Roof drainage systems*~~
~~5.2 Site and *foundation drainage systems*~~
~~5.3 *Plumbing systems* and devices~~
5.4 Sprinkler systems including water flow-indicating devices where applicable
5.5 Continuity of *fire separations* at plumbing penetrations
~~5.6 Local building and plumbing bylaw requirements~~
5.7 Functional testing of plumbing related fire emergency systems including waterflow-indicating devices where applicable
~~5.8 Maintenance manuals for *plumbing systems*~~
~~5.9 Structural capacity of plumbing components, anchorage and seismic restraint~~
~~5.10 Review of all applicable shop drawings~~

Fire Suppression Systems

6.1 Suppression systems classification for type of *occupancy*
6.2 Design coverage, including concealed or special areas
6.3 Compatibility and location of electrical supervision, ancillary alarms and control devices
6.4 Evaluation of the capacity of city water supply versus system demands and domestic demand, including plumbing devices where applicable
6.5 Qualification of welder, quality of welds and material
6.6 Acceptance testing for —"Contractor's Material and Test Certificate"— as per NFPA Standard
6.7 Maintenance program and manual for suppression systems
6.8 Structural capacity of sprinkler components, anchorage and seismic restraint
6.9 For partial systems—confirm sprinklers are installed in all areas where required
6.10 Fire department access requirements
6.11 Fire Department connections and hydrant locations
6.12 Fire hose standpipes
6.13 Function Testing of fire suppression systems and waterflow– Indicating devices
6.14 Review of all applicable shop drawings

Electrical

~~7.1 Electrical systems and devices, including high building systems where applicable~~
7.2 Continuity of *fire separations* at electrical penetrations
7.3 Functional testing of electrical related fire emergency systems, fire alarm systems and waterflow-indicating devices
~~7.4 Emergency electrical power supply for buildings where applicable~~
~~7.5 Electrical systems and devices maintenance manuals~~
~~7.6 Structural capacity of electrical components, anchorage and seismic restraint~~
~~7.7 Clearances from *building* of all electrical utility equipment~~
7.8 Fire protection of wiring for emergency systems
~~7.9 Review of all applicable shop drawings~~

I hereby give assurance that

a) I have fulfilled my obligations for *field reviews* as required by the previously submitted - "CONFIRMATION OF ASSURANCE OF PROFESSIONAL DESIGN AND COMMITMENT FOR FIELD REVIEWS",
b) I have completed the functional testing of the ~~*fire protection*~~ Fire Protection by Others @ and *life safety systems* to ascertain that they substantially comply in all material respects with
   (i) the applicable requirements of the Yukon Building Standards Act and Regulations, the National Building Code of Canada and other applicable regulations with regards to safety, and
   (ii) the plans and supporting documents submitted in support of the application for the building permit.
c) I am a *registered professional* as defined at the bottom of this document.

Date: May 15, 2018

Definitions:

Field review means a review of the work at a building site and, where applicable, at locations where building components are fabricated for use at the building site that a *registered professional* in his or her professional discretion considers necessary to ascertain whether the work substantially complies in all material respects with the plans and supporting documents prepared by a *registered professional.*

Fire protection systems means heat and smoke detectors that can activate audible alarms that may automatically notify local fire departments, sprinkler systems, standpipe systems, hand operated extinguishers, the ability to control smoke spread thru ventilation, and pressurization control, door open devices, elevator recalls, smoke and fire dampers

Life safety system means any building element (e.g., emergency power generators and emergency lighting) designed to protect and evacuate the building population in emergencies (e.g., fires and earthquakes) and less critical events (e.g., power failures).

Registered professional means a person who is registered or licensed to practice as a professional engineer under the Yukon Engineering Profession Act.

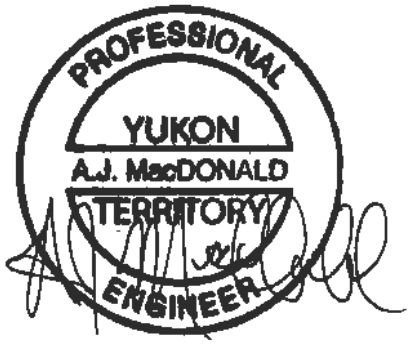
Definitions:



Building Commissioning means where there is *life safety systems* and/or *fire protection systems* that are installed in compliance with the National Building Code of Canada or the National Fire Code of Canada. These systems have been tested together to ensure the proper operation and inter-relationship between the systems.

Field review means a review of the work at a building site and, where applicable, at locations where building components are fabricated for use at the building site that a *registered professional* in his or her professional discretion considers necessary to ascertain whether the work substantially complies in all material respects with the plans and supporting documents prepared by a *registered professional.*

Fire protection systems means heat and smoke detectors that can activate audible alarms that may automatically notify local fire departments, sprinkler systems, standpipe systems, hand operated extinguishers, the ability to control smoke spread through ventilation and pressurization control, door open devices, elevator recalls, smoke and fire dampers.

Life safety system means any building element (e.g., emergency power generators and emergency lighting) designed to protect and evacuate the building population in emergencies (e.g., fires and earthquakes) and less critical events (e.g., power failures).

Registered professional means a person who is registered or licensed to practice as a professional engineer under the Yukon Engineering Profession Act.

Summary of Design and Field Review Requirements

(Initial applicable discipline below and cross out and initial only those items not applicable to the project)

J.M **Architectural**

1.1 Fire resisting assemblies
1.2 *Fire separations* and their continuity
1.3 *Closures*, including tightness and operation
1.4 Interior and exterior finishes, including exterior glazing
1.5 Egress systems, including *access to exit* within *suites* and *floor areas*
1.6 Performance and physical safety features (guardrails, handrails, etc.)
1.7 Structural capacity of architectural components, anchorage & seismic restraint
1.8 Roofing and flashings
1.9 Wall cladding systems
1.10 Dampproofing and/or waterproofing of walls & slabs below grade
1.11 Thermal insulation systems, including condensation control & cavity ventilation
1.12 Sound control
1.13 Landscaping, screening and site grading
1.14 Provisions for fire fighting access
1.15 Access requirements for persons with disabilities
1.16 Elevating devices
1.17 Coordination of testing of fire emergency systems & maintenance programs
1.18 Development permit and conditions therein
1.19 Local building and plumbing bylaw requirements
1.20 Interior signage, including acceptable materials, dimensions & locations
J.M 1.21 ~~Energy Efficiency Part 9.36 requirements~~ N/A
J.M 1.22 ~~Construction safety measures~~ N/A
1.23 Review of all applicable shop drawings

~~**Structural**~~

~~2.1 Structural capacity of the *building*, including anchorage & seismic restraint~~
~~2.2 Structural capacity of a *post-disaster building*, anchorage & seismic restraint~~
~~2.3 Structural aspects of *deep foundations*~~
~~2.4 Qualification of structural welder~~
~~2.5 Excavation & shoring~~
~~2.6 Underpinning~~
~~2.7 Backfill~~
~~2.8 Review of all Applicable Shop Drawings~~

J.M

J.M **Mechanical**

3.1 HVAC systems & devices, including high *building* requirements where applicable
3.2 *Fire dampers* at required *fire separations*
3.3 Continuity of fire separations at HVAC penetrations
3.4 All environmental separation requirements
J.M ~~3.5 Energy Efficiency Part 9.36 requirements~~ N/A
3.6 Functional testing of mechanically related (i.e. sprinkler systems) fire emergency systems & devices
3.7 Maintenance manuals for mechanical systems
3.8 Structural capacity of mechanical components, anchorage & seismic restraint
3.9 Review of all applicable shop drawings

J.M **Commissioning of life safety and fire protection systems**

4.1 Commissioning of life safety and fire protection systems

I hereby give assurance that

a) I have fulfilled my obligations for *field reviews* as required by the previously submitted - "CONFIRMATION OF ASSURANCE OF PROFESSIONAL DESIGN AND COMMITMENT FOR FIELD REVIEWS",
b) I have completed the functional testing of the *fire protection* and *life safety systems* to ascertain that they substantially comply in all material respects with
(i) the applicable requirements of the Yukon Building Standards Act and Regulations, the National Building Code of Canada and other applicable regulations with regards to safety, and
(ii) the plans and supporting documents submitted in support of the application for the building permit.
c) I am a *registered professional* as defined at the bottom of this document.

Definitions:

Field review means a review of the work at a building site and, where applicable, at locations where building components are fabricated for use at the building site that a *registered professional* in his or her professional discretion considers necessary to ascertain whether the work substantially complies in all material respects with the plans and supporting documents prepared by a *registered professional*.

Fire protection systems means heat and smoke detectors that can activate audible alarms that may automatically notify local fire departments, sprinkler systems, standpipe systems, hand operated extinguishers, the ability to control smoke spread thru ventilation, and pressurization control, door open devices, elevator recalls, smoke and fire dampers

Life safety system means any building element (e.g., emergency power generators and emergency lighting) designed to protect and evacuate the building population in emergencies (e.g., fires and earthquakes) and less critical events (e.g., power failures).

Registered professional means a person who is registered or licensed to practice as a professional engineer under the Yukon Engineering Profession Act.

I hereby give assurance that

a) I have fulfilled my obligations for *field reviews* as required by the previously submitted - "CONFIRMATION OF ASSURANCE OF PROFESSIONAL DESIGN AND COMMITMENT FOR FIELD REVIEWS",
b) I have completed the functional testing of the *fire protection* and *life safety systems* to ascertain that they substantially comply in all material respects with
(i) the applicable requirements of the Yukon Building Standards Act and Regulations, the National Building Code of Canada and other applicable regulations with regards to safety, and
(ii) the plans and supporting documents submitted in support of the application for the building permit.
c) I am a *registered professional* as defined at the bottom of this document.

Definitions:

Field review means a review of the work at a building site and, where applicable, at locations where building components are fabricated for use at the building site that a *registered professional* in his or her professional discretion considers necessary to ascertain whether the work substantially complies in all material respects with the plans and supporting documents prepared by a *registered professional*.

Fire protection systems means heat and smoke detectors that can activate audible alarms that may automatically notify local fire departments, sprinkler systems, standpipe systems, hand operated extinguishers, the ability to control smoke spread thru ventilation, and pressurization control, door open devices, elevator recalls, smoke and fire dampers

Life safety system means any building element (e.g., emergency power generators and emergency lighting) designed to protect and evacuate the building population in emergencies (e.g., fires and earthquakes) and less critical events (e.g., power failures).

Registered professional means a person who is registered or licensed to practice as a professional engineer under the Yukon Engineering Profession Act.

Yukon Government

Summary of Design and Field Review Requirements

(Initial applicable discipline below and cross out and initial only those items not applicable to the project)

J.M **Architectural**

1.1 Fire resisting assemblies
1.2 *Fire separations* and their continuity
1.3 *Closures*, including tightness and operation
1.4 Interior and exterior finishes, including exterior glazing
1.5 Egress systems, including *access to exit* within *suites* and *floor areas*
1.6 Performance and physical safety features (guardrails, handrails, etc.)
1.7 Structural capacity of architectural components, anchorage & seismic restraint
1.8 Roofing and flashings
1.9 Wall cladding systems
1.10 Dampproofing and/or waterproofing of walls & slabs below grade
1.11 Thermal insulation systems, including condensation control & cavity ventilation
1.12 Sound control
1.13 Landscaping, screening and site grading
1.14 Provisions for fire fighting access
1.15 Access requirements for persons with disabilities
1.16 Elevating devices
1.17 Coordination of testing of fire emergency systems & maintenance programs
1.18 Development permit and conditions therein
1.19 Local building and plumbing bylaw requirements
1.20 Interior signage, including acceptable materials, dimensions & locations
J.M ~~1.21 Energy Efficiency Part 9.36 requirements~~ N/A
J.M ~~1.22 Construction safety measures~~ N/A
1.23 Review of all applicable shop drawings

Structural

2.1 Structural capacity of the *building*, including anchorage & seismic restraint
2.2 Structural capacity of a *post-disaster building*, anchorage & seismic restraint
2.3 Structural aspects of *deep foundations*
2.4 Qualification of structural welder
2.5 Excavation & shoring
2.6 Underpinning
2.7 Backfill
2.8 Review of all Applicable Shop Drawings

J.M **Mechanical**

3.1 HVAC systems & devices, including high *building* requirements where applicable
3.2 *Fire dampers* at required *fire separations*
3.3 Continuity of fire separations at HVAC penetrations
3.4 All environmental separation requirements
J.M ~~3.5 Energy Efficiency Part 9.36 requirements~~ N/A
3.6 Functional testing of mechanically related (i.e. sprinkler systems) fire emergency systems & devices
3.7 Maintenance manuals for mechanical systems
3.8 Structural capacity of mechanical components, anchorage & seismic restraint
3.9 Review of all applicable shop drawings

J.M **Commissioning of life safety and fire protection systems**

4.1 Commissioning of life safety and fire protection systems

Summary of Design and Field Review Requirements, continued

Plumbing

~~5.1 *Roof drainage systems*~~
~~5.2 Site and *foundation drainage systems*~~
~~5.3 *Plumbing systems* and devices~~
5.4 Sprinkler systems including water flow-indicating devices where applicable
5.5 Continuity of *fire separations* at plumbing penetrations
~~5.6 Local building and plumbing bylaw requirements~~
5.7 Functional testing of plumbing related fire emergency systems including waterflow-indicating devices where applicable
~~5.8 Maintenance manuals for *plumbing systems*~~
~~5.9 Structural capacity of plumbing components, anchorage and seismic restraint~~
~~5.10 Review of all applicable shop drawings~~

Fire Suppression Systems

6.1 Suppression systems classification for type of *occupancy*
6.2 Design coverage, including concealed or special areas
6.3 Compatibility and location of electrical supervision, ancillary alarms and control devices
6.4 Evaluation of the capacity of city water supply versus system demands and domestic demand, including plumbing devices where applicable
6.5 Qualification of welder, quality of welds and material
6.6 Acceptance testing for —"Contractor's Material and Test Certificate"— as per NFPA Standard
6.7 Maintenance program and manual for suppression systems
6.8 Structural capacity of sprinkler components, anchorage and seismic restraint
6.9 For partial systems—confirm sprinklers are installed in all areas where required
6.10 Fire department access requirements
6.11 Fire Department connections and hydrant locations
6.12 Fire hose standpipes
6.13 Function Testing of fire suppression systems and waterflow– Indicating devices
6.14 Review of all applicable shop drawings

Electrical

~~7.1 Electrical systems and devices, including high building systems where applicable~~
7.2 Continuity of *fire separations* at electrical penetrations
7.3 Functional testing of electrical related fire emergency systems, fire alarm systems and waterflow-indicating devices
~~7.4 Emergency electrical power supply for buildings where applicable~~
~~7.5 Electrical systems and devices maintenance manuals~~
~~7.6 Structural capacity of electrical components, anchorage and seismic restraint~~
~~7.7 Clearances from *building* of all electrical utility equipment~~
7.8 Fire protection of wiring for emergency systems
~~7.9 Review of all applicable shop drawings~~

5.5 Continuity of *fire separations* at plumbing penetrations
~~5.6 Local building and plumbing bylaw requirements~~
5.7 Functional testing of plumbing related fire emergency systems including waterflow-indicating devices where applicable
~~5.8 Maintenance manuals for *plumbing systems*~~
~~5.9 Structural capacity of plumbing components, anchorage and seismic restraint~~
~~5.10 Review of all applicable shop drawings~~

Fire Suppression Systems

6.1 Suppression systems classification for type of *occupancy*
6.2 Design coverage, including concealed or special areas
6.3 Compatibility and location of electrical supervision, ancillary alarms and control devices
6.4 Evaluation of the capacity of city water supply versus system demands and domestic demand, including plumbing devices where applicable
6.5 Qualification of welder, quality of welds and material
6.6 Acceptance testing for —"Contractor's Material and Test Certificate"— as per NFPA Standard
6.7 Maintenance program and manual for suppression systems
6.8 Structural capacity of sprinkler components, anchorage and seismic restraint
6.9 For partial systems—confirm sprinklers are installed in all areas where required
6.10 Fire department access requirements
6.11 Fire Department connections and hydrant locations
6.12 Fire hose standpipes
6.13 Function Testing of fire suppression systems and waterflow– Indicating devices
6.14 Review of all applicable shop drawings

Electrical

~~7.1 Electrical systems and devices, including high building systems where applicable~~
7.2 Continuity of *fire separations* at electrical penetrations
7.3 Functional testing of electrical related fire emergency systems, fire alarm systems and waterflow-indicating devices
~~7.4 Emergency electrical power supply for buildings where applicable~~
~~7.5 Electrical systems and devices maintenance manuals~~
~~7.6 Structural capacity of electrical components, anchorage and seismic restraint~~
~~7.7 Clearances from *building* of all electrical utility equipment~~
7.8 Fire protection of wiring for emergency systems
~~7.9 Review of all applicable shop drawings~~

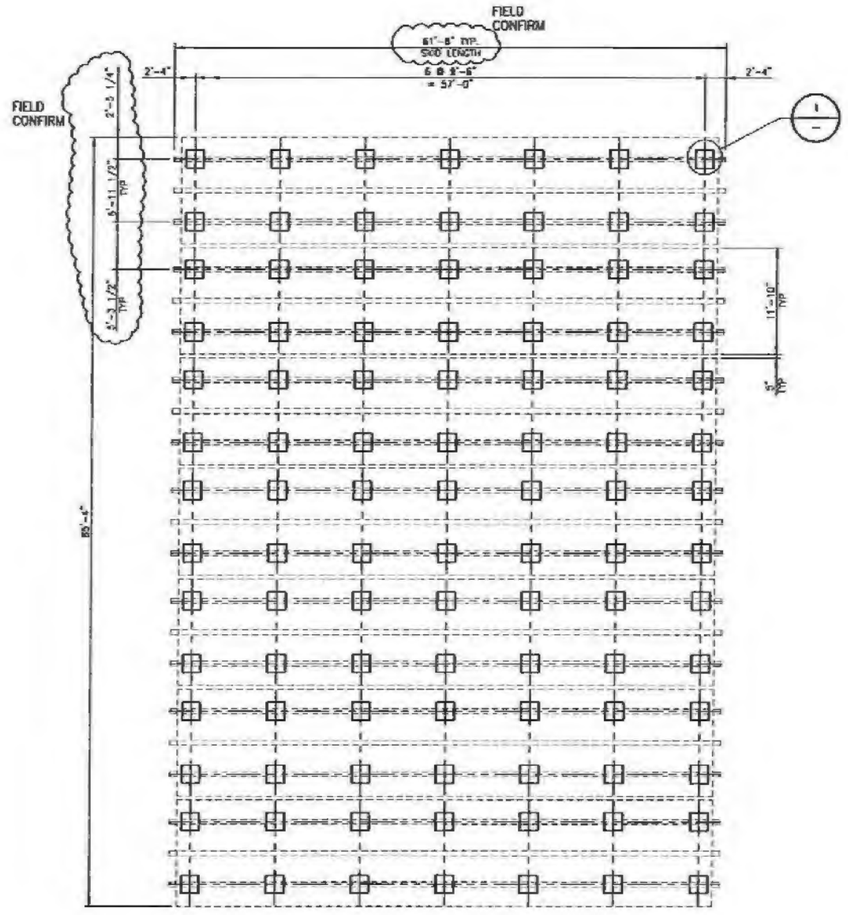
I hereby give assurance that

a) I have fulfilled my obligations for *field reviews* as required by the previously submitted - "CONFIRMATION OF ASSURANCE OF PROFESSIONAL DESIGN AND COMMITMENT FOR FIELD REVIEWS",
b) I have completed the functional testing of the *fire protection* and *life safety systems* to ascertain that they substantially comply in all material respects with
(i) the applicable requirements of the Yukon Building Standards Act and Regulations, the National Building Code of Canada and other applicable regulations with regards to safety, and
(ii) the plans and supporting documents submitted in support of the application for the building permit.
c) I am a *registered professional* as defined at the bottom of this document.

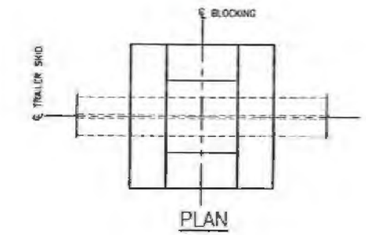


Definitions:

Field review means a review of the work at a building site and, where applicable, at locations where building components are fabricated for use at the building site that a *registered professional* in his or her professional discretion considers necessary to ascertain whether the work substantially complies in all material respects with the plans and supporting documents prepared by a *registered professional*.

Fire protection systems means heat and smoke detectors that can activate audible alarms that may automatically notify local fire departments, sprinkler systems, standpipe systems, hand operated extinguishers, the ability to control smoke spread thru ventilation, and pressurization control, door open devices, elevator recalls, smoke and fire dampers

Life safety system means any building element (e.g., emergency power generators and emergency lighting) designed to protect and evacuate the building population in emergencies (e.g., fires and earthquakes) and less critical events (e.g., power failures).



Registered professional means a person who is registered or licensed to practice as a professional engineer under the Yukon Engineering Profession Act.

This report only contains information about permits that have been issued. Government of Yukon offers no warranties about the completeness of this report. It does not contain information about investigations, stop work orders, un-permitted installations or activities. The inspections undertaken by the Government of Yukon are made on the basis of visual observations of readily apparent circumstances and made only to satisfy the requirements of the relevant permit. The issuance of a final inspection is not a warranty or assessment about the suitability or fitness for a purpose of any permitted construction or installation. In consideration of the receipt of this report you waive any claim against Government of Yukon resulting from your reliance on the information in this report. For properties in the City of Whitehorse, purchasers may wish to contact the City of Whitehorse.

Les renseignements contenus dans le présent rapport concernent uniquement les permis qui ont déjà été délivrés. Le gouvernement du Yukon ne donne aucune garantie en ce qui concerne le caractère exhaustif du rapport. Le rapport ne contient pas d'information sur des enquêtes, des ordres de suspension de travaux, des installations ou activités réalisées sans permis. Les inspections menées par le gouvernement du Yukon sont effectuées au moyen d'un examen visuel de conditions facilement observables, et ce, uniquement aux fins de satisfaire aux exigences associées au permis. La présentation d'un rapport d'inspection final n'est pas une garantie ni une opinion quant à la pertinence ou à la conformité, relativement à son usage, d'une construction ou d'une installation réalisée en vertu d'un permis. En recevant le présent rapport, vous renoncez à intenter toute poursuite contre le gouvernement du Yukon pour des dommages pouvant résulter de l'utilisation de l'information contenue dans le rapport. S'il s'agit d'une propriété située à Whitehorse, l'acheteur est invité à communiquer avec la Ville de Whitehorse.

If you wish to receive this information in French, please contact the Whitehorse Building Safety Office.

Si vous souhaitez recevoir l'information contenue dans le présent rapport en français, veuillez communiquer avec le bureau de la Sécurité des bâtiments, à Whitehorse.

Contractor's Material and Test Certificate for Aboveground piping

PROCEDURE

Upon completion of work inspection and tests shall be made by the contractor's representative and witnessed by an owner's representative. All defects shall be corrected and system left in service before contractor's personnel finally leave the job.

A certificate shall be filled out and signed by both representatives. Copies shall be prepared for approving authorities, owners and contractor. It is understood the owner's representative's signature in no way prejudices any claim against contractor for faulty material, poor workmanship, or failure to comply with approving authority's requirements or local ordinances.

TEST DESCRIPTION

HYDROSTATIC: Hydrostatic tests shall be made at not less than 200 psi (13.6 bars) for two hours or 50 psi (3.4 bars) above static pressure in excess of 150 psi (10.2 bars) for two hours. Differential dry-pipe valve clappers shall be left open during test to prevent damage. All aboveground piping leakage shall be stopped.

PNEUMATIC: Establish 40 psi (2.7 bars) air pressure and measure drop which shall not exceed 1-1/2 psi (0.1 bars) in 24 hours. Test pressure tanks at normal water level and air pressure and measure air pressure drop which shall not exceed 1-1/2 psi (0.1 bars) in 24 hours.

TEST

ALL NEW PIPING HYDROSTATICALLY TESTED AT 200 PSI FOR 2 HRS ☐ YES ☑ NO | IF NO, STATE REASON

DRY PIPING PNEUMATICALLY TESTED ☐ YES ☑ NO

EQUIPMENT OPERATES PROPERLY ☑ YES ☐ NO

DO YOU CERTIFY AS THE SPRINKLER CONTRACTOR THAT ADDITIVES AND CORROSIVE CHEMICALS, SODIUM SILICATE OR DERIVATIVES OF SODIUM SILICATE, BRINE, OR OTHER CORROSIVE CHEMICALS WERE NOT USED FOR TESTING SYSTEMS OR STOPPING LEAKS? ☑ YES ☐ NO

DRAIN TEST: READING OF GAGE LOCATED NEAR WATER SUPPLY TEST CONNECTION: _____ PSI | RESIDUAL PRESSURE WITH VALVE IN TEST CONNECTION OPEN WIDE _____ PSI

UNDERGROUND MAINS AND LEAD IN CONECTIONS TO SYSTEM RISERS FLUSHED BEFORE CONNECTION MAKE TO SPRINKLER PIPING.

VERIFIED BY COPY OF THE U FORM NO. 85B ☐ YES ☑ NO | OTHER | EXPLAIN

FLUSHED BY INSTALLER OF UNDER-GROUND SPRINKLER PIPING ☐ YES ☐ NO

IF POWDER-DRIVEN FASTENERS ARE USED IN CONCRETE, HAS REPRESENTATIVE SAMPLE TESTING BEEN SATISFACTORILY COMPLETED? ☐ YES ☐ NO | IF NO, EXPLAIN

ADDITIONAL EXPLANATION AND NOTES

Contractor's Material and Test Certificate for Aboveground piping

PROCEDURE

Upon completion of work inspection and tests shall be made by the contractor's representative and witnessed by an owner's representative. All defects shall be corrected and system left in service before contractor's personnel finally leave the job.

A certificate shall be filled out and signed by both representatives. Copies shall be prepared for approving authorities, owners and contractor. It is understood the owner's representative's signature in no way prejudices any claim against contractor for faulty material, poor workmanship, or failure to comply with approving authority's requirements or local ordinances.

GENERAL NOTES ON REINFORCEMENT

THE FOLLOWING NOTES SHALL APPLY TO ALL REINFORCEMENT SHOWN ON THE DRAWINGS UNLESS OTHERWISE NOTED.

DIMENSIONS:
DIMENSIONS TO REINFORCEMENT ARE TO CENTRE LINES OF BARS, EXCEPT WHERE CONCRETE COVER OR CLEARANCE BETWEEN BARS IS SHOWN.

COVER:
SEE STRUCTURAL ENGINEER TYPICAL NOTES FOR ALL COVER SPECIFICATIONS.

SPACING:
UNLESS OTHERWISE SHOWN, THE FIRST AND LAST BARS IN SLABS AND WALLS, STIRRUPS IN BEAMS SHALL BE PLACED AT A MAXIMUM OF HALF THE SPECIFIED SPACING OF ADJACENT BARS FROM THE END OF THE MEMBER.

STEEL SPECIFICATIONS:
STEEL REINFORCEMENT SHALL BE DEFORMED BARS OF GRADE 400 CONFORMING TO CSA STANDARDS G30.18 BILLET-STEEL BARS FOR CONCRETE REINFORCEMENT.

WELDING:
WELDING OF REINFORCEMENT SHALL NOT BE PERMITTED.

SPLICES AND EMBEDMENTS:
UNLESS OTHERWISE SPECIFIED, ALL EMBEDMENTS SHALL BE TREATED AS TENSION EMBEDMENTS AND ALL LAP SPLICES SHALL BE CONSIDERED AS TENSION LAP SPLICES.

WHEN REINFORCING BARS OF DIFFERENT SIZE ARE TO BE SPLICED, THE LENGTH OF THE LAP SHALL BE BASED ON THE DIAMETER OF THE SMALLER BAR.

SPLICES ARE TO BE MADE SO THAT THE GIVEN CLEAR DISTANCE COVER WILL BE MAINTAINED.

LAP LENGTHS UNLESS SHOWN OTHERWISE:

	HORZ	OTHER
10M	520	400
15M	715	555
20M	1020	790
25M	1545	1240
30M	1940	1485
35M		

PLACEMENT:
PLACE REINFORCING STEEL IN ACCORDANCE WITH CSA A23.1-14.

REINFORCEMENT MAY BE DISPLACED TO CLEAR PIPES, RECESSES, EMBEDDED METAL WORKS AND CONDUITS.

A MINIMUM CLEARANCE OF 1" SHALL BE MAINTAINED BETWEEN REINFORCEMENT AND EMBEDDED MATERIALS. THE MINIMUM CLEARANCE BETWEEN REINFORCEMENT

REINFORCEMENT SHALL BE ACCURATELY PLACED IN ACCORDANCE WITH THE DRAWING AND SHALL BE ADEQUATELY SECURED AGAINST DISPLACEMENT BY USING ANNEALED IRON WIRE AT INTERSECTIONS AND SHALL BE SUPPORTED BY APPROVED CONCRETE OR METAL SUPPORTS. SPACERS OR METAL HANGERS EXCEPT AT SURFACES EXPOSED TO THE GROUND OR TO THE WEATHER WHERE SUPPORTS SHALL BE APPROVED. ALL METAL ACCESSORIES ARE TO BE GALVANIZED.

THE FULL EXTENT AND PURPOSE OF THESE DRAWINGS IS PLACING OF REINFORCING STEEL BARS ONLY. IT IS NOT TO BE USED AS A MEANS OF COMMUNICATION BETWEEN THE ARCHITECT, ENGINEER, CONTRACTOR OR ANY OTHER SUBTRADE.

REINFORCEMENT MAY BE DISPLACED TO CLEAR PIPES, BOLTSETS, EMBEDDED METAL WORKS AND CONDUITS.

A MINIMUM CLEARANCE OF 1" SHALL BE MAINTAINED BETWEEN REINFORCEMENT AND EMBEDDED MATERIALS. THE MINIMUM CLEARANCE BETWEEN REINFORCEMENT

REINFORCEMENT SHALL BE ACCURATELY PLACED IN ACCORDANCE WITH THE DRAWINGS AND SHALL BE ADEQUATELY SECURED AGAINST DISPLACEMENT BY USING ANNEALED IRON WIRE AT INTERSECTIONS AND SHALL BE SUPPORTED BY APPROVED CONCRETE OR METAL SUPPORTS, SPACERS OR METAL HANGERS EXCEPT AT SURFACES EXPOSED TO THE GROUND OR TO THE WEATHER WHERE SUPPORTS SHALL BE APPROVED. ALL METAL ACCESSORIES ARE TO BE GALVANIZED.

THE FULL INTENT AND PURPOSE OF THESE DRAWINGS IS PLACING OF REINFORCING STEEL BARS ONLY. IT IS NOT TO BE USED AS A MEANS OF COMMUNICATION BETWEEN THE ARCHITECT, ENGINEER, CONTRACTOR OR ANY OTHER SUBTRADE.

GENERAL NOTES ON REINFORCEMENT

THE FOLLOWING NOTES SHALL APPLY TO ALL REINFORCEMENT SHOWN ON THE DRAWINGS UNLESS OTHERWISE NOTED.

DIMENSIONS:
DIMENSIONS TO REINFORCEMENT ARE TO CENTRE LINES OF BARS, EXCEPT WHERE CONCRETE COVER OR CLEARANCE BETWEEN BARS IS SHOWN.

COVER:
SEE STRUCTURAL ENGINEER TYPICAL NOTES FOR ALL OTHER SPECIFICATIONS

SPACING:
UNLESS OTHERWISE SHOWN, THE FIRST AND LAST BARS IN SLABS AND WALLS, STIRRUPS IN BEAMS SHALL BE PLACED AT A MAXIMUM OF HALF THE SPECIFIED SPACING OF ADJACENT BARS FROM THE END OF THE MEMBER.

STEEL SPECIFICATIONS:
STEEL REINFORCEMENT SHALL BE DEFORMED BARS OF GRADE 400 CONFORMING TO CSA STANDARDS G30.18 BILLET-STEEL BARS FOR CONCRETE REINFORCEMENT.

WELDING:
WELDING OF REINFORCEMENT SHALL NOT BE PERMITTED.

SPLICES AND EMBEDMENTS:
UNLESS OTHERWISE SPECIFIED, ALL EMBEDMENTS SHALL BE TREATED AS TENSION EMBEDMENTS AND ALL LAP SPLICES SHALL BE CONSIDERED AS TENSION LAP SPLICES.

WHEN REINFORCING BARS OF DIFFERENT SIZE ARE TO BE SPLICED, THE LENGTH OF THE LAP SHALL BE BASED ON THE DIAMETER OF THE SMALLER BAR.

SPLICES ARE TO BE MADE SO THAT THE GIVEN CLEAR DISTANCE COVER WILL BE MAINTAINED.

LAP LENGTHS UNLESS SHOWN OTHERWISE:

	HOOK	OTHER
10M	320	400
15M	475	595
20M	1050	750
25M	1625	1240
30M	1940	1485
35M		

PLACEMENT:
PLACE REINFORCING STEEL IN ACCORDANCE WITH CSA CAN3-A23.1-M.

REINFORCEMENT MAY BE DISPLACED TO CLEAR PIPES, RECESSES, EMBEDDED METAL ARMS AND CONDUITS.

A MINIMUM CLEARANCE OF 1" SHALL BE MAINTAINED BETWEEN REINFORCEMENT AND EMBEDDED MATERIALS. THE MINIMUM CLEARANCE BETWEEN REINFORCEMENT

REINFORCEMENT SHALL BE ACCURATELY PLACED IN ACCORDANCE WITH THE DRAWING AND SHALL BE HORIZONTALLY SECURED AGAINST DISPLACEMENT BY USING ANNEALED IRON WIRE AT INTERSECTIONS.
USE SHALL BE SUPPORTED BY APPROVED CONCRETE OR METAL SUPPORTS, SPACERS OR METAL HANGERS EXCEPT AT SURFACES EXPOSED TO THE GROUND OR TO THE WEATHER WHERE SUPPORTS SHALL BE APPROVED. ALL METAL ACCESSORIES ARE TO BE GALVANIZED.

THE FULL INTENT AND PURPOSE OF THESE DRAWINGS IS PLACING OF REINFORCING STEEL BARS ONLY. IT IS NOT TO BE USED AS A MEANS OF COMMUNICATION BETWEEN THE ARCHITECT, ENGINEER, CONTRACTOR OR ANY OTHER SUBTRADE.

FOUNDATION NOTES:

2.1 ALL CONCRETE FOUNDATION SUBGRADE SHALL BE EITHER ROCK OR 38 mm NFS STRUCTURAL BACKFILL DOWN TO 3 METERS BELOW THE FINISH GRADE COMPACTED TO 95% MODIFIED PROCTOR.
2.2 ALL BACKFILL AROUND AND ABOVE CONCRETE FOUNDATIONS, PEDESTALS AND PADS SHALL BE 38 mm MINUS NFS STRUCTURAL BACKFILL.
2.3 ALL FOUNDATION SUBGRADE SHALL BE INSPECTED AND APPROVED BY THE GEOTECHNICAL ENGINEER PRIOR TO PLACEMENT OF CONCRETE.
2.4 THE PREPARED FOOTING SUBGRADE SHALL BE PROTECTED FROM WATER INGRESS AND SOFTENING BY PROVIDING ADEQUATE DRAINAGE OR PLACING A LEAN CONCRETE MUD SLAB.

GENERAL NOTES:

1.1 READ THESE DRAWINGS IN CONJUNCTION WITH ALL OTHER PERTINENT CONTRACT DOCUMENTS.
1.2 FOR CONCRETE TYPICAL DETAILS DRAWING SET AND GENERAL NOTES, SEE DRAWINGS 354138-0000-231-294-0001 TO -0007.
1.3 REFER TO MECHANICAL, PROCESS AND ELECTRICAL DRAWINGS FOR LOCATIONS AND DIMENSIONS OF OPENINGS, SLEEVES AND OTHER BUILDING COMPONENTS NOT SHOWN ON STRUCTURAL DRAWINGS, REPORT DISCREPENCIES TO THE OWNER OR HIS REPRESENTATIVE PRIOR TO PROCEEDING WITH THE WORK.
1.4 FOR GENERAL SITE LOCATION AND WORK POINT COORDINATES, SEE DRAWING H354138-2000-220-270-0002.
1.5 HIGH ENERGY COMPACTION EQUIPMENT SUCH AS LARGE ROLLERS MUST NOT BE USED FOR COMPACTING BACKFILL WITHIN 1 METER OF THE EDGE OF THE WALLS.
1.6 FOR GROUNDING LOOP SEE ELECTRICAL DRAWING H354138-3000-260-272-1000-0004. FOR GROUNDING INSTALLATION DETAILS SEE DRAWING SET H354138-0000-260-294-0001-0001, -0002. -0009 AND -0010.
1.7 FOR CAST-IN PLACE CONCRETE, SEE SPECIFICATION SECTION H354138-S032000.
1.8 FOR CONCRETE FORMWORK, SEE SPECIFICATION SECTION H354138-S031000.
1.9 FOR CONCRETE REINFORCEMENT, SEE SPECIFICATION SECTION H354138-S033000.
1.10 FOR GROUTING, SEE SPECIFICATION SECTION H354138-S036000.
1.11 CONSTRUCTION JOINTS NOT SHOWN ON THE DRAWINGS MUST BE APPROVED BY THE CONTRUCTION MANAGER.
1.12 IN CASE OF ANY DISCREPANCIES, INFORM THE CONSTRUCTION MANAGER BEFORE COMMENCING WORK.
1.13 ALL DIMENSIONS ARE IN MILLIMETERS AND ELEVATIONS ARE IN METERS.
1.14 PROVIDE 19mm X 19mm CHAMFER AT ALL EXPOSED CONCRETE CORNERS AND EDGES ABOVE GRADE LEVEL.
1.15 THE DRAWINGS SHOULD BE READ IN CONJUNCTION WITH THE PROJECT CIVIL DESIGN CRITERIA H654138-0000-220-210-0001.
1.16 FOR FURTHER GEOTECH INFORMATION, SEE "2011 GEOTECHNICAL INVESTIGATION FOR MINE SITE INFRASTRUCTURE FOUNDATION REPORT" BY BGC ENGINEERING DATED JAN 31, 2012.
1.17 SET ANCHOR RODS USING TEMPLATES WHICH MUST BE LEFT IN PLACE UNTIL THE CONCRETE HAS SET. ANCHOR RODS SHALL BE PLUMBED AND SECURED FROM MOVEMENT PRIOR TO CASTING CONCRETE.

Question from Ryan de Milliano (Clark Builders - Edmonton) at 09:10 PM on 30/09/2018

Please confirm it would be acceptable to modify the stirrups, for pedestal types P5 and P6, as noted in the attached sketches/markups.

There are 3 changes being requested:
1. Use 3 large stirrups in each pedestal to avoid the embedded items.
2. Use hairpin stirrups to connect each side to avoid stirrup congestion and allow faster and easier installation.
3. In the P6 Pedestal, allow fabrication and use of the same triangle stirrup used in Pedestal P5.

Awaiting an Official Response

All Replies:

It is acceptable to modify the pedestals P5 and P6 shown on dwg H354138-3400-231-260-0005 as described below:

1. Use 3 large stirrups in each pedestal as shown on your sketch
2. Use S shape hairpin with hooks on both ends to connect every other bar in the short direction, except the ones at the corners of the big stirrups (bars at the inside corner of stirrups or connected by an S shape hairpin are considered as restrained. Every other longitudinal bar needs to be restrained.)
3. In pedestal P6, it is accepted to use the same triangle stirrup used in P5 as shown on your sketch

ORE PREP PAD AND OVERLAND CONVEYOR FIELD REPORT

To:	Roman Bilobrowka; Calvin Goldschmidt; Chris Copley, Matt Coverdale, Mike Blusson		
Cc:	Chad Cowan; Robert Zschuppe; James Buyck, John Purvis, Richard Oswell, Mark Estrada	**From:**	Scott Dimitroff
Project:	Ore Prep Pad and Overland Conveyor	**Date:**	September 22, 2018
Location:	Eagle Gold Mine, YK	**Weather:**	Overcast
Client:	JDS		High 9°C
File:	ENG.WARC03235-02.005		Low -2°C

1.0 ORE PREP PAD AND OVERLAND CONVEYOR

- JDS requested that TetraTech provide construction monitoring for the Ore Prep Pad and Overland Conveyor.
- Arrived on site to find that a pad approximately 4 metres high had already been placed. The pad was being built out of excavated Type 3 material from the cut for the ore pad. Material was being packed with loaded haul trucks as the packer was broken down.
- The area from sta. 1100 (Dublin Gulch Creek) to the pad appeared to have been excavated down to original ground with an organic spill pile on the east edge.
- Proof rolling with a loaded 40 ton haul truck indicated some soft, wet areas that needed to be removed. The contractor was in the process of doing this.

2.0 DISCUSSION/OTHER

- TetraTech will provide monitoring of the fill placement.
- Lifts of the Type 3 were being placed in 0.7 metre lifts. Contractor was advised to reduce lifts to 0.3 metres but continued with 0.7 metre lifts.

1.0 CV-016 BENT 1 FOUNDATION PAD CONSTRUCTION SUMMARY

Equipment	Work
CAT 314E Excavator	Placing backfill
CAT 740 Rock Truck	Hauling backfill to Excavation
CS56B Smooth Drum Compactor	Compacting backfill
1000 lbs Vibratory Plate Compactor	Compacting backfill

2.0 CV-016 BENT 1 FOUNDATION PAD EXCAVATION AND BACKFILL

Night Shift:

- Footprint for Bent 1 footing for the CV-016 Conveyor excavated 1.5 m below the footing base and was reportedly approved by JDS and surveyed prior to the site visit by Tetra Tech. Loose fill was visually observed at base of excavation. Loose fill was compacted with a sing 4 passes (back and forth) with the CS56B smooth drum vibratory compactor prior to placement of 100 mm NFS aggregate fill.
- Placed and compacted 5 lifts of 100 mm NFS material as backfill. Lifts were visually observed to be placed at approximately 300 mm lift thickness. Compaction for this lift was completed using 4 passes (back and forth) with the CS56B smooth drum vibratory compactor as per method specifications. Each pass was conducted with sufficient overlap and complete coverage over the compacted area. A 1000 lbs plate tamper was used to obtain compaction around the edges of each lift. Laser level used to mark lift thicknesses and achieve final grade on lift 5.

3.0 DISCUSSION/OTHER

- None

EXCAVATION AND BACKFILL PRE POUR INSPECTION

Rev 00 May 4, 2018

SUBCONTRACTOR: Copar	INSPECTION DATE: September 18, 2018
SUBCONTRACTOR CONTACT PERSON:	
INSPECTOR(S): Ryan DeMilliano	
LOCATION: Transfer Tower 2 Subbase.	
DRAWING REV:	DRAWING NO.(S): SPEC SECTION(S):

ITEM	ITEMS TO BE CHECKED	PASS	FAIL	N/A
1.0	Drainage has been planned and is being provided continuously	☐	☐	☐
2.0	Survey complete, stakes and monuments located	☐	☐	☐
3.0	If needed, are barricades, stop logs, properly placed?	☐	☐	☐
4.0	Drawings are approved and stamped prior to work begins	☐	☐	☐
5.0	Utilities and other underground potential interferences to remain are located, stakes and protected?	☐	☐	☐
		☐	☐	☐

ITEM	ITEMS TO BE CHECKED	PASS	FAIL	N/A
6.0	Backfill materials have been tested and approved to use	☐	☐	☐
7.0	Clarify compaction requirements by material, use, lift thickness, frequency, etc.	☐	☐	☐
8.0	Need of slope design for trenching or excavation has been reviewed	☐	☐	☐
9.0	Blast/fractured rock requirements have been reviewed	☐	☐	☐
10.0	Testing, inspection and compaction requirements have been reviewed	☐	☐	☐
		☐	☐	☐

CONCRETE REINFORCEMENT PRE POUR

Rev 00 May 4, 2018

SUBCONTRACTOR: Ultimate Reinforcing	INSPECTION DATE: October 2, 2018
SUBCONTRACTOR CONTACT PERSON: Sunny M.	~~ACTION BY:~~ Pour (Pass) October 3, 2018
INSPECTOR(S): Ryan DeMilliano	
LOCATION: 3330 - Transfer Tower 2 (TT2) Mat Foundation.	
DRAWING REV: 01 / DRAWING NO.(S): 330-231-260-0011	SPEC SECTION(S): 503 20 00

ITEM	ITEMS TO BE CHECKED	PASS	FAIL	N/A
1.0	Grade (400W unless otherwise noted) and type of steel delivered and installed as required by approved drawings.	X		
2.0	Inspect rebar distribution, spacing and cover per design/project requirements.	X		
3.0	Length of splices as specified	X		
4.0	Staggered splices as specified	X		
5.0	Any mechanical splices have been approved by the owner prior to install			X
6.0	Bars cleaned and free of material that may reduce bond including loose rust, scale, oil, structural defects and that they are uncoated and unpainted.	X		
7.0	Dowels at wall ends, construction joints, and openings as specified (length, location, size, etc.)	X		
8.0	No unauthorized field bent bars including hooks installed	X		
	Resolve conflicts between embedded items and reinforcement	X		
9.0	When authorized, field bends done without heat and inspected for fissures or cracks.			X

ITEM	ITEMS TO BE CHECKED	PASS	FAIL	N/A
10.0	Bars tied and supported to prevent displacement	X		
11.0	Spacers, tie wire and chairs as required	X		
12.0	Conduits at design location and minimum separation from rebar as specified			X
13.0	No contact of bars is made with dissimilar metals as per CSA A23.1	X		
14.0	Bars, nails or tie wire not sticking out from surfaces that allow rusting/corrosion	X		
15.0	Rebar is welds inspected by qualified inspectors certified to CSA W178.2			X
16.0	No rebar congestion or other obstruction for deposit of concrete	X		
17.0	Adjustments required for interfering items (piping, inserts, sleeves, etc.) have been submitted and approved by owner.			X
18.0	Rebar was stored off ground to prevent damage/corrosion	X		
19.0	Review drawings for anchors, piping, sleeves, boxes	X

FORMWORK & FALSEWORK PRE POUR | QA INSPECTION

Rev 01 August 25, 2018

CONTRACTOR: Clark Builders	INSPECTION DATE: October 2, 2018
CONTRACTOR CONTACT PERSON: Dan Pelletier / Gary Hosey	DATE OF POUR: October 3, 2018
INSPECTOR(S): Dan Pelletier, Gary Hosey.	
LOCATION: 3330 - Transfer Tower 2 (TT2) Mat Foundation	
DRAWING REV: 01 / DRAWING NO.(S): 3330 - 231-260-0011	SPEC SECTION(S): 503 1000

ITEM	ITEMS TO BE CHECKED	PASS	FAIL	N/A
1.0	Location, survey, dimension and grades as required	X		
2.0	Plumbness and Flatness verified	X		
3.0	Joints are aligned and watertight.	X		
4.0	Formwork shop drawings are Engineered and reviewed	X		
5.0	Re-used formwork reconditioned and treated	X		
6.0	Formwork and ties according to finishing requirements. Confirm no holes in the concrete surface are greater than 25mm in diameter or expose steel at less than 25mm from surface. As per spec.	X		
7.0	Installation of embeds are located and secured	X		
8.0	Chamfer requirements checked. 25mm chamfers required for all exterior corners and edges exposed to view including horizontal edges of pads.	X		
9.0	Key ways and/or other provisions according to design are provided in construction joints			X

ITEM	ITEMS TO BE CHECKED	PASS	FAIL	N/A
10.0	Inspect types of form spacers, ties and bracing.	X		
11.0	Spacing of ties to be set to a pattern	X		
12.0	Expansion, construction, contraction joints as required & located as coordinated with structural Engineer			X
13.0	Forms secured against movement during placing	X		
14.0	Forms are braced for alignment and blow out	X		
15.0	Forms are cleaned of all debris, and dry, prior to concrete placement including standing water.	X		
16.0	Openings in formwork permit inspection and cleaning, placing and compaction of concrete, and forming and processing of construction joints.	X		
17.0	Formwork has been coated with release agent prior to rebar placement.	X		
18.0	Anchor Bolts and Embeds are secured to formwork.	X

CONCRETE POST POUR COLD WEATHER MONITORING

Rev 01 July 4, 2018

SUBCONTRACTOR: CLARK BUILDERS	DATE OF POUR: OCTOBER 3, 2018
WEATHER/ AMBIENT TEMP (°C):	DATE FORMWORK STRIPPED:
INSPECTOR(S): Ryan deMilturo	DATE OF INSPECTION: Various.
LOCATION: 3330 - Transfer Tower 2 (TT2) Mat Foundation.	
DRAWING NO.(S):	DRAWING REV:
SPEC SECTION(S): S03 30 00 – Cast-In-Place	

TYPE OF CURING:

CURING COMPOUND	☐	DAMP BURLAP OR FABRIC	☐	INSULATION (TARPS)	☒
POLYETHYLENE SHEETS	☐	WATER/FOG SPRAY/ PONDING	☐	FORMS (COVERED BY)	☒

COLD WEATHER REQUIREMENTS (WHEN AMB. TEMP < 5°C)	PASS	FAIL	N/A	REMARKS
Protection in place for 5 days at temperatures not lower than 20°C or until 70% of the 28-day strength has been reached.	☒	☐	☐	
Cold weather protection provided by means of heated enclosures, coverings, insulation, or a suitable approved combination of these methods during complete curing period.	☒	☐	☐	
During freezing weather, water curing terminated 12h before the end of the protection period (CSA A 23.1 clause 7.4.2.4.2)	☒	☐	☐	No standing water.

CONCRETE CURING TEMPERATURE LOG (COLD WEATHER CONCRETEING ONLY)

DATE	TIME (24 HR)	OUTSIDE AIR TEMP (°C)	TEMP INSIDE HOARDING (°C)	CONCRETE SURFACE TEMP (°C) HIGH (°C)	CONCRETE SURFACE TEMP (°C) LOW (°C)	INITIALS OF READER
① Oct 4, 2018	07:00	-8°C	+23°C	+25°C	+18°C	[illegible]
Oct 5, 2018	07:05	-9°C	+21°C	+24°C	+16°C	[illegible]
Oct 6, 2018	12:00	-2°C	-	+16°C	+12°C	[illegible]

COMMENTS: ① Oct 4, 2018 @ 7:00am - Cylinders found outside of hoarding in morning. Placed back into hoarding but freezing temperatures overnight may have frozen cylinders. (PICTURES TAKEN) [illegible]

CONCRETE REINFORCEMENT PRE POUR

Rev 01 August 25, 2018

SUBCONTRACTOR: Ultimate Reinforcing // McNish	INSPECTION DATE: October 8, 2018
SUBCONTRACTOR CONTACT PERSON: Jimmy M.	PROJ. POUR DATE: Oct 9, 2018
INSPECTOR(S): Ryan deMilliano, KHAN	
LOCATION: 3330 //TT2 REMAINING PEDESTALS	
DRAWING REV: 01 / DRAWING NO.(S): 3370-231-260-0011	SPEC SECTION(S): S03 20 00 – Concrete Reinforcing Steel

ITEM	ITEMS TO BE CHECKED	PASS	FAIL	N/A
1.0	Grade (400W unless otherwise noted) and type of steel delivered and installed as required by approved drawings.	☒	☐	☐
2.0	Inspect rebar distribution, spacing and cover per design/project requirements.	☒	☐	☐
3.0	Length of splices as specified	☒	☐	☐
4.0	Staggered splices as specified	☒	☐	☐
5.0	Any mechanical splices have been approved by the owner prior to install	☐	☐	☒
6.0	Bars cleaned and free of material that may reduce bond including loose rust, scale, oil, structural defects and that they are uncoated and unpainted.	☒	☐	☐
7.0	Dowels at wall ends, construction joints, and openings as specified (length, location, size, etc.)	☒	☐	☐
8.0	No unauthorized field bent bars including hooks installed	☒	☐	☐
9.0	Resolve conflicts between embedded items and reinforcement	☒	☐	☐
10.0	When authorized, field bends done without heat and inspected for fissures or cracks	☐	☐	☒

ITEM	ITEMS TO BE CHECKED	PASS	FAIL	N/A
11.0	Bars tied and supported to prevent displacement	☒	☐	☐
12.0	Spacers, tie wire and chairs as required	☒	☐	☐
13.0	Conduits at design location and minimum separation from rebar as specified	☐	☐	☒
14.0	No contact of bars is made with dissimilar metals as per CSA A23.1	☒	☐	☐
15.0	Bars, nails or tie wire not sticking out from surfaces that allow rusting/corrosion	☒	☐	☐
16.0	Rebar welds are inspected by qualified inspectors certified to CSA W178.2	☐	☐	☒
17.0	No rebar congestion or other obstruction for deposit of concrete	☒	☐	☐
18.0	Adjustments required for interfering items (piping, inserts, sleeves, etc.) have been submitted and approved by owner.	☒	☐	☐
19.0	Rebar was stored off ground to prevent damage/corrosion	☒	☐	☐
20.0	Review drawings for anchors, piping, sleeves, boxes	☒	☐	☐

COMMENTS:

REMOVE ALL COARSE IS DEBRIS AT TIME OF POUR.
CLEAN BOTTOM OF TIE WIRE.

CONCRETE REINFORCEMENT PRE POUR

Rev 01 August 25, 2018

SUBCONTRACTOR: Ultimate Reinforcing // McNish	INSPECTION DATE: Nov 20, 2018
SUBCONTRACTOR CONTACT PERSON: CLAYTON	PROJ. POUR DATE: Nov 21, 2018
INSPECTOR(S): Ryan deMilliano, Dan Pelletier, Matt Coverdale. (JDS)	
LOCATION: 3330 CV016 - GDV PODIATRAS. (REMAINING 2 OF 4)	
DRAWING REV: 01 / DRAWING NO.(S): 3330-231-240-00004	SPEC SECTION(S): S03 20 00 – Concrete Reinforcing Steel

ITEM	ITEMS TO BE CHECKED	PASS	FAIL	N/A
1.0	Grade (400W unless otherwise noted) and type of steel delivered and installed as required by approved drawings.	☑	☐	☐
2.0	Inspect rebar distribution, spacing and cover per design/project requirements.	☑	☐	☐
3.0	Length of splices as specified	☑	☐	☐
4.0	Staggered splices as specified	☐	☐	☒
5.0	Any mechanical splices have been approved by the owner prior to install	☐	☐	☒
6.0	Bars cleaned and free of material that may reduce bond including loose rust, scale, oil, structural defects and that they are uncoated and unpainted.	☑	☐	☐
7.0	Dowels at wall ends, construction joints, and openings as specified (length, location, size, etc.)	☑	☐	☐
8.0	No unauthorized field bent bars including hooks installed	☑	☐	☐
9.0	Resolve conflicts between embedded items and reinforcement	☑	☐	☐
10.0	When authorized, field bends done without heat and inspected for fissures or cracks.	☐	☐	☒

ITEM	ITEMS TO BE CHECKED	PASS	FAIL	N/A
11.0	Bars tied and supported to prevent displacement	☑	☐	☐
12.0	Spacers, tie wire and chairs as required	☑	☐	☐
13.0	Conduits at design location and minimum separation from rebar as specified	☐	☐	☒
14.0	No contact of bars is made with dissimilar metals as per CSA A23.1	☒	☐	☐
15.0	Bars, nails or tie wire not sticking out from surfaces that allow rusting/corrosion	☒	☐	☐
16.0	Rebar welds are inspected by qualified inspectors certified to CSA W178.2	☐	☐	☒
17.0	No rebar congestion or other obstruction for deposit of concrete	☒	☐	☐
18.0	Adjustments required for interfering items (piping, inserts, sleeves, etc.) have been submitted and approved by owner.	☑	☐	☐
19.0	Rebar was stored off ground to prevent damage/corrosion	☑	☐	☐
20.0	Review drawings for anchors, piping, sleeves, boxes	☑	☐	☐

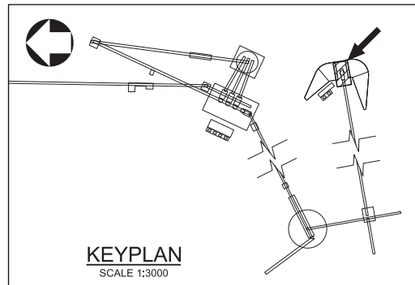
NTS

BUILDING FOUNDATION NOTES:



2.1 BUILDING FOUNDATION SUBGRADE SHALL CONSIST OF SOUND BEDROCK.
2.2 THE PREPARED FOOTING SUBGRADE SHALL BE PROTECTED FROM WATER INGRESS AND SOFTENING BY PROVIDING ADEQUATE DRAINAGE OR PLACING A LEAN CONCRETE MUD SLAB.
2.3 ALL FOUNDATION SUBGRADE SHALL BE INSPECTED AND APPROVED BY THE GEOTECHNICAL ENGINEER PRIOR TO PLACEMENT OF CONCRETE.

WALL NOTES:

3.1 IN ORDER TO MINIMIZE THE INFILTRATION AND SEEPAGE BEHIND THE WALLS, THE UPPER SURFACE OF THE BACKFILL SHALL BE COVERED WITH A LOW PERMEABILITY MATERIAL, AND THE SITE SHOULD BE GRADED AWAY FROM THE STRUCTURE TO PREVENT SURFACE WATER FROM ACCUMULATING AGAINST THE BACK OF THE WALLS.
3.2 FOR PERIMETER DRAIN PIPE LAYOUT AND DETAIL SEE CIVIL DRAWING H354138-2120-220-290-0004.
3.3 TOP 3.0 METERS OF THE BACKFILL AROUND THE WALL AND FOUNDATION TO BE "NFS STRUCTURAL BACKFILL" AS DEFINED IN CIVIL DESIGN CRITERIA.
3.4 SEE MSE WALL INSTALLATION DRAWINGS BY TENSAR FOR THE BACKFILL TYPE BEHIND THE SIDE WALLS.

GENERAL NOTES:

1.1 READ THESE DRAWINGS IN CONJUNCTION WITH ALL OTHER PERTINENT CONTRACT DOCUMENTS.
1.2 FOR CONCRETE TYPICAL DETAILS DRAWING SET AND GENERAL NOTES, SEE DRAWINGS 354138-0000-231-294-0001 TO -0007.
1.3 REFER TO MECHANICAL, PROCESS AND ELECTRICAL DRAWINGS FOR LOCATIONS AND DIMENSIONS OF OPENINGS, SLEEVES AND OTHER BUILDING COMPONENTS NOT SHOWN ON STRUCTURAL DRAWINGS. REPORT DISCREPENCIES TO THE OWNER OR HIS REPRESENTATIVE PRIOR TO PROCEEDING WITH THE WORK.
1.4 FOR GENERAL SITE LOCATION AND WORK POINT COORDINATES, SEE DRAWING H354138-2000-220-270-0003.
1.5 HIGH ENERGY COMPACTION EQUIPMENT SUCH AS LARGE ROLLERS MUST NOT BE USED FOR COMPACTING BACKFILL WITHIN 1 METER OF THE EDGE OF THE WALLS.
1.6 FOR GROUNDING LOOP SEE ELECTRICAL DRAWING H354138-3100-260-272-1000-0001 TO -0003. FOR GROUNDING INSTALLATION DETAILS SEE DRAWING SET H354138-3100-260-290-0001-0001 TO -0105.
1.7 FOR FINISHED GRADING PLAN SEE DRAWING H354138-2120-220-290-0001.
1.8 FOR CAST-IN PLACE CONCRETE, SEE SPECIFICATION SECTION H354138-S032000.
1.9 FOR CONCRETE FORMWORK, SEE SPECIFICATION SECTION H354138-S031000.
1.10 FOR CONCRETE REINFORCEMENT, SEE SPECIFICATION SECTION H354138-S033000.
1.11 FOR GROUTING, SEE SPECIFICATION SECTION H354138-S036000.
1.12 CONSTRUCTION JOINTS NOT SHOWN ON THE DRAWINGS MUST BE APPROVED BY THE CONTRUCTION MANAGER.
1.13 IN CASE OF ANY DISCREPANCIES, INFORM THE CONSTRUCTION MANAGER BEFORE COMMENCING WORK.
1.14 ALL DIMENSIONS ARE IN MILLIMETERS AND ELEVATIONS ARE IN METERS.
1.15 PROVIDE 19mm X 19mm CHAMFER AT ALL EXPOSED CONCRETE CORNERS AND EDGES ABOVE GRADE LEVEL.
1.16 THE DRAWINGS SHOULD BE READ IN CONJUNCTION WITH THE PROJECT CIVIL DESIGN CRITERIA H654138-0000-220-210-0001.
1.17 FOR FURTHER GEOTECH INFORMATION, SEE "2011 GEOTECHNICAL INVESTIGATION FOR MINE SITE INFRASTRUCTURE FOUNDATION REPORT" BY BGC ENGINEERING DATED JAN 31, 2012.
1.18 SET ANCHOR RODS USING TEMPLATES WHICH MUST BE LEFT IN PLACE UNTIL THE CONCRETE HAS SET. ANCHOR RODS SHALL BE PLUMBED AND SECURED FROM MOVEMENT PRIOR TO CASTING CONCRETE.

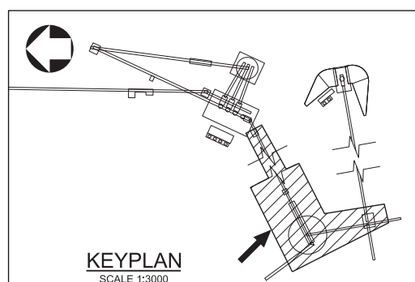
FOUNDATION NOTES:



2.1 ALL CONCRETE FOUNDATION SUBGRADE SHALL BE EITHER ROCK OR 38 mm MINUS NFS STRUCTURAL BACKFILL DOWN TO 3 METERS BELOW THE FINISH GRADE COMPACTED TO 95% MODIFIED PROCTOR.
2.2 ALL BACKFILL AROUND AND ABOVE CONCRETE FOUNDATIONS, PEDESTALS AND PADS SHALL BE 38 mm MINUS NFS STRUCTURAL BACKFILL.
2.3 ALL FOUNDATION SUBGRADE SHALL BE INSPECTED AND APPROVED BY THE GEOTECHNICAL ENGINEER PRIOR TO PLACEMENT OF CONCRETE.
2.4 THE PREPARED FOOTING SUBGRADE SHALL BE PROTECTED FROM WATER INGRESS AND SOFTENING BY PROVIDING ADEQUATE DRAINAGE OR PLACING A LEAN CONCRETE MUD SLAB.

GENERAL NOTES:

1.1 READ THESE DRAWINGS IN CONJUNCTION WITH ALL OTHER PERTINENT CONTRACT DOCUMENTS.
1.2 FOR CONCRETE TYPICAL DETAILS DRAWING SET AND GENERAL NOTES, SEE DRAWINGS 354138-0000-231-294-0001 TO -0007.
1.3 REFER TO MECHANICAL, PROCESS AND ELECTRICAL DRAWINGS FOR LOCATIONS AND DIMENSIONS OF OPENINGS, SLEEVES AND OTHER BUILDING COMPONENTS NOT SHOWN ON STRUCTURAL DRAWINGS. REPORT DISCREPENCIES TO THE OWNER OR HIS REPRESENTATIVE PRIOR TO PROCEEDING WITH THE WORK.
1.4 FOR GENERAL SITE LOCATION AND WORK POINT COORDINATES, SEE DRAWING H354138-2120-220-290-0001.
1.5 HIGH ENERGY COMPACTION EQUIPMENT SUCH AS LARGE ROLLERS MUST NOT BE USED FOR COMPACTING BACKFILL WITHIN 1 METER OF THE EDGE OF THE WALLS.
1.6 FOR GROUNDING LOOP SEE ELECTRICAL DRAWING H354138-3210-260-272-1000-0001, FOR GROUNDING INSTALLATION DETAILS SEE DRAWING SET H354138-3210-260-290-0001-0001 TO -0015.
1.7 FOR CAST-IN PLACE CONCRETE, SEE SPECIFICATION SECTION H354138-S032000.
1.8 FOR CONCRETE FORMWORK, SEE SPECIFICATION SECTION H354138-S031000.
1.9 FOR CONCRETE REINFORCEMENT, SEE SPECIFICATION SECTION H354138-S033000.
1.10 FOR GROUTING, SEE SPECIFICATION SECTION H354138-S036000.
1.11 CONSTRUCTION JOINTS NOT SHOWN ON THE DRAWINGS MUST BE APPROVED BY THE CONTRUCTION MANAGER.
1.12 IN CASE OF ANY DISCREPANCIES, INFORM THE CONSTRUCTION MANAGER BEFORE COMMENCING WORK.
1.13 ALL DIMENSIONS ARE IN MILLIMETERS AND ELEVATIONS ARE IN METERS.
1.14 PROVIDE 19mm X 19mm CHAMFER AT ALL EXPOSED CONCRETE CORNERS AND EDGES ABOVE GRADE LEVEL.
1.15 THE DRAWINGS SHOULD BE READ IN CONJUNCTION WITH THE PROJECT CIVIL DESIGN CRITERIA H654138-0000-220-210-0001.
1.16 FOR FURTHER GEOTECH INFORMATION, SEE "2011 GEOTECHNICAL INVESTIGATION FOR MINE SITE INFRASTRUCTURE FOUNDATION REPORT" BY BGC ENGINEERING DATED JAN 31, 2012.
1.17 SET ANCHOR RODS USING TEMPLATES WHICH MUST BE LEFT IN PLACE UNTIL THE CONCRETE HAS SET. ANCHOR RODS SHALL BE PLUMBED AND SECURED FROM MOVEMENT PRIOR TO CASTING CONCRETE.

BUILDING FOUNDATION NOTES:

2.1 BUILDING FOUNDATION SUBGRADE SHALL CONSIST OF SOUND BEDROCK.
2.2 THE PREPARED FOOTING SUBGRADE SHALL BE PROTECTED FROM WATER INGRESS AND SOFTENING BY PROVIDING ADEQUATE DRAINAGE OR PLACING A LEAN CONCRETE MUD SLAB.
2.3 ALL FOUNDATION SUBGRADE SHALL BE INSPECTED AND APPROVED BY THE GEOTECHNICAL ENGINEER PRIOR TO PLACEMENT OF CONCRETE.
2.4 ALL STRUCTURAL BACKFILL UNDER AND AROUND THE BUILDING FOUNDATIONS AND SLAB ON GRADE SHALL BE "NFS STRUCTURAL FILL" AS DESCRIBED IN H354138-0000-220-210-0001 CIVIL DESIGN CRITERIA-TABLE 4-1.

GENERAL NOTES:

1.1 READ THESE DRAWINGS IN CONJUNCTION WITH ALL OTHER PERTINENT CONTRACT DOCUMENTS.
1.2 FOR CONCRETE TYPICAL DETAILS DRAWING SET AND GENERAL NOTES, SEE DRAWINGS H354138-0000-231-294-0001 TO -0007.
1.3 REFER TO MECHANICAL, PROCESS AND ELECTRICAL DRAWINGS FOR LOCATIONS AND DIMENSIONS OF OPENINGS, SLEEVES AND OTHER BUILDING COMPONENTS NOT SHOWN ON STRUCTURAL DRAWINGS. REPORT DISCREPENCIES TO THE OWNER OR HIS REPRESENTATIVE PRIOR TO PROCEEDING WITH THE WORK.
1.4 FOR GENERAL SITE LOCATION AND WORK POINT COORDINATES, SEE DRAWING H354138-2000-220-270-0003.
1.5 HIGH ENERGY COMPACTION EQUIPMENT SUCH AS LARGE ROLLERS MUST NOT BE USED FOR COMPACTING BACKFILL WITHIN 1 METER OF THE EDGE OF THE WALLS.
1.6 FOR GROUNDING LOOP SEE ELECTRICAL DRAWING H354138-3300-260-272-1000-0001 TO 0003. FOR GROUNDING INSTALLATION DETAILS SEE DRAWING SET H354138-0000-260-294-0001-0009 AND 0010.
1.7 FOR FINISHED GRADING PLAN SEE DRAWING H354138-2120-220-290-0002.
1.8 FOR CAST-IN PLACE CONCRETE, SEE SPECIFICATION SECTION H354138-S032000.
1.9 FOR CONCRETE FORMWORK, SEE SPECIFICATION SECTION H354138-S031000.
1.10 FOR CONCRETE REINFORCEMENT, SEE SPECIFICATION SECTION H354138-S033000.
1.11 FOR GROUTING, SEE SPECIFICATION SECTION H354138-S036000.
1.12 CONSTRUCTION JOINTS NOT SHOWN ON THE DRAWINGS MUST BE APPROVED BY THE CONTRUCTION MANAGER.
1.13 IN CASE OF ANY DISCREPANCIES, INFORM THE CONSTRUCTION MANAGER BEFORE COMMENCING WORK.
1.14 ALL DIMENSIONS ARE IN MILLIMETERS AND ELEVATIONS ARE IN METERS.
1.15 PROVIDE 19mm X 19mm CHAMFER AT ALL EXPOSED CONCRETE CORNERS AND EDGES ABOVE GRADE LEVEL, EXCEPT TOP OF ALL THE PEDESTALS, GRADE BEAMS AND CURBS, WHERE WALL CLADDING TO BE CONNECTED.
1.16 THE DRAWINGS SHOULD BE READ IN CONJUNCTION WITH THE PROJECT CIVIL DESIGN CRITERIA H654138-0000-220-210-0001.
1.17 FOR FURTHER GEOTECH INFORMATION, SEE "2011 GEOTECHNICAL INVESTIGATION FOR MINE SITE INFRASTRUCTURE FOUNDATION REPORT" BY BGC ENGINEERING DATED JAN 31, 2012.
1.18 SET ANCHOR RODS USING TEMPLATES WHICH MUST BE LEFT IN PLACE UNTIL THE CONCRETE HAS SET. ANCHOR RODS SHALL BE PLUMBED AND SECURED FROM MOVEMENT PRIOR TO CASTING CONCRETE.

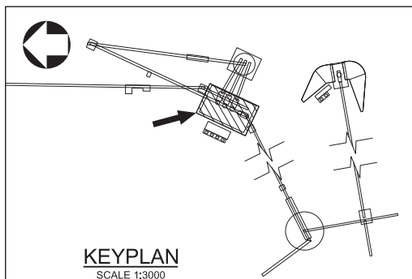
BUILDING FOUNDATION NOTES:



2.1 BUILDING FOUNDATION SUBGRADE SHALL CONSIST OF SOUND BEDROCK.
2.2 THE PREPARED FOOTING SUBGRADE SHALL BE PROTECTED FROM WATER INGRESS AND SOFTENING BY PROVIDING ADEQUATE DRAINAGE OR PLACING A LEAN CONCRETE MUD SLAB.
2.3 ALL FOUNDATION SUBGRADE SHALL BE INSPECTED AND APPROVED BY THE GEOTECHNICAL ENGINEER PRIOR TO PLACEMENT OF CONCRETE.
2.4 ALL STRUCTURAL BACKFILL UNDER AND AROUND THE BUILDING FOUNDATIONS AND SLAB ON GRADE SHALL BE "NFS STRUCTURAL FILL" AS DESCRIBED IN H354138-0000-220-210-0001 CIVIL DESIGN CRITERIA - TABLE 4-1.

GENERAL NOTES:

1.1 READ THESE DRAWINGS IN CONJUNCTION WITH ALL OTHER PERTINENT CONTRACT DOCUMENTS.
1.2 FOR CONCRETE TYPICAL DETAILS DRAWING SET AND GENERAL NOTES, SEE DRAWINGS 354138-0000-231-294-0001 TO -0007.
1.3 REFER TO MECHANICAL, PROCESS AND ELECTRICAL DRAWINGS FOR LOCATIONS AND DIMENSIONS OF OPENINGS, SLEEVES AND OTHER BUILDING COMPONENTS NOT SHOWN ON STRUCTURAL DRAWINGS. REPORT DISCREPENCIES TO THE OWNER OR HIS REPRESENTATIVE PRIOR TO PROCEEDING WITH THE WORK.
1.4 FOR GENERAL SITE LOCATION AND WORK POINT COORDINATES, SEE DRAWING H354138-2000-220-270-0003.
1.5 HIGH ENERGY COMPACTION EQUIPMENT SUCH AS LARGE ROLLERS MUST NOT BE USED FOR COMPACTING BACKFILL WITHIN 1 METER OF THE EDGE OF THE WALLS.
1.6 FOR GROUNDING LOOP SEE ELECTRICAL DRAWINGS H354138-3300-260-272-1000-0001 TO 0003. FOR GROUNDING INSTALLATION DETAILS SEE DRAWINGS H354138-0000-260-294-0001-0009 TO 0010.
1.7 FOR FINISHED GRADING PLAN SEE DRAWING H354138-2120-220-290-0002.
1.8 FOR CAST-IN PLACE CONCRETE, SEE SPECIFICATION SECTION H354138-S032000.
1.9 FOR CONCRETE FORMWORK, SEE SPECIFICATION SECTION H354138-S031000.
1.10 FOR CONCRETE REINFORCEMENT, SEE SPECIFICATION SECTION H354138-S033000.
1.11 FOR GROUTING, SEE SPECIFICATION SECTION H354138-S036000.
1.12 CONSTRUCTION JOINTS NOT SHOWN ON THE DRAWINGS MUST BE APPROVED BY THE CONTRUCTION MANAGER.
1.13 IN CASE OF ANY DISCREPANCIES, INFORM THE CONSTRUCTION MANAGER BEFORE COMMENCING WORK.
1.14 ALL DIMENSIONS ARE IN MILLIMETERS AND ELEVATIONS ARE IN METERS.
1.15 PROVIDE 19mm X 19mm CHAMFER AT ALL EXPOSED CONCRETE CORNERS AND EDGES ABOVE GRADE LEVEL EXCEPT TOP OF ALL THE PEDESTALS, GRADE BEAMS AND CURBS WHERE WALL CLADING TO BE CONNECTED.
1.16 THE DRAWINGS SHOULD BE READ IN CONJUNCTION WITH THE PROJECT CIVIL DESIGN CRITERIA H354138-0000-220-210-0001.
1.17 FOR FURTHER GEOTECH INFORMATION, SEE "2011 GEOTECHNICAL INVESTIGATION FOR MINE SITE INFRASTRUCTURE FOUNDATION REPORT" BY BGC ENGINEERING DATED JAN 31, 2012.
1.18 SET ANCHOR RODS USING TEMPLATES WHICH MUST BE LEFT IN PLACE UNTIL THE CONCRETE HAS SET. ANCHOR RODS SHALL BE PLUMBED AND SECURED FROM MOVEMENT PRIOR TO CASTING CONCRETE.

FOUNDATION NOTES:

2.1 ALL CONCRETE FOUNDATION SUBGRADE SHALL BE EITHER ROCK OR 38 mm NFS STRUCTURAL BACKFILL DOWN TO 3 METERS BELOW THE FINISH GRADE COMPACTED TO 95% MODIFIED PROCTOR.
2.2 ALL BACKFILL AROUND AND ABOVE CONCRETE FOUNDATIONS, PEDESTALS AND PADS SHALL BE 38 mm MINUS NFS STRUCTURAL BACKFILL.
2.3 ALL FOUNDATION SUBGRADE SHALL BE INSPECTED AND APPROVED BY THE GEOTECHNICAL ENGINEER PRIOR TO PLACEMENT OF CONCRETE.
2.4 THE PREPARED FOOTING SUBGRADE SHALL BE PROTECTED FROM WATER INGRESS AND SOFTENING BY PROVIDING ADEQUATE DRAINAGE OR PLACING A LEAN CONCRETE MUD SLAB.

GENERAL NOTES:

1.1 READ THESE DRAWINGS IN CONJUNCTION WITH ALL OTHER PERTINENT CONTRACT DOCUMENTS.
1.2 FOR CONCRETE TYPICAL DETAILS DRAWING SET AND GENERAL NOTES, SEE DRAWINGS 354138-0000-231-294-0001 TO -0007.
1.3 REFER TO MECHANICAL, PROCESS AND ELECTRICAL DRAWINGS FOR LOCATIONS AND DIMENSIONS OF OPENINGS, SLEEVES AND OTHER BUILDING COMPONENTS NOT SHOWN ON STRUCTURAL DRAWINGS. REPORT DISCREPENCIES TO THE OWNER OR HIS REPRESENTATIVE PRIOR TO PROCEEDING WITH THE WORK.
1.4 FOR GENERAL SITE LOCATION AND WORK POINT COORDINATES, SEE DRAWING H354138-2120-220-290-0002.
1.5 HIGH ENERGY COMPACTION EQUIPMENT SUCH AS LARGE ROLLERS MUST NOT BE USED FOR COMPACTING BACKFILL WITHIN 1 METER OF THE EDGE OF THE WALLS.
1.6 FOR GROUNDING LOOP SEE ELECTRICAL DRAWING H354138-3320-260-272-1000-0001/0002. FOR GROUNDING INSTALLATION DETAILS SEE DRAWING SET H354138-3210-260-290-0001-0001 TO -0015.
1.7 FOR CAST-IN PLACE CONCRETE, SEE SPECIFICATION SECTION H354138-S032000.
1.8 FOR CONCRETE FORMWORK, SEE SPECIFICATION SECTION H354138-S031000.
1.9 FOR CONCRETE REINFORCEMENT, SEE SPECIFICATION SECTION H354138-S033000.
1.10 FOR GROUTING, SEE SPECIFICATION SECTION H354138-S036000.
1.11 CONSTRUCTION JOINTS NOT SHOWN ON THE DRAWINGS MUST BE APPROVED BY THE CONTRUCTION MANAGER.
1.12 IN CASE OF ANY DISCREPANCIES, INFORM THE CONSTRUCTION MANAGER BEFORE COMMENCING WORK.
1.13 ALL DIMENSIONS ARE IN MILLIMETERS AND ELEVATIONS ARE IN METERS.
1.14 PROVIDE 19mm X 19mm CHAMFER AT ALL EXPOSED CONCRETE CORNERS AND EDGES ABOVE GRADE LEVEL.
1.15 THE DRAWINGS SHOULD BE READ IN CONJUNCTION WITH THE PROJECT CIVIL DESIGN CRITERIA H654138-0000-220-210-0001.
1.16 FOR FURTHER GEOTECH INFORMATION, SEE "2011 GEOTECHNICAL INVESTIGATION FOR MINE SITE INFRASTRUCTURE FOUNDATION REPORT" BY BGC ENGINEERING DATED JAN 31, 2012.
1.17 SET ANCHOR RODS USING TEMPLATES WHICH MUST BE LEFT IN PLACE UNTIL THE CONCRETE HAS SET. ANCHOR RODS SHALL BE PLUMBED AND SECURED FROM MOVEMENT PRIOR TO CASTING CONCRETE.

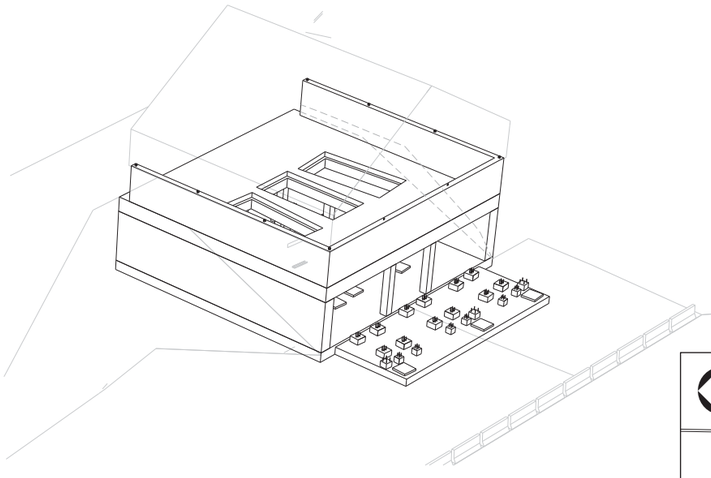
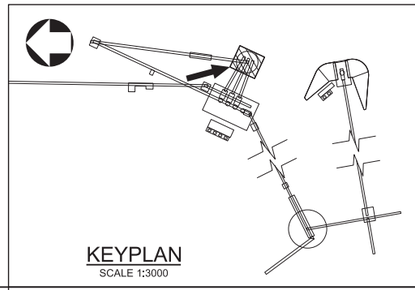
TERTIARY ORE STOCKPILE RECLAIM TUNNEL - PLAN

FIN. GRADE EL. VARIES



FOUNDATION NOTES:

2.1 FOUNDATION SUBGRADE SHALL CONSIST OF SOUND BEDROCK.
2.2 THE PREPARED FOOTING SUBGRADE SHALL BE PROTECTED FROM WATER INGRESS AND SOFTENING BY PROVIDING ADEQUATE DRAINAGE OR PLACING A LEAN CONCRETE MUD SLAB.
2.3 ALL FOUNDATION SUBGRADE SHALL BE INSPECTED AND APPROVED BY THE GEOTECHNICAL ENGINEER PRIOR TO PLACEMENT OF CONCRETE.
2.4 ALL STRUCTURAL BACKFILL UNDER AND AROUND THE FOUNDATIONS AND SLAB ON GRADE SHALL BE "NFS STRUCTURAL FILL" AS DESCRIBED IN H354138-0000-220-210-0001 CIVIL DESIGN CRITERIA - TABLE 4-1.



GENERAL NOTES:

1.1 READ THESE DRAWINGS IN CONJUNCTION WITH ALL OTHER PERTINENT CONTRACT DOCUMENTS.
1.2 FOR CONCRETE TYPICAL DETAILS DRAWING SET AND GENERAL NOTES, SEE DRAWINGS H354138-0000-231-294-0001 TO -0007.
1.3 REFER TO MECHANICAL, PROCESS AND ELECTRICAL DRAWINGS FOR LOCATIONS AND DIMENSIONS OF OPENINGS, SLEEVES AND OTHER BUILDING COMPONENTS NOT SHOWN ON STRUCTURAL DRAWINGS. REPORT DISCREPENCIES TO THE OWNER OR HIS REPRESENTATIVE PRIOR TO PROCEEDING WITH THE WORK.
1.4 FOR GENERAL SITE LOCATION AND WORK POINT COORDINATES, SEE DRAWING H354138-2000-220-270-0003.
1.5 HIGH ENERGY COMPACTION EQUIPMENT SUCH AS LARGE ROLLERS MUST NOT BE USED FOR COMPACTING BACKFILL WITHIN 1 METER OF THE EDGE OF THE WALLS.
1.6 FOR GROUNDING LOOP SEE ELECTRICAL DRAWINGS H354138-3330-260-272-1000-0001 AND 0002. FOR GROUNDING INSTALLATION DETAILS SEE DRAWINGS H354138-0000-260-294-0001-0009 TO 0010.
1.7 FOR FINISHED GRADING PLAN SEE DRAWING H354138-2120-220-290-0002.
1.8 FOR CAST-IN PLACE CONCRETE, SEE SPECIFICATION SECTION H354138-S032000.
1.9 FOR CONCRETE FORMWORK, SEE SPECIFICATION SECTION H354138-S031000.
1.10 FOR CONCRETE REINFORCEMENT, SEE SPECIFICATION SECTION H354138-S033000.
1.11 FOR GROUTING, SEE SPECIFICATION SECTION H354138-S036000.
1.12 CONSTRUCTION JOINTS NOT SHOWN ON THE DRAWINGS MUST BE APPROVED BY THE CONTRUCTION MANAGER.
1.13 IN CASE OF ANY DISCREPANCIES, INFORM THE CONSTRUCTION MANAGER BEFORE COMMENCING WORK.
1.14 ALL DIMENSIONS ARE IN MILLIMETERS AND ELEVATIONS ARE IN METERS.
1.15 PROVIDE 19MM X 19MM CHAMFER AT ALL EXPOSED CONCRETE CORNERS AND EDGES ABOVE GRADE LEVEL EXCEPT TOP OF ALL THE PEDESTALS, GRADE BEAMS AND CURBS WHERE WALL CLADING TO BE CONNECTED.
1.16 THE DRAWINGS SHOULD BE READ IN CONJUNCTION WITH THE PROJECT CIVIL DESIGN CRITERIA H354138-0000-220-210-0001.
1.17 FOR FURTHER GEOTECH INFORMATION, SEE "2011 GEOTECHNICAL INVESTIGATION FOR MINE SITE INFRASTRUCTURE FOUNDATION REPORT" BY BGC ENGINEERING DATED JAN 31, 2012.
1.18 SET ANCHOR RODS USING TEMPLATES WHICH MUST BE LEFT IN PLACE UNTIL THE CONCRETE HAS SET. ANCHOR RODS SHALL BE PLUMBED AND SECURED FROM MOVEMENT PRIOR TO CASTING CONCRETE.

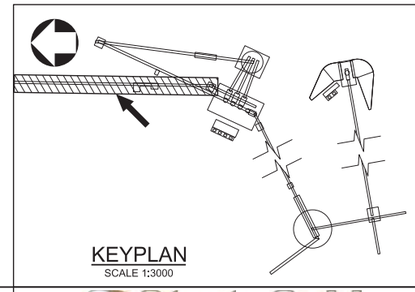
FOUNDATION NOTES:



2.1 ALL CONCRETE FOUNDATION SUBGRADE SHALL BE EITHER ROCK OR 38 mm NFS STRUCTURAL BACKFILL DOWN TO 3 METERS BELOW THE FINISH GRADE COMPACTED TO 95% MODIFIED PROCTOR.
2.2 ALL BACKFILL AROUND AND ABOVE CONCRETE FOUNDATIONS, PEDESTALS AND PADS SHALL BE 38 mm MINUS NFS STRUCTURAL BACKFILL.
2.3 ALL FOUNDATION SUBGRADE SHALL BE INSPECTED AND APPROVED BY THE GEOTECHNICAL ENGINEER PRIOR TO PLACEMENT OF CONCRETE.
2.4 THE PREPARED FOOTING SUBGRADE SHALL BE PROTECTED FROM WATER INGRESS AND SOFTENING BY PROVIDING ADEQUATE DRAINAGE OR PLACING A LEAN CONCRETE MUD SLAB.

GENERAL NOTES:

1.1 READ THESE DRAWINGS IN CONJUNCTION WITH ALL OTHER PERTINENT CONTRACT DOCUMENTS.
1.2 FOR CONCRETE TYPICAL DETAILS DRAWING SET AND GENERAL NOTES, SEE DRAWINGS 354138-0000-231-294-0001 TO -0007.
1.3 REFER TO MECHANICAL, PROCESS AND ELECTRICAL DRAWINGS FOR LOCATIONS AND DIMENSIONS OF OPENINGS, SLEEVES AND OTHER BUILDING COMPONENTS NOT SHOWN ON STRUCTURAL DRAWINGS. REPORT DISCREPENCIES TO THE OWNER OR HIS REPRESENTATIVE PRIOR TO PROCEEDING WITH THE WORK.
1.4 FOR GENERAL SITE LOCATION AND WORK POINT COORDINATES, SEE DRAWING H354138-2000-220-270-0002 AND -0003.
1.5 HIGH ENERGY COMPACTION EQUIPMENT SUCH AS LARGE ROLLERS MUST NOT BE USED FOR COMPACTING BACKFILL WITHIN 1 METER OF THE EDGE OF THE WALLS.
1.6 FOR GROUNDING LOOP SEE ELECTRICAL DRAWING H354138-3400-260-272-1000-0001, FOR GROUNDING INSTALLATION DETAILS SEE DRAWING SET H354138-0000-260-294-0001-0001.
1.7 FOR CAST-IN PLACE CONCRETE, SEE SPECIFICATION SECTION H354138-S032000.
1.8 FOR CONCRETE FORMWORK, SEE SPECIFICATION SECTION H354138-S031000.
1.9 FOR CONCRETE REINFORCEMENT, SEE SPECIFICATION SECTION H354138-S033000.
1.10 FOR GROUTING, SEE SPECIFICATION SECTION H354138-S036000.
1.11 CONSTRUCTION JOINTS NOT SHOWN ON THE DRAWINGS MUST BE APPROVED BY THE CONTRUCTION MANAGER.
1.12 IN CASE OF ANY DISCREPANCIES, INFORM THE CONSTRUCTION MANAGER BEFORE COMMENCING WORK.
1.13 ALL DIMENSIONS ARE IN MILLIMETERS AND ELEVATIONS ARE IN METERS.
1.14 PROVIDE 19mm X 19mm CHAMFER AT ALL EXPOSED CONCRETE CORNERS AND EDGES ABOVE GRADE LEVEL.

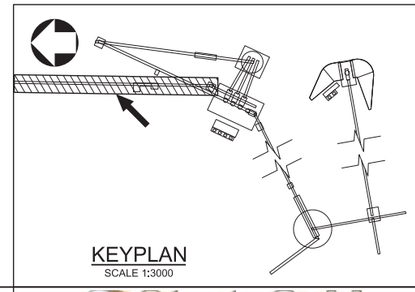
FOUNDATION NOTES:



2.1 ALL CONCRETE FOUNDATION SUBGRADE SHALL BE EITHER ROCK OR 38 mm NFS STRUCTURAL BACKFILL DOWN TO 3 METERS BELOW THE FINISH GRADE COMPACTED TO 95% MODIFIED PROCTOR.
2.2 ALL BACKFILL AROUND AND ABOVE CONCRETE FOUNDATIONS, PEDESTALS AND PADS SHALL BE 38 mm MINUS NFS STRUCTURAL BACKFILL.
2.3 ALL FOUNDATION SUBGRADE SHALL BE INSPECTED AND APPROVED BY THE GEOTECHNICAL ENGINEER PRIOR TO PLACEMENT OF CONCRETE.
2.4 THE PREPARED FOOTING SUBGRADE SHALL BE PROTECTED FROM WATER INGRESS AND SOFTENING BY PROVIDING ADEQUATE DRAINAGE OR PLACING A LEAN CONCRETE MUD SLAB.

GENERAL NOTES:

1.1 READ THESE DRAWINGS IN CONJUNCTION WITH ALL OTHER PERTINENT CONTRACT DOCUMENTS.
1.2 FOR CONCRETE TYPICAL DETAILS DRAWING SET AND GENERAL NOTES, SEE DRAWINGS 354138-0000-231-294-0001 TO -0007.
1.3 REFER TO MECHANICAL, PROCESS AND ELECTRICAL DRAWINGS FOR LOCATIONS AND DIMENSIONS OF OPENINGS, SLEEVES AND OTHER BUILDING COMPONENTS NOT SHOWN ON STRUCTURAL DRAWINGS. REPORT DISCREPENCIES TO THE OWNER OR HIS REPRESENTATIVE PRIOR TO PROCEEDING WITH THE WORK.
1.4 FOR GENERAL SITE LOCATION AND WORK POINT COORDINATES, SEE DRAWING H354138-2000-220-270-0002 AND -0003.
1.5 HIGH ENERGY COMPACTION EQUIPMENT SUCH AS LARGE ROLLERS MUST NOT BE USED FOR COMPACTING BACKFILL WITHIN 1 METER OF THE EDGE OF THE WALLS.
1.6 FOR GROUNDING LOOP SEE ELECTRICAL DRAWING H354138-3400-260-272-1000-0001, FOR GROUNDING INSTALLATION DETAILS SEE DRAWING SET H354138-0000-260-294-0001-0001.
1.7 FOR CAST-IN PLACE CONCRETE, SEE SPECIFICATION SECTION H354138-S032000.
1.8 FOR CONCRETE FORMWORK, SEE SPECIFICATION SECTION H354138-S031000.
1.9 FOR CONCRETE REINFORCEMENT, SEE SPECIFICATION SECTION H354138-S033000.
1.10 FOR GROUTING, SEE SPECIFICATION SECTION H354138-S036000.
1.11 CONSTRUCTION JOINTS NOT SHOWN ON THE DRAWINGS MUST BE APPROVED BY THE CONTRUCTION MANAGER.
1.12 IN CASE OF ANY DISCREPANCIES, INFORM THE CONSTRUCTION MANAGER BEFORE COMMENCING WORK.
1.13 ALL DIMENSIONS ARE IN MILLIMETERS AND ELEVATIONS ARE IN METERS.
1.14 PROVIDE 19mm X 19mm CHAMFER AT ALL EXPOSED CONCRETE CORNERS AND EDGES ABOVE GRADE LEVEL.
1.15 THE DRAWINGS SHOULD BE READ IN CONJUNCTION WITH THE PROJECT CIVIL DESIGN CRITERIA H654138-0000-220-210-0001.

GENERAL NOTES ON REINFORCEMENT

THE FOLLOWING NOTES SHALL APPLY TO ALL REINFORCEMENT SHOWN ON THE DRAWINGS UNLESS OTHERWISE NOTED.

DIMENSIONS:
DIMENSIONS TO REINFORCEMENT ARE TO CENTRE LINES OF BARS, EXCEPT WHERE CONCRETE COVER OR CLEARANCE BETWEEN BARS IS SHOWN.

COVER:
SEE STRUCTURAL ENGINEER TYPICAL NOTES FOR ALL COVER SPECIFICATIONS

SPACING:
UNLESS OTHERWISE SHOWN, THE FIRST AND LAST BARS IN SLABS AND WALLS, STIRRUPS IN BEAMS SHALL BE PLACED AT MAXIMUM OF HALF THE SPECIFIED SPACING OF ADJACENT BARS FROM THE END OF THE MEMBER.

STEEL SPECIFICATIONS:
STEEL REINFORCEMENT SHALL BE DEFORMED BARS OF GRADE 400 CONFORMING TO CSA STANDARDS G30.12 BILLET-STEEL BARS FOR CONCRETE REINFORCEMENT.

WELDING:
WELDING OF REINFORCEMENT SHALL NOT BE PERMITTED.

SPLICES AND EMBEDMENTS:
UNLESS OTHERWISE SPECIFIED, ALL EMBEDMENTS SHALL BE TREATED AS TENSION EMBEDMENTS AND ALL LAP SPLICES SHALL BE CONSIDERED AS TENSION LAP SPLICES.

WHEN REINFORCING BARS OF DIFFERENT SIZE ARE TO BE SPLICED, THE LENGTH OF THE LAP SHALL BE BASED ON THE DIAMETER OF THE SMALLER BAR.

SPLICES ARE TO BE MADE SO THAT THE GIVEN CLEAR DISTANCE COVER WILL BE MAINTAINED.

- LAP LENGTHS UNLESS SHOWN OTHERWISE:

	HORZ	OTHER
10M	530	400
15M	775	585
20M	1030	750
25M	1675	1240
30M	1940	1485
35M		

PLACEMENT:
PLACE REINFORCING STEEL IN ACCORDANCE WITH CSA CAN3-A23.1-M.

REINFORCEMENT MAY BE DISPLACE TO CLEAR PIPES, RECESSES, EMBEDDED METAL WORKS AND CONDUITS.

A MINIMUM CLEARANCE OF 1" SHALL BE MAINTAINED BETWEEN REINFORCEMENT AND EMBEDDED MATERIALS. THE MINIMUM CLEARANCE BETWEEN REINFORCEMENT

REINFORCEMENT SHALL BE ACCURATELY PLACED IN ACCORDANCE WITH THE DRAWING AND SHALL BE ADEQUATELY SECURED AGAINST DISPLACEMENT BY USING ANNEALED IRON WIRE AT INTERSECTIONS AND SHALL BE SUPPORTED BY APPROVED CONCRETE OR METAL SUPPORTS, SPACERS OR METAL HANGERS EXCEPT AT SURFACES EXPOSED TO THE GROUND OR TO THE WEATHER WHERE SUPPORTS SHALL BE APPROVED. ALL METAL ACCESSORIES ARE TO BE GALVANIZED.

THE FULL INTENT AND PURPOSE OF THESE DRAWINGS IS PLACING OF REINFORCING STEEL BARS ONLY. IT IS NOT TO BE USED AS A MEANS OF COMMUNICATION BETWEEN THE ARCHITECT, ENGINEER, CONTRACTOR OR ANY OTHER SUBTRADE.

GENERAL NOTES ON REINFORCEMENT

THE FOLLOWING NOTES SHALL APPLY TO ALL REINFORCEMENT SHOWN ON THE DRAWINGS UNLESS OTHERWISE NOTED.

DIMENSIONS:
DIMENSIONS TO REINFORCEMENT ARE TO CENTRIC LINES OF BARS, EXCEPT WHERE CONCRETE COVER OR CLEARANCE BETWEEN BARS IS SHOWN.

COVER:
SEE STRUCTURAL ENGINEER TYPICAL NOTES FOR ALL COVER SPECIFICATIONS

SPACING:
UNLESS OTHERWISE SHOWN, THE FIRST AND LAST BARS IN SLABS AND WALLS, STIRRUPS IN BEAMS SHALL BE PLACED AT MAXIMUM OF HALF THE SPECIFIED SPACING OF ADJACENT BARS FROM THE END OF THE MEMBER.

STEEL SPECIFICATIONS:
STEEL REINFORCEMENT SHALL BE DEFORMED BARS OF GRADE 400 CONFORMING TO CSA STANDARDS G30.12 BILLET-STEEL BARS FOR CONCRETE REINFORCEMENT.

WELDING:
WELDING OF REINFORCEMENT SHALL NOT BE PERMITTED.

SPLICES AND EMBEDMENTS:
UNLESS OTHERWISE SPECIFIED, ALL EMBEDMENTS SHALL BE TREATED AS TENSION EMBEDMENTS AND ALL LAP SPLICES SHALL BE CONSIDERED AS TENSION LAP SPLICES.

WHEN REINFORCING BARS OF DIFFERENT SIZE ARE TO BE SPLICED, THE LENGTH OF THE LAP SHALL BE BASED ON THE DIAMETER OF THE SMALLER BAR.

SPLICES ARE TO BE MADE SO THAT THE GIVEN CLEAR DISTANCE COVER WILL BE MAINTAINED.

LAP LENGTHS UNLESS SHOWN OTHERWISE:

	HORZ	OTHER
10M	520	400
15M	775	595
20M	1030	790
25M	1675	1240
30M	1940	1485
35M		

PLACEMENT:
PLACE REINFORCING STEEL IN ACCORDANCE WITH CSA CAN3-A23.1-M.

REINFORCEMENT MAY BE DISPLACE TO CLEAR PIPES, RECESSES, EMBEDDED METAL WORKS AND CONDUITS.

A MINIMUM CLEARANCE OF 1" SHALL BE MAINTAINED BETWEEN REINFORCEMENT AND EMBEDDED MATERIALS. THE MINIMUM CLEARANCE BETWEEN REINFORCEMENT

REINFORCEMENT SHALL BE ACCURATELY PLACED IN ACCORDANCE WITH THE DRAWING AND SHALL BE ADEQUATELY SECURED AGAINST DISPLACEMENT BY USING APPROVED SPACER BARS, BAR SUPPORTS, TIES AND SHALL BE SUPPORTED BY APPROVED CONCRETE OR METAL SUPPORTS. SPACERS OR METAL HANGERS EXCEPT AT SURFACES EXPOSED TO THE GROUND OR TO THE WEATHER WHERE SUPPORTS SHALL BE APPROVED. ALL METAL ACCESSORIES ARE TO BE GALVANIZED.

THE FULL INTENT AND PURPOSE OF THESE DRAWINGS IS PLACING OF REINFORCING STEEL BARS ONLY. IT IS NOT TO BE USED AS A MEANS OF COMMUNICATION BETWEEN THE ARCHITECT, ENGINEER, CONTRACTOR OR ANY OTHER SUBTRADE.

Package Engineer: Name, signature and date
ESA AKINCI, EA Sept 6, 2018

Reviewed only for general conformity with the specifications. Acceptance by the engineer does not warrant or represent that the information contained on this drawing/document is either accurate or complete. The sole responsibility for correct design, details & dimensions shall remain with the party submitting the drawing/document.

GENERAL NOTES ON REINFORCEMENT

THE FOLLOWING NOTES SHALL APPLY TO ALL REINFORCEMENT SHOWN ON THE DRAWINGS UNLESS OTHERWISE NOTED.

DIMENSIONS:
DIMENSIONS TO REINFORCEMENT ARE TO CENTRE LINES OF BARS, EXCEPT WHERE CONCRETE COVER OR CLEARANCE BETWEEN BARS IS SHOWN.

COVER:
SEE STRUCTURAL ENGINEER TYPICAL NOTES FOR ALL COVER SPECIFICATIONS

SPACING:
UNLESS OTHERWISE SHOWN, THE FIRST AND LAST BARS IN SLABS AND WALLS, STIRRUPS OR BEAMS SHALL BE PLACED AT A MAXIMUM OF HALF THE SPECIFIED SPACING OF ADJACENT BARS FROM THE END OF THE MEMBER.

STEEL SPECIFICATIONS:
STEEL REINFORCEMENT SHALL BE DEFORMED BARS OF GRADE 400 CONFORMING TO CSA STANDARDS G30.12 BILLET-STEEL BARS FOR CONCRETE REINFORCEMENT.

WELDING:
WELDING OF REINFORCEMENT SHALL NOT BE PERMITTED.

SPLICES AND EMBEDMENTS:
UNLESS OTHERWISE SPECIFIED, ALL EMBEDMENTS SHALL BE TREATED AS TENSION EMBEDMENTS AND ALL LAP SPLICES SHALL BE CONSIDERED AS TENSION LAP SPLICES.

WHEN REINFORCING BARS OF DIFFERENT SIZE ARE TO BE SPLICED, THE LENGTH OF THE LAP SHALL BE BASED ON THE DIAMETER OF THE SMALLER BAR.

SPLICES ARE TO BE MADE SO THAT THE GIVEN CLEAR DISTANCE COVER WILL BE MAINTAINED.

LAP LENGTHS UNLESS SHOWN OTHERWISE:

	HORZ	OTHER
10M	520	400
15M	775	595
20M	1030	790
25M	1675	1240
30M	1940	1485
35M		

PLACEMENT:
PLACE REINFORCING STEEL IN ACCORDANCE WITH CSA CAN3-A23.1-M.

REINFORCEMENT MAY BE DISPLACE TO CLEAR PIPES, RECESSES, EMBEDDED METAL WORKS AND CONDUITS.

A MINIMUM CLEARANCE OF 1" SHALL BE MAINTAINED BETWEEN REINFORCEMENT AND EMBEDDED MATERIALS. THE MINIMUM CLEARANCE BETWEEN REINFORCEMENT

REINFORCEMENT SHALL BE ACCURATELY PLACED IN ACCORDANCE WITH THE DRAWING AND SHALL BE ADEQUATELY SECURED AGAINST DISPLACEMENT BY USING ANNEALED IRON WIRE AT INTERSECTIONS AND SHALL BE SUPPORTED BY APPROVED CONCRETE OR METAL SUPPORTS. SPACERS OR METAL HANGERS EXCEPT AT SURFACES EXPOSED TO THE GROUND OR TO THE WEATHER WHERE SUPPORTS SHALL BE APPROVED. ALL METAL ACCESSORIES ARE TO BE GALVANIZED.

THE FULL INTENT AND PURPOSE OF THESE DRAWINGS IS PLACING OF REINFORCING STEEL BARS ONLY. IT IS NOT TO BE USED AS A MEANS OF COMMUNICATION BETWEEN THE ARCHITECT, ENGINEER, CONTRACTOR OR ANY OTHER SUBTRADE.

GENERAL NOTES ON REINFORCEMENT

THE FOLLOWING NOTES SHALL APPLY TO ALL REINFORCEMENT SHOWN ON THE DRAWINGS UNLESS OTHERWISE NOTED.

DIMENSIONS:
DIMENSIONS TO REINFORCEMENT ARE TO CENTRE LINES OF BARS, EXCEPT WHERE CONCRETE COVER OR CLEARANCE BETWEEN BARS IS SHOWN.

COVER:
SEE STRUCTURAL ENGINEER TYPICAL NOTES FOR ALL COVER SPECIFICATIONS

SPACING:
UNLESS OTHERWISE SHOWN, THE FIRST AND LAST BARS IN SLABS AND WALLS, STIRRUPS IN BEAMS SHALL BE PLACED AT MAXIMUM OF HALF THE SPECIFIED SPACING OF ADJACENT BARS FROM THE END OF THE MEMBER.

STEEL SPECIFICATIONS:
STEEL REINFORCEMENT SHALL BE DEFORMED BARS OF GRADE 400 CONFORMING TO CSA STANDARDS G30.12 BILLET-STEEL BARS FOR CONCRETE REINFORCEMENT.

WELDING:
WELDING OF REINFORCEMENT SHALL NOT BE PERMITTED.

SPLICES AND EMBEDMENTS:
UNLESS OTHERWISE SPECIFIED, ALL EMBEDMENTS SHALL BE TREATED AS TENSION EMBEDMENTS AND ALL LAP SPLICES SHALL BE CONSIDERED AS TENSION LAP SPLICES.

WHEN REINFORCING BARS OF DIFFERENT SIZE ARE TO BE SPLICED, THE LENGTH OF THE LAP SHALL BE BASED ON THE DIAMETER OF THE SMALLER BAR.

SPLICES ARE TO BE MADE SO THAT THE GIVEN CLEAR DISTANCE COVER WILL BE MAINTAINED.

LAP LENGTHS UNLESS SHOWN OTHERWISE:

	HORZ	OTHER
10M	520	400
15M	775	595
20M	1030	790
25M	1615	1240
30M	1940	1485
35M		

PLACEMENT:
PLACE REINFORCING STEEL IN ACCORDANCE WITH CSA CAN3-A23.1-M.

REINFORCEMENT MAY BE DISPLACE TO CLEAR PIPES, RECESSES, EMBEDDED METAL WORKS AND CONDUITS.

A MINIMUM CLEARANCE OF 1" SHALL BE MAINTAINED BETWEEN REINFORCEMENT AND EMBEDDED MATERIALS. THE MINIMUM CLEARANCE BETWEEN REINFORCEMENT

REINFORCEMENT SHALL BE ACCURATELY PLACED IN ACCORDANCE WITH THE DRAWING AND SHALL BE ADEQUATELY SECURED AGAINST DISPLACEMENT BY USING ANNEALED IRON WIRE AT INTERSECTIONS AND SHALL BE SUPPORTED BY APPROVED CONCRETE OR METAL SUPPORTS. SPACERS OR METAL HANGERS EXCEPT AT SURFACES EXPOSED TO THE GROUND OR TO THE WEATHER WHERE SUPPORTS SHALL BE APPROVED. ALL METAL ACCESSORIES ARE TO BE GALVANIZED.

THE FULL INTENT AND PURPOSE OF THESE DRAWINGS IS PLACING OF REINFORCING STEEL BARS ONLY. IT IS NOT TO BE USED AS A MEANS OF COMMUNICATION BETWEEN THE ARCHITECT, ENGINEER, CONTRACTOR OR ANY OTHER SUBTRADE.

Reviewed only for general conformity with the specifications. Acceptance by the engineer does not warrant or represent that the information contained on this drawing/document is either accurate or complete. The sole responsibility for correct design, details & dimensions shall remain with the party submitting the drawing/document.

GENERAL NOTES ON REINFORCEMENT

THE FOLLOWING NOTES SHALL APPLY TO ALL REINFORCEMENT SHOWN ON THE DRAWINGS UNLESS OTHERWISE NOTED.

DIMENSIONS:
DIMENSIONS TO REINFORCEMENT ARE TO CENTRE LINES OF BARS, EXCEPT WHERE CONCRETE COVER OR CLEARANCE BETWEEN BARS IS SHOWN.

COVER:
SEE STRUCTURAL ENGINEER TYPICAL NOTES FOR ALL COVER SPECIFICATIONS

SPACING:
UNLESS OTHERWISE SHOWN, THE FIRST AND LAST BARS IN SLABS AND WALLS, STIRRUPS IN BEAMS SHALL BE PLACED AT MAXIMUM OF HALF THE SPECIFIED SPACING OF ADJACENT BARS FROM THE END OF THE MEMBER.

STEEL SPECIFICATIONS:
STEEL REINFORCEMENT SHALL BE DEFORMED BARS OF GRADE 400 CONFORMING TO CSA STANDARDS G30.12 BILLET-STEEL BARS FOR CONCRETE REINFORCEMENT.

WELDING:
WELDING OF REINFORCEMENT SHALL NOT BE PERMITTED.

SPLICES AND EMBEDMENTS:
UNLESS OTHERWISE SPECIFIED, ALL EMBEDMENTS SHALL BE TREATED AS TENSION EMBEDMENTS AND ALL LAP SPLICES SHALL BE CONSIDERED AS TENSION LAP SPLICES.

WHEN REINFORCING BARS OF DIFFERENT SIZE ARE TO BE SPLICED, THE LENGTH OF THE LAP SHALL BE BASED ON THE DIAMETER OF THE SMALLER BAR.

SPLICES ARE TO BE MADE SO THAT THE GIVEN CLEAR DISTANCE COVER WILL BE MAINTAINED.

LAP LENGTHS UNLESS SHOWN OTHERWISE:

GENERAL NOTES ON REINFORCEMENT

THE FOLLOWING NOTES SHALL APPLY TO ALL REINFORCEMENT SHOWN ON THE DRAWINGS UNLESS OTHERWISE NOTED.

DIMENSIONS:
DIMENSIONS TO REINFORCEMENT ARE TO CENTRE LINES OF BARS. EXCEPT WHERE CONCRETE COVER OR CLEARANCE BETWEEN BARS IS SHOWN.

COVER:
SEE STRUCTURAL ENGINEER TYPICAL NOTES FOR ALL COVER SPECIFICATIONS

SPACING:
UNLESS OTHERWISE SHOWN, THE FIRST AND LAST BARS IN SLABS AND WALLS, STIRRUPS IN BEAMS SHALL BE PLACED AT MAXIMUM OF HALF THE SPECIFIED SPACING OF ADJACENT BARS FROM THE END OF THE MEMBER.

STEEL SPECIFICATIONS:
STEEL REINFORCEMENT SHALL BE DEFORMED BARS OF GRADE 400 CONFORMING TO CSA STANDARDS G30.12 BILLET-STEEL BARS FOR CONCRETE REINFORCEMENT.

WELDING:
WELDING OF REINFORCEMENT SHALL NOT BE PERMITTED.

SPLICES AND EMBEDMENTS:
UNLESS OTHERWISE SPECIFIED, ALL EMBEDMENTS SHALL BE TREATED AS TENSION EMBEDMENTS AND ALL LAP SPLICES SHALL BE CONSIDERED AS TENSION LAP SPLICES.

WHEN REINFORCING BARS OF DIFFERENT SIZE ARE TO BE SPLICED, THE LENGTH OF THE LAP SHALL BE BASED ON THE DIAMETER OF THE SMALLER BAR.

SPLICES ARE TO BE MADE SO THAT THE GIVEN CLEAR DISTANCE COVER WILL BE MAINTAINED.

LAP LENGTHS UNLESS SHOWN OTHERWISE:

	HORZ	OTHER
10M	520	400
15M	775	595
20M	1035	790
25M	1615	1240
30M	1940	1485
35M		

PLACEMENT:
PLACE REINFORCING STEEL IN ACCORDANCE WITH CSA CAN3-A23.1-M.

REINFORCEMENT MAY BE DISPLACED TO CLEAR PIPES, RECESSES, EMBEDDED METAL WORKS AND CONDUITS.

A MINIMUM CLEARANCE OF 1" SHALL BE MAINTAINED BETWEEN REINFORCEMENT AND EMBEDDED MATERIALS. THE MINIMUM CLEARANCE BETWEEN REINFORCEMENT

REINFORCEMENT SHALL BE ACCURATELY PLACED IN ACCORDANCE WITH THE DRAWING AND SHALL BE ADEQUATELY SECURED AGAINST DISPLACEMENT BY USING ANNEALED IRON WIRE AT INTERSECTIONS AND SHALL BE SUPPORTED BY APPROVED CONCRETE OR METAL SUPPORTS. SPACERS OR METAL HANGERS EXCEPT AT SURFACES EXPOSED TO THE GROUND OR TO THE WEATHER WHERE SUPPORTS SHALL BE APPROVED. ALL METAL ACCESSORIES ARE TO BE GALVANIZED.

THE FULL INTENT AND PURPOSE OF THESE DRAWINGS IS PLACING OF REINFORCING STEEL BARS ONLY. IT IS NOT TO BE USED AS A MEANS OF COMMUNICATION BETWEEN THE ARCHITECT, ENGINEER, CONTRACTOR OR ANY OTHER SUBTRADE.

PLACEMENT:
PLACE REINFORCING STEEL IN ACCORDANCE WITH CSA CAN3-A23.1-M.

REINFORCEMENT MAY BE DISPLACE TO CLEAR PIPES, RECESSES, EMBEDDED METAL WORKS AND CONDUITS.

A MINIMUM CLEARANCE OF 1" SHALL BE MAINTAINED BETWEEN REINFORCEMENT AND EMBEDDED MATERIALS. THE MINIMUM CLEARANCE BETWEEN REINFORCEMENT

REINFORCEMENT SHALL BE ACCURATELY PLACED IN ACCORDANCE WITH THE DRAWING AND SHALL BE ADEQUATELY SECURED AGAINST DISPLACEMENT BY USING ANNEALED IRON WIRE AT INTERSECTIONS AND SHALL BE SUPPORTED BY APPROVED CONCRETE OR METAL SUPPORTS. SPACERS OR METAL HANGERS EXCEPT AT SURFACES EXPOSED TO THE GROUND OR TO THE WEATHER WHERE SUPPORTS SHALL BE APPROVED. ALL METAL ACCESSORIES ARE TO BE GALVANIZED.

THE FULL INTENT AND PURPOSE OF THESE DRAWINGS IS PLACING OF REINFORCING STEEL BARS ONLY. IT IS NOT TO BE USED AS A MEANS OF COMMUNICATION BETWEEN THE ARCHITECT, ENGINEER, CONTRACTOR OR ANY OTHER SUBTRADE.

GENERAL NOTES ON REINFORCEMENT

THE FOLLOWING NOTES SHALL APPLY TO ALL REINFORCEMENT SHOWN ON THE DRAWINGS. UNLESS OTHERWISE NOTED.

DIMENSIONS:
DIMENSIONS TO REINFORCEMENT ARE TO CENTRE LINES OF BARS, EXCEPT WHERE CONCRETE COVER OR CLEARANCE BETWEEN BARS IS SHOWN.

COVER:
SEE STRUCTURAL ENGINEER TYPICAL NOTES FOR ALL COVER SPECIFICATIONS

SPACING:
UNLESS OTHERWISE SHOWN, THE FIRST AND LAST BARS IN SLABS AND WALLS, STIRRUPS IN BEAMS SHALL BE PLACED AT MAXIMUM OF HALF THE SPECIFIED SPACING OF ADJACENT BARS FROM THE END OF THE MEMBER.

STEEL SPECIFICATIONS:
STEEL REINFORCEMENT SHALL BE DEFORMED BARS OF GRADE 400 CONFORMING TO CSA STANDARDS G30.12 BILLET-STEEL BARS FOR CONCRETE REINFORCEMENT.

WELDING:
WELDING OF REINFORCEMENT SHALL NOT BE PERMITTED.

SPLICES AND EMBEDMENTS:
UNLESS OTHERWISE SPECIFIED, ALL EMBEDMENTS SHALL BE TREATED AS TENSION EMBEDMENTS AND ALL LAP SPLICES SHALL BE CONSIDERED AS TENSION LAP SPLICES.

WHEN REINFORCING BARS OF DIFFERENT SIZE ARE TO BE SPLICED, THE LENGTH OF THE LAP SHALL BE BASED ON THE DIAMETER OF THE SMALLER BAR.

SPLICES ARE TO BE MADE SO THAT THE GIVEN CLEAR DISTANCE COVER WILL BE MAINTAINED.

LAP LENGTHS UNLESS SHOWN OTHERWISE:

	HORZ	OTHER
10M	520	400

GENERAL NOTES ON REINFORCEMENT

THE FOLLOWING NOTES SHALL APPLY TO ALL REINFORCEMENT SHOWN ON THE DRAWINGS UNLESS OTHERWISE NOTED.

DIMENSIONS:
DIMENSIONS TO REINFORCEMENT ARE TO CENTRE LINES OF BARS, EXCEPT WHERE CONCRETE COVER OR CLEARANCE BETWEEN BARS IS SHOWN.

COVER:
SEE STRUCTURAL ENGINEER TYPICAL NOTES FOR ALL COVER SPECIFICATIONS

SPACING:
UNLESS OTHERWISE SHOWN, THE FIRST AND LAST BARS IN SLABS AND WALLS, STIRRUPS IN BEAMS SHALL BE PLACED AT MAXIMUM OF HALF THE SPECIFIED SPACING OF ADJACENT BARS FROM THE END OF THE MEMBER.

STEEL SPECIFICATIONS:
STEEL REINFORCEMENT SHALL BE DEFORMED BARS OF GRADE 400 CONFORMING TO CSA STANDARDS G30.12 BILLET-STEEL BARS FOR CONCRETE REINFORCEMENT.

WELDING:
WELDING OF REINFORCEMENT SHALL NOT BE PERMITTED.

SPLICES AND EMBEDMENTS:
UNLESS OTHERWISE SPECIFIED, ALL EMBEDMENTS SHALL BE TREATED AS TENSION EMBEDMENTS AND ALL LAP SPLICES SHALL BE CONSIDERED AS TENSION LAP SPLICES.

WHEN REINFORCING BARS OF DIFFERENT SIZE ARE TO BE SPLICED, THE LENGTH OF THE LAP SHALL BE BASED ON THE DIAMETER OF THE SMALLER BAR.

SPLICES ARE TO BE MADE SO THAT THE GIVEN CLEAR DISTANCE GIVEN WILL BE MAINTAINED.

LAP LENGTHS UNLESS SHOWN OTHERWISE:

	HORZ	OTHER
10M	320	400
15M	775	595
20M	1030	790
25M	1615	1240
30M	1540	1485
35M		

PLACEMENT:
PLACE REINFORCING STEEL IN ACCORDANCE WITH CSA CAN3-A23.1-M.

REINFORCEMENT MAY BE DISPLACE TO CLEAR PIPES, RECESSES, EMBEDDED METAL WORKS AND CONDUITS.

A MINIMUM CLEARANCE OF 1" SHALL BE MAINTAINED BETWEEN REINFORCEMENT AND EMBEDDED MATERIALS. THE MINIMUM CLEARANCE BETWEEN REINFORCEMENT

REINFORCEMENT SHALL BE ACCURATELY PLACED IN ACCORDANCE WITH THE DRAWING AND SHALL BE ADEQUATELY SECURED AGAINST DISPLACEMENT BY USING ANNEALED IRON WIRE AT INTERSECTIONS AND SHALL BE SUPPORTED BY APPROVED CONCRETE OR METAL SUPPORTS. SPACERS OR METAL HANGERS EXCEPT AT SURFACES EXPOSED TO THE GROUND OR TO THE WEATHER WHERE SUPPORTS SHALL BE APPROVED. ALL METAL ACCESSORIES ARE TO BE GALVANIZED.

THE FULL INTENT AND PURPOSE OF THESE DRAWINGS IS PLACING OF REINFORCING STEEL BARS ONLY. IT IS NOT TO BE USED AS A MEANS OF COMMUNICATION BETWEEN THE ARCHITECT, ENGINEER, CONTRACTOR OR ANY OTHER SUBTRADE.

30M	1940	1485
35M		

PLACEMENT:
PLACE REINFORCING STEEL IN ACCORDANCE WITH CSA CAN3-A23.1-M.

REINFORCEMENT MAY BE DISPLACE TO CLEAR PIPES, RECESSES, EMBEDDED METAL WORKS AND CONDUITS.

A MINIMUM CLEARANCE OF 1" SHALL BE MAINTAINED BETWEEN REINFORCEMENT AND EMBEDDED MATERIALS. THE MINIMUM CLEARANCE BETWEEN REINFORCEMENT

REINFORCEMENT SHALL BE ACCURATELY PLACED IN ACCORDANCE WITH THE DRAWING AND SHALL BE ADEQUATELY SECURED AGAINST DISPLACEMENT BY USING ANNEALED IRON WIRE AT INTERSECTIONS AND SHALL BE SUPPORTED BY APPROVED CONCRETE OR METAL SUPPORTS. SPACERS OR METAL HANGERS EXCEPT AT SURFACES EXPOSED TO THE GROUND OR TO THE WEATHER WHERE SUPPORTS SHALL BE APPROVED. ALL METAL ACCESSORIES ARE TO BE GALVANIZED.

THE FULL INTENT AND PURPOSE OF THESE DRAWINGS IS PLACING OF REINFORCING STEEL BARS ONLY. IT IS NOT TO BE USED AS A MEANS OF COMMUNICATION BETWEEN THE ARCHITECT, ENGINEER, CONTRACTOR OR ANY OTHER SUBTRADE.

GENERAL NOTES ON REINFORCEMENT

THE FOLLOWING NOTES SHALL APPLY TO ALL REINFORCEMENT SHOWN ON THE DRAWINGS UNLESS OTHERWISE NOTED.

DIMENSIONS:
DIMENSIONS TO REINFORCEMENT ARE TO CENTRE LINES OF BARS, EXCEPT WHERE CONCRETE COVER OR CLEARANCE BETWEEN BARS IS SHOWN.

COVER:
SEE STRUCTURAL ENGINEER TYPICAL NOTES FOR ALL COVER SPECIFICATIONS

SPACING:
UNLESS OTHERWISE SHOWN, THE FIRST AND LAST BARS IN SLABS AND WALLS, STIRRUPS IN BEAMS SHALL BE PLACED AT MINIMUM OF HALF THE SPECIFIED SPACING OF ADJACENT BARS FROM THE END OF THE MEMBER.

STEEL SPECIFICATIONS:
STEEL REINFORCEMENT SHALL BE DEFORMED BARS OF GRADE 400 CONFORMING TO CSA STANDARDS G30.18 BILLET-STEEL BARS FOR CONCRETE REINFORCEMENT.

WELDING:
WELDING OF REINFORCEMENT SHALL NOT BE PERMITTED.

SPLICES AND EMBEDMENTS:
UNLESS OTHERWISE SPECIFIED, ALL EMBEDMENTS SHALL BE TREATED AS TENSION EMBEDMENTS AND ALL LAP SPLICES SHALL BE CONSIDERED AS TENSION LAP SPLICES.

WHEN REINFORCING BARS OF DIFFERENT SIZE ARE TO BE SPLICED, THE LENGTH OF THE LAP SHALL BE BASED ON THE DIAMETER OF THE SMALLER BAR.

SPLICES ARE TO BE MADE SO THAT THE CLEAR DISTANCE COVER WILL BE MAINTAINED.

LAP LENGTHS UNLESS SHOWN OTHERWISE:

Reviewed only for general conformity with the specifications. Acceptance by the engineer does not warrant or represent that the information contained on this drawing/document is either accurate or complete. The sole responsibility for correct design, details & dimensions shall remain with the party submitting the drawing/document.

GENERAL NOTES ON REINFORCEMENT

THE FOLLOWING NOTES SHALL APPLY TO ALL REINFORCEMENT SHOWN ON THE DRAWINGS UNLESS OTHERWISE NOTED.

DIMENSIONS:
DIMENSIONS TO REINFORCEMENT ARE TO CENTRE LINES OF BARS. EXCEPT WHERE CONCRETE COVER OR CLEARANCE BETWEEN BARS IS SHOWN.

COVER:
SEE STRUCTURAL ENGINEER TYPICAL NOTES FOR ALL COVER SPECIFICATIONS.

SPACING:
UNLESS OTHERWISE SHOWN, THE FIRST AND LAST BARS IN SLABS AND WALLS, STIRRUPS IN BEAMS SHALL BE PLACED AT MAXIMUM OF HALF THE SPECIFIED SPACING OF ADJACENT BARS FROM THE END OF THE MEMBER.

STEEL SPECIFICATIONS:
STEEL REINFORCEMENT SHALL BE DEFORMED BARS OF GRADE 400 CONFORMING TO CSA STANDARDS G30.12 BILLET-STEEL BARS FOR CONCRETE REINFORCEMENT.

WELDING:
WELDING OF REINFORCEMENT SHALL NOT BE PERMITTED.

SPLICES AND EMBEDMENTS:
UNLESS OTHERWISE SPECIFIED, ALL EMBEDMENTS SHALL BE TREATED AS TENSION EMBEDMENTS AND ALL LAP SPLICES SHALL BE CONSIDERED AS TENSION LAP SPLICES.

WHEN REINFORCING BARS OF DIFFERENT SIZE ARE TO BE SPLICED, THE LENGTH OF THE LAP SHALL BE BASED ON THE DIAMETER OF THE SMALLER BAR.

SPLICES ARE TO BE MADE SO THAT THE GIVEN CLEAR DISTANCE COVER WILL BE MAINTAINED.

LAP LENGTHS UNLESS SHOWN OTHERWISE:

	HORZ	OTHER
10M	300	400
15M	775	585
20M	1000	790
25M	1675	1240
30M	1940	1485
35M		

PLACEMENT:
PLACE REINFORCING STEEL IN ACCORDANCE WITH CSA CAN3-A23.1-M.

REINFORCEMENT MAY BE DISPLACE TO CLEAR PIPES, RECESSES, EMBEDDED METAL WORKS AND CONDUITS.

A MINIMUM CLEARANCE OF 1" SHALL BE MAINTAINED BETWEEN REINFORCEMENT AND EMBEDDED MATERIALS. THE MINIMUM CLEARANCE BETWEEN REINFORCEMENT

REINFORCEMENT SHALL BE ACCURATELY PLACED IN ACCORDANCE WITH THE DRAWING AND SHALL BE ADEQUATELY SECURED AGAINST DISPLACEMENT BY USING ANNEALED IRON WIRE AT INTERSECTIONS AND SHALL BE SUPPORTED BY APPROVED CONCRETE OR METAL SUPPORTS. SPACERS OR METAL HANGERS EXCEPT AT SURFACES EXPOSED TO THE GROUND OR TO THE WEATHER WHERE SUPPORTS SHALL BE APPROVED. ALL METAL ACCESSORIES ARE TO BE GALVANIZED.

THE FULL INTENT AND PURPOSE OF THESE DRAWINGS IS PLACING OF REINFORCING STEEL BARS ONLY. IT IS NOT TO BE USED AS A MEANS OF COMMUNICATION BETWEEN THE ARCHITECT, ENGINEER, CONTRACTOR OR ANY OTHER SUBTRADE.

GENERAL NOTES ON REINFORCEMENT

THE FOLLOWING NOTES SHALL APPLY TO ALL REINFORCEMENT SHOWN ON THE DRAWINGS UNLESS OTHERWISE NOTED.

DIMENSIONS:
DIMENSIONS TO REINFORCEMENT ARE TO CENTRE LINES OF BARS, EXCEPT WHERE CONCRETE COVER OR CLEARANCE BETWEEN BARS IS SHOWN.

COVER:
SEE STRUCTURAL ENGINEER TYPICAL NOTES FOR ALL COVER SPECIFICATIONS

SPACING:
UNLESS OTHERWISE SHOWN, THE FIRST AND LAST BARS IN SLABS AND WALLS, STIRRUPS IN BEAMS SHALL BE PLACED AT A MINIMUM OF HALF THE SPECIFIED SPACING OF ADJACENT BARS FROM THE END OF THE MEMBER.

STEEL SPECIFICATIONS:
STEEL REINFORCEMENT SHALL BE DEFORMED BARS OF GRADE 400 CONFORMING TO CSA STANDARDS G30.12 BILLET-STEEL BARS FOR CONCRETE REINFORCEMENT.

WELDING:
WELDING OF REINFORCEMENT SHALL NOT BE PERMITTED.

SPLICES AND EMBEDMENTS:
UNLESS OTHERWISE SPECIFIED, ALL EMBEDMENTS SHALL BE TREATED AS TENSION EMBEDMENTS AND ALL LAP SPLICES SHALL BE CONSIDERED AS TENSION LAP SPLICES.

WHEN REINFORCING BARS OF DIFFERENT SIZE ARE TO BE SPLICED, THE LENGTH OF THE LAP SHALL BE BASED ON THE DIAMETER OF THE SMALLER BAR.

SPLICES ARE TO BE MADE SO THAT THE GIVEN CLEAR DISTANCE COVER WILL BE MAINTAINED.

LAP LENGTHS UNLESS SHOWN OTHERWISE:

	HORZ	OTHER
10M	530	400
15M	775	595
20M	1050	790
25M	1615	1240
30M	1940	1485
35M		

PLACEMENT:
PLACE REINFORCING STEEL IN ACCORDANCE WITH CSA CAN3-A23.1-94.

REINFORCEMENT MAY BE DISPLACE TO CLEAR PIPES, RECESSES, EMBEDDED METAL WORKS AND CONDUITS.

A MINIMUM CLEARANCE OF 1" SHALL BE MAINTAINED BETWEEN REINFORCEMENT AND EMBEDDED MATERIALS. THE MINIMUM CLEARANCE BETWEEN REINFORCEMENT

REINFORCEMENT SHALL BE ACCURATELY PLACED IN ACCORDANCE WITH THE DRAWING AND SHALL BE ADEQUATELY SECURED AGAINST DISPLACEMENT BY USING ANNEALED IRON WIRE AT INTERSECTIONS AND SHALL BE SUPPORTED BY APPROVED CONCRETE OR METAL SUPPORTS. SPACERS OR METAL HANGERS EXCEPT AT SURFACES EXPOSED TO THE GROUND OR TO THE WEATHER WHERE SUPPORTS SHALL BE APPROVED. ALL METAL ACCESSORIES ARE TO BE GALVANIZED.

THE FULL INTENT AND PURPOSE OF THESE DRAWINGS IS PLACING OF REINFORCING STEEL BARS ONLY. IT IS NOT TO BE USED AS A MEANS OF COMMUNICATION BETWEEN THE ARCHITECT, ENGINEER, CONTRACTOR OR ANY OTHER SUBTRADE.

GENERAL NOTES ON REINFORCEMENT

THE FOLLOWING NOTES SHALL APPLY TO ALL REINFORCEMENT SHOWN ON THE DRAWINGS UNLESS OTHERWISE NOTED.

DIMENSIONS:
DIMENSIONS TO REINFORCEMENT ARE TO CENTRE LINES OF BARS. EXCEPT WHERE CONCRETE COVER OR CLEARANCE BETWEEN BARS IS SHOWN.

COVER:
SEE STRUCTURAL ENGINEER TYPICAL NOTES FOR ALL OTHER SPECIFICATIONS

SPACING:
UNLESS OTHERWISE SHOWN, THE FIRST AND LAST BARS IN SLABS AND WALLS, STIRRUPS IN BEAMS SHALL BE PLACED AT MAXIMUM OF HALF THE SPECIFIED SPACING OF ADJACENT BARS FROM THE END OF THE MEMBER.

STEEL SPECIFICATIONS:
STEEL REINFORCEMENT SHALL BE DEFORMED BARS OF GRADE 400 CONFORMING TO CSA STANDARDS G30.12 BILLET-STEEL BARS FOR CONCRETE REINFORCEMENT.

WELDING:
WELDING OF REINFORCEMENT SHALL NOT BE PERMITTED.

SPLICES AND EMBEDMENTS:
UNLESS OTHERWISE SPECIFIED, ALL EMBEDMENTS SHALL BE TREATED AS TENSION EMBEDMENTS AND ALL LAP SPLICES SHALL BE CONSIDERED AS TENSION LAP SPLICES.

WHEN REINFORCING BARS OF DIFFERENT SIZE ARE TO BE SPLICED, THE LENGTH OF THE LAP SHALL BE BASED ON THE DIAMETER OF THE SMALLER BAR.

SPLICES ARE TO BE MADE SO THAT THE GIVEN CLEAR DISTANCE COVER WILL BE MAINTAINED.

LAP LENGTHS UNLESS SHOWN OTHERWISE:

	HORZ	OTHER
10M	500	400
15M	775	595
20M	1030	790
25M	1575	1240
30M	1540	1485
35M		

PLACEMENT:
PLACE REINFORCING STEEL IN ACCORDANCE WITH CSA CAN3-A23.1-M.

REINFORCEMENT MAY BE DISPLACED TO CLEAR PIPES, RECESSES, EMBEDDED METAL WORKS AND CONDUITS.

A MINIMUM CLEARANCE OF 1" SHALL BE MAINTAINED BETWEEN REINFORCEMENT AND EMBEDDED MATERIALS. THE MINIMUM CLEARANCE BETWEEN REINFORCEMENT

REINFORCEMENT SHALL BE ACCURATELY PLACED IN ACCORDANCE WITH THE DRAWING AND SHALL BE ADEQUATELY SECURED AGAINST DISPLACEMENT BY USING ANNEALED IRON WIRE AT INTERSECTIONS AND SHALL BE SUPPORTED BY APPROVED CONCRETE OR METAL SUPPORTS. SPACERS OR METAL HANGERS EXCEPT AT SURFACES EXPOSED TO THE GROUND OR TO THE WEATHER WHERE SUPPORTS SHALL BE APPROVED. ALL METAL ACCESSORIES ARE TO BE GALVANIZED.

THE FULL INTENT AND PURPOSE OF THESE DRAWINGS IS PLACING OF REINFORCING STEEL BARS ONLY. IT IS NOT TO BE USED AS A MEANS OF COMMUNICATION BETWEEN THE ARCHITECT, ENGINEER, CONTRACTOR OR ANY OTHER SUBTRADE.

GENERAL NOTES ON REINFORCEMENT

THE FOLLOWING NOTES SHALL APPLY TO ALL REINFORCEMENT SHOWN ON THE DRAWINGS UNLESS OTHERWISE NOTED.

DIMENSIONS:
DIMENSIONS TO REINFORCEMENT ARE TO CENTRE LINES OF BARS, EXCEPT WHERE CONCRETE COVER OR CLEARANCE BETWEEN BARS IS SHOWN.

COVER:
SEE STRUCTURAL ENGINEER TYPICAL NOTES FOR ALL COVER SPECIFICATIONS

SPACING:
UNLESS OTHERWISE SHOWN, THE FIRST AND LAST BARS IN SLABS AND WALLS, STIRRUPS IN BEAMS SHALL BE PLACED AT MAXIMUM OF HALF THE SPECIFIED SPACING OF ADJACENT BARS FROM THE END OF THE MEMBER.

STEEL SPECIFICATIONS:
STEEL REINFORCEMENT SHALL BE DEFORMED BARS OF GRADE 400 CONFORMING TO CSA STANDARDS G30.12 BILLET-STEEL BARS FOR CONCRETE REINFORCEMENT.

WELDING:
WELDING OF REINFORCEMENT SHALL NOT BE PERMITTED.

SPLICES AND EMBEDMENTS:
UNLESS OTHERWISE SPECIFIED, ALL EMBEDMENTS SHALL BE TREATED AS TENSION EMBEDMENTS AND ALL LAP SPLICES SHALL BE CONSIDERED AS TENSION LAP SPLICES.

WHEN REINFORCING BARS OF DIFFERENT SIZE ARE TO BE SPLICED, THE LENGTH OF THE LAP SHALL BE BASED ON THE DIAMETER OF THE SMALLER BAR.

SPLICES ARE TO BE MADE SO THAT THE CLEAR DISTANCE COVER WILL BE MAINTAINED.

LAP LENGTHS UNLESS SHOWN OTHERWISE:

	HORZ	OTHER
10M	520	400
15M	775	595
20M	1030	790
25M	1615	1240
30M	1940	1485
35M		

PLACEMENT:
PLACE REINFORCING STEEL IN ACCORDANCE WITH CSA CAN3-A23.1-M.

REINFORCEMENT MAY BE DISPLACE TO CLEAR PIPES, RECESSES, EMBEDDED METAL WORKS AND CONDUITS.

A MINIMUM CLEARANCE OF 1" SHALL BE MAINTAINED BETWEEN REINFORCEMENT AND EMBEDDED MATERIALS. THE MINIMUM CLEARANCE BETWEEN REINFORCEMENT

REINFORCEMENT SHALL BE ACCURATELY PLACED IN ACCORDANCE WITH THE DRAWING AND SHALL BE ADEQUATELY SECURED AGAINST DISPLACEMENT BY USING ANNEALED IRON WIRE AT INTERSECTIONS AND SHALL BE SUPPORTED BY APPROVED CONCRETE OR METAL SUPPORTS. SPACERS OR METAL HANGERS EXCEPT AT SURFACES EXPOSED TO THE GROUND OR TO THE WEATHER WHERE SUPPORTS SHALL BE APPROVED. ALL METAL ACCESSORIES ARE TO BE GALVANIZED.

THE FULL INTENT AND PURPOSE OF THESE DRAWINGS IS PLACING OF REINFORCING STEEL BARS ONLY. IT IS NOT TO BE USED AS A MEANS OF COMMUNICATION BETWEEN THE ARCHITECT, ENGINEER, CONTRACTOR OR ANY OTHER SUBTRADE.

GENERAL NOTES ON REINFORCEMENT

THE FOLLOWING NOTES SHALL APPLY TO ALL REINFORCEMENT SHOWN ON THE DRAWINGS UNLESS OTHERWISE NOTED.

DIMENSIONS:
DIMENSIONS TO REINFORCEMENT ARE TO CENTRE LINES OF BARS, EXCEPT WHERE CONCRETE COVER OR CLEARANCE BETWEEN BARS IS SHOWN.

COVER:
SEE STRUCTURAL ENGINEER TYPICAL NOTES FOR ALL COVER SPECIFICATIONS

SPACING:
UNLESS OTHERWISE SHOWN, THE FIRST AND LAST BARS IN SLABS AND WALLS, STIRRUPS IN BEAMS SHALL BE PLACED AT MAXIMUM OF HALF THE SPECIFIED SPACING OF ADJACENT BARS FROM THE END OF THE MEMBER.

STEEL SPECIFICATIONS:
STEEL REINFORCEMENT SHALL BE DEFORMED BARS OF GRADE 400 CONFORMING TO CSA STANDARDS G30.12 BILLET-STEEL BARS FOR CONCRETE REINFORCEMENT.

WELDING:
WELDING OF REINFORCEMENT SHALL NOT BE PERMITTED.

SPLICES AND EMBEDMENTS:
UNLESS OTHERWISE SPECIFIED, ALL EMBEDMENTS SHALL BE TREATED AS TENSION EMBEDMENTS AND ALL LAP SPLICES SHALL BE CONSIDERED AS TENSION LAP SPLICES.

WHEN REINFORCING BARS OF DIFFERENT SIZE ARE TO BE SPLICED, THE LENGTH OF THE LAP SHALL BE BASED ON THE DIAMETER OF THE SMALLER BAR.

SPLICES ARE TO BE MADE SO THAT THE GIVEN CLEAR DISTANCE COVER WILL BE MAINTAINED.

LAP LENGTHS UNLESS SHOWN OTHERWISE:

	HORZ	OTHER
10M	520	400
15M	775	595
20M	1030	790
25M	1615	1240
30M	1940	1485
35M		

PLACEMENT:
PLACE REINFORCING STEEL IN ACCORDANCE WITH CSA CAN3-A23.1-M.

REINFORCEMENT MAY BE DISPLACE TO CLEAR PIPES, RECESSES, EMBEDDED METAL WORKS AND CONDUITS.

A MINIMUM CLEARANCE OF 1" SHALL BE MAINTAINED BETWEEN REINFORCEMENT AND EMBEDDED MATERIALS. THE MINIMUM CLEARANCE BETWEEN REINFORCEMENT

REINFORCEMENT SHALL BE ACCURATELY PLACED IN ACCORDANCE WITH THE DRAWING AND SHALL BE ADEQUATELY SECURED AGAINST DISPLACEMENT BY USING ANNEALED IRON WIRE AT INTERSECTIONS AND SHALL BE SUPPORTED BY APPROVED CONCRETE OR METAL SUPPORTS. SPACERS OR METAL HANGERS EXCEPT AT SURFACES EXPOSED TO THE GROUND OR TO THE WEATHER WHERE SUPPORTS SHALL BE APPROVED. ALL METAL ACCESSORIES ARE TO BE GALVANIZED.

THE FULL INTENT AND PURPOSE OF THESE DRAWINGS IS PLACING OF REINFORCING STEEL BARS ONLY. IT IS NOT TO BE USED AS A MEANS OF COMMUNICATION BETWEEN THE ARCHITECT, ENGINEER, CONTRACTOR OR ANY OTHER SUBTRADE.

DESIGN CRITERIA AND CONSTRUCTION REQUIREMENTS
TENSAR PERMANENT WWF RETAINING WALL SYSTEM

1.0 PROJECT INTRODUCTION

1.1 THE PERMANENT WWF RETAINING WALL SYSTEM FOR THE EAGLE GOLD PROJECT IS A MECHANICALLY STABILIZED EARTH (MSE) STRUCTURE. THE DRAWINGS AND ASSOCIATED ANALYSES ARE PRESENTED BY TENSAR INTERNATIONAL CORPORATION (TIC) TO NILEX (CLIENT) UNDER CONTRACT.

2.0 MATERIALS

2.1 BACKFILL

2.1.1 BACKFILL (REINFORCED AND RETAINED ZONES) SHALL BE FREE OF EXCESS MOISTURE, ROOTS, MUCK, SOD, SNOW, FROZEN LUMPS, ORGANIC MATTER OR OTHER DELETERIOUS MATERIALS. ALL ROCK PARTICLES AND HARD EARTH CLODS SHALL BE LESS THAN 4 INCHES IN THE LONGEST DIMENSION. BACKFILL WHICH DOES NOT MEET THESE CRITERIA SHALL BE CONSIDERED UNSUITABLE AND SHALL BE REMOVED.

2.1.2 REINFORCED BACKFILL SHALL BE ON-SITE OR IMPORT SOILS THAT MEET THE STRENGTH REQUIREMENTS DEFINED IN SECTION 4.2 AND THE GRADATION LIMITS LISTED BELOW. THE PORTION OF THE REINFORCED BACKFILL PASSING THE NO. 40 SIEVE SHALL HAVE A LIQUID LIMIT LESS THAN 20 AND PLASTICITY INDEX LESS THAN 6. REINFORCED BACKFILL SHALL BE CLASSIFIED PER THE UNIFIED SOIL CLASSIFICATION SYSTEM AS LOW OR NON-PLASTIC SOILS.

SIEVE OPENING (MM)	PERCENT PASSING, MIN.	PERCENT PASSING, MAX.
100	100	-
0.425	0	60
0.075	0	15

2.2 SOIL REINFORCEMENT
GEOGRID REINFORCEMENT SHALL BE TENSAR TPG AND BIAXIAL GEOGRIDS SUPPLIED BY TENSAR INTERNATIONAL CORPORATION, MORROW, GEORGIA, USA.

2.3 FACING MATERIAL

2.3.1 WELDED WIRE FORMS (WWF) SHALL BE SUPPLIED BY NILEX CIVIL ENVIRONMENTAL GROUP, CALGARY, AB, CANADA.

2.4 DRAINAGE MATERIAL

2.4.1 GEOTEXTILE SHALL MEET THE SPECIFICATION FOR AASHTO M288 GEOTEXTILES, AS NOTED IN THE DETAILS.

3.0 DESIGN RESPONSIBILITY

3.1 TIC RESPONSIBILITY
TIC HAS DESIGNED THE PERMANENT WWF RETAINING WALL SYSTEM TO SATISFY THE MSE CHARACTERISTICS LISTED BELOW.

INTERNAL STABILITY	STATIC	SEISIC
GEOGRID TENSILE STRENGTH, MINIMUM FS	1.5	1.1
GEOGRID PULLOUT CAPACITY, MINIMUM FS	1.5	1.1
SLIDING AT LOWEST GEOGRID, MINIMUM FS	1.5	1.1
EXTERNAL STABILITY	**STATIC**	**SEISMIC**
SLIDING AT MSE BASE, MINIMUM FS	1.5	1.1
ECCENTRICITY RATIO AT MSE BASE, MAXIMUM	0.17	0.33

3.2 THE SITE CHARACTERISTICS LISTED BELOW AFFECT THE PERFORMANCE OF THE PERMANENT WWF RETAINING WALL SYSTEM. TIC IS NOT RESPONSIBLE FOR EVALUATING OR VERIFYING SITE CHARACTERISTICS, THEREFORE TIC ASSUMES NO LIABILITY FOR THE POTENTIAL NEGATIVE EFFECTS OF THE SITE CHARACTERISTICS. THE CLIENT IS RESPONSIBLE FOR ENSURING THAT A QUALIFIED ENGINEER PROPERLY ADDRESSES THE FOLLOWING SITE CHARACTERISTICS.

3.2.1 TIC REPORTS PHYSICAL AND STRENGTH REQUIREMENTS OF THE BACKFILL. THE CLIENT IS RESPONSIBLE FOR VERIFICATION OF BACKFILL SPECIFICATIONS AND APPROPRIATE BACKFILL TESTING METHODS AND FREQUENCY.

3.2.2 ALLOWABLE BEARING CAPACITY
THE APPLIED BEARING PRESSURE HAS BEEN CALCULATED FOR EACH DESIGN CASE IN THE CALCULATION PACKAGE REFERENCED IN SECTION 7.1. THE CLIENT IS RESPONSIBLE FOR ENSURING THAT A QUALIFIED GEOTECHNICAL ENGINEER PERFORMS AN EVALUATION OF THE FOUNDATION AND ITS ALLOWABLE BEARING CAPACITY. THE CLIENT IS RESPONSIBLE TO NOTIFY TIC IF THE APPLIED BEARING PRESSURE EXCEEDS THE ALLOWABLE BEARING CAPACITY.

3.2.3 HYDROSTATIC CONDITIONS
TIC REPORTS MAXIMUM DESIGN WATER LEVELS (SURFACE AND SUBSURFACE) IN SECTION 4.6. TIC REQUIRES THAT THE REINFORCED ZONE OF THE MSE STRUCTURE REMAINS FREE OF WATER AND ALL UNBALANCED HYDROSTATIC FORCES. THE CLIENT IS RESPONSIBLE FOR ENSURING THAT THE DESIGN, ANALYSIS, DETAILING, AND MITIGATION OF SURFACE WATER AND SUBSURFACE WATER, INCLUDING BUT NOT LIMITED TO COLLECTION, DIVERSION, AND EROSION/SCOUR PROTECTION ARE PROPERLY ADDRESSED BY A QUALIFIED ENGINEER.

3.2.4 SETTLEMENT
TOTAL SETTLEMENT AND DIFFERENTIAL SETTLEMENT OF THE MSE STRUCTURE EXCEEDING 1/50 SHALL BE THE RESPONSIBILITY OF THE CLIENT. THE CLIENT IS RESPONSIBLE TO NOTIFY TIC IF IT IS DETERMINED THAT THE POTENTIAL FOR DIFFERENTIAL SETTLEMENT EXCEEDS THIS VALUE. TIC ACCEPTS NO LIABILITY OR RESPONSIBILITY FOR THE EVALUATION OF SETTLEMENT.

3.2.5 GLOBAL STABILITY
GLOBAL STABILITY IS OUTSIDE THE SCOPE OF TIC'S RESPONSIBILITY FOR THE PROJECT. THE CLIENT IS RESPONSIBLE FOR ENSURING THAT THE SOILS BEHIND AND BELOW THE MSE STRUCTURES ARE CAPABLE OF RESISTING ROTATIONAL AND WEDGE-SHAPED FAILURE.

4.0 DESIGN PARAMETERS

4.1 DESIGN OF THE PERMANENT WWF RETAINING WALL IS BASED ON FHWA-NHI-00-043, "MECHANICALLY STABILIZED EARTH WALLS AND REINFORCED SOIL SLOPES DESIGN & CONSTRUCTION GUIDELINES", 2001. THE FOLLOWING PARAMETERS CONTROL THE DESIGN:

4.2 SOIL PARAMETERS

SOIL ZONE	MOIST UNIT WEIGHT (kN/m^3) ⚠1	EFFECTIVE FRICTION ANGLE (DEGREES)	EFFECTIVE COHESION (kPa)
REINFORCED ZONE	20.5	40	0
RETAINED ZONE	20.5	40	0
FOUNDATION ZONE	20.5	40	0

NOTE: THE PROJECT GEOTECHNICAL ENGINEER SHALL CONFIRM THE APPROPRIATNESS OF THE PARAMETERS ABOVE. IF SOIL TESTING CONCLUDES THAT ACTUAL SOIL PARAMETERS DIFFER THAN THOSE STATED ABOVE, TIC SHALL BE NOTIFIED TO MODIFY THE DESIGN ACCORDINGLY.

4.3 GEOGRID
GEOGRID TENSILE PROPERTIES AND REDUCTION FACTORS USED FOR THE CALCULATIONS REFERENCED IN SECTION 7.1 ARE LISTED BELOW.

GEOGRID TYPE	ULTIMATE TENSILE STRENGTH, T_{ULT} (kN/m)	REDUCTION FACTORS			ALLOWABLE DESIGN STRENGTH, T_{AL} (kN/m)
		CREEP, RF_{CR}	INSTALLATION DAMAGE, RF_{ID}	DURABILITY, RF_D	
TPG100D	110.2	1.51	1.25	1.10	53.1
TPG130D	150.3	1.51	1.25	1.10	72.4

⚠1 ⚠1

4.3.1	SOIL-GEOGRID INTERACTION COEFFICIENT (PULLLOUT), Ci	= 0.8
4.3.2	SOIL-GEOGRID INTERACTION COEFFICIENT (DIRECT SLIDING), Cds	= 0.8
4.3.3	GEOGRID COVERAGE RATIO, Rc	= 1.0
4.4	DESIGN LIFE	= 20 YEARS
4.5	LOADINGS	
4.5.1	TAKE-UP TOWER LOADING	= 200 kPa
4.5.2	TERTIARY STOCKPILE LOAD P1	= 26000 kN
4.5.3	TERTIARY STOCKPILE LOAD P2	= 29600 kN
4.5.4	TERTIARY STOCKPILE LOAD P3	= 3900 kN
4.5.5	TERTIARY STOCKPILE LOAD P4	= 1620 kN
4.5.6	SEISMIC ACCELERATION COEFFICIENT, Kh	= 0.22g

4.6 HYDROSTATIC PARAMETERS

PHREATIC SURFACES WERE NOT CONSIDERED IN DESIGN OF THE PERMANENT WWF RETAINING WALL SYSTEM. WATER LEVELS (SURFACE AND SUBSURFACE) SHALL REMAIN SUFFICIENTLY BELOW THE BOTTOM OF THE STRUCTURES (> H, HEIGHT OF MSE STRUCTURE) FOR THE LIFE OF THE STRUCTURE TO PRECLUDE NEGATIVES EFFECTS ON THE INTERNAL OR EXTERNAL STABILITY OF THE STRUCTURES.

5.0 CONSTRUCTION

5.1 A COMPLETE SET OF APPROVED SHOP DRAWINGS AND CONTRACT SPECIFICATIONS SHALL BE ON SITE AT ALL TIMES DURING CONSTRUCTION OF THE PERMANENT WWF RETAINING WALL SYSTEM. THE CONTRACTOR IS RESPONSIBLE TO FOLLOW THE DRAWINGS AND THE INSTRUCTIONS PROVIDED IN THE CONSTRUCTION AND QUALITY CONTROL MANUAL PROVIDED BY TIC.

5.2 FOUNDATION PREPARATION
PRIOR TO CONSTRUCTION OF THE PERMANENT WWF RETAINING WALL SYSTEM, THE CONTRACTOR SHALL CLEAR AND GRUB THE REINFORCED BACKFILL FOOTPRINT, REMOVING TOP SOIL, BRUSH, SOD OR OTHER ORGANIC OR DELETERIOUS MATERIAL. ANY UNSUITABLE SOILS SHALL BE OVER-EXCAVATED, REPLACED WITH COMPACTED BACKFILL MATERIAL TO PROJECT SPECIFICATIONS OR AS OTHERWISE DIRECTED BY A QUALIFIED GEOTECHNICAL ENGINEER. THE FOUNDATION SHALL BE PROOF ROLL INSPECTED USING A LOADED TRUCK WITH 80 KN AXLE LOADS OR PER PROJECT SPECIFICATIONS. THE CLIENT IS RESPONSIBLE TO HAVE A QUALIFIED GEOTECHNICAL ENGINEER CONFIRM THAT THE FOUNDATION HAS BEEN PROPERLY PREPARED AND MEETS THE SOIL PARAMETERS STATED IN SECTION 4.2.

5.3 MSE FACING

5.3.1 THE CLIENT IS RESPONSIBLE TO SURVEY AND LAYOUT THE PERMANENT WWF RETAINING WALL FACING AS SHOWN ON THE OWNER'S CONTRACT DRAWINGS.

5.3.2 INSTALL WWF FACING UNITS ON LEVEL GRADE. ENDS OF ADJACENT FACING UNITS SHALL BE OVERLAPPED 100 MM. ATTACH THE END VERTICAL WIRES OF ADJACENT FACING UNITS WITH CABLE TIES OR TIE WIRES TO MAINTAIN ALIGNMENT AND CONTAIN FILL. FACING UNIT BATTER SHOWN HEREIN SHALL BE MAINTAINED DURING CONSTRUCTION. THE CLIENT SHALL PROVIDE ALIGNMENT CONTROL FOR EACH COURSE OF FACING UNITS AND MAKE ALIGNMENT CORRECTIONS AS NECESSARY. HORIZONTAL DEFORMATION OF INDIVIDUAL FACING UNITS (BULGING) SHALL BE LIMITED TO 50 MM BETWEEN STRUTS AND BETWEEN THE BASE AND TOP OF THE FACING UNIT. THE CLIENT SHALL MODIFY COMPACTION PROCEDURES IF EXCESSIVE DEFORMATION OF THE FACING UNIT OCCURS. ADDITIONAL STRUTS MAY BE USED TO STIFFEN THE FACING UNIT.

5.4 GEOGRID PLACEMENT

5.4.1 GEOGRIDS SHALL BE INSTALLED AT THE LENGTHS, ELEVATIONS, AND LOCATIONS SHOWN ON THE DRAWINGS HEREIN. CHANGES TO GEOGRID LAYOUT ARE NOT PERMISSIBLE WITHOUT THE EXPRESS WRITTEN CONSENT OF TIC.

5.4.2 GEOGRID REINFORCEMENT SHALL BE CONTINUOUS THROUGHOUT THEIR EMBEDMENT LENGTH. GEOGRID-TO-GEOGRID CONNECTION IS NOT ALLOWED.

5.4.3 TPG GEOGRID SHALL BE ROLLED OUT PERPENDICULAR TO THE FACING UNITS UNLESS OTHERWISE NOTED. THE TRANSVERSE BAR OF THE GEOGRID (ACROSS THE ROLL WIDTH) SHALL BE IN CONTACT WITH THE VERTICAL FACE OF THE GEOTEXTILE FACE WRAP. NO OVERLAP IS REQUIRED. BIAXIAL GEOGRID SHALL BE ROLLED OUT PARALLEL TO THE FACING UNITS. BIAXIAL GEOGRID SHALL BE OVERLAPPED MINIMUM 4 INCHES.

5.4.4 TRACKED CONSTRUCTION EQUIPMENT SHALL NOT BE OPERATED DIRECTLY ON THE GEOGRID REINFORCEMENT. A MINIMUM BACKFILL THICKNESS OF 150 MM IS REQUIRED FOR OPERATION OF TRACKED VEHICLES OVER THE GEOGRID REINFORCEMENT. TURNING OF TRACKED VEHICLES SHOULD BE KEPT TO A MINIMUM TO PREVENT TRACKS FROM DISPLACING THE FILL AND/OR GEOGRID REINFORCEMENT. RUBBER-TIRED VEHICLES MAY PASS OVER THE GEOGRID REINFORCEMENT AT SPEEDS LESS THAN 15 KPH. SUDDEN BRAKING AND SHARP TURNING SHALL BE AVOIDED.

5.4.5 A MINIMUM OF 75 MM OF REINFORCED BACKFILL SHALL BE PLACED BETWEEN OVERLAPPING LAYERS OF GEOGRID REINFORCEMENT.

5.5 BACKFILL PLACEMENT

5.5.1 PRIOR TO PLACING BACKFILL, POSITION THE FACE BACKING AND INSTALL THE WIRE STRUTS AS SHOWN IN THE DRAWINGS. BACKFILL AND FACE FILL SHALL BE PLACED IN ALTERNATING LIFTS. THE GEOGRID SHALL BE TENSIONED BY HAND TO ELIMINATE SLACK AND ANCHORED BY PINNING OR PLACING SOIL ON THE GEOGRID AT THE BACK OF THE REINFORCED ZONE. BACKFILL SHALL BE PLACED IN HORIZONTAL LAYERS NOT EXCEEDING 250 MM OR 150 MM IN UNCOMPACTED THICKNESS FOR HEAVY OR LIGHTWEIGHT COMPACTION EQUIPMENT RESPECTIVELY. ONLY LIGHTWEIGHT EQUIPMENT SHALL BE ALLOWED WITHIN 1 METER OF THE BACK FACE OF THE MSE STRUCTURE.

5.5.2 BACKFILL SHALL BE PLACED FROM THE BACK OF THE MSE STRUCTURE FACING (WWF UNIT) TOWARDS THE ENDS OF THE GEOGRID TO PROMOTE PROPER TENSIONING.

5.5.3 BACKFILL SHALL BE PLACED AT A MOISTURE CONTENT NO GREATER THAN TWO PERCENT WET AND NO LESS THAN TWO PERCENT DRY OF OPTIMUM MOISTURE CONTENT AND COMPACTED TO A MINIMUM OF 95% OF MAXIMUM STANDARD PROCTOR DRY DENSITY AS DETERMINED IN ACCORDANCE WITH AASHTO T-99 OR AS SPECIFIED BY PROJECT SPECIFICATIONS.

5.5.4 AT THE END OF EACH WORKDAY, BACKFILL SURFACE SHALL BE GRADED AWAY FROM THE WALL FACE. THE BACKFILL SURFACE SHALL BE COMPACTED WITH A SMOOTH DRUM ROLLER TO MINIMIZE PONDING OF WATER AND SATURATION OF THE BACKFILL. A TEMPORARY SOIL BERM SHALL BE CONSTRUCTED NEAR THE CREST OF THE MSE STRUCTURE TO PREVENT SURFACE WATER RUNOFF FROM OVERTOPPING THE MSE STRUCTURE.

6.0 SPECIAL PROVISIONS

6.1 THE DESIGN PRESENTED HEREIN IS ONLY VALID FOR THE PERMANENT WWF RETAINING WALL SYSTEM FOR THE EAGLE GOLD PROJECT. THE DESIGN IS BASED ON SOIL PARAMETERS, FOUNDATION CONDITIONS, GROUNDWATER CONDITIONS, AND LOADINGS STATED IN SECTION 4.0. TIC ASSUMES NO LIABILITY FOR INTERPRETATION OR VERIFICATION OF SUBSURFACE CONDITIONS, FOR SUITABILITY OF SOIL DESIGN PARAMETERS OR FOR INTERPRETATION OF SUBSURFACE GROUNDWATER CONDITIONS. THE CLIENT IS RESPONSIBLE TO VERIFY THAT ACTUAL SITE CONDITIONS, PARAMETERS, AND STRUCTURE GEOMETRIES ARE AS DESCRIBED HEREIN PRIOR TO AND DURING CONSTRUCTION. PROCEEDING WITH CONSTRUCTION WITHOUT FIRST VERIFYING CONDITIONS AND PARAMETERS DISCUSSED ABOVE SHALL ABSOLVE TIC FROM ALL LIABILITY FOR THE DESIGN AND CONSTRUCTION OF THIS STRUCTURE AND THE CONTRACTOR SHALL INDEMNIFY AND HOLD HARMLESS TIC FROM ALL RESULTING CLAIMS, DAMAGES, LOSSES AND EXPENSES.

6.2 THE CLIENT IS RESPONSIBLE FOR PROVIDING QUALITY ASSURANCE AND QUALITY CONTROL PROGRAMS THAT ENSURE CONSTRUCTION OF THE MSE STRUCTURE IS PERFORMED IN ACCORDANCE WITH THE TIC NOTES AND DRAWINGS, AND THE OWNER'S CONTRACT PLANS AND SPECIFICATIONS.

6.3 THE CLIENT SHALL IMMEDIATELY REPORT ANY CHANGES TO TIC (770-344-2090) PRIOR TO PROCEEDING WITH CONSTRUCTION. THE CLIENT SHALL IMMEDIATELY REPORT TO TIC THE DISCOVERY OF ANY ROCK FORMATIONS AND/OR GROUNDWATER DURING CONSTRUCTION.

6.4 TIC IS NOT RESPONSIBLE FOR HAVING PERSONNEL ON-SITE UNLESS SPECIFICALLY PROVIDED FOR IN A WRITTEN CONTRACT SIGNED BY TIC. ANY TIC REPRESENTATIVE ON SITE DOES NOT HAVE THE AUTHORITY TO STOP OR START CONSTRUCTION OF THE MSE STRUCTURE OR ANY OTHER WORK.

7.0 REFERENCE DOCUMENTS

7.1 THE DESIGN CALCULATIONS PREPARED BY TIC ARE SUBMITTED UNDERS A SEPARATE COVER AND HAVE BEEN DATED JULY 31, 2018.

7.2 THE FOLLOWING DOCUMENTS WERE USED TO PREPARE THE SHOP DRAWINGS AND CALCULATIONS.

7.2.1 SECONDARY AND TERTIARY CRUSHING TERTIARY STOCKPILE RETAINIANG WALL SECTIONS - SHEET 1 AND SHEET 2, DATED JULY 9, 2018, PREPARED BY HATCH.

7.2.2 EMAIL COMMUNICATION BETWEEN TESAR, NILEX AND HATCH DATED JUNE 6, 2018 THROUGH JULY 10, 2018.

RESPONSE

☐ Approved ☐ Approved as noted ☐ Rejected as noted

Response:

1. a. Accepted (bottom thread to top of bottom nuts only)
   b. Accepted (tack weld bottom nut to bolt only)

2. Correct, all equipment anchors shown and specified on the concrete drawings (e.g. supply of Primary, Secondary and Tertiary Crusher bolts in sleeves) to be supplied by the concrete contractor. And the anchor material is ASTM F1554 36ksi as specified on standard drawing H354138-0000-231-294-0002 Note1, unless noted

otherwise on the design drawings.

3. Pipe sleeves for the anchors need to be welded to the lower embed plates as an assembly in both cases.

4. Please use the details given for T1 - 38mm (1-1/2") anchors for the 1-3/4" rod, except the details provided on the design drawing section (projection, embedment etc.)

5. Please use 1" details

June 12, 2018

Attention:

Reference: RFI #7 – Eagle Gold Project

Dear Mr. Goldschmidt,

RFI #7- Anchor Bolt Details

Project: Eagle Gold Project

The following information is requested by anchor bolt supplier/drafter:

1. Fabricator requests to modify anchor bolt Detail 11/H354138-0000-231-294-0002 as follows for expedited fabrication:
    a. Bottom thread to top of bottom nuts only
    b. Tack weld bottom nut to bolt only

2. Clark Builders has anticipated that all equipment anchor supply is within anchor bolt supply scope, please confirm (e.g. supply of primary/secondary crusher base bolts in DN pipe sleeves). CB has assumed standard anchor rod material per H354138-0000-231-294-0002 note 1 (UNO).

3. M72 anchor rod detail (Drawing H354138-3320-231-260-0014 Rev 0 detail 7) shows pipe sleeve welded to lower plate as an assembly, but H354138-31000-231-260-0010/Detail 16 (equipment bolts, gyratory crusher) does not. Please confirm that lower embed plate on H354138-31000-231-260-0010/Detail 16 is **not** welded to DN65XS pipe sleeve.

4. For drawing H354138-3100-231-260-0014 Rev 0 Section U, please provide bolt type and details for 16-Ø1 ¾" bolts. The chart on H354138-0000-231-294-0002 Rev 0 only goes up to Ø1 ½".

5. For Drawing H354138-5710-231-260-0012 Rev 0, please provide details for 88-Ø7/8" bolts. Bolt table has ¾" and 1". Use 1" details?

END OF RFI #7

Sincerely,

CLARK BUILDERS

Question from Ryan de Milliano (Clark Builders - Edmonton) at 03:16 PM on 11/07/2018

Please specify the required material grade for all embedded steel.

Our supplier has noted that abrasion resistant steel is typically used in harsh conditions to extend the service life of steel exposed to rocks, chains and equipment. If abrasion resistant steel is required onsite, please specify the specific grade of the steel required as well as all locations needed.

If these is no requirement for abrasion resistant material, please confirm that all steel will be grade 300W.

!This is a high priority RFI since the abrasion resistant steel may be required to be ordered in by our fabricator.

Awaiting an Official Response

All Replies:

No need for abrasion resistant steel. All the embedded plates shown on the concrete drawings to be grade 300W.

Dear Mr. Goldschmidt,

RFI #15- Lagstud Reinforcing Tack Welding REV1

Project: Eagle Gold Project

Clark Builders is requesting permission to tack weld lagstud form ties to top reinforcing steel @ 4' OC, for pad footings on the ADR and secondary/tertiary crushing building footing. Method would be used on ADR footing line A/6-9, GLE/4-11, and for secondary/tertiary crushing building footings.

END OF RFI #15R1

Sincerely,

CLARK BUILDERS

HATCH RESPONSE:

Request for tack welding the lag stud form ties to the footing rebars in ADR and Secondary Tertiary Crushing Building is approved.

Question from Ryan de Milliano (Clark Builders - Edmonton) at 04:08 PM on 25/07/2018

The supplier of the shear pins onsite has requested a change to the diameter of the shear pins as shown on drawing H354138-3100-231-260-0005 Rev 01 (attached).

The reason for the change is that it will be easier to source 38mm round bar vs the 35mm required by the IFC drawings.

Attachments:
H354138-3100-231-260-0005_1_V4.PDF

Awaiting an Official Response

All Replies:

Request approved. Please provide 38mm shear pins instead of 35mm at the location shown on the attached dwg.

Question from Jackson Wenger (Clark Builders - Edmonton) at 09:27 AM on 06/08/2018

Clark Builders requests that the secondary crushing mat foundation be broken into 2 pours (requests similar to RFI 27). One pour lift from U/S of Footing to 1019.000, left rough, water bond; second pour to 1019.500 (mat complete). Drawing snapshot attached for reference.

Question from Ryan de Milliano (Clark Builders - Edmonton) at 10:45 AM on 13/08/2018

Hook detail shown on attached drawing markup, from drawing H354138-3100-231-260-0006 Rev 1, shows 1300mm hooks going up into WB1 wall beam and down at the other end. Both ends of the noted hooks are required to be pointing up for installation. Please confirm this is an acceptable change.

RFI #49- P2 Pedestal Anchor Embedment at Secondary Mat

Project: Eagle Gold Project

For P2 pedestals between gridlines A.3-B.2/2.3-4/7, the mat foundation was not bulk-headed to allow for the additionally required 50 mm of anchor bolt projection (850 embedment required).

Clark Builders suggests the following, in order of best schedule option:

1. Decreased embedment to 800 mm on P2 pedestals at this location, cast anchors and rethread the anchor top afterwards
2. Decreased embedment to 800, rethread anchors prior to concrete pour
3. Remove pedestal reinforcing and chip concrete to allow for 850 anchor embedment. *Please note that the specified additional embedment from chipping will not embed the bottom anchor plate washer, see below.

Question from Jackson Wenger (Clark Builders - Edmonton) at 06:59 PM on 01/09/2018

Reinforcing installer has requested permission to cut 15m stirrups adjacent to opening in Primary Crusher suspended slab (elevation 1045.300) so that mat reinforcing for suspended slab can be pre-fabricated in sections, laid flat on form decks, then mated by capping the cut stirrups w/ u-bars. Marked up vendor shop and reference detail from design drawing are attached. Please advise if acceptable.

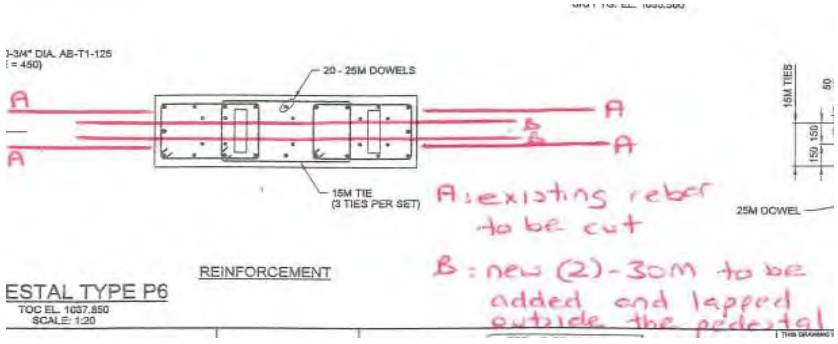
Question from Ryan de Milliano (Clark Builders - Edmonton) at 10:53 PM on 22/08/2018

Anchor Bolts detailed on drawing for pedestals type 6 near center line of crusher will be installed at a future date. A blockout has been created for each type pedestal.

Please confirm this is acceptable.



Attachments:
file-1.jpeg file1.png

Awaiting an Official Response

All Replies:

In general pouring pedestals together with mat is preferable, but if there are schedule restrictions in this case, the request for pouring these two pedestals after the mat is accepted.

Referring to the photo attached, the anchor bolts will likely be clashing with the lap splice inside the pedestal. It is suggested to move these splices out of the pedestal before the mat pour, by cutting the 4 horizontal bars inside the pedestal and adding 2 new bars creating the lap splices outside the pedestal as shown on the sketch below

Question from Ryan de Milliano (Clark Builders - Edmonton) at 12:22 PM on 23/08/2018

Z bars shipped to site have not been modified as per RFI 33 (Hook Detail Change on the Primary Crusher) with both hooks pointing up. The bars shipped to site are Z bars. Reinforcing installers are requesting that Z bars be cut, spliced and staggered onsite. If acceptable, provide detail for the location of cuts acceptable for modification. If not acceptable, respond as soon as possible so that we can re-order the steel as soon as possible.

Attachments:

Question from Jackson Wenger (Clark Builders - Edmonton) at 04:31 PM on 02/09/2018

For pedestals at top of secondary crusher mat foundation, it will difficult to use traditional forming for close-proximity pedestals once the first set has been poured. Clark Builders is requesting permission to form the subsequent pedestals tight to face of the previously cast set, with expansion board between. See attached sketch for details.

Question from Jackson Wenger (Clark Builders - Edmonton) at 08:31 AM on 19/09/2018

Reinforcing installer would like to replace the request made in RFI 51 for L-Bar installation at corner zone steel on primary walls, to instead cut inside face (only) of 30M horizontal reinforcing (instead of both inside and outside) horizontal, with standard lapped 30M straight bar ties to the cut horizontals once the cage is set in place. Please see attached markup for reference.

Question from Jackson Wenger (Clark Builders - Edmonton) at 06:27 PM on 16/09/2018

U-bars for reinforcing at WB1 at Primary Crushing Slab at 1045.300 have been fabricated to incorrect dimensions, and reinforcing installer has requested permission to install lapped 15M L bars as an alternative, from available site steel (instead of field bending).

Please see attached sketch for the requested L-bar dimensions vs. original u-bar dimensions.

Question from Ryan de Milliano (Clark Builders - Edmonton) at 05:23 PM on 18/09/2018

Reinforcing detail at El. 1052.500 suspended slab has hooks pointing down at both locations and top of wall at west side. Based on our proposed pour break at u/s of slab we would like to propose the below solutions for each side:

1. Turn hooks up at continuous wall (similar to RFI 47)

2. Cast in hooked dowels into wall pour (TOC Elev. 1052.100) and lap suspended slab mat reinforcing onto the projecting hooked dowels for beam/suspended slab pour.

Question from Ryan de Milliano (Clark Builders - Edmonton) at 03:51 PM on 30/09/2018

Please confirm it would be acceptable to modify stirrups for suspended slab at elevation 1057.300 as follows:

1. All stirrups for in slab beams (B8, B7, WB3) changed from single closed stirrups to U-Stirrups capped with U-bars lapped on after beam/slab reinforcing installed.

2. At opening, where a 20M U-bar is required; confirm it would be acceptable to replace U-bars with 2 overlapping L-bars.

Question from Ryan de Milliano (Clark Builders - Edmonton) at 08:39 PM on 30/09/2018

Due to the difficulty and long duration of pouring large lifts of wall sections, please confirm it would be acceptable to pour the final wall sections into two pours (see attached) from EL. 1057.200 to 1060.200 then from 1060.200 to 1063.300/1065.650.

A small wood strip at the pour break can be installed to improve appearance. We recommend a 1 1/2" x 1/2" strip covering the entire joint.

Question from Jackson Wenger (Clark Builders - Edmonton) at 03:09 PM on 12/10/2018

Review of shop drawing 1-K indicates that phase 4 wall vertical reinforcing is to be installed full length, to u/s of slab elevation. In previous submittal, reinforcing shop drawings showed proposed slab dowels as part of level 3 elevated slab (1056.300 to 1057.300), so that final wall verticals could be set on the dowels, where the overhang begins. Please confirm that wall dowels can be included as part of 1057.300 slab installation. Installation of vertical wall steel from 1056.300 to 1063+ would require full height wall verticals to be cast in to the 1057.300 slab pour. Markups are attached for clarity.

Question from Jackson Wenger (Clark Builders - Edmonton) at 06:28 PM on 07/10/2018

Clark Builders is requesting permission to provide a vertical pour break in 3320 suspended slab, along the north edge of slab beam B4 at gridline 4. Clark builders will provide (2)- 3" horizontal shear keys at requested construction joint if approved. Please see attached markup for requested location of the construction joint.

Attachments:
D3438D5B-BFAE-4C10-BADD-740C1D46B68B-7066-00000FAFD8AF000C_image.jpg

Awaiting an Official Response

All Replies:

Request is rejected.

The suspended slab in 3320 area, supporting 4 cone crushers, will have very high shear forces due to the dynamic loading and needs to be poured monolithically.

Question from Jackson Wenger (Clark Builders - Edmonton) at 02:15 PM on 09/10/2018

Clark Builders is requesting clarification regarding the termination of B3 beams at elevation 1052.500 slab: Drawings show B3 beams running east-west, terminating at face of wall, and wall has been constructed to U/S of slab height, without block-outs for B3 beam reinforcing. Reinforcing has been detailed/provided to site to allow for the B3 beams to run the entire width of the crusher, to terminate at exterior face of wall, and is inquiring whether this is the actual structural intent. If full length B3 beams, integrated into the east and west wall reinforcing is the intent, please confirm if Clark Builders is to cut and chip wall concrete to allow for beam pockets as part of the 1052.500 elevated slab pour. Please see attached markup for details.

Attachments:
238163A7-D05F-4355-944C-79D0C07A5CF7-7246-0000107950FF9C26_image.jpg

Awaiting an Official Response

All Replies:

B3 beam rebars definitely need to be extended to the exterior face of the walls. Please cut and chip the wall concrete to create the beam pockets as required.

This correction is very critical as these beams are supporting the Gyratory Crusher.

Question from Jackson Wenger (Clark Builders - Edmonton) at 07:24 PM on 13/10/2018

During installation of beam pockets per RFI 90, (4) 30M horizontal wall reinforcing bars were scored approximately 40%, and (1) 30M horizontal was scored approximately 25% by the concrete cutting saw. 15m vertical stirrups have also been removed at beam pocket locations to allow for B3 beam reinforcing to be installed. Clark Builders is requesting review of the attached photos, and confirmation that additional remediation does not need to take place.

Awaiting an Official Response

All Replies:

Additional remediation for the scored horizontal bars are not needed.

Referring to the attached sketch provided by Clark on Oct 14:

- Please add the additional 30M bars with hooks lapping 2m with the B3 bottom horizontals as shown on the sketch
- Please do not add any additional horizontal wall bars next to the scored wall bars which will make this area too congested and will not leave enough space for the concrete needed around the B3 horizontals

Question from Ryan de Milliano (Clark Builders - Edmonton) at 07:56 AM on 18/10/2018

URGENT (We would like to pour today)

Hat bars that have arrived onsite, for the 1052.750 motor pad, cannot be placed into the suspended slab to allow for required projection out of the slab to get the right cover when pouring the motor pad.

Below are the two options we propose to correct this:

1. Drill and Epoxy later and cap with Ubars.
2. Cast into place L-bars with slab pour, cap with Ubars for motor pad pour.

Question from Ryan de Milliano (Clark Builders - Edmonton) at 03:22 PM on 29/10/2018

Please confirm it will be acceptable to change the reinforcing detail of the interior faces of the walls, starting at elev. 1057.300, on the east and west side to allow horizontals to be trimmed at the edge of the corner stirrup and a 4000mm 30M lap bar be added to connect to the end of wall. Horizontal reinforcing will be cut 1800mm from edge of wall, outside the corner stirrups)

Our reinforcing installer has requested this so that wall steel can be flown in quicker and safely.

See attached sketch for additional details.

Question from Ryan de Milliano (Clark Builders - Edmonton) at 09:16 AM on 30/10/2018

The detail shown in the shop drawings for McNish shows that the hook goes inside the wall reinforcing on the inside mat of reinforcing. The IFC detail 'V', shows the hook wrapping to include the wall reinforcing.

Please confirm the shop drawing detail is acceptable.

Question from Jackson Wenger (Clark Builders - Edmonton) at 06:13 PM on 05/11/2018

Clark Builders is requesting that the 3330-TRX foundation serving the secondary/tertiary crushing building be moved 600mm east, due to site conditions. Current design layout will require rework of the existing secondary pad area/construction access roads.

Awaiting an Official Response

All Replies:

Sec/Ter Crushing Area Transformer Foundation is moved by 400mm to East. Please see attached civil dwg showing the revised work point.

It could not be moved 600mm because of the cable tray bending radius requirements between the Transformer Yard and the Electrical Room.

Question from Jackson Wenger (Clark Builders - Edmonton) at 02:29 PM on 16/11/2018

Please confirm that the 1200 thick elevated slab for the tertiary ore stockpile reclaim tunnel can be poured in two lifts, of approximately 600mm depth each (similar to pour plan for 3320 secondary/tertiary crushing suspended slab). Plan is to pour on two consequent days, but pour days are adjacent to a shift change— if the second pour could acceptably be completed with 48 hours instead of 24 hours after the first pour it would be beneficial to have as an option.

Awaiting an Official Response

All Replies:

Request is accepted

It is preferable to have the second pour within 24 hrs, but if it can not be done due to any reason, it is acceptable to have the second pour within 48 hrs.

Question from Ryan de Milliano (Clark Builders - Edmonton) at 12:03 PM on 18/11/2018

Clark requires to modify stirrup location or modify bolts to fit designed anchor bolts into place. Please confirm on of the following solutions: 1. Remove stirrups from top of Pedestals to allow anchor bolts to fit. Since each stirrup location has a set of stirrups, we could remove one of the two which could allow room to fit in anchor bolts and most likely need to bend out the remaining stirrups. 2. Bent stirrups to allow bolts to go through. If both stirrups are left in place we would likely need to trim the washer of bolts.

Attachments:
1542567723688.807861_tempImage.jpeg

Awaiting an Official Response

All Replies:

Please modify the stirrups at the top 3 level by keeping the square one and removing one of the rectangular stirrups as required.

Question from Ryan de Milliano (Clark Builders - Edmonton) at 09:47 AM on 07/12/2018

Clark Builders is unable to access, form and place the west ramp detailed, in the IFC drawing H354138-3100-231-260-0002 Rev4, since Structural Steel staging and erection is being done in the area. The backfill has also been placed too high, roughly 8".

Please confirm it is acceptable to remove this ramp from Clark Builders scope of work.

Clark Builders is able to precast the 2 stair pads detailed on same drawing if requested, so others can place at later date.

Question from Ryan de Milliano (Clark Builders - Edmonton) at 07:04 PM on 07/12/2018

The reinforcing installer has noted that the congestion, at the projecting dowels location for each anchor bolt zone, will not allow for typical stirrups detailed to be installed. Please confirm it would be acceptable to remove the bottom 4 stirrups at the 8 locations where dowel congestion does not allow stirrup installation.

Question from Ryan de Milliano (Clark Builders - Edmonton) at 07:31 PM on 08/12/2018

At the 4 locations of P9 Pedestals, on the CWT on CV-019, the anchor bolts conflict with the diamond stirrups show in pedestal detail. Below are the proposed solutions: 1. Remove the diamond stirrups as required. 2. Turn the diamond stirrups to allow anchorbolts to be installed. This will require some field bending to make work. 3. If 2 does not work and 1 not allowed, we could customize 2 ubars to fit into place.

Question from Ryan de Milliano (Clark Builders - Edmonton) at 07:46 PM on 08/12/2018

During the final wall pour some locations on the strip embed plates shifted. Please confirm it would be acceptable to weld on a wedge to create a flush surface again at the noted locations in the attached sketches. The shifts range from 1/2" to 1".

Question from Ryan de Milliano (Clark Builders - Edmonton) at 03:29 PM on 10/12/2018

Please confirm it will be acceptable to cold bend anchor bolts in order to fit within the congested Pedestals. The reason for this field bending of anchor bolts is that during the slab pour, the pedestal dowels at some locations shifted down the slope.

HEAVY NORTH

Secondary & Tertiary MSE Wall

Assembly Sequence Proposal

Sept. 1, 2018

As per yesterday & todays discussions please see the proposed sequence of steps to construct the Secondary & Tertiary MSE Wall. The following has been generated to set a standard build practice to effectively construct the wall as per design & esthetic requirements; given the conditions encountered on site during early construction of the wall.

Step 1:

- Place baskets with the face at the surveyed string line.
- Overlap baskets one square (100mm).
- *Optional: May wire or zap strap the baskets together.*
- For WWF basket installed at the end of the layer that will be exposed - follow details of WWF Outside Corner Unit (600mm minimum length on each side of bend)

Step 2:

- Roll out biaxial BX112060 Parallel to face of wall. Overlap with the next roll by 100mm.
- Measure 1.5m from edge of BX112060. Kink the BX at the 1.5m measurement as this will nestle into the bottom corner of the baskets.
- *Optional: May tie the BX grid to the basket for security.*
- Drape the remainder of the 2.5m width of BX over the top of the basket so it is out of the way for now.

Step 3:

- Cut appropriate length of the proper TPG uni-axial geogrid to be put in the location as indicated on the drawing elevation views – **ensure minimum embedment length installation as per design**.
- Place 1 end of the TPG geogrid into the bottom corner of the basket overtop the BX and butting up to the tight vertical component of the BX. Extend to rear of reinforced area with no slack to the required embedment length.
  Note: At this stage a small amount of extra TPG grid extended at the face may help to ensure that when backfilling reinforced fill, the grid doesn't pull away from the face.
- *Optional: May tie the TPG grid to the basket for security.*
- Repeat with no overlap of TPG geogrid, butting the pieces next to each other.

Step 4:

- Attach struts, every 250mm (~2 squares), carefully placed in between the geogrid openings.
- Use *as needed* to prevent deformation of the wall during construction.

Step 5:

- **Place & compact reinforced backfill (4" minus) first**, ensuring no slack in the geogrid during backfill operation.
- Backfill & compact up to the face fill area (435mm from wall face) and place precut geotextile underneath the reinforced fill - as shown in the details of the drawings.
  Note: at this stage it is imperative to ensure that the WWF baskets are aligned as per design elevation and setback. Ensure that no movement has occurred & the WWFs are secured prior to backfilling of the face rock.
- Pull geotextile back to expose the remaining fill area and begin to backfill the remaining face

of the wall (u-shape) with 4"-2" face fill. Bring the face fill material near the top of the basket stopping just below the top of the WWF, ensuring complete coverage of the metal strut (approximately 100mm from the top of basket)

- Face fill to be placed carefully using the 305-314 (mini) excavator ensuring the WWF baskets remain in position during operation.
- Ensure geotextile separation extends a minimum 150mm underneath the reinforced fill & pull over the face fill to prevent migration of the 20mm levelling material to be placed on top.
- 20mm drain rock material levelling course to used achieve a level surface for subsequent WWF basket placement

Step 6:

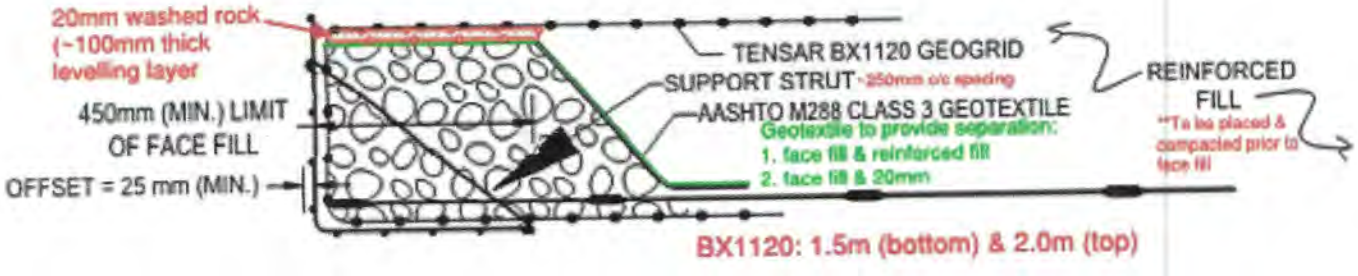
- A 100lb-200lb plate tamper to be used to compact the 4"-2" face fill & 20mm levelling material to ensure compaction, flat surface, & prevent future bulging of lower layers.

Step 7:

- Pull the 2.0m biaxial geogrid over the 20mm material and backfill ensuring the geogrid remains taut.
- Fill and compact reinforced fill to top of basket elevation meeting compaction requirements.
- Maintain 75mm of fill between the BX upper length (2.0m) of the lower basket and the lower BX length (1.5m) of the upper basket.

Step 8:

- Set back baskets 25mm (min) as you progress with each layer. Monitor this setback frequently and ensure compaction does not affect the facing setback. As compaction occurs, the basket w/ rock face may be pushed forward during construction.
- Ensure 20:1 slope maintained during construction of the MSE Wall.



Repeat Steps 1 - 8.

Owner Acknowledgement:

I _____ of _____ have read and agree to the construction steps above as best practice given the conditions encountered during construction of the MSE Wall.

Sincerely,

Aaron Wagner

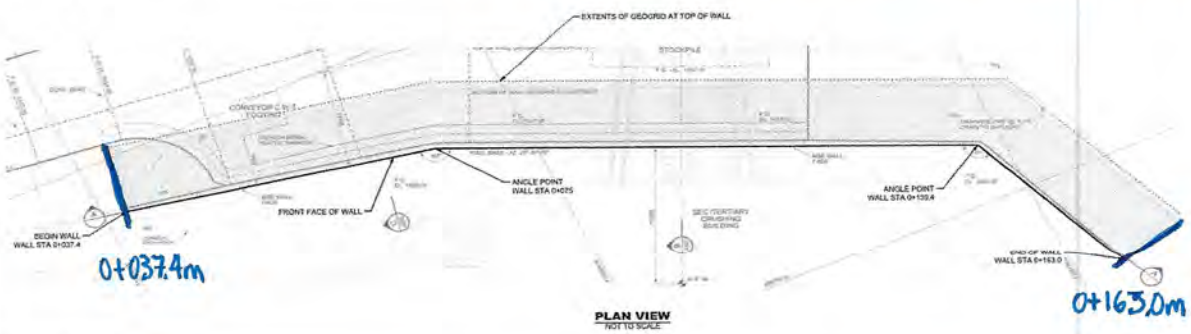
Backfill Inspection



Date: 2018/09/21 **Plant/Area:** Secondary MSE Wall

Location: See area marked below

ITP Line Item Number: 4.1

DESCRIPTION	Compliance N/A	No	Yes
Subgrade			
Subgrade compacted to approved SPMDD & approved by QA/QC Manager?			✓*
Construction			
Ensure backfill area is free of debris, frozen material etc.			✓
Ensure joint seal requirements and/or protection is installed on all structures prior to backfill.	✓		
Ensure only hand operated compaction equipment is used within 1.0m of face structure unless otherwise specified.	✓		
Ensure specified compaction is achieved.			✓
Ensure each layer compacted prior to addition of subsequent layers.	✓		
Backfill approval by QA/QC			✓
Is protection required for frost, moisture, traffic or other?	✓		
Survey and Geometry			
Ensure the completed surface of backfill conforms to the required line, grade, and cross section with a tape measure.			✓
Is an As-built required			✓

Notes and or Comments: * Method specification met for area noted below. AW

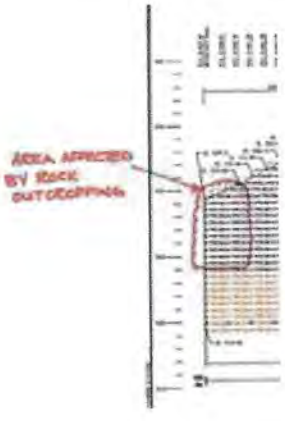
Subject: RE: Victoria Gold MSE Wall - Rock Outcropping Interference
To: Scott Chipman <scott.chipman@nilex.com>
Cc: Gary Sander <GSander@tensarcorp.com>, David Tomlinson <david.tomlinson@nilex.com>



Hi Scott,

Looking forward to meeting you on Monday. I am not going to be available for the weekend, so I am responding to you so I don't get involved in emails coming and going the whole weekend. Thanks.

I had the chance to look at the markups they send and the solution proposed by JDS for the segment requested is acceptable

"Is it possible to reduce/cut the geogrid shorter at this location, keep it horizontal, and have it terminate at the rock face? Effective length would be about 7.5m – 8.0m. As the rock face slopes back at higher elevations, the lengths above would be able to be installed as per design." TIC RS response: Yes, it is acceptable for the segment requested at the end of wall with the effective length proposed not less than 7.5m.

A comment from pictures provided: ensure the side of the wall is backfilled as the top of wall is reached to avoid having a vertical face without reinforcement at the side of the wall.

Regards,

Robert Saenz P. Eng. | Regional Manager Walls & Slopes - Canada

Thanks Scott,

We are able to work on the remainder of the wall, but if Robert could look at it over the weekend, and provide some guidance, it would be great.

I am available via email, or by phone at site.

Good Evening Roman,

Good to hear from you.

The designer, Robert Saenz (the Tensar wall designer that sealed the drawings) is cc'd on this reply.

Not sure if the design will be able to accomodate shorter reinforcement.

Robert will need time to review this.

Not sure if he will get this over the weekend and he is travelling and in airports heading to Whitehorse all day Monday.

He and I are travelling to your site and will be there Tuesday afternoon.

When do you need to know the answer on this earliest/latest?

I'll try calling him tomorrow morning.

Good evening Scott,

I am sending this to you with a request to forward this information to the respective individual who could answer this technical question. (if it is not you) (several member of our site team are not available due to a corporate event)

We have a condition on the Victoria Gold Project where a rock outcropping encroaches into an area of the geogrid panels. The encroachment is fairly significant, but is at the very end of the wall.

I have provided some photos, and some marked up drawings to better reflect the site condition. The rock outcropping leaves about 7.5m – 8.0m of geogrid behind the wall until it encroaches into the rock. The rock affects about 1.5 panels in width, starts at the tenth level up, and would affect up to the twentieth level. (basically the top corner of the wall before it starts to step in) This also the elevation where the geogrid lengths get longer.

In lieu of removing the rock, we are requesting an alternate solution, with Nilex approval.

Is it possible to place the geogrid up the face of the rock, and maintain its designed length?

Is it possible to reduce/cut the geogrid shorter at this location, keep it horizontal, and have it terminate at the rock face? Effective length would be about 7.5m – 8.0m. As the rock face slopes back at higher elevations, the lengths above would be able to be installed as per design.

Can you please review and offer any guidance on a possible solution?

Regards,

Roman Bilobrowka

				80% of 4th lit	

A. SUMMARY OF DAILY WORK — Please ensure to mention as much detail as possible (Time, Area, Activity, Material, etc)

	Time	Area	Notes:
1.0	14:00	Secondary/Tertiary Wall	Observed continuous construction of the wall. Heavy North had completed up to and approximately 80% of the 4th layer of baskets
2.0			and geogrid. The total batter was being observed by the surveyors to maintain precision as the height of the wall increased. Although
3.0			Geogrids were being tensioned appropriately and fill was being placed on top to maintain a tight fit to the BX. The uniaxial was not
4.0			observed to be tensioned today and placed into position but was confirmed by Sam that it was indeed tensioned in a similar fashion and
5.0			reinforced fill placed on top after to lock it into place. The workers are using rakes to pull the geogrid taut, careful not to tear the geogrid.
6.0			There is noticeable inconsistencies with the 25mm setback, but with large rock fill and inconsistent compaction, this is expected. There
7.0			were no noticeable overhanging baskets. As discussed in a previous RFI, mitigation of inconsistent 25mm setbacks include the following:
8.0			1. Ensuring properly tensioned geogrids, that the crew appear to be doing accurately and tightly, up the face and extending away from the
9.0			face. Again,Heavy North workers appeared to be installing the geogrid in this method.
10.0			2. Using a hand tamper on the rock fill, a plate tamper behind the rock fill up to 1m away from the face and large compaction equipment
11.0			further than 1m away from the face & driving parallel to the face of the wall. The workers appeared to be constructing in this fashion.
12.0			3. Heavy North was placing face rock in postion, with baskets in alignment for front face batter. If placing the rock and hand tamping was
13.0			causing baskets at face to move outward, they would use a 2x4 to push the basket backwards into position before fill was placed on the
14.0			uniaxial geogrid. Once alignment was acceptable, fill would begin being placed on the uniaxial geogrid close to the face then towards the tail
15.0			Generally speaking, besides small inconsistencies in the facing setback, construction looks good, geogrids are tight and the construction
			team is diligently working to follow the drawing and design requirements.

B. Foundation Check Approval: YES ☑ NO ☐ (Describe Location/Station and any problems to be brought to attention)

Notes: Tetra Tech was on site monitoring compaction

C. Compaction Testing: YES ☑ NO ☐ (Describe location/station and provide any notes) Compaction Engineer/Tester:

Notes: Per TetraTech compaction was consistently being met.

D. Plan For Tomorrow: (Considering areas available and weather)

Notes: Meet at 6:45am for safety meeting and inspection of night shift work completion.

E. Actions Taken: (Direction given to individuals by Nilex representative)

Notes: Advice was given about using a smaller stone material to help provide a more flat area for placing baskets on the next layer.
Gaps were noticed in the transition between the wrapped face stone and the top of the wedge of the reinforced fill where 4" rock was preventing excellent material coverage with fines along this edge. It was directed that the contractor try to fill in these gaps with finer material, and as much as possible.

E. Attachment of Drawing of Work Done? YES ☐ **NO** ☑

Special Provisions:

On-site assistance will be provided by Nilex at the request of the contractor or as provided in the contract specifications. Nilex is not responsible for having personnel on-site unless specifically provided for in a written contract signed by Nilex. The Nilex representative will not have the authority to stop or start construction of the retaining wall. Nilex is not responsible for foundation, drainage, and backfill/compaction of each station.

A. SUMMARY OF DAILY WORK

Please ensure to mention as much detail as possible (Time, Area, Activity, Material, etc)

	Time	Area	Notes:
1.0	11:00	Secondary/Tertiary Wall	The same concerns brought up yesterday were brought up again today.
2.0			
3.0			Overall, 1:20 batter is being met. There are no overhanging baskets. Suggestions were made yesterday and today to attempt to mitigate
4.0			the movement of the baskets. It was advised to use the geogrid to try to hold the baskets in place while backfilling.
5.0			Suggestions were made to place fill strategically to maintain tight geogrids and mitigate the movement of the baskets at the
6.0			face.
7.0			Elevations are being monitored by surveyors. Overall look of wall appears good. Geogrids are generally quite tight and in position.
8.0			
9.0			There is difficulty with the larger 4" material to fill in all the gaps of the system AND to compact without movment as the 4" is proving
10.0			to move a fair bit during compaction. The contractor suspects this is due to large voids in the material.
11.0			I had advised the individuals to use the geogrid and fill to help lock things in place before compaction. Heavy North looks like they
12.0			are settling into a consistent and effective construction method moving forward. Now all 3 crews are experienced and construction should
13.0			go more smoothly and efficiently.
14.0			
15.0			

B. Foundation Check Approval:

YES ✓ NO (Describe Location/Station and any problems to be brought to attention)

Notes: Tetra Tech was on site monitoring compaction

C. Compaction Testing:

YES ✓ NO (Describe location/station and provide any notes) Compaction Engineer/Tester:

Notes: Per TetraTech compaction was consistently being met.

Nilex Representative	**DATE**	**Client**	**DATE**

Nilex Construction Progress Report

Project Name: Eagle Gold Secondary Crusher Wall **Order No.**

Date: Sept 11, 2018

Weather: Sunny

Time: Arrived site 2:20 pm

Contractor: Heavy North , JDS

Equipment: Dozer, articulating dump trucks, skid steers, packer, walk behind compactor

Labour: Approx 5 to 7 personnel

Work Completed: Working on 14th course

Additional Notes (Meetings / Design / Construction Changes):

Met with Calvin, D'Arcy, Branden, Aaron at JDS office. Introduced Robert to them.

Had a quick discussion in the office about the retained fill spec and compaction. Robert deferred that to needing to talk with Ezra from Hatch, and the Geotech engineer. Whatever they put there has to work with the wall design and not overwhelm the resistive force of the wall. Ezra is looking into it. Tensar will react with a design check once they decide what they are placing there. The wall was designed based on parameters shown in the drawings for unit weight and phi angle of the retained soil.

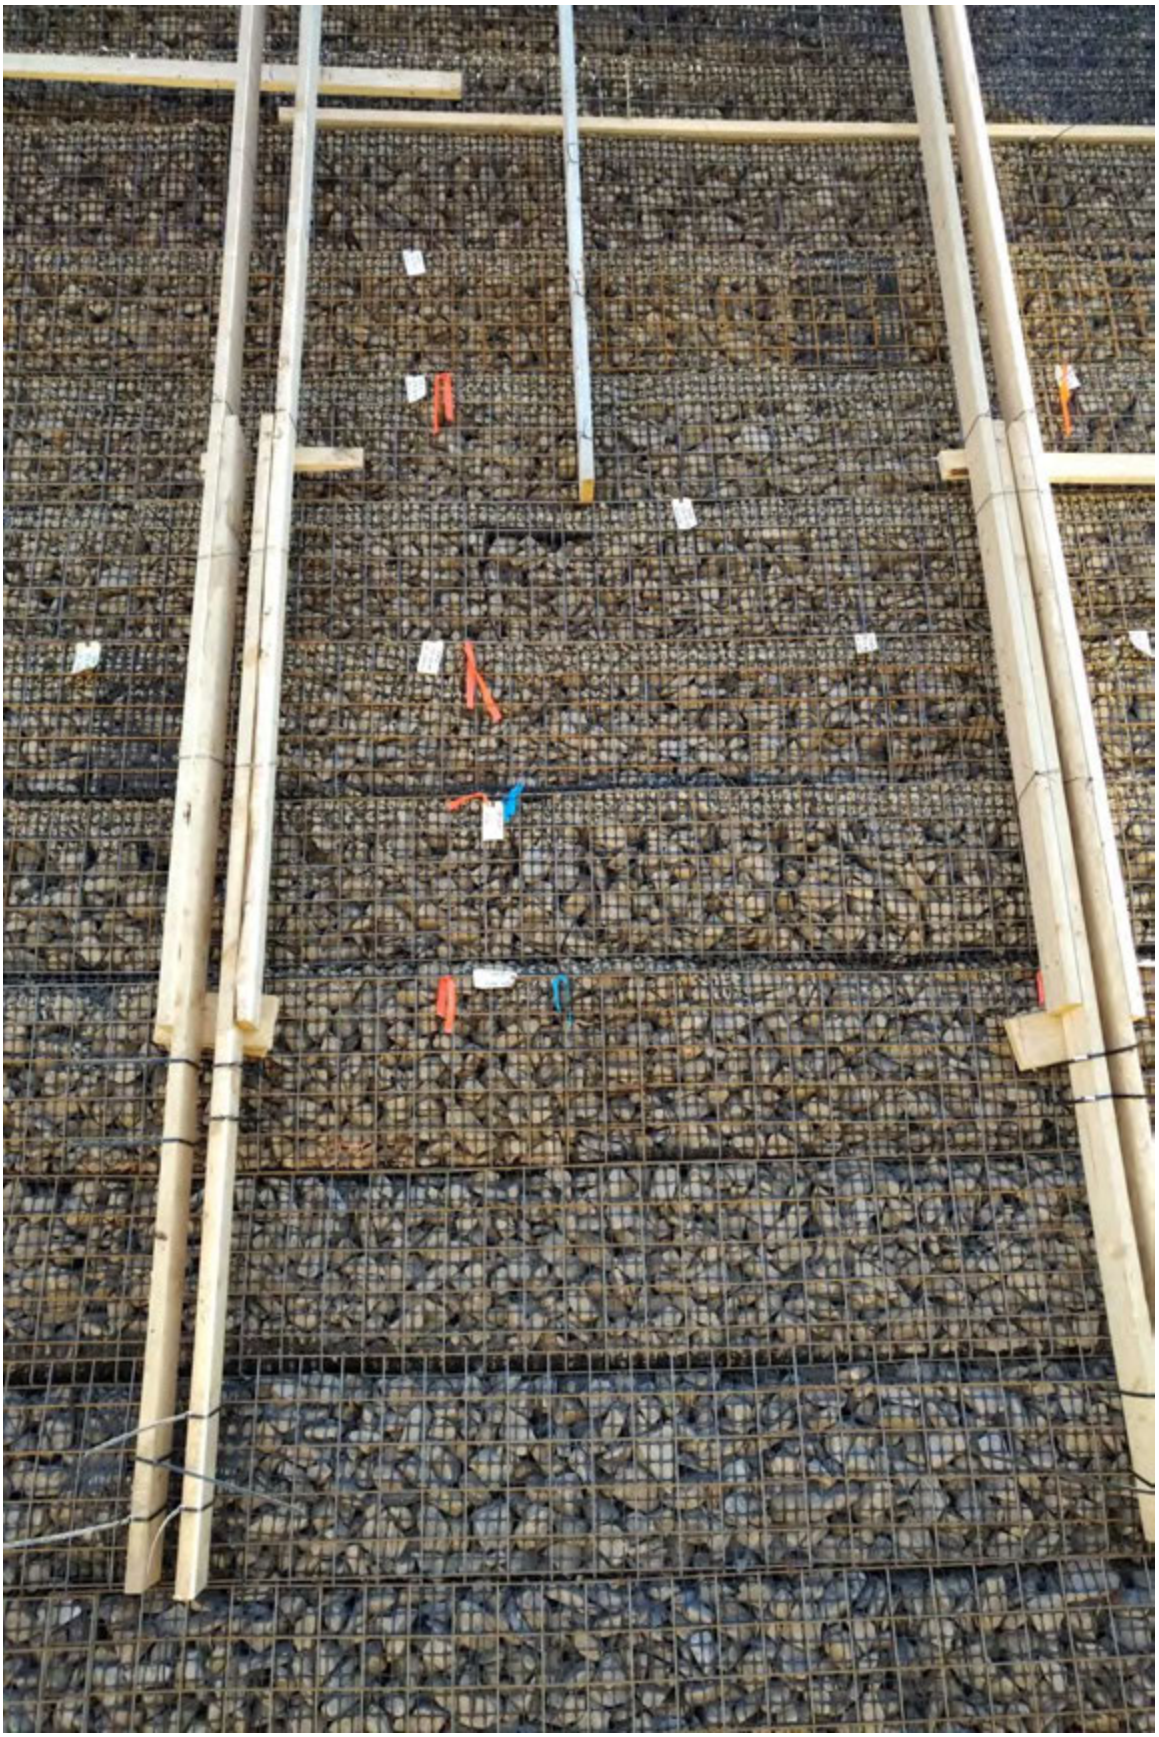
Also quick discussion about shorted grid, and what we are doing to sort that out, including possibly shortening the grid lengths at the ends of the wall.

Headed almost immediately to site with JDPS personnel including Calvin and Aaron and met Heavy North project manager Matt and superintendent, and crew. And walked the wall from left to right.

Right away started answering question from Calvin, Matt, Aaron on appearance of wall and conversations of note:

- Questions about batter and setback at the 12th course that looks to be bout 4 inches. They did this to correct the overall batter. Robert approved of the correction.
- QA and QC advice re: ensuring basket bottom wire set back from course below at least 25mm. Baskets above not to overhang baskets below nor being on top of the top wire of the basket below. Tolerances are on the drawings for setback and variances both vertically and horizontally. Better face control and rock placement technique will help this movement.
- Voids caused by placement of face rock noted here and there. Pointed out these should be avoided.
- Levelling course previously approved is not working out when considering potential long-term settlement deformation. Contractor has gone from approved 50mm to at least 100mm or higher in some places. Relying too heavily on it. Robert and I suggested we need to re-visit the original

installation practices for the face rock to reduce or eliminate the levelling course rock. Robert noted this layer may settle due to failure of the geotextile, or by gravity pressure of the courses above and this can cause the face to distort / bulge.



- Discussion about rock face control. They described their procedure using a skid steer to place using vibration to help drop the rock in place. No labourers with shovels to help guide the rock in place.
- They are using struts at 250m spacing. Robert pointed out this can cause voids because of potentially locking up irregular shaped rocks hanging up on the struts and locking the rock above it. This is due to a smaller aperture as well. We talked about them trying a section using less struts and more finesse, and using labourers with shovels to help place material.
- Went to top of wall, observed progress. Noted distance from face to backfill was 2 to 3m and Robert asked why. They had not finished blading out fill yet. He mentioned the wrinkles in the reinforcement and that they should start placing backfill at about the 1.5m mark from face (at the end of the biaxial grid). This will help alleviate wrinkles and help lock everything up.
- Agreed to them demonstrating their rock placement. Observed bucket was quite high, dropping rocks right at or on the front of the basket. We tried three drops – A) as they were B) with struts at 450mm and C) with struts at 450mm and I showed them how to lower the bucket, and drop rocks on the back of the form first, then move forward to face gently. Takeaway:
  1. They must use a spotter to guide the operator.
  2. They must lower the bucket to almost touching the ground.
  3. Move rocks forward with the help of shovels if necessary and hand pick out large ones that can interfere with horizontal basket placement.
  4. Struts at 450mm will ensure the rocks will settle voids better.
- Discussion about vertical and horizontal alignments and offset limits. We pointed out the limits are in the drawings and Robert shared a brochure highlighting these limits.
- Discussion about correction technique from course to course if there is any horizontal deviation. A little deviation is normal and can be corrected at the next course using rockface material.
- Contractor seems to be on board with the procedures we laid out.
- Left site and went back to JDS office for Robert to go thru a Visitor Safety Orientation
- Robert asked Calvin if he was happy with the wall. He said he is happy Robert said it is structurally sound.
- Calvin wants to eliminate the 2” levelling course. It is expensive, poses a potential risk for settlement, and is an added step.
- Plan for Wednesdy – Meet contractor at site 7 AM, show them rockfill techniques, lunch, then meeting with JDS re: missing grid.
- We would like to look over the roll stock and see what is left.

1.0 MSE WALL CONSTRUCTION SUMMARY

Unit ID	Equipment	Work
-	CAT D6T Dozer	Placing backfill
-	CAT 324 Excavator	Scaling rock wall
-	CAT 730 Rock Truck	Hauling backfill to MSE wall
-	CAT 740B Rock Truck	Hauling backfill to MSE wall
-	CAT 950K Loader	Loading backfill and moving equipment
-	CS55 Smooth Drum Compactor	Compacting backfill at the MSE wall
-	Plate Tamper	Compacting backfill at the MSE wall

2.0 MECHANICALLY STABILIZED EARTH WALL

- Material placement for the first lift of subgrade foundation was completed. Thickness of lift was below or equal to 250 mm, which is within specification.
- First lift of subgrade material compacted using CS55 smooth drum compactor and plate tamper. Four passes observed at sufficient speed and overlap to meet required method specification.
- Material placement for the second lift of subgrade foundation was completed. Thickness of lift was below or equal to 250 mm, which is within specification.
- Second lift of subgrade material compacted using CS55 smooth drum compactor and plate tamper. Four passes observed at sufficient speed and overlap to meet required method specification. A proof roll was conducted which demonstrated minimal deflection in compacted backfill.
- Material placement for the third lift of subgrade foundation was completed. Thickness of lift was below or equal to 250 mm, which is within specification.
- Third lift of subgrade material compacted using CS55 smooth drum compactor and plate tamper. Four passes observed at sufficient speed and overlap to meet required method specification.

3.0 DISCUSSION/OTHER

- During the startup meeting with JDS, Heavy North, and Tetra Tech, sampling frequency for backfill was discussed. A sampling frequency of one sample per 5000 m^3 was decided on, with an RFI to Tensar to ensure this sample frequency is adequate.
- An RFI was sent to Tensar on having less than 8.1 m of width on the north and south end of the wall. To reach the required width the rock wall would have to be undercut, potentially endangering equipment and workers.

1.0 MSE WALL CONSTRUCTION SUMMARY

Unit ID	Equipment	Work (Dayshift)
-	CAT D6T Dozer	Placing backfill
-	CAT 324 Excavator	Scaling rock face
-	CAT 730 Rock Truck	Hauling backfill to MSE wall
-	CAT 740B Rock Truck	Hauling backfill to MSE wall
-	CAT 950K Loader	Loading backfill and moving equipment
-	CS55 Smooth Drum Compactor	Compacting backfill at the MSE wall
-	Plate Tamper	Compacting backfill at the MSE wall

2.0 MECHANICALY STABILIZED EARTH WALL

- Excavator scaled the northeast corner of the wall to try to meet the required 8.1 m width.
- Material placement for the fourth lift of the foundation was completed. Thickness of lift was below or equal to 250 mm, which is within specification. This lift reached the required elevation for the foundation of 1019.4 m.
- Fourth lift of the foundation material was compacted using CS55 smooth drum compactor. Four passes observed at sufficient speed and overlap to meet required method specification. A proof roll was conducted which demonstrated minimal deflection in the compacted foundation, see photo 2.

3.0 DISCUSSION/OTHER

- Confirmation was received from Tensar that a less than 8.1 m width of geogrid on the north and south end of the MSE wall is adequate for construction. Between stations 0+037.4 to 0+044.08 a width of 6.6 m is allowed, between the stations 0+059.9 to 0+080.16 a width of 7.15 m is allowed, and between stations 0+124.17 to 0+163 a width of 5.64 m is allowed.
- Finer material was brought in to help reach the required elevation of 1019.4 m and to ensure level foundation.

1.0 MSE WALL CONSTRUCTION SUMMARY

Unit ID	Equipment	Work (Dayshift)
-	CAT D6T Dozer	Placing backfill
-	CAT 324 Excavator	Placing drain rock
-	CAT 730 Rock Truck	Hauling backfill to MSE wall
-	CAT 740B Rock Truck	Hauling backfill to MSE wall
-	CAT 950K Loader	Loading backfill and moving equipment
-	CS55 Smooth Drum Compactor	Compacting backfill at the MSE wall
-	Plate Tamper	Compacting backfill at the MSE wall

2.0 MECHANICALY STABILIZED EARTH WALL

- Biaxial and uniaxial geogrid, facing units, and support struts were installed for the first and second layers of the first lift for the MSE wall, approximately between stations 0+037 to 0+075. Facing units had 100 mm of overlap, following specification.
- Material placement of reinforced backfill for the first and second layer of the MSE wall started, approximately between stations 0+037 to 0+065. Thickness of each layer was below or equal to 250 mm, which is within specification.
- First and second layer of MSE wall was compacted using CS55 smooth drum compactor. Four passes observed at sufficient speed and overlap to meet required method specification.
- Drain rock was backfilled into the facing units, with geotextile placed on top, approximately between stations 0+037 to 0+065.

3.0 DISCUSSION/OTHER

- Material was not placed along the back wall, a drain will be placed there later using geotextile wrapped pipe.

2.0 MECHANICALY STABILIZED EARTH WALL

- Drain pipe and drain rock wrapped in geotextile was placed along the back wall. Approximately between stations 0+037 to 0+065.
- Biaxial and uniaxial geogrid, facing units, and support struts were installed for lift #2 for the MSE wall, approximately between stations 0+037 to 0+060. Facing units had 100 mm of overlap, following specification.
- Material placement of reinforced backfill for the first layer of lift #2 for the MSE wall started, approximately between stations 0+037 to 0+055.
- Nightshift completed 30 m of lift #1, approximately between stations 0+075 to 0+105. Full installation of geogrid, fill material and facing units.

3.0 DISCUSSION/OTHER

- The importance of taunt biaxial geogrid and ensuring face rock is as flat as possible inside the facing units, was discussed with the operators.

-	CS55 Smooth Drum Compactor	Compacting backfill at the MSE wall
-	Plate Tamper	Compacting backfill at the MSE wall

2.0 MECHANICALY STABILIZED EARTH WALL

- Drain pipe and drain rock wrapped in geotextile was placed along the back wall. Approximately between stations 0+065 to 0+075.
- Biaxial and uniaxial geogrid, facing units, and support struts were installed for lift #2 for the MSE wall, approximately between stations 0+060 to 0+075. Facing units had 100 mm of overlap, following specification.
- Material placement of reinforced face rock for lift #2 was placed, with layer thickness equal or less to 250 mm which is in specification, approximately between stations 0+037 to 0+055.
- Layers were compacted using a smooth drum compactor and plate tamper with four passes observed, to meet method specification.
- Nightshift partially constructed 10 m of lift #2 between stations 0+055 to 0+080 and partially constructed 25 m of lift #1 between stations 0+075 to 0+110.

3.0 DISCUSSION/OTHER

- Ensuring all struts are installed onto the facing units before placing any material on the geogrid was discussed with the operators.

Tetra Tech Canada Inc.
61 Wasson Place
Whitehorse YT, Y1A 0H7 CANADA
Tel 867.668.3068 Fax 867.668.4349

- Placing and compacting material from the face wall to the back wall, to help tension the uniaxial geogrid, was discussed with the operators.

1.0 MSE WALL CONSTRUCTION SUMMARY

Unit ID	Equipment	Work (Dayshift)
-	CAT D6T Dozer	Placing backfill
-	CAT 324 Excavator	Placing drain rock
-	CAT 730 Rock Truck	Hauling backfill to MSE wall
-	CAT 740B Rock Truck	Hauling backfill to MSE wall
-	CAT 950K Loader	Loading backfill and moving equipment
-	CS55 Smooth Drum Compactor	Compacting backfill at the MSE wall
-	Plate Tamper	Compacting backfill at the MSE wall

2.0 MECHANICALY STABILIZED EARTH WALL

- Material placement of reinforced backfill for lift #4 was placed, with layer thickness less than or equal to 250 mm, between stations 0+095 to 0+100.
- Layers were compacted using a smooth drum compactor and plate tamper with four passes, to meet method specification.
- The drain was installed between stations 0+105 to 0+115.
- Nightshift installed facing units, face rock, and geogrid between stations 0+100 to 0+112 and lift #3 was completed to station 0+110.

3.0 DISCUSSION/OTHER

- The dayshift crew finished their rotation today, a new crew will be coming in August 24th, 2018.

1.0 MSE WALL CONSTRUCTION SUMMARY

Unit ID	Equipment	Work (Dayshift)
-	CAT D6T Dozer	Placing backfill
-	CAT 324 Excavator	Placing backfill
-	CAT Skid Steer Loader	Placing backfill
-	CAT 730 Rock Truck	Hauling backfill
-	CAT 740B Rock Truck	Hauling backfill
-	CAT 950K Loader	Loading backfill and moving equipment
-	CS55 Smooth Drum Compactor	Compacting backfill
-	Plate Tamper	Compacting backfill

2.0 MECHANICALY STABILIZED EARTH WALL

- The drain was installed between stations 0+105 to 0+115.
- Nightshift removed the face rock placed as a layer and replaced it with reinforced backfill on lift #4, between stations 0+095 to 0+115 and placed facing units from 0+120 to 0+140 for lift #1.

3.0 DISCUSSION/OTHER

- A startup meeting was conducted for the new crew, with a step by step plan for construction. Then a tour of the site was given showing the different procedures needed to construct the wall.
- Dayshift placed face rock as a layer instead of reinforced fill on lift #4 (see photo 3), which nightshift removed.

1.0 MSE WALL CONSTRUCTION SUMMARY

Unit ID	Equipment	Work (Dayshift)
-	CAT D6T Dozer	Placing backfill
-	CAT 324 Excavator	Placing drain rock
-	CAT 730 Rock Truck	Hauling backfill to MSE wall
-	CAT 740B Rock Truck	Hauling backfill to MSE wall
-	CAT 950K Loader	Loading backfill and moving equipment
-	CS55 Smooth Drum Compactor	Compacting backfill at the MSE wall
-	Plate Tamper	Compacting backfill at the MSE wall

2.0 MECHANICALY STABILIZED EARTH WALL

- The drain was installed between stations 0+115 to 0+155.
- Facing units, uniaxial and biaxial geogrid, support struts, face rock, and geotextile was installed between stations 0+120 to 0+150 for lift #1.
- Nightshift added two layers of backfill and compacted each layer for lift #1 from stations 0+120 to 0+150 and placed facing units from stations 0+120 to 0+150.

3.0 DISCUSSION/OTHER

- Where facing units overlap, a support strut will always be added to the outside facing unit beside the overlap.

-	CS55 Smooth Drum Compactor	Compacting backfill at the MSE wall
-	Plate Tamper	Compacting backfill at the MSE wall

2.0 MECHANICALY STABILIZED EARTH WALL

- Facing units, uniaxial and biaxial geogrid, support struts, face rock, and geotextile was installed between stations 0+120 to 0+150 for lift #2.
- Two layers of backfill was placed for lift #2, layers were below or equal to 250 mm, which is in specification.
- One layer was compacted using a smooth drum compactor with four passes, to meet method specification.

3.0 DISCUSSION/OTHER

- A proof role was conducted on the foundation around station 0+150, with very minor deflection.
- Between stations 0+90 to 0+100 the facing units on lifts #3 are not properly offset, due to bulging on lift #3 and facing units set back too far on lift #4 (see photo 2&3).
- Between stations 0+110 to 0+120 the facing units on lift #3 are not properly offset, with a max offset of 50 mm too far into the wall compared to the design location. A more consistent and accurate procedure will need to be used to place facing units in the required locations.
- At station 0+095 a dent was found in a facing unit on lift #3 (see photo 4). It was discussed with Sam Elson that care should be taken when pushing against the facing units when correcting placement.

2.0 MECHANICALY STABILIZED EARTH WALL

- Uniaxial and biaxial geogrid, support struts, face rock, and geotextile was installed between stations 0+120 to 0+160 for lift #3.
- Two layers of backfill was placed for lift #3, between stations 0+120 to 0+140, layers were below or equal to 250 mm, which is within specification.
- One layer was compacted using a smooth drum compactor with four passes, to meet method specification.
- Night shift completed lift #3 from stations 0+140 to 0+160

3.0 DISCUSSION/OTHER

- Increased fines have been noticed in the face rock, a different stockpile will be used with less fines in the rock.
- Nightshift covered the drain with backfill around station 0+160.

-	CS55 Smooth Drum Compactor	Compacting backfill at the MSE wall
-	Plate Tamper	Compacting backfill at the MSE wall

2.0 MECHANICALY STABILIZED EARTH WALL

- Facing units and biaxial geogrid were installed between stations 0+037 to 0+120, for lift #5.
- Support struts and uniaxial geogrid were installed between stations 0+037 to 0+095, for lift #5.
- One layer of backfill was placed for lift #5, between stations 0+037 to 0+75, the layer was below or equal to 250 mm, which is within specification.
- Face rock was placed between stations 0+037 to 0+060, for lift #5.
- Night shift completed lift #5 from stations 0+040 to 0+120.

3.0 DISCUSSION/OTHER

- The support struts on site are longer than stated in the design. The support struts on site have a length of 660 mm and the design calls for a length of 610 mm.
- There is some concern that the support struts could come loose on the bottom of the facing units and not be noticed before face rock is filled. Caution should be used when placing face rock to ensure that all support struts are connected to the facing unit.

Tetra Tech Canada Inc.
61 Wasson Place
Whitehorse YT, Y1A 0H7 CANADA
Tel 867.668.3068 Fax 867.668.4349

- During nightshift, no geotextile was placed between the face rock and reinforced backfill between stations 0+100 to 0+130 (see photo 5).
- Facing unit alignment for lift #5 is not following design specifications between stations 0+080 to 0+130, with large variations in placement (see photos 6&7).
- Uniaxial geogrid was found to be folded over itself at the toe of the slope, around station 0+130 (see photo 8).

2.0 MECHANICALY STABILIZED EARTH WALL

- Nightshift installed geotextile, face rock, support struts, and reinforced fill material from stations 0+040 to 0+100 for lift #8.
- WWF baskets were installed between stations 0+140 to 0+160 for lift #8.
- Support struts and face rock material were installed between stations 0+100 to 0+140 for lift #8.
- 20 mm drain rock material was placed on top of the geotextile, compacted, and backfilled from stations 0+040 to 0+090 for lift #8.
- Layers were compacted using a smooth drum compactor and plate tamper with four passes, to meet method specification.

-	Plate Tamper	Compacting backfill at the MSE wall

2.0 MECHANICALY STABILIZED EARTH WALL

- Nightshift completed lift #8 and prepared the following materials for lift #9: WWF Baskets, biaxial geogrids, and TPG 130 uniaxial geogrids were installed from stations 0+040 to 0+140. Support struts, geotextile, face rock, and first layer of reinforced material was placed between stations 0+040 to 0+090. Second layer of reinforced backfill was placed between stations 0+040 to 0+090.
- Dayshift prepared the following materials for lift #9: Support struts, geotextile, face rock, and first layer of reinforced material was placed between stations 0+090 to 0+120. Drain rock material was placed and compacted between stations 0+040 to 0+110. Second layer of reinforced backfill was placed between stations 0+040 to 0+110, and compacted between stations 0+040 to 0+070.
- Access ramps to the MSE pad was built up by the loader.
- Layers were compacted using a smooth drum compactor and plate tamper with four passes, to meet method specification.

Tel 867.668.3068 Fax 867.668.4349

3.0 DISCUSSION/OTHER

- Nightshift did not install the TPG 130 uniaxial geogrid to cover the gap at the corner of station 0+140. This was notified by Heavy North's lead hand. The backfill material was removed using an excavator to expose the adjacent TPG 130 uniaxial geogrid, then the corner piece was installed and backfilled.
- It was noticed that outside WWF basket at station 0+160 for lift #8 was not level. This was completed by nightshift.

-	Plate Tamper	Compacting backfill at the MSE wall

2.0 MECHANICALY STABILIZED EARTH WALL

- Nightshift prepared the following materials for lift #10:
    - WWF Baskets, biaxial geogrids, and TPG 100 uniaxial geogrids were installed from stations 0+120 to 0+160. TPG 100 uniaxial geogrid was backfilled between stations 0+110 to 0+160.
    - Support struts, geotextile, face rock, and drain rock were placed between stations 0+060 to 0+140.
    - Drain rock and second layer of reinforced backfill was placed between stations 0+040 to 0+120.
- Dayshift prepared the following materials for lift #10:
    - Support struts, geotextile, face rock, and drain rock were placed between stations 0+150 to 0+160.
    - Drain rock and second layer of reinforced backfill was placed between stations 0+130 to 0+160.
- Dayshift prepared the following materials for lift #11:
    - WWF Baskets were installed between stations 0+040 to 0+140.
    - Biaxial geogrid and TPG 100 uniaxial geogrid were installed between stations 0+040 to 0+070.

Tetra Tech Canada Inc.
61 Wasson Place
Whitehorse YT, Y1A 0H7 CANADA
Tel 867.668.3068 Fax 867.668.4349

- Layers were compacted using a smooth drum compactor and plate tamper with four passes, to meet method specification.

3.0 DISCUSSION/OTHER

- Dozer was scraping second layer of reinforced fill for lift #10 placed by nightshift because the lift was approximately 250 mm too thick.
- WWF basket alignment is still an issue. Discussed a possible solution with survey. Came up with the idea of aligning the baskets by hanging a plumb bob from a reference string line marked out by survey, rather than using the previous WWF basket as reference.
- Excavator finished pushing bedrock face back at station 0+070. The area was backfilled and packed accordingly.

-	CAT 950K Loader	Loading backfill and moving equipment
-	CS55 Smooth Drum Compactor	Compacting backfill at the MSE wall
-	Plate Tamper	Compacting backfill at the MSE wall

2.0 MECHANICALY STABILIZED EARTH WALL

- Nightshift prepared the following materials for lift #11:
    - WWF baskets from stations 0+120 to 0+160.
    - TPG 100 uniaxial geogrids between stations 0+080 to 0+160. Backfill placed.
    - Biaxial geogrids between stations 0+080 to 0+100.
    - Support struts between stations 0+040 to 0+100.
    - Geotextile, face rock, and drain rock between stations 0+040 to 0+080.
- Dayshift placed the following materials for lift #11:
    - Support struts between stations 0+110 to 0+160.
    - Geotextile and face rock between stations 0+090 to 0+130.
    - Drain rock between stations 0+090 to 0+120.

Tetra Tech Canada Inc.
61 Wasson Place
Whitehorse YT, Y1A 0H7 CANADA
Tel 867.668.3068 Fax 867.668.4349

- Layers were compacted using a smooth drum compactor and plate tamper with four passes, to meet method specification.

3.0 DISCUSSION/OTHER

- At station 0+130, there was a section where the TPG 100 uniaxial geogrid didn't have 100% coverage for lift #11. The gap between the uniaxial geogrids was approximately 6 inches near the MSE face. This issue was fixed by dayshift.
- At the corner of station 0+140 on lift #11, it was noticed that the uniaxial geogrid was cut to cover the corner gap, instead of placing a rectangular section of geogrid, and placing 75 mm of backfill between overlapping geogrids for proper anchorage. This was placed by nightshift. This issue was fixed by dayshift.
- Reinforced backfill placed by nightshift in preparation for lift #12 was placed at a 500 mm lift instead of in multiple layers of 250 mm with each layer compacted. This issue was fixed by dayshift.

File:	ENG.WARC03235-05.004		Low -1°C

1.0 MSE WALL CONSTRUCTION SUMMARY

Unit ID	Equipment	Work
-	CAT D6T Dozer	Placing backfill
-	CAT 324 Excavator	Placing backfill
-	CAT 730 Rock Truck	Hauling backfill to MSE wall
-	CAT Skid Steer	Placing backfill
-	CAT Skid Steer	Placing backfill
-	CAT 740B Rock Truck	Hauling backfill to MSE wall
-	CAT 950K Loader	Loading backfill and moving equipment
-	CS55 Smooth Drum Compactor	Compacting backfill at the MSE wall
-	Plate Tamper	Compacting backfill at the MSE wall

2.0 MECHANICALY STABILIZED EARTH WALL

- Nightshift prepared materials for lift #11 at the following approximate locations:
    - Geotextile between stations 0+140 to 0+160.
    - Drain rock between stations 0+130 to 0+160.
- Nightshift prepared materials for lift #12 at the following approximate locations:
    - WWF baskets between stations 0+040 to 0+160.
    - Biaxial geogrids between stations 0+040 to 0+140.
    - TPG 100 uniaxial geogrids between stations 0+040 to 0+160. Backfill placed and compacted.
    - Support struts, and face rock between stations 0+040 to 0+130.
    - Geotextile between stations 0+040 to 0+120.
    - Drain rock placed and compacted between stations 0+040 to 110.

Tetra Tech Canada Inc.
61 Wasson Place
Whitehorse YT, Y1A 0H7 CANADA
Tel 867.668.3068 Fax 867.668.4349

  - Second layer of reinforced backfilled placed between stations 0+040 to 0+080.

- Dayshift placed materials for lift #12 at the following approximate locations:
  - Biaxial geogrids between stations 0+150 to 0+160.
  - Support struts, geotextile, and face rock material between stations 0+130 to 0+160.
  - Drain rock between stations 0+120 to 0+160.
  - Second layer of reinforced backfill material placed and compacted from station 0+090 to 0+160.
- Dayshift placed materials for lift #13 at the following approximate locations:
  - WWF baskets, biaxial geogrids, TPG 100 uniaxial geogrids, and first layer of reinforced backfill material placed and compacted between stations 0+040 to 0+080.
- Layers were compacted using a smooth drum compactor and plate tamper with four passes, to meet method specification.

3.0 DISCUSSION/OTHER

- The offset distance of the WWF basket face between lift #11 and lift #12 was 12 cm to reset the alignment of the wall. The plumb bob method to align the WWF basket face guided by survey will be used moving forward.

4.0 CLOSURE

We trust that the information provided herein is accurate and complete. Please contact the undersigned if you require additional information or have any concerns.

Tel 867.668.3068 Fax 867.668.4349

3.0 DISCUSSION/OTHER

- The placement of corner WWF baskets at station 0+160 between lifts #15 and #16, and #16 and #17 does not comply with the drawings supplied by Tensar. Heavy North foreman and Project Manager was notified. Heavy North did not choose to correct this issue by excavating to the layer that needs to be corrected, instead, Heavy North placed lift #18's WWF corner basket between stations 0+145.05 and 0+143.65.
- 100 mm minus material brought to the MSE wall is becoming coarser.

1.0 MSE WALL CONSTRUCTION SUMMARY

Unit ID	Equipment	Work
-	CAT D6T Dozer	Placing backfill
-	CAT 324 Excavator	Placing backfill
-	CAT 730 Rock Truck	Hauling backfill to MSE wall
-	CAT Skid Steer	Placing backfill
-	CAT Skid Steer	Placing backfill
-	CAT 740B Rock Truck	Hauling backfill to MSE wall
-	CAT 950K Loader	Loading backfill and moving equipment
-	CS55 Smooth Drum Compactor	Compacting backfill at the MSE wall
-	Plate Tamper	Compacting backfill at the MSE wall

2.0 MECHANICALY STABILIZED EARTH WALL

- Nightshift completed lift #18.
- Nightshift placed materials for lift #19 at the following approximate locations:
    - WWF baskets between stations 0+040 to 0+145.
    - Biaxial geogrids, TPG 100 uniaxial geogrids between stations 0+040 to 0+100.
- Dayshift placed materials for lift #19 at the following approximate locations:
    - Biaxial geogrid and TPG 100 uniaxial geogrid between stations 0+110 to 0+145.
    - First layer of backfill, support struts, face rock material, and geotextile between stations 0+040 to 0+145.
- Reinforced backfill was compacted on lift #19 using a smooth drum compactor and plate tamper with four passes, to meet method specification.

2.0 MECHANICALY STABILIZED EARTH WALL

- Nightshift completed lift #23.
- Nightshift placed materials for lift #24 at the following approximate locations:
    - WWF baskets, biaxial geogrids, TPG 100 uniaxial geogrids, and support struts between stations 0+040 to 0+140.
- Dayshift placed materials for lift #24 at the following approximate locations:
    - First layer of backfill on TPG 100 uniaxial geogrids between stations 0+080 to 0+140.
    - Face rock material, geotextile, drain rock, and the second layer of backfill on top of the TPG 100 uniaxial geogrids between stations 0+040 to 0+140.

Tetra Tech Canada Inc.
61 Wasson Place
Whitehorse YT, Y1A 0H7 CANADA
Tel 867.668.3068 Fax 867.668.4349

3.0 DISCUSSION/OTHER

- Tetra Tech on site for periodic spot checks only on dayshift. No Tetra Tech nightshift QC.
- Significant deflection (15 – 30 mm) was observed when a loaded rock truck drove on the retained fill material placed on the MSE pad approximately between stations 0+040 to 0+120. The contractor was notified. The material was observed to have excessive moisture and a trace of organic material. It was recommended to the contractor to remove the unsuitable material until competent material is exposed. After cutting 1 m of unsuitable retain fill material with the dozer, the area was compacted with the CS55 Smooth Drum Compactor and a proof-roll test was conducted using a loaded rock truck. Severe depth of rutting (greater than 30 mm) was observed. It was recommended to the contractor to dig a test pit with an excavator to determine how thick the the layer of unsuitable retain fill is.

CAT D6T Dozer	Placing backfill
CAT 324 Excavator	Placing backfill
CAT 730 Rock Truck	Hauling backfill to MSE wall
CAT Skid Steer	Placing backfill
CAT Skid Steer	Placing backfill
CAT 740B Rock Truck	Hauling backfill to MSE wall
CAT 950K Loader	Loading backfill and moving equipment
CS55 Smooth Drum Compactor	Compacting backfill at the MSE wall
Plate Tamper	Compacting backfill at the MSE wall

2.0 MECHANICALY STABILIZED EARTH WALL

- Nightshift finished lift #30.
- Nightshift placed materials for lift #31 at the following approximate locations:
    - WWF baskets, biaxial geogrids, TPG 100 uniaxial geogrids, first layer of backfill, support struts, and face rock material between stations 0+040 to 0+140.
- Dayshift finished lift #31.
- Dayshift placed materials for lift #32 at the following approximate locations:
    - WWF baskets, biaxial geogrids, TPG 100 uniaxial geogrids, first layer of backfill, and support struts between stations 0+040 to 0+140.

3.0 DISCUSSION/OTHER

- Tetra Tech on site for periodic spot checks only on dayshift. No Tetra Tech nightshift QC.

Ryan,

Can we get confirmation for the T.O.C for P4 plan number 3330-231-260-023,027. It might be 1037.750 but it is not explicitly stated.

Thank you,

Erik.

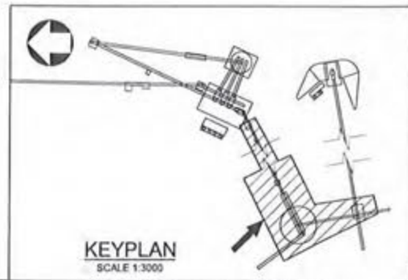
FOUNDATION NOTES:



2.1 ALL CONCRETE FOUNDATION SUBGRADE SHALL BE EITHER ROCK OR 38 mm MINUS NFS STRUCTURAL BACKFILL DOWN TO 3 METERS BELOW THE FINISH GRADE COMPACTED TO 95% MODIFIED PROCTOR.
2.2 ALL BACKFILL AROUND AND ABOVE CONCRETE FOUNDATIONS, PEDESTALS AND PADS SHALL BE 38 mm MINUS NFS STRUCTURAL BACKFILL.
2.3 ALL FOUNDATION SUBGRADE SHALL BE INSPECTED AND APPROVED BY THE GEOTECHNICAL ENGINEER PRIOR TO PLACEMENT OF CONCRETE.
2.4 THE PREPARED FOOTING SUBGRADE SHALL BE PROTECTED FROM WATER INGRESS AND SOFTENING BY PROVIDING ADEQUATE DRAINAGE OR PLACING A LEAN CONCRETE MUD SLAB.

GENERAL NOTES:

1.1 READ THESE DRAWINGS IN CONJUNCTION WITH ALL OTHER PERTINENT CONTRACT DOCUMENTS.
1.2 FOR CONCRETE TYPICAL DETAILS DRAWING SET AND GENERAL NOTES, SEE DRAWINGS 354138-0000-231-294-0001 TO -0007.
1.3 REFER TO MECHANICAL, PROCESS AND ELECTRICAL DRAWINGS FOR LOCATIONS AND DIMENSIONS OF OPENINGS, SLEEVES AND OTHER BUILDING COMPONENTS NOT SHOWN ON STRUCTURAL DRAWINGS. REPORT DISCREPENCIES TO THE OWNER OR HIS REPRESENTATIVE PRIOR TO PROCEEDING WITH THE WORK.
1.4 FOR GENERAL SITE LOCATION AND WORK POINT COORDINATES, SEE DRAWING H354138-2120-220-290-0001.
1.5 HIGH ENERGY COMPACTION EQUIPMENT SUCH AS LARGE ROLLERS MUST NOT BE USED FOR COMPACTING BACKFILL WITHIN 1 METER OF THE EDGE OF THE WALLS.
1.6 FOR GROUNDING LOOP SEE ELECTRICAL DRAWING H354138-3210-260-272-1000-0001. FOR GROUNDING INSTALLATION DETAILS SEE DRAWING SET H354138-3210-260-290-0001-0001 TO -0015.
1.7 FOR CAST-IN PLACE CONCRETE, SEE SPECIFICATION SECTION H354138-S032000.
1.8 FOR CONCRETE FORMWORK, SEE SPECIFICATION SECTION H354138-S031000.
1.9 FOR CONCRETE REINFORCEMENT, SEE SPECIFICATION SECTION H354138-S033000.
1.10 FOR GROUTING, SEE SPECIFICATION SECTION H354138-S036000.
1.11 CONSTRUCTION JOINTS NOT SHOWN ON THE DRAWINGS MUST BE APPROVED BY THE CONTRUCTION MANAGER.
1.12 IN CASE OF ANY DISCREPANCIES, INFORM THE CONSTRUCTION MANAGER BEFORE COMMENCING WORK.
1.13 ALL DIMENSIONS ARE IN MILLIMETERS AND ELEVATIONS ARE IN METERS.
1.14 PROVIDE 19mm X 19mm CHAMFER AT ALL EXPOSED CONCRETE CORNERS AND EDGES ABOVE GRADE LEVEL.
1.15 THE DRAWINGS SHOULD BE READ IN CONJUNCTION WITH THE PROJECT CIVIL DESIGN CRITERIA H354138-0000-220-210-0001.
1.16 FOR FURTHER GEOTECH INFORMATION, SEE "2011 GEOTECHNICAL INVESTIGATION FOR MINE SITE INFRASTRUCTURE FOUNDATION REPORT" BY BGC ENGINEERING DATED JAN 31, 2012.
1.17 SET ANCHOR RODS USING TEMPLATES WHICH MUST BE LEFT IN PLACE UNTIL THE CONCRETE HAS SET. ANCHOR RODS SHALL BE PLUMBED AND SECURED FROM MOVEMENT PRIOR TO CASTING CONCRETE.

AREA CONCRETE TURNOVER

Rev 00 September 18, 2018

OWNER REPRESENTATIVE(S): Jerry Chrzaszcz	DATE OF TURNOVER: December 9, 2018
CLARK BUILDERS REPRESENTIVE(S): Ryan de Milliano; Garry Dahl; Jackson Wenger	AREA/ LOCATION: 3100 Primary Crusher Concrete Installations

TURNOVER TYPE:	☒ COMPLETE AREA ☐ PARTIAL AREA ☐ EQUIPMENT ☐ SYSTEM ☐ OTHER
COMPLETE DESCRIPTION OF AREA TO BE TURNED OVER:	Primary Crusher Concrete installations turnover for concrete, embeds, electrical grounding. This turnover excludes the transformer pad, this will be submitted in another turnover.
SCOPES INCLUDED:	☐ CIVIL/EARTHWORK ☒ CONCRETE ☒ ANCHOR BOLTS/EMBEDS ☒ GROUNDING ☐ GROUT
RELEASED FROM (Company):	Clark Builders
RELEASED TO (Company):	JDS

ATTACHMENT(S):
Attachment "A" – 2018.12.09 Site Walk-down

Question from Ryan de Milliano (Clark Builders - Edmonton) at 03:51 PM on 30/09/2018

When required, please confirm it would be acceptable to modify stirrups, with slight field bends, at locations where anchor bolts cannot fit into the forms at correct location.

Examples are P3 Pedestals (Drawing H354138-3210-231-260-0005) and P1 Pedestals (drawing H354138-3210-231-260-0002 r2). The interior stirrups add there is congestion to the pedestal that the anchor bolts cannot fit in correct position. Bowing out the stirrups will allow the anchor bolts to be in correct position and also allow concrete to surround the reinforcing entirely.

Official Response: **Ryan de Milliano (Clark Builders - Edmonton)** *responded on Tuesday, October 2nd, 2018 at 7:22PM MDT*
2018.10.01 HATCH Response:

"It is acceptable to modify the stirrups with slight field bends ONLY at the locations it will help locating the anchor bolts correctly."

Esra Akinci

TETRA TECH

TECHNICAL MEMO

ISSUED FOR USE

To:	Calvin Goldschmidt; Matt Coverdale; Ishan Fechter		
Cc:		**From:**	James Buyck
Project:	Secondary & Tertiary MSE Wall	**Date:**	September 27, 2018
Location:	Eagle Gold Mine, YT	**Weather:**	Sunny
Client:	JDS Energy & Mining (Strata Gold Corp)		High 25°C
File:	ENG.WARC03235-05.004		Low 19°C

Re: **100 mm Minus Type 4 Material Test Fill**

1.0 INTRODUCTION AND OBJECTIVE

This memo presents the findings and results of a test fill to determine method specification of Type 4 Material used as backfill for the Mechanically Stabilized Earth (MSE) Wall located at the Secondary and Tertiary Crusher site.

As requested, Tetra Tech Canada Inc. (Tetra Tech), NELPCo's service provider, supervised the method specification to evaluate the engineering properties of the 100 mm Minus Type 4 structural fill. This material was screened from the borrow source located at the end of ROM Road.

The test fill for the method specification was conducted on August 11, 2018, and was supervised by Tetra Tech site representative, James Buyck. JDS representatives, Matt Coverdale and Ishan Fechter were also present.

The following summarizes the methodology, execution and results of the test fill.

2.0 TEST FILL CONSTRUCTION AND EXECUTION

The test fill performed is based on previous test fills developed by BGC Engineering for other projects associated with the mine site. The test fill was prepared by Heavy North Construction Ltd. (Heavy North) and survey provided by Underhill Geomatics Ltd. with on-site representation by Richard Morin.

2.1 Test Fill Material and borrow Description

The materials used in the test fill was generated by Nuway Crushing Limited (NCL) from the ROM Road borrow source area. The borrow source comprises drilled, blasted, and heavy equipment ripped materials. The Type 4 100 mm Minus material is produced using a McCloskey Screener. Gradation analysis and moisture content determination were also performed. Results are attached following this memo. In general, the material comprises 100 mm minus well graded gravel and sand portions. Laboratory determined moisture content was 4.2%.

Tetra Tech Canada Inc.
61 Wasson Place
Whitehorse YT, Y1A 0H7 CANADA
Tel 867.668.3068 Fax 867.668.4349

Photo 1: View of 100 mm Minus test fill material during survey of steel plates used to measure settlement after compaction with a CAT CS56B Series steel drum vibratory roller.

2.2 Test Fill Foundation

The area used for the test fill is located west of the Secondary and Tertiary Crusher site. The foundation base was level, compact, dry and previously compacted with heavy equipment traffic. There was no noted deflection in the foundation under roller traffic.

2.3 Test Fill Placement and Compaction

The test fill was constructed by end dumping of the Type 4 100 Minus and then levelling in-place using a CAT 324E Series excavator. The loose lift thickness of the test fill was about 0.3 to 0.4 m, and approximately 4 m x 6 m in size.

Photo 2: The CAT CS56B Series steel drum vibratory roller used for the test fill.

2.4 Moisture Conditioning

Moisture was not added to the test fill.

2.5 Test Fill Compaction and Settlement Measurements

To measure the rate of settlement under compaction three steel plates were placed in a row down the center of the lift and used as monitoring points (as shown in Photo 1, above). The settlement monitoring points were initially surveyed using a Total Station. The test fill was then compacted with one cycle (1 forward pass and 1 reverse pass) of the CAT CS56B Series steel drum roller on full vibration and an effective drum weight of 6,350 kg (13,990 lbs). After completion of one compaction cycle, each settlement point was surveyed. This was repeated for 4 full compaction cycles for the test fill. Specifications for the CAT CS56B Series compactor are included in Attachment 2.

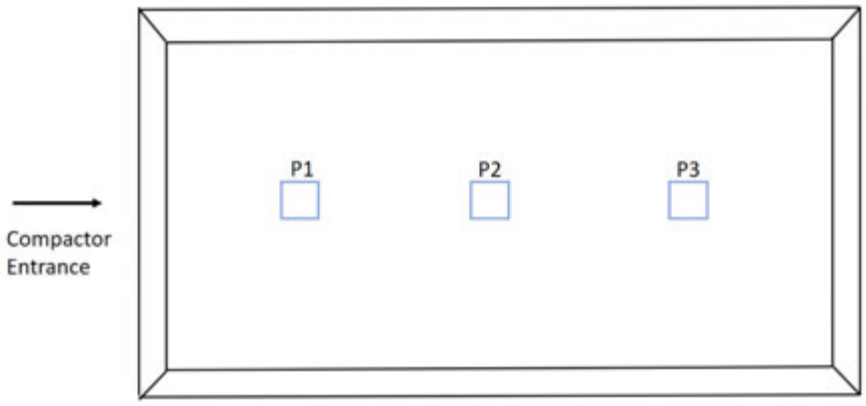

Figure 2: Approximate layout of survey monitoring points within test fill pad.

Settlement data collected is included in ***Table 1*** below.

Number of Passes	Settlement Survey Results (mm)		
	Plate No. 1 (P1)	Plate No. 2 (P2)	Plate No. 3 (P3)
0	N/A	N/A	N/A
1	22	51	44
2	8	5	9
3	8	8	7
4	2	0	2

2.6 Test Fill Observations

Evident surface yield was observed within the test fill after the initial pass of the vibratory compactor, as indicated in the survey results that ranged from 21 to 55 mm. Subsequent passes resulted in reduced settlement and after four passes limited to 0 to 2 mm. It was also observed that after 4 passes, fracturing of the larger (50 to 100 mm) particles had occurred.

3.0 CONCLUSION

The results of the test fill indicate that the Type 4 Material can achieve sufficient densities with a minimum of 4 passes with a minimum 6,350 kg compactor set at high frequency, and in lifts up to 0.3 m thick.

Tetra Tech recommends that the following criteria be used for placement and compaction of the Type 4 Material for use as structural fill within the MSE wall:

- A maximum loose lift thickness of 0.3 m should be applied.

- The minimum number of passes with the CAT CS56B Series compactor should be at least, but not exceed, 4 passes. The number of passes to be adjusted should a larger or smaller compactor be used. Observation of the larger particles within the fill should also be noted and excessive fracturing be avoided.
- If gradation of the fill material vary significantly then additional testing may be required.

- Proof roll of the placed and compacted fill be conducted for each lift while observed and noted by Tetra Tech site representative. Proof rolling to be conducted with a loaded single axel end dump. legally loaded dual rear wheel truck with an effective single axle load of 18,000 lbs. (or 80 kN). This can be a truck that hauls gravel or excavated material or a water truck. In some cases, other equipment may be used to conduct a proof-roll; however, care must be taken to account for the different stresses applied from the variable load ratings of these vehicles.

4.0 CLOSURE

We trust that the information provided herein is accurate and complete. Please contact the undersigned if you require additional information or have any concerns.

Axial LDT	Serial #	BBD100410
Axial Load Cell	Serial #	1084597
Vertical LDT	Serial #	BBD110464
Vertical Load Cell	Serial #	978593

Remarks

- Three test specimens were built and sheared at 100, 200, and 400 kPa normal stresses to develop the friction envelop of this material
- Each test specimen was built/ reconstituted to approximately 95% of the Standard Proctor of this material (I.e. 2232 kg/m^3, this value includes a 30% rock correction; at +2% of the Optimum water content)
- An area correction was applied to the normal and shear stress calculations during shear testing

Sample Description: (GP-GM) sandy fine to coarse sub-angular GRAVEL, fine to medium sand, some coarse sand, some non-plastic fines; brown; non-cohesive, loose, moist.

CONTRACTOR / INTERDISCIPLINARY RELEASE FORM

Project:	Eagle Gold Project	**Revision No.**	0
Contractor:	Clark Builders	**Contract No:**	CB201
Area:	3300 – Secondary / Tertiary Crusher		

Date:	July 19, 2018	**Drawing No:**	H354138-3310-231-260-0002
Discipline:	Civil/Subgrade		

The following: **Area** ☒ **Equipment** ☐ **System** ☐ **Other** ☐

(Provide complete description of area item, equipment system and Tag Numbers where applicable):

Subgrade preparation to the underside of footing +0 and – 150mm at the Secondary/Tertiary Crushing Building in the areas highlighted in the above mentioned drawing.

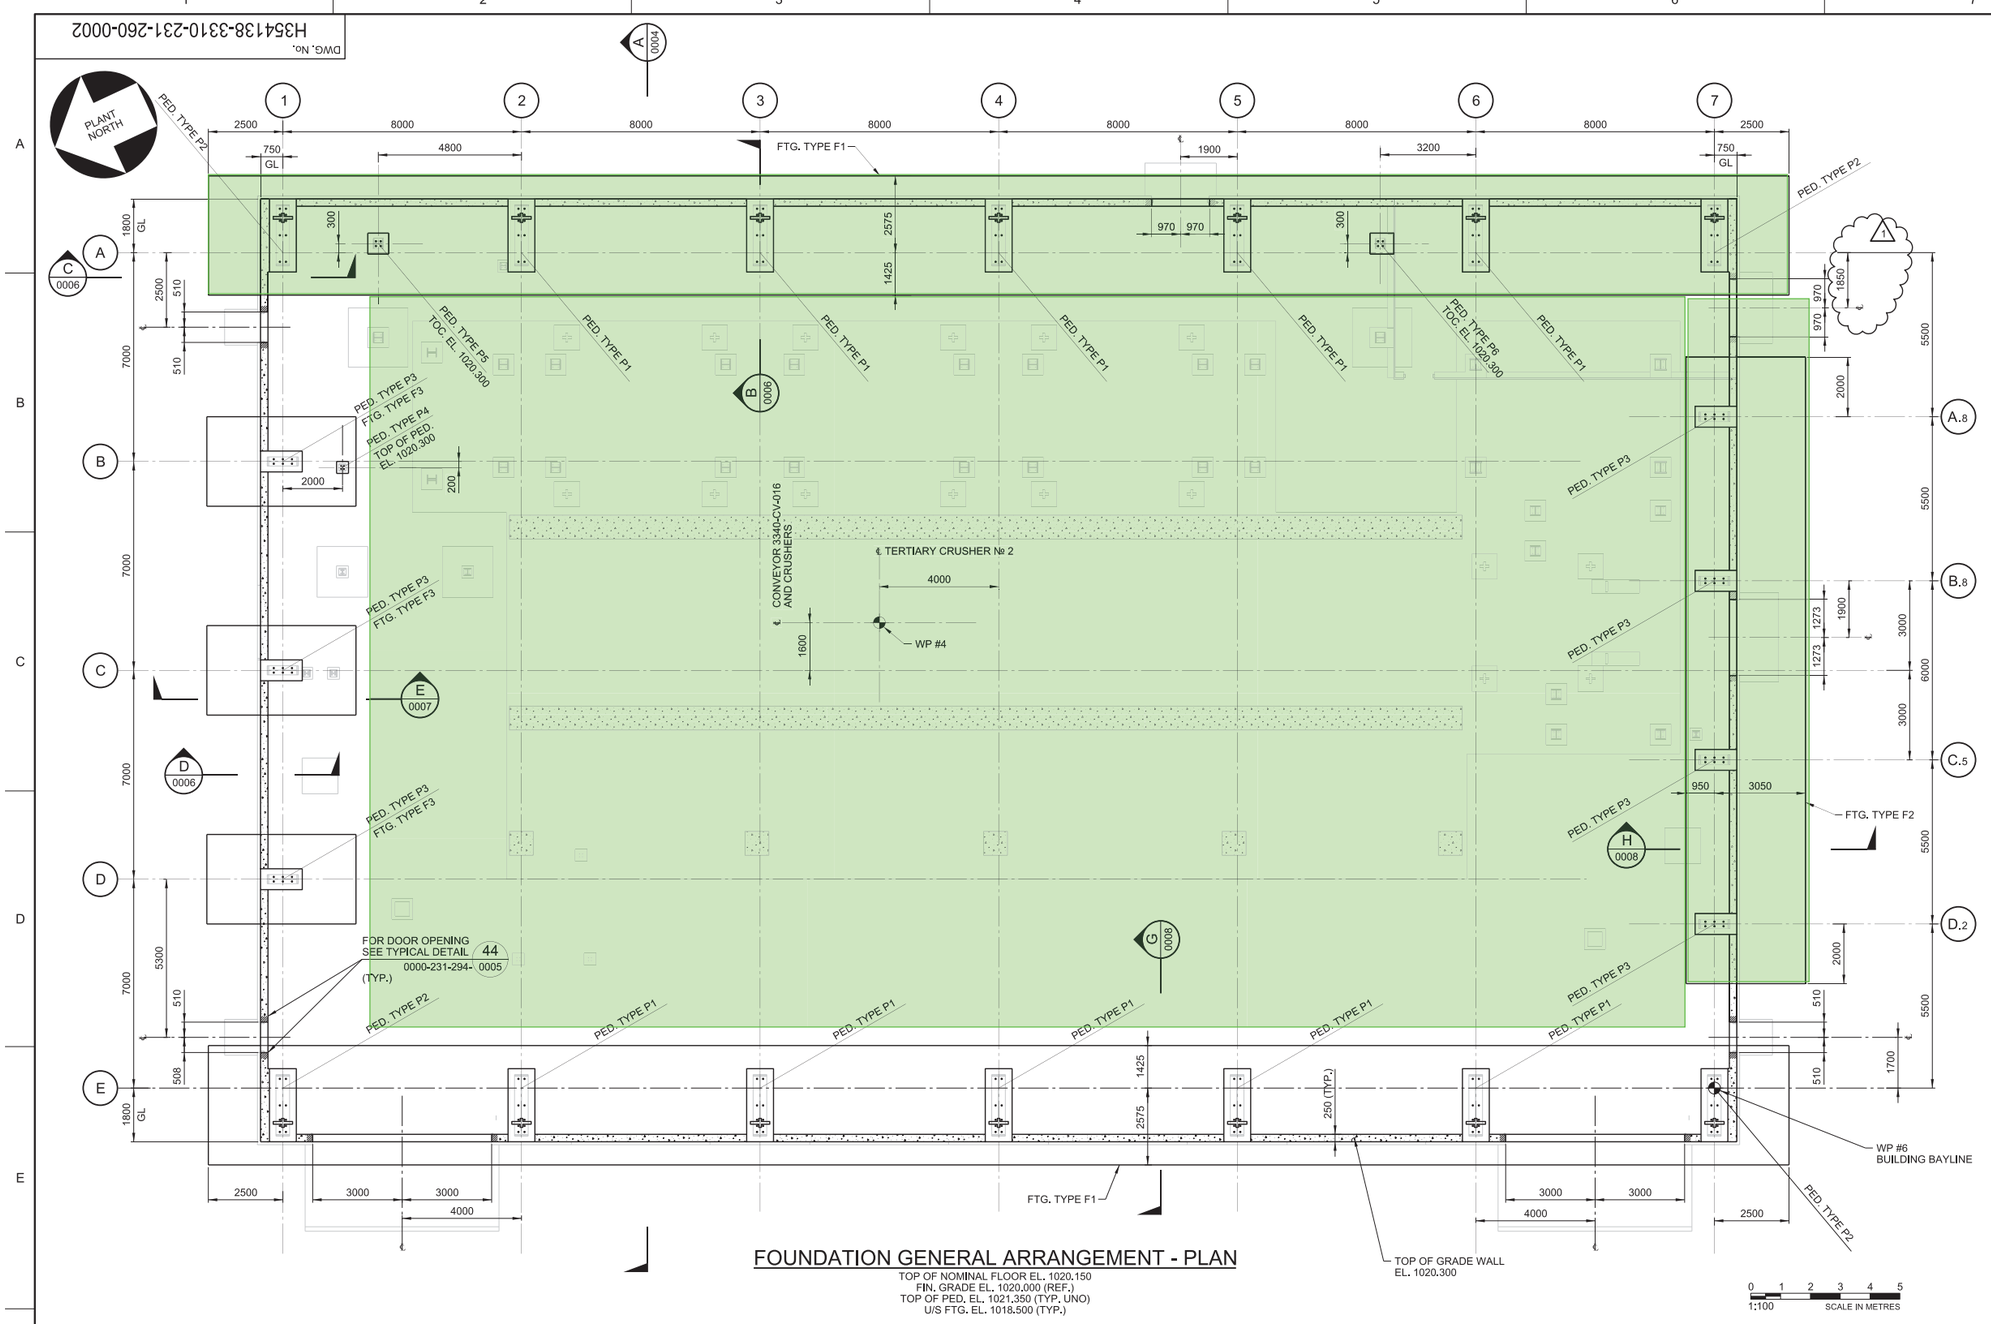
Released to: Clark Builders

Release Basis:			
☒	Civil	☐	Paintings/Coatings
☐	Structural	☐	Electrical
☐	Mechanical	☐	Tracing
☐	Piping	☐	Insulation
☐	NDE	☐	Fireproofing
☐	PHWT	☐	Walkdown/Punchout
☐	Pressure Test	☐	Other

Comments:

The foundation on the North and West side of the building perimeter are also turned over to Clark to perform foundation preparation to the satisfaction of the Owners Engineer or Record (EOR).

This will required detailed excavation to suitable rock (similar to the other released areas) and backfilling and compacting with specified materials to the u/s of footings elevation.



Also attached are Secondary Crusher Survey Control information for Clark Builder use.

Coordinate Methodology

Control Points are originally UTM NAD83 (CSRS) coordinates.
Control points are scaled to ground distances from WP4 at a CSF of 1.000526
Control points are truncated to differentiate from UTM coordinates.
Scaled UTM Northing - 7,000,000 = Ground Northing
Scaled UTM Easting - 400,000 = Ground Easting

COMPACTION DENSITY TEST SUMMARY REPORT

ASTM Designation D6938

Project: Eagle Gold Project | **Test Apparatus:** Nuclear | **Troxler No:** 60841

QC Inspection & Testing | **Specified Compaction:** 95 % Mod. Proctor Max. Dry Density

Project No.: WARC.03235-05 | **Specified Moisture** (MC)**:** As Below

Client: JDS Energy & Mining/Hatch | **Temperature** **Air:** 14 ºC **Soil:** ºC

Attention: | **Date Tested:** 8/30/2018 **By:** AS

Contractor: Cobalt/Clark Construction | **Construction Period:** DAYSHIFT

Soil Description: GRAVEL, Sandy, trace silt

Material Usage/Zone: 38mm minus ODF

Date yyyy/mm/dd	**Test No.** / Probe (mm)	**Location:**	El.	Dry Density (kg/m³)	MC %	Max. Dry Density	Opt. MC %	Comp % MPD
8/30/2018	**1** / 300	Above primary crusher south drain, first lift	n/a	2179	7.0	2250	6.0	**96.8**
8/30/2018	**2** / 300	Above primary crusher south drain, second lift	n/a	2199	5.9	2250	6.0	**97.7**
8/30/2018	**3** / 300	Above primary crusher south drain, final lift	n/a	2156	4.9	2250	6.0	**95.8**

CONTRACTOR / INTERDISCIPLINARY RELEASE FORM

Project:	Eagle Gold Project	**Revision No.**	0
Contractor:	Clark Builders	**Contract No:**	CB201
Area:	3300 – Secondary / Tertiary Crusher		

Date:	September 13, 2018	**Drawing No:**	H354138-3310-231-260-####
Discipline:	Civil/Subgrade		

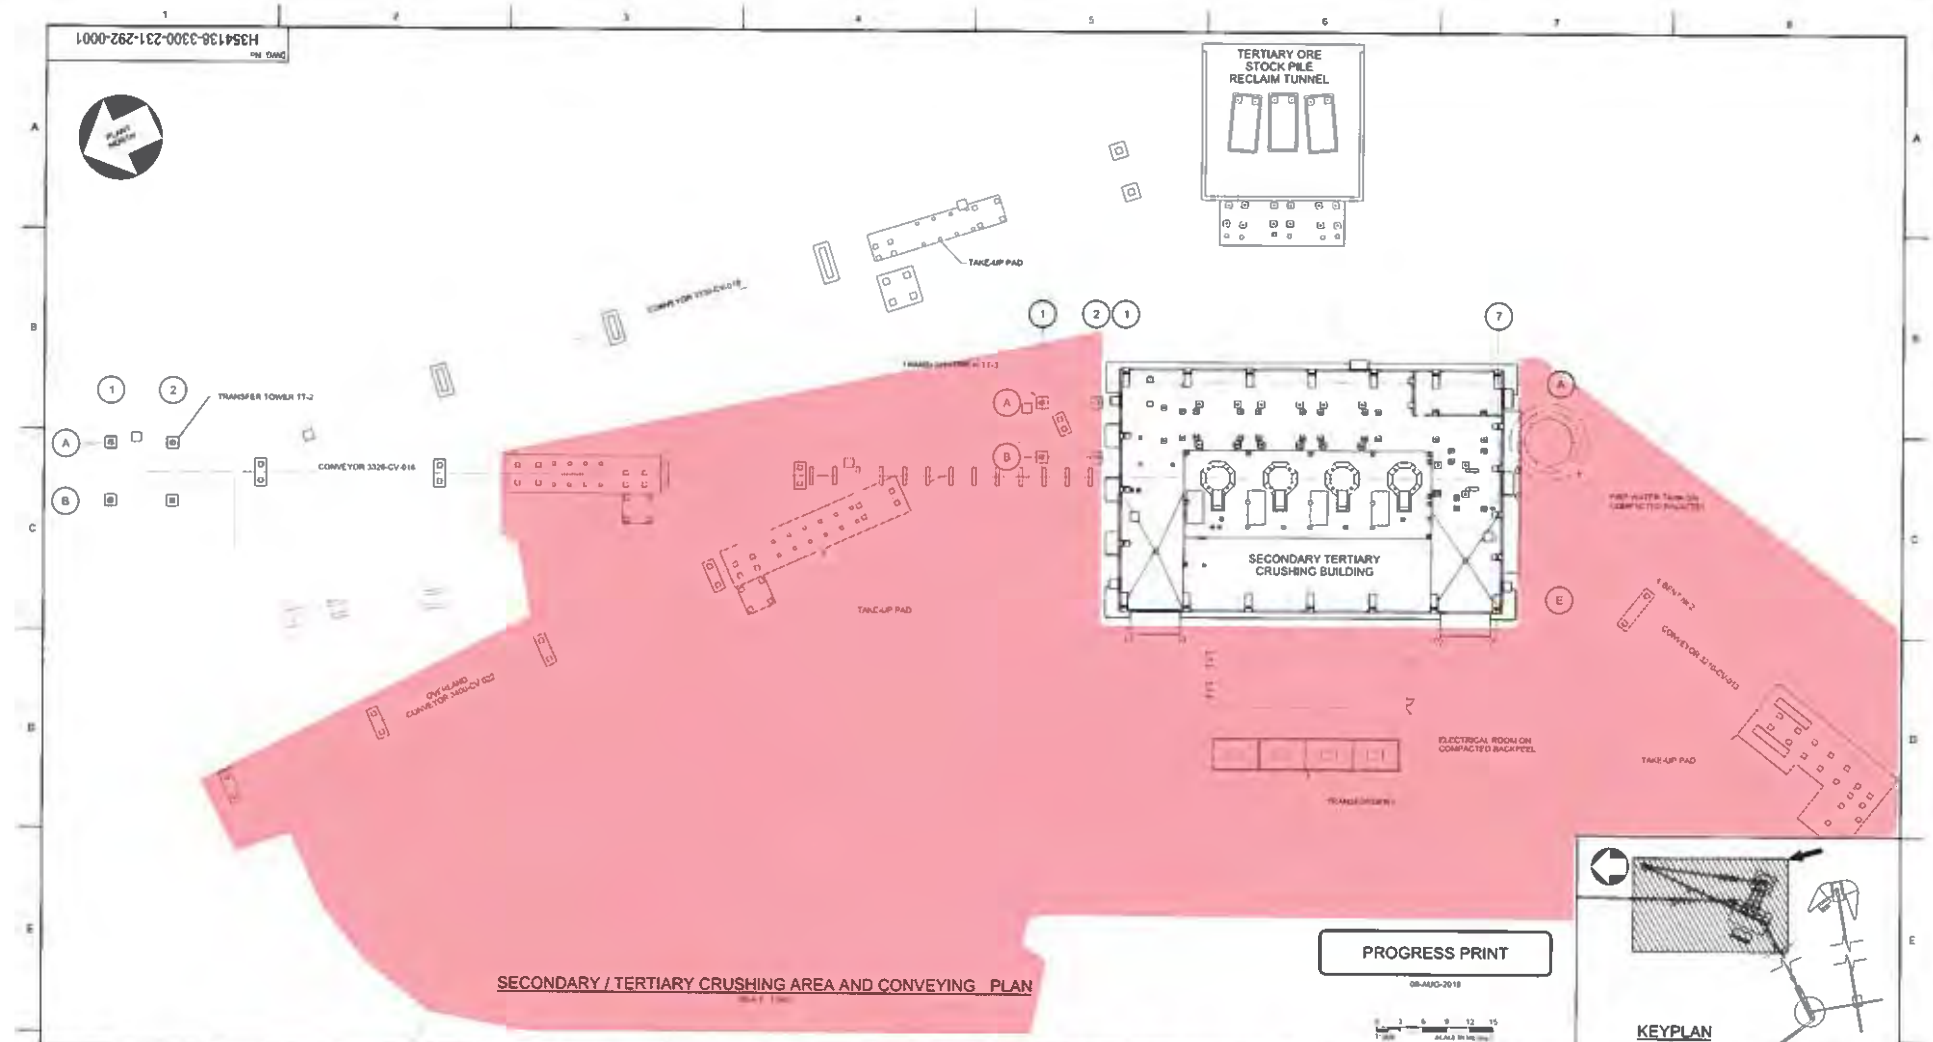
The following: **Area** ☒ **Equipment** ☐ **System** ☐ **Other** ☐

(Provide complete description of area item, equipment system and Tag Numbers where applicable):

Rough grade preparation to the underside of footing +0 and – 150mm at the Secondary/Tertiary Crushing pad. See highlighted drawing attached for extents of turnover area.

Released to: Clark Builders

Release Basis:



☒	Civil	☐	Paintings/Coatings
☐	Structural	☐	Electrical
☐	Mechanical	☐	Tracing
☐	Piping	☐	Insulation
☐	NDE	☐	Fireproofing
☐	PHWT	☐	Walkdown/Punchout
☐	Pressure Test	☐	Other

Comments:

All foundations within the highlighted area are turned over to Clark to perform foundation preparation to the satisfaction of the Owners Engineer or Record (EOR).

This will require detailed excavation to suitable rock (similar to the other released areas) or 3m below finished grade and backfilling and compacting (95% modified proctor) with specified materials (38mm NFS) to the u/s of footings elevation.

CONCRETE REINFORCEMENT PRE POUR

Rev 01 August 25, 2018

SUBCONTRACTOR: Ultimate Reinforcing // McNish	INSPECTION DATE: SEPTEMBER 18, 2018
SUBCONTRACTOR CONTACT PERSON: JIMMY	PROJ. POUR DATE: SEPTEMBER 18, 2018
INSPECTOR(S): Ryan del Milano	
LOCATION: 3100 PRIMARY SUSPENDED SLAB @ ELEV 1045.300	
DRAWING REV: 02 / DRAWING NO.(S): 3100-231-260-0005/6	SPEC SECTION(S): S03 20 00 – Concrete Reinforcing Steel

ITEM	ITEMS TO BE CHECKED	PASS	FAIL	N/A
1.0	Grade (400W unless otherwise noted) and type of steel delivered and installed as required by approved drawings.	X		
2.0	Inspect rebar distribution, spacing and cover per design/project requirements. SEE NOTES	X		
3.0	Length of splices as specified	X		
4.0	Staggered splices as specified	X		
5.0	Any mechanical splices have been approved by the owner prior to install			X
6.0	Bars cleaned and free of material that may reduce bond including loose rust, scale, oil, structural defects and that they are uncoated and unpainted.	X		
7.0	Dowels at wall ends, construction joints, and openings as specified (length, location, size, etc.)	X		
8.0	No unauthorized field bent bars including hooks installed	X		
9.0	Resolve conflicts between embedded items and reinforcement	X		
10.0	When authorized, field bends done without heat and inspected for fissures or cracks.			X

ITEM	ITEMS TO BE CHECKED	PASS	FAIL	N/A
11.0	Bars tied and supported to prevent displacement	X		
12.0	Spacers, tie wire and chairs as required	X		
13.0	Conduits at design location and minimum separation from rebar as specified			X
14.0	No contact of bars is made with dissimilar metals as per CSA A23.1	X		
15.0	Bars, nails or tie wire not sticking out from surfaces that allow rusting/corrosion	X		
16.0	Rebar welds are inspected by qualified inspectors certified to CSA W178.2			X
17.0	No rebar congestion or other obstruction for deposit of concrete	X		
18.0	Adjustments required for interfering items (piping, inserts, sleeves, etc.) have been submitted and approved by owner.	X		
19.0	Rebar was stored off ground to prevent damage/corrosion	X		
20.0	Review drawings for anchors, piping, sleeves, boxes	X

CONCRETE REINFORCEMENT PRE POUR

Rev 01 August 25, 2018

SUBCONTRACTOR: Ultimate Reinforcing // McNish	INSPECTION DATE: October 7, 2018
SUBCONTRACTOR CONTACT PERSON: Jimmy M.	PROJ. POUR DATE: October 7, 2018
INSPECTOR(S): Ryan deMilliano (CB), Ishan (JDS)	
LOCATION: 3100 II Primary 2x P6 pedestals inside structure on Gdn. Mat (+) 1x P4 ped.	
DRAWING REV: 03 / DRAWING NO.(S): 3100-231-260-0002	SPEC SECTION(S): S03 20 00 – Concrete Reinforcing Steel

ITEM	ITEMS TO BE CHECKED	PASS	FAIL	N/A
1.0	Grade (400W unless otherwise noted) and type of steel delivered and installed as required by approved drawings.	X		
2.0	Inspect rebar distribution, spacing and cover per design/project requirements.	X		
3.0	Length of splices as specified	X		
4.0	Staggered splices as specified	X		
5.0	Any mechanical splices have been approved by the owner prior to install			X
6.0	Bars cleaned and free of material that may reduce bond including loose rust, scale, oil, structural defects and that they are uncoated and unpainted.	X		
7.0	Dowels at wall ends, construction joints, and openings as specified (length, location, size, etc.)			X
8.0	No unauthorized field bent bars including hooks installed	X		
9.0	Resolve conflicts between embedded items and reinforcement	X		
10.0	When authorized, field bends done without heat and inspected for fissures or cracks.			X

ITEM	ITEMS TO BE CHECKED	PASS	FAIL	N/A
11.0	Bars tied and supported to prevent displacement	X		
12.0	Spacers, tie wire and chairs as required	X		
13.0	Conduits at design location and minimum separation from rebar as specified			X
14.0	No contact of bars is made with dissimilar metals as per CSA A23.1	X		
15.0	Bars, nails or tie wire not sticking out from surfaces that allow rusting/corrosion	X		
16.0	Rebar welds are inspected by qualified inspectors certified to CSA W178.2			X
17.0	No rebar congestion or other obstruction for deposit of concrete	X		
18.0	Adjustments required for interfering items (piping, inserts, sleeves, etc.) have been submitted and approved by owner.	X		
19.0	Rebar was stored off ground to prevent damage/corrosion	X		
20.0	Review drawings for anchors, piping, sleeves, boxes	X		

COMMENTS:

Heat was on all pedestals at time of inspection. Temp inside heaters +26°C

Dowels (HHL limited)

CONCRETE REINFORCEMENT PRE POUR

Rev 01 August 25, 2018

SUBCONTRACTOR: Ultimate Reinforcing // McNish	INSPECTION DATE: November 14, 2018
SUBCONTRACTOR CONTACT PERSON: Jimmy M.	PROJ. POUR DATE: November 17 → 20
INSPECTOR(S): Ryan deMilliano; Jerry C; Matt C	
LOCATION: 3100 / Primary walls to 1063.300 / 1065.200	
DRAWING REV: Various	DRAWING NO.(S): 3100-006; 17; 18; 19; 20; 21; 22; 23; 14
SPEC SECTION(S): S03 20 00 – Concrete Reinforcing Steel	

ITEM	ITEMS TO BE CHECKED	PASS	FAIL	N/A
1.0	Grade (400W unless otherwise noted) and type of steel delivered and installed as required by approved drawings.	☑	☐	☐
2.0	Inspect rebar distribution, spacing and cover per design/project requirements.	☑	☐	☐
3.0	Length of splices as specified	☑	☐	☐
4.0	Staggered splices as specified	☑	☐	☐
5.0	Any mechanical splices have been approved by the owner prior to install	☐	☐	☑
6.0	Bars cleaned and free of material that may reduce bond including loose rust, scale, oil, structural defects and that they are uncoated and unpainted.	☑	☐	☐
7.0	Dowels at wall ends, construction joints, and openings as specified (length, location, size, etc.)	☑	☐	☐
8.0	No unauthorized field bent bars including hooks installed	☑	☐	☐
9.0	Resolve conflicts between embedded items and reinforcement	☑	☐	☐
10.0	When authorized, field bends done without heat and inspected for fissures or cracks.	☐	☐	☑

ITEM	ITEMS TO BE CHECKED	PASS	FAIL	N/A
11.0	Bars tied and supported to prevent displacement	☑	☐	☐
12.0	Spacers, tie wire and chairs as required	☑	☐	☐
13.0	Conduits at design location and minimum separation from rebar as specified	☐	☐	☑
14.0	No contact of bars is made with dissimilar metals as per CSA A23.1	☑	☐	☐
15.0	Bars, nails or tie wire not sticking out from surfaces that allow rusting/corrosion	☑	☐	☐
16.0	Rebar welds are inspected by qualified inspectors certified to CSA W178.2	☐	☐	☑
17.0	No rebar congestion or other obstruction for deposit of concrete	☑	☐	☐
18.0	Adjustments required for interfering items (piping, inserts, sleeves, etc.) have been submitted and approved by owner.	☐	☐	☑
19.0	Rebar was stored off ground to prevent damage/corrosion	☑	☐	☐
20.0	Review drawings for anchors, piping, sleeves, boxes	☑	☐	☐

COMMENTS:

Nov 14/18 - 1st PRE CLOSURE INSPECTION NOTES: CLEAN CONCRETE OF ALL DIRT/DUST/FINE WIRE. DOWELS TIE SOME BARS THAT ARE LOOSE — NOW COMPLETED & LOOSE EMBEDS SECURE AS PER IFT.
Nov 15/18 - REINSPECTION - PICS TAKEN AS REQUESTED BY MATT C.

ATTACHMENT(S):

DEFICIENCIES NOTES:

Added rock breaker missing N15 horizontal bars & 3 E/W ties
Clean rock breaker area & the bottom of anchor bolts
Added plywood strip @ southeast corner, ensure embeds are tight to form
