2020 ANNUAL REPORT

APRIL 2020

THIS PAGE INTENTIONALLY LEFT BLANK

TABLE OF CONTENTS

1 Introduction 1

2 Site Activities 4

2.1 Overview of Construction and Maintenance 4

2.1.1 Summary of Construction Activities 4

2.1.1.1 Ditch A Improvements 5

2.1.1.2 Ditch B 7

2.1.1.3 Lower Dublin South Pond 8

2.1.1.4 PG WRSA Rock Drain 9

2.1.1.5 Run of Mine Road 11

2.1.1.6 Power Supply 12

2.1.1.7 Heap Leach Facility 13

2.2 Overview of Mining 19

2.2.1 Ore, Waste and Gold Production 19

2.2.2 Reserve and Mine Life Update 25

2.3 Quality Assurance and Quality Control Program for Mine Operations 25

2.3.1 QA/QC Failure Investigation and Correction Program 25

2.3.2 External QA/QC Program 25

2.4 Proposed Development & Production in 2021 25

2.4.1 Field Supervisor 25

2.4.2 Additional Construction Activities 26

2.4.2.1 Ditch B 26

2.4.2.2 PG WRSA Rock Drain Completion 26

2.4.2.3 EP WRSA Rock Drain Progressive Development 26

2.4.2.4 Fixed HLF Conveyors 27

2.4.2.5 ROM Road 27

2.4.2.6 HLF Phase 2 Bulk Earthworks 27

2.4.2.7 Mine Water Treatment Plant 27

2.4.2.8 Events Pond fencing 27

2.4.2.9 Additional Facilities 27

2.4.3 Production Activities 27

2.5 Description of Water Use and Deposit of Waste 34

2.5.1 Description of Water Use 34

2.5.1.1 Water Use 34

2.5.1.2 Water Storage 35

2.5.1.3 Water Transfers 37

2.5.2 Deposit of Waste 38
2.6 HLF Solution Monitoring Program 38
2.6.1 HLF Solution Inventory Monitoring program 39
2.6.2 HLF Foundation Drainage System Monitoring 41

3 Environmental Monitoring 43
3.1 Surface Water Hydrology 43
3.1.1 Surface Water Hydrology Monitoring 45
3.1.2 Site QA/QC Programs 48
3.1.2.1 Stage Measurements and Corrections 48
3.1.2.2 Rating Curve Error 48
3.1.3 Effluent Discharge 49
3.1.4 Adaptive Management 49
3.2 Surface Water Quality 50
3.2.1 Surface Water Quality Monitoring 50
3.2.2 Quality Assurance and Quality Control Program 53
3.2.2.1 QA/QC Methodology - Field Sampling Program 54
3.2.2.2 QA/QC Methodology - Laboratory Analytical 55
3.2.2.3 Results and Discussion 56
3.2.3 Water Quality Results 61
3.2.3.1 Mine Site Monitoring Compliance Results 61
3.2.3.2 Receiving Environment Surface Water Quality Monitoring Program 70
3.3 Water Balance and Water Quality Modeling 80
3.3.1 HLF Water Balance Model Integration 82
3.3.1.1 Results 83
3.4 Groundwater 83
3.4.1 Groundwater Quantity Monitoring 85
3.4.2 Groundwater Quality Monitoring 86
3.4.2.1 Groundwater Quality QA/QC 99
3.4.3 Adaptive Management 99
3.4.3.1 Groundwater Quantity 99
3.4.3.2 Groundwater Quality 100
3.5 Geochemical Monitoring 100
3.5.1 Geochemical Barrel Testing 100
3.5.1.1 Eagle Waste Rock Unsaturated Columns 102
3.5.2 Material Testing 103
3.5.2.1 Construction Material Sampling 103
3.5.2.2 Waste Rock Characterization 103
3.5.2.3 Blast Hole Chip Sampling 104

3.6 Aquatic Environment 107
3.7 Metal and Diamond Mining Effluent Regulations Monitoring Program 107
3.8 Meteorology and Air Quality Monitoring 107
3.8.1 Climate Monitoring 107
3.8.2 Air Quality Monitoring 108
3.8.2.1 TSP, $PM_{2.5}$ and PM_{10} 109
3.8.2.2 Dustfall 110
3.8.2.3 SO_2, NO_2 and NH_3 112
3.8.2.4 Metals 113
3.9 Terrestrial 115
3.9.1 Vegetation Monitoring Program 115
3.9.2 Invasive Plants Management Program 116
3.9.2.1 Prevention 117
3.9.2.2 Control 118
3.9.2.3 Assessment and Monitoring 118
3.9.3 Soils 119
3.9.4 Wildlife 120
3.9.4.1 Nesting Songbird Surveys 120
3.9.4.2 Pre-clearing Wildlife and Wildlife Habitat Surveys 120
3.9.4.3 Wildlife Incidents 120
3.9.4.4 Annual Moose Survey 120
3.10 Permafrost 122
3.10.1 Data Analysis 124
3.10.1.1 Eagle Pup WRSA Multi Bead Thermistors 124
3.10.1.2 Platinum Gulch WRSA Multi Bead Thermistors 125
3.10.1.3 Overland Conveyor Multi Bead Thermistor 125
3.10.1.4 Upgradient of LDSP Facility Multi Bead Thermistor 125
3.10.1.5 Camp Facility Multi Bead Thermistor 126
3.10.1.6 Reclamation Material Stockpile Multi Bead Thermistor 126
3.10.1.7 Ground Temperatures of Single Bead Thermistors 127
3.10.1.8 HLF Embankment Piezometers and Temperatures 127
3.11 Noise 127
3.11.1 Sounds Levels Related to Blasting 127
3.12 Spills and Accidents 128
3.12.1 Spill Contingency Overview 128
3.12.2 Reportable Summary 128
3.13 Traffic and Access, Upcoming Maintenance 130
3.13.1 Level of Traffic 130

3.13.2 Access Control Issues 130
3.13.3 Incidents 131
3.13.4 Planned Access Road Work 131
3.14 Water Management & Sediment and Erosion Control 131
3.14.1 Major Water Management Infrastructure 131
3.14.1.1 Lower Dublin South Pond 131
3.14.1.2 Ditches and Pipes 132
3.14.2 Erosion and Sediment Control Infrastructure 132
3.15 Independent Environmental Audit 134

4 Physical Monitoring 135
4.1 Eagle Pit 135
4.1.1 Stability Incidents 136
4.2 Waste Rock Storage Areas 139
4.2.1 2020 WRSA Development 139
4.2.2 WRSA Monitoring 140
4.3 Heap Leach Facility and Process Facilities 143
4.3.1 Stability Inspection 146
4.3.1.1 Engineer of Record Physical Stability Inspection 146
4.3.2 Status Report on Backup Equipment and Supplies for Emergency Management 151
4.3.2.1 PLS Pumps 151
4.3.2.2 Barren Solution Pumps 152
4.3.2.3 Power Supply 153
4.4 Material Storage and Stockpile Management Areas 154
4.5 Engineer's Physical Stability Annual Inspection 156

5 Cyanide Management 162
5.1 Transportation and Storage Controls 162
5.1.1 Transport 162
5.1.2 Receipt, Handling, and Storage 162
5.2 Operational Controls 163
5.2.1 Facilities Monitoring and Inspections 163
5.2.2 Wildlife Monitoring 165
5.2.3 Surface and Groundwater Monitoring 165
5.2.4 Worker Safety 166
5.2.5 General Signage Requirements 167
5.2.6 Emergency Response 167
5.2.7 Emergency Equipment 167
5.2.8 Medical Emergency Response 168
5.2.9 Emergency Response Team 168

5.2.10 Mock Emergency Drills 168
5.2.11 Cyanide Emergency Destruction 169
5.3 Training 169
5.4 Annual Cyanide Management Plan Audit 170
5.4.1 Audit Review 170
5.4.2 Audit Recommendations 171

6 Reclamation & Closure 174
6.1 Reclamation Research 174
6.1.1 Revegetation Program 175
6.1.1.1 Locally Harvested Seed Trials 176
6.1.2 Engineered Cover Trials 177
6.1.3 Passive Water Treatment 178

7 Socio-Economic Monitoring 182

1 INTRODUCTION

Victoria Gold (Yukon) Corp. (VGC) currently operates the Eagle Gold Mine in central Yukon. The Eagle Gold Mine ('the Project') is located 85 km from Mayo Yukon using existing highway and access roads (Figure 1.1-1). The Project involves open pit mining and gold extraction using a three-stage crushing process, heap leaching, and a carbon adsorption, desorption, and recovery system over the mine life (Figure 1.1-2).

The Project is being operated in accordance with the terms of the Type A Water Use Licence (WUL) QZ14-041-01 and the Quartz Mining License (QML) QML-0011. The reporting period for this Annual Report is from January 1 to December 31, 2020 and serves to report on both WUL and QML conditions and associated management plans.

2 SITE ACTIVITIES

Work on the Project during 2020 included ongoing operations, as well construction activities related to operational improvements of facilities, ongoing development of the HLF, and advancement of the PG WRSA and the open pit. The configuration of major Project facilities is provided in Figure 2.1-1 and Figure 2.1-2. Appendix A provides as built designs, status reports, and quality assurance and quality control records for certain relevant facilities discussed within Section 2.

2.1 Overview of Construction and Maintenance

2.1.1 Summary of Construction Activities

Construction of all major fixed facilities required for the Mine were completed during previous reporting periods. For 2020 (and future years), the primary construction activities will relate to the ongoing development of the HLF and advancement of the WRSAs and open pit.

In 2020, in addition to the completion of minor outstanding facility construction tasks, additional construction efforts focused on improvements to Ditch A, sediment removal and low-permeable liner installation for the Lower Dublin South Pond (LDSP) forebay, ongoing construction of Ditch B in preparation for connection and use in 2021, run of mine haul road development and ongoing construction of the Platinum Gulch (PG) rock drain and Heap Leach Facility (HLF) Phase 1B area.

Additionally, the advancement of design work for the Mine Water Treatment Plant (MWTP) and truck maintenance shop commenced. These activities are intended to support construction works in 2021 and 2022.

Construction report for completed Engineered Structures as defined in QZ14-041-1 (which for 2020 includes the Ditch A performance upgrades and the completion of a subsequent phase of the HLF [Phase 1B]) are provided in Appendix A1 and A2, respectively.

Additional certifications (and inspection in the case of the HLF) by a Professional Engineer for the PG WRSA, the open pit and the HLF are provided as Appendix B1, B2 and B3, respectively.

Table 2.1-1 depicts specific construction activities conducted during each month of 2020.

Ditch B - Shaping, line and rip rap install	Sep	2021												
Ditch A – Operability Improvements	Sept	Oct												

2.1.1.1 Ditch A Improvements

During 2020, the operational limitations with the previously constructed Ditch A configuration (i.e., a large HDPE pipeline installed within a geotextile and rip rap lined ditch) were corrected. The originally installed design did not fully meet the requirements for collecting contact water and sediment laden water during freshet and summer rain events due to sediment build-up at the sump, while at the same time specific maintenance activities (e.g., sediment clean out) in the ditch were impractical due the presence of the 28-inch pipe. During construction of the ditch in February and March 2018, a large icing developed at the designed location for the PG sump due to the intersection of groundwater. Large icings formed in the sump and along the upper portion of Ditch A which made it not feasible to build the sump at the design location. The sump location was moved about 200 m downgradient from the original design location, although Ditch A still extended to the design toe of the PG WRSA.

To correct the operational issues with Ditch A, the EOR established for the work and the VGC Technical Services department determined that the best solution was to remove the pipe entirely and reline the ditch with an impermeable liner and replace the rip rap. The impermeable liner installed in the ditch was sourced from unused liner available from the ongoing heap leach pad construction program. The liner is 2 mm Linear Low-Density Polyethylene (LLDPE) black textured geomembrane. Most of the rip rap used to complete the ditch upgrades was sourced from the ditch itself and reused with supplemental rip rap sourced from metasediment/granodiorite waste rock from the open pit and leftover rip rap from other Mine construction areas sourced from the Dublin Gulch valley.

All additional rip rap used for the Ditch A works was tested for compliance with the construction grade waste rock requirements of the Quartz Mining License QML-0011 and Water Use Licence QZ14-041-1 and were deemed suitable. Pictures of various stages of the construction work are shown below in Photo 2.1-1 to Photo 2.1-4 and the construction report is provided as Appendix A1.

Photo 2.1-2: Ditch A HDPE Liner Installation (~0+300) – September 18, 2020

Photo 2.1-3: PG Sump Deconstruction (~0+000) – September 20, 2020

Photo 2.1-4: Ditch A Rip Rap Placement on Liner (~0+900) – October 21, 2020

2.1.1.2 **Ditch B**

During the reporting period the remaining length of Ditch B (from Suttles Gulch to future EP WRSA rock drain sump) was shaped in preparation for liner and rip rap installations. By the end of 2020, liner and rip rap was placed from the LDSP forebay to approximately 100m east. Further construction activities for the completion of the ditch were pending until suitable rip rap could be sourced and will be completed in 2021.

Photo 2.1-5: Ditch B Alignment Shaping – October 10, 2020

Photo 2.1-6: Ditch B Liner Installations – November 29, 2020

2.1.1.3 Lower Dublin South Pond

As a condition of QZ14-041-1, a hydrogeological assessment was required to determine if the forebay of the Lower Dublin South Pond (LDSP or Control Pond) should be lined with low permeability liner. QZ14-041-1 mandated that if the hydrogeological assessment recommended that the forebay required a low permeability liner, then one must be installed by September 30, 2020.

VGC made the decision to simply install a liner system (rather than rely on the findings of a hydrogeological assessment) to proactively demonstrate the forebay base has low permeability. This minor modification was completed during Q4 2020 by removing the sediment accumulated in the forebay and installing the liner. The delay in constructing the liner was to allow for the adequate dewatering of the forebay area and provide sufficient time for sediment to stiffen (freeze) to allow excavation.

No changes to the alignment, berms, or functionality of the forebay was made and whilst the liner installation is complete the construction is not considered fully finalized as ballast (sand bags) placement on the liner remains outstanding and will be completed in 2021.

Photo 2.1-7: LDSP Forebay Cleanout and Shaping – November 7, 2020

Photo 2.1-8: LDSP Forebay Liner Installation – December, 2020

2.1.1.4 PG WRSA Rock Drain

Construction of the PG WRSA Rock drain was ongoing throughout the reporting period. Specific sections of the rock drain were placed in advance of waste rock dumping as access was developed from open pit ramp outs in accordance with the mine plan. Approximately 225 m of PG WRSA Rock Drain was built in 2020 requiring the placement of about 25,000 m^3 of waste rock material deemed appropriate for the use based on the design criteria and material testing.

Progression on the PG WRSA rock drain is part of weekly mine planning and, as sections are constructed, approval for use and waste rock dumping commencement is sought from the EOR.

Photo 2.1-10: PG WRSA Rock Drain Material Placement – June 7, 2020

Photo 2.1-11: PG WRSA Rock Drain Construction Progression – September 22, 2020

Photo 2.1-12: PG WRSA Rock Drain Surveying – September 26, 2020

2.1.1.5 Run of Mine Road

Construction and use of the Run of Mine (ROM) Road from the open pit to the HLF commenced in 2020 to support stacking and ore placement operations on the HLF. Construction commenced in July 2020 with connection completion to the 995 masl elevation of the HLF in December. At year-end 2020, temporary snow fill/ice bridge crossings were being utilized on Dublin Gulch and Stewart Gulch until culvert installations are completed in 2021.

The activities undertaken in 2020 include cut and fill development of the ROM Road in the footprint of the future EP WRSA for temporary use. Over the life of mine, the ROM road alignment on the south of Dublin Gulch will be configured based on waste rock stacking schedules as a true final alignment will not be realized until the lowest lifts of the EP WRSA are completed. The road alignment from Stewart Gulch to the HLF and the culvert crossings will provide sustained access during the life of the HLF.

Photo 2.1-13: ROM Road Cut and Fill – November 19, 2020

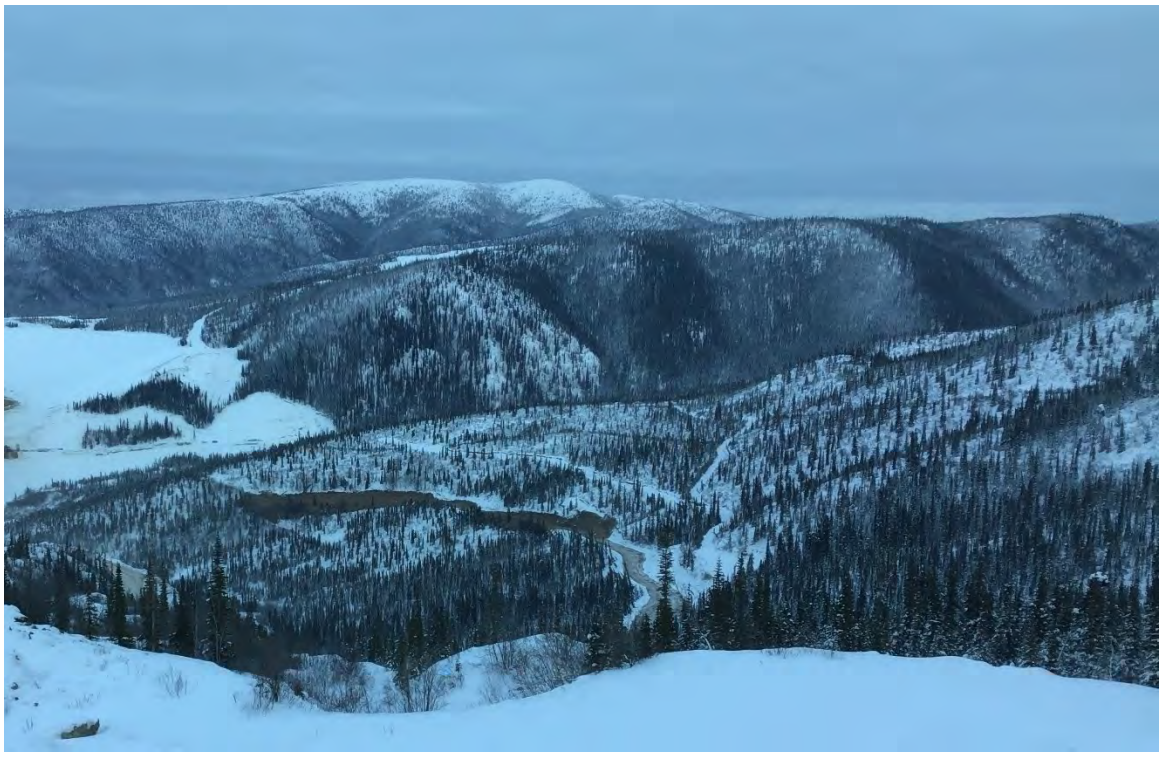

Photo 2.1-14: ROM Road Progression from Open Pit to HLF – November 30, 2020

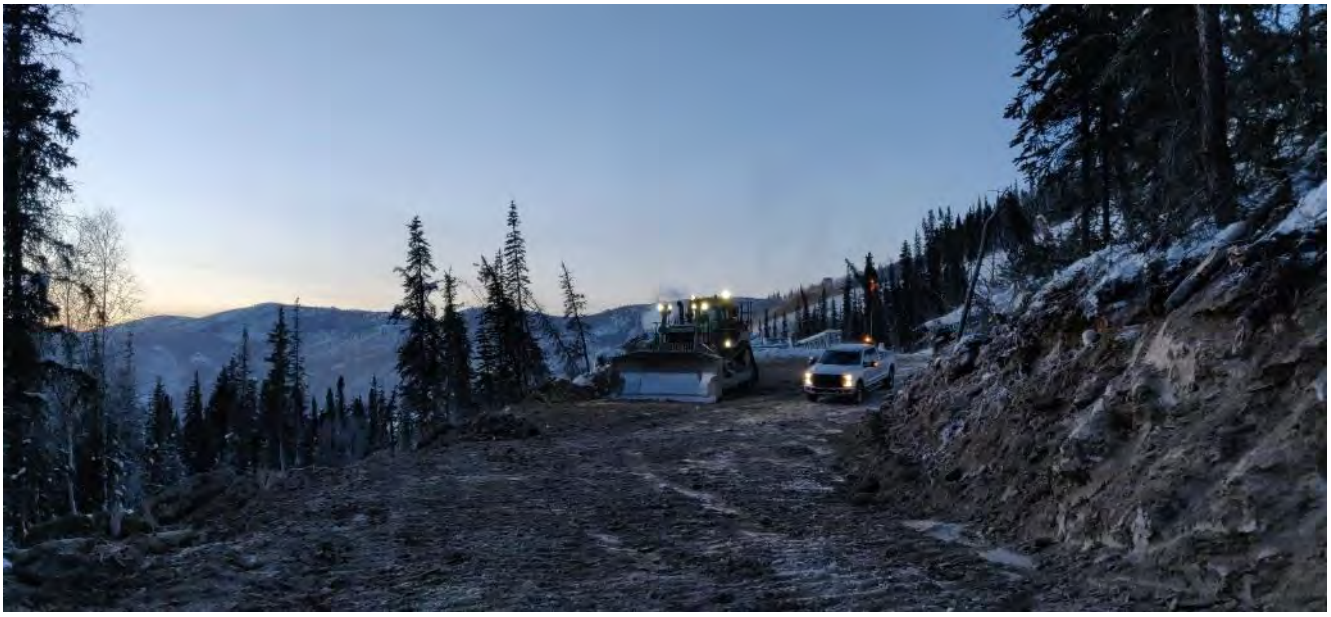

Photo 2.1-15: ROM Road Tie in to HLF – December 25, 2020

2.1.1.6 **Power Supply**

In 2019, a wildfire along the South McQuesten Road caused minor damage to sections of the transmission line that required repair. A small number of the poles were charred but not compromised; however, sections of the

fiber optic cable and 69 kV overhead line were impacted and it was determined that their immediate function was not a concern but the longer term integrity of the cable and line were at risk particularly under snow and ice loads. In 2020, repair work was undertaken on the following sections:

- Overhead section of fiber cable between structures 5/6 to 6/3 was replaced; and,
- 69 kV overhead cable between structures 5/11 to 5/12 was spliced.

To support the maintenance and repair activities, the design engineer for the transmission line was engaged to complete an overhead line inspection. Due to access limitation at the time of the inspection, the full ~45 km transmission line was not able to be inspected. Some minor deficiencies were identified and they will be rectified when the remaining sections of the transmission line are inspected in 2021.

2.1.1.7 **Heap Leach Facility**

In the reporting period, construction of the HLF Phase 1B area was completed and deemed acceptable by the EOR for receiving crushed ore as contemplated in the design. The Phase 1B Heap Pad consists of the lined area of the HLF between elevations 990 masl and 1050 masl and includes the perimeter berms along the eastern and western edges of the Phase 1B Heap Pad.

Design criteria adhered to during construction included:

- As with the Phase 1A Pad, the Phase 1B Pad subgrade foundation was excavated down to Type 3 bedrock and included removal of all organic, ice rich, and soft or yielding soils. Areas were delineated for removal and backfilled with Compacted Rockfill. Subgrade was inspected and approved by Tetra Tech and Layfield prior to liner installation.
- Compacted Rockfill fill was used in select areas as needed to achieve design grade.
- Select Fill was used in select areas as needed as liner bedding.
- Perimeter berms were required on the west and east side of the Phase 1B Heap Pad area. These structures were constructed with Rockfill.

The following Phase 1B Heap Pad components were completed:

- Preparation of the subgrade for liner placement. This included excavation of finger drains, where needed, excavation to approved grade and shape, and placement of Select Fill (bedding sand) where needed.
- Placement of the liner system along the Phase 1B Heap Pad.

The single liner system is installed directly on the prepared subgrade and consists of the following layers (starting from the top to the bottom):

- An 80-millimetre (80-mil), textured double-sided low-density polyethylene (LLDPE) geomembrane liner; and,
- A geosynthetic clay liner (GCL), which is reinforced with a layer of sodium bentonite.

The 80-mil LLDPE double-sided, textured geomembrane was placed directly on the GCL throughout all areas of Phase 1B. The GCL was placed directly on the prepared and inspected subgrade, which was smooth and free of all protruding rocks, stones, sticks, roots, sharp objects, or debris of any kind. GCL liner was covered the same day, if possible, to limit exposure to moisture.

Once the liner had been deployed, fused, repaired, and tested, a final walk-off was performed by Tetra Tech and Layfield to inspect for deficiencies such as holes, missing repairs, and missing testing. The walk-off consisted of inspecting the entire liner area, including seams, the tie-in to Phase 1A, and the anchor trench. If any deficiency was noted, the deficiency was remedied immediately. Once all deficiencies had been remedied, Layfield drafted a Certificate of Final Inspection and Acceptance to be signed by the CQA Monitor and Layfield's Supervisor or QC representative. Upon sign off, Tetra Tech provided the Certificate of Final Inspection and Acceptance to Victoria and Forte (the EOR).

The as-built report for Phase 1B of the HLF is provided as Appendix A2.

2.2 Overview of Mining

2.2.1 Ore, Waste and Gold Production

Commercial production for the Eagle Gold Mine was officially declared in the second quarter of 2020. The declaration was based on VGC examining the following key factors for the Mine:

- All major capital expenditures to bring the mine to the condition necessary for it to be capable of operating in the manner intended by management had been completed;
- The completion of a reasonable period of testing of the mine properties;
- The mine reached the pre-determined production threshold; and,
- The ability to sustain ongoing production rates.

Upon achieving commercial production, for the purposes of ongoing financial reporting, costs were transferred from assets under construction into the appropriate asset classifications (such as inventory, mineral properties, property, plant and equipment). Gold sales are now recognized as revenue and production costs as a component of cost of goods sold.

For 2020, the total amount of ore and waste mined in the reporting period was 20 Mt, of which 7.5 Mt was ore and 12.5 Mt was classified as waste (representing a strip ratio of 1.64:1 waste to ore). Of the mined ore, approximately 7.3 Mt was stacked on the HLF with an average gold grade of 0.84 g/t. 116,644 ounces of gold was produced and 102,551 ounces were sold. Based on analysis of the mined ore and the HLF metallurgical model, there was an estimated 62,959 recoverable ounces within the mineral inventory (i.e., in solution/stacked ore on the heap, or in broken inventory).

The production rates realized in 2020 were below the planned rates provided in the 2019 annual reports for QML-0011 and QZ14-041-1 due to a number of factors. A requirement for material handling improvements within the process circuit were identified during the reporting period. A comprehensive Operations Reliability Enhancement Phase, to improve equipment mechanical availability and maintenance practices, was completed. The primary goal of the Operations Reliability Enhancement Phase was to increase plant uptime and thereby achieve throughput design capacity. Key areas for improvement included: feeder and feed chute design; wear liner selection and design; control logic improvements in the process system and addressing under designed capacity of the mobile grasshopper conveyor stacking system on the heap leach pad.

The majority of mined material was removed from the Phase 1 pit area however pre-striping of Phase 2 of the pit was also initiated during the reporting period. Ore removed from the pit was delivered to the primary crusher and waste rock was sent to the 8 different lifts in the PG WRSA ranging from 1100 lift up to the 1370 lift. Waste rock material deposited into the PG WRSA was classified by the following six different lithologies:

- Oxidized granodiorite: Pervasive oxidation, relatively continuous throughout the whole rock. Granodiorite may also be altered by sericite/clay but is within the oxide zone. Rock may be friable.
- Altered granodiorite: Dominantly sericite/clay altered granodiorite. Original texture may be obliterated. May see zones of sheared or faulted granodiorite with intense sericitization and few remnant granodiorite particles.

- Unaltered fresh granodiorite: Oxidation weak and restricted to fractures or weakly in vein selvages. Rock is competent and not wholly altered.
- Oxidized metasediments: Hornfels Hyland Group metasediments with whole rock oxidation.
- Fresh metasediments: Hornfels Hyland Group metasediments with no oxidation, may be altered (likely silicified).
- Overburden: Generally colluvium.

The mass and volume of waste rock by lithology delivered to the PG WRSA in 2020 is depicted in Figures 2.2-1 and 2.2-2. The configuration of the Eagle pit and the PG WRSA at the end of 2020 is shown in Figure 2.2-3 and Figure 2.2-4, respectively.

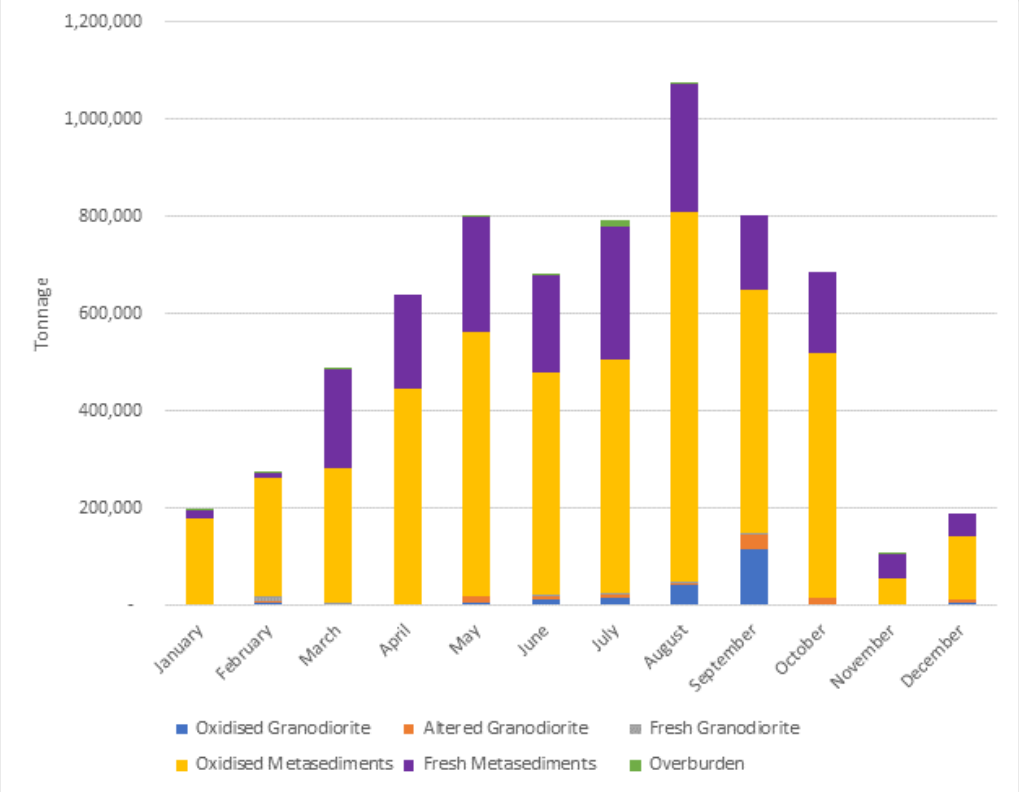

Figure 2.2-1: Mass of Waste Rock Deposited in the PG WRSA by Lithology in 2020

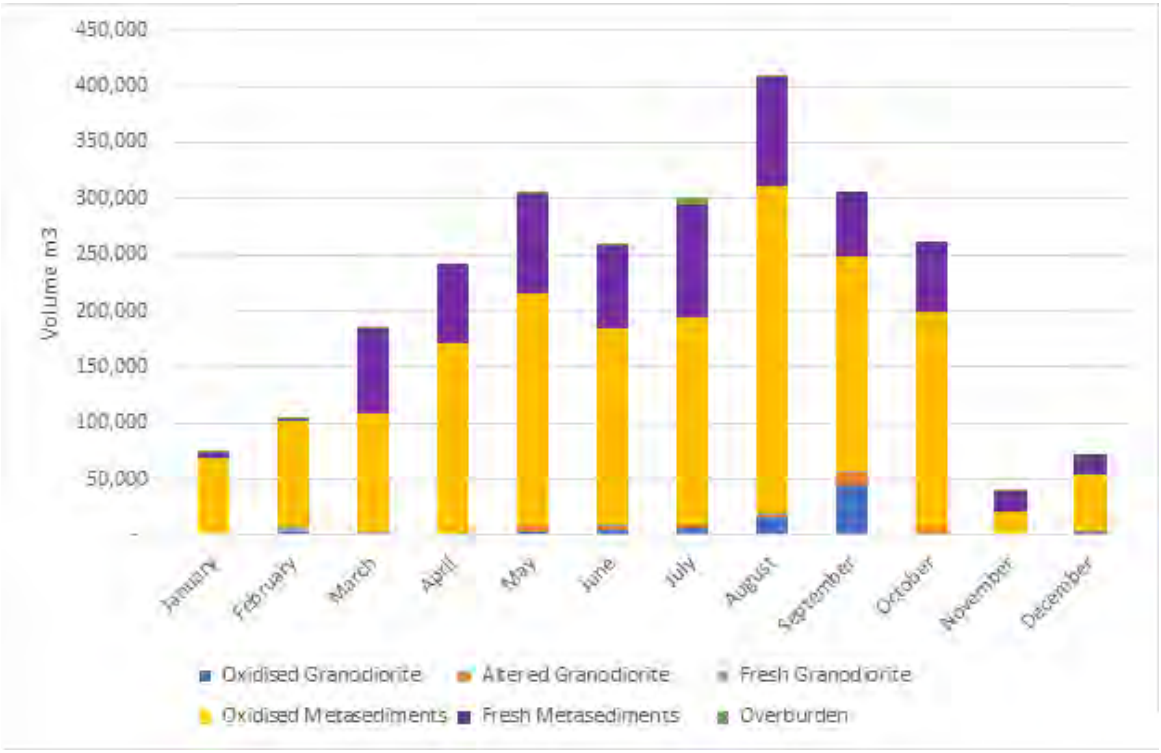

Figure 2.2-2: Volume of Waste Rock Deposited in the PG WRSA by Lithology in 2020

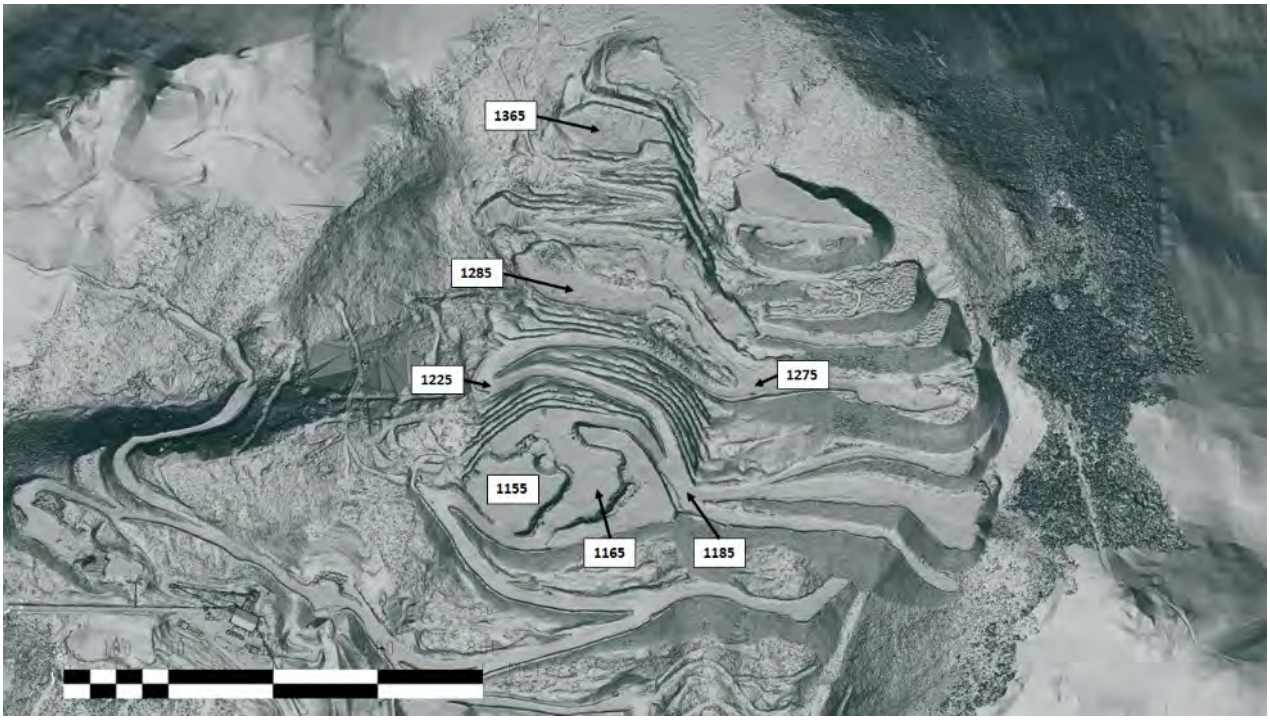

Figure 2.2-3: Eagle Pit Configuration at end of 2020

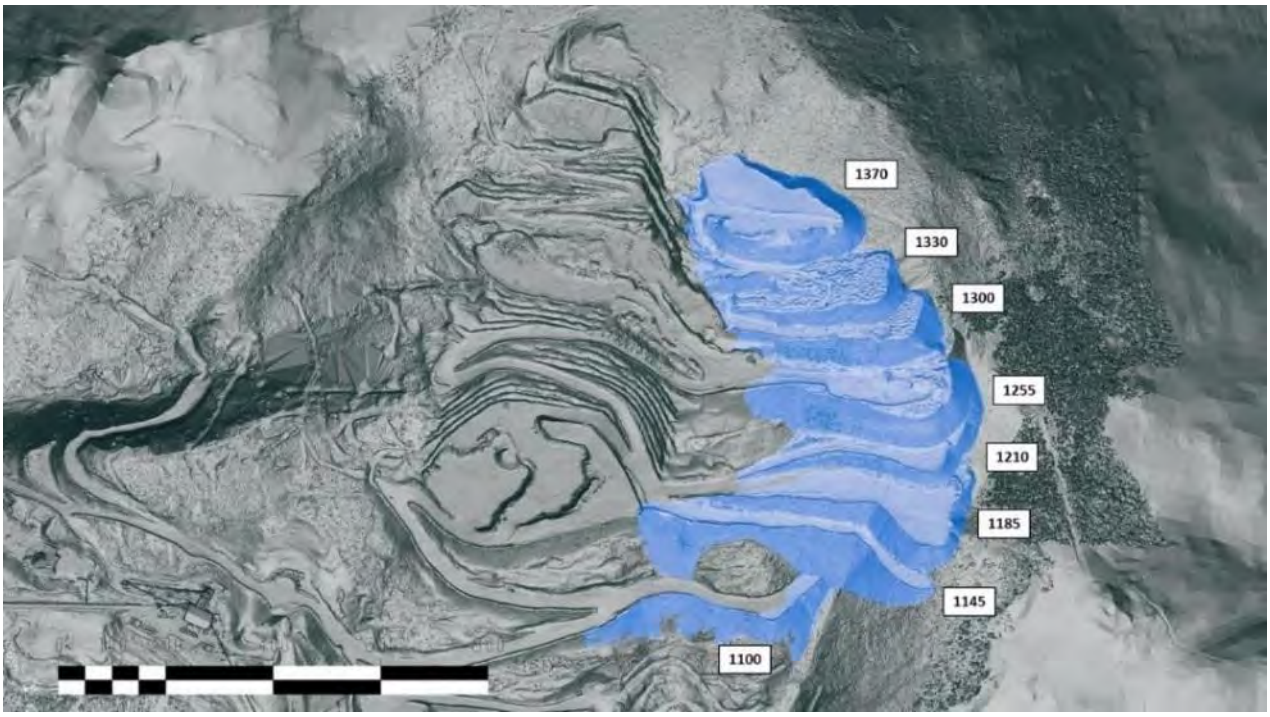

Figure 2.2-4: PG WRSA Configuration at end of 2020

Ore stacking during the reporting period was primarily within phase 1A of the HLF; however, towards the end of the year the Phase 1B area became available to receive ore and material was placed up to the 1,000 elevation. At year end, there was approximately 150,000 m^2 under active leach. Weekly planning meetings continued through the year in which weekly stacking and leaching plans are defined to guide efficient placement of ore and barren solution distribution systems. Examples of site planning data compiled each week is shown below in Figure 2.2-5.

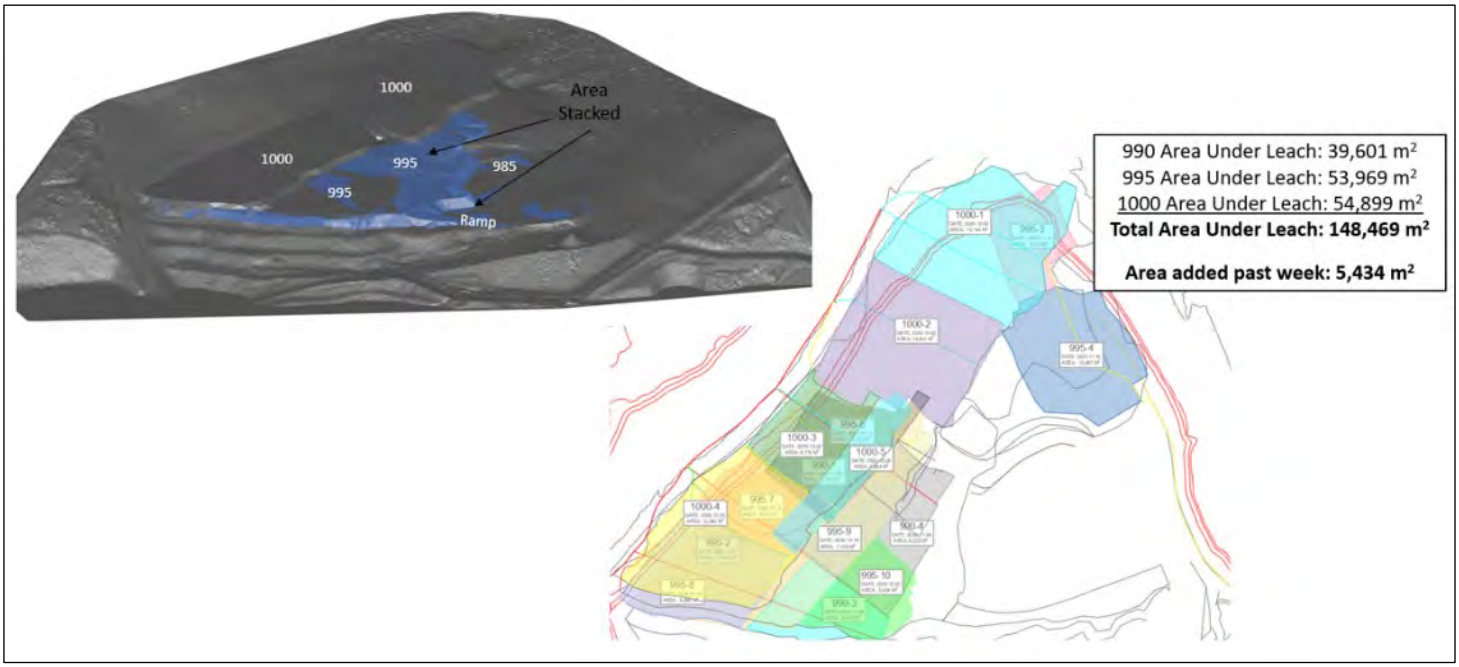

Figure 2.2-5: Example of Weekly Ore Stacking and Leaching Plan (December 2020)

Recovery from the ore stacked within the HLF trended up steadily throughout the year as the HLF and area available for leaching increased in size. The recovery model which utilizes ore characteristics (particle size, ore grade from block model, leach kinetics, etc.) showed good agreement with realized recoveries and as such the HLF leaching process is progressing as expected.

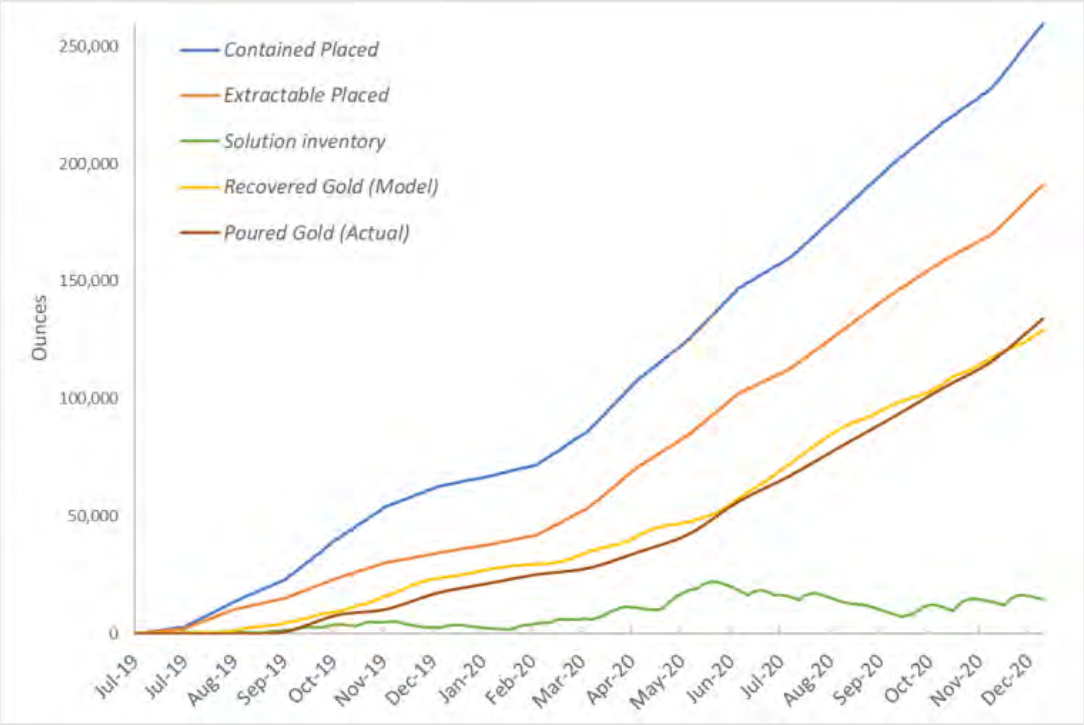

Figure 2.2-6: Gold Recovery Reconciliation 2020

Over the life of the Eagle pit, based on the current mine plan and regulatory approvals, 86 Mt of ore will be processed and 116 Mt of waste (which includes a current estimate of ~16Mt of ROM material) will be placed in waste rock storage areas. Table 2.2-1 provides annual tonnages for ore and waste rock scheduled to be removed from the open pit by year.

Table 2.2-1: Life of Mine Production Schedule

	2019	2020	2021	2022	2023	2024	2025	2026	2027	Total

Total Material Mined (kt)	**4,924**	**20,545**	**26,409**	**27,726**	**28,206**	**26,228**	**22,617**	**22,892**	**23,004**	**202,550**

NOTE:
Destination and production rate for run of mine material is based on current mine planning assumptions (e.g., equipment availability, gold price, etc.) and may vary during each production year.

2.2.2 Reserve and Mine Life Update

An updated mineral resource and reserve estimate for the Eagle Gold Mine was prepared in 2019 by JDS Energy & Mining Inc. (JDS) on behalf of VGC. The "Technical Report for the Eagle Gold Mine, Yukon Territory, Canada" prepared by JDS was discussed in the 2019 annual report presented for QML-0011 and QZ14-041-1. At the time of preparing this annual report for QML-0011 and QZ14-041-1, there has been no official update to the mineral resource and reserve estimate for the Project and thus remains unchanged.

2.3 Quality Assurance and Quality Control Program for Mine Operations

Samples are collected from each blast hole associated with all blast patterns at the open pit. The blast holes are spaced according to the Engineer design and range from 6 to 7 meter spacing on average.

Each blast pattern is comprised of approximately 100 blast holes for which there is one sample per blast hole collected from blast hole cuttings. Samples are collected, described, matched and geo-referenced to a blast hole pattern map and subsequently entered into a database which is updated and reviewed on a daily basis to inform material placement decisions.

For the purposes of mine operations, the Eagle Gold Quality Assurance/ Quality Control (QA/QC) protocol includes Blanks (3 per 100 samples), Certified Standard material (3 per 100 samples), Field Duplicates (2 per 100 samples) and pulp/prep duplicates (2 per 100 samples) prepared by the onsite assay laboratory. In total, QA/QC samples represent approximately 10% of the total blast hole sample program.

2.3.1 QA/QC Failure Investigation and Correction Program

QA/QC failures are associated with standards and blanks reporting values outside of the parameters expected for each sample, and in this case, values above or below three standard deviations. These are investigated on a case by case basis. In general, when a standard or blank fail, the whole batch is analyzed and the leg before and after (5-10 samples) the failed QC sample is then analyzed. If necessary, the laboratory is requested to re-analyze the whole sample batch and report assay results again. QC failures as well as actions taken for correction are logged into a datasheet for recording assay certificate number, sample number and a brief description of problem and actions.

2.3.2 External QA/QC Program

Currently, 10% of sample pulps are resubmitted from the onsite laboratory to an external laboratory (Bureau Veritas), where pulps are analyzed for gold with fire assay and ICP-MS analysis for 37 elements. These results are compared with onsite laboratory results to determine linear correlations, variance and the coefficient of determination.

2.4 Proposed Development & Production in 2021

2.4.1 Field Supervisor

In 2021, the field supervisor for the Mine is Victoria's Vice President of Operations and General Manager Mr. David Rouleau (phone: 867-456-7700 extension 6328).

2.4.2 Additional Construction Activities

The major construction activities planned for 2021 and the planned schedule is provided in Table 2.4-1. Additional details regarding the scope for each activity is provided below.

Table 2.4-1: 2021 Planned Construction Schedule

Activity	Start	Finish	2021											
			J	F	M	A	M	J	J	A	S	O	N	D
PG Rock Drain	Jan	Apr												
ROM Road – Widen and culvert install	Jan	Apr												
Ditch B	Jan	Apr												
Explosives Plant	Jan	June												
Fixed HLF Conveyors – Phased works	Jan	Nov												
Truck Shop – Design and Construct	Jan	Oct												
Mine Water Treatment Plant – Design and Construct	Jan	2022												
EP Rock Drain	Apr	2022												
ERT Building Upgrades	May	May												
Events Pond Fencing	May	Jun												
Process/Maintenance Office	May	Jun												
HLF Phase 2 - Bulk Earthworks and Underdrain	May	Nov												

2.4.2.1 **Ditch B**

The final liner and rip rap placement in Ditch B is scheduled for completion in April or May. This work is being sequenced with the weekly mine plan to ensure that the ditch is completed to current design specifications in advance of active waste rock placement in the Eagle Pup WRSA. The schedule is being updated as necessary to ensure that mine contact water is captured and conveyed to the LDSP as is considered in the Water Management Plan.

2.4.2.2 **PG WRSA Rock Drain Completion**

As discussed in section 2.1, the development of the PG WRSA rock drain is being completed on an as required basis that is dictated by waste rock deposition, pit development and equipment availability. Specific sections of the rock drain are completed in advance of active waste rock dumping and, once approval to proceed is received from the EOR, waste rock placement begins. It is currently anticipated that the full length of the PG WRSA rock drain will be completed in April 2021 as the base lifts of the WRSA will have been started. Once the full length of the rock drain is complete a construction report will be finalized and submitted in accordance with the regulatory approvals.

2.4.2.3 **EP WRSA Rock Drain Progressive Development**

The EP WRSA will be developed in a sequential manner as has been undertaken with the PG WRSA. With active dumping in the EP WRSA scheduled to commence in Q2 2021, surveying, clearing and grubbing and staking will commence in April/May with rock drain material placement beginning shortly thereafter and be progressive as base lifts on the EP WRSA are developed.

2.4.2.4 **Fixed HLF Conveyors**

To support crushed ore delivery from the crushing circuit to higher elevations on the HLF, a permanent high angle conveyor system will be installed on the eastern perimeter of the heap leach pad. The system will be developed in phases as stacking progresses up slope. The conveyors system will then be used to supply the grasshopper conveyors on the ore pile for efficient delivery of the crushed ore to the active lift.

2.4.2.5 **ROM Road**

ROM Road construction will continue in 2021 with final widening and culvert replacement expected to be completed in April. The section of the ROM Road in the Eagle Pup drainage will continue to be modified over the next 2 to 3 years as the lower lifts of the EP WRSA are developed which will necessitate reconfiguration of the road alignment within that drainage basin.

2.4.2.6 **HLF Phase 2 Bulk Earthworks**

Analysis of the performance of Phase 1 of the HLF is currently ongoing to inform Issued for Construction design of Phase 2 of the HLF. Once analysis is complete, and designs are ready for construction in accordance with the regulatory approvals for the project, clearing, grubbing and bulk earthworks for Phase 2 of the HLF will commence. Underdrain header pipe installation will also take place in 2021 with GCL and geosynthetic liner placement currently planned for 2022.

2.4.2.7 **Mine Water Treatment Plant**

Bench scale testing, final detailed design, pad preparation and long lead item procurement for the Mine Water Treatment Plant (MWTP) are all proposed for execution in 2021. Final complete construction and commissioning of the MWTP is scheduled for 2022.

2.4.2.8 **Events Pond fencing**

The permanent wildlife exclusion fencing surrounding the Events Pond will be installed in the summer of 2021.

2.4.2.9 **Additional Facilities**

In 2021, various additional supporting buildings and facilities will be constructed including:

- Emulsion plant to support ongoing pit advancement;
- Permanent truck shop to allow for more efficient winter maintenance activities;
- Concrete floor installations for the Emergency Response Team building; and,
- Process and maintenance department offices.

2.4.3 Production Activities

Production activities planned by VGC in January for 2021 are consistent with the Mine Plan presented previously and it is anticipated that approximately 10.2 Mt of ore will be placed on the HLF during 2021 by year end. To achieve this production target, at total of approximately 26.4 Mt of material will be mined for an overall strip ratio in 2021 of 1.59:1 waste to ore.

Waste rock will be trucked to the PG WRSA throughout the year and by year end the available capacity of the PG WRSA is expected to be depleted. Waste rock dumping within the EP WRSA is expected to commence in late Q2/early Q3 and will continue for the life of mine. Table 2.4-2 provides the production schedule for 2021 as it stood in January 2021. Figure 2.4-1 to Figure 2.4-9 provides the planned quarter end configurations for the pit, WRSAs and HLF in 2021

2.5 Description of Water Use and Deposit of Waste

2.5.1 Description of Water Use

2.5.1.1 Water Use

Water supply for the camp facility is sourced from the groundwater well MW10-DG07 located to the north of the main camp. Daily usage remained below the authorized daily limit of 157 m^3/day, averaging approximately 50 m^3/day throughout the year.

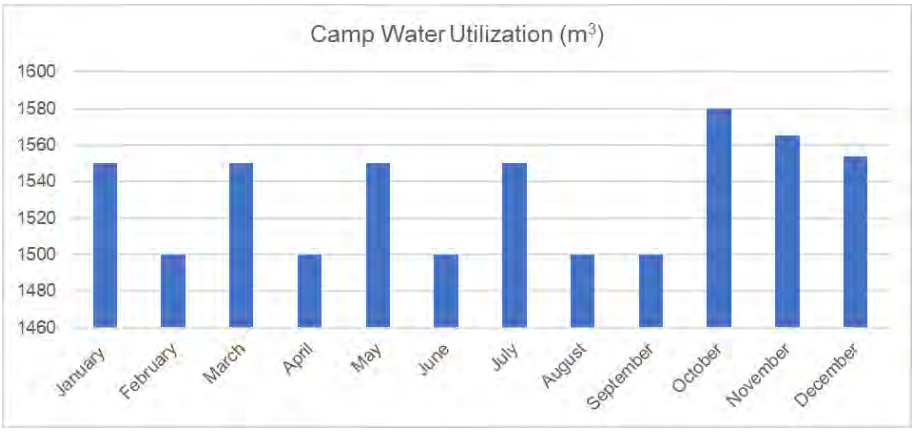

Figure 2.5-1: Camp Water Usage (m^3/month) 2020

During the reporting period, approximately 11,400 m^3 of groundwater was used for dust suppression (Figure 2.5-2) which was within the daily usage limit of 908 m^3/day provided by QZ14-041-1. Total annual water use for gold processing is discussed in section 2.6 as part of the HLF Solution Inventory Monitoring Program; however, the annual daily average of water used for irrigating and rinsing ore on the heap pad was ~802m^3/day which was within the QZ14-041-1 limit of 3,387 m^3/day.

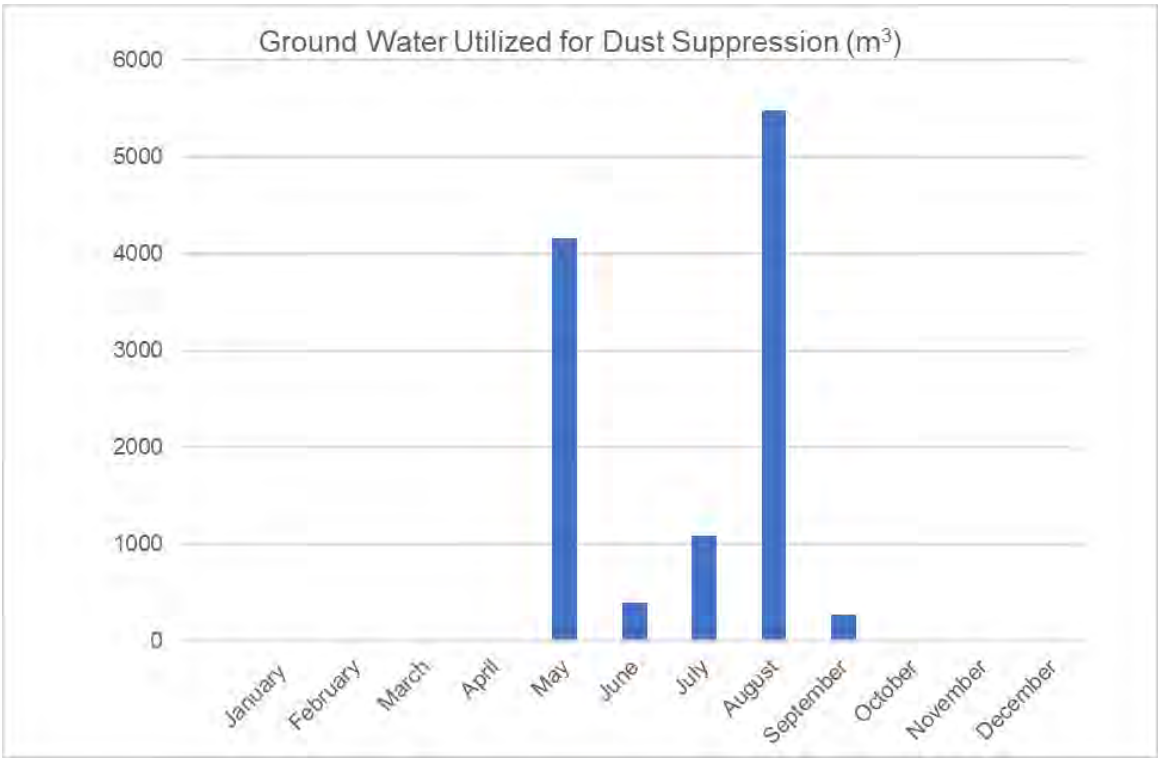

Figure 2.5-2: Dust Suppresssion Water Usage (m^3/month) 2020

2.5.1.2 **Water Storage**

The amount of water stored within the Events Pond and LDSP are calculated based on regular surveys of fluid elevations in each pond. The In-Heap Pond is determined based on measurement of the fluid elevations levels within the HLF.

Figure 2.5-3 provides the total available storage in the HLF system (i.e., the In-Heap Pond and Events Pond). As discussed in section 3 of this report, 2020 experienced significant rainfall and the 2019/2020 snowpack was the largest recorded at the Project site. The combination of a large snow water equivalent from the winter snowpack and high rainfall (at the camp station, months with successful data capture where all precipitation was as rainfall were the highest in the period of record) led to exceedance of the QZ14-041-1 desired available storage (DAS) at various points through the year.

A combination of controlled discharges of water compliant with the effluent quality standards of QZ14-041-1 in July, August and September (Table 3.1-12) and water use recycling to the HLF in November and December (Table 2.6-1) returned water storage volumes to well within the Phase 1 WUL DAS.

Additional information responding to questions on the VGC Freshet Water Management Plan (which had been required under the direction of the Inspector) was submitted to the Inspector on November 22, 2020. In the response, VGC identified a current operations DAS. The current operations DAS was a value derived using identical parameters for the WUL DAS except for the utilization of the actual solution application rate rather than the maximum application rate possible with the pumping system. The use of the actual solution application rate informs the 72-hour draindown that would be experienced in the event of the loss of pumping ability within the In-Heap Pond. This information was developed purely to provide context to the Inspector on the current status of operations and is not intended to alter the DAS required by the WUL. Table 2.5-1 provides the tow DAS volumes. The current operations DAS was not encroached upon at any point in 2020.

Table 2.5-1: Phase 1 Desired Available Storage Considerations

	WUL Condition for Phase 1	Current Operations
Application Rate (m^3/hr)	2,070	770
72-hour Draindown (m^3)	149,040	55,440
24-hour 100-year event (m^3)	29,700	29,700
0.5 m EP freeboard (m^3)	19,600	19,600
Desired Available Storage	**198,340**	**104,740**

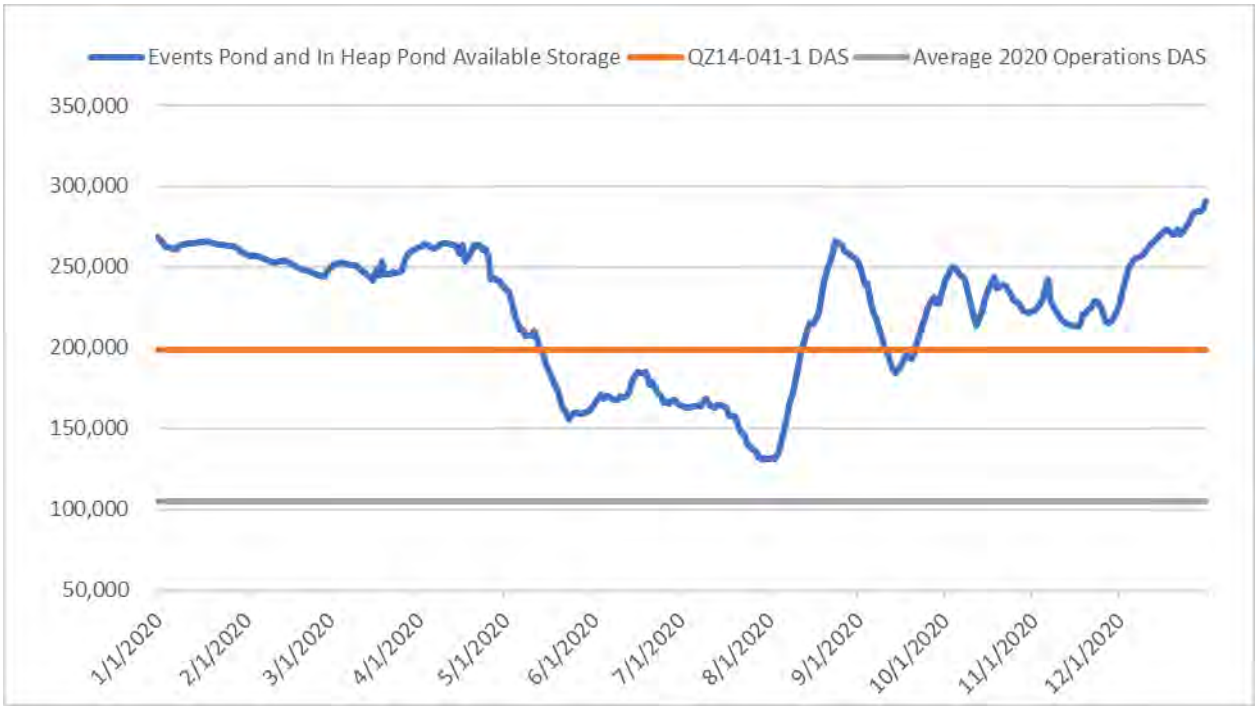

Figure 2.5-3: Avaialble Storage Volume and Desired Available Storage 2020 (m^3/day)

The LDSP held a maximum volume of ~62,163 m^3 in 2020 on April 20 resulting in an available storage of 6,357 m^3 within the pond. This occurred during Project record Freshet flows entering the LDSP. The volume of water within the LDSP was reduced by transferring water to the Events Pond (Table 2.5-2) and exfiltration discharge to a sump in the Dublin Gulch valley (FDP#5). By April month end, water levels within the LDSP had returned to values able to accommodate the runoff from a 1 in 5-year rainfall event which is an internal management trigger

for the pond. LDSP water transfers to the Events Pond continued throughout the ice-free months in 2020 as required for settling capabilities and eventual Project compliant discharge or use as make up water in the process circuit.

The maximum month end water volume recorded within the In-Heap Pond in 2020 was 46,346 m^3 on July 28th. In-Heap pond water was recirculated continuously to the ADR plant for gold recovery and subsequent reuse as barren solution for the heap leaching process. The Red Alert level for In-Heap Pond fluid levels as provided in the HLF OMS was never experienced in 2020.

Table 2.5-2: Water Storage Volumes 2020

End of Month	Month End Volume of Water Stored in Events Pond (m^3)	Month End Volume of Water Stored in Lower Dublin South Pond (m^3)	Month End Volume of Water Stored in the In-Heap Pond (m^3)
January	85,791	29,567	14,440
February	89,172	27,661	21,250
March	91,828	28,138	5,000
April	121,293	29,567	2,589

June	161,249	27,899	33,555
July	179,661	45,023	43,827
August	96,775	40,511	28,460
September	71,782	33,691	35,494
October	112,260	21,945	27,106
November	96,104	23,374	24,819
December	37,022	25,041	25,733

2.5.1.3 **Water Transfers**

Section 2.6 provides specific details on the volumes and rates of water and solution management for the HLF as required under the Solution Inventory Monitoring Program specified in QZ14-041-1. Additional water transfer required for the Project are provided below in **Error! Reference source not found.**..

Table 2.5-3: Water Transfers 2020 (excluding SIMP related transfers)

End of Month	Total Volume from HLF Underdrain to Events Pond (m^3)	Total Volume from LDSP to Events Pond (m^3)	Total Volume of Water Transferred from Production Well to HLF/ADR (m^3)	Total Volume of Water Transferred from Control Pond to HLF/ADR (m^3)
January	0	0	10,686	0
February	0	0	14,049	0
March	0	0	37,857	0
April	2,065	12388	23700	0
May	3,570	28489	0	0
June	7828	0	13,658	0
July	13763	8,990	13,226	0
August	16,410	18,000	12000	0

End of Month	Total Volume from HLF Underdrain to Events Pond (m^3)	Total Volume from LDSP to Events Pond (m^3)	Total Volume of Water Transferred from Production Well to HLF/ADR (m^3)	Total Volume of Water Transferred from Control Pond to HLF/ADR (m^3)
September	13,100	33,800	14,200	0
October	12,050	24,300	15,320	0
November	9,650	0	39,500	0
December	7,640	0	2,400	0

2.5.2 Deposit of Waste

A controlled discharge to ground from the LDSP to an exfiltration sump FDP#5 was undertaken during the period of April 20-28, 2020. Approximately 40,130 m^3 of water was discharged in total; no direct discharge to receiving surface water bodies occurred.

The exfiltration sump is located approximately 300 meters upgradient of the LDSP in the lower Dublin Gulch Valley. The sump area is occupied by a thick (over 20 m) sequence of placer deposits and alluvium that overlies bedrock. The sump was previously used successfully in 2018 during construction activities, and at that time was deemed to be an acceptable measure for addressing an excess of runoff water collected from construction activities. Thus, in this case, exfiltrating the water to ground was ascertained to have the lowest potential for an adverse response in the receiving environment as it allows for natural mitigation of total suspended solids (TSS), the main parameter of concern, through natural filtration, as opposed to direct discharge to receiving waters (e.g., Haggart Creek).

On April 20, 2020, prior to any discharge, notification was provided to regulators and the FNNND regarding the planned discharge of water from the LDSP to the exfiltration sump. The following were notified:

- Yukon Energy Mines and Resources (EMR) Compliance Inspector,
- Environment and Climate Change Canada (ECCC) Compliance Inspector, and
- FNNND Lands and Resources Manager.

On April 30, 2020, and within 24 hours of receiving the analytical laboratory results, notification was provided to the Yukon Spill Reporting hotline for water quality exceeding WUL effluent licence criteria (TSS and total arsenic) from the discharge water pumped to the exfiltration sump. Subsequent to the notification provided to the Yukon Spill Reporting hotline, additional laboratory results were received and an exceedance of licence criteria for total iron was also identified.

Final reports pursuant to the WUL and Metal and Diamond Mining Effluent Regulations (MDMER) effluent parameters are provided in Appendix C1 and C2, respectively.

Additional discharges of water compliant with the effluent quality standards of QZ14-041-1 were undertaken in July, August and September as discussed in detail in section 3.2.3.

2.6 HLF Solution Monitoring Program

Stacking of ore on the Heap Leach Pad continued through 2020, with the exception of planned maintenance down times scheduled throughout the year

2.6.1 HLF Solution Inventory Monitoring program

The WUL condition #117 requires eleven specific data requirements be recorded as part of the HLF Solution Inventory Monitoring Program (SIMP). Conditions 117a) and 117j) require daily reporting while the remaining conditions require monthly reporting. The following summarizes the data for each sub-condition of WUL #117:

117a) The daily average available storage volume in the In-Heap Pond is provided in Appendix D. The data record begins on January 1, 2020 and was recorded daily.

117b) The month-end volumes of water stored in the HLF are provided in Table 2.6-1. These volumes include the month end volumes of water stored in the Events Pond and the In-Heap Pond plus the month-end volume of draindown water stored in ore above the residual moisture content. The steady increase in moisture stored reflect ramp up in operations as well as the increasing tonnage of stacked ore.

117c) The total monthly volumes and the average pumping rates of barren solution pumped to the heap leach pad for leaching are provided in Table 2.6-1.

117d) The total monthly volumes and the average pumping rates of pregnant solution pumped from the In-heap Pond to the ADR are provided in Table 2.6-1.

117e) The total monthly volumes of water flowing or pumped from the In-Heap Pond to the Events Pond is provided in Table 2.6-1. There were no water transfers from the In-Heap Pond to the Events Pond during the 2020 reporting period.

117f) The total monthly volumes of water pumped from the Events Pond to the ADR and the In-Heap Pond are provided in Table 2.6-1.

117g) The total monthly volumes of precipitation falling on the HLF and the Events Pond catchments are provided in Table 2.6-1. These values reflect the catchments below diversions.

117h) The total monthly volumes of Water Transfers into the ADR/HLF are provided in Table 2.6-1. The values reflect groundwater input from the main production well.

117i) The total monthly volumes and average treatment rates of any solution treated in the MWTP and released to the environment are provided in Table 2.6-1. No HLF solution water was treated and released to the environment and the MWTP has not yet been constructed.

117j) The daily average moisture volumes of ore delivered to the HLF is provided in Appendix D.

117k) The monthly volumes of water added to the HLF as ore moisture content are provided in Table 2.6-1. These values are based on the daily moisture volumes in Appendix D.

Table 2.6-1: Heap Leach Solution Inventory Monitoring Program – Monthly Volumes and Flow Rates

End of Month	117b) Month-end Volume of Water Stored in the HLF (m^3)[a]	117c) Total Volume of Barren Solution Pumped to HLF (m^3)	117c) Average Barren Flow Rate (m^3/hr)	117d) Total Pregnant Volume Pumped to ADR (m^3)	117d) Average Pregnant Return Flow Rate (m^3/hr)	117e) Total Volume from In-Heap Pond to Events Pond (m^3)	117f) Total Volume from Events Pond to ADR (m^3)	117f) Total Volume from Events Pond to HLF (m^3)	117g) Total Precipitation Falling on HLF and Event Pond Catchments (m^3)[b]	117h) Total Volume of Water Transfers Pumped into HLF/ADR (m^3)	117i) Total Volume of HLF Solution Treated and Released (m^3)	117k) Total Volume of Water Added to HLF as Ore Moisture (m^3)
January	168,614	480,014	645	480,014	645	0	0	0	24,596	10,686	0	2,935

September	254,303	583,271	810	620,516	862	0	0	0	43,043	14,200	0	19,592
October	340,888	554,285	745	586,684	789	0	0	0	36,894	15,320	0	20,376
November	403,636	644,972	896	646,105	897	0	28,500	0	27,950	68,000	0	13,767
December	345,143	819,373	1,101	808,553	1,087	0	67,740	0	17,329	70,140	0	25,605

NOTES:

a) Defined as total water stored in In-Heap Pond minus field capacity, plus the draindown volume stored above the In-Heap Pond at optimum moisture minus residual by volume, plus water stored in the Events Pond.

b) Values developed for precipitation data at 1000m elevation based on Camp and PH station climate records in 2020 and applied to the catchment of the HLF1b pad and Events Pond.

2.6.2 HLF Foundation Drainage System Monitoring

The WUL condition #134a requires that the annual report include a description of the water use and also a description of any deposit of waste carried out during the year associated with leakage into the Leak Detection and Recovery System (LDRS) of the HLF. There was no deposit of waste associated with the LDRS. All leakage was recovered in the LDRS and pumped back into the process solution circuit. The following describes the operation of the LDRS during 2020.

The LDRS within the In-Heap Pond has a sump that is located at the bottom of the In-Heap Pond. The sump sits between the closure sump and the PLS sump, with a bottom elevation of 908.5 m sealed with an 80-mil (2.0 mm) LLDPE primary liner. The top of the sump lies at 911.5 m and is sealed with a 60-mil (1.5 mm) LLDPE secondary liner. The leak detection layer of the liner system (i.e., geonet material located between the two geomembranes) under the In-Heap Pond drains into the LDRS sump. The LDRS pump casings consist of steel 600-mm pipes which ends in a perforated hammer head configuration at the bottom of the sump. A grid of corrugated, perforated 250-mm N-12 pipes collect and direct seepage towards the LDRS pump casings and LDRS pump. The pump is sized to sufficiently remove fluids to minimize head on the bottom liner. The LDRS sump is filled with crushed overliner drain fill material. The LDRS sump is also equipped with an instrument casing that houses a vibrating wire piezometer (VWP), which is used to monitor fluid levels in the LDRS sump.

The HLF LDRS has established alert levels for the design and operation of the In-Heap Pond and Events Pond. Alert levels vary with the pond level since the hydraulic head dictates the rate of leakage. Alert Level 1 (AL1) provides a benchmark for liner performance in a double-lined pond under typical operating conditions based on industry standard rates for expected leakage from “normal” defects in the liner. AL1, as measured by the amount of fluid pumped by the pond’s LDRS, is a low-level trigger that may indicate the presence of a small hole or defect in the top geomembrane and is intended to represent the leakage rate expected from geomembranes installed with strict construction quality assurance. Alert Level (AL2) provides a high-level trigger that indicates serious malfunction of the liner system. The expected leakage rates are based on design criteria and the as-built conditions. As detailed in the HLF Operation, Maintenance and Surveillance Manual, there are four response levels considered for the operations of the HLF to ensure that response actions can be taken at periods when leakage levels may be approaching the design Alert Levels.

Figure 2.6-1 shows the measured leakage rates compared to the AL1 leakage rate which confirms that the HLF liner system is functioning as designed. These rates were reviewed by the Engineer of Record for the HLF and verified to represent proper functioning of the liner system.

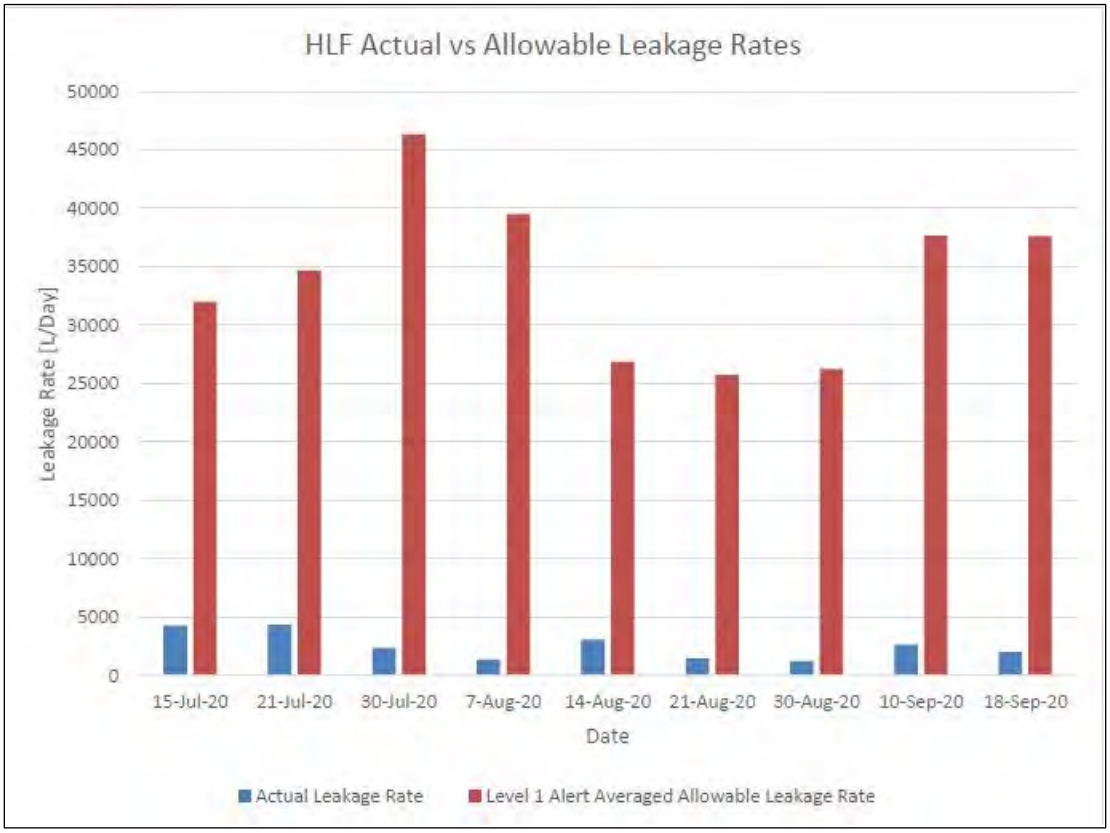

Figure 2.6-1: LDRS Actual Leakage Rates Versus AL1 Leakage Rates July to September 2020

3 ENVIRONMENTAL MONITORING

3.1 Surface Water Hydrology

The 2020 Streamflow Monitoring Report included as Appendix E presents summaries of all streamflow data (i.e., baseline, construction and operational data) collected for the Project since August 2007, including hydrometric information summarized in previous reports a summary (Jacques Whitford 2008; Stantec 2010; Stantec 2011a; Stantec 2012a; Knight Piésold 2013, Lorax 2017, Lorax 2018, Lorax 2019 and Lorax 2020) and data collected in 2020. Figure 3.1-1 shows the locations of Project hydrometric stations monitored and Table 3.1-1 presents station monitoring records and drainage information.

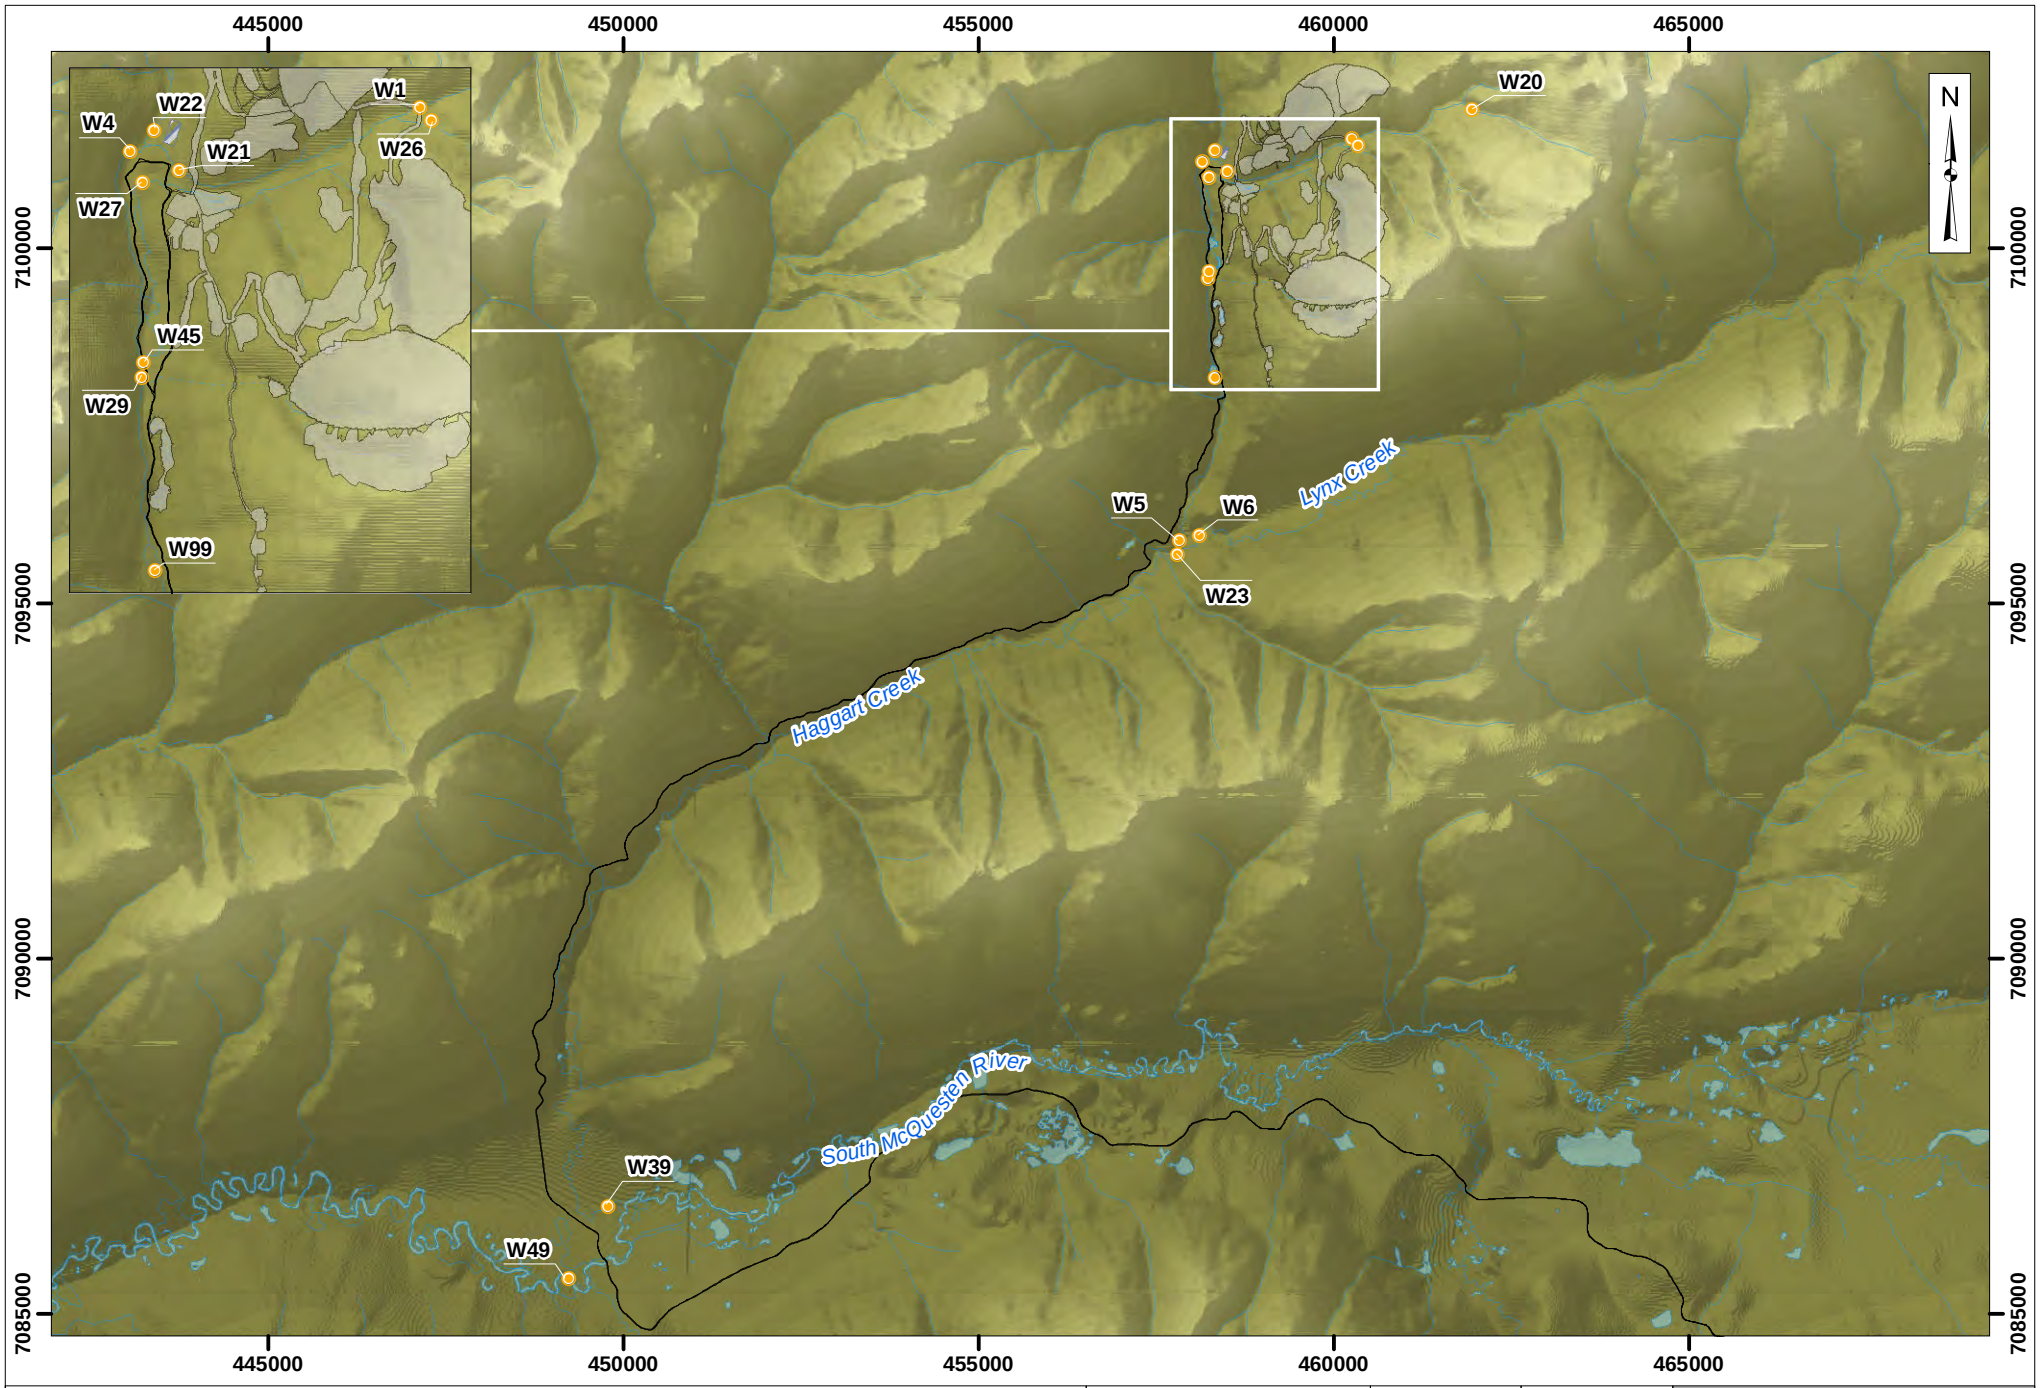

Table 3.1-1: Project Hydrology Stations

Station	Station Name	Record Period	Northing	Easting	Drainage Area (km^2)	Median Basin Elevation (m)	Notes
W1	Dublin Gulch above Stewart Gulch	2007 - 2020	7101545	460249	6.8	1,303	Continuous discharge time-series

3.1.1 Surface Water Hydrology Monitoring

Streamflow data for the automated stations listed in Table 3.1-1 are provided in Appendix E in the following formats:

- Monthly tables showing average, maximum and minimum 15-minute discharge values (m^3/s);
- Monthly tables showing average discharge (m^3/s), average unit yields ($L/s/km^2$) and total runoff (mm);
- Time-series plots of continuous average daily discharge (m^3/s) and spot flow measurements (m^3/s), and;
- Time series plots of average daily unit yields ($L/s/km^2$), by year.

Issues were encountered with the stage records for 2020 at the following stations:

- W21 - Water level logger experienced a malfunction in early summer and continuous water level data collected was sporadic for 2020. Sufficient manual measurement now exist to develop a preliminary rating curve
- W22 - Technical issues with the datalogger resulted in a data gap from August 11 to September 7, 2020.
- W26 - manual measurements are available for 2020. Bank instability and low flow conditions at W26 have prevented datalogger installation since 2011.
- W29 - The stilling well and datalogger at W29 were decommissioned due to channel instability in the area in 2019. W99 is utilized as a surrogate station. The station was re-commissioned in July 2020 as a backup for the W99 record and to maintain the site in accordance with licence terms. Manual measurements continue to be reported for this station.
- W45 - No clear rating curve has yet been developed for this station. Fourteen paired staff gauge: discharge measurements are available, however there is not sufficient range in flow and stage data to develop a rating curve. Further refinement of the stage discharge relationship is required to develop a robust rating curve from which to derive a continuous discharge time series.
- W20 - Manual flow and stage measurements are conducted when access allows which can be challenging in freshet or winter conditions. Data is not sufficient to develop a rating curve.

Tables 3.1-2 to 3.1-10 below compare the complied streamflow summary statistics (average, minimum and maximum flows) for 2020 to the same statistics compiled over the full period of baseline record. All values are in m3/s using 15-minute continuous discharge records.

NOTE:
W99 station was installed in 2019.

3.1.2 Site QA/QC Programs

3.1.2.1 Stage Measurements and Corrections

All automated stations were instrumented with metric staff gauges, mounted to vertical angle iron in the stream channel, and regularly surveyed to nearby benchmarks. Continuously recording pressure transducers were installed in stilling wells and set to record water level every 15 minutes. These readings were corrected for fluctuations in barometric pressure in a post-processing step. During each site visit, unless in winter ice conditions, water level was noted on the staff gauge. These readings form the basis for the continuous water level records, which were adjusted to match the manual stage readings. Level surveys determined the staff gauge zero datum and water level, and were used to correct the station records for changes due to shifts in the channel bed (i.e., aggradation or scour), frost-jacking or station relocation following a high-magnitude flood event.

3.1.2.2 Rating Curve Error

The overall quality of the discharge record was assessed by reviewing the average and standard errors calculated from the differences between the measured discharges, and those estimated from the rating equation. A positive rating curve error is defined where the discharge calculated from the rating curve overestimates the value when compared to the measured discharge, and vice-versa for a negative error.

A summary of the error metrics for all stations and rating curve control percentages are presented in Table 3.1-11. Rating curve control values indicate the percent of time that a continuously recorded observation (15-minute intervals) falls between the highest and lowest manually recorded measurements for each monitoring station.

Overall, the rating curves provided reasonable estimates of discharge across a wide range of flows at most of the Project stations. The rating curve errors presented in Table 3.1-11 indicate that the average errors were relatively low, ranging from -10% (W29) to 4% (W5). The standard error, or the degree of variability about the average error values varied more between stations, from a high of 32% for station W21, to a low of 7% for station W99. Note that continuous discharge data are not currently generated for W21 due to a lack of water level data, and that W29 data, due to bank and stream section instabilities, are considered only as a potential backup in regards to adaptive management evaluations in the event that data from W99 are not available.

Rating curves for the site hydrometric stations are presented in Appendix E. For the 2020 update, the rating equations were compared to those previously developed for each station to ensure that the coefficients and exponents were consistent through time. No further updates to the rating curves developed in 2017 were necessary, and the same curves were applied to the 2020 continuous water level data which fell within the rating relations per monitoring station. Note that because stations W26 and W27 are instrumented with Parshall flumes, rating curves were not developed for these stations. The rating curve plot and error table for the relatively new hydrometric station W99, based off of measurements collected in 2019 and 2020, are provided in Appendix E.

Table 3.1-11: Rating Curve Error Summary for Project Hydrometric Stations

Station	Measurements (n)	Average Error (%)	Standard Error (%)	Rating Curve Control
W1	52	-4%	22%	97%
W4	55	0%	14%	100%
W5	45	4%	17%	96%
W6	36	-1%	9%	94%

Station	Measurements (n)	Average Error (%)	Standard Error (%)	Rating Curve Control
W21	15	4%	32%	79%
W22	46	0%	14%	100%
W26	37	--	--	100%
W27	77	--	--	100%
W29	26	-10%	21%	95%
W99	11	-1%	7%	96%
Average	43	-1%	17%	96%

NOTES:
Stations W26 and W27 currently have Parshall flumes installed, and therefore rating curves were not developed for these sites as part of the 202 Streamflow Monitoring Report

3.1.3 Effluent Discharge

Water management infrastructure for the Project is designed to convey site contact water via Ditch C to Haggart Creek above the W4 station. Flows in Ditch C are monitored continuously when discharging, with a V-notch weir, staff gauge and pressure transducer. In 2020 regular LDSP and Events Pond elevation surveys were conducted to compare to weir measurements during active periods of discharge. Table 3.1-12 details the total volumes of effluent discharged via Ditch C in 2020. A discharge to ground of approximately 43,130 m^3 from the LDSP through the FDP#5 exfiltration sump was also conducted in April 2020. Contributions to potential receiving environment stream flow discharges are assumed to be negligible.

Table 3.1-12: Monthly Discharge Totals via Ditch C - 2020

Month	Survey (m^3)	Weir (m^3)	RPD %
July	7,689	7,693	0.1
August	118,368	107,903	9.3
September	73,038	71,209	2.5
Total	199,095	186,805	6.4

NOTES:
RPD Relative Percent Difference

3.1.4 Adaptive Management

The EMSAMP outlines adaptive management protocols for the Project. A three-tiered threshold system has been developed for the adaptive management of surface water flow. The thresholds provided in Table 2.4-1 of the EMSAMP are different for the ice-free and ice-affected seasons, and are based on the median baseflows established for hydrometric stations W4 and W29 over the baseline period that encompassed the period August 2007 to August 2017. Note that adaptive management evaluations for the W29 station (due to bank and stream section instabilities) have been replaced by the W99 station, which has a 3% larger drainage area (Table 3.1-1). To account for this difference, the W29 baseline values have been adjusted upward by a factor of 1.03 to represent baseline conditions at W99.

Flow values presented in Table 3.1-13 for the months of May through September inclusive are median values, derived from continuous time-series discharge data, while the flow values reported for the months of November through April are based on one to two manual measurements (when possible) that are impacted by ice and snow

formation within the channel. Therefore, winter reported values have potential for higher uncertainty and deviation between baseline values and reported values. Threshold 3 was surpassed at W99 in February and March 2020, but not at W4, indicating that the data values were potentially an artefact of the limited monitoring frequency and challenging flow gauging conditions, rather than from mine water management practices. Baseflows were lower than average at the end of 2019, as a result of reduced snowmelt and precipitation during the year. The noted reductions in streamflow in Haggart Creek relative to the baseline condition in early 2020 were concluded to be a result of regional hydro-meteorological conditions rather than mine water management. The remainder of 2020 was characterized by stream discharges well above EMSAMP thresholds, which was attributed to a significant 2020 winter snow pack and record summer precipitation values on the Project.

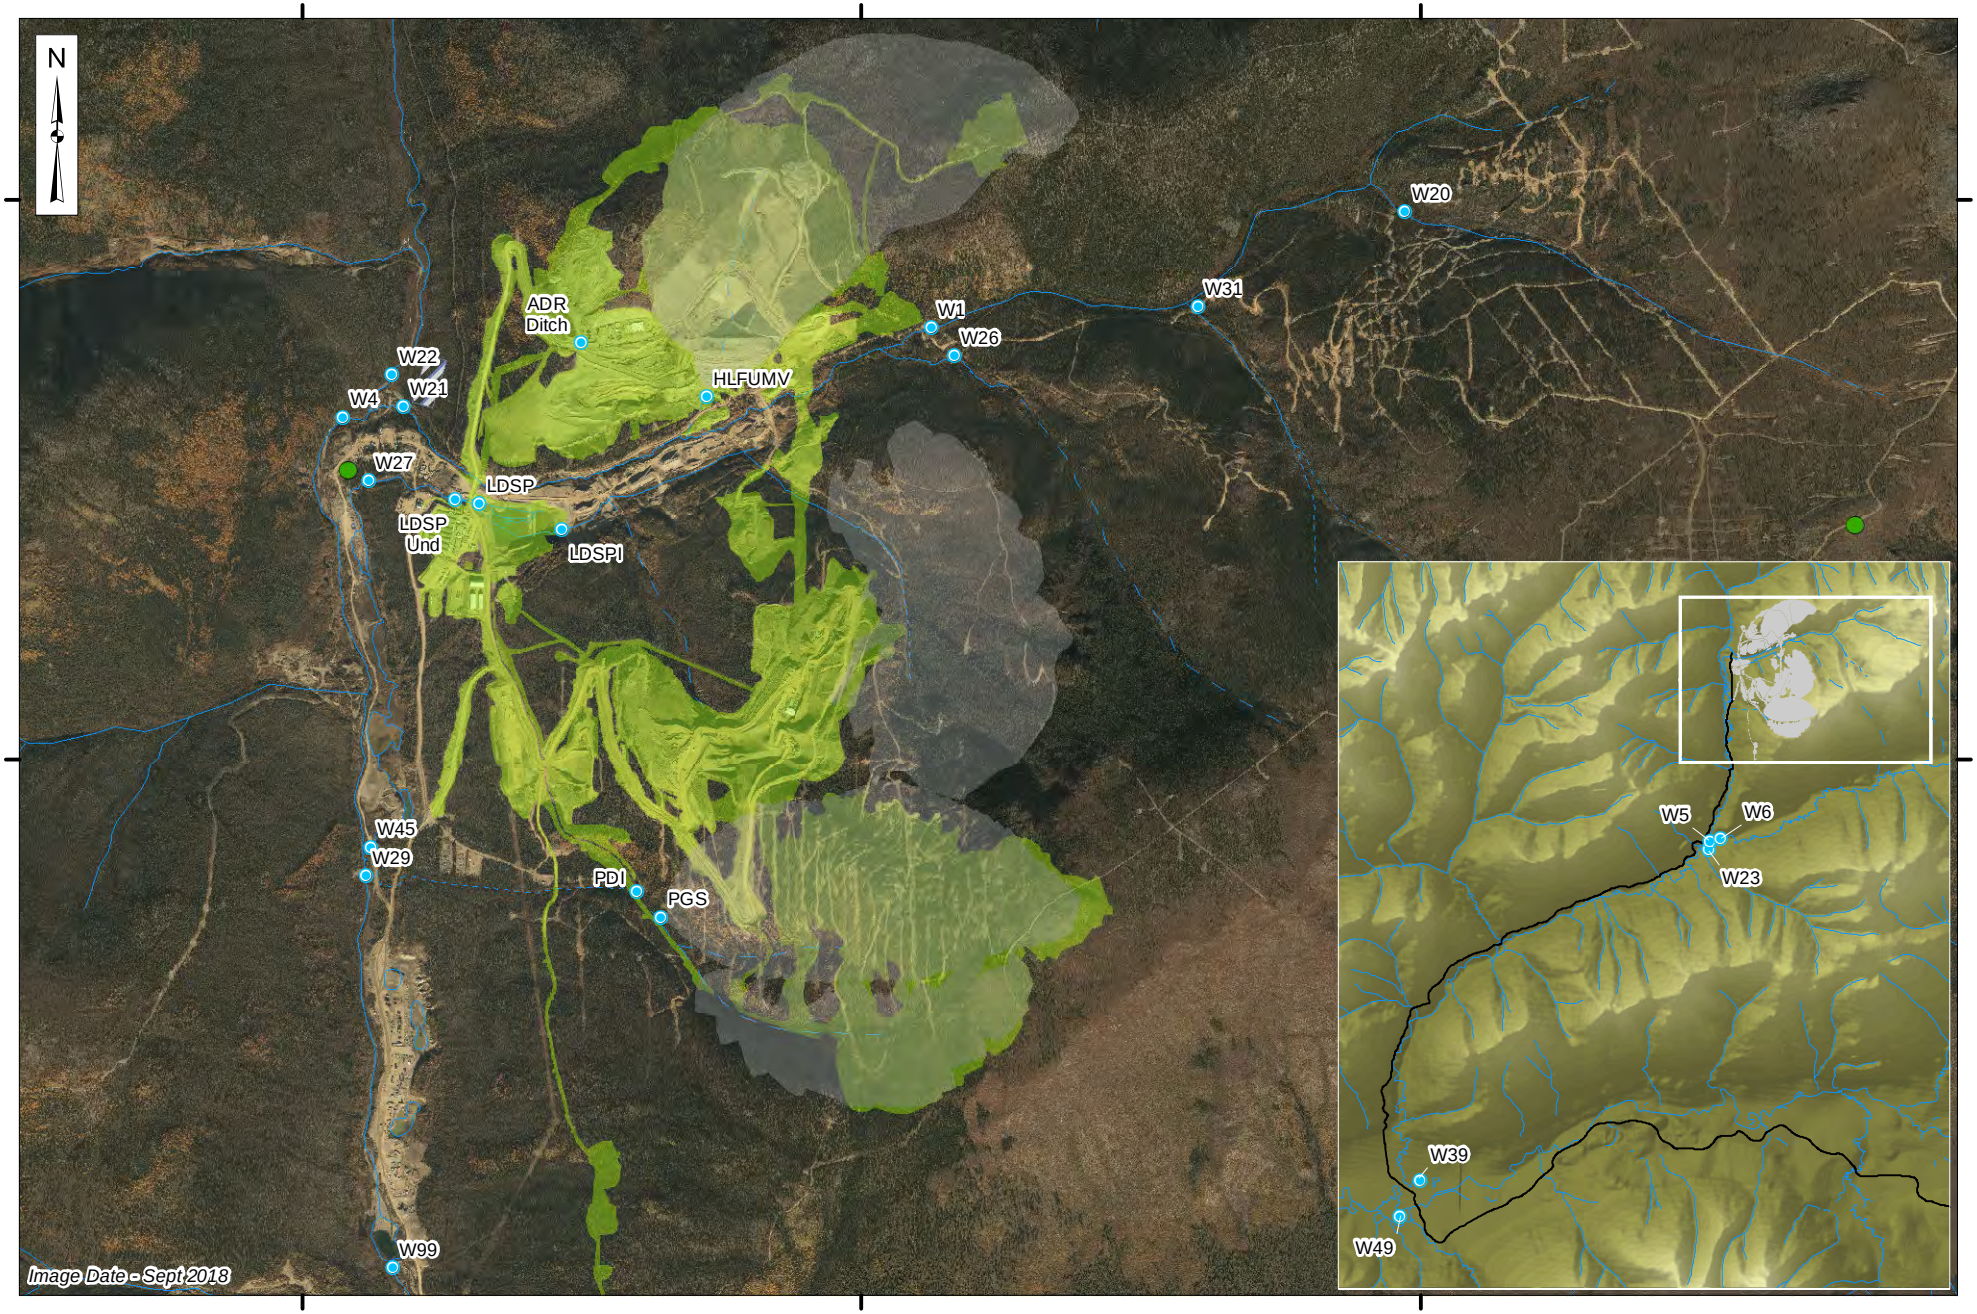
Table 3.1-13: Median Monthly Streamflows for the Baseline (2007-2017) Period and for 2020 for W4 and W99

Month	Baseline (2007-2017)		2020		Percent Difference[1]	
	W4	W99	W4	W99	W4	W99
Jan	0.187	N/A	0.143	0.130	-24%	N/A
Feb	0.193	0.361	0.174	0.172	-10%	-52%
Mar	0.133	0.206	0.236	0.132	77%	-36%
Apr	0.159	0.202	0.254	1.319	60%	553%
May	1.826	1.817	1.544	2.456	-15%	35%
Jun	0.922	0.995	2.933	2.425	218%	144%
Jul	0.756	1.126	1.842	1.646	144%	46%
Aug	0.739	0.938	1.771	1.611	140%	72%
Sep	0.812	1.050	1.454	1.412	79%	34%
Oct	0.729	0.866	1.328	1.835	82%	112%
Nov	0.333	0.330	N/A[2]	N/A[2]	N/A[2]	N/A[2]
Dec	0.248	0.283	0.381	0.521	54%	84%

NOTES:
Shaded areas in Table indicate ice covered season, when flow measurements are limited to monthly manual data
1 Percent difference calculated as (2020 – Baseline)/Baseline. Positive values indicate that flows were higher than baseline in 2020, and *vice versa*.
2 Manual flow measurements were not made in November 2020 due to unsafe ice conditions.

3.2 Surface Water Quality

3.2.1 Surface Water Quality Monitoring



The surface water quality monitoring program for the Eagle Gold Mine (Project) includes monitoring of water quality of watercourses within the Project area at strategic mine site locations and at water management facilities that have the potential to discharge to the environment (Figure 3.2-1). The water quality monitoring plan has been designed to meet the following objectives:

- Collect water quality data in the receiving environment at stations upstream and downstream of Project influences.

- Collect water quality data to verify compliance with the Effluent Quality Standards (EQSs) and monitor receiving environment Water Quality Objectives (WQOs) specified in QZ14-041-1 for Haggart Creek at W4, W29, W99 and W23.
- Provide a continuous water quality database to support adaptive management strategies to meet water quality objectives in Haggart Creek in order to protect aquatic life.

Surface water quality monitoring programs are outlined in the Environmental Monitoring, Surveillance and Adaptive Management Plan (EMSAMP). Surface water quality monitoring in 2020 consisted of monitoring those sites as identified for the operations phase monitoring in the EMSAMP (Table 3.2-1) which were active and includes all receiving environment locations specified in QZ14-041-1 (Schedule 1A) for the Project.

Following this introduction, Section 3.2.2 outlines the Quality Assurance and Quality Control (QA/QC) program and provides a summary of results for 2020. Section 3.2.3 presents the surface water quality results for monitoring conducted in 2020 and, where relevant, compares these results to monitoring data from 2019. Section 3.2.3.1 presents water quality results for mine site compliance monitoring stations. Receiving water quality data at key locations in Haggart Creek and Dublin Gulch are presented in Section 3.2.3.2.

	HLFUMV	Heap Leach Facility Underdrain Monitoring Vault	7101298	459445	C, D, W	D[4], M[2,3]	M

NOTES:
1 – Laboratory analysis includes WAD, Total CN, Thiocyanate and Cyanate.
2 – Laboratory analysis includes WAD and Total CN.
3 – Calculation of un-ionized ammonia
4 - Laboratory analysis only includes WAD and Total CN - no other parameters required.
5 – An alternate monitoring location for W39 that provides more reliable year-round access has been established. Location listed in Table 3.2-1 is from QZ14-041-1 and remains a monitoring location while the monitoring data from the alternate location is assessed to ensure that it is an appropriate alternative.
C – Continuous monitoring for specific conductance; D – Daily when discharging; W – Weekly when discharging; M – Monthly; Md – Monthly when discharging; Q – Quarterly

3.2.2 Quality Assurance and Quality Control Program

VGC has a well-established quality assurance/quality control (QA/QC) program in place to ensure the surface water quality program for the Eagle Gold Project is reliable, representative of the water quality conditions throughout the project area and of the highest quality. This program is intended to validate the monitoring data,

and to identify any potential methodological and/or analytical errors in the data set that might require modifications to the sample collection program and/or elemental analyses. The following sections provide a summary of the QA/QC program with respect to field sample quality, analytical data processing and internal laboratory procedures for the 2020 collection year.

Field ("SampleID"02), travel blanks ("SampleID" 03) and laboratory duplicates ("SampleID"01) were also included in the elemental analysis. Laboratory results were reviewed upon arrival to evaluate compliance with laboratory data quality objectives (DQO). Overall, reported data is considered to be of good quality and met laboratory DQO. All generated tables, summary statistics and graphs were checked for unit conversions, formulas and transcription errors with original data files.

The QA/QC results described in the following sections provides a reasonable level of confidence in the water quality data set. More importantly, the minor issues noted during the QA/QC assessment do not alter the interpretation of the reported data. Based on the results of field duplicates, field blanks, travel blanks, and dissolved vs total metal concentrations, the reported analytical data are considered reproducible, of good quality and representative of current water quality in the Project area. A description of QA/QC methods and results is provided in the sections below.

3.2.2.1 QA/QC Methodology - Field Sampling Program

Water quality samples were collected in accordance with methods described in the EMSAMP (2020). Specifically, water samples were collected following the methods outlined in the 2013 British Columbia Field Sampling Manual, Ambient Freshwater and Effluent Sampling, Part E – Water and Wastewater Sampling. The associated QA/QC protocols are designed to provide reliable data by preventing sampling error and cross contamination of the collected samples. Samples were collected from downstream to upstream to avoid substrate disturbance and sample contamination. The QA/QC samples comprised 9% of the total collected samples (28 QA/QC samples/321 of total collected samples) just slightly below the required 10% by applicable protocols (e.g., (BC MOE [2016]). Haggart Creek and Dublin Gulch monitoring locations within the immediate vicinity of the Project were sampled on the same date, when possible, to support data analysis and adaptive management considerations. Pre-cleaned and pre-labelled bottles, nitrile gloves and filtering equipment (if required) were used for sample collection to prevent sample integrity.

Field Blanks

Field blank samples are analyte-free reagent water samples used to assess the purity of chemical preservatives and potential contamination sources at the sampling location due to the collection method, handling, preservation, and exposure to the environment. Blank samples are generated by pouring distilled de-ionized (DI) water into clean sample bottles and then exposing the sample bottles to the same environment in which actual samples are collected. The Field blanks are analyzed for the same parameters as is routinely performed in the actual collected samples.

The widely used acceptability criterion of 2×Reported Detection Limit (RDL) was used to evaluate the integrity of the collected field blanks. Detected values in blanks higher than the proposed criterion were flagged as samples that required further investigation.

Travel Blanks

Travel blanks are provided by the analytical laboratory and are used during field surveys to identify potential contamination during storage and transport. These blanks are kept sealed and transported with water collected samples. Concentrations in these blanks are generally below detection limits, however if any measured parameter is detected above detection limit this may suggest a potential contamination during sample handling and transport.

Field Duplicates

The British Columbia Field Sampling Manual (Clark 2013) specifies that a relative percent difference (RPD) greater than 20 percent indicates a possible sample contamination. An RPD greater than 50 percent indicates a definite sample integrity problem; however, it is not unusual to find high variability for field duplicates, especially if the water is turbid with elevated total suspended solids. Field duplicate samples are generally collected at the same location and time as a site sample to assess the natural variability of the site. For the purpose of this analysis, originals and duplicates are considered paired replicates collected from the same location sequentially in time and were used to calculate the RPD.

3.2.2.2 QA/QC Methodology - Laboratory Analytical

All analytical analyses were performed by ALS laboratories (Burnaby, BC) a member of the Canadian Association for Laboratory Accreditation Inc. (CALA). The laboratory QA/QC program included analysis of certified reference materials, laboratory control samples, laboratory duplicates, method blanks and matrix spikes to determine accuracy and precision of instrumentation and methods. Laboratory results were reviewed upon arrival to evaluate compliance with DQO. The majority of reported data met the laboratory DQO. However, in some instances, method recovery was not accurately calculated due to matrix interferences; thus, detection limits were adjusted to prevent any influence on analytical results. All generated tables, summary statistics and graphs were checked for unit conversions, formulas and transcription errors with original data files.

Overall, reported data were of good quality and met the laboratory QA/QC objectives. Complete analytical datasets for the reporting period have been provided as part of monthly reporting responsibilities and are not included here.

Dissolved Metal versus Total Metals Concentrations

A dissolved metal concentration that was higher than the corresponding total metal concentration was considered an indicator of potential sample contamination and/or analytical error. Samples for total and dissolved metals are collected in separate bottles and are handled differently. Samples for dissolved metal analysis are filtered through a 45 µm filter either in the field, if conditions allow, or as soon as possible after collection in a clean room to minimize the potential for contamination; nonetheless, the filtration process has the potential to introduce contamination.

Dissolved metal concentrations were flagged as a potential QA/QC issue if the concentration was >20% higher than the corresponding total metal value in the same sample. Variability of less than 20% is excluded because it generally falls within the analytical margin of uncertainty (or error). Dissolved and total metal pairs are included in this analysis if the dissolved value is greater than five-times its RDL (Clark 2013).

3.2.2.3 **Results and Discussion**

Field Blanks

Field blanks were collected and analyzed to assess purity of chemical preservatives and potential contamination sources at the sampling location. Results of field blank analyses for all parameters are presented in Appendix F1; Table 3.2-2 provides a summary of field blank results for key parameters. A few parameters exceeded the detection limit (DL) for a blank for samples collected in 2020. Parameters above detection limit included ammonia, manganese and titanium (Table 3.2-2). This may be related to the DI water used for field blanks over the course of multiple sampling events, potentially resulting in environmental concentration of ions and other metals entering the DI water. However, concentrations of exceeding parameters rarely occurred at the levels observed in the collected water samples at the monitoring stations with observed values only slightly above DL. This suggests that results in the field blanks may be due to matrix interferences within the blank sample and the corresponding adjustments of DLs by the analytical laboratory (e.g., Titanium) (Appendix F1 [provided electronically]).

Travel Blanks

Travel blank results are summarized in Table 3.2-3 and Appendix F1. As illustrated, the majority of measured parameters were below DL. Only dissolved phosphorus, total organic carbon (TOC) and total tin were measured above the analytical DL in travel blanks. Collectively, these results indicate that good protocols of sample handling and transporting were applied in the field, given essentially all travel blank values were reported as non-detects (< DL).

Field Duplicates

A total of 21 field duplicates were collected as part of the surface water quality sampling program during 2020. Appendix F1 (provided electronically) shows the number of duplicates that had parameters with RPDs greater than the acceptability criteria of 20% and 50% and a summary of the results for key parameters are provided in Table 3.2-4 to Table 3.2-6 for physical/nutrient parameters, total metals and dissolved metals, respectively. Water quality results were generally similar between field duplicates. Most duplicates had at least one parameter with an RPD between 20 and 50%, but typically less than half of duplicates had one or more parameters with an RPD greater than 50%. An RPD greater than 50 percent indicates a sample integrity problem; however, it is not unusual to find high variability for the field duplicates, especially under certain conditions such as for example, high TSS, particularly occurring during freshet or after precipitation events.

Dissolved Metal versus Total Metal Concentrations

Dissolved vs total metal concentrations are presented in Appendix F1 (provided electronically). The number of analyte pairs with dissolved metal values greater than 120 and 150% of the corresponding total are uncommon (generally < 4 occurrences of the total collected samples per station). Parameters such as cadmium, selenium, titanium and zinc showed > 150% exceedances for the majority of the stations. For stations W22, W23, and W26, tin showed exceedances to the 150% threshold. Other parameters with percentages above 150% sporadically occurred for the remaining stations (e.g., aluminum, and lead in station W26; arsenic and potassium in station W22). It should be noted however, that the number of recorded incidents in dissolved metal concentrations above 120% or 150% of the total metal value, with the exception of cadmium, selenium, titanium and zinc, occurred only in a low number of the analyzed samples. Accordingly, these results provide a high degree of confidence in the water quality sampling and analytical program for 2020 at Eagle Mine.

3.2.3 Water Quality Results

The following section focuses on surface water quality monitoring results for mine site compliance monitoring as well as receiving environment locations in Haggart Creek at W4, W29, W99 and W23; background Haggart Creek data at W22 where relevant; and Dublin Gulch at stations W1 and W21 where monitoring data adds to context of observed results in Haggart Creek.

3.2.3.1 **Mine Site Monitoring Compliance Results**

Discharge compliance points monitored in 2020, as identified in QZ14-041-1, are shown in Table 3.2-1.

Pre-Discharge Lower Dublin South Pond (LDSP) Water Quality

Sampling and monitoring of the LDSP discharge station (or LDSP outflow) happens only when a discharge is occurring to the receiving environment; however, other monitoring points within the LDSP are sampled and analyzed on a regular internal sampling schedule to inform operational water management and discharge decisions. Monitoring stations within the LDSP are illustrated in Figure 3.2-2 and include:

- LDSPs – Along shore of Lower Dublin South Pond (pre-discharge location);
- LLO – Low-level outlet in a perforated pipe (pre-discharge location);
- LDSPI – Along shore of Forebay connection to main Lower Dublin South Pond: and
- LDSP – Outflow discharge sampling location of Lower Dublin South Pond.

In addition, water management at the Project also includes intermittent pumping of Lower Dublin South Pond water to the Events Pond to increase available storage within the Lower Dublin South Pond.

Water quality within the Lower Dublin South Pond was measured periodically in 2020 at stations LDSPs, LLO and LDSPI. Table 3.2-7 summarizes the number of full analytical suite sampling events for LDSPs, LLO and LDSPI, by month, for 2020 and compares to sampling events in 2019.

In 2020, a total of 5 LDSPs, 4 LLO and 11 LDSPI full suite sampling events occurred. For 2019, a total of 20 and 16 full suite sampling events occurred at LDSPs and LLO, respectively. Sampling in 2019 for station LDSPI did not occur but rather sampling occurred at station DB4. A total of 11 full suite sampling events occurred at this station in 2019 but is not necessarily directly comparable to LDSPI.

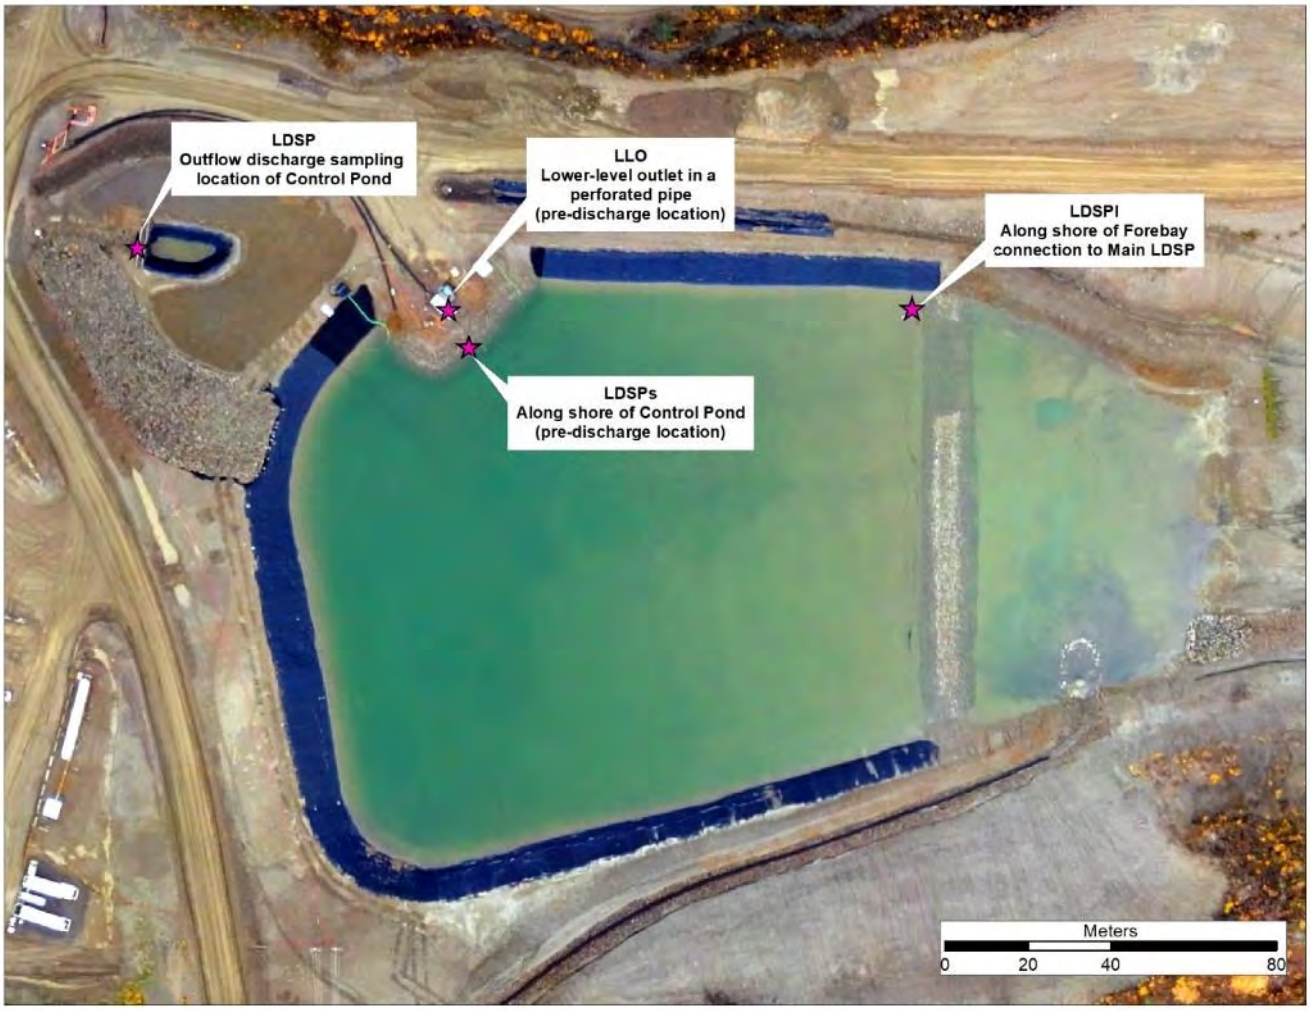

Figure 3.2-2: Lower Dulbin South Pond (LDSP) Sampling Locations

Table 3.2-7: Number of Full Suite Analytical Sampling Events for LDSPs, LLO and LDSPI by Month in 2019 and 2020 for Open Water Period (March to October)

Month	LDSPs (2019)	LLO (2019)	LDSPI_DB4 (2019)	LDSPs (2020)	LLO (2020)	LDSPI (2020)
March	0	0	0	0	1	0
April	5	2	3	2	2	4
May	5	5	5	0	0	1
June	2	2	1	0	0	1
July	3	3	1	2	0	1
August	2	2	2	0	0	1
September	2	1	1	0	0	2
October	1	1	0	1	1	1
Total	***20***	***16***	***13***	***5***	***4***	***11***

LDSPs LLO and LDSPI sampling locations characterize water chemistry in the Lower Dublin South Pond overall; however, these are pre-discharge sampling locations and direct comparison to EQS is only for the purposes of reference. In 2020, all parameters analyzed for LDSPs and LLO were present at concentrations below QZ14-041-1 EQS with the sole exceptions of TSS and total As (Figure 3.2-3; Appendix F2). For station LDSPI, only TSS, As and Fe were present at concentrations above the respective EQS (Figure 3.2-4; Appendix F2).

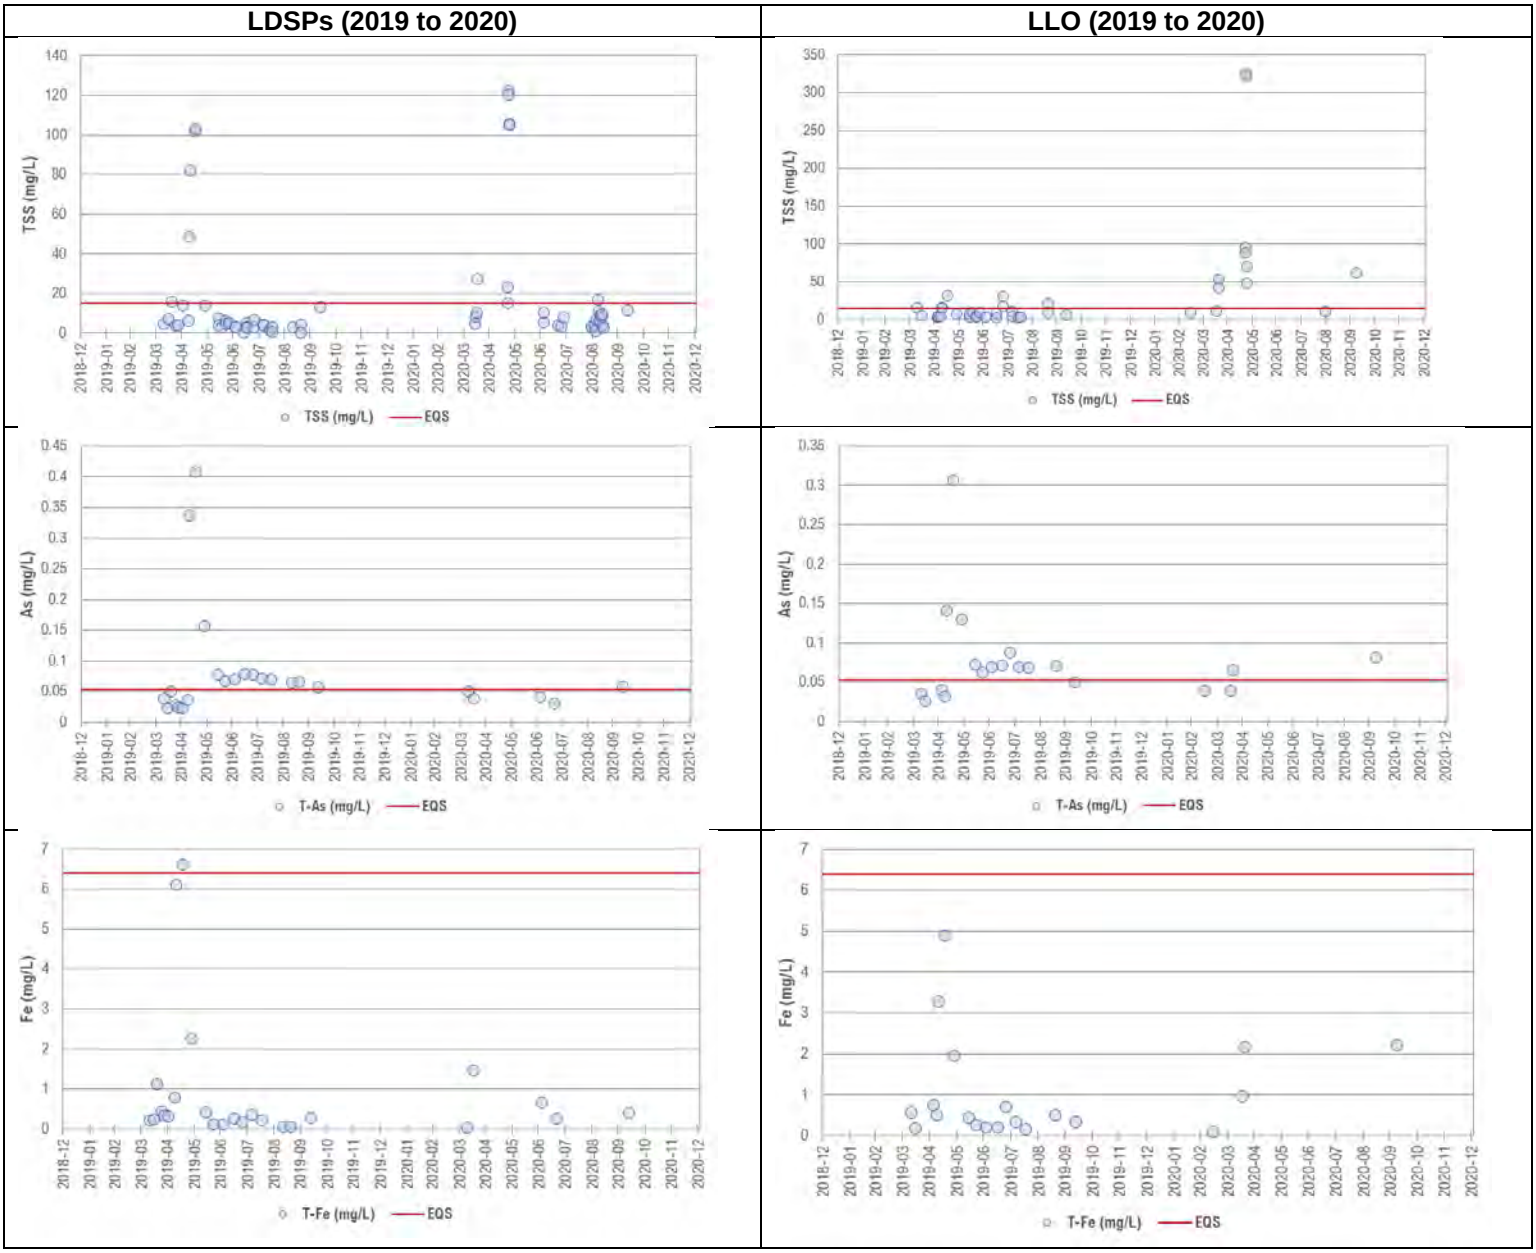

Figure 3.2-3: Concentrations of TSS, total As and total Fe at Pre-Discharge Locations LDSPs and LLO for 2019 and 2020

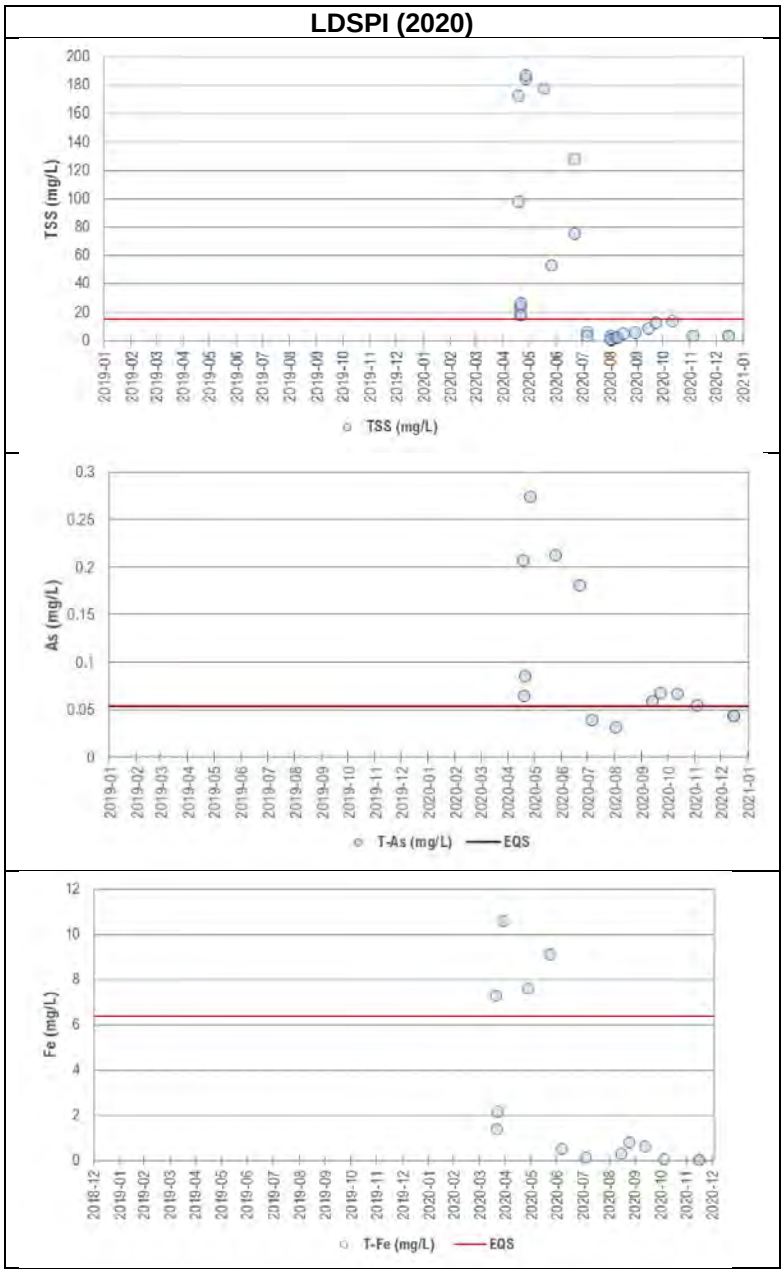

Figure 3.2-4: Concentrations of TSS, total As and total Fe at LDSPI for 2020

TSS concentrations at LDSPs were elevated above 15 mg/L primarily during the freshet period of 2020 and generally similar in magnitude as compared to observations for TSS in 2019. TSS concentrations at LDSPs for the period of July to October 2020 ranged from less than 5 mg/L to approximately 16 mg/L. Total As and total Fe concentrations measured at LDSPs were generally lower in 2020 as compared to 2019, although this may reflect the lower density of sampling during freshet (e.g., April and May) in 2020 as compared to 2019 (Figure 3.2-3; Table 3.2-7). Total As values at LDSPs for 2020 narrowly ranged between 0.031 mg/L to 0.058 mg/L; the observed 2019 total As values for LDSPs ranged from approximately 0.023 mg/L to 0.41 mg/L.

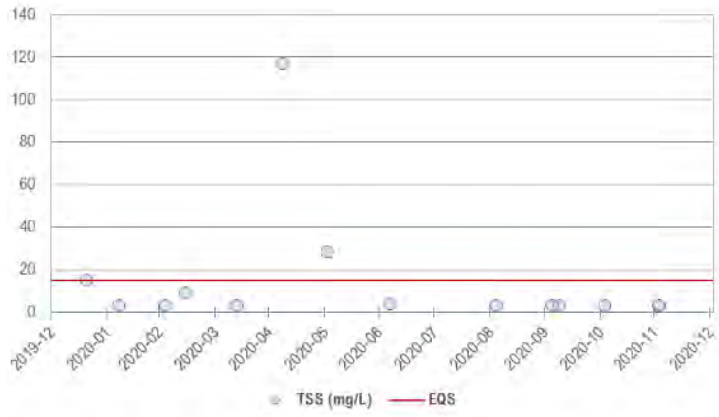
TSS values recorded at LLO in 2020 were notably higher for the freshet period (April) as compared to observations in 2019 (Figure 3.2-3).

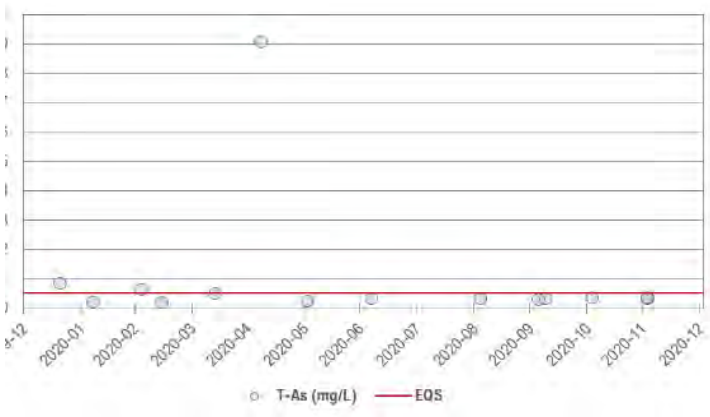
For station LDSPI, TSS concentrations were elevated during the freshet period of late April to June and below 15 mg/L for the remainder of the open water period. Elevated total As and total Fe concentrations measured at LDSPI coincided with peak TSS levels during April. Total As concentrations were present at concentrations slightly above the EQS value of 0.058 mg/L for sampling events in September and October 2020. Total Fe values remained well below the EQS value of 6.4 mg/L once TSS values were less than 15 mg/L (Figure 3.2-4).

LDSP-UND and HLFUMV Water Quality

The LDSP-UND is a discharge compliance monitoring station and was monitored monthly during 2020 to satisfy the requirements of QZ14-04-1. The LDSP-UND continues to pass natural groundwater flow underneath the LDSP to lower Eagle Creek. Water quality monitoring of the LDSP-UND began in July 2019 and no exceedances of the effluent quality standards (EQS) were observed for the period July 2019 to December 2020.

The HLFUMV is a discharge compliance monitoring station that captures natural groundwater flow passing underneath the HLF. Currently and throughout 2020, all flow from the HLFUMV was captured and recirculated back to the Events Pond and no discharge to the receiving environment occurred. Water quality monitoring occurred monthly in 2020. Water quality of the HLFUMV throughout 2020 exhibited concentrations for all parameters well below the EQS with the exception of TSS (April and May) and total As (April) as illustrated in Figure 3.2-5 (see Appendix F2 for graphical representation of full suite data and Appendix F3 for raw data output).





HLFUMV TSS (2020)	HLFUMV T-As (2020)
	

Figure 3.2-5: Concentrations of TSS and total As at HLFUMV for 2020

LDSP Discharge Water Quality

All discharges from the Eagle Mine to the receiving environment are required to meet EQS stipulated in QZ14-041-1. In 2020, four (4) discharge events occurred as indicated in Table 3.2-8; the April event did not discharge directly to the receiving environment but rather to the exfiltration sump FDP#5 used successfully during construction activities in 2018 (and registered with Environment and Climate Change Canada as an approved discharge location for the purposes of the *Metals and Diamond Mining Effluent Regulations* [MDMER]).

Table 3.2-8: Discharge Events in 2020 and Discharge Duration and Location

Month	Duration and Location of Discharge	
	FDP#5	Ditch C to Haggart Creek
April	April 20 to April 28	
July/August		July 29 to August 18
September		September 14 to September 20
		September 23 to September 27

April 2020 Discharge Water Quality

Discharge to FDP#5 occurred from April 20 to April 28, 2020 in order to maintain storage capacity in the LDSP. High snowfall during 2019 and 2020 prompted VGC to develop an adaptive water management strategy in advance of the 2020 freshet period at the Eagle Gold Mine. The plan included execution of two key water management strategies to ensure adequate water storage availability in the LDSP to accommodate potentially higher than normal freshet flows:

Early controlled release of water from the LDSP to Haggart Creek in accordance with the terms of QZ14-041-1 to increase surge storage capacity of the LDSP; and

Transfer an additional portion of water in the LDSP to the Events Pond to increase surge storage capacity in the LDSP and to allow for passive settling treatment in the Events Pond prior to potential discharge.

Peak freshet in the project area typically occurs in early May; however unseasonably warm temperatures occurred at the Eagle Mine in mid-April 2020 which resulted in rapid melting of the snowpack, high runoff flow rates with commensurate high total suspended solids (TSS) loadings within site ditches draining to the LDSP. This influx of high TSS water degraded water quality in the LDSP to the point where direct discharge to Haggart Creek would not be compliant with effluent quality standards (EQS) permitted in the WUL. In addition to the influx of high TSS water via the ditch inlets to the LDSP, an overflow into the South West corner of the LDSP occurred due to the breach of a portion of Ditch A resulting in the forebay being bypassed and the residence time to allow for settling of solids not being achieved. While transfer of LDSP water to the Events Pond occurred, the rate of water accumulation in the LDSP, and a portion of the inflows not receiving the designed settling period, demanded that other water management strategies, such as discharge to an exfiltration sump be undertaken. Exfiltration was successfully used in 2018 during early construction to remove TSS, and avoid a direct discharge from the LDSP to Haggart Creek. The exfiltration sump (FDP#5) is located approximately 300 meters upgradient of the LDSP in the lower Dublin Gulch valley (Figure 3.2-6) and over 1 km upgradient of Haggart Creek. FDP#5 is underlain by a thick (over 20 m) sequence of placer deposits and alluvium overlying bedrock. Exfiltration through the excavated sands and gravels to filter the water for TSS and associated metals was ascertained to have the lowest potential for adverse impacts on the receiving environment and was selected over a direct discharge to Haggart Creek.

Figure 3.2-6: Location of Exfiltration Sump (FDP#5) in Relation to Haggart Creek and Dublin Gulch

Pumping to the exfiltration sump commenced on the afternoon of April 20 and continued to the morning of April 28, 2020. Samples from FDP#5 were collected for required analyses on April 20, 21 and 27; salient results are presented in Table 3.2-9. For the samples collected during the discharge period, TSS and total As were present at concentrations in excess of their respective WUL EQS for all samples, whereas total Fe exceeded the WUL EQS only on the April 27 sample. Conversely and importantly, dissolved As and dissolved Fe concentrations were present at much lower concentrations, indicating that total As and Fe values were largely associated with the suspended solids. Hence the adaptive water management strategy of releasing LDSP water to the exfiltration sump to allow for settling and filtering of the solids along the flow path would likely have served to progressively reduce total As concentrations with increasing distance away from FDP#5. The exfiltration would not likely have reduced dissolved As concentrations to a similar extent as total metals along the discharge subsurface water flow path through the placer/colluvial sediments. However, the dissolved As concentrations in the LDSP water discharged to FDP#5 were lower than background dissolved As concentrations in Dublin Gulch (see Section 3.2.3.2 and discussions of water quality at W1 and W21) which are consistently present at concentrations ranging from 0.03 mg/L to 0.04 mg/L throughout the year and therefore would not have resulted in increased dissolved As concentrations in the receiving environments of Dublin Gulch and Haggart Creek.

July 29 to August 18 Discharge Water Quality

A planned discharge was initiated on July 29 and continued to the morning of August 18, 2020 from the Events Pond through the LDSP weir outlet to reduce water volumes in the Events Pond to within HLF Phase 1 Desired Available Storage (DAS) volumes. Weekly samples were collected at the discharge outlet as required by the QZ14-041-1 and the MDMER on July 29, August 3, August 10 and August 17. All parameters were well below the WUL EQS and MDMER limits throughout the discharge (Table 3.2-10).

September 14 to September 20 and September 23 to September 27 Discharge Water Quality

Discharges to Haggart Creek via Ditch C occurred over two periods (September 14 to September 20 and again on September 23 to September 27) to reduce water volumes in the Events Pond to within HLF Phase 1 DAS volumes. Weekly samples were collected at the discharge outlet as required by the QZ14-041-1 and the MDMER on September 14 and September 23. All parameters were well below the WUL EQS and MDMER limits throughout the discharge (Table 3.2-11).

3.2.3.2 **Receiving Environment Surface Water Quality Monitoring Program**

The 2020 surface water quality monitoring program included continuing the surveillance of watercourses monitored as part of the EMSAMP with particular focus on those stations within Haggart Creek with adaptive management plan (AMP) water quality tiers including W4, W29, W99 and W23 (see Figure 3.2-1 for station locations).

Based on water quality monitoring, TSS, total As, total Cu and total Fe were measured, on at least one occasion at concentrations greater than the Tier 3 water quality objective (WQO) for all stations (e.g., W4, W29, W99 and W23). Dissolved Al was observed at concentrations greater than the WQO at stations W4, W29 and W99. Total Cd and total Pb were measured at values greater than the WQO at stations W4 and W29 (Table 3.2-12).

Table 3.2-12: Number of Sampling Occasions where Measured Values were Greater than Tier 3 WQOs at EMSAMP Monitoring Locations in Haggart Creek (2020)

As illustrated, all other parameters were measured at concentrations below their respective WQO at all locations and at all sampling periods in Haggart Creek (Table 3.2-12; Appendix F3 and Appendix F4). A more detailed discussion of the 2020 monitoring results for W4, W29, W99 and W23, including AMP trend analysis, is provided below. Specifically, monthly water quality data collected for the Eagle Gold project is compared to each stations baseline water quality condition. For stations W4 and W23, the baseline water quality is represented by monitoring results for the period 2007 to 2018. For station W29, the baseline period spans 2009 to 2018 and for station W99, there does not exist a true baseline as water quality sampling was initiated at this station in April 2019 during early operations. In the case of W99, monthly data for 2020 is compared only to 2019. Haggart Creek exhibits strong flow-based variability and therefore data was compared among months between years as the most appropriate approach rather than assessing water quality changes observed over consecutive months.

Determination as to whether parameters measured in 2020 are exhibiting an increasing trend has been based on consideration of the natural variability in the baseline. Specifically, monthly mean 2020 observations for AMP key parameters are compared to baseline monthly mean +1 and +2 standard deviations (e.g., 68th and 95th percentile). Monthly mean 2020 values within +1 standard deviation of baseline values are considered to be unchanged;

values measured within +2 standard deviations are considered to be within the natural observed variability. Monthly mean 2020 values measured above +2 standard deviations of the baseline and above the Tier 3 WQO are considered to be an increase over the baseline condition. In some instances, and for some parameters, monthly mean 2020 values were measured above the Tier 3 WQO but below +2 standard deviations of baseline conditions. In these instances, no specific action is required due to high background conditions.

As will be illustrated below, most parameters that measured +2 standard deviations above monthly baseline variability and/or Tier 3 WQOs were a result of natural Dublin Gulch inflows to Haggart Creek. Therefore, where relevant, discussion is also provided for station W21 in lower Dublin Gulch owing to the importance of the Dublin Gulch tributary to observed water quality in Haggart Creek downstream of its confluence and Project potential impact.

W4

Station W4 is located downstream of the confluence of both Dublin Gulch (Figure 3.2-1) and downstream of where the discharge via Ditch C enters Haggart Creek. Discharge via Ditch C to Haggart Creek only occurred during the period of July 29 to August 18, September 14 to 20 and September 23 to 27 (Table 3.2-8). Discharge from the LDSP in April was pumped to the exfiltration sump FDP#5 and filtered down through placer and alluvium deposits, entering the shallow groundwater system and did not reach Haggart Creek directly. Trend analysis summary of W4 baseline water quality, for the period 2007 to 2018, compared to monthly mean 2020 water quality data for the open water period of April to October is presented in Table 3.2-13. Full graphical results for all parameters in 2020 are also presented in Appendix F4.

As illustrated, most parameters measured at W4 during 2020 were at concentrations very similar to baseline values (e.g., ≤ +2 std. dev. (95th percentile limits); only TSS, total As and total Fe were measured at concentrations greater than the baseline variability and greater than the respective Tier 3 WQO (Table 3.2-8). In April, TSS, total As and total Fe were measured at elevated concentrations at W4. These elevated levels were a result of Dublin Gulch inflows containing elevated concentrations of these parameters. During the latter part of April corresponding with the onset of initial snowpack melt, an increase in TSS and total As concentrations is observed between station W1 and W21 on Dublin Gulch (Figure 3.2-7). For most of the 2020 monitoring year, station W1 and W21 exhibit very similar concentrations of TSS and total As; however, the onset of freshet in mid to late April 2020 was characterised by increased levels of these parameters. As described previously in Section 3.2.3.1, high snowmelt conditions occurred during this period, leading to the water management decision to discharge excess contact water to ground via FDP#5. While natural TSS levels increased in upstream monitoring station W1, station W21 experienced a much greater increase in concentrations of TSS and consequently, total As and total Fe as well (Figure 3.2-7). These data reflect the difficulty in managing snowmelt generated sediment-laden runoff coming from the historically constructed Dublin Gulch road, which has been documented in previous years to contribute to high TSS in Dublin Gulch during freshet. Water management and sediment mitigation strategies, such as upgradient water diversion structures, check dams, silt fences, jute and hay bales have been employed to reduce sediment laden water entering Dublin Gulch and ultimately Haggart Creek.

Table 3.2-13: Summary Comparison of Key Water Quality Parameters at W4 for Baseline Period (2007 – 2018) to 2020 monthly Mean Values Relative to AMP Threshold Values

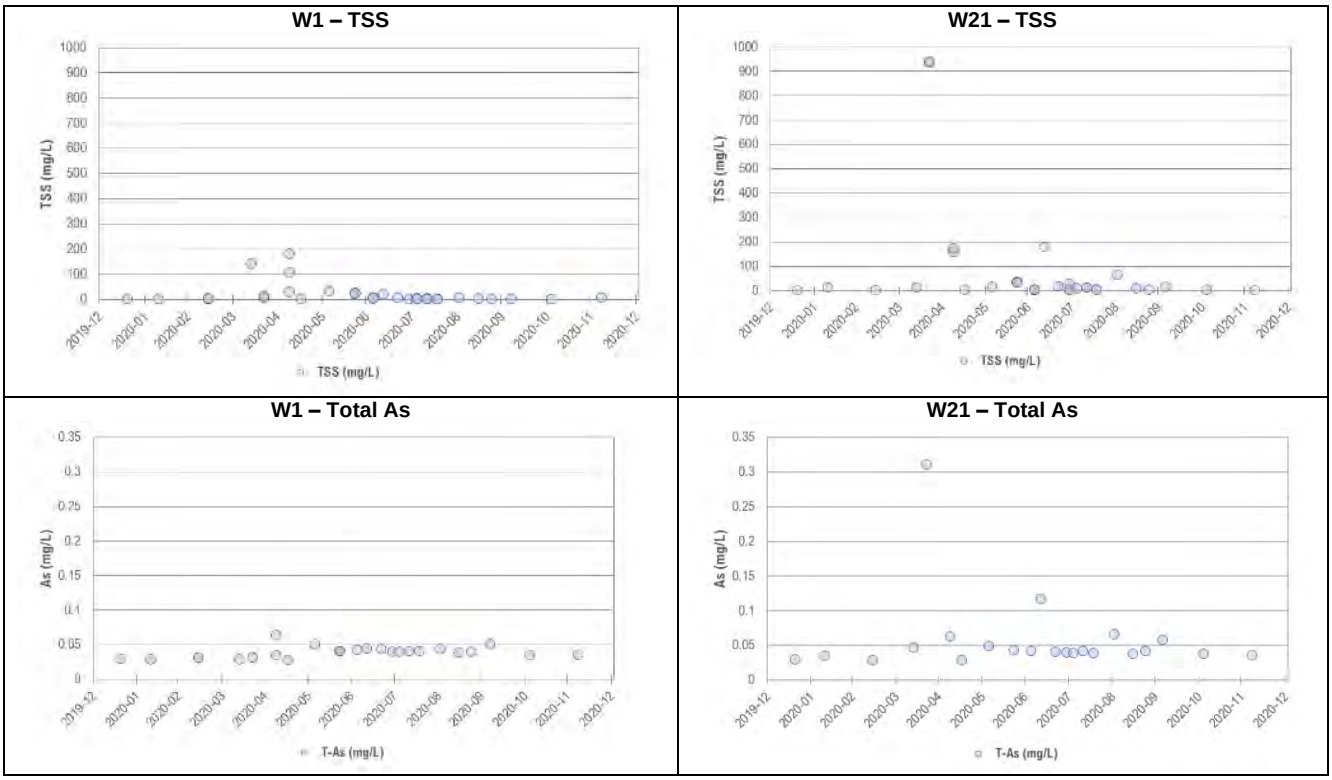

Figure 3.2-7: TSS and Total As Concentrations at W1 and W21 in Dublin Gulch (2020)

Elevated total As concentrations above the AMP T3 WQO of 0.0085 mg/L were observed at station W4 during the July 29 to August 18 and the September 14 to September 27 discharge events. These results are not considered to be attributed to the Project given that all LDSP discharges during these events were compliant with all QZ14-041-1 EQS (see Section 3.2.3.1). Total As concentrations during the July/August and September discharges ranged between 0.027 mg/L and 0.033 mg/L, well below the EQS of 0.053 mg/L. The results prompted further investigation as per EMSAMP requirements and it was postulated that complete mixing of Dublin Gulch and Ditch C discharges with Haggart Creek may not occur by the time water reaches station W4. Exploratory transect sampling from the east bank to west bank at W4 and a visual dye test in Haggart Creek in September 2020 confirmed that Dublin Gulch and Ditch C discharges are poorly mixed at W4. Water quality sampling at W4 were erroneously biased upward owing to the incomplete mixing occurring at the W4 Haggart Creek monitoring station. (QZ14-041-1 August Monthly Report 2020 provides a more detailed discussion on the mixing evaluation and assessment at W4).

As such, all “elevated” total As concentrations, total Fe and TSS values measured at W4 must be viewed with caution and are not likely representative of fully mixed conditions and therefore biased upwards due to the sampling location. Potential impacts from the Project may also be more appropriately assessed based on consideration of Haggart Creek sites W29, W99 and W23. Future sampling of Haggart Creek below Ditch C is evaluating appropriate revised locations for station W4 that is further downstream and reflective of fully mixed conditions.

W29

Water quality parameters at W29 in 2020 were present at concentrations very similar to the observed baseline values (e.g. ≤ +2 std. dev.) during the baseline period of 2009 to 2018 (Table 3.2-14). Minor exceptions to these observations occurred in June 2020, where elevated TSS, dissolved Al and total Fe were present in concentrations greater than AMP T3 and baseline values for the same period. No discharge was occurring from the Project in June and there were no identified Project influence point sources for the elevated water quality concentrations. In April, May and June 2020, mean monthly total As concentrations were higher than the AMP T3 WQO of 0.0085 mg/L; however, the monthly mean values were lower than the observed baseline values and therefore cannot be viewed as an upward trend at this time. Indeed, for most months, the mean monthly total As concentrations measured in 2020 were typically at or below the observed baseline +1 std. dev. value (Table 3.2-14).

W99

Station W99 was added in 2019 and therefore does not have a true “baseline” record of measurements to which trend analysis is applicable. In 2020, April, June and September observed mean monthly total As concentrations were greater than the AMP T3 threshold of 0.0085 mg/L (Table 3.2-15 and Figure 3.2-8). The elevated As concentrations measured in the aforementioned months appear to be associated with elevated TSS at W99 on those sampling occasions. Without historical baseline data it is not possible to determine whether these concentrations would have fallen within observed baseline values (e.g. ≤ +2 std. dev.). Elevated concentrations of total Cu and Fe were also observed in May 2020 (Table 3.2-15). Dissolved As concentrations at W99 in the open water period of 2020 (e.g., April to October) narrowly ranged between 0.004 mg/L and 0.006 mg/L, much lower than Total As concentrations. The low dissolved As concentrations contrast the corresponding total As measurements. Similarly, to W4 this supports the hypothesis that the majority of arsenic concentrations within the waters at W99 are associated with suspended sediment within the water column. Dublin Gulch is believed to be the primary source for the elevated concentrations of total As observed. The monitoring station W45 on Eagle Creek situated nearby central Project infrastructure and laydowns, which discharges into Haggart Creek just above W29, did not exhibit the similar elevated metal signatures when compared to W99.

No baseline available for W99 - sampling commenced in April 2019

Colour Coding Legend for Trend Assessment	
Monthly 2020 mean is ≤ any Tier and ≤ Baseline 2 stdev	no action
Monthly 2020 mean is ≥ any Tier but ≤ Baseline 2 stdev	no action
Monthly 2020 mean is ≥ Tier 2 < Tier 3 ≥ Baseline 2 stdev	monitor
Monthly 2020 mean is ≥ Tier 3 > Baseline 2 stdev	investigate further
Monthly 2020 mean is ≥ Tier 3 < Baseline 2 stdev	high background

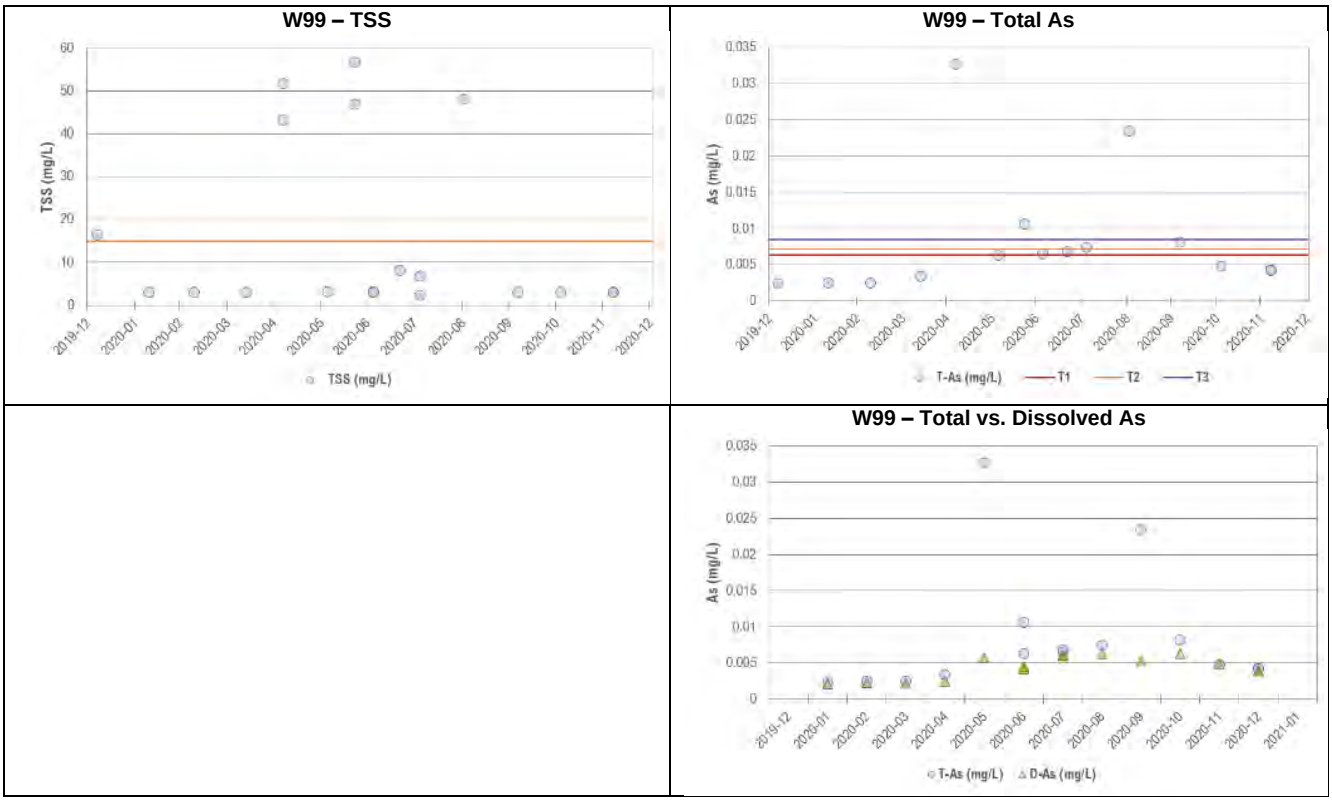

Figure 3.2-8: TSS, Total As and total vs. Dissolved As Concentrations at W99 (2020)

W23

Water quality at W23 reflects loadings from Dublin Gulch and all mine related inputs as well as additional loadings from Lynx Creek. Water quality observed in 2020 at W23 relative to the baseline period of 2007 to 2018 indicated that most parameters measured in 2020 were at concentrations very similar to those observed during baseline monitoring. Most parameters were present at a concentration within 1 standard deviation of the baseline monthly mean concentration with the exception of As during freshet in May (Table 3.2-16). Concentrations of total As on May 5, 2020 at W23 (0.032 mg/L) were similar to total As concentrations measured at W99 on the same date (0.033 mg/L) and are a consequence of elevated TSS. This is supported by dissolved As concentrations at W23 in May 2020 of 0.005 mg/L. In addition, record snow pack and resultant increased flow within Haggart Creek throughout May as compared to baseline conditions contributed to TSS being more persistent within the water column, staying suspended for longer durations. Snow management, silt fencing, water diversion structures, check dams, jute and hay bales were all employed to mitigate potential sediment laden water souring from the Project entering Haggart creek. Efforts to improve sediment controls and upgrade water management structures on the Project are a key focus of ongoing water management improvements at the Eagle Mine.

Table 3.2-16: Summary Comparison of Key Water Quality Parameters at W23 for Baseline Period (2007 – 2018) to 2020 monthly Mean Values Relative to AMP Threshold Values

Parameter	T1	T2	T3	W23 - Haggart Creek																				
				April			May			June			July			August			September			October

3.3 Water Balance and Water Quality Modeling

The Eagle Gold Project water balance and water quality model (WBWQM) is a mass-conserving mixing model that predicts water quality for 38 parameters at key monitoring and compliance points in the receiving waters affected by mine activity. The model was designed on the GoldSim® platform and the water balance and water quality model uses a daily time-step for 50 years, spanning operations, closure and several years into post-closure.

The WBWQM has been updated and integrates the following:

- Description of the water management plan as described in: *Eagle Gold Project Water Management Plan*. Version 2020-01. January 2020;
- Revisions to the heap leach facility water balance modeling as prepared by Forte Dynamics;
- Baseline climate and hydrology data collected since 2007 and inclusive of data collected in 2020;
- Updated baseline surface water quality monitoring data collected from 2007 to 2017 prior to initiation of construction in August 2017;
- Surface water quality monitoring data collected in 2018 through 2020 reflective of construction and early Operations phases; and,
- Updated geochemical source term data collected from re-designed and revised field bins of waste rock and unsaturated laboratory-based kinetic leach columns.

The revisions to the operations water management plan and site-wide water balance model are reflected in the updated schematic (Figure 3.3-1). Water quality from mine discharge during operations is driven by contact water reporting to the Lower Dublin South Pond. Contact water from Platinum Gulch WRSA, the temporary (or 90-Day) ore stockpile, and any drainage from the open pit all report to the LDSP through Ditch A. Suttles Gulch drains to the LDSP via Ditch B. The Eagle Pup WRSA has not been utilized to date, such that Eagle Pup currently drains to Dublin Gulch. During 2020, excess water was primarily managed through:

- Transfer of Lower Dublin South Pond water to the Events Pond to manage water volumes within the Lower Dublin South Pond;
- Water stored in the Events Pond was used for process make-up water requirements;
- Discharge to Haggart Creek via Ditch C when water quality met discharge requirements of QZ14-041-1 for effluent quality (EQS).

The MWTP was not constructed during 2020.

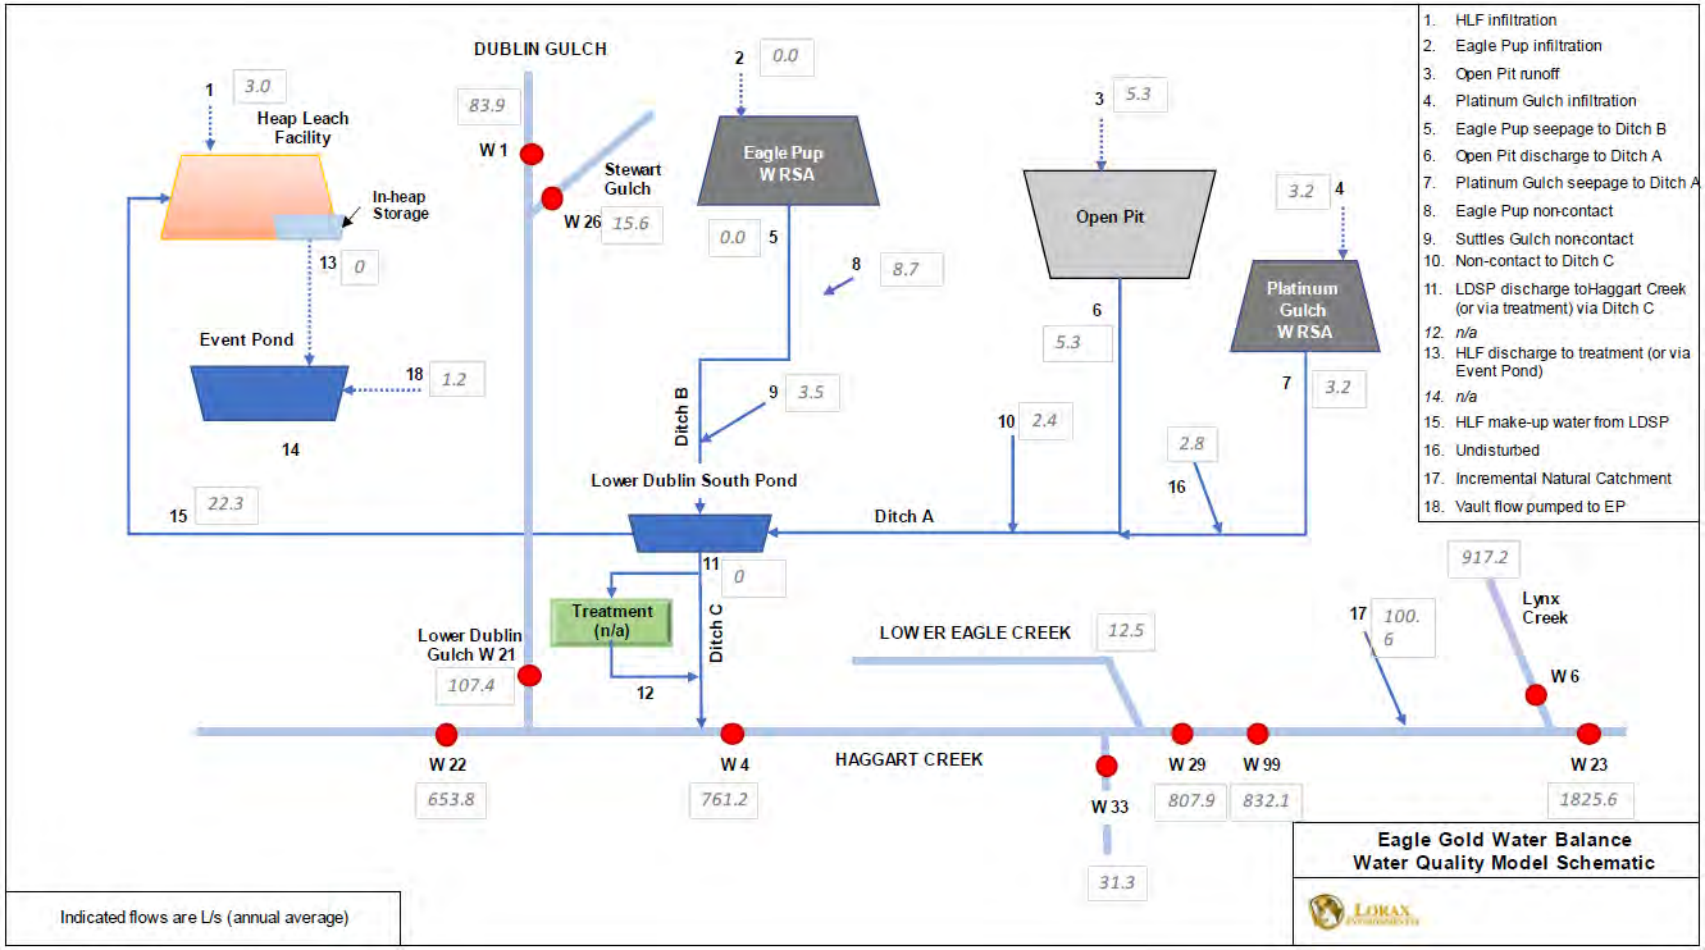

Figure 3.3-1 Water Balance Model Schematic - Overview

3.3.1 HLF Water Balance Model Integration

The Eagle Gold WBWQM is a GoldSim-based integrated water balance and water quality model that was developed in two parts. The water quality component was developed by Lorax Environmental Services Ltd. (Lorax) and integrated within the WBM to combine source concentrations of potential contaminants of concern with contact and non-contact flows allowing contaminant loading to be tracked throughout the mine site and into the receiving waters of Haggart Creek. The WBWQM integrates logic and assumptions from Forte's Heap Leach Facility Water Balance Model (HLF WBM).

The Forte HLF WBM is used for daily operations. Inputs include measured meteorological and site operational data for the period in which such data are available (e.g., assumes July 1, 2019 start date of the simulations to a March 1st, 2021 forecasting date). This distinction in measured and forecasted data, described in the report, effects the Deterministic and Stochastic model simulations in slightly different ways.

The Forte Model makes use of a large array of operational, meteorological, geotechnical, and metallurgical input data. The inputs include updated values from the previous heap water balance model developed by the Mines Group (2019) to provide site with an operational model as the mine site transitioned into production. Additional ore samples were collected, and further testing was conducted to characterize ore properties which have been used in the updated model. Additionally, as the site moved into operations, site operators required a model that could incorporate the daily data recorded at site, including climatic conditions, measured flows, and tonnage placed on the HLF. The updated HLF WBM incorporates an increasing detail surrounding the HLF while providing operations with the ability to utilize more recorded inputs and better understand solution and pond level management.

The SWBM also incorporates groundwater baseflow and recharge rates estimated by the groundwater model, as well as provides inputs to the water quality model. Figure 3.3-2 illustrates the integration of the water balance with the HLF WBM, groundwater model and water quality model.

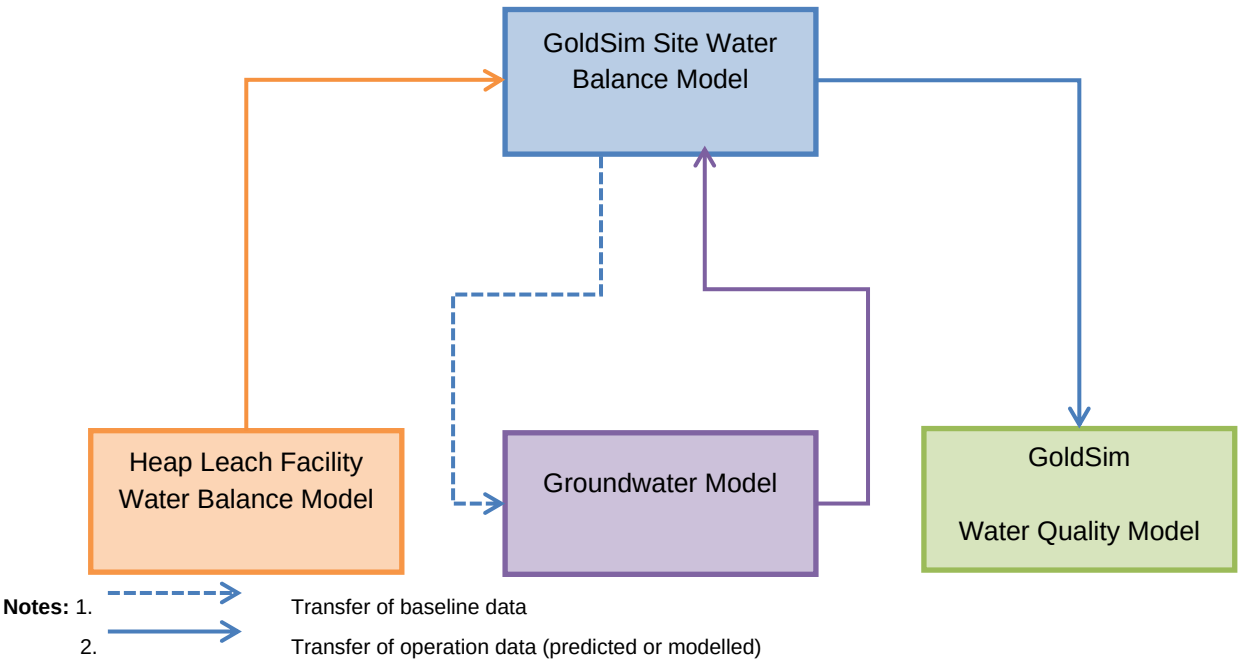

Figure 3.3-2 Water Balance Model Integration

3.3.1.1 **Results**

The results of the updated models are provided in the Eagle Gold Project 2020 Water Balance and Water Quality Model Update Report (Appendix G) and Forte Heap Leach Facility Water Balance Model Report (Appendix H). The model utilizes the active mine plan and considers the receiving environment WQOs developed for the QZ14-041-1, the effluent quality standards mandated by QZ14-041-1, and updated data collected under the Environmental Monitoring, Surveillance and Adaptive Management Plan.

3.4 Groundwater

The majority of the Mine footprint is situated within the Dublin Gulch basin, which is part of the Haggart Creek basin. The hydrogeologic zones used to characterize groundwater in the area include Eagle Pup and the Ann, Suttles, Olive, Bawn Boy, Platinum and Dublin Gulches. The groundwater monitoring program in 2020 continued the general data collection program initiated during baseline monitoring and construction that focused on specific spatial zones and where facilities were constructed and operated to help monitor potential effects on the groundwater flow system. The wells monitored during 2020 are depicted in Figure 3.4-1 and include the following zones:

- Heap Leach Facility (Ann Gulch catchment) and the Events Pond,
- Eagle Pup WRSA (Eagle Pup catchment),
- Platinum Gulch WRSA (Platinum Gulch catchment),
- Open Pit (Upper Suttles and Platinum Gulch catchments)
- Olive and Bawn Boy Gulches (Upper Dublin Gulch catchment), and
- Lower Dublin South Pond (Lower Dublin Gulch valley).

The installation of additional wells near major facilities was planned for 2020 (i.e.., the HLF, Eagle Pit, and the Platinum Gulch WRSA); however, these wells could not be completed due to site access restrictions associated with the ongoing Covid-19 pandemic. Thus, these additional monitoring wells are planned for installation at several locations in 2021. These locations will provide data near the HLF and down gradient from the Eagle Pit PG WRSA. Monitoring well installations in 2021 are also planned down gradient of the EP WRSA Groundwater wells that were decommissioned during the 2020 reporting period due to operational requirements are listed in Table 3.4-1. Wells are decommissioned using ASTM 529999 decommissioning guidelines.

Table 3.4-1: Groundwater Well Decommissioning 2020

Well ID	Date Decommissioned	Reason for Decommissioning
Heap Leach Facility and Events Pond (Ann Gulch catchment and adjacent area)		
MW09-AG2	Jan 1	Well within HLF Phase 1B construction area
MW09-AG3AB	Jan 15	Well within HLF Phase 1B construction area
Eagle Pit Area (Suttles and Platinum Gulch catchments)		
PW-BGC11-02	April 14	Well was within planned pit blast pattern
BH-BGC11-73	Feb 20	Well was within planned pit blast pattern
MW96-17AB	Feb 21	Well was within planned pit blast pattern

3.4.1 Groundwater Quantity Monitoring

The objectives of the groundwater quantity monitoring program are to provide continuous and spot level groundwater level measurements to monitor potential Project effects on the occurrence and quantity of groundwater. Groundwater level data have been collected since 2009 from the wells/piezometers installed throughout the project footprint. Continuous recording data loggers have been used at various locations on site to provide a better understanding of seasonal variability in areas of current and planned infrastructure.

Continuous data logger information collected in 2020 was compiled by BGC in hydrograph plots showing groundwater elevations from monitoring wells; data compilation and analytical methods for processing the groundwater level data are described in the BGC report provided as Appendix I1.

As outlined in the EMSAMP, quarterly monitoring (sampling and water level measurements) was conducted during 2020 at the locations listed in Table 3.4-2 and shown in Figure 3.4-1.

Table 3.4-2: Groundwater Well Monitoring 2020

BH-BGC11-73a,b,c	No	No	Decommissioned
Upper Dublin Gulch (Bawnboy catchment)			
MW96-9B	Yes	Yes	No sample Q1 and Q2 due to access issues

As described in previous reports (Stantec 2012b. BGC 2013, and BGC 2014), and for the 2018, 2019 and 2020 Annual Reports the well network hydrographs have demonstrated a large range in seasonal variability (since 2009), with some wells (e.g., in the Ann Gulch area) experiencing small changes over the period of record (i.e., 1 to 2 m), while others in the Eagle pit areas historically showed much larger ranges (over 10 meters). For almost all the wells monitored in 2020, seasonal groundwater levels (i.e., peaks associated with freshet melt) returned to more average levels compared to 2019, likely reflecting the greater precipitation experienced in 2020 compared to 2019.

The available data indicate that the groundwater table generally mimics the surface topography, with recharge along topographic highs, and discharge along creeks and gullies. Seasonal groundwater level fluctuations are generally 5 m or less and typically peak in the spring (e.g., MW96-9B). The groundwater levels recorded in 2020 generally reflect similar trends to previous years. Greater amounts of precipitation were received in 2020 than is typical for the Project area, and groundwater elevations have recovered from the lower groundwater elevations observed in 2019. In some locations (e.g., MW96-9B), peak groundwater elevations were slightly higher than the historical range, likely in response to the high precipitation values observed in 2020.

The available data do not indicate noticeable impacts from mining on groundwater levels. The installation of additional wells near major facilities in 2021 is intended to provide additional data to further assess potential effects of mining operations on groundwater levels.

3.4.2 Groundwater Quality Monitoring

The groundwater quality monitored program is undertaken in conjunction with the quantity program with water quality samples taken on a quarterly basis (Table 3.4-2).

The discussion on groundwater quality in this report has been broken into four spatial areas to align with the major facility footprints, they are; HLF & Event Pond, LDSP, Platinum Gulch Waste Rock Storage Area and the future Eagle Pup Waste Rock Storage Area. Parameters discussed herein were previously identified as parameters of concern based on prior environmental characterization work (BGC, 2013) and were also considered in the 2019 annual report, and include: pH, aluminum, arsenic, cadmium, copper, lead, iron and selenium. Detailed results are available in Appendix I2.

Groundwater quality data collected from 1995-2016 was characterized in 2017 as required by the WUL (CoreGeo, 2017). In an effort to better characterize, and respond to if necessary, potential changes to groundwater quality during the life of the mine, VGC will continue to build upon this report and work towards creating management triggers for groundwater quality.

Groundwater quality data for wells within the Ann Gulch drainage (which is the location for the HLF and Event Pond) is provided in Figure 3.4-2 and Figure 3.4-3 for the period of 2010 through 2020. The wells monitoring in Ann Gulch include MW10-AG6, MW10AG3A, MW10-DG6, MW19-DG6RB, MW19-DG6RA, and MW19-HLF1B. Due to construction activities, MW10-DG6 was decommissioned and replaced with MW19-DG6R A/B. MW10-AG3A was also decommissioned during 2020.

Parameter observations include the following:

- pH has remained neutral to slightly basic for the duration of the monitoring program.
- Aluminum generally fluctuates between 1 order of magnitude with the exception of a one sample in 2010 (MW10-DG6 1.02 mg/L), one in 2014 (MW10-AG3 – 0.121 mg/L) and one in 2017 (MW10-AG3 0.109 mg/L).
- Arsenic levels were relatively stable from 2009-2019 with the exception of one outlier at MW10-DG6 which had a result 4 orders of magnitude lower than historical samples. New wells were established in 2019 and there is minor variability observed at MW19-HLF1B.
- Cadmium shows a decreasing trend in well MW18-DG6R over 2020, MW19-DG6RB has relatively stable values throughout 2020 and overall dissolved cadmium concentrations have a variability of approximately two orders of magnitude over the monitoring period.
- Copper at all historic stations have a variability of approximately one order of magnitude over time. In 2020 MW19-DG6RA shows a decreasing trend and MW19-DG6RB is stable throughout the year.
- Lead values in wells that were drilled in 2019 (MW19-HLF1B and MW19-DG6RA&B show higher concentrations then decommissioned baseline wells. MW19-DG6RA show a variability of 2 orders of magnitude during the two years of data.
- Iron displays a large variability between stations but each station shows consistent ranges over 2009 to 2020.
- Selenium displayed results for MW19-DG6RB at detection limits in 2020. MW19-HLF1B shows a slight increase over the 2 years of monitoring but is still lower than baseline results at MW10-DG6.

Figure 3.4.2: Ann Gulch Drainage Groundwater Quality Data

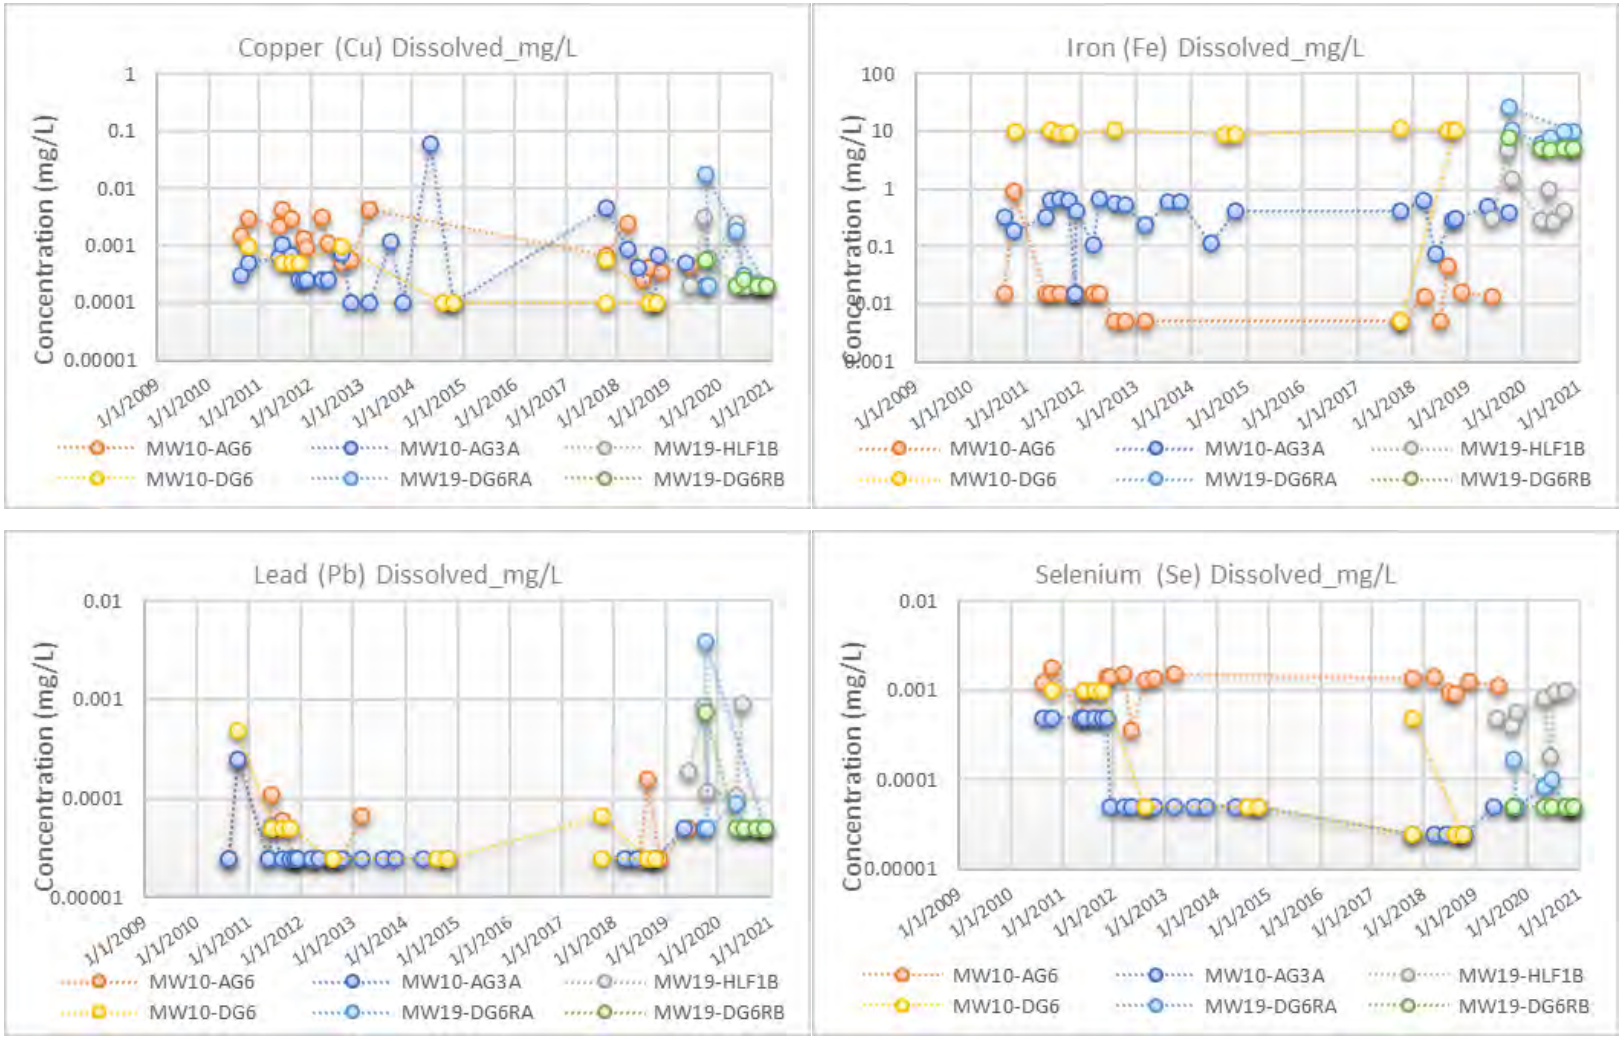

Figure 3.4.3: Ann Gulch Drainage Groundwater Quality Data

Groundwater data for the well network in the area of the LDSP is provided in Figure 3.4.4 and Figure 3.4.5. The wells considered include BH-BGC11-72, MW10-OBS1, MW19-LDSP2A, MW19-LDSP2B and MW18 DG2R. The data set for this area consists of groundwater quality data from 2017 through 2020. MW10-OBS1 was replaced with MW19-LDSP2A and is no longer monitored on a quarterly schedule.

Parameter observations include the following:

- pH is consistently neutral to slightly basic across all station and has a variability of 1 order of magnitude.
- Aluminum within the majority of groundwater samples are within 0.001 to 0.01 (one order of magnitude). In 2019, BH-BGC11-72 had aluminum concentrations 3 orders of magnitude higher than the majority of samples, but throughout 2020 concentrations have lowered and are closer to 0.001 mg/L.
- Arsenic ranges from 0.00032 mg/L to 4.48 mg/L across all stations, with the majority of values ranges from 0.001 to 0.1 mg/L or two orders of magnitude. MW18-DG2R had consistent arsenic concentrations above all other sample sites.
- Cadmium concentrations range from 0.00001 mg/L to 0.001 mg/L across all stations. MW10-OBS1 showed the largest variance, particularly the 2020 sample. Cadmium concentrations for the other four stations in the LDSP area display similar ranges to each other. Over the data collection period, there is a downward trend in cadmium concentrations across all stations.
- Copper concentrations show a downward trend in all stations with a concentration range of below 0.0002 mg/L (detection limit) to 0.00272 mg/L.
- Iron concentrations at BH-BGC11-72 displayed low variability during 2019-2020 monitoring with a range of 2.47 mg/L to 2.30 mg/L. MW19-LDSP2A displayed a decreasing trend with the 2020 Q4 sample concentration measured at method detection limits.
- Lead concentrations display a large variability over the 3 years of data (up to 4 orders of magnitude); however, the 2020 sample results are closer to detection limits and within 1 order of magnitude of one another.
- Selenium concentrations at MW10-OBS1 have remained stable over the 3 years of data collection at this monitoring station. MW19-LDSP2B has concentrations close to the laboratory detection limit. All samples are within 1 order of magnitude and have generally displayed low variability.

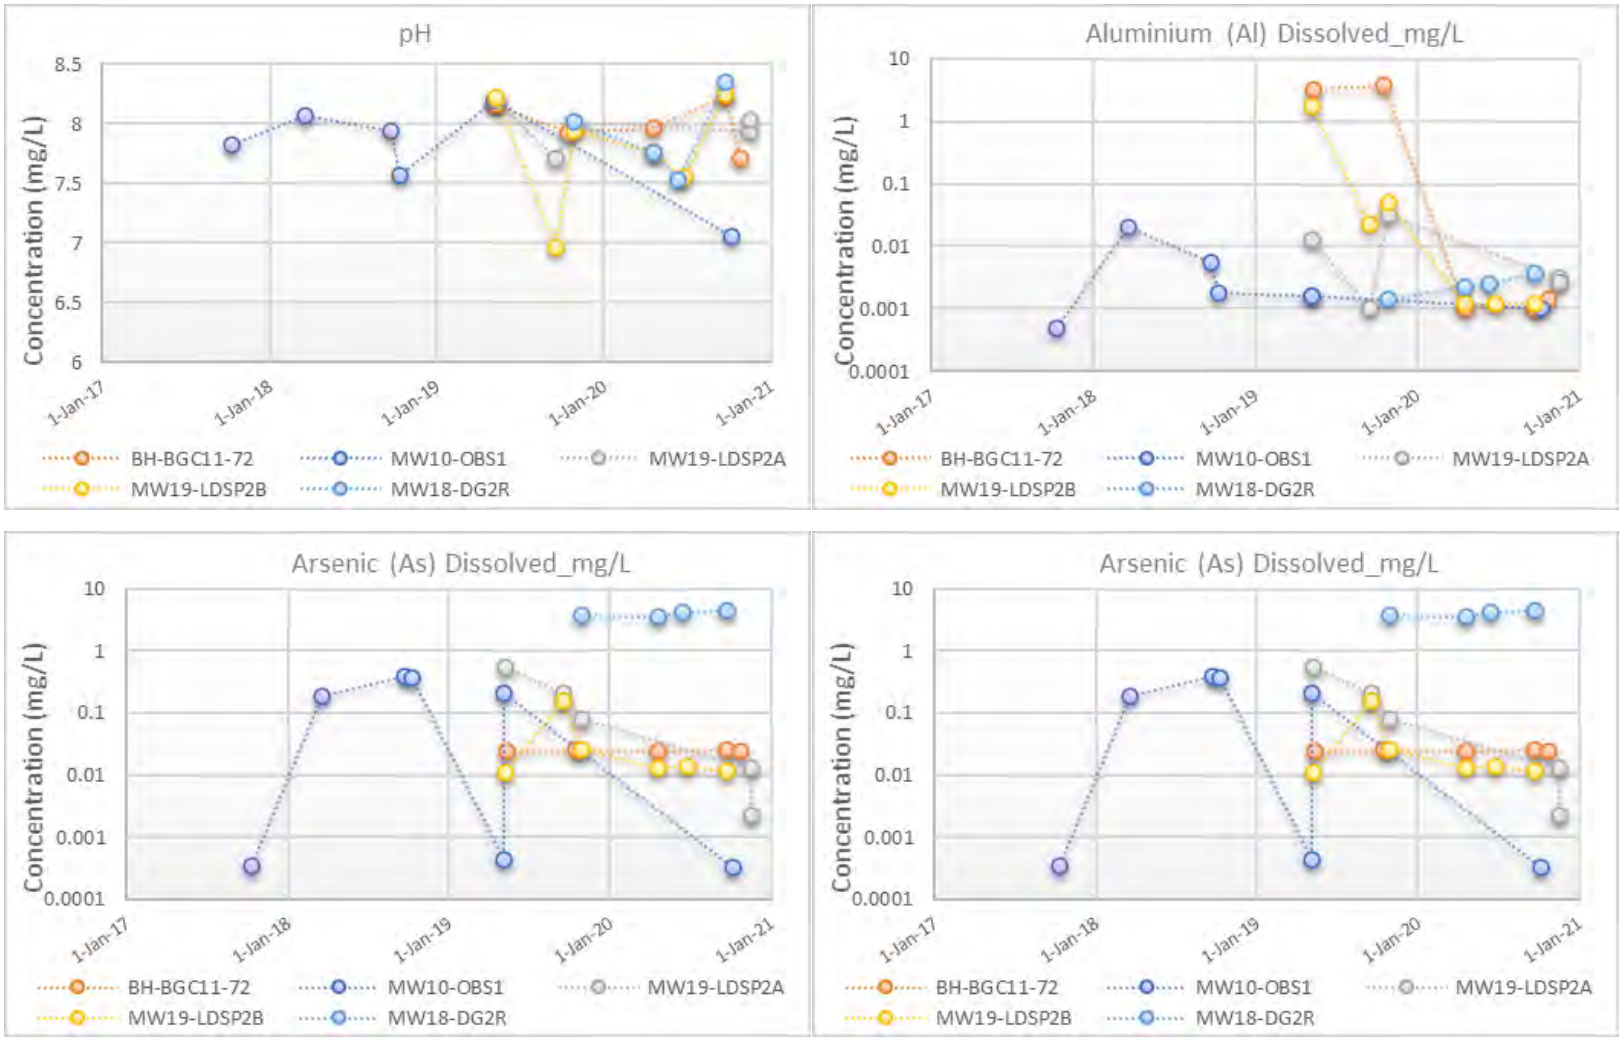

Figure 3.4.4: LDSP Area Groundwater Quality Data

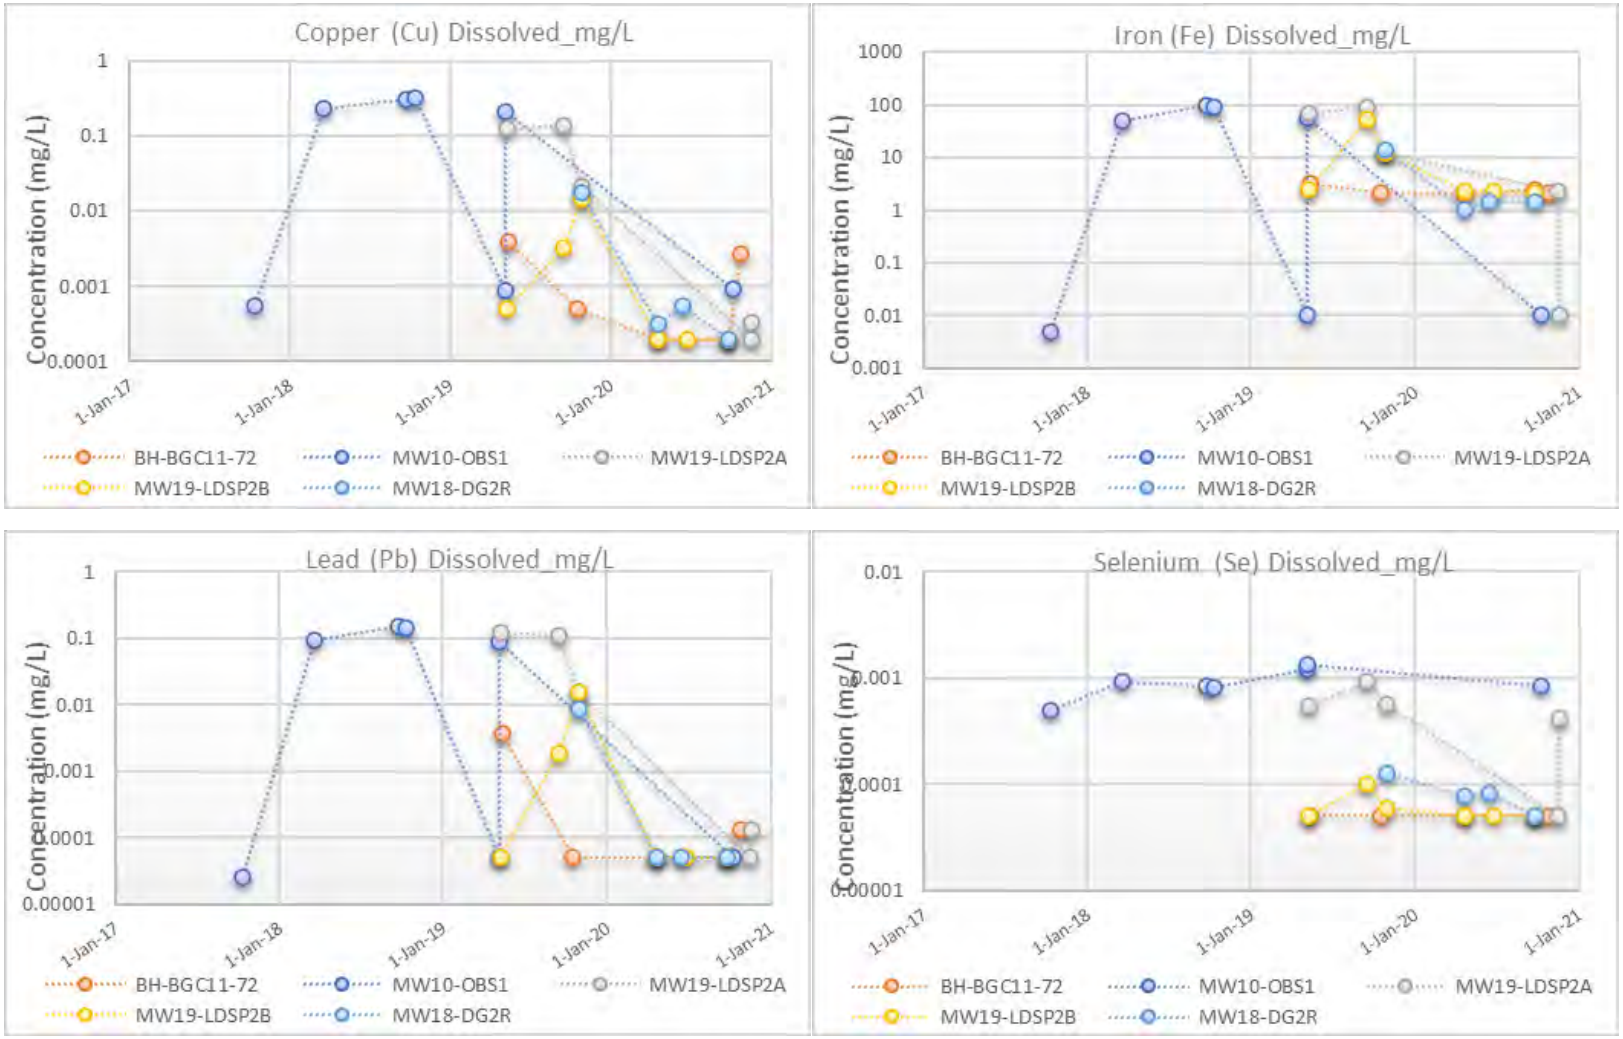

Figure 3.4.5: LDSP Area Groundwater Quality Data

There are currently two functional wells in the area of the PG WRSA that are part of the groundwater monitoring program. MW19-PG1b was damaged in 2019 and no sampling has occurred to date and the well is scheduled to be replaced in 2021. MW10-PG1 and MW19-PG1a were monitored during the reporting period (Figure 3.4.6 and Figure 3.4.7).

Parameter observations include the following:

- pH as remained neutral to slightly basic over the two years of data collected. Both stations have similar trendlines over the collection period.
- Aluminum concentrations at MW10-PG1 and MW19-PG1A have a range of one order of magnitude from 2019 to present.
- Arsenic concentrations at MW19-PG1A have displayed a downward trend since data was collected from June 2019 to present. MW10-PG1 arsenic concentration are consistently higher than MW19-PG1A with concentrations ranging from 7.78 mg/L to 9 mg/L over the 2020 sampling period.
- Cadmium concentrations at both stations show an overall downward trend over the 2 years of sample collection. MW10-PG1 displayed a downward trend over the 2020 monitoring period and MW19-PG1A displayed a slight increase throughout 2020.
- Copper concentrations at both stations showed a downward trend over the 2020 sampling period.
- Iron concentrations have displayed a downward trend over the 2 years of data collection, with concentrations varying up to three orders of magnitude.
- Lead concentrations for both MW10-PG1 and MW19-PG1A stations displayed a downward trend in 2020 closer to the laboratory detection limit of 0.00005 mg/L.
- Selenium concentrations at MW19-PG1A display a relatively flat trend and sample results are within one order of magnitude of each other.

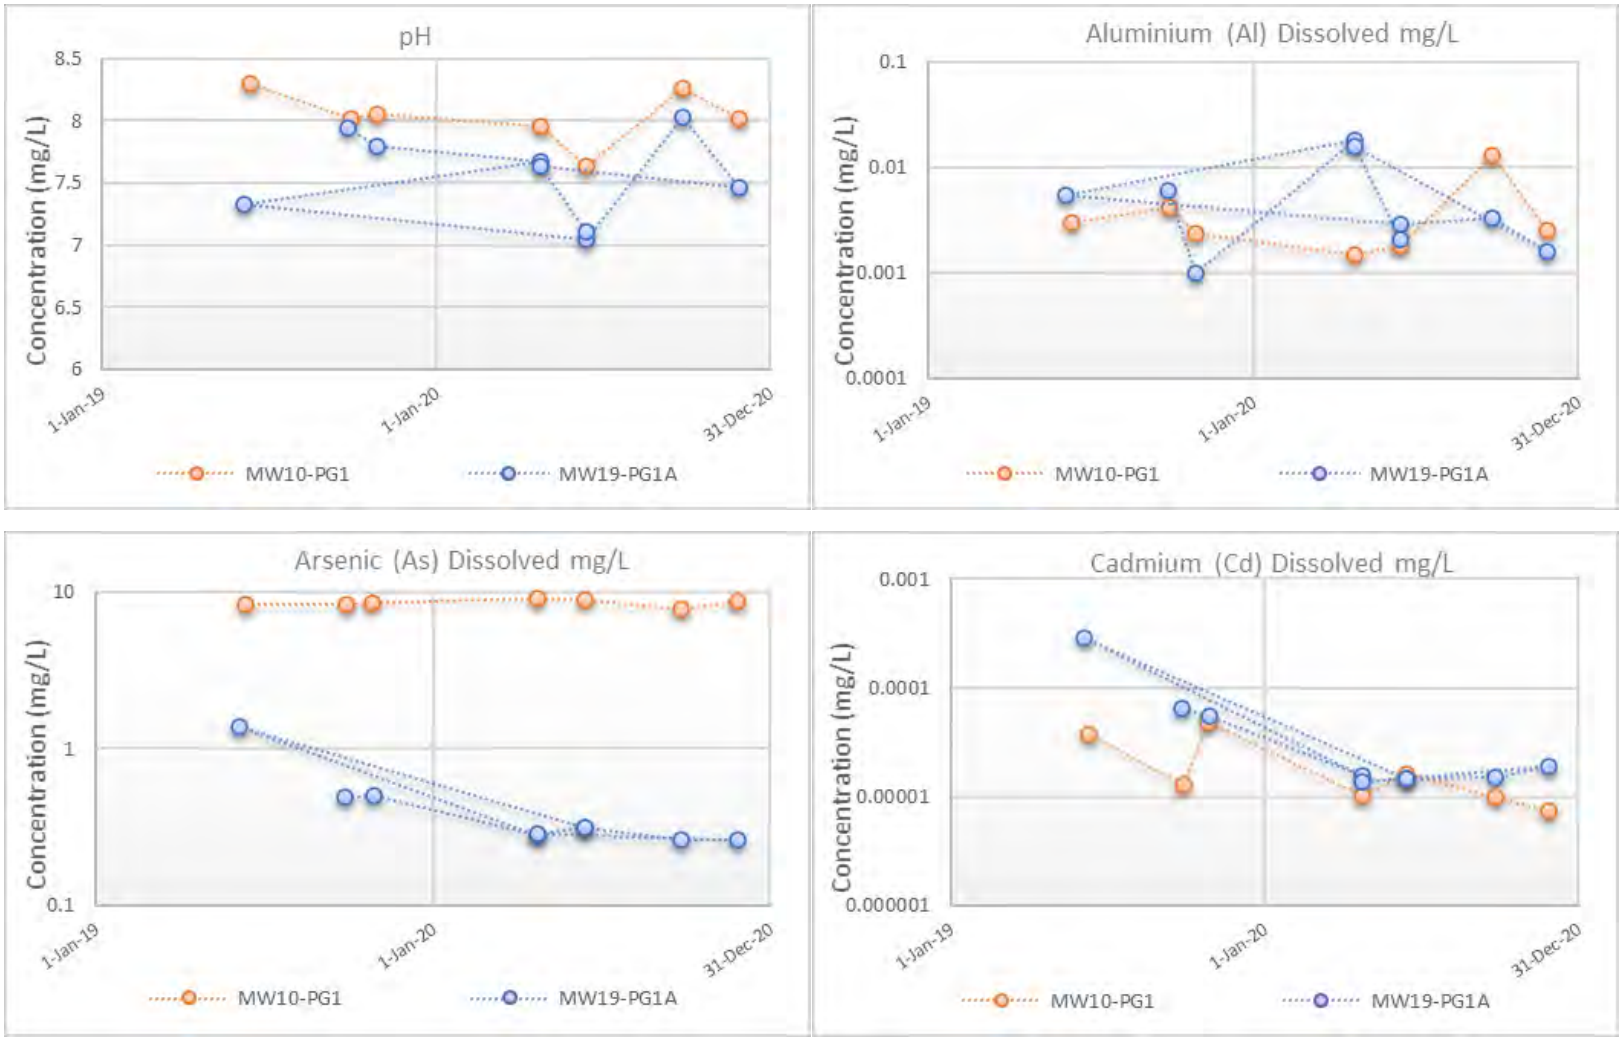

Figure 3.4.6: PG WRSA Area Groundwater Quality Data

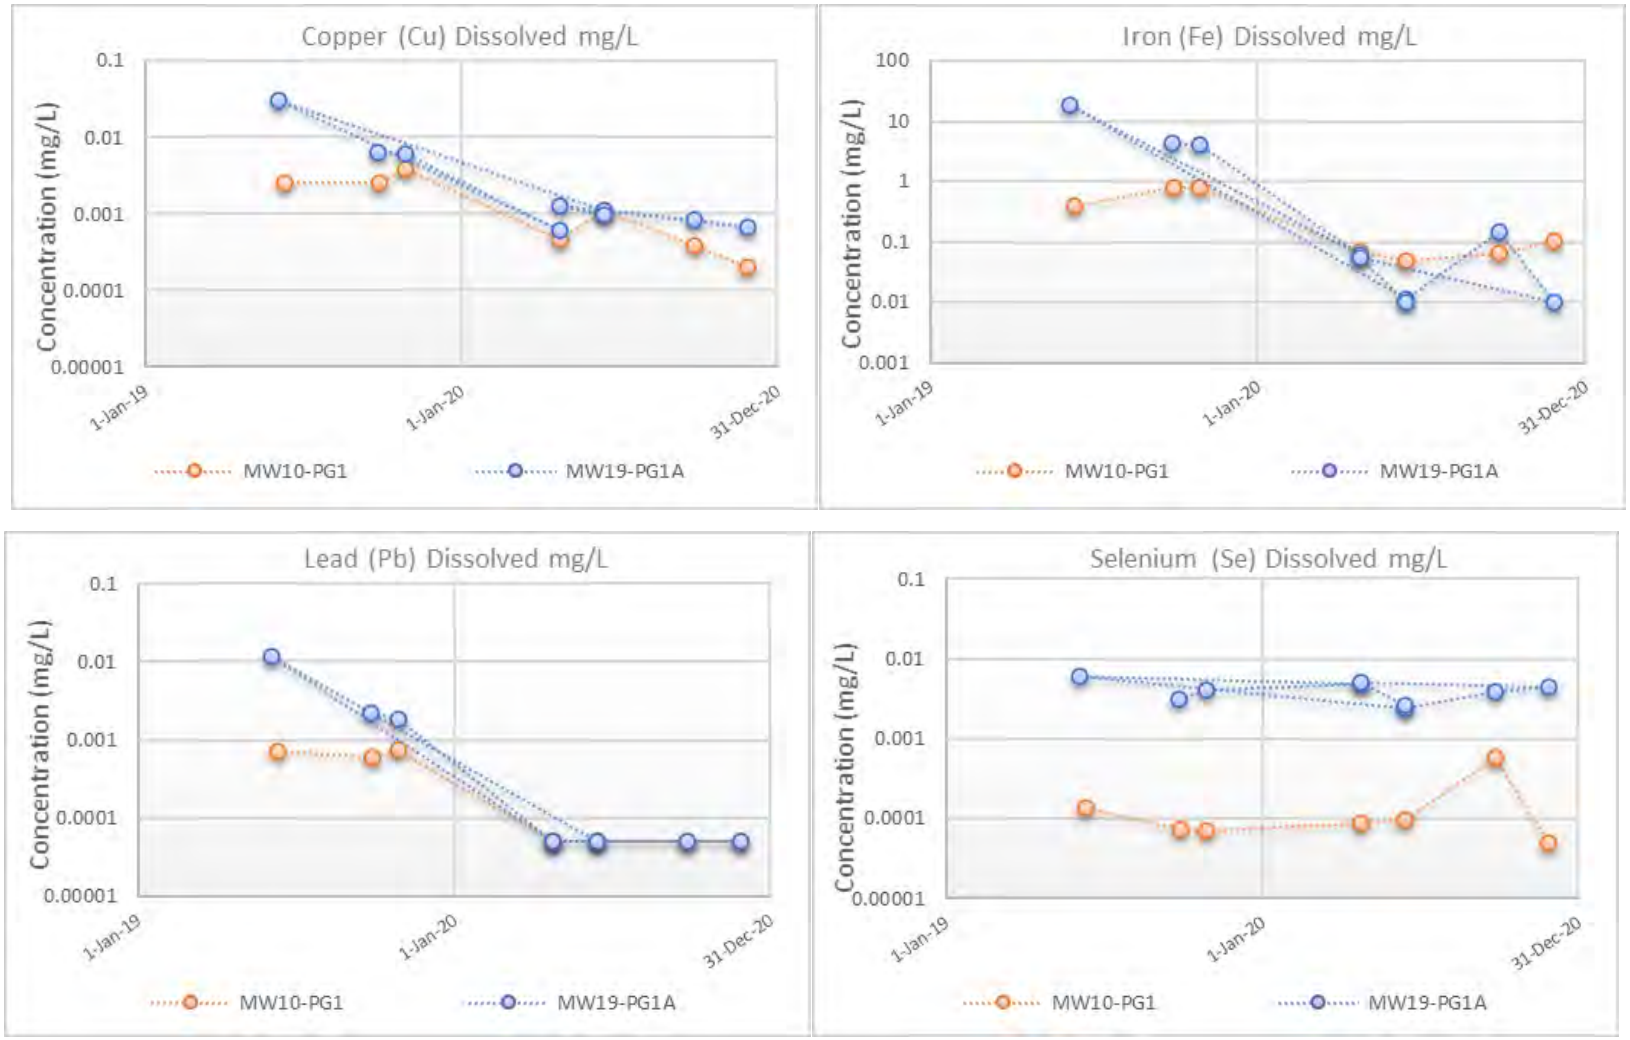

Figure 3.4.7: PG WRSA Area Groundwater Quality Data

Well information has been gathered in the Eagle Pup drainage area at two locations since 2009 (MW96-13A, MW96-15) and an additional station was installed in 2019 (MW19-EPW1A). MW96-9B is located in the Bawn Boy drainage and is considered a background site that is discussed herein with the Eagle Pup sites and has been monitored since 2019.

- pH in the Eagle Pup drainage is neutral to slightly basic, with field measurement being within one order of magnitude of each other. The only exception is MW96-9B which is a background well above the project and is part of the Bawn Boy drainage.
- Aluminum concentrations have remained relatively constant with MW96-13A showing a slight decrease in dissolved concentrations. While MW19-EPW1A shows a slight increase since the well was established in 2019.
- Arsenic concentrations at MW96-15 have displayed a stable range of 0.1 - 0.3 mg/L throughout the dataset.
- Cadmium concentrations for the majority of the samples are within one order of magnitude. MW96-15 shows a greater variability from 2017-2019, but fluctuations have reduced in 2020. MW96-13A shows a slight decrease with result values being below detection limit.
- Copper concentrations measured at MW96-15 experienced fluctuation of up two orders of magnitude from 2017-2019. 2020 sampling results show much less variability and are within one order of magnitude throughout the year. MW96-9B shows a downward trend over time, but only two sampling were collected in 2020 due to issues accessing the site.
- Iron concentrations at MW96-13A have low variability over the three-year monitoring period and MW96-15 has a variability of one order of magnitude from 2009-present.
- Lead concentrations display a historic concentration range close to detection limits for MW96-15 and MW96-13A. MW19-EPW1A and MW96-9B show a decreasing trend from 0.00785 and 0.00373 mg/L in 2019 and closer to detection limit in 2020.
- Selenium concentrations at station MW96-13A have been measured at or near to the detection limit of the time from 2009 to 2020. MW96-15 displayed selenium concentrations close to the detection limit from 2009 to 2014, and have generally remained within an order of magnitude. Concentrations remained near method detection limits for the MW96-9B station and MW19-EPW1A displays concentrations within an order of magnitude to the neighbor stations with a small range.

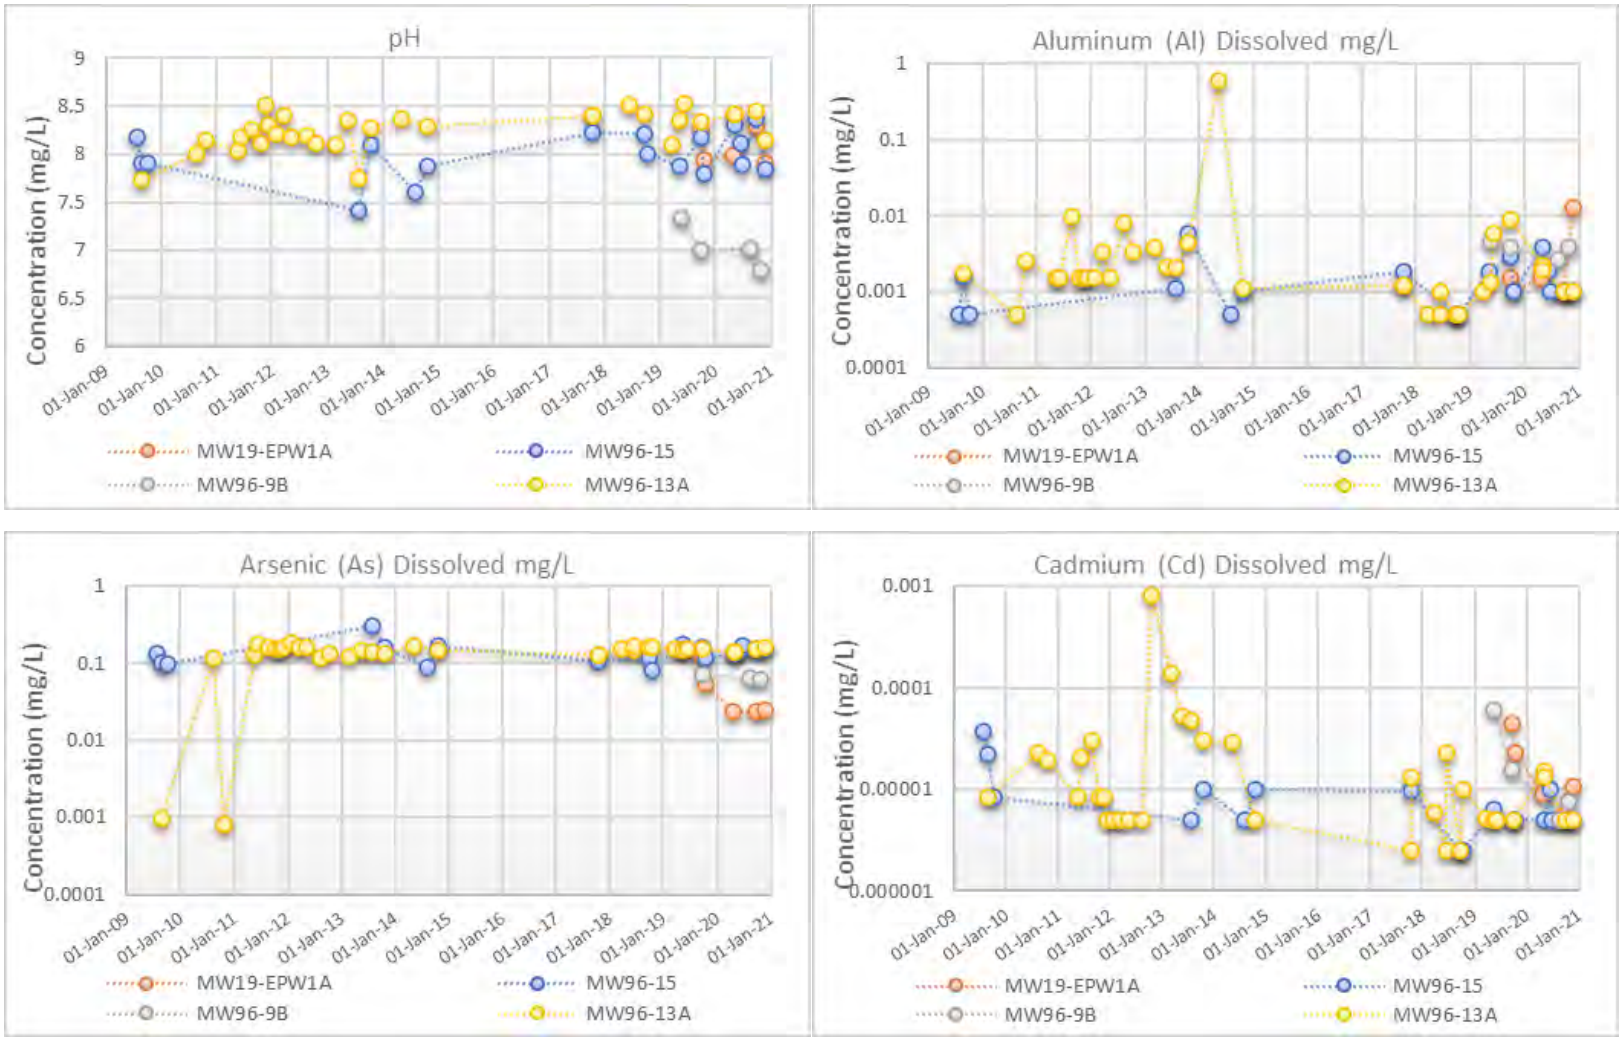

Figure 3.4.8: EP WRSA Area Groundwater Quality Data

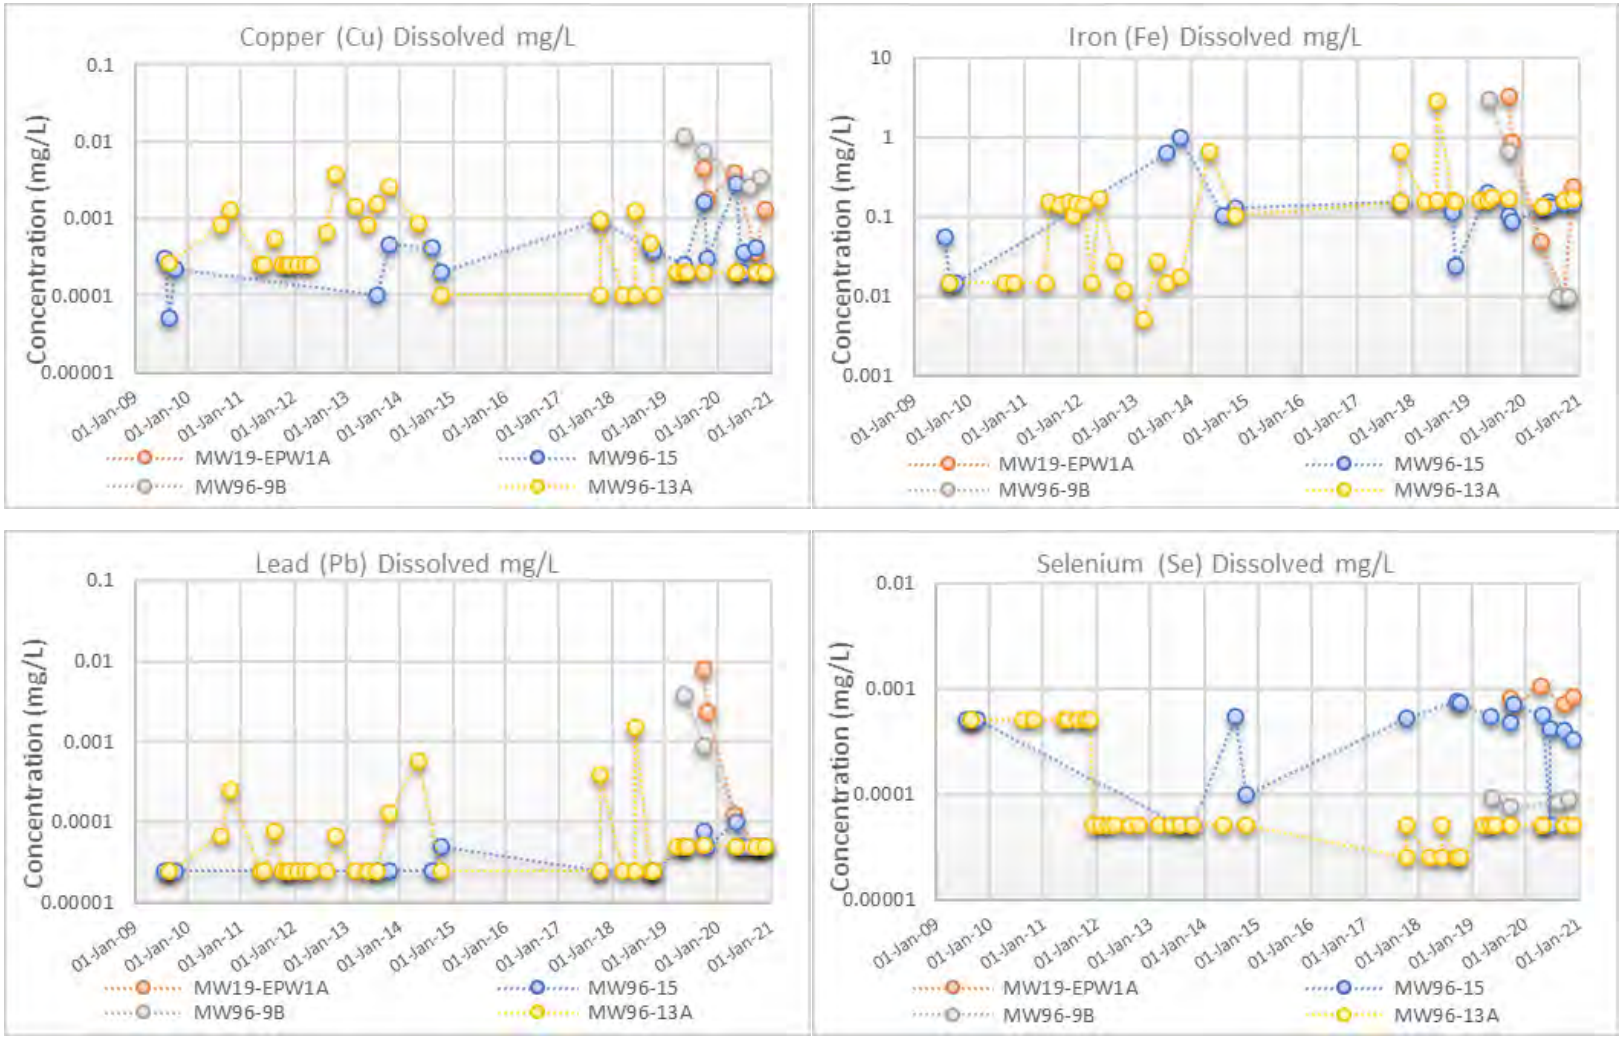

Figure 3.4.9 EP WRSA Area Groundwater Quality Data

3.4.2.1 Groundwater Quality QA/QC

As per the VGC QA/QC program, field samples were collected in addition to the groundwater quality samples and included duplicates (01), field blanks (02), and travel blanks (03) (Table 3.4-3). The British Columbia Field Sampling Manual (Clark 2013) specifies that a relative percent difference (RPD) greater than 20 percent indicates a possible sample contamination. An RPD greater than 50 percent indicates a definite sample integrity problem; however, it is not unusual to find high variability for field duplicates, especially if the water is turbid, such as those typical of groundwater samples. Some duplicates presented in Table 3.4-3 displayed RPDs greater than the criteria of 20% (red highlighted) and 50% (orange highlighted).

Blank samples did not display concentrations that exceeded detection limits.

Table 3.4-3: Groundwater Quality QA/QC 2020

3.4.3 Adaptive Management

3.4.3.1 Groundwater Quantity

2020 represents the first full year of production at the Mine site. Based on the observations of groundwater levels to date, the construction and operation of the mine is likely to have had some effect on groundwater levels within the mine footprint. However, the short period of record for the operation of the mine and highly variable precipitation levels during this time does not provide an ability for strong quantification of effects.

As expected, due to construction of the lined heap leach pad, a decrease in recharge rate within the Ann Gulch catchment was observed and up to a one-meter decline from baseline levels was observed in wells associated with the HLF (i.e., MW10-AG3A, MW10-AG6, MW10-DG6/6R). Further, declines in the lower Dublin Gulch valley aquifer (BH-BGC11-74, MW10-OBS1) likely reflect the capture of groundwater by the LDSP underdrains and the usage of groundwater (from MW10-DG7) for potable water. In contrast, there was no measurable effect on wells outside the mine footprint (i.e., those in Eagle Pup, and the upper basin of Dublin Gulch valley. Further, significant declines (over 5 m) were recorded in BH-BGC-11-73, a tri-nested VWP located above the Eagle Pit. The declines began at the onset of pre-stripping and continued with the deepening of the Eagle pit throughout the year, indicating that some depressurization has occurred.

When comparing groundwater level data collected during the baseline period (up to August 2017) to the last two years since mine construction began and when the mine became operational, the observed downward trends in a few wells adjacent to certain facilities were expected and consistent with dewatering activities in the area of the HLF, Eagle Pit and the LDSP. No adaptive management mitigations were deemed necessary.

3.4.3.2 **Groundwater Quality**

When considering dissolved concentrations for all eight parameters at each station, it seems that some of the wells exhibited higher overall concentrations and higher overall ranges in concentrations than other wells. For example, MW10-PG1 and MW19-DG6RA/B (replacement for MW10-DG6) exhibits relatively high dissolved concentrations of arsenic and iron. MW96-13a and MW10-PG1 exhibit relatively higher pH than the other wells. Nevertheless, there does not appear to be any obvious or consistent spatial connection or temporal association to explain these characteristics, and, there are no discernible changes associated with the 2020 production phase of the operation. All observed increasing or decreasing trends were apparent before construction and operations began. It is expected that there will be seasonal changes to groundwater quality but in an effort to address significant changes to groundwater quality associated with mine production, VGC is in the process of creating thresholds for groundwater quality to help guide adaptive management. VGC acknowledges that adaptive management thresholds still need further development and will endeavor to complete this work for use in 2021.

3.5 Geochemical Monitoring

The geochemical monitoring program continued to provide on-going characterization of rock encountered during the operation of the Project. Whenever possible the geochemical monitoring program is tied to operational activities and the monitoring program has been designed to:

- Assess the level of weathering-driven reaction products and their potential to migrate;
- Verify geochemical predictions made during the mine planning phase;
- Assess the potential for metal leaching and acidic drainage from excavated rock to determine if it is suitable for construction material and;
- Evaluate the effectiveness of measures to prevent and control metal leaching and acidic drainage (if applicable).

3.5.1 Geochemical Barrel Testing

The assessment of water chemistry for leachate through field barrels developed from site waste rock continued throughout 2020. Natural precipitation percolates through the barrels and is captured in collection jugs that are

connected to the bottom of the barrels. Field staff collect samples several times throughout non-freezing conditions and samples are process through an accredited laboratory.

In 2020, based on consideration of previous results, Lorax Environmental provided guidance on a modification to the project design that had been operational since 2012. The modification is intended to help further the understanding of arsenic leaching behavior in a mixed-lithology waste rock facility. The original field barrels created in 2012 were disassembled in June 2020, and two new field barrels were created from their contents (Photo 3.5-1). LX-2020-FB-1 is representative of the composition within the Platinum Gulch WRSA which is mainly composed of metasediments, LX-2020-FB-2 was constructed with granodiorite blended with various other lithologies in proportions representative of the Eagle Pup WRSA (Table 3.5-1).

Table 3.5-1: Breakdown of Field Barrels Samples Re-Purposed for 2020 Kinetic Test Program

	Sample ID (SRK)	Unit	Mass (kg)	Purpose
Barrel 1			150*	Assess arsenic attenuation capacity of MSED unit
Top Layer	DG12-MET-04	Oxide GND	75	
Bottom Layer (LX-2020-FB1)	DG12-MET-01	Oxide MSED	30	
	DG12-MET-02	Fresh MSED	30	
	DG12-MET-03	Oxide/Fresh MSED	30	
Barrel 2			150*	Constrain arsenic leaching behaviour from mixed lithology sample
Composite (LX-2020-FB2)	DG12-MET-01	Oxide MSED	45	
	DG12-MET-02	Fresh MSED	50	
	DG12-MET-04	Oxide GND	25	
	DG12-MET-05	Fresh GND	25	
	DG12-MET-06	Altered GND	5	
	DG12-MET-08	Overburden	15	

Notes:
GND = Granodiorite
MSED = Metasediment
*Sample mass accounts for the removal of a subsample after compositing.

Photo 3.5-1: Cone and quartering technique used to mix materials for barrel reconstruction

3.5.1.1 Eagle Waste Rock Unsaturated Columns

In addition to field barrel tests, off site lab scale unsaturated columns tests were completed to investigate the processes controlling the leachate chemistry of the revised field barrel program in a controlled environment. Subsamples from each barrel were submitted to an external laboratory for testing. The columns were irrigated weekly with 600 ml of deionized water over a 15-week period. Since the materials have already been leached in the field for seven years prior to the column testing the experiment is considered sufficient to produce long-term leaching data.

The geochemistry of field barrel leachates collected during 2020 were used in conjunction with analytical results from previous years, lab based kinetic tests (i.e., humidity cells), scaling factors, and mass and volume of ore and waste rock to inform predictive modeling for seepage chemistry for the WRSAs, ore stockpile and pit walls.

In summary, pH and sulphate concentrations of the re-purposed field barrels showed similar results to previous field barrel tests. pH remained close to neutral and the sulphate levels stabilized around 40 to 60 mg/L for Barrel 1 and Barrel 2. Despite having variable solid-phase arsenic (As) contents, both Barrel 1 and Barrel 2 produced similar As concentrations.

As, Sb, and Se concentrations in field barrel leachates before and after the reconstruction of the SRK kinetic experiment should have comparable concentrations. Sb concentrations showed a relatively narrow range between 0.01 and 0.02 mg/L over the field season. There was an initial selenium spike of 0.0053 mg/L before the stabilizing around 0.0020 mg/L in the last 3 sampling events.

Overall, the initial results from the re-constructed field barrel experiments appear to show that mixed lithology waste rock materials generate more consistent and moderate concentrations of various metals of concern. The results from both the field geochemical barrel and off-site unsaturated columns are discussed in greater detail in the updated geochemical source term model provided as Appendix A to Appendix G.

3.5.2 Material Testing

3.5.2.1 Construction Material Sampling

During this reporting period, there were two construction projects that required borrow or fill material and thus required geochemical analysis to determine if the construction grade rock criteria of the licenses was met. The two projects were the continuation of the PG WRSA rock drain construction and the placement of rip rap material in Ditch B.

All samples analyzed to determine suitable as construction grade material are outlined in Table 3.5-2. Results from samples met the criteria required for construction or fill purposes, with a pH of at least 5.0, an NP:AP ratio of at least 3:1, and a total sulphide sulphur content of no greater than 0.3%. Samples ranged in pH from 6.88 to 7.85, with a median of 7.41, with Sulphur content ranging from 0.02% to 0.1% and a median of 0.006 (Table 3.5-2). In all cases, the NP:AP ratio was greater than 3.

Table 3.5-2: 2020 Construction Rock Characterization Summary

Sample ID	ALS ID	Date Sampled	Paste pH	Sulfur (%)	NP:AP Ratio
Construction Testing					
E00074984	VA20A6826	2020-05-20	7.05	0.07	10:0.3 (33.3)
E00074936	VA20B0775	2020-07-17	7.58	0.07	7:2.2 (3.18)
F00057971	VA20C4284	2020-12-12	7.48	0.04	10:1.3 (7.70)
F00057972	VA20C4284	2020-12-12	7.85	0.10	11:3.1 (3.55)
F00057973	VA20C4284	2020-12-12	7.64	0.06	12:1.9 (6.32)
F00057974	VA20C4284	2020-12-12	6.88	0.02	3:0.6 (5.0)

3.5.2.2 Waste Rock Characterization

Additional waste rock characterization is conducted as further confirmation of the geochemical composition of waste materials placed in the WRSAs. The program includes quarterly grab samples representing blasted waste and annual waste sampling analysis of grab samples per 1 million tonnes waste rock representing placed material in the WRSAs. Samples were taken from various benches and sample locations were mapped for future analyses. As outlined in the EMSAMP the Sobek Method for Modified Acid Base Accounting was used to analyze each grab sample from an accredited laboratory.

As a preliminary check of the material characteristics, geochemical results were compared to the construction grade use criteria (Table 3.5-3) and the majority of sample results meet the criteria required for construction or fill purposes, with a pH of at least 5.0, an NP:AP ratio of at least 3:1, and a total sulphide sulfur content of no greater than 0.3%. All sample met criteria for pH, two samples collected on August 10, 2020 had slightly higher sulfur content than the above the outlined 0.3%, and six NP:AP ratios were below the 3:1 ratio. These results confirm pre-mining assumptions that the majority of the waste rock and ore from this site has a low sulphur content (typically less than 0.5%), and is predominantly non-acid generating.

Table 3.5-3: 2020 Waste Rock Characterization Summary

Sample ID	ALS ID	Date Sampled	Paste pH	Sulfur (%)	NP:AP Ratio
Quarterly Sample					
F00057954	VA20A9008	2020-03-24	7.42	0.12	2:1 (2.0)

3.5.2.3 **Blast Hole Chip Sampling**

Geochemical analysis of pulp splits from blast hole chip cuttings from each pattern on every bench in the Eagle open pit is undertaken. The current program for sampling and tracking blast hole data is being refined and updates will be presented in the future reports.

Currently, blast hole sample results are geospatially referenced to the block model (See Figure 3.5-1 for example) and a statistical analysis was undertaken based on the sample results and the volume of each lithology in the blasted bench (Table 3.5-4).

Table 3.5-4: 2020 Blast Hole Sampling Results Summary

Bench	Arsenic (ppm)	Sulfur (%)	Total Inorganic Carbon (%)	Total Tonnage per bench to date (tonnes)
1195	226.95	0.03	0.51	1,633,736

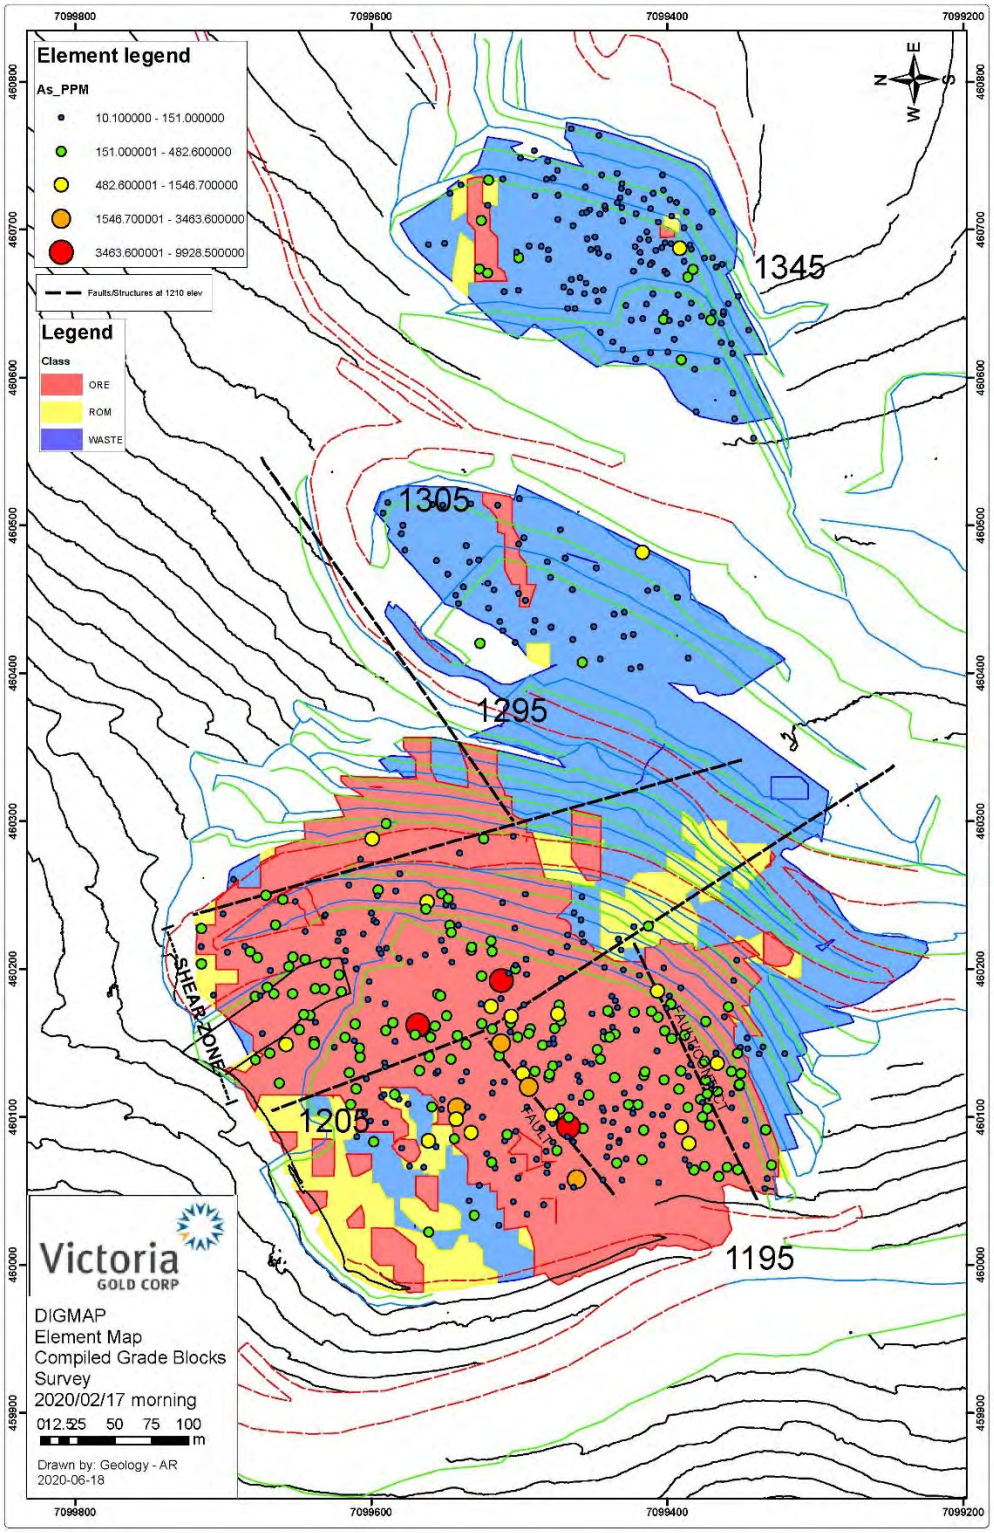

Figure 3.5-1: Element-Grade Blocks for As and Material Destination/Characterization

3.6 Aquatic Environment

Stream sediment, benthic macroinvertebrate, and water quality programs have historically been performed concurrently to support a more robust characterization of the existing conditions. The stream sediment and benthic invertebrate sampling is required on biennial basis (i.e., once every 2 years) under the WUL. The next sampling is scheduled for 2021, since previous sampling was conducted in 2019.

On April 20, 2019 the mine became subject to *Metal and Diamond Mining Effluent Regulations (*MDMER) and as a result required an Environmental Effects Monitoring (EEM) program to be developed and approved under the MDMER. An EEM Study Design was submitted to Environment and Climate Change Canada (ECCC) on April 20, 2020 which was subsequently approved by ECCC on December 11, 2020. This program requires a fisheries assessment in the second quarter (Q2) of 2021, according to the methods and timing detailed in the Study Design (Appendix J1). As stated in the EMSAMP, the aquatic environment monitoring program for the Project will now conform to the EEM study design and the scope of the program under the EMSAMP is now considered to be the same as the EEM Study. As required by QZ14-041-1, the results obtained under the EEM study will become part of the material submitted in future WUL reports as they become available.

3.7 Metal and Diamond Mining Effluent Regulations Monitoring Program

The MDMER requires monitoring and reporting of discharged effluent volume and quality to ECCC. Details of registered Final Discharge Points (FDPs) and required monitoring results are submitted on a quarterly and annual basis to ECCC through the online electronic Mine Effluent Reporting System (MERS) and the Environmental Effects Monitoring Reporter (EEMR).

The MDMER requires effluent monitoring and sampling at FDPs if discharge occurs. Deleterious substance samples are collected at least 24 hours apart and not more than 7 days apart if discharge is occurring. Effluent Characterization, and Reference and Exposure Water Quality sample are collected on a quarterly basis if discharge is occurring. Acute lethality tests are performed on a monthly basis if discharge occurs, while sublethal testing occurs on an annual basis if 30 days or less of discharge occurs.

Discharge from the VGC FDPs in 2020 met Schedule 4 deleterious substance criteria with the exception of TSS, which exceeded schedule 4 criteria for grab and monthly mean concentrations, at FDP#5 during the discharge event in April 2020. Details regarding this discharge event are provided in section 3.2.

Water from the HLFUMV FDP was captured and recirculated back to the Events Pond. No water was discharged from the Events Pond FDP Emergency spillway.

The Annual Effluent Monitoring Program results are presented in Appendix J2.

As discussed in section 3.6, an EEM Study Design was submitted to ECCC on April 20, 2020 which was subsequently approved by ECCC on December 11, 2020 (Appendix J1) A final schedule of the biological monitoring program will be provided to the ECCC Coordinator prior to commencement of field activities in the spring of 2021.

3.8 Meteorology and Air Quality Monitoring

3.8.1 Climate Monitoring

Climate monitoring continued at the Project throughout 2020 with two onsite climate stations; the Potato Hills station, a Campbell Scientific CR1000 datalogger (1,420 meters above sea level (masl)), and the Camp station,

a Campbell Scientific CR800 datalogger (782 masl) (Table 3.8-1, and Figure 3.8-1). Both stations measure temperature, rainfall, wind speed and direction, relative humidity, barometric pressure and solar radiation at 15-minute intervals.

Table 3.8-1: Project Climate Station Locations

Station	Elevation (masl)	Zone	Coordinates		Site Type
			North	East	
Potato Hills	1,420	8V	7,100,800	463,550	Automated
Camp	782	8V	7,101,000	458,200	Automated

The original Potato Hills climate station (ONSET Hobo weather station) was replaced with the Campbell Scientific unit on March 13, 2020. The Camp and Potato Hill stations received annual general maintenance and replacement of the original snowfall monitoring equipment with a Geonor all-weather precipitation monitor.

The Potato Hills station experienced repeated failures in 2020 associated with connectivity, sensor and stable power issues. Due to mine site and Yukon travel restrictions associated with the COVID-19 pandemic, the offsite specialists required for resolution to the barometric pressure sensor were unavailable and the sensor continues to provide erroneous values.

Snow course surveys as considered in the EMSAMP were completed in 2020 at Potato Hills, the Camp station and within the HLF catchment.

The data collected during 2020 was used in the preparation of an updated climate data report and is provided as Appendix K

3.8.2 Air Quality Monitoring

The ambient air quality monitoring program for the Project employees multiple monitoring methods at various locations around the site. The methods/equipment utilized are:

- Beta-Attenuation Particulate Monitors (EBAM) for the collection of continuous active total suspended particulate matter (TSP), particulate matter less than 10 µm (PM_{10}), and particulate matter less than 2.5 µm ($PM_{2.5}$);
- Dustfall samplers for the passive collection of dust for analysis of total particulates and metals;
- Passive air sampling systems (PASS) for the collection of samples for analysis of nitrogen dioxide (NO_2), sulphur dioxide (SO_2), and ammonia (NH_3); and,
- Active high-volume flow monitoring for TSP and metal concentrations.

Table 3.8-2: Project Air Quality and Dustfall Monitoring Locations

Monitoring Station	Station Status	Dustfall Canister	Coordinates (Zone 8N)		Location
			UTM N	UTM E	
AQ1	Active	D1	7,100,818	463,559	Exploration trail near Potato Hills weather station
AQ2B	Active	D2B	7,100,976	458,254	Near the Camp Climate station and water quality station W27
AQ3	Active	D3	7,099,088	460,583	Above Eagle Pit and PG WRSA
AQ4	*Inactive*	*D4*	*7,097,951*	*458,436*	*Upstream of Haggart Creek Road (HCR) crossing of Haggart Creek (KM 42)*

Monitoring Station	Station Status	Dustfall Canister	Coordinates (Zone 8N)		Location
			UTM N	UTM E	
AQ4B	Active	D4B	7,097,734	458,290	Rex Road near KM 42 HCR, west side of HCR (previously labelled AQ5/D5 up to June 30, 2020)
AQ5	*Inactive*	*D5*	*7,097,734*	*458,290*	*Rex Road near KM 42 HCR,*
AQ5B	Active	D5B	7,095,942	457,864	Confluence of Lynx Creek and Haggart Creek (near W5) (established July 1, 2020)
EBAM	Active	N/A	7,101,021	458,237	Near Camp station and south of Ditch C

In support of the ambient air quality monitoring program, a visual monitoring program is also employed to identify areas where fugitive dust emissions from roadways, crushing facilities, construction areas, and transfer and conveying infrastructure for ore were prevalent. Fugitive dust events observed during the reporting period were generally minor and were addressed through the application of water in heavy traffic areas.

3.8.2.1 TSP, $PM_{2.5}$ and PM_{10}

Three Beta-Attenuation Particulate Monitors (EBAMs) are installed east of the camp. Routine measurements are taken on 15-minute intervals for Total Suspended Particulate (TSP), Fine Particulate Matter ($PM_{2.5}$) and Coarse Particulate Matter (PM_{10}). The EBAM system includes real time data transmission that can be monitored remotely with daily summaries automatically generated by the associated software platform. Site personnel complete routine checks and monthly maintenance. Appendix L provides minimum, maximum, and mean daily values (24hr).

Daily recorded results are compared to the Yukon Ambient Air Quality Standards (YAAQS) in Table 3.8-3. Annual averages are calculated from January until December 31, 2020. All measured air quality particulates were below the annual average outlined in the current YAAQS. It should be noted that the 2019 Annual WUL/QML report and the VGC Environmental Characterization Report 2020 inadvertently referenced an out-of-date YAAQS, thus the results from 2019 are also presented below and compared against the updated standards in Table 3.8-4. In 2019, there were two occurrences of TSP exceeding the 24hr standard, which occurred in May and June. $PM_{2.5}$ results exceeded the 24hr YAAQS 16 times, between the period of May to September. PM_{10} results exceeded the 24hr YAAQS 10 times, between the period of May to September. The surrounding Project area experienced a significant fire season in summer 2019 which may have contributed to the elevated concentrations measured. In 2020, no exceedances to the YAAQS were measured on the Project.

Table 3.8-3: TSP, $PM_{2.5}$ and PM_{10} Monitoring Results – 2020 and 2019

Year	Parameter	Annual / 24hr YAAQS (µg/m³)	Results (Annual / 24hr)			No. of Exceedances[1]
			Min	Max	Mean	
2020	TSP	60 / 120	-0.6 / -0.6	17.6 / 17.6	2.1 / 1.7	0
	$PM_{2.5}$	8.8 / 27	-0.6 / -0.6	17.0 / 17.0	1.6 / 1.3	0
	PM_{10}	* / 50	-0.6 / -0.6	30.2 / 30.2	6.1 / 5.1	0
2019	TSP	60 / 120	-0.7 / -0.7	172.3 / 172.3	5.0 / 4.7	2
	$PM_{2.5}$	8.8 / 27	-0.7 / -0.7	172.3 / 172.3	5.1 / 4.6	16
	PM_{10}	* / 50	0.4 / 0.4	196.2 / 196.2	12.4 / 11.3	10

NOTES:
* No Annual Ambient Air Quality Objectives outlined in the Yukon Standard.
1 All 2019 exceedances documented above are for 24hr standards

3.8.2.2 **Dustfall**

Dustfall stations are located around the Project site adjacent to the five permanent vegetation plots described in Section 3.9.1. Dustfall container samples are collected and submitted for total particulate laboratory analysis on a monthly basis (and metals analysis on a quarterly basis for the 2021 and onwards program).

As the dustfall station monitoring (and PASS systems discussed below) have evolved, the location of the stations have been optimized to better to meet the intent of the monitoring program. The D4 station adjacent to the access road at km 42 was decommissioned and relocated to the D5 station on the Rex exploration road and renamed D4B. The D5 station was decommissioned and relocated to a new location situated adjacent to the W5 water quality sampling site at the Lynx/ Haggart creek confluence. The new station is called D5B. Relocation of sites was required to align with locations documented in the Project Air Emissions Permit #60-060 and Air Quality Monitoring Plan.

The 2020 dustfall data is provided in Table 3.8-4, which show monthly measured total values compared against the monthly standard (7.0 g/m2). Monthly means were processed into an annual g/m2 values for comparison against the Project annual standard (4.6 g/m2). All monitored dustfall stations met monthly and annual guidelines with the exception of monthly exceedances at D3 from March to May which contributed to a minor exceedance of the annual standard at the monitoring location. The D3 station is located immediately above the PG WRSA and the 1370 masl PG WRSA bench was receiving waste rock from mining operations during the periods in which the monthly exceedances were experienced. Values returned to below guidelines following the active construction of the 1370 masl bench. One exceedance at D4 also occurred in May however values readily returned to below guidelines in following months. Of note the naming of two stations changed during the 2020 reporting period as described above.

Table 3.8-4: 30-Day Total and Annual Dustfall Monitoring Results – 2020

Station	Sample Month	Total Insoluble Dustfall ($mg/dm^2.day$)	Days Deployed	$mg/dm^2.day$ (Monthly total)	g/m^2
D1	January	<0.10	32	< MDL	0.32
	February	Cracked – Sample lost			
	March	0.31	40	12.4	1.2
	April	0.32	21	6.72	0.7

3.8.2.3 SO_2, NO_2 and NH_3

A network of five Passive Air Sampling System (PASS) stations were launched on January 1, 2020. The PASS units monitor for trace levels of SO_2, NO_2 and NH_3 in ambient air based on a 30-day average. The results for 2020 are provided below in Table 3.8-5. Results were either below instrument detection limits or well below the highest similar Yukon Ambient Air Quality Standards. While the PASS results are reported in (parts per billion [ppb]), the Yukon Standards (ug/m^3) can be converted to (parts per billion [ppb]), for comparison. The results for NO_2 and SO_2 at PASS monitoring stations were compiled across months and averaged for comparisons to annual standards in ppb. PASS station annual averages for NO_2 results fell between 0.41 and 1.68 ppb while annual averages for SO_2 results fell between 0.1 and 0.12. The annual averages for all monitored stations were well below Project air quality guidelines.

NOTES:
NR No results due to equipment breakage.
1 AQ2 station was moved slightly due to construction activities. AQ2B is still considered representative of the location AQ2.
2 AQ4 station decommissioned in June 2020 as it was inadvertently installed at the wrong location.
3 AQ4B station was identified as AQ5 from January to June 2020.
4 AQ5B station added July 2020 as background site at the confluence of Lynx and Haggart Creek.

3.8.2.4 **Metals**

An active Partisol™ 2000*i* Air Sampler was installed adjacent to the EBAM air quality monitoring location on May 21, 2020 to support quantified TSP and metals monitoring. Particulate matter sampling is conducted over a 24-hour period every six days according to the Project Air Emissions permit #60-060 (monitoring station AQ2) and the National Air Pollution Surveillance (NAPS) program schedule.

To date, the Partisol™ 2000*i* Air Sampler has only been used for TSP monitoring and the metals analysis component of this monitoring method will be utilized for the 2021 program.

Climate and Air Quality Monitoring Locations - 2020

3.9 Terrestrial

3.9.1 Vegetation Monitoring Program

As outlined in the EMSAMP, four vegetation plots were established in 2018 to monitor changes in vegetation during the life of the Project. The vegetation monitoring plots consist of two sites in the Subalpine Zone with elevations greater than 1225 masl and two sites at lower elevation in the Forested Zone. These vegetation plots are monitored once a year during the growing season to provide data to determine if there are potential changes associated with metals in and on plant tissue due to Project activities.

In 2020, due to snow clearing activities, Site D1 was relocated approximately 40 m south of the original site, and re-established as D1B. The location and description of the vegetation monitoring sites are presented in Table 3.9-1. The coordinates of each site represent the center point of that site. Four corner points were then established in cardinal directions 10 meters from the center.

Monitoring and sampling of sites was conducted August 8 to 10, 2020.

Table 3.9-1: Location and Description of Vegetation Monitoring Sites

Sites #	NAD 83 Zone 8N		Aspect	Elevation (m)	Site Description
	Easting	Northing			
D1B	463530	7100794	Level	1437	Potato Hills near climate station, 40 m south of original site D1.
D2B	458256	7100972	West	791	Upslope of the air quality station and the camp climate station, south side of Eagle Creek within influence. Established in 2019 approximately 70 m from original site D2.
D3	460598	7099079	South west	1356	Top of Eagle Pup/Platinum Gulch drainages near the over-the-top road.
D4B	458279	7097731	East	751	On the west side of the access road south of the Haggart Creek culverts and the power line. Established in 2019 approximately 300 m south of the original site D4.
D5	457857	7095962	level	720	Near surface water quality site W5, Haggart Creek upstream of Lynx Creek.

Vegetation samples were collected for species found within the plots at each of the five sites. Table 3.9-2 lists the species and sites where the sample biomass was large enough to run analyses. Samples were analyzed for a suite of 34 metals, with a focus on metals related to potential emissions related to the gold recovery process (arsenic, cadmium, chromium, lead, and mercury). The metal concentrations were averaged per vegetation type for the number of samples collected at each site. The results of the analysis for the selected metals are presented in Table 3.9-2.

Table 3.9-2: Results of 2020 Vegetation Monitoring Metals Analysis

Plot	Tissue Type	No. of Samples	Selected Metal Concentrations (mg/kg) per Tissue Type				
			Arsenic	Cadmium	Chromium	Lead	Mercury

D5	Poplar Twigs	2	0.303	1.382	0.071	0.094	ND
Toxicity thresholds for beef cattle (Puls, 1994):			>10	50 - 500	>40	>100	N/A

NOTES:

Source Laberge 2020 (Appendix M); ND=not detected, below analysis detection limits.

Although foliar tissue samples have been collected for three years at the sites (with the exception of D5), not all sites have been in consistent locations. Compared to the 2019 reporting year, D1B (D1) and D3 displayed some increases in select metals, while D2B and D4B showed metals concentrations that were generally similar or less than previous years.

There was no visible sign of stress in any of the vegetation in the plots. Full results of the 2020 Vegetation Monitoring program can be found in Appendix M.

3.9.2 Invasive Plants Management Program

The Invasive Plant Management Program is used to develop strategies that help prevent the introduction and spread of invasive species and noxious weeds on the Project site. VGC has taken measures that help reduce the likelihood of plant infestations from occurring. If any significant infestations are identified they will be actively managed, including removals within mine operations areas. This section provides a summary of monitoring and measures taken on site to control invasive plants.

The Yukon Invasive Species Council (YISC) defines invasive species as:

"…an organism (plant, animal, fungus, or bacterium) that is introduced and has effects on our economy, our environment, or our health. Not all introduced species are invasive. The term "invasive" is reserved for the

most aggressive species that reproduce rapidly and cause major changes to the areas where they become established."

The YISC has documented approximately 160 introduced plant species in the Yukon, with 18 species as highly invasive based on abundance, aggressiveness, and persistence, detailed in Table 3.9-3 (YISC 2020). This categorization is used as a guide by VGC in prioritizing its management efforts to control invasive plants. Management activities will focus on the highest ranked plant species for invasiveness; however, activities also include other species if they become established on the Project footprint.

Table 3.9-3: Highly Invasive Plant Species Documented in Yukon

Family	Genus	Species	Common Name	Abundance	Persistence
Grass	Agropyron	cristatum	Crested Wheat Grass	C	1
Grass	Bromus	inermis	Smooth Brome	C	1
Sunflower	Centaurea	stoebe	Spotted Knapweed	X	3
Sunflower	Cirsium	arvense	Creeping (Canada) Thistle	R	2
Sunflower	Crepis	tectorum	Narrow-leaved Hawksbeard	C	1
Euphorbia	Euphorbia	esula	Leafy Spurge	R	2
Sunflower	Hieracium	caespitosum	Field Hawkweed	R	2
Sunflower	Leucanthemum	vulgare	Oxeye daisy	R	1
Grass	Leymus	angustus	Narrow-leaved (Altai) Lyme Grass	R	2
Figwort	Linaria	dalmatica	Dalmatian Toadflax	X	3
Figwort	Linaria	vulgaris	Butter-and-Eggs	C	1
Pea	Medicago	falcata	Lucerne	C	1
Pea	Melilotus	alba	White Sweetclover	C	1
Pea	Melilotus	officinalis	Yellow Sweetclover	C	1
Sunflower	Sonchus	arvensis ssp. uliginosus	Field Sow-thistle	C	1
Sunflower	Tanacetum	vulgare	Common Tansy	U	2
Sunflower	Tripleurospermum	inodoratum	Scentless Chamomile	R	1
Pea	Vicia	cracca	Tufted Vetch	C	2

NOTES:
General Abundance: C – common widespread established, R – rare known from only 1 or two localities, X – possibly not persistent, U – unknown. Persistence: 1 – widespread, 2 – local, 3 – not persistent.

3.9.2.1 **Prevention**

The main objective in managing invasive plant infestations on the Project footprint is to conduct mining activities in a manner that prevents the introduction or spread of invasive plants. Prevention is the most effective means of controlling invasive species, and helps to avoid significant long-term economic, environmental, and social costs (YISC, 2020). Invasive species are opportunistic in nature, taking advantage of a lack of competition from other

species. Thus, in natural conditions with biodiversity and a dense population of native species, invasive species are less likely to establish.

VGC's ongoing prevention strategies include the following:

- Minimizing soil disturbance during construction and operations to limit availability of exposed soils to invasive plant seeding.
- Establishing a vegetation cover as soon as possible after ground disturbance, by seeding areas that will be inactive with interim reclamation indigenous seed mixtures.
- Minimizing invasive plant seed introduction to disturbed sites by:
    - Keeping equipment clean on site and ensuring contractors are bringing clean equipment into the Project site.
    - Keeping equipment laydowns and storage areas free of invasive plants.
    - Retaining vegetated areas along the site access and haul roads during maintenance where possible.

During the period considered in this report, vegetation removal and soil disturbance was minimized to the extent practicable by adhering closely to construction plans, and leaving vegetation strips where possible. When clearing was required, the humus layer and vegetation root mat was retained and stored in predetermined soil stockpile areas.

A combination of revegetation and bioengineering of exposed slopes was conducted in the fall of 2020 to control runoff, stabilize slopes, and prevent establishment of invasive species. Revegetation focused on seeding native plant species that were selected based upon the baseline vegetation survey inventory, suitability for site characteristics and commercial availability (Appendix N). Bioengineering techniques also sourced local willow (*Salix*) species from the Project site. These efforts are detailed in Section 6.

Contractors on site were expected to keep their equipment clean and in good working order, particularly prior to mobilizing to site. The majority of the contractor-maintained equipment was sourced from within the Yukon, thus reducing the risk of invasive transmission across provincial and territorial boundaries

3.9.2.2 **Control**

During the report period of 2020, no control or removal methods was required to manage invasive plants on the Project site.

3.9.2.3 **Assessment and Monitoring**

During the August 2020 vegetation monitoring program, no invasive plant species were identified at any of the vegetation plots, nor any were identified on route to the plots (Appendix M).

Disturbed lands in the Project footprint will continue to be monitored to detect the establishment of invasive plant and noxious weed species on both revegetated and unvegetated areas. The surveys were conducted in 2020 and are planned for either the late spring or early summer of 2021 so that plant control measures can be undertaken prior to seed dispersal.

In the event that invasive plant populations do become established on the mine site or associated disturbances, VGC will utilize one or a combination of the listed methods to control these infestations. VGC will undertake control efforts on species that are listed for Yukon as noxious weeds or invasive plant species that pose a threat to humans, animals or ecosystems.

3.9.3 Soils

The soils monitoring program was designed to provide data to assess whether there are changes to metal and nutrient levels in soils adjacent to the mine as a result of dust deposition occurring during Project activities. Soil sampling locations were picked in conjunction with the vegetation monitoring program (see Table 3.9-1).

The most recent Canadian Council of Ministers of the Environment (CCME) guidelines, which include new guidelines from 2018, and the Yukon Contaminated Sites Regulations for agriculture and parklands were tabulated and compared to the concentrations found in the soils.

The soil sample analysis indicates that, consistent with prior characterization programs, the soils at the Project are relatively nutrient poor. The soil samples were analyzed for pH and a suite of 36 metals (Table 3.9-4). The soils at all sites were slightly acidic, ranging from 4.59 to 6.60. Of the 36 elements analyzed, boron, sulphur and tin were not detected. Consistent with prior characterization programs, arsenic concentrations displayed higher values than the recommended guidelines at all sample sites. This is most likely due to the naturally high arsenic found in the region, documented in previous years of the monitoring program (Laberge 2018, Laberge 2019) and in previous studies (Stantec 2011a). Arsenic is often associated with gold bearing anomalies in the region and these concentrations reflect the natural mineralization of the Project area.

Table 3.9-4: Results of Soil monitoring Compared to CCME and Yukon CSR

Element	CCME (mg/kg)		Yukon CSR (mg/kg)		D1	D2B	D3	D4B	D5

The full results of the soil monitoring program can be found in Appendix M.

3.9.4 Wildlife

Wildlife mitigation measures are implemented through mandatory Project site orientation, traffic control policies, and training and implementation of the Project's management plans including bear awareness and the wildlife observation reporting program.

Personnel record wildlife sightings and encounters on wildlife observation cards available at a variety of locations throughout the site. The use of wildlife observation cards is a tool used to track and evaluate the frequency of animal encounters; these cards help monitor species at risk, nuisance wildlife and to notify site personnel of potentially dangerous animals around work areas. Observations of wildlife and indicators of wildlife such as tracks, scat or auditory observations are also recorded (even in the absence of visual confirmation). Wildlife observations recorded through 2020 are compiled on a quarterly basis and submitted to the Department of Energy, Mines and Resources in accordance with QML-0011.

3.9.4.1 **Nesting Songbird Surveys**

Nesting songbird bird surveys were completed for clearing activities that took place within the breeding bird window (May 1-late summer). A total of ten nesting songbird pre-clearing surveys took place from May to July 2020; any nests identified were either outside of the active work zone or deemed inactive nests through follow up monitoring procedures.

3.9.4.2 **Pre-clearing Wildlife and Wildlife Habitat Surveys**

Outside of the nesting songbird breeding window for the Project area, pre-clearing survey are completed for wildlife habitat features for potential salvage if possible (mineral licks, dens, nest trees, snags, rocky outcrops, small ponds/seepages). A total of three wildlife habitat pre-clearing surveys took place during December of 2020.

3.9.4.3 **Wildlife Incidents**

Throughout 2020 there were observations of several animals in close proximity to the camp and areas of mining activity. The Environmental Department reported several incidences of nuisance bears to the Mayo Conservation Officer in May and August. The nuisance animals were able to be deterred with on-site deterrents and no relocation or lethal actions were necessary.

The Environmental Department provides ongoing education for site personnel through site-wide bulletins, collaborations with department heads, and presentations in toolbox meetings.

3.9.4.4 **Annual Moose Survey**

A late-winter moose distribution survey was conducted to monitor Project effects on moose distribution. The survey included a 10 km radius around the Project area and Haggart Creek and South McQuesten access roads. The survey was completed by VGC Employees, Environmental Dynamics Inc., and a FNNND representative. The annual moose survey report is provided in Appendix O.

Three surveys were completed during pre-construction and are considered as a baseline (2011-2013). Surveys were conducted in 2018 and 2019, representing the construction phase. A survey was completed in 2020 and represented the operations phase. Moving forward, the frequency of subsequent aerial surveys will be reassessed in collaboration with the Yukon Government Northern Tutchone Regional Biologist.

The 2020 aerial survey was conducted from March 5 to 6, 2020. The primary objective was to document the distribution and abundance of moose during the late-winter season. Survey data is used to inform adaptive management strategies designed to mitigate any effects from the Project on moose in the region. The conditions in 2020 were ideal (consistent, winds calm to light, bright light clear skies), as detailed in (Table 3.9-5).

Table 3.9-5: Survey Conditions During Late-Winter Moose distribution Survey

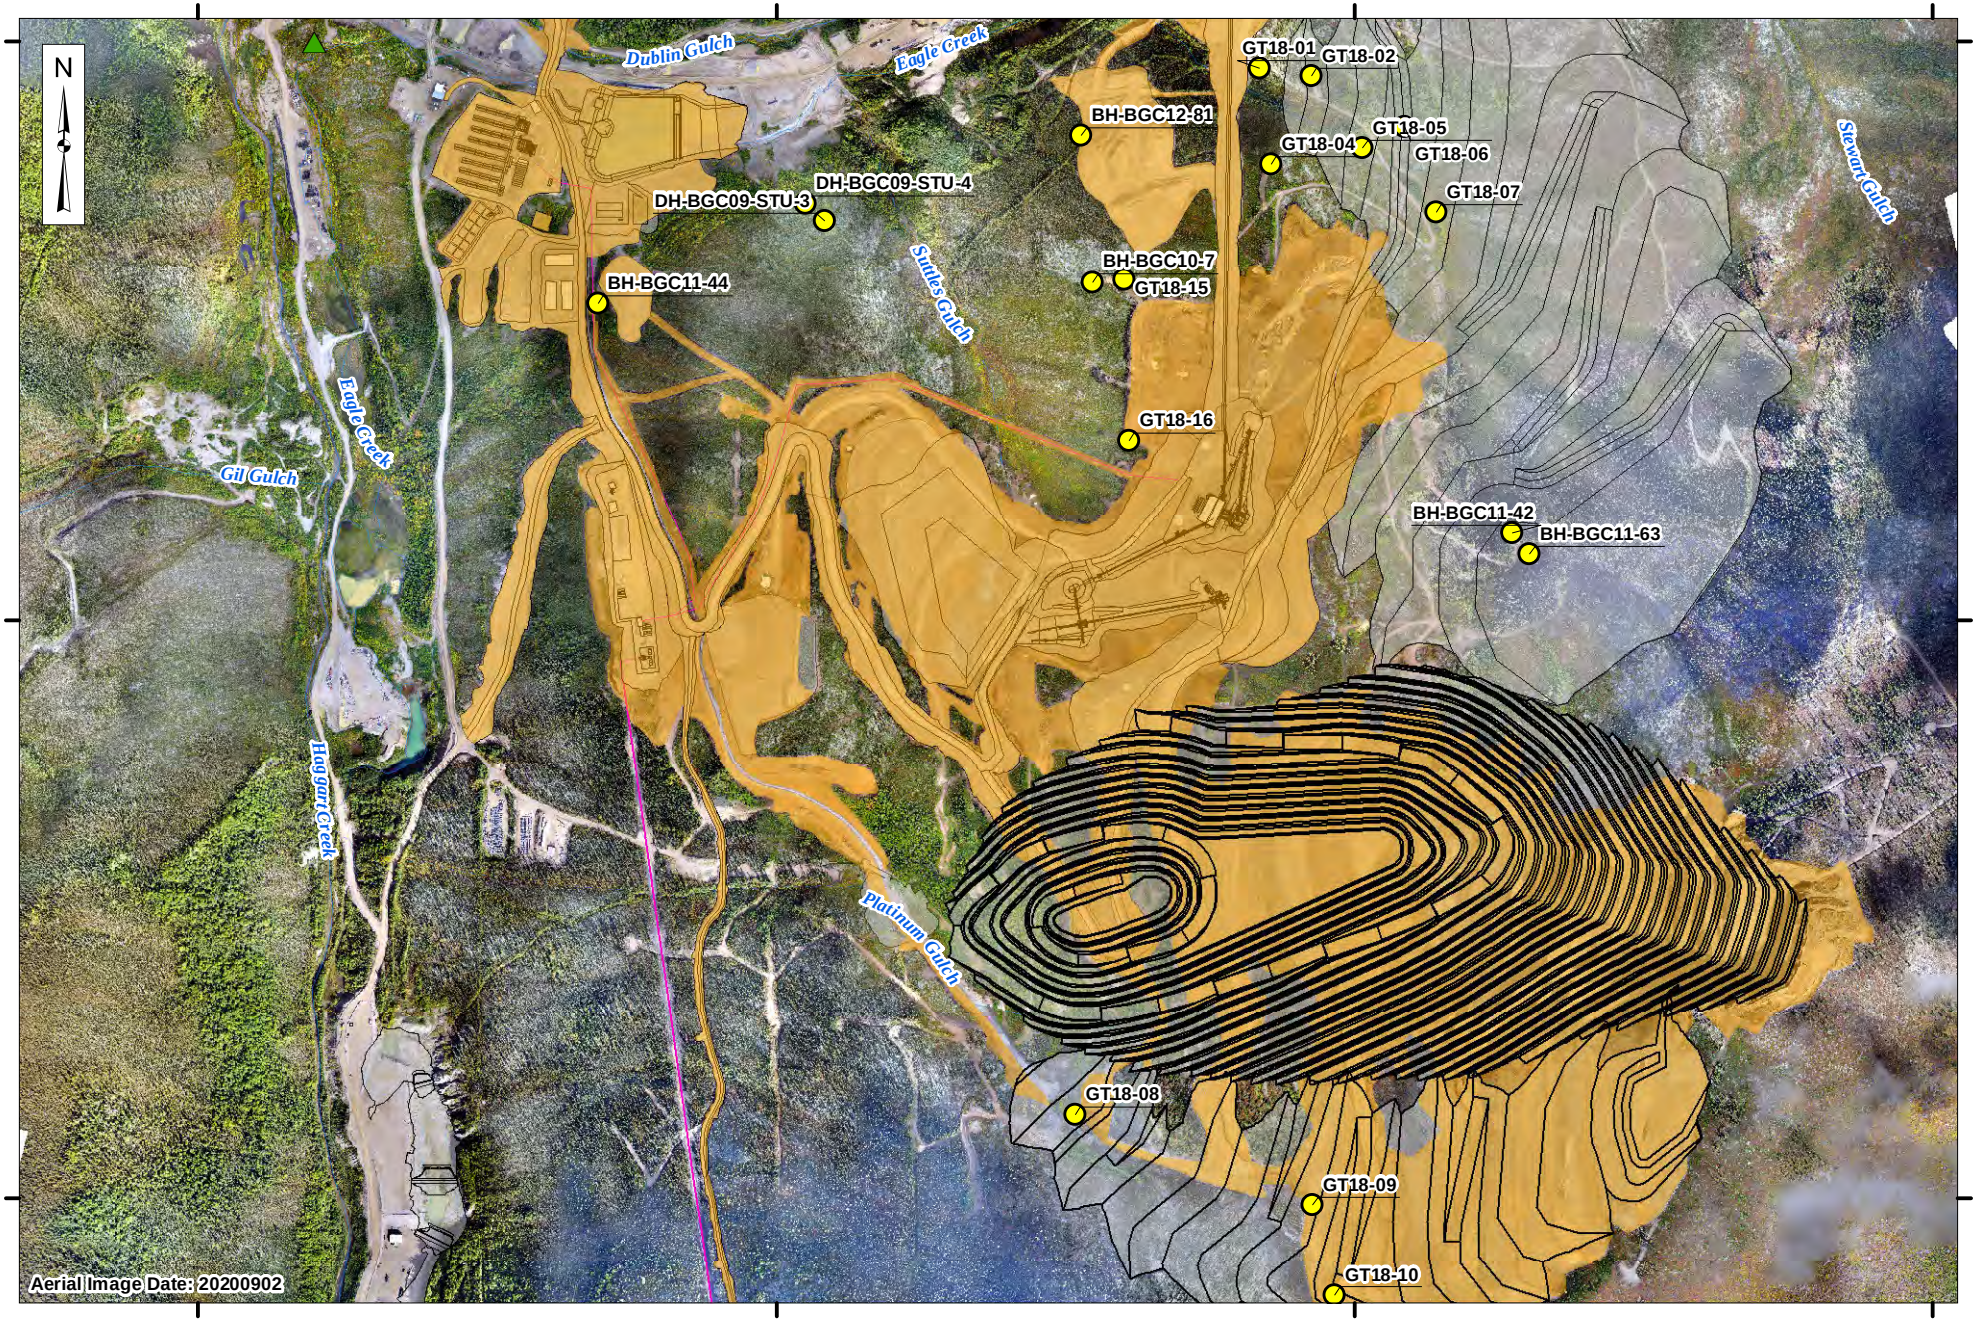
Survey Conditions	2011	2012	2013	2018	2019	2020
Date	7-9 March	7-8 March	4-6 March	5-6 March	5-7 March	5-6 March
Snow Conditions	Old (>2 weeks)	Lots of fresh snow prior to survey	10 days old	Some fresh snow prior to survey and on morning of March 6	Old (>3 weeks)	Lots of fresh snow prior to survey
Cloud Cover	Clear in morning changing to overcast by late afternoon on all days	Clear to slightly overcast on 8 March	Clear	Clear on 5 March; clear in morning changing to slightly overcast by mid-afternoon on 6 March	Clear, light high-altitude have on Mar 7	Clear
Light	Bright in the morning to flat by late afternoon	Bright	Bright	Bright	Bright	Bright
Wind	Light to moderate	Calm	Calm	Calm	Calm to light	Calm to Light
Temperature	-35°C to -17°C	-30°C to -10°C	-27°C to -10°C	-20°C to -10°C	-31°C to -25°C	-35°C to -29°C
Comment	Old snow and flat afternoon light made it difficult to sight moose	Considerable snowfall in days prior to survey	Delayed both mornings due to low fog	Light snow and low ceiling delayed start of survey on second day	Very old snow made recording fresh tracks unfeasible. Could not survey the afternoon of 6 March due to observer fatigue	Deep and fresh snow improved track detection and ageing (old vs. fresh tracks)

The number of moose observations within the Project area during the 2020 survey was consistent with the 2019 survey year, which were higher than all previous years (Table 3.9-6). The majority of moose observed in 2020 were observed in the Haggart Creek and South McQuesten River valleys, with the remaining located within mid-elevation burn areas. Snow depth was substantially above average in 2020, and similar to previous high snow depth years appears to correlate with the greater use of moderate to low elevation habitats by moose. That is, during high snow depth years moose will gravitate to lower elevations and treelines, presumably where there is less snow, and in low snow depth years will migrate to open areas (e.g., burn plateaus).

Table 3.9-6: Survey Intensity and Moose Observations within the Study Area

Year	Survey Intensity (min/km^2)	Moose Observations within the Study Area (10 km buffer)
2011	0.53	26
2012	0.52	48
2013	0.50	39
2018	0.49	75
2019	0.52	82
2020	0.47	82

Overall moose distribution throughout all surveys has been variable between years, an association exists between moose distribution and the moderate elevation burns. While moose densities during 2019 construction within 1 km of the Project footprint were moderate, so were densities observed in 2018 during a cessation of construction activities; moose densities were high within 1 km of the project in 2020 during mine operations. This suggests a natural variability in distributions, as well as expected variability in survey results given the methodology. It is likely that moose distribution is more associated with annual snow depths, winter habitat distribution than Project activities.



3.10 Permafrost

Permafrost monitoring at the project site in 2020 consisted of quarterly subsurface temperature monitoring via thermistors at the locations shown in Figure 3.10-1 and Table 3.10-1.

Monitoring occurred at 18 thermistor locations in Q1. In Q2, two thermistor locations, GT18-09 and GT18-10 were decommissioned due to development of the installation areas and monitoring at the remaining 16 thermistor locations occurred in Q2 and Q3. In Q4, an additional thermistor location was decommissioned (GT18-08) to allow for the continued construction of the PG WRSA rock drain and monitoring occurred at the remaining 15 thermistor locations.

Table 3.10-1: Thermistor Monitoring Locations – 2020

Thermistor	Status	Facility	Coordinates (Zone 8)	
			North	East
GT18-08	Decommissioned Q4	PG WRSA	7,099,141	459,517
GT18-09	Decommissioned Q2	PG WRSA	7,098,851	459,968

3.10.1 Data Analysis

3.10.1.1 **Eagle Pup WRSA Multi Bead Thermistors**

Seven multi bead thermistors were monitored in the area of the future Eagle Pup WRSA, as shown in Table 3.10-2. Multi bead thermistors documented subsurface temperatures up to 20 m below the surface. The majority of thermistors recorded temperatures above zero degrees with the exception of sporadic subzero readings during first and fourth quarter winter conditions; which were attributed to general seasonal temperature changes. The two thermistors that recorded consistent subzero temperatures were BH-BGC11-42 and BH-BGC11-63, which are installed in the interior of the proposed Eagle Pup WRSA. The presence of only two thermistors with consistent subzero temperatures throughout multiple bead depths supports the presence of a local discontinuous permafrost zone

Table 3.10-2: Eagle Pup WRSA Multi Bead Thermistor Temperatures - 2020

3.10.1.2 **Platinum Gulch WRSA Multi Bead Thermistors**

Two multi bead thermistors installed in the area of the Platinum Gulch WRSA were operational in 2020; however, GT18-08 was decommissioned in the third quarter while GT18-09 was decommissioned in the first quarter. Temperature readings in GT18-08 were subzero through much of the total depths and indicate a relatively thick but warm permafrost zone below a cover of deposited organics and material. Conversely, first quarter readings from GT18-09 suggest an active zone overlying non-permafrost material. Further monitoring to ensure Platinum Gulch WRSA stability is described in Section 4.

Table 3.10-3: Platinum Gulch WRSA Multi Bead Thermistor Temperatures - 2020

Thermistor	Date	Bead Temperature ºC															
		1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16

3.10.1.3 **Overland Conveyor Multi Bead Thermistor**

GT18-15 is installed to the west of the future Eagle Pup WRSA and the overland conveyor. The thermistor documented subzero temperatures throughout all seasons with the exception of depths above 11.5 meters (bead 11). The results indicate a relatively thick but warm permafrost zone below a cover of deposited organics and material.

Table 3.10-4: Overland Conveyor Multi Bead Thermistor Temperatures - 2020

Thermistor	Date	Bead Temperature ºC															
		1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16
GT18-15	1st Quarter	0.0	0.0	0.0	0.0	0.1	0.1	0.1	0.2	0.1	0.0	-0.1	-0.1	-0.1	-0.1	-0.1	-0.1
	2nd Quarter	6.50	4.84	3.33	1.48	0.56	0.27	0.14	0.10	0.06	0.01	-0.04	-0.06	-0.09	-0.10	-0.10	-0.09

3.10.1.4 **Upgradient of LDSP Facility Multi Bead Thermistor**

DH-BGC09-STU-3 and DH-BGC-STU-4 are multi bead thermistors installed upgradient of the LDSP. Both datasets documented zero or subzero temperatures below the active layer of surficial organics (bead 2-3), indicating the presence of warm permafrost at depth. Temperatures were consistent across all seasons suggesting stable permafrost

Table 3.10-5: LDSP Multi Bead Thermistor Temperatures - 2020

Thermistor	Date	Bead Temperature ºC					
		1	2	3	4	5	6
DH-BGC09-STU-3	1st Quarter	0.0	-0.1	-3.5	0.1	-1.4	-0.1
	2nd Quarter	2.39	0.34	-3.51	0.04	-1.45	-0.13
	3rd Quarter	8.55	5.99	-1.35	2.00	-1.57	-0.13
	4th Quarter	2.53	3.01	-2.25	1.89	-1.67	-0.14

	2nd Quarter	4.66	0.01	0.05	-3.50	0.01	-0.09
	3rd Quarter	10.73	7.33	5.10	-3.45	-0.01	-0.11
	4th Quarter	-1.95	1.68	2.31	-3.57	-0.02	-0.12

3.10.1.5 **Camp Facility Multi Bead Thermistor**

BH-BGC11-44 is a multi-bead thermistor installed near camp support facilities and just above Ditch A. The documented temperatures in Bead 8 suggest the presence of permafrost at depth, while the near-surface beads registered temperatures consistent with seasonal temperatures changes and a thick organic active zone.

Table 3.10-6: Camp Facility Multi Bead Thermistor Temperatures - 2020

Thermistor	Date	Bead Temperature ºC							
		1	2	3	4	5	6	7	8
BH-BGC11-44	1st Quarter	12.0	5.4	1.2	0.0	0.0	0.0	0.0	-0.2
	2nd Quarter	12.02	5.35	1.19	0.03	0.03	0.01	0.01	-0.24
	3rd Quarter	12.02	10.77	9.27	7.40	4.82	1.62	0.03	-0.25
	4th Quarter	-3.06	-0.50	1.11	2.14	2.96	1.82	0.07	-0.26

3.10.1.6 **Reclamation Material Stockpile Multi Bead Thermistor**

BH-BGC12-81 is a multi-bead thermistor that is installed west of the main ore conveyor to the HLF, situated near reclamation material stockpiles. The dataset showed subzero temperatures beginning at bead depth 6 supporting the presence of permafrost at depth protected by a thick surficial organic active zone. The subzero temperatures at depth were consistent across seasonal changes indicating stable permafrost.

Table 3.10-7: Reclamation Material Stockpile Multi Bead Thermistor Temperatures - 2020

Thermistor	Date	Bead Temperature ºC						
		1	2	3	4	5	6	7
BH-BGC12-81	1st Quarter		4.2	1.5	0.6	0.0	-0.2	-0.3
	2nd Quarter		4.20	1.49	0.60	0.00	-0.16	-0.30
	3rd Quarter		5.61	4.47	3.38	1.46	-0.15	-0.29
	4th Quarter		-0.10	0.29	0.32	0.25	-0.14	-0.29

3.10.1.7 **Ground Temperatures of Single Bead Thermistors**

Ground temperature data collected at the single bead thermistors installed across the Eagle Gold site are provided below Table 3.10-8. Five single bead thermistors were monitored in 2020. GT18-10, which was installed in the Platinum Gulch WRSA, documented subzero temperatures at depths between 8.5 m in the first quarter of 2020. GT18-10 was decommissioned following the first quarter of the year. GT18-02, GT18-04 and GT18-06, situated within the Eagle Pup WRSA, exhibited above zero temperatures across all seasons which indicated a lack permafrost within the installation area. GT18-16, installed below crushing facilities, documented above zero temperatures across all seasons which indicated no influence of permafrost in the critical infrastructure location.

Table 3.10-8: Single Bead Thermistor Temperatures - 2020

Thermistor	Bead Depth	Q1	Q2	Q3	Q4
GT18-02	7.9	1.4	0.59	0.59	2.08
GT18-04	8.5	1.3	1.12	1.12	1.95
GT18-06	9	0.3	0.33	0.33	0.23
GT18-10	8.5	-0.2	Decom	Decom	Decom
GT18-16	8.2	1.2	1.1	1.1	1.95

3.10.1.8 **HLF Embankment Piezometers and Temperatures**

Three standpipes with Vibrating Wire Piezometers are installed through the HLF dam crest. Piezometer P1 was installed into the dam foundation bedrock and Piezometers P2 and P3 were installed in the dam fill just above the western and eastern underdrains, respectively. The piezometer readings for P1, P2, and P3 are provided in the Forte Annual HLF Inspection Report in Appendix B3. Temperature values observed in 2020 were similar to that of 2019 showing gradual seasonal fluctuation. No concerns resultant of temperature monitoring was noted within the Forte Annual HLF inspection Report.

3.11 Noise

The objective of the noise monitoring program was to ensure that public users of the Haggart Creek/South McQuesten Road adjacent to the Project site were not at risk of exposure to high sound levels associated with blasting.

3.11.1 Sounds Levels Related to Blasting

Blasting activities related to construction and mining activities took place at the Project throughout 2020. Monitoring of noise levels associated with these blasting activities was not conducted as per the proposed methods considered in the EMSAMP. As reported in previous annual reports, noise monitoring was conducted in 2019 and 2018 and was determined to be below thresholds set out in the EMSAMP; thus, continued monitoring was not necessary as per guidelines described in the EMSAMP.

The need for further monitoring will be evaluated based on whether significant changes in mining activity occur or in the event that a noise complaint related to Project activities is received.

3.12 Spills and Accidents

3.12.1 Spill Contingency Overview

The Spill Response program was maintained throughout the reporting period and included ongoing site orientation training on spill response and reporting procedures, spill prevention education, Field Level Risk Assessments (FLRAs), pre-operation inspections, and appropriate use of spill containment and response materials.

Unauthorized releases continued to be reviewed for causality and when identified as due to human error, were followed up with supplemental education on the Spill Response Plan and Standard Operating Procedures (SOP). Spills identified through investigation to be as a result of equipment failure or regular wear and tear included a review of vehicle inspection and maintenance logs in conjunction with inter-departmental collaboration to determine if any engineering/mechanical improvements were required on the associated equipment.

As component of this annual report cycle, the VGC Spill Response Plan was updated (provided in Appendix P1). A significant update to the Spill Response Plan included reference to a specific threshold volume that triggers soil sampling requirements according to Yukon Contaminated Sites Regulation (CSR) standards.

Ongoing spill response audits continue to verify the adequacy of existing spill equipment. In addition, regular monitoring of major work areas is reviewed by VGC Environmental staff to ensure proactive measures are being implemented according to the Spill Response Plan, such as having adequate equipment available and proper management of hazardous waste. Any non-compliances identified through regular environmental site monitoring are logged in a tracking spreadsheet to ensure follow up by responsible departments.

The permitted Land Treatment Facility (LTF), constructed in 2019 for progressive treatment and remediation of hydrocarbon contaminated soils, was operational during the reporting period. Contaminated soils are stored and remediated within the LTF through regular aeration and sampled prior to relocation around the site on mine roads or as fill. Contaminated soils are tested for hydrocarbons prior to treatment and post treatment to meet CSR standards.

An additional lined, bermed temporary storage area was constructed adjacent to the current inert waste landfill site in response to a diesel spill on February 21, 2020. This temporary holding area contains the remnants of the potentially contaminated materials excavated from the diesel spill and will be tested prior to reallocation around the site or as fill. Once these materials are relocated the temporary storage area will be decommissioned.

3.12.2 Reportable Summary

During the period of this report, eighteen (18) reportable spills occurred at the Project site. Spills described in Table 3.12-1 were reported to the Yukon Spill Report Line as required by the *Spills Regulations* of the *Yukon Environment Act*, and Spill Reports for each occurrence were uploaded to the Yukon Water Board's electronic platform Waterline. Spill remediation occurred as per CSR standards and guidelines stipulated by Yukon Government Department of Environment and Department of Health and Social Services personnel. Non-reportable spills were tracked internally and remediated as above. Spill Response Forms and photos for each of the reportable spills is provided in Appendix P2.

Table 3.12-1: 2020 Reportable Spills

Date	Volume (L)	Substance	Location	Spill Details and Remediation
21-Feb-20	4,000	Diesel	HLF Phase 1B laydown	A fuel pump discharge line separated from a fuel pump releasing diesel onto the frozen ground. The pump was immediately shut off and absorbent spill pads deployed to collect and contain the material. Contaminated materials were characterized, excavated and transported to a temporary, lined, bermed storage area.
28-Feb-20	387	Coolant	Primary Crusher	A damaged hydraulic line on the rock breaker resulted in a release of coolant onto the ground. Contaminated materials were collected and taken to the LTF.
16-Mar-20	9	Coolant	1315 Bench	A heater hose in the 601-shovel engine room ruptured spilling coolant to the ground. A barrel was placed under the leak and spill pads deployed to absorb standing product. Contaminated materials were collected and taken to the LTF.
3-Apr-20	400	Hydraulic oil	1315 Bench	Bolts on the hydraulic manifold of the shovel boom failed resulting in the release of hydraulic oil to the ground. Spill trays and pads were deployed and an excavator used to remove contaminated soil. Contaminated materials were collected and taken to the LTF.
27-Apr-20	20	Coolant	Eagle Pit Road (switchback #2)	A radiator hose came loose on a haul truck resulting in product release to the ground. The truck was immediately shut down and the area cleaned up with spill pads. Contaminated materials were collected and taken to the LTF.
23-May-20	104	Coolant	Eagle Pit	A failed coolant line resulted in coolant release to the ground. A barrel was used to contain the leak and absorbent pads deployed to collect standing liquids. Coolant collected in the barrel was pumped back to the fuel and lube truck, contaminated materials were collected and taken to the LTF.
29-May-20	15	Coolant	Eagle Pit Road (Between switchback #2 and 3)	A failed coolant line resulted in product release to the ground. Spill pads were utilized to soak up pooled product and heavy equipment removed 1 m^3 of contaminated road material. Contaminated materials were collected and taken to the LTF.
1-Jun-20	350	Hydraulic oil	Eagle Pit Blast Area	A worn-out dust collection impeller caused a hydraulic fitting to fail and release hydraulic oil onto the ground. Spill booms and pads were used to contain and soak up free product. Oil gator was applied and contaminated material was collected and taken to the LTF.
4-Jun-20	140	Coolant	Eagle Pit Switchback #2	A hose clamp failed on the main coolant return line resulting in a coolant release to ground. Spill pads were deployed to contain and collect residual material and contaminated pads were brought to the hazardous waste storage for removal by KBL Environmental.
30-Jun-20	8	Coolant	HLF Phase 1B	A coolant hose for the DEF pump failed resulting in product loss to ground. Absorbent socks were used to contain the release and universal absorbent pads were used to soak up excess coolant. Contaminated material was taken to the hazardous waste facility for disposal.
10-Jul-20	15	Coolant	1050 bench lube skid station	A failed lower mount on the radiator resulted in movement which caused it to leak under pressure. Spill tray and pads were placed under unit to collect spilled product, and contaminated material was taken to the hazardous waste facility for disposal.
11-Jul-20	4,500	HLF Solution	HLF Loadout pad	A mixture of rainwater and process solution was identified seeping from the loadout pile adjacent to the Heap Transfer Tower (CV-023) pad. Investigations indicated that a combination of a damaged solution distribution pipe and the extension of the loadout pile beyond lined containment were the primary root causes of the release. The damaged solution distribution pipeline was isolated and shutoff and a berm with ditching established to contain the seep. Potentially

Date	Volume (L)	Substance	Location	Spill Details and Remediation
				contaminated soils were excavated and placed within the lined containment of the HLF.
20-Jul-20	12	Coolant	1B Access road	A failed coolant line on a rock truck resulted in coolant being released onto the road surface. The leak was contained using a spill tray and sorbent pads deployed to soak up excess coolant. Contaminated materials were collected and taken to the LTF.
26-Jul-20	1,250	Diesel	Warehouse Cold Storage yard	Approximately 1,250 liters of diesel was released from a fuel truck onto the Warehouse pad. Fuel pumps were shut off and free product contained using earthen berms, booms, and spill pads. Oil gator was spread on impacted soil and contaminated water and free product transferred into totes. Contaminated soil was excavated and disposed of in the LTF.
6-Sep-20	180	Waste Oil	1050 bench lube skid station	An accidental overflow occurred while transferring waste oil to a disposal tote. Earthen berms, spill booms, and pads were deployed to contain fugitive liquid. Soil was removed for treatment in the permitted LTF.
19-Oct-20	50	Waste Oil	1050 bench lube skid station	A hose was left un-attended while transferring used oil from lube station into a tote resulting in overflow. The drain line was turned off to prevent further spillage and spill pads deployed to absorb spilled oil. Oil absorbent was spread over the affected area and contaminated material collected and disposed of in accordance with site policies.
28-Nov-20	500	Hydraulic oil	Secondary parking lot	A punctured tote released approximately 500 L of hydraulic oil onto the ground. The tote was tipped onto its side to stop further release and berms created to contain the free product. Spill pads and synthetic booms were deployed to collect residual oil, and contaminated snow and soil were transferred into lined mega bags and taken to the LTF.
26-Dec-20	200	Septic	Warehouse	Vac truck operator failed to close the shutoff valve prior to driving away resulting in product loss onto the ground. The impacted area was contained and spill response was initiated. Contaminated material was scraped up with a bucket and spread out over the septic field and lime was spread out on the contaminated snow.

3.13 Traffic and Access, Upcoming Maintenance

3.13.1 Level of Traffic

From Mayo, access to the Project site is along approximately 85 km of existing paved and gravel roads. Roads from Mayo to the site include the Silver Trail (Highway 11) and via the existing South McQuesten Road and the Haggart Creek Road. All but the Haggart Creek Road are government-maintained roads. During the period between January 2020 and December 2020 there were approximately 1,900 one-way vehicle trips.

Vehicle traffic was significantly lower than the 2019 and 2018 reporting years. The reduction in traffic was due to the lack of construction related traffic that was experienced in prior years and site travel restrictions imposed by VGC in response to the COVID-19 pandemic limiting the number of visitors, contractors and non-essential site staff.

3.13.2 Access Control Issues

No access control issues were documented during the period of this report.

3.13.3 Incidents

To respond to incidents on site and along the access roads, the Project maintains a current Emergency Response Plan. The Plan is supported by VGC emergency response personnel who are trained and certified in advanced first aid, firefighting and mine rescue and the use of equipment required for all response types. In addition, reporting and investigation of incidents is standard practice at the site.

During the reporting period, there were no wildlife-traffic or access incidents reported. Wildlife observations, including those made along the access roads, are included in the quarterly reports submitted pursuant to QML-0011.

3.13.4 Planned Access Road Work

To ensure the continued safety of visitors, employees and contractors to the site through 2021, Victoria Gold continues to perform routine snow clearing along the South McQuesten and Haggart Creek Roads from the Silver Trail (Yukon Highway 11) to the Eagle Gold camp and routine maintenance along Haggart Creek Road (e.g., maintaining culverts and ditches, repairing pot holes, etc.). Snow clearing efforts include installing wildlife escape routes into the banks at regular intervals. Ongoing maintenance and roadway improvements will be in accordance with Victoria's current Work within a Right of Way Permit issued by the Department of Highways and Public Works (HPW) and Land Use Permit issued by the Department of Energy, Mines and Resources.

3.14 Water Management & Sediment and Erosion Control

The mine site water management objectives focus on keeping clean water clean and continuing to meet the water quality standards in the receiving environment while ensuring facilities are able to safety convey and detain the design storm events. These objectives are met through ongoing maintenance of water management infrastructure to minimize the chance of release of contact waters to receiving watersheds, ongoing erosion source control, and the diversion of non-contact water away from disturbed areas to reduce the total volume of water requiring management.

3.14.1 Major Water Management Infrastructure

A number of water management facilities including ponds and sediment basins, diversions and interceptor ditches have been developed to proactively manage sediment-laden, contact and non-contact water throughout the life of the Mine. Details regarding the development and operation of the water management facilities are found in the Water Management Plan Version 2020-01 (VGC, 2020).

3.14.1.1 **Lower Dublin South Pond**

The LDSP is managed as a retention pond that collects water from the southern portion of the Project which currently includes runoff and mine water routed from the Platinum Gulch WRSA, the crusher areas, the 90-day stockpile, and the open pit. The primary water management ditches, Ditch A and Ditch B, route the collected water to the LDSP where it is stored and either used for process makeup water needs or discharged if effluent quality standards are achieved.

As discussed in section 2.1, the LDSP underwent maintenance and improvement works in 2020 as required by QZ14-041-1. To allow for the installation of the low-permeability liner, approximately 8,050 m^3 of accumulated sediment captured by the LDSP forebay was removed during the fourth quarter of 2020. The LDSP forebay liner

installation was completed in 2020; however, the permanent ballast system for the liner currently remains outstanding.

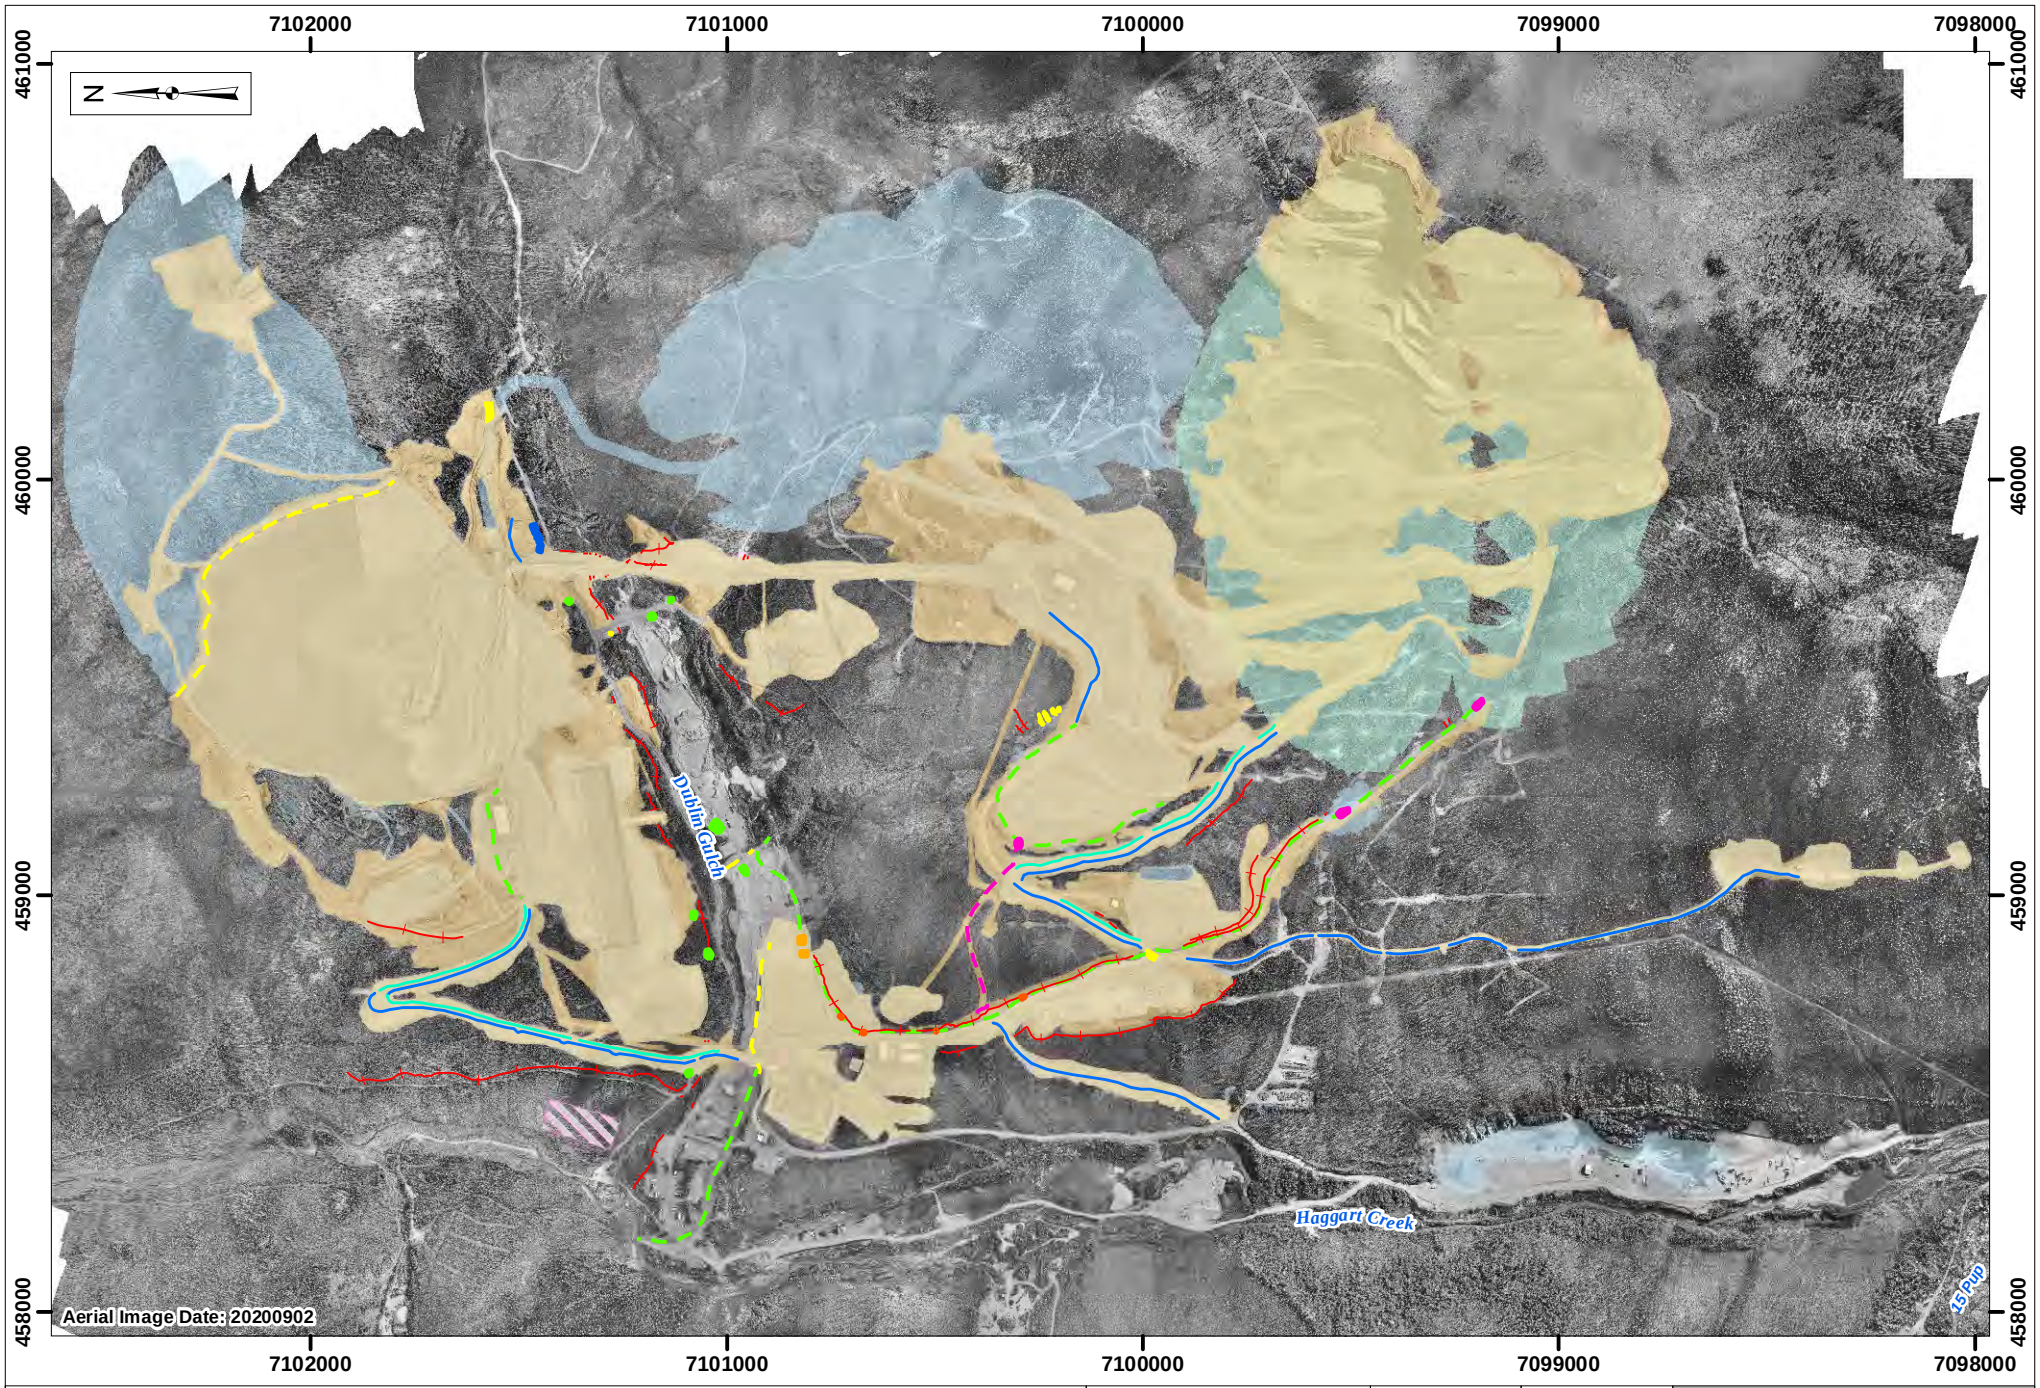
3.14.1.2 **Ditches and Pipes**

Initial construction of Ditch A was completed in March of 2019 and included the development of a rock lined ditch, installation of a HDPE pipe and an inlet sump at the base of the Platinum Gulch WRSA. During freshet in 2020, the installed configuration for Ditch A was found to be inefficient and a risk for proper containment of sediment laden runoff and mine contact water. In particular, the design resulted in sediment build-up at the sump and sediment clean out from the ditch was impractical due to the presence of the 28-inch HDPE pipe.

To improve the functionality of the ditch, modifications were made in 2020 that included the removal of the existing pipe and accumulated sediments, relining the ditch with a low permeability liner, and replacing the rip rap. Improvements were developed by the Technical Services team under the supervision of the VGC Engineer of Record, Mr. Richard Tuohey.

Ditch B construction continued in 2020 with excavation of the alignment east of Suttles Gulch toward the future EP WRSA toes. The construction of Ditch B will follow the modified design considerations of Ditch A (i.e., utilizing a low permeability liner rather than a HDPE pipe) and will be completed in 2021.

Ditch C was constructed in March of 2019 and continues to convey any non-continuous, periodic outflow discharge from the LDSP to Haggart Creek; Ditch C flows west to a discharge location upstream of W4.



3.14.2 Erosion and Sediment Control Infrastructure

Monitoring of the effectiveness of erosion and sediment control was ongoing throughout the reporting period to support the overall water management objectives for the Project and to ensure compliance with regulatory approvals. Revegetation and reseeding work was undertaken in the areas of the LDSP, the Events Pond spillway, the laydown area east of the warehouses, and the overland conveyor adjacent to Dublin Gulch its west slope near Eagle Pup, and its east drainage ditch between Dublin Gulch and Eagle Creek (see Section 6.2).

Construction and operations activities continued to be supported by the implementation of sediment and erosion control measures, in accordance with the Water Management Plan, which included:

- Proper staging of construction activities and BMP installations to mitigate erosion and the potential entrainment of sediment.
- Installation of berms at the top of fill slopes to protect newly formed slopes from erosion.
- Application of bioengineering techniques for slope stabilization and channel protection as necessary in the sediment basins, ditches, and on any unstable and/or disturbed slopes and surfaces.
- Application of additional BMPs for slope stabilization and channel protection as necessary in the sediment basins, ditches, and on any unstable and/or disturbed slopes and surfaces.
- Installation of silt fences around the downslope perimeter of material stockpiles and disturbed surfaces to prevent sediment migration downslope.
- Monitoring, maintenance, repair, or replacement the mitigating measures listed above to ensure BMP effectiveness and efficiency.

Figure 3.14-1 shows the currently installed erosion and sediment control infrastructure.

3.15 Independent Environmental Audit

Clause 12.0 of QML-0011 requires the undertaking of an environmental audit every two years by an independent contractor acceptable to the Director of the Mineral Resources Branch of EMR. Stantec Consulting Ltd. (Stantec) was deemed acceptable by the Director and subsequently contracted by VGC to complete this Environmental Audit. The audit was completed and considered information inclusive of monitoring and surveillance activities undertaken at the site from July 1, 2018 to June 30, 2020.

The audit evaluated:

- Reporting compliance and adequate implementation of the plans and associated monitoring programs; and,
- Confirmation that water monitoring (surface water quality and quantity, groundwater, and aquatic, habitat), terrestrial environmental monitoring, and physical stability assessments were completed to the specifications in the approved plans.

Stantec's audit indicated that implementation of VGC's environmental management system was adequate and that continual improvement had been demonstrated throughout the audit period (Stantec, 2020). Reports reviewed did not indicate any immediate concerns for water quality and quantity, aquatic habitat, air quality, soils, vegetation, wildlife and wildlife habitat, stability of physical structures and waste management.

Stantec's key findings are provided within the report (Appendix Q1) and Stantec has stated in the audit report:

"Reports and data reviewed do not indicate that indicators of environmental quality (water quality and quantity, aquatic resources (sediment, benthic invertebrates, fish and fish habitat) air quality, soils, vegetation, wildlife and wildlife habitat, stability of physical structures and waste management) are degraded or degrading."

In summary, Stantec noted that there were some common themes with regard to deficiencies across several monitoring programs. The majority of the identified deficiencies were related to reporting on activities undertaken and not the actual execution of programs. The noted and summarized deficiencies were:

- Reporting monitoring activities and results without providing all supporting data and information (e.g., validated datasets, statistical analyses, results compared against relevant standards or guidelines),
- Inconsistent implementation and/or documentation of QA/QC monitoring programs,
- Equipment malfunction resulting in gaps in datasets (i.e., climate, hydrology),
- Missing rationale in reports for gaps in implementation of the monitoring schedule,
- For monitoring programs with threshold standards or objectives, statistical analyses were not performed to determine statistically significant changes occurred to the receiving environment (i.e., air quality, hydrology, surface water quality, groundwater, soils, vegetation)
- Lack of adaptive management responses or rationale for not implementing adaptive management measures.

VGC's response to recommendations was provided separately with the environmental audit to EMR, and specifically addressed each recommendation or perceived gap. The response document is provided in Appendix Q2.

4 PHYSICAL MONITORING

4.1 Eagle Pit

Mining in the Eagle Pit has been ongoing since initial development in 2019. Mining in 2020 focused on Phase 1 single benching and the development of Phase 2 with single and double benches. During 2020 pit development, visual monitoring of the pit walls was actively conducted during regular pit inspections. A majority of the pit consists of single benches with 10 m bench heights and 6 m wide berms, and one wall in Phase 2 is double benched with 20 m bench heights and 10 m wide berms. The lithologies exposed in Phase 1 display equal portions of metasedimentary and granodiorite. Phase 2 is predominantly metasedimentary rock. Most rock within the pit was oxidized, weathered, and blocky.

A full inspection of the pit walls and dumps are completed on a weekly basis using a combination of visual observations and UAV drone photography (Figure 4.1-1) to support geotechnical stability monitoring.

Figure 4.1-1: Example of UAV Photography Used to Support Geotechnical Inspections

Bi-weekly surveys of the open pit and dump are completed using UAV drone photogrammetry to produce georeferenced surfaces. These surfaces are utilized to track dump progression and aid in pit wall analysis (Figure 4.1-2).

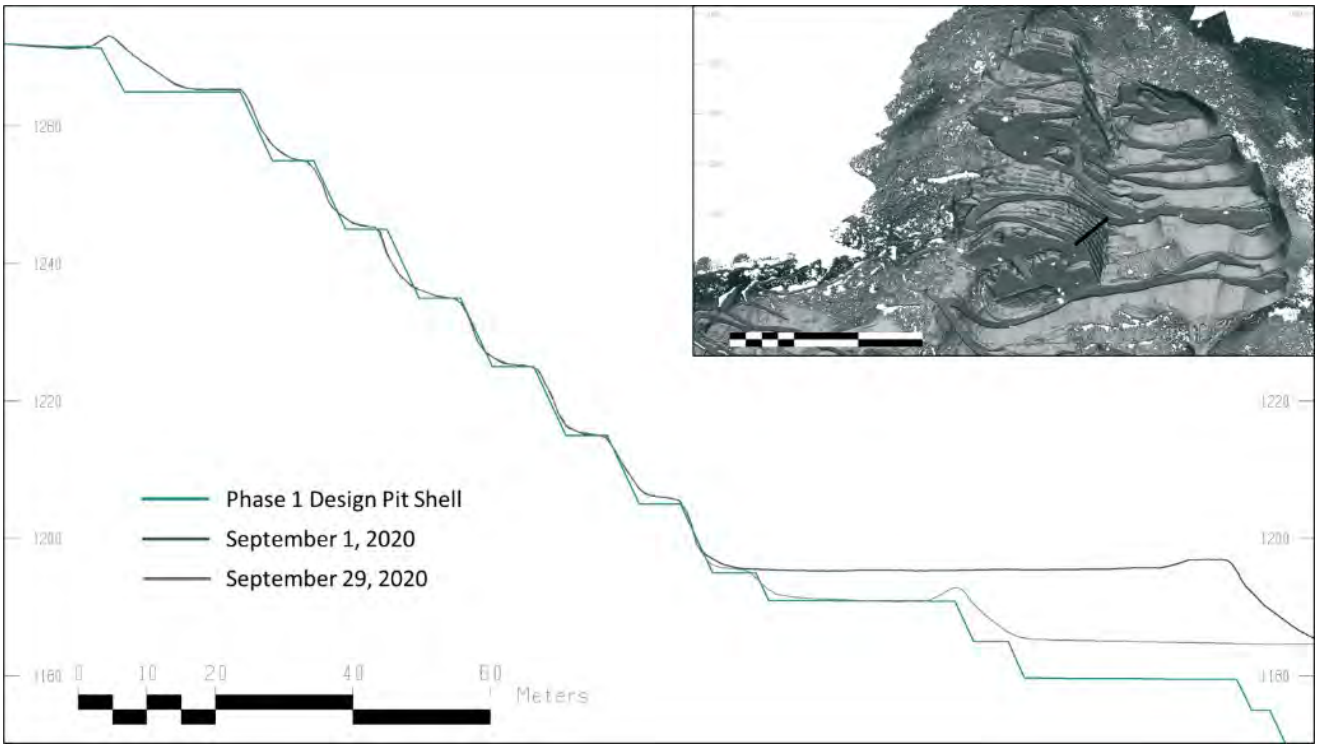

Figure 4.1-2: Example of Surfaces Produced by Drone Photogrammetry

4.1.1 Stability Incidents

A majority of the rock exposed on the pit walls is weathered rock mass. Figure 4.1-3 is an example surface from September 29, 2020 that illustrates a Phase 1 wall exposed along weathered metasediment and granodiorite. Figure 4.1-4 is an example surface from September 29, 2020 that illustrates a Phase 2 wall exposed along weathered metasediment and overburden.

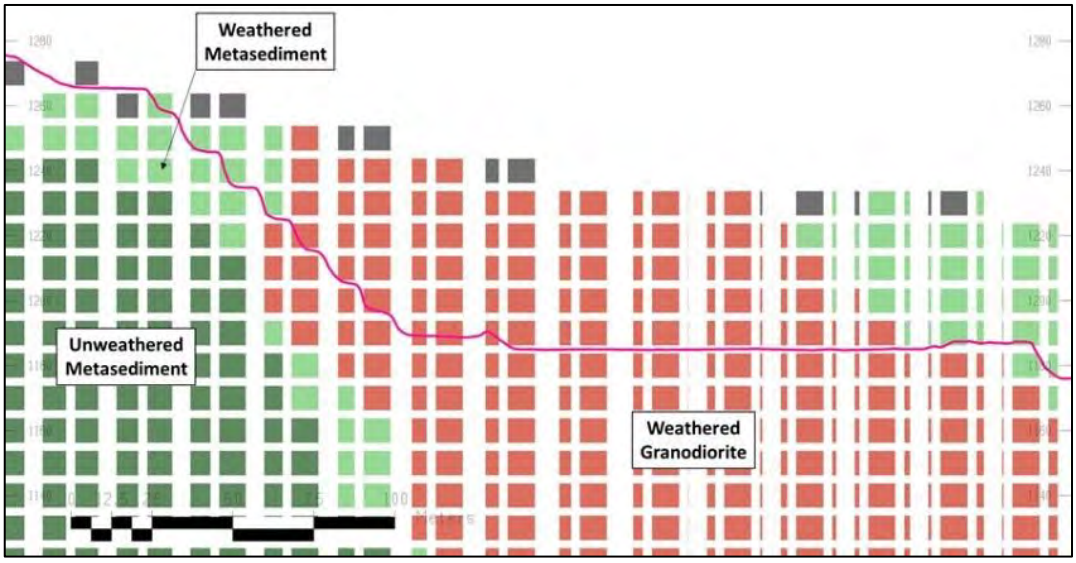

Figure 4.1-3: Eagle Pit Phase 1 – NW-SE Vertical Section from September 29, 2020 Surface

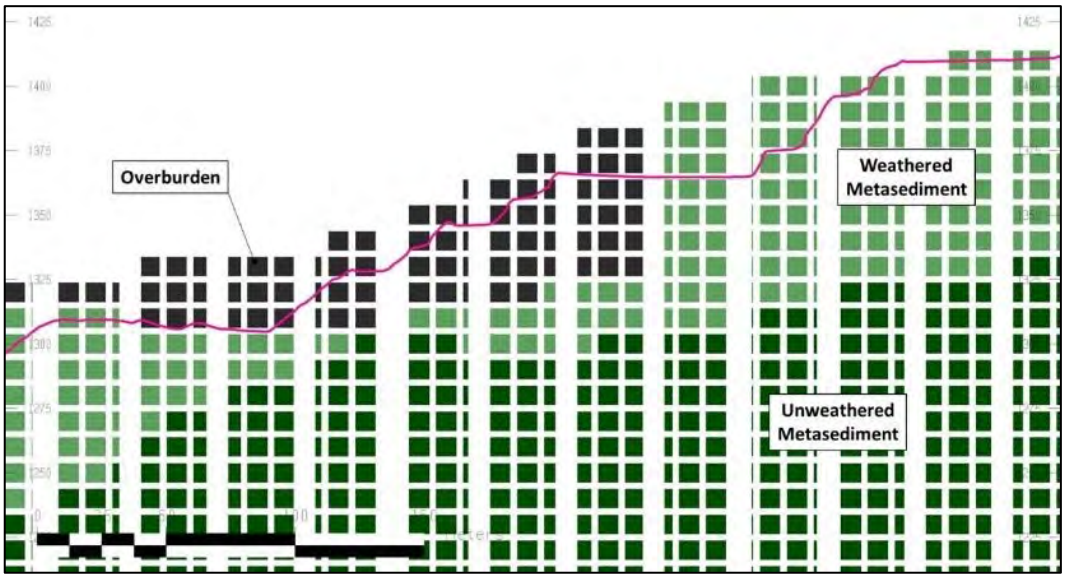

Figure 4.1-4: Eagle Pit Phase 2 – NW-SE Vertical Section from September 29, 2020 Surface

A fairly dominant NE-SW trending fault zone in Phase 2, in combination with the exposed weathered metasedimentary rock, caused a localized instability along one of the Phase 2 haul ramps in September 2020 (Photo 4.1-1). The area was bermed off and monitored using extensometers. Movement rates were measured to be consistently low. Access to the haul road was not required at the time of the instability, so the area is set to be remediated once heavy traffic access is required in 2021. Figure 4.1-5 and Figure 4.1-6 show the extensometer data collected on the instability.

Photo 4.1-1: Phase 2 East Wall Instability El. 1,333 masl (September 29, 2020)

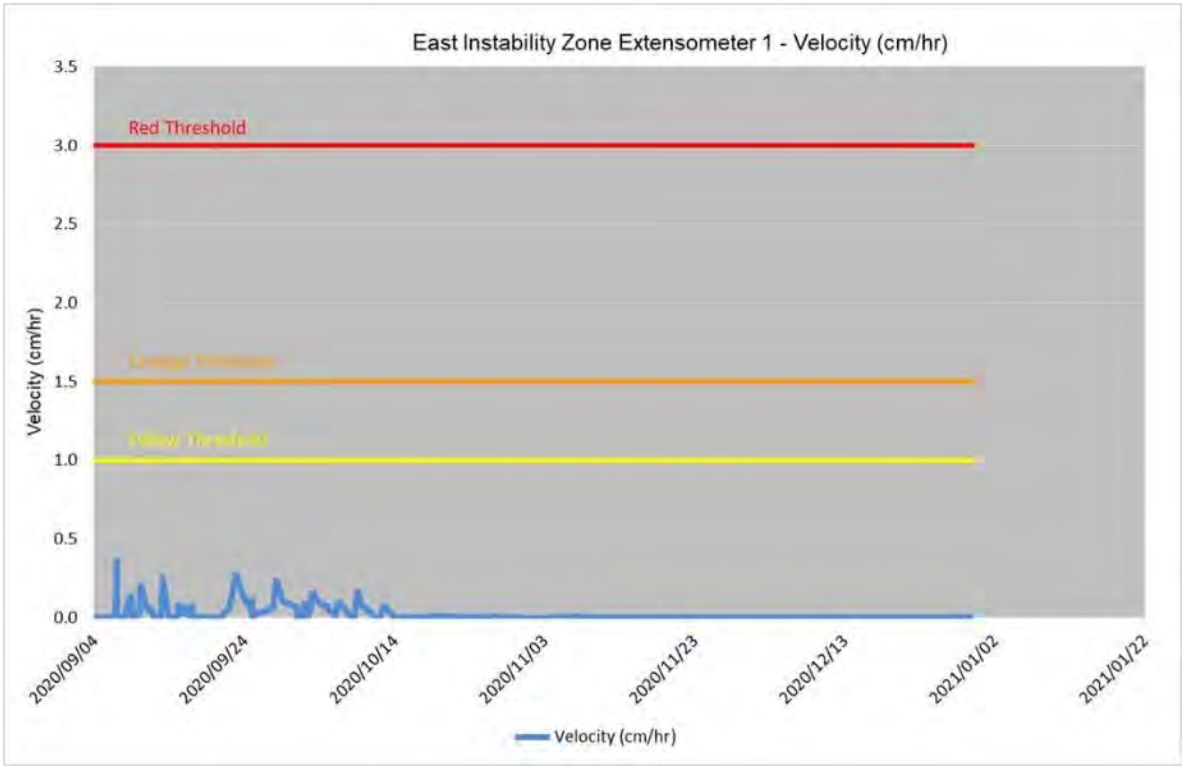

Figure 4.1-5: Extensometer Velocity Readings for Extensometer 1 on the East Wall Instability

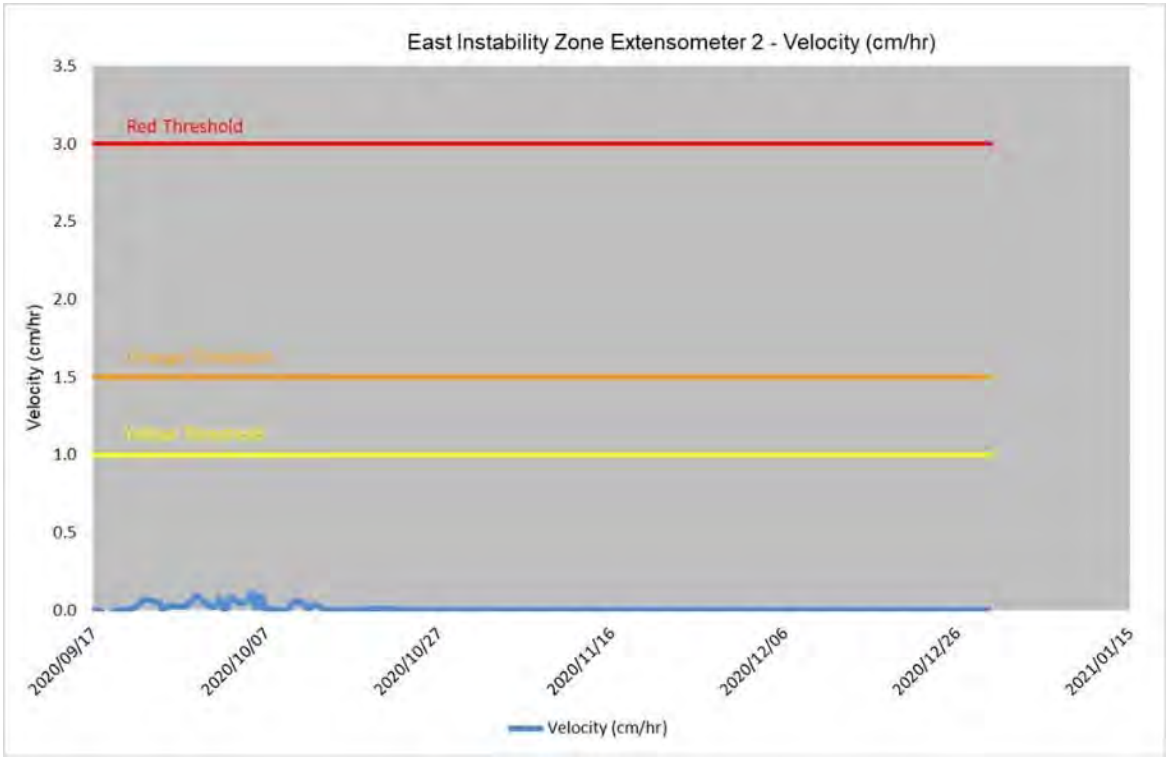

Figure 4.1-6: Extensometer Velocity Readings for Extensometer 2 on the East Wall Instability

4.2 Waste Rock Storage Areas

4.2.1 2020 WRSA Development

During 2020 waste rock was placed in the Platinum Gulch (PG) WRSA. The PG WRSA was built in lifts using the end-dumped method for the majority of construction and occasionally using the free-dump method. Figure 4.2-1 shows the total material moved during 2020 highlighted in blue, with the dump elevations labelled. A cross section of waste rock placement during 2020 can be seen in Figure 4.2-2.

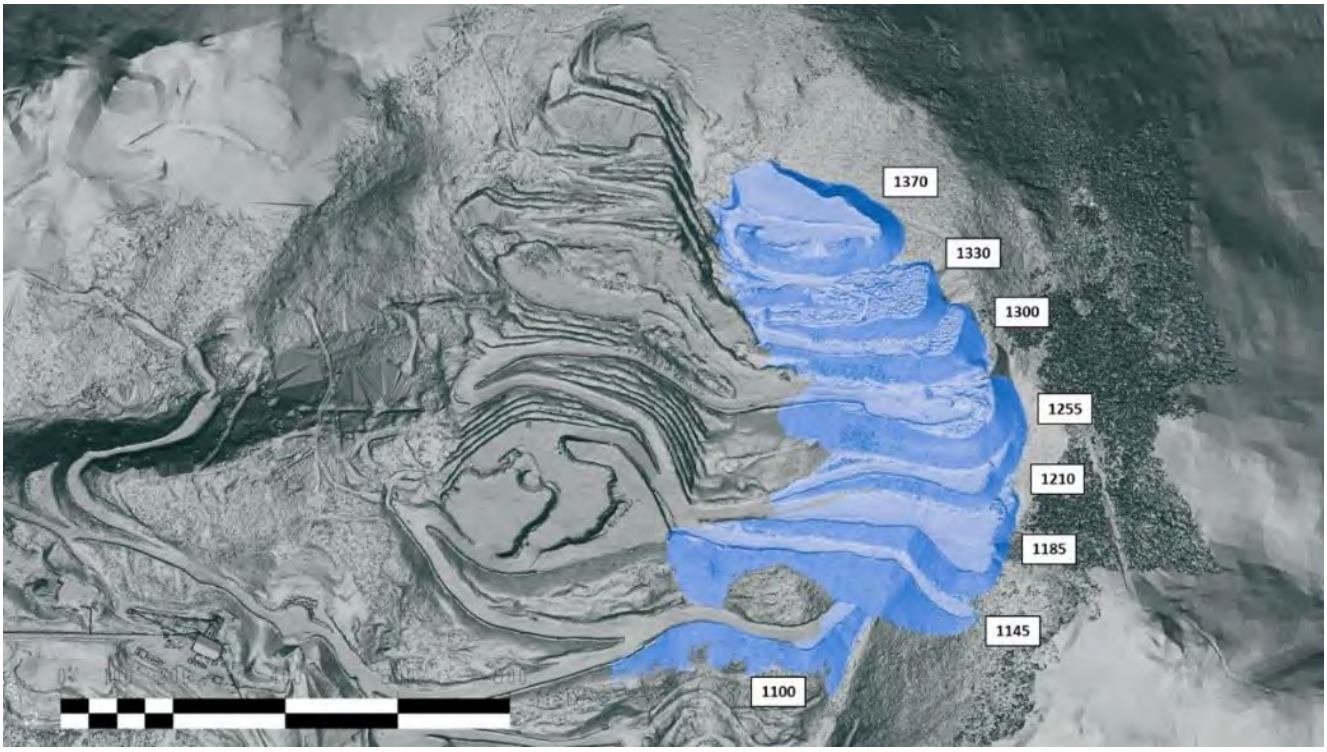

Figure 4.2-1: Waste Material Place in the PG WRSA in 2020 (Surface from December 15, 2020)

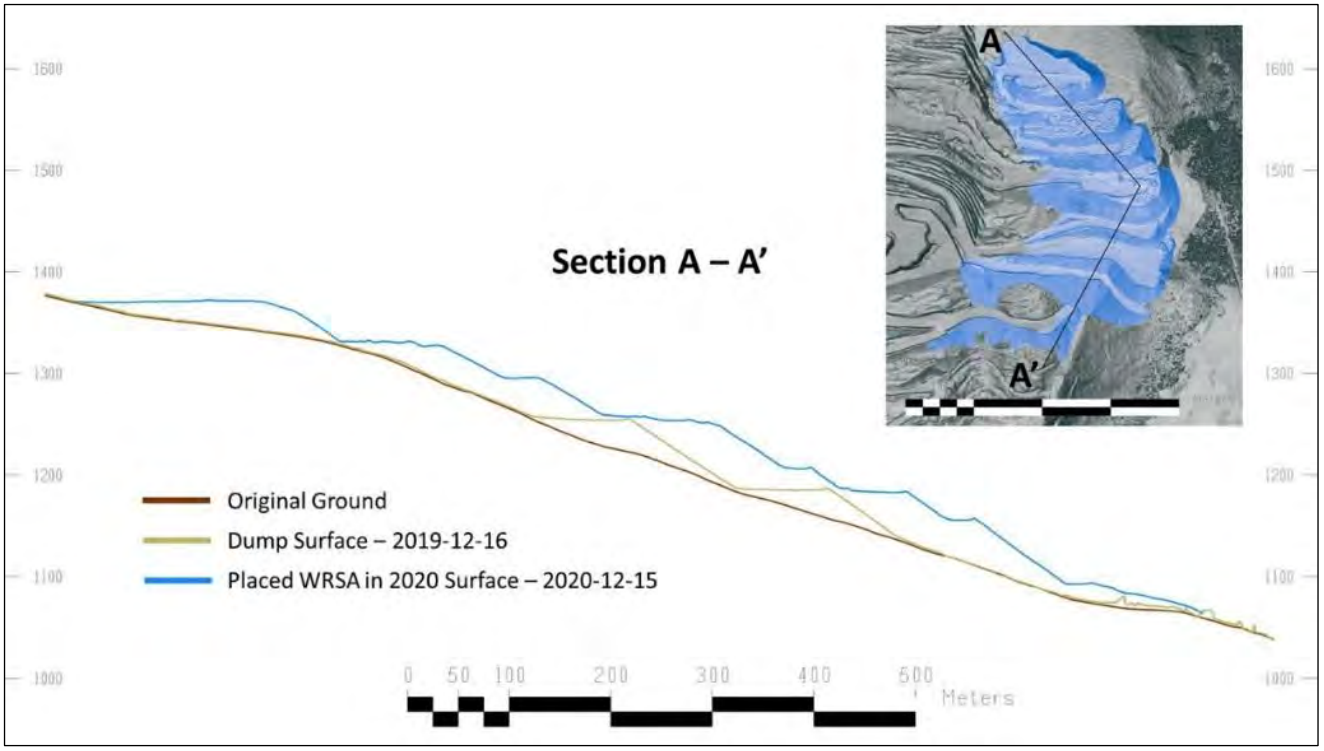

Figure 4.2-2: Cross Section of Material Placed in 2020

4.2.2 WRSA Monitoring

Active and non-active lifts of the PG WRSA were monitored for movement using extensometers. Readings were taken on a regular basis to determine the rate the structure was moving. Photo 4.2-1 shows an example of one of the site extensometers.

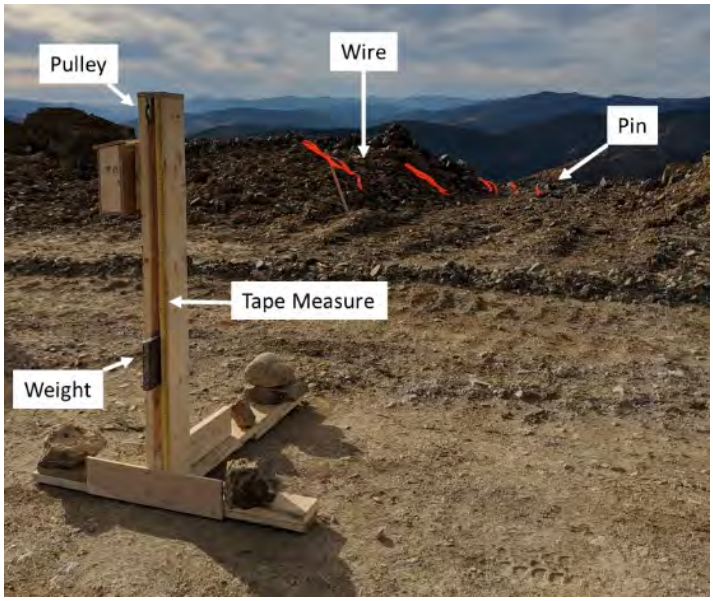

Photo 4.2-1: Extensometer Deployed on an Active WRSA Lift

Table 4.2-1 provides the movement rate thresholds for guiding the monitoring activities. Figures 4.3-2 through 4.3-5 show extensometer readings on the PG WRSA for 2020. All extensometers deployed in the PG WRSA showed movement rates below the monitoring thresholds. The PG WRSA is performing as per design.

Table 4.2-1: Movement Rate Threshold for Extensometer Monitoring

Alert	Green	Yellow	Orange	Red
Platform Condition	No new tension cracks; no recent movement on old tension cracks.	Existing cracks opening and new tension cracks developing close to the crest.	Cracking extends well behind the crest; obvious differential settlement and/or development of steps or grabens on the platform.	**Rapidly** coalescing, cracks that extend well behind the crest; deep, open tension cracks and/or grabens; platform not trafficable.
Crest, face and toe condition	Normal toe, face and crest geometry; no toe spreading or heaving, face bulging, crest over-steepening or excessive raveling.	Minor changes in dump geometry (minor toe spreading/heaving, face bulging, crest over-steepening); minor face and crest raveling.	Pronounced toe spreading/heaving, and/or face bulging; substantial over-steeping of the crest; small sliver failures; active face and crest raveling/break back.	Extensive toe spreading/heaving and/or face bulging; active face and crest slumping/raveling; frequent sliver failures; active instability.
Deformation rate	Rate of movement <1cm/hr, extensometer monitoring frequency every 4 hours.	Rate of movement >1cm/hr and <1.5cm/hr, rate increasing; extensometer reading every 2 hours.	Rate of movement >1.5cm/hr and <3cm/hr, rate increasing; extensometer reading every 2 hours.	Rate of movement >3cm/hr. Cease readings on extensometer due to potential safety issues.

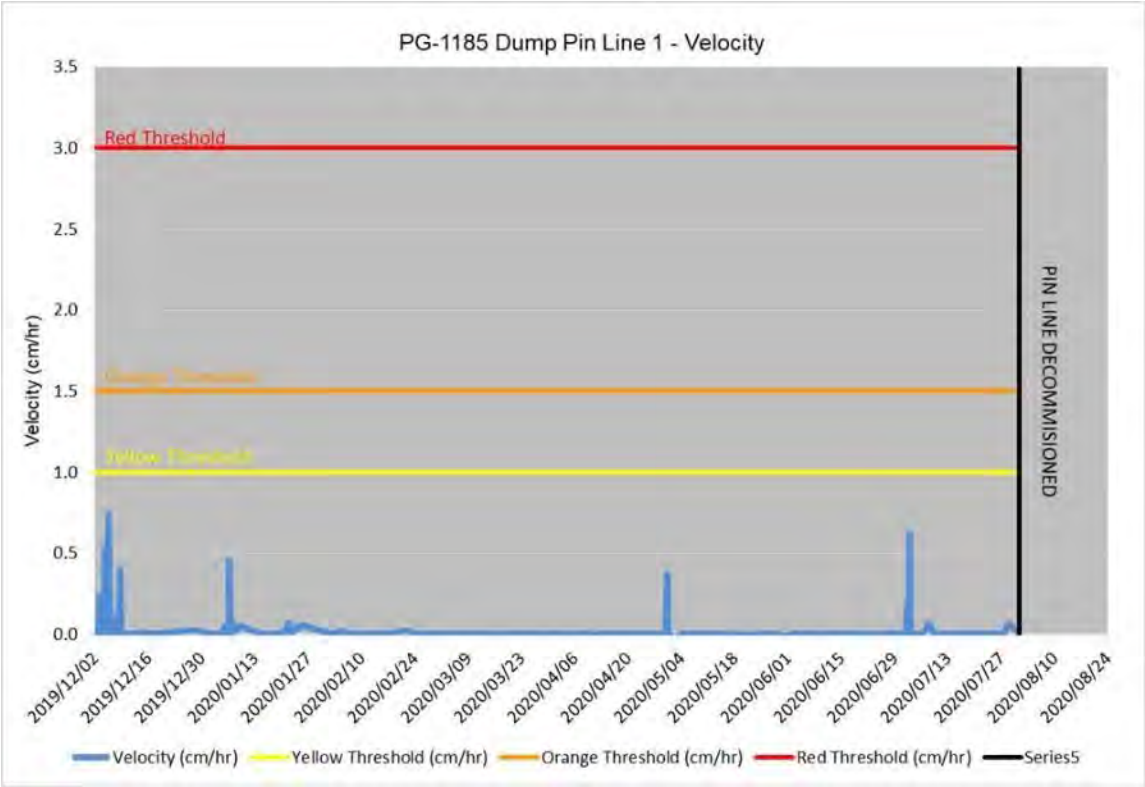

Figure 4.2-4: Total Discplacement for the 1185 WRSA Bench Pin Line 1 from Dec 2019 to July 2020

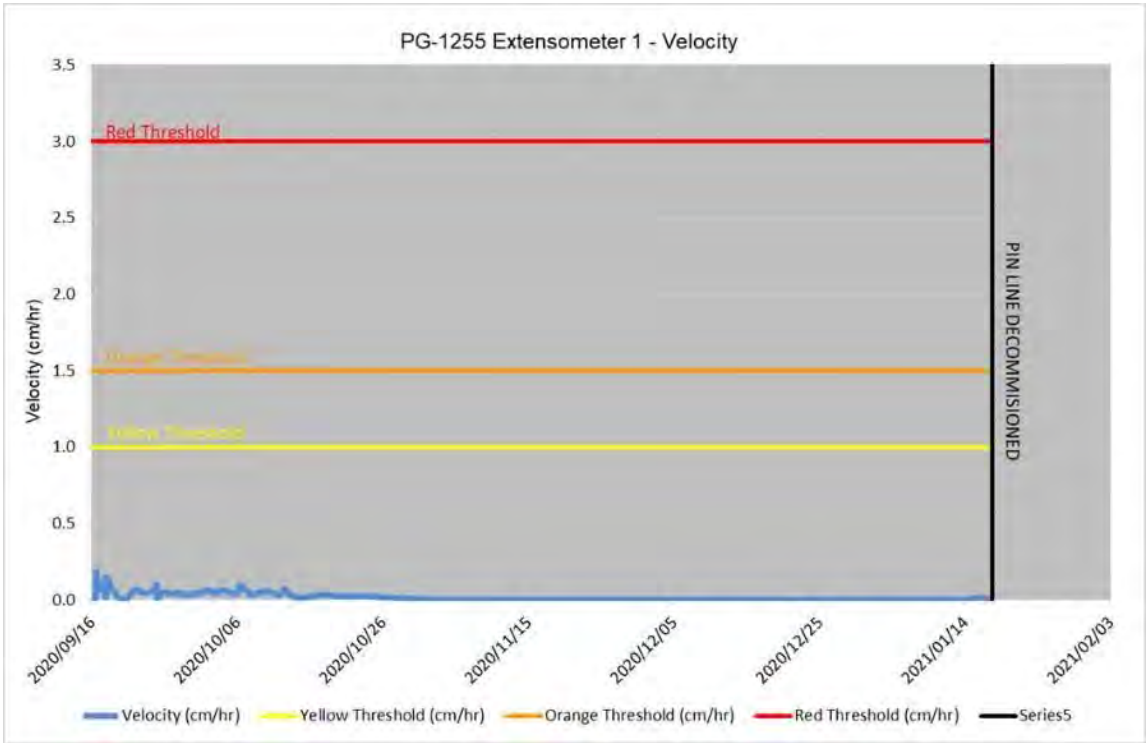

Figure 4.2-5: Total Discplacement for the 1255 WRSA Bench Extensometer 1 from Sep 2020 to Jan 2021

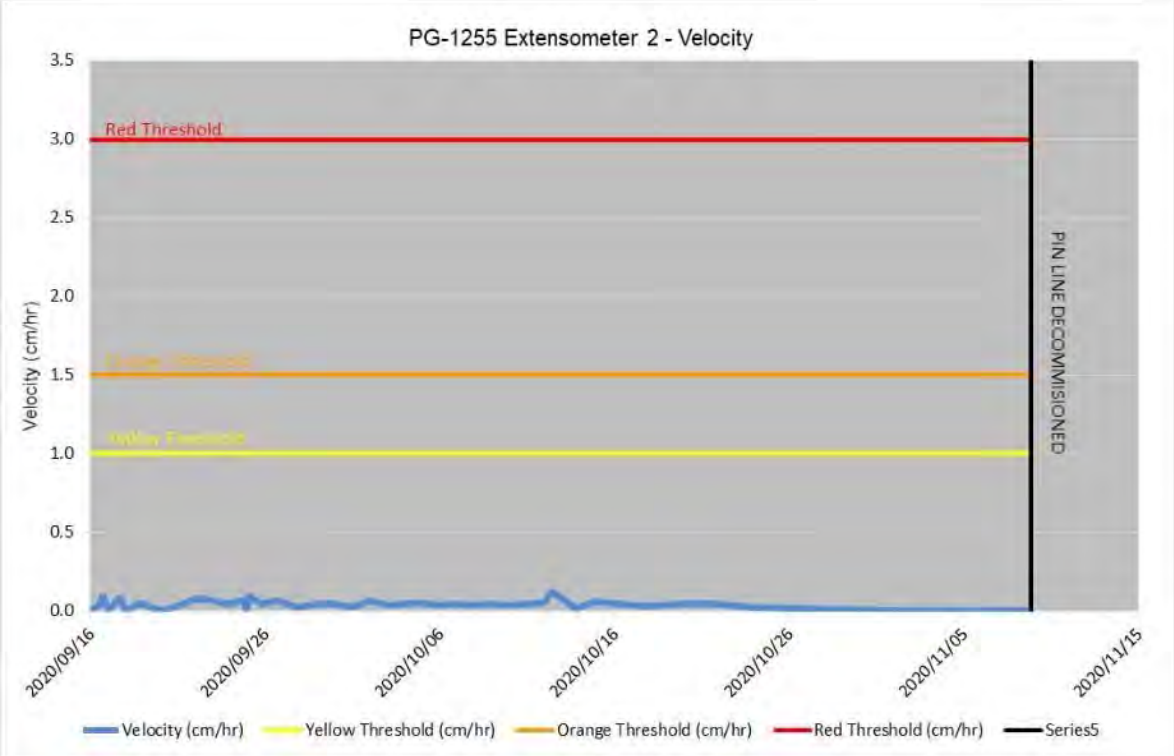

Figure 4.2-6: Total Discplacement for the 1255 WRSA Bench Extensometer 2 from Sep 2020 to Nov 2020

4.3 Heap Leach Facility and Process Facilities

Clearing and grubbing for Phase 1B of the HLF (from the Phase 1A boundary at 990 masl elevation to the Phase 1 interceptor ditch at an approximate elevation of 1050 masl) commenced in Q1 2020. Grading, underdrain excavation and a test pitting program was then completed. The test pitting program was used to identify and delineate the areas of the subgrade with ice rich or frost-susceptible soils as required in the Foundation Improvement Plan (StrataGold, 2017). Ice rich and frost susceptible soils identified were then removed from within the Phase 1B Heap Pad area. Upon completion of the foundation preparation works, the underdrain headers and lateral drains were installed, final grading undertaken, GCL and textured LLDPE liner installed, and PLS collection piping and ODF material placed. The HLF Phase 1B Record of Construction completed by Forte Dynamics Inc. is provided as Appendix A1 to this report.

On October 14, 2020, an annual inspection was completed by Mr. Clint Green P.E. of Forte Dynamics. Figure 4.3-1 presents a composited drone shot that is representative of the site during the Engineer of Record's site inspection (see Section 4.3.1).

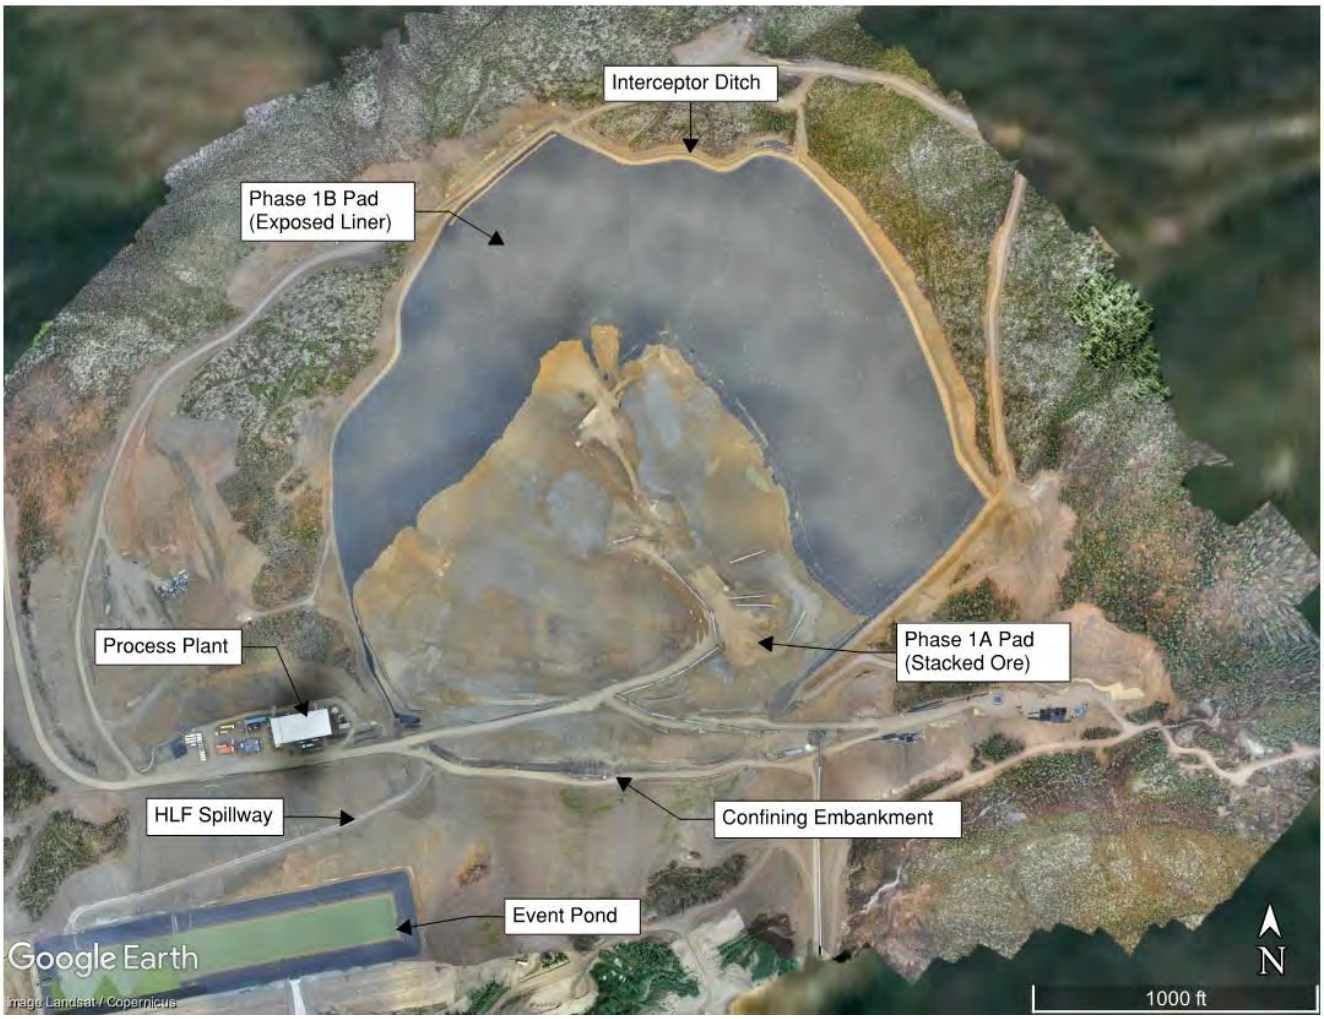

Figure 4.3-1: Drone Photo Map of HLF and Process Facilities September 2020

Three standpipes with vibrating wire piezometers are installed through the HLF. Piezometer P1 was installed into the dam foundation bedrock and Piezometers P2 and P3 were installed in the dam fill just above the western and eastern underdrains, respectively. The P1 level data appears to have remained unchanged from previous readings taken during the 2019 annual inspection. The P2 and P3 sensors still appear to be dry and small fluctuations are likely attributed to the changes in barometric pressure. The water levels are presented in Figure 4.3-2, Figure 4.3-3 and Figure 4.3-4.

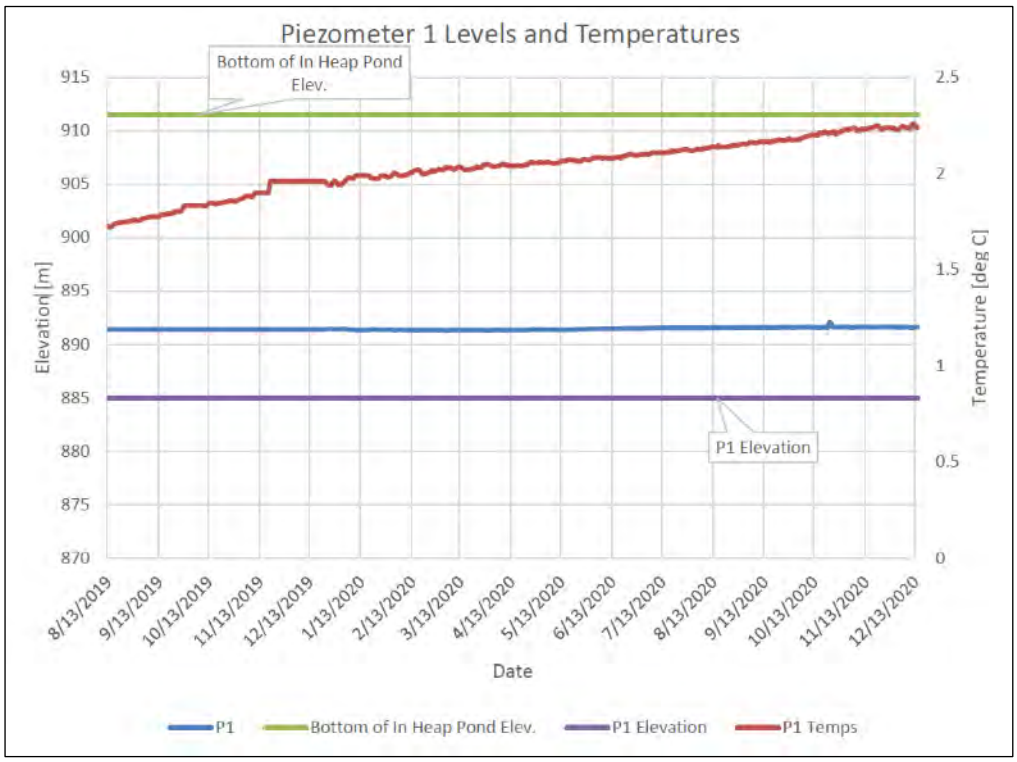

Figure 4.3-2: Piezometer P1 Readings

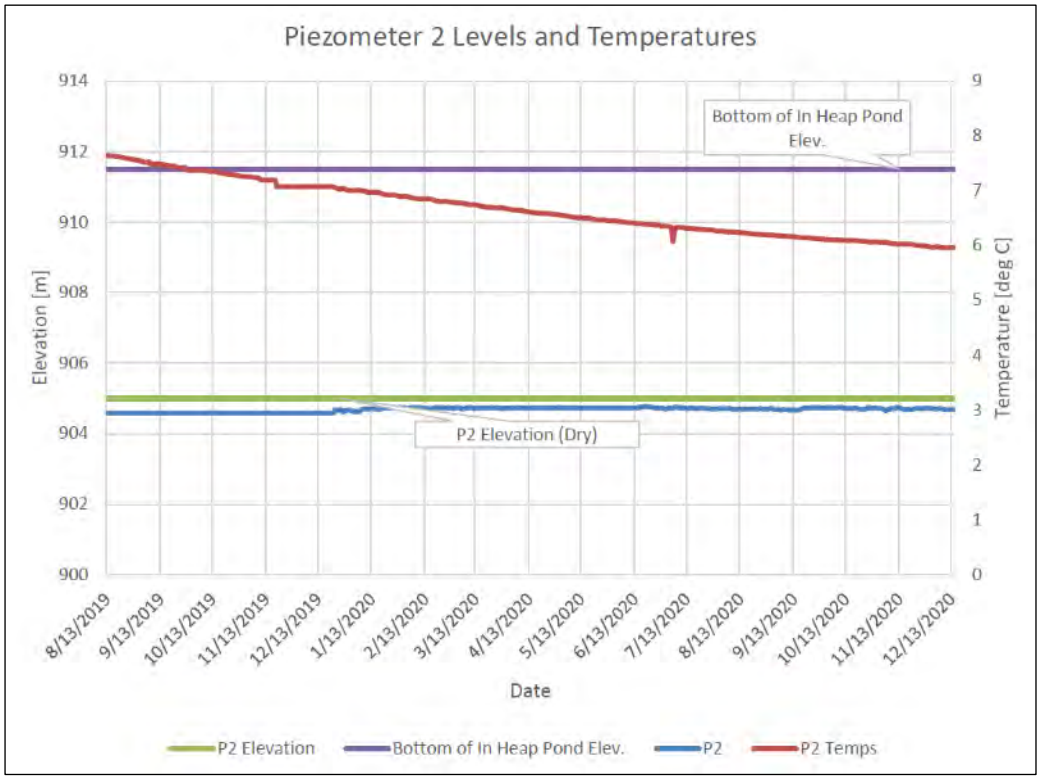

Figure 4.3-3: Piezometer P2 Readings

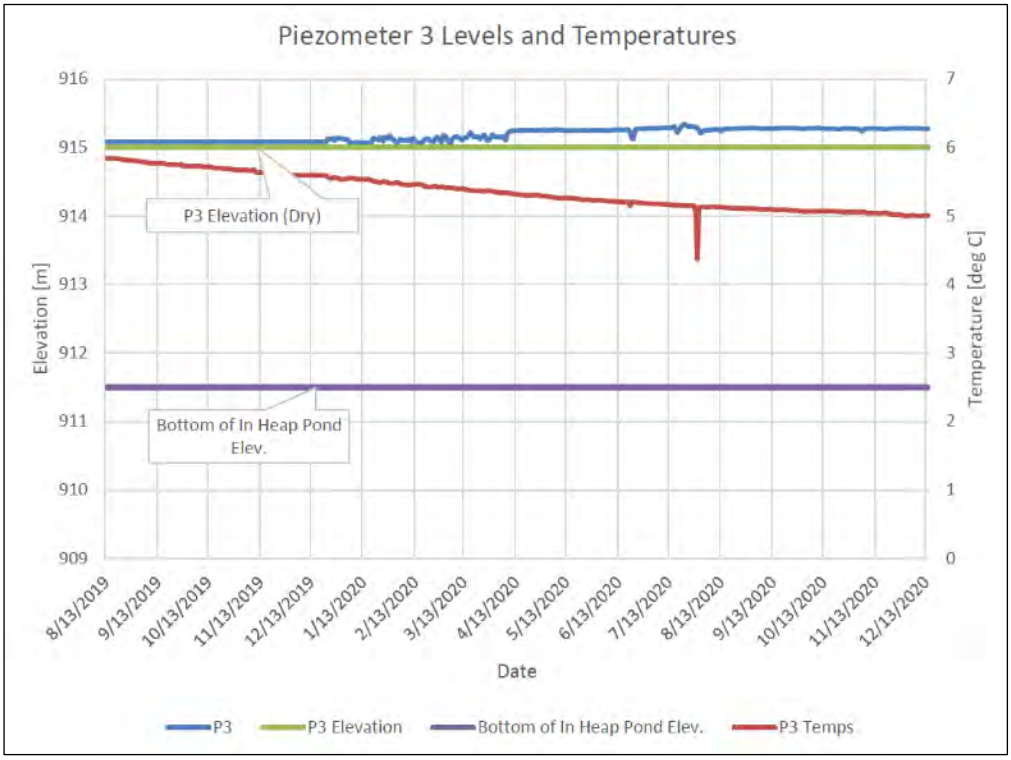

Figure 4.3-4: Piezometer P3 Readings

An inclinometer casing was also installed through the HLF dam crest and installation details are presented in BGC (2018). Results from an RST MEMS Digital inclinometer System show negligible movement or deformation of the embankment as shown in Appendix B3.

There were no stability incidents anywhere on the HLF, including the embankment, events pond embankment, or stacked ore or in any of the adjoining areas and access roads.

4.3.1 Stability Inspection

4.3.1.1 Engineer of Record Physical Stability Inspection

Heap Leach Facility

The 2020 inspection was completed by Mr. Clint Green, P.E. of Forte Dynamics on October 14, 2020. The 2020 EOR Annual Inspection Report was prepared under the direct supervision of Mr. Barry Carlson, P.Eng as the HLF Engineer of Record with the assistance of Mr. Green and Mr. Will Reinhardt, P.E. of Forte Dynamics. The full inspection report is provided as Appendix B3 and the general site layout of the HLF facility is shown in Figure 4.3-1.

At the time of the inspection, the PLS pipework had been completed through Phase 1A and the ODF had been advanced to 995 masl along the east perimeter and 1005 masl into Phase 1B footprint along the west.

The inspection took place on site and was in general conformance with the VGC HLF Operations, Maintenance, and Surveillance (OMS) Manual. The scope of this annual dam inspection work was limited to:

- Visual inspection of the HLF and dam by the EOR, including taking appropriate photographs of the observed conditions;
- Review of routine inspection records prepared by operating personnel in the past year;
- Review whether or not recommendations from previous year's inspection had been addressed, and any incidents or actions arising from those previous recommendations;
- Review of instrumentation and monitoring data;
- Review of the previous year's operations including reports of any incidents (and remedial measures) that may have occurred;
- Evaluation of the structural performance of the embankment and related components and identify any potential safety deficiencies or recommended items that need to be addressed in the coming year;
- Review of construction records, quality assurance and quality control (QA/QC) data and as-built information on facility construction; and
- Evaluation of the OMS Manual to assess the need for updating.

Based on the findings of the annual inspection, the EOR provided a summary of recommended maintenance and monitoring action items for the HLF. Each action item was assigned a priority ranking level from 1 to 3 with 1 indicating the highest priority and 3 indicating the lowest. A ranking of 3 was generally assigned to items that would be considered routine inspection or monitoring. A summary of recommended maintenance and monitoring action items and VGC's response and schedule to complete are presented in Table 4.3-1.

Table 4.3-1: Recommended Maintenance and Monitoring Action Items from 2019 EOR Inspection and Site Response

Name of Structures	Maintenance/Monitoring Actions Required					VGC Response
	Routine Monitoring/ Maintenance	Increased Monitoring/ Maintenance	Remediation and Engineering Review Necessary	Priority Level[1]	Recommendations	
Heap Leach Facility (HLF)	Yes	-	Yes	3	Continue the routine inspection and monitoring of the dam, abutments, emergency spillway, discharge outlet areas, LDRS sump, PLSsump, pad liner, PLS and barren pipes, monitoring wells (P-1, P-2, P-3), and pond level as per the current OMS manual.	Will continue routine inspection and monitoring of HLF as per OMS.
				2	Document using routine inspection forms all unusual/adverse conditions observed, as well as maintenance work undertaken.	Will develop standard inspection forms for HLF observations /maintenance works before end of Q2, 2021. Routine inspections will continue.
				1	Install pad cell piezometers in Phase 1B footprint per drawing 109005-51100-03-CV-F005 Rev 2 (August 2020).	Will be completed during summer 2021 during ODF placement.
				1	Continue collecting inclinometer readings in casing INC-1 quarterly per OMS.	Schedule being maintained and data collection occurring quarterly.
				2	Instrument setup for continuous data download.	Instrument received on site, mounting and installation to be completed by end of April 2021.
				1	Automate the evacuation of the LDRS sump based on water level readings (no greater than 0.5m above bottom end of LDRS pipe should be allowed).	Work order placed in Project resource planning system. Component sourcing ongoing.
				1	Place additional coarse fill on the dam crest to limit ponding and construct a small swale (see Appendix E of the EOR Inspection Report) along the crest of the underdrain containment area to direct surface water flows to the west edge of the monitoring vault area.	Scheduled to be complete post freshet 2021.
				2	Install signage to clearly mark the HLF east underdrain outlet. Not primary outlet for underdrain seepage as water is pumped back to process, however the underdrain outlet still requires marking.	Signage prepared and will be installed post freshet 2021.
				1	Review of the underdrain monitoring vaults pumps' design. Procure spare pump for underdrain monitoring vault and store on site.	Backup pump available on site for rapid deployment as necessary.
				1	Install survey monuments along embankment crest and take initial readings.	Survey monuments will be installed post freshet 2021.

Name of Structures	Maintenance/Monitoring Actions Required					VGC Response
	Routine Monitoring/ Maintenance	Increased Monitoring/ Maintenance	Remediation and Engineering Review Necessary	Priority Level[1]	Recommendations	
				1	Place additional coarse fill along the berm on the south side of the Process Plant to divert runoff and re-grade the spillway access road to drain into the HLF Spillway.	Work scope considered part of freshet management planning. Will be complete in 2021 when conditions allow.
Events Pond (EP)	Yes	-	-	3	Continue the routine inspection and monitoring of the embankment, abutments, pond liner, LDRS sump, and pond level as per the current OMS manual.	Will continue routine inspection and monitoring of Events Pond as per OMS.
				2	Instrument setup for continuous data download.	Instrument received on site, mounting and installation to be completed by end of April 2021.
				2	Document using routine inspection forms all unusual/adverse conditions observed, as well as maintenance work undertaken.	Will develop standard inspection forms for Events Pond observations /maintenance works before end of Q2, 2021. Routine inspections will continue.
				1	Automate the evacuation of the LDRS sump based on water level readings (no greater than 0.5m above bottom end of LDRS pipe should be allowed).	Work order placed in Project resource planning system. Component sourcing ongoing.
				2	Install signage to clearly mark the Event Pond underdrain outlet.	Signage prepared and will be installed post freshet 2021.
HLF Spillway	Yes	-	Yes	3	Continue the routine inspection and monitoring of the spillway armoring, adjacent access road, seepage collection pipe outlet as per the current OMS manual.	Will continue routine inspection and monitoring of HLF Spillway as per OMS.
				2	Document using routine inspection forms all unusual/adverse conditions observed, as well as maintenance work undertaken.	Will develop standard inspection forms for HLF Spillway observations /maintenance works before end of Q2, 2021. Routine inspections will continue.
				1	Remediation of the significant surface erosion along the downstream face of the HLF spillway access road.	Scheduled to be complete during summer of 2021.
				1	Placement of riprap along the groin between HLF spillway access road and HLF embankment to mitigate further rill or gullies from forming	Scheduled to be complete during summer of 2021.
Emergency Spillway	Yes	-	-	3	Continue the routine inspection and monitoring of the spillway armoring, adjacent access road, seepage collection pipe outlet as per the current OMS manual.	Will continue routine inspection and monitoring of Emergency Spillway, adjacent road, seepage

Name of Structures	Maintenance/Monitoring Actions Required					VGC Response
	Routine Monitoring/ Maintenance	Increased Monitoring/ Maintenance	Remediation and Engineering Review Necessary	Priority Level[1]	Recommendations	
						collection pipe outlet as per OMS.
				2	Document using routine inspection forms all unusual/adverse conditions observed, as well as maintenance work undertaken.	Will develop standard inspection forms for observations /maintenance works before end of Q2, 2021. Routine inspections will continue.

Notes:

1 Priority Levels are assigned from 1 to 3. 1 indicating highest priority and 3 indicating lowest priority. A ranking of 3 was generally assigned to items that would be considered routine inspection or monitoring.

4.3.2 Status Report on Backup Equipment and Supplies for Emergency Management

A range of backup equipment and supplies are maintained at site to ensure that solution within the HLF can be managed effectively in the event of an emergency. At the time of this report, equipment necessary for the emergency management of the HLF was available and operational.

The key backup equipment for management of solution for the HLF are all related to the pumping system (i.e., the pump components and equipment to power the pump components).

4.3.2.1 **PLS Pumps**

The HLF includes five inclined steel casings that terminate in the In-Heap Pond Pregnant Leach Solution (PLS) Sump. The casings house the PLS pumps for transferring gold bearing solution to the ADR Plant (Photo 4.3-1). There are currently five SAER Elettropompe 6S-302 pumps installed within the casings which includes an installed spare as only 4 pumps are operated at once (to provide installed n+1 redundancy).

Photo 4.3-1: PLS Casings and Pump Configuration – June 15, 2020

Manufacturer recommenced maintenance activities and schedules are programmed into the Project resource planning software to alert maintenance personnel when routine maintenance is required. Additionally, any observations of performance issues by process and maintenance personnel are logged in the resources planning system to allow for the tracking of work order requests from entry through to completion. Planned preventative

and routine maintenance was completed by the maintenance personnel and the installed pumps are all operating as intended. To date, the installed spared pump has not been required. An unused spare pump is also available on the site as a specific replacement for any of the installed pumps.

Photo 4.3-2: PLS Pump Receiving Routine Maintenance – May 7, 2020

4.3.2.2 **Barren Solution Pumps**

PLS is pumped from the In-Heap Pond to the ADR Plant for gold recovery and amendment of cyanide and then recycled to the HLF as barren solution by the barren solution pumps. Under an emergency scenario, solution pumped from the In-Heap Pond would only need to be recirculated back to the HLF thus the barren solution pumps represent a critical component for emergency management. The ADR Plant includes five barren solution pumps that are operated in an n+1 configuration.

As with all fixed and mobile equipment, maintenance of the barren solution pumps is tracked through the Enterprise Resource Planning (ERP) software platform. The ERP allows for the management of maintenance work orders and work flows, planning, scheduling through completion, close-out and record keeping. Records of any routine or follow-up maintenance activities for the barren solution pumps are kept by the ERP software on the Project site.

Photo 4.3-3: Barren Solution Pump Maintenance – December 7, 2020

4.3.2.3 **Power Supply**

Primary power for operations on the site is provided by the Yukon Energy Corporation electrical grid. There are also three diesel generators on the site, each rated for 1650 KW output (Photo 4.3-4). Each generator has weekly work orders inputted in the ERP software that details the daily checks to be conducted to complete the weekly work order. The daily checks, conducted by qualified maintenance staff, include logging engine hours, checking oil, coolant and other fluid levels, and general observations (including inspection for leaks). In addition to the daily checks required to complete the weekly work orders, routine service is conducted in accordance with manufacturer's instructions and the maintenance department standards. At the end of 2020, 851, 518, and 943 operating hours had been logged on generators 101, 102 and 103, respectively. The ERP software shows the completion of weekly checks and 500 hours preventative maintenance, service and inspection for each generator.

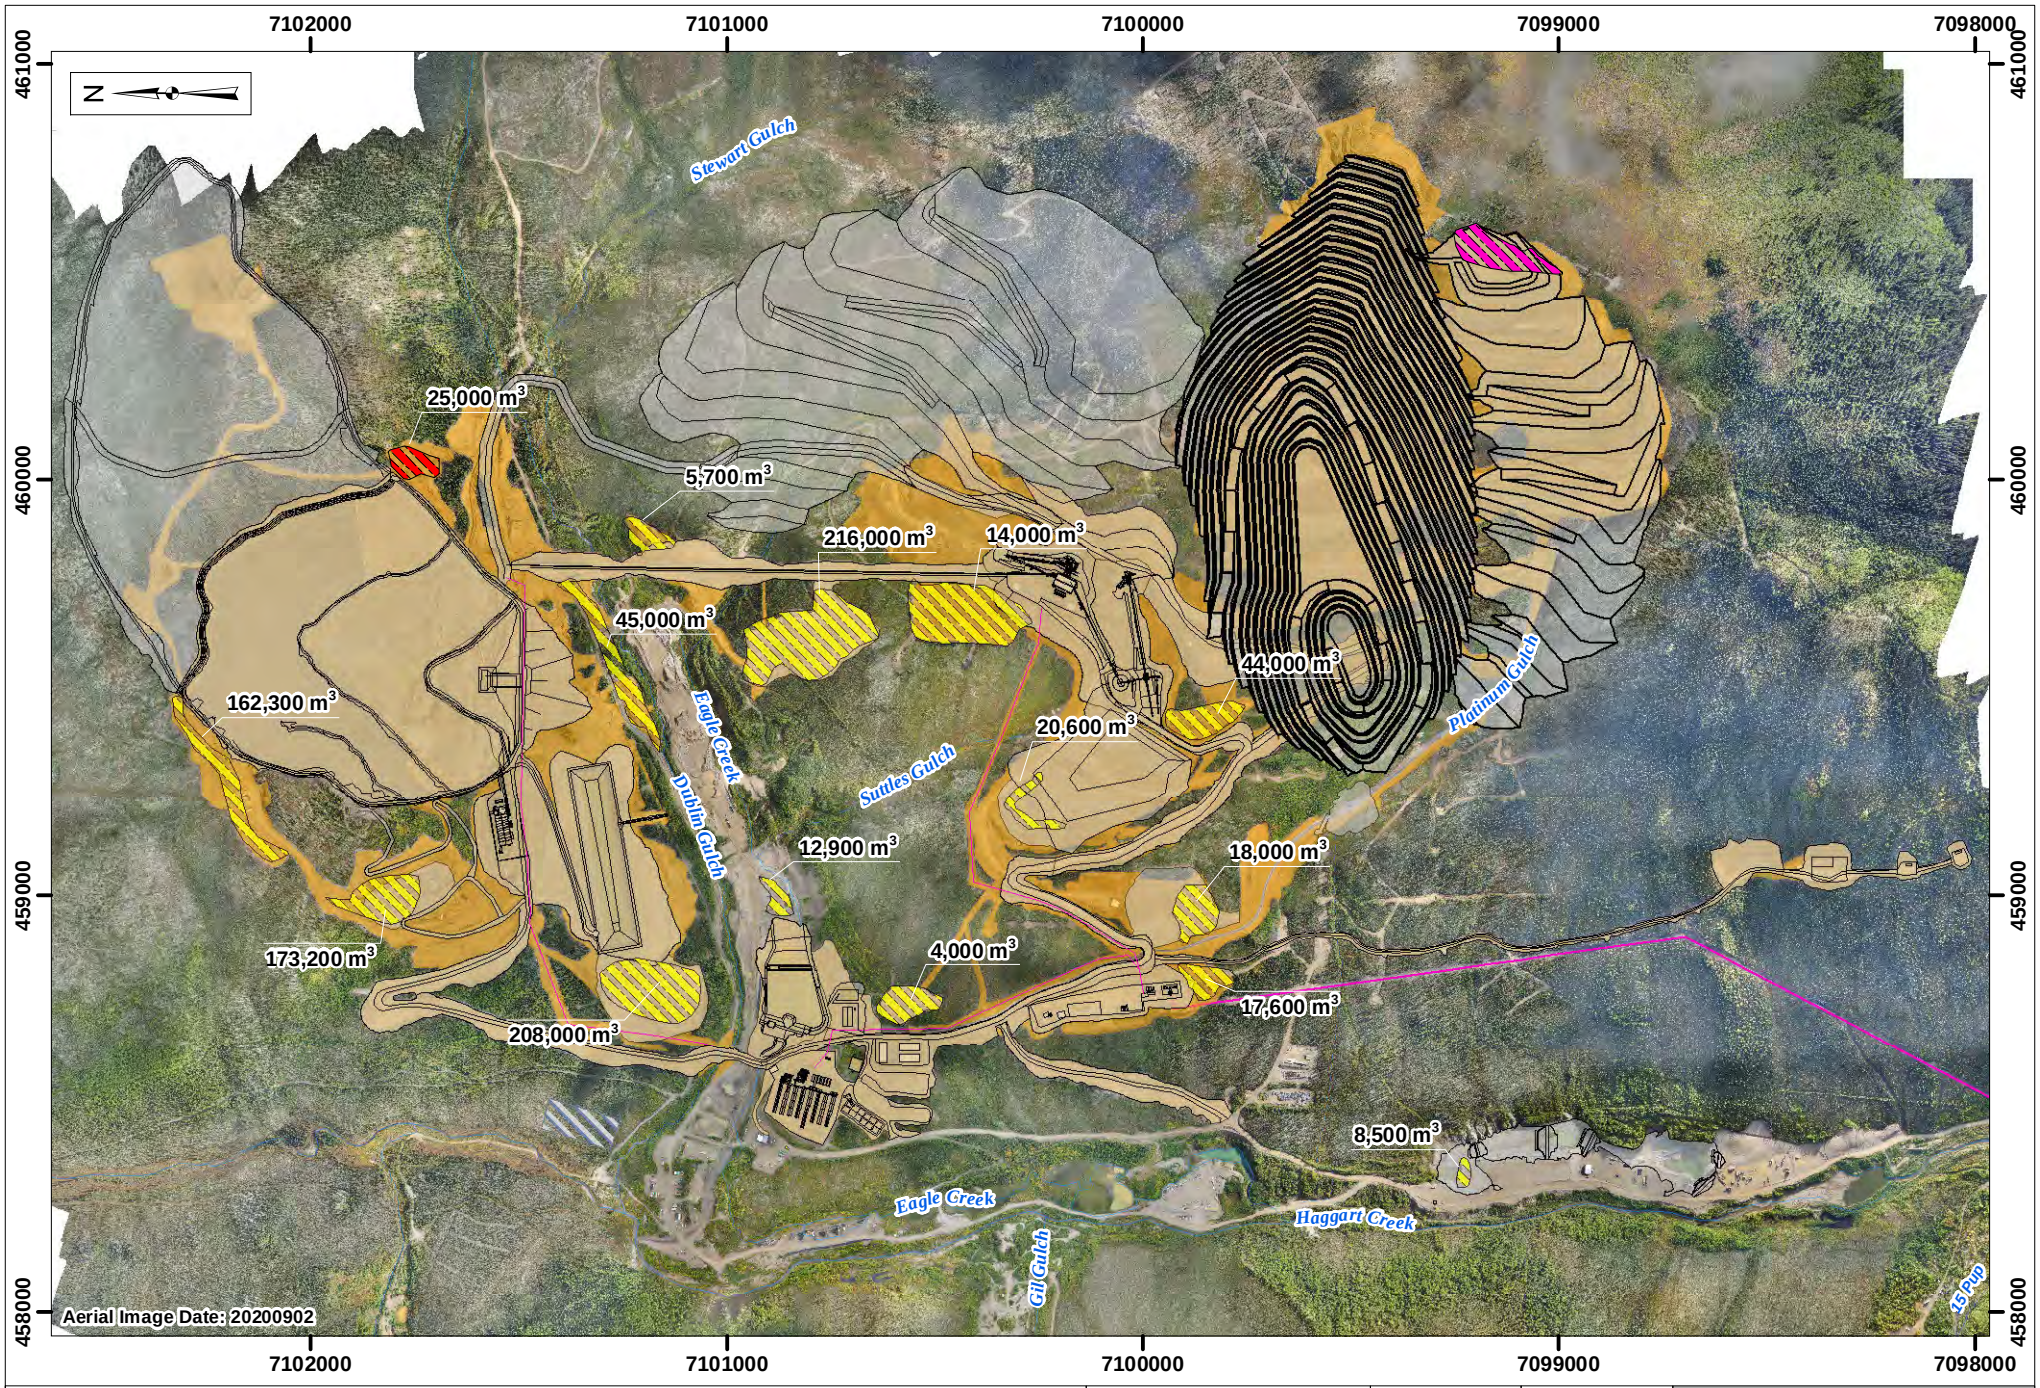

Photo 4.3-4: Project Substation and Back-Up Generators - 2019

4.4 Material Storage and Stockpile Management Areas

During construction and operational activities to date, various material types have been encountered that have not met construction specifications but would likely prove suitable for cover materials for facility closure. These materials have been either relocated to dedicated topsoil and overburden storage areas or have been stored locally to support future reclamation activities. The location and volumes of these materials are depicted in Figure 4.4-1.

Monitoring equipment to determine the stability of these stockpiles have not been employed to date due to their relatively small sizes and minimal consequence of failure. VGC will continue to work with the independent third-party geotechnical reviewers (discussed in section 4.5) to ensure that if evidence of movement is observed the stability of the stockpiles are addressed appropriately.

Legend:

- Facility Footprint
- Current Construction and Mining Impacted
- Reserved Area
- Material Stockpile - 2020
- Material Stockpile - 2019 Placed as Cover
- Material Stockpile - 2019

4.5 Engineer's Physical Stability Annual Inspection

As required by Section 13.2 of QML-0011, a physical stability assessment of all engineered structures, works and installations at the Project was undertaken by an independent engineer between September 23rd and 24th, 2020. The findings of the assessment are provided in Appendix R.

The assessment undertaken in 2020 included the following facilities and structures:

- Open Pit;
- Platinum Gulch Dump;
- Lower Dublin South (Control) Pond and Area;
- Primary Crusher;
- Secondary/Tertiary Crusher;
- Secondary Stockpile;
- Absorption, Desorption and Recovery Plant Area;
- Heap Leach Facility, Embankment and Area;
- Event Pond;
- Ditches A, B, and C;
- Former Nuway Crusher Pad;
- Orica Laydown;
- Various Un-named Stockpiles.

The Engineer's report included sixteen recommendations for the thirteen specific areas that were observed, and in the opinion of the independent engineer required further consideration. Table 4.5-1 provides the recommendations per area, VGC's response and the schedule to complete the response.

Table 4.5-1: Recommendations from Independent Engineer and Site Response

AllNorth Report - Observations	AllNorth Recommendations	VGC Response	Schedule to Complete
General Report Comment	**18.1 - General** **1.** VGC should assign a qualified, on site, individual to be responsible for monitoring and documentation of any mass earth structures that have significant risks in the case of a failure. The individual should develop a standard operating procedure for the monitoring and risk management of these structures. This individual should be responsible for coordination with a qualified professional to review monitoring data for concerns and trends, if they are not qualified themselves.	Monitoring of structures is completed by the Technical Services Department under the direction of the Technical Services Superintendent working closely with the EOR for the areas while following standard operating procedures. The Technical Services Superintendent is the EOR for a number of the Engineered Structures on the Mine site.	Ongoing
	18.1 - General **2.** VGC should continue to assign individuals to document and be responsible for the monitoring and construction of any structures to determine if the structures are constructed in accordance with design. Any variations between design documents and final construction should be included in final record drawings.	Monitoring of structures including construction review to meet design specifications is done by the Technical Services department under the direction of the Technical Services Superintendent working closely with the EOR for the areas. Construction reports and as-built drawings document variations or minor modification from IFC designs.	On-going
	18.1 - General **3.** Any finalized construction of mass earth structures should include a final construction report that includes any operational and maintenance requirements (if any) to ensure stability of the structure.	As per both the Quartz Mining License and Water Use Licence, the EOR provides final construction reports of Engineered Structures, which includes requirements for maintenance as needed, once the structures are complete.	On-going
	18.1 - General **4.** VGC should consider a monitoring program to assist in early warning and detection of any movements in mass earth structures. Such a program might use permanent survey points, slope inclinometers, piezometers, or other tools to measure internal/external movements and pore water pressures. Such a monitoring program should be developed with the assistance of and be implemented with the oversight of a qualified professional.	Monitoring programs have been developed, are in use, and undergoing further refinement by the Technical Services department with the oversight of a qualified professional. In addition to routine visual inspection, monitoring for physical stability include the following: • Pit wall and dump bi weekly survey using unmanned aerial vehicle or drone; • Extensometer installation on active lifts of the dump with regular movement calculations conducted; • Vibrating wire piezometer water level readings in the HLF dam foundation bedrock and dam fill just above the western and eastern underdrains to determine pore water pressures; and,	On-going

		• Slope inclinometer readings in the HLF dam crest.	
	18.1 - General **5.** For any stockpiles, cut slopes, and/or fill slopes with over-steepened slopes that do not require immediate rectification (due to proximity to structures, roadways, active work areas, etc) VGC should still cordon off the area above and/or below the over-steepened slope depending on what would be accessible to site staff.	VGC will conduct an internal assessment of areas that may pose a risk to site staff and cordon off those areas post freshet 2021	Q2 2021
3 **Lower Dublin South (Control) Pond**	**18.2 - LDSP (Control Pond)** **1.** Address erosion occurring on the southwest slope of the pond. This is likely due to water infiltration from Ditch A or the adjacent culvert outlet. This section of ditch may require further armoring or installation of a liner to properly direct water away from the Control Pond slope.	Upgrade work to comply with a directive given by a Yukon Government Department of Energy, Mines and Resources (EMR) Inspector which included the installation of an impermeable liner in Ditch A was completed after the field visit by the Auditor. It is assumed that this work will resolve any seepage concerns associated with this location. In 2019 and 2020, reseeding of the area to stabilize the slope was completed. The effectiveness of the reseeding will be inspected in 2021.	Complete Ongoing
4 **Secondary Stockpile**	**18.3 - Secondary Stockpile** **1.** Tie the perimeter ditch into the collection sump.	The secondary stockpile ditch will be cleaned out and tied into Ditch A in 2021.	Q1/Q2 2021
5 **Heap Leach Facility**	**18.4 - HLF** **1.** Continue to monitor the cut slopes around the perimeter of the HLF for erosion. Maintain the upper bench and remove sloughing material as required.	This area will be monitored and repaired with the continued construction and eventual stacking of ore into the Phase 1B expansion area. The Engineer of Record for the HLF has subsequently provided the Phase 1B as built report and the annual HLF inspection report which assessed HLF conditions in greater detail. The deficiencies identified by the EOR will addressed as necessary 2021 as described in section 4.3.	Q4 2020, 2021
	2. Monitor the toe slope below the HLF for rill erosion and revegetate and stabilize the slopes as needed.	As shown in Figure 19 of the report, the embankment face has been reseeded and is showing good vegetation growth. The area will continue to be monitored and will be addressed as necessary based on the recommendations of the Engineer of Record.	Ongoing
	3. Consider re-grading temporary access road (slope towards interception ditch) above HLF to prevent pooling water forming. **4.** Monitor soft/deflecting areas of temporary access road above HLF, particularly above HLF liner anchor trench.	The temporary access road area will be monitored in the spring of 2021 to establish if re-grading is necessary. This section of the HLF will ultimately be reworked to allow for the construction of Phase 2 of the HLF H2 2021. The Engineer of Record for the HLF is currently preparing the Phase 1B as built report which will include commentary and	Q1/Q2 2021

		recommendations on areas of the current configuration of the HLF which may require additional maintenance or upgrade. Any deficiencies identified by the EOR will addressed as necessary in H1 2021.	
	5. Check Phase 1B Interception Ditch design and complete construction if needed for sections that are lined but not armored. Check design for sloping requirements to outfall and confirm whether installed ditch meets design and monitor ditch for potential of pooling water.	The Engineer of Record for the HLF is currently preparing the Phase 1B as built report which will include commentary and recommendations on areas of the current configuration of the HLF which may require additional maintenance or upgrade. Any deficiencies identified by the EOR will addressed as necessary in H1 2021.	Q1/Q2 2021
8 Primary Crusher	**18.7 - Primary Crusher and MSE Wall** **1.** A monitoring program should be established using regular survey of the MSE walls, to detect any potential movement. 3D scanning equipment would provide an adequate monitoring program, with scan frequency to be determined between site and an experienced professional.	The development of monitoring program for the MSE walls is currently scheduled for Q1 2021 for execution in Q2 2021.	Q2 2021
9 Secondary/ Tertiary Crusher	**18.8 - Secondary/Tertiary Crusher and MSE Wall** **1.** A monitoring program should be established using regular survey of the MSE walls, to detect any potential movement. 3D scanning equipment would provide an adequate monitoring program, with scan frequency to be determined between site and an experienced professional.	The development of monitoring program for the MSE walls is currently scheduled for Q1 2021 for execution in Q2 2021.	Q2 2021
10 Adsorption, Desorption, and Recovery Plant (ADR)	**18.9 - ADR** **1.** Review engineering requirements for the North Toe Ditch to confirm ditch size, and need for rock armoring. Toe ditch is currently tied into the roadside ditch, which should also be reviewed for engineering requirements. Recommend reviewing hydraulic design of both ditches to determine what is necessary.	Review of design will be completed if surface runoff is observed to be above the carrying capacity of the ditch. To date, no observations of uncontrolled surface runoff has been observed in this ditch.	As necessary
11 Event Pond	**18.10 - Event Pond** **1.** Monitor minor erosion of cut slopes and maintain as required.	Revegetation work was undertaken in 2020 to stabilize this area. The performance of revegetation measures will be monitored during 2021 and maintained/improved as necessary.	Ongoing
	2. Monitor pooling water above the North side of the Event Pond and regrade area to prevent pool formation or install a water handling system (sump pumps, etc.).	The area will be monitored on an ongoing basis to determine if the installation of a water handling system or additional grading to improve drainage is warranted.	As necessary
	3. Monitor material deposits on HLF spillway and Event Pond to ensure the spillway and pond designs are not compromised through either blockage of flow or reduced pond capacity.	The area will be monitored on an ongoing basis to ensure that flow capacity in the spillway and storage volume in the Events Pond are sufficient to meet the design specifications.	Ongoing

		In accordance with the conditions of the Type A WUL for the Mine, by March 31 of each year, all ditches and culverts will be cleared of ice, snow and debris that would affect their operational capacity and be maintained free of such obstruction until at least October 31. VGC considers this requirement to also be applicable to all spillways.	
12 Ditch A	**18.11 - Ditch A** **1.** Un-block the feeder ditch/culvert which will carry flow from the Secondary Stockpile perimeter ditch to Ditch A.	The secondary stockpile ditch will be cleaned out and tied into Ditch A in 2021.	Q1, Q2 2021
13 Ditch B	**18.12 - Ditch B** **1.** Continue to manage sediment entering the ditch from the cut slopes on the downstream end. Silt fencing is currently in place to address this. **2.** Monitor erosion above South side of Ditch B and consider re-sloping area as needed.	The areas identified were included in the 2019 revegetation program to promote stability of the area. Reseeding and willow staking were completed and the performance of this work will be monitored during 2021 and maintained/improved as necessary. Silt fencing will be inspected after freshet 2021 and repaired or added to as may be necessary	Ongoing Q2 2021
14 Ditch C	**18.13 - Ditch C** **1.** Monitor pooling water above LDSP outlet to Ditch C. Consider tieing in pooled water discharge ditch with Ditch C to prevent erosion and scouring on North side of Ditch C.	The temporary water pooling in response to rainfall events will be monitored to ensure that it does not result in erosion and scouring. The area identified was included in the 2019 revegetation program to reduce erosion and scouring potential and the performance of this work will be monitored during 2021 and maintained/improved as necessary.	Ongoing
15 Former Nuway Crusher Pad	**18.14 - Former Nuway Crusher Pad** **1.** Pull back over-steepened slopes prior to utilizing this area. Flag over-steepened slopes in the meantime to protect site staff.	The area will be inspected post freshet with areas flagged as necessary to ensure staff safety. This area will ultimately be within Phase 3 of the HLF and as such will be regarded in preparation for liner installation and ore stacking.	Ongoing.
16 Orica Laydown	**18.15 - Orica Laydown** 1. Monitor perimeter sump for flow interruptions/blockages and consider re-trenching if pooled water observed.	This area will be inspected prior to freshet to ensure that there are no blockages and that the sump is performing as expected. If maintenance work is warranted, it will be undertaken as necessary.	Q1/Q2 2021
17 Un-Named Stockpile Area	**18.16 - Un-Named Stockpile Area** 1. Consider additional ditching and water management in the area to prevent scouring of the road surfaces and erosion around the stockpiles. Ditch water away from the laydown areas to prevent ponding.	This area will be inspected prior to freshet 2021 and additional ditching installed as necessary. This area will also be considered for the 2021 revegetation program.	Q1/Q2 2021

	2. Flag over-steepened slopes in area to protect site staff.	The area will be inspected post freshet with areas flagged as necessary to ensure staff safety.	

5 CYANIDE MANAGEMENT

Operations at the Eagle Gold Project follows practices and procedures described in the VGC Cyanide Management Plan (CMP) version 2019-02 and the associated Standard Operating Procedures (SOPs) which govern the procurement, delivery, storage handling, and use of sodium cyanide for mineral extraction purposes. The practices comply with the *International Cyanide Management Code* (ICMC), a globally accepted set of practices applied at international gold mining projects involving cyanide-based mineral extraction (ICMI 2016 and 2018).

In accordance with the requirements of QML-0011, QZ14-041-1, VGC engaged an independent third-party to complete an audit of the CMP and its execution consistent with the International Cyanide Management Code. As discussed in section 5.4 and Appendix S, minor items were identified by the third-party auditor which will be addressed through updates to the CMP and SOPs and alterations/improvements to certain site practices. The majority of the revisions recommended by the auditor are due to the preparation of the CMP in advance of the final as-built configuration of the Project and consideration of actual site operations. These updates are planned as part of the 2021 CMP audit cycle.

5.1 Transportation and Storage Controls

5.1.1 Transport

VGC continues to sole source cyanide for use on the Project site through a long-term cyanide supply contract with Cyanco Canada Inc. (Cyanco), an experienced ICMC-certified North American supplier. Cyanide supplied to the Project is manufactured at Cyanco's ICMC certified plant at Alvin, Texas. VGC established contractual conditions under which Cyanco assumes responsibility for management of the entire supply chain pursuant to ICMC requirements. For incidents in proximity to the mine, VGC will, on request from the transporter, assist with responding to a transportation related incident. Transportation to the Project by Cyanco is supported by Cyanco's Global Transportation Emergency Response Plan (GTERP), which includes the Emergency Response Assistance Plan for Canada. The emergency response capability and preparedness of the transporter is clearly set out in the ICMI Cyanide Transportation Verification Protocol (ICMI, 2016).

Cyanco, as part of the western supply chain re-certification process under the ICMC, included the transportation route to the Project as part of their audit. The process included auditing the operations and planning processes for Alaska Marine Lines, Alaska Marine Trucking and Canadian Lynden. The recertification process was officially completed on April 22, 2020 and the transportation route to the Eagle Gold Mine is now fully certified under the ICMC. During the reporting period there were no spills of cyanide documented during transportation.

5.1.2 Receipt, Handling, and Storage

Cyanide is delivered to the Project site in solid briquette form, in one tonne nylon "supersacks", overpacked in polyethylene-lined plywood pallet crates (known as Intermediate Bulk Containers or IBCs) within standard 20-foot steel intermodal containers.

VGC is responsible for unloading intermodal containers of cyanide upon receipt, and takes formal ownership of the product at that point. The product is received at a designated unloading and storage area adjacent to the ADR

plant building. The intermodal containers are configured so that the lockable doors are facing one another such that access to the door is restricted without movement of the entire container. When product is required for barren solution amendment, a single steel intermodal container is moved to the concrete unloading area immediately outside of the ADR Plant. The delivery area is marked with warning signs and spotters are utilized to prevent unauthorised passage of personnel and equipment while the cyanide intermodal containers are being offloaded.

The internal cyanide storage area is located inside the concrete lined plant area. The internal storage area provides warning signage at all entry doors, an audible and visual hydrogen cyanide (HCN) alarm and monitoring systems, combination safety shower and eyewash station, and dry powder fire extinguishers for use in an emergency.

5.2 Operational Controls

5.2.1 Facilities Monitoring and Inspections

The HLF infrastructure is monitored regularly according to SGC-CMP-SOP-007, "*Cyanide Facility Inspections"* and the VGC *HLF Operation, Maintenance and Surveillance Manual* (HLF OMS). Physical stability and integrity inspections of the Heap Pad and associated infrastructure are completed and recorded through supervisor and operator checklists, records are then filed on site by VGC Process department staff. Specific focus areas for inspections of cyanide related facilities are listed in Table 5.2-1.

Table 5.2-1: Cyanide Related Infrastructure Routine Inspection Areas

Facilities	Inspection Focus Area
Cyanide unloading and storage area	• Maintenance of general housekeeping practices, presence of water or debris • Proper segregated storage of incompatible materials • Integrity and proper positioning and stacking of stored intermodal containers and IBCs; according to or exceeding that specified by manufacturer specifications and best management practices. • Presence of properly rated fire extinguishers (non-carbon monoxide detectors) • Functionality of fixed HCN alarms • Legibility of hazard warning signage • Availability of Material Safety Data Sheets (MSDSs) for cyanide briquettes • Personnel spotters deployed during container unloading operations, to ensure restriction of access by unauthorized personnel • Use of appropriate operator PPE during unloading operations • Functionality of eyewashes/emergency showers and water supply line pressure • Condition of emergency response equipment and first aid storage cabinets
Cyanide bag cutter arrangement, mixing and storage tanks, and secondary containments	• Structural integrity, signs of corrosion, buildup of cyanide salts, or leakage (tanks, valves, pumps, and other piping system components) • Structural integrity, cracks, spalling, or deterioration of concrete impoundments • Functionality of fixed HCN alarms • Functionality of tank level indicators • Condition of chain hoist and bag lifting bridle • Functionality of eyewashes/emergency showers and water supply line pressure • Temperature, cleanliness, and condition of first aid storage cabinets • Condition of emergency response equipment and PPE • Use of appropriate operator PPE during mixing operations

Facilities	Inspection Focus Area
	• Legibility of hazard warning and direction flow signage • Integrity of lockout/tag-out mechanisms on major solution or containment drain valves • Maintenance of physical separation from chemically incompatible materials • Maintenance of general housekeeping practices, presence of spilled solution or debris
Incineration of cyanide packaging materials	• Legibility of hazard warning signage • Adequacy and integrity of security fencing, gate, and lock • Completeness of combustion of packaging residues • Control of windblown debris outside of fenced area • Evidence of animal intrusion
ADR plant and secondary containments	• Structural integrity, signs of corrosion, buildup of cyanide salts, or leakage involving process solution storage tanks, valves, pumps, and other piping system components • Structural integrity, cracks, spalling, or deterioration of concrete impoundments • Management of fluids in impoundments • Functionality of fixed HCN alarms • Functionality of tank level indicators • Functionality of eyewashes/emergency showers and water supply line pressure • Condition of emergency response equipment and PPE • Legibility of hazard warning and direction flow signage • Integrity of lockout/tag-out mechanisms on major solution or containment drain valves • Maintenance of physical separation from chemically incompatible materials • Maintenance of good general housekeeping practices, including routine cleanup of spilled or leaked solution or debris
Pregnant and barren solution pipelines and pumping stations/ containments	• Structural integrity, signs of corrosion, buildup of cyanide salts, or leakage (pipelines, valves, pumps, and other components) • Structural integrity, cracks, spalling, or deterioration of concrete impoundments • Functionality of eyewashes/emergency showers • Condition of emergency response equipment and PPE • Legibility of hazard warning and direction flow signage • Integrity of lockout/tag-out mechanisms on major solution or containment drain valves
HLF earthworks, risers, distribution lines, emitters, internal pond(s), and leak detection system	• Signs of erosion, slumps, or cracks in earthworks or the ore pile • Signs of pipeline/flange leakage, and associated ponding • Signs of ponding on HLF surface; if present, adequacy of screening or other appropriate avian exclusion devices • Signs of animal trails or intrusion • Management of fluids in impoundments • Functionality of leak detection system and maintenance of associated detection logs • Legibility of hazard warning and direction flow signage
External Events Pond and leak detection systems	• Adequacy of available freeboard • Tears or holes in liner material or signs of erosion or slumps in underlying earthworks • Signs of pipeline/flange leakage, and associated ponding • Adequacy of wildlife monitoring, fencing and/or avian exclusion devices • Signs of animal trails or intrusion • Functionality of leak detection system and maintenance of associated detection logs

Facilities	Inspection Focus Area
	• Legibility of hazard warning and direction flow signage
Surface water interceptor ditches	• Tears or holes in liner material (if lined) or signs of erosion, slumps, or cracks in earthworks • Signs of animal trails or intrusion • Signs of blockage or other surface runoff impediments

5.2.2 Wildlife Monitoring

The documentation and monitoring of wildlife related to cyanide management is conducted according to HLF area and Events Pond monitoring programs detailed in VGC's *Wildlife Protection Plan* and SOP SGC-CMP-SOP-011 "*Wildlife Mortality Reporting/Investigation"*. The objective of the monitoring is to confirm that wildlife access to process solution is restricted. This was ensured through the Wildlife Records Program that requires that all VGC employees report wildlife observations throughout the Project site and regular inspections completed by VGC Process and Environmental staff of the HLF area and Events Pond. Wildlife observations and incidents are documented and reported quarterly through the Environmental department as per QML-0011.

As an additional mitigation measure, VGC has deployed electronic propane sound cannons in the area of Events Pond throughout the summer and fall to deter wildlife, particularly migratory birds and water fowl from the pond.

As outlined in the CMP, a wildlife exclusion fence is to be installed around the perimeter of the Events Pond to prevent access by larger terrestrial wildlife. This fencing is planned for installation during 2021. The Events Pond has not received any direct overflow from the In-Heap Pond (via the spillway) and there has been no detection of cyanide in any laboratory sample for groundwater flow circulated to the Events Pond from the HLF underdrain monitoring vault.

There were no wildlife incidents associated with the Events Pond during the 2020 reporting period. In July 2020, there was one documented incident of a bird mortality on the HLF. The non-SARA listed species was found adjacent to temporary standing water that contained diluted concentrations of process solution. The mortality was reported to the local Conservation Officer as per the Wildlife Protection Plan. Monitoring in that particular area of the HLF was prioritized until the pooling was mitigated and no other incidents were recorded.

5.2.3 Surface and Groundwater Monitoring

The mine operations do not have direct discharges to surface water from cyanide facilities, and the HLF and ADR are engineered and constructed with measures to protect groundwater from seepage of process solution. In addition to facility monitoring, surface water and groundwater monitoring in the vicinity of the HLF, Events Pond and ADR plant is routinely undertaken to determine if process solution has escaped from these facilities.

The sites monitored, and the frequency of water quality monitoring, to determine if process solution has reached the receiving environment are provided in Table 5.2-2.

Table 5.2-2: Surface Water and Groundwater Monitoring Locations for the Presence of Cyanide

Site	Frequency	Coordinates (Zone 8)		Site Type
		North	East	
LDSP	D & W	7100857	458672	Surface Water - Compliance
ADR Pad Ditch	D & M	7101471	459043	Surface Water - Compliance

MW19-EVP1a/b	Q	7101188	459264	Groundwater - Receiving Environment
MW19-EVP2a/b	Q	7101091	459073	Groundwater - Receiving Environment
MW19-HLF1a/b	Q	7101316	459542	Groundwater - Receiving Environment

NOTES:
D – Daily when discharging; W – Weekly when discharging; M – Monthly; Q – Quarterly

There was one documented release of process solution from the lined footprint of the HLF to soils documented in 2020. This incident was investigated, reported and mitigated as documented in the VGC *Spill Report Process Solution Spill to Ground – July 11, 2020* (Appendix P2). While a low-level detection of cyanide was detected for one soil sample downgradient of the release area (below all soil quality guidelines for free cyanide provided in the Canadian Soil Quality Guidelines for the Protection of Environmental and Human Health (Canadian Council of Ministers of the Environment, 1999)), no detection of total or WAD cyanide was detected in monitored surface water or groundwater downgradient of the HLF.

Other than the above-described incident, cyanide solution was not detected at any of the monitoring locations in the receiving environment.

5.2.4 Worker Safety

VGC has developed multiple operating procedures for managing its facilities to limit worker exposure to Hydrogen Cyanide (HCN) gas and sodium cyanide salts. Operational monitoring of cyanide facility worker health and safety is based on managing pH throughout the facilities to mitigate the risk of HCN gas production, use of ambient/personal monitoring devices when working directly with cyanide-related tasks, and ensuring timely investigation and evaluation of exposure incidents.

Fixed HCN monitors are installed in all areas of the ADR plant deemed to have a higher risk of HCN exposure. These areas include the carbon column upper trash screen, carbon column, acid wash, caustic system, strip system, carbon regent, and barren solution sump. Additional monitors were installed during the second quarter of 2020 in the gold room and cyanide mixing tank area. Monitors are tested and calibrated on a monthly basis by the on-site electrical and instrumentation team, according to scheduled work orders.

Workers are required to carry portable HCN monitors when performing tasks directly related to cyanide use (e.g., maintenance procedures requiring decontamination of cyanide equipment, mixing, and unloading). VGC continually conducts calibrations and bump tests of the portable monitors with a docking station with plumbed in calibration gases, tracked by an online software platform.

All alarms are set to alarm visually with a strobe at 4.7 parts per million (ppm), and to alarm both visually and audibly at 10 ppm. These thresholds are well below the internationally recognized LD50 for gaseous hydrogen cyanide (HCN) of 100-300 ppm (ICMC, 2018), as is consistent with ICMC guidance for fixed and portable HCN monitors.

All site employees, visitors and contractors must receive site hazard training, which includes basic information regarding cyanide safety training (as detailed in Section 5.3). Site employees are required to complete the basic cyanide safety training on an annual basis. Additional detailed cyanide training is provided to employees with a high potential for exposure to cyanide through work-related activities, such as all Process department personnel, ERT members, and Environmental sampling staff.

During the period of this report there were no first aid, medical aid, or lost time incidents related to an exposure to HCN gas or sodium cyanide salts.

5.2.5 General Signage Requirements

As recommended in the ICMC, warning signs are placed to alert workers that cyanide is present, that smoking, open flames, eating and drinking are not allowed and that the necessary cyanide-specific personal protective equipment must be worn. Tanks and piping containing cyanide are identified by color code, signs, labels, tags, decals or other means to alert workers of their contents. The direction of cyanide flow in pipes are also labeled, marked or otherwise designated according to the American National Standards Institute (ANSI) guidelines *"Scheme for the Identification of Piping Systems"* (ANSI/ASME 2007). Special signage is also placed to identify emergency exits and the location of emergency equipment stations including emergency shower/eyewash stations, dry powder/non-acidic sodium bicarbonate fire extinguishers, cyanide antidote kits, and first aid stations. Safety Data Sheets (SDS), which include first aid procedures and additional information on cyanide safety and exposure, are found in hard copy in the ADR Plant, and available electronically to all employees via the company network. Similar information is posted directly on the cyanide mixing and storage tanks, including exposure symptoms, first aid and emergency response. All signage and SDS are printed in English, the language of the workforce.

5.2.6 Emergency Response

VGC has developed a CMP, HLF OMS, EMSAMP, HLF Contingency Water Management Plan, and Emergency Response Plan (ERP), all of which address responses to the potential release of cyanide. The ERP considers multiple potential failure scenarios involving cyanide and the site-specific environment, operation, and response.

During the reporting period no cyanide exposure occurred at the Project site or with Project-related cyanide activities, nor did cyanide exceed limits in water quality monitoring outlined in WUL QZ14-041-1. As noted in Section 5.2.3, there was a documented short-term release of Process Solution outside of lined HLF containment on July 11, 2020. The incident was investigated, reported and mitigated as documented in Appendix P2.

5.2.7 Emergency Equipment

VGC maintains emergency equipment and supplies at strategic locations to allow rapid response to emergencies involving cyanide exposure. Potable water is supplied to the safety showers and eyewash stations; as well as oxygen, a resuscitator, and a radio are readily available at the ADR Plant, near the mixing and storage area. In addition to the shower/eyewash stations and dry chemical fire extinguishers, cyanide first aid kits are maintained that include medical oxygen equipment with resuscitator, activated carbon, and antidote. The Project currently

utilizes the Cyanokit® containing hydroxocobalamin as the antidote for cyanide exposure with six (6) kits present at site at all times. Cyanokits® are located at the site medical clinic and in the site ambulance (within a heated bay) as these can only be administered by the site Primary Care Paramedic (PCP). The cyanide emergency response equipment is checked regularly by the site paramedics, while ERT members check other emergency response equipment, including the site ambulance.

All employees that work with cyanide, and are able to respond to a cyanide exposures emergency, are trained in cyanide exposure recognition, first response and basic first aid procedures; a portion of employees are trained in application of medical oxygen, and antidote, as available and as suitably qualified.

5.2.8 Medical Emergency Response

A first aid room is established at the Project site, with the equipment and staff to handle first response of all readily foreseeable types of medical emergencies. The first aid room is staffed 24 hours a day, 7 days a week and able to provide advanced emergency first aid, including first aid to respond to cyanide poisoned patients. On site medical staff include one PCP with IV endorsements and one Registered Nurse (RN) to allow administration of the Cyanokit®. There were no medical emergencies involving cyanide in 2020.

5.2.9 Emergency Response Team

The Project retains an Emergency Response Team (ERT). The VGC Emergency Response Plan provides primary contact details for the incident management team members, including the General Manager who has authority to ensure that sufficient and adequate resources are allocated to carry out the ERP. The ERP describes the roles and responsibilities for those involved in responding to an emergency. ERT members are site personnel that receive training and certification as emergency responders. All ERT responders undergo the same training, which includes fire, highwall, and hazardous materials emergency response and include members trained to Occupational First Aid (OFA) Level 3 medical first aid.

The Project maintains and updates an *Emergency Response Plan* that details the following:

- Primary and alternate emergency response coordinators who have authority to commit the resources necessary to implement the Plan;
- Current members of the ERT;
- Minimum training requirements for emergency responders;
- Mustering procedures and 24-hour contact information for emergency coordinators and ERT members;
- Duties and responsibilities of the emergency coordinators and ERT members;
- Procedures for periodic inspection of emergency response equipment to ensure its functionality and availability; and,
- Specific roles of external responders, medical facilities, or community organisations in the emergency response process.

5.2.10 Mock Emergency Drills

Mock cyanide exposure drills are to be undertaken by the ERT as part of regular training sessions. The drills are designed to test each of the potential cyanide emergencies scenarios appropriate for the site as considered in the

Heap Leach Facility Emergency Response Plan. Should the evaluation of a mock drill identify deficiencies in the methods and effectiveness of the response, the adequacy of emergency response training will be reviewed, and additional or revised training may be recommended to hone the knowledge and skills of the responders.

A mock exercise was undertaken by the ERT members on August 29, 2020 that simulated a cyanide leak within the ADR Plant. The ERT members assembled quickly and initiated cyanide release protocols and the site Emergency Response Plan. Areas identified for improvement included radio communications, area specific emergency evacuation procedures, and medical training for ERT members. These areas will be incorporated into ERT response and personnel training in future.

5.2.11 Cyanide Emergency Destruction

A supply of hydrogen peroxide is maintained on site as part of the emergency response for neutralizing and decontaminating areas impacted by potential cyanide spills. SGC-CMP-SOP-020 "*Cyanide Emergency Response Procedures*" describes the method for preparing neutralization chemicals for safe use and application to ensure that treatment chemicals and by-products of the neutralization process do not unduly impact surface waters. Additionally, cyanide destruction can be accomplished with the use of lime, soda ash, sodium hypochlorite, or high pH water for neutralization response to spills on site where the neutralization agents will not come into contact with aquatic systems.

There has been no release of cyanide on the Project site requiring emergency cyanide destruction.

5.3 Training

Training programs (as outlined in SGC-CMP-SOP-002, "*Eagle Gold Project Training Program*") are implemented to ensure that employees work in compliance with regulations, approved policies, and procedures.

All site employees are required to receive Cyanide Hazard Recognition Training (Level 1) in accordance with the guidance provided in the ICMC. Detailed cyanide training (Level 2 and 3) is further provided to employees with a higher potential for exposure to cyanide through work-related activities, such as all Process department personnel and ERT members. Cyanide specific training is currently tracked through the VGC Training department and all training records are retained on site. Annual refresher training is required and is tracked through the training department. Cyanide workplace safety meetings are ongoing through daily toolboxes to discuss risks and potential issues related to cyanide-related tasks. Additional on-site training includes the following:

- WHMIS;
- Lime Hazard Recognition Training;
- Cyanide Exposure Symptoms; and,
- First Aid.

To ensure relevant and up to date training programs, and in keeping with the VGC Occupational Health and Safety Policy and with maintaining a safe working environment, workers are encouraged to provide input on occupational health and safety issues. VGC considers this input in developing, evaluating and reviewing operating procedures and during the mock drills, formal safety meetings and informal pre-work safety toolbox sessions. Monthly JOHSC meetings and mandatory all staff monthly safety meetings allow for the review of incidents and provision of employee feedback on health and safety issues.

5.4 Annual Cyanide Management Plan Audit

An independent third-party audit of the VGC Cyanide Management Plan and on-site implementation was undertaken for the period of June 2019 to June 2020, to cover the period of time from when cyanide use was initiated on site. Adam House (of Forte Dynamics Inc.) a certified technical expert auditor for gold mining under the Code performed the audit of operational procedures following the guidelines of the International Cyanide Code. An independent Limited Assurance Report was further provided by SmartAccEss Socio-Environmental Consulting to provide assurance on the conformance of the Eagle Gold Mine CMP with the International Cyanide Management Code.

The Audit Report and Limited Assurance Report are provided as Appendix S and T, respectively.

5.4.1 Audit Review

The audit focused on the nine Principles of the Cyanide Code related to operations and safety aspects considered by the ICMC:

- Production;
- Transportation;
- Handling and Storage;
- Operations;
- Decommissioning;
- Worker Safety;
- Emergency Response;
- Training; and
- Dialogue.

The audit concluded that systems are in place to manage cyanide in a responsible manner and in compliance with the ICMC, this was reviewed and verified by SmartAccEss Socio-Environmental Consulting as shown in the Limited Assurance Report. The report highlights the following regarding VGC operations during the audit period:

- Appropriate SOPs and practices to handle and prepare cyanide solutions in a safe manner;
- Contingency and emergency response plans in place to respond to cyanide related emergencies;
- No impacts to surface water or groundwater related to cyanide;
- No wildlife mortalities related to cyanide;
- Programs to regularly inspect and maintain facilities to ensure safe management of cyanide;
- A water balance that is managed to protect against unintentional releases;
- Cyanide facilities that have been constructed following QA/QC procedures;
- A closure plan including decommissioning activities and bonding in place;
- Health and safety measures to protect workers from exposure to cyanide;

- Training programs for workers and emergency response personnel in cyanide management; and,
- Engagement programs with local communities and disclosure.

5.4.2 Audit Recommendations

At the time of the audit, the Eagle mine had less than one year of cyanide related operation and in certain cases systems are still under implementation (e.g., annual refresher training). The report identified opportunities for mostly minor improvements in some of the Code Principles, see Table 5.4-1 for recommendations. In response to the audit recommendations, the CMP will be updated prior to the completion of the next annual audit cycle in 2021.

Table 5.4-1: CMP Audit Recommendations and VGC Responses 2020

Audit Section	Section Description	Audit Recommendation	VGC Response
1	INTRODUCTION	During the next CMP update, update references throughout the document to reflect active mining operations and processing with cyanide, as well as updating the company name and logo to consistently reflect Victoria Gold Corp. across all documents associated with the plan. It is further recommended the annual internal review and update be conducted ahead of the compliance audit so that the auditor(s) are reviewing the most recent version of the document.	CMP and supporting SOPs will be updated in 2021 prior to the 2021 audit to reflect current mining operations, and updated company name and logo. The 2021 CMP and SOPs review and update is currently in progress.
3	HANDLING AND STORAGE: Protect workers and the environment during cyanide handling and storage.	The CMP indicates that the cyanide delivery area will be "cordoned off with warning signs and visual barriers to prevent unauthorized passage of personnel and equipment while the cyanide intermodal containers are being offloaded". In practice, signs and barriers are not used for the offloading process; however, spotters are utilized to keep personnel away from the area while the crane is unloading a container from the truck. The use of spotters was verified through photographs taken during the process. The CMP should be updated to reflect the actual operational practices.	The CMP will be updated to reflect actual operational practices during the 2021 CMP and SOPs review and update.
		The plan further indicates that a dedicated area for the sea containers will be provided at the ADR plant. The area was intended to be fenced off for container storage. However, fencing was not installed to allow better access to the containers and for use of the crane to unload the containers from the trucks. The CMP should be updated to reflect the actual operational practices.	CMP will be updated to reflect the actual operational practices during the 2021 CMP and SOPs review and update, and reference to fencing the securely locked intermodal containers in storage will be removed.
		A single container is to be placed on a "bermed concrete pad" at the main entry to the ADR plant to allow operations access for unloading the cyanide crates for use. The intent of the bermed pad was to permit the dry retrieval of any potential spillage of cyanide. A dedicated concrete pad was verified for this purpose. The pad is not bermed, as this would impede normal access into the ADR plant; however, the existing arrangement would still allow for the dry retrieval of any potential spillage. The CMP description should be updated to reflect the as-built condition of the pad.	CMP will be updated to reflect the as-built configuration of the pad during the 2021 CMP and SOPs review and update.
		The CMP and procedure [CMP-SOP-005 – Cyanide Mixing Process] should be updated to reflect actual operational practices.	CMP and SOP update will be completed in 2021 to consistently

Audit Section	Section Description	Audit Recommendation	VGC Response
			specify a pH of 11 to reflect actual operation practices.
4	OPERATIONS: Manage cyanide process solutions and waste streams to protect human health and the environment.	Several minor items within the CMP and SOPs were recommended to be updated to reflect the now as-built nature of the facility for consistency with the delivered project and operation.	CMP and SOPs will be updated to reflect the as-built configuration of the facilities during the 2021 CMP and SOPs review and update.
		The mechanical as-built/record of construction package is believed to be available and compiled by JDS; however, as it was not provided for this audit, the site was requested to obtain all relevant documents ahead of the next audit to demonstrate adherence to the CMP.	VGC will work with our EPCM support to obtain the relevant information prior to the next audit cycle.
6	WORKER SAFETY: Protect workers' health and safety from exposure to cyanide.	The CMP and SOP [CMP-SOP-005 – Cyanide Mixing Process] should be updated to reflect the operational practices of the site.	CMP and SOP update will be completed in 2021 to reflect actual operation practices.
		The CMP references use of an in-line cyanide analyzer; however, an analyzer was not installed and is not currently planned. Cyanide concentrations are measured and recorded every two hours, along with the pH, with adjustments to the addition rate made as necessary to control at the target concentration.	CMP will be updated in 2021 to accurately reflect the installed equipment.
		The CMP and SOP's have varying descriptions of detection level (4.5 vs. 4.7 ppm and 6.7 vs. 10 ppm), as well as strobe colors (red vs. blue) [of the HCN detectors]. The site confirmed the setpoints as 4.7 and 10 ppm, as well as the strobe colors as amber and blue. The CMP and SOPs should be updated to reflect the operation of the installed units.	CMP and SOPs will be updated to reflect the operation of the installed units during the 2021 CMP and SOPs review and update.
		Site should ensure drills with varying scenarios are conducted at least annually, consistent with the CMP.	A drill scenario was completed in 2020 and additional drills will be conducted in 2021.
		The auditor requested written confirmation that a formal agreement was in place for offsite medical facilities to assist in an emergency, as required under the Code and specified within the CMP. However, no response was provided to verify that a formal agreement is in place."	No further communication / coordination with local emergency responders at this time. Initiative will be furthered in 2021.
7	EMERGENCY RESPONSE: Protect communities and the environment through the development of emergency response strategies and capabilities	Site should confirm that offsite partners are aware of and are properly trained for their role in assisting with a cyanide related emergency.	No further communication / coordination with local emergency responders at this time. Initiative will be furthered in 2021.
		Alternate personnel are named for some roles, but not all roles have an identified alternate. The ERP does describe the roles and responsibilities for those involved in responding to an emergency.	ERP will be reviewed and alternate personnel will be identified for roles where warranted.
		Emergency response equipment, including the locations of cyanide antidote kits are provided in the CMP and SOPs. As noted, the CMP references a kit at the ADR Plant, but upon startup of operations, it was determined that the kits should remain at the site medical clinic, as they cannot be administered by personnel other than the site paramedics.	CMP and SOPs will be updated to reflect the actual locations of the kits during the 2021 CMP and SOPs review and update.
		Emergency response planning requirements have not been confirmed with external resources who may be required in an emergency. Outside entities should be engaged regularly and included in mock drills, as appropriate.	No further communication / coordination with local emergency responders at this time. Initiative will be furthered in 2021.
		The CMP does not explicitly prohibit the use of chemicals such as sodium hypochlorite, ferrous sulfate and hydrogen peroxide to treat any cyanide that would have been	CMP will be updated to specify that addition of these chemicals to surface water is prohibited.

Audit Section	Section Description	Audit Recommendation	VGC Response
		released into surface water. The plan references the safe use and application of the peroxide detox system to ensure that the process does not unduly impact surface waters. The plan should be updated to specify that addition of these chemicals to surface water is prohibited.	
8	TRAINING: Train workers and emergency response personnel to manage cyanide in a safe and environmentally protective manner.	The tracker did not provide the date that training was complete. The date of initial training and all subsequent refresher training should be recorded in the tracker.	Training tracker will be updated as suggested to track the additional information going forward.
		An ERT specific certification tracking sheet was provided, but the sheet did not indicate specific training that was completed, such as firefighting, occupational first aid, HAZMAT, etc. Specific and detailed training records should be kept for the ERT for both initial certifications and ongoing refresher training.	ERT certification tracking sheet will be updated as suggested to track additional information going forward.
		As noted above, training records were provided, but the tracking sheet only indicated the individual, department, and level of training. The training record should also indicate the date training was completed, the name of the trainer, and the written test results.	Training tracker will be updated as suggested to track the additional information going forward.
		Records of ERT and employee involvement, as well as any offsite support, in any future mock drills should be recorded and the lessons learned incorporated into the ERP.	Mock drills records will include suggested information going forward.

6 RECLAMATION & CLOSURE

VGC submitted an updated Reclamation and Closure Plan (RCP 2020-01) on October 23, 2020 for review and approval as required by QML-0011 and QZ14-041-1. Subsequent to the submission of RCP 2020-01, a meeting was held between VGC, EMR and the YWBS in which VGC agreed to the review of RCP 2020-01 being conducted as a pilot project for a coordinated costing review by the YWB and YG. To date, the YWB and EMR remain engaged in their review process of the RCP and no questions or comments have been provided to VGC.

On January 14, 2020, in response to the YG review and approval of RCP Version 2018-03, VGC provided updated Bond #962-019824 in the amount of $27,406,539.00 to EMR.

On August 12, 2020, the YWB issued Order No.:1 pursuant to section 15 of the *Waters Act* and section 11 of the *Waters Regulations* ordering VGC to furnish and maintain security with the Minister in the amount of $30,780,939, inclusive of any security required under the *Quartz Mining Act*. Effective September 2nd, 2020, Bond #962-019824 was amended by VGC to increase the amount to $30,780,939 as required by the YWB Order.

VGC considers the currently held security amount to be more than adequate to reclaim the Project in accordance with the RCP as the assumed current actual liability for closure is less than the security held.

6.1 Reclamation Research

The RCP considers the undertaking of various reclamation research programs to support the progressive and final reclamation and closure of the Mine. There are six main research programs (each with sub-tasks):

- Revegetation – To support the selection of suitable candidate species based on site specific considerations (e.g., growing season/climate, soil fertility, etc.).
- Engineered covers – Phased program to support final HLF and WRSA soil cover design including:
    - Updates to conceptual cover model;
    - Characterization of materials to be used for the cover systems;
    - Characterization of materials placed in the HLF and WRSAs;
    - Enhanced meteorological monitoring;
    - Field trials for performance monitoring; and,
    - Assessment of effects of placement of MWTP high pH solid residuals in the cover system.
- Vegetation rooting depth – To inform cover designs and revegetation programs as to the most suitable candidate species based on rooting depth and distribution of key functional types of mature plants, and the characterization of growth materials associated with plant roots at the most active rooting depths.
- Passive water treatment – To support the design and operation of the PTS for water treatment purposes during closure.
- HLF biological detoxification – To further refine the possible biological treatment of heap fluids at closure for cyanide destruction and some metals removal (as an alternative to active treatment processes).
- Groundwater arsenic attenuation – To further evaluate the direction that seepage from the WRSAs may migrate and potential effects.

To date, specific programs have commenced to advance the revegetation, engineered covers and passive water treatment research programs. Components of ongoing operations will also provide information to support final closure measures (e.g., heap leaching performance supporting understanding of potential lateral variability and flow paths providing relevant information for biological detoxification); however, this information is not collected specifically for the purposes of reclamation research and thus is not part of this report.

6.1.1 Revegetation Program

The objective of the revegetation program is to design and implement erosion control measures using revegetation and bioengineering techniques to act as interim methods to control potential erosion and inform final reclamation decisions with respect to appropriate seed mixes and revegetation methods.

Inspection of the areas that were part of the 2019 program were undertaken to evaluate the success of previous efforts and to further inform the 2020 program (Photo 6.1-1 and Photo 6.1-2). The areas previously completed showed that there was an outstanding success rate of close to 100% survival of willow staking, while seeded areas all had good growth and coverage of grass. Revegetation in 2020 included further seeding, willow staking, and bioengineering techniques completed throughout additional areas at the Mine site, as detailed in Table 6.1-1 and shown in Figure 6.1-1. The program was completed in September by VGC with expertise provided by Laberge Environmental Services.

The revegetation program in 2021 will continue the assessment and monitoring of previously treated areas to inform appropriate species and method selection. Additional seeding and planting are also contemplated in 2021 to address locations that were not conducive to completion in prior campaigns.

Table 6.1-1: Revegetation and Bioengineering Treated Areas 2020

Location	Method / Installation	Notes
LDSP slopes	Hand seeding	Application of commercially available fowl bluegrass, Rocky Mountain fescue, tufted hairgrass and wheatgrass
	Willow staking	South eastern shore of the LDSP
	Pole drains	Four pole drains installed in erosion channels
	Live Silt Fences	Installed upslope of other bioengineering works within erosion channel
Slope north of Event Pond spillway	Hand seeding	Application of commercially available fowl bluegrass, Rocky Mountain fescue, tufted hairgrass and wheatgrass
Exposed laydown area east of warehouses	Hand seeding	Application of commercially available fowl bluegrass, Rocky Mountain fescue, tufted hairgrass and wheatgrass
Overland conveyor adjacent to Dublin Gulch	Hand seeding	Application of commercially available fowl bluegrass, Rocky Mountain fescue, tufted hairgrass and wheatgrass
Overland conveyor west slope near Eagle Pup	Hand seeding	Application of commercially available fowl bluegrass, Rocky Mountain fescue, tufted hairgrass and wheatgrass
Overland conveyor east drainage ditch between Dublin Gulch and Eagle Creek	Willow staking	Planted willows stakes harvested from donor site.

6.1.1.1 Locally Harvested Seed Trials

The 2020 program included seed trials to evaluate the success of three native species (Appendix U1). Two trial plot locations were selected for south and north facing aspects. In each location, trial plots were constructed for three species, with duplicates for each, for a total of six 1 m^2 plots per trial location. The species selected for the trial are Elymus sp. (wheatgrass), Festuca altai (Altai fescue), and Achillea millefolium (yarrow). The seeds were purchased from a local supplier and First Nation of Na-Cho Nyak Dun joint venture (Yukon Seed & Restoration Inc.) and are harvested within the local area. Prior to seeding, each plot was scarified to a depth of approximately 15 cm and any existing vegetation and large rocks were removed. Once the plots were prepared, the seeds were

scattered evenly throughout the square meter. The seeds were then gently tamped down to ensure good seed/soil contact. A buffer was left between each seeded plot. Commencing in the summer of 2021, annual monitoring of the trials will be conducted. The assessments will measure the progress and allow for refinement of the prescriptions and techniques for application to similar areas requiring erosion control at the Mine.

6.1.2 Engineered Cover Trials

To support the advancement of the current base case cover system design for major facilities, a pilot scale trial of the design was constructed in September 2020. The trial included the placement of approximately 0.5m of overburden material on one plateau and one inter-bench slope of the PG WRSA. The program completed in 2020 included material sampling before and during the cover system placement (to characterize the physical and hydraulic properties of the overburden material) and the installation of monitoring instrumentation.

The first phase automated performance monitoring system was installed in the cover system in October 2020. Monitoring performance of the cover system trial includes: 1) net radiometers, 2) snow surveys, and 3) a rainfall gauge. Additional meteorological parameters for use in performance monitoring will utilize data collected at the Camp and Potato Hills Stations. As the cover trial advances, stations will be installed to capture data on a plateau location and on different slope locations (upper, mid, and lower slope) to determine spatial variability. The number and location of the automated stations will be determined as part of the final design of the cover system monitoring trials informed by the updated conceptual model, the material characterization program, and the expanded site-specific meteorological dataset.

Analyses of the monitoring and other climate data will be an important element in confirming the base case cover system. Cover system performance monitoring will focus on partial elements of atmospheric water and energy balance inputs, along with soil water balance parameters. Measurements taken within the cover system provide insight into the partitioning of water at the cover system-atmosphere interface and the cover system-waste material interface. Additionally, measured in-situ soil parameters will include volumetric soil water content, soil temperature, and soil matric potential.

The cover trial will incorporate automated soil monitoring stations that consist of volumetric water content and matric suction sensors to quantify key surface water and energy balance fluxes. Data will be collected by a datalogger powered by battery and solar panel set up. Sensors will be installed in pairs through the cover system profile to capture data to calculate water and energy fluxes at the interfaces of different material types including between the cover system layers and between the cover system and waste.

Details regarding the construction and instrumentation of the trial, and the ways in which data collected at the trial will be used to advance subsequent areas of research is provided in Appendix U2 and U3. Monitoring of the performance of the pilot scale trial will continue throughout 2021.

Photo 6.1-3: PG WRSA Cover Trial on 1370 masl Bench – September 20, 2020

6.1.3 Passive Water Treatment

Sampling and management of the pilot bioreactor program established on the Project site in 2019 continued throughout 2020. The program, being conducted with guidance from the Yukon Industrial Research Chair - Northern Mine Remediation at the Yukon College Research Centre, expands upon earlier lab scale trials on the removal rates for arsenic, selenium, antimony and other metals under site conditions. The pilot program includes trial components exposed to ambient freeze-thaw stresses to evaluate the effect of the site climate regime on removal rates. More specifically, the primary objective of the research program is to study freeze-thaw cycles on sulfate reducing bacteria and to assess their efficiency to remove heavy metals (particularly arsenic, selenium and antimony) from mine influenced water (MIW), and in this case MIW originating from Platinum Gulch catchment and the PG WRSA.

Photo 6.1-4: MIW Holding Tank for On-Site Bioreactor Program 2020

Photo 6.1-5: On-Site Bioreactor Inlet and Outlet Drums 2020

The passive water treatment program will be expanded in 2021 to support the planned design and construction of the field scale constructed wetland treatment system proposed in the area of the PG WRSA and open pit in 2022. The 2021 program will include:

- Further desktop studies of: recent water balance and water quality models; range in constituent concentrations paired with flow rates; worst-case scenarios for constituent ranges and flow rates; vegetation in the proposed area that is amendable to CWTS construction; survey data and aerial photos; geotechnical and hydrotechnical characteristics of the proposed CWTS area; location, volume and geotechnical characteristics of available materials at any borrow sources; and, constructability including access to the proposed CWTS area.
- Field investigation for borrow sources of plants (and collection of same for use in off-site trials) and substrate (and collection of same for use in off-stie trials).
- Off-site bench scale trials over a period of approximately 5 months to evaluate the suitability of selected substrates and plants identified during the desktop studies and field investigation using synthetic water mimicking predicted water chemistries to further refined potential treatment rates and percent removal.

7 SOCIO-ECONOMIC MONITORING

The focus of socio-economic work in 2020 continued to be primarily on ensuring that contracts for the operation of the Project were right scaled to allow for the involvement of Yukon and First Nations businesses to the greatest extent practicable.

VGC is committed to procuring goods and services from registered FNNND and Yukon based companies whenever possible.

To date, contracts with a total value of approximately $240,000,000 have been with Yukon companies. VGC is now the largest private sector employer in Yukon with a workforce of over 350 people, 50% of whom are Yukoners.

In 2020, under the Victoria Gold NND CBA Scholarship Program, 15 students were awarded funds to continue their education. Since the establishment of this program, 120 scholarships have been awarded to FNNND students for a total disbursement totaling over $115,000.

The company also continued its community involvement where possible under COVID-19 protocols and was a proud supporter of the following local organizations and events in 2020:

- AMEBC Round Up - Old Timers Luncheon;
- YFN Hockey Assoc - YFNHA Tournament Sponsor;
- Yukon T1Diabetes Support Network - Boulevard of Hope;
- Food Bank Society of Whitehorse - Yukon Communities Food Banks;
- Mayo Sewing - Dorothy Profeit - Sew 300 masks;
- Village of Mayo - Halloween Event;
- Mayo Volunteer Fire Dept - MVFD Fireman's Ball - gifts for kids;
- Yukon Imagination Library - Whitehorse Winterval Santa Claus Parade;
- FNNND - Christmas Food Hampers;
- Yukon Hospital Foundation - Winter Wonderland at Meadow Lakes; and,
- VGYSES - ESED Gala.

1. INTRODUCTION

This report provides the record of construction (ROC) for Phase 1B expansion of the Primary Heap Leach Facility (PHLF) at the Eagle Gold Mine, located in Yukon Territory, Canada, owned and operated by Victoria Gold Corporation (VGC). The PHLF is located approximately 1.2 km north of the Eagle Zone orebody. The PHLF is located in the Ann Gulch catchment, a small ephemeral tributary to Dublin Gulch. The base of the PHLF confining embankment is located just upstream of the confluence of Ann Gulch and Dublin Gulch at an elevation of 880 masl. At full height in Phase 3, the PHLF extends up Ann Gulch to an elevation of approximately 1225 masl (at the top of the planned ore stack) and will accommodate approximately 86 Mt of ore. The Phase 1B expansion project consisted of a newly lined pad extension approximately 250,000m^2 in surface area between elevation 990m and the Interceptor Ditch (approximate elevation 1050m).

Construction items for Phase 1B included:

- Phase 1B Heap Leach Facility Pad
- Layout and Survey Control
- Staging Area (Liner)
- Decommissioning Water Monitoring Wells in Phase 1B Pad limits
- Clearing, Grubbing, and Topsoil Removal
- Removal of Unsuitable Material and Surface Grading
- Excavation and Installation of the HLF Underdrain System in Phase 1B Pad limits
- Prep Surface for Liner Placement
- Liner Placement

The Phase 1B expansion was constructed between February 24, 2020 and September 15, 2020. Construction activities were completed under the supervision of JDS Energy and Mining (JDS). Earthworks were completed by Ewing Construction (Ewing) and geosynthetics were supplied and installed by Layfield Group Ltd. (Layfield). Construction Quality Assurance (CQA) of the earthworks and liner system was performed by Tetra Tech. Surveying services were provided by Underhill Geomatics Ltd (Underhill). This scope did not include construction and CQA oversight of the PLS pipework and overliner drain fill (ODF) placement on the Phase 1B pad as this responsibility was with VGC personnel.

The Phase 1B expansion design and technical specifications are presented in the Detail Design Report for Eagle HLF Phase 1B issued by Forte Dynamics and dated January 6, 2020 (Doc. No. 109005-47310-03-DES-0001).

2. SCOPE OF WORK

In November 2019, Troy Meyers, P. Eng of BGC, transitioned out of the Engineer of Record (EOR) role, which was thereafter filled by Barry Carlson, P. Eng. of Forte Dynamics. Engineering design and construction support was provided by Forte Dynamics for the Phase 1B expansion project. The execution scope of work included:

- On-site inspections at the commencement and completion of construction activities
- Off-site engineering support throughout the duration of construction
- Attending weekly construction meetings with contractors and the JDS construction management team, as well as other meetings requested by VGC or JDS.
- Overseeing the CQA monitoring program which included monitoring of QC processes to ensure that any deficiencies were identified and addressed.
- Review of QA and QC test data and daily reports from the CQA team (Tetra Tech)
- Providing input to responses for Request for Information (RFI) and other contractor submittals
- Assisting with design of additional related engineering work as required
- Communicating with JDS and CQA personnel in accordance with the provisions of the Technical Specifications
- Reviewing and approving changes to the Technical Specifications

- Proactively recommending construction or design improvements to enhance the design constructability and performance.

3. GENERAL PROJECT DESCRIPTION

3.1 Main Project Features

The PHLF is comprised of a number of elements: a confining embankment to provide stability to the base of the HLF, a lined storage area for the ore to be leached, pumping wells for the extraction of solution, a lined event pond to contain excess solution in extreme events, upstream surface water interceptor ditches, and leak detection, recovery and monitoring systems to ensure the containment of solution.

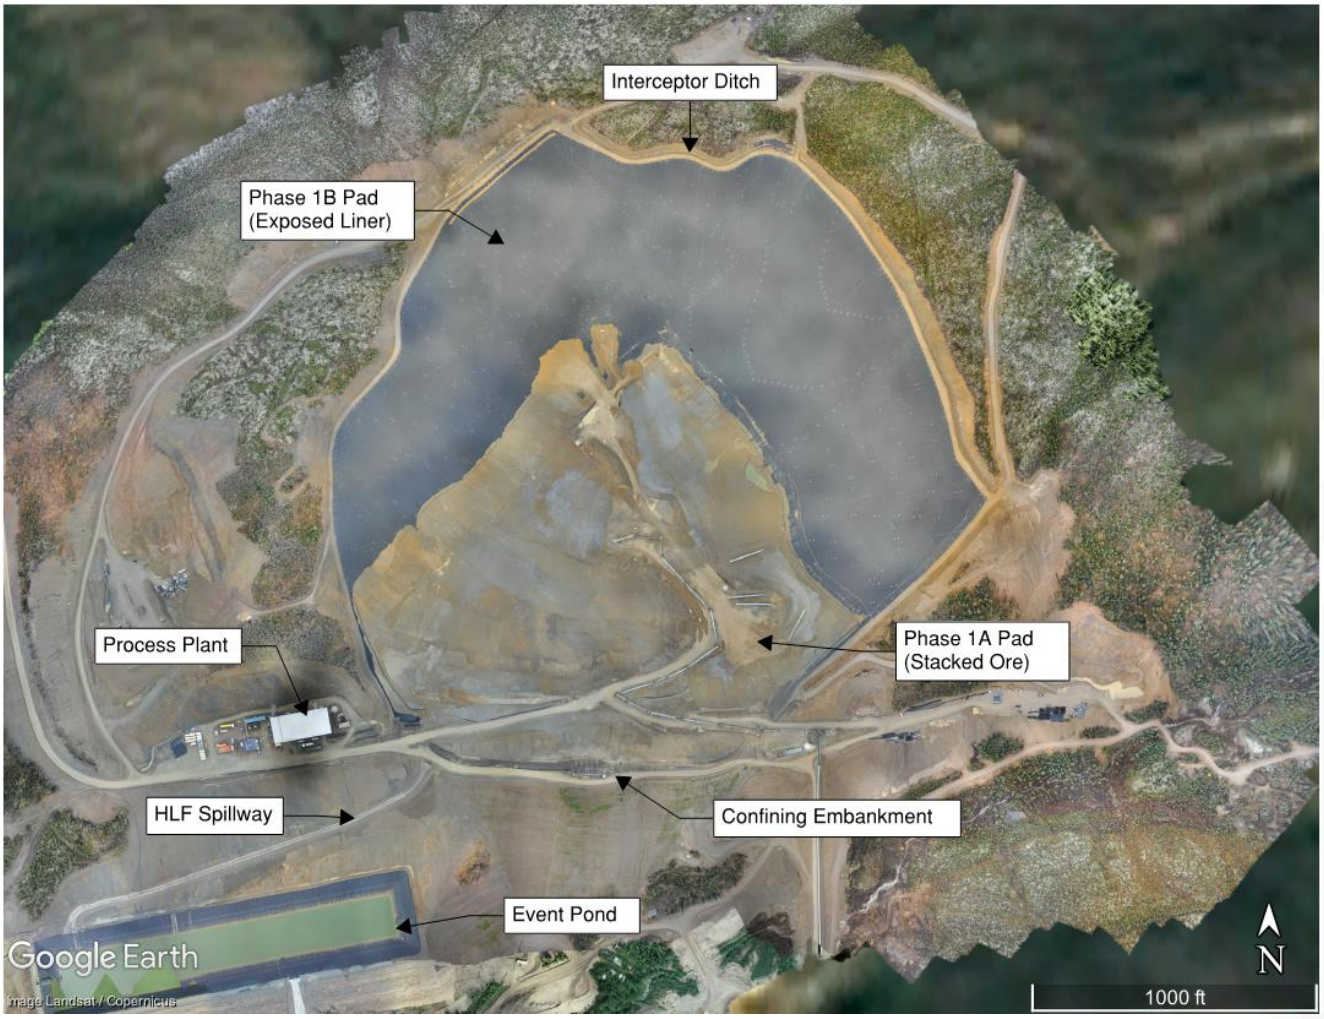

Figure 3-1 HLF Construction Areas

3.1.1 Underdrain System

The HLF underdrain system provides for the collection and conveyance of subsurface water flows beneath the lined HLF Pad and Confining Embankment to limit upward pressure on the liner system and prevent the buildup of phreatic levels in the embankment fills. The HLF underdrain system consists of a network of lateral drains below the Phase 1 Pad area, finger drains below the In-Heap Pond and Confining Embankment, and an underdrain header pipe trench that extends from the toe of the Confining Embankment to the upper limit of the

Phase 1B Pad. Flows in the underdrain system are conveyed to collector pipes that discharge to a monitoring vault at the downstream toe of the Confining Embankment. The vault is configured to allow for sampling of seepage flows for water quantity and is equipped with a system that can either pump return flows to the HLF for use as make up water or allow seepage to flow to the environment if discharge criteria are met.

3.1.2 Phase 1B Pad

The Phase 1B Pad area was constructed for ore storage and leaching between elevations 990m and 1050m. The design includes a composite liner system comprised of a geomembrane over geosynthetic clay liner (GCL), ODF and PLS recovery piping. The overall HLF design allows for future expansion of the Pad up the Ann Gulch drainage basin. The next planned expansion (Phase 2) would be constructed between the upper limit of Phase 1B at elevation 1050m and approximate elevation of 1105m.

3.1.3 HLF Liner System

The HLF liner system was designed to contain PLS for recovery and to prevent the release of process solutions to the environment. The HLF single composite liner system within the Phase 1B footprint (above Elevation 990m) was constructed with GCL overlain by textured LLDPE liner consistent with the design of the Phase 1A liner system.

4. SITE CONDITIONS

4.1 Topography

The HLF site topography is described as moderate to high relief, with ground elevation varying from approximately 880 to 1400 masl. The HLF is situated in the Ann Gulch drainage which is a first-order tributary to Dublin Gulch.

4.2 Climate and Weather

The property lies within the Mayo Lake–Ross River Eco-region in central Yukon. The area is characterized by a “continental” type climate, with moderate annual precipitation and a large temperature range. Summers are short and can be hot, while winters are long and cold with moderate snowfall. Rainstorms can occur frequently during the summer and may contribute 30% to 40% of the annual precipitation. Higher elevations are generally snow-free by mid-June. Freezing temperatures may occur at any time during the year, including summer or fall.

The mean annual temperature for the area is approximately -3°C, with an annual range of 63.5°C for the period of record. The estimated mean annual precipitation at the Eagle Gold site ranges from 350 mm to over 600 mm, depending on elevation. This climate description has been summarized from Stantec (2012b), Knight Piesold (2013) and Lorax (2017).

The hydrology of the region is generally characterized by large snowmelt runoff during the spring freshet, which quickly tapers off to low summer stream flows interspersed with periodic increases in flow associated with intense rainfall events (Stantec 2012).

4.3 Geology

Geologic conditions in the Dublin Gulch area have been strongly influenced by the geotectonic forces that produced the Eagle Zone deposit. The folding, faulting and plutonic activities have resulted in relatively weak rock mass with relatively poor mechanical properties. Further, with frost fracturing and permafrost common at the latitude of the project site, shallow subsurface processes and rock/soil characteristics are more complex (BGC 2019).

Overburden soils encountered on the sloping ground at the HLF site typically consist of a veneer of organic soils overlying a blanket of colluvium, which overlies weathered bedrock. Placer tailings (fill remainders of previous

dredge mining operations) cover most of the valley bottom of Dublin Gulch, which is outside the footprint of the HLF (BGC 2019).

The bedrock encountered in the area is generally classified as metamorphosed sedimentary rock, with a variably deep weathering profile (BGC 2018). The intact rock strength of the encountered rock types is highly variable, ranging between R0 class (i.e., corresponding to < 1 MPa Unconfined Compressive Strength, UCS) and R4 (50-100 MPa UCS). The average intact strength is estimated to be approximately R2 (5-25 MPa UCS) in the metasedimentary rock, depending upon the degree of weathering, but with significant variability across the site (BGC 2019).

5. CONSTRUCTION MANAGEMENT

JDS Energy and Mining (JDS) was retained to provide construction management services for Phase 1B. Layfield Environmental Containment (Layfield) of Edmonton, Alberta was retained to provide the geosynthetics for the liner system, as well as install the geosynthetics and provide QC inspection of deployed liner. Ewing Construction Ltd (Ewing) was retained as the earthworks construction contractor for Phase 1B. Their activities included installing the lateral and header drains, preparing the subgrade for geosynthetics placement, and assisting with liner deployment activities. Tetra Tech was retained to provide inspection services for header and lateral drain installation and to provide CQA monitoring for the entire geosynthetics portion of the project. An organization chart is included as **Figure *5-1***.

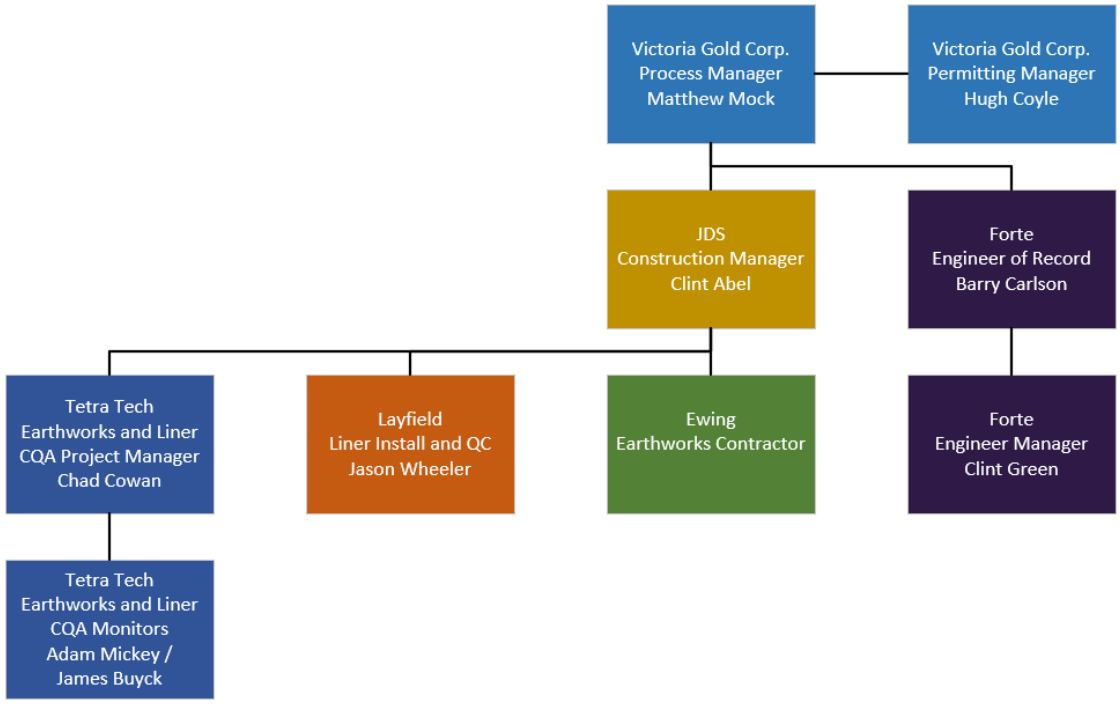

Figure 5-1: Organization Chart

6. CONSTRUCTION OBSERVATIONS, DESIGN MODIFICATIONS, QA/QC RESULTS

The Phase 1B HLF expansion was generally completed in conformance with the Technical Specifications provided in the Detail Design Report for Eagle HLF Phase 1B issued by Forte Dynamics and dated January 6, 2020 (Doc. No. 109005-47310-03-DES-0001). During Phase 1A construction, the EoR (BGC) produced Technical Field Memorandums for various material test fills. As the same Construction Manager and CQA Team was used for Phase 1B, Forte Dynamics reviewed and approved the use of the Technical Field Memorandums for use on Phase 1B construction. Construction observations and instances where designs were modified to accommodate field conditions or construction limitations are discussed in this section.

6.1 Material Production and Borrow Areas

6.1.1 Borrow Area

A borrow area was developed north of the Phase 1B construction area within the future Phase 3 footprint of the PHLF. A rock outcrop was blasted to produced Rock Fill material that was used as Site Grading Fill. Additionally, material from the borrow was transported to Nuway's mobile crushing & screening plant to produce Select Drain Fill and Select Fill materials.

6.1.2 Material Production

The following materials were produced for construction of the Phase 1B pad.

6.1.2.1 Site Grading Fill

Site Grading Fill consists of any material which, when compacted, is suitable for use in areas where the material is not required to be of uniform character and engineering properties. Unsuitable material or material containing organic material was removed and Site Grading Fill from within the HLF limits or from borrow areas was placed. A sizeable stockpile of unsuitable material from Phase 1A construction activities remained within the Phase 1B footprint but was removed prior to commencement of Phase 1B pad construction. The borrow material used as Site Grading Fill was primarily Compacted Rock Fill that was blasted, excavated and hauled directly from the borrow source. No further processing was performed.

6.1.2.2 Select Fill

Select Fill was used as bedding for the HLF liner system in Phase 1B. Select Fill was produced as a byproduct (fines reject) of the crushing/screening production of the Select Drain Fill. The term used for this material on-site was “reject sand” as the material consisted of well-graded sand. Additionally, some remaining placer tailings deposits in the Haggart Creek valley consisting of sand was utilized as Select Fill.

The gradation allowed for Select Fill per the Technical Specifications was 35 to 100% passing the #200 mesh, 60 to 100% passing the No. 4 sieve, and a maximum size of 75mm. Figure 6-1 provided below is a gradation of the actual Select Fill material produced by Nuway. The material was approved because it met the design intent of providing a densely compacted material that is free of oversize material (which could pose a risk of puncturing the liner system). As a continuation from Phase 1A, a compaction method was used to replace the QC testing requirements for the Select Fill. Field Memorandum CTFM-01 documents the test fill that was performed and the results.

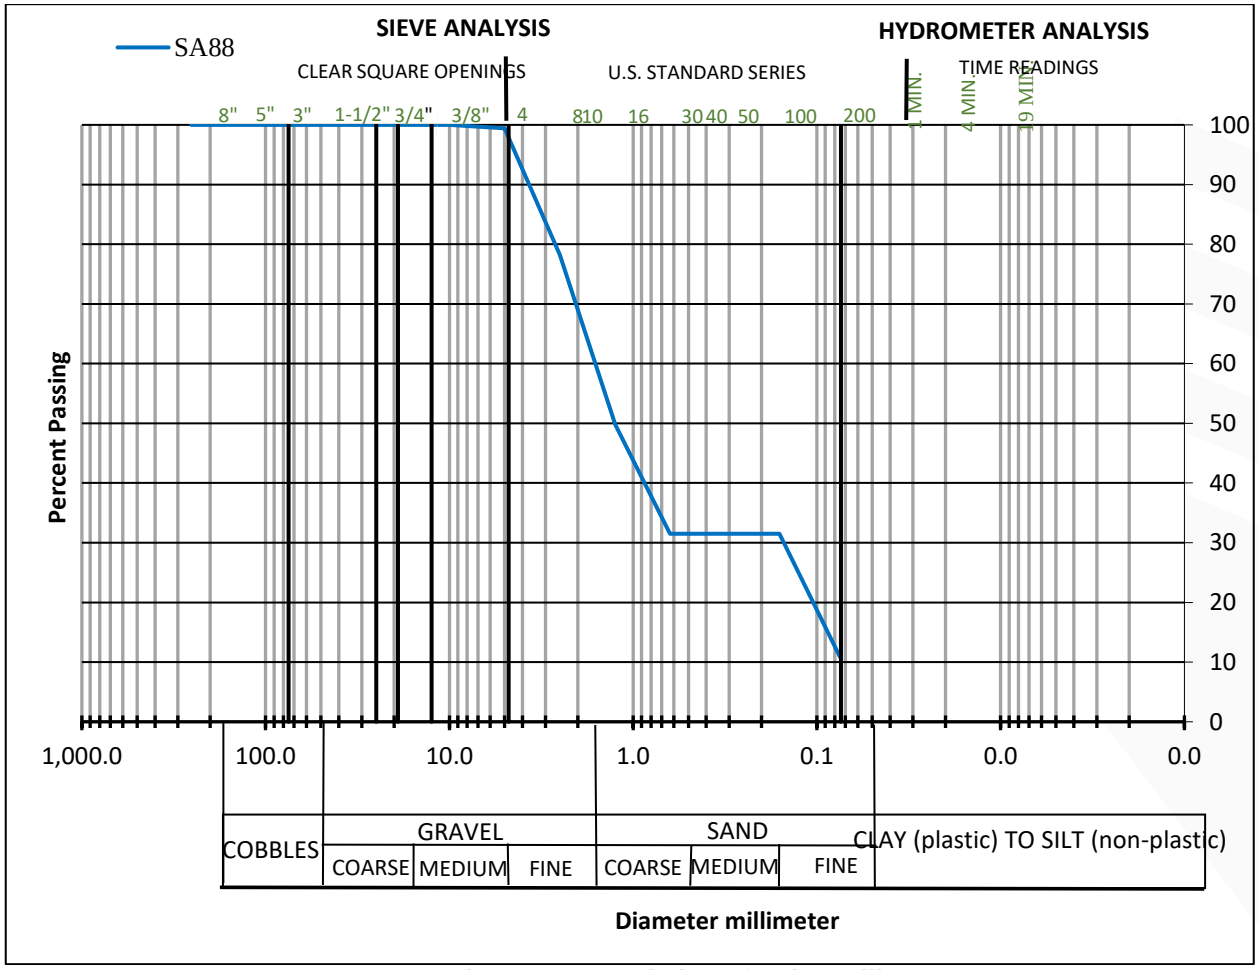

Figure 6-1: Gradation of Select Fill

6.1.2.3 Select Drain Fill

Select Drain Fill was placed in the underdrain collection trenches as a medium for flow. Select Drain Fill was produced by Nuway's mobile crushing and screening plant. The Select Drain Fill was required to have an operational permeability of $1x10^{-2}$ cm/s or higher. The gradation specification for Select Drain Fill called for a 25mm maximum particle size and a maximum of 7% passing the #200 mesh. Gradation tests performed on the Select Drain Fill produced by Nuway are provided in Figure 6-2 below.

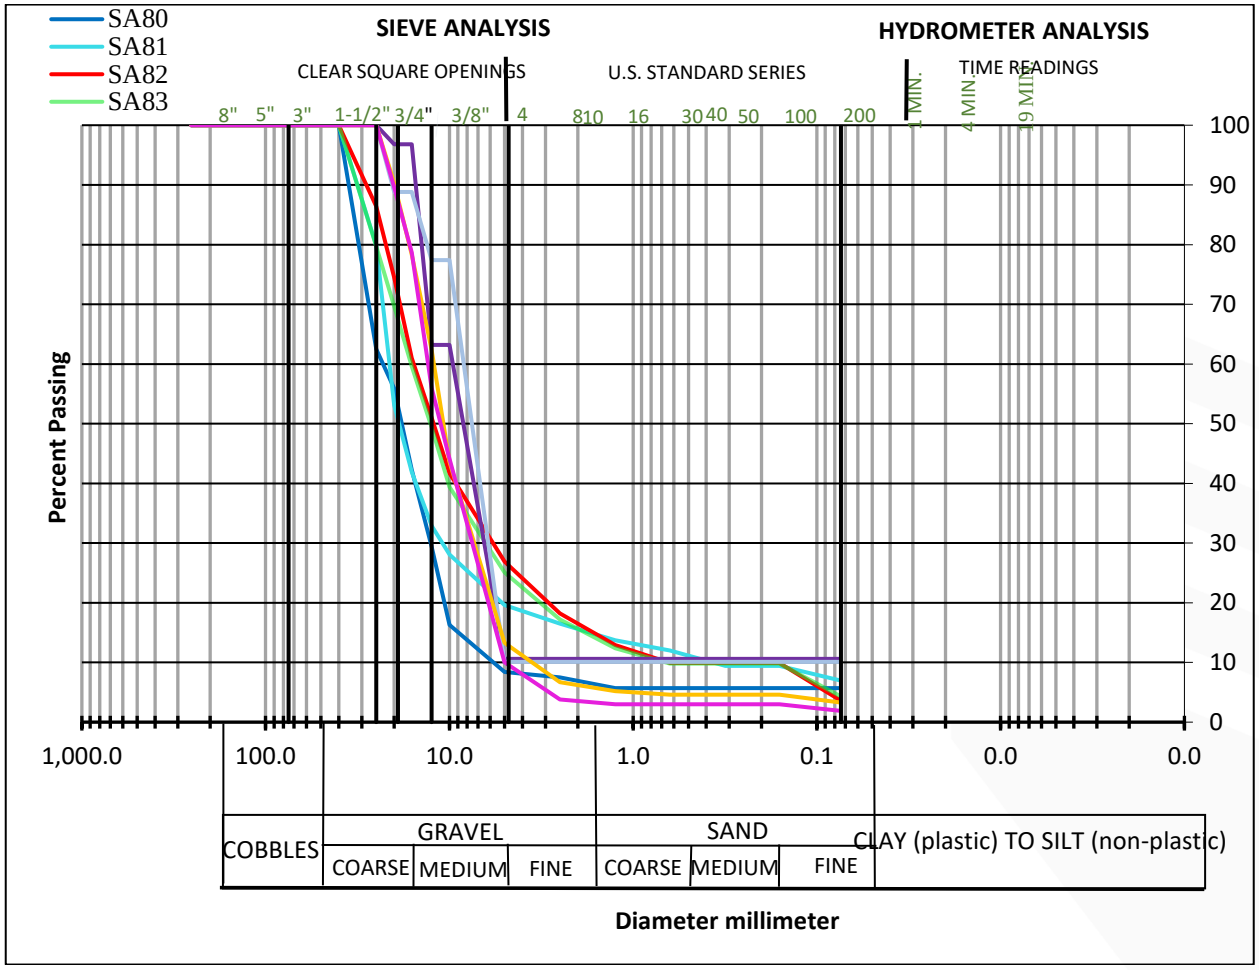

Figure 6-2: Gradation Tests

6.1.2.4 Compacted Rock Fill

Rockfill was used in the construction of the subgrade of the Phase 1B pad. As previously mentioned, Compacted Rock Fill was blasted, excavated and hauled directly from the borrow source. No further processing was performed. The maximum particle size required for Compacted Rock Fill was no greater than 2/3 the fill loose lift thickness and no more than 30% larger than 19mm. Visual inspections of the placed material were performed daily by Ewing and Tetra Tech. Lab gradation tests were not required due to the material's maximum particle size. QA/QC observations reported that the material generally conformed with requirements in the Technical Specifications. Compaction control during construction was achieved based on method specifications developed by the test fills (Field Memorandum CTFM-02).

6.2 Underdrain System

6.2.1 Construction Criteria

Typical underdrain construction consisted of the following components:

- Perforated, corrugated, N-12 polyurethane (PE) piping with bell style joints secured with wire ties. Lateral drains and any finger drains installed to collect and convey groundwater seepage during construction were designed and installed with these drainpipes.
- Select Drain Fill was used as granular drain rock medium. No compaction was required for placement.
- Select Fill was used as cover over the underdrain Select Drain Fill and geotextile to provide a separation between upper fills or a cushion below the liner system.
- 12 oz non-woven geotextile was used between the Select Drain Fill and the natural ground and/or backfill material.
- Solid walled HDPE SDR 11 pipe was used from Station 8+30 to 10+70 m. Solid walled pipe was joined using a butt fusing or electrofusion method.

6.2.2 QA/QC Requirements and Observations

JDS and Tetra Tech provided visual inspection and approval for the majority of the underdrain construction. This included verification that the specified geotextile, drainpipes, and aggregate were used, and that the drainage network was properly spaced to capture visible seeps and to meet the requirements of the design.

6.2.2.1 Fill Materials

Select Fill and Select Drain Fill were used in the construction of the underdrains. No compaction was required for the placement of Select Drain Fill.

During Phase 1A construction a test fill was performed on June 30, 2018, to determine the best compaction method and to replace the QC testing requirements for Select Fill. The results from the test fill are discussed in CTFM-01 located in Appendix 10. A Standard Proctor test was also performed on the Select Fill to determine the optimum moisture and density. Additionally, in-situ field moisture and density measurements were taken during the test fill using a nuclear density gauge. The results of the test fill indicated that >9% maximum dry Proctor density was achieved at >6% moisture and a minimum of 3 passes with 6,000 kg vibratory compactor. This method was used and tracked for placement of Select Fill throughout the construction of the HLF and replaced the field density testing requirements.

Four field density readings were also collected in the central underdrain pipe trench as verification of method developed to compact Select Fill. Results from the testing all reported >99% compaction, therefore the same methods were used for Phase 1B construction.

6.2.2.2 Solid Walled HDPE Pipe Installation QC Testing

All solid-walled HDPE pipe used in the underdrain header pipe trench was joined by butt-fusing per ASTM F2620 or electro-welding per ASTM F1055.

All underdrain header pipes will have gravity flow conditions and are not designed for pressure flow. All welding QC was performed and documented by Ewing. This included destruction of some welds to perform visual inspection.

6.2.3 Construction Completed

Underdrain construction began in March 2020 and advanced to August 2020. Underdrain construction was typically completed after subgrade or foundation preparation for any given area of the HLF. As construction progressed the underdrain system was expanded to include additional fingers in response to observed seepage. Construction was performed by Ewing. As-built drawings for the Underdrain system constructed at the HLF are included in Appendix 4.

6.2.3.1 HLF Underdrain Header Pipe Trench and Finger Drains

The HLF Underdrain Header Pipe Trench was constructed below the Interceptor Ditch starting at elevation 990 m and ending at the 1040m elev.

6.2.3.2 Lateral Drain Construction

Four lateral drains labeled East and West extend from the HLF Underdrain Header Pipe Trench above Elevation 990 m and extend throughout the remaining footprint of the HLF Phase 1B Pad. Piping from the underdrains is connected to the HLF underdrain header pipes. Small amounts of water had been flowing from the interceptor ditch down the header drain. A spur trench running from lateral drain 4E to the source of water in the interceptor ditch was constructed to prevent water from continuing to run down the header drain. This section of ditch was constructed following the same procedures as all other lateral drains. Refer to RFI-002 located in Appendix 7 for documentation on this corrective action.

6.2.4 Approved Minor Modifications, Rationale and Clarifications to the Design

The following minor modifications approved by the Engineer of Record were made to the design during construction activities.

- Approved use of either external snap coupler or split coupler for connection of two ADS N-12 plain end pipes as long as manufacturer's recommendations are followed. Split couplers must be bound by 2" wide polyethylene tape.
- Approved corrective action to collect small amounts of water into lateral drain 4E to prevent water flowing down the header drain.

These minor modifications can be found in RFIs 001 and 002 located in Appendix 7.

6.3 Phase 1B Pad

6.3.1 Construction Criteria

The Phase 1B Heap Pad consisted of the lined area of the HLF between elevations 990 m and 1050 m. It included perimeter berms along the eastern and western edges of the Phase 1B Heap Pad. Construction criteria included:

- As with the Phase 1A Pad, the Phase 1B Pad subgrade foundation was excavated down to Type 3 bedrock and included removal of all organic, ice rich, and soft or yielding soils. Areas were delineated for removal and backfilled with Compacted Rockfill. Subgrade was inspected and approved by Tetra Tech and Layfield prior to liner installation. Subgrade approvals are included in Layfield's QA/QC Package in Appendix 6.
- Compacted Rockfill fill was used in select areas as needed to achieve design grade.
- Select Fill was used in select areas as needed as liner bedding.
- Perimeter berms were required on the west and east side of the Phase 1B Heap Pad area. These structures were constructed with Rockfill.

6.3.2 QA/QC Requirements

- JDS performed daily inspections of the subgrade for general conformance with the requirements of the technical specifications. Subgrade suitability was assessed by observing deflection during subgrade compaction with either a six-ton or nine-ton vibratory compactor. Subgrade approvals are included in Appendix 6.
- In areas where Compacted Rockfill was used to achieve design grade and where Select Fill was used as bedding, placement and compaction was monitored by and documented by Ewing and/or Tetra Tech as required in Field Memorandums CTFM01 through CTFM-05. These inspections were documented in Tetra Tech's daily reports.
- CQA of liner placement was performed by Tetra Tech reporting to Forte. Tetra Tech performed CQA testing per the project technical specifications and reviewed all QC testing performed by Layfield. A Tetra Tech technician was present during all liner work. Tetra Tech provided daily reports that included test results, observations, and recommendations. Tetra Tech's Liner QA daily reports are included in Appendix 6. Any issues reported by Tetra Tech were addressed by Layfield. This included instances where weld tests failed, or areas needed rewelding or patching.

6.3.3 Construction Completed

The following Phase 1B Heap Pad components were completed:

- Preparation of the subgrade for liner placement. This included excavation of finger drains, where needed, excavation to approved grade and shape, and placement of Select Fill (bedding sand) where needed.
- Placement of the liner system along the Phase 1B Heap Pad.

6.3.4 Minor Modifications and Clarifications to the Design

The following minor modifications were made to the design during the construction activities:

- Removal of the 55m setback previously shown in the Heap Section view of Phase 1A Drawings. Additional slope stability modeling and direct shear test work is included in Appendix 2.

6.4 Investigations Completed

Test pits were excavated to identify and delineate the areas of the subgrade with ice rich or frost-susceptible soils as required in the Foundation Improvement Plan (StrataGold, 2017). Any ice rich and frost susceptible soils were identified and removed from within the Phase 1B Heap Pad area. These areas were confined to the central Ann Gulch drainage. The areas identified as having ice rich or frost susceptible soils were delineated by Underhill's survey crew and excavated by Ewing. The test pit logs and photographs taken of the test pits can be found in Appendix 11. Locations of the test pits are identified on the Record Drawings in Appendix 4.

6.5 HLF Liner System

6.5.1 Liner Profile

The HLF at the Eagle Gold Mine is constructed in phases as ore is stacked and leached in the facility, exhausting the installed liner systems' available space. The Eagle Gold Mine will utilize three HLF construction phases to bring the HLF to its final size. Prior to Phase 1B, Phase 1A and the In-heap Pond had been constructed and lined with geosynthetics. The In-heap Pond is a double liner system, while all subsequent phases are a single liner system. The single liner system is installed directly on the prepared subgrade and consists of the following layers (starting from the top to the bottom):

- An 80-millimetre (80-mil), textured double-sided low-density polyethylene (LLDPE) geomembrane liner; and

- A geosynthetic clay liner (GCL), which is reinforced with a layer of sodium bentonite.

The 80-mil LLDPE double-sided, textured geomembrane was placed directly on the GCL throughout all areas of Phase 1B.

The GCL was placed directly on the prepared and inspected subgrade, which was smooth and free of all protruding rocks, stones, sticks, roots, sharp objects, or debris of any kind. GCL liner was covered the same day, if possible, to limit exposure to moisture.

6.5.2 Manufacturer's Quality Control Certification

Layfield and SOLMAX, a geosynthetics manufacturer, provided Manufacturing Quality Control certificates for the GCL and 80-mil LLDPE geomembrane produced and delivered to site. These certificates show the average and minimum values for each roll of material delivered to site.

A summary of the manufacturer's certifications for the GCL, geomembrane, and geocomposite materials used for this project are included in in Tetra Tech's CQA package included in Appendix 6.

Forte reviewed the test data contained within the Manufacturer's Certificates for comparison to the product specifications. This comparison demonstrated that the material supplied met or exceeded all the typical project specific requirements.

6.5.3 Installation of GCL

The GCL for the project was provided by SOLMAX and was installed directly on all prepared subgrade extending into the anchor trench. The GCL was overlapped at least 0.5 m at all horizontal seams and 0.15 m at all vertical seams. Along every seam, loose sodium bentonite powder was placed to act as a seam sealant. All horizontal seams were fused using a propane torch, and vertical seams were only torched, as necessary.

6.5.4 Installation of 80-mil Linear Low-Density Polyethylene Geomembrane

The 80-mil geomembrane used for Phase 1B was 80-mil LLDPE Layfield Enviroliner manufactured by Layfield. The geomembrane was installed directly on the GCL and extended into the anchor trench to ensure that the liner system would be retained on the slope once the anchor trench was backfilled. The liner was deployed immediately after the placement of the GCL to limit the exposure of the GCL to rain. In instances where GCL was left exposed overnight, or longer, it was thoroughly inspected to ensure it was clear of debris, and no swelling had occurred prior to any placement of 80-mil geomembrane.

During placement, each geomembrane panel was inspected for signs of manufacturing defects or damage that may have been caused by the shipping, handling, or storage of the material. Any damage identified as part of the inspection was marked and removed from the roll prior to installation or repaired once deployed on the slope.

6.5.5 Final Inspection and Acceptance

Once the liner had been deployed, fused, repaired, and tested, a final walk-off was performed by Tetra Tech and Layfield to inspect for deficiencies such as holes, missing repairs, and missing testing. The walk-off consisted of inspecting the entire liner area, including seams, the tie-in to Phase 1A, and the anchor trench. If any deficiency was noted, the deficiency would be remedied immediately. Once all deficiencies had been remedied, Layfield drafted a Certificate of Final Inspection and Acceptance to be signed by the CQA Monitor and Layfield's Supervisor or QC representative. Upon sign off, Tetra Tech provided the Certificate of Final Inspection and Acceptance to Victoria Gold and Forte. The Certificates of Final Inspection and Acceptance can be found in Tetra Tech's CQA package included in Appendix 6.

7. RECORD DRAWINGS

Record drawings can be found in Appendix 4 and are based on as-built survey data provided by Underhill. Electronic files of the record drawings are available upon request from Forte and files of raw survey data are available through JDS.

8. REQUESTS FOR INFORMATION AND RESPONSES

A list of Requests for Information responded to by Forte and created by JDS during the construction is included below. RFIs can be found in Appendix 7.

RFI	From	Date Closed	Subject
VITGOLD-RFI-001	JDS/Ewing	4/24/2020	Lateral ADS N-12 (plain end to plain end)
VITGOLD-RFI-002	JDS/Ewing	5/29/2020	Spur Lateral Drain off 4E
VITGOLD-RFI-003	JDS/Ewing	6/11/2020	Horizontal seams on slopes greater than 2.5:1

9. CONSTRUCTION WORK PLANS

The following construction work plan was developed by Victoria Gold Corporation and reviewed by Forte and JDS. Construction work plans can be found in Appendix 1.

- CWP-HLF Phase 1B: Work plan detailing the construction of Phase 1B pad and liner installation.

10. DAILY REPORTS

Daily reports from Tetra Tech for earthworks and liner CQA services and JDS's daily reports are included in Appendix 3.

11. WELL DECOMMISSIONING REPORTS

Most monitoring wells and piezometers on the Eagle Gold property are used for water quality sampling and/or water level observations. Decommissioning monitoring wells is necessary to prevent migration of contaminants into an aquifer or between aquifers. The well decommissioning reports are included in Appendix 8.

12. TECHNICAL SPECIFICATIONS AND MEMOS

Technical field memorandums adopted for Phase 1B construction are included in Appendix 9. These field memos include construction and execution of the following test fills:

- Select Fill Test Fills 01 & 02
- Compacted Rockfill Test Fills 01 & 02
- Structural Fill Test Fills 01, 02, & 03

Technical Specifications are included in Appendix 5.

13. CLOSURE

Forte Dynamics Inc. (Forte) prepared this document for the account of Victoria Gold Corporation. The material in it reflects the judgment of Forte staff in light of the information available to Forte at the time of document preparation. Any use which a third party makes of this document or any reliance on decisions to be based on it is the responsibility of such third parties. Forte accepts no responsibility for damages, if any, suffered by any third party as a result of decisions made or actions based on this document.

As a mutual protection to our client, the public, and ourselves, all documents and drawings are submitted for the confidential information of our client for a specific project. Authorization for any use and/or publication of this document or any data, statements, conclusions or abstracts from or regarding our documents and drawings, through any form of print or electronic media, including without limitation, posting or reproduction of same on any website, is reserved pending Forte's written approval. A record copy of this document is on file at Forte. That copy takes precedence over any other copy or reproduction of this document.

Note the conclusions provided herein will change as the recommended maintenance measures are undertaken.

We trust the above satisfies your requirements at this time. Should you have any questions or comments, please do not hesitate to contact us.

Yours sincerely,

Forte Dynamics Inc.

SAFETY

Potential Hazard	Precautions and Actions
Clearing & Grubbing	• Minimize backing equipment up in fallen timber • Be aware of stored energy when clearing and grubbing • Watch for falling tree tops when knocking timber over
Steep Slopes	• Dozers and Excavators working on slope will require corks • Avoid working sideways on steep slopes
Winter Driving Conditions	• Road will to be maintained and sanded when required • Haul trucks will stop hauling if road conditions are unmanageable due to poor weather – haulage will resume when road conditions are addressed
One Way Haul Road	• Road way will be radio controlled • Pullouts will be constructed for haul truck

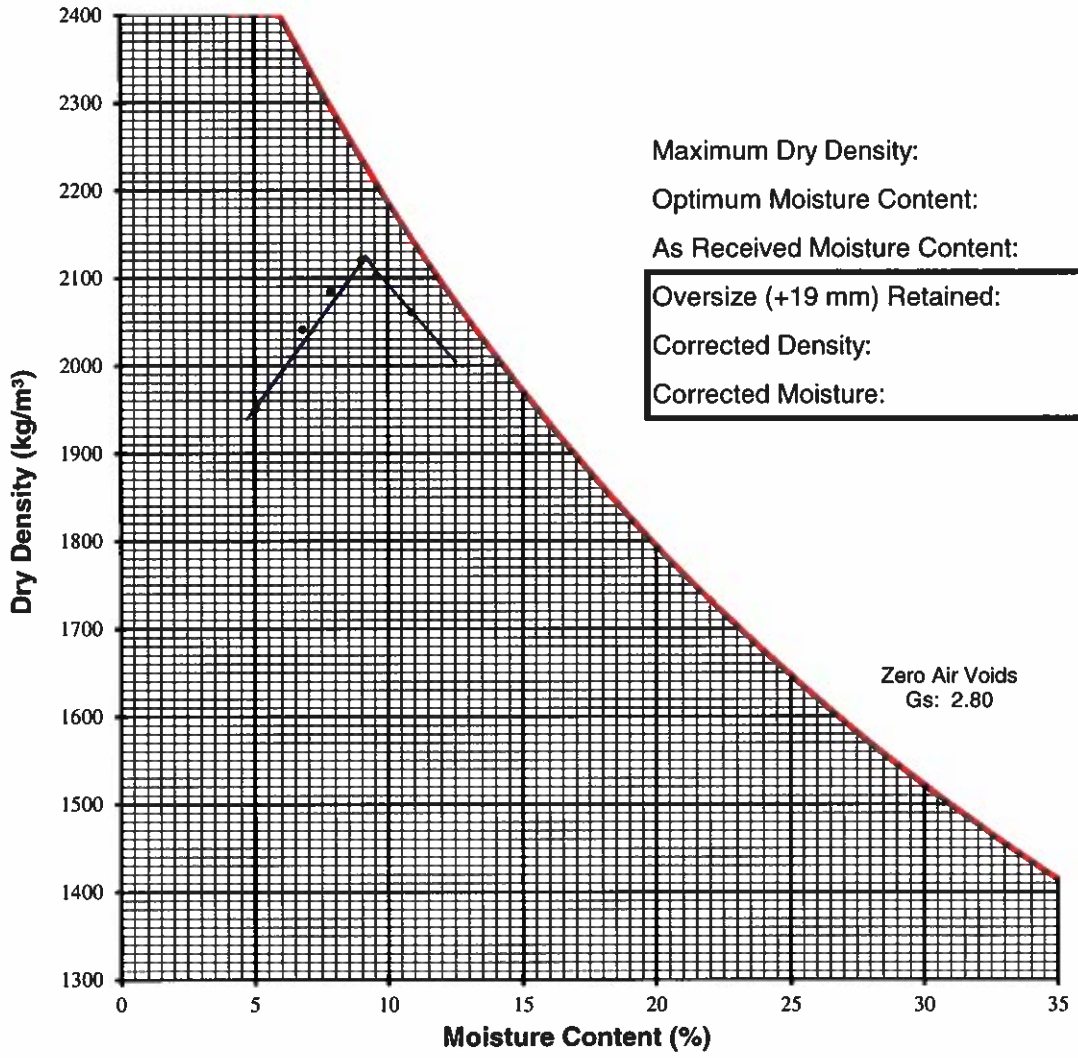
ENVIRONMENT

Critical Items	Precautions and Actions
Potential Spills (oil, fuel, coolant)	• All equipment is to be equipped with a spill kit • Spills will be cleaned up and placed in designated containment cell

SCOPE OF WORK

Description	Responsible
1. <u>Layout and Survey Control</u> • Layout clearing limits – clearing limits will have to be pushed back enough to ensure there is room for the perimeter access road (6 meters wide), key trench excavation, and liner deployment • Grade control required when finishing surface to ensure a 2H:1V slope is never exceeded – west slope may require some engineer design once the topsoil is removed • Underdrain and laterals drain layout, grade control, and as-built pick up • Liner as-built during placement of liner • Final overall as-built	Underhill
2. <u>Staging Area (Liner)</u> • Staging area will be developed in the southwest corner of Phase 2 – Crossing required at the west end of the 1045 ditch (18" ADS available near burn pit) – Construct crossing outside the liner key trench so it can stay for future phases • Crossing may have to be pulled during freshet due to the undersized culverts	Ewing
3. <u>Decommissioning 5 Water Monitoring Wells</u> • Decommissioning completed MW09-AG2, MW10-AG3, MW10-AG3B, TP-BGC10-26 • Decommissioning remaining BH-BGC11-29 • Environmental collected water samples and removed instrumentation	Environmental Ewing

Description	Responsible
• Excavator will be utilized to excavate a minimum of 2 meters below finished grade around the well monument • Cut PVC off at the bottom of the excavation and fill PVC pipe with bentonite chips • Backfill excavation with blast rock and pack in maximum 0.9m loose lifts with minimum of 3 passes • Have survey check wells depths from surface once final grade is established	
4. <u>Clearing, Grubbing and Topsoil Removal</u> • The excavator and wiggle waggons will be required to complete the construction of Phase 1B • 3 dump locations – South of inert waste dump, east side of the 1045 ditch, and along Phase 1B access • Trees will be removed with grubbing and topsoil – timber will be knocked down and mixed in with the topsoil • The topsoil is to be push down from the top of Phase 1B to suitable loading locations, generally closer to the bottom • The topsoil piles will be required in areas to gain access to steeper portions of Phase 1B – Utilizing topsoil for access roads will reduce cutting into finished surface grade and backfilling requirements • The topsoil access road will be retreat excavated when construction is completed above them	Ewing
5. <u>Removal of Unsuitable Material and Surface Grading</u> • Establish Phase 1B perimeter access road / liner deployment bench 6 m wide • Slopes are not to exceed 2H:1V for liner placement • 1030 deployment bench has been removed • Any unsuitable material or excess material requiring removal to maintain finished grade can be pushed into areas suitable for loading (Do not mix with topsoil) • Some unsuitable material excavations will require backfill to maintain necessary grading, this must be backfilled with blast rock in 0.9m loose lifts – 3 passes minimum with a 9000KG packer • The ditch at approximately EL1000 will have to be cleaned out and backfilled – This can be addressed once the topsoil has been pushed below EL1000 • Compactor will be required for compacting finished surfaces, backfilling, and sand placement for liner deployment	Ewing
6. <u>Excavation and Installation of the Underdrain System</u> • Reference Drawing CV-F003, DTL-F003 and 109005 – underdrain profile • 20mm Underdrain material will have to be produced by other (Nuway) • Underdrain excavation can commence once surface grading is completed in work area, all necessary materials have arrived, and 20mm drain rock is available • Survey will layout underdrain alignment and cuts to ensure correct depth and grade is maintained between STA 0+800 to STA 1+087 – minimum excavation depth is 750mm and 5 meters wide across the bottom • During construction of Phase 1 small V-ditch's had to be excavated on both side of the excavation to manage ground water • The (4) 6" DR11 HDPE underdrain pipes will have to be exposed just above	Ewing



Description	Responsible
the 990 bench – top end of the underdrain was covered to stop fines from silting up the drainage system • When excavating the main underdrain there will be 4 lateral drains spaced approximately 75 meters apart (0+825, 0+900, 0+975,1+050) • Lateral drains are graded at plus or minus 3% - minimum excavation is 700mm deep by 1 meter wide • All underdrain excavations to be as-built by survey • Install geotextile as shown in drawing DTL-F003 • Place 100mm of drain rock onto the geotextile • Install (4) 6" DR11 HDPE pipe evenly spaced 1 meter apart – Line will have to be fused with the 412 fusing machine – 6" Wyes will have to be fused in at lateral drain locations – First portion of the lateral drain will have to be excavated and installed at the same time for backfill purposes • Place drain rock 300mm above the pipe and finish wrapping the drain rock with 12 oz. non-woven geotextile – geotextile must be overlapped 500mm • Place 300mm of SDF material over the geotextile and compact (backfill of any portion of the trench shall not be frozen) • Lateral drains are to be constructed the same way except you'll be install 100mm ADS N-12 corrugated pipe – The 100mm N-12 ADS is already fused to the 150mm header wye pipes • Plate tamper will be required to pack lateral drains correctly • Additional drains (or small extensions) may be required if seepage is identified and not being captured by the designed underdrain system	
7. <u>Prep surface for Liner Placement</u> • Snow removal • Access roads will be constructed out of sand on the western side to make placement of sand safer. Start placement and compaction from upper access road working your way down in section. • Dozer and grader can be utilized for grading surface to be compacted • Sand (Potential sand requirement 266,680m^2 X 0.05m = 13,334 m^3) placement will be required over any rocky or ruff surfaces • Excavate key trench ahead of liner placement (excavate 0.4 m in from the crest of slope 0.75 m D X 0.75 m W) • These steps will have to advanced ahead of the liner crew	Ewing
8. <u>Liner Placement</u> • Support equipment – excavator for deploying liner, loader or telehandler for loading and moving rolls, • Labour crew to support liner crew – Ewing supplied labour crew for Phase 1A • Ewing Labour crew will have to make a few hundred sand bags • Approximately 7500 sq. m of liner will be placed each day – GCL will be covered with 2mm (80-mil) liner as soon as possible	Layfield / Ewing

Dear Mr. Green,

Re: Forte Dynamics Lab Testing

1.0 INTRODUCTION

BGC Engineering Inc. (BGC) was retained by Forte Dynamics Inc. to conduct a series of liner interface shear tests for the expansion phases of the Victoria Gold Corp Project "Eagle Gold Mine". The results of these tests are attached herein.

2.0 BACKGROUND

On January 20th, 2020, BGC received a shipment of geosynthetic clay liners (GCL) and geomembranes from Layfield Group LTD. The product name associated with the GCL and the geomembrane was GSE BentoLiner NWL-60 and Layfield Enviro Liner 4280 CT, respectively. Product data sheets are included in Appendix A.

During the first three tests, BGC observed lower than expected shear strengths between the GCL and the geomembrane. When comparing the 2020 GCL with the GCL tested by BGC in 2018 and 2019 (also GSE BentoLiner NWL-60), the results were incongruent. BGC observed that the 2020 GCL swelled approximately twice as much when compared to the GCL tested in 2018 and 2019 GCL. The lower internal shear strength of the 2020 GCL was attributed to the higher water content of the bentonite.

BGC notified Forte Dynamics Inc. of the apparent discrepancy in GCL types, and Forte Dymamics said they would reach out to Layfield and arrange to have new GCL sent to the BGC laboratory for testing.

On March 4th, 2020, BGC received the new shipment of GCL with product name GSE BentoLiner NWL-60. A second round of liner interface testing was completed using this GCL. The new GCL swelled to a similar water content and hydrated thickness as the GSE BentoLiner NWL-60 tested in 2018 and 2019.

In addition to completing the liner interface shear tests, BGC also completed Standard Proctor and particle size distribution tests on subgrade and overliner materials.

Individual laboratory reports for the completed tests are included in Appendix B. This work was conducted in general accordance with the scope of work provided in an email sent by Clint Green of Forte Dynamics Inc. to David Oldford of BGC on January 13, 2020 entitled "VGC-Eagle-Interface Shear", and according to the terms and conditions provided in Appendix C.

3.0 STANDARDS FOLLOWED

The index tests and the liner interface samples were tested in accordance with the latest editions of applicable American Society for Testing and Materials (ASTM) standards and recognized good practice. The following ASTM Standards were utilized:

- ASTM D5321 - Standard Test Method for Determining the Shear Strength of Soil-Geosynthetic and Geosynthetic-Geosynthetic Interfaces by Direct Shear.
- ASTM D6913 - Standard Test Methods for Particle-Size Distribution (Gradation) of Soils Using Sieve Analysis.
- ASTM D698 - Standard Test Methods for Laboratory Compaction Characteristics of Soil Using Standard Effort (12,400 ft-lbf/ft^3 (600 kN-m/m^3).

4.0 EQUIPMENT

The liner interface tests were completed using BGC's large direct shear box apparatus. The shear box has horizontal dimensions of 40 cm x 40 cm and a height of 51 cm, and allows testing to be completed at vertical stresses of up to 5.5 MPa. The vertical stress is applied to a top plate by means of two 50 ton jacks. A horizontal force is applied by means of a single 50 ton jack. Vertical and horizontal displacements are measured and logged continuously throughout the test by means of Liner Variable Displacement Transducers (LVDT). The use of two vertical jacks and LVDT's allows adjustment of the top plate throughout the test. This ensures that the top plate remains parallel while maintaining a constant vertical stress. The horizontal force is continuously measured and logged by means of a load cell. A photograph of the equipment is provided in Figure 4-1.

Figure 4-1. BGC's Large Direct Shear Apparatus

5.0 METHODOLOGY

The liner interface tests were conducted by placing a subgrade material into the bottom half of the shear box. The subgrade was compacted to a minimum of 92% of the maximum Standard Proctor dry density as requested by Forte Dynamics. Next, a pre-soaked GCL was placed on top of the subgrade, followed by a geomembrane. The top half of the shear box was placed over the geomembrane and was filled with the overliner material. Finally, a top plate was placed above the overliner material. For each GCL type tested, two rounds of testing were completed at vertical stresses 400, 800 and 1200 kPa. The vertical stresses were applied to the system until the vertical deformation had stabilized. After consolidation, the liner systems were sheared at an average displacement rate of approximately 0.28 cm/min while maintaining a constant vertical stress.

6.0 CLOSURE

BGC Engineering Inc. (BGC) prepared this document for the account of Forte Dynamics Inc. The material in it reflects the judgment of BGC staff in light of the information available to BGC at the time of document preparation. Any use which a third party makes of this document or any reliance on decisions to be based on it is the responsibility of such third parties. BGC accepts no responsibility for damages, if any, suffered by any third party as a result of decisions made or actions based on this document.

As a mutual protection to our client, the public, and ourselves, all documents are submitted for the confidential information of our client for a specific project. Authorization for any use and/or publication of this document or any data, statements, conclusions or abstracts from or regarding our documents, through any form of print or electronic media, including without limitation, posting or reproduction of same on any website, is reserved pending BGC's written approval. A record copy of this document is on file at BGC. That copy takes precedence over any other copy or reproduction of this document.

APPENDIX A
PRODUCT DATA SHEETS

PRODUCT DATA SHEET

GSE BentoLiner NWL-60 Geosynthetic Clay Liner

GSE BentoLiner "NWL-60" is a heavily needlepunched reinforced composite geosynthetic clay liner (GCL) comprised of a uniform layer of granular sodium bentonite encapsulated between a nonwoven and a scrim-nonwoven geotextile for dimensional stability. The product is intended for steep slopes and high load applications where increased internal shear strength is required.

AT THE CORE:

This composite clay liner is intended for steep slopes and high load applications where increased internal shear strength is required.

Product Specifications

Tested Property	Test Method	Frequency	VALUE
Geotextile Property			
Cap Nonwoven, Mass/Unit Area	ASTM D 5261	1/200,000 ft^2	6.0 oz/yd^2 MARV(1)
Carrier Scrim Nonwoven, Mass/Unit Area	ASTM D 5261	1/200,000 ft^2	6.0 oz/yd^2 MARV
Bentonite Property

LAYFIELD

Geomembrane [EL4280, 2-sided Coarse Textured]

Our Enviro Liner 4000 coarse textured series Geomembranes have better interface friction capabilities compared to our standard textured geomembranes. Texturing can be accomplished either on one side or on both sides. Enviro Liner 4000 coarse textured product can be manufactured to custom asperity heights and is available by special order. Layfield is capable of supplying the friction and strength properties you require for your design build project. Enviro Liner 4280 Coarse Textured Geomembrane meets or exceeds the requirements of Table 2(B) GRI GM 17 specification for textured Linear Low-Density Polyethylene Geomembranes.

Property	ASTM	EL4280[1] 2-sided Coarse Textured	Frequency

PROJECT INFORMATION		LINER SYSTEM	
Number	2140-001	Subgrade	Gravel, sandy, trace fines
Name	Forte Dynamics Liner Testing	GCL	GSE BentoLiner NWL-60 GCL
Location	Yukon Territory	Geomembrane	Layfield Enviro Liner 4280 CT
Client	Forte Dynamics Inc.	Overliner	Poorly graded gravel with sand (GP)

INDEX PROPERTIES OF SUBGRADE	Initial
Length and Width (cm)	40.5 x 40.5
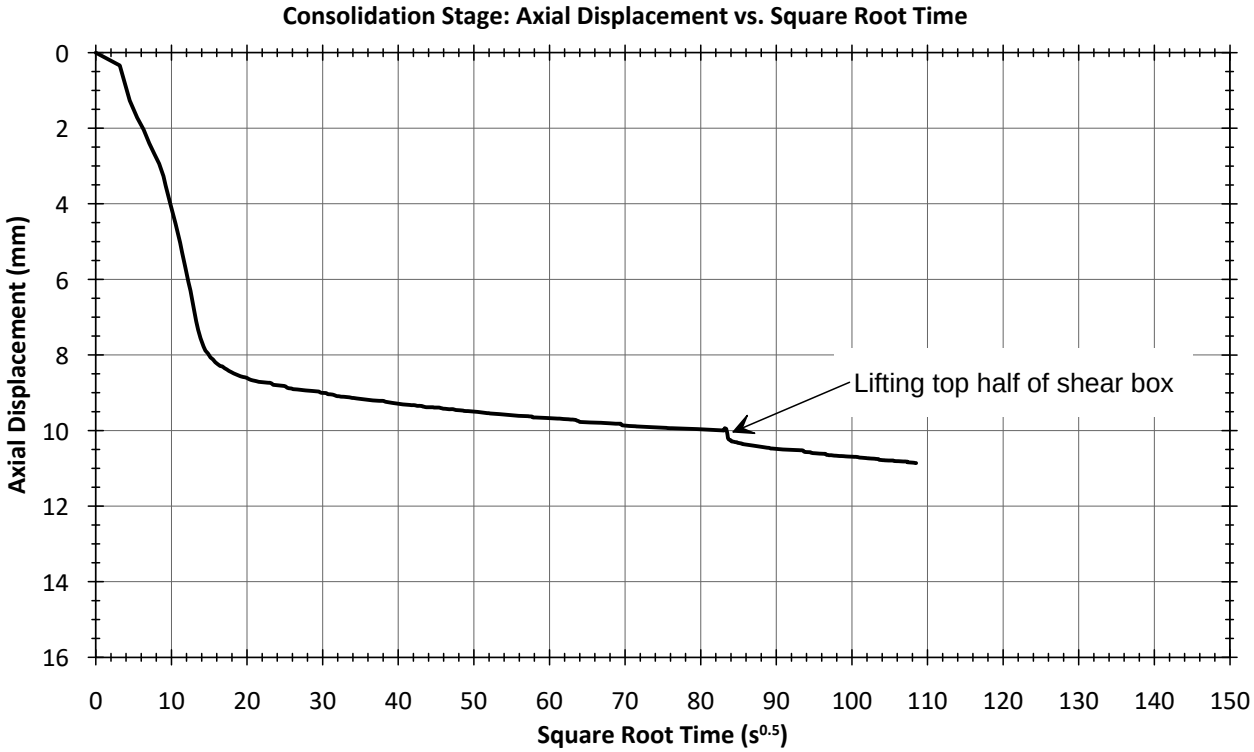
Thickness (cm)	14.8
Bulk Density ρ_b (g/cm^3)	2.29
Dry Density ρ_d (g/cm^3)	2.13
Void Ratio e	0.27
Water Content (%)	7.3
Specific Gravity G_s (Assumed)	2.70

INDEX PROPERTIES OF OVERLINER	Initial
Length and Width (cm)	40.5 x 40.5
Thickness (cm)	11.0
Bulk Density ρ_b (g/cm^3)	2.25
Dry Density ρ_d (g/cm^3)	2.12
Void Ratio e	0.23
Water Content (%)	6.3
Specific Gravity G_s (Assumed)	2.60



INDEX PROPERTIES OF GCL	
Initial Average Hydrated Thickness (cm)	1.09
Initial Water Content (%)	186.4
Final Water Content (%)	140.5

SHEARING PARAMETERS	
Vertical Stress σ'_v (kPa)	800
Displacement Rate (cm/min)	0.15

RESULTS	
τ_{max} (kPa)	195
τ_{res} (kPa)	32

Note: Internal failure was observed in the geosynethetic clay liner (GCL). Displacement between the subgrade and the GCL was observed, along with displacement between the geomembrane and GCL.

APPENDIX C
BGC's STANDARD TERMS AND CONDITIONS

AGREEMENT FOR LABORATORY TESTING SERVICES

Dated as of this 21 day of February, 2020, is made by and between:

Client: Forte Dynamics ("the **Client**"),

Address: 3003 E. Harmony Road, Suite 320
Fort Collins, Co 80528

AND:

BGC ENGINEERING INC. ("**BGC**")
Suite 500 – 980 Howe Street
Vancouver BC, V6Z 0C8
Canada

The Client and BGC agree as follows:

1. THE LABORATORY SERVICES

1.1 BGC will provide Client certain Laboratory Services (as defined below) for the following project:

(Insert brief description of the project (the "Project").

1.2 The Laboratory Services BGC will provide Client for the Project are either described below, or are described in the following document: SEE ATTACHED SCOPE OF WORK FOR LINER INTERFACE SHEAR

(Either add a description of the lab testing work BGC will perform, or insert the date and description/title of a document that contains the scope of work. Note whether the document is attached to this Agreement – e.g., see attached Proposal for Laboratory Services dated September 24, 2019) (the "Scope of Services Document")

2. AGREEMENT DOCUMENTS

2.1 The following documents form part of and are incorporated into this Agreement:

- This *Agreement For Laboratory Testing Services*
- Definitions
- General Conditions
- Scope of Services Document

If there is any conflict or inconsistency between or among the documents listed above, then the provision in the document listed closer to the top of the list will prevail.

3. SUCCESSION

3.1 This Agreement will inure to the benefit of and be binding upon the Parties, and their respective administrators, successors, and permitted assigns.

IN WITNESS THEREOF, the Parties hereto have executed this Agreement as of the day and year indicated on page one of this Agreement.

DEFINITIONS

In addition to any other terms defined elsewhere in this Agreement, the following terms have the meanings set forth below when capitalized and used in this Agreement:

"**Affiliate**" means any Person which directly or indirectly controls, is controlled by, or is under common control with, a Party to this Agreement. For purposes of the preceding sentence, "**control**" means the power to direct or manage affairs through ownership of voting securities, contract, voting trust, or any other means.

"**BGC**" means BGC Engineering Inc., a British Columbia, Canada corporation.

"**BGC Group**" refers collectively to BGC, BGC's Affiliates, BGC's sub-contractors, BGC's sub-consultants, and each of their respective Personnel.

"**Claim**" means any claim, action, legal proceeding, lawsuit, claim through arbitration, or other cause of action of any kind, including third party claims for contribution or indemnity.

"**Client**" means the Person identified as the "Client" in the *Agreement For Laboratory Testing Services*.

"**Client Group**" refers collectively to Client and Client's Affiliates.

"**Damages**" means any of the following: damages, losses, liabilities, costs, expenses, arbitration awards, penalties, fines, or assessments.

"Laboratory Services" means the laboratory testing and analysis that BGC performs for Client on one or more Samples, as well as the preparation of any Work Product related to such testing and analysis.

"Party" refers to either of BGC or Client, and **"Parties"** refers to both of BGC and Client.

"Person" means, as applicable, a natural person or an entity, including a partnership, corporation, company, limited liability company, joint venture, trust, government agency, unincorporated organization or other form of entity.

"Personnel" means current, former and future directors, officers, employees, shareholders, agents, and representatives.

"Sample" means any specimen of soil, rock, material, or other substance that BGC evaluates or tests for Client pursuant to the terms of this Agreement.

"Third Party" means any Person other than a member of BGC Group or a member of Client Group.

"Work Product" means any report or deliverable that BGC generates in connection with the Laboratory Services.

GENERAL CONDITIONS

1. STANDARD OF CARE

BGC will perform the Laboratory Services in accordance with the prevailing standard of care, skill, and diligence ordinarily exercised by a consulting engineering firm when performing similar services under comparable circumstances at the same or a similar location. BGC provides no other warranty, guarantee, representation, or covenant with respect to the Laboratory Services, either express or implied.

2. COMPENSATION

2.1 BGC will charge Client for the Laboratory Services in accordance with *BGC's Schedule of Fees and Disbursements,* as updated from time to time. Unless otherwise agreed, all charges are payable in Canadian Dollars (CAD). or US Dollars,

2.2 BGC may charge Client for any applicable sales taxes, value-added taxes, import duty, and any other transactional taxes arising, accruing, or collectable with respect to the Laboratory Services. The Client bears all costs and risks of carrying out customs formalities related to the Samples, including but not limited to payment of duties, taxes, and import fees before the Samples are delivered to BGC's laboratory.

2.3 Invoices are due and payable by the Client within thirty (30) days of the invoice date.

3. RIGHT OF ENTRY AND PROJECT INFORMATION

3.1 On a timely basis, the Client shall permit, or arrange for permission, for the BGC Group to enter onto and pass over all properties to which access is necessary for the Laboratory Services. However, BGC will only visit the Project site if both Parties agree that it is necessary for BGC to do so.

3.2 The Client shall promptly provide BGC all available documents, data, and other information relevant to either the Samples or the Laboratory Services. BGC may assume that all documents, information, and data provided to BGC by the Client, the Client's Personnel or the Client's other consultants are accurate and complete. The Client will immediately notify BGC if any such document, data, or information changes or is discovered to be incomplete or unreliable.

4. SCOPE OF WORK

4.1 The Scope of Services Document will specify the scope and nature of Laboratory Services (including the applicable testing standards) that BGC will perform on a Sample. BGC is only required to prepare a report as part of the Laboratory Services if the Scope of Services Document states that BGC will prepare a report. Otherwise, BGC may only provide the raw data resulting from any tests performed during the Laboratory Services.

4.2 If BGC and the Client do not confirm in writing the scope and nature of Laboratory Services that BGC is required to perform on a Sample, then BGC may perform such tests and analyses as BGC deems appropriate, based on information the Client previously provided BGC.

4.3 Unless BGC expressly agrees otherwise in writing, BGC is not required to evaluate the Samples for pollution, radioactivity, volatile organic compounds, or toxicity. Client must notify BGC immediately if Client determines or suspects that any Sample may contain unsafe levels of pollution, radioactivity, volatile organic compounds, or toxicity.

4.4 BGC is committed to the safety of its Personnel. BGC complies with occupational safety and environmental protection codes. To safely conduct the Laboratory Services, BGC requires compliance with the conditions listed below. Failure to comply with those conditions will cause delay or refusal of a Sample delivery:

4.4.1 A Safety Data Sheet (SDS) must accompany all Samples. At a minimum, the SDS must provide the following information for all Samples:

a. Responsible Person and phone number
b. Chemical name (for mixtures list percentage composition)
c. Specific gravity, appearance, color and odor
d. Explosion hazards or reactivity
e. Health hazards
f. Personal protective equipment and any special procedures required for safe handling.

4.4.2 If any material in a Sample is known or suspected to be carcinogenic, radioactive, pathogenic, infectious, or extremely hazardous, then Client must email the SDS for the Sample to BGC at least five (5) business days before Client intends to ship the Sample to BGC. BGC may decline to accept or test any such Sample.

4.4.3 All samples must be transported in suitable containers not larger than ten (10) gallons unless BGC approves another sample size and appropriate container.

4.5 Unless BGC expressly agrees otherwise in writing, BGC is not responsible for either: (a) collecting or gathering any Samples; (b) shipping or handling for any Samples while in transit to BGC's laboratory testing facility; or (c) any loss, damage, or deterioration of any Samples while in transit to BGC's laboratory testing facility.

4.6 Client is solely responsible, at the Client's expense, for: (a) properly collecting the Samples, (b) appropriately labelling the Samples, and (c) carefully shipping the Samples to BGC's laboratory facility.

4.7 **Client acknowledges that Samples may not be fully representative of the Project's actual site conditions. Project site conditions may vary from place to place. BGC does not represent, warrant or guarantee that the results of the Laboratory Services will provide a full, complete, or representative summary of actual Project site conditions.**

4.8 Unless the Parties agree otherwise in writing, BGC may destroy or permanently dispose of any Sample one hundred eighty (180) days after BGC first receives the Sample. Until BGC is permitted to dispose of a Sample, BGC will make reasonable efforts to follow accepted industry practice for storing the Sample. If BGC agrees to return a Sample to Client, then Client will reimburse BGC for all costs incurred to do so. A disposal fee will apply if BGC is required to dispose of a Sample.

5. INTELLECTUAL PROPERTY

5.1 BGC retains sole and exclusive ownership of all right, title, and interest for, in, and to all inventions, software, programs, processes, innovations, and other intellectual property in any form that BGC creates, invents, conceives of, or acquires while performing the Laboratory Services or as a result of the Laboratory Services.

6. WORK PRODUCT

6.1 Only qualified geotechnical experts should review and interpret the Work Product. BGC will not be responsible or liable for any Claims or Damages arising from any misinterpretation of the Work Product.

6.2 BGC is entitled to retain a file copy of any Work Product and all documents the Client provides BGC.

6.3 The Client agrees to use the Work Product solely for the specific purpose(s) for which BGC prepared or disclosed such Work Product. Any alteration or other use of Work Product not authorized by BGC shall be at the Client's sole risk.

7. INSURANCE

BGC shall carry the following insurance:

a. Such coverage as may be required pursuant to applicable Worker's Compensation legislation, or satisfactory employer's liability insurance;

b. Commercial general liability insurance for bodily injury and property damages in the amount of Two Million Canadian Dollars ($2,000,000.00 CAD) per occurrence and in the aggregate; and

c. Professional liability insurance, which insures BGC against liability arising from negligent acts, errors, and omissions in BGC's professional services, in the amount of Five Hundred Thousand Canadian Dollars ($500,000.00 CAD) per claim and in the aggregate.

8. ABSOLUTE LIMIT OF LIABILITY

8.1 Claims by Client Group

8.1.1 The absolute maximum aggregate liability of the BGC Group, or any of them, to the Client Group for Claims or Damages arising out of the Laboratory Services or related in any way to the Project shall not exceed **TWO HUNDRED FIFTY THOUSAND CANADIAN DOLLARS ($250,000.00 CAD)**. For greater certainty, this liability limitation applies whether all or any of the Client Group bring one or more Claims against all or any of BGC Group in any way related to this Agreement, the Project, or the Laboratory Services. This limit of liability shall apply to all Claims and Damages including, but not limited to, those arising due to breach of contract, tort, negligence, negligent misrepresentation, errors, omissions, breach of warranty, strict liability, breach of any statutory or regulatory requirement, or under any other theory of recovery or liability at law or in equity.

8.1.2 The Client, for itself and as agent for and on behalf of the other entities of the Client Group, hereby releases the BGC Group, and each of them, from any and all past, present and future liability for Claims or Damages arising from the Laboratory Services or the Project in excess of $250,000.00 CAD.

8.1.3 The Client confirms and expressly acknowledges that it has authority to act as agent for the other entities in the Client Group for the purposes of providing the liability limitation and release noted above.

8.1.4 The Client waives and releases any right to assert any Claims against the individual Personnel of either BGC, BGC's Affiliates, or BGC's subcontractors, even if Claims or Damages arise due to the negligence, errors, omissions, or other fault of such individuals.

8.2 Claims by Third Parties

8.2.1 The Client agrees to limit the total aggregate liability of the BGC Group, or any of them, to Third Parties for Claims or Damages arising out of the Laboratory Services to **TWO HUNDRED FIFTY THOUSAND CANADIAN DOLLARS ($250,000.00 CAD)** (the "Third Party Liability Limit"). If the total aggregate liability of all or any of the BGC Group for Third Parties' Claims or Damages exceeds the Third Party Liability Limit, then the Client will indemnify the BGC Group, and each of them, for all liability above the Third Party Liability Limit.

8.2.2 The indemnity in section 8.2.1 shall apply to all Claims or Damages including, but not limited to, those arising due to breach of contract, tort, negligence, negligent misrepresentation, errors, omissions, breach of warranty, strict liability, breach of any statutory or regulatory requirement, or under any other theory of recovery or liability at law or in equity.

9. EXCLUSIONS OF LIABILITY, AGREEMENTS TO DEFEND, AND INDEMNITIES

9.1 The Client agrees to defend, indemnify and hold harmless the BGC Group, and each of them, against any Claim asserted, brought, or prosecuted by a Third Party against the BGC Group, or any of them, that relates, in whole or in part, to any of the following:

9.1.1 the negligence, breach of contract, breach of duty, or any other fault of the Client, the Client's Affiliates, the Client's other contractors, the Client's other consultants, or any of their respective Personnel;

9.1.2 defects in data or Samples supplied to BGC by the Client or the Client's contractors or other consultants; or

9.1.3 use of any Work Product by the Client, its Affiliates, or their respective Personnel for any purpose other than the specific purpose or Project for which BGC prepared such Work Product.

9.2 All the Client's obligations to defend, release, and indemnify BGC Group in this Agreement shall survive any termination or expiry of this Agreement.

10. MUTUAL WAIVER OF PUNITIVE, EXEMPLARY, INDIRECT, INCIDENTAL, AND CONSEQUENTIAL DAMAGES

10.1 Each Party, for itself and as agent on behalf of its Affiliates, hereby releases the other Party, such other Party's Affiliates, and their respective Personnel from all liability for any punitive, exemplary, aggravated, indirect, incidental, and consequential damages that may arise in connection with the performance, purported performance, or non-performance of this Agreement or the Laboratory Services, howsoever caused, and whether arising due to breach of contract, tort (including negligence), strict liability, or under any other theory of liability at law or in equity. This waiver and release applies even if the possibility of

such losses or damages was known or foreseeable. Examples of such waived damages include, but are not limited to, lost profits, lost revenue, loss of contracts, loss of production, loss of business opportunity, costs of capital, business interruptions, loss of goodwill, loss of work, and loss of Project use. Each Party confirms and acknowledges that it has authority to act as agent for its Affiliates for the purposes of providing this waiver and release.

11. TERMS FAIRLY NEGOTIATED IN CONSIDERATION OF RELATIVE RISKS AND BENEFITS

11.1 The Parties acknowledge and agree that the exclusions of liability, limitations of liability, agreements to defend, indemnities, and waivers in this Agreement were fairly negotiated between them in consideration of the relative risks and benefits of the Laboratory Services to the Parties.

12. EARLY TERMINATION

12.1 Either Party may terminate this Agreement for any reason upon thirty (30) days written notice to the other Party.

12.2 Either Party may terminate this Agreement upon ten (10) days written notice to the other Party if the other Party is in default of its obligations under this Agreement and has failed within five (5) business days after receiving a default notice to cure such default, or to take reasonable steps towards curing such default.

12.3 Either Party may immediately terminate this Agreement if the other Party becomes insolvent, takes the benefit of any insolvency or bankruptcy law without providing prompt assurance that it will perform the balance of its obligations under this Agreement, makes a general assignment for the benefit of its creditors, or enters into a plan or arrangement for the benefit of its creditors.

12.4 If this Agreement is terminated for any reason, the Client shall forthwith pay BGC all amounts the Client owes BGC for satisfactorily performed Laboratory Services.

13. ASSIGNMENT

13.1 Except as otherwise agreed in writing, no Party may assign this Agreement without the other Party's written consent. The Parties' permitted successors and assigns are entitled to the benefit of, and shall be bound by, this Agreement.

14. FORCE MAJEURE

14.1 BGC shall not be in breach of this Agreement or liable for any Claims or Damages caused by delay or failure to perform, in full or in part, any of its obligations under this Agreement when such delay or failure to perform is due to any circumstance beyond BGC's reasonable control, including, without limitation: any strikes, walk-outs, riots, unavoidable incidents, floods, fires, earthquakes, natural disasters, inclement weather, acts of God or a public enemy, or a lawful order issued by a governmental authority.

15. NOTICES

15.1 Required written notices between the Parties shall be considered to have been received by the addressee on the date of delivery if personally delivered by hand during normal business hours to the addressee, or to a member of the addressee's firm, or to an officer of the corporation for whom the notice is intended. If sent by regular post, such written notice shall be deemed to have been delivered five (5) business days from the date of mailing. Notices sent by email or facsimile shall be deemed delivered upon completed transmission if properly directed and sent before 4:30pm Atlantic Time on a normal workday that is not a federal Canadian holiday, provided that the sending Party has an electronic acknowledgement that the facsimile or e-mail was received by the other Party.

15.2 Each Party shall designate a representative who is authorized to act on behalf of that Party and to receive notices under this Agreement. In the absence of such designation of an authorized representative, a Party's signatory to this Agreement is deemed to be that Party's representative. If this Agreement has not been signed, then the notice shall be provided by delivering written notice in accordance with section 15.1 to a Party's place of business.

16. SURVIVAL

16.1 All rights and obligations between the Parties under Sections 5 (Intellectual Property), 6 (Work Product), 8 (Absolute Limit of Liability), 9 (Exclusions of Liability, Agreements to Defend and Indemnities), 10 (Mutual Waiver of Punitive, Exemplary, Indirect, Incidental and Consequential Damages) shall survive and remain binding on the Parties after completion of the Laboratory Services or the expiry or any termination of this Agreement.

17. GENERAL PROVISIONS

17.1 This Agreement is governed by the law of British Columbia, Canada, without regard to any conflicts of law principles or any international treaty that may direct the application of the substantive law of another jurisdiction.

17.2 A Party's waiver of any breach of the other Party's obligations under this Agreement shall not be binding unless the waiver is in writing and signed by an authorized representative of the waiving Party.

17.3 If a court of competent jurisdiction determines that any part or provision of this Agreement is illegal, invalid, or unenforceable, then any such part or provision shall be limited or modified to the minimum extent necessary to make it and the remainder of this Agreement enforceable, and the provisions of this Agreement as so amended shall remain in full force and effect.

17.4 In this Agreement, the singular includes the plural and vice versa. All headings in this Agreement are for convenience only, and shall not be used to interpret this Agreement. This Agreement may be executed in separate counterparts, including electronically or by facsimile, and all such counterparts taken together shall be deemed the same original instrument.

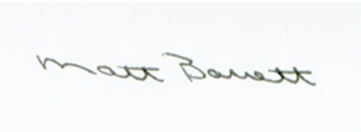
LABORATORY TEST RESULTS FOR VICTORIA GOLD CORPORATION (VICTORIA)



DEAR MR. CHEUNG,

Golder Associates Inc. (Golder) has prepared this summary report to present the results of geotechnical laboratory testing conducted on a sample submitted by Victoria. The sample was tested at Golder's Geotechnical Laboratory in Lakewood, Colorado. This report presents results of the Compression Permeability testing along with the index testing (USCS soil classification, Atterberg Limits, and grain size distribution) before and after the permeability tests

All pending laboratory test results will be sent when testing has been completed. Thank you for the opportunity to provide these laboratory testing services, and we look forward to assisting you on any future projects.

Should you have any questions or comments, please do not hesitate to call.

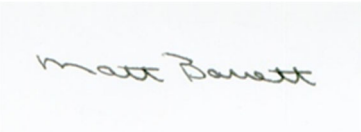
LABORATORY TEST RESULTS FOR VICTORIA GOLD CORPORATION (VICTORIA)



DEAR MR. CHEUNG,

Golder Associates Inc. (Golder) has prepared this summary report to present the results of geotechnical laboratory testing conducted on a sample submitted by Victoria. The sample was tested at Golder's Geotechnical Laboratory in Lakewood, Colorado. This report presents results of the Compression Permeability testing along with the index testing (USCS soil classification, Atterberg Limits, and grain size distribution) before and after the permeability tests

All assigned laboratory testing has been completed. Thank you for the opportunity to provide these laboratory testing services, and we look forward to assisting you on any future projects.

Should you have any questions or comments, please do not hesitate to call.

Golder Associates Inc.

Matthew Barrett
Associate, Geotechnical Lab Manager

Weather:	Variable	**Tetra Tech Representative:**	Adam Mickey
File:	704-ENG.WARC03235-09	**Status:**	Issued for Use

1.0 INTRODUCTION

The following Field Report summarizes Tetra Tech's site visit from March 11, 2020, to March 16, 2020

2.0 DAILY FIELD OBSERVATIONS

2.1 March 11, 2020

Traveled around the site with Clint Abel and Clint Green for an orientation to the project.

Conducted testpit logging along the under drain trench. Submitted logs to be drafted.

Ewing dug two trenches approximately 5 m long for the lateral drains to be installed at station 8+45.6 in the Phase 1B under drain trench.

2.2 March 12, 2020

Ewing excavated ice lens located at existing under drain location along the under drain trench. Confirmed that ice lens no longer remained. (Figure 1)

Ewing laid filter cloth at the base of the under drain trench. Two sheets were used, maintaining a minimum overlap of 0.5 m, along the base of the trench with excess cloth being laid along the sides of the trench to wrap the select drain fill once drain pipes are installed.

Ewing placed select drain rock on the installed filter cloth for the length of a single HDPE under drain pipe to facilitate fusing to existing under drain piping. The rock was shot by Underhill to confirm that the thickness met specifications. (Figure 2)

2.3 March 13, 2020

Clint Abel fused new HDPE pipe to the existing under drain piping. (Figures 3 & 4)

Ewing placed select drain rock at the fused joints and laid filter cloth on top. 200 mm cover of select drain rock was maintained above the pipe, and filter cloth overlap achieved 0.5 m overlap between sheets. Noted to Ewing that a small piece of filter cloth would be required along the west side to achieve the required overlap prior to the placement of select fill sand. (Figures 5 & 6)

Tetra Tech Canada Inc.
61 Wasson Place
Whitehorse, YT Y1A 0H7 CANADA
Tel 867.668.3068 Fax 867.668.4349

2.4 March 14, 2020

No inspection work required.

2.5 March 15, 2020

No Inspection work required.

2.6 March 16, 2020

10:30 am – Ewing placed filter cloth in the under drain trench. All joints were checked and confirmed to have a minimum 0.5 m overlap. During placing of filter cloth, noted that it might be easier to place a roll down the bottom of the trench, and then a roll on each side with a 0.5 m overlap in the bottom of the trench at each side. During the day, the filter cloth was falling down on the edges, and soil from the trench walls was falling on top of the filter cloth. (Figures 7 & 8)

11:30 am – Placement of select drain rock began. Underhill was on site to survey the surface as placement proceeded. Ewing met design requirements for thickness of rock.

12:30 pm – Fusing of under drain pipe began. The fuser operator was using the app and applying the correct temperature for 2 minutes and 42 seconds. Fuser had seven joints completed by the time Clint returned. (Figure 9)

The ice lens dug out at 8+45 was not fully excavated. During the day, warm temperature caused melting to the north of the excavated area. Identified that ice was still present and requested Ewing to excavate out the area. During excavation, it was noted that the ice lens sloped downwards towards the trench. Ewing ripped the ice lens out and confirmed that it was removed in the area. Ice could still be present and suggested cleaning up the excavation to see if any ice continued to melt out of slope. (Figures 10, 11, & 12)

A soft spot was found at the base of the under drain trench, where the ice lens was dug out on March 20. Clint was made aware upon return to site.

Weekly Report #1
March 15-21, 2020

Site Location: Phase 1B

Hours worked this period: 864
Hours total to date: 2,466

Summary:

- Construction
  - Continue construction of the header underdrain.
  - Fusing 6" HDPE DR11 Header Underdrain piping.
  - Day shift crew has been supporting the header drain material requirements
  - Night shift has been focusing on removing material the D10 dozer has been pushing down below the western end of the 1045 ditch.

Legend:
Red = Trouble
Yellow = Caution
Green = On track

Weather:

- Temperatures: Daytime average -2C to -10C
- Snow: March 18th – trace snow fall overnight

Incidents / Health & Safety:

- Incidents or accidents: None to report this week
- Weekly site safety inspection:
- Weekly safety meeting: Toolbox meeting held every morning in the Ewing office

Incidents to date:

0
0
7

Project Milestones:	Responsible:	Completion Date:
Nuway crushing gravel for underdrain construction – Sand was not completed to move crusher to Secondary – Mine will have to produce remain sand required for liner placement	Nuway	March 11th
Header Underdrain excavation and installation	Ewing	March 17th
Lateral drain excavation and installation	Ewing	April 21st
Ditching for freshet / Water management	Ewing	March 31
Removal of all grubbing and shaping material for liner placement	Ewing	April 20th
Removal of any unsuitable material	Ewing	May 4th
Surface preparation for liner placement	Ewing	July 7th
Liner placement	Layfield / Ewing	Aug 4th

Construction:
Activities This Week:

- Fusing Header Underdrain Pipes
- Header Underdrain construction supported by the day shift crew and some labour support from Process. Crews continued to placement of geotextile, 20mm drain rock, and sand.
- Unsuitable material had to be excavated from under the header drain pipes that had already been installed. The unsuitable material at the beginning of the drain looked to be an old sump Pelly Construction utilized during construction. We lost 1 ½ days addressing the unsuitable material.
- D10 dozer ripping and sloping wester end of the 1045 slope (2.5H:1V) and removing any other grubbing material remaining.
- Night shift has been has been focussed on removing the material the D10 has been pushing up during day shift.

Activities Planned for Next Week:

- Complete fusing header underdrain pipes
- Complete construction of the header underdrain
- Day shift crew to resume removal of material on the west slope

- Pad start padding access along the lower western lateral drain – this will be utilized to finish cleaning up the western slope
- Night shift to continue bulk material removal pushed down up by the D10 dozer on day shift

1.0 INTRODUCTION

The following Field Report summarizes Tetra Tech's site visit from March 20, 2020, to March 23, 2020

2.0 DAILY FIELD OBSERVATIONS

2.1 March 20, 2020

Traveled to site from Whitehorse arriving at 12:00 pm.

Fusing of Under Drain (U/D) pipes continuing. (Figure 1)

Sand placed with survey control over top of U/D to approximately 8+55. Proof rolled sand with roller compactor until lines at edges of passes were to a minimum. (Figure 2)

Large gaps between sand and U/D trench walls existed. Advised Ewing to fill with rock fill and roll with roller compactor. (Figure 3)

10 cm of select drain rock placed to excavation limits of U/D trench. Placement surveyed at end of day. Some low spots to be addressed March 21 prior to fusing pipe in area.

From 8+55 to 9+12 U/D pipes spaced 1.0 m apart and placed select drain rock with survey control to 200 mm above pipes. (Figures 4 & 5)

Sloping of Phase 1B at NW edge continuing.

2.2 March 21, 2020

Work on U/D trench began at 8:00 am.

Fusing of U/D piping continuing at approximately 9+50.

Placed filter cloth on select drain rock in U/D trench from 8+55 to 9+12. Minimum 0.5 m overlap maintained at all filter cloth joints. (Figures 6, 7, & 8)

Ewing excavating U/D trench to end point. (Figures 9 & 10)

Tetra Tech Canada Inc.
61 Wasson Place
Whitehorse, YT Y1A 0H7 CANADA
Tel 867.668.3068 Fax 867.668.4349

Sand placement with survey control to 300 mm above pipe in U/D trench from 8+55 to 9+12. Sand brought level to edges of U/D trench. (Figure 11)

Sand proof rolled with roller compactor from 8+55 to 9+12.

Ewing Spaced pipes out with 1.0 m separation from 9+12 to 9+37. (Figure 12)

Place U/D pipe select drain rock over pipe with survey control from 9+12 to 9+37. Filter cloth installed over select drain rock with minimum 0.5 m overlap. Trench has widened out requiring filter cloth strips to be cut to ensure minimum overlap met. (Figures 13 & 14)

Began placing 300 mm sand cover on filter cloth from 9+12 to 9+37.

Fusing of U/D pipe made it to 3rd lateral drain at 9+87.

2.3 March 22, 2020

Snowed overnight (<2cm).

Sand cover continuing from 9+12 to 9+37.

Fusing continuing at 3rd lateral drains.

Ewing continuing to excavate U/D trench to end point and completed. (Figure 15)

Select drain rock placed over U/D pipes from 9+37 to 9+55 with survey control. Filter cloth placed over rock with minimum 0.5 m overlap then sand cover. (Figures 16, 17, & 18)

Sand proof rolled with roller compactor up to 9+37.

Ewing began placing filter cloth to end of U/D trench.

U/D pipe aligned with 1.0 m spacing to 9+90.

2.4 March 23, 2020

Ewing continuing to place filter cloth to end of U/D trench and placing 100 mm of select drain rock with survey control. (Figures 19, 20, & 21)

Select drain rock placed over U/D pipe from 9+55 to 9+90 with survey control. Filter cloth was then placed, and cover sand with survey control. Did not finish sand cover prior to leaving site. (Figures 22, 23, 24, & 25)

Fusing of U/D pipe began at approximately 11:00 am.

Weekly Report #2
March 22-28, 2020

Site Location: Phase 1B

Hours worked this period: 919
Hours total to date: 3,385

Summary:

- Construction
  - Finished construction of the header underdrain March 26th
  - Day shift crew hauling material off the west slope
  - Night shift focusing on removing ripped material produced by the D10 dozer
  - Started cleaning up the eastern toe along the 990 bench

Legend:
Red = Trouble
Yellow = Caution
Green = On track

Weather:

- Mostly clear all week with some over cast on Wednesday.
- Temperatures: Daytime average -2C° to -14C° until Friday morning -24C° to -35C°
- Snow: March 22nd – snow fall accumulation of <2 cm

Incidents / Health & Safety:

- Incidents or accidents: None to report this week
- Weekly site safety inspection: No inspections this week
- Weekly safety meeting: Toolbox meeting held every morning

Incidents to date:

0
0
7

Project Milestones:

	Responsible:	Completion Date:
Nuway crushing gravel for underdrain construction – Sand was not completed before move the crusher to Secondary – Mine will have to produce remain sand required for liner placement	Nuway	March 11th
Header Underdrain excavation and installation	Ewing	Complete
Lateral drain excavation and installation	Ewing	April 21st
Ditching for freshet / Water management	Ewing	March 31
Removal of all grubbing and shaping material for liner placement	Ewing	April 20th
Removal of any unsuitable material	Ewing	May 4th
Surface preparation for liner placement	Ewing	July 7th
Liner placement	Layfield / Ewing	Aug 4th

Construction:
Activities This Week:

- Top two laterals were moved down slightly to get some separation from the liner key trench
- Finished fusing Header Underdrain on March 25th
- Completed construction of the Header Underdrain March 26th
- Day shift crew has been focussing on removing the material remaining on the western slope. There was an old trench excavation found in the middle of the western slope. Ewing cleaned all the grubbing and snow out of the trench, but will require backfilled to maintain 2:1 slope.
- The D10 dozer completed ripping and sloping (2.5H:1V) below the 1045 ditch from the header underdrain west. The dozer started ripping some of the western access for night shift to haul.
- Borrowed Process D10 dozer on March 26th to start assisting with shaping the eastern section of the slope above the 990 bench. Both dozers will focus on this section to ensure the construction of the water management ditch is complete before freshet.
- Night shift continues to focus on removal of material the D10 dozers push up during day shift.

Activities Planned for Next Week:

- Start receiving loads of GCL and staging in the Phase 2 staging area

- Finish cleaning up and shaping along the eastern toe above the 990 bench
- Start excavating the water management ditch along the eastern side when shaping complete
- Start padding access along the lower western lateral drain – this will be utilized to finish cleaning up the western slope
- Backfill old exploration trench on the western slope
- Day shift crew to resume removal of material on the west slope whenever possible
- Night shift will continue removing material produced by the D10 dozer on day shift
- Rebuild the section of ditch at the top of the header underdrain. This section will require liner to ensure the water stays in the ditch.

Project: Victoria Gold
Weekly Report #4
April 5-11, 2020

Site Location: Phase 1B

Hours worked this period: 960
Hours total to date: 5,230

Summary:

- Construction
  - Focusing both crews on removing material along the eastern side above the 990 bench so temporary water management ditch can be constructed.
  - Completed energy dissipater at the end of the interceptor ditch.
  - Completed decommissioning last monitoring well in Phase 1B (BGC11-29).
  - Completed interceptor ditch repair where Header Underdrain was installed.
  - Started excavating and installing lateral drain 4W.

Legend:
Red = Trouble
Yellow = Caution
Green = On track

Weather:

- A mix of sun and overcast over the week with some light snow March 8th
- Temperatures: Morning lows of -20C° with daytime highs hitting -2C°

Incidents / Health & Safety:

- Incidents or accidents: Fender damaged on 730 wiggle wagon, potentially mud build up, but unknown.
- Weekly site safety inspection: No inspections this week
- Weekly safety meeting: Toolbox meeting held every morning in the field to ensure enough room for social spacing.

Incidents to date:

1

Project Milestones:	**Responsible:**	**Completion Date:**
Nuway crushing gravel for underdrain construction – Sand was not completed before move the crusher to Secondary – Mine will have to produce remain sand required for liner placement	Nuway	March 11th
Header Underdrain excavation and installation	Ewing	Complete
Lateral drain excavation and installation	Ewing	April 21st
Ditching for freshet / Water management	Ewing	March 31
Removal of all grubbing and shaping material for liner placement	Ewing	April 20th
Removal of any unsuitable material	Ewing	May 4th
Surface preparation for liner placement	Ewing	July 7th
Liner placement	Layfield / Ewing	Aug 4th

Construction:
Activities This Week:

- Completed constructing the ditch at the top of the header underdrain. This section was lined with 2mm LLDPE to ensure the water stays in the interceptor ditch. Rip rap was replaced to original 300mm thickness April 6th.
- Competed placement of rip rap in energy dissipater at the end of the interceptor ditch.
- Excavated and installed 70% of lateral drain 4W.
- Cut access along lateral 1W to help with cleanup on the western slope.
- Excavated and decommissioned final well in Phase 1B (BH-BPC11-29). Well was backfilled in 900mm lifts and compacted.
- First 2 loads (18 rolls each) of LLDPE liner arrived on site April 9th.
- Ewing's D10 dozers continued shaping the eastern section of the slope above the 990 bench and the eastern end of the interceptor ditch (There is much more material remaining on the eastern slope than anticipated).
- Both day and nightshift are focussed on completing material removal along the eastern side above the 990 bench so freshet ditch can be constructed.
- Dozers did some shaping and lowed access on the western side so remain material can be retreated.

Activities Planned for Next Week:

- Finish removing material above the 990 bench on the eastern side so freshet ditch construction can start
- Excavate freshet water management ditch along the eastern side when shaping is completed.
- Have both day and nightshift resume removal of material on the west slope.
- Cut perimeter access along the western slope.
- Continue excavating and installing western lateral drains whenever possible.
- Push snow into piles so the surface will dry quickly.

Weekly Report #5
April 12-18, 2020

Site Location: Phase 1B

Hours worked this period: 1063
Hours total to date: 6,293

Summary:

- Construction
  - Completed bulk material removal along the eastern side above the 990 bench.
  - Completed excavation of temporary water management ditch along the eastern side.
  - Dayshift focusing on removing material on the western slope.
  - Nightshift continues removing material produced by the D10 dozer
  - Started excavating lateral 3W April 17, 2020
  - Started excavating the perimeter access along the top of the western slope.

Legend:
Red = Trouble
Yellow = Caution
Green = On track

Weather:

- A mix of sun and overcast this week with much warmer temperatures. The snow is going very quickly right now.
- Temperatures: Morning lows of 2C° with daytime highs of 10C°

Incidents / Health & Safety:

- Incidents or accidents: No incidents to report this week
- Weekly site safety inspection: No inspections this week
- Weekly safety meeting: Toolbox meeting held every morning in the field to ensure enough room for social spacing.

Incidents to date:

1

Project Milestones:	**Responsible:**	**Completion Date:**
Nuway crushing gravel for underdrain construction – Sand was not completed before move the crusher to Secondary – Mine will have to produce remain sand required for liner placement	Nuway	March 11th
Header Underdrain excavation and installation	Ewing	Complete
Lateral drain excavation and installation – Behind due to the much larger amount of grubbing and shaping	Ewing	April 21st
Ditching for freshet / Water management	Ewing	Mostly Complete
Removal of all grubbing and shaping material for liner placement – Volume of material larger then estimate	Ewing	April 20th
Removal of any unsuitable material	Ewing	May 4th
Surface preparation for liner placement	Ewing	July 7th
Liner placement – Liner is now scheduled to start May 28th	Layfield / Ewing	Aug 4th

Construction:
Activities This Week:

- Excavated freshet ditch along the eastern side of Phase 1B
- Started excavating lateral drain 3W
- First 40% of LLDPE liner is on site until after road bands are lifted
- Ewing's D10 dozers continued cutting and shaping the 2.5:1 sloe along the eastern section of the interceptor ditch.
- Nightshift continued removing material produced by the D10 dozer along the eastern end of the interceptor ditch.
- Day shift crew continued material removal along the western slope and supporting lateral drain construction.

Activities Planned for Next Week:

- Double shift the western slope until grubbing and shaping is completed.
- Continue excavating and installing western lateral drains.
- Finish perimeter access along the western slope.
- Continue managing water and access roads in Phase 1B.
- The fist 50% of GCL hauling will be complete this week until after road bands are lifted.

Project: Victoria Gold
Weekly Report #6
April 19-25, 2020

Site Location: Phase 1B

Hours worked this period: 1,272
Hours total to date: 7,565

Summary:

- Construction
  - Repaired access road into Phase 1B due to muddy conditions.
  - Continue excavating and installing lateral drain 3W.
  - Continued working on perimeter access along the top of the western slope.
  - Dozer is shaping western slope and supporting the loading tool.
  - Both day and nightshift focusing on removing material on the western slope.
  - Installed 30 m section of liner in the interceptor ditch above the header underdrain.
  - Identified permafrost area.

Legend:
Red = Trouble
Yellow = Caution
Green = On track

Weather:

- Mostly overcast skies this week with some precipitation (first light rain April 19th fallowed up with rain April 21st). Slightly lower temperatures this week except for Friday and Saturday dropped to -18C° overnight.
- Temperatures: Morning lows of -18C° with daytime highs of 8C°

Incidents / Health & Safety:

- Incidents or accidents: No incidents to report this week
- Weekly site safety inspection: No inspections this week
- Weekly safety meeting: Toolbox meeting held every morning in the field to ensure enough room for social spacing.

Incidents to date:

1

Project Milestones:	**Responsible:**	**Completion Date:**
Nuway crushing gravel for underdrain construction – Sand was not completed before move the crusher to Secondary – Mine will have to produce remain sand required for liner placement	Nuway	March 11th
Header Underdrain excavation and installation	Ewing	Complete
Lateral drain excavation and installation – Behind due to the much larger amounts of material requiring removal	Ewing	April 21st
Ditching for freshet / Water management	Ewing	Mostly Complete
Removal of all grubbing and shaping material for liner placement – Volume of material larger then estimate	Ewing	April 20th
Removal of any unsuitable material	Ewing	May 4th
Surface preparation for liner placement	Ewing	July 7th
Liner placement – Liner is now scheduled to start May 28th	Layfield / Ewing	Aug 4th

Construction:
Activities This Week:

- Spent one day padding blast rock down Phase 1B access road to make passible for fuel truck and liner loads. Liner loads still require regular support from D7 dozer to make steeper muddy grades.
- Continued excavating and backfilling lateral drain 3W (65% Complete)
- Completed lateral drain 4W April 24th.
- Continued working on perimeter access road when possible.
- Last 5 loads on route to have the first 50% of the GCL liner on site.
- Dozer support focused on shaping the western slope and supporting the loading tool.
- The day shift crew continued removing material along the western slope and supporting lateral drain construction.
- Night shift assisted with material removal along the western slope.
- The interceptor ditch was leaking water down the header underdrain causing some damage to the sand. To address the exfiltration problem a 30 m section of rip rap was removed above the header underdrain. The ditch was graded to ensure good drainage by survey and lined with 2 mm LLDPE liner. A second piece of liner was keyed in along the uphill side and draped over the liner in the ditch. This should address the majority of water from running under the liner.
- Identified a small section of permafrost in the lower northwest corner below lateral drain 2W.

Activities Planned for Next Week:

- Continue double shifting the western slope until grubbing and shaping is completed.
- Complete lateral drain 3W and start excavating and installing lateral drain 2W.
- Finish cutting the perimeter access to grade along the western slope.
- Continue managing water and access roads into Phase 1B whenever necessary.

Weekly Report #11
May 24-30, 2020

Site Location: Phase 1B

Hours worked this period: 1,145
Hours total to date: 12,732

Summary:

- Construction
  - Completed backfilling lateral drains1W & 2W along the western slope.
  - Dozer continuing final shaping along the western slope and compacting for liner placement.
  - Dozer work has started on the eastern side whenever possible.
  - Day shift continued to focus on removing material on the western slope.
  - Night shift crew continues placing ODF at the HLF.
  - Layfield crew arrived on site May 28th.

Legend:
Red = Trouble
Yellow = Caution
Green = On track

Weather:

- Mostly overcast skies with some rain.
- Temperatures: Morning lows of 6 C° with daytime highs of 12 C°

Incidents / Health & Safety:

- Incidents or accidents: No incidents this week
- Weekly site safety inspection: No inspections this week
- Weekly safety meeting: Toolbox meeting held every morning in the field to ensure enough room for social spacing.

Incidents to date:

2

Project Milestones:	**Responsible:**	**Completion Date:**
Nuway crushing gravel for underdrain construction – Sand was not completed before move the crusher to Secondary – Mine will have to produce remain sand required for liner placement	Nuway	March 11th
Header Underdrain excavation and installation	Ewing	Complete
Lateral drain excavation and installation – Behind due to the much larger amounts of material requiring removal	Ewing	April 21st
Ditching for freshet / Water management	Ewing	Mostly Complete
Removal of all grubbing and shaping material for liner placement – Volume of material much larger then estimate	Ewing	April 20th
Removal of any unsuitable material – will not affect liner placement schedule	Ewing	May 4th
Surface preparation for liner placement	Ewing	July 7th
Liner placement – Liner is now scheduled to start May 28th	Layfield / Ewing	Aug 4th

Construction:
Activities This Week:

- Finished backfilled lateral drains 1W & 2W along the western slope so final shaping can be completed for liner placement.
- Started excavating lateral drain 1E May 26th and started install the next day.
- The D7 dozer focused on final shaping along the western slope advancing from the south to the north. The packer has been packing the finished surface as the dozer advances.
- Utilizing Process D10T on the eastern side of Phase 1B whenever possible.
- The day shift crew continued removing material along the north western slope and removed unsuitable material along the north western perimeter berm. This material had to be removed so the perimeter berm can be constructed. The excavation along the perimeter was backfilled to original grade in lifts and compaction tested by Tetra Tech.
- The night shift crew placed ODF material at the HLF most of the week. The nightshift crew was utilized to haul rock backfill to Phase 1B for a couple of shifts.
- The Layfield and Ewing labour crew arrived on site May 28th later in the afternoon. The crews produced approximately 7000 sand bags over the weekend in preparation to start liner placement.

Activities Planned for Next Week:

- Start liner placement along the western side.
- Continue advancing north along the western side with final shaping and packing.
- Excavate key trench ahead of liner placement.
- Complete excavating and installing lateral drain 1E and start the first section of lateral 4E.
- Resume topsoil removal, sloping (2.5:1) below the interceptor ditch, and removing any unsuitable material on the eastern side.
- Backfill the top end of the header underdrain.

TETRA TECH

WEEKLY FIELD REPORT

ISSUED FOR USE

Project:	Eagle Gold Heap Leach Phase 1B	**Date:**	May 30, 2020
Location:	Eagle Gold Mine	**Contractor:**	Ewing Transport / Layfield
Client:	Victoria Gold Corp.	**Contractor's Rep:**	Marshall Ewing / Chad Messervey
Contact:	Clint Abel	**Contractor's Email:**	
Weather:	Variable (see daily entries)	**Tetra Tech Representative:**	Adam Mickey
File:	704-ENG.WARC03235-09	**Status:**	Issued for Use

1.0 INTRODUCTION

Tetra Tech Canada Inc. (Tetra Tech) was retained by Victoria Gold Corp. (Victoria Gold) to provide CQA services at the Eagle Gold mine located north of Mayo, Yukon, at Dublin Gulch for the Eagle Gold Heap Leach Phase 1B expansion (Phase 1B).

Forte Dynamics (Forte) out of Fort Collins, Colorado provided the design and specification for Phase 1B, and Forte's representative is Clint Green.

Clint Abel of JDS Energy and Mining is Victoria Gold's project manager on site at the Eagle Gold mine.

Ewing Transport (Ewing), based out of Mayo, Yukon, is the construction contractor for Phase 1B.

Layfield Environmental Containment (Layfield) has been retained to provide and install the liner for Phase 1B, and their supervisor on site is Chad Messervey.

The following Field Report outlines Tetra Tech's CQA from May 28, 2020, to May 31, 2020.

2.0 DAILY REPORTS

2.1 May 28, 2020

Tetra Tech's field representative, Adam Mickey, mobilized to site from Whitehorse.

2.2 May 29, 2020

- Weather: sunny and windy.
- Layfield began setting up for liner placement by making sandbags, taking inventory of GCL and liner rolls, and misc other duties. 4,000 sandbags were made.
- Chad brought up safety concerns over liner deployment on the west side of Phase 1B due to the slope of the top access road. Discussions with Layfield and Ewing resulted in determining that Ewing is responsible for the safety of the excavator used for deployment. If it is not deemed safe, a new plan will be made.

Tetra Tech Canada Inc.
61 Wasson Place
Whitehorse, YT Y1A 0H7 CANADA
Tel 867.668.3068 Fax 867.668.4349

- Underhill surveyed the west side of Phase 1B to confirm that no areas were steeper than 2:1 (H:V) at Layfield's request.
- Tetra Tech monitored and provided compaction testing for backfilling of an excavation where unsuitable material was found near the waste dump site.
  - Tetra Tech confirmed that the unsuitable material was excavated beyond the limits of the Phase 1B liner and perimeter road.
  - The excavated surface was uneven, as shown in Figures 1 and 2, as well as soft and wet in places.
  - Tetra Tech advised Ewing to place a 0.5 m lift in the deeper section beneath the liner area and rock along the edge where unsuitable material was left due to being outside the limits of excavation to reduce the impact of melting snow on backfill materials (Figure 3).
  - Moisture conditioning of backfill materials was not penetrating the soil. Tetra Tech advised Ewing to wet the surface of the compacted lift to allow water to be drawn into the lifts from the base. Ewing achieved compaction of 95% with this method.
- Tetra Tech had preliminary discussions with Layfield regarding QA and QC with Layfield's QC representative, Thomas Howald (Red).
- Ewing is continuing to work on E1 lateral and sloping of the west side of Phase 1B for liner placement.

2.3 May 30, 2020

- Weather: sunny and windy.
- Ewing is continuing E1 lateral drain, sloping of west side of Phase 1B, and backfilling of excavation.
- Layfield is making 4,000 more sandbags and prepping for liner placement.
- Tetra Tech discussed QA/QC plans with Layfield and examined the destructive testing apparatus' Calibration Certificate. The apparatus was last calibrated on November 11, 2019, and shows a Total Deviation Error of 0.00%. The calibration certificate is shown in Figure 4.
- Tetra Tech performed a subgrade inspection with Thomas on first 9,000 m^2 of the west slope beginning at the west limit of Phase 1B. See Figures 5 to 8.
  - Overall slope area ready for liner.
  - Ewing is placing sand at the crest of slope along perimeter road where fractured bedrock exposed and no fines to fill in voids. Figures 9 & 10.
  - Identified a yielding area approximately 2 m x 6 m where the subgrade had tension cracks and collapsed up to 300 mm when stepped on. See Figures 11 & 12.
    - After review of Forte specifications and a conversation with Chad, Tetra Tech informed Ewing that the area would have to be filled in and recompacted. Ewing placed sand with an excavator and bucket packed the sand into place. Ewing then compacted the yielding area with a roller compactor performing a minimum of two passes.
    - Ewing completed the repair, and the subsequent inspection showed that the soft spots had been eliminated. See Figure 13.

  - A Certificate of Inspection was signed off by Layfield and Tetra Tech, confirming that the subgrade is ready for liner placement. See Figure 14.

- Ewing filled in limits of excavation with rock fill and compacted it. See Figure 15.
- Layfield prepped for beginning liner placement on May 31, 2020, by digging anchor trench and staging liner materials and sandbags.

2.4 May 31, 2020

- Weather: cloudy turning to rain and windy mid-afternoon.
- Ewing is continuing to shape slopes, backfill excavation, and install E1 lateral drain.
- Layfield beginning liner placement (see Figures 16 to 22):
  - Ewing excavating anchor trench along perimeter road in deployment area. See Figure 16.
  - Tetra Tech noted damage to the approved compacted subgrade due to side by sides running up and down the slope on May 30. Where the side by sides traveled, sharp rocks between 50 to 150 mm were pulled out of slope. Tetra Tech spoke with Javier from Layfield and advised that the large rocks should be removed from slope prior to placement of GCL. Rocks are to be cast onto slope in next subgrade inspection area and Ewing will run a roller compactor along the slope again to prep the subgrade and drive the rocks into the slope.
  - Layfield inspected existing liner from west side to panel P320 where ODF has not been placed to check for damage due to rocks rolling down slope and impacting liner. Tetra Tech accompanied Layfield for the inspection. Defects and holes were found in panels P320 & 322. See Figure 17.
  - Due to slope steepness, Layfield using Ewing's CAT 325 excavator to pull GCL down slope. The excavator rips up the surface of the slope as it tracks up and down.
    - Tetra Tech requested that Layfield ensure that any rocks be removed from the slope face or soil protrusions from the slope face be smoothed out prior to placement of the GCL.
    - Layfield pulls out a roll of GCL then fuses it to the next roll and continues to pull down the slope. The GCL is pulled to the base of the slope to the edge of the key trench of the existing liner. The GCL is placed in the key trench at the top of the perimeter road.
  - After the 3:00 pm break, Layfield quit placing GCL due to rainy weather and high winds.
    - 2 panels of GCL were placed on the slope.
    - Sandbags were placed at leading edges of the GCL to prevent upheaval and movement due to wind.
  - Layfield conducted a trial seam on rough pieces of liner to simulate joint connections. The first trial seam failed due to the nature of the break during the peel test, but a subsequent trial seam passed. Trial seam numbers were not recorded due to not conducting any seaming today. A new trial seam will be conducted prior to liner fusing.
  - The following GCL roll numbers were placed on the slope:
    - 502347042;
    - 502347028;

- 502347043;
- 502346988;
- 502347041;
- 502347034;
- 502347044; and
- 502347037.

CALIBRATION CERTIFICATE

Tensiometer Model: Pro-Tester T-0100
Device Calibrated: S Type load cell
Range: 0 - 750 lbs tension
Model No: SSM-AJ-750
Serial No: **682290**

Calibration Apparatus:
Pro-Cal unit, model TC-0100A

A/D Module Model No: T-096
A/D Module Serial No: **2171682290**
Channel No: N/A

Dead Weight: W1 2, W2 152, W3 302
Reference Cell: R1 2, R2 152, R3 302

Indicator reading with no load: 0
Offset: **1.047773** Scale: **3.189854**

Applied Force lbs.	Cell Response	Deviation Error
2	2	0.00
52	52	0.00
102	102	0.00
152	152	0.00
202	202	0.00
252	252	0.00
302	302	0.00

Total Deviation Error (%): 0.00%

Temperature at time of calibration: 73 degrees F
Excitation Voltage: 5 V DC

This calibration conforms to the standards set by ASTM E4 and is traceable to NIST standards

Note: A/D Module and load cell above have been systems calibrated and are considered a matched pair. In general, calibrated A/D Modules and load cells are not interchangeable.

Date: 11/20/19

CERTIFICATE OF INSPECTION
OF SOIL SUBGRADE SURFACE

LAYFIELD

PROJECT NAME: Heap leach Pad Phase 1B
PROJECT NUMBER: CT001401
OWNER/CONTRACTOR: Victoria Gold
LOCATION: Eagle gold Mine

I, the undersigned, a duly appointed representative of Layfield Canada Ltd. (Layfield), have visually observed the soil subgrade surface described below, and:

☐ *found it to be an acceptable surface on which to install geomembrane; OR*
☐ *found it to be an Unacceptable surface on which to install geomembrane*

Area Inspected (☐Partial or ☒Complete): Shape of a rectangle.
Dimensions of Subgrade Inspection: 1600m² N/A
Anchor Trench Dimensions:
Comments:

This certification is based on observations of the surface of the subgrade only. No subterranean inspections or tests have been performed by Layfield and Layfield makes no representations or warranties regarding conditions which may exist below the surface of the subgrade. Layfield accepts no responsibility for conformance of the subgrade to this project's specifications.

The soil subgrade inspected on this date refers to its present condition. Any changes in the subgrade condition that result from the effects of inclement weather and/or other forces beyond the control of Layfield and remedial work to correct the resulting deficiencies, will be the direct responsibility of the General Contractor.

LAYFIELD REPRESENTATIVE:
Date: May 30 2020
Signature:
Name: Thomas Heuald
Title: QC

OWNERS REPRESENTATIVE:
I, the undersigned, a duly appointed representative of the Owner, hereby understand the soil subgrade surface inspection described above and authorize Layfield to proceed with deployment of geosynthetics on the subgrade provided.
Date: May 30/2020
Signature:
Name: Adam Mickel
Title: CQA
Company: Tetra Tech

Project: Victoria Gold
Weekly Report #12
May 31-June 6, 2020

Site Location: Phase 1B

Hours worked this period: 1,424
Hours total to date: 14,156

Summary:

- Construction
  - Completed excavating and installing lateral drain 1E.
  - Dozer continuing final shaping along the western slope and compacting for liner placement.
  - Dozer work continued on the eastern side whenever possible.
  - Day shift focused removing material pushed up on the eastern side.
  - Night shift crew continues placing ODF at the HLF.
  - Layfield crew placed liner on the south western corner of Phase 1B.

Legend:
Red = Trouble
Yellow = Caution
Green = On track

Weather:

- Couple of nice days this week. The remainder of the week was overcast skies with sunny breaks and rain showers.
- Temperatures: Morning lows of 6 C° with daytime highs of 12 C°

Incidents / Health & Safety:

- Incidents or accidents: No incidents this week
- Weekly site safety inspection: No inspections this week
- Weekly safety meeting: Toolbox meeting held every morning in the field to ensure enough room for social spacing.

Incidents to date:

2

Project Milestones:	**Responsible:**	**Completion Date:**
Nuway crushing gravel for underdrain construction – Sand was not completed before move the crusher to Secondary – Mine will have to produce remain sand required for liner placement	Nuway	March 11th
Header Underdrain excavation and installation	Ewing	Complete
Lateral drain excavation and installation – Behind due to the much larger amounts of material requiring removal	Ewing	April 21st
Ditching for freshet / Water management	Ewing	Mostly Complete
Removal of all grubbing and shaping material for liner placement – Volume of material much larger then estimate	Ewing	April 20th
Removal of any unsuitable material – will not affect liner placement schedule	Ewing	May 4th
Surface preparation for liner placement	Ewing	July 7th
Liner placement – Liner is now scheduled to start May 28th	Layfield / Ewing	Aug 4th

Construction:
Activities This Week:

- Finishing install of lateral drain 1E.
- The D7 dozer focused on final shaping along the western slope advancing from the south to the north. The packer has been packing the finished surface as the dozer advances.
- Utilizing Process D10T on the eastern side of Phase 1B whenever possible.
- The day shift crew started removing material on the eastern slope. Finished cleaning up some material along the north western perimeter berm in preparation to construct this section.
- The night shift crew placed ODF material at the HLF all week.
- The Layfield crew started placing liner on the south western portion of the slope. Deployment is slow due to the steep slope (2:1), access, and the subgrade damage from the excavator pulling liner down the slope. June 1st was a full day of standby due to rain and a third of a day on June 3rd.
- Preformed a Liner and GCL test – Rocks of various size were placed on a hard surface, liner placed overtop, and ran over 3 time with a loaded 730 wiggle wagon. Then the truck stopped and articulated on the liner and no holes were found.

Activities Planned for Next Week:

- Place sand on steep western slope (2:1) to address the subgrade issue.
- Continue liner placement along the western side.
- Continue packing the western slope to the north.
- Excavate key trench ahead of liner placement.
- Excavate and install the first section of lateral drain 4E.
- Start excavating and installing lateral drain 2E.
- Resume topsoil removal, sloping (2.5:1) below the interceptor ditch, and removing any unsuitable material on the eastern side.

HSE SAFETY REPORT

	PERIOD TO	MONTH TO DATE	YEAR TO DATE	
Total Hours	1,424	1,196	14,156	
Incidents (Non-injury)	0	1	2	
First Aid Injuries	0	0	0	
Medical Aid Injuries	0	0	0	
Loss Time Injuries (LTI)	0	0	0	
Recordable Incident	0	0	0	

Layfield hours will be added to the total next week.

Liner Delivery:

Material	Number of Loads	Total on Site
GCL	42	975 (73%)
Liner	8	145.5 (44%)
Bentonite (pallets)	Arriving on liner loads	28

Production:

Material	Month Total (June 2020)	Total to Date
Shaping (Common)/ Grubbing	6,188 m^3	203,224 m^3
Re-handle Material	0 m^3	784 m^3
20mm Drain rock	182 m^3	2,436 m^3
Sand	308 m^3	2,548 m^3
Blast Rock Backfill	168 m^3	6,006 m^3
Blast Rock to Road Repairs	0 m^3	672 m^3
Total Material	6,846 m^3	215,670 m^3

Hey Clint,

We were rained out today and spent the day in camp. Chad checked some of the GCL and he said they will be replacing some areas that hydrated.

Cheers,

Adam Mickey, M.Eng. | EIT

WEEKLY FIELD REPORT

ISSUED FOR USE

Project:	Eagle Gold Heap Leach Phase 1B	**Date:**	June 7, 2020
Location:	Eagle Gold Mine	**Contractor:**	Ewing Transport / Layfield
Client:	Victoria Gold Corp.	**Contractor's Rep:**	Marshall Ewing / Chad Messervey
Contact:	Clint Abel	**Contractor's Email:**	
Weather:	Variable (see daily entries)	**Tetra Tech Representative:**	Adam Mickey
File:	704-ENG.WARC03235-09	**Status:**	Issued for USE

1.0 INTRODUCTION

Tetra Tech Canada Inc. (Tetra Tech) was retained by Victoria Gold Corp. (Victoria Gold) to provide CQA services at the Eagle Gold mine located north of Mayo, Yukon, at Dublin Gulch for the Eagle Gold Heap Leach Phase 1B expansion (Phase 1B). Mr. Adam Mickey, EIT, is Tetra Tech's representative on site.

Forte Dynamics (Forte) out of Fort Collins, Colorado provided the design and specification for Phase 1B, and Forte's representative is Clint Green.

Clint Abel, of JDS Energy & Mining, is Victoria Gold's project manager on site at the Eagle Gold mine.

Ewing Transport (Ewing), based out of Mayo, Yukon, is the construction contractor for Phase 1B.

Layfield Environmental Containment (Layfield) has been retained to provide and install the liner for Phase 1B, and their supervisor on site is Chad Messervey.

The following Field Report outlines Tetra Tech's CQA for the period of June 1, 2020, to June 7, 2020.

2.0 DAILY REPORTS

2.1 Highlights

- Panels P1 through P26 placed on slope. Total meters of liner placed are approximately 1,606.8 m for a total area placed of approximately 10,766 m^2.
- Hole in GCL identified on May 31 was repaired by replacing hydrated GCL on June 2.
- Rain delayed liner deployment throughout the week.
- Layfield is placing three panels of GCL for every two panels of 80 mm LLDPE liner.
- Ongoing subgrade issues with rocks being plucked from subgrade and lodged between GCL and subgrade during GCL deployment. Forte and Victoria Gold were made aware of the issues.
- Layfield has been diligent about removing rocks from subgrade pre and post GCL deployment.

Tetra Tech Canada Inc.
61 Wasson Place
Whitehorse, YT Y1A 0H7 CANADA
Tel 867.668.3068 Fax 867.668.4349

- All QA/QC testing has met specifications throughout the week, except for the subgrade disturbance during deployment.

2.2 June 1, 2020

Heavy rain overnight and into the morning. No work performed today.

2.3 June 2, 2020

- Weather: partly cloudy with patches of rain in the afternoon.
- Clint Abel back on site and monitoring earthworks.
- Layfield identified areas where the GCL placed on May 31, hydrated due to rainfall on June 1. Layfield is removing hydrated sections and replacing them with new GCL. See Figures 1 & 2.
  - Layfield placed bentonite at seams and fused them together with a propane torch.
  - Removal of GCL at base of slope eliminated hole identified by Tetra Tech on May 31, 2020.
- Layfield placed a third panel of GCL then switched to 80 mm LLDPE.
- Trial seams performed for rough seams at joints and smooth seams along panel edges. Two fails on rough trial seam before getting a passing trial seam. Smooth seam trial passed on first test.
- Panel #'s P1 and P2 deployed, and the joint seamed between the two panels. See Figures 3 to 7.
- Layfield is having to drive spikes through the liner to hold sandbags and liner on the slope.
- P1-P2 panel joint is 40.2 m from anchor trench, and panel P1 is 128 m in length from P1-P2 joint to base of the slope.
- Rain/hail began at approximately 12:30 pm, putting deployment on hold.
- Deployment of panels P3 and P4 began at 1:30 pm.
- P3-P4 panel joint is 72 m from anchor trench, and panel P3 is 88 m in length from P3-P4 joint to base of slope.
- The downslope seam between panels P1, P2, P3, & P4 was fusion welded. Non-destructive testing was not performed due to the requirement for a patch at the P3-P4 joint. The seam was finished being welded at 4:10.
- No further deployment today due to rain in the forecast for tomorrow. Chad determined that Layfield would not be able to get GCL and liner deployed by the end of the day.
- Clint Green provided a plan to identifying areas on the slope for 45-degree cross seams (joints).

2.4 June 3, 2020

- Weather: Cloudy with rain showers in the distance turning to rain showers at site.
- Layfield held off deploying GCL due to large rain cloud in valley. At 10:30 am, Chad notified the crew that GCL deployment would commence at 11:00 am. Rain cloud appears to be dispersing.
- Layfield conducted an extrusion trial seam, which passed, and is patching holes on the existing liner where ODF placement is occurring, including a hole created today from an excavator.
- GCL deployment until 1:00 pm. Two panels were deployed until a rainstorm shut down deployment. Layfield placed sandbags to protect GCL from uplift due to wind. At 2:45 pm, Chad determined that deployment was done for the day due to weather. See Figures 8 & 9.
- Clint Abel submitted an RFI to Clint Green to use horizontal seams (joints) rather than 45-degree seams. Layfield used horizontal seams on previous liner installation.

2.5 June 4, 2020

- Weather: cloudy and raining, turning to partly cloudy with scattered rain showers in the afternoon.
- Deployment delayed in the morning due to weather.
- Layfield mobilized to begin deployment at 8:00 am once rain ceased. See Figures 10 through 20.
  - Layfield checked deployed GCL for hydration. No hydration noted.
  - Layfield deployed LLDPE panel P5 then panel P6.
  - 45-degree angles were cut for the P5-P6 joint, and then Layfield fused the joint. Non-destructive testing could not be performed due to ends of seam. Will be tested once T-joints are extrusion welded.
  - Rocks noted beneath liner by Tetra Tech and were marked for further inspection.
  - Panel P7 was rolled out and had a length of 13.6 m. P7 will be at the base of the slope at tie into Phase 1A liner. Layfield requested authorization for a horizontal seam by Tetra Tech. Tetra Tech authorized a horizontal seam as the slope was less than 2.5:1 (H:V).
  - Panels P7 through P9 was placed on the slope and fused.
  - Layfield switched seam testing apparatus. Calibration sheet shows a Total Deviation Error of 0.00% performed on July 25, 2019. See Figure 17 for the calibration sheet.
  - Layfield and Tetra Tech performed a non-destructive pressure test on the P7-P8 joint. The test passed with a pressure loss of 1 psi. The P7-P8 joint seam is a good seam that will only require a T-weld to finalize.
  - The P8-P9 joint seam could not be tested as the vertical P5 through P9 vertical seam had been fusion welded prior to testing. A T-weld will have to be performed to allow for testing of the joint seam.
  - GCL placement continuing in advance of liner placement.
  - Ewing is tidying up anchor trench and extending further towards the west end of the perimeter road.

- Layfield continued to place GCL till the end of the day and has 3 panels deployed ready for liner placement tomorrow.
- Destructive testing will not occur until Layfield uses extrusion apparatus to make repairs to the liner.

2.6 June 5, 2020

- Weather: partly cloudy turning to mostly cloudy in the afternoon.
- Layfield is placing LLDPE liner overtop of GCL placed on June 4. See Figures 21 to 33 for today's photos.
  - Trial seams being conducted for smooth and textured seams. Trial seam testing passed, and Layfield is authorized to fusion weld the liner as it is placed.
  - Chad checked one of the locations identified with rock beneath the liner and removed four rocks from the location, confirming that other locations will have to be checked. Layfield is checking the slope prior to GCL placement, but dragging the GCL along the slope pulls rocks out of the subgrade.
  - Non-destructive testing of joint seams for panels P10-P11 and P12-P13 joints could not be performed. Testing will be performed once T-welds are completed during extrusion welding.
    - Destructive tests D1, D2, & D3, tested by Layfield in the presence of Tetra Tech's representative. All destructive testing passed. For panels P1 through P9, one more destructive test is required, which will be performed when Layfield begins extrusion welding of repairs. Archive samples have been retained by tetra Tech as per Forte's specifications.
  - Layfield placed panels P10 through P13 on slope. Non-destructive testing of joints will not be performed until T-welds are performed by extrusion, where joints meet vertical seams.
    - P11-P13 seam has a defect 38.8 m from anchor trench. Repair will be required during extrusion welding. Fusion welding was interrupted due to generator falling over. See Figure 29.
  - Layfield is continuing to place GCL in advance of further liner deployment.
    - Four panels of GCL placed.
    - Holes in GCL were present at the beginning of the rolls due to handling. Layfield patched the holes in the presence of Tetra Tech to specifications.
    - Tetra Tech suggested to Layfield to address rocks pulled out of subgrade at the GCL deployment stage because it is easier to repair GCL than the GCL and the liner.
      - Rocks larger than 75 mm were to be either removed from beneath the GCL by pulling it back or cutting a hole in the GCL and repairing. If the rocks could be pounded into the slope, they were not required to be removed.
      - In advance of each GCL panel deployment, Layfield removed rocks from slope. Layfield is bringing armfuls of rocks larger than 75 mm off the slope.
      - Tetra Tech attempted to contact Clint Green regarding the subgrade as discussions with Layfield highlight that angular rocks as small as 50 mm could be problematic. Clint could not be reached by phone, so an email was sent. A phone call between Clint Green and Clint Abel was set up for the morning. Tetra Tech is seeking information regarding the minimum size of rock that must be removed beneath the liner as well as determining a plan for the rest of the 2:1 (H:V) slopes where rock is present.

- After conducting trial seams, panels P14 and P15 of LLDPE liner were deployed and fused.
    - Non-destructive testing of joints will take place after extrusion welding has been completed.

2.7 June 6, 2020

- Weather: partly cloudy with a thundershower at the end of shift.
- Layfield is continuing to deploy GCL and liner. See Figures 34 to 40.
    - Deployed and fused panels P16 through P21.
    - Ewing is digging the anchor trench deeper as the liner has pulled out of the anchor trench 300 mm over time.
    - Layfield extrusion welded liner panels along the anchor trench so that they could place backfill to limit the liner pulling down the slope. Ewing did not backfill the anchor trench completely and placed material between seams as they still require pressure testing.
        - Layfield's extrusion tech exceeded the allowable time for fusing between trial seams by one hour. Tetra Tech spoke with Layfield regarding the issue and reminded them that trial seams must be performed every four hours.
    - Tommy conducted vacuum testing on all extrusion welds. Tetra Tech observed the testing on fusion welds conducted in exceedance of allowable time between trial seams. All vacuum testing passed.
    - At approximately 3:30 pm, the wind picked up a panel of liner being deployed and carried it down the slope. Tetra Tech observed them pull the liner back up the slope with the excavator. A walkover will be required to confirm that no damage occurred to the liner.
- Tetra Tech had a conference call at 9:10 am with Clint Green, Victoria Gold's Mine Manager Mark Ayranto, Clint Abel, and Layfield's Project Manager Jason Wheeler regarding the subgrade issues.
    - Layfield was going to attempt deployment by walking the roll of GCL down the slope with an excavator with a spreader bar to limit the GCL moving on the slope and plucking rocks from the subgrade.
        - This was attempted at 10 am and deemed unsafe, so deployment has to continue as it has.
    - Mark suggested fabricating wheels to the spreader bar and lowering down the slope. This method would slow down deployment and cause a shut down until it was fabricated.
    - It was agreed upon that a test strip should be performed by placing rocks of varying sizes on a competent and flat subgrade, deploying GCL and LLDPE liner overtop, then placing 1 to 2 m of material overtop and running over with a rock truck.
        - Tetra Tech suggested using a loaded 785 rock truck to simulate loading of over 40 m of heap leach material on the liner.
        - Clint Green wanted to conduct the test strip on Monday or Tuesday once Clint Abel was back on site.
        - Tetra Tech asked what should be done for further deployment regarding the subgrade and rocks until the test strip trial was conducted.
            - As there was no clear answer, it was determined that Layfield would decide if it was acceptable to them first if Layfield deemed areas unacceptable, Tetra Tech would make note, and if the test strip

showed that liner puncture was likely, the owner would take responsibility for remedial actions to bring the liner to acceptable limits including remove and replace if necessary.

- After the meeting, Tetra Tech returned to site and spoke with Chad about what was decided in the meeting. Chad said that he could not feel confident about the subgrade and suggested that the test strip should be conducted as soon as possible.
  - Tetra Tech and Chad returned to the office and had a conference call with Clint Green.

    Tetra Tech suggested that a test strip should be conducted under extreme conditions to determine if the liner will puncture. The extreme conditions included using a flat and well-compacted subgrade, having an assortment of different rock sizes in different configurations, and not placing any cover material over the liner.

    Tetra Tech requested information for requirements for patches to GCL, where rocks cut out and removed from subgrade. Clint said if cuts are vertical, they can be patched with bentonite powder beneath the GCL and on top. If cuts are horizontal, then they would require a GCL patch.

– Tetra Tech coordinated and conducted the test strip as agreed upon in the meeting with Clint Green.
  - The liner was run over three times by a loaded 30-ton rock truck as well as the worst rock having a tire on top of it and twisting the liner overtop of it by turning the rock truck back and forth.
  - No punctures in the liner were observed by Tetra Tech or Layfield.
  - Coupon samples were obtained at highly stressed areas and pulled using the seam testing apparatus by Layfield. The coupons all exhibited similar strength characteristics to new liner, and where the rock truck was used to twist the liner overtop of a rock, the coupons maintained strength above the minimum shear values required for a fusion weld.
  - Tetra Tech and Chad from Layfield called Clint Green to inform him of the results. Clint could not give a definitive answer on how to proceed with the subgrade issues without reviewing the information.
    - Tetra Tech submitted an RFI detailing the subgrade issues, the liner puncture test strip, and requested guidance for subgrade acceptance.

2.8 June 7, 2020

- Weather: partly cloudy.
- Layfield is continuing to place GCL and LLDPE liner. See Figures 41 to 49.
  – Tetra Tech has requested that Layfield does thorough walkovers of the GCL once placed to remove any rocks that cannot be pounded into the subgrade.
    - On GCL placed today and immediately before liner deployment, Layfield is walking the slope before and after GCL placement to remove rocks from the subgrade. Rocks beneath the GCL are being cut out with vertical cuts, and bentonite powder is placed beneath and above the cut in the GCL.
    - Numerous rocks are being removed both pre and post GCL placement. Post GCL placement is leading to numerous vertical cuts in the GCL.
    - The slope length is getting shorter, and liner is being deployed with less joints.

    - Layfield deployed and fused panels P22 to P26 of liner today.
    - GCL is protected by liner in advance of potential rain tomorrow.

- Tetra Tech and Layfield QC obtained six destructive testing samples from fused seams and joints on the deployed liner. Testing was performed immediately, and all destructive samples passed. Tetra Tech retained archive samples of all destructive samples. Destructive testing is now caught up for all liner placed to the end of June 6.
- Layfield has raised concerns over the number of rocks on the surface of the remainder of the 2:1 slope. Chad said that they would not place liner on the remainder of the surface without sand being placed to cover the rocks. Once the liner has been laid to the south corner of Phase 1B, Layfield expects that there is approximately 40 m of slope that is acceptable enough to place liner.
    - Even after compaction of the subgrade, there are large amounts of rocks greater than 50 mm on the subgrade surface.
    - A review of the specifications shows that all rocks greater than 50 mm are required to be removed from the slope surface prior to liner placement. The amount of rocks greater than 50 mm is too great to be removed by hand. A surface covering of sand will be the most time effective method to provide and acceptable subgrade.
        - Ewing laid a test strip of 20 mm drain rock used for the drainage trenches and compacted it to show Layfield how the surface would be if used on the slope. Layfield stated that they do not typically accept any angular rocks beneath the GCL. Using the drain rock would be a better surface than the existing subgrade soils. Layfield would require Forte to spec the drain rock as an acceptable subgrade soil for continuing placement.
        - The subgrade that Layfield has been deploying liner on is marginally acceptable based on Forte's specifications. There were small areas that could be deemed unacceptable, but most of the rock beneath the GCL is the result of the excavator used in deployment, disturbing the subgrade, excavation of the anchor trench, and the GCL plucking rocks out of the subgrade.
    - See Figures 50 to 52 for subgrade conditions.

3.0 GEOSYNTHETIC ROLL NUMBERS PLACED

Table 1 summarizes the daily geosynthetic roll numbers placed on the slope during liner installation. All panel lengths are approximate and where 45-degree joints are used; panel length is based from the center of the panel.

Table 1: Geosynthetic Roll Numbers Placed on Slope

Date	GCL Roll Number	LLDPE Liner Roll Number	Panel Number (Length)
June 1	-	-	
June 2	502346989, 502347001 502347039, 502346951	10694-012 10694-017 10694-007	P1 (40.2 m) P2 (128 m), P3 (88 m) P4 (72.1 m)

4.0 TRIAL SEAM

Table 2 summarizes the weekly trial seam results. For fusion, the apparatus settings are temperature and speed, and for extrusion, the apparatus settings are preheat and barrel temperature. Five tests are performed for each criterion.

Table 2: Trial Seam Results

Date	Time	Fusion or Extrusion	Tech	Apparatus #	Temp or Preheat (ºF)	Speed (%) or Barrel Temp (ºF)	$Peel_{inside}$ (100 min)	$Peel_{outside}$ (100 min for Fusion 88 min for Extrusion)	Shear (120 min)	Smooth or Textured

Project: Victoria Gold
Weekly Report #13
June 7-13, 2020

Site Location: Phase 1B

Hours worked this period: 2,619
Hours total to date: 18,245

Summary:

- Construction
  - Main focus this week was hauling and placing sand on the western slope.
  - Dozer continuing final shaping along the western slope for liner placement.
  - Dozer (D10) continued working on the eastern side whenever possible.
  - Layfield crew placing liner on western slope.

Legend:
Red = Trouble
Yellow = Caution
Green = On track

Weather:

- Mixed weather this week, sun, overcast, and rain
- Temperatures: Morning lows of 6 C° with daytime highs of 20 C°

Incidents / Health & Safety:

- Incidents or accidents: No incidents this week
- Weekly site safety inspection: No inspections this week
- Weekly safety meeting: Toolbox meeting held every morning in the field to ensure enough room for social distancing.

Incidents to date:

2

Project Milestones:	**Responsible:**	**Completion Date:**
Nuway crushing gravel for underdrain construction – Sand was not completed before move the crusher to Secondary – Sand will now be recovered from wasted material during production of the ODF on Dublin. Nuway will screen the oversize material out of the sand.	Nuway	March 11th
Header Underdrain excavation and installation	Ewing	Complete
Lateral drain excavation and installation – Behind due to the much larger amounts of material requiring removal	Ewing	April 21st
Ditching for freshet / Water management	Ewing	Mostly Complete
Removal of all grubbing and shaping material for liner placement – Volume of material much larger then estimate	Ewing	April 20th
Removal of any unsuitable material – will not affect liner placement schedule	Ewing	May 4th
Surface preparation for liner placement	Ewing	July 7th
Liner placement – Liner is now scheduled to start May 28th	Layfield / Ewing	Aug 4th

Construction:
Activities This Week:

- Day and night shift have been hauling sand to the western slope. Sand supply in Phase 3 was depleted June 9th and continued hauling sand from Dublin. Excavator has been sorting rocks out of the sand until Nuway's screening plant arrives on site.
- The D7 dozer focused on sand placement on the western slope and final shaping when waiting for sand.
- Excavated and installed a spur drain from lateral drain 4E to the interceptor ditch. This was installed to address a small amount of water that wasn't captured by the liner above the header underdrain. The water was causing damage to the sand in the header drain.
- Ewing's D10R has been working on the eastern side of Phase 1B whenever possible. The dozer mainly focused on completing the remaining topsoil and organics along lateral drain 2E.
- The Layfield crew continued placing liner on the south western portion of the slope. No liner placement Friday or Saturday for safety reasons (rolling rocks from sand placement).

Activities Planned for Next Week:

- Continue placing sand on the steep western slope to address the subgrade issue.

- Finish constructing the north western section of the perimeter berm. This section requires material placement and compaction.
- Continue liner placement along the western side.
- Continue packing the western slope to the north.
- Excavate key trench ahead of liner placement.
- Start excavating and installing lateral drain 2E
- Continue topsoil removal, sloping (2.5:1) below the interceptor ditch, and removing any unsuitable material on the eastern side.

HSE SAFETY REPORT

	PERIOD TO	MONTH TO DATE	YEAR TO DATE	
Total Hours	2,619	4,925	18,245	
Incidents (Non-injury)	0	1	2	
First Aid Injuries	0	0	0

TETRA TECH

WEEKLY FIELD REPORT

ISSUED FOR USE

Project:	Eagle Gold Heap Leach Phase 1B	**Date:**	June 14, 2020
Location:	Eagle Gold Mine	**Contractor:**	Ewing Transport / Layfield
Client:	Victoria Gold Corp.	**Contractor's Rep:**	Marshall Ewing / Chad Messervey
Contact:	Clint Abel	**Contractor's Email:**	
Weather:	Variable (see daily entries)	**Tetra Tech Representative:**	Adam Mickey
File:	704-ENG.WARC03235-09	**Status:**	Issued for USE

1.0 INTRODUCTION

Tetra Tech Canada Inc. (Tetra Tech) was retained by Victoria Gold Corp. (Victoria Gold) to provide CQA services at the Eagle Gold mine located north of Mayo, Yukon, at Dublin Gulch for the Eagle Gold Heap Leach Phase 1B expansion (Phase 1B). Mr. Adam Mickey, EIT, is Tetra Tech's representative on site.

Forte Dynamics (Forte) out of Fort Collins, Colorado provided the design and specification for Phase 1B, and Forte's representative is Clint Green.

Clint Abel, of JDS Energy & Mining, is Victoria Gold's project manager on site at the Eagle Gold mine.

Ewing Transport (Ewing), based out of Mayo, Yukon, is the construction contractor for Phase 1B.

Layfield Environmental Containment (Layfield) has been retained to provide and install the liner for Phase 1B, and their supervisor on site is Chad Messervey.

The following Field Report outlines Tetra Tech's CQA for the period of June 8, 2020, to June 14, 2020.

2.0 DAILY REPORTS

2.1 Highlights

- Panels P27 through P42 placed on slope. Approximate total length of panels deployed was 590.9 m for a total approximate area of 4,018 m^2.
- Deployment delayed during the week due to lack of prepared subgrade.
- All destructive testing for liner deployed up to June 13 was completed, and all destructive testing passed.
- Non-destructive testing of liner seams was performed for panels P1 through P36. Most seams passed with a few requiring further testing once extrusion welding has been performed to fix air leaks.
- All vacuum box testing was completed on extrusion welding for panels P1 through P36 up to June 13.

Tetra Tech Canada Inc.
61 Wasson Place
Whitehorse, YT Y1A 0H7 CANADA
Tel 867.668.3068 Fax 867.668.4349

- Panels P3 through P36 was tied into Phase 1A by extrusion welding.
- A final walkthrough is still required for panels P1 through P36 once all non-destructive testing has been completed.

2.2 June 8, 2020

- Weather: partly cloudy, turning to rain at 12:30 pm.
- Layfield is continuing to deploy GCL and liner towards the south corner of Phase 1B on the west side. Figure 1 and Figure 2.
  - A trial seams passed. The textured trials seam initially failed, but a subsequent test passed.
  - Layfield is continuing to pick rocks off to slope prior to GCL deployment and cutting rocks out of the GCL as required.
  - Layfield has two extrusion techs patching holes and doing T-welds at all joint seams.
- On June 7, Tetra Tech had a conversation with Clint Abel regarding the subgrade conditions. It was agreed that sand should be placed on the slope in advance of GCL placement as deployment continues northward from where liner deployment started.
  - Layfield does not think compaction of the sand will be necessary.
  - Tetra Tech informed Ewing of the plan to place sand on the slopes. Tetra Tech recommended that large rocks at the base of the slope where it meets the existing liner should be removed and that the subgrade should be compacted prior to sand placement. See Figure 3.
  - Tetra Tech worked with Ewing to determine the minimum thickness of sand required such that the D7 dozer can place sand without ripping up the subgrade.
  - Tetra Tech determined that 100 mm of sand is required on the slope in advance of liner deployment.
- Work shut down at 12:30 pm due to rain for the rest of the day.
- Tetra Tech and Layfield had a phone meeting with Clint Green at 2:00 pm.
  - Discussed the requirements for sand placement on the subgrade, including the area. It was determined that the slope area greater than 2:1 (H:V) would be required to be coated with sand prior to liner deployment and possibly the other slopes depending on how the subgrade looks after compaction.

2.3 June 9, 2020

- Weather: cloudy and raining, turning to partly cloudy in the afternoon.
- Rain and wet conditions delayed deployment and extrusion until 10:00 am.
- Layfield is extrusion seaming the deployed liner to the existing liner as well as continuing with extrusion patches on the deployed liner. See Figures 4 through 8.
- Layfield is placing rest of GCL into south corner and will finish lining the south corner tomorrow. See Figures 9 through 11.
  - Rained heavily overnight. Layfield is checking deployed GCL for hydration. Last 3 m on two panels require removal and replacement. Layfield replaced hydrated GCL.

- Tetra Tech attended the weekly Phase 1B meeting with Layfield, Ewing, Clint Abel, Matt Monk, and Mark Ayranto.
  - Forte to provide an answer on 45-degree cross seams soon.
  - The primary topic discussed was sand bedding on the rocky slopes.
    - Nuway is going to mob to Nuway pit to begin crushing approximately 6000 m^3 of bedding material.
    - It was discussed if the 20 mm drain rock would be acceptable to use as a bedding material as the pit will be out of sand today, and it could be up to three days until Nuway is producing sand. It was agreed to use the 20 mm drain rock on the lower portions of the slope, and Ewing will do their best to blend it with some sand.
    - Clint Abel asked if the gradation of the bedding material could be increased in size. Forte is going to look into a maximum size for bedding material.
    - Tetra Tech raised the question to bedding material thickness to Forte. It was determined that bedding material thickness should be based on performance in the field during GCL placement. Currently 100 mm of bedding material is being placed on the slope, but it could be increased or reduced depending on what happens when GCL is deployed.
    - Ewing will work on prepping another area for liner deployment to allow time for bedding material production and placement.
      - Tetra Tech requested an area get packed to view the potential subgrade conditions that will be on other areas of Phase 1B. If the subgrade conditions are not conducive to deploying liner, sand will be required on a larger area of the slope, or the entire of Phase 1B.
- Clint Abel found a sand source that has been mixed with large rocks. There is approximately 500 m^3 of sand, and Nuway is mobbing in a power screener to screen the rest.

2.4 June 10, 2020

- Weather: partly cloudy.
- Layfield is deploying liner into the south corner on the west side of Phase 1B. See Figures 12 to 14.
  - All fusion welding completed.
  - Panel P36 is the last panel at the south corner of the west side of Phase 1B.
- Layfield is continuing to patch, and extrusion weld holes on the liner and do T-welds at all fusion seaming intersections.
- Ewing continued to haul sand for slope bedding throughout the night. See Figures 15 and 16.
- Four destruct samples were obtained. All destructive testing is up to date for liner placed to June 10, and all samples passed. Layfield is patching all destruct samples immediately.
- Ewing backfilled the anchor trench completely up to June 10's deployment and spot filled the anchor trench for today's deployment. See Figure 17.

2.5 June 11, 2020

- Weather: partly cloudy, turning to rain at 1:30 pm.

- Ewing is continuing to place bedding sand on the slopes.
- Tetra Tech and Layfield's QC conducted pressure testing of seams. Three seams require more extrusion welding due to pressure loss; all pressure testing was not completed due to weather.
- Layfield conducted vacuum box testing. Tetra Tech confirmed that vacuum box testing was being conducted according to specifications and checked any extrusion welding areas for confirmation of passes while conducting pressure testing. Three areas failed and required repair; Layfield completed the repairs immediately.
- Layfield extrusion welded the remaining tie in of Phase 1B to Phase 1A. Layfield also fixed some extrusion areas that failed vacuum box testing.
  - Further extrusion welding is required to address areas where pressure testing failed.
- A hole was identified on Panel P8. Layfield was notified to repair it.
- Due to rain, work was halted at 1:30 pm for the rest of the day.
- Forte provided a response to the RFI regarding horizontal seams authorizing them as long as certain conditions were met. Layfield has been made aware of the conditions.

2.6 June 12, 2020

- Layfield did not work today due to not having an area to deploy liner onto.
- Ewing continued to place bedding sand on slope.
- Tetra Tech and Layfield's QC finished pressure testing of the fusion welded seams.
  - Four seams require repair to complete all pressure testing.

2.7 June 13, 2020

- No work today as bedding sand subgrade is not ready for liner placement. See Figure 19.

2.8 June 14, 2020

- Weather: partly cloudy to sunny.
- Ewing is continuing to place bedding sand on the rocky slopes in advance of liner deployment.
  - Tetra Tech noted depressions along the anchor trench of Phase 1A filled with water. Tetra Tech advised Ewing to fill them in with sand prior to GCL deployment.
- Tetra Tech and Layfield's QC approved subgrade for two panels of liner deployment. See Figures 20 and 21.
  - Due to rocks in the bedding sand, Ewing must remove rocks in advance of liner deployment. For now, subgrade will be approved on a daily basis.
  - Rocks greater than 50 mm are to be removed from subgrade bedding sand in advance of liner deployment.
  - Once a screener is on site, rocks will be screened from the bedding sand.
  - Bedding sand is being placed approximately 100 mm thick and track packed by the dozer as it is placed.
- Ewing excavated anchor trench in advance of liner deployment. See Figures 22 and 23.

  - Anchor trench is being excavated deeper than specifications to mitigate liner movement down slope due to expansion and contraction.

- Survey notified Tetra Tech that patches on the liner will be picked up during survey of the seams.
- Layfield is deploying GCL and liner moving northward from where the liner installation began on May 31. See Figures 24 to 28.
  - For the first deployment of GCL, the bedding sand was checked after each roll was deployed.
    - Bedding sand is not being stripped from the slope by GCL deployment.
    - Layfield is removing any rocks picked from the edge of the anchor trench after each deployment.
    - Tetra Tech checked high spots in GCL to identify rocks.
      - Rocks identified were generally flat and were easily pushed into the bedding sand on the slope by stepping on them.
  - Bedding sand placed on slope is proving to be a suitable subgrade for liner deployment as long as rocks are removed prior to GCL deployment.
  - Layfield placed three panels of GCL and two rows of liner panels, which was fused by the end of the day.

3.0 GEOSYNTHETIC ROLL NUMBERS PLACED

Table 1 summarizes the daily geosynthetic roll numbers placed on the slope during liner installation. All panel lengths are approximate and where 45-degree joints are used; panel length is based from the center of the panel.

Table 1: Geosynthetic Roll Numbers Placed on Slope

Date	GCL Roll Number	LLDPE Liner Roll Number	Panel Number (Length)
June 8	502344539, 502344003 502344506, 502344508 502344565	10694-031 10694-018	P27 (31.6 m) P28 (38.7 m)

WEEKLY FIELD REPORT

ISSUED FOR REVIEW

Project:	Eagle Gold Heap Leach Phase 1B	**Date:**	May 30, 2020
Location:	Eagle Gold Mine	**Contractor:**	Ewing Transport / Layfield
Client:	Victoria Gold Corp.	**Contractor's Rep:**	Marshall Ewing / Chad Messervey
Contact:	Clint Abel	**Contractor's Email:**	
Weather:	Variable (see daily entries)	**Tetra Tech Representative:**	Adam Mickey
File:	704-ENG.WARC03235-09	**Status:**	Issued for Review

This 'Issued for Review' report is provided solely for the purpose of client review and presents our findings and recommendations to date. Our findings and recommendations are provided only through an 'Issued for Use' report, which will be issued subsequent to this review. You should not rely on the interim recommendations made herein. Once our report is issued for use, the 'Issued for Review' document should be either returned to Tetra Tech Canada Inc. (Tetra Tech) or destroyed.

1.0 INTRODUCTION

Tetra Tech Canada Inc. (Tetra Tech) was retained by Victoria Gold Corp. (Victoria Gold) to provide CQA services at the Eagle Gold mine located north of Mayo, Yukon, at Dublin Gulch for the Eagle Gold Heap Leach Phase 1B expansion (Phase 1B). Mr. Adam Mickey, EIT, is Tetra Tech's representative on site.

Forte Dynamics (Forte) out of Fort Collins, Colorado provided the design and specification for Phase 1B, and Forte's representative is Clint Green.

Clint Abel, of JDS Energy & Mining, is Victoria Gold's project manager on site at the Eagle Gold mine.

Ewing Transport (Ewing), based out of Mayo, Yukon, is the construction contractor for Phase 1B.

Layfield Environmental Containment (Layfield) has been retained to provide and install the liner for Phase 1B, and their supervisor on site is Chad Messervey.

The following Field Report outlines Tetra Tech's CQA for the period of June 15, 2020, to June 21, 2020.

2.0 DAILY REPORTS

2.1 Highlights

- Rain delayed liner deployment throughout the week.
- Layfield is placing three panels of GCL for every two panels of 80 mm LLDPE liner.

2.2 June 15, 2020

- Weather: partly cloudy turning to cloudy

Tetra Tech Canada Inc.
61 Wasson Place
Whitehorse, YT Y1A 0H7 CANADA
Tel 867.668.3068 Fax 867.668.4349

- Ewing is continuing to place bedding sand on slopes.
- Layfield is continuing to deploy GCL and liner. See Figures 1 to 6.
  - Four slope lengths of GCL deployed and two slope lengths of liner deployed.
- Ewing and Layfield picked rocks out of bedding sand for approximately 45 m from edge of P47 along anchor trench.
  - Tetra Tech inspected the subgrade and approved it for liner deployment. For subgrade approval going forward, subgrade will be approved on a daily basis, but a Layfield subgrade inspection report will be generated based on the liner panels deployed over the subgrade.
- Layfield began extrusion on panels placed since June 14 and extruded at the top seams to allow anchor trench to be backfilled.

2.3 June 16, 2020

- Weather: cloudy and light rain turning to mostly cloudy in the afternoon.
- Ewing is not placing bedding sand on slope due to slippery road conditions from stockpile to site.
- Layfield is continuing to deploy GCL and liner. See Figures 7 to 11.
  - Tetra Tech approved the subgrade for liner deployment.
  - One more slope length of GCL panels were deployed and then liner panels P48 and P49 were deployed overtop.
  - Deployment was halted at 10:30 am due to rain and resumed at 1:00 pm when the rain stopped.
  - Layfield continued to place GCL till the end of the day. At the end of the day, five slope lengths of GCL were deployed.
    - Layfield folded up the GCL at the bottom of the slope in case of rain.
- Tetra Tech attended the weekly Phase 1B meeting and updated all parties on the progress. No specific issues were raised.
- Tetra Tech performed compaction testing on subgrade fills as required.

2.4 June 17, 2020

- Weather: cloudy turning to rain at 8:00 am.
- It rained heavily overnight on deployed GCL. See Figures 12 to 14.
  - Heavy erosion was evident of the bedding sand on the slope as it washed to the bottom in places.
    - Sand was displaced on to leading panels along the slope.
    - An erosion gully formed along the leading edge of the GCL. It will have to be raked smooth prior to further deployment.
    - Areas at the bottom of the slope will have to be raked to smooth out contours and fix erosional features.

- Tetra Tech and Layfield inspected the GCL on the slope. GCL on the slope did not hydrate due to the rainfall, but the GCL that was folded back hydrated at the fold. Layfield is replacing the GCL and cutting it off 1 m up from the folded area.
    - Weather conditions during deployment have been unpredictable throughout the project and weather reports do not reflect the conditions experienced at site. It is impossible to protect the GCL on the slope overnight by covering it, and it has been shown that the GCL will not hydrate on the steep slopes during rainfall, so Layfield has continued deployment to advance the project understanding that GCL may need to be replaced at the toe of the slope.

- Due to rain and saturated conditions, deployment was shut down for the day at 9:30 am.

2.5 June 18, 2020

- Weather: Partly cloudy turning to cloudy with periods of rain in the afternoon.
- Layfield fixed subgrade and replaced hydrated GCL.
    - Subgrade was smoothed out using rakes and additional sand was placed in wet spots by Ewing and Layfield personnel.
    - The subgrade had dried out sufficiently to place liner.
    - Layfield is not going to leave any GCL exposed overnight anymore due to unpredictable weather. This could lead to shorter days due to the time it takes to deploy GCL and liner, as well as fusing the liner.
- Layfield is deploying liner to cover the deployed GCL.
    - Panels P50 to P57 were deployed on the slope and fused.
- Layfield placed two more slope lengths of GCL and then deployed and fused panels P58 and P59.
- Layfield performed extrusion welding on deficient areas from panels P1 to P36, including fixing seams to finish pressure testing.
- Rock picking and subgrade acceptance will be required to continue deployment.

3.0 GEOSYNTHETIC ROLL NUMBERS PLACED

Table 1 summarizes the daily geosynthetic roll numbers placed on the slope during liner installation. All panel lengths are approximate and where 45 degree joints are used, panel length is based from the center of the panel.

Table 1: Geosynthetic Roll Numbers Placed on Slope

Date	GCL Roll Number	LLDPE Liner Roll Number	Panel Number (Length)

WEEKLY FIELD REPORT

ISSUED FOR USE

Project:	Eagle Gold Heap Leach Phase 1B	**Date:**	June 28, 2020
Location:	Eagle Gold Mine	**Contractor:**	Ewing Transport / Layfield
Client:	Victoria Gold Corp.	**Contractor's Rep:**	Marshall Ewing / Chad Messervey
Contact:	Clint Abel	**Contractor's Email:**	
Weather:	Variable (see daily entries)	**Tetra Tech Representative:**	Adam Mickey
File:	704-ENG.WARC03235-09	**Status:**	Issued for Use

1.0 INTRODUCTION

Tetra Tech Canada Inc. (Tetra Tech) was retained by Victoria Gold Corp. (Victoria Gold) to provide CQA services at the Eagle Gold mine located north of Mayo, Yukon, at Dublin Gulch for the Eagle Gold Heap Leach Phase 1B expansion (Phase 1B). Mr. Adam Mickey, EIT, is Tetra Tech's representative on site.

Forte Dynamics (Forte) out of Fort Collins, Colorado provided the design and specification for Phase 1B, and Forte's representative is Clint Green.

Clint Abel, of JDS Energy & Mining, is Victoria Gold's project manager on site at the Eagle Gold mine.

Ewing Transport (Ewing), based out of Mayo, Yukon, is the construction contractor for Phase 1B.

Layfield Environmental Containment (Layfield) has been retained to provide and install the liner for Phase 1B, and their supervisor on site is Chad Messervey.

The following Field Report outlines Tetra Tech's CQA for the period of June 22, 2020, to June 28, 2020.

2.0 DAILY REPORTS

2.1 Highlights

- Rain delayed liner deployment for four days this week.
- Panels P63 through P76 were deployed this week for a total length of approximately 1,161.2 m and a total area covered of approximately 7,896 m^2.
- Pressure testing has been completed for all panels up to panel P57 has been completed and passed except for the P51-P54 vertical seam.
- Layfield is keeping up with all detailing of the liner panels.
- Layfield is placing three panels of GCL for every two panels of 80 mm LLDPE liner.
- All geotextiles deployed have been deployed as per contract specifications.

Tetra Tech Canada Inc.
61 Wasson Place
Whitehorse, YT Y1A 0H7 CANADA
Tel 867.668.3068 Fax 867.668.4349

2.2 June 22, 2020

- Weather: cloudy
- Layfield and Ewing came to site to assess the subgrade conditions and determine if deployment was possible.
  - No work performed today due to saturated subgrade conditions and erosion from heavy rainfall on June 21.
  - Rainfall caused erosion of sand on subgrade to the base of the slope and along GCL. See Figures 1 to 4.
  - Ewing is removing sand on GCL and flipping it over to protect the GCL from further sand migration.

2.3 June 23, 2020

- Weather: raining
- No work performed today due to rain.

2.4 June 24, 2020

- Weather: raining
- No work performed today due to rain.

2.5 June 25, 2020

- Weather: partly cloudy with periods of light rain.
- Ewing is fixing subgrade erosion for further liner deployment.
- Layfield is performing extrusion welding on panels P37 through P62 and also tying in deployed panels to Phase 1A.
- Tetra Tech and Layfield conducted pressure testing of seams.
  - Some seams failed requiring further block offs or patches.
- Destruct D14B was obtained and tested as a result of the failed destruct on June 20. The destruct passed.
- Tetra Tech inspected the subgrade that Ewing worked on throughout the day. At the toe of the slope along the anchor trench of Phase 1A, the subgrade was saturated as well as soft in areas. See Figures 6 and 7.
  - Tetra Tech discussed the issues with Clint Abel, and Clint noted that he had told Ewing to excavate out any soft or saturated materials.
  - Tetra Tech spoke to Clint Green about what would be tolerated with the subgrade to determine how much additional work would be required to deploy GCL.
    - It was agreed that no soft/yielding or saturated areas would be accepted for the subgrade, which follows the original specifications.
    - Tetra Tech spoke with Ewing and advised that the saturated sand at the toe of the slope would have to be removed.

2.6 June 26, 2020

- Weather: partly cloudy with periods of rain in the afternoon.
- Ewing is removing soft and saturated subgrade materials from the toe of the slope.
  - Tetra Tech directed the subgrade removal for the next two slope lengths of liner and showed Ewing what was expected for further subgrade excavation.
  - Once the subgrade materials had been removed, Ewing raked the subgrade smooth and removed any large rocks over 50 mm.
  - Ewing will continue to fix the subgrade in advance of liner deployment as they have time.
  - Tetra Tech advised Ewing that low spots that are saturated and soft along the Phase 1A anchor trench should be backfilled as soon as possible to limit further water infiltration due to rainfall.
- Tetra Tech approved the subgrade for the next two slope lengths of liner to be deployed.
- Layfield and Ewing labourers removed eroded sand from the GCL and then placed three slope lengths of GCL and one slope length of liner.
  - Layfield could not get all the GCL covered by the end of the day due to lost time in the morning because of subgrade prep and periodic rainstorms in the afternoon.
  - Layfield deployed liner panels P63 and P64.
- All extrusion welding and liner repairs identified by pressure testing were completed on June 25. Layfield completed pressure testing of seams for panels P37 to P57. One more seam requires extrusion welding to test on the P51-P54 vertical seam.

2.7 June 27, 2020

- Weather: partly cloudy with wind and rainy periods.
- Ewing continued to repair subgrade at toe of slope in advance of liner deployment. See Figures 8 to 11.
  - The toe was repaired to allow two slope lengths of liner to be deployed.
  - Upon completion of repairs, Tetra Tech inspected and approved the subgrade for GCL deployment.
- Layfield continued liner deployment.
  - Layfield deployed, and fused liner overtop of GCL from June 26, then deployed two slope lengths of GCL and one slope length of liner. The liner was fused immediately upon deployment.
  - Rain delayed deployment at 9:45 am for approximately 1.5 hours.
  - Layfield deployed one more slope length of GCL and liner.
  - Liner panels P65 through P71 were deployed today.
- Layfield conducted extrusion welding on identified repairs as well as conducted required extrusion welding on liner deployed June 26.

2.8 June 28, 2020

- Weather: sunny with windy periods in the afternoon.
- Ewing repaired subgrade at the toe of the slope to allow for two slope lengths of liner to be deployed. See Figure 13.
  - Tetra Tech approved the subgrade for liner deployment.
- Layfield deployed three slope lengths of GCL and two slope lengths of liner. See Figures 14 to 16.
  - Liner was fused immediately after deployment.
- Tetra Tech and Chad worked with Ewing to fix up the toe of the slope subgrade. See Figures 17 to 20.
  - Ewing continued to work on subgrade on the slope afterward.
- Tetra Tech and Layfield obtained seven destructive samples for testing.
  - Layfield immediately patched where destructive samples were taken on the slope.
  - Upon obtaining the destruct sample from the P68-P70 vertical seam, it was found that due to a fusion apparatus operator error, the air seam was damaged along the entire length of the seam. See Figures 21 and 22.
    - Although the seam is fused together, it cannot be pressure tested. Layfield will extrusion weld the entire seam.
  - Destructive testing was not performed today

3.0 GEOSYNTHETIC ROLL NUMBERS PLACED

Table 1 summarizes the daily geosynthetic roll numbers placed on the slope during liner installation. All panel lengths are approximate and where 45 degree joints are used, panel length is based from the center of the panel.

Table 1: Geosynthetic Roll Numbers Placed on Slope

Date	GCL Roll Number	LLDPE Liner Roll Number	Panel Number (Length)
June 22			
June 23			
June 24			
June 25

4.0 TRIAL SEAM

Table 2 summarizes the weekly trial seam results. For fusion, the apparatus settings are temperature and speed, and for extrusion, the apparatus settings are preheat and barrel temperature. Five tests are performed for each criterion.

Table 2: Trial Seam Results

Date	Time	Fusion or Extrusion	Tech	Apparatus #	Temp or Preheat (ºF)	Speed (%) or Barrel Temp (ºF)	$Peel_{inside}$ (100 min)	$Peel_{outside}$ (100 min for Fusion 88 min for Extrusion)	Shear (120 min)	Smooth or Textured

StrataGold Corporation, Eagle Gold Project
Project: Victoria Gold
Weekly Report #17
July 5-11, 2020

Site Location: Phase 1B

Hours worked this period: 2,564
Hours total to date: 29,012

Summary:

- Construction
  - The day shift continues to remove unsuitable material on the eastern side of Phase 1B, hauled sand and 20mm to lateral drains, and finished raising the northwestern portion of the perimeter berm 2.5 meters.
  - Dozer continues finishing the surface working it way around to the east.
  - Continued excavating and installing lateral drain 3E.
  - Continued screening sand on Eagle Pup for Phase 1B.
  - Layfield crew continued to place liner along the western slope.
  - Nightshift supported ODF placement, and hauled unsuitable material from the eastern side.

Legend:
Red = Trouble
Yellow = Caution
Green = On track

Weather:

- Showers pretty much every day and completely shut down Friday night through Saturday due to heavy rain
- Temperatures: Morning lows of 5 C° with daytime highs of 17 C°

Incidents / Health & Safety:

- Incidents or accidents: Layfield had a piece of liner slide down the slope and Ewing wiggle wagon box tip.
- Weekly site safety inspection: No inspections this week.
- Weekly safety meeting: Toolbox meeting held every morning in the field to ensure enough room for social distancing.

Incidents to date:

6

Project Milestones:	**Responsible:**	**Completion Date:**
Nuway crushing gravel for underdrain construction – Sand was not completed before move the crusher to Secondary – Sand will now be recovered from wasted material during production of the ODF on Eagle Pup. Nuway screening plant screening oversize material out of the sand.	Nuway / Ewing	March 11th
Header Underdrain excavation and installation	Ewing	Complete
Lateral drain excavation and installation – Behind due to the much larger amounts of material requiring removal	Ewing	April 21st
Ditching for freshet / Water management	Ewing	Mostly Complete
Removal of all grubbing and shaping material for liner placement – Volume of material much larger then estimate	Ewing	April 20th
Removal of any unsuitable material – will not affect liner placement schedule	Ewing	May 4th
Surface preparation for liner placement – final surface preparation ahead of liner crew will continue until complete	Ewing	July 22nd
Liner placement – All material have been delivered to site – Started June 2nd and should close to completion August 30th	Layfield / Ewing	Aug 30th

Construction:
Activities This Week:

- Day shift finished building the western perimeter berm up an additional 2.5 meters. This requirement was confirmed by Clint Green (Forte). Continued removing unsuitable material on the eastern side of Phase 1B, hauled sand and 20mm to the lateral drains.
- Night shift hauled material to the west perimeter berm, ODF placement for Process, and hauled unsuitable material on the eastern side.
- Both crews were down from Friday night until Sunday morning due to rain.
- Ewing continued operating Nuway's screening plant to produce sand for Phase 1B. Mine Operations night shift hauled some sand away from the screening plant July 8th for steaming material.
- The dozer is continuing to finish the surface from the west and working around to the eastern side. The packer has been compacting finished areas behind the dozers.
- Finished excavating lateral drain 3E and continuing the install.
- Layfield was only able to place liner 3 days this week with rain delays on 2 of them. The crew took a couple rest days after the liner sliding incident to have a rest. The steep western portion of the slope is completed and signed off by Tetra Tech. The signoffs were sent to Forte for final approval before ODF can be placed on the surface.

Activities Planned for Next Week:

- Focus on removing unsuitable material on the eastern side of Phase 1B.
- Place sand where necessary ahead of the liner crew.
- Continue advancing the liner placement along the western side.
- Continue excavate anchor trench ahead of liner placement.
- Backfill and compact anchor trench behind completed section of liner placement.
- Excavate and install final lateral drain 4E.
- Continue screening sand on Eagle Pup for Phase 1B.

WEEKLY FIELD REPORT

ISSUED FOR USE

Project:	Eagle Gold Heap Leach Phase 1B	**Date:**	July 12, 2020
Location:	Eagle Gold Mine	**Contractor:**	Ewing Transport / Layfield
Client:	Victoria Gold Corp.	**Contractor's Rep:**	Marshall Ewing / Chad Messervey
Contact:	Clint Abel	**Contractor's Email:**	
Weather:	Variable (see daily entries)	**Tetra Tech Representative:**	Adam Mickey/James Buyck
File:	704-ENG.WARC03235-09	**Status:**	Issued for USE

This 'Issued for Review' report is provided solely for the purpose of client review and presents our findings and recommendations to date. Our findings and recommendations are provided only through an 'Issued for Use' report, which will be issued subsequent to this review. You should not rely on the interim recommendations made herein. Once our report is issued for use, the 'Issued for Review' document should be either returned to Tetra Tech Canada Inc. (Tetra Tech) or destroyed.

1.0 INTRODUCTION

Tetra Tech Canada Inc. (Tetra Tech) was retained by Victoria Gold Corp. (Victoria Gold) to provide CQA services at the Eagle Gold mine located north of Mayo, Yukon, at Dublin Gulch for the Eagle Gold Heap Leach Phase 1B expansion (Phase 1B). Mr. Adam Mickey, EIT, is Tetra Tech's representative on site.

Forte Dynamics (Forte) out of Fort Collins, Colorado provided the design and specification for Phase 1B, and Forte's representative is Clint Green.

Clint Abel, of JDS Energy & Mining, is Victoria Gold's project manager on site at the Eagle Gold mine.

Ewing Transport (Ewing), based out of Mayo, Yukon, is the construction contractor for Phase 1B.

Layfield Environmental Containment (Layfield) has been retained to provide and install the liner for Phase 1B, and their supervisor on site is Chad Messervey.

The following Field Report outlines Tetra Tech's CQA for the period of July 6, 2020, to July 12, 2020.

2.0 DAILY REPORTS

2.1 Highlights

- Rain delayed liner deployment throughout the week.
- Layfield is placing three panels of GCL for every two panels of 80 mm LLDPE liner.

2.2 July 6, 2020

- Weather: partly cloudy.

Tetra Tech Canada Inc.
61 Wasson Place
Whitehorse, YT Y1A 0H7 CANADA
Tel 867.668.3068 Fax 867.668.4349

- Layfield is continuing to deploy liner over deployed GCL.
  - During the deployment of the first panel an incident occurred where the 128 m of deployed liner slid down the hill to the toe of the slope.
    - Two of Layfield's employees were swept down the hill with the liner, and one of Layfield's employees and one of Ewing's employees sustained minor injuries.
    - Deployment was halted for the rest of the day due to the incident.
    - Tetra Tech attended the post-incident safety meeting with Layfield and Ewing and provided a witness statement.
    - Multiple factors led to the incident, including lack of communication, complacency, and fatigue.
    - Layfield will be taking July 7 off to give the crews a rest day.

2.3 July 7, 2020

- Tetra Tech spent part of the rest day working on paperwork and other miscellaneous tasks.
- Tetra Tech attended the weekly progress meeting at 10:30 am.
- James Buyck arrived on site to take over CQA Inspection duties for Adam Mickey

2.4 July 8, 2020

- Weather: mostly cloudy, light afternoon drizzle.
- Layfield and Tetra Tech performed a final inspection on panels P1 through P59.
  - Three areas requiring vacuum testing were identified and vacuum tested immediately.
  - The area is ready for final sign off and be passed over to the client.
- Layfield repaired the out of spec cross seam by cutting out the liner to a point 10 m away from the adjacent cross seam and replaced with new liner.
- Layfield recovered the liner that slide down the slope on July 6, cutting it into manageable pieces, and deploying it on the slope. Chad M. indicated there was no significant damage caused to the liner and Layfield was able to completely reuse.
- Tetra Tech signed off on Layfield's subgrade acceptance for liner deployed between June 29 and July 5.

2.5 July 9, 2020

- Weather: sun and cloud, light drizzle mid-afternoon.
- No GCL or 80 mm LLDPE liner placed today. Layfield concentrated on completing patch repair and extrude welding bottom section of entire length of panel placed to date to the previous Phase 1B.
- Anchor trench compacted along entire section of liner placed to date.
- Approximately 30 m of anchor trench excavated beyond last panel of liner placed.
- Ewing Transport continued placement and compaction of fill for liner bench

2.6 July 10, 2020

- Weather: sun and cloud, light medium rain in afternoon.
- Layfield deployed 21 GCL panels and no LLDPE liner – work delayed ~2.5 hours because of rainy and windy conditions.

2.7 July 11, 2020

- Weather: Overcast with rainy periods.
- Steady rain overnight with continued rain in the morning halted work for the day.

2.8 July 12, 2020

- Weather: Sun and cloud with periods of light rain. Little to moderate breeze.
- LLDPE Liner deployment and ground work commenced in the morning after site conditions were assessed by Ewing Transport and Layfield to be acceptable to proceed.
- GCL and LLDPE panels placed in the afternoon. Detail work also performed once GCL and LLDPE placed.
- Ewing completed regrading and static rolling of the next section of subgrade planned for GCL. The entire area had been scoured by recent rains.
- Trenching for anchoring the liners completed, as required.
- A number of failed pressure test were encountered from today's welding. Layfield QC representative investigated and discussed improvements required with the individuals completing the grinding prep work. A demonstration was provided to further improve this process.

3.0 GEOSYNTHETIC ROLL NUMBERS PLACED

Table 1 summarizes the daily geosynthetic roll numbers placed on the slope during liner installation. All panel lengths are approximate and where 45 degree joints are used, panel length is based from the center of the panel.

Table 1: Geosynthetic Roll Numbers Placed on Slope

Date	GCL Roll Number	LLDPE Liner Roll Number	Panel Number (Length)
July 6	None	None	None
July 7	None	None	None
July 8		10700-001	P108 (39.2 m)
		10700-023	P109 (39.4 m)
		10694-019	P110 (29.9 m)
		10700-001	P111 (39.2 m)
		10694-015	P112 (33.8 m)
		10694-015	P113 (29.4 m)
		10694-015	P114 (19.2 m)
		10694-013	P115 (24.9 m)
		10694-012	P116 (56.6 m)
		10694-013	P117 (27.1 m)
		10694-013	P118 (13.1 m)

TETRA TECH

WEEKLY FIELD REPORT

ISSUED FOR USE

Project:	Eagle Gold Heap Leach Phase 1B	**Date:**	July 22, 2020
Location:	Eagle Gold Mine	**Contractor:**	Ewing Transport / Layfield
Client:	Victoria Gold Corp.	**Contractor's Rep:**	Marshall Ewing / Chad Messervey
Contact:	Clint Abel	**Contractor's Email:**	
Weather:	Variable (see daily entries)	**Tetra Tech Representative:**	James Buyck
File:	704-ENG.WARC03235-09	**Status:**	Issued for Use

1.0 INTRODUCTION

Tetra Tech Canada Inc. (Tetra Tech) was retained by Victoria Gold Corp. (Victoria Gold) to provide CQA services at the Eagle Gold mine located north of Mayo, Yukon, at Dublin Gulch for the Eagle Gold Heap Leach Phase 1B expansion (Phase 1B). Mr. James Buyck is Tetra Tech's representative on site.

Forte Dynamics (Forte) out of Fort Collins, Colorado provided the design and specification for Phase 1B, and Forte's representative is Clint Green.

Clint Abel, of JDS Energy & Mining, is Victoria Gold's project manager on site at the Eagle Gold mine.

Ewing Transport (Ewing), based out of Mayo, Yukon, is the construction contractor for Phase 1B.

Layfield Environmental Containment (Layfield) has been retained to provide and install the liner for Phase 1B, and their supervisor on site is Chad Messervey.

The following Field Report outlines Tetra Tech's CQA for the period of July 13, 2020, to July 19, 2020.

2.0 DAILY REPORTS

2.1 Highlights

- Rain and some wind delayed liner deployment throughout the week.
- Layfield is placing three panels of GCL for every two panels of 80 mm LLDPE liner.

2.2 July 13, 2020

Weather: sun and cloud. Light breeze throughout the day.

- Layfield continued placement of GCL (17 rolls) and LLDPE liner (6 panels) with no major issues. Some delay early afternoon due to wind.
- Ewing Transport continued regrading and rolling subgrade ahead of liner deployment. As well, continued sub-excavation and hauling from NE slope. Areas of soft and wet subgrade and organics encountered.

Tetra Tech Canada Inc.
61 Wasson Place
Whitehorse, YT Y1A 0H7 CANADA
Tel 867.668.3068 Fax 867.668.4349

2.2 July 13, 2020

Weather: sun and cloud. Light breeze to light wind throughout the day.

- Continued regrading and rolling of subgrade and noted to be acceptable for liner deployment. Sub-excavation continues along the NE slope.
- Deployment of GLC and liner continued with good progress in the morning and delays in the afternoon due to windy conditions.

2.3 July 14, 2020

Weather: sun and cloud. Light breeze to light wind throughout the day.

- Continued deployment of GCL and Liner with detail work and Qc testing performed by Layfield. Ewing Transport continued removal of material and sloping NE section of HLF.

2.4 July 15, 2020

- Weather: Overcast, rain through the morning and early afternoon.
- Layfield suspended work for the day due to rain. Ewing Transport continued sub-excavation along NE slope.
- Layfield QC performed destruct testing (D58 to D62) with Tetra Tech QA present throughout. All results exceeded minimum specification.

2.5 July 16, 2020

- Weather: Mostly clear in the morning and overcast in the afternoon.
- The subgrade immediately ahead of planned deployment for today observed to be minimally affected by yesterday's rainfall. Only minor raking required to repair some localized areas along with additional rolling with the steel drum vibratory compactor.
- Upon Tetra Tech approval of subgrade and trenching ahead completed, deployment of GLC and Liner commenced in the morning immediately. Sub-excavation continues within the NE slope.

2.6 July 17, 2020

- Weather: Overcast with heavy rain starting at 12:30 pm until 2:00 pm. Work limited to detail work later in the day.
- Minor subgrade prep work required and once completed liner deployment approved by Tetra Tech QC and Layfield reps. GCL was placed at the request of the owner rep but was not yet covered by liner once the rain started. The subgrade and GCL will be evaluated prior to commencing further work.
- Ewing Transport did not perform sub-excavation work today to allow the crew relief from their extended work schedule.
- Additional work required by Ewing liner crew to regrade the next section of subgrade affected by the rainfall.
- GCL and LLDPE were deployed in the a.m. but halted around noon due to rain. Detail work commenced for a short period after rain but once again halted for the day due to further rain.
- Air testing, destructs, and non-destructive testing performed with applicable results to be summarized in tomorrows report submission.

2.7 July 18, 2020

- Weather: Sun, some clouds in the a.m. with drizzle starting around 12:30 pm and heavier with lightning from 1:30 p.m. to 2:00 p.m.
- Rainfall yesterday and overnight caused some minor scouring of the subgrade. The section scheduled for deployment was back-bladed with a dozer and compacted with a smooth drum vibratory compactor, as required.
- The exposed GCL was observed not to be adversely affected by the rain. Approval was granted to Layfield to proceed with LLDPE liner deployment.
- Deployment halted due to rain and lightning from 12:30 p.m. to 2:00 p.m. Deployment of LLDPE re-commenced shortly afterward until about 4:00 p.m. The crew then switched to detail work, testing and clean-up.
- Work suspended for the day due to rain around 5:15 p.m.

2.8 July 19, 2020

- Weather: Sun and some clouds in the a.m. with drizzle starting around.
- Layfield recovery day.
- Ewing Transport continues to sub-excavate and place sand along the NE slope.

3.0 GEOSYNTHETIC ROLL NUMBERS PLACED

Table 1 summarizes the daily geosynthetic roll numbers placed on the slope during liner installation. All panel lengths are approximate, and where 45 degree joints are used, panel length is based from the center of the panel.

Table 1: Geosynthetic Roll Numbers Placed on Slope

Date	GCL Roll Number	LLDPE Liner Roll Number	Panel Number (Length)

4.0 TRIAL SEAM

Table 2 summarizes the weekly trial seam results. For fusion, the apparatus settings are temperature and speed, and for extrusion, the apparatus settings are preheat and barrel temperature. Five tests are performed for each criterion.

Table 2: Trial Seam Results

Date	Time	Fusion or Extrusion	Tech	Apparatus #	Temp or Preheat (ºF)	Speed (%) or Barrel Temp (ºF)	$Peel_{inside}$ (100 min)	$Peel_{outside}$ (100 min for Fusion 88 min for Extrusion)	Shear (120 min)	Smooth or Textured

TETRA TECH

WEEKLY FIELD REPORT

ISSUED FOR USE

Project:	Eagle Gold Heap Leach Phase 1B	**Date:**	July 26, 2020
Location:	Eagle Gold Mine	**Contractor:**	Ewing Transport / Layfield
Client:	Victoria Gold Corp.	**Contractor's Rep:**	Marshall Ewing / Chad Messervey
Contact:	Clint Abel	**Contractor's Email:**	
Weather:	Variable (see daily entries)	**Tetra Tech Representative:**	James Buyck
File:	704-ENG.WARC03235-09	**Status:**	Issued for Use

1.0 INTRODUCTION

Tetra Tech Canada Inc. (Tetra Tech) was retained by Victoria Gold Corp. (Victoria Gold) to provide CQA services at the Eagle Gold mine located north of Mayo, Yukon, at Dublin Gulch for the Eagle Gold Heap Leach Phase 1B expansion (Phase 1B). Mr. James Buyck is Tetra Tech's representative on site.

Forte Dynamics (Forte) out of Fort Collins, Colorado provided the design and specification for Phase 1B, and Forte's representative is Clint Green.

Clint Abel, of JDS Energy & Mining, is Victoria Gold's project manager on site at the Eagle Gold mine.

Ewing Transport (Ewing), based out of Mayo, Yukon, is the construction contractor for Phase 1B.

Layfield Environmental Containment (Layfield) has been retained to provide and install the liner for Phase 1B, and their supervisor on site is Chad Messervey.

The following Field Report outlines Tetra Tech's CQA for the period of July 20, 2020, to July 26, 2020.

2.0 DAILY REPORTS

2.1 Highlights

- Rain delayed liner deployment throughout the week.
- Layfield is placing three panels of GCL for every two panels of 80 mm LLDPE liner.

2.2 July 20, 2020

- Weather: cloudy, turning to rain by mid-morning
- Layfield deployed two slope lengths of GCL before work halted by rain.
- Four additional destructive samples were obtained by Layfield with extrusion welded repair completed immediately afterward and just prior to rainfall.
- Ewing halted sub-excavation of NE Slope because of wet and slippery haul road. Continued placement and compaction of fill along the west side of the perimeter road.

2.3 July 21, 2020

- Weather: Sunny in a.m., some cloud and rain in the p.m. L 9°C H 17°C
- The GCL placed yesterday prior to rainfall was evaluated and noted to have localized wetted areas estimated to be about 10 % of the total area placed. Select areas were further investigated by cutting through the GCL. The bentonite was noted to be moistened and 'pasty' with the internal fibres connecting the outer layers still intact. There was no noticeable migration of bentonite through the outer layers. Layfield superintendent (Chad M.) proceeded with placement with QA agreement.
- The area of subgrade planned for today's deployment was evaluated and noted to have only some localized minor scour and instability issues - permission granted to Layfield to proceed with deployment.
- Two slope lengths of GCL and slope length of LLDPE Liner deployed in the a.m. Two slope lengths of GCL and one slope length of LLDPE Liner placed in the p.m.
- Layfield also continued obtaining destructs and performing detail work.
- Ewing focused on placement of fill short-hauled from a nearby source to the West Perimeter Berm, as well, continued installation perforated corrugated pipe along Lateral #3.
- Ewing requested review of the sub-grade of the recently excavated Perimeter East Berm. The area observed to design grade, and with the exception of a few localized soft areas and minor clean-up, the majority of the area appears satisfactory -another review will be completed once clean-up has been finalized.

2.4 July 22, 2020

- Weather: Overcast, with rain by mid-morning L 10°C H 12°C
- Layfield deployed one slope length of LLDPE Liner and GCL until work halted around 10:30 a.m. due to rain.
- Work re-commenced after the rain stopped around 12:30 p.m., and two more slope lengths of GCL and one LLDPE Liner were deployed. Prior to deployment of the LLDPE, the GCL was observed to be wet but not adversely affected by the rain – No signs of 'popcorn' effect through liner, or delamination of the internal connective fibers.
- Ewing continued placement and compaction of fill hauled from nearby source to West Perimeter Berm, and install of perforated corrugated pipe along Lateral #3.
- Anchor trench excavated, but rain around 3:15 p.m. halted further deployment.
- Liner deployment halted for rest of the day at 4:00 p.m.

2.5 July 23, 2020

- Weather: Overcast, L 6°C H 15°C
- Regrading and rolling of subgrade required by Ewing prior to GCL deployment. Layfield commenced GCL deployment immediately afterward, around 9:00 a.m.
- Three slope lengths of GCL placed by 1:00 p.m. Deployment of LLDPE Liner commenced around 1:30 p.m.
- Two slope lengths of GCL and one slope length of LLDPE Liner placed in afternoon. No issues of concerns with deployment noted.
- Filled placement and compaction along the West Perimeter Berm completed for now. The area observed stable with little to no deflection under loaded haul truck traffic.

2.6 July 24, 2020

- Weather: Sunny with some cloud, L 6°C H 16°C
- Subgrade observed to be unchanged and acceptable for deployment. Ewing continued reconditioning subgrade further on in preparation for the next few days of deployment.
- Ewing Transport continued installation of drain at Lateral #3.
- Some delays encountered with deployment of LLDPE Liner due to windy conditions around 1:30 p.m. Layfield progressed with deploying GCL instead.
- Layfield deployed six slope lengths of GLC and one of LLDPE Liner. Four slope lengths remained exposed at the end of the day.

2.7 July 25, 2020

- Weather: Overcast, periods of light rain throughout the a.m. to steady rain in p.m. L 8°C H 14°C
- GCL left exposed from previous day's deployment observed wetted from overnight rain adjacent the last LLDPE Liner deployed. This was mainly due to run-off from the LLDPE. The remaining three slope lengths appeared less affected. Layfield indicated the wetted were not an issue, and no hydration had occurred, as confirmed by QA. It was further observed that 'popcorn' effect had not occurred.
- Subgrade observed to be in acceptable condition for GCL deployment when required.
- Three slope lengths of LLDPE placed by 10:30 p.m., totally covering the GCL. With rain forecast, Layfield moved to detail work, exclusively.
- Ewing continued installation of Lateral #3, sloping within NE Slope, and construction of West Perimeter Berm.

2.8 July 26, 2020

- Weather: Overcast, rainy in the p.m. L 7°C H 12°C
- With rain in the forecast for today, Layfield focused on detail work, exclusively.
- Ewing continued with fill placement and compaction of the West Perimeter Berm.
- Layfield suspended work for the day around 1:00 p.m. due to rain.

3.0 GEOSYNTHETIC ROLL NUMBERS PLACED

Table 1 summarizes the daily geosynthetic roll numbers placed on the slope during liner installation. All panel lengths are approximate, and where 45 degree joints are used, panel length is based from the center of the panel.

Table 1: Geosynthetic Roll Numbers Placed on Slope

Date	GCL Roll Number	LLDPE Liner Roll Number	Panel Number (Length)
Jul 19	-	-	-
Jul 20	0242-347635; 0242-347533, 0242-347613, 0242-347619, 0242-347617, 0242-347629		-

4.0 TRIAL SEAM

Table 2 summarizes the weekly trial seam results. For fusion, the apparatus settings are temperature and speed, and for extrusion, the apparatus settings are preheat and barrel temperature. Five tests are performed for each criterion.

Table 2: Trial Seam Results

WEEKLY FIELD REPORT

ISSUED FOR REVIEW

Project:	Eagle Gold Heap Leach Phase 1B	**Date:**	July 21, 2020
Location:	Eagle Gold Mine	**Contractor:**	Ewing Transport / Layfield
Client:	Victoria Gold Corp.	**Contractor's Rep:**	Marshall Ewing / Chad Messervey
Contact:	Clint Abel	**Contractor's Email:**	
Weather:	Variable (see daily entries)	**Tetra Tech Representative:**	Adam Mickey
File:	704-ENG.WARC03235-09	**Status:**	Issued for Review

This 'Issued for Review' report is provided solely for the purpose of client review and presents our findings and recommendations to date. Our findings and recommendations are provided only through an 'Issued for Use' report, which will be issued subsequent to this review. You should not rely on the interim recommendations made herein. Once our report is issued for use, the 'Issued for Review' document should be either returned to Tetra Tech Canada Inc. (Tetra Tech) or destroyed.

1.0 INTRODUCTION

Tetra Tech Canada Inc. (Tetra Tech) was retained by Victoria Gold Corp. (Victoria Gold) to provide CQA services at the Eagle Gold mine located north of Mayo, Yukon, at Dublin Gulch for the Eagle Gold Heap Leach Phase 1B expansion (Phase 1B). Mr. Adam Mickey, EIT, is Tetra Tech's representative on site.

Forte Dynamics (Forte) out of Fort Collins, Colorado provided the design and specification for Phase 1B, and Forte's representative is Clint Green.

Clint Abel, of JDS Energy & Mining, is Victoria Gold's project manager on site at the Eagle Gold mine.

Ewing Transport (Ewing), based out of Mayo, Yukon, is the construction contractor for Phase 1B.

Layfield Environmental Containment (Layfield) has been retained to provide and install the liner for Phase 1B, and their supervisor on site is Chad Messervey.

The following Field Report outlines Tetra Tech's CQA for the period of June 15, 2020, to June 21, 2020.

2.0 DAILY REPORTS

2.1 Highlights

- Rain delayed liner deployment throughout the week.
- Layfield is placing three panels of GCL for every two panels of 80 mm LLDPE liner.

2.2 July 20, 2020

- Weather: cloudy, turning to rain by mid-morning
- Layfield deployed two slope lengths of GCL before work halted by rain.

Tetra Tech Canada Inc.
61 Wasson Place
Whitehorse, YT Y1A 0H7 CANADA
Tel 867.668.3068 Fax 867.668.4349

- Four additional destructive samples were obtained by Layfield with extrusion welded repair completed immediately afterward and just prior to rainfall.
- Ewing halted sub-excavation of NE Slope because of wet and slippery haul road. Continued placement and compaction of fill along the west side of the perimeter road.

2.3 July 21, 2020

Weather: Sunny in a.m., some cloud in the p.m. L 9°C H 17°C

- The GCL placed yesterday prior to rainfall was evaluated and noted to have localized wetted areas estimated to be about 10 % of the total area placed. Select areas were further investigated by cutting through the GCL. The bentonite was noted to be moistened and 'pasty' with the internal fibres connecting the outer layers still intact. There was no noticeable migration of bentonite through the outer layers. Layfield superintendent (Chad M.) proceeded with placement with QA agreement.
- The area of subgrade planned for today's deployment was evaluated and noted to have only some localized minor scour and instability issues - permission granted to Layfield to proceed with deployment.
- Two slope lengths of GCL and slope length of LLDPE Liner deployed in the a.m. Two slope lengths of GCL and one slope length of LLDPE Liner placed in the p.m.
- Layfield also continued obtaining destructs and performing detail work.
- Ewing focused on placement of fill short-hauled from a nearby source to the West Perimeter Berm, as well, continued installation of perforated corrugated pipe along lateral #3.
- Ewing requested review of the sub-grade of the recently excavated Perimeter East Berm. The area observed to design grade and with the exception of a few localized soft areas and minor clean-up the majority of the area appears satisfactory -another review will be completed once clean-up has been finalized.

3.0 GEOSYNTHETIC ROLL NUMBERS PLACED

Table 1 summarizes the daily geosynthetic roll numbers placed on the slope during liner installation. All panel lengths are approximate and where 45 degree joints are used, panel length is based from the center of the panel.

Table 1: Geosynthetic Roll Numbers Placed on Slope

Date	GCL Roll Number	LLDPE Liner Roll Number	Panel Number (Length)
Jul 19	None	None	-
Jul 20	0242-347635; 0242-347533, 0242-347613, 0242-347619, 0242-347617, 0242-347629		-
Jul 21	502344019, 0242-347558, 347660, 0242-347587, 0242-347599, 0242-347661, 0242-347638, 0242-347585, 0242-347648, 0242-347644, 0242-347645, 0242-347649, 0242-347542, 0242-347643, 0242-347654, 0242-347539, 0242-347541, 0242-347657, 0242-347642,		

Date	GCL Roll Number	LLDPE Liner Roll Number	Panel Number (Length)

4.0 TRIAL SEAM

Table 2 summarizes the weekly trial seam results. For fusion, the apparatus settings are temperature and speed, and for extrusion, the apparatus settings are preheat and barrel temperature. Five tests are performed for each criterion.

Table 2: Trial Seam Results

Date	Time	Fusion or Extrusion	Tech	Apparatus #	Temp or Preheat (°F)	Speed (%) or Barrel Temp (°F)	$Peel_{inside}$ (100 min)	$Peel_{outside}$ (100 min for Fusion 88 min for Extrusion)	Shear (120 min)	Smooth or Textured
Jul 20	8:00	Extrusion	EA	EX-4035	500	495	99 98 97 90 108		154 163 165 158 163	Textured

5.0 NON-DESTRUCTIVE TESTING

Table 3 summarizes the weekly non-destructive pressure testing results.

Table 3: Non-Destructive Testing Results

Date Fused	Date Tested	Time Tested	Seam #	psi Start	psi End	Pass or Fail	Notes

6.0 DESTRUCTIVE TESTING

Table 4 summarizes the weekly destructive testing results. Five tests are performed for each criterion.

Table 4: Destructive Testing Results

Date Fused	Time Fused	Tech	Apparatus	Location (UTM is +/- 4 m)	Sample ID	$Peel_{in}$ (100 min)	$Peel_{out}$ (100 min)	Shear (120 min)	Pass or Fail

Forte Dynamics (Forte) out of Fort Collins, Colorado provided the design and specification for Phase 1B, and Forte's representative is Clint Green.

Clint Abel, of JDS Energy & Mining, is Victoria Gold's project manager on site at the Eagle Gold mine.

Ewing Transport (Ewing), based out of Mayo, Yukon, is the construction contractor for Phase 1B.

Layfield Environmental Containment (Layfield) has been retained to provide and install the liner for Phase 1B, and their supervisor on site is Chad Messervey.

The following Field Report outlines Tetra Tech's CQA for the period of July 27, 2020, to August 2, 2020.

2.0 DAILY REPORTS

2.1 Highlights

- Layfield deployed approximately 2,912.5 m of liner this week, covering an area of approximately 19,805 m^2.
- Soft subgrade conditions caused delays to deployment, causing Layfield to change their deployment plan.

2.2 July 27, 2020

- No work performed today due to rain.

2.3 July 28, 2020

- No work performed today due to rain

Tetra Tech Canada Inc.
61 Wasson Place
Whitehorse, YT Y1A 0H7 CANADA
Tel 867.668.3068 Fax 867.668.4349

2.4 July 29, 2020

- Weather: rain in the morning, turning to cloudy in the afternoon.
- See Figures 1 through 9.
- Layfield began work at 12:00 pm due to rain throughout the morning.
  - Layfield performed detail work on deployed liner and completed all detailing for liner deployed up to July 29.
- Tetra Tech conducted a shift change with Adam Mickey arriving back on site.
- Tetra Tech inspected the E4 lateral trench excavation to conduct a testpit log and organics were found at the base of the trench indicating that the soil between the lateral trench and the perimeter road is not the original subgrade
  - Clint Abel was notified but could not inspect immediately. Ewing is continuing to excavate the E4 lateral.
- The rain caused subgrade damage alongside the deployed liner requiring repair before further liner deployment, as well as the areas for further deployment.
  - The subgrade is too saturated to repair today.
    - Ewing to repair the subgrade during nightshift.
  - 2 m deep erosion trenches are present in the subgrade. Tetra Tech and Clint Abel will inspect and determine the best course of action to repair the subgrade at these locations.
    - Ewing will dig out the erosion trenches and backfill with rockfill in 0.9 m lifts, and compact then cap with sand.

2.5 July 30, 2020

- Weather: sunny with smoke in the air, turning to windy in the afternoon.
- See Figures 10 through 15.
- Tetra Tech and Layfield inspected the subgrade prior to the morning safety meeting.
  - The lower quarter of the slope to Phase 1A is still saturated and soft. Pickups leave ruts up to 200 mm deep in areas. Tetra Tech rejected the subgrade for deployment.
    - Ewing is stripping approximately 200 mm of saturated material off then recompacting.
  - Tetra Tech approved the rest of the subgrade for deployment to begin once Ewing proof rolled the slope with a packer.
  - Ewing continued to prep subgrade at the base of the slope and in advance of liner deployment.
    - Tetra Tech approved the subgrade as Ewing completed subgrade prep.
  - Tetra Tech inspected the subgrade at the base of the slope towards the end of the day.
    - Some soft spots were noted, and Ewing is going to scarify them and let them dry out overnight. If they are still soft in the morning, Ewing will excavate the soft spots and place dry material.
- Layfield is deploying GCL and liner on the approved subgrade while Ewing repairs the lower third of subgrade.

- Layfield deployed seven slope lengths of GCL and four slope lengths of liner.

- Layfield's QC is conducting pressure testing of seams.

2.6 July 31, 2020

- Weather: sunny and smoky with a light wind. Wind speed increased throughout the day.
- See Figures 16 through 35.
- Tetra Tech and Ewing inspected the subgrade at the base of the slope prior to the morning safety meeting.
  - Soft spots in the subgrade were found where the subgrade would move underfoot and/or deflection cracks from the packer.
  - Additional soft spots were found when the loader ran over them, causing depressions up to 50 mm deep.
  - Ewing is excavating out the soft spots with an average cut of 300 mm.
    - Additional cuts were required after the packer ran over the subgrade, and the subgrade was proof rolled with a loaded 30-ton rock truck.
  - Tetra Tech contacted Clint Green regarding the soft and yielding subgrade conditions to determine whether there could be some leeway to ensure that liner deployment is not hindered.
    - Based on the pictures that Tetra Tech provided, the saturated and soft subgrade must be excavated and replaced.
    - Tetra Tech informed Ewing of Clint's decision, and Ewing will continue to work on the subgrade as planned
  - Tetra Tech and Ewing agreed that all areas would be proof rolled with a loaded 30-ton rock truck to confirm that the subgrade is competent and ready for liner deployment.
  - Ewing will backfill the subgrade with sand in 300 mm compacted lifts.
    - Sand is too saturated to be used for backfilling. Ewing is blending subgrade materials and recompacting.
  - Ewing proof rolled the subgrade with a 30-ton rock truck in the presence of Tetra Tech.
    - 90% of the subgrade area was competent as identified by minimal to no deflection beneath rock truck tires.
    - Two soft areas were identified through proof rolling, and Ewing will remedy the soft spots prior to final subgrade sign off.
- Layfield is deploying GCL and Liner on the upper two-thirds of the slope.
  - Layfield placed three slope lengths of GCL, then placed liner.
  - The wind picked up in the afternoon, so Layfield continued to deploy GCL and laid out six more slope lengths of GCL.
- Layfield's QC continued to conduct pressure testing of deployed liner and completed pressure testing on liner seams for liner deployed prior to July 26.
- Layfield is conducting detail work on liner deployed yesterday.

- Four destructive samples were obtained from liner deployed yesterday.

2.7 August 1, 2020

- Weather: Sunny with a light wind, turning to cloudy and windy in the afternoon with a period of rain beginning at 5:00 pm
- See Figures 36 through 45.
- Tetra Tech and Ewing inspected the subgrade below the deployed liner on the lower third of the slope.
  - Soft spots identified on July 31 have been fixed.
  - The subgrade requires work to the north of liner deployed, and Ewing is working on the subgrade today.
  - Spots requiring sand were identified, and Ewing will place sand prior to liner deployment.
- Layfield is placing four slope lengths of liner on the upper two-thirds of the slope where GCL was deployed yesterday.
  - Layfield completed liner installation by first break. After break, Layfield moved to the lower third of the slope to tie in deployed liner to Phase 1A.
- After break, Layfield moved the bag line on deployed liner and moved to the bottom two-thirds of the slope to deploy liner.
  - Ewing's labour crew cleaned up the perimeter of the area and raked contours smooth for the tie in to Phase 1A.
  - Layfield and Ewing cleaned off debris from the GCL from the rainfall prior to rolling out GCL.
  - Layfield began deploying the GCL, using the skid steer to roll it out.
  - Layfield deployed nine slope lengths of GCL, then switched to liner and got six slope lengths of liner out.

2.8 August 2, 2020

- Weather: Sunny and windy.
- See Figures 46 through 54.
- Tetra Tech and Ewing inspected the subgrade on the lower third of the slope.
- Ewing is removing approximately 400 mm of subgrade at an identified soft spot with a D7 dozer.
  - Tetra Tech inspected the subgrade prior to rolling with a packer to confirm that the subgrade was firm.
  - Ewing blended the subgrade for smooth transitions and rolled it with a packer.
  - Tetra Tech inspected the subgrade after rolling and approved the subgrade for deployment.
    - Due to the packer's vibration being broken, some cat tracks were left in the subgrade, but the divots were less than 25 mm in depth.
- Ewing continued to fix soft spots in the subgrade, as identified by Tetra Tech.
- The rain from yesterday evening had minimal impact on the prepared subgrade.

  - Layfield used their skid steer to smooth the slope and add sand to erosion areas.
  - Ewing smoothed the subgrade with the packer.
  - Ewing's labourers raked the subgrade smooth at the tie in to the Phase 1A liner as well as cleaned the liner off.
- Ewing is continuing to prep subgrade on the upper two-thirds of the slope in advance of GCL deployment.
- Layfield is deploying GCL and liner to tie in to the deployed liner on the upper two-thirds of the slope.
  - Six slope lengths of GCL and four slope lengths of liner were deployed.
- Layfield is conducting extrusion detail work and pressure testing of liner seams.
- Layfield and Tetra Tech obtained destructs for liner placed up to 12:00 pm on August 2.
- Layfield moved back to the perimeter road and began deploying GCL on the upper two-thirds of the slope.
  - Six slope lengths of GCL were deployed by the end of the day.

3.0 GEOSYNTHETIC ROLL NUMBERS PLACED

Table 1 summarizes the daily geosynthetic roll numbers placed on the slope during liner installation. All panel lengths are approximate, and where 45 degree joints are used, panel length is based from the center of the panel.

Table 1: Geosynthetic Roll Numbers Placed on Slope

4.0 TRIAL SEAM

Table 2 summarizes the weekly trial seam results. For fusion, the apparatus settings are temperature and speed, and for extrusion, the apparatus settings are preheat and barrel temperature. Five tests are performed for each criterion.

Table 2: Trial Seam Results

TETRA TECH

WEEKLY FIELD REPORT

ISSUED FOR USE

Project:	Eagle Gold Heap Leach Phase 1B	**Date:**	August 9, 2020
Location:	Eagle Gold Mine	**Contractor:**	Ewing Transport / Layfield
Client:	Victoria Gold Corp.	**Contractor's Rep:**	Marshall Ewing / Chad Messervey
Contact:	Clint Abel	**Contractor's Email:**	
Weather:	Variable (see daily entries)	**Tetra Tech Representative:**	Adam Mickey
File:	704-ENG.WARC03235-09	**Status:**	Issued for Use

1.0 INTRODUCTION

Tetra Tech Canada Inc. (Tetra Tech) was retained by Victoria Gold Corp. (Victoria Gold) to provide CQA services at the Eagle Gold mine located north of Mayo, Yukon, at Dublin Gulch for the Eagle Gold Heap Leach Phase 1B expansion (Phase 1B). Mr. Adam Mickey, EIT, is Tetra Tech's representative on site.

Forte Dynamics (Forte) out of Fort Collins, Colorado provided the design and specification for Phase 1B, and Forte's representative is Clint Green.

Clint Abel, of JDS Energy & Mining, is Victoria Gold's project manager on site at the Eagle Gold mine.

Ewing Transport (Ewing), based out of Mayo, Yukon, is the construction contractor for Phase 1B.

Layfield Environmental Containment (Layfield) has been retained to provide and install the liner for Phase 1B, and their supervisor on site is Chad Messervey.

The following Field Report outlines Tetra Tech's CQA for the period of August 3, 2020, to August 9, 2020.

2.0 DAILY REPORTS

2.1 Highlights

- Layfield deployed approximately 5,589 m of liner covering an area of approximately 38,005 m^2.
- Layfield is placing three panels of GCL for every two panels of 80 mm LLDPE liner.

2.2 August 3, 2020

- Sunny and calm, turning to cloudy with periods of rain in the late afternoon.
- See Figures 1 through 4.
- A heavy rainstorm occurred on the evening of August 2. Therefore, Tetra Tech and Ewing inspected the subgrade prior to deployment.
  - No erosion was noted in the subgrade due to the rain.

Tetra Tech Canada Inc.
61 Wasson Place
Whitehorse, YT Y1A 0H7 CANADA
Tel 867.668.3068 Fax 867.668.4349

  - Ewing is going to roll the subgrade with a packer in advance of GCL deployment today.
- Ewing is working on the subgrade at the top of the slope to cover rocky areas with sand.
- Layfield is covering GCL deployed on August 2 with liner.
  - Layfield checked the GCL for hydration and none of the GCL hydrated.
  - Four slope lengths of liner were deployed and fused.
- Layfield moved to the bottom third of the slope and deployed six slope lengths of GCL and four slope lengths of liner.
- Tetra Tech and Layfield's QC conducted destructive testing for all liner deployed up to August 2.
  - All destructive samples passed testing.
- Layfield is conducting pressure testing on liner deployed up to August 2.
- After liner deployment, Layfield finished the day by doing detail extrusion work and tying in to Phase 1A.

2.3 August 4, 2020

- Weather: mostly sunny and calm, turning to mostly cloudy with periods of rain in the afternoon.
- See Figures 5 through 7.
- Tetra Tech inspected the subgrade conditions for today's deployment and approved the subgrade once Ewing rolled one spot with a packer.
- Tetra Tech discussed with Ewing about sanding rocky areas of the subgrade. Ewing is going to sand areas on nightshift that they will not be able to access once deployment begins on the east perimeter road.
- Layfield is continuing to deploy GCL and liner.
  - Layfield deployed five slope lengths of GCL and three slope lengths of liner.
  - Rain in the afternoon did not inhibit liner deployment.
- Layfield conducted extrusion welding detail work on deployed liner.
- Layfield's QC conducted pressure testing of seams on deployed liner.
  - Layfield noted some seams failed requiring re-blocks at intersections.

2.4 August 5, 2020

- Weather: partly cloudy with scattered rain showers in the afternoon.
- See Figures 8 through 15.
- Tetra Tech inspected the subgrade in advance of today's deployment with Ewing.
  - Nightshift did not get subgrade to spec.
  - Ewing is continuing to place sand on rocky areas and compact today.
  - The packer is rolling the subgrade in advance of deployment.

  - Ewing rock picked the subgrade to remove angular rocks greater than 50 mm that could be plucked out of the subgrade.
- Tetra Tech approved the subgrade for deployment after remedial work had been completed.
- Layfield is continuing deployment today.
  - Layfield placed four slope lengths of GCL and three slope lengths of liner.
- Layfield performed detail extrusion work on deployed liner in the afternoon.
- Additional organics were found in the E4 lateral beyond the limits of excavation of the organics found last week. Ewing is going to step the lateral out to see if they get out of the organics.
- Ewing is going to place sand on rocky areas of the slope on nightshift in advance of liner deployment tomorrow.

2.5 August 6, 2020

- Weather: partly cloudy, turning to cloudy and windy in the afternoon with rain beginning at 4:00 pm.
- See Figures 16 through 33.
- Tetra Tech inspected the subgrade for today's deployment.
  - Rocky areas were identified and covered with sand.
  - Ewing continued to roll the subgrade with a packer.
  - Tetra Tech approved the subgrade for today's deployment.
- Ewing is continuing to work on subgrade prep.
- Ewing was digging anchor trench in advance of deployment and reached the header drain trench by the end of the day.
  - Ewing is raking the edge of the anchor trench to remove rocks.
  - Roots were identified along areas of the anchor trench up to 300 mm in depth.
    - No organic soils were identified, and the roots were cut flush with the anchor trench sidewall.
  - Tetra Tech noted rocky areas along the edge of the anchor trench and directed Ewing to place sand in these areas.
- Layfield and Tetra Tech signed off on subgrade acceptance for liner deployed between July 17 and August 5.
- Layfield is performing detail extrusion work on deployed liner.
- Layfield and Tetra Tech obtained destructive samples for testing.
  - Destructive samples are caught up for deployment up to and including August 5.
- Layfield is beginning deployment along the north perimeter road, which is between the header drain trench and the west perimeter road.
  - Layfield changed the direction of deployment and tied in to liner deployed on Aug 5.
  - Layfield is leaving slack at the tie in to allow for contraction of the liner.

- Ewing is backfilling the anchor trench along the west perimeter road as the liner is beginning to pull out.

2.6 August 7, 2020

- Weather: partly cloudy.
- See Figures 34 through 39.
- Rainfall occurred overnight. Tetra Tech inspected the subgrade in the deployment area, and no damage occurred. Tetra Tech approved the subgrade for liner deployment.
- Ewing is continuing to prepare subgrade for deployment.
- Layfield is continuing to deploy GCL and liner.
  - Layfield performed a correction in deployment angle due to curve in north perimeter road.
- Tetra Tech and Layfield performed testing of destructive samples.
  - All samples passed destructive testing.
  - Destructive testing is caught up for all liner deployed up to and including August 5.

2.7 August 8, 2020

- No work performed today due to rain.

2.8 August 9, 2020

- Weather: mostly cloudy with periods of wind, turning to rain at 6:00 pm.
- See Figures 40 through 43.
- Tetra Tech inspected the subgrade for today's deployment.
  - No erosion of the subgrade from the rain.
  - The subgrade may be too saturated for deployment. Layfield will attempt to deploy, and if it is too saturated, will let the liner dry out and move to detail.
    - Subgrade was not too saturated, and Tetra Tech approved the subgrade for deployment.
- Layfield deployed GCL and liner.
  - Layfield deployed eight runs of liner and fused it by the end of the day.

3.0 GEOSYNTHETIC ROLL NUMBERS PLACED

Table 1 summarizes the daily geosynthetic roll numbers placed on the slope during liner installation. All panel lengths are approximate, and where 45 degree joints are used, panel length is based from the center of the panel.

Table 1: Geosynthetic Roll Numbers Placed on Slope

Date	GCL Roll Number	LLDPE Liner Roll Number	Panel Number (Length)

4.0 TRIAL SEAM

Table 2 summarizes the weekly trial seam results. For fusion, the apparatus settings are temperature and speed, and for extrusion, the apparatus settings are preheat and barrel temperature. Five tests are performed for each criterion.

Table 2: Trial Seam Results

TETRA TECH

WEEKLY FIELD REPORT

ISSUED FOR USE

Project:	Eagle Gold Heap Leach Phase 1B	**Date:**	August 16, 2020
Location:	Eagle Gold Mine	**Contractor:**	Ewing Transport / Layfield
Client:	Victoria Gold Corp.	**Contractor's Rep:**	Marshall Ewing / Chad Messervey
Contact:	Clint Abel	**Contractor's Email:**	
Weather:	Variable (see daily entries)	**Tetra Tech Representative:**	Adam Mickey
File:	704-ENG.WARC03235-09	**Status:**	Issued for Use

1.0 INTRODUCTION

Tetra Tech Canada Inc. (Tetra Tech) was retained by Victoria Gold Corp. (Victoria Gold) to provide CQA services at the Eagle Gold mine located north of Mayo, Yukon, at Dublin Gulch for the Eagle Gold Heap Leach Phase 1B expansion (Phase 1B). Mr. Adam Mickey, EIT, is Tetra Tech's representative on site.

Forte Dynamics (Forte) out of Fort Collins, Colorado provided the design and specification for Phase 1B, and Forte's representative is Clint Green.

Clint Abel, of JDS Energy & Mining, is Victoria Gold's project manager on site at the Eagle Gold mine.

Ewing Transport (Ewing), based out of Mayo, Yukon, is the construction contractor for Phase 1B.

Layfield Environmental Containment (Layfield) has been retained to provide and install the liner for Phase 1B, and their supervisor on site is Chad Messervey.

The following Field Report outlines Tetra Tech's CQA for the period of August 10, 2020, to August 16, 2020.

2.0 DAILY REPORTS

2.1 Highlights

- Layfield deployed approximately 2280.9 m of liner covering an area of approximately 15,282 m^2.
- Soft spots in the subgrade associated with the east laterals were found ahead of deployment. Ewing excavated the soft spots and replaced with rock fill to improve the subgrade conditions.
- Layfield is placing three panels of GCL for every two panels of 80 mm LLDPE liner.

2.2 August 10, 2020

- Weather: cloudy, turning to periods of heavy rain in the afternoon.
- See Figures 1 and 2.
- Layfield finished fusion welding seams and completed the work by first break.

Tetra Tech Canada Inc.
61 Wasson Place
Whitehorse, YT Y1A 0H7 CANADA
Tel 867.668.3068 Fax 867.668.4349

- After first break, weather conditions permitted deployment of liner.
  - Tetra Tech inspected the subgrade and found muddy spots as well as erosion of the subgrade from the heavy rain.
    - Tetra Tech deemed the subgrade unacceptable for deployment, requiring time to dry out and repairs.
- Layfield moved to detail extrusion work, vacuum testing, and pressure testing for the rest of the day.

2.3 August 11, 2020

- Weather: mostly sunny.
- See Figures 3 through 6.
- Ewing is repairing subgrade washed out by rain.
  - Ewing completed the repairs at 1:00 pm, and Tetra Tech approved the subgrade for deployment.
- Layfield is performing detail extrusion work, vacuum box testing, and pressure testing of seams.
- After subgrade repairs were completed, Layfield began deploying liner.
  - Layfield deployed three runs of liner.

2.4 August 12, 2020

- Weather: rain in the morning, turning to cloudy with periods of rain in the afternoon.
- Layfield took the morning off due to rain and arrived on site at 12:20 pm to begin work.
- Subgrade conditions are too saturated to deploy liner.
- Layfield is performing detail extrusion work, vacuum box testing, and pressure testing of seams.
  - Layfield qualified the extruders, and then rain began again at 1:00 pm.
  - Layfield left site at 3:00 pm because the periods of rain did not cease.

2.5 August 13, 2020

- Weather: Cloudy and raining, with rain ceasing in the afternoon.
- Ewing is repairing subgrade for deployment.
- Layfield is continuing detail work on deployed liner.
  - Layfield qualified the extruders, and then it began raining.
  - Rain ceased at 1:00 pm, and Layfield began detail work for the rest of the day.
- Tetra Tech and Layfield's QC conducted destructive testing of obtained samples.
  - D155A failed due to peel into the weld. As the sample was obtained from the anchor trench, Layfield will obtain a sample 3 m from the sample location and retest. If the test fails, Layfield will extrude the seam.
    - D155B was obtained 3.0 m down seam from 155A and passed destructive testing. Layfield patched the destruct location and extrusion welded between patches.

2.6 August 14, 2020

- Weather: cloudy with periods of wind.
- See Figures 7 through 14.
- Ewing is repairing subgrade in the northeast corner.
  - Ewing repaired the subgrade along the area prior to deployment by scraping the saturated subgrade and placing sand over rocky areas.
  - Ewing continued to repair the subgrade in the northeast corner throughout the day.
  - Tetra Tech approved the areas for today's deployment.
- Layfield began the day by prepping areas for deployment and continued detail extrusion work, including finishing the tie in to Phase 1A.
  - Layfield deployed three runs of liner prior to 4:00 pm, then bagged off the deployed liner. No further deployment as we're waiting for subgrade to be prepped.
- Layfield continued conducting pressure testing on deployed and detailed liner.
- Layfield obtained destructive samples for testing.

2.7 August 15, 2020

- Weather: mostly cloudy, turning to rain in the later afternoon.
- See Figures 15 through 25.
- Ewing is continuing to prepare subgrade for deployment.
- Tetra Tech approved the subgrade in the northeast corner for deployment.
- Layfield is deploying GCL and liner.
  - Layfield started on the east side of the corner, working towards the deployed liner.
  - Layfield deployed eight runs of liner.
  - Rain shut down deployment at 5:00 pm.

2.8 August 16, 2020

- Weather: cloudy with periods of rain ending at 9:00 am.
- See Figures 26 through 39.
- Ewing is continuing to prepare subgrade in advance of deployment.
  - Tetra Tech noted soft spots along the E4 Lateral.
    - Ewing will excavate out the soft material and replace with rockier material then skim with sand.
  - Tetra Tech inspected the entire subgrade and found many areas that were deficient due to either being soft or yielding when stepped on, organics protruding from the surface, or rocky areas requiring sand cover.

- Soft areas were identified based on cracks left by rolling with a packer, meaning that the ground was deflecting under the weight of the packer.
- Soft areas could also be identified by wheel ruts from pickup traffic.
- Many of the soft spots are associated with the E2, E3, and E4 Lateral Drains.
- After consulting with Clint Green, Tetra Tech informed Ewing that the soft spots would have to be fixed.

- Tetra Tech and Ewing worked together on a cluster of soft spots to determine what remedial works would be required to repair them.
  - Subexcavation of 600 to 700 mm of colluvium, then backfill with rock fill was required to repair the soft spots.
  - Ewing will coat the rock fill with sand prior to deployment.
- Layfield is continuing to fill in the northeast corner with liner.
  - Tetra Tech inspected the subgrade to assess whether yesterday's rain impacted the subgrade. The subgrade was deemed acceptable for deployment.
  - Layfield completed deployment in the northeast corner by 12:30 pm.
  - Layfield finished the day conducting detail work, pressure testing, and cleaning up.

3.0 GEOSYNTHETIC ROLL NUMBERS PLACED

Table 1 summarizes the daily geosynthetic roll numbers placed on the slope during liner installation. All panel lengths are approximate, and where angled joints are used, panel length is based from the center of the panel.

Table 1: Geosynthetic Roll Numbers Placed on Slope

Date	GCL Roll Number	LLDPE Liner Roll Number	Panel Number (Length)
August 10	-	10690-013	P354 (4.7 m)

4.0 TRIAL SEAM

Table 2 summarizes the weekly trial seam results. For fusion, the apparatus settings are temperature and speed, and for extrusion, the apparatus settings are preheat and barrel temperature. Five tests are performed for each criterion.

Table 2: Trial Seam Results

5.0 NON-DESTRUCTIVE TESTING

Table 3 summarizes the weekly non-destructive pressure testing results.

Table 3: Non-Destructive Testing Results

Date Fused	Date Tested	Time Tested	Seam #	psi Start	psi End	Pass or Fail	Notes
Aug 1	Aug 11	11:40	P235-P238 Vertical	40	40	Pass	Top of seam to first patch
Aug 1	Aug 11	14:21	P232-P235 Vertical	40	40	Pass	
Aug 1	Aug 11	11:50	P235-P238 Vertical	40	38	Pass	Between patches
Aug 1	Aug 11	10:17	P235-P238 vertical	40	40	Pass	Second patch to bottom of seam
Aug 3	Aug 11	13:19	P268-P269 Cross	40	39	Pass	
Aug 4	Aug 11	13:00	P276-P277 Cross	40	40	Pass	
Aug 4	Aug 11	13:19	P269-P277 Vertical	40	40	Pass	
Aug 4	Aug 11	13:00	P268-P277 Vertical	40	38	Pass	
Aug 4	Aug 11	13:00	P268-P276 Vertical	40	40	Pass	
Aug 4	Aug 11	13:23	P279-P280 Cross	40	39	Pass	
Aug 4	Aug 11	12:36	P280-P281 Cross	40	40	Pass	
Aug 4	Aug 11	12:36	P277-P281 Vertical	40	40	Pass	
Aug 4	Aug 11	12:35	P277-P280 Vertical	40	40	Pass	
Aug 4	Aug 11	12:55	P276-P280 Vertical	40	40	Pass	
Aug 4	Aug 11	12:55	P283-P284 Cross	40	40	Pass	
Aug 4	Aug 11	13:06	P281-P284 Vertical	40	40	Pass	
Aug 4	Aug 11	12:33	P280-P284 Vertical	40	40	Pass	
Aug 4	Aug 11	12:55	P280-P283 Vertical	40	40	Pass	
Aug 5	Aug 11	13:24	P286-P287 Cross	40	40	Pass	
Aug 5	Aug 11	13:01	P287-P288 Cross	40	39	Pass	
Aug 5	Aug 11	13:00	P284-P288 Vertical	40	39	Pass	
Aug 5	Aug 11	12:53	P283-P287 Vertical	40	40	Pass	
Aug 5	Aug 11	12:20	P291-P292 Cross	40	40	Pass	
Aug 5	Aug 11	13:05	P288-P292 Vertical	40	40	Pass	
Aug 5	Aug 11	12:20	P287-P292 Vertical	40	40	Pass	
Aug 5	Aug 11	12:25	P287-P291 Vertical	40	40	Pass	
Aug 5	Aug 11	12:40	P294-P295 Cross	40	40	Pass	
Aug 5	Aug 11	12:12	P292-P295 Vertical	40	40	Pass	
Aug 5	Aug 11	12:15	P291-P295 Vertical	40	40	Pass	Top of seam to patch
Aug 5	Aug 11	12:25	P291-P295 Vertical	40	40	Pass	Patch to bottom of seam
Aug 6	Aug 11	12:11	P295-P296 Vertical	40	39	Pass	
Aug 6	Aug 11	8:02	P296-P297 Vertical	40	40	Pass	
Aug 6	Aug 11	8:15	P297-P298 Vertical	40	40	Pass	
Aug 6	Aug 11	9:16	P308-P309 Vertical	40	40	Pass	
Aug 6	Aug 11	8:44	P307-P308 Vertical	40	40	Pass	
Aug 6	Aug 11	8:29	P305-P306 Cross	40	40	Pass	
Aug 6	Aug 11	8:41	P306-P307 Vertical	40	40	Pass	
Aug 6	Aug 11	8:52	P304-P306 Vertical	40	40	Pass	Top of seam to patch
Aug 6	Aug 11	8:41	P305-P307 Vertical	40	40	Pass	
Aug 6	Aug 11	8:26	P304-P305 Vertical	40	40	Pass	
Aug 6	Aug 11	8:29	P304-P306 vertical	40	40	Pass	Patch to bottom of seam
Aug 6	Aug 11	8:24	P303-P304 Vertical	40	40	Pass	

Date Fused	Date Tested	Time Tested	Seam #	psi Start	psi End	Pass or Fail	Notes

TETRA TECH

WEEKLY FIELD REPORT

ISSUED FOR USE

Project:	Eagle Gold Heap Leach Phase 1B	**Date:**	August 23, 2020
Location:	Eagle Gold Mine	**Contractor:**	Ewing Transport / Layfield
Client:	Victoria Gold Corp.	**Contractor's Rep:**	Marshall Ewing / Chad Messervey
Contact:	Clint Abel	**Contractor's Email:**	
Weather:	Variable (see daily entries)	**Tetra Tech Representative:**	Adam Mickey
File:	704-ENG.WARC03235-09	**Status:**	Issued for Use

1.0 INTRODUCTION

Tetra Tech Canada Inc. (Tetra Tech) was retained by Victoria Gold Corp. (Victoria Gold) to provide CQA services at the Eagle Gold mine located north of Mayo, Yukon, at Dublin Gulch for the Eagle Gold Heap Leach Phase 1B expansion (Phase 1B). Mr. Adam Mickey, EIT, is Tetra Tech's representative on site.

Forte Dynamics (Forte) out of Fort Collins, Colorado provided the design and specification for Phase 1B, and Forte's representative is Clint Green.

Clint Abel, of JDS Energy & Mining, is Victoria Gold's project manager on site at the Eagle Gold mine.

Ewing Transport (Ewing), based out of Mayo, Yukon, is the construction contractor for Phase 1B.

Layfield Environmental Containment (Layfield) has been retained to provide and install the liner for Phase 1B, and their supervisor on site is Chad Messervey.

The following Field Report outlines Tetra Tech's CQA for the period of August 17, 2020, to August 23, 2020.

2.0 DAILY REPORTS

2.1 Highlights

- Layfield deployed approximately 6,642.3 m of liner, covering an area of approximately 44,503 m^2.
- Rain delayed liner deployment throughout the week.
- Layfield is placing three panels of GCL for every two panels of 80 mm LLDPE liner.

2.2 August 17, 2020

- Weather: cloudy with sunny periods.
- Tetra Tech and Ewing had a meeting with Matthew Mock, Clint Abel, and Forte at 11 am to discuss the soft spot in the subgrade.
  - Over the laterals, permission was given to excavate them till 10 cm of sand remained over the drain rock and then backfill with rock fill.

Tetra Tech Canada Inc.

Whitehorse, YT Y1A 0H7 CANADA
Tel 867.668.3068 Fax 867.668.4349

  - Areas not in conflict with laterals were to be excavated to competent ground and backfill with rock fill and compacted.

- Ewing conducted a test section over the 4E lateral, and subgrade conditions improved once the rockfill had been placed and compacted.
- After the test section, Ewing began working at the northernmost limit of soft spots along the 4E lateral.
  - Water was encountered during digging, and Ewing quickly backfilled to seal the water up.
  - Tetra Tech informed Clint Green and Clint Abel about the issue.
    - Clint Abel and Clint Green agreed that a sub-lateral should be run between 4E and 3E laterals to capture the water.
  - Ewing continued to work on other soft spots in the subgrade.
- Layfield deployed two slope lengths of liner and one slope length of GCL to complete the tie in seam to the panels deployed in a different direction.
- Layfield conducted pressure testing, vacuum box testing, and extrusion detail work on all deployed liner.
- Tetra Tech and Layfield conducted a walk-off of the deployed liner.
  - Five spots for extrusion and numerous placed that required vacuum box testing was identified.
  - 70% of the walk-off was completed by the end of the day, with the rest to be completed on the next workday.
- Tetra Tech and Layfield conducted destructive testing of samples.
  - All samples passed, and destructive testing is caught up to all deployment up to and including August 16 (Panel P402).
- Due to subgrade not being ready for deployment, Layfield will be taking August 18 off.

2.3 August 18, 2020

- No work performed today due to no prepared subgrade.
- Ewing continued to work on subgrade.

2.4 August 19, 2020

- Weather: mostly cloudy.
- Ewing is continuing to work on subgrade in advance of deployment.
  - Ewing is identifying soft spots as they arise and repairing them by excavating the material and replacing it with rock fill.
- Tetra Tech inspected and approved the subgrade in advance of today's deployment.
- Layfield is deploying liner on the prepared subgrade.
  - Layfield deployed nine slope lengths of GCL and four slope lengths of liner by the end of the day.
- Tetra Tech and Layfield's QC finished the walk-off of all liner deployed up to and including August 16 (Panels P92 through P402).

- Some areas require patching and vacuum box testing.
  - All Patching and vacuum box testing was completed by the end of the day.

2.5 August 20, 2020

- Weather: mostly sunny.
- Ewing is continuing to prepare subgrade and excavate soft spots in advance of liner deployment.
  - Soft spots were identified where repairs had been made along the 4E lateral.
    - Clint Abel authorized deployment over the areas.
- Tetra Tech inspected and approved the subgrade in advance of today's deployment.
  - Rocks are continuing to be an issue as they are pulled out of the subgrade by the side by sides. Layfield is picking the larger rocks off the slope as they occur.
- Layfield is continuing to deploy liner.
  - Layfield deployed ten slope runs of GCL and seven slope runs of liner.
  - Layfield had an extruder out on the slope conducting detail work as required.
- Layfield's QC conducted pressure testing of seam as they were ready.
- Tetra Tech and Layfield signed the Certificate of Final Inspection and Acceptance for panels P93 to P402 as well as the Certificate of Inspection of Soil Subgrade Surface for liner panels P295 to P402. All documentation was submitted to Forte, Clint Abel, and Victoria Gold.

2.6 August 21, 2020

- Weather: cloudy with periods of light rain, turning to mostly cloudy in the afternoon.
- Ewing is continuing to prepare subgrade and excavate soft spots in advance of deployment.
  - Deployment is quickly catching up to subgrade preparation.
- Tetra Tech inspected and approved the subgrade in advance of today's deployment.
- Layfield is continuing to deploy liner.
  - Layfield has an extruder at deployment to conduct detail work as required.
  - Layfield deployed three slope lengths of liner by first break. After first break, Layfield could not deploy GCL due to soft spot repairs until 1:00 pm then began at 1:30 pm due to rain. Layfield conducted clean up until they could deploy.
  - Layfield deployed five slope lengths of liner by the end of the day.
- Layfield's QC conducted pressure testing of seams as they were ready.

2.7 August 22, 2020

- Weather: mostly cloudy.
- Ewing is continuing to prepare subgrade in advance of deployment.

  - Small and isolated soft spots still exist in the subgrade, but at Clint Abel's authorization, liner will be deployed over them.

- Tetra Tech inspected and approved the subgrade for today's deployment.
  - Rocks being picked out of the subgrade is continuing to be an ongoing problem. Layfield is picking the rocks in advance of deployment, and Ewing is covering the rocky section as they are identified.
- Layfield is continuing to deploy GCL and liner.
  - Layfield has an extruder at deployment, conducting detail work as required.
  - Layfield deployed five slope runs of liner by 5:00 pm.
  - For the rest of the day, Layfield cleaned up garbage and did miscellaneous tasks.
- Layfield's QC is conducting pressure testing of seams.

2.8 August 23, 2020

- Weather: partly cloudy.
- Ewing is continuing to prepare subgrade in advance of liner deployment.
  - Ewing is sanding rocky areas on the slope.
  - Tetra Tech identified a soft spot requiring repair.
    - Ewing excavated the soft spot and backfilled with rock fill, then coated it with sand.
- Tetra Tech inspected and approved the subgrade for today's deployment.
- Layfield is continuing to deploy liner.
  - Layfield deployed four slope lengths of liner.
    - Layfield finished deploying at 4:30 pm and held off further deployment due to rain in tomorrow's forecast.
  - Rocks in the subgrade are continuing to be an issue.
    - While Ewing is sanding rock fill areas on the slope, the use of side by sides are loosening up the dry subgrade surface and pulling rocks out in areas that have not been sanded.
      - Rocks are being found beneath the GCL, and Layfield is pulling out the rocks larger than 50 mm.
- Layfield's QC conducted pressure testing of fused seams.

3.0 GEOSYNTHETIC ROLL NUMBERS PLACED

Table 1 summarizes the daily geosynthetic roll numbers placed on the slope during liner installation. All panel lengths are approximate, and where angled joints are used, panel length is based from the center of the panel.

Table 1: Geosynthetic Roll Numbers Placed on Slope

Date	GCL Roll Number	LLDPE Liner Roll Number	Panel Number (Length)
August 17	502343993, 502344594 502344654, 502344586 502344653, 502346982 502344675, 502343994 502344020, 502344587 502344605, 502344017 502343605	10699-006 10699-014 10690-030	P403 (37.6 m) P404 (129.4 m) P405 (99.9 m)

4.0 TRIAL SEAM

Table 2 summarizes the weekly trial seam results. For fusion, the apparatus settings are temperature and speed, and for extrusion, the apparatus settings are preheat and barrel temperature. Five tests are performed for each criterion.

Table 2: Trial Seam Results

6.0 DESTRUCTIVE TESTING

Table 4 summarizes the weekly destructive testing results. Five tests are performed for each criterion.

Table 4: Destructive Testing Results

Date Fused	Time Fused	Tech	Apparatus	Location (UTM is +/- 4 m)	Sample ID	$Peel_{in}$ (100 min)	$Peel_{out}$ (100 min)	Shear (120 min)	Pass or Fail
Aug 16	13:19	JC	WW-054	P398-P399 Vertical Bottom of Seam	D161	132 138 139 147 146	143 134 136 146 135	151 159 163 162 150	Pass

StrataGold Corporation, Eagle Gold Project
Project: Victoria Gold
Weekly Report #25
August 30 – September 5, 2020

Site Location: Phase 1B

Hours worked this period: 1,536
Hours total to date: 48,133

Summary:

- Construction
  - Continued constructing the southeastern perimeter berm.
  - Layfield placed liner Sunday on the eastern side of Phase 1B.
  - Finished ditching along the western perimeter access.

Legend:
Red = Trouble
Yellow = Caution
Green = On track

Weather:

- Rained Monday, Tuesday, Friday, and Saturday this week.
- Temperatures: Morning lows of 0 C° with daytime highs of 12 C°

Incidents / Health & Safety:

- Incidents or accidents: No incidents this week.
- Weekly site safety inspection: No inspections this week.
- Weekly safety meeting: Toolbox meeting held every morning in the field to ensure enough room for social distancing.

Incidents to date:

9

Project Milestones:	Responsible:	Completion Date:
Nuway crushing gravel for underdrain construction – Sand was not completed before moving the crusher to Secondary – Sand will now be recovered from wasted material during production of the ODF on Eagle Pup. Nuway screening plant screening oversize material out of the sand.	Nuway / Ewing	Complete
Header Underdrain excavation and installation	Ewing	Complete
Lateral drain excavation and installation – Behind due to the much larger amounts of material requiring removal	Ewing	Complete
Ditching for freshet / Water management	Ewing	Complete
Removal of all grubbing and shaping material for liner placement – Volume of material much larger then estimate	Ewing	Complete
Removal of any unsuitable material – will not affect liner placement schedule	Ewing	May 4th
Surface preparation for liner placement – final surface preparation ahead of liner crew will continue until complete	Ewing	July 22nd
Liner placement – All material has been delivered to site – Started June 2nd and should be close to completion August 30th	Layfield / Ewing	Aug 30th

Construction:
Activities This Week:

- Continued constructing the southeastern perimeter berm when possible this week due to rain.
- Layfield was only able to placed liner on Sunday this week. The crew was given a few days off site because of continual rain forecasted for the week. Layfield traveled to Whitehorse Tuesday morning and return to site Friday. No deployment on Saturday due to additional rain.
- The Ewing Liner Support crew left site on Monday and returned to site Friday.
- Ewing finished excavating the western perimeter access ditch.

Activities Planned for Next Week:

- Remove any unsuitable material if encounter on the eastern side of Phase 1B.
- Finished constructing the southeastern perimeter burn along Phase 1A &B.
- Place sand where necessary ahead of the liner crew and remove mud whenever required.
- Continue advancing the liner deployment to the east along the interceptor ditch.
- Continue excavating anchor trench as required for liner placement.
- Backfill and compact anchor trench behind completed section of liner placement.

HSE Safety Report:

	PERIOD TO	MONTH TO DATE	YEAR TO DATE	
Total Hours	1,536	1,014	48,133	
Incidents (Non-injury)	0	1	6	
First Aid Injuries	0	0	3	
Medical Aid Injuries	0	0	0	
Loss Time Injuries (LTI)	0	0	0	
Recordable Incident	0	0	2	

Phase 1B Liner Placement:

	GCL	LLDPE 80	
Total Placed	244,430	237,649	482,079
Total Area	266,680	266,680	533,360
Remaining	22,250	29,031	51,281
Percent Complete	90%		
Updated	September 7, 2020		

Production:

Material	Month Total (September 2020)	Total to Date
Shaping (Common)/ Grubbing	0 m^3	256,298 m^3
Re-handle Material	0 m^3	784 m^3
20mm Drain rock	0 m^3	3,906 m^3
Sand	0 m^3	16,814 m^3
Pit Run	0 m^3	9,926 m^3
Blast Rock Backfill	4,886 m^3	28,000 m^3
Blast Rock / Rip Rap to HLF/ Road Repairs	0 m^3	854 m^3
Total Material	4,886 m^3	316,582 m^3

TETRA TECH

WEEKLY FIELD REPORT

ISSUED FOR REVIEW

Project:	Eagle Gold Heap Leach Phase 1B	**Date:**	September 13, 2020
Location:	Eagle Gold Mine	**Contractor:**	Ewing Transport / Layfield
Client:	Victoria Gold Corp.	**Contractor's Rep:**	Marshall Ewing / Chad Messervey
Contact:	Clint Abel	**Contractor's Email:**	
Weather:	Variable (see daily entries)	**Tetra Tech Representative:**	Adam Mickey
File:	704-ENG.WARC03235-09	**Status:**	Issued for Review

This 'Issued for Review' report is provided solely for the purpose of client review and presents our findings and recommendations to date. Our findings and recommendations are provided only through an 'Issued for Use' report, which will be issued subsequent to this review. You should not rely on the interim recommendations made herein. Once our report is issued for use, the 'Issued for Review' document should be either returned to Tetra Tech Canada Inc. (Tetra Tech) or destroyed.

1.0 INTRODUCTION

Tetra Tech Canada Inc. (Tetra Tech) was retained by Victoria Gold Corp. (Victoria Gold) to provide CQA services at the Eagle Gold mine located north of Mayo, Yukon, at Dublin Gulch for the Eagle Gold Heap Leach Phase 1B expansion (Phase 1B). Mr. Adam Mickey, EIT, is Tetra Tech's representative on site.

Forte Dynamics (Forte) out of Fort Collins, Colorado provided the design and specification for Phase 1B, and Forte's representative is Clint Green.

Clint Abel, of JDS Energy & Mining, is Victoria Gold's project manager on site at the Eagle Gold mine.

Ewing Transport (Ewing), based out of Mayo, Yukon, is the construction contractor for Phase 1B.

Layfield Environmental Containment (Layfield) has been retained to provide and install the liner for Phase 1B, and their supervisor on site is Chad Messervey.

The following Field Report outlines Tetra Tech's CQA for the period of September 7, 2020, to September 13, 2020.

2.0 DAILY REPORTS

2.1 Highlights

- Rain delayed liner deployment throughout the week.
- Layfield is placing three panels of GCL for every two panels of 80 mm LLDPE liner.

2.2 September 7, 2020

- Weather: cloudy and windy with periods of rain, turning to cloudy at 10:00 am.
- Ewing in continuing to prepare subgrade in advance of deployment.

Tetra Tech Canada Inc.
61 Wasson Place
Whitehorse, YT Y1A 0H7 CANADA
Tel 867.668.3068 Fax 867.668.4349

- Rain in the morning halted subgrade preparation.
    - Ewing is waiting for the subgrade to dry prior to continuing preparation.
        - Tetra Tech and Ewing inspected the subgrade at 12:00 pm. The subgrade is too saturated to get the packer on it and prepare more subgrade.
- Ewing was able to begin prepping subgrade around 3:00 pm. Soft spots were found, and they were excavated out, filled with rock fill, and compacted and covered with sand.

- Tetra Tech inspected and approved the subgrade for today's deployment.
- Layfield is continuing to deploy liner.
    - Rain delayed deployment at 7:45 am till 8:30 am.
    - Layfield deployed and fused two slope runs of liner by 1:30 pm. As there was no prepared subgrade, Layfield moved over to conducting detail work.
- Tetra Tech and Layfield conducted destructive testing on samples obtained from the liner.
    - All destructive testing is caught up for all liner deployed up to and including August 30.
    - The P526-P529 vertical seam destructive sample failed testing due to excessive peel into the weld. Layfield will obtain a new sample 3 m down seam from the original test location.
    - The P500-P532 tie in seam marginally passed testing. Tetra Tech requested that Layfield extrusion weld the seam, but no further destructive testing is required.

2.3 September 8, 2020

- Weather: cloudy.
- Ewing is continuing to prepare subgrade for deployment.
    - Tetra Tech and Ewing identified soft spots requiring subex and replacement with rock fill.
        - Ewing worked on the soft spots throughout the day.
- Layfield is continuing to deploy liner.
    - Layfield deployed four slope runs of liner by 4:00 pm.
    - Layfield could not deploy any more liner as there was no more prepared subgrade to deploy on.

2.4 September 9, 2020

- Weather: partly cloudy.
- Ewing is continuing to prepare subgrade for deployment.
    - Nightshift removed excess subgrade soils from the slope, but also dug up the E3 lateral, which had to be repaired.
    - Soft spots are continuing to be excavated and repaired as identified.
    - Tetra Tech identified soft spots at the toe of the slope where 1B meets 1A. Tetra Tech worked with Ewing to remove the soft soil to ready the area for deployment.

- Layfield is continuing to deploy liner.
  - Layfield deployed four slope runs of liner and two additional GCL beyond the deployed liner by the end of the day.

2.5 September 10, 2020

- Weather: sunny, turning to cloudy with a period of rain in the afternoon.
- Ewing is continuing to prepare subgrade in advance of deployment.
  - Heavy rainfall from yesterday evening saturated the subgrade too much to compact it.
    - Ewing is attempting to repair the subgrade to allow for deployment.
  - Tetra Tech informed Ewing that the subgrade at the toe of the slope would have to be excavated due to soft conditions. No fill is required, the soft subgrade can be excavated and reshaped.
- Tetra Tech inspected the subgrade first thing and determined that it was too saturated to deploy.
  - Tetra Tech inspected the subgrade at 12:00 pm and authorized deployment of GCL.
- Layfield is continuing to deploy liner.
  - Layfield deployed one slope length of liner, and then had to wait to continue deployment until the subgrade was prepared.
  - Layfield was authorized to deploy liner at 12:00 pm.
  - Layfield deployed three slope runs of liner by 4:00 pm and finished the day by continuing to deploy GCL. Only two slope runs of GCL could be deployed before they were out of prepared subgrade to deploy on.
- After laying the first slope run of liner, Tetra Tech and Layfield walked off all of the deployed liner laid from last walk off to August 30.

2.6 September 11, 2020

- Weather: partly cloudy.
- Ewing is continuing to prepare subgrade in advance of deployment.
  - The skid steer is covering any rocky areas with sand.
  - The packer is rolling the subgrade.
  - By the end of the day, all sloping of the subgrade was complete, and the remainder of work required is rolling the subgrade with a packer and sanding rocky areas.
- Tetra Tech inspected and approved the prepared subgrade for today's deployment.
  - Tetra Tech had to inspect and approve the subgrade as it was prepared.
- Layfield is continuing to deploy liner.
  - Layfield deployed two slope runs of liner.
  - Due to wind in the afternoon, Layfield continued to deploy GCL for the rest of the day.

- Layfield began working down the perimeter road from Phase 1B perimeter road to the Phase 1A perimeter road.
- Layfield's QC conducted pressure testing of deployed liner seams.

2.7 September 12, 2020

- Weather: mostly sunny.
- Ewing is continuing to perform finish work on the subgrade.
  - The skid steer is sanding rocky areas and removing soft spots at the toe of the slope.
  - The packer is packing rough areas and sanded areas.
- Tetra Tech inspected and approved the subgrade for deployment.
  - Soft spots were identified at the toe of the slope, which the skid steer removed.
- Layfield is continuing to deploy liner.
  - Below freezing temperatures last night resulted in frost on the liner. Layfield could not deploy liner due to slippery conditions, so began the day by deploying GCL.
  - Once the liner had warmed up, Layfield began deploying liner overtop of the GCL.
  - Layfield deployed four slope runs of liner and finished the day by deploying one slope run of GCL.
- Layfield conducted pressure testing of fused seams.
- ODF placement damaged the signed off liner on nightshift, so Layfield had to send an extrusion team to repair it in the afternoon.

2.8 September 13, 2020

- Weather: sunny, turning to partly cloudy in the afternoon.
- Ewing is continuing to perform finish work on the subgrade in advance of liner deployment.
- Tetra Tech inspected and approved the subgrade for deployment as required.
- Layfield is continuing to deploy liner.
  - Layfield deployed seven slope runs of liner.
  - One small corner remains to be covered. Deployment will be complete tomorrow.
- Tetra Tech and Layfield's QC conducted destructive testing of deployed liner samples.
  - One sample failed due to peel into the weld. The samples was DxxxA of panels Pxxx-Pxxx.
    - Tetra Tech was informed that this seam had been extrusion welded, so to confirm, a destructive sample was obtained from panels Pxxx-Pxxx for testing.

3.0 GEOSYNTHETIC ROLL NUMBERS PLACED

Table 1 summarizes the daily geosynthetic roll numbers placed on the slope during liner installation. All panel lengths are approximate, and where angled joints are used, panel length is based from the center of the panel.

Table 1: Geosynthetic Roll Numbers Placed on Slope

Date	GCL Roll Number	LLDPE Liner Roll Number	Panel Number (Length)
September 7	0242-347713, 0242-347551 502343944, 502343914 502343912, 502343922 502343923, 502343916 502343917, 502343915	10697-025 10697-026 10697-031 10697-034 10697-008	P547 (19.8 m) P548 (128.0 m) P549 (63.0 m), P550 (60.9 m) P551 (127.3 m) P552 (21.5 m)

StrataGold Corporation, Eagle Gold Project
Project: Victoria Gold
Weekly Report #27
September 13-19, 2020

Site Location: Phase 1B

Hours worked this period: 768
Hours total to date: 51,336

Summary:

- Construction
  - Layfield completed liner placement in Phase 1B this week.
  - Completed backfilling the liner anchor.
  - Placed ODF at the toe of the northwestern perimeter berm.

Legend:
Red = Trouble
Yellow = Caution
Green = On track

Weather:

- No rain delays to finish off liner placement
- Temperatures: Morning lows of -3 C° with daytime highs of 9C°

Incidents / Health & Safety:

- Incidents or accidents: No incidents this week.
- Weekly site safety inspection: No inspections this week.
- Weekly safety meeting: Toolbox meeting held every morning.

Incidents to date:

9

Project Milestones:	**Responsible:**	**Completion Date:**
Nuway crushing gravel for underdrain construction – Sand was not completed before moving the crusher to Secondary – Sand will now be recovered from wasted material during production of the ODF on Eagle Pup. Nuway screening plant screening oversize material out of the sand.	Nuway / Ewing	Complete
Header Underdrain excavation and installation	Ewing	Complete
Lateral drain excavation and installation – Behind due to the much larger amounts of material requiring removal	Ewing	Complete
Ditching for freshet / Water management	Ewing	Complete
Removal of all grubbing and shaping material for liner placement – Volume of material much larger then estimate	Ewing	Complete
Removal of any unsuitable material – will not affect liner placement schedule	Ewing	Complete
Surface preparation for liner placement – final surface preparation ahead of liner crew will continue until complete	Ewing	Complete
Liner placement – All material has been delivered to site – Started June 2nd and should be close to completion August 30th	Layfield / Ewing	Complete

Construction:
Activities This Week:

- Layfield finished placing liner September 14th before lunch and completed final walk through with Tetra Tech.
- Ewing finished backfilling the anchor trench on September 16th.
- Ewing placed ODF from Phase 3 along the toe of the northwestern perimeter berm on Wednesday and Thursday afternoon when temperatures were warmer. This was placed to stop the liner from trampolining during temperatures change.

Planned Activities:

- Complete final grading on the southeastern perimeter berm for CV65-1 & CV65-2 when final grades are received.
- Upgrade eastern access to install new conveyors.

HSE Safety Report:

	PERIOD TO	MONTH TO DATE	YEAR TO DATE	
Total Hours	768	4,217	51,336	
Incidents (Non-injury)	0	1	6	
First Aid Injuries	0	0	3	
Medical Aid Injuries	0	0	0	
Loss Time Injuries (LTI)	0	0	0	
Recordable Incident	0	0	2	

Phase 1B Liner Placement:

	GCL	LLDPE 80	
Total Placed	274,203	271,965	546,168
Total Area	266,680	266,680	533,360
Remaining	- 7,523	- 5,285	- 12,808
Percent Complete	102.4%		
Complete	September 14, 2020		

Final as-built surface excluding anchor trench: 265,327 m^2

Production:

Material	Month Total (September 2020)	Total to Date
Shaping (Common)/ Grubbing	1,638 m^3	257,936m^3
Re-handle Material	0 m^3	784 m^3
20mm Drain rock	28 m^3	3,934 m^3
Sand	378 m^3	17,192 m^3
Pit Run	0 m^3	9,926 m^3
Blast Rock Backfill	6,958 m^3	30,072 m^3
Blast Rock / Rip Rap to HLF/ Road Repairs	0 m^3	854 m^3
Total Material	9,002 m^3	320,698 m^3

TETRA TECH

WEEKLY FIELD REPORT

ISSUED FOR REVIEW

Project:	Eagle Gold Heap Leach Phase 1B	**Date:**	September 17, 2020
Location:	Eagle Gold Mine	**Contractor:**	Ewing Transport / Layfield
Client:	Victoria Gold Corp.	**Contractor's Rep:**	Marshall Ewing / Chad Messervey
Contact:	Clint Abel	**Contractor's Email:**	
Weather:	Variable (see daily entries)	**Tetra Tech Representative:**	Adam Mickey
File:	704-ENG.WARC03235-09	**Status:**	Issued for Review

This 'Issued for Review' report is provided solely for the purpose of client review and presents our findings and recommendations to date. Our findings and recommendations are provided only through an 'Issued for Use' report, which will be issued subsequent to this review. You should not rely on the interim recommendations made herein. Once our report is issued for use, the 'Issued for Review' document should be either returned to Tetra Tech Canada Inc. (Tetra Tech) or destroyed.

1.0 INTRODUCTION

Tetra Tech Canada Inc. (Tetra Tech) was retained by Victoria Gold Corp. (Victoria Gold) to provide CQA services at the Eagle Gold mine located north of Mayo, Yukon, at Dublin Gulch for the Eagle Gold Heap Leach Phase 1B expansion (Phase 1B). Mr. Adam Mickey, EIT, is Tetra Tech's representative on site.

Forte Dynamics (Forte) out of Fort Collins, Colorado provided the design and specification for Phase 1B, and Forte's representative is Clint Green.

Clint Abel, of JDS Energy & Mining, is Victoria Gold's project manager on site at the Eagle Gold mine.

Ewing Transport (Ewing), based out of Mayo, Yukon, is the construction contractor for Phase 1B.

Layfield Environmental Containment (Layfield) has been retained to provide and install the liner for Phase 1B, and their supervisor on site is Chad Messervey.

The following Field Report outlines Tetra Tech's CQA for the period of September 14, 2020, to September 17, 2020.

2.0 DAILY REPORTS

2.1 Highlights

- Rain delayed liner deployment throughout the week.
- Layfield is placing three panels of GCL for every two panels of 80 mm LLDPE liner.

2.2 September 14, 2020

- Weather: cloudy.

Tetra Tech Canada Inc.
61 Wasson Place
Whitehorse, YT Y1A 0H7 CANADA
Tel 867.668.3068 Fax 867.668.4349

- Ewing finished preparing the subgrade is the southeast corner to tie Phase 1B into Phase 1A at the anchor trench.
- Layfield deployed four slope runs of liner and finished all deployment for Phase 1B.
- After liner deployment, Layfield put three extrusion teams out on the slope to detail all remaining deployed liner as well as to tie Phase 1B into Phase 1A at the Phase 1A anchor trench.
- Layfield and Tetra Tech obtained the remaining destructive samples from the deployed liner and conducted destructive testing.
  - All samples passed destructive testing, including D151B.
- Layfield's QC conducted pressure testing of deployed liner seams.
- Ewing labourers are cleaning up all the garbage around Phase 1B.

2.3 September 15, 2020

- Weather: cloudy.
- Layfield completed all detail work for Phase 1B, including extrusion welding, pressure testing, and vacuum boxing.
- Tetra Tech and Layfield walked-off the liner deployed since the last walk-off. Seven vacuum testes were missed.
  - After the vacuum testing was completed, Tetra Tech signed the final Certificate of Acceptance for both the liner and subgrade.

3.0 GEOSYNTHETIC ROLL NUMBERS PLACED

Table 1 summarizes the daily geosynthetic roll numbers placed on the slope during liner installation. All panel lengths are approximate, and where angled joints are used, panel length is based from the center of the panel.

Table 1: Geosynthetic Roll Numbers Placed on Slope

Date	GCL Roll Number	LLDPE Liner Roll Number	Panel Number (Length)
September 14	502343546, 502343586 502343585, 502343662 502343691	10698-006 10698-013	P615 (17.2 m) P616 (30.3 m), P617 (30.1 m), P618 (29.1 m), P619 (3.6 m)

4.0 TRIAL SEAM

Table 2 summarizes the weekly trial seam results. For fusion, the apparatus settings are temperature and speed, and for extrusion, the apparatus settings are preheat and barrel temperature. Five tests are performed for each criterion.

Table 2: Trial Seam Results

Date	Time	Fusion or Extrusion	Tech	Apparatus #	Temp or Preheat (ºF)	Speed (%) or Barrel Temp (ºF)	$Peel_{inside}$ (100 min)	$Peel_{outside}$ (100 min for Fusion 88 min for Extrusion)	Shear (120 min)	Smooth or Textured

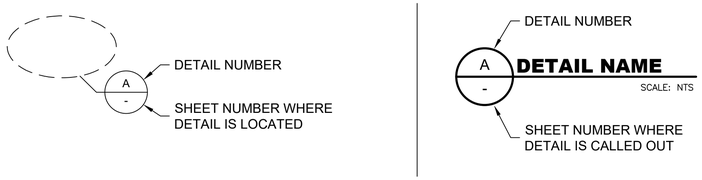
GENERAL NOTES:



UNLESS OTHERWISE INDICATED ON THE DRAWINGS, THE FOLLOWING GENERAL NOTES SHALL APPLY:

1. ALL COORDINATES AND ELEVATIONS ARE SHOWN IN METRES, UNLESS NOTED OTHERWISE. COORDINATES AND TOPOGRAPHY ARE IN NAD83 (CSRS) UTM ZONE 8N COORDINATE SYSTEM. SURVEY PROVIDED BY UNDERHILL GEOMATICS LTD.
2. THESE DRAWINGS ARE TO BE READ IN CONJUNCTION WITH ACCOMPANYING DRAWINGS AND SPECIFICATIONS. THE CONTRACTOR SHALL IMMEDIATELY NOTIFY THE ENGINEER SHOULD UNCERTAINTIES ARISE WITH THE DRAWINGS, SCOPE, AND/OR TECHNICAL SPECIFICATIONS.
3. UNLESS FORTE DYNAMICS AGREES OTHERWISE IN WRITING, THIS DRAWING SHALL NOT BE MODIFIED OR USED FOR ANY PURPOSE OTHER THAN THE PURPOSE FOR WHICH FORTE GENERATED IT. FORTE SHALL HAVE NO LIABILITY FOR ANY DAMAGES OR LOSS ARISING IN ANY WAY FROM ANY USE OR MODIFICATION OF THIS DOCUMENT NOT AUTHORIZED BY FORTE. ANY USE OF OR RELIANCE UPON THIS DOCUMENT OR ITS CONTENT BY THIRD PARTIES SHALL BE AT SUCH THIRD PARTIES' SOLE RISK
4. SURFICIAL GEOLOGY PROVIDED BY BGC.
5. ALL DIMENSIONS, STATIONING, AND SCALES ARE SI METRIC SYSTEM.
6. SITE INVESTIGATION BOREHOLES, TEST PITS, AND SEISMIC LINE LOCATIONS SHOWN ON THESE DRAWINGS ARE THE BASIS FOR INTERPRETATION OF SUBSURFACE CONDITIONS FOR DESIGN. SEE APPENDIX A - SUPPORTING INFORMATION OF THE REPORT TITLED: "EAGLE GOLD PROJECT - HEAP LEACH FACILITY DETAILED DESIGN - FINAL" DATED JANUARY, 2018. SUBSURFACE CONDITIONS MAY VARY BETWEEN THE SITE INVESTIGATION LOCATIONS DURING CONSTRUCTION. THE CONTRACTOR SHALL BE RESPONSIBLE FOR VERIFICATION OF ACTUAL SUBSURFACE CONDITIONS FOR CONSTRUCTION, AS WELL AS ANY CHANGES IN DESIGN GROUND LINES VERSUS EXISTING GROUND LINES BASED ON 2 METRE CONTOUR INTERVAL TOPOGRAPHY.
7. TOPOGRAPHY FOR MINE FACILITY AND PROCESS PLANT LAYOUTS PROVIDED BY HATCH'S DESIGN.
8. ROAD SURFACES TO BE SLOPED AND GRADED TO DRAIN. CULVERTS TO BE INSTALLED AS REQUIRED TO PREVENT PONDING.
9. FINAL DESIGN OF SITE-WIDE ACCESS ROADS BY OTHERS, OTHER THAN THAT SHOWN HEREIN.
10. FINAL DESIGN OF THE PROCESS PLANT, CONVEYORS AND RELATED FACILITIES BY OTHERS. ELECTRICAL UTILITIES DESIGNED BY OTHERS.
11. ALL FOUNDATIONS AND OTHER EXCAVATIONS SHALL BE INSPECTED BY THE OWNER'S ENGINEER PRIOR TO FILL PLACEMENT.
12. ALL DRILL HOLES SHALL BE PLUGGED WITH CEMENT OR BENTONITE (WITHIN LIMITS OF AFFECTED AREA).
13. PHASE 2 AND 3 FACILITY LAYOUT IS PRELIMINARY AND CONSTRUCTION OF PHASE 2 AND 3 FACILITY IS NOT IN CONTRACT.

FILL TYPES FOR CONSTRUCTION

MATERIAL No.	FILL MATERIAL NAME	FILL DESCRIPTION	MOISTURE CONDITIONING	LOOSE LIFT THICKNESS	COMPACTION EFFORT	HATCH
1	SITE GRADING FILL	SITE GRADING SOILS FROM REQUIRED EXCAVATIONS AND CUT/FILL ACTIVITIES	2% +/- OF OPTIMUM	300 mm MAX.	95% OF ASTM D698 COMPACTION	
2	SELECT FILL	FINE GRAINED MATERIALS FOR LINER BEDDING	-2% + 1% OF OPTIMUM	150 mm MAX.	95% OF ASTM D698 COMPACTION	
4	OVERLINER DRAIN FILL (ODF)	CLEAN GRAVEL MATERIALS FOR HLF LINER COVER, PLS AND LDRS SUMPS	NONE	FILL NOTE 1	NONE REQUIRED	
5	SELECT DRAIN FILL	CLEAN GRAVEL MATERIAL FOR UNDERDRAIN PIPES	NONE	AS REQUIRED	NONE REQUIRED	
7	COMPACTED ROCKFILL	HIGH STRENGTH ROCK MATERIALS	AS REQUIRED	FILL NOTE 2	LARGE SCALE TEST FILL REQUIRED (FILL NOTE 2)	
8	ANCHOR TRENCH BACKFILL	SITE GRADING FILL MATERIAL FOR USE IN LINER ANCHOR TRENCHES	AS REQUIRED	150 mm	85% OF ASTM D698 COMPACTION	
9	ROAD WEARING COARSE	WELL GRADED SANDY GRAVEL	AS REQUIRED	150 mm	95% OF ASTM D698 COMPACTION	
11	ORE	CRUSHED ORE MATERIAL FOR HEAP LEACHING	N/A	N/A	N/A	

FILL NOTES:

1) OVERLINER DRAIN FILL TO BE PLACED IN A SINGLE LOOSE LIFT OF 0.6 m (MINIMUM) ON THE UPPER PAD AREAS.
2) COMPACTED ROCKFILL THICKNESS AND COMPACTION DEPENDING ON AVAILABLE MATERIALS AND RESULTS OF LARGE SCALE TEST FILLS CONDUCTED BY THE ENGINEER DURING CONSTRUCTION, AS REQUIRED BY THE SPECIFICATIONS.
3) FILL TYPES 3, 6, & 10 INTENTIONALLY OMITTED.

REV 0	6 JAN 2020	Issued for Construction	W. Reinhardt	C. Green

1. SCOPE AND REQUIREMENTS

1.1 Definition of Terms

"Owner" is defined as an authorized representative of Victoria Gold Corporation.

"Engineer" is defined as a representative appointed and authorized by the Owner. The Engineer shall be a registered professional engineer or a designated site representative under the supervision of a registered professional engineer.

"Contractor" is defined as the party which has executed a contract agreement with the Owner for the specified Work.

"Technical Specifications" is defined as this document, prepared by Forte Dynamics Inc. (Forte) and all supplemental addenda.

"Drawings" are defined as the Drawings, in conjunction with these Technical Specifications, entitled "Victoria Eagle Gold, Heap Leach Pad Facility Phase 1B, Final Design" prepared by Forte and dated January 2019.

"Work" is defined as the entire completed construction or the various separately identifiable parts thereof, required to be furnished under the Contract Documents.

"Site" is defined as the project area where the Work is to be performed.

"Contract Documents" are defined as the Agreement, Addenda, Contractor's Bid (when attached as an Exhibit to the Agreement), Bonds, General Conditions, Special Conditions, Technical Specifications, Drawings and all modifications issued after execution of the Agreement.

"Modifications" are defined as changes made to the Technical Specifications or the Drawings that are approved by the Owner and Engineer in writing after the Technical Specifications and Drawings have been finalized.

1.2 Work Scope

The work scope of these Technical Specifications is to set out the requirements and procedures necessary to complete the construction of earthwork, geosynthetics and pipework for the Eagle Gold Heap Leach Facility (HLF). Any alternatives or exceptions to these specifications shall be submitted in writing to the Owner and shall require approval in writing from the Owner prior to implementation of the Work.

The work scope generally includes the following: site preparation, fill placement, geosynthetics installation and pipework installation. The process solution pumps and facilities, ore delivery and heap stacking equipment and their associated structures are not part of these Technical Specifications. Specific features of the work scope include, but are not limited to the following:

a. Mobilization/demobilization of all equipment and material required for the work
b. Installation of temporary and permanent diversions for surface water control
c. Clearing, grubbing and stripping in required areas (Potential Self-Perform)
d. Excavation in required areas
e. Development of borrow areas within and outside the HLF limits (Potential Self-Perform)
f. Construction of temporary and permanent access roads (Potential Self-Perform)
g. Foundation preparation for site grading fill and liner placement
h. Underdrain system (Potential Self-Perform)
i. Fill placement and compaction
j. Installation of geosynthetic materials for liner, drainage and leak detection systems
k. Installation of leach pad gravity flow drain pipework (solution collection piping)
l. Placement of overliner drain fill
m. Installation of required instrumentation
n. Furnishing and installing all materials and constructing all items appurtenant and incidental to the above.

The Owner may wish to supply and or install any or all work described above, to the specifications provided including required QA/QC testing.

The construction plans and the quality of the constructed leach pad and collection ponds are important aspects of this project. All earthwork and geosynthetic construction Quality Assurance/Quality Control (QA/QC) test locations and results shall be summarized in an as-built report, a copy of which shall be kept in the Owner's files at the completion of each phase of the HLF.

1.3 General Technical Requirements

The general technical requirements specified herein shall apply to all activities and operations relating to carrying out the Work or as required by the Engineer or the Owner.

In the event of a contradiction in the Technical Specifications and Drawings, the Contractor shall refer all questions to the Engineer for final decision. Work that concerns the contradiction shall not be performed until the contradiction is remedied or explained by the Engineer. In all events, the decision of the Engineer is final.

1.4 Submittals

Any alternatives or exceptions to these Technical Specifications shall be submitted in writing with the Contractor's bid.

The Contractor shall provide the Owner and Engineer with the procedures and equipment to be used for surveying and construction and the material specifications. This is required for review and approval prior to the Work being allowed to commence and the materials brought to the Site.

1.5 Mobilization and Demobilization

1.5.1 Mobilization

The Contractor shall mobilize to the Site sufficient labor, materials and equipment to allow commencement of the Work. The Contractor shall bring onto the Site, as and when necessary, any additional equipment, labor and materials which may be required to complete the remainder of the Work in the time specified in the General Terms and Conditions.

1.5.2 Construction Roads

All temporary construction roads, which the Contractor may require to complete the Work, shall be constructed at the Contractor's expense. The location of any temporary roads or portions thereof, on the Site shall be subject to the Owner's and Engineer's approval prior to construction. Unless otherwise approved by the Owner, all temporary roads shall be reclaimed at the Contractor's expense upon completion of the Work.

1.5.3 Drainage

The Contractor shall provide, maintain and operate any temporary drainage and/or pumping facilities required to control ground and surface water to keep the excavations dry and in a stable condition. Adequate drainage facilities in the form of ditches, culverts or other conduits shall be installed as necessary to protect the Work and to maintain temporary construction or access roads. The Contractor's dewatering operations shall be accomplished in a manner that will not adversely affect the stability of excavated slopes and will not cause erosion or softening of adjacent materials. These temporary drainage facilities shall be constructed to the satisfaction of the Engineer and Owner. The Owner reserves the right to stop work if it deems conditions to be unsafe.

1.5.4 Demobilization

Upon completion of the Work, the Contractor shall remove all the Contractor's equipment and materials from the Site. The Site shall be left in a clean and tidy state to the satisfaction of the Engineer and Owner. All waste and refuse shall be disposed of in a manner acceptable to the Owner.

2. EARTHWORKS

2.1 Clearing, Grubbing and Stripping

The natural ground surface shall be cleared, grubbed and stripped of all organic and objectionable materials by the Earthwork Contractor to the limits shown on the Drawings or as required by the Owner. The limits of stripping shall generally be 3 m outside of the Work activity areas or as shown on the Drawings. All usable topsoil, as determined by the Owner, shall be properly stockpiled in locations shown on the Drawings or designated by the Owner.

Clearing shall mean the removal of vegetation. Stripping shall mean the removal of topsoil, which shall be defined as soil of any gradation or degree of plasticity that contains significant quantities of visually identifiable vegetable matter, sod, roots or humus as determined by the Engineer or that can be used as growth medium. The depth of topsoil to be removed will be determined by the Engineer based on the character and thickness of material encountered, estimated at approximately the upper 6 to 12 inches in depth. Clearing and grubbing may generally be conducted as a single operation together with stripping.

Stripping shall be carried out using whatever method deemed necessary providing it is consistent with producing an acceptable end result as determined by the Owner. Stripped material will be brought to and stored at approved topsoil stockpile. Any stripping beyond the limits shown on the Drawings or as required by the Owner, shall be subject to the approval of the Owner. Any stripping of material that the Contractor elects to perform for his or her own purposes shall be to the approval of the Owner and shall be performed at the Contractor's expense. Unapproved stripping will be subject to remediation at the sole expense of the Earthwork Contractor.

After stripping of the required area, the ground surface shall be treated as specified on the Drawings or in these Technical Specifications. This activity can involve trimming and shaping the surface, scarifying, moisture conditioning and compacting fill material. Prior to any surface treatment on a stripped area, the Engineer shall be notified to inspect the stripped area and designate the method of treatment. A survey will be taken of the area to determine quantities and/or verification of lift/layer thickness.

The Owner may request to self-perform this work.

2.2 Excavation and Foundation Preparation

Excavation shall consist of excavating to the lines and grades shown on the Drawings and hauling materials to designated fill, stockpile or waste areas. Excavation methods, techniques and procedures shall be

developed by the Earthwork Contractor with due consideration of the nature of the materials to be excavated and shall include all precautions that are necessary to preserve, in an undisturbed condition, all areas outside the lines and grades shown on the Drawings or required by the Owner.

No excavation beyond the lines and grades shown on the Drawings or as required by the Engineer, shall be done without the prior written approval of the Owner. If such additional excavation is done without the prior written approval of the Owner and, in the opinion of the Engineer, requires backfilling in order to satisfactorily complete the Work, such backfilling shall be completed at the Contractor's expense. All such backfilling will be subject to approval by the Engineer.

Pockets of unsuitable materials within the limits of an excavation shall be removed and disposed of as directed by the Owner and Engineer. Unsuitable materials may include, but not be limited to, ice-rich materials, ash, boulder or gravel zones, soft saturated zones, highly organic zones, drilling mud pits and other deleterious material.

The Heap Leach Facility Foundation Improvement Plan provides a review of the characteristics and the estimated spatial extent of the ground ice under the HLF, highlights the characteristics of the ground ice encountered during site investigations and includes a definition and discussion of ice-rich soils. The report discusses how ice-rich soil can be identified during construction and reviews ground ice removal measures, as well as potential techniques to thaw ice-rich soils. The Earthwork Contractor shall prepare and submit a detailed excavation plan for the work for review by the Engineer. The plan shall comply with the requirements and follow the guidance of the Frozen Materials Management Plan (FMMP) and the Heap Leach Facility Foundation Improvement Plan. Removal of ice-rich materials and replacement (as necessary) with compacted fill shall be performed to the satisfaction of the Engineer. The general approach for excavation and identification and removal of ice-rich materials is provided below:

Identify and Remove Topsoil and Loose or Unsuitable Materials - The natural ground surface will be cleared, grubbed and stripped per requirements detailed in Section 2.1.

Excavation to Type 3 Bedrock - In the area of the HLF embankment, excavation to Type 3 bedrock (or better) will be completed. Bedrock at the Project site is subdivided into three broad categories - Type 1, Type 2 and Type 3. Type 3 bedrock consists of highly weathered metasedimentary rock that has a confined compressive strength of 1 to 5 MPa. Type 3 bedrock is the lowest quality rock mass that is considered to behave as rock (rather than as a soil) and can be recognized on the basis of evident preserved fabric of

the parent rock within the highly weathered rock mass and requires moderate effort to excavate with heavy excavators. Identification of Type 3 bedrock will be identified by suitable qualified construction personnel under the supervision of the Engineer.

Identify and Remove Ice-Rich Soils - Ice-rich soils in permafrost, when thawed and generating excess pore pressures, can result in soil instabilities and therefore, it is critical to identify and remove any ice-rich soils in the foundation of the HLF prior to liner construction and stacking. On the other hand, if the frozen ground does not contain excess ice (no ice-rich soils) and is thaw stable, there is negligible impact on the stability of the ground upon thaw.

For preparation of the HLF foundation subgrade, all organic soils will be removed, exposing the underlying colluvium. Removal of loose native colluvium and weathered bedrock will be required to provide a suitable subgrade for the placement of the liner and the ore in areas beyond the HLF embankment.

A primary goal of the HLF foundation preparation work will be to identify whether ice-rich soils exist in the foundation subgrade, and then if it does, since all ice-rich soil shall be removed from the footprint of the HLF, further classify it into the appropriate frozen soil type so it can be removed from the HLF footprint and managed accordingly. The identification and management of ice-rich soils can involve up to four steps that would include, in order:

1. Visual observations
2. Test pit excavations, where no visible ice was identified
3. Shallow auger drilling where test pitting was not conclusive
4. Increased density of test pitting and/or drilling

After completing the first two steps, the ground will then be inspected for the presence of ice and classification of the material (following the system described in Table 2-1), to determine if additional excavation may be necessary. The first observations in the field will be made using surficial grab-samples approximately every 25 m immediately upon excavation and exposure of the layer.

Table 2-1. Frozen material management.

Material Classification Type	Frozen Material Type	Strategy	Management Description
I	Fine and/or coarse-grained colluvial/alluvial soils or weathered bedrock with little or no ice content	Used as fill or stockpiled for closure	Used as general fill or if excess to a local fill requirement stored for reclamation.
II	Coarse-grained sands and gravels with zones of variable ice content	Used as fill	Exposed and readily thawed and drained, and then used as general fill within embankments and platforms.
III	Fine-grained soils with relatively thin zones (lenses) of low proportions of "excess ice"	Stockpiled for closure	Separated and co-disposed with other nonfrozen soils within stockpiles to be used for reclamation.
IV	Fine-grained silty and clayey soils with relatively thick lenses of highly visible "excess ice"	To IROSA*	Segregated at excavation site based on prior field data/ information, and additional observations during excavations. Excavated and hauled to IROSA located in the Haggart Creek valley.
V	Small quantities of ice-rich soils (fine or coarse)	Locally stored	Disposed of adjacent to excavation sites where thawing and drainage can be managed locally rather than hauled to the IROSA.

*IROSA: Ice-rich overburden storage area

If ground ice is visible, and the soil is predominantly fine-grained with visible ice laterally continuous between observation points and the ice lensing is greater than 1mm, and/or the volumetric ice content is estimated to be more than 10%, the material is classified as Type IV. This material is considered to be ice rich soil and shall be excavated and hauled to the IROSA.

If ground ice is visible, the soil is fine or coarse grained with isolated pockets between observation points with ice lensing less than 1mm, and/or the volumetric ice content is estimated to be less than 10%, the material is classified as Type I/II/III. This material, for the purposes of the HLF foundation, is not considered ice rich soil and will only be excavated and hauled to the Reclamation Stockpiles (location per the Owner) if in the opinion of the Engineer it is necessary.

If ground ice is not visible and the soil is predominantly fine-grained, the temperature of the sample shall be taken, and the sample manually warmed in the field. If the soil is <0 C and then excess water forms

upon warming, the soil is classified as Type III. This material, for the purposes of the HLF foundation, is not considered ice rich soil and will only be excavated and hauled to the Reclamation Stockpiles (location per the Owner) if in the opinion of the Engineer it is necessary.

If ground ice is not visible, the soil is fine or coarse-grained and the sample shows little moisture or remains intact upon warming, it is Type II, and this material, for the purposes of the HLF foundation, is not considered ice rich soil and will remain in-situ and/or can be used as fill within the HLF footprint.

Since the required subgrade excavation depth may be thin, it is possible that the excavation required for foundation preparation does not reach to the permafrost table. Therefore, ice-rich or thaw unstable soil that is not visible on the exposed subgrade cannot be excluded, so additional investigations will be conducted to demonstrate the absence of ice rich soils at depth (i.e., to a depth of 6 m below the initial subgrade). With respect to outside the HLF embankment foundation area, test pits using a large excavator will be excavated to Type 3 bedrock or, if bedrock is not encountered, to a depth of at least 6 m below the initial excavated subgrade. Due to the heterogeneous nature of the ground, investigations at 100 m x 100 m spacing will be completed while foundation preparation is being carried out. Samples will be visibly inspected as described above and classified accordingly. Test pits should be properly backfilled and compacted using approved, non-frost susceptible and ice-free fill material.

Shallow auger drilling, which will only be carried out at locations where test pit excavation is not successful (i.e., did not reach 6 m below the initial excavated subgrade). The locations and density of boreholes in an area will be determined in the field under the supervision of the Engineer, but in general, will be used to supplement and refine the test pitting findings. The ground ice inspection boreholes are expected to reach competent bedrock but also to be not deeper than 6 m.

All observations from site shall be supervised by an engineering professional with experience in ground ice characterization. Where adjacent test pitting and augering show conflicting results, additional test pitting and/or augering will be completed in the intervening zones to resolve any issues related to identifying lateral extent of ice-rich soil.

Excavating ice-rich soils, in particular coarse colluvium, is challenging due to the high strength of the frozen material at temperatures below mainly -1°C, as the amount of unfrozen water in the ground becomes negligible.

The frozen ground can be broken using a ripper tooth attached to a large dozer or an excavator. Once broken, the pieces of ice rich soil can be loaded and hauled with excavator and haul trucks to the reclamation stockpile or hauled to the IROSA. As described above, the goal of excavating will be to excavate to Type 3 bedrock in the area of the embankment, and if ice-rich soil is present, excavate to below the extent of ice-rich soil.

As stripping and excavating of the active layer and the permafrost advances, ground thawing is initiated at the new surfaces. These newly thawed conditions can result in surficial soil sliding and slumping, and cause non-trafficable condition for heavy equipment, necessitating the use of rig mats, or additional fill.

To evaluate the foundation conditions and demonstrate the absence of ice-rich soil in the foundation area, the subgrade will be visually monitored during the thawing season, following stripping, under the supervision of the Engineer. The monitoring will focus on visually identifying signs of subsidence and water surfacing. If ice-rich soil is present under the excavated subgrade and it is exposed to warming during the summer, the ground would start to thaw, settle and water would be visible at the surface. Depending on the time of the year, this would be visible within days following the excavation. The presence of ice rich soil in shallow ground can also be noted if runoff shows a daily pattern. In the absence of snow melt, increase in runoff at the bottom of HLF construction areas towards the end of day can be related to the melting of ground ice.

In addition to ripping ice rich soils, it is also possible to allow the exposed subgrade to thaw naturally during the summer. The thickness of the ground layer that thaws during a summer depends on the surface, ground and climate conditions. The vegetation forms the main insulating layer within the footprint of the HLF. By clearing the vegetation and stripping the active layer, ground ice containing permafrost is exposed to the atmosphere. Judging from the ground temperature data available (see Appendix A2) thaw depths between 2 m and 3 m can be expected for the area in one summer, where ice-rich soil is present. While natural thawing of ice-rich soils is generally not practical during preparation of the HLF subgrade due to time constraints, it may prove useful in some areas where the ice content is low (< 10%) and sporadically located (i.e. non ice rich soils), and the subgrade area can be exposed for the summer prior to development. The steps for natural thawing operations would include as follows:

- Strip vegetation and organic layer prior to summer;
- Expose frozen surface to atmosphere;
- Excavate any thawed ground at the end of the period or by end of summer.

3003 E. Harmony Rd., Ste 320, Fort Collins, CO 80528

Independent of the thawing method used, controlling surficial melt water runoff, sediment transport and potential soil instabilities that occur upon ground thawing will be necessary. This will be achieved by digging dewatering trenches or installing drainage pipes that provide a controlled drainage system as well as potential sediment transport. Running or standing water on permafrost subgrades will be avoided.

The first excavation pass will then be undertaken to the lines and grades as specified by the Engineer. During final grade preparation, there may still be areas left with pockets of loose or unsuitable materials. Under the direction of the Engineer, these loose or unsuitable materials will be removed. Unsuitable materials may include ash, boulder or gravel zones, soft saturated zones, highly organic zones or drilling mud pits.

The evaluation methods for loose or unsuitable materials will depend on the location and the materials that will be placed over the subgrade. The evaluation methods may include proof-rolling with a loaded dump truck or similar pneumatic-tired equipment to ensure that the surface is firm and smooth. Probing with a metal rod may also be performed.

Soft or yielding areas delineated by the evaluation methods described above that cannot be stabilized by compacting under the supervision of the Engineer will be removed and replaced with site grading fill or structural fill meeting the requirements of these specifications. If deemed necessary by the Engineer, the treated areas will be re-evaluated by test pitting such that the cut face is clearly visible so that they can be examined and logged by the Engineer. After the re-evaluation has been completed, the test pit locations will be backfilled with the excavated material and compacted in layers to the surface to the satisfaction of the Engineer.

Once the foundation area has been managed to mitigate instances of loose or unsuitable materials or ice rich soils, and in the HLF embankment area confirmation that Type 3 bedrock is exposed, the Engineer will be notified, and a final inspection will be undertaken to determine the appropriate method of treatment for the ground surface prior to the placement of the embankment and underdrain system. The methods of treatment that will be utilized may include trimming and shaping the surface, scarifying, moisture conditioning, or compacting of any area where fill material was placed. Excavated surfaces shall not be covered with fill/liner until the surface has been approved by the Engineer. The Contractor shall uncover, at his or her own expense, any excavated surface, which has been covered prior to inspection and approval by the Engineer.

Any damage resulting from the Contractor's operations during site preparation or excavation, including damage to foundations and excavated surfaces, shall be repaired at the expense of the Contractor and to the satisfaction of the Owner and the Engineer.

Topsoil and waste stockpiles shall be leveled, trimmed and shaped as required by the Owner to prevent the occurrence of ponding or concentrations of surface runoff and to provide a neat appearance. Finished slopes of the topsoil stockpiles shall be graded to 2.5H:1V (horizontal: vertical) for interim reclamation. All surface water runoff shall be directed to existing surface water management structures.

2.3 Subgrade Preparation

After clearing, grubbing, stripping and excavating, the exposed subgrade surface shall be inspected and evaluated by the Engineer for the presence of loose or soft areas or unsuitable material prior to fill placement or geomembrane installation. Evaluation methods will depend on the location and the materials that will be placed over the subgrade and on the prevailing field conditions. Evaluation methods may include proof-rolling with a loaded dump truck or similar pneumatic-tired equipment to ensure that the surface is firm and smooth. Probing with a metal rod may also be performed. Soft or yielding areas delineated by the evaluation that cannot be stabilized by compacting shall be removed and replaced with site grading fill. Unsuitable materials shall also be removed and replaced with site grading fill as directed by the Engineer. The subgrade shall be prepared to the satisfaction of the Engineer.

If deemed necessary by the Engineer, evaluation of the subgrade soils may include excavating test pits to allow the Engineer to designate the method of surface treatment, as needed. The Earthwork Contractor shall, under the direction of the Engineer, excavate shallow test pits oriented as directed by the Engineer. The pits may cover the entire Work area and any other area designated by the Engineer and shall be spaced as directed by the Engineer. The pits may be excavated by whatever method the Contractor deems necessary provided it produces a clearly visible cut face in the soils. After the pits have been examined and logged by the Engineer, they are to be backfilled by backfilling the excavated material back into the pits and compacting in layers to the surface to the satisfaction of the Engineer.

Stripped rock subgrade surfaces and rock outcrops in at-grade areas shall be cleared of loose rock fragments greater than 50 mm in size and wetted in preparation for foundation preparation. Foundation preparation shall consist of placing and compacting granular soil fill material in varying thicknesses to suit field conditions to support the leach pad and collection ponds liner systems. The granular fill shall be placed and compacted as specified in Section 2.6 - Site Grading Fill of these Technical Specifications.

Soil subgrade surface receiving site grading fill shall be scarified to a minimum depth of 150 mm, moisture conditioned if necessary, to within plus or minus two (±2) percent of the optimum moisture content as determined by the Standard Proctor test (ASTM D-698) and recompacted to a minimum of 95 percent of the maximum dry density (ASTM D-698).

The Contractor shall modify (smooth) the existing contours such that the finished subgrade surface approximately conforms to the dimensions shown on the Drawings. While exact contours are not required, the Contractor shall maintain positive drainage and ensure that there are no abrupt changes in grade that would prohibit placement of or create stress in, the overlying liner systems. No site-grading fill shall be placed, until the stripped and reworked areas have been inspected and approved by the Engineer.

Soil subgrade surface receiving geosynthetics, including geosynthetic clay liner (GCL), should be rolled with a smooth-drum compactor to remove any wheel ruts, tracks, or other abrupt grade changes greater than 1" (25 mm) in depth. All protrusions extending more than 0.5 inch (12 mm) from the subgrade surface shall be removed. The prepared subgrade surface must be smooth and free of any vegetation, sharp-edged rocks, stones, sticks, construction debris, and other foreign matter that could contact and potentially the geosynthetic material.

2.4 Borrow Development

The majority of the site grading fill will consist of material excavated from the HLF area. The Contractor shall excavate, haul, place and compact site grading cut materials from required excavations within the limits of the HLF, as shown on the Drawings. In addition, the Owner will designate borrow areas and limits outside the HLF for the Contractor to excavate, haul, place and compact site grading fill, as needed. The Owner plans to stockpile crushed ore materials adjacent to the pad limits for the Contractor to haul and place as drain cover fill above the pad liner.

The Contractor may select and use any Owner/Engineer approved borrow area for this construction materials provided the materials meet the Specification requirements for the intended use. Representative tests shall be conducted by the Engineer on the borrow materials in the field or at an offsite laboratory to determine the materials' suitability for use as fill. It shall be the Contractor's responsibility to notify the Engineer of changes in borrow materials in advance of development to allow time for representative testing without unduly interrupting construction activities.

Should a borrow material prove to be unsuitable for fill, a new borrow source shall be designated by the Owner or the Contractor's processing operations shall be adjusted to produce acceptable fill material meeting the Specifications.

The Contractor shall liaise with the Owner, as needed, to schedule and coordinate the production and/or stockpiling of acceptable borrow materials from the mine pit area and other sources onsite and offsite for the execution of the Contractor's work.

Acceptable borrow areas shall be cleared, grubbed and stripped in stages, as approved by the Owner/Engineer, to minimize ground disturbance. Each stage of stripping shall be sufficient in areal extent for the Contractor to operate conventional earthwork equipment for conditioning and excavating materials acceptable for fill placement. Moisture conditioning in preparation for fill placement, if required, shall be done in the borrow areas as much as practical.

The final surfaces of all borrow areas developed by the Contractor shall be left in reasonably smooth, even conditions and graded to drain for long-term stability. Final surface grading shall be by dozer or grader blade operations, as approved by the Engineer. Final cut slopes shall be no steeper than 2.5H:1V unless approved by the Engineer. The Contractor shall replace stripped topsoil cover over the final borrow cuts, unless otherwise approved by the Owner.

2.5 General Fill Placement Procedures

All materials used for fill shall be loaded and hauled to the placement site, dumped, spread and leveled to the specified layer thickness, moisture conditioned if required and compacted to form a dense integral fill in accordance with these Technical Specifications and to the approval of the Owner and Engineer.

Under most conditions, the fill shall be constructed in near horizontal layers with each layer being completed over the full length and breadth of the zone before placement of subsequent layers. Each zone shall be constructed with materials meeting the specified requirements and shall be free from lenses, pockets and layers of materials that are substantially different in gradation from the surrounding material in the same zone as determined by the Engineer. All fill placed shall be free from organic debris, frozen soil, ice or other unsuitable materials. All oversized material shall be removed from the fill material either prior to it being placed or after it is dumped and spread but prior to compaction.

All particles that have dimensions that will interfere with compaction in the specified layer thickness, as determined by the Engineer, shall be removed from the zone in which they were placed either prior to or during compaction.

As approved by the Engineer, fill may be compacted by routing the hauling and spreading equipment approximately parallel to the long axis of fill. The hauling equipment shall be routed in such a manner that they do not follow the same paths but spread their traveled paths evenly over the surface of the fill.

Moisture conditioning is the operation required to increase or decrease the moisture content of material to within the specified limits. If moisture conditioning is necessary, it shall be carried out by whatever method the Earthwork Contractor deems suitable provided it produces the moisture content specified in these Technical Specifications or designated by the Engineer. The moisture shall be distributed uniformly throughout each layer of material being placed immediately prior to compaction. Measures shall be adopted as necessary to ensure that the designated moisture content is preserved after compaction and until the succeeding layer is placed.

Should the surface of the fill become rutted or uneven subsequent to compaction, it shall be regraded and recompacted before the next layer of fill is placed. To permit suitable bonding with the subsequent layer if necessary, the surface material shall be loosened by scarifying or disk harrowing, as approved by the Engineer and if necessary, it shall be moisture conditioned before an additional layer is placed.

Compaction of each layer of fill shall proceed in a systematic, orderly and continuous manner approved by the Engineer to ensure that each layer receives the compaction specified. The rolling pattern for compaction of all zone boundaries or construction joints shall be such that the full number of roller passes required in one of the adjacent zones or on one side of the construction joint, extends completely across the boundary or joint.

Fill shall not be placed on frozen soil or when air temperatures drop below 0°C unless otherwise approved by the Engineer.

2.5.1 Compaction Equipment

Sufficient compaction equipment shall be provided as necessary for compaction of the various fill materials. Compaction equipment shall be maintained in good working condition at all times to ensure that the amount of compactive effort obtained is a maximum for the equipment. Before commencing Work with the proposed

compaction equipment, the Owner and the Engineer shall be provided with a list of each piece of equipment to be used together with the Manufacturer's specifications.

If alternative equipment than initially proposed is to be used, a submittal shall be made to the Engineer for approval of the equipment and the submittal shall give complete details of such equipment and the methods proposed for its use. The Engineer's approval of the use of alternative equipment may be dependent upon completion of suitable test fills, to the satisfaction of the Engineer, to confirm that the alternative equipment will compact the fill materials to the specified density.

The Contractor's procedures for compaction of fill shall be subject to the approval of the Engineer. Compaction of each layer of fill or subgrade shall proceed in a systematic, orderly and continuous manner approved by the Engineer such as to ensure that all of each layer receives the compaction Specified. The compaction shall be carried out by routing the compaction equipment parallel to the axis of the fill, except that where such routing is impractical and where otherwise required by the Engineer, the compaction equipment may be routed in any direction approved by the Engineer.

For compaction by the vibratory roller, coverage shall consist of a minimum of one pass of the roller. A minimum overlap of 12 inches shall be maintained between the surfaces traversed by adjacent passes of the roller drum. During compaction the roller shall be propelled at a speed appropriate to achieve the desired compaction with reasonable number of passes. The power of the motor driving the vibrator shall be sufficient to maintain the specified frequency and centrifugal force under the most adverse conditions that may be encountered during the compaction of the fill.

The use of mine haul trucks or scrapers as compaction equipment shall be acceptable provided that test fills confirm the fill materials can be adequately compacted with the proposed equipment.

The following compaction equipment and specifications may be considered.

2.5.2 Smooth Steel Drum Vibratory Roller

Smooth steel drum vibratory rollers shall be equipped with a suitable cleaning device to prevent the accumulation of material on the drum during rolling. Each roller shall have a total static weight of not less than 9,000 kg at the drum when the roller is standing on level ground. The drum shall be not less than 1.5 m in diameter and 2 m in width. The vibration frequency of the roller drum during operation shall be between 1,100 and 1,500 vibrations per minute and the centrifugal force developed by the roller, at 1,250 vibrations

per minute, shall not be less than 170 kN. The power of the motor driving the vibrator shall be sufficient to maintain the specified frequency and centrifugal force under the most adverse conditions, which may be encountered during the compaction of the fill.

2.5.3 Tamping Foot Roller

In order to achieve the required compaction with fine-grained cohesive soils, including some of the engineered fill, the Contractor may be required to compact the fill with a tamping foot roller. Subgrade material which is conglomerated into blocks shall require compaction with the tamping foot roller to ensure that the intended permeability of the subgrade material is obtained.

The tamping foot roller shall be a self-propelled, fully ballasted, standard tamping foot design developing 75 kN per linear m of width at rest on level ground or equivalent, as approved by the Engineer. Following compaction with a tamping foot roller, the final surface shall be bladed smooth and then proof-rolled with a smooth drum compactor until the surface is smooth, firm and free from projections.

2.5.4 Special Compactors

Special compactors and compaction measures shall be used to compact materials that, in the opinion of the Engineer, cannot be compacted properly by the specified roller because of location or accessibility. Such special compactors and measures may include hand-held vibratory compactors or other methods approved by the Engineer to compact fill in trenches, around structures and in other confined areas that are not accessible to the larger vibratory roller or tamping foot roller. All compaction shall be to the specified density.

2.5.5 Test Fills

Test fills shall be conducted according to US Army Corps of Engineers standards to establish the specifications for the proper placement and compaction of site grading rockfill having more than 30 percent particles larger than 19 mm. Test fills shall also be conducted if circumstances arise where they are deemed necessary by the Engineer such as in order to determine if greater or lesser lift thicknesses are appropriate for certain soils and to still meet the design intent for site grading fill. The type of compaction equipment, number of passes and maximum particle size and loose lift thickness to be used in the Work will be approved by the Engineer in writing based on the acceptable test fill performance. The Contractor shall outline his proposed procedures for moisture conditioning and fill placement and submit them to the Engineer for review and approval.

The test fill shall be constructed within the limits of the Work to determine the compactive effort required to be applied to a particular material or increased lift thickness. The test fill shall be sufficiently wide to support the compaction equipment. The proposed compaction equipment to be used in actual site grading fill placement shall be routed over the test fill.

In the soil test fill, the number of compaction equipment passes shall be counted and, at certain numbers of passes, in-place density tests shall be performed by the nuclear gauge method (ASTM D-2922) or sand cone method (ASTM D-1556). This process shall be repeated until a curve representing number of passes versus density is generated. This information will allow the Engineer to evaluate the optimum density of the soil and the corresponding number of passes. This will establish a guideline for the compaction procedure required during construction.

For rockfills, the data to be collected from the test fill shall include the following:

- Lift thickness of 0.3, 0.6 and 0.9 m (three test fills to establish optimum lift thickness)
- Amount of settlement after every two passes of compactor to a maximum of 25 passes
- Gradation and moisture content of in-place material
- In-place fill density at completion of the test fill by nuclear gauge method (ASTM D-2922) or sand cone method (ASTM D-1556), as approved by the Engineer.

A curve showing change in rockfill lift settlement versus number of passes shall be produced from the data. The minimum number of passes to achieve acceptable compaction will be the number required to achieve 80 percent of the total settlement obtained after no fewer than ten complete passes of the compaction equipment. The lift thickness and minimum number of passes with compaction equipment shall be approved by the Engineer after review of test fill data.

Upon completion of each test fill, a test fill report shall be generated that must include all appropriate documentation pertinent to the test fill, including but not limited to, field and laboratory test results, graphics displaying the aforementioned curves, photographs and a written narrative of the test fill and results.

2.6 Site Grading Fill

Site grading fill will be placed within the HLF limits to achieve the desired final grades as shown on the Drawings.

2.6.1 Material Requirement

Material for compacted site grading fill may consist of any material which, when compacted, is suitable for use in the various parts of the Work. The site grading fill material will have a wide range of Unified Soil Classifications and may contain significant variations in gradation and compaction properties. Materials that contain or are contaminated by organic matter are not suitable for use as site grading fill. Site grading fill will be placed in areas where the material is not required to be of uniform character and engineering properties. The site grading fill will be obtained from several sources including from required excavation or regrading activities within the HLF limits and from borrow areas.

Site grading soil fill shall generally include inorganic soils with less than 30 percent particles larger than 19 mm and a maximum 150 mm particle size. Soft, weathered rock that breaks down during the excavation, hauling and processing operations to form essentially a soil and compacts without excessive voids may be used for site grading soil fill, as approved by the Engineer, but may not be used in the HLF confining embankment or event pond embankments. Materials (such as placer tailings) containing large size, sound rock or cobbles and gravels from required excavations may be used as site grading fill subject to the Engineer's approval and provided the rock is reasonably graded such that large void spaces do not result. The maximum particle size in the fill shall be no larger than two-thirds the fill compacted lift thickness, unless otherwise approved by the Engineer. Oversized materials shall be removed from the fill.

2.6.2 Placement

The surface upon which site grading fill is placed shall be prepared as specified in Section 2.3 - Subgrade Preparation of these Technical Specifications.

The site grading soil fill material shall be placed and spread in the fill to form lifts which shall not exceed 0.3 m in loose thickness unless otherwise specified by the Engineer and proven to achieve the specified compaction in a test fill. The actual lift thickness may need to be less than 0.3 m in loose thickness to meet the compaction requirement. Cobbles and boulders that are large enough to interfere with the construction of the designated lift thickness shall be removed and disposed of in areas specified by the Owner.

After spreading, the site grading soil fill material shall be moisture conditioned, if necessary, by sprinkling and disk harrowing until a uniform distribution of moisture is obtained. Material that is too wet may be spread on the fill area and permitted to dry, assisted by disking and harrowing if necessary, until the moisture is reduced to an amount within the specified limits. The Contractor shall utilize all measures necessary to achieve a moisture content for site grading soil fill within plus or minus two (±2) percent of the

optimum moisture content as determined by the Standard Proctor test (ASTM D-698), distributed uniformly throughout the lift of material being placed, immediately prior to compaction. The Contractor shall utilize whatever measures necessary to ensure that the designated moisture content is preserved after compaction until the succeeding lift is placed. The Engineer may specify deviation from the moisture content limits provided the required compaction is achieved. Each site grading soil fill lift shall be compacted to a minimum of 95 percent of the maximum dry density (ASTM D-698).

The site grading rockfill material shall also be spread in individual lifts and shall be conditioned, placed and compacted according to the specifications derived from the results of a test fill. The rockfill lifts shall generally not exceed 0.5 m in loose thickness unless otherwise specified by the Engineer and proven to achieve the specified compaction in the test fill. The actual lift thickness may need to be less than 0.5 m in loose thickness to meet the compaction requirement. The test fill procedures are outlined in the following section. Site Grading fill shall not be placed in freezing temperatures without approval from the Engineer.

2.7 Select Fill

The intent of the design is to construct a compacted thickness of soil beneath the liner system as shown on the Drawings.

If the in-place material is not suitable to meet the requirement in Section 2.3 – Subgrade Preparation, then suitable material shall be imported from required excavations within the HLF limits and/or from borrow sources. Imported Select Fill material shall be placed in maximum 0.15 m thick lifts (after compaction) and be moisture conditioned if necessary and compacted according to the requirements stated herein. Prior to placing each lift and if necessary, the surface of the first lift shall be scarified to a depth of 50 mm or otherwise roughened to ensure complete bonding between the lifts, as directed by the Engineer.

Moisture conditioning of Select Fill material to adjust the measured moisture content shall occur when the material is in a loose condition such as after scarifying or during placement of imported materials and never after compaction. The Select Fill material shall be scarified, mixed and moisture conditioned, if necessary, by sprinkling and disk harrowing until a uniform distribution of moisture is obtained. Material that is too wet may be spread on the fill area and permitted to dry, assisted by disking and harrowing if necessary, until the moisture content is reduced to within the specified limits.

The Contractor shall adopt removal of oversized or protruding particles at the top of Select Fills as specified in Section 2.3 - Subgrade Preparation of these specifications.

2.7.1 Material Requirement

In-place or imported fine-grained soil liner material meeting the requirements stated herein shall be acceptable. If suitable in-place soil liner material cannot be found as specified by the Engineer, additional material, which meets the material requirements, shall be imported from excavations within the HLF limits or designated borrow areas. Suitability of soils in this category is dependent on the properties of gradation to provide a suitable foundation for the geosynthetics.

The Engineer will have the authority to approve variations to the compaction and moisture content requirements. The Engineer will determine the suitability of the material for use as Select Fill material. The Select Fill material shall conform to the following gradation:

Table 2-2. Select Fill material gradation.

ASTM Sieve Size	Percent Passing
75 mm	100
No. 4	60-100
No. 200	35-100

Select Fill material shall be free of organic matter in quantities that would adversely affect the performance of the HLF, as specified by the Engineer.

2.7.2 Placement

Where suitable material exists in-place, the top 0.15 m of the material shall be removed and windrowed to allow access to the lower half of the Select fill layer. The lower 0.15 m of the soil liner shall be scarified by disking or other approved means, moisture conditioned if necessary and compacted to minimum of 95 percent of the maximum dry density at a moisture content between -2 and +1 percent of the optimum, as determined by the Standard Proctor test (ASTM D 698). Once the compaction of the lower layer has been confirmed, the upper 0.15 m of material shall be spread across the surface; moisture conditioned if necessary and compacted according to the requirements stated above. Select fill shall not be placed in freezing temperatures without approval from the Engineer.

2.8 Granular Fill

2.8.1 Overliner and Select Drain Fill (ODF & SDF)

Drain fill shall be used to construct the leach pad liner cover fill and in pipe trench drains as shown on the Drawings. The drain fill material shall be produced from crushing and/or screening operations of ore and/or

mine waste and/or from screening of sand and gravel aggregate from borrow sources. The material shall be free of organic matter and soft, friable particles in quantities objectionable to the Engineer.

2.8.1.1 Material Requirement

The ODF for the leach pad liner cover fill and select drain fill for the cover of the underdrain system shall consist of free-draining granular material with 38-mm maximum particle size and a maximum of 5 percent fines passing the No. 200 ASTM sieve size (0.075-mm). The ODF shall have an operational permeability to allow maximum phreatic surface of 0.6 meters. If compacted permeability utilizing loads equivalent to full heap height produce permeabilities less than of 2x10-2 cm/sec or lower, than pipe spacing may need to be reduced. The engineer of record will utilize actual permeabilities and analyze pregnant solution collection pipe spacing requirements.

Table 2-3. Overliner Drain Fill material gradation.

ASTM Sieve Size	Percent Passing
38 mm	100
No. 200	5

Drain Fill shall consist of hard and durable free-draining fine gravels with 12.5 mm maximum particle size and a maximum of 3 percent passing the No. 200 ASTM sieve size (0.075-mm). The select drain fill shall have an operational permeability of 1x10-2 cm/sec or higher.

Table 2-4. Select Drain Fill material gradation.

ASTM Sieve Size	Percent Passing
12 mm	100
No. 200	3

2.8.1.2 Placement

The drain fill material shall be placed in such a manner as to reduce segregation and construct the zones in accordance with the details and to the lines and grades shown on the Drawings or as specified by the Engineer. Methods shall be developed on site for placing the material in a manner that will protect the drain pipework from damage and keep compaction of the material to a minimum. Any drain fill material that has received too much compaction shall be scarified to a loose condition without damage to the underlying geomembrane and pipework.

The ODF above the geomembrane shall be placed in a single 0.6 m minimum lift thickness by suitable dozer and truck equipment, as approved by the Engineer. A thicker layer, a minimum of twice the pipe diameter, shall be placed above the larger diameter primary collection drain pipes as detailed on the Drawings. A thicker layer, a minimum of twice the pipe diameter, shall be placed above the larger diameter primary collection drain pipes as detailed on the Drawings. A layer thicker than 0.6 m may be required by the Engineer to protect the liner system based on conditions, ground slope, equipment type and observed placement methods. No moisture conditioning or compaction is required. Haul truck speeds, braking and turning during drain cover fill placement shall be strictly controlled by the Contractor to prevent damage to the underlying geomembrane and pipework. The cover fill thickness shall also be increased in concentrated traffic areas or across collection pipes, as required, to prevent damage to the geomembrane and pipework. Haul traffic on the cover fill surface shall be spread out as much as practical to prevent over-compaction of the cover fill in localized areas. A test fill shall be constructed by the contractor prior to placement of overliner drain fill on the pad to demonstrate the protection of the liner system upon trafficking and placement with proposed equipment. The Engineer shall oversee and evaluate the test pad and make final recommendations for thickness and crush size.

A sheet temperature of minus 10 degrees C (14 degrees F) is the lower limit that ODF shall be placed on the geomembrane unless it is shown otherwise to the satisfaction of the Engineer.

Select drain fill to backfill around pipes should be carefully placed and spread in uniform layers. and should be placed to approximately the same elevation on both sides of the pipe to prevent unequal loading and displacement of the pipe. Backfilling procedures shall generally follow guidance from “Plastic Pipe Used in Embankment Dams Best Practices for Design, Construction, Problem Identification and Evaluation, Inspection, Maintenance, Renovation, and Repair Federal Emergency Management Agency, November 2007”. The backfill in all areas shall be compacted by vibrating, tamping, or a combination thereof to seventy five percent (75%) relative density for Select drain fill as determined by the relative density of cohesionless soils test, ASTM D4253. Bedding shall be distributed in 150mm maximum lifts over the full width of the trench.

2.8.2 Compacted Rock Fill

Compacted Rock Fill shall be used for structural fills in the HLF as shown on the drawings. The rock fill will have more than 30 percent particles larger than 19 mm and the maximum rock particle size shall be no more than two thirds the loose thickness of the fill lift. The rockfill shall generally have 300 mm maximum rock particle size and oversized rocks larger than 300 mm shall be removed to the exterior fill slopes. Rocks

larger than 300 mm may be incorporated in thicker fill lifts provided the rocks do not protrude from the lift surfaces after compaction and the required compaction of the lifts is proven achievable by a test fill.

2.8.2.1 Material Requirement

Compacted rock fill shall consist of rock from required excavations and from mine pre-stripping operations that generate relatively high strength, durable and relatively clean rock resistant to weathering and to water action and free of potentially acid-generating rock, shale, soil, organic, deleterious or other objectionable material. Rounded rock, in general, is not desirable. The quality of the material must be approved by the Engineer prior to removal from the processed stockpile.

The maximum particle size for the compacted rock fill shall be no greater than 2/3 the fill loose lift thickness as determined in test fills and all rock fill material shall contain more than 30 percent particles larger than 19 mm.

Rock fill shall be competent material with a minimum strength rating determined by International Society for Rock Mechanics (ISRM) methods of R3, medium strong rock.

Rock fill shall not be placed in freezing temperatures without approval from the Engineer. A test fill may be performed to establish lower limits of fill temperature during placement and compaction.

2.8.2.2 Placement

The Contractor shall place the rock fill in maximum loose lifts and compact in accordance with specifications derived from results of test fills.

2.8.3 Anchor Trench Backfill

2.8.3.1 Material Requirement

Geomembrane anchor trenches shall be backfilled with inorganic material meeting the site grading fill material requirement.

2.8.3.2 Placement

The anchor trenches shall be excavated to the lines and grades shown on the Drawings. Particles greater than 138 mm size and any other protrusions shall be removed from the trench bottom and sides to protect the geomembrane from puncture. The backfill material shall be placed in nominal 150 mm thick lifts and compacted to a minimum of 85 percent of the maximum dry density as determined by the Standard Proctor

test (ASTM D-698). Moisture conditioning will not be critical, as determined by the Engineer. Compaction shall be accomplished by the use of hand-operated compactors. Care shall be exercised to avoid damage to the geomembrane. The final backfill surface shall be rolled by a rubber-tired front-end loader with loaded bucket or equivalent equipment approved by the Engineer. The final backfill surface shall be graded to drain.

2.8.4 Road Wearing Course

The road wearing course material shall be selected and placed as specified by the Owner. The following should be considered as guidelines.

2.8.4.1 Material Requirement

Generally, the road wearing course material shall be produced from crushing and/or screening operations of mine waste or borrow sources and shall consist of well-graded sandy gravel. The wearing course material shall conform to the following gradation:

Table 2-5. Wearing course material gradation.

ASTM Sieve Size	Percent Passing
50 mm	100
38 mm	95-100
19 mm	65-95
No. 4	35-55
No. 16	15-45
No. 200	4-15

2.8.4.2 Placement

The wearing course shall be placed and compacted to a compacted thickness of no less than 0.15 m to the lines and grades shown on the Drawings or as required by the Owner. The layer shall be graded to form a relatively smooth surface, free of rock pockets or protrusions of rock fragments. The wearing course shall be compacted by a minimum of three passes with a smooth drum roller to achieve a minimum 95 percent of the maximum dry density as determined by the Standard Proctor test (ASTM D-698). The wearing course shall contain enough moisture to produce a homogeneous, smooth and compacted layer. To achieve this, the Contractor may be required to moisture condition the material in the processing operation before placement or after spreading but before compaction.

2.9 QA/QC Testing

2.9.1 General

The Engineer and their quality assurance team will be responsible for testing construction materials to assess whether materials and methods comply with these Technical Specifications. All testing performed by the Engineer will be performed in accordance with procedures outlined in the Specifications. The results of the tests carried out by the Engineer will be final and conclusive in determining compliance with the Specifications. The QA/QC test results shall be used to document and verify the quality of work and the extent to which the earthwork and related installations have been completed as set forth in the Drawings, Technical Specifications and permits for the construction and operation of the facilities.

To the extent possible, QA/QC testing shall be conducted so as not to interfere with normal construction operations. However, if required for any reason, the Contractor shall stop work in the area being tested, until the QA/QC testing is complete or approval to proceed has been given by the Engineer or his appointed representative. Each lift of fill will require approval by the Engineer prior to placement of the next lift. Sufficient time shall be allowed by the Contractor for the Engineer to carry out the required test work and interpretation of the test results in order to decide upon the acceptability of each lift. Cooperation shall be given by the Contractor to the Owner and the Engineer for taking samples and making tests and such assistance shall be rendered as is necessary to enable sampling and testing to be carried out expeditiously.

The QA/QC guidelines do not relieve the Contractor of any of his responsibilities to conduct his own daily quality control testing or to complete in a timely manner the Work agreed to under the Contract Documents in accordance with the Specifications.

2.9.2 Tests

Laboratory tests including moisture content (ASTM D-2216), Atterberg limits (ASTM D-4318), gradation (ASTM C-136/D-6913[1]), moisture/density relationship (ASTM D-1557), permeability (ASTM D 5084) and other tests, where applicable, will be conducted by the Engineer on samples of fill materials taken from cuts within the HLF limits and from borrow areas at frequencies sufficient to assess whether the materials are in compliance with these Technical Specifications. The Engineer will also conduct field density tests (ASTM D-6938[2] /nuclear gauge method and/or ASTM D-1556/sand cone method) and will obtain samples of the compacted fill for related laboratory testing at such frequency as the Engineer considers necessary to

[1] ASTM C-136/D-6913 superseded ASTM D-422

[2] ASTM D-6938 superseded ASTM D-2922

assess whether the compacted fill is in full compliance with the Specifications. In-place field density testing on soil fills may also be conducted in accordance with ASTM D-2167 and D-6938[3], as specified by the Engineer. Rockfill materials exceeding the standard range of soil testing methods shall be tested for acceptable compactive effort as specified in Section 2.6 - Site Grading Fill of these Specifications.

2.9.3 QA/QC Plan

If the above tests indicate the Work does not meet the specified requirements, the following remedial action shall be performed.

Compaction below specified minimum: apply additional effort or scarify, moisture condition, recompact and retest.

Moisture content outside of specified limits during compaction:

- Moisture content below specified minimum: scarify the depth of the lift, moisture condition, mix to achieve uniform moisture content, compact and retest
- Moisture content above specified maximum: scarify the depth of the lift, allow to air dry, mix to achieve uniform moisture content, compact and retest; or remove the wet material. Mixing of dry material to lower the moisture content shall not be allowed without the prior approval of the Engineer and on a case by case basis.

Moisture content outside of specified limits after compaction and approval but prior to covering: determine depth of material outside of specified limits and correct as specified above.

Material not in accordance with the Specification requirements: remove material in its entirety, as directed by the Engineer.

2.9.4 Reporting

The Engineer will prepare daily progress reports throughout the period of construction. The reports will summarize pertinent construction activities and results of testing completed during the period as well as highlight any difficulties encountered.

[3] ASTM D-6938 superseded D-3017

The Engineer will maintain a record of all tests. The tests will be recorded on a form applicable to the test being performed. The location of all tests will be recorded and accurately described. A plan indicating the locations of all tests will be maintained.

On completion of the work the Engineer will prepare a construction report which will include a summary of results from all tests carried out as part of the QA/QC program and construction record drawings. The construction report will be submitted to the Owner for submittal to the appropriate regulatory agencies.

2.9.5 Testing Frequency

The testing frequencies in the following tables are the minimum number of record QC tests to be completed on the various fill materials during the Work. The Engineer may specify additional tests to be carried out, if in the opinion of the Engineer, such additional tests are required due to variability in the soil materials or soil properties that may affect the Work. Control tests shall be performed on the material, as necessary, to determine the suitability of borrow areas. The number of control tests shall satisfy the minimum record test frequency for the volume anticipated to be removed. This may entail performing enough testing to develop "families" of borrow area soils, classified by both gradation and moisture/density relationship. The control test results shall be submitted to the Engineer for approval prior to removing material from borrow areas for fill placement. The results must demonstrate that the borrow materials conform to the Specifications. The control tests conducted for borrow areas are considered essential to understanding how borrow area materials will be placed in the Work. Upon review of the control test data, the Engineer may specify that additional tests be performed prior to approval of a borrow area.

Table 2-6. Site grading fill.

Laboratory/Field Test	Test Frequency
Moisture Content	Minimum 1 per 5,000 m^3
Atterberg Limits	Minimum 1 per soil type or 1 per 5,000 m^3, whichever is more frequent
Gradation	Minimum 1 per soil type or 1 per 5,000 m^3, whichever is more frequent
Moisture/Density Relationship	Minimum 1 per soil type or 1 per 5,000 m^3, whichever is more frequent
In-Place Density and Moisture	Minimum 1 per 1,500 m^3 placed

Table 2-7. Select fill.

Laboratory/Field Test	Test Frequency
Moisture Content	Minimum 1 per 3,000 m^3
Atterberg Limits	Minimum 1 per soil type or 1 per 3,000 m^3, whichever is more frequent
Gradation	Minimum 1 per soil type or 1 per 3,000 m^3, whichever is more frequent
Moisture/Density Relationship	Minimum 1 per soil type or 1 per 3,000 m^3, whichever is more frequent
In-Place Density and Moisture	Minimum 1 per lift per 1,500 m^2

Table 2-8. Overliner drain fill, Select drain fill and Trench drain fill.

Laboratory/Field Test	Test Frequency
Gradation	Minimum 1 per 5,000 m^3
Laboratory Compacted Permeability	Minimum 1 per 50,000 m^3 or as directed by the Engineer based on gradation results

Table 2-9. Anchor trench backfill.

Laboratory/Field Test	Test Frequency
Moisture Content	Minimum 1 per 5,000 m^3
Atterberg Limits	Minimum 1 per soil type or 1 per 5,000 m^3, whichever is more frequent
Gradation	Minimum 1 per soil type or 1 per 5,000 m^3, whichever is more frequent
Moisture/Density Relationship	Minimum 1 per soil type or 1 per 5,000 m^3, whichever is more frequent
In-Place Density and Moisture	Minimum 1 per 150 linear m of trench length

Gradation testing of the rock fill shall not be required. The Engineer will visually inspect the rock fill in conjunction with measurement of the size of select stones to determine its compliance with the gradation requirements.

Tests may be conducted more frequently at the direction of the Engineer. More frequent testing shall be performed, where indicated by the following guidelines:

- Areas where special compaction equipment or methods are used

- Areas where the height of fill rises quickly versus the quantity of fill placed, specifically in areas of slope reduction fill
- Areas where compaction control is particularly important such as around appurtenant structures
- Areas where doubtful construction procedures are being used
- Areas where the required compaction may not have been achieved based upon visual observations
- Areas where unacceptable material may have been placed

3. GEOSYNTHETICS

3.1 Geomembrane

3.1.1 General

The intent of the design is to provide linear low-density polyethylene (LLDPE) geomembrane for the leach pad. The geomembrane shall be manufactured in the largest widths and lengths possible to minimize the number of field seams. The Geomembrane Installer shall install geomembrane materials and miscellaneous materials incident thereto in accordance with the Manufacturer's recommendations. Alignments, lengths and areas are shown on the Drawings. Exact locations and lengths may vary to suit field conditions, as approved by the Engineer.

Direct vehicular contact with the geomembrane shall not be allowed to prevent geomembrane damage. Ultra-violet (UV) sensitive geomembrane shall be protected from exposure to sunlight until placement. After placement, the geomembrane shall be covered within three months of placement, unless otherwise approved by the Owner and warranted by the Manufacturer.

The Installer shall notify the Engineer for written acceptance of the completed geomembrane installation prior to covering the leach pad's geomembrane with drain fill.

The geomembrane materials, installation and testing shall be in accordance with the following sections and shall generally conform to the Geosynthetic Research Institute (GRI) standards GM 13, GM-17 and GM-19 or Engineer approved equivalent.

3.1.2 Manufacturer's Experience

The Manufacturer of the geomembrane shall have previously demonstrated the ability to produce the specified geomembrane by having successfully manufactured a minimum of 500 acres of similar geomembrane for hydraulic lining installations. A list of similar containment projects completed in which the manufactured material has been successfully used shall be submitted and is subject to approval by the Engineer.

3.1.3 Submittal of Engineering Data

The Installer is responsible for supplying engineering data and results of QC testing of the geomembrane materials. The Manufacturer shall allow sufficient time in his production schedule to perform the specified QC testing for the project. The results of all required testing shall be supplied at least seven days prior to

shipment of the materials to the site. The Installer shall furnish the following engineering data prior to construction:

- Shop drawings with panel layouts and appropriate details along with a time schedule for the installation of the geomembrane.
- An instruction manual which includes the proper storage, handling, deployment and seaming of the geomembrane. This manual shall be in compliance with these Technical Specifications and any conditions of warranty.
- QC certificates on the resin used to manufacture the geomembrane. The data submitted on the resin shall include production dates and the results of conformance tests. The submittals for the resin shall also include a statement that no reclaimed polymer was used. The edges of geomembrane that are trimmed during the manufacturing process are not considered reclaimed polymer. All resin shall be of the same type and quality.
- QC certificates on each geomembrane roll. Each certificate shall be customized for the project and shall include but not be limited to: the roll and resin batch numbers, production date of the roll, a listing of the QC tests, test method numbers, values specified for the project and the QC test results. All tests shall be performed prior to submittal of the QC certificates to the Engineer. Test results for each property specified shall be provided on the QC certificate.
- Certification that the geomembrane and extrudate rod or beads are made from the same resin type and have the same properties.

3.1.4 Delivery, Storage and Handling of the Geomembrane

The Installer shall be responsible for transporting, unloading and storing the geomembrane. At the discretion of the Owner, conformance testing, and a plant audit may be performed by the Engineer and/or Owner prior to shipment. In the event that conformance testing is to be performed, the Manufacturer shall not arrange for transport of the geomembrane until such testing is complete. The Installer or Manufacturer shall provide the Engineer and Owner a schedule for manufacturing the materials for the project at least 14 days prior to manufacturing so that testing and travel arrangements can be properly arranged. This schedule shall remain firm throughout the duration of the project. Any proposed changes to the production schedule shall be approved by the Owner. The Engineer shall notify the Manufacturer at least seven days prior to performing the testing or plant audit of his intentions to perform these tasks.

The geomembrane shall be shipped such that it is not damaged in transport and shall be offloaded in the presence of the Owner. Any damage to the geomembrane during the offloading process will be

documented by the Owner. All damaged rolls shall be separated from undamaged material. The final disposition of the damaged rolls shall be determined by the Owner with input from the Engineer. The Installer shall be responsible for replacing any geomembrane determined to be unacceptable at no additional cost to the Owner.

Once the geomembrane rolls have been offloaded, they shall be stacked on a prepared surface no more than three rolls high. The surface shall be prepared such that the geomembrane is not subjected to rocks or sharp objects, water, oil or other deleterious conditions. The geomembrane rolls shall not be placed on pallets.

The Installer shall use appropriate equipment to transport the geomembrane from the storage area and deploy it. This equipment may include a spreader and roll bars and shall not damage the geomembrane or subgrade. Any damage shall be repaired by the Installer to the satisfaction of the Engineer.

3.1.5 Material Requirement

The geomembrane shall be composed of new, first quality material designed and manufactured specifically for the purpose of liquid containment. The geomembrane shall be produced in rolls and shall be free of holes, blisters, undispersed raw material, cuts, folds or any sign of foreign matter. Each roll of geomembrane shall be identified with a label that provides the thickness, length, width, roll number and plant location.

The material shall be warranted against Manufacturer's defects as well as degradation due to UV light for exposed geomembrane for a minimum of 20 years from the date of installation or as mutually agreed upon in writing prior to award of the contract between the Owner and the Manufacturer. This warranty shall cover the cost of material, shipping and handling, labor and equipment to replace the defective or failed material.

The materials and testing shall conform to the standards in Table 3-1 and GRI - GM17 Standard Specification "Test Methods, Test Properties and Testing Frequency for Linear Low-Density Polyethylene (LLDPE) Smooth and Textured Geomembranes".

Table 3-1. Geomembrane properties.

Tested Property	Test Method	Frequency	Test Value
Thickness, Minimum average, mm Lowest individual reading, mm	 ASTM D 5994 ASTM D 5994	 every roll 10 out of 10 rolls	 1.90 1.70
Density, g/cm^3 (min.)	ASTM D 792	Every 10 rolls	0.939
Tensile Properties (min. ave, each direction) Strength at Break, kN/mm Elongation at Break, %	ASTM D 6693, Type IV	Every 2 rolls	 31 380
Tear Resistance (min ave.), N	ASTM D 1004	Every 5 rolls	200
Puncture Resistance, N	ASTM D 4833	Every 5 rolls	500
Carbon Black Content, % (Range)	ASTM D 4218	Every 2 rolls	2.0 - 3.0
Carbon Black Dispersion	ASTM D 5596	Every 10 rolls	Note 1
Asperity Height (min. avg), mm	ASTM D 7466	Every roll	0.50

Notes:

1. Carbon black dispersion (only near spherical agglomerates) for 10 different views: 9 in Categories 1 or 2 and 1 in Category 3.
2. Independent testing utilizing project specific materials may be required for allowances.

3.1.6 Conformance Testing

Prior to or upon delivery to the site, samples of the geomembrane shall be removed by the Owner or Engineer and sent to a laboratory selected by the Owner for testing to ensure conformance to the requirements of these Technical Specifications. Conformance sampling may be performed at the Manufacturer's plant or in the field at the site. Unless testing is performed prior to shipment, the Installer shall deliver the geomembrane to the site an adequate period of time prior to installation to allow for sufficient time for sampling and testing, as specified by the Owner or Engineer.

Samples shall be taken at the rate of one sample per batch or one sample per 6 acres, whichever is less. Samples shall be taken from across the entire width of the geomembrane roll and shall be at least 1 m long unless otherwise approved by the Engineer. The samples shall not include the first 1 m of the roll. The Engineer may increase the frequency of sampling in the event that test results do not comply with these

Specifications. Any material that is not certified in accordance with the Specifications shall be rejected and replaced with new material.

3.1.7 Installation

Installation of the geomembrane shall be performed by the geomembrane Manufacturer or an Installer trained and certified by the Manufacturer. The purpose of these Specifications is to achieve a lined system as free of defects as current installation and inspection techniques will allow.

Surfaces to receive geomembrane shall be prepared as specified in Section 2.3 - Subgrade Preparation of these Technical Specifications. The surfaces shall be smooth and free of all rocks, stones, sticks, roots, sharp objects or debris of any kind. The surface shall provide a firm, unyielding foundation for the geomembrane with no sudden, sharp or abrupt changes in grade. No standing water or excessive moisture shall be allowed. The Installer shall certify in writing that the surface on which the geomembrane is to be installed is acceptable before commencing work.

Once the subgrade is acceptable, it shall be maintained until the geomembrane has been installed and accepted. Any rough areas or damage caused by the installation shall be repaired by the Installer. The leading edge of the anchor trench shall be rounded to avoid a sharp bend in the geomembrane.

3.1.7.1 Placement

To the maximum extent possible, the geomembrane panels shall be oriented such that they are perpendicular to the natural contours (parallel to the maximum slope). Unless otherwise approved in writing by the Engineer, no horizontal seams will be allowed on slopes steeper than 3H:1V. All seams shall be oriented such that they are shingled in a down-slope direction. If cross seams are required on a steep slope, the end of each panel shall be cut at a diagonal of 45 degrees and seamed to prevent installation of a horizontal seam. The geomembrane shall be placed according to the panel layout drawing submitted by the Installer and approved by the Engineer.

Each geomembrane panel shall be labeled with a unique identification number or code which is agreed to by all parties. The geomembrane shall be placed using methods and equipment that do not damage it or the subgrade. Installation personnel working on the geomembrane shall not smoke, wear shoes that could damage the geomembrane or engage in potentially damaging activities.

The Installer shall use appropriate means to protect the geomembrane from uplift from the wind. Edges of panels shall have continuous ballast to lessen the chance of wind flow under the panels. The material used to hold down the geomembrane shall not cause damage to it. No vehicles shall be allowed to drive over exposed geomembrane.

As the geomembrane material is deployed, it shall be visually inspected, and any defects marked for repair. If a significant number of defects are identified as determined by the Engineer, the material shall be removed and replaced at no expense to the Owner. No geomembrane deployment shall be allowed during periods of wet or extremely windy weather or in the presence of ponded water.

The Installer shall provide sufficient slack in the geomembrane to allow for contraction due to cold temperatures. Prior to the start of construction, the Installer shall submit calculations and a resultant table showing the amount of extra material required per 30 m of geomembrane in place, for a given temperature.

3.1.7.2 Seaming

Prior to installation, the Installer shall submit the resumes of seaming personnel who will be used on the project. At least one seaming supervisor shall be present who has the experience of a minimum of 0.5 hectares of geomembrane installation using the seaming device proposed for use at the project site.

The Installer shall weld the geomembrane, where possible, using the double-wedge fusion welding method. No seaming shall begin until each welding technician and apparatus used in the field has passed a test weld. Scrap pieces of geomembrane material at least 1 m long and 0.3 m wide shall be seamed together under the same conditions as those in the area to be lined. A minimum of four 25 mm wide coupons shall be cut from the test weld and quantitatively tested for shear and peel with a field tensiometer in accordance with ASTM D-6392. A test weld passes when the break is ductile and a film tearing bond (FTB); and the following minimum values are met:

Table 3-2. LLDPE seam strength properties.

Material	Shear Strength (PPI)	Fusion Peel (PPI)	Extrusion Peel (PPI)
2.0 mm Textured	120	100	88

A test weld is considered passing when all coupons pass the above requirements. If repeated test welds fail, the welding technician or apparatus may not be used until the reason for the failing values is identified.

Once the test welds have passed and are approved by the Engineer, seaming of the geomembrane may begin.

The geomembrane panels shall overlap a minimum of 75 mm for extrusion welding and 100 mm for fusion welding. Any fish-mouths or wrinkles at seam overlaps shall be cut out and removed. If the overlap after cutting is less than 75 mm, the area shall be patched. As seaming progresses, the Installer shall log the temperature measured at 150 mm above the geomembrane, the operating temperature, pressure and speed of the wedge welder and the extrudate temperatures in the barrel and at the nozzle of the extrusion welder.

If a hot wedge welding device is used by the Installer, it shall be self-propelled and equipped with gauges that monitor the temperature and speed of the apparatus. The wedge welder shall not be placed directly on the geomembrane when not in use. The Installer shall make sure that there is no dirt or moisture build-up between the geomembrane sheets.

When using an extrusion welder, the Installer shall tack bond the geomembrane sheets together in a manner that does not damage the geomembrane. The Installer shall thoroughly clean and dry the seam area immediately before tack bonding (lystering) and wedge welding. Prior to welding and after any work stoppages of more than three minutes, the welding apparatus shall be purged of heat-degraded extrudate. The top edges of the geomembrane shall be beveled prior to welding and the oxidation on the geomembrane surface shall be removed by a disc grinder no more than a half hour before welding. On seams that are more than five minutes old, the end of the seam shall be ground prior to continuing the weld. All grind marks shall not extend more than 6 mm beyond the weld head. The grinder shall be held parallel to the geomembrane edge and any area where grinding removes more than 4 mils shall be patched.

Cold weather installations should follow guidelines as outlined in GRI GM9: Standard Practice for Cold Weather Seaming of Geomembranes. No geomembrane material shall be seamed when liner (sheet) temperatures are less than 0 degrees C (32 degrees F) unless the following conditions are complied with:

1. Seaming of the geomembrane at material temperatures below 0 degrees C (32 degrees F) is allowed if the Geomembrane Installer can demonstrate to the Engineer, using pre-qualification test seams, that field seams comply with the project specifications, the safety of the crew is ensured, and geomembrane material can be fabricated (i.e. pipe-boots, penetrations, repairs, etc.) at sub-freezing temperatures.

2. The Geomembrane Installer shall submit to the Engineer for approval, detailed procedures for seaming at low temperatures, including the following:
    a. Preheating of the geomembrane, if necessary.
    b. The provision of a tent or other device if necessary, to prevent heat losses during seaming and rapid heat losses subsequent to seaming.
    c. Number of test welds to determine appropriate seaming parameters.

Trial welds shall always be done in the environment (temperature) and geometry in which production welding is to be done.

Freezing temperatures can cause geomembrane sheets to crack when unrolled, folded, impacted or loaded. Geomembranes when unrolled or folded in cold weather should not crack, craze, or distort in texture. A sheet temperature of minus 10 degrees C (14 degrees F) is the lower limit that a geomembrane shall be unrolled unless it is shown otherwise to the satisfaction of the Engineer.

Section 2.8.1.2 of the project technical specifications addresses placement of Overliner Drain Fill (ODF) on the installed liner. A sheet temperature of minus 10 degrees C (14 degrees F) is the lower limit that ODF shall be placed on the geomembrane unless it is shown otherwise to the satisfaction of the Engineer.

3.1.7.3 Seaming Equipment

The approved processes for field seaming are extrusion welding and fusion (hot wedge) welding. The preferred method of seaming is the double-fusion welding. Proposed alternative processes shall be documented and submitted to the Owner or Engineer for approval.

The extrusion welding apparatus shall be equipped with gauges giving the temperature of the apparatus at the nozzle. The fusion-welding apparatus shall be an automated vehicular-mounted device which produces a double seam with an enclosed space. The fusion welding apparatus shall be equipped with gauges giving the applicable temperatures. The Engineer shall verify that:

- Equipment used for seaming is not likely to damage the geomembrane.
- The extrusion welder is purged prior to beginning a seam until all heat-degraded extrudate has been removed from the barrel.
- The electric generator is placed on a smooth base such that no damage occurs to the geomembrane.

The Installer shall carry on-site spare welders and the necessary spare parts for their repair, such that construction delays do not occur.

3.1.8 Field Quality Control

The Installer shall designate a technician that is responsible for supervising and/or conducting the Installer's field quality control program. Testing of the geomembrane seams shall consist of both destructive and non-destructive testing. All seams shall be 100 percent inspected using non-destructive test methods. Non-destructive and destructive testing procedures are outlined below.

In addition to the field seam testing specified herein, the Installer shall water test the top geomembrane installed in the Event Pond sump area with ponded fresh water to a level of 3 m above the top of the sump. No leaks shall be detected by the pond's leak detection system over a 48-hour period prior to acceptance by the Owner. If leaks occur in the installed geomembrane, the Installer shall find and repair the leaks and retest as before.

The Installer shall test the In-Heap Pond upper liner for post-installation damage utilizing spark testing technology per ASTM D 7240 and utilizing electrical resistivity testing per ASTM D 7002 on exposed geomembranes and ASTM D 7007 after water or cover soil placement. If leaks are detected in the installed geomembrane, the Installer shall find and repair the leaks and retest as before.

3.1.8.1 Non-Destructive Testing

Vacuum boxes shall be used to non-destructively test extrusion or single wedge fusion welds over their entire length. Prior to using the vacuum box, the weld to be tested shall be wetted with a soapy solution. The vacuum box shall then be placed over the weld and a vacuum of 35 to 56 kN/m2 (5 to 8 psi) shall be drawn. The entire length of the box shall be observed through the viewing window for the creation of bubbles for a period of at least 15 seconds and shall be tested with a minimum of 75 mm of overlap with the previous section. Any areas that bubbles appear on, shall be identified, repaired and retested.

In areas that cannot be tested with a vacuum box, the seam should be cap-stripped if possible. If the seam can be tested prior to installation, then the Installer shall do so. Seaming and testing in these areas shall be observed by the Engineer.

If the double hot wedge welding system is used, air pressure testing may be conducted instead of vacuum testing. Each continuous length of seam shall be pressurized to 210 kN/m2 (30 psi) and monitored for a

period of 5 minutes. In order to pass, the seam shall stabilize and not lose more than 28 kN/m2 (4 psi) of pressure. The test method shall include a method to verify that the entire length of the air channel is pressurized. If the wedge weld cannot be air tested because of a blockage in the air channel, the welded seam shall be considered a failure. Any failed seams shall be repaired and retested. The repair may include running an extrusion weld along the wedge weld.

3.1.8.2 Destructive Testing

The location of all destructive tests shall be determined by the Engineer. A minimum of one sample per 150 m of seam shall be obtained. The frequency of testing may be increased by the Engineer to suit the field conditions. The Installer shall repair any suspicious looking welds before release of a seam for destructive sampling. Destructive samples shall be cut as the installation progresses and not at the completion of the project. All destructive samples shall be marked with consecutive numbers along with the seam number. A log shall be kept with the date, time, location, seaming technician, apparatus, temperature and pass or fail criteria. All destructive sample holes shall be repaired immediately. The destructive samples shall be a minimum of 0.3 m wide by 1m long with the seam centered lengthwise.

The destructive samples shall be cut into three total samples, two which are 0.3 m by 0.3 m (one each for the Installer and Owner) and one which is 0.3 m by 1.0 m (for the Engineer). Prior to removing a destructive sample, two 25 mm coupons shall be cut off of each end of the designated destructive sample location and tested in the field using a field tensiometer. These coupons shall pass the specified requirements for shear and peel. If a coupon sample fails, the Installer shall go a minimum of 3 m in each direction and obtain additional samples for retesting. These samples shall also be given to the Engineer for testing using a field tensiometer. This procedure shall continue until the coupons on each side of a destructive sample location pass the shear and peel criteria.

Once the sample coupons pass the seam strength requirements, a destructive sample shall be obtained and divided as specified above. No destructive sample need be obtained between failing coupon tests. The destructive samples shall be tested in the field by the Engineer or the testing may be conducted offsite with the consent of the Owner.

For each destructive test, a minimum of five samples in shear and five samples in peel shall be tested according to ASTM D-6392. In order to have passing results, a minimum of four out of five samples shall meet the specified test values. In order for one failed test out of five to be acceptable, the failure shall be ductile, a film tearing bond and shall be within 80 percent of the required specifications.

The seam must exhibit film tear bond (FTB). Welds should have < 25% incursion into the weld. The minimum values in Tables 4-2 and 4-3 must be met.

The Engineer will notify the Installer and Owner of any failing results. Should a destructive sample fail, the Installer shall move 3 m in either direction from the failure and take additional destructive samples. This procedure shall continue until passing results are obtained. The Installer shall repair or cap-strip seams that have failing destructive tests. The Installer shall not cover any seams which have not been tested unless he agrees in writing to uncover any failing seams and make the required repairs.

3.1.9 Repairs

The Installer may repair holes smaller than 6 mm by using an extrusion weld. The surface oxidation surrounding the hole shall be removed a minimum of 125 mm around the hole and then immediately welded. After the hole has been welded, it shall be vacuum tested for leaks. The result of the test, the name of the tester and the date shall be recorded on the geomembrane near the repair.

All destructive sample holes, tears, large holes or areas with blisters or undispersed raw materials shall be patched. Patches shall be round or oval in shape, extend at least 150 mm beyond the defect and made of the same material as the geomembrane. The edge of the patch shall be beveled and welded to the geomembrane according the procedures outlined for extrusion welding. All patches shall be vacuum tested, and the results recorded on the geomembrane.

For areas that have very large defects, the material shall be removed and replaced. All folds or large wrinkles shall also be removed. The Engineer shall determine the areas that require removal. Seams that fail destructive testing or cannot be vacuum tested shall be cap-stripped. Bridging or trampolining of the geomembrane shall also be repaired prior to covering. At no time shall the Installer discard excess geomembrane, packaging materials or other items beneath the geomembrane.

3.1.10 Quality Assurance Acceptance

Quality Assurance testing will be performed by the Engineer in accordance with these Specifications. The Installer shall be responsible for notifying the Engineer when areas of Work are completed and ready for QA testing. Additionally, the Installer shall allow time for the testing to be performed. Every reasonable effort will be made to expedite the necessary testing; nevertheless, delays occasioned by testing will not be considered grounds for extension of time to complete the contract Work.

The Installer shall be responsible for maintaining the geomembrane until final acceptance by the Engineer. The Engineer will recommend final acceptance when all seams have passed destructive testing, the Installer has supplied all documentation and all field and laboratory testing is complete and satisfactory. As part of the final acceptance, the Installer shall furnish reproducible as-built drawings showing the location of the geomembrane panels, seams, repairs, patches and destructive samples. The drawings shall be prepared on 24 by 32-inch size sheets to a scale approved by the Engineer. They shall be submitted in final form to the Owner within two weeks after completion of each phase of construction.

3.2 Nonwoven Geotextile

A 405 gr/sq. m (12 oz/sq. yd) nonwoven geotextile will be used as specified on the Drawings.

3.2.1 Material Requirement

The nonwoven geotextile shall be of new, first-quality (needle-punched) material having polymer of 100 percent polyethylene, 100 percent polypropylene or polyester/polypropylene blend designed and manufactured specifically for the purpose of separation, tensile reinforcement, planar flow and filtration. The geotextile material shall be produced such that it is free of holes, undispersed raw materials, broken needles or any sign of contamination by foreign matter. The geotextile shall be uniform in color, thickness, size and texture and all rolls shall be properly tagged and identified by the Manufacturer.

The non-woven geotextile shall conform to the following minimum average roll values (MARV) unless otherwise specified.

Table 3-3. Minimum average roll values for non-woven geotextile.

Nonwoven Geotextile Property	ASTM Test Method	Value[1]
		405 gr/sq. m (12 oz/sq. yd)
Grab Tensile Strength, N (lb.)	D-4632	1,420 (320)
Grab Elongation, %	D-4632	50
Puncture Strength, N (lb.)	D-4833	930 (210)
Mullen Burst, kPa (psi)	D-3786	4,270 (620)
Trapezoidal Tear Strength, N (lb.)	D-4533	555 (125)
Apparent Opening Size, US Sieve No. (mm)	D-4751	100 (0.150)
Permeability, cm/sec	D-4491	0.29
Water Flow Rate, lpm/m^2 (gpm/ft^2)	D-4491	2,440 (60)
UV Resistance (retained after 500 hours), %	D-4355	70

Note:

1. All values are MARV except apparent opening size; it is the maximum average value per roll and the UV resistance is the minimum value.

3.2.2 Installation

The nonwoven geotextile fabric sheets shall be placed as shown on the Drawings or as directed by the Engineer. All joints shall have a 0.15 m minimum overlap and shall be heat fused or sewn. The integrity of each seam is important. As a means of regulating the fusion machines, frequent samples of seams will be tested for grab strength. Minimum grab strength of 80 percent of the fabric strength, as defined above, will be required. Any machine that produces failing samples shall be repaired or removed from the Work. On slopes steeper than 10H:1V, all seams shall be oriented parallel to the slope direction. Seams constructed perpendicular or transverse to the direction of the slope will not be accepted, unless approved by the Engineer.

Seams shall be sewn using a Type 401 stitch. One or two rows of stitching may be used. Each row of stitching shall consist of four to seven stitches per 25 mm. The minimum seam allowance (minimum distance from the geotextile edge to the stitch line nearest that edge) shall be 38 mm if a Type SSa (prayer or flat) seam is used. The minimum seam allowance for all other seam types shall be 25 mm. The Engineer

shall have final approval of all seams. The Installer shall ensure that no soil materials are present within seams or overlaps.

All seams will be inspected for continuity and the Installer shall repair any gaps or seams that are flawed. Costs for repairing the geotextile shall be borne by the Installer.

Sandbags shall be provided as ballast to hold the various layers of geotextile in place prior to the next operation. If permanently left in place to ensure that wind damage does not occur during the expected exposure life, sufficient ultraviolet-resistant sandbags shall be used.

3.3 Geosynthetic Clay Liner

A geosynthetic clay liner (GCL) will be used in the leach pad liner system instead of the low-permeability clay soil liner for the HLF and ponds, as shown on the Drawings.

3.3.1 Material Requirement

The GCL shall be reinforced consisting of a layer of sodium bentonite between two nonwoven geotextiles, which are needle-punched together (similar to GSE BentoLiner “NWL-60” or equivalent). The geotextile shall conform to the standards in the previous section of these Specifications. The GCL material shall be warranted against Manufacturer’s defects for a period mutually agreed upon in writing prior to award of the contract between the Owner and the Manufacturer. This warranty shall cover the cost of material, shipping and handling, labor and equipment to replace the defective or failed material.

The GCL material shall conform to the following standards and shall be free of tears, holes or other defects that may affect its serviceability.

Table 3-4. GCL material standards.

GCL Property	ASTM Test Method	Required Value
Bentonite Swell Index	D-5890	24 mL/2 g min.
Bentonite Fluid Loss	D-5891	18 mL max.
Bentonite Mass/Area[1]	D-5993	3.6 kg/m^2 min.
GCL Tensile Strength[2]	D-6768	7.8 kN/m MARV
GCL Peel Strength[2]	D-4632 D-6496	93 N min. 610 N/m min.
GCL Hydraulic Conductivity	D-5887	5 x 10^{-9} cm/sec max.
GCL Hydrated Internal Shear Strength[3]	D-5321 D-6243	24 kPa typ.

Notes:

1. At 0 percent moisture content.
2. Testing is performed in the machine direction using 100-mm grips. Results are reported as minimum average roll values (MARV) unless otherwise indicated.
3. Peak values measured at 10 kPa (200 psf) normal stress for a specimen hydrated for 48 hours.

The GCL material shall be sampled and tested in accordance with the Manufacturer's approved QC Manual.

3.3.2 Installation

In general, the GCL material shall be installed in accordance with the procedures provided in the Manufacturer's QC Manual and approved by the Engineer. In particular, the following procedures shall be followed.

The GCL rolls shall be protected from damage during shipping and exposure to the elements until time of deployment. Rolls damaged during shipping, storing and deploying or from climate exposure, in ways that affect the quality of the GCL as an effective seepage barrier, shall be rejected as determined by the Engineer and replaced with acceptable rolls.

The subgrade shall be prepared in accordance with Section 2.3 - Subgrade Preparation of these Technical Specifications prior to GCL installation. The GCL shall be installed in advance of the geomembrane

installation, provided the GCL panels can be covered with seamed geomembrane within each day of deployment. Only those GCL panels that can be covered in the same day shall be unpackaged and installed. If exposed GCL cannot be permanently covered before the end of the work day, it shall be temporarily covered with plastic or other waterproof material to prevent hydration.

The GCL panels shall be placed with seams oriented parallel to the line of maximum slope and shall be free of tension or stress upon completion of the installation. Panels shall be positioned with the seam overlap not less than 250 mm (12 in) for longitudinal seams and 500 mm (24 in) for end-of-panel seams. Dirt or other foreign matter shall be removed from the overlap area immediately prior to seaming. Granular sodium bentonite of the same type as the bentonite used in the GCL shall be placed along the entire seam overlap at minimum widths of 75 mm (3 in) and 250 mm (12 in) from the edge of the underlying panel for longitudinal and end-of-panel seams, respectively. The minimum application rate of the granular sodium bentonite shall be 0.27 lb./ft. End-of-panel overlapped seams shall be constructed such that they are shingled in the direction of the grade to prevent runoff from entering the overlap zone.

Holes or tears in the GCL shall be repaired by placing a patch of GCL extending a minimum of 250 mm (12 in) beyond the edges of the hole or tear on all sides. Granular sodium bentonite or bentonite mastic shall be applied in the overlap area. Patches shall be secured with construction adhesive or other approved methods.

GCL shall not be covered prior to inspection and approval by the Engineer.

REV A	27 NOV 2019	Internal Review	W. Reinhardt	C. Green
REV B	6 DEC 2019	Client Review	W. Reinhardt	C. Green
REV 0	6 JAN 2020	Issued for Construction	W. Reinhardt	C. Green

4. PIPEWORK AND APUURTENANCES

4.1 Corrugated PE Pipe

This section refers to all corrugated polyethylene (PE) pipework to be used in the project including solution collection and drainage pipes. Pipe and fittings shall be made of virgin polyethylene compounds, which shall have a minimum cell classification of 324420C for 75 mm through 250 mm diameters or 335420C for 300 mm through 1,500 mm diameters as defined in ATSM D-3350. Pipe and fittings shall be manufactured and comply with AASHTO Standard Specifications M-252, M-294 and MP-7. All sizes shall conform to the AASHTO classification “Type S” for dual wall smooth interior solid pipe, “Type SP” for dual wall smooth interior perforated pipe, and “type CP” for single wall perforated pipe, or “Type D” for diameters greater than 1,050 mm. Sealed couplers shall conform to ASTM D-3212.

Dual wall pipe shall have minimum pipe stiffness at 5 percent deflection when tested in accordance with ASTM D-2412. Where perforations are specified, they shall conform to the requirements as follows:

- ASTM F-667 for 75 mm diameter pipe
- AASHTO M-252 “Class 2” for 100 mm to 250 mm diameter pipe
- AASHTO M-294 “Class 2” for 300 mm to 1,200 mm diameter pipe
- AASHTO MP-7 “Class 2” for 1,500 mm diameter pipe

Slots shall be cut circumferentially unless specified otherwise.

Couplings shall be corrugated to match the pipe corrugations and shall provide sufficient longitudinal strength to preserve pipe alignment and prevent separation at the joints. Couplings, unless watertight connections are specified, shall be split collar and shall engage at least two full corrugations on each pipe section.

4.2 HDPE Pipe

Materials used for the manufacture of high-density polyethylene (HDPE) pipe and fittings shall not contain any recycled compounds other than those generated in the Manufacturer’s plant from the resin of the same specification and from the same raw material supplier. The material shall be very high molecular weight, high-density ethylene/hexene copolymer polyethylene resin, having a material designation of PE 4710. The material classification shall be Type III, PE 34 and the minimum Cell Classification shall be 345464C as per ASTM D-3350.

Table 3-5. Physical Material Properties for HDPE Pipe (PE 4710)

Property	Unit	Standard	Nominal Value
Material Designation	-	ASTM F412	PE 4710
Cell Classification	-	ASTM D3350	445474 C (black)
Density (Natural)	g/cc	ASTM D1505	0.947
Density (Black)	g/cc	ASTM D1505	0.959
Melt Index	g/10 minutes	ASTM D1238	<0.08
Flexural Modulus	psi	ASTM D790	140,000
Tensile Strength @ Ultimate	psi	ASTM D638	5,000
Tensile Strength @ yield	psi	ASTM D638	>36,000
PENT	hours	ASTM F1473	>500
ESCR	hours	ASTM D1693	>10,000
HDB at 73˚F (23˚C)	psi	ASTM D2837	1,600
Color; UV Stabilizer	% C	ASTM D1603	Black with minimum 2% carbon black with UV Stabilizer
Modulus of Elasticity (long term)	psi	ASTM D638	30,000

Dimensions and workmanship for HDPE pipe shall be as specified by ASTM F-714, D-2513 and D-3035, and pipe diameters shall be as specified on the Drawings. Slots in slotted pipe shall be as specified on the Drawings.

HDPE pipe lengths shall be joined by thermal butt fusion in strict accordance with the pipe Manufacturer's recommendations, unless flanged end pipes are specified on the Drawings. The butt fusion equipment used in the joining procedures shall be capable of meeting all conditions recommended by the pipe Manufacturer. Stub ends and pipe fittings for butt fusion shall be of at least the same wall thickness and pressure rating and the same resin type, grade, and cell classification and Manufacturer as the pipe to be joined, unless otherwise recommended by the Manufacturer. Thermal butt fusion of HDPE pipe shall be carried out by qualified technicians.

Backup rings for flanged joints shall be the convoluted type of ductile iron material (ASTM 536-80 Grade Range from 60/40/18 to 64/45/12), drilled to ANSI bolt circles, and have a pressure rating of 1,030 kPa (150 psi), unless otherwise specified. Backup flanges and bolts shall be as approved or supplied by the pipe Manufacturer.

4.3 Delivery, Handling and Storage

Pipe, fittings, valves and other appurtenances shall be loaded and unloaded by lifting with hoists in such a manner as to avoid damage or hazard. The interior of all pipe and fittings shall be kept free from dirt and foreign material at all times.

The Contractor shall be responsible for all material furnished to him and shall replace or repair, in a manner approved by the Engineer, at the Contractor's expense, all such material damaged in handling after delivery by the Owner. This shall include the furnishing of all materials and labor required for the replacement of installed material discovered damaged prior to the final acceptance of the work. All materials are to be stored on dunnage or other suitable materials to keep the piping material off the ground.

4.4 Installation

The Contractor shall furnish and install the pipework and miscellaneous materials incident thereto, in accordance with the Manufacturer's instructions and recommendations. The pipework shall be installed to the lines and grades and generally in the manner shown on the Drawings. Where specific lines and grades are not indicated on the Drawings, the lines and grades will be specified by the Engineer in the field to suit the existing ground conditions. The pipe shall be installed using equipment and methods described in these Specifications and in accordance with the pipe Manufacturer's recommendations for handling and placement of the pipe and fittings.

The pipework shall be installed in accordance with good piping practices, whether such practices are specifically detailed on the Drawings or not. The general layout as shown on the Drawings shall be maintained. Where interference is encountered during installation or relocation of pipework is deemed necessary, the Engineer shall be consulted and shall approve the revised plan before any changes are made.

All pipework shall be erected to preserve accurate alignment. Care shall be taken during the installation of pipeline runs where drainage is required to ensure that the pipeline has a continuous slope to the point of drainage.

Construction equipment shall not cross over installed pipework unless covered with specified material or protective cover fill approved by the Engineer. If pipework is damaged by the Contractor's method of installation and construction and are deemed not suitable for use in construction, as determined by the Engineer, the damaged pipework shall be replaced by the Contractor at no expense to the Owner.

Prior to installation, each segment of pipe and all fittings shall be inspected for defects and/or damage. Care shall be exercised to prevent foreign matter from entering the pipe while it is being installed. Open ends of the pipe shall be covered by temporary end caps or other approved means when installation is not in progress to prevent foreign matter from entering the pipe.

Pipe bends to form curves either in the horizontal or vertical plane shall not exceed that recommended by the Manufacturer or approved by the Engineer. The cutting of pipe for inserting fittings or closure pieces shall be done in a neat and workmanship like manner without damage to the pipe and so as to leave a smooth end at right angles to the axis of the pipe.

Couplers used to join two sections of corrugated pipe together or to join a pipe section with a fitting (e.g., wye, tee, etc.) shall be of the snap variety for diameters of 250 mm or less and of the split variety for diameters greater than 300 mm. Zip ties used to secure split couplers must be manufactured of the same material as that for the couplers themselves. All unions between pipe sections or specific fittings shall be completed such that the seam in the split coupler (for diameters that require split couplers) shall be rotated to the pipe spring line such that the potential ingress of solids is eliminated.

During actual solution collection pipework installation, methods shall be developed to ensure the corrugated pipe is not damaged during installation or backfilling. Sequencing of corrugated pipe placement on the leach pad shall be done such that vehicle traffic is minimized over the completed areas.

4.5 Joining

4.5.1 Heat Fusion

Pipe and fittings shall be joined by one of the following types of thermal fusion in accordance with the manufacturer's recommended procedures: butt fusion, saddle fusion, or socket fusion. Upon request, the manufacturer shall provide fusion training by authorized personnel or an authorized representative. The Contractor shall be responsible for ensuring that personnel have received proper training in accordance with the manufacturer's recommended procedures. Records of training shall be maintained by the Contractor and evidence of training shall not exceed 12 months from date of construction.

Butt fusions performed between pipe ends or pipe ends, and fittings shall be within the following allowable wall mismatches:

- Two (2) SDR difference for pipe and fitting diameters six (6) inch IPS and smaller
- One (1) SDR difference for above six (6) inch through 18 inches
- No difference for diameters above 18 inches.

The difference in SDR is determined from the following SDR values: 7, 9, 11, 13.5, 17, 21, 26, and 32.5. Contractor is to maintain a fusion map showing who was responsible for all fusion welds for all piping.

4.5.2 Other Methods of Joining

Polyethylene pipe and fittings where heat fusion is not possible may be joined together or to other materials through the use of electrofusion fittings; flange adapters with backup rings; mechanical couplings designed for connecting polyethylene pipe and fittings to itself or to another material; or Mechanical Joint (MJ) adapters. All alternative joining methods and devices shall be approved by the Engineer. The manufacturer of the joining device shall be consulted for proper installation procedures.

4.5.3 Marking

Pipe and tubing shall be permanently marked in accordance with all applicable standards in accordance with this specification. Marking, as follows, shall be continuously (or spaced at intervals not exceeding 5 feet) heat-stamped indent print and shall remain legible under normal handling and installation practices:

1. Name and/or trademark of the pipe manufacturer
2. Nominal pipe size
3. Dimensional Ratio (DR)
4. The letters PE followed by the polyethylene grade per ASTM D3350, followed by the Hydrostatic Design basis in 100's of psi, e.g., PE 4710
5. Manufacturing Standard Reference, e.g., ASTM F714
6. A production code from which the date and place of manufacture can be determined

Fittings shall be marked on the body or hub. Marking shall be in accordance with the applicable standard depending on the fitting type. Marking on the fitting shall include the following whenever possible:

1. Nominal size and Outside Diameter (OD) base (such as 12-inch IPS)
2. Standard material code designation (such as PE 4710)
3. Dimension ratio
4. Pressure class if for pressure service

Mechanical fittings shall be marked with size, body material designation code, pressure rating, and the manufacturer's name or trademark.

4.5.4 Testing

The Contractor shall be responsible for field setup and performance of the fusion equipment and the fusion procedure used by the operator. Upon request, the Contractor shall verify the fusion quality by marking and testing in accordance with the manufacturer's recommended qualification procedure. The Contractor shall be responsible for the necessary adjustments to the setup, equipment, operation, and fusion procedure. Fusions that fail the qualification procedure shall be remade.

At a minimum, in-service testing shall be conducted on all HDPE solid collection piping system and show no signs of leakage.

EXECUTIVE SUMMARY

Tetra Tech Canada Inc. has completed the construction quality assurance program during the installation of the geosynthetic liner system at the Eagle Gold Heap Leach Facility – Phase 1B (HLF – Phase 1B) located at Dublin Gulch, Yukon territory, approximately 85 km north of the Town of Mayo, Yukon Territory, centred at 62° 2'N, 135° 50'W.

The HLF – Phase 1B project included constructing the subgrade, which included sloping of the subgrade, installing a central header drain, and installing lateral drains, and geosynthetic placement of geocomposite liner and 80 mm LLDPE liner.

This report covers the installation of the geosynthetic liner system for Phase 1B.

The purpose of the construction quality assurance program was to verify the Contractor's quality control program and conformance with the plans and specifications prepared for the project and the final preparation of the subgrade.

The completion of the construction quality assurance program demonstrates that the geosynthetic installation completed to date was completed in accordance with the project plans and specifications, and any variances documented and accepted by the proper authorities.

LIMITATIONS OF REPORT

This report and its contents are intended for the sole use of Victoria Gold Corp. and their agents. Tetra Tech Canada Inc. (Tetra Tech) does not accept any responsibility for the accuracy of any of the data, the analysis, or the recommendations contained or referenced in the report when the report is used or relied upon by any Party other than Victoria Gold Corp., or for any Project other than the proposed development at the subject site. Any such unauthorized use of this report is at the sole risk of the user. Use of this document is subject to the Limitations on the Use of this Document attached in the Appendix or Contractual Terms and Conditions executed by both parties.

1.0 INTRODUCTION

1.1 Project Organization

The StrataGold Corporation (StrataGold), a wholly-owned subsidiary of Victoria Gold Corp. who operates the Eagle Gold Mine (EGM), contracted NND-EBA Land Protection Corp., operating as NELPCo Limited Partnership (NELPCo) to conduct Construction Quality Assurance (CQA) inspections for the Eagle Gold Heap Leach Facility – Phase 1B (Phase 1B) geosynthetic liner installation at the Eagle Gold Mine in Central Yukon, north of Mayo, YT. Tetra Tech is NELPCo's engineering services provider and provided CQA services throughout the project's duration on behalf of NELPCo.

Tetra Tech's Project Manager for the project was Chad Cowan, P.Eng., with Adam Mickey, E.I.T. and James Buyck acting as Tetra Tech's CQA monitors for the entire geosynthetics portion of the project, as well, Mr. Mickey provided inspection services for header and lateral drain installation prior to the commencement of geosynthetic placement. Tetra Tech's CQA monitor was on site on a full-time basis for all geosynthetics installation. They worked closely with the Contractor supervising daily activities such as panel placement, wedge welder and extruder qualifications, liner installation and repair inspection, and all testing completed on the liner materials, both destructive and non-destructive.

Forte Dynamics (Forte), out of Fort Collins Colorado, was retained to provide the design and specifications for Phase 1B and be the Engineer-of-Record (EOR) for the project. Clint Green and Will Reinhart were Forte's representatives for Phase 1B.

JDS Energy and Mining (JDS) were retained to provide project management services for Phase 1B. Clint Abel was JDS's representative on site for the duration of the project.

Layfield Environmental Containment (Layfield) of Edmonton, Alberta were retained to provide the geosynthetics for the liner system, as well as install the geosynthetics and provide QC inspection of deployed liner. The project supervisor was Chad Messervey, and Jason Wheeler was the project manager for the project.

Ewing Transport Ltd (Ewing) was retained as the construction contractor for Phase 1B. Their activities included installing the lateral and header drains, preparing the subgrade for geosynthetics placement, and assisting with liner deployment activities.

1.2 General

Tetra Tech Canada Inc. (Tetra Tech) has prepared this CQA Report that details the CQA program completed during the installation of the geosynthetic liner system for Phase 1B of the Heap Leach Facility (HLF). The liner system was installed above the existing Heap Leach Facility – Phase 1A (Phase 1A).

The geosynthetics CQA program was implemented to ensure that the liner system installed for Phase 1B of the HLF satisfied the design requirements and was installed in accordance with the plans and specifications prepared for the project by Forte Dynamics, as well as any variances that were documented and accepted by the proper authorities.

For this report, the term CQA refers to the activities of Tetra Tech relating to the testing and inspections required to assure the Client that the various elements met the requirements of the project specifications, which is distinct from

quality control (QC). QC refers to the activities of the Contractor in the construction of various elements to meet the requirements of the specification.

1.3 Project Description

1.3.1 Project

The HLF at the Eagle Gold Mine (EGM) is constructed in phases as ore is stacked and leached in the facility, exhausting the installed liner systems' available space. The EGM will utilize three HLF construction phases to bring the HLF to its final size. Prior to Phase 1B, Phase 1A and the In-heap Pond had been constructed and lined with geosynthetics. The In-heap Pond is a double liner system, while all subsequent phases are a single liner system. The single liner system is installed directly on the prepared subgrade and consists of the following layers (starting from the top to the bottom):

- An 80-millimetre (80-mil), textured double-sided low-density polyethylene (LLDPE) geomembrane liner; and
- A geosynthetic clay liner (GCL), which is reinforced with a layer of sodium bentonite.

1.3.2 Project Location

The Eagle Gold Mine is located in Dublin Gulch, approximately 85 km north of Mayo, Yukon Territory, centred at 62°2'N, 135°50'W. The HLF is located in the northeast corner of the mine site across the Eagle Valley from the open-pit mining operations.

1.4 Project Documentation

The following documentation is included in various sections of this report and was collected by on-site personnel during CQA Inspection as well as by Layfield during QC testing:

- Tetra Tech's Weekly Inspection Reports, which include:
  - Daily notes of activities performed, and observations noted;
  - Daily trial seam results;
  - Weekly non-destructive testing results;
  - Weekly destructive testing results; and
  - Photographs.
- Supporting Documentation of Variances from Design;
- Testpit Logs for the Foundation Improvement Plan;
- Compaction Testing Results;
- Layfield's QC Package, which includes:
  - Certificate of Inspection of Soil Subgrade Surface;
  - Geomembrane Deployment Log;

  - Geomembrane Seam and Test Log;
  - Geomembrane Detail and Test Log;
  - Geomembrane Destruct Log;
  - As-built of Liner Panels;
  - Certificate of Final Inspection and Acceptance;
  - Geosynthetic Inventory Log;
  - Geomembrane Mill Certificates;
  - GCL Mill Certificates; and
  - Installation Warranty.
- Tetra Tech's Limitations on the Use of this Document.

2.0 CONSTRUCTION QUALITY ASSURANCE PROGRAM

2.1 Objective

The CQA program's objective was to ensure that the geosynthetic liner system was installed in accordance with the construction specifications.

The CQA program was designed to supplement the QC program implemented by Layfield, and fulfilled two purposes:

- To provide documentation of the specific technical requirements of the CQA program to be followed during the installation of the geosynthetic liner systems; and
- To be a source of information for personnel performing and monitoring construction.

2.2 Construction Quality Assurance Program Components

The following activities were performed as components of the CQA program:

- **Supervision of foundation preparation** performed by Ewing. The supervision activities included monitoring the installation of the header drain and lateral drains in Mr. Abel's absence, compaction testing, and logging soils in the lateral drains as part of Forte's foundation improvement plan. Compaction testing reports are found in Appendix D.
- **Field inspections** were performed by the CQA monitor. These inspections were primarily visual examinations and included measurements of materials and equipment used and techniques employed. The purpose of these inspections was to demonstrate that the specific guideline, specification, or procedure for the activity was successfully completed.
- **Field laboratory seam testing** performed on site by the Contractor and visually inspected by the CQA monitor according to specified procedures. Seam tests were performed on samples of the installed geomembrane

seams to confirm the Contractor's QC testing and ensure that actual seam performance was meeting the project seaming requirements.

- **Receiving inspections** performed by the CQA monitor. These inspections included visual examinations of materials received from the supplier along with their matching manufacturer certificates. The purpose of these inspections was to verify that the materials used met the specifications' requirements and were free from defects.

3.0 HLF GEOSYNTHETIC SYSTEM

3.1 Geosynthetic Liner Profile

The geosynthetics liner system for the Heap Leach Pad Phase 1B is a single liner system, which is installed directly on the prepared subgrade, consisting of the following layers (starting from the top to the bottom):

- An 80-mil double-sided, textured, LLDPE geomembrane; and
- GCL reinforced with a layer of sodium bentonite.

The 80-mil LLDPE double-sided, textured geomembrane was placed directly on the GCL throughout all areas of Phase 1B.

The GCL was placed directly on the prepared and inspected subgrade, which was smooth and free of all protruding rocks, stones, sticks, roots, sharp objects, or debris of any kind. GCL liner was covered the same day, if possible, to limit exposure to moisture.

3.2 Manufacturer's Quality Control Certification

Layfield and SOLMAX provided Manufacturing Quality Control certificates for the GCL and 80-mil LLDPE geomembrane produced and delivered to site. These certificates show the average and minimum values for each roll of material delivered to site.

A summary of the manufacturer's certifications for the GCL, geomembrane, and geocomposite materials used for this project are included in Layfield's QC package shown in Appendix F.

Tetra Tech reviewed the test data contained within the Manufacturer's Certificates for comparison to the product specifications. This comparison demonstrated that the material supplied met or exceeded all the typical project-specific requirements.

3.3 Installation of GCL

The GCL for the project was provided by SOLMAX and was installed directly on all prepared subgrade extending into the anchor trench. The GCL was overlapped at least 0.5 m at all horizontal seams and 0.15 m at all vertical seams. Along every seam, loose sodium bentonite powder was placed to act as a seam sealant. All horizontal seams were fused using a propane torch, and vertical seams were only torched as necessary.

3.4 Installation of 80-mil Linear Low-Density Polyethylene Geomembrane

The 80-mil geomembrane used for Phase 1B was 80-mil LLDPE Layfield Enviroliner manufactured by Layfield. The geomembrane was installed directly on the GCL and extended into the anchor trench to ensure that the liner system would be retained on the slope once the anchor trench was backfilled. The liner was deployed immediately after the placement of the GCL to limit the exposure of the GCL to rain. In instances where GCL was left exposed overnight, or longer, it was thoroughly inspected to ensure it was clear of debris, and no swelling had occurred prior to any placement of 80-mil geomembrane.

The geomembrane overall panel layout and tie-in seams are included in Layfield's QC package shown in Appendix F. This final as-built differs from Forte's design drawings, as discussed in Section 3.8.

During placement, each geomembrane panel was inspected for signs of manufacturing defects or damage that may have been caused by the shipping, handling, or storage of the material. Any damage identified as part of the inspection were marked and removed from the roll prior to installation or repaired once deployed on the slope.

3.5 Trial Seams

Seam quality is one of the most critical aspects of geomembrane installation. The ambient conditions at the time of seaming, setup of the welding equipment, and other variables can all affect the welded seams' quality. Care was taken by the Installer to ensure that the welding equipment was properly set up and producing a conforming seam prior to field seaming operations. The welding equipment was requalified at four-hour intervals, as per Layfield's QC program, and as necessary during the working day, in accordance with specifications. For Phase 1B, Layfield had a set speed and temperature for each type of seam, and no deviations from these specifications were required unless the wedge was not properly set up.

3.6 Seam Wedge (Fusion) Welding

The seaming operations were continuously monitored by the CQA monitor to ensure there were no isolated problems, such as water puddles or dirt under the liner that could affect seam quality over any length of the seam. The geomembrane's temporary leading edges occasionally became dirty due to windblown dust or rain washing debris onto an exposed seam. These edges were scrubbed and wiped clean prior to seaming.

3.6.1 Air Pressure Test

Fusion welded seams were non-destructively tested over their full-length using air pressure testing. The air pressure tests were performed by Layfield and observed by the CQA monitor. An air channel located between the dual tracks of the fusion welded seam was pressurized to a minimum of 276 kN/m^2 (40 lbs/in^2 (pounds per square inch [psi])) for a period of at least five minutes; an air pressure loss of more than 28 kN/m^2 or 4 psi required that the air leak be located, repaired, and retested.

3.6.2 Destructive Test

Samples of the fusion welded seams were destructively tested at regular intervals of a minimum of one per 150 linear metres of seam throughout the installation of the liner to ensure that seam quality did not change throughout seaming operations. In cases where a failed coupon from a destructive test was identified, the total length of failed seam was determined by taking additional destructive tests 3 linear metres before and after the first destructive test and retesting until a passing destructive test result was obtained in both directions of the first failed

destructive test. The length of seam between the passing destructive tests was then replaced, patched, or extrusion welded.

3.7 Extrusion Welding

Each panel and seam were inspected continuously by the CQA monitor during the installation. Any defects found in the LLDPE membrane or in the seams were marked so that the installation crew was aware that a defect was found. Once all repairs were completed by the Installer, the CQA monitor reviewed each panel and seam from the anchor trench to the panel end to ensure all defects were adequately repaired.

Any repairs to the panels or seams were completed by placing an extrusion welded bead over defects smaller than 6 mm or by extrusion welding a patch of LLDPE over any destructive sample holes, tears, holes larger than 6 mm, or areas with blisters. Scratches, scuffs, or creases were generally repaired by placing an extrusion welded bead over the defect area if required.

3.7.1 Vacuum Test

All extrusion welded repairs were non-destructively tested using the vacuum box test method. The vacuum box assembly consists of a rigid housing, a transparent viewing window, and a vacuum gauge. The weld to be tested was wetted with a soapy solution, and the vacuum box assembly was placed over the soapy weld, ensuring a seal over the test area.

A vacuum pressure between 5 psi to 8 psi was induced for at least 15 seconds, and the area within the viewing window was examined for the presence of bubbling, indicating a leak. Suspect areas were marked, repaired, and retested. As with the air pressure tests, the vacuum box tests were performed by Layfield and observed by the CQA monitor.

3.8 Variations from Design

3.8.1 Proposed Panel Layout

Layfield provided a proposed panel layout prior to the commencement of the project. The panel layout was based on plans provided by Forte. The in-field slope conditions did not match Forte's plans, so the as-built panel layout does not match the proposed panel layout. Multiple angle corrections were required as the project progressed to ensure that slope runs of liner were in-line with the slope grade and perpendicular to the anchor trench, and Phase 1A tie in as much as possible.

Forte’s slope plans were based on an idealized slope, whereas the constructed slope followed the valley's natural contours to minimize earthworks and material placement/removal. As such, the final panel layout was a field fit.

3.8.2 Horizontal Cross Seams on Steep Slopes

The original design called for no slopes to be steeper than 2:1 (H:V), and any slope steeper than 2.5:1 (H:V) to have cross seams cut at a 45-degree angle to eliminate horizontal cross seams. Steep slopes were checked prior to liner deployment to ensure they did not exceed 2:1 (H:V).

As the southwest section of Phase 1B had a large area with slopes steeper than 2.5:1 (H:V), Layfield requested a variance to install horizontal rather than 45-degree cross seams. Tetra Tech and Layfield conducted destructive

seam testing at a 45-degree angle to the wedge weld to verify if the strength was significantly different. The test results showed that the seam's strength did not vary significantly if it was pulled at a 45-degree angle vs a horizontal angle. Clint Abel submitted an RFI to authorize the use of horizontal seams on slopes greater than 2.5:1 (H:V) to Forte for consideration on June 3. Forte responded by saying that horizontal cross seams were acceptable so long as cross seams were spaced at least 10 m apart, and no cross seams could be installed within 10 m of the anchor trench or Phase 1A tie in. During installation, one cross seam was installed less than 1 m from an adjacent cross seam. Layfield repaired the out of spec cross seam. The RFI provided by Forte is found in Appendix C.

3.8.3 Acceptable Subgrade Conditions

The specifications provided by Forte stated that the prepared subgrade shall be smooth and free of rocks greater than 50 mm and all protruding rocks, stones, sticks, roots, sharp objects, or debris of any kind. As well, no soft or yielding subgrade conditions would be acceptable.

3.8.3.1 Rocky Subgrade Conditions

At the start of the project, on the steep slopes, an excavator had to be utilized to deploy the GCL and liner down the slope as the slope was too steep to utilize non-tracked equipment. During this process, the prepared subgrade was ripped up, which caused significant amounts of rocks to be lodged between the subgrade and the GCL. The rocks could not be controlled to adequately satisfy the contract specifications even though Layfield was picking rocks prior to and after GCL deployment. Layfield ensured that all rocks greater than 50 mm were removed from beneath the GCL. Tetra Tech requested guidance from Forte on how to proceed. A meeting was called between Forte, Victoria Gold, JDS, Tetra Tech, and Layfield to discuss the problem. At Victoria Gold’s and Forte’s direction, deployment was to continue deployment, and a test strip was performed to verify the liner’s resistance to puncture. Panels P1 through P35 were installed on rocky subgrade conditions, not meeting contract specifications. After this, rocky sections of the slope were covered with sand prior to GCL deployment. A copy of Tetra Tech’s RFI detailing the test strip results can be found in Appendix C.

Even though rocky subgrade sections were covered with sand for the remainder of the project, rocks plucked out of the subgrade by deployment practices continued to be an issue throughout the rest of the deployment. Subgrade that appeared to be acceptable once shaped and compacted had rocks just below the surface that could be removed by vehicle traffic and the side by sides used for deployment. Due to the changing conditions, Tetra Tech performed daily inspections on the prepared subgrade in advance of the day’s deployment. Layfield was constantly removing rocks from beneath the GCL that would be lodged between the GCL and the subgrade. Ewing continually placed sand on areas identified by Tetra Tech as unacceptable subgrade. Forte allowed Layfield to make a small vertical slice in the GCL to remove rocks without requiring a patch, so long as loose bentonite was added below the slice in the GCL and on the surface. The severity of rocks being removed from the subgrade increased as the subgrade surface dried out and lost cohesion.

3.8.3.2 Soft and Yielding Subgrade Conditions

Soft and yielding conditions began to be encountered as the project progressed off the steeper, west side of Phase 1B. These conditions were due to the excessive amount of rainfall experienced throughout the project and caused due to lack of adequate drainage either from flatter spots on the slope or piles of subgrade soil blocking water flow during lateral drain installation and the subgrade soils increasing fines content. The colluvium soils contain varying amounts of silt and clay. Tetra Tech noted that when these soils get saturated, they exhibit a plastic behaviour that causes them to soften even though they are not fully saturated. Tetra Tech performed daily inspections of the subgrade due to conditions changing regularly.

In the area covered by panels P242 through P257 and P270 through P274, heavy rainfall from July 26 to July 29 caused soft subgrade conditions after portions of the slope eroded and deposited the saturated material in the area. Tetra Tech identified extensive soft and yielding areas that required removal. Ewing worked on fixing the soft spots for five days while liner deployment continued, but due to requiring the affected area to deploy on, stopped short to allow the subgrade to be repaired. Even after cutting 300 to 500 mm of affected subgrade soils from the surface, small (< 1m^2) soft spots remained. Tetra Tech sought guidance from Forte for a variance from the specifications to allow deployment to continue due to the soft spots being on a flat area and the LLDPE liner's capabilities. In a phone call discussion with Clint Green on July 31, it was agreed that the small soft spots would not be an issue as they were surficial and not a larger issue with the underlying subgrade soils. See the weekly reports for July 27 to August 2 in Appendix B for details and pictures of the soft spots and repairs.

Beginning at panel P417, pervasive soft and yielding areas were encountered along the slopes, which were associated with the lateral drains. Laterals 4E, 3E, and 2E all had varying amounts of soft and yielding areas along their alignment, with 4E and 3E being the most affected. Tetra Tech and Ewing performed a test excavation to determine a solution to repair the soft areas. At the test area, the subgrade soils had to be excavated approximately 700 mm to reach competent ground. The area was then backfilled with rock fill, compacted, and capped with sand. In a meeting with Forte, JDS, Tetra Tech, and Ewing on August 17, it was agreed that the soft areas would be excavated to competent soils, backfilled with rock fill, compacted, and capped with sand for any area that Tetra Tech or Ewing identified as a soft or yielding area. At soft areas directly over a lateral, the soils would be excavated as deep as possible, then backfilled using the same method. Even after repairs of larger soft area, smaller ones still existed. On August 20, Tetra Tech noted smaller soft spots in the subgrade that began to show up after compaction where repairs had been made. Clint Abel authorized deployment over the areas at the mine’s discretion. See the weekly reports for August 10 to August 23 in Appendix B for details and pictures of the soft spots and repairs.

3.8.4 Anchor Trench

Due to the slope's length and its steepness in areas, the anchor trench was excavated deeper than design specifications to increase the weight of material holding the edge of the liner in the anchor trench. The liner was also extended further into the anchor trench to allow the liner to cycle without pulling it out of the anchor trench. Early on in the project, Layfield had to begin spot filling the anchor trench to retain the liner on the slope as sandbags were not sufficient to retain the liner in the anchor trench. Layfield continued to employ a deeper anchor trench for the remainder of the project.

3.8.5 Exposed GCL

The project specifications stated that GCL could not be left exposed overnight or for long periods of time, and hydrated GCL must not be allowed to hydrate prior to LLDPE liner deployment. Due to the weather experienced, sometimes, GCL was exposed to rain overnight or for multiple days. The GCL used for the project was highly resistant to hydration. Due to wind or timing and to keep the project advancing on schedule, Layfield had to leave GCL exposed overnight. On some of these nights, it would rain, or a multi-day rainstorm would occur. Prior to the liner being deployed over the GCL, Tetra Tech and Layfield would inspect the GCL for hydration and remove any GCL that had hydrated. To check for hydration, a slice would be made in the GCL to determine whether the fibres had broken between the upper and lower geosynthetic. As well, the surface of the GCL was checked for “popcorning” where the bentonite would expand out of the holes in the geosynthetic. Due to the GCL’s resistance to hydration, GCL was rarely removed from the slope after a rainfall event.

3.8.6 Destructive Testing

The project specifications stated that CQA was to conduct independent destructive testing alongside Layfield's QC destructive testing. For Phase 1A and the In-Heap Pond, Tetra Tech had observed Layfield's destructive testing and verified the results, which meant that Tetra Tech did not perform their own set of testing. After the project kickoff meeting with Forte, Tetra Tech confirmed that Forte would accept this destructive testing observation method in lieu of Tetra Tech performing their own testing. Mr. Green agreed that this method was acceptable for Phase 1B. Tetra Tech directly observed all destructive testing performed by Layfield for the duration of the project.

4.0 CONSTRUCTION QUALITY ASSURANCE RECORDS AND TESTS

The following tasks where performed during the installation of the geosynthetic liner system:

- Material Inventory Record;
- Panel Installation Record;
- Trial (or Qualification) Seams;
- Geomembrane Fusion Seam Installation;
- Air Pressure Tests (Wedge Welding);
- Vacuum Test and Repairs (Extrusion Welding);
- Panel Diagrams; and
- Destructive Testing of Geomembrane Seam.

The following provides a brief description of the various CQA testing methodologies. Records of these activities are included in Layfield's QC package shown in Appendix F.

4.1 Material Inventory

An inventory of the 80-mil LLDPE geomembrane liner was completed as the material was placed. This inventory is documented in the material inventory summary data sheets contained in the Installer's QC records.

A panel installation summary datasheet contains further information on the individual panels of geomembrane installed and can be found in Layfield's QC package shown in Appendix F.

4.2 Subgrade Acceptance

Prior to the deployment of the geosynthetics, the subgrade had to be accepted by both Tetra Tech and Layfield. Typically, a large area would be walked off and accepted, with a Certificate of Subgrade Acceptance being drafted by Layfield and signed off by Tetra Tech. Due to the ever-changing subgrade conditions, daily subgrade walk-offs were performed, with a Certificate of Subgrade Acceptance drafted at certain milestones of deployment, which was typically when the liner was signed off to the mine. For the subgrade to be accepted, the subgrade had to meet contract specifications to be accepted by Tetra Tech and meet Layfield's QC standards to be accepted by Layfield. The Certificates of Subgrade Acceptance can be found in Layfield's QC package shown in Appendix F.

4.3 Trial (or Qualifying) Seams

Trial seams using both the hot wedge welder and the extrusion welder were produced using LLDPE geomembrane strips prior to the welding of any seams each day, and every four hours thereafter for each type of seam. The three seam types fused using a wedge welder were: smooth-smooth, textured-textured, and textured-smooth. Seaming of installed geomembrane panels did not commence until passing trial seams were completed.

A minimum of five test coupons was cut from the trial seams for both peel and shear strength and tested by Layfield on site. The CQA monitor was present during trial seam testing to observe that quality seams were being produced. In order to receive a passing result, the trial seam sample was required to meet the criteria laid out in Table 1.

Table 1: LLDPE Seam Strength Properties

Material	Fusion (Wedge Weld) Shear Strength (PPI)	Fusion (Wedge Weld) Peel Strength (PPI)	Extrusion Shear Strength (PPI)	Extrusion Peel Strength (PPI)
80-mil LLDPE	120	100	120	88

In addition to meeting the minimum strength requirements, the test coupons were required to meet an adhesion specification of less than 25% incursion into the weld.

These minimum requirements are based on the project specifications from Forte.

All trial seam results are recorded and detailed in Tetra Tech's Weekly Reports found in Appendix B and Layfield's QC package shown in Appendix F.

4.4 Geomembrane Seaming

The CQA monitor observed and recorded information pertinent to fusion welding (hot wedge seaming) of the 80-mil geomembrane. The details include start times of the seam, the seam's length, ambient temperature, welding equipment identification and operator, and machine settings.

A summary of the seaming completed can be found in Layfield's QC package shown in Appendix B.

4.5 Non-destructive Testing of Geomembrane Seams

4.5.1 Hot Wedge Welding

All hot wedge welded seams were non-destructively tested using the air pressure test method by Layfield, as described in Section 3.6.1. Air pressure testing results can be found in Layfield's QC package shown in Appendix F. Seams that failed air pressure tests were investigated for possible causes and, depending on the cause, repaired and retested or extrusion welded, and vacuum tested. Typically, seams failed non-destructive testing due to a poor air channel block at cross seams.

4.5.2 Extrusion Welding

Extrusion welded repairs were non-destructively tested using the vacuum box test method by Layfield and observed by the CQA monitor. Any weld defects found using the vacuum box test method were marked as VTF (vacuum test failed) at the defect's location and repaired. Vacuum box testing results are documented in the repair logs contained

in Layfield's QC package shown in Appendix F. The panel diagrams contained in Appendix F display the location of each repair.

4.6 Destructive Testing of Geomembrane Seams

Destructive tests were carried out on wedge welded seams at a frequency of one per 150 linear metres (500 linear feet) of seam. Samples were selected by the CQA monitor to give the best representation of seam quality and were tested by the Installer under the observation of the CQA monitor. They were tested to ensure they met or exceeded the minimum peel and shear strength requirements outlined in Table 2. The locations of the destructive samples varied from seam to seam, but most samples were obtained from locations in the seam that would not affect the integrity of the liner system or require any extra patches or extrusion welding. Examples of locations of destructive samples include anchor trenches and seam cut-offs. Results of the destructive testing are presented in Tetra Tech's Weekly Reports in Appendix B and Layfield's QC package shown in Appendix F.

4.7 Final Inspection and Acceptance

Once the liner had been deployed, fused, repaired, and tested, a final walk-off was performed by Tetra Tech and Layfield to inspect for deficiencies such as holes, missing repairs, and missing testing. The walk-off consisted of inspecting the entire liner area, including seams, the tie in to Phase 1A, and the anchor trench. If any deficiency was noted, the deficiency would be remedied immediately. Once all deficiencies had been remedied, Layfield drafted a Certificate of Final Inspection and Acceptance to be signed by the CQA Monitor and Layfield's Supervisor or QC representative. Upon sign off, Tetra Tech provided the Certificate of Final Inspection and Acceptance to Victoria Gold and Forte. The Certificates of Final Inspection and Acceptance can be found in Layfield's QC package shown in Appendix F.

5.0 CLOSURE

We trust this document meets your present requirements. If you have any questions or comments, please contact the undersigned.

Respectfully submitted,
Tetra Tech Canada Inc.

TETRA TECH'S LIMITATIONS ON THE USE OF THIS DOCUMENT

LIMITATIONS ON USE OF THIS DOCUMENT

GEOTECHNICAL – YUKON GOVERNMENT

1.1 USE OF DOCUMENT AND OWNERSHIP

This document pertains to a specific site, a specific development, and a specific scope of work. The document may include plans, drawings, profiles and other supporting documents that collectively constitute the document (the "Professional Document").

The Professional Document is intended for the use of TETRA TECH's Client, its officers, employees, agents, representatives, successors and assigns (the "Client") as specifically identified in the TETRA TECH Services Agreement or other Contractual Agreement entered into with the Client (either of which is termed the "Contract" herein). TETRA TECH does not accept any responsibility for the accuracy of any of the data, analyses, recommendations or other contents of the Professional Document when it is used or relied upon by any party other than the Client, unless authorized in writing by TETRA TECH. Any changes to the conclusions, opinions, and recommendations presented in TETRA TECH's Professional Document must be authorized by TETRA TECH.

1.2 ALTERNATIVE DOCUMENT FORMAT

Where TETRA TECH submits electronic file and/or hard copy versions of the Professional Document or any drawings or other project-related documents and deliverables (collectively termed TETRA TECH's "Instruments of Professional Service"), only the signed and/or sealed versions shall be considered final. The original signed and/or sealed electronic file and/or hard copy version archived by TETRA TECH shall be deemed to be the original. TETRA TECH will archive a protected digital copy of the original signed and/or sealed version for a period of 10 years.

Electronic files submitted by TETRA TECH have been prepared and submitted using specific software and hardware systems, as per agreed project deliverable formats. TETRA TECH makes no representation about the compatibility of these files with the Client's future software and hardware systems.

1.3 STANDARD OF CARE

Services performed by TETRA TECH for the Professional Document have been conducted in accordance with the Contract, in a manner consistent with the level of skill ordinarily exercised by members of the profession currently practicing under similar conditions in the jurisdiction in which the services are provided. Professional judgment has been applied in developing the conclusions and/or recommendations provided in this Professional Document.

If any error or omission is detected by the Client or an Authorized Party, the error or omission must be brought to the attention of TETRA TECH within a reasonable time.

1.4 DISCLOSURE OF INFORMATION BY CLIENT

The Client acknowledges that it has fully cooperated with TETRA TECH with respect to the provision of all available information on the past, present, and proposed conditions on the site, including historical information respecting the use of the site.

1.5 INFORMATION PROVIDED TO TETRA TECH BY OTHERS

During the performance of the work and the preparation of this Professional Document, TETRA TECH may have relied on information provided by third parties other than the Client.

While TETRA TECH endeavours to verify the accuracy of such information, and subject to the standard of care herein, TETRA TECH accepts no responsibility for the accuracy or the reliability of such information even where inaccurate or unreliable information impacts any recommendations, design or other deliverables and causes the Client or an Authorized Party loss or damage, except where TETRA TECH has subcontracted for such information.

1.6 GENERAL LIMITATIONS OF DOCUMENT

This Professional Document is based solely on the conditions presented and the data available to TETRA TECH at the time the data were collected in the field or gathered from available databases.

The Client, and any Authorized Party, acknowledges that the Professional Document is based on limited data and that the conclusions, opinions, and recommendations contained in the Professional Document are the result of the application of professional judgment to such limited data.

The Professional Document is not applicable to any other sites, nor should it be relied upon for types of development other than those to which it refers. Any variation from the site conditions present, or variation in assumed conditions which might form the basis of design or recommendations as outlined in this report, at or on the development proposed as of the date of the Professional Document requires a supplementary exploration, investigation, and assessment.

TETRA TECH is neither qualified to make, nor is it making, any recommendations with respect to the purchase, sale, investment or development of the property, the decisions on which are the sole responsibility of the Client.

1.7 NOTIFICATION OF AUTHORITIES

In certain instances, the discovery of hazardous substances or conditions and materials may require that regulatory agencies and other persons be informed and the Client agrees that notification to such bodies or persons as required may be done by TETRA TECH in its reasonably exercised discretion.

1.8 ENVIRONMENTAL AND REGULATORY ISSUES

Unless stipulated in the report, TETRA TECH has not been retained to explore, address or consider and has not explored, addressed or considered any environmental or regulatory issues associated with development on the subject site.

1.9 NATURE AND EXACTNESS OF SOIL AND ROCK DESCRIPTIONS

Classification and identification of soils and rocks are based upon commonly accepted systems, methods and standards employed in professional geotechnical practice. This report contains descriptions of the systems and methods used. Where deviations from the system or method prevail, they are specifically mentioned.

Classification and identification of geological units are judgmental in nature as to both type and condition. TETRA TECH does not warrant conditions represented herein as exact, but infers accuracy only to the extent that is common in practice.

Where subsurface conditions encountered during development are different from those described in this report, qualified geotechnical personnel should revisit the site and review recommendations in light of the actual conditions encountered.

1.10 LOGS OF TESTHOLES

The testhole logs are a compilation of conditions and classification of soils and rocks as obtained from field observations and laboratory testing of selected samples. Soil and rock zones have been interpreted. Change from one geological zone to the other, indicated on the logs as a distinct line, can be, in fact, transitional. The extent of transition is interpretive. Any circumstance which requires precise definition of soil or rock zone transition elevations may require further investigation and review.

1.11 STRATIGRAPHIC AND GEOLOGICAL INFORMATION

The stratigraphic and geological information indicated on drawings contained in this report are inferred from logs of test holes and/or soil/rock exposures. Stratigraphy is known only at the locations of the test hole or exposure. Actual geology and stratigraphy between test holes and/or exposures may vary from that shown on these drawings. Natural variations in geological conditions are inherent and are a function of the historical environment. TETRA TECH does not represent the conditions illustrated as exact but recognizes that variations will exist. Where knowledge of more precise locations of geological units is necessary, additional exploration and review may be necessary.

1.12 PROTECTION OF EXPOSED GROUND

Excavation and construction operations expose geological materials to climatic elements (freeze/thaw, wet/dry) and/or mechanical disturbance which can cause severe deterioration. Unless otherwise specifically indicated in this report, the walls and floors of excavations must be protected from the elements, particularly moisture, desiccation, frost action and construction traffic.

1.13 SUPPORT OF ADJACENT GROUND AND STRUCTURES

Unless otherwise specifically advised, support of ground and structures adjacent to the anticipated construction and preservation of adjacent ground and structures from the adverse impact of construction activity is required.

1.14 INFLUENCE OF CONSTRUCTION ACTIVITY

Construction activity can impact structural performance of adjacent buildings and other installations. The influence of all anticipated construction activities should be considered by the contractor, owner, architect and prime engineer in consultation with a geotechnical engineer when the final design and construction techniques, and construction sequence are known.

1.15 OBSERVATIONS DURING CONSTRUCTION

Because of the nature of geological deposits, the judgmental nature of geotechnical engineering, and the potential of adverse circumstances arising from construction activity, observations during site preparation, excavation and construction should be carried out by a geotechnical engineer. These observations may then serve as the basis for confirmation and/or alteration of geotechnical recommendations or design guidelines presented herein.

1.16 DRAINAGE SYSTEMS

Where temporary or permanent drainage systems are installed within or around a structure, the systems which will be installed must protect the structure from loss of ground due to internal erosion and must be designed so as to assure continued satisfactory performance of the drains. Specific design detail of such systems should be developed or reviewed by the geotechnical engineer. Unless otherwise specified, it is a condition of this report that effective temporary and permanent drainage systems are required and that they must be considered in relation to project purpose and function.

1.17 DESIGN PARAMETERS

Bearing capacities for Limit States or Allowable Stress Design, strength/stiffness properties and similar geotechnical design parameters quoted in this report relate to a specific soil or rock type and condition. Construction activity and environmental circumstances can materially change the condition of soil or rock. The elevation at which a soil or rock type occurs is variable. It is a requirement of this report that structural elements be founded in and/or upon geological materials of the type and in the condition used in this report. Sufficient observations should be made by qualified geotechnical personnel during construction to assure that the soil and/or rock conditions considered in this report in fact exist at the site.

1.18 SAMPLES

TETRA TECH will retain all soil and rock samples for 30 days after this report is issued. Further storage or transfer of samples can be made at the Client's expense upon written request, otherwise samples will be discarded.

1.19 APPLICABLE CODES, STANDARDS, GUIDELINES & BEST PRACTICE

This document has been prepared based on the applicable codes, standards, guidelines or best practice as identified in the report. Some mandated codes, standards and guidelines (such as ASTM, AASHTO Bridge Design/Construction Codes, Canadian Highway Bridge Design Code, National/Provincial Building Codes) are routinely updated and corrections made. TETRA TECH cannot predict nor be held liable for any such future changes, amendments, errors or omissions in these documents that may have a bearing on the assessment, design or analyses included in this report.

WEEKLY FIELD REPORT

ISSUED FOR USE

Project:	Eagle Gold Heap Leach Phase 1B	**Date:**	May 30, 2020
Location:	Eagle Gold Mine	**Contractor:**	Ewing Transport / Layfield
Client:	Victoria Gold Corp.	**Contractor's Rep:**	Marshall Ewing / Chad Messervey
Contact:	Clint Abel	**Contractor's Email:**	
Weather:	Variable (see daily entries)	**Tetra Tech Representative:**	Adam Mickey
File:	704-ENG.WARC03235-09	**Status:**	Issued for Use

1.0 INTRODUCTION

Tetra Tech Canada Inc. (Tetra Tech) was retained by Victoria Gold Corp. (Victoria Gold) to provide CQA services at the Eagle Gold mine located north of Mayo, Yukon, at Dublin Gulch for the Eagle Gold Heap Leach Phase 1B expansion (Phase 1B).

Forte Dynamics (Forte) out of Fort Collins, Colorado provided the design and specification for Phase 1B, and Forte's representative is Clint Green.

Clint Abel of JDS Energy and Mining is Victoria Gold's project manager on site at the Eagle Gold mine.

Ewing Transport (Ewing), based out of Mayo, Yukon, is the construction contractor for Phase 1B.

Layfield Environmental Containment (Layfield) has been retained to provide and install the liner for Phase 1B, and their supervisor on site is Chad Messervey.

The following Field Report outlines Tetra Tech's CQA from May 28, 2020, to May 31, 2020.

2.0 DAILY REPORTS

2.1 May 28, 2020

Tetra Tech's field representative, Adam Mickey, mobilized to site from Whitehorse.

2.2 May 29, 2020

- Weather: sunny and windy.
- Layfield began setting up for liner placement by making sandbags, taking inventory of GCL and liner rolls, and misc other duties. 4,000 sandbags were made.
- Chad brought up safety concerns over liner deployment on the west side of Phase 1B due to the slope of the top access road. Discussions with Layfield and Ewing resulted in determining that Ewing is responsible for the safety of the excavator used for deployment. If it is not deemed safe, a new plan will be made.

Tetra Tech Canada Inc.
61 Wasson Place
Whitehorse, YT Y1A 0H7 CANADA
Tel 867.668.3068 Fax 867.668.4349

- Underhill surveyed the west side of Phase 1B to confirm that no areas were steeper than 2:1 (H:V) at Layfield's request.
- Tetra Tech monitored and provided compaction testing for backfilling of an excavation where unsuitable material was found near the waste dump site.
  - Tetra Tech confirmed that the unsuitable material was excavated beyond the limits of the Phase 1B liner and perimeter road.
  - The excavated surface was uneven, as shown in Figures 1 and 2, as well as soft and wet in places.
  - Tetra Tech advised Ewing to place a 0.5 m lift in the deeper section beneath the liner area and rock along the edge where unsuitable material was left due to being outside the limits of excavation to reduce the impact of melting snow on backfill materials (Figure 3).
  - Moisture conditioning of backfill materials was not penetrating the soil. Tetra Tech advised Ewing to wet the surface of the compacted lift to allow water to be drawn into the lifts from the base. Ewing achieved compaction of 95% with this method.
- Tetra Tech had preliminary discussions with Layfield regarding QA and QC with Layfield's QC representative, Thomas Howald (Red).
- Ewing is continuing to work on E1 lateral and sloping of the west side of Phase 1B for liner placement.

2.3 May 30, 2020

- Weather: sunny and windy.
- Ewing is continuing E1 lateral drain, sloping of west side of Phase 1B, and backfilling of excavation.
- Layfield is making 4,000 more sandbags and prepping for liner placement.
- Tetra Tech discussed QA/QC plans with Layfield and examined the destructive testing apparatus' Calibration Certificate. The apparatus was last calibrated on November 11, 2019, and shows a Total Deviation Error of 0.00%. The calibration certificate is shown in Figure 4.
- Tetra Tech performed a subgrade inspection with Thomas on first 9,000 m^2 of the west slope beginning at the west limit of Phase 1B. See Figures 5 to 8.
  - Overall slope area ready for liner.
  - Ewing is placing sand at the crest of slope along perimeter road where fractured bedrock exposed and no fines to fill in voids. Figures 9 & 10.
  - Identified a yielding area approximately 2 m x 6 m where the subgrade had tension cracks and collapsed up to 300 mm when stepped on. See Figures 11 & 12.
    - After review of Forte specifications and a conversation with Chad, Tetra Tech informed Ewing that the area would have to be filled in and recompacted. Ewing placed sand with an excavator and bucket packed the sand into place. Ewing then compacted the yielding area with a roller compactor performing a minimum of two passes.
    - Ewing completed the repair, and the subsequent inspection showed that the soft spots had been eliminated. See Figure 13.

  - A Certificate of Inspection was signed off by Layfield and Tetra Tech, confirming that the subgrade is ready for liner placement. See Figure 14.

- Ewing filled in limits of excavation with rock fill and compacted it. See Figure 15.
- Layfield prepped for beginning liner placement on May 31, 2020, by digging anchor trench and staging liner materials and sandbags.

2.4 May 31, 2020

- Weather: cloudy turning to rain and windy mid-afternoon.
- Ewing is continuing to shape slopes, backfill excavation, and install E1 lateral drain.
- Layfield beginning liner placement (see Figures 16 to 22):
  - Ewing excavating anchor trench along perimeter road in deployment area. See Figure 16.
  - Tetra Tech noted damage to the approved compacted subgrade due to side by sides running up and down the slope on May 30. Where the side by sides traveled, sharp rocks between 50 to 150 mm were pulled out of slope. Tetra Tech spoke with Javier from Layfield and advised that the large rocks should be removed from slope prior to placement of GCL. Rocks are to be cast onto slope in next subgrade inspection area and Ewing will run a roller compactor along the slope again to prep the subgrade and drive the rocks into the slope.
  - Layfield inspected existing liner from west side to panel P320 where ODF has not been placed to check for damage due to rocks rolling down slope and impacting liner. Tetra Tech accompanied Layfield for the inspection. Defects and holes were found in panels P320 & 322. See Figure 17.
  - Due to slope steepness, Layfield using Ewing's CAT 325 excavator to pull GCL down slope. The excavator rips up the surface of the slope as it tracks up and down.
    - Tetra Tech requested that Layfield ensure that any rocks be removed from the slope face or soil protrusions from the slope face be smoothed out prior to placement of the GCL.
    - Layfield pulls out a roll of GCL then fuses it to the next roll and continues to pull down the slope. The GCL is pulled to the base of the slope to the edge of the key trench of the existing liner. The GCL is placed in the key trench at the top of the perimeter road.
  - After the 3:00 pm break, Layfield quit placing GCL due to rainy weather and high winds.
    - 2 panels of GCL were placed on the slope.
    - Sandbags were placed at leading edges of the GCL to prevent upheaval and movement due to wind.
  - Layfield conducted a trial seam on rough pieces of liner to simulate joint connections. The first trial seam failed due to the nature of the break during the peel test, but a subsequent trial seam passed. Trial seam numbers were not recorded due to not conducting any seaming today. A new trial seam will be conducted prior to liner fusing.

3.0 GEOSYNTHETIC ROLL NUMBERS PLACED

Table 1 summarizes the daily geosynthetic roll numbers placed on the slope during liner installation. All panel lengths are approximate, and where angled joints are used, panel length is based from the center of the panel.

Table 1: Geosynthetic Roll Numbers Placed on Slope

Date	GCL Roll Number	LLDPE Liner Roll Number	Panel Number (Length)
May 31	502347042, 502347028 502343043, 502346988 502347041, 502347034 502347044, 502347037	-	-

CERTIFICATE OF INSPECTION
OF SOIL SUBGRADE SURFACE

LAYFIELD

PROJECT NAME: Heap leach Pad Phase 1B
PROJECT NUMBER: 20001401
OWNER/CONTRACTOR: Victoria Gold
LOCATION: Eagle gold Mine

I, the undersigned, a duly appointed representative of Layfield Canada Ltd. (Layfield), have visually observed the soil subgrade surface described below, and:

☐ *found it to be an acceptable surface on which to install geomembrane; OR*
☐ *found it to be an Unacceptable surface on which to install geomembrane*

Area Inspected (☐Partial or ☑Complete): shape as a triangle
Dimensions of Subgrade Inspection: 1000 m²
Anchor Trench Dimensions: N/A
Comments:

This certification is based on observations of the surface of the subgrade only. No subterranean inspections or tests have been performed by Layfield and Layfield makes no representations or warranties regarding conditions which may exist below the surface of the subgrade. Layfield accepts no responsibility for conformance of the subgrade to this project's specifications.

The soil subgrade inspected on this date refers to its present condition. Any changes in the subgrade condition that result from the effects of inclement weather and/or other forces beyond the control of Layfield and remedial work to correct the resulting deficiencies, will be the direct responsibility of the General Contractor.

LAYFIELD REPRESENTATIVE:
Date: May 30 2020
Signature:
Name: Thomas Heuald
Title: QC

OWNERS REPRESENTATIVE:
I, the undersigned, a duly appointed representative of the Owner, hereby understand the soil subgrade surface inspection described above and authorize Layfield to proceed with deployment of geosynthetics on the subgrade provided.

1.0 INTRODUCTION

Tetra Tech Canada Inc. (Tetra Tech) was retained by Victoria Gold Corp. (Victoria Gold) to provide CQA services at the Eagle Gold mine located north of Mayo, Yukon, at Dublin Gulch for the Eagle Gold Heap Leach Phase 1B expansion (Phase 1B). Mr. Adam Mickey, EIT, is Tetra Tech's representative on site.

Forte Dynamics (Forte) out of Fort Collins, Colorado provided the design and specification for Phase 1B, and Forte's representative is Clint Green.

Clint Abel, of JDS Energy & Mining, is Victoria Gold's project manager on site at the Eagle Gold mine.

Ewing Transport (Ewing), based out of Mayo, Yukon, is the construction contractor for Phase 1B.

Layfield Environmental Containment (Layfield) has been retained to provide and install the liner for Phase 1B, and their supervisor on site is Chad Messervey.

The following Field Report outlines Tetra Tech's CQA for the period of June 1, 2020, to June 7, 2020.

2.0 DAILY REPORTS

2.1 Highlights

- Panels P1 through P27 placed on slope. Total meters of liner placed are approximately 1,682.6m for a total area placed of approximately 11,273 m^2.
- Hole in GCL identified on May 31 was repaired by replacing hydrated GCL on June 2.
- Rain delayed liner deployment throughout the week.
- Layfield is placing three panels of GCL for every two panels of 80 mm LLDPE liner.
- Ongoing subgrade issues with rocks being plucked from subgrade and lodged between GCL and subgrade during GCL deployment. Forte and Victoria Gold were made aware of the issues.
- Layfield has been diligent about removing rocks from subgrade pre and post GCL deployment.

Tetra Tech Canada Inc.
61 Wasson Place
Whitehorse, YT Y1A 0H7 CANADA
Tel 867.668.3068 Fax 867.668.4349

- All QA/QC testing has met specifications throughout the week, except for the subgrade disturbance during deployment.

2.2 June 1, 2020

Heavy rain overnight and into the morning. No work performed today.

2.3 June 2, 2020

- Weather: partly cloudy with patches of rain in the afternoon.
- Clint Abel back on site and monitoring earthworks.
- Layfield identified areas where the GCL placed on May 31, hydrated due to rainfall on June 1. Layfield is removing hydrated sections and replacing them with new GCL. See Figures 1 & 2.
  - Layfield placed bentonite at seams and fused them together with a propane torch.
  - Removal of GCL at base of slope eliminated hole identified by Tetra Tech on May 31, 2020.
- Layfield placed a third panel of GCL then switched to 80 mm LLDPE.
- Trial seams performed for rough seams at joints and smooth seams along panel edges. Two fails on rough trial seam before getting a passing trial seam. Smooth seam trial passed on first test.
- Panel #'s P1 and P2 deployed, and the joint seamed between the two panels. See Figures 3 to 7.
- Layfield is having to drive spikes through the liner to hold sandbags and liner on the slope.
- P1-P2 panel joint is 40.2 m from anchor trench, and panel P1 is 128 m in length from P1-P2 joint to base of the slope.
- Rain/hail began at approximately 12:30 pm, putting deployment on hold.
- Deployment of panels P3 and P4 began at 1:30 pm.
- P3-P4 panel joint is 72 m from anchor trench, and panel P3 is 88 m in length from P3-P4 joint to base of slope.
- The downslope seam between panels P1, P2, P3, & P4 was fusion welded. Non-destructive testing was not performed due to the requirement for a patch at the P3-P4 joint. The seam was finished being welded at 4:10.
- No further deployment today due to rain in the forecast for tomorrow. Chad determined that Layfield would not be able to get GCL and liner deployed by the end of the day.
- Clint Green provided a plan to identifying areas on the slope for 45-degree cross seams (joints).

2.4 June 3, 2020

- Weather: Cloudy with rain showers in the distance turning to rain showers at site.
- Layfield held off deploying GCL due to large rain cloud in valley. At 10:30 am, Chad notified the crew that GCL deployment would commence at 11:00 am. Rain cloud appears to be dispersing.
- Layfield conducted an extrusion trial seam, which passed, and is patching holes on the existing liner where ODF placement is occurring, including a hole created today from an excavator.
- GCL deployment until 1:00 pm. Two panels were deployed until a rainstorm shut down deployment. Layfield placed sandbags to protect GCL from uplift due to wind. At 2:45 pm, Chad determined that deployment was done for the day due to weather. See Figures 8 & 9.
- Clint Abel submitted an RFI to Clint Green to use horizontal seams (joints) rather than 45-degree seams. Layfield used horizontal seams on previous liner installation.

2.5 June 4, 2020

- Weather: cloudy and raining, turning to partly cloudy with scattered rain showers in the afternoon.
- Deployment delayed in the morning due to weather.
- Layfield mobilized to begin deployment at 8:00 am once rain ceased. See Figures 10 through 20.
  - Layfield checked deployed GCL for hydration. No hydration noted.
  - Layfield deployed LLDPE panel P5 then panel P6.
  - 45-degree angles were cut for the P5-P6 joint, and then Layfield fused the joint. Non-destructive testing could not be performed due to ends of seam. Will be tested once T-joints are extrusion welded.
  - Rocks noted beneath liner by Tetra Tech and were marked for further inspection.
  - Panel P7 was rolled out and had a length of 13.6 m. P7 will be at the base of the slope at tie into Phase 1A liner. Layfield requested authorization for a horizontal seam by Tetra Tech. Tetra Tech authorized a horizontal seam as the slope was less than 2.5:1 (H:V).
  - Panels P7 through P9 was placed on the slope and fused.
  - Layfield switched seam testing apparatus. Calibration sheet shows a Total Deviation Error of 0.00% performed on July 25, 2019. See Figure 17 for the calibration sheet.
  - Layfield and Tetra Tech performed a non-destructive pressure test on the P7-P8 joint. The test passed with a pressure loss of 1 psi. The P7-P8 joint seam is a good seam that will only require a T-weld to finalize.
  - The P8-P9 joint seam could not be tested as the vertical P5 through P9 vertical seam had been fusion welded prior to testing. A T-weld will have to be performed to allow for testing of the joint seam.
  - GCL placement continuing in advance of liner placement.
  - Ewing is tidying up anchor trench and extending further towards the west end of the perimeter road.

- Layfield continued to place GCL till the end of the day and has 3 panels deployed ready for liner placement tomorrow.
- Destructive testing will not occur until Layfield uses extrusion apparatus to make repairs to the liner.

2.6 June 5, 2020

- Weather: partly cloudy turning to mostly cloudy in the afternoon.
- Layfield is placing LLDPE liner overtop of GCL placed on June 4. See Figures 21 to 33 for today's photos.
  - Trial seams being conducted for smooth and textured seams. Trial seam testing passed, and Layfield is authorized to fusion weld the liner as it is placed.
  - Chad checked one of the locations identified with rock beneath the liner and removed four rocks from the location, confirming that other locations will have to be checked. Layfield is checking the slope prior to GCL placement, but dragging the GCL along the slope pulls rocks out of the subgrade.
  - Non-destructive testing of joint seams for panels P10-P11 and P12-P13 joints could not be performed. Testing will be performed once T-welds are completed during extrusion welding.
    - Destructive tests D1, D2, & D3, tested by Layfield in the presence of Tetra Tech's representative. All destructive testing passed. For panels P1 through P9, one more destructive test is required, which will be performed when Layfield begins extrusion welding of repairs. Archive samples have been retained by tetra Tech as per Forte's specifications.
  - Layfield placed panels P10 through P13 on slope. Non-destructive testing of joints will not be performed until T-welds are performed by extrusion, where joints meet vertical seams.
    - P11-P13 seam has a defect 38.8 m from anchor trench. Repair will be required during extrusion welding. Fusion welding was interrupted due to generator falling over. See Figure 29.
  - Layfield is continuing to place GCL in advance of further liner deployment.
    - Four panels of GCL placed.
    - Holes in GCL were present at the beginning of the rolls due to handling. Layfield patched the holes in the presence of Tetra Tech to specifications.
    - Tetra Tech suggested to Layfield to address rocks pulled out of subgrade at the GCL deployment stage because it is easier to repair GCL than the GCL and the liner.
      - Rocks larger than 75 mm were to be either removed from beneath the GCL by pulling it back or cutting a hole in the GCL and repairing. If the rocks could be pounded into the slope, they were not required to be removed.
      - In advance of each GCL panel deployment, Layfield removed rocks from slope. Layfield is bringing armfuls of rocks larger than 75 mm off the slope.
      - Tetra Tech attempted to contact Clint Green regarding the subgrade as discussions with Layfield highlight that angular rocks as small as 50 mm could be problematic. Clint could not be reached by phone, so an email was sent. A phone call between Clint Green and Clint Abel was set up for the morning. Tetra Tech is seeking information regarding the minimum size of rock that must be removed beneath the liner as well as determining a plan for the rest of the 2:1 (H:V) slopes where rock is present.

- After conducting trial seams, panels P14 and P15 of LLDPE liner were deployed and fused.
    - Non-destructive testing of joints will take place after extrusion welding has been completed.

2.7 June 6, 2020

- Weather: partly cloudy with a thundershower at the end of shift.
- Layfield is continuing to deploy GCL and liner. See Figures 34 to 40.
    - Deployed and fused panels P16 through P21.
    - Ewing is digging the anchor trench deeper as the liner has pulled out of the anchor trench 300 mm over time.
    - Layfield extrusion welded liner panels along the anchor trench so that they could place backfill to limit the liner pulling down the slope. Ewing did not backfill the anchor trench completely and placed material between seams as they still require pressure testing.
        - Layfield's extrusion tech exceeded the allowable time for fusing between trial seams by one hour. Tetra Tech spoke with Layfield regarding the issue and reminded them that trial seams must be performed every four hours.
    - Tommy conducted vacuum testing on all extrusion welds. Tetra Tech observed the testing on fusion welds conducted in exceedance of allowable time between trial seams. All vacuum testing passed.
    - At approximately 3:30 pm, the wind picked up a panel of liner being deployed and carried it down the slope. Tetra Tech observed them pull the liner back up the slope with the excavator. A walkover will be required to confirm that no damage occurred to the liner.
- Tetra Tech had a conference call at 9:10 am with Clint Green, Victoria Gold's Mine Manager Mark Ayranto, Clint Abel, and Layfield's Project Manager Jason Wheeler regarding the subgrade issues.
    - Layfield was going to attempt deployment by walking the roll of GCL down the slope with an excavator with a spreader bar to limit the GCL moving on the slope and plucking rocks from the subgrade.
        - This was attempted at 10 am and deemed unsafe, so deployment has to continue as it has.
    - Mark suggested fabricating wheels to the spreader bar and lowering down the slope. This method would slow down deployment and cause a shut down until it was fabricated.
    - It was agreed upon that a test strip should be performed by placing rocks of varying sizes on a competent and flat subgrade, deploying GCL and LLDPE liner overtop, then placing 1 to 2 m of material overtop and running over with a rock truck.
        - Tetra Tech suggested using a loaded 785 rock truck to simulate loading of over 40 m of heap leach material on the liner.
        - Clint Green wanted to conduct the test strip on Monday or Tuesday once Clint Abel was back on site.
        - Tetra Tech asked what should be done for further deployment regarding the subgrade and rocks until the test strip trial was conducted.
            - As there was no clear answer, it was determined that Layfield would decide if it was acceptable to them first if Layfield deemed areas unacceptable, Tetra Tech would make note, and if the test strip

showed that liner puncture was likely, the owner would take responsibility for remedial actions to bring the liner to acceptable limits including remove and replace if necessary.

- After the meeting, Tetra Tech returned to site and spoke with Chad about what was decided in the meeting. Chad said that he could not feel confident about the subgrade and suggested that the test strip should be conducted as soon as possible.
  - Tetra Tech and Chad returned to the office and had a conference call with Clint Green.

    Tetra Tech suggested that a test strip should be conducted under extreme conditions to determine if the liner will puncture. The extreme conditions included using a flat and well-compacted subgrade, having an assortment of different rock sizes in different configurations, and not placing any cover material over the liner.

    Tetra Tech requested information for requirements for patches to GCL, where rocks cut out and removed from subgrade. Clint said if cuts are vertical, they can be patched with bentonite powder beneath the GCL and on top. If cuts are horizontal, then they would require a GCL patch.

- Tetra Tech coordinated and conducted the test strip as agreed upon in the meeting with Clint Green.
  - The liner was run over three times by a loaded 30-ton rock truck as well as the worst rock having a tire on top of it and twisting the liner overtop of it by turning the rock truck back and forth.
  - No punctures in the liner were observed by Tetra Tech or Layfield.
  - Coupon samples were obtained at highly stressed areas and pulled using the seam testing apparatus by Layfield. The coupons all exhibited similar strength characteristics to new liner, and where the rock truck was used to twist the liner overtop of a rock, the coupons maintained strength above the minimum shear values required for a fusion weld.
  - Tetra Tech and Chad from Layfield called Clint Green to inform him of the results. Clint could not give a definitive answer on how to proceed with the subgrade issues without reviewing the information.
    - Tetra Tech submitted an RFI detailing the subgrade issues, the liner puncture test strip, and requested guidance for subgrade acceptance.

2.8 June 7, 2020

- Weather: partly cloudy.
- Layfield is continuing to place GCL and LLDPE liner. See Figures 41 to 49.
  - Tetra Tech has requested that Layfield does thorough walkovers of the GCL once placed to remove any rocks that cannot be pounded into the subgrade.
    - On GCL placed today and immediately before liner deployment, Layfield is walking the slope before and after GCL placement to remove rocks from the subgrade. Rocks beneath the GCL are being cut out with vertical cuts, and bentonite powder is placed beneath and above the cut in the GCL.
    - Numerous rocks are being removed both pre and post GCL placement. Post GCL placement is leading to numerous vertical cuts in the GCL.
    - The slope length is getting shorter, and liner is being deployed with less joints.

        - Layfield deployed and fused panels P22 to P26 of liner today.
        - GCL is protected by liner in advance of potential rain tomorrow.

- Tetra Tech and Layfield QC obtained six destructive testing samples from fused seams and joints on the deployed liner. Testing was performed immediately, and all destructive samples passed. Tetra Tech retained archive samples of all destructive samples. Destructive testing is now caught up for all liner placed to the end of June 6.
- Layfield has raised concerns over the number of rocks on the surface of the remainder of the 2:1 slope. Chad said that they would not place liner on the remainder of the surface without sand being placed to cover the rocks. Once the liner has been laid to the south corner of Phase 1B, Layfield expects that there is approximately 40 m of slope that is acceptable enough to place liner.
    - Even after compaction of the subgrade, there are large amounts of rocks greater than 50 mm on the subgrade surface.
    - A review of the specifications shows that all rocks greater than 50 mm are required to be removed from the slope surface prior to liner placement. The amount of rocks greater than 50 mm is too great to be removed by hand. A surface covering of sand will be the most time effective method to provide and acceptable subgrade.
        - Ewing laid a test strip of 20 mm drain rock used for the drainage trenches and compacted it to show Layfield how the surface would be if used on the slope. Layfield stated that they do not typically accept any angular rocks beneath the GCL. Using the drain rock would be a better surface than the existing subgrade soils. Layfield would require Forte to spec the drain rock as an acceptable subgrade soil for continuing placement.
        - The subgrade that Layfield has been deploying liner on is marginally acceptable based on Forte's specifications. There were small areas that could be deemed unacceptable, but most of the rock beneath the GCL is the result of the excavator used in deployment, disturbing the subgrade, excavation of the anchor trench, and the GCL plucking rocks out of the subgrade.
    - See Figures 50 to 52 for subgrade conditions.

3.0 GEOSYNTHETIC ROLL NUMBERS PLACED

Table 1 summarizes the daily geosynthetic roll numbers placed on the slope during liner installation. All panel lengths are approximate and where 45-degree joints are used; panel length is based from the center of the panel.

Table 1: Geosynthetic Roll Numbers Placed on Slope

Date	GCL Roll Number	LLDPE Liner Roll Number	Panel Number (Length)
June 1	-	-	-
June 2	502346989, 502347001 502347039, 502346951	10694-012 10694-017 10694-007	P1 (128 m) P2 (40.2 m), P3 (88.6 m) P4 (72.1 m)

4.0 TRIAL SEAM

Table 2 summarizes the weekly trial seam results. For fusion, the apparatus settings are temperature and speed, and for extrusion, the apparatus settings are preheat and barrel temperature. Five tests are performed for each criterion.

Table 2: Trial Seam Results

Date	Time	Fusion or Extrusion	Tech	Apparatus #	Temp or Preheat (°F)	Speed (%) or Barrel Temp (°F)	$Peel_{inside}$ (100 min)	$Peel_{outside}$ (100 min for Fusion 88 min for Extrusion)	Shear (120 min)	Smooth or Textured

WEEKLY FIELD REPORT

ISSUED FOR USE

Project:	Eagle Gold Heap Leach Phase 1B	**Date:**	June 14, 2020
Location:	Eagle Gold Mine	**Contractor:**	Ewing Transport / Layfield
Client:	Victoria Gold Corp.	**Contractor's Rep:**	Marshall Ewing / Chad Messervey
Contact:	Clint Abel	**Contractor's Email:**	
Weather:	Variable (see daily entries)	**Tetra Tech Representative:**	Adam Mickey
File:	704-ENG.WARC03235-09	**Status:**	Issued for Use

1.0 INTRODUCTION

Tetra Tech Canada Inc. (Tetra Tech) was retained by Victoria Gold Corp. (Victoria Gold) to provide CQA services at the Eagle Gold mine located north of Mayo, Yukon, at Dublin Gulch for the Eagle Gold Heap Leach Phase 1B expansion (Phase 1B). Mr. Adam Mickey, EIT, is Tetra Tech's representative on site.

Forte Dynamics (Forte) out of Fort Collins, Colorado provided the design and specification for Phase 1B, and Forte's representative is Clint Green.

Clint Abel, of JDS Energy & Mining, is Victoria Gold's project manager on site at the Eagle Gold mine.

Ewing Transport (Ewing), based out of Mayo, Yukon, is the construction contractor for Phase 1B.

Layfield Environmental Containment (Layfield) has been retained to provide and install the liner for Phase 1B, and their supervisor on site is Chad Messervey.

The following Field Report outlines Tetra Tech's CQA for the period of June 8, 2020, to June 14, 2020.

2.0 DAILY REPORTS

2.1 Highlights

- Panels P27 through P42 placed on slope. Approximate total length of panels deployed was 590.9 m for a total approximate area of 4,018 m^2.
- Deployment delayed during the week due to lack of prepared subgrade.
- All destructive testing for liner deployed up to June 13 was completed, and all destructive testing passed.
- Non-destructive testing of liner seams was performed for panels P1 through P36. Most seams passed with a few requiring further testing once extrusion welding has been performed to fix air leaks.
- All vacuum box testing was completed on extrusion welding for panels P1 through P36 up to June 13.

Tetra Tech Canada Inc.
61 Wasson Place
Whitehorse, YT Y1A 0H7 CANADA
Tel 867.668.3068 Fax 867.668.4349

- Panels P3 through P36 was tied into Phase 1A by extrusion welding.
- A final walkthrough is still required for panels P1 through P36 once all non-destructive testing has been completed.

2.2 June 8, 2020

- Weather: partly cloudy, turning to rain at 12:30 pm.
- Layfield is continuing to deploy GCL and liner towards the south corner of Phase 1B on the west side. Figure 1 and Figure 2.
  - All trial seams passed. The textured trials seam initially failed, but a subsequent test passed.
  - Layfield is continuing to pick rocks off to slope prior to GCL deployment and cutting rocks out of the GCL as required.
  - Layfield has two extrusion techs patching holes and doing T-welds at all joint seams.
- On June 7, Tetra Tech had a conversation with Clint Abel regarding the subgrade conditions. It was agreed that sand should be placed on the slope in advance of GCL placement as deployment continues northward from where liner deployment started.
  - Layfield does not think compaction of the sand will be necessary.
  - Tetra Tech informed Ewing of the plan to place sand on the slopes. Tetra Tech recommended that large rocks at the base of the slope where it meets the existing liner should be removed and that the subgrade should be compacted prior to sand placement. See Figure 3.
  - Tetra Tech worked with Ewing to determine the minimum thickness of sand required such that the D7 dozer can place sand without ripping up the subgrade.
  - Tetra Tech determined that 100 mm of sand is required on the slope in advance of liner deployment.
- Work shut down at 12:30 pm due to rain for the rest of the day.
- Tetra Tech and Layfield had a phone meeting with Clint Green at 2:00 pm.
  - Discussed the requirements for sand placement on the subgrade, including the area. It was determined that the slope area greater than 2:1 (H:V) would be required to be coated with sand prior to liner deployment and possibly the other slopes depending on how the subgrade looks after compaction.

2.3 June 9, 2020

- Weather: cloudy and raining, turning to partly cloudy in the afternoon.
- Rain and wet conditions delayed deployment and extrusion until 10:00 am.
- Layfield is extrusion seaming the deployed liner to the existing liner as well as continuing with extrusion patches on the deployed liner. See Figures 4 through 8.
- Layfield is placing rest of GCL into south corner and will finish lining the south corner tomorrow. See Figures 9 through 11.
  - Rained heavily overnight. Layfield is checking deployed GCL for hydration. Last 3 m on two panels require removal and replacement. Layfield replaced hydrated GCL.

- Tetra Tech attended the weekly Phase 1B meeting with Layfield, Ewing, Clint Abel, Matt Monk, and Mark Ayranto.
  - Forte to provide an answer on 45-degree cross seams soon.
  - The primary topic discussed was sand bedding on the rocky slopes.
    - Nuway is going to mob to Nuway pit to begin crushing approximately 6000 m^3 of bedding material.
    - It was discussed if the 20 mm drain rock would be acceptable to use as a bedding material as the pit will be out of sand today, and it could be up to three days until Nuway is producing sand. It was agreed to use the 20 mm drain rock on the lower portions of the slope, and Ewing will do their best to blend it with some sand.
    - Clint Abel asked if the gradation of the bedding material could be increased in size. Forte is going to look into a maximum size for bedding material.
    - Tetra Tech raised the question to bedding material thickness to Forte. It was determined that bedding material thickness should be based on performance in the field during GCL placement. Currently 100 mm of bedding material is being placed on the slope, but it could be increased or reduced depending on what happens when GCL is deployed.
    - Ewing will work on prepping another area for liner deployment to allow time for bedding material production and placement.
      - Tetra Tech requested an area get packed to view the potential subgrade conditions that will be on other areas of Phase 1B. If the subgrade conditions are not conducive to deploying liner, sand will be required on a larger area of the slope, or the entire of Phase 1B.
- Clint Abel found a sand source that has been mixed with large rocks. There is approximately 500 m^3 of sand, and Nuway is mobbing in a power screener to screen the rest.

2.4 June 10, 2020

- Weather: partly cloudy.
- Layfield is deploying liner into the south corner on the west side of Phase 1B. See Figures 12 to 14.
  - All fusion welding completed.
  - Panel P36 is the last panel at the south corner of the west side of Phase 1B.
- Layfield is continuing to patch, and extrusion weld holes on the liner and do T-welds at all fusion seaming intersections.
- Ewing continued to haul sand for slope bedding throughout the night. See Figures 15 and 16.
- Four destruct samples were obtained. All destructive testing is up to date for liner placed to June 10, and all samples passed. Layfield is patching all destruct samples immediately.
- Ewing backfilled the anchor trench completely up to June 10's deployment and spot filled the anchor trench for today's deployment. See Figure 17.

2.5 June 11, 2020

- Weather: partly cloudy, turning to rain at 1:30 pm.

- Ewing is continuing to place bedding sand on the slopes.
- Tetra Tech and Layfield's QC conducted pressure testing of seams. Three seams require more extrusion welding due to pressure loss; all pressure testing was not completed due to weather.
- Layfield conducted vacuum box testing. Tetra Tech confirmed that vacuum box testing was being conducted according to specifications and checked any extrusion welding areas for confirmation of passes while conducting pressure testing. Three areas failed and required repair; Layfield completed the repairs immediately.
- Layfield extrusion welded the remaining tie in of Phase 1B to Phase 1A. Layfield also fixed some extrusion areas that failed vacuum box testing.
  - Further extrusion welding is required to address areas where pressure testing failed.
- A hole was identified on Panel P8. Layfield was notified to repair it.
- Due to rain, work was halted at 1:30 pm for the rest of the day.
- Forte provided a response to the RFI regarding horizontal seams authorizing them as long as certain conditions were met. Layfield has been made aware of the conditions.

2.6 June 12, 2020

- Layfield did not work today due to not having an area to deploy liner onto.
- Ewing continued to place bedding sand on slope.
- Tetra Tech and Layfield's QC finished pressure testing of the fusion welded seams.
  - Four seams require repair to complete all pressure testing.

2.7 June 13, 2020

- No work today as bedding sand subgrade is not ready for liner placement. See Figure 19.

2.8 June 14, 2020

- Weather: partly cloudy to sunny.
- Ewing is continuing to place bedding sand on the rocky slopes in advance of liner deployment.
  - Tetra Tech noted depressions along the anchor trench of Phase 1A filled with water. Tetra Tech advised Ewing to fill them in with sand prior to GCL deployment.
- Tetra Tech and Layfield's QC approved subgrade for two panels of liner deployment. See Figures 20 and 21.
  - Due to rocks in the bedding sand, Ewing must remove rocks in advance of liner deployment. For now, subgrade will be approved on a daily basis.
  - Rocks greater than 50 mm are to be removed from subgrade bedding sand in advance of liner deployment.
  - Once a screener is on site, rocks will be screened from the bedding sand.
  - Bedding sand is being placed approximately 100 mm thick and track packed by the dozer as it is placed.
- Ewing excavated anchor trench in advance of liner deployment. See Figures 22 and 23.

  - Anchor trench is being excavated deeper than specifications to mitigate liner movement down slope due to expansion and contraction.

- Survey notified Tetra Tech that patches on the liner will be picked up during survey of the seams.
- Layfield is deploying GCL and liner moving northward from where the liner installation began on May 31. See Figures 24 to 28.
  - For the first deployment of GCL, the bedding sand was checked after each roll was deployed.
    - Bedding sand is not being stripped from the slope by GCL deployment.
    - Layfield is removing any rocks picked from the edge of the anchor trench after each deployment.
    - Tetra Tech checked high spots in GCL to identify rocks.
      - Rocks identified were generally flat and were easily pushed into the bedding sand on the slope by stepping on them.
  - Bedding sand placed on slope is proving to be a suitable subgrade for liner deployment as long as rocks are removed prior to GCL deployment.
  - Layfield placed three panels of GCL and two rows of liner panels, which was fused by the end of the day.

3.0 GEOSYNTHETIC ROLL NUMBERS PLACED

Table 1 summarizes the daily geosynthetic roll numbers placed on the slope during liner installation. All panel lengths are approximate and where 45-degree joints are used; panel length is based from the center of the panel.

Table 1: Geosynthetic Roll Numbers Placed on Slope

Date	GCL Roll Number	LLDPE Liner Roll Number	Panel Number (Length)
June 8	502344539, 502344003 502344506, 502344508 502344565	10694-031 10694-018	P27 (31.6 m) P28 (38.7 m)

TETRA TECH

WEEKLY FIELD REPORT

ISSUED FOR USE

Project:	Eagle Gold Heap Leach Phase 1B	**Date:**	June 21, 2020
Location:	Eagle Gold Mine	**Contractor:**	Ewing Transport / Layfield
Client:	Victoria Gold Corp.	**Contractor's Rep:**	Marshall Ewing / Chad Messervey
Contact:	Clint Abel	**Contractor's Email:**	
Weather:	Variable (see daily entries)	**Tetra Tech Representative:**	Adam Mickey
File:	704-ENG.WARC03235-09	**Status:**	Issued for Use

1.0 INTRODUCTION

Tetra Tech Canada Inc. (Tetra Tech) was retained by Victoria Gold Corp. (Victoria Gold) to provide CQA services at the Eagle Gold mine located north of Mayo, Yukon, at Dublin Gulch for the Eagle Gold Heap Leach Phase 1B expansion (Phase 1B). Mr. Adam Mickey, EIT, is Tetra Tech's representative on site.

Forte Dynamics (Forte) out of Fort Collins, Colorado provided the design and specification for Phase 1B, and Forte's representative is Clint Green.

Clint Abel, of JDS Energy & Mining, is Victoria Gold's project manager on site at the Eagle Gold mine.

Ewing Transport (Ewing), based out of Mayo, Yukon, is the construction contractor for Phase 1B.

Layfield Environmental Containment (Layfield) has been retained to provide and install the liner for Phase 1B, and their supervisor on site is Chad Messervey.

The following Field Report outlines Tetra Tech's CQA for the period of June 15, 2020, to June 21, 2020.

2.0 DAILY REPORTS

2.1 Highlights

- Rain delayed liner deployment throughout the week.
- Layfield is placing three panels of GCL for every two panels of 80 mm LLDPE liner.
- Panels P43 through P62 were deployed, giving a total length of approximately 1,544.4 m placed on the slope for a total area of approximately 10,502 m^2.
- Ongoing rain in the evenings caused GCL to hydrate at the toe of the slope. Hydrated GCL was removed each morning at the direction of Tetra Tech.
- Rain also caused erosion of the placed bedding sand on the slope requiring ongoing maintenance to maintain subgrade integrity.

Tetra Tech Canada Inc.

Whitehorse, YT Y1A 0H7 CANADA
Tel 867.668.3068 Fax 867.668.4349

2.2 June 15, 2020

- Weather: partly cloudy turning to cloudy
- Ewing is continuing to place bedding sand on slopes.
- Layfield is continuing to deploy GCL and liner. See Figures 1 to 6.
  - Four slope lengths of GCL deployed and two slope lengths of liner deployed.
- Ewing and Layfield picked rocks out of bedding sand for approximately 45 m from edge of P47 along anchor trench.
  - Tetra Tech inspected the subgrade and approved it for liner deployment. For subgrade approval going forward, subgrade will be approved on a daily basis, but a Layfield subgrade inspection report will be generated based on the liner panels deployed over the subgrade.
- Layfield began extrusion on panels placed since June 14 and extruded at the top seams to allow anchor trench to be backfilled.

2.3 June 16, 2020

- Weather: cloudy and light rain turning to mostly cloudy in the afternoon.
- Ewing is not placing bedding sand on slope due to slippery road conditions from stockpile to site.
- Layfield is continuing to deploy GCL and liner. See Figures 7 to 11.
  - Tetra Tech approved the subgrade for liner deployment.
  - One more slope length of GCL panels was deployed, and then liner panels P48 and P49 were deployed overtop.
  - Deployment was halted at 10:30 am due to rain and resumed at 1:00 pm when the rain stopped.
  - Layfield continued to place GCL till the end of the day. At the end of the day, five slope lengths of GCL were deployed.
    - Layfield folded up the GCL at the bottom of the slope in case of rain.
- Tetra Tech attended the weekly Phase 1B meeting and updated all parties on the progress. No specific issues were raised.
- Tetra Tech performed compaction testing on subgrade fills as required.

2.4 June 17, 2020

- Weather: cloudy, turning to rain at 8:00 am.
- It rained heavily overnight on deployed GCL. See Figures 12 to 14.
  - Heavy erosion was evident of the bedding sand on the slope as it washed to the bottom in places.
    - Sand was displaced on to leading panels along the slope.

    - An erosion gully formed along the leading edge of the GCL. It will have to be raked smooth prior to further deployment.
    - Areas at the bottom of the slope will have to be raked to smooth out contours and fix erosional features.
  - Tetra Tech and Layfield inspected the GCL on the slope. GCL on the slope did not hydrate due to the rainfall, but the GCL that was folded back hydrated at the fold. Layfield is replacing the GCL and cutting it off 1 m up from the folded area.
    - Weather conditions during deployment have been unpredictable throughout the project, and weather reports do not reflect the conditions experienced at site. It is impossible to protect the GCL on the slope overnight by covering it, and it has been shown that the GCL will not hydrate on the steep slopes during rainfall, so Layfield has continued deployment to advance the project understanding that GCL may need to be replaced at the toe of the slope.
- Due to rain and saturated conditions, deployment was shut down for the day at 9:30 am.

2.5 June 18, 2020

- Weather: Partly cloudy turning to cloudy with periods of rain in the afternoon.
- Layfield fixed subgrade and replaced hydrated GCL. See Figures 15 to 17.
  - Subgrade was smoothed out using rakes, and additional sand was placed in wet spots by Ewing and Layfield personnel.
  - The subgrade had dried out sufficiently to place liner.
  - Layfield is not going to leave any GCL exposed overnight anymore due to unpredictable weather. This could lead to shorter days due to the time it takes to deploy GCL and liner, as well as fusing the liner.
- Layfield is deploying liner to cover the deployed GCL. See Figures 18 and 19.
  - Panels P50 to P57 were deployed on the slope and fused.
- Layfield placed two more slope lengths of GCL and then deployed and fused panels P58 and P59.
- Layfield performed extrusion welding on deficient areas from panels P1 to P36, including fixing seams to finish pressure testing.
- Rock picking and subgrade acceptance will be required to continue deployment.

2.6 June 19, 2020

- Weather: cloudy with chances of rain.
- Rained overnight.
  - Layfield is assessing the slope to determine if deployment is possible.
- Ewing is picking rocks and cleaning up hydrated GCL at the base of the slope. Also, Ewing is fixing the subgrade at the base of the slope and placing sand in areas that the dozer could not finish.
- Layfield is extrusion welding the tie in to Phase 1A.
- Tetra Tech and Layfield's QC obtained 12 destructive testing samples for liner deployed to date.

  - The P1-P38 vertical seam failed and requires further destructive testing. Destructive testing failed due to peel into weld beyond specifications on four samples.
  - All other destructive samples passed, and the required amount of destructive samples have been obtained and tested for liner deployed.
- Rain delayed detail work at 10:00 am. Layfield shut down until 11:30 am.
  - Layfield continued extrusion and detail work.
  - Ewing is continuing to pick rocks and spread sand at the toe of the slope.

2.7 June 20, 2020

- Weather: Partly cloudy, turning to cloudy and rain.
- Layfield placed one slope length of GCL and then deployed and fused panels P60, P61, and P62.
  - Due to rain on the horizon and in the forecast, Layfield halted further deployment at 11:00 am. The rain began at 1:00 pm as they were gearing up to perform extrusion welding.
- Tetra Tech and Layfield's QC performed pressure testing on failed seams for panels P1 through P36 as the extrusion welders had re-blocked the air channels at the ends.
  - All pressure testing passed.
  - On the P1-P3 seam, there is an approximately 1 m section that will have to be extrusion welded along the seam as it is where the air channel was blocked.
- Work was halted for the rest of the day due to rain.

2.8 June 21, 2020

- No work performed today due to rain.

3.0 GEOSYNTHETIC ROLL NUMBERS PLACED

Table 1 summarizes the daily geosynthetic roll numbers placed on the slope during liner installation. All panel lengths are approximate, and where 45 degree joints are used, panel length is based from the center of the panel.

Table 1: Geosynthetic Roll Numbers Placed on Slope

Date	GCL Roll Number	LLDPE Liner Roll Number	Panel Number (Length)
June 15	502344581, 502344142	10694-001	P43 (102.3 m)

4.0 TRIAL SEAM

Table 2 summarizes the weekly trial seam results. For fusion, the apparatus settings are temperature and speed, and for extrusion, the apparatus settings are preheat and barrel temperature. Five tests are performed for each criterion.

Table 2: Trial Seam Results

Date	Time	Fusion or Extrusion	Tech	Apparatus #	Temp or Preheat (°F)	Speed (%) or Barrel Temp (°F)	$Peel_{inside}$ (100 min)	$Peel_{outside}$ (100 min for Fusion 88 min for Extrusion)	Shear (120 min)	Smooth or Textured

TETRA TECH

WEEKLY FIELD REPORT

ISSUED FOR USE

Project:	Eagle Gold Heap Leach Phase 1B	**Date:**	June 28, 2020
Location:	Eagle Gold Mine	**Contractor:**	Ewing Transport / Layfield
Client:	Victoria Gold Corp.	**Contractor's Rep:**	Marshall Ewing / Chad Messervey
Contact:	Clint Abel	**Contractor's Email:**	
Weather:	Variable (see daily entries)	**Tetra Tech Representative:**	Adam Mickey
File:	704-ENG.WARC03235-09	**Status:**	Issued for Use

1.0 INTRODUCTION

Tetra Tech Canada Inc. (Tetra Tech) was retained by Victoria Gold Corp. (Victoria Gold) to provide CQA services at the Eagle Gold mine located north of Mayo, Yukon, at Dublin Gulch for the Eagle Gold Heap Leach Phase 1B expansion (Phase 1B). Mr. Adam Mickey, EIT, is Tetra Tech's representative on site.

Forte Dynamics (Forte) out of Fort Collins, Colorado provided the design and specification for Phase 1B, and Forte's representative is Clint Green.

Clint Abel, of JDS Energy & Mining, is Victoria Gold's project manager on site at the Eagle Gold mine.

Ewing Transport (Ewing), based out of Mayo, Yukon, is the construction contractor for Phase 1B.

Layfield Environmental Containment (Layfield) has been retained to provide and install the liner for Phase 1B, and their supervisor on site is Chad Messervey.

The following Field Report outlines Tetra Tech's CQA for the period of June 22, 2020, to June 28, 2020.

2.0 DAILY REPORTS

2.1 Highlights

- Rain delayed liner deployment for four days this week.
- Panels P63 through P76 were deployed this week for a total length of approximately 1,161.2 m and a total area covered of approximately 7,896 m^2.
- Pressure testing has been completed for all panels up to panel P57 has been completed and passed except for the P51-P54 vertical seam.
- Layfield is keeping up with all detailing of the liner panels.
- Layfield is placing three panels of GCL for every two panels of 80 mm LLDPE liner.
- All geotextiles deployed have been deployed as per contract specifications.

2.2 June 22, 2020

- Weather: cloudy
- Layfield and Ewing came to site to assess the subgrade conditions and determine if deployment was possible.
  - No work performed today due to saturated subgrade conditions and erosion from heavy rainfall on June 21.
  - Rainfall caused erosion of sand on subgrade to the base of the slope and along GCL. See Figures 1 to 4.
  - Ewing is removing sand on GCL and flipping it over to protect the GCL from further sand migration.

2.3 June 23, 2020

- Weather: raining
- No work performed today due to rain.

2.4 June 24, 2020

- Weather: raining
- No work performed today due to rain.

2.5 June 25, 2020

- Weather: partly cloudy with periods of light rain.
- Ewing is fixing subgrade erosion for further liner deployment.
- Layfield is performing extrusion welding on panels P37 through P62 and also tying in deployed panels to Phase 1A.
- Tetra Tech and Layfield conducted pressure testing of seams.
  - Some seams failed requiring further block offs or patches.
- Destruct D14B was obtained and tested as a result of the failed destruct on June 20. The destruct passed.
- Tetra Tech inspected the subgrade that Ewing worked on throughout the day. At the toe of the slope along the anchor trench of Phase 1A, the subgrade was saturated as well as soft in areas. See Figures 6 and 7.
  - Tetra Tech discussed the issues with Clint Abel, and Clint noted that he had told Ewing to excavate out any soft or saturated materials.
  - Tetra Tech spoke to Clint Green about what would be tolerated with the subgrade to determine how much additional work would be required to deploy GCL.
    - It was agreed that no soft/yielding or saturated areas would be accepted for the subgrade, which follows the original specifications.
    - Tetra Tech spoke with Ewing and advised that the saturated sand at the toe of the slope would have to be removed.

2.6 June 26, 2020

- Weather: partly cloudy with periods of rain in the afternoon.
- Ewing is removing soft and saturated subgrade materials from the toe of the slope.
  - Tetra Tech directed the subgrade removal for the next two slope lengths of liner and showed Ewing what was expected for further subgrade excavation.
  - Once the subgrade materials had been removed, Ewing raked the subgrade smooth and removed any large rocks over 50 mm.
  - Ewing will continue to fix the subgrade in advance of liner deployment as they have time.
  - Tetra Tech advised Ewing that low spots that are saturated and soft along the Phase 1A anchor trench should be backfilled as soon as possible to limit further water infiltration due to rainfall.
- Tetra Tech approved the subgrade for the next two slope lengths of liner to be deployed.
- Layfield and Ewing labourers removed eroded sand from the GCL and then placed three slope lengths of GCL and one slope length of liner.
  - Layfield could not get all the GCL covered by the end of the day due to lost time in the morning because of subgrade prep and periodic rainstorms in the afternoon.
  - Layfield deployed liner panels P63 and P64.
- All extrusion welding and liner repairs identified by pressure testing were completed on June 25. Layfield completed pressure testing of seams for panels P37 to P57. One more seam requires extrusion welding to test on the P51-P54 vertical seam.

2.7 June 27, 2020

- Weather: partly cloudy with wind and rainy periods.
- Ewing continued to repair subgrade at toe of slope in advance of liner deployment. See Figures 8 to 11.
  - The toe was repaired to allow two slope lengths of liner to be deployed.
  - Upon completion of repairs, Tetra Tech inspected and approved the subgrade for GCL deployment.
- Layfield continued liner deployment.
  - Layfield deployed, and fused liner overtop of GCL from June 26, then deployed two slope lengths of GCL and one slope length of liner. The liner was fused immediately upon deployment.
  - Rain delayed deployment at 9:45 am for approximately 1.5 hours.
  - Layfield deployed one more slope length of GCL and liner.
  - Liner panels P65 through P71 were deployed today.
- Layfield conducted extrusion welding on identified repairs as well as conducted required extrusion welding on liner deployed June 26.

2.8 June 28, 2020

- Weather: sunny with windy periods in the afternoon.
- Ewing repaired subgrade at the toe of the slope to allow for two slope lengths of liner to be deployed. See Figure 13.
  - Tetra Tech approved the subgrade for liner deployment.
- Layfield deployed three slope lengths of GCL and two slope lengths of liner. See Figures 14 to 16.
  - Liner was fused immediately after deployment.
- Tetra Tech and Chad worked with Ewing to fix up the toe of the slope subgrade. See Figures 17 to 20.
  - Ewing continued to work on subgrade on the slope afterward.
- Tetra Tech and Layfield obtained seven destructive samples for testing.
  - Layfield immediately patched where destructive samples were taken on the slope.
  - Upon obtaining the destruct sample from the P68-P70 vertical seam, it was found that due to a fusion apparatus operator error, the air seam was damaged along the entire length of the seam. See Figures 21 and 22.
    - Although the seam is fused together, it cannot be pressure tested. Layfield will extrusion weld the entire seam.
  - Destructive testing was not performed today

3.0 GEOSYNTHETIC ROLL NUMBERS PLACED

Table 1 summarizes the daily geosynthetic roll numbers placed on the slope during liner installation. All panel lengths are approximate and where 45 degree joints are used, panel length is based from the center of the panel.

Table 1: Geosynthetic Roll Numbers Placed on Slope

Date	GCL Roll Number	LLDPE Liner Roll Number	Panel Number (Length)
June 22	-	-	-

4.0 TRIAL SEAM

Table 2 summarizes the weekly trial seam results. For fusion, the apparatus settings are temperature and speed, and for extrusion, the apparatus settings are preheat and barrel temperature. Five tests are performed for each criterion.

Table 2: Trial Seam Results

Date	Time	Fusion or Extrusion	Tech	Apparatus #	Temp or Preheat (°F)	Speed (%) or Barrel Temp (°F)	$Peel_{inside}$ (100 min)	$Peel_{outside}$ (100 min for Fusion 88 min for Extrusion)	Shear (120 min)	Smooth or Textured

TETRA TECH

WEEKLY FIELD REPORT

ISSUED FOR USE

Project:	Eagle Gold Heap Leach Phase 1B	**Date:**	July 5, 2020
Location:	Eagle Gold Mine	**Contractor:**	Ewing Transport / Layfield
Client:	Victoria Gold Corp.	**Contractor's Rep:**	Marshall Ewing / Chad Messervey
Contact:	Clint Abel	**Contractor's Email:**	
Weather:	Variable (see daily entries)	**Tetra Tech Representative:**	Adam Mickey
File:	704-ENG.WARC03235-09	**Status:**	Issued for Use

1.0 INTRODUCTION

Tetra Tech Canada Inc. (Tetra Tech) was retained by Victoria Gold Corp. (Victoria Gold) to provide CQA services at the Eagle Gold mine located north of Mayo, Yukon, at Dublin Gulch for the Eagle Gold Heap Leach Phase 1B expansion (Phase 1B). Mr. Adam Mickey, EIT, is Tetra Tech's representative on site.

Forte Dynamics (Forte) out of Fort Collins, Colorado provided the design and specification for Phase 1B, and Forte's representative is Clint Green.

Clint Abel, of JDS Energy & Mining, is Victoria Gold's project manager on site at the Eagle Gold mine.

Ewing Transport (Ewing), based out of Mayo, Yukon, is the construction contractor for Phase 1B.

Layfield Environmental Containment (Layfield) has been retained to provide and install the liner for Phase 1B, and their supervisor on site is Chad Messervey.

The following Field Report outlines Tetra Tech's CQA for the period of June 29, 2020, to July 5, 2020.

2.0 DAILY REPORTS

2.1 Highlights

- Panels P77 through P103 were deployed this week for a total length of approximately 2,162.2 m, giving a total area deployed of approximately 14,703 m^2.
- Destructive testing has been performed for all panels placed up to July 3, and all destructive samples passed.
- All pressure testing has been completed for all liner deployed to July 1.
- Rain delayed liner deployment throughout the week.
- Layfield is placing three panels of GCL for every two panels of 80 mm LLDPE liner.

2.2 June 29, 2020

- Weather: cloudy, turning to rain in the afternoon.
- Layfield is deploying GCL and Liner.
  - Three slope lengths of GCL and two slope lengths of liner were deployed.
  - Rain at 3:00 halted deployment.
  - Deployment continued after rain, and Layfield deployed 1 ¾ slope lengths of GCL.
  - Panels P77 through P81 were deployed today.
- Three additional destructive samples were obtained by Tetra Tech and Layfield.
  - Destructive sampling is caught up to all deployment as of June 28.
  - Destructive testing was performed with all samples passing.

2.3 June 30, 2012

- Weather: mostly cloudy, turning to cloudy with periods of rain.
- Layfield is continuing deployment of GCL and liner.
  - Layfield is conducting trial seam testing at deployment location.
  - 1 ¼ slope lengths of GCL were placed, followed by two slope lengths of liner.
  - Periods of rain began at 12:00 pm halting deployment and fusing.
    - A break in the rain allowed fusing of the last vertical seam to commence.
    - Rain began again at 2:00 pm, shutting down deployment for the rest of the day.
  - Panels P82 through P87 were deployed today.

2.4 July 1, 2020

- Weather: cloudy, turning to partly cloudy in the late afternoon.
- Layfield is continuing deployment of GCL and liner.
  - Layfield deployed three slope lengths of GCL and two slope lengths of liner by 1:30 pm.
  - Layfield placed two more slope lengths of GCL and one more slope length of liner.
  - Panels P87 through P94 were deployed today.
- Layfield's QC conducted pressure testing on all untested seams up to panel P76.
  - With the exception of the P61-P64 vertical seam, all seams passed pressure testing.
  - The P51-P54 seam retest passed.

2.5 July 2, 2020

- Weather: sunny.
- Tetra Tech performed soils logging at three spots along the east laterals.
- Ewing is continuing to fix subgrade at the toe of the slope ahead of deployment.
  - Tetra Tech made regular inspections throughout the day to ensure that the subgrade was being prepared to contract specifications.
- Layfield is continuing deployment of GCL.
  - Layfield is beginning to angle deployment of the GCL to correct the angles for a continuation of straight deployment.
    - A straight piece of liner will be installed further along the perimeter road to correct the angle, and then the liner will be angled from the current deployment edge at approximately 45 degree angles to the slope.
  - Layfield spent the day deploying GCL.
    - Rain is not expected for the next few days. Layfield has to deploy the area shown in photos with GCL prior to deploying liner.
  - Layfield is picking large rocks out of the sand subgrade as they are found during deployment.
- Tetra Tech identified two cross seams that did not have the required 10 m of spacing between them.
  - Spacing is approximately 0.5 m.
  - Tetra Tech discussed with Chad about the issue. Chad is expecting that they will remove one of the cross seams and repair the section to have proper spacing between the cross seams.
- Layfield's QC performed extrusion welding on deployed liner.
  - Tetra Tech and QC determined required locations for destructive testing samples to be obtained. QC repaired any destructive testing samples obtained on the slope immediately.

2.6 July 3, 2020

- Weather: sunny and windy.
- Ewing is continuing to prep subgrade at the toe of the slope.
  - Tetra Tech is assessing the subgrade periodically to ensure it meets contract specifications.
- Layfield is continuing to deploy GCL on the slope.
  - Layfield intended to deploy liner, but wind conditions are not conducive to liner deployment.
  - Layfield completed GCL placement, but it was still too windy to begin liner deployment.
- Tetra Tech and Layfield QC performed destructive testing.
  - All destructive samples passed, and destructive testing is caught up to all liner deployed to date.

- After GCL placement, Layfield finished the day by doing extrusion welding on the deployed liner.
- Layfield has decided that the improper cross-seam panel will be removed and replaced as soon as possible.

2.7 July 4, 2020

- Weather: sunny.
- Layfield is deploying liner on GCL placed between July 2 and July 3.
  - Wind delayed deployment throughout the day, and deployment was halted at 4:30 pm due to wind.
  - Layfield got three slope lengths of liner on the slope but did not complete deployment of liner over the area of exposed GCL.
- Layfield's QC is extrusion welding liner deployed before July 1.
  - All panel intersections have been T-welded.
  - The P68-P70 seam with the damaged air channel has been extrusion welded for its length.
  - Remaining detail work required for panels P1 through P94:
    - Tie in to Phase 1A; and
    - Replace panels with out of spec distance between cross seams.
- Layfield's QC conducted pressure testing on seams up to P94.
- All geosynthetics have been delivered to site, and Tetra Tech completed the review of all Mill Certs. All geosynthetics meet or exceed contract specifications.

2.8 July 5, 2020

- Weather: Partly cloudy, turning to cloudy in the morning.
- Layfield is continuing to deploy liner on GCL deployed on July 2 and July 3.
  - Layfield had to stop deployment multiple times due to wind and shut down deployment for the day at 3:00 pm due to wind
    - Layfield could not do any other work due to rain beginning at 3:30 pm.
- Layfield's QC continued pressure testing on seams up to P94.

3.0 GEOSYNTHETIC ROLL NUMBERS PLACED

Table 1 summarizes the daily geosynthetic roll numbers placed on the slope during liner installation. All panel lengths are approximate and where 45 degree joints are used, panel length is based from the center of the panel.

Table 1: Geosynthetic Roll Numbers Placed on Slope

4.0 TRIAL SEAM

Table 2 summarizes the weekly trial seam results. For fusion, the apparatus settings are temperature and speed, and for extrusion, the apparatus settings are preheat and barrel temperature. Five tests are performed for each criterion.

Table 2: Trial Seam Results

WEEKLY FIELD REPORT

ISSUED FOR USE

Project:	Eagle Gold Heap Leach Phase 1B	**Date:**	July 12, 2020
Location:	Eagle Gold Mine	**Contractor:**	Ewing Transport / Layfield
Client:	Victoria Gold Corp.	**Contractor's Rep:**	Marshall Ewing / Chad Messervey
Contact:	Clint Abel	**Contractor's Email:**	
Weather:	Variable (see daily entries)	**Tetra Tech Representative:**	Adam Mickey/James Buyck
File:	704-ENG.WARC03235-09	**Status:**	Issued for Use

1.0 INTRODUCTION

Tetra Tech Canada Inc. (Tetra Tech) was retained by Victoria Gold Corp. (Victoria Gold) to provide CQA services at the Eagle Gold mine located north of Mayo, Yukon, at Dublin Gulch for the Eagle Gold Heap Leach Phase 1B expansion (Phase 1B). Mr. Adam Mickey, EIT, is Tetra Tech's representative on site till July 8, and Mr. James Buyck is Tetra Tech's representative after July 8.

Forte Dynamics (Forte) out of Fort Collins, Colorado provided the design and specification for Phase 1B, and Forte's representative is Clint Green.

Clint Abel, of JDS Energy & Mining, is Victoria Gold's project manager on site at the Eagle Gold mine.

Ewing Transport (Ewing), based out of Mayo, Yukon, is the construction contractor for Phase 1B.

Layfield Environmental Containment (Layfield) has been retained to provide and install the liner for Phase 1B, and their supervisor on site is Chad Messervey.

The following Field Report outlines Tetra Tech's CQA for the period of July 6, 2020, to July 12, 2020.

2.0 DAILY REPORTS

2.1 Highlights

- Rain delayed liner deployment throughout the week.
- Layfield is placing three panels of GCL for every two panels of 80 mm LLDPE liner.

2.2 July 6, 2020

- Weather: partly cloudy.
- Layfield is continuing to deploy liner over deployed GCL.
  - During the deployment of the first panel, an incident occurred where the 128 m of deployed liner slid down the hill to the toe of the slope.

Tetra Tech Canada Inc.
61 Wasson Place
Whitehorse, YT Y1A 0H7 CANADA
Tel 867.668.3068 Fax 867.668.4349

- Two of Layfield's employees were swept down the hill with the liner, and one of Layfield's employees and one of Ewing's employees sustained minor injuries.
- Deployment was halted for the rest of the day due to the incident.
- Tetra Tech attended the post-incident safety meeting with Layfield and Ewing and provided a witness statement.
- Multiple factors led to the incident, including lack of communication, complacency, and fatigue.
- Layfield will be taking July 7 off to give the crews a rest day.

2.3 July 7, 2020

- Tetra Tech spent part of the rest day working on paperwork and other miscellaneous tasks.
- Tetra Tech attended the weekly progress meeting at 10:30 am.
- James Buyck arrived on site to take over CQA Inspection duties for Adam Mickey

2.4 July 8, 2020

- Weather: mostly cloudy, light afternoon drizzle.
- Layfield and Tetra Tech performed a final inspection on panels P1 through P59.
  - Three areas requiring vacuum testing were identified, and vacuum tested immediately.
  - The area is ready for final sign off to be passed over to the client.
- Layfield repaired the out of spec cross seam by cutting out the liner to a point 10 m away from the adjacent cross seam and replaced with new liner.
- Layfield recovered the liner that slid down the slope on July 6, cutting it into manageable pieces and deploying it on the slope. Chad M. indicated there was no significant damage caused to the liner, and Layfield was able to completely reuse.
- Tetra Tech signed off on Layfield's subgrade acceptance for liner deployed between June 29 and July 5.

2.5 July 9, 2020

- Weather: sun and cloud, light drizzle mid-afternoon.
- No GCL or 80 mm LLDPE liner placed today. Layfield concentrated on completing patch repair and extrude welding bottom section of entire length of panel placed to date to the previous Phase 1B.
- Anchor trench compacted along entire section of liner placed to date.
- Approximately 30 m of anchor trench excavated beyond last panel of liner placed.
- Ewing Transport continued placement and compaction of fill for liner bench

2.6 July 10, 2020

- Weather: sun and cloud, light to medium rain in afternoon.

- Layfield deployed 21 GCL panels and no LLDPE liner – work delayed ~2.5 hours because of rainy and windy conditions.

2.7 July 11, 2020

- Weather: Overcast with rainy periods.
- Steady rain overnight with continued rain in the morning halted work for the day.

2.8 July 12, 2020

- Weather: Sun and cloud with periods of light rain. Little to moderate breeze.
- LLDPE Liner deployment and ground work commenced in the morning after site conditions were assessed by Ewing Transport and Layfield to be acceptable to proceed.
- GCL and LLDPE panels placed in the afternoon. Detail work also performed once GCL and LLDPE placed.
- Ewing completed regrading and static rolling of the next section of subgrade planned for GCL. The entire area had been scoured by recent rains.
- Trenching for anchoring the liners completed, as required.
- A number of failed pressure test were encountered from today's welding. Layfield QC representative investigated and discussed improvements required with the individuals completing the grinding prep work. A demonstration was provided to further improve this process.

3.0 GEOSYNTHETIC ROLL NUMBERS PLACED

Table 1 summarizes the daily geosynthetic roll numbers placed on the slope during liner installation. All panel lengths are approximate, and where 45 degree joints are used, panel length is based from the center of the panel.

Table 1: Geosynthetic Roll Numbers Placed on Slope

Date	GCL Roll Number	LLDPE Liner Roll Number	Panel Number (Length)
July 6	-	-	-
July 7	-	-	-
July 8	-	10700-001 10700-023 10694-019 10700-001 10694-015 10694-013	P108 (39.2 m) P109 (39.4 m) P110 (29.9 m) P111 (39.2 m) P112 (33.8 m), P113 (29.4 m), P114 (19.2 m) P115 (24.9 m), P116 (56.6 m), P117 (27.1 m) ,P118 (13.1 m), P119 (22.8 m), P120 (6.0 m)

Forte Dynamics (Forte) out of Fort Collins, Colorado provided the design and specification for Phase 1B, and Forte's representative is Clint Green.

Clint Abel, of JDS Energy & Mining, is Victoria Gold's project manager on site at the Eagle Gold mine.

Ewing Transport (Ewing), based out of Mayo, Yukon, is the construction contractor for Phase 1B.

Layfield Environmental Containment (Layfield) has been retained to provide and install the liner for Phase 1B, and their supervisor on site is Chad Messervey.

The following Field Report outlines Tetra Tech's CQA for the period of July 13, 2020, to July 19, 2020.

2.0 DAILY REPORTS

2.1 Highlights

- Rain and some wind delayed liner deployment throughout the week.
- Layfield is placing three panels of GCL for every two panels of 80 mm LLDPE liner.

2.2 July 13, 2020

Weather: sun and cloud. Light breeze throughout the day.

- Layfield continued placement of GCL (17 rolls) and LLDPE liner (6 panels) with no major issues. Some delay early afternoon due to wind.
- Ewing Transport continued regrading and rolling subgrade ahead of liner deployment. As well, continued sub-excavation and hauling from NE slope. Areas of soft and wet subgrade and organics encountered.

Tetra Tech Canada Inc.
61 Wasson Place
Whitehorse, YT Y1A 0H7 CANADA
Tel 867.668.3068 Fax 867.668.4349

2.2 July 13, 2020

Weather: sun and cloud. Light breeze to light wind throughout the day.

- Continued regrading and rolling of subgrade and noted to be acceptable for liner deployment. Sub-excavation continues along the NE slope.
- Deployment of GCL and liner continued with good progress in the morning and delays in the afternoon due to windy conditions.

2.3 July 14, 2020

Weather: sun and cloud. Light breeze to light wind throughout the day.

- Continued deployment of GCL and Liner with detail work and Qc testing performed by Layfield. Ewing Transport continued removal of material and sloping NE section of HLF.

2.4 July 15, 2020

- Weather: Overcast, rain through the morning and early afternoon.
- Layfield suspended work for the day due to rain. Ewing Transport continued sub-excavation along NE slope.
- Layfield QC performed destruct testing (D58 to D62) with Tetra Tech QA present throughout. All results exceeded minimum specification.

2.5 July 16, 2020

- Weather: Mostly clear in the morning and overcast in the afternoon.
- The subgrade immediately ahead of planned deployment for today observed to be minimally affected by yesterday's rainfall. Only minor raking required to repair some localized areas along with additional rolling with the steel drum vibratory compactor.
- Upon Tetra Tech approval of subgrade and trenching ahead completed, deployment of GCL and Liner commenced in the morning immediately. Sub-excavation continues within the NE slope.

2.6 July 17, 2020

- Weather: Overcast with heavy rain starting at 12:30 pm until 2:00 pm. Work limited to detail work later in the day.
- Minor subgrade prep work required and once completed liner deployment approved by Tetra Tech QC and Layfield reps. GCL was placed at the request of the owner rep but was not yet covered by liner once the rain started. The subgrade and GCL will be evaluated prior to commencing further work.
- Ewing Transport did not perform sub-excavation work today to allow the crew relief from their extended work schedule.
- Additional work required by Ewing liner crew to regrade the next section of subgrade affected by the rainfall.
- GCL and LLDPE were deployed in the a.m. but halted around noon due to rain. Detail work commenced for a short period after rain but once again halted for the day due to further rain.
- Air testing, destructs, and non-destructive testing performed with applicable results to be summarized in tomorrows report submission.

2.7 July 18, 2020

- Weather: Sun, some clouds in the a.m. with drizzle starting around 12:30 pm and heavier with lightning from 1:30 p.m. to 2:00 p.m.
- Rainfall yesterday and overnight caused some minor scouring of the subgrade. The section scheduled for deployment was back-bladed with a dozer and compacted with a smooth drum vibratory compactor, as required.
- The exposed GCL was observed not to be adversely affected by the rain. Approval was granted to Layfield to proceed with LLDPE liner deployment.
- Deployment halted due to rain and lightning from 12:30 p.m. to 2:00 p.m. Deployment of LLDPE re-commenced shortly afterward until about 4:00 p.m. The crew then switched to detail work, testing and clean-up.
- Work suspended for the day due to rain around 5:15 p.m.

2.8 July 19, 2020

- Weather: Sun and some clouds in the a.m. with drizzle starting around.
- Layfield recovery day.
- Ewing Transport continues to sub-excavate and place sand along the NE slope.

3.0 GEOSYNTHETIC ROLL NUMBERS PLACED

Table 1 summarizes the daily geosynthetic roll numbers placed on the slope during liner installation. All panel lengths are approximate, and where 45 degree joints are used, panel length is based from the center of the panel.

6.0 DESTRUCTIVE TESTING

Table 4 summarizes the weekly destructive testing results. Five tests are performed for each criterion. Tetra Tech QA representative was present during testing.

TETRA TECH

WEEKLY FIELD REPORT

ISSUED FOR USE

Project:	Eagle Gold Heap Leach Phase 1B	**Date:**	July 26, 2020
Location:	Eagle Gold Mine	**Contractor:**	Ewing Transport / Layfield
Client:	Victoria Gold Corp.	**Contractor's Rep:**	Marshall Ewing / Chad Messervey
Contact:	Clint Abel	**Contractor's Email:**	
Weather:	Variable (see daily entries)	**Tetra Tech Representative:**	James Buyck
File:	704-ENG.WARC03235-09	**Status:**	Issued for Use

1.0 INTRODUCTION

Tetra Tech Canada Inc. (Tetra Tech) was retained by Victoria Gold Corp. (Victoria Gold) to provide CQA services at the Eagle Gold mine located north of Mayo, Yukon, at Dublin Gulch for the Eagle Gold Heap Leach Phase 1B expansion (Phase 1B). Mr. James Buyck is Tetra Tech's representative on site.

Forte Dynamics (Forte) out of Fort Collins, Colorado provided the design and specification for Phase 1B, and Forte's representative is Clint Green.

Clint Abel, of JDS Energy & Mining, is Victoria Gold's project manager on site at the Eagle Gold mine.

Ewing Transport (Ewing), based out of Mayo, Yukon, is the construction contractor for Phase 1B.

Layfield Environmental Containment (Layfield) has been retained to provide and install the liner for Phase 1B, and their supervisor on site is Chad Messervey.

The following Field Report outlines Tetra Tech's CQA for the period of July 20, 2020, to July 26, 2020.

2.0 DAILY REPORTS

2.1 Highlights

- Rain delayed liner deployment throughout the week.
- Layfield is placing three panels of GCL for every two panels of 80 mm LLDPE liner.

2.2 July 20, 2020

- Weather: cloudy, turning to rain by mid-morning
- Layfield deployed two slope lengths of GCL before work halted by rain.
- Four additional destructive samples were obtained by Layfield with extrusion welded repair completed immediately afterward and just prior to rainfall.
- Ewing halted sub-excavation of NE Slope because of wet and slippery haul road. Continued placement and compaction of fill along the west side of the perimeter road.

2.3 July 21, 2020

- Weather: Sunny in a.m., some cloud and rain in the p.m. L 9°C H 17°C
- The GCL placed yesterday prior to rainfall was evaluated and noted to have localized wetted areas estimated to be about 10 % of the total area placed. Select areas were further investigated by cutting through the GCL. The bentonite was noted to be moistened and 'pasty' with the internal fibres connecting the outer layers still intact. There was no noticeable migration of bentonite through the outer layers. Layfield superintendent (Chad M.) proceeded with placement with QA agreement.
- The area of subgrade planned for today's deployment was evaluated and noted to have only some localized minor scour and instability issues - permission granted to Layfield to proceed with deployment.
- Two slope lengths of GCL and slope length of LLDPE Liner deployed in the a.m. Two slope lengths of GCL and one slope length of LLDPE Liner placed in the p.m.
- Layfield also continued obtaining destructs and performing detail work.
- Ewing focused on placement of fill short-hauled from a nearby source to the West Perimeter Berm, as well, continued installation perforated corrugated pipe along Lateral #3.
- Ewing requested review of the sub-grade of the recently excavated Perimeter East Berm. The area observed to design grade, and with the exception of a few localized soft areas and minor clean-up, the majority of the area appears satisfactory -another review will be completed once clean-up has been finalized.

2.4 July 22, 2020

- Weather: Overcast, with rain by mid-morning L 10°C H 12°C
- Layfield deployed one slope length of LLDPE Liner and GCL until work halted around 10:30 a.m. due to rain.
- Work re-commenced after the rain stopped around 12:30 p.m., and two more slope lengths of GCL and one LLDPE Liner were deployed. Prior to deployment of the LLDPE, the GCL was observed to be wet but not adversely affected by the rain – No signs of 'popcorn' effect through liner, or delamination of the internal connective fibers.
- Ewing continued placement and compaction of fill hauled from nearby source to West Perimeter Berm, and install of perforated corrugated pipe along Lateral #3.
- Anchor trench excavated, but rain around 3:15 p.m. halted further deployment.
- Liner deployment halted for rest of the day at 4:00 p.m.

2.5 July 23, 2020

- Weather: Overcast, L 6°C H 15°C
- Regrading and rolling of subgrade required by Ewing prior to GCL deployment. Layfield commenced GCL deployment immediately afterward, around 9:00 a.m.
- Three slope lengths of GCL placed by 1:00 p.m. Deployment of LLDPE Liner commenced around 1:30 p.m.
- Two slope lengths of GCL and one slope length of LLDPE Liner placed in afternoon. No issues of concerns with deployment noted.
- Filled placement and compaction along the West Perimeter Berm completed for now. The area observed stable with little to no deflection under loaded haul truck traffic.

2.6 July 24, 2020

- Weather: Sunny with some cloud, L 6°C H 16°C
- Subgrade observed to be unchanged and acceptable for deployment. Ewing continued reconditioning subgrade further on in preparation for the next few days of deployment.
- Ewing Transport continued installation of drain at Lateral #3.
- Some delays encountered with deployment of LLDPE Liner due to windy conditions around 1:30 p.m. Layfield progressed with deploying GCL instead.
- Layfield deployed six slope lengths of GLC and one of LLDPE Liner. Four slope lengths remained exposed at the end of the day.

2.7 July 25, 2020

- Weather: Overcast, periods of light rain throughout the a.m. to steady rain in p.m. L 8°C H 14°C
- GCL left exposed from previous day's deployment observed wetted from overnight rain adjacent the last LLDPE Liner deployed. This was mainly due to run-off from the LLDPE. The remaining three slope lengths appeared less affected. Layfield indicated the wetted were not an issue, and no hydration had occurred, as confirmed by QA. It was further observed that 'popcorn' effect had not occurred.
- Subgrade observed to be in acceptable condition for GCL deployment when required.
- Three slope lengths of LLDPE placed by 10:30 p.m., totally covering the GCL. With rain forecast, Layfield moved to detail work, exclusively.
- Ewing continued installation of Lateral #3, sloping within NE Slope, and construction of West Perimeter Berm.

2.8 July 26, 2020

- Weather: Overcast, rainy in the p.m. L 7°C H 12°C
- With rain in the forecast for today, Layfield focused on detail work, exclusively.
- Ewing continued with fill placement and compaction of the West Perimeter Berm.
- Layfield suspended work for the day around 1:00 p.m. due to rain.

3.0 GEOSYNTHETIC ROLL NUMBERS PLACED

Table 1 summarizes the daily geosynthetic roll numbers placed on the slope during liner installation. All panel lengths are approximate, and where 45 degree joints are used, panel length is based from the center of the panel.

Table 1: Geosynthetic Roll Numbers Placed on Slope

Date	GCL Roll Number	LLDPE Liner Roll Number	Panel Number (Length)
Jul 19	-	-	-
Jul 20	0242-347635; 0242-347533, 0242-347613, 0242-347619, 0242-347617, 0242-347629		-

TETRA TECH

WEEKLY FIELD REPORT

ISSUED FOR USE

Project:	Eagle Gold Heap Leach Phase 1B	**Date:**	August 2, 2020
Location:	Eagle Gold Mine	**Contractor:**	Ewing Transport / Layfield
Client:	Victoria Gold Corp.	**Contractor's Rep:**	Marshall Ewing / Chad Messervey
Contact:	Clint Abel	**Contractor's Email:**	
Weather:	Variable (see daily entries)	**Tetra Tech Representative:**	Adam Mickey
File:	704-ENG.WARC03235-09	**Status:**	Issued for Use

1.0 INTRODUCTION

Tetra Tech Canada Inc. (Tetra Tech) was retained by Victoria Gold Corp. (Victoria Gold) to provide CQA services at the Eagle Gold mine located north of Mayo, Yukon, at Dublin Gulch for the Eagle Gold Heap Leach Phase 1B expansion (Phase 1B). Mr. Adam Mickey, EIT, is Tetra Tech's representative on site.

Forte Dynamics (Forte) out of Fort Collins, Colorado provided the design and specification for Phase 1B, and Forte's representative is Clint Green.

Clint Abel, of JDS Energy & Mining, is Victoria Gold's project manager on site at the Eagle Gold mine.

Ewing Transport (Ewing), based out of Mayo, Yukon, is the construction contractor for Phase 1B.

Layfield Environmental Containment (Layfield) has been retained to provide and install the liner for Phase 1B, and their supervisor on site is Chad Messervey.

The following Field Report outlines Tetra Tech's CQA for the period of July 27, 2020, to August 2, 2020.

2.0 DAILY REPORTS

2.1 Highlights

- Layfield deployed approximately 2,912.5 m of liner this week, covering an area of approximately 19,805 m^2.
- Soft subgrade conditions caused delays to deployment, causing Layfield to change their deployment plan.

2.2 July 27, 2020

- No work performed today due to rain.

2.3 July 28, 2020

- No work performed today due to rain

Tetra Tech Canada Inc.
61 Wasson Place
Whitehorse, YT Y1A 0H7 CANADA
Tel 867.668.3068 Fax 867.668.4349

2.4 July 29, 2020

- Weather: rain in the morning, turning to cloudy in the afternoon.
- See Figures 1 through 9.
- Layfield began work at 12:00 pm due to rain throughout the morning.
  - Layfield performed detail work on deployed liner and completed all detailing for liner deployed up to July 29.
- Tetra Tech conducted a shift change with Adam Mickey arriving back on site.
- Tetra Tech inspected the E4 lateral trench excavation to conduct a testpit log and organics were found at the base of the trench indicating that the soil between the lateral trench and the perimeter road is not the original subgrade
  - Clint Abel was notified but could not inspect immediately. Ewing is continuing to excavate the E4 lateral.
- The rain caused subgrade damage alongside the deployed liner requiring repair before further liner deployment, as well as the areas for further deployment.
  - The subgrade is too saturated to repair today.
    - Ewing to repair the subgrade during nightshift.
  - 2 m deep erosion trenches are present in the subgrade. Tetra Tech and Clint Abel will inspect and determine the best course of action to repair the subgrade at these locations.
    - Ewing will dig out the erosion trenches and backfill with rockfill in 0.9 m lifts, and compact then cap with sand.

2.5 July 30, 2020

- Weather: sunny with smoke in the air, turning to windy in the afternoon.
- See Figures 10 through 15.
- Tetra Tech and Layfield inspected the subgrade prior to the morning safety meeting.
  - The lower quarter of the slope to Phase 1A is still saturated and soft. Pickups leave ruts up to 200 mm deep in areas. Tetra Tech rejected the subgrade for deployment.
    - Ewing is stripping approximately 200 mm of saturated material off then recompacting.
  - Tetra Tech approved the rest of the subgrade for deployment to begin once Ewing proof rolled the slope with a packer.
  - Ewing continued to prep subgrade at the base of the slope and in advance of liner deployment.
    - Tetra Tech approved the subgrade as Ewing completed subgrade prep.
  - Tetra Tech inspected the subgrade at the base of the slope towards the end of the day.
    - Some soft spots were noted, and Ewing is going to scarify them and let them dry out overnight. If they are still soft in the morning, Ewing will excavate the soft spots and place dry material.
- Layfield is deploying GCL and liner on the approved subgrade while Ewing repairs the lower third of subgrade.

- Layfield deployed seven slope lengths of GCL and four slope lengths of liner.

- Layfield's QC is conducting pressure testing of seams.

2.6 July 31, 2020

- Weather: sunny and smoky with a light wind. Wind speed increased throughout the day.
- See Figures 16 through 35.
- Tetra Tech and Ewing inspected the subgrade at the base of the slope prior to the morning safety meeting.
  - Soft spots in the subgrade were found where the subgrade would move underfoot and/or deflection cracks from the packer.
  - Additional soft spots were found when the loader ran over them, causing depressions up to 50 mm deep.
  - Ewing is excavating out the soft spots with an average cut of 300 mm.
    - Additional cuts were required after the packer ran over the subgrade, and the subgrade was proof rolled with a loaded 30-ton rock truck.
  - Tetra Tech contacted Clint Green regarding the soft and yielding subgrade conditions to determine whether there could be some leeway to ensure that liner deployment is not hindered.
    - Based on the pictures that Tetra Tech provided, the saturated and soft subgrade must be excavated and replaced.
    - Tetra Tech informed Ewing of Clint's decision, and Ewing will continue to work on the subgrade as planned
  - Tetra Tech and Ewing agreed that all areas would be proof rolled with a loaded 30-ton rock truck to confirm that the subgrade is competent and ready for liner deployment.
  - Ewing will backfill the subgrade with sand in 300 mm compacted lifts.
    - Sand is too saturated to be used for backfilling. Ewing is blending subgrade materials and recompacting.
  - Ewing proof rolled the subgrade with a 30-ton rock truck in the presence of Tetra Tech.
    - 90% of the subgrade area was competent as identified by minimal to no deflection beneath rock truck tires.
    - Two soft areas were identified through proof rolling, and Ewing will remedy the soft spots prior to final subgrade sign off.
- Layfield is deploying GCL and Liner on the upper two-thirds of the slope.
  - Layfield placed three slope lengths of GCL, then placed liner.
  - The wind picked up in the afternoon, so Layfield continued to deploy GCL and laid out six more slope lengths of GCL.
- Layfield's QC continued to conduct pressure testing of deployed liner and completed pressure testing on liner seams for liner deployed prior to July 26.
- Layfield is conducting detail work on liner deployed yesterday.

- Four destructive samples were obtained from liner deployed yesterday.

2.7 August 1, 2020

- Weather: Sunny with a light wind, turning to cloudy and windy in the afternoon with a period of rain beginning at 5:00 pm
- See Figures 36 through 45.
- Tetra Tech and Ewing inspected the subgrade below the deployed liner on the lower third of the slope.
  - Soft spots identified on July 31 have been fixed.
  - The subgrade requires work to the north of liner deployed, and Ewing is working on the subgrade today.
  - Spots requiring sand were identified, and Ewing will place sand prior to liner deployment.
- Layfield is placing four slope lengths of liner on the upper two-thirds of the slope where GCL was deployed yesterday.
  - Layfield completed liner installation by first break. After break, Layfield moved to the lower third of the slope to tie in deployed liner to Phase 1A.
- After break, Layfield moved the bag line on deployed liner and moved to the bottom two-thirds of the slope to deploy liner.
  - Ewing's labour crew cleaned up the perimeter of the area and raked contours smooth for the tie in to Phase 1A.
  - Layfield and Ewing cleaned off debris from the GCL from the rainfall prior to rolling out GCL.
  - Layfield began deploying the GCL, using the skid steer to roll it out.
  - Layfield deployed nine slope lengths of GCL, then switched to liner and got six slope lengths of liner out.

2.8 August 2, 2020

- Weather: Sunny and windy.
- See Figures 46 through 54.
- Tetra Tech and Ewing inspected the subgrade on the lower third of the slope.
- Ewing is removing approximately 400 mm of subgrade at an identified soft spot with a D7 dozer.
  - Tetra Tech inspected the subgrade prior to rolling with a packer to confirm that the subgrade was firm.
  - Ewing blended the subgrade for smooth transitions and rolled it with a packer.
  - Tetra Tech inspected the subgrade after rolling and approved the subgrade for deployment.
    - Due to the packer's vibration being broken, some cat tracks were left in the subgrade, but the divots were less than 25 mm in depth.
- Ewing continued to fix soft spots in the subgrade, as identified by Tetra Tech.
- The rain from yesterday evening had minimal impact on the prepared subgrade.

  - Layfield used their skid steer to smooth the slope and add sand to erosion areas.
  - Ewing smoothed the subgrade with the packer.
  - Ewing's labourers raked the subgrade smooth at the tie in to the Phase 1A liner as well as cleaned the liner off.
- Ewing is continuing to prep subgrade on the upper two-thirds of the slope in advance of GCL deployment.
- Layfield is deploying GCL and liner to tie in to the deployed liner on the upper two-thirds of the slope.
  - Six slope lengths of GCL and four slope lengths of liner were deployed.
- Layfield is conducting extrusion detail work and pressure testing of liner seams.
- Layfield and Tetra Tech obtained destructs for liner placed up to 12:00 pm on August 2.
- Layfield moved back to the perimeter road and began deploying GCL on the upper two-thirds of the slope.
  - Six slope lengths of GCL were deployed by the end of the day.

3.0 GEOSYNTHETIC ROLL NUMBERS PLACED

Table 1 summarizes the daily geosynthetic roll numbers placed on the slope during liner installation. All panel lengths are approximate, and where 45 degree joints are used, panel length is based from the center of the panel.

Table 1: Geosynthetic Roll Numbers Placed on Slope

Date	GCL Roll Number	LLDPE Liner Roll Number	Panel Number (Length)

4.0 TRIAL SEAM

Table 2 summarizes the weekly trial seam results. For fusion, the apparatus settings are temperature and speed, and for extrusion, the apparatus settings are preheat and barrel temperature. Five tests are performed for each criterion.

Table 2: Trial Seam Results

Date	Time	Fusion or Extrusion	Tech	Apparatus #	Temp or Preheat (°F)	Speed (%) or Barrel Temp (°F)	$Peel_{inside}$ (100 min)	$Peel_{outside}$ (100 min for Fusion 88 min for Extrusion)	Shear (120 min)	Smooth or Textured

TETRA TECH

WEEKLY FIELD REPORT

ISSUED FOR USE

Project:	Eagle Gold Heap Leach Phase 1B	**Date:**	August 9, 2020
Location:	Eagle Gold Mine	**Contractor:**	Ewing Transport / Layfield
Client:	Victoria Gold Corp.	**Contractor's Rep:**	Marshall Ewing / Chad Messervey
Contact:	Clint Abel	**Contractor's Email:**	
Weather:	Variable (see daily entries)	**Tetra Tech Representative:**	Adam Mickey
File:	704-ENG.WARC03235-09	**Status:**	Issued for Use

1.0 INTRODUCTION

Tetra Tech Canada Inc. (Tetra Tech) was retained by Victoria Gold Corp. (Victoria Gold) to provide CQA services at the Eagle Gold mine located north of Mayo, Yukon, at Dublin Gulch for the Eagle Gold Heap Leach Phase 1B expansion (Phase 1B). Mr. Adam Mickey, EIT, is Tetra Tech's representative on site.

Forte Dynamics (Forte) out of Fort Collins, Colorado provided the design and specification for Phase 1B, and Forte's representative is Clint Green.

Clint Abel, of JDS Energy & Mining, is Victoria Gold's project manager on site at the Eagle Gold mine.

Ewing Transport (Ewing), based out of Mayo, Yukon, is the construction contractor for Phase 1B.

Layfield Environmental Containment (Layfield) has been retained to provide and install the liner for Phase 1B, and their supervisor on site is Chad Messervey.

The following Field Report outlines Tetra Tech's CQA for the period of August 3, 2020, to August 9, 2020.

2.0 DAILY REPORTS

2.1 Highlights

- Layfield deployed approximately 5,589 m of liner covering an area of approximately 38,005 m^2.
- Layfield is placing three panels of GCL for every two panels of 80 mm LLDPE liner.

2.2 August 3, 2020

- Sunny and calm, turning to cloudy with periods of rain in the late afternoon.
- See Figures 1 through 4.
- A heavy rainstorm occurred on the evening of August 2. Therefore, Tetra Tech and Ewing inspected the subgrade prior to deployment.
  - No erosion was noted in the subgrade due to the rain.

Tetra Tech Canada Inc.
61 Wasson Place
Whitehorse, YT Y1A 0H7 CANADA
Tel 867.668.3068 Fax 867.668.4349

  - Ewing is going to roll the subgrade with a packer in advance of GCL deployment today.
- Ewing is working on the subgrade at the top of the slope to cover rocky areas with sand.
- Layfield is covering GCL deployed on August 2 with liner.
  - Layfield checked the GCL for hydration and none of the GCL hydrated.
  - Four slope lengths of liner were deployed and fused.
- Layfield moved to the bottom third of the slope and deployed six slope lengths of GCL and four slope lengths of liner.
- Tetra Tech and Layfield's QC conducted destructive testing for all liner deployed up to August 2.
  - All destructive samples passed testing.
- Layfield is conducting pressure testing on liner deployed up to August 2.
- After liner deployment, Layfield finished the day by doing detail extrusion work and tying in to Phase 1A.

2.3 August 4, 2020

- Weather: mostly sunny and calm, turning to mostly cloudy with periods of rain in the afternoon.
- See Figures 5 through 7.
- Tetra Tech inspected the subgrade conditions for today's deployment and approved the subgrade once Ewing rolled one spot with a packer.
- Tetra Tech discussed with Ewing about sanding rocky areas of the subgrade. Ewing is going to sand areas on nightshift that they will not be able to access once deployment begins on the east perimeter road.
- Layfield is continuing to deploy GCL and liner.
  - Layfield deployed five slope lengths of GCL and three slope lengths of liner.
  - Rain in the afternoon did not inhibit liner deployment.
- Layfield conducted extrusion welding detail work on deployed liner.
- Layfield's QC conducted pressure testing of seams on deployed liner.
  - Layfield noted some seams failed requiring re-blocks at intersections.

2.4 August 5, 2020

- Weather: partly cloudy with scattered rain showers in the afternoon.
- See Figures 8 through 15.
- Tetra Tech inspected the subgrade in advance of today's deployment with Ewing.
  - Nightshift did not get subgrade to spec.
  - Ewing is continuing to place sand on rocky areas and compact today.
  - The packer is rolling the subgrade in advance of deployment.

  - Ewing rock picked the subgrade to remove angular rocks greater than 50 mm that could be plucked out of the subgrade.
- Tetra Tech approved the subgrade for deployment after remedial work had been completed.
- Layfield is continuing deployment today.
  - Layfield placed four slope lengths of GCL and three slope lengths of liner.
- Layfield performed detail extrusion work on deployed liner in the afternoon.
- Additional organics were found in the E4 lateral beyond the limits of excavation of the organics found last week. Ewing is going to step the lateral out to see if they get out of the organics.
- Ewing is going to place sand on rocky areas of the slope on nightshift in advance of liner deployment tomorrow.

2.5 August 6, 2020

- Weather: partly cloudy, turning to cloudy and windy in the afternoon with rain beginning at 4:00 pm.
- See Figures 16 through 33.
- Tetra Tech inspected the subgrade for today's deployment.
  - Rocky areas were identified and covered with sand.
  - Ewing continued to roll the subgrade with a packer.
  - Tetra Tech approved the subgrade for today's deployment.
- Ewing is continuing to work on subgrade prep.
- Ewing was digging anchor trench in advance of deployment and reached the header drain trench by the end of the day.
  - Ewing is raking the edge of the anchor trench to remove rocks.
  - Roots were identified along areas of the anchor trench up to 300 mm in depth.
    - No organic soils were identified, and the roots were cut flush with the anchor trench sidewall.
  - Tetra Tech noted rocky areas along the edge of the anchor trench and directed Ewing to place sand in these areas.
- Layfield and Tetra Tech signed off on subgrade acceptance for liner deployed between July 17 and August 5.
- Layfield is performing detail extrusion work on deployed liner.
- Layfield and Tetra Tech obtained destructive samples for testing.
  - Destructive samples are caught up for deployment up to and including August 5.
- Layfield is beginning deployment along the north perimeter road, which is between the header drain trench and the west perimeter road.
  - Layfield changed the direction of deployment and tied in to liner deployed on Aug 5.
  - Layfield is leaving slack at the tie in to allow for contraction of the liner.

- Ewing is backfilling the anchor trench along the west perimeter road as the liner is beginning to pull out.

2.6 August 7, 2020

- Weather: partly cloudy.
- See Figures 34 through 39.
- Rainfall occurred overnight. Tetra Tech inspected the subgrade in the deployment area, and no damage occurred. Tetra Tech approved the subgrade for liner deployment.
- Ewing is continuing to prepare subgrade for deployment.
- Layfield is continuing to deploy GCL and liner.
  - Layfield performed a correction in deployment angle due to curve in north perimeter road.
- Tetra Tech and Layfield performed testing of destructive samples.
  - All samples passed destructive testing.
  - Destructive testing is caught up for all liner deployed up to and including August 5.

2.7 August 8, 2020

- No work performed today due to rain.

2.8 August 9, 2020

- Weather: mostly cloudy with periods of wind, turning to rain at 6:00 pm.
- See Figures 40 through 43.
- Tetra Tech inspected the subgrade for today's deployment.
  - No erosion of the subgrade from the rain.
  - The subgrade may be too saturated for deployment. Layfield will attempt to deploy, and if it is too saturated, will let the liner dry out and move to detail.
    - Subgrade was not too saturated, and Tetra Tech approved the subgrade for deployment.
- Layfield deployed GCL and liner.
  - Layfield deployed eight runs of liner and fused it by the end of the day.

3.0 GEOSYNTHETIC ROLL NUMBERS PLACED

Table 1 summarizes the daily geosynthetic roll numbers placed on the slope during liner installation. All panel lengths are approximate, and where 45 degree joints are used, panel length is based from the center of the panel.

Table 1: Geosynthetic Roll Numbers Placed on Slope

Date	GCL Roll Number	LLDPE Liner Roll Number	Panel Number (Length)
August 3	0242-347826 502347815, 502347810 502347825, 502344522 502344528, 502344516 502344521	10692-037 10692-029 10692-013 10693-017 10692-031 10692-034 10692-020 10692-002 10692-011 10692-017 10693-001 10692-006	P258 (67.2 m) P259 (128.3 m) P260 (50.4 m), P261 (77.0 m) P262 (128.7 m) P263 (44.0 m), P264 (81.6 m) P265 (128.5 m) P266 (47.8 m), P267 (72.4 m) P268 (128.0 m) P269 (53.0 m) P270 (55.1 m) P271 (51.9 m), P272 (44.2 m), P273 (25.0 m) P274 (16.0 m)

4.0 TRIAL SEAM

Table 2 summarizes the weekly trial seam results. For fusion, the apparatus settings are temperature and speed, and for extrusion, the apparatus settings are preheat and barrel temperature. Five tests are performed for each criterion.

Table 2: Trial Seam Results

TETRA TECH

WEEKLY FIELD REPORT

ISSUED FOR USE

Project:	Eagle Gold Heap Leach Phase 1B	**Date:**	August 16, 2020
Location:	Eagle Gold Mine	**Contractor:**	Ewing Transport / Layfield
Client:	Victoria Gold Corp.	**Contractor's Rep:**	Marshall Ewing / Chad Messervey
Contact:	Clint Abel	**Contractor's Email:**	
Weather:	Variable (see daily entries)	**Tetra Tech Representative:**	Adam Mickey
File:	704-ENG.WARC03235-09	**Status:**	Issued for Use

1.0 INTRODUCTION

Tetra Tech Canada Inc. (Tetra Tech) was retained by Victoria Gold Corp. (Victoria Gold) to provide CQA services at the Eagle Gold mine located north of Mayo, Yukon, at Dublin Gulch for the Eagle Gold Heap Leach Phase 1B expansion (Phase 1B). Mr. Adam Mickey, EIT, is Tetra Tech's representative on site.

Forte Dynamics (Forte) out of Fort Collins, Colorado provided the design and specification for Phase 1B, and Forte's representative is Clint Green.

Clint Abel, of JDS Energy & Mining, is Victoria Gold's project manager on site at the Eagle Gold mine.

Ewing Transport (Ewing), based out of Mayo, Yukon, is the construction contractor for Phase 1B.

Layfield Environmental Containment (Layfield) has been retained to provide and install the liner for Phase 1B, and their supervisor on site is Chad Messervey.

The following Field Report outlines Tetra Tech's CQA for the period of August 10, 2020, to August 16, 2020.

2.0 DAILY REPORTS

2.1 Highlights

- Layfield deployed approximately 2280.9 m of liner covering an area of approximately 15,282 m^2.
- Soft spots in the subgrade associated with the east laterals were found ahead of deployment. Ewing excavated the soft spots and replaced with rock fill to improve the subgrade conditions.
- Layfield is placing three panels of GCL for every two panels of 80 mm LLDPE liner.

2.2 August 10, 2020

- Weather: cloudy, turning to periods of heavy rain in the afternoon.
- See Figures 1 and 2.
- Layfield finished fusion welding seams and completed the work by first break.

Tetra Tech Canada Inc.
61 Wasson Place
Whitehorse, YT Y1A 0H7 CANADA
Tel 867.668.3068 Fax 867.668.4349

- After first break, weather conditions permitted deployment of liner.
  - Tetra Tech inspected the subgrade and found muddy spots as well as erosion of the subgrade from the heavy rain.
    - Tetra Tech deemed the subgrade unacceptable for deployment, requiring time to dry out and repairs.
- Layfield moved to detail extrusion work, vacuum testing, and pressure testing for the rest of the day.

2.3 August 11, 2020

- Weather: mostly sunny.
- See Figures 3 through 6.
- Ewing is repairing subgrade washed out by rain.
  - Ewing completed the repairs at 1:00 pm, and Tetra Tech approved the subgrade for deployment.
- Layfield is performing detail extrusion work, vacuum box testing, and pressure testing of seams.
- After subgrade repairs were completed, Layfield began deploying liner.
  - Layfield deployed three runs of liner.

2.4 August 12, 2020

- Weather: rain in the morning, turning to cloudy with periods of rain in the afternoon.
- Layfield took the morning off due to rain and arrived on site at 12:20 pm to begin work.
- Subgrade conditions are too saturated to deploy liner.
- Layfield is performing detail extrusion work, vacuum box testing, and pressure testing of seams.
  - Layfield qualified the extruders, and then rain began again at 1:00 pm.
  - Layfield left site at 3:00 pm because the periods of rain did not cease.

2.5 August 13, 2020

- Weather: Cloudy and raining, with rain ceasing in the afternoon.
- Ewing is repairing subgrade for deployment.
- Layfield is continuing detail work on deployed liner.
  - Layfield qualified the extruders, and then it began raining.
  - Rain ceased at 1:00 pm, and Layfield began detail work for the rest of the day.
- Tetra Tech and Layfield's QC conducted destructive testing of obtained samples.
  - D155A failed due to peel into the weld. As the sample was obtained from the anchor trench, Layfield will obtain a sample 3 m from the sample location and retest. If the test fails, Layfield will extrude the seam.
    - D155B was obtained 3.0 m down seam from 155A and passed destructive testing. Layfield patched the destruct location and extrusion welded between patches.

2.6 August 14, 2020

- Weather: cloudy with periods of wind.
- See Figures 7 through 14.
- Ewing is repairing subgrade in the northeast corner.
  - Ewing repaired the subgrade along the area prior to deployment by scraping the saturated subgrade and placing sand over rocky areas.
  - Ewing continued to repair the subgrade in the northeast corner throughout the day.
  - Tetra Tech approved the areas for today's deployment.
- Layfield began the day by prepping areas for deployment and continued detail extrusion work, including finishing the tie in to Phase 1A.
  - Layfield deployed three runs of liner prior to 4:00 pm, then bagged off the deployed liner. No further deployment as we're waiting for subgrade to be prepped.
- Layfield continued conducting pressure testing on deployed and detailed liner.
- Layfield obtained destructive samples for testing.

2.7 August 15, 2020

- Weather: mostly cloudy, turning to rain in the later afternoon.
- See Figures 15 through 25.
- Ewing is continuing to prepare subgrade for deployment.
- Tetra Tech approved the subgrade in the northeast corner for deployment.
- Layfield is deploying GCL and liner.
  - Layfield started on the east side of the corner, working towards the deployed liner.
  - Layfield deployed eight runs of liner.
  - Rain shut down deployment at 5:00 pm.

2.8 August 16, 2020

- Weather: cloudy with periods of rain ending at 9:00 am.
- See Figures 26 through 39.
- Ewing is continuing to prepare subgrade in advance of deployment.
  - Tetra Tech noted soft spots along the E4 Lateral.
    - Ewing will excavate out the soft material and replace with rockier material then skim with sand.
  - Tetra Tech inspected the entire subgrade and found many areas that were deficient due to either being soft or yielding when stepped on, organics protruding from the surface, or rocky areas requiring sand cover.

- Soft areas were identified based on cracks left by rolling with a packer, meaning that the ground was deflecting under the weight of the packer.
- Soft areas could also be identified by wheel ruts from pickup traffic.
- Many of the soft spots are associated with the E2, E3, and E4 Lateral Drains.
- After consulting with Clint Green, Tetra Tech informed Ewing that the soft spots would have to be fixed.

- Tetra Tech and Ewing worked together on a cluster of soft spots to determine what remedial works would be required to repair them.
  - Subexcavation of 600 to 700 mm of colluvium, then backfill with rock fill was required to repair the soft spots.
  - Ewing will coat the rock fill with sand prior to deployment.
- Layfield is continuing to fill in the northeast corner with liner.
  - Tetra Tech inspected the subgrade to assess whether yesterday's rain impacted the subgrade. The subgrade was deemed acceptable for deployment.
  - Layfield completed deployment in the northeast corner by 12:30 pm.
  - Layfield finished the day conducting detail work, pressure testing, and cleaning up.

3.0 GEOSYNTHETIC ROLL NUMBERS PLACED

Table 1 summarizes the daily geosynthetic roll numbers placed on the slope during liner installation. All panel lengths are approximate, and where angled joints are used, panel length is based from the center of the panel.

Table 1: Geosynthetic Roll Numbers Placed on Slope

Date	GCL Roll Number	LLDPE Liner Roll Number	Panel Number (Length)
August 10	-	10690-013	P354 (4.7 m)

4.0 TRIAL SEAM

Table 2 summarizes the weekly trial seam results. For fusion, the apparatus settings are temperature and speed, and for extrusion, the apparatus settings are preheat and barrel temperature. Five tests are performed for each criterion.

Table 2: Trial Seam Results

5.0 NON-DESTRUCTIVE TESTING

Table 3 summarizes the weekly non-destructive pressure testing results.

Table 3: Non-Destructive Testing Results

Date Fused	Date Tested	Time Tested	Seam #	psi Start	psi End	Pass or Fail	Notes
Aug 1	Aug 11	11:40	P235-P238 Vertical	40	40	Pass	Top of seam to first patch
Aug 1	Aug 11	14:21	P232-P235 Vertical	40	40	Pass	
Aug 1	Aug 11	11:50	P235-P238 Vertical	40	38	Pass	Between patches
Aug 1	Aug 11	10:17	P235-P238 vertical	40	40	Pass	Second patch to bottom of seam
Aug 3	Aug 11	13:19	P268-P269 Cross	40	39	Pass	
Aug 4	Aug 11	13:00	P276-P277 Cross	40	40	Pass	
Aug 4	Aug 11	13:19	P269-P277 Vertical	40	40	Pass	
Aug 4	Aug 11	13:00	P268-P277 Vertical	40	38	Pass	
Aug 4	Aug 11	13:00	P268-P276 Vertical	40	40	Pass	
Aug 4	Aug 11	13:23	P279-P280 Cross	40	39	Pass	
Aug 4	Aug 11	12:36	P280-P281 Cross	40	40	Pass	
Aug 4	Aug 11	12:36	P277-P281 Vertical	40	40	Pass	
Aug 4	Aug 11	12:35	P277-P280 Vertical	40	40	Pass	
Aug 4	Aug 11	12:55	P276-P280 Vertical	40	40	Pass	
Aug 4	Aug 11	12:55	P283-P284 Cross	40	40	Pass	
Aug 4	Aug 11	13:06	P281-P284 Vertical	40	40	Pass	
Aug 4	Aug 11	12:33	P280-P284 Vertical	40	40	Pass	
Aug 4	Aug 11	12:55	P280-P283 Vertical	40	40	Pass	
Aug 5	Aug 11	13:24	P286-P287 Cross	40	40	Pass	
Aug 5	Aug 11	13:01	P287-P288 Cross	40	39	Pass	
Aug 5	Aug 11	13:00	P284-P288 Vertical	40	39	Pass	
Aug 5	Aug 11	12:53	P283-P287 Vertical	40	40	Pass	
Aug 5	Aug 11	12:20	P291-P292 Cross	40	40	Pass	
Aug 5	Aug 11	13:05	P288-P292 Vertical	40	40	Pass	
Aug 5	Aug 11	12:20	P287-P292 Vertical	40	40	Pass	
Aug 5	Aug 11	12:25	P287-P291 Vertical	40	40	Pass	
Aug 5	Aug 11	12:40	P294-P295 Cross	40	40	Pass	
Aug 5	Aug 11	12:12	P292-P295 Vertical	40	40	Pass	
Aug 5	Aug 11	12:15	P291-P295 Vertical	40	40	Pass	Top of seam to patch
Aug 5	Aug 11	12:25	P291-P295 Vertical	40	40	Pass	Patch to bottom of seam
Aug 6	Aug 11	12:11	P295-P296 Vertical	40	39	Pass	
Aug 6	Aug 11	8:02	P296-P297 Vertical	40	40	Pass	
Aug 6	Aug 11	8:15	P297-P298 Vertical	40	40	Pass	
Aug 6	Aug 11	9:16	P308-P309 Vertical	40	40	Pass	
Aug 6	Aug 11	8:44	P307-P308 Vertical	40	40	Pass	
Aug 6	Aug 11	8:29	P305-P306 Cross	40	40	Pass	
Aug 6	Aug 11	8:41	P306-P307 Vertical	40	40	Pass	
Aug 6	Aug 11	8:52	P304-P306 Vertical	40	40	Pass	Top of seam to patch
Aug 6	Aug 11	8:41	P305-P307 Vertical	40	40	Pass	
Aug 6	Aug 11	8:26	P304-P305 Vertical	40	40	Pass	
Aug 6	Aug 11	8:29	P304-P306 vertical	40	40	Pass	Patch to bottom of seam

6.0 DESTRUCTIVE TESTING

Table 4 summarizes the weekly destructive testing results. Five tests are performed for each criterion.

Table 4: Destructive Testing Results

Date Fused	Time Fused	Tech	Apparatus	Location (UTM is +/- 4 m)	Sample ID	$Peel_{in}$ (100 min)	$Peel_{out}$ (100 min)	Shear (120 min)	Pass or Fail
Aug 9	12:19	JC	WW-022	P342-P344 Vertical Top of Seam	D140	142 148 137 151 146	153 154 153 137 123	158 162 151 166 155	Pass

TETRA TECH

WEEKLY FIELD REPORT

ISSUED FOR USE

Project:	Eagle Gold Heap Leach Phase 1B	**Date:**	August 23, 2020
Location:	Eagle Gold Mine	**Contractor:**	Ewing Transport / Layfield
Client:	Victoria Gold Corp.	**Contractor's Rep:**	Marshall Ewing / Chad Messervey
Contact:	Clint Abel	**Contractor's Email:**	
Weather:	Variable (see daily entries)	**Tetra Tech Representative:**	Adam Mickey
File:	704-ENG.WARC03235-09	**Status:**	Issued for Use

1.0 INTRODUCTION

Tetra Tech Canada Inc. (Tetra Tech) was retained by Victoria Gold Corp. (Victoria Gold) to provide CQA services at the Eagle Gold mine located north of Mayo, Yukon, at Dublin Gulch for the Eagle Gold Heap Leach Phase 1B expansion (Phase 1B). Mr. Adam Mickey, EIT, is Tetra Tech's representative on site.

Forte Dynamics (Forte) out of Fort Collins, Colorado provided the design and specification for Phase 1B, and Forte's representative is Clint Green.

Clint Abel, of JDS Energy & Mining, is Victoria Gold's project manager on site at the Eagle Gold mine.

Ewing Transport (Ewing), based out of Mayo, Yukon, is the construction contractor for Phase 1B.

Layfield Environmental Containment (Layfield) has been retained to provide and install the liner for Phase 1B, and their supervisor on site is Chad Messervey.

The following Field Report outlines Tetra Tech's CQA for the period of August 17, 2020, to August 23, 2020.

2.0 DAILY REPORTS

2.1 Highlights

- Layfield deployed approximately 6,642.3 m of liner, covering an area of approximately 44,503 m^2.
- Rain delayed liner deployment throughout the week.
- Layfield is placing three panels of GCL for every two panels of 80 mm LLDPE liner.

2.2 August 17, 2020

- Weather: cloudy with sunny periods.
- Tetra Tech and Ewing had a meeting with Matthew Mock, Clint Abel, and Forte at 11 am to discuss the soft spot in the subgrade.
  - Over the laterals, permission was given to excavate them till 10 cm of sand remained over the drain rock and then backfill with rock fill.

Tetra Tech Canada Inc.

Whitehorse, YT Y1A 0H7 CANADA
Tel 867.668.3068 Fax 867.668.4349

  - Areas not in conflict with laterals were to be excavated to competent ground and backfill with rock fill and compacted.

- Ewing conducted a test section over the 4E lateral, and subgrade conditions improved once the rockfill had been placed and compacted.
- After the test section, Ewing began working at the northernmost limit of soft spots along the 4E lateral.
  - Water was encountered during digging, and Ewing quickly backfilled to seal the water up.
  - Tetra Tech informed Clint Green and Clint Abel about the issue.
    - Clint Abel and Clint Green agreed that a sub-lateral should be run between 4E and 3E laterals to capture the water.
  - Ewing continued to work on other soft spots in the subgrade.
- Layfield deployed two slope lengths of liner and one slope length of GCL to complete the tie in seam to the panels deployed in a different direction.
- Layfield conducted pressure testing, vacuum box testing, and extrusion detail work on all deployed liner.
- Tetra Tech and Layfield conducted a walk-off of the deployed liner.
  - Five spots for extrusion and numerous places that required vacuum box testing were identified.
  - 70% of the walk-off was completed by the end of the day, with the rest to be completed on the next workday.
- Tetra Tech and Layfield conducted destructive testing of samples.
  - All samples passed, and destructive testing is caught up to all deployment up to and including August 16 (Panel P402).
- Due to subgrade not being ready for deployment, Layfield will be taking August 18 off.

2.3 August 18, 2020

- No work performed today due to no prepared subgrade.
- Ewing continued to work on subgrade.

2.4 August 19, 2020

- Weather: mostly cloudy.
- Ewing is continuing to work on subgrade in advance of deployment.
  - Ewing is identifying soft spots as they arise and repairing them by excavating the material and replacing it with rock fill.
- Tetra Tech inspected and approved the subgrade in advance of today's deployment.
- Layfield is deploying liner on the prepared subgrade.
  - Layfield deployed nine slope lengths of GCL and four slope lengths of liner by the end of the day.
- Tetra Tech and Layfield's QC finished the walk-off of all liner deployed up to and including August 16 (Panels P92 through P402).

- Some areas require patching and vacuum box testing.
  - All Patching and vacuum box testing was completed by the end of the day.

2.5 August 20, 2020

- Weather: mostly sunny.
- Ewing is continuing to prepare subgrade and excavate soft spots in advance of liner deployment.
  - Soft spots were identified where repairs had been made along the 4E lateral.
    - Clint Abel authorized deployment over the areas.
- Tetra Tech inspected and approved the subgrade in advance of today's deployment.
  - Rocks are continuing to be an issue as they are pulled out of the subgrade by the side by sides. Layfield is picking the larger rocks off the slope as they occur.
- Layfield is continuing to deploy liner.
  - Layfield deployed ten slope runs of GCL and seven slope runs of liner.
  - Layfield had an extruder out on the slope conducting detail work as required.
- Layfield's QC conducted pressure testing of seam as they were ready.
- Tetra Tech and Layfield signed the Certificate of Final Inspection and Acceptance for panels P93 to P402 as well as the Certificate of Inspection of Soil Subgrade Surface for liner panels P295 to P402. All documentation was submitted to Forte, Clint Abel, and Victoria Gold.

2.6 August 21, 2020

- Weather: cloudy with periods of light rain, turning to mostly cloudy in the afternoon.
- Ewing is continuing to prepare subgrade and excavate soft spots in advance of deployment.
  - Deployment is quickly catching up to subgrade preparation.
- Tetra Tech inspected and approved the subgrade in advance of today's deployment.
- Layfield is continuing to deploy liner.
  - Layfield has an extruder at deployment to conduct detail work as required.
  - Layfield deployed three slope lengths of liner by first break. After first break, Layfield could not deploy GCL due to soft spot repairs until 1:00 pm then began at 1:30 pm due to rain. Layfield conducted clean up until they could deploy.
  - Layfield deployed five slope lengths of liner by the end of the day.
- Layfield's QC conducted pressure testing of seams as they were ready.

2.7 August 22, 2020

- Weather: mostly cloudy.
- Ewing is continuing to prepare subgrade in advance of deployment.

  - Small and isolated soft spots still exist in the subgrade, but at Clint Abel's authorization, liner will be deployed over them.

- Tetra Tech inspected and approved the subgrade for today's deployment.
  - Rocks being picked out of the subgrade is continuing to be an ongoing problem. Layfield is picking the rocks in advance of deployment, and Ewing is covering the rocky section as they are identified.
- Layfield is continuing to deploy GCL and liner.
  - Layfield has an extruder at deployment, conducting detail work as required.
  - Layfield deployed five slope runs of liner by 5:00 pm.
  - For the rest of the day, Layfield cleaned up garbage and did miscellaneous tasks.
- Layfield's QC is conducting pressure testing of seams.

2.8 August 23, 2020

- Weather: partly cloudy.
- Ewing is continuing to prepare subgrade in advance of liner deployment.
  - Ewing is sanding rocky areas on the slope.
  - Tetra Tech identified a soft spot requiring repair.
    - Ewing excavated the soft spot and backfilled with rock fill, then coated it with sand.
- Tetra Tech inspected and approved the subgrade for today's deployment.
- Layfield is continuing to deploy liner.
  - Layfield deployed four slope lengths of liner.
    - Layfield finished deploying at 4:30 pm and held off further deployment due to rain in tomorrow's forecast.
  - Rocks in the subgrade are continuing to be an issue.
    - While Ewing is sanding rock fill areas on the slope, the use of side by sides are loosening up the dry subgrade surface and pulling rocks out in areas that have not been sanded.
      - Rocks are being found beneath the GCL, and Layfield is pulling out the rocks larger than 50 mm.
- Layfield's QC conducted pressure testing of fused seams.

3.0 GEOSYNTHETIC ROLL NUMBERS PLACED

Table 1 summarizes the daily geosynthetic roll numbers placed on the slope during liner installation. All panel lengths are approximate, and where angled joints are used, panel length is based from the center of the panel.

Table 1: Geosynthetic Roll Numbers Placed on Slope

Date	GCL Roll Number	LLDPE Liner Roll Number	Panel Number (Length)
August 17	502343993, 502344594 502344654, 502344586 502344653, 502346982 502344675, 502343994 502344020, 502344587 502344605, 502344017 502343605	10699-006 10699-014 10690-030	P403 (37.6 m) P404 (129.4 m) P405 (99.9 m)

4.0 TRIAL SEAM

Table 2 summarizes the weekly trial seam results. For fusion, the apparatus settings are temperature and speed, and for extrusion, the apparatus settings are preheat and barrel temperature. Five tests are performed for each criterion.

Table 2: Trial Seam Results

Date	Time	Fusion or Extrusion	Tech	Apparatus #	Temp or Preheat (°F)	Speed (%) or Barrel Temp (°F)	$Peel_{inside}$ (100 min)	$Peel_{outside}$ (100 min for Fusion 88 min for Extrusion)	Shear (120 min)	Smooth or Textured

TETRA TECH

WEEKLY FIELD REPORT

ISSUED FOR USE

Project:	Eagle Gold Heap Leach Phase 1B	**Date:**	August 30, 2020
Location:	Eagle Gold Mine	**Contractor:**	Ewing Transport / Layfield
Client:	Victoria Gold Corp.	**Contractor's Rep:**	Marshall Ewing / Chad Messervey
Contact:	Clint Abel	**Contractor's Email:**	
Weather:	Variable (see daily entries)	**Tetra Tech Representative:**	Adam Mickey
File:	704-ENG.WARC03235-09	**Status:**	Issued for Use

1.0 INTRODUCTION

Tetra Tech Canada Inc. (Tetra Tech) was retained by Victoria Gold Corp. (Victoria Gold) to provide CQA services at the Eagle Gold mine located north of Mayo, Yukon, at Dublin Gulch for the Eagle Gold Heap Leach Phase 1B expansion (Phase 1B). Mr. Adam Mickey, EIT, is Tetra Tech's representative on site.

Forte Dynamics (Forte) out of Fort Collins, Colorado provided the design and specification for Phase 1B, and Forte's representative is Clint Green.

Clint Abel, of JDS Energy & Mining, is Victoria Gold's project manager on site at the Eagle Gold mine.

Ewing Transport (Ewing), based out of Mayo, Yukon, is the construction contractor for Phase 1B.

Layfield Environmental Containment (Layfield) has been retained to provide and install the liner for Phase 1B, and their supervisor on site is Chad Messervey.

The following Field Report outlines Tetra Tech's CQA for the period of August 24, 2020, to August 30, 2020.

2.0 DAILY REPORTS

2.1 Highlights

- The total length of liner deployed this week was approximately 3,167.9 m for a total area covered of approximately 21,225 m^2.
- Layfield is placing three panels of GCL for every two panels of 80 mm LLDPE liner.

2.2 August 24, 2020

- Weather: cloudy with periods of rain throughout the day.
- Ewing is continuing to prepare subgrade and excavate soft spots.
- Tetra Tech inspected and approved the subgrade for today's deployment.
  - Rocks pulling out of the subgrade are an ongoing issue.

Tetra Tech Canada Inc.
61 Wasson Place
Whitehorse, YT Y1A 0H7 CANADA
Tel 867.668.3068 Fax 867.668.4349

- Layfield is continuing to deploy liner.
  - Due to rain in the forecast, Layfield is deploying enough GCL for one liner panel at a time.
  - Deployment was delayed from 9:00 am to 11:30 am due to rain.
  - After three slope lengths of liner had been deployed, rain began prior to having the third slope run fused.
  - Rain halted deployment at 3:00 pm for the rest of the day.
- Tetra Tech and Layfield's QC conducted destructive testing on obtained samples.
  - One destructive sample failed testing due to excessive peel into the weld, which was the P273-P403 tie in seam.
    - The seam will be extruded, and samples will be obtained from panels above and below the failed seam.

2.3 August 25, 2020

- No work performed today due to rain.

2.4 August 26, 2020

- No work performed today due to rain.

2.5 August 27, 2020

- Weather: partly cloudy with an early morning rainstorm prior to shift.
- Subgrade conditions are too saturated to deploy liner and subgrade requires work to repair damage from rain.
  - Erosion has damaged the subgrade extensively requiring sanding of the slope to fill in ruts.
  - At the bottom of the slope at Phase 1A, the subgrade is saturated, and the saturated materials will have to be cut out prior to deployment.
  - Ewing is repairing the subgrade along the GCL where erosion left ruts up to 250 mm deep.
- Layfield is performing detail work and clean up.
  - Layfield has three extruders working today.
    - One extruder is performing detail work on deployed liner.
    - One extruder is doing tie in to Phase 1A.
    - One extruder is doing patches where destructive samples have been obtained.
  - Layfield is vacuum testing all detail work performed to date.
- Tetra Tech and Layfield's QC finished destructive testing for liner deployed up to, and including, August 22.
  - For the failed destruct, samples were obtained from the P272-P403 and P275-P403 tie in seams. The samples passed destructive testing, so Layfield extruded the P273-P403 seam.
- Due to the rain, seams along the leading edge of GCL filled with mud.
  - Clint Green said it was ok to clean the mud out and continue deployment if the GCL was not hydrated.

- Layfield checked the GCL for hydration, and the fibers were intact.

2.6 August 28, 2020

- Weather: partly cloudy.
- Ewing is continuing to repair the subgrade damaged by rain.
  - The loader is back blading the subgrade and the packer is recompacting.
  - The skid steer is covering rocky areas with sand as required.
- Layfield is continuing to deploy liner.
  - Layfield cleaned the leading edge of the GCL and cleaned the mud out of the seams.
  - At 9:00 am, Layfield began deploying liner once Tetra Tech inspected and approved the subgrade.
  - Layfield deployed four slope runs of liner by the end of the day.

2.7 August 29, 2020

- Weather: mostly sunny.
- Heavy rain overnight cause minimal erosion to the subgrade, but a wet spot exists at the base of the slope at Phase 1A.
  - Ewing is going to clean the saturated soils out of the area and replace with drier material.
- Ewing is continuing to work on subgrade in advance of liner deployment.
  - Due to rain in the forecast, Ewing is going to limit the amount of prepared subgrade exposed to the weather.
- Layfield is continuing to deploy liner.
  - Layfield is performing a correction to the deployment angle today.
    - To ensure the correction is filled in by the end of the day, Layfield is correcting to a point halfway down the slope. Once the corner is filled in, they will continue deploying to the south.
  - Tetra Tech inspected the prepared subgrade and approved it for deployment after the packer rolled some loose areas where the skid steer placed cover sand over rocky areas.
    - The subgrade to the south of the correction is too saturated to continue deployment.
      - The packer can not roll the slope to tighten it up and pound in loose rocks, and the subgrade materials are sticking to the drum while rolling the subgrade.
  - Due to subgrade conditions, upon completion of deployment at 1:00 pm, Layfield is performing detail extrusion work.
    - If the subgrade dries out enough by mid-afternoon, Layfield will continue to deploy GCL.
    - The subgrade was dry enough by 2:00 pm to begin rolling with a packer, and Layfield began deployment at 4:00, getting out one slope run of liner to tie into the existing deployed liner.
- Concerns were raised whether there was enough GCL on site to finish the slope as the overall slope area is greater than the original design.

  - Survey picked up the slope and estimated that the remaining slope area to be covered is 46,300 m^2 to 48,000 m^2. There are 279 rolls of GCL on site, which should cover an area of approximately 51,500 m^2. The 279 rolls include the rolls at Victoria Gold's Laydown area from the previous year.
    - There are more rolls at Victoria Gold's laydown, but they do not have their protective wrapping on them, so they could be compromised due to hydration.
- Tetra Tech and Layfield's QC conducted destructive testing of liner seam samples.
  - All destructive testing has been performed on all liner deployed to the end of the day on August 24.

2.8 August 30, 2020

- Weather: mostly cloudy with periods of light rain.
- Ewing is continuing to prepare subgrade in advance of deployment.
  - Due to heavy rain in the forecast for the next five days beginning Monday, Ewing is going to ensure the subgrade drains with no spots where water can collect.
    - Ewing will establish drainage ditches to protect the deployed liner from washouts, if required.
- Tetra Tech inspected the prepared subgrade and approved it for today's deployment.
- Layfield is continuing to deploy liner.
  - Layfield deployed liner till 4:00 pm.
    - Deployment was halted due to rain on the horizon. Due to rain in the forecast, Layfield did not want to have any GCL exposed because of not being able to get it covered today.
    - Layfield spent the rest of the day ensuring that the deployed liner is protected from rain and wind.
- Due to the five days of rain in the forecast, Victoria Gold authorized personnel associated with liner deployment to take the days off in Whitehorse.
  - The crews will leave once the rain begins in case more deployment can occur prior to leaving.
  - For Tetra Tech and Layfield, the crew will likely return to site once the subgrade repairs begin because Layfield is caught up on detail work.

3.0 GEOSYNTHETIC ROLL NUMBERS PLACED

Table 1 summarizes the daily geosynthetic roll numbers placed on the slope during liner installation. All panel lengths are approximate, and where angled joints are used, panel length is based from the center of the panel.

Table 1: Geosynthetic Roll Numbers Placed on Slope

Date	GCL Roll Number	LLDPE Liner Roll Number	Panel Number (Length)
August 24	502344053, 502344079 502344104, 502344044 502344072, 502344101 502344052, 502344078 502344629, 502344080 502344102, 502344088 502344042. 502344099 502343970, 502344089 502344043, 502344636 502344045, 502344621	10695-023 10695-006 10695-012 10695-025 10695-035 10695-032 10695-021	P483 (76.1 m) P484 (127.6 m) P485 (32.7 m), P486 (82.5 m) P487 (127.9 m) P488 (25.0 m), P489 (92.6 m) P490 (131.5 m) P491 (14.8 m)

TETRA TECH

WEEKLY FIELD REPORT

ISSUED FOR USE

Project:	Eagle Gold Heap Leach Phase 1B	**Date:**	September 6, 2020
Location:	Eagle Gold Mine	**Contractor:**	Ewing Transport / Layfield
Client:	Victoria Gold Corp.	**Contractor's Rep:**	Marshall Ewing / Chad Messervey
Contact:	Clint Abel	**Contractor's Email:**	
Weather:	Variable (see daily entries)	**Tetra Tech Representative:**	Adam Mickey
File:	704-ENG.WARC03235-09	**Status:**	Issued for Use

1.0 INTRODUCTION

Tetra Tech Canada Inc. (Tetra Tech) was retained by Victoria Gold Corp. (Victoria Gold) to provide CQA services at the Eagle Gold mine located north of Mayo, Yukon, at Dublin Gulch for the Eagle Gold Heap Leach Phase 1B expansion (Phase 1B). Mr. Adam Mickey, EIT, is Tetra Tech's representative on site.

Forte Dynamics (Forte) out of Fort Collins, Colorado provided the design and specification for Phase 1B, and Forte's representative is Clint Green.

Clint Abel, of JDS Energy & Mining, is Victoria Gold's project manager on site at the Eagle Gold mine.

Ewing Transport (Ewing), based out of Mayo, Yukon, is the construction contractor for Phase 1B.

Layfield Environmental Containment (Layfield) has been retained to provide and install the liner for Phase 1B, and their supervisor on site is Chad Messervey.

The following Field Report outlines Tetra Tech's CQA for the period of August 31, 2020, to September 6, 2020.

2.0 DAILY REPORTS

2.1 Highlights

- Rain delayed liner deployment throughout the week.
- The entire liner crew left site from August 31 to September 4 due to weather.
- The total length of deployed liner this wee was approximately 619.2 m, covering a slope area of approximately 4,148 m^2.
- Layfield is placing three panels of GCL for every two panels of 80 mm LLDPE liner.

2.2 August 31, 2020

- Weather: raining.
- Tetra Tech and Ewing labourers returned to Whitehorse for days off.

Tetra Tech Canada Inc.
61 Wasson Place
Whitehorse, YT Y1A 0H7 CANADA
Tel 867.668.3068 Fax 867.668.4349

2.3 September 1, 2020

- Layfield returned to Whitehorse for days off.

2.4 September 2, 2020

- Days off.

2.5 September 3, 2020

- Days off.

2.6 September 4, 2020

- Layfield and Ewing returned to site.

2.7 September 5, 2020

- Weather: raining, turning to periods of rain in the afternoon.
- No work performed today due to weather conditions and saturated subgrade.
- Tetra Tech retuned to site.

2.8 September 6, 2020

- Weather: mostly cloudy.
- Ewing is preparing the subgrade for deployment by removing saturated areas, recompacting, and sanding rocky areas.
- Layfield is conducting detail work and pressure testing while the subgrade is being prepared.
- Ewing had enough subgrade prepared at 12:00 pm to begin deployment.
  - Tetra Tech inspected and approved the subgrade for deployment.
    - Some minor surficial soft spots exist less than 100 mm in thickness, but they are not wet.
  - Layfield began deploying liner once the subgrade had been inspected.
    - Layfield deployed three slope runs of liner by the end of the day.
- Layfield conducted pressure testing of deployed liner.
- Layfield obtained destructive samples for all liner deployed up to, and including, August 30 at Tetra Tech's direction.

3.0 GEOSYNTHETIC ROLL NUMBERS PLACED

Table 1 summarizes the daily geosynthetic roll numbers placed on the slope during liner installation. All panel lengths are approximate, and where angled joints are used, panel length is based from the center of the panel.

Table 1: Geosynthetic Roll Numbers Placed on Slope

Date	GCL Roll Number	LLDPE Liner Roll Number	Panel Number (Length)

4.0 TRIAL SEAM

Table 2 summarizes the weekly trial seam results. For fusion, the apparatus settings are temperature and speed, and for extrusion, the apparatus settings are preheat and barrel temperature. Five tests are performed for each criterion.

Table 2: Trial Seam Results

Date	Time	Fusion or Extrusion	Tech	Apparatus #	Temp or Preheat (°F)	Speed (%) or Barrel Temp (°F)	$Peel_{inside}$ (100 min)	$Peel_{outside}$ (100 min for Fusion 88 min for Extrusion)	Shear (120 min)	Smooth or Textured

WEEKLY FIELD REPORT

ISSUED FOR USE

Project:	Eagle Gold Heap Leach Phase 1B	**Date:**	September 13, 2020
Location:	Eagle Gold Mine	**Contractor:**	Ewing Transport / Layfield
Client:	Victoria Gold Corp.	**Contractor's Rep:**	Marshall Ewing / Chad Messervey
Contact:	Clint Abel	**Contractor's Email:**	
Weather:	Variable (see daily entries)	**Tetra Tech Representative:**	Adam Mickey
File:	704-ENG.WARC03235-09	**Status:**	Issued for Use

1.0 INTRODUCTION

Tetra Tech Canada Inc. (Tetra Tech) was retained by Victoria Gold Corp. (Victoria Gold) to provide CQA services at the Eagle Gold mine located north of Mayo, Yukon, at Dublin Gulch for the Eagle Gold Heap Leach Phase 1B expansion (Phase 1B). Mr. Adam Mickey, EIT, is Tetra Tech's representative on site.

Forte Dynamics (Forte) out of Fort Collins, Colorado provided the design and specification for Phase 1B, and Forte's representative is Clint Green.

Clint Abel, of JDS Energy & Mining, is Victoria Gold's project manager on site at the Eagle Gold mine.

Ewing Transport (Ewing), based out of Mayo, Yukon, is the construction contractor for Phase 1B.

Layfield Environmental Containment (Layfield) has been retained to provide and install the liner for Phase 1B, and their supervisor on site is Chad Messervey.

The following Field Report outlines Tetra Tech's CQA for the period of September 7, 2020, to September 13, 2020.

2.0 DAILY REPORTS

2.1 Highlights

- Layfield deployed approximately 4,942.8 m of liner covering an approximate area of 33,117 m^2.
- Rain delayed liner deployment throughout the week.
- Layfield is placing three panels of GCL for every two panels of 80 mm LLDPE liner.

2.2 September 7, 2020

- Weather: cloudy and windy with periods of rain, turning to cloudy at 10:00 am.
- Ewing in continuing to prepare subgrade in advance of deployment.
  - Rain in the morning halted subgrade preparation.
    - Ewing is waiting for the subgrade to dry prior to continuing preparation.

Tetra Tech Canada Inc.
61 Wasson Place
Whitehorse, YT Y1A 0H7 CANADA
Tel 867.668.3068 Fax 867.668.4349

        - Tetra Tech and Ewing inspected the subgrade at noon. The subgrade is too saturated to get the packer on it and prepare more subgrade.
    - Ewing was able to begin prepping subgrade around 3:00 pm. Soft spots were found, and they were excavated out, filled with rock fill, and compacted and covered with sand.
- Tetra Tech inspected and approved the subgrade for today's deployment.
- Layfield is continuing to deploy liner.
    - Rain delayed deployment from 7:45 am till 8:30 am.
    - Layfield deployed and fused two slope runs of liner by 1:30 pm. As there was no prepared subgrade, Layfield moved over to conducting detail work.
- Tetra Tech and Layfield conducted destructive testing on samples obtained from the liner.
    - All destructive testing is caught up for all liner deployed up to and including August 30.
    - The P526-P529 vertical seam destructive sample failed testing due to excessive peel into the weld. Layfield will obtain a new sample 3 m down seam from the original test location.
    - The P500-P532 tie in seam marginally passed testing. Tetra Tech requested that Layfield extrusion weld the seam, but no further destructive testing is required.

2.3 September 8, 2020

- Weather: cloudy.
- Ewing is continuing to prepare subgrade for deployment.
    - Tetra Tech and Ewing identified soft spots requiring subex and replacement with rock fill.
        - Ewing worked on the soft spots throughout the day.
- Layfield is continuing to deploy liner.
    - Layfield deployed four slope runs of liner by 4:00 pm.
    - Layfield could not deploy any more liner as there was no more prepared subgrade to deploy on.

2.4 September 9, 2020

- Weather: partly cloudy.
- Ewing is continuing to prepare subgrade for deployment.
    - Nightshift removed excess subgrade soils from the slope and dug up the E3 lateral, which had to be repaired.
    - Soft spots are continuing to be excavated and repaired as identified.
    - Tetra Tech identified soft spots at the toe of the slope where 1B meets 1A. Tetra Tech worked with Ewing to remove the soft soil to ready the area for deployment.
- Layfield is continuing to deploy liner.

- Layfield deployed four slope runs of liner and two additional GCL beyond the deployed liner by the end of the day.

2.5 September 10, 2020

- Weather: sunny, turning to cloudy with a period of rain in the afternoon.
- Ewing is continuing to prepare subgrade in advance of deployment.
  - Heavy rainfall from yesterday evening saturated the subgrade too much to compact it.
    - Ewing is attempting to repair the subgrade to allow for deployment.
  - Tetra Tech informed Ewing that the subgrade at the toe of the slope would have to be excavated due to soft conditions. No fill is required; the soft subgrade can be excavated and reshaped.
- Tetra Tech inspected the subgrade first thing and determined that it was too saturated to deploy.
  - Tetra Tech inspected the subgrade at 12:00 pm and authorized deployment of GCL.
- Layfield is continuing to deploy liner.
  - Layfield deployed one slope length of liner and then had to wait to continue deployment until the subgrade was prepared.
  - Layfield was authorized to deploy liner at noon.
  - Layfield deployed three slope runs of liner by 4:00 pm and finished the day by continuing to deploy GCL. Only two slope runs of GCL could be deployed before they were out of prepared subgrade to deploy on.
- After laying the first slope run of liner, Tetra Tech and Layfield walked off all of the deployed liner laid from last walk off to August 30.

2.6 September 11, 2020

- Weather: partly cloudy.
- Ewing is continuing to prepare subgrade in advance of deployment.
  - The skid steer is covering any rocky areas with sand.
  - The packer is rolling the subgrade.
  - By the end of the day, all sloping of the subgrade was complete, and the remainder of work required is rolling the subgrade with a packer and sanding rocky areas.
- Tetra Tech inspected and approved the prepared subgrade for today's deployment.
  - Tetra Tech had to inspect and approve the subgrade as it was prepared.
- Layfield is continuing to deploy liner.
  - Layfield deployed two slope runs of liner.
  - Due to wind in the afternoon, Layfield continued to deploy GCL for the rest of the day.
- Layfield began working down the perimeter road from Phase 1B perimeter road to the Phase 1A perimeter road.

- Layfield's QC conducted pressure testing of deployed liner seams.

2.7 September 12, 2020

- Weather: mostly sunny.
- Ewing is continuing to perform finish work on the subgrade.
  - The skid steer is sanding rocky areas and removing soft spots at the toe of the slope.
  - The packer is packing rough areas and sanded areas.
- Tetra Tech inspected and approved the subgrade for deployment.
  - Soft spots were identified at the toe of the slope, which the skid steer removed.
- Layfield is continuing to deploy liner.
  - Below freezing temperatures last night resulted in frost on the liner. Layfield could not deploy liner due to slippery conditions, so began the day by deploying GCL.
  - Once the liner had warmed up, Layfield began deploying liner over top of the GCL.
  - Layfield deployed four slope runs of liner and finished the day by deploying one slope run of GCL.
- Layfield conducted pressure testing of fused seams.
- ODF placement damaged the signed off liner on nightshift, so Layfield had to send an extrusion team to repair it in the afternoon.

2.8 September 13, 2020

- Weather: sunny, turning to partly cloudy in the afternoon.
- Ewing is continuing to perform finish work on the subgrade in advance of liner deployment.
- Tetra Tech inspected and approved the subgrade for deployment as required.
- Layfield is continuing to deploy liner.
  - Layfield deployed seven slope runs of liner.
  - One small corner remains to be covered. Deployment will be complete tomorrow.
- Tetra Tech and Layfield's QC conducted destructive testing of deployed liner samples.
  - One sample failed due to peel into the weld. The samples were D251A of panels P559-P562.
    - Tetra Tech was informed that this seam had been extrusion welded, so to confirm, a destructive sample was obtained from panels P559-P561 for testing.

3.0 GEOSYNTHETIC ROLL NUMBERS PLACED

Table 1 summarizes the daily geosynthetic roll numbers placed on the slope during liner installation. All panel lengths are approximate, and where angled joints are used, panel length is based from the center of the panel.

Table 1: Geosynthetic Roll Numbers Placed on Slope

Date	GCL Roll Number	LLDPE Liner Roll Number	Panel Number (Length)

4.0 TRIAL SEAM

Table 2 summarizes the weekly trial seam results. For fusion, the apparatus settings are temperature and speed, and for extrusion, the apparatus settings are preheat and barrel temperature. Five tests are performed for each criterion.

TETRA TECH

WEEKLY FIELD REPORT

ISSUED FOR USE

Project:	Eagle Gold Heap Leach Phase 1B	**Date:**	September 16, 2020
Location:	Eagle Gold Mine	**Contractor:**	Ewing Transport / Layfield
Client:	Victoria Gold Corp.	**Contractor's Rep:**	Marshall Ewing / Chad Messervey
Contact:	Clint Abel	**Contractor's Email:**	
Weather:	Variable (see daily entries)	**Tetra Tech Representative:**	Adam Mickey
File:	704-ENG.WARC03235-09	**Status:**	Issued for Use

1.0 INTRODUCTION

Tetra Tech Canada Inc. (Tetra Tech) was retained by Victoria Gold Corp. (Victoria Gold) to provide CQA services at the Eagle Gold mine located north of Mayo, Yukon, at Dublin Gulch for the Eagle Gold Heap Leach Phase 1B expansion (Phase 1B). Mr. Adam Mickey, EIT, is Tetra Tech's representative on site.

Forte Dynamics (Forte) out of Fort Collins, Colorado provided the design and specification for Phase 1B, and Forte's representative is Clint Green.

Clint Abel, of JDS Energy & Mining, is Victoria Gold's project manager on site at the Eagle Gold mine.

Ewing Transport (Ewing), based out of Mayo, Yukon, is the construction contractor for Phase 1B.

Layfield Environmental Containment (Layfield) has been retained to provide and install the liner for Phase 1B, and their supervisor on site is Chad Messervey.

The following Field Report outlines Tetra Tech's CQA for the period of September 14, 2020, to September 16, 2020.

2.0 DAILY REPORTS

2.1 Highlights

- Layfield deployed a total of approximately 110.3 m of liner covering an approximate area of 739 m^2.
- The Phase 1B project was completed this week.
- Layfield is placing three panels of GCL for every two panels of 80 mm LLDPE liner.

2.2 September 14, 2020

- Weather: cloudy.
- Ewing finished preparing the subgrade is the southeast corner to tie Phase 1B into Phase 1A at the anchor trench.
- Layfield deployed four slope runs of liner and finished all deployment for Phase 1B.

Tetra Tech Canada Inc.
61 Wasson Place
Whitehorse, YT Y1A 0H7 CANADA
Tel 867.668.3068 Fax 867.668.4349

- After liner deployment, Layfield put three extrusion teams out on the slope to detail all remaining deployed liner as well as to tie Phase 1B into Phase 1A at the Phase 1A anchor trench.
- Layfield and Tetra Tech obtained the remaining destructive samples from the deployed liner and conducted destructive testing.
  - All samples passed destructive testing, including D151B.
- Layfield's QC conducted pressure testing of deployed liner seams.
- Ewing labourers are cleaning up all the garbage around Phase 1B.

2.3 September 15, 2020

- Weather: cloudy.
- Layfield completed all detail work for Phase 1B, including extrusion welding, pressure testing, and vacuum boxing.
- Tetra Tech and Layfield walked-off the liner deployed since the last walk-off. Seven vacuum testes were missed.
  - After the vacuum testing was completed, Tetra Tech signed the final Certificate of Acceptance for both the liner and subgrade and provided them to Forte and Victoria Gold.

2.4 September 16, 2020

- Tetra Tech demobilized to Whitehorse. The liner destructive testing archives have been returned to Tetra Tech's Whitehorse office for storage.

3.0 GEOSYNTHETIC ROLL NUMBERS PLACED

Table 1 summarizes the daily geosynthetic roll numbers placed on the slope during liner installation. All panel lengths are approximate, and where angled joints are used, panel length is based from the center of the panel.

Table 1: Geosynthetic Roll Numbers Placed on Slope

Date	GCL Roll Number	LLDPE Liner Roll Number	Panel Number (Length)
September 14	502343546, 502343586 502343585, 502343662 502343691	10698-006 10698-013	P615 (17.2 m) P616 (30.3 m), P617 (30.1 m), P618 (29.1 m), P619 (3.6 m)

4.0 TRIAL SEAM

Table 2 summarizes the weekly trial seam results. For fusion, the apparatus settings are temperature and speed, and for extrusion, the apparatus settings are preheat and barrel temperature. Five tests are performed for each criterion.

Table 2: Trial Seam Results

Contractor RFI:	
Site Location: EAGLEGOLD	
Date Submitted: June 3, 2020	

Subject: Horizontal seams on slopes greater than 2.5:1	**Project Zone/Area: Heap Leach Phase 1B**
Contractor: JDS/Ewing	**Station/Location:**
Attention: Clint Green	**Discipline: Civil**

REQUEST

Related Drawings: Conceptual Panel Layout Ph 1B-FORTE DYNAMICS-6-11-20.pdf	**Other Related Documents:** **Technical Specifications – Geosynthetics** **3.1.7.1 Placement**

Information Request/Description of Issue:

Requesting additional information on the requirement to connect the liner end seams at 45 degrees. Will the liner on slopes greater than 2.5H:1V require a 45 degree angle connection as listed in the Technical Specifications?

Proposed Corrective Action

There were no 45° angle end seams utilized in Phase 1A, but this could've been due to the length of the material deployed. All horizontal seams have to be staggered to ensure good material is welded on both side of each end seam.

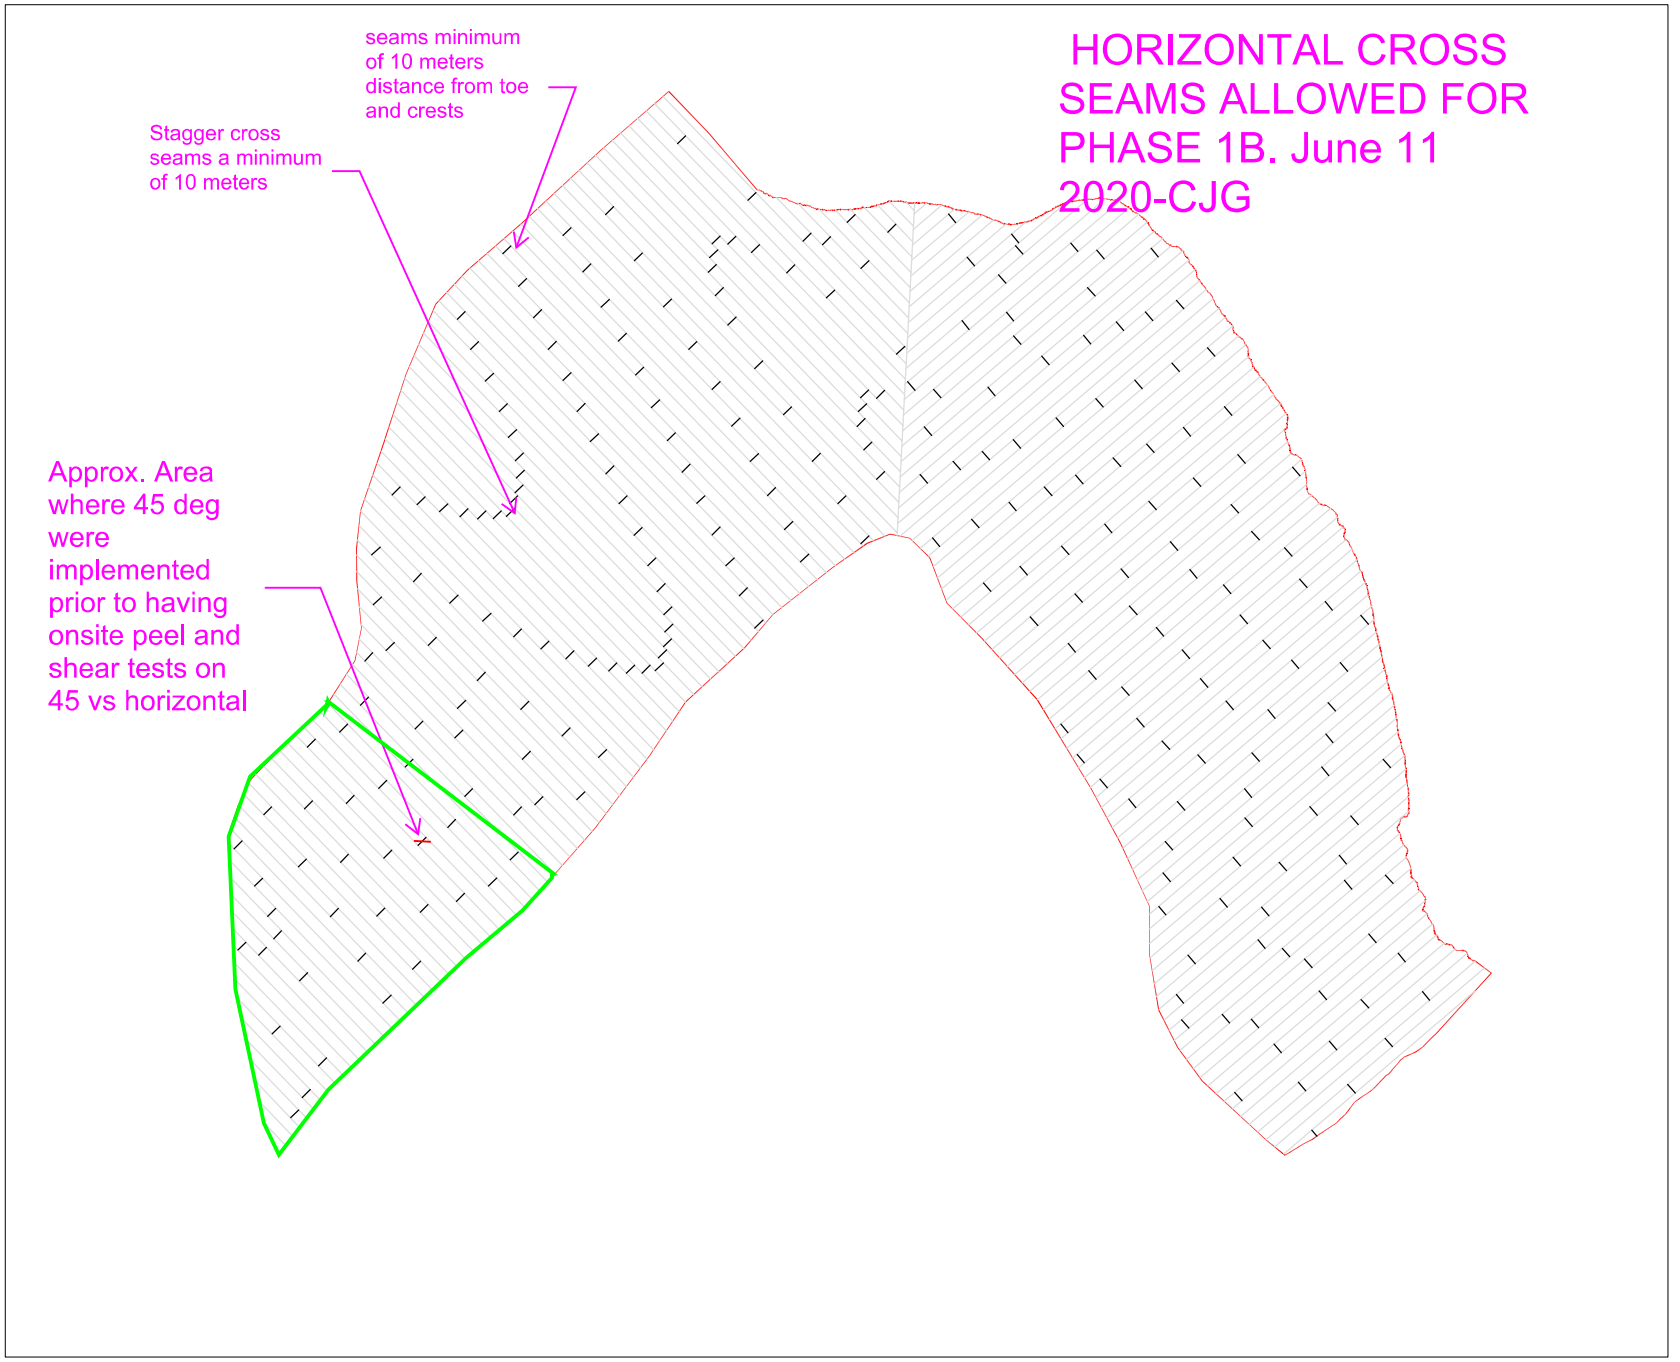
RESPONSE

☐	Approved	☒	Approved as noted	☐	Rejected as noted

Response:

Liner already deployed and welded at 45-degree angled seams shall remain in area delineated in green on the attached exhibit already lined with LLDPE.



Based on the on-site 45-degree seam vs. horizontal seam destructive testing (peel & shear) results, horizontal seams shall be allowed on the side slopes for remainder of un-lined areas within Phase 1B footprint. Given the following conditions are met:

- **Horizontal seams must be staggered at least 10m apart at different elevations across the slope**
- **No Horizontal seams shall be within 10m of the toe or crest of a slope**
- **Upper geomembrane panel must be shingled over the lower geomembrane when placing horizontal seam on side slope**

TETRA TECH

REQUEST FOR INFORMATION

ISSUED FOR USE

Request for Information #1

Project Name:	Eagle Gold Heap Leach Expansion Phase 1B	**Date:**	June 6, 2020
Location:	Eagle Gold Mine	**Page:**	1 of 3
Date of RFI:	June 6, 2020	**File:**	704-ENG.WARC03235-09

1.0 INTRODUCTION

Tetra Tech Canada Inc (Tetra Tech) is contracted by Victoria Gold Corp. (Victoria Gold) to provide CQA services for liner placement for the Eagle Gold Heap Leach Expansion Phase 1B. The following RFI outlines Tetra Tech's request for guidance from Forte Dynamics (Forte), who is the Engineer of Record (EOR) for the heap leach expansion, regarding the subgrade and ongoing issues with rocks lodging between the subgrade soils and liner during deployment. Layfield Environmental Containment (Layfield), who is installing the liner, is also seeking guidance on the acceptability of rocks between the subgrade and deployed liner.

2.0 BACKGROUND

Currently, Layfield is deploying liner on the westernmost portion of Phase 1B, which is the steepest portion of the heap leach facility and will be herein noted as the west side. The subgrade on the west side of the heap leach facility consists of either colluvium or degraded bedrock that has been ripped with a dozer and bladed to form a continuous slope with relatively gentle transitions (3:1 or less) across the slope but is steeper than 2:1 downslope. Once the slope has been contoured with a dozer, a packer is run over the slope to smooth out the surface in preparation for liner deployment. In advance of liner deployment, Tetra Tech and Layfield conduct a subgrade inspection prior to ensure that a smooth surface free of protruding rocks or other deleterious conditions that may cause failure to the liner is present. After compaction, the subgrade meets the aforementioned conditions.

Layfield is deploying the GCL, which lies beneath the liner on top of the subgrade, via a spreader bar suspended by an excavator. Typically, Layfield would pull the liner down the slope using a side by side, but the steepness of the slope requires deployment using an excavator to pull the GCL. Tetra Tech has noted that the subgrade disturbs easily, which loosens the surface up. Also, the excavator used for deployment causes subgrade disturbance. Due to the GCL sliding along the slope, rocks are pulled out of the subgrade and are lodged between the GCL and the subgrade, causing protrusions in the GCL. Tetra Tech has noted that this occurs both in disturbed and undisturbed areas. Tetra Tech had requested that Layfield remove the rocks once the GCL is deployed, but there are too many to remove and would require hundreds of cuts in the GCL to remove every noticeable protrusion. Other deployment options have been discussed, and some have been tried, but all other deployment options have been deemed too unsafe or would require significant work stoppages to work and will also be slower methods of deployment with no guarantee of working across the entire slope.

Due to the challenging subgrade conditions and Layfield expressing concern for the installed liner, a meeting was held between Forte, Tetra Tech, Victoria Gold, and Layfield to discuss options to continue to move forward with the challenging subgrade conditions. A test strip was suggested and agreed upon by all parties to test the impact of rocks beneath the liner.

3.0 ROCK PROTRUSION TEST STRIP

Tetra Tech, Forte, and Layfield discussed a test strip method that would help do determine the puncture resistance by rocks on the liner system. The following section details the results of the test strip.

Adam Mickey, EIT, is Tetra Tech's representative on site. Mr. Mickey suggested a test strip that would test conditions that would represent extreme cases of rocks beneath the liner system. It was suggested that the following conditions would be tested:

- The test strip would be the complete liner system of GCL and 80 mm LLDPE liner;
- The test strip would be conducted on a flat, well-compacted subgrade;
- Angular rocks of varying sizes would be placed on top of the subgrade and beneath the liner system in test sections ranging from only rocks less than 50 mm in size to large rocks up to 200 mm in size; and
- A fully loaded 30-ton rock truck would run over the LLDPE liner without any soil on the surface of the liner to protect it.

Tetra Tech set up the test strip with Layfield present and conducted the testing. During testing, the liner was at a temperature of 21°C. The liner test sections were run over three times by the fully loaded rock truck. A fourth test was conducted where the rock truck tire was placed on the largest, most protruding rock, and the rock truck turned left, and right overtop of the rock. No rock penetrated the liner at any stage of the testing. The GCL did not puncture, except for the at the rock where the rock truck twisted back and forth on. It was noted that the rocks were driven into the subgrade during testing. Once testing was completed, two coupons were cut out of the liner at the most significant rock protrusions and tested in the liner seam testing apparatus by Layfield with Tetra Tech present. The results are presented below in Table 1.

Table 1: Liner Protrusion Shear Testing

Test ID	Coupon 1 Shear	Coupon 2 Shear
PT1	189	170
PT2	191	228
PT3	159	134
PT4	204	205

Except for PT3, all values were similar to shear values exhibited by new LLDPE liner. PT3 was cut from the protrusion area where the rock truck twisted back and forth over. Note that the shear values are still above the required shear value of 120 for a fusion weld.

Photos have been provided to Forte is a separate document that shows the liner test at all stages of testing. Tetra Tech has retained the liner for further inspection if necessary.

4.0 REQUEST FOR GUIDANCE

Based on the protrusion test and the subgrade conditions present on the steep slopes, Tetra Tech is requesting guidance on the following:

- What is an acceptable amount, and size, of rocks between the GCL and the subgrade with the understanding that it is not possible to eliminate all rock between the subgrade and the GCL, GCL placement causes rocks to be plucked out of the subgrade, deployment using an excavator causes damage to the subgrade, and that

subgrade conditions get rockier as deployment moves towards the header trench from the southernmost limit of the west side of the Phase 1B;

- Guidance on sand placement in exceptional rocky areas of the subgrade to limit the plucking of rocks by GCL placement including thickness and compaction requirements; and
- What are Tetra Tech's and Layfield's responsibilities regarding the subgrade moving forward?

Respectfully submitted,

Adam Mickey, M.Eng., EIT

Tetra Tech CQA Representative

APPENDIX D

TESTPIT LOGS FOR FOUNDATION IMPROVEMENT PLAN

TERMS USED ON BOREHOLE LOGS

TERMS DESCRIBING CONSISTENCY OR CONDITION

COARSE GRAINED SOILS (major portion retained on 0.075mm sieve): Includes (1) clean gravels and sands, and (2) silty or clayey gravels and sands. Condition is rated according to relative density, as inferred from laboratory or in situ tests.

DESCRIPTIVE TERM	RELATIVE DENSITY	N (blows per 0.3m)
Very Loose	0 TO 20%	0 to 4
Loose	20 TO 40%	4 to 10
Compact	40 TO 75%	10 to 30
Dense	75 TO 90%	30 to 50
Very Dense	90 TO 100%	greater than 50

The number of blows, N, on a 51mm O.D. split spoon sampler of a 63.5kg weight falling 0.76m, required to drive the sampler a distance of 0.3m from 0.15m to 0.45m.

FINE GRAINED SOILS (major portion passing 0.075mm sieve): Includes (1) inorganic and organic silts and clays, (2) gravelly, sandy, or silty clays, and (3) clayey silts. Consistency is rated according to shearing strength, as estimated from laboratory or in situ tests.

DESCRIPTIVE TERM	UNCONFINED COMPRESSIVE STRENGTH (KPA)
Very Soft	Less than 25
Soft	25 to 50
Firm	50 to 100
Stiff	100 to 200
Very Stiff	200 to 400
Hard	Greater than 400

NOTE: Slickensided and fissured clays may have lower unconfined compressive strengths than shown above, because of planes of weakness or cracks in the soil.

GENERAL DESCRIPTIVE TERMS

Slickensided - having inclined planes of weakness that are slick and glossy in appearance.
Fissured - containing shrinkage cracks, frequently filled with fine sand or silt; usually more or less vertical.
Laminated - composed of thin layers of varying colour and texture.
Interbedded - composed of alternate layers of different soil types.
Calcareous - containing appreciable quantities of calcium carbonate.;
Well graded - having wide range in grain sizes and substantial amounts of intermediate particle sizes.
Poorly graded - predominantly of one grain size, or having a range of sizes with some intermediate size missing.

Data presented hereon is for the sole use of the stipulated client. Tetra Tech EBA is not responsible, nor can be held liable, for use made of this report by any other party, with or without the knowledge of EBA. The testing services reported herein have been performed to recognized industry standards, unless noted. No other warranty is made. These data do not include or represent any interpretation or opinion of specification compliance or material suitability. Should engineering interpretation be required, EBA will provide it upon written request.

MODIFIED UNIFIED SOIL CLASSIFICATION

CERTIFICATE OF FINAL INSPECTION AND ACCEPTANCE

PROJECT NAME: Heap Leach Pad, Phase 1-B
PROJECT NUMBER: CT001401 **DATE:** July 9 2020
OWNER: Victoria Gold.
LOCATION: Eagle Gold Mine, YT

Scope of Installation(s): **THE WORK**
Area/Layer: Primary Area Inspected: ☑ Partial or ☐ Complete
Dimensions: Panels 1-59. Layfield has completed work on Panels 1-59. The area has had Final inspection and can now be turned over to Client

Part 1 – LAYFIELD CANADA LTD.

I, Chad Messervey, a duly appointed representative of Layfield Canada Ltd. (Layfield), have visually observed the installations (as outlined above), and have found the Work to be complete and free of defects and declare that the Work was completed in accordance with the project specifications, Layfield's QC program and the terms and conditions of the contract.

Layfield Representative:
Name: Chad Messervey
Title: Project Supervisor
Date: July 9 2020 **Signature:**

Part 2 – OWNER (or Representative)

I, JAMES BUYCK, a duly appointed representative of TETRA TECH, do hereby take over and accept the installation(s) described above, and confirm that the work has been completed in accordance with the project specifications and the terms of the conditions of the contract.

I have evaluated and measured the work together with the Layfield representative, and agree that the measurements shown are both true and correct, and that the installation has met our approval.

CERTIFICATE OF INSPECTION OF SOIL SUBGRADE SURFACE

PROJECT NAME: Heap leach Pad Phase 1, B
PROJECT NUMBER: CT001401
OWNER/CONTRACTOR: Victoria Gold
LOCATION: Eagle gold Mine

I, the undersigned, a duly appointed representative of Layfield Canada Ltd. (Layfield), have visually observed the soil subgrade surface described below, and:

- ☐ *found it to be an acceptable surface on which to install geomembrane; OR*
- ☐ *found it to be an Unacceptable surface on which to install geomembrane*

Area Inspected (☐ Partial or ☑ Complete): _____
Dimensions of Subgrade Inspection: 9000 m^2 shape of a triangle.
Anchor Trench Dimensions: 1X1m
Comments: _____

This certification is based on observations of the surface of the subgrade only. No subterranean inspections or tests have been performed by Layfield and Layfield makes no representations or warranties regarding conditions which may exist below the surface of the subgrade. Layfield accepts no responsibility for conformance of the subgrade to this project's specifications.

The soil subgrade inspected on this date refers to its present condition. Any changes in the subgrade condition that result from the effects of inclement weather and/or other forces beyond the control of Layfield and remedial work to correct the resulting deficiencies, will be the direct responsibility of the General Contractor.

LAYFIELD REPRESENTATIVE:

Date: May 30 2020
Signature: [signature]
Name: Thomas Howald
Title: QC

OWNERS REPRESENTATIVE:

I, the undersigned, a duly appointed representative of the Owner, hereby understand the soil subgrade surface inspection described above and authorize Layfield to proceed with deployment of geosynthetics on the subgrade provided.

DETAIL TYPE:

AD - ANIMAL DAMAGE	DS-# - DESTRUCT SAMPLE NUMBER	IO - INSUFFICIENT OVERLAP	T - THREE PANEL INTERSECTION
ATL - AIR TEST LEAK	EE - EARTHWORK EQUIPMENT DAMAGE	MD - MANUFACTURER/DELIVERY DAMAGE	VL - VACUUM TEST LEAK
BO - FUSION WELDER BURN	EXT - EXTENSION	P - PENETRATION	WR - WRINKLE
CR - CREASE	FM - FISHMOUTH	PT - PRESSURE TEST CUT	WS - WELDER RESTART
D - INSTALLATION DAMAGE	FS - FAILED SEAM LENGTH	SI - SOIL SURFACE IRREGULARITY	OTHER:

TEST METHOD:

AL - AIR LANCE	VB - VAC BOX
PS - POINT STRESS	ST - SPARK TEST

REPAIR TYPE:

G&W - GRIND & WELD	B - BOOT	P - PATCH
HAW - HOT AIR WELD	C - CAP
