Victoria
GOLD CORP

MEMORANDUM

To:	**Steve Wilbur, Victoria Gold Corp.**	**Date: 19 March, 2020**
From:	**Scott Jackson and Colin Fraser**	**Project #: A562-1**
Subject:	**Eagle Gold Project – Topographical Characteristics of Gauged Catchments**	

1. Introduction

This brief technical memo presents the topographical characteristics of the Dublin Gulch tributaries and Haggart Creek mainstem, as measured from the hydrometric monitoring stations. This information is presented as hypsometric curves (cumulative percent basin area plotted against elevation), with the median elevations, average slope and catchment areas summarized in Table 1.

Table 1:
Topographical Characteristics of Gauged Catchments

Station ID	Station Name	Area (km^2)	Median Elevation (m)	Average Slope (°)
W1	Dublin Gulch above Stewart Gulch	7.0	1,313	11.3
W4	Haggart Creek below Dublin Gulch	76.8	1,129	15.4
W5	Haggart Creek above Lynx Creek	97.7	1,091	15.3
W6	Lynx Creek above Haggart Creek	100.9	1,044	13.2
W10	Stuttle Gulch	0.7	1,012	15.6
W20	Bawn Bay Gulch	2.4	1,364	8.4
W21	Dublin Gulch at the Mouth	10.1	1,263	12.5
W22	Haggart Creek above Dublin Gulch	66.5	1,113	15.9
W26	Stewart Gulch	1.4	1,211	16.1
W27	Eagle Creek	2.6	1,031	16.5
W29	Haggart Creek below Eagle Creek	84.9	1,112	15.3
W31	Olive Gulch	1.8	1,328	10.7
W45	Eagle Creek above Haggart Creek	3.9	957	14.9
W99	Haggart Creek above 15 Pup	88.7	1,105	15.4

1. Introduction

VICTORIA
GOLD CORP

1. Introduction

1.1 Project Description

Victoria Gold Corp's (VGCX) Eagle Gold Mine is located in the Central Yukon Territory, approximately 350 km north of Whitehorse and approximately 45 km north of Mayo. Much of the mine site lies within the Dublin Gulch watershed, a tributary that reports to Haggart Creek, and which then flows to the South McQuesten River. Ultimately, the South McQuesten River joins the Stewart River, which flows west to its eventual confluence with the Yukon River.

A Type A Water Use License (QZ14-041) was issued for the Eagle Gold Project on December 3rd, 2015 to allow the construction, operation and closure of the open pit heap leach gold mine in central Yukon. Following several updates to key water management features, heap leach facility construction and waste rock storage facility design an amended Water Use License (QZ14-041-1) was issued to VGC on August 22, 2019.

The Eagle Gold Mine water balance and water quality model (WBWQM) has been updated to reflect the most recent baseline information, heap leach water balance modeling and updated geochemical source term modeling.

1.2 Scope of Report

The Eagle Gold WBWQM is a GoldSim-based integrated water balance and quality model. This report presents the most recent update of the Eagle Gold water balance model and water quality model (WBWQM) that fully integrates the following:

- Description of the water management plan as described in: *Eagle Gold Project Water Management Plan*. Version 2020-01. January 2020;
- Revisions to the heap leach facility water balance modeling as prepared by Forte Dynamics;
- Baseline climate and hydrology data collected since 2007 and inclusive of data collected in 2020;
- Updated baseline surface water quality monitoring data collected from 2007 to 2017 prior to initiation of construction in August 2017;
- Surface water quality monitoring data collected in 2018 through 2020 reflective of construction and early Operations phases; and,
- Updated geochemical source term data collected from re-designed and revised field bins of waste rock and unsaturated laboratory-based kinetic leach columns. Data

from the updated kinetic testing have been used to update geochemical source terms employed in the WBWQM.

Following this introduction, Section 2 presents the updated input parameters and assumptions used to update the water balance and water quality models. Section 3 presents a summary of the water quality model results and Section 4 provides a summary of the results for water quantity.

2. Model Inputs and Assumptions

VICTORIA
GOLD CORP

2. Model Inputs and Assumptions

2.1 Water Balance Model Inputs and Assumptions

2.1.1 Hydro-meteorological Updates

Following the issuance of WUL QZ14-041 in 2015, the collection of climate and streamflow data has continued at the Project site. This additional data has been incorporated into the site monitoring records, and the results are presented in the climate and hydrology data summary reports (Lorax 2021a and 2021b), along with additional analysis in the updated hydrometeorology report (Lorax 2021c). In previous iterations of the WBM, the annual runoff at the W4 hydrometric station was assumed to represent the effective precipitation at the Project site and formed the primary driver of the WBM. The model inputs were updated in 2018 to reflect slight changes in estimated runoff values that resulted from additional streamflow and climate data collected since the initial WBM (Knight Piésold, 2014) was submitted in support of a Water Use Licence application in 2014.

The changes from the initial estimates made by Knight Piesold in 2014 relevant to the WBM parameterization are as follows:

- Mean annual precipitation (MAP) at the 1,125 m elevation decreased by 4%, from 500 mm to 480 mm;
- Mean annual runoff (MAR) for the W4 hydrometric station increased by 9% from 230 mm to 253 mm; and
- The monthly distribution of annual runoff used to distribute the MAR value for W4 changed slightly, as outlined in Table 2.1-2.

For the 2020 WBM update, all assumptions and methods related to the derivation of the synthetic climate dataset were consistent with those described in Lorax (2017a), with two exceptions:

- The synthetic record was updated to include 2020 based on the Mayo A climate record; and
- The precipitation gradients were updated to reflect the additional climate and snow survey data collected at the Project site. The daily time-series of climate parameters is scaled by elevation for temperature on a monthly basis (Table 2.1-1), and for precipitation on a seasonal basis, as follows:
    - Winter – 11%/100 m

- October to March < 1,000 m
- October to April > 1,000 m

- Summer – 4%/100 m
  - April to September < 1,000 m
  - May to October > 1,000 m

Since the 2018 WBM updates, given that monitoring data is now available with which to characterize the Projects' water management regime, and potential changes to streamflows in Haggart Creek, the WBM shifted from a runoff-based WBM to a watershed model architecture, driven by a climate time-series input. The WBM is configured to include all relevant Project infrastructure, including the HLF, open pit, WRSAs, 90-day ore stockpiles, and water management infrastructure (*e.g.*, sediment ponds, collection ditches, event pond, *etc*.). Within the Base Case module of the WBM, each mine component is spatially defined by year of the Project life, which allows the footprints (sub-catchments) and /or volumes of each component to expand as the mine development progresses. Each sub-catchment represents a single land cover type (*e.g.*, WRSA, open pit, natural ground, *etc*.)

The climate inputs are comprised of daily temperature and precipitation data which are used to drive the WBM, with meteoric water being converted to runoff using assumptions and coefficients specific to the land surface type represented in each sub-catchment. All sub-catchments are assembled in hierarchical order, with runoff tracked and aggregated across the Project site and downstream into the receiving environment. The climate input series is based on the Mayo A record, adjusted according to relationships developed between the Mayo A and site climate records as measured at the Camp and Potato Hills stations (Lorax 2017).

The previous average runoff inputs were replaced with the daily climate series from a representative average year (2016) to drive the WBM. Mean annual precipitation (MAP) at the Camp station elevation (782 m) is 360 mm, and total annual precipitation in 2016 was 364 mm (Figure 2.1-1). There are a total of 10 years within the 72 year synthetic climate record that fall within 2% of the MAP value, however 2016 was chosen as it falls within the site baseline monitoring period, and extensive climate, snowpack and streamflow data are available with which to benchmark the model performance.

Monthly summaries of the synthetic climate series parameters are presented for the three representative elevations that bound the Project site in Table 2.1-2.

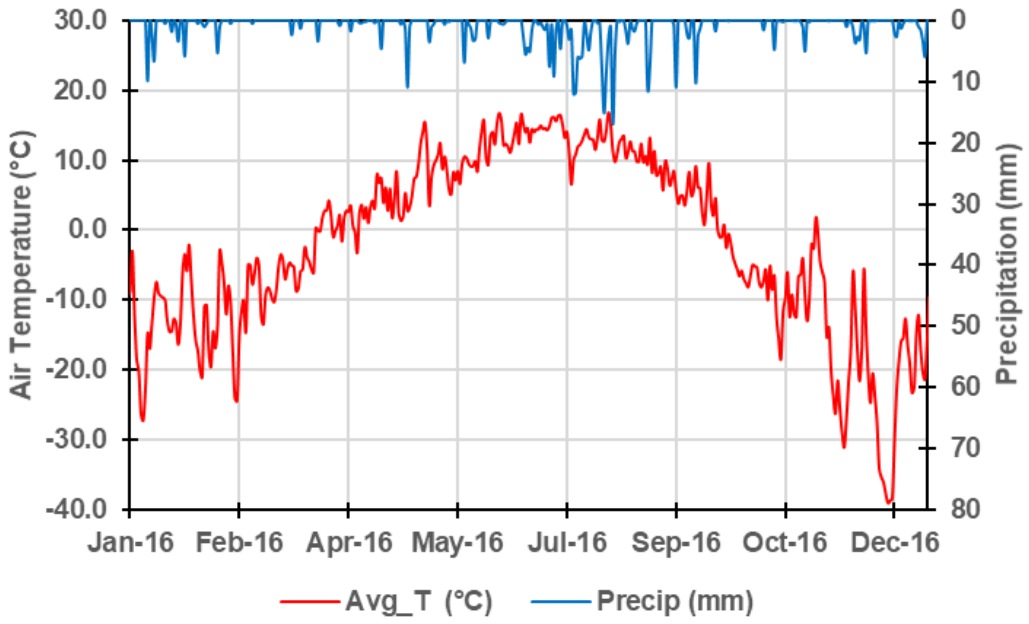

Figure 2.1-1: Daily temperature and precipitation from the Camp Station elevation (782 m) for the representative average year (2016) used as WBM input.

2.1.1.1 2020 Climate and Streamflow Conditions

2020 was an unusually wet year, which influenced both the mine water management practices as well as the model validation exercise described in Sections 2.1.5 and 2.2.5. This section summarizes the climate and streamflow conditions measured at the Project site for the 2020 water year. Data from the Camp climate station (782 m), and the Potato Hills climate station (1,420 m) are presented alongside data from a nearby climate station in Mayo (504 m) for reference, and site snow course data are compared to nearby regional snow course data. All comparisons to regional climate records are made to the 1991-2019 average, to better represent the dominant climatic conditions of the past 30-years. The full historical climate and streamflow records for the Project site are presented in Lorax (2021a and 2021b). Streamflow data from Project site hydrometric stations are presented and compared to the baseline reference period (2007-2017). Overall, the 2020 water year (October 2019 to September 2020) was characterized by slightly lower air temperatures than normal, and substantially higher snowpacks and summer rainfall, leading to elevated streamflows across the Project site.

At the regional scale, annual average air temperature at the Mayo A climate station (-3.7 °C) was slightly cooler than the 1991-2019 annual average (-2.2 °C; Table 2.1-3).

Table 2.1-3:
Monthly air temperature comparison for Mayo A station – normal vs. 2019-2020 water year. Warmer and colder values relative to normal are highlighted in orange and blue, respectively.

Year	Month	Mayo A (2019-2020)			Mayo A - Averages		
		MinT (°C)	AvgT (°C)	MaxT (°C)	MinT (°C)	AvgT (°C)	MaxT (°C)
2019	Oct	-5.7	-2.3	1.1	-6.2	-2.2	1.7
2019	Nov	-18.0	-13.6	-9.1	-19.5	-15.2	-10.9
2019	Dec	-25.4	-20.3	-15.1	-24.9	-19.7	-14.5
2020	Jan	-35.2	-30.3	-25.2	-27.8	-22.8	-17.8
2020	Feb	-28.6	-21.6	-14.6	-23.7	-17.5	-11.4
2020	Mar	-22.3	-14.8	-7.2	-16.9	-10.0	-3.0
2020	Apr	-7.9	-1.3	5.3	-5.0	1.1	7.5
2020	May	3.7	10.0	16.3	2.4	9.2	15.9
2020	Jun	8.6	13.7	18.8	7.9	14.8	21.6
2020	Jul	9.6	14.8	19.9	9.6	16.1	22.6
2020	Aug	8.9	13.7	18.5	7.1	13.3	19.4
2020	Sep	3.2	8.0	12.7	1.3	6.9	12.5
	Annual	**-9.1**	**-3.7**	**1.8**	**-8.0**	**-2.2**	**3.6**

The 2020 water year was characterized by higher than the 1991-2019 average maximum snow water equivalents (SWE) at snow courses located near the Project site:

- Mayo A - 2020 was the 2nd highest at 173 mm, with a maximum of 176 mm in 2004, and 66% higher than the 1991-2019 average.
- Calumet – 2020 represents the maximum on record (305 mm), 2nd highest was 300 mm in 1993, and 50% higher than the 1991-2019 average.

A similar pattern was evident at the Project site snow courses, with the maximum annual measured SWE equal to the highest values on record at the Camp and Potato Hills snow courses (Table 2.1-4). The synthetic precipitation data for these stations that was scaled from the Mayo A winter precipitation data also displayed historical maximums. These comparisons confirm that the scalars used to estimate winter precipitation at the Project site are able to accurately represent unusually high precipitation years and do not require updating.

Table 2.1-4:
Comparison of annual maximum snow water equivalent values for the Camp and Potato Hills stations.

Year	Camp (782 m)			Potato Hills (1,420 m)		
	Measured	Measured + 20% Sublimation	Synthetic	Measured	Measured + 20% Sublimation	Synthetic
	Annual Maximum SWE (mm)					
2010	99	119	122	405	486	325
2011	93	112	166	251	301	238
2012	161	193	217	262	314	217
2013	108	130	179	190	228	383
2014	100	120	158	275	330	325
2015	110	132	145	N/A	N/A	161
2016	140	168	180	257	308	361
2017	117	140	110	244	293	280
2018	109	131	127	219	263	385
2019	72	86	68	200	240	446
2020	199	239	222	431	517	451
Average	**119**	**143**	**154**	**286**	**343**	**323**

The unusually large snowpacks were followed by a wet summer in 2020, with the sixth highest May-September total precipitation on record at the Mayo climate station, placing it in the 90th percentile. Overall, the 2020 water year received 40% more precipitation than the 1991-2019 average, with double the normal precipitation in November 2019, June and July 2020 (Table 2.1-5).

The maximum 24-hour rainfall totals recorded at the Project site in 2020 were 44 mm on July 11, 2020 at the Camp station and 19 mm at the Potato Hills station. While Potato Hills is located at a much higher elevation (1,420 m) than the Camp climate station (782 m), and typically, rainfall is enhanced due to orographic gradients, the relatively low value at the higher elevation suggests that the rainfall event was highly localized and that some of the high-magnitude rainfall events result in the distribution of rainfall depths that don't correspond to the long-term pattern. For example, the July 2020 event resulted in a 24-hour rainfall depth less than half of that recorded at the Camp station. With over ten years of site data collection and a longer term regional data set to develop 24-hour recurrence data, these totals approximately represent the estimated 50-year (42 mm), and approximately half the 2-year (37 mm) 24-hour storms for the Camp and the Potato Hills stations, respectively.

Table 2.1-5:
Monthly precipitation comparison for
Mayo A station – normal vs. 2019-2020 water year.

Year	Month	Mayo A (2019-2020)	Mayo A - Average	Mayo A - Percent of Average
		Precipitation (mm)		
2019	Oct	22.9	24.9	-8%
2019	Nov	47.2	22.6	109%
2019	Dec	31.5	20.1	57%
2020	Jan	26.2	18.2	44%
2020	Feb	23	11.9	94%
2020	Mar	13	10.5	23%
2020	Apr	12.3	8.7	42%
2020	May	12.6	21.9	-42%
2020	Jun	83.3	42.2	97%
2020	Jul	109.7	54.7	100%
2020	Aug	54.9	52.6	4%
2020	Sep	23.7	39.3	-40%
Annual		**460.3**	**327.6**	**40%**

The precipitation received by the Project site over the course of the 2020 water year resulted in much higher than average streamflows at all monitored stations, characterized by a large freshet followed and by frequent high-flow events driven by episodic rainfall throughout the summer (Figure 2.1-2). Modelled annual runoff was 122% to 239% higher than that modelled for 2019 (Table 2.1-6).

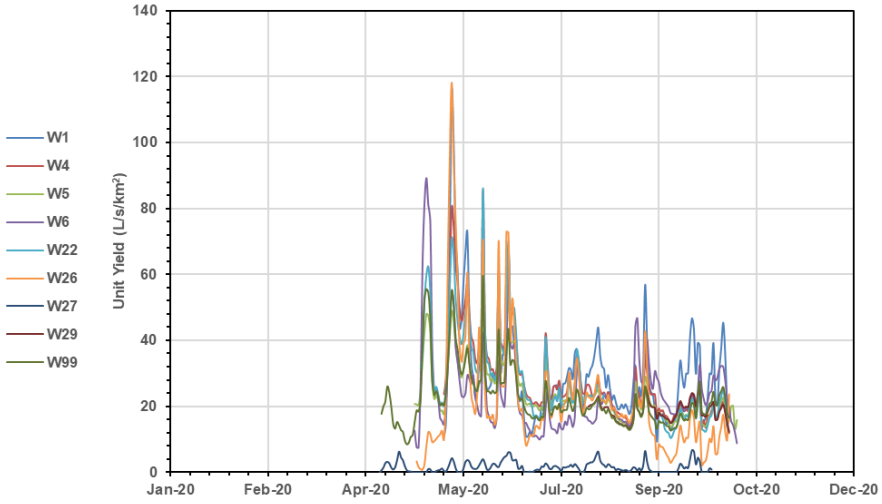

Figure 2.1-2: Daily average unit yields for the Eagle Gold hydrometric stations (2020).

Table 2.1-6:
Comparison of 2019 and 2020 modelled runoff for Project site catchments.

Basin	Median Basin Elevation (m)	Area (km^2)	2019 Annual Runoff (mm)	2020 Annual Runoff (mm)	% Change MAR From 2019 WBM
Upper Dublin Gulch (W1)	1,303	6.8	187	415	122%
Stewart Gulch (W26)[1]	1,183	1.4	172	395	130%
Haggart Ck u/s Dublin Gulch (W22)	1,113	66.8	148	409	176%
Haggart Ck d/s Dublin Gulch (W4)	1,125	76.9	149	405	172%
Lynx Ck u/s Haggart Ck (W6)	1,049	100.9	113	383	239%

2.1.2 Site-wide WBM Approach and Assumptions

This section presents the inputs and assumptions employed in the assembly, calibration and running of the site-wide WBM. At a high-level, the WBM produces outputs of daily discharge values for Project site stations based on the currently licensed mine plan and water management activities associated with the Project. To capture the highly dynamic nature of streamflows and water management activities at the Project site, the WBM is run on a daily time-step and flow outputs from the WBM are output at a monthly time-step.

The watershed model architecture is driven by a daily climate time-series input. The WBM is configured to include all relevant Project infrastructure, including the HLF, open pit, WRSAs, 90-day ore stockpiles, and water management infrastructure (*e.g.*, sediment ponds, collection ditches, events pond, *etc*.). Within the Base Case module of the WBM, each mine component is spatially defined by year of the Project life, which allows the footprints (sub-catchments) and /or volumes of each component to expand as the mine development progresses. Each sub-catchment represents a single land cover type (*e.g.*, WRSA, open pit, natural ground, *etc*.)

The natural catchment runoff module of the WBM generates estimates of streamflow from climate data using a watershed modeling approach. The architecture of the watershed model is predicated on the concept that streamflow is comprised of three components: quickflow, interflow and baseflow (Maidment, 1993). The natural catchment WBM was assembled using three reservoirs to represent these components (Section 2.1.4), and the factors governing the rates at which these reservoirs fill via precipitation and snowmelt were varied by basin and/or mine component type (*e.g.,* natural ground, WRSAs, open pit). This foundational WBM architecture is used consistently within each natural watershed of mine sub-watershed to convert meteoric water into runoff based on sub-watersheds

characteristics (*e.g.*, elevation, surface type, water management infrastructure). The delineation of mine area sub-catchments is covered in detail in Section 2.1.4.

Modelled flows for each sub-catchment are routed to the next downstream node depending on water management practices or natural catchment topography, as applicable. This allows the predicted flows to be derived for any sub-watershed in the WBM, or aggregated and reported for a collection point of interest (*e.g.*, sediment collection pond discharge, or receiving environment node). This approach also allows concentrations and loads of water quality parameter to be tracked for each sub-catchment and mine component, and balanced at each successive downstream node.

All mine facilities are assumed to be developed according to the development schedules and timelines set out in Sections 2.1.3 and 2.1.8.

The HLF water balance model described in Forte (2020) forms a sub-component of the site-wide water balance model, and the climate data inputs and assumptions are notably consistent between the two models to ensure discrepancies are not introduced by differing architecture or inputs. Integration of the HLF WBM outputs is described in further detail in Section 2.1.6.

2.1.3 Mine Area Catchment Delineation

In order to generate predictions of water volume from a climate driven watershed model, effective precipitation and evapotranspiration depths must be multiplied by drainage area at each time-step. This required the delineation of all mine affected and adjacent natural catchment areas, for each year of mine life. The resultant delineated sub-catchments are presented for each year of mine life in Figure 2.1-7 through Figure 2.1-15.

Annual areas for all sub-catchments are presented for natural areas (Table 2.1-7), open pits (Table 2.1-8), WRSAs (Table 2.1-9), other mine infrastructure (Table 2.1-10), and the HLF (Table 2.1-11). Hypsometric curves were calculated for each catchment and used to determine the median elevation within each basin/sub-catchment, which formed the elevation target for orographic scaling of the climate inputs.

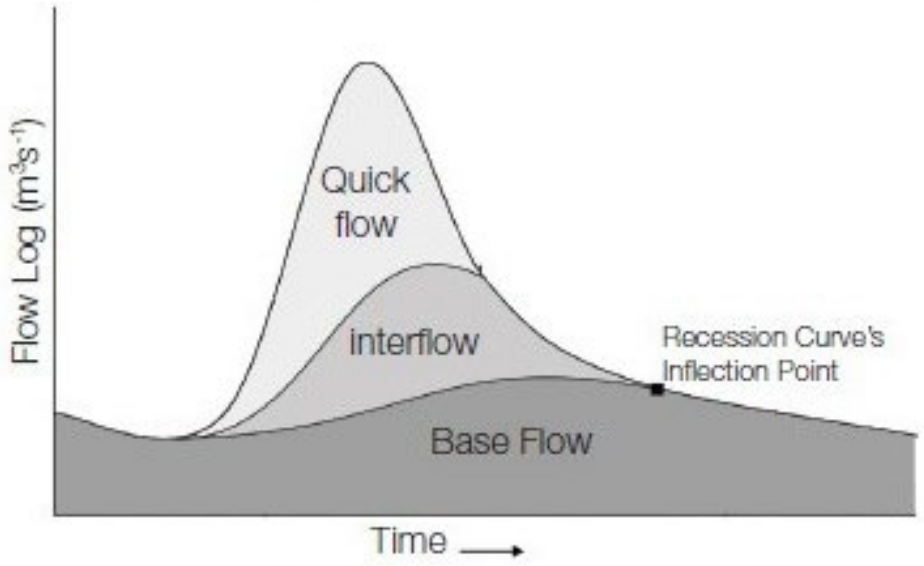
2.1.4 Natural Catchment Watershed Model

The streamflow regime at the Project site is highly variable, with multiple peak flow events common place throughout the year, driven by an initial freshet and following convective rainfall events in the summer. Significant volumes of water can report to local tributaries in the span of 2 days yet may subsequently be followed by prolonged dry periods where



surface flows diminish to the point where groundwater discharge is the main driver of streamflow.

As the open water season progresses, active layer melt contributes increasing amounts of discharge to local creeks, which is expressed as an increasing low flow signature throughout the summer. Finally, average winter temperatures are well below zero, and surface flow in all local watersheds is reduced to zero as the stream channels freeze-up during winter. In winter, the only moving water at the site is generated by discharging groundwater, which will freeze in laminae (aufeis) as cold conditions progress. This icing phenomenon continues throughout the winter, and results in ice sheets that greatly exceed the existing channel width. A customized site-wide water balance model was constructed in the GoldSim modeling environment to allow the Project site streamflow regime to be accurately replicated.

Figure 2.1-16 shows the commonly accepted components of streamflow with surface volumes of water reporting from with one of three signatures:

- Quick flow – generated by storm or snowmelt events and often resulting in peak flow events. For the Project site tributaries, water contributed via this mechanism may report to creeks in less than 2 days time;
- Interflow – this refers to the lateral movement of infiltrated meteoric water through the shallow overburden to the stream channel. Flow reporting to creeks along this pathway is often referred to as vadose or unsaturated zone flow, and comprises a significant component of the total flow within some of the tributaries reporting to Dublin Gulch; and,
- Baseflow – the portion of surface flow derived from groundwater discharge. At the Project site, this composes the majority of streamflow during summer low flow periods and through the winter season.

The watershed model assembled to replicate the streamflow regime at the Project site incorporates this understanding of streamflow composition and response directly into the model architecture. Accordingly, surface runoff, baseflow, snowfall/melt processes and aufeis production from winter baseflow are all represented in the site-wide WBM, which is a modified version of the Birkenes model. This model was developed as part of a research program to understand linkages between stream chemistry and flow in a small (< 1 km^2) catchment in southern Norway (*e.g.,* Christophersen and Seip, 1982; Seip *et al*., 1985; Stone and Seip, 1989). The modelling approach is depicted as a conceptual diagram in Figure 2.1-17.

Figure 2.1-12: Conceptual hydrograph showing runoff partitioning.

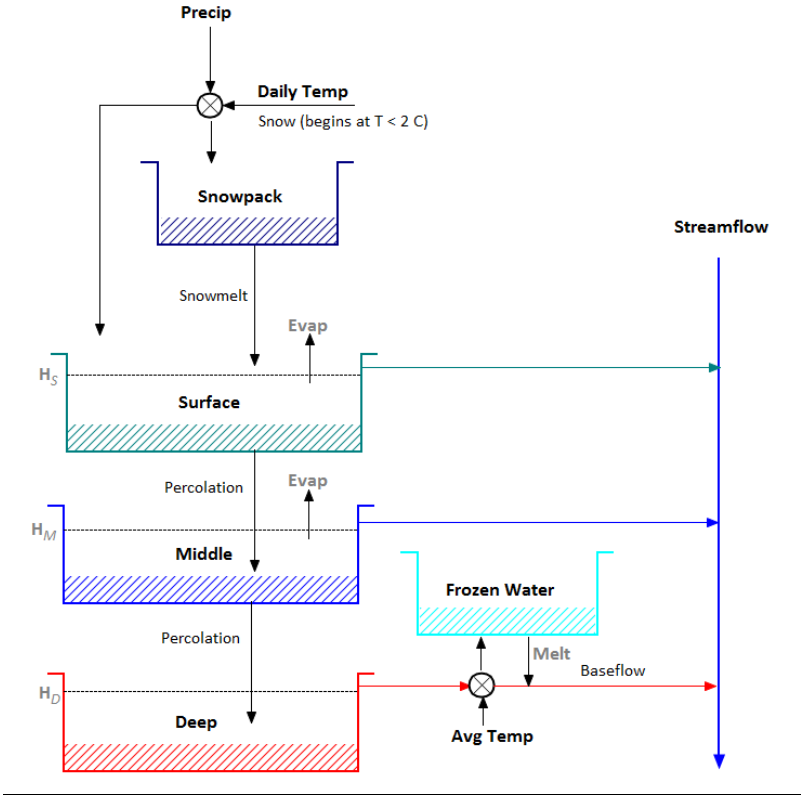

Figure 2.1-13: Schematic presenting an overview of the three-reservoir water balance model in conceptual format

Conceptually, incoming precipitation is partitioned in the WBM to rain or a snow reservoir based on air temperature thresholds. As shown in Figure 2.1-17, all precipitation falls as snow at -2°C and rain at +2°C, with the proportions of each changing linearly between these thresholds. Rainfall and snowmelt are directed into the Surface reservoir, which represents a layer of fast runoff response, which lies above a slower-draining Middle soil layer. Fast and slow surface recession flow from these two surface storage reservoirs can go directly to surface discharge, or to the Deep reservoir, depending on the fraction of remaining available storage in the latter. Figure 2.1-17 shows that when the Deep reservoir fills, slow recession flow from the reservoir reports to baseflow (and fractionally to aufeis in winter). Where aufeis has been modelled (based on air temperature) to freeze completely during the winter months, streamflow is zero. In the model, evaporation is withdrawn from both surface reservoirs (Fast and Slow), and from the Deep reservoir but at a lower rate. The deepest water in the Deep reservoir is protected from evaporation and provides a source for winter baseflow. Only when both the Fast and Slow surface reservoirs are empty may evaporation occur from the Deep reservoir, and at a much-reduced rate, which is calibrated uniquely by watershed. Finally, snowmelt and melting of aufeis are indexed to the rolling 7-day average air temperature. Aufeis is assumed to melt at 10% of the snowmelt rate, due to its higher density and location in the shaded valley bottoms.

2.1.5 Validation of Watershed Model With Monitoring Data

Following the update of the measured streamflow time-series to include data collected in 2020, a verification exercise was conducted to ensure that the water balance model inputs were still adequately representing site conditions. As outlined in Section 2.1.1, the model was updated to a watershed model that has been calibrated to measured flow data collected at site monitoring locations that span a wide variety of catchment types and sizes. These catchments include those that are reflective of the receiving environment in Haggart Creek and are therefore largely unimpacted by mining activities (*e.g.*, W4), and catchments that are located within the mine site (*e.g.*, Ann Gulch).

In most cases, the measured streamflow records cover the open water season from May to October, with May generally showing incomplete data due to extensive channel icing conditions. Therefore, depending on the availability of data for May at each station, it is expected that the measured runoff will be less than the model input. The winter flow data for November to April, where available, are based on monthly averages of manual measurements that are made concurrent with the water quality sampling trips.

Figure 2.1-18 to Figure 2.1-22 present the results of the verification exercise and compare measured and model runoff from key locations within the Haggart Creek, Dublin Gulch and Lynx Creek catchments. Overall, the model outputs replicate the monthly distribution

of runoff well, however it is notable that modelled runoff is lower than measured runoff in May, October and November, and higher in June at W1 and W4, and lower in May only at W5 and W22. Given that the measured record spans from 9 to 15 years, and that many of the monthly averages calculated from this record are based on incomplete records (*e.g.*, May, when average monthly measured runoff underestimates actual runoff), the updated watershed model is thought to best represent the long-term average runoff conditions at site. For several of the smaller watersheds (*e.g.*, Stewart Gulch, Eagle Pup and Suttles Gulch), the modelled runoff is notably higher than measured values (Table 2.1-11). The higher modelled runoff values are supported by the stream chemistry, and it is likely that the measured runoff is underestimated relative to actual values due to gauge bypass through alluvial sediments at the confluence with Dublin Gulch. Model calibration continues to improve over time as additional monitoring data become available and understanding of the relevant processes evolves.

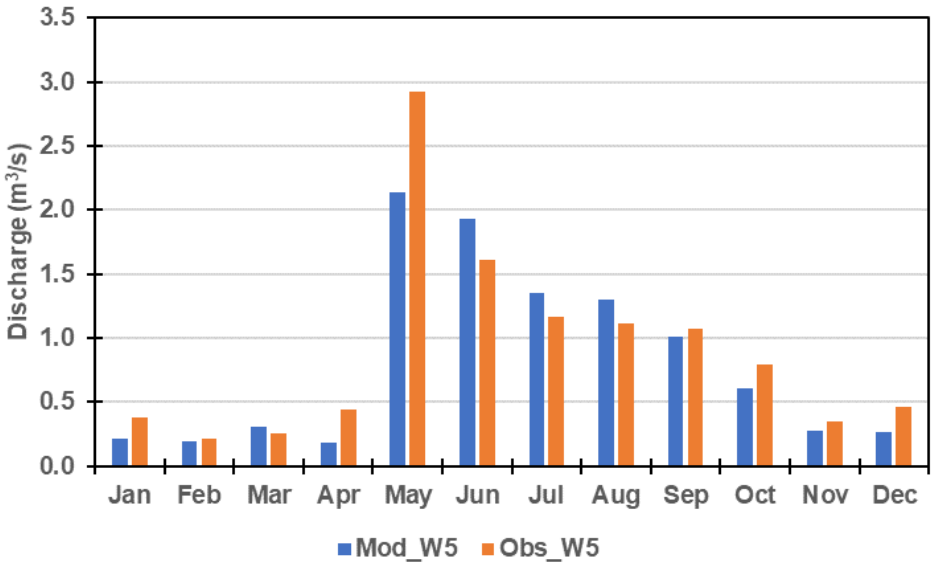

Figure 2.1-17: Measured and modelled runoff for the W5 station (Haggart Creek (immediately upstream of confluence with Lynx Creek).

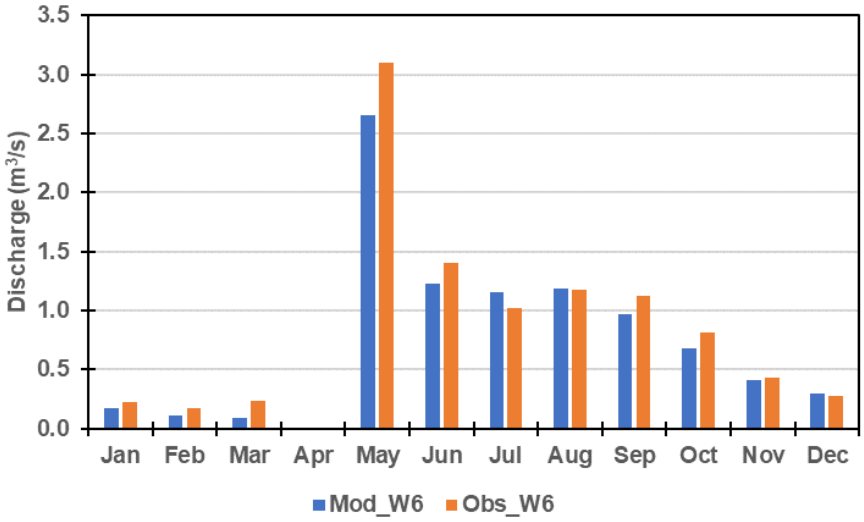

Figure 2.1-18: Measured and modelled runoff for the W6 station (Lynx Creek upstream of Haggart Creek).

2.1.6 Heap Leach Facility Water Balance Model Updates

The GoldSim HLF model was completed by Forte Dynamics and is compatible with the current daily WBM created by Lorax. The Forte Dynamics HLF model uses the same climate inputs as described in Section 2.1.1 to match the Lorax site-wide GoldSim model. The make up water and drain down discharge water were incorporated similar to the 2019 model. Make up water is drawn from the Event Pond from 2019-2027 (2019-2020 make up is based on actual reported pumping from site). Barren solution is drawn from the HLF

starting soon after stacking is completed in 2027 and continues to treatment until draindown is complete. Using the EQS discharge limits to represent treated discharge to Haggart Creek results in a draindown period spanning 2031-2051 (Yr-13 to Yr-33) inclusive.

2.1.7 Groundwater Model Updates

The site-wide groundwater model has been updated to include the following flows:

- Pit wall depressurization (updated values from 2019)
- Platinum Gulch WRSA underdrain (new)
- Eagle Pup WRSA underdrain (new)
- Vault flow under the HLF (new)

Pit wall depressurization was adjusted to match observed 2020 flows and the new underdrain and vault flows were added. The HLF vault flow is documented; 2020 flow rates were supplemented by the groundwater model predictions for the life of mine.

2.1.8 Mine Infrastructure

In addition to the specific mine infrastructure described below, the WB/WQM includes assumptions for camp potable water requirements and dust control water requirements that remain consistent with updates described in the 2018 WB/WQM update (Lorax 2018).

2.1.8.1 Waste Rock Storage Area Progression and Assumptions

Waste rock storage facility placement phasing for Eagle Pup and Platinum Gulch are presented by year in Table 2.1-12. The WB/WQM assumes that the Platinum Gulch WRSA is covered at the end of 2023. Prior to cover placement, basal seepage from this facility is predicted to range from 47% to 54% of MAP, dropping to 34% after the cover is in place. Similarly, the Eagle Pup WRSA is scheduled to be covered at the end of 2029 (Yr-11), with a comparable decrease in the proportion of MAP reporting as basal seepage.

The proportion of runoff versus infiltration for the WRSAs during operations was carried over from the 2014 WUL application model, with notable changes indicated below. This proportion is characterized as the percent of net precipitation minus AET losses:

- Operations (until closure covers are assumed to be effective):
    - WRSAs – small runoff fraction during freshet; otherwise 100% of net precipitation (*e.g.*, total precipitation minus evaporation)

- HLF – 100% of net precipitation assumed to infiltrate (consistent with the 2014 model).

- Closure (once closure covers are assumed to be effective):
  - WRSAs – A 40% reduction wastargeted for infiltration to the WRSAs, with approximately 10% modelled as surface runoff from the cover.
    - Platinum Gulch WRSA – closure cover effective as of in the end of Year 5;
    - Eagle Pup WRSA – closure cover effective as of in the end of Yr-11, and;
    - HLF –fully reclaimed (960,000 m^2) as of in the end of Yr-13; the cover is assumed to reduce net infiltration by 60%

Water that infiltrates the WRSAs experiences a slower recession flow which results in a 1-month lag time (on average) before that water reports to the collection pond (LDSP). This attenuated hydrograph mimics the influence of water retention within the pore spaces of the WRSA, and the slower release of water than would be seen in a natural catchment with thinner overburden cover.

Table 2.1-12:
Waste Rock Storage Areas Tonnages and Surface Area by Year

Facility	Waste Type	2019 Yr-1	2020 Yr-2	2021 Yr-3	2022 Yr-4	2023 Yr-5	2024 Yr-6	2025 Yr-7	2026 Yr-8	2027 Yr-9
Eagle Pup WRSA	Mass incremental (Mt)	0	0	8.8	18	20	11	7.7	9.6	13
	Mass cumulative (Mt)	0	0	8.8	26	46	58	65	75	88
	Area (ha)	0.0	0.0	8.4	19.5	41.8	53.1	65.9	77.3	77.3
Platinum Gulch WRSA	Mass incremental (Mt)	2.3	13	7.4						
	Mass cumulative (Mt)	2.3	15	22	22	22	22	22	22	22
	Area (ha)	8	30.5	38.1	38.1	38.1	38.1	38.1	38.1	38.1

2.1.8.2 Sediment Control Ponds

The LDSP serves as the primary contact water management pond for the Project throughout Operations, and all contact water from the Eagle Pup WRSA, 90-day ore stockpile, Open Pit and Platinum Gulch WRSA will be directed to this pond. The Platinum Gulch PTS will be constructed during the operations phase (2023) of the Project to serve as a trial passive treatment system (PTS). This PTS will continue in operation during the closure and post closure phases.

Using 2020 records from site the inflows from Ditch A and Ditch B to the LDSP were adjusted to match LDSP and Event Pond daily volumes. The model predicted flows in

Ditches A and B overestimate the net inflow to the LDSP when all outflows (pump to the Event Pond, pump to the HLF inheap pond, dust suppression and evaporation, *etc*.) are taken into consideration.

2.1.8.3 Event Pond

Event Pond volumes were calibrated in 2020 using reported water management and observed pond inflows where available. For 2021 there will be no available treatment for the removal of water from the LDSP or Event Pond; however, based on the 2020 calibration and expected flows for this year there is no anticipated unmanaged overflow from either pond expected. There may be periods (freshet in particular) when storage in the Event Pond encroaches on the desired available storage for short periods of time, but this should be manageable through the use of Event Pond water as make up water to the HLF.

2.1.8.4 Contact Water Ditches

A detailed description of contact water ditches and design parameter are presented in Victoria Gold (2020), but the summary of ditch locations, and the specific water sources reporting to the contact water ditches is presented below.

Ditch A

Ditch A collects contact water from the Platinum Gulch WRSA, 90-day stockpile and open pit, as well as non-contact water from Platinum Gulch, and routes it northwards to the LDSP.

Ditch B/Eagle Creek

Ditch B/Eagle Creek collects contact water from the Eagle Pup WRSA, as well as non-contact water from the Eagle Pup and Suttles Gulch drainage. This ditch is generally aligned with the natural Eagle Creek drainage and flows west from the northern end of the Eagle Pup WRSA to the LDSP.

Ditch C

Ditch C routes the LDSP outflow westward to Haggart Creek where it discharges just downstream of the confluence of Dublin Gulch. At closure, the mine plan routes HLF draindown water to the MWTP and is then discharged directly to Ditch C. At post-closure, HLF seepage water is directed to a PTS, which discharges directly to Haggart Creek immediately upstream of the confluence with Dublin Gulch.

2.2 Water Quality Model Inputs and Assumptions

The Eagle Gold Project water quality model (WQM) is a mass-conserving mixing model that predicts water quality for 38 parameters at key monitoring and compliance points in the receiving waters affected by mine activity. The model was designed on the GoldSim® platform and utilizes a GoldSim® water balance model (WBM). Both the WBM and the WQM use a daily time-step for 50 years, spanning operations, closure and several years into post-closure. Below is a brief description of water quality model inputs including seepage contact water source terms, Mine Water Treatment Plant (MWTP) and Passive Treatment Systems (PTS) effluent discharge requirements and background water quality for non-contact flows.

2.2.1 Seepage Contact Water – Geochemical Source Terms

The drainage chemistry from the various Eagle Gold mine facilities discussed herein is influenced by a variety of geochemical and physical aspects. Overarching controls that will govern the water quality associated with any facility that contains exposed waste rock and ore, include:

- Mineralogy and geochemistry of the exposed material;
- Grain size distribution;
- Water/rock ratio;
- Depositional environment (*e.g.*, saturated versus unsaturated conditions); and
- Temperature.

The rate at which minerals weather chemically in laboratory kinetic tests is typically observed to be many times faster than rates inferred from field observations of drainage from the toe of waste rock piles (Malmström, 2000). This discrepancy is in part due to the formation of distinct flow channels within the waste rock pile that results in the incomplete flushing of weathering products from the waste rock dump (Nichol *et al.*, 2005). An overview of the source term approach and results is presented in the following sections while a more detailed discussion of the source term model as well as the 2020 field kinetic (field barrel) test program is given in the Appendix A.

2.2.1.1 Waste Rock

The prediction of both the major and trace elemental geochemistry of waters in contact with the WRSAs was conducted by upscaling of loading rates derived from kinetic tests (humidity cells). A flow chart of the work stages involved in this exercise is given in Figure

2.2-1. Assumptions around the temporary (90 day) ore stockpile were not changed since the previous source term model iteration and as a result, this facility was not re-modelled within the scope of this work. Refer to Lorax (2020) for an overview of the operational source term predictions relating to stockpiled ore.

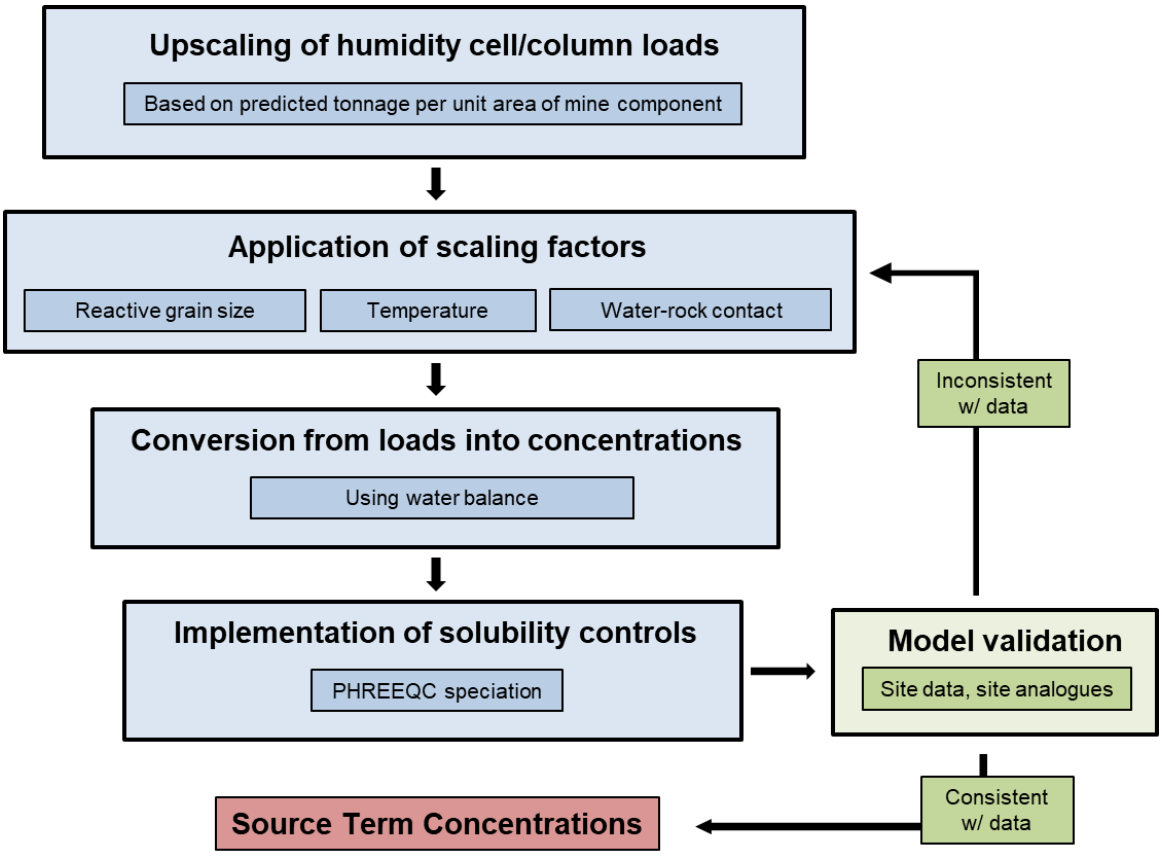

Figure 2.2-1: Work stages involved in the scaling of geochemical source terms

As a first step in the development of geochemical source terms, input solution chemistry needed to be defined. For this purpose, Eagle humidity cell leaching rates were derived from the data presented in SRK (2014) and were grouped to represent the various waste rock types expected to be disturbed during mining. Humidity cells used to produce these contact water model input solutions are listed in Table 2.2-1.

Table 2.2-1:
Summary of kinetic test cells used for the individual rock units modelled

Lithology/Material	Eagle Pit HC
Oxide GND	HC 5, HC 10
Fresh GND	HC 3, HC 9
Altered GND	HC 4, HC 6, HC 11
Oxide MSED	HC 8
Fresh MSED	HC 1, HC 2, HC 8, HC 13
Overburden (OB)	HC 10

Two different scenarios are presented for the WRSA and pit wall source terms; an operational and a post-closure scenario. More specifically, for the operational scenario, the 75th percentile of all available humidity cell leachates for a given species were used as the model input solution. In contrast, to model longer term ("stable") geochemical loading rates, the 75th percentile loading rates of the last three humidity cell cycles (weeks) with metal analysis were utilized to produce a solution input, assuming geochemical reaction rates reach a steady-steady state after soluble minerals have been flushed. Note that for the derivation of the model pH, the respective median value was used for operational and post-closure scenarios. Table 2.2-2 provides an overview of the input solution chemistries used for all Eagle Gold waste rock facilities.

Once the input solution chemistry is defined, the geochemical loads are upscaled to match the tonnage of the mine facility in question. Current estimates of mine tonnage stored in WRSAs, ore stockpile and HLF were provided by VGC. The waste production schedule and pit wall exposures used for this assessment are given in Table 2.2-3 and Table 2.2-4.

While the rock mass of the described mine components can be easily translated from the waste production schedule, the derivation of reactive rock mass within the exposed pit walls is less straightforward. The final pit walls are expected to be fractured as a result of blasting operations. Controlled blasting of rock does not completely eliminate fracturing of underlying rock but results in a blast-damaged transition zone extending into the pit walls. This blast-damaged transition zone comprises a blast-fractured zone and a blast-influenced zone that would be subject to oxidative weathering. The penetration depth of the blast-damaged zones into the wall rock is dependent on a variety of parameters. Hustrulid (1999) estimated ranges of 0.85 to 1.05 m and 2.65 to 3.15 m for the blast-fractured and the blast-influenced zones, respectively. For modelling purposes thicknesses of 1.0 and 3.0 m were chosen for the blast-fractured and the blast-influenced zones, respectively. Using a bulk density of 2.5 t/m^3 along with the annual surface areas broken out into waste rock type, these thicknesses were subsequently used to calculate a rock mass that will come in contact with the pit walls.

Table 2.2-2:
Composite input loads (mg/kg/wk) used for the different model scenarios in Eagle Gold waste rock facilities

Scenario	Operational (75th percentile)						Post-Closure (75th percentile)

Owing to several lab-to-field comparison studies it has been recognized that drainage chemistry predictions based on direct mass upscaling often strongly overestimate the quantities of dissolved solids that are in fact leached from the mine rock (Malmström et al., 2000; Sapsford *et al*., 2009; Plante *et al.,* 2014; Kirchner & Mattson, 2015). This is due to a variety of differences between lab and field conditions such as climate, water/rock ratios, hydrogeological pathways, grain size distribution and secondary mineral controls, all of which act to reduce geochemical loads per mass contacted in the field. As a result, it is the industry standard to implement scaling factors when upscaling humidity cell leachate results to account for these discrepancies. For the Eagle Gold project source term model, scaling factors were specifically applied to correct for the following parameters:

- Temperature
- Grain size
- Water/rock ratio.

The background theory and rationale leading to the definition of these scaling factors is described in detail in Appendix A.

Water/rock ratios in humidity cell testing are generally high enough to prevent the saturation of leachates with respect to secondary mineral phases. Upscaling of geochemical loads as described above is generally carried out with no consideration given to mineral phases that may limit the dissolved concentrations of relatively insoluble elements such as Fe and Al, particularly at circum-neutral pH. In order to avoid the prediction of unrealistically high concentrations for species that are known to form secondary phases in mine drainage, PHREEQC - a thermodynamic mineral solubility model (Parkhurst and Appelo, 1999) - was employed on the upscaled model output concentrations to account for mineral solubility controls. As part of this modelling step, minerals commonly seen in mine drainage were allowed to precipitate from the predicted drainage solutions. An overview of the modelled phases is given in Table 2.2-5. Phases that were identified to be supersaturated in at least one output solution draining from the individual mine components are indicated by a check mark. Unmarked phases merely served as a theoretical concentration cap but do not affect the corresponding species.

Table 2.2-5:
Mineral phase allowed to precipitate in the Eagle Gold speciation model (PHREEQC)

Mineral	Ideal Formula	Eagle Pup WRSA	Platinum Gulch WRSA	Stewart Gulch WRSA	Pit walls
Barite	$BaSO_4$	✓	✓	✓	✓
Calcite	$CaCO_3$	✓	✓	✓	✓
Dolomite	$(Ca, Mg)(CO_3)_2$			✓	
Ferrihydrite	$Fe(OH)_3(a)$	✓	✓	✓	✓
Gibbsite	$Al(OH)_3$	✓	✓	✓	✓
Gypsum	$CaSO_4*2H_2O$				
Malachite	$CuCO_3$				
Quartz	SiO_2	✓	✓	✓	✓
Rhodochrosite	$MnCO_3$				
Smithsonite	$ZnCO_3$				

Notes: Phases with a check mark did in fact precipitate in the source term model output solutions.

In contrast to solutes that were capped via PHREEQC modelling, the comparison of the model output with the field barrel database revealed that some source term predictions may also be unrealistically low. This is interpreted to be an artifact of uncertainties relating to the scaling exercise and/or flow predictions. To maintain conservatism, a concentration minimum was implemented for each based on long-term field barrel data preceding the re-construction of the field barrel experiments in 2020 (Appendix A). The resulting predicted minimum concentrations are summarized in Table 2.2-6. Note that these values were imposed equally for every model year and into post-closure.

Another adjustment made to the upscaled loads is the derivation of selenium concentrations. Kinetic test data suggest that Se is strongly correlated with dissolved sulphate and is interpreted to be mineralogically associated with sulphur in both sulphate and sulphide minerals. For predictions made based on humidity cell upscaling, Se concentrations were modelled as a function of the sulphate concentration using Se/SO_4 ratios observed in the individual field barrels and proportioned according to rock type expected in a given mine year.

2.2.1.2 Nitrogen Source Term Derivation

Nitrogen based blasting reagents have been identified by Pommen (1983) as a source of nitrogen compounds from surface mining operations. The nitrogen compounds ammonia (NH_3) and nitrate (NO_3) are constituents of the explosives, while nitrite (NO_2) is typically an intermediate oxidation product of ammonia. The release of nitrogen compounds from blasting reagents can occur within the pit during mining operations and from residual

reagents stored within blasted rock. The release of nitrogen from explosives loaded in boreholes and from explosive residue on blasted rock surfaces occurs by dissolution of nitrogen compounds into water and subsequent aqueous transport to the downstream receiving environment.

A detailed discussion of the Eagle Gold nitrogen-specific source term assumptions and results was presented in Lorax (2014a). For this iteration, no changes to this approach were made and the nitrogen source terms are unchanged; the reader is referred to Lorax (2014a) for an overview of these results.

2.2.1.3 Heap Leach Facility

Prediction of the HLF drainage chemistry during operations and in post-closure (draindown phase and in the long-term) relied heavily on metallurgical column experiments as well as existing full-scale site-specific and site analogue data from the Brewery Creek Mine. It is anticipated that the operational and early post-closure HLF drainage chemistry will be governed by the effects of residual cyanide and its degradation products.

A barren solution source term was generated in support of the water quality model and treatment considerations during operations. Early-stage, full-scale barren solution data for the operating Eagle Gold mine was provided by VGC (Wilbur, 2020) and was reviewed by Lorax. Barren solution data from February 07, 2020 was used as the basis for the calculation of the geochemical source term however, due to these data representing an early-stage barren solution chemistry that will likely evolve over time as this water is being re-circulated, the following adjustments were made:

- A re-circulation factor was incorporated to account for the accumulation and attenuation of geochemical loads as the barren solution is recycled. This factor was derived based on observations from the metallurgical column testing over time. It was calculated as follows:

$$\text{Recirculation Factor} = \frac{\text{Median column concentration (cycles 2–4)}}{\text{Median column concentration (last 3 cycles)}}$$

- Several species that are required for the site-wide water quality model were not determined as part of the operational barren solution analysis. Predictions for these species were quantified either based on site analogue data (Brewery Creek), from the leach phase of the Eagle Gold metallurgical columns or based on expected operational concentrations provided by VGC.

Two periods were modelled for the post-closure HLF drainage chemistry, namely an early draindown and a long-term period. For each of these temporal predictions, a base and an upper case were modelled, such that a total of four source terms were generated. The HLF

source term model relied predominantly on data from metallurgical columns as well as Brewery Creek water quality monitoring (Viceroy Minerals, 2003; Alexco, 2012; SRK, 2014, Harrington, pers. comm., 2014). Specifically, for most species back-calculated scaling factors derived from the Brewery Creek HLF water quality monitoring with Brewery Creek metallurgical columns were applied to the metallurgical column data (post Au-leach and detox phase) available for Eagle Pit ore.

For the two temporal scenarios, base case scaling factors were calculated using Brewery Creek data as follows:

- Early draindown: $\text{Scaling Factor} = \frac{\text{Median HLF concentration (draindown)}}{\text{Median column concentration}}$
- Long-term: $\text{Scaling Factor} = \frac{\text{Median HLF concentration (long-term)}}{\text{Median column concentration}}$

For the upper case, the same general approach was employed, however instead of the median HLF monitoring data, the maximum observed concentrations were considered. The Brewery Creek HLF drainage databases used for this exercise include the following:

- Early draindown: Monitoring data from station BC-28a in in year 2002 (draindown)
- Long-Term: Monitoring data from station BC-28a in in years 2006-2012.

Note that no geochemical data was available for a number of solutes in the Brewery Creek metallurgical column dataset. Therefore, a subset of element-specific scaling factors were adopted from solutes where data was available based on the type of solute (major ions, minor/trace element, oxyanions). These scaling factors were then multiplied with the median concentrations produced by the Eagle Pit metallurgical columns after detoxification.

For CN and other N species (NH_3, NO_2, NO_3), scaling factors were not extrapolated, but rather median and maximum concentrations of these species from the Brewery Creek HLF monitoring database were used directly for the base and upper cases, respectively.

Lastly, in order to not produce unrealistically high source term predictions through uncertainties in scaling of metallurgical columns, concentrations caps were imposed. To maintain conservatism, these caps were calculated as 3 x the maximum water quality monitoring result from the Brewery Creek site (BC-28a) for a given species.

2.2.1.4 Results

One of the key underlying assumptions with respect to WRSA and pit wall drainage chemistry is that PAG material is sufficiently sparse, evenly distributed and/or adequately managed to prevent the onset of acidic conditions. Therefore, all geochemical source terms

generated as part of this document are assumed to remain circum-neutral in the long-term with pH values expected to fall around 8.0 based on observations from the field barrel program.

Model results are shown as time-series plots for the parameters of concern (As, Sb, Se, and SO_4) in Figure 2.2-2 and Figure 2.2-3. Full source term predictions for waste rock, pit walls and HLF is provided in Appendix A. The relatively large range in the values within a scenario and mine component presented can be explained by the proportion of surfaces rinsed in response to seasonally variable flow rates and the consideration of temperature effects. Where seasonal variability is minor (*e.g.,* As in Eagle open pit), predictions are dominated by calibration with field barrel results. The last year of the plotted drainage quality predictions represent post-closure conditions and are imported in the water quality model repeatedly on an annual basis.

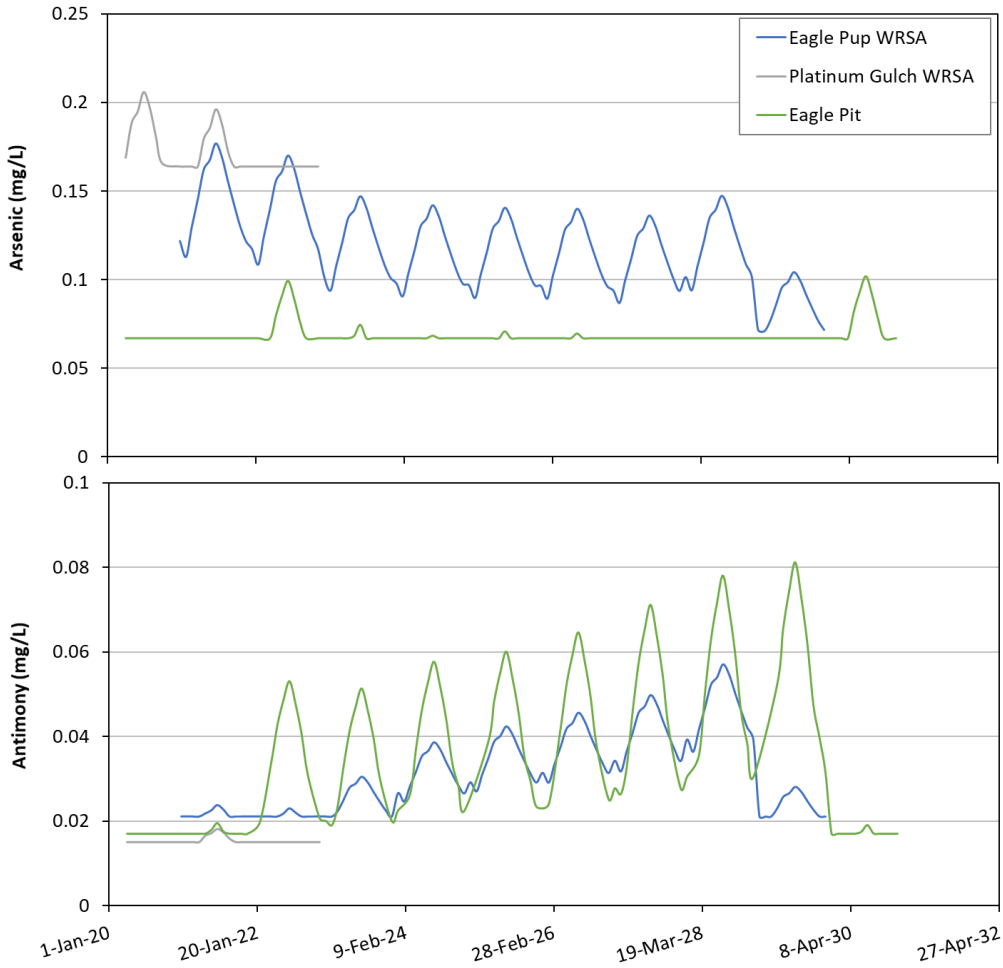

Figure 2.2-2: Source term predictions for the different Eagle Gold mine components for As and Sb

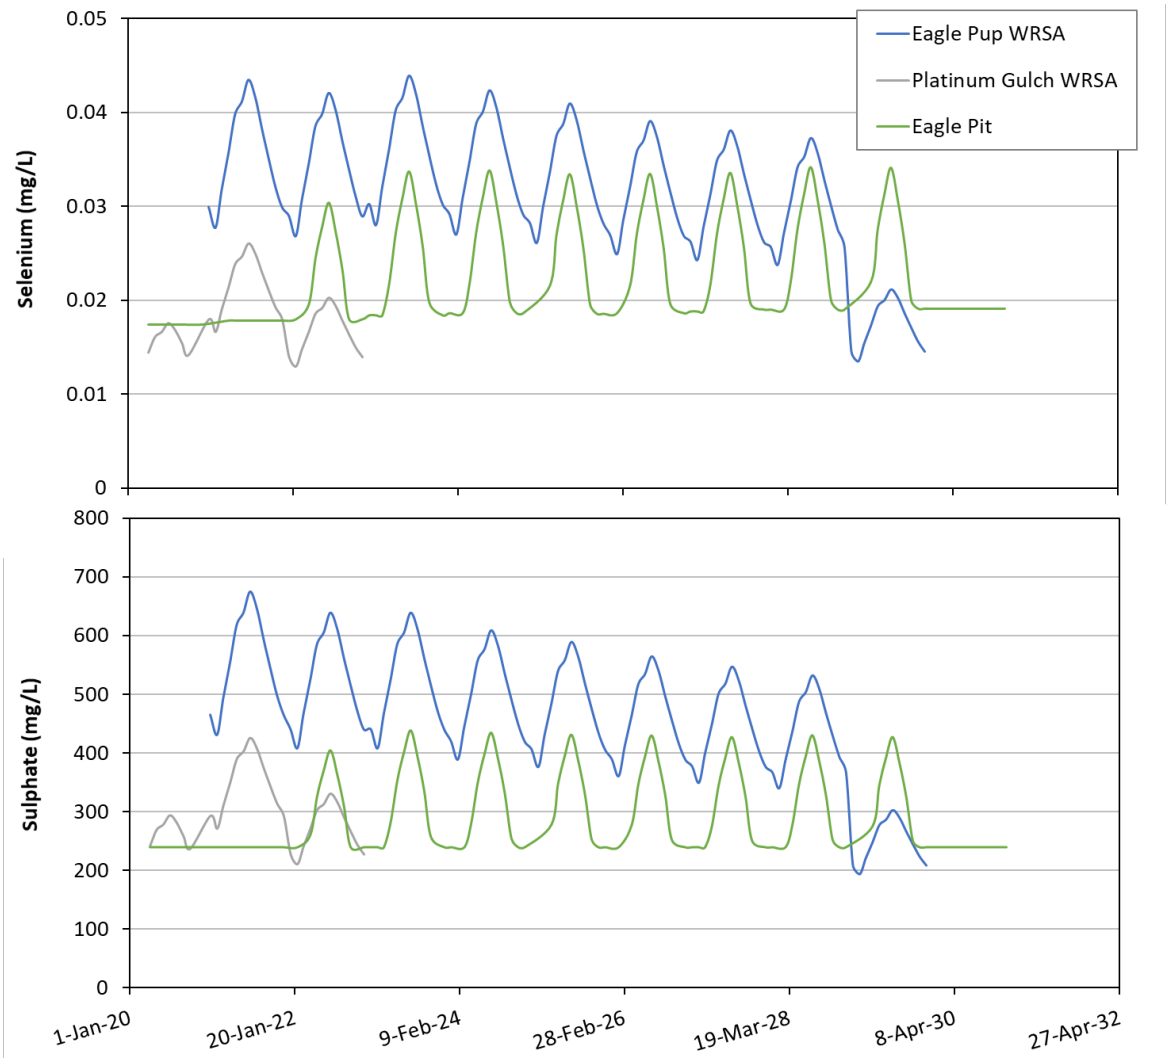

Figure 2.2-3: Source term predictions for the different Eagle Gold mine components for Se and sulphate

Source term concentrations predicted for the HLF are summarized in Table 2.2-7.

2.2.2 MWTP and PTS Effluent Quality Standards

Effluent quality standards (EQS) were set during the Water Use License process for the MWTP during operations and PTS for the closure phase (Table 2.2-8). The EQS values are specified in QZ14-041-1 (Part F; clause 108). The effluent quality standards for each component are utilized in the model representing treatment flows and chemistry.

During the Water Use License application process, it was agreed upon by all parties that the Project would be required to go through additional evaluation to support establishment of final effluent quality standards for the closure phase. As a conservative approach to closure and post closure water quality modeling, it has been assumed that the higher discharge criteria initially proposed by VGC would represent the effluent quality discharge. It is understood that continued modeling and eventual field trials of passive treatment systems for the Project will be undertaken by VGC to support the planned final reclamation and licencing for the closure plan of the Project.

Table 2.2-8:
MWTP and PTS Effluent Water Quality Used in Model

Parameter	*Effluent Quality Standards (mg/L)*
pH	6.5 to 8
TSS	15
Cl	250
SO_4	1850
Nitrate-N	19.5
Nitrite-N	0.12
NH_3-N	7.5
CN_{WAD}	0.03
Al (diss)	0.4
Sb	0.13
As	0.053
Cd	0.00125
Cu	0.026
Co	0.026
Fe	6.4
Pb	0.05
Hg	0.00008
Mn	7.7
Mo	0.45
Ni	0.5
Se	0.025
Ag	0.01
U	0.09
Zn	0.23

The MWTP is assumed to discharge at or below the effluent quality standard (EQS) that defines dischargeable water in the WUL. The expectation is that actual treatment performance will exceed (be better than) the EQS. Maximum treatment flow rates are assumed to be:

- 2022-2027: 8,500 m^3/day
- 2027-draindown completion: 13,900 m^3/day

Daily discharge rates may be at or below the prescribed maximum rates depending on flow conditions in the receiver (assimilative capacity considerations) or the need to remove water from the system to maintain desired storage in the LDSP and the Event Pond.

2.2.3 Background Water Quality Inputs

Background flows and water quality from runoff (*e.g.*, non-contact water) and background receiving environment water chemistry were fully characterized and included in the model. Water quality data collected from project area streams from 2007 to August 2017, prior to construction, were incorporated into the water quality baseline dataset.

2.2.4 Modeling Approach

Flows from background sources and mine facilities were taken directly from the daily flows generated by the WBM. Watershed model parameters that control runoff and infiltration rates were adjusted depending on catchment type; for flow through waste rock facilities the infiltration rates were adjusted to attenuate the flow within the waste rock pile in a manner consistent with observed waste rock seepage hydrographs from other sites.

Water quality parameters tracked by the model are listed in Table 2.2-9. Each parameter is treated as a conservative tracer which is mixed at model nodes (confluences) by the following equation:

$$C_r = \frac{\sum_i Q_i C_i}{\sum_i Q_i}$$

where C_r is the resultant concentration, $Q_i$are the source flows into the mixing point and $C_i$are the concentrations associated with the source flows. The only exceptions to this flow-weighted instantaneous mixing scheme are for the Lower Dublin South Pond (LDSP) and for the HLF event pond which are represented by constituent transport flow cells in GoldSim.

Table 2.2-9:

	Cu	Tl
	Fe	U
	Pb	V
	Mg	Zn

As previously indicated, the WQM simulates 50 years of mine life, beginning in operations and ending several years into post-closure. The model time step is daily, with concentrations reported as monthly averages. The three principal mine periods for reporting are:

1. Operations (Corresponds to mine–years 1 to 10) with LDSP treated in the MWTP; in Phase 5 the heap is rinsed during cyanide destruction;
2. Early Closure (Corresponds to mine–years 13 to 33): LDSP is decommissioned and the heap drain-down is controlled with the MTWP operating to treat heap seepage. Eagle Pup WRSA and Platinum Gulch WRSA seepage waters are passively treated (or actively, if required) before discharge to receiving waters;
3. Late Closure (Years 33+): Waste rock, pit overflow contact water and heap seepages are passively treated before discharge to receiving waters.

Source terms were developed for the median and 75th percentile case. To remain conservative, the discussion is based on the results of the 75th percentile source terms coupled with the median WBM flow scenario.

Water quality from mine discharge during operations is driven by the contact water reporting to the Lower Dublin South Pond. Contact water from the Eagle Pup and Platinum Gulch WRSAs, the temporary ore stockpile, and the sump water from the open pit all report to the LDSP at some point during operations. Excess water from the LDSP is treated through the MWTP to meet the effluent quality standards in Table 2.2-8 and discharged to Haggart Creek upstream of W4. Figure 2.2-10 and Figure 2.2-11 are schematic illustrations of the water balance and water quality model for mine year 3 and 10, respectively.

Beginning in years 9 and 33 respectively, the Platinum Gulch and Eagle Pup waste rock seeps are treated by the Platinum Gulch and LDSP passive treatment systems to meet the EQS Table 2.2-8. . During this time period (Phase 6), HLF drain-down water reports to the MWTP and is treated to meet discharge criteria as indicated in Table 2.2-8. Figure 2.2-12 illustrates the water balance conditions for mine year 15.

The late closure period begins with the decommissioning of the MWTP and the full application of passive treatment for all contact mine waters including pit overflow waters (year 33+). At this time, the HLF has little excess water to drain, and post-closure monthly discharge is driven largely by infiltration. After year 33, the HLF seep is treated solely through a PTS to values indicated in Table 2.2-8 (Figure 2.2-13).

The WQM provides monthly predictions of water quality at key locations in Haggart Creek, namely:

- W4 in Haggart Creek just downstream of the chief compliance point (*i.e.*, MWTP discharge);
- W29 in Haggart Creek downstream of all project influences;
- W99 in Haggart Creek downstream of all project influences; and
- W23 in Haggart Creek, immediately downstream of the confluence with Lynx Creek.

3. Water Quality Predictions

VICTORIA GOLD CORP

3. Water Quality Predictions

The results of the updated Water Balance Water Quality Model (WBM v6.1.2) are presented in this section. Results are presented in downstream order for four Haggart Creek EMSAMP monitoring stations W4, W29, W99 and W23 (Figure 3.1-1), for the main parameters of interest, namely As and Se. Time-series of all predicted parameters are provided in Appendix B of this report and all raw output data is provided in Appendix C (electronically).

3.1 Station W4 – Haggart Creek

Station W4 in Haggart Creek (Figure 3.1-1) is located just downstream of the primary effluent discharge location for the Eagle Gold Mine (*i.e.*, Ditch C discharge originating from LDSP Weir or MWTP). Water quality objectives for W4 were developed during the licensing process (Table 3.1-1) and were developed using the effluent quality standards specified in QZ14-041-1.

Table 3.1-1:
Water Quality Objectives for Haggart Creek at W4

All values as mg/L

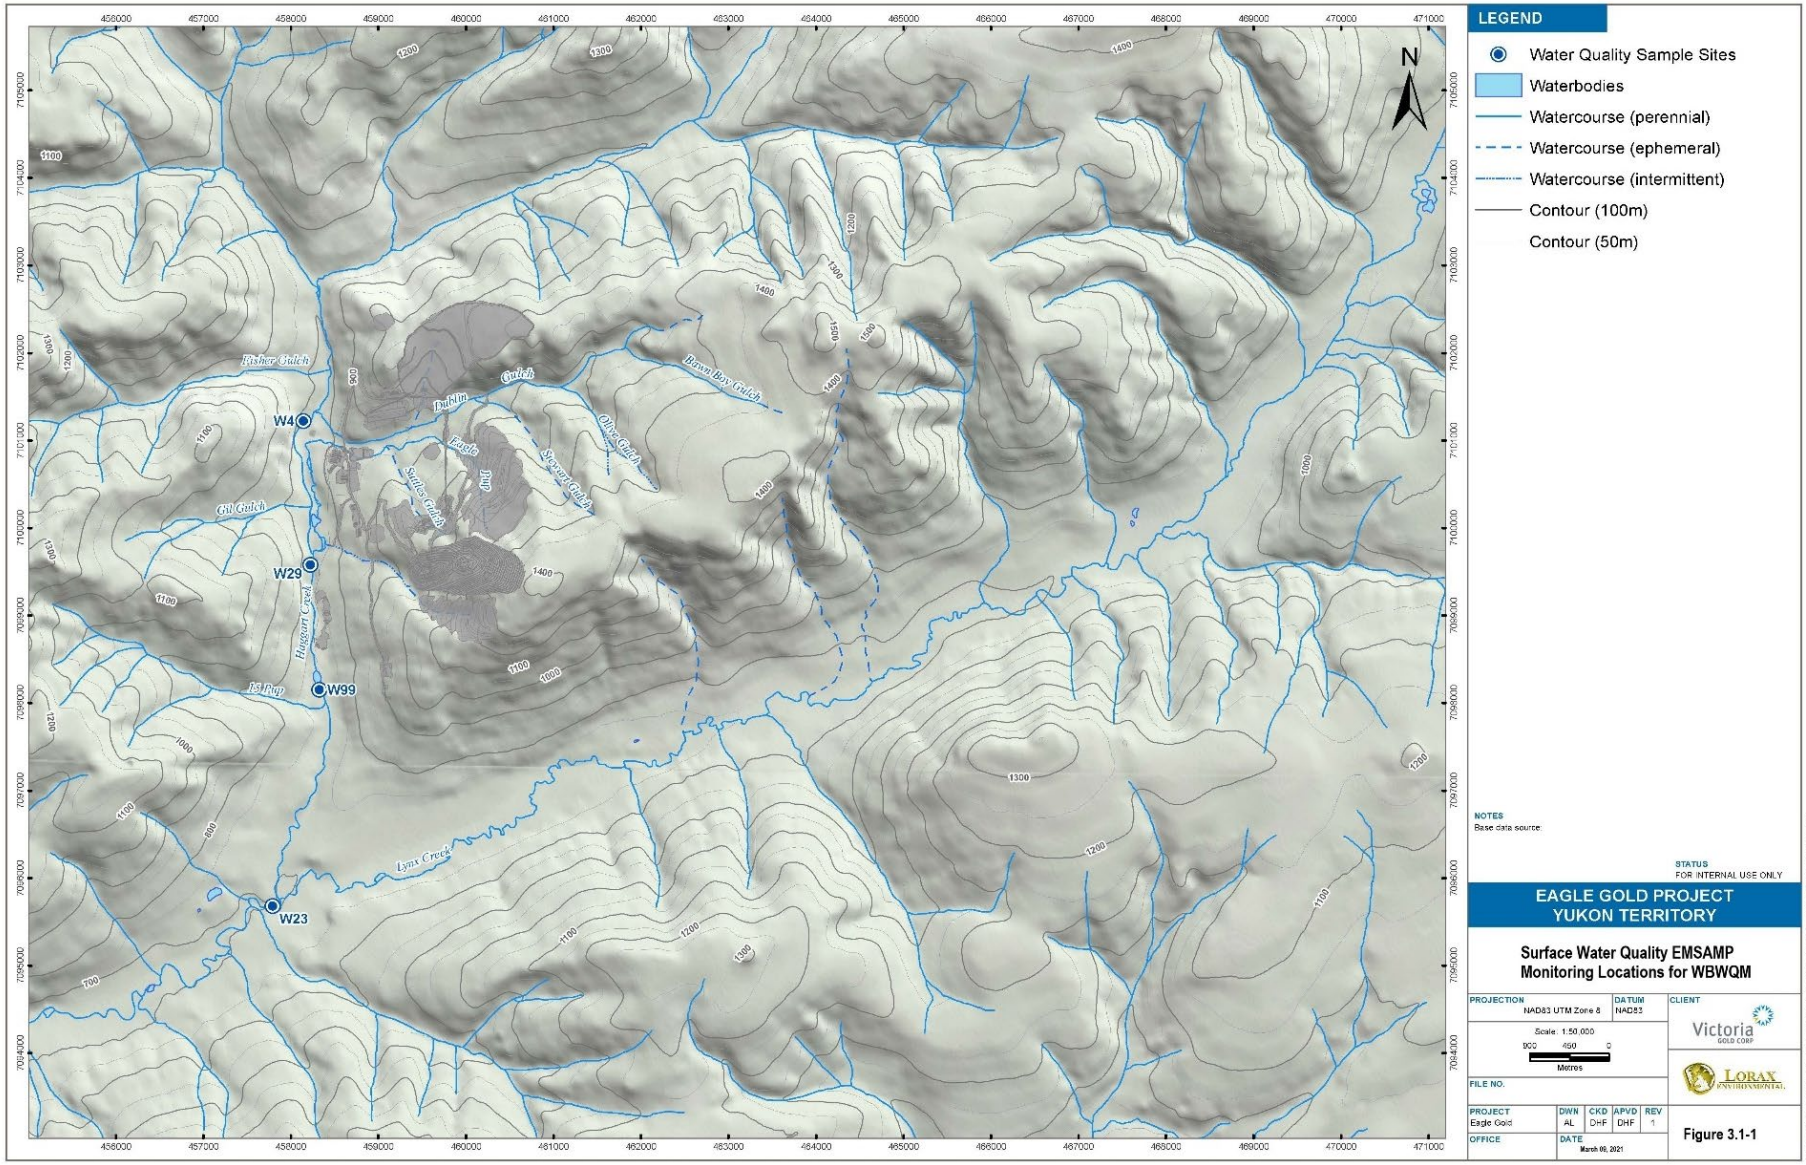

Figure 3.1-1: Key Surface Water Quality EMSAMP Stations for WBWQM

Figure 3.1-2 summarizes the updated water quality model predictions for As at W4 in Haggart Creek. The updated model predicts seasonal monthly mean As concentrations at W4 during operations (Yr-1 to Yr-9) ranging between approximately 0.001 mg/L to 0.0084 mg/L, with a monthly median total As of approximately 0.006 mg/L over that period. Peak monthly mean As concentrations are predicted to occur in the lower flow month of October. During HLF draindown (Yr 13 to Yr 33), monthly mean As concentrations ranging between approximately 0.0058 mg/L to 0.0084 mg/L are predicted (see Appendix C).

During the post closure period (Yr 34 onwards), when all contact water is being treated through a PTS, monthly mean peak As concentrations are predicted to be on the order of 0.0077 mg/L. Peak concentrations are predicted to appear during higher flow periods (e.g., June) with lower monthly mean concentrations predicted for the lower flow months of October to March (Appendix C and Figure 3.1-2).

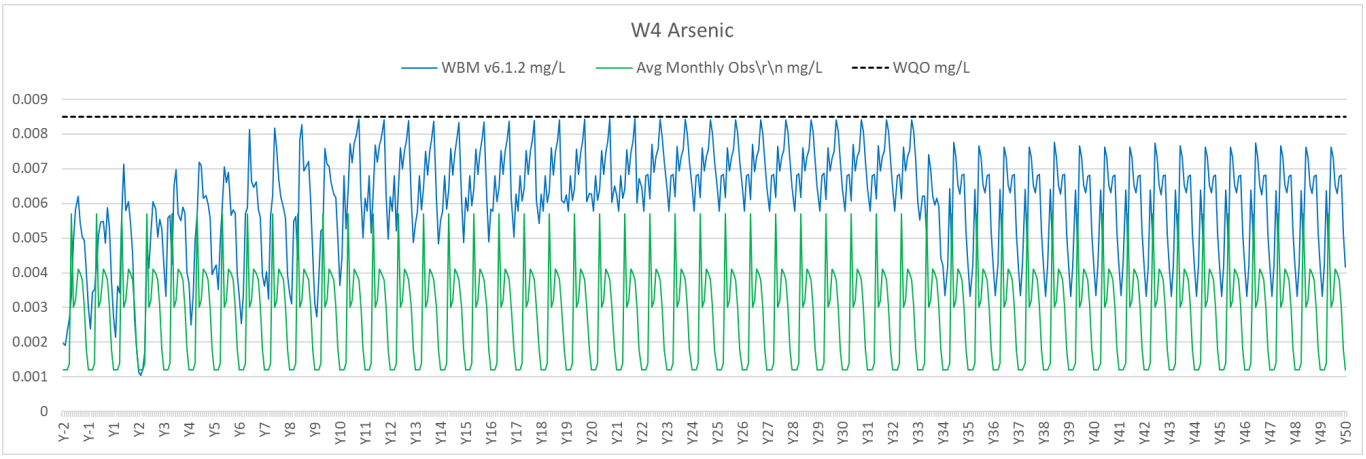

Figure 3.1-2: Predictions for Monthly Mean Total As at W4 in Haggart Creek for WBWQM v6.1.2. Baseline mean monthly concentration denoted by green line; Water Quality Objective denoted by dashed line.

Predicted monthly mean concentrations for total Se at W4 in Haggart Creek are presented in Figure 3.1-3. The primary source of Se in contact water is associated with the HLF. As such, monthly mean total Se concentrations predicted during operations (*e.g.*, Yr-1 to Yr-9) are predicted to be low with total Se concentrations ranging between 0.00015 mg/L to 0.0011 mg/L. Updated predictions indicate that Se concentrations are highest during the late draindown closure period (*e.g.*, Yr-29 to Yr-33). Peak concentrations during this period are predicted to be roughly 0.002 mg/L and occur during the lower flow months of late winter (*e.g.*, January to March; Appendix C). Conversely, during most of the open water period (May to September), monthly mean Se concentrations are predicted to range between less than 0.0005 mg/L to roughly 0.0013 mg/L.

Table 3.1-2 summarizes the maximum WQM v6.1.2 predicted concentrations for all parameters at W4 in Haggart Creek. As illustrated, all parameters are predicted to be below their respective water quality objective. WQM v6.1.2 output for all parameters for station W4 can be found in Appendix B and Appendix C.

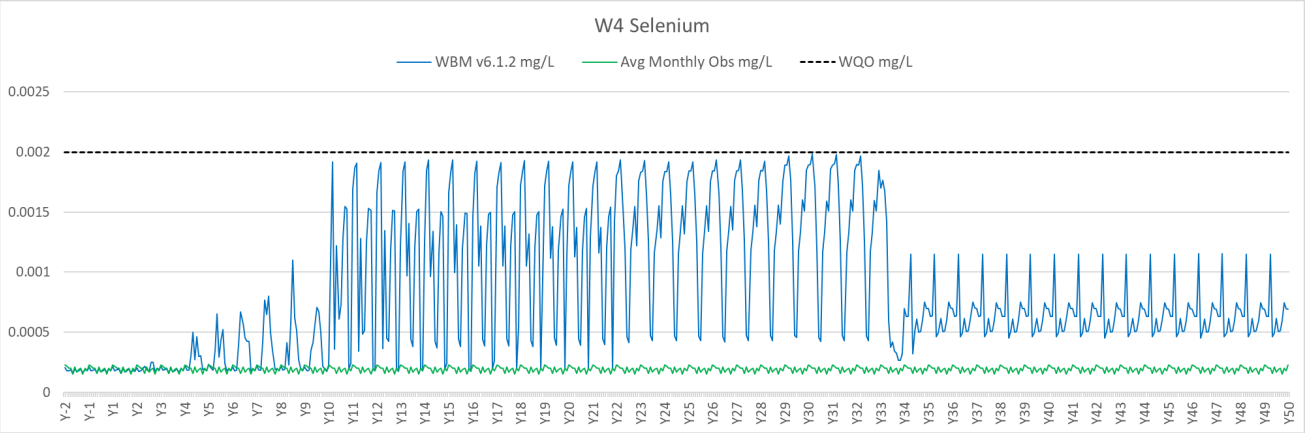

Figure 3.1-3: Predictions for Monthly Mean Total Se at W4 in Haggart Creek for WBM 4.0. Baseline mean monthly concentration denoted by green line; Water Quality Objective denoted by dashed line.

Table 3.1-2:
Maximum WBM v6.1.2 Predicted Concentrations Compared to Water Quality Objectives at W4 for Haggart Creek

Parameter List		Maximum Mean Predicted Concentration at W4	WQ Objectives at W4
Dissolved Parameters	SO_4	158	309
	Cl	2.4	150
	Nitrate-N	1.5	3
	Nitrite-N	0.013	0.02
	NH_3-N	0.42	1.13
	CN_{WAD}	0.0026	0.005
	Al (diss)	0.14	0.1
Total Metalloids and Metals	Sb	0.009	0.02
	As	0.0084	0.0085
	Cd	0.00012	0.000197
	Cu	0.0038	0.005
	Co	0.0021	0.004
	Fe	0.39	1.0
	Pb	0.0027	0.0077
	Hg	0.000015	0.00002

All values as mg/L

3.2 Station W29 – Haggart Creek

WBWQM v6.1.2 output is graphically presented in Figure 3.2-1 for As at station W29 in Haggart Creek. Peak monthly mean As concentrations at W29 are predicted to be slightly lower as compared to station W4 during the draindown period (*e.g.*, Yr 13 to Yr 33) and generally approximately 0.008 mg/L with few exceptions (Figure 3.2-1). During post closure, As loadings occur to Haggart Creek upstream of W29 from Platinum Gulch PTS, which treats water from waste rock seepage and pit overflow water. Post closure predicted As concentrations are highly flow dependent during this period of passive discharge with values ranging from approximately 0.0035 mg/L in February to monthly mean maximum values of roughly 0.0084 mg/L in June/July (Figure 3.2-1). As expected, higher monthly As concentrations are experienced during the open water period (April to September) when the EP PTS and PG PTS are discharging.

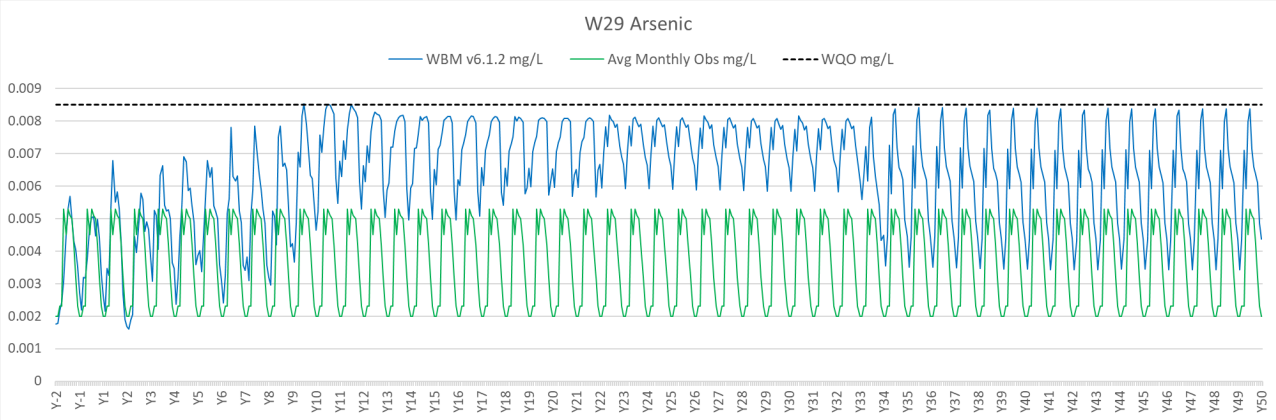

Figure 3.2-1: Predictions for Monthly Mean Total As at W29 in Haggart Creek for WBM v6.1.2. Baseline mean monthly concentration denoted by green line; Water Quality Objective denoted by dashed line.

The modeled peak monthly mean Se concentrations at W29 are predicted to occur during late operations and into the draindown period (*e.g.*, Yr-10 to Yr-33; Figure 3.2-2). Total monthly mean Se concentrations during this period are predicted to range from approximately 0.00015 mg/L, during higher flow months of May to July, to approximately 0.0018 mg/L, during winter low flow months (e.g., February and March). During closure, mean monthly total Se concentrations at W29 are predicted to more narrowly range between approximately 0.0006 mg/L to 0.0013 mg/L. The complete excel output data for all parameters modelled at station W29 is presented in Appendix C.

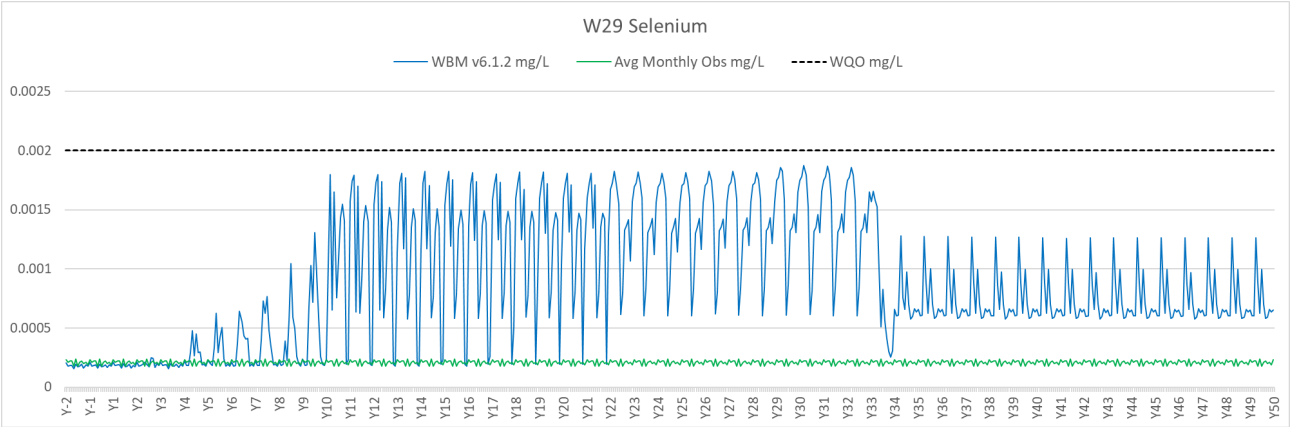

Figure 3.2-2: Predictions for Monthly Mean Total Se at W29 in Haggart Creek for WBM v6.1.2. Baseline mean monthly concentration denoted by green line; Water Quality Objective denoted by dashed line.

3.3 Station W99 –Haggart Creek

WBM v6.1.2 predictions for mean monthly total As and total Se at W99 in Haggart Creek are graphically presented in Figure 3.3-1 and Figure 3.3-2, respectively. Modeled prediction concentrations for both parameters are very similar to those values presented for station W29 although very slightly lower. These minor changes reflect the fact that the additional catchment at W99 is only 1.03 times (3%) greater than at W29. As such, modeled predicted concentrations are not materially different between the two stations.

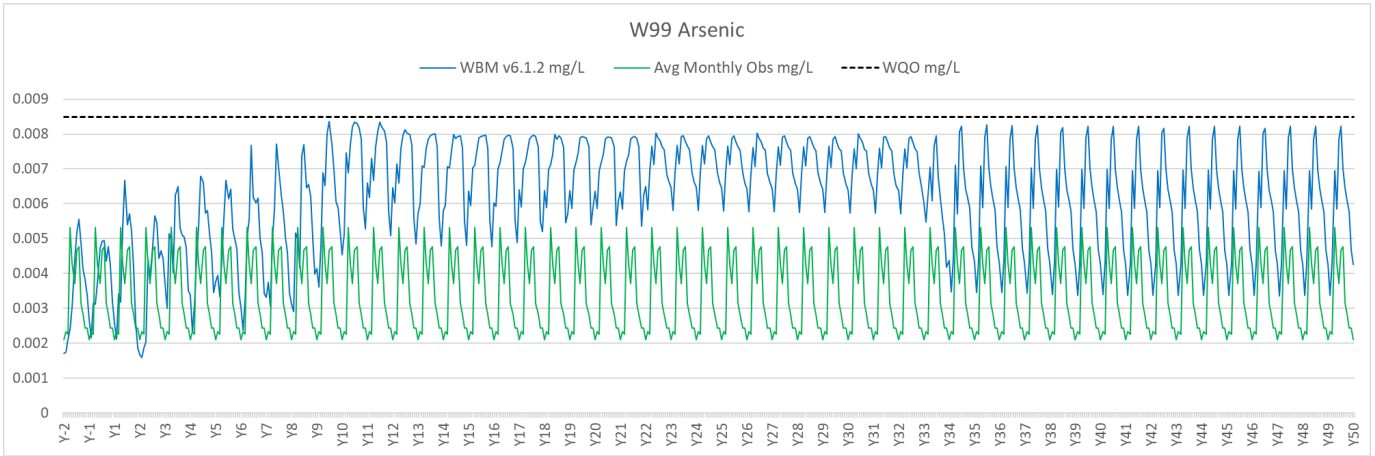

Figure 3.3-1: Predictions for Monthly Mean Total As at W99 in Haggart Creek for WBM v6.1.2. Baseline mean monthly concentration denoted by green line; Water Quality Objective denoted by dashed line.

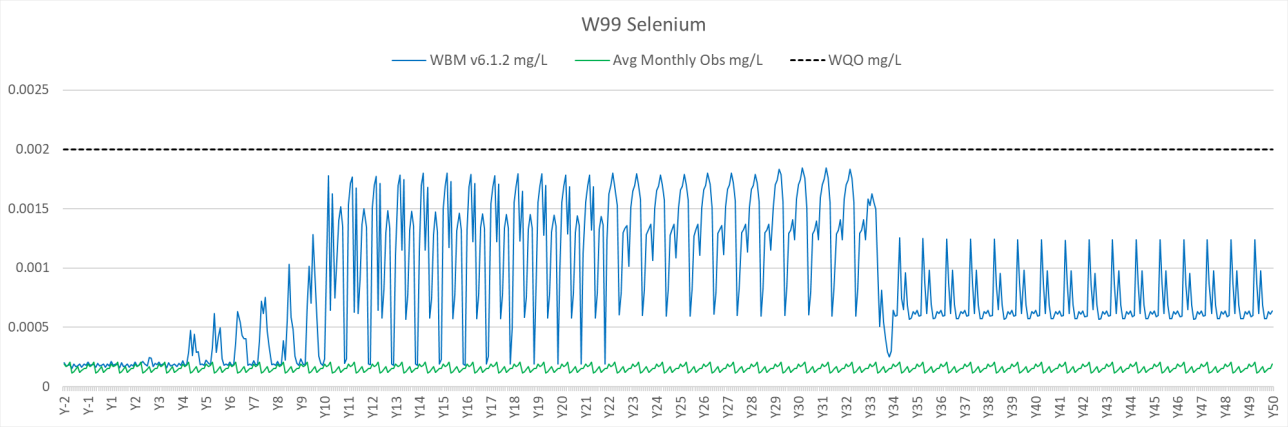

Figure 3.3-2: Predictions for Monthly Mean Total Se at W99 in Haggart Creek for WBM v6.1.2. Baseline mean monthly concentration denoted by green line; Water Quality Objective denoted by dashed line.

3.4 Station W23 – Far-Field Haggart Creek

WBM v6.1.2 predictions for total As at W23 in Haggart Creek are graphically presented in Figure 3.4-1. Unlike stations more proximal to the Eagle Mine in Haggart Creek (*e.g.*, W4 and W29), predicted peak As concentrations at W23 are less variable throughout the life of mine period. For example, peak As concentrations during the entire life of mine period are not predicted to exceed 0.0074 mg/L. Most notably, the maximum predicted incremental increase in As concentrations at W23, over baseline values, is roughly 0.0028 mg/L and occurs during March (Yr-9). During the open water period of April to September, predicted incremental increases in As over background range from less than 0.001 mg/L to approximately 0.002 mg/L. Predicted maximum concentrations of As at W23 throughout the mine life are all well below the water quality objective (Figure 3.4-1).

Water quality predictions for total Se at W23 are presented in Figure 3.4-2. Maximum predicted total Se concentrations in WBM v6.1.2 are approximately 0.0013 mg/L and, like upstream locations in Haggart Creek, occur during the late operations and draindown period. Closure (Yr-33+) monthly mean Se concentration predictions are between approximately 0.0005 mg/L and 0.00068 mg/L (Appendix C). All predicted concentrations are well below the water quality objective for Se of 0.002 mg/L.

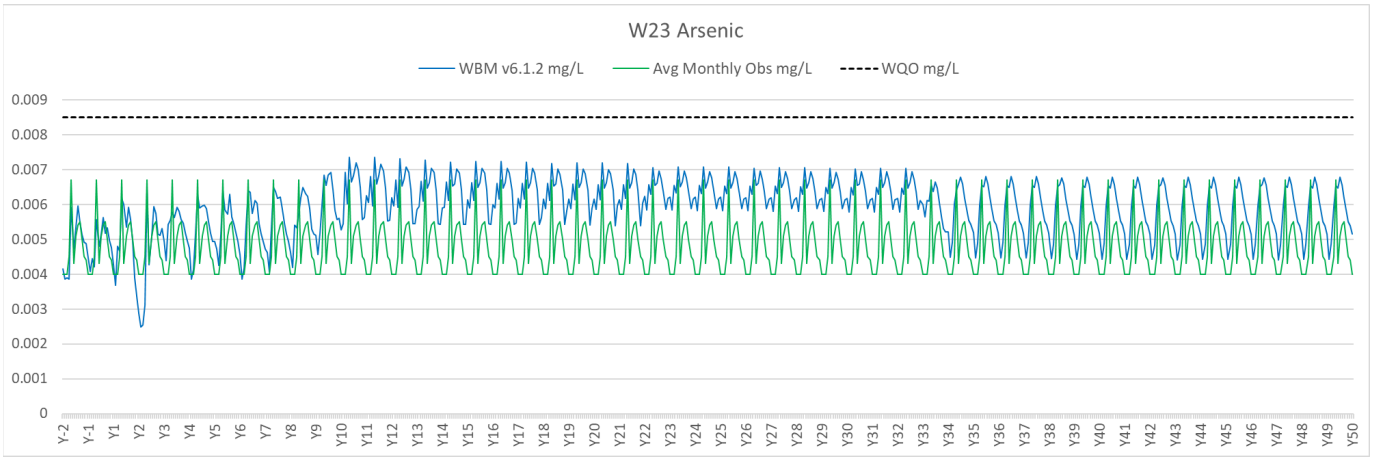

Figure 3.4-1: Predictions for Monthly Mean Total As at W23 in Haggart Creek for WBM v6.1.2. Baseline mean monthly concentration denoted by green line; Water Quality Objective denoted by dashed line.

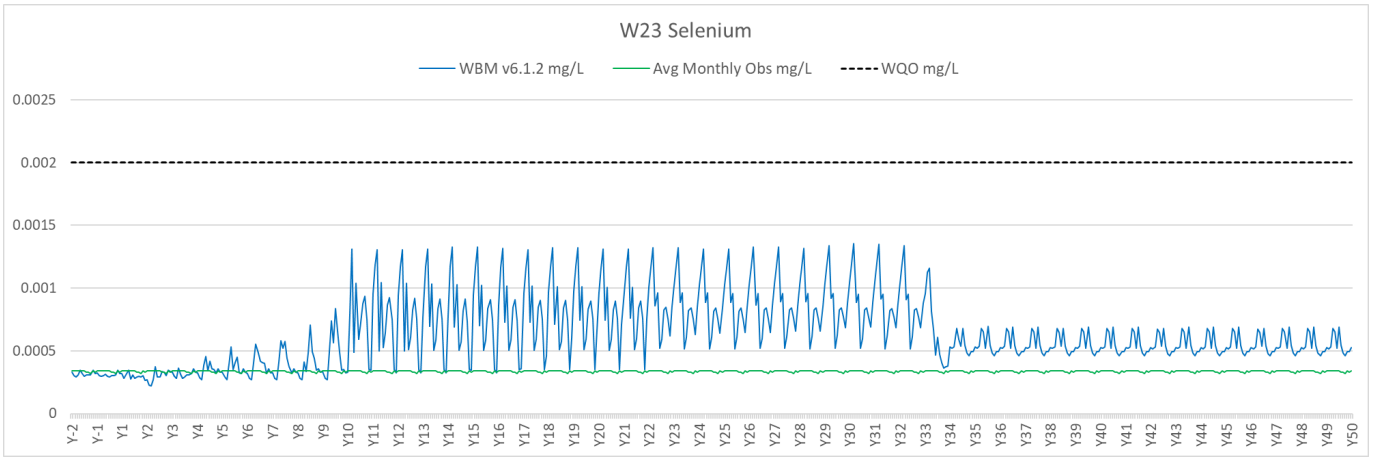

Figure 3.4-2: Predictions for Monthly Mean Total Se at W23 in Haggart Creek for WBM v6.1.2. Baseline mean monthly concentration denoted by green line; Water Quality Objective denoted by dashed line.

4. Water Quantity Predictions

VICTORIA GOLD CORP

4. Water Quantity Predictions

4.1 Predicted Streamflow Changes

The results of the WBM v6.1.2 are presented in this section. There have been no substantive changes from the 2014 WBM outputs as a result of the changes in the mine plan since 2014. The predicted changes to the baseline streamflow regime (2010-2017 average) as a result of mine development and operation are presented for the average monthly discharge for four distinct years of the mine life – representative of key changes to the management of site water. These correspond to the WBM/WQM schematics presented in Figure 2.2-10 through Figure 2.2-13.

- Modelled Year 2020 = Year 2 (Phase 1 of the HLF)
    - 2020 climate series used as input, see discussion on wet conditions experienced in 2020 (Section 2.1.1.1)
- Modelled Year 2028 = Year 10 (first year of rinse/gold recovery)
- Modelled Year 2031 = Year 13 (first year of HLF draindown)
- Modelled Year 2051 = Year 33 (end of active closure)

The average monthly baseline and mine affected streamflows are presented for two key receiving environment nodes W4 (Haggart Creek downstream of Dublin Gulch) and W29 (Haggart Creek downstream of Platinum Gulch) in tabular (Table 4.1-1) and figure formats (Figure 4.1-1 through Figure 4.1-8).

Table 4.1-1:
Predicted percent change in flows at W4 and W29 nodes for Project years.

Mine Phase	Operations (Year 2)		First Year of HLF Rinsing		First Year of HLF Draindown		End of Active Closure	
Month	**W4**	**W29**	**W4**	**W29**	**W4**	**W29**	**W4**	**W29**

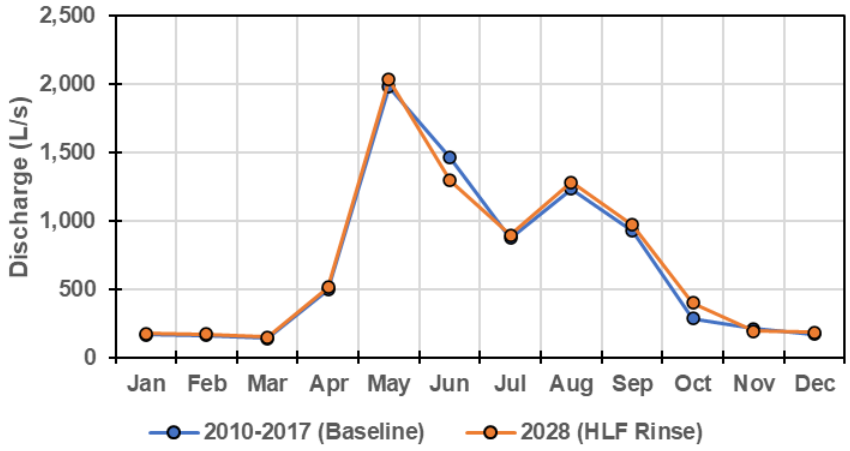

Figure 4.1-2: Average monthly and predicted mine affected streamflows for the W4 node (Year 10; WBM v6.1.2).

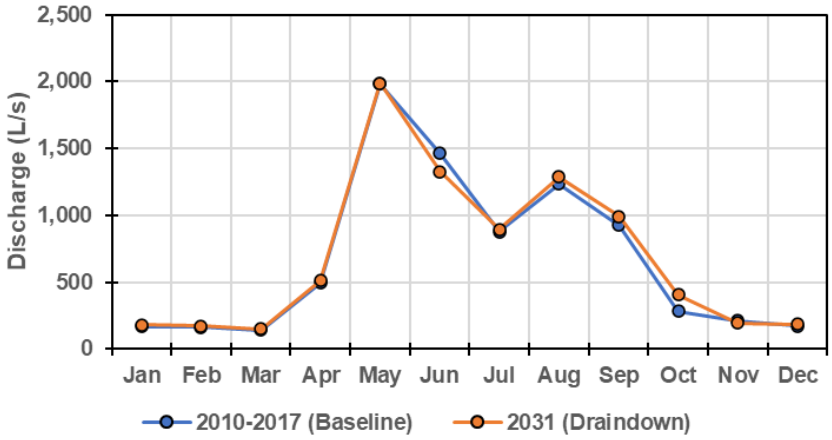

Figure 4.1-3: Average monthly and predicted mine affected streamflows for the W4 node (Year 13; WBM v6.1.2).

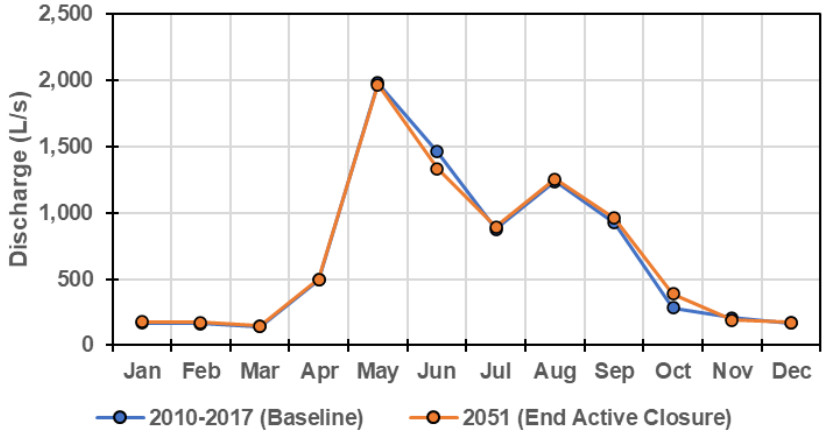

Figure 4.1-4: Average monthly and predicted mine affected streamflows for the W4 node (Year 33; WBM v6.1.2).

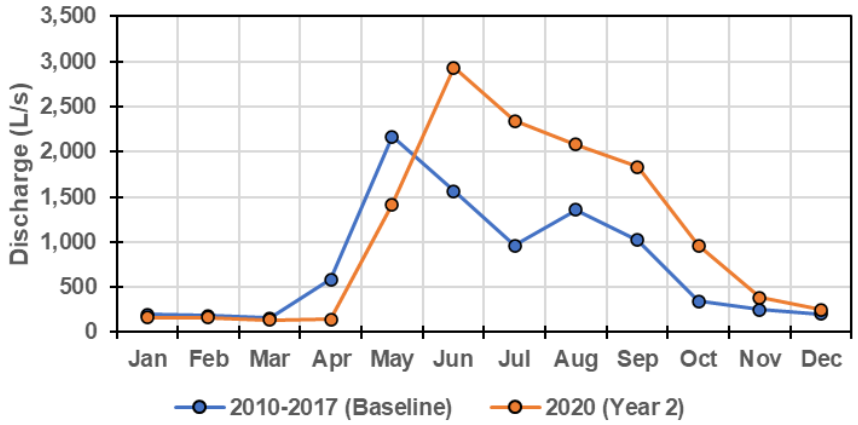

Figure 4.1-5: Average monthly and predicted mine affected streamflows for the W29 node (Year 2; WBM v6.1.2).

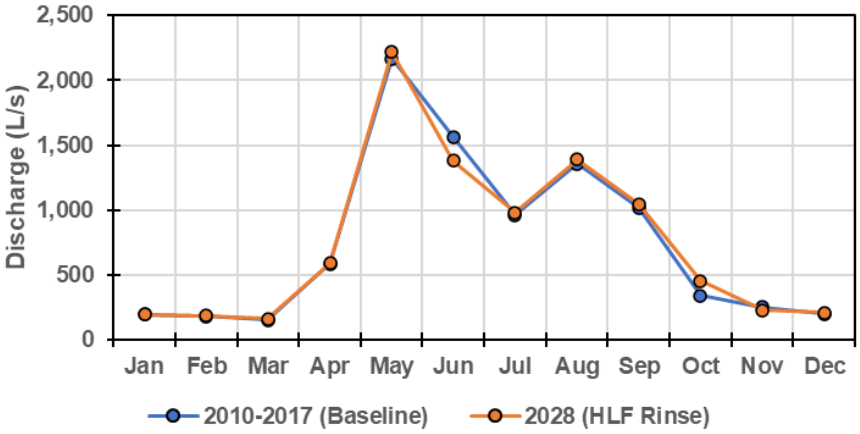

Figure 4.1-6: Average monthly and predicted mine affected streamflows for the W29 node (Year 10; WBM v6.1.2).

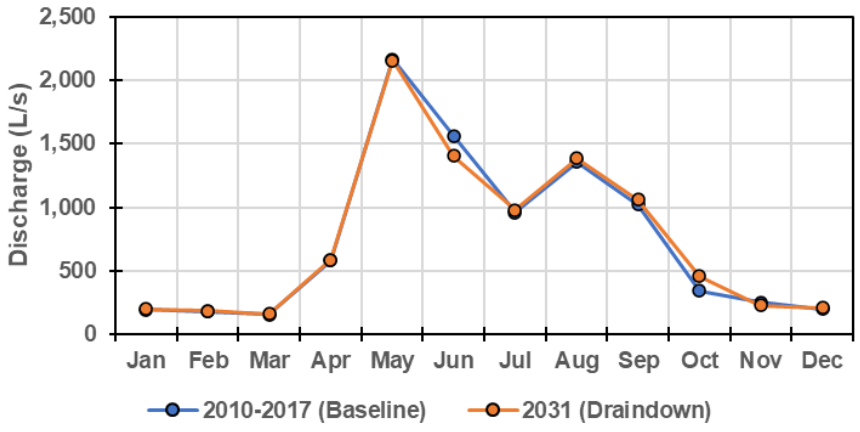

Figure 4.1-7: Average monthly and predicted mine affected streamflows for the W29 node (Year 13; WBM v6.1.2).

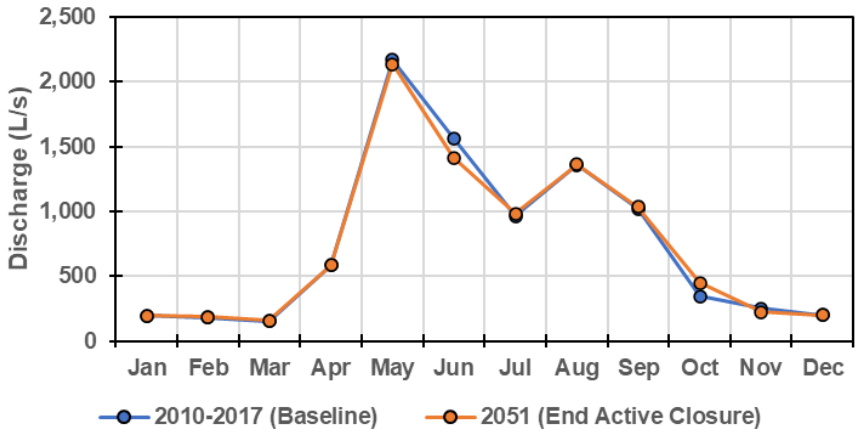

Figure 4.1-8: Average monthly and predicted mine affected streamflows for the W29 node (Year 33; WBM v6.1.2).

Elevated flows in 2020 relative to the baseline condition are reflective of the increased precipitation received at the Project site (Section 2.1.1.1), and not mine operations. Maximum expected decreases in the baseline streamflow volumes occur in June (-9% to -11%), and the minimum predicted changes occur in November through April (-11% to 8%; Table 4.1-1). The average open water season (May-September) flow changes are predicted to be 1% at W4 during Operations and the Active Closure (draindown) phase. On an average annual basis, flows in Haggart Creek at W4 are predicted to change from baseline by 5%, and by 2% at W29. The reductions in June flows (-10%) are due to staging of treated discharge to the receiving environment to maintain water quality within the prescribed limits. The substantial relative increases in predicted October flows are due to the MWTP continuing to discharge treated water at a higher rate than experienced under baseline conditions during this month. Note that due to the low flows experienced in Haggart Creek during the winter and shoulder seasons (October to April), small changes in predicted flows due to mine operations result in larger relative predicted changes to the baseline streamflow regime. This is also the period for which continuous flow data are not available due to extensive channel icing, and thus characterization of the baseline flow regime is based largely on infrequent spot flow measurements. For these reasons, relatively less weight is placed on the predicted changes to the winter streamflow regime in Haggart Creek.

Appendix A: Geochemical Source Team Update Memorandum

VICTORIA GOLD CORP

TECHNICAL MEMORANDUM

To:	**Stephen Wilbur** **Hugh Coyle, VGCX**	**Date: March 23, 2021**
From:	**Timo Kirchner, M.Sc., P.Geo.** **David Flather, M.Sc.**	**Project #: A610-1**
Subject:	**Eagle Gold Mine - Geochemical Source Terms for 2020 WBWQ Model Update**	

1. Introduction

Victoria Gold Corp. (VGCX) owns and operates the Eagle Gold mine located approximately 45 km north of Mayo. As part of annual reporting requirements for the Eagle Gold Project under the Water Use Licence (WUL) issued by the Yukon Water Board, Lorax Environmental Services Ltd. (Lorax) annually revisits available data and assumptions in support of the water balance and water quality model (WBWQM). This modelling effort accounts for updated climate, hydrology and water quality data as well as changes to the mine plan. Geochemical source terms represent an integral input into the water quality model. Due to changes in various of the above components, the revision of the geochemical source term model was considered necessary for the 2020 WBWQM update. Of most significance were updated geochemical data and findings from a new (2020) kinetic test program that was initiated, under Lorax's guidance, to quantify the arsenic (As) leaching behaviour of Eagle Mine waste under various conditions. This memorandum provides the rationale and methodology associated with the 2020 Eagle kinetic test program as well as preliminary results obtained to date in Section 2. An overview of the approach and results of the 2020 source term modelling exercise is given in Section 3.

2. Eagle Gold Kinetic Test Program (2020)

In 2012, a set of field kinetic tests (field barrels) were initiated by SRK consulting to gain insight into the geochemical behaviour of the main Eagle Pit waste rock units at intermediate scales and under site climatic conditions. These field barrels contained ~150 to 200 kg of waste rock and leachate was continuously sampled by VGC personnel until 2019. Data generated from these experiments has proven invaluable for the development of geochemical source terms generated in support of the Water Use Licence (WUL) application (Lorax, 2014) and model iterations thereafter (Lorax, 2017, 2018, 2019). Refer to SRK (2014) for an overview of the sample selection rationale as well as the sampling methodology for these field barrels.

Since 2015, the Oxide GND field barrel sample (DG12-MET-04) produced steadily increasing arsenic concentrations reaching maximum values of up to >3 mg/L in 2018. Consequently, the representativeness of this sample and whether similarly high As concentrations may be expected in full-scale mine drainage warranted further investigation. To address these findings, VGC discontinued the SRK program in 2020, disassembled all field barrels, and re-initiated field kinetic testing of two field barrels (Barrel 1, Barrel 2) with guidance from Lorax. The objective of this revised program is to assess:

i. the sorption capacity of a metasediment composite (new sample ID: LX-2020-FB1) underlying the high-As leaching material (DG12-MET-04); and
ii. As leaching characteristics of a mixed lithology field barrel constructed with lithological proportions that resemble those expected in the Eagle Gold waste rock storage areas (WRSAs) (new sample ID: LX-2020-FB2).

Data produced from these experiments are intended support the validation of source term model and especially as it pertains to As leaching from waste rock.

2.1 Methods

2.1.1 Eagle Waste Rock Field Barrels (SRK)

A breakdown of the SRK field barrel samples and how they were re-purposed for the 2020 kinetic test program is given in Table 2-1.

Table 2-1:
Breakdown of field barrel samples re-purposed for 2020 Eagle kinetic test program

	Sample ID (SRK)	Unit	Mass (kg)	Purpose
Barrel 1			150*	Assess arsenic attenuation capacity of MSED unit
Top Layer	DG12-MET-04	Oxide GND	75	
Bottom Layer (LX-2020-FB1)	DG12-MET-01	Oxide MSED	30	
	DG12-MET-02	Fresh MSED	30	
	DG12-MET-03	Oxide/Fresh MSED	30	
Barrel 2			150*	Constrain arsenic leaching behaviour from mixed lithology sample
Composite (LX-2020-FB2)	DG12-MET-01	Oxide MSED	45	
	DG12-MET-02	Fresh MSED	50	
	DG12-MET-04	Oxide GND	25	
	DG12-MET-05	Fresh GND	25	
	DG12-MET-06	Altered GND	5	
	DG12-MET-08	Overburden	15	

Notes:
GND = Granodiorite, MSED = Metasediment.
*Sample mass accounts for the removal of a subsample after compositing.

To obtain representative subsamples of the decommissioned SRK field barrels, compositing of the new field kinetic test samples was achieved using the cone-and-quarter

technique following thorough manual mixing of each composite subsample. Note that the top layer of Barrel 1 is composed of the former DG12-MET-04 sample only and therefore did not require processing prior to filling the field barrel. The sampling of leachate is being conducted in the same manner as previously where pH, conductivity, temperature and water volume are recorded in the field while the analysis of chemical solutes (anions, acidity, cations, etc.) is conducted at an external laboratory.

To gain an in-depth understanding of the solid-phase characteristics of materials undergoing additional kinetic testing, the three unique samples generated in 2020 (top and bottom layers of Barrel 1; all of Barrel 2) were subsampled and submitted for static geochemical analysis including ABA, aqua regia digestible metals, grain size analysis, mineralogical analysis (Rietveld X-Ray diffraction), as well as sequential extraction method that was specifically designed to quantify the speciation of As (CIEMAT procedure; Larios et al., 2012). An overview of the solvents used and solid phases targeted in this procedure is given in Table 2-2.

Table 2-2:
Procedural steps employed in the sequential
CIEMAT extraction methods designed to quantify on As speciation

Fraction targeted	Reagent/Solvent
Readily Soluble	Nanopure Distilled Water
Strongly Adsorbed on Mineral Surfaces	Na_2HPO_4
Al Oxyhydroxides	NH_4F
Organic Matter	$Na_4P_2O_7$
Amorphous Fe oxyhydroxides	Ammonium Oxalate + Oxalic Acid
Poorly Crystalline Fe oxyhydroxides	Na citrate + $NaHCO_3$ + Ascorbic Acid
Residual Fraction	Four Acid Digestion

2.1.2 Eagle Waste Rock Unsaturated Columns

To investigate the geochemical processes controlling the leachate chemistry of the revised field barrel program in a more controlled environment, subsamples of DG12-MET-04, LX-2020-FB1 and -FB2 were submitted for unsaturated column testing in the laboratory. For this, the samples were screened to < ¼“ to facilitate the comparison with other bench-scale kinetic tests. Each column consists of a 17 cm diameter acrylic cylinder that holds ~5 kg of waste rock material and has a leachate sampling port at the bottom. The main difference between the laboratory and field experimental set-up is that the upper and lower layers of Barrel 1 were split out into two separate columns which allows for the analysis of leachate after contact with the sample that had exhibited increasing As-leaching (DG12-MET-04) first before this leachate is routed through the attenuating MSED base (LX-2020-FB1). As a result, the As attenuation capacity can be calculated more accurately. Further, a duplicate

column of this same attenuating layer was constructed to provide a baseline of the As leaching behaviour of this material on its own. Figure 2-1 provides a schematic of the unsaturated column design for LX-2020-FB1 material. Conversely, LX-2020-FB2 material was treated as a single composite sample simply representing a bench-scale duplicate of Barrel 2.

After an initial rinse of each column with 1 to 2 L of deionized water, the irrigation rate was set to 300 mL for each individual column with the exception of the column constructed with sample DG12-MET-04 (top layer of Barrel 1). Since the effluent from this sample is additionally routed through the MSED column, 600 mL of deionized water is used for the first column in order to generate enough effluent for chemical analysis after passing through both columns. The Eagle unsaturated columns are irrigated weekly with a total experimental duration of 15 weeks. Since these materials have already been leached in the field for 7 years prior, this experimental runtime is considered sufficient to produce long-term leaching data.

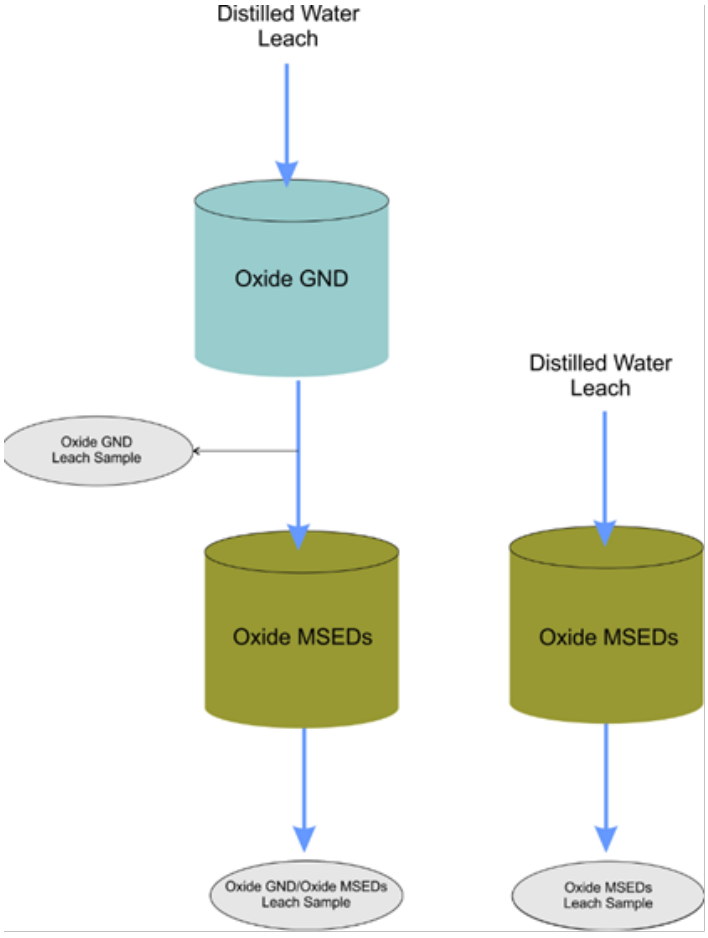

Figure 2-1: Schematic of the unsaturated column experimental design for Eagle field barrel subsamples (2020 kinetic test program).

2.2 Results

The following section gives an overview of the static characterization results for the composited samples as well as preliminary data from the field and laboratory kinetic experiments.

2.2.1 Static Characterization

2.2.1.1 ABA and Metals

All three unique samples that were used to construct the unsaturated columns for the laboratory portion of this study were submitted for static analysis. An overview of select static test parameters is given in Table 2-3.

Table 2-3:
Selected ABA and metals results for the three Eagle Pit samples chosen for advanced kinetic testing

Sample ID	Total S	Modified NP	NPR	As	Cd	Cu	Mo	Ni	Pb	Sb	Se	U	Zn
	%	*kg $CaCO_3$/t*		*ppm*	*ppm*	*ppm*	*ppm*	*ppm*	*ppm*	*ppm*	*ppm*	*ppm*	*ppm*
DG12-MET-04	0.20	18	2.8	2525	0.26	40	2.5	20	29	12	2.0	3.6	70
LX-2020-FB1	0.11	11	3.2	190	0.18	24	3.5	27	15	7.9	2.0	2.2	62
LX-2020-FB2	0.13	18	4.3	752	1.1	37	3.0	23	54	16	2.0	2.7	208

Note: Values in grey represent aqua regia digestible solid-phase metal contents exceeding 10x the AUCA.

With total S contents ranging from 0.11% to 0.20% and Modified NP values ranging from 11 to 18 kg $CaCO_3$/t, all three samples can be classified as NPAG. This is consistent with the pre-test geochemical characterization conducted on all field barrel subsamples (SRK, 2014).

Aqua regia digestible solid-phase metal contents exceeding 10x the average upper crustal abundance (AUCA) include As, Sb, and Se for all samples as well as Cd for LX-2020-FB2. Sample DG12-MET-04, which was selected to assess as a result of the high As leaching rates in the field was confirmed to also have very high As solid-phase content (2,525 ppm; Table 2-3). Note that this value is more than twice the As content that was reported (1,065 ppm) for the same sample in SRK (2014). It is assumed that this discrepancy is due to sample heterogeneity and the error associated with subsampling for static testing from a >150 kg sample.

2.2.1.2 Particle Size Distribution

The particle size distribution (PSD) of the three kinetic test samples is presented in Figure 2-2. Note that these were determined on the field barrel subsamples received by the lab "as-is" before further crushing for the laboratory kinetic program. The two samples making

up the two layers in the one field barrel intended to investigate As attenuation (DG12-MT-04 and LX-2020-FB1) show a comparable PSD with ≤10% of the sample falling into the sand fraction or finer (silt/clay). Therefore, >90% of the material mass is represented by the pebble fraction or coarser (i.e., boulders). Sample LX-2020-FB2 contains a slightly higher proportion fines with approximately 12% of the material mass falling into the sand fraction or finer. The relatively coarse makeup of the field barrel subsamples is relevant to the interpretation of metal leaching and attenuation rates.

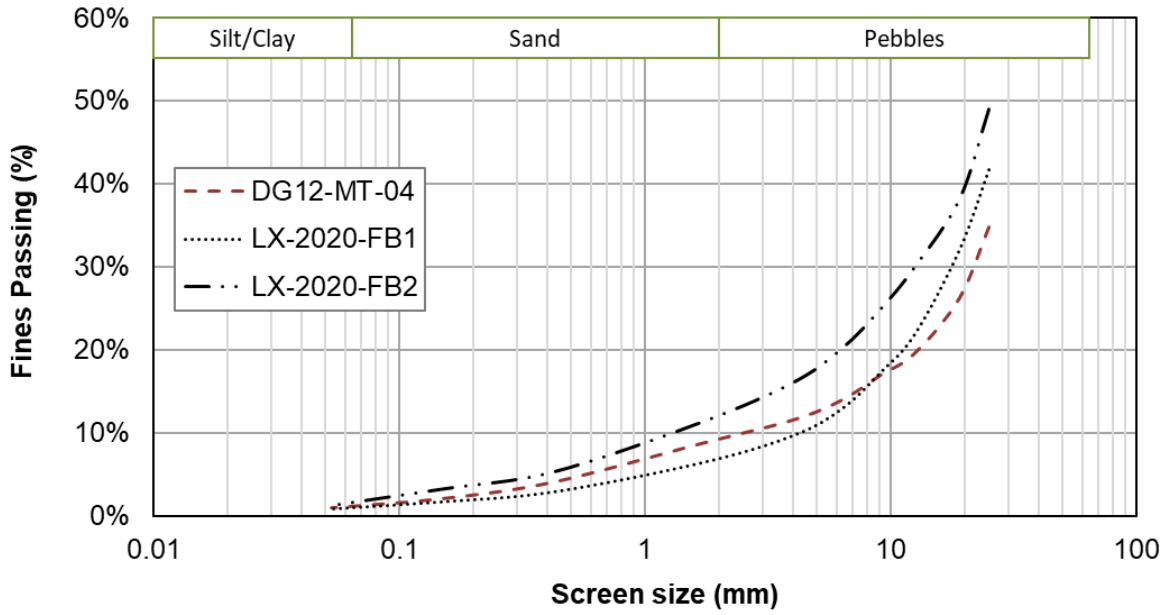

Figure 2-2: Particle size distribution curves for the three Eagle Pit kinetic test samples

2.2.1.3 Mineralogy (XRD)

Mineralogical analyses were conducted on the two samples that are the focus of the As attenuation investigation, namely the upper (DG12-MET-04) and lower (LX-20202-FB1) layers of the repurposed field barrel and sequential unsaturated columns. This work was completed to gain a high-level understanding of the As phase association as well as to identify, on a high level, any mineral phases with a large surface area that would be afford As sorption sites. Limitations to XRD analysis present relatively high detection limits (~0.5-1%) as well as the inability to identify poorly-crystalline and amorphous phases.

The rock-forming mineralogy of both samples is dominated by quartz, feldspars (microcline, albite, anorthite), as well as micas (biotite, muscovite). Chlorite, carbonates (calcite, ankerite), and rutile were detected at minor abundances in both samples (Table 2-4). It is notable that no sulphide minerals were detected by XRD. This is likely due to the high detection limit of this analytical method and possibly, to some extent, the fact that

these samples have been actively weathering for >8 years, thereby depleting sulphide phases.

Due to the lack of detection of poorly-crystalline and amorphous phases, it is difficult to quantify the sorption capacity of sample LX-20202-FB1 based on XRD analysis alone. Fe-oxyhydroxide are known to be the most potent sorbent for As and this phase would not have been detected via XRD. Findings from optical microscopy (to be completed) will provide more insight into the textural relationships of the two mineral assemblages and how these may affect As release and attenuation.

Table 2-4:
XRD results for the two samples that were re-purposed for the Eagle kinetic As attenuation study

Mineral	Formula	DG12-MET-04	LX-20202-FB1
		(wt %)	(wt %)
Quartz	SiO_2	32	47
Muscovite	$KAl_2(AlSi_3O_{10})(OH)_2$	4.4	13
Biotite	$K(Mg,Fe)_3(AlSi_3O_{10})(OH)_2$	4.3	6.0
Chlorite	$(Fe,(Mg,Mn)_5,Al)(Si_3Al)O_{10}(OH)_8$	4.7	3.6
Ankerite	$CaFe(CO_3)_2$	0.28	0.59
Calcite	$CaCO_3$	1.7	1.1
Rutile	TiO_2	0.38	0.98
Microcline	$KAlSi_3O_8$	26	11
Albite	$NaAlSi_3O_8$	26	11
Anorthite	$CaAl_2Si_2O_8$	-	4.9
TOTAL		***100***	***100***

2.2.1.4 Sequential Extractions (CIEMAT)

Sequential extraction testing is one way to assess the speciation of specific elements of interest by sequentially reacting a sample with a series of solvents that are known to attack specific solid phases only. With this knowledge, conclusion with respect to phase stability and elemental mobility may be drawn. Since As release was the driver in the design of the 2020 Eagle kinetic test program a sequential extraction test method that focusses on the accurate determination of As speciation was chosen for this purpose (Larios et al., 2012).

Sequential extraction results for As and S are shown in Figure 2-3 as relative (%) and absolute (mg/kg) extracted quantities. It is important to note that by design of the experimental procedure, sulphide phases are captured by the residual fraction step (Larios et al., 2012). This can be seen in Figure 2-3 which shows that >20% of all extracted sulphur is hosted in the residual fraction.

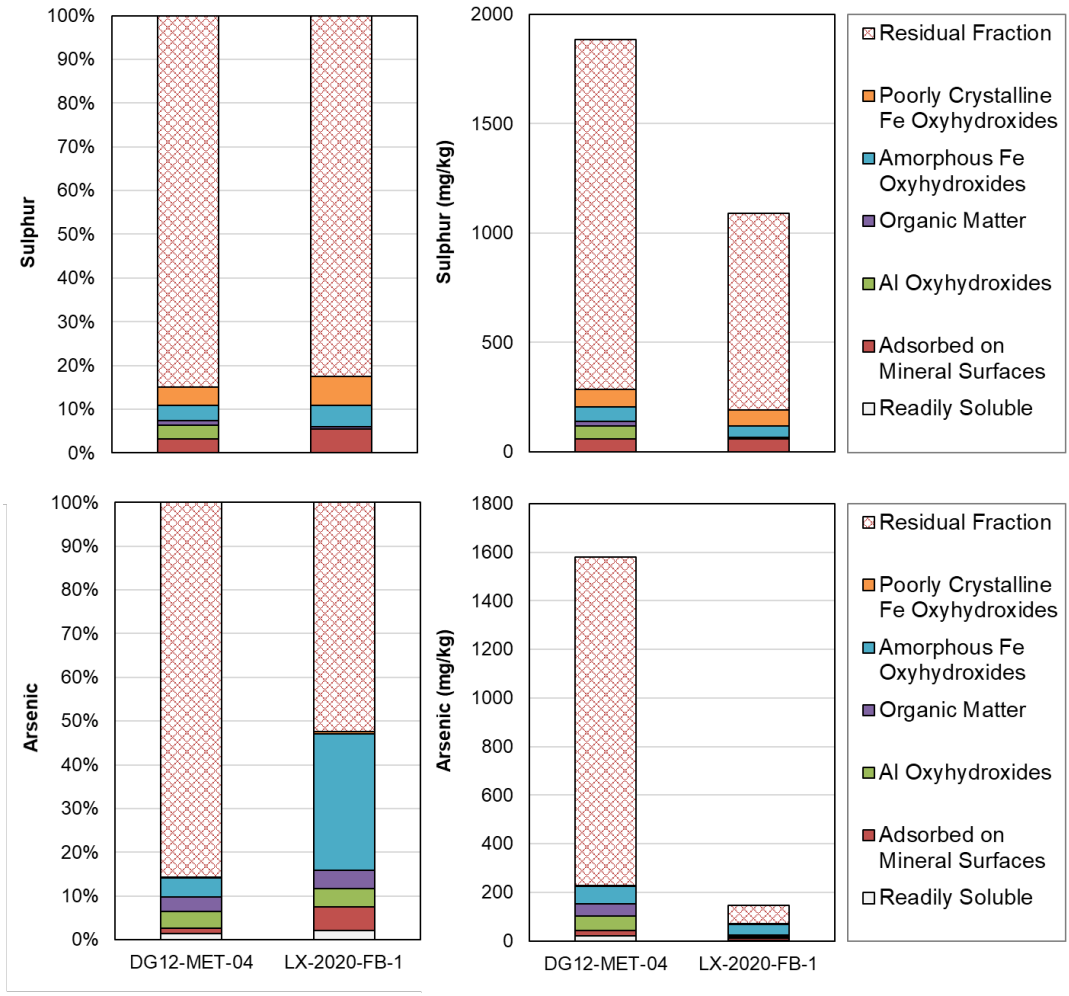

Figure 2-3: Sequential extraction results for the Barrel 1 sub-samples that were re-purposed for the Eagle kinetic As attenuation study

Pre-test characterization work conducted by SRK (2014) confirms that the majority of sulphur is hosted in sulphide phases across all field barrel samples. Due to the limitations with respect to the methods specificity, and with regards to the individual extraction steps for species other than As, it cannot be stated with certainty whether the more soluble sulphur is in fact associated with the phases defined by the procedure. It is likely that this fraction is represented in the form of primary and secondary sulphate phases that are leached alongside the targeted phases for As mobility. Note that extended oxic weathering of these samples may have re-distributed some of the sulphur into sulphide oxidation products.

Figure 2-3 shows that the majority of As is associated with the residual (sulphide) fraction (e.g., pyrite, arsenopyrite) as well. Specifically, sample DG12-MET-04 contains approximately 15% of non-sulphide bound As which is predominantly distributed across

all extraction steps with the exception of the poorly crystalline Fe-oxyhdroxides. This sample has a much higher total solid phase As content (1,581 ppm) compared with LX-20202-FB1 consistent with the results from aqua regia analysis (Table 2-3). Composite MSED sample, which is intended as the As attenuating layer, contains a cumulative solid-phase As content of 147 ppm and exhibits a markedly different distribution of this species. Here, just over 50% of the As is associated with the residual sulphide fraction, while the remaining portion is distributed over amorphous Fe oxyhydroxides (31%) and more soluble fractions. Of those, a non-negligible proportion (5%) is adsorbed to mineral surfaces.

2.2.2 Field Barrel Leachates

Field barrel leachate data collected before the initiation of the reconstructed 2020 kinetic test programs are presented in SRK (2014) as well as in the context of geochemical source terms most recently in Lorax (2019). Herein, these leachate results are not discussed in detail and are only included for comparative purposes (data shown from 2017 onward) to contextualize changes in drainage chemistry seen in response to the kinetic test re-initiation.

Figure 2-4 shows the pH and sulphate concentrations of the previous and re-purposed field barrels and illustrates that after re-compositing both parameters produced by both field barrels fall well within the range of the previous leachate results. While pH remains circum-neutral as expected, sulphate concentrations produced by the two field barrels appear to be stabilizing around 40 and 60 mg/L for Barrel 1 and Barrel 2, respectively. Coinciding temporal fluctuation trends between the two field barrels for pH and, to a lesser degree, for sulphate are evidence that leachate chemistry is at least in part driven by meteoric precipitation events.

Leachate concentrations for As, Sb, and Se are shown in Figure 2-5. The most notable finding from these plots is the narrow range of concentrations for As and Sb in particular across the two new field barrels in comparison with the observed variability before re-compositing. The bottom layer of Barrel 1 (LX-2020-FB1) is the last point of contact for the barrel infiltrate before leaching into the collection jugs. If the top layer of Barrel 2 (DG12-MET-04) is assumed to continue to produce As concentrations of >1mg/L, this would indicate that the LX-2020-FB1 provides significant attenuation capacity, since all Barrel 1 leachates collected to date have As concentrations of <0.1 mg/L. Interestingly, despite having variable solid-phase As contents (Table 2-3), both Barrel 1 and Barrel 2 produce remarkably similar As concentrations (Figure 2-5).

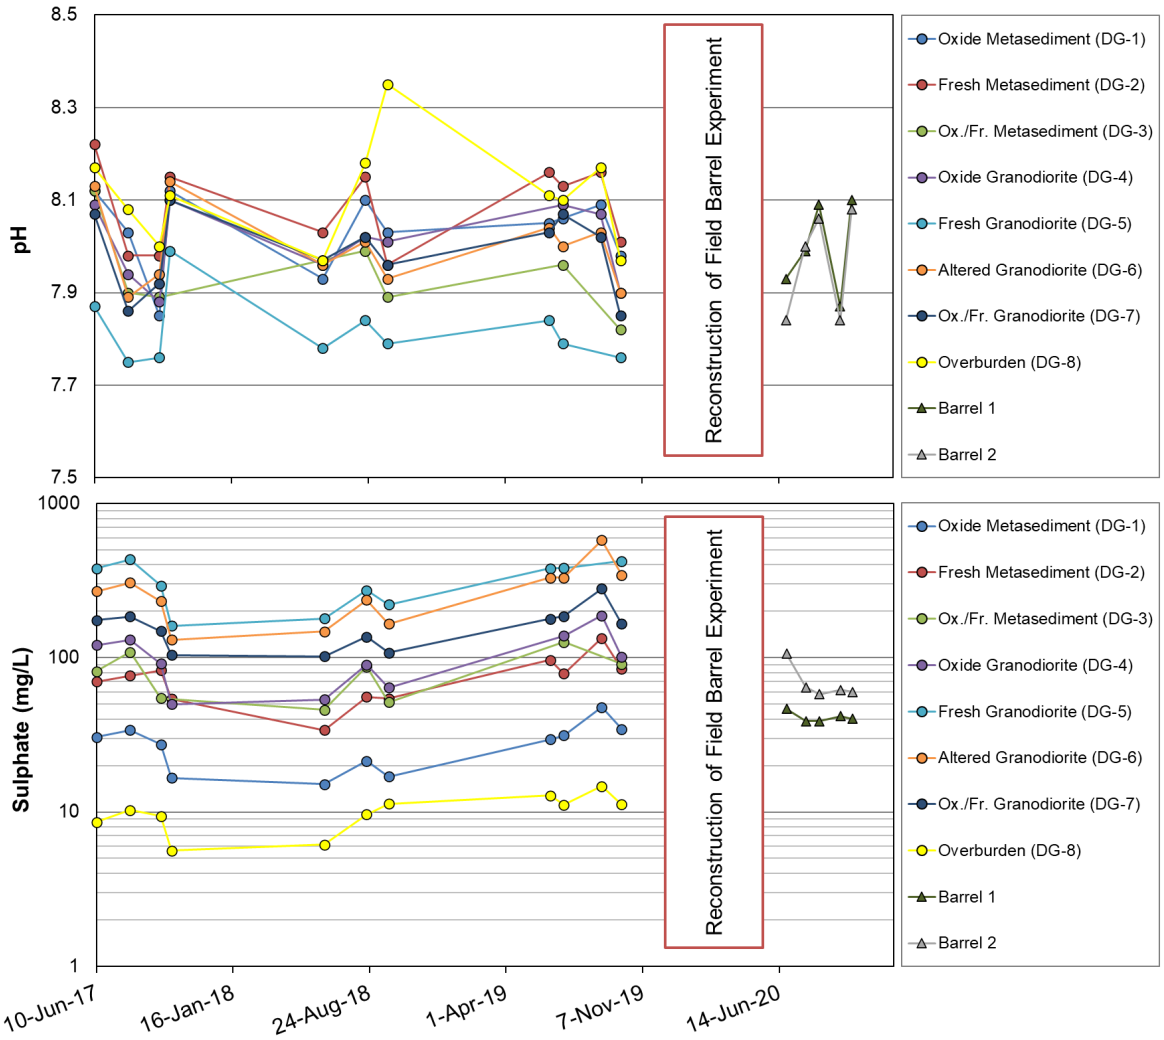

Figure 2-4: pH and sulphate concentrations in field barrel leachates before and after the reconstruction of the SRK kinetic experiments

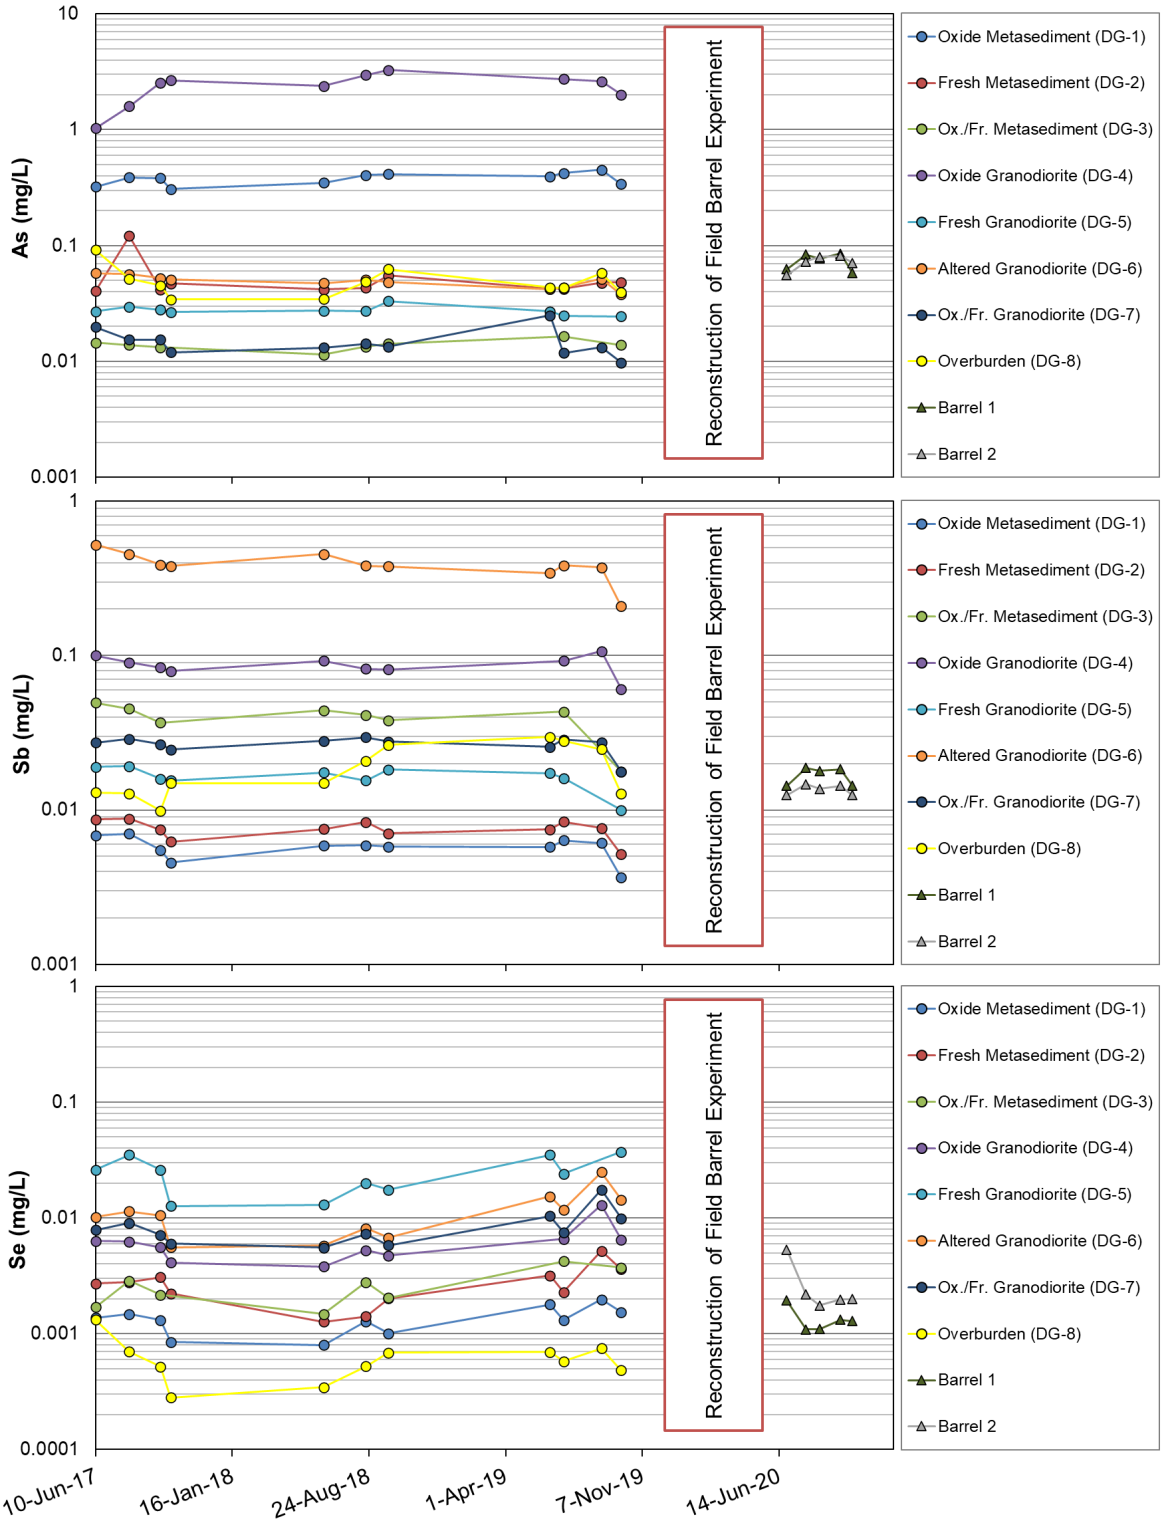

Figure 2-5: Arsenic, Sb, and Se concentrations in field barrel leachates before and after the reconstruction of the SRK kinetic experiments

Comparable concentrations were also measured for Sb which shows a relatively narrow range between 0.01 and 0.02 mg/L across the two field barrels to date. Temporal trends in Se leaching are almost identical in Barrel 1 and Barrel 2 effluent, although Barrel 2 has consistently released slightly higher Se concentrations peaking at 0.0053 mg/L and stabilizing approximately 0.0020 mg/L in the last three sampling cycles (Figure 2-5). The temporal trends and relative Se leaching behaviour for Barrels 1 and 2 mimics that of sulphur (Figure 2-4) providing additional evidence that Se may be closely tied to sulphur leaching.

Overall, the initial results from the re-constructed field barrel experiments appear to show that mixed lithology waste rock materials generate more consistent and moderate concentrations for various metals of concern. Waste rock from the MSED unit, which is expected make up a high proportion of the initial (basal) lifts of the different WRSAs seem to provide significant As attenuation capacity.

2.2.3 Unsaturated Columns

Time-series plots of pH and sulphate concentrations for the various field barrel subsamples are shown in Figure 2-6. As for the field barrels, effluent from the unsaturated columns has expectedly remained neutral circum-neutral to slightly alkaline in all samples collected to date. Importantly, measurements of column pH are comparable to those seen in field barrel leachates, suggesting that the same pH buffering controls apply. Sulphate concentrations are initially high in all column leachates, reaching up to 370 mg/L in Col 2. Over time, sulphate release has stabilized to 104 to 209 mg/L across the various columns in the most recent sampling cycles.

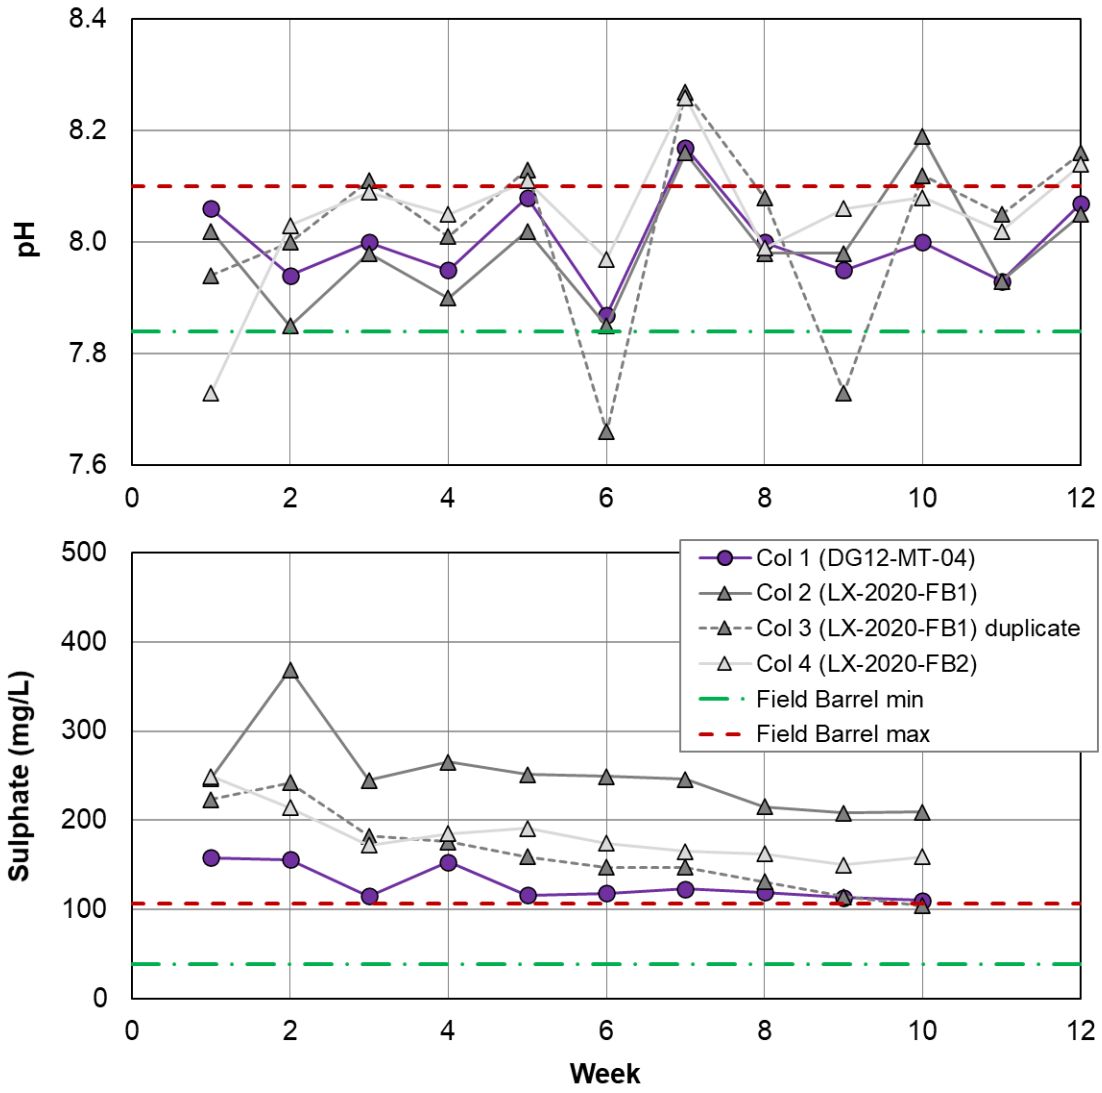

Figure 2-6: pH and sulphate concentrations in effluent from columns constructed with Eagle Pit field barrel duplicate samples

Effluent from Col 3, which contains a duplicate sample of Col 2 (LX-2020-FB1), shows markedly lower sulphate concentrations than Col 2 leachate. Note that the latter's influent represents Col 1 leachate, while Col 3 is irrigated with deionized water. The higher sulphate concentrations produced by Col 2 may therefore be a result of cumulative sulphate leaching from the two columns or, alternatively, may be a result of sample heterogeneity of the two LX-2020-FB1 split samples. It is important to note that the columns are producing sulphate concentrations that are consistently higher than those measured in the field barrels (Figure 2-6). The most likely explanation for this finding is the effect of crushing of the column subsamples to <1/4 inches leading to a smaller grain size. These results show that the scale

of an experiment is not the only control on the concentration of solutes in mine rock contact water.

Arsenic concentrations leaching from Col 4 are remarkably similar to the maximum concentration measured in field barrel leachates and generally fall between 0.08 and 0.09 mg/L (Figure 2-7). Col 2 and Col 3 produced As concentrations of 0.04 mg/L or lower. This is an important finding since the effluent from Col 1 (DG12-MT-04) exhibits As concentrations that are consistently elevated above 0.7 mg/L. Although the observed column effluent concentrations from this sample are not as high as those observed in the DG12-MT-04 field barrel prior to reconstruction (Figure 2-5), this trend nevertheless confirms that sample LX-2020-FB1 has significant attenuation capacity with an effectiveness of >90%. Since Col 3 releases comparable As concentrations without the application of high-As influent, an As solubility control is indicated for the MSED composite sample.

Attenuation is also observed in Col 2 for Sb, but not Se (Figure 2-7). In detail, Sb concentrations in effluent from Col 1 are reduced from >0.1 mg/L to <0.03 mg/L upon contact with Col 2 waste rock material. Since the Sb concentrations leaching from Col 3 are virtually identical, like for As, this suggests that solubility constraints for this species apply. Relatively elevated Sb concentrations measured in Col 4 (LX-2020-FB2) leachate may be explained by the increased solid-phase Sb content of this sample.

Initially, Se concentrations leaching from all column samples exceed those seen in the corresponding field barrels. However, a gradual transition to 0.003 mg/L or less has occurred in the more recent sampling cycles. Col 2 does not show appear to attenuate Se concentrations produced by Col 1 but does in fact release higher Se concentrations initially. As for the field barrel results, the trends observed indicate a connection between Se and sulphate leaching.

Albeit preliminary, the combined findings from the Eagle field barrel and duplicate laboratory experiments have increased the understanding of metal leaching and attenuation and are considered in the development of geochemical source terms.

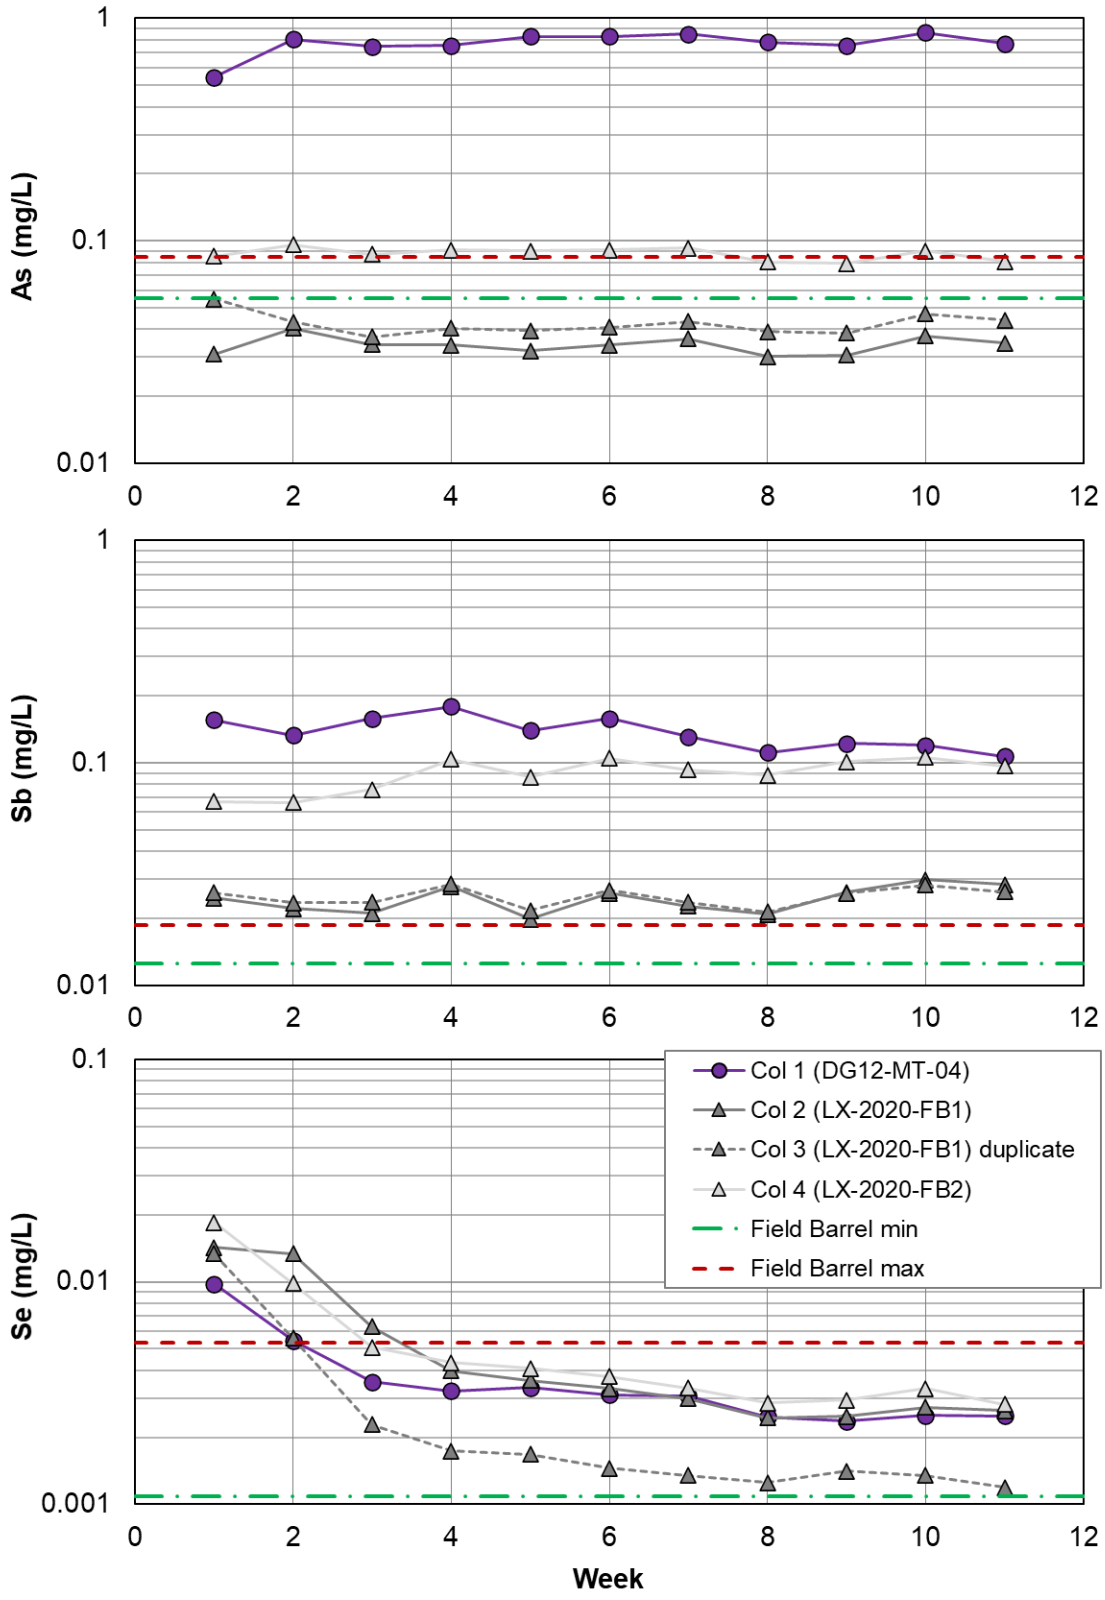

Figure 2-7: As, Sb, and Se concentrations in effluent from columns constructed with Eagle Pit field barrel duplicate samples

3. Development of Geochemical Source Terms

The prediction of the water chemistry in contact with the various Eagle Gold Project facilities containing disturbed mine rock (waste rock, ore) is required for the development of site-wide water quality models and, in turn, for the assessment of project effects on the aquatic environment and water treatment considerations. The modelled contact water chemistry effectively applies to drainage from the WRSAs, pit walls, or post-closure heap leach facility (HLF) and is referred to as *geochemical source terms*. Overarching controls that govern mine contact water quality include:

- mineralogy and geochemistry of the exposed material;
- grain size distribution;
- water/rock ratio;
- depositional environment (*e.g.*, saturated versus unsaturated conditions); and
- temperature.

The rate at which minerals weather chemically in laboratory kinetic tests is typically significantly faster than rates inferred in the field (Malmström, 2000). This discrepancy is in part due to the formation of distinct flow channels within the waste rock pile that results in the incomplete flushing of weathering products from the waste rock dump (Nichol et al., 2005).

While these factors will also play a role in the drainage chemistry from the HLF, the HLF source term is expected to be more strongly governed by gold leaching reagents (NaCN) being added as part of the barren solution application and solution recycling. During operations and in the early stages after mine closure, residual cyanide and its decay products (ammonia, nitrite, nitrate) will result in the increased mobility of various solutes until process solution pore water is displaced (e.g., Parshley et al, 2012).

The following provides an overview of the approach and results of the geochemical source term model developed for Eagle Gold waste rock facilities and HLF. Note that assumptions around the temporary (90 day) ore stockpile were not changed since the previous source term model iteration and as a result, this facility was not re-modelled within the scope of this work. Refer to Lorax (2020) for an overview of the operational source term predictions relating to stockpiled ore.

3.1 Approach: Waste Rock Facilities

For the Eagle Gold Mine, the prediction of both the major and trace elemental geochemistry of waters in contact with the modelled waste rock facilities was conducted via upscaling of loading rates derived from humidity cell tests. A flow chart illustrating the work stages involved in this exercise is given in Figure 3-1. On a high-level, the approach is similar to

that of the original source term model developed for the project (Lorax, 2014), however minor changes to the model assumptions were made and site-specific and supporting analogue datasets were updated.

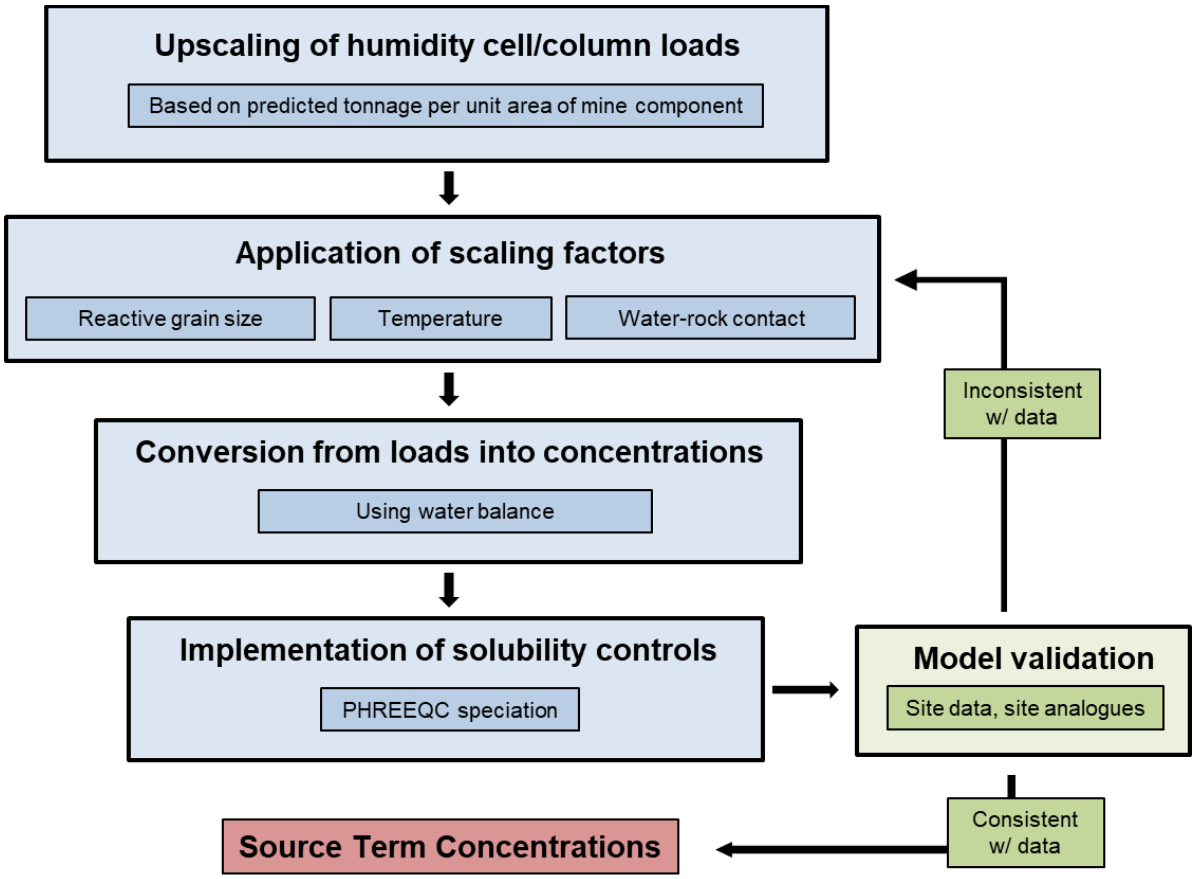

Figure 3-1: Work stages involved in the scaling of waste rock geochemical source terms

3.1.1 Selection of Input Loading Rates

As a first step in the development of geochemical source terms, the appropriate input solution chemistry was defined. For this purpose, Eagle humidity cell leaching rates were derived from the data presented in SRK (2014) and were grouped to represent the various waste rock types expected to be disturbed during mining. Humidity cells used to produce these contact water model input solutions are listed in Table 3-1.

Waste rock geochemical source terms were derived for the two WRSAs (Platinum Gulch, Eagle Pup) as well the open pit. During operations, the geochemical predictions were provided on an annual basis, while the post-closure source terms are expected to remain relatively stable in the long-term such that only one set of annually recurring predictions is accounted for in the site-wide water quality model.

To maintain conservatism, the 75th percentile values of all available humidity cell leachates for a given species were used as the model input solution. Conversely, the 75th percentile loading rates of the last three humidity cell cycles (weeks) with metals analyses were utilized to produce a solution input for the post-closure ("stable") scenario. This assumes that geochemical reaction rates reach a steady-steady state after soluble minerals have been flushed. Table 3-2 provides an overview of the input solution chemistries used for all Eagle Gold waste rock facilities.

Table 3-1:
Summary of kinetic test cells used for the individual block model units

Lithology/Material	Eagle Pit HC
Oxide GND	HC 5, HC 10
Fresh GND	HC 3, HC 9
Altered GND	HC 4, HC 6, HC 11
Oxide MSED	HC 8
Fresh MSED	HC 1, HC 2, HC 8, HC 13
Overburden (OB)	HC 10

Notes: All parameters except pH are given in mg/kg/wk.

3.1.2 Upscaling of Kinetic Test Loads

Once the input solution chemistry was defined, the geochemical loads were upscaled to match the tonnage of the mine facility in question. Current estimates of mine tonnage stored in WRSAs were provided by VGC. The waste production schedule and pit wall exposures used for this assessment are given in Table 3-4 and Table 3-5, respectively. Note that approximately 2.4 Mt of waste rock material were already deposited in the Platinum Gulch WRSA by the end of 2019 and a total of almost 13 Mt in 2020. This tonnage was accounted for in the upscaling exercise.

While the rock mass of the described mine components can be easily translated from the waste production schedule, the derivation of reactive rock mass within the exposed pit walls is less straightforward. The final pit walls are expected to be fractured as a result of blasting operations. Fracturing of the pit walls exposes a greater proportion of the wall rock to weathering and hence wall rock drainage will have the geochemical signature of the respective rock type. In this assessment, it was assumed that controlled blasting would be used at the limits of the proposed open pit mine. Controlled blasting of rock does not completely eliminate fracturing of underlying rock but results in a blast-damaged transition zone extending into the pit walls. This blast-damaged transition zone comprises a blast-fractured zone and a blast-influenced zone that would be subject to oxidative weathering. The penetration depth of the blast-damaged zones into the wall rock is dependent on a variety of parameters. Hustrulid (1999) estimated ranges of 0.85 to 1.05 m and 2.65 to 3.15 m for the blast-fractured and the blast-influenced zones, respectively. These estimates are based on controlled blasting and an intermediate rock strength. For modelling purposes thicknesses of 1.0 and 3.0 m were chosen for the blast-fractured and the blast-influenced zones, respectively. Using a bulk density of 2.5 t/m^3 along with the annual surface areas broken out into waste rock type, these thicknesses were subsequently used to calculate a rock mass that will come in contact with the pit walls.

Table 3-3:
Waste rock production schedule (in Mt) by mine year for the modelled Eagle Gold WRSAs

WRSA	Waste Type	2020	2021	2022	2023	2024	2025	2026	2027	2028	Total

3.1.3 Scaling Factors

Owing to several empirical studies investigating the relationship of geochemical loads released in the laboratory compared to full-scale minesites, it has been recognized that drainage chemistry predictions based on direct mass upscaling often vastly overestimate the quantities of dissolved solids that are leached from the mine rock (Malmström et al., 2000; Sapsford *et al*., 2009; Plante *et al.,* 2014; Kirchner & Mattson, 2015). This is due to a variety of differences between laboratory and field conditions such as climate, water/rock ratios, hydrogeological pathways, grain size distribution and secondary mineral controls. All of these are factors that have the potential to reduce geochemical loads per unit mass contacted in the field. As a result, it is the industry standard to implement scaling factors when upscaling humidity cell leachate results to account for these discrepancies. The following describes the scaling factors applied in the Eagle Gold Project source term model and the rationale for correcting for specific conditions. Refer to Kempton (2012) for a review of the various scaling factors commonly considered for geochemical source term predictions.

3.1.3.1 Temperature

The Project is located in the Yukon with average monthly temperatures ranging from approximately -21 to 10.5˚C for January and July, respectively. Kinetic experiments used for the source term model were conducted at a temperature of 22˚C and it is well established that the rate of many geochemical reactions leading to the release of acidity and dissolved metals is temperature-dependent. For the waste rock assessed, the oxidation of pyrite can be considered the driving force in terms of contaminant leaching for most parameters of concern. This reaction has been extensively studied and its rate has been determined over a range of temperatures that can be expressed in terms of an Arrhenius correlation. The Arrhenius relationship describing pyrite oxidation rate as a function of temperature is given by:

$$Temperature\ adjustment\ [\%] = e^{[E_a * (T_x - T_y)/(R * T_x * T_y)]}$$

With E_a = activation energy;

R = universal gas constant = 8.314 J/K/mol;

T_x = temperature of interest; and

T_y = experimental temperature.

The activation energy determines the slope of this function and, therefore, the temperature-dependence of the oxidation reaction. For the purposes of this model, an E_a of 40 kJ/mol was chosen to be consistent with the range of values reported in the literature (e.g., Nicholson *et al.*, 1988; Kamei and Ohmoto, 1999).

The bulk portion of waste and ore piles will not adopt ambient air temperatures but have a much smaller amplitude in temperature variation throughout the year. To account for this thermal inertia, monthly temperatures were adjusted for these mine components to produce a smoother temperature distribution curve while still maintaining average annual ambient temperatures and an average temperature scaling factor of approximately 28% (range from 24-34% depending upon month; Table 3-6). For the pit walls, the temperature distribution was smoothed less strongly as the depth of reaction is shallow, yielding a wider range in scaling factors (16-41%) while showing a similar average scaling factor throughout the year.

Table 3-5:
Temperature scaling applied for the modelled waste rock mine components

Month	Pit walls	WRSAs
Jan	16%	24%
Feb	17%	24%
Mar	19%	25%
Apr	28%	29%
May	33%	31%
Jun	39%	33%
Jul	41%	34%
Aug	37%	33%
Sep	33%	31%
Oct	24%	28%
Nov	21%	26%
Dec	16%	24%
Average	27%	28%

3.1.3.2 Grain Size Distribution

Before representative material is placed into laboratory kinetic test cells, rock samples are crushed to a nominal grain size of <1/4" (6.35 mm) to allow for better comparability of reaction rates between different cells containing different geological material. The smaller the grain size, the higher the amount of surface area that is exposed to weathering, thereby causing increased reaction rates. Studies investigating the effect of grain size distribution on drainage chemistry in mine environments found that >80% of the geochemical loads are leached from the <25 mm fraction (Strömberg and Banwart, 1999; Stockwell *et al*., 2006). Dependent on the rock type and blasting method, it was estimated that this fraction represents between 10 and 40% by mass of a typical waste dump with the majority of studied waste dumps falling into the lower end of this range. Wickland and Wilson (2004) measured the particle size distribution of a waste rock dump and material less than 6 mm accounted for approximately 15% of the total dump mass. For the WRSA source term models, a scaling factor of 20% was utilized. For the pit wall blast-fractured zone, a reasonably conservative scaling factor of 30% was implemented to account for the increased mass

of reactive rock in response to blasting activities. A grain size scaling factor of 20% was assigned to the less damaged pit wall blast-influenced zone.

3.1.3.3 Contact Water

Humidity cell experiments are conducted using water/rock ratios that allow for the flushing of all rock material placed into the cells. Various studies suggest that only a portion of the rock mass contained in a waste dump is contacted by infiltrating water. In one study, for example, a small-scale waste rock dump was disassembled one year after its construction and the distribution of moisture contents within the dump indicated that the development of preferential flow paths is an important process (Marcoline *et al.,* 2006). Under low-flow conditions, water is preferentially retained in and will travel along the fine fractions within the waste dumps, whereas heavy rainfalls may flush relatively higher proportions of the coarser grain sizes (Andrina, 2009). It has also been postulated that, in months of higher rain intensity, a larger overall portion of the dump is contacted as more pathways are being activated. Further, the discrepancy between lab and field derived loading rates tends to be smaller for certain major ions that behave more conservatively (e.g., Kirchner & Mattson, 2015). This is likely as result of natural attenuation mechanisms (*e.g.,* co-precipitation, adsorption) that apply more effectively to minor and trace elements. In accordance with these concepts, contact water scaling factors were applied as a function of infiltration volume for each month as well as in dependence of the type of element modelled (major versus minor/trace). Specifically, four times larger scaling factors (*i.e.,* less correction) were applied to the following species: SO_4, Cl, F, Ca, Na, K, and Mg.

As the WRSAs becomes larger with time during operations, it can be assumed that the percentage of contact water decreases with increasing dump size over time since larger zones within the facility become isolated from infiltration as a result of the increasing rock volume/area ratio and corresponding decrease in the water/rock ratio. To account for this concept, the contact water scaling factors were adjusted across the different facilities proportional to the change in water/rock ratio modelled for each facility in a given model year. This approach was carried forward into the post-closure scenario where the WRSAs will be covered with soil as part of the closure process to reduce infiltration. An overview of the maximum assumed contact water factors for the two WRSAs is provided in Table 3-7. These maximum scaling factors apply in the month of the highest infiltration and are downscaled proportionally in lower-flow months.

The maximum contact water factor was held constant for pit walls over time where 100% and 80% contact water scaling factors were applied to the blast-fractured and blast-influenced zones, respectively, for the same major elements described above. For minor and trace elements, these maximum scaling factors were reduced by a factor of four to 25% and 20%. It is important to note that the scaling factors for pit walls and WRSAs are calibrated under consideration of the 2020 Eagle Gold kinetic test program described in Section 2.

Table 3-6:
Maximum contact water scaling factors implemented for the WRSA source term model

Facility	Platinum Gulch WRSA		Eagle Pup WRSA	
	Major Elements	*Minor/Trace Elements*	*Major Elements*	*Minor/Trace Elements*
2020	11%	3%

2022	27%	7%	15%	4%
2023			13%	3%
2024			13%	3%
2025			13%	3%
2026			12%	3%
2027			10%	3%
2028			10%	2%
PC	*12%*	*3%*	*6%*	*2%*

3.1.4 Model Output Adjustments

Water/rock ratios in humidity cell testing are generally high enough to prevent the saturation of leachates with respect to secondary mineral phases. Upscaling of geochemical loads, as described above, is generally carried out with no consideration given to mineral phases that may limit the dissolved concentrations of relatively insoluble elements such as Fe and Al, particularly at circum-neutral pH. In order to avoid the prediction of unrealistically high concentrations for species that are known to form secondary phases in mine drainage, PHREEQC - a thermodynamic mineral solubility model (Parkhurst and Appelo, 1999) - was employed on the upscaled model output concentrations to account for mineral solubility controls. As part of this modelling step, minerals commonly seen in mine drainage were allowed to precipitate from the predicted drainage solutions. An overview of the modelled phases is given in Table 3-8. Phases that were identified to be supersaturated in at least one output solution draining from the individual mine components are indicated by a check mark. Unmarked phases merely served as a theoretical concentration cap but do not affect the corresponding species.

In contrast to solutes that were capped via PHREEQC modelling, the comparison of the model output with the field barrel database revealed that some source term predictions may also be unrealistically low. This is interpreted to be an artifact of uncertainties relating to the scaling exercise and/or flow predictions. To maintain conservatism, a concentration minimum was implemented for each based on long-term field barrel data (pre-2020) and in consideration of waste rock lithological proportions for each given waste rock facility at end of mining. The resulting predicted minimum concentrations are summarized in Table 3-9. Note that these values were imposed equally for every model year and into post-closure.

Table 3-7:
Mineral phase allowed to precipitate in the Eagle Gold speciation model (PHREEQC)

Mineral	Ideal Formula	Eagle Pup WRSA	Platinum Gulch WRSA	Stewart Gulch WRSA	Pit walls
Barite	$BaSO_4$	✓	✓	✓	✓
Calcite	$CaCO_3$	✓	✓	✓	✓
Dolomite	$(Ca, Mg)(CO_3)_2$			✓	
Ferrihydrite	$Fe(OH)_3(a)$	✓	✓	✓	✓
Gibbsite	$Al(OH)_3$	✓	✓	✓	✓
Gypsum	$CaSO_4*2H_2O$				
Malachite	$CuCO_3$				
Quartz	SiO_2	✓	✓	✓	✓
Rhodochrosite	$MnCO_3$				
Smithsonite	$ZnCO_3$				

Notes: Phases with a check mark did in fact precipitate in the source term model output solutions.

Lastly, another adaption made to the upscaled loads is the derivation of selenium concentrations. Kinetic test data suggest that Se is strongly correlated with dissolved sulphate and is interpreted to be mineralogically associated with sulphur in both sulphate and sulphide minerals. For predictions made based on humidity cell upscaling, Se concentrations were modelled as a function of the sulphate concentration using Se/SO_4 ratios observed in the individual field barrels and proportioned according to rock type expected in a given mine year.

3.2 Results: Waste Rock Facilities

One of the key underlying assumptions with respect to WRSA and pit wall drainage chemistry is that PAG material is sufficiently sparse, evenly distributed and/or adequately managed to prevent the onset of acidic conditions. Therefore, all geochemical source terms generated as part of this document are assumed to remain circum-neutral in the long-term with pH values expected to fall around 8.0 based on observations from the field barrel program.

Model results are shown as time-series plots for the parameters of concern (As, Sb, Se, and SO_4) in Figure 3-2 and Figure 3-3. The relatively large range in the values within a scenario and mine component presented can be explained by the proportion of surfaces rinsed in response to seasonally variable flow rates and the consideration of temperature effects. Where seasonal variability is minor (*e.g.,* As in Eagle open pit), predictions are dominated by calibration with field barrel results (Table 3-9). The last year of the plotted drainage quality predictions represent post-closure conditions and are imported in the water quality model repeatedly on an annual basis. The full suite of source terms for Eagle Pup and Platinum Gulch WRSAs is presented in Appendix A and the source terms for the Eagle pit walls are presented in Appendix B.

3.3 Heap Leach Facility

Prediction of the HLF drainage chemistry during operations and in post-closure (draindown phase and in the long-term) relied heavily on metallurgical column experiments as well as existing full-scale site-specific and site analogue data from the Brewery Creek Mine. It is anticipated that the operational and early post-closure HLF drainage chemistry will be governed by the effects of residual cyanide and its degradation products. The approach chosen for the prediction of HLF drainage chemistry is outlined in the following.

3.3.1 Barren Solution (Operations)

A barren solution source term was generated in support of water quality and treatment considerations during operations. Early-stage, full-scale barren solution data for the operating Eagle Gold mine was provided by VGC (Wilbur, 2020) and was reviewed by Lorax. Barren solution data from February 07, 2020 was used as the basis for the calculation of the geochemical source term however, due to these data representing an early-stage barren solution chemistry that will likely evolve over time as this water is being re-circulated, the following adjustments were made:

- A re-circulation factor was incorporated to account for the accumulation and attenuation of geochemical loads as the barren solution is recycled. This factor was derived based on observations from the metallurgical column testing over time. It was calculated as follows:

$$\text{Recirculation Factor} = \frac{\text{Median column concentration (cycles 2–4)}}{\text{Median column concentration (last 3 cycles)}}$$

- Several species that are required for the site-wide water quality model were not determined as part of the operational barren solution analysis. Predictions for these species were quantified either based on site analogue data (Brewery Creek), from the leach phase of the Eagle Gold metallurgical columns or based on expected operational concentrations provided by VGC.

The barren solution source term is presented in Table 3-10 along with a list of modifications made to the original analytical data received (February 7, 2020 barren solution).

Table 3-9:
HLF barren solution source term input and results (in mg/L)

Parameter	Barren Solution (Feb 07, 2020)	Recirculation factor	Data Source	Source Term

Zn	45	1.1	Recirculated barren sol.	51

Notes: met. col. = Eagle metallurgical columns; BC = Brewery Creek; all concentrations are in mg/L.

3.3.2 Post-Closure

Two scenarios were modelled for the post-closure HLF drainage chemistry, namely an early draindown as well as a long-term period. For each of these temporal predictions, a base and an upper case were modelled, such that a total of four source terms were generated. The HLF source term model relied predominantly on data from metallurgical columns as well as Brewery Creek water quality monitoring (Viceroy Minerals, 2003; Alexco, 2012; SRK, 2014, Harrington, pers. comm., 2014). Specifically, for most species back-calculated scaling factors derived from the Brewery Creek HLF water quality monitoring with Brewery Creek metallurgical columns were applied to the metallurgical column data (post Au-leach and detox phase) available for Eagle Pit ore.

For the two temporal scenarios, base case scaling factors were calculated using Brewery Creek data as follows:

- Early draindown: $\text{Scaling Factor} = \frac{\text{Median HLF concentration (draindown)}}{\text{Median column concentration}}$
- Long-term: $\text{Scaling Factor} = \frac{\text{Median HLF concentration (long-term)}}{\text{Median column concentration}}$

For the upper case, the same general approach was employed, however instead of the median HLF monitoring data, the maximum observed concentrations were considered. The Brewery Creek HLF drainage databases used for this exercise include the following:

- Early draindown: Monitoring data from station BC-28a in in year 2002 (draindown)
- Long-Term: Monitoring data from station BC-28a in in years 2006-2012.

Note that no geochemical data was available for a number of solutes in the Brewery Creek metallurgical column dataset. Therefore, a subset of element-specific scaling factors were adopted from solutes where data was available based on the type of solute (major ions, minor/trace element, oxyanions). These scaling factors were then multiplied with the median concentrations produced by the Eagle Pit metallurgical columns after detoxification.

For CN and other N species (NH_3, NO_2, NO_3), scaling factors were not extrapolated, but rather median and maximum concentrations of these species from the Brewery Creek HLF monitoring database were used directly for the base and upper cases, respectively.

Lastly, in order to not produce unrealistically high source term predictions through uncertainties in scaling of metallurgical columns, concentrations caps were imposed. To maintain conservatism, these caps were calculated as 3 x the maximum water quality monitoring result from the Brewery Creek site (BC-28a) for a given species. The geochemistry model input data, scaling factors, as well as resulting source term predictions for the Eagle Gold HLF are summarized in Table 3-11.

Table 3-10:
Eagle Gold HLF post-closure source term model inputs and results (in mg/L)

	Eagle Column Data	Scaling Factors		Scaling Factors		Source Term Predictions		Source Term Predictions	
		Base Case		Upper Case		Base Case		Upper Case	
	Median (post-detox)	Early Draindown	Long-term	Early Draindown	Long-term	Early Draindown	Long-term	Early Draindown	Long-term

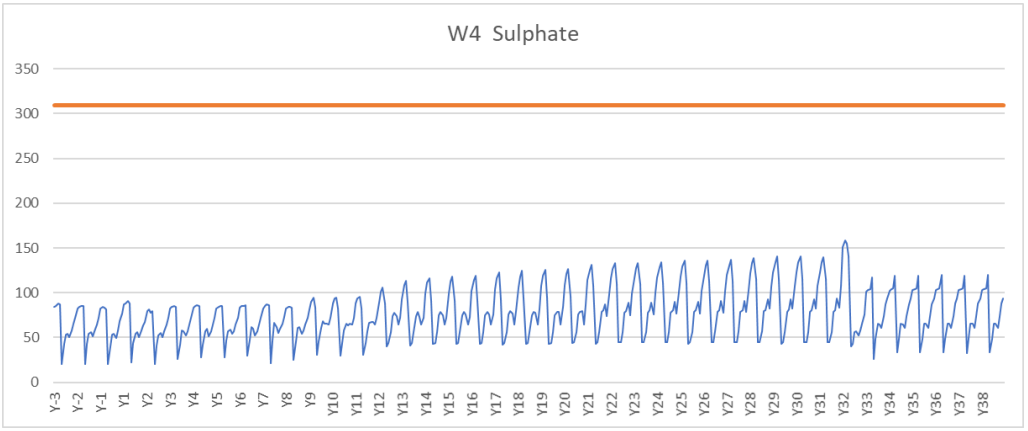
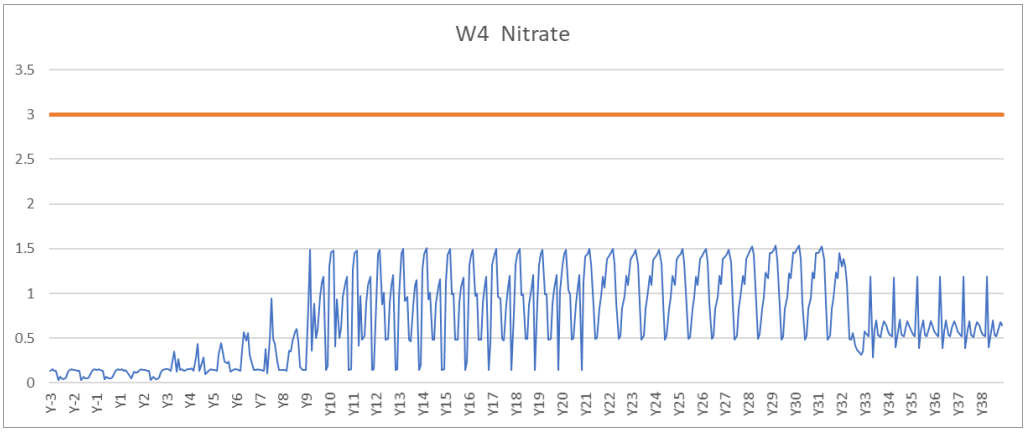
Appendix B: Water Quality Model Plots for all Parameters

B.1. Haggart Creek below Dublin Gulch (W4) – Water Quality Predictions



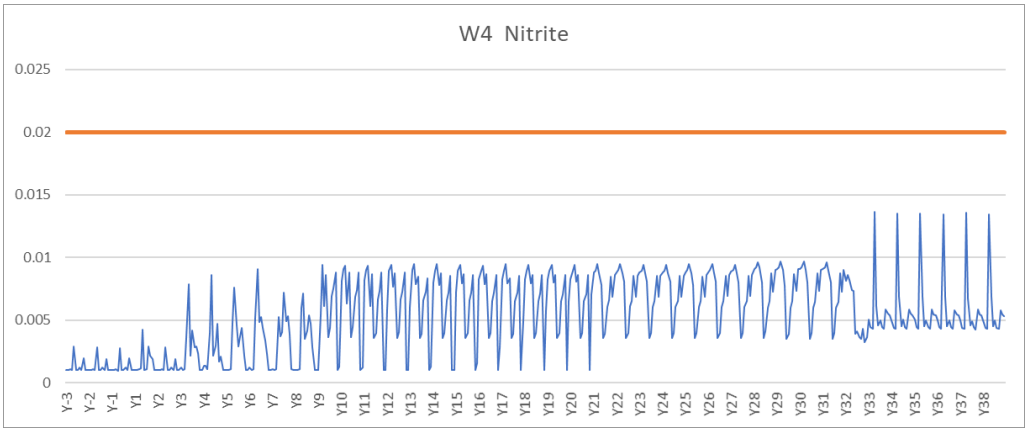
B.2. Haggart Creek below Eagle Creek (W29) – Water Quality Predictions

B.3. Haggart Creek below Eagle Creek (W99) – Water Quality Predictions

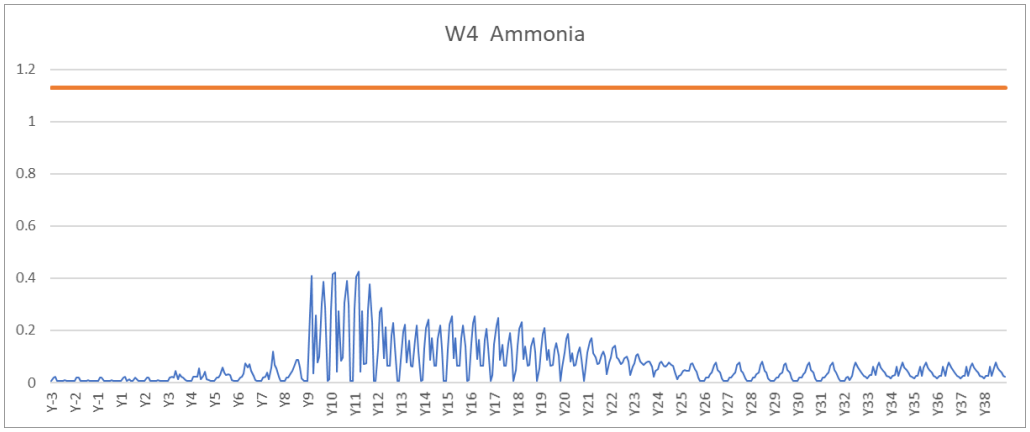


B.4. Haggart Creek below Lynx Creek (W23) – Water Quality Predictions

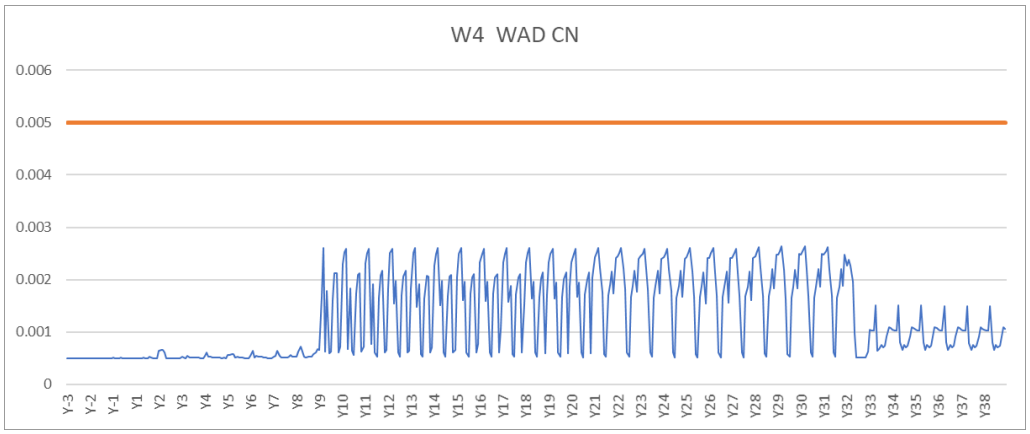
VICTORIA GOLD CORP



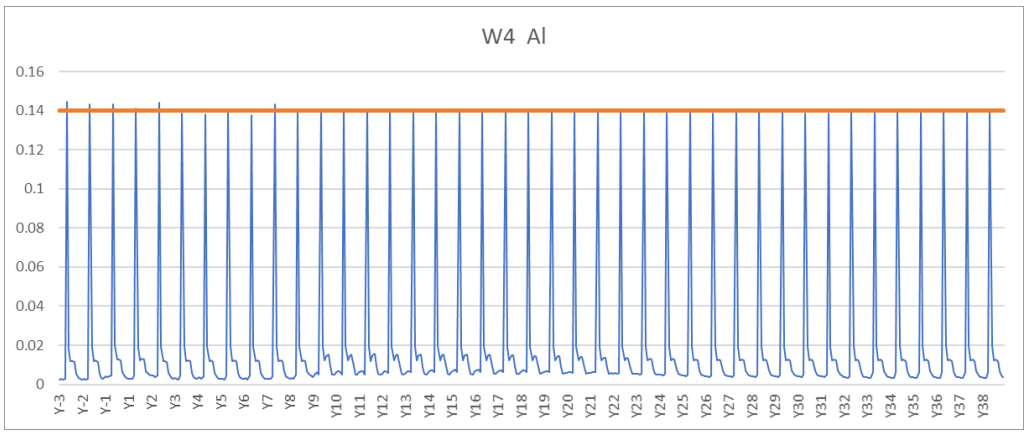
B.1. Haggart Creek below Dublin Gulch (W4) – Water Quality Predictions



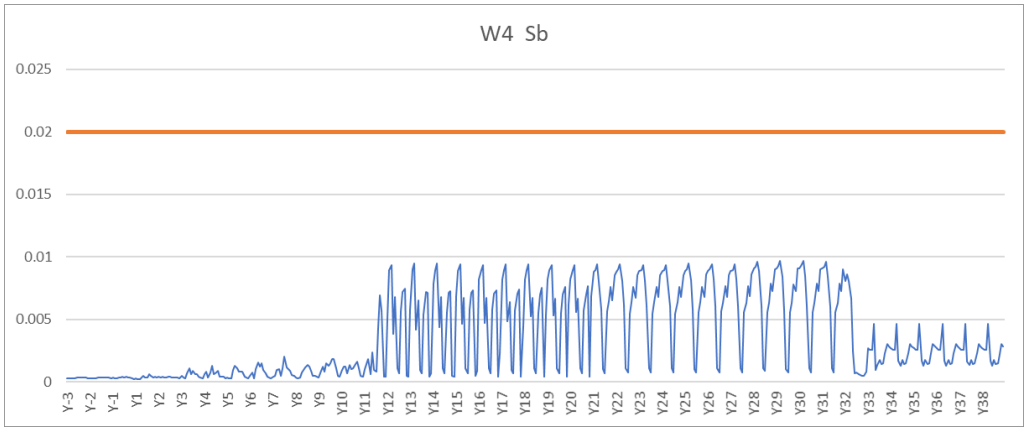
B.1-1: Time series of predicted sulphate concentrations (mg/L) for W4. Water Quality Objective is shown by red line.



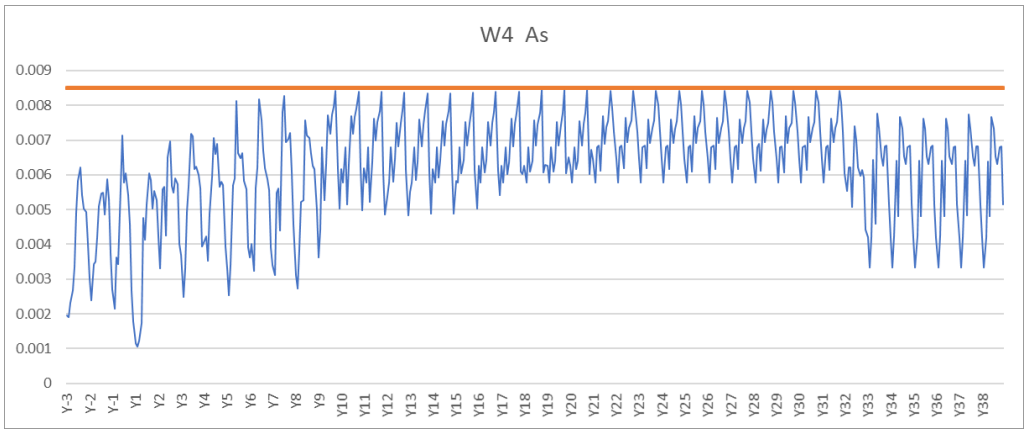
B.1-2: Time series of predicted nitrate concentrations (mg/L) for W4. Water Quality Objective is shown by red line.



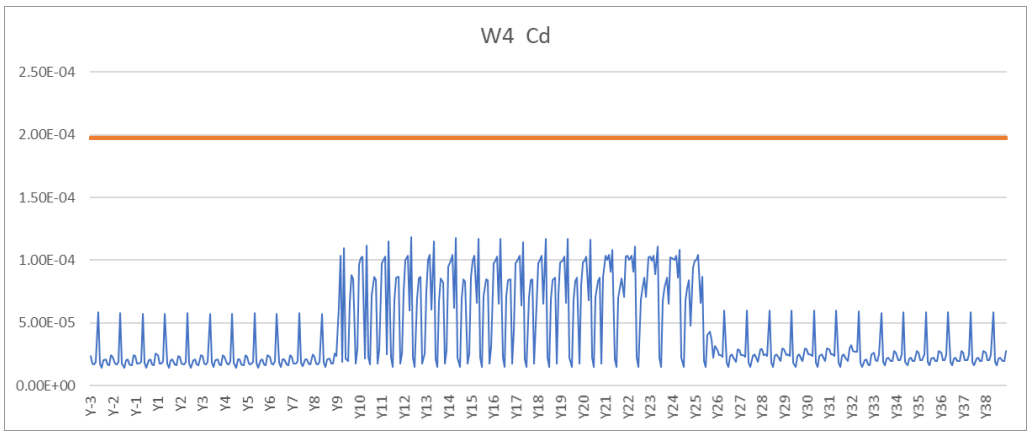
B.1-3: Time series of predicted nitrite concentrations (mg/L) for W4. Water Quality Objective is shown by red line.



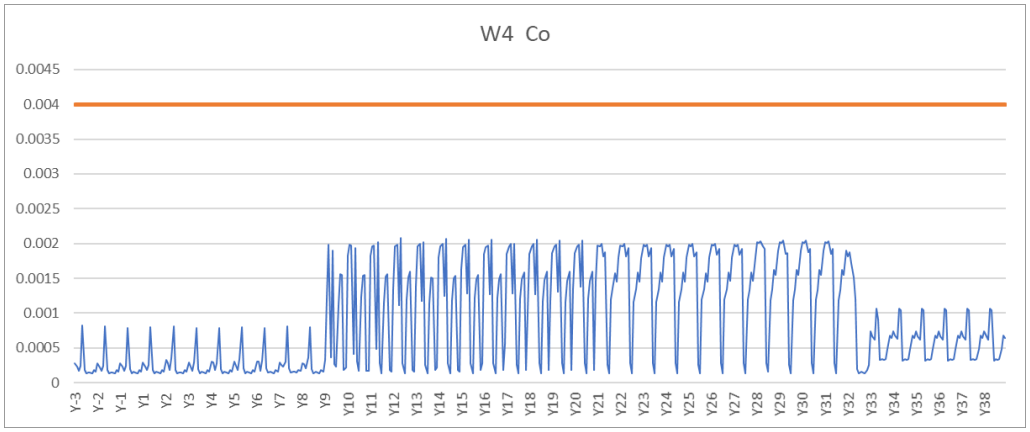
B.1-4: Time series of predicted ammonia concentrations (mg/L) for W4. Water Quality Objective is shown by red line.



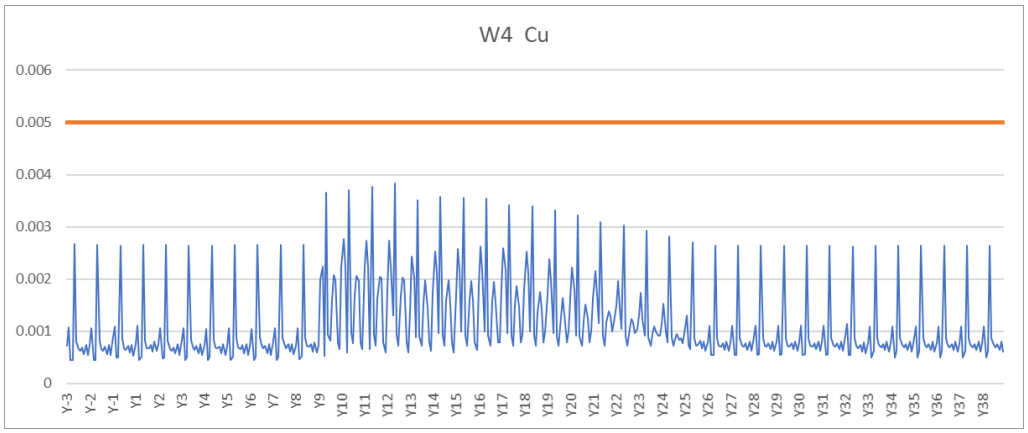
B.1-5: Time series of predicted WAD-CN concentrations (mg/L) for W4. Water Quality Objective is shown by red line.



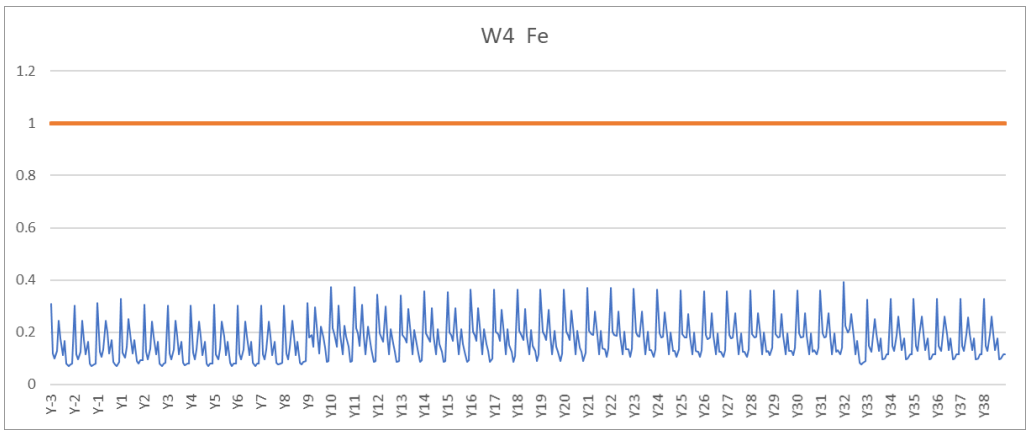
B.1-6: Time series of predicted aluminum concentrations (mg/L) for W4. Water Quality Objective is shown by red line.



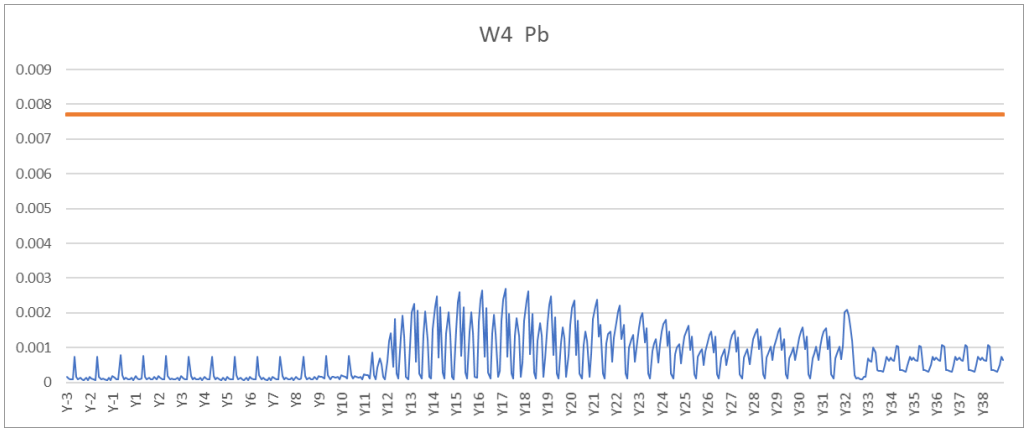
B.1-7: Time series of predicted antimony concentrations (mg/L) for W4. Water Quality Objective is shown by red line.



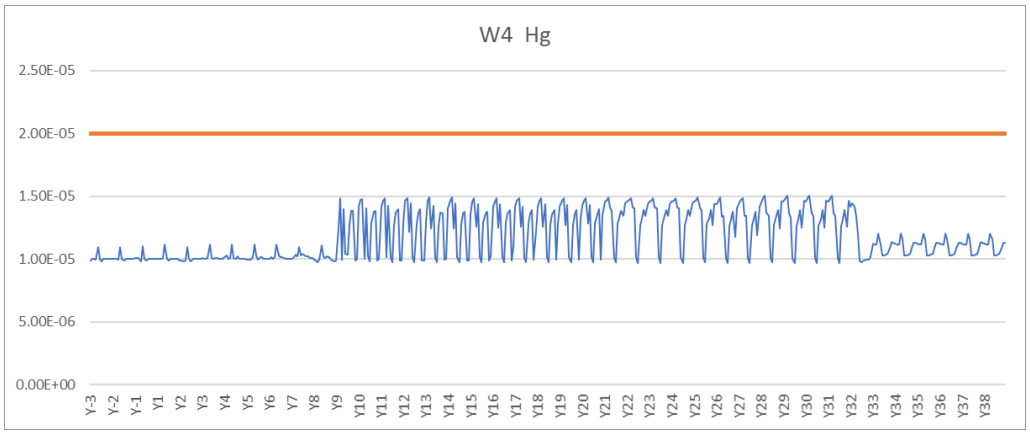
B.1-8: Time series of predicted arsenic concentrations (mg/L) for W4. Water Quality Objective is shown by red line.



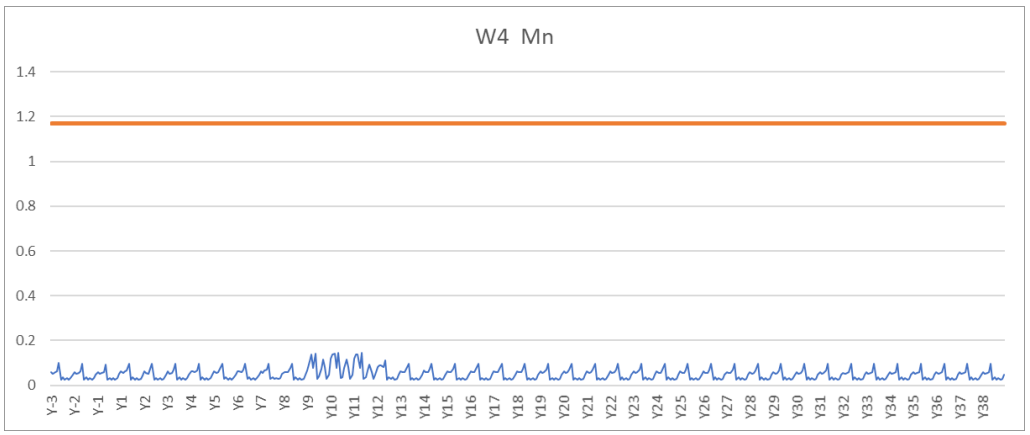
B.1-9: Time series of predicted cadmium concentrations (mg/L) for W4. Water Quality Objective is shown by red line.



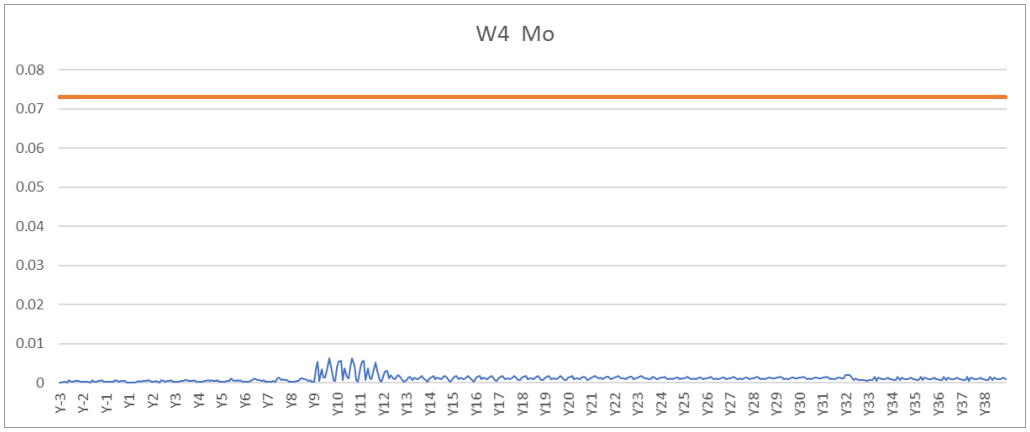
B.1-10: Time series of predicted cobalt concentrations (mg/L) for W4. Water Quality Objective is shown by red line.



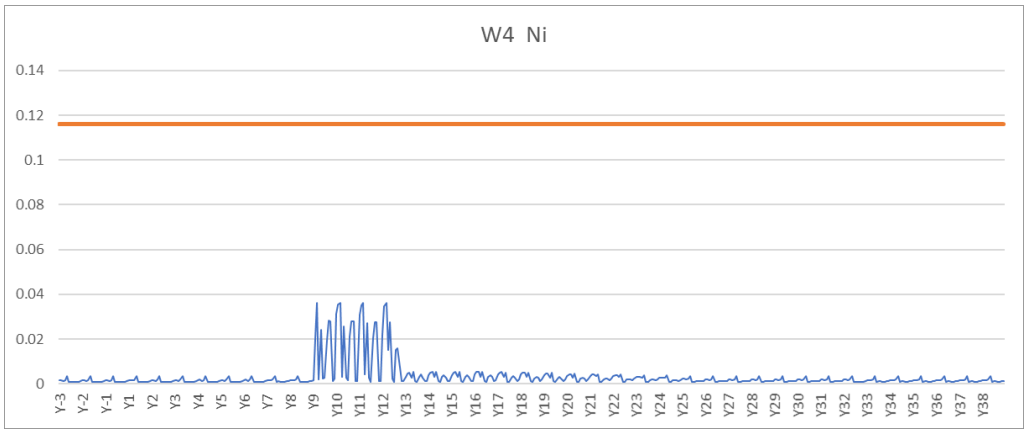
B.1-11: Time series of predicted copper concentrations (mg/L) for W4. Water Quality Objective is shown by red line.



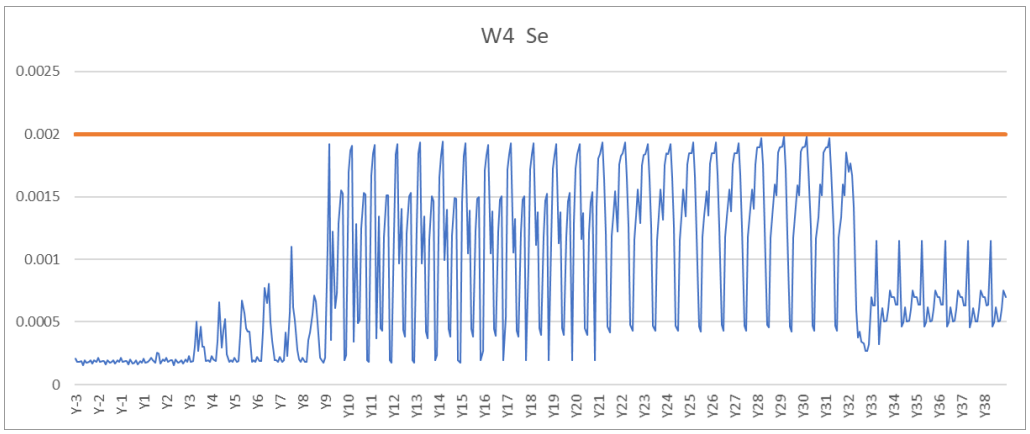
B.1-12: Time series of predicted iron concentrations (mg/L) for W4. Water Quality Objective is shown by red line.



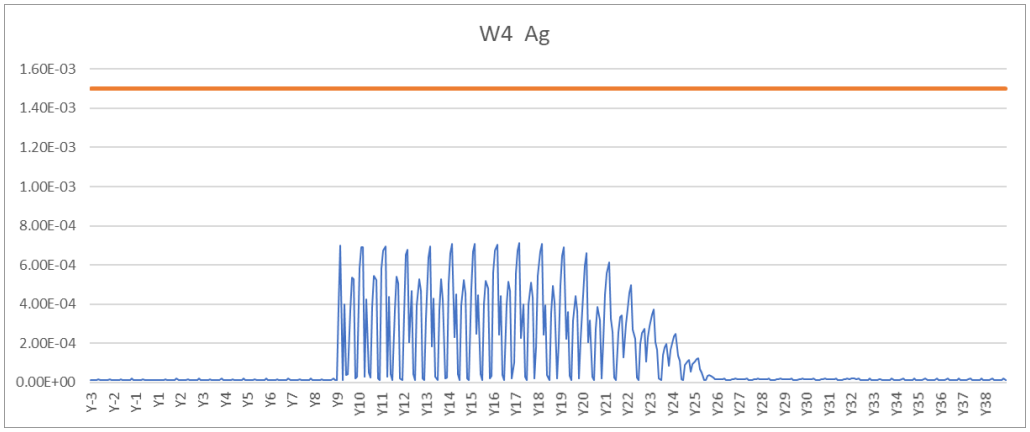
B.1-13: Time series of predicted lead concentrations (mg/L) for W4. Water Quality Objective is shown by red line.



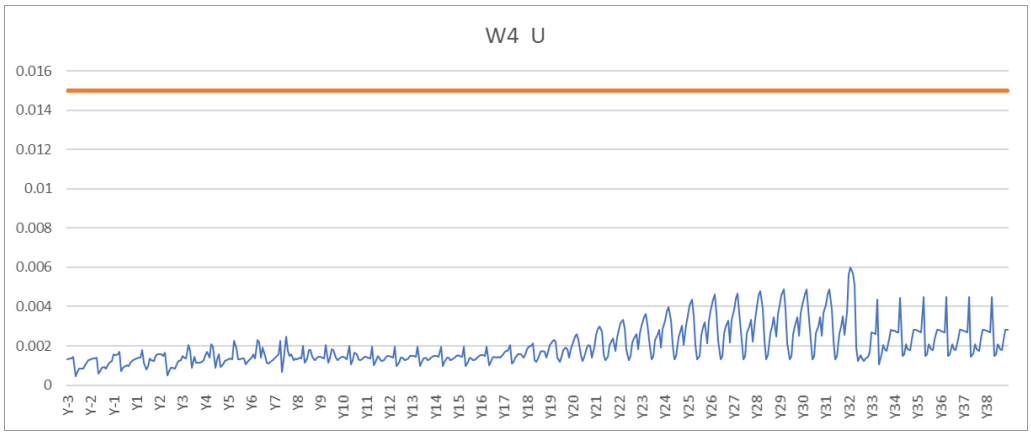
B.1-14: Time series of predicted mercury concentrations (mg/L) for W4. Water Quality Objective is shown by red line.



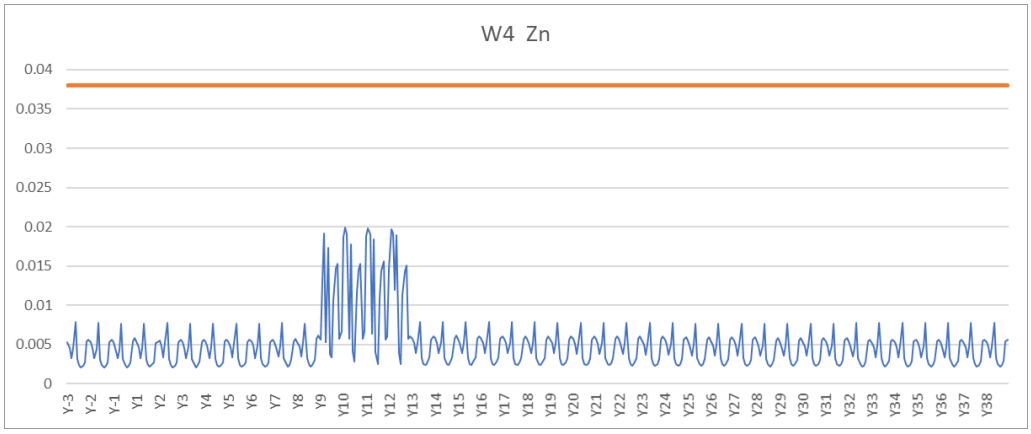
B.1-15: Time series of predicted manganese concentrations (mg/L) for W4. Water Quality Objective is shown by red line.



B.1-16: Time series of predicted molybdenum concentrations (mg/L) for W4. Water Quality Objective is shown by red line.

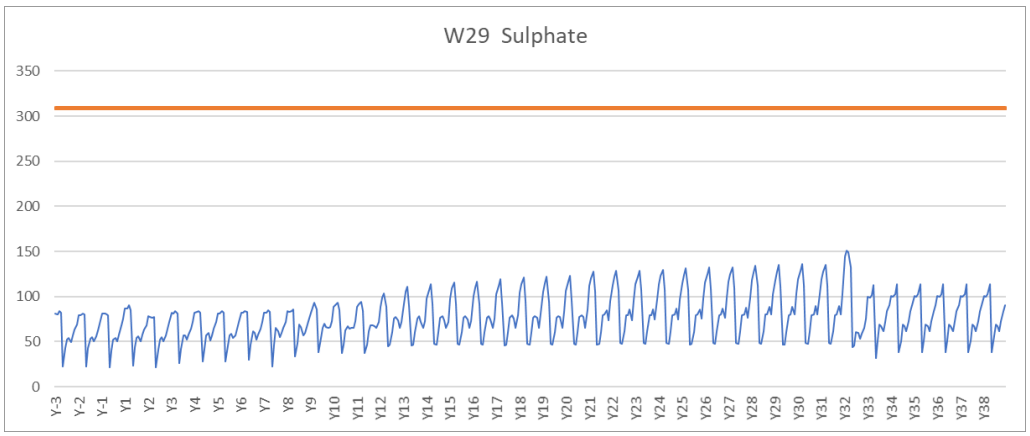


B.1-17: Time series of predicted nickel concentrations (mg/L) for W4. Water Quality Objective is shown by red line.

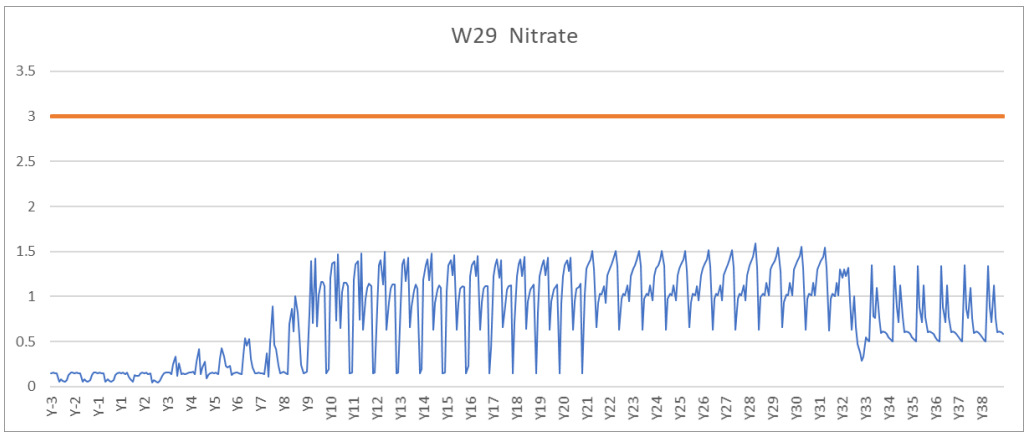


B.1-18: Time series of predicted selenium concentrations (mg/L) for W4. Water Quality Objective is shown by red line.

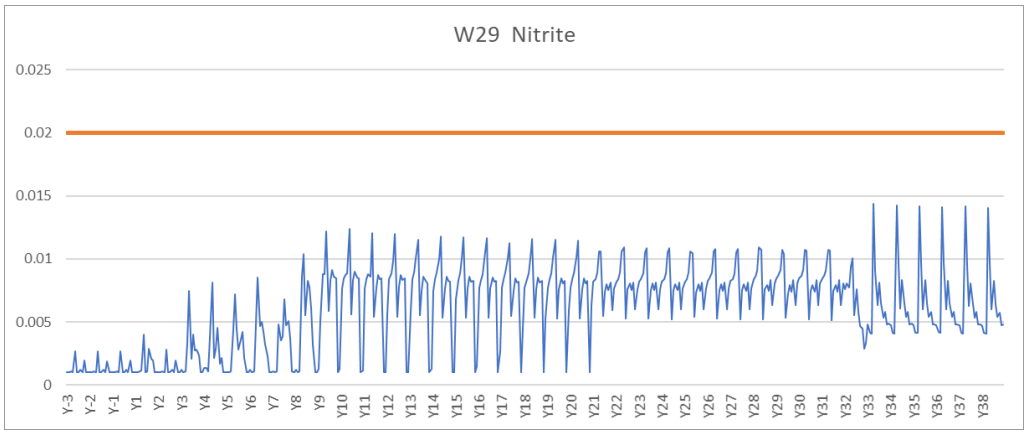
B.1-19: Time series of predicted silver concentrations (mg/L) for W4. Water Quality Objective is shown by red line.



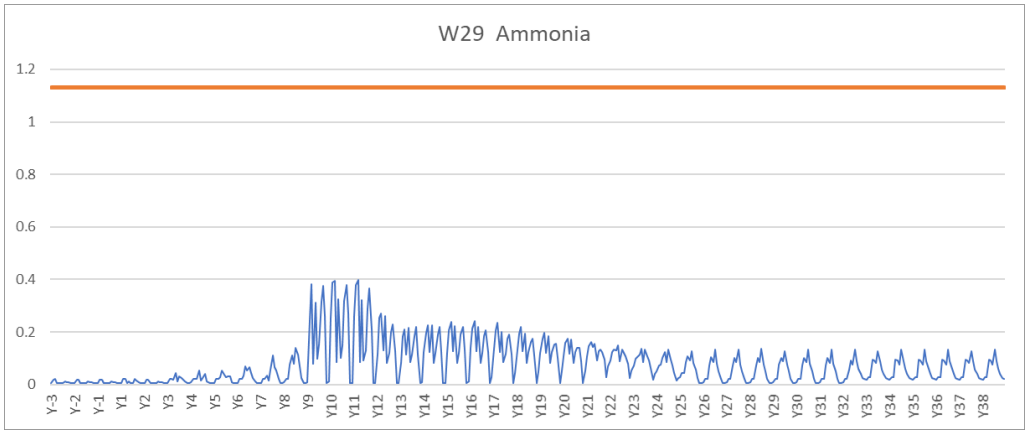
B.1-20: Time series of predicted uranium concentrations (mg/L) for W4. Water Quality Objective is shown by red line.



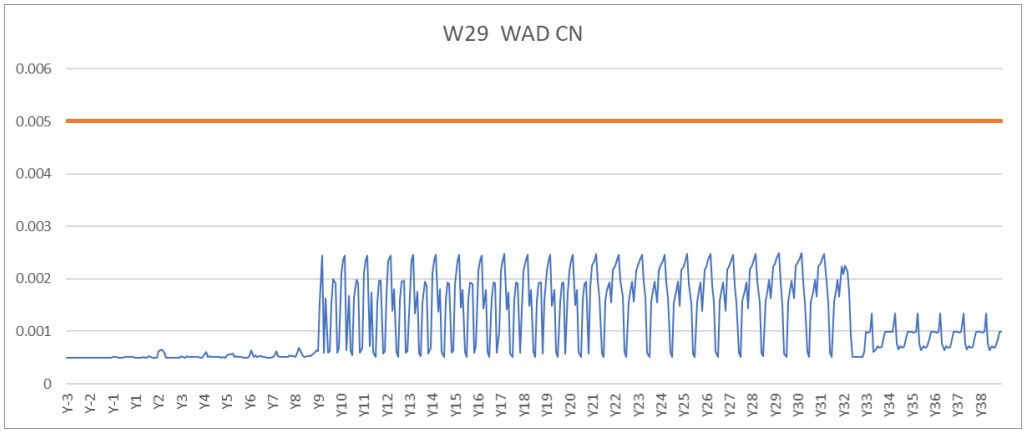
B.1-21: Time series of predicted zinc concentrations (mg/L) for W4. Water Quality Objective is shown by red line.



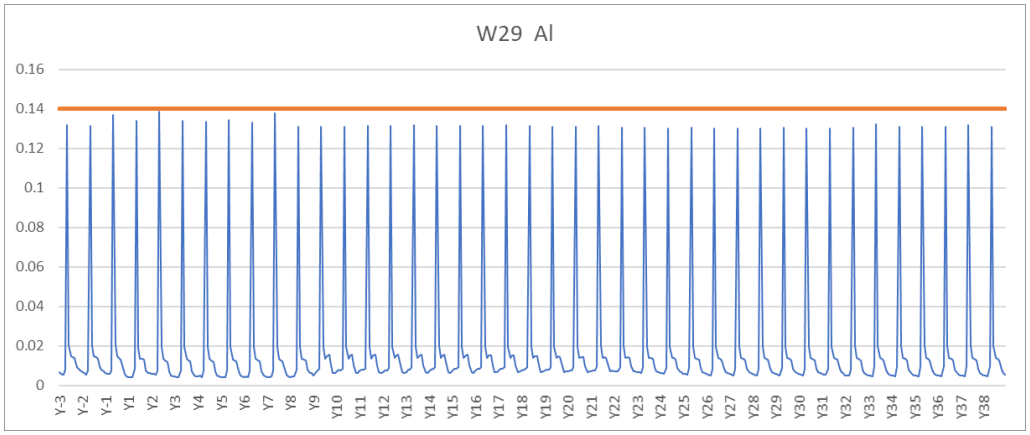
B.2. Haggart Creek below Eagle Creek (W29) – Water Quality Predictions



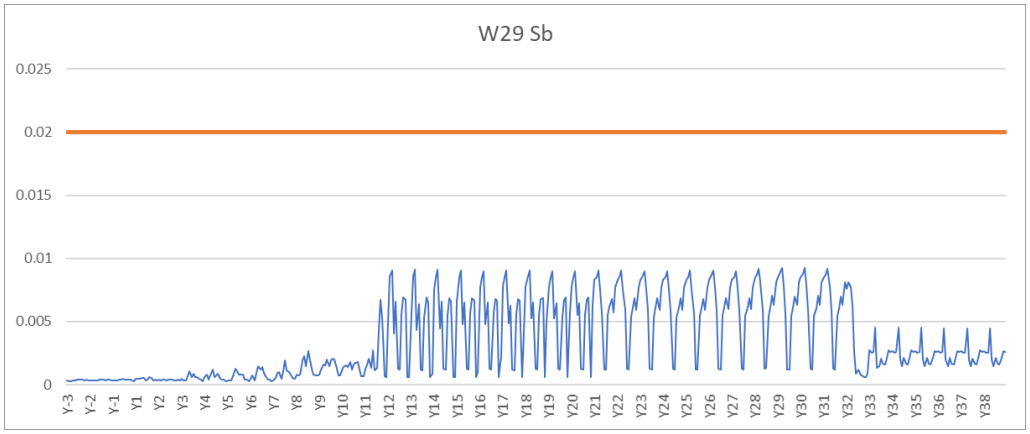
B.2-1: Time series of predicted sulphate concentrations (mg/L) for W29. Water Quality Objective is shown by red line.



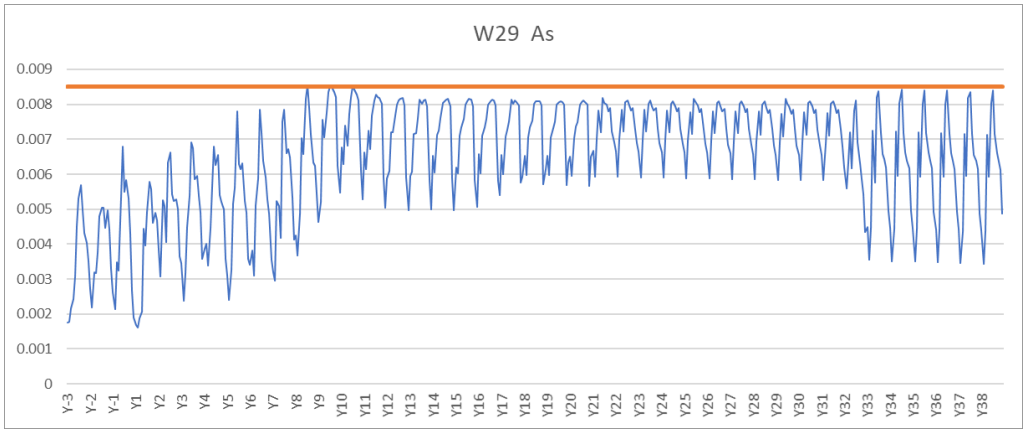
B.2-2: Time series of predicted nitrate concentrations (mg/L) for W29. Water Quality Objective is shown by red line.



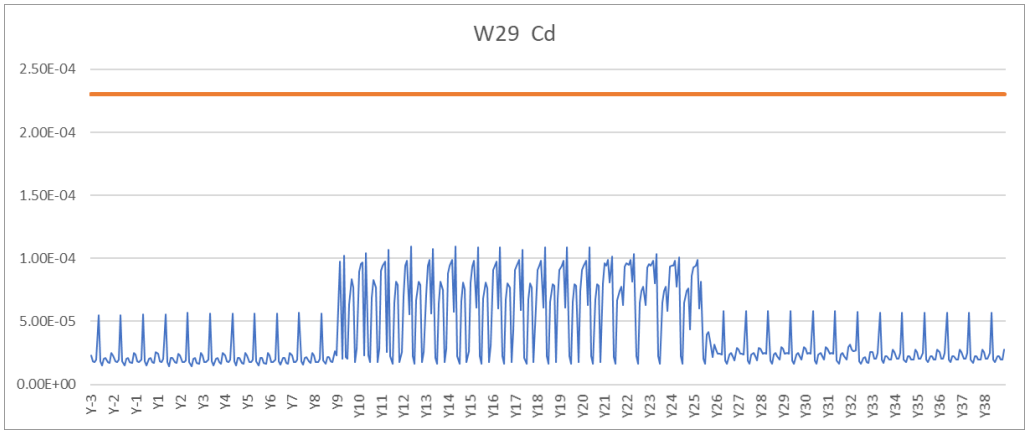
B.2-3: Time series of predicted nitrite concentrations (mg/L) for W29. Water Quality Objective is shown by red line.



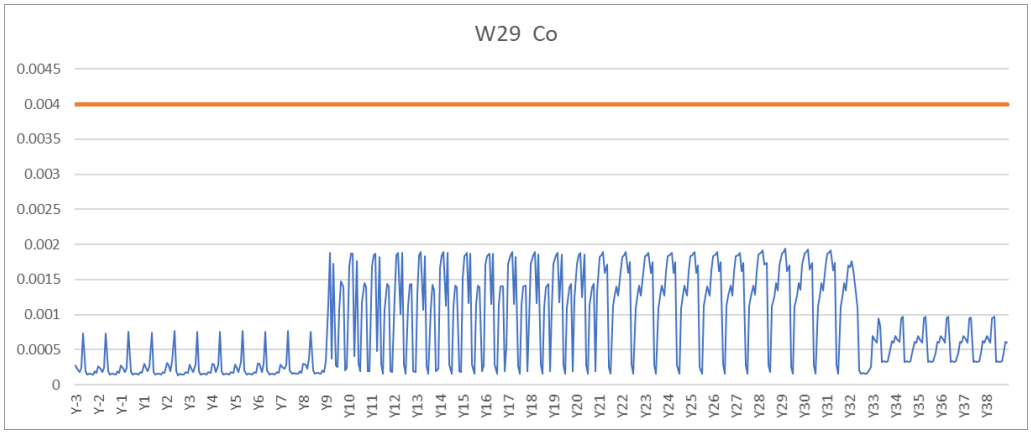
B.2-4: Time series of predicted ammonia concentrations (mg/L) for W29. Water Quality Objective is shown by red line.



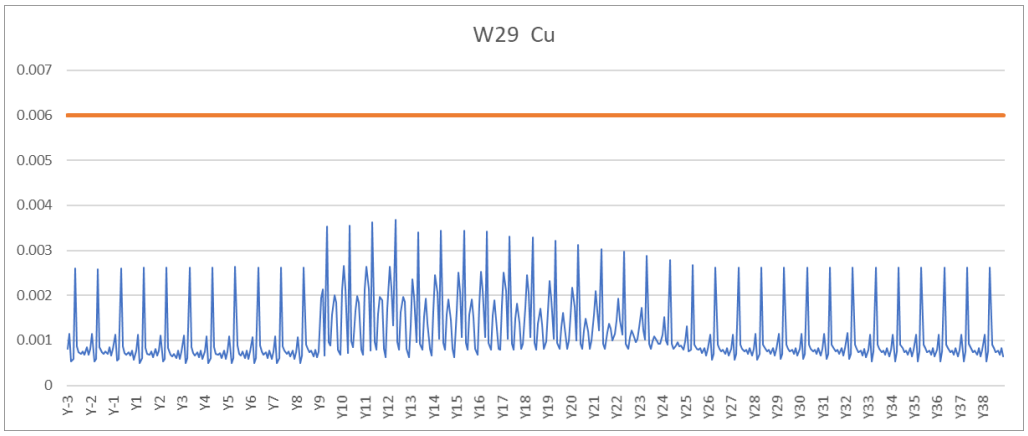
B.2-5: Time series of predicted WAD-CN concentrations (mg/L) for W29. Water Quality Objective is shown by red line.



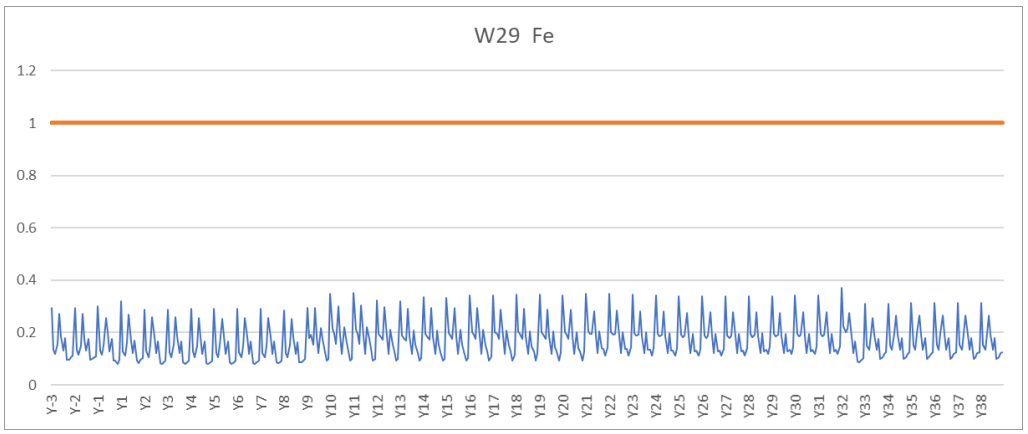
B.2-6: Time series of predicted aluminum concentrations (mg/L) for W29. Water Quality Objective is shown by red line.



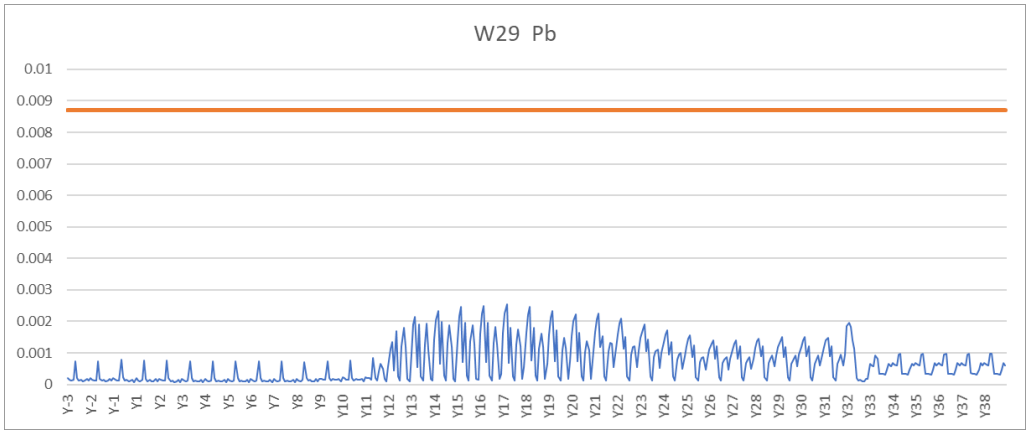
B.2-7: Time series of predicted antimony concentrations (mg/L) for W29. Water Quality Objective is shown by red line.



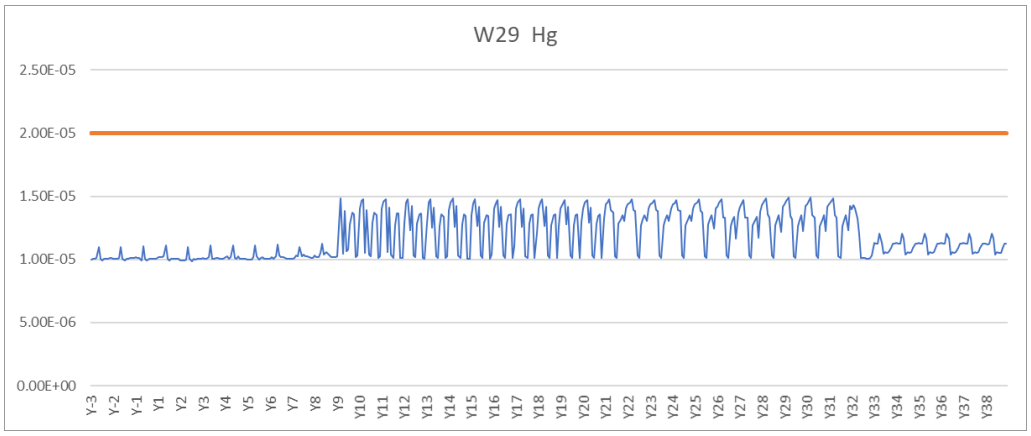
B.2-8: Time series of predicted arsenic concentrations (mg/L) for W29. Water Quality Objective is shown by red line.



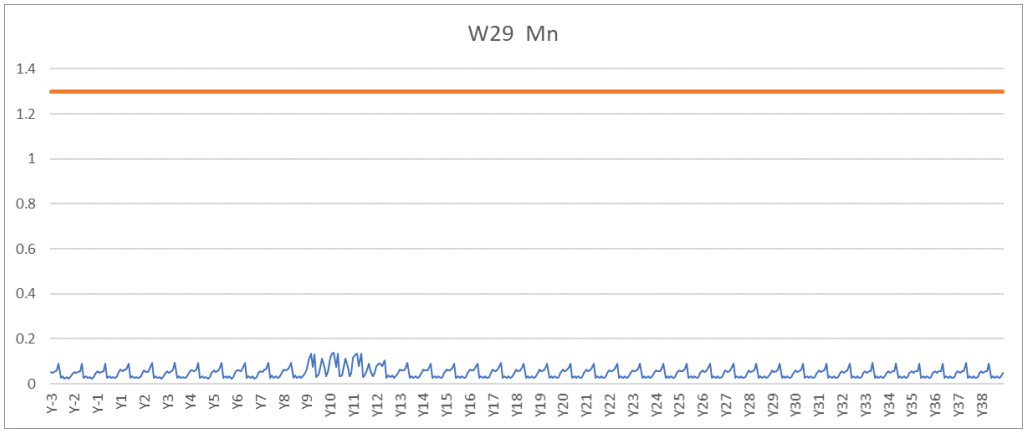
B.2-9: Time series of predicted cadmium concentrations (mg/L) for W29. Water Quality Objective is shown by red line.



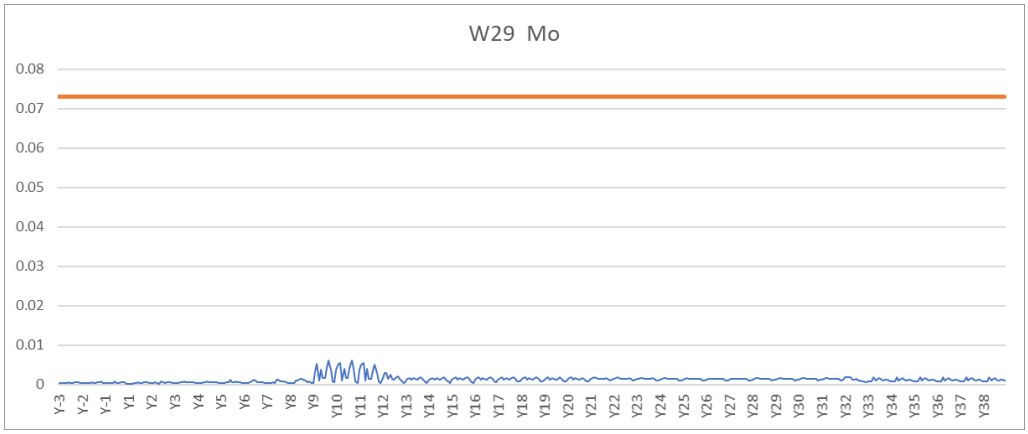
B.2-10: Time series of predicted cobalt concentrations (mg/L) for W29. Water Quality Objective is shown by red line.



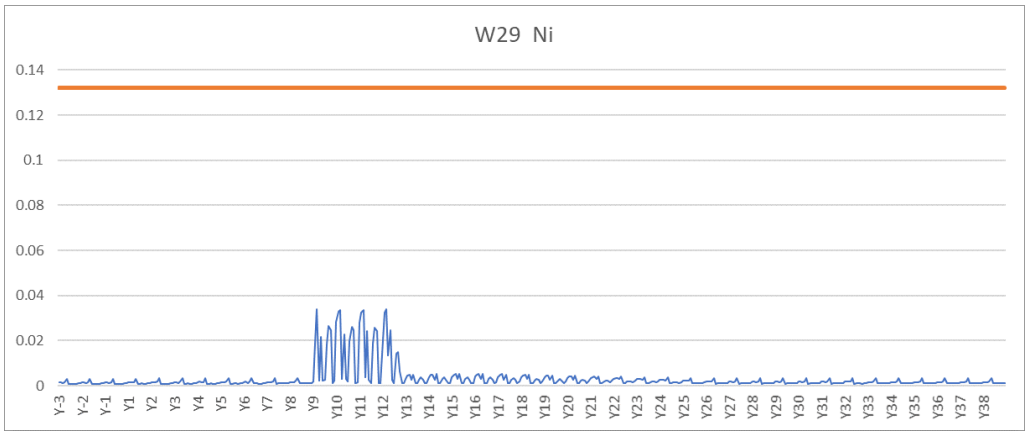
B.2-11: Time series of predicted copper concentrations (mg/L) for W29. Water Quality Objective is shown by red line.



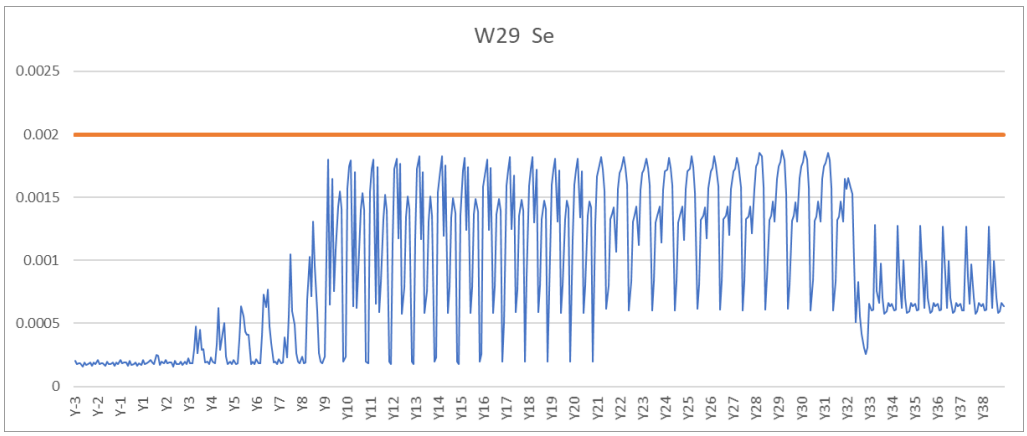
B.2-12: Time series of predicted iron concentrations (mg/L) for W29. Water Quality Objective is shown by red line.



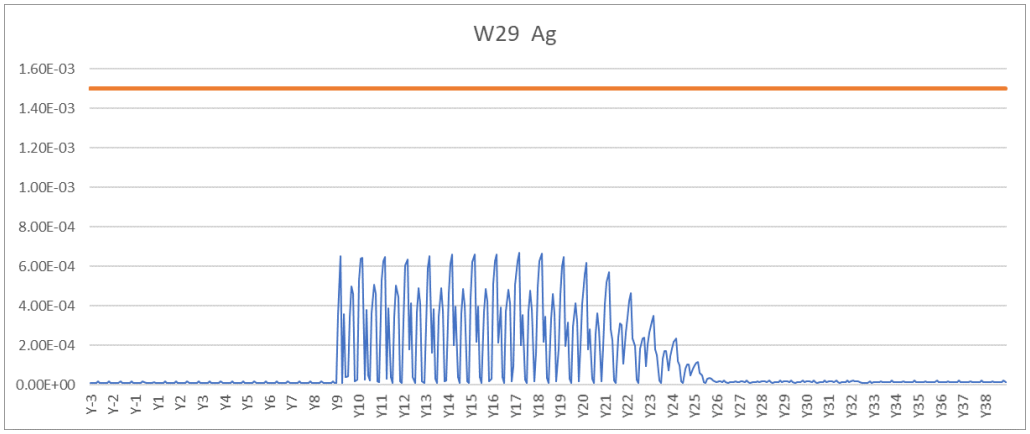
B.2-13: Time series of predicted lead concentrations (mg/L) for W29. Water Quality Objective is shown by red line.



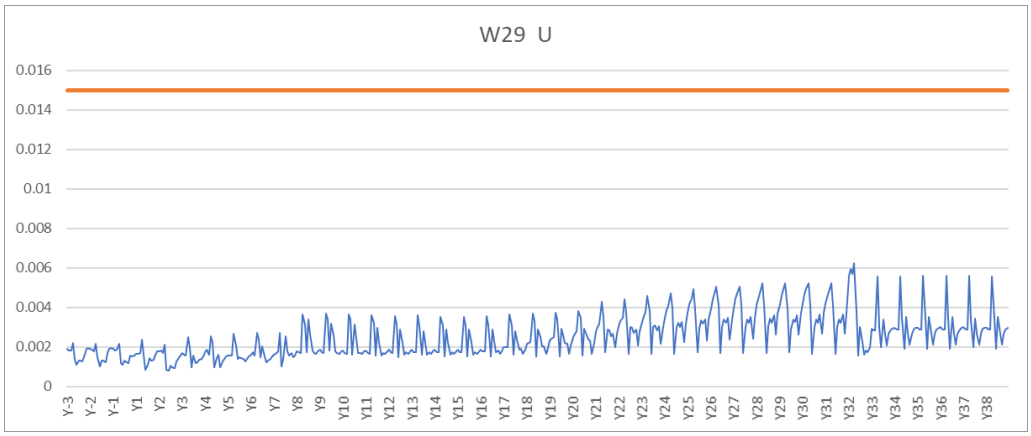
B.2-14: Time series of predicted mercury concentrations (mg/L) for W29. Water Quality Objective is shown by red line.



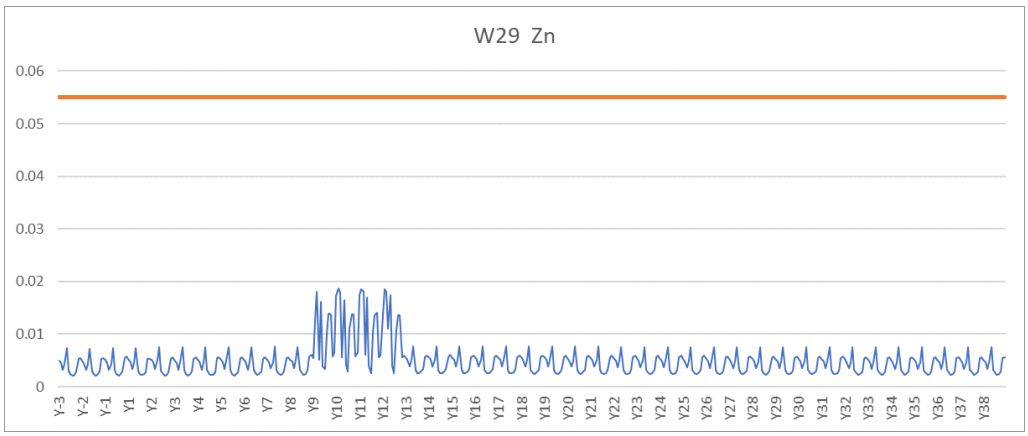
B.2-15: Time series of predicted manganese concentrations (mg/L) for W29. Water Quality Objective is shown by red line.



B.2-16: Time series of predicted molybdenum concentrations (mg/L) for W29. Water Quality Objective is shown by red line.

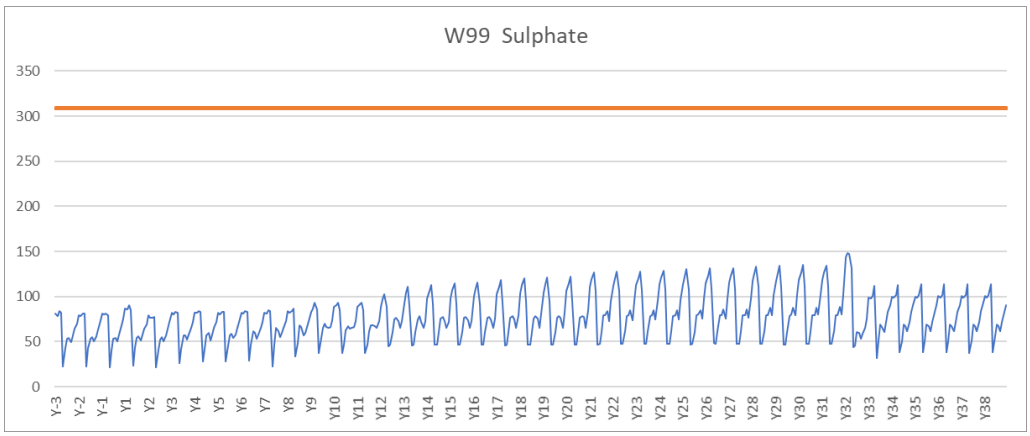


B.2-17: Time series of predicted nickel concentrations (mg/L) for W29. Water Quality Objective is shown by red line.

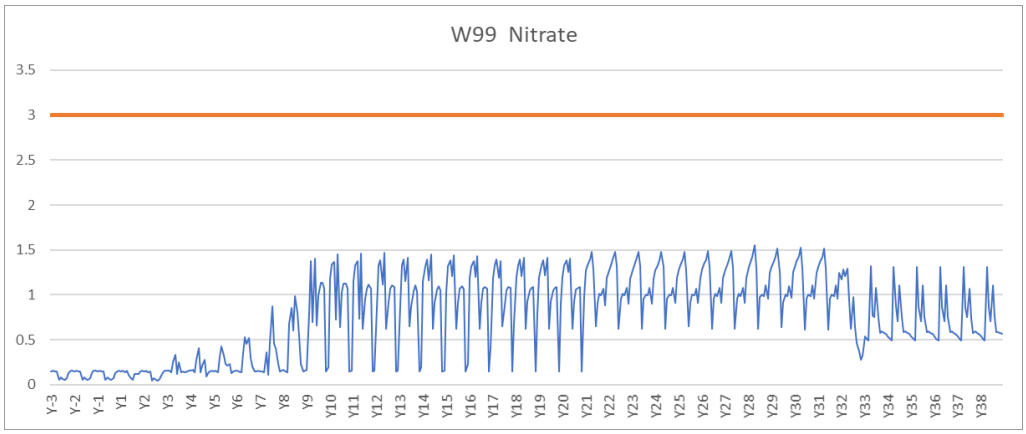


B.2-18: Time series of predicted selenium concentrations (mg/L) for W29. Water Quality Objective is shown by red line.

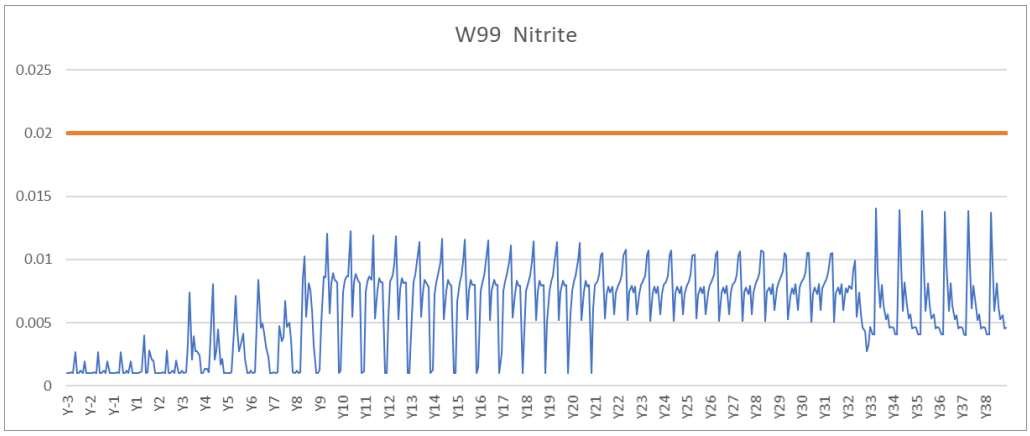
B.2-19: Time series of predicted silver concentrations (mg/L) for W29. Water Quality Objective is shown by red line.



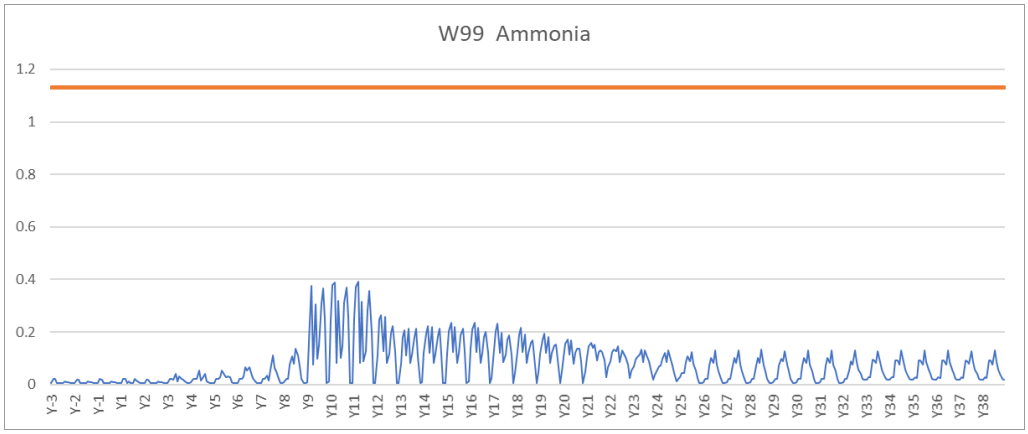
B.2-20: Time series of predicted uranium concentrations (mg/L) for W29. Water Quality Objective is shown by red line.



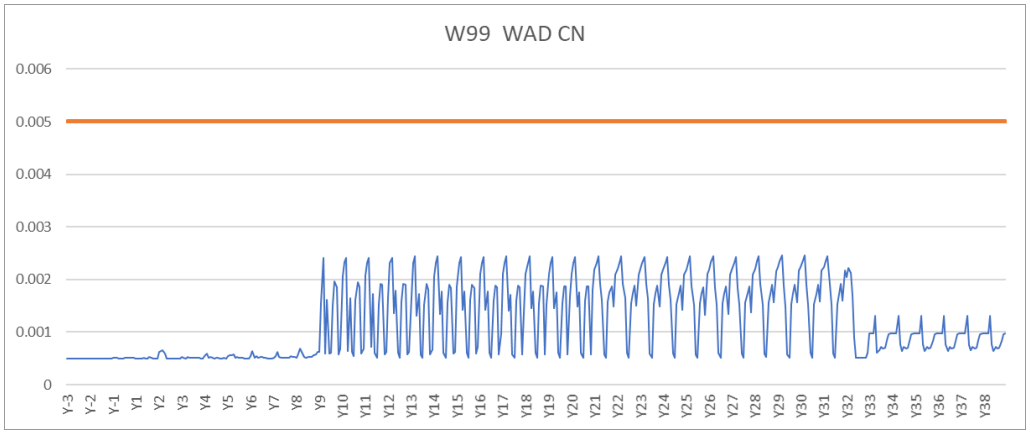
B.2-21: Time series of predicted zinc concentrations (mg/L) for W29. Water Quality Objective is shown by red line.



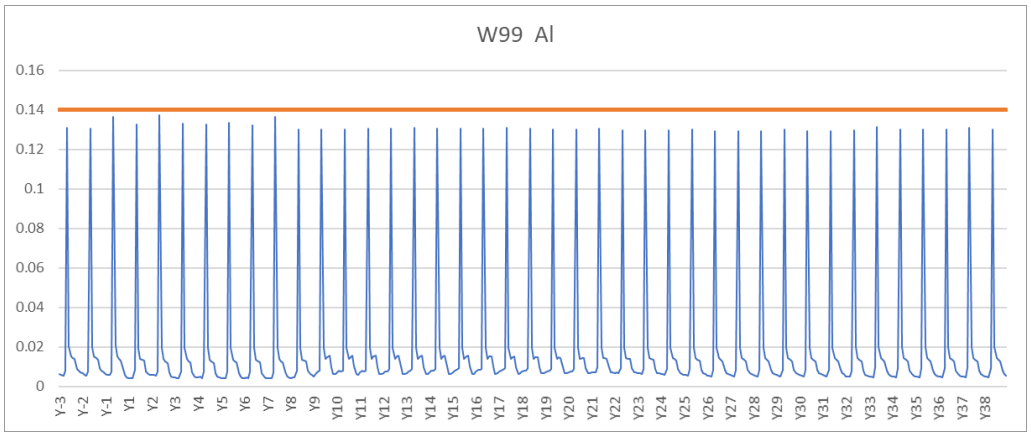
B.3. Haggart Creek below Eagle Creek (W99) – Water Quality Predictions



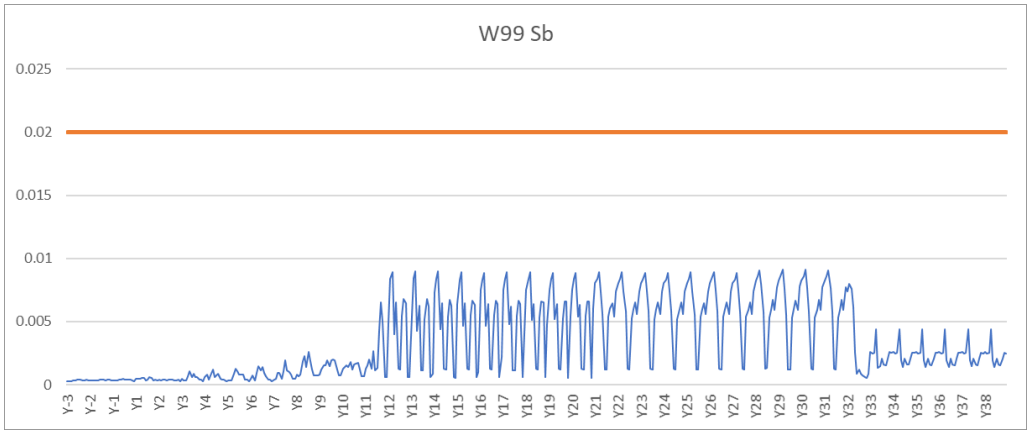
B.3-1: Time series of predicted sulphate concentrations (mg/L) for W99. Water Quality Objective is shown by red line.



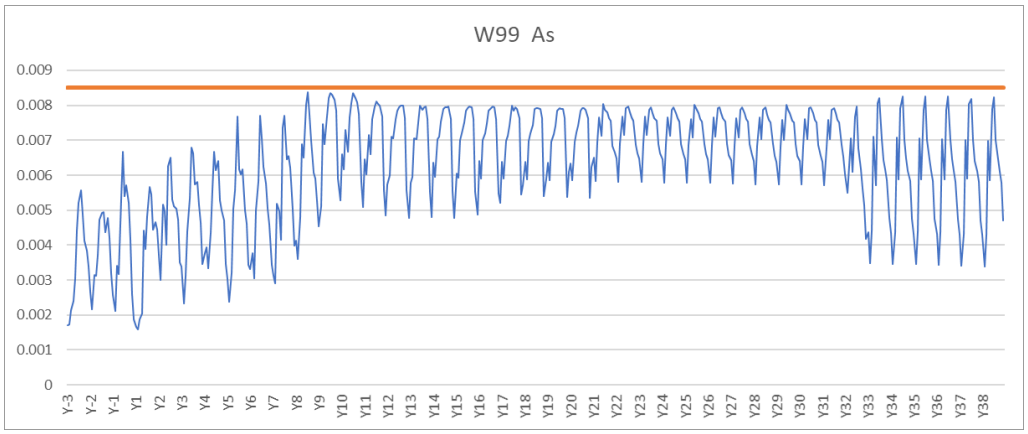
B.3-2: Time series of predicted nitrate concentrations (mg/L) for W99. Water Quality Objective is shown by red line.



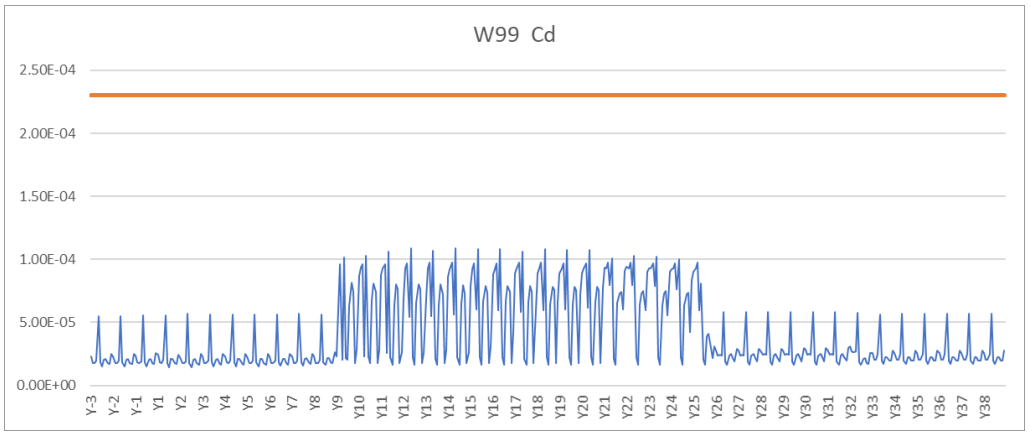
B.3-3: Time series of predicted nitrite concentrations (mg/L) for W99. Water Quality Objective is shown by red line.



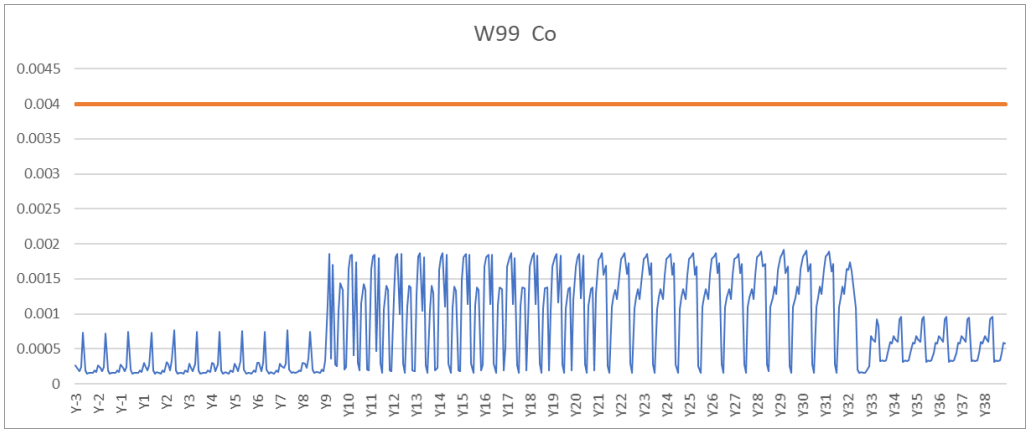
B.3-4: Time series of predicted ammonia concentrations (mg/L) for W99. Water Quality Objective is shown by red line.



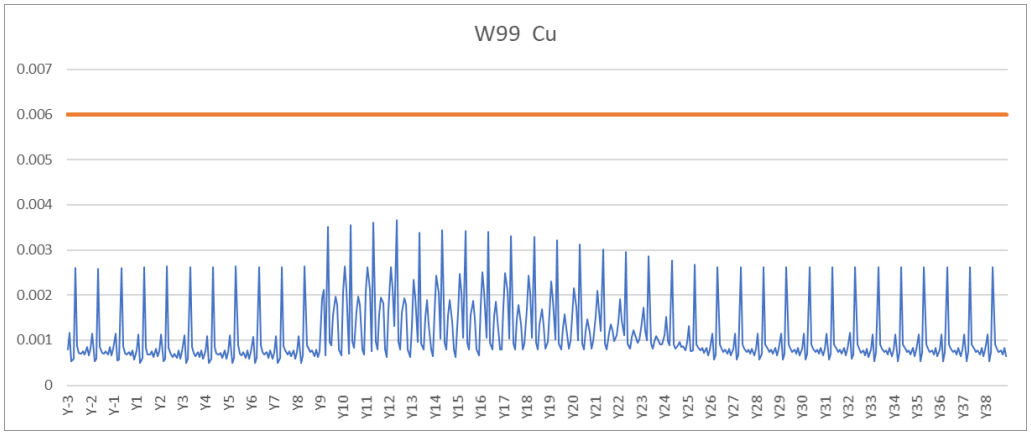
B.3-5: Time series of predicted WAD-CN concentrations (mg/L) for W99. Water Quality Objective is shown by red line.



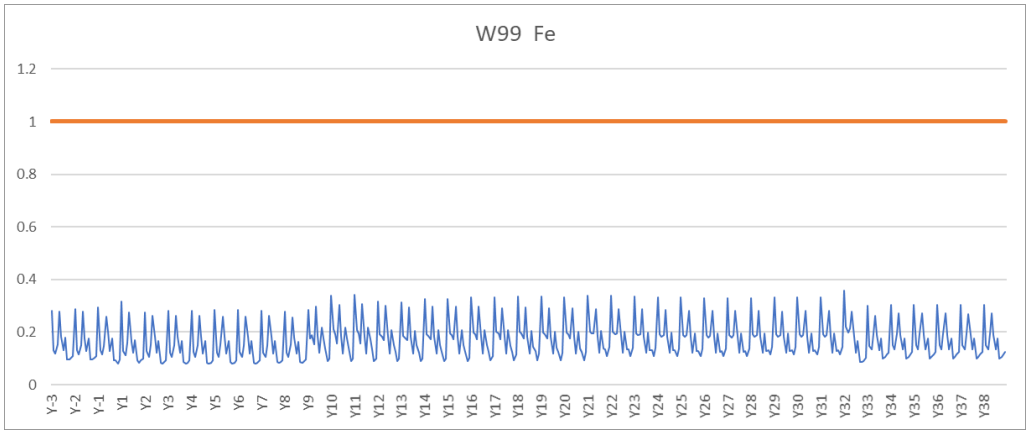
B.3-6: Time series of predicted aluminum concentrations (mg/L) for W99. Water Quality Objective is shown by red line.



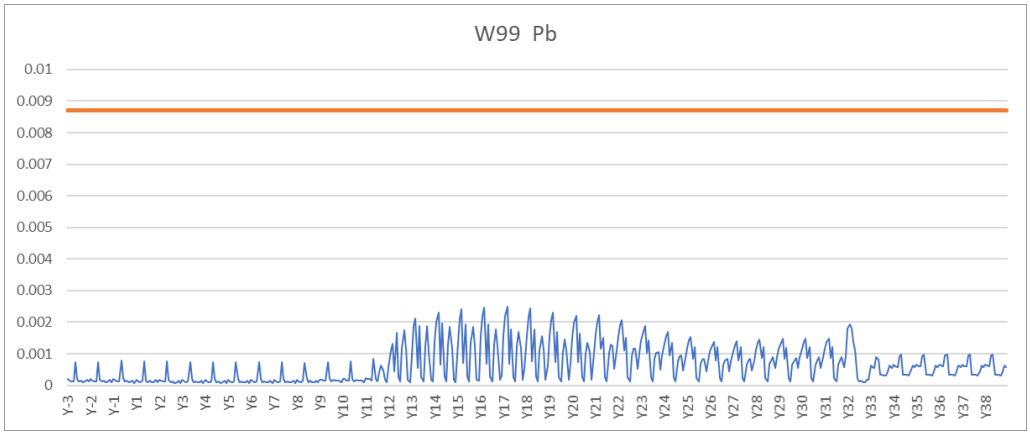
B.3-7: Time series of predicted antimony concentrations (mg/L) for W99. Water Quality Objective is shown by red line.



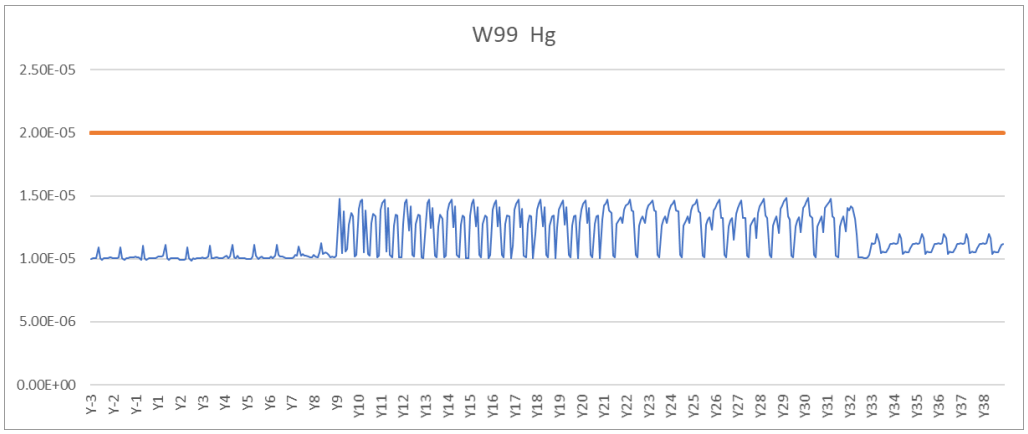
B.3-8: Time series of predicted arsenic concentrations (mg/L) for W99. Water Quality Objective is shown by red line.



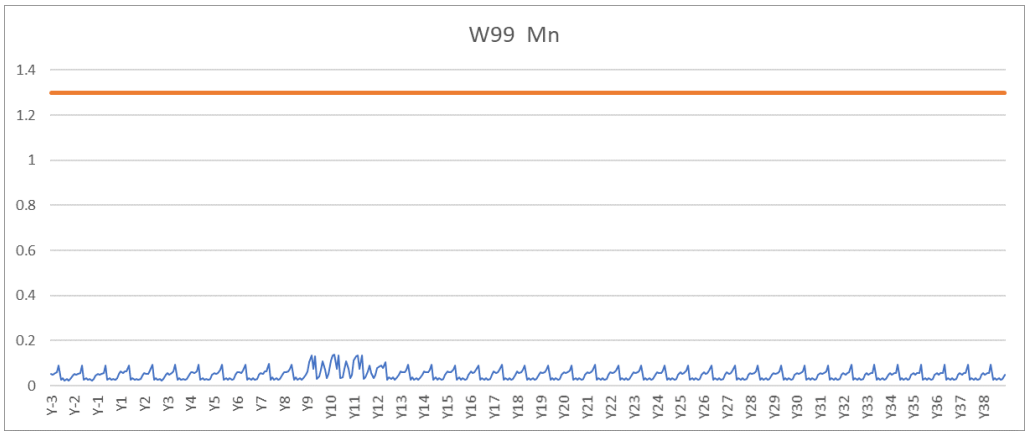
B.3-9: Time series of predicted cadmium concentrations (mg/L) for W99. Water Quality Objective is shown by red line.



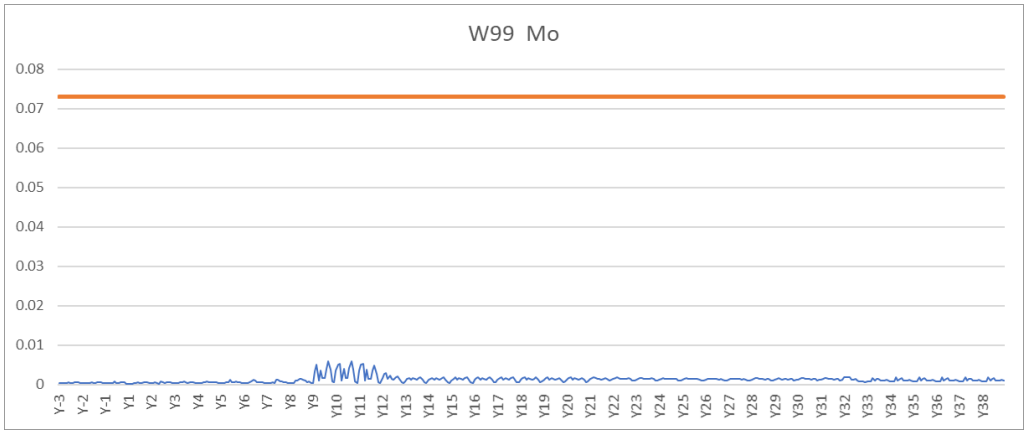
B.3-10: Time series of predicted cobalt concentrations (mg/L) for W99. Water Quality Objective is shown by red line.



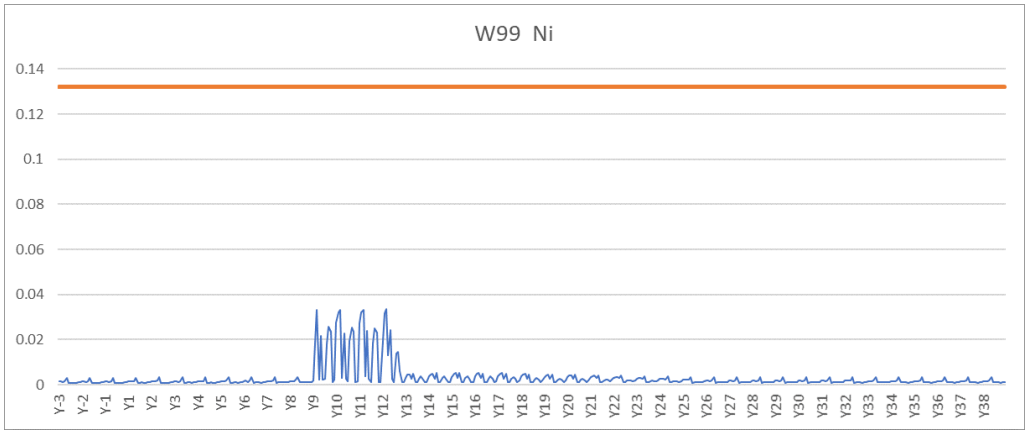
B.3-11: Time series of predicted copper concentrations (mg/L) for W99. Water Quality Objective is shown by red line.



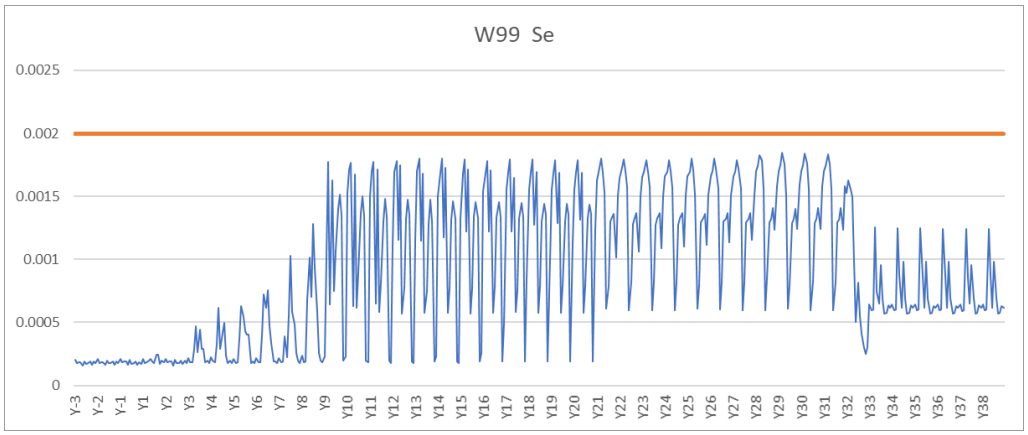
B.3-12: Time series of predicted iron concentrations (mg/L) for W99. Water Quality Objective is shown by red line.



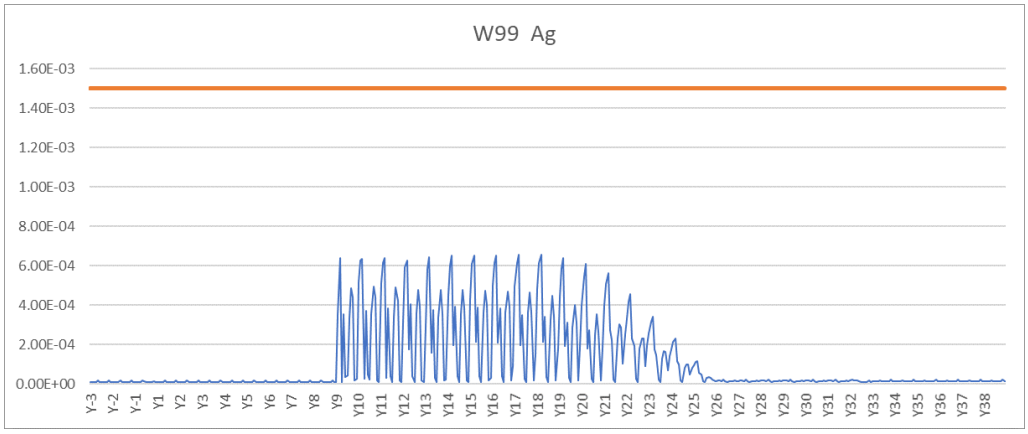
B.3-13: Time series of predicted lead concentrations (mg/L) for W99. Water Quality Objective is shown by red line.



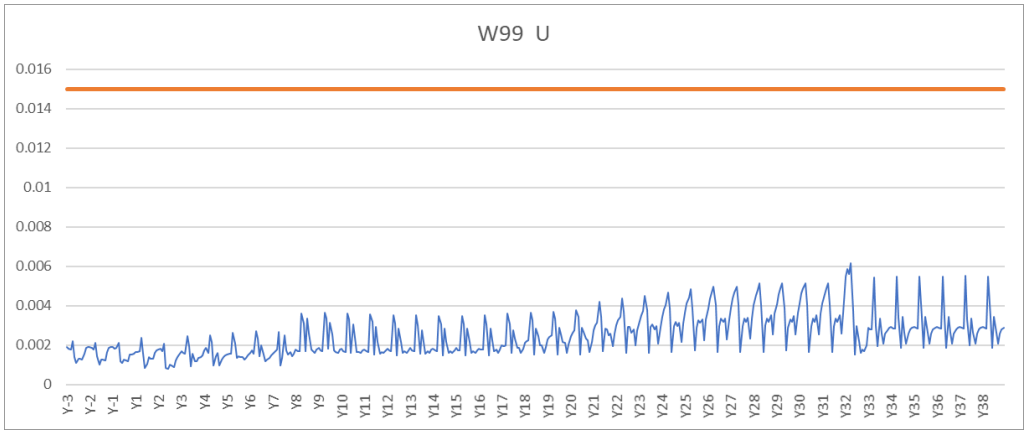
B.3-14: Time series of predicted mercury concentrations (mg/L) for W99. Water Quality Objective is shown by red line.



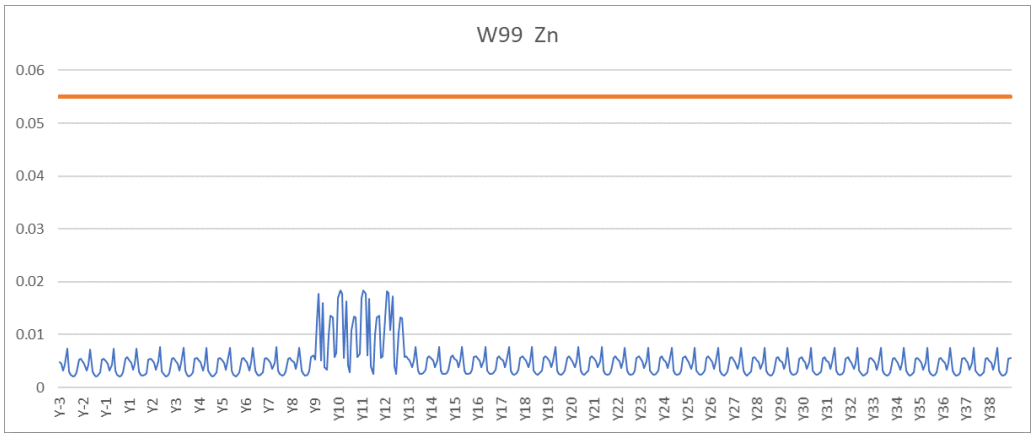
B.3-15: Time series of predicted manganese concentrations (mg/L) for W99. Water Quality Objective is shown by red line.



B.3-16: Time series of predicted molybdenum concentrations (mg/L) for W99. Water Quality Objective is shown by red line.

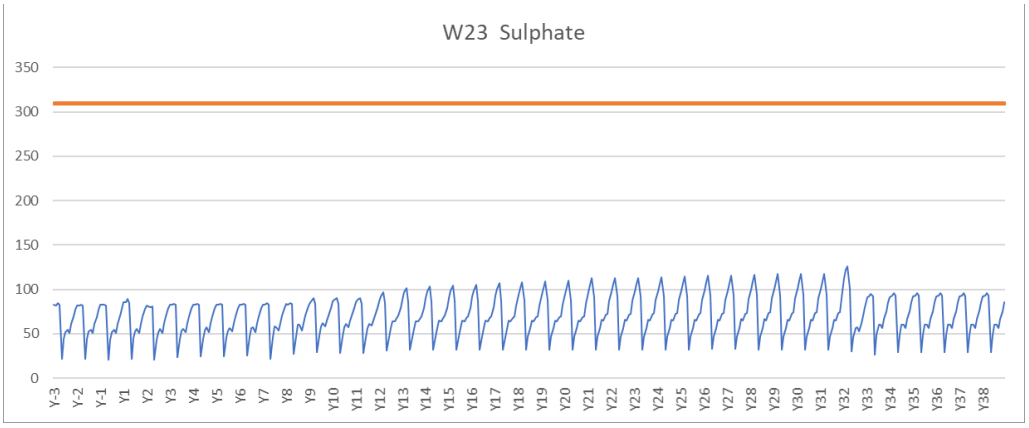


B.3-17: Time series of predicted nickel concentrations (mg/L) for W99. Water Quality Objective is shown by red line.

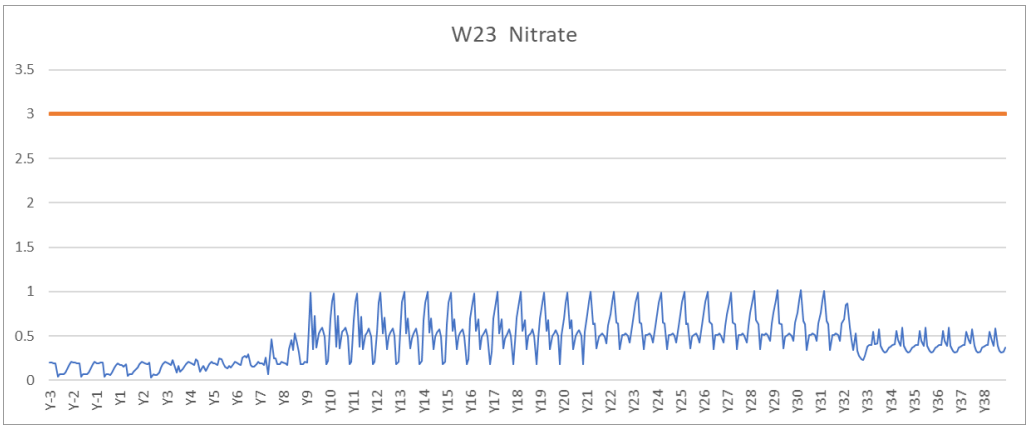


B.3-18: Time series of predicted selenium concentrations (mg/L) for W99. Water Quality Objective is shown by red line.

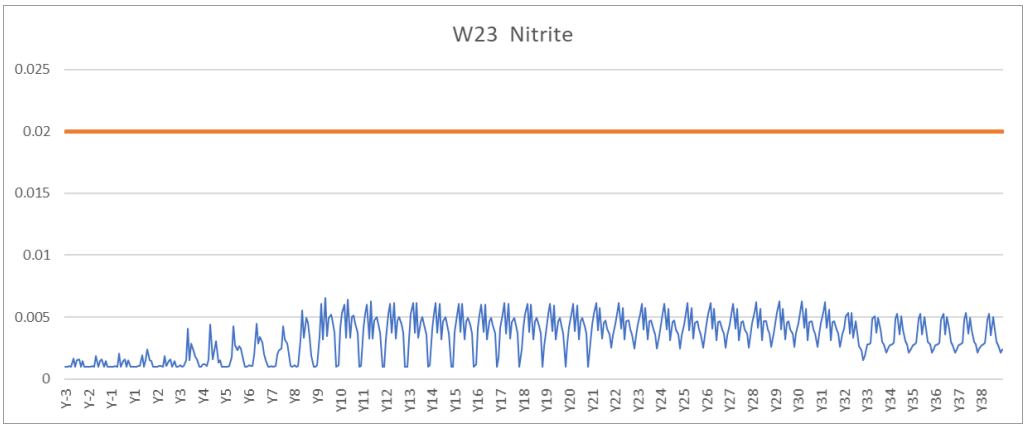
B.3-19: Time series of predicted silver concentrations (mg/L) for W99. Water Quality Objective is shown by red line.



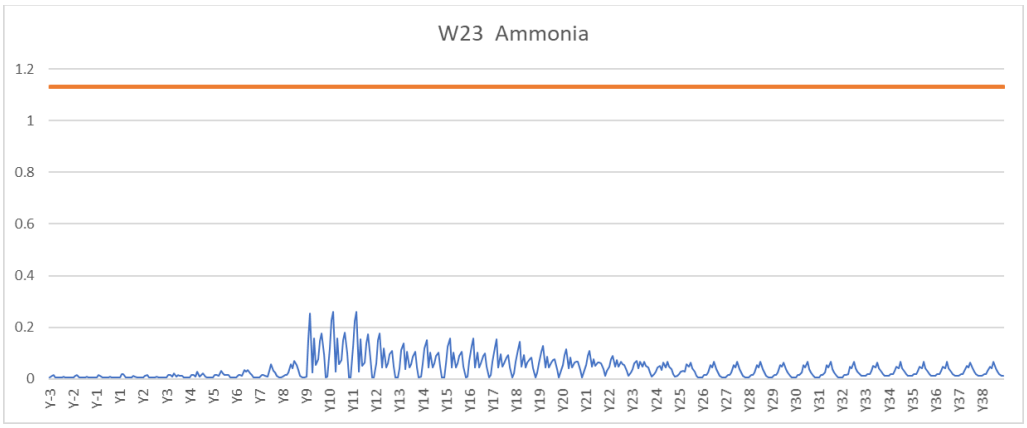
B.3-20: Time series of predicted uranium concentrations (mg/L) for W99. Water Quality Objective is shown by red line.



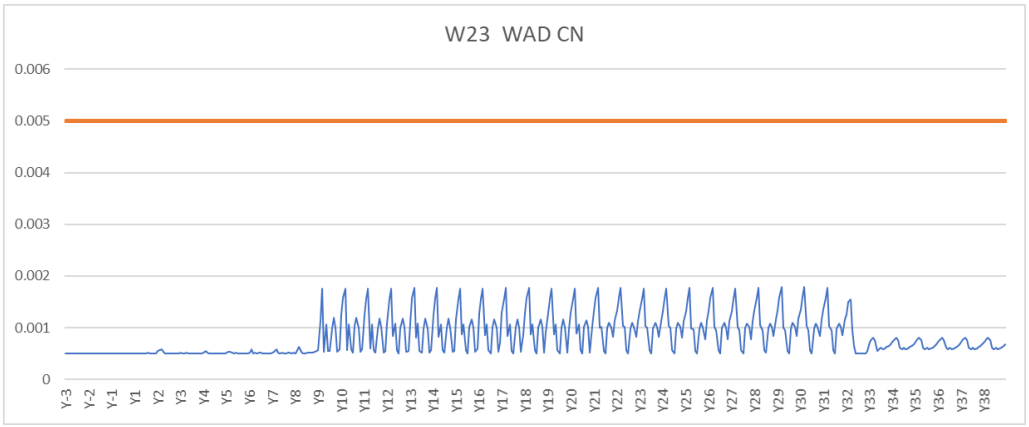
B.3-21: Time series of predicted zinc concentrations (mg/L) for W99. Water Quality Objective is shown by red line.



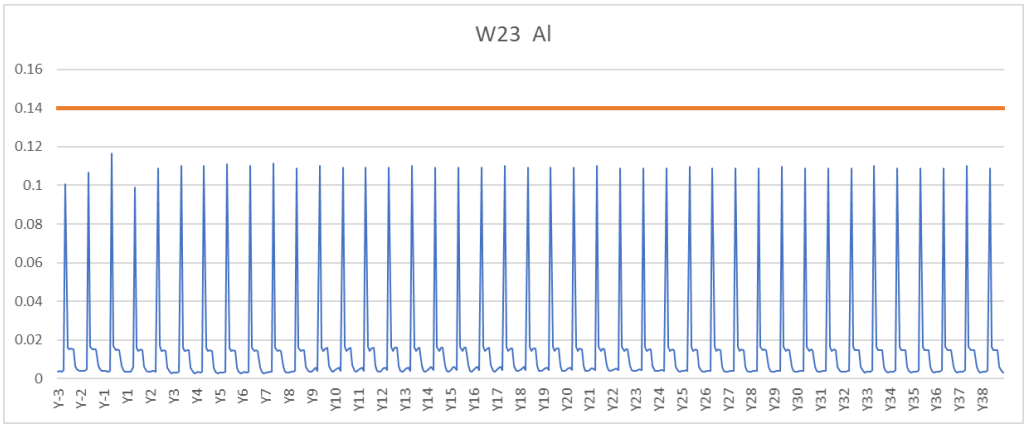
B.4. Haggart Creek below Lynx Creek (W23) – Water Quality Predictions



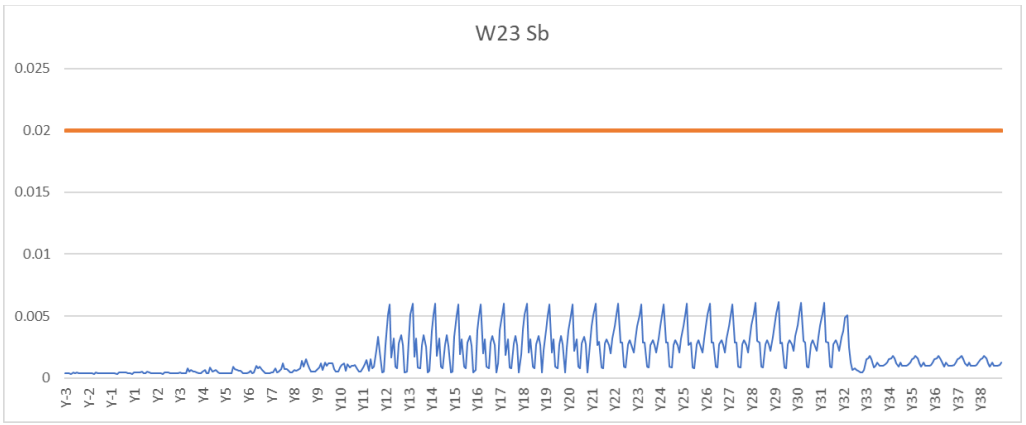
B.4-1: Time series of predicted sulphate concentrations (mg/L) for W23. Water Quality Objective is shown by red line.



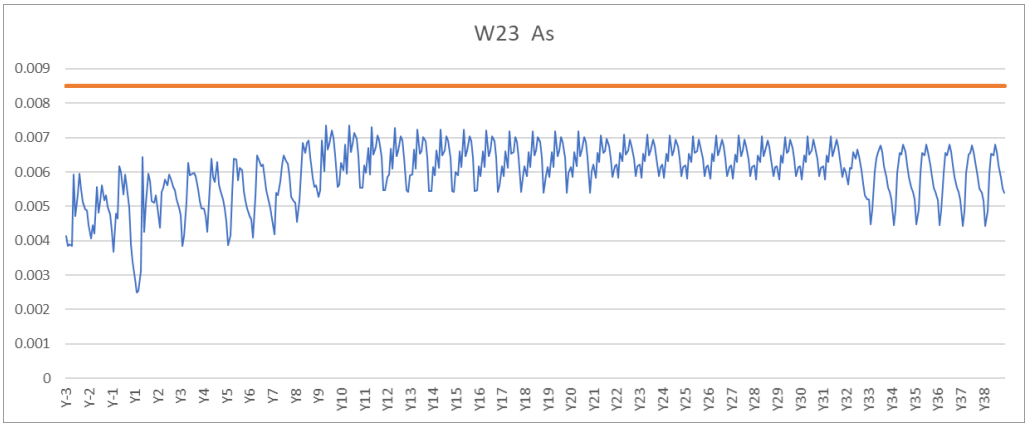
B.4-2: Time series of predicted nitrate concentrations (mg/L) for W23. Water Quality Objective is shown by red line.



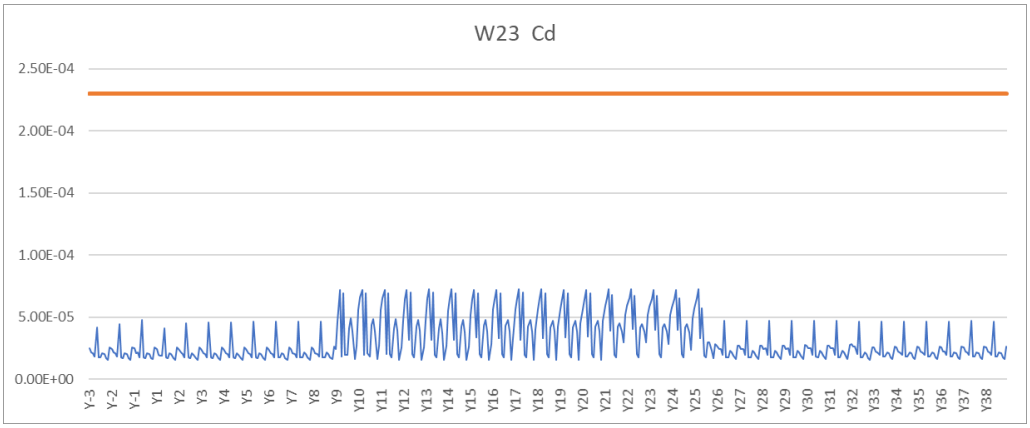
B.4-3: Time series of predicted nitrite concentrations (mg/L) for W23. Water Quality Objective is shown by red line.



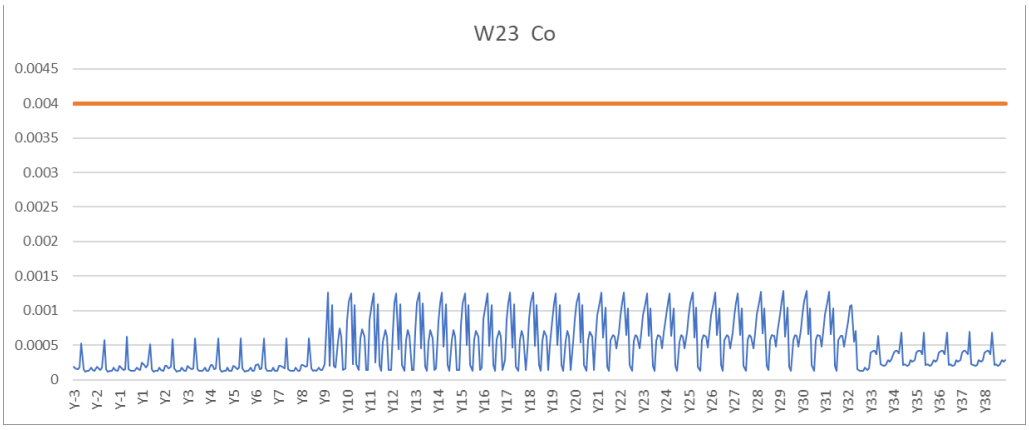
B.4-4: Time series of predicted ammonia concentrations (mg/L) for W23. Water Quality Objective is shown by red line.



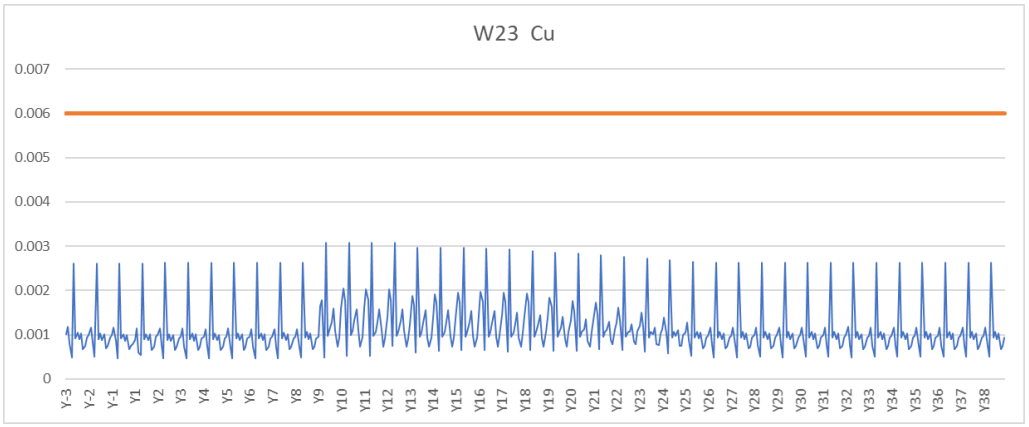
B.4-5: Time series of predicted WAD-CN concentrations (mg/L) for W23. Water Quality Objective is shown by red line.



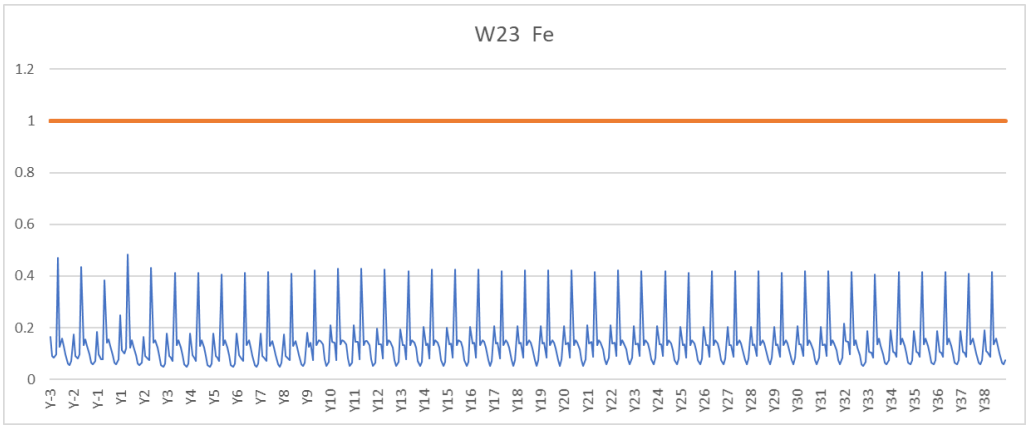
B.4-6: Time series of predicted aluminum concentrations (mg/L) for W23. Water Quality Objective is shown by red line.



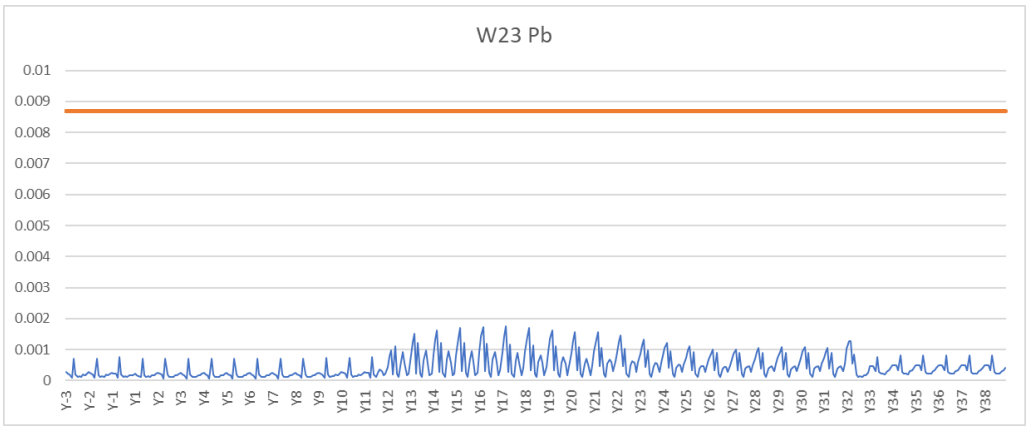
B.4-7: Time series of predicted antimony concentrations (mg/L) for W23. Water Quality Objective is shown by red line.



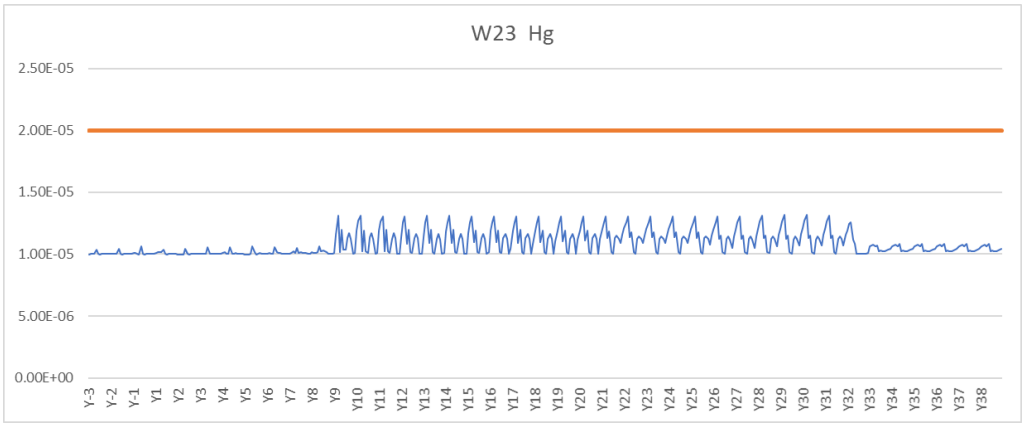
B.4-8: Time series of predicted arsenic concentrations (mg/L) for W23. Water Quality Objective is shown by red line.



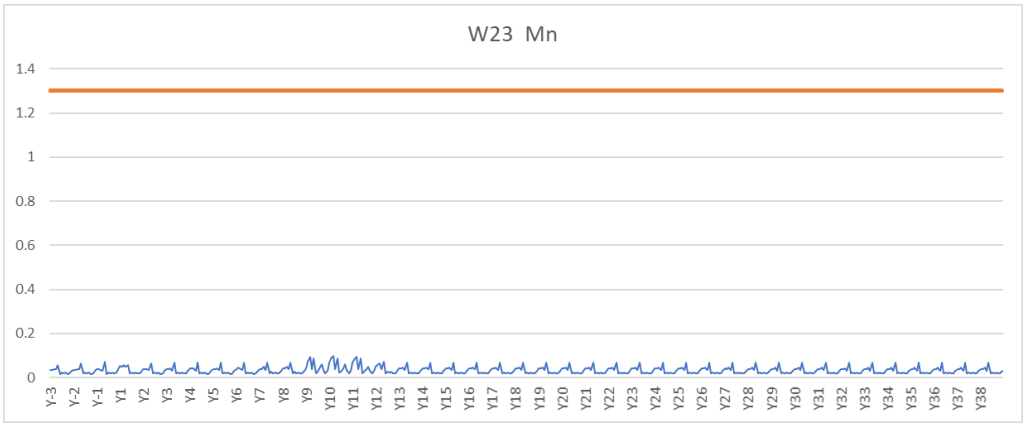
B.4-9: Time series of predicted cadmium concentrations (mg/L) for W23. Water Quality Objective is shown by red line.



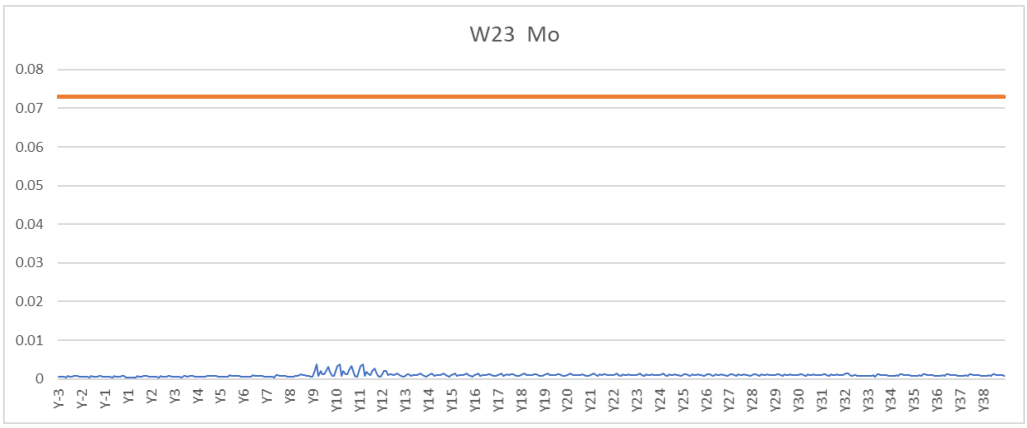
B.4-10: Time series of predicted cobalt concentrations (mg/L) for W23. Water Quality Objective is shown by red line.



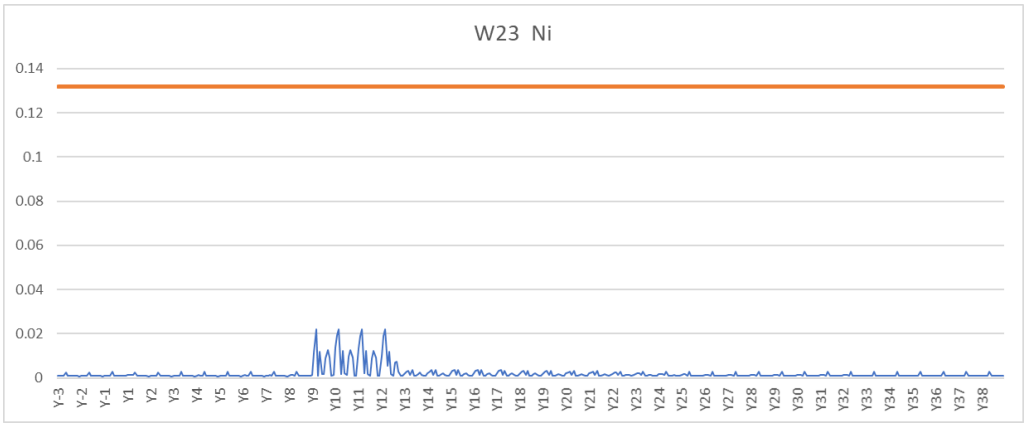
B.4-11: Time series of predicted copper concentrations (mg/L) for W23. Water Quality Objective is shown by red line.



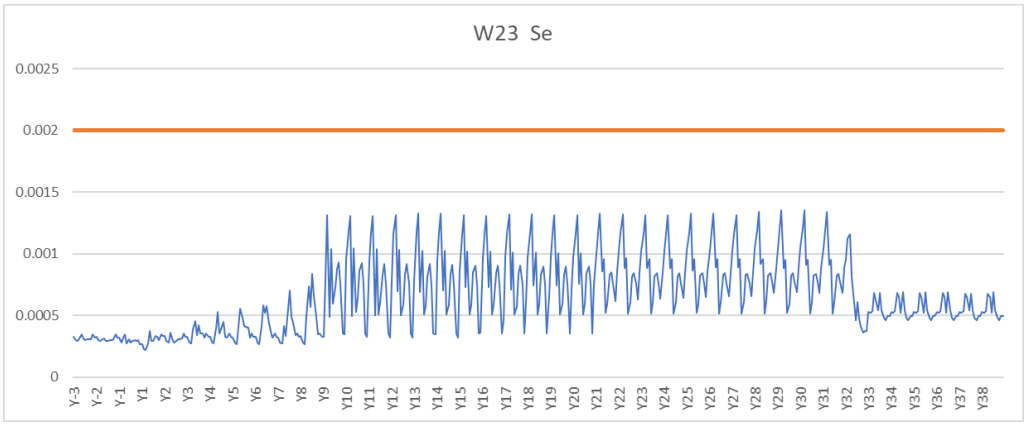
B.4-12: Time series of predicted iron concentrations (mg/L) for W23. Water Quality Objective is shown by red line.



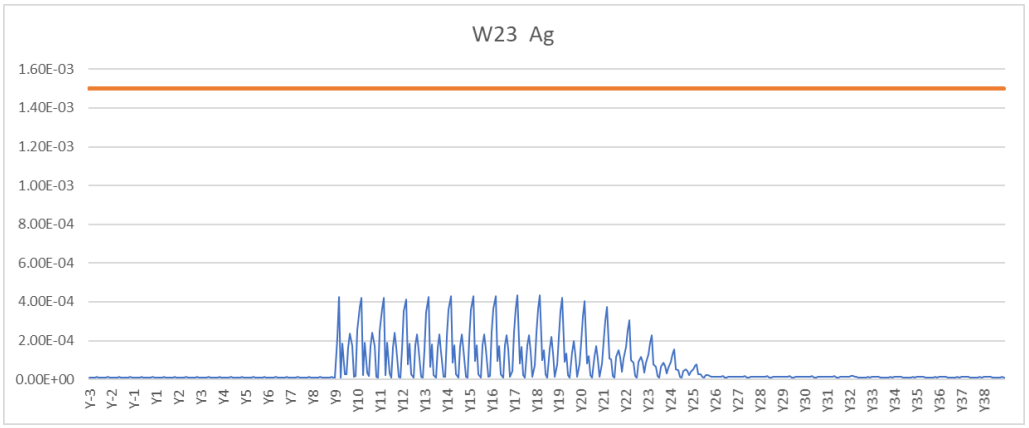
B.4-13: Time series of predicted lead concentrations (mg/L) for W23. Water Quality Objective is shown by red line.



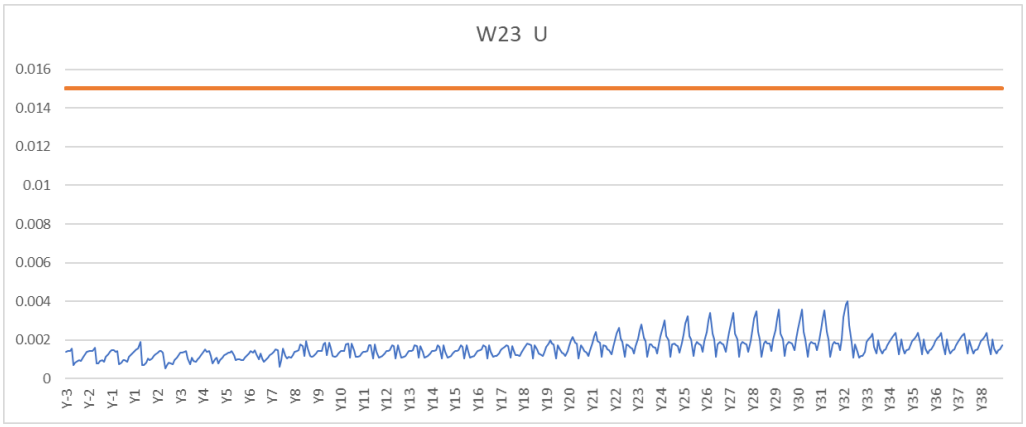
B.4-14: Time series of predicted mercury concentrations (mg/L) for W23. Water Quality Objective is shown by red line.



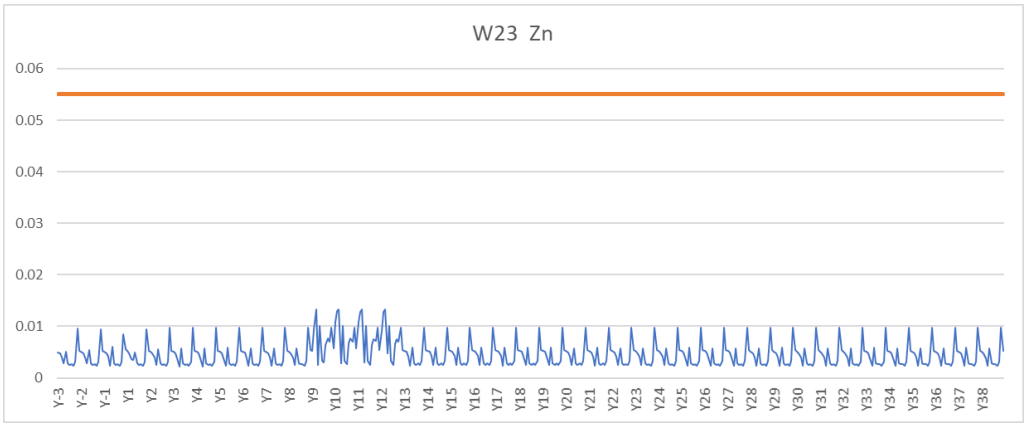
B.4-15: Time series of predicted manganese concentrations (mg/L) for W23. Water Quality Objective is shown by red line.



B.4-16: Time series of predicted molybdenum concentrations (mg/L) for W23. Water Quality Objective is shown by red line.



B.4-17: Time series of predicted nickel concentrations (mg/L) for W23. Water Quality Objective is shown by red line.



B.4-18: Time series of predicted selenium concentrations (mg/L) for W23. Water Quality Objective is shown by red line.

B.4-19: Time series of predicted silver concentrations (mg/L) for W23. Water Quality Objective is shown by red line.

B.4-20: Time series of predicted uranium concentrations (mg/L) for W23. Water Quality Objective is shown by red line.

B.4-21: Time series of predicted zinc concentrations (mg/L) for W23. Water Quality Objective is shown by red line.

1. INTRODUCTION

This document has been prepared by Forte Dynamics, Inc. (Forte) on behalf of Victoria Gold (Yukon) Corp. (VGC) for the Eagle Project. Each year as per Water Use License (WUL) condition #107, VGC (The Licensee) must submit to the YWB updated surface water balance and water quality models which must include updated:

a) Site data collected as per the EMSAMP and the Heap Leach Facility (HLF) Solution Inventory Monitoring Program;
b) Input from any updates to the HLF water balance model; and
c) Predictions for Production Phase through to Permanent Closure including discussion on variances identified and implications on site water management.

Additionally, as per WUL condition #118, the annual report must include a stochastic projection of the expected water volumes stored within the HLF and Event Pond for the period of March 1 to August 31 of that year.

This report addresses the HLF water balance model specifically including the inputs and outputs for the HLF water balance. This includes updates to the HLF water balance model as well as the outputs developed for the surface water balance and water quality models as well as the stochastic projections surrounding the HLF and Event Pond.

2. INPUTS AND ASSUMPTIONS

This HLF Water Balance Model developed by Forte Dynamics is used for daily operations and uses measured meteorological and site operational data for the period in which such data are available from the July 1st, 2019 start date of the operations to the January 1st, 2021 forecasting date. This distinction in measured and forecasted data, detailed further in this document, effects the Deterministic and Stochastic model simulations, which are discussed in detail in the succeeding sections.

The HLF Water Balance Model used by Forte makes use of a large array of operational, meteorological, geotechnical, and metallurgical input data. During production, routine testing is conducted to characterize ore properties which have been used to refine certain input parameters for the heap water balance model. The heap water balance model incorporates details surrounding the HLF while providing operations with the ability to utilize more recorded inputs to support ongoing solution and pond level management.

2.1 Modeling Timeframe

- **Deterministic Modeling:**
    - 19.5 years of operations modelled from:
        - 7/1/2019 – 2/15/2028: Normal Operations (stacking and leaching of HLF)
            - Note that a Forecasting Date of 1/1/2021 was used in modeling, beyond which, all data is forecasted. Greater detail on the forecasting of specific data is provided in subsequent sections.
        - 2/15/2028 – 1/1/2040: Residual recovery, closure, solution management (ore rinsing, discharge to treatment)
        - *Resource:* VGC input with guidance from Forte engineering experience
- **Stochastic Modeling:**
    - 2.5 years of operations modelled from:
        - 7/1/2019 – 3/1/2021: Observed Normal Operations (stacking and leaching of HLF)
        - 3/1/2021 – 1/1/2022: Normal Operations (stacking and leaching of HLF)
            - 3/1/2021 is the Forecasting Date at which point the Stochastic Climate/Meteorological datasets are introduced and all data is forecasted.
        - *Resource:* VGC input with guidance from Forte engineering experience

2.2 Ore Properties

- **Initial Moisture Content:**
    - 1.5% by weight
        - *Resource:* Based on site measurements taken during operation
- **Residual Moisture Content:**
    - 8.6% by weight, corresponding to a 7.69% by weight for Brooks-Corey Calculations
        - *Resource:* Calibrated for Brooks-Corey Residual Moisture equation

- **Active Leaching Ore Moisture Content**
  - 14.35% - 11.46% by weight
    - *Resource:* Calculated based on current site ore properties and changes in density based on loading
- **Bulk Dry Density**
  - 1.72 tonne/m^3
    - *Resource:* Unchanged
- **Density Consolidation**
  - Density_Consolidated=Bulk_Density*Material_Depth^(Power_Factor), curve fit equation developed from test work with the Power Factor calculated as 0.0195
    - *Resource:* KCA test work at loads simulating heap depths of 0m to 170m
- **Specific Gravity**
  - 2.65
    - *Resource:* Unchanged
- **Saturated Hydraulic Conductivity**
  - 0.07268 cm/s (universally scaled down by 1 order of magnitude in model for in-field correction)
    - *Resource:* VGC site measurements and calibrated model confirmation
- **Saturated Hydraulic Conductivity Consolidation**
  - K_sat_consolidated=Density_Consolidated*Slope+Intercept, linear fit equation developed from test work with Slope=-0.2285 and Intercept=0.4657
    - *Resource:* KCA test work at loads simulating heap depths of 0m to 170m
- **SCS Curve Number – Loaded HLF**
  - 70 for un-leached ore, 91 for leached ore
    - *Resource:* Engineering judgement and prior experience
- **SCS Curve Number – Un-loaded HLF**
  - 99 for un-loaded HLF area, treated as bare HDPE liner surface
    - *Resource:* Engineering judgement and prior experience

2.3 Heap Leach Facility Parameters

- **Total Tonnes:**
  - 86Mt
    - *Resource:* VGC
- **Loading Months:**
  - April through December each year (9 months of loading)
    - *Resource:* VGC
- **Ultimate Elevation:**

- 1225m above mean sea level
  - *Resource:* VGC provided, ultimate HLF design

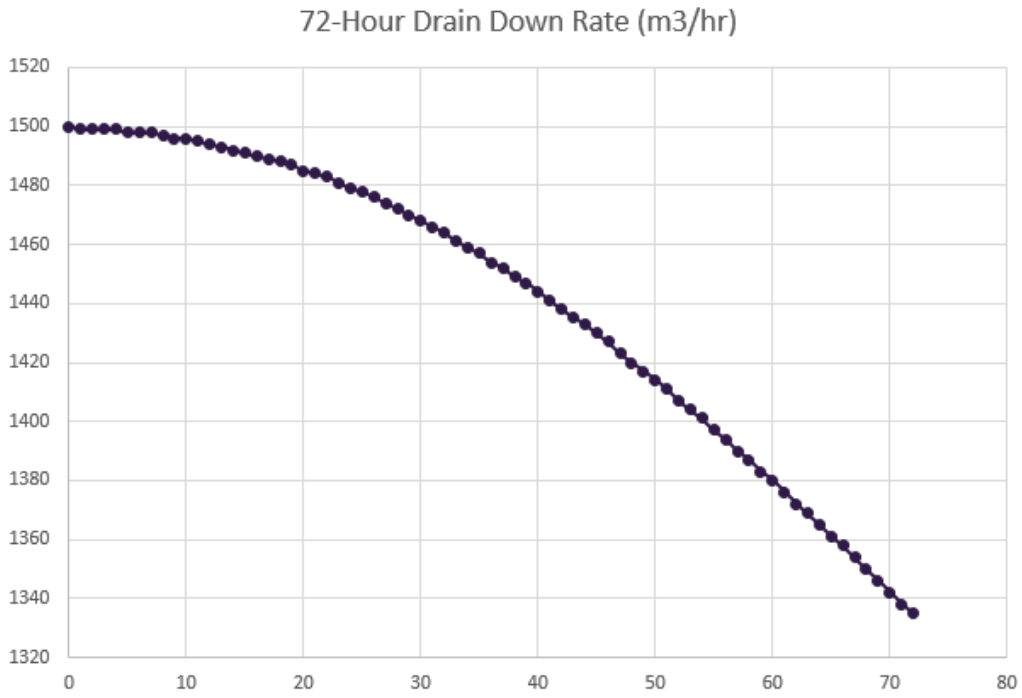
- **Lift Height:**
  - 10m
    - *Resource:* VGC provided
- **Precipitation Soak-up/Initial Abstraction of Precipitation:**
  - SCS Curve Number Excess Moisture Method Used
    - *Resource:* engineering judgement and prior experience
- **Evaporation Loss from Drip Emitters:**
  - 0.5% only in months with average daily temperatures above 0 Celsius
    - *Resource:* VGC provided, buried drip emitters in sub-zero months

2.4 Operational Parameters

- **Initial Leach Cycle:**
  - 45 days
    - *Resource:* VGC provided with planned operations
- **Leaching Application Rate (nominal):**
  - 7 L/hr/m^2 for fresh and aged ore
    - *Resource:* VGC provided
- **Target Plant Flow Rate:**
  - 1500 m^3/hr, varies through start-up and dependent on total available area for leaching, see Additional Discussion for more information on how this was treated for modeling of the mine closure in the Deterministic Modeling
    - *Resource:* VGC provided
  - Additional Discussion: For the updated Deterministic Model simulations performed by Forte, additional specificity of the plant flow rate and its effects on overall solution management is necessary.
    - *From the model start date (7/1/2019) to the model forecasting date (1/1/2021):* The measured Total Plant Flow Rate is used.
    - *After the forecasting date:* During normal operations (following initial ramp-up during development of the HLF), the Target Plant Flow Rate is a maximum of 1500 m^3/hr limited by the Leaching Application Rate with the Evaporation Loss from Drip Emitters being subtracted off in the applicable months.
    - *Once the mine reaches the end of loading (1/1/2028):* After one complete Leach Cycle of the last ore loaded (45 days, 2/15/2028), the Make-up Water supply is turned off, at which point solution begins to be managed through the discharge of barren solution to treatment, in order to reduce total volume of solution in the

system in preparation for HLF closure. More information for the modeling of Make-up Water, Discharge to Treatment, Leach Cycle, In-Heap Pond, and Event Pond can be found in each of those respective sections.

- **Discharge to Treatment Rate:**
  - 1000m Climate Series:12.1 L/s after stacking and initial leach cycle for loaded ore is complete (2/15/2028 to 1/1/2030), 19 L/s after 2030
  - Climate Change Climate Series: 19 L/s after stacking and initial leach cycle for loaded ore is complete (2/15/2028 to 1/1/2030), 28.5 L/s after 2030
    - *Resource:* The 12.1 and 19 L/s discharge to treatment rates used in the updated model were selected based on engineering judgement by Forte to match previous assumptions while maintaining a maximum rate of less than 20 L/s per VGC direction. The Climate Change Climate Series Discharge to Treatment Rate was increased after model calibration to ensure that metastable equilibrium during the closure period of the HLF is maintained.
- **Event Pond Storage:**
  - 300,577 m^3 maximum, 0.5 m Freeboard Volume of 19,325 m^3
    - *Resource:* As-built surveyed volume
  - Additional Discussion: For all the modeling simulations performed by Forte, the Event Pond was modeled being the first source of make-up water required to meet leaching demands. Then, after 2/15/2028, the Event Pond is allowed to partially fill from meteoric inputs, then periodically discharged through the system to the In-Heap Pond when the In-Heap Pond is empty. During this time period, the In-Heap Pond level is primarily managed by recirculation and through discharge to treatment.
- **In-Heap Pond Storage Volume:**
  - 63,338 m^3 (always occupied during operation) plus 53,803 m^3 (maximum available storage volume during operation before overflowing to the Event Pond)
    - *Resource:* Consistent with the assumptions utilized for the last annual report, Forte calculation was updated with as-built survey information and placed density and particle size distribution of In-Heap Pond material. This is currently considered a conservative estimate based on assumptions of placed material properties, adjusted for consolidation. This volume will be verified after the conclusion of the In-Heap Pond verification test.
  - Additional Discussion: For all of the modeling simulations performed by Forte, the In-Heap Pond was drawn from in the following way:
    - The measured plant flow rate from 7/26/2019 to 1/1/2021



- As much as possible to maintain the circulation of the targeted flow rate of 1500 m^3/hr, with that flow rate acting as the maximum total withdrawal rate from the In-Heap Pond throughout the entire mine life beginning 1/1/2021.
- As much as possible to maintain the target for Discharge to Treatment rates with those rates acting as the maximum solution removal rates from the system beginning 2/15/2028.

- **Total Available Storage Volume vs Desired Available Storage**
  - The Maximum Total Available Storage Volume is **354,380 m^3**, which is calculated by subtracting the amount of solution considered to always be stored in the In-Heap from the Maximum Total Storage Volume:
    - 117,141 m^3 (In-Heap Pond Total Volume) – 63,338 m^3 (Occupied In-Heap Pond Volume) = **53,803 m^3** (Maximum Available In-Heap Pond Storage Volume)
    - **300,577 m^3** (Maximum Available Event Pond Storage Volume to the spillway invert)
    - **300,577 + 53,803 = 354,380 m^3**
- **Desired Available Storage Volume:**
  - 183,259 m^3 (Extreme Precipitation Reference Event as described below plus a 0.5 m Freeboard Volume buffer as described previously, and matching the volume used for the 2020 Annual Update)
    - *Resource:* 0.5 m Freeboard Volume of the Events Pond updated based on as-built survey.

2.5 Meteorological Inputs and Parameters

For the 2021 Annual Update, Lorax provided Forte with measured meteorological data for the site from 2020 and incorporated it into an updated set of 1000m data. The set of Climate Change meteorological data was unchanged for this modeling from what was provided in 2020.

- **Extreme Precipitation Reference Event:**
  - 54 mm (24-hr, 100 yr Event) maximum volume of 58,733 m^3 plus a 72-hr Heap Draindown of 105,199 m^3 (based on an initial nominal 1500 m^3/hr leach rate, see Plot 1 below), for a total volume of 163,932 m^3.

Plot 1 – 72 hr Draindown Curve for HLF

- *Resources:* Lorax, 2017 meteorological data, using design values regarding catchment area for final HLF (catchment area for the In-Heap Pond and Event Pond through closure)

  Forte, June 27, 2018 Yukon Water Board Responses for Plot 1 above

- **Precipitation Data used in Deterministic Modeling:**
  - Two updated, separate composite sets of data provided by Lorax were used by Forte for the updated water balance model.
    - 1000m Set: The daily Site Synthetic data is used through 2020 with the data from the hydrologic 2016 year (Oct 2015 to September 2016) repeated as a typical year from start of 2021 through closure.
    - Climate Change Set: This set has the identical basis as the 1000m set (Site Synthetic through 2020, 2016 data repeated for years 2020 through 2099); however, Lorax provided a data set to incorporate the effects of climate change on the weather at the site.
    - *Resource:* Lorax 1000m and Climate Change (CC) data sets provided to Forte in 2020
    - Refer to Figures 1-4
- **Potential Evaporation Data used in Deterministic Modeling:**

- Two separate composite sets of data provided by Lorax were used by Forte for the water balance model.
  - 1000m Set: The daily Site Synthetic data is used through 2020 with the data from the hydrologic 2016 year (October 2015 to September 2016) repeated as a typical year from start of 2020 through closure.
  - Climate Change Set: This set has the identical basis as the 1000m set (Site Synthetic through 2020, 2016 data repeated for years 2020 through 2099); however, Lorax provided a data set to incorporate the effects of climate change on the weather at the site.
  - *Resource:* Lorax 1000m and Climate Change (CC) data sets provided to Forte in 2020
  - Refer to Figures 5-8

- **Temperature Data used in Deterministic Modeling:**
  - Two separate composite sets of data provided by Lorax were used by Forte for the updated water balance model.
    - 1000m Set: The daily Site Synthetic data is used through 2020 with the data from the hydrologic 2016 year (October 2015 to September 2016) repeated as a typical year from start of 2021 through closure.
    - Climate Change Set: This set has the identical basis as the 1000m set (Site Synthetic through 2020, 2016 data repeated for years 2021 through 2099); however, Lorax provided a data set to incorporate the assumed effects of climate change on the weather at the site.
    - *Resource:* Lorax 1000m and Climate Change (CC) data sets provided to Forte in 2021 and 2020, respectively
    - Refer to Figures 9-12
- **Stochastic Sampling and Iterations:**
  - Latin Hypercube Sampling, 100 iterations/realizations
    - *Resource:* Engineering and statistical modeling experience updated to reflect the added robustness and detail of the updated operational model with a quarter day timestep.
- **Precipitation Data used in Stochastic Modeling:**
    - 7/1/2019 to 1/1/2021: Measured data is used to represent data prior to the Forecasting Date.
    - 1/1/2021 to 3/1/2021: 1000m dataset is used prior to the Stochastic data starting date.

- 3/1/2021 to 1/1/2022: WGEN (Richardson and Wright, USDA, 1984) with up-front detailed descriptive statistic parameter generation was used on the 71 years of daily Site Synthetic data. Using the stochastic sampling and iterations described previously, 100 realizations of data were produced for each day of data for Precipitation, Maximum and Minimum Temperature, Evaporation, and Solar Radiation.
- *Resource:* Lorax Site Synthetic dataset from 1948-2019 provided to Forte in 2020 for use in WGEN Stochastic data production.
- Refer to Figures 13 and 14

- **Potential Evaporation Data used in Stochastic Modeling:**
  - 7/1/2019 to 1/1/2021: Measured data is used to represent data prior to the Forecasting Date.
  - 1/1/2021 to 3/1/2021: 1000m dataset is used prior to the Stochastic data starting date.
  - 3/1/2021 to 1/1/2022: Refer to the Precipitation Data used in Stochastic Modeling section for a description of how the 100 yearly Realizations of data were produced for Precipitation, Maximum and Minimum Temperature, Evaporation, and Solar Radiation.
  - *Resource:* Lorax Site Synthetic dataset from 1948-2019 provided to Forte in 2020 for use in WGEN Stochastic data production.
  - Refer to Figures 15 and 16
- **Temperature Data used in Stochastic Modeling:**
  - 7/1/2019 to 1/1/2021: Measured data is used to represent data prior to the Forecasting Date.
  - 1/1/2021 to 3/1/2021: 1000m dataset is used prior to the Stochastic data starting date.
  - 3/1/2021 to 1/1/2022: Refer to the Precipitation Data used in Stochastic Modeling section for a description of how the 100 yearly Realizations of data are produced for Precipitation, Maximum and Minimum Temperature, Evaporation, and Solar Radiation. As WGEN outputs the Minimum and Maximum Average Daily Temperature, the Forte model calculates the Overall Average Daily Temperature from these.
  - *Resource:* Lorax Site Synthetic dataset from 1948-2019 provided to Forte in 2020 for use in WGEN Stochastic data production.
  - Refer to Figures 17 and 18
- **Solar Radiation Data used in Stochastic Modeling:**

  - 7/1/2019 to 1/1/2021: Measured data is used to represent data prior to the Forecasting Date.
  - 1/1/2021 to 3/1/2021: The monthly average from the Solar Radiation dataset (Eagle Climate Data) is used to represent data prior to the Stochastic data starting date.
  - 3/1/2021 to 1/1/2022: Refer to the Precipitation Data used in Stochastic Modeling section for a description of how the 100 yearly Realizations of data are produced for Precipitation, Maximum and Minimum Temperature, Evaporation, and Solar Radiation. The Solar Radiation is used in the calculation of Evapotranspiration specifically for the HLF.
  - *Resource:* Lorax Eagle Climate Data provided to Forte in 2020.
  - Refer to Figure 19

- **Evapotranspiration Calculated on HLF Only:**
  - Specifically, for the HLF, the Eagle Climate Data was used for the solar radiation, wind speed, and relative humidity necessary (along with temperature data from the 1000m and Climate Change data) for the calculation of evapotranspiration. The evaporation data provided in the 1000m and Climate Change datasets were used for the ponds.
    - *Resource:* Lorax 1000m and Climate Change (CC) data sets provided to Forte in 2021 and 2020 respectively, calculations/technique determined by Forte from engineering and HLF modeling experience
- **Sublimation Calculated:**
  - Sublimation is calculated using heat transfer principles and is included implicitly within the Snow 17 (Snow Accumulation and Ablation, Anderson, 2016) submodel used by Forte discussed in greater detail below.
    - *Resource:* Lorax 1000m, Climate Change (CC), and Site Synthetic data sets provided to Forte in 2021 and 2020 respectively as the necessary inputs for Snow 17 (Snow Accumulation and Ablation, Anderson, 2016)
  - Additional Discussion: Snow 17 uses heat transfer and energy balance methodologies to calculate the energy exchange at the snow-air interface taking into account latent and sensible heat exchange, vapor pressure differential, dew-point temperature.
- **Snowfall, Rain, and Melt:**
  - The division of precipitation between rain and snow and the calculation of Snow Water Equivalent and excess water (rain and melt) are modeled by Forte using the Snow 17 submodel. The Snow 17 submodel takes average daily temperature and precipitation as the critical inputs but also corrects for seasonal solar radiation changes, latitude and altitude in the implicit calculations of melt factor and lapse rate most notably. Snow 17 also

makes use of daily heat deficit accounting for determination of the internal condition of the snowpack based on the net heat transfer effects caused by the daily temperature and precipitation at the snow surface.

3. RESULTS AND DISCUSSION

Please refer to figures 20-34 below for the following discussion of the Deterministic modeling performed from 7/1/2019 through 12/31/2039 and figures 36 and 37 for the Stochastic modeling performed through 2021.

3.1 Deterministic Modeling Results

Deterministic modeling of the HLF was performed using two sets of Climate/Meteorological data provided to Forte by Lorax labeled in the graphs and discussed below as “1000m” and “Climate Change”/“CC”. Lorax stated that the basis of both sets of data before 1/1/2021 is historic and after 1/1/2021 is the 2016 calendar year of climate records. The key difference between the 1000m and CC data are changes to account for the impact of climate change for the Eagle site. For the 20+ year timeline modeled by Forte in the Deterministic modeling, the results were consolidated into Monthly datasets and graphed as such.

- **Total Available Storage Volume vs Desired Available Storage**
    - For both the 1000m and Climate Change datasets and model runs, the total available storage volume fell below the Desired Available Storage (DAS) volume for short periods during the measured period (prior to 1/1/2021); however, as this infringement occurred for less than 30 days (meeting the current license requirements) the plotted monthly average values show no encroachment on the DAS. The only exception to this in which the Total Available Storage infringes upon the DAS for greater than 30 days occurred in the historic data period of summer 2020 as shown in Figure 20. There were no infringements on the DAS in the forecasting period.
    - During the forecasted period, the minimum average monthly total available pond storage volume resulting from the Deterministic modeling for the Climate Change dataset was in May of 2025. For the 1000m dataset there were no infringements on the DAS and the minimum total available pond storage volume was in May of 2024.
    - Refer to Figures 20-23
- **Total Flow to Plant and Drainage from Heap**
    - The Total Flow to Plant (presumed to flow through the plant with negligible changes in volume to be pumped back to the HLF) and Drainage from HLF rates represent the measured and forecasted values of the “barren” solution flow rate pumped to the HLF and the “pregnant” solution reporting back to the In-Heap Pond from the HLF respectively.
    - Total Flow to Plant:
        - From 7/1/2019 to about 1/1/2022, the rate increases over this period and is primarily a function of the increasing HLF area available for leaching at the planned solution application rate of 7 L/hr/m^2 as the HLF is being developed. The gradual increase in this rate reflects the increase in ore loaded onto the HLF and the total area available for barren solution application.

- From about 1/1/2022 to 2/15/2028, this rate is primarily a function of the Target Plant Flow Rate of 1500 m^3/hr and this rate is seen to stay near the 1500 m^3/hr target throughout most of this time period. Slight dips can be correlated with both peaks in the total volume available for storage and the Make-Up Water supply indicating that water is being added into the system to maintain the Target Plant Flow Rate (Figure 24 and Figure 25). These periodic drops in the Total Flow to Plant also coincide with the winter months in which the stacking of new ore onto the HLF is continued from October through December as precipitation is largely in the form of snow instead of immediately infiltrating rain. From January through the freshet runoff until about mid-May, there is sufficient volume of solution maintained in the In-Heap Pond for the Total Flow to Plant to consistently meet the target leaching demand at about 1500 m^3/hr. In the event that there is not enough solution to meet the Target Plant Flow Rate requirement, the demand for Make-Up Water is triggered as shown in Figure 28 and Figure 29.
- From 2/15/2028 to about 3/1/2036 for the 1000m Climate Series and about 4/1/2031 for the Climate Change Climate Series, the Total Flow to Plant demand for solution from the In-Heap Pond becomes secondary after the initial leach cycle is completed on the last ore loaded onto the HLF. Solution from the In-Heap Pond is actively pumped out to be discharged to treatment as the top priority and the remaining solution/water is recirculated to the HLF for storage within the ore to maintain the DAS while residual gold recovery continues.
- Beyond 3/1/2036 for the 1000m Climate Series and 4/1/2031 for the Climate Change Climate Series, the In-Heap Pond reaches sufficiently low levels that there is no longer a need for continuous recirculation of solution. It is at this point the Total Flow to Plant falls to zero in perpetuity, and the flow from the pond is directed to the HLF passive treatment system. The Climate Change Climate Series yields an earlier date for the Total Flow to Plant Rate falling to zero due to the relatively greater continuous Discharge to Treatment targeted. The Climate Change model utilizes a higher discharge rate than the 19 L/s rate used for the 1000m Climate Series as this showed to be insufficient to eliminate all recirculation requirements.

o Drainage from Heap

- Generally, the Drainage from Heap is a function of the Total Flow to Plant plus Make-Up Water with the addition of meteorological factors. Energy transfer (e.g., sublimation of snow and evapotranspiration) is applied at the surface of the HLF as well as the percentage of precipitation (rain or melt) that infiltrates into the HLF. Note that the portion of this precipitation that does not infiltrate into the HLF reports

to the In-Heap Pond by running off the heap or exposed liner then infiltrates into the ore at the lowest surface elevation of the heap facility.

- Refer to Figures 24-27

- **Make-Up Water and Discharge to Treatment Rates**
  - The Make-Up Water is taken as the difference between the solution demand for leaching of ore on the HLF and the available solution in both the In-Heap and Event Pond sent through the plant. The Make-Up water requirement is generally seasonal, up until the Make-Up Water supply is shut off to facilitate the closure of the HLF in 2/15/2028. The Make-Up Water requirement is reduced to near zero levels around February each year. This coincides with the middle of the three-month period in which the mine does not load fresh ore onto the HLF. Once the runoff from snow melt is completed in about mid-May each year, the demand for Make-Up Water from an outside source begins to increase and fluctuate through the summer until the average temperature falls below 0 Celsius. Once the site is generally below freezing in about October, precipitation no longer adds significantly to the In-Heap Pond Volume and the requirement for Make-Up Water reaches its highest levels throughout the remaining period of the winter in which the mine continues to stack new ore on the HLF.
  - The Discharge to Treatment Rates used by Forte are in line with the WUL with an updated solution management strategy to reduce solution earlier while residual gold recovery continues from the HLF with the majority of solution continuing to be recirculated through the HLF. This will serve to continue producing gold while gradually reducing solution in the system; approximately 1000 m^3/hr is maintained in circulation through the HLF for more than 2 years after the initiation of the Discharge to Treatment.
    - 1000m Climate Series: After the initial leach cycle of the last ore loaded is complete on 2/15/2028, discharge to treatment begins at a constant rate of 12.1 L/s. This rate is maintained without interruption until it is increased on 1/1/2030 to 19 L/s per previous model runs, Forte engineering judgement, and site direction to not exceed a Discharge to Treatment rate of 20 L/s in line with the WUL.
    - Climate Change Climate Series: After the initial leach cycle of the last ore loaded is complete on 2/15/2028, discharge to treatment begins at a constant rate of 19 L/s. This rate is maintained without interruption until it is increased on 1/1/2030 to 28.5 L/s per calibration model runs and Forte engineering judgement. Given the increased overall quantity of precipitation in the latter years of the Climate Change Climate Series, the use of the same discharge rates as for the 1000m series are insufficient to drain the HLF of solution. Even with a constant discharge rate of 19 L/s from 2/15/2028 onward, there is sufficient meteoric inflow that the HLF

remains in a pseudo-equilibrium requiring constant recirculation. As such, Forte increased the Discharge to Treatment Rate by 50% on 1/1/2030 to 28.5 L/s thus ensuring a swift draindown of the HLF by about 4/1/2031.

  - Refer to Figures 28-31

- **Snow Water Equivalent**
  - The Snow Water Equivalent (SWE) as modeled by the Snow 17 method shows both the 1000m and Climate Change datasets repeatedly peaking in April of each year, reaching zero (signifying complete melt) in June of each year, and beginning to increase again in September of each year. The Climate Change dataset yields greater and lesser maximum SWE values than the repeated 1000m dataset indicating that some years the overall effect of the increased temperature will outweigh the effect of the increased precipitation resulting in lower SWE values while in other years the exact reversal of effects is seen.
  - Refer to Figures 32-35

3.2 Stochastic Modeling Results

Stochastic modeling of the HLF was performed using Climate/Meteorological data generated utilizing WGEN and historic data records. For each model run, measured data was taken from the 1000m climate series dataset from 7/1/2019 to 1/1/2021 then from the forecasted 1000m climate series from 1/1/2021 to 3/1/2021 at which point the stochastically created Climate/Meteorological data was used. The basis of the stochastically created data is the 71-year Site Synthetic data provided by Lorax which was used in the WGEN model to produce 100 realizations of daily climate data for a single-year record. For the 2.5-year total timeline modeled by Forte in the Stochastic modeling, the results were consolidated into Weekly datasets and graphed as such.

- **Total Available Storage Volume vs Desired Available Storage**
    - Only the freshet and summer period from 3/1/2021 to 8/31/2021 were graphed to show the highest resolution in the period in which the Total Available Storage Volume reaches its minimum for all datasets.
    - The minimum Total Available Storage Volume, of 240,170 m^3, (corresponding to the 1st Percentile/Lower “Tail”) is reached in the week of June 7th, 2021. Based on this, there is shown to be no probability of an infringement on the DAS during the summer of 2021.
    - Refer to Figure 36
- **Snow Water Equivalent**
    - For the Stochastic modeling, the simulated SWE values reach their maximum around early May with all of the maximum SWE values between 190mm and 240mm. In all datasets, the SWE shows a decrease from the peak value to about zero over the course of late-May and early-June with variations correlated to variations in the climate input data, especially precipitation and temperature.
    - Refer to Figure 37

4. CONCLUSION/SUMMARY

4.1 Deterministic Modeling

For the historic period:

- During the summer of 2020 there was a period in which the Total Available Storage Volume infringed upon the DAS as seen in Figure 20.
    - There was no uncontrolled release to the environment during this period.

For the 1000m climate dataset presented on a monthly basis, during the forecasted period:

- The Total Available Storage Volume available in the In-Heap and Event Pond never falls below the DAS volume.
    - Implicit in this is that there was no release to the environment during this period.
    - By turning off the supply of Make-Up water, turning on a first priority 12.1 L/s Discharge to Treatment (increased to 19 L/s in 2030) and maintaining secondary recirculatory pumping after all of the ore has been loaded onto the HLF and undergone initial leaching, the HLF In-Heap Pond and Event Pond can maintain storage volumes above the DAS volume.

For the Climate Change climate dataset presented on a monthly basis, during the forecasted period:

- The Total Available Storage Volume available in the In-Heap and Event Pond never falls below the DAS volume.
    - Implicit in this is that there was no release to the environment during this period.
    - By turning off the supply of Make-Up water, turning on a first priority 19 L/s Discharge to Treatment (increased to 28.5 L/s in 2030) and maintaining secondary recirculatory pumping after all of the ore has been loaded onto the HLF and undergone initial leaching, the HLF In-Heap Pond and Event Pond can maintain storage volumes above the DAS volume.

4.2 Stochastic Modeling

For all stochastically generated climate datasets presented on a weekly basis:

- Based on water management methodology utilized in the modeling for the HLF, the Total Available Storage Volume in the In-Heap Pond and Event Pond has a 0% probability of falling below the DAS volume required at any point in 2021, utilizing the 100 iterations of stochastic climate data.

APPENDIX I1

Eagle Gold Mine Hydrograph Update (2020 Data)

BGC ENGINEERING INC.
AN APPLIED EARTH SCIENCES COMPANY
Suite 500 - 980 Howe Street, Vancouver, BC Canada V6Z 0C8
Telephone (604) 684-5900 Fax (604) 684-5909

Transmittal

To:	**Victoria Gold Corporation**	**Doc. No.:**	**N/A**
Attention:	**Stephen Wilbur**	**cc:**	**Lindsay Rear**
From:	**Andrew Krentz**	**Date:**	**March 19, 2021**
Subject:	**Eagle Gold Mine Hydrograph Update (2020 Data)**		
Project No.:	**0792029**		

BGC Engineering Inc. (BGC) was retained by Victoria Gold Corporation (VGC) to review and process physical hydrogeological and climate data collected from the Eagle Gold mine site by VGC during 2020. BGC has previously provided these services to VGC and the methods used for the data review and processing described herein are similar to those used previously (BGC, March 9, 2020). This transmittal letter documents the review and includes hydrograph plots (Figures 1 through 24) and a potentiometric map (Figure 25) updated with data collected in 2020. Hydrograph plots are only provided for locations where data were collected in 2020. The potentiometric map considers all locations where groundwater data are available, including data collected prior to 2020, with consideration given to the effects of mining activities such as dewatering.

The groundwater data to be reviewed and processed were provided via email from Lindsay Rear (VGC) on January 20, 2021 and January 22, 2021. The data included field notes, manual depth to water measurements, and data from Solinst Leveloggers and a Solinst Barologger. A summary of the locations where data from 2020 were received is provided in Table 1.

The data provided by VGC were processed by BGC to produce hydrograph plots showing the groundwater elevation through time at each location. The tasks completed by BGC to produce the hydrographs were limited to:

1. Reviewing the data to identify gaps, inconsistencies, and duplicates. As part of this review, the depth to the bottom of each hole (as measured by Victoria Gold field staff in 2020) was compared to records of screen depths and borehole depths maintained by BGC and documented in bore hole logs available for each location. Discrepancies that were observed were reported to VGC and were resolved.
2. Converting manual measurements of groundwater levels to groundwater elevations. These elevations were calculated based on top of casing elevations that are consistent with those used during the previous hydrograph update (BGC, March 9, 2020).
3. Barometrically correcting data from the Leveloggers with data from the Barologger. The corrected data were then converted into groundwater elevations through comparison with the manual measurements of groundwater levels. During this step, the data were corrected for discrepancies associated with deploying the loggers at inconsistent depths throughout time. The manual data generally aligned well with the barometrically corrected datalogger data.

4. The processed Levelogger data were converted to average daily values to decrease the volume of data, and relevant field notes were added to each plot.
5. Climate data from the Camp Meteorological Station (Figure 25) were added in a second plot below each of the hydrographs. These data were converted to daily averages (for temperature) and daily totals (for precipitation) prior to plotting.

CLOSURE

BGC Engineering Inc. (BGC) prepared this document for the account of Victoria Gold Corporation. The material in it reflects the judgment of BGC staff in light of the information available to BGC at the time of document preparation. Any use which a third party makes of this document or any reliance on decisions to be based on it is the responsibility of such third parties. BGC accepts no responsibility for damages, if any, suffered by any third party as a result of decisions made or actions based on this document.

As a mutual protection to our client, the public, and ourselves all documents and drawings are submitted for the confidential information of our client for a specific project. Authorization for any use and/or publication of this document or any data, statements, conclusions or abstracts from or regarding our documents and drawings, through any form of print or electronic media, including without limitation, posting or reproduction of same on any website, is reserved pending BGC's written approval. A record copy of this document is on file at BGC. That copy takes precedence over any other copy or reproduction of this document.

Yours sincerely,

BGC ENGINEERING INC.

APPENDIX J1

Eagle Gold Mine Phase 1 Environmental Effects Monitoring Study Design

VICTORIA GOLD CORP
TSX | VGCX

December 1, 2020

Ms. Myra Page
Environmental Effects Monitoring Coordinator
Environmental Stewardship Branch
Environment and Climate Change Canada
101-401 Burrard Street
Vancouver, BC V3C 3R2

Dear Ms. Page,

Re: Eagle Gold Mine Phase 1 EEM Study Design Addendum (File #: MM4039)

Please accept this letter as a response from Victoria Gold Corp. (VGC) to the Eagle Gold Mine Phase #1 EEM Study Design- Action items identified review document provided by Environment and Climate Change Canada dated November 10, 2020. The response provided herein has been prepared by VGC and Minnow Environmental Inc. (Minnow), the Environmental Effects Monitoring (EEM) study design lead consultant retained by VGC.

This detailed response has been prepared as an addendum to the Eagle Gold Mine Phase 1 Environmental Effects Monitoring Study Design. Action Item #1 has been addressed by VGC while Action Items 2 through 5 have been addressed by Minnow.

Action Item #1: Details required for all Final Discharge Points (FDP) and water treatment processes.

Comment: *Schedule 5 paragraph 10(a)(iii) requires information regarding the production processes used by a mine.*

- *Section 2.2.1 of the Phase 1 study design provides some details regarding the treatment of mine water/solution from the HLF and Gold Recovery Plant and lists four final discharge points. The mine water treatment plant is not built and it is unclear when water treatment will commence. Currently water is being directed to the Lower Dublin South Pond (LDSP) but no details are provided as to what, if any, water treatment is used prior to discharge.*
- *The Eagle Gold Project Environmental Monitoring Surveillance and Adaptive Management Plan Version 2019-02 (received via email 2019-08-14) section 2.4.3 indicated that water from LDSP will also be used for dust suppression.*
- *The study design indicated that a fifth FDP, the LDSP Contingency Sump has been decommissioned; however, the 2020 Quarterly effluent monitoring, 2nd quarter, report submitted to the Mine Effluent Reporting System on August 13, 2020, reported a*

discharge from the contingency sump on April 20, 2020 that exceeded the total suspended solids authorized limits for deleterious substances (Schedule 4 of the MDMER).”

Action Item*:* Provide details for current water treatment processes and all proposed uses for water held in the Lower Dublin South Pond. Provide details for the missing FDP LDSP Contingency Sump.

Response: As discussed in the VGC Eagle Gold Mine Phase 1 EEM Study Design, water management at the Eagle Gold Mine is operated in two discrete areas that are bisected by Dublin Gulch. The southern management area includes the Lower Dublin South Pond (LDSP). The primary water management strategy for the southern management area involves the capture of contact water via a series of engineered ditches which is then conveyed to the LDSP. The LDSP was designed, and is constructed, with a forebay for deposition of coarse material (primarily sand) and a main sedimentation pond for deposition of fine-grained material (silts and clay). The pond system is designed to allow a minimum 24-hour residence time to allow settling of Total Suspended Solids (TSS) and associated total metals such as arsenic, while water migrates to the area of the LDSP FDP#3.

Prior to a decision to discharge contact water from FDP #3, VGC staff collect predischarge samples of LDSP water to compare with the Authorized Limits of Deleterious Substances defined in Schedule 4 of the Metal and Diamond Mine Effluent Regulations (MDMER). These results are used to determine compliance with the MDMER authorized limits and to inform management decisions with respect to mine contact water.

VGC is currently targeting the construction of a Mine Water Treatment Plant (MWTP) during 2021 with final commissioning scheduled in Q4 2021. A preliminary design was developed as part of the territorial water licencing process, and that design is currently under review and refinement. The final issued for construction design will be based on the available water quality dataset, modelled water chemistry that will be encountered as the Mine develops, the currently licensed effluent quality standards and the limits prescribed in the MDMER.

Water transfers between the LDSP and the Events Pond (a large lined containment pond in the northern water management area), the Heap Leach Pad and the gold plant are also utilised to manage contact water at the mine. This transferred contact water is utilised for process needs including leaching ore on the heap leach pad or for gold elution within the gold recovery plant. The Events Pond also provides a mechanism for additional settling time to support achieving deleterious standards or for storing water for process needs.

As noted, contact water within the LDSP is also utilised for dust suppression primarily on Project

roadways but also within the crushing and conveying circuits.

With respect to the discharge to the contingency sump on April 20, 2020. The FDP (identified as FDP #5 LDSP Contingency Sump) is located at approximately 64° 2'0.84"N 135°50'9.11"W. A letter to ECCC on July 24, 2019 explained that the LDSP Contingency Sump FDP #5 was no longer necessary; however, on April 20, 2020, Victoria informed our ECCC Enforcement Officer that due to significant freshet water volumes and lack of adequate pumping infrastructure, that the LDSP Contingency Sump FDP#5 would be required and was to be utilised to discharge water from the LDSP by the process of exfiltration. LDSP Contingency Sump FDP #5, which discharges to ground, was utilised in late April 2020, and re-added to the FDPs identified for the mine, as it represented a Final Discharge Point with the lowest potential for environmental effects. The exfiltration mitigated TSS exceeded deleterious substance criteria during the discharge. The Eagle Gold Mine Phase 1 EEM Study Design was drafted prior to the occurrence of this spring Freshet discharge from the LDSP Contingency Sump FDP#5. Therefore, the Eagle Gold Mine Phase 1 EEM Study Design submission did not document the potential for the continued use of LDSP Contingency Sump FDP #5. FDP #5 and FDP#3 are documented and reported on regularly in MERS now that discharges have occurred from both FDPs following the Mine becoming subject to MDMER.

If ECCC requires any further discussion or clarity regarding the information provided herein, Victoria proposes arranging a conference call to discuss any remaining items to the satisfaction of ECCC.

Sincerely,
William Bowden, Environmental Superintendent

Dear Ms. Page,

Re: Eagle Gold Mine Phase 1 EEM Study Design Addendum

Environment and Climate Change Canada (ECCC) has completed an initial review of the "Eagle Gold Mine Phase 1 Environmental Effects Monitoring Study Design", dated April 2020, submitted by Victoria Gold Corporation (VGC). In a letter dated November 10th, 2020, ECCC identified Action Items that required a response from VGC in order for ECCC to complete their review and provide approval of the Environmental Effects Monitoring (EEM) Study Design (ECCC 2020). This detailed response has been prepared as an addendum to the aforementioned study design to address four of the five Action Items (2 through 5) and one review comment provided by ECCC upon their initial review of the study design document.

Action Item #2: Additional details regarding effluent mixing.

Comment: "*Schedule 5, paragraph 10(a)(i) requires a description of the manner in which effluent mixes in exposure areas at 100 metres and 250 metres.*

- *Section 2.4.1 of the study design indicates that the estimated effluent concentration at Haggart Creek near-field was 13.8%. However, the distances from the near-field sampling site (W4) and the far-field site (W22) to the FDP are not provided. The scale used by Figure 2.2 showing the hydrology station locations is too small to accurately determine the location of the sampling station in relation to the final discharge point. The study design suggests that concentrations greater than 10% can occur at the Haggart Creek effluent-exposed area but the total length is not defined.*

- *Section 2.2.1.2 of the EEM TGD covers measuring conductivity in effluent using a formula to determine relative concentrations (formula indicated). Temperature readings are also recommended since conductivity rises approximately 2% for every 1º C rise in temperature.*
- *Section 2.3 of the study design used data from two days, however, conductivity was not measured for the reference W22 or the effluent LPSD Outlet for both days. The effluent concentration (Ca) was calculated using an average of the two readings for W4 while Cb and Ce had only one measurement each. Samples should have been collected on the same days and Cr calculated for each day rather than averaging the measured conductivity at W4. By not using an average for W4 the estimated effluent concentration for April 18 would be 34%. It is also unclear from Table 2.2 how far the extent of the reported 13.8% concentration is in the near-field."*

Action Item*: "Provide additional information for the sampling sites used to estimate effluent concentrations (W22 and W4) in terms of distance from the FDP discharge in metres. Provide a larger scale map that provides greater detail for locations of sampling sites W22 and W4 in relation to each other and the final discharge point."*

Response: The Haggart Creek near-field effluent-exposed station W4 is located approximately 70 m downstream of the Ditch C confluence, and approximately 170 m downstream of the Dublin Gulch confluence on Haggart Creek (Figure 1). As indicated in Study Design Section 2.4.1, effluent from LDSP is discharged to Haggart Creek via Ditch C, and thus areas downstream of the Ditch C confluence on Haggart Creek are designated as the "effluent-exposed" area. The Haggart Creek reference station W22 is located approximately 250 m upstream of the Ditch C confluence, and approximately 150 m upstream of the Dublin Gulch confluence on Haggart Creek (Figure 1). The location of Station W22 is well upstream of the influence from effluent discharge, potential surface water runoff, and potential seepage from the Eagle Gold Mine. Station W22 was approved as a reference location for the Eagle Gold Mine through the *Yukon Environmental and Socio-economic Assessment Act* process and for territorial Water Use License (WUL) monitoring programs designed to assess potential mine-related effects on aquatic resources.

As requested, a larger scale map of the effluent receiving area of Haggart Creek is provided in this addendum to provide further perspective for the proposed EEM study areas (Figure 1). Limited effluent discharge data were available for determining effluent mixing and/or effluent concentrations in Haggart Creek during study design preparation (i.e., effluent had only been discharged a total of four days in April 2019 prior to study design development). Based on the examination of data used at the time of study design development, it was clear that effluent concentrations approximately 10% and higher could be expected to extend from the Ditch C confluence to approximately 1,050 m downstream of Ditch C in Haggart Creek, near the Gil Gulch confluence based on derivation from hydrological station data and specific conductance data

(Study Design Appendix Tables 2.1 and 2.2). In September 2020, VGC conducted visual dye experiments to improve understanding of effluent mixing within the Haggart Creek receiver. The results of these initial studies indicated that effluent primarily remained within the right half of the Haggart Creek channel as far downstream as 100 m from the Ditch C confluence (Photos 1 to 3), and partial effluent mixing was evident to at least 150 m downstream of Ditch C (Photo 4) under the September 2020 flow conditions. The Ditch C plume characteristics in Haggart Creek are expected to be variable and dependent upon seasonal flow conditions (e.g., freshet versus summer low flow). Additional plume characterization work in 2021 will be aimed at better defining the full effluent mixing zone, and will include the estimation of effluent concentrations at 100 m and 250 m downstream of the Ditch C (effluent) discharge. Conductivity measurements of the final effluent, Haggart Creek at the reference area, and Haggart Creek at the effluent-exposed area 100 m and 250 m downstream of the effluent discharge will also be conducted at the time of the benthic invertebrate community and fish population field studies to allow effluent concentration determination at these key distances from the discharge. Based on these studies, a description of the manner in which effluent mixes in Haggart Creek will be provided in the Eagle Gold Mine Phase 1 Interpretive Report.

Photo 2: Effluent Plume in Haggart Creek Approximately 70 m Downstream of Ditch C, at Station W4, during the September 2020 Dye Study

Photo 3: Effluent Plume in Haggart Creek Approximately 100 m Downstream of Ditch C during the September 2020 Dye Study

Photo 4: Effluent Plume in Haggart Creek Approximately 150 m Downstream of Ditch C during the September 2020 Dye Study

Action Item #3: Fish population study clarification

Comment: "*Schedule 5 paragraph 10(b)(ii) requires an explanation as to how the study will provide the information necessary to determine the effluent effect on fish. The study design is proposing to use a control-impact lethal design for slimy sculpin and a control-impact non-lethal design for arctic grayling.*

- *Section 3.3.2 of the study design provides details of the sample sizes and collection methods for slimy sculpin and arctic grayling. Table 3.3 indicates that lethal sampling (should be non-lethal) will be conducted for arctic grayling and that 100 individuals will be taken for each study area. It is unclear from the information in Table 2.12 in the study design that 100 fish per sample site would be attainable given the low density numbers presented from past baseline sampling (53 fish total caught for Haggart Creek and 13 fish total caught for Lynx Creek). The study design does not address if 100 fish/site (total 200) proposed can actually be met."*

Action Item*: "Provide information detailing how the arctic grayling non-lethal sampling will be able to collect 100 fish/site (2 sites x 100 = 200 fish) given the low density numbers. Details should include any proposed alternate studies if 100 fish/site cannot be obtained."*

Response: As noted, slimy sculpin will be targeted using a traditional (lethal) sampling approach, and arctic grayling will be targeted using a non-lethal sampling approach. We apologize for any confusion related to reference to a lethal sampling approach targeting arctic grayling in Table 3.3 of the study design.

Arctic grayling densities appear to be relatively low in Haggart Creek and Lynx Creek based on depletion sampling methods conducted using backpack electrofishing during baseline, construction, and the first year of operations. These density estimates provided in the study design were determined for 'closed' stations (i.e., area enclosed by stop nets at upstream and downstream boundaries) established at pre-defined areas that are then sampled at the same location each year. The establishment of closed-station locations/station boundaries was not determined randomly, but rather habitat features that allowed for efficient sampling (e.g., absence of large/deep pools, avoidance of high gradient areas, avoidance of boulder habitat and/or areas with large amounts of overhanging and/or woody debris) were selected considering habitat features at all study areas. This methodology allowed for repeatable sampling over time without the confounding influences associated with 'difficult' habitat. Because the historical closed stations were not established randomly and may not incorporate all types of habitat, it is currently unclear whether a target number of 100 arctic grayling cannot be attained at each study area employing an 'open' station sampling method (i.e., no use of stop nets) of all available habitat types at each of the Haggart Creek effluent-exposed area and Lynx Creek reference area.

Fish sampling for the EEM study will also be conducted over a larger area than the historical baseline and current biennial monitoring programs. Thus, sampling using an 'open' station electrofishing approach over a larger surface area at each of the effluent-exposed and reference areas is the logical first step in determining whether the target number of 100 arctic grayling can be achieved at each area. Although backpack electrofishing has been shown to be the most efficient method for arctic grayling collection historically, minnow trapping has also shown modest success. Therefore, minnow trapping will be used as a back-up collection method to electrofishing if the latter is unsuccessful for capturing the requisite number of arctic grayling. Notably, no other fish species appeared to be present in sufficient abundance at either Haggart Creek or Lynx Creek to allow successful implementation of lethal or non-lethal sampling approaches based on historical baseline and current biennial monitoring programs.

Action Item #4: Benthic study sampling site requirements

Comment: "*Schedule 5 sub-paragraph 10(c)(1)(A) requires a description of the sampling areas and a scientific rationale why the sampling areas were selected.*

- *The study design proposes a control-impact design using exposure/reference sampling sites. Section 3.2.1 of the study design (pg42) states "The effluent-exposed and reference study areas indicated above correspond to Stations W4/W29 and W22, respectively, that are used to assess Project-related effects on chemical and biological conditions at Haggart Creek in accordance with territorial WUL stipulations (VGC 2020). These same study areas (and station locations, if possible) are proposed for benthic sampling as part of the Phase 1 EEM (Figure 3.1)." However, Table 3.1 indicates only 2 study areas W4 and W22. It is unclear if study area W29 is part of the proposed study.*
- *There is concern with the reference sampling site (W22) given its close proximity to the discharge point and mine footprint. The study design states that the site is sufficiently upstream of the LDSP outlet but details on how far are not provided and the map in Figure 3.1 does not provide any details on sampling site locations or distances. Note that the MDMER paragraph 2(2)(b) defines effluent as "any seepage or surface runoff containing any deleterious substance that flows over, through or out of the site of a mine." Thus any reference sampling site must not be situated where there is the potential for any effluent including seepage or surface runoff from the mine site that may impact the reference site."*

Action Item*: "Provide additional details to support the scientific rationale for the exposure and reference sites selected and the total number of sampling sites proposed. Update Table 3.1 if W29 is to be used as an exposure site. Update the Figure 3.1 map showing locations of sampling sites at a larger scale.*"

Response: Consistent with standard EEM nomenclature, study areas were identified for the Eagle Gold Mine Phase 1 EEM that included an effluent-exposed area (downstream of the Ditch C effluent discharge on Haggart Creek) and two reference areas (a benthic invertebrate community reference area located upstream of the Ditch C effluent discharge on Haggart Creek, and a fish reference area located on Lynx Creek) in the Study Design. In an attempt to facilitate harmonization between the EEM study sampling locations and territorial sampling locations under the Eagle Gold Mine WUL, benthic invertebrate community stations used for the latter were intended to be evaluated for adequacy for EEM and if suitable, fall within the EEM study areas.

The intended definition for the (near-field) effluent-exposed area in Haggart Creek was the area bound by Station W4 on the upstream end, and Station W29 on the downstream end. This corresponds to approximately 1,600 m of creek length, extending from about 70 m downstream of Ditch C at the upstream (north; Station W4) end to about 1,670 m downstream of Ditch C at the downstream (south; Station W29) end on Haggart Creek (Figure 1). This (near-field) area is the only effluent-exposed area proposed for the Phase 1 EEM study. Five benthic invertebrate community stations will be established within this (near-field) effluent-exposed area for EEM purposes. Although a different naming convention will be used for the EEM benthic invertebrate community samples, samples may be collected at WUL Station W4 and Station W29 (as two of the five EEM benthic invertebrate community samples from the effluent-exposed area) to serve

as benthic invertebrate community samples for both the EEM and WUL programs. Except for stations W4 and W29, benthic invertebrate community station locations have yet to be determined and will be established at the time of sampling. Similarly, fish population survey sampling will be confined to the 1,600 m length of creek defined by the (near-field) effluent-exposed area for EEM purposes.

The Haggart Creek (benthic) reference area used for EEM purposes will include WUL Station W22 (at the lower end of the reference area) to allow dual use of this station in the EEM and WUL programs. The EEM benthic reference area on Haggart Creek will extend approximately 1,300 m in length, beginning approximately 250 m upstream of Ditch C at the downstream (south; Station W22) end to about 1,550 m upstream of Ditch C at the upstream (north) end on Haggart Creek. The location of Station W22, and thus the lower end of the EEM reference area, is well upstream of the influence from effluent discharge, surface water runoff, and potential seepage from the Eagle Gold Mine. As indicated previously, Station W22 was approved as a reference location for the Eagle Gold Mine through the *Yukon Environmental and Socio-economic Assessment Act* process and for territorial WUL monitoring programs designed to assess potential mine-related effects on aquatic resources.

The scientific rationale for the selection of effluent-exposed and reference areas for the EEM, as well as the total number of benthic community sampling stations, was provided in the study design (Section 3.2). As requested, a larger scale map of the Haggart Creek study areas (including currently applicable WUL stations) is provided in this addendum to provide better perspective (Figure 1)

Action Item #5: Benthic study sediment sampling

Comment: "*Schedule 5 paragraphs 10(c)(i) and (ii) and subparagraph 12(1)e)(ii) require the description and scientific rationale for benthic studies, explaining how the study will provide the information necessary to determine effect. In addition, "if the study is conducted in an area where it is possible to sample sediment, total organic carbon content of sediment and particle size distribution of sediment" should be provided.*

- *The study design does not indicate if any sediment sampling will be conducted.*

Action Item*: "Provide details for sediment sampling, and if no sediment sampling is to be conducted, provide the rationale.*"

Response: No sediment sampling is proposed for the Eagle Gold Mine Phase 1 EEM. As indicated in the study design, benthic invertebrate community samples will be collected from erosional riffle-run habitat characterized by coarse gravel-small cobble substrate in the 64 mm to 256 mm diameter size range (Wentworth Scale) at the effluent-exposed and reference study areas of Haggart Creek. Substrates in these size ranges are generally not subject to total organic

carbon (TOC) content analysis (i.e., substrates are entirely mineral in composition) or particle size analyses.

Review Comment #1: Bray-Curtis critical effect size

Comment: "*Schedule 5 subsection 1(2) requires critical effect sizes (CES) and provides the CES for benthic density, evenness and richness. For the Bray-Curtis Index, Table 1-3 of the EEM Technical Guidance Document sets the CES at +2SD.*"

Response: The Bray-Curtis Index will be computed and assessed statistically using procedures recently recommended by ECCC for the analysis of EEM benthic invertebrate community data (i.e., Borcard and Legendre 2013). Based on our understanding of this method, the Mantel R^2 and dbRDA R^2 values can be construed as a measurement of effect size (i.e., how well the data fit each test model, represented by the proportion of variance of the community data explained by the reference versus exposed classification criterion), with values closer to 1 indicating greater difference in community characteristics between two populations for each of the Mantel and dbRDA tests. Based on this approach, no generation of a CES based on standard deviations of the reference mean, as stipulated in the Environment Canada (2012) Technical Guidance Document, appears to be possible. If ECCC can provide guidance as to how CES can be applied to the newly recommended method of assessing differences in community structure using the Bray-Curtis Index, VGC will apply a comparison to CES for this metric in the Eagle Gold Mine Phase 1 EEM Interpretive Report.

Closing

If you would like to further discuss any aspects of this study approach, please do not hesitate to contact Bill Bowden, Environmental Superintendent for the VGC Eagle Gold Mine (bbowden@vgcx.com; 867.456.7700 x6381).

Sincerely,
Minnow Environmental Inc.

Paul LePage, M.Sc.
Senior Project Manager

1 INTRODUCTION

Victoria Gold (Yukon) Corp. (VGC), a directly held, wholly owned subsidiary of Victoria Gold Corp., operates the Eagle Gold Mine (the Project) in the Mayo Mining District of central Yukon, approximately 45 km (85 km by existing road access) north-northeast of the Village of Mayo (Figure 1.1). The Project will include an open pit gold mine, material storage and stockpile management areas, and process facilities that include crushing, heap leaching, carbon adsorption, desorption, and recovery (ADR) for gold extraction. Mine construction was completed in July 2019, and gold production began in September 2019. Approximately 29,500 tonnes of ore will be mined daily and, following three-stage crushing and cyanide heap leaching, gold is recovered using carbon ADR, electrowinning, and smelting processes to produce gold doré.

Water management at the Project is operated in two discrete areas that are bisected by Dublin Gulch. The northern management area includes leak detection, monitoring, and recovery systems to ensure the containment of solution within the heap leach facility, a lined external events pond to contain excess solution from the heap leach facility (all of which operates as a closed system with no planned release to the environment), and surface water management ditches and berms for roads, laydowns, and the ADR plant. For the other major Project infrastructure (i.e., the open pit, waste rock dumps, crushing area) in the southern management area, various surface water interceptor/diversion ditches and pipes are utilized to direct contact and non-contact waters to appropriate locations. Excess contact water from these sources is directed to a lined collection pond, referred to as the Lower Dublin South Pond (LDSP), for temporary storage and recirculation within the gold extraction process as conditions allow. Following achievement of effluent quality limits, effluent from the LDSP is released to Haggart Creek. From the point of effluent reception, Haggart Creek flows approximately 23 km southwest into South McQuesten River, which is located within the Stewart River sub-basin of the Yukon River watershed.

On April 20, 2019, the Project became subject to the Metal and Diamond Mining Effluent Regulations (MDMER) under the federal *Fisheries Act* as a result of the discharge of effluent in excess of 50 cubic metres (m^3) in a single day from the LDSP. The MDMER outline requirements for routine effluent and water quality monitoring and for biological monitoring, collectively referred to as Environmental Effects Monitoring (EEM) studies, as a condition governing the authority to discharge effluent. The objective of EEM is to determine whether mine effluent is causing an effect on the fish population, human use of fisheries resources (i.e., mercury accumulation in fish tissues) and/or benthic invertebrate communities. An EEM Study Design is required within 12 months of a mine becoming subject to the MDMER, and at least 6 months prior to conducting the biological monitoring field study. In accordance with the MDMER, this Study Design provides

detailed site characterization information and outlines the approach to the Project's first (Phase 1) EEM biological study, the field component of which is scheduled for 2021.

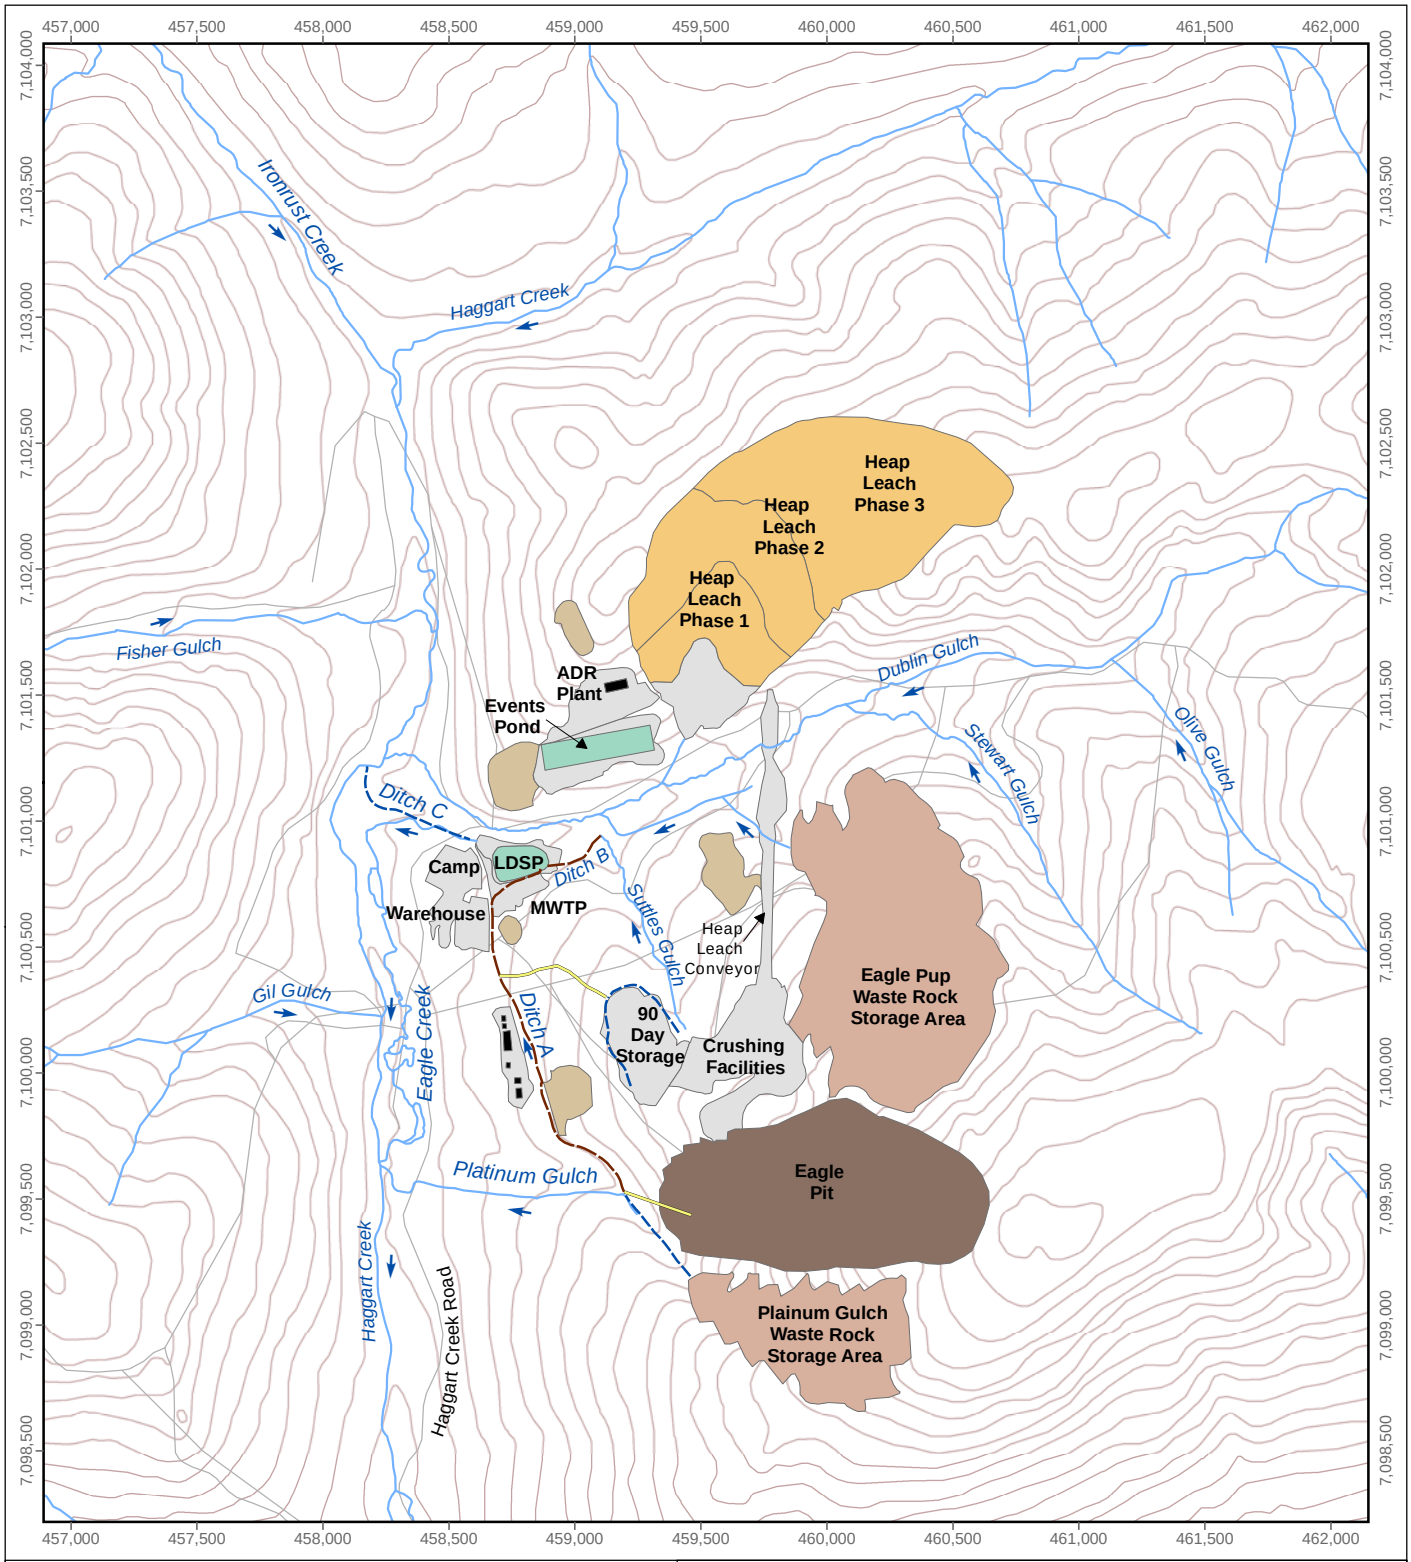
2 SITE CHARACTERIZATION

2.1 Overview

Site characterization provides key background information that forms the foundation for the design of each study phase within the EEM program (see Environment Canada 2012). The content of this site characterization reflects the requirements outlined under the EEM studies portion of the MDMER (Schedule 5, Division 1; Government of Canada 2019). Accordingly, information regarding mine operations, effluent mixing characteristics, effluent receiving environment and reference area characteristics, confounding influences for the evaluation of effluent-related effects within the receiving environment, and other mine/study area aspects relevant to the development of the Phase 1 EEM biological study are summarized herein as specified in the MDMER.

2.2 Project Operations

2.2.1 Project History and Process Description



The Project is located in central Yukon in the Traditional Territory of the First Nation of Na-Cho Nyäk Dun (FNNND). Placer gold was discovered on Haggart Creek in 1895 and on Dublin Gulch in 1898. Prospecting and subsequent surface (i.e., placer) mining on Haggart Creek and Dublin Gulch was undertaken by multiple claim owners on a relatively small scale (pick and shovel and small placer workings) until the late 1930s when larger mechanized equipment including draglines was brought to the area. Placer mining in the local area is ongoing; however, in the immediate area of the Project, larger scale placer mining ceased in the mid-1990s. The first hard rock claims for the Dublin Gulch area were recorded in 1901, and from 1904 to 2004 the development of the hard rock deposits included trenching, adits, shallow shafts, and exploratory drilling by various companies, including Treadwell Yukon Ltd. (1937 to 1946), Keno Hill Mining Company/Avoca (1946 to 1962), Peso Silver Mines (1962 to 1973), Adonis Mine Ltd. (1973 to 1978), Queenstake Resource Ltd. and Canada Tungsten Corporation Ltd. (1978 to 1991), Amax Gold Inc. (1991 to 1993), Ivanhoe Goldfields Ltd./First Dynasty Mines Ltd./Sterlite Gold Ltd. (1993 to 2004). In 2004, StrataGold Corporation acquired all the Dublin Gulch interests. In 2009, VGC acquired StrataGold Corporation and subsequently advanced the Project through pre-feasibility to feasibility study level design, the regulatory process, and into final detailed design for construction and operation.

Construction of the Project commenced in August 2017 and was completed in July 2019. The Eagle Deposit is currently being mined by conventional drill, blast, shovel, and haul operation. The benches are mined at a height of 10 m with an overall 20 m effective bench height based on a double-bench final wall configuration. Over the life of the Project, the open pit will be advanced

in stages with an ultimate pit size of approximately 1,300 m long and 550 m wide totaling about 67 hectares (ha; Figure 2.1). Based on the surface topography, the Eagle Pit will be scalloped-shaped with a lower west highwall. To maintain access to the primary crusher, a single ramp will spiral down to the bottom of the final pit. The currently authorized Project is expected to produce a total of 86 million tonnes (Mt) of heap leach feed and 98 Mt of waste (at a 1.14:1 overall strip ratio) over the life of mine. Waste rock for the Project is to be deposited at storage facilities located north (Eagle Pup Waste Rock Storage Area) and south (Platinum Gulch Waste Rock Storage Area) of the Eagle Pit, whereas overburden will be categorized and segregated into reclamation (top)soil stockpiles and ice-rich overburden storage areas (Figure 2.1).

Economic ore is fed through a three-stage crushing plant to produce an 80% passing (P80) 6.5 mm product (referred to as crushed ore). The crushing circuit consists of a primary gyratory crusher, a secondary cone crusher, and three tertiary cone crushers. Ore is conveyed between the primary, secondary, and tertiary crushing stations by covered conveyor or enclosed conveyor gallery. After the tertiary crushing stage, ore is transported by covered conveyor to the HLF area where the ore is stacked on a lined solution collection pad via a series of portable conveyors and finally a radial stacking conveyor. The HLF is located in Ann Gulch, approximately 1.2 km north of the Eagle Pit. The toe of the HLF embankment occurs at an elevation of approximately 880 metres above sea level (masl), and at full height will extend up to the height of land in Ann Gulch and accommodate about 86 Mt of ore. The HLF pad consists of a confining embankment to provide stability to the base of the HLF and create an operational *in situ* storage sump for process solution, a composite lined area for ore leaching and solution containment, pumping wells for the extraction of solution, a lined external events pond to contain excess solution in extreme events, upstream surface water interceptor ditches, and leak detection, recovery, and monitoring systems to ensure solution containment. The gold extraction process includes irrigation of ore in the HLF with a barren cyanide solution via drip emitters fed from the Gold Recovery Plant. The barren solution is allowed to percolate through ore in the HLF, dissolving the gold to produce a gold-bearing “pregnant” solution (pregnant leach solution [PLS]). The PLS is pumped from the HLF to the Gold Recovery Plant for further processing.

At the Gold Recovery Plant, the PLS is processed through a carbon ADR circuit that consists of two trains of five cascading-flow carbon columns Briefly, loaded carbon is extracted from the first carbon adsorption columns and is acid washed prior to advancing to the desorption circuit in the strip vessel. The pregnant solution from the strip vessel flows to the electrowinning circuit. At the conclusion of the strip cycle, the stripped carbon is thermally regenerated in the carbon reactivation kiln and then returned to the carbon columns. Gold sludge is plated onto steel wool cathodes in electrowinning cells, and is then dried, fluxed, and smelted to produce gold doré. The barren solution discharged from the final carbon column is pumped to a barren solution tank

where liquid sodium cyanide solution, caustic, and antiscalant are added to maintain the required pH and optimal cyanide concentrations for leaching. The resulting barren sodium cyanide solution is then applied to the ore in the HLF to repeat the process.

Mine water/solution from the HLF and Gold Recovery Plant are not expected to require treatment and release through the planned Mine Water Treatment Plant[1] (MWTP) until closure or in the unlikely case that extreme freshet, precipitation or process upset events are experienced. Mine contact water from other Project areas that are directed to the LDSP will be preferentially utilized to meet barren solution requirement such that any retention of water and subsequent discharges from the LDSP are expected to occur only rarely under freshet or extreme precipitation events. The current MWTP treatment design considers both HLF contact waters and water collected in the LDSP from other Project areas. Upon meeting regulatory effluent quality standards, treated effluent from the MWTP will discharge through the LDSP Final Discharge Point (FDP) to Haggart Creek via Ditch C (Figure 2.1). This FDP, referred to as "LDSP Outlet" (or FDP #3), is one of four FDP maintained at the Project (StrataGold 2019a,b,c).[2] Effluent was discharged from this FDP over two separate events in 2019, including a single day event on April 20, 2019 in which a total of 3,186 m^3 was released, and a three-day event from April 27th to 29th, 2019 in which a total of 12,229 m^3 was released. The other Project FDPs include:

- The HLF underdrain (referred to as the "HLF Underdrain Monitoring Vault", or FDP #1), that intercepts non-contact groundwater beneath the HLF and is either directed back to the Gold Recovery Plant for process feed water or directed to Dublin Gulch if water meets discharge criteria.
- The Events Pond Emergency Spillway serves as the location for FDP #2. The Events Pond, used primarily for temporary storage of direct precipitation or water diverted from the LDSP. This water is then used as make-up water within the HLF process circuit. The Events Pond is also designed as overflow containment for the HLF in the event of extreme precipitation within the HLF catchment or process upset events within the HLF. Water would discharge through FDP #2 to the Dublin Gulch receiving waterbody only under a very unlikely emergency scenario (StrataGold 2019c).
- The LDSP is designed with an emergency spillway that serves as the location for FDP #4. The spillway is designed to protect the pond infrastructure in the event of extreme

[1] A Mine Water Treatment Plant (MWTP) will be constructed and commissioned prior to stacking ore into HLF Phase 2 that includes cyanide detoxification and ability to treat 13,824 m^3 of Mine Water and 691 m^3 of HLF solution daily while achieving the effluent quality standards set out in the Project's territorial Water Use Licence (Q14-041-1).

[2] A fifth FDP, the LDSP Contingency Sump, was in place during construction of the Project, but has since been decommissioned (StrataGold 2019c)

runoff events. The LDSP Emergency Spillway FDP is unlikely to be used, but in the very unlikely occurrence of an emergency flow event, would discharge to Haggart Creek via Ditch C (StrataGold 2019c).

2.2.2 Deposit Geochemical Characterization

The geology of the Project[3] is principally composed of two lithological units, including a granodiorite intrusive and metasedimentary host rock (Brown et al. 2001; SRK 2014). The granodiorite is a Cretaceous-aged intrusive stock comprised of four phases, including the predominant granodiorite as well as younger phases compositionally consisting of quartz diorite, quartz monzonite, leucogranite, and aplite dikes and sills that cut both the granodiorite and the surrounding metasediments (StrataGold 2009). The stock intruded Proterozoic to Lower Cambrian-aged Hyland Group metasediments comprised of interbedded quartzites and phyllitic metasedimentary rocks. These quartzites are variably gritty, micaceous and massive, whereas the phyllitic metasediments are predominantly comprised of muscovite-sericite and chlorite with a relatively thin but definite hornfelsic contact aureole adjacent to the intrusive.

Gold mineralization associated with the stock occurs as quartz veins along the intrusive contacts, and as sheeted quartz veins within the granodiorite itself. The sheeted veins are discontinuous and primarily contain quartz, feldspar with or without muscovite, and biotite. Gold occurs primarily as pure gold and in association with very small (less than 1%) amounts of metallic bismuth (Bi) and arsenopyrite (FeAsS). Other vein minerals include, in decreasing occurrence, pyrite/ marcasite (FeS_2), pyrrhotite ($Fe_{1-x}S$), and minor amounts of sphalerite ([Zn,Fe]S), chalcopyrite ($CuFeS_2$), galena (PbS), molybdenite (MoS_2), and iron oxides/hydroxides. Intimately admixed with the sulphides are inclusions of metallic bismuth, Pb-Sb-(Cu,Zn) sulphosalts (e.g., bournonite [$PbCuSbS_3$] and boulangerite [$Pb_5Sb_4S_{11}$]) and tetrahedrite [$Cu_{12}Sb_4S_{13}$]. Suphide particle sizes varied from <5 micron to over 1 mm, with typical sizes on the order of 300 to 800 microns. Alteration is limited and localized to the vestiges of the veins; alteration phases include albite, potassium feldspar, sericite, carbonate, and chlorite. Weathered ore material has included oxidation products of bismuth, particularly bismite (Bi_2O_3) and minor bismutite ($Bi_2[CO_3]O_2$), as well as arsenic-bearing hydrous iron oxides and/or scorodite ($Fe[AsO_4]•2H_2O$).

Within the deposit material, carbonates predominantly as calcite (1 to 4%) generally occurred well in excess of sulphides (less than 0.5%). Static testing has shown a strong propensity towards non-acid generating conditions based on most samples having a neutralization potential to acid

[3] The discussion of Project geology provided herein was largely taken from SRK (2014), who completed a geochemical characterization of the deposit material using existing documentation in combination with expanded sample testing.

potential ratio above four (4). Therefore, limited potential for acid rock drainage (ARD) is anticipated for the Project. Kinetic testing based on humidity cell testing and a field barrel program indicated that although neutral pH conditions were expected, some leaching of sulphate, arsenic, cadmium, manganese, antimony, selenium, and uranium, and potentially also fluoride, iron, lead, molybdenum, and zinc, may still occur from the deposit material (e.g., ore and waste rock; SRK 2014).

2.2.3 Environmental Protection Practices

Management plans, emergency response plans, adaptive management plans, and operation, maintenance, and surveillance (OMS) manuals have been developed by VGC to monitor/ensure long-term chemical and physical stability of waste rock and overburden storage areas/stockpiles, proper functioning and environmental performance of the HLF, and to identify thresholds for adaptive management actions (VGC 2020). These include:

- Waste Rock and Overburden Facility Management Plan;
- Frozen Materials Management Plan;
- Heap Leach Facility Operation, Maintenance and Surveillance Manual;
- Heap Leach Facility Contingency Water Management Plan;
- Heap Leach and Process Facilities Emergency Response Plan;
- Cyanide Management Plan, including:
    - Standard Operating Procedures;
    - ADR Plant Operations Plan;
    - ADR Plant Preventative Maintenance Plan;
- Environmental Monitoring, Surveillance and Adaptive Management Plan (EMSAMP); and,
- Waste Management Plan.

Monitoring and surveillance of the material storage and stockpile areas includes routine visual and/or drone inspections and evaluation using various instrumentation and survey tools to detect movement and stability of the facilities. In addition, characterization of seepage water quality, runoff water quality, and flow conditions are monitored at the material storage and stockpile areas to inform water management strategies including water treatment requirements, conveyance and storage needs, and sediment and erosion control practices (VGC 2020). Regular visual surveillance and monitoring of instrumentation is conducted at the HLF to ensure ongoing safety of the heap leach and process facilities and to identify areas requiring maintenance before problems and safety concerns develop (Appendix Table A.1). Physical inspections of the Gold Recovery Plant are conducted to allow the identification of areas, components, or issues that are not functioning as designed or could potentially require modification, repair, or rehabilitation (Appendix Table A.2). An Emergency Response Plan (ERP) has been developed by VGC that

considered HLF foundation/slope failure and overtopping, ore heap slope failure, Events Pond foundation/slope failure and overtopping, HLF liner system failure, leak detection and recovery system failure, failure of overliner drain fill, failure of solution collection and delivery system, and catastrophic release of hydrogen cyanide from the Gold Recovery Plant or during transportation of dry cyanide briquettes to the Project. For each scenario, the potential causes, preventative measures, detection methods, site response, emergency level classification, potential effects, and follow up activities have been described along with internal and external communication protocols.

Adaptive management is used as a tool to advance continuous improvement of environmental management policies and practices at the Project, and is focused on specific areas where uncertainty regarding performance expectations exist including surface water hydrology, surface water quality, groundwater quality, HLF and Events Pond leak detection, and in-heap pond maximum available storage volume. Adaptive management plans (AMP) were developed for these components using a science-based learning process in which outcomes are used for evaluation and adjustment (Environment Canada 2009; VGC 2020). The AMP include definitions for the indicator(s) that describe a condition and thresholds used to trigger a corresponding response plan. Performance objectives have been developed for each environmental resource and major Project facility, and are used as thresholds for mitigative response(s). Action will also be taken if trends are observed that indicate a high likelihood of not meeting a performance objective in the future. Monthly and annual reporting is used to summarize the monitoring and surveillance information, compare the results to AMP action triggers, assess the adequacy and appropriateness of the various components of adaptive management, and to provide recommendations for modification as necessary (VGC 2020).

2.3 Receiving Environment Effluent Mixing

A tracer-based effluent plume delineation study has not been conducted at the Project to evaluate the concentration of the Project effluent in Haggart Creek. However, effluent concentrations during the two brief discharges in late April 2019 to Haggart Creek were estimated using the 2019 (April) LDSP Outlet effluent discharge data together with monthly average unit yield discharge data available for the mine baseline period (2007 to 2016) from three hydrometric stations on Haggart Creek located near the Ditch C confluence (Table 2.1).[4] Because site-specific hydrometric station data were not available for the days in which effluent discharge occurred in April 2019, effluent concentrations were estimated using average monthly baseline period data for April and May to bracket low flow and high flow (freshet) scenarios, respectively.

[4] Haggart Creek hydrology stations W22 (upstream of Dublin Gulch), W4 (downstream of Dublin Gulch), and W29 (downstream of Eagle Creek) were used to provide unit area flow data for the calculation of effluent concentrations.

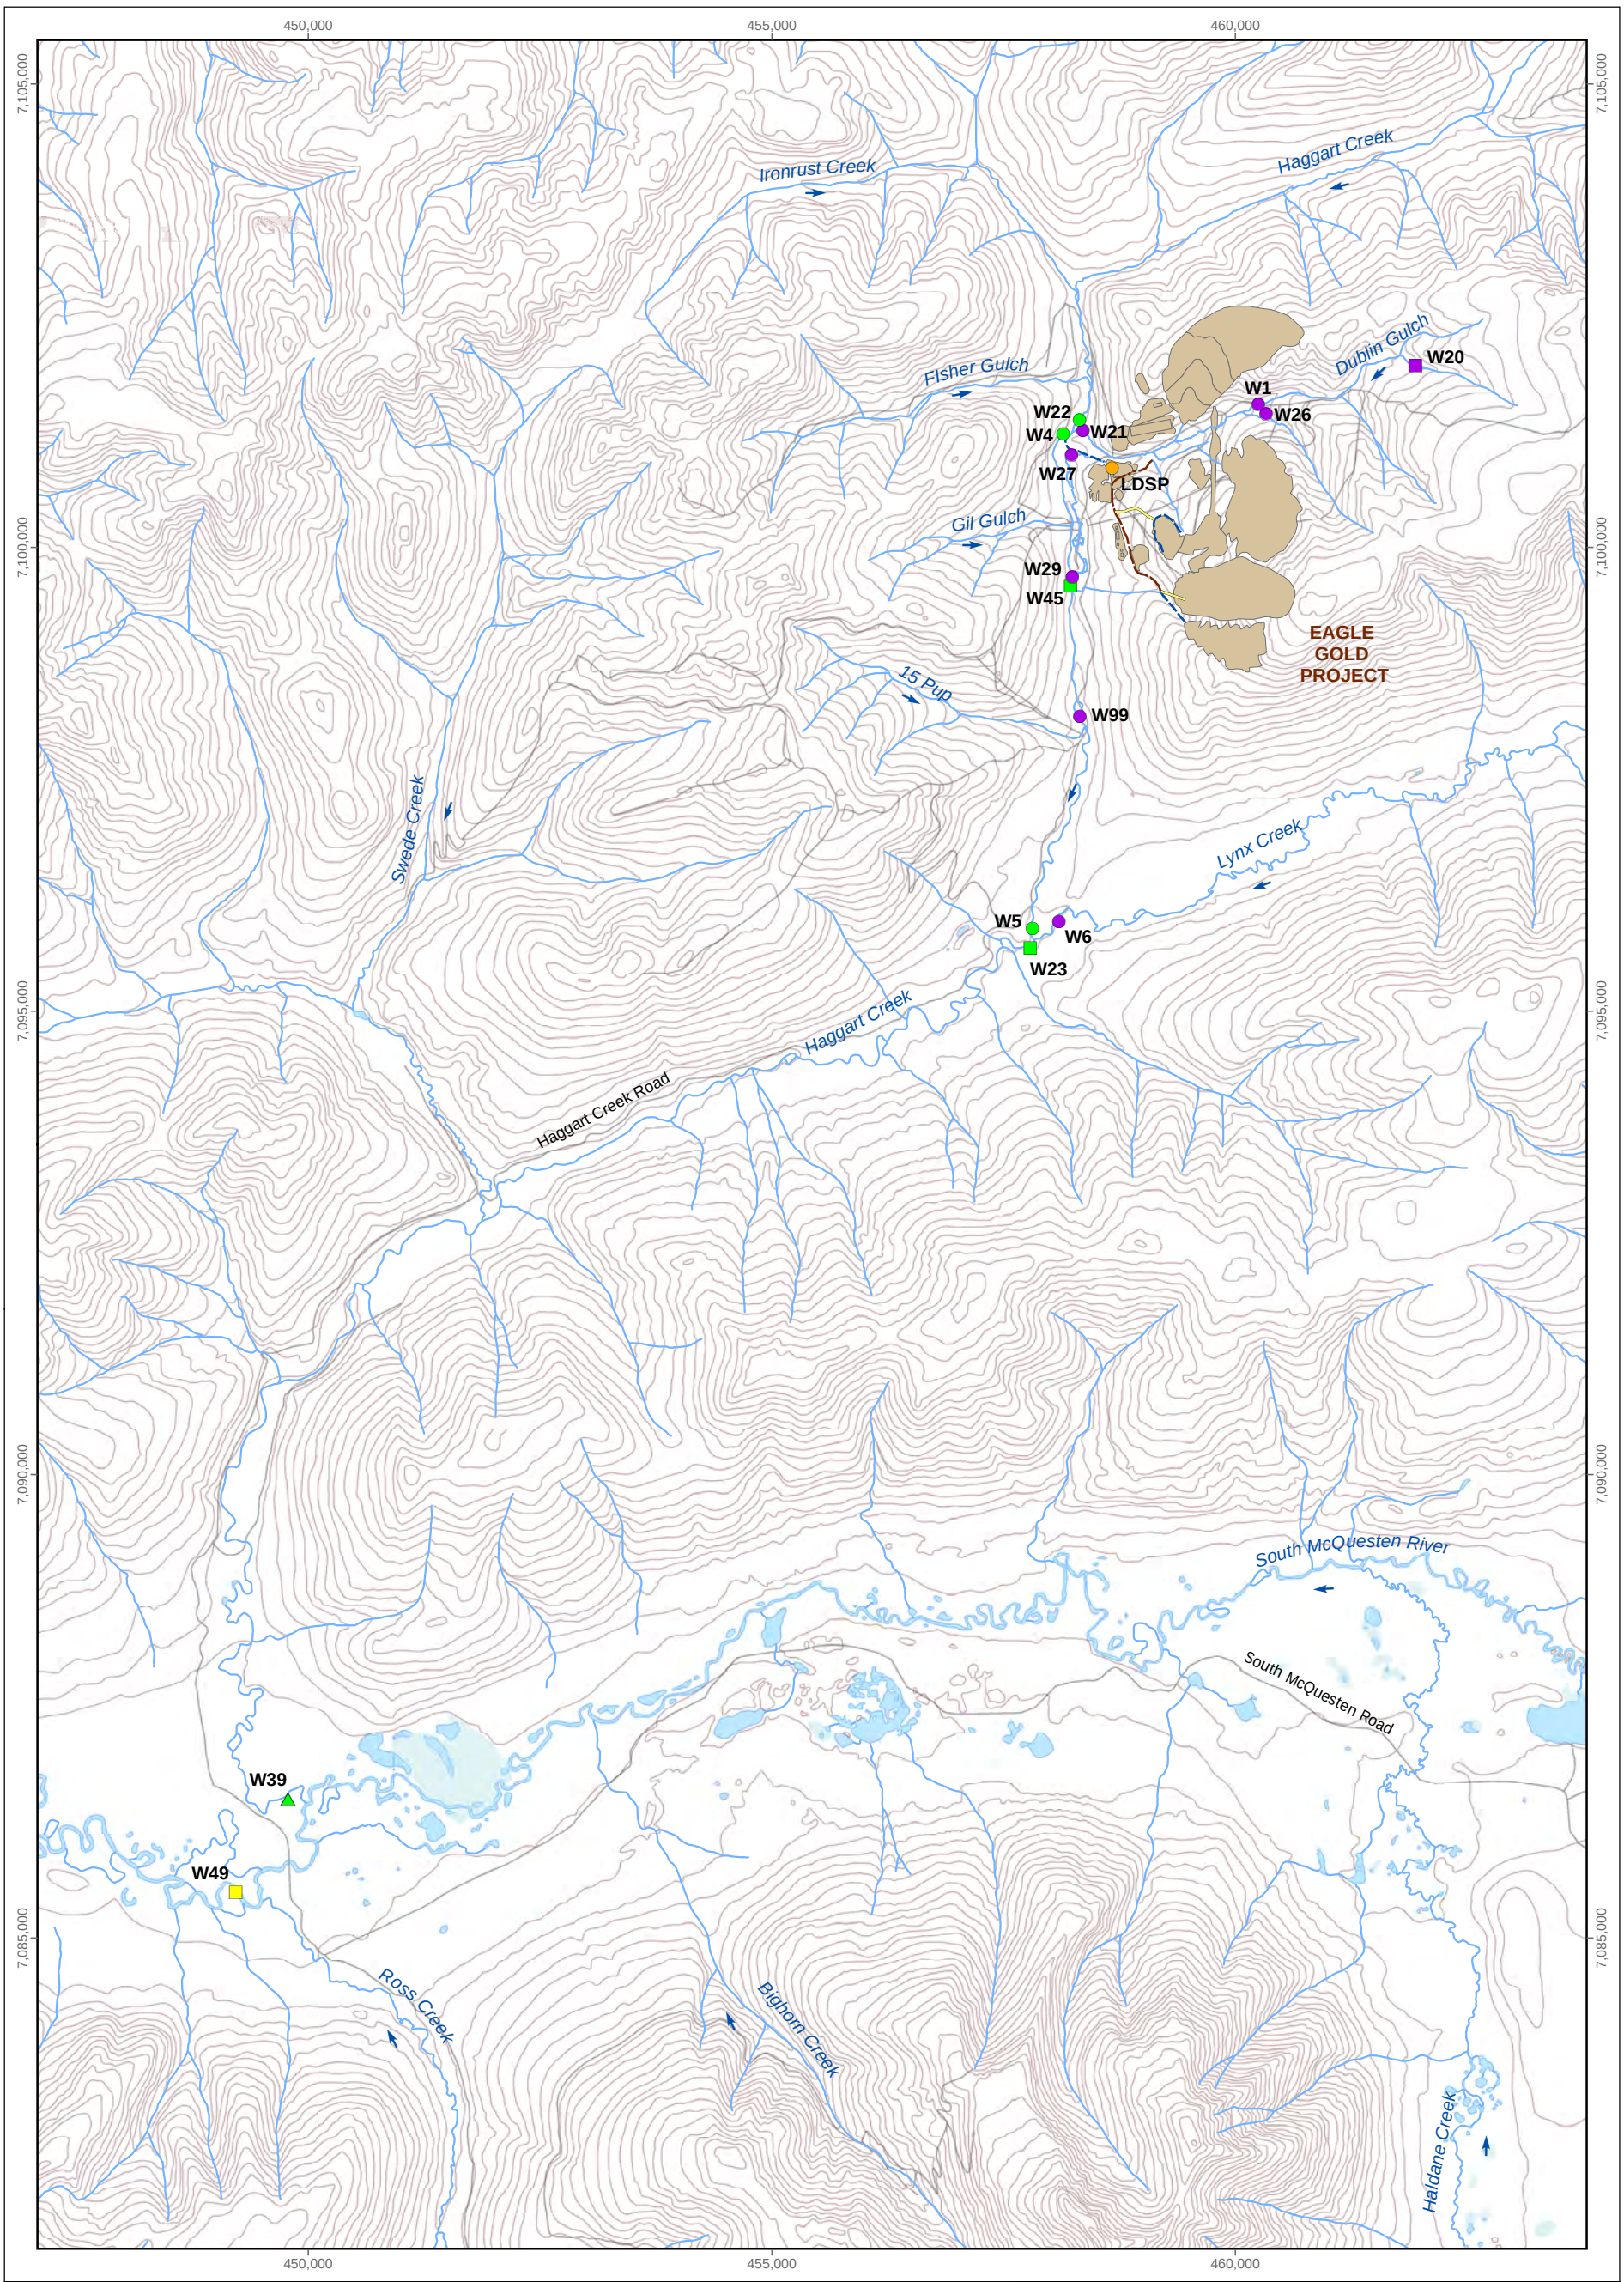
Table 2.1: Raw Hydrological Data Used to Estimate the LPSD Outlet Effluent Concentration at the Edge of the Mixing Zone in Haggart Creek for the April 2019 Effluent Discharge Event

Descriptor	Units		Date	
			April 20, 2019	April 27 to April 29, 2019
Effluent Discharge	m^3/day		3,186	4,076
	m^3/s		0.037	0.047
Average April Unit Yield by Station	W22	L/s/km^2	3.98	
	W4	L/s/km^2	4.58	
	W29	L/s/km^2	5.13	
Haggart Creek Near-Field Average[a]	Unit Yield (L/s/km^2)		4.56	
	Discharge (m^3/s)		0.350	
Estimated Effluent Concentration at Haggart Creek Near-Field	Percent (%)		9.5	11.9

[a] Haggart Creek near-field average calculated using data from Stations W22, W4, and W29.

Using the LDSP Outlet effluent discharge rates from April 2019, estimates of effluent concentrations in Haggart Creek just below the confluence with Ditch C ranged from 9.5% to 11.9% under low flow conditions typically expected to occur in April (Table 2.1). Notably, an effluent concentration of 13.8% was estimated at the Haggart Creek effluent-exposed area immediately below the effluent discharge using field-based specific conductance measurements of the LDSP Outlet effluent and waters of Haggart Creek upstream and downstream of the Ditch C confluence at the time of effluent release from April 27th to 29th, 2019 (Table 2.2). The relatively close agreement in estimated concentrations between methods suggested that effluent concentrations greater than 10% can occur at the Haggart Creek effluent-exposed area. Only minor sources of dilution occur between the Ditch C confluence and Gil Gulch, located approximately 1,050 m downstream, on Haggart Creek (Figure 2.2). Therefore, similar concentrations of effluent can be expected in Haggart Creek at points 100 m and 250 m downstream of the confluence with the ditch that receives LDSP Outlet effluent (i.e., Ditch C).

Table 2.2: Raw Specific Conductance Data Used to Estimate the LDSP Outlet Effluent Concentration at the Edge of the Mixing Zone in Haggart Creek for the April 2019 Effluent Discharge Event



Sampling Date	Specific Conductance (uS/cm)			Estimated Effluent Concentration at Haggart Creek Near-Field[a]
	LPSD Outlet Effluent	Haggart Creek Area		
		W22 (Reference)	W4 (Effluent-Exposed)	
April 28, 2019	519	not measured	425	13.8%
April 29, 2019	not measured	376	366	

[a] Effluent concentration calculated as the average of W4 specific conductance from April 28 and 29 less the W22 specific conductance from April 29, divided by the LPSD Outlet effluent specific conductance from April 28 less the W22 specific conductance from April 29, expressed as a percentage.

2.4 Study Area Biophysical Descriptions

2.4.1 Proposed Study Areas

For mines that have more than one FDP, the receiving environment that has the greatest potential to show adverse environmental impacts as determined through evaluation of greatest total monthly loadings of deleterious substances and the manner in which effluent mixes within the receiving environment serves as the focus for EEM biological studies (Government of Canada 2019). Effluent discharges from the Project's four potentially active FDP are anticipated to occur rarely and intermittently in response to extreme precipitation and/or runoff events. To date, effluent has only been discharged from the LDSP Outlet (FDP #3), and therefore the evaluation of effects from this FDP serves as the focus for EEM biological studies at the Project. Accordingly, Haggart Creek downstream of the Ditch C confluence will serve as the effluent-exposed study area, and the portion of Haggart Creek upstream of Ditch C will serve as an appropriate reference study area, for this Phase 1 EEM biological study. Because no barriers to fish movement exist between the effluent-exposed and reference areas of Haggart Creek indicated above, Lynx Creek is proposed as the reference area for the fish population survey component of the EEM biological study. Habitat, hydrological, chemical (e.g., water quality, sediment quality), and biological characteristics available for the proposed EEM effluent-exposed and reference areas are summarized below. In accordance with the MDMER, a summary of previous biological study results, including comparisons to reference conditions and a description

of any determined cause of effect(s), has been integrated into the biophysical characterization of the proposed EEM study areas.

2.4.2 Haggart Creek

2.4.2.1 Habitat Description

The Project is situated within the Yukon Plateau North Ecoregion, in the Boreal Cordillera Ecozone, which encompasses the Stewart, MacMillan, and Pelly plateaus and southern part of the Selwyn Mountains (Smith et al. 2004). The majority of the Project lies within the Dublin Gulch watershed, for which elevations range from 765 m above sea level (masl) near the Dublin Gulch confluence with Haggart Creek, to 1,525 masl at the eastern boundary of the Dublin Gulch watershed near the summit of Potato Hills. Most of the Project area remained un-glaciated during the last glacial period (Bostock 1965) and has not been glaciated for more than 200,000 years (Stantec 2011). As a result, valleys tend to be deep, narrow, and V-shaped to the head of streams, where they rise steeply and end abruptly as transition to rounded upland surfaces occurs. Prior to the last glacial period, glacial-ice action formed many of the tributaries to Haggart Creek, including Dublin, Ann, Eagle, and Platinum gulches. Within these gulches, headscarps of landslides and rock and debris slides are common, and through the erosion of these features, contribute to elevated sediment loads to Haggart Creek during freshet and other high flow events.

Vegetation in the vicinity of the Project is characteristic of the Yukon Plateau North Ecoregion, which includes a combination of northern boreal forest and subalpine ridges and plateaus. The forested zone near the Project extends to an elevation of approximately 1,225 masl, and is characterized by a mix of coniferous and deciduous species at various stages of succession. Vegetation monitoring conducted at the Project indicated the forested zone overstory was dominated by white spruce (*Picea glauca*), black spruce (*P. mariana*), trembling aspen (*Populus tremuloides*), balsam poplar (*P. balsamifera*), and paper birch (*Betula neoalaskana*), understory dominated by willow (*Salix* sp.) and dwarf birch (*B. glandulosa*) shrubs, and ground cover including horsetail (*Equisetum* sp.), mosses, grasses and lichens (Laberge 2019a). Vegetation at Project area elevations from 1,225 masl to about 1,400 masl is characterized by discontinuous, open canopy subalpine-fir-dominated forest patches, and by shrub-lichen dominated ecosystems (Stantec 2011). Dwarf birch and willow shrubs, and fescue (*Festuca altaica*) and lichen groundcover, were the dominant vegetation observed at sub-alpine plots monitored in 2019, with some scattered subalpine fir (*Abies lasiocarpa*) and white spruce also present (Laberge 2019a). Vegetation at elevations above 1,500 masl is dominated by ecosystems containing a mixture of shrubs, graminoids, herbs, bryophytes, and lichens (Stantec 2011).

The headwaters of Haggart Creek originate approximately 11 km north and east of the Project. Near the Dublin Gulch confluence, Haggart Creek occurs as a moderate-sized third-order stream, draining a watershed of approximately 77 square kilometres (km^2). Key tributaries to Haggart Creek upstream of the Project include Ironrust Creek and Fisher Gulch, whereas downstream of the Project, Haggart Creek receives flow from Gil, Platinum, and 15 Pup gulches before meeting Lynx Creek approximately 5.6 km downstream of Dublin Gulch. Haggart and Lynx creeks share similar watershed size at their confluence (i.e., approximately 98 km^2 and 101 km^2, respectively). Downstream of Lynx Creek, Haggart Creek receives flow from Swede Creek before draining into South McQuesten River approximately 22 km downstream of the Dublin Gulch confluence.

Haggart Creek is a low gradient, perennial flowing stream in the vicinity of the Project, with grades ranging from 1.1% to 1.4% at locations used for fish monitoring between Fisher Gulch and Lynx Creek (upstream and downstream of the Project, respectively). The stream morphology of Haggart Creek consists predominantly of riffle-run habitat with occasional presence of pools and rapids reflecting localized topography. Average wetted and bankfull width of Haggart Creek downstream of the Project extending to the confluence of Lynx Creek has ranged from 5.6 to 7.3 m (overall average of 6.3 m) and 7.6 to 9.8 m (overall average of 8.8 m) wide, respectively, during biological monitoring studies conducted in September from 2017 to 2019, which were slightly greater than at the area upstream of Dublin Gulch (Table 2.3). The average water depth of riffle habitat in Haggart Creek at the time of these studies ranged from 0.20 to 0.36 m (overall average of 0.27 m) downstream of the Project, and was comparable to that upstream of Dublin Gulch (i.e., approximately 0.25 m; Table 2.3). Water velocities at Haggart Creek stations between Dublin Gulch and Lynx Creek ranged from 0.35 to 0.48 m/s (overall average of 0.43 m/s), which were slightly greater than the average water velocity observed at the reference area upstream Dublin Gulch based on conditions observed in September (2017 to 2019 data; Table 2.3).

The surficial substrate at erosional habitat of Haggart Creek is composed predominantly of coarse gravel, with the sub-dominant bed material generally including a combination of medium gravel and small cobble (Table 2.3). Sand and small gravel generally constitute the interstitial material at the riffle areas (de Graff 2017, 2019, 2020). Large cobble and small boulder substrate occur in low abundance at Haggart Creek stations used historically for biological monitoring with the exception of near the confluence with Platinum Gulch (Station W29), where these substrates occur in moderate abundance (Laberge 2018, 2019b, 2020). The substrate of pool habitats in Haggart Creek generally has a greater proportion of fines, including silt, and variable amounts of organic detritus. No substantial differences in surficial substrate characteristics has been noted between Haggart Creek biological monitoring stations located downstream and upstream of the Project. In-stream vegetation is sparse and limited to algae typically present as periphyton

Table 2.3: Summary of Habitat Features at Haggart Creek and Lynx Creek Benthic and Fish Monitoring Stations

Metric	Statistic	Haggart Creek					Lynx Creek

(i.e., biofilms attached to substrate), with similar abundance suggested between Haggart Creek biological monitoring stations in September from 2017 to 2019 based on visual observations (de Graff 2017, 2019, 2020).

2.4.2.2 Hydrology

Hydrology monitoring was conducted at Haggart Creek during baseline and as part of on-going streamflow monitoring to comply with territorial Water Use Licence conditions (Lorax 2020; VGC 2020). Seven hydrology stations have been established downstream, and one station has been established upstream, of the LDSP Outlet effluent discharge on Haggart Creek (Table 2.4; Figure 2.2). In addition to these stations, seven hydrology stations have been established on tributaries feeding Haggart Creek in the Project area, and one station has been established on South McQuesten River (Figure 2.2). Hydrological monitoring data has generally been collected at the Haggart Creek stations using a combination of continuous recording (using automated pressure transducer datalogging units) and manual stage and discharge measurements during the ice-free period (i.e., from prior to freshet to just before freeze-up; Table 2.4).[5]

The hydrology of Haggart Creek is characterized by a dominant snowmelt-driven freshet signature that typically occurs between early May and early June (Lorax 2020). The receding limb of the freshet tapers to a lower summer flow regime primarily reflective of groundwater baseflow punctuated by periodic rainfall-driven runoff events that result in higher flow over one- to four-day durations. Baseflows are lowest in the winter and although sub-ice flow typically occurs over the winter months in Haggart Creek, groundwater may be depleted in tributaries to Haggart Creek resulting in no winter flow at these tributaries. Aufeis (i.e., groundwater that seeps and freezes onto and adjacent to local watercourses) and shelf ice occurs in Haggart Creek, generally melting during freshet but in some cases persisting into early summer (Lorax 2020). Historical placer mining activities have altered natural channel conditions and drainage areas in Haggart Creek and sub-watersheds within the system (Stantec 2012), potentially contributing to altered unit yield flow based on the ratio of natural to altered channel and/or riparian characteristics.

Hydrology stations with the most complete continuous recordings showed relatively low variation in unit yields and runoff for the open water season at the Haggart Creek effluent-exposed area between Dublin Gulch and Lynx Creek (Table 2.5). Slightly higher average annual discharge was indicated between the Dublin Gulch and Platinum Gulch confluences on Haggart Creek, but no change in annual average discharge was indicated between the Platinum Gulch confluence and

[5] Salt dilution methods were also implemented to determine discharge during baseline studies. However, this method is no longer used at the Project as part of its routine hydrological monitoring program (VGC 2020).

Table 2.4: Haggart Creek and Lynx Creek Hydrometric Stations Maintained at the Eagle Gold Project

Station ID	Station Name	Northing	Easting	Drainage Area (km^2)	Median Basin Elevation (m)	Notes
W22	Haggart Creek above Dublin Gulch	7101378	458319	66.8	1,113	continuous discharge time-series

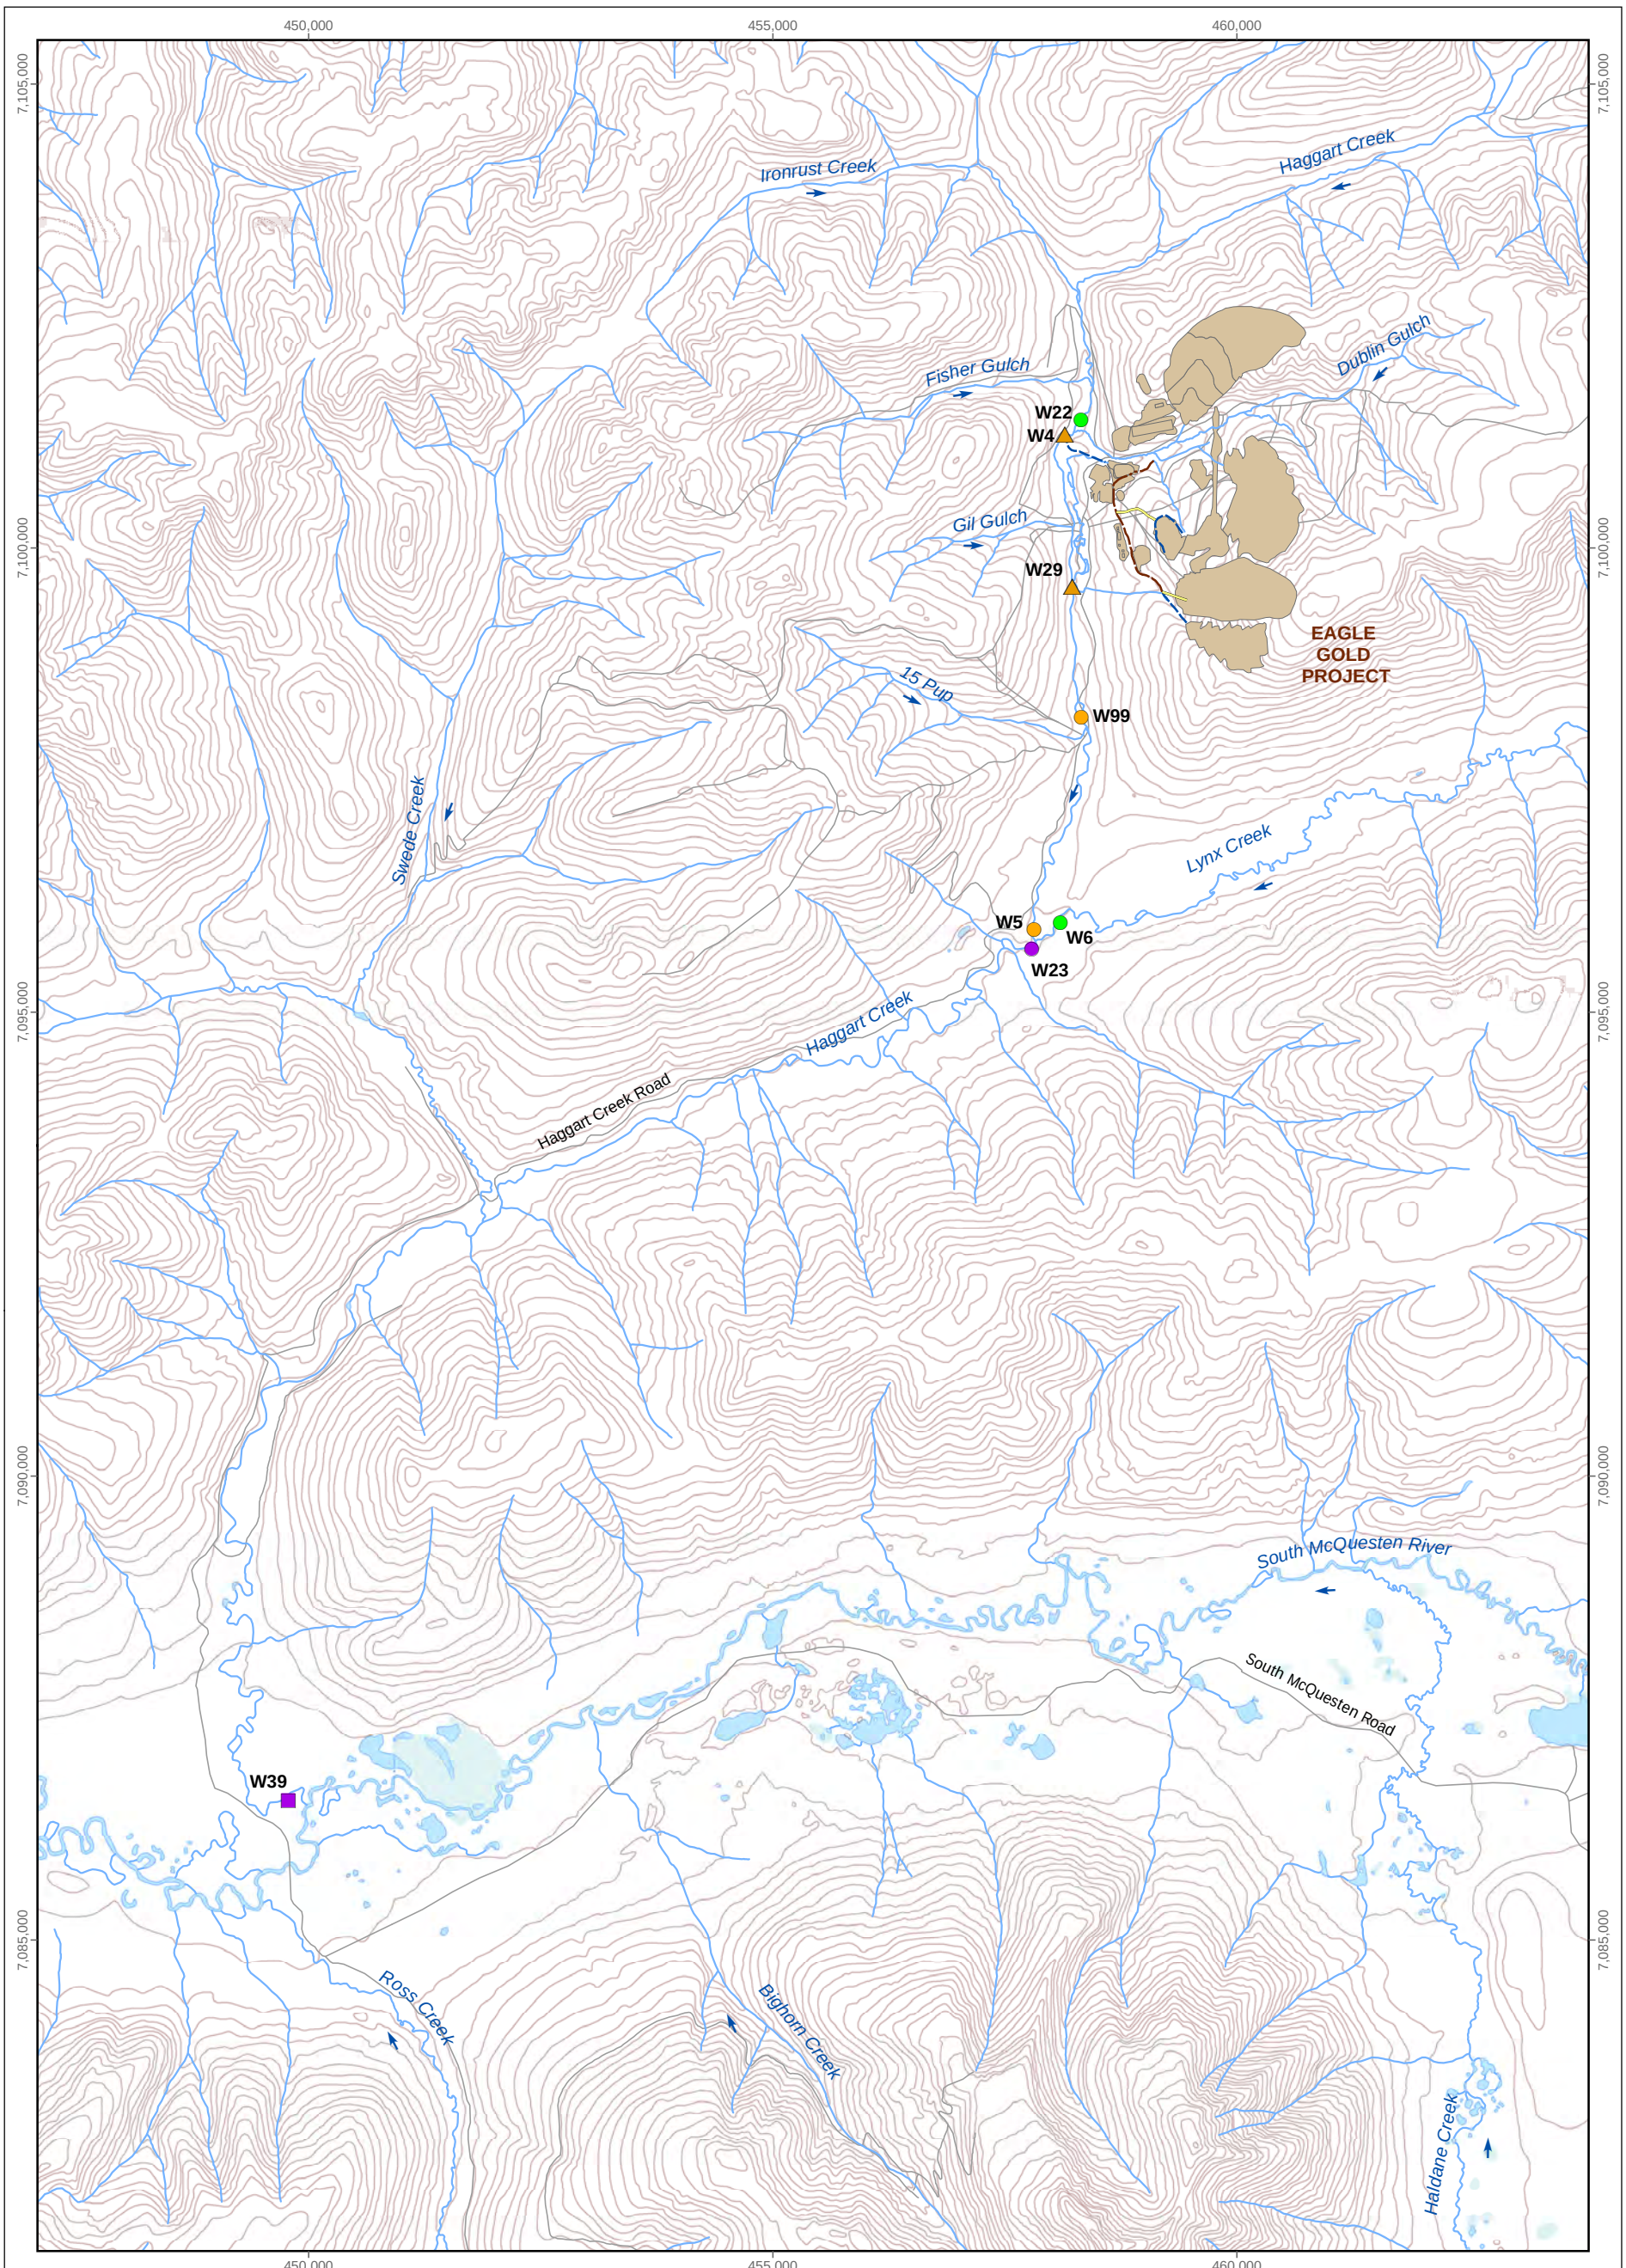
Note: "-" indicates no data collected from those months.

[a] Reproduced from Lorax 2018. No data reported for months of ice-cover in January, February, March, and December.

just upstream of Lynx Creek on Haggart Creek over the open water season (Table 2.5). Only minor sources of flow were indicated between the Dublin Gulch and Lynx Creek confluences on Haggart Creek over the open water season based on the hydrology station data, suggesting relatively consistent effluent concentrations can be expected within Haggart Creek to a distance of approximately 4 km downstream of the Project effluent discharge to the Lynx Creek confluence.

2.4.2.3 Surface Water Quality



Surface water quality was monitored at seven stations on Haggart Creek during baseline and as part of on-going water quality monitoring to comply with territorial Water Use Licence conditions (Table 2.6; Figure 2.3; Stantec 2012; Lorax 2013, 2017; VGC 2020). Surface water of Haggart Creek has historically shown high dissolved oxygen concentrations that were well above the applicable water quality guideline (WQG) lowest acceptable concentration for the protection of early life stages of cold-water biota (i.e., 9.5 mg/L), reflecting predominantly erosional, turbulent flow conditions within the creek (Stantec 2011; Laberge 2018). The pH at all Haggart Creek stations located within the area of Project influence during baseline and monthly sampling in 2019 was slightly basic, but was consistently within the WQG acceptable range for the protection of aquatic life. The surface water of Haggart Creek naturally shows high acid buffering capacity as indicated by annual average total alkalinity and hardness concentrations greater than 75 mg/L and 130 mg/L (as $CaCO_3$), respectively (Table 2.7; Stantec 2012). In addition, moderately high conductivity has been observed at Haggart Creek stations located within the area of Project influence, reflecting moderate concentrations of total dissolved solids and major ions including chloride and sulphate (Table 2.7). No consistent differences in pH or conductivity were shown between the Haggart Creek mine-exposed stations and applicable reference stations, nor with progression downstream of Dublin Gulch within Haggart Creek, based on baseline records and on monthly sampling completed in 2019 (Appendix Tables B.1 to B.3), suggesting no marked influences on these field parameters related to the past or present Project footprint.

Water quality monitoring conducted at the Haggart Creek mine-exposed stations during baseline studies indicated annual average concentrations of all monitored parameters were below applicable WQG except aluminum, which was elevated above WQG downstream of Platinum Gulch (Table 2.7). No elevation in parameter concentrations were indicated at Haggart Creek stations located downstream of the Project compared to the upstream reference station and Lynx Creek reference station based on overall annual averages for the baseline period except for arsenic. On average, arsenic concentrations at Station W4 were roughly four times that observed at Station W22, reflecting significant natural loadings of arsenic entering Haggart Creek from Dublin Gulch (Lorax 2017). At individual stations during baseline, average concentrations of most parameters showed relatively low variation among months except in May and to a lesser

Table 2.6: Water Quality Monitoring Stations Maintained on Haggart Creek and Lynx Creek

Station ID	Station Name	Coordinates (Zone 8)		Sampling Frequency

Indicates parameter concentration above applicable Water Quality Guideline.

[a] British Columbia Water Quality Guideline (BCMOE 2020).

[b] Canadian Water Quality Guideline for the protection of aquatic life (CCME 1999, 2020).

[c] Yukon Contaminated Sites Regulation (CSR), (Yukon Government 2012).

[d] Indicates water quality guideline may not have been the most stringent criterion, but rather reflected the most recent update.

extent June, during which time concentrations of total suspended solids (TSS), organic carbon, and non-ionic parameters were generally higher, and conductivity, hardness, and concentrations of several ionic parameters were generally lower than during the other months (Appendix Tables B.1 to B.4). This phenomenon reflected varying proportions of snow-melt driven surface runoff (lower ionic strength) and groundwater inputs (higher ionic strength) as driven by the seasonal water balance. Aluminum concentrations were associated with high TSS concentrations during freshet, indicating natural surface runoff was the source of aluminum (Stantec 2012; Lorax 2013, 2017). Water quality during the effluent discharge events (Table 2.8) was generally comparable to average water quality data collected over the baseline period.

2.4.2.4 Sediment Geochemical Characterization

Surficial materials within the area of Haggart Creek include abundant Pleistocene and Holocene colluvial deposits that are typically composed of diamicton, gravel, shattered bedrock, and lenses of sand and silt derived from bedrock and surficial materials (SRK 2013). Glacial till occurs infrequently, but when observed is typically composed of either a silty or sandy clay matrix with some proportion of larger clasts. The Haggart Creek valley bottom is dominated by alluvium and tailings from placer mining (SRK 2013), and widespread covering of bedrock by colluvium occurs in the region (BGC 2012). Geochemical characterization of overburden within the Project area, including soils, colluvium, and gravels (alluvium or placer tailings) indicated low sulphur content (i.e., less than 0.02%) suggesting a largely non-reactive condition. Although neutralization potential ratios suggested that up to 14% of these surficial materials may be Potentially Acid Generating (PAG), sulphides present in these materials were hypothesized to mainly be encapsulated within larger gravel to cobble size particles, and thus would be unavailable for reaction and pose very low risk for ARD (SRK 2013). Solid-phase metal analyses completed on overburden material showed consistent enrichment of arsenic, bismuth, and silver, and to a lesser extent, enrichment in antimony, cadmium, gold, lead, gold, potassium, and tungsten (SRK 2013).

Stream sediment monitoring was conducted at five stations in Haggart Creek during baseline and biennially as part of on-going sediment monitoring to comply with territorial Water Use Licence conditions (StrataGold 2019d; VGC 2020). Four sediment stations have been established downstream, and one station has been established upstream, of the LDSP Outlet effluent discharge on Haggart Creek, the locations of which generally correspond to the same stations as water quality monitoring (Table 2.9; Figure 2.4). Stream sediment monitoring was conducted in triplicate at each station, and included collection of fine-grained material at depositional habitat using a stainless steel trowel. At the laboratory, the samples were sieved and the portion passing 63 microns was analyzed for total metals (including mercury), pH, and total organic carbon (TOC) content. The sediment chemistry data were compared to British Columbian Sediment

Quality Guideline (SQG) probable effect levels (PEL). These SQG are based on whole sediment rather than the fine fraction analyzed for the Project, and therefore because higher concentrations of metals were expected in fine sediment than the whole sediment, comparison to the SQG was considered highly conservative. Moreover, because depositional habitat sampled for sediment was not the dominant habitat present within Haggart Creek, fine sediment deposits are unlikely to be an important exposure route for metal uptake by biota. Therefore, the use of SQG for predicting effects to sediment dwelling biota is highly conservative for the Haggart Creek system.

Average concentrations of metals in in-stream sediment collected at Haggart Creek stations downstream of the Project from 2007 to 2019 were below applicable SQG except for arsenic and manganese (Table 2.10). However, average concentrations of both arsenic and manganese were above SQG at the Haggart Creek upstream reference area, and arsenic was also above SQG at the Lynx Creek reference area (Table 2.10; Appendix Table B.5), indicating natural elevation of these metals above guidelines in local watercourse sediments. Arsenic concentrations were notably elevated within Haggart Creek downstream compared to upstream of Dublin Gulch (i.e., Station W4 compared to W22, respectively). This was consistent with patterns in water quality data that suggested that Dublin Gulch was a natural source of arsenic to Haggart Creek, reflecting background mineralization in the watershed (Stantec 2012; Lorax 2017; Laberge 2018, 2020). The pH of in-stream sediments throughout Haggart Creek was slightly alkaline, and showed no substantial changes between stations located downstream and upstream of the Project operations (Table 2.10).

2.4.2.5 Biological Characteristics

Benthic Invertebrate Community

Benthic invertebrate community (benthic) monitoring was conducted at Haggart Creek during baseline studies and as part of on-going annual biological monitoring to comply with territorial Water Use Licence (WUL) conditions (StrataGold 2019d; VGC 2020). Benthic samples were collected from riffle habitat containing cobble-gravel substrate using a Surber sampler (0.093 m^2 sampling area) outfitted with a 250 µm mesh net during baseline studies completed in mid-August (2010) or mid-September (2007 and 2009), or with a 300 µm mesh net for WUL studies conducted in mid-September (2017, 2018, and 2019). Five replicate samples were collected at as many as four stations within the current stream area influenced by the Project, and at one reference station located upstream of Dublin Gulch during baseline studies conducted at Haggart Creek (Figure 2.4). For annual monitoring conducted from 2017 to 2019, three replicate samples were collected at each of the same five Haggart Creek stations sampled during baseline. Data analysis for the baseline and WUL studies generally included qualitative comparisons of benthic invertebrate density (number of benthic invertebrates per square metre), richness (number of taxa

Indicates parameter concentration above Sediment Quality Guideline (SQG).

[a] British Columbia Working Sediment Quality Guideline (BCSQG) probable effects level (PEL; BCMOE 2015).

per sample), Simpson's Diversity, relative abundance of dominant taxonomic groups, most notably including the collective Ephemeroptera-Plecoptera-Trichoptera (EPT) orders of insects, and the associated EPT Index (i.e., the number of distinct EPT taxa).

Density, richness, and Simpson's Diversity showed no substantial spatial differences with distance downstream of the Dublin Gulch confluence (i.e., Stations W4 to W23) among study years from 2007 to 2019 that were suggestive of a consistent longitudinal change in community compositional features (Table 2.11). In addition, each of these respective benthic metrics showed close similarity between Haggart Creek stations located downstream and upstream of Dublin Gulch, as well as between Haggart Creek and the Lynx Creek reference station (Table 2.11; Appendix Table B.6). The benthic invertebrate community at riffle habitat of Haggart Creek was composed predominantly of Ephemeroptera (mayflies) and Plecoptera (stoneflies), and on occasion oligochaete aquatic worms, in studies conducted from 2007 to 2019 (Table 2.11). The relative abundance of all dominant taxonomic groups at Haggart Creek stations located downstream of Dublin Gulch generally bracketed those observed at reference stations within any given study year. Because mayflies are generally considered sensitive to elevated concentrations of metals, nutrients, and/or suspended solids (Ward 1992; Resh and Rosenberg 1993; Mebane et al. 2020), a high relative abundance of this group at all Haggart Creek stations located downstream of Dublin Gulch suggested no adverse influences to aquatic biota associated with the mine construction phase (Laberge 2020). Overall, the baseline and WUL studies suggested no unusual natural gradients in key benthic metrics at Haggart Creek with distance downstream of the Project, nor any substantial differences in these key benthic metrics between Haggart Creek stations currently within the effluent-exposed area compared to applicable reference stations.

Fish Population

Fish community assessments have been conducted at Haggart Creek as part of baseline fisheries evaluations and on-going annual fish and fish habitat monitoring to comply with territorial WUL conditions (Jacques Whitford 2008; VGC 2020). Baseline fisheries assessments conducted in 2007 and 2008 at Haggart Creek used closed-station depletion surveys[6] to determine fish presence and habitat usage in summer (August) and early fall (October), provide fish population density estimates, characterize fish health (size and condition), and provide samples for determination of metal concentrations in fish tissues (Jacques Whitford 2008). Since 2017, annual fish and fish habitat monitoring has been conducted at Haggart Creek in late summer

[6] Closed stations enclosing a station area approximately 100 m in length were established using ¼ inch mesh stop nets and two to four successive passes by an electrofishing team were conducted working in an upstream direction until a depletion pattern was identified.

Table 2.11: Average Benthic Invertebrate Community Data Collected at Haggart Creek and Lynx Creek, 2007 to 2019

Benthic Endpoint	Haggart Creek					Lynx Creek
	W22 reference	W4 near-field	W29 near-field	W5 near-field	W23 far-field	W6 reference
Density (no. organisms/m^2)	4,219	4,661	6,101	4,351	6,222	9,664
Richness (no. of family level taxa)	17.0	18.4	17.7	16.9	18.1	15.8
Simpson's Diversity	0.83	0.86	0.79	0.86	0.87	0.81
EPT (% of community)	60	67	52	75	67	69
Ephemeroptera (% of community)	33	39	28	36	41	40
Plecoptera (% of community)	21	25	21	37	24	28
Trichoptera (% of community)	6	3	3	2	2	1
Diptera (% of community)	9	12	8	17	21	9
Oligochaeta (% of community)	25	15	35	2	5	21

(mid-September) using open-station single-pass surveys[7] to provide a basis for tracking changes in relative numbers of fish and potential effects of Project activities on fish and fish habitat (VGC 2020). Backpack electrofishing was the primary method of fish sampling for the baseline and WUL studies, although minnow trapping, gill netting, and angling methods also have been applied. Two fish sampling stations established in lower Haggart Creek between Dublin Gulch and Lynx Creek (Stations H2 and H1, respectively), one station established in upper Haggart Creek (upstream of Dublin Gulch; Reference Station H3), and one station in lower Lynx Creek (Reference Station L1) have served as monitoring locations for the Project since baseline (Figure 2.4). Notably, no barriers to fish movement occur in Haggart Creek between Ironrust Creek (approximately 1.5 km upstream of Dublin Gulch) and South McQuesten River (Jacques Whitford 2008).

A total of 11 fish species have been recorded from the South McQuesten River watershed by DFO (2010), including arctic grayling (*Thymallus arcticus*), Chinook salmon (*Oncorhynchus tshawytscha*), rainbow trout (*O. mykiss*), northern pike (*Esox lucius*), longnose sucker (*Catostomus catostomus*), arctic lamprey (*Lampetra camtschatica*), burbot (*Lota lota*), slimy sculpin (*Cottus cognatus*), round whitefish (*Prosopium cylindraceum*), inconnu (*Stenodus leucichthys*), and lake whitefish (*Coregonus clupeaformis*). Of these, arctic grayling, Chinook salmon, burbot, round whitefish, and slimy sculpin have been reported from Haggart Creek (Jacques Whitford 2008; DFO 2010; Stantec 2011; de Graff 2017, 2019, 2020). No COSEWIC (2018)-listed endangered, threatened, or special concern fish species have been captured at Haggart Creek historically, and none are found in the entire Yukon Territory (COSEWIC 2018).

Slimy sculpin was the most abundant species captured at Haggart Creek during baseline and WUL fish monitoring (Stantec 2011; de Graff 2017, 2019, 2020). Densities of slimy sculpin in lower Haggart Creek ranged from 1.0 to 4.6 individuals/100 m^2 of wetted area during depletion surveys conducted in August and October 2007, which was comparable to densities observed at reference areas on Haggart Creek (i.e., Station HC3; 5.7 individuals/100 m^2) and Lynx Creek (1.9 to 4.6 individuals/100m^2) based on sampling conducted in August (Table 2.12). Catch-per-unit-effort (CPUE) from single-pass electrofishing and minnow trapping also suggested similar abundance of slimy sculpin between lower Haggart Creek and candidate reference areas on upper Haggart Creek and Lynx Creek (Appendix Table B.9). Lower densities of slimy sculpin were captured in fall than in summer at lower Haggart Creek during baseline (Table 2.12), suggesting that slimy sculpin may migrate downstream and/or seek pool habitat for overwintering.

[7] A standard effort (minimum) of 500 active seconds of electrofishing were applied at each station in fish community monitoring studies conducted beginning in 2017 (de Graff 2017, 2019, 2020)

Table 2.12: Slimy Sculpin and Arctic Grayling Density Estimates for Haggart Creek and Lynx Creek Stations Determined from Depletion Sampling Conducted During Baseline for the Project, 2007

Fish Species	Creek	Area Type	Station ID	Sampling Date	Area Sampled (m^2)	No. of Fish Caught	Observed Catch Rate (no. / $100m^2$)	Estimated Density (no. / $100m^2$)
Slimy Sculpin	Haggart	Reference	HC3	August 2007	647	37	5.7	nr
		Near-Field	HC2	August 2007	920	25	2.7	nr
				October 2007	920	9	1.0	4.3
		Near-Field	HC1	August 2007	736	34	4.6	6.0
				October 2007	736	29	3.9	nr
	Lynx	Reference	L1	August 2007	802	37	4.6	nr
			L4	August 2007	696	10	1.4	1.9
Arctic Grayling	Haggart	Reference	HC3	August 2007	647	7	1.1	1.1
		Near-Field	HC2	August 2007	920	4	0.4	0.4
				October 2007	920	0	0	0
		Near-Field	HC1	August 2007	736	25	3.4	nr
				October 2007	736	17	2.3	4.5
	Lynx	Reference	L1	August 2007	802	6	0.7	0.7
			L4	August 2007	696	7	1.0	1.4

Note: nr - indicates no regression generated during depletion sampling, and therefore density could not be estimated.

Total lengths of slimy sculpin captured at lower Haggart Creek has ranged from 33 to 120 mm, the majority of which (95%) were greater than 50 mm long (Appendix Tables B.10 and B.13), consistent with an adult size class based on comparison to published literature accounts (e.g., McPhail 2007; Barrett and Munkittrick 2010). Slimy sculpin aged from three years to seven years collected at lower Haggart Creek during baseline (Appendix Table B.10) were also consistent with an adult size class (Barrett and Munkittrick 2010). Plotted weight-at-length relationships suggested similar condition between slimy sculpin captured at lower Haggart Creek and those from candidate reference areas at upper Haggart Creek and Lynx Creek (Figure 2.5).

Arctic grayling densities at lower Haggart Creek ranged from 0.4 to 3.4 individuals/100 m^2 in summer and nil to 4.5 individuals/100 m^2 in fall during baseline (Table 2.12). Although depletion sampling suggested similar arctic grayling densities between lower Haggart Creek and the candidate reference areas (Table 2.12), CPUE from single-pass electrofishing and minnow trapping suggested a higher abundance of arctic grayling at lower Haggart Creek, near the Lynx Creek confluence, than at areas further upstream including the candidate reference area on upper Haggart Creek as well as at Lynx Creek (Appendix Table B.9). The fork length of arctic grayling captured at lower Haggart Creek has ranged from 64 to 358 mm (Appendix Tables B.11 and B.16), reflective of young-of-the-year (YOY) to adult size classes based on comparison to published literature accounts (e.g., Scott and Crossman 1998; McPhail 2007; Barrett and Munkittrick 2010). However, the majority of arctic grayling captured at lower Haggart Creek, including all fish taken from riffle-run areas during single-pass sampling conducted from 2017 to 2019, were reflective of juveniles aged one year or less (i.e., YOY; Appendix Table B.11). Plotted weight-at-length relationships suggested very similar condition between arctic grayling captured at lower Haggart Creek and those captured from candidate reference areas at upper Haggart Creek and Lynx Creek (Figure 2.5).

The majority of arctic grayling in the Project area appear to overwinter in South McQuesten River and migrate into Haggart Creek and its tributaries to rear in June and July (Pendray 1983). However, moderate to good quality overwintering habitat was identified in Haggart Creek based on the presence of some pools with residual depths ≥0.8 m that most likely do not freeze to the bottom in winter (Stantec 2011). In addition to capture of juvenile arctic grayling in Haggart Creek 19 km upstream from the South McQuesten River in May (Pendray 1983), the presence of arctic grayling under ice in April at temporary pools developed as a result of placer mining (Jacques Whitford 2008) confirmed that low numbers of arctic grayling overwinter in the Haggart Creek watershed. Pendray (1983) observed that most arctic grayling spawning in the region occurred predominantly in South McQuesten River during the last two weeks of May. Although a small area at the mouth of Haggart Creek on South McQuesten River was identified as a probable arctic grayling spawning site, arctic grayling primarily use Haggart Creek as summer rearing

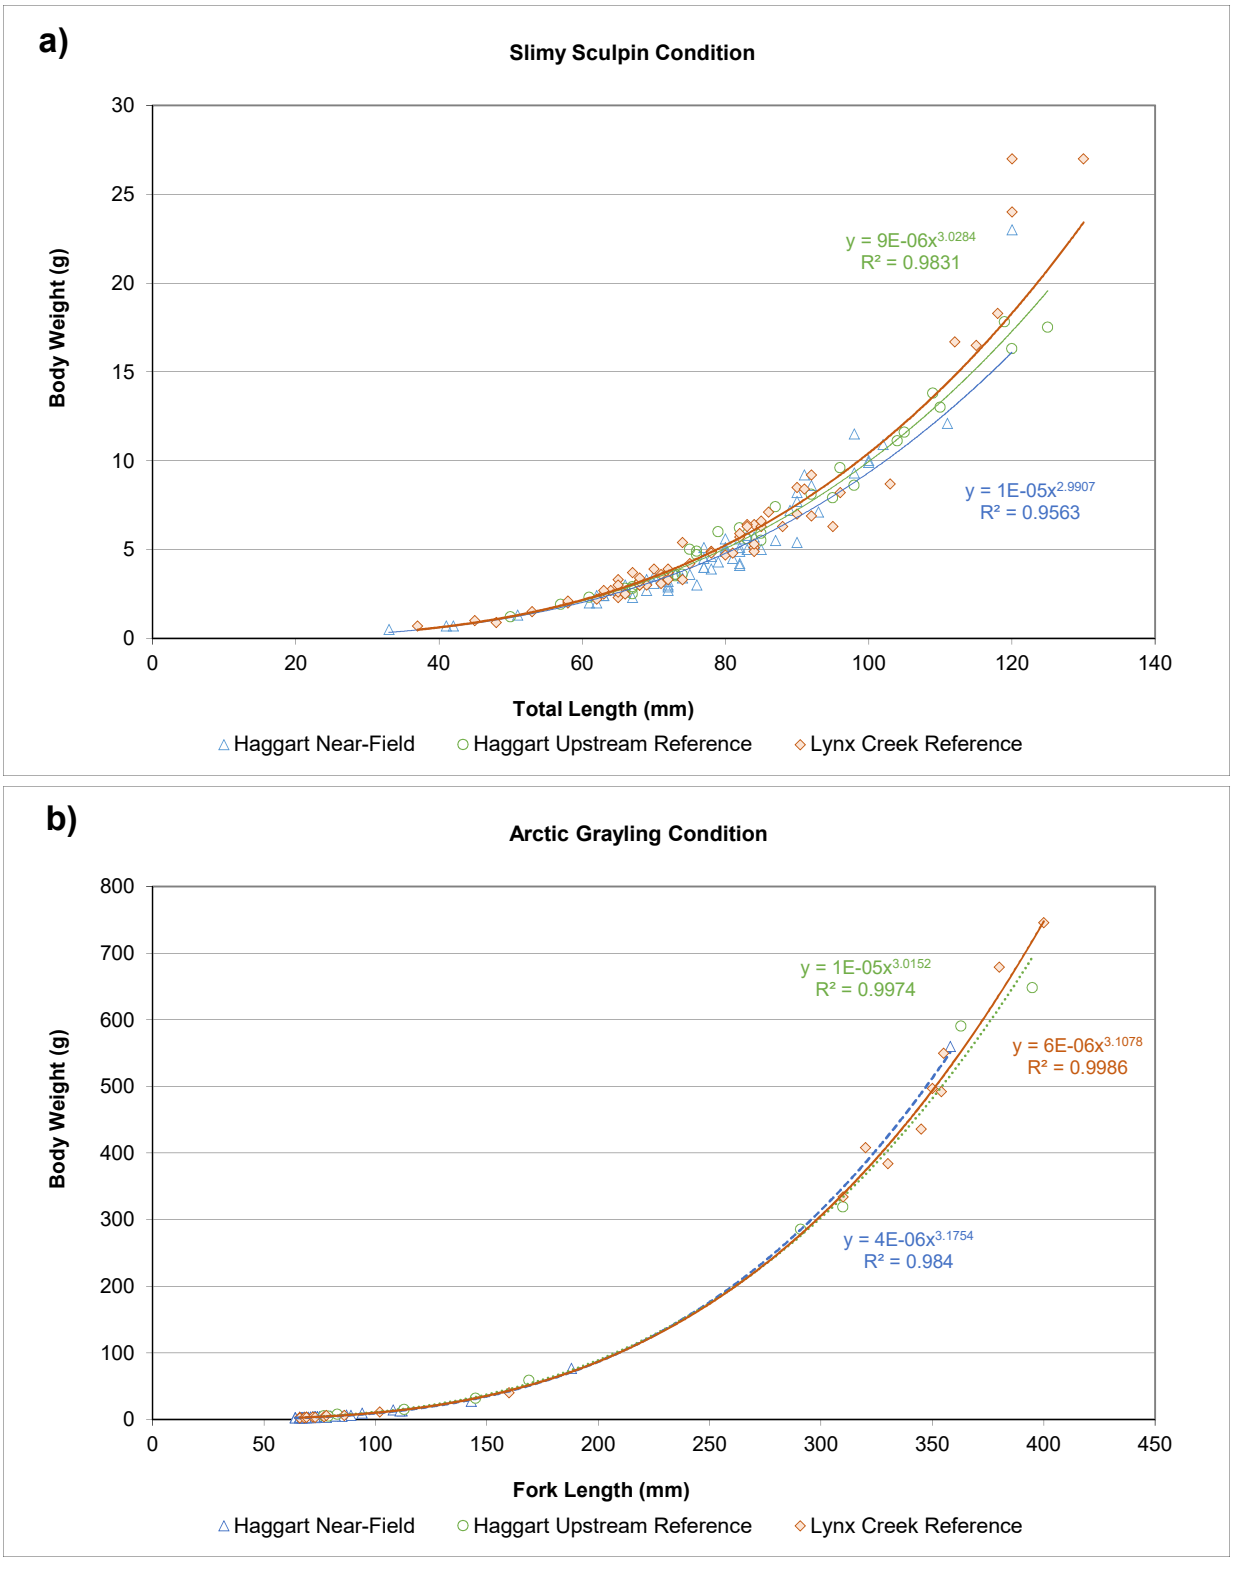

Figure 2.5: Comparison of Condition (Weight-at-fork-length Relationship) for Pooled Slimy Sculpin (a) and Arctic Grayling (b) Data Collected at Haggart and Lynx Creeks, 2007 to 2019

habitat (Pendray 1983; Stantec 2011). Haggart Creek was observed to provide good to excellent rearing habitat for arctic grayling based on the presence of abundant complex cover and availability of pool, riffle, and run habitats (Jacques Whitford 2008). The timing of outmigration to overwintering areas has not been confirmed at Haggart Creek, but similar densities of arctic grayling between August and October during baseline, even after anchor ice was beginning to form on the stream margins in October, suggested that significant outmigration may not occur until after October (Stantec 2011).

2.4.3 Lynx Creek

2.4.3.1 Background and General Habitat Description

Lynx Creek has served as a reference area for the evaluation of potential Project-related effects on water quality, sediment quality, and biological receptors at Haggart Creek during baseline studies and for on-going territorial WUL monitoring (Stantec 2011; VGC 2020). Lynx Creek drains a small catchment to the south of the Project that has not been affected by placer mining or any other development activities (Stantec 2011). Geological and vegetative community features of Lynx Creek have not been thoroughly assessed, although each can be expected to be similar to baseline features described for Haggart Creek (Section 2.4.2.1). The headwaters of Lynx Creek originate approximately 18 km east of its confluence with Haggart Creek. Lynx Creek occurs as a small fourth-order stream at the point at which it drains into Haggart Creek and shares a similar watershed size to Haggart Creek at this location (i.e., approximate watershed sizes of 101 km^2 and 98 km^2 at Lynx Creek and Haggart Creek, respectively).

Lynx Creek is perennial flowing stream characterized by grades below 1% at locations used for fish monitoring in the lower portion of the watercourse (Stantec 2011; de Graff 2020). The stream morphology of Lynx Creek consists predominantly of riffle-run habitat with some pools, and is occasionally dammed by beavers (de Graff 2020). The average wetted and bankfull width of lower Lynx Creek was 5.5 m (range from 4.7 to 6.4 m) and 7.4 m (range from 6.0 to 11.4 m) wide, respectively, during biological monitoring studies conducted in September from 2017 to 2019 (Table 2.3). The average water depth and water velocity of riffle habitat at lower Lynx Creek at the time of these studies was 0.15 m (range from 0.11 to 0.20 m) and 0.31 m/s (range from 0.26 to 0.36 m/s), respectively (Table 2.3). The surficial substrate at erosional habitat of lower Lynx Creek is composed predominantly of coarse gravel, with the sub-dominant bed material generally including a combination of medium-sized gravel and small cobble (Table 2.3). Sand generally constitutes the interstitial material at riffle areas (de Graff 2017, 2019, 2020). In-stream vegetation at Lynx Creek is sparse and limited to a thin layer of algae typically as periphyton on physically stable substrates (de Graff 2017, 2019, 2020).

2.4.3.2 Hydrology

Hydrology monitoring conducted at Lynx Creek indicated a similar flow regime to that of Haggart Creek, including a dominant snowmelt-driven freshet signature that typically occurs between early May and early June that tapers to a lower summer flow regime primarily reflective of groundwater baseflow (Lorax 2020). Baseflows are lowest in the winter, at which time aufeis and shelf ice can occur that may persist through freshet into early summer (Lorax 2020). Average discharge and unit yield at Lynx Creek over the open water period (i.e., May through November) were comparable to those at Haggart Creek, suggesting close similarity in flow between watercourses (Table 2.5).

2.4.3.3 Surface Water Quality

Surface water in Lynx Creek has historically shown high dissolved oxygen concentrations well above WQG lowest acceptable concentrations for the protection of early life stages of cold-water biota (i.e., 9.5 mg/L; Laberge 2018). The pH at Lynx Creek was slightly basic, but consistently within the WQG acceptable range for the protection of aquatic life, during baseline and recent water quality monitoring. The surface water of Lynx Creek showed naturally high hardness (i.e., 169 mg/L as $CaCO_3$) indicating high acid buffering capacity (Table 2.7; Stantec 2012). Moderately high conductivity has also been observed at Lynx Creek, likely reflecting moderate concentrations of total dissolved solids and major ions including chloride and sulphate (Table 2.7). Average concentrations of monitored parameters were all below applicable WQG at Lynx Creek over the course of baseline studies from 2007 to 2016 except for arsenic (Table 2.7). Naturally elevated arsenic concentrations in surface waters of the Project region were hypothesized to reflect background geology and mineralization (Lorax 2020). Similar to monthly water quality patterns at Haggart Creek, average concentrations of most parameters at Lynx Creek showed relatively low variation among months except in May and to a lesser extent June, during which time concentrations of TSS, organic carbon, and non-ionic parameters were generally higher, and conductivity, hardness, and concentrations of several ionic parameters were generally lower, than during the other months (Appendix Table B.4). This phenomenon reflected varying proportions of snow-melt driven surface runoff (lower ionic strength) and groundwater inputs (higher ionic strength) as driven by the seasonal flow regimes (Lorax 2018).

2.4.3.4 Sediment Quality

Average concentrations of metals in the fine fraction (i.e., fraction passing 63 microns) of in-stream sediment collected at Lynx Creek from 2007 to 2019 were all below applicable SQG PEL (that are based on whole sediment rather than the fine fraction) except arsenic (Table 2.10). Natural elevation of arsenic above guidelines in reference area watercourse sediments may

reflect background geology what includes the presence of arsenopyrite (FeAsS) and arsenic-bearing hydrous iron oxides and/or scorodite ($Fe[AsO_4]•2H_2O$) in the area (Stantec 2012; SRK 2014). Elevated concentrations of arsenic in fine sediment of Lynx Creek were consistent with relatively high concentrations of arsenic in surface water of Lynx Creek (see previous section) compared to applicable environmental quality guidelines, and suggested that arsenic was readily mobilized from solid to aqueous phases. The pH of in-stream sediments at Lynx Creek was slightly alkaline (Table 2.10).

2.4.3.5 Biological Characteristics

Benthic Invertebrate Community

Benthic invertebrate density at Lynx Creek was moderately variable among study years from 2007 to 2019, and ranged from 3,701 organisms/m^2 to 14,535 organisms/m^2 (Table 2.11). Benthic invertebrate richness and Simpson's Diversity were moderate, and were not highly variable over these study years (Table 2.11). The benthic invertebrate community at riffle habitat of Lynx Creek was dominated by mayflies and stoneflies in all study years except 2007, when aquatic worms numerically composed approximately half of the benthic invertebrate community (Table 2.11; Appendix Table B.6). A high proportion of relatively metal-sensitive mayflies at Lynx Creek suggested that this watercourse can serve as a suitable reference area for the assessment of potential effluent-related influences on biota at the Haggart Creek effluent-exposed area.

Fish Population

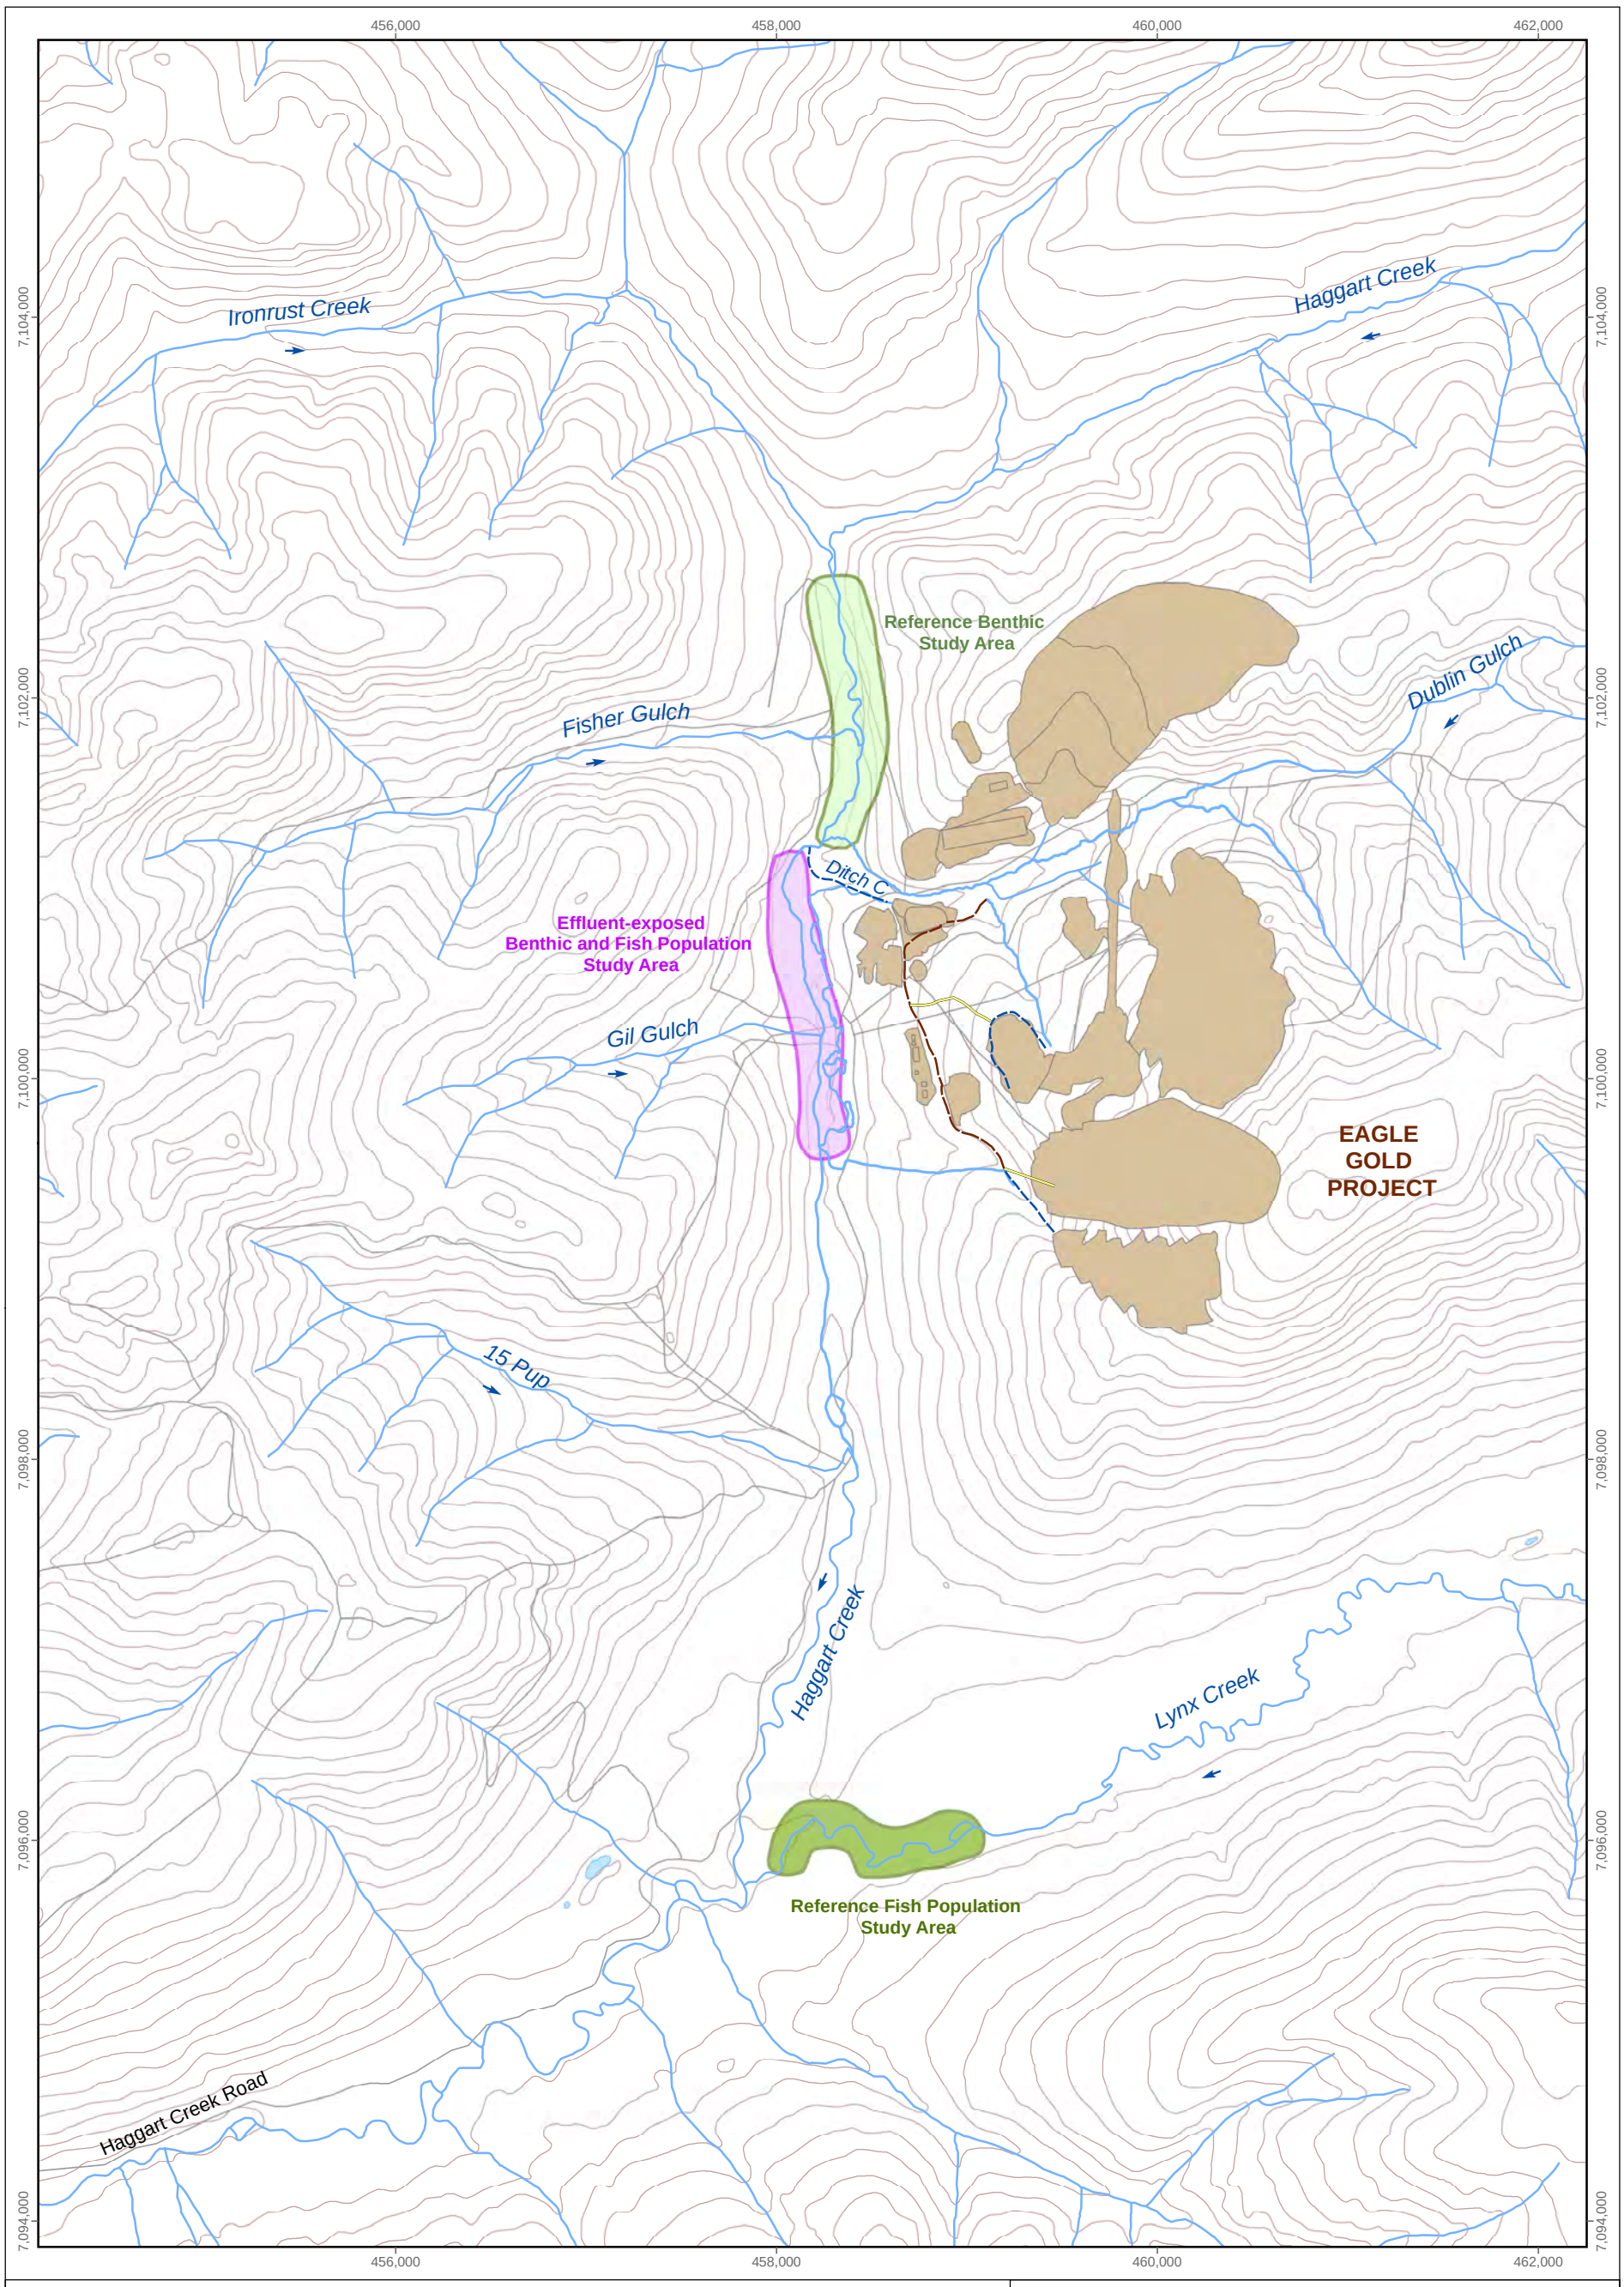
Arctic grayling, Chinook salmon, burbot, and slimy sculpin have been captured at Lynx Creek historically (Jacques Whitford 2008; DFO 2010; Stantec 2011; de Graff 2017, 2019, 2020). Slimy sculpin was the most abundant species captured at Lynx Creek during baseline and WUL fish monitoring (Stantec 2011; de Graff 2017, 2019, 2020). Densities of slimy sculpin at lower Lynx Creek averaged 3.0 individuals per 100 m^2 of wetted area during depletion sampling conducted in August 2007 (Table 2.12). The relative abundance of slimy sculpin was quite variable at lower Lynx Creek in annual monitoring conducted from 2017 to 2019 in early September based on CPUE from single-pass electrofishing and minnow trapping, with sequentially lower relative abundance occurring since 2017 (Appendix Table B.9). The total length of slimy sculpin captured at lower Lynx Creek ranged from 37 to 130 mm (Figure 2.5), the majority of which (97%) were greater than 50 mm long (Appendix Tables B.10 and B.14) suggesting that most were likely adult size class based on comparison to published literature accounts (e.g., McPhail 2007; Barrett and Munkittrick 2010). Slimy sculpin sampled from Lynx Creek were aged as three to nine years old during baseline monitoring, which was also consistent with an adult size class for these fish (Barrett and Munkittrick 2010).

Arctic grayling densities at lower Lynx Creek were low, average just 0.9 individuals/100 m^2 in mid-August 2007 (Table 2.12). Fish monitoring to meet WUL requirements from 2017 to 2019 also indicated relatively low arctic grayling relative abundance at Lynx Creek based on CPUE from single-pass electrofishing and minnow trapping (Appendix Table B.9). The fork length of arctic grayling captured at lower Lynx Creek has ranged from 66 to 400 mm (Appendix Tables B.11 and B.15), reflective of YOY to adult size classes based on comparison to published literature accounts (e.g., Scott and Crossman 1998; McPhail 2007; Barrett and Munkittrick 2010). However, only low numbers of YOY arctic grayling were captured at lower Lynx Creek during the most recent fish monitoring conducted from 2017 to 2019 (i.e., a collective total of 7 individuals), indicating relatively low numbers of arctic grayling reside within lower Lynx Creek in early September.

2.5 Potential Confounding Factors

Potential anthropogenic influences on chemical and biological conditions of Haggart Creek in the vicinity of the Project relate primarily to physical disturbances to Haggart Creek itself as well as tributaries feeding into the creek stemming from past and present placer mining (Stantec 2012). Placer mining activities were first reported in Haggart Creek and Dublin Gulch in 1895 and 1898, respectively, and continued at relatively minor levels in the Project area over the next several decades. Beginning in the 1970s, extensive placer mining occurred within the Dublin Gulch and Haggart Creek channels and tributaries which continued in the valley bottoms until the mid-1990s (New Millennium Mining 1997). Limited placer mining was conducted within Haggart Creek and its tributaries in the 2000s, and since 2009, placer-related activity has occurred only in Swede Creek, 15 Pup, Gil Gulch and Fisher Gulch, and not within the main channel of Haggart Creek or within the Dublin Gulch/Eagle Creek basin. Historical placer mining activity potentially has implications on physical substrate properties, channel and riparian features, erosion/ sedimentation, and flow regimes within the Haggart Creek watershed.

3 PHASE 1 EEM STUDY DESIGN



3.1 Overview

The Eagle Gold Project Phase 1 EEM biological study will include a benthic invertebrate community survey, a fish population survey, and supporting water quality assessments to assist with data interpretation. In accordance with MDMER requirements, this study design provides a description of, and the scientific rationale for, sampling areas, sample sizes, species selection (fish population survey only), and methods for field sample collection, laboratory analysis, and data analysis that will be used for the benthic invertebrate and fish population surveys, as well as a schedule for study completion. Notably, no fish tissue mercury or selenium studies are required for the Phase 1 EEM, the rationale for which is provided herein (Section 3.4). Other EEM components routinely implemented by VGC, including effluent quality monitoring (i.e., effluent characterization, effluent sublethal toxicity testing) and receiving environment water quality monitoring, will be incorporated into the Eagle Gold Project Phase 1 EEM Interpretive Report, and therefore methods for these components are briefly discussed in this study design. This Phase 1 EEM Study Design was devised through consideration of available site characterization information, as well as consideration of the methods and results of historical biological monitoring studies completed to satisfy territorial WUL conditions (e.g., Laberge 2018, 2019b, 2020; de Graffe 2017, 2019, 2020).

3.2 Benthic Invertebrate Community Survey

3.2.1 General Approach and Study Area Overview

During the effluent deposits in late April 2019, maximum concentrations of LDSP Outlet effluent in the Haggart Creek receiving environment greater than 1% were estimated within 100 m from the point at which effluent entered the creek (i.e., the effluent ditch outlet; Section 2.3). Therefore, the MDMER requires implementation of a benthic invertebrate community (benthic) survey (Government of Canada 2019). The Phase 1 EEM benthic survey will employ a standard control-impact design incorporating quantitative sampling at an effluent-exposed area and a comparable reference area located on Haggart Creek downstream and upstream, respectively, of the confluence with Ditch C that receives Project effluent (Figure 3.1; Table 3.1). Five stations, separated from one another by a distance of at least 20 m, will be sampled at each of the effluent-exposed and reference study areas. This level of replication provides adequate statistical power to detect differences of ± two standard deviations from the reference area mean (± 2 SD_{REF}) based on Type I and II error probability (α and β, respectively) set equally at 0.10 for the analysis as recommended in EEM standard guidance (Environment Canada 2012).

Table 3.1: Summary of Study Areas, Sampling Information, and Laboratory Processing Information for the Phase 1 EEM Benthic Survey

Study Detail	Description
Study Areas	Haggart Creek Downstream (effluent-exposed; W4) Haggart Creek Upstream (reference; W22)
Survey Timing	September 2021
Number of Stations	5 per study area
Sampling Device	0.10 m^2 Hess Sampler
Target Substrate	5 to 10 cm diameter cobble
Target Sampling Depth	0.15 to 0.3 m
Processing Mesh Size	300 um
Composite Sample Area Size	0.3 m^2 per station (3 grabs)
Processing Level of Taxonomy	Lowest practical level (genus, species)

The effluent-exposed and reference study areas indicated above correspond to Stations W4/W29 and W22, respectively, that are used to assess Project-related effects on chemical and biological conditions at Haggart Creek in accordance with territorial WUL stipulations (VGC 2020). These same study areas (and station locations, if possible) are proposed for benthic sampling as part of the Phase 1 EEM (Figure 3.1) based on the following rationale:

- During periods of discharge, effluent concentrations were estimated to range from 1% to 15% at the effluent-exposed area (Section 2.3), and therefore this area is ideal for evaluating effects related to the Project effluent.
- The proposed reference area is sufficiently upstream of the LDSP Outlet effluent discharge precluding any effluent-related influences on physical, chemical, and biological conditions at this area. Metal concentrations in water and sediment collected at the reference area have generally been below applicable guidelines (Tables 2.7 and 2.10), suggesting no substantial anthropogenic influences upstream of and at this area.
- Average channel dimensions, water depth, water velocity, and substrate size were similar between the proposed effluent-exposed and reference study areas on Haggart Creek indicated above (Section 2.4.2.1), reducing the potential confounding influence of differing physical habitat for evaluating effluent-related influences on benthic invertebrates. Notably, locations of historical placer mining in Haggart Creek will be taken into account during the selection of suitable benthic sampling stations during the Phase 1 EEM field study.

- Because the proposed study areas incorporate the locations of stations sampled historically, the use of these study areas for EEM provides temporal continuity and a basis for tracking changes in benthic invertebrate community endpoints over time.

The Phase 1 EEM benthic survey will be conducted in early September 2021 (Table 3.1), which generally coincides with the seasonal timing of fieldwork for WUL benthic studies conducted from 2017 to 2019. This seasonal timing is considered optimal for benthic sampling as it ensures that benthic invertebrate communities are relatively stable (i.e., late summer is typically outside of any major aquatic insect emergence periods) and organisms are reasonably well developed, allowing identification to suitable taxonomic levels.

3.2.2 Sample Collection and Laboratory Processing

Shallow (i.e., ≤0.4 m) riffle-run habitat characterized by coarse gravel-small cobble substrate will be targeted for benthic sample collection at each of the effluent-exposed and reference study areas. The benthic samples will preferentially be collected using a Hess sampler (0.1 m^2 sampling area) as recommended in EEM technical guidance (Environment Canada 2012). Previous and current benthic sampling implemented for baseline and WUL monitoring was conducted using a Surber sampler (0.093 m^2 sampling area), presumably because depths less than 10 cm did not allow effective sampling using a Hess sampler. Therefore, a Surber sampler will be used for benthic sampling only if very shallow water depths are encountered at the time of the EEM benthic survey field study that preclude sampling using a Hess sampler. The Hess sampler (or Surber sampler, as appropriate) will be outfitted with a 300-µm mesh net rather than a conventional 500-µm mesh net to provide consistency with all previous baseline and WUL benthic monitoring. One sample, representing a composite of three sub-samples (i.e., 0.3 m^2 total area), will be collected at each station to ensure adequate representation of the benthic invertebrate community. Each sub-sample will be collected by carefully placing the base of the sampler onto undisturbed substrate and subsequently scrubbing all coarse material within the sampler area to a depth of approximately 10 cm and allowing the current to carry all dislodged organisms into the sampler net. After all substrate within the sampler has been completely washed and all organisms have been rinsed into the collection net, the sampler will be moved to the next sub-sample location and the procedure repeated. Following collection of the third sub-sample using the above procedure, all material and organisms retained in the collection net will be carefully transferred into labelled plastic sample jars. The benthic samples will then be preserved to a level of 10% buffered formalin in ambient water.

Supporting information collected at each benthic station at the time of sample collection will include substrate description (type and approximate diameter), water velocity (m/s), sampling

depth (cm), water quality at the sediment-water interface (see Section 3.4), stream dimensions (wetted and bankfull width), general habitat notes (e.g., stream morphology, extent of riparian cover, surrounding land use, potential confounding influences, etc.), and global positioning system (GPS) coordinates (recorded in latitude and longitude decimal degrees and based on the North American Datum of 1983 [NAD 83] to conform with standard EEM requirements).

Upon completion of the field program, benthic samples will be submitted to and processed by a qualified laboratory that includes Society of Freshwater Sciences (SFS) certified taxonomists. Benthic sample processing will be conducted using standard sorting methods that incorporate recognized quality assurance and quality control (QA/QC) measures (e.g., Environment Canada 2012). Sample material retained by the 300-µm mesh will be examined under a stereomicroscope using a magnification of at least ten times. All benthic organisms will be removed from the sample debris and placed into vials containing 70% ethanol by a technician. A senior taxonomist will then enumerate and identify the benthic organisms to lowest practical level (typically genus or species) using up-to-date taxonomic keys. This level of taxonomy exceeds the Environment Canada (2012) minimum requirements of "family level" for EEM studies, and will be conducted to provide additional supporting information for effects assessment. During taxonomic identification, representative specimens of each taxon will be placed into separately labeled vials and preserved with a 75% ethanol/3% glycerol solution to create a site-specific voucher collection for potential future reference. Benthic invertebrate community sample processing QA/QC measures will be conducted on a minimum of 10% of samples. These measures will be used to verify that sub-sampling accuracy and precision is within 20% and that greater than 90% of the total organisms were recovered from the benthic invertebrate community samples (Environment Canada 2012).

3.2.3 Data Analysis

Benthic invertebrate communities will be evaluated using EEM primary metrics of mean taxonomic richness (as identified to family level), mean invertebrate density (average number of organisms per m^2), Simpson's Evenness Index, and the Bray-Curtis Index of Dissimilarity as required by the MDMER (Table 3.2). Additional comparisons may also be conducted using lowest practical level (LPL) taxonomic richness, percent composition of dominant or indicator taxa (calculated as the abundance of each respective taxonomic group relative to the total number of organisms in the sample), and any other metrics (e.g., functional feeding groups, habit preference groups) that may assist with data interpretation.

All required and selected endpoints, with the exception of Bray-Curtis Index, will be summarized by separately reporting mean, median, minimum, maximum, standard deviation, standard error,

and sample size for each study area. For these endpoints, statistical comparisons between the effluent-exposed and reference areas will be conducted using Analysis-of-Variance (ANOVA).

Table 3.2: Required and Supporting Endpoints to be Examined for the Eagle Gold Mine Phase 1 EEM Benthic Invertebrate Community Survey

Response	Endpoint	Critical Effect Size
Effects on Benthic Invertebrates[a]	Organism density (number of invertebrates·m^2)	± 2 standard deviations of the reference mean
	Taxonomic richness (number of taxa)	± 2 standard deviations of the reference mean
	Simpson's Evenness	± 2 standard deviations of the reference mean
	Bray-Curtis Index of dissimilarity	-
Supporting Response Variables[b]	Proportion of dominant groups	-
	Proportion of metal-sensitive groups	-
	Proportion of Functional Feeding Groups (FFG)	-
	Shannon-Wiener Diversity	-
	Proportion of Habit Preference Groups (HPG)	-

[a] Endpoints to be used for determining "effects" as designated by statistically significant differences between effluent-exposed and reference areas (Environment Canada 2012)

[b] These analyses are for informational purposes and significant differences between exposure and reference areas are not necessarily used to designate an effect (Environment Canada 2012).

Briefly, the benthic data will be assessed for normality and homogeneity of variance, with the data transformed as required to satisfy the assumptions of ANOVA. If data significantly violate the assumption of normality following transformation, non-parametric statistics will be applied using the untransformed data. An effect on the benthic invertebrate community will be defined as a statistically significant difference between the effluent-exposed area and the reference area at an alpha level of 0.10 (Environment Canada 2012). The magnitude of effect for all benthic invertebrate community effect indicators that differ significantly between study areas will be calculated for the effluent-exposed area based on the formula provided in the MDMER. For effect indicators of density, richness, and Simpson's Evenness, the derived magnitude of difference will be compared to applicable critical effect sizes (CES) that are presented in the MDMER (i.e., ±2 SD_{REF}; Table 3.2). A statistical analysis will also be completed using these latter effect indicators to determine the probability of correctly detecting an effect for a range of pre-defined

sizes, as well as to determine the degree of confidence placed in these calculations. All statistical analyses will be described in detail in the Interpretive Report, including any transformations or alterations performed on the data.

The Bray-Curtis Index will be used to evaluate community level differences between study areas, as computed and assessed statistically using procedures recommended by Environment and Climate Change Canada (ECCC) for EEM studies (i.e., Borcard and Legendre 2013). Specifically, abundance data will be ln-transformed in preparation for Bray-Curtis Index calculation. Community level differences between study areas will be assessed in a pairwise fashion, with homogeneity of group variance calculated according to the PERMDISP2 procedure provided by Anderson (2006). A Mantel Test and distance-based Redundancy Analysis (dbRDA) will then be used to assess for differences in community structure between study areas using R statistical software (as per Borcard and Legendre 2013).

3.3 Fish Population Survey

3.3.1 General Approach and Study Area Overview

During the effluent deposits in late April 2019, maximum concentrations of LDSP Outlet effluent in the Haggart Creek receiving environment greater than 1% were estimated within 250 m from the point at which effluent entered the creek (Section 2.3). Therefore, the MDMER requires implementation of a fish population survey (Government of Canada 2019). The Phase 1 EEM fish population survey will employ a control-impact lethal design targeting slimy sculpin (*Cottus cognatus*) and a control-impact non-lethal design targeting arctic grayling (*Thymallus arcticus*). The fish population sampling will be conducted at the same Haggart Creek effluent-exposed study area sampled to evaluate effluent-related effects on benthic invertebrates, but rather than using upper Haggart Creek, reference area fish samples will be collected from Lynx Creek (Figure 3.1; Table 3.3). These study areas correspond to Stations H1/H2 and L1,[8] respectively, that are used to assess Project-related effects on fish and fish habitat at Haggart Creek in accordance with territorial WUL stipulations (de Graffe 2020; VGC 2020). The rationale for the sentinel fish species, sampling approach, and fish population study area selection for the Phase 1 EEM is as follows:

- Slimy sculpin and arctic grayling were the most abundant fish species present at the proposed effluent-exposed and reference areas during baseline and previous WUL monitoring (Section 2.4.2.5). In addition, all other fish species did not appear to be present

[8] The proposed Haggart Creek effluent-exposed fish population survey study area also incorporates Stations W4 and W29, which are used for water quality, sediment quality, and benthic invertebrate community monitoring to meet WUL conditions (VGC 2020).

- in sufficient numbers to support the implementation of either a lethal or non-lethal EEM fish population survey (i.e., minimum of 40 mature adults or 100 individuals, respectively).
- Environment Canada (2012) generally recommends the monitoring of two sexually mature, sedentary, fish species using a lethal sampling approach for EEM fish population surveys. However, arctic grayling historically captured at Haggart Creek and Lynx Creek have primarily been represented by YOY individuals (i.e., >95% of sampled individuals) and very few adults (i.e., seven-year-old individuals greater than approximately 33 cm long; Barrett and Munkittrick 2010). A short-term residency can also be expected for most of the relatively few adult arctic grayling that reside in Haggart Creek over the open water period (Pendray 1983). The low numbers of adult arctic grayling within the Haggart Creek system coupled with low residency time within a given effluent-exposed or reference area of Haggart Creek precludes using adult arctic grayling for the fish population study.
- During periods of discharge, effluent concentrations were estimated to range from 1% to 15% at the proposed effluent-exposed area (Section 2.3) and therefore this area is ideal for evaluating effects related to the Project effluent. Upper Haggart Creek, upstream of Ditch C, was not selected as a reference area of the EEM fish population survey due to insufficient area between the proposed effluent-exposed and reference study areas (i.e., questionable site fidelity and associated exposure time to reflect ambient local conditions on fish health; Gray et al. 2004) and relatively low numbers of each of the sentinel species at upper Haggart Creek (Section 2.4.2.5). The use of Lynx Creek as a reference area for the fish population survey avoids these issues, and is consistent with the sampling areas utilized under the territorial WUL fish and fish habitat monitoring program (VGC 2020). Metal concentrations in water and sediment collected at Lynx Creek were generally below applicable guidelines (except naturally high arsenic concentrations) and were indicative of no substantial anthropogenic influences.

The Phase 1 EEM fish population survey will be conducted in May 2021 (Table 3.3), which corresponds with the seasonal timing at which sufficient gonad development has occurred in slimy sculpin for the evaluation of all EEM endpoints, including reproduction (Barrett and Munkittrick 2010). Slimy sculpin are resident single spawners that spawn in May at water temperatures ranging from 5° to 10°C (Coad et al. 1995; Barrett and Munkittrick 2010). Notably, high flows at this time of year may present challenging field conditions for the collection of fish in lotic environments like those at Haggart Creek, and therefore adequate precautions must be taken to ensure the safety of field crews. To ensure EEM sampling is initiated prior to slimy sculpin spawning activity, water temperatures will be monitored daily in Haggart Creek following

ice-off in the spring of 2021 with the aim of initiating sampling when approximately 5°C water temperatures occur in the morning and taking into account effluent discharge history.

Table 3.3: Summary of Sampling Information for the Eagle Gold Mine Phase 1 EEM Fish Population Survey

Study Component	Study Detail	Description
General	Effluent-Exposed Area	Haggart Creek Near-Field (effluent-exposed; W4)
	Reference Area	Lynx Creek (reference; L1)
	Fieldwork Timing	May 2021
Lethal (Traditional) Survey	Target Species	Slimy Sculpin
	Sampling Method	Backpack Electrofishing
	Sample Size	20 males / study area 20 females / study area
Lethal (Traditional) Survey	Target Species	Arctic Grayling
	Sampling Method	Backpack Electrofishing
	Sample Size	100 individuals / study area

3.3.2 Sample Sizes and Sample Collection Methods

At each of the Haggart Creek effluent-exposed and Lynx Creek reference area, a minimum of twenty (20) sexually mature male and twenty (20) sexually mature female slimy sculpin will be targeted for the lethal survey, and one hundred (100) arctic grayling will be targeted for the non-lethal survey. Slimy sculpin and arctic grayling will be collected using an electrofishing team consisting of a backpack electrofisher operator and a single netter (Table 3.3). 'Open' station sampling will be conducted in an upstream direction at each study area. All fish captured at each open station will be placed into buckets containing aerated water. At the conclusion of sampling at each station, total shocking effort (i.e., electrofishing seconds) will be recorded to allow calculation of time-standardized catch, station upstream and downstream boundaries will be georeferenced using a handheld GPS unit, and habitat notes pertinent to the fish population survey will be recorded. All captured fish will be identified to species and enumerated. Slimy sculpin and arctic grayling will be retained for subsequent measures (see description below), whereas all non-target fish species will be released at the area of capture once the requisite number of sentinel species has been captured.

3.3.3 Field and Laboratory Processing

For slimy sculpin retained for lethal sampling, the fish will be transported to a dedicated field laboratory for processing as soon as is practical following capture (i.e., within hours). Measurements and observations collected from each individual fish will include those recommended for the EEM program (Environment Canada 2012) as briefly described herein. From each individual fish, total length will be measured to the nearest tenth of a millimetre using digital calipers and fish weight will be measured to the nearest milligram using an appropriately sized electronic balance. The external condition of each fish will be assessed for abnormalities and incidence/types of parasites during the collection of these measurements. The body cavity of each individual will then be opened and the sex and/or sexual maturity will be recorded. Whole gonads and livers will be removed from all sexually mature fish and weighed to the nearest milligram (0.001 g) using an analytical balance outfitted with a surrounding draft shield. Following weighing, whole ovaries from each sexually mature female will be placed in individually labelled sampling bags and preserved using an appropriate fixative (e.g., 10% buffered formalin solution). Any internal abnormalities observed during processing will be recorded on laboratory bench sheets. Finally, appropriate aging structures (otoliths, using pectoral fin rays as backup) will be collected from each individual fish, placed into a separately labelled bag, and following the field study, submitted to a qualified laboratory for age analysis.

For arctic grayling retained for non-lethal sampling, the fish will be processed on the shoreline at each study area shortly following collection. For each individual, external condition will be assessed, fork and total length will be measured to the nearest millimetre using a standard measuring board, and fresh body weight will be measured to the nearest milligram using an analytical balance with ± one percent precision that has been outfitted with a surrounding draft shield or appropriately sized spring scales for fish less than or greater than 50 grams, respectively. A subset of individuals spanning the size range of captured fish at each study area will be sacrificed for age determination (i.e., approximately 10% of the total number of fish sampled from each study area). Otoliths will be extracted in the field from all arctic grayling sampled for age determination and placed in separately labelled containers and upon return from the field, submitted for age determination. Immediately following the measurements indicated above, arctic grayling not retained for age analysis will be placed in a bucket containing aerated water and later, upon recovery to an upright, alert position, released to the study area at which they were collected after marking with a visible implant elastomer (VIE) tag to be used to ensure that in the event of re-capture later in the survey, that measurements are not repeated.

Slimy sculpin ovary samples will be shipped to a qualified laboratory to determine fecundity and egg weight. Briefly, following rinsing to remove the preservative, ovary samples will be weighed

to the nearest milligram at the laboratory. Three gonad tissue sub-samples will be separated from the ovaries, weighed to the nearest milligram, and then subject to the tallying of the number of eggs in the sub-sample with the aid of a dissecting microscope. In the event that a subsample does not contain 100 eggs, an additional portion of ovary tissue will be taken, processed as described above, and added to the subsample to ensure at least 100 eggs are processed as part of the sub-sample. Laboratory QA/QC measures that will be applied to the processing of samples for fecundity determination will include recounting the numbers of eggs in ten percent of sub-samples assessed to verify ±5% precision. The egg count data will then be used to estimate the total fecundity and the average individual egg weight for each female. Tissue samples for age determination will be shipped to a qualified laboratory for age analysis upon completion of the field study. Otoliths will be used as the primary aging structure, with pectoral fin rays and/or scales used as backup and/or confirmatory age structures. Prepared sections of otoliths or pectoral fin ray, and/or scale samples will be mounted on a glass slide using a mounting medium and aged (annuli counted) under a compound microscope or similar magnifying device and the age and edge condition will be recorded along with a confidence rating for the age determination.

3.3.4 Data Analysis

Fish community sampling data will be tabulated and catch-per-unit-effort (CPUE) will be calculated separately for the Haggart Creek effluent-exposed and Lynx Creek reference study areas. Electrofishing CPUE will be calculated as the number of fish captured per electrofishing minute. Analysis of the fish community sampling data will include comparisons of total fish species richness, total number of fish captured, and total CPUE between study areas. In addition, temporal comparison of fish assemblage and relative abundance (i.e., CPUE) will be conducted to evaluate potential changes in fish community features compared to historical data.

Data analysis methods will follow those recommended for EEM fish population surveys (Environment Canada 2012) as briefly described herein. For the slimy sculpin lethal population survey fish measurements, summary statistics including mean, median, minimum, maximum, standard deviation, standard error and sample size will be calculated separately for each sex by study area (effluent-exposed area and the reference area) for all endpoints related to survival (age and age structure), energy use (growth and reproduction), and energy storage (condition and relative liver size; Table 3.4). All data sets will be assessed for normality and equality of variance in order to determine the suitability of parametric statistical procedures. If data significantly violate the assumption of normality following transformation, non-parametric statistics will be applied. For each of the calculated endpoints, statistical differences between the effluent-exposed and reference study areas, assessed separately for each fish sex, will be made using ANOVA, Mann-Whitney U-tests, or Analysis-of-Covariance (ANCOVA) as appropriate and

Table 3.4: EEM Endpoints Examined for Lethal and Non-Lethal Fish Population Surveys

Response			Endpoint	Statistical Procedure[c,d,e]	Applicable Critical Effect Size
Lethal Survey (Slimy Scupin)	Effects on Fish[a]	Survival	Age	ANOVA	± 25%
			Age-frequency distribution	K-S Test	-
		Growth	Size-at-age (body weight against age)	ANCOVA	± 25%
		Reproduction	Relative gonad size (gonad weight against body weight)	ANCOVA	± 25%
		Energy Storage	Condition (body weight against length)	ANCOVA	± 10%
			Relative liver size (liver weight against body weight)	ANCOVA	± 25%
	Supporting Response Variables[b]	Growth	Length	K-S Test	-
			Body weight (whole)	ANOVA	-
			Size-at-age (length against age)	ANCOVA	-
		Reproduction	Relative fecundity (no. of eggs/female against body weight)	ANCOVA	-
			Relative egg size (mean egg weight against body weight)	ANCOVA	-
Non-Lethal Survey (Arctic Grayling)	Effects on Fish[a]	Survival	Length-frequency distribution	K-S Test	-
		Growth	Body weight (whole)	ANOVA	± 25%
			Length	ANOVA	± 25%
		Reproduction	Relative abundance of YOY (% composition)	K-S Test	-
		Energy Storage	Condition (body weight against length)	ANCOVA	± 10%

Note: "-" indicates no CES applicable.

[a] Endpoints to be used for determining "effects" as designated by statistically significant differences between exposure and reference areas (Government of Canada 2019).

[b] These analyses are for informational purposes and significant differences between exposure and reference areas are not necessarily used to designate an effect (Government of Canada 2019).

[c] ANOVA (Analysis of Variance) used except for non-parametric data, where Mann Whitney U-test may have been used.

[d] ANCOVA (Analysis of Covariance). For the ANCOVA analyses, the first term in parentheses is the endpoint (dependent variable Y) that is analyzed for an effluent effect. The second term in parentheses is the covariate, X (age, weight, or length).

[e] K-S Test (Kolmogorov-Smirnov test).

following accepted approaches as described in available technical guidance (Table 3.4; Environment Canada 2012).

For the arctic grayling non-lethal population survey, length-frequency distributions will be plotted so that, together with aging data, YOY individuals can be distinguished from non-YOY individuals separately for each study area. Summary statistics including mean, median, minimum, maximum, standard deviation, standard error and sample size for length and weight measures will be calculated by study area (effluent-exposed and reference) and, if possible, YOY and non-YOY (juvenile/adult) age categories separately based on the outcome of the length-frequency distribution analysis. The proportion of YOY and individual length and weight measurements will be used to calculate endpoints associated with survival, growth, reproduction, and energy storage for each study area according to the procedures outlined for a non-lethal assessment (Table 3.4; Environment Canada 2012). Briefly, length-frequency distributions will be compared using a non-parametric, two-sample, Kolmogorov-Smirnov goodness of fit test. Relative proportions of YOY will be compared between the effluent-exposed and reference area to evaluate potential differences in reproductive success. Mean length and body weight will be compared separately for YOY and non-YOY groups between the effluent-exposed and reference study areas using ANOVA, with the data inspected for normality and homogeneity of variance before applying parametric statistical procedures. In cases where data do not meet the assumptions of ANOVA despite log transformation, non-parametric Mann-Whitney U-tests will be performed to test for differences between areas. Body weight at fork length (condition) will be compared using ANCOVA based on methods provided in EEM technical guidance (Table 3.4; Environment Canada 2012).

An effect on the fish population, defined as a statistically significant difference between an effluent-exposed area and a reference area at an alpha level of 0.10 (Environment Canada 2012), will be evaluated for each of the EEM effect endpoints (Table 3.4; Government of Canada 2019). For endpoints showing significant area differences, the magnitude of difference between the effluent-exposed and reference areas will be calculated as described by Environment Canada (2012) using mean (ANOVA), adjusted mean (ANCOVA with no significant interaction) or predicted values (ANCOVA with significant interaction). Similar to the Critical Effect Sizes (CES) applied to the benthic invertebrate community survey, a magnitude of difference of ± 25% for survival and growth indicators, and a magnitude of difference of ± 10% for the indicator of condition, will be used as fish population survey CES applicable for defining ecologically relevant differences between study areas (Table 3.4; Munkittrick et al. 2009; Government of Canada 2019). Finally, an a priori power analyses will be completed to determine appropriate sample sizes for future fish population surveys as recommended by Environment Canada (2012). The power analyses will be completed based on the mean square error values generated during

the ANOVA or ANCOVA procedures calculated with alpha and beta equal to 0.10. The power analysis results will be reported as the minimum sample size (number of fish/area) required to detect a given magnitude of difference (effect size) between the effluent-exposed and reference area populations for each effect endpoint.

3.4 Fish Tissue Surveys

The LPSD Outlet effluent contained mercury and selenium concentrations below the EEM triggers for conducting applicable fish tissue surveys as defined in the MDMER (i.e., average annual concentrations of mercury and selenium in effluent were below 0.10 µg/L and 10 µg/L, respectively)[9] in two separate samples collected over the four days in April 2019 that effluent was released to the receiving environment (Table 3.5). Therefore, VGC is not required to conduct either a fish tissue mercury survey or a fish tissue selenium survey as part of their MDMER obligations for the Eagle Gold Project Phase 1 EEM.

3.5 Supporting Environmental Information

Additional environmental information collected to support the benthic invertebrate community and fish population surveys during the EEM biological field program will include water quality assessment. The supporting environmental data will be collected from the Haggart Creek effluent-exposed area, Haggart Creek upstream reference area, and/or Lynx Creek reference area at the same time as benthic invertebrate community and fish population sampling is conducted in September and May 2021, respectively. Water quality information used to support interpretation of the biological data will include *in situ* water quality and water chemistry assessment. Water temperature, dissolved oxygen, pH, and specific conductance (i.e., temperature-standardized measurement of conductivity) will be measured *in situ* near the water-sediment interface at each benthic station and fish survey sampling area using portable field meters that have been calibrated and/or checked against standard solutions on the day of measurement. *In situ* water quality data collected at benthic stations and fish survey sampling areas will be statistically compared between the effluent-exposed and reference areas using appropriate tests and following any applicable data transformation to satisfy statistical test assumptions.

Water samples for chemical analysis will be collected at each study area during the benthic and fish population monitoring field surveys conducted in May and September 2021, respectively. A single water sample will be collected from approximately mid-column at each study area

[9] This statement also takes into account that (calendar) annual average concentrations of mercury and method detection limits for mercury were well below 0.10 µg/L, and (calendar) annual mean concentrations of selenium and laboratory method detection limits were less than 5 µg/L, as per the MDMER.

Table 3.5: LDSP Outlet Effluent Chemistry During Discharge in April 2019

Parameters		Units	April 27, 2019	April 28, 2019
Conventionals	Conductivity (lab)	umho/cm	504	497
	pH (lab)	pH	8.11	8.12
	Hardness (as $CaCO_3$)	mg/L	238	226
	Total Suspended Solids (TSS)	mg/L	20.2	47.2
	Total Dissolved Solids (TDS)	mg/L	308	301
	Alkalinity (as $CaCO_3$)	mg/L	142	139
Nutrients and Organics	Total Ammonia	mg/L	0.005	0.009
	Nitrate	mg/L	0.113	0.108
	Nitrite	mg/L	0.0049	0.0042
	Dissolved Organic Carbon	mg/L	10.1	16.9
	Total Organic Carbon	mg/L	8.9	10.4
	Orthophosphorus	mg/L	0.001	0.001
Anions	Chloride (Cl)	mg/L	16.5	15.7
	Fluoride (Fl)	mg/L	0.17	0.16
	Sulphate (SO_4)	mg/L	102	101
	Cyanide, WAD	mg/L	<0.0050	0.005
	Cyanide, Total	mg/L	<0.0050	0.005
Total Metals	Aluminum (Al)	mg/L	2.230	1.410
	Antimony (Sb)	mg/L	0.0055	0.0060
	Arsenic (As)	mg/L	0.075	0.098
	Cadmium (Cd)	mg/L	0.00010	0.00013
	Calcium (Ca)	mg/L	52	52
	Chromium (Cr)	mg/L	0.00294	0.00276
	Cobalt (Co)	mg/L	0.00135	0.00197
	Copper (Cu)	mg/L	0.00618	0.00839
	Iron (Fe)	mg/L	2.4	3.6
	Lead (Pb)	mg/L	0.00607	0.01110
	Magnesium (Mg)	mg/L	23	23
	Manganese (Mn)	mg/L	0.118	0.160
	Mercury (Hg)	mg/L	0.000008	0.000025
	Molybdenum (Mo)	mg/L	0.0012	0.0012
	Nickel (Ni)	mg/L	0.0045	0.0059
	Potassium (K)	mg/L	4.64	4.09
	Selenium (Se)	mg/L	0.00057	0.00043
	Silver (Ag)	mg/L	0.00006	0.00006
	Sodium (Na)	mg/L	12.7	12.1
	Thallium (Tl)	mg/L	0.000038	0.000041
	Uranium (U)	mg/L	0.0059	0.0059
	Vanadium (V)	mg/L	0.0038	0.0034
	Zinc (Zn)	mg/L	0.010	0.015

sampled during each field survey. The water chemistry samples will be shipped to an accredited laboratory for analysis of electrical conductivity, hardness, alkalinity, total suspended solids (TSS), nutrients (ammonia, nitrate, phosphorus), chloride, sulphate, and total metals (including aluminum, arsenic, cadmium, chromium, cobalt, copper, iron, lead, manganese, mercury, molybdenum, nickel, selenium, thallium, uranium, and zinc) as required for EEM, using standard analytical procedures. The QA/QC for water sampling will include the collection and analysis of field duplicates (on 10% of samples), as well as assessment of laboratory duplicates, spike recoveries and blank analyses. Water chemistry data from the effluent-exposed area will be compared to data collected at the reference area, to applicable water quality guidelines, and to data collected historically to potentially identify changes in water chemistry over time.

3.6 Effluent and Receiving Environment Water Quality Monitoring

Effluent and receiving environment water quality monitoring studies consist of effluent characterization, effluent sublethal toxicity testing, and routine collection and analysis of receiving environment water quality samples. In accordance with recent promulgation of the MDMER, effluent characterization will be conducted once per calendar quarter or, in instances in which effluent is released for only a short portion of the year, at a minimum frequency of not less than 30 days apart, at the final effluent discharge point over the duration of the Phase 1 EEM period (i.e., April 2019 to April 2022). The effluent characterization samples will be shipped to an accredited laboratory for analysis of the EEM parameters stipulated by the MDMER using appropriate method detection limits and quality assurance protocols (Government of Canada 2019). Effluent characterization data will be reported electronically to ECCC on an annual basis by VGC, and these data will also be summarized in the Phase 1 EEM Interpretive Report.

Effluent sublethal toxicity testing will be conducted on LPSD Outlet effluent two times per calendar year in accordance with the MDMER. The sublethal toxicity tests will be conducted using fathead minnow (7-day survival and growth test; Environment Canada 2011), the invertebrate *Ceriodaphnia dubia* (7-day survival and reproduction test; Environment Canada 2007a), the alga *Pseudokirchneriella subcapitata* (3-day growth inhibition test; Environment Canada 2007b) and the aquatic plant *Lemna minor* (7-day growth inhibition test; Environment Canada 2007c). Effluent samples for sublethal toxicity sampling will be collected using methods consistent with Environment Canada (2001, 2012). The sublethal toxicity tests will be performed by a laboratory accredited by the Canadian Association for Laboratory Accreditation Inc. (CALA). The sublethal toxicity data will be reported annually to ECCC by VGC, and these data will be summarized in the Phase 1 EEM Interpretive Report.

Water quality monitoring will be conducted at applicable EEM effluent-exposed and reference stations (i.e., W4 and W22, respectively) four times per calendar year, not less than one month apart, during periods of effluent deposit from LPSD Outlet over the duration of the Phase 1 EEM (April 2019 to April 2022 in conjunction with routine water quality monitoring conducted for the territorial WUL). Water samples will also be collected from areas of biological sampling, at the same time that biological sampling is being conducted, for EEM as described above in Section 3.5.2. The water quality samples will be shipped to an accredited laboratory for analysis of the EEM parameters stipulated by the MDMER using appropriate method detection limits and quality assurance protocols (as per Government of Canada 2019). These water quality monitoring data will be reported electronically to ECCC on an annual basis by VGC, and these data together with data collected during the biological monitoring described in this report, will be summarized in the Phase 1 EEM Interpretive Report.

3.7 Schedule and Reporting

The Phase 1 EEM biological study will require two field events to separately collect benthic invertebrate community samples in September and fish population samples in May (along with supporting information applicable to each of these components), followed by the preparation and submission of an interpretative report to ECCC. The chronological schedule for completion of these tasks is as follows:

- Study Design Submission to ECCC — April 2020
- Fish Population Survey Fieldwork — May 2021
- Benthic Survey Fieldwork — September 2021
- Interpretive Report Submission to ECCC — April 20th, 2022.

The Study Design must be submitted to ECCC (for review and approvals) within one year of becoming subject to the MDMER (Government of Canada 2019) which, for the Project, was April 20th, 2019. The proposed timing for the biological monitoring studies is May and September 2021. With the submission of all applicable water chemistry, benthic invertebrate community, and fish ovary (fecundity) and aging samples to relevant laboratories for analysis shortly after completion of applicable fieldwork, all laboratory results should be available by early2022. This will provide adequate time for data analysis and completion of a final Interpretive Report for submission to ECCC on or before the regulatory deadline of April 20th, 2022.

APPENDIX A

ENVIRONMENTAL PROTECTION PRACTICES INFORMATION

Table A.1: Surveillance Requirements for the Heap Leach Facility (HLF)

Surveillance	Frequency	Responsibility
Embankment	Weekly by staff (Annually by Engineer)	Process General Foreman or alternate
Embankment Geotechnical Instrumentation (piezometers and inclinometer)	Continuous using wireless relays to office	Process General Foreman Process General Foreman
Pad Liner	Weekly	Process General Foreman or alternate
Stacked leach ore for stability	Weekly	Process General Foreman or alternate
In-Heap Pond Piezometers	Continuous using wireless relays to office	Process General Foreman
Solution collection and recovery system	Weekly	Process General Foreman or alternate
Leak Detection and Recovery System Monitoring Ports	Daily	Environmental Superintendent
Heap leach pad vibrating wire piezometers	Daily during freshet or when solution inflow and outflow rates are not equalized (i.e., application and withdrawal rates altered for operational purposes or equipment malfunction/upset event), weekly during the remainder of the year.	Environmental Superintendent
Monitoring Vault	Weekly	Environmental Superintendent
Events Pond fluid levels	Daily if the desired available storage has been reached and weekly otherwise.	Environmental Superintendent
Events Pond liners	Weekly	Environmental Superintendent
Conveyors and radial stacker	Monthly	Crushing & Conveying Supervisor
Geochemical sampling of pregnant and barren process solution	Quarterly	Metallurgist

Table A.1: Surveillance Requirements for the Heap Leach Facility (HLF)

Surveillance	Frequency	Responsibility
HLF and Dam Inspection by Engineer	Annually	Engineer of Record
Independent third-party physical stability inspection	Annually	Engineering Consultant
Event Driven Inspection	Following unusual event (e.g., heavy precipitation, freshet, earthquake)	Managers - Process, Maintenance, Health & Safety and Environmental
Comprehensive Review (Dam Safety Review)	No later than 5 years after construction and prior to decommissioning	Engineering Consultant
Instrumentation	Monthly and per Manufacturer Guidelines	Instrumentation Technician
General Visual Inspection of HLF Components and the Events Pond	Daily during the completion of standard work procedures	Environmental Superintendent and Coordinators and Health, Safety and Security Manager and Coordinator

Table A.2: ADR Facility Surveillance and Inspection Focus Areas

Facilities	Inspection Focus Area
Cyanide unloading and storage area	• maintenance of general housekeeping practices, presence of water or debris
	• proper segregated storage of incompatible materials
	• integrity and proper positioning and stacking of stored intermodal containers and IBCs
	• presence of properly rated fire extinguishers
	• functionality of fixed HCN alarms and video monitors
	• legibility of hazard warning signage
	• availability of Material Safety Data Sheets (MSDSs) for cyanide briquettes
	• cordoning of container unloading area during unloading operations, and restriction of access by unauthorized personnel
	• use of appropriate operator PPE during unloading operations
	• functionality of eyewashes/emergency showers and water supply line pressure
	• condition of emergency response equipment and first aid storage cabinets
Cyanide bag cutter arrangement, mixing and storage tanks, and secondary containments	• structural integrity, signs of corrosion, buildup of cyanide salts, or leakage (tanks, valves, pumps, and other piping system components)
	• structural integrity, cracks, spalling, or deterioration of concrete impoundments
	• functionality of fixed HCN alarms and video monitors
	• functionality of tank level indicators
	• condition of chain hoist and bag lifting bridle
	• functionality of eyewashes/emergency showers and water supply line pressure
	• temperature, cleanliness, and condition of cyanide antidote kits and first aid storage cabinets
	• condition of emergency response equipment and PPE
	• use of appropriate operator PPE during mixing operations
	• legibility of hazard warning and direction flow signage
	• integrity of lockout/tag-out mechanisms on major solution or containment drain valves
	• maintenance of physical separation from chemically incompatible materials
	• maintenance of general housekeeping practices, presence of spilled solution or debris

Table A.2: ADR Facility Surveillance and Inspection Focus Areas

Facilities	Inspection Focus Area
Incineration of cyanide packaging materials	• legibility of hazard warning signage
	• adequacy and integrity of security fencing, gate, and lock
	• completeness of combustion of packaging residues
	• control of windblown debris outside of fenced area
	• evidence of animal intrusion
ADR plant and secondary containments	• structural integrity, signs of corrosion, buildup of cyanide salts, or leakage involving process solution storage tanks, valves, pumps, and other piping system components
	• structural integrity, cracks, spalling, or deterioration of concrete impoundments
	• management of fluids in impoundments
	• functionality of fixed HCN alarms and video monitors
	• functionality of tank level indicators
	• functionality of eyewashes/emergency showers and water supply line pressure
	• temperature and condition of cyanide antidote kits
	• condition of emergency response equipment and PPE
	• legibility of hazard warning and direction flow signage
	• integrity of lockout/tag-out mechanisms on major solution or containment drain valves
	• maintenance of physical separation from chemically incompatible materials
	• maintenance of good general housekeeping practices, including routine cleanup of spilled or leaked solution or debris
Pregnant and barren solution pipelines and pumping stations/ containments	• structural integrity, signs of corrosion, buildup of cyanide salts, or leakage (pipelines, valves, pumps, and other components)
	• structural integrity, cracks, spalling, or deterioration of concrete impoundments
	• functionality of eyewashes/emergency showers
	• temperature and condition of cyanide antidote kits
	• condition of emergency response equipment and PPE
	• legibility of hazard warning and direction flow signage
	• integrity of lockout/tag-out mechanisms on major solution or containment drain valves

Table A.2: ADR Facility Surveillance and Inspection Focus Areas

Facilities	Inspection Focus Area
HLF earthworks, risers, distribution lines, emitters, internal pond(s), and leak detection system	• signs of erosion, slumps, or cracks in earthworks or the ore pile
	• signs of pipeline/flange leakage, and associated ponding
	• signs of ponding on HLF surface; if present, adequacy of screening or other appropriate avian exclusion devices
	• signs of animal trails or intrusion
	• management of fluids in impoundments
	• functionality of leak detection system and maintenance of associated detection logs
	• legibility of hazard warning and direction flow signage
External Events Pond and leak detection systems	• adequacy of available freeboard (comparison to surveyed markers)
	• tears or holes in liner material or signs of erosion or slumps in underlying earthworks
	• signs of pipeline/flange leakage, and associated ponding
	• adequacy of wildlife fencing and avian exclusion devices
	• signs of animal trails or intrusion
	• functionality of leak detection system and maintenance of associated detection logs
	• legibility of hazard warning and direction flow signage
Surface water interceptor ditches	• tears or holes in liner material (if lined) or signs of erosion, slumps, or cracks in earthworks
	• signs of animal trails or intrusion
	• signs of blockage or other surface runoff impediments

APPENDIX B

GENERAL SUPPORTING INFORMATION

Table B.1: Baseline Monthly Average Water Chemistry at Haggart Creek Upstream of Dublin Gulch (Station W22), 2007 to 2016

Parameters		Units	Water Quality Guideline	Month												
				January (n=2)	February (n=3)	March (n=5)	April (n=4)	May (n=6)	June (n=3)	July (n=5)	August (n=8)	September (n=7)	October (n=8)	November (n=3)	December (n=2)	Annual Average

Indicates parameter concentration above applicable Water Quality Guideline.

[a] British Columbia Water Quality Guideline (BCMOE 2020).

[b] Canadian Water Quality Guideline for the protection of aquatic life (CCME 1999, 2020).

[c] Yukon Contaminated Sites Regulation (Yukon Government 2012).

[d] Indicates instance in which selected water quality guideline may not have been the lowest, most stringent, criteria, but rather reflected the most recent update.

Indicates parameter concentration above applicable Water Quality Guideline.

[a] British Columbia Water Quality Guideline (BCMOE 2020).

[b] Canadian Water Quality Guideline for the protection of aquatic life (CCME 1999, 2020).

[c] Yukon Contaminated Sites Regulation (Yukon Government 2012).

[d] Indicates instance in which selected water quality guideline may not have been the lowest, most stringent, criteria, but rather reflected the most recent update.

Table B.5: Sediment Total Organic Carbon and Metal Concentrations at Haggart Creek and Lynx Creek Sediment Stations, 2007 to 2019

Parameter	Units	Sediment Quality Guideline	W22 Upstream			W4 Downstream of Dublin Gulch			W29 Downstream of Platinum Gulch

Eagle Gold Mine – Annual Effluent Monitoring Report – Version 1 - 2020

Government of Canada Gouvernement du Canada

Canada

Eagle Gold Mine - Annual effluent monitoring report - Version 1 - 2020

Report details

Facility name	Eagle Gold Mine
Reporting period	2020
Version	1
Status	Completed
Last modified	2021/03/29 22:41 (PDT)
Submission date	

Parent company

Parent company	Physical address
StrataGold Corporation	1000, 1050 West Pender, Street, Vancouver, British Columbia, V6E 3S7, Canada

History

Status	Version	Last modified	Submission date
Completed	1	2021/03/29 22:41 (PDT)	

Identifying information

Reporting period	**2020**
Facility name	**Eagle Gold Mine**
Facility physical address	
Operator name (required)	StrataGold Corporation
Operator telephone number	
Operator extension	
Operator e-mail address	

Note	Date	User name
No data available		

Test results

Final discharge point **LDSP**

Final discharge point latitude **64.15639**

Final discharge point longitude **-135.50460**

Non-compliance information An FDP#5 follow up exceedance report was submitted to Travis Teel on June 18 2020.

The discharge exceedance report summarized the implementation of water management strategies that were necessary to address rapid snowmelt, which led to a reduction of the Lower Dublin South Pond available capacity, and the decision to discharge water from the Lower Dublin South Pond to FDP#5 during the period of April 20-28, 2020. All schedule 4 parameters were compliant with criteria with the exception of grab and mean TSS values. FDP#5 is an exfiltration sump and is located in an area occupied by a thick sequence of placer deposits and alluvium that overlies bedrock. Thus, exfiltrating the water to ground at FDP#5 was ascertained to have the lowest potential for an adverse response in potential receiving environments as it allows for natural mitigation of total suspended solids (TSS), the main parameter of concern, through natural filtration, as opposed to direct discharge via FDP#3 to receiving waters. On April 30, 2020, and within 24 hours of receiving the analytical laboratory results, notification was provided to the Yukon Spill Reporting hotline of the discharge of water to FDP#5 with TSS concentrations exceeding MDMER criteria for TSS. VGCX prioritized multiple corrective actions in 2020 to mitigate the potential for a reoccurrence of the exceedance reported sourcing from the Lower Dublin South Pond. Ditch A, the current primary water conveyance structure directing contact water to the Lower Dublin South Pond was lined and rip rapped with clean aggregate. The forebay of the Lower Dublin South Pond was cleaned of deposited sediments from the 2020 open water season and lined to improve passive settling capabilities. Silt fencing, check dams, collection sumps and water diversion structures were also strategically placed around the Project to mitigate sediment transport into Ditch A and ultimately the Lower Dublin South Pond. Supporting the construction works undertaken in 2020, three high powered diesel pumps were procured for 2021 Freshet to improve resident pumping and water transfer capacities to the Events Pond used to store excess water from the Lower Dublin South Pond and settle waters prior to potential discharges on the Project.

1 Introduction

Victoria
GOLD CORP

1 Introduction

1.1 Scope of Report

This report presents a summary of all climate data collected for the Eagle Gold Project (Project) since August 2007[1]. Monitoring data from two Project climate stations and four local snow courses are presented to characterize local conditions for the following variables:

- Air temperature;
- Rainfall;
- Snow depth and snow water equivalent (SWE);
- Barometric pressure;
- Relative humidity;
- Wind speed and direction, and;
- Solar radiation.

Measured data are also used to estimate potential evaporation for the Project site.

1.2 Previous Reports

The climate data collected at the Eagle Gold Project site from 2007, up to and including December 2019, have been previously summarized in the following reports:

- *Dublin Gulch Project - Climate and Hydrology Environmental Baseline Report* (2008), prepared by Jacques Whitford AXYS (Burnaby, BC) for StrataGold Corp. (Vancouver, BC), December 2008.
- *Snow Survey Environmental Baseline Report* (2009), prepared by Jacques Whitford Stantec AXYS (Burnaby, BC) for StrataGold Corp. (Vancouver, BC).
- *Eagle Gold Project, Environmental Baseline Report: Climate* (2010), prepared by Stantec (Burnaby, BC) for Victoria Gold Corp., February 2010.
- *Eagle Gold Project, Surface Water Balance Model Report* (2011), prepared by Stantec (Burnaby, BC) for Victoria Gold Corp., June 2011.

[1] Historic climate data collected during 1993 to 1996 for the Project area is summarized in *Eagle Gold Project, Environmental Baseline Report: Climate*, prepared by Stantec (Burnaby, BC) for Victoria Gold Corp., March 2012

- *Eagle Gold Project, Environmental Data Summary Report: Climate 2011 Update* (2011), prepared by Stantec (Burnaby, BC) for Victoria Gold Corp., June 2011.
- *Eagle Gold Project, Environmental Baseline Report: Climate* (2012), prepared by Stantec (Burnaby, BC) for Victoria Gold Corp., March 2012.

2 Climate Monitoring Locations

Victoria
GOLD CORP

2 Climate Monitoring Locations

2.1 Meteorological Stations

Climatic parameters are measured at the Project site by two weather stations that were originally installed by Stantec (formerly Jacques Whitford AXYS). The Potato Hills station is situated near the eastern basin divide (1,420 m) and was installed in August 2007. The second station was originally installed near the camp at 823 m in August 2009, and subsequently was moved to its current location in September 2010 (782 m) following construction of new camp facilities.

The Potato Hills station installed by Stantec used an ONSET Hobo datalogger to measure air temperature, rainfall, wind speed and direction, barometric pressure, relative humidity, snow depth and solar radiation at 15-minute intervals. The recording interval was initially set to record at 60-minute intervals from August 14, 2007 to August 13, 2008 and then was switched to record at 15-minute intervals as of August 13, 2008.

A snow sensor was added to the Potato Hills station in April 2011. However, since snow sensor installation, the continuous snow depth data have not been reliable and therefore are not presented in this report. The Potato Hills station experienced repeated failures in 2019 and was decommissioned in October 2019. A replacement all weather station was installed at Potato Hills in March 2020. The new station includes a Campbell Scientific CS1000 datalogger measuring air temperature, precipitation, wind speed and direction, barometric pressure, snow depth, solar radiation and relative humidity at 15-minute intervals.

The Camp station consists of a Campbell Scientific CR800 datalogger and sensors measuring air temperature, precipitation, wind speed and direction, barometric pressure, snow depth, solar radiation and relative humidity. All data are recorded at a 15-minute interval at this location. The snow sensor and pyranometer (measuring solar radiation) were added in April and October 2011, respectively. Continuous snow depth data are provided herein for the Camp station, as are records of snow survey measurements for actively measured stations through spring 2020. The Camp station was serviced and calibrated in March 2020 and a new Geonor precipitation gauge was installed.

The Project climate stations and snow survey locations are presented in Table 2-1 and Figure 2-1.

2.1.1 Data Gaps for 2020

This section of the report summarizes data gaps in the climate record for the Potato Hills and Camp climate stations during the period January 2020 to December 2020. Data gaps prior to January 2020 are discussed in previous reports.

Potato Hills Station – The available data spans the period March 14 to December 31. Several data gaps greater than 24 hours exist in the Potato Hills climate station record:

- Data loss occurred from May 1 to June 4 as a result of a malfunction during a software update and install.
- Air temperature and barometric pressure during January and February were recorded using a standalone HOBO sensor.
- The barometric pressure sensor malfunctioned for the remainder of the year, and no data was collected from March through December.

Camp Station – The data record for the Camp climate station spans January 2020 to December 2020. The main data gaps for the Camp climate station are as follows:

- Data was not recorded from May 14 to May 27 due to a possible data logger malfunction.
- Precipitation data were not recorded from March 9 to May 27.
- Erratic snow depth data was recorded beginning on March 9 and continuing for the remainder of the snowmelt season. The onset of the questionable data coincided with station servicing.

2.2 Snow Surveys

Snow surveys were completed in 2020 at the Camp (Lower) snow course and Potato Hills (Upper) snow course. The location established in Ann Gulch upgradient from HLF Phase 1 construction activities for the 2019 (HLF) snow survey season was revisited in 2020. All snow surveys were generally conducted at, or near to the date that Water Resources Branch of Environment Yukon conducted their monthly surveys, which included the annual maximum snowpack. This peak in terms of SWE measurement typically occurs between late-March to mid-April in the Yukon.

Snow surveys are conducted following the guidelines set out in the *Snow Survey Sampling Guide* (BC Ministry of Environment, 1981). At each site, 10 sampling locations along a transect were sampled for depth and snow water equivalent [SWE] using a Federal snow sampler, and then averaged. As summarized in previous annual reports, snow courses were established at the Project site to discern effects of aspect and elevation gain on local snow accumulation (Table 2-1 and Figure 2-1).

3 Climate Data Summary

Victoria
GOLD CORP

3 Climate Data Summary

3.1 Temperature

Air temperatures at the Project site are consistent with those throughout the Yukon interior. Mean annual air temperature at site is -3.7°C at the Camp station (782 m) and -3.6°C at the Potato Hills station (1,420 m) over their respective periods of record.

Mean, maximum and minimum monthly (based on the daily average) temperatures are presented in Table 3-1 for both stations. At the Camp station, monthly average temperature ranges from -20.0°C in January to 13.3°C in July, and -15.3°C to 10.9°C at the Potato Hills station, for the same months. The minimum (maximum) recorded daily average temperatures were -43.8°C (22.0°C) and -36.6°C (22.9°C) at the Camp and Potato Hills stations, respectively. The minimum (maximum) recorded 15-minute temperatures were -46.4°C (31.6°C) and -37.6°C (31.7°C) at the Camp and Potato Hills stations, respectively.

The monthly mean temperature signatures for both climate stations are shown in Figure 3-1, and the pattern is consistent with the larger regional picture. During the months of March to October inclusive, the standard lapse rate applies, with temperatures decreasing with rising elevation, and are approximately 3°C cooler at the upper station, on average. However, during the winter months of November to February, temperature inversions are common at the Project site, with temperatures approximately 2.5°C cooler on average in the valley bottom than at the height of land.

The spring/summer lapse rate of -3.7°C/1000 m is consistent with the saturated adiabatic lapse rate (SALR) of -5.0°C/1000 m. Minor deviation from the SALR is likely due to the increased frequency of precipitation during the summer months, when a larger portion of the annual precipitation falls, resulting in warmer and wetter air masses at the Project site. The winter lapse rate of +4.3°C/1000 m is consistent with that reported by Wahl *et al.* (1987), which states that during a temperature inversion, lapse rates can range from 3-5°C/1000 m of elevation gain.

Table 3-1:
Project site monthly air temperature record.

Notes:
1. Values are calculated from average daily temperatures.
2. Data is considered missing for a month when there are less than 25 days of data available for that month (beginning of data record until end of 2020).
3. Monthly values in italics for the Potato Hills station, for the period of 2013 through 2015 have been infilled using monthly regression relationships with temperature data from the Camp station.
4. Monthly values in gray for the period of June 2014 to March 2015, May through July 2016, November 2019 and January to February 2020 were recorded by a standalone HOBO temperature sensor.
5. 'M' denotes data missing due to a sensor/datalogger malfunction.
6. Monthly temperature lapse rates presented in Section 3.1 are based on a comparison of monthly average temperature data from the Camp and Potato Hills stations.

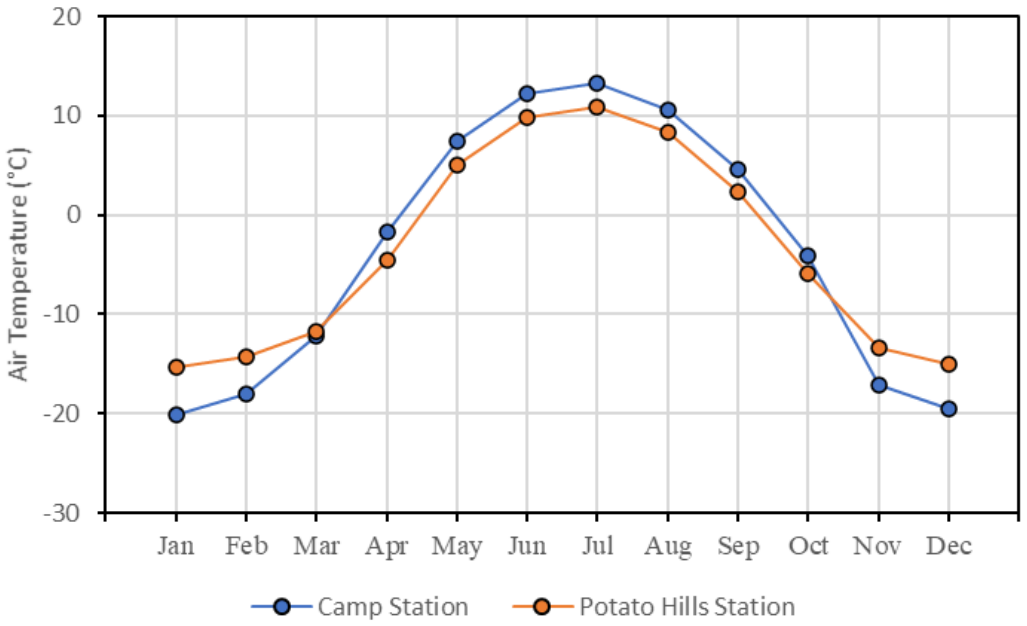

Figure 3-1: Monthly mean air temperature for the Project climate stations for the available period of record.

3.2 Rainfall

Historically, gauge precipitation data was collected at the Project site using tipping bucket rain gauges, which were not adapted to measure snowfall. Therefore, the precipitation data presented in Table 3-2 is for rainfall only, collected between the months of March and October, inclusive. The precipitation gauges were replaced with all-season instruments in 2020, and thus these data accurately represent total solid phase precipitation. Generally, precipitation falls as snow from November through March, with precipitation falling as a mix of rain and snow in April and October. Rainfall data for March is included in the table below, where the temperature record indicates that precipitation would have fallen as rain (*i.e.*, daily average air temperature was above zero). June to October monthly precipitation values for 2020 at the Camp Station were highest on record and measured at two to three times the mean monthly values from 2011 to 2019. Similar but less pronounced patterns were observed at Potato Hills station with the exception of August 2020 where monthly precipitation was only slightly elevated above historical average.

Table 3-2:
Project site monthly rainfall data.

Notes:
1. Winter precipitation data (October through April in many years) are unreliable due to the majority falling as snow. The months where no rainfall was recorded due to freezing conditions are denoted by an 'S'. The exception is October through December of 2020, following the installation of an all-season Geonor precipitation gauge at both climate stations.
2. Data for the month of October are in italics, as rainfall is not measured for the entire month.
3. 'M' denotes when there are less than 25 days of data available for that month.
4. In August 2015, the primary rain gauge at the Potato Hills Station was replaced by a standalone tipping bucket rain gauge. The replacement gauge is deployed each spring (i.e., in April or May) then decommissioned in the autumn (October). Missing data at Potato Hills Station denoted by 'D' indicate time periods during which the standalone tipping bucket rain gauge was not functioning.

3.3 Snow Water Equivalent and Continuous Snow Depth Data

As discussed in Section 2.2, snow data have been collected at three snow courses[2] at the Project site since 2009. Furthermore, the annual maximum snow water equivalent (SWE) value generally occurs in late-March or early-April at the Project site. Field measurements from site show that snow density is generally lower earlier in the season, corresponding to colder temperatures, but increases through winter as the snowpack deepens, consolidates and as snow melt progresses.

Project site snow survey data is summarized in Table 3-3 for period of record 2009 to 2020. Annual maximum SWE values range from 72 mm to 199 mm at the Camp snow course, 98 mm to 117 mm (shorter record) at the Ann Gulch snow course and from 190 mm to 431 mm at the Potato Hills snow course.

The Potato Hills snow survey was conducted in the immediate vicinity of the weather station from 2009 to 2011. However, due to the exposed location, snow redistribution resulted in variable measurements, and therefore the survey was moved to its current and more sheltered location in 2012, several hundred metres to the south-east (Figure 2-1). Note that high snowpacks did not allow access to the Potato Hills snow course in March 2012, and therefore the survey was conducted at Stewart Gulch (Snow Survey #2; see Figure 2-1). Snow surveys conducted at the Heap Leach facility in 2019 were primarily above or below the diversion ditch as indicated in Table 3-3. All 2020 snow surveys exhibited historical maximums with SWE for each survey greater than any measurement collected at their respective sites between 2011 to 2019.

[2] See Note 1 in Table 3-3.

Table 3-3:

Notes:
1. Snow survey data for Potato Hills collected on 2012-03-20 is from the Stewart Gulch survey (Snow Survey #2) at 995 m asl (see Figure 2-1).
2. No snow surveys were conducted at site in 2015.
3. Snow survey data for Heap Leach Facility collected on 2019-04-02 from above and below the diversion ditch.
4. Snow survey data for Heap Leach Facility collected on 2019-04-30 from above the diversion ditch.
5. The Potato Hills Station SWE value for 2020-03-13 was estimated from the average March snow density value (22%) and the measured snow depth on this date, to correct for an error in the SWE measurements.

3.3-1 Continuous Snow Depth Data

Continuous snow depth data is summarized for the Camp climate station in Figure 3-2.

The upper panel of Figure 3-2 shows the evolution of the snowpack for the 2012 to 2020 time-period, with pack depth showing initial and appreciable accumulation through the months of November and December, typically reaching maximum depth by mid-March each year. These data then show that snowpack depth remains deep and relatively stable to April. As with the historical maximum SWE observed in snow surveys, spring 2020 snow depth at Camp Station also exceeded all other years.

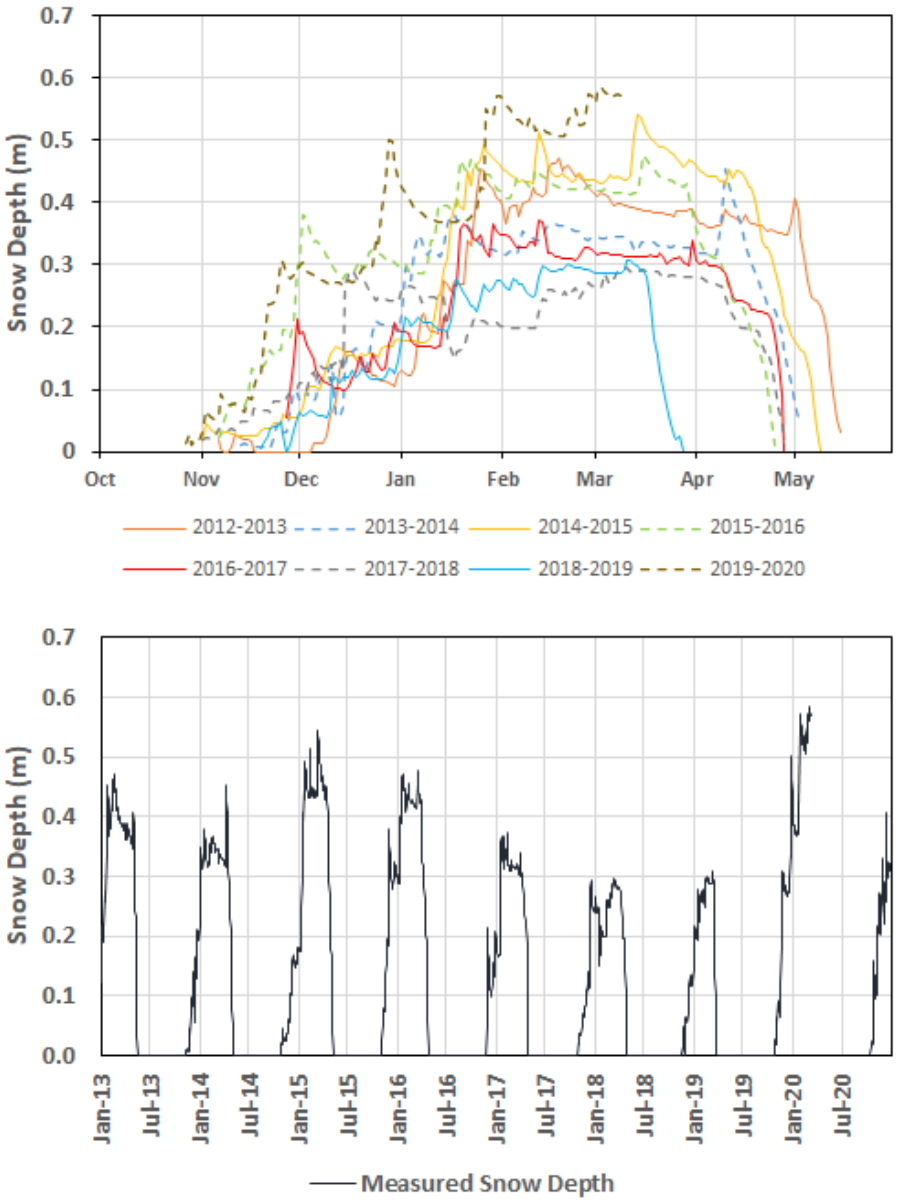

Figure 3-2: Summary of recent (2012-2020) continuous snow depth data for the Camp climate station.

The lower panel of Figure 3-2, illustrates the timing and rate of snowpack loss for the Camp climate station. While variable from year to year, these data show snowpack losses typically begin in earnest by mid- to late-April, with the duration of melt lasting 15-20 days. Although the duration of melt in 2019 was fairly typical, the timing of melt was roughly early by a month compared to prior years of observation. Due to unreliable data beginning March 9, melt timing and rate for 2020 snowpack could not be established.

3.4 Barometric Pressure

Barometric pressure provides a measure of the weight exerted by the atmosphere on the earth's surface at a point and provides a direct indication of changes in the synoptic weather pattern (*e.g.*, dropping barometric pressure can indicate the approach of a warm front). As expected, barometric pressure decreases with elevation at site, and is generally elevated during the summer months in comparison to the winter season (Table 3-4). When the Potato Hills climate station experienced a malfunction between May 2014 and July 2015, Table 3-4 was populated with data recorded by a standalone HOBO temperature/pressure logger for this time period. Similarly, a standalone HOBO sensor measured barometric pressure at the Potato Hills station in January and February 2020, but malfunctioned thereafter, resulting in no further usable data collected in 2020. Annual average barometric pressure is 91.9 kPa at the Camp station, and 84.9 kPa at the Potato Hills station.

Table 3-4:
Project site monthly average barometric pressure data.

Climate Station	Elevation (m asl)	Barometric Pressure (kPa)												
		Year	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec	Annual

Notes:
1. Monthly values in gray for the period of June 2014 to March 2015, November 2019 and January to February 2020 were recorded by a standalone HOBO barometric pressure sensor.
2. 'M' denotes data missing when there are less than 25 days per month due to a sensor malfunction.

3.5 Relative Humidity

Relative humidity is a measure of the water vapour content of an air parcel, expressed as a percentage of the total water vapour required for the air to be fully saturated at a given temperature. Therefore, at colder temperatures, less water vapour is required to achieve a high relative humidity, and conversely at higher temperatures, more water vapour is required to obtain the same relative humidity value.

Given that air temperatures are well below zero during the winter, relative humidity values are elevated throughout the winter, and lower during the summer. With respect to monthly patterns for relative humidity, the annual minimum is expected to occur in the month of May. All monthly average relative humidity values from both climate stations are provided in Figure 3-3 and Table 3-5. Annual average relative humidity is 70% at the Camp station, and 77% at the Potato Hills station.

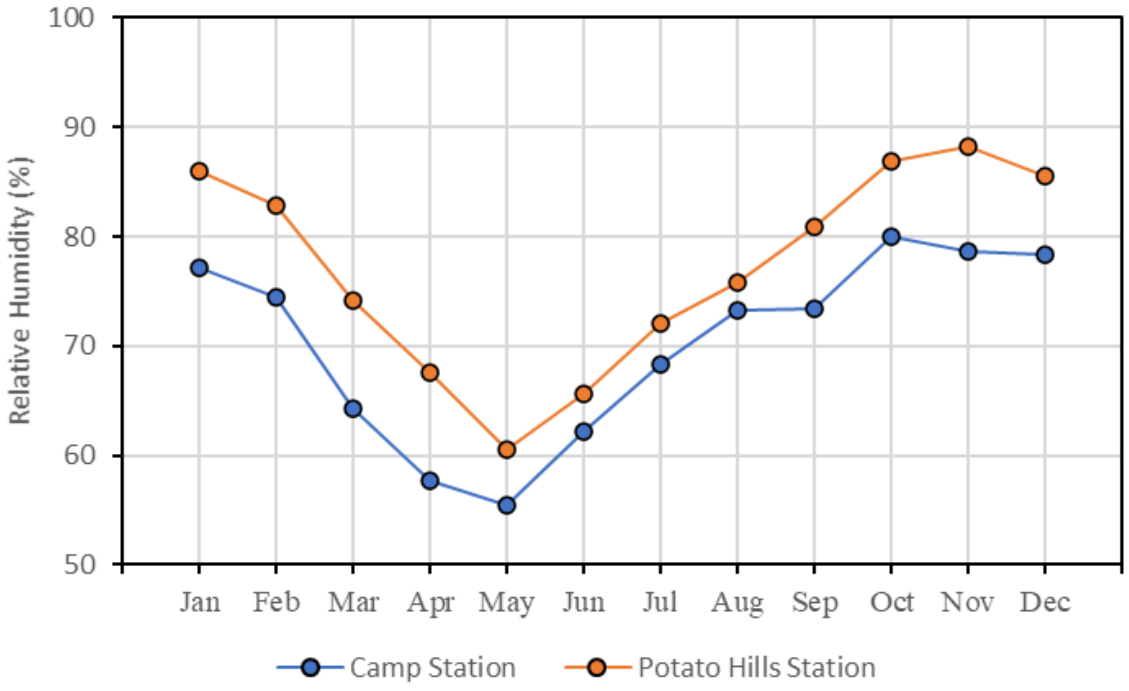

Figure 3-3: Project site average monthly relative humidity for the period of record.

Table 3-5:
Project site monthly average relative humidity measurements.

		Average	86	83	74	68	60	66	72	76	81	87	88	85	77

Notes: 1'M' denotes data missing for at least 14 days in the month due to a sensor malfunction.

3.6 Wind Speed and Direction

The predominant wind direction at the climate stations is north, and west-northwest, for the Camp and Potato Hills stations, respectively. No wind direction data was collected at the Potato Hills station in 2019 and early 2020. Wind speeds averaged 1.2 m/s at the Camp station, and 2.4 m/s at the Potato Hills station, on an annual basis (Table 3-6; Figure 3-4). The maximum recorded gust speed at the Camp station was 23.5 m/s over a 15-minute interval (August 15, 2016). At the Potato Hills station, wind speeds averaged 23.5 m/s over a 1-hour period (November 3, 2010; 15-min maximum gust of 23.9 m/s), and during the same event, wind speeds in excess of 20 m/s were recorded for a 4.5-hour period. As shown in Table 3-6, the mean monthly wind speeds for both stations are higher in the spring, summer, and autumn months, and lower in the winter, with annual average monthly minimums occurring in December, and annual maximum winds in April and May.

Table 3-6:
Project site monthly average wind speed data.

Climate Station	Elevation (m asl)	Wind Speed (m/s)												
		Year	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec	Annual

		2019	0.7	M	3.0	3.1	M	2.8	2.0	M	M	M	M	M	-
		2020	M	M	M	2.7	M	2.3	2.5	2.4	2.6	2.2	2.5	2.7	-
		Average	1.9	2.3	2.9	3.2	3.0	2.4	2.2	2.2	2.3	2.1	1.9	1.4	2.4

Notes:
1. Zero value for the Potato Hills Station in January 2012 is likely due to icing of the wind sensor.
2. 'M' denotes data missing when there are less than 25 days per month due to a sensor malfunction and R an indicator the wind sensor affected by rime.

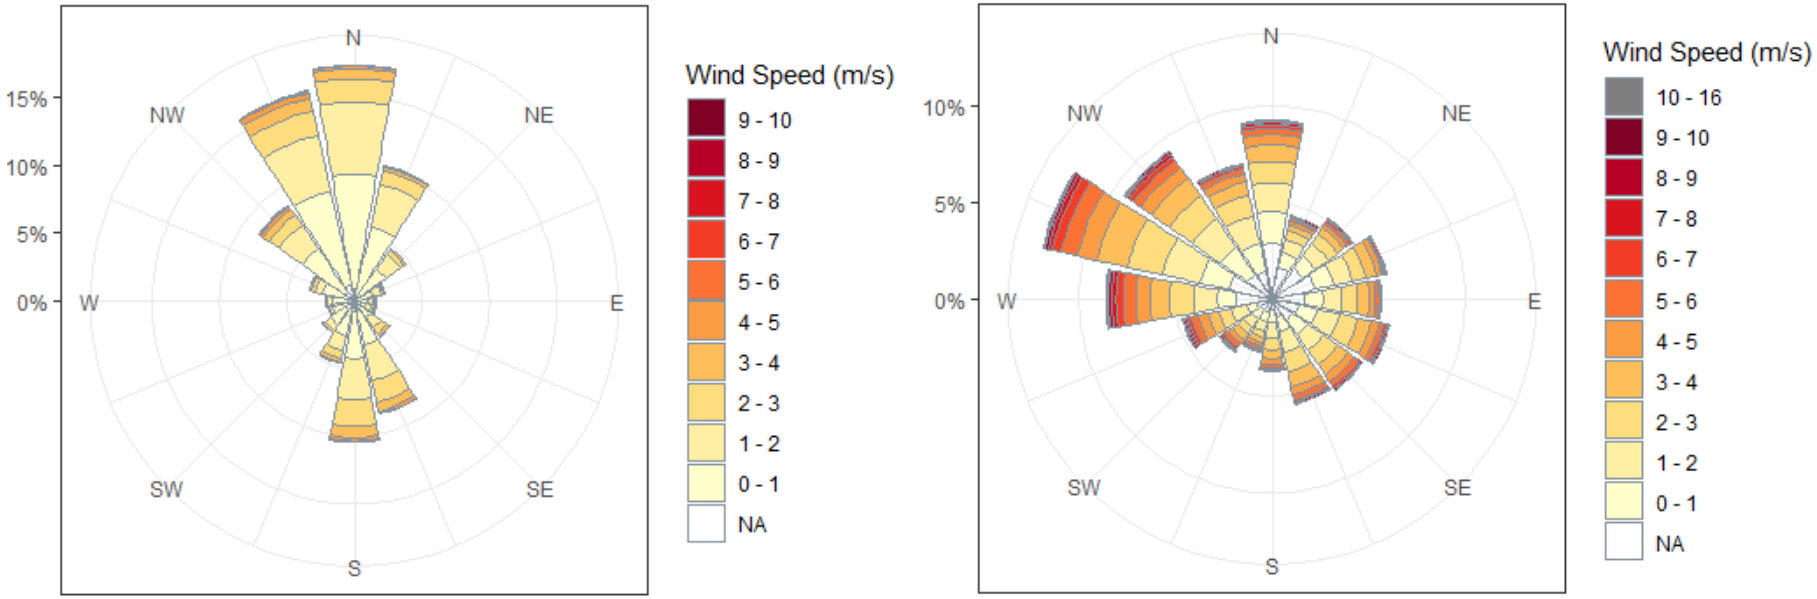

Figure 3-4: Project site wind roses for the Camp station (a) and the Potato Hills station (b). Wind roses are based on hourly averages of 15-minute readings of wind speed and direction.

3.7 Solar Radiation

Solar radiation (or solar irradiance) is a measure of the power per unit area provided by the Sun, in watts per square meter (W/m^2). Given the high-latitude location of the Project site, day length, and therefore solar radiation, fluctuate greatly on a seasonal basis. The average annual minimum of 2 W/m^2 (Camp station) and 3 W/m^2 (Potato Hills station) occur in the month of December, while the average annual maximum of 223 W/m^2 and 224 W/m^2 occur in May at the Camp station and Potato Hills stations, respectively. The Camp station location in the valley bottom results in slightly lower incident solar radiation, presumably due to the shading effect of the surrounding terrain. The monthly average and maximum solar radiation values for both stations are presented in Table 3-7 for their periods of record. Monthly maximum and average solar radiation values at Camp Station from March 2020 to October 2020 were considerably greater than the maximum and average values, respectively, for all other years on record. The deviation from the historical average coincides with servicing and calibration of the station, indicating a possible change introduced during this maintenance.

Table 3-7:
Project site monthly maximum and average incoming solar radiation data.

Climate Station	Elevation (m asl)	Maximum Solar Radiation (W/m^2)												
		Year	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec	Annual

Notes:

1. Solar radiation is zero at night.
2. Maximum values are based on an hourly/sub-hourly recording interval, and are calculated based on all available data, including months with fewer than 25 days of data.
3. Zero values are included in the calculation of averages.
4. 'M' denotes data missing when there are less than 25 days per month due to a sensor malfunction

3.8 Potential Evaporation

15-minute potential evaporation rates were computed for the Camp station using available climate and the Ref-ET calculator – a compiled, stand-alone computer program that calculates reference evapotranspiration (ASCE, 2005). For the period of available record (January 2013 to December 2020), a 15-minute climate input file was prepared for the Eagle Gold site. The input variables required by Ref-ET are: maximum air temperature, minimum air temperature, relative humidity, incoming solar radiation, atmospheric pressure and wind speed. Albedo values were estimated to be 0.6 during winter and 0.18 for snow-free months.

From the assembled climate inputs, Ref-ET returned potential evaporation (PE) computations at daily time-step based on an array of evaporation models (*e.g.,* Penman-Monteith model, Priestley-Taylor formulation). Presented in Table 3-8 (monthly tabulations) are resulting outputs from Ref-ET for months March to October. May to end-September PE for the Camp station is estimated to range from 367-448 mm with the Priestley-Taylor equation resulting in average PE estimates similar to values calculated using the Penman-Monteith equation. 2020 PE estimates using the Priestley-Taylor equation substantially exceeded the historical average from April – September. A potential reason for this increase is the abnormally high solar radiation measured at Camp station during this period and the considerable influence exerted by solar radiation in the Priestley-Taylor equation. The highest monthly rates of PE are expected in May, June, July and August of each year.

Table 3-8:
Potential evaporation (PE) estimates for the Camp station.

1.0 INTRODUCTION

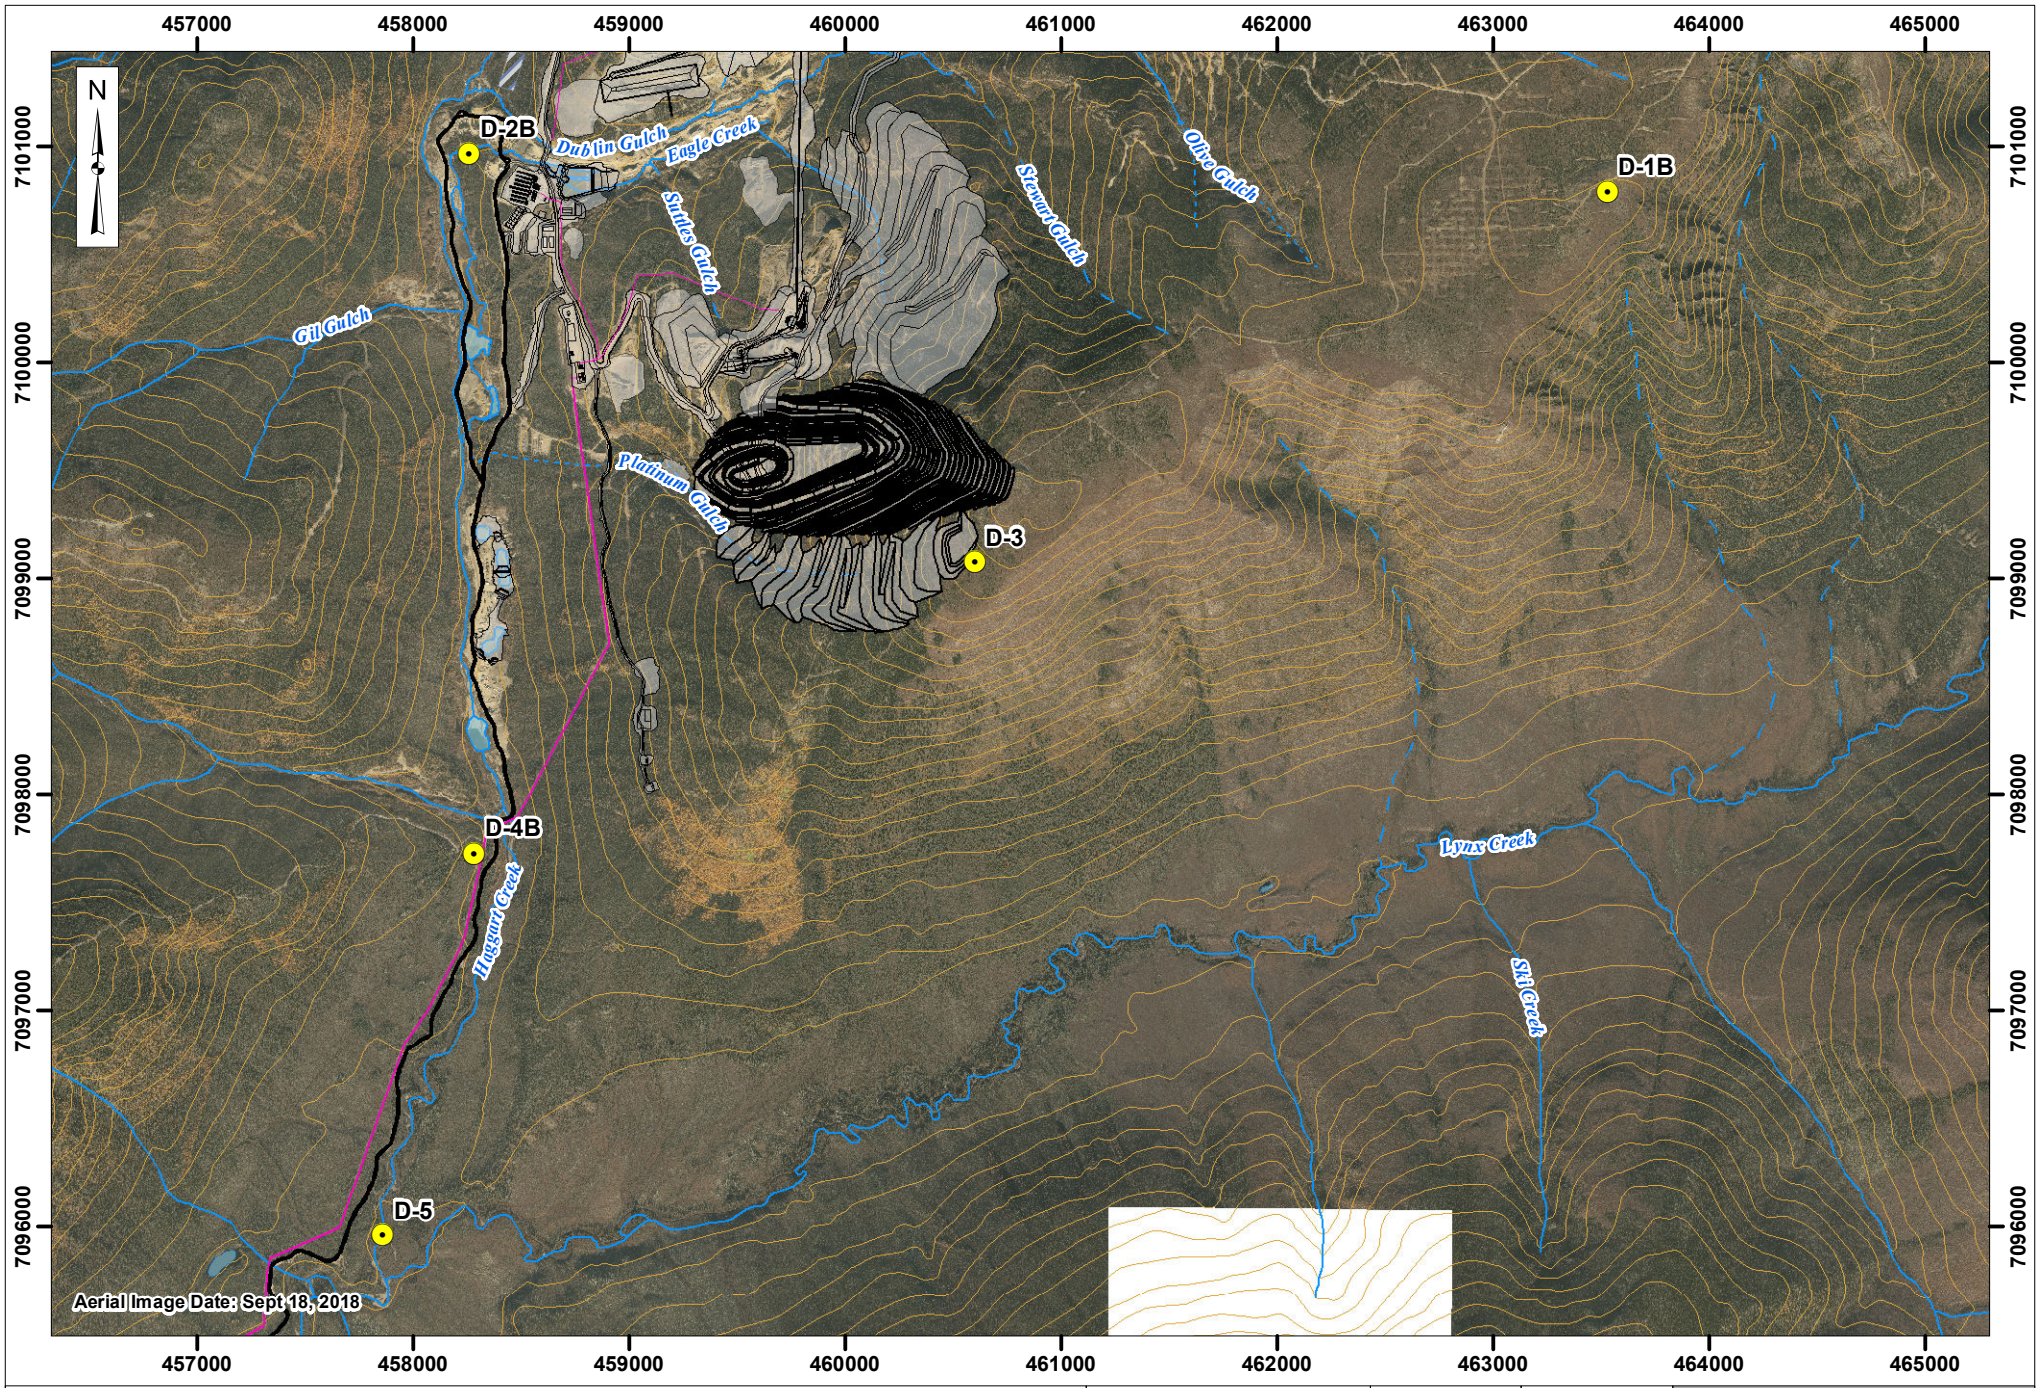
The vegetation monitoring program has been designed to evaluate changes to vegetation during the life of the Eagle Gold Project. Specifically, metal burden in and on plant tissues is measured annually during the growing season of each year to help identify whether any trends may be attributed to the Project. The 2020 survey is the third year of the program.

The soils monitoring program was designed to provide data to determine changes to metal and nutrient levels in soils adjacent to the mine and to identify whether any changes could be attributable to Project activities.

The Environmental Monitoring, Surveillance and Adaptive Management Plan (EMSAMP), Version 2020-01, identifies four areas located within the Project area for the establishment of permanent vegetation and soil plots. These sites are also the locations of dust fall monitoring installations.

An additional dust fall station was established during 2020 as contemplated in the Air Quality Monitoring Plan (dated August 2019). A vegetation plot was also established at this site during 2020.

2.0 METHODS



The original four sites were established in each of the identified quadrants with initial assessments and collections completed in early August 2018 (Laberge, 2018a). Two of these original sites (D-1 and D-3) were assessed and sampled again on July 11, 2019. Due to construction requirements, alternate sites for D-2 (approximately 70 m from original site) and D-4 (approximately 300 m south of the original site) were established and sampled as D-2B on July 10, 2019 and D-4B on July 12, 2019.

During late spring of 2020 part of site D-1 was impacted by a snowplow as it was clearing site roads. This site was re-located 40 m south of the original site and assessed and renamed D-1B. A new site (D-5) was established in 2020 by the dust fall station that had been launched near the confluence of Haggart Creek and Lynx Creek. In early August 2020, sites D-1B, D-2B, D-3, D-4B and D-5 were assessed.

Descriptions and locations are detailed in Table 1 and displayed on Figure 1. The coordinates of each site represent the centre point for that site. Four corner points were then established in cardinal directions 10 metres from the centre. The plot layout is represented in Figure 2. For each plot the five points were identified with fluorescent painted half-inch diameter rebar, 50 cm long.

TABLE 1 LOCATION AND DESCRIPTION OF VEGETATION AND SOIL SITES

Site #	NAD 83 Zone 8W		Aspect	Elevation (m)	Site Description
	Easting	Northing			
D-1B	463530	7100794	level	1437	Potato Hills near climate station, 40 m south of the original site D-1.
D-2B	458256	7100972	west	791	Upslope of the air quality station and the camp climate station, south side of Eagle Cr. Within influence.
D-3	460598	7099079	south west	1356	Top of Eagle Pup near the over-the-top road. Within influence.
D-4B	458279	7097731	east	751	On the west side of the access road south of the Haggart Cr culverts and the power line, downwind of influence.
D-5	457857	7095962	level	720	Near surface water quality site W5, Haggart Creek upstream of Lynx Creek, downwind of influence.

2.1 Vegetation Assessments

At each site, circle plots of one-meter radius, were flagged around each of the rebars that were located at the centre, north, south, east and west points. The EMSAMP states that foliar samples of willow (*Salix* spp.), sedge (*Carex* spp.), bluejoint (*Calamagrostis canadensis*) and northern rough fescue (*Festuca alpaca*) are to be collected within these five two-meter diameter plots. As each of these five vegetation sites are located in different ecosystem units, not all species were present at each site and substitutions were made where applicable. Duplicates were not collected during this field sampling program. Duplicate collection of selected vegetation samples is attempted for the purpose of QA/QC of laboratory analytical techniques if sufficient vegetation is available.

New disposable nitrile gloves were worn for each collection and tissues were placed in new resealable plastic bags. Where possible, separate samples were collected for willow leaves and the current season's growth of twigs. Due to their presence at most of the plots, and the fact they also have reasonable surface area for dust deposits, dwarf birch (*Betula glandulosa*) leaves were also sampled. As in previous years (except for the original location of D-4 in 2018) sedge and bluejoint were not present in collectable quantities at any of the sites. Fescue biomass was sufficient for collection at D-1B only. Other species were substituted that were present at the plots. Table 2 lists the foliar samples that were collected and analyzed per plot.

A total of 58 foliar samples were collected and kept cool until delivered to the ALS depot in Whitehorse, Yukon. After they were logged in, the samples were frozen and shipped to the ALS laboratory in Burnaby, BC for analysis. Analysis was performed on unrinsed tissues as in the past

surveys, and thus data includes dust deposition as well as metal uptake from the soil.

The foliar samples were homogenized and sub-sampled prior to hot-block digestion with nitric and hydrochloric acids, in combination with the addition of hydrogen peroxide. Metals were analyzed using collision cell inductively coupled plasma-mass spectrometry. Analysis for mercury was done by atomic fluorescence or atomic absorption spectrophotometry.

2.2 Soil Characterization

Soil samples were collected as per the protocols detailed in the EMSAMP (2020-01). Specifically, one soil sample was collected from each site, 2.5 m in from the east plot as indicated by "Year 3" on Figure 2. Samples were collected with a stainless steel trowel from a depth of 0 to 0.5 m below the litter layer. Samples were transferred into clean glass jars for metal analysis. New nitrile gloves were worn prior to sampling to prevent cross-contamination between sites. Samples were kept cool until delivered to the ALS lab/depot in Whitehorse, Yukon. Samples were analyzed for pH, metals, texture, and available nitrite, nitrate, phosphate and potassium.

3.0 RESULTS

3.1 Description of the Vegetation Sites

The five 200 m^2 established sites lie within two ecological zones; the Subalpine Zone where the elevation is greater than 1225 masl and the Forested Zone which includes the treed areas on the mountain slopes and the valley bottoms (Stantec, 2011b). D-1B and D-3 are located in the Subalpine Zone and D-2B, D-4B and D-5 are in the Forested Zone. Selected photographs of the sites are presented in Appendix A.

D-1
D-1B was re-established to approximately 40 meters west of the Potato Hills Climate station upgradient of significant Project infrastructure. Stantec (2011b) conducted ecosystem mapping throughout the Eagle Gold Project area in 2009. The polygon that contains D-1B is classified as 50% Dwarf Birch and Lichen, 40% Dwarf Birch and Northern Rough Fescue and 10% Subalpine Fir, Dwarf Birch, Crowberry and Lichens (Stantec, 2011b, Appendix 11, Part 1).

Within the boundary of D-1B, as observed in 2019, dwarf birch was the dominant species followed by willow. Tree species were solitary sporadic subalpine fir. There was exposed rock and talus throughout the site with the majority encrusted with lichen. A diversity of forbs was noted. The following plants were identified within D-1B:

Common Name	Scientific Name
Subalpine Fir	*Abies lasiocarpa*
White Spruce	*Picea glauca*
Dwarf Birch	*Betula glandulosa*
Willow	*Salix* sp.
Diamond Leaf Willow	*Salix pulcha*
Willow	*Salix richardsonii*
Northern Labrador Tea	*Rhododendron tomentosum*
Low Bush Cranberry	*Vaccinium vitis-idaea*
Blueberry	*Vaccinium uliginosum*
Arctic White Heather	*Cassiope tetragona*

Common Name	Scientific Name
Crowberry	*Empetrum nigrum*
Colt's Foot	*Petasites frigidus* var. *sagittatus*
Lupine	*Lupinus arcticus*
Mountain Sagewort	*Artemisia norvegica*
Anemone	*Anemone narcissiflora*
Richardson's Anemone	*Anemone richardsonii*
Labrador lousewort	*Pedicularis labradorica*
Spike Trisetum	*Trisetum spicatum*
Altai fescue	*Festuca altaica*
Heron bill moss	*Dicranum sp. – D. acutifolium?*
Red-stemmed feather moss	*Pleurozium schreberi*
Haircap moss	*Polytrichum sp.*
Arctic butterfingers lichen	*Dactylina arctica*
Star reindeer lichen	*Cladina stellaris*
Grey reindeer lichen	*Cladina rangiferina*
Club lichen	*Cladonia* spp.
Arctic kidney lichen	*Nephroma arcticum*
Alpine foam lichen	*Stereocaulon alpinum*
Rockstripe lichen	*Umbilicaria torrefacta*
Green crusticose lichen	*Aspicilia caesiocinerea*
Common freckle pelt lichen	*Peltigera aphthosa*
Caribou horn tumbleweed lichen	*Masonhalea richardsonii*

D-2B

D-2B is located east of the camp weather station on the south side of Eagle Creek, approximately 70 m south of the original D-2. Stantec (2011b) classified the polygon where D-2B is located as 80% Black spruce, Labrador Tea and Feathermoss and 20% Subalpine Fir, Crowberry and Lichen.

Tree species found within the boundary of site D-2B consisted of white spruce, trembling aspen, balsam poplar and paper birch, which is consistent with the D-2 site located approximately 70 m north that was sampled in 2018. Willows were the dominant shrub species. Equisetum (horsetail) and grasses were the dominant ground cover. Forbs and other shrubs were also present. Moose scat was observed throughout the plot.

The following plants were identified at D-2B:

Common Name	Scientific Name
Balsam poplar	*Populus balsamifera*
Trembling aspen	*Populus tremuloides*
White spruce	*Picea glauca*
Alaska paper birch	*Betula neoalaskana*
Green alder	*Alnus viridis* subsp. *crispa*
Kinnikinnick	*Arctostaphylos uva-ursi*
Black crowberry	*Empetrum nigrum*
Diamond Leaf Willow	*Salix pulchra*
Scouler's Willow	*Salix scouleriana*
Felt-leaf willow	*Salix alaxensis*
Little-tree willow	*Salix arbusculoides*

Common Name	Scientific Name
Grey-leaved willow	*Salix glauca*
Blueberry willow	*Salix myrtillifolia*
Dwarf Birch	*Betula glandulosa*
Labrador Tea	*Rhododendron groenlandicum*
Low Bush Cranberry	*Vaccinium vitis-idaea*
Bog blueberry	*Vaccinium uliginosum*
Prickly rose	*Rosa acicularis*
Soapberry	*Shepherdia canadensis*
Alpine milk-vetch	*Astragalus alpinus*
Fireweed	*Chamerion angustifolium*
Alpine sweet-vetch	*Hedysarum alpinum*
Arctic sweet coltsfoot	*Petasites frigidus*
Wintergreen	*Pyrola sp.*
Grass-of-Parnassus	*Parnassia palustris*
Northern green bog orchid	*Habenaria hyperborea*
Small tofieldia	*Tofieldia pulsilla*
Hedysarum	*Hedysarum alpina*
Common horsetail	*Equisetum arvense*
Dwarf scouring-rush	*Equisetum scirpoides*
Small sedge	*Carex* sp.
Altai fescue	*Festuca altaica*
Fire moss	*Ceratadon purpureus*
Step moss	*Hylocomium splendens*
Red-stemmed feather moss	*Pleurozium schreberi*
Star reindeer lichen	*Cladina stellaris*
Grey reindeer lichen	*Cladina rangiferina*
Club lichen	*Cladonia* spp.
Crinkled snow lichen	*Flavocetraria nivalis*
Common freckle pelt lichen	*Peltigera apthosa*
Alpine foam lichen	*Stereocaulon alpinum*

D-3

D-3 is located in a subalpine setting above Platinum Gulch. The site itself has not been disturbed however the waste rock dump has encroached closer to the site. The ecosystem classification in the polygon where D-3 is situated is 50% Dwarf Birch and Northern Rough Fescue, 40% Dwarf birch and Lichen, and 10% Subalpine Fir, Dwarf Birch, Crowberry and lichens (Stantec, 2011b).

As observed in 2018 and 2019, within the boundaries of D-3 dwarf birch was the dominant species with scattered subalpine fir and white spruce. Willows, berry bushes, lichens and moss were also present.

The following plants were identified at D-3:

Common Name	Scientific Name
Subalpine Fir	*Abies lasiocarpa*
White Spruce	*Picea glauca*
Grey-leaved Willow	*Salix glauca*
Diamond Leaf Willow	*Salix pulchra*

Common Name	Scientific Name
Dwarf Birch	*Betula glandulosa*
Low Bush Cranberry	*Vaccinium vitis-idaea*
Blueberry	*Vaccinium uliginosum*
Crowberry	*Empetrum nigrum*
Labrador tea	*Rhododendron groelandicum*
Labrador Lousewort	*Pedicularis labradorica*
Anemone	*Anemone narcissiflora*
Mountain sagewort	*Artemisia norvegica*
Caespitose fleabane	*Erigeron caespitosus*
Labrador lousewort	*Pedicularis labradorica*
Altai fescue	*Festuca altaica*
Alpine bluegrass	*Poa alpina*
Woodrush	*Luzula parviflora*
Glow moss	*Aulacomnium palustre*
Broom moss	*Dicranum* sp. *– D. acutifolium?*
Haircap moss	*Polytricum* sp.
Red-stemmed feather moss	*Pleurozium schreberi*
True Iceland lichen	*Cetraria islandica*
Club lichens	*Cladonia* spp.
Crinkled snow lichen	*Flavocetraria nivalis*
Arctic kidney lichen	*Nephroma arcticum*
Star reindeer lichen	*Cladina stellaris*
Caribou horn	*Masonhalea richardsonii*
Common freckle pelt lichen	*Peltigera aphthosa*

D-4B

D-4B is located in the Forested Zone downstream of the Haggart Creek culverts on the west side of the road just past the power line in an undisturbed area of the natural forest. The ecosystem classification in the polygon in which D-4B is situated is 60% subalpine fir, crowberry and lichens, 30% black spruce, Labrador tea and feathermoss and 10% Alaska paper birch, white spruce and willow (Stantec 2011b). This is somewhat different to the classification of D-4, sampled in 2018, which was located in the Haggart Creek floodplain, and classified as river/creek system with gravel bars and 20% as an ecosystem type of White Spruce and Horsetail.

Alaska paper birch, white spruce, black spruce and trembling aspen were the tree species identified within the boundaries of plot D-4B. Many species of shrubs dominated the site notably willows and dwarf birch. Moss and lichens were common. Berries were prolific on the bog blueberry, cranberry, crowberry and bearberry shrubs.

The following plants were identified at D-4B:

Common Name	Scientific Name
Alaska paper birch	*Betula neoalaskana*
White spruce	*Picea glauca*
Black spruce	*Picea mariana*
Trembling aspen	*Populus tremuloides*
Green alder	*Alnus viridis* subsp. *crispa*
Red bearberry	*Arctos rubra*

Common Name	Scientific Name
Glandular scrub birch	*Betula glandulosa*
Water birch	*Betula occidentalis*
Shrubby cinquefoil	*Dasiphora fruticosa*
Black crowberry	*Empetrum nigrum*
Labrador tea	*Rhododendron groenlandicum*
Prickly rose	*Rosa acicularis*
Arctic willow	*Salix arctica*
Barclay's willow	*Salix barclayi*
Bebb's willow	*Salix bebbiana*
Grey-leaved willow	*Salix glauca*
Blueberry willow	*Salix myrtillifolia*
Diamond leaved willow	*Salix pulchra*
Small cranberry	*Vaccinium oxycoccos*
Bog blueberry	*Vaccinium uliginosum*
Lowbush cranberry	*Vaccinium vitis-idaea*
Twinflower	*Linnaea borealis*
Arctic lupine	*Lupinus arcticus*
Tall bluebells	*Mertensia paniculata*
Labrador lousewort	*Pedicularis labradorica*
Arctic sweet coltsfoot	*Petasites frigidus*
Hooded ladies' tresses	*Spiranthes romanzoffiana*
Small tofieldia	*Tofieldia pulsilla*
Common horsetail	*Equisetum arvense*
Dwarf scouring rush	*Equisetum scirpoides*
Woodland horsetail	*Equisetum sylvaticum*
Bristly club-moss	*Lycopodium annotinum*
Polar grass	*Arctagrostis latifolia*
Bigelow sedge	*Carex consimilis*
Glow moss	*Aulacomnium palustre*
Bryum family moss	*Bryacease* sp. – *Pohlia nutans?*
Broom mosses	*Dicranum* spp.
Red-stemmed feather moss	*Pleurozium schreberi*
Haircap moss	*Polytricum* sp.
Narrow-leaved peat moss	*Sphagnum angustifolium?*
Warnstorf's peat moss	*Sphagnum warnstorfii?*
Golden fuzzy fen moss	*Tomenthypnum nitens*
True Iceland lichen	*Cetraria islandica*
Grey reindeer lichen	*Cladina rangiferina*
Star reindeer lichen	*Cladina stellaris*
Club lichens	*Cladonia* spp.
Crinkled snow lichen	*Flavocetraria nivalis*
Candy lichen	*Icmadophila ericetorum*
Reindeer tumbleweed lichen	*Masonhalea richardsonii*
Arctic kidney lichen	*Nephroma arcticum*
Common freckle pelt lichen	*Peltigera apthosa*
Undulating pelt lichen	*Peltigera neopolydactyla*

D-5

D-5 is located in the Forested Zone near Haggart Creek and water quality station W-5. According to Stantec's ecosystem mapping (2011) site D-5 lies in the 100% White Spruce Horsetail unit within the active floodplain. D-5 was set up so that one of the plots was located in the riparian zone. Balsam poplar saplings were common. Shrubs and forbs were common in the forested section and horsetail was the dominant ground cover.

The following plants were identified at D-5:

Common Name	Scientific Name
White spruce	*Picea glauca*
Balsam poplar	*Populus balsamifera*
River alder	*Alnus incanna*
Grey-leafed willow	*Salix glauca*
Shrubby cinquefoil	*Potentilla fruticosa*
Soapberry	*Shepherdia canadensis*
Kinnikinnick	*Arctostaphylos uva-ursi*
Crowberry	*Empetrum nigrum*
Blueberry	*Vaccinium uliginosum*
Hedysarum	*Hedysarum alpinum*
Pussytoes	*Antennaria microphylla*
Fireweed	*Chamerion angustifolium*
Jacob's ladder	*Polemonium pulcherrimum*
Bearberry	*Arctos rubra*
Bastard toad-flax	*Geocaulon lividum*
Green kidney lichen	*Nephroma arcticum*
Common freckle pelt lichen	*Peltigera aphthosa*
Tree lichen	*Parmelia sulcata*
Common horsetail	*Equisetum arvense*
Feather moss	*Pleurozium schreberi*
Numerous species of mushrooms	

It should be noted that no invasive plant species were identified at any of the plots nor on route to the plots during the 2020 survey.

3.2 2020 Metals Data in Vegetation

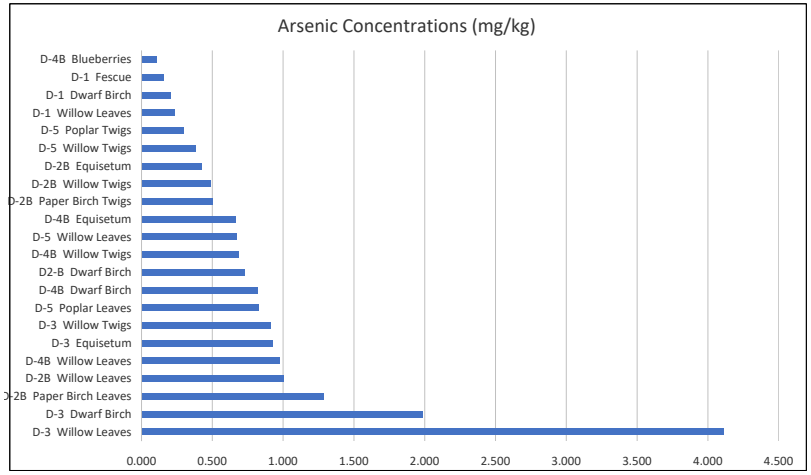
Foliar samples were collected from each site and where possible from each of the five plots at each site (Table 2). Willows were collected from all of the sites and most of the individual plots, followed by dwarf birch. The majority of the willows were *Salix pulchra*, diamond leaf willow, and this species was present at all of the sites. There was insufficient biomass for the collection of fescue (*Festuca altaica*) except at site D-1B where the grass sample was gathered throughout the site. With the addition of site D-5 an additional species was collected for foliar analysis, balsam poplar. Since it was such a good berry year, a sample of blueberries was collected at D-4B for analysis.

The analytical tissue reports for monitored vegetation species and plots are presented in Appendix B. Samples were analyzed for a suite of 34 metals including mercury.

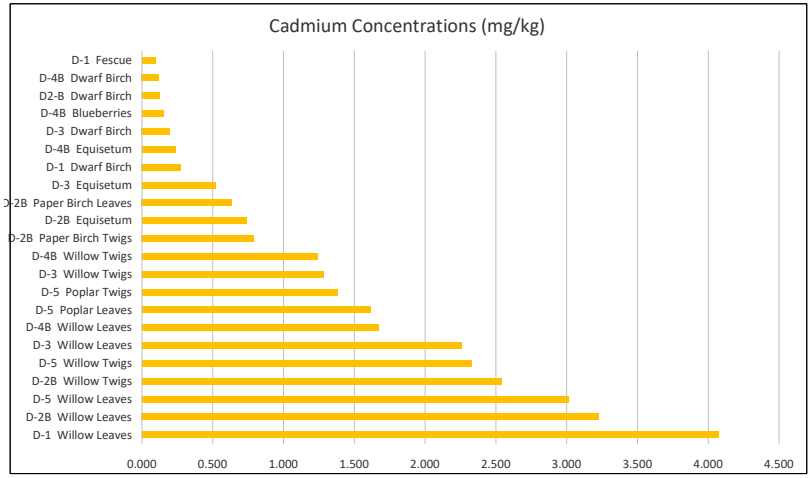
The range of concentrations of each parameter for all vegetation types per site is summarized in Table B-1 (in Appendix B). There are no territorial or federal guidelines regarding metal concentrations in vegetation with respect to wildlife consumption (e.g., moose, caribou and/or bear). For reference, Stantec (2011b) compared the 2009 Eagle Gold foliar data to the dietary tolerances for beef cattle (Puls, 1994). These toxic values have also been included in Table B-1. For the majority of the metals compared against these same dietary tolerances, concentrations in the 2020 foliar samples were well below these levels. The exception to this was selenium. The toxic threshold for selenium was exceeded in one Equisetum tissue sample (29.2 mg/kg) collected from the north plot of D-2B, however all other selenium samples within D-2B were well below the selenium guideline. This reflects the 2019 data where a concentration of 26.7 mg/kg was documented in equisetum tissues at the same plot. Barium does not have a toxic threshold however a concentration of 20 mg/kg was considered high by Puls (1994). This value was exceeded in many of the foliar samples collected from all of the sites in 2018, 2019 and 2020.

Potential emissions related to the gold recovery process include the metals arsenic, cadmium, chromium, mercury and lead (EMSAMP, 2020-01). These metals were averaged per vegetation type for the five collection plots at each site. These data were sorted from lowest concentration to highest and charted on Figure 3 to help assess potential relationships between tissue type and location. Mercury was not charted due to the high number of non-detections and any detected concentrations were very low.

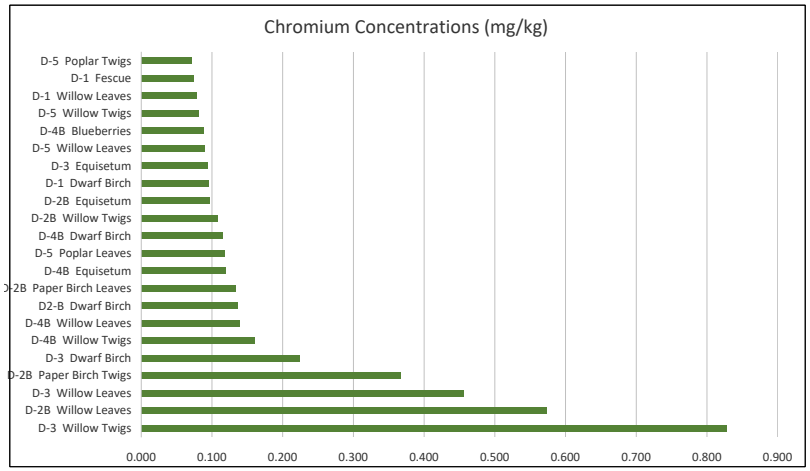
Overall, blueberries collected from D-4B had the lowest arsenic levels (0.106 mg/kg), followed by all tissue types collected from D-1. The greatest average concentration of arsenic was documented in willow leaves (n=4) collected from D-3. The single highest concentration of arsenic, 7.18 mg/kg, was found in the willow leaves sampled from the centre plot at D-3 (Appendix B). Although there is not a toxic threshold for arsenic, the value given in Table B-1 indicates a normal or adequate concentration; all concentrations were less than this.



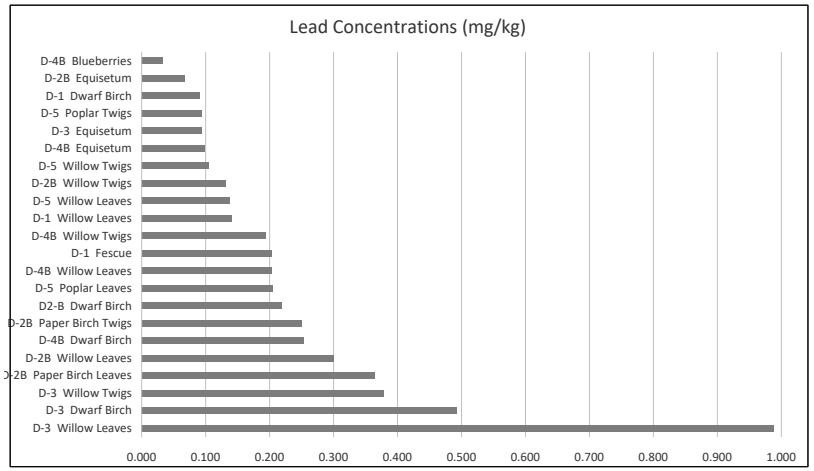
Cadmium concentrations were very low in the fescue and dwarf birch tissues unrelated to the site they were collected from and were similar to values reported in 2018 and 2019. The highest average concentrations of cadmium were documented in the willow leaves collected from D-1, then followed by willow leaves from D-2B, which had the highest concentration in 2019. Willow leaves and twigs from the other sites also had higher levels than were documented in 2019. However, these values are consistent with the findings from 2018 and are very low and well below the referenced toxic level (Table B-1).



Chromium concentrations were low at most of the sites and in most of the tissues. The highest concentration was documented in the willow twigs (n=1) at D-3 with a value of 0.828 mg/kg. Levels were also quite high in the willow leaves from D-2B and D-3 and in the paper birch twigs compared to the other tissue types. However all concentrations were well below the toxicity threshold.



Lead levels were low in the blueberry and Equisetum tissues. The highest concentration was reported in the willow leaves at D-3 (n=4) with an average of 0.989 mg/kg, an almost tripling of the concentration in 2019. This concentration is well below the toxicity threshold of 100 mg/kg.



Mercury levels were very low in the tissues at all of the sites (no exceedances) and were not detected in any of the willow or paper birch twigs or in the fescue tissues.

FIGURE 3 **GRAPHICAL REPRESENTATION OF METALS IN VEGETATION TISSUES, 2020**

3.3 Previous Vegetation Data

Foliar samples for tissue analysis have been collected in 2018, 2019 and 2020. The selected metal concentrations in the tissue samples have been tabulated per site, per year, per tissue type, in Table B-2 in Appendix B. Foliar samples have been collected for three years, however not all sites have been in consistent locations. Site D-3 is the only site where vegetation tissue samples have been collected every year. Data from all three years for site D-1B have also been included since the location was only shifted by approximately 40 m in 2020 and therefore should be relatively representative of conditions. Site D-5 has only one set of data and has not been included below or in Table B-2. General observations of the data with some discussion are listed below:

- Arsenic, cadmium and lead concentrations were higher in 2020 in all tissue types at D-1. This site was moved slightly in 2020 which may attribute to the increase.

- Site D-2B has only 2 sets of data as it was relocated in 2019. Concentrations are fairly similar between the two years with some minor fluctuations.

- Three consecutive years of data exist for D-3. There has been an increase each year of all of the selected metals in the willow leaves. Average concentrations of arsenic, chromium, lead and mercury in the dwarf birch tissue leaves have increased over time. Arsenic, lead and notably chromium have increased in the willow twigs over the course of the three years. The Platinum Gulch waste rock storage area (WRSA) has encroached closer to D-3 during the time period. It is likely that dust generated from the off loading of waste rock to the storage area has possible lead to the increase in tissue concentrations. The summer season's dust fall data on metal concentrations don't support this (unpublished data), however an analysis of the data over the monitoring period has not been done for this report. The 2020 precipitation data from the Potato Hills Climate station shows that 103.0 mm and 9.2 mm of rain fell during the month of July and the first days of August prior to sampling, respectively, and may have created a rinsing effect of the foliage. Conversely, during rainy periods, the stomatal openings and cuticles expansion favour high level of metal leaf penetration from atmospheric deposition (Shahida, 2017). No dust accumulations were observed on the vegetation during the collection process. Little is known about heavy metal uptake by plant leaves from the atmosphere however studies have shown that non-essential metals such as lead, cadmium, chromium and arsenic can enter plant leaves via foliar transfer (Shahida, 2017). Plants also uptake metals from the soil. The soil data are presented and discussed in Section 3.4.

- Site D-4B has two sets of data due to relocation of the site in 2019. Data were generally similar each year although it appears that chromium concentrations decreased in all tissue types, and lead levels slightly increased in 2020.

3.4 Soil Analyses

Soil samples were collected from all five sites 2.5 m in from the east plot and represent Year 3 (see Figure 2). Note that this is the first year that soil has been collected at Site D-5. Permafrost was encountered at 20 cm beneath the moss layer at D-4B.

The soil samples were analyzed for a range of parameters. The analytical report is presented in Appendix C.

The soil samples were sieved and based on the distribution of grain size less than 2mm, texture was determined (Table 3). The texture of the soil was generally either sandy or silty loam.

TABLE 3 PARTICLE SIZE AND TEXTURE, AUGUST 2020					
Site	**D-1B**	**D-2B**	**D-3**	**D-4B**	**D-5**
% Sand (2.0mm - 0.05mm)	21.92	53.62	44.35	45.87	84.69
% Silt (0.05mm - 0.002mm)	68.51	41.13	48.91	45.7	14.36
% Clay (<0.002mm)	9.57	5.24	6.74	8.43	0.95
Texture Class	Silt Loam	Sandy Loam	Loam /Sandy Loam	Loam	Loamy Sand

Nutrients and available plant nutrients were analyzed and summarized in Table 4. The soil at D-3 D-4B had greater total nitrogen content than the other three sites. Available Nitrate + Nitrite and Nitrite were not detected in any of the samples. Available Phosphate was just over the detection limit at D-1B, D-2B and D-3. Available potassium ranged from 31 mg/kg at D-1B to 134 mg/kg at D-3. Potassium is a primary nutrient used in large quantities by plants. The range of 80 to 250 ppm is where plant growth is optimal (Legg, n.d.). The soil at D-2B and D-3 fell within this range.

TABLE 4 PLANT NUTRIENTS, AUGUST 2020					
Site	**D-1B**	**D-2B**	**D-3**	**D-4B**	**D-5**
Nutrients					
Total Nitrogen %	0.091	0.086	0.188	0.165	0.049
Plant Available Nutrients					
Nitrate + Nitrite (mg/kg)	<1.0	<1.0	<1.0	<1.0	<1.0
Phosphate P (mg/kg)	2.5	2.5	2.7	<2.0	<2.0
Potassium K (mg/kg)	31	104	134	62	34
Nitrite N (mg/kg)	<0.40	<0.40	<0.40	<0.40	<0.40

The soil samples were also analyzed for pH (Table 5) and a suite of 36 metals (Appendix C). The soil at all sites was slightly acidic ranging from a pH of 4.59 at D-3 to 6.6 at D-5. Of the 36 elements analyzed, boron, sulphur and tin were not detected.

The most recent Canadian Council of Ministers of the Environment (CCME) guidelines, which include new guidelines from 2018, and the Yukon Contaminated Sites Regulations for agriculture and parklands were tabulated and compared to the concentrations found in the soils (Table 5).

Arsenic exceeded the recommended guidelines at all of the sites. This is most likely attributed to the naturally high arsenic found in the mineralized zones throughout the region as documented during previous studies (Stantec 2011a). Chromium concentrations at D-3 exceeded the CSR guideline for agriculture but met the other guidelines. All of the recommended guidelines for chromium were exceeded in the soil collected from D-4B. The CSR and CCME agriculture guidelines for molybdenum was exceeded at D-4B. The CCME guideline for nickel was slightly exceeded at D-3 and D-4B. The remaining concentrations at all sites were well below the referenced guidelines.

TABLE 5 RESULTS COMPARED TO CCME AND YUKON AGRICULTURE AND PARKLAND GUIDELINES FOR METALS IN SOILS, 2020

Element	D-1	D-2B	D-3	D-4B	D-5	CCME (mg/kg)		Yukon CSR (mg/kg)	
						Agriculture	Parkland	Agriculture	Parkland
pH	5.28	5.07	4.59	5.71	6.6	--	--	--	--
Antimony (Sb)	9.57	3.01	5.13	7.41	16.4	20	20	20	20
Arsenic (As)	20.4	95.7	83.5	33.4	92.7	12	12	15	15

Zinc (Zn)	111	52.3	77.6	75	84.1	250	250	150	150

Note: Exceedance of any guideline is shaded in orange

3.5 Previous Soil Data

Soil samples have been collected on two occasions at all sites except for D-5. The results have been tabulated in Table C-1 in Appendix C. Soil samples are to be collected in different locations of the 200 m^2 area of each site throughout the duration of the sample period (25 years) as indicated in Figure 2. Changes in concentrations in the soil may not necessarily reflect effects from Project emissions as the differences could be attributable to localized mineralization at a particular place or other contributing factors. This seems to be the situation at D-4B where the concentrations of many of the parameters are very different between the two years. Several metals had much higher concentrations near the east plot, notably aluminum, antimony, arsenic, chromium, cobalt, iron, lead, lithium, mercury, molybdenum, vanadium and zinc. Conversely, concentrations of calcium, phosphorus, selenium, silver, sodium and strontium were higher near the north plot.

There were anomalies at D-2B as well. The soil near the east plot was acidic (pH 5.07) and near the north plot was alkaline (pH 8.23). Concentrations of arsenic and tungsten were significantly greater near the east plot.

4.0 DISCUSSION

The levels of metals found in the foliar samples collected in 2020 represent the third year of assessment for sites D-1 and D-3, second year for sites D-2B and D-4B and first year for D-5. The data gives a general idea of the metal burden (uptake from soil in tissues as well as through dust deposition) in various species in different ecological zones.

Arsenic is potentially a parameter of concern in the Eagle Gold Project area. The soil samples collected to date indicate high naturally occurring levels of arsenic in the area. Arsenic is associated with the gold bearing anomalies in the district and these initial concentrations reflect the natural mineralization of the Project area. Arsenic soil concentrations exceeded the CCME and CSR guidelines in the samples collected in 2018 (Laberge, 2018), 2019 (Laberge, 2019) and 2020 (Appendix C). However, these relatively high soil concentrations are not overly reflected in the plant tissues. This incongruity may be related to the bioavailability associated with arsenic speciation.

It is a general consensus that arsenic is not essential for plants. The concentration of arsenic in plants is usually less than 1.0 mg/kg (Abbas, 2018). Arsenic concentrations ranged from 0.106 to 7.18 mg/kg in the 58 individual tissue samples analyzed in 2020 with 17 of those having concentrations of 1.0 mg/kg or greater.

The toxicity of arsenic to biota depends upon the speciation with inorganic forms generally thought to be more toxic than organic forms. Arsenate [As(V)] is the dominant form of arsenic in aerobic soils (Meharg et al, 2002). It is similar to the macronutrient phosphate and creates toxicity in plants by competing with phosphate. Processes within the plant convert arsenate to the more toxic arsenite [As(III)]. Trivalent arsenic (arsenite) is 5 to 10 times more toxic than pentavalent arsenic (arsenate). Elemental arsenic is non-toxic. There was no visible sign of stress in any of the vegetation in the plots. It is not known what species of arsenic are present in the Project's soils or the species present in the plant tissues. Investigations into the speciation of arsenic in plant tissues have shown more than one species present (Meharg et al, 2002). Therefore, the arsenic present in the soil may not be bioavailable to plants or the availability may be limited by the mycelium associated with the vegetation types, which effectively screen out toxins at the root hairs.

VEGETATION TISSUES DATA

- **TABLE B-1**
- **TABLE B-2**
- **ANALYTICAL REPORT, AUGUST 2020**

Table B-1 Range of Detected Metals (mg/kg) in all Tissue Types, 2020

Parameter	LDL	units	D-1B (n=10)	D-2B (n=13)	D-3 (n=10)	D-4B (n=13)	D-5 (n=12)	Toxic
Moisture Content	0.5	%	58.9 to 64.1	43.8 to 76.6	55.4 to 67.6	54.1 to 85.3	46.9 to 77.7	
Aluminum (Al)	2	mg/kg	12 to 56.7	14 to 66.4	102 to 452	7.9 to 61.8	11.4 to 50.3	>1200
Antimony (Sb)	0.01	mg/kg	0.014 to 0.087	0.012 to 0.105	0.084 to 0.38	0.019 to 0.108	0.017 to 0.101	
Arsenic (As)	0.02	mg/kg	0.155 to 0.274	0.307 to 1.29	0.915 to 7.18	0.106 to 1.16	0.282 to 1.29	>10*
Barium (Ba)	0.05	mg/kg	22.4 to 73	28.8 to 143	25 to 200	9.59 to 69.6	7.84 to 42.9	>20**
Beryllium (Be)	0.01	mg/kg	0.015 to 0.035	not detected	0.011 to 0.041	not detected	not detected	
Bismuth (Bi)	0.01	mg/kg	0.01 to 0.022	not detected to 0.047	0.024 to 0.179	0.011 to 0.072	0.013 to 0.077	
Boron (B)	1	mg/kg	1.8 to 5.7	2.2 to 20.3	1.4 to 6	2.5 to 13.6	6 to 19.4	>200
Cadmium (Cd)	0.005	mg/kg	0.0948 to 8.16	0.125 to 4.75	0.155 to 3.04	0.0452 to 3.82	0.386 to 5.05	50 - 500
Calcium (Ca)	20	mg/kg	2570 to 11900	3770 to 28300	3910 to 14500	1540 to 18700	4700 to 21000	
Cesium (Cs)	0.005	mg/kg	0.0107 to 0.179	0.0107 to 0.0715	0.0576 to 0.266	0.0085 to 0.271	0.0069 to 0.253	
Chromium (Cr)	0.05	mg/kg	0.053 to 0.157	0.055 to 1.22	0.191 to 0.828	0.084 to 0.217	0.055 to 0.14	>40
Cobalt (Co)	0.02	mg/kg	0.106 to 8.2	0.035 to 2.89	0.529 to 11.2	0.072 to 0.902	0.101 to 1.45	>30
Copper (Cu)	0.1	mg/kg	2.84 to 5.89	3.51 to 7.22	3.24 to 5.94	1.93 to 7.44	2.38 to 6.59	>100
Iron (Fe)	3	mg/kg	46.6 to 92.3	47.6 to 154	113 to 665	20 to 137	34.5 to 126	>4000
Lead (Pb)	0.02	mg/kg	0.06 to 0.203	0.064 to 0.425	0.379 to 1.41	0.033 to 0.338	0.058 to 0.238	>100
Lithium (Li)	0.5	mg/kg	not detected	not detected	not detected to 0.64	not detected	not detected to 1.6	
Magnesium (Mg)	2	mg/kg	878 to 2980	778 to 7100	1380 to 3950	648 to 4870	936 to 5680	
Manganese (Mn)	0.05	mg/kg	1260 to 3510	23.1 to 1630	303 to 2440	29.2 to 1170	28.4 to 517	2000 - 4000
Mercury (Hg)	0.005	mg/kg	0.0058 to 0.0073	0.0053 to 0.0076	not detected to 0.0109	not detected to 0.0072	not detected to 0.0074	
Molybdenum (Mo)	0.02	mg/kg	0.023 to 0.186	0.022 to 1.28	0.042 to 0.407	0.025 to 0.352	0.037 to 0.395	10 - 20
Nickel (Ni)	0.2	mg/kg	0.91 to 10.3	0.77 to 7.63	4.69 to 16.9	0.39 to 4.07	0.45 to 5.98	>1500
Phosphorus (P)	10	mg/kg	1710 to 3310	1070 to 3030	1810 to 4940	901 to 3440	803 to 3640	
Potassium (K)	20	mg/kg	6750 to 17400	3310 to 33000	4800 to 14500	5230 to 22200	3720 to 55100	
Rubidium (Rb)	0.05	mg/kg	5.38 to 43.5	1.07 to 26.1	6.62 to 25.6	2.09 to 37.9	3.36 to 79.7	
Selenium (Se)	0.05	mg/kg	not detected to 0.05	0.083 to 29.2	not detected to 0.095	not detected to 0.236	not detected to 0.082	5 - 20
Sodium (Na)	20	mg/kg	not detected	22 to 30	not detected to 49	not detected to 26	not detected to 72	
Strontium (Sr)	0.05	mg/kg	10.2 to 68.8	18.3 to 88.9	9.71 to 130	5.1 to 67.2	23.5 to 94.8	>2000
Tellurium (Te)	0.02	mg/kg	not detected	not detected	not detected	not detected	0 to 0	
Thallium (Tl)	0.002	mg/kg	0.002 to 0.0024	not detected to 0.007	not detected	0.0033 to 0.0091	0.0021 to 0.0138	
Tin (Sn)	0.1	mg/kg	not detected	0.39 to 0.39	not detected	not detected	not detected	
Uranium (U)	0.002	mg/kg	0.0022 to 0.0031	0.0023 to 0.0098	0.0076 to 0.045	0.0028 to 0.0133	0.0021 to 0.0188	
Vanadium (V)	0.1	mg/kg	not detected	not detected to 0.1	0.1 to 0.77	not detected to 0.11	not detected to 0.1	
Zinc (Zn)	0.5	mg/kg	26.6 to 242	26.1 to 150	86.7 to 171	20 to 259	43.2 to 327	>5000
Zirconium (Zr)	0.2	mg/kg	not detected	not detected	not detected	not detected	not detected	

* There is no actual toxic value, only what is considered normal or adequate in the referenced table. Toxicity of As depends on its form.

** There is no actual toxic value, only what is considered high in the referenced table.

CERTIFICATE OF ANALYSIS

Work Order	: **WR2000652**	Page	: 1 of 28
Client	: **Victoria Gold (Yukon) Corp.**	Laboratory	: Whitehorse - Environmental
Contact	: Bill Bowden	Account Manager	: Hilary Woods
Address	: Suite 1000 - 1050 W. Pender St Vancouver BC Canada V6E 3S7	Address	: #12 151 Industrial Road Whitehorse YT Canada Y1A 2V3
Telephone	: 867.456.7700 ext. 6381	Telephone	: +1 867 668 6689
Project	: Eagle Gold	Date Samples Received	: 10-Aug-2020 14:07
PO	: 16965	Date Analysis Commenced	: 14-Aug-2020
C-O-C number	: 1 of 5	Issue Date	: 28-Sep-2020 08:36
Sampler	: Bonnie Burns & Crystal Beaudry		
Site	: Victoria Gold Corp.		
Quote number	: Q68199		
No. of samples received	: 63		
No. of samples analysed	: 63		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Angela Ren	Team Leader - Metals	Metals, Burnaby, British Columbia
Dwayne Bennett	Technical Specialist	Metals, Saskatoon, Saskatchewan
Evan Ben-Oliel	Metal Analyst	Metals, Burnaby, British Columbia
Hedy Lai	Team Leader - Inorganics	Inorganics, Saskatoon, Saskatchewan
Kinny Wu	Lab Analyst	Metals, Burnaby, British Columbia
Melissa Shaw	Team Leader - Inorganics	Inorganics, Saskatoon, Saskatchewan
Nancy Cruse	Laboratory _ Supervisor	Inorganics, Saskatoon, Saskatchewan
Rebecca Merilees	Team Leader - Soil Preparation	Inorganics, Saskatoon, Saskatchewan
Robin Weeks	Team Leader - Metals	Metals, Burnaby, British Columbia
Xihua Yao	Laboratory Analyst	Inorganics, Saskatoon, Saskatchewan

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
%	percent
mg/kg	milligrams per kilogram
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in reports identified as "Preliminary Report" are considered authorized for use.

Workorder Comments

RRR: Due to RM failure, Thallium LOR has been raised within 5 LOR.

Qualifiers

Qualifier	*Description*
DLIS	*Detection Limit Adjusted due to insufficient sample.*
RRR	*Refer to report remarks for issues regarding this analysis.*

ALS Environmental

CERTIFICATE OF ANALYSIS

Work Order	: **WR2000652**	Page	: 1 of 28
Client	: **Victoria Gold (Yukon) Corp.**	Laboratory	: Whitehorse - Environmental
Contact	: Bill Bowden	Account Manager	: Hilary Woods
Address	: Suite 1000 - 1050 W. Pender St Vancouver BC Canada V6E 3S7	Address	: #12 151 Industrial Road Whitehorse YT Canada Y1A 2V3
Telephone	: 867.456.7700 ext. 6381	Telephone	: +1 867 668 6689
Project	: Eagle Gold	Date Samples Received	: 10-Aug-2020 14:07
PO	: 16965	Date Analysis Commenced	: 14-Aug-2020
C-O-C number	: 1 of 5	Issue Date	: 28-Sep-2020 08:36
Sampler	: Bonnie Burns & Crystal Beaudry		
Site	: Victoria Gold Corp.		
Quote number	: Q68199		
No. of samples received	: 63		
No. of samples analysed	: 63		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Angela Ren	Team Leader - Metals	Metals, Burnaby, British Columbia
Dwayne Bennett	Technical Specialist	Metals, Saskatoon, Saskatchewan
Evan Ben-Oliel	Metal Analyst	Metals, Burnaby, British Columbia
Hedy Lai	Team Leader - Inorganics	Inorganics, Saskatoon, Saskatchewan
Kinny Wu	Lab Analyst	Metals, Burnaby, British Columbia
Melissa Shaw	Team Leader - Inorganics	Inorganics, Saskatoon, Saskatchewan
Nancy Cruse	Laboratory _ Supervisor	Inorganics, Saskatoon, Saskatchewan
Rebecca Merilees	Team Leader - Soil Preparation	Inorganics, Saskatoon, Saskatchewan
Robin Weeks	Team Leader - Metals	Metals, Burnaby, British Columbia
Xihua Yao	Laboratory Analyst	Inorganics, Saskatoon, Saskatchewan

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
%	percent
mg/kg	milligrams per kilogram
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in reports identified as "Preliminary Report" are considered authorized for use.

Workorder Comments

RRR: Due to RM failure, Thallium LOR has been raised within 5 LOR.

Qualifiers

Qualifier	*Description*
DLIS	*Detection Limit Adjusted due to insufficient sample.*
RRR	*Refer to report remarks for issues regarding this analysis.*

Laberge Environmental Services

Re: **SEEDING AND EROSION CONTROL INSTALLATIONS AT SPECIFIC SITES, EAGLE GOLD PROJECT, 2020**

Bonnie Burns and Alex Therriault of Laberge Environmental Services conducted the fall seeding program and installed some bioengineering structures at several sites from Sept 18 to 30, 2020. The purpose of the revegetation program was to prevent and control erosion on the newly exposed slopes created during the construction of several operational structures at the Eagle Gold mining site at the Dublin Gulch property. On-site staff who participated in the seeding programs as their other duties allowed, included Kate Titterington, Faith Ladue, and Muhammad Yasirkhan. Photographs of the activities are provided in Appendix A.

A custom reclamation seed mix was ordered from BrettYoung of Calmar, Alberta. Due to their small size, fowl bluegrass, Rocky Mountain fescue and tufted hairgrass seeds were shipped in bags comprised of 10%, 19% and 41% of the total mix respectively. Slender wheatgrass seeds were shipped in individual bags and applied separately due to their much larger size. The composition of the mix that was applied to the seeded areas is summarized below in Table 1.

TABLE 1 SEED MIX FOR EROSION CONTROL AT EAGLE GOLD PROJECT

Common Name	Scientific Name	Percent Composition
Fowl bluegrass	*Poa palustris*	10
Rocky Mountain Fescue	*Festuca saximontana*	19
Tufted hairgrass	*Deschampsia caespitosa*	41
Slender wheatgrass	*Elymus trachycaulus*	30

Fall Seeding Program

Several steep slopes were identified as requiring seeding this fall. These are identified on Figure 1 and details are presented in Table 2. All areas were seeded at a rate of 30.5 kg/ha of pure live seed. Not all sites displayed on Figure 1 were seeded for a variety of reasons: the ground of the chosen areas was not prepped in time; insufficient small seed; and lack of time and personnel resources.

TABLE 2 AREAS SEEDED IN 2020

Area	Size (ha)	Estimated Slope (%)	Aspect
G	1.13	0 to 20	Mostly west facing with a level area
E	1.31	50	South and east facing
D	0.13	55	West facing
A	2.91	46 to 51	South facing
J	0.87	40	West and north facing

Area G
Area G was the first site prepared by cross-ripping. Seeding conditions were great and the soil was loose and moist. Alex, Faith and Bonnie hand spread 11 kg of the small seed mix and 30.1 kg of wheatgrass.

Area E
Due to the steep slope of Area E it could not be cross-ripped but was tracked and roughened using a bulldozer. Not all of Area E could be prepared due to the extreme steepness at the eastern end, however the complete seed mixture 12.8 kg of small seed and 34.8 kg of wheatgrass was applied by Alex and Kate.

Area D
The same preparation procedure as was used for Area E was used again at Area D due to the steepness of the slope. The small area of D was seeded with 1.3 kg of the small seed mix and 3.5 kg of wheatgrass by Alex and Kate.

Area A
It took several days for the large area of A to be prepared and it was seeded gradually over time

with a total of 28.3 kg of the small seed mix and 77.4 kg of wheatgrass by Alex, Kate and Muhammad.

Area J
Area J was seeded by Kate and Alex with 8.5 kg of the small seed mix and 23.1 kg of wheatgrass.

In total, it took 49 person hours to seed 6.35 ha in 2020. The number of hectares seeded in 2019 and in 2020 totals 11.4 representing the broadcasting of a combined total of 480 kg of seeds.

Soil Characterization

Composite soil samples were collected from each of the areas and submitted to ALS for a variety of analyses. Selected characteristics are summarized in tables below and the complete report is included as Appendix B.

TABLE 3 PHYSICAL AND NUTRIENT CHARACTERISTICS

Parameter	LDL	Units	Area A	Area D	Area E	Area G	Area J
pH (1:2 soil:water)	0.1	pH units	8.13	8.18	7.54	8.17	8.01
Texture class			Coarse	Coarse	Coarse	Coarse	Fine
Available phosphate (as P)	2	mg/kg	<2.0	3.5	3.8	<2.0	<2.0
Available nitrate + nitrite (as N)	1	mg/kg	<1.0	<1.0	<1.0	<1.0	<1.0
Available nitrite (as N)	0.4	mg/kg	<0.40	0.49	<0.40	0.54	0.41
Available nitrate (as N)	2	mg/kg	<2.0	<2.0	<2.0	<2.0	<2.0
Available potassium	20	mg/kg	41	88	75	78	56
Total carbon	0.05	%	0.274	0.142	0.169	0.153	0.397
Inorganic carbon (as CaCO3 equivalent)	0.4	%	0.6	0.45	0.45	0.57	0.8
Inorganic carbon	0.05	%	0.072	0.054	0.054	0.068	0.096
Total organic carbon	0.05	%	0.202	0.088	0.115	0.085	0.301
Organic matter	0.1	%	0.35	0.15	0.2	0.15	0.52

The soil at all areas was near neutral or slightly alkaline with pH ranging from 7.54 to 8.18 (Table 3). All soils were coarse with the exception of fine soils located at Area J. The soil at Areas D and E contained available phosphate but was not detected at the other areas. Except for available nitrite at Areas D and G, there was no nitrogen, documented in any form, in the other soil samples. Available potassium was documented at all areas and ranged from 41 mg/kg to 88 mg/kg. Carbon, organic and inorganic, and organic matter were present at all areas with the greatest concentrations occurring at Area J.

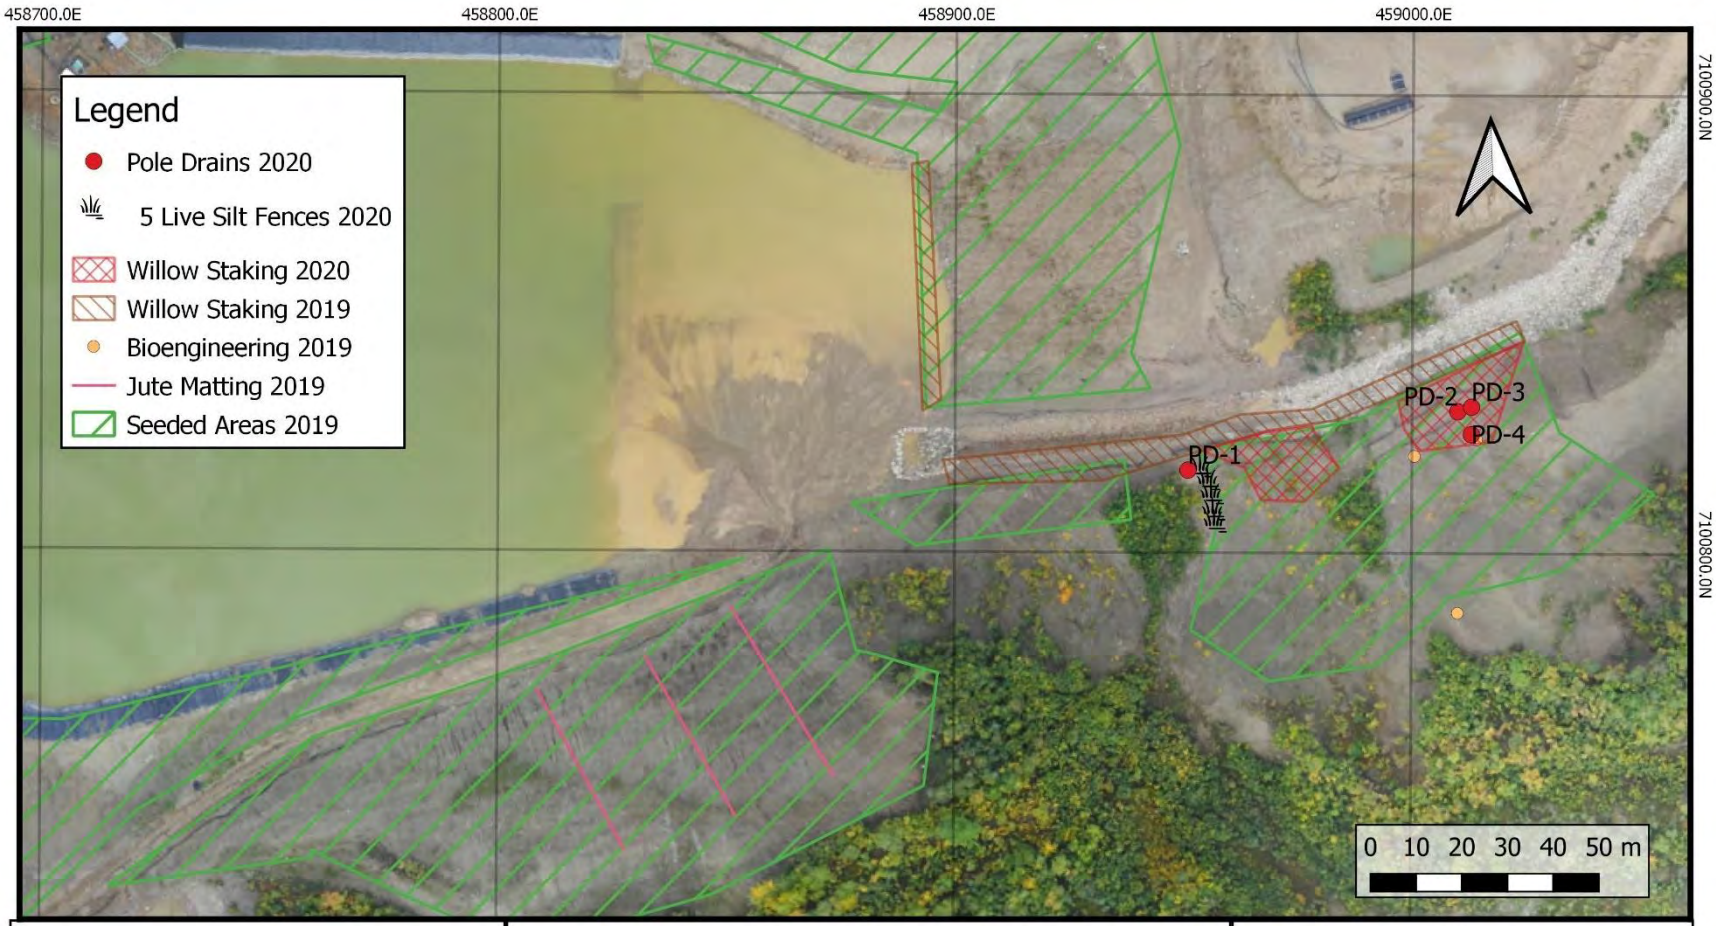
The soil samples were also analyzed for a suite of 35 metals (Appendix B). Of these, boron and tin were not detected in any samples. Concentrations of applicable metals were compared to the most recent Canadian Council of Ministers of the Environment (CCME) guidelines and the Yukon Contaminated Sites Regulations (CSR) for agriculture and parklands (Table 4). Arsenic was the only parameter that exceeded all of these guidelines in all of the samples. Concentrations ranged from 85.4 mg/kg at Area A to 1480 mg/kg at Area D. There were a few other exceedances; antimony at Areas D, E and J, lead at Area E, the CCME guideline for copper and nickel at Area E.

As a measure of quality assurance and quality control (QA/QC) a duplicate composite soil sample was collected from Area A. The relative percent difference (RPD) for all parameters was calculated to determine the representativeness of sample collection and thus the validity of the data (Table B-1, Appendix B). CCME (2016) has suggested that the RPD for soils should be ≤30%. Based on this, the representativeness of antimony, arsenic, mercury and strontium may be questionable. However, the vast majority of RPD for the remaining parameters were well below 30% and would indicate that the soil samples are representative of the locations sampled and that data integrity is intact.

In summary, the characteristics documented in the soil at the five sites appear suitable for revegetation with native species. The high concentrations of arsenic do not appear to be inhibiting growth as evidenced by the healthy forest surrounding the site as well as the healthy growth of grasses on the 2019 seeded areas (Laberge Environmental Services, 2020a). Soil samples were collected from these sites in 2019 and analysis reported high levels of arsenic throughout (Laberge Environmental Services, 2019a). Arsenic is associated with the gold bearing anomalies in the district. Stantec (2011) states in their baseline report that the soil and overburden of the local study area are highly enriched with arsenic and most baseline samples collected have concentrations well above the CCME and Yukon CSR guidelines for Agriculture and Parkland soils. The mean concentration of arsenic in soils (0 – 50 cm depth) was 193 mg/kg, with a range of 2.4 to 880 mg/kg. In overburden, the mean arsenic concentration was 320 mg/kg, ranging from 23.7 to 1350 mg/kg (Stantec 2011).

Although present in the foliar tissues, the vegetation monitoring programs conducted in 2018, 2019 and 2020 indicated that arsenic was not readily taken up by the plants, although concentrations could be quite high in the corresponding soil (Laberge Environmental Services, 2018 a and b, Laberge Environmental Services, 2019b and Laberge Environmental Services, 2020b). It is assumed that arsenic is tightly bound up in the soil and rocks and/or is not in a bioavailable form for plant uptake.

TABLE 4 SELECTED METAL RESULTS COMPARED TO CCME AND YUKON AGRICULTURE AND PARKLAND GUIDELINES FOR SOILS



Parameter	Site-A	Site-D	Site-E	Site-G	Site-J	CCME (mg/kg)		Yukon CSR (mg/kg)	
						Agriculture	Parkland	Agriculture	Parkland
Antimony (Sb)	7.22	**48.9**	**69.4**	17.5	**21.4**	20	20	20	20
Arsenic (As)	**85.4**	**1480**	**1140**	**497**	**204**	12	12	15	15
Barium (Ba)	47.5	112	110	100	113	750	500	750	500
Beryllium (Be)	0.3	0.76	1.05	0.97	0.39	4	4	4	4
Cadmium (Cd)	0.147	0.506	0.901	0.339	0.406	1.4	10	1.5	1.5
Chromium (Cr)	16	18.6	21.9	20.9	17.6	64	64	50	60
Cobalt (Co)	15.4	17.1	21.3	16.9	12.8	40	50	40	50
Copper (Cu)	49.7	50.3	**65.2**	45.1	35.2	63	63	90	90
Lead (Pb)	22	64.5	**153**	51.2	**81.3**	70	140	100	100
Mercury (Hg)	0.0232	0.0869	0.0479	0.0488	0.0541	6.6	6.6	0.6	15
Molybdenum (Mo)	0.43	1.48	1.88	1.75	0.77	5	10	5	10
Nickel (Ni)	28.3	38.1	**50.3**	36.7	29.3	45	45	150	150
Selenium (Se)	<0.20	0.25	0.27	0.24	0.29	1	1	2	1
Silver (Ag)	0.4	1.55	1.92	0.32	1.51	20	20	20	20
Thallium (Tl)	0.109	0.491	0.552	0.412	0.184	1	1	2	--
Tin (Sn)	<2.0	<2.0	<2.0	<2.0	<2.0	5	50	5	50
Uranium	1.04	2.45	2.65	2.48	1.52	23	23		
Vanadium (V)	17.2	22	25.5	25.2	21.1	130	130	200	200
Zinc (Zn)	65.4	122	127	105	99.7	250	250	150	150

Note: Exceedances of the guideline(s) are highlighted in orange.

Bioengineering Program

Willows were harvested from the donor area near W29 on September 20th for additional installations of pole drains and further staking near the Lower Dublin Settling Pond (LDSP) (Figure 2) and at the stream crossings by the conveyor belt (Figure 3), to complement work completed in the fall of 2019. Donor plants from the 2019 harvesting were recovering, and sprouting on the stems was observed (see Photo in Appendix A).

Precipitation was high during the summer season of 2020 resulting in the creation of a few gullies near the silt fences at LDSP. The smaller ones were backfilled and then staked. Pole drains were constructed and placed within the larger gullies and then backfilled. Willow staking was applied throughout in moist areas or where future gullying was anticipated at a density of one to three stakes per square meter. Details of the pole drain installations are tabulated below (Table 5).

Notes:
2019 Seed mix: slender wheatgrass, fowl bluegrass, ticklegrass, tufted hairgrass
Application rate: 18.5 kg/ha (around pond)
30.5 kg/ha (cutbank)

Bioengineering species: feltleaf willow, little tree willow

TABLE 5 POLE DRAIN LOCATIONS, SEPT 2020			
Pole Drain #	NAD 83 Zone 8W		Elevation (m)
	Easting	Northing	
PD-1	458951	7100818	825.1
PD-2	459010	7100831	828.3
PD-3	459013	7100826	829.7
PD-4	459013	7100823	831.4

A large gully, approximately 60 cm deep and 7 m long had formed near the first series of silt fences at the weir pond. Water was still trickling down the slope and through the gully. A series of small live silt fences was installed across this minimal flow to decrease the velocity and also allow sediment to settle out. A large pole drain (PD-1) was constructed and installed in the gully between the two rows of silt fencing.

Three shorter pole drains were installed in a gully that was eroding beside the pole drain installed in 2019 at the far eastern edge of the second series of silt fences. Some erosion was occurring along the "Y" pole drain that was installed in 2019 and this was backfilled. Photographs are presented in Appendix A.

Recommendations for 2021

- Prepare the remaining areas (B, G, H, I, L) and apply the mixed seed and the wheatgrass seed at the 30.5 kg/ha rate in May or June – timing to be determined by weather and spring conditions. If this cannot be accomplished in the spring, conduct a fall seeding program. Fall seeding is preferable as it allows insitu scarification and/or stratification of the seeds over the winter, and moisture is already present in the soil after snowmelt for germination in the following spring.

- Conduct an assessment of all seeded sites (including the 2019 sites) in mid summer (mid July to early August) to identify any areas missed or newly eroded. Include these areas in the fall seeding program.

- Inspect the bioengineered structures and upgrade or repair as necessary in the fall.

- Only use the annual rye grass from late July onwards to ensure that they do not produce seed and thus remain an annual grass.

As an adaptive management approach regarding erosion control at the site, a Trigger and Response Plan (TARP) has been suggested below.

TABLE 6 TRIGGER AND RESPONSE PLAN FOR EROSION CONTROL			
	Yellow Trigger Level	Orange Trigger Level	Red Trigger Level
Trigger	Minor localized gullying on slopes	Significant erosion of slope which could impact water quality in the receiving environment	Imminent failure of an embankment that may release mine waste offsite.
Action	Backfilling, revegetation, bioengineering	Resloping, revegetation and/or armouring	To be determined based on the specific conditions

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
%	percent
mg/kg	milligrams per kilogram
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in reports identified as "Preliminary Report" are considered authorized for use.

EXECUTIVE SUMMARY

Following advanced exploration activities and obtention of regulatory approvals, Victoria Gold (Yukon) Corp.'s Eagle Gold Mine (the Project) is currently in its first year of operation. As part of their operating licence terms and conditions, Victoria Gold is required to conduct annual winter moose surveys within 10 km of the Project footprint.

The primary objective of this study was to document the distribution and abundance of moose during the late-winter season to inform adaptive management strategies for mitigating Project effects on moose. The 2020 survey is the first operation phase survey completed at the Eagle Gold Mine and builds on the construction phase surveys conducted in 2018 and 2019 and on the baseline/pre-construction surveys conducted from 2011 to 2013.

The 2020 aerial survey was conducted in late winter from March 5 to 6, 2020. A total of 10.4 hours of flight time was required to complete the moose survey resulting in a survey intensity of 0.47 min/km^2 which is consistent with standard intensive stratification survey protocols required for adequate coverage. A total of 91 moose were observed during the survey of which 82 were observed within the study area boundary. Most moose were observed as individuals or pairs.

The number of moose observed within the survey area in 2020 was similar to 2018 and 2019; however, the number of moose observed in the study area between 2018 and 2020 was considerably higher than in previous surveys. Potential factors for the variation in moose numbers typically include observer bias and seasonal variability in the regional distribution of moose. The latter can be influenced by annual and regional variations in snow characteristics such as depth and hardness. Variability could also be the result of high wolf activity preceding surveys within or near habitats seasonally important to moose.

Moose distribution varied in each year of the study. In 2018 and 2019, moose were predominantly observed in moderate elevation burns, mid-slope mixed shrub and spruce, and subalpine mixed shrub and subalpine fir. Higher densities of moose were observed in low elevation valleys in 2012, 2013, and 2020 than in 2018 and 2019. These patterns may be attributed to annual snow loads, with moose using the mid and high elevation areas more in years with lower snow loads (i.e., 2018 and 2019) and using the valleys more in deeper snow years (i.e., 2012, 2013, 2020). Regional moose distribution appears to be influenced by snow depth in late-winter more so than by sensory disturbance in proximity to Project infrastructure.

ACKNOWLEDGEMENTS

The 2020 Eagle Gold Project moose survey was completed with the assistance from Helaina Moses (Victoria Gold Corp.), Felix Plouffe (First Nation of Na-Cho Nyäk Dun), and Andrew Swenson (Alpine Aviation). Their professionalism, vigilance, and companionship during the survey were greatly appreciated. We thank Lindsay Rear (Victoria Gold Corp.) for her review and comments.

Funding and logistical support for this project were provided by Victoria Gold Corp.

1 BACKGROUND

Following advanced exploration activities and obtention of regulatory approvals, Victoria Gold (Yukon) Corp.'s (VGC) Eagle Gold Mine (the Project) is currently in its first year of operation. The Eagle Gold Mine produces ore from a conventional open pit operation and gold recovery plant. The Project is located approximately 85 km by road from the village of Mayo and has year-round road access to the site via the Haggart Creek Access Road. The access road and mine site are within the traditional territory of the First Nation of Na-Cho Nyäk Dun. The Eagle Gold Project has received all major permits required for construction and operations following the Environmental Assessment process.

As part of the environmental assessment completed under *YESAA*, VGC committed to conducting annual winter moose distribution surveys. Commitment #35 from Appendix A of the YESAB Screening Report and Recommendation (YOR 2010-0267-358-2) states:

> *VIT* (now VGC) *will implement annual aerial mapping of winter moose distribution within 5 km of the access road and mine site and in adjacent control areas. This will be conducted before construction (in 2011 and 2012), during construction, and during mine operations, to allow assessment of displacement and population reduction resulting from mine activities, and adaptive management measures if negative effects occur.*

Commitment #35 is re-iterated in the Final Screening Report and Recommendation issued by YESAB February 13, 2013. However, the YESAB recommendation specifies that the survey area be extended to 10 km from Project infrastructure. This recommendation was initially proposed on August 24, 2011, by Environment Yukon's Environmental Programs Branch (YOR 2010-0267-197-1). It was recommended that the study design change to delineate a zone of influence (ZOI) extending 5 km from the Project area and access road and that a survey area extending from 5 km to 10 km beyond the ZOI be treated as the "control" area. Environment Yukon intended this study design, referred to as before-after control-impact (BACI), to detect changes in moose distribution near Project infrastructure due to unanticipated Project effects. It should be noted here that moose winter habitat distribution is not homogenous across the study area and that key factors that affect late-winter habitat use, notably browse availability and snow depth, differ between the 5 km and 10 km buffer areas.

In their Screening Report and Recommendation issued on February 19, 2013, YESAB recommended to the Yukon Government that this commitment become a Term and Condition which was supported by the Yukon Government in their Decision Document (YOR 2010-0267-361-1). Term and Condition #99 states:

> *The Proponent shall, in cooperation with Government of Yukon, Department of Environment, design and conduct annual winter moose surveys consistent with methodology and study area (ten kilometres from infrastructure) used in 2011.*

Moose are the most common ungulate species in the region and occur in the Project area during all seasons. The most critical season for moose is late-winter (January–April) when browse availability and access is most limited. The Project area was identified as important moose habitat by local residents and contains some high quality early successional and lower elevation winter habitat. According to the Terrestrial Wildlife

Environmental Baseline Report (Stantec Consulting Ltd. 2011a) and the Yukon Government regional biologist (personal communication with M. O'Donoghue), the South McQuesten River and Haggart Creek valleys contain winter habitats of particular importance to the local moose population.

Studies examining the effects of disturbance on the distribution and behaviour of moose along access corridors found that these effects were limited to within 1000 m of the corridors (Colescott and Gillingham 1998, Yost and Wright 2001, Laurian et al. 2008, 2012, Shanley and Pyare 2011). If avoidance of habitat due to mining-related activities was observed, this data would be useful in understanding moose distribution near the access road in order to implement additional mitigation measures to reduce traffic/moose interactions and potential of vehicle collisions.

In consultation with Environment Yukon, VGC agreed to conduct late-winter moose distribution monitoring relative to the Project infrastructure for a total of five years including 2 years pre-construction, 2 years of the construction phase, and the first year of operations (email communication with Mark O'Donoghue, Northern Tutchone Regional Biologist, on 5 August 2010). The study was designed with input from Environment Yukon to monitor moose distribution within the ZOI of the proposed mine site (0 to 1 km), and to include a control area well outside of the ZOI (5 to 10 km). If no effects were observed after five years of monitoring, the parties agreed that the frequency of this monitoring could be reduced during subsequent years of the operations phase (email communication with Mark O'Donoghue, Northern Tutchone Regional Biologist, on 5 August 2010). The 2020 moose survey represents the sixth year of monitoring.

Prior to 2020, moose surveys were conducted in early-March of 2011, 2012, 2013, 2018, and 2019. The 2011 baseline moose distribution survey was conducted by Stantec (Stantec Consulting Ltd. 2011b) using a 10 km buffer from the Project and access road footprints. The 2012, 2013, 2018, and 2019 surveys were conducted by EDI Environmental Dynamics Inc. (EDI) using the 2011 survey methodology and study area as per Term and Condition #99 (EDI Environmental Dynamics Inc. 2012, 2013, 2018). However, in consultation with the Environment Yukon Regional Biologist for the Northern Tutchone Region, EDI made some slight modifications to the survey methodology to improve efficiency, moose detection rates, and crew safety while maintaining the same survey intensity.

This report presents and compares the results of the 2020 late-winter moose distribution survey with those of previous surveys. The 2020 survey is the first operation phase survey following the pre-construction (2011-2013) and construction (2018-2019) phase surveys against which it will be compared to evaluate potential changes in moose distribution and abundance in the survey area.

2 METHODS

2.1 SURVEY AREA

The Project is located approximately 45 km north of Mayo. In 2011, a 1,130 km² survey area was generated by applying a 10 km buffer to the proposed mine site and the access road footprints. In 2012, the size of the survey area was increased by 10 km² to accommodate a modified Project footprint. In 2013, a survey grid comprised of 5 minutes longitude by 2 minutes latitude blocks (approximately 4 x 4 km at this latitude) was developed to guide survey intensity. This method also aligns with the methods used by the Yukon Government for moose stratification (distribution) surveys (Environment Yukon 2010, O'Donoghue et al. 2014). The addition of blocks at the edge of the survey area increased the size of the survey area from 1,140 km² to 1,320 km². The 2018-2020 surveys followed the same survey design as the 2013 survey (Map 1).

Most of the survey area is suitable moose winter habitat except for small portions of rock cliffs and scree on Mount Haldane and other hilltops as well as a few small lakes. The Silver Trail Highway, which extends from Mayo to Keno City, cuts across the southeast corner of the study area. Major geographic features of the area include the valley and riparian flats of the South McQuesten River as well as Mount Haldane, a prominent mountain in the region.

The survey area lies entirely within the Yukon Plateau North ecoregion (Yukon Ecoregions Working Group 2004). The survey area consists of rolling highlands with a generally northeast-southwest orientation dissected by numerous small creeks. Vegetation cover is predominantly boreal but ranges from boreal to alpine. Alpine environments are characterized by low ericaceous shrubs, small willows (*Salix sp.*), and lichens. Subalpine environments are typically vegetated with willow and shrub birch (*Betula glandulosa*) with scattered white spruce (*Picea glauca*) and subalpine fir (*Abies lasiocarpa*). At lower elevations, black spruce (*P. mariana*) and white spruce forests grow over moist sites. Trembling aspen (*Populus tremuloides*), lodgepole pine (*Pinus contorta*), and white spruce stands grow in warmer and better-drained sites. Some nearly pure deciduous stands comprised primarily of birch and aspen can be found on south aspect slopes in southeastern portions of the study area. A riparian flat approximately 3 km wide dominated by a mix of shrub lands, grasslands, and black spruce occurs along the South McQuesten River.

The study area has a complex and diverse forest fire history contributing to the high diversity of forest covers. These burned areas have variable habitat suitability for moose depending on their age, elevation, and intensity of the burn. Three large fires have occurred recently in the study area. The most recent is a 2019 fire that burned 69 km² of shrub and sparse forest along the South McQuesten River and Flat Creek lowlands north of the Silver Trail and west of Elsa. Most of a 2005 fire that burned 55 km² of forest in the headwaters of Shanghai Creek north of the South McQuesten River occurred within the study area and extended as far west as the Project footprint. A 1998 fire that burned 71 km² of forest from Hanson Lake to Skate Creek only partially overlaps with the study area. Other smaller fires, mainly from the mid-1990s, are scattered throughout the area.

Air temperatures at the Project site are consistent with those throughout the Yukon interior. Mean annual air temperature is -3.2°C at the Camp (782 m) weather station and -3.8°C at the Potato Hills (1420 m) weather station (Lorax Environmental Services Ltd. 2019). The temperature gradient usually shifts at low elevation and high elevation between winter and summer (i.e., temperature inversion). In December, monthly average temperature is -19.9°C at the Camp station and -15.2°C at the Potato Hill station (i.e., warmer at higher elevation). In July, monthly average temperature is 13.2°C at the Camp station and 10.8°C at the Potato Hill station (i.e., warmer at lower elevation) (Lorax Environmental Services Ltd. 2019). Rain and snowfall is moderate in the region and annual precipitation amounts range from 93 to 161 mm at the Camp station and 190 to 410 mm a the Potato Hills station (snow water equivalent) (Lorax Environmental Services Ltd. 2019). Mean monthly wind speeds are higher in spring, summer, and fall months and lower in the winter with annual minimums occurring in December and maximums occurring in April and May (Lorax Environmental Services Ltd. 2019).

2.2 SURVEY DETAILS

The survey took place March 5 to 6, 2020. The survey crew included Andrew Swenson (pilot, Alpine Aviation), Alain Fontaine (navigator, EDI), Helaina Moses (observer, Victoria Gold Corp.), and Felix Plouffe (observer, FNNND). The survey was completed with a Cessna 206 (C-FBVA) flown at 120–150 km/hr and an elevation of 100–200 m above ground level.

The design of the 2011 moose survey included forty east-west transects spaced at 1 km intervals (Stantec Consulting Ltd. 2011b). Flight lines followed the planned transects to the extent possible based on flight and terrain conditions. In 2012, EDI adjusted the survey methods used in the 2011 survey to increase their efficiency, moose sightability, and safety in mountainous terrain while maintaining the same survey intensity. The method used the same transect spacing (1 km) but did not restrict the survey crew to predetermined east-west transect lines. Instead, the survey crew flew linear transects (generally east-west) when flying over terrain with moderate topography but adjusted transects to follow contour lines over terrain with more relief and topography. This allowed the aircraft to fly at a more consistent height and speed and minimized crew discomfort which generally improves ungulate detection rates.

In 2013, 2018, 2019, and 2020, survey blocks were used to guide survey intensity while providing flexibility to fly according to the terrain. This alteration in methodology improves comparability among years and with other moose surveys conducted by Environment Yukon (Environment Yukon 2010). Blocks were used to confirm that a minimum of four passes were flown through each block, which is equivalent to 1 km transect spacing and similar to previous surveys. As per the 2012 survey, linear north-south and east-west transects were flown over terrain with moderate topography while terrain guided transects in areas with more relief. A limitation of moose distribution surveys conducted following intensive stratifications methods using fixed-wing aircraft is a sightability bias towards open habitats. Moose are more easily observed in open habitats compared to dense cover and open habitats are often composed of early seral stage vegetation (i.e., burns) that contain higher browse quality (i.e., shrubs). Furthermore, monitoring of moose distribution via annual

aerial surveys provides a snapshot in time of moose abundance and distribution that can be influenced by weather, snow conditions, and predation risk.

During the survey, observers recorded all moose observations as well as any incidental wildlife sightings. All moose and wildlife observations were recorded as waypoints using a handheld GPS (Garmin GPSMAP 64). Wildlife observations documented the species and number of animals in the group and, when possible, the age class (adult/calf) and sex of the animals. However, it is generally difficult to classify animals by age and sex during moose distribution surveys using fixed-wing aircraft, due to their minimum speed and height above ground requirements. Therefore, most moose were unclassified. We estimated the distance and direction of animals relative to the position of the plane and direction of the flight path when the waypoint was recorded to correct moose spatial locations.

We also recorded moose tracks using methods consistent with the intensive stratification survey track recording protocol developed by Environment Yukon (Environment Yukon 2011). Recording tracks is meant to supplement moose observations to better delineate moose distribution at the time of the survey. As specified in the protocol, only fresh moose tracks that crossed directly beneath the aircraft flight path were recorded. Consequently, tracks did not require spatial correction. In 2020, fresh snowfall in the days preceding the survey improved moose detectability and our ability to differentiate between old and fresh tracks. Tracks were categorized as one, two, several (three to five), or many (more than five) track sets to indicate the relative number of animals.

2.3 SURVEY CONDITIONS

Weather conditions in 2020 were ideal for aerial wildlife surveys (Table 1). Weather conditions were consistent throughout the survey; winds were calm to light, skies were clear resulting in bright light conditions which helped to detect and assess the relative age of moose tracks (i.e., fresh vs old), and temperatures ranged from −35°C to −29°C. The survey crew could not survey after the mid-day refuel on 5 March as a result of an aircraft malfunction that required that the aircraft be sent back to Whitehorse for certified maintenance. Previous survey conditions were ideal for aerial wildlife surveys in 2012, 2013, 2018, and 2019, but old snow and flat light during afternoons in 2011 made it more difficult to sight moose (Table 1).

Table 1. Survey conditions during the 2011-2013 and 2018-2020 late-winter moose distribution surveys at the Eagle Gold Project.

Survey Conditions	2011	2012	2013	2018	2019	2020
Date	March 7-9	March 7-8	March 4-6	March 5-6	March 5-7	March 5-6
Snow Condition	Old (> 2 weeks)	Lots of fresh snow prior to the survey	~10 days old	Some fresh snow prior to the survey and on the morning of 6 March	Old (> 3 weeks)	Lots of fresh snow prior to the survey
Cloud Cover	Clear in the morning changing to overcast by late afternoon on all days	Clear to slightly overcast on 8 March	Clear	Clear on 5 March; clear in the morning changing to slightly overcast by mid-afternoon on 6 March	Clear; light high-altitude haze on 7 March	Clear
Light	Bright in the morning to flat by late afternoon	Bright	Bright	Bright	Bright	Bright
Wind	Light to moderate	Calm	Calm	Calm	Calm to light	Calm to light
Temperature	−35°C to −17°C	−30°C to −10°C	−27°C to −10°C	−20°C to −10°C	−31°C to −25°C	−35°C to −29°C
Comment	Old snow and flat afternoon light made it difficult to sight moose	Considerable snow fall in days prior to the survey	Delayed both mornings due to low fog	Light snow and low ceiling delayed the start of the survey on the second day	Very old snow made recording fresh tracks unfeasible	Deep and fresh snow improved track detection and ageing (old vs. fresh tracks)

3 RESULTS AND DISCUSSION

A total of 10.4 hours were spent surveying moose and 0.6 hours were needed to ferry between the survey area and Mayo. In addition, 3.0 hours of ferry time was required to mobilize (March 4) and demobilize (March 7) the aircraft between Whitehorse and Mayo.

Survey intensity was 0.47 min/km² and comparable to the survey intensity of previous years which ranged from 0.49 min/km² in 2018 to 0.53 min/km² in 2011 (Table 2). A survey intensity of 0.4 to 0.5 min/km² is required for adequate coverage of the study area and for consistency in comparing survey results between years and with other surveys across Yukon (Environment Yukon 2010).

3.1 ABUNDANCE

In total, we observed 91 moose during the 2020 survey of which 82 were observed within the study area (Table 2). Most moose were observed as individuals or pairs with few observations of groups of three to five moose.

The number of moose observed within the survey area from 2018 to 2020 was much larger than in previous surveys (Table 2). However, 28 moose were observed just outside the study area boundary in the 1998 Hanson Lake burn in 2013. Potential factors for the variation in annual moose numbers include a methodology change in 2012 that increased detection rates (however, methods were consistent from 2012 forward), observer bias (i.e., observer experience and variability in survey crews), and changes in the regional distribution of moose. The latter can be influenced by annual and regional variations in snow characteristics such as depth and hardness as well as high wolf activity preceding the survey within or near habitats seasonally important to moose (wolves are the only predator of moose in Yukon over the winter). Survey results from 2011 are not covered in detail in the following discussion due to the low sample size and the change in survey method starting in 2012 making direct comparisons to other survey years inadequate.

Table 2. Survey intensity and moose observations within the survey area for 2011-2013 and 2018-2020 late-winter moose distribution surveys at the Eagle Gold Project.

Year	Survey Intensity (min/km²)	Total Moose in Study Area (10 km buffer)	Total Moose Observed[1]
2011	0.53	26	31
2012	0.52	48	61
2013	0.50	39	74
2018	0.49	75	100
2019	0.52	82	100
2020	0.47	82	91

[1]Inlcudes moose observed just outside the study area, within and outside the survey grid (2013, 2018-2020), and incidental moose observations in transit to and from Mayo.

3.2 GENERAL DISTRIBUTION

In 2020, approximately 75% of the moose we observed were distributed within the Haggart Creek and South McQuesten River valleys; both valleys are reported to be important for moose in late-winter (Stantec Consulting Ltd. 2011a) and overlap part of a moose late-winter Wildlife Key Area (Environment Yukon 2014) (Map 1). Most of the remaining moose observations were located within mid-elevation burns and in small valley bottoms where shrub browse was available. The abundance of fresh moose tracks observed in the southern half of the 2005 Shanghai Creek burn (survey blocks 43 and 44; Map 1 and 2), but relatively low number of moose observed in this area compared to previous surveys, suggest that moose were making foraging forays into the burn but otherwise retreated to the forests on the south facing slopes of the mountain block between Shanghai Creek and the South McQuesten River where snow depth was presumably shallower under the forest cover but where they were difficult to detect during the survey.

The distribution of moose within the survey area varied throughout survey years (Map 2). However, some areas received consistent use across most survey years such as the 2005 Shanghai Creek and Lynx Creek burn, the 1998 Hanson Lake burn, the high elevation ridges between Red Mountain and Haggart Creek, and small burns along the southern edge of the study area. Moose made greater use of low elevation habitats during the 2012, 2013, and 2020 surveys; fewer moose were observed at low elevations during the 2018 and 2019 surveys.

During the 2012 survey, moose used habitats at mid to low elevations, but were primarily observed in old burns, and west of the Haggart Creek Access Road and the existing advanced exploration camp operated by VGC (Map 2). In 2013, moose were again observed in mid to low elevation areas; however, most observations were located east of the Haggart Creek Access Road and the camp in the moderate elevation burns. In 2018 and 2019, moose were predominantly observed in high-density clusters within moderate and higher elevation burned plateaus on the eastern side of the survey area, namely within the 2005 burn of the Shanghai Creek and Lynx Creek drainages. High densities of moose were also observed in subalpine mixed shrub and subalpine fir habitats in 2018, whereas in 2019 they appeared to occupy mid-slope mixed shrub and spruce habitats. Fewer moose were observed in the high elevation ridges between Red Mountain and Haggart Creek in 2019 than in 2018. This may be a result of the old snow age in 2019 and corresponding difficulty in detecting fresh tracks that would have otherwise alerted observers to the presence of moose and increased detection rates in subalpine fir habitats. Furthermore, moose detectability may have been lower in more heavily vegetated habitats mid-slope.

Yearly variation in the distribution of large ungulates is common. Food availability, snow depth, and risk of predation affect late-winter moose distribution (Dussault et al. 2005). Food availability is assumed to be constant in the study area year over year because there have not been major changes to moose habitat in the survey area during the survey years with the exception of the large 2019 fire in the South McQuesten lowlands to the west Elsa. However, the Shanghai Creek burn may be entering a successional stage of high-quality moose winter habitat (i.e., a greater abundance of winter browse) where the local moose population is becoming increasingly concentrated over the winter months in some years.

3.3 DISTRIBUTION RELATIVE TO DISTURBANCE

To examine the potential effects of Project disturbance on moose distribution, moose abundance was stratified in 1 km buffer increments from the Project footprint (Figure 1) as well as in 5 km buffer increments (Figure 2), the latter as per Environment Yukon's recommendation (YOR 2010-0267-197-1). Moose density is presented rather than the total number of moose observed within each distance buffer. This provides a better relative basis for comparison because the area of each buffer increases in size as the distance from the Project footprint increases.

A moose density of 32 moose per 100 km² was calculated within 1 km of the Project footprint along the Haggart Creek Access Road and infrastructure in 2020 during mining operations. Five moose were observed within the infrastructure footprint. In comparison, moose densities of 5.2 moose per 100 km² were calculated within 1 km of the Project footprint along the Haggart Creek Access Road and other infrastructure in 2019, 0 moose per 100 km² in 2018, and 11.2 moose per 100 km² in both 2012 and 2013 (Figure 1). Human activity along the access road and at the Project site during the winter 2018 survey was similar to that of the 2012 and 2013 pre-construction surveys; construction activity occurred from August to October 2017, ceased over the winter months from November 2017 to March 2018, and resumed in April 2018. The road was not accessible other than by snowmobile over the winter months. Therefore, construction activities could not have influenced moose distribution in early-March 2018. More moose were observed within 1 km of project infrastructure in 2019 and 2020, during construction and operation activities respectively, than in 2018 when no construction was occurring at the time of the survey (Figure 1). Moose densities in the distance buffers located 7 to 10 km from infrastructure were higher on average than other distance buffers with the exception of the 0 to 1 km buffer. These buffers overlap clusters of moose observations within mid-elevation burns where browse is abundant. Moose density in the 0 to 5 km buffer was higher than in the 5 to 10 km buffer in 2012 and 2013 during pre-construction and in 2020 during mining operations and lower in 2018 and 2019 during the winter halt in construction and during construction, respectively (Figure 2).

The study design developed with Environment Yukon has inherent limitations in its ability to detect changes in moose distribution related to disturbance from industrial activity near the mine and road infrastructure because it does not account for the distribution of winter habitat across the study area (i.e., habitat heterogeneity), browse availability, and for the effects of snow depth on moose distribution. Examining moose density in increments of 1 and 5 km buffers from Project infrastructure, we did not detect a consistent pattern of declining moose density in proximity to infrastructure relative to an increase in Project activity levels through the phases of project development as expected if increasing disturbance through phases of development influenced moose distribution. In fact, the intensity of use of habitats near the Project infrastructure appears to be highly variable between years and, to date, unrelated to anthropogenic disturbance effects.

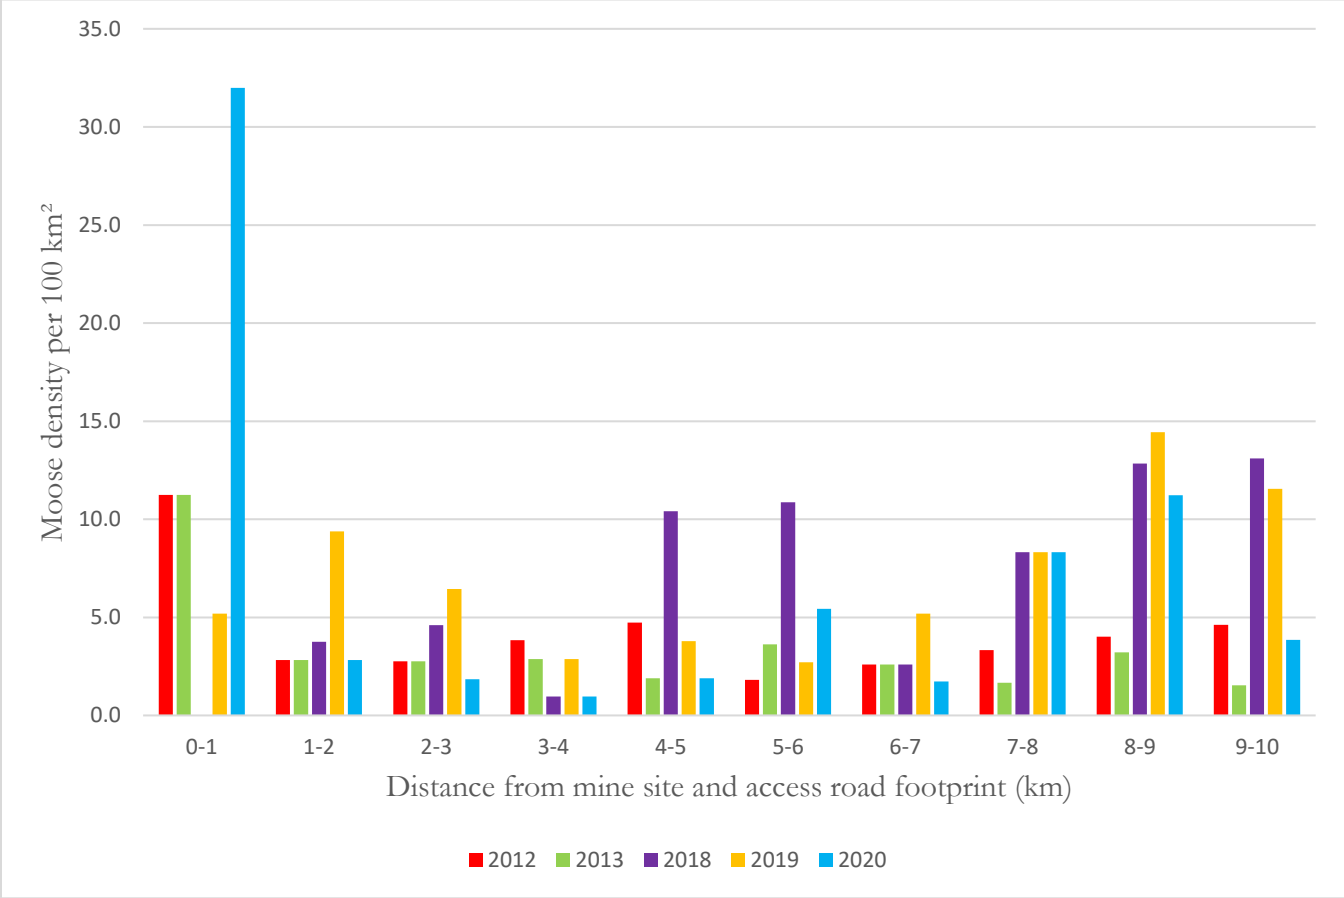

Figure 1. Moose density per 100 km² at 1 km intervals within 10 km of the Eagle Gold Project infrastructure during the late-winter 2012-2013 and 2018-2020 moose surveys.

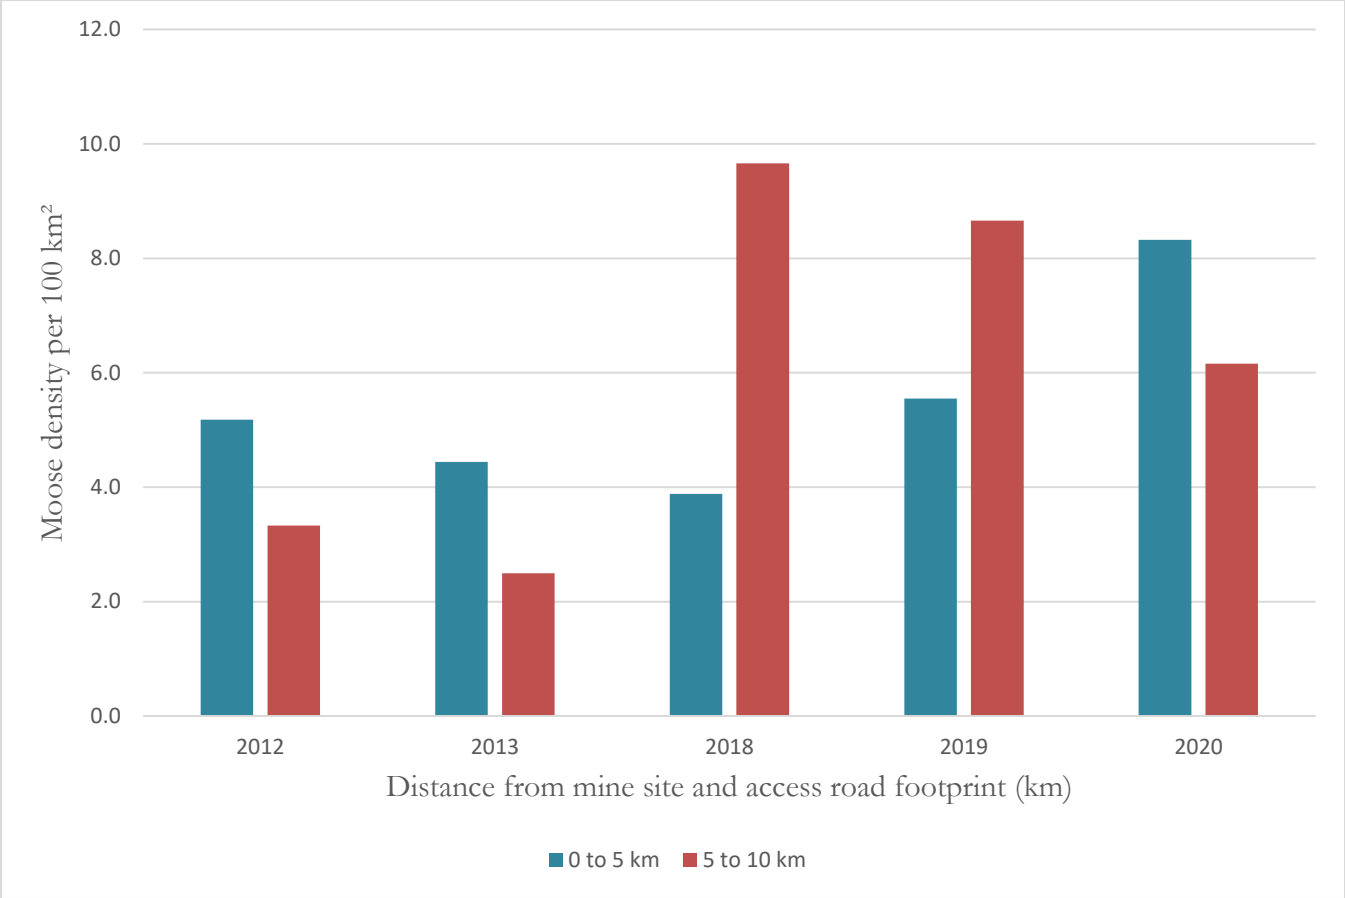

Figure 2. Moose density per 100 km² at 0 to 5 km and 5 to 10 km intervals from the Eagle Gold Project infrastructure during the late-winter 2012-2013 and 2018-2020 moose surveys.

3.4 DISTRIBUTION RELATIVE TO SNOW DEPTH

Although moose are well adapted to snow environments, characteristics of snow such as temperature, density, hardness, and depth, influence moose movement, distribution, and habitat use (Peek 2007). Snow depth is the most frequently studied variable and depths of >70 to >99 cm have been shown to restrict moose movement (Kelsall 1969, Telfer 1970, Peek 2007). In mountainous terrain, some moose populations make an altitudinal migration within their winter range in response to increasing snow depth (O'Donoghue 2005, Gillingham and Parker 2008, O'Donoghue et al. 2014, McCulley et al. 2017). During early winter, moose are generally found at higher elevations in open habitats with extensive deciduous shrub cover, such as subalpine shrublands and mid-elevation early-succession forests following wildfires. As winter progresses, increasing snow depth and hardness at higher elevation habitats cause a seasonal movement to lower elevation habitats where snow conditions are shallower and softer through late-winter. When snow loads are low, some moose may remain in higher elevation habitats through the winter. Thus, late winter habitats may not be used to the same degree or by as many moose every year, but in deep snow years, these areas are critical to moose over-winter survival. Local knowledge and results from Environment Yukon surveys confirm that moose in the

Project region exhibit this typical seasonal movement from higher to lower elevation as winter advances (Stantec Consulting Ltd. 2011a, O'Donoghue et al. 2014).

We obtained snow depth data from the Water Resources Branch, Environment Yukon, for the snow course survey stations nearest to the Project (Mayo A, Mayo B, and Calumet) from 1987 to present. The Calumet snow station (1310 m) is generally more representative of snow conditions in the Project area than the Mayo A and B snow stations. The latter are located near the Mayo airport at lower elevations and are subject to wind scour and human disturbance related to airport activities (Email communication on 27 April 2018 with Steve Therriault, Energy, Mines and Resources, and Jonathan Kollot, Environment Yukon). Snow depth was also measured at two climate stations within the Project area: Potato Hills (alpine, 1420 m) and Camp (valley bottom, 782 m) (Lorax Environmental Services Ltd. 2019).

2020 is the deepest snow year on record since 1987 for the late February to early March snow surveys. Snow depth in 2020 was 54% to 74% deeper than regional long term averages and contributed to a substantial increase in the average snow depth for the past 10 years. Regionally, snow depth was substantially above average in 2020, above average in 2012 and 2013, and below average in 2018 and 2019 (Table 3). Snow depth at stations located at higher elevations (Potato Hill, Calumet) was much deeper and denser than those recorded at stations located at lower elevations (Camp, Mayo A and B; Table 3).

Table 3. Snow depth for 2012-2013 and 2018-2020 at weather stations within or near the Eagle Gold Project during the snow sampling event closest to survey dates.

Year	VGC Camp (cm)[1]	VGC Potato Hills (cm)[1]	YG Mayo Airport A (cm)[2]	YG Mayo Airport B (cm)[2]	YG Calumet (cm)[2]
2012	78	99	51	64	94
2013	61	96	62	60	87
2018	53	85	40	46	83
2019	48	79	41	36	63
2020	90	189	88	92	133
2011-2020 Average	61	103	53	55	87
1987-2020 Average	n/a	n/a	51	53	86

[1](Lorax Environmental Services Ltd. 2019)
[2]Snow depth data for the Mayo A, Mayo B, and Calumet snow course stations were obtained from the Water Resources Branch, Environment Yukon.

Much of the Project infrastructure, and correspondingly the shorter distance increment buffers (Figures 1 and 2), is located at lower elevations. The higher than average snow depth in 2012, 2013, and 2020, especially at higher elevations, appears to correlate with the greater use of moderate to low elevation habitats by moose during those surveys relative to 2018 and 2019. The Haggart Creek valley, which follows the access road for over 50% of its length, contains abundant browse and cover that is suitable late-winter moose habitat. Land clearing associated with placer mining operations adjacent to the Haggart Creek Access Road has also created early-successional habitats favoured by moose. Regional moose distribution appears to be influenced by snow depth in late-winter more so than by sensory disturbance in proximity to Project infrastructure. Moose are

likely to continue to use areas adjacent to Project infrastructure as late-winter habitat, especially in deep snow years.

3.5 INCIDENTAL OBSERVATIONS

Caribou or caribou tracks were not observed during the 2011, 2012, 2019, and 2020 late-winter surveys. However, a group of five woodland caribou was observed in 2013 in an alpine area on Red Mountain, which is located on the western edge of the survey area approximately 10 km from the Haggart Creek Access Road. In 2018, caribou cratering (i.e., digging in snow for forage and mineral-rich water) was observed in a wetland complex along the South McQuesten River approximately 14 km southeast of the Project, and an east-west oriented trail from around the same time period and thought to be from a group of caribou was observed on the ridgeline between the South McQuesten River and the Project. In the Terrestrial Wildlife Environmental Baseline Report, local knowledge indicated that caribou were known to occur in the Red Mountain area (Stantec Consulting Ltd. 2011a). However, based on the distribution of herd ranges in the region, caribou are expected to be an uncommon occurrence in the study area. The closest woodland caribou range to the survey area is that of the Clear Creek caribou herd and its range does not overlap with the study area. A 2001 survey estimated the herd to be composed of 900 caribou (Environment Canada 2012).

Three wolf packs were observed in 2013, two of which were in the vicinity of the South McQuesten River area (EDI Environmental Dynamics Inc. 2013) and one wolf was observed between the eastern foothills of Mount Haldane and Haldane Creek during the 2019 survey. No wolves were observed in 2011, 2012, 2018, and 2020 surveys. However, high densities of wolf tracks were detected in most annual surveys within the flats of the South McQuesten River, especially in the blocks west of the access road crossing but also north of Mount Haldane.

4 CONCLUSIONS

The data collected as part of the 2011–2013 moose surveys were intended to reflect the baseline pre-construction distribution of moose in the study area, while those of the 2018 and 2019 survey were collected near the end of a 5-month halt during the construction phase and through construction, respectively, and those of the 2020 survey were collected during mine operation. The survey schedule was designed to detect the potential effects of mine construction and operation activities on moose sensory disturbance and subsequent avoidance of habitat within a zone of influence (ZOI) around the mine site and access road.

Variability in distribution and density of moose were expected among years as a result of annual snow loads, dynamic habitat variables and predation risk. Although some areas appear to hold higher moose densities across years, overall moose distribution to date has been variable among years. Some areas received consistent use across most survey years such as moderate elevation burns, particularly the Shanghai Creek and Lynx Creek burn, and mixed shrub and subalpine fir habitats on high elevation ridges between Red Mountain and Haggart Creek.

Moose made greater use of low elevation habitats in years with higher than average snow depth (2012, 2013, and 2020) than in years with lower than average snow depth (2018 and 2019), irrespective of Project development phase. No moose were observed within 1 km of the Project footprint in 2018 that coincided with a 5-month halt in construction activities and unmaintained road access conditions. Moose densities were moderate within 1 km of the Project footprint in 2019 when construction was in earnest and very high in 2020 during mine operation. No evidence of moose harvest was documented along the access road in 2020 or previous surveys.

There is little evidence that moose distribution is being affected by the Project. The weight of evidence from surveys to date suggests that variation in the distribution of moose likely has more to do with annual snow depth and winter habitat distribution than project activities at the mine and along the road. Furthermore, survey results also reflect the variance expected given the survey methods (i.e., fixed-wing aircraft at high elevation and speed) and intensity (i.e., wide transect spacing).

Submission History

Version Number	Version Date	Document Description and Revisions Made
2013-01	Apr 2013 (draft)	Submission of preliminary draft
2013-01	Sep 2013	Original submission to the Department of Energy, Mines and Resources in support of an application for a Quartz Mining Licence allowing for preliminary construction activities and submitted to the Yukon Water Board in support of the application to amend Type B Water Use License QZ11-013. The amendment application considered the use of water and deposit of waste associated with preliminary construction activities and included the construction and operation of the Dublin Gulch Diversion Channel.
2014-01	Jun 2014	Revisions made in support of an application to the Yukon Water Board for a Type A Water Use License for the full Construction, Operation and Closure of the Project. Version 2014-01 was also submitted to the Department of Energy, Mines and Resources in support of an application for a Quartz Mining Licence allowing the full Construction, Operation and Closure of the Project.
2016-01	Feb 2016	Revisions made in support of an application to the Yukon Water Board for a renewal of the Type B Water Use Licence.
2017-01	Mar 2017	Revisions made to address comments received during the adequacy review of the application to the Yukon Water Board for a Type A Water Use Licence and to address the conditions of the Quartz Mining Licence QML-0011. Version 2017-01 was submitted to the Department of Energy, Mines and Resources and the Yukon Water Board to satisfy VGC's annual reporting requirements.
2017-02	Jul 2017	Revisions made to reflect the current site general arrangement and submitted as part of a consolidated application for *Environment Act* permits.
2019-01	Mar 2019	Revisions made in accordance with Clause 8 of QZ14-041 and with Paragraph 2.5 of Schedule C, Part 2 of QML-0011, which require an annual review of the Spill Response Plan.
2021-01	Mar 2021	Revisions made in accordance with Clause 8 of QZ14-041-1 and with Paragraph 2.5 of Schedule C, Part 2 of QML-0011, which require an annual review of the Spill Response Plan. Primary revision is to clarify soil sampling protocols as per the Yukon Contaminated Sites Regulations and discussions with relevant regulatory agency representatives.

Version 2017-02 of the Spill Response Plan (the Plan) for the Project has been revised in March 2019 to update Version 2017-02 submitted in July 2017. The table below is intended to identify modifications to the Plan and provide the rationale for such modifications

Version 2021-01 Revisions

Section	Revision/Rationale
Title Page	▪ Updated to reflect company name change.

Section	Revision/Rationale
Table 3.1-1	▪ Updates to available spill response equipment based on actual site purchases and availability.
Table 3.4-1	▪ Updated contacts.
Section 3.6 Contaminated Soil	▪ Updated to include details regarding confirmatory and characterization sampling.

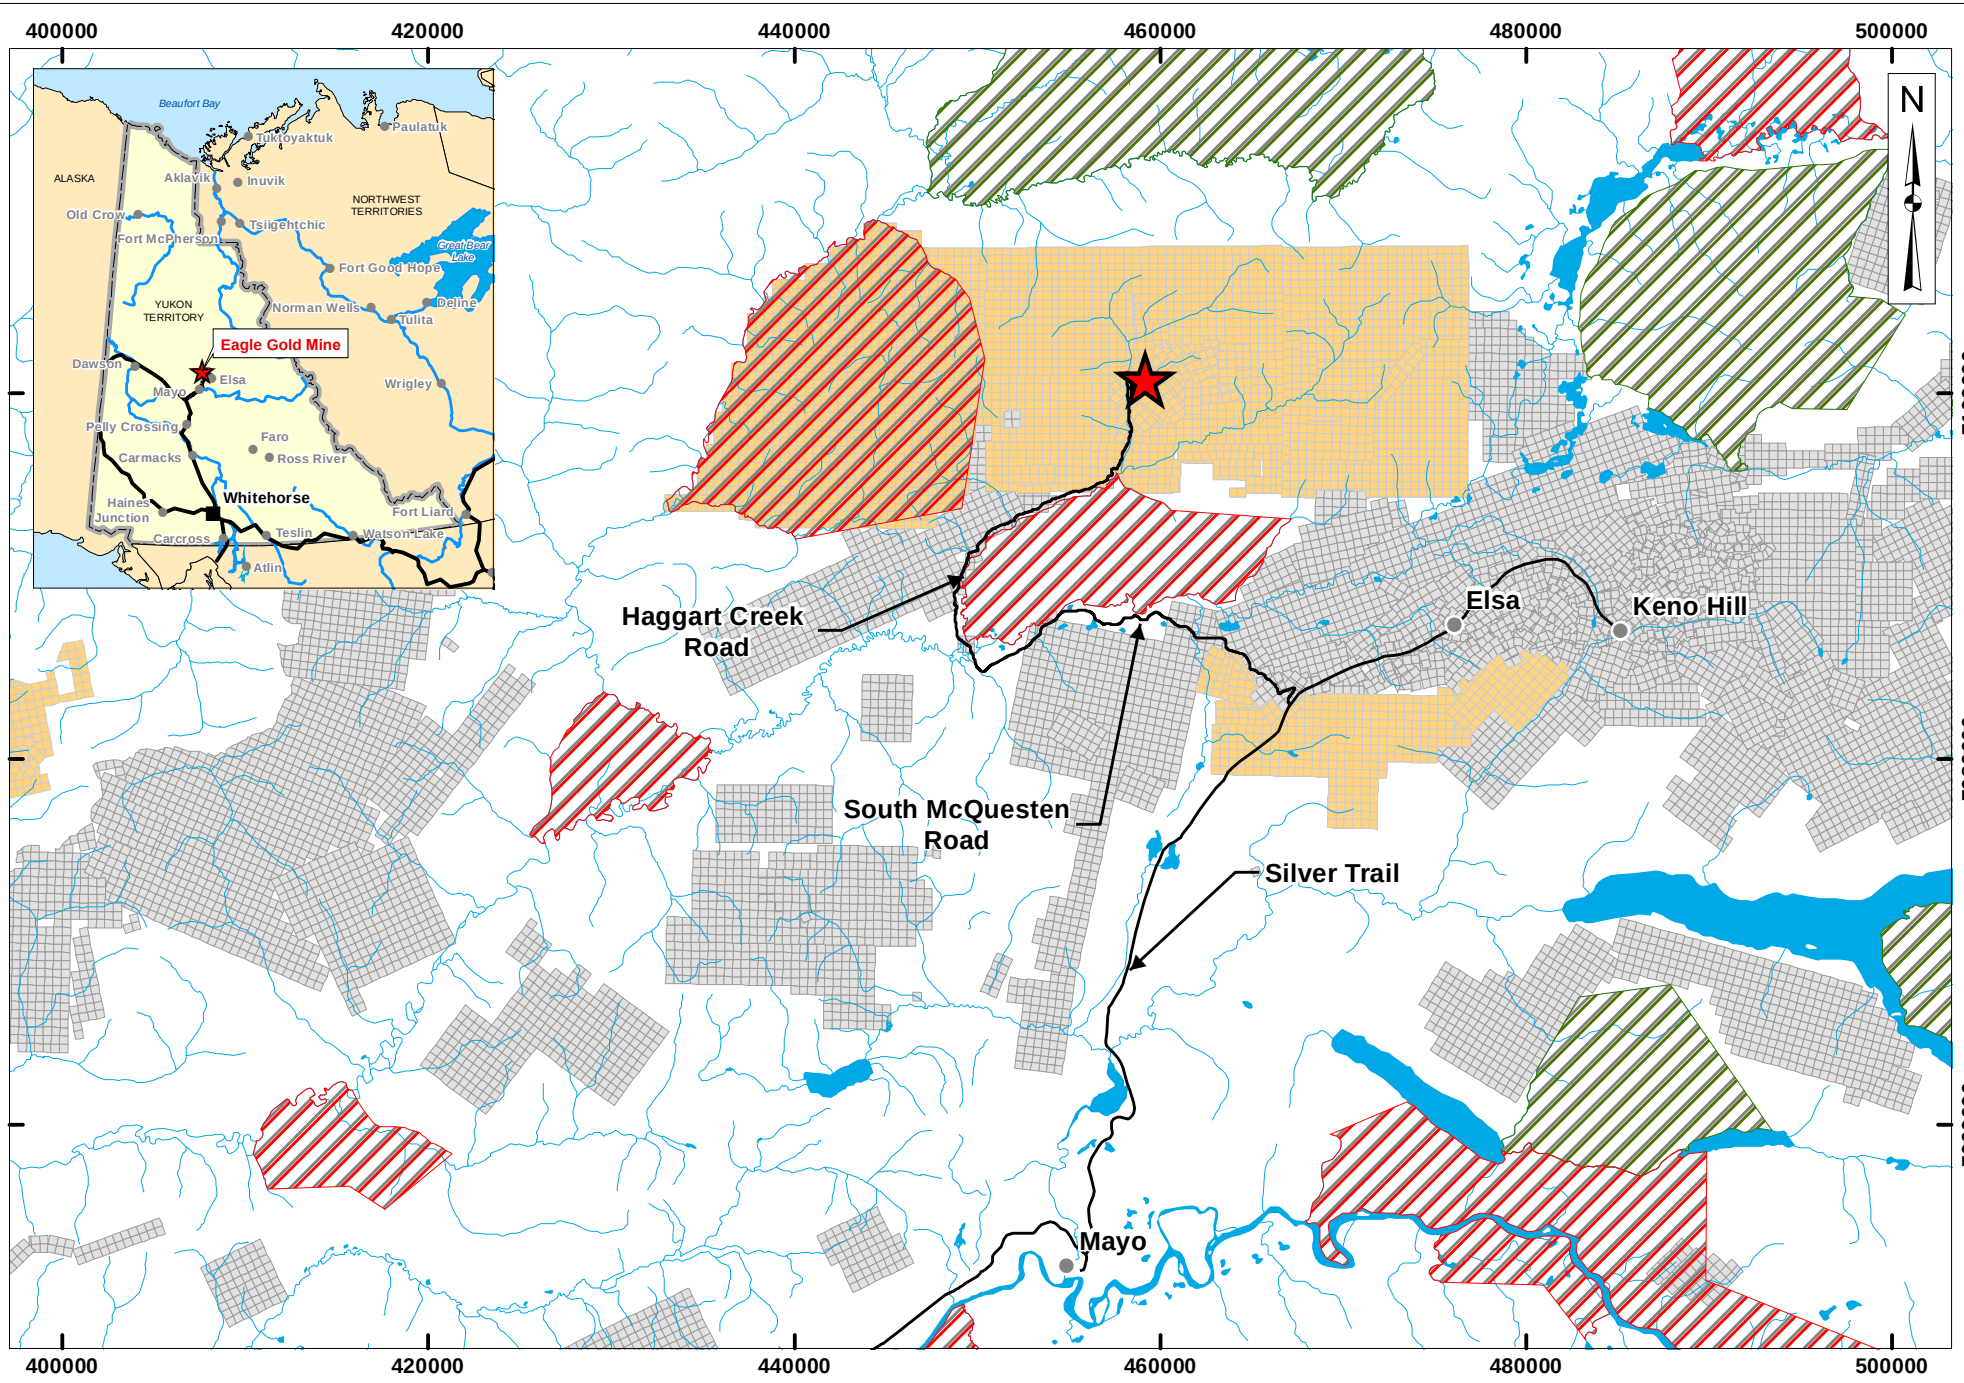
1 INTRODUCTION



Victoria Gold (Yukon) Corp. (VGC), a directly held-wholly owned subsidiary of Victoria Gold Corp., has constructed, is currently operating, and proposes to close and reclaim a gold mine in central Yukon. The Eagle Gold Project ('the Project') is located 85 km from Mayo Yukon using existing highway and access roads (Figure 1.1-1). The Project will involve open pit mining and gold extraction using a three stage crushing process, heap leaching, and a carbon adsorption, desorption, and recovery system over the mine life.

VGC is committed to exploring for, building, operating and closing mines in an environmentally, socially and financially responsible manner. VGC will endeavor to protect the environment in which it operates by providing a safe, responsible and efficient operating atmosphere through the development, and implementation of corporate policies as well as development and operational plans.

The purpose of this Spill Response Plan (the Plan) is to enable timely and effective responses to spills throughout the life of the Project. The Plan provides measures to prevent spills from occurring, and response measures to be implemented in the event of a spill.

This plan was informed by the guidelines provided by Government of Yukon's Department of Energy, Mines and Resources and the Yukon Water Board in the Plan Requirement Guidance for Quartz Mining Projects (August 2013), the Terms and Conditions of Recommendation, Proponent Commitments and Proponent Mitigations specified in the Final Screening Report and Recommendation (Yukon Environmental and Socio-economic Assessment Board Project Assessment 2010-0267), and the regulatory approvals issued for the Project.

Appendix A summarizes the requirements pertaining to spill prevention and response outlined in the Final Screening Report and Recommendation and other licenses and permits issued to date.

2 SPILL DEFINITION AND CATEGORIES

2.1 SPILL DEFINITION

A spill is defined under Section 132 of the *Yukon Environment Act* ("the Act") as a "release of a substance into the natural environment; from or out of a structure, vehicle or other container; and that is abnormal in quantity or quality in light of all the circumstances of the release; or in excess of an amount specified in the regulations". For the purposes of the *Act*, a "substance" means a hazardous substance, pesticide, contaminant or special waste.

2.2 REPORTABLE SPILLS

Schedule A of the *Yukon Spills Regulations* defines reportable spill quantities in reference to hazardous material classes defined under the *Transportation of Dangerous Goods Regulations*. The release into the environment of a hazardous material above the reportable quantities or any release into a watercourse is a reportable spill under the *Yukon Spills Regulations* and VGC is required immediately notify the 24-hour Yukon Spill Report line at:

867-667-7244

All reportable spills must be reported as soon as possible, within 24 hours. The reporting should be performed by the Environmental Coordinator or their designate. If the Environmental Coordinator is not on site, the Site Services Manager should perform the reporting. If there is uncertainty regarding the volume or type of material that has been spilled, it is advised that a report be made to the Spill Hotline.

Spill Reporting Forms will be completed for all spills (Appendix B).

Reporting thresholds for all substances including hazardous materials, pesticide, contaminant or special waste used or stored at the Project are provided in Table 2.2-1, Table 2.2-2 and Appendix C.

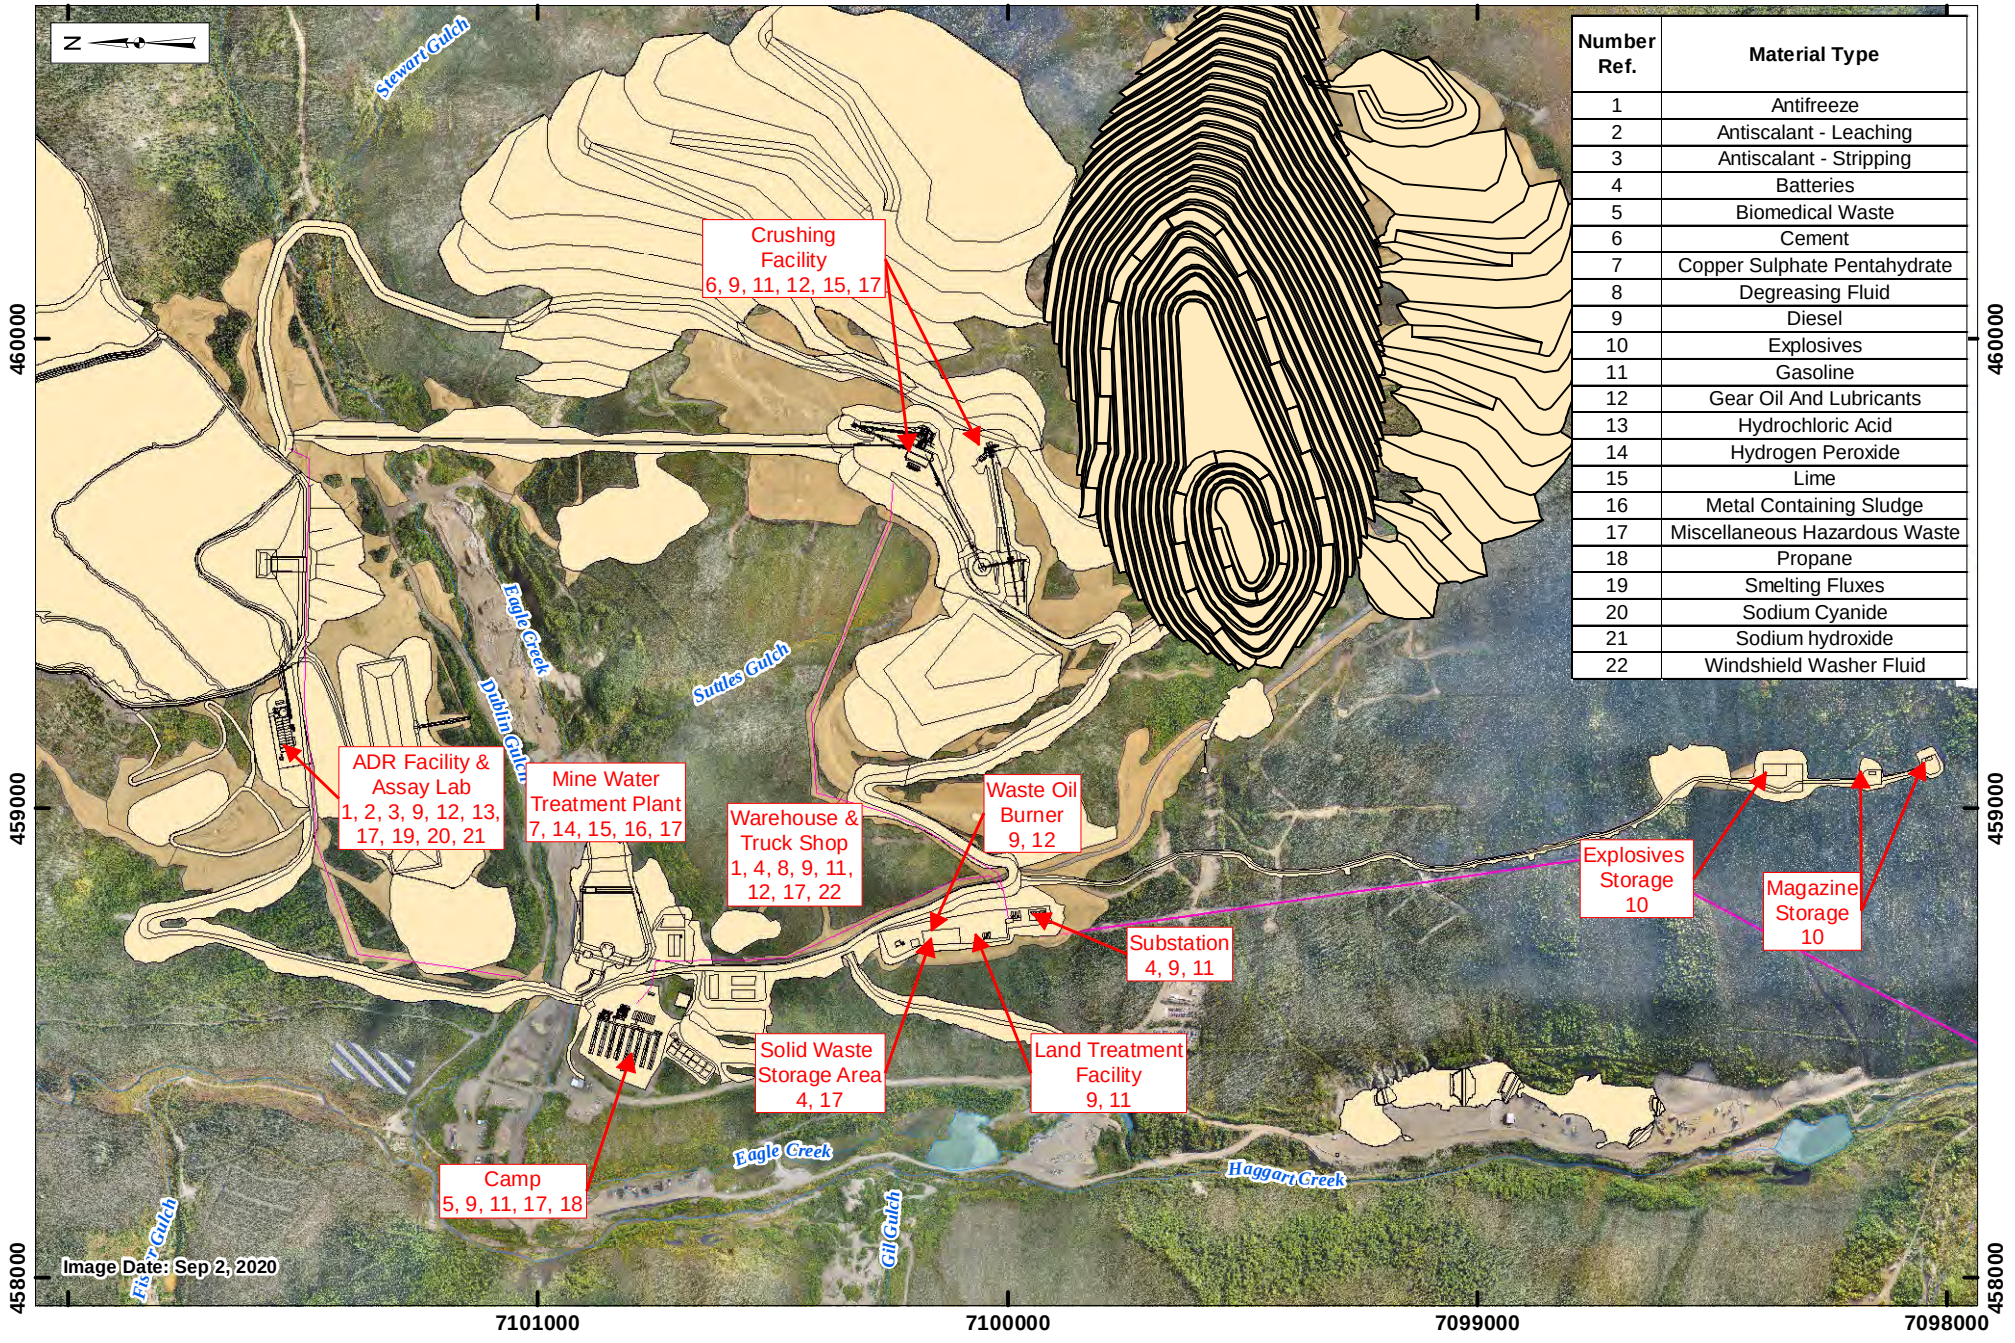
Safety Data Sheets (SDS) for all hazardous substances used for the Project at risk of spills are provided in Appendix D.

Table 2.2-1: Reportable Spill Thresholds

Substance Name	Type	TDGA Class	Reportable Threshold
Propane	Petroleum product	2	Any amount of gas from a container larger than 100 L, or where the spill results from equipment failure, error, or deliberate action or inaction
Acetylene	Petroleum product	2	Any amount of gas from a container larger than 100 L, or where the spill results from equipment failure, error, or deliberate action or inaction
Oxygen	Gas	2	Any amount of gas from a container larger than 100 L, or where the spill results from equipment failure, error, or deliberate action or inaction
Gasoline	Petroleum product	3	200 L (any amount if spilled into a watercourse)

Substance Name	Type	TDGA Class	Reportable Threshold
Diesel	Petroleum product	3	200 L (any amount if spilled into a watercourse)
Jet A & B Aviation Fuel	Petroleum Product	3	200 L (any amount if spilled into a watercourse)
Antifreeze	Solvent	9	5 L (any amount it spilled into a watercourse)
Lubricating and Hydraulic Oils	Lubricating oil	n/a	200 L (any amount if spilled into a watercourse)

Table 2.2-2: Reportable Spill Thresholds for Special Waste



Substance Type	Time period	Reportable Threshold
Special Waste that may cause an adverse effect	N/A	Any amount
Solid Special Waste	24 hours	500 g
	30 days	5 kg
Liquid Special Waste	24 hours	500 ml
	30 days	5 L
Mixture of Solid and Liquid Waste	24 hours	500 g or 500 ml whichever is less
	30 days	5 kg or 5 L whichever is less

2.3 NON-REPORTABLE SPILLS

Spilled materials which are below the reporting thresholds are not required to be reported externally; however, all spills (whether reportable externally or not) must be reported internally to the VGC Environmental Department, and the VGC Environmental Department will maintain a record of all spills. The VGC Spill Report Form (Appendix B) is to be used by all contractors and Victoria Gold employees who first observe a spill. Non-reportable spills will be handled according to the Spill Response Procedure described in Section 3 of this Plan. After any non-reportable spill is controlled and cleaned up, the Environmental Department will complete the Spill Response Form and perform an inspection of the area as required. Spill cleanup supplies used for the response must be replenished by area supervisors.

2.4 STORAGE LOCATIONS AND USE OF HAZARDOUS MATERIALS

Hazardous materials used on site and storage locations are described in the Solid Waste and Hazardous Materials Management Plan and shown on Figure 2.4-1. VGC will ensure that spill kits compatible with the type and volume of material stored and used are available at sites where hazardous materials are stored and used.

Number Ref.	Material Type
1	Antifreeze
2	Antiscalant - Leaching
3	Antiscalant - Stripping
4	Batteries
5	Biomedical Waste
6	Cement
7	Copper Sulphate Pentahydrate
8	Degreasing Fluid
9	Diesel
10	Explosives
11	Gasoline
12	Gear Oil And Lubricants
13	Hydrochloric Acid
14	Hydrogen Peroxide
15	Lime
16	Metal Containing Sludge
17	Miscellaneous Hazardous Waste
18	Propane
19	Smelting Fluxes
20	Sodium Cyanide
21	Sodium hydroxide
22	Windshield Washer Fluid

3 SPILL RESPONSE PROCEDURE

The immediate priority in the event of a spill is to ensure the safety of any personnel in the immediate vicinity and to minimize the potential impact to the environment due to a sustained release of hazardous material. The implementation of spill containment measures and site cleanup and remediation will only be undertaken when safety is assured and the source of the release has been controlled.

In the case of a small spill, for example an overturned drip tray or a small coolant leak noticed under equipment, the first observer should immediately try to contain the spill. This can be done by using a drip tray, or placing absorbent pads under the leak.

Before responding to any large spill, it is important to first STOP and THINK:

- Identify hazards
- Assess Risks
- Control Risks

The priority sequence for spill response is as follows:

1. **ENSURE SAFETY**
    - Identify the spilled material (if not possible, assume dangerous)
    - Use Personal Protective Equipment (PPE)
    - Ensure the safety of nearby personnel
    - Remove all ignition sources – no smoking
2. **FIRST AID**
    - Call for assistance if necessary
    - Attend to the injured
    - Begin first aid immediately as required by following the guidelines from SDS for the substance released
3. **STOP THE FLOW (IF POSSIBLE)**
    - Close valves, shut off pumps and plug holes or leaks (if safe to do so)
4. **NOTIFY YOUR SUPERVISOR AND/OR SPILL RESPONSE TEAM**
    - Provide basic information of spill – What, Who, Where, When and How
    - Activate Spill Response Team
5. **SECURE THE AREA**
    - Limit access to the spill area and prevent unauthorized entry

6. CONTAIN THE RELEASE

- Block off and protect drains, culverts, and other drainage structures which are not designated for spill management
- Use dykes, berms, trenches, ditches or sorbent material from spill kits to control the spilled substances

7. CLEAN-UP

- Under the direction of the Spill Response Team or Environmental Personnel, begin clean-up activities

8. REPORT THE SPILL

- The Environmental Manager, or designate, will report the spill to the appropriate agencies.

9. CONDUCT INCIDENT INVESTIGATION

- Undertake appropriate corrective and preventative action and document all activities on the Spill Report Form

3.1 SPILL RESPONSE EQUIPMENT

Spill kits will be available at all hazardous materials storage sites and transfer areas shown in Figure 2.4-1. Spill kits will also be available in hazardous material transporters, heavy equipment and light trucks. Spill kits will contain booms, sorbent materials, shovels and PPE, and fire extinguishers will be located in close proximity to assist in responding to a possible spill incident involving flammable materials. Spill kits will also contain a kit inventory sheet to assist with monthly inspections and the replenishment of spent supplies and equipment. The VGC Environmental Department will be responsible for monthly spill kit inspections. The area supervisors will be responsible for the replenishment of spent supplies and equipment, and ensuring that their worksite is equipped with a fully stocked 50 Gallon Spill Response Kit. Spare spill response supplies will be maintained on site to replenish spill kits and to be deployed to other locations in the event of a spill requiring additional equipment or as a replacement until spent, location specific, kits can be replenished.

If there is a risk of spills on open water, surface booms will be available for deployment.

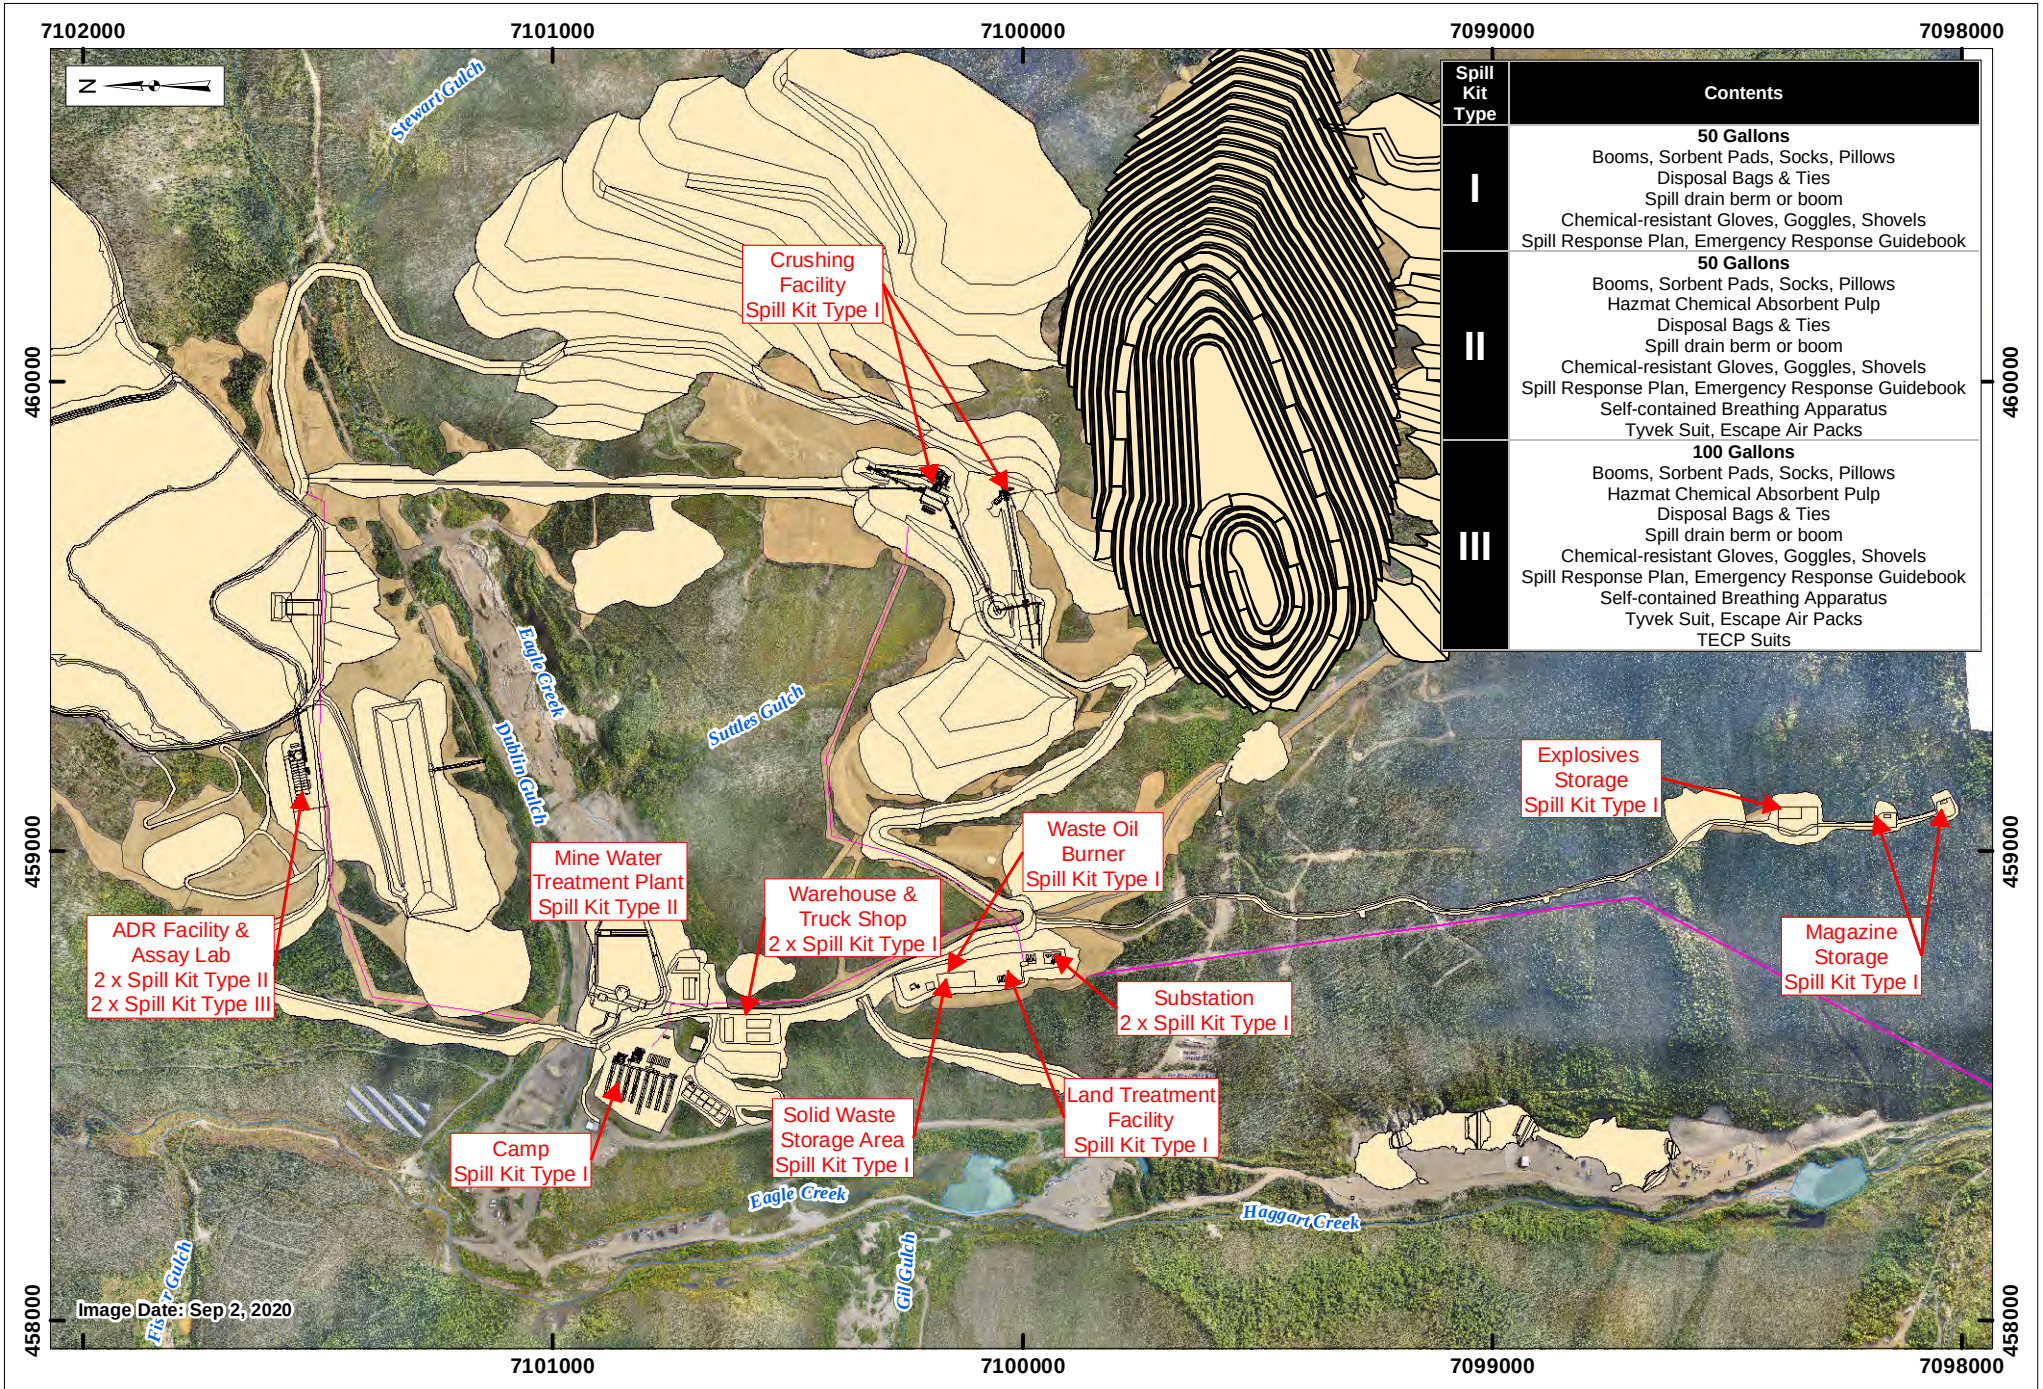
All spill kits will include the 2016 Emergency Response Guidebook which has been developed jointly by Transport Canada (TC), the U.S. Department of Transportation (DOT), the Secretariat of Transport and Communications of Mexico (SCT) and with the collaboration of CIQUIME (Centro de Informaciòn Quìmica para Emergencias) of Argentina, for use by fire fighters, police, and other emergency services personnel who may be the first to arrive at the scene of a transportation incident involving dangerous goods.

The Emergency Response Guidebook is a guide to aid first responders in quickly identifying the specific or generic hazards of the material(s) involved in the incident, and protecting themselves and the general public during the initial response phase of the incident.

Figures 3.1-1 and 3.1-2 provide the location of Spill Response Equipment and Table 3.1-1 provides an inventory of anticipated Spill Response Equipment located around the Project Site. Area

supervisors are responsible for ensuring spill response equipment is sufficient for the substances and tasks being performed at their respective locations.

Table 3.1-1: Inventory of Spill Response Equipment Planned for the Project



Location	Type of Equipment
ADR Facility and Assay Lab – Reagent Storage area	2X100 Gallon Spill response carts containing: ▪ Booms, sorbent pads, socks, dikes, pillows ▪ Hazmat Chemical Absorbent Pulp ▪ Disposal bags and Ties ▪ Spill drain berm or boom ▪ Spill Response Plan ▪ Emergency Response Guidebook ▪ Chemical-resistant gloves ▪ Goggles This location will also be equipped with the following: ▪ Self-contained breathing apparatus ▪ Tyvek suit ▪ Totally-Encapsulating Chemical Protective (TECP) suits ▪ Escape air packs (10 minute)
ADR Facility and Assay Lab – At each reagent handling area	2X50 Gallon Spill kits containing: ▪ Sorbent Pads, Socks, Pillows ▪ Disposal Bags and Ties ▪ Hazmat Chemical Absorbent Pulp ▪ Spill drain berm or boom ▪ Chemical-resistant Gloves ▪ Tyvek suit ▪ Goggles ▪ Spill Response Plan ▪ Emergency Response Guidebook This location will also be equipped with the following: ▪ Self-contained breathing apparatus ▪ Escape air packs (10 minute)
Mine water treatment plant (to be built)	1X100 Gallon Spill response carts containing: ▪ Booms, sorbent pads, socks, dikes, pillows ▪ Hazmat Chemical Absorbent Pulp ▪ Disposal bags and Ties ▪ Chemical-resistant Gloves ▪ Goggles ▪ Spill drain berm or boom ▪ Spill Response Plan ▪ Emergency Response Guidebook This location will also be equipped with the following: ▪ Self-contained breathing apparatus ▪ Escape air packs (10 minute)

Location	Type of Equipment
Truck shop (permanent shop to be built)	2 X 50 Gallon Spill kits containing: ▪ Booms, Sorbent Pads, Socks, Pillows ▪ Disposal Bags and Ties ▪ Granular Absorbent ▪ Spill drain berm or boom ▪ Chemical-resistant Gloves ▪ Goggles ▪ Spill Response Plan ▪ Emergency Response Guidebook
Crushing and screening plants	1 X 50 Gallon Spill kits containing: ▪ Sorbent Pads, Socks, Pillows ▪ Disposal Bags and Ties ▪ Granular Absorbent ▪ Spill drain berm or boom ▪ Chemical-resistant Gloves ▪ Goggles ▪ Spill Response Plan ▪ Emergency Response Guidebook This location will also be equipped with the following: ▪ Respirators (requires fit testing)
Fuel storage areas	1 X 50 Gallon Spill kits containing: ▪ Sorbent Pads, Socks, Pillows ▪ Disposal Bags and Ties ▪ Granular Absorbent ▪ Spill drain berm or boom ▪ Chemical-resistant Gloves ▪ Goggles ▪ Spill Response Plan ▪ Emergency Response Guidebook
Explosives storage facility	1 X 50 Gallon Spill kits containing: ▪ Sorbent Pads, Socks, Pillows ▪ Disposal Bags and Ties ▪ Granular Absorbent ▪ Spill drain berm or boom ▪ Chemical-resistant Gloves ▪ Goggles ▪ Spill Response Plan ▪ Emergency Response Guidebook
Explosives magazine	1 X 50 Gallon Spill kits containing: ▪ Sorbent Pads, Socks, Pillows ▪ Disposal Bags and Ties ▪ Granular Absorbent ▪ Spill drain berm or boom

Location	Type of Equipment
	▪ Chemical-resistant Gloves ▪ Goggles ▪ Spill Response Plan ▪ Emergency Response Guidebook
Camp	1 X 50 Gallon Spill kits containing: ▪ Booms, Sorbent Pads, Socks, Pillows ▪ Disposal Bags and Ties ▪ Granular Absorbent ▪ Spill drain berm or boom ▪ Chemical-resistant Gloves ▪ Goggles ▪ Spill Response Plan ▪ Emergency Response Guidebook
Solid Waste Storage Area	1 X 50 Gallon Spill kits containing: ▪ Sorbent Pads, Socks, Pillows ▪ Disposal Bags and Ties ▪ Granular Absorbent ▪ Spill drain berm or boom ▪ Chemical-resistant Gloves ▪ Goggles ▪ Spill Response Plan ▪ Emergency Response Guidebook
Substation	2 X 50 Gallon Spill kits containing: ▪ Sorbent Pads, Socks, Pillows ▪ Disposal Bags and Ties ▪ Granular Absorbent ▪ Spill drain berm or boom ▪ Chemical-resistant Gloves ▪ Goggles ▪ Spill Response Plan ▪ Emergency Response Guidebook
Inside mine vehicles: Fuel carts Utility vehicles Explosive transport vehicles Emergency response vehicles	Vehicle spill kits containing: ▪ Sorbent Pads, Socks and Pillows ▪ Disposable Bags and Ties ▪ Granular Absorbent ▪ Neoprene Drain Cover ▪ Chemical-resistant Gloves ▪ Goggles ▪ Shovels ▪ Spill Response Plan ▪ Emergency Response Guidebook
Strategic locations along access road	1 X 50 Gallon Spill kits containing: ▪ Booms, Sorbent Pads, Socks, Pillows

Location	Type of Equipment
	▪ Disposal Bags and Ties ▪ Granular Absorbent ▪ Chemical-resistant Gloves ▪ Goggles ▪ Spill Response Plan ▪ Emergency Response Guidebook

An inventory of spill kits will be maintained and routine inspections will be carried out to ensure that they are suitably stocked. SDS will be available for the substances used in the area serviced by the kit.

Spill Kit Type	Contents
I	**50 Gallons** Booms, Sorbent Pads, Socks, Pillows Disposal Bags & Ties Spill drain berm or boom Chemical-resistant Gloves, Goggles, Shovels Spill Response Plan, Emergency Response Guidebook
II	**50 Gallons** Booms, Sorbent Pads, Socks, Pillows Hazmat Chemical Absorbent Pulp Disposal Bags & Ties Spill drain berm or boom Chemical-resistant Gloves, Goggles, Shovels Spill Response Plan, Emergency Response Guidebook Self-contained Breathing Apparatus Tyvek Suit, Escape Air Packs
III	**100 Gallons** Booms, Sorbent Pads, Socks, Pillows Hazmat Chemical Absorbent Pulp Disposal Bags & Ties Spill drain berm or boom Chemical-resistant Gloves, Goggles, Shovels Spill Response Plan, Emergency Response Guidebook Self-contained Breathing Apparatus Tyvek Suit, Escape Air Packs TECP Suits

3.2 DUTIES AND RESPONSIBILITIES

To ensure human safety and limit potential environmental effects resulting from a spill, all site personnel will have specific responsibilities when responding to a spill. The responsibilities for spill response are summarized in Table 3.2-1 and depicted in Figure 3.2-1.

Table 3.2-1: Position and Responsibilities of Personnel Involved in Spill Response

Position	Responsibilities
All Personnel (Discoverer)	▪ Assess the initial severity of the spill and safety concerns ▪ Identify the source of the spill ▪ Ensure the safety of nearby personnel ▪ Begin first aid immediately as required ▪ Report all spills to Supervisor and Environmental Coordinator as soon as possible ▪ Determine the size of the spill and, if safe to do so, stop or contain it ▪ Remove all ignition sources if safe to do so ▪ Participate in spill response as a member of cleanup crew under the direction of the Spill Response Team
Supervisors	▪ Contact the Mine Manager ▪ Report to the site of the spill ▪ Gather information on the spill (substance, location, approximate area/quantity, in water, etc.) ▪ Participate in spill response as a member of cleanup crew under the direction of the Spill Response Team
Emergency Response/Spill Response Team	▪ Report to the site of the spill ▪ Assume primary role for first aid (Emergency Response Team) ▪ Stop or contain the spill ▪ Remove all ignition sources ▪ Take appropriate response measures – deploy booms, absorbents, and other equipment and materials as required ▪ Continue cleanup as directed by Mine Manager or Environmental Coordinator
Mine Manager	▪ Report to the site of the spill or Incident Command Centre (if Emergency Response Team has been deployed) ▪ Coordinate initial and ongoing response efforts ▪ Ensure source of spill has stopped and contain spill ▪ Record spill information ▪ Ensure a log book of all spill or unauthorized discharge occurrences is maintained ▪ Ensure coordination of equipment and personnel as needed ▪ Oversee the cleanup operation until it is satisfactorily completed ▪ Decide with the Environmental Coordinator if mobilization of additional equipment, resources or personnel is warranted
Environmental Manager / Designate	▪ Report to the site of the spill ▪ Report the spill to the Yukon 24-Hour Spill Report Line and Energy Mines and Resources - Client Services and Inspections ▪ Ensure timely response and cleanup of spill site and impacted areas

Position	Responsibilities
	▪ With the Mine Manager, decide if additional equipment, resources or personnel is required for containment and remedial activities ▪ Notify senior management ▪ With the Mine Manager and senior management, discuss and implement additional external reporting if it is required ▪ Oversee completion and distribution of Spill Report ▪ Ensure investigation identifies measures to prevent similar spills
Chief Operations Officer / Designate	▪ Communicate with the media for large spills when required. ▪ Ensure that all press releases are accurate and in accordance with policy ▪ Make financial decisions on major expenses during large spill response ▪ Oversee preventative measures to ensure risk of a similar incident is mitigated

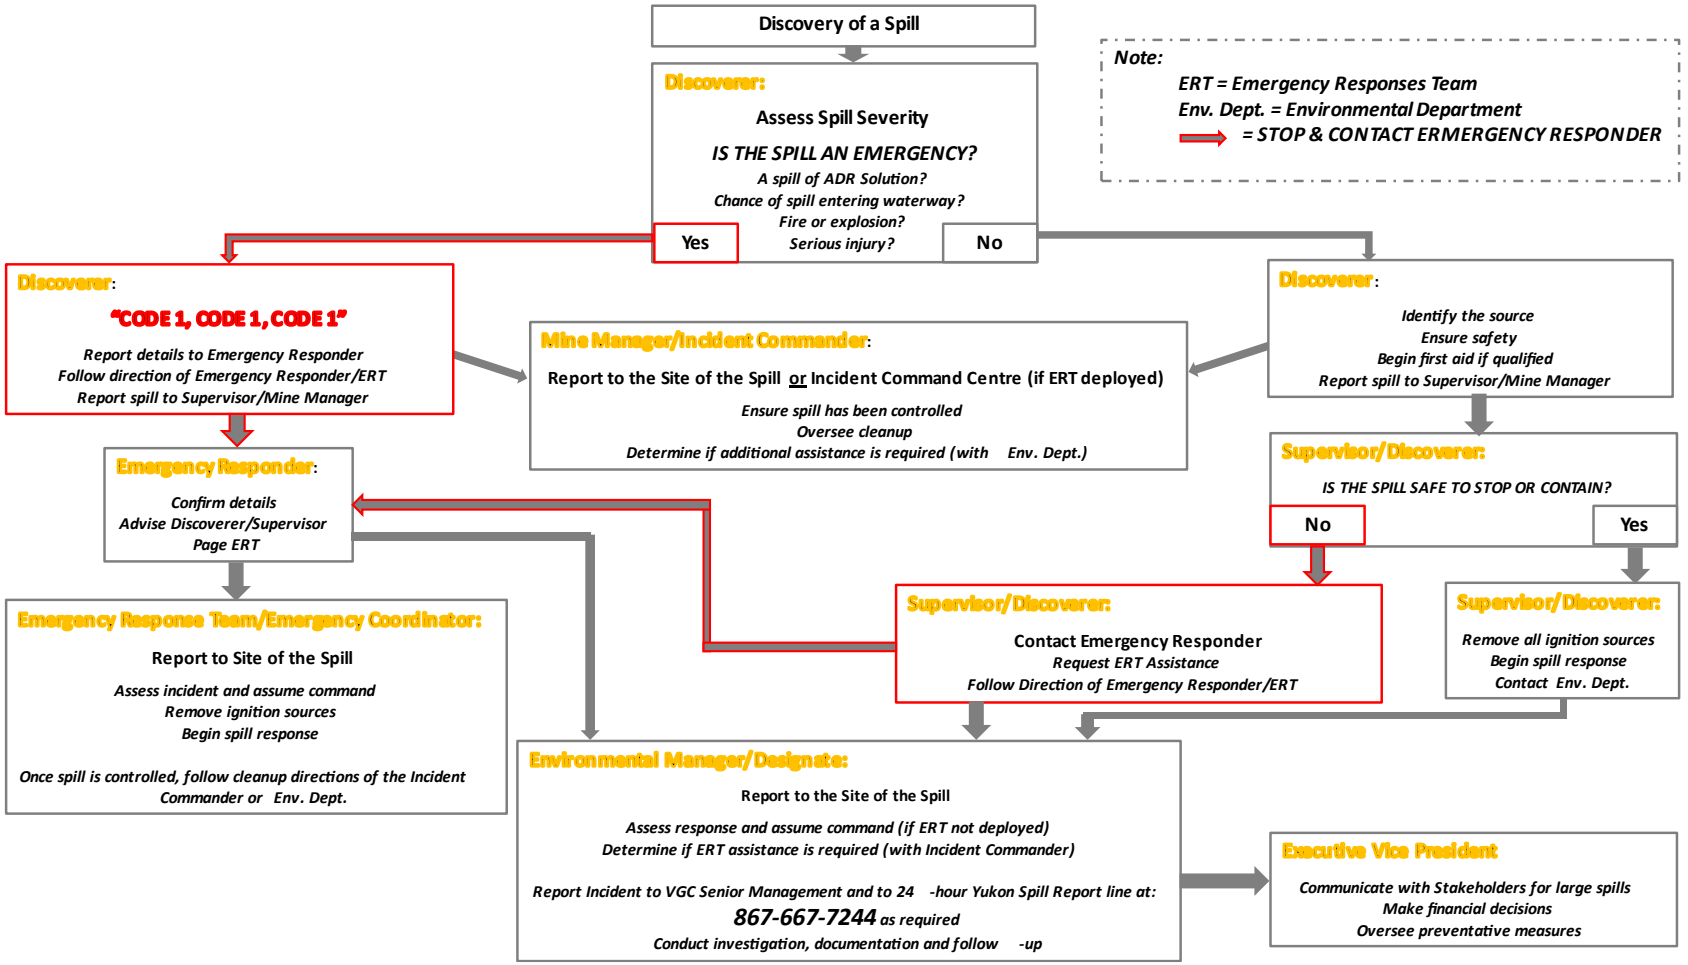

Figure 3.2-1: Spill Response Procedure

3.3 CONTAINMENT AND CLEANUP PROCEDURES

Containment methods for spills vary depending on the substance, size of the spill, location (inside buildings or outside), terrain and soil type, proximity to watercourses, climatic conditions and the availability of equipment and personnel.

Spill containment and response steps for each substance that could be spilled are summarized in Table 3.3-1 and Appendix C.

Table 3.3-1: Spill Containment Procedures by Substance

Substance Name	Type	TDGA Class	PPE required for Spill Response	Cleanup or disposal method
Propane	Petroleum product	2	Insulated gloves, safety glasses, respirator if there is a possible of oxygen reduction (confined spaces with poor ventilation)	Shut off flow and remove ignition sources if safe to do so and evacuate area. Consult supplier if container needs disposal.
Acetylene	Petroleum product	2	Insulated gloves, safety glasses, respirator	Shut off flow and remove ignition sources if safe to do so and evacuate area. Consult supplier if container needs disposal.
Oxygen	Gas	2	Insulated gloves, safety glasses	Allow gas to dissipate. Consult supplier if container needs disposal.
Gasoline	Petroleum product	3	Chemical-resistant impervious gloves, safety glasses, respirator if ventilation is inadequate	Approach from upwind, contain and collect spillage with sorbents from spill kits and/or sand and gravel. Pump free liquid into containment. Arrange for transport of material to an approved facility.
Diesel	Petroleum product	3	Chemical-resistant impervious gloves, safety glasses	Approach from upwind and contain and collect spillage with sorbents from spill kits and/or sand and gravel. Pump free liquid into containment. Arrange for transport of material to an approved facility.
Jet A & B Aviation Fuel	Petroleum Product	3	Chemical resistant gloves, safety glasses	Use sorbents, pump free liquid into containment. Arrange for transport of material to an approved facility.
Antifreeze	Solvent	9	Chemical-resistant impervious gloves, safety glasses	Approach from upwind, contain and collect spillage with sorbents from spill kits and/or sand and gravel. Pump free liquid into containment. Arrange for transport of material to an approved facility.
Lubricating and Hydraulic Oils	Lubricating oil	n/a	Chemical-resistant gloves, safety glasses.	Approach from upwind, contain and collect spillage with sorbents from spill kits and/or sand and gravel. Pump free liquid into containment. Arrange for transport of material to an approved facility.

Various practical methods of containment and recovery have been proven and effective for use in northern climates on land, snow ice or in open water. These methods are summarized in Table 3.3-2.

Table 3.3-2: Spill Containment Procedures by Location

Spill location	Response Actions	Containment Methods	Limitations	Required resources
Snow and Ice	▪ Stop spill source ▪ Eliminate ignition sources ▪ Block entry to waterways with snow dyke or other barrier ▪ Trench or ditch to intercept or contain spill ▪ Compact snow around spill to increase retention ▪ Contain or collect contaminated snow	Snow or Ice dykes	▪ Best suited for flat areas in winter ▪ Requires sufficient snow or ice	▪ Shovels ▪ Heavy equipment
		Snow or Ice trench	▪ Requires sufficient snow or ice ▪ Only applicable when ice is >1m thick ▪ Generally requires mechanical equipment for construction on ice	▪ Shovels ▪ Heavy equipment ▪ Ice chain saws
		Sorbent berm	▪ Requires sufficient, readily available sorbent material ▪ Impractical for larger spills	▪ Sorbents
Land	▪ Stop spill source ▪ Eliminate ignition sources ▪ Block entry to waterways with sand or gravel dyke ▪ Trench or ditch to intercept or contain spill ▪ Deploy sorbents ▪ Recover liquids with pumps or vacuum equipment	Sand or gravel dykes	▪ Best suited for flat areas ▪ Requires sufficient, easily excavated material if hand tools are being used	▪ Shovels ▪ Heavy equipment ▪ Sandbags or liner material if available ▪ Pump out equipment
		Land trench	▪ Can be difficult to excavated if soil is frozen ▪ Not conducive to areas with shallow bedrock	▪ Shovels ▪ Heavy equipment ▪ Pump out equipment
		Sorbent berm	▪ Requires sufficient, readily available sorbent material ▪ Impractical for larger spills	▪ Sorbents
Open Water	▪ Stop spill source ▪ Eliminate ignition sources ▪ Deploy sorbent booms or containment booms to control spread of substance	Sorbent boom	▪ Requires sufficient, readily available sorbent material ▪ No suitable for fast moving watercourses	▪ Sorbents
		Containment boom	▪ Requires sufficient, readily available sorbent material	▪ Sorbents

An effective way of controlling spills on land is through the construction of trenches or berms using sand and gravel. Small spills may be contained manually using shovels. More substantial spills may require the use of heavy equipment to dig trenches or place berm material.

Since snow has absorbent and containment properties, snow can be very effective for containing spills. Liquid spills typically become immobile within the snow pack and can be easily removed for transport

and disposal. Snow will be used to its advantage in the construction of snow dykes, and whenever possible, the snow pack will be left in place to avoid contaminating the underlying substrate. For spills on ice, the methods of containment are similar to those used on land.

Spills occurring on open water (e.g. water retention ponds) will spread very rapidly, and therefore, initial preventative measures such as those described in Table 3.3-1 will be taken to minimize the potential for spills to enter open water. In the event of a petroleum product spills on open water, booms will be deployed immediately to limit the spread of the product and to facilitate recovery, by absorbents or by pumping.

3.4 OFF-SITE RESOURCES

With the exception of medical aid incidents, external resources will be authorized only by the Mine Manager or designate, or those with a higher level of responsibility. Key municipal, territorial and federal services and contact numbers are provided in Table 3.4-1.

Table 3.4-1: Municipal, Territorial and Federal Services and Contact Numbers

Name	Office	Location
Canutec – Emergency Response for TDG spill	**613-996-6666** or ***666 on a cellular phone**	Ottawa
Mayo Nursing Station	867-996-4444	Mayo
Mayo Fire & Rescue	867-996-2222	Mayo (Volunteer Responders)
Mayo RCMP	Emergency: 867-996-5555 Admin: 867-996-2677	Mayo
Whitehorse Regional Hospital - Emergency and Admissions	867-393-8700	Whitehorse
Environment Yukon Conservation Officer – Sean Cox	867-996-2202	Mayo
Environment Yukon Conservation Officer Services Branch	867-667-8005	Whitehorse
First Nation of Na-cho Nyäk Dun	867-996-2265	Mayo
Environment Yukon Fish and Wildlife Branch	867-667-5715	Whitehorse
Fisheries and Oceans Canada	867-393-6722	Whitehorse
Yukon Energy Corporation	867-996-2387	Mayo

Name	Office	Location
Yukon Energy Corporation	1-800-676-2843	After hours Whitehorse
Yukon Workers' Compensation Health and Safety Board, Chief Mines Safety Officer, Occupational Health & Safety Branch - Michael Henney	867-667-8739	Whitehorse
Yukon Workers' Compensation Health and Safety Board 24-Hour Emergency Line for Reporting Serious Workplace Incidents and Injuries	867-667-5450	Whitehorse
Canadian Wildlife Services (CWS) Pacific and Yukon Region	1-800-668-6767	Delta, BC
TIPP (Turn in Poachers and Polluters)	1-800-661-0525	Whitehorse, YT

3.5 FIRE SUPPRESSION

The Fire Response Procedure in the Emergency Response Plan must be implemented in the event of a fire.

Fire suppression equipment will be located at all hazardous materials storage, transfer and dispensing areas. If a spill of a flammable substance occurs and is ignited, firefighting efforts may be required prior to spill containment and cleanup. Personnel will be made aware of substance specific dangers prior to conducting fire suppression activities.

Any individual discovering a fire is responsible for attempting to control it and notifying his or her supervisor (Note: Any attempt to control the fire should be made without exposing oneself to risk or injury).

An individual should never enter a smoke-filled environment without self-contained breathing apparatus, appropriate protective clothing and proper training. If a fire is not immediately extinguished and poses an active threat to human health or the environment, then a 'Code 1' call that describes the size and location of the fire must be activated. Immediately notify the Mine Manager in such an event.

In the event that the Mine Manager deems that site wide evacuation is necessary, all personnel must gather at the appropriate muster station so that transport from the site can be arranged, and all mine personnel can be accounted for.

The Mine Manager or designate must:

- Take and remain in charge of firefighting activities until the fire is extinguished
- Ensure all personnel not involved are evacuated to a safe zone and instructed to be on standby for deployment on firefighting duties

- Identify all fire extinguishers used in the firefighting effort and ensure they are serviced, tested, re-charged, and returned for re-use.

3.6 CONTAMINATED SOIL

Sampling procedures for material potentially contaminated by a spill and analytical methods for contamination locations and clean-up areas will adhere to the requirements of the Yukon Environment Protocol for the Contaminated Sites Regulation (CSR) under the *Environmental Act*, specifically Protocol No. 3: Soil Sampling Procedures at Contaminated Sites and Protocol No. 5: Petroleum Hydrocarbon Analytical Methods and Standards.

Hazardous materials that cannot be re-used or recycled locally will be handled in accordance with VGC's Solid Waste and Hazardous Materials Management Plan.

VGC operates and maintains a land treatment facility authorized under Yukon Environment Permit No: 24-047. The facility is utilized for the progressive treatment and remediation of potentially hydrocarbon and coolant contaminated soils. The land treatment facility is located adjacent to the waste management and incinerator area and consists of a bermed, geo-membrane lined cell with access apron and is sloped such that run-off from the area is contained and treated prior to release to the receiving environment as required.

Hydrocarbon and coolant contaminated soils are stored within the land treatment facility and remediated by regular tilling (aeration) and standard northern bioremediation practices. Runoff from the facility will be collected in a sump and treated via an oil water separator in the sump prior to discharge to ground. Remediation treatment will occur in summer months only.

Soils are tested for contaminant concentrations prior to treatment in accordance with the characterization sampling protocols of the CSR.

3.6.1 Confirmatory Soil Sampling

For spills to ground that require removal of potentially contaminated materials, confirmatory soil sampling is conducted according to Protocol No. 3: Soil Sampling Procedures at Contaminated Sites of the CSR.

Following excavation of contaminated material, the floor and walls of the excavation must be sampled and analyzed to confirm that no contaminated material remains at that location or to identify any contaminated material remaining at the removal location. A minimum of 5 samples must be taken from the faces of the excavation: one from each wall and one from the excavation floor. Depending on the extent of excavation, additional samples are required as follows: one sample per 10 metres (m) running length and one sample per 3 m depth. If any of the characterization samples demonstrate that the excavated material is highly contaminated, one sample must be taken for each 5 m running length and for each 3 m running depth. In the case of the excavation floor, one sample must be collected for each 10 m running length and for each 10 m running width.

For shallow excavations not exceeding 0.20 m in depth, step out samples are to be collected adjacent to each excavation boundary in lieu of wall samples at a frequency of one sample for each 10 m

running length or for each 5 m running length if any of the characterization samples demonstrate that the excavated material is highly contaminated. Floor samples are to be collected as outlined above.

When conducting confirmatory sampling at large sites, at least the first five confirmatory samples for each contaminant plume at any site must be analyzed for VPH, LEPH, HEPH, BTEX + Styrene, and all regulated PAHs. After that, only every tenth confirmatory sample needs this analysis; the remainder can be analyzed for VHS6-10, EPHS10-19, and EPHS19-32.

Full protocol sampling as described above is not always applicable. Although the Yukon CSR policy does not always default to no sampling, discussions between Yukon Environment, CMI-Major Mines, and VGC Environmental Manager and Superintendent (November 20, 2020) confirmed that minor spills resulting in less than 1 m^3 of excavated materials do not require confirmatory samples. The excavation volume of 1 m^3 will trigger the full protocol sampling as described above. The CMI Inspector will be informed on a regular basis of non-reportable spills exceeding 1 m^3 with details and results of the confirmatory sampling.

3.6.2 Characterization Sampling

Characterization sampling is required for all potentially contaminated materials prior to deposit and treatment in the site LTF. Ex-situ sampling of materials may be conducted for initial characterization purposes in situations where emergency response is required (i.e., immediate excavation of recent spills). Ex-situ sampling for characterization purposes will be the standard at the site based on protocols for immediate spill response and contaminant removal, in-situ will not occur unless historical spills are identified.

When characterizing contaminated material, at least the first five samples for each contaminant plume must be analyzed for BTEX + Styrene and PAHs. If more than five samples are taken from a single plume, the remainder can be analyzed only for VHS6-10, EPHS10-19, and EPHS19-32. The samples analyzed for BTEX + Styrene and PAHs should be taken from the area thought to be the most contaminated.

In addition, and in accordance with the LTF permit, characterization sampling will occur at a rate of one sample per 50 m^3 for material intended to be placed in the LTF. These sample may represent combined contaminated materials from different spills at the site, as typically spills on site generate much less than 50 m^3 of material requiring treatment. Hydrocarbon and glycol contaminated materials will continue to remain separated within the LTF.

4 INTERNAL AND EXTERNAL REPORTING

Any spill for which external reporting is required, as described in Section 2.2, will be reported to the 24-hour Yukon Spill Report Line. The reporting sequence below will be followed to allow for an efficient and effective response, completion of an accurate spill report, and timely notification of VGC management, government agencies, and First Nations.

- The First Observer (the person who discovers the spill) will identify the source and report to his/her direct supervisor.
- The supervisor will gather spill information and provide to the Mine Manager and Environmental Manager or designate.
- The Environmental Manager or designate will record the information regarding the spill and forward it to the Mine Manager.
- The Environmental Manager or designate will report the spill to VGC senior management and the 24-hour Spill Report Line and the Department of Energy, Mines and Resources - Client Services and Inspections, and to the Yukon Water Board Waterline online registry, as well as overseeing the completion and distribution of spill-related information.
- The Environmental Manager and senior management will determine responsibility for reporting to the FNNND within 24 hours as required.

5 TRAINING REQUIREMENTS

All personnel on site involved with the handling, use, storage and transportation of hazardous substances will be trained in the procedures for responding to and reporting of spills. Training topics will include:

- Workplace Hazardous Materials Information System (WHMIS) – renewed every 3 years and mandatory for all new hires
- Transportation of Dangerous Goods
- Hazmat training will be delivered to Emergency Response Team members

The following spill related topics will be covered during site orientation for all relevant personnel:

- Responsibilities of personnel
- Causes of spills and preventative measures
- Control, containment and cleanup methods for various spill locations
- Emergency contact information and location
- Storage and disposal of materials used on site
- Reporting requirement and procedure
- Overview of Spill Response Plan
- PPE requirements for handling potential spill materials

6 BEST MANAGEMENT PRACTICES

VGC will incorporate best management practices (BMPs) into all work procedures and plans. BMPs relating to spills are outlined below.

6.1 HEALTH AND SAFETY

VGC will implement a system of workplace inspections to ensure that procedures put in place to prevent incidents and accidents relating to hazardous materials are followed. This system will identify levels of hazard, which will trigger immediate work stoppages, and levels of hazards, which will trigger notification of management. This system will ensure that work does not continue with inadequate provisions for health and safety and those personnel are empowered to address unsafe or potentially unsafe scenarios.

Specifically, in relation to hazardous materials, the following will be provided:

- Engineering controls and engineered hazardous material handling mechanisms to ensure that manual handling and ergonomic issues do not exacerbate the risk associated with working with hazardous materials.
- Monitoring systems for detection of hazardous solution and gaseous leaks.
- PPE designed for use in handling the various types of hazardous materials.
- Communication systems with emergency response capabilities.
- SDS for all hazardous materials will be readily available anywhere these products are stored or used.
- A copy of the SDSs will be accessible in the site offices.
- Emergency contact information will be posted and kept current.

6.2 SPILL PREVENTION

All relevant personnel that will use or handle hazardous materials will receive WHMIS training and will be trained in proper handling, spill response, and PPE use specific to their job tasks.

No lubrication, refueling or maintenance of equipment is permitted to occur within 30 m of watercourses or wetlands. All fueling and lubrication of equipment will be conducted in a manner that minimizes the possibility of spills with containers, hoses and nozzles kept free of leaks and all fuel nozzles equipped with functional automatic shutoffs.

Sodium cyanide will be mixed with water in a well-ventilated area and maintained at a high pH to prevent the evolution of hydrogen cyanide gas.

The following mitigation measures will be implemented to minimize the potential for transportation incidents that could result in a hazardous substance spill:

- VGC will work with the Department of Highways and Public Works to ensure the access road is properly maintained.
- Speed limits will be strictly enforced for all Project vehicles.
- VGC will ensure trucking and hauling contractors have appropriate driver training, radio contact capabilities, properly maintained vehicles, and spill response capabilities.
- VGC will ensure all hazardous materials are transported and handled in accordance with the *Transportation of Dangerous Goods Act.*
- Signage will be posted along the access road to the Project to ensure non-Project traffic is aware of radio protocols.
- Wildlife migration corridors and crossings along the access road will be identified and signage provided in high-risk areas.
- Wildlife crossing and escape points will be plowed in the access road snow banks.
- VGC will have on-site personnel with emergency first aid training to provide primary care in the event of an accident, and will implement the appropriate components of the Emergency Response Plan for the Project.

6.3 SPILL RESPONSE

All site personnel will be familiar with VGC's Spill Response Plan, and their duties and responsibilities. Storage sites will be well labeled, and SDS are accessible in storage areas. This Spill Response Plan will be kept current, and made available to all personnel. VGC will ensure that suitable spill kits are used for spill response and that personnel are trained in using the spill response equipment.

6.4 STORAGE OF HAZARDOUS MATERIALS

The Solid Waste and Hazardous Materials Management Plan, describes the method of storage of hazardous materials for the Project. VGC will ensure that all hazardous materials are stored with secondary containment structures, either in the form of concrete foundations with curbed sides or double walling of the primary container. Hazardous material storage areas will be well labeled and access to the storage areas will be restricted.

Spill response equipment will be available at hazardous materials storage locations and will be inventoried, maintained and inspected monthly. Signage will be clearly visible in storage, dispensing and transfer areas. Fire extinguishers and/or fire suppression systems will be located at all hazardous material storage locations. Fuel and lubrication materials will be stored a minimum of 30 m from natural watercourses.

6.5 FUEL TRANSFER PROCEDURES

All personnel responsible for transfer, storage, transportation or handling of fuel will be trained in safe work practices for fuel and lubricants.

Caches of spill response materials will be placed along the South McQuesten Road and the Haggart Creek Road, including at the Haggart Creek crossing. Project personnel will have appropriate emergency response and spill contingency training and knowledge; equipment, materials and procedures will be maintained to limit consequences of releases of fuel or oil to the terrestrial or aquatic environment through prompt containment and clean-up.

6.5.1 Spill Protection and Prevention

Spill prevention will be undertaken through ensuring that accepted standard operating procedures are employed for the safe and secure transfer of hazardous materials from product transporters and within the Project site. Hazardous materials will be stored in areas that have containment structures such as concrete foundations with curbed sides. Hazardous material handling will be undertaken within the concrete foundations. Equipment handling hazardous materials will be inspected regularly and any inadequacies will be reported to maintenance personnel and repaired prior to continuation with work.

Spills will be responded to using the methods described in this Plan, according to what type of substance and what surface they occur on, as described in Section 3.3 and Appendix C. Routine inspections and maintenance will be conducted at hazardous material storage and transfer areas. Storage areas will be kept clean through good housekeeping practices.

6.5.2 Dispensing

Storage containers will be stored properly, and will not be over filled. Operating procedures will be established to minimize the potential for fuel spills during dispensing. All personnel handling fuel will be trained on these procedures.

6.6 ROUTINE MONITORING

Monitoring and maintenance is essential in the prevention of spills, and the effective handling of potential spills.

6.6.1 Maintenance

Maintenance procedures will be posted in applicable service areas. Maintenance personnel will be trained and familiar with the procedures. Regular checks will be performed on storage and dispensing equipment to identify any potential problems. If the regular checks identify issues, repairs are to be made prior to continued use of the piece of equipment. Spill response equipment will be kept stocked and maintained, and maintenance logs will be kept.

6.6.2 Perimeter Assessment

The following outlines items that will be identified during inspection:

- Signs of leakage from storage containers, loss of material, cracks, holes etc.
- Signs of inadequacy of secondary containment structures

- Unexpected solution or gaseous emissions will be thoroughly investigated to determine the source and nature of the emissions.
- Discoloration, oily discharges or any unusual odours.

6.6.3 Hazardous Material Storage and Transfer Areas

The following outlines items that will be identified during inspection:

- Spills or stains on the ground.
- Losses of material from storage containers.
- Cracks or damage to storage containers.
- Emergency shut off systems in place, functioning and clearly marked.
- Spill kits are available, adequate and accessible.
- Procedures posted for reference, SDS are available

APPENDIX A

Assessment, Licence and Permit Requirements for Spill Prevention and Response

THIS PAGE INTENTIONALLY LEFT BLANK

Assessment, Licence and Permit Requirements for Spill Prevention and Response

Document, License or Permit	Section Number	Requirement
Final Screening Report and Recommendation: Terms and Condition of Recommendation	11	As proposed, the Proponent shall ensure a certified cyanide transporter is used and appropriate driver training, radio contact capabilities, vehicle maintenance, and emergency clean-up kits will be on trucks carrying NaCN. Furthermore, the Proponent shall ensure that emergency clean-up kits include equipment to contain NaCN as well and material to protect from, and respond to, cyanide toxicity in spill responders.
Final Screening Report and Recommendation: Terms and Condition of Recommendation	23	The proponent shall ensure that the following communication elements are in the ERP: a) Notification to management, regulatory agencies, outside response providers and medical facilities of the cyanide emergency. b) Notification to potentially affected communities of the cyanide related incident and any necessary response measures. c) Communication protocols with the media.
Final Screening Report and Recommendation: Proponent Commitments	97	SGC will implement the following to maximize road and transport safety: a) Ensure trucking/hauling contractors have appropriate driver training, radio contact capabilities, vehicle maintenance requirements, and spill response capabilities b) Ensure all hazardous materials are transported and handled in accordance with the Transport of Dangerous Goods Act and Regulations
Final Screening Report and Recommendation: Proponent Commitments	98	SGC commits to the following spill prevention and response measures: a) If there is any doubt regarding the size of a spill, material involved, and whether it is reportable, SGC will err on the side of caution and report the spill. b) Caches of spill response materials will be placed along the access road as required by the Spill Contingency Plan, including the Haggart Creek Crossing. c) Project staff will have appropriate emergency response and spill contingency training and knowledge. Equipment, materials, and procedures will be maintained to limit the consequences of releases to the environment through prompt containment and clean-up. d) Fuels, hydrogen peroxide, and other hazardous liquids will be transferred from tanker trucks to storage tanks by enclosed lines, hoses, and pumps equipped with pressure transducers and volume counters to ensure tanks cannot be overfilled. e) No lubrication, refuelling or maintenance of equipment will occur within 30 m of wetlands or watercourses. f) All fuelling and lubrication of construction equipment will be carried out in a manner that minimizes the possibility of spills. All containers, hoses, and nozzles will be free of leaks and all fuel nozzles equipped with functional automatic shut-offs. g) Where stationary equipment cannot be relocated more than 30 m from a watercourse, it will be situated in a designated area that has been bermed and lined with an impermeable barrier with a holding capacity equal to 125% of the largest tank within the berm. h) Equipment operators will be appropriately trained in spill response procedures and carry spill kits capable of handling spills on land and water.

Assessment, Licence and Permit Requirements for Spill Prevention and Response

Document, License or Permit	Section Number	Requirement
Final Screening Report and Recommendation: Proponent Commitments	110	SGC is committed to developing and implementing Environmental Management Plans with the following components: a) Spill Contingency Plan
Final Screening Report and Recommendation: Proponent Commitments	112	The ERP will include the following commitments: a) Resource inventories of personnel, equipment, first aid kits, spill kits, and clean-up materials will be maintained on-site and updated regularly. These inventories will also contain information on external resources available off-site (e.g., RCMP, fire department, other mining establishments in the vicinity). b) All staff on site will receive basic training, including environmental awareness, general emergency response, spill contingency measures, and communication procedures. Truck drivers transporting hazardous materials will also receive additional training on spill response, hazardous material handling, and emergency driving techniques. All security personnel will be trained in first aid.
Final Screening Report and Recommendation: Proponent Mitigations	26	Prevent and respond to all potential spills.
Final Screening Report and Recommendation: Proponent Mitigations	59	Fuel, hazardous material and explosives will be managed according to industry standards including; storage in appropriate containers; containment areas sized to hold the larger of 110% of the largest tank or 10% of the total maximum volume of all tanks in the facility; and storage of explosives in separate buildings away from the rest of the mine activities.
Quartz Mining License QML-0011	9.1	The Licensee must immediately implement the relevant component of the environmental management system if a spill or release of dangerous or hazardous substances or materials occurs at site.
Class 4 Mining Lands Approval LQ00303b	6	All spills must be reported immediately to the 24-Hour Yukon Spill Reporting Line (867) 667-7244 and to the Mining Inspections Division (867) 456-3882.
Class 4 Mining Lands Approval LQ00303b	37	A spill contingency plan for petroleum products and other hazardous waste must be prepared and posted in the camp and at all fuel handling locations used in carrying out the exploration program. The spill plan shall include reporting to EMR-CSI Mining Inspections and the Chief to ensure compliance with spill reporting requirements.
Class 4 Mining Lands Approval LQ00303b	38	All spill clean-up equipment and material must be maintained in a state of readiness sufficient at all times to contain and clean-up any hazardous material spills.
Class 4 Mining Lands Approval LQ00303b	39	If a spill occurs, the spill contingency plan must be immediately implemented and notice given to the 24-hour Yukon Spill Report Line. As soon as practicable, an inspector must be contacted. Whatever remedial action is required to clean-up the spill and reclaim the affected land and water must be taken.
Class 4 Mining Lands Approval LQ00303b	40	Routine maintenance areas where heavy equipment is serviced or repaired should be inspected regularly for minor spills and stored waste hydrocarbons.
Class 4 Mining Lands Approval LQ00303b	41	Any contaminated soils should be excavated and contained for eventual land farm treatment at an approved facility.

Assessment, Licence and Permit Requirements for Spill Prevention and Response

Document, License or Permit	Section Number	Requirement
Type B Water Use Licence QZ16-006	19	Where a spill or an unauthorized discharge occurs, that is of a reportable quantity under the Yukon Spills Regulations, the Licensee shall immediately contact the 24-hour Yukon Spill Report number, (867) 667-7244 and implement the Spill Contingency Plan. A detailed written report on any such event including, but not limited to, dates, quantities, parameters, causes and other relevant details and explanations, shall be submitted to the Board not later than 10 days after the occurrence.
Type B Water Use Licence QZ16-006	20	The Licensee shall apply the relevant procedures in the Spill Contingency Plan. The Licensee shall review the Spill Contingency Plan annually and shall provide a summary of that review, including any revisions to the plan, as a component of the annual report.
Type B Water Use Licence QZ16-006	21	The Licensee shall maintain a log book of all spill or unauthorized discharge occurrences, including spills that are less than the reportable quantities under the Yukon Spills Regulations. The log book shall be made available at the request of an Inspector. The log book shall include, but not necessarily be limited to the: a) date and time of the spill or unauthorized discharge occurrence; b) substance spilt or discharged; c) approximate amount spilt or discharged; d) location of the spill; e) distance between the spill or discharge and the nearest Watercourse; and f) remedial measures taken to contain and clean-up the spill area or to cease the unauthorized discharge.
Type B Water Use Licence QZ16-006	22	The Licensee shall include a summary of all spills or unauthorized discharges that occurred during the year reported, as part of the annual report.
Type B Water Use Licence QZ16-006	23	All personnel shall be trained in procedures to be followed and the equipment to be used in the containment of a spill.
Type B Water Use Licence QZ16-006	24	Prior to the commencement of construction. the Licensee shall update the Spill Contingency Plan and provide the updated plan to the Board.
Type B Water Use Licence QZ16-006	25	The Spill Contingency Plan shall be posted on site for the duration of the works.
Type B Water Use Licence QZ16-006	26	Ten days prior to construction, the Licensee shall submit material safety data sheets to the Board for all petroleum products and/or hazardous materials that are to be present during this undertaking.
Type B Water Use Licence QZ16-006	27	Fuel, lubricants, hydraulic fluids, coolants and similar substances shall be stored and/or transferred a minimum of 30 metres from the Natural Boundary of any Watercourse, in such a way that said substances are not deposited in or allowed to be deposited in waters.
Type A Water Use Licence QZ14-041-1	127	Where a spill or an unauthorized discharge occurs, that is of a reportable quantity under the Yukon Spills Regulations, the Licensee must immediately contact the 24-hour Yukon Spill Report number, (867) 667-7244 and implement the Spill Contingency Plan. A detailed written report on any such event including, but not limited

Assessment, Licence and Permit Requirements for Spill Prevention and Response

Document, License or Permit	Section Number	Requirement
		to, dates, quantities, parameters, causes and other relevant details and explanations, must be submitted to the Board not later than 10 days after the occurrence.
Type A Water Use Licence QZ14-041-1	128	The Licensee must apply the relevant procedures in the Spill Contingency Plan. The Licensee must review the Spill Contingency Plan annually and must provide a summary of that review, including any revisions to the plan, as a component of the annual report.
Type A Water Use Licence QZ14-041-1	129	The Licensee must maintain a log book of all spill or unauthorized discharge occurrences, including spills that are less than the reportable quantities under the Yukon Spills Regulations. The log book must be made available at the request of an Inspector. The log book must include: a) Date and time of the spill; b) Substance spilt or discharged; c) Approximate amount spilt or discharged; d) Location of the spill; e) Distance between the spill or discharge and the nearest Watercourse; and f) Remedial measures taken to contain and clean-up the spill area or to cease the unauthorized discharge.
Type A Water Use Licence QZ14-041-1	130	The Licensee must include a summary of all spills or unauthorized discharges that occurred during the year reported, as part of the annual report.
Type A Water Use Licence QZ14-041-1	131	All relevant personnel must be trained in procedures to be followed and the equipment to be used in the containment of a spill.
Type A Water Use Licence QZ14-041-1	132	The Spill Contingency Plan must be posted on site for the duration of the Project.
Type A Water Use Licence QZ14-041-1	133	Fuel, lubricants, hydraulic fluids, coolants and similar substances must be stored and/or transferred a minimum of 30 meters from the Natural Boundary of any Watercourse, in such a way that said substances are not deposited in waters.

Reportable Spill Thresholds

THIS PAGE INTENTIONALLY LEFT BLANK

Reportable Spill Thresholds, Personal Protective Equipment and Clean-up Method by Substance FOR UNUSED PRODUCTS

Substance Name	Type	TDGA Class	Reportable Threshold	PPE required for Spill Response	Cleanup or disposal method
Propane	Petroleum product	2	Any amount of gas from a container larger than 100 L, or where the spill results from equipment failure, error, or deliberate action or inaction	Insulated gloves, safety glasses, respirator if there is a possible of oxygen reduction (confined spaces with poor ventilation)	Shut off flow and remove ignition sources if safe to do so and evacuate area. Consult supplier if container needs disposal.
Acetylene	Petroleum product	2	Any amount of gas from a container larger than 100 L, or where the spill results from equipment failure, error, or deliberate action or inaction	Insulated gloves, safety glasses, respirator	Shut off flow and remove ignition sources if safe to do so and evacuate area. Consult supplier if container needs disposal.
Oxygen	Gas	2	Any amount of gas from a container larger than 100 L, or where the spill results from equipment failure, error, or deliberate action or inaction	Insulated gloves, safety glasses	Allow gas to dissipate. Consult supplier if container needs disposal.
Gasoline	Petroleum product	3	200 L (any amount if spilled into a watercourse	Chemical-resistant impervious gloves, safety glasses, respirator if ventilation is inadequate	Approach from upwind, contain and collect spillage with sorbents from spill kits and/or sand and gravel. Pump free liquid into containment. Arrange for transport of material to an approved facility.
Diesel	Petroleum product	3	200 L (any amount if spilled into a watercourse)	Chemical-resistant impervious gloves, safety glasses	Approach from upwind and contain and collect spillage with sorbents from spill kits and/or sand and gravel. Pump free liquid into containment. Arrange for transport of material to an approved facility.
Jet A & B Aviation Fuel	Petroleum Product	3	200 L (any amount if spilled into a watercourse)	Chemical resistant gloves, safety glasses	Use sorbents, pump free liquid into containment. Arrange for transport of material to an approved facility.
Antifreeze	Solvent	9	5 L	Chemical-resistant impervious gloves, safety glasses	Approach from upwind, contain and collect spillage with sorbents from spill kits and/or sand and gravel. Pump free liquid into containment. Arrange for transport of material to an approved facility.
Lubricating and Hydraulic Oils	Lubricating oil	n/a	200 L (any amount if spilled into a watercourse)	Chemical-resistant gloves, safety glasses.	Approach from upwind, contain and collect spillage with sorbents from spill kits and/or sand and gravel. Pump free liquid into containment. Arrange for transport of material to an approved facility.

Reportable Spill Thresholds, Personal Protective Equipment and Clean-up Method by Substance
FOR USED/WASTE PRODUCTS

Substance Type	Time period	Reportable Threshold
Special Waste that may cause an adverse effect	N/A	Any amount
Solid Special Waste	24 hours	500 g
	30 days	5 kg
Liquid Special Waste	24 hours	500 ml
	30 days	5 L
Mixture of Solid and Liquid Waste	24 hours	500 g or 500 ml whichever is less
	30 days	5 kg or 5 L whichever is less

1 INTRODUCTION

On February 21, 2020 at approximately 10:30 pm, a reportable diesel spill occurred on Victoria Gold (Yukon) Corp's (VGC) Eagle Gold Mine Heap Leach Facility (HLF) Phase 1B area. The spill occurred at approximate UTM coordinates 0459419 E, 7102263 N, elevation 1044 meters above sea level (masl) (Figure 1.1-1). A fuel and lube maintenance truck was performing service on a dozer that required the PTO pump to be engaged in order to operate the maintenance truck compressor. While the fuel pump was not actively fueling machinery during this service, the fuel pump discharge line separated from the engaged, pressurized fuel pump, releasing diesel contained within the fuel tank rapidly onto the adjacent frozen ground and snow. The volume of diesel was conservatively estimated based on the volume of fuel that was missing from the fuel tank after the release occurred. The fuel pump was immediately shut off when the spill was identified and absorbent spill pads were deployed onto the ground. Site characterisation and material excavation followed spill response efforts.

Soil sampling and excavation of potentially impacted materials was undertaken on three separate occasions between the date of the spill occurrence to mid-April when remediation efforts were completed. Materials recovered from the site of the spill were transported to a lined, bermed temporary storage area adjacent to the current inert waste landfill site (0458977 E, 7101651 N). Communication with a Yukon Government Department of Energy, Mines and Resources (EMR) Senior Natural Resource Officer (SNRO) was ongoing during the spill response and remediation. Approximately 314 m^3 of potentially impacted soils was excavated from the spill location and relocated to the lined temporary storage area. Results of the analysis of soil samples taken of the exposed area upon completion of the third round of excavation displayed concentrations below Yukon Contaminated Sites Regulations (CSR) standards for hydrocarbons related to diesel product. The final excavated area was covered with clean fill from the surrounding area and compacted.

Remediation efforts at the spill site are now considered complete. The VGC Environment department will continue to monitor the contaminated material within the temporary holding cell for water management issues.

2 RELEASE DETAILS

The below description of events and sampling efforts provides an overview of all notification, sampling and remedial efforts undertaken to address this spill. This information has been previously provided to the EMR Senior Natural Resource Officer and the Manager of Lands and Resources for the First Nation of Na-Cho Nyak Dun (FNNND). Photo documentation during the spill remediation process are provided in Appendix A, and referred to in the event descriptions in Section 2.1.

2.1 EVENT TIMELINE AND DESCRIPTION

Date	Description
February 21, 2020	• Spill of diesel from the fuel and lube maintenance truck occurs at 22:30 (Photo 1). The spill was identified by the presence of a diesel odour (Photo 2). Once identified, the fuel truck pump was immediately shut down; the spill was contained to the flat laydown area below the fuel truck. Spill volume was estimated at 4000 L based on reconciling the fuel tank quantity before and after the spill. The spill was contained in the immediate spill area, impacting snow and soils. Spill location is approximately 1 kilometer away from all watercourses.
February 22, 2020	• Spill reported to Spill Reporting Hotline at 13:00 and logged as Spill #20-006 under the Yukon Government tracking system. • EMR SNRO was called directly to report the spill the morning of February 22nd. • Spill notification email sent to EMR SNRO and the FNNND Lands and Resources Manager at 2:00pm. • Spill limits delineated based on visual staining and presence of diesel odour; marked with stakes and flagging; impacted area delineated of approximately 20 m x 25 m. • Soil samples taken at the four corners of the staked spill limits. • 1st round of excavation removes the top layer of material within the staked spill limits and stockpiles adjacent to spill area.
February 23, 2020	• Ongoing 1st round of excavation initiated on February 22, 2020 (Photo 3). Excavated material was stored adjacent to the spill site on flat ground. Frozen conditions at the time ensured that spill migration resultant of potential melt would not occur.
February 24, 2020	• Composite samples were taken from aggregated spill material piles resultant of the excavation.

Date	Description
February 25, 2020	• Additional details related to spill volume, location and site characteristics provided to EMR SNRO in order for SNRO to assess risk level, spill is subsequently classed at Risk Level 2, not requiring a follow up Spill Order.
February 27, 2020	• Local Mayo based EMR Natural Resource Officer visits site to photo document spill location on behalf of SNRO.
March 3, 2020	• Interim Spill Report submitted to EMR SNRO, FNNND Lands and Resources Manager, and uploaded to Yukon Water Board Waterline website in accordance with the Type A Water Use Licence for the Project (Appendix B). • Due to the volume of material from the 1st round of excavation and potential additional material to be removed, preparation was initiated of a lined, bermed area adjacent to the Inert Waste Landfill on flat ground for temporary storage of contaminated soils.
March 4, 2020	• 2nd round of excavation to remove additional materials commences, based on visual staining and presence of diesel odour. Excavation efforts are focused to the north and eastern corners of the delineated spill area based on laydown topography, visual staining and odour.
March 10, 2020	• Analytical results for soil samples taken February 22 and 24 received. • Evaluation of the second round of excavation for next steps (Photo 4).
March 11, 2020	• Soil confirmatory samples taken from floor and walls of area exposed by 2nd round of excavation.
March 19, 2020	• Construction of the temporary, lined containment berm completed adjacent to the Inert Waste Landfill (Photo 5).
April 6 – 7, 2020	• 3rd round of excavation was conducted between April 6 – 7, 2020 (Photo 6). Excavation efforts are focused to the areas exhibiting visual staining and presence of diesel odour.
April 15, 2020	• By April 15, 2020 excavated contaminated material has been moved into the completed lined, bermed temporary storage area (Photo 7).
April 18, 2020	• Soil confirmatory soil samples taken from floor and walls of area exposed by 3rd round of excavation.
April 24, 2020	• Analytical results for soil samples taken April 18 received. • Impacted area determined to be remediated based on consideration of analytical results and Yukon CSR standards.

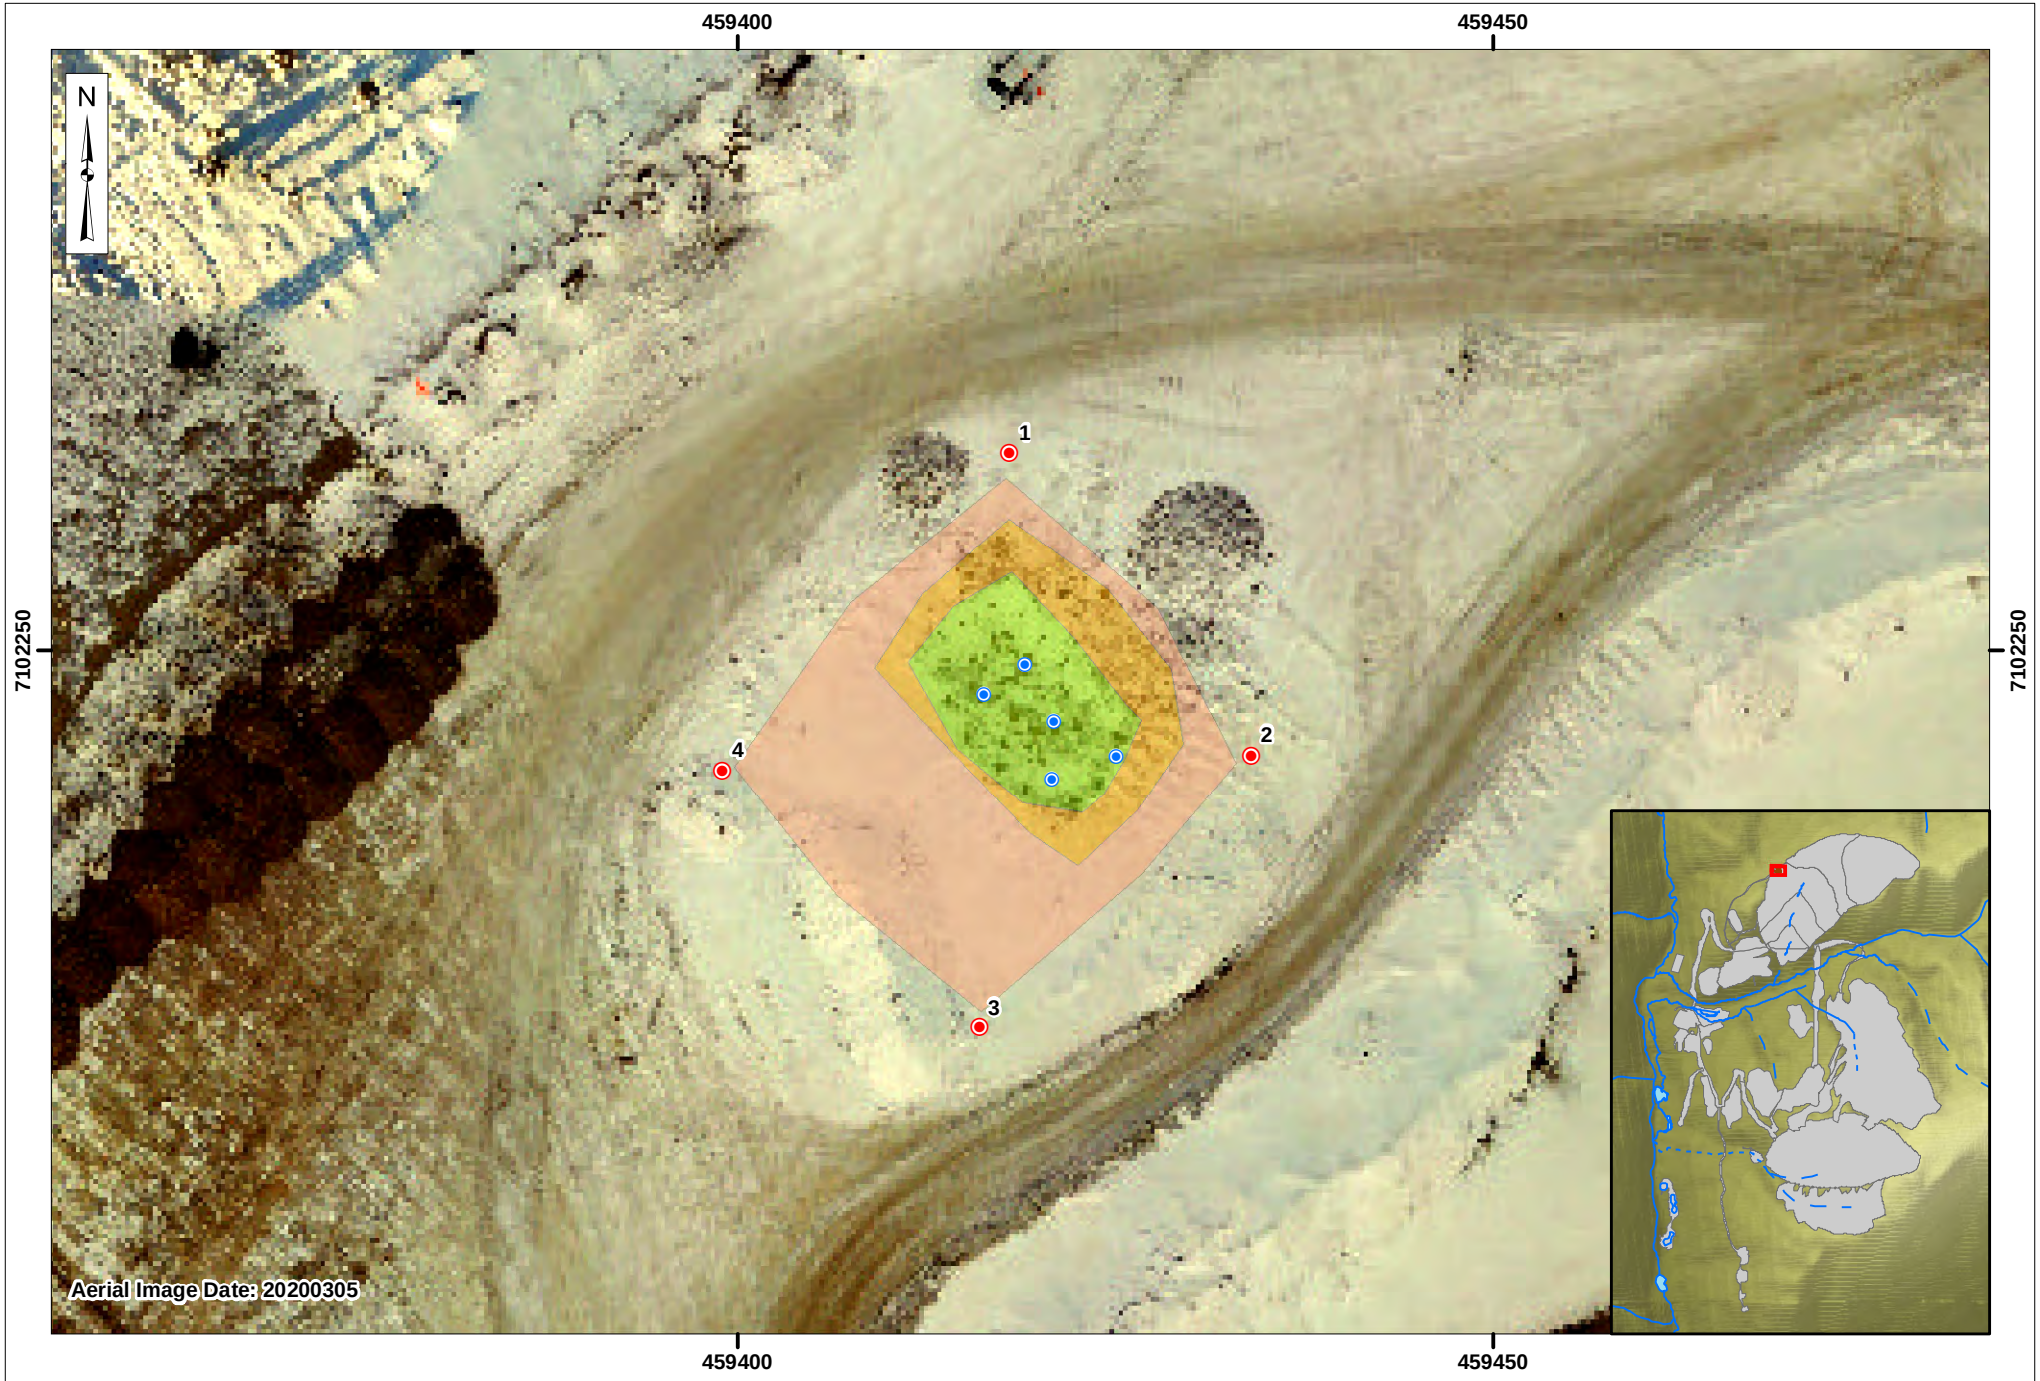
Date	Description
April 27, 2020	• Excavated area backfilled with clean material sourced from the surrounding unimpacted area and compacted.

2.2 SAMPLE RESULTS

Soil sampling was conducted throughout the remediation efforts in accordance with the Yukon Contaminated Sites Regulation (CSR) Protocols, specifically Protocols 2, 3 and 5 and compared to the limits detailed in Schedules 1 and 2 for commercial and industrial sites. Samples were obtained by compositing material from the floor and walls of areas exposed by excavation (Figure 2.2-1). Table 2.2-1 summarizes the compound groups that were analyzed and includes the maximum values determined through laboratory analysis pertinent to the Yukon CSR analytes. Laboratory results are provided in Appendix C.

Soil samples were collected on February 22, 2020 outside of the assumed lateral extent of the spill limits (four corners around the impacted ground), based on visual staining and diesel odour. These four samples had non-detectable concentrations of Light Extractable Petroleum Hydrocarbons (LEPH) and low concentrations (i.e., below Yukon CSR standards) of Polycyclic aromatic hydrocarbons (PAHs) in two corners (north and east), indicating that the assumed spill limits were accurate. The top layer of material was excavated from within these spill limits.

The second round of excavation in early March targeted an area based on site topography, visual staining, and presence of diesel odour within the previously identified spill perimeter. Soil samples were collected on March 11, 2020 after the completion of the second round of excavation. The results indicated LEPH and some PAH compounds above CSR standards for commercial and industrial properties, within the south wall of the excavation and along the southwest and northwest floor of the excavation. VOCs and ethylbenzene were detected in the samples but were below the CSR standards.



The third and final round of excavation was performed in April to further remove potentially impacted material within the area that March samples had confirmed concentrations of LEPH, VOCs, and PAHs. Subsequent confirmatory samples taken on April 18, 2020, following the third round of excavation, showed no exceedance of the Yukon CSR standards for commercial and industrial criteria.

Table 2.2-1 Soil Samples Summary Results February, March, April 2020*

Sample Date	Sample Location	Compound Groups**			
		Ethylbenzene (mg/kg)	VOCs (mg/kg)	LEPH (mg/kg)	PAH (mg/kg)

Spill Soil Sample Locations and Excavations

3 SPILL REPORTING AND MITIGATION

3.1 REPORTING YUKON GOVERNMENT AND FNNND

Notification was submitted to the Yukon Spill Reporting Hotline on February 22, 2020 at 13:00 pm (14.5 hours after the event). Email notification was then sent directly to the EMR SNRO and the FNNND Lands and Resources Manager on February 22, 2020.

Updates and responses to inquiries from both the EMR SNRO and FNNND Lands and Resources Manager were ongoing throughout March, April, and May.

3.2 MITIGATIONS

After the event, the truck fuel system was immediately inspected by the VGC Maintenance Department and was subsequently scheduled for a mechanical upgrade. The mechanical upgrade included the installation of punch lock clamps on the fuel discharge line to ensure a secure connection between the discharge line and the fuel pump for future operations.

The excavation area was covered and compacted with clean backfill sourced from the surrounding unimpacted area. Additionally, HDPE liner required for the continued construction of the HLF will ultimately key into a trench that will cover the current spill area. The installation of the HDPE liner will mitigate future infiltration of precipitation coming into contact with any potential residual contaminants.

4 CLOSURE

Remediation efforts at the spill site are now considered complete. The excavated material relocated to the temporary lined containment berm will continue to be monitored for water management issues throughout 2020. Timing for relocation of this material to the permitted LTF (Permit #24-047) has not yet been determined and will depend on remediation of materials currently within the LTF to allow for their removal. As space allows the temporarily stored material will be relocated into the LTF.

SPILL RESPONSE FORM

StrataGold Corporation

FIRST OBSERVER			
Name & Company:	Victoria Gold Corp.		
Date Observed:	February 21, 2020	**Time Observed:** 10:30 PM	
Location of Spill:	HLF Phase 1B Laydown	**VGC Tracking Number:** VGC20-007	
Distance to Waterbody:	1KM	**Photos Taken?**	☑ Yes ☐ No
Estimated Spill Volume:	4000 L	**Reported to:** ENV	
PERSON/DEPT. RESPONSIBLE FOR SPILL			
Supervisor/Investigator:	Chad Erb, Process Nightshift Supervisor/Trevor Dunn Maintenance		
Date of Spill:	February 21, 2020		
Substance Spilled:	Diesel		
Equipment Involved:	Fuel/Lube Truck 6930-SV-037		
Volume of Contaminated Material:	TBD - Currently excavated 300 m3 soil/rock material		
Personnel Contacted for Disposal (Name):	Environment Dept coordinating with Site Services		
Cause of Spill: (Equipment Failure, vehicle accident, foreign object, etc.)	Fuel/Lube truck was performing service on 403 Dozer. PTO pump on fuel truck was engaged to operate compressor. Hose clamps on the main fuel supply line failed allowing the line to separate from the pump, releasing the diesel into the truck housing and overflowing onto the frozen ground.		
Spill Response Actions Taken: (Containment and/or absorbent materials used, equipment required for clean-up, Pre-trip attached, etc.)	Pump shut off when spill noticed, supervisor was notified and pads laid down. Contaminated material to be excavated and stored on lined, bermed area adjacent to Inert Waste Landfill. Fuel truck discharge line to be upgraded with punch lock clamps. Truck inspections to include complete fuel system inspection. See additional information for detail.		
ENVIRONMENTAL DEPARTMENT USE ONLY			
Spill Line Tracking Number	20-006	**Reportable to Spill Hotline?**	☑ Yes ☐ No
Info Re. Spill Hotline:	Reported to Hotline Feb 22, 2020 at 1300pm and NND & EMR Feb 22

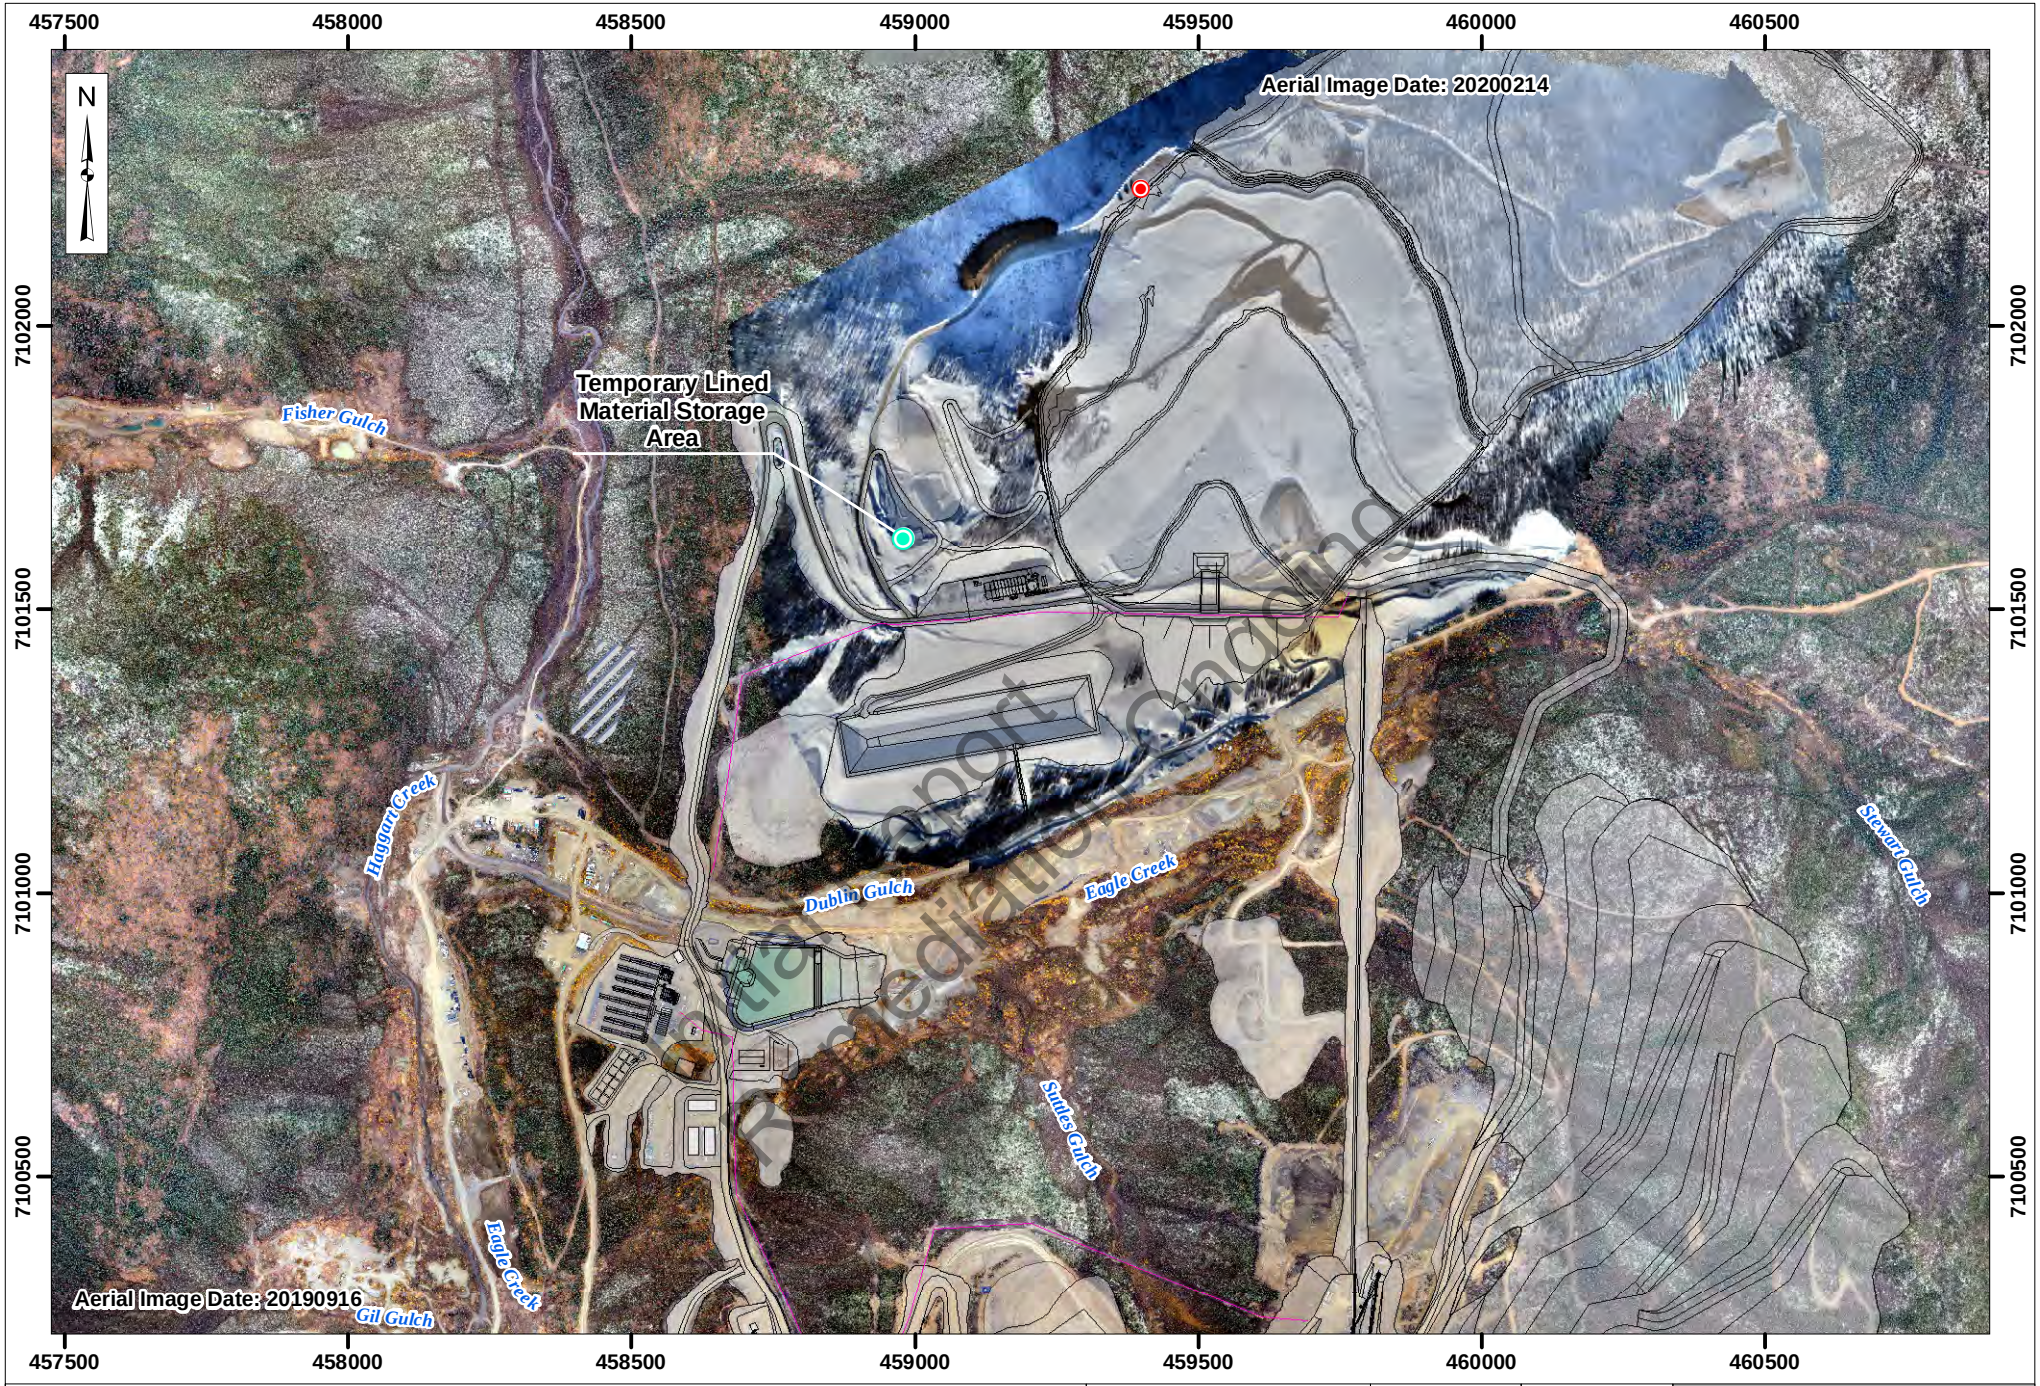
	Additional Information		
Spill Date:	Feb 21, 2020	VGC Spill #	VGC20-007
Volume (L):	4000.0	Yukon Government #	Spill 20-006
Substance	Diesel	Location	HLF Phase 1B laydown

1 Additional Info

1.1 An area of approximately 20m x 25m was delineated as impacted ground (Figure 1).

1.2 A soil sample (4 total) was taken at each corner to delineate the extent of the spill, plus 3 composite samples of the excavated affected material (Figure 2).



1.3 The estimated volume of contaminated material was determined too large to feasibly place in the current half-filled Land Treatment Facility (LTF).

1.4 An alternate plan was developed for temporary storage of the material on a lined, bermed area until current LTF material is tested and removed from the LTF later in 2020.

1.5 Preparation was initiated on two separate lined, bermed areas adjacent to the Inert Waste Landfill on flat ground for temporary storage of contaminated soils and contaminated rock material.

1.6 Excavation of impacted material will continue to the extent possible, based on visual staining, presence of diesel odour, the use of a Petroflag sampling kit, and final confirmatory sampling.

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
%	percent
mg/kg	milligrams per kilogram

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in reports identified as "Preliminary Report" are considered authorized for use.

Qualifiers

Qualifier	*Description*
DLCI	*Detection Limit Raised: Chromatographic interference due to co-elution.*
DLQ	*Detection Limit raised due to co-eluting interference. GCMS qualifier ion ratio did not meet acceptance criteria.*
SUR-ND	*Surrogate recovery marginally exceeded ALS DQO. Reported non-detect results for associated samples were deemed to be unaffected.*

Amendment	: **1**		
Client	: **Victoria Gold (Yukon) Corp.**	Laboratory	: Whitehorse - Environmental
Contact	: Hugh Coyle	Account Manager	: Hilary Woods
Address	: Suite 1000 - 1050 W. Pender St Vancouver BC Canada V6E 3S7	Address	: #12 151 Industrial Road Whitehorse YT Canada Y1A 2V3
Telephone	: 604 682 5122	Telephone	: +1 867 668 6689
Project	: ----	Date Samples Received	: 16-Mar-2020 09:47
PO	: 14043	Date Analysis Commenced	: 18-Mar-2020
C-O-C number	: 20200313	Issue Date	: 06-Apr-2020 10:50
Sampler	: ----		
Site	: ----		
Quote number	: Q68199		
No. of samples received	: 8		
No. of samples analysed	: 8		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Ophelia Chiu	Supervisor - Organics Instrumentation	Organics, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
%	percent
mg/kg	milligrams per kilogram

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in reports identified as "Preliminary Report" are considered authorized for use.

Qualifiers

Qualifier	*Description*
DLCI	*Detection Limit Raised: Chromatographic interference due to co-elution.*
DLQ	*Detection Limit raised due to co-eluting interference. GCMS qualifier ion ratio did not meet acceptance criteria.*

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
%	percent
mg/kg	milligrams per kilogram

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in reports identified as "Preliminary Report" are considered authorized for use.

Qualifiers

Qualifier	*Description*
DLCI	*Detection Limit Raised: Chromatographic interference due to co-elution.*
DLQ	*Detection Limit raised due to co-eluting interference. GCMS qualifier ion ratio did not meet acceptance criteria.*

EAGLE GOLD PROJECT
SPILL RESPONSE FORM

FIRST OBSERVER			
Name & Company:	Victoria Gold Corp.		
Date & Time Observed:	February 28, 2020		
Location of Spill:	Primary Crusher - Rock Breaker VGC Tracking #VGC20-009		
Distance to Waterbody:	1000 m	**Photos Taken?**	☐ Yes ☐ No
Estimated Spill Volume:	378 L	**Reported to:**	Process Supervisor
COMPANY RESPONSIBLE			
Supervisor/Investigator:	Corey Hancock, Process		
Date of Spill:	Majority of release around February 24, 2020, estimated volume.		
Substance Spilled:	Hydraulic Oil		
Equipment Involved:	Primary Crusher - hydraulic line on the Rock Breaker		
Volume of Contaminated Material:	~5 tons soil material collected in supersacks.		
Personnel Contacted for Disposal (Name):	Phil Emerson, Environmental Department		
Cause of Spill: (Equipment Failure, vehicle accident, foreign object, etc.)	A hydraulic line of the rock breaker leaked oil near the swing gear (area situated on a concrete pad adjacent to rock breaker), through multiple leaks over time, resulting in a spill from the concrete pad to ground. The inspection area was covered by excessive quantities of snow so visual inspections could not identify the spill; volume of spill was estimated based on hydraulic line capacity.		
Spill Response Actions Taken: (Containment and/or absorbent materials used, equipment required for clean-up, Pre-trip attached, etc.)	The contaminated soils were collected and placed in poly Super Sacks and stored at the Land Treatment Facility (LTF); the repairs on the Rock breaker hydraulic line are currently underway. Future spill prevention and mitigation includes maintaining good housekeeping around the hydraulics to ensure accuracy of the visual inspections, the hydraulic lines were added to departmental area daily inspections, a spill sock was installed around the edge of the concrete pad supporting the hydraulics system to contain potential leaks, and preventative maintenance is scheduled monthly for rock breaker hydraulics.		
ENVIRONMENTAL DEPARTMENT USE ONLY			
IR#:	Spill Hotline #20-007	**Reportable to Spill Hotline?**	☐ Yes ☐ No
Info Re. Spill Hotline:	Spill reported to Hotline Feb 29, 2020.		
Disposal Container Labelled?	☐ Yes ☐ No	**Samples taken?**	☐ Yes ☐ No
Environmental areas affected: (Watercourse, soil, etc.):	Contaminate snow and soils in immediate vicinity.		
Method of Disposal & Further Remediation Required:	Soils taken to the LTF. No further action required.		
Follow Up Required?	☐ Yes ☐ No	**Follow Up Date:**	N/A

Estimated Spill Volume:	9 L	**Reported to:** Environment	
PERSON/DEPT. RESPONSIBLE FOR SPILL			
Supervisor/Investigator:	Ryan Hogue		
Date of Spill:	March 16, 2020		
Substance Spilled:	Glycol (coolant)		
Equipment Involved:	601 shovel (Cat 6040)		
Volume of Contaminated Material:	9 liters of glycol mixed with rock and dirt (Approximately 500 pounds)		
Personnel Contacted for Disposal (Name):	Katie Babin, ENV dept		
Cause of Spill: (Equipment Failure, vehicle accident, foreign object, etc.)	Equipment Failure: A heater hose in the 601 shovel engine room ruptured spilling approximately 9 liters of coolant to the ground.		
Spill Response Actions Taken: (Containment and/or absorbent materials used, equipment required for clean-up, Pre-trip attached, etc.)	Spill response was immediately initiated and a barrel placed under the leak. Spill pads were put down to absorb most of the coolant on the ground. The contaminated material was placed in the LTF.

EAGLE GOLD PROJECT
SPILL RESPONSE FORM

FIRST OBSERVER			
Name & Company:	Victoria Gold Corp		
Date Observed:	April 3 2020	**Time Observed:** 10:30am	
Location of Spill:	1365 Bench	**VGC Tracking Number:** VGC20-012	
Distance to Waterbody:	N/A	**Photos Taken?**	☑ Yes ☐ No
Estimated Spill Volume:	400L	**Reported to:** Environment	
PERSON/DEPT. RESPONSIBLE FOR SPILL			
Supervisor/Investigator:	Chad Erb		
Date of Spill:	April 3 2020		
Substance Spilled:	Hydraulic Oil		
Equipment Involved:	601 Shovel		
Volume of Contaminated Material:	40m3		
Personnel Contacted for Disposal (Name):	Site Service		
Cause of Spill: (Equipment Failure, vehicle accident, foreign object, etc.)	Mechanical Failure: Upon further investigation, it was determined that two manufacturer stock bolts on the hydraulic manifold of the 601 shovel boom came loose and failed resulting in the release of hydraulic oil to the adjacent ground on the 1365 Phase 2 bench. The bolts were determined to be improperly specified for the hydraulic manifold fittings and the cause of mechanical failure.		
Spill Response Actions Taken: (Containment and/or absorbent materials used, equipment required for clean-up, Pre-trip attached, etc.)	Spill tray and spill pads were used to contain the spill and clean up. Excavator was used to load out contaminated soil into a 740 rock truck and then hauled and deposited into the Land Treatment Facility for remediation.

	Additional Information		
Spill Date:	April 3, 2020	VGC Spill #	VGC20-012
Volume (L):	400	Yukon Government #	20-015
Substance	Hydraulic Fluid	Location	1365 Bench

1 Additional Info

1.1 An area of approximately 10m x 3m was determined to be impacted by the hydraulic fluid release.

1.2 The estimated volume of contaminated material was determined to be approximately 40m3 or one 740 rock truck load (photo 2). The contaminated material was deposited in the Land Treatment Facility (LTF) for subsequent remediation.

1.3 Majority of the release was captured with spill trays and spill kit containment barrels. The remainder of free product that reached the ground surface was soaked up with spill pads and booms (photo 1).

1.4 601 Shovel hydraulic release corrective actions:

1.4.1 After further investigation, it was determined that the root cause of the mechanical failure, which resulted in the release, was improper stock bolts that hold the hydraulic manifold to the 601 shovel boom. The bolts failed due to continued operation and wear on the shovel. The bolts that hold the hydraulic manifold to the shovel boom and the hydraulic lines were evaluated by Finning maintenance technicians on site and subsequently replaced with proper bolts for the fittings. The bolts for the hydraulic manifold of the 602 shovel were proactively changed, upon determining this manufacturer stock defect.

1.4.2 Preventative Maintenance programs: Inspections of the hydraulic manifold and identifying hydraulic lines that have potential for failure from prolonged use and wear have been added to the regular Preventative Maintenance programs of both Shovels operating within the Pit.

1.4.3 Spill Supplies will be posted in work areas of active shovels within the pit and on the machine to ensure rapid response for potential future releases.

1 INTRODUCTION

This report summarizes the events that occurred during the early hours of July 11, 2020 that resulted in a release of process solution from the lined footprint for the Heap Leach Facility (HLF) to soils outside of containment. This report also summarizes the subsequent responses implemented to mitigate this release and to prevent possible reoccurrence. **At the time of this report there has been no detection of total or WAD cyanide in monitored surface water or groundwater downgradient of the HLF.** A low-level detection of total cyanide was received for one soil sample downgradient of the CV-022 road access road. The total cyanide (which includes free cyanide) concentration detected is below all soil quality guidelines for free cyanide provided in the Canadian Soil Quality Guidelines for the Protection of Environmental and Human Health (Canadian Council of Ministers of the Environment, 1999).

On July 11, 2020, at 01:30, during heavy rains, pooling water was reported on the HLF loadout area. At 04:00, inspections of the HLF area identified a channelized flow of rainwater mixed with process solution seeping from the base of the loadout pile adjacent to the Heap Transfer Tower (CV-023) pad. The seep was located about 2 metres above the main east-west access roadway (the HLF Perimeter Road) just to the west of the transformer and E house area, which are situated below the conveyors. The seep emerged outside of the lined containment of the HLF and was observed to commingle with the roadway runoff; however, due to the very low flow of the seep, it was not distinguishable on the roadway.

Investigations during and since the incident indicate a combination of a damaged solution distribution pipe on an upper ore lift of the HLF, heavy rainfall and the extension of the loadout pile beyond lined containment were the primary root causes of the release.

The damaged solution distribution pipeline was isolated and flow shutoff upon discovery. Earthworks (berm construction and ditching) was initiated to contain and stop the source of the seep, as well as contain the release of the seep. The seep was fully contained by 09:00 that morning, and directed back into the lined containment of the HLF. The estimated volume of fluid (i.e., comingled rainfall and process solution) released outside of containment is approximately 4.5m^3. Based on both surface and ground water samples taken, there is no evidence that any potential receiving water bodies or groundwater were affected by process solution. Onsite analyses for free cyanide concentrations in samples collected on the morning of the release from streams downgradient of the seep and HLF showed values below the onsite method detection limit. External laboratory analysis was also actioned on samples collected, and yielded non-detect results for Total or WAD cyanide.

On July 12, 2020, notification was provided to regulators and the First Nation of Nacho Nyak Dun (FNNND) regarding the incident. The following were notified:

- Natural Resource Officer, Inspector Major Mines - Compliance Monitoring and Inspection, Department of Energy, Mines and Resources (EMR)
- Director - Minerals Resource Branch, EMR,
- Enforcement Officer - Enforcement Branch, Environment and Climate Change Canada (ECCC), and
- FNNND Lands and Resources Manager.

Section 1: Introduction

This report provides a detailed chronological event summary, release details, important environmental and site factors that led to the incident, concurrent and post-incident responses, and reporting.

2 CHRONOLOGICAL EVENT SUMMARY

2.1 RELEASE RECOGNITION AND IMMEDIATE RESPONSES

Features relevant to this event summary are provided in Figure 2-1 and Figure 2-2.

July 10, 2020

Heavy rains commenced just prior to midnight on July 10. Approximately 43.5 mm of precipitation fell at the Camp Climate Station (located approximately 1,500 metres from the seepage location) between 21:00 July 10 and 21:00 July 11. The highest intensity of rain recorded during the incident time frame was between 23:00 July 10 and 02:00 July 11, at one point reaching an intensity of approximately 7.2 mm/hr. Prior to the incident and earlier that same day, rainfall intensity peaked at 10 mm/hr between 20:00 and 21:00 on July 10. The weather data indicate that the HLF and Eagle Site sustained high intensity microbursts of rainfall throughout July 10 and July 11, leading up to and throughout the incident timeline.

July 11, 2020

01:30 Pooling water was reported on the heap leach pad CV-023 loadout area (on the 950 lift) from a loader operator and was investigated by the Process foreman. Water was observed cascading down from the 975 lift, accumulating on the 950 bench in the stockpile-loadout. It was believed at that time that the pooling water was sourced from the precipitation event. A berm was constructed from the crushed ore within the HLF across the loadout area to contain the pooling water up against the toe of the 965 lift, and keep water away from the stockpile and the loadout operations.

03:45 The heavy rain had stopped, however pooling water on the loadout area continued to increase in volume and depth, so a berm across the loadout was raised. The Process General Foreman was called out to help investigate. It was determined that solution flow from the 8” process solution distribution line on the 975 lift directly uphill from the stockpile-loadout area was leaking and contributing to the flow of water to the pooled area on the 950 lift. The leaking distribution line was immediately turned off.

03:45 to 04:30 Investigation was turned to areas downgradient of the stockpile-loadout area. The HLF perimeter road was wet and muddy throughout. A small channelized flow (or rivulet) was noticed seeping about 2 metres above the driving surface of the road from the base of the crushed ore pile below the stockpile-loadout area. The rivulet was observed to distribute down to the roadway into a small ponded area which had formed in a low area west of, and immediately adjacent to, the westernmost transformer of the E-House. Once the rivulet reached the roadway it could not be discerned in the mud and rainwater that covered the roadway. An excavator was mobilized and dispatched to this area to commence immediate remedial earthworks.

04:30 – 05:30 Remedial earthworks outside of the lined containment area commenced; over the next hour, three berms were constructed. One berm was built adjacent to the transformer area across the rivulet to contain water upgradient of the roadway. A second berm was built across the junction of the

Dublin Gulch access road and the HLF perimeter road, and a third berm was built across the junction of the HLF perimeter road and the CV-022 Road.

Additionally, the Process Manager designate and Site General Manager were informed of the incident and the remedial measures being taken. As a precaution, all ADR processes feeding all the distribution lines were shutdown.

07:00 to 09:00 Inspections of the incident area were undertaken by the General Manager, and managers/superintendents from the Environment, Process, and Health and Safety Departments. During the inspection:

- Water was observed to continue to emerge from the seep.
- Water was pooling behind the bermed area west of the transformer. The berm was observed to be containing the pool and deemed to be providing appropriate containment thereof.
- A suction pumping system was established to collect all pooling water and pump it back into the HLF containment area.
- Additional earthworks were undertaken and a liner was installed in the seep area to direct the pooling water back to lined containment.
- Visual assessment of other areas of HLF was undertaken and no concerns were noted.
- Offsite Senior Management was notified.
- Emergency Operations Centre (EOC) was activated and the Emergency Response Plan and Cyanide Management Plan was initiated.
- Incident management team meeting was conducted to coordinate, release response, further remediation and sampling efforts.

Photo 2-1: Seep Location Looking North - July 11, 2020 @ 07:00

Photo 2-2: Containment Berm Construction Adjacent to HLF Perimeter Road Looking West - July 11, 2020 @ 07:00

09:00 Berms, ditches, liners and pumping set-ups were completed, directing all fluid back to lined containment. The seep was still flowing but was fully contained.

09:00 to 15:00 The seep was sampled and on-site analysis for cyanide confirmed that the water was diluted solution (approximately 175 parts per million {ppm} free cyanide was detected compared to the 250 ppm in the process solution as it is distributed to the HLF). Flow was estimated at seepage location at approximately 10 L/min. Based on initial observations from when the seep was suspected to begin flowing (01:30) and when the flow from the seep was fully contained (09:00), the estimated volume of potential infiltrated rainwater and process solution released outside of containment is 4.5 m^3. This equates to a release of less than 1kg of free cyanide.

Further, as part of the Cyanide Management Plan (specifically the Environmental (Soil/Water Quality) Monitoring Procedures SOP), water quality samples were collected at standard Environmental Monitoring, Surveillance and Adaptive Management Plan locations (see Figure 2-3) and other locations above and downgradient of the incident area including:

- Two stations on Dublin Gulch
- One station on Eagle Creek, and
- Three stations on Haggart Creek.

2.2 FOLLOW-UP REMEDIAL MEASURES

Work continued on July 12, 2020 to mitigate the condition. Surveys were conducted to confirm the perimeter of the liner. Ground and overhead drone photos were taken and compared to construction period photos to establish

the critical components of the work zone (i.e., the liner perimeter, the liner base elevations, and the CV-023 foundation).

On July 13, 2020, using a surveyed line as a guide, an excavator was utilized to pull the crushed ore pile from the conveyor away from the edge of the lined HLF containment facility with the material cast to the north (fully within the HLF) and then loaded and trucked to another portion of the HLF for more even distribution. When the crushed ore pile had been excavated closer to the liner edge, a smaller excavator was utilized to prevent any damage to the liner.

By July 19, 2020, the edge of the HLF liner perimeter was exposed (see Photo 2-3 to 2-5) from the roadway to approximately 5 metres below the CV-023 tower supports. The excavation cannot move further until the stacker can be moved as part of the full grasshopper HLF move project (scheduled to commence within three weeks of the date of this report); otherwise the stacker would be undermined and unstable. More specifically, if the liner trench is excavated all the way up to the stacker elevation there will be insufficient material to establish a safe slope grade/area for workers to perform final clean on the liner in the trench. Also, in excavating the trench up to the stacker, the stability of the stacker would be compromised. Currently, there is sufficient containment to capture any leakage from the pile and convey it towards the In-heap Pond. Prior to the stacker and grasshopper move, the area will be continually monitored for seepage.

Monitoring Locations

3 RELEASE DETAILS

3.1 FLOW ESTIMATE

Flow from the seep was estimated using the bucket method as the flow was too low for any alternate accurate measurements. Two separate measurements were conducted. Each measurement was conducted by filling up a 1 liter wide-mouth bottle five times from the seep flow that was dribbling over rocks in the pile. The two measurements were conducted at 10:00 and 10:10 on July 11, 2020. The overall flow rate was approximated to be 10 liters/minute based on an average of the two measurements.

The seep is estimated to have begun around 01:30 (based on when the pool began to form on the loadout). The seep was fully contained and flowing back into the pad by 09:00 on the same day. Thus, the seep was flowing for 7.5 hours, which resulted in approximately 4.5 m^3 of diluted process solution leaving containment.

Photo 3-1 shows the seep around 07:00 July 11. Based on when the seep was first observed at 04:00 and when the seep flow was contained at 09:00, there was little variability observed in the rate of flow.

Photo 3-1: Seep Flow Looking North - July 11, 2020

3.2 SEEP SAMPLING

A sample was collected from the seep on the morning of July 11 at 08:17. Onsite analyses was performed on the sample for free cyanide using a silver nitrate test, which yielded a concentration of 175 ppm. External (off-site third party) analyses were also actioned with ALS Burnaby where a sample was analyzed for total cyanide, weak acid dissociable (WAD) cyanide, cyanate, and thiocyanate. Preliminary results yielded a concentration of 199 ppm total Cyanide.

Based on the quantity of solution released (4.5 m^3 or 4,500 kg) and a seep concentration of 195 g/kg yields a total of ~880 g of cyanide released outside of containment. Converting to NaCN (sodium cyanide) and assuming the molecular masses of NaCN and CN yields approximately 1.6 kg of NaCN in solution released outside of containment.

3.3 RECEIVING ENVIRONMENT MONITORING

3.3.1 Surface Water Quality Sampling

The receiving water body related to the Project is Haggart Creek. The Type A Water Use Licence (WUL), and VGC monitoring programs under the EMSAMP has established monitoring locations and water quality objectives on Haggart Creek. The following locations considered in the WUL and the EMSAMP as shown on Figure 2-3 were sampled on July 11:

- Upstream of the seep on Dublin Gulch at W1;
- On Haggart Creek upstream of Dublin Gulch at W22;
- Downstream on Dublin Gulch at W21;
- On Haggart Creek downstream of Dublin Gulch at W4; and,
- On Haggart Creek further downstream at W29.

In addition, water samples were collected at two additional sites:

- Downstream of the seep on Dublin Gulch at DG1 (referred to as HLFDG1 in the chain-of-custody and laboratory report)
- On Eagle Creek at W61 and upstream of the confluence with Dublin Gulch (referred to as HLFEP1).

There was no detection of total or WAD cyanide in surface water quality samples. The preliminary reports from ALS are provided as Appendix A.

3.3.2 Groundwater Quality Sampling

On July 13, water quality samples were taken from two groundwater wells immediately downgradient of the HLF (MW19 HLF-1b and MW10-AG6 as shown on Figure 2-3). There was no detection of Total or WAD cyanide in either groundwater quality sample. The preliminary report from ALS is provided as Appendix B.

3.3.3 Soil Sampling

On July 16, 2020, in order to determine if cyanide was present in the surrounding soils, soil samples were collected at three locations downgradient of the seep (in potential depositional areas) as shown in Figure 3-1. The samples were analyzed for the presence of total and WAD cyanide. Preliminary laboratory results indicate the presence of cyanide in one of the sampled locations; however, the concentration shown in the preliminary report for total cyanide is below all soil quality guidelines for free cyanide (which is consider in total cyanide results) provided in the Canadian Soil Quality Guidelines for the Protection of Environmental and Human Health (Canadian Council of Ministers of the Environment, 1999). The preliminary report from ALS is provided as Appendix C.

3.3.4 Acute Lethality Testing

In the absence of receipt of the laboratory results confirming that no process solution was detected in surface waters, VGC undertook sampling for acute lethality single concentration tests for 96 hr rainbow trout and 48 hr Daphnia magna in addition to full suite water chemistry on July 11, 2020 at W1, W21, W4, W22 and W29.

The results for acute toxicity tests are included in Appendix D. The results for these tests show that water quality in the receiving environment was not acutely lethal, (Table 3-4).

Table 3-1: Acute Lethality Testing Results

Sample Location on July 11, 2020	Percent survival in 100% (v/v) sample	
	Rainbow Trout	*Daphnia magna*
W21	100	100
W4	90	100

Soil Sample Locations

4 IMPORTANT ENVIRONMENTAL AND SITE FACTORS (ROOT CAUSES)

4.1 ROOT CAUSE

The primary root cause of the release was the stockpile of crushed ore material in the loadout area building up such that the pile went beyond liner containment. While active leaching does not occur on the ore discharge pile it created a potential flow path during rainfall events that have the potential to overwhelm the infiltration rate of the material.

Figure 4-1 provides a cross section which depicts the area of concern on July 17, and indicates that the stockpile had been pushed southward towards the HLF Perimeter Road, towards the E-House and passed the edge of the liner.

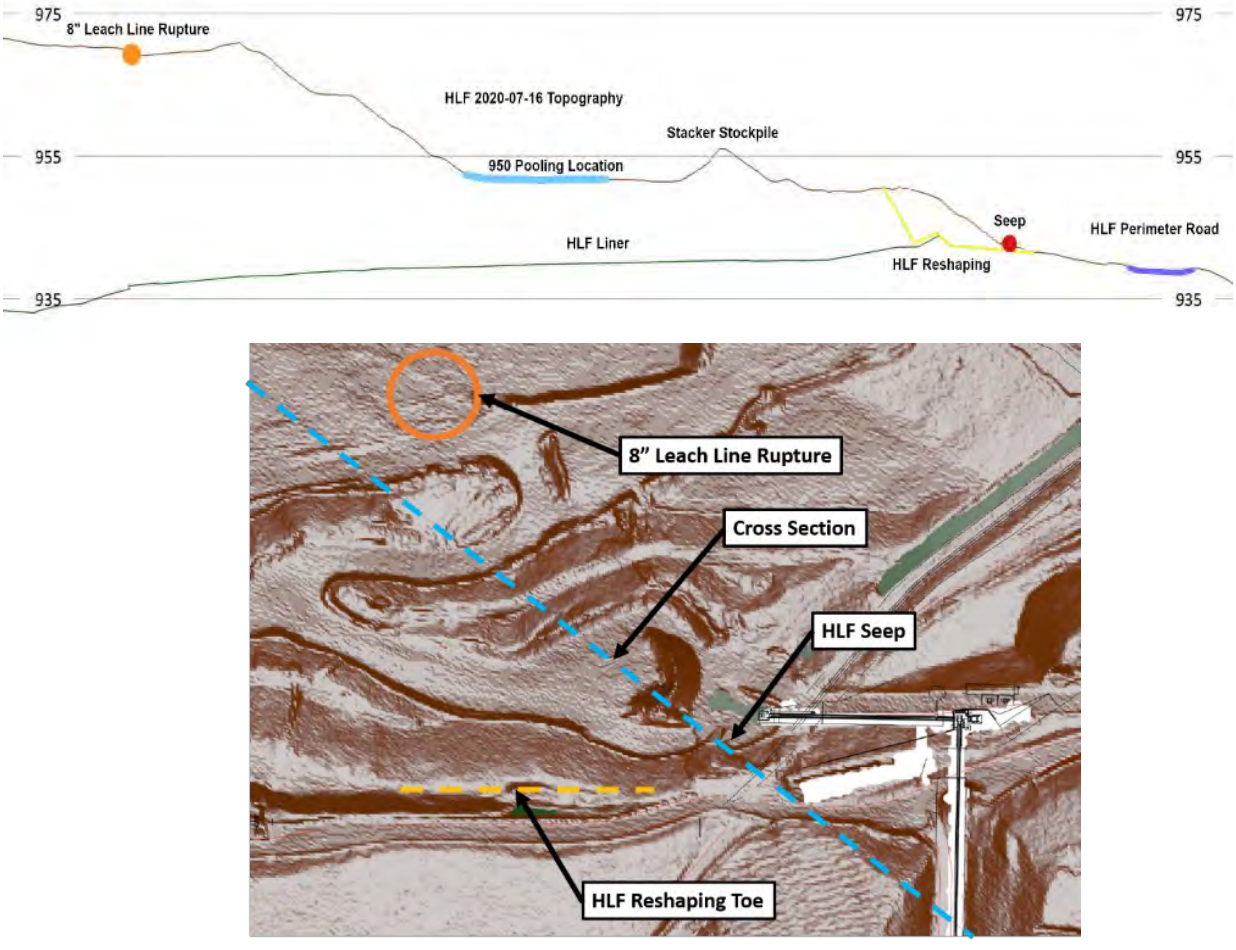

Figure 4-1: HLF South West Corner Cross Section and Plan View Map

Photo 4-1 depicts the location of liner with respect to the July 11 pile location, and illustrates the pile was extended beyond liner containment. The southern edge of the crushed ore pile from the conveyor discharge was pushed approximately 20 metres to south, where there was no lined ditch between the roadway and ore pile.

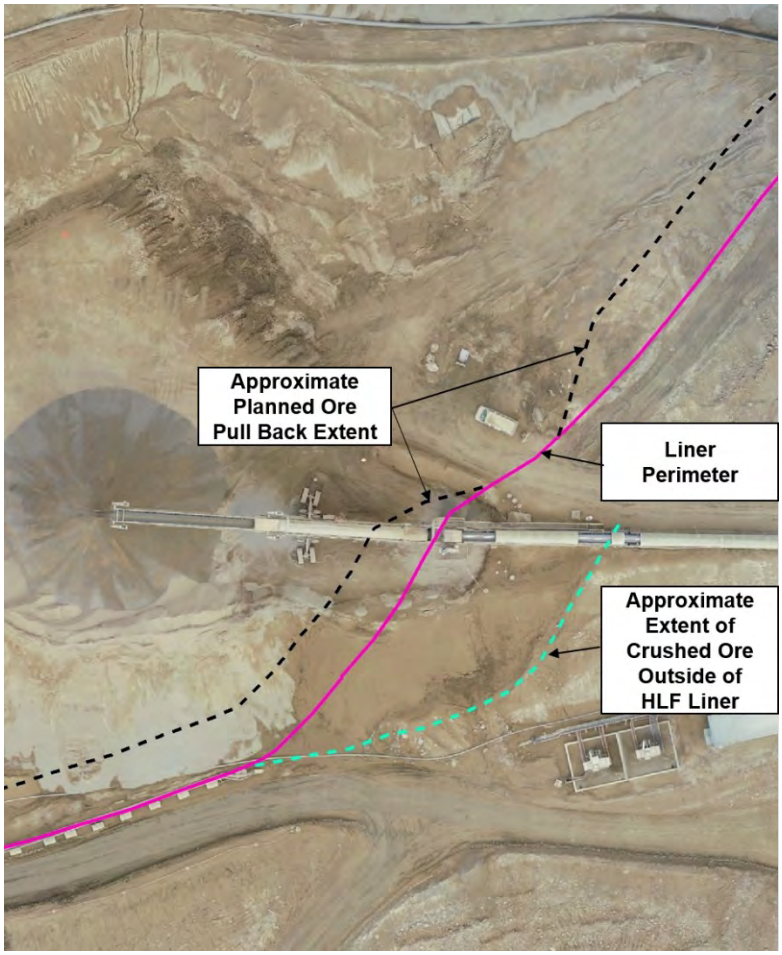

Photo 4-1: Crushed Ore Configuration Relative to HLF Liner - June 30, 2020

The ore pile extended southwards during winter operations in an effort to manage snow on the loadout area, and had not been pulled back fully after freshet. Although the loadout area is not in an active leaching zone, the volume of leakage from the damaged distribution line on the 975 lift and the heavy rainfall resulted in pooling water in a low spot on the 950 lift (shown north of the stockpile on the figure). A temporary berm was constructed to prevent the pool from flowing into the stockpile. While the depth of the pool grew behind the berm, the head in the pool first pushed water into the pad and vertically down to the liner and ultimately to the In-Heap Pond. However, the head also likely created a subsurface water mounding effect leading to sub-horizontal flow in all directions including to the south. As the volume of solution built up behind the liner edge, the solution began to leak over the liner berm wall following preferential pathways until eventual emergence at the seep location.

4.2 CONTRIBUTING FACTORS

A number of contributing environmental and site factors occurred that led to the incident. These included:

- Heavy rains from 23:00 to around 02:00 (~17.6 mm and ~7.2 mm/hr through peak intensity) resulting in additional water pooling on the 950 bench (Table 4-1). Further, substantial rain fell during the previous week that led to wet antecedent moisture conditions and low percolation rates. The Camp Climate Station has recorded ~91.3 mm of precipitation from July 3 to July 21 (Table 4-1) and, examining hourly data, recorded approximately ~43.5 mm of precipitation between 20:00 July 10 and 20:00 July 11, contributing to the onset of the incident. Comparison of Camp and Potato Hills hourly precipitation data supports that the Camp and HLF area received localized microbursts of severe precipitation leading up to and during the incident.

Table 4-1: Climate Station Rainfall Records

Date	Camp Station		Potato Hills

18-Jul-20	2.75	91.30	3.76	50.33
19-Jul-20	0.00	91.30	0.18	50.52

NOTES
1 - Daily rainfall values are calculated by Geonor Precipitation Gauge. Negative values have been replaced by "zeros". Negative values are reported by Geonor from interference with wind or vibrations.

- 28 spin locks were crushed during road and pad development and distribution line deployment on the 975 lift (Photo 4-2). While the leaked solution originated from the 8-inch distribution line, if the damage to the lines was recognized earlier, or if it occurred on a different location of the pad, the leak from containment likely would not have occurred.

Photo 4-2: Damaged Spin Locks Decoupled from 8" Distribution Line - July 12, 2020

- Extended periods of loadout area use resulted in layers of compacted ore and possibly snow lensing, resulting in lateral preferential pathways of infiltrating water.
- Pooling of loadout area (held behind berm). The berm was built to ~1.5 m high while the pool was at least 1.0 deep; this constant head boundary formed a groundwater mound which resulted in vertical and lateral migration (using preferential pathways) rather than primarily downward migration of solution (see Figure 4-1)

5 SPILL REPORTING

5.1 YUKON GOVERNMENT AND FNNND

On July 12, 2020, the day following the solution release, notification was provided to regulators and the FNNND of the release of HLF solution outside of primary containment. The following people and/or agencies were included in these notifications:

- Yukon Spill Reporting hotline
- Natural Resource Officer, Inspector Major Mines - Compliance Monitoring and Inspection, Department of Energy, Mines and Resources (EMR)
- Director - Minerals Resource Branch, EMR,
- Enforcement Officer - Enforcement Branch, Environment and Climate Change Canada (ECCC), and
- FNNND Lands and Resources Manager.

A copy of this report will be provided to all parties contacted during the preliminary event.

6 FINAL REMEDIATION MEASURES

To ensure that there is no recurrence of this issue, the ore stack discharge from the CV-023 conveyor will continue to be pulled back from the HLF lined footprint to negate the ability for a flow path to be formed. The extent of the push back is depicted in Photo 6-1. This work is currently ongoing. In the meantime, berms and trenches have been constructed to prevent the potential for a future release of process solution and rainwater outside of containment. A Standard Operating Procedure will be developed to ensure that potential ore stack creep is captured in routine surveillance of the HLF.

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
%	percent
µS/cm	Microsiemens per centimetre
meq/L	milliequivalents per litre
mg/L	milligrams per litre
NTU	nephelometric turbidity units
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in reports identified as "Preliminary Report" are considered authorized for use.

CERTIFICATE OF ANALYSIS

Work Order	: **VA20B0234**	Page	: 1 of 6
Amendment	: **(Preliminary Report)**		
Client	: **Victoria Gold (Yukon) Corp.**	Laboratory	: Vancouver - Environmental
Contact	: Bill Bowden	Account Manager	: Hilary Woods
Address	: Suite 1000 - 1050 W. Pender St Vancouver BC Canada V6E 3S7	Address	: 8081 Lougheed Highway Burnaby BC Canada V5A 1W9
Telephone	: 867.456.7700 ext. 6381	Telephone	: +1 604 253 4188
Project	: HLF Dublin Haggart - Jul 11	Date Samples Received	: 13-Jul-2020 11:10
PO	: 15673	Date Analysis Commenced	: 13-Jul-2020
C-O-C number	: 20200711e	Issue Date	: 20-Jul-2020 10:46
Sampler	: KB/KT		
Site	: ----		
Quote number	: Q68199		
No. of samples received	: 5		
No. of samples analysed	: 5		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Angelo Salandanan	Lab Assistant	Metals, Burnaby, British Columbia
Annabelle Prasad	Analyst	Metals, Burnaby, British Columbia
Bruna Botti	Analyst	Inorganics - Water Quality, Burnaby, British Columbia
Dee Lee	Analyst	Metals, Burnaby, British Columbia
Jon Fisher	Department Manager - Inorganics	Inorganics, Waterloo, Ontario
Kevin Duarte	Team Leader - Inorganics	Inorganics - Water Quality, Burnaby, British Columbia
Lindsay Gung	Supervisor - Water Chemistry	Inorganics - Water Quality, Burnaby, British Columbia
Muneeb Alam	Analyst	Metals, Burnaby, British Columbia
Owen Cheng		Metals, Burnaby, British Columbia
Robin Weeks	Team Leader - Metals	Inorganics - Water Quality, Burnaby, British Columbia
Robin Weeks	Team Leader - Metals	Metals, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
%	percent
µS/cm	Microsiemens per centimetre
meq/L	milliequivalents per litre
mg/L	milligrams per litre
NTU	nephelometric turbidity units
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in reports identified as "Preliminary Report" are considered authorized for use.

Sample Comments

Sample	Client Id	*Comment*
VA20B0234-001	W4	Sample(s) W4, W21, W29 and W22: Water sample(s) for dissolved mercury analysis was not submitted in glass or PTFE container with HCl preservative. Results may be biased low.

Qualifiers

Qualifier	*Description*
DTC	*Dissolved concentration exceeds total. Results were confirmed by re-analysis.*

CERTIFICATE OF ANALYSIS

Work Order	: **VA20B0441**	Page	: 1 of 4
Amendment	: **(Preliminary Report)**		
Client	: **Victoria Gold (Yukon) Corp.**	Laboratory	: Vancouver - Environmental
Contact	: Lindsay Rear	Account Manager	: Hilary Woods
Address	: Suite 1000 - 1050 W. Pender St Vancouver BC Canada V6E 3S7	Address	: 8081 Lougheed Highway Burnaby BC Canada V5A 1W9
Telephone	: ----	Telephone	: +1 604 253 4188
Project	: GWQ (HLF)	Date Samples Received	: 15-Jul-2020 16:50
PO	: 14043	Date Analysis Commenced	: 15-Jul-2020
C-O-C number	: 20200714a	Issue Date	: 20-Jul-2020 09:43
Sampler	: KT/KB/JJ/SB		
Site	: ----		
Quote number	: Q68199		
No. of samples received	: 2		
No. of samples analysed	: 2		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Angelo Salandanan	Lab Assistant	Metals, Burnaby, British Columbia
Dee Lee	Analyst	Metals, Burnaby, British Columbia
Kevin Duarte	Team Leader - Inorganics	Inorganics - Water Quality, Burnaby, British Columbia
Kim Jensen	Department Manager - Metals	Metals, Burnaby, British Columbia
Tracy Harley	Supervisor - Water Quality Instrumentation	Inorganics - Water Quality, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
µS/cm	Microsiemens per centimetre
mg/L	milligrams per litre
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in reports identified as "Preliminary Report" are considered authorized for use.

Qualifiers

Qualifier	*Description*
SFT	*Sample was filtered due to turbidity interference. Result reflects soluble analyte concentration.*

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Lindsay Gung	Supervisor - Water Chemistry	Inorganics - Water Quality, Burnaby, British Columbia
Ophelia Chiu	Supervisor - Organics Instrumentation	Organics, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
%	percent
mg/kg	milligrams per kilogram

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in reports identified as "Preliminary Report" are considered authorized for use.

APPENDIX A – Summary of test conditions

Table 1. Summary of test conditions: 96-h rainbow trout (*Oncorhynchus mykiss*) single concentration test.

Test species	*Oncorhynchus mykiss*
Organism source	Hatchery
Organism age	Juvenile
Test type	Static
Test duration	96 hours
Test vessel	20-L glass aquarium
Test volume	10 to 20 L (depending on size of fish)
Test solution depth	≥15 cm
Test concentrations	100% (undiluted) sample, plus laboratory control
Test replicates	1 per treatment
Number of organisms	10 per replicate
Control/dilution water	Dechlorinated Metro Vancouver municipal tapwater
Test solution renewal	None
Test temperature	15 ± 1°C
Feeding	None
Light intensity	100 to 500 lux
Photoperiod	16 hours light / 8 hours dark
Aeration	6.5 ± 1 mL/min/L
Test measurements	Temperature, dissolved oxygen and pH measured daily; salinity measured in the undiluted sample at test initiation; conductivity measured at test initiation and termination; survival checked daily
Test protocol	Environment Canada (2000), EPS 1/RM/13, with 2007 & 2016 amendments
Test endpoints	Survival
Test acceptability criterion for controls	Survival ≥90%
Reference toxicant	Zinc (added as $ZnSO_4$)

Table 2. Summary of test conditions: 48-h *Daphnia magna* single concentration test.

Test species	*Daphnia magna*
Organism source	In-house culture
Organism age	<24-hour old neonates
Test type	Static
Test duration	48 hours
Test vessel	250-mL glass beaker
Test volume	200 mL
Test solution depth	6 cm
Test concentrations	100% (undiluted) sample, plus laboratory control
Test replicates	3 per treatment
Number of organisms	10 per replicate
Control/dilution water	Moderately-hard reconstituted water + 2.5 µg/L Se
Test solution renewal	None
Test temperature	20 ± 2°C
Feeding	None
Light intensity	400 to 800 lux
Photoperiod	16 hours light / 8 hours dark
Aeration	None
Test measurements	Temperature, dissolved oxygen and pH measured daily; salinity, hardness and alkalinity measured in the undiluted sample at test initiation; conductivity measured at test initiation and termination; survival checked daily
Test protocol	Environment Canada (2000), EPS 1/RM/14, with 2016 amendments
Test endpoint	Survival
Test acceptability criterion for controls	Survival ≥90%
Reference toxicant	Sodium chloride (NaCl)

END OF REPORT

EAGLE GOLD PROJECT
SPILL RESPONSE FORM

VICTORIA GOLD CORP

FIRST OBSERVER			
Name & Company:	Victoria Gold		
Date Observed:	26-Jul-2020	**Time Observed:** 5:10 am	
Location of Spill:	Warehouse Cold Storag	**VGC Tracking Number:** VGC20-024	
Distance to Waterbody:	400	**Photos Taken?**	☑ Yes ☐ No
Estimated Spill Volume:	1250 L	**Reported to:** K.Babin	

PERSON/DEPT. RESPONSIBLE FOR SPILL	
Supervisor/Investigator:	Trevor Dunn
Date of Spill:	26-Jul-2020
Substance Spilled:	Diesel
Equipment Involved:	Fuel Truck
Volume of Contaminated Material:	20 m3 of potentially contaminated soil material
Personnel Contacted for Disposal (Name):	Site services
Cause of Spill: (Equipment Failure, vehicle accident, foreign object, etc.)	Operator error. Operator left the refueling area while offloading fuel. Fuel spilled out of truck tank when tank was full.
Spill Response Actions Taken: (Containment and/or absorbent materials used, equipment required for clean-up, Pre-trip attached, etc.)	Operator shut off truck fuel pump once aware of the spill. Soil samples were taken at the base of removed materials. Free product was contained by earthen berms, spill sorbents and booms. Oil gator was spread on impacted areas. Residual contaminated water and free product was directed to a sump and pumped to containment totes.

ENVIRONMENTAL DEPARTMENT USE ONLY			
Spill Line Tracking Number	20-072	**Reportable to Spill Hotline?**	☑ Yes ☐ No
Info Re. Spill Hotline:	Reported July 26, 2020 - 20:50 Justin Hooper		
Disposal Container Labelled?	☐ Yes ☐ No	**Samples taken?**	☑ Yes ☐ No
Environmental areas affected: (Watercourse, soil, etc.):	Soil samples were taken from base of removed materials and results are pending.		
Method of Disposal & Further Remediation Required:	Potentially contaminated materials relocated to the Land Treatment Facility (LTF).		
Follow Up Required?	☐ Yes ☑ No	**Follow Up Date:**	

SIGNATURES REQUIRED FOR ALL REPORTABLE SPILLS

EAGLE GOLD PROJECT
SPILL RESPONSE FORM

VICTORIA GOLD CORP

FIRST OBSERVER			
Name & Company:	Victora Gold		
Date Observed:	2020-09-06	**Time Observed:** 9:00 Am	
Location of Spill:	1050 Bench lube skid	**VGC Tracking Number:** VGC20-029	
Distance to Waterbody:	>1km	**Photos Taken?**	☑ Yes ☐ No
Estimated Spill Volume:	180 L	**Reported to:** B.Bowden	
PERSON/DEPT. RESPONSIBLE FOR SPILL			
Supervisor/Investigator:	Denys Evans		
Date of Spill:	2020-09-06		
Substance Spilled:	Waste oil		
Equipment Involved:	Lube Skid		
Volume of Contaminated Material:	10 m2 of ground material		
Personnel Contacted for Disposal (Name):	Site Services		
Cause of Spill: (Equipment Failure, vehicle accident, foreign object, etc.)	Accidental overflow while transferring waste oil to disposal tote.		
Spill Response Actions Taken: (Containment and/or absorbent materials used, equipment required for clean-up, Pre-trip attached, etc.)	Containment using earthen berms, spill booms, pads and gator powder. Soil was removed for treatment in the permitted LTF. Contaminated pads and booms were placed in mega bags for back haul.		
ENVIRONMENTAL DEPARTMENT USE ONLY			
Spill Line Tracking Number	20-085	**Reportable to Spill Hotline?**	☑ Yes ☐ No
Info Re. Spill Hotline:	Reported to Murray		
Disposal Container Labelled?	☑ Yes ☐ No	**Samples taken?**	☑ Yes No
Environmental areas affected: (Watercourse, soil, etc.):	10 50 bench ground		
Method of Disposal & Further Remediation Required:	Contaminated material was removed for treatment in the LTF.		
Follow Up Required?	☑ Yes ☐ No	**Follow Up Date:**

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
%	percent
mg/kg	milligrams per kilogram

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in reports identified as "Preliminary Report" are considered authorized for use.

Qualifiers

Qualifier	*Description*
DLCI	*Detection Limit Raised: Chromatographic interference due to co-elution.*
DLQ	*Detection Limit raised due to co-eluting interference. GCMS qualifier ion ratio did not meet acceptance criteria.*

EAGLE GOLD PROJECT
SPILL RESPONSE FORM

VICTORIA GOLD CORP

FIRST OBSERVER			
Name & Company:	Victoria Gold Corp.		
Date Observed:	November 28, 2020	**Time Observed:** 5:30pm	
Location of Spill:	Sec/Ter Laydown	**VGC Tracking Number:** VGC-20-039	
Distance to Waterbody:	+1000m	**Photos Taken?**	☑ Yes ☐ No
Estimated Spill Volume:	500 L	**Reported to:** Environment	
PERSON/DEPT. RESPONSIBLE FOR SPILL			
Supervisor/Investigator:	Justin Magill		
Date of Spill:	November 28, 2020		
Substance Spilled:	Hydraulic Oil		
Equipment Involved:	Zoom Boom/Tote container		
Volume of Contaminated Material:	7 cubic meters of snow and gravel		
Personnel Contacted for Disposal (Name):	Phil Emerson, Environment Dept.		
Cause of Spill: (Equipment Failure, vehicle accident, foreign object, etc.)	Zoom boom was moving totes at the secondary crusher parking lot and in front of one tote there was a small raised berm. The fork of the zoom boom was lifted by the berm and instead of sliding into the pallet the fork punctured the tote, releasing some contents.		
Spill Response Actions Taken: (Containment and/or absorbent materials used, equipment required for clean-up, Pre-trip attached, etc.)	Snow berms and spill booms were deployed to contain the spill and absorbent pads were applied to ground to clean up free product. Snow was collected and placed in mega bags and an excavator with digging bucket was used to scrap up frozen material and place in mega bags for transport to the LTF. Soil sampling conducted.		
ENVIRONMENTAL DEPARTMENT USE ONLY			
Spill Line Tracking Number	20-107	**Reportable to Spill Hotline?**	☑ Yes ☐ No
Info Re. Spill Hotline:	500L hydraulic spill caused by a zoom boom puncturing a hydraulic tote		
Disposal Container Labelled?	☐ Yes ☐ No	**Samples taken?**	☑ Yes ☐ No
Environmental areas affected: (Watercourse, soil, etc.):	none		
Method of Disposal & Further Remediation Required:	Contaminated material will be placed in the LTF upon receipt of ALS results		
Follow Up Required?	☑ Yes ☐ No	**Follow Up Date:** Dec 7	
SIGNATURES REQUIRED FOR ALL REPORTABLE SPILLS

SPILL RESPONSE FORM

VICTORIA GOLD CORP

FIRST OBSERVER			
Name & Company:	Victoria Gold Corporation		
Date Observed:	2020-12-26	**Time Observed:** 09:00	
Location of Spill:	Warehouse	**VGC Tracking Number:** VGC20-042	
Distance to Waterbody:	500m	**Photos Taken?**	☑ Yes ☐ No
Estimated Spill Volume:	200L	**Reported to:** Enviro	

PERSON/DEPT. RESPONSIBLE FOR SPILL	
Supervisor/Investigator:	Chris Schaad
Date of Spill:	2020-12-26
Substance Spilled:	Septic Waste
Equipment Involved:	Vac Truck
Volume of Contaminated Material:	0 - snow
Personnel Contacted for Disposal (Name):	Site Services
Cause of Spill: (Equipment Failure, vehicle accident, foreign object, etc.)	Pumping out septic tank at W.S.L washcar with vac truck. Once finished, operator turned off shut off valve and pump controls as well as P.T.O. Before driving away, operator noticed septic waste being released to the laydown and realized that the shut off valve was not completely closed.
Spill Response Actions Taken: (Containment and/or absorbent materials used, equipment required for clean-up, Pre-trip attached, etc.)	Operator closed the shut off valve completely and notified supervisor. The impacted area was contained and spill response was initiated. The contaminated material was scraped up with a bucket and spread out over the septic field. Lime was spread out on the contaminated snow at the area where the incident occured.

ENVIRONMENTAL DEPARTMENT USE ONLY			
Spill Line Tracking Number	20-113	**Reportable to Spill Hotline?**	☑ Yes ☐ No
Info Re. Spill Hotline:			
Disposal Container Labelled?	☐ Yes ☑ No	**Samples taken?**	☐ Yes ☑ No
Environmental areas affected: (Watercourse, soil, etc.):	None - contaminated snow was moved to septic field.		
Method of Disposal & Further Remediation Required:	Scraped up impacted snow and placed on septic field. Lime spread on impacted area.		
Follow Up Required?	☐ Yes ☑ No	**Follow Up Date:** N/A

APPENDIX Q1

Eagle Gold Mine 2020 Environmental Audit Report

Eagle Gold Mine 2020 Environmental Audit Report

November 30, 2020

Prepared for:

Victoria Gold Corporation

Prepared by:

Stantec Consulting Ltd.

Project Number: 123221646

Revision: 1

Executive Summary

The Eagle Gold Mine (the Project), is owned and operated by Victoria Gold (Yukon) Corp (VGC) and is located within the Mayo mining district of Yukon Territory, Canada. The mine is situated approximately 85 km north of Mayo and 400 km north of Whitehorse. The Project is an open pit mine, in-valley heap leach with three stage crush and gold recovery plant.

VGC received a quartz mining license to build the open pit mine in September 2013. A Comprehensive Cooperation Benefits Agreement was signed with the First Nation of Na-Cho Nyak Dun in 2011. Preliminary construction works began in August 2017 and full construction works commenced in March 2018. The Project poured its first gold Q3, 2019 and achieved commercial production on July 1, 2020. In full production, the mine will produce 210,000 ounces per year and the mine life is ten plus years.

Clause 12.0 of Quartz Mine License 0011 (QML-0011) requires the undertaking of an environmental audit every two years, by an independent contractor acceptable to the Director of the Mineral Resources Branch of EMR. Stantec Consulting Ltd. (Stantec) was contracted by VGC to complete an Environmental Audit for the Project in accordance with the conditions of QML-0011. The period of this audit report is inclusive of monitoring and surveillance activities at the Project site from July 1, 2018 to June 30, 2020. This report will be the first audit for the mine, and this audit spans the construction phase and into the first year of mine operations.

The audit scope involved an evaluation of compliance with the following approved plans:

- Environmental Monitoring, Surveillance and Adaptive Management Plan (EMSAMP) Version 2018-01, 2019-01 and 2020-01
- Construction and Operations Water Management Plan Version 2017-01,
- Water Management Plan Version 2020-01,
- Solid Waste and Hazardous Materials Management Plan Version 2017-02,
- Spill Response Plan Version 2017-02,
- Wildlife Protection Plan Version 2017-01.

The auditors reviewed the following regulatory reporting submissions:

- Water License QZ14-041-01 / Quartz Mining License QML-0011 2018 Annual Report and relevant appendices,
- Water License QZ14-041-01 / Quartz Mining License QML-0011 2019 Annual Report and relevant appendices,
- Monthly reports covering climate, air quality, hydrology, groundwater quality and quantity, surface water quality, geochemistry, soils, vegetation, and physical structures monitoring from January to June 2020 and relevant appendices,

- Annual Physical Stability Assessment Report dated December 20, 2018,
- Annual Physical Stability Assessment Report dated October 29, 2019,
- Quarterly Wildlife Reports from September 2018 to June 1, 2020.

Additional records and documents that were reviewed, but not listed above, are listed in the discipline sections under sub-sections titled ‘Documents Reviewed’.

The audit evaluated:

- Compliance and adequate implementation of the plans and associated monitoring programs,
- Confirming the water monitoring (surface water quality and quantity, groundwater, and aquatic, habitat), terrestrial environment and physical stability assessments were completed to the specifications in the approved plans.

The following general steps were taken to conduct the audit:

1. Identification of documents to be reviewed to fulfill the audit objectives and requirements
2. Comparison of monitoring activities at all sites against the execution described in the. EMSAMP for frequency, methods, and results,
3. Review of data quality assurance and quality control procedures,
4. Confirmation that AMP thresholds are being monitored in conformance with the EMSAMP,
5. Confirmation that AMP responses follow what is outlined in the EMSAMP and were reported, appropriately,
6. Provision of an audit adequacy statement regarding conformance with plans within the audit scope,
7. Provision of a summary table of identified gaps and/or recommendations for the monitoring programs

Key findings of the audit are provided in section 8.0 of the report. Overall, the implementation of VGC’s environmental management system has been adequate and has demonstrated continual improvement throughout the audit period. Reports and data reviewed do not indicate that indicators of environmental quality (water quality and quantity, aquatic resources (sediment, benthic invertebrates, fish and fish habitat) air quality, soils, vegetation, wildlife and wildlife habitat, stability of physical structures and waste management) are degraded or degrading.

Stantec noted that there were some common deficiencies across several monitoring programs and associated recommendations (Table ES 1).

Table ES 1 Global Audit Themes and Corrective Actions

Global Audit Deficiency	Recommendation
Reporting monitoring activities and results without sufficient supporting data and information (e.g., validated datasets, statistical analyses, results compared against relevant standards or guidelines)	All reports (monthly, quarterly, annual) should provide validated data sets, supporting data QA/QC documentation, and data analyses and interpretation specified in the project Environmental Monitoring and Surveillance and Adaptive Management Plan
Inconsistent implementation and/or documentation of QA/QC programs	Standard Operating Procedures and/or checklist QA/QC checklist should be developed for all monitoring programs
Equipment malfunction resulting in gaps in datasets (i.e. climate, hydrology)	Regularly inspect equipment and data sensors/loggers to prevent prolonged periods of data loss. Maintain an Equipment Maintenance Log for monitoring equipment and maintain equipment on a regular schedule and/or as required
Missing rationale in reports for gaps in implementation of monitoring schedules	Provide rationale for gaps in quarterly, monthly, and annual reporting, and any corrective action taken to address gaps
For monitoring programs with numerical threshold standards or objectives, statistical analyses were not performed to determine if statistically significant changes occurred to the receiving environment (i.e. air quality, hydrology, surface water quality, groundwater, soils, vegetation)	Develop discipline-appropriate statistical tests and report on trend analysis relative to baseline data
Lack of adaptive management responses or rationale for not implementing adaptive management measures.	Provide reasoning for implementing and not implementing adaptive management measures in quarterly, monthly, and annual reporting

1.0 INTRODUCTION

Stantec Consulting Ltd. (Stantec) was retained by Victoria Gold (Yukon) Corporation (VGC) in August 2020 to carry out an audit of the Eagle Gold Mine (the Project) in accordance with the conditions of the Quartz Mine License QML-0011 (QML). The objective of this audit was to assess whether the environmental management plans and regulatory controls set out in the QML are implemented in and about the mine and that the environmental management systems and controls are functioning as intended.

1.1 BACKGROUND

The Eagle Gold Mine is owned and operated by VGC and is located within the Mayo mining district of Yukon Territory, Canada. The Project is situated approximately 85 km north of Mayo and 400 km north of Whitehorse. The Project is an open pit mine, in-valley heap leach with three stage crush and gold recovery plant.

VGC completed the Environmental Assessment process under the *Yukon Environmental and Socio-economic Assessment Act* (YESAA) and received Decision Documents from the Yukon Government and federal regulatory agencies in April 2013. An initial quartz mining license was received in September 2013, followed by a Water Use License in Dec 2015. Preliminary construction began in August 2017 and full construction works commenced in March 2018. A Comprehensive Cooperation Benefits Agreement was signed with the First Nation of Na-Cho Nyak Dun in 2011.

In 2017, construction activities began with camp expansion, access road upgrades, site road construction, diversions and ditching, pond construction, clearing and grubbing, civil earthworks, septic system upgrade, and borrow source development. In March 2018, after a winter hiatus, activities resumed and included construction of Phase I of the Heap Leach Facility (HLF), Events Pond, Crushing and Screening Plants, Overland Conveying System and coarse ore transfer areas, Cement and Lime Silos, Adsorption, Desorption and Recovery Plant and Reagent Storage Buildings, Metallurgical Laboratories, Administration Office, mine offices, ANFO and Detonator Storage, Water Distribution Systems, pre-stripping of the Eagle pit and initial development of the Platinum Gulch Waste Rock Storage Area, and construction of 90-day Ore Stockpile.

Commissioning of the built facilities began in Q2 2019. On February 16, 2019, VGC notified responsible authorities of their intent to enter the Production Phase (defined in the regulatory approvals as the relocation of waste rock from the Eagle Pit to a waste rock storage area) on March 17, 2019.
Ore production commenced on July 1, 2019 and VGC poured its first gold Q3, 2019. The mine achieved commercial production on July 1, 2020. In full production, the mine will produce 210,000 ounces per year and the mine life is ten plus years.

1.2 REGULATORY SETTING

The operation of the Project is governed by various regulatory approvals and non-discretionary Territorial and Federal legislation. A key regulatory approval for the Project is the Quartz Mining Licence QML-0011 issued pursuant to section 141(2)(a) of the Quartz Mining Act by the Department of Energy, Mines and Resources (EMR).

Clause 12.0 of QML-0011 requires the undertaking of an environmental audit every two years, by an independent contractor acceptable to the Director of the Mineral Resources Branch of EMR.

The period of this audit report is inclusive of monitoring and surveillance activities that occurred at the mine site from July 1, 2018 through to June 30, 2020. This report documents the first audit and spans the end of construction activities and into the first year of mine operations.

Three approved versions of the Project Environmental Monitoring and Surveillance and Adaptive Management Plan (EMSAMP) [versions 2018-01, 2019-01, 2020-01] and two versions of the Water Management Plan (WMP) [versions 2017-02 and 2020-01] were effective for specific timeframes during the audit period. The Solid Waste and Hazardous Waste Management Plan (version 2017-02), Spill Response Plan (version 2017-02) and Wildlife Protection Plan (2017-01) were in effect for the entire audit period. Table 1 shows the effective periods of the plans approved during construction and operations.

Table 1 Effective Time Periods of Management Plans

Audit Period	Plans / Effective Period	Project Phase
Audit Period (July 1, 2018–June 30, 2020)	EMSAMP 2018-01 (Beginning of Audit Period: July 1, 2018–June 18, 2019)	**Construction** (August 18, 2017–March 16, 2019) **Operations/Production Phase** (commencement of operations — March 17, 2019–present)
	EMSAMP 2019 -01 (June 19, 2019–May 18, 2020)	End of Construction, Beginning of Operations
	EMSAMP 2020-01 (May 19, 2020–June 30, 2020, End of Audit Period)	Operations
	Construction and Operations Water Management Plan 2017-02 – (Beginning of Audit Period, July 1 2018 to January 2020)	Construction and Beginning of Operations
	Water Management Plan 2020-01 – January 2020 to June 30, 2020 End of Audit Period	Operations

Monitoring activities and results specified by these plans (reported in annual and monthly reports) were audited to the requirements of these plans, during their effective period.

1.3 APPROACH

The scope and objectives of the audit were approved by the Yukon Government Department of Energy, Mines and Resources (EMR). The audit for 2020 was a desk top exercise due to Covid-19 precautions.

The audit scope involved an evaluation of compliance with the following approved plans:

- Environmental Monitoring, Surveillance and Adaptive Management Plan (EMSAMP) Version 2018-01, 2019-01 and 2020-01
- Construction and Operations Water Management Plan Version 2017-01,
- Water Management Plan Version 2020-01,
- Solid Waste and Hazardous Materials Management Plan Version 2017-02,
- Spill Response Plan Version 2017-02,
- Wildlife Protection Plan Version 2017-01.

The auditors reviewed the following regulatory reporting submissions:

- Water License QZ14-041-01 / Quartz Mining License QML-0011 2018 Annual Report and relevant appendices,
- Water License QZ14-041-01 / Quartz Mining License QML-0011 2019 Annual Report and relevant appendices,
- Monthly reports covering climate, air quality, hydrology, groundwater quality and quantity, surface water quality, geochemistry, soils, vegetation and physical structures monitoring from January to June 2020 and relevant appendices,
- Annual Physical Stability Assessment Report dated December 20, 2018,
- Annual Physical Stability Assessment Report dated October 29, 2019,
- Quarterly Wildlife Reports from September 2018 to June 1, 2020.

The audit evaluated:

- Compliance and adequate implementation of the plans and associated monitoring programs,
- Confirming the monitoring (surface water quality and quantity, groundwater, and aquatics and fish and fish habitat), terrestrial environment and physical stability assessments were completed to the specifications in the approved plans and licences.

The following general steps were taken to conduct the audit:

1. Identification of documents to be reviewed to fulfill the audit objectives and requirements,
2. Comparison of monitoring activities at all sites against the execution described in the EMSAMP for frequency, methods, and results,
3. Review of data quality assurance and quality control procedures,
4. Confirmation that AMP thresholds are being monitored in conformance with the EMSAMP,
5. Confirmation that AMP responses follow what is outlined in the EMSAMP and were reported appropriately,
6. Provision of an audit adequacy statement regarding conformance with plans within the audit scope, and
7. Provision of a summary table of identified gaps and/or recommendations for the monitoring programs.

The evaluated disciplines were meteorological and atmospheric environment, water resources (which included surface quantity and quality, groundwater quantity and quality, geochemistry and the aquatic environment), the terrestrial environment (which included reclamation, vegetation, soils, and wildlife) and geotechnical stability (which included permafrost monitoring, open pits, material storage and stockpiles and the heap leach and process facilities). The audit also covered a review of the solid waste and hazardous materials handling and spill response.

In accordance with VGC commitments during the YESAA process ongoing noise monitoring is not required. VGC has committed to monitoring sound levels related to significant changes in mining activity or if complaints are made. VGC conducted monitoring of noise levels during blasting in July 2018 and again in May and June 2019. Noise levels were below thresholds set out in the EMSAMP (below 120 dB) therefore continued monitoring was not necessary. VGC has committed to recording any noise complaints received and including them in reporting required by the regulatory approvals for the Project. Additional mitigation measures, or adaptive management strategies will be identified and implemented as required.

2.0 ATMOSPHERIC ENVIRONMENT

This section presents an audit of the climate and air quality monitoring programs as specified in the applicable EMSAMP documents, compared to the data and information reported in supporting annual and monthly reports. The intent is to determine if ongoing monitoring and data collection meets the commitments outlined in the EMSAMP.

2.1 CLIMATE

2.1.1 Documents Reviewed

Documents shown in Table 2 were reviewed for the climate monitoring section of the audit:

Table 2 Climate Monitoring Program Documents Reviewed

Document	Version Reviewed	Sections Applicable during Construction Phase	Sections Applicable to Mine Operations Phase

Standard Operating Procedures/QA/QC Program	Not developed	Not developed	VGC SOP ENV 17 Weather and Climate Stations

2.1.2 Monitoring Program Implementation and Data QA/QC

Two solar powered automated climate stations are currently operating in the Project area. The Potato Hills station (elevation 1,420 m) was installed in 2007 and the Camp station (elevation 782 m) in 2009. The climate stations continuously collect data for the following parameters:

- Air temperature
- Precipitation
- Wind speed and direction
- Barometric pressure,
- Solar radiation
- Snow depth, and
- Relative Humidity

Snow depth information is also collected during winter with monthly manual snow course surveys near both climate stations and in the vicinity of the Heap Leach Facility (in Ann Gulch). During the audit period, the 2018 manual snow survey location in Ann Gulch was discontinued due to construction activity (HLF Phase 1 construction). The new survey location was established in 2019 upgradient of the HLF.

Climate data for each station is collected and submitted in full as excel data and also summarized in annual and monthly reports for the following frequencies:

- Monthly and annual recorded mean, minimum and maximum air temperature
- Total monthly and annual precipitation, as well as estimated rainfall and snowfall amounts
- Maximum 24-hour precipitation totals for each month
- Monthly snowpack depth as well as estimated monthly snowmelt distribution
- Monthly average barometric pressure and relative humidity
- Monthly and annual recorded mean, minimum and maximum wind speed and direction
- Monthly and annual recorded mean, minimum and maximum net solar radiation
- Estimates of monthly sublimation and evaporation/evapotranspiration

Data retrieval frequencies require monthly station visits during the open water season concurrent with hydrology data collection, and in the winter concurrent with collection of the manual snow course surveys.

Climate monitoring parameters, frequencies and reporting requirements have remained the same throughout construction and operations phases.

Table 3 summarizes compliance with the construction and operations EMSAMPs climate data collection programs for the audit period. Note that the data record is considered incomplete for a month when there are less than 25 days of data available for that month.

Table 3 Climate Monitoring Program Implementation

Monitoring Method	EMSAMP Version 2018-01 Compliance	EMSAMP Version 2019-01 Compliance	EMSAMP Version 2020-01 Compliance	Data QA/QC	Reporting
Climate Station: Potato Hills	• Data record incomplete[1] for: – Air temperature – Wind speed and direction[2] – Relative humidity – Barometric pressure – Solar radiation – Snow depth[3] • Station replaced on Sept. 22, 2018, but malfunctioned Dec. 2018	• Data record incomplete for: – Air temperature[5] – Wind speed and direction[5] – Relative humidity[6] – Barometric pressure[6] – Wind direction[2] – Snow depth[7] – Precipitation[8] – Solar radiation[9] • Station decommissioned in Oct. 2019. To be replaced in 2020	• Data record incomplete[11] for: – Wind speed and direction – Relative humidity – Barometric pressure – Wind direction – Snow depth – Precipitation – Solar radiation • Station replaced March 13, 2020. Data was not recorded during May due to technical malfunction. Servicing completed in May 2020 to correct malfunction.	Data set was incomplete for the audit period, but improved consistently in monthly data collection during 2020	• Annual reports are adequate • Monthly reports should present summary statistics of raw data for snow depth, wind direction and solar radiation, similar to summary statistics presented for temperature, barometric pressure, relative humidity, wind speed and precipitation.
Climate Station: Camp	Data record complete	• Data record incomplete for: – Precipitation[10]	• Data record incomplete for: – Precipitation[12] • Station received general maintenance and a replacement of the existing precipitation gauge with a Geonor all-weather precipitation monitor March 11, 2020. Data complete to end of April. Data was not recorded throughout May due to technical malfunction. Servicing completed in May 2020 to correct malfunction. Data complete from May 28–June 30, 2020	Incomplete for the audit period, but improved significantly during 2020	
Manual Snow Course Survey: Potato Hills	Data record complete	Data record complete	Data record complete	Complete	Annual and monthly reporting is adequate
Manual Snow Course Survey: Camp	Data record complete	Data record complete	Data record complete	Complete	
Manual Snow Course Survey: Ann Gulch	Data record incomplete[4]	• Discontinued due to construction • Re-established at HLF (in Ann Gulch upgradient from HLF Phase 1 construction)	N/A	Complete	
Manual Snow Course Survey: Heap Leach Facility (HLF)	N/A	Data record complete	Data record complete	Complete	

Table 3 Climate Monitoring Program Implementation

NOTES:

[1] Air temperature, wind speed, relative humidity and barometric pressure data were not recorded to the central datalogger at Potato Hills for the following time periods in 2018: April 28 to May 16; June 7 to June 29; July 3 to July 13; August 5 to September 22; and December 2 to December 16.

[2] Potato Hills wind direction sensor was disabled in October 2018 due to power drain on other station sensors.

[3] The snow depth sensor installed at the Potato Hills climate station did not return usable data for the period January 2017 to December 2018.

[4] The Ann Gulch survey location was not available in 2018 due to construction activities in the area. A new survey location was established in 2019 uphill from the active HLF pad.

[5] Potato Hills air temperature and wind speed data were not recorded to the central datalogger for the following time periods in 2019: February 1 to February 28; May 10 to June 1; August 17 to August 24; and September 4 to October 7. No wind direction data was available from the Potato Hills climate station in 2019.

[6] Potato Hills barometric pressure and relative humidity data were not recorded for the following time periods in 2019: February 1 to February 28; May 10 to June 1; August 17 to October 7.

[7] Potato Hills snow depth sensor installed returned minimally usable data for the periods of March 1 to April 16 and May 2 to May 9, 2019.

[8] The Potato Hills climate precipitation sensor did not return usable data from March to June 2019 and from August to October 2019.

[9] The Potato Hills solar radiation sensor did not return usable data for 2019.

[10] The Camp climate station precipitation sensor did not return usable data from January 2019 to December 2019.

[11] Audit of 2020 climate data collection program was based solely on monthly summary data reports. Data gaps are considered preliminary until data validation is performed for the purposes of annual reporting.

[12] The Camp climate station precipitation gauge malfunctioned in January 2020. Precipitation data was incomplete to the end of May 2020.

2.1.3 Reporting Adequacy, Compliance and Recommendations

Data gaps in the implementation of the climate monitoring program during the construction and operations phase of the audit period were due to malfunction of climate station sensors and deficiency in the implementation of QA/QC procedures during this time. Stantec notes that VGC has taken steps to rectify this deficiency in the spring of 2020, by replacing the Potato Hills climate station, which had exceeded its expected lifetime, servicing the Camp Station (which included replacing certain sensors) and retaining a qualified professional (QP) to perform annual calibrations and data validation.

Due to the sensitive nature of climate station sensors, and regulatory requirements to maintain complete climate datasets, Stantec recommends that VGC consider maintaining a spare climate station sensors on site that may be easily deployed should sensors fail or when gaps are noted during monthly review of data records.

Table 4 summarizes compliance gaps and/or deficiencies for the climate monitoring program and provides recommendations for corrective action.

Table 4 Climate Monitoring Program Compliance and Recommendations

Compliance Gaps and/or Deficiencies	Recommendation/Corrective Action
Incomplete climate data recorded between 2018–2020 during the construction phase and portions of the operations phase of mining	• Keep spare climate station sensors on-site for rapid deployment should sensors/equipment begin to fail or data gaps are noted. • Append annual QP climate stations' calibration report/records to annual report.

2.2 AIR QUALITY

2.2.1 Documents Reviewed

Documents shown in Table 5 were reviewed for the audit of air quality:

2.2.2 Monitoring Program Implementation and Data QA/QC

The air quality monitoring program began in 2018 and will continue throughout operations.

Prior to and during the mine construction phase, air quality monitoring was conducted in accordance with approved EMSAMPs (versions 2018-01 and 2019-01). Early in the construction phase, VGC installed and operated three (environment) Beta-Attenuation Particulate Monitors (EBAMs) capable of continuous measurement of Total Suspended Particulate (TSP), Coarse Particulate Matter (PM_{10}) and Fine Particulate Matter ($PM_{2.5}$). These monitors were and continue to be located near the Camp climate station. EBAM sampling began August 22, 2018. Four dustfall sampling stations were also established on August 23, 2018 alongside four permanent vegetation sampling plots. Dustfall samples were and continue to be collected and submitted for laboratory analysis monthly. The main change between construction and start-up of operations of the mine was the addition of the Passive Air Sampling System (PASS) stations and Hi-Volume Partisol Air Sampler.

Monitoring during operations is conducted for the following parameters: TSP, $PM_{2.5}$, PM_{10}, Nitrogen Dioxide (NO_2), Sulphur Dioxide (SO_2) and Ammonia (NH_3). PASSs for NO_2, SO_2 and NH_3 was initiated in January 2020, in accordance with the conditions of the mine Air Emissions Permit #60-060.

VGC currently employs the following methods to collect air quality data:

1. Three continuous EBAM monitors for TSP, PM_{10}, and $PM_{2.5}$
2. Five dustfall stations collect samples for analysis of total particulates and total metals deposition (flux)
3. Five PASS samplers collect samples for analysis of NO_2, SO_2 and NH_3
4. One Hi-Volume Partisol sampler collects samples for analysis of TSP and metals

EBAMs monitors are located near the Camp climate station, west of the existing camp and within the Haggart Creek valley. Dustfall and PASS samplers are located at various locations south, west and east of the mine facilities, adjacent to soil and vegetation monitoring plots. The Hi-Volume sampler is co-located with the EBAM monitors near the camp station.

TSP, $PM_{2.5}$, and PM_{10} concentrations in ambient air are monitored continuously, and recorded each hour, 24-hours per day. Total dustfall, NO_2, SO_2, and NH_3 samples are collected monthly for laboratory analysis. Metals deposition samples are collected monthly for laboratory analysis and Hi-Volume TSP samples are collected weekly for laboratory analysis.

Monitoring results are compared to air quality criteria set out in the Project Air Emissions Permit No. 60-060 (effective as of December 2019 and amended September 2020). The Project Air Quality Criteria (AQC) are the most stringent criteria referenced in Yukon Ambient Air Quality Objectives (YAAQO), Canadian Ambient Air Quality Standards (CAAQS) and Ontario Air Quality Criteria (OAQC) for metals and NH_3. Collectively, the AQCs define the maximum allowable limits during mine operations for the above-described parameters. Monitoring results are reported monthly and annually as part of EMSAMP reporting, and quarterly, in compliance with the Air Emissions Permit. Quarterly reporting began in Q1 of 2020.

Data reliability and integrity is maintained through implementation of an air quality data QA/QC program. The QA/QC program is described in the project Air Quality Monitoring Plan (AQMP) and relies primarily on:

- Weekly EBAM operational inspections,
- Monthly EBAM Leak/Flow Audits,
- Bi-annual EBAM calibration and maintenance,
- Standard Operating Procedure for PASS samplers
- Quarterly calibration of Hi-Volume Partisol sampler
- All sample laboratory analysis completed by external accredited laboratories
- Chain of custody are used to send samples to the external accredited laboratories

Data validation criteria defined in the AQMP are:

24-hour samples (TSP/$PM_{2.5}$/Metals):

- valid only if within ±10% of the required sample period;
- valid only if the sampled air volume is within ±10% of the target flow;
- valid only if filter material (High volume sampler only) is intact upon retrieval, and not damaged during removal, storage or shipping.

Annual means:

- Annual arithmetic or geometric means are valid only if at least 75% of the possible samples under the relevant sample frequency are valid.

Passive samplers (SO_2, NO_2, NH_3):

- Valid only if the targeted 30-day sampling period is met within ±2 days.

Dustfall (Total Particulate and metals)

- Valid only if the targeted 30-day sampling period is met within ±2 days.

Quantitative air quality management triggers are defined in the EMSAMP and require corrective actions to reduce or bring emissions into compliance with the Project AQC. The management triggers are as follows:

- If air quality concentrations are within 80% of YAAQOs, actions will be taken to minimize the emissions
- If TSP concentrations exceed 100 µg/m^3 24-hour average, or 50 µg/m^3 as an annual geometric mean, additional dust control mitigation measures will be implemented. Additional measures are specified in versions of the EMSAMP and in the Air Emissions Permit.

Table 6 below summarizes compliance with the construction and operations EMSAMPs air quality data collection programs and Air Emissions Permit for the audit period.

Table 6 Air Quality Monitoring Program Implementation

Monitoring Method	EMSAMP Version 2018-01 Compliance	EMSAMP Version 2019-01 /Air Emission Permit[a] Compliance	EMSAMP Version 2020-01/Air Emission Permit Compliance	Data QA/QC	Reporting
EBAMs (stations installed August 22, 2018 adjacent to the Camp climate station)	• Compliant with the exception of: – 9 instances when the TSP 24 hr average concentration was greater than the Yukon Ambient Air Quality Standards – 5 instances when the PM_{10} 24 hr average concentration was greater than the Yukon Ambient Air Quality Standards	• Compliant with the exception of – 2 instances when the TSP 24 hr average concentration was greater than the AQC – 5 instances when the $PM_{2.5}$ 24 hr average concentration was greater than the AQC – 4 instances when the PM_{10} 24 hr average concentration was greater than the AQC	Compliant	• EBAMs inspections, audits, calibration and maintenance adequate • Operations carried out according to SOP • Data validation adequate	• 2018 annual reporting adequate. Supporting air quality data provided in appendix. • 2019 annual reporting inadequate due to missing air quality data appendix and an error in Table 3.8-2. This table was copied without alteration from the 2018 report. • Q1 quarterly report adequate • Q2 quarterly report adequate
Dustfall (stations installed Aug 23, 2018 adjacent to vegetation plots)	Compliant with respect to monthly laboratory sample analysis and reporting	Compliant with respect to monthly laboratory sample analysis and reporting	Compliant with respect to monthly laboratory sample analysis and reporting	• Laboratory QA/QC procedure report and results are provided with analytical results. • Operations carried out according to SOP	• 2018 monthly reporting adequate, but should show comparison to AQC • 2019 monthly reporting adequate, but should show comparison to AQC • Results not discussed in 2018 or 2019 annual reports • Q1 quarterly report adequate • Q2 quarterly report adequate
Passive Air Sampling System (PASS) (stations installed Jan 1, 2020 adjacent to dustfall stations)	Not in use for this period	Compliant with respect to monthly laboratory sample analysis and reporting	Compliant with respect to monthly laboratory sample analysis and reporting	• Laboratory QA/QC procedure report and results are provided with analytical results. • Operations carried out according to SOP	• January-March 2020 reporting adequate • Q1 quarterly report adequate • Q2 quarterly report adequate
Hi-Volume Partisol Air Sampler (installed May 21, 2020 adjacent to EBAMs)	Not in use for this period	Not in use for this period	Compliant with respect to monthly laboratory sample analysis and reporting	• Laboratory QA/QC procedure report and results are provided with analytical results. • Operations carried out according to SOP	Q2 quarterly report adequate

NOTE:
[a] Air Emissions Permit No. 60-060 effective as of December 2019 and amended in September 2020.

.

2.2.3 Reporting Adequacy, Compliance and Recommendations

The implementation of the Eagle Gold Mine air quality monitoring program was adequate during the audit period. Performance data indicated that measured concentrations were greater than the 24-hour AQC for TSP, $PM_{10,}$ and $PM_{2.5}$ some days during the construction phase. Management responses set out in the construction phase EMSAMPs were implemented appropriately and described adequately in the 2018 and 2019 annual reports. Reports reviewed for the operations phase of the audit period indicate that the frequency of exceedances decreased compared to the construction period.

Stantec noted reporting inconsistencies during the audit period such as omitting to provide validated datasets to support discussion of results, and reporting results of sampling without showing comparison to the AQC. Implementation of the monitoring program going forward should involve improvements in reporting monitoring results.

Table 7 summarizes compliance gaps and/or deficiencies for the air quality monitoring program and provides recommendations for corrective action.

Table 7 Air Quality Monitoring Program Compliance and Recommendations

Compliance Gaps and/or Deficiencies	Recommendation/Corrective Action
Inconsistency in data reporting	Submit validated datasets with all annual and quarterly reports, and compare monitoring results to AQC

3.0 WATER RESOURCES

This section presents an audit of the water resources monitoring programs as specified in the applicable EMSAMP documents, compared to the data and information reported in supporting annual and monthly reports. The intent is to determine if ongoing monitoring and data collection meets the commitments outlined in the EMSAMP. This audit is specific to the following areas:

- Surface Water Hydrology
- Surface Water Quality
- Groundwater Quantity and Quality
- Geochemical Monitoring
- Stream Sediment
- Benthic Macroinvertebrates
- Fish and Fish Habitat

The scope of this water resources audit is limited to those monitoring methods as specified in the three versions of the EMSAMPs effective during the audit period.

3.1 SURFACE WATER HYDROLOGY

3.1.1 Documents Reviewed

Documents shown in Table 8 were reviewed for the surface water hydrology section of the audit:

Table 8 Surface Water Hydrology Documents Reviewed

Document	Version Reviewed	Sections Applicable during Construction Phase	Sections Applicable to Operations Phase
EMSAMP	2018-01	2.0 – Surface Water Hydrology	N/A
EMSAMP	2019-01	2.0 – Surface Water Hydrology	2.0 – Surface Water Hydrology
EMSAMP	2020-01	2.0 – Surface Water Hydrology	2.0 – Surface Water Hydrology
Water Licence QZ14-041 Quartz Mining License QML-0011 2018 Annual Report	N/A	3.1 – Surface Water Hydrology	N/A
Water Licence QZ14-041 Quartz Mining License QML-0011 2019 Annual Report	N/A	3.1 – Surface Water Hydrology	3.1 – Surface Water Hydrology

Water Management Plan	2020-01	All	All

3.1.2 Monitoring Program Implementation and Data QA/QC

Table 9 summarizes the compliance requirement categories for surface water hydrology.

Table 9 Surface Water Hydrology Compliance Requirements

Category	Compliance Criteria	Description of Compliance Requirement
1. Field Program	1A: Frequency	Monitoring was performed at the prescribed frequency (station-specific).
	1B: Tasks	Required tasks were completed at each site visit (e.g., collect data, perform routine maintenance, obtain discharge measurement)
2. Analysis	2A: Rating Curve	For automated stations, a rating curve has been (or is being) developed in accordance with standard industry practices and applicable EMSAMP.
	2B: Streamflow Record	For automated stations, a continuous streamflow record has been generated using continuous stage record and rating curve or other method. For manual stations, discharges and/or water levels have been summarized.
	2C: QA/QC	QA/QC has been performed in accordance with standard industry practices and applicable EMSAMP.
3. Reporting and Adaptive Management	3A: Reporting	Reporting covering/discussing the station was submitted at the prescribed frequency.
	3B: Exceedance Check/Comment	The results were compared to the applicable exceedance thresholds and an evaluation was formally made.
	3C: Response to Exceedance(s)	If an exceedance occurred, the appropriate adaptive management response was performed.

The specifics (e.g., applicable sites, monitoring frequency, required data) of the compliance requirements in Table 9 varied between the three EMSAMP versions (i.e., EMSAMP 2018-01, EMSAMP 2019-01, EMSAMP 2020-01). Therefore, a surface water hydrology audit was performed separately for each of the three EMSAMP versions.

The two WMP versions did not differ to a significant enough degree as to require separate sections. Therefore, WMP compliance was evaluated considering both WMP's simultaneously.

3.1.2.1 EMSAMP 2018-01

EMSAMP2018-01 was applicable from July 1, 2018 to June 18, 2019. The stations and corresponding monitoring requirements for this phase are summarized in Table 2.3.1 within Section 2 of EMSAMP 2018-01. The 2018 and 2019 annual reports were reviewed for compliance with EMSAMP2018-01 requirements for construction from July 1, 2018 to March 16, 2019 and for operations from March 17, 2019 to June 18, 2019. VGC monthly reports completed for the applicable period were not reviewed.

Table 10 summarizes the compliance performance for EMSAMP 2018-01.

3.1.2.2 EMSAMP 2019-01

EMSAMP 2019-01 was applicable from June 19, 2019 to May 18, 2020. The stations and corresponding monitoring requirements are summarized in Table 2.3-1 and 2.3-2 within Section 2 of EMSAMP 2019-01. The 2019 annual report and the January – May 2020 monthly reports were reviewed for compliance with operations phase requirements of the EMSAMP 2019-01.

Table 11 summarizes the compliance performance for EMSAMP 2019-01.

3.1.2.3 EMSAMP 2020-01

EMSAMP2020-01 was applicable from May 19, 2020 to June 30, 2020. During this time, the mine was in the operations phase. The stations and corresponding monitoring requirements are summarized in Table 2.3-2 within Section 2 of EMSAMP 2020-01. The May and June 2020 monthly reports were reviewed for compliance with EMSAMP 2020-01.

Table 12 summarizes the compliance performance for EMSAMP 2020-01.

Table 10 Surface Water Hydrology Monitoring Program Compliance – EMSAMP 2018-01

Station	Monitoring Required		Location Description	Compliance Requirements							
				1. Field Program		2. Analysis			3. Reporting and Adaptive Management		
	Construction	Operations		1A: Frequency	1B: Tasks	2A: Rating Curve	2B: Streamflow Record	2C: QA/QC	3A: Reporting Frequency	3B: Check for Threshold Event	3C: Response to Threshold Event
W1 [a]	a	a	Dublin Gulch above Stewart	Partial compliance. Winter frequency ok. Freshet frequency not completed [2]. Loggers installed during open water.	Partial compliance. Flows obtained. Monitoring visit tasks outlined in EMSAMP 2018-01 Section 2.3.1 not documented.	Compliant. Rating curve developed.	Compliant. Flow record from open water logger data/rating curve and manual winter measurement interpolation. Freshet measurements required to improve continuous record.	Partial compliance. Field visit QA/QC tasks discussed but not documented. Equipment calibration not documented. Rating curve/flow record QA/QC demonstrated.	Compliant. Station covered in annual reports.	Compliant. Evaluation of flows compared to qualitative triggers for adaptive management was made.	N/A. Adaptive management measures not applicable, as the qualitative triggers for adaptive management were considered to be not met.
W4 [a]	a	a	Haggart Creek below Dublin	Partial compliance. Winter frequency ok. Freshet frequency not completed [2]. Loggers installed during open water.	Partial compliance. Flows obtained. Monitoring visit tasks outlined in EMSAMP 2018-01 Section 2.3.1 not documented.	Compliant. Rating curve developed.	Compliant. Flow record from open water logger data/rating curve and manual winter measurement interpolation. Freshet measurements required to improve continuous record.	Partial compliance. Field visit QA/QC tasks discussed but not documented. Equipment calibration not documented. Rating curve/flow record QA/QC demonstrated.	Compliant. Station covered in annual reports.	Compliant. Evaluation of flows compared to qualitative triggers for adaptive management was made.	N/A. Adaptive management measures not applicable, as the qualitative triggers for adaptive management were considered to be not met.
W5 [a]	a	a	Haggart Creek above Lynx Creek	Partial compliance. Winter frequency ok. Freshet frequency not completed [2]. Loggers installed during open water.	Partial compliance. Flows obtained. Monitoring visit tasks outlined in EMSAMP 2018-01 Section 2.3.1 not documented.	Compliant. Rating curve developed.	Compliant. Flow record from open water logger data/rating curve and manual winter measurement interpolation. Freshet measurements required to improve continuous record.	Partial compliance. Field visit QA/QC tasks discussed but not documented. Equipment calibration not documented. Rating curve/flow record QA/QC demonstrated.	Compliant. Station covered in annual reports.	Compliant. Evaluation of flows compared to qualitative triggers for adaptive management was made.	N/A. Adaptive management measures not applicable, as the qualitative triggers for adaptive management were considered to be not met.
W6 [a]	a	a	Lynx Creek above Haggart Creek	Partial compliance. Winter frequency ok. Freshet frequency not completed [2]. Loggers installed during open water.	Partial compliance. Flows obtained. Monitoring visit tasks outlined in EMSAMP 2018-01 Section 2.3.1 not documented.	Compliant. Rating curve developed.	Compliant. Flow record from open water logger data/rating curve and manual winter measurement interpolation. Freshet measurements required to improve continuous record.	Partial compliance. Field visit QA/QC tasks discussed but not documented. Equipment calibration not documented. Rating curve/flow record QA/QC demonstrated.	Compliant. Station covered in annual reports.	Compliant. Evaluation of flows compared to qualitative triggers for adaptive management was made.	N/A. Adaptive management measures not applicable, as the qualitative triggers for adaptive management were considered to be not met.

Table 10 Surface Water Hydrology Monitoring Program Compliance – EMSAMP 2018-01

Station	Monitoring Required		Location Description	Compliance Requirements							
				1. Field Program		2. Analysis			3. Reporting and Adaptive Management		
	Construction	Operations		1A: Frequency	1B: Tasks	2A: Rating Curve	2B: Streamflow Record	2C: QA/QC	3A: Reporting Frequency	3B: Check for Threshold Event	3C: Response to Threshold Event
W20 [b]	b	b	Bawn Boy Gulch	Partial compliance. Manual measurement frequency ok for 2018. No data for 2019. Future monitoring plan not communicated.	Partial compliance. Flows partially obtained. Monitoring visit tasks outlined in EMSAMP 2018-01 Section 2.3.1 not documented.	N/A. Rating curve not required for manual measurement stations.	Partial compliance. Manual flow measurements reported for 2018, but not 2019.	Partial compliance. Field visit QA/QC tasks discussed but not documented. Equipment calibration not documented.	Compliant. Station covered in annual reports.	Not compliant. Data not provided; check for whether threshold triggered.	Not compliant. Data not provided; check for check for whether threshold triggered and response performed.
W21 [d]	d	g	Dublin Gulch at Mouth	Partial compliance. Winter frequency ok. Freshet frequency not completed [2]. Loggers installed during open water.	Partial compliance. Flows obtained. Monitoring visit tasks outlined in EMSAMP 2018-01 Section 2.3.1 not documented.	Compliant. Rating curve being developed.	Partial compliance. Winter interpolation not completed. Flow record from open water logger data/rating curve.	Partial compliance. Field visit QA/QC tasks discussed but not documented. Equipment calibration not documented. Rating curve/flow record QA/QC demonstrated.	Compliant. Station covered in annual reports.	Partial compliance. Evaluation of flows compared to qualitative triggers for adaptive management was made for other automated stations, but not this station.	Partial compliance. Unknown if adaptive management measurements are required as evaluation for triggers for adaptive management not completed for this site.
W22 [a]	a	a	Haggart Creek above Project Influence	Partial compliance. Winter frequency ok. Freshet frequency not completed [2]. Loggers installed during open water.	Partial compliance. Flows obtained. Monitoring visit tasks outlined in EMSAMP 2018-01 Section 2.3.1 not documented.	Compliant. Rating curve developed.	Compliant. Flow record from open water logger data/rating curve and manual winter measurement interpolation. Freshet measurements required to improve continuous record.	Partial compliance. Field visit QA/QC tasks discussed but not documented. Equipment calibration not documented. Rating curve/flow record QA/QC demonstrated.	Compliant. Station covered in annual reports.	Compliant. Evaluation of flows compared to qualitative triggers for adaptive management was made.	N/A. Adaptive management measures not applicable, as the qualitative triggers for adaptive management were considered to be not met.
W23 [b]	b	b	Haggart Creek below Lynx Creek	Not compliant. 2019 annual report suggest no data collected since 2011. No future monitoring plan communicated.	Not compliant. Monitoring visit tasks outlined in EMSAMP 2018-01 Section 2.3.1 not documented.	N/A. Rating curve not required for manual measurement stations.	Not compliant. No manual flow measurements provided.	Partial compliance. Field visit QA/QC tasks discussed but not documented. Equipment calibration not documented.	Partial compliance. Mention of W23 in 2019 annual report only.	Partial compliance. Evaluation of flows compared to qualitative triggers for adaptive management was made for other automated stations, but not this station.	Partial compliance. Unknown if adaptive management measurements are required as evaluation for triggers for adaptive management not completed for this site .

Table 10 Surface Water Hydrology Monitoring Program Compliance – EMSAMP 2018-01

Station	Monitoring Required		Location Description	Compliance Requirements							
				1. Field Program		2. Analysis			3. Reporting and Adaptive Management		
	Construction	Operations		1A: Frequency	1B: Tasks	2A: Rating Curve	2B: Streamflow Record	2C: QA/QC	3A: Reporting Frequency	3B: Check for Threshold Event	3C: Response to Threshold Event
W26 [a]	a	a	Stewart Gulch	Partial compliance. Winter measurements not completed. Freshet frequency not completed [2]. Loggers installed during open water.	Partial compliance. Flows obtained. Monitoring visit tasks outlined in EMSAMP 2018-01 Section 2.3.1 not documented.	N/A. Parshall flume installed.	Partial compliance. Flow record from open water logger data and parshall flume provided. Winter measurement interpolation not completed. Freshet measurements required to improve continuous record...	Partial compliance. Field visit QA/QC tasks discussed but not documented. Equipment calibration not documented. Flow record QA/QC demonstrated.	Compliant. Station covered in annual reports.	Partial compliance. Evaluation of flows compared to qualitative triggers for adaptive management was made for other automated stations, but not this station.	Partial compliance. Unknown if adaptive management measurements are required as evaluation for triggers for adaptive management not completed for this site.
W27 [a]	a	N/A	Eagle Creek near Camp below Eagle Creek Pond	Partial compliance. Winter measurements not completed. Freshet frequency not completed [2]. Loggers installed during open water.	Partial compliance. Flows obtained. Monitoring visit tasks outlined in EMSAMP 2018-01 Section 2.3.1 not documented.	N/A. Parshall flume installed.	Partial compliance. Incomplete flow record from open water logger data due to logger malfunction. Winter measurement interpolation not completed. Freshet measurements required to improve continuous record.	Partial compliance. Field visit QA/QC tasks discussed but not documented. Equipment calibration not documented. Flow record QA/QC demonstrated.	Compliant. Station covered in annual reports.	Partial compliance. Evaluation of flows compared to qualitative triggers for adaptive management was made for other automated stations, but not this station.	Partial compliance. Unknown if adaptive management measurements are required as evaluation for triggers for adaptive management not completed for this site.
W29 / W99 [a]	a	a	Haggart Creek below Eagle Creek and Platinum Gulch	Partial compliance. Winter frequency ok. Freshet frequency not completed [2]. Loggers installed during open water.	Partial compliance. Flows obtained. Monitoring visit tasks outlined in EMSAMP 2018-01 Section 2.3.1 not documented.	Compliant. Rating curve developed at W29. Rating curve being developed at W99.	Partial compliance. Flow record not provided at W29 due to logger malfunction and station damage. Flow record provided at W99 for open water season; winter interpolation not completed.	Partial compliance. Field visit QA/QC tasks discussed but not documented. Equipment calibration not documented. Rating curve/flow record QA/QC demonstrated.	Compliant. Station covered in annual reports.	Partial compliance. Evaluation of flows compared to qualitative triggers for adaptive management was made for other automated stations, but not this station.	Partial compliance. Unknown if adaptive management measurements are required as evaluation for triggers for adaptive management not completed for this site.
W39 [c]	c	c	Haggart Creek above South McQuesten River	Partial compliance. Manual measurements obtained, but not on consistent or quarterly schedule.	Partial compliance. Flows obtained. Monitoring visit tasks outlined in EMSAMP 2018-01 Section 2.3.1 not documented.	N/A. Rating curve not required for manual measurement stations.	Partial compliance. Manual measurements reported, but not on consistent or quarterly schedule.	Partial compliance. Field visit QA/QC tasks discussed but not documented. Equipment calibration not documented.	Compliant. Station covered in annual reports.	Partial compliance. Evaluation of flows compared to qualitative triggers for adaptive management was made for other automated stations, but not this station.	Partial compliance. Unknown if adaptive management measurements are required as evaluation for triggers for adaptive management not completed for this site.

W45 [a]	a	N/A	Eagle Creek above Haggart Creek	Partial compliance. Winter frequency ok. Freshet frequency not completed [2]. Loggers installed during open water.	Partial compliance. Flows obtained. Monitoring visit tasks outlined in EMSAMP 2018-01 Section 2.3.1 not documented.	Compliant. Rating curve being developed.	Compliant. Flow record not provided as rating curve is in development. Water level record for open water season provided.	Partial compliance. Field visit QA/QC tasks discussed but not documented. Equipment calibration not documented. Rating curve/flow record QA/QC demonstrated.	Compliant. Station covered in annual reports.	Partial compliance. Evaluation of flows compared to qualitative triggers for adaptive management was made for other automated stations, but not this station.	Partial compliance. Unknown if adaptive management measurements are required as evaluation for triggers for adaptive management not completed for this site.
W49 [c]	c	c	South McQuesten River below Haggart Creek	Partial compliance. Manual measurements obtained, but not on consistent or quarterly schedule.	Partial compliance. Flows obtained. Monitoring visit tasks outlined in EMSAMP 2018-01 Section 2.3.1 not documented.	N/A. Rating curve not required for manual measurement stations.	Partial compliance. Manual measurements reported, but not on consistent or quarterly schedule.	Partial compliance. Field visit QA/QC tasks discussed but not documented. Equipment calibration not documented. documented.	Compliant. Station covered in annual reports.	Partial compliance. Evaluation of flows compared to qualitative triggers for adaptive management was made for other automated stations, but not this station.	Partial compliance. Unknown if adaptive management measurements are required as evaluation for triggers for adaptive management not completed for this site.
CS-01 [d]	d	N/A	Sediment Basin - below lower Process Access Road	Reports reviewed do not address/discuss this station. Compliance cannot be determined using reports. VGC communication outside of reporting (personal communication, October 29, 2020), indicated the site was not constructed and is inactive, suggesting EMSAMP requirements not applicable.							
CS-02 [d]	d	N/A	Sediment Basin - below Truck Shop	Reports reviewed do not address/discuss this station. Compliance cannot be determined using reports. VGC communication outside of reporting (personal communication, October 29, 2020), indicated the site was not constructed and is inactive, suggesting EMSAMP requirements not applicable.							
CS-03 [d]	d	N/A	Sediment Basin - below AN/Emulsion access and storage area	Reports reviewed do not address/discuss this station. Compliance cannot be determined using reports. VGC communication outside of reporting (personal communication, October 29, 2020), indicated the site was not constructed and is inactive, suggesting EMSAMP requirements not applicable.							
CS-04 [d]	d	d	Sediment Basin - below Ice Rich Storage Area	Reports reviewed do not address/discuss this station. Compliance cannot be determined using reports. VGC communication outside of reporting (personal communication, October 29, 2020), indicated the site was not constructed and is inactive, suggesting EMSAMP requirements not applicable.							
EPS [d]	d	d	Eagle Pup WRSA Seepage	Reports reviewed do not address/discuss this station. Compliance cannot be determined using reports. VGC communication outside of reporting (personal communication, October 29, 2020), indicated the site was not constructed and is inactive, suggesting EMSAMP requirements not applicable.							
LDSPI [d]	d	e	Lower Dublin South Pond Inflow	Reports reviewed do not address/discuss this station directly; only make indirect reference to upstream diversions to accommodate work in and around LDSP (suggests not constructed yet). Compliance cannot be determined using reports. VGC communication outside of reporting (personal communication, 29 October 2020) indicated discharging to LDSP did not occur, making EMSAMP requirements not applicable.							
LDSPO [d]	d	e	Lower Dublin South Pond Outflow	Reports reviewed do not address/discuss this station directly; only make indirect reference to upstream diversions to accommodate work in and around LDSP (suggests not constructed yet). Compliance cannot be determined using reports. VGC communication outside of reporting (personal communication, 29 October 2020) indicated discharging from LDSP did not occur, making EMSAMP requirements not applicable.							

Table 10 Surface Water Hydrology Monitoring Program Compliance – EMSAMP 2018-01

Station	Monitoring Required		Location Description	Compliance Requirements							
				1. Field Program		2. Analysis			3. Reporting and Adaptive Management		
	Construction	Operations		1A: Frequency	1B: Tasks	2A: Rating Curve	2B: Streamflow Record	2C: QA/QC	3A: Reporting Frequency	3B: Check for Threshold Event	3C: Response to Threshold Event
PDI [d]	d	N/A	Platinum Gulch Ditch	Reports reviewed do not address/discuss this station. Compliance cannot be determined using reviewed reports. VGC communication outside of reporting (personal communication, October 29, 2020), indicated the site was not constructed and is inactive, suggesting EMSAMP requirements not applicable.							
PGS	N/A	d	Platinum Gulch WRSA Seepage	Reports reviewed do not address/discuss this station. Compliance cannot be determined using reviewed reports. VGC communication outside of reporting (personal communication, October 29, 2020), indicated the site was not active, suggesting EMSAMP requirements not applicable.							
PDI & PGS PTS	N/A	g	Platinum Gulch Ditch into Lower Dublin South Pond	Reports reviewed do not address/discuss this station. Compliance cannot be determined using reviewed reports. VGC communication outside of reporting (personal communication, October 29, 2020), indicated the site was not active, suggesting EMSAMP requirements not applicable.							
PS	N/A	f	Open Pit Sump	Reports reviewed do not address/discuss this station. Compliance cannot be determined using reviewed reports. VGC communication outside of reporting (personal communication, October 29, 2020), indicated the site was not active, suggesting EMSAMP requirements not applicable.							
MWTP	N/A	d	Mine Water Treatment Plant	Reports reviewed do not address/discuss this station. Compliance cannot be determined using reviewed reports. VGC communication outside of reporting (personal communication, October 29, 2020), indicated the site was not active, suggesting EMSAMP requirements not applicable.							
FT	N/A	d	Mine Water Treatment Plant Finishing Tank	Reports reviewed do not address/discuss this station. Compliance cannot be determined using reviewed reports. VGC communication outside of reporting (personal communication, October 29, 2020), indicated the site was not active, suggesting EMSAMP requirements not applicable.							
OPP	N/A	g	Open Pit Pond	No open pit pond. EMSAMP requirements not applicable.							
OPPO	N/A	b	Open Pit Pond Overflow	No open pit pond. EMSAMP requirements not applicable.							

NOTES:
[1] N/A if manual monitoring protocol is performed. If automated monitoring protocol is performed, rating curve must be developed.
[2] VGC communication outside of reporting (personal communication, 29 October 2020) indicated certain freshet measurements not obtained due to unsafe ice or flow conditions.
[a] Automated monitoring. Manual monitoring weekly during freshet until loggers installed and twice a month during winter.
[b] Manual monitoring on a monthly basis.
[c] Manual monitoring on a quarterly basis.
[d] Station may be either manual or automatic. Measurements taken weekly when discharging if manual measurements only.
[e] Automated monitoring when discharging.
[f] Automated monitoring when dewatering
[g] Manual measurement of water level

Table 11 Surface Water Hydrology Monitoring Program Compliance – EMSAMP 2019-01

Station	Location Description	Compliance Requirements							
		1. Field Program		2. Analysis [1]			3. Reporting and Adaptive Management [1]		
		1A: Frequency	1B: Tasks	2A: Rating Curve	2B: Streamflow Record	2C: QA/QC	3A: Reporting	3B: Check for Threshold Event	3C: Response to Threshold Event
W1	Dublin Gulch above Stewart Gulch inflow	Partial compliance. Winter frequency not sufficient. Freshet frequency insufficient[3]. Loggers installed during open water.	Partial compliance. Monitoring visit tasks outlined in EMSAMP 2019-01 Section 2.3.1 not documented.	Compliant. Rating curve developed. 2020 data not incorporated yet.	Partial compliance. Winter interpolation compliance unknown. No open water season data due to logger malfunction.	Partial compliance. Field visit QA/QC tasks discussed but not documented. Equipment calibration not documented. Rating curve/flow record QA/QC demonstrated.	Compliant. Station in 2019 annual report, 2020 monthly reports.	N/A. Not listed as requiring adaptive management check in EMSAMP 2019-01.	N/A. Not listed as requiring adaptive management check in EMSAMP 2019-01.
W4	Haggart Creek below Dublin Gulch	Partial compliance. Winter frequency not sufficient. Freshet frequency sufficient. Loggers installed during open water.	Partial compliance. Flows obtained. Monitoring visit tasks outlined in EMSAMP 2019-01 Section 2.3.1 not documented.	Compliant. Rating curve developed. 2020 data not incorporated yet.	Compliant. Flow record from open water logger data/rating curve. Winter interpolation compliance unknown. Freshet measurements required to improve data record.	Partial compliance. Field visit QA/QC tasks discussed but not documented. Equipment calibration not documented. Rating curve/flow record QA/QC demonstrated.	Compliant. Station in 2019 annual report, 2020 monthly reports.	Partial compliance. Average monthly variance computed (instead of median). Comparison to quantitative performance thresholds not completed.	Not compliant. Performance thresholds exceeded but adaptive management responses were not performed/documented, nor were they documented as not applicable with a rationale.
W5	Haggart Creek above Lynx Creek	Partial compliance. Winter frequency not sufficient. Freshet frequency not sufficient[3]. Loggers installed during open water.	Partial compliance. Flows obtained. Monitoring visit tasks outlined in EMSAMP 2019-01 Section 2.3.1 not documented.	Compliant. Rating curve developed. 2020 data not incorporated yet.	Compliant. Flow record from open water logger data/rating curve. Winter interpolation compliance unknown. Freshet measurements required to improve data record.	Partial compliance. Field visit QA/QC tasks discussed but not documented. Equipment calibration not documented. Rating curve/flow record QA/QC demonstrated.	Compliant. Station in 2019 annual report, 2020 monthly reports.	N/A. Not listed as requiring adaptive management check in EMSAMP 2019-01.	N/A. Not listed as requiring adaptive management check in EMSAMP 2019-01.
W6	Lynx Creek above Haggart Creek	Partial compliance. Winter frequency not sufficient. Freshet frequency not sufficient[3]. Loggers installed during open water.	Partial compliance. Flows obtained. Monitoring visit tasks outlined in EMSAMP 2019-01 Section 2.3.1 not documented.	Compliant. Rating curve developed. 2020 data not incorporated yet.	Compliant. Flow record from open water logger data/rating curve. Winter interpolation compliance unknown. Freshet measurements required to improve data record.	Partial compliance. Field visit QA/QC tasks discussed but not documented. Equipment calibration not documented. Rating curve/flow record QA/QC demonstrated.	Compliant. Station in 2019 annual report, 2020 monthly reports.	N/A. Not listed as requiring adaptive management check in EMSAMP 2019-01.	N/A. Not listed as requiring adaptive management check in EMSAMP 2019-01.
W20	Bawn Boy Gulch	Partial compliance. No data for 2019. 2020 monthly reports indicate monitoring re-started. Unsafe winter conditions noted.	Partial compliance. Flow measurements attempted in 2020. Monitoring visit tasks outlined in EMSAMP 2019-01 Section 2.3.1 not documented.	N/A. Rating curve not required for manual measurement stations.	Not compliant. Water level records not provided.	Partial compliance. Field visit QA/QC tasks discussed but not documented. Equipment calibration not documented.	Partial compliance. Not in 2019 annual report. Station included in 2020 monthly reports.	N/A. Not listed as requiring adaptive management check in EMSAMP 2019-01.	N/A. Not listed as requiring adaptive management check in EMSAMP 2019-01.
W21	Dublin Gulch above confluence with Haggart Creek	Unknown. Required frequency not specified in EMSAMP.	Partial compliance. Flows/water levels attempted. Monitoring visit tasks outlined in EMSAMP 2019-01 Section 2.3.1 not documented.	N/A. Compliance requires water levels only; rating curve not required. Noted that rating curve was actively being developed.	Not compliant. No manual water level measurements provided; no automated water levels provided as logger malfunctioned in 2019.	Partial compliance. Field visit QA/QC tasks discussed but not documented. Equipment calibration not documented.	Compliant. Station in 2019 annual report, 2020 monthly reports.	N/A. Performance thresholds for water level not provided in EMSAMP2019-01.	N/A. Performance thresholds for water level not provided in EMSAMP2019-01.

Table 11 Surface Water Hydrology Monitoring Program Compliance – EMSAMP 2019-01

Station	Location Description	Compliance Requirements							
		1. Field Program		2. Analysis [1]			3. Reporting and Adaptive Management [1]		
		1A: Frequency	1B: Tasks	2A: Rating Curve	2B: Streamflow Record	2C: QA/QC	3A: Reporting	3B: Check for Threshold Event	3C: Response to Threshold Event
W22	Haggart Creek above Project Influence	Partial compliance. Winter frequency not sufficient. Freshet frequency likely not sufficient[3]. Loggers installed during open water.	Partial compliance. Flows obtained. Monitoring visit tasks outlined in EMSAMP 2019-01 Section 2.3.1 not documented.	Compliant. Rating curve developed. 2020 data not incorporated yet.	Compliant. Flow record from open water logger data/rating curve. Winter interpolation compliance unknown. Freshet measurements required to improve data record.	Partial compliance. Field visit QA/QC tasks discussed but not documented. Equipment calibration not documented. Rating curve/flow record QA/QC demonstrated.	Compliant. Station in 2019 annual report, 2020 monthly reports.	N/A. Not listed as requiring adaptive management check in EMSAMP 2019-01.	N/A. Not listed as requiring adaptive management check in EMSAMP 2019-01.
W23	Haggart Creek below Lynx Creek	Partial compliance. No data in 2019. 2020 monthly reports indicate monitoring re-started.	Partial compliance. Flow measurements attempted/obtained in 2020. Monitoring visit tasks outlined in EMSAMP 2019-01 Section 2.3.1 not documented.	N/A. Rating curve not required for manual measurement stations.	Not compliant. No manual flow measurements provided.	Partial compliance. Field visit QA/QC tasks discussed but not documented. Equipment calibration not documented.	Partial compliance. Not in 2019 annual report. Station included in 2020 monthly reports.	N/A. Not listed as requiring adaptive management check in EMSAMP 2019-01.	N/A. Not listed as requiring adaptive management check in EMSAMP 2019-01.
W26	Stewart Gulch	Partial compliance. Winter frequency not sufficient. Freshet frequency not sufficient[3]. Loggers installed during open water.	Partial compliance. Flows obtained. Monitoring visit tasks outlined in EMSAMP 2019-01 Section 2.3.1 not documented.	N/A. Parshall flume installed.	Compliant. Flow record from open water logger data/parshall flume. Winter interpolation compliance unknown. Freshet measurements required to improve data record.	Partial compliance. Field visit QA/QC tasks discussed but not documented. Equipment calibration not documented. Parshall flume/flow record QA/QC demonstrated.	Compliant. Station in 2019 annual report, 2020 monthly reports.	N/A. Not listed as requiring adaptive management check in EMSAMP 2019-01.	N/A. Not listed as requiring adaptive management check in EMSAMP 2019-01.
W27	Eagle Creek near Camp below Eagle Creek Pond	Partial compliance. Winter frequency not sufficient. Freshet frequency not sufficient[3]. Loggers installed during open water.	Partial compliance. Flows obtained. Monitoring visit tasks outlined in EMSAMP 2019-01 Section 2.3.1 not documented.	N/A. Parshall flume installed.	Compliant. Flow record from open water logger data/parshall flume. Winter interpolation compliance unknown. Freshet measurements required to improve data record.	Partial compliance. Field visit QA/QC tasks discussed but not documented. Equipment calibration not documented. Flow record QA/QC demonstrated.	Compliant. Station in 2019 annual report, 2020 monthly reports.	N/A. Not listed as requiring adaptive management check in EMSAMP 2019-01.	N/A. Not listed as requiring adaptive management check in EMSAMP 2019-01.
W29	Haggart Creek below Eagle Creek and Platinum Gulch	Partial compliance. Winter frequency not sufficient. Freshet frequency sufficient. Loggers installed during open water.	Partial compliance. Flows obtained. Monitoring visit tasks outlined in EMSAMP 2019-01 Section 2.3.1 not documented.	Compliant. Rating curve developed. 2020 data not incorporated yet.	Partial compliance. Winter interpolation compliance unknown. No open water season automated data due to logger malfunction, however it is noted that data records for W29 have been replaced by W99.	Partial compliance. Field visit QA/QC tasks discussed but not documented. Equipment calibration not documented. Rating curve/flow record QA/QC demonstrated.	Compliant. Station in 2019 annual report, 2020 monthly reports.	Not compliant. Flow records not compared to performance thresholds.	Not compliant. Performance thresholds exceeded but adaptive management responses were not performed/ documented, nor were they documented as not applicable with a rationale.

Table 11 Surface Water Hydrology Monitoring Program Compliance – EMSAMP 2019-01

Station	Location Description	Compliance Requirements							
		1. Field Program		2. Analysis [1]			3. Reporting and Adaptive Management [1]		
		1A: Frequency	1B: Tasks	2A: Rating Curve	2B: Streamflow Record	2C: QA/QC	3A: Reporting	3B: Check for Threshold Event	3C: Response to Threshold Event
W39	Haggart Creek above South McQuesten River	Partial compliance. Manual measurements obtained, but not on consistent or quarterly schedule.	Partial compliance. Flows obtained. Monitoring visit tasks outlined in EMSAMP 2019-01 Section 2.3.1 not documented.	N/A. Rating curve not required for manual measurement stations.	Partial compliance. Manual measurements reported, but not on consistent or quarterly schedule.	Partial compliance. Field visit QA/QC tasks discussed but not documented. Equipment calibration not documented.	Compliant. Station in 2019 annual report, 2020 monthly reports.	N/A. Not listed as requiring adaptive management check in EMSAMP 2019-01.	N/A. Not listed as requiring adaptive management check in EMSAMP 2019-01.
W45	Eagle Creek above Haggart Creek	Partial compliance. Winter frequency not sufficient. Freshet frequency not sufficient[3]. Loggers installed during open water.	Partial compliance. Flows obtained. Monitoring visit tasks outlined in EMSAMP 2019-01 Section 2.3.1 not documented.	Compliant. Rating curve being developed. 2020 data not incorporated yet.	Partial compliance. Winter interpolation compliance unknown but manual measurements not shown. Water level records provided in lieu of discharge as rating curve still being developed.	Partial compliance. Field visit QA/QC tasks discussed but not documented. Equipment calibration not documented. Rating curve/flow record QA/QC demonstrated.	Compliant. Station in 2019 annual report, 2020 monthly reports.	N/A. Not listed as requiring adaptive management check in EMSAMP 2019-01.	N/A. Not listed as requiring adaptive management check in EMSAMP 2019-01.
W49	South McQuesten River below Haggart Creek	Partial compliance. Manual measurements obtained, but not on consistent or quarterly schedule.	Partial compliance. Flows obtained. Monitoring visit tasks outlined in EMSAMP 2019-01 Section 2.3.1 not documented.	N/A. Rating curve not required for manual measurement stations.	Partial compliance. Manual measurements reported, but not on consistent or quarterly schedule.	Partial compliance. Field visit QA/QC tasks discussed but not documented. Equipment calibration not documented.	Compliant. Station in 2019 annual report, 2020 monthly reports.	N/A. Not listed as requiring adaptive management check in EMSAMP 2019-01.	N/A. Not listed as requiring adaptive management check in EMSAMP 2019-01.
W99	Haggart Creek above 15 Pup	Partial compliance. Winter frequency not sufficient. Freshet frequency not sufficient[3]. Loggers installed during open water.	Partial compliance. Flows obtained. Monitoring visit tasks outlined in EMSAMP 2019-01 Section 2.3.1 not documented.	Compliant. Rating curve being developed. 2020 data not incorporated yet.	Compliant. Winter interpolation compliance unknown. Freshet measurements required to improve data record.	Partial compliance. Field visit QA/QC tasks discussed but not documented. Equipment calibration not documented. Rating curve/flow record QA/QC demonstrated.	Compliant. Station in 2019 annual report, 2020 monthly reports.	N/A. Not listed as requiring adaptive management check in EMSAMP 2019-01.	N/A. Not listed as requiring adaptive management check in EMSAMP 2019-01.
CS-01	Sediment Basin - below lower Process Access Road	These stations are not constructed. Station is not active.							
CS-03	Sediment Basin - below Truck Shop	These stations are not constructed. Station is not active.							
CS-06	Sediment Basin - below AN/Emulsion access and storage area	These stations are not constructed. Station is not active.							
CS-07	Sediment Basin - below Ice Rich Storage Area	These stations are not constructed. Station is not active.							
EPS	Eagle Pup WRSA Seepage	These stations are not constructed. Station is not active.							
FT	Mine Water Treatment Plant Finishing Tank	These stations are not constructed. Station is not active.							

Table 11 Surface Water Hydrology Monitoring Program Compliance – EMSAMP 2019-01

Station	Location Description	Compliance Requirements							
		1. Field Program		2. Analysis [1]			3. Reporting and Adaptive Management [1]		
		1A: Frequency	1B: Tasks	2A: Rating Curve	2B: Streamflow Record	2C: QA/QC	3A: Reporting	3B: Check for Threshold Event	3C: Response to Threshold Event
HLFUMV	Heap Leach Facility Underdrain Monitoring Vault	Partial compliance. No data in 2019. 2020 monthly reports indicate site not active until May 2020.	Partial compliance. No data in 2019.	Partial compliance. No data in 2019.	Partial compliance. No data in 2019.	Partial compliance. No data in 2019.	Partial compliance. Not in 2019 annual report. Station included in 2020 monthly reports.	N/A. Not listed as requiring adaptive management check in EMSAMP 2019-01.	N/A. Not listed as requiring adaptive management check in EMSAMP 2019-01.
LDSPI	Lower Dublin South Pond Inflow	Partial compliance. No data in 2019. 2020 monthly reports indicate site not active.	Partial compliance. No data in 2019.	Partial compliance. No data in 2019.	Partial compliance. No data in 2019.	Partial compliance. No data in 2019.	Partial compliance. Not in 2019 annual report. Station included in 2020 monthly reports.	N/A. Not listed as requiring adaptive management check in EMSAMP 2019-01.	N/A. Not listed as requiring adaptive management check in EMSAMP 2019-01.
LDSP	Lower Dublin South Pond Outflow	Partial compliance. No data in 2019. 2020 monthly reports indicate site not active.	Partial compliance. No data in 2019.	Partial compliance. No data in 2019.	Partial compliance. No data in 2019.	Partial compliance. No data in 2019.	Partial compliance. Not in 2019 annual report. Station included in 2020 monthly reports.	N/A. Not listed as requiring adaptive management check in EMSAMP 2019-01.	N/A. Not listed as requiring adaptive management check in EMSAMP 2019-01.
MWTP	Mine Water Treatment Plant	2019 annual report reviewed do not address/discuss this station. 2020 monthly reports indicate station not active. Compliance cannot be fully determined using reports. VGC communication outside of reporting (personal communication, 29 October 2020), indicated the site was not constructed and is inactive, suggesting EMSAMP requirements not applicable.							
OPP	Open Pit Pond	2019 annual report reviewed do not address/discuss this station. 2020 monthly reports indicate station not active. Compliance cannot be fully determined using reports. VGC communication outside of reporting (personal communication, 29 October 2020), indicated the site was not constructed and is inactive, suggesting EMSAMP requirements not applicable .							
OPPO	Open Pit Pond Overflow	2019 annual report reviewed do not address/discuss this station. 2020 monthly reports indicate station not active. Compliance cannot be fully determined using reports. VGC communication outside of reporting (personal communication, 29 October 2020), indicated the site was not constructed and is inactive, suggesting EMSAMP requirements not applicable.							
PGS	Platinum Gulch WRSA Seepage	Partial compliance. No data in 2019. 2020 monthly reports indicate site not active.	Partial compliance. Flow conditions (no flow/frozen/flow measurement) obtained in 2020. Monitoring visit tasks outlined in EMSAMP 2019-01 Section 2.3.1 not documented.	N/A. Rating curve not required for manual measurement stations.	Not compliant. No streamflow record demonstrated.	Partial compliance. Field visit QA/QC tasks discussed but not documented. Equipment calibration not documented.	Partial compliance. Not in 2019 annual report. Station included in 2020 monthly reports.	N/A. Not listed as requiring adaptive management check in EMSAMP 2019-01.	N/A. Not listed as requiring adaptive management check in EMSAMP 2019-01.
PDI	Platinum Gulch Ditch	Partial compliance. No data in 2019. 2020 monthly reports indicate site not active.	Partial compliance. Flow conditions (no flow/frozen/flow measurement) obtained in 2020. Monitoring visit tasks outlined in EMSAMP 2019-01 Section 2.3.1 not documented.	N/A. Rating curve not required for manual measurement stations.	Not compliant. No streamflow record demonstrated.	Partial compliance. Field visit QA/QC tasks discussed but not documented. Equipment calibration not documented.	Partial compliance. Not in 2019 annual report. Station included in 2020 monthly reports.	N/A. Not listed as requiring adaptive management check in EMSAMP 2019-01.	N/A. Not listed as requiring adaptive management check in EMSAMP 2019-01.
PS	Open Pit Sump	2019 annual report reviewed do not address/discuss this station. 2020 monthly reports indicate station not active. Compliance cannot be fully determined using reports. VGC communication outside of reporting (personal communication, 29 October 2020), indicated the site was not constructed and is inactive, suggesting EMSAMP requirements not applicable.							

Table 12 Surface Water Hydrology Monitoring Program Compliance – EMSAMP 2020-01

Station	Location Description	Compliance Requirements							
		1. Field Program		2. Analysis [1]			3. Reporting and Adaptive Management [1]		
		1A: Frequency	1B: Tasks	2A: Rating Curve	2B: Streamflow Record	2C: QA/QC	3A: Reporting	3B: Check for Threshold Event	3C: Response to Threshold Event
W1 [a]	Dublin Gulch above Stewart	Compliant. Manual measurements demonstrated. Logger installations not documented.	Partial compliance. Flows obtained. Monitoring visit tasks outlined in EMSAMP 2020-01 Section 2.3.1 not documented.	N/A. Rating curve information not required in monthly reports.	N/A. Flow records not required in monthly reports	Not compliant. QA/QC procedures not demonstrated.	Compliant. Included in monthly reports.	N/A. Not listed as requiring adaptive management check in EMSAMP 2020-01.	N/A. Not listed as requiring adaptive management check in EMSAMP 2020-01.
W4 [a]	Haggart Creek below Dublin	Compliant. Manual measurements demonstrated. Logger installations not documented.	Partial compliance. Flows obtained. Monitoring visit tasks outlined in EMSAMP 2020-01 Section 2.3.1 not documented.	N/A. Rating curve information not required in monthly reports.	N/A. Flow records not required in monthly reports	Not compliant. QA/QC procedures not demonstrated.	Compliant. Included in monthly reports.	N/A. Performance threshold check or discussion of adaptive management applicability to be completed in annual reporting.	N/A. Performance threshold check to be completed in annual reporting.
W5 [a]	Haggart Creek above Lynx Creek	Compliant. Manual measurements demonstrated. Logger installations not documented.	Partial compliance. Flows obtained. Monitoring visit tasks outlined in EMSAMP 2020-01 Section 2.3.1 not documented.	N/A. Rating curve information not required in monthly reports.	N/A. Flow records not required in monthly reports	Not compliant. QA/QC procedures not demonstrated.	Compliant. Included in monthly reports.	N/A. Not listed as requiring adaptive management check in EMSAMP 2020-01.	N/A. Not listed as requiring adaptive management check in EMSAMP 2020-01.
W6 [a]	Lynx Creek above Haggart Creek	Compliant. Manual measurements demonstrated. Logger installations not documented.	Partial compliance. Flows obtained. Monitoring visit tasks outlined in EMSAMP 2020-01 Section 2.3.1 not documented.	N/A. Rating curve information not required in monthly reports.	N/A. Flow records not required in monthly reports	Not compliant. QA/QC procedures not demonstrated.	Compliant. Included in monthly reports.	N/A. Not listed as requiring adaptive management check in EMSAMP 2020-01.	N/A. Not listed as requiring adaptive management check in EMSAMP 2020-01.
W20 [b]	Bawn Boy Gulch	Compliant. Site visits demonstrated.	Partial compliance. Flows attempted. Monitoring visit tasks outlined in EMSAMP 2020-01 Section 2.3.1 not documented.	N/A. Rating curve information not required for manual measurement stations.	N/A. Flow records not required in monthly reports	Not compliant. QA/QC procedures not demonstrated.	Compliant. Included in monthly reports.	N/A. Not listed as requiring adaptive management check in EMSAMP 2020-01.	N/A. Not listed as requiring adaptive management check in EMSAMP 2020-01.
W21 [a]	Dublin Gulch at Mouth	Compliant. Manual measurements demonstrated. Logger installations not documented.	Partial compliance. Flows obtained. Monitoring visit tasks outlined in EMSAMP 2020-01 Section 2.3.1 not documented.	N/A. Rating curve information not required in monthly reports.	N/A. Flow records not required in monthly reports	Not compliant. QA/QC procedures not demonstrated.	Compliant. Included in monthly reports.	N/A. Not listed as requiring adaptive management check in EMSAMP 2020-01.	N/A. Not listed as requiring adaptive management check in EMSAMP 2020-01.
W22 [a]	Haggart Creek above Project Influence	Compliant. Manual measurements demonstrated. Logger installations not documented.	Partial compliance. Flows obtained. Monitoring visit tasks outlined in EMSAMP 2020-01 Section 2.3.1 not documented.	N/A. Rating curve information not required in monthly reports.	N/A. Flow records not required in monthly reports	Not compliant. QA/QC procedures not demonstrated.	Compliant. Included in monthly reports.	N/A. Not listed as requiring adaptive management check in EMSAMP 2020-01.	N/A. Not listed as requiring adaptive management check in EMSAMP 2020-01.
W23 [b]	Haggart Creek below Lynx Creek	Compliant. Manual measurements demonstrated.	Partial compliance. Flows attempted. Monitoring visit tasks outlined in EMSAMP 2020-01 Section 2.3.1 not documented.	N/A. Rating curve information not required for manual measurement stations.	N/A. Flow records not required in monthly reports	Not compliant. QA/QC procedures not demonstrated.	Compliant. Included in monthly reports.	N/A. Not listed as requiring adaptive management check in EMSAMP 2020-01.	N/A. Not listed as requiring adaptive management check in EMSAMP 2020-01.

Table 12 Surface Water Hydrology Monitoring Program Compliance – EMSAMP 2020-01

Station	Location Description	Compliance Requirements							
		1. Field Program		2. Analysis [1]			3. Reporting and Adaptive Management [1]		
		1A: Frequency	1B: Tasks	2A: Rating Curve	2B: Streamflow Record	2C: QA/QC	3A: Reporting	3B: Check for Threshold Event	3C: Response to Threshold Event
W26 [a]	Stewart Gulch	Compliant. Manual measurements demonstrated. Logger installations not documented.	Partial compliance. Flows obtained. Monitoring visit tasks outlined in EMSAMP 2020-01 Section 2.3.1 not documented.	N/A. Rating curve information not required in monthly reports.	N/A. Flow records not required in monthly reports	Not compliant. QA/QC procedures not demonstrated.	Compliant. Included in monthly reports.	N/A. Not listed as requiring adaptive management check in EMSAMP 2020-01.	N/A. Not listed as requiring adaptive management check in EMSAMP 2020-01.
W27 [a]	Eagle Creek near Camp below Eagle Creek Pond	Compliant. Manual measurements demonstrated. Logger installations not documented.	Partial compliance. Flows obtained. Monitoring visit tasks outlined in EMSAMP 2020-01 Section 2.3.1 not documented.	N/A. Rating curve information not required in monthly reports.	N/A. Flow records not required in monthly reports	Not compliant. QA/QC procedures not demonstrated.	Compliant. Included in monthly reports.	N/A. Not listed as requiring adaptive management check in EMSAMP 2020-01.	N/A. Not listed as requiring adaptive management check in EMSAMP 2020-01.
W29 [b]	Haggart Creek below Eagle Creek and Platinum Gulch	Compliant. Manual measurements demonstrated. Logger installations not documented.	Partial compliance. Flows obtained. Monitoring visit tasks outlined in EMSAMP 2020-01 Section 2.3.1 not documented.	N/A. Rating curve information not required for manual measurement stations.	N/A. Flow records not required in monthly reports	Not compliant. QA/QC procedures not demonstrated.	Compliant. Included in monthly reports.	N/A. Performance threshold check or discussion of adaptive management applicability to be completed in annual reporting.	N/A. Performance threshold check to be completed in annual reporting.
W39 [c]	Haggart Creek above South McQuesten River	Compliant. Manual measurement attempted in May.	Partial compliance. Flows attempted. Monitoring visit tasks outlined in EMSAMP 2020-01 Section 2.3.1 not documented.	N/A. Rating curve information not required for manual measurement stations.	N/A. Flow records not required in monthly reports	Not compliant. QA/QC procedures not demonstrated.	Compliant. Included in monthly reports.	N/A. Not listed as requiring adaptive management check in EMSAMP 2020-01.	N/A. Not listed as requiring adaptive management check in EMSAMP 2020-01.
W45 [a]	Eagle Creek above Haggart Creek	Compliant. Manual measurements demonstrated. Logger installations not documented.	Partial compliance. Flows obtained. Monitoring visit tasks outlined in EMSAMP 2020-01 Section 2.3.1 not documented.	N/A. Rating curve information not required in monthly reports.	N/A. Flow records not required in monthly reports	Not compliant. QA/QC procedures not demonstrated.	Compliant. Included in monthly reports.	N/A. Not listed as requiring adaptive management check in EMSAMP 2020-01.	N/A. Not listed as requiring adaptive management check in EMSAMP 2020-01.
W49 [c]	South McQuesten River below Haggart Creek	Compliant. Manual measurement attempted in May.	Partial compliance. Flows attempted. Monitoring visit tasks outlined in EMSAMP 2020-01 Section 2.3.1 not documented.	N/A. Rating curve information not required for manual measurement stations.	N/A. Flow records not required in monthly reports	Not compliant. QA/QC procedures not demonstrated.	Compliant. Included in monthly reports.	N/A. Not listed as requiring adaptive management check in EMSAMP 2020-01.	N/A. Not listed as requiring adaptive management check in EMSAMP 2020-01.
W99 [a]	Haggart Creek above 15 Pup	Compliant. Manual measurements demonstrated. Logger installations not documented.	Partial compliance. Flows obtained. Monitoring visit tasks outlined in EMSAMP 2020-01 Section 2.3.1 not documented.	N/A. Rating curve information not required in monthly reports.	N/A. Flow records not required in monthly reports	Not compliant. QA/QC procedures not demonstrated.	Compliant. Included in monthly reports.	N/A. Not listed as requiring adaptive management check in EMSAMP 2020-01.	N/A. Not listed as requiring adaptive management check in EMSAMP 2020-01.

Table 12 Surface Water Hydrology Monitoring Program Compliance – EMSAMP 2020-01

Station	Location Description	Compliance Requirements							
		1. Field Program		2. Analysis [1]			3. Reporting and Adaptive Management [1]		
		1A: Frequency	1B: Tasks	2A: Rating Curve	2B: Streamflow Record	2C: QA/QC	3A: Reporting	3B: Check for Threshold Event	3C: Response to Threshold Event
ADR Pad Ditch [h]	ADR Pad Ditch Outlet	N/A. Daily site visits not required as site not active and not discharging. .	N/A. Not required when not discharging or not active..	N/A. Rating curve information not required for manual measurement stations.	N/A. Flow records not required in monthly reports	N/A. Not required when not active.	N/A	N/A. Not listed as requiring adaptive management check in EMSAMP 2020-01.	N/A. Not listed as requiring adaptive management check in EMSAMP 2020-01.
CS-07 [e]	Sediment Basin - below Ice Rich Storage Area	Compliant. Site visit demonstrated but noted as not active.	N/A. Not required when not active	N/A. Rating curve information not required in monthly reports.	N/A. Flow records not required in monthly reports	N/A. Not required when not active.	N/A	N/A. Not listed as requiring adaptive management check in EMSAMP 2020-01.	N/A. Not listed as requiring adaptive management check in EMSAMP 2020-01.
EPS [b]	Eagle Pup WRSA Seepage	Compliant. Site visit demonstrated but noted as not active.	N/A. Not required when not active.	N/A. Rating curve information not required for manual measurement stations.	N/A. Flow records not required in monthly reports	N/A. Not required when not active.	N/A	N/A. Not listed as requiring adaptive management check in EMSAMP 2020-01.	N/A. Not listed as requiring adaptive management check in EMSAMP 2020-01.
FT [e]	Mine Water Treatment Plant Finishing Tank	Compliant. Site visit demonstrated but noted as not active.	N/A. Not required when not active	N/A. Rating curve information not required in monthly reports.	N/A. Flow records not required in monthly reports	N/A. Not required when not active	N/A	N/A. Table 12 Surface Water Hydrology Monitoring Program Compliance – EMSAMP 2020-01

Station	Location Description	Compliance Requirements							
		1. Field Program		2. Analysis [1]			3. Reporting and Adaptive Management [1]		
		1A: Frequency	1B: Tasks	2A: Rating Curve	2B: Streamflow Record	2C: QA/QC	3A: Reporting	3B: Check for Threshold Event	3C: Response to Threshold Event

NOTES:
[1] Compliance for analysis and reporting requirements could often not be checked for compliance; 2020 monthly reports do not provide rating curves, flow records, QA/QC, monitoring summaries, or adaptive management checks
[a] Automated monitoring. Manual monitoring weekly during freshet until loggers installed and monthly during winter.
[b] Manual monitoring on a monthly basis.
[c] Manual monitoring on a quarterly basis.
[e] Automated monitoring when discharging.
[f] Automated monitoring when dewatering.
[g] Quarterly manual water level measurements during active closure.
[h] Manual measurement on a daily basis when discharging.

3.1.2.4 Water Management Plan

The Licensee's compliance with WMP 2017-01 and WMP 2020-01 was evaluated concurrently. Both WMP 2017-01 and WMP 2020-01 are approved plans with design components and as-recorded surveys sealed by a professional engineer licensed to practice in the Yukon.

The compliance evaluation for the WMPs checked for completion, and for effectiveness. Compliance with completion occurred if the water management infrastructure item was documented as installed by the required time (e.g., prior to operation). Compliance with effectiveness occurred if water quality did not exceed the Effluent Quality Standards during operations (Table 7.1-1 in WMP 2017-01, Table 6.1-1 in WMP 2020-01), and if regular inspection (as required) was documented for water management infrastructure/measures. Table 13 summarizes the main water management infrastructure, and provides an evaluation of compliance based on the reviewed reporting. Water quality implications are discussed in Section 3.2 (Surface Water Quality).

Table 13 Water Management Plan Implementation

Water Management Infrastructure	Compliance
LDSP	Partial compliance. VGC communication outside of reviewed reporting (personal communication, 29 October 2020) indicated as built report submitted in 2017 annual report. Completion date not documented in reviewed reports. Use of water from LDSP for dust suppression and concrete mentioned in June–October 2018 (2018 annual report) and storage in LDSP mentioned in May–September 2019, suggesting completion to some degree. Completion of specific LDSP components (spillway, embankment, inlet tie-ins, etc.) not documented in reviewed reports.
Ditch A	Partial compliance. VGC communication outside of reviewed reporting (personal communication, 29 October 2020) indicated ditch as built report provided to EMR as appendix to 2019 Annual Report. In reviewed reporting, excavation, rip rap armoring, HDPE pipe fusing documented as completed in 2019. Inlet to LDSP documented as completed in 2019. Month of completion not documented in reviewed reports. Completion prior to beginning of operation (August 31, 2020) not documented in reviewed reports
Ditch B	Partial compliance. VGC communication outside of reporting (personal communication, October 29, 2020) indicated ditch as built report provided to EMR as appendix to 2019 Annual Report. In reviewed reporting, excavation, rip rap armoring began in 2018, scheduled for completion in March 2019. Completion not documented in reviewed reports. Inlet to LDSP documented as completed in 2019 (month of completion not documented). Completion prior to beginning of operation (August 31, 2020) not documented in reviewed reports. Ditch B extension to toe of Eagle Pup documented as planned for 2020.
Ditch C	Compliant. Excavation, rip rap armoring completed in April 2019, prior to beginning of operation (August 31, 2020).
Culverts	Partial compliance. VGC communication outside of reporting (personal communication, October 29, 2020) indicated culvert inventory has been provided to EMR-CMI. In reviewed reporting, installation of numerous culverts throughout 2018 and 2019 documented. Inventory of culvert locations, characteristics, and completion dates not provided in reviewed reports.
Unnamed Ditches	Partial compliance. Installation of numerous conveyance/diversion ditches throughout 2018 and 2019 documented. Inventory of ditch locations, characteristics, and completion dates not provided.

Table 13 Water Management Plan Implementation

Water Management Infrastructure	Compliance
Events Pond	Partial compliance. VGC communication outside of reporting (personal communication, October 29, 2020) indicated as builts provided to YWB as appendix to 2019 Annual Report. In reviewed reporting, documented as completed in 2019. Month of completion not documented. Completion prior to beginning of operation (August 31, 2020) not documented in reviewed reports.
MWTP	N/A. Not required until Phase 2.
Erosion and Sediment Control BMP's	N/A. Reporting requirements are on an annual basis and were not specified as required until the 2020 Water Management Plan (Table 2.3-2); the 2020 annual report was not a reviewed report. Current and planned implementation of ESC BMP's are generally referenced in 2018 and 2019 annual reporting.

3.1.3 Reporting Adequacy, Compliance and Recommendations

Overall, compliance results for the applicable EMSAMPs were a mix of compliant, partial compliance, and not compliant (See Table 10 to Table 12). Several consistent non-compliance or partial compliance themes were observed throughout the audit period. The Licensee's adherence to the applicable EMSAMP has appeared to improve through the audit period. This improvement was gradual through the audit period and was not related to a transition in project phase (e.g., construction to start-up/operation). For example, in the January – June 2020 monthly reports, all of the stations which were listed in EMSAMP 2019-01 and EMSAMP 2020-01 were listed and commented on in the 2020 monthly reports, whereas the 2018 and 2019 annual reports did not cover/discuss all of the stations listed in the EMSAMPs.

Table 14 summarizes the consistent compliance gaps/deficiencies resulting in partial compliance or non-compliance, and provides recommendations/corrective actions for each.

Table 14 Surface Water Hydrology Compliance and Recommendations

Compliance Gap and/or Deficiency	Recommendation/Corrective Action
EMSAMPs reference RISC (2009) as the document which was used to develop hydrology data collection. This document is out of date; Version 2.0 of that document was published in 2018.	The EMSAMP surface water hydrology program should be updated to reflect Version 2 of the hydrometric standards (RISC 2018).
Poor documentation of revised sampling approaches for various stations based on data collection challenges or change in phase (e.g., monitoring frequency, monitoring type).	Explicitly document and provide rationale for changes to station monitoring approach or regime where applicable, and indicate plans for revising applicable EMSAMP sections.
Prior to the 2020 monthly reports, there was insufficient documentation of periods where “discharging” or “dewatering” was occurring; this informs the requirement for monitoring at several station.	Based on review of monthly reports from 2020, it appears that VGC has improved this. The 2020 annual report, and future monthly and annual reports, should continue to document periods of discharging or dewatering at applicable locations throughout site as to inform the need for monitoring at applicable sites.
For automated stations, winter and freshet time periods were not clearly delineated as to allow for demonstration of compliance as outlined in the EMSAMPs.	Recommend one of two changes: 1. Document approximate dates of freshet start and logger deployment each year in the monthly and annual reports to delineate winter, freshet, and open water periods (each of which have different monitoring requirements), or 2. Update the EMSAMP requirements for the freshet period to better acknowledge i) the subjectivity of determining freshet period and/or ii) the difficulty of obtaining flow measurements during freshet flows.
Quarterly manual monitoring stations are not completed at consistent times of the year.	Clarify “quarterly monitoring” schedule, with backup sampling protocols if conditions are unsafe.
Prior to the 2020 Monthly Reports, not all of the monitoring stations outlined in the EMSAMPs are discussed/addressed in the annual reports.	Discuss/address all monitoring stations listed in the applicable EMSAMP, noting the status (e.g., active, not active) of each. Include data for all active monitoring stations (automated, manual) in reporting.
The EMSAMPs list general tasks to be completed at each field visit (Section 2.3.1). Completion of these tasks was discussed in general in annual reports but documentation was not provided per requirements of RISC (2018).	Provide summary information regarding the completion of the tasks associated with each field visit in the annual reports, and/or indicate (in reporting) that these data have been documented internally and are available upon request.
Logger malfunctions resulted in the loss of partial or full open water season datasets at several stations.	As outlined in the general tasks in the EMSAMPs (Section 2.3.1), download logger data either at every monitoring visit, or at an appropriate regular frequency, to minimize data loss and rectify issues.
Sites experienced flows which were too high to safely obtain a flow measurement. The flows experienced in June are part of the seasonal range in flows and should be captured as part of the rating curve development or verification.	If possible considering a reasonable level of effort and resources, safe flow measurement methods and procedures should be developed and implemented to capture high flows which are essential to development of reliable rating curves. If no method is safe considering reasonable levels of effort and resources, it should be stated in the reporting as such (e.g., as was completed in 2020 Monthly Reports) with a rationale, and the rating curves identified as valid below an identified threshold.

Table 14 Surface Water Hydrology Compliance and Recommendations

Compliance Gap and/or Deficiency	Recommendation/Corrective Action
QA/QC related to field and analytical tasks (e.g., benchmark surveys, station condition, field processes, photos, equipment calibration) were not documented.	Recommend that QA/QC processes in accordance with Section 2.3.1 in EMSAMP2018-01, EC 2001, RISC 2018 are documented and provided in reporting.
Flow records are in partial compliance due to lack of winter and freshet measurements and/or logger malfunctions.	Implement monitoring program as outlined in applicable EMSAMP or provide rationale for implementation not being possible in reporting and amend EMSAMP.
For automated stations, it is not clear what the manual monitoring frequency is during the freshet in EMSAMP2020-01.	Clarify this in future EMSAMPs/reporting.
It is not clear in the EMSAMPs if the adaptive management performance thresholds are applicable to manual monitoring stations.	Clarify this in future EMSAMPs/reporting.
Average monthly flows were used instead of median monthly flows (as specified in Table 2.4-1 in EMSAMP2019-01 and EMSAMP2020-01) in evaluation of performance thresholds.	Use median monthly flows in evaluation of performance thresholds as outlined in EMSAMP.
The method of evaluation of performance thresholds for adaptive management was not completed in accordance with quantitative procedure outlined in EMSAMPs.	Apply the quantitative evaluation protocol outlined in the EMSAMPs for performance thresholds for adaptive management at relevant monitoring locations.
The evaluation of performance thresholds for adaptive management was not completed for all automated stations listed in the EMSAMPs.	Perform evaluation of performance thresholds for adaptive management for all relevant automated stations as outlined in the EMSAMP.
Adaptive management responses were not clearly performed following an AMP event of performance thresholds.	Implement and document the adaptive management responses if performance thresholds exceeded at relevant monitoring locations as outlined in EMSAMPs.
Full documentation of completion timelines and dates for key water management infrastructure not documented in reviewed reports.	Include specific completion dates in annual reporting for all key water management components.

3.2 SURFACE WATER QUALITY

3.2.1 Documents Reviewed

Documents shown in Table 15 were reviewed for the surface water quality monitoring section of the audit. In addition, the monitoring program was reviewed with respect to procedures outlined in the British Columbia Field Sampling Manual as per the EMSAMPs (BC ENV 2013), and the Guidance Document for the Sampling and Analysis of Metal Mining Effluents (EC 2001).

Table 15 Surface Water Quality Documents Reviewed

Document	Version Reviewed	Sections Applicable during Construction Phase	Sections Applicable to Operations Phase
EMSAMP	2018-01	3.0 – Surface Water Quality	N/A
EMSAMP	2019-01	3.0 – Surface Water Quality	3.0 – Surface Water Quality
EMSAMP	2020-01	N/A	3.0 – Surface Water Quality
Construction and Operations Water Management Plan	2017-01	3.4.3 – Surface Water Quality	3.4.3 – Surface Water Quality 4.3 – Discharge Protocols 7.0 – Operations Water Management
Water Management Plan	2020-01	N/A	3.4.2 – Surface Water Quality 4.3 – Discharge Protocols 6.0 Water Management Implementation
Water Licence QZ14-041, Quartz Mining License QML-0011 2018 Annual Report	N/A	3.2 – Surface Water Quality	N/A
Water Licence QZ14-041, Quartz Mining License QML-0011 2019 Annual Report	N/A	3.2 – Surface Water Quality	3.2 – Surface Water Quality
Water Licence QZ14-041-01 Monthly reports January 1 to June 30, 2020	N/A	N/A	3.0 – Surface Water Quality
Water Licence QZ14-041-01 (Amendment 1, August 23, 2019)	Amendment 1	Schedule 3 – WQOs	Part F – EQS

3.2.2 Monitoring Program Implementation

The surface water monitoring program was designed to meet the following objectives during construction and operations as described in EMSAMP 2018-01 and EMSAMP 2019-01:

- Continue to collect water quality data in the receiving environment as the Project transitions from construction to operations at stations upstream and downstream of Project influences.
- Collect water quality data to verify compliance with the discharge criteria specified in QZ14-041.
- Provide a continuous water quality database to support adaptive management strategies to meet water quality compliance criteria and protect aquatic life.

The following are key watersheds where the surface water monitoring program focuses on compliance monitoring and environmental effects:

- Haggart Creek from below the confluence of Fisher Gulch to immediately downstream of the confluence of Lynx Creek;
- Dublin Gulch from Bawn Boy Gulch to the confluence with Haggart Creek;
- Eagle Creek;
- Lynx Creek; and
- South McQuesten River at the confluence of Haggart Creek

The surface water monitoring program is implemented according the objectives stated in the EMSAMP versions.

3.2.3 Compliance with EMSAMP

The Construction and Operations Water Management Plan 2017-01 and the Water Management Plan 2020-01 were reviewed for alignment with the applicable EMSAMP. Discharge protocols relating to the adaptive management thresholds (AMTs) and EQS were aligned with the EMSAMP and Water Licence QZ14-041.

For the construction phase, the 2018 and 2019 Annual Reports were reviewed for compliance with surface water quality sections of the EMSAMP 2018-01 and EMSAMP 2019-01. In this review, monitoring stations, sampling frequency, parameters analyzed, and rationale for missing data were checked for compliance with the applicable EMSAMPs. The results of this task are listed in Table 16.
During construction, effluent compliance points and effluent quality standards were not established and no discharge of contact water to the surface water occurred.

For the operational phase, the 2019 Annual Report and applicable 2020 Monthly Reports were reviewed for compliance with EMSAMP 2019-01 and EMSAMP 2020-01. In this review, monitoring stations, sampling frequency, parameters analyzed, and rationale for missing data were checked for compliance with the applicable EMSAMPs. The results of this task are listed in in Table 17. Effluent compliance points, effluent quality standards (EQS), and water quality objectives (WQOs) were described in EMSAMP 2019-01 as per the Water License QZ14-041, Amendment 1, August 23, 2019. Table 18 lists the threshold trigger events for surface water monitoring sites during operations while Table 19 describes the responses and follow up actions completed with auditor's comments on deficiencies.

NOTES:

[1] Laboratory analysis includes WAD, Total CN, Thiocyanate and Cyanate.

[2] Laboratory analysis includes WAD and Total CN.

[3] Calculation of un-ionized ammonia

[4] Laboratory analysis only includes WAD and Total CN - no other parameters required.

[5] Laboratory analysis includes physical parameters: pH, Specific Conductance, turbidity, TSS, TDS and hardness as well as total and dissolved organic carbon; cyanide species, major anions and nutrients (alkalinity, total nitrogen, total Kjeldahl nitrogen (TKN), ammonia-N, nitrate-N, nitrite-N, total dissolved phosphate-P, ortho-phosphate-P, sulphate, bromide, chloride, fluoride); and, total and dissolved metals (Al, Sb, As, Cd, Ca, Cr, Co, Cu, Fe, Pb, Mg, Mn, Mo, Hg, Ni, , K, Se, Ag, Na, Sr, Tl, S U, Zn).

[6] May 2020 Monthly Report states LDSPI sampled as a combination of all ditch inflows but no analytical data was associated with this Station

C - Continuous monitoring for specific conductance; D - Daily when discharging; W - Weekly when discharging; M - Monthly; Md - Monthly when discharging; Q - Quarterly

Y - No Sample = inactive station, no flow, no discharge, dry conditions, frozen, not active, heavy sediment, or no safe access

									Construction[1]						Operations											
									EMSAMP 2018-01						EMSAMP 2019-01											EMSAMP 2020-01

NOTES:
[1] Exceedances are reported for all 2019 data (as per the Quartz Mining Licence QML-0011 2019 Annual Report), although at the time of the sample event, the WQO were not established (part of the EMSAMP 2019-01)
[2] Results from September 11, 2019 is currently considered potentially erroneous as most other measured metals or metalloid parameters were not highly elevated in the W4 September 11, 2019 sample.
WQO = Water Quality Objective (QZ14-041)
MDMER = Metal and Diamond Mining Effluent Regulations, Schedule 4 Authorized Discharge
EQS = Effluent Quality Standard (QZ14-041)
AMT = Adaptive Management Threshold, T1 = Tier 1, T2 = Tier 2, T3 = Tier 3

Table 19 Surface Water Quality Exceedances and Responses

Date	Stations	Standard Exceeded	Response(s)	Follow Up Reporting	Auditor's Comments
April 2019	W4, W29, W99, W23	WQO	• Discharges were ceased when on-site TSS data indicated EQS exceedance	Results included in the 2019 Annual Report. Email notification sent to NND (Na-Cho Nyak Dun) Lands & Resources and the Energy and Mines Resources Compliance Inspector.	As per Section 3.8.3 of the EMSAMP 2018-01, adaptive management measures during operations that will be employed in the event these thresholds are reached include: • MWTP inspection during operations to determine if system is functioning as intended • PTS inspection early and post closure to determine if system is functioning as intended • Repair MWTP components and adjust reagent dosages as necessary • Perform maintenance on passive treatment systems • Verify on site analysis results with accredited laboratory results • Re-sample and analyze after verification water treatment system functioning properly • Consider need for temporary re-routing of contact water to suspend effluent discharge until licensed effluent concentrations are achieved prior to discharge. Examples of operational/ routing changes include: – Recirculation of excess process water within the HLF until repairs and adjustments are made to MWTP to achieve licensed effluent concentrations – Rerouting contact water from Open Pit and Waste Rock Storage Areas from MWTP to the events pond and/or HLF for storage and recirculation temporarily – Suspend Open Pit dewatering operations • Consider capital improvements to augment or replace existing treatment systems The 2019 Annual Report did not include a detailed AMT response following the above stated methods.
April 2020	W23, W29, W99	WQO and AMT T3	• Sample frequency changed from monthly to weekly. • Acute lethality testing was performed on the discharged water on April 21 and yielded results that were non-acutely lethal to rainbow trout or Daphnia Magna. • VGC continued to maintain the Dublin Gulch exploration road to keep snowmelt runoff from mobilizing sediment from the road.	A full report regarding the discharge from April 20–28, 2020 has been provided to the Yukon Water Board via the Waterline registry for QZ14-04-1 on May 19, 2020. A Freshet/High-Volume Management Plan was requested by Energy and Mines Resources in July 2020 to be prepared. VGC submitted this plan on September 30, 2020.	As per Section 3.8 of the EMSAMP 2019-01 notification, review, evaluation, and action for exceeding an AMT were partially completed. Missing: • For WQO and AMT exceedances, compare values to baseline to determine if any significant changes have occurred to the receiving environment water quality, complete a trend analysis and include methods and results in the report. • Detailed AMT response following the EMSAMP methods was not clear.
May 2020	W22, W4, W29, W99, W23	WQO and AMT T2 and T3	• Additional samples were collected mid-May at Stations W22, W4, and W29.	No follow up reporting noted.	As per Section 3.8 of the EMSAMP 2019-01 notification, review, evaluation, and action for exceeding an AMT were not completed. Increased sample frequency (monthly to weekly) as per the Water Management Plan was not completed after the exceedance in early May.
June 2020	W4, W29, W99	WQO and AMT T2 and T3	• Additional samples were collected mid-June following an AMT T2 exceedance at W4	No follow up reporting noted.	As per Section 3.8 of the EMSAMP 2019-01 notification, review, evaluation, and action for exceeding an AMT were not completed. Increased sample frequency (monthly to weekly) as per the Water Management Plan was not completed after the exceedance in mid-June.

3.2.4 Data QA/QC

2018 Annual Report

The methods of the QA/QC program were adequately described, though results (e.g., number of samples collected, duplicate relative percent differences, any failed data quality objectives (DQOs), and corrective action if DQOs fail) were not included in the report body nor were results of the QA/QC samples included in Appendix D and therefore total number of QA/QC samples (e.g., >10% of dataset) could not be determined.

2019 Annual Report

The methods and summary of results of the QA/QC program were adequately described except for the duplicate samples – where summary of results was omitted. However, detailed results (e.g., number of samples collected, duplicate relative percent differences, any failed DQOs were not included in the report body nor were analytical results of the QA/QC samples included in Appendix F; however, this data was available in the 2019 Monthly Reports. A total of 14% of QA/QC samples were collected (30 QA/QC samples per 212 surface water samples) which follows recommendations (>10%) as per BC ENV (2013).

2020 Monthly Reports

Details of the QA/QC program was not included in the monthly reports. For all 2020 monthly reports—in the report body or Appendix A, QA/QC duplicate samples are not identified, but assumed to be the Station number followed by "…01" for duplicates, "…02" for travel blanks, "…03" for travel blanks, and "…04" for equipment blank. From this assumption, 7 duplicate samples, three field blanks, and three travel blanks were collected between January and June 2020 resulting in 9.1% of QA/QC samples to total samples (13 QA/QC samples per 143 surface water samples). BC ENV (2013) recommends >10%.

3.2.5 Reporting Adequacy

The 2018 Annual Report, the 2019 Annual Report, and the 2020 Monthly Reports were reviewed for adequacy and compliance. Overall, the reporting and summarization of data collected for the surface water quality monitoring program is complete and adequate with deviations described below.

2018 Annual Report

The 2018 Annual Report adequately described and reported the construction monitoring program as described in the EMSAMP 2018-01; however, deviations and omissions were noted:

- Rationale for missed sampling events was not provided in relevant sections and was inferred from the TSS table (Table 3.2-2)
- As described in Section 3.2.4, the results of the QA/QC samples were not described or included in Appendix D.

2019 Annual Report

The 2019 Annual Report adequately described and reported the construction and operational monitoring program as described in the EMSAMP 2018-01 and EMSAMP 2019-01; however, some deviations and omissions were noted:

- Tabulated list of the water quality results including QA/QC data, reported from the analytical lab, were absent from the report and appendices. Instead, water quality results were reported in graph form which adequately compared parameters to WQOs and Effluent Quality Standards, as stated in the Water Licence QZ14-041, but does not show the laboratory reported value or full analytical suite.
- As this report does not include the tabulated water quality results, a check for compliance with the EMSAMPs was completed using the 2019 Monthly Reports
- A summary of QA/QC duplicate sample results were not included in the report body.
- In Appendix F, the quality of Figures 2-5, 2-6, 2-9, 2-11, 2-13, 2-14, 2-15, 2-16, and 2-17, was poor, the x axis could not be read.
- In Appendix F, scatter plots of arsenic, aluminum, sulphate, selenium, and uranium were plotted with baseline (2007) to current (2019) data; however, analytes were not statistically compared to baseline values to determine if any significant changes have occurred to the receiving environment water quality nor method or results of trend analysis included.
- Cyanate and thiocyanate were not included in the analytical suite.
- TSS and arsenic exceeded MDMER (TSS) and EQS (arsenic and TSS) during a discharge event at Station LDSP in April 2019. While discharge was ceased due to high field TSS, details of adaptive management measures (as per EMSAMP 2018-01 as this was during construction) were omitted (e.g., inspections, repairs, verification of analyte results, and/or re-run samples).

2020 Monthly Reports

The 2020 Monthly Reports adequately described and reported the operational monitoring program as described in the EMSAMP 2019-01; however, some deviations and omissions were noted:

- In Table 3.3-1 in January 2020 Monthly report, no rationale was provided for missing field parameters for Station W27, rationale was found in Table 2.2-1, part of the hydrology section.
- For all 2020 monthly reports – in the report body or Appendix A, QA/QC duplicate samples are not identified, but assumed to be the Station number followed by "…01 or …02". In addition, duplicate samples should not include the parent sample (i.e., Station number) in the sample name.
- WQO and Adaptive Management Thresholds (AMT) were exceeded in April, May, and June 2020. Exceeded analytes were not statistically compared to baseline values to determine if any significant changes have occurred to the receiving environment water quality nor method or results of trend analysis included. In addition, details of the AMT response were not included.
- Table 3.2-1 in May 2020 Monthly report states that Station LDSPI was sampled as a combination of all ditch flows, but laboratory data was not attached to the report for that station.

- Table 3.2-1 in May 2020 Monthly report states that Station EPS was not active, but Appendix A included laboratory water quality data for Station EPS. VG noted that EPS is active and the discrepancy was a reporting error.

3.2.6 Summary of Deficiencies and Recommendations

Table 20 summarizes compliance gaps and/or deficiencies for the surface water monitoring program and provides recommendations for corrective actions.

Table 20 Surface Water Quality Compliance and Recommendations

Compliance Gap and/or Deficiency	Recommendation/Corrective Action
2018 Annual Report – Rationale for missing sample events	Include a footnote for each table describing missing data rationale (e.g., frozen water)
2018 Annual Report – QA/QC results not described	Include text in the report body describing the results of the QA/QC program (e.g., number of QA/QC samples, summary of results, DQOs, and corrective actions for failed DQOs). Also include these data in the database (Appendix D) or tabulated form.
2019 Annual Report – Water Quality Results	Include a tabulated form of all water quality data including QA/QC samples
2019 Annual Report – QA/QC results not completely described	Include results of duplicate sample results as well as total amount of QA/QC samples collected and summarize data in a tabulated form.
2019 Annual Report – Quality of plots	Improve quality of plots so axes can be read (Appendix F)
2019 Annual Report – Statistical and trend analysis	For WQO exceedances, the EMSAMP commits VGC to compare values to baseline to determine if any significant changes have occurred to the receiving environment water quality, complete a trend analysis, and include methods and results in the report. We recommend an adjustment to this commitment with the goal of an achievable exercise for this project (e.g., complete statistical analysis to determine significance, and/or monitor over x number of sampling events to determine if it is a real change in water quality)
2019 Annual Report – Cyanide species	Include cyanate and thiocyanate in the analytical suite for compliance with EMSAMP 2019-01
2019 Annual Report – AMT Responses	The EMSAMPs requests VGC to describe in detail the response for any AMT exceedances. As per the Water Management Plan, sampling frequency will increase accordingly (next higher order) to better characterize trends.
2020 Monthly Reports – QA/QC	Report on QA/QC samples collected monthly and include results in the report body including laboratory QA/QC results. Frequency of QA/QC samples are to meet >10% ratio of QA/QC samples to total water quality samples. Currently field blanks are being collected are documented in the 2020 monthly report water quality appendices.

Table 20 Surface Water Quality Compliance and Recommendations

Compliance Gap and/or Deficiency	Recommendation/Corrective Action
2020 Monthly Reports – AMT Responses	For WQO and AMT exceedances, the EMSAMP commits VGC to compare values to baseline to determine if any significant changes have occurred to the receiving environment water quality, complete a trend analysis and include methods and results in the report. We recommend an adjustment to this commitment with the goal of an achievable exercise for this project (e.g., complete statistical analysis to determine significance, and/or monitor over x number of sampling events to determine if it is a real change in water quality). We also recommend to include a detailed AMT response. As per the Water Management Plan, sampling frequency should increase accordingly (next higher order) to better characterize trends.

3.3 GROUNDWATER QUANTITY AND QUALITY

3.3.1 Documents Reviewed

Documents in Table 21 were reviewed for the groundwater quantity and quality section of the audit:

The periods of the groundwater monitoring program audited (January 2018 to June 2020) include the mine's construction phase and operations phase, and a transition period between the two phases. The approved groundwater monitoring program (e.g. well locations, data collection frequency) presented in the EMSAMP are different for each of the phases. The relevant version of the EMSAMP and groundwater monitoring programs used as the basis of the auditing are presented in Table 21.

3.3.2 Monitoring Program Implementation and Data QA/QC

3.3.2.1 Groundwater Quantity

The objective of the groundwater quantity monitoring program presented in the EMSAMP is to provide groundwater level measurement to monitor potential project effects on the occurrence and quantity of groundwater during mine construction and start-up phases. The main components of the groundwater quantity program, as presented in the relevant EMSAMPs, are:

- Field program to install and maintain a network of groundwater monitoring wells at strategic locations and perform continuous and/or manual groundwater level measurement at selected wells in accordance with the monitoring schedule proposed in the EMSAMPs.
- Desktop assessment to compile and calibrate field groundwater level data, plot hydrographs versus time, precipitation, and temperature, and compare the hydrographs to existing baseline data.
- Preparation of data summary report at the completion of construction, annually during operation, and for specific reporting periods as identified in the Reclamation and Closure Plan.

As a part of the audit's effort to evaluate the implementation of the groundwater quantity monitoring program, the groundwater level records presented in the 2018 and 2019 annual reports and 2020 monthly reports were reviewed and compared with the applicable groundwater quantity monitoring requirements in the relevant EMSAMP.

As noted in Section 3.3.1, groundwater quantity monitoring requirements (e.g. well locations, data collection frequency) for the construction and operations phases were different. It is understood that during the transition period from the mine construction phase to operations phase most of the monitoring wells in the construction phase monitoring program (Table 22) were gradually decommissioned and no longer being monitored. At the same time, new wells in the operations phase monitoring network were progressively installed. The audit results of the two phases are presented separately in Table 22 and Table 23. Recommendations on the implementation of the groundwater quantity monitoring program are presented in section 3.3.3.

[2] "M" – manual groundwater level record, "L" – datalogger groundwater level record, the timing of the records shown in the table was visually identified from hydrographs therefore is approximate.

3.3.2.2 Groundwater Quality

The objective of the groundwater quality monitoring program is to monitor project effects on the quality of groundwater as the project transitions from baseline conditions through construction and operations. The key components of the groundwater quantity program, as presented in the relevant EMSAMP, are:

- Field program to install and maintain a network of groundwater monitoring wells at strategic locations, and collect groundwater samples from selected wells in accordance with the monitoring schedule, and sampling and transportation protocols presented in the EMSAMP. The groundwater quality monitoring is integrated with the groundwater quantity monitoring program such that groundwater samples are collected from a subset of wells that are monitored for groundwater levels.
- Field QA/QC program including collection of trip blanks, field blanks, and field duplicates samples.
- Field and lab analysis of groundwater samples for the following groundwater quality parameters:
  - Field parameters: temperature, pH, conductivity, turbidity
  - Lab physical parameters: temperature, conductivity, turbidity, TDS, TSS, pH
  - Anion: Cl, SO_4, NO_3, NO, CN_2, Total Alkalinity
  - Nutrients: TKN, NH3, T-Nitrogen, Total-PO_4, Dissolved-PO_4, Ortho-PO_4
  - Carbon: Dissolved Organic Carbon, Total Organic Carbon
  - Total metals: ICPOES/MS + mercury, trace metals (Al, Sb, As, Ba, Be, B, Cd, Ca, Cr, Co, Cu, Fe, Pb, Mg, Mn, Hg, Mo, Ni, P, K, Se, Si, Ag, Na, Sr, Tl, V, U, Zn)
  - Dissolved metals: ICPOES/MS + mercury, trace metals (Al, Sb, As, Ba, Be, B, Cd, Ca, Cr, Co, Cu, Fe, Pb, Mg, Mn, Hg, Mo, Ni, P, K, Se, Si, Ag, Na, Sr, Tl, V, U, Zn)
- Desktop analysis of analytical results and compilation of groundwater quality data, review data against baseline groundwater quality and QA/QC criteria to identify and eliminate false positives and negatives, compare results to applicable permit discharge or monitoring criteria, and plot concentration of regulated constituents and key indicator parameters versus time and applicable standards and baseline concentrations.
- Submission of groundwater quality data for regulatory review.

As a part of this audit's effort to evaluate the implementation of the groundwater quality monitoring program, the groundwater quality data presented in the 2018 and 2019 annual reports and 2020 monthly reports were reviewed and compared to applicable groundwater quality monitoring requirements in the relevant EMSAMP.

As noted in Section 3.3.1, monitoring requirements (e.g. well locations, data collection frequency) for construction phase and operations phase are different. It is understood that during the transition period from the mine construction phase to operations phase , most of the monitoring wells in the construction phase monitoring program (Table 24) were gradually decommissioned and no longer being monitored. At the same time, new wells in the mine operation phase monitoring network were progressively installed. The audit results of the evaluation of the two phases are presented separately in Table 24 and Table 25.

3.3.3 Reporting Adequacy, Compliance and Monitoring

Table 26 summarizes compliance gaps and/or deficiencies for the groundwater quantity and quality monitoring program and provides recommendations for corrective action.

Table 26 Groundwater Quantity and Quality Compliance and Recommendations

Compliance Gaps and/or Deficiencies	Recommendation/Corrective Action
Groundwater quantity and quality monitoring from some wells was performed less frequently than the schedule prescribed in the relevant EMSAMPs.	• A number of factors, including those beyond the control of VGC may result in a scheduled monitoring not being performed (e.g. weather, equipment malfunction, unsafe condition, construction, pandemic). The monthly and annual reporting needs to provide the rationale for missed monitoring in tabular format and if any corrective action will be taken. • The annual and monthly reporting should include the installation and decommission date, and operational status of monitoring wells. • A maintenance log should be maintained for any maintenance or repairs made to logs and reported in the annual report.
EMSAMP (2020-01, S. 4.5) states that groundwater levels will be compared to predicted (modeled) effects due to the loss of recharge in the HLF and WRSA.. However, trends were not quantitatively compared with predicted (modelled) effect in the 2019 Annual Report or 2020 Monthly Reports. It is unclear if the trends are consistent with the predicted thresholds or if the model requires calibration based on field observation.	• Compare measured groundwater levels to predicated effects in assessment in operations phase once dewatering of the pit commences. • Calibrate modeled adaptive management thresholds for groundwater quantity based on field observation.
EMSAMP (2020-01, S. 4.4) states that groundwater hydrographs will be compared with existing baseline data to assess potential change associated with the Project. The 2019 Annual Report in S. 3.4.3.1 presents a qualitative discussion of the observed changes in groundwater quantity associated with the construction and operation of mine. This discussion is not presented in the context of modelled effect or groundwater quantity indicators.	Present further assessment of the change in groundwater quantity associated with the Project. The assessment would be strengthened if a list of groundwater quantity indicators and associated triggers were developed and utilized in the operation stage.
EMSAMP (2020-01, S. 5.2) presents groundwater quality parameters to be analyzed in the monitoring program. Review of groundwater quality records in the 2019 Annual Report suggests some samples were not analyzed for the full suite of parameters.	• Review water licence conditions and lab records to confirm if required parameters were analyzed. • Include all analyzed parameters and lab reports in annual reporting.

Table 26 Groundwater Quantity and Quality Compliance and Recommendations

Compliance Gaps and/or Deficiencies	Recommendation/Corrective Action
• EMSAMP (2020-01, S. 5.3.2 and 5.3.3) describes the field QA/QC program for groundwater quality monitoring, which includes collection and analysis of trip blanks, field blanks and duplicates. • The 2019 Annual Report does not present information on the implementation of the QA/QC program. Appendix K of the 2019 Annual Report (Groundwater Quality Data) does not contain records of the QA/QC samples.	• Present information on the implementation of the field QA/QC program and the results of the QA/QC program in the annual reports.
EMSAMP (2020-01, S. 5.3.3) states that plots of concentrations of regulated constituents and key indicator parameters versus time will also show applicable standards and baseline concentration. Plots in the 2019 Annual Report do not contain the applicable standards and baseline concentration.	Present applicable standards and baseline concentration in the groundwater water sample constituent concentration plots for the annual report.
EMSAMP (2020-01, S. 5.4.1) describes that trends in groundwater quality will be examined to potentially inform management actions. The existing analysis of the water quality trend in the 2019 Annual Report contains discussion of the trend but in some cases does not provide rationale for the observed trends.	• Present groundwater quality trend analysis in monthly and annual reporting to confirm that trends are being monitored appropriately. • Present groundwater quality trend assessment in the context of baseline water quality and predicted effects of the Project. • Provide greater logical link between discussion of observed groundwater quality trend and proposed adaptive management actions (e.g. no action).

3.4 GEOCHEMICAL MONITORING

3.4.1 Documents Reviewed

Documents shown in Table 27 were reviewed for the geochemical section of the audit:

3.4.2 Monitoring Program Implementation

During construction, the geochemical monitoring program was designed to meet the following objectives as described in EMSAMP 2018-01, EMSAMP 2019-01, EMSAMP 2020-01:

- Assess the potential for metal leaching and acidic drainage from excavated rock to determine if it is suitable for construction material.
- Verify geochemical predictions made during the mine planning phase.
- Assess the level of weathering-driven reaction products and their potential to migrate; and
- Evaluate the effectiveness of measures to prevent and control metal leaching and acidic drainage (if applicable).

During operations, the geochemical monitoring program was designed with the following methods as described in EMSAMP 2018-01, EMSAMP 2019-01, EMSAMP 2020-01:

- Assaying capability will be required once operations commence. Assaying may include a mobile or containerized lab whose equipment would be re-installed in the permanent facilities once constructed, or a program to build a lab utilizing modular or pre-engineered construction that would be extended to provide the additional facilities contemplated.
- The assay lab will use both fire assay and perform atomic absorption assay to support both mining and processing functions. It is estimated that up to 200 blast-hole samples will require gold assays each day using fire assay.
- Crushing equipment to prepare samples for metallurgical testing to be included with all appropriate dust controls.
- Plant ore head samples, process solution samples and carbon samples will require assaying as well as samples from the metallurgical laboratory. The laboratory will include crushers, pulverizers and all associated equipment, including dust collection and environmental safety controls for sample preparation through to fire assaying.
- Analysis will be primarily for gold and silver, however pH, cyanide, total and sulfide sulfur, as well as arsenic will be included.

In addition, waste rock contact water monitoring during operations comprises in EMSAMP 2018-01, EMSAMP 2019-01, EMSAMP 2020-01:

- Monthly water quality sample collection at seeps if detected from the toe of Eagle Pup and Platinum Gulch WSRAs (included as part of the surface water quality audit)
- Flow monitoring every two weeks when flow is occurring and measurable at each seep collection point (included as part of the hydrology audit)
- Field barrel monitoring at least four times per year (during ice-free periods)
- Analysis to include hardness, pH, anions and nutrients (acidity, alkalinity, chloride, fluoride, nitrate, nitrite, and sulfate) and dissolved metals
- One replicate analyses conducted for each sampling event
- Monthly survey of waste facilities during ice-free months to observe developments of new seeps (as per Section 6.3.3 of the EMSAMP 2020-01)

The geochemical monitoring sampling protocol of the EMSAMP was updated in the 2020 version as per requirement in the Water Licence QZ14-041 Amendment 1 (August 23, 2019) to reflect:

5. *i) the collection and analysis of blast-hole chip composite samples of waste rock and ore from each blast round in the open pit;*
6. *ii) each composite sample will represent a maximum of 20% of the total blast holes per blast round;*
7. *iii) composite samples will be analysed for carbon, sulphur and arsenic; and*
8. *iv) results will be geospatially linked to the sample location from the pit, and if possible, to the deposition area within the WRSA and the HLF Pad.*

The geochemical monitoring program is consistent across all three version of the EMSAMPs, with minor variances noted above. The geochemical monitoring program was implemented according the objectives stated in the EMSAMP versions; however, compliance with the EMSAMP is included in the following section.

3.4.3 Compliance with EMSAMP

For the construction phase, the 2018 and 2019 Annual Reports were reviewed for compliance with EMSAMP 2018-01 and EMSAMP 2019-01. For the operations phase, the 2019 Annual Report and the 2020 Monthly Reports were reviewed for compliance with EMSAMP 2019-01 and EMSAMP 2020-01.

The following field and laboratory methods and compliance with sampling frequencies per the EMSAMP were reviewed for each mine phase:

- Construction
  - Surficial material static testing
  - Bedrock material static testing
- Operations
  - Blast-hole static testing
  - Waste rock static testing
  - Field barrel kinetic testing
  - Waste rock contact water (seep) monitoring

The results of this task are listed in Table 28.

Table 28 Geochemical Monitoring Program Compliance Table – Construction and Operations

Phase	Program	Analysis Location	Methods	Required		Conducted		Sample Compliance Check (Y/N) with Rationale	Methods Check (Y/N) with Rationale
				Sampling Quantity	Sampling Frequency	Sampling Quantity	Sampling Frequency		
Construction	Surficial Material Static Testing	Off-Site Analysis	• Visual inspection to determine presence of high concentrations of sulphides. • Bulk grab samples at each major excavation in distinct geological formations encountered and/or from every 200,000 m3 material moved. • The samples will be reduced to 1-2 kg in size using a riffle splitter prior to shipping to an accredited analytical laboratory for testing. • Test methods will include the following as recommended in MEND (2009) and summarized in Table 6.3-1: – Rinse pH and electrical conductivity (EC) on the <2 mm fraction -Modified Acid Base Accounting on the bulk sample and the <2 mm fraction – Metal analysis by ICP-MS following aqua regia digestion on the bulk sample and the <2 mm fraction – Leach extraction tests will be completed on every 5th sample using a 3:1 water to solid ratio on the <1 cm sample fraction Waste rock used for construction or fill purposes must have a pH of at least 5.0, a NP:AP ratio of at least 3:1, and a total sulphide sulphur content of no greater than 0.3% (QML-0011)	Varies	Each major excavation or every 200,000 m^3 material moved	**2018 Annual Report** - 12 Samples	**2018 Annual Report -** Not described, grab samples	**2018 Annual Report** - N Visual inspection not described. No description of volume of material moved or if samples were per distinct geological formation	**2018 Annual Report** - Y

Table 28 Geochemical Monitoring Program Compliance Table – Construction and Operations

Phase	Program	Analysis Location	Methods	Required		Conducted		Sample Compliance Check (Y/N) with Rationale	Methods Check (Y/N) with Rationale
				Sampling Quantity	Sampling Frequency	Sampling Quantity	Sampling Frequency		
Construction	Bedrock Static Testing	Off-Site Analysis	• Grab samples at each major excavation in distinct geological formations encountered and/or from every 100,000 m3 material moved (except for the open pit) • The samples will be reduced to 1-2 kg in size using a riffle splitter prior to shipping to an accredited analytical laboratory for testing. • Test methods will include the following as recommended in MEND (2009) and summarized in Table 6.3-1: – Rinse pH and electrical conductivity (EC) on the <2 mm fraction – Modified Acid Base Accounting on the bulk sample and the <2 mm fraction – Metal analysis by ICP-MS following aqua regia digestion on the bulk sample and the <2 mm fraction – Leach extraction tests will be completed on every 5th sample using a 3:1 water to solid ratio on the <1 cm sample fraction Waste rock used for construction or fill purposes must have a pH of at least 5.0, a NP:AP ratio of at least 3:1, and a total sulphide sulphur content of no greater than 0.3% (QML-0011)	Varies	Each major excavation or every 100,000 m^3 material moved (except for open pit)	**2018 Annual Report -** 15 Samples **2019 Annual Report -** 7 Samples	**2018 Annual Report -** Not described, grab samples **2019 Annual Report -** Not described, grab samples collected on January 25, 2019	**2018 Annual Report** - N No description of volume of material moved or if samples were per distinct geological formation **2019 Annual Report** - N No description of volume of material moved or if samples were per distinct geological formation	**2018 Annual Report** - Y - all bedrock samples met criteria for construction or fill purposes. Y
Operations	Blast-hole Static Testing	On-Site Analysis	• Blast-hole chip composites of waste rock and ore from each blast round in the open pit. Each composite sample will represent a maximum of 20% of the total blast holes per blast round. • Geological logging of blast hole composites. • Analysis for **carbon,** sulphur and arsenic. • Results will be geospatially linked to the sample location from the pit, and if possible, to the area within the waste storage facilities **and the HLF pad** that it is placed.	20% of total blast hole (EMSAMP 2020-01 onwards)	Each blast round	**2019 Annual Report** - 7 samples	**2019 Annual Report** - Not described, samples collected in July and December, 2019	**2019 Annual Report** - N - Details of blast rounds were not included in the annual report Section 3.5; therefore sample compliance could not be completed.	**2019 Annual Report** - N - analysis for carbon, sulfur, and arsenic were still being compiled and not included in the annual report. Geological logs were not included in the annual report. Confirmation of the geo-spatial link of the samples pending.

Table 28 Geochemical Monitoring Program Compliance Table – Construction and Operations

Phase	Program	Analysis Location	Methods	Required		Conducted		Sample Compliance Check (Y/N) with Rationale	Methods Check (Y/N) with Rationale
				Sampling Quantity	Sampling Frequency	Sampling Quantity	Sampling Frequency		
Operations	Blast-hole Static Testing	Off-Site Analysis	• Grab samples collected quarterly representing blasted waste, reduced to 1–2 kg in size using a riffle splitter prior to shipping to an accredited analytical laboratory for testing of the following methods as recommended in MEND, 2009. – Rinse pH and EC – Modified Acid Base Accounting (ABA) including a total sulphur, sulphate sulphur, fizz rating, modified Sobek neutralization potential and total inorganic carbon – Metal analysis by ICP-MS following aqua regia digestion	20% of total blast hole (EMSAMP 2020-01 onwards)	Quarterly	**2019 Annual Report - 7 samples**	**2019 Annual Report** - 7 samples collected in Q3 and Q4	**2019 Annual Report** - Y	**2019 Annual Report** - Y
Operations	Waste Rock Static Testing	Off-Site Analysis	Annual waste sampling from placed waste rock in the storage facilities (Eagle Pup and Platinum Gulch) consisting of collection of grab samples from waste produced in the previous calendar year. The number of samples will vary depending on production. One sample per million tonnes of waste produced be collected.	Varies. 1 sample/million tonnes of waste	Annual	**2019 Annual Report** - N/A**	**2019 Annual Report** - N/A**	2019 Annual Report - N/A**	2019 Annual Report - N/A**
Operations	All Static Testing	Off-Site Analysis	Samples will be sieved to collect samples representing specific grain size distributions as follows: • Bulk sample • <2 mm fraction • <1 cm fraction (including the < 2 mm fraction) • The samples will be reduced to 1-2 kg in size using a riffle splitter prior to shipping to an accredited analytical laboratory for testing. Test methods will include the following as recommended in MEND (2009) and summarized in Table 6.3-1: • Rinse pH and EC on the <2 mm size fraction • Modified Acid Base Accounting including a total sulphur, sulphate sulphur, fizz rating, modified Sobek neutralization potential and total inorganic carbon on all three size fractions • Metal analysis by ICP-MS following aqua regia digestion on all four size fractions • Leach extraction analyses using a 3:1 water to solid ratio on the <1 cm sample fraction	N/A	N/A	N/A	N/A	N/A	**2019 Annual Report** - N - All analyses are correct with the exception of conducting the SFE tests on < 1 cm and <2 mm fractions. These details are not included in Appendix I ALS Reports. ALS states a 0.50 g sample is prepared, but does not include size fractions completed in that preparation - only refers to MEND 1.20.1 Predication Manual. The MEND 1.20.1 Prediction Manual methods describe 100 g samples of minus 6.35 mm size fraction.

Table 28 Geochemical Monitoring Program Compliance Table – Construction and Operations

Phase	Program	Analysis Location	Methods	Required		Conducted		Sample Compliance Check (Y/N) with Rationale	Methods Check (Y/N) with Rationale
				Sampling Quantity	Sampling Frequency	Sampling Quantity	Sampling Frequency		
Operations	Field Barrel Kinetic Testing	Off-Site Analysis	Field barrel monitoring is currently being conducted at least four times per year (during ice-free periods), and will continue through initial operations to expand the time trends until actual seepage database is adequate and can be related to the barrel data. Analysis currently includes hardness, pH, anions and nutrients (acidity, alkalinity, chloride, fluoride, nitrate, nitrite and sulfate) and dissolved metals. Replicate analyses are completed on one sample for each sampling campaign.	Four	Per Year	**2019 Annual Report** - field bin dataset was not included, sample frequency could be inferred from figures in Appendix H. Inferred: 7 samples between mid-2018 and October 2019	**2019 Annual Report** -Could not be determined. No attached dataset.	**2019 Annual Report -** Y*	**2019 Annual Report -** N - raw data not attached. No replicate samples reported.
Operations	Waste Rock Contact Water (Seep) Monitoring	Off-Site Analysis	Monthly sample collected as part of the Surface Water Quality Monitoring (included as part of the surface water quality audit) Flow measurements every two weeks when flowing at each seep collection point (included as part of the hydrology audit) Monthly survey of waste facilities during ice-free months to monitor for development of new seeps.	As needed	Monthly Survey	N/A	N/A	N/A	**2019 Annual Report** - N - Monthly seep survey not documented.

3.4.4 Data QA/QC

2018 Annual Report

- A total of 27 samples were collected as part of construction activities. There were no documented duplicate samples collected nor analyzed.

2019 Annual Report

- A total of 14 samples were collected as part of construction (7 samples) and operation (7 samples) activities. There were no documented duplicate samples collected nor analyzed.

2020 Monthly Reports

- In June 2020, two field bins were installed with two samples collected and one duplicate (with the assumption that reference "samples number…01" is a duplicate sample). From this assumption, 50% of total samples were QA/QC samples (half of the samples), compliant with EMSAMP (requiring one duplicate per sampling campaign). In May 2020, one sample of construction material was collected, analyzed, and reported in the June 2020 report. There were no QA/QC samples for the construction material sample. Overall greater than 10% QA/QC samples were collected as required by the EMSAMP.
- Results of the QA/QC samples (i.e., duplicate relative percent differences) were not included in the report body for June 2020.

3.4.5 Reporting Adequacy

The 2018 Annual Report, the 2019 Annual Report, and the 2020 Monthly Reports were reviewed for adequacy and compliance. Overall, the reporting and summarization of data collected for the geochemical monitoring program is complete and adequate with deviations described below.

2018 Annual Report

- Section 3.4.3 reports sulphur content ranging from non-detect at <0.01% to 22%, where it is reported as <0.01% to 0.22% in Table 3.4-1
- In Section 3.4.3, the NP:AP ratio reported in Table 3.4.1 would be better interpreted as the neutralization potential ratio (NPR) which is neutralization potential / acid potential (NP/AP) (e.g., 13.3, instead of 8:0.6 as per Sample VICEAG-GCM-01). This was corrected in the 2019 Annual Report.
- Section 3.4.3, Table 3.4-1 lists 26 samples, but Appendix I list 27 samples collected in 2018. Sample VICEAG-GCM-31 was omitted from Table 3.4-1
- In Section 3.4.3, Table 3.4-1 does not mention the type of material (i.e., surficial or bedrock) nor the rationale for sampling (i.e., distinct geological formation encountered and/or from every 100,000 or 200,000 m^3 material moved as per EMSAMP 2018-01)
- Acid base accounting results, including rinse pH and electrical conductivity, were not included in Appendix I

2019 Annual Report

- Field barrel analytical data was not included in the report or appendices (only figure form in Appendix H); therefore, compliance with sample frequency could not be determined nor compliance for analytical parameters analyzed determined.
- Section 3.5.2, Table 3.5-1 does not mention the type of material (i.e., surficial or bedrock) nor the rationale for sampling (i.e., distinct geological formation encountered and/or from every 100,000 or 200,000 m^3 material moved as per EMSAMP 2019-01)
- Details of blast rounds were not included in the annual report Section 3.5; therefore, sample compliance could not be completed for operations blast hole static testing.
- Geological logs of the blast-hole samples were not included.
- Appendix I did not state whether <1 cm size fraction was used for shake flask extraction tests
- Details of monthly seep survey for development on new seeps were not documented.

2020 Monthly Reports

- Results of the QA/QC samples (i.e., duplicate relative percent differences) were not included in the report body for June 2020. Duplicate samples were not explicitly described as such, the assumption that reference “samples number…01” is a duplicate sample.

3.4.6 Summary of Deficiencies and Recommendations

Table 29 summarizes compliance gaps and/or deficiencies for the geochemical monitoring program and provides recommendations for corrective actions.

Table 29 Geochemical Monitoring Compliance and Recommendations

Compliance Gaps and/or Deficiencies	Recommendation/Corrective Action
2018 Annual Report – QA/QC samples	Collect duplicate samples of construction monitoring samples and include discussion of results including relative percent differences in report body and append dataset.
2018 Annual Report – Report NPR values	Report NPR values in addition to NP:AP for better interpretation of results. This was corrected in the 2019 Annual Report.
2018 and 2019 Annual Report – Sample type description	Include details on the material sample collected (i.e., surficial, or bedrock) and why these samples were collected (i.e., 1 per 100,000 m^3 material moved or distinct geological unit).
2018 Annual Report – Appended analytical data	Include all analytical data in appendices. Missing: acid base accounting, rinse pH, and electrical conductivity.
2019 Annual Report – Appended analytical data	Include field barrel analytical data in appendices.

Table 29 Geochemical Monitoring Compliance and Recommendations

Compliance Gaps and/or Deficiencies	Recommendation/Corrective Action
2019 Annual Report – QA/QC samples	Collect duplicate samples of construction and operational monitoring samples, include discussion of result (including relative percent differences) in report body, and append dataset.
2019 Annual Report – Details of blast rounds	Include details of blast rounds so compliance with EMSAMP can be evaluated. Include geological logs of blast holes.
2019 Annual Report – Monthly seep sample survey	Include details of monthly seep sample survey in report.
2019 Annual Report – Shake flask extraction size fraction	Check with off-site laboratory (ALS) if shake flask extraction is conducted on <2 mm and <1 cm size fraction.
2020 Monthly Reports – QA/QC samples	Collect duplicate samples of construction monitoring samples and include discussion in report body and append dataset. For operational samples, include relative percent differences and discuss results in the report body. Consider re-naming duplicate samples to not include parent sample name. Explicitly describe which samples are duplicates of respective parent sample.

3.5 AQUATIC ENVIRONMENT

3.5.1 Stream Sediment

3.5.1.1 Documents Reviewed

Documents shown in Table 30 were reviewed for the stream sediment section of the audit.

3.5.1.2 Stream Sediment Monitoring Program Design in EMSAMPS

The objectives of the stream sediment monitoring program, in all versions of the EMSAMP (Strata Gold 2018, 2019, Victoria Gold 2020), were to:

- collect data on pH and metal levels in the fine sediment fraction in watercourses in the study area as these parameters are relevant to toxicity and physical habitat requirements for benthos, fish eggs, and juvenile fish
- obtain data on sediment quality that can be used to evaluate changes related to the Project
- provide ongoing data to support refinement of future monitoring programs.

These data were to be collected from:

- five sites in Haggart Creek between the confluence of Fisher Gulch to the confluence of Lynx Creek (one above Project influence and four below Project influence)
- two sites in Dublin Gulch (both above Project influence)
- one site in Lower Eagle Creek (below Project influence)
- one site in Lynx Creek (reference site in unaffected stream)

Field samples were to be collected in depositional habitats (i.e., pools) downstream of riffle habitats using methods compatible with Part D (Soil and Sediment Sampling) of the British Columbia Field Sampling Manual (BC Ministry of Forests and Natural Resource Operations 2013).

Triplicate samples were to be collected from each of nine sites with each sample being comprising of a composite of five individual grabs. Composite samples were to be placed in individual acid-wash glass bottles and kept cool for delivery to the analytical lab.

Quality assurance/quality control (QA/QC) methods to be used in the field included: cleaning equipment with de-ionized water between sites, rinsing equipment with ambient water between replicates, wearing nitrile gloves while sampling and preparing samples, using acid-washed glass sampling jars, and storing samples on ice in a clean cooler. A field replicate was also to be collected at each site.

In the lab, sediment samples were to be sieved to isolate the <63 µm fraction so that analysis of total metal concentrations could be conducted. In 2018 and 2019, the fine fraction was to be analyzed for pH, and total concentrations of 19 metals and metalloids. In 2020, the fine fraction was to be analyzed for particle size distribution, pH, total organic carbon, and a suite of 33 metals and metalloids. In all years, only total concentrations were to be analyzed; no dissolved fractions were required in any of the EMSAMPs. While detection limits for some parameters have remained the same from 2018 to 2020 (e.g., zinc), required detection limits for many parameters are orders of magnitude lower in 2020 than for 2018 and 2019 (e.g., antimony, arsenic, silver) (Table 31).

QA/QC methods to be used in the lab included: use of certified reference materials including CRM standard MESS-2 for trace elements from the National Research Council of Canada and analysis of laboratory replicates. Laboratory replicates were not defined in any of the EMSAMPs.

Results were to be compared to pre-construction baseline values and the BC Interim Sediment Quality Guidelines (ISQG) for arsenic, cadmium, chromium, copper, iron, lead, manganese, mercury, nickel, silver, and zinc (Nagpal et al. 2006). Statistical analyses were to be performed on the monitoring data and compared directly to baseline results (i.e., pre 2018) to determine if any statistically significant change in sediment quality had occurred.

Adaptive management thresholds for sediment monitoring were set at:

- 25% higher than median baseline concentrations for those parameters that currently exceed the Probable Effects Level[1] (PEL) as a baseline condition
- The PEL for those parameters that do not exceed PELs at baseline

If parameter concentrations exceed these thresholds, adaptive management measures specific in EMSMAP will be considered. Because sediment arsenic concentrations naturally exceed the arsenic PEL at most sites, the dominant species of arsenic was to be identified to determine if it was the biologically available form.

Table 32 and Table 33 below provides the audit results of the sediment quality monitoring programs.

[1] The Probable Effects Level is a threshold above which adverse biological effects frequently occur (more than 50% adverse effects occur above the PEL).

NOTES:

[1] Samples could not be collected due to low water and absence of depositional areas

[2] Particle size distribution and a suite of 32 metals and metalloids were analyzed in 2018 instead of the 19 required by the 2019 EMSAMP; particle size distribution was not prescribed in the 2018 EMSAMP

[3] Lab QA/QC included analysis of lab duplicates; standard protocol for Certified Analytical Labs but not prescribed in 2019 EMSAMP

[4] Arsenic and nickel only

3.5.1.3 Compliance with the EMSAMP Stream Sediment Monitoring Program

In 2018, triplicate stream sediment samples were collected at the nine required sites (Table 32). In 2019, triplicate stream sediment samples were collected at only eight of the nine required sites (Table 33). No samples were collected from site W26 in Dublin Gulch in 2019 due to low flow conditions and lack of depositional areas to collect sediment.

All required field QA/QC protocols were followed in 2018 and 2019 with the exception that field duplicates were only collected at one of the nine sites. In the lab, all required analyses were conducted plus the additional analysis of particle size distribution, total organic carbon, and 13 other sediment quality parameters. Detection limits were provided in the laboratory analytical reports and met or exceeded those required in the 2018 and 2019 EMSAMPs. Lab QA/QC protocols included analysis of lab duplicates, which were not prescribed in the 2018 or 2019 EMSAMP but are an industry standard.

Mean concentrations, standard deviations, and coefficients of variation were calculated for the 2018 and 2019 data. Mean concentrations were compared to the appropriate CCME and/or BC ISWGs. However, the author reported a BC Working Sediment Quality Guideline for selenium; there is only an “alert” concentration for selenium in sediment and not an official BC working sediment quality guideline.

Results of the 2018 and 2019 surveys were presented in tabular form for 10 selected sediment quality parameters and not the entire suite; selected parameters were those deemed potential toxic to aquatic ecosystems, likely presence in the mineral deposit near the mine, and existence of environmental guidelines for the protection of freshwater aquatic life. Mean concentrations of arsenic and nickel were presented graphically to show comparison to Interim Sediment Quality Guidelines (ISQGs) and Probably Effects Levels (PELs) and the spatial differences between sites. Mean concentrations of arsenic and nickel were also compared in tables and graphs to mean arsenic and nickel concentrations determined from the 63 µm fraction from the same sites in previous years. These two parameters were selected because they consistently exceeded the PEL or ISWG at each sample site in 2018. Comparison of results for other parameters between years was not provided. Statistical analyses of potential significant differences in mean parameter concentrations, including arsenic and nickel, between 2018 and 2019 and previous years were not conducted.

Arsenic was the only parameter to exceed the CCME and BC WQG PEL for freshwater aquatic life in 2018; mean arsenic concentrations exceeded the PEL at all nine sites in 2018 and at all eight sites in 2019. Although mean arsenic concentrations exceeded the PEL at all sites in all previous years of sampling, including at reference sites and sites upstream of the influence of the Project, there was no mention of whether the 2018 or 2019 mean arsenic concentrations exceeded the adaptive management threshold defined in the 2018 and 2019 EMSAMPs or whether additional mitigation measures to control arsenic concentrations in stream sediments are warranted. Further, arsenic speciation was not conducted although recommended in the EMSAMP if arsenic concentrations in stream sediments exceeded guideline PELs.

3.5.1.4 Summary of Deficiencies and Recommendations

Deficiencies in the 2018 and 2019 annual reports are summarized in Table 34. VGC indicated the identified compliance gaps or deficiencies are being addressed in the Study Design that Victoria Gold is preparing for submission to Environment and Climate Change Canada for its Environmental Effects Monitoring (EEM) plan under Schedule 5 of the MDMER. However, this EEM plan study design was not included in the scope of this audit and, therefore, the gaps and deficiencies are only based on a comparison of the annual monitoring program reports to the requirements of the EMSAMPs.

Table 34 Stream Sediment Monitoring Program Deficiencies and Recommendations

Compliance Gaps and/or Deficiencies	Recommendation/Corrective Action
Field methods – use of stainless-steel trowel to collect samples	Samples collected for analysis of metal concentrations should be collected with plastic utensils to avoid potential contamination
Field methods – out of date field method guidelines	Methods should be consistent with updated BC Field Sampling Manual from 2020 and with BC's "Water and Air Baseline Monitoring Guidance Document for Mine Proponents and Operators" (BC MoE 2016)
Field methods – site documentation	Water depth, sediment texture and color, and presence of debris, biofilms, odours, or sheens should be described at each site. Sites should be photographed showing upstream, downstream, obliques, banks, riparian vegetation, and substrates
Lab methods – screening equipment	Laboratories should be required to screen sediment samples for particle size distribution and <63 µm fraction using non-metallic screens to avoid potential contamination
Reporting – units	Clearly document that guidelines and concentrations are reported as dry or wet weight
Reporting - guidelines	Sediment quality guideline for selenium is only an "alert" concentration and not a working sediment quality guideline
Reporting - guidelines	Clearly indicate whether guidelines for specific parameters are from CCME and/or BC WQG
Reporting – detection limits	Reports should identify results that are below detection limits (e.g., boron and silver)
QA/QC – field methods	Clearly document the field QA/QC procedures followed
QA/QC – field duplicates	Every third or fifth sample should be "field split" to assess sampler and laboratory QA/QC as per BC MoE 2016
QA/QC – laboratory detection limits	Reports should describe instances where laboratory detection limits are not ≤ $1/5^{th}$ of the respective sediment quality guideline or ≤ $1/5^{th}$ of the lowest background concentration
Reporting – lack of statistical analyses	Reports should include statistical comparison of data to pre-construction baseline data as required by EMSAMP
Reporting – lack of discussion of need for adaptive management due to PEL exceedances for arsenic	Conduct statistical analyses comparing contemporary and pre-construction data to identify any significant differences and conduct arsenic speciation analyses on future stream sediment samples

3.5.2 Benthic Invertebrates

Documents shown in Table 35 were reviewed for the benthic invertebrate monitoring section of the audit.

3.5.2.1 Benthic Invertebrates Monitoring Program Design in EMSAMPS

The objectives of the benthic invertebrate monitoring program, in all versions of the EMSAMP (Strata Gold 2018, 2019, Victoria Gold 2020), were to:

- Characterize community diversity and abundance during the transition from baseline and through construction of the Project
- Determine variation relative to baseline data
- Provide supporting information for fisheries assessments and to comply with future MMER requirements

Benthic invertebrate data were to be collected from the same nine sites as the stream sediments:

- five sites in Haggart Creek between the confluence of Fisher Gulch to the confluence of Lynx Creek (one above Project influence and four below Project influence)
- two sites in Dublin Gulch (both above Project influence)
- one site in Lower Eagle Creek (below Project influence)
- one site in Lynx Creek (reference site in unaffected stream)

Benthic macroinvertebrates sampling methods were to be consistent with methods recommended in the Metal Mine Guidance Document for Aquatic Environmental Effects Monitoring (Environmental Canada 2012). Riffle habitat were to be sampled in late summer/fall using a quantifiable bottom sampler (e.g., Surber). Three replicate samples were to be collected at each site with a minimum separation of three times bank-full width between replicates. Field measurements of water temperature, dissolved oxygen concentration, pH, and conductivity, bankfull and wetted width, depth, gradient and canopy cover were to be measured at each site.

Benthic invertebrates were to be identified to lowest practical level (typically genus) and enumerated by a qualified taxonomic laboratory with experience identifying benthic invertebrates from northern environments. The method and level of sub-sampling was to be identified during sorting.

Data analysis as per the EMSAMP is to include total number of individuals per sample, number of organisms per unit area, and the following indices:

- Total invertebrate density for each replicate as well as arithmetic mean, standard deviation, median, minimum, and maximum
- Family density for each replicate as well as arithmetic mean, standard deviation, median, minimum, and maximum
- Family richness
- Simpson’s diversity or similar index
- Simpson’s evenness, or similar index
- Bray Curtis index or similar index
- Taxon (i.e., Family) proportion
- Taxon (i.e., Family) presence/absence

Total invertebrate density, Family richness, Simpson’s evenness index, and Bray-Curtis index was to be statistically analyzed using ANOVA (power of 0.1). If the ANOVA determined that a metric had a significant difference among stations, a multiple comparison test (e.g., Tukey test) was to be used to determine if the exposure sites were significantly different from reference sites. Any significant differences were to be interpreted as a Project effect requiring adaptive management measures listed in the EMSAMPs. Results were to be interpreted relative to the other indices as well as to supporting environmental variables measured at the time of sampling, results of fish surveys, and relative to historical sampling. The effect of any outliers on results were to be evaluated.

Table 36 and Table 37 below provides the audit results of the benthic invertebrate monitoring program.

3.5.2.2 Compliance with the EMSAMP Stream Benthic Invertebrate Monitoring Program

Benthic invertebrate samples were collected from riffle habitats at all nine sites using a Surber sampler with a 300 micron mesh net in September 2018 (Table 36) and September 2019 (Table 37). Samples were preserved in buffered formalin and transported to the taxonomic lab in Summerland, BC. The required in-situ water quality parameters were collected at each site. Channel measurements (e.g., bankfull width, gradient, canopy cover) were reported in the appendices except for channel gradient. Site photos were provided in an appendix. QA/QC procedures in the field were consistent with those described in the EMSAMP. However, as per EEM QA/QC protocols, no *a priori* criteria for acceptability of samples obtained in the field were not developed or followed.

In the lab, samples were sorted and if the number of organisms in each sample was estimated to be greater than 600 individuals, the sample was sub-sampled to achieve a minimum of 300 organisms for identification and enumeration. Organisms were identified to genus or species level. QA/QC procedures and results of QA/QC procedures for lab sorting, sub-sampling, and individual identification were not provided in the 2018 report or in the appendices but were provided in the 2019 report and appendices.

Data analysis in 2018 and 2019 included total abundance per site, total density per site (organisms/m^2), taxonomic richness, Simpson's Diversity Index, and taxon proportion percentage as required by the EMSAMP. However, standard deviation, median, and minimum and maximum values for total density were not calculated, nor were family density, family richness, Simpson's evenness, and a Bray-Curtis index for any site in 2018 and 2019 as was required by the EMSAMP. Abundance, relative abundance, and richness of pollution sensitive Ephemeroptera, Plecoptera, and Trichoptera (EPT taxa) were calculated in both years as was a Hilenshoff Biotic Index. Neither of these indices were required by the EMSAMPs. No statistical comparisons of total invertebrate density, Family richness, Simpson's evenness index, or Bray-Curtis index were analyzed using ANOVAs as required by the EMSAMP. Instead, qualitative comparisons were made between sites sampled in 2018 and 2019. Statistical analyses are planned in 2021 after the completion of the first EEM study year

Data from 2018 and 2019 were compared to previous year's data using total density and Simpson's Diversity Indices as metrics for comparison. No statistical analyses were performed comparing 2018 and 2019 data to pre-construction data and only qualitative trends were identified. As a result, the need for adaptive management actions could not be determined and was not discussed. Although potential effects of elevated arsenic on benthic invertebrate communities was discussed, arsenic concentrations were collected from depositional areas while benthic invertebrates were collected from erosional areas and the discussion does not mention the implications of this difference. There was no discussion of potential effects of environmental variables measured at the time of sampling, or results of fish surveys, or acknowledgment of any outliers or their effects on benthic invertebrate results as was required by the EMSAMP.

3.5.2.3 Summary of Deficiencies and Recommendations

Deficiencies in the 2018 and 2019 annual reports for the benthic invertebrate monitoring program are summarized in Table 38. The identified compliance gaps or deficiencies are being addressed by VGC in the Study Design that Victoria Gold is preparing for submission to Environment and Climate Change Canada for its Environmental Effects Monitoring (EEM) plan under Schedule 5 of the MDMER. However, this EEM plan study design was not included in the scope of this audit and, therefore, the gaps and deficiencies are only based on a comparison of the annual monitoring program reports to the requirements of the EMSAMPs.

Table 38 Benthic Macroinvertebrates Monitoring Program Deficiencies and Recommendations

Compliance Gaps and/or Deficiencies	Recommendation/Corrective Action
Study design – insufficient sites in reference or upstream areas as per EEM guidance	Identify and begin sampling in second reference stream to bring the number of unaffected sites up to 5 as recommended in Environment Canada's EEM guidance; a minimum of three reference sites are recommended in BC's Water and Air Quality Baseline Monitoring Guidance Document
Study design – number of appropriate replicate numbers is unknown	Conduct power analysis on existing data to determine the number of replicate samples required to provide sufficient data to determine statistically significant differences between sites and between years given known variability in benthic communities. Without a power analysis, the default number of replicates per site should be increased to 5.
Field QA/QC procedures – no *a prior* criteria for sample appropriateness as required by EEM	Develop *a priori* criteria and apply to next survey
Lab QA/QC procedures and results – not provided in report or appendices	Provide lab QA/QC procedures and results in appendix
Data analysis - Missing community metrics required in EMSAMP (i.e., family density and richness, Simpson's evenness, and Bray-Curtis)	Include all community indices identified in EMSAMP
Data analysis – missing statistical analyses comparing sites and contemporary data to pre-construction data	Conduct the required ANOVAs and multiple comparison tests as required by EMSAMP (e.g., append appropriate statistical analyses in excel format) and EEM for BACI study design.
Reporting – only qualitative comparisons between sites and years discussed	There is sufficient data from sites and between years to conduct quantitative statistical analysis to determine significant difference between impact and reference sites and trends between years.
Reporting – no discussion of need for adaptive management actions; no statistical analyses performed to inform adaptive management	Discuss adaptive management considering quantitative analysis of site data and trend analysis
Reporting – no indication that results are site averages in the tables	Clearly identify what data in tables represents

Table 38 Benthic Macroinvertebrates Monitoring Program Deficiencies and Recommendations

Compliance Gaps and/or Deficiencies	Recommendation/Corrective Action
Reporting – no reference for Pacific Salmon Federation rating of "good quality" based on EPT taxa in the 2018 annual report	Provide all references in report
Reporting – incorrect identification of "fair" based on HBI to Site W26 in 2018 annual report	Incorporate quality and independent review into reporting structure
Reporting – no analysis or discussion of environmental variables, fish results, or outlier effects on benthic invertebrate results as required by EMSAMP	Discuss all requirements of the EMSAMPs in the annual reports.

3.5.3 Fish and Fish Habitat

3.5.3.1 Documents Reviewed

Documents shown in Table 39 were reviewed for the fish and fish habitat section of the audit.

3.5.3.2 Fish and Fish Habitat Monitoring Program Design in EMSAMPS

The overall objectives of the Fish and Fish Habitat monitoring program in the 2018, 2019 and 2020 EMSAMPs were to assess the effect of effluent on fish and to document changes to fish habitat downstream of the Project. A fish tissue study was to be undertaken if the concentration of effluent in the exposure area was >1% in the area within 250 m of the final discharge point, as per Environment Canada EEM guidance.

Fish sampling was to occur annually in July or August and was to include sampling locations in Iron Rust Creek (n=1), upstream of the Project, Haggart Creek (n=3), downstream of the project, and Lynx Creek (n=1), a reference site. Sampling was to be conducted with standard collection methods suitable for the habitats present (e.g., electrofishing, baited minnow traps, angling, seining). The following data was to be collected from fish captured at each sample location:

- Abundance (based on catch-per-unit effort)
- Species
- Weight
- Length
- General condition

All data were to be recorded on modified RISC site cards.

Various adaptive management measures would be triggered if direct or indirect mortality of fish or change to fish abundance or community assemblage occur including:

- Fish mortalities
- Chronic toxicity effects to individual fish
- changes to fish abundance or community assemblages
- Acute or chronic toxicity effects are observed while the effluent discharge standards and receiving water quality objectives are consistently met
- Low flows result in decreased habitat availability
- Changes to fish habitat occur as described in hydrology, sediment, and benthic invertebrate sections, including Increased sedimentation

Table 40 summarizes the fish and fish habitat monitoring program compliance with the construction and operations EMSAMPs for the audit.

Table 40 2018 & 2019 Fish and Fish Habitat Monitoring Program Implementation

Stream	Site	Sampling conducted at appropriate time of year? (Yes/No)	Appropriate methods used? (Yes/No)	All required data collected? (Yes/No)	Appropriate data analysis performed? (Yes/No)	Adaptive Management Requirements Met? (Yes/No)	Data meets requirements of future EEM plan? (Yes/No)
Haggart Creek	HC1	No[1]	Yes	No[2]	Yes	No[3]	No[4]
	HC2	No[1]	Yes	No[2]	Yes	No[3]	No[4]
	HC3	No[1]	Yes	No[2]	Yes	No[3]	No[4]
Iron Rust Creek	IR2	No[1]	Yes	No[2]	Yes	No[3]	No[4]
Lynx Creek	L1	No[1]	Yes	No[2]	Yes	No[3]	No[4]

NOTES:

[1] Sampling conducted in September and not in July or August as required by EMSAMP

[2] Condition of fish not recorded

[3] No mention of adaptive management thresholds or triggers in annual reports or appendices

[4] Insufficient fish abundance for non-lethal sampling; no baseline fish tissue concentrations; no data on reproduction, growth, or condition provided; no indicator fish species identified

3.5.3.3 Compliance with the EMSAMP Fish and Fish Habitat Monitoring Program

Fish and fish habitat surveys were conducted in September of 2018 and 2019 instead of July or August as prescribed in the EMSAMP. This delay in sampling likely resulted in results not directly comparable to previous summer surveys due to the onset of winter conditions that may have limited fish efficiency and movement of fish to overwintering areas. Single-pass electrofishing was conducted within open stream sections (i.e., without block nets) and baited minnow traps were set overnight. Both methods are consistent with the EMSAMP.

Results of the fish habitat surveys were presented in site summary sheets (with photos), raw data appendices, tabular summaries, and comparative graphs. Data analyses included characterization of channel, substrate, cover, and habitat conditions at each site, total number of fish captured, by species, at each site and length frequency distributions for fish species with enough individual captures. Condition of individual fish was not recorded. Fish data were compared to previous year's data in text and tables. Only 33 fish were captured in 2018 and only fish 70 fish were captured in 2019 which was below the minimum number of 100 individual fish recommended by EEM technical guidance (Environment Canada 2012). Only 85 fish were captured in 2017 suggesting that the EEM minimum is unlikely to be attained at current effort levels.

There was no mine effluent discharge in 2018, therefore, there was no need for a fish tissue study. Mine effluent was discharged to Haggart Creek on two occasions in 2019: April 20 and April 27–29. Although the 2019 annual report includes a section regarding EEM monitoring requirements under the MDMER (including preparation of a final EEM study design for submission to Environment Canada in April 2020), there was no mention in the fish section of the 2019 annual report or the fish and fish habitat appendix about the need for fish tissue sampling in accordance with the MDMER due to these effluent discharges (i.e., whether the concentration of effluent in the exposure area was >1% in the area within 250 m of the final discharge point).

Neither the 2018 or 2019 annual reports or their appendices indicated whether any of the thresholds for adaptive management were triggered and if any of the prescribed measures were implemented. Neither annual report provided any recommendations for which fish species in any of the affected or unaffected watersheds would be suitable as indicator fish species for EEM.

3.5.3.4 Reporting Adequacy, Compliance and Recommendations

Table 41 summarizes compliance gaps and/or deficiencies for the fish and fish habitat monitoring program and provides recommendations for corrective action. In general, the fish and fish habitat monitoring program in 2018 and 2019 was completed as specified in the EMSAMPs. However, the surveys were conducted in September and not in summer as required by the EMSAMP. As the author's reported, this delay in sampling likely reduced the efficiency of sampling and reduced the numbers of fish captured. Condition of fish was also not recorded in 2018 or 2019 nor were indication of whether adaptive management thresholds were exceeded.

Although not required in the EMSAMPs, future annual reporting should make recommendations for fish tissue and fish community sampling for future EEM programs should mine effluent discharge occur once the mine is in operation. Finally, the identified compliance gaps or deficiencies are being addressed by VGC in the Study Design that Victoria Gold is preparing for submission to Environment and Climate Change Canada for its Environmental Effects Monitoring (EEM) plan under Schedule 5 of the MDMER. However, this EEM plan study design was not included in the scope of this audit and, therefore, the gaps and deficiencies are only based on a comparison of the annual monitoring program reports to the requirements of the EMSAMPs.

Table 41 Fish and Fish Habitat Monitoring Program Deficiencies and Recommendations

Compliance Gaps and/or Deficiencies	Recommendation/Corrective Action
Field methods - Fish and fish habitat surveys conducted in September instead of July or August when fish communities are likely more stable and fish sampling is more efficient	Although not a deficiency of the annual monitoring programs, sampling should be conducted in summer when fish community is most stable and sampling efficiency is highest.
Field methods – fish condition was not documented as required by the EMSAMPs	Conduct external examinations and fill in standardized necropsy form for each fish or sub-sample of fish of each species captured
Field methods – single pass open sites	Although not required by the EMSAMPs and not a deficiency of the annual monitoring programs, multi-pass depletion estimates in closed sites would provide more accurate and repeatable results and be better for long-term monitoring and statistical analyses
Field methods – insufficient numbers of fish captured for EEM program at current effort levels	The EMSAMP references that a minimum of 100 fish is recommended for non-lethal sampling according to EEM technical guidance (Environment Canada 2012). Sampling in summer and using multi-pass electrofishing methods may increase numbers of fish available for capture
Reporting – no mention of need for fish tissue study	Even if no mine effluent discharge occurred, reports should indicate whether a fish tissue study is required or not as part of MDMER monitoring; the EMSAMP indicates that a fish tissue study is required if the concentration of effluent in the exposure area was >1% in the area within 250 m of the final discharge point but the 2019 annual report did not indicate if this criterion was met.
Reporting – no recommendation for indicator fish species for future EEM program	Although not required by the EMSAMPs, the authors should provide a recommendation for a suitable indicator fish species for monitoring potential effects of future mine effluent discharges. Given the fish community present at the site, slimy sculpin would appear to be at least one of the indicator species chosen for future EEM programs
Reporting – no mention of adaptive management trigger or threshold exceedances	Reports should specify whether any of the adaptive management thresholds in the EMSAMPs were exceeded and if any of the adaptive management measures were required and implemented each year

4.0 TERRESTRIAL ENVIRONMENT

This section presents an audit of the terrestrial environment monitoring programs as specified in the applicable EMSAMP documents, compared to the data and information reported in supporting annual and monthly reports. The intent is to determine if ongoing monitoring and data collection meets the commitments outlined in the EMSAMP. This audit is specific to the following areas:

- Vegetation
- Soils
- Wildlife Protection

The scope of this terrestrial environment audit is limited to those monitoring methods as specified in the three versions of the EMSAMPs and in the Wildlife Protection Plan (version 2017-01) effective during the audit period.

4.1 VEGETATION AND SOILS

4.1.1 Documents Reviewed

Documents in Table 42 were reviewed for the vegetation and soils section of the audit:

Table 42 Vegetation, Soils and Reclamation Documents Reviewed

4.1.2 Monitoring Program Implementation and Data QA/QC

4.1.2.1 Vegetation Monitoring Program

The objectives of vegetation monitoring program were established prior to the mine construction phase and remain the same for the operations phase. These objectives are:

- To measure plant metal uptake, and
- To identify whether any trends in metal uptake could be attributed to site activities.

Vegetation (foliar) samples are collected annually in the summer (July/August) from four permanent plots at the locations shown in Table 43. Soil monitoring samples are collected in the same plots in conjunction with annual vegetation sampling.

Due to construction in 2019 and evolving operations needs, sites D2B and D4B were re-established at short distances from their original locations, established in 2018.

Table 43 Locations of Vegetation and Soil Monitoring Plots

Plot #	Aspect	Elevation (m)	Site Description
D1	Level	1417	Potato Hills near climate station
D2B	West	834	Upslope of the air quality station and the camp climate station
D3	Southwest	1356	Top of Eagle Pup near the over-the-top road
D4B	Level	757	On the west side of the access road just upstream of the Haggart Creek culverts

Samples are sent for laboratory analysis of 34 total metals concentrations. Total metals concentrations in sample results are compared to toxicity values for cattle (Puls, 1994) as there are no territorial or federal guidelines regarding metals concentrations in vegetation with respect to wildlife consumption (e.g., moose and/or caribou). Results are presented in the annual report and data for metals associated with the gold recovery process (arsenic, cadmium, chromium, mercury and lead) are compared year over year to assess for increases in concentrations over baseline values. Vegetation species composition is also assessed to determine vegetative assembly and local ecosystem changes over the Project phases.

For the purpose of QA/QC of laboratory analytical technique, duplicates of selected vegetation samples and reference standards are completed.

In the event vegetation monitoring indicates that metals concentration in vegetation is significantly increasing, VGC will consider additional dust control contingency measures described by the Dust Control Plan, Air Quality Management Plan, and applicable EMSAMP to limit particulate matter settling on vegetation.

4.1.2.2 Soil Monitoring Program

The objectives of the soils monitoring program were established prior to the mine construction phase and remain the same for the operations phase. These objectives are:

- To measure metal and nutrient levels in soils during operations, and
- To help identify whether any trends in trace metal and nutrient levels in soils could be attributed to site activities.

Soil monitoring is performed in coordination with vegetation monitoring, once annually during the growing season (July /August). Soil samples are collected from the surface soil horizon at depths between 0 and 0.5 m and then sent for laboratory analysis of pH, 36 metals and plant available nutrients. Ten percent of analyzed samples are blind duplicates, as an assurance on analytical quality and consistency.

Soil metals analytical results are compared to Canadian Council of Ministers of the Environment (CCME) soil quality guidelines (2018) and Yukon Contaminated Sites Regulations for agriculture and parklands soils (2002). All results are presented in the annual reports

Due to the need to re-establish vegetation/soil monitoring sites D2 and D4 (now D2B and D4B) in 2019, soil monitoring program results to date are considered representative of baseline soil conditions.

In the event future monitoring data indicates that metals concentration in soil within the mine footprint or at sites established outside the mine footprint are increasing, VGC will engage additional dust control contingency measures to limit particulate matter settling on soils.

Table 44 below provides the audit results of the vegetation and soil monitoring programs.

Table 44 Vegetation and Soils Monitoring Program Implementation

Monitoring Program	EMSAMP Version 2018-01 Compliance	EMSAMP Version 2019-01 Compliance	EMSAMP Version 2020-01 Compliance	Data QA/QC & Reporting
Vegetation	Monitoring program compliant with the EMSAMP for this period	Monitoring program compliant with the EMSAMP for this period	2020 monitoring program schedule outside of audit period	• 2018 annual reporting adequate • 2019 annual reporting adequate • Duplicate samples not collected in 2018 or 2019
Soils	Monitoring program compliant with the EMSAMP for this period	Monitoring program compliant with the EMSAMP for this period	2020 monitoring program schedule outside of audit period	• 2018 annual reporting adequate • 2019 annual reporting adequate • Duplicate samples not collected in 2018 or 2019

4.1.3 Reporting Adequacy, Compliance and Recommendations

The sampling program, data analysis, discussion and regulatory reporting for the vegetation and soils monitoring program was adequate for the audit period and compliant with the versions of the EMSAMP in effect during each sample program. However, Stantec recommends that the adaptive management component of the program rely on a statistical method to determine increases in metals associated with the gold recovery process (arsenic, cadmium, chromium, mercury and lead) in vegetation and soils that are 'significant'. This would facilitate management decision-making on implementing additional dust control contingency measures and would help to determine if the monitoring program is achieving its objectives.

Table 45 summarizes compliance gaps and/or deficiencies for the soils and vegetation monitoring program and provides recommendations for corrective action.

Table 45 Reclamation, Soils and Vegetation Monitoring Program Compliance and Recommendations

Compliance Gaps and/or Deficiencies	Recommendation/Corrective Action
N/A	Develop statistically-based trigger for determining 'significant' increases in metals (arsenic, cadmium, chromium, mercury and lead) concentrations in vegetation plot samples.
Missing duplicate vegetation sample analysis in 2018 and 2019	Collect duplicate samples, if sufficient vegetation is available

4.2 WILDLIFE PROTECTION

4.2.1 Documents Reviewed

Documents in Table 46 were reviewed for the wildlife protection section of the audit:

Table 46 Wildlife Protection Documents Reviewed

4.2.2 Management and Monitoring Program Implementation and Data QA/QC

The Wildlife Protection Plan (the Plan) guides management and monitoring of wildlife during the mine's construction and operations phases. Section 4.0 of the Plan describes four wildlife-related monitoring programs that have been implanted at the Mine:

1. Wildlife Records Program
2. Heap Leach Facility Area and Events Pond Monitoring Program
3. Moose Distribution Surveys
4. Metal Levels in Vegetation Monitoring Program

An audit of the Wildlife Records Program, Heap Leach Facility Area and Events Pond Monitoring Program, and Moose Distribution Surveys are provided in this section. Table 46 lists the documents reviewed. An audit of the Metal Levels in Vegetation Monitoring Program is provided in Section 4.1 (Vegetation, Soils and Reclamation) of this audit.

Wildlife Records Program

The objective of the Wildlife Records Program is to provide data to evaluate changes to wildlife distribution and habitat use as a result of Mine activities during construction and operations. The wildlife records program includes monitoring of wildlife incidents, observations of focal species and species at risk, and monitoring of the implementation of mitigation measures described in Section 3.0 of the Plan. The data collected are also intended to inform adaptive management as required. The Plan requires annual reporting be completed on the findings of the Wildlife Records Program.

The wildlife sections of the 2018 and 2019 Annual Reports were reviewed (Table 46).

Wildlife is addressed in four sections of the 2018 Annual Report. Section 3.8.3 (Wildlife) states that bear aware training was provided to all personnel as part of the site orientation. Section 3.8.3.1 (Pre-Clearing Wildlife Surveys) states that pre-clearing wildlife feature and bird surveys were completed and no notable wildlife features were found. No information is provided on the survey locations or on the number or species of bird nests detected. Section 3.8.3.2 (Wildlife Incidents) summarizes wildlife incidents which occurred in 2018. The report lists three wildlife incidents, one involving an injured red fox and two involving grizzly bears. Finally, Section 3.8.3.3 (Annual Moose Survey) summarizes the annual moose survey.

Wildlife is addressed in four sections of the 2019 Annual Report. Section 3.9.4 (Wildlife) states that wildlife mitigation measures were implemented. Section 3.9.4.1 (Nesting Songbird Surveys) states that pre-clearing nesting bird surveys were completed.. Section 3.9.4.2 (Wildlife Incidents) states that there were several observations of animals near the camp and mine site and that live trapping of nuisance animals was completed three times. There is no information provided on the species trapped or why they were deemed nuisance animals. Finally, Section 3.9.4.3 (Annual Moose Survey) summarizes the annual moose survey.

Quartz Mining License QML-0011 requires that quarterly reporting of wildlife incidents and observation be completed. The September 2018 through June 2020 quarterly reports were reviewed (Table 46). These reports summarized wildlife incidents and observations as required by QML-0011.

Heap Leach Facility Area and Events Pond Monitoring Program

The objective of the Heap Leach Facility Area and Events Pond Monitoring Program is to confirm that wildlife access to process solution is restricted. Section 4.2 of the Plan states that monitoring of the heap leach facility area will be undertaken as part of the Wildlife Records Program and that regular inspections of the events pond will be completed by the Environmental Coordinator. The Plan requires annual reporting be completed on the results of the heap leach facility area monitoring and events pond inspections.

Monitoring and inspection of the heap leach facility area and events pond is only required once process solution is present during operations. These facilities did not become operational until August 2019; therefore, the audit of the Heap Leach Facility Area and Events Pond Monitoring Program is limited to the period from August 2019 to June 30, 2020.

The 2019 Annual Report and QML-0011 quarterly reports do not contain any records from the heap leach facility area during the audit period (Table 47). However, there are wildlife observations from the heap leach facility area recorded as part of the wildlife records program from outside the audit period. The 2019 Annual Report and QML00011 quarterly reports do not contain any information regarding wildlife-related inspections of the events pond during the audit period (Table 47). However, Stantec received verbal confirmation that monitoring of the heap leach facility and events pond is completed routinely. These data are collected on hard copy datasheets before being entered onto internal tracking sheets. Stantec received an internal tracking sheet with records for May 2020 through November 2020. A review of the hand-written records was beyond the scope of this review.

Moose Distribution Surveys

The purpose of the moose distribution surveys is to monitor the distribution and abundance of moose during the late-winter season to inform adaptive management strategies for mitigating mine effects on moose. The Plan commits to annual winter moose distribution surveys during construction and operations. The 2018 moose distribution survey was completed in March 2018, which is outside the period considered by this audit. The 2019 moose distribution survey was completed from March 5 to 7, 2019 and was the second construction phase survey (Table 47). The 2020 moose distribution survey was completed from March 5 to 6, 2020 and was the first operations phase survey (Table 47).

Table 47 Wildlife Protection Monitoring Program Implementation

	Wildlife Records Program		Heap Leach Facility Area and Events Pond Monitoring Program	Moose Distribution Surveys
	Wildlife Incidents	Wildlife Observations		
2018	Completed	Completed	N/A[1]	N/A[2]
2019	Completed	Completed	Completed[3]	Completed
2020	Completed	Completed	Completed[3]	Completed

NOTES:

[1] The heap leach facility area and events pond did not become operational until August 2019. Monitoring of these facilities is only required during operations; therefore, the audit of the Heap Leach Facility Area and Events Pond Monitoring Program is limited to the period from August 2019 to June 30, 2020.

[2] The 2018 moose distribution survey was completed in March 2018, which is outside the period considered by this audit.

[3] Stantec received verbal confirmation that this monitoring was completed

4.2.3 Reporting Adequacy, Compliance and Recommendations

Wildlife Records Program

There were minor discrepancies between the wildlife incidents described in the 2018 Annual Report, the 2018 September Quarterly Report, and the 2018 December Quarterly Report (Table 48). The 2018 Annual Report includes only one wildlife incident during the audit period, the discovery and subsequent euthanasia of an injured red fox on November 20, 2018. However, the 2018 September Quarterly report identifies three additional wildlife incidents: a bird fatality on a site access road, the removal of two squirrel middens, and the relocation of an active bird nest.

Stantec recommends that all wildlife incidents which result in human-wildlife conflict, wildlife fatality or removal, or nest disturbance be documented in a table in the main body of the annual report. Stantec also recommends that where possible the root cause(s) of the incident be determined and included in the annual report, and that this information be used as part of the adaptive management framework as described in the Plan (Table 48).

Stantec also recommends that location names be standardized where possible, and that coordinates be recorded so as to allow more accurate mapping of wildlife observations. This would assist in evaluating changes to wildlife distribution and habitat use as a result of Mine activities (Table 48).

Heap Leach Facility Area and Events Pond Monitoring Program

Stantec received verbal confirmation that routine monitoring of the heap leach facility and events pond is completed. These data are collected on hard copy datasheets before being entered onto internal tracking sheets. Stantec received an internal tracking sheet with records for May 2020 through November 2020. A review of the hand-written records was beyond the scope of this review. Stantec recommends that reporting on the heap leach facility and events pond monitoring be summarized in the annual report (Table 48).

Moose Distribution Surveys

The methods used in the 2019 and 2020 surveys followed those described in the Plan. The 2019 and 2020 surveys and reports are considered reliable, and no compliance gaps or deficiencies were identified. While not a gap, to improve readability Stantec recommends that the summary of incidental observations clearly indicate the current-year's observations before providing a comparison with prior-year surveys.

Table 48 Wildlife Protection Monitoring Program Compliance and Recommendations

Compliance Gaps and/or Deficiencies	Recommendation/Corrective Action
Specific information on wildlife incidents is not provided in the Wildlife Records Program	Provide a summary of all wildlife incidents resulting in human-wildlife conflict, wildlife fatality or removal, or nest disturbance in the annual reports along with a summary of the root cause(s). Any corrective actions should be documented.
There is no formal documentation of the wildlife protection monitoring in the Heap Leach Facility Area and Events Pond Monitoring Program	Include the results of the monitoring program in the annual report or in a separate report.

5.0 GEOTECHNICAL STABILITY OF INFRASTRUCTURE AND FACILITIES

This section presents an audit of the geotechnical and physical stability monitoring procedures of infrastructure and facilities on site as specified in the applicable EMSAMP documents, compared to the data and information reported in supporting annual and monthly reports. The intent is to determine if ongoing monitoring and data collection meets the commitments outlined in the EMSAMP. This audit is specific to the following areas:

- Permafrost foundations
- Open pit
- Material Storage and Stockpiling Areas
- Heap Leach Facility

The scope of this physical stability audit is limited to those monitoring methods as specified in the three EMSAMP documents listed below in Table 49.

This audit does not assess the ongoing geotechnical stability, or infrastructures stabilities outside of the four areas stated above. This audit also excludes review and assessment on the limit equilibrium slope stability and related Factor of Safety (FOS) design criteria, quantifying deformation and/or settlement, comparing reported groundwater tables with established trigger levels in other documentation, open pit wall stability, catch berm adequacy, the surveillance and inspection checklist of the Adsorption Desorption Recovery (ADR) Plant as laid out in EMSAMP 2020-01 Table 18.3-1, and determination if WRSA or stockpile structures were constructed to design specification.

5.1 PERMAFROST MONITORING

5.1.1 Documents Reviewed

The following documents in Table 49 were reviewed as part of the permafrost physical stability section of the audit.

Table 49 Permafrost Monitoring Program Document Review

Document	Version Reviewed	Sections applicable during construction phase	Sections applicable to Operations phase
Quartz Mining License QML-0011	Amendment April 17, 2018 Amendment May 19, 2020	13.0 – Reporting and Inspections	13.0 – Reporting and Inspections
EMSAMP	2018-01	15.0 – Infrastructure and Facilities	N/A
EMSAMP	2019-01	15.0 – Infrastructure and Facilities	15.0 – Infrastructure and Facilities
EMSAMP	2020-01	N/A	15.0 – Infrastructure and Facilities
Water Licence QZ14-041 Quartz Mining License QML-0011 2018 Annual Report	N/A	4.0 - Physical Monitoring	N/A
Water Licence QZ14-041 Quartz Mining License QML-0011 2019 Annual Report	N/A	4.0 - Physical Monitoring	4.0 - Physical Monitoring
Type A Water Use License QZ14-041-1 Monthly Report, Reporting Period: January 2020 to June 2020	N/A	N/A	8.0 - Physical Monitoring

5.1.2 Monitoring Program Implementation and Data QA/QC

This section compares the permafrost monitoring program described in the EMSAMP to the field programs and data collected over the audit period reported in the annual reports.

Permafrost monitoring activities summarized in those documents in 49 The documents were checked for compliance with monitoring frequency and methods described in the EMSAMP documents. Non-compliances, such as missing monitoring results, AMP thresholds, or other deficiencies in carrying out the monitoring programs are identified in Table 50 and discussed in 5.1.3.

Table 50 Permafrost Monitoring Program Implementation

Monitoring Method	EMSAMP – 2018 Monitoring Requirements	Compliance (Yes/No)	EMSAMP – 2019 Monitoring Requirements	Compliance (Yes/No)	EMSAMP – 2020 Monitoring Requirements	Compliance (Yes/No)
Visual Inspection	• Regular Intervals • Freshet, prolonged rainy periods, freeze-up	No[1]	• Regular Intervals • Freshet, prolonged rainy periods, freeze-up	No[1]	• Regular Intervals • Freshet, prolonged rainy periods, freeze-up	No[1]
Subsurface temperature monitoring (thermistor)[2]	• Quarterly	Yes	• Quarterly	Yes	• Quarterly	Yes
Surface water Quality (TSS, Turbidity)	• Freshet, rainy periods, freeze-up	Yes	• Freshet, rainy periods, freeze-up	Yes	• Freshet, rainy periods, freeze-up	Yes
Weather Data Review (precipitation, temperature, freezing/thawing indices)	• Annually	No[3]	• N/A (requirement removed)	N/A[4]	• N/A (requirement removed)	N/A[3]

NOTES:

[1] Execution of visual inspections not documented or discussed in annual or monthly reports.

[2] 13 thermistors are located where visual inspections are required.

[3] Freeze, thaw indices not documented or referenced in 2018 annual report.

[4] Weather data review criteria for removed in EMSAMP 2019-01 and EMSAMP 2020-01.

5.1.3 Reporting Adequacy, Compliance and Recommendations

Table 51 summarizes the compliance gaps and/or deficiencies identified with the permafrost monitoring program.

The notable non-compliance related to permafrost monitoring is the absence of recorded and documented regular visual inspections, specifically during the freshet, rainy periods, and freeze-up. These inspections should be recorded and documented as per the EMSAMP 2020-01 document.

Table 51 Permafrost Monitoring Program Compliance and Recommendations

Compliance Gaps and/or Deficiencies	Recommendation/Corrective Action
Regular visual Inspections not reported.	Include an appendix in Annual and Monthly reporting that summarizes the observations from regular visual inspections to identify and quantify any deformation associated with melting of permafrost, such as but not limited to, cracks, subsidence, sinkholes, and sloughing on existing foundations and slope overlay permafrost. Summarize those visual inspections executed during the freshet, prolonged rainy periods, and rising trend in any thermistors.
Prolonged rainy period not quantified.	Define / quantify duration of a prolonged rainy period based on exceedance of design criteria (duration, precipitation volume).
Freeze/Thaw indices not reported under EMSAMP -2018-01.	Corrective action no longer required because Weather Data Review requirement removed from EMSAMP monitoring program starting June 2019 (EMSAMP 2019-01 and 2020-01).
Thermistor GT18-09 not read in Q3 of 2019	Provide reasoning for missed reading.

5.2 OPEN PIT

5.2.1 Documents Reviewed

The following documents in Table 52 were reviewed as part of the geotechnical stability of the open pit portion of the audit.

Table 52 Open Pit Monitoring Program Document Review

Document	Version Reviewed	Sections applicable during construction phase	Sections applicable to Operations phase

5.2.2 Monitoring Program Implementation and Data QA/QC

This section compares the open pit monitoring program described in the EMSAMP to the field programs and data collected over the audit period. The open pit development did not commence prior to 2019, thus the audit is based on one year from the commencement of the operations phase to June 2020.

Open pit monitoring activities summarized in documents shown in Table 52 were checked for compliance with monitoring frequency and methods described in the EMSAMP. Non-compliances, such as missing monitoring results and exceedances of objectives/standards, AMP thresholds, or other deficiencies in carrying out the monitoring programs are identified in Table 53 and discussed in Section 5.2.3.

Table 53 Open Pit Monitoring Program Implementation

Monitoring Method	EMSAMP – 2018 Monitoring Requirements	Compliance (Yes/No)	EMSAMP – 2019 Monitoring Requirements	Compliance (Yes/No)	EMSAMP – 2020 Monitoring Requirements	Compliance (Yes/No)

Table 53 Open Pit Monitoring Program Implementation

Monitoring Method	EMSAMP – 2018 Monitoring Requirements	Compliance (Yes/No)	EMSAMP – 2019 Monitoring Requirements	Compliance (Yes/No)	EMSAMP – 2020 Monitoring Requirements	Compliance (Yes/No)

NOTES:

[1] Open pit not developed in 2018.

[2] Execution of visual inspections not documented or discussed in annual or monthly report

[3] Drone survey criteria not included in EMSAMP 2018-01 and 2019-01.

[4] Survey prisms scheduled for implementation at open pit.

[5] Monitoring method not implemented / installed at open pit.

[6] The following piezometers listed in EMSAMP2019-01 MW96-17A, MW96-17B 09-BGC-GTH2a, 10-BGC-GTH-05, 10-BGC-GTH-06, 10-BGC-GTH-07, 10-BGC-GTH-08, 10-BGC-GTH-10 are not reported in the 2019 annual report: VGC indicated they were decommissioned in February 2019.

[7] The following piezometer installations listed in EMSAMP2020-01 are not reported in the June 2020 monthly report: BH-BGC11-73a, BH-BGC11-73b, and BH-BGC11-73c. [8] Annual physical stability report deadline given as October 1 2020, beyond the time scope of this audit.

In addition to the EMSAMP monitoring requirements listed above, the Quartz Mining Licence requires VGC to respond to recommendations resulting from the annual stability inspection that are related to the open pit. From the one (1) annual inspection within the audit scope for the open pit, for 2019, Stantec identified three (3) general recommendations relevant to the open pit. These relevant recommendations are listed below, as referenced from the 2019 physical stability inspection (All North, 2019).

1. VGC should assign a qualified, on site, individual to be responsible for monitoring and documentation of any mass earth structures that have significant risks in the case of a failure. The individual should develop a standard operating procedure for the monitoring and risk management of these structures. This individual should be responsible for coordination with a qualified professional to review monitoring data for concerns and trends if they are not qualified themselves.
    a. VGC response: Monitoring of structures is done by the Technical Services department working closely with the EOR for the areas and while following standard operating procedures (ongoing).
2. Any finalized construction of mass earth structures should include a final construction report that includes any operational and maintenance requirements (if any) to ensure stability of the structure.
    a. VGC response: As per both the QML and WL, the EOR will provide a final construction report, which includes requirements for maintenance as needed, once the structures are complete (ongoing).
3. VGC should consider a monitoring program to assist in early warning and detection of any movements in mass earth structures. Such a program might use permanent survey points, slope inclinometers, piezometers, or other tools to measure internal/external movements and pore water pressures. Such a monitoring program should be developed with the assistance of and be implemented with the oversight of a qualified professional.
    a. VGC response: Monitoring programs have been developed, are in use and undergoing further refinement by the technical services department with the oversight of a qualified professional. (Q2 2020).

5.2.3 Reporting Adequacy, Compliance and Recommendations

Table 54 summarizes the compliance gaps and/or deficiencies identified with the open pit monitoring program.

The notable non-compliance related to open monitoring is the absence of reported daily visual inspections. These inspections should be recorded and documented as per the EMSAMP 2020-01 document. There is also a lack of consistency between the number of piezometer instruments listed in the EMSAMP documents (2019-01, 2020-01) and those with reported water tables in the 2019 annual report and June 2020 monthly report. Stantec understands the MW series instruments, MW97-17A and MW96-17B, : 09-BGC-GTH2a, 10-BGC-GTH-05, 10-BGC-GTH-06, 10-BGC-GTH-07, 10-BGC-GTH-08, 10-BGC-GTH-10 were decommissioned in February 2019 and therefore excluded from the 2019 annual report. Stantec also understands the BH-BGC11-73 series instruments (a, b, and c) were decommissioned in early 2020 and therefore excluded from the 2020 monthly report.

VGC plans to implement a system of prisms to detect movements, initially scheduled for implementation in 2020 but delayed due to site access complications. This combined with documented visual inspection, piezometric monitoring, bi-weekly drone survey and annual stability review would provide sufficient general monitoring of the performance of the open pit. There are number of instruments and monitoring listed in EMSAMP that are not yet implemented, such as, robotic theodolite, TDR cables, slope inclinometers, fixed slope radar, and mobile slope radar. These instruments and monitoring can be considered as contingency when movements are observed from the general monitoring. It would be recommended to adjust the EMSAMP to indicate that these are contingent to general monitoring subject to review of the qualified personnel for the open pit stability.

Of the three (3) physical stability recommendations, two (2) are ongoing and Recommendation 3 is addressed by the bi-weekly execution of drone surveys and the planned implementation of monitoring prisms.

Table 54 Open Pit Monitoring Program Compliance and Recommendations

Compliance Gaps and/or Deficiencies	Recommendation/Corrective Action
Daily visual inspections not reported.	Include an appendix in Annual and Monthly reporting that summarizes the observations from these daily visual inspections.
Monthly collection of survey prism data not reported.	Stantec understands there are currently no active prisms installed at the open pit, and VGC is implementing a program scheduled for 2020 to install up to 15 prisms on the 1408, 1375, and 1395 benches. Following prism installation, include in Annual and Monthly reports a list of active survey prisms with coordinates (northing, easting, elevation) and deformation readings.
Piezometers read quarterly instead of monthly in 2018 as required in EMSAMP 2018-01.	Corrective action not required since the piezometer reading frequency is specified as quarterly in subsequent EMSAMP 2019-01, superseding the 2018 requirement and bringing the piezometer reading schedule into compliance.
Scheduled piezometer readings for Q1 2020 not collected due to COVID-19 related staffing issues.	Assess if datalogger installed in Open Pit piezometer BH-BGC11-73a,b,c collected and stored data for Q1 2020. For remaining piezometer(s), collect data as soon as reasonably practical and provide reading summary or reasoning for data gap in Annual reporting.
Piezometer data not collected in Q2 2020.	Assess if datalogger installed in Open Pit piezometer BH-BGC11-73a,b,c collected and stored data for Q2 2020. For remaining piezometer(s), collect data as soon as reasonably practical and provide reading summary or reasoning for data gap in Annual reporting.
Piezometers listed in EMSAMP documentation without reported water tables.	Provide reasoning for piezometers with absence of documented water table readings.
Data for two (2) extensometers installed at open pit not reported.	The EMSAMP documents do not lay out a minimum required monitoring frequency for extensometers installed at the open pit. A qualified personnel should determine a reading frequency for these instruments and should be summarized in the annual reports and compared against established velocity trigger levels.
Multiple instrumentation listed in EMSAMP documentation that is not currently installed on site (robotic theodolites, TDR cables, slope inclinometers, fixed slope radar, mobile slope radar).	Remove from EMSAMP documentation reference to instrumentation not installed (or planned for installation) on Open Pit.
Equipment maintenance logs were not provided to back-up data reported in monthly/annual reports.	Provide equipment maintenance logs as supporting documentation to monthly/annual reports.

5.3 MATERIALS STORAGE AND STOCKPILE MANAGEMENT AREAS

5.3.1 Documents Reviewed

The following documents in Table 55 were reviewed as part of the geotechnical stability of the materials storage and stockpile management areas portion of the audit.

Table 55 Materials Storage and Stockpile Management Areas Monitoring Program Document Review

5.3.2 Monitoring Program Implementation and Data QA/QC

This section compares the materials storage and stockpile management areas monitoring program described in the EMSAMP to the field programs and data collected over the audit period.

Monitoring activities summarized in documents shown in Table 55 were checked for compliance with monitoring frequency and methods described in the EMSAMP. Non-compliances, such as missing monitoring results and exceedances of objectives/standards, AMP thresholds, or other deficiencies in carrying out the monitoring programs are identified in Table 56 and discussed in section *12.a*.

Table 56 Materials Storage and Stockpile Management Areas Monitoring Program Implementation

Monitoring Method	EMSAMP 2018-01 Monitoring Requirements	Compliance (Yes/No)	EMSAMP 2019-01 Monitoring Requirements	Compliance (Yes/No)	EMSAMP 2020-01 Monitoring Requirements	Compliance (Yes/No)
Visual / Drone inspection	• Daily (WRSA crest) • Weekly (WRSA toe) • Weekly (developing Stockpile) • Monthly (established Stockpile) • Monthly (detailed WRSA)	No[1]	• Daily (WRSA crest) • Weekly (WRSA toe) • Weekly (developing Stockpile) • Monthly (established Stockpile) • Monthly (detailed WRSA)	No[1]	• Daily (WRSA crest) • Weekly (WRSA toe) • Weekly (developing Stockpile) • Monthly (established Stockpile) • Monthly (detailed WRSA)	No[1]
Piezometers	• Quarterly • Annual (data summary Report)	Yes	• Quarterly	Yes	• Quarterly	No[2]
Rock Drain Flow	• Weekly	N/A[3]	• Weekly	N/A[3]	• Weekly	N/A[3]
Survey Prisms	• No frequency	N/A[4]	• No frequency	N/A[4]	• No frequency	N/A[4]

Annual Physical Stability	• Annually, prior to October 1	Yes	• Annually, prior to October 1	Yes	• Annually, prior to October 1	N/A[5]

Table 56 Materials Storage and Stockpile Management Areas Monitoring Program Implementation

Monitoring Method	EMSAMP 2018-01 Monitoring Requirements	Compliance (Yes/No)	EMSAMP 2019-01 Monitoring Requirements	Compliance (Yes/No)	EMSAMP 2020-01 Monitoring Requirements	Compliance (Yes/No)
NOTES: [1] Execution of daily, weekly, monthly visual / drone inspections not documented or discussed in annual or monthly reports. [2] The following piezometer installations listed EMSAMP2020-01 are not listed in the June 2020 monthly report: MW96-15, and MW96-14B Stantec understands these piezometer installations were reported in the monthly report as MW96-15b and MW96-14, respectively. Stantec further understands that MW19-PGW-1b was damaged and could not be sampled for the monthly report. [3] Rock drain under construction as of June 2020 monthly report. [4] Monitoring method not implemented / installed at WRSA or stockpile structures. [5] Annual physical stability report deadline given as October 1 2020, beyond the time scope of this audit. [6] Wireline extensometer reading frequency not listed as monthly, may be provided in 2020 annual report.						

Stantec understands a physical stability inspection for the year ending 2020 was executed over September 23 and 24 of this year,

In addition to the EMSAMP monitoring requirements listed above, the Quartz Mining Licence requires VGC to respond to recommendations resulting from the annual stability inspections that are related to material storage and stockpile. From the two (2) annual inspection completed, by All North in 2018 and 2019, Stantec identified a total of 12 separate recommendations relevant to the material storage and stockpiles, are listed below:

1. 2018 – All stockpiles, material storage areas, and other mass earth structures should all have formal foundation and construction designs completed by a qualified professional.
    a. VGC response: Formal foundation and construction designs are part of EPCM's work for turnover to VGC. All turnover documentation will specifically identify minor modifications from the issued for construction design and the final constructed facility (Jun 2019).
2. 2018 – [related to 90 day stockpile] mitigate risks associated with perched rocks throughout the slope. Boulders should be removed in a controlled manner, or have a machine press (or bury) the boulders into the existing fill so they have a more stable base, and are less likely to become dislodged. Care should be taken during this work to ensure that the critical infrastructure, workers, and equipment are restricted from the fallout path, or other appropriate mitigation measures are pure in place.
    a. VGC response: The 90-day stockpile had only undergone preliminary clearing and earthworks at the time of the annual physical stability assessment. Stability analyses for this facility have been completed (post assessment) and provide recommendations for suitable foundation conditions for the 90-day stockpile to ensure that the required factors of safety are achieved (completed).
3. 2018 - [related to Stockpile B] this stockpile should be graded on top to eliminate or seal tension cracking.
    a. VGC response: Grading has taken place to stabilize the location identified (completed).
4. 2018 – [related to Stockpile B] the extent (volume and location) of ice and other frozen materials in the stockpile should be determined based on site records and information from site staff available. A record of the resulting instability should be noted.
    a. VGC response: Stockpile B will be reviewed post assessment by a Geotechnical Engineer. Any recommendations made (reshaping etc.) will be performed prior to handing over to VGC at completion. A material tracking sheet showing what as hauled to this location has been maintained during construction activities but was inadvertently not made available during the assessment (Jun 2019).
5. 2018 – [related to Stockpile B] have a qualified professional determine if ice and other frozen materials are an acceptable material for construction of a mass earth structure, and if they are, how they should be placed or incorporated in an overall stockpile design to ensure that there are no localized failures as a result.
    a. VGC response: Stockpile B will be reviewed post assessment by a Geotechnical Engineer. Any recommendations that made (reshaping etc.) will be performed prior to handing over to VGC at completion (Jun 2019).

6. 2019 - [related to 90 Day Stockpile] pull back over-steepened walls along the perimeter ditch which are sloughing into the ditch. This ditch may require a liner and/or rock armoring, and final grading to attain physical stability and prevent pooling.
    a. VGC response: Oversteepened slopes were temporary in nature, and have been reduced since observation in Sept 2019. Pad construction will continue after freshet 2020, and so will require ongoing monitoring and maintenance (Q3 2020 / ongoing).
7. 2019 – [related to 90 Day Stockpile] Tie perimeter ditch into the collection sump, directing water away from the road
    a. VGC response: this ditch/sump system will be completed as per engineering specifications and will be tied into the Ditch A pipeline (Q2 2020).
8. 2019 – [related to Un-named Stockpile Area] consider additional ditching and water management in the area to prevent scouring of the road surfaces and erosion around the stockpiles. Ditch water away from the laydown areas to prevent ponding.
    a. VGC response: Continual monitoring of stockpiles underway and will address water management on an as needed basis (on-going).
9. 2018&2019 - VGC should assign a qualified, on site, individual to be responsible for monitoring and documentation of any mass earth structures that have significant risks in the case of a failure. The individual should develop a standard operating procedure for the monitoring and risk management of these structures. This individual should be responsible for coordination with a qualified professional to review monitoring data for concerns and trends, if they are not qualified themselves.
    a. VGC response: Monitoring of structures is done by the Technical Services department working closely with the EOR for the areas and while following standard operating procedures (on-going).
10. 2018&2019 - VGH should continue to assign individuals to document and be responsible for the monitoring and construction review to determine if such structures are constructed in accordance with design. any variations between design documents and final construction should be included in the final record drawings.
    a. VGC response: Monitoring of structures including construction review to meet design specs is done by the Technical Services department working closely with the EOR for the areas. Construction reports and as-built drawings document variations or minor modification from IFC designs (on-going).
11. 2018&2019 - Any finalized construction of mass earth structures should include a final construction report that includes any operational and maintenance requirements (if any) to ensure stability of the structure.
    a. VGC response: VGC response: As per both the QML and WL, the EOR will provide a final construction report, which includes requirements for maintenance as needed, once the structures are complete (ongoing).

12. 2018&2019 - VGH should consider a monitoring program to assist in early warning and detection of any movements in mass earth structures. Such a program might use permanent survey points, slope inclinometers, piezometers, or other tools to measure internal/external movements and pore water pressures. Such a monitoring program should be developed with the assistance of and be implemented with the oversight of a qualified professional.
    a. VGC response: Monitoring programs have been developed, are in use and undergoing further refinement by the technical services department with the oversight of a qualified professional (Q2 2020).

5.3.3 Reporting Adequacy, Compliance and Recommendations

Table 57 summarizes compliance gaps and/or deficiencies identified with the materials storage and stockpile management areas monitoring program.

The notable non-compliance is the absence of documented visual inspections. These inspections should be recorded and documented as required in the EMSAMP 2020-01 document. There is also a lack of consistency between the number of piezometer instruments listed in the EMSAMP document 2020-01 and those with reported water tables in the June 2020 monthly report as listed: MW96-15, MW96-14B, and MW19-PGW-1b. Stantec understands the first two installation, MW96-15 and MW96-14B, were listed as MW96-15B and MW96-14 respectively, in the monthly report. MW19-PGW-1b was reported as damaged and could not be sampled.

The EMSAMP documents require weekly inspections of WRSA rock drain discharge areas. However, Stantec understands that as of June 2020 these structures are still under construction and not yet operational, thus monitoring requirements are not applicable until their completion.

Of the 12 physical stability recommendations, recommendations #1, 4, 5, 7, and 12 are scheduled for completion within the scope of this environmental audit. The remaining recommendations are ongoing, planned for future implementation, or are listed as completed by VGC.

- Recommendation 1 is addressed with the official handover package from construction to operations (Construction release, C1 Certification). Stantec assumes this handover package contains all relevant foundation and construction designs and accepted by a qualified professional.
- Recommendation 4 is not addressed in the available documentation, with no mention of a Stockpile B review.
- Recommendation 5 is not addressed in the available documentation, with no mention of a Stockpile B review.
- Recommendation 7 is scheduled for implementation in March and April 2020. This implementation is not documented in the relevant monthly reports.
- Recommendation 12 is addressed and the 2019 annual report presents readings for two (2) wireline extensometers installed on PG WRSA. Stantec understands an additional two (2) extensometers have been installed on this structure, with data not reported. The WRSA structures are also reported to be monitored bi-weekly with aerial drones.

Table 57 Materials Storage and Stockpile Management Areas Monitoring Program Compliance and Recommendations

Compliance Gaps and/or Deficiencies	Recommendation/Corrective Action
Visual inspections (daily, weekly, monthly) not reported.	Include an appendix in Annual and Monthly reporting that summarizes the observations from these visual inspections.
Not all WRSA and stockpile piezometers as listed in EMSAMP 2020-01 have water levels reported in June 2020 monthly report.	Confirm list of active piezometers installed in WRSA and stockpiles, include data in monthly and annual reports. Provide reasoning behind non-documented groundwater tables.
Multiple instrumentation listed in EMSAMP documentation that is not currently installed on site (Survey Prisms, Inclinometers, Radar / photogrammic surveying).	Remove from EMSAMP documentation reference to instrumentation not installed (or planned for installation) on WRSA and stockpile structures.
Existing monitoring methods (wireline extensometer) implemented on site do not state a monitoring frequency.	VGC should consider discrete reading frequencies for wireline extensometers, specify in EMSAMP documentation.
Follow up and close out of physical stability recommendation 4 and 5 not documented in annual or monthly reports.	Provide documentation detailing the follow up and response actions for addressing recommendations.

5.4 HEAP LEACH FACILITY

5.4.1 Documents Reviewed

The following documents in Table 58 were reviewed as part of the physical stability of the Heap Leach Facility portion of the audit.

Table 58 Heap Leach Facility Monitoring Program Document Review

5.4.2 Monitoring Program Implementation and Data QA/QC

This section compares the Heap Leach Facility monitoring program described in the EMSAMP to the field programs and data collected and provided for the purpose of the audit over the audit period.

Heap Leach Facility monitoring activities summarized in documents shown in Table 58 were checked for compliance with monitoring frequency and methods described in the EMSAMP. The details for the non-compliance, such as missing monitoring results and exceedances of objectives/standards, AMP thresholds, or other deficiencies in carrying out the monitoring programs are identified in Table 59 and discussed in Section 5.4.3.

Table 59 Heap Leach Facility Monitoring Program Implementation

Monitoring Method	EMSAMP 2018-01 Monitoring Requirements	Compliance (Yes/No)	EMSAMP 2019-01 Monitoring Requirements	Compliance (Yes/No)	EMSAMP 2020-01 Monitoring Requirements	Compliance (Yes/No)
Routine (visual) Inspection	• Weekly • Daily (General Visual)	No[1]	• Weekly • Daily (General Visual)	No[1]	• Weekly (Embankment)	No[1]

Surveillance and Inspection of Adsorption, Desorption, and Recovery (ADR) Plant	• Regularly	N/A[8]	• Regularly	N/A[8]	• Regularly	N/A[8]

NOTES:

[1] Execution of daily, weekly, visual inspections not documented or discussed in annual or monthly reports.

[2] The following piezometers listed in EMSAMP 2019-01 are not reported in the 2019 annual report: MW10-AG6, BG-BGC11-26, MW19-HLF2a, MW19-HLF2b.

[3] The following piezometer listed in EMSAMP 2020-01 are not reported in the June 2020 monthly report: MWXX-AGR6, MW10-AG3A, MWXX-HLF2a, MWXX-HLF2b, MWXX-HLF3a, MWXX-HLF3b, MWXX-HL4a, MWXX-HLF4b. Stantec assumes the “XX” series instruments were not installed prior to June 30, 2020.

[4] Inclinometer data not reported in 2019 annual report, Q1/Q2 monthly reports.

[5] Monitoring requirement not laid out in relevant EMSAMP document.

[6] Annual physical stability, HLF and Dam Inspection for 2020 can be carried out in remainder of 2020 calendar year, outside scope of this audit.

[7] Dam Safety Review (DSR) not required during time scope of audit.

[8] ADR Plant surveillance and inspection checklist laid out in EMSAMP documents outside scope of this physical stability section of the environmental audit. Stantec assumes this is documented by VGC supervisor and operator and records filed on site.

Stantec understands a physical stability inspection for the year ending 2020 was executed over September 23 and 24 of this year.

In addition to the EMSAMP monitoring requirements listed above, the Quartz Mining Licence requires VGC to respond to recommendations resulting from the annual stability inspection that are related to the Heap Leach Facility. From the two (2) annual inspection completed, by All North in 2018 and 2019, Stantec identified a total of 12 separate recommendations relevant to the ADR and heap leach facility, are listed below:

1. 2018 – [related to ADR] reduce the outside slope of material in the stockpile above the ADR Access Road. The stockpile West Northwest of the ADR Building is composed of a mix of several materials with unknown compaction and possibly over steepened outside slopes. It is recommended that the stockpile be shaped within geotechnical design specifications, or that the location of the pile is adjusted so that there is a bench between the crest of the adjacent slope, and the toe of the stockpile. If the stockpile is to remain long term, the structure should have a design completed by a qualified professional.
    a. VGC response: The over-steepening of the crest area was addressed when an access road adjacent to the area was developed. Slopes above ADR access road will be addressed as part of the final area handover. Post completion a Geotechnical Engineer will conduct a further review of the installation and provide recommendations for additional mitigations as necessary (Jun 2019).
2. 2018 - [related to ADR] at the time of inspection, there appeared to be over-steepened temporary cut slopes created adjacent to short term haul roads used for construction access in the area. Cut back slopes adjacent to haul roads that do not meet geotechnical specifications for the site, or have recommendations in place for temporary slopes during construction.
    a. VGC response: The area adjacent to the ADR pad continues to be used for construction purposes. The interior area has been utilized as a storage area for unsuitable materials backhauled from local cut areas which has been used as backfill to mitigate this concern (completed).
3. 2019 - [related to ADR] review engineering requirements for the North Toe Ditch to confirm ditch size, and need for rock armoring. Toe ditch is currently tied into the roadside ditch, which should also be reviewed for engineering requirements. Recommend reviewing hydraulic design of both ditches to determine what is necessary.
    a. VGC response: Review of design to be done and if necessary ditch system will be modified (Q2 2020).
4. 2019 – [related to HLF] continue to monitor the cut slopes around the perimeter of the HLF for erosion. Maintain the upper bench and remove sloughing material as required.
    a. VGC response: This area will be monitored and repaired with the Phase 1B Expansion (Q2/Q3 2020).

5. 2019 – [related to HLF] install further ditching at the top of the temporary upper overburden stockpile area to control water flow and address scouring issue on the access road.
    a. VGC response: This area will be regraded and grubbed as part of the Phase 1 B Expansion (Q2/Q3 2020).
6. 2019 – [related to HLF] consider re-shaping the temporary upper overburden stockpile to reduce risk of material sloughing down towards the access road.
    a. VGC response: This area will be monitored and repaired with the Phase 1B Expansion (Q2/Q3 2020).
7. 2019 – [related to HLF] review requirements of Phase 1 Interception ditch outfall. Currently the ditch terminates at the top of an un-vegetated slope, and would be more stable with an armored exfiltration outfall/sediment sump.
    a. VGC response: Most of this area will be grubbed and regraded in preparation for the Phase 1 B Expansion. The outfall for the interceptor ditch will be constructed in Q2/Q3 (Q2/Q3 2020).
8. 2019 – [related to HLF] monitor road settlement around 0+650 of the interceptor ditch alignment. Currently this section requires some additional fill to facilitate truck traffic. Additional settlement could impact the functionality of the interception ditch. Additional settlement or failure is unlikely to impact other infrastructure, due to adequate setback from the toe of the slope.
    a. VGC response: Most of this area will be grubbed and regraded in preparation for the Phase 1 B Expansion. The outfall for the interceptor ditch will be constructed in Q2/Q3 (Q2/Q3 2020).
9. 2018&2019 - VGC should assign a qualified, on site, individual to be responsible for monitoring and documentation of any mass earth structures that have significant risks in the case of a failure. The individual should develop a standard operating procedure for the monitoring and risk management of these structures. This individual should be responsible for coordination with a qualified professional to review monitoring data for concerns and trends, if they are not qualified themselves.
    a. VGC response: VGC response: Monitoring of structures is done by the Technical Services department working closely with the EOR for the areas and while following standard operating procedures (on-going).
10. 2018&2019 - VGC should continue to assign individuals to document and be responsible for the monitoring and construction review to determine if such structures are constructed in accordance with design. any variations between design documents and final construction should be included in the final record drawings.
    a. VGC response: Monitoring of structures including construction review to meet design specs is done by the Technical Services department working closely with the EOR for the areas. Construction reports and as-built drawings document variations or minor modification from IFC designs (on-going).

11. 2018&2019 - Any finalized construction of mass earth structures should include a final construction report that includes any operational and maintenance requirements (if any) to ensure stability of the structure.
    a. VGC response: As per both the QML and WUL, the EOR will provide a final construction report, which includes requirements for maintenance as needed, once the structures are complete (ongoing).
12. 2018&2019 - VGC should consider a monitoring program to assist in early warning and detection of any movements in mass earth structures. Such a program might use permanent survey points, slope inclinometers, piezometers, or other tools to measure internal/external movements and pore water pressures. Such a monitoring program should be developed with the assistance of and be implemented with the oversight of a qualified professional.
    a. VGC response: Monitoring programs have been developed, are in use and undergoing further refinement by the technical services department with the oversight of a qualified professional (Q2 2020).

5.4.3 Reporting Adequacy, Compliance and Recommendations

Table 60 summarizes the compliance gaps and/or deficiencies identified with the Heap Leach Facility monitoring program.

The notable non-compliance is the absence of documented routine (visual) inspections. These inspections should be recorded and documented as per the EMSAMP 2020-01 document. There is also a lack of consistency between the piezometer instruments listed in the EMSAMP documents (2019-01, 2020-01) and those with reported water tables in the 2019 annual report and June 2020 monthly report. The piezometers listed in EMSAMP 2019-01 without reported water levels in the 2019 annual report are: MW10-AG6, BG-BGC11-26, MW19-HLF2a, MW19-HLF2b. MW10-AG3a is listed in EMSAMP 2020-01 and is not documented in the June 2020 monthly report. Stantec is assuming the following piezometers listed in EMSAMP 2020-01 were not installed prior to June 30, 2020: MWXX-HLF2a, MWXX-AGR6 MWXX-HLF2b, MWXX-HLF3a, MWXX-HLF3b, MWXX-HL4a, MWXX-HLF4b.

Of the 12 physical stability recommendations, recommendation #1, 3, and 12 are scheduled for completion within the scope of this environmental audit. The remaining recommendations are listed as ongoing, scheduled for future implementation, or listed as complete by VGC.

- Recommendation 1 is addressed with the official handover package from construction to operations (Construction release, C1 Certification). Stantec assumes this handover package contains all relevant foundation and construction designs and accepted by a qualified professional.
- Recommendation 3 is not addressed in the 2020 monthly reports, and review of the North Toe Ditch has not been documented in the available reports.
- Recommendation 12 is addressed with the installation of piezometers P1, P2, and P3 through the HLF embankment, in addition to an inclinometer casing for monitoring deformation. Available documentation does not present inclinometer casing readings.

Table 60 Heap Leach Facility Monitoring Program Compliance and Recommendations

Compliance Gaps and/or Deficiencies	Recommendation/Corrective Action
Routine (visual) inspections (daily, weekly) not reported.	Include an appendix in Annual and Monthly reporting that summarizes the observations from these visual inspections.
Embankment Piezometers P1, P2, P3 appear to be collecting data continuously but data not reported monthly.	Provide continuous data plots of embankment piezometers P1, P2, P3 in monthly reports. Include these instruments in next EMSAMP revision.
Partial reporting of piezometer readings as listed in EMSAMP 2019-01 in 2019 annual report.	Confirm HLF piezometers as listed in EMSAMP 2019-01 are reporting groundwater readings, include in monthly and annual reporting. Provide reasoning for missing groundwater level readings.
Partial reporting of piezometer readings as listed in EMSAMP 2020-01 in June 2020 monthly report.	Confirm HLF piezometers as listed in EMSAMP 2020-01 are reporting groundwater readings, include in monthly and annual reporting. Provide reasoning for missing groundwater level readings.
Existing monitoring methods (slope inclinometer casing) implemented on site do not state a monitoring frequency.	VGC to consider discrete reading frequencies for slope inclinometer casing, specify in EMSAMP documentation.
Follow up and close out of physical stability recommendation 3 not documented in annual or monthly reports.	Provide documentation detailing the follow up and response actions for addressing recommendation.

6.0 SOLID WASTE AND HAZARDOUS MATERIALS MANAGEMENT

6.1 DOCUMENTS REVIEWED

Documents in Table 61 were reviewed for the solid waste and hazardous materials management section of the audit. As this aspect of site environmental management is carried out in the field and documented by hand written reports required at various frequencies (daily, weekly, monthly, quarterly), Stantec modified the audit approach to review representative inspection logs and reports (Table 62). This review was supported by an interview with the site Environmental Superintendent regarding oversight of this program (personal communication, B. Bowden, September 23, 2020). Table 63 was prepared in consultation with VGCs site services department.

Table 61 Solid Waste and Hazardous Materials Management Document Reviewed

Document	Version Reviewed	Sections applicable during construction phase	Sections applicable to Operations phase
Solid Waste and Hazardous Materials Management Plan	2017-02	All sections	All sections

Version 2017-01 of the Solid Waste and Hazardous Materials Management Plan was approved on March 17, 2017. Version 2017-02, approved in July 2017, incorporated revisions made to update the site layout, and to support applications for permits under the *Environment Act* (i.e. Waste Management Permit, Air Emissions Permit, Burning Permit, Permit/certificate for Transport of Dangerous Goods and Land Treatment Facility Permit). Version 2017-02 was the approved plan effective during the audit period.

6.2 PLAN IMPLEMENTATION

Implementation of the Solid Waste and Hazardous Materials Management Plan (during construction and operations) was and is carried out through scheduled inspections and related documentation of inspections. Field inspections are carried out, according to the frequencies specified in the Solid Waste and Hazardous Materials Management Plan by VGC Environmental Technicians, and reports are reviewed by site VGC Environmental Coordinators for items that require corrective action by operations staff or senior management. Corrective actions are tracked in a dedicated log and updated upon completion.

Stantec reviewed inspections records shown in Table 62.

Table 62 Solid Waste and Hazardous Materials Management Inspections Records Reviewed

Waste Category	Frequency	Record	Record Date/Period

Wet/Dry Waste	As Required	Incinerator Operations Log	July 26–Sept 1, 2020
Wet/Dry Waste	Weekly	Incinerator Maintenance Log	May–June 2019
Hazardous Waste	Daily	Hazardous Substance Inspection Checklist (Fuel Stations/Propane Tanks	Week of July 21, 2020
Solid Waste/Fuel	Weekly	Environmental QA/QC Inspection (includes inspection of site waste management, fuel management and spill kits)	Week of July 10 and 27, 2020
Brush	As Required	Control Burn Log	January–August 2020

Table 63 below provides the audit results of the solid and hazardous waste management program.

Table 63 Solid Waste and Hazardous Materials Management Program Implementation

Solid Waste and Hazardous Materials Storage Areas	Inspections[a]		Record Keeping[b]	
	Frequency	Compliance (Yes/No)	Frequency	Compliance (Yes/No)
Waste Storage Areas	Daily	Yes	n/a	Yes
Landfill Area	Weekly	Yes	As Required	Yes
Incinerator	Monthly or As Required	Yes	As Required Per Use	Yes
Incinerator Stack Tests	n/a	n/a	Quarterly or to supplier recommended frequency	n/a[d]o
Waste Oil Burner	Monthly or As Required	Yes	Monthly or Each Inspection	Yes
Land Treatment Facility	Quarterly or As Required	Yes	Quarterly or Each Inspection	Yes
Used Tire Storage Area (Truck Shop)	Quarterly or As Required	Yes	Quarterly or As Required	Yes
Haz.Mat. & Special Waste Storage Areas	Weekly or As Required	Yes	Monthly or As Required	Yes
Open Burning Area	n/a	Yes	As Required Per Use	Yes
Spills and Leaks	n/a	Yes	See audit section 4.0	Yes

NOTES:

[a] Inspection requirements are as set out in the plan and permits

[b] Record keeping requirements are as set out in the plan and permits

[c] As required when wastes are disposed of and when cells are activated or closed

[d] As per the incinerator supplier recommended frequency, the incinerator did not require at stack test during the audit period.

6.3 REPORTING ADEQUACY, COMPLIANCE AND RECOMMENDATIONS

Based on the organization and inspection details in the various logs and inspection reports kept by VGC, Stantec confirms that implementation of the solid waste and hazardous materials management program was carried out adequately during the audit period.

Regular inspections are conducted by a Yukon Government (YG) Inspector and include inspection of solid waste and hazardous waste management areas. There were no corrective actions related to solid and hazardous waste management required by the YG Inspector during the audit period.

Table 64 Solid and Hazardous Waste Management Plan Compliance and Recommendations

Compliance Gaps and/or Deficiencies	Recommendation/Corrective Action
None	

7.0 SPILL RESPONSE

7.1 DOCUMENTS REVIEWED

Documents in Table 65 were reviewed for the spill response section of the audit. Spill response training, procedures and reporting measures were audited against the 2017-02 version of the Spill Response Plan as it was the approved version for the audit period.

Table 65 Spill Response Plan Documents Reviewed

Document	Version Reviewed	Sections applicable during construction phase	Sections applicable to Operations phase
Spill Response Plan	2017-02	All sections	N/A
Water Licence QZ14-041 Quartz Mining License QML-0011 2018 Annual Report	N/A	3.10 - Spills and Accidents and Appendix U – Spill Response Forms	N/A
Water Licence QZ14-041 Quartz Mining License QML-0011 2019 Annual Report	N/A	3.12 - Spills and Accidents and Appendix X – Spill Response Forms	NA
Type A Water Use License QZ14-041-1 Monthly Report, Reporting Period: January 2020 to June 2020	N/A	N/A	All sections

Table 66 below provides the audit results of the spill response program.

7.2 SPILL RESPONSE PLAN IMPLEMENTATION

Table 66 Spill Response Plan Implementation

Year	No. of Reportable Spills	Response Procedures Implemented	Reporting	Training and Prevention
2018	• 9 Septic • 3 Coolant	• Spill response procedures implemented as per the Spill Response Plan • Construction of Land Treatment Facility planned for 2019	• Spills reported to Yukon Spill Report Line	• Spill response training was a component of site orientation for all staff • Spill prevention was carried out through routine vehicle and equipment maintenance and pre-operation inspections
2019	• 1 Diesel • 4 Coolant • 1 Waste Oil • 3 Hydraulic Oil	• Spill response procedures implemented as per the Spill Response Plan • Land Treatment Facility (LTF) constructed in summer of 2019 • Excavated contaminated materials were transferred to the LTF	• Spills reported to Yukon Spill Report Line • Spills reports sent to the Yukon Water Board and the Dept. of Energy, Mines and Resources	• Spill response training was a component of site orientation for all staff • Spill prevention was carried out through routine vehicle and equipment maintenance and pre-operation inspections
2020	• 1 Diesel • 5 Coolant • 3 Hydraulic Oil	• Spill response procedures implemented as per the Spill Response Plan • Excavated contaminated materials were transferred to the LTF	• Spills reported to Yukon Spill Report Line • Spills reports sent to the Yukon Water Board and the Dept. of Energy, Mines and Resources	• Spill response training was a component of site orientation for all staff • Spill prevention was carried out through routine vehicle and equipment maintenance and pre-operation inspections

7.3 REPORTING ADEQUACY, COMPLIANCE AND RECOMMENDATIONS

Spill training and prevention, response and reporting was carried out according to the Spill Response Plan effective during the audit period (version 2017-02). All reportable spills were reported to the Yukon Spill Line, the Department of Energy, Mines and Resources and the Yukon Water Board within the required timeframe. VGC has notified FNNND Lands and Resources Manager of reportable spills (by email) since November 2019 (personal communication, L.Rear, September 29, 2020). An FNNND site Environmental Monitor also assists with liaising with FNNND regarding spills by providing spill status updates and carrying out inspections.

All reportable spills, with the exception of the spill (control pond discharge to ground) described in Section 3.2.3 (Table 19) are considered closed by the YG Inspector (i.e. remediation is complete). VGC has completed corrective actions regarding the first spill and expects that the incident will be closed by the YG Inspector within 2020. VGC conducted excavation and sampling operations from February to April to remediate the diesel spill. Final soil samples taken from the excavation floor and walls show that soil quality meets the Yukon Contaminated Sites Regulation standards for commercial and industrial soils. A 0final report describing the incident, remediation operations and soil sampling results was submitted to the Yukon Government on May 28, 2020.

VGC provided adequate responses to spills and is compliant with reporting requirements and personnel training specified in the Spill Response Plan.

Note that:

- VGC maintains records of preventative maintenance and all work orders in a dedicated database named PRONTO Xi. This software is used for tracking assets, work orders, and procurement,
- Light Vehicles are inspected prior to use.
- Both reportable and non-reportable spills, are tracked in a log specifying key information such as date, spill type, quantity, location, cause, mitigations employed and clean-up status.

Table 67 Spill Response Program Compliance and Recommendations

Compliance Gaps and/or Deficiencies	Recommendation/Corrective Action
None	None

8.0 SUMMARY AND RECOMMENDATIONS

Stantec has conducted this audit and prepared this report with the objective of assessing whether VGC's environmental management plans and regulatory controls set out in the Quartz Mining Licence (QML)-0011 are implemented in and about the mine, and that the environmental management systems and controls are functioning as intended.

Stantec has audited VGCs implementation of environmental and physical stability monitoring programs against versions of the EMSAMP, Water Management Plan and Wildlife Protection Plan in effect during the mine construction (July 1, 2018–March 16, 2019) and operations phases (March 17, 2019–June 2020) for compliance with these plans and with regulatory standards and thresholds set out in these plans.

Overall the implementation of VGC's environmental management system has been adequate and has demonstrated continual improvement throughout the audit period. Reports and data reviewed do not indicate there is any immediate concerns for water quality and quantity, aquatic habitat, air quality, soils, vegetation, wildlife and wildlife habitat, stability of physical structures and waste management.

Gaps, deficiencies and recommendations for corrective actions and improvements discussed above are shown in Table 68 for all disciplines. Stantec noted that there were some common themes with regard to deficiencies across several monitoring programs:

- Reporting monitoring activities and results without sufficient supporting data and information (e.g., validated datasets, statistical analyses, results compared against relevant standards or guidelines)
- Inconsistent implementation and/or documentation of QA/QC monitoring programs,
- Equipment malfunction resulting in gaps in datasets (i.e. climate, hydrology),
- Missing rationale in reports for gaps in implementation of the monitoring schedule,
- For monitoring programs with threshold standards or objectives, statistical analyses were not performed to determine statistically significant changes occurred to the receiving environment (i.e., air quality, hydrology, surface water quality, groundwater, soils, vegetation)
- Lack of adaptive management responses or rationale for not implementing adaptive management measures.

With respect to the last two deficiencies, the EMSAMP lacks quantitative adaptive management thresholds for certain monitored parameters/functional areas that would provide clear triggers for implementation of management actions. Stantec recommends that VGC work towards setting up statistically based sampling plans to help inform development of some adaptive management trigger thresholds into the next version of the EMSAMP.

Table 68 Recommendations for Improvements and Corrective Actions

Discipline	Compliance Gaps and/or Deficiencies	Recommendation/Corrective Action
Atmospheric Environment		
Climate	Incomplete climate data recorded between 2018–2020 during the construction phase and portions of the operations phase of mining	• Keep spare climate station sensors on-site for rapid deployment should sensors/equipment begin to fail or data gaps are noted. • Append annual QP climate stations' calibration report/records to annual report.
Air Quality	Inconsistency in data reporting	Submit validated datasets with all annual and quarterly reports, and compare monitoring results to AQC
Water Resources		
Surface Water Hydrology	EMSAMPs reference RISC (2009) as the document which was used to develop hydrology data collection. This document is out of date; Version 2.0 of that document was published in 2018.	The EMSAMP surface water hydrology program should be updated to reflect Version 2 of the hydrometric standards (RISC 2018).
	Insufficient documentation of revised sampling approaches for various stations based on data collection challenges or change in phase (e.g., monitoring frequency, monitoring type).	Explicitly document and provide rationale for changes to station monitoring approach or regime where applicable, and indicate plans for revising applicable EMSAMP sections.
	Prior to the 2020 monthly reports, there was insufficient documentation of periods where "discharging" or "dewatering" was occurring; this informs the requirement for monitoring at several stations.	Based on review of monthly reports from 2020, it appears that VGC has improved this. The 2020 annual report, and future monthly and annual reports, should continue to document periods of discharging or dewatering at applicable locations throughout site to inform the need for monitoring at applicable sites.
	For automated stations, winter and freshet time periods were not clearly delineated as to allow for demonstration of compliance as outlined in the EMSAMPs.	Recommend one of <u>two</u> changes: 1. Document dates of freshet start and logger deployment each year in the monthly and annual reports to delineate winter, freshet, and open water periods (each of which have different monitoring requirements), <u>or</u> 2. Update the EMSAMP requirements for the freshet period to better acknowledge i) the subjectivity of determining freshet period and/or ii) the difficulty of obtaining flow measurements during freshet flows.
	Prior to the 2020 Monthly Reports, not all of the monitoring stations outlined in the EMSAMPs are discussed/addressed in the annual reports.	Discuss/address all monitoring stations listed in the applicable EMSAMP, noting the status (e.g., active, not active) of each. Include data for all active monitoring stations (automated, manual) in reporting.
	Quarterly manual monitoring stations are not completed at consistent times of the year.	Clarify "quarterly monitoring" schedule, with backup sampling protocols if conditions are unsafe.
	The EMSAMPs list general tasks to be completed at each field visit (Section 2.3.1). Completion of these tasks was discussed in general in annual reports but documentation was not provided per requirements of RISC (2018).	Provide summary information regarding the completion of the tasks associated with each field visit in the annual reports, and/or indicate (in reporting) that these data have been documented internally and are available upon request.
	Logger malfunctions resulted in the loss of partial or full open water season datasets at several stations.	As outlined in the general tasks in the EMSAMPs (Section 2.3.1), download logger data either at every monitoring visit, or at an appropriate regular frequency, to minimize data loss and rectify issues.
	Sites experienced flows which were too high to safely obtain a flow measurement. The flows experienced in June are part of the seasonal range in flows and should be captured as part of the rating curve development or verification.	If possible, considering a reasonable level of effort and resources, safe flow measurement methods and procedures should be developed and implemented to capture high flows which are essential to development of reliable rating curves. If no method is safe considering reasonable levels of effort and resources, it should be stated in the reporting as such (e.g., as was completed in 2020 Monthly Reports) with a rationale, and the rating curves identified as valid below an identified threshold.
	QA/QC related to field and analytical tasks (e.g., benchmark surveys, station condition, field processes, photos, equipment calibration) were not documented.	Recommend that QA/QC processes in accordance with Section 2.3.1 in EMSAMP2018-01, EC 2001, RISC 2018 are documented and provided in reporting.
	Flow records are in partial compliance due to lack of winter and freshet measurements and/or logger malfunctions.	Implement monitoring program as outlined in applicable EMSAMP , or provide rationale for implementation not being possible in reporting and amend EMSAMP.
	For automated stations, it is not clear what the manual monitoring frequency is during the freshet in EMSAMP2020-01.	Clarify this in future EMSAMPs/reporting.
	It is not clear in the EMSAMPs if the adaptive management performance thresholds are applicable to manual monitoring stations.	Clarify this in future EMSAMPs/reporting.

Table 68 Recommendations for Improvements and Corrective Actions

Discipline	Compliance Gaps and/or Deficiencies	Recommendation/Corrective Action
Surface Water Hydrology (cont'd)	Average monthly flows were used instead of median monthly flows (as specified in Table 2.4-1 in EMSAMP2019-01 and EMSAMP2020-01) in evaluation of performance thresholds.	Use median monthly flows in evaluation of performance thresholds as outlined in EMSAMP.
	The method of evaluation of performance thresholds for adaptive management was not completed in accordance with quantitative procedure outlined in EMSAMPs.	Apply the quantitative evaluation protocol outlined in the EMSAMPs for performance thresholds for adaptive management at relevant monitoring locations.
	The evaluation of performance thresholds for adaptive management was not completed for all automated stations listed in the EMSAMPs.	Perform evaluation of performance thresholds for adaptive management for all relevant automated stations as outlined in the EMSAMP.
	Adaptive management responses were not clearly performed following exceedance of performance thresholds.	Implement and document the adaptive management responses if performance thresholds exceeded at relevant monitoring locations as outlined in EMSAMPs.
	Full documentation of completion timelines and dates for key water management infrastructure not documented.	Include specific completion dates in annual reporting for all key water management components.
Surface Water Quality	2018 Annual Report – Rationale for missing sample events	Include a footnote for each table describing missing data rationale (e.g., frozen water)
	2018 Annual Report – QA/QC results not described	Include text in the report body describing the results of the QA/QC program (e.g., number of QA/QC samples, summary of results, DQOs, and corrective actions for failed DQOs). Also include these data in the database (Appendix D) or tabulated form.
	2019 Annual Report – Water Quality Results	Include a tabulated form of all water quality data including QA/QC samples
	2019 Annual Report – QA/QC results not completely described	Include results of duplicate sample results as well as total amount of QA/QC samples collected and summarize data in a tabulated form.
	2019 Annual Report – Quality of plots	Improve quality of plots so axes can be read (Appendix F)
	2019 Annual Report – Statistical and trend analysis	For WQO exceedances, the EMSAMP commits VGC to compare values to baseline to determine if any significant changes have occurred to the receiving environment water quality, complete a trend analysis, and include methods and results in the report. We recommend an adjustment to this commitment with the goal of an achievable exercise for this project (e.g., monitor over x number of sampling events to determine if it is a real change in water quality)
	2019 Annual Report – Cyanide species	Include cyanate and thiocyanate in the analytical suite for compliance with EMSAMP 2019-01
	2019 Annual Report – AMT Responses	The EMSAMPs requests VGC to describe in detail the response for any AMT exceedances. As per the Water Management Plan, sampling frequency will increase accordingly (next higher order) to better characterize trends.
	2020 Monthly Reports – QA/QC	Report on QA/QC samples collected monthly and include results in the report body including laboratory QA/QC results. Frequency of QA/QC samples are to meet >10% ratio of QA/QC samples to total water quality samples. *(Stantec understands that currently, Field blanks are being collected and are documented in the 2020 monthly report water quality appendices.)*
	2020 Monthly Reports – AMT Responses	For WQO and AMT exceedances, the EMSAMP commits VGC to compare values to baseline to determine if any significant changes have occurred to the receiving environment water quality, complete a trend analysis and include methods and results in the report. We recommend an adjustment to this commitment with the goal of an achievable exercise for this project (e.g., monitor over x number of sampling events to determine if it is a real change in water quality). We also recommend to include a detailed AMT response. As per the Water Management Plan, sampling frequency should increase accordingly (next higher order) to better characterize trends.

Table 68 Recommendations for Improvements and Corrective Actions

Discipline	Compliance Gaps and/or Deficiencies	Recommendation/Corrective Action
Groundwater Quantity and Quality	Groundwater quantity and quality monitoring from some wells was performed less frequently than the schedule prescribed in the relevant EMSAMPs.	• A number of factors, including those beyond the control of VGC may result in a scheduled monitoring not being performed (e.g. weather, equipment malfunction, unsafe condition, construction, pandemic). The monthly and annual reporting needs to provide the rationale for missed monitoring in tabular format and if any corrective action will be taken. • The annual and monthly reporting should include the installation and decommission date, and operational status of monitoring wells. • A maintenance log should be maintained for any maintenance or repairs made to logs and reported in the annual report.
	EMSAMP (2020-01, S. 4.5) states that groundwater levels will be compared to predicted (modeled) effects due to the loss of recharge in the HLF and WRSA. However, trends were not quantitatively compared with predicted (modelled) effect in the 2019 Annual Report or 2020 Monthly Reports. It is unclear if trends are consistent with the predicted thresholds or if the model requires calibration based on field observation.	• Compare measured groundwater levels to predicated effects in assessment. • Calibrate modeled adaptive management thresholds for groundwater quantity based on field observation.
	EMSAMP (2020-01, S. 4.4) states that groundwater hydrographs will be compared with existing baseline data to assess potential change associated with the Project. The 2019 Annual Report in S. 3.4.3.1 presents a qualitative discussion of the observed changes in groundwater quantity associated with the construction and operation of mine. This discussion is not presented in the context of modelled effect or groundwater quantity indicators.	Present further assessment of the change in groundwater quantity associated with the Project. The assessment would be strengthened if a list of groundwater quantity indicators and associated triggers were developed and utilized in the operation stage.
	EMSAMP (2020-01, S. 5.2) presents groundwater quality parameters to be analyzed in the monitoring program. Review of groundwater quality records in the 2019 Annual Report suggests some samples were not analyzed for the full suite of parameters.	• Review water licence conditions and lab records to confirm if required parameters were analyzed. • Include all analyzed parameters and lab reports in annual reporting.
	• EMSAMP (2020-01, S. 5.3.2 and 5.3.3) describes the field QA/QC program for groundwater quality monitoring, which includes collection and analysis of trip blanks, field blanks and duplicates. • The 2019 Annual Report does not present information on the implementation of the QA/QC program. Appendix K of the 2019 Annual Report (Groundwater Quality Data) does not contain records of the QA/QC samples.	Present information on the implementation of the field QA/QC program and the results of the QA/QC program in the annual reports.
	EMSAMP (2020-01, S. 5.3.3) states that plots of concentrations of regulated constituents and key indicator parameters versus time will also show applicable standards and baseline concentration. Plots in the 2019 Annual Report do not contain the applicable standards and baseline concentration.	Present applicable standards and baseline concentration in the groundwater water sample constituent concentration plots for the annual report.
	EMSAMP (2020-01, S. 5.4.1) describes that trends in groundwater quality will be examined to potentially inform management actions. The existing analysis of the water quality trend in the 2019 Annual Report contains discussion of the trend but in some cases does not provide rationale for the observed trends.	• Present groundwater quality trend analysis in monthly and annual reporting to confirm that trends are being monitored appropriately. • Present groundwater quality trend assessment in the context of baseline water quality and predicted effects of the Project. • Provide greater logical link between discussion of observed groundwater quality trend and proposed adaptive management actions (e.g., no action).

Table 68 Recommendations for Improvements and Corrective Actions

Discipline	Compliance Gaps and/or Deficiencies	Recommendation/Corrective Action
Geochemistry	2018 Annual Report – QA/QC samples	Collect duplicate samples of construction monitoring samples and include discussion of results including relative percent differences in report body and append dataset.
	2018 Annual Report – Report NPR values	Report NPR values in addition to NP:AP for better interpretation of results. This was corrected in the 2019 Annual Report.
	2018 and 2019 Annual Report – Sample type description	Include details on the material sample collected (i.e., surficial, or bedrock) and why these samples were collected (i.e., 1 per 100,000 m^3 material moved or distinct geological unit).
	2018 Annual Report – Appended analytical data	Include all analytical data in appendices. Missing: acid base accounting, rinse pH, and electrical conductivity.
	2019 Annual Report – Appended analytical data	Include field barrel analytical data in appendices.
	2019 Annual Report – QA/QC samples	Collect duplicate samples of construction and operational monitoring samples, include discussion of result (including relative percent differences) in report body, and append dataset.
	2019 Annual Report – Details of blast rounds	Include details of blast rounds so compliance with EMSAMP can be evaluated. Include geological logs of blast holes.
	2019 Annual Report – Monthly seep sample survey	Include details of monthly seep sample survey in report.
	2019 Annual Report – Shake flask extraction size fraction	Check with off-site laboratory (ALS) if shake flask extraction is conducted on <2 mm and <1cm size fraction.
	2020 Monthly Reports – QA/QC samples	Collect duplicate samples of construction monitoring samples and include discussion in report body and append dataset. For operational samples, include relative percent differences and discuss results in the report body. Consider re-naming duplicate samples to not include parent sample name. Explicitly describe which samples are duplicates of respective parent sample.
Aquatic Environment		
Stream Sediment	Field methods – use of stainless-steel trowel to collect samples	Samples collected for analysis of metal concentrations should be collected with plastic utensils to avoid potential contamination
	Field methods – out of date field method guidelines	Methods should be consistent with updated BC Field Sampling Manual from 2020 and with BC's "Water and Air Baseline Monitoring Guidance Document for Mine Proponents and Operators" (BC MoE 2016)
	Field methods – site documentation	Water depth, sediment texture and color, and presence of debris, biofilms, odours, or sheens should be described at each site. Sites should be photographed showing upstream, downstream, obliques, banks, riparian vegetation, and substrates
	Lab methods – screening equipment	Laboratories should be required to screen sediment samples for particle size distribution and <63 µm fraction using non-metallic screens to avoid potential contamination
	Reporting – units	Clearly document that guidelines and concentrations are reported as dry or wet weight
	Reporting - guidelines	Sediment quality guideline for selenium is only an "alert" concentration and not a working sediment quality guideline
	Reporting - guidelines	Clearly indicate whether guidelines for specific parameters are from CCME and/or BC WQG
	Reporting – detection limits	Reports should identify results that are below detection limits (e.g., boron and silver)
	QA/QC – field methods	Clearly document the field QA/QC procedures followed
	QA/QC – field duplicates	Every third or fifth sample should be "field split" to assess sampler and laboratory QA/QC as per BC MoE 2016
	QA/QC – laboratory detection limits	Reports should describe instances where laboratory detection limits are not ≤ $1/5^{th}$ of the respective sediment quality guideline or ≤ $1/5^{th}$ of the lowest background concentration
	Reporting – lack of statistical analyses	Reports should include statistical comparison of data to pre-construction baseline data as required by EMSAMP
	Reporting – lack of discussion of need for adaptive management due to PEL exceedances for arsenic	Conduct statistical analyses comparing contemporary and pre-construction data to identify any significant differences and conduct arsenic speciation analyses on future stream sediment samples

Table 68 Recommendations for Improvements and Corrective Actions

Discipline	Compliance Gaps and/or Deficiencies	Recommendation/Corrective Action
Benthic Macroinvertebrates	Study design – insufficient sites in reference or upstream areas as per EEM guidance	Identify and begin sampling in second reference stream to bring the number of unaffected sites up to 5 as recommended in Environment Canada's EEM guidance; a minimum of three reference sites are recommended in BC's Water and Air Quality Baseline Monitoring Guidance Document. (*Stantec understands that VGC is currently preparing an Environmental Effects Monitoring plan for submission to Environment and Climate Change Canada in 2021 that will address this recommendation.)*
	Study design – number of appropriate replicate numbers is unknown	Conduct power analysis on existing data to determine the number of replicate samples required to provide sufficient data to determine statistically significant differences between sites and between years given known variability in benthic communities. Without a power analysis, the default number of replicates per site should be increased to 5. (*Stantec understands that VGC is currently preparing an Environmental Effects Monitoring plan for submission to Environment and Climate Change Canada in 2021 that will address this recommendation.)*
	Field QA/QC procedures – not *a prior* criteria for sample appropriateness as required by EEM	Develop *a priori* criteria and apply to next survey (*Stantec understands that VGC is currently preparing an Environmental Effects Monitoring plan for submission to Environment and Climate Change Canada in 2021 that will address this recommendation.)*
	Lab QA/QC procedures and results – not provided in report or appendices	Provide lab QA/QC procedures and results in appendix
	Data analysis - Missing community metrics required in EMSAMP (i.e., family density and richness, Simpson's evenness, and Bray-Curtis)	Include all community indices identified in EMSAMP
	Data analysis – missing statistical analyses comparing sites and contemporary data to pre-construction data	Conduct the required ANOVAs and multiple comparison tests as required by EMSAMP (e.g., append appropriate statistical analyses in excel format) and EEM for BACI study design. (*Stantec understands that VGC is currently preparing an Environmental Effects Monitoring plan for submission to Environment and Climate Change Canada in 2021 that will address this recommendation.)*
	Reporting – only qualitative comparisons between sites and years discussed	There is sufficient data from sites and between years to conduct quantitative statistical analysis to determine significant difference between impact and reference sites and trends between years.
	Reporting – no discussion of need for adaptive management actions; no statistical analyses performed to inform adaptive management	Discuss adaptive management considering quantitative analysis of site data and trend analysis
	Reporting – no indication that results are site averages in the tables	Clearly identify what data in tables represents
	Reporting – no reference for Pacific Salmon Federation rating of "good quality" based on EPT taxa in the 2018 annual report	Provide all references in report
	Reporting – incorrect identification of "fair" based on HBI to Site W26 in 2018 annual report	Incorporate quality and independent review into reporting structure
	Reporting – no analysis or discussion of environmental variables, fish results, or outlier effects on benthic invertebrate results as required by EMSAMP	Discuss all requirements of the EMSAMPs in the annual reports.
Fish and Fish Habitat	Field methods - Fish and fish habitat surveys conducted in September instead of July or August when fish communities are likely more stable and fish sampling is more efficient	Although not a deficiency of the annual monitoring programs, sampling should be conducted in summer when fish community is most stable and sampling efficiency is highest.
	Field methods – fish condition was not documented as required by the EMSAMPs	Conduct external examinations and fill in standardized necropsy form for each fish or sub-sample of fish of each species captured
	Field methods – single pass open sites	Although not required by the EMSAMPs and not a deficiency of the annual monitoring programs, multi-pass depletion estimates in closed sites would provide more accurate and repeatable results and be better for long-term monitoring and statistical analyses
	Field methods – insufficient numbers of fish captured for EEM program at current effort levels	The EMSAMP references that a minimum of 100 fish is recommended for non-lethal sampling according to EEM technical guidance (Environment Canada 2012). Sampling in summer and using multi-pass electrofishing methods may increase numbers of fish available for capture

Table 68 Recommendations for Improvements and Corrective Actions

Discipline	Compliance Gaps and/or Deficiencies	Recommendation/Corrective Action
Fish and Fish Habitat (cont'd)	Reporting – no mention of need for fish tissue study	Even if no mine effluent discharge occurred, reports should indicate whether a fish tissue study is required or not as part of MDMER monitoring; the EMSAMP indicates that a fish tissue study is required if the concentration of effluent in the exposure area was >1% in the area within 250 m of the final discharge point but the 2019 annual report did not indicate if this criterion was met. (*Stantec understands that VGC is currently preparing an Environmental Effects Monitoring plan for submission to Environment and Climate Change Canada in 2021 that will address this recommendation.)*
	Reporting – no recommendation for indicator fish species for future EEM program	Although not required by the EMSAMPs, the authors should provide a recommendation for a suitable indicator fish species for monitoring potential effects of future mine effluent discharges. Given the fish community present at the site, slimy sculpin would appear to be at least one of the indicator species chosen for future EEM programs. (*Stantec understands that VGC is currently preparing an Environmental Effects Monitoring plan for submission to Environment and Climate Change Canada in 2021 that will address this recommendation.)*
	Reporting – no mention of adaptive management trigger or threshold exceedances	Reports should specify whether any of the adaptive management thresholds in the EMSAMPs were exceeded and if any of the adaptive management measures were required and implemented each year
Terrestrial Environment		
Vegetation and Soils	N/A	Develop statistically-based trigger for determining 'significant' increases in metals (arsenic, cadmium, chromium, mercury and lead) concentrations in vegetation plot samples.
	Missing duplicate vegetation sample analysis in 2018 and 2019	Collect duplicate samples if sufficient vegetation is available
Wildlife Protection	Specific information on wildlife incidents is not provided in the Wildlife Records Program	Provide a summary of all wildlife incidents resulting in human-wildlife conflict, wildlife fatality or removal, or nest disturbance in the annual reports along with a summary of the root cause(s). Any corrective actions should be documented.
	There is no formal documentation of the wildlife protection monitoring in the Heap Leach Facility Area and Events Pond Monitoring Program	Include the results of the monitoring program in the annual report or in a separate report.
Geotechnical Stability of Infrastructure and Facilities		
Permafrost	Regular visual Inspections not reported.	Include an appendix in Annual and Monthly reporting that summarizes the observations from regular visual inspections to identify and quantify any deformation associated with melting of permafrost, such as but not limited to, cracks, subsidence, sinkholes, and sloughing on existing foundations and slope overlay permafrost. Summarize those visual inspections executed during the freshet, prolonged rainy periods, and rising trend in any thermistors.
	Prolonged rainy period not quantified.	Define / quantify duration of a prolonged rainy period based on exceedance of design criteria (duration, precipitation volume).
	Freeze/Thaw indices not reported under EMSAMP -2018-01.	Corrective action no longer required because Weather Data Review requirement removed from EMSAMP monitoring program starting June 2019 (EMSAMP 2019-01 and 2020-01).
	Thermistor GT18-09 not read in Q3 of 2019	Provide reasoning for missed reading.
Open Pit	Daily visual inspections not reported.	Include an appendix in Annual and Monthly reporting that summarizes the observations from these daily visual inspections.
	Monthly collection of survey prism data not reported.	Stantec understands there are currently no active prisms installed at the open pit, and VGC is implementing a program scheduled for 2020 to install up to 15 prisms on the1408, 1375, and 1395 benches. Following prism installation, include in Annual and Monthly reports a list of active survey prisms with coordinates (northing, easting, elevation) and deformation readings.
	Piezometers read quarterly instead of monthly in 2018 as required in EMSAMP 2018-01.	Corrective action not required since the piezometer reading frequency is specified as quarterly in subsequent EMSAMP 2019-01, superseding the 2018 requirement and bringing the piezometer reading schedule into compliance.
	Scheduled piezometer readings for Q1 2020 not collected due to COVID-19 related staffing issues.	Assess if datalogger installed in Open Pit piezometer BH-BGC11-73a,b,c collected and stored data for Q1 2020. For remaining piezometer(s), collect data as soon as reasonably practical and provide reading summary or reasoning for data gap in Annual reporting.

Table 68 Recommendations for Improvements and Corrective Actions

Discipline	Compliance Gaps and/or Deficiencies	Recommendation/Corrective Action
Open Pit (cont'd)	Piezometer data not collected in Q2 2020.	Assess if datalogger installed in Open Pit piezometer BH-BGC11-73a,b,c collected and stored data for Q2 2020. For remaining piezometer(s), collect data as soon as reasonably practical and provide reading summary or reasoning for data gap in Annual reporting.
	Piezometers listed in EMSAMP documentation without reported water tables.	Provide reasoning for piezometers with absence of documented water table readings.
	Data for two (2) extensometers installed at open pit not reported.	The EMSAMP documents do not lay out a minimum required monitoring frequency for extensometers installed at the open pit. A qualified personnel should determine a reading frequency for these instruments and should be summarized in the annual reports and compared against established velocity trigger levels.
	Multiple instrumentation listed in EMSAMP documentation that is not currently installed on site (robotic theodolites, TDR cables, slope inclinometers, fixed slope radar, mobile slope radar).	Remove from EMSAMP documentation reference to instrumentation not installed (or planned for installation) on Open Pit.
	Equipment maintenance logs were not provided to back-up data reported in monthly/annual reports.	Provide equipment maintenance logs as supporting documentation to monthly/annual reports.
Materials Storage and Stockpile Management	Visual inspections (daily, weekly, monthly) not reported.	Include an appendix in Annual and Monthly reporting that summarizes the observations from these visual inspections.
	Not all WRSA and stockpile piezometers as listed in EMSAMP 2020-01 have water levels reported in June 2020 monthly report.	Confirm list of active piezometers installed in WRSA and stockpiles, include data in monthly and annual reports. Provide reasoning behind non-documented groundwater tables.
	Multiple instrumentation listed in EMSAMP documentation that is not currently installed on site (Survey Prisms, Inclinometers, Radar / photogrammic surveying).	Remove from EMSAMP documentation reference to instrumentation not installed (or planned for installation) on WRSA and stockpile structures.
	Existing monitoring methods (wireline extensometer) implemented on site do not state a monitoring frequency.	VGC should consider discrete reading frequencies for wireline extensometers, specify in EMSAMP documentation.
	Follow up and close out of physical stability recommendation 4 and 5 not documented in annual or monthly reports.	Provide documentation detailing the follow up and response actions for addressing recommendations.
Heap Leach Facility	Routine (visual) inspections (daily, weekly) not reported.	Include an appendix in Annual and Monthly reporting that summarizes the observations from these visual inspections.
	Embankment Piezometers P1, P2, P3 appear to be collecting data continuously but data not reported monthly.	Provide continuous data plots of embankment piezometers P1, P2, P3 in monthly reports. Include these instruments in next EMSAMP revision.
	Partial reporting of piezometer readings as listed in EMSAMP 2019-01 in 2019 annual report.	Confirm HLF piezometers as listed in EMSAMP 2019-01 are reporting groundwater readings, include in monthly and annual reporting. Provide reasoning for missing groundwater level readings.
	Partial reporting of piezometer readings as listed in EMSAMP 2020-01 in June 2020 monthly report.	Confirm HLF piezometers as listed in EMSAMP 2020-01 are reporting groundwater readings, include in monthly and annual reporting. Provide reasoning for missing groundwater level readings.
	Existing monitoring methods (slope inclinometer casing) implemented on site do not state a monitoring frequency.	VGC to consider discrete reading frequencies for slope inclinometer casing, specify in EMSAMP documentation.
	Follow up and close out of physical stability recommendation 3 not documented in annual or monthly reports.	Provide documentation detailing the follow up and response actions for addressing recommendation.
Solid Waste and Hazardous Materials Management	No recommendation	
Spill Response	No recommendation	

9.0 CLOSURE AND LIMITATIONS

The audit was executed by the Stantec Consulting Limited by qualified professionals in their identified area of competency shown in Table 69.

Table 69 List of Auditors and their Credentials for the Eagle Gold Mine 2020 Environmental Audit Report

Auditors & Reviewers	Credentials	Discipline
Christiane Buie	M.A., Dipl.Tech., EPt	Auditor: Air quality, Climate, Spill response, Solid Waste and Hazardous Materials Management
Jeff Muirhead	M.A.Sc., P.Eng. (Yukon), CISEC	Auditor: Hydrology and Water Management
Xéna McArthur	B.Sc., P.Geo (BC)	Auditor: Surface Water Quality and Geochemistry
Ryan Shao	MSc., P.Geo (BC)	Auditor: Hydrogeology
Brad Horne	M Sc., R.P. Bio. (BC)	Auditor: Aquatic Resources
Andrew Burgin	P.Eng. (BC)	Auditor: Geotechnical Engineering
Christina Ball	B.Sc., R.P.Bio (BC)	Auditor: Wildlife Protection
Ali Naghibi	Ph.D., P.Eng. (BC)	Hydrology Quality Reviewer
Brenda Bailey	Ph.D, P.Geo. (BC)	Surface Water Quality and Geochemistry Quality Reviewer
Alvin Tong	P.Eng. (BC)	Geotechnical Engineering Quality Reviewer
Colleen Bryden	M.Sc., R.P.Bio.(BC)	Wildlife Quality Reviewer
Dan Jarratt	Ph.D, P.Eng. (BC)	Meteorological and Atmospheric Quality Reviewer
Sandra Nelson	M.Sc., R.P. Bio. (BC)	Aquatic Resources Quality Reviewer
Natalie Tashe	M.Sc., P.Ag.,(BC) MCPM	Independent Reviewer

Stantec's Quality and Independent Reviewers have employed Stantec's strict Quality Assurance (QA) and Quality Control (QC) program throughout the audit execution process. The QA/QC program is designed to reduce the potential for errors while providing a systematic review of all facets of the audit. Our Quality and Independent Reviewers have provided critical quality review to verify that key issues were addressed, and that VGC's and Stantec's internal quality control standards were met.

This document entitled Eagle Gold Mine 2020 Environmental Audit Report was prepared by Stantec Consulting Ltd. ("Stantec") for the account of Victoria Gold Corp. (the "Client"). The material in it reflects Stantec's professional judgment in light of the scope, schedule and other limitations stated in the document and in the contract between Stantec and the Client. The audit objective is to report on the findings of the documents reviewed with respect to protection of the receiving environment.

Closure and LImitations
November 30, 2020

The audit recommendations in the document are based on conditions and information existing at the time the document was published and do not take into account any subsequent changes that may happened at the mine. The audit is a desktop assessment and does not include site verification. In preparing the document, Stantec did not verify information supplied to it by others. Any use which a third party makes of this document is the responsibility of such third party. Such third party agrees that Stantec shall not be responsible for costs or damages of any kind, if any, suffered by it or any other third party as a result of decisions made or actions taken based on this document.

APPENDIX Q2

VGC Response to 2020 Environmental Audit Report Findings

Table 1: Third Party Audit Findings and Victoria Gold Response

Discipline	Compliance Gaps and/or Deficiencies	Recommendation/Corrective Action	VGC Response
		ATMOSPHERIC ENVIRONMENT	
Climate	Incomplete climate data recorded between 2018–2020 during the construction phase and portions of the operations phase of mining	• Keep spare climate station sensors on-site for rapid deployment should sensors/equipment begin to fail or data gaps are noted. • Append annual QP climate stations' calibration report/records to annual report.	VGC has received the recommended equipment maintenance and part replacement summary from the supplier of the two site climate stations. Based on the summary, a critical parts procurement and maintenance program will be instituted by the VGC Environmental Department that is further informed by their site experience with the equipment. Relevant calibration and maintenance logs for climate stations will be provided in future annual report.
Air Quality	Inconsistency in data reporting	Submit validated datasets with all annual and quarterly reports, and compare monitoring results to AQC	The scope of the audit did not initially include review of the quarterly reports required under the Air Emissions Permit issued for the Eagle Gold Mine. The quarterly reports prepared up to the effective date of the audit were subsequently provided to the auditor and, as noted in Table 6 of audit, were found to be adequate. VGC will continue to prepare and submit air quality information as required by Air Emissions Permit #60-060. Inconsistency in data reporting identified in the audit were based on annual reports prepared by VGC prior to the receipt of Permit #60-060. Future annual reporting under the QML with respect to air quality will be informed by the detailed quarterly reports which VGC believes will address the findings of the audit.
		WATER RESOURCES	
Surface Water Hydrology	EMSAMPs reference RISC (2009) as the document which was used to develop hydrology data collection. This document is out of date; Version 2.0 of that document was published in 2018.	The EMSAMP surface water hydrology program should be updated to reflect Version 2 of the hydrometric standards (RISC 2018).	In the event that an update to the EMSAMP is warranted in the future, the most current RISC standards will be referenced as recommended.
	Insufficient documentation of revised sampling approaches for various stations based on data collection challenges or change in phase (e.g., monitoring frequency, monitoring type).	Explicitly document and provide rationale for changes to station monitoring approach or regime where applicable, and indicate plans for revising applicable EMSAMP sections.	As noted in Tables 10 to 12 in the audit, VGC's compliance with the frequency and reporting of field programs improved over time and, based on EMSAMP v2020-01, were found to be compliant. VGC has reviewed summary information relating to QA/QC and site task programs contained within monthly reporting for the Wolverine Mine (as these reports are completed by a third-party consultant on behalf of Yukon Government) and will work towards emulating this information in future reporting as necessary. In the event that an update to the EMSAMP is warranted in the future, changes to station monitoring approach or regime will be updated as necessary
	Prior to the 2020 monthly reports, there was insufficient documentation of periods where "discharging" or "dewatering" was occurring; this informs the requirement for monitoring at several stations.	Based on review of monthly reports from 2020, it appears that VGC has improved this. The 2020 annual report, and future monthly and annual reports, should continue to document periods of discharging or dewatering at applicable locations throughout site to inform the need for monitoring at applicable sites.	As noted by the auditor, the deficiency in monthly reporting prior to 2020 has been corrected. Ongoing annual and monthly reports will continue to document periods of discharge as recommended.
	For automated stations, winter and freshet time periods were not clearly delineated as to allow for demonstration of compliance as outlined in the EMSAMPs.	Recommend one of <u>two</u> changes: 1) Document dates of freshet start and logger deployment each year in the monthly and annual reports to delineate winter, freshet, and open water periods (each of which have different monitoring requirements), <u>or</u>	Data logger deployment and winterization are performed when the task is deemed safe for access and when monitoring will have minimal impact from ice conditions. VGC will clearly report the date of the deployment of hydrology loggers in future monthly and annual reports.

Discipline	Compliance Gaps and/or Deficiencies	Recommendation/Corrective Action	VGC Response
		2) Update the EMSAMP requirements for the freshet period to better acknowledge i) the subjectivity of determining freshet period and/or ii) the difficulty of obtaining flow measurements during freshet flows.	Winter and freshet time periods are subjective definitions which has been generally acknowledged by the regulatory bodies involved with the Project to date thus, VGC does not believe an update to the EMSAMP is warranted.
	Prior to the 2020 Monthly Reports, not all of the monitoring stations outlined in the EMSAMPs are discussed/addressed in the annual reports.	Discuss/address all monitoring stations listed in the applicable EMSAMP, noting the status (e.g., active, not active) of each. Include data for all active monitoring stations (automated, manual) in reporting.	As noted by the auditor, the deficiency in monthly reporting prior to 2020 has been corrected. The status of each monitoring station will continue to be provided in monthly reporting and will be provided in annual reports.
	Quarterly manual monitoring stations are not completed at consistent times of the year.	Clarify “quarterly monitoring” schedule, with backup sampling protocols if conditions are unsafe.	Quarterly flow measurement will comply with EMSAMP and Water Use Licence (WUL) timing requirements as safe sampling conditions allow. Should quarterly measurement not occur during the licenced time period, the backup protocol is to sample during the next safest condition.
	The EMSAMPs list general tasks to be completed at each field visit (Section 2.3.1). Completion of these tasks was discussed in general in annual reports but documentation was not provided per requirements of RISC (2018).	Provide summary information regarding the completion of the tasks associated with each field visit in the annual reports, and/or indicate (in reporting) that these data have been documented internally and are available upon request.	Confirmation that tasks associated with each field visit will be provided in future annual reports and that documentation is available upon request. For clarity, documentation is prepared as required by RISC (2018); however, the data was not provided in VGC reporting but has been and will continue to be checked to ensure compliance with the requirements of RISC (2018).
	Logger malfunctions resulted in the loss of partial or full open water season datasets at several stations.	As outlined in the general tasks in the EMSAMPs (Section 2.3.1), download logger data either at every monitoring visit, or at an appropriate regular frequency, to minimize data loss and rectify issues.	Logger data will be downloaded at regular intervals to minimize potential for data loss. VGC plans to install direct read cables in 2021 to allow for more efficient and accurate data transfer and in field determination of the adequacy of data collection.
	Sites experienced flows which were too high to safely obtain a flow measurement. The flows experienced in June are part of the seasonal range in flows and should be captured as part of the rating curve development or verification.	If possible, considering a reasonable level of effort and resources, safe flow measurement methods and procedures should be developed and implemented to capture high flows which are essential to development of reliable rating curves. If no method is safe considering reasonable levels of effort and resources, it should be stated in the reporting as such (e.g., as was completed in 2020 Monthly Reports) with a rationale, and the rating curves identified as valid below an identified threshold.	While VGC endeavors to retrieve all data samples staff safety is the first consideration. Where a flow measurement is omitted due to unsafe conditions this will continue to be stated in reporting.
	QA/QC related to field and analytical tasks (e.g., benchmark surveys, station condition, field processes, photos, equipment calibration) were not documented.	Recommend that QA/QC processes in accordance with Section 2.3.1 in EMSAMP2018-01, EC 2001, RISC 2018 are documented and provided in reporting.	The review of this information was not within the scope of the audit, nevertheless, summary information and confirmation that data related to field and analytical tasks have been documented internally. Confirmation that QA/QC related to field and analytical tasks will be provided in annual reports. Documentation is available upon request.
	Flow records are in partial compliance due to lack of winter and freshet measurements and/or logger malfunctions.	Implement monitoring program as outlined in applicable EMSAMP, or provide rationale for implementation not being possible in reporting and amend EMSAMP.	VGC endeavors to complete flow measurements as outlined in the EMSAMP; however, winter hydrological monitoring at certain stations is not always possible due to ice and frozen conditions on creeks and streams. Where a flow measurement is omitted due to winter access conditions or safety concerns, this will continue to be stated in reporting.
	For automated stations, it is not clear what the manual monitoring frequency is during the freshet in EMSAMP2020-01.	Clarify this in future EMSAMPs/reporting.	The frequency for manual measurements listed in EMSMAP 2020-01 is taken verbatim from the WUL. VGC undertakes monthly manual flow measurements when the automated stations are not installed and again when the station is installed.
	It is not clear in the EMSAMPs if the adaptive management performance thresholds are applicable to manual monitoring stations.	Clarify this in future EMSAMPs/reporting.	In general, AMT’s do not apply to those considered only manual monitoring stations. As the execution of the program is VGC’s responsibility, our Environmental Department understands that the thresholds are intended to apply year-round to W4 and W99 (for additional comparison to W29 baseline and W99 established dataset), which are continuous gaged stations during

Discipline	Compliance Gaps and/or Deficiencies	Recommendation/Corrective Action	VGC Response
			ice-free season and manually monitored otherwise. No additional clarification to the EMSAMP is required.
	Average monthly flows were used instead of median monthly flows (as specified in Table 2.4-1 in EMSAMP2019-01 and EMSAMP2020-01) in evaluation of performance thresholds.	Use median monthly flows in evaluation of performance thresholds as outlined in EMSAMP.	Median monthly flows will be used when comparing hydrology performance thresholds as outlined in the EMSAMP (this is available in 2020 August and September monthly reports).
	The method of evaluation of performance thresholds for adaptive management was not completed in accordance with quantitative procedure outlined in EMSAMPs.	Apply the quantitative evaluation protocol outlined in the EMSAMPs for performance thresholds for adaptive management at relevant monitoring locations.	Quantitative evaluations when adaptive management triggers have been reached were initiated subsequent to the effective date of the audit. This information is available for review by interested parties in the August and September monthly reports. Additionally, VGC has recently purchased a more robust software package to support our adaptive management evaluations.
	The evaluation of performance thresholds for adaptive management was not completed for all automated stations listed in the EMSAMPs.	Perform evaluation of performance thresholds for adaptive management for all relevant automated stations as outlined in the EMSAMP.	Quantitative evaluations when adaptive management triggers have been reached were initiated subsequent to the effective date of the audit. This information is available for review by interested parties in the August and September monthly reports. Additionally, VGC has recently purchased a more robust software package to support our adaptive management evaluations.
	Adaptive management responses were not clearly performed following exceedance of performance thresholds.	Implement and document the adaptive management responses if performance thresholds exceeded at relevant monitoring locations as outlined in EMSAMPs.	Adaptive management responses will be implemented as necessary and documented if performance thresholds are exceeded at relevant monitoring locations as outlined in the EMSAMP. This evaluation first considers whether the exceedances are attributable to Project influence (i.e., very high or low flows attributed to seasonally wet or dry periods).
	Full documentation of completion timelines and dates for key water management infrastructure not documented.	Include specific completion dates in annual reporting for all key water management components.	All key water management component completion dates will be documented in annual reporting. Completion timelines and dates were provided to the relevant regulatory agencies in as built reports submitted 60 days after infrastructure completion; however, review of this documentation was not within the scope of the audit.
Surface Water Quality	2018 Annual Report – Rationale for missing sample events	Include a footnote for each table describing missing data rationale (e.g., frozen water)	The observation provided by the auditor was not found again in response to their review of the 2019 annual report thus VGC considers this deficiency to have been resolved. VGC will continue to provide a rationale for missing sampling events, where applicable, in future annual reporting.
	2018 Annual Report – QA/QC results not described	Include text in the report body describing the results of the QA/QC program (e.g., number of QA/QC samples, summary of results, DQOs, and corrective actions for failed DQOs). Also include these data in the database (Appendix D) or tabulated form.	QA/QC program results including duplicates and total amount of QA/QC sampling will be included in future annual reports.
	2019 Annual Report – Water Quality Results	Include a tabulated form of all water quality data including QA/QC samples	Water quality data and QA/QC program results are provided in monthly water use licence reports. VGC does not consider the duplication of this information in annual reporting necessary.
	2019 Annual Report – QA/QC results not completely described	Include results of duplicate sample results as well as total amount of QA/QC samples collected and summarize data in a tabulated form.	QA/QC program results including duplicates and total amount of QA/QC sampling will be included in future annual reports.
	2019 Annual Report – Quality of plots	Improve quality of plots so axes can be read (Appendix F)	Diagrams in annual reporting will be reviewed for legibility.
	2019 Annual Report – Statistical and trend analysis	For WQO exceedances, the EMSAMP commits VGC to compare values to baseline to determine if any significant changes have occurred to the receiving environment water quality, complete a trend analysis, and include methods and results in the report. We recommend an adjustment to this commitment with the goal of an achievable exercise for this project (e.g.,	Quantitative evaluations when water quality objective adaptive management triggers have been reached were initiated subsequent to the effective date of the audit. This information is available for review by interested parties in the August and September monthly reports. Additionally, VGC has recently purchased a more robust software package to support our adaptive

Discipline	Compliance Gaps and/or Deficiencies	Recommendation/Corrective Action	VGC Response
		monitor over x number of sampling events to determine if it is a real change in water quality)	management evaluations. We will consider the recommendation to revise the way in which the data is analyzed.
	2019 Annual Report – Cyanide species	Include cyanate and thiocyanate in the analytical suite for compliance with EMSAMP 2019-01	ESAMP 2019-01 is no longer the active version of the Plan. Audit review of compliance with EMSAMP 2020-01 (which mimics WUL requirements) indicates that this matter has been resolved.
	2019 Annual Report – AMT Responses	The EMSAMPs requests VGC to describe in detail the AMT response for any AMT exceedances. As per the Water Management Plan, sampling frequency will increase accordingly (next higher order) to better characterize trends.	Section 3.2.5 of the audit references adaptive management reporting with respect to a discharge event in April 2019. A full, detailed report for this discharge including sampling approach and frequency was provided as an appendix to the 2019 annual report. The full review of this appendix was not within the scope of the audit and VGC believes sufficiently detailed information was provided and that the adaptive management approach was sufficient.
	2020 Monthly Reports – QA/QC	Report on QA/QC samples collected monthly and include results in the report body including laboratory QA/QC results. Frequency of QA/QC samples are to meet >10% ratio of QA/QC samples to total water quality samples. *(Stantec understands that currently, Field blanks are being collected and are documented in the 2020 monthly report water quality appendices.)*	QA/QC water quality samples are collected currently at a rate of >10% ratio to total water quality samples. VGC has reviewed summary information relating to QA/QC and site task programs contained within monthly reporting for the Wolverine Mine as a recent Yukon example (as these reports are completed by a third-party consultant on behalf of Yukon Government). Based on this review we will use this as a good example as one to follow in future reporting as necessary.
	2020 Monthly Reports – AMT Responses	For WQO and AMT exceedances, the EMSAMP commits VGC to compare values to baseline to determine if any significant changes have occurred to the receiving environment water quality, complete a trend analysis and include methods and results in the report. We recommend an adjustment to this commitment with the goal of an achievable exercise for this project (e.g., monitor over x number of sampling events to determine if it is a real change in water quality). We also recommend to include a detailed AMT response. As per the Water Management Plan, sampling frequency should increase accordingly (next higher order) to better characterize trends.	Quantitative evaluations when water quality objective adaptive management triggers have been reached were initiated subsequent to the effective date of the audit. This information is available for review by interested parties in the August and September monthly reports. For future reporting, we will consider the recommendation to revise the way in which the data is analyzed. Additionally, VGC has recently purchased a more robust software package to support our adaptive management evaluations.
Groundwater Quantity and Quality	Groundwater quantity and quality monitoring from some wells was performed less frequently than the schedule prescribed in the relevant EMSAMPs.	• A number of factors, including those beyond the control of VGC may result in a scheduled monitoring not being performed (e.g. weather, equipment malfunction, unsafe condition, construction, pandemic). The monthly and annual reporting needs to provide the rationale for missed monitoring in tabular format and if any corrective action will be taken. • The annual and monthly reporting should include the installation and decommission date, and operational status of monitoring wells. • A maintenance log should be maintained for any maintenance or repairs made to logs and reported in the annual report.	The rationale for missed monitoring events will be expanded upon in relevant monthly reports and in the annual report. VGC can include well installation, decommissioning and operational status in future annual reports. Maintenance records are currently maintained for groundwater wells and will be referenced in future annual reports as necessary.
	EMSAMP (2020-01, S. 4.5) states that groundwater levels will be compared to predicted (modeled) effects due to the loss of recharge in the HLF and WRSA. However, trends were not quantitatively compared with predicted (modelled) effect in the 2019 Annual Report or 2020 Monthly Reports. It is unclear if trends are consistent with the predicted thresholds or if the model requires calibration based on field observation.	• Compare measured groundwater levels to predicated effects in assessment. • Calibrate modeled adaptive management thresholds for groundwater quantity based on field observation.	VGC intends to complete quantitative comparison between observed and modeled groundwater levels in future annual reports. Given the level of effort to undertake such comparisons, and that the groundwater level data is collected quarterly, meaningful comparisons cannot really be made until full hydrologic cycle has occurred, thus quarterly comparisons are not believed to be necessary.
	EMSAMP (2020-01, S. 4.4) states that groundwater hydrographs will be compared with existing baseline data to assess potential change associated	Present further assessment of the change in groundwater quantity associated with the Project. The assessment would be strengthened if a list	VGC intends to complete quantitative comparison between observed and modeled groundwater levels in future annual reports.

Discipline	Compliance Gaps and/or Deficiencies	Recommendation/Corrective Action	VGC Response
	with the Project. The 2019 Annual Report in S. 3.4.3.1 presents a qualitative discussion of the observed changes in groundwater quantity associated with the construction and operation of mine. This discussion is not presented in the context of modelled effect or groundwater quantity indicators.	of groundwater quantity indicators and associated triggers were developed and utilized in the operation stage.	VGC acknowledges that adaptive management thresholds still need further development and will endeavor to complete this work for use in 2021.
	EMSAMP (2020-01, S. 5.2) presents groundwater quality parameters to be analyzed in the monitoring program. Review of groundwater quality records in the 2019 Annual Report suggests some samples were not analyzed for the full suite of parameters.	• Review water licence conditions and lab records to confirm if required parameters were analyzed. • Include all analyzed parameters and lab reports in annual reporting.	At the time of the preparation of this response, VGC had not clarified with the auditor which parameter(s) had been omitted in the suite of parameters analyzed at reported on for 2019. VGC will ensure that all future groundwater quality samples are analyzed for the parameters required by the WUL conditions and the EMSAMP and that laboratory data is reported in future annual reports.
	• EMSAMP (2020-01, S. 5.3.2 and 5.3.3) describes the field QA/QC program for groundwater quality monitoring, which includes collection and analysis of trip blanks, field blanks and duplicates. • The 2019 Annual Report does not present information on the implementation of the QA/QC program. Appendix K of the 2019 Annual Report (Groundwater Quality Data) does not contain records of the QA/QC samples.	Present information on the implementation of the field QA/QC program and the results of the QA/QC program in the annual reports.	Groundwater quality QA/QC data results will be included in annual reporting.
	EMSAMP (2020-01, S. 5.3.3) states that plots of concentrations of regulated constituents and key indicator parameters versus time will also show applicable standards and baseline concentration. Plots in the 2019 Annual Report do not contain the applicable standards and baseline concentration.	Present applicable standards and baseline concentration in the groundwater water sample constituent concentration plots for the annual report.	Applicable standards and baseline concentrations will be included in the groundwater constituent concentration plots in future annual reports.
	EMSAMP (2020-01, S. 5.4.1) describes that trends in groundwater quality will be examined to potentially inform management actions. The existing analysis of the water quality trend in the 2019 Annual Report contains discussion of the trend but in some cases does not provide rationale for the observed trends.	• Present groundwater quality trend analysis in monthly and annual reporting to confirm that trends are being monitored appropriately. • Present groundwater quality trend assessment in the context of baseline water quality and predicted effects of the Project. • Provide greater logical link between discussion of observed groundwater quality trend and proposed adaptive management actions (e.g. no action).	VGC intends to complete quantitative comparison between observed and baseline groundwater quality trends in future annual reports. VGC acknowledges that adaptive management thresholds still need further development and will endeavor to complete this work for use in 2021.
Geochemistry	2018 Annual Report – QA/QC samples	Collect duplicate samples of construction monitoring samples and include discussion of results including relative percent differences in report body and append dataset.	Total QA/QC samples endeavor to be equal or greater to 10%, relative to project samples. Certain programs may have more or less than this general overall target. QA/QC duplicate samples for construction material geochemical analysis will be conducted and reported in the annual report.
	2018 Annual Report – Report NPR values	Report NPR values in addition to NP:AP for better interpretation of results. This was corrected in the 2019 Annual Report.	No further action necessary.
	2018 and 2019 Annual Report – Sample type description	Include details on the material sample collected (i.e., surficial, or bedrock) and why these samples were collected (i.e., 1 per 100,000m^3 material moved or distinct geological unit).	Material sample information will be included in future annual reports.
	2018 Annual Report – Appended analytical data	Include all analytical data in appendices. Missing: acid base accounting, rinse pH, and electrical conductivity.	Analytical data, including ABA, rinse pH and EC, are currently provided in monthly reporting. This data is also provided to a third-party consultant responsible for the development and assessment of source term chemistry for the site water quality model. Submission of this information is thus considered by VGC to be sufficient.
	2019 Annual Report – Appended analytical data	Include field barrel analytical data in appendices.	Analytical data, including the field barrel data, are currently provided in monthly reporting. This data is also provided to a third-party consultant responsible for the development and assessment of source term chemistry

Discipline	Compliance Gaps and/or Deficiencies	Recommendation/Corrective Action	VGC Response
			for the site water quality model. Submission of this information is thus considered by VGC to be sufficient.
	2019 Annual Report – QA/QC samples	Collect duplicate samples of construction and operational monitoring samples, include discussion of result (including relative percent differences) in report body, and append dataset.	Total QA/QC samples endeavor to be equal or greater to 10%, relative to project samples. Certain programs may have more or less than this general overall target. QA/QC duplicate samples for construction material geochemical analysis will be conducted and reported in the annual report.
	2019 Annual Report – Details of blast rounds	Include details of blast rounds so compliance with EMSAMP can be evaluated. Include geological logs of blast holes.	Geological logging of blast hole composites will be undertaken, and provided in annual reports, as considered in the EMSAMP. This will not be completed for each blast hole, but on a representative basis
	2019 Annual Report – Monthly seep sample survey	Include details of monthly seep sample survey in report.	Monthly surveys of the WRSAs are undertaken during normal stacking operations for the facilities and as a component of the physical stability inspection program. To date, there has been no report of the development of seeps which is to be expected given the configuration of the active dump (the Platinum Gulch WRSA) being only in the upland section of the drainage where groundwater levels are not near surface.
	2019 Annual Report – Shake flask extraction size fraction	Check with off-site laboratory (ALS) if shake flask extraction is conducted on <2mm and <1cm size fraction.	Analytical methods will be confirmed with external laboratory to confirm that the methods are as proposed in the EMSAMP.
	2020 Monthly Reports – QA/QC samples	Collect duplicate samples of construction monitoring samples and include discussion in report body and append dataset. For operational samples, include relative percent differences and discuss results in the report body. Consider re-naming duplicate samples to not include parent sample name. Explicitly describe which samples are duplicates of respective parent sample.	Total QA/QC samples endeavor to be equal or greater to 10%, relative to project samples. Certain programs may have more or less than this general overall target. RPDs and QA/QC results will be discussed in future annual reporting. The naming convention that VGC has adopted for QA/QC samples has met our needs and will continue.
AQUATIC ENVIRONMENT			
Stream Sediment	Field methods – use of stainless-steel trowel to collect samples	Samples collected for analysis of metal concentrations should be collected with plastic utensils to avoid potential contamination	To date, the execution of the stream sediment field program has been undertaken by an independent qualified third party. VGC will discuss the methods proposed in the EMSMAP and actually used for the field programs to ensure that an appropriate utensil is used. In the event that an update to the EMSAMP is warranted in the future, the sampling method will be updated as necessary.
	Field methods – out of date field method guidelines	Methods should be consistent with updated BC Field Sampling Manual from 2020 and with BC's "Water and Air Baseline Monitoring Guidance Document for Mine Proponents and Operators" (BC MoE 2016)	To date, the execution of the stream sediment field program has been undertaken by an independent qualified third party. VGC will discuss the methods proposed in the EMSMAP and actually used for the field programs to ensure that appropriate methods are used. In the event that an update to the EMSAMP is warranted in the future, the sampling methods will be updated as necessary.
	Field methods – site documentation	Water depth, sediment texture and color, and presence of debris, biofilms, odours, or sheens should be described at each site. Sites should be photographed showing upstream, downstream, obliques, banks, riparian vegetation, and substrates	
	Lab methods – screening equipment	Laboratories should be required to screen sediment samples for particle size distribution and <63 µm fraction using non-metallic screens to avoid potential contamination	The lab certificates for stream sediment samples acknowledge that the correct screen size has been utilized but does not state the material that the screen is made from. VGC will raise this matter with the third party engaged to complete the stream sediment monitoring to ensure that industry standard practices are followed.
	Reporting – units	Clearly document that guidelines and concentrations are reported as dry or wet weight	Future reporting will document whether the guidelines and concentrations reported are dry or wet weight.

Discipline	Compliance Gaps and/or Deficiencies	Recommendation/Corrective Action	VGC Response
	Reporting - guidelines	Sediment quality guideline for selenium is only an “alert” concentration and not a working sediment quality guideline	Noted.
	Reporting - guidelines	Clearly indicate whether guidelines for specific parameters are from CCME and/or BC WQG	Future reporting will clearly indicate specific guideline sources.
	Reporting – detection limits	Reports should identify results that are below detection limits (e.g., boron and silver)	Future reporting will identify whether results are below detection limits.
	QA/QC – field methods	Clearly document the field QA/QC procedures followed	QA/QC field procedures will be included in final reports as appropriate or indicate that this information can be provided upon request.
	QA/QC – field duplicates	Every third or fifth sample should be “field split” to assess sampler and laboratory QA/QC as per BC MoE 2016	To date, the execution of the stream sediment field program has been undertaken by an independent qualified third party. VGC will discuss the QA/QC proposed in the EMSMAP and actually used for the field programs to ensure that appropriate QA/QC approach is used.
	QA/QC – laboratory detection limits	Reports should describe instances where laboratory detection limits are not ≤ 1/5th of the respective sediment quality guideline or ≤ 1/5th of the lowest background concentration	
	Reporting – lack of statistical analyses	Reports should include statistical comparison of data to pre-construction baseline data as required by EMSAMP	VGC will evaluate how best to conduct statistical comparisons with pre-construction baseline data as a component of future stream sediment sampling programs.
	Reporting – lack of discussion of need for adaptive management due to PEL exceedances for arsenic	Conduct statistical analyses comparing contemporary and pre-construction data to identify any significant differences and conduct arsenic speciation analyses on future stream sediment samples	
Benthic Macroinvertebrates	Study design – insufficient sites in reference or upstream areas as per EEM guidance	Identify and begin sampling in second reference stream to bring the number of unaffected sites up to 5 as recommended in Environment Canada’s EEM guidance; a minimum of three reference sites are recommended in BC’s Water and Air Quality Baseline Monitoring Guidance Document. (*Stantec understands that VGC is currently preparing an Environmental Effects Monitoring plan for submission to Environment and Climate Change Canada in 2021 that will address this recommendation.)*	VGC became subject to ECCC’s EEM Sampling program requirements in April 2019 (with the first site discharge) requiring an EEM Study to be submitted in April 2020, with study implementation planned for 2021. VGC is currently finalizing an EEM Study Design in compliance with ECCC’s technical guidance that will address this recommendation.
	Study design – number of appropriate replicate numbers is unknown	Conduct power analysis on existing data to determine the number of replicate samples required to provide sufficient data to determine statistically significant differences between sites and between years given known variability in benthic communities. Without a power analysis, the default number of replicates per site should be increased to 5. (*Stantec understands that VGC is currently preparing an Environmental Effects Monitoring plan for submission to Environment and Climate Change Canada in 2021 that will address this recommendation.)*	
	Field QA/QC procedures – no *a prior* criteria for sample appropriateness as required by EEM	Develop *a priori* criteria and apply to next survey (*Stantec understands that VGC is currently preparing an Environmental Effects Monitoring plan for submission to Environment and Climate Change Canada in 2021 that will address this recommendation.)*	
	Lab QA/QC procedures and results – not provided in report or appendices	Provide lab QA/QC procedures and results in appendix	A summary of lab QA/QC procedures will be provided in future annual reports and results will be provided upon request.
	Data analysis - Missing community metrics required in EMSAMP (i.e., family density and richness, Simpson’s evenness, and Bray-Curtis)	Include all community indices identified in EMSAMP	Appropriate community metrics will be provided based on the results obtained from EEM studies.

Discipline	Compliance Gaps and/or Deficiencies	Recommendation/Corrective Action	VGC Response
	Data analysis – missing statistical analyses comparing sites and contemporary data to pre-construction data	Conduct the required ANOVAs and multiple comparison tests as required by EMSAMP (e.g., append appropriate statistical analyses in excel format) and EEM for BACI study design. (*Stantec understands that VGC is currently preparing an Environmental Effects Monitoring plan for submission to Environment and Climate Change Canada in 2021 that will address this recommendation.)*	VGC is currently finalizing an EEM Study Design in compliance with ECCC's technical guidance that will address this recommendation.
	Reporting – only qualitative comparisons between sites and years discussed	There is sufficient data from sites and between years to conduct quantitative statistical analysis to determine significant difference between impact and reference sites and trends between years.	As stated in the EMSMAP, the current aquatic environment monitoring program is considered interim until the finalization of the EEM study design. As stated in section 3.5.2.2, statistical analyses are planned in 2021 after the completion of the first EEM study year.
	Reporting – no discussion of need for adaptive management actions; no statistical analyses performed to inform adaptive management	Discuss adaptive management considering quantitative analysis of site data and trend analysis	VGC will work with third party consultants engaged to prepare reports on our behalf to ensure that statistical analyses are performed as necessary to inform adaptive management.
	Reporting – no indication that results are site averages in the tables	Clearly identify what data in tables represents	VGC will work with third party consultants engaged to prepare reports on our behalf to ensure that tables in final reporting clearly indicate the type of data presented.
	Reporting – no reference for Pacific Salmon Federation rating of "good quality" based on EPT taxa in the 2018 annual report	Provide all references in report	VGC will discuss this matter with the author of the report and follow up with the auditor as necessary. The referenced section appears to list the Pacific Stream Keepers Federation document with "DFO" listed as the source and the refence being "Stream Keepers Module 4 Stream Invertebrate Survey. Stewardship Series. British Columbia." thus the concern is unclear at this time.
	Reporting – incorrect identification of "fair" based on HBI to Site W26 in 2018 annual report	Incorporate quality and independent review into reporting structure	Quality reviews of final reports are included through consultant and VGC report production. If future audits identify additional review issues, VGC will consider engaging alternate consultant support to ensure reports are sufficiently prepared.
	Reporting – no analysis or discussion of environmental variables, fish results, or outlier effects on benthic invertebrate results as required by EMSAMP	Discuss all requirements of the EMSAMPs in the annual reports.	Benthic invertebrate study results will be incorporated into the fish studies as supporting information (as an indication of overall health of system from keystone species condition).
Fish and Fish Habitat	Field methods - Fish and fish habitat surveys conducted in September instead of July or August when fish communities are likely more stable and fish sampling is more efficient	Although not a deficiency of the annual monitoring programs, sampling should be conducted in summer when fish community is most stable and sampling efficiency is highest.	VGC environmental staff have conducted fish studies in collaboration with Aquatic Biologists familiar with the regional area and fish community habits and will continue to rely on their expertise, and that of our own field staff, with respect to the most appropriate time of year to conduct sampling.
	Field methods – fish condition was not documented as required by the EMSAMPs	Conduct external examinations and fill in standardized necropsy form for each fish or sub-sample of fish of each species captured	VGC is currently finalizing an EEM Study Design to be in compliance with ECCC's technical guidance which currently includes an assessment of the external condition of each fish with standard necropsy observations.
	Field methods – single pass open sites	Although not required by the EMSAMPs and not a deficiency of the annual monitoring programs, multi-pass depletion estimates in closed sites would provide more accurate and repeatable results and be better for long-term monitoring and statistical analyses	VGC has historically conducted Catch Per Unit Effort (CPUE) sampling procedures, due to the low population numbers typical of the local stream systems. VGC is currently finalizing an EEM Study Design in compliance with ECCC's technical guidance that will address this recommendation.
	Field methods – insufficient numbers of fish captured for EEM program at current effort levels	Although not specified in the EMSAMPs, a minimum of 100 fish is required for non-lethal sampling according to EEM technical guidance. Sampling in summer and using multi-pass electrofishing methods may increase numbers of fish available for capture	CPUE can be used to justify lower catch. Streams in the project area have low density of fish and with high effort required

Discipline	Compliance Gaps and/or Deficiencies	Recommendation/Corrective Action	VGC Response
	Reporting – no mention of need for fish tissue study	Even if no mine effluent discharge occurred, reports should indicate whether a fish tissue study is required or not as part of MDMER monitoring; the EMSAMP indicates that a fish tissue study is required if the concentration of effluent in the exposure area was >1% in the area within 250 m of the final discharge point but the 2019 annual report did not indicate if this criterion was met. (*Stantec understands that VGC is currently preparing an Environmental Effects Monitoring plan for submission to Environment and Climate Change Canada in 2021 that will address this recommendation.)*	Data obtained to date indicate that mercury and selenium concentrations were below the EEM triggers for conducting applicable fish tissue surveys as defined in the MDMER. Therefore, VGC is not required to conduct either a fish tissue mercury or selenium survey.
	Reporting – no recommendation for indicator fish species for future EEM program	Although not required by the EMSAMPs, the authors should provide a recommendation for a suitable indicator fish species for monitoring potential effects of future mine effluent discharges. Given the fish community present at the site, slimy sculpin would appear to be at least one of the indicator species chosen for future EEM programs. (*Stantec understands that VGC is currently preparing an Environmental Effects Monitoring plan for submission to Environment and Climate Change Canada in 2021 that will address this recommendation.)*	VGC became subject to ECCC's EEM Sampling program requirements in April 2019 (with the first site discharge) requiring an EEM Study to be submitted in April 2020, with study implementation planned for 2021. VGC is currently finalizing an EEM Study Design in compliance with ECCC's technical guidance that will address this recommendation.
	Reporting – no mention of adaptive management trigger or threshold exceedances	Reports should specify whether any of the adaptive management thresholds in the EMSAMPs were exceeded and if any of the adaptive management measures were required and implemented each year	VGC is currently finalizing an EEM Study Design in compliance with ECCC's technical guidance that will address this recommendation. Any quantitative analysis conducted will inform on adaptive management strategies and be reported in annual reporting.
TERRESTRIAL ENVIRONMENT			
Vegetation and Soils	N/A	Develop statistically-based trigger for determining 'significant' increases in metals (arsenic, cadmium, chromium, mercury and lead) concentrations in vegetation plot samples.	VGC will work the third-party contractor engaged for sampling and reporting on the vegetation monitoring program and will develop statistically based triggers for determining significance that can be used in future reports.
	Missing duplicate vegetation sample analysis in 2018 and 2019	Collect duplicate samples if sufficient vegetation is available	QA/QC duplicate samples are collected if sufficient vegetation is available.
Wildlife Protection	Specific information on wildlife incidents is not provided in the Wildlife Records Program	Provide a summary of all wildlife incidents resulting in human-wildlife conflict, wildlife fatality or removal, or nest disturbance in the annual reports along with a summary of the root cause(s). Any corrective actions should be documented.	A summary and resulting corrective actions of all wildlife incidents resulting in human-wildlife conflict, wildlife fatality or removal, or nest disturbance will be included in the annual reports. This data and information are also currently provided in quarterly wildlife reports provided to EMR.
	There is no formal documentation of the wildlife protection monitoring in the Heap Leach Facility Area and Events Pond Monitoring Program	Include the results of the monitoring program in the annual report or in a separate report.	To date, there has only been one wildlife related incident related to the HLF and Events Pond. The findings from this incident have been provided to the appropriate Conservation Officer and in the pertinent quarterly wildlife report provided to EMR. Summaries of the wildlife monitoring program will continue to be provided to EMR by way of quarterly wildlife reports and in future annual reporting.
GEOTECHNICAL STABILITY OF INFRASTRUCTURE AND FACILITIES			
Permafrost	Regular visual Inspections not reported.	Include an appendix in Annual and Monthly reporting that summarizes the observations from regular visual inspections to identify and quantify any deformation associated with melting of permafrost, such as but not limited to, cracks, subsidence, sinkholes, and sloughing on existing foundations and slope overlay permafrost. Summarize those visual inspections executed during the freshet, prolonged rainy periods, and rising trend in any thermistors.	Infrastructure monitoring including permafrost will continue to be summarized in annual reporting. Geotechnical stability of major infrastructure is also considered in the annual independent physical stability inspection conducted to fulfill conditions in the Quartz Mine Licence. Areas of specific concern identified by the independent third party (note - no significant concerns have been raised to date) will be specific focus areas for VGC operational staff.

Discipline	Compliance Gaps and/or Deficiencies	Recommendation/Corrective Action	VGC Response
	Prolonged rainy period not quantified.	Define / quantify duration of a prolonged rainy period based on exceedance of design criteria (duration, precipitation volume).	The design basis for various infrastructure adjacent to permafrost includes concepts for short term rain events (i.e., 100 yr 24-hr) and long term (monthly) conditions as evaluated using water balance models that consider upset conditions (including sustained rainy periods). These considerations are already reflected in the design and capacity for each structure. For natural terrain, such as permafrost, a subjective analysis focusing on actual observed effects of rainy periods on the terrain is better suited to evaluate terrain stability. Thus, this recommendation is not considered necessary.
	Freeze/Thaw indices not reported under EMSAMP -2018-01.	Corrective action no longer required because Weather Data Review requirement removed from EMSAMP monitoring program starting June 2019 (EMSAMP 2019-01 and 2020-01).	Noted.
	Thermistor GT18-09 not read in Q3 of 2019	Provide reasoning for missed reading.	While VGC endeavors to fulfill all EMSAMP listed sampling, occasionally samples are missed based on adverse weather conditions or department resource constraints. Future annual reports will include reasoning for missed readings.
Open Pit	Daily visual inspections not reported.	Include an appendix in Annual and Monthly reporting that summarizes the observations from these daily visual inspections.	Infrastructure monitoring including the open pit is conducted regularly and will continue to be summarized in annual reporting.
	Monthly collection of survey prism data not reported.	Stantec understands there are currently no active prisms installed at the open pit, and VGC is implementing a program scheduled for 2020 to install up to 15 prisms on the1408, 1375, and 1395 benches. Following prism installation, include in Annual and Monthly reports a list of active survey prisms with coordinates (northing, easting, elevation) and deformation readings.	VGC has scheduled installation of survey prism within the pit benches over the winter of 2020/2021. Resulting data will be included in future annual reporting.
	Piezometers read quarterly instead of monthly in 2018 as required in EMSAMP 2018-01.	Corrective action not required since the piezometer reading frequency is specified as quarterly in subsequent EMSAMP 2019-01, superseding the 2018 requirement and bringing the piezometer reading schedule into compliance.	Noted.
	Scheduled piezometer readings for Q1 2020 not collected due to COVID-19 related staffing issues.	Assess if datalogger installed in Open Pit piezometer BH-BGC11-73a,b,c collected and stored data for Q1 2020. For remaining piezometer(s), collect data as soon as reasonably practical and provide reading summary or reasoning for data gap in Annual reporting.	Data collection and rationale for missed samples will be included in future annual reporting.
	Piezometer data not collected in Q2 2020.	Assess if datalogger installed in Open Pit piezometer BH-BGC11-73a,b,c collected and stored data for Q2 2020. For remaining piezometer(s), collect data as soon as reasonably practical and provide reading summary or reasoning for data gap in Annual reporting.	Data collection and rationale for missed samples will be included in future annual reporting. Note that BH-BGC11-73a,b,c was decommissioned in early 2020 during open pit advancement, therefore there was no data to collect.
	Piezometers listed in EMSAMP documentation without reported water tables.	Provide reasoning for piezometers with absence of documented water table readings.	All data collection and rationale for missed samples will be included in annual reporting.
	Data for two (2) extensometers installed at open pit not reported.	The EMSAMP documents do not lay out a minimum required monitoring frequency for extensometers installed at the open pit. A qualified personnel should determine a reading frequency for these instruments and should be summarized in the annual reports and compared against established velocity trigger levels.	The implementation of monitoring strategies and instrumentation is ongoing and future annual reports will provide relevant information as it becomes available. The discussion provided in the EMSAMP was intended to provide context for overall environmental monitoring on the site only. Observation of pit wall stability is undertaken by qualified personnel on the mine site on a regular and frequent basis.
	Multiple instrumentation listed in EMSAMP documentation that is not currently installed on site (robotic theodolites, TDR cables, slope inclinometers, fixed slope radar, mobile slope radar).	Remove from EMSAMP documentation reference to instrumentation not installed (or planned for installation) on Open Pit.	Instrumentation proposed for the observation of facilities was intended to be understood to develop over time. The implementation of monitoring strategies and instrumentation is ongoing and future annual reports will

Discipline	Compliance Gaps and/or Deficiencies	Recommendation/Corrective Action	VGC Response
			provide relevant information as it becomes available. The discussion provided in the EMSAMP was intended to provide context for overall environmental monitoring on the site only.
	Equipment maintenance logs were not provided to back-up data reported in monthly/annual reports.	Provide equipment maintenance logs as supporting documentation to monthly/annual reports.	A summary of relevant equipment maintenance logs will be included in future annual reports and will be made available upon request.
Materials Storage and Stockpile Management	Visual inspections (daily, weekly, monthly) not reported.	Include an appendix in Annual and Monthly reporting that summarizes the observations from these visual inspections.	Future annual reports will include a summary of material storage and stockpile monitoring undertaken the previous year. Additionally, the annual independent third-party inspection, provided to EMR, includes observation of material storage and stockpile areas.
	Not all WRSA and stockpile piezometers as listed in EMSAMP 2020-01 have water levels reported in June 2020 monthly report.	Confirm list of active piezometers installed in WRSA and stockpiles, include data in monthly and annual reports. Provide reasoning behind non-documented groundwater tables.	Available data from relevant monitoring instrumentation is provided in monthly and annual reports. Additional installations proposed for the operations period of the mine have been impacted by COVID-19 travel restrictions. The planned installations will take place when travel and site restrictions allow.
	Multiple instrumentation listed in EMSAMP documentation that is not currently installed on site (Survey Prisms, Inclinometers, Radar / photogrammic surveying).	Remove from EMSAMP documentation reference to instrumentation not installed (or planned for installation) on WRSA and stockpile structures.	Instrumentation proposed for the observation of facilities was intended to be understood to develop over time. The implementation of monitoring strategies and instrumentation is ongoing and future annual reports will provide this information as it becomes available
	Existing monitoring methods (wireline extensometer) implemented on site do not state a monitoring frequency.	VGC should consider discrete reading frequencies for wireline extensometers, specify in EMSAMP documentation.	Monitoring of material storage and stockpiles provided in the EMSAMP is to provide overall context for site inspections and management. Details regarding frequencies for monitoring these facilities are considered in plan outside of the scope of the audit and standard operating procedures followed at the project site. Inclusion of this level of detail in the EMSAMP is not considered appropriate as it is not an environmental monitoring function.
	Follow up and close out of physical stability recommendation 4 and 5 not documented in annual or monthly reports.	Provide documentation detailing the follow up and response actions for addressing recommendations.	The physical stability inspection is conducted on an annual basis and the selected firm utilizes previous reports to describe activities undertaken by VGC to address previously identified issues and whether a concern remains. Any facility that requires major construction or maintenance to address performance issues will have follow up documentation included in the annual report as required by the QML and WUL.
Heap Leach Facility	Routine (visual) inspections (daily, weekly) not reported.	Include an appendix in Annual and Monthly reporting that summarizes the observations from these visual inspections.	Visual inspections for the HLF are part of routine operations. This information is provided to the EOR for the facility which is then used for their third-party reporting and as design input for subsequent phases of the HLF. VGC considers this approach more appropriate than providing raw inspection data as a component of EMSAMP reporting.
	Embankment Piezometers P1, P2, P3 appear to be collecting data continuously but data not reported monthly.	Provide continuous data plots of embankment piezometers P1, P2, P3 in monthly reports. Include these instruments in next EMSAMP revision.	Piezometers installed in the HLF are recording data continuously and this information will be provided in future annual reports
	Partial reporting of piezometer readings as listed in EMSAMP 2019-01 in 2019 annual report.	Confirm HLF piezometers as listed in EMSAMP 2019-01 are reporting groundwater readings, include in monthly and annual reporting. Provide reasoning for missing groundwater level readings.	Piezometers installed in the HLF are recording data continuously and this information will be provided in future annual reports
	Partial reporting of piezometer readings as listed in EMSAMP 2020-01 in June 2020 monthly report.	Confirm HLF piezometers as listed in EMSAMP 2020-01 are reporting groundwater readings, include in monthly and annual reporting. Provide reasoning for missing groundwater level readings.	Piezometers installed in the HLF are recording data continuously and this information will be provided in future annual reports.
	Existing monitoring methods (slope inclinometer casing) implemented on site do not state a monitoring frequency.	VGC to consider discrete reading frequencies for slope inclinometer casing, specify in EMSAMP documentation.	Monitoring frequencies are evaluated on a case by case basis depending on overall assessment of the facility and daily observations made by the general foreman. Discrete (or absolute) reading frequencies are not recommended.

Discipline	Compliance Gaps and/or Deficiencies	Recommendation/Corrective Action	VGC Response
	Follow up and close out of physical stability recommendation 3 not documented in annual or monthly reports.	Provide documentation detailing the follow up and response actions for addressing recommendation.	The physical stability inspection is conducted on an annual basis and the selected firm utilizes previous reports to describe activities undertaken by VGC to address previously identified issues and whether a concern remains. Any facility that requires major construction or maintenance to address performance issues will have follow up documentation included in the annual report as required by the QML and WUL.
OTHER PLANS			
Solid Waste and Hazardous Materials Management	No recommendation		
Spill Response	No recommendation

Document Description

Annual Physical Stability Assessment Report – Victoria Gold – Eagle Gold Project

Project Description:

Visual inspection of the following structures: Open Pit, Platinum Gulch Dump, Lower Dublin South (Control) Pond, Secondary Crusher, Primary Crusher, Secondary Stockpile, Adsorption, Desorption and Recovery Plant, Heap Leach Facility, Events Pond, Ditches A, B, and C, Former Nuway Crusher Pad, Orica Laydown, Various Un-named Stockpiles.

1 BACKGROUND

In September, 2020, Allnorth Consultants Limited (Allnorth) was retained by Victoria Gold Corp. (VGC) to conduct a visual physical stability assessment of their Eagle Gold mining operation located in Mayo Mining District, Yukon, Canada in support of Quartz Mining License QML-0011. Spencer Bergin, EIT of Allnorth conducted the inspection on September 23rd and 24th. The inspection was limited to visual inspection and did not include any specific geotechnical or structural testing or evaluation. Visual inspection generally consisted of traversing the structures on foot, and viewing the structures in their entirety from accessible vantage points. Any issues that were discovered were investigated and documented with detailed notes and photographs. The Allnorth inspector was given complete freedom in determining what to look at, and was not restricted access to any locations within the site. Conditions on site were clear for inspections though the on-site representative indicated that there had been heavy rain recently and through-out the summer.

Allnorth previously completed similar inspections in September of 2019 and 2018. Some photos taken during these inspections were used for comparison. Some areas had no basis for comparison, as construction was underway during the previous inspection, and has since been completed. Any photos included from the previous 2019 and 2018 inspections are noted.

The mining project was currently extracting, storing, processing, and refining ore at the time of inspection. Construction of all major infrastructure has been completed and development of successive phases of the Heap Leach Facility (HLF), open pit mine and waste rock area expansion continue. A few remaining areas are under construction or will be further developed within the next year such as Ditch A and B. As the project is in the early stages, historical records for survey data are limited to certain facilities at this time. As more survey data is collected and made available this can be used for stability monitoring and will likely become part of the physical stability assessment in the future.

2 SCOPE

This report outlines the findings of the physical stability assessment conducted from September 23rd-24th of 2020. This report documents the findings of the physical stability assessment and makes recommendations for remediation, additional inspection or monitoring of the issues identified. The following structures were included in the assessment:

- Lower Dublin South (Control) Pond and outfall,
- Secondary Stockpile (also known as 90 Day Stockpile),
- Heap Leach Facility,
- Open Pit
- Platinum Gulch Dump
- Cut and fill slopes of the Primary, Secondary, and Tertiary Crushers including MSE walls,
- Cut and fill slopes of the Adsorption, Desorption and Recovery Plant,
- Events Pond,
- Ditches A, B, and C,
- Former Nuway Crusher Pad,
- Orica Laydown,
- Various un-named stockpiles

The purpose of the inspection is to identify any visual indicators associated with instability of mass earth structures, including but not limited to tension cracking, bulging, pooled water above the slope or near the toe of the slope, falling material, indications of creep, slumps, deposits of debris, or cracking in bedrock. Additionally, constructed slopes were reviewed for slope angles and compared against the recommend slope angles for known material types on site. Refer to **Appendix A** for a map showing the site plan for the 2020 inspection. A site plan for the 2019 inspection is available in **Appendix B** for comparison. A site plan for the 2018 inspection was not available.

3 LOWER DUBLIN SOUTH (CONTROL) POND

3.1 Diversion Ditch Overflow

Some minor pooling of water was noticed at the shed which houses the junction of pipes and is adjacent to the rip-rapped groundwater diversion ditch (Figure 1), no other items noted. Site noted that there was above average rainfall throughout the summer and leading up to the site visit which may have lead to this and other instances of pooling water on site. There is an outlet sump and weir which were constructed between the 2018 and 2019 inspections; no issues noted (Figure 2).

Figure 1: LDSP – Pooling adjacent to Shed and Diversion Ditch

Figure 2: LDSP – Outlet Sump and Weir

3.2 1500mm Spillway Outlet Culvert

1. The condition of this culvert appears to be the same compared to the previous years inspections (Figures 3 and 4). No water was observed flowing through the culvert in the 2018 and 2019 inspections but a steady flow was observed for this inspection (Figure 5). No concerns noted.

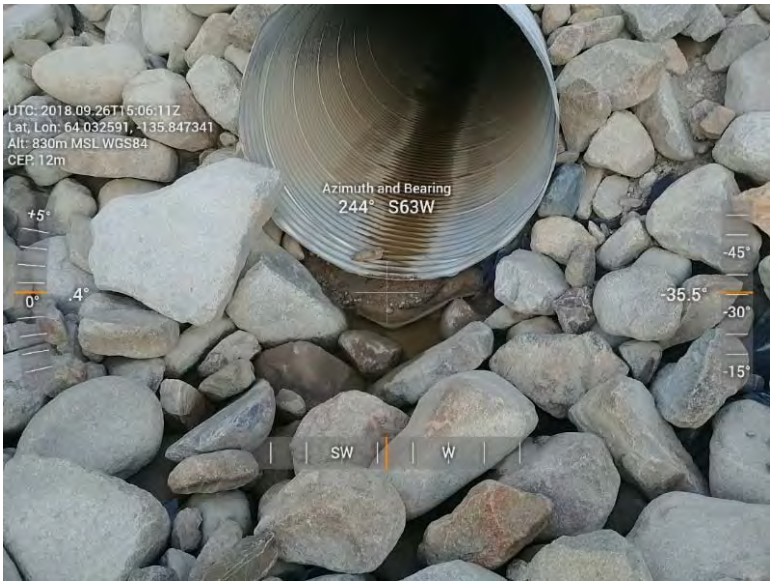

Figure 3: LDSP - 1500mm Culvert 2018 Inspection

Figure 4: LDSP - 1500mm Culvert 2019 Inspection

Figure 5: LDSP - 1500mm Culvert 2020 Inspection

3.3 Cut slopes

1. Some saturated material and erosion was noted on the slope of the southwest corner of the Control Pond over the width of the narrow access road in 2019 (Figure 6) and does not appear to have been completely rectified as of this inspection (Figure 7). Water flowing down Ditch A may be leaking into the fill in this area. There was some flow into this area from a culvert crossing a former construction access road, which was observed in 2019 (Figure 8) and still present as of this inspection (Figure 9). This area will be included in the Ditch A remediation effort which was observed to be underway in other areas during the site inspection. This would include lining and armoring Ditch A.

Figure 6: LDSP – Erosion on the Southwest slope 2019

Figure 7: LDSP – Erosion on the Southwest slope 2020

Figure 8: LDPS – Some flow from adjacent culvert 2019

Figure 9: LDPS – Some flow from adjacent culvert 2020

4 SECONDARY STOCKPILE

4.1 Benches and Cut Slopes

1. The Secondary Stockpile (also known as the 90 Day Stockpile) was under construction in 2019 (Figure 10) and was completed by the time of this inspection (Figure 11). Some over-steepened cut slopes were observed in the 2019 inspection (photos unavailable) however they appear to have been addressed as of this inspection (Figure 12).

Figure 10: Secondary Stockpile under construction 2019

Figure 11: Secondary Stockpile completed 2020

Figure 12: Secondary Stockpile Cut Slopes 2020

4.2 Perimeter Interception Ditch

1. A perimeter interception ditch extends around the downhill toe of the Secondary Stockpile area (Figure 13 and Figure 14). The construction of this ditch is not yet complete, as it is currently un-lined with no rock armoring, and is founded on native soils, and over-steepened and sloughing in places.

Figure 13: Perimeter Ditching

Figure 14: Perimeter Ditching

2. In one location some pooling of water has occurred as it appears that the final grade has not been completed (Figure 15).

Figure 15: Pooling water in perimeter ditch

3. The outlet of one side of the perimeter ditch does not currently tie into the collection sump (Figures 16).

Figure 16: Unconnected Ditch Section

4. The Secondary Stockpile perimeter ditch eventually ties into Ditch A, with part of the connecting ditch blocked by a buried culvert. This is noted in Section 12 – Ditch A.

5 HEAP LEACH FACILITY

The Heap Leach Facility (HLF) is currently operational. In 2019 the Phase 1A expansion had been constructed as shown in Figure 17. By the time of the 2020 inspection the Phase 1B expansion was largely complete with placement of overliner drain fill and PLS collection piping ongoing as shown in Figure 18.

Figure 17: Heap Leach Facility Overview 2019

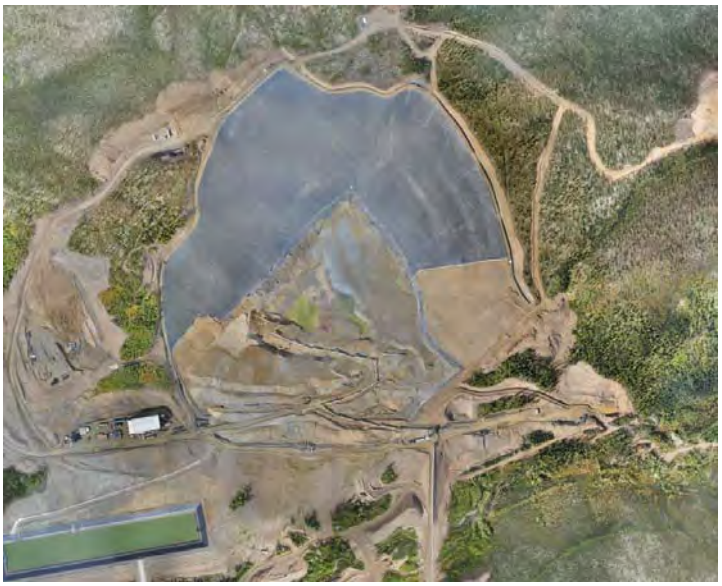

Figure 18: Heap Leach Facility Overview 2020

5.1 Toe Slope

1. Some scouring and rilling noted along the toe slope below the HLF and above the un-named stockpile area. See Figure 19 below for details.

Figure 19: Scouring and rilling along toe slope of HLF

5.2 Temporary Access Road above HLF

1. Noted sections of pooling water and or soft/deflecting areas on temporary access road above Phase 1B of the HLF. See Figures 20 – 22.

Figure 20: Pooling water above Phase 1B of the HLF

Figure 21: Soft road sections above Phase 1B of the HLF

Figure 22: Soft road sections above Phase 1B of the HLF

5.3 Phase 1B Interception Ditch

1. The phase 1B interception ditch appears to have been recently constructed. Rock armoring appears to be class 25kg to 50kg, and approximately 100mm to 150mm thick. Geotextile was visible in several locations (Figure 23).

Figure 23: Typical Phase 1B Ditch

2. The interceptor ditch has collected silt/material in some sections, indicating scour and/or erosion on the uphill cut slope and/or sloughing from the access road. (Figure 24, 25)

Figure 24: Material deposited in HLF Phase 1B Interceptor Ditch

Figure 25: Material deposited in HLF Phase 1B Interceptor Ditch

3. A section of the interceptor ditch along the North edge of the HLF appeared to be unfinished, with geotextile installed but no rock armoring (Figure 26).

Figure 26: Unfinished section of Interceptor Ditch

4. Based on visual inspection it did not appear that the Phase 1B Interceptor Ditch was properly graded from the ditch origin (East) to the discharge point (West). This could lead to pooling water forming above the HLF and lead to slope stability issues. See Figure 27 for a view from the ditch origin above the East edge of the Phase 1B HLF expansion.

Figure 27: Phase 1B Interception Ditch sloping

6 OPEN PIT

1. The pit walls appear stable, and constructed in competent rock. See Figure 28 below for details.

Figure 28: Pit Walls

7 PLATINUM GULCH DUMP

1. Platinum Gulch Dump is currently operational, and the side slopes appear to be stable. See Figure 29 below.

Figure 29: Dump Fill Slope

8 PRIMARY CRUSHER

8.1 MSE Walls

1. No apparent damage or deterioration was noted during the inspection of the Primary Crusher MSE wall (Figure 30 - 32). No changes were visually identified from the 2019 inspection.

Figure 30: Primary Crusher

Figure 31: Northwest Face

Figure 32: Southeast Face

8.2 Cut and Fill slopes

1. Cut and fill slopes appear to be acceptable, no stability or erosion issues noted. (Figures 33 and 34).

Figure 33: Northwest fill slopes

Figure 34: Cut slopes above Primary Crusher

9 SECONDARY/TERTIARY CRUSHER

9.1 MSE Wall

1. No apparent damage or deterioration was noted during the inspection of the Secondary/Tertiary Crusher MSE wall (Figure 35 – 36). No changes were visually identified from the 2019 inspection.

Figure 35: South side of MSE wall

Figure 36: MSE wall behind secondary/tertiary crusher

9.2 Cut Slopes

1. Observed locations behind the secondary crusher showed no signs of stability or erosion issues (Figure 37). Some outcrops of rippable rock visible.

Figure 37: Cut slopes above Secondary/Tertiary Crusher

10 ADSORPTION, DESORPTION, AND RECOVERY PLANT (ADR)

10.1 Cut and Fill Slopes

1. Cut slopes behind the ADR area appear to be competent rock, and currently stable though some unraveling and rilling were noted (Figure 38). Minor accumulation of small debris was noted at the toe of the slope, collecting in the ditch, and was observed in the 2018 and 2019 inspections (Figures 39 and 40).

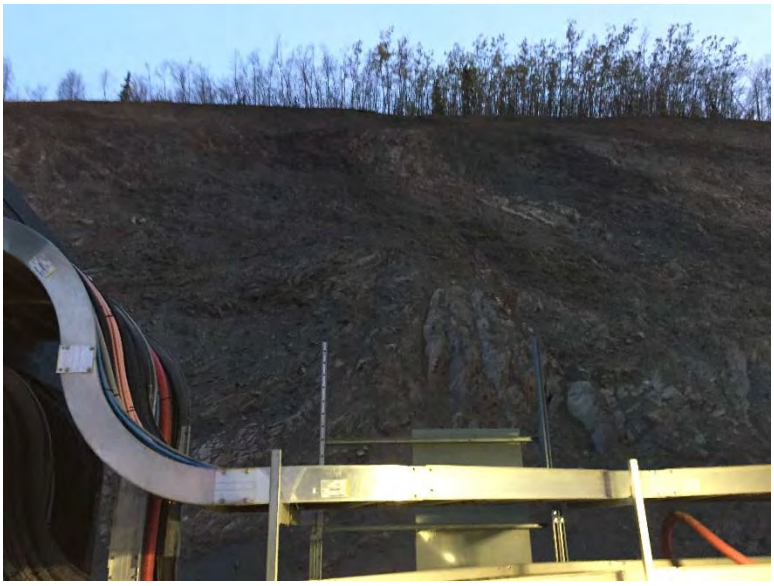

Figure 38: Slopes behind ADR (2020) with unraveling and rilling

Figure 39: Slopes behind ADR (2019)

Figure 40: Slopes behind ADR (2018)

10.2 North Toe Ditch

1. There is a small V ditch, referred to here as the North Toe Ditch (Figure 41), with sides close to 1:1 cut at the base of a large steep slope which is cut into bedrock; the ditch is not armored and contains loose gravel and fines, although there are no apparent scouring issues. There is also a culvert which has been installed along the ditch alignment.

Figure 41: Typical North Toe Ditch cross section

11 EVENTS POND

11.1 Cut/Fill Slopes

1. The events pond was constructed between the 2018 and 2019 inspections, with hillslope unraveling noted in the 2019 inspection.

Figure 42: Overall view of event pond

2. Rill erosion and scour channels on the cut slopes above the event pond and the heap leach spillway were noted in this inspection as shown in Figures 43 – 45.

Figure 43: Rill erosion below HLF spillway

Figure 44: Rill erosion above HLF spillway

Figure 45: Scoured channel above Event Pond

11.2 Pooling Water

1. Pooling water was noted in various locations along the North side of the event pond as shown in Figures 46 – 48.

Figure 46: Pooling water above Event Pond

Figure 47: Pooling water above Event Pond

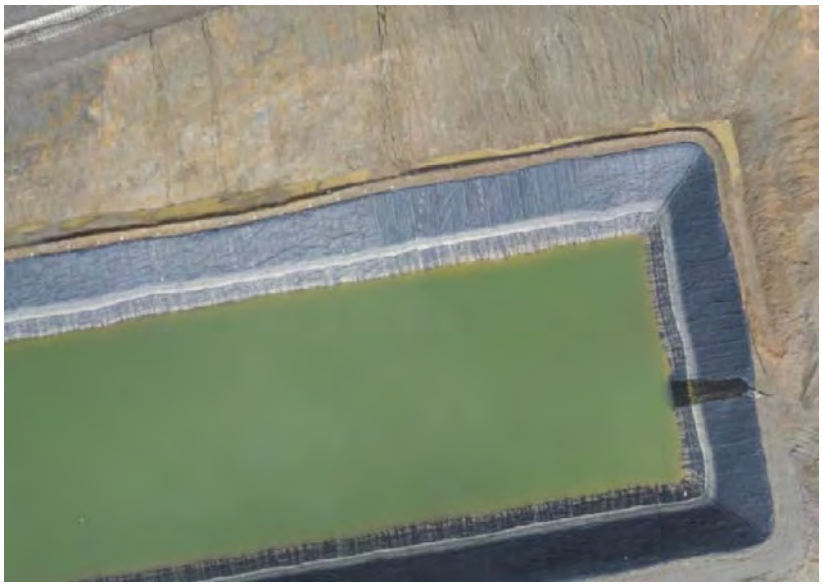

Figure 48: Pooling water above Event Pond

11.3 Silt Build-up

1. Silt build-up was noted at the discharge of the heap leach spillway into the event pond as shown in Figure 49. Material accumulation on the bottom of the pond was also observed from above as shown in Figure 50.

Figure 49: Silt build-up at HLF Spillway discharge

Figure 50: Material build-up on Event Pond bottom

11.4 Heap Leach Spillway

1. As noted in Section 11.1 scouring was observed upslope and downslope of the heap leach spillway. Material has begun to accumulate in the spillway as shown in Figure 51. The spillway is constructed with a concrete-filled fabric liner and appears stable.

Figure 51: Slopes from heap leach spillway

11.5 Events Pond Emergency Spillway

1. The emergency spillway is in place, constructed of similar material as the HLF spillway, and appears stable (Figure 52). The spillway is directed downslope towards Dublin Gulch. No concerns at this time.

Figure 52: Events Pond Emergency spillway

12 DITCH A

1. Ditch A carries flow from the Platinum Gulch Dump down to the Control Pond. The ditch formerly (2019) collected flow in a collection sump (Figure 53) which was then transferred in gravity drain HDPE piping down to the LDSP. The sump and all piping (other than sections acting as temporary culverts at road crossings) has since been removed and the ditch is being reconstructed with liner and armoring as seen in Figure 54 and 55.

Figure 53: Flow into collection sump (2019)

Figure 54: Ditch A under construction (2020)

Figure 55: Ditch A under construction (2020)

2. A culvert for a tie-in ditch from the Secondary Stockpile perimeter ditch was observed to be blocked with sediment/material just before the connection to Ditch A. The culvert outlet and inlet (buried) can be seen in Figures 56 and 57 respectively.

Figure 56: Secondary Stockpile drainage ditch culvert blocked (outlet)

Figure 57: Secondary Stockpile drainage ditch culvert blocked (inlet)

13 DITCH B

1. Ditch B begins at a small watercourse known as Suttles Gulch. The ditch flows West towards the Control Pond. The ditch is armored with approximately class 25kg rock. Some slope instability was noted near the control pond, with erosion carrying sediment down the cut slope (Figure 58). Site representatives are already aware of this issue, and sediment is being actively managed using silt fencing (Figure 59).

Figure 58: Erosion on South cut slope above Ditch B

Figure 59: Silt fencing constructed in areas of erosion on cut slopes

14 DITCH C

1. Diversion Ditch C (Figure 60) begins at the 1500mm outlet culvert for the Control Pond and terminates in Haggart Creek (Figure 61). This ditch acts as both an emergency spillway if the Control Pond is filled over capacity or a conveyance channel for water released from the control pond through the low level outlet. The ditch is armored with approximately class 10kg rock, and liner is visible in several locations. The ditch crosses several roads via culverts.

Figure 60: Ditch C typical section

Figure 61: Ditch C Outfall to Haggart Creek

2. Pooling water and sedimentation was observed on the North side of Ditch C immediately West of the culvert from the LDSP spillway to Ditch C (Figure 62). There appeared to be a lined ditch that provided a path for the pooled water to flow down to Ditch C though the discharge of this ditch was not controlled (Figure 63)

Figure 62: Pooled water above Ditch C

Figure 63: Pooled water ditch discharge into Ditch C

15 FORMER NUWAY CRUSHER PAD

1. This area is not currently being used, but a VGC representative indicated that it is within the Phase 3 footprint of the HLF and will eventually be regraded in preparation for ongoing HLF development. Observed some over steepened slopes (Figure 64), with material collecting at the toe of these slopes.

Figure 64: Over steepened slopes

16 ORICA LAYDOWN

1. One section of cut slope was noted as being over-steepened in the 2019 inspection (Figure 65). This appears to have been since rectified as slopes appeared acceptable during this years inspection (Figure 66).

Figure 65: Section of over-steepened slope (2019)

Figure 66: Section of corrected slope (2020)

2. An unlined, unarmored ditch from the portable structures (Figure 67) appears to have been constructed since the previous inspection. The ditch appears interrupted in places but flow generally leads to the Orica sump (Figure 68) before discharging to the woods.

Figure 67: Orica perimeter ditch

Figure 68: Orica sump

17 UN-NAMED STOCKPILE AREA

17.1 Stockpile Sloping

1. Several un-named overburden stockpiles have been placed to the south of the HLF and Event Pond (Figure 69). Some of the stockpiles have over-steepened sides, but there is little risk to other infrastructure. The area is currently mostly un-used.

Figure 69: Some stockpiles with steep side slopes

17.2 Water Management

1. There are some minor water management issues in the area, with rainfall run-off flowing down and around the stockpiles as apparent from the small gulley that formed at the base (Figure 70). Some ponding water is present in the laydown areas (Figure 71).

Figure 70: Small gulley forming adjacent to stockpiles

Figure 71: Ponded area adjacent to stockpiles

18 RECOMMENDATIONS

18.1 General

1. VGC should assign a qualified, on site, individual to be responsible for monitoring and documentation of any mass earth structures that have significant risks in the case of a failure. The individual should develop a standard operating procedure for the monitoring and risk management of these structures. This individual should be responsible for coordination with a qualified professional to review monitoring data for concerns and trends, if they are not qualified themselves.
2. VGC should continue to assign individuals to document and be responsible for the monitoring and construction of any structures to determine if the structures are constructed in accordance with design. Any variations between design documents and final construction should be included in final record drawings.
3. Any finalized construction of mass earth structures should include a final construction report that includes any operational and maintenance requirements (if any) to ensure stability of the structure.
4. VGC should consider a monitoring program to assist in early warning and detection of any movements in mass earth structures. Such a program might use permanent survey points, slope inclinometers, piezometers, or other tools to measure internal/external movements and pore water pressures. Such a monitoring program should be developed with the assistance of and be implemented with the oversight of a qualified professional.
5. For any stockpiles, cut slopes, and/or fill slopes with over-steepened slopes that do not require immediate rectification (due to proximity to structures, roadways, active work areas, etc) VGC should still cordon off the area above and/or below the over-steepened slope depending on what would be accessible to site staff.

18.2 LDSP (Control Pond)

1. Address erosion occurring on the southwest slope of the pond. This is likely due to water infiltration from Ditch A or the adjacent culvert outlet. This section of ditch may require further armoring or installation of a liner to properly direct water away from the Control Pond slope.

18.3 Secondary Stockpile

1. Tie the perimeter ditch into the collection sump.

18.4 HLF

1. Continue to monitor the cut slopes around the perimeter of the HLF for erosion. Maintain the upper bench and remove sloughing material as required.
2. Monitor the toe slope below the HLF for rill erosion and revegetate and stabilize the slopes as needed.
3. Consider re-grading temporary access road (slope towards interception ditch) above HLF to prevent pooling water forming.

4. Monitor soft/deflecting areas of temporary access road above HLF, particularly above HLF liner anchor trench.
5. Check Phase 1B Interception Ditch design and complete construction if needed for sections that are lined but not armored. Check design for sloping requirements to outfall and confirm whether installed ditch meets design and monitor ditch for potential of pooling water.

18.5 Open Pit

1. No specific recommendations at this time.

18.6 Platinum Gulch Dump

1. No specific recommendations at this time.

18.7 Primary Crusher and MSE Wall

1. A monitoring program should be established using regular survey of the MSE walls, to detect any potential movement. 3D scanning equipment would provide an adequate monitoring program, with scan frequency to be determined between site and an experienced professional.

18.8 Secondary/Tertiary Crusher and MSE Wall

1. A monitoring program should be established using regular survey of the MSE walls, to detect any potential movement. 3D scanning equipment would provide an adequate monitoring program, with scan frequency to be determined between site and an experienced professional.

18.9 ADR

1. Review engineering requirements for the North Toe Ditch to confirm ditch size, and need for rock armoring. Toe ditch is currently tied into the roadside ditch, which should also be reviewed for engineering requirements. Recommend reviewing hydraulic design of both ditches to determine what is necessary.

18.10 Event Pond

1. Monitor minor erosion of cut slopes and maintain as required.
2. Monitor pooling water above the North side of the Event Pond and regrade area to prevent pool formation or install a water handling system (sump pumps, etc.).
3. Monitor material deposits on HLF spillway and Event Pond to ensure the spillway and pond designs are not compromised through either blockage of flow or reduced pond capacity.

18.11 Ditch A

1. Un-block the feeder ditch/culvert which will carry flow from the Secondary Stockpile perimeter ditch to Ditch A.

18.12 Ditch B

1. Continue to manage sediment entering the ditch from the cut slopes on the downstream end. Silt fencing is currently in place to address this.
2. Monitor erosion above South side of Ditch B and consider re-sloping area as needed.

18.13 Ditch C

1. Monitor pooling water above LDSP outlet to Ditch C. Consider tieing in pooled water discharge ditch with Ditch C to prevent erosion and scouring on North side of Ditch C.

18.14 Former Nuway Crusher Pad

1. Pull back over-steepened slopes prior to utilizing this area. Flag over-steepened slopes in the meantime to protect site staff.

18.15 Orica Laydown

1. Monitor perimeter sump for flow interruptions/blockages and consider re-trenching if pooled water observed.

18.16 Un-Named Stockpile Area

1. Consider additional ditching and water management in the area to prevent scouring of the road surfaces and erosion around the stockpiles. Ditch water away from the laydown areas to prevent ponding.
2. Flag over-steepened slopes in area to protect site staff.

19 CONCLUSION

The structures reviewed in this inspection generally show little evidence of movement or risk indicators. Where risk of movement was identified, the risk is typically low and the consequence of a small instability is managed by minimizing exposure to workers, infrastructure or high value natural resources. Slopes reviewed meet the recommendations for slope angles in most locations.

The fact that some current infrastructure is currently incomplete and in construction leaves insufficient baseline data for comparison, but will improve with subsequent reviews. VGC representatives have noted that they have surveys and monitoring programs for infrastructure where a risk of failure would have significant consequences (i.e. the Open Pit, Platinum Gulch Dump, HLF) but review of that survey data was not included as a part of this inspection. Comparisons to inspection reports from previous years have been noted where relevant.

There are some minor erosional and stability concerns within the project, that can be addressed with some minor planning and maintenance as mining operations continue in order to moderate or eliminate the associated risks.

We trust this report satisfies your requirements at this time and thank you for the opportunity to work with you on the project. If you have questions or concerns do not hesitate to contact our office.

Yours truly,

Table of Contents

SECTION 1 – INTRODUCTION.....7
SECTION 2 – PRINCIPLE 1, PRODUCTION: Encourage responsible cyanide manufacturing by purchasing from manufacturers who operate in a safe and environmentally protective manner.....8
1.1 Purchase cyanide from manufacturers employing appropriate practices and procedures to limit exposure of their workforce to cyanide and to prevent releases of cyanide to the environment.....8
2. TRANSPORTATION: Protect communities and the environment during cyanide transport.....8
2.1 Establish clear lines of responsibility for safety, security, release prevention, training and emergency response in written agreements with producers, distributors and transporters.....8
2.2 Require that cyanide transporters implement appropriate emergency response plans and capabilities and employ adequate measures for cyanide management.....9
3. HANDLING AND STORAGE: Protect workers and the environment during cyanide handling and storage.....9
3.1 Design and construct unloading, storage and mixing facilities consistent with sound, accepted engineering practices and quality control and quality assurance procedures, spill prevention and spill containment measures**.**.....9
3.2 Operate unloading, storage and mixing facilities using inspections, preventive maintenance and contingency plans to prevent or contain releases and control and respond to worker exposures.....11
4. OPERATIONS Manage cyanide process solutions and waste streams to protect human health and the environment.....12
4.1 Implement management and operating systems designed to protect human health and the environment including contingency planning and inspection and preventive maintenance procedures.....13
4.2 Introduce management and operating systems to minimize cyanide use, thereby limiting concentrations of cyanide in mill tailings.....15
4.3 Implement a comprehensive water management program to protect against unintentional releases.....15
4.4 Implement measures to protect birds, other wildlife and livestock from adverse effects of cyanide process solutions.....16
4.5 Implement measures to protect fish and wildlife from direct and indirect discharges of cyanide process solutions to surface water.....17
4.6 Implement measures designed to manage seepage from cyanide facilities to protect the beneficial uses of ground water.....17
4.7 Provide spill prevention or containment measures for process tanks and pipelines.....18

4.8 Implement quality control/quality assurance procedures to confirm that cyanide facilities are constructed according to accepted engineering standards and specifications. 18

4.9 Implement monitoring programs to evaluate the effects of cyanide use on wildlife, surface and ground water quality. 19

5. DECOMMISSIONING: Protect communities and the environment from cyanide through development and implementation of decommissioning plans for cyanide facilities. 19

5.1 Plan and implement procedures for effective decommissioning of cyanide facilities to protect human health, wildlife and livestock. 19

5.2 Establish an assurance mechanism capable of fully funding cyanide-related decommissioning activities. 20

6. WORKER SAFETY: Protect workers' health and safety from exposure to cyanide. 20

6.1 Identify potential cyanide exposure scenarios and take measures as necessary to eliminate, reduce and control them. 20

6.2 Operate and monitor cyanide facilities to protect worker health and safety and periodically evaluate the effectiveness of health and safety measures. 21

6.3 Develop and implement emergency response plans and procedures to respond to worker exposure to cyanide. 23

7. EMERGENCY RESPONSE: Protect communities and the environment through the development of emergency response strategies and capabilities. 23

7.1 Prepare detailed emergency response plans for potential cyanide releases. 24

7.2 Involve site personnel and stakeholders in the planning process. 24

7.3 Designate appropriate personnel and commit necessary equipment and resources for emergency response. 24

7.4 Develop procedures for internal and external emergency notification and reporting. 25

7.5 Incorporate into response plans monitoring elements and remediation measures that account for the additional hazards of using cyanide treatment chemicals 26

7.6 Periodically evaluate response procedures and capabilities and revise them as needed. 26

8. TRAINING: Train workers and emergency response personnel to manage cyanide in a safe and environmentally protective manner. 27

8.1 Train workers to understand the hazards associated with cyanide use. 27

8.2 Train appropriate personnel to operate the facility according to systems and procedures that protect human health, the community and the environment. 27

8.3 Train appropriate workers and personnel to respond to worker exposures and environmental releases of cyanide 28

9. DIALOGUE: Engage in public consultation and disclosure 29

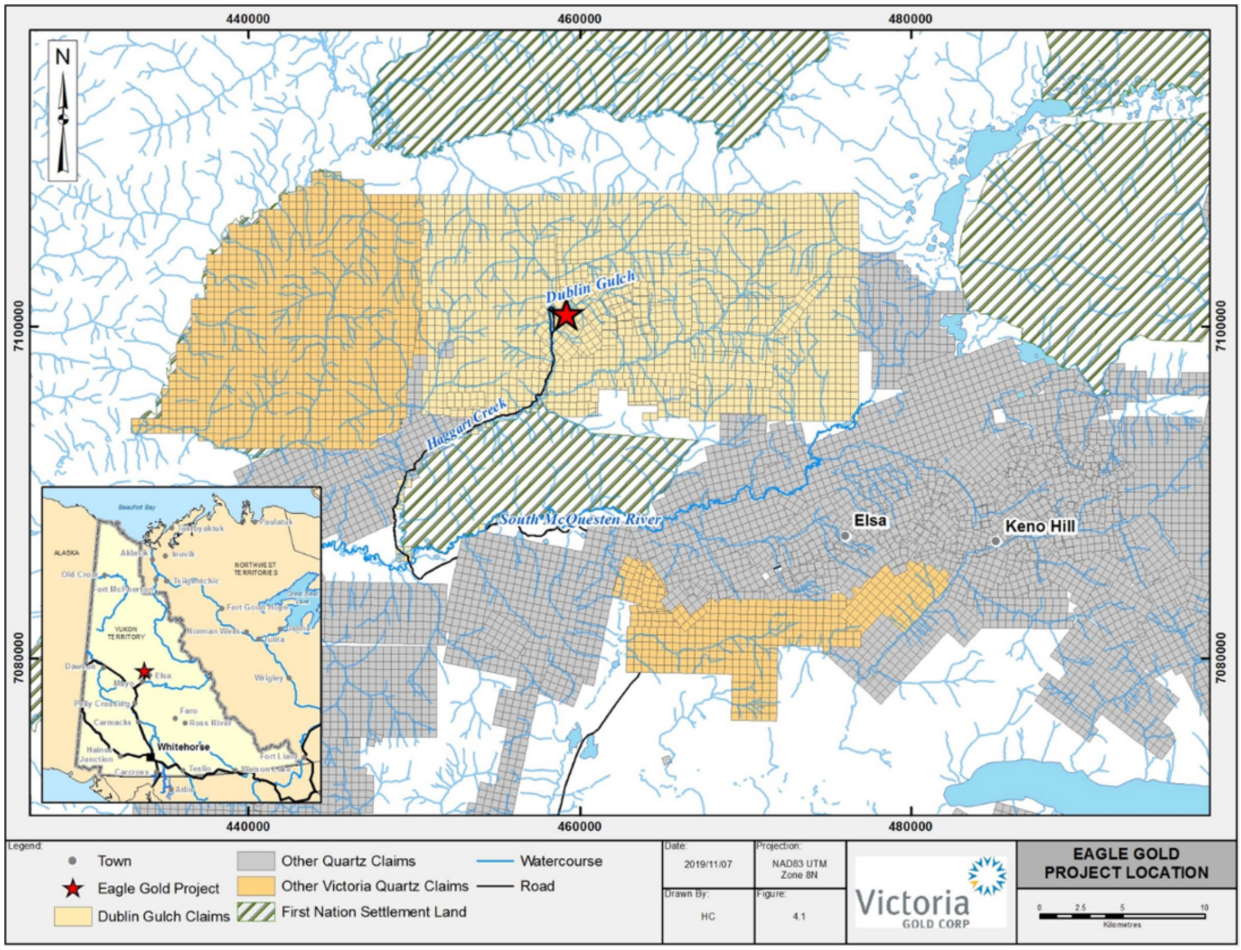
9.1 Provide stakeholders the opportunity to communicate issues of concern. 29

9.2 Initiate dialogue describing cyanide management procedures and responsively address identified concerns. 29
9.3 Make appropriate operational and environmental information regarding cyanide available to stakeholders. 29

Mining Operation: Eagle Gold Mine

Mine Owner: Victoria Gold Corp.

Mine Operator: Victoria Gold (Yukon) Corp.

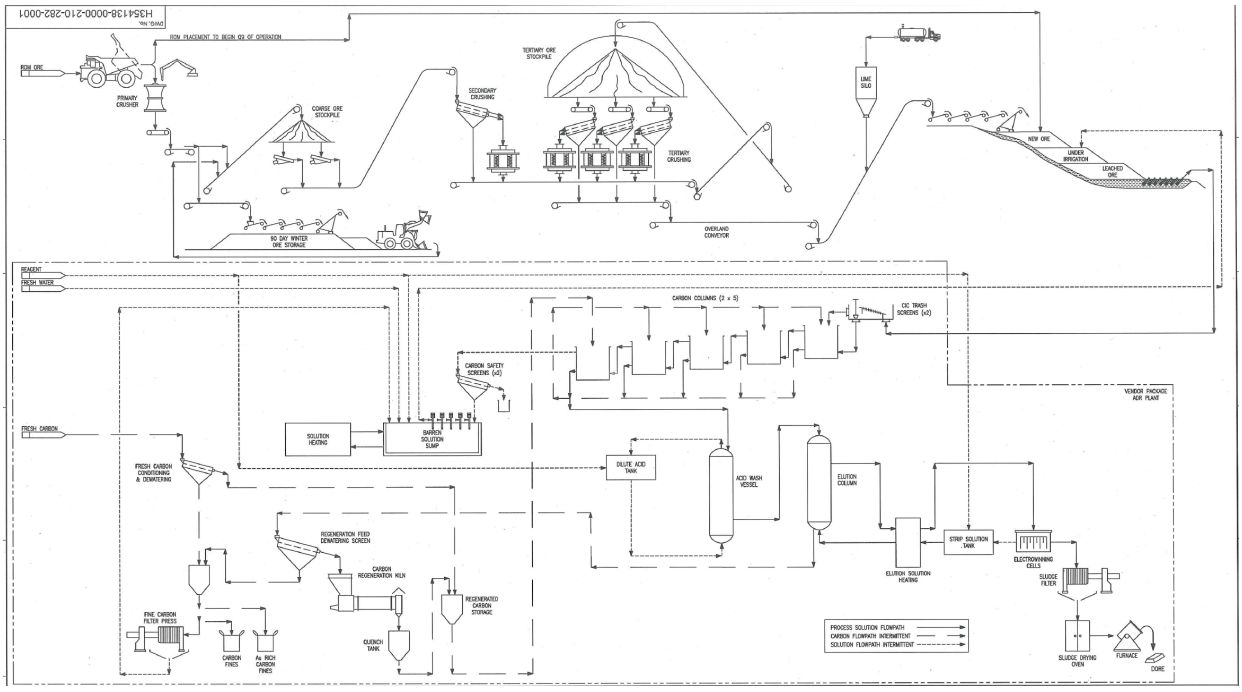


Name of Responsible Manager: John McConnell, President & CEO

Address and Contact Information:

Victoria Gold Corp.,
80 Richmond Street West
Suite 204
Toronto, ON M5H 2A4, Canada
T: 416.866.8800
F: 416.866.8801

Location and description of the operation



The Eagle Gold Mine location is presented in the picture below:

The Eagle Gold deposit is situated within Victoria Gold's Dublin Gulch property. The Eagle deposit is actively being mined using open pit methods. Ore extracted from the open pit is either fed through a three-stage crushing plant (to produce an 80% passing (P80) 6.5 mm product) and transferred by covered conveyor to the heap leach pad (HLP) or trucked as run-of-mine (ROM) ore, that bypasses the crushing plant, to the HLP.

Gold is extracted from ore into a solution by using a sodium cyanide heap leaching process within the HLP. Gold is then recovered from solution by an adsorption-desorption-recovery (ADR) carbon plant.

The Eagle process flows diagram is presented below:

Scope of service

Forte Dynamics, Inc. (Forte) was requested by Victoria Gold Corp. (Victoria, VGC) to perform the annual audit of the Eagle Gold Mine's Cyanide Management Plan (CMP) and its implementation following the guidelines of the International Cyanide Code for the Manufacture, Transport, and Use of Cyanide in the Production of Gold (Cyanide Code, Code). Adam House, a certified technical expert auditor for gold mining under the Code performed the audit. Forte has reviewed the CMP and supporting information, and the findings of the review are presented below following the Cyanide Code summary report format. The scope did not include a Cyanide Code certification audit, nor did it include a dedicated site visit for the purpose of the audit given the challenges due to COVID-19. Rather, Forte relied on prior site visits and communication with the site team, photographs, electronic document review, and personnel interviews to conduct the assessment remotely.

SECTION 1 – INTRODUCTION

As part of project development and as a condition of the Water Use License (WUL), License #QZ14-041-1, issued by the Yukon Water Board, Victoria prepared a Cyanide Management Plan. The plan is written to follow the guidelines of the Cyanide Code for the Principles and Standards of Practice under the Code. The WUL requires an annual audit of the CMP. The CMP provided for review was Version 2019-02, issued April 2019. A cutoff date of June 30, 2020 was used for data analysis purposes.

The CMP was developed prior to project completion and still references the operation as a "project", bearing the StrataGold Corporation name and logo. At the time of the audit, the CMP had not undergone the required annual internal review and update. It is VGC's intent to have

the annual internal review coincide with the annual compliance audit. It is recommended that during the 2020 update, references throughout the document be updated to reflect active mining operations and processing with cyanide, as well as updating the company name and logo to consistently reflect Victoria Gold Corp. across all documents associated with the plan. It is further recommended the annual internal review and update be conducted ahead of the compliance audit so that the auditor(s) are reviewing the most recent version of the document. Any recommendations as outcomes of the audit would warrant the appropriate review and update to the CMP, as would any changes in the operation that impact the CMP.

SECTION 2 – PRINCIPLE 1, PRODUCTION: Encourage responsible cyanide manufacturing by purchasing from manufacturers who operate in a safe and environmentally protective manner.

1.1 Purchase cyanide from manufacturers employing appropriate practices and procedures to limit exposure of their workforce to cyanide and to prevent releases of cyanide to the environment.

The operation's long-term supply contract with the cyanide supplier, Cyanco Canada Inc. (Cyanco), does not require that the cyanide be produced at a facility that has been certified as following the Code. However, the certification status of the cyanide supplier, who is the product manufacturer, was verified by review of the ICMI website. During the audit period VGC only purchased cyanide from Cyanide Code certified producers, with the agreement to purchase 100% of their required cyanide from Cyanco. No cyanide was purchased from an independent distributor(s) during the audit period, nor are current plans or provisions in place to do so. While no secondary supply contract is in place, there are alternative suppliers available in North America that are also certified under the Code if a disruption in the supply chain necessitated an alternative supplier.

Cyanco provides cyanide to the Eagle Mine in intermediate bulk containers (IBC's) consisting of dual layer polypropylene/polypropylene bags with wooden overpack crates. The crates are loaded into 20-foot seaworthy intermodal containers for delivery to site by truck.

2. TRANSPORTATION: Protect communities and the environment during cyanide transport.

2.1 Establish clear lines of responsibility for safety, security, release prevention, training and emergency response in written agreements with producers, distributors and transporters.

Written agreements meeting the Cyanide Code's requirements were in place for the supply contract (i.e. Cyanco) during the audit. The cyanide purchase contract includes the cyanide manufacturer's (seller) responsibility on delivering the product to the mine site.

The seller's transportation supply chain is currently certified under the Cyanide Code. Supply is through the Cyanco Western U.S./Canada Rail, Barge & Truck Supply Chain. The supply chain includes rail, barge, & truck transportation from Cyanco's Alvin, Texas, USA production

plant to the Eagle site in Canada. The certification status of the supply chain was verified via the Cyanide Code website. One element of the supply chain was implied but not implicitly stated in the summary audit report available on Cyanide Code website; however, inclusion of this portion of the supply chain, and a status of full compliance, was confirmed with the lead auditor responsible for certifying transportation with an amendment intended to be submitted for the summary audit report.

Regarding storage and security at ports of entry, the contract includes Seller´s responsibility for interim loading, storage, unloading during shipment and unloading at the operation.

Safety and maintenance of the means of transportation throughout transport is addressed as seller's responsibility in the contracts, as well for task and safety training and emergency response for transporters and handlers throughout transport.

2.2 Require that cyanide transporters implement appropriate emergency response plans and capabilities and employ adequate measures for cyanide management.

The contract states the seller is responsible for all aspects of transportation of cyanide to the Eagle site, as well as cyanide production. The contract does not commit the Seller to maintaining ICMC certification and signatory status. However, the cyanide transporters to Eagle are certified under the Code.

The sole cyanide supply chain to Eagle is certified under the Code. The Cyanco Western U.S. / Canada Rail, Barge, & Truck Supply Chain, currently supplies the cyanide to the mine site. It is comprised of barge, rail and truck movements using the Cyanco supply chain from the Alvin, TX production plant to the customer location. The Cyanco supply chain was first ICMC certified on March 06, 2013 and underwent appropriate recertification audits since that time. This branch of the supply chain was most recently recertified on April 22, 2020 to include transportation to the Eagle site.

Cyanco is responsible for the safety and security of the transport, including emergency response. Cyanco follows their Global Transportation Emergency Response Plan (GTERP) and engages CHEMTREC for emergency response notifications in the US and ERAP in Canada. Cyanco utilizes Terrapure as the emergency response contractor within Canada.

3. HANDLING AND STORAGE: Protect workers and the environment during cyanide handling and storage.

3.1 Design and construct unloading, storage and mixing facilities consistent with sound, accepted engineering practices and quality control and quality assurance procedures, spill prevention and spill containment measures.

The CMP indicates that the cyanide delivery area will be “cordoned off with warning signs and visual barriers to prevent unauthorized passage of personnel and equipment while the cyanide intermodal containers are being offloaded”. In practice, signs and barriers are not used for the

offloading process; however, spotters are utilized to keep personnel away from the area while the crane is unloading a container from the truck. The use of spotters was verified through photographs taken during the process. The CMP should be updated to reflect the actual operational practices.

The plan further indicates that a dedicated area for the sea containers will be provided at the ADR plant. The area was intended to be fenced off for container storage. However, fencing was not installed to allow better access to the containers and for use of the crane to unload the containers from the trucks. The CMP should be updated to reflect the actual operational practices. The CMP also describes placement of the containers such that the lockable doors are facing one another such that access to the door is restricted without movement of the entire container. Placement of the containers with the doors facing one another was verified and documented.

A single container is to be placed on a “bermed concrete pad” at the main entry to the ADR plant to allow operations access for unloading the cyanide crates for use. The intent of the bermed pad was to permit the dry retrieval of any potential spillage of cyanide. A dedicated concrete pad was verified for this purpose. The pad is not bermed, as this would impede normal access into the ADR plant; however, the existing arrangement would still allow for the dry retrieval of any potential spillage. The CMP description should be updated to reflect the as-built condition of the pad.

A dedicated area within the ADR plant is used for the short-term storage of the IBC’s as they are prepared for use. Access to the building contains appropriate warning signs, consistent with the language specified in the Code. The storage area also includes an HCN detector with audible and visual alarms, combination safety shower and eyewash station, and dry powder fire extinguishers for use in an emergency.

Eagle uses cyanide from IBC containers, which are stored in the sea containers until they are brought into the plant and prepared for use. The cyanide mixing system, including the cyanide mixing and cyanide storage tanks, was designed by Hatch. A complete set of design drawings was available for review by the auditor. These drawings are stamped by a Certified Professional Engineer Registered in the Yukon Territory.

Observations within the plant confirmed that the cyanide mixing area was located within the internal structure of the process plant within a dedicated concrete containment area. The mixing system appeared to be maintained in good condition. Cyanide mixing and storage tanks were located within concrete berms. The mixing area is also subject to inspections each shift to detect any obvious releases or failure in containment. Shift reports were provided for review during the audit.

The cyanide storage area is located inside the plant area and located far away from communities and surface waters. The cyanide storage is adjacent to the process plant building, where the Process operations personnel are located. The process plant has HCN gas monitors equipped with visual and audible alarms at the cyanide mix area that will alert employees in case of a release of HCN gas. Operators are also required to have a portable HCN monitor in use. In

addition, the standard operating procedure (SOP) CMP-SOP-020 – Cyanide Emergency Response Procedures covers multiple emergency scenarios, including for the process plant in the event of high concentrations of HCN gas.

Any potential spills of solid cyanide from the IBC containers in the bulk storage area will be contained within the sea container. Spillage of any dry product during unloading of the containers would be contained on the concrete pad, as noted above, allowing for dry cleanup. Spillage inside the plant would also occur within the concrete containment area, allowing for dry cleanup.

Eagle has a preparation area for cyanide that includes a mixing tank and a storage tank. There are solution level indicators with high-level alarms installed on both tanks. These levels are continuously monitored from the control room. No failures of the level indicators were reported. The auditor observed screenshots of HMI showing that the level indicators were functioning correctly.

Cyanide mixing and storage tanks are secured to solid, reinforced concrete pedestal-type foundations and are contained within concrete bunded areas which appear to be in good condition. The cyanide mixing and storage containment volume is not the recommended 110% of the largest tank. It is approximately 40% of the required volume, including the dedicated sump that reports back to the mixing tank. A low point in one section of the containment wall, measuring approximately 2” deep x 13’ wide would direct any excess solution into the main containment area beneath the carbon columns. This combined containment exceeds the 110% required. In addition, the carbon column area also has a dedicated sump to evacuate any spillage to the discharge launder of the final carbon column.

The cyanide storage is located in an outdoor area west of the process plant building. As such, it has adequate ventilation, and build-up of hydrogen cyanide gas is unlikely to occur. As it does not have a roof, the site uses the characteristics of the IBC’s, securely stored within the sea containers, to meet the intent of the Code requirements. The risk of potential contact with meteoric water is very low. The cyanide storage containers are secured with a lock and positioned door to door such that access to the cyanide containers is restricted.

The cyanide mixing and storage tanks are located in southwestern portion of the plant area, near the main rollup equipment door. The building appears to have appropriate ventilation to prevent build-up of hydrogen cyanide gas. These tanks are located within the plant building and has restricted access. The area can only be accessed with the presence of authorized operations personnel. The cyanide mixing and storage tanks are stored within a dedicated containment area with concrete berms, with no other materials permitted to be stored in this area.

3.2 Operate unloading, storage and mixing facilities using inspections, preventive maintenance and contingency plans to prevent or contain releases and control and respond to worker exposures.

The empty cyanide bags are triple rinsed over the mix tank after the contents are emptied. The rinsed bags, including the liner, plywood crate, and strapping materials are collected and transported to a secure, onsite incinerator for disposal, according to CMP-SOP-006 – Controlled

Disposal of Cyanide Packaging Materials. The packaging materials are stored inside of a secure sea container until they are incinerated in maximum batch sizes of 340 kg. Photographs of the rinse system and secure storage area were provided to the auditor.

Eagle has CMP-SOP-005 – Cyanide Mixing Process that outlines the requirements for inspection, observation and mixing of cyanide solutions, including the sequence required for the cyanide mixing process. It also includes instructions for the prefill of the cyanide mixing tank with water and ensure a pH of at least 12 through caustic solution prior to adding cyanide. The current operational practice is to ensure a pH of at least 11 prior to cyanide addition A pH of 11 is adequate to avoid HCN evolution, but remains below the threshold for dissolving silica, which is problematic for operations. The pH is achieved through the addition of sodium hydroxide to the mix tank, or through the pH from the residual solution remaining from the prior batch. The CMP and procedure should be updated to reflect actual operational practices. This procedure also requires that any solid cyanide spillage in the mixing area must be swept up for disposal and the area cleaned with hypochlorite solution to detoxify any residue before being hosed to the sump.

The Cyanide Mixing Process procedure requires operators to use the appropriate personal protective equipment (PPE) during mixing activities. These include both standard PPE required for operations, as well as specialty items such as steel-toed boots, rubber gloves, rubber boots, approved respirator, face shield, chemical suit with hood, hardhat, safety glasses, hearing protection and a personal HCN detector. The PPE requirements are further described in CMP-SOP-008 – PPE for Cyanide Facility Operations. The mixing process was verified by the auditor during prior site visits and through photographs provided for the audit. The CMP references a video monitoring system to allow remote observation of the mixing area; however, site confirms that the video monitoring system has not yet been installed. The procedure does require two operations personnel for cyanide mixing with the area barricaded and secured from unauthorized access during mixing. Remote video monitoring capability should be considered best practice, but the current procedure satisfies the intent of the Code.

Procedure CMP-SOP-004 – Receipt and Storage of Reagent Cyanide indicates that the sea containers are handled using a forklift to unload the delivery trucks and either to place the containers within the bulk storage area or on the concrete pad near the ADR plant and cyanide mixing area. While not specified within the procedure, truck unloading and container movement also occurs through the use of a mobile crane, as observed through photos provided for the audit. This procedure also indicates that containers shall not be stacked. The solid cyanide product inside the IBCs already comes with red colorant dye, as delivered by Cyanco.

The cyanide mixing process was observed through photos provided during the audit. Prior onsite reviews, the procedures, and the documentation provided during the review indicated that Eagle has appropriate SOPs and practices to handle and prepare cyanide solutions in a safe manner.

4. OPERATIONS Manage cyanide process solutions and waste streams to protect human health and the environment.

4.1 Implement management and operating systems designed to protect human health and the environment including contingency planning and inspection and preventive maintenance procedures.

Eagle has several documents that are intended to support the safe operation of cyanide facilities. Some of these key items include the Cyanide Management Plan, the SOP's related to cyanide operations, and the Heap Leach Facility Operation, Maintenance and Surveillance (OMS) Manual. All SOPs include a section related to PPE requirements and considerations of safety hazards. The operation has identified equipment, personnel, and procedures for cyanide unloading and mixing activities as well as for storage facilities, processing facilities, and all associated piping and pumps as having contact with cyanide. SOPs were reviewed and found to be sufficiently detailed to enable safe operation. Several minor items within the CMP and SOPs were recommended to be updated to reflect the now as-built nature of the facility for consistency with the delivered project and operation. These updates are planned as part of the 2021 CMP update cycle.

Eagle has manuals and procedures that identify the assumption and parameters for the safe operation of the facilities. The Operational Maintenance and Surveillance Manual considers routine operational aspects, as well as maintenance requirements and surveillance of the facility. The Heap Leach Facility Contingency Water Management Plan addresses the design storm event considerations for the HLF, including the Probable Maximum Flood. Maximum operating in-heap pond level and response actions at various levels are detailed in the OMS. Historic in-heap pond level data during 2020 was reviewed and evidenced that at all times the pond elevation maintained at least the required freeboard within the pond. The Environmental Monitoring, Surveillance and Adaptive Management Plan (EMSAMP) is in place to manage key items such as surface water hydrology, surface and ground water quality, HLF and pond leak detection, and storage volumes. The plan details indicators, thresholds, and adaptive management measures to be taken for threshold exceedances.

The CMP also includes monitoring point of 50 ppm weak acid dissociable (WAD) cyanide present in the event pond to trigger wildlife deterrent measures. Further, if the need arises, and for the protection of the environment, a cyanide detoxification system is available in the ADR plant to assist in reducing the cyanide concentration of process solutions. The pond level and subsequent cyanide concentration are reviewed on a continuous basis to maintain a concentration that is not toxic to avian and terrestrial wildlife that could come in contact with the pond water for a short period of exposure. Eagle does not have direct water discharges that have been treated for cyanide to surface water.

The CMP and OMS include a list of critical aspects and areas to be inspected and inspection frequencies. At the HLF and ADR plant, Eagle conducts inspections for pipeline leaks, ponding or pooling of solution, wildlife, condition of interceptor ditches, pond levels, condition of the facilities, functionality of safety equipment, signage, facility integrity, etc. In the case of the process plant, inspections include: the bulk cyanide storage area, the cyanide mixing and storage area, the incinerator area, the ADR plant primary and containment areas, the pregnant and barren solution pipelines, among others.

Eagle has developed and implemented a management of change (MOC) process for operational changes to ensure that a systematic approach to changes is followed with the aim of ensuring the continued safety throughout the process. These systematic processes ensure that the change is managed in a proactive fashion. The MOC process ensures safety, health, and environmental risks and hazards are properly controlled when making changes to the facility, operation, or personnel. The MOC uses a format that includes a description of the proposed change, a risk assessment section, review, evaluation, and approval.

Eagle has implemented a HLF Contingency Water Management Plan for the site to respond to upsets in water balance, problems identified by inspections, and to address temporary shutdowns of the facilities. Procedures for stopping and starting the plant facilities, events of a power outage, provide response measures for emergencies related to failures of cyanide equipment, and response plans to address upsets in the process water balance. Contingency scenarios are included in the CMP, OMS Manual and SOPs. The OMS also includes activities related to surveillance of the HLF and solution pipelines and actions to be taken in case of a line rupture. Any spillage within the ADR plant are contained within the process plant containment. The pregnant and barren solution lines are contained within lined ditches or on the lined HLF, allowing for containment of any leakage. Should the in-heap pond become overwhelmed, solution would report to the events pond. In relation to a temporary closure or cessation of operations scenario, Eagle addresses options to manage solution in the HLF Contingency Water Management Plan, including the use of the in-pad and event ponds volumes, the use of liner to reduce meteoric water infiltration, or the use of enhanced evaporation.

Eagle has a program to conduct routine inspections of cyanide facilities, with the results of the inspections reviewed by the designated staff at least weekly. The inspections are conducted in different areas of the operation, with the frequencies varying from every shift to special annual inspections. The inspection program of cyanide facilities including unloading, mixing and storage activities and frequency of inspections were found to be sufficient to assure that the operation is safe and functioning within design parameters. The auditor reviewed inspections records and verified that inspections are conducted on a consistent manner.

A site visit specific to the audit was not possible due to COVID. However, based on prior site visits during operation, as well as photos provided for the audit, the auditor did verify the condition of tanks, secondary containments, pipelines, pumps, valves, pipeline trench, pond freeboard, and the absence of salt buildup is consistently in good order. The auditor reviewed inspection records and verified that inspections of cyanide facilities are conducted on a consistent manner. The inspections are documented and include date of the inspection, the name of the inspector and observed deficiencies.

Eagle uses two mechanisms to document, track and close corrective actions identified during inspections: Corrective actions that are related to maintenance of equipment at the process plants and HLF are managed by the maintenance department. Work orders resulting from deficiencies related to the cyanide facilities are initiated, tracked, prioritized, planned, and closed. All other corrective actions not related to maintenance of equipment that are identified through inspections conducted by process personnel or other areas (e.g. Environmental) are tracked, implemented and followed up until closure. The auditors reviewed examples of items identified

during inspections and records of the corrective actions. The inspections are reviewed by managers to ensure closure of the corrective action items.

The maintenance group has a preventive maintenance program for pumps, pipelines, valves, flow meters, gauges, level sensors, pH meters, sump pumps, filters, HCN sensors, tanks, ponds, and cyanide facilities in general. The Preventative Maintenance Plan is included in the CMP. The preventive maintenance program helps perform periodic maintenance and inspections of the integrity of process equipment, piping and tanks to ensure they are working properly. A corrective action maintenance schedule is also generated every week. Examples of corrective action records were reviewed and followed up to ensure they are being closed according to schedule.

Emergency power considerations are included in the CMP under CMP-SOP-010 – Backup Generator Operations and Maintenance. Eagle has three emergency power generators for the site. Each generator is rated for 1650 kW of output. In addition, eight (8) other generators of varying output are available on site. These three generators start automatically if there is a grid power outage to immediately restore power to the ADR Plant and HLF, allowing for the rapid restart of all critical equipment. Generators are monitored continuously via the plant control system and they are electrically and mechanically inspected on a weekly basis. Other routine and preventative maintenance programs specific to the generators are also in place, including on-load and no-load testing per the maintenance schedule.

4.2 Introduce management and operating systems to minimize cyanide use, thereby limiting concentrations of cyanide in mill tailings.

This section is not applicable to the Eagle site under the Cyanide Code, as there is no milling operation.

4.3 Implement a comprehensive water management program to protect against unintentional releases.

Eagle uses a comprehensive, probabilistic water balance using the Monte Carlo simulation software, GoldSim. This model was updated from the initial projections to include site operational data, as well as updated Climate/Meteorological data from operations, considering the proposed process plan through mine closure. An external consulting company (Mines Group, 2019) performed the initial water balance. The most recent water balance update report was produced by Forte Dynamics, Inc. in April 2020, approximately two months prior to the data cutoff date for the audit.

The operational water balance includes the following factors: solution application rates, precipitation and evaporation rates, effects of freshet runoff, and impacts of freezing and thawing. Potential power outages is not included in the operational water balance as Eagle has emergency backup generators on site which will avoid any effects on water balance activities. However, the potential impacts of power outages on solution management are considered in the most recent water balance update report. The event pond has a storage capacity capable of receiving 72-hours of drain down and runoff from a 100-year rainfall event, while still maintaining

a 0.5m freeboard. Should solution enter the event pond, the operation prioritizes solution recovery from the pond for makeup water in the HLF rather than continuing fresh water addition.

Eagle has zero process water discharges to surface waters during operations. In closure when the leach pad begins to drain down, water collected in the events pond or excess solutions may be treated in the mine water treatment plant and discharged if water quality standards are met. A description of the water balance model and calculations are included in the GoldSim Water Balance Model Report, dated April 2020.

Eagle conducts frequent inspections of the HLF and monitoring activities to ensure these facilities are operated according to the design criteria, following the inspection program included in the CMP and OMS manual. Process operators conduct routine inspections on the HLF, including conditions of the HLF and event ponds. The auditor reviewed inspections records and verified that inspections to the ADR Plant and HLF facilities are conducted on a consistent manner.

Freeboard in the in-heap pond is monitored on a continuous basis and reported daily. The auditor reviewed historic data on the pond level and confirmed that the level was maintained below the overflow level to the event pond. The event pond level was also maintained below the trigger points. During prior field visits, the auditor also observed that the freeboard was being maintained.

Climate data for Eagle has been collected since 2007. Multiple weather stations on site collects precipitation data on a daily basis. Data collected is used to compare the results to design assumptions and to calibrate the water balance model. The water balance model is updated and calibrated annually using precipitation, pond levels, solution flow rates and temperature data, as mentioned in the GoldSim Water Balance Report, dated April 2020. Eagle is a fairly young operation; however, several of the water balance model input parameters have been updated with revised assumptions based on actual operating data, as noted in the Water Balance Report by Forte Dynamics Inc. The water balance projections will continue to be revised as necessary based on actual data.

4.4 Implement measures to protect birds, other wildlife and livestock from adverse effects of cyanide process solutions.

Eagle monitors the HLF for indications of solution ponding. If ponding is observed, the CMP and OMS outline measures to be taken to mitigate the ponding or exclude avian species from accessing the solution. Measures can include reducing or eliminating flow to the area and/or covering the ponded area with avian exclusion screens.

If process or storm water collects in the event pond, operations recycles the solution back onto the HLF as soon as possible. If the solution concentration is determined to be above 50 mg/L WAD cyanide, the site increases monitoring of the effectiveness of the installed avian deterrent devices. Eagle has implemented electronic propane gas cannons to be used to scare away birds and other wildlife getting too close to the event pond. No cyanide-related wildlife mortalities have occurred since the startup of Eagle operations through the audit period of June 2020.

The CMP indicates that a wildlife exclusion fence was to be installed around the perimeter of the event pond to prevent access by larger terrestrial wildlife. The fencing was not installed as part of the project, but the auditor confirmed that the fence is included for installation under the 2021 capital budget.

4.5 Implement measures to protect fish and wildlife from direct and indirect discharges of cyanide process solutions to surface water.

Eagle does not have direct discharges to surface water from cyanide facilities during operation. When operations cease, process solutions will be managed by recirculating solution onto the leach pad or through evaporation. If the ponds or pad are unable to manage the solution, during closure, solution could be discharged through the mine water treatment plant if the water quality levels are met. The site has a comprehensive water management program in place to help protect against unintentional releases. Further, the facility design as a zero discharge facility aids in reducing the potential for indirect discharge.

Surface water quality monitoring data was provided from July 2019 through June 2020, covering the period prior to the introduction of cyanide. Trace quantities of cyanide measuring 0.005 mg/L total & WAD are present in both reference sites and surface monitoring locations indicated in the Environmental Monitoring, Surveillance, and Adaptive Management Plan, which are outside of the project influence, suggesting this as a natural background level. The monitoring results have no measured cyanide concentrations exceeding the background levels in down gradient monitoring locations, suggesting that direct or indirect discharge is not occurring.

4.6 Implement measures designed to manage seepage from cyanide facilities to protect the beneficial uses of ground water.

The Eagle HLF was constructed with measures to protect groundwater from seepage of process solutions and water. The HLF is constructed with a dual-layer synthetic geomembrane liner system of linear low-density polyethylene (LLDPE) over a geosynthetic clay liner (GCL) system in the in-heap pond area. This design is also used for the event pond. Above the pond level in the HLF, the pad transitions to an LLDPE over GCL system. A solution drainage and collection system lies on top of the liner system for recovery and pumping of the pregnant solution. A Leak Detection and Recovery System (LDRS) is constructed in the in-heap pond and event pond which return any solution collected to the heap or pond, respectively. This system is installed between the two layers of LLDPE to allow for detection of any leaks in the primary liner system.

The process plant is designed and operated to manage seepage and protect groundwater quality. The entire process area, including the cyanide mixing area, is contained within a reinforced concrete pad surrounded by curbs, parapets and stem walls, which provide a competent barrier to seepage. The concrete floor is sloped to drain solution into common sumps and then pump the solution back into the process circuit. All process tanks at the plant are secured to solid, reinforced concrete pedestal-type foundations and are contained within concrete berms with good condition concrete flooring. This foundation and floor system serves to prevent any seepage from the tank bottoms from entering the ground. Further, an LLDPE liner system was placed beneath the entire extents of the ADR plant and pregnant and barren

solution pipeline corridor. The additional liner system further serves to minimize the potential for seepage and protect groundwater for beneficial uses.

Similar to surface water monitoring results, the site data reviewed for groundwater does not suggest any impacts from cyanide to the beneficial use of groundwater from the operation.

4.7 Provide spill prevention or containment measures for process tanks and pipelines.

Spill prevention and containment measures are provided for all cyanide mixing, storage, and process solution tanks. The ADR plant tanks, piping, and pumps are enclosed within the ADR plant building which has a reinforced concrete slab and stem walls to provide containment. The floor is sloped to solution collection sumps. The sumps are designed to operate with automatic level sensors to return any solution collected back into the process. The combined containment within the ADR plant exceeds the minimum requirement of 110% of the largest tank. As noted above in under Standard of Practice 3.1, the cyanide mixing and storage containment is approximately 40% of the tank volume, with excess solution reporting to the CIC area containment and sump.

Other secondary and tertiary containment, including liner under the ADR plant provides for additional protection. Where the pregnant solution pipeline enters the building and the barren solution pipeline exits the building, the lines are run parallel to one another in an LLDPE lined channel, providing secondary containment. The facility design and subsequent visual inspection confirmed that pipes, tanks, and other systems containing process solution utilize carbon steel, HDPE, corrugated polyethylene, or stainless steel, all of which are compatible with cyanide and high pH solutions.

The tertiary lined event pond provides additional containment for the HLF in-heap pond to contain any spillage if the overflow level is reached. The pond has a pump back system for storm water or process solution return to the process system.

4.8 Implement quality control/quality assurance procedures to confirm that cyanide facilities are constructed according to accepted engineering standards and specifications.

The HLF at Eagle was designed by BGC Engineering Inc. with the process plant designed by Hatch. The design drawings by both firms were produced by Professional Engineers registered in the Yukon Territory and both having the appropriate Permit to Practice. Construction management was overseen primarily by JDS Energy & Mining Inc. The Eagle facility construction was performed by multiple contractors, including but not limited to Pelly Construction, The Gisborne Group, Clark Builders, and others. The quality control and quality assurance (QA/QC) programs were implemented during the initial construction of cyanide facilities at Eagle, with services provided primarily by Tetra Tech and Layfield Canada Ltd. The complete record package of the QA/QC documents was reviewed by the auditor.

The final record of construction package for the ADR plant and HLF areas is available electronically and was provided for auditor review. This package covered the leach pad earthworks and geosynthetic liner installation, as well as the ADR LLDPE liner and concrete

equipment foundations and containment area. The final issued for construction (IFC) drawings were available for piping and mechanical disciplines and indicate that the design is consistent with the intent of the Code. Turnover package requirements for the mechanical and piping elements of the project specify inclusion of all required welding certifications and non-destructive test results were provided in a table of contents for these elements, however, no QA/QC or record report or as-built drawings were provided. Visual inspection during prior site visits indicated that the tanks and pipelines were in good working order with no evidence of leakage, such as buildup of salts. The mechanical as-built/record of construction package is believed to be available and compiled by JDS; however, as it was not provided for this audit, the site was requested to obtain all relevant documents ahead of the next audit to demonstrate adherence to the CMP.

4.9 Implement monitoring programs to evaluate the effects of cyanide use on wildlife, surface and ground water quality.

The CMP, the Environmental Monitoring, Surveillance, and Adaptive Management Plan, the Wildlife Protection Plan, and CMP-SOP-025 – Environmental Monitoring Procedures specify the requirements implemented by Eagle to monitor the effects of cyanide use on wildlife, surface, and ground water quality.

A comprehensive wildlife monitoring program is in place and detailed records were provided documenting the extensive wildlife interactions at the site. No wildlife mortalities related to cyanide have occurred at the site during the period of the audit.

The groundwater and surface water monitoring program also provide for an extensive program to ensure water quality is protected for beneficial uses. The documents noted above also provide requirements for sampling, preservation, chain of custody requirements, reporting requirements, etc. to ensure sample integrity is maintained. Results from the monitoring program were reviewed by the auditor as discussed previously.

5. DECOMMISSIONING: Protect communities and the environment from cyanide through development and implementation of decommissioning plans for cyanide facilities.

5.1 Plan and implement procedures for effective decommissioning of cyanide facilities to protect human health, wildlife and livestock.

Eagle has an approved Reclamation and Closure Plan (RCP) for the site, which addresses the long-term physical and chemical stability of the site, including reclamation of surface disturbances from existing development. The plan was first submitted to the Yukon Water Board in August 2014, and the plan is required to be revised and resubmitted every two (2) years on or before October 1st. The last plan submittal, and thus the current plan during the audit period covering through June 2020 was RCP Version 2018-03 submitted in September 2018. In addition to regulatory approval, the RCP also includes engagement with First Nations groups and other stakeholders. The plan seeks to guide the return of the site to appropriate and functional ecosystems, similar to predevelopment conditions, while meeting key end land use

objectives. The RCP addresses water quality, physical stability, land use, aesthetics, and public health and safety.

The RCP outlines the measures to be implemented to achieve the objectives, as well as the criteria that will be used to determine the successful implementation of the plan. The HLF facility will continue residual leaching until such time that cyanide destruction and rinsing can occur. This period will be followed by final draindown and cover. The RCP describes the use of the in-heap pond as a bioreactor to improve solution quality. Considerations of evaporation, water treatment, and revegetation of the cover with local species that have high moisture uptake characteristics are also considered in the RCP. The process plant will be decommissioned and dismantled. Foundations will be broken up to the extents possible, with reinforced concrete generally buried in place with material suitable for supporting revegetation.

As noted above, the RCP, which includes the closure cost estimate, is required by the Yukon Water Board (YWB) and the Yukon Government Department of Energy, Mines and Resources (EMR) to be resubmitted every two years.

5.2 Establish an assurance mechanism capable of fully funding cyanide-related decommissioning activities.

The RCP includes a detailed cost estimate for closure of the Eagle project, including all cyanide facilities and cyanide-related closure activities. The cost estimate provides for a two-year peak liability, covering the construction year and first year of operation, as well as the life-of-mine (LOM) closure cost. The cost estimate was developed in compliance with the Yukon Mine Site Reclamation and Closure Policy Financial Guidelines and approved by the YWB. The estimate uses unit rates and quantities for items such as earthworks, piping removal, building removal, HLF detoxification, and care and maintenance monitoring costs. Labor is assumed to be provided by a third-party, consistent with requirements under the Code. The current bonding required is to cover the two-year peak liability and surety for this bond is held by Intact Insurance Company, which was updated most recently on January 14, 2020, with the certificate provided to the auditor for review. The bond amount will continue to be reviewed and updated, as necessary, with each subsequent resubmittal of the RCP.

6. WORKER SAFETY: Protect workers' health and safety from exposure to cyanide.

6.1 Identify potential cyanide exposure scenarios and take measures as necessary to eliminate, reduce and control them.

The CMP includes procedures describing the proper execution of cyanide-related tasks, such as unloading bulk cyanide shipments, mixing cyanide batches, plant operations, confined space entry, and equipment decontamination for maintenance. The CMP and associated SOPs provide guidance as to how tasks should be conducted to reduce or eliminate worker exposure. The CMP requires regular review of the SOPs with updates occurring, as needed. Several of the procedures reviewed for cyanide related tasks have undergone multiple revisions.

The procedures indicate to the operator the personal protective equipment (PPE) that is required for each task to be undertaken. Area inspections are also conducted each shift to minimize risk to employees. Personnel are also required to conduct and document pre-work inspections prior to carrying out a specific task.

Eagle has implemented procedures for the review of proposed modifications to procedures. The Management of Change procedure requires review and approval of a cross-functional team, including representatives from Health, Safety & Security, Environmental, Maintenance, Mine Operations, Processing, Site Services, Information Technology (IT), Supply Chain, and the General Manager prior to implementing any proposed change.

Input from workers is considered in procedure development and while evaluating the effectiveness of the procedures. The workers can contribute to the procedures through direct comments on the procedure, pre-task inspections, or during safety meetings.

6.2 Operate and monitor cyanide facilities to protect worker health and safety and periodically evaluate the effectiveness of health and safety measures.

Eagle has determined the appropriate pH for limiting HCN evolution during mixing and operations. The CMP indicates that a pH of between 10 and 10.5 should be maintained in the pregnant and barren solutions. In the CMP and CMP-SOP-005 – Cyanide Mixing Process, the pH of the solution prior to adding cyanide is indicated to be at least 12. However, site practice, which is consistent with industry practice, is to achieve a pH of at least 11 prior to adding cyanide to the mix tank. Operator logs documenting the pH of the process solutions every two hours and were found to be maintained above pH 10. The control system continuously monitors and trends for the mix tank pH, indicating that it is being maintained above pH 11. Both the operator logs and pH trend were reviewed by the auditor. The CMP and SOP should be updated to reflect the operational practices of the site.

Eagle monitors the cyanide concentration in the HLF and plant to determine the appropriate cyanide addition rates, and operations adjusts the addition rates as necessary. Eagle was designed with a cyanide concentration of 500 ppm in the barren solution; however, operating data shows that the site solution concentration is significantly lower than the design point, with operating logs indicating actual concentrations ranging from approximately 200 to 300 ppm. The CMP references use of an inline cyanide analyzer; however, an analyzer was not installed and is not currently planned. Cyanide concentrations are measured and recorded every two hours, along with the pH, with adjustments to the addition rate made as necessary to control at the target concentration.

A pre-startup risk assessment was undertaken to determine the locations that the HCN detectors should be placed. These locations were selected, based on where workers could be exposed to HCN at 10 ppm on an instantaneous basis or 4.7 ppm continuously over an 8-hour period. There are nine detectors placed throughout the ADR Plant. The detectors are Dräger brand and have both audible and visual alarms, with the low-level alarm point at 4.7 ppm with an amber strobe and 10 ppm with a blue strobe. The CMP and SOP's have varying descriptions of

detection level (4.5 vs. 4.7 ppm and 6.7 vs. 10 ppm), as well as strobe colors (red vs. blue). The site confirmed the setpoints as 4.7 and 10 ppm, as well as the strobe colors as amber and blue. The CMP and SOPs should be updated to reflect the operation of the installed units. The stationary HCN detectors are calibrated monthly on a regular PM schedule, per the manufacturer's procedure. Maintenance records for all 9 units were reviewed and found to be consistently calibrated, per the schedule and spanned over a one-year period.

In addition to the stationary detectors, operators in the ADR Plant carry a personal gas detector. The personal detectors are Gas Badge Pro units. These units are to be bump tested daily, prior to use. Calibration logs provided by the manufacturer indicated that the instruments were generally functioning as they were supposed to, with a couple of units that failed calibration or had an extended period without undergoing calibration. In review with site, it was indicated that failed units are not placed into service until they pass calibration, and units with extended calibration periods are typically those that have not been in service for a period of time.

Warning signs advising anyone entering the area that cyanide is present are posted at the entrances to the facility. Anyone coming on site, including visitors and contractors, must receive site hazard training, which includes basic information regarding cyanide. The signage clearly indicates that eating, drinking, or open flames are not permitted within cyanide facilities.

Safety showers, eye wash stations and dry powder/non-acidic sodium bicarbonate fire extinguishers are located throughout the operation. Two additional combination shower/eyewash units were recommended at the CIC feed level, as well as on the carbon safety screen platform over the barren solution sump. Confirmation by the operation that work orders have been generated for the installation of the additional units was provided. These items are maintained, inspected, and tested on a routine basis, as indicated in CMP-SOP-008 – Cyanide Facility Inspection.
The mixing and storage tanks, as well as pipelines containing cyanide are clearly identified to alert personnel to the contents. All lines containing cyanide, including low concentrations, are labeled with the specific contents and flow direction. Line labels are orange with black lettering. In addition, concentrated cyanide lines are indicated with orange/black labels, as well as purple tape on both sides of the label to further alert individuals to the presence of concentrated cyanide.

Safety Data Sheets (SDS), which include first aid procedures and additional information on cyanide safety and exposure, are found in hard copy in a binder in the ADR Plant control room. In addition, electronic copies of the information are available to all employees via the process drive on the site network. Similar information is posted directly on the cyanide mixing and storage tanks, including exposure symptoms, first aid and emergency response. All signage and SDS are printed in English, the language of the workforce.

The CMP includes procedures to investigate and evaluate cyanide exposure incidents to determine if the programs and procedures are adequate or if changes are required to protect worker health and safety or improve emergency response to cyanide exposures. The MoC process would be utilized to implement any recommended changes.

6.3 Develop and implement emergency response plans and procedures to respond to worker exposure to cyanide.

Eagle has potable water supply to the safety showers and eyewash stations, oxygen, a resuscitator, and a radio are readily available at the ADR Plant, near the mixing and storage area.

The CMP references amyl nitrite, as well as the Cyanokit, as being available at the control room and medical clinic. However, Canada discontinued the use of amyl nitrite for cyanide exposure. Upon startup, due to the qualifications required and the administration procedures for the Cyanokit, the site elected to store all of the antidote kits at the medical clinic, with kits split between the clinic and the ambulance. The kits are checked for proper storage, inventory and product expiry by the medical clinic staff.

Eagle has a written emergency response plan and procedures for responding to cyanide related incidents. The plan and procedures include responding to cyanide exposures, the site's "Code 1" procedure, rapid response process, communications, air ambulance evacuation and response to medical emergencies. Eagle has a medical clinic staffed 24/7 with two primary care paramedics with IV endorsements to allow administration of the Cyanokit. The clinic and the paramedics are under the medical direction of Iridia Healthcare. The site Cyanokit administration procedure was developed and approved by Iridia.

In addition to the clinic staff, the site has an emergency response team to provide primary response, rescue, and recovery, if required. An ambulance is available on site; however, due to the remote location of the site and limited regional resources, an emergency extending beyond the capabilities of the site clinic would likely require patient transport by air. The primary destination for air transport is Whitehorse General Hospital, however, if travel to Whitehorse is not possible, resources are available at the Mayo Nurses' Station, as well as Dawson City Community Hospital. If a patient requires transport offsite for a cyanide related emergency, the procedures require attendance by one of the site paramedics and at least one Cyanokit must accompany the patient.

The CMP requires that mock drills related to cyanide emergencies be conducted at least annually. Through the audit data cutoff period of June 2020, no drill had been conducted to date. However, a drill was reported to have occurred in August 2020, but documentation of the drill was not provided. Site should ensure drills with varying scenarios are conducted at least annually, consistent with the CMP.

The auditor requested written confirmation that a formal agreement was in place for offsite medical facilities to assist in an emergency, as required under the Code and specified within the CMP. However, no response was provided to verify that a formal agreement is in place.

7. EMERGENCY RESPONSE: Protect communities and the environment through the development of emergency response strategies and capabilities.

7.1 Prepare detailed emergency response plans for potential cyanide releases.

Eagle has developed the CMP, the HLF OMS, the Environmental Monitoring, Surveillance, and Adaptive Management Plan, the HLF Contingency Water Management Plan, and the Emergency Response Plan (ERP), all of which address response to the accidental release of cyanide. The Emergency Response Plan considers multiple potential failure scenarios involving cyanide and the site-specific environment, operation, and response.

Cyanco and its supply chain are responsible for the safe transport of cyanide to the site. As such, any cyanide related spills prior to delivery at site would be managed by Cyanco or their transporters. If necessary, site personnel could be requested to assist in an offsite response. Site personnel assisted with a December 2019 incident involving the rollover of a sea container carrying cyanide to the site. There was no release of product due to the incident, but the site assisted in securing and recovering the sea container.

Multiple emergency situations that could occur at site are addressed through the various documents, including the CMP and ERP. The plans detail responses specific to cyanide spills or leaks including process solution and dry reagent spills and makes provision for initial response, first aid, spill reporting contacts and spill control and cleanup. The HLF OMS provides specific procedures related to the heap leach area. Any potential emergency that has the potential to affect a community will trigger the notification requirements outlined in the Emergency Response Plan.

7.2 Involve site personnel and stakeholders in the planning process.

Eagle has included its workforce and stakeholders as potentially affected communities in emergency response planning. Coordination with local offsite medical providers was reported to have occurred, including air ambulance support. However, as noted, documentation confirming that formal agreements are in place were requested but not supplied. Site should confirm that offsite partners are aware of and are properly trained for their role in assisting with a cyanide related emergency.

Worker input into the planning is intended through comments on procedures, feedback in safety meetings and by taking part in the mock drills. Examples of worker input into procedures and cyanide related safety meetings were provided. As noted previously, a mock drill had not yet occurred as of the cutoff date for data collection related to this audit.

Eagle had regular interaction and consultation with the First Nation of Na-Ch Nyäk Dun (FNNND) and the Village of Mayo prior to startup to solicit input. Documentation of ongoing routine coordination was also provided to the auditor. Information regarding accidental releases, or any other incident that could impact water supplies, human health, or wildlife habitat are to be communicated to the potentially affected communities.

7.3 Designate appropriate personnel and commit necessary equipment and resources for emergency response.

The ERP provides primary contact details for the incident management team members, including the General Manager who has authority to ensure that sufficient and adequate resources are allocated to carry out the ERP. Alternate personnel are named for some roles, but not all roles have an identified alternate. The ERP does describe the roles and responsibilities for those involved in responding to an emergency.

Contact information in the ERP includes call-out procedures and 24-hour contact information for the Incident Management Team and the ERT. Phone numbers and email for all relevant parties are included in the ERP. Radios are also available for 24-hour communications.

The ERT Team Roles, Responsibilities, and Minimum Requirements are documented within the ERP, including training requirements for the ERT members, and it is the responsibility to the Emergency Response Coordinators to ensure that training is provided and maintained. All responders undergo the same training.

Emergency response equipment, including the locations of cyanide antidote kits are provided in the CMP and SOPs. As noted, the CMP references a kit at the ADR Plant, but upon startup of operations, it was determined that the kits should remain at the site medical clinic, as they cannot be administered by personnel other than the site paramedics.

The cyanide emergency response equipment is checked regularly by the site paramedics. ERT members check other emergency response equipment, including the site ambulance. The medical clinic inventory checks, which include the Cyanokits, as well as ambulance inspection forms were provided to the auditor.

Emergency response planning requirements have not been confirmed with external resources who may be required in an emergency. Outside entities should be engaged regularly and included in mock drills, as appropriate.

7.4 Develop procedures for internal and external emergency notification and reporting.

The CMP and ERP provide communication requirements and procedures for the site. The ERP addresses contact requirements for public communications, employee communications, regulatory contacts, contact information for response assistance from local assets, as well as through Cyanco, First Nations contacts, among others.

Among other responsibilities, the Incident Management Team Leader coordinates overall crisis management during an emergency. The Information Officer is responsible for overall communications and is the link between the onsite Incident Commander and the Corporate Emergency Management Team. The Information Officer will also prepare responses to media inquiries, with the appropriate spokesperson designated to deliver appropriate messaging. The Government/Regulatory and Liaison Officer is the point of contact for First Nations communications. The Emergency Response Coordinator advises when mutual aid assistance is required. Appropriate subject matter experts provide consultation related to emergencies where technical expertise relevant to the incident is required.

The ERP contains procedures for communication including emergency response contact information. In the event of an incident, the Corporate Emergency Management Team in consultation with the Incident Command Team, will notify affected parties in local communities, as necessary. Procedures for notifying outside agencies and the media are provided in the ERP.

7.5 Incorporate into response plans monitoring elements and remediation measures that account for the additional hazards of using cyanide treatment chemicals.

The CMP provides procedures in the event of cyanide release and addresses cyanide recovery and remediation if necessary. CMP-SOP-020 – Cyanide Emergency Response Procedures identifies the monitoring activities to be undertaken to identify the extent and effects of a release, The EMSAMP and CMP-SOP-025 – Environmental Monitoring Procedures detail the requirements for sampling and disposal of any contaminated material from a cyanide release. Releases resulting in contaminated soils would be cleaned up and disposed of onto the HLF.

Treatment with chemicals for neutralization or decontamination is allowed for managing spilled solid cyanide within the mixing area containment, per CMP-SOP-005 – Cyanide Mixing Process. Operations would treat any contaminated area with sodium or calcium hypochlorite to destroy the cyanide. Following a minimum one-hour decomposition, the spillage could be washed to a sump with a large volume of water and the solution returned to the process. The CMP-SOP-020 – Cyanide Emergency Response Procedures further allows treatment with hypochlorite of any water flowing through the area where a spill has occurred, requiring the slurry to be contained and recovered into suitable containers.

Drinking water is prepared through onsite generation of potable water. In the event of an emergency, drinking water could be trucked to site, if necessary.

The CMP does not explicitly prohibit the use of chemicals such as sodium hypochlorite, ferrous sulfate and hydrogen peroxide to treat any cyanide that would have been released into surface water. The plan references the safe use and application of the peroxide detox system to ensure that the process does not unduly impact surface waters. The plan should be updated to specify that addition of these chemicals to surface water is prohibited.

The CMP, the HLF OMS, and the Environmental Monitoring, Surveillance, and Adaptive Management Plan all address response to the accidental release of cyanide and detail the requirements for sampling and disposal of any contaminated material from a cyanide release. These documents outline procedures for validation sampling of any cleanup or remediation measures in the event of a cyanide release.

The CMP and the Environmental Monitoring, Surveillance, and Adaptive Management Plan address the potential need for monitoring the effects of a cyanide release. These documents also address sampling and monitoring.

7.6 Periodically evaluate response procedures and capabilities and revise them as needed.

The CMP requires that the ERP be reviewed at least annually and updated to incorporate changes in facility infrastructure or operational processes that involve management or the use of cyanide. The ERP is also intended to be updated to incorporate any lessons learned as outcomes from emergency response or mock drills.

As noted previously, mock drills involving cyanide are intended to be conducted at least annually. However, at the data cutoff date of June 2020, Eagle had not yet undergone its first mock drill since commencing operations. Also, at the time of the audit cutoff date, the ERP had not required implementation due to any cyanide-related incidents. Provisions are in place within the CMP to incorporate lessons learned from any incidents or mock drills, if and when they occur.

8. TRAINING: Train workers and emergency response personnel to manage cyanide in a safe and environmentally protective manner.

8.1 Train workers to understand the hazards associated with cyanide use.

New workers at the mine receive detailed orientation training. Workers typically receive classroom training prior to receiving in-plant training. Initial cyanide hazard training (Level 1) addresses cyanide basics and awareness. Upon completing orientation, personnel requiring it also receive detailed cyanide related training (Level 2 and Level 3), as well initial task training, which includes task specific hazards.

Contractors working at site must also undergo site induction training, which includes cyanide hazard training. Depending on the nature of the work to be performed, contractors may receive Level 1 through Level 3 training.

Annual cyanide refresher training, cyanide related task training, and cyanide release training are to be provided to all employees who may be exposed to cyanide. However, at the time of the data cutoff date, refresher training was not yet required, given the short duration the site has been in operation. The tracker did not provide the date that training was complete. The date of initial training and all subsequent refresher training should be recorded in the tracker. All three levels of training include a written test.

Training records for all initial cyanide hazard training for all site and contractor personnel have been retained electronically. ERT member records for cyanide hazard training are recorded separately in the tracking spreadsheet. An ERT specific certification tracking sheet was provided, but the sheet did not indicate specific training that was completed, such as firefighting, occupational first aid, HAZMAT, etc. Specific and detailed training records should be kept for the ERT for both initial certifications and ongoing refresher training.

8.2 Train appropriate personnel to operate the facility according to systems and procedures that protect human health, the community and the environment.

Eagle trains personnel to perform their routine tasks, including unloading bulk cyanide, mixing, production tasks, and maintenance with minimal risk to health, safety or the environment by

preventing unplanned releases. Employees whose role requires working around cyanide receive training on how to perform their assigned tasks with minimal risk.

Cyanide related training elements for employee training are addressed in the Level 1, 2, and 3 cyanide training program, as well as through the operation's SOPs. Operators will also be trained components from the Heap Leach and Process Facilities Plan, the Spill Response Plan, the HLF Contingency Water Management Plan, the Emergency Response Plan, the Environmental Monitoring Surveillance and Adaptive Management Plan and the Preventive Maintenance Program Plan relevant to their duties.

The cyanide related training program at Eagle is intended to be administered by personnel or supervisors with prior experience in training and the knowledge and experience in the systems that are the primary subject of the training. The training content for Eagle was developed by the Process Manager who has extensive experience in personnel training on the safe use of cyanide.

Cyanide is a regular topic for safety meetings. The sign in sheets for several meetings with a cyanide-related topic were provided for review.

All operators are trained prior to working with cyanide. New employees are required to complete the appropriate level of training for their specific task, including the written test, prior to beginning work. These written tests for each level of training are used, in part, to help evaluate the effectiveness of the training and ensure the trainees understand the material being presented.

As noted above, training records were provided, but the tracking sheet only indicated the individual, department, and level of training. The training record should also indicate the date training was completed, the name of the trainer, and the written test results.

8.3 Train appropriate workers and personnel to respond to worker exposures and environmental releases of cyanide.

Eagle trains employees in the use and handling of cyanide, including mixing, leaching and maintenance processes, so that they are aware of the proper handling, decontamination, and first aid procedures. Training also includes response to first aid or cyanide release incidents. The CMP also indicates that workers will participate in the mock emergency drills.

Employees working with cyanide are trained in initial response, including recognizing the signs and symptoms of exposure, as well as basic first aid measures. Employees are also trained as to the locations of emergency response equipment. The ERT also received additional training, such as firefighting, occupational first aid (OFA) level 3, HAZMAT response, etc.

Given the remote and self-contained nature of the site, Eagle intends for all emergency response to be performed by site personnel. However, in the event of an emergency that is beyond site management's capabilities, a contingency plan should be in place, including formal agreements for offsite assistance.

Mock drills involving cyanide are intended to be conducted at least annually. However, at the data cutoff date of June 2020, Eagle had not yet undergone its first mock drill since commencing operations. Also, at the time of the audit cutoff date, the ERP had not required implementation due to any cyanide-related incidents. Records of ERT and employee involvement, as well as any offsite support, in any future mock drills should be recorded and the lessons learned incorporated into the ERP.

9. DIALOGUE: Engage in public consultation and disclosure.

9.1 Provide stakeholders the opportunity to communicate issues of concern.

Eagle conducts on-going communication in Mayo and other regional locations in order to provide general information on the Project. This communication permits discussion of any concerns or questions related to the use of cyanide or other aspects of mine operations. Stakeholders participate through informal meetings, Project specific workshops and open houses, or the regulatory engagement processes to include the FNNND, the YWCHSB, community leaders, and other stakeholders in discussions on the project. The Environmental Assessment Consultation Summary was provided to document initial engagement. Documentation of regular ongoing communication meetings with the FNNND were provided to the auditor.

9.2 Initiate dialogue describing cyanide management procedures and responsively address identified concerns.

The meetings referenced above also allow the site to disseminate general written or visual information on cyanide, its use in the mining process, and the general practices established to protect the environment and the health and safety of the workforce and the public with respect to any potential spills or releases. The Environmental Assessment Consultation Summary was provided to document initial engagement. Documentation of regular ongoing communication meetings with the FNNND were provided to the auditor.

9.3 Make appropriate operational and environmental information regarding cyanide available to stakeholders.

Eagle makes information about the operation publicly available and is committed to disseminating information on any cyanide exposures or releases that could impact human health or the environment, in compliance with all applicable Yukon and Federal Government requirements. These will include any release of process solution outside of containment, any release of hazardous product in which there is a potential for that product to enter a waterway, and any release that results in dysfunction from lack of oxygen or poisoning. In addition, as noted in the Emergency Response Plan, a designated member of the senior management team, the Information Officer/Government Liaison Officer, will serve as a single point of contact with the media for specific information on any such exposure or release, associated corrective measures, and preventive measures taken the reduce or prevent the recurrence of similar incidents in future. As of the cutoff date for data collection, no cyanide related releases or significant injuries had occurred.

APPENDIX T

Independent Limited Assurance Review of the Eagle Gold Mine Cyanide Management Plan

Independent Limited Assurance Report

To the Directors of Victoria Gold Corp:

SmartAccEss Socio-Environmental Consulting (SmartAccEss) was engaged by Victoria Gold Corp (Victoria, VGC) to provide limited assurance on the conformance of the Eagle Gold Mine Cyanide Management Plan (CMP) with the International Cyanide Management Code (Cyanide Code, Code) for the period ended June 30th 2020.

Assurance conclusion

Based on the evidence reviewed by SmartAccEss, nothing has come to our attention to indicate that Victoria's Eagle Mine CMP conformance with the Cyanide Code as described below, as of June 30th 2020, is not fairly stated, in all material respects. This conclusion is to be read in the context of the remainder of this report.

Assurance scope

The assurance scope consists solely of an independent review of the *Summary Audit Report "Review of the Cyanide Management Plan and Implementation*" prepared by Forte Dynamics dated February 2, 2021. SmartAccEss has not conducted a site visit nor reviewed the CMP content.

Forte Dynamics was requested by Victoria to perform the annual audit of the Eagle Gold Mine's CMP to comply with a condition of the Water Use License #QZ14-041-1, issued by the Yukon Water Board. The annual audit did not include a Cyanide Code certification audit, nor did it include a dedicated site visit for the purpose of the audit given the challenges due to COVID-19. Rather, Forte Dynamics relied on prior site visits and communication with the site team, photographs, electronic document review, and personnel interviews to conduct the assessment remotely.

The criteria for Victoria's conformance with the Cyanide Code requirements are set out by the International Cyanide Management Institute (ICMI) in the revised *Auditor Guidance for Use of Gold Mining Operations Verification Protocol* dated February 2018.

Respective responsibilities of the company and the independent practitioner

Victoria is responsible for ensuring that the company designs, implements, operates and monitors activities, processes and controls to ensure conformance with the requirements of the Cyanide Code. It is also responsible for the preparation and regular update of the CMP and to conduct the annual audits required by permit conditions.

SmartAccEss responsibilities are to carry out a limited assurance engagement and to express a conclusion based on the work performed. The extent of evidence-gathering procedures performed in a limited assurance engagement is less than for a reasonable level of assurance, and therefore level of assurance is provided.

www.smartaccess.us

Limited assurance performed

SmartAccEss reviewed the *Summary Audit Report "Review of the Cyanide Management Plan and Implementation*" to compare its content with the requirements set out in the Cyanide Code, and validates that Victoria has conducted an annual audit of the Cyanide Management Plan. The review verified that:

- The CMP follows the structure of the Cyanide Code, and the report prepared by Forte follows the structure of a Cyanide Code Summary report covering all 9 Principles and 31 Standards of Practice.
- All key aspects and elements of the Cyanide Code have been included in the report. Systems are in place to manage cyanide in a responsible manner and in compliance with the Code. The report indicates that the Eagle mine has:
  - Appropriate SOPs and practices to handle and prepare cyanide solutions in a safe manner.
  - Contingency and emergency response plans in place to respond to cyanide related emergencies.
  - No impacts to surface water or groundwater related to cyanide.
  - No wildlife mortalities related to cyanide.
  - Programs to regularly inspect and maintain facilities to ensure safe management of cyanide.
  - A water balance that is managed to protect against unintentional releases.
  - Cyanide facilities that have been constructed following QA/QC procedures.
  - A closure plan including decommissioning activities and bonding in place.
  - Health and safety measures to protect workers from exposure to cyanide.
  - Training programs for workers and emergency response personnel in cyanide management.
  - Engagement programs with local communities and disclosure.
- The Eagle mine has less than one year of operation and in certain cases systems are still under implementation (e.g. mock drills, annual refresher training).

Based on the review, it is fair to conclude that Victoria substantially complies with the Cyanide Code requirements. The report identified opportunities for improvement in some of the Code Principles.

This assurance report is provided solely to Victoria in accordance with the terms of engagement. This work has been undertaken so that SmartAccEss might report to Victoria on those matters we have been engaged to report upon in this assurance report, and for no other purpose. SmartAccEss does not accept or assume responsibility to anyone other than Victoria for the work conducted, for this assurance report, or for the conclusion we have reached.

Considering this assurance was mainly focused on validating the completion of the annual audit of the CMP, the engagement was conducted by a professional with suitable skills and experience in both assurance and in the Cyanide Code.

Inherent limitations

Non-financial information, such as Eagle Mine conformance with the Cyanide Code, is subject to more inherent limitations than financial information, given the more qualitative characteristics of the subject matter and the methods used for determining conformance. The absence of a significant body of established

11762 Calle Vivienda
San Diego, CA, 92128
Telephone: (720) 442-3919
www.smartaccess.us

practice on which to draw to evaluate and measure nonfinancial information allows for different, but acceptable, measurement techniques and can affect comparability between entities and over time.

Independence and competency statement

In conducting this engagement, SmartAccEss has complied with the independence and other ethical requirements of the Code of Ethics for Environmental Professionals issued by the National Registry of Environmental Professional (NREP – www.nrep.com), which is founded on fundamental principles of integrity, objectivity, professional competence and due care, confidentiality and professional behavior.

SmartAccEss confirms that the independent reviewer that undersigns this letter is accredited as both Lead Auditor and Mining Technical Expert Auditor by the International Cyanide Management Institute and have ample experience auditing the Cyanide Code.

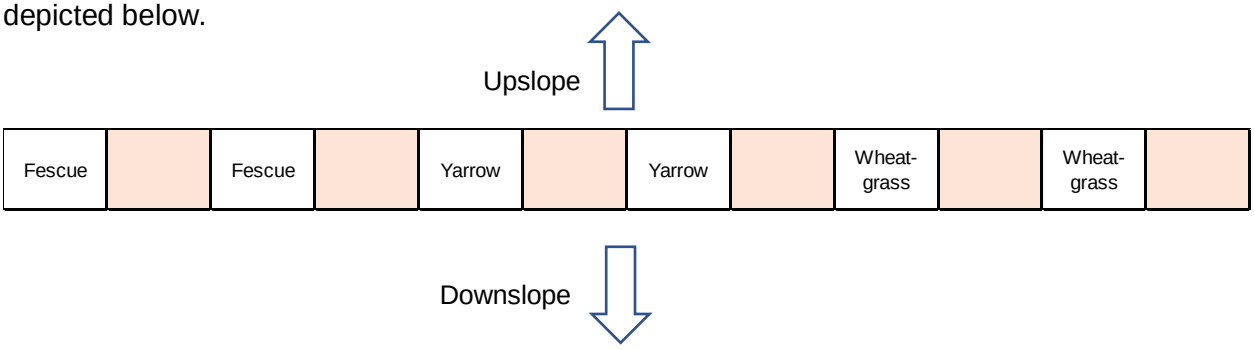
TECHNICAL MEMO

To: Lindsay Rear
Victoria Gold



Date: October 14th, 2020

From: Bonnie Burns
Laberge Environmental Services

Re: **SEEDING TRIALS WITH SEEDS SOURCED FROM YUKON SEED AND RESTORATION, SEPTEMBER 2020**

Yukon Seed and Restoration of Mayo Yukon provided Victoria Gold (VG) with three species of locally sourced seeds for trial testing. It is the intent of VG to hopefully purchase local seeds in the future for their reclamation needs.

Three species that have erosion control potential were seeded on trial plots. Included were yarrow (*Achillea millefolium*), Altai fescue (*Festuca altaica*) and wheatgrass (*Elymus sp*.). In collaboration with Katie Babin of VG, two sites were chosen that will likely remain undisturbed in the long term, on slopes at the Pelly Laydown area south of the security gate at Km 43. The plots were laid out in a linear fashion perpendicular to the slope. Duplicate plots were seeded per species at each site. Each plot was one square meter with a buffer plot between the seeded plots. The layout is depicted below.

The objective was to apply 500 pure live seeds (PLS) per plot. Since the purity or the germination rate of the supplied local seed was unknown, and the seeds were not completely clean (some chaff etc was present) the amount of seed was doubled. Weights of each species of seed were determined and then an appropriate amount weighed to achieve the approximate number of seeds per plot. This worked out to 0.3 g/plot for yarrow, 1.3 g/plot for fescue and 2.0 g/plot for wheatgrass.

Prior to seeding, each plot was scarified to a depth of approximately 15 cm and any existing vegetation and large rocks were removed. Once the plots were prepared the seeds were scattered evenly throughout the square meter. The seeds were then gently tamped down to ensure good seed/soil contact. A buffer was left between each seeded plot.

Characteristics of the two sites established and seeded on September 22nd are tabulated below.

Characteristic	Site #1	Site #2
UTM Coordinates, NAD 83, Zone 8W	458360 7098961	458413 7098306
Aspect	South facing	North facing
Bearing	190°	315°
Slope	20 to 30°	5 to 10°
Elevation (m)	751	758

Composite soil samples were collected at each site and analyzed by ALS. Two scoops of soil were collected from each of the six plots per site prior to seeding, mixed thoroughly and placed into new, clean glass jars. Samples were kept cool prior to delivery to the ALS depot in Whitehorse, Yukon. Analyses were completed by the ALS laboratory in Burnaby, BC. Data is summarized below with the full analytical report appended to this memo.

PHYSICAL AND NUTRIENT CHARACTERISTICS				
Parameter	**LDL**	**Units**	**TP-1**	**TP-2**
pH (1:2 soil:water)	0.1	pH units	7.9	7.36
Texture class			Coarse	Coarse
Available phosphate (as P)	2	mg/kg	<2.0	<2.0
Available nitrate + nitrite (as N)	1	mg/kg	<1.0	<1.0
Available nitrite (as N)	0.4	mg/kg	<0.40	<0.40
Available nitrate (as N)	2	mg/kg	<2.0	<2.0
Available potassium	20	mg/kg	43	34
Total carbon	0.05	%	0.575	0.299
Inorganic carbon (as CaCO3 equivalent)	0.4	%	1.59	<0.40
Inorganic carbon	0.05	%	0.191	<0.050
Total organic carbon	0.05	%	0.384	0.299
Organic matter	0.1	%	0.66	0.52

The coarse, near neutral soil at both sites contained no available phosphate or any form of nitrogen, and very little carbon, as is typical of mineral soils.

The soil samples were also analyzed for a suite of 35 metals. Of these boron, sulfur and tin were not detected at either site. Concentrations of applicable metals were compared to the most recent Canadian Council of Ministers of the Environment (CCME) guidelines and the Yukon Contaminated Sites Regulations for agriculture and parklands in the table below. Arsenic was the only parameter that exceeded all of the guidelines and did so at both sites. Arsenic is associated with the gold bearing anomalies in the district and these concentrations reflect the natural mineralization of the Project area that have been documented in previous baseline reports.

RESULTS COMPARED TO CCME AND YUKON AGRICULTURE AND PARKLAND GUIDELINES FOR METALS IN SOILS						
Element	**TP-1**	**TP-2**	**CCME (mg/kg)**		**Yukon CSR (mg/kg)**	
			Agriculture	**Parkland**	**Agriculture**	**Parkland**
Antimony (Sb)	9.95	8.01	20	20	20	20
Arsenic (As)	**224**	**159**	12	12	15	15
Barium (Ba)	144	74.2	750	500	750	500
Beryllium (Be)	0.3	0.29	4	4	4	4
Cadmium (Cd)	0.325	0.333	1.4	10	1.5	1.5
Chromium (Cr)	14.2	12.9	64	64	50	60
Cobalt (Co)	10.4	9.64	40	50	40	50
Copper (Cu)	35.7	23.6	63	63	90	90
Lead (Pb)	31	28.2	70	140	100	100
Mercury (Hg)	0.0478	0.0429	6.6	6.6	0.6	15
Molybdenum (Mo)	0.76	0.76	5	10	5	10
Nickel (Ni)	24.7	21.3	45	45	150	150
Selenium (Se)	0.33	0.24	1	1	2	1
Silver (Ag)	0.24	0.13	20	20	20	20
Thallium (Tl)	0.134	0.1	1	1	2	--
Tin (Sn)	<2.0	<2.0	5	50	5	50
Uranium	1.2	1.36	23	23		
Vanadium (V)	19.4	14.8	130	130	200	200
Zinc (Zn)	72.7	70.4	250	250	150	150
Data that exceeds the guidelines are highlighted in orange.						

Commencing in the summer of 2021, annual monitoring of the trials will be conducted. The assessments will measure the progress and allow for refinement of the prescriptions and techniques for application to similar areas requiring erosion control at the Eagle Gold Project.

Photographs of each site are presented below.

Notes:

Near Pelly Laydown

Each site is a transect of six 1 m x 1 m plots perpendicular to the slope

Test species: Altai fescue, yarrow and slender wheatgrass

Shaneel Dayal	Analyst	Metals, Burnaby, British Columbia
Xihua Yao	Laboratory Analyst	Inorganics, Saskatoon, Saskatchewan

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
%	percent
mg/kg	milligrams per kilogram
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in reports identified as "Preliminary Report" are considered authorized for use.

DISCLAIMER

This document has been provided by Okane Consultants Inc. (Okane) subject to the following limitations:

1. This document has been prepared for the client and for the particular purpose outlined in the Okane proposal and no responsibility is accepted for the use of this document, in whole or in part, in any other contexts or for any other purposes.
2. The scope and the period of operation of the Okane services are described in the Okane proposal and are subject to certain restrictions and limitations set out in the Okane proposal.
3. Okane did not perform a complete assessment of all possible conditions or circumstances that may exist at the site referred to in the Okane proposal. If a service is not expressly indicated, the client should not assume it has been provided. If a matter is not addressed, the client should not assume that any determination has been made by Okane in regards to that matter.
4. Variations in conditions may occur between investigatory locations, and there may be special conditions pertaining to the site which have not been revealed by the investigation, or information provided by the client or a third party and which have not therefore been taken into account in this document.
5. The passage of time will affect the information and assessment provided in this document. The opinions expressed in this document are based on information that existed at the time of the production of this document.
6. The investigations undertaken and services provided by Okane allowed Okane to form no more than an opinion of the actual conditions of the site at the time the site referred to in the Okane proposal was visited and the proposal developed and those investigations and services cannot be used to assess the effect of any subsequent changes in the conditions at the site, or its surroundings, or any subsequent changes in the relevant laws or regulations.
7. The assessments made in this document are based on the conditions indicated from published sources and the investigation and information provided. No warranty is included, either express or implied that the actual conditions will conform exactly to the assessments contained in this document.
8. Where data supplied by the client or third parties, including previous site investigation data, has been used, it has been assumed that the information is correct. No responsibility is accepted by Okane for the completeness or accuracy of the data supplied by the client or third parties.
9. This document is provided solely for use by the client and must be considered to be confidential information. The client agrees not to use, copy, disclose reproduce or make public this document, its contents, or the Okane proposal without the written consent of Okane.
10. Okane accepts no responsibility whatsoever to any party, other than the client, for the use of this document or the information or assessments contained in this document. Any use which a third party makes of this document or the information or assessments contained therein, or any reliance on or decisions made based on this document or the information or assessments contained therein, is the responsibility of that third party.
11. No section or element of this document may be removed from this document, extracted, reproduced, electronically stored or transmitted in any form without the prior written permission of Okane.

EXECUTIVE SUMMARY

Victoria Gold Corp. (VG) has committed to a phased approach to reclamation and closure for the Eagle Gold Mine in central Yukon Territory, as described in Version 2020-01 of the Reclamation and Closure Plan (RCP). Relocation of an overburden stockpile presented an opportunity to advance cover system monitoring in support of this goal. VG contracted Okane for characterization and instrumentation of the relocated overburden stockpile.

The scope of work is construction of a base case cover system following the construction and material sampling quality assurance / quality control (QA/QC) programs developed by Okane for relocated overburden at the Platinum Gulch WRSA 1370 Dump, and training support and virtual overview to ensure that VG carries out the program with site personnel. The material sampling program conducted before and during cover system construction was developed to characterize the physical and hydraulic properties of the overburden material to determine its suitability for use in a reclamation cover system.

The plateau and adjacent slope of the waste rock storage area (WRSA) were covered with approximately 0.50 m of overburden material in September 2020 in accordance with the base case configuration in the RCP. Soil moisture and meteorological monitoring systems were installed by VG in October 2020.

1 INTRODUCTION

Victoria Gold Corp. (VG) owns and operates the Eagle Gold Mine on the Dublin Gulch property located in central Yukon Territory. Version 2020-01 of the Reclamation and Closure Plan (RCP) was submitted to the Yukon Water Board (YWB) and the Department of Energy, Mines, and Resources (EMR) in fulfillment of the requirements of the mine water use licences issued by the YWB October 23, 2020.

Victoria Gold has committed to a phased approach to reclamation and closure through operations and into decommissioning. The current RCP outlined a series of tasks for a proposed research program in support of ongoing reclamation and closure planning. Previous research tasks in the RCP included research into reclamation cover system configurations and the processes governing performance. Relocation of an overburden stockpile presented an opportunity to advance cover system monitoring in support of progressive reclamation. VG contracted Okane Consultants Inc. (Okane) for characterization and instrumentation of the relocated overburden stockpile to take advantage of the relocation by developing an understanding of performance for a base case cover system design configuration (Okane, 2020a).

1.1 Project Objectives and Scope

The objective of the overburden stockpile relocation was to cover the plateau and slope of the waste rock storage area (WRSA) to 0.50 m depth, aligned with the base case configuration in Version 2020-01 of the RCP, in a fashion consistent with expected full-scale practices. VG took advantage of this opportunity to cover an adjacent slope on the existing WRSA, the objective of which was to test the feasibility of covering the preferred angle of repose slope post closure. The current slope of the WRSA is approximately 1.15H:1V, the angle of repose, which will have a high likelihood of segregation of overburden during placement on the slope (Okane, 2020b).

The objective of the material sampling program conducted before and during cover system construction was characterization of the physical and hydraulic properties of the overburden material to determine its suitability for use in a reclamation cover system. Data from the characterization program will aid in the interpretation of performance monitoring data collected as part of the instrumentation program. Furthermore, material characterization data serves as a critical input for numerical modelling programs that use performance monitoring data for calibration (Okane, 2020a).

The scope of work is construction of a base case cover system following the construction and material sampling quality assurance / quality control (QA/QC) programs for relocated

overburden at the Platinum Gulch WRSA 1370 Dump, and training support and virtual overview to ensure that VG carries out the program with site personnel.

2 GENERAL INFORMATION

A construction QA/QC program is necessary to ensure documentation of base case cover system construction. Okane developed the Eagle Mine Cover Trial Construction Quality Control Program which outlines the QA / QC procedures and criteria to be followed during cover system construction (Okane, 2020b). Field QA/QC procedures included a material sampling and testing plan to determine as-built properties of the cover system (Okane, 2020c). The material sampling plan and construction quality control program were submitted to VG on August 20 and 28, respectively.

VG site personnel completed the construction QA/QC program on site. Okane provided virtual training via PowerPoint presentation to VG site personnel prior to construction commencement. Qualified, experienced Okane personnel were available during the duration of construction for virtual oversight of VG employees implementing field QA/QC techniques. It was proposed that reports be provided to Okane every second day by VG site personnel completing the work to facilitate oversight, and morning meetings be completed after a review of the reports by Okane. A laboratory material testing program was designed as part of the QA/QC program (Okane, 2020c) and completed at an accredited laboratory. Okane provided instruction on material sampling and recommended the number and types of laboratory tests as part of the QA/QC plan. VG collected material samples and submitted the samples to the laboratory for testing.

2.1 Construction Team

Table 2.1 provides a list of personnel involved in the construction of the cover system, including progress reports provided by VG and collection of samples.

Table 2.1: Construction and Sampling Team

Personnel	Company	Role
Lindsay Rear	VG	Environmental Manager
Phil Emerson	VG	Environmental Coordinator
Jessica Wilkinson	VG	Environmental Technician
Larisa Doucette	Okane	Project Coordinator
Hal Cooper	Okane	Sampling Program Contact
Kevin Olynyk	Ewing Construction	Excavator Operator
Marshall Ewing	Ewing Construction	Supervisor and Dozer Operator
Mike Cox	Mueller Electric	Electrician
Curtis Dinan	Mueller Electric	Electrician

2.2 Construction Timeline

Based on progress reports provided by VG, a timeline for construction, sample collection and instrumentation install is provided below.

- September 2: VG reported that efforts had been made to prepare the plateau by filling holes and flattening the bench.
- September 3-4: The area, perimeter, and depth of the overburden spread were measured.
- September 6-7: Overburden samples were collected at Zones 1-3.
- September 7: Construction began. VG reported on September 8 that half of the overburden pile had been knocked down.
- September 10: Overburden samples were collected at Zones 4-6. A shovel was pulling out overburden material from pile and spreading it out as sampling was being conducted.
- September 22: Construction of the overburden spread was complete.
- October 19-20: Ewing Construction regraded the overburden to achieve the target depth of 0.50 m, focusing on the staked areas designated for monitoring station installation. VG completed a successful test of internet and cell access on October 19 in preparation for Okane support of instrumentation installation planned for October 22.
- October 21: Both meteorological stations were installed but the sensors were not wired because the electrician preferred to wait until all sensors were installed.
- October 22: Excavation for the slope soil monitoring station began that morning but the overburden material depth was >1.5 m. The slope was regraded with the excavator to achieve the target depth of closer to 0.50 m. The excavator dug pits on the plateau and slope for the soil monitoring stations, and the pits were instrumented with soil sensors. Both soil and meteorological sensors were then wired.
- October 23: Larisa Doucette worked remotely with the crew to verify the monitoring stations were working properly. The soil sensors were packed within the soil pits with hand tools. The plateau meteorological station was leveled, and the soil pits were backfilled and leveled by the excavator. The excavator then completed packing the berm at the slope station location.

- October 26: Phil was to request a final as-built survey of the plateau. A survey of the slope had been completed.

2.3 Equipment

The overburden material was spread across the waste rock using a dozer operated by Ewing Construction. The soil pits for the plateau and slope soil monitoring stations were excavated and backfilled with an excavator operated by Ewing Construction.

A camera was installed prior to construction with a view of a large portion of the area to be covered, in order to monitor construction activities. Following construction, the camera was moved to the plateau monitoring station to provide information on snow melt timing.

2.4 Safety and Environment

No safety or environmental incidents were reported.

3 COVER SYSTEM CONSTRUCTION

A 0.50 m cover system was recommended for construction on the eastern portion of the plateau area and a portion of the south-southeast slope of the WRSA. Standard operating procedures were implemented to complete construction of the cover system. Standard procedures include paddock dumping and dozing of the overburden material from the existing stockpile across the plateau of the WRSF to produce the 0.50 m cover system layer, and nominal tracking by dozer after placement. Some of the remaining overburden was pushed over the crest and spilled down the south-southeast slope. The area for slope coverage was selected in order to reduce slope lengths while avoiding the air quality station on the east side of the WRSA. This application method for the cover system aligns with the proposed final closure method for the mine, as waste rock slopes are not intended to be regraded and slope faces will be covered by dozing material over the crest of each bench. This application method does not provide a uniform cover system thickness on the waste rock slopes but will allow for a greater understanding of the infiltration rates on both benches and slopes for the refinement of cover system model inputs. A plateau area berm was constructed to prevent additional run-on from the plateau onto the slope, isolating the water balance to a single landscape element and preventing erosion to the extent possible.

3.1 Construction Materials

The approximate area of the 1370 plateau is 47,500 m^2, and the amount of stockpiled overburden that was relocated is 20,777 m^3. The overburden material was described as "gravelly silt, light to medium brown, compacted in some areas, with some coarser material." The overburden material was frozen to the consistency of cement overnight on September 10 but described as "soup-like" the following morning after thawing. Material was frozen during excavation to install soil monitoring stations on October 22.

3.1.1 Material Control Testing

The material characterization program collected samples from six overburden zones to account for potential variability in properties of the material. Three zones were within the overburden stockpile and three zones were within the overburden material that was already spread on the plateau when sampling began.

Overburden material samples were collected from five random locations in each discrete zone to produce one composite sample collected in one 20 L pail. The same procedure was carried out two additional times for a total of three composite samples per zone. Three composite samples were collected in this manner in each of the six zones, for a total of 18 composite samples (Okane, 2020c). Sampling locations were spread out to capture the variability of material properties within the overburden stockpile and spread material. In

addition, a digital particle size distribution (PSD) sample was collected for each composite sample. Table 3.1 outlines the testing regime and samples tested, and sampling locations are shown in Figure 3.1. The laboratory testing program included:

- PSD as determined by the hydrometer method using AASHTO T 88 Standard Method of Test for Particle Size Analysis of Soils;
- Atterberg Limits using ASTM D4318-17 Standard Test Methods for Liquid Limit, Plastic Limit, and Plasticity Index of Soils;
- Standard Proctor using D698-12;
- Hydraulic Conductivity using D5084-16; and
- Soil Water Characteristic Curve using ASTM D6839-02.

Two samples (20-VGE-OVB-03-01 and 20-VGE-OVB-04-01) were chosen by Okane for additional analysis based on the results from the first three laboratory tests which included hydraulic conductivity (k_{sat}), soil water characteristic curves (SWCC), specific gravity, and standard proctor compaction testing. Specific gravity, standard proctor, and hydraulic conductivity tests have been completed on the two samples to date.

A summary of the test results is provided in Section 3.3 and the full test results in Appendix A.

Figure 3.1: Sampling locations at 1370 Bench in September 2020.

3.2 Construction of Cover System

The construction areas and locations of the monitoring stations are provided in Appendix B, and photographs of construction in Appendix C. Progress reports prepared by VG during sampling and construction are provided in Appendix D.

The plateau was prepared for overburden by filling holes and flattening the bench. The area, perimeter, and depth of overburden spread were measured on September 3-4 by taking eight (8) waypoints as well as a track of the spread. The total area of overburden spread was 5,317 m^2 (57,234 ft^2) with a perimeter of 405 m. The spread of overburden was uneven, ranging from 0.15 to 0.50 m. Personnel collecting overburden samples from the slope at Zones 4 to 6 on September 10 described the slope as approximately 60% or 1.66:1V, similar to the 1.15:1V angle of repose.

Construction of the overburden spread was completed between September 7-22. VG observed on September 22 that the meteorological station planned for the slope could not be located on the slope because the incline was too steep for safe installation. A new location

was proposed "right on the edge", near the time lapse camera. Instrumentation installation was delayed until the trial area could be regraded to 0.50 m.

Phil Emerson and Lindsay Rear of VG arrived at the 1370 Bench on October 19 to observe the new contractor, Ewing Construction, levelling overburden throughout the pad. Approximately 2" of snow was observed on the bench. The survey contractor had staked a 20 x 20 m location for the plateau meteorological station further to the north. VG consulted with operator and supervisor Marshall Ewing to level the pad to 0.50 m, requesting high accuracy for the proposed meteorological station location. In addition, VG reviewed the staked area for the slope meteorological station and determined the area was adequate.

Spreading of overburden material continued on October 20, with even spreading hampered by freezing conditions. The overburden depth was expected to be between 0.4 to 0.7 m but the surveyor was unable to advise on cut/fill in this area because the original elevation of the stockpile was not captured in earlier surveys. The operator, Senior Mine Technician and Senior Project Manager decided the dozer operator would cut down the dump to confirm 0.50 m of overburden had been placed and then cut and fill accordingly.

Both meteorological stations were installed on October 21. The excavator was unavailable until 3 pm so operators decided to wait until 8 am the following morning to excavate pits to install the soil monitoring sensors, rather than allow the pits to freeze overnight. Wiring of the soil sensors was therefore also delayed because the electrician requested to wait until the pits were dug.

Frost had penetrated 0.2 to 0.3 m into the ground when excavation to install the soil sensors began on October 22. Excavation for the slope monitoring station began in the morning but the overburden material depth was found to be >1.5 m, so Larisa Doucette (Okane) was consulted. The berm and slope were excavated back to stockpile in a section of ~20 m, and the slope was regraded with the excavator to achieve the target depth of 0.50 m.

Following regrading the slope from the crest to the sensor installation location was 2.5H:1V and from the crest to the bottom toe was 2H:1V (Rear, 2021). The slope soil monitoring station was therefore installed on the slope instead of the berm. The excavator dug a pit on the plateau for the soil monitoring station, finding the overburden was frozen throughout the profile with large chunks of frozen earth, and an overburden depth of approximately 0.6 m. Soil sensors were installed and both soil and meteorological sensors were then wired. The progress report indicates the soil pit for the slope monitoring station was excavated and instrumented on October 22 as well.

Larisa Doucette worked remotely with the crew on October 23 to verify the monitoring stations were working properly. The Ewing operator moved material to cover the excavation on the slope, using hand tools to level the areas close to the weather stations, and reshaped the

berm. Unfrozen material was transported to the soil pit on the plateau and the sensors were packed within the soil pit using hand tools. The plateau meteorological station was leveled, and the soil pit was backfilled and leveled by the excavator. The excavator then completed packing the berm at the slope station location.

3.2.1 Construction QA/QC Activities

The slope was regraded when the overburden depth was discovered to be >1.5 m instead of the target 0.50 m depth. The regrading reduced the slope angle from the 1.15H:1V angle of repose to 2-2.5H:1V.

3.3 Material Properties

PSD of the nine overburden samples submitted for analysis was determined using the American Association of State Highway and Transportation Officials (AASHTO) Soil Classification System as shown in Table 3.2. The AASHTO classification is A-2-4 based on PSD and Atterberg Limits, provided in Table 3.3.

The overburden is 43% gravel and 57% sandy loam as classified using the Canadian System of Soil Classification (CSSC), with clay and sand representing approximately 8.5% and 58% respectively of particles >2 mm in diameter. The low plasticity of the overburden is attributed to low clay content. PSD data is provided in Appendix A.

Table 3.2: Summary of PSD of overburden samples.

AASHTO Soil Classification System	Average (%)	Minimum (%)	Maximum (%)
Clay	4	3	5
Silt	18	13	25
Fine sand	11	7	12
Coarse sand	21	15	23
Fine and medium gravel	34	31	49
Coarse gravel	8	2	13
Summary			
Silt and clay	26	19	31
Sand	31	22	35
Gravel	43	36	59

Table 3.3: Summary of Atterberg limits from overburden samples.

Atterberg Limit	Average (%)	Minimum (%)	Maximum (%)
Plastic Limit (PL)	21	20	22
Liquid Limit (LL)	27	24	30
Plasticity Index (PI)	6	3	9

Nine samples of overburden and six samples of waste rock were collected from the slope and plateau monitoring station locations for material calibration of the soil moisture sensors. Analysis for the overburden and waste rock material is provided in Table 3.4 and Table 3.5.

Table 3.4: Overburden bulk density and gravimetric water content.

Parameter	Average (%)	Minimum (%)	Maximum (%)
Bulk Density (g/cm^3)	1.71	1.6	1.8
Gravimetric water content (g/g)	0.11	0.05	0.16
Porosity[1] (%)	34		

[1]Porosity estimated assuming particle density of 2.6 g/cm^3.

Table 3.5: Waste rock bulk density and gravimetric water content.

Parameter	Average (%)	Minimum (%)	Maximum (%)
Bulk Density (g/cm^3)	1.71	1.6	1.8
Gravimetric water content (g/g)	0.07	0.002	0.13
Porosity[1] (%)	34		

[1]Porosity estimated assuming particle density of 2.6 g/cm^3.

Standard proctor testing on two overburden samples (20-VGE-OVG-03-01 and 20-VGE-OVG-04-01) determined that molding water content is 9.7 to 11.3% for maximum compaction of 1,988 to 2,054 kg/m^3 dry density. Hydraulic conductivity testing on two overburden samples (20-VGE-OVG-03-01 and 20-VGE-OVG-04-01) determined hydraulic conductivities of 2.5 x 10^{-9} m/s and 4.4 x 10^{-9} m/s, respectively at 95% compaction. Standard proctor and hydraulic conductivity data is provided in Appendix A.

Soil water characteristic curves (SWCCs) are currently being completed on two overburden samples and data is not yet available.

4 CLOSURE

Please do not hesitate to contact me at (403) 815-0009 or tbaker@okc-sk.com should you have any questions or comments.

Appendix D

Progress Reports

Eagle Mine 1370 Cover System Progress Report

Date:	2020-09-03, 04	**Owner/Client:**	
Day:		**Okane Project #:**	
Prepared by:	KT	**Project Location:**	Eagle Mine - Bench 1370

Number of Pages in Report

Environmental Conditions:

Weather	Showers	Wind	Low
Temperature (High/Low)	4C -	Humidity	80 to 100%

Location of Work:

Overburden on the 1370 Bench. Specifically, the overburden that has been spread out already (57234 sq ft).

Effects on Work (weather, incidents, breakdowns, delays, etc.):

Heavy rain was making the roads muddy. 4x4 is needed.

Health, Safety, & Environment:

Safety: To access the 1370 Bench, communication with the Pit Supervisor is to be obtained prior to entry. Haul trucks are hauling ore most days, situational awareness is imperative to worker's safety.

Sampling/Construction/Installation Notes:

Obtained area, perimeter and depth readings of overburden material that has been spread out. See photos and map attached.

Sampling was not conducted at this time.

Construction was not ongoing at this time.

Communication:

Total area of overburden spread to date is 57234 sq ft.
Total perimeter of overburden spread to date is 405m.
Depth of spread is uneven, approximately 15-50cm.
8 waypoints were taken (shown on map) as well as a track of the spread.

Sampling will be conducted within the next couple days once all equipment is obtained.

Incidents:

No incidents.

Other General Remarks:

By signing below I agree that the above statements are an accurate representation of events.

Okane Consultants:

Victoria Gold Representative:

Eagle Mine 1370 Cover System Progress Report

Date:	2020-09-10	**Owner/Client:**	
Day:	2	**Okane Project #:**	
Prepared by:	KT	**Project Location:**	Eagle Gold Mine

Number of Pages in Report

Environmental Conditions:

Weather	Clear		Wind	Moderate
Temperature (High/Low)	2C	- 0C	Humidity	40 to 60%

Location of Work:

Overburden on the 1370 Bench.

Effects on Work (weather, incidents, breakdowns, delays, etc.):

Frost is now present at Eagle Mine. Wind was moderate during this visit.

Health, Safety, & Environment:

Safety: To access the 1370 Bench, communication with the Pit Supervisor is to be obtained prior to entry. Haul trucks are hauling ore, call your km's in the pit. Be aware of machinery blind spots.

Sampling/Construction/Installation Notes:

Sampling:
Sampled Zone 4, 5 and 6. Slope was approximately a 60% incline, so sampling took longer. Because of the frost at night and sun during the morning, material was becoming saturated with moisture and becoming soup-like.

Construction:
A shovel was pulling out overburden material from pile and spreading it out during our time sampling. Communication was established prior to sampling. Photos were taken. Time lapse camera is still taking 2 photos every hour.

Communication:

Two different sized balls were used (one 6" and one 8.7" due to communication error). Red is 8.7", orange is 6". The 8.7" red ball was always placed above the 6" orange ball in medium scale photos.

We (the samplers) had a tough time sampling the slope. The material was almost equivalent to cement (probably the frost) but it did loosen up after walking around on it mixed with the warmth from the sun.

Incidents:

No incidents.

Other General Remarks:

By signing below I agree that the above statements are an accurate representation of events.

Okane Consultants:

Eagle Mine 1370 Cover System Progress Report

Date:	Sep-19-20	**Owner/Client:**	
Day:	4	**Okane Project #:**	
Prepared by:	KT, KB	**Project Location:**	Eagle

Number of Pages in Report

Environmental Conditions:

Weather	Fair		Wind	Low
Temperature (High/Low)	1	5	Humidity	60 to 80%

Location of Work:

Overburden on the 1370 Bench.

Effects on Work (weather, incidents, breakdowns, delays, etc.):

Weather: Heavy fog in the early morning until 9am.

Health, Safety, & Environment:

Safety: To access the 1370 Bench, communication with Pit Supervisor is to be obtained prior to entry. Haul trucks are hauling ore, call your km's in the pit. Be aware of machinery blind spots.

Sampling/Construction/Installation Notes:

Construction ongoing.

Communication:

Checked time lapse camera, all operations normal - taking photos every 2 hours.

Incidents:

No incidents.

Other General Remarks:

By signing below I agree that the above statements are an accurate representation of events.

Okane Consultants:

Victoria Gold Representative:

Eagle Mine 1370 Cover System Progress Report

Date:	Sep-22-20	**Owner/Client:**	
Day:	5	**Okane Project #:**	
Prepared by:	KT, KB	**Project Location:**	Eagle

Number of Pages in Report

Environmental Conditions:

Weather	Cloudy		Wind	High
Temperature (High/Low)	1	-4	Humidity	40 to 60%

Location of Work:

Overburden on the 1370 Bench.

Effects on Work (weather, incidents, breakdowns, delays, etc.):

Weather: High wind.

Health, Safety, & Environment:

Safety: To access the 1370 Bench, communication with Pit Supervisor is to be obtained prior to entry, Haul trucks are hauling re, call your km's in the pit. Be aware of machinery blind spots.

Sampling/Construction/Installation Notes:

Construction of the overburden spread is complete.

Took photos of overview shots, a shot showing the berms, a shot showing slope down where the slope weather station is going to go, and shots showing the least impacted rutting area and the most impacted rutting area.

Wx Plateau Proposed Location: 0460592N 7099173W
Wx Slope Proposed Location: 0460592 7099173

The weather station on the slope can not physically be on the slope as the incline is too great to achieve safe installation. This proposed location is right on the edge, close to where the time lapse camera is set up.

Communication:

See photos.

Incidents:

No incidents.

Other General Remarks:

By signing below I agree that the above statements are an accurate representation of events.

Date: October 26, 2020

Prepared by: Phil Emerson

Temp: -20 to -10

Location: 1370

Effects on work

Slope hole was started at 9:30am, material was >150cm, call to Larisa was made for guidance. Berm and slope were excavated back to stockpile in a section of about 20m. Slope was regraded with the excavator in order to get closer to the project scope of 50cm.

Frost has penetrated about 20-30cm into the ground

Heath, Safety and Environment

Cold conditions

Working around excavator

Sampling/Construction/Installation Notes:

Crew was ready to start at 9:00

Mueller electric - Mike & Kurt

VGC - Jessica &Phil

Ewing - Kevin

9:30- Issue with depth of material on the slope station - Larisa was called and it was decided to reshape the slope and get the depth closer to project scope of 50cm.

10:00- Decided to cut berm and slope and create a station on the slope instead of the berm

10:30- Excavator still has earthworks to complete on the slope. Operator was asked to dig a hole on the plateau station so the group could continue with the installation

10:45- Plateau hole has been dug, frozen the entire way down, large chunks of frozen earth in the work area. Overburden depth is approximately 60cm

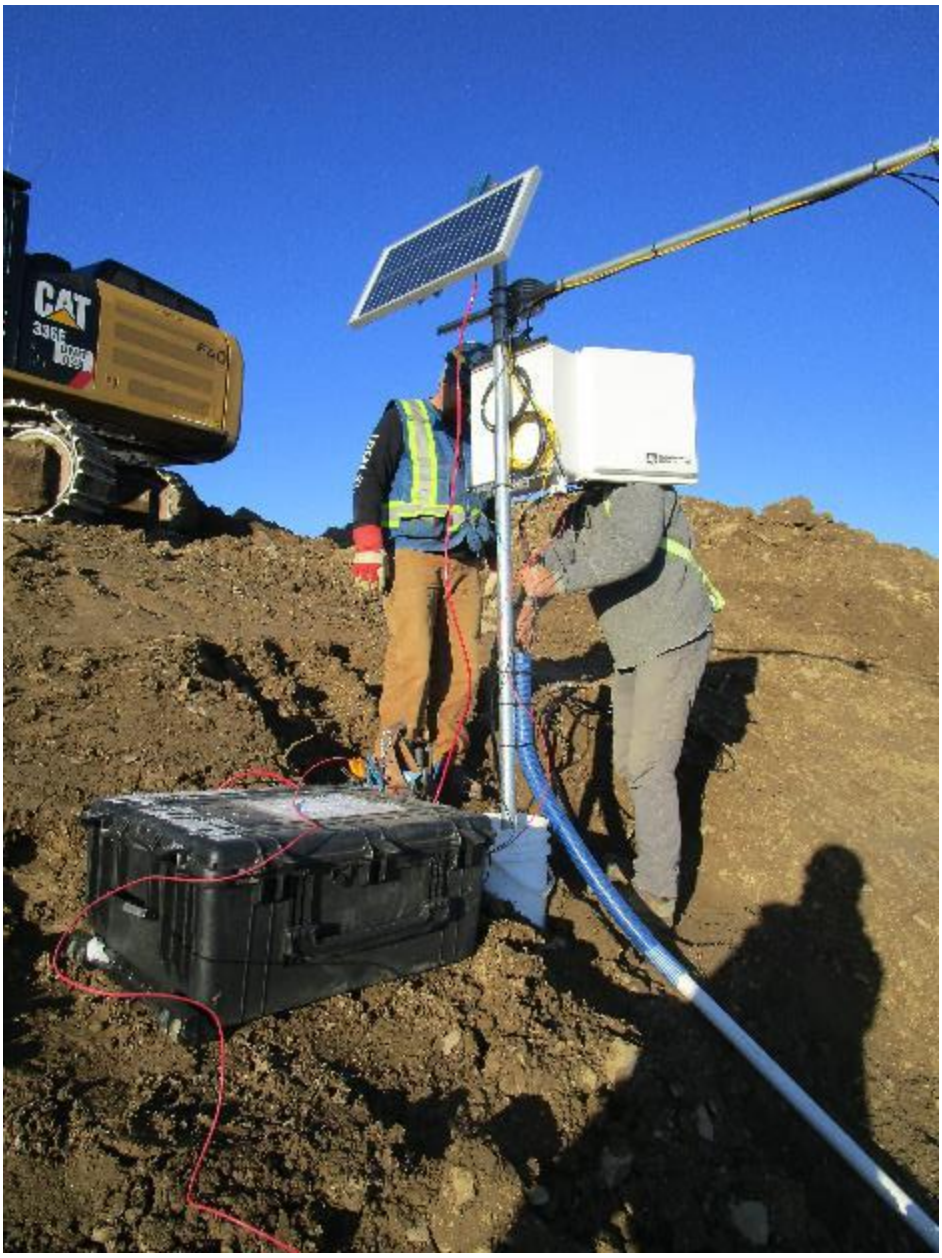
11:15- Wiring has been fed through the PVC and rain gauge has been mounted

11:30- Area is within the blast radius, crew left work area

13:00- Returned to work area and started to prep plateau excavation for instrumentation

13:00- Slope station has been prepped, slope has been regraded and is less steep than before.

13:30 - Phil left site and group had instruction to install instrument in both locations.



14:00- Plateau station instruments were installed, because of the frozen ground and rocks present in the overburden CS616 were partial set into the wall and then dirt was built up around them. CS229 sensors were left in the packaging overnight to avoid damage.

Communication:

Larisa was sent updated picture throughout the day

Pic 1: Hooking up sensors to the weather station

Pic 2: Wiring sensors

Pic 3: Icy/frozen conditions rock was placed around probe at the the OB/Dump interface

Pic 4: Excavator removing material at slope station to meet project specs of 50cm

Date: Oct 23, 2020

Prepared by: Phil Emerson

Weather: -20 to -10

Location: 1370 bench

Effects on Work (weather, incidents, breakdowns, delays, etc.)

Cold weather trucks were left running and used as warm up zones

Blast scheduled for 12pm must clear the area at 11:30

At slope station we could have positioned the weather station further up on the slope. Will require workers to upload information on the slope. Extra wiring has been secured to the weather station pole and station could be moved in the future if needed.

Health, Safety & Environment:

Cold weather

Working around excavator

Sampling/Construction/ Installation Notes:

8:15- Contacted Larisa to test the system via Team Viewer. Slope station was verified and we moved to plateau station to complete verification

8:45 - Verification has been completed at both stations Ewing operator starting moving material to cover excavation. hand tools were used to level area close to the weather station

9:30 - Slope station has been covered Slope sensors distance ground- snow 183cm, NRlite 241cm

and excavator started to reshape berm

10:00- Asked for unfrozen material to be tracked to the plateau station so field crew could move forward with completion of instrumentation installation (packing around instruments), leveling weather station, installation of ground, etc.

11:00- instruments have been packed and the hole was ready for backfill, combination of excavator and hand tools used

12:00- hole was backfilled and ground leveled

12:00- Excavator moved back to the slope station to completed packing the the berm before it tracked out back to site.

Pic 1: Instruments installation before program tested. CS229 probes were removed from case before hole was filled

Pic 2: Instrument installation before program test. CS229 sensors were removed from case prior to being buried

Pic 3: Excavator completing slope station fill and grading

Pic 4: Completed plateau station with Ewing operator completing finishing touches around station

2. The scope and the period of operation of the Okane services are described in the Okane proposal and are subject to certain restrictions and limitations set out in the Okane proposal.
3. Okane did not perform a complete assessment of all possible conditions or circumstances that may exist at the site referred to in the Okane proposal. If a service is not expressly indicated, the client should not assume it has been provided. If a matter is not addressed, the client should not assume that any determination has been made by Okane in regards to that matter.
4. Variations in conditions may occur between investigatory locations, and there may be special conditions pertaining to the site which have not been revealed by the investigation, or information provided by the client or a third party and which have not therefore been taken into account in this document.
5. The passage of time will affect the information and assessment provided in this document. The opinions expressed in this document are based on information that existed at the time of the production of this document.
6. The investigations undertaken and services provided by Okane allowed Okane to form no more than an opinion of the actual conditions of the site at the time the site referred to in the Okane proposal was visited and the proposal developed and those investigations and services cannot be used to assess the effect of any subsequent changes in the conditions at the site, or its surroundings, or any subsequent changes in the relevant laws or regulations.
7. The assessments made in this document are based on the conditions indicated from published sources and the investigation and information provided. No warranty is included, either express or implied that the actual conditions will conform exactly to the assessments contained in this document.
8. Where data supplied by the client or third parties, including previous site investigation data, has been used, it has been assumed that the information is correct. No responsibility is accepted by Okane for the completeness or accuracy of the data supplied by the client or third parties.
9. This document is provided solely for use by the client and must be considered to be confidential information. The client agrees not to use, copy, disclose reproduce or make public this document, its contents, or the Okane proposal without the written consent of Okane.
10. Okane accepts no responsibility whatsoever to any party, other than the client, for the use of this document or the information or assessments contained in this document. Any use which a third party makes of this document or the information or assessments contained therein, or any reliance on or decisions made based on this document or the information or assessments contained therein, is the responsibility of that third party.

1 BACKGROUND

Victoria Gold Corp. (VG) owns and operates the Eagle Gold Mine on the Dublin Gulch property located in central Yukon Territory. Version 2020-01 of the Reclamation and Closure Plan (RCP) was submitted to the Yukon Water Board (YWB) and the Department of Energy, Mines, and Resources (EMR) on October 23, 2020 in fulfillment of the requirements of the mine water use licences issued by the YWB.

Victoria Gold has committed to a phased approach to reclamation and closure through operations and into decommissioning. The current RCP outlined a series of tasks for a proposed research program in support of ongoing reclamation and closure planning. Previous research tasks in the RCP included research into reclamation cover system configurations and the processes governing performance. Relocation of an overburden stockpile presented an opportunity to advance cover system monitoring in support of progressive reclamation. VG contracted Okane for characterization and instrumentation of the relocated overburden stockpile to take advantage of the relocation by developing an understanding of performance for a base case cover system design configuration (Okane 2020a).

The base case cover system provided the opportunity to track the evolution of the cover system in response to site-specific processes (physical, chemical, and biological) to enhance understanding of key characteristics and processes that control cover system performance. Cover system performance will primarily be assessed in terms of net percolation of meteoric waters, and geotechnical, geomorphological, and geochemical stability. It was proposed that a performance monitoring system with automated measurements be implemented to evaluate the base case cover system constructed from relocation of the overburden stockpile. Okane provided VG an instruction manual (Okane, 2020c) that detailed the proposed sensor locations, depths, and installation procedures. Design drawings of the final station details are provided in Appendix A.

1.1 Project Objectives and Scope

A key objective of the proposed research program is to measure and understand a base case cover system (0.50 m overburden) water dynamics, such that an appropriate estimate can be made of net percolation rates through the cover system. Net percolation rates can then be used by VG to determine whether the base case cover system implementation is likely to result in achieving site water quality criteria both during operations and at closure and to update the proposed cover system configuration, if necessary. These efforts to instrument a cover system trial are in service of advancing commitments made in the RCP (Okane, 2020d).

A secondary objective of the research program is to demonstrate that the base case cover system design is geotechnically, geomorphologically, and geochemically stable. Thus, it will be necessary to demonstrate that the integrated performance of the system is sufficient to meet closure performance objectives without the need to re-slope the WRSAs from the current angle of repose.

The scope of work is to install a performance monitoring program for the relocated overburden at the Platinum Gulch WRSA 1370 Dump.

There are two full meteorological stations, the Potato Hills and Camp stations, are located near the 1370 waste rock storage area (WRSA) that are collecting parameters required for the water balance. Some data collected by the Potato Hills and Camp meteorological stations will be used for the trial study, although this does not present the ideal situation due to the distance and difference in elevation between the stations and the 1370 WRSA. Therefore, sensors to monitor net radiation, snow depth, and rainfall were installed to monitor site-specific parameters on the plateau of the base case cover system constructed from the relocated overburden. In addition, meteorological sensors were installed on the slope area soil monitoring station to monitor net radiation and snow depth, as these parameters are aspect dependent.

The soil monitoring system design is for one soil monitoring station on the covered area of the WRSA plateau at a proposed location of 8 W 460592 E 7099173 N and one soil monitoring station on the adjacent covered slope at a proposed location of 8 W 460550 E 7099045 N. The actual location of the plateau station is 8 W 460548 E 7099154 N, while the actual location of the slope station is 8 W 460551 E 7099045 N. Maps of the proposed and actual station locations are provided in Appendix A. This design ensures that spatial and slope variability of soil parameters is captured. It was recommended that five (5) volumetric water content probes and five (5) matric suction / temperature probes be installed at each monitoring station: four (4) pairs in the cover system, and one (1) pair in the upper waste material. The volumetric water content and matric suction measurements will monitor water movement through the cover system and confirm the timing and magnitude of net percolation. Five sensors are the minimum recommended for the soil monitoring station based on the 0.5 m cover system depth, in order to adequately determine soil water dynamics of the cover system and upper waste material.

2 INSTALLATION DETAILS

The monitoring system design for the cover system trial includes one monitoring station on the covered area of the WRSA plateau and one monitoring station on the adjacent covered southeast slope. Okane developed a finalized design and instrumentation installation plan to be completed by VG site personnel after cover system construction (Okane, 2020c). In addition, Okane provided virtual training via PowerPoint presentation to VG site personnel in instrumentation installation procedures prior to installation, as well as a PowerPoint presentation on maintenance and data collection procedures following installation. Qualified, experienced Okane personnel were available during the duration of instrumentation installation for virtual oversight. Reports were provided to Okane by VG personnel approximately every second day throughout the installation to facilitate oversight of instrumentation installation, and regularly scheduled meetings with VG and Okane staff were held to review progress. Survey control was provided by VG during instrumentation installation to assist in documentation.

Station profile design drawings are provided in Appendix A. The datalogger programs are described in Appendix B. Photographs of station installation are located in Appendix C.

2.1 Data Acquisition System

A robust power system was designed for the monitoring stations to maintain station power through long winters with low solar energy. Soil and meteorological sensors for each station are controlled with one (1) CS CR1000X-XT measurement and control datalogger supplied with power by one (1) CS SP30R 30 W solar panel with 12V regulator and two (2) NAPA Deep Cycle Battery BCI No. 31 650 A in parallel. Soil sensors are wired to a CS AM16/32B-XT multiplexer. Schematics of datalogger and multiplexer wiring are provided in Appendix A. The datalogger and multiplexer are contained in a CS ENC 14/16 fiberglass enclosure mounted to a 4x4" fencepost in a 20 L pail filled with concrete and grounded with a CS L31163 basic grounding kit. The batteries are protected in a watertight container. Sensor wires from the sensors to the data acquisition system (DAS) are protected in Schedule 40 PVC tubing. The datalogger programs are provided in Appendix B.

2.2 Meteorological Sensors

The purpose of the above ground components of the monitoring system is to quantify elements of an energy and water balance for the cover system. Net radiation and snow depth are measured at both the plateau and slope monitoring stations, as these parameters are aspect-specific, while rainfall is measured at the plateau station. Meteorological instruments installed include:

- Kipp and Zonen NRLite2 net radiometers measure the net input of radiation into or out of the soil-atmosphere boundary. Net radiation is important in understanding temperature fluctuations in the cover system and is the primary energy input for evaporating water from the cover system surface. The net radiometers are mounted to the station post with a CS L26120 mount kit with built-in leveling.

- Campbell Scientific (CS) SR50ATH sonic ranging sensors measure the depth of snow above the cover system surface. Snow represents a major input of water into the cover system. Knowing how snow is partitioned between runoff, storage in the cover system, or percolation through the cover system will have a large effect on the design of the closure system. Sonic sensors determine distance by emitting an ultrasonic pulse and then measuring the elapsed time between the emission and return of the pulse. The temperature probe allows the SR50ATH to output temperature-corrected values. The integrated heater prevents ice and frost from coating the transducer. The temperature sensor is mounted in a RM Young 41303-5A radiation shield.

- An EML Metric ARG314 tipping bucket rain gauge (TBRG) with 0.2 mm resolution measures the amount of liquid precipitation that is incident to the cover system surface. Rainfall is the primary input of liquid water to the cover system during periods when the cover system is not frozen. Knowing the volume of precipitation incident to the cover system will allow for development of a defensible cover system water balance. The aerodynamic shape of the TBRG reduces wind loss of rainfall over the orifice, improving accuracy of the measurement. The rain gauge is mounted on a 2" galvanized steel post in a concrete-filled pail with a flat platform.

Net radiation will be measured every minute, snow depth will be measured once per hour, and rainfall will be measured on an event basis. Meteorological parameters will be output into daily and hourly data tables.

2.3 Soil Monitoring Stations

Measurements taken within the cover system provide insight into the partitioning of water at the cover system-atmosphere interface and the cover system-waste material interface. Measured parameters are volumetric soil water content, soil temperature, and soil matric potential. Drawings of station locations and Schematics of the soil sensor installations are located in Appendix A.

High frequency data collection ensures that cover system water balances can be estimated on a daily basis. Soil parameters will be measured every four (4) hours to capture any changes that may occur following precipitation events.

2.3.1 CS 616 Sensors

CS616 time domain reflectometry (TDR) sensors measure the volume of water in the soil at given depths throughout the profile and add to measurements from adjacent sensors to determine cover system water storage. Soil water content is the primary parameter used when developing water balance inputs to a cover system model for a reclamation cover system. The changes of water storage in the cover system provide insight into how the system behaves, and whether water is stored and subsequently released through evaporation, runs off overland, or is transported through the cover system into the underlying waste material.

A CS616 sensor consists of two stainless steel rods (300 mm long x 3 mm in diameter; referred to as the wave guide) connected to a printed circuit board encapsulated in epoxy. An electromagnetic pulse is propagated along the wave guide and the time between sending the original pulse and receiving the reflected pulse is measured. The time period is a function of the apparent dielectric constant of the soil, which is strongly dependent on the volumetric water content of the soil.

Okane applies a temperature correction to CS616 TDR output when the period output is ≥27:

1) $p = \tau + (20 - T)(0.526 - 0.052 + 0.00136\tau^2)\ if\ \tau < 27$

2) $p = \tau + (20 - T)(0.009\tau - 0.013)\ if\ \tau \geq 27$

Where p = period corrected for soil temperature
τ = period measured by CS616 TDR and output by datalogger
T = soil temperature measured by 229 sensor (°C)

Material specific calibration curves are required for correction of CS616 data following installation and these calibration curves were developed in Okane's Saskatoon laboratory from overburden and waste rock material collected during construction and installation. It should be noted that the calibration for the waste rock material is currently being undertaken.

3) $VWC_{OB} = 0.0000408p^3 - 0.003961p^2 + 0.1349p - 1.326$

4) $VWC_{WR} = Ap^3 + Bp^2 + Cp + D$

Where VWC_{OB} = volumetric water content (cm^3/cm^3) of overburden
VWC_{WR} = volumetric water content (cm^3/cm^3) of waste rock

2.3.2 CS 229 Sensors

CS 229 heat dissipation matric potential sensors measure the temperature and stress state of the soil, expressing the wetness of the system in terms of a potential, at given depths

throughout the profile. Soil temperature is an important parameter of interest in cold regions, as temperature is indicative of the energy balance of the system and provides insight into how water is partitioned at the soil-atmosphere interface. Measurement of soil matric potential provides an indication of how tightly the soil is holding the pore water at a given depth. When used with water content sensors it allows for the calculation of gravitational gradients that are then used to calculate a flux through the system. The calculated flux is then used to calculate a rate of percolation of water through the cover system into the underlying waste, where it is then available to report to surface or groundwater receptors.

A CS 229 sensor consists of a probe inserted axially in a porous cylinder, which has a diameter of 15 mm and a length of 32 mm. The probe consists of a stainless steel tube in which a heating element and a thermocouple are embedded. The heating element and thermocouple are connected to lead wires; this connection is embedded in an electrical insulating resin. The thermal conductivity sensor is heated for 30 seconds to determine the change in temperature, which varies depending on the moisture content of the ceramic block.

The CS 229 sensor records heat dissipation from a current, referred to as temperature rise.

5) $T_{norm} = \frac{\Delta T_{max} - \Delta T}{\Delta T_{max} - \Delta T_{min}}$

Where T_{norm} = normalized temperature rise
ΔT = temperature rise measured by the 229 sensor and output by datalogger
ΔT_{max} = maximum of sensor calibration curve
ΔT_{min} = minimum of sensor calibration curve

Constants for the slope function of the CS 229 sensor response to temperature were developed from Flint et al (2002):

6) $s^* = F_1 {T_{norm}}^5 + F_2 {T_{norm}}^4 + F_3 {T_{norm}}^3 + F_4 {T_{norm}}^2 + F_5 T_{norm} + F_6$

Where s* = position of T_{norm} on the slope function s
F1 = Flint et al. 2002 constant to fit T_{norm} to the slope function = -0.00774
F2 = Flint et al. 2002 constant to fit T_{norm} to the slope function = 0.03311
F3 = Flint et al. 2002 constant to fit T_{norm} to the slope function = -0.044
F4 = Flint et al. 2002 constant to fit T_{norm} to the slope function = 0.01334
F5 = Flint et al. 2002 constant to fit T_{norm} to the slope function = 0.00498
F6 = Flint et al. 2002 constant to fit T_{norm} to the slope function = 0.00064

Matric suction is calculated from the temperature-corrected CS 229 sensor output ΔT_{corr}:

7) $\Delta T_{corr} = \Delta T_{max} - \big(T_{norm} - s^*(T - 20)\big)(\Delta T_{max} - \Delta T_{min})$

Where ΔT_{corr} = input to the matric suction function
T = soil temperature measured by CS 229 sensor (°C)

The calibration curve relating sensor response (ΔT_{corr}) to soil water potential or matric suction (Ψ) is empirical. The most commonly used form is:

8) $$ln(|\Psi|) = \alpha \Delta T_{corr} + \beta$$

Where Ψ = matric suction (kPa)
α = slope of the calibration curve
β = intercept of the calibration curve

CS 229 sensors were calibrated individually in Okane's Saskatoon laboratory prior to installation and matric suction is calculated using Okane's proprietary calibration curve. The calibration data are provided in Table 2.1.

Table 2.1: Calibration constants for CS 229 sensors.

Serial #	ΔT_{min}	ΔT_{max}	A	N	M

2.3.3 Plateau Performance Monitoring Station

The plateau performance monitoring was located in the middle of the bench to avoid edge effects (see Appendix A). The meteorological station equipment was installed on October 21, 2020. The soil pit was excavated, and the soil sensors installed on October 22. The CS616 sensors were partially set in the soil pit wall and then overburden built up around them because the overburden was frozen and contained rocks. The 229 sensors were left in packaging overnight to avoid freezing because the soil pit was not backfilled until October 23, after the sensors were wired and correct operation verified (Okane, 2021).

The overburden depth at the plateau station location was approximately 0.65 m instead of the target 0.5 m. Sensor depth was recorded during installation as elevation in meters above sea level (masl), with the surface of the pad at 1371.46 masl, after sensor installation as shown in Table 2.2.

Table 2.2: Sensors installed at the plateau monitoring station.

Elevation (masl)	Depth (cm)	CS616 #	CS229 #
1371.338	12.4		S/N 0057
1371.326	13.6	1	
1371.303	15.9	2	
1371.176	28.6		S/N 0060
1371.095	36.7	3	
1371.058	40.4		S/N 0058
1371.02	44.2	4	
1370.953	50.9		S/N 0059
1370.866	59.6	5	
1370.833	62.9		S/N 0062

The distance between the SR50ATH, NRLite2, TBRG and ground is 1.86 m, 1.88m and 1.89 m, respectively. These measurements were conducted by Victoria Gold at the plateau station on February 28, 2021.

2.3.4 Slope Performance Monitoring System

Sensor depth was recorded during installation as elevation, as shown in Table 2.3, and the surface of the overburden is located at 1367.58 masl and 1367.48 masl above the CS229 and CS616 profiles, respectively. The location of the slope station on the landform is shown in Appendix A. Installation at a mid-slope position on a shorter slope was desired to monitor a location with mid-grade texture and reduced segregation. The slope from the crest to the sensor installation location is 2.5H:1V and from the crest to the bottom toe is 2H:1V (Rear, 2021).

The meteorological station equipment was installed on October 21, 2020. The slope was regraded on October 22, reducing slope angle, to achieve desired overburden depth of 0.5 m; the monitoring station was then installed on the slope instead of the berm as planned. Based on surface and instrumentation elevations, it is estimated that the overburden depth is between 0.40 and 0.5 m. The soil pit was excavated, and the soil sensors installed on October 22, and the pit backfilled on October 23 following verification of station operation. The 229 sensors were left in packaging overnight to avoid freezing (Okane, 2021). Phil Emerson of VG observed on October 23 that the meteorological station could have been positioned further up the slope and secured extra wiring to the meteorological station mounting post to move the station in future if required.

Table 2.3: Sensors installed at the slope monitoring station.

Elevation (masl)	Depth (cm)	CS616 #	CS229 #
1367.407	7.3	1	
1367.405	17.5		S/N 0053
1367.321	25.9		S/N 0054
1367.315	16.5	2	
1367.232	34.8		S/N 0061
1367.219	26.1	3	
1367.167	31.3	4	
1367.157	42.3		S/N 0056
1367.036	54.4		S/N 0055
1367.024	45.6	5	

The distance between the SR50ATH and ground is 1.74 m. The distance between the NRLite2 and ground is 2.29 m. These values are approximate due to the difficulty to achieve precision due to the inherent angle of the slope and ground. Measurements were recorded by Victoria Gold on February 28, 2021.

3 CLOSURE

Appendix C

Photo Log

Photo 1 View directly north across the 1370 bench with the staked 20x20 m area for the plateau monitoring station on October 19, 2020.

Photo 2 View east over the covered slope on October 19, 2020, showing the staked location for the slope climate station.

Photo 3 View south from the designated slope meteorological station area on October 19, 2020.

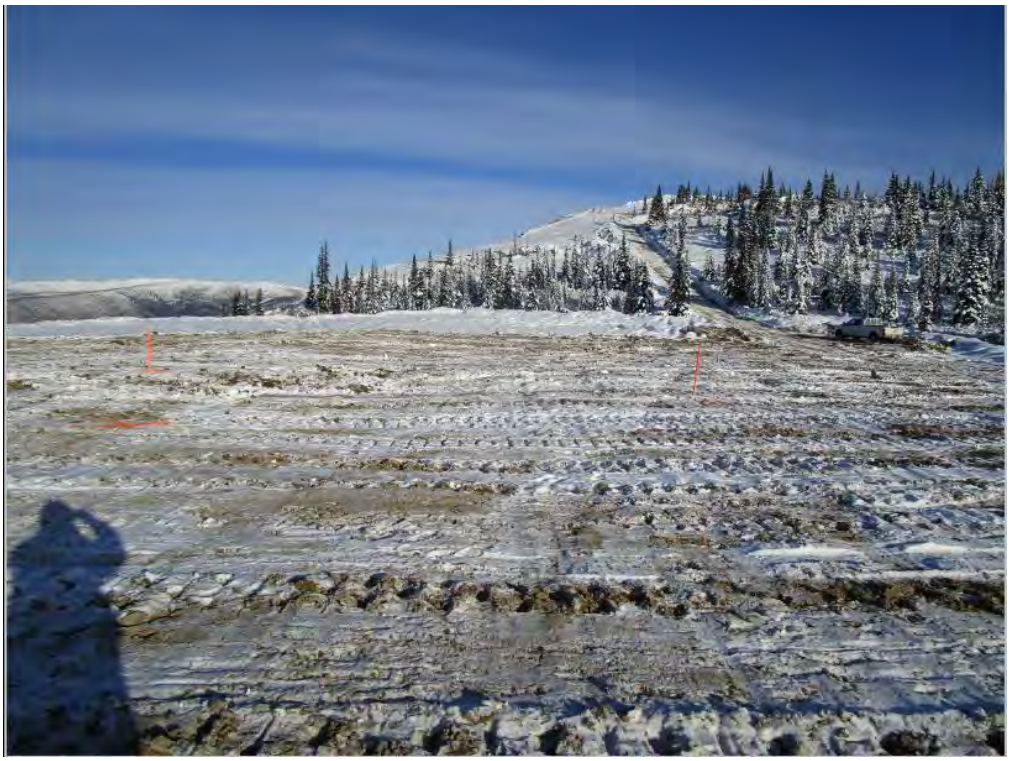

Photo 4 1370 bench on October 20, 2020 following removal of snow and grade stakes.

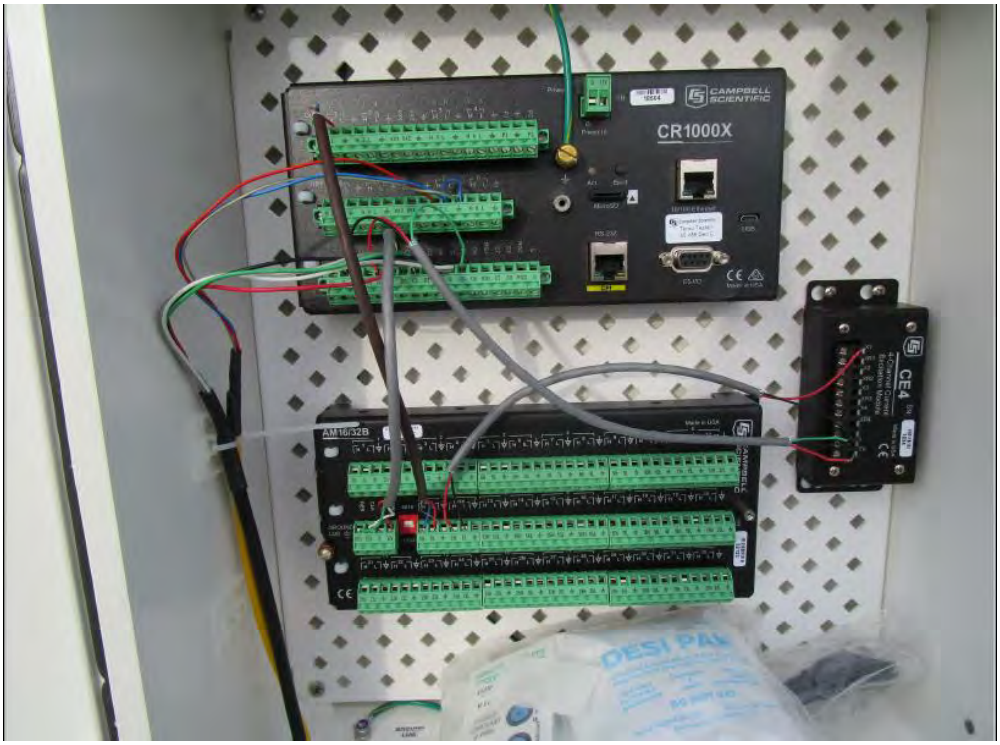

Photo 5 Wiring of slope monitoring station on October 21, 2020.

Photo 6 Stations were completed and laid on the pelican case overnight on October 21, 2020.

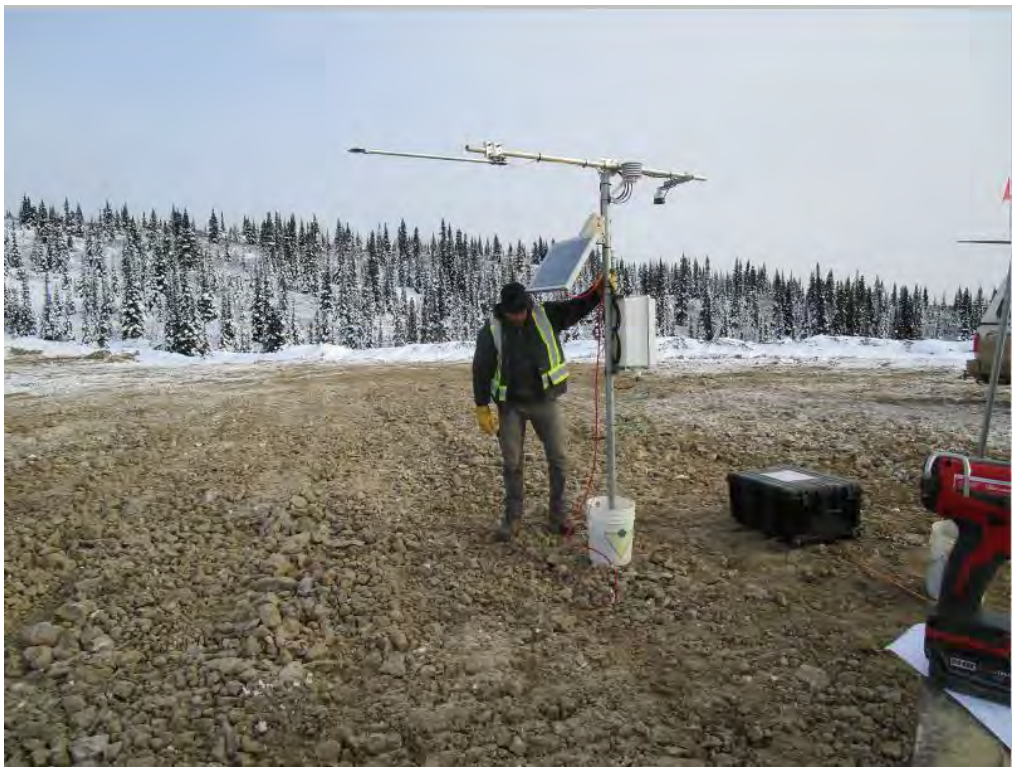

Photo 7 Plateau monitoring station set on October 21, 2020.

Photo 8 Attaching sensor to the plateau meteorological station on October 22, 2020.

Photo 9 Wiring sensors on October 22, 2020.

Photo 10 Icy/frozen rock was placed around sensors at the overburden / dump interface on October 22, 2020.

Photo 11 Excavator removing material at slope monitoring station on October 22, 2020 to meet project specification of 0.50 m.

Photo 12 Sensor installation before the datalogger program was tested on October 23, 2020. CS 229 sensors were removed from cases prior to backfilling pit.

Photo 12 Sensor installation before the datalogger program was tested on October 23, 2020. CS 229 sensors were removed from cases before the pit was filled.

Photo 13 Excavator completing slope monitoring station fill and grading on October 23, 2020.

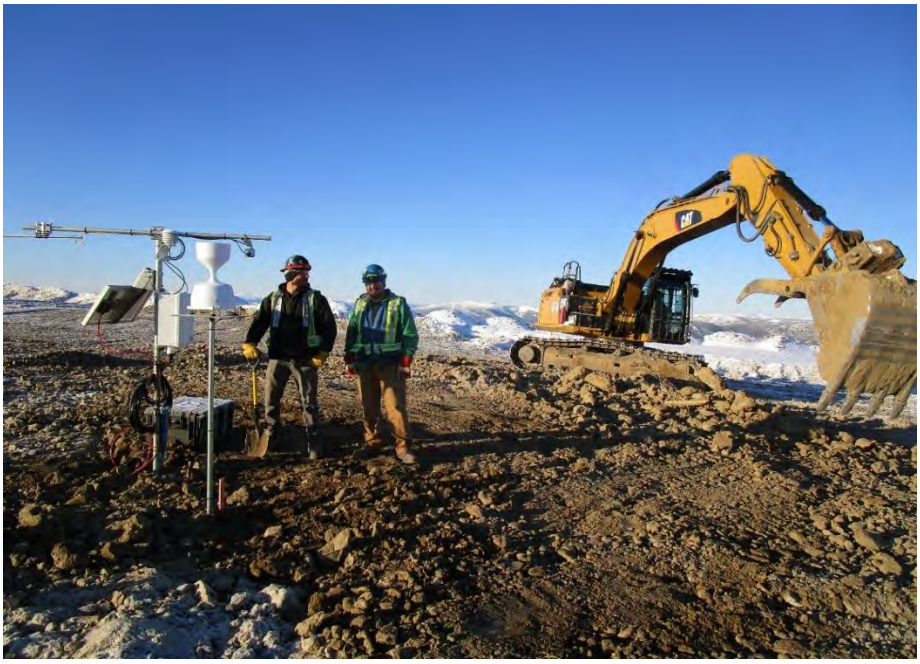

Photo 14 Completed plateau monitoring station with Ewing operator completing finishing touches around station on October 23, 2020.
