SAG AND TENSION	
CIRCUIT	VICTORIA GOLD 69kV
DOCUMENT	1407-T-1A50
DATE	23-Oct-18
REVISION	0
ISSUED FOR	CONSTRUCTION
PREPARED BY	MP
CHECKED BY	PC
APPROVED BY	PC

ENGINEER'S SEAL

NOTES

1. All spans must be installed to the sag values provided. Tension values are provided as a reference only.
2. Sag and tension values shown are for new conductor under initial conditions.
3. For conductors left hanging in sheaves for longer than 3 hours between initial stringing and final sag, a creep correction factor must be applied.
4. All span lengths and sag values are provided in metres unless otherwise noted.
5. Conductors and cables:
   - Overhead Shieldwire (OHSW): Partridge ACSR
   - 69kV Transmission Line: Partridge ACSR
   - ADSS: OFC-24G-652D-FASA-S1

Clean Energy

ISSUED FOR	CONSTRUCTION
PREPARED BY	MP
CHECKED BY	PC
APPROVED BY	PC

ENGINEER'S SEAL

YUKON ASSOCIATION OF ENGINEERS
23-OCT-2018

NOTES
1. All spans must be installed to the sag values provided. Tension values are provided as a reference only.
2. Sag and tension values shown are for new conductor under initial conditions.
3. For conductors left stringing in sheaves for longer than 3 hours between initial stringing and final sag, a creep correction factor must be applied.
4. All span lengths and sag values are provided in metres unless otherwise noted.
5. Conductors and cables:
   - Overhead Shieldwire (OHSW): Partridge ACSR
   - 69kV Transmission Line: Partridge ACSR
   - ADSS: OFC-24G-652D-FASA-S1

23-OCT-2018
ENGINEER

NOTES
1. All spans must be installed to the sag values provided. Tension values are provided as a reference only.
2. Sag and tension values shown are for new conductor under initial conditions.
3. For conductors left hanging in dressers for longer than 3 hours between initial stringing and final sag, a creep correction factor must be applied.
4. All span lengths and sag values are provided in metres unless otherwise noted.
5. Conductors and cables:
   - Overhead Shieldwire (OHSW): Partridge ACSR
   - 69kV Transmission Line: Partridge ACSR
   - ADSS: OFC-24G 6520-FASA-S1

SAG AND TENSION

CIRCUIT	VICTORIA GOLD 69kV
DOCUMENT	1407-T-1A50
DATE	23-Oct-18
REVISION	0
ISSUED FOR	CONSTRUCTION
PREPARED BY	MP
CHECKED BY	PC
APPROVED BY	PC

ENGINEER'S SEAL
PROFESSIONAL ENGINEER
YUKON
TERRITORY
23-OCT-2018

NOTES
1. All spans must be installed to the sag values provided. Tension values are provided as a reference only.
2. Sag and tension values shown are for new conductor under initial conditions.
3. For conductors left hanging in sheaves for longer than 3 hours between initial stringing and final sag, a creep correction factor must be applied.
4. All span lengths and sag values are provided in metres unless otherwise noted.
5. Conductors and cables:
- Overhead Shieldwire (OHSW): Partridge ACSR
- 69kV Transmission Line: Partridge ACSR
- ADSS: OFC-24G 652D-FASA-SS

SAG AND TENSION	
CIRCUIT	VICTORIA GOLD 69kV
DOCUMENT	1407-T-1450
DATE	23-Oct-18
REVISION	0
ISSUED FOR	CONSTRUCTION
PREPARED BY	MP
CHECKED BY	PC
APPROVED BY	PC

NOTES
1. All spans must be installed to the sag values provided. Tension values are provided as a reference only.
2. Sag and tension values shown are for new conductor under initial conditions.
3. For conductors left hanging in sheaves for longer than 3 hours between initial stringing and final sag, a creep correction factor must be applied.
4. All span lengths and sag values are provided in metres unless otherwise noted.
5. Conductors and cables:
   - Overhead Shieldwire (OHSW): Partridge ACSR
   - 69kV Transmission Line: Partridge ACSR
   - ADSS: OFC-24G 6520-FASA-51

ELEARENERGY CONSULTING INC.
23-OCT-2018
PERMIT NUMBER P1065

SAG AND TENSION	
CIRCUIT	VICTORIA GOLD 69kV
DOCUMENT	1407-T-(45)1
DATE	23-Oct-18
REVISION	0
ISSUED FOR	CONSTRUCTION
PREPARED BY	MP
CHECKED BY	PC
APPROVED BY	PC

ENGINEER'S SEAL

PROFESSIONAL ENGINEER
YUKON
TERRITORY
23-Oct-2018

NOTES:
1. All spans must be installed to the sag values provided. Tension values are provided as a reference only.
2. Sag and tension values shown are for new conductor under initial conditions.
3. For conductors left hanging in sheaves for longer than 3 hours between initial stringing and final sag, a creep correction factor must be applied.
4. All span lengths and sag values are provided in metres unless otherwise noted.
5. Conductors and cables:
   Overhead Shieldwire (OHSW): Partridge ACSR
   69kV Transmission Line: Partridge ACSR
   - ADSS: OFC-24G-6520-FASA-51

TERRITORY
23-OCT-2018

NOTES
1. All spans must be installed to the sag values provided. Tension values are provided as a reference only.
2. Sag and tension values shown are for new conductor under initial conditions.
3. For conductors left hanging in sheaves for longer than 3 hours between initial stringing and final sag, a creep correction factor must be applied.
4. All span lengths and sag values are provided in metres unless otherwise noted.
5. Conductors and cables:
   - Overhead Shieldwire (OHSW): Partridge ACSR
   - 69kV Transmission Line: Partridge ACSR
   - ADSS: OFC-24G 652D-FASA-S1

SAG AND TENSION	
CIRCUIT	VICTORIA GOLD 69kV
DOCUMENT	1407-T-1450
DATE	23-Oct-18
REVISION	0
ISSUED FOR	CONSTRUCTION
PREPARED BY	MP
CHECKED BY	PC
APPROVED BY	PC

ENGINEER'S SEAL
ASSOCIATION OF PROFESSIONAL ENGINEERS YUKON TERRITORY
24-Oct-2018

NOTES
1. All spans must be installed to the sag values provided. Tension values are provided as a reference only.
2. Sag and tension values shown are for new conductor under "final" conditions.
3. For conductors left hanging in sheaves for longer than 3 hours between aerial stringing and final sag a creep correction factor must be applied.
4. All span lengths and sag values are provided in metres unless otherwise noted.
5. Conductors and cables:
   Overhead Shieldwire (OHSW): Partridge ACSR
   69kV Transmission Line: Partridge ACSR
   ADSS: OFC-24G/652D-FASA-S1

TERRITORY
23-OCT-2018

NOTES
1. All spans must be installed to the sag values provided. Tension values are provided as a reference only.
2. Sag and tension values shown are for new conductor under initial conditions.
3. For conductors left hanging on sheaves for longer than 3 hours between initial stringing and final sag, a creep correction factor must be applied.
4. All span lengths and sag values are provided in metres unless otherwise noted.
5. Conductors and cables:
   Overhead Shieldwire (OHSW): Partridge ACSR
   69kV Transmission Line: Partridge ACSR
   ADSS: OFC-24G 652D-FASA-S1

TERRITORY
23-OCT-2018

NOTES
1. All spans must be installed to the sag values provided. Tension values are provided as a reference only.
2. Sag and tension values shown are for new conductor under initial conditions
3. For conductors left hanging in sheaves for longer than 3 hours between initial stringing and finishing a creep correction factor must be applied
4. All span lengths and sag values are provided in metres unless otherwise noted.
5. Conductors and cables:
   Overhead Shieldwire (OHSW): Partridge ACSR
   69kV Transmission Line: Partridge ACSR
   ADSS: OFC-24G-652D-FASA-S1

PERMIT TO PRACTICE
CLEAN ENERGY CONSTRUCTORS INC.
Date 23-OCT-2018
PERMIT NUMBER: P11234

SAG AND TENSION	
CIRCUIT	VICTORIA GOLD 69kV
DOCUMENT	1407-T-1451i
DATE	23-Oct-18
REVISION	0
ISSUED FOR	CONSTRUCTION
PREPARED BY	MP
CHECKED BY	PC
APPROVED BY	PC

ENGINEER'S SEAL

PROFESSIONAL ENGINEER
YUKON
TERRITORY
23-OCT-2018

NOTES
1. All spans must be installed to the sag values provided. Tension values are provided as a reference only.
2. Sag and tension values shown are for new conductor under initial conditions
3. For conductors left hanging in sheaves for longer than 3 hours between initial stringing and final sag, a creep correction factor must be applied.
4. All span lengths and sag values are provided in metres unless otherwise noted
5. Conductors and cables:
   Overhead Shieldwire (OHSW): Partridge ACSR
   - 69kV Transmission Line: Partridge ACSR
   ADSS: OFC-24G.652D-FASA-S1

A. POLES

1. LENGTH AND CLASS OF POLES ARE SPECIFIED ON STRUCTURE DATA SHEETS OR CONSTRUCTION DRAWINGS.

2. FOR POLE TOP CAP, NAIL ALUMINUM SHEET AT EACH CORNER. FLATTEN PROTRUDING EDGE OF THE CAP AGAINST THE SURFACE OF THE POLE. NAILS MUST NOT BE DRIVEN THROUGH THE TOP SURFACE OF THE POLE. ALTERNATIVE CAPPING IS ACCEPTABLE IF APPROVED BY ENGINEER.

3. SETTING POLES:
   a) TANGENT LINES – SET ADJACENT POLES TO HAVE GAINS FACING IN OPPOSITE DIRECTIONS.
   b) ANGLE AND DEADENDS – SET ADJACENT POLES TO HAVE GAINS FACE THE ANGLE OR DEADEND STRUCTURE
   c) GRADES – SET POLES TO HAVE GAINS FACE UP THE GRADE.
   d) CROSSING – SET ADJACENT POLES TO HAVE GAINS FACING THE CROSSING STRUCTURES.
   e) LONG SPANS – SET ADJACENT POLES TO HAVE GAINS FACE AWAY FROM THE LONG SPAN.

4 ALL NEW POLES TO BE INTERIOR DOUGLAS FIR, THROUGH BORED AT GROUNDLINE, PENTACHLOROPHENOL (PENTA) TREATED, AND FURNISHED WITH BUTT GAINS AT 3650 MM (12'–0") FROM POLE BASE.

5. ALL POLES TO HAVE AN ALUMINUM DATE TAG INSTALLED INDICATING POLE HEIGHT, CLASS, AND DATE OF INSTALLATION

6. WHEN SETTING POLES IN SOIL THE TOP 300mm (1') OF IN–SITU OVERBURDEN SHALL BE DISREGARDED IN DETERMINING THE REQUIRED POLE SETTING DEPTH.

B. GUYS

1. INSTALL GUYS ONLY WHEN SPECIFIED ON STRUCTURE DATA SHEETS OR CONSTRUCTION DRAWINGS.

2. PROCEED WITH THE INSTALLATION OF SIDE AND LONGITUDINAL GUYS ONLY WHEN GUY HOOK(S) AND BOLT ASSEMBLY HAVE BEEN PERMANENTLY INSTALLED ON THE POLE.

3. ALL GUYS WILL BE PRETENSIONED TO A MAXIMUM LOAD OF 2.5 kN (500 LB).

4. GUY INSULATORS TO BE USED ON ALL 69 kV STRUCTURE GUYS. TOP GUY INSULATOR TO BE LOCATED A MINIMUM OF 2500 mm HORIZONTALLY FROM THE POLE. BOTTOM GUY INSULATOR TO BE LOCATED AT A MINIMUM DIMENSION OF 3000 mm ABOVE GROUND.

5. GUY GUARDS SHALL BE USED ON ALL GUYS.

6. FOR DEADEND TYPE STRUCTURES WITH LINE ANGLES 5° – 30° INCLUSIVE, GUY ANCHOR LOCATIONS TO BE LA/2 + 2'.

7. POLES AT ANGLE OR TERMINAL STRUCTURES SHOULD HAVE GUYS AND ANCHORS INSTALLED BEFORE ANY CONDUCTORS ARE ATTACHED TO THE POLE. BEFORE BACKFILLING AND TAMPING ARE COMPLETE, THE POLE MUST BE RAKED TOWARDS THE GUY BY APPROXIMATELY 300 mm TO COMPENSATE FOR MOVEMENT FROM THE CONDUCTOR TENSIONING AND ANCHOR SETTLING. IT IS IMPORTANT THAT THE POLE NOT BE SET PLUMB AND THEN PULLED BACK WITH THE GUY BECAUSE THIS PRE–STRESSES THE GUY AND POLE AND CAN SIGNIFICANTLY REDUCE THE STRUCTURE'S CAPACITY.

C. HARDWARE

1. WHERE THE END OF A BOLT PROTRUDES MORE THAN 50 mm BEYOND PAL NUT, IT SHALL BE CUT OFF APPROXIMATELY 15 mm FROM NUT AND THE SHARP END OF THE BOLT FILED SMOOTH, THEN LIBERALLY COATED WITH ZINC–RICH PAINT. ALTERNATIVELY, INSTALL SHORTER BOLTS.

2. THE TEETH OF ALL GRID–GAINS SHALL BE COMPLETELY EMBEDDED INTO THE WOOD WITH THE AID OF A HYDRAULIC PRESS.

3. FIELD–DRILLED HOLES IN WOOD COMPONENTS TO BE TREATED WITH AN APPROVED WOOD PRESERVATIVE. FIELD–DRILLED HOLES IN STEEL SHALL BE PAINTED WITH ZINC–RICH PAINT.

4. PAL NUTS ARE TO BE USED ON ALL BOLTS THAT CONNECT COMPONENTS TOGETHER WITH WOOD BETWEEN THEM. HELICAL SPRING WASHERS ARE TO BE USED WHEN THERE IS ONLY METAL.

5. BOND ALL GROUPS OF HARDWARE AS SHOWN ON DRAWING. WIRE SHALL BE WRAPPED ONE COMPLETE TURN AROUND EACH BOLT BETWEEN HARDWARE AND POLE. USE STAPLES WHERE REQUIRED. WHEN GROUNDING IS REQUIRED, SPACE THE STAPLES ON THE WIRE DOWN THE WOOD POLE AT ABOUT 0.5 m SPACING. CARE SHALL BE TAKEN TO ENSURE BONDING WIRE IS NOT NICKED BY ANY SHARP EDGES OF HARDWARE.

6. STRAIN, SUSPENSION, AND TRUNNION CLAMP BOLTS TO BE TORQUED TO MANUFACTURER'S SPECIFICATIONS. IF NO MANUFACTURER'S SPECIFICATIONS ARE PROVIDED THEN USE THE FOLLOWING TORQUING:
   ½" ø BOLTS 50 N.m
   ⅝" ø BOLTS 100 N.m

D. INSULATORS

1. 69 kV LINE POST INSULATORS:

MANUFACTURER	STOCK NO.	DESCRIPTION
~~NGK~~ (LAPP) CL203822075A	~~L2–SN181–23~~	HORIZONTAL CLAMP TOP WITH BENDABLE CURVED BASE
~~NGK~~ (LAPP) CL203744075A1	~~L2–SN181–47~~	VERTICAL CLAMP TOP WITH STUD BASE

2. 69 kV GLASS SUSPENSION, ANGLE, AND DEADEND INSULATORS:

MANUFACTURER	STOCK NO.	DESCRIPTION
SEDIVER	N70/146	GLASS INSULATORS, 146 mm x 254mm, 70 kN

E. CROSSARMS AND CROSSBRACES

1 INSTALL DOUBLE CROSSARMS AND CROSSBRACES ONLY WHEN SPECIFIED ON STRUCTURE DATA SHEET OR CONSTRUCTION DRAWINGS.

2. STEEL CROSSARM AND CROSSBRACES MUST BE BONDED AND GROUNDED.

F. CONDUCTOR CLEARANCES

1. THE MINIMUM CONDUCTOR CLEARANCE TO POLES AND GUY WIRES MUST NOT BE LESS THAN 500 mm.

2. TO OBTAIN THE MAXIMUM CONDUCTOR TO IN–LINE GUY CLEARANCE, POSITION THE HIGHER DEADEND POLE ATTACHMENT ON THE SIDE FACING THE SPAN TO AN ADJACENT STRUCTURE LOCATED AT A LOWER ELEVATION.

WOODPOLE STRUCTURE, GENERAL CONSTRUCTION NOTES (SHEET 1 OF 2)

PROJECT No.	DRAWING No.	REV.
1407	1407–T–1300–1	0

THIS DRAWING IS PROTECTED BY COPYRIGHT LAW AND CANNOT BE REPRODUCED IN ANY MANNER EXCEPT BY WRITTEN PERMISSION OF CLEAN ENERGY CONSULTING INC.

G. ADSS UNDERBUILD

1. ADSS COMMUNICATION CABLE UNDERBUILD TO BE INSTALLED AS PER THE CONSTRUCTION DRAWINGS AND STRUCTURE DATA SHEETS.

2. CONTRACTOR TO LOCATE SPLICES DEPENDING ON REEL LENGTHS PROCURED AND STRINGING SEQUENCE. THE NUMBER OF SPLICES ARE TO BE KEPT TO A MINIMUM AND MUST BE DONE BY SUITABLE PROFESSIONAL.

H. OVERHEAD SHIELD WIRE

1. OVERHEAD SHIELD WIRE TO BE INSTALLED AS PER THE CONSTRUCTION DRAWINGS AND STRUCTURE DATA SHEETS.

I. GROUNDING

1. GROUNDING TO BE INSTALLED IN ACCORDANCE WITH DRAWING 1407-T-4450 AS SPECIFIED ON PROJECT DATA SHEETS.

2. WHERE OVERHEAD SHIELD WIRE IS USED MULTI GROUND ARRANGEMENT REQUIRED. FOR OTHER LOCATIONS USE SINGLE GROUND ROD ARRANGEMENT.

J. SUPPLIER/MANUFACTURER LIST

1. TABLE 1 OUTLINES THE MATERIAL SUPPLIERS/MANUFACTURERS AND THEIR ABBREVIATIONS. THESE ABBREVIATIONS ARE USED ON THE STRUCTURE, FOUNDATION, AND ASSEMBLY DRAWINGS.

   - EXAMPLE: PL-80 (HB) IS A PART MANUFACTURED BY HUGHES BROTHERS.

SUPPLIER/MANUFACTURER NAMES	
COMPANY NAME	ABBREVIATION
ANIXTER	AXR

NOTES

1. ALL DIMENSIONS IN METRES (m) UNLESS NOTED OTHERWISE.
2. COORDINATES ARE IN UTM NAD83 ZONE 8N.
3. ELEVATIONS ARE IN METRES (m) ABOVE MEAN SEA LEVEL (AMSL).
4. 69 kV CONDUCTOR, ADSS CABLE AND OVERHEAD SHIELD WIRE "OHSW" DISPLAYED AT "WET SNOW" (-10° C, 51mm RADIAL SNOW).
5. LINE ANGLE DEFLECTION LOOKING TOWARD EAGLE GOLD PROJECT SITE INDICATED AS FOLLOWS:
   + RIGHT ANGLE DEFLECTION
   - LEFT ANGLE DEFLECTION
6. THIS LINE WILL BE NUMBERED L251 IN THE YUKON ENERGY CORPORATION (YEC) SYSTEM.
7. LEFT (DASH) AND RIGHT (DOT) PROFILE OFFSETS SHOWN AT 5 m CENTERLINE OFFSET.
8. DESIGN TENSIONS SHOWN IN TABLE 1.

TABLE 1

CABLE TYPE	MEAN ANNUAL TEMP (-4° C) FULL TENSION SPANS (N)	MEAN ANNUAL TEMP (-4° C) TERMINAL SPANS (N) (SLACK)	WET SNOW (-10° C, 51mm RADIAL SNOW) FULL TENSION SPANS (N)	WET SNOW (-10° C, 51mm RADIAL SNOW) TERMINAL SPANS (N) (SLACK)
PARTRIDGE ACSR	3,750	550	23,300	3,300

EAGLE GOLD PROJECT
L251 - 69 kV TRANSMISSION LINE
PLAN AND PROFILE (SHEET 50 OF 54)

PROJECT No.	DRAWING No.	REV.
1407	1407-T-1200-50	2

THIS DRAWING IS PROTECTED BY COPYRIGHT LAW AND CANNOT BE REPRODUCED IN ANY MANNER EXCEPT BY WRITTEN PERMISSION OF CLEAN ENERGY CONSULTING INC.

NOTES

1. ALL DIMENSIONS IN METRES (m) UNLESS NOTED OTHERWISE.
2. COORDINATES ARE IN UTM NAD83 ZONE 8N.
3. ELEVATIONS ARE IN METRES (m) ABOVE MEAN SEA LEVEL (AMSL).
4. 69 kV CONDUCTOR, ADSS CABLE AND OVERHEAD SHIELD WIRE "OHSW" DISPLAYED AT "WET SNOW" (-10° C, 51mm RADIAL SNOW).
5. LINE ANGLE DEFLECTION LOOKING TOWARD EAGLE GOLD PROJECT SITE INDICATED AS FOLLOWS:
   + RIGHT ANGLE DEFLECTION
   - LEFT ANGLE DEFLECTION
6. THIS LINE WILL BE NUMBERED L251 IN THE YUKON ENERGY CORPORATION (YEC) SYSTEM.
7. LEFT (DASH) AND RIGHT (DOT) PROFILE OFFSETS SHOWN AT 5 m CENTERLINE OFFSET.
8. DESIGN TENSIONS SHOWN IN TABLE 1.

TABLE 1

CABLE TYPE	MEAN ANNUAL TEMP (-4° C) FULL TENSION SPANS (N)	MEAN ANNUAL TEMP (-4° C) TERMINAL SPANS (N) (SLACK)	WET SNOW (-10° C, 51mm RADIAL SNOW) FULL TENSION SPANS (N)	WET SNOW (-10° C, 51mm RADIAL SNOW) TERMINAL SPANS (N) (SLACK)
PARTRIDGE ACSR	3,750	550	23,300	3,300

NOTES

1. ALL DIMENSIONS IN METRES (m) UNLESS NOTED OTHERWISE.
2. COORDINATES ARE IN UTM NAD83 ZONE 8N.
3. ELEVATIONS ARE IN METRES (m) ABOVE MEAN SEA LEVEL (AMSL).
4. 69 kV CONDUCTOR, ADSS CABLE AND OVERHEAD SHIELD WIRE "OHSW" DISPLAYED AT "WET SNOW" (-10° C, 51mm RADIAL SNOW).
5. LINE ANGLE DEFLECTION LOOKING TOWARD EAGLE GOLD PROJECT SITE INDICATED AS FOLLOWS:
   + RIGHT ANGLE DEFLECTION
   - LEFT ANGLE DEFLECTION
6. THIS LINE WILL BE NUMBERED L251 IN THE YUKON ENERGY CORPORATION (YEC) SYSTEM.
7. LEFT (DASH) AND RIGHT (DOT) PROFILE OFFSETS SHOWN AT 5 m CENTERLINE OFFSET.
8. DESIGN TENSIONS SHOWN IN TABLE 1.

TABLE 1	MEAN ANNUAL TEMP (-4° C)		WET SNOW (-10° C, 51mm RADIAL SNOW)

Subject: VG_CB201 - ADR Grounding Plates
Date: Sunday, August 19, 2018 9:46:57 AM
Importance: High

Garry,

After this morning's meeting I checked on the status of RFIs related to grounding. The only one I can find was related to ground grid depth (RFI-024). This was responded to on the 13th.

I don't have an rfi specific to replacement of ground rods with plates or sizing of plates. However I know these have been discussed.

So please proceed with the following related to the grounding at the ADR:
1: Ground rods specified on the drawings can be replaced with ground plates
2: Size of grounding plates can be 300mm x 300mm or similar in size.

To formalize this, please ensure an RFI is sent ASAP and we will attach this email as the response.

Thanks.

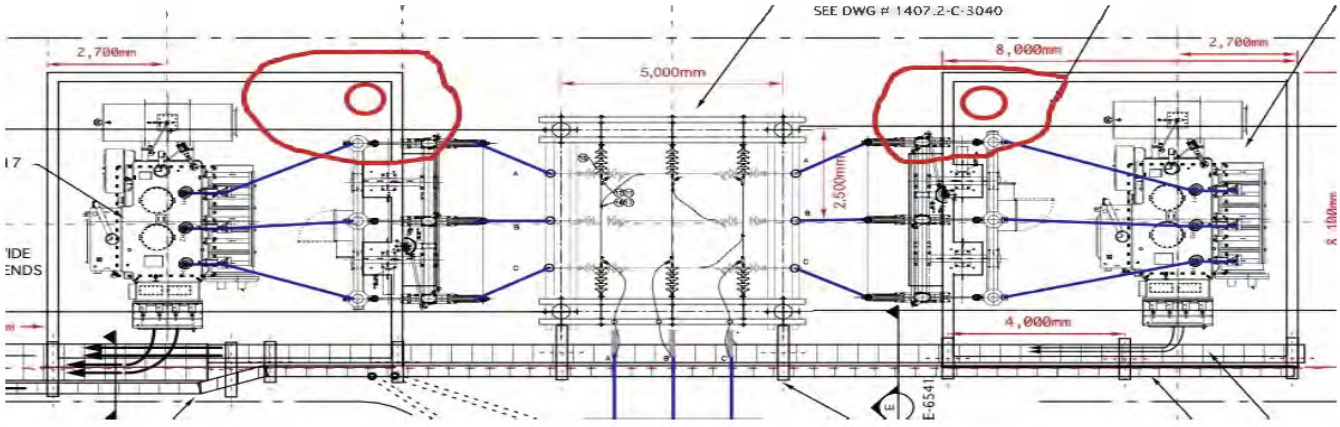
Question from Jackson Wenger (Clark Builders - Edmonton) at 08:41 PM on 10/10/2018



Clark Builders is requesting to use a 16” metal culvert for the substation sump block out. Please advise if acceptable.

Attachments:
3E52290B-518D-4385-ADBE-EBF6FD356DCA-261-000000085962243A_image.jpg

Awaiting an Official Response

All Replies:

Galvanized culvert is fine. Drill some holes neaer the bottum to let the water in. (Touch up with Galvicon paint)
Also note, as indicated on the grounding drawing the metal pipes will have to be grounded.
Please install both on the east side. As per the drawings since T2 foundation is "turned around" the sump would have fallen on the west side and would have been inconveniently been under the cable tray.

Question from Jackson Wenger (Clark Builders - Edmonton) at 01:22 PM on 07/10/2018

Clark Builders is requesting permission to substitute grounding plates in lieu of 3000mm deep grounding rods indicated in 3000-260 drawings (coarse, tertiary, overland, and ore prep./lime addition conveyors).

Awaiting an Official Response

All Replies:

Substitution is not acceptable as a global response to all ground rods as shown in the drawings. Wherever possible ground rods shall be used.
Understanding that there are a few areas only where there is immediate bedrock that would otherwise prevent the installation of a ground rod, for those areas, the location of the rod can be moved a few meters outside the area (along the routing of the perimeter ground conductor , or a ground plate will need to be used if that moves it more than 10 meters. All instances of substitution shall first be approved by Sven or Don on site and marked up accordingly in the drawings.
Ground rods can also be inserted at a 45 degree angle if needed.

Question from Ryan de Milliano (Clark Builders - Edmonton) at 04:46 PM on 09/11/2018

Reinforcing steel supplier has provided 15M bars for horizontals on detailed module foundations. The design notes 16x20M for the foundations. We are requesting to use the delivered 15M bars to avoid any schedule delay. There is contingency 15M reinforcing if additional 15M reinforcing is required.

Attachments:
2E8FF2BA-2A44-4AD4-9B17-162E6CE9F3FB-37826-00000A86685A9185_image.jpg

Awaiting an Official Response

All Replies:

Our structural engineer, Jim MacKenzie reports:

"I don't need 20M on the sides but to keep things simple I used 20M instead of 15M so for the 4 on the sides we are Ok with 15M. For the top and bottom 12 bars total we need 50 percent more, (area if we use 15M) so 6 more 15M if that is what we have lying around. That would result in 9 top, 9 bottom, and 4 sides for a total of 22 bars all 15M instead of what is shown now as 16 bars all 20M. "

Consequently it is required that (a) provide 20 M for top and bottom bars or (b) use 9 (nine) 15 M on the top and 9 (nine) 15M on the bottom and (c) the 2 bars on each side can be 15M.

Please advise which solution you choose.

NO.	ITEMS TO BE INSPECTED	INSPECTED BY: CONTRACTOR	INSPECTED BY: CLIENT
1.	Materials conform to specification	NB	
2.	Grounding installations conform to drawing and specification	NB	
3.	Terminations to equipment conform to project standard drawing	N/A	
4.	Location, type, size and insulation colour as per drawing	NB	
5.	Thermal connections checked (no cold joints or burn outs)	N/A	
6.	Thermal connections are insulated	N/A	
7.	System grounding rod resistance to ground measurements in accordance with specification - record these measurements	N/A	
8.	Bonding to equipment and structural steel installed as per drawing. Measure resistance between ground conductor and tagged equipment bus bars, tagged equipment enclosures, structural steel surface in addition to all other items designed on the drawing. Record test results	N/A	
9.	Continuity between ground conductor and conduit, metal junction boxes and between sections of cable tray verified and found correct	N/A	
10.	High quality ground installation conform to specification	NB	
11.	All revisions recorded on "As built" drawing	NB	
12.	"As built" signed off, transmitted and recorded	NB	
13.	Manufacturer's commissioning procedures available and followed	N/A	
14.	Manufacturer's commissioning report available and recorded	N/A	
15.	Relative deficiencies list closed-out	N/A

Bare Copper, Solid and Stranded

Applications
Solid (medium-hard or hard-drawn temper) for use in overhead, outdoor applications for distribution circuits.
Stranded (hard-, medium-hard or soft-drawn temper) for grounding.

Specifications
- SOLID: ASTM B-1=Hard-drawn temper; ASTM B-2=Medium-hard-drawn temper; ASTM B-3=Soft-drawn temper
- STRANDED: ASTM B-8=Concentric lay, Class B or Class C

SOLID
All part numbers are for soft-drawn temper. For other tempers use the suffix "H" for hard-drawn or "M" for medium-hard-drawn temper, (e.g. 1A-0801H). Diameters and weights may vary among manufacturers.

Ground Rods

Sectional type Ground Rods

- Sectional type ground rods have the same high-quality as regular copper bonded steel ground rods and are threaded top and bottom

Cat. No.	Trade Size in.	Trade Size ft.	Rod Size (nominal diameter x length) mm	Rod Size (nominal diameter x length) m	Plating Thickness	Thread Size	Standard Packaging	Weight per 100 lb.	Weight per 100 kg
5008ES	1/2	8	12.7	2.4	10 mils	5/16–12	5	546	248
5010LS		10		3.0				682	309

6260S		10		3.0				837	384
7506S	3/4	6	17.3	1.8	5 mils	3/4–10		774	160
7508S		8		2.4	10 mils			992	450
7510S		10		3.0				1040	562
10108	1		25.4			8–1	1	2246	1020

CSA lists rods 1/2 in. and larger, 10 ft. and longer.

Couplings

- Threaded couplings are made of high-strength, corrosion resistant alloy. Streamlined design reduces driving friction. Couplings are tapped for use on all standard threaded sectional rods

Cat. No.	Rod Size Diameter (in.)	Thread Size	Standard Packaging	Weight per 100 (lb.)
50LC	1/2	9/16 in. – 12 UNS	25	17
60C	5/8	5/8 in. – 11 UNS		25
70C	3/4	3/4 in. – 10 UNS		38
80C	1	1 – 8 UNS	10	75

Driving Studs

- Driving Studs of high-strength steel
- May be used with all standard threaded couplings

Cat. No.	Rod Size Diameter (in.)	Thread Size	Standard Packaging	Weight per 100 (lb.)
50LDS*	1/2	9/16 in. – 12 UNS	10	16
60DS*+	5/8	5/8 in. – 11 UNS	25	29
70DS*	3/4	3/4 in. – 10 UNS	5	35
80DS	1	1 – 8 UNS	10	75

* UL Listed
+ CSA Certified

Ground Rods

Galvanized Ground Rods

- Made of high-strength quality cold drawn steel (1035) hot dip galvanized
- Meets ANSI C135.30-1979 requirements
- Stainless steel rods are also available (for more detailed information, contact your T&B Regional Sales Office)

Cat. No.	Trade Size		Rod Size (nominal diameter x length)		Plating Thickness	Standard Packaging	Weight per 100	
	in.	ft.	mm	m			lb.	kg
GR5006	1/2	6	12.7	1.8		10	410	186
GR6256				1.8			600	272
GR6258 (0.620 – 0.630)		8		2.4			800	363
GR6250 (0.555 – 0.565)	5/8		15.9					
GR6260 (0.620 – 0.630)		10		3.0	4 mils	5	1000	454
GR6250B* (0.555 – 0.565)								
GR7506	3/4	6	19.1	1.8			700	318
GR7508 (0.745 – 0.755)		8		2.4			1200	545
GR7510 (0.745 – 0.755)		10		3.0			1500	681

* B suffix denotes black iron bare steel ground rod (CSA not applicable).
CSA lists rods 1/2 in. and larger, 10 ft. and longer.

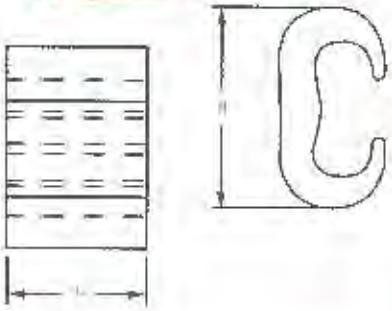
Copper Bonded Steel Ground Rods

- All EZGroundGround™ ground rods have a heavy uniform covering of electrolytic copper bonded to a rigid steel core
- Copper ions are forced electrically to join with the steel core establishing a corrosion-resistant bond between the copper and the steel

Cat. No.	Trade Size		Rod Size (nominal diameter x length)		Plating Thickness	Standard Packaging	Weight per 100	
	in.	ft.	mm	m			lb.	kg
5005	1/2	5	12.7	1.5	10 mils	10	305	138
5006		6		1.8			370	168
5008		8		2.4			545	247
5010		10		3.0			611	277
6256	5/8	6	15.8	1.8		5	508	230
6258*		8		2.4			678	308
6260*		10		3.0			847	384
7508*	3/4	8	19.3	2.4			992	450
7510*		10		3.0			1240	462
1010*	1		25.4			1	2248	1020

* Ground rods are UL Listed (4256), except for regular rods shorter than 8 ft. or less than 1/2 in.
CSA lists rods 1/2 in. and larger, 10 ft. and longer.

Knurling Die for 14- & 15-Ton Tools



Cat. No.	Description
1550SS	For 5/8 in. and 3/4 in. ground rods

Used to knurl ground rods in order to increase the pullout value of the compression connection by as much as 20%. Use hand knurling tool Cat. No. 240-31565-94 for all ground rods.

Question from Jackson Wenger (Clark Builders - Edmonton) at 08:41 PM on 10/10/2018

Clark Builders is requesting to use a 16" metal culvert for the substation sump block out. Please advise if acceptable.

Attachments:
3E52290B-518D-4385-ADBE-EBF6FD356DCA-261-000000085962243A_image.jpg

Official Response: **Ryan de Milliano (Clark Builders - Edmonton)** *responded on Friday, October 19th, 2018 at 6:26PM MDT*
Engineer Response:

Galvanized culvert is fine. Drill some holes near the bottom to let the water in. (Touch up with Galvicon paint)
Also note, as indicated on the grounding drawing the metal pipes will have to be grounded.
Please install both on the east side. As per the drawings since T2 foundation is "turned around" the sump would have fallen on the west side and would have been inconveniently been under the cable tray.

W. Neil Brazier Oct 11, 2018

Question from Ryan de Milliano (Clark Builders - Edmonton) at 04:46 PM on 09/11/2018

Reinforcing steel supplier has provided 15M bars for horizontals on detailed module foundations. The design notes 16x20M for the foundations. We are requesting to use the delivered 15M bars to avoid any schedule delay. There is contingency 15M reinforcing if additional 15M reinforcing is required.

Attachments:
2E8FF2BA-2A44-4AD4-9B17-162E6CE9F3FB-37826-00000A86685A9185_image.jpg

Official Response: **Ryan de Milliano (Clark Builders - Edmonton)** *responded on Sunday, November 11th, 2018 at 6:16PM MST*

Our structural engineer, Jim MacKenzie reports:
"I don't need 20M on the sides but to keep things simple I used 20M instead of 15M so for the 4 on the sides we are Ok with 15M. For the top and bottom 12 bars total we need 50 percent more, (area if we use 15M) so 6 more 15M if that is what we have lying around. That would result in 9 top, 9 bottom, and 4 sides for a total of 22 bars all 15M instead of what is shown now as 16 bars all 20M."
Consequently it is required that (a) provide 20 M for top and bottom bars or (b) use 9 (nine) 15 M on the top and 9 (nine) 15M on the bottom and (c) the 2 bars on each side can be 15M.
Please advise which solution you choose.
W.N. Brazier, P.Eng. 10 Nov, 2018

Project Name:	Eagle Gold Mine	Facility:	LFG	ITP number:	FBE-1
Contract Number:	CCPL Pipeline Installation	Contractor:	FORBES BROS LTD	ITP Revision:	1

Definitions - Inspection points:

1. Hold Point: A 'hold' point is a mandatory stop at a point beyond which work may not proceed without the expressed or implied consent of the witnessing party.
2. Witness point: A 'witness' point advises another party to verify the inspection or test which is to be progressed at their option.
3. Review point: A 'review' point is a point at which the person / organization doing the work verifies the details as the work is performed, and records a statement or checklist verifying that the work meets the specific requirements specified.
4. Other types of inspection and hold points may be specified in contract documents.

Types of Work	Responsibility during construction
1 Prime	QC Supervisor, Foreman for in-house staff personnel
2 Geotechnical	QC & Construction Representative for Piling, Geotechnical and Instrumentation Installation
3 Electrical	QC Supervisor, Foreman, Electrical Contractor, Electrical Consultant
4 Instrumental	QC Rep, Instrument Technician & Site Representative
5 Construction Manager	Site Representative - Responsible and supervise all activities on the Project Site
6 Mechanical - Pipelines (e.g. Structural, Steel, etc.)	
7 Contractor	
8 Manufacturer (e.g. Fabricator)	
9 Other	

Other Remarks for the ITP:

Other Records for the ITP may be kept by Vendors or Contractors, but need, in a minimum, to hold the following information for Verify:

- Quality reference for a spec, drawing, site specific Matrix for acceptable material descriptions, project type ITP/QCP, attached, Shell, warning signs
- Clear suggestion of recommendations
- Quality Hold is to be pointed out and referenced, approval time allowed Management approvers end dates

Project Quality Frequently Include:

1. Task / Inspection Incrementally Above, etc. Is not Final
2. Notes and comments regarding specific ITP's
3. Specific deviations, equipment and personnel inspection ITP's
4. Testing Use and Acceptance results, credible data as cumulative records of Verify, materials, equipment and personnel Qualifications
5. Hold reviewing, witnessed and any results, check completed and signed off's
6. Commissioning, post commissioning, final inspections, and Manager records, Performance data, etc.

Powerplant Generation Services

Inspection and Test Plan (ITP)					
Project Name:	Kruger Gold ASVP	Location:	[illegible]	ITP Number:	HAS-1
Contract Number:	CC432 - Power Plant Installation	Customer:	FORBES BROS LTD	ITP Revision:	1

Definitions / Interpretations:

1. "Hold Points" A "hold" point is a mandatory stop or pause beyond which work may not proceed without the inspection and being verified by another party.
2. Witness points: A "witness" point allows another party to verify the completion at that point which it is in progress, or is not applied.
3. Review Point: A "review" point is a point at which the person responsible for the work verifies that quality (or the working performance) and records a statement of conformance certifying that the work meets the quality requirements and specified.
4. Other terms: All other terms and phrases may be specified in the text and Schedule.

Types of Tests	Responsibility Assignment (Legend)
1. Visual	[illegible]
2. Dimensional	[illegible]
3. Chemical	[illegible]
4. Hard Tests	[illegible]
5. Inspection and Measure	[illegible]
6. Performance Witness e.g. drawings, data, docs	
7. Functional	
8. Hold Point (Yes or No) - add reasons	
9. Others	

Other Issues for the ITP:

What formats for the ITP may be used by Vendors or Contractors, but must, at a minimum, include the following information. As many
Quality criteria in a shop drawing, etc. which meets the accreditation requirements as outlined in the Table of Hold, Witness, Audit requirements.
Clear assignment of responsibilities.
Quality records to be provided and submitted, to whom and when allowed dependent upon timing and value.

Project Quality Documents Include:

1. Test connection, inspection tests, etc. from client
2. Initial and updated QCP documents, [illegible]
3. Initial, modified, approved Accepted Vendor ITP.
4. Certified material inspection records. Certificates of conformance required to follow, and this document and included for Quality ITP's
5. Field monitoring, inspection and test results. Field completed and signed ("F").
6. Commissioning, pre-commissioning, final inspection, walk through reports, Deficiency lists, etc.

5.3	Tagging of Conductor and Overhead	• Approved Work Construction Specifications, section 5.3.3 • IESO OHL Std. • Arranging Tagging Charts	a) The overhead span must be as shown on drawing for the span to be per IESO Std. b) The conductor tension of each phase to be used is: Length of Ruling Span Tension of Conductor in lbs 2 to 6 spans 1 7 to 14 spans 2 15 to 20 spans 3 c) The maximum allowable sagging tolerance to be applied for each phase shall be as per IESO Std.	Contractor Owner / Representative		PM CM	TA	Feb 15 2019	NA	FEB 16/19
5.4	Inspection and Acceptance of Construction and Commissioning	• Approved Construction Specifications, section 7.3 • IESO Standards	a) All tools to be used shall be available at a TA at site. b) Verify all hardware is installed as per the drawing. c) Verify all conductor attachments and/or connections are installed.	Contractor Owner / Representative		PM CM	TA		NA	
5.5	Guy Construction and Installation	• Approved Construction Specifications, section 7.5 • IESO Standards	a) Guy wire shall be placed in a way shown on the drawings. b) The hardware assembly shall be installed as per the drawings. c) The contractor shall provide and use a "guy pull" gauge for verification of the tension of each guy wire to the recommended value. d) Temporary guy wires for blade to maintain a straight alignment with the centerline of both ends of the line.	Contractor Owner / Representative		PM CM	TA		NA	
5.6	Stringing of Conductor and Cables	• Approved Construction Specifications, section 7.6 • IESO Standards	a) Conductor tension shall not exceed the maximum allowable tension as per the drawings. b) Conductors and cables shall be protected from damage during the stringing operation. c) Conductors and cables shall be installed in such a manner as to not damage the conductor or cable.	Contractor Owner / Representative		PM CM	TA		NA	
5.7	Visual Vibration Damper (VVD) and Inverter Loop Installation	• Approved Construction Specifications, section 7.7 • IESO Standards	a) All conductor vibration dampers shall be installed according to the drawings and the manufacturer's installation specifications. b) Inverter loop and conductor shall be installed to ensure no contact between the conductor and the loop.	Contractor Owner / Representative		PM CM	TA		NA	
5.8	Completion Deficiencies (Commissioning)	• Approved Construction Specifications, section 7.8 • IESO Standards • Deficiency List	a) The equipment shall be inspected for deficiencies. b) Deficiencies to be recorded. c) Deficiencies shall be rectified.	Contractor Owner / Representative		PM CM	TA		NA	

Forbes Bros

Project Name:	[illegible]	Facility:	CFH	ITP number:	[illegible]
Contract Number:	CFBH - Preventive [illegible]	Contractor:	FORBES BROS LTD	ITP Version:	1

Definitions - Inspection points:

1. Hold Point - A "hold" point is a predefined stop at a point beyond which work may not proceed without the acceptance or witnessing verified by another party.
2. Witness point - An "witness" point means advance notice is given to the appropriate party when a specified activity is to be carried out, so that, if they so desire, they may be present at that point.
3. Review point - A "review" point is a point at which the relevant [illegible] is undertaking the work verifies the quality of the work's performance and records a statement or document to that effect and [illegible] that the work meets the quality requirements specified.
4. Other types of inspections and may specifically be identified if required and defined.

Types of Test	Responsibility Assignment Legend
1 Visual	(a) Supervisor: Responsible for ensuring work operations
2 Dimensional	(b) Quality Officer: Responsible for [illegible] and management coordination
3 Chemical	(c) Engineer: Provides engineering support for the Commercial Director
4 Destructive	(d) [illegible]: Responsible for [illegible]
5 Compression Strength	(e) Responsible: Responsible and carries out a particular task
6 Mechanical Analysis e.g. UV strength, Slump, Sieve	
7 Electrical	
8 Non-Destructive e.g. radiography	
9 Other	

Other formats on the ITP:

Other formats for the ITP may be used by Principal or Contractor, but must, at a minimum, include the following information / features:

Quality compliance to the spec., drawing, and, where there are relevant standard construction codes / best practice / industry standards recommended.

Clear acceptance or response criteria.

Quality hold to be provided and submitted / approved prior allowed to proceed to previous work done.

Record Quality Requirements include:

1. Test / inspection reports results, Report, etc. Action taken
2. Defect and rejected Work summaries (NCR's).
3. Work completed, approved and progress claimed (IPC).
4. Update log and inspection results, modifications or corrections / work completed, approved and assessed summaries (NCR).
5. Performance, inspection and test results, final compliance and signoff (ITP's).
6. Commissioning, pre-commissioning, final inspection work through results, Deficiency sets, etc.

Inspection Test Plan - Short					
Project Name:	Light Gold Mill	Facility:	LGM	ITP Initiated:	Add-E
Contract Number:	CLDV- Preventive Installations	Contractor:	United States LLC	ITP Version:	1

Definitions - Inspection points:

1. Hold Point: A 'hold' point is a mandatory stop in a work sequence to verify work requirements and confirm the acceptance of the item being verified by another party.
2. Witness Point: A 'witness' point allows another party to carry out the inspection or test and if it is acceptable, allow work to proceed.
3. Review Point: A 'review' point is a point at which the primary organization doing the work verifies the quality of the work is performed, and passes it to customer or third party for the next work item or inspection requirements are met.
4. Other types of inspection and documentation may be specified if required (add further).

	Type of Test	Responsible Person / Organization
1	Visual	QA Approval, Responsible for review and approval
2	Dimensional	QC Coordinator, Responsible for Review, Witness and sign for acceptance/rejection
3	Cleanliness	QC Support Provides support services that complement Control
4	Functional	Quality Assurance collects and stores the information
5	Control Measurements	Construction Supervisor and owner's representative
6	Reference Use Reference e.g. drawings, charts, etc.	
7	Electrical	
8	Non-Destructive e.g. Ultrasonic	
9	Other	

Other Comments And Use ITP:

Client Comment: Use this ITP may be used by Vendors or Contractors. It is meant to be a minimum, include the following information: As-built

Drawing reference no e.g. spool drawing, etc., which shows the area/work sequence / penetration or circuit / line of test - witness, hold, review points

Mark up comments or recordings here

Quality review & sign-off to be completed and authorised & approved (Client or Client's Representative) signature and date

Project Quality Documents Include:

1. Test / inspection requirements, forms / set, Asset Cards
2. Install and capture 'as-built' photographs (QA's)
3. Install, modify & approved (and permitted Vendor (CP))
4. Vendor test and inspection results / certificates or completion records 'Active' conditions, approved and accepted / concession (if) –
5. Hold point issues, concessions and non-cons, these completed and signed (if)
6. Commissioning, pre-commissioning, Work completion, work through Agents, Delivered (QA's, etc)

Megger Ground Rod Report

Date	Oct 29 2018	**Line No**	L251
Project #	4581	**Project Name**	Eagle Gold 69 Kv
Structure Type		**Structure No.**	0/10A - 1/2

Checklist

Structure #	Ground Rod Distance from Structure	Length of Ground Rods Installed	Soil Condition	Measured Resistance (ohms)	Foundation Type
0/10A	2.82 m	10ft	Gravel	75 Ω	Groundwell
0/10B	2.82 m	10ft	Gravel	7.8 Ω	Groundwell
0/10C	2.82 m	10ft	Gravel	20 Ω	Groundwell
0/11	2.82 m	10ft	Gravel	22.7 Ω	Groundwell
0/12	2.82 m	10ft	Gravel	17.1 Ω	Groundwell
0/13	2.82 m	10ft	Gravel	15.7 Ω	Groundwell
0/14	2.82 m	10ft	Permafrost	43 Ω	Groundwell
1/1	2.82 m	10ft	Permafrost	120 Ω	Groundwell
1/2	2.82 m	10ft	Permafrost	70 Ω	Groundwell

Additional Comments:

Used Erico GEM Grout. Ground rods set at 5.5m
4 single ground rods placed 4m apart at each structure
AS PER RFI-037 - no additional ground rods to install to meet your 13. OHMS, No steel casing used

Clipping Inspection

Project No.	4581	Project Name	Eagle Gold 69 KV		
Line No.	L251	From Structure No.	32/8	To Structure No.	37/9

Checklist

Items	Inspected	Comments
Verify if Required, any crossing Permits and agreements are in place	Y ☐ N/A ☑	
Verify Conductor is sagged as specified	Y ☑ N/A ☐	
Insulator strings on at least 3 suspension structures adjacent to the new sag section clipped in	Y ☑ N/A ☐	
Verify all Insulators & conductor hardware is clean & free of defects	Y ☑ N/A ☐	
Travelers removed and conductor clipped in as per specifications	Y ☑ N/A ☐	
Verify Suspension clamp is plumb and centered on conductor point mark	Y ☑ N/A ☐	
Compression joints required in sagged span and recorded	Y ☐ N/A ☑	
All assemblies are made in strict accordance with the manufacture applicable specifications	Y ☑ N/A ☐	
Sagged conductor is free from any Bird caging/damage and does not required any repair	Y ☑ N/A ☐	
Verify no metal contact made with Insulators and no conductor damage during Clipping procedure	Y ☑ N/A ☐	

Additional Comments

No compression or implos used
32/8, 35/3,37/9 deadend hardware and insulators have been verified as correct as per drawing

CONCRETE REINFORCEMENT PRE POUR

Rev 01 August 25, 2018

SUBCONTRACTOR: Ultimate Reinforcing // McNish	INSPECTION DATE: NOV 7 2018
SUBCONTRACTOR CONTACT PERSON: GARRY DAHL	PROJ. POUR DATE: NOV 9 2018
INSPECTOR(S): GARRY DAHL / Clean Energy & MASS CREEK	
LOCATION: Substation	
DRAWING REV: 1	DRAWING NO.(S): Clean Energy 1407.2-C-3015 SPEC SECTION(S): S03 20 00 – Concrete Reinforcing Steel

ITEM	ITEMS TO BE CHECKED	PASS	FAIL	N/A
1.0	Grade (400W unless otherwise noted) and type of steel delivered and installed as required by approved drawings.	☑	☐	☐
2.0	Inspect rebar distribution, spacing and cover per design/project requirements.	☑	☐	☐
3.0	Length of splices as specified	☑	☐	☐
4.0	Staggered splices as specified	☑	☐	☐
5.0	Any mechanical splices have been approved by the owner prior to install	☑	☐	☐
6.0	Bars cleaned and free of material that may reduce bond including loose rust, scale, oil, structural defects and that they are uncoated and unpainted.	☑	☐	☐
7.0	Dowels at wall ends, construction joints, and openings as specified (length, location, size, etc.)	☑	☐	☐
8.0	No unauthorized field bent bars including hooks installed	☐	☐	☑
9.0	Resolve conflicts between embedded items and reinforcement	☐	☐	☑
10.0	When authorized, field bends done without heat and inspected for fissures or cracks.	☐	☐	☑

ITEM	ITEMS TO BE CHECKED	PASS	FAIL	N/A
11.0	Bars tied and supported to prevent displacement	☑	☐	☐
12.0	Spacers, tie wire and chairs as required	☑	☐	☐
13.0	Conduits at design location and minimum separation from rebar as specified	☑	☐	☐
14.0	No contact of bars is made with dissimilar metals as per CSA A23.1	☑	☐	☐
15.0	Bars, nails or tie wire not sticking out from surfaces that allow rusting/corrosion	☑	☐	☐
16.0	Rebar welds are inspected by qualified inspectors certified to CSA W178.2	☐	☐	☑
17.0	No rebar congestion or other obstruction for deposit of concrete	☑	☐	☐
18.0	Adjustments required for interfering items (piping, inserts, sleeves, etc.) have been submitted and approved by owner.	☑	☐	☐
19.0	Rebar was stored off ground to prevent damage/corrosion	☑	☐	☐
20.0	Review drawings for anchors, piping, sleeves, boxes	☑	☐	☐

COMMENTS:

Inspection on Transformer Base and circuit switcher
- NOT ABLE TO VERIFY CIRCUIT SWITCHER ANCHOR PLACEMENT AT TIME OF INSPECTION. TO BE VERIFIED BEFORE POUR
- CONDUIT SLIGHTLY OFF CENTRE (~150mm) DOES NOT CONFLICT WITH ANCHORS :- OKAY AS CONFIRMED W/ ELECTRICAL SUPERINTENDENT DON CARTER

ATTACHMENT(S):

DEFICIENCIES NOTES:

- 2 LONGITUDINAL BARS ADDED TO T1 PEDESTAL PAD (2700 LONG) NCR
- 4 CORNER VERTICALS ADDED TO T2 TRANSFORMER PLINTH NCR

SPEC SECTION(S): 03 10 00	

ITEM	ITEMS TO BE CHECKED	PASS	FAIL	N/A
1.0	Location, survey, dimension and grades as required	☑	☐	☐
2.0	Plumbness and Flatness verified	☑	☐	☐
3.0	Joints are aligned and watertight.	☑	☐	☐
4.0	Formwork shop drawings are Engineered and reviewed	☐	☐	☑
5.0	Re-used formwork reconditioned and treated	☑	☐	☐
6.0	Formwork and ties according to finishing requirements. Confirm no holes in the concrete surface are greater than 25mm in diameter or expose steel at less than 25mm from surface. As per spec.	☑	☐	☐
7.0	Installation of embeds are located and secured	☑	☐	☐
8.0	Chamfer requirements checked. 25mm chamfers required for all exterior corners and edges exposed to view including horizontal edges of pads.	☑	☐	☐
9.0	Key ways and/or other provisions according to design are provided in construction joints	☐	☐	☑

ITEM	ITEMS TO BE CHECKED	PASS	FAIL	N/A
10.0	Inspect types of form spacers, ties and bracing.	☑	☐	☐
11.0	Spacing of ties to be set to a pattern	☑	☐	☐
12.0	Expansion, construction, contraction joints as required & located as coordinated with structural Engineer	☑	☐	☐
13.0	Forms secured against movement during placing	☑	☐	☐
14.0	Forms are braced for alignment and blow out	☑	☐	☐
15.0	Forms are cleaned of all debris, and dry, prior to concrete placement including standing water	☑	☐	☐
16.0	Openings in formwork permit inspection and cleaning, placing and compaction of concrete, and forming and processing of construction joints.	☑	☐	☐
17.0	Formwork has been coated with release agent prior to rebar placement	☑	☐	☐
18.0	Anchor Bolts and Embeds are secured to formwork.	☐	☐	☑

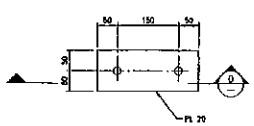
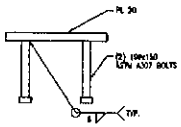
SECTION A
1:25



SECTION B
1:25



DETAIL 1
1:10

SECTION C
1:10

DETAIL 2
1:5

SECTION D
1:5

NOTES:

1) ALL CONCRETE WORK SHALL CONFORM TO THE REQUIREMENTS OF NBC 2015 AND:
   A. CAN/CSA-A23.1-14 CONCRETE MATERIALS AND METHODS OF CONCRETE CONSTRUCTION
   B. CAN/CSA-A23.2-14 METHODS OF TEST FOR CONCRETE
   C. CAN/CSA-A23.3-14 DESIGN OF CONCRETE STRUCTURES
2) CAST-IN-PLACE CONCRETE SHALL HAVE A MINIMUM COMPRESSIVE STRENGTH OF 30MPa AT 28 DAYS UNLESS NOTED OTHERWISE.
3) COLD WEATHER PLACING METHODS OF CONCRETE WORK SHALL CONFORM TO CAN/CSA-A23.1
4) REINFORCING STEEL SHALL BE DEFORMED BARS CONFORMING TO CAN/CSA-G30.18. ALL REINFORCING STEELS SHALL BE MINIMUM GRADE 400MPa.
5) GEOTECHNICAL BASIS OF AS "GEOTECHNICAL RECOMMENDATIONS FOR SUBSTATION STRIP FOOTINGS" DATED 17 SEPT 2018, BY WSP-GOLDER IN GENERAL.

BEARING SURFACE: 100mm THICK LAYER OF CRUSHED 20mm MINUS GRAVEL COMPACTED TO 98% SPMDD.
BACKFILL: GRANULAR FILL COMPACTED TO 98% SPMDD.

Measurement of Soil or Aggregate Resistivity using Two-Electrode Soil Box Method

ASTM G 187-12

Project No:	ENG.WARC03235-03	**Sample No.:**	2703
Project:	Eagle Gold Project	**Date Received:**	24-Sep-18
Client:	JDS Energy & Mining	**Sampled By:**	Client
		Date Tested:	27-Sep-18
Attention:	R Bilobrowka **Ph:**	**Tested By:**	MA
Email:		**Office:**	Edmonton

Description:	40-20 mm Insulating Gravel	Temperature of sample;	
Source:	N:7098841, E:458324, Washed 38 mm Minus	As collected :	°C
Sample Location:	Stockpile Adjacent Finning Staging Area	As Tested :	°C
Model of meter:			

Resistivity of Aggregate (Wetted Condition)

Resistivity = R x S / L

Box Used: **TB 4**

Sample Temperature: **20.0 °C**

Where :	L = Length of sample box (cm)	L =	44.8	cm
	h = height of sample in box	h =	19.8	cm
	S = Cross-sectional area of sample (cm^2)	S =	390.06	cm^2
	R = Resistance (Ohms)	R =	120000	Ohms

Resistivity = 120000 x 390.06 ÷ 44.8 ÷ 100

Resistivity = **10450** Ohm•m

Remarks:

Wetted with distilled water

Clipping Inspection

Project No.	4581	Project Name	Eagle Gold 69 KV		
Line No.	L251	From Structure No.	32/8	To Structure No.	37/9

Checklist

Items	Inspected	Comments
Verify if Required, any crossing Permits and agreements are in place	Y ☐ N/A ☑	
Verify Conductor is sagged as specified	Y ☑ N/A ☐	
Insulator strings on at least 3 suspension structures adjacent to the new sag section clipped in	Y ☑ N/A ☐	
Verify all Insulators & conductor hardware is clean & free of defects	Y ☑ N/A ☐	
Travelers removed and conductor clipped in as per specifications	Y ☑ N/A ☐	
Verify Suspension clamp is plumb and centered on conductor point mark	Y ☑ N/A ☐	
Compression joints required in sagged span and recorded	Y ☐ N/A ☑	
All assemblies are made in strict accordance with the manufacture applicable specifications	Y ☑ N/A ☐	
Sagged conductor is free from any Bird caging/damage and does not required any repair	Y ☑ N/A ☐	
Verify no metal contact made with Insulators and no conductor damage during Clipping procedure	Y ☑ N/A ☐	

Additional Comments

No compression or implos used
32/8, 35/3,37/9 deadend hardware and insulators have been verified as correct as per drawing

CONCRETE REINFORCEMENT PRE POUR

Rev 01 August 25, 2018

SUBCONTRACTOR: Ultimate Reinforcing // McNish	INSPECTION DATE: NOV 7 2018
SUBCONTRACTOR CONTACT PERSON: GARRY DAHL	PROJ. POUR DATE: NOV 9 2018
INSPECTOR(S): GARRY DAHL / Clean Energy & MASS CREEK	
LOCATION: Substation	
DRAWING REV: 1	DRAWING NO.(S): Clean Energy 1407.2-C-3015 SPEC SECTION(S): S03 20 00 – Concrete Reinforcing Steel

ITEM	ITEMS TO BE CHECKED	PASS	FAIL	N/A
1.0	Grade (400W unless otherwise noted) and type of steel delivered and installed as required by approved drawings.	☑	☐	☐
2.0	Inspect rebar distribution, spacing and cover per design/project requirements.	☑	☐	☐
3.0	Length of splices as specified	☑	☐	☐
4.0	Staggered splices as specified	☑	☐	☐
5.0	Any mechanical splices have been approved by the owner prior to install	☑	☐	☐
6.0	Bars cleaned and free of material that may reduce bond including loose rust, scale, oil, structural defects and that they are uncoated and unpainted.	☑	☐	☐
7.0	Dowels at wall ends, construction joints, and openings as specified (length, location, size, etc.)	☑	☐	☐
8.0	No unauthorized field bent bars including hooks installed	☐	☐	☑
9.0	Resolve conflicts between embedded items and reinforcement	☐	☐	☑
10.0	When authorized, field bends done without heat and inspected for fissures or cracks.	☐	☐	☑

ITEM	ITEMS TO BE CHECKED	PASS	FAIL	N/A
11.0	Bars tied and supported to prevent displacement	☑	☐	☐
12.0	Spacers, tie wire and chairs as required	☑	☐	☐
13.0	Conduits at design location and minimum separation from rebar as specified	☑	☐	☐
14.0	No contact of bars is made with dissimilar metals as per CSA A23.1	☑	☐	☐
15.0	Bars, nails or tie wire not sticking out from surfaces that allow rusting/corrosion	☑	☐	☐
16.0	Rebar welds are inspected by qualified inspectors certified to CSA W178.2	☐	☐	☑
17.0	No rebar congestion or other obstruction for deposit of concrete	☑	☐	☐
18.0	Adjustments required for interfering items (piping, inserts, sleeves, etc.) have been submitted and approved by owner.	☑	☐	☐
19.0	Rebar was stored off ground to prevent damage/corrosion	☑	☐	☐
20.0	Review drawings for anchors, piping, sleeves, boxes	☑	☐	☐

COMMENTS:

Inspection on Transformer Base and circuit switcher
- NOT ABLE TO VERIFY CIRCUIT SWITCHER ANCHOR PLACEMENT AT TIME OF INSPECTION. TO BE VERIFIED BEFORE POUR
- CONDUIT SLIGHTLY OFF CENTRE (~150mm) DOES NOT CONFLICT WITH ANCHORS :- OKAY AS CONFIRMED W/ ELECTRICAL SUPERINTENDENT DON CARTER

ATTACHMENT(S):

DEFICIENCIES NOTES:

- 2 LONGITUDINAL BARS ADDED TO T1 PEDESTAL PAD (2700 LONG) NCR
- 4 CORNER VERTICALS ADDED TO T2 TRANSFORMER PLINTH NCR

Rev 01 August 21, 2018

CONTRACTOR: Clark Builders	INSPECTION DATE: NOV. 25/2018
CONTRACTOR CONTACT PERSON: GREG WATSON	DATE OF POUR: NOV. 26/2018
INSPECTOR(S): JACKSON WENGER	
LOCATION: 6300 SUBSTATION MODULE FOOTINGS	
DRAWING REV: 0	DRAWING NO.(S): 001-2700-C-0002
SPEC SECTION(S): 03 10 00	

ITEM	ITEMS TO BE CHECKED	PASS	FAIL	N/A
1.0	Location, survey, dimension and grades as required	☑	☐	☐
2.0	Plumbness and Flatness verified	☑	☐	☐
3.0	Joints are aligned and watertight.	☑	☐	☐
4.0	Formwork shop drawings are Engineered and reviewed	☐	☐	☑
5.0	Re-used formwork reconditioned and treated	☑	☐	☐
6.0	Formwork and ties according to finishing requirements. Confirm no holes in the concrete surface are greater than 25mm in diameter or expose steel at less than 25mm from surface. As per spec.	☑	☐	☐
7.0	Installation of embeds are located and secured	☑	☐	☐
8.0	Chamfer requirements checked. 25mm chamfers required for all exterior corners and edges exposed to view including horizontal edges of pads.	☑	☐	☐
9.0	Key ways and/or other provisions according to design are provided in construction joints	☐	☐	☑

ITEM	ITEMS TO BE CHECKED	PASS	FAIL	N/A
10.0	Inspect types of form spacers, ties and bracing.	☑	☐	☐
11.0	Spacing of ties to be set to a pattern	☑	☐	☐
12.0	Expansion, construction, contraction joints as required & located as coordinated with structural Engineer	☑	☐	☐
13.0	Forms secured against movement during placing	☑	☐	☐
14.0	Forms are braced for alignment and blow out	☑	☐	☐
15.0	Forms are cleaned of all debris, and dry, prior to concrete placement including standing water	☑	☐	☐
16.0	Openings in formwork permit inspection and cleaning, placing and compaction of concrete, and forming and processing of construction joints.	☑	☐	☐
17.0	Formwork has been coated with release agent prior to rebar placement	☑	☐	☐
18.0	Anchor Bolts and Embeds are secured to formwork.	☐	☐	☑

NOTES:

1) ALL CONCRETE WORK SHALL CONFORM TO THE REQUIREMENTS OF NBC 2015 AND:
   A. CAN/CSA-A23.1-14 CONCRETE MATERIALS AND METHODS OF CONCRETE CONSTRUCTION
   B. CAN/CSA-A23.2-14 METHODS OF TEST FOR CONCRETE
   C. CAN/CSA-A23.3-14 DESIGN OF CONCRETE STRUCTURES
2) CAST-IN-PLACE CONCRETE SHALL HAVE A MINIMUM COMPRESSIVE STRENGTH OF 30MPa AT 28 DAYS UNLESS NOTED OTHERWISE.
3) COLD WEATHER PLACING METHODS OF CONCRETE WORK SHALL CONFORM TO CAN/CSA-A23.1
4) REINFORCING STEEL SHALL BE DEFORMED BARS CONFORMING TO CAN/CSA-G30.18. ALL REINFORCING STEELS SHALL BE MINIMUM GRADE 400MPa.
5) GEOTECHNICAL BASIS OF AS "GEOTECHNICAL RECOMMENDATIONS FOR SUBSTATION STRIP FOOTINGS" DATED 17 SEPT 2018, BY WSP-GOLDER IN GENERAL.

BEARING SURFACE: 100mm THICK LAYER OF CRUSHED 20mm MINUS GRAVEL COMPACTED TO 98% SPMDD.
BACKFILL: GRANULAR FILL COMPACTED TO 98% SPMDD.

Cold weather protection provided by means of heated enclosures, coverings, insulation, or a suitable approved combination of these methods during complete curing period.	☐	☐	☐	
Concrete test cylinders are kept within hoarding or in area where temperatures are ideal for curing. (No frozen Cylinders)	☐	☐	☐	
Heat is not directed onto concrete. This may result in thermal cracking.	☐	☐	☐	
During freezing weather, and standing water removed before the end of the protection period (CSA A 23.1 clause 7.4.2.4.2)	☐	☐	☐

Measurement of Soil or Aggregate Resistivity using Two-Electrode Soil Box Method

ASTM G 187-12

Project No:	ENG.WARC03235-03	**Sample No.:**	2703
Project:	Eagle Gold Project	**Date Received:**	24-Sep-18
Client:	JDS Energy & Mining	**Sampled By:**	Client
		Date Tested:	27-Sep-18
Attention:	R Bilobrowka **Ph:**	**Tested By:**	MA
Email:		**Office:**	Edmonton

Description:	40-20 mm Insulating Gravel	Temperature of sample;	
Source:	N:7098841, E:458324, Washed 38 mm Minus	As collected :	°C
Sample Location:	Stockpile Adjacent Finning Staging Area	As Tested :	°C
Model of meter:			

Resistivity of Aggregate (Wetted Condition)

Resistivity = R x S / L

Box Used: **TB 4**

Sample Temperature: **20.0 °C**

Where :	L = Length of sample box (cm)	L =	44.8	cm
	h = height of sample in box	h =	19.8	cm
	S = Cross-sectional area of sample (cm^2)	S =	390.06	cm^2
	R = Resistance (Ohms)	R =	120000	Ohms

Resistivity = 120000 x 390.06 ÷ 44.8 ÷ 100

Resistivity = **10450** Ohm•m

Remarks:

Wetted with distilled water

Anchor Pull Test

Project #	4581	Project Name	Eagle gold 69 KV	Facility#	
Structure #	42/6	Structure Type	PVO		

Anchor Test Record

Time and Date Started	Feb 11 2019 8:45
Time and Date completed	Feb 11 2019 8:10
Test Device	Dyna Link 2 MSI7300
Operator	Excavator/Foreman

Anchor #	Pre-Load Benchmark	Amount of Stretch at 50% Tension	Final Reading at Full Tension	Final Reading when Tension Released	Change After Testing
1	0 mm @ 0	0 mm @ 9240	1 mm @ 18190	1 mm @ 0	1 mm
2	0 mm @ 0	0 mm @ 9270	2 mm @ 18210	1 mm @ 0	1 mm

Test Procedure:

1. Take Benchmark reading of anchor rod.
2. Pull Anchor rod at 50% load and hold for 2 minutes. Record movement.
3. Pull Anchor rod at Full tension load and hold for 2 minutes. Record movement.
4. Release tension and record rod movement.
5. For 2 anchor configuration, the single anchor will be pulled at 50% Tension. Wait 5 minutes between pulls.

Anchor Pull Test

Project #	4581	Project Name	Eagle gold 69 KV	Facility#	
Structure #	42/1	Structure Type	PVO		

Anchor Test Record

Time and Date Started	Feb 11 2019 14:50
Time and Date completed	Feb 11 2019 15:30
Test Devke	Dyna Link 2 MSI7300
Operator	Excavator/Foreman

Anchor #	Pre-Load Benchmark	Amount of Stretch at 50% Tension	Final Reading at Full Tension	Final Reading when Tension Released	Change After Testing
1	0 mm @ 0	0 mm @ 9280	3 mm @ 18140	2 mm @ 0	2 mm
2	0 mm @ 0	0 mm @ 9270	2 mm @ 18210	2 mm @ 0	2 mm

Test Procedure:

1. Take Benchmark reading of anchor rod.
2. Pull Anchor rod at 50% load and hold for 2 minutes. Record movement.
3. Pull Anchor rod at Full tension load and hold for 2 minutes. Record movement.
4. Release tension and record rod movement.
5. For 2 anchor configuration, the single anchor will be pulled at 50% Tension. Wait 5 minutes between pulls.

Clipping Inspection

Project No.	4581	Project Name	Eagle Gold 69 KV		
Line No.	L251	From Structure No.	40/6	To Structure No.	42/8

Checklist

Items	Inspected	Comments
Verify if Required, any crossing Permits and agreements are in place	Y ☐ N/A ☑	
Verify Conductor is sagged as specified	Y ☑ N/A ☐	
Insulator strings on at least 3 suspension structures adjacent to the new sag section clipped in	Y ☑ N/A ☐	
Verify all insulators & conductor hardware is clean & free of defects	Y ☑ N/A ☐	
Travelers removed and conductor clipped in as per specifications	Y ☑ N/A ☐	
Verify Suspension clamp is plumb and centered on conductor point mark	Y ☑ N/A ☐	
Compression joints required in sagged span and recorded	Y ☐ N/A ☑	
All assemblies are made in strict accordance with the manufacture applicable specifications	Y ☑ N/A ☐	
Sagged conductor is free from any Bird caging/damage and does not required any repair	Y ☑ N/A ☐	
Verify no metal contact made with insulators and no conductor damage during Clipping procedure	Y ☑ N/A ☐	

Additional Comments

40/6,41/6,42/7,42/8 Dead End assemblies are verified correct and jumpers installed properly
No Implos or compression joints used

Clipping Inspection

Project No.	4581	Project Name	Eagle Gold 13.8 KV		
Line No.	2	From Structure No.	11	To Structure No.	22

Checklist

Items	Inspected	Comments
Verify if Required, any crossing Permits and agreements are in place	Y ☐ N/A ☑	
Verify Conductor is sagged as specified	Y ☑ N/A ☐	
Insulator strings on at least 3 suspension structures adjacent to the new sag section clipped in	Y ☐ N/A ☑	
Verify all insulators & conductor hardware is clean & free of defects	Y ☑ N/A ☐	
Travelers removed and conductor clipped in as per specifications	Y ☑ N/A ☐	
Verify Suspension clamp is plumb and centered on conductor point mark	Y ☑ N/A ☐	
Compression joints required in sagged span and recorded	Y ☐ N/A ☑	
All assemblies are made in strict accordance with the manufacture applicable specifications	Y ☑ N/A ☐	
Sagged conductor is free from any Bird caging/damage and does not required any repair	Y ☑ N/A ☐	
Verify no metal contact made with insulators and no conductor damage during Clipping procedure	Y ☑ N/A ☐	

Additional Comments

L2 17 Dead End hardware verified correct and jumpers done correctly
L2 11 and L2 22 Riser poles connections have been verified correct

Test Device	Dyna Link 2 MSI7300
Operator	Excavator/Foreman

Anchor #	Pre-Load Benchmark	Amount of Stretch at 50% Tension	Final Reading at Full Tension	Final Reading when Tension Released	Change After Testing
1	0 mm @ 0	0 mm @ 9090	4 mm @ 18180	3 mm @ 0	3 mm
2	0 mm @ 0	0 mm @ 9240	3 mm @ 18150	3 mm @ 0	3 mm

Test Procedure:

1. Take Benchmark reading of anchor rod.
2. Pull Anchor rod at 50% load and hold for 2 minutes. Record movement.
3. Pull Anchor rod at Full tension load and hold for 2 minutes. Record movement.
4. Release tension and record rod movement.
5. For 2 anchor configuration, the single anchor will be pulled at 50% Tension. Wait 5 minutes between pulls.

Anchor Pull Test

Project #	4581	Project Name	Eagle gold 69KV	Facility#	
Structure #	13/13	Structure Type	VMA		

Anchor Test Record

Time and Date Started	Nov 10 2018 9:15
Time and Date completed	Nov 10 2018 9:45
Test Device	Dyna Link 2 MSI7300
Operator	Excavator/Foreman

Anchor #	Pre-Load Benchmark	Amount of Stretch at 50% Tension	Final Reading at Full Tension	Final Reading when Tension Released	Change After Testing
1	0 mm @ 0	0 mm @ 9150	1 mm @ 18270	1 mm @ 0	1 mm
2	0 mm @ 0	0 mm @9180	2 mm @ 18240	1 mm @ 0	1 mm

Test Procedure:

1. Take Benchmark reading of anchor rod.
2. Pull Anchor rod at 50% load and hold for 2 minutes. Record movement.
3. Pull Anchor rod at Full tension load and hold for 2 minutes. Record movement.
4. Release tension and record rod movement.
5. For 2 anchor configuration, the single anchor will be pulled at 50% Tension. Wait 5 minutes between pulls.

Anchor Pull Test

Project #	4581	Project Name	Eagle gold 69KV	Facility#	
Structure #	28/2	Structure Type	VDEMA		

Anchor Test Record

Time and Date Started	Dec 7 2018 12:15
Time and Date completed	Dec 7 2018 13:20
Test Device	Dyna Link 2 MSI7300
Operator	Excavator/Foreman

Anchor #	Pre-Load Benchmark	Amount of Stretch at 50% Tension	Final Reading at Full Tension	Final Reading when Tension Released	Change After Testing
1	0 mm @ 0	0 mm @ 9160	2 mm @ 18160	2 mm @ 0	2 mm
2	0 mm @ 0	0 mm @ 9240	3 mm @ 18200	2 mm @ 0	2 mm
3	0 mm @ 0	0 mm @ 9270	3 mm @ 18280	3 mm @ 0	3 mm
4	0 mm @ 0	0 mm @ 9080	2 mm @ 18150	2 mm @ 0	2 mm

Test Procedure:

1. Take Benchmark reading of anchor rod.
2. Pull Anchor rod at 50% load and hold for 2 minutes. Record movement.
3. Pull Anchor rod at Full tension load and hold for 2 minutes. Record movement.
4. Release tension and record rod movement.
5. For 2 anchor configuration, the single anchor will be pulled at 50% Tension. Wait 5 minutes between pulls.

Anchor Pull Test

Project #	4581	Project Name	Eagle gold 69 KV	Facility#	
Structure #	32/13	Structure Type	PT		

Anchor Test Record

Time and Date Started	February 20 2019 9:20
Time and Date completed	February 20 2019 9:50
Test Device	Dyna Link 2 MSI7300
Operator	Excavator/Foreman

Anchor #	Pre-Load Benchmark	Amount of Stretch at 50% Tension	Final Reading at Full Tension	Final Reading when Tension Released	Change After Testing
1	0 mm @ 0	0 mm @ 9260	1 mm @ 18280	1 mm @ 0	1 mm
2	0 mm @ 0	0 mm @ 9220	2 mm @ 18230	2 mm @ 0	2 mm

Test Procedure:

1. Take Benchmark reading of anchor rod.
2. Pull Anchor rod at 50% load and hold for 2 minutes. Record movement.
3. Pull Anchor rod at Full tension load and hold for 2 minutes. Record movement.
4. Release tension and record rod movement.
5. For 2 anchor configuration, the single anchor will be pulled at 50% Tension. Wait 5 minutes between pulls.

Time and Date Started	Oct 6 2018 11:15
Time and Date completed	Oct 6 2018 12:00
Test Device	Dyna Link 2 MSI7300
Operator	Excavator/Foreman

Anchor #	Pre-Load Benchmark	Amount of Stretch at 50% Tension	Final Reading at Full Tension	Final Reading when Tension Released	Change After Testing
1	0 mm @ 0	0 mm @ 9280	2 mm @ 18110	2 mm @ 0	2 mm
2	0 mm @ 0	0 @ 9240	2 mm @ 18240	2 mm @ 0	2 mm

Test Procedure:

1. Take Benchmark reading of anchor rod.
2. Pull Anchor rod at 50% load and hold for 2 minutes. Record movement.
3. Pull Anchor rod at Full tension load and hold for 2 minutes. Record movement.
4. Release tension and record rod movement.
5. For 2 anchor configuration, the single anchor will be pulled at 50% Tension. Wait 5 minutes between pulls.

Anchor Pull Test

Project #	4581	Project Name	Eagle gold 69KV	Facility#	
Structure #	9/11	Structure Type	VMA		

Anchor Test Record

Time and Date Started	Nov 6 2018 8:30
Time and Date completed	Nov 6 2018 9:15
Test Device	Dyna Link 2 MSI7300
Operator	Excavator/Foreman

Anchor #	Pre-Load Benchmark	Amount of Stretch at 50% Tension	Final Reading at Full Tension	Final Reading when Tension Released	Change After Testing
1	0 mm @ 0	0 mm @ 9060	2 mm @ 18170	2 mm @ 0	2 mm
2	0 mm @ 0	0 mm @ 9140	2 mm @ 18220	2 mm @ 0	2 mm

Test Procedure:

1. Take Benchmark reading of anchor rod.
2. Pull Anchor rod at 50% load and hold for 2 minutes. Record movement.
3. Pull Anchor rod at Full tension load and hold for 2 minutes. Record movement.
4. Release tension and record rod movement.
5. For 2 anchor configuration, the single anchor will be pulled at 50% Tension. Wait 5 minutes between pulls.

Clipping Inspection

Project No.	4581	Project Name	Eagle Gold 13.8 KV		
Line No.	1	From Structure No.	01	To Structure No.	21

Checklist

Items	Inspected	Comments
Verify if Required, any crossing Permits and agreements are in place	Y ☐ N/A ☑	
Verify Conductor is sagged as specified	Y ☑ N/A ☐	
Insulator strings on at least 3 suspension structures adjacent to the new sag section clipped in	Y ☐ N/A ☑	
Verify all Insulators & conductor hardware is clean & free of defects	Y ☑ N/A ☐	
Travelers removed and conductor clipped in as per specifications	Y ☑ N/A ☐	
Verify Suspension clamp is plumb and centered on conductor point mark	Y ☑ N/A ☐	
Compression joints required in sagged span and recorded	Y ☑ N/A ☐	
All assemblies are made in strict accordance with the manufacture applicable specifications	Y ☑ N/A ☐	
Sagged conductor is free from any Bird caging/damage and does not required any repair	Y ☑ N/A ☐	
Verify no metal contact made with Insulators and no conductor damage during Clipping procedure	Y ☑ N/A ☐	

Additional Comments

Compression Joint in between span 19 and 20 is 11 meters away from structure 19
L2 09 Deadend hardware has been verified correct and jumpers installed correctly

RESPONSE

☐ Approved ☒ Approved as noted ☐ Rejected as noted

Response:

See BGC Attachment for approval details.

Answered by: Roy Morlan, BGC Engineering (Name) Roy Morlan (Signature) May 10, 2018 (Date)

Note: Response to this RFI does not constitute authorization to perform a change to any Contract. The Requestor may proceed with the response only on the basis

The borrow for use as general fill is defined as "course grained colluvial/alluvial soils or weathered bedrock with little or no ice content and/or coarse grained sands and gravels with zones of variable ice content." The excavated material coming from the ADR cut is beginning to turn hard. If it continues to be rippable it should meet the criteria for weathered bedrock which is within specification.

Should the material become unrippable, it will be necessary to complete the excavation by drilling and blasting, the resulting material should still be quite satisfactory and is likely to be denser than the specified general fill and still be porous enough to better aid in the prevention of pore pressure build up from moisture entering the embankment from the insitu contacts. Good consolidation can be achieved by placing the material in 0.5 meter lifts and consolidating by cat packing and passing over each lift with a vibratory compactor equipped with Elliot Grid drum surface. Any pieces larger than can be accommodated in the lift could be bladed off of the fill. There would be no change in the unit prices other than the drill and blast costs that will be incurred in any case.

If the use of shot rock is not permitted in the embankment, the alternative is to take that material to the waste dump and replace it with other material which may be very hard to source nearby. This would raise the cost of the embankment fill considerably.

Response to CC204-RFI-006

To:	**D'Arcy Comerford**	**Project:**	**Eagle Gold HLF**
Company:	**JDS**	**Project No.**	**0792021**
From:	**Roy Morlan**	**Date:**	**May 10, 2018**
Copied:	**Troy Meyer; Dan Granda**	**Record:**	**Response to CC204-RFI-006**

Re: Response to CC204-RFI-006:

1.0 INTRODUCTION AND OBJECTIVE

Use of rock generated from blasting for Rockfill as a substitution for structural fill is permittable. A final determination of Rockfill suitability should be evaluated by BGC once the material is generated. In general, Rockfill used in the embankment should conform with the following:

- Shot-rock will generally be allowed provided it meets the requirements for Rockfill in the project specifications.
- The rockfill shall generally have 300 mm maximum rock particle size and oversized rocks larger than 300 mm shall be removed to the exterior fill slopes. Rocks larger than 300 mm may be incorporated in thicker fill lifts provided the rocks do not protrude from the lift surfaces after compaction and the required compaction of the lifts is proven achievable by a test fill.
- Larger particles (>8”) should have a rock strength of at least an R3 on the International Society of Rock Mechanics Field Identification Hardness Scale.
- A test fill should be performed using the Rockfill material to determine the lift size and compaction/wetting method. A lift thickness of 50cm has been proposed by Pelly and can be tested with a test fill. The max Rockfill particle size should be 2/3 the lift thickness. Therefore, a 50cm lift would require a maximum particle size of 33cm (13 -inches). Other lift thicknesses can also be tested depending on the maximum particle sizes being generated.
- Rockfill and Structural Fill lifts cannot be interbedded. Rockfill and Structural Fill materials cannot be interchanged during construction of a single lift. Zones defined in EPCM-RFI-002 should be maintained.
- A method for keying the rockfill and structural fill zones should be proposed by Pelly and reviewed by BGC. It should include the equipment proposed to do the work.

- The QC program for Rockfill placement at the embankment will be developed by BGC after the test fill observations.

From:	**Roy Morlan**	**Date:**	**May 23, 2018**
Copied:	**Troy Meyer; Dan Granda**	**Record:**	**Response to CC204-RFI-008**

Re: Response to CC204-RFI-008:

1.0 RESPONSE

The use of electro-fusion is conditionally approved as a general replacement for butt-fusion in the underdrains at the embankment, HLF, and event pond. Conditions to this approval are as follows:

-Butt fusing is the preferred method. Electro fusion should only be used where butt fusion is not practical (ie limited space, equipment not available, ect).

-Fusion should be performed in strict adherence to the manufactures recommendations and applicable ASTM standards and that fusion should be performed by a qualified technician. The procedure should adhere to the manufacture's quality control requirements. Fusion procedures and QC plans should be reviewed by the engineer prior to use of this technique. BGC has already been provided the fusion equipment's operation manual.

- Pipe couplings at minimum need to meet the standards and specifications for the pipe they will be joining. Coupling specifications should be provided to the Engineer for review and inclusion in the construction record.

-Provide the Engineer with installation details and procedures ensuring and that the liner system and geotextiles will be protected from puncture or tearing if the pipe and couplings are moved across or placed on these surfaces.

-Joints should not be dragged across uneven, jagged, or rocky ground and fills. If this becomes necessary the Constructor should review the process for dragging the pipe with the Engineer.

Response:

EPCM provided Pelly with an EPCM generated materials take-off via email on April 8th and attached for convenience. EPCM instructs the Contractor to perform their own materials takeoff as the Contractor is responsible for supply and installation of all materials. The EPCM materials list provided should be used as guidance only. Any variation to the provided take-off shall be noted by the contractor when returning the updated unit pricing for the selected items.

Contract Title	Eagle Gold Heap Leach	**Date Issued**	May 11, 2018
Client	Pelly	**RFI #**	01
Contract #	27233	**Revision #**	00
Layfield Project #	CT001045	**Layfield Originator**	Jason Wheeler

Type: Change specifications to have horizontal seams approved throughout project

Description: We would like to change the specification in 4.1.7.1. to allow for horizontal seams throughout the project. Most of the project will be at 3H:1V and is allowable as per spec but we are hoping we can avoid delays during installation and have horizontal seams approved in advance instead of cutting at 45 degree angles.

Schedule Impact: Should help maintain or increase our schedule as we have many cross seams to do.

Total Value of Change: Quicker installation and less wasted material

Attached Drawings and/or Documents: Proposed Layout plans, Shear testing results

Re: Response to CC204-RFI-012:

1.0 RESPONSE

Question 3: "Information request – geotextile wrapping of steel: plastic connections in LDRS and PLS Sump System, what is the purpose of this?"

Response: Secure geotextile wrapping of both sides of the steel: plastic connections are to decrease the risk of sediment infiltration. This wrapping may also serve as an extra layer of protection against damaging the geomembrane, depending on its location and application. Wrapping these connections were one of the recommendations made during a peer review of the project.

Questions 4: "N12 perf pipe specification. Some supplier vendors propose sock material for parts of the scope."

Wrapping of perforated, corrugated, N-12 PE pipes are not permitted due to potential reduction in permeability over time at the pipe slots.

Information Request/Description of Issue:

1) Steel/Pipe specification. Please confirm specification for steel materials. Plans and Design Report call for ASTM 139 High Strength Low Alloy Steel (A606 Type 4). We understand that this specification provides some level of corrosion resistance. However, these materials are more difficult and expensive to procure, approximately double the cost before freight and fabrication considerations.
2) Constructability. The long section of pipe and manifold systems will be onerous to cost and schedule, and create more risk to damaging liner if welding fabrication must occur within the sump areas.
3) Information Request: geotextile wrapping of steel:plastic connections in LDRS and PLS sump systems, what is the purpose of this?
4) N12 perf pipe specification. Some supplier vendors proposing socked material for parts of the scope.

Proposed Corrective Action

1) There was verbal suggestion that all these steel pipe requirements in the HLF could be replaced with common stock steel, using schedule 40 pipe with typical ~150 psi pressure rating. Pelly would like this confirmed in writing prior to procurement.
2) Fabrication and installation will be more manageable and readily achieved with less risk to liner through use of segmented components that will be flanged together in the field.
    a. Pelly would like confirmation that using a flanged approach is acceptable.
    b. Pelly would like to know of any design constraints that these flanges must achieve to ensure same structural and performance integrity:
        i. Gasket material specification.
        ii. Hardware, bolt pattern specification
3) N/A, clarification request.
4) Pelly is seeking permission to use socked material if cost effective to procure.

RESPONSE					
☐	Approved	☐	Approved as noted	☒	Rejected as noted

Response:

Item 1 of the RFI: Pump Casings for Barren Solution Pumps:

Caution should be made with placement of the material around the pipe – There is some risk of ovalizing the pipe.

Go with 900mm x 12.7mm (or thicker) AWWA C200 pipe.
This pipe is spiral welded.
We should ensure the steel grade is A36 / A139 Gr B / A252 Gr. 2 as a minimum.

Item 2 of the RFI: We would expect that these headers can be fabricated using metal flanges – specification should be as per FLS pipe spec with

- Gasket, 3mm PTFE Garlock Blue-Gard 3000
- Bolts, Stud w/2 heavy Hex Nuts ASTM A193 GR B7/A194 GR 2H Nuts

Request for Information

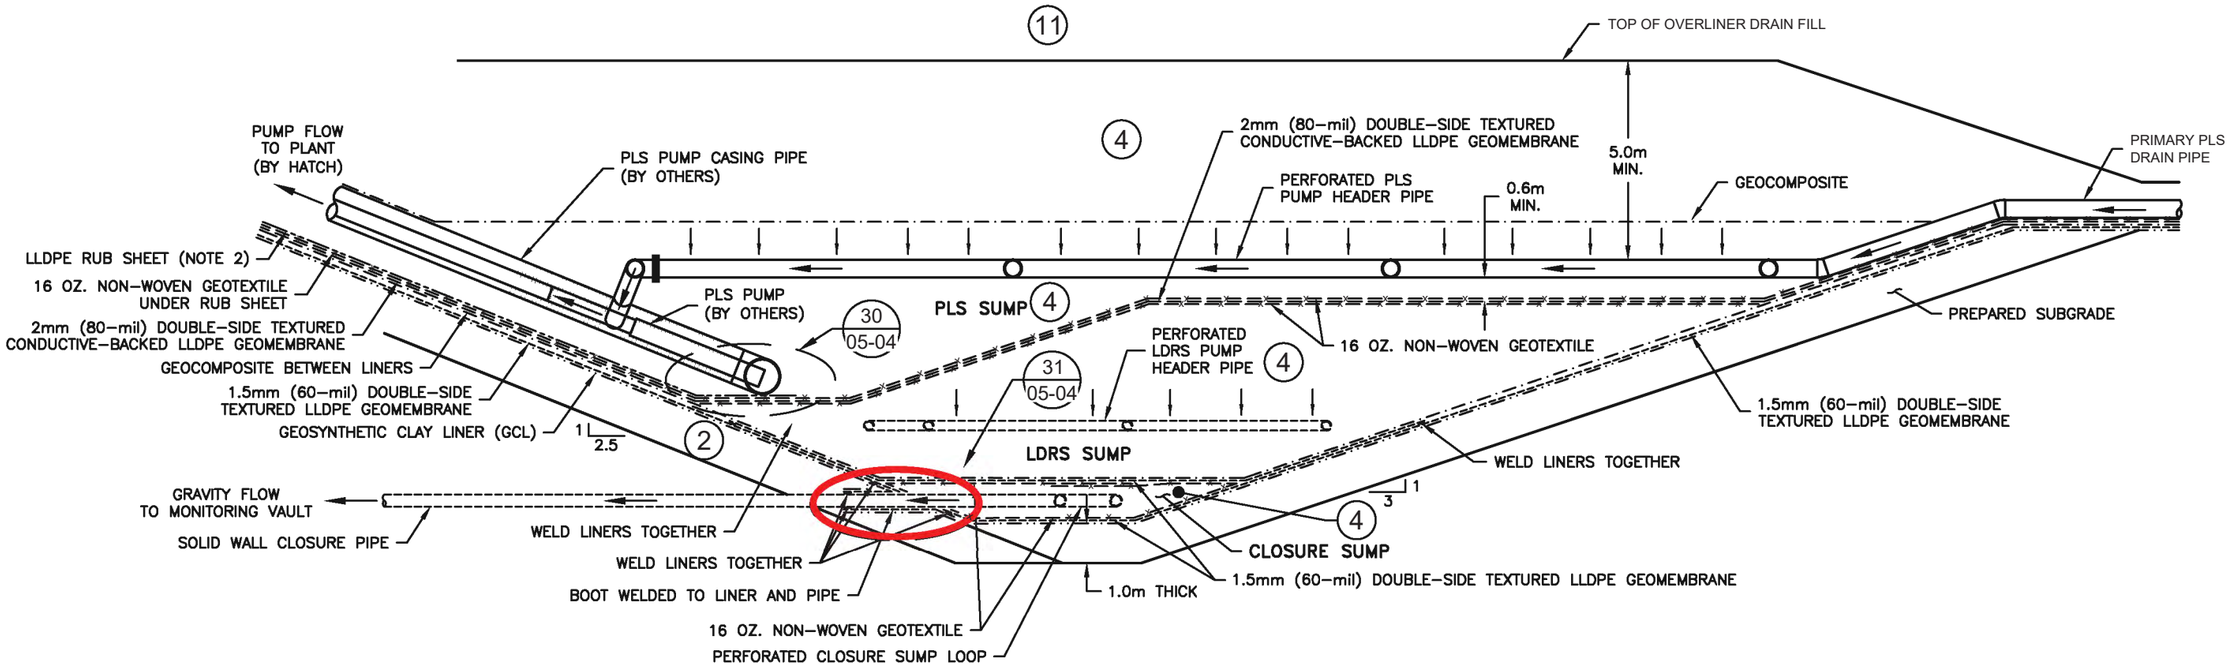
Contract Title	Eagle Gold Heap Leach	**Date Issued**	May 16, 2018
Client	Pelly	**RFI #**	02
Contract #	27233	**Revision #**	00
Layfield Project #	CT001045	**Layfield Originator**	Jason Wheeler

Type: Change specifications to have horizontal seams approved throughout project

Description: On drawing Number EGHLF-XD-05-02 PLS, LDRS & CLOSURE SUMP DETAIL 22, in the closure sump the drawing shows a boot that is inverted and going into the slope. Layfield will not be able to install a boot like this in the field. We would like to propose 2 options for review:

1. If the pipe installation/fusing crew deems it possible installs a HDPE plate at the location where the pipe meets the slope at the proper slope factor. Layfield can attach to the HDPE plate when we are installing the liner system
2. We install a typical sloped pipe boot which would be going into the pond. We will be able to do this when on site for the liner installation

Schedule Impact: Would need to install the boot during slope construction. Chances of the skirt left to attach to being damaged and not repairable is very high



Total Value of Change: N/A

Attached Drawings and/or Documents: Typical sloped pipe boot penetration detail, HDPE plate to pipe penetration, copy of drawing in question

Response Required by: May 30, 2018

2017 RFP:

3.13 Heap Leach Earthworks (Activities 5.80 to 5.99)

The overall construction of the Heap Leach Pad (HLP) is comprised of several different elements and involves several different types of construction methodology. Construction plans and the finished quality of the constructed leach pad/collection ponds are the most important aspects of the project. The location is a natural valley, which is made up of the east and west banks of what is named Ann Gulch. The containment of the emulsion solution requires the construction of an earth embankment, installation of multi-layers of LLDPE (liner low density polyethylene) and GCL. (geocomposite clay liner) Included in this scope is the sump collection piping, and sloped piping installation to the top of the embankment.
The 2017 scope is comprised in a manner to support the strategy where a majority of the work is to be undertaken in 2018. No additional work beyond the description below will be undertaken without approval from the Owner.

In 2017, the contractor will be responsible for:

- Clearing the vegetation and removing the topsoil off the entire HLP footprint, (Phase 1) (as described in the Clearing and Topsoil stockpiling scope) the Process Area Pad and the Event Ponds.
- Supply and installation of silt fencing at the interface line of the site work and Dublin Gulch.
- Excavation of the sediment containment pond, (required at the south end of the embankment excavation) and all diversion/water management ditches. (refer to the Water Management Plan)
- The partial construction of the HLP embankment in 2017, which includes (within the HLP embankment footprint) the excavation to bedrock, stockpiling and replacement of soil back to original ground. (with suitable material) Borrow Material for the embankment construction will be drawn from the Process Area Pad excavation. The remainder of the embankment, (above original ground) will be constructed starting in the spring of 2018. The contractor will be required to manage any water generated from the immediate area, during the construction of the embankment. Refer to the Water Management scope for additional information regarding the areas infrastructure to support water management.
  The construction of the Process Area Pad, (cut and fill) as per the design and specifications.

Excavation quantity of the HLP Embankment (from original ground) is approximately 136,000 m3
In 2018, the Contractor will be responsible for:

- Remobilization of necessary resources to continue the construction of the Embankment, Heap Leach Pad, and Event Ponds.
- Snow removal from the working area footprint.
- Reinstatement of any erosion control/water management measures.
- Preparation of Embankment Area to continue addition of remaining fill.
- Supply and installation of the non –perforated under liner drainage piping, (within the Embankment footprint) including the monitoring vault.

- Construction of the Embankment. (in concert with the excavation of the Event Ponds and ADR Plant Pad)
- Supply and installation of the perforated under liner drainage piping. Construction of the Closure Sump, Leak Detection and Recovery Sump, and the PLS Collection Sump. (includes all liners, piping, and associated components)
- Supply and installation of the LLDPE, Geocomposite, and HDPE liners.
- Supply and installation of collection piping.
- Installation of over liner fill.
- Demobilization, removal of all stationary equipment, mobile equipment, tools, and support resources upon completion of the scope.

Activity 5.80:
The Contractor shall excavate the Heap Leach Embankment limits in accordance with direction of the Owners Engineer down to an approved foundation (rock). This material is considered suitable for engineered embankment backfill; however it requires excavation, placement and compaction.
Activity 5.81:
The Contractor shall place and compact the Heap Leach Embankment in accordance with the drawings and specifications. This activity shall fully compensate the Contractor for this activity.
Activity 5.82:
The Contractor shall excavate the heap leach area to the design grades. This material may be used as backfill for embankment.
Activity 5.83:
In the event that any material unsuitable for engineered backfill / embankment is encountered in activity 5.80 or 5.82 and the Owners Engineer directs the Contractor to haul this material to waste, then activity 5.83 shall compensate the contractor to haul the material to a waste storage facility within 1.5km.

1.7 Water Management

The contractor is to take into consideration the Water Management activities required to support the Earthworks scope. The responsible water management on the site is a regulated requirement, and will require the installation of infrastructure such as:

- Supply and installation of silt fencing.
- Excavation of swales or ditches to direct water to a collection point, or to the Collection Pond
- Temporary culverts
- The excavation of the Collection Pond
- The excavation of temporary sedimentation ponds.

Costs for the construction of the Control Pond are captured in the price breakdown spreadsheet, but all other costs associated with water management are to be inclusive within the unit rates.

Re: Response to CC204-RFI-017:

1.0 RESPONSE

The embankment toe and drain trench should be completed as shown in the attached ***Figure 1***. Construction should conform with the requirements in the Technical Specifications. Beyond details presented in the figures and specifications the following requirements should also be followed:

- Due to the difficulties of water management in this area and uncertain subsurface conditions the construction approach in this response is discussed in phases. Phase 1 includes identify and preparing competent foundation. Phase 2 includes backfill and drain construction.
- The first step should include water removal, control, and monitoring as well as cleaning loose silt and soil from toe and drain area, as best as possible. Once water runoff to work area is controlled, the work zone should be excavated to take out all sedimentation collected and deteriorated colluvium and type 3. Excavator should indicate when harder material has been reached to Field Engineer.
- Once approved by Field Engineer, Excavator will commence Phase 1 of Detail 1 with approved Rockfill material (should be free draining) by Field Engineer. The Excavator will place material in lifts and compact with bucket until thick enough to bridge out remaining soft wet materials as determined by Field Engineer.
- A geogrid should be placed as a base for the geofabric, before commencing Phase 2 as presented in ***Figure 1***.
- Phase 2 is repeated until surface field matches the point of entry from the underdrain upstream. After this is reached, all aspects of the original design should be considered.
- Course, strong, rockfill can be used as backfill under the pipe trench. The rockfill should be relatively free draining. Rockfill should be approved by the Engineer prior to placement.

- Final elevations will be dependent on work performed to prepare the foundation and will be approved by the Engineer.

EMBANKMENT FILL PROJECTED TO TOP OF DRAIN

Related Drawings: XD-02-03 & 04 Note: #3	**Other Related Documents:**

Information Request/Description of Issue:

A 1.8m subsoil excavation is required below the 940 elevation and 0.3m subsoil excavation is required above the 940 elevation. The design scope calls for these spoiled materials to be backfilled in 0.15m lifts throughout the pad area.

If these materials are unsuitable as backfill, where must these materials be wasted and what will be the alternative backfilling medium? Please identify which cost item this is applicable to if not already clearly identified.

Proposed Corrective Action

RESPONSE

☐ Approved ☒ Approved as noted ☐ Rejected as noted

Response: EPCM assumes that the Contractor is referring to Note #3 on BGC drawings XD-02-03 & 04. Please see note #6 on XD-00-02 where it states that Contractor is responsible for verifying subsurface conditions. EPCM recommend that Pelly dig a number of test pits with BGC field representative present to confirm subsurface conditions. EPCM have instructed BGC to further clarify what is meant by “prepared subgrade” and a response will be provided in due course.

Information Request/Description of Issue:

Upstream of the Embankment structure Pelly would like confirmation on the underdrain installation depths. The underdrain piping will be below the primary collection and liner systems, it is not entirely clear what min/max depths the underdrains need to be installed relative to other infrastructure or if the same type 3 bedrock constraint must be maintained upstream of the embankment.
Q1. Please describe the constraints and where possible provide 3D dxf/dwg linework of designed pipe invert routing as shown on the IFC drawings.
Q2. Please confirm minimum cover requirements for bearing a loaded 40ton articulated truck without damaging the piping associated with the underdrain systems.

Proposed Corrective Action

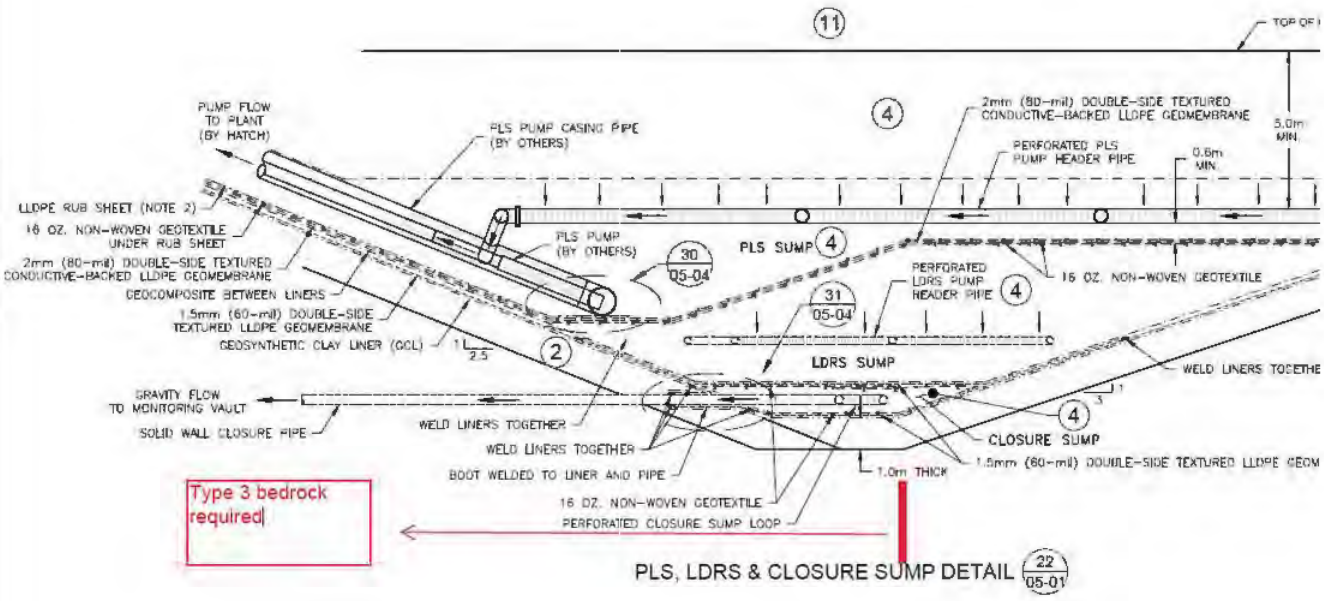
Schedule Impact:	

Requested by:

Shipeng Zheng		**May 26, 2018**
Name	Signature	Date



RESPONSE

☐ Approved ☐ Approved as noted ☐ Rejected as noted

Response:

The dimensions can also be found from other details e.g. Detail 22 on drawing 05-02 shows a subgrade thickness of 1 metre. The underdrain will be installed at the bottom of this zone and is about 0.5 metres thick, meaning there will be a 0.5 metres subgrade cover over the drain.

Question 1.
Figure 1 presents the type 3 bedrock constraint.

Question 2.

We will require official specifications of the equipment that will be used. Respond with an RFI attaching official CAT information for trucks and dozers for a better response. Please submit a separate RFI with attached official equipment information.

Response to CC204-RFI-022

To:	**Calvin Goldschmidt**	**Project:**	**Eagle Gold HLF**
Company:	**JDS**	**Project No.**	**0792021**
From:	**Roy Morlan**	**Date:**	**June 16, 2018**
Copied:	**Troy Meyer; Dan Granda**	**Record:**	**Response to CC204-RFI-022**

Re: Response to CC204-RFI-022:

1.0 RESPONSE

The use of rockfill for construction of the HLF embankment was approved and initially described in EPCM-RFI-002. A drawing was included in the response to that RFI to provide guidance for the use of Rockfill and is presented as ***Figure 1***.

Sketch illustrating acceptable area for placement of Compacted Rockfill, shown in red shade. Background drawing (black) is for reference only, not for construction.

Figure 1: Figure included in response to EPCM-RFI-002 showing the general configuration of Material 7 – Rockfill and Material 3 – Structural Fill in the embankment.

CC204-RFI-022 requested design lines provided in a dxf/dwg file. Design lines cannot be provided by BGC because the amount of Structural Fill Pelly will substitute with Rockfill is unknown to us. For this reason we provided the general guidelines in the EPCM-RFI-002 response.

The following response provides further clarification to the use of Material 7 – Rockfill in the embankment to help Pelly plan for its use.

Configuration of Zones

BGC originally approved the use of Material 7 using the dimensions shown in Figure 1. Take-off volumes for the conditions set forth in Figure 1 were provided to Pelly and JDS via email on May 5, 2018. As shown in Figure 1, rockfill should be placed in a separate zone downstream of the structural fill core. The structural fill should have a base of a minimum of 50 m measured from the center line of the crest to the downstream toe of the Structural Fill core zone. The contact between the Rockfill and Structural Fill on the downstream side of the embankment should be sloped in the downstream direction and should not be greater than 1 vertical for every 2 horizontal. A near horizontal slope at the contact between the Rockfill and Structural Fill is not acceptable as it can potentially create a zone susceptible to increased pore water pressure and/or water accumulation at this contact. Rockfill and Structural Fill cannot be interbedded. The height of the structural fill on the downstream side of the embankment will be governed by the final thickness of rockfill and the downstream slope of the Structural Fill/Rockfill contact. Rockfill cannot be in contact with Material 2 – Select Fill used as bedding underneath the upstream liner system.

Construction Considerations

If Rockfill is used in the construction of the embankment lift thicknesses should be chosen to allow the Rockfill to be easily tied into the Structural Fill lifts. Downstream lifts should be keyed into upstream construction by removing all lose material from the face of the slope and excavating a key platform to allow a minimum 1m overlap (measured horizontally). Key platforms must be prepared as a typical lift surface prior to placement and compaction of the Rockfill lift as is required in the Technical Specifications.

Alternative Sloping of the Contact Between Rockfill and Structural Fill

Alternative grade breaks in the contact between Rockfill and Material 3 – Structural Fill can be considered. The location of the grade break would be determined by the volumes of materials being generated. Pelly should propose a grade break based on material quantities available and constructability. All grades used at the contact between the rockfill on the downstream side of the embankment should be a minimum 1 vertical for every 2 horizontal. Slopes should be sufficient to allow water filtration from the overlaying rockfill to drain towards the downstream underdrain. An example of the grade break proposed by Pelly is included in ***Figure 2***.

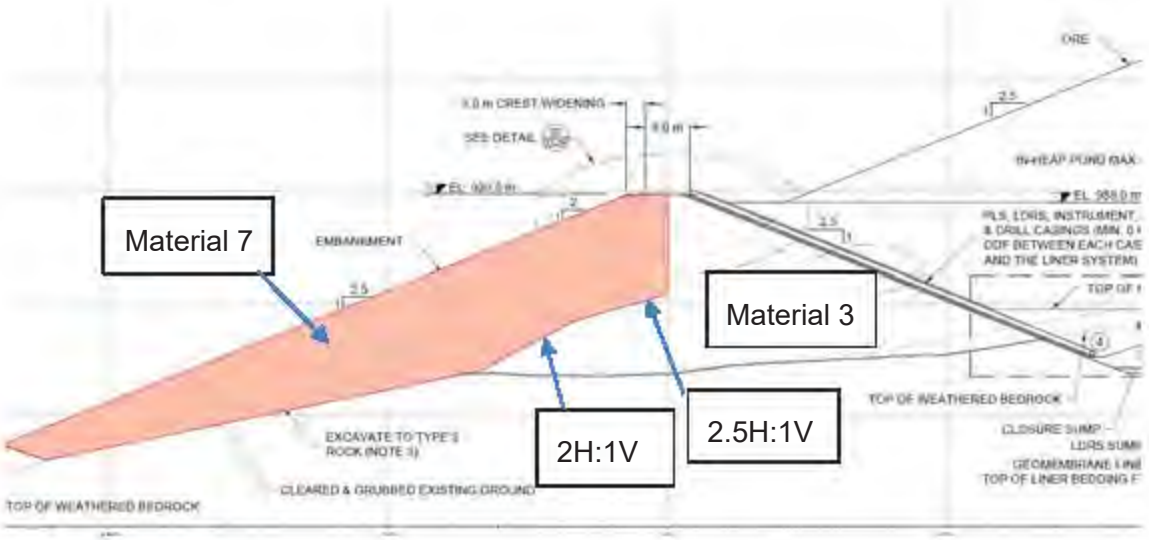

Figure 2: Example of potential grade break.

Upstream Construction Phasing

Pelly discussed the potential use of upstream construction by building a portion of the upstream embankment face with Material 3 then completing the remaining raise of the dam using both Material 3 and Material 7 as shown in ***Figure 3***. This is an acceptable method if Pelly finds it more efficient to construct. Configurations of zones should follow the layout previously discussed in this document. Downstream embankment phases must be keyed into the upstream phase as discussed earlier in this document. The top surface of the Phase 1 construction should be prepared like a typical lift surface as discussed in the Technical Specifications.

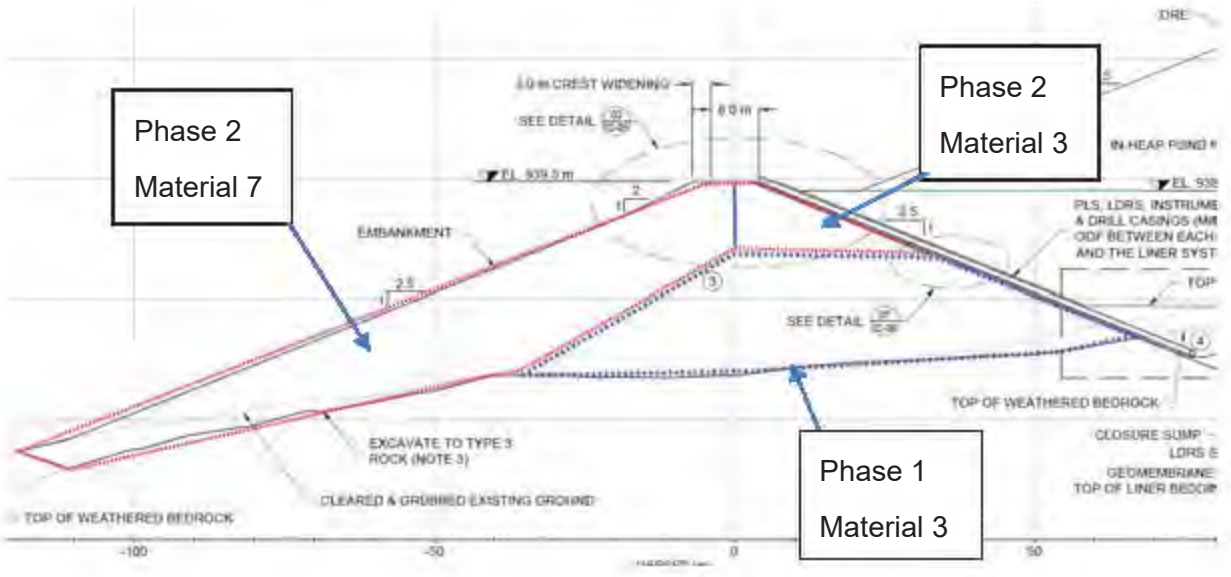

Figure 3: Phase construction proposed by Pelly.

Construction using Material 3 over Material 7

The use of Material 3 over Material 7 is not recommended as it can result in piping from the Material 3 into the Material 7. Options to prevent piping in such a configuration would include development of transition zones and/or engineering the gradation of both the Material 3 and 7. Both options would limit the availability of the materials, increase the complexity of the design, and could add a significant amount of cost to the project.

Other Related Documents:

Information Request/Description of Issue:

1) Please confirm the supply and installation of the PLS and LDRS pump casing is by Pelly; this is contrary to what the drawing shows

2) Pelly understands that the PLS and LDRS pump piping, pipe supports, concrete and polylock embedment strip or batten strip liner anchor will be by others, please confirm

3) For ease of fabrication, Pelly would like to know if there are any limiting constraints or specific design criteria associated with the piping and connections between the casing and manifold piping that must be achieved. Angles, spacing, distances. A pipe schematic design diagram with angles and distances is requested.
   Other than some faint hatching on the pipe drawings there are no specific references to slotting requirements for the PLS casing pipes. Please confirm slotting requirements, if any, with the PLS pump casings.

4) Per note #9, slotting of the casing materials for the LDRS sump is specified for the instrumentation casing. Please confirm that no slotting is required for the LDRS pump casings.

5) Given the slope distance and mean average temperature, please confirm overall length of pipe that is required for each casing. To understand constructability constraints, please provide minimum cover and/or submersion requirements for the thermal protection of buried pipe infrastructure over winter/persisting freezing conditions.

6) Albeit different pipe diameter, please confirm the same gasket and bolt requirements are the same for steel components associated with the LDRS system. Please also confirm if flanging is permissible on the embankment slope components (pump and instrumentation casings) that follow the slope. Pelly's fabricator highly recommends a flanged approach for sectioning the spiral pipe components; this will speed up installation, increase quality assurance, reduce overall cost, and reduce risk of damaging liner by reducing onsite welding and fabrication.

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY

Monitoring Well Decommissioning Requirements

To:	**Calvin Goldschmidt**	**Project:**	**Eagle Gold HLF**
Company:	**JDS**	**Project No.**	**0792021**
From:	**Daniel Granda**	**Date:**	**June 1, 2018**
Copied:	**Troy Meyer; Roy Morlan**	**Record:**	**Water Management**

Re: Monitoring Well Decommissioning Requirements

The requirements should follow the Protocol for the ***Contaminated Sites Regulation Under the Environment Act, Protocol No. 7: Groundwater Monitoring Well Installations, Sampling and Decommissioning, effective March 1, 2011***. This document, along with ***ASTM D5299-99*** should be the main guide for monitoring well decommissioning requirements.

1.0 PURPOSE

To decommission monitoring wells within the vicinity of the Eagle Gold HLF and achieve the following:

- Preventing contamination of groundwater by surface sources,
- Reducing risk of void creation in foundation area of Heap Leach Facility,
- Reducing environmental and engineering risk through construction phases, operation and closure.

2.0 GROUT MATERIAL

The grout mix should be designed by contractor and meet the following criteria:

- Not react with groundwater or in-situ geology,
- Have a lower than in-situ geology hydraulic conductivity,
- Form a tight bond with the borehole wall (wall should be clean of obstructions),
- Be resistant to cracking and shrinking,
- Be capable of being placed safely, and
- Have sufficient strength to withstand subsurface pressures.

3.0 FIELD PROCEDURE

The suggested field procedure for decommissioning a groundwater monitoring well is described below.

3.1. Inspection and Preparation

Each borehole and decommissioned well should be inspected to confirm depth, obstructions (e.g. debris, and caving) that may interfere with the placement and performance of the grout. A camera survey can identify the depth and construction of the well if this information is not known.

3.2. Casing Removal

Casings will be removed as part of properly sealing a borehole or decommissioned well. The technique of pulling casing using a rig is acceptable only for steel casings. The technique of over drilling, which means drilling around the borehole or decommissioned well casing and pulling out the casing, is also acceptable.

If casing cannot be removed through these two methods, the Engineer with consultation from Victoria Gold's Environmental Representatives will need to approve a plan to seal properly.

3.3. Grouting

The borehole should be pressure grouted using a tremie pipe as the drilling stem is removed. The grout should be applied in one continuous procedure to prevent segregation, bridging and dilution. The tremie pipe should be in constant contact with the grout level inside the borehole or decommissioned well to prevent air pockets from forming. The borehole and decommissioned well should be sealed from the bottom of hole to surface. Grout should be inspected 24 hours after placement for settlement, more grout should be added if needed. Inspection should be done by Engineer.

4.0 ARTESIAN WELLS

Driller should be equipped to handle a 10 litre per minute artesian well. The hole ID: DG17-847C, is 154.25 metres deep, angle with a true azimuth of 50 degrees and adip of -45 degrees. Hole size is HTW. Regulations should be followed on decommissioning this type of hole, grout from bottom of hole to surface is the expected solution.

5.0 DOCUMENTATION

Driller contractor should keep logs of end of construction sealing practices, product certificates and specification. This documentation will be collected for the final construction report from BGC and to document decommissioning of the wells on the Heap Leach Facility.

6.0 PROCEDURES AND PROTOCOL

Contractor should refer to “Protocol for the Contaminated Sites Regulation Under the Environment Act, Protocol No. 7: Groundwater Monitoring Well Installation, Sampling and Decommissioning.

Section 4, titled Well Decommissioning, applies and governs all procedures. The standard used by this document refers to American Society of Testing and Materials (ASTM) standard D 5299-99 Standard Guide for Decommissioning of Ground Water Wells, Vadose Zone Monitoring Devices, Boreholes and Other Devices for Environmental Activities.

7.0 NOTIFICATION

BGC is expected to be notified of activities for decommissioning to observe procedures and conduct an independent inspection 24 hours after grouting was placed. BGC will ask for copy of the logs at the earliest convenience of drilling contractor for records of construction and foundation preparation.

RESPONSE

☐ Approved ☐ Approved as noted ☐ Rejected as noted

Response:

1.) Fish-plating or any method requiring bolting of plates together is not acceptable. Bold can cause stress points on the liner during operation.
2.) Plate width should be 4m wide per the design. If two connected plates are used the total width should be 4m.
3.) The steel angle should be the width of the steel plate (i.e. 4m) and should have a height of 0.5m perpendicular to the steel plate.

RESPONSE

☐ Approved ☐ Approved as noted ☐ Rejected as noted

Response:
As per Victoria Gold Well de-commissioning procedure (Attached), plug cut off elevation is to be 1m below the existing surface, backfilled and bucket compacted with surrounding material.

As the well locations in question fall within BGC HLF design area, BGC site engineer has directed cut off elevation of plug to be at existing ground elevation to suit field conditions.

APPENDIX A Well /Borehole Inspection and Decommissioning Record

1 SUMMARY

This procedure covers steps necessary to permanently decommission wells on the Eagle Gold property. The document has been adapted from the ASTM International *Standard Guide for Decommissioning of Groundwater Wells, Vadose Zone Monitoring Devices, Boreholes, and Other Devices for Environmental Activities* (2012). The information contained herein is designed to serve as a general guide only. The ASTM standards should be consulted in the event that any deviation from the steps listed in this document is required.

The guidelines apply to the following:

- Boreholes used for geoenvironmental purposes;
- Monitoring wells;
- Observation wells;
- Piezometers;
- Boreholes used to construct monitoring wells; and
- Any other vadose zone monitoring device.

The process outlined in this document contains four primary phases:

1. Information gathering and planning;
2. Plan implementation;
3. Decontamination of downhole equipment; and
4. Documentation.

Most monitoring wells and piezometers on the Eagle Gold property are used for water quality sampling and/or water level observations. Decommissioning monitoring wells is necessary to prevent migration of contaminants into an aquifer or between aquifers. The intent of this procedure is to provide a reasonable level of confidence to Strata Gold Corp and its contractors in the integrity of decommissioning activities during the construction phase of the Eagle Gold Project.

2 PLANNING AND INFORMATION GATHERING

Ideally, planning for well and borehole decommissioning, including information gathering and field inspection, should occur two weeks prior to the anticipated decommissioning date. SGC will share all available well location information with JDS so that appropriate planning can take place and interruptions to the construction schedule can be avoided.

2.1 INFORMATION REVIEW

Prior to decommissioning a well, SGC and JDS will work to gather and review all available well-specific information including consultant installation reports and historic test results. SGC and JDS personnel will conduct a field inspection of the well and take a current water level depth reading. Prior to developing a plan for decommissioning a particular well or borehole, SGC, JDS and their subcontractors, should have a thorough understanding of:

- Borehole Depth;
- Historic water level fluctuation;
- Current water level;
- Surface infrastructure (existing and proposed);
- Downhole casing, screen, and instrumentation types;
- Downhole geophysical conditions;
- Contamination concerns; and
- Other installation details.

2.2 REVIEW OF DECOMMISSIONING OPTIONS

Decommissioning options will be determined based on well/borehole details gathered during the information review. The casing-type most commonly used on the Eagle Gold property is PVC with vibrating wire piezometers (VWPs) or thermistors installed at one or more depths. However, the characteristics of each well/borehole must be independently verified prior to selecting the most appropriate decommissioning approach (casing removal, plug material, etc.). Below is a general decommissioning process for cased monitoring holes. If water depth is measured at 20 m or less to top of casing, water quality testing and dewatering may have to occur. This determination should be made by the field engineer.

- Whenever possible, the well construction material (casing) should be removed. This can be accomplished through over-drilling for deeper PVC wells, or through the use of an excavator or crane for shallow or steel encased wells. If steel casing cannot be removed, a strategy that perforates the pipe should be considered with a pressurized plug injection system.
- Once casing and instrumentation have been removed, the borehole should be plugged with bentonite, grout, or a bentonite/grout mixture that conforms with ASTM standards.

- Whenever possible, the plugging material should be added as the casing is being removed, serving as a tremie pipe (a.k.a. grout pipe), and ensuring the plug reaches the lowest depth of the borehole.
- If bentonite chips are used, they should be applied in 1 m lifts and allowed to hydrate (absorb water and swell) prior to adding additional lifts. Water used in the creation of a slurry should be of good quality and free of debris, silt, or other deleterious materials.
- Once the grout or bentonite has set, the top 1 m should be excavated and backfilled with surrounding overburden and top soil material.
- The step-by-step decommissioning process utilized should be documented using a standardized form (Appendix A) and include before and after pictures, inspection records, and all other pertinent information such as problems encountered during decommissioning.

Consult Appendix A of the ASTM guidelines for trouble shooting information if abnormal conditions are anticipated or encountered during the decommissioning process.

2.3 REVIEW OF MATERIALS

Using borehole specific data, determine the most suitable type and quantity of plug material. To prevent borehole volume underestimation, for example due to overdrilling, it is recommended that an additional 25% of plug material be added to the minimum volume estimate. The use of additives such as cement accelerators or retarders should also be considered where appropriate.

If possible, it is recommended that an on-site geotechnical or hydrogeological engineer be consulted to determine appropriate plug material. This is particularly important in areas near major infrastructure, such as beneath waste rock storage facilities, the heap leach facility, and other water management infrastructure.

3 IMPLEMENTATION

3.1 DEVELOP FIELD PROCEDURE

Using the information gathered in the previous steps, the EPCM team (SGC and JDS) and sub-contractors should formally review the procedure to identify risks and associated mitigation strategies.

A template for the decommissioning plan can be found in Appendix A.

3.2 PLAN IMPLEMENTATION

If possible, a field engineer, hydrogeologist or geologist should be on site to help direct decommissioning activities. If unforeseen conditions cause deviation from the original plan, these deviations will be thoroughly recorded and reported on once decommissioning activities are complete.

4 DECONTAMINATION OF DOWNHOLE EQUIPMENT

Some boreholes will contain downhole monitoring equipment such as thermistors or piezometers. Unless already cemented in place, all equipment should be salvaged whenever possible. While contamination is considered to be low risk on the Eagle Gold property, if it is suspected upon inspection that a well or it's groundwater might be contaminated staff should consult the ASTM guidelines for appropriate decontamination strategies.

5 DOCUMENTATION

5.1 INSPECTION RECORDS

The primary purpose field work records are to provide evidence that appropriate measures have been taken to permanently decommission a well or borehole in a manner that minimizes it from being a conduit for fluid, water, or vapor migration. Properly decommissioned boreholes and wells should have no adverse influence on the local environment.

Maintain the narrative report of activities as a permanent record of the decommissioning activities and include the full set of field activities including:

- Decommissioning date;
- Personnel;
- Source of decommissioning method;
- Step-by-step procedures used in the field;
- Record of all measurements made, depths encountered, types and volume of fluids pumped;
- Photographs before and after, and
- All other pertinent information that is required based on site conditions or regulatory requirements. Any problems encountered should also be documented in detail.

See Appendix A for template.

5.2 REPORT

At the completion of field work, a formal technical memo will be developed to document the entire procedure used in the decommissioning process for the borehole or well.

Report in detail the following items as a minimum:

- Background Information:
    - Location of the borehole/well,
    - Purpose of the borehole/well,
    - History of the borehole/well,
    - Chemical parameters and concentrations present during the active life of the well and at the time of plugging; and
    - Information collected prior to the inspection record.
- Testing Prior to Decommissioning:
    - Site characterization (if applicable),
    - Physical testing (depth, structural condition, etc.),
    - Chemical testing results (last chemical analysis for record), and
- Geophysical logging results (if any).
- Decommissioning Design Procedure:
    - Rationale for selection of method used, and
    - Presentation of a decommissioning plan.
- Field Implementation:
    - Description of activities,
    - Variance from plan, and
    - Result of testing and measurements.

Re: Seeps and Finger Drains

1.0 INTRODUCTION

The purpose of this memorandum is to discuss the field observations made along the exposed right abutment and artesian well identified upstream of the partially excavated undrain pipe trench.

Field observations included daily monitoring of potential seeps during no precipitation days, photo records to document observations, and visual confirmation of water flow. The intend of this document is to classify areas that may interfere with moisture conditioning of lifts during construction, damage approved fill placement through water flow and present solutions to be implemented in the field during construction.

2.0 WATER MANAGEMENT FIELD OBSERVATION

On May 26th, 2018, representatives from Pelly and JDS, accompanied BGC Resident Engineer (Daniel Granda) to walk the site (**Figure 1**). This meeting took place a day after significant rainfall and the ground was fairly moist. This was used a baseline for identifying seeps occurring during drier conditions.

Figure 1: Pelly and JDS representatives present for water management field observation visit.

During the visit, the ground was found to be moist. Sediments had been transported on exposed Type 3 foundation in underdrain pipe trench and moisture from the abutments seemed to be rainfall moisture (**Figure 2**).

Figure 2: Seeps were difficult to see after significant rainfall events.

3.0 OBSERVATIONS

During a course of 5 days, and in consistent drier weather, moisture spots remained concentrated in areas identified. **Figure 3** presents observations from June 1st, 2018 inspection. **Figure 4** presents field interpretation and seep identification.

Figure 3: Upstream view from proposed embankment toe looking upstream

Figure 4: Field Interpretation of seeps with identifications for descriptions.

Figure 4: Field Interpretation of seeps with identifications for descriptions.

Figure 5: Seep 1 view from left abutment.

Both Seep 1 and 2 have been occurring for the past 5 days. Weak, very moist and low resistance to puncture zones were identified by applying finger pressure on wet areas. **Figure 6** presents the interpretation that may be confirmed during abutment foundation preparation for seep 1.

Figure 6: Seep 1 interpretation of potential flow path.

The specific source zone point is unknown as the materials on the abutment have high moisture absorption and fine lenses exhibit matric suction properties. In seep 1, the moisture is visible at the close sight on the abutment, liquid is transported downstream of the abutment and reconnects to the underdrain trench sides.

Figure 7: Seep 2 view from left abutment.

Seep 2 exhibits the same characteristics as seep 1, with ponded water on surface on bench between abutment and bottom of underdrain trench.

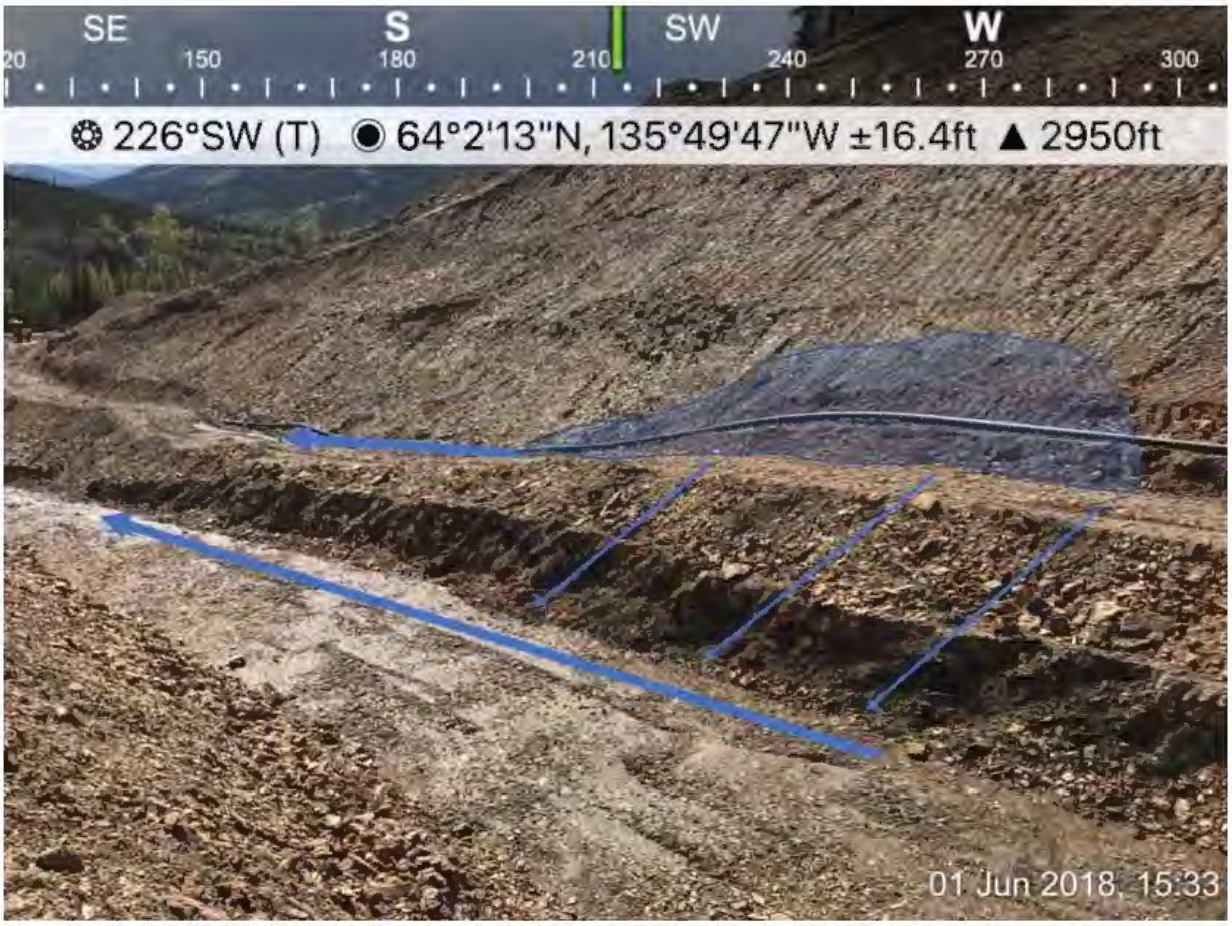

Figure 8: Seep 2 interpretation of potential flow path.

Figure 9: Seep 3 view from upstream underdrain trench

Seep 3 is believed to be coming from the artesian source identified during inspections. There is a clear connection of moisture oriented from the assumed source to the underdrain trench.

Figure 10: Seep 3 interpretation of potential flow path.

4.0 SUGGESTED MITIGATION

A field design to help the contractor to dissipate seepage and surface runoff from the abutments during construction seems to be the best approach. The goal of this mitigation is to provide a way of transporting excess water during construction (lift placements and compaction) to meet compaction specifications, transport and reduce pore water pressures inside the constructed embankment for long term stability.

5.0 FINGER DRAIN

A total of 3 finger drains are proposed (one finger drain at Seep 1, one finger drains at Seep 2, and one finger drain at Seep 3). The centerline location of each finger drain was surveyed by Pelly's survey team. A figure showing the location was not provided to BGC before completion of this memorandum. However, each drain will be an estimated 10 m in length. Although it is not currently anticipated, these finger drains can be extended in length if moisture along the abutments appear to be an issue during construction.

The finger drain trenches should be a minimum of 2 m wide, by a minimum of 0.75 m high, with a 2:1 slope on each side. The drain trench should be excavated in Type 3 Bedrock or better. Similar requirements to the underdrain will be used to construct it (e.g. geotextile overlap, select throughout). The final drain will be field fitted and the final length and construction details will be dependent on the ground conditions and its ability to tie into the Pipe Trench. However, the drain should meet the minimum dimensions discussed here. The detail for the minimum requirements is presented as **Figure 11**.

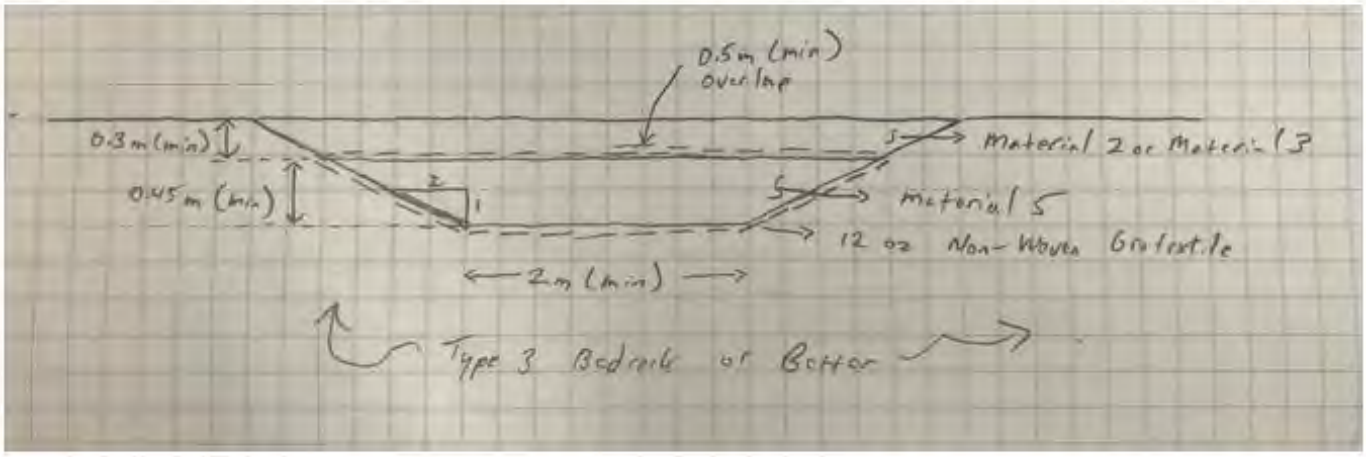

Figure 11: Typical section for finger drain.

Finger drains will tie into the drain rock at the pipe trench. Geotextile in the finger drains should overlap with the pipe trench by a minimum of 0.5 m. The Constructor should propose a method to overlap the geotextile at this connection based on constructability. BGC should review this connection prior to construction. The following sketch is a plan view of the finger drains in relation to the pipe trench (**Figure 12**).

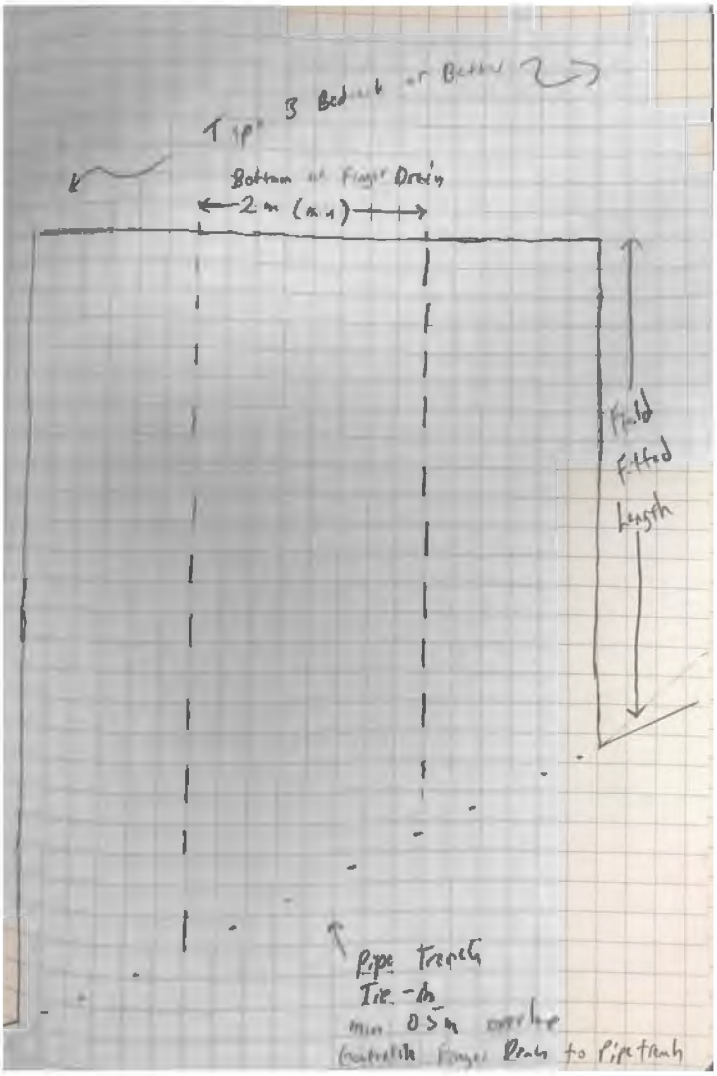

Figure 12: Plan view for finger drain layout.

6.0 SUMMARY AND RECOMMENDATIONS

A finger drain will be needed to reduce porewater pressures during construction through operations. The design presented could help drain slopes and maintain control of water during material lift placements prior to compaction.

This drain design is not intended for the control of the water on the east side of the embankment where the artesian hole was discovered. A separate design will be developed for the drain on that side of the embankment.

7.0 CLOSURE

BGC Engineering Inc. (BGC) prepared this document for the account of JDS. The material in it reflects the judgment of BGC staff in light of the information available to BGC at the time of document preparation. Any use which a third party makes of this document or any reliance on decisions to be based on it is the responsibility of such third parties. BGC accepts no responsibility for damages, if any, suffered by any third party as a result of decisions made or actions based on this document.

As a mutual protection to our client, the public, and ourselves, all documents and drawings are submitted for the confidential information of our client for a specific project. Authorization for any use and/or publication of this document or any data, statements, conclusions or abstracts from or regarding our documents and drawings, through any form of print or electronic media, including without limitation, posting or reproduction of same on any website, is reserved pending BGC's written approval. If this document is issued in an electronic format, an original paper copy is on file at BGC and that copy is the primary reference with precedence over any electronic copy of the document, or any extracts from our documents published by others.

Re: Strata Gold – Eagle Gold Project
Contract No. YG403 – Heap Leach Facility
Subject: Stockpile Management Plan

Response to BGC-RFI-003

Response:

The produced Heap Leach Facility (HLF) fill materials are to be managed by the EPCM team while Pelly Construction will manage stockpiled materials excavated from the ADR Plant pad and HLF abutment.

EPCM Managed Materials

Attached drawing VICEAG05E-220-9900-0001 illustrates the produced stockpiles locations, material type, specification, total quantity produced, contractor responsible for placement, and engineering firm responsible for materials specification.

- HLF Materials
    1. Spec #6 – Pipe Bedding (SDF) Select Drain Fill
    2. Spec #7 – Overliner Drain Fill (ODF)

- Material Testing
    - Sieve analysis testing will continue to be performed by Tetra-tech.

- Quantity
    - Produced stockpiles will be surveyed weekly; updated quantities and newly produced stockpiles will be shown in an updated revision of drawing VICEAG05E-220-9900-0001 and distributed to the appropriate parties.

- Identification
    - Signs are to be placed at the toe of each stockpile identifying the material type and contractor responsible for placement.

- Tracking
    - Placed material quantities to be tracked by recording the number of loads by truck type.

Pelly Construction Managed Materials

Attached drawings EMB008-1 and EMB008-2 illustrates stockpiled locations, material type, and quantity.

- Structural Fill
  1. 82,181 m3 contained within the HLF Embankment footprint
  2. 55,912 m3 at the ADR Pad stockpile
  3. Estimated 34,300 m3 will be structural fill for the remainder of the unexcavated ADR Pad material

- Rockfill
  1. 89,995m3 at the ADR Pad stockpiles
  2. Estimated 68,700 m3 will be rockfill for the remainder of the unexcavated ADR Pad material

- Quantity
  - Produced stockpiles will be surveyed prior to excavation

- Tracking
  - Placed material quantities to be tracked by recording the number of loads by truck type.

Information Request/Description of Issue:

Issue:

(1) The majority of surface water and groundwater seepage is found at the interface between colluvial material and bedrock, as a result, the use of temporary sumps and ditching in the overlying colluvium are not sufficient to capture/divert upslope drainage from reaching embankment underdrain system during course of construction.

The colluvium materials exhibit signs of high moisture: a solution is required to help drain elevated moistures in advance of subsequent pad development while helping to reduce unsuitable material classification that results from excessive moisture content.

The wet colluvium materials and drainage along bedrock contacts is already disruptive to planned productivities in achieving timely embankment construction and threatens to delay further embankment and pad area preparations if not sufficiently addressed.

(2) Potential encroachment conflict between underdrain piping and overlying liner and PLS collection systems.

(3) IFC drawings showing a pitchfork arrangement for the closure underdrain that splits into 3 runs leading up to the closure sump. This was changed from Y connections in the course of the draft drawings in response to procurement options that were being explored.

(4) The drawings do not specify the exact type of ADS N12 product to use, therefore Pelly is seeking formal approval of the ADS N12 pipe material that our vendor can supply.

Proposed solution for approval relative to above numbering:

(1)

a. Begin construction of pad area underdrains upstream of the embankment. Pelly seeks approval to proceed with the sump and pad area underdrain installations (associated with this will be COR#3 pertaining to

4110.5.03/04 pad area underdrains, to follow after confirmation of the construction approach).

b. Help ensure drainage occurring at the interface with bedrock is most efficiently captured by the underdrains by excavating trenches for the underdrains such that the underdrains are sufficiently recessed below the bedrock contact, including consideration for Select Fill and Select Drain Fill.

   i. Trench spoil will be side cast as there will be no practical means to achieve hauling access for loading out materials; colluvial and bedrock materials will both be casted and mixed together.

   ii. Once the headers and laterals are installed, colluvium to design depth will be dozed down slope, above/across installed underdrains for loading out where practical truck access may be achieved.

(2) Pelly requests a 3D profile of the trench before backfill that establishes the maximum elevation profile for underdrain piping occurring below the PLS header piping. This is needed to ensure a minimum excavation depth such that there is no encroachment on the liner and PLS collection system requirements, with consideration for minimum thicknesses for Select Fill and Select Drain Fill, liner bedding and geometries as may be applicable.

(3) Revert to Y connection arrangement as originally shown on EGHLF-XD-03-05 REV A; insofar as the Y type connections versus a cross connection with 2x 90 degree elbows to establish the 3 runs to the closure sump.

(4) ADS N12 BXS HDPE Perforated Corrugated.

Re: Response to CC204-RFI-037:

1.0 RESPONSE

Response to Question 1: The use of heap leach underdrains as water control for construction.

Construction of the Header Trench and Lateral Trenches into Bedrock

The Header Trench and Lateral Trenches will meet the design intent if excavated into the upper bedrock zone and the drains constructed. If done so, the final construction to grade should be as shown in ***Figure 1*** where colluvium will separate the drain construction from the liner system. Construction can be done prior to preparation of subgrade at the Phase 1 HLF, as is suggested in the RFI. BGC would provide approval of what constitutes the upper bedrock zone based on the Technical Specifications. Excavation should not be performed unless BGC is present.

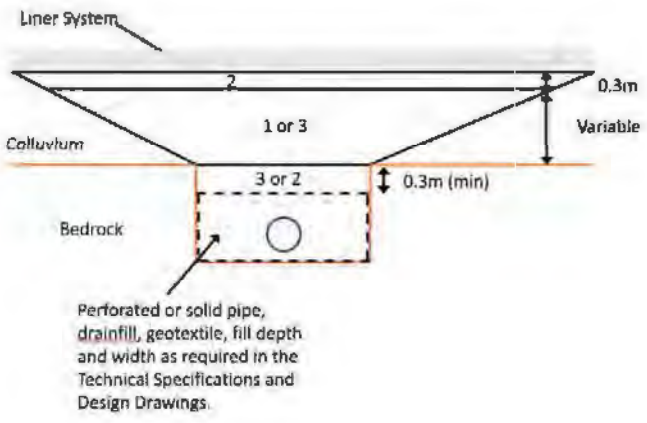

Figure 1: Typical completed drain trench design when build in bedrock with colluvium overburden.

Construction considerations

The following construction considerations should be taken into account:

- Trench spoils can be side cast from the trench with the assumption that they will be removed or used later in construction.
- Trench spoils may be used to backfill in the trench. However, the spoils must meet requirements in the Technical Specifications for the zone it will be used in (i.e. Material 1, Material 2, or Material 3).
- Dozing over drain construction is acceptable if the drain fill maintains a cover of at least 0.3m. Trafficking over a drain with less than 0.3m of cover may result in excavation and re-construction of the drain due to the potential for damaging of the drain pipe.
- If dozing during site grading results in undercutting of the pipe trench fill materials or adjacent bedrock then the undercut area will be filled back to grade with Material 2 or Material 3. Damage to the geotextile in the drain will result in excavation and repair of that drain.
- All Lateral Drains must be sloped at a minimum of 2% towards the Header Trench through the entire run of the drain.
- If high velocity water flows are observed in the drain trenches measures may be needed to reduce the volume and/or flow velocities in order to place materials.
- Material 2 and Material 1 must be graded such that they are filter compatible when placed next to each other. The field engineer will determine compatibility based on lab testing and recommend mitigation measure (such as geotextile separation) if appropriate.
- Drain construction (i.e select drain fill, geotextile, and 30cm cover) should be protected from erosion caused by surface flow. This can be done by placing sacrificial lifts above the construction. Pelly can propose other methods to protect the construction for BGC's review.
- Installed drain rock, piping, and geotextile should not be left exposed where siltation can occur.
- The final spacing, location, and number of the laterals may be altered by the field engineer to accommodate observed field conditions and/or to collect observed seeps and drain wet areas.

Response to Question 2: 3D profile

BGC can provide a 3D profile of the Lateral and Header pipe trenches before backfill, pursuant on JDS's approval of the costs associated with the effort. For Pelly's planning purposes it should be understood that before a profile can be generated BGC will need to be provided a detailed topography and raw data for the entire area to be modeled with a resolution of 1m. BGC will require 7 days from the time we receive this data to complete the model and perform quality control.

Response to Question 3: Y Connection

A Y connection will be acceptable.
