DETAIL TYPE:

AD - ANIMAL DAMAGE	DS-# - DESTRUCT SAMPLE NUMBER	IO - INSUFFICIENT OVERLAP	T - THREE PANEL INTERSECTION
ATL - AIR TEST LEAK	EE - EARTHWORK EQUIPMENT DAMAGE	MD - MANUFACTURER/DELIVERY DAMAGE	VL - VACUUM TEST LEAK
BO - FUSION WELDER BURN	EXT - EXTENSION	P - PENETRATION	WR - WRINKLE
CR - CREASE	FM - FISHMOUTH	PT - PRESSURE TEST CUT	WS - WELDER RESTART
D - INSTALLATION DAMAGE	FS - FAILED SEAM LENGTH	SI - SOIL SURFACE IRREGULARITY	OTHER:

TEST METHOD:

AL - AIR LANCE	VB - VAC BOX
PS - POINT STRESS	ST - SPARK TEST

REPAIR TYPE:

G&W - GRIND & WELD	B - BOOT	P - PATCH
HAW - HOT AIR WELD	C - CAP

LAYFIELD
ENVIRONMENTAL CONTAINMENT

CERTIFICATE OF FINAL INSPECTION AND ACCEPTANCE

PROJECT NAME: Heap Leach Pad, Phase 1-B
PROJECT NUMBER: CT001401 **DATE:** July 9 2020
OWNER: Victoria Gold.
LOCATION: Eagle Gold Mine, YT

Scope of Installation(s): **THE WORK**
Area/Layer: Primary Area Inspected: ☑ Partial or ☐ Complete
Dimensions: Panels 1-59. Layfield has completed work on Panels 1-59. The area has had Final inspection and can now be turned over to Client

Part 1 – LAYFIELD CANADA LTD.

I, Chad Messervey, a duly appointed representative of Layfield Canada Ltd. (Layfield), have visually observed the installations (as outlined above), and have found the Work to be complete and free of defects and declare that the Work was completed in accordance with the project specifications, Layfield's QC program and the terms and conditions of the contract.

Layfield Representative:
Name: Chad Messervey
Title: Project Supervisor
Date: July 9 2020 **Signature:**

Part 2 – OWNER (or Representative)

I, JAMES BUYCK, a duly appointed representative of TETRA TECH, do hereby take over and accept the installation(s) described above, and confirm that the work has been completed in accordance with the project specifications and the terms of the conditions of the contract.

I have evaluated and measured the work together with the Layfield representative, and agree that the measurements shown are both true and correct, and that the installation has met our approval.

Owners Representative:
Name: JAMES BUYCK
Title: GEOTECHNICAL TECHNICIAN
Company: TETRA TECH
Date: JULY 9, 2020 **Signature:**

SOLMAX

BentoLiner Manufacturing Certification

Sales Order: 88708

Customer: Layfield Canada Ltd

Project: Layfield CA / Eagle Gold Mine

Product Type: BLI-075-06N-06W-D-60 BentoLiner NWL

The GCL purchased and shipped for the above referenced project does meet or exceed the project specifications.

The GCL supplied to this project has been continuously inspected for the presence of needles and is certified to be needle free.

Chuck Taylor
Laboratory Technician

SOLMAX

BentoLiner Manufacturing Certification

Sales Order: 88708

Customer: Layfield Canada Ltd

Project: Layfield CA / Eagle Gold Mine

Product Type: BLI-075-06N-06W-D-60 BentoLiner NWL

The GCL purchased and shipped for the above referenced project does meet or exceed the project specifications.

The GCL supplied to this project has been continuously inspected for the presence of needles and is certified to be needle free.

SOLMAX

BentoLiner Manufacturing Certification

Sales Order: 88708

Customer: Layfield Canada Ltd

Project: Layfield CA / Eagle Gold Mine

Product Type: BLI-075-06N-06W-D-60 BentoLiner NWL

The GCL purchased and shipped for the above referenced project does meet or exceed the project specifications.

The GCL supplied to this project has been continuously inspected for the presence of needles and is certified to be needle free.

Chuck Taylor
Laboratory Technician

SOLMAX

BentoLiner Manufacturing Certification

Sales Order: 88708

Customer: Layfield Canada Ltd

Project: Layfield CA / Eagle Gold Mine

Product Type: BLI-075-06N-06W-D-60 BentoLiner NWL

The GCL purchased and shipped for the above referenced project does meet or exceed the project specifications.

The GCL supplied to this project has been continuously inspected for the presence of needles and is certified to be needle free.

Chuck Taylor
Laboratory Technician

BentoLiner Manufacturing Certification

Sales Order: 84739

Customer: Layfield Canada Ltd

Project: Layfield/Eagle Gold Heap Leach Facility

Product Type: BLI-075-06N-06W-D-60 BentoLiner NWL

The GCL purchased and shipped for the above referenced project does meet or exceed the project specifications.

The GCL supplied to this project has been continuously inspected for the presence of needles and is certified to be needle free.

Chuck Taylor
Laboratory Technician

INSTALLATION WARRANTY

Layfield Reference No. : (Job #) CT001401

LAYFIELD CANADA LTD. (LAYFIELD) hereby warrants to Victoria Gold Corp.; (the Customer) that the work performed by LAYFIELD on the Installation described as Eagle Gold Heap Leach ad Phase 1B will:

1. Meet the field seam specifications set out in the contract between LAYFIELD and the Customer (as amended by LAYFIELD's quotation), all workmanship to meet the requirements of LAYFIELD's Field Installation Quality Assurance program, and be free of defects at the time of completion of the Installation; and

2. Be free of installation defects from the date of the completion of the Installation (September 28, 2020), for a period of One year so long as the completed Installation is used for the purposes and in the manner for which the Installation was designed.

Should damage or defects within the scope of the aforesaid warranties occur, LAYFIELD shall repair the damage or defects, PROVIDED THAT the area to be repaired must first be made ready by the Customer and be in a clean, dry, unencumbered condition, free from all water, soil, sludge, residuals, and liquids of any kind.

To enable LAYFIELD to investigate and determine the cause of any alleged damage or defect, notice and details of any claim hereunder must be presented in writing to LAYFIELD within thirty (30) days after the alleged damage or defect was first noticed or observed. Failure to provide such notice and details shall invalidate all warranties provided hereunder.

The liability of LAYFIELD under the aforesaid warranties are subject to the following conditions:

a. LAYFIELD's only obligation shall be to repair or replace any defective workmanship and in no event shall LAYFIELD be liable for any amount in excess of the cost of the Installation;

b. No allowance will be made for repairs, replacements or alterations made by the Customer unless with the prior written consent of LAYFIELD;

c. The warranties hereunder extend only to the Customer and are not transferable;

d. The warranties hereunder shall not apply to any damage or defects resulting from misuse, mechanical abuse by machinery, equipment or persons, excessive pressures or stresses, exposure of the completed Installation of harmful chemicals, unusual weather conditions, casualty catastrophe such as (but not limited to) earthquake, flood, hail, tornado, or any other act of God;

e. Under no circumstances shall LAYFIELD be liable for any special, direct, indirect, or consequential damages including the loss of use of the Installation howsoever caused;

f. The warranties hereunder are given in lieu of all other warranties, express, implied, statutory, or otherwise, and the Customer expressly waives all other warranties and claims whatsoever except those specifically given herein, and the Customer acknowledges that the warranties hereunder are accepted in preference to and to the exclusion of any or all other warranties; and

g. An Installation Warranty will not be provided for lining projects unless the installation is completed by LAYFIELD personnel or designated LAYFIELD subcontractors.

RESPONSE

☐ Approved ☐ Approved as noted ☐ Rejected as noted

Response:

2 types of couplers (external snap coupler and split couplers) were found onsite for connecting two ADS N-12 plain end pipes. Either coupler can be used as long as manufacturer's recommendations are followed.

Split couplers need to be bound by 2" wide polyethylene tape per manufacturer's recommendation. The 3M tape product submitted via e-mail will work. If you are having issues getting the 3M product to site, below is the product number for the ADS-supplied product:

ADS 2" Black Filament Tape-1137KA

Attention: Clint Green	**Discipline: Civil**

REQUEST

Related Drawings: **Forte Drawing CV-F003, DTL-F002, DTL-F003**	**Other Related Documents:**

Information Request/Description of Issue:

Requesting approval to collect a small amount of water into lateral drain 4E? The lined section of the interceptor ditch above the header underdrain is controlling the majority of flow. However there is still a small amount of water finding its way down the header drain.

Proposed Corrective Action

We propose excavating a spur trench from lateral drain 4E to the source of water in the interceptor ditch. This section of ditch will be constructed the same as all other lateral drains in detail 14 on drawing DTL-F003. The lower end will be installed the same as the typical primary drain detail 8 on drawing DTL-F002. The upper end of the pipe will be capped to ensure no large partials enter the drainage system. The upper end of the 20mm drain rock will not be wrapped in geotextile to ensure the water enters the drainage system. Rip rap will be utilized to cover the inlet end at a minimum thickness of 300mm.

REQUEST

Related Drawings: Conceptual Panel Layout Ph 1B-FORTE DYNAMICS-6-11-20.pdf	**Other Related Documents:** **Technical Specifications – Geosynthetics** **3.1.7.1 Placement**

Information Request/Description of Issue:

Requesting additional information on the requirement to connect the liner end seams at 45 degrees. Will the liner on slopes greater than 2.5H:1V require a 45 degree angle connection as listed in the Technical Specifications?

Proposed Corrective Action

There were no 45° angle end seams utilized in Phase 1A, but this could've been due to the length of the material deployed. All horizontal seams have to be staggered to ensure good material is welded on both side of each end seam.

RESPONSE

☐	Approved	☒	Approved as noted	☐	Rejected as noted

Response:

Liner already deployed and welded at 45-degree angled seams shall remain in area delineated in green on the attached exhibit already lined with LLDPE.

Based on the on-site 45-degree seam vs. horizontal seam destructive testing (peel & shear) results, horizontal seams shall be allowed on the side slopes for remainder of un-lined areas within Phase 1B footprint. Given the following conditions are met:

- **Horizontal seams must be staggered at least 10m apart at different elevations across the slope**
- **No Horizontal seams shall be within 10m of the toe or crest of a slope**
- **Upper geomembrane panel must be shingled over the lower geomembrane when placing horizontal seam on side slope**

Re: Material 2 Test Fills 01 and 02

1.0 INTRODUCTION AND OBJECTIVE

On June 26, 2018 BGC developed and oversaw a test fill to evaluate the engineering properties of crusher reject sand for use as Material 2 – Select Fill and to determine if loose lift thickness could be increased from 0.15 m to 0.03 m using a 6 ton compactor. The test fills were intended to simulate placement and compaction of the material over the HLF embankment pipe trench drain fill and, therefore, no vibration was used while compacting.

2.0 TEST FILL CONSTRUCTION AND EXECUTION

The test fill was performed on June 26, 2018. BGC's representative, Roy Morlan, developed the test fill and was present during the test fills execution. Two test fill pads were constructed. Material 2 – Test Fill 01 was placed in 0.3m loose lifts. Material 2 – Test Fill 02 was placed in 0.15 m loose lifts. The test fills were constructed and survey control was provided by Pelly Construction. Sampling and testing was performed by Tetra Tech. The following sections discuss the execution of the test fill.

2.1. Test Fill Materials

The material use in the test fill was waste product from the Neway crusher operation (referred to as reject sand). Gradation, moisture, and a standard proctor test was performed by Tetra Tech at their on-site field laboratory prior to placement of the material. The results from this testing are included in ***Attachment 1***. The material generally consists of a well graded sand with a maximum size of 10 mm and a fines content of approximately 10%. Standard proctor results reported a maximum dry density of 2,080 kg/m3 and an optimum moisture of 9.5 %.

2.2. Test Fill Foundation

An area on Eagle Pup Road formally used as an equipment parking yard was used as the test foundation. The foundation consisted of sandy, gravely soils which were well compacted by heavy equipment traffic. The foundation was flat and dry. The foundation was proof rolled using a loaded 400D Deere haul truck (***Photo 1***). No deflection was noted in the foundation.

Photograph 1: Loaded haul truck proof rolling test fill foundation surface.

2.3. Lift Placement

Lifts were placed by end dump material from the haul truck then spreading the material with a Link Belt track mounted excavator. Material 2 – Test Fill 1 was placed in one 0.3 m loose lift. Material 2 – Test Fill 02 was place in one 0.15 loose lift. Lift thickness was measured by Pelly's surveyor using a mobile station. Each test fill measured approximately 6m x 6m.

2.4. Moisture Conditioning

Moisture was not added to the material prior or during the test fill.

2.5. Compaction Testing and Settlement Surveying

To perform compaction tracking at the test fill a flat (approximately 2cm thick), hard rock was placed in the center of the lift and used as a monitoring point. Initial survey of the settlement monitoring points was collected using a GPS surveying rod. The entire test fill surface was then compacted with one cycle (2 pass) of a CAT CS54 B vibratory compactor with an effective drum weight of 5,760 kg. (***Photo 2***) No vibration was used while compacting. After completion of one compaction cycle, settlement was measured at the settlement points. This compaction/survey procedure was repeated for 4 full compaction cycles.

***Photograph 2*:** Compaction of 0.30 m lift.

Settlement data collected is included in ***Table 1***.

	Pass 1 (mm)	Pass 2 (mm)	Pass 3 (mm)	Pass 4 (mm)
Test Fill 01	80	50	20	10
Test Fill 02	90	50	10	0

2.6. In-situ Density and Moisture Testing

In-situ density and moisture testing was performed by Tetra Tech using a nuclear density gauge. Density and moistures reported by Tetra Tech are included in ***Table 2***. Tetra Tech's data report for this testing is included in ***Attachment 1***.

	Comp % SPD	Moisture (%)
Test Fill 01	96.5	6.5
Test Fill 02	95.0	6.1

Table 1: Density Reported by SGSCM

2.7. Field Testing Observational

Little surface yield was observed in the lifts after the initial compaction pass. Excavations through the compacted material lifts revealed a well compacted, well graded matrix with little void space. Moisture within the lift was spread evenly. No material degradation or pulverization was observed. (***Photo 3***)

Photograph 3: Excavation through the compacted Test Fill 01 lift.

3.0 CONCLUSIONS

The results of the test fill indicate that the crusher reject sand can achieve sufficient densities for use as Material 2 – Select Fill with a minimum of 3 passes of a minimum 6,000 kg compactor, with or without vibration, and in lifts of up to 0.30m. As the material's stockpiled moisture was approximately 3% below optimum moisture the addition of water would likely result in compaction properties greater than 95% SPD when compacting without vibration. BGC recommends the addition of moisture to achieve - 1%/+ 3% optimum moisture when compacting without vibration over the drain pipe trenches. All other areas where the material is used can maintain a moisture of +/- 2% (per the Technical Specifications) and should be placed using vibratory roller compaction.

Re: Material 7 Test Fill 01

1.0 INTRODUCTION AND OBJECTIVE

On June 30, 2018 BGC developed and oversaw a test fill to evaluate the engineering properties of Material 7 – Compacted Rockfill for use in the embankment construction. The rockfill was generated from the ADR excavation mostly from ripping and blasting bedrock.

2.0 TEST FILL CONSTRUCTION AND EXECUTION

The test fill was performed on June 30, 2018. BGC's representative, Roy Morlan, developed the test fill and was present during the test fills execution. Material 7 – Rockfill was placed in 0.9m loose lifts. The test fills were constructed and survey control was provided by Pelly Construction. Material sampling and testing was performed by Tetra Tech. Water replacement density testing was overseen by BGC. The following sections discuss the execution of the test fill.

2.1. Test Fill Materials and Borrow Description

The rockfill used in the test fill was generated by Pelly construction as borrow from excavation of the ADR plant foundation. Gradation testing was performed on the finer (3" minus) fraction of the material by Tetra Tech. Mid-fraction material (3" to 8") was estimated by Tetra Tech by scalping this material from the 3" sample. Larger fraction (>8") was visually estimated. Moisture content for the finer fraction of material was analyzed by Tetra Tech. The results from this testing are included in ***Attachment 1***. The material generally consists of a well graded gravel and sand matrix with approximately 30% rocks greater than 8" and a maximum size of 23". Moisture content of the fine fraction was reported as 3.2 %.

The rock used in the test fill was derived from a mostly quartzite source, which is the predominant rock type at this borrow. The quartzite material properties are mostly fine grained, orange brown, some banding present, slightly weathered (W2), strong to very strong (R4 to R5), and hard (H3).

Although not used in the test fill, zones of a weaker phyllitic rock (potentially phyllite or phyllonite) are also present within this borrow. This material is platy, very fine grained (aphantic), micaceous, has a significant amount of graphite, is gray, slightly weathered (W2), with rock quality ranging from (R1 to R3), and varies from soft (H6) to moderate hard (H4). The general recommended approach will involve mixing the stronger quartzite rock with the weaker phyllitic rock to produce an acceptable material for embankment fill. Additional test fills will be necessary to evaluate rock fill with significant portions of phyllitic rock. Alternatively, the weaker phyllitic material could be sorted and used as Material 3 fill.

2.2. Test Fill Foundation

An area on top of the ADR Material 3 Stockpile was used as the test location because it was close to the source material and relatively traffic free (***Figure 1***). The test location was hard, dry and previously compacted by heavy equipment traffic. However, the location was not flat so a leveling pad was constructed for the test fill. The leveling pad was constructed with Material 7 rockfill placed in an approximately 0.5m lift and compacted using a CAT CS68 B vibratory compactor and 4 passes. (***Photo 1***). The final foundation was flat, dry, and dense. No deflection from roller passes was noted in the foundation after compaction.

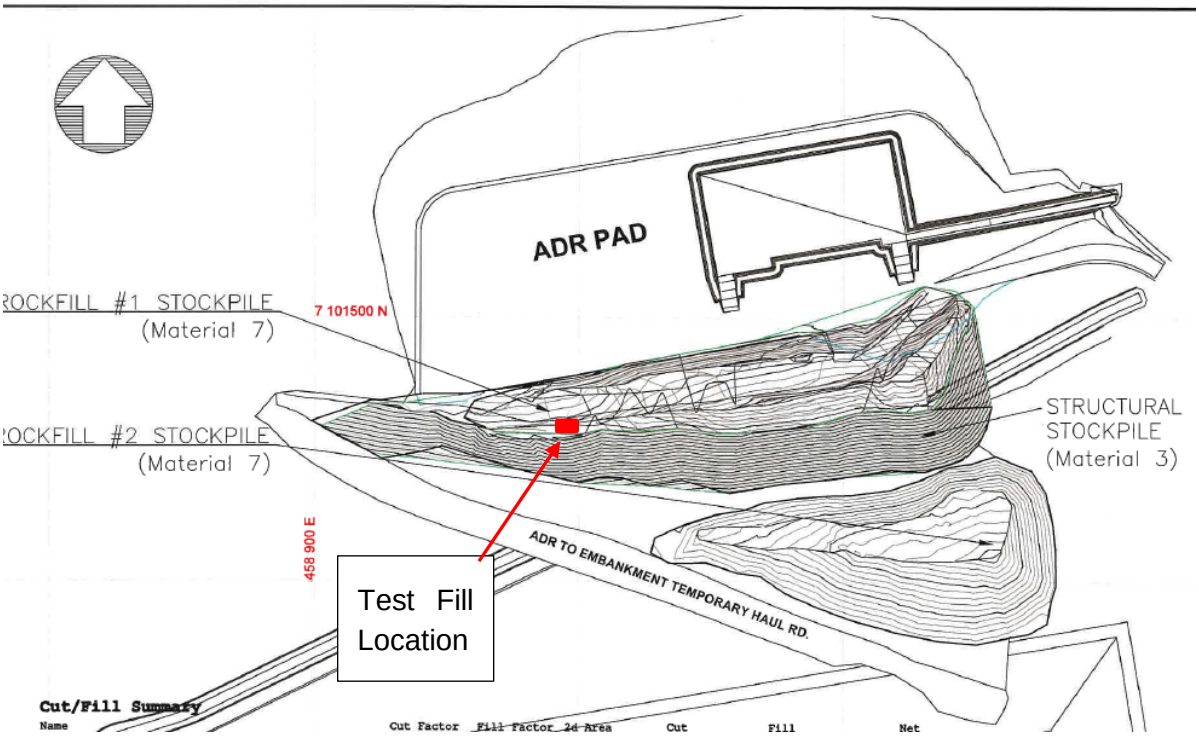

Figure 1: Test Fill Location

Photo 1: Construction of the test fill foundation leveling lift.

2.3. Test Fill Lift Placement

The test fill lift was placed by a Link Belt track mounted excavator directly from the stockpile. Material 7 – Test Fill 1 was placed in one 0.9 m loose lift. Lift thickness was measured by Pelly's surveyor using a mobile station. The test fill measured approximately 8m x 6m.

2.4. Moisture Conditioning

Moisture was not added to the material prior or during the test fill. However, moisture conditioning is generally encouraged during rock fill placement to facilitate compaction and will likely be necessary.

2.5. Compaction Testing and Settlement Surveying

To perform compaction tracking three steel plates were placed in a row down the center of the lift and used as a monitoring points (***Figure 2***). Initial survey of the settlement monitoring points was collected using a GPS surveying rod. The entire test fill surface was then compacted with one cycle (1 forward pass and 1 reverse pass) of a CAT CS68 B vibratory compactor with an effective

drum weight of 8,920 kg. After completion of one compaction cycle, settlement was measured at the settlement points. This compaction/survey procedure was repeated for 4 full compaction cycles.

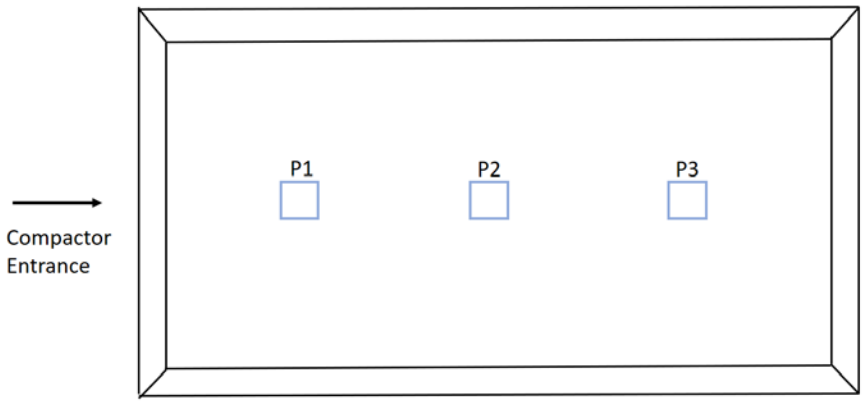

***Figure 1*:** Approximation of test fill pad and survey points

Settlement data collected is included in ***Table 1***. A settlement graph is shown in ***Figure 3***.

	Pre-Compaction	Pass 1	Pass 2	Pass 3	Pass 4
Survey Point 1 (P1)	950.40 m	950.37 m	950.35 m	950.33 m	950.32 m
Survey Point 2 (P2)	950.55 m	950.46 m	950.46 m	950.43 m	950.43 m
Survey Point 3 (P3)	950.59 m	950.49 m	950.47 m	950.46 m	950.45 m

Table 1: Survey elevation data collected during settlement tracking.

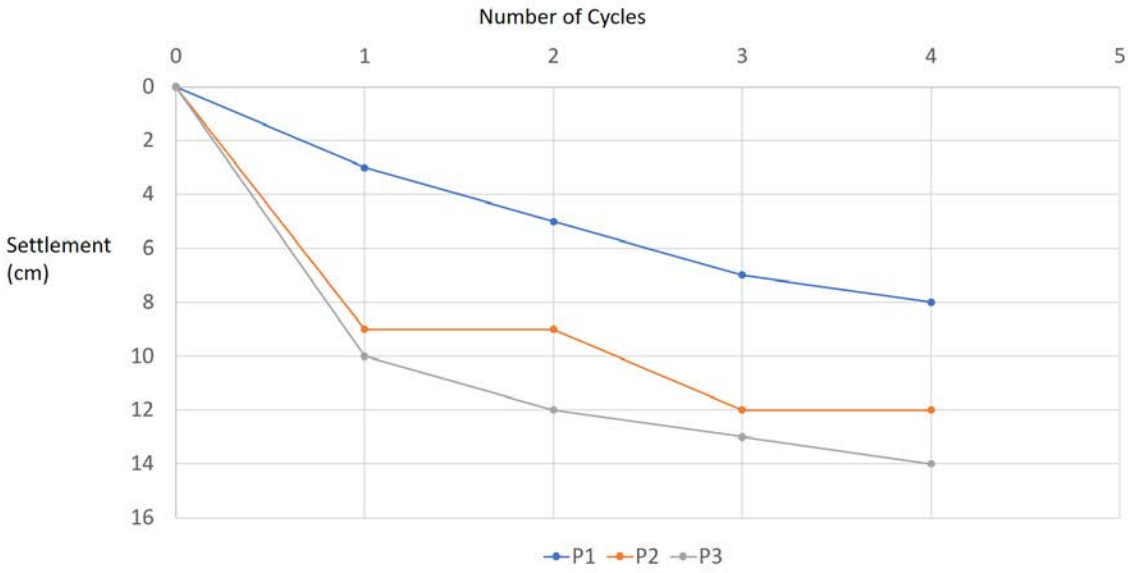

***Figure 3*:** Settlement recorded for each cycle.

2.6. In-situ Density and Moisture Testing

In-situ density and moisture collected by Tetra Tech

In-situ density and moisture testing was collected for reference by Tetra Tech using a nuclear density gauge. Results from nuclear density gauge testing on rockfill are known to be unreliable due to the presence of large, dense rocks and void spaces caused by displacement of rocks when hammering the steel rod. Therefore, these tests were performed for reference only. Water content was also analyzed by Tetra Tech in their field laboratory from a sample of the rockfill's finer material fraction (>3"). Density and moistures reported by Tetra Tech are included in ***Table 2***. Tetra Tech's data report for this testing is included in ***Attachment 1***.

	Dry Density (kg/m^3)	Moisture (%)
Nuclear Gage Test 1	2224	4.6
Nuclear Gage Test 2	2137	5.0
Standard Lab Testing	NA	3.2%

Table 2: Tetra Tech testing results

Water Replacement Test

A water replacement test was performed to determine the density of the compacted soil (***Photo 2 and 3***). A test pit was dug in the compacted lift. Material excavated from the pit was placed in three super sacks and weighed using Pelly's Terex Crane RT780 crane. The test pit was lined with 60 mil poly urethane liner and filled with water. The volume of water used was recorded and the density determined using the weight of the material excavated and the volume of the test pit.

The weight of the material was reported as 2,676 kg and volume of the test pit was determined to be 1.33 cubic meters. The density of the compacted rockfill was determined to be 2,012 kg/m^3 wet density and an estimated 1,965 kg/m^3 dry density assuming 70% rock smaller than 8".

Photo 2: Volume determination using water.

Photo 3: Super sacks with material excavated for the water replacement test.

2.7. Field Testing Observational

Little surface yield was observed in the lifts after the initial compaction pass. Excavations through the compacted material lifts revealed a well compacted, well graded matrix with little void space. Moisture within the lift was spread evenly. Rock was predominantly supported by the sandy gravel matrix. No material degradation or pulverization was observed. (***Photo 4***)

Photo 4: Compacted rockfill observed in the test fill trench cut.

3.0 CONCLUSIONS

The results of the test fill indicate that the rockfill produced from a mostly quartzite source at the ADR borrow can achieve sufficient compaction with a minimum of 4 cycles (1 forward and 1 reverse pass per cycle) of a minimum 9,000 kg compactor with vibration, and in lifts of up to 0.90m. These results were obtained with a stockpile moisture of 3.2% within the fill's fine fraction matrix.

BGC recommends that this criteria be used for placement and compaction of the rockfill within the embankment. If rock size and/or rock type, or general gradation varies significantly within this material an additional test fill will be required. If moisture content of the rockfill is below 3.2 % the Engineer may require additional moisture to be added before placement. Overly wet material may require the removal of moisture before placement. The Engineer will inspect the rockfill material during borrowing or placement to make these determinations.

As the rockfill generated from the ADR borrow area is variable due to the presence of weaker zones of phyllitic material, BGC recommends that the above criteria be used on rockfill produced from the zones of harder quartzite formations, which are more predominant at this borrow. Small zones of phyllitic material should be blended within the quartzite rockfill before use. Phyllitic material should not be allowed to be placed in a manner that would create lifts or zones within a lift composed of predominately weaker phyllitic material. Since these zones are more prone to material breakdown and develop a finer matrix they may be sorted and re-stockpiled for use as Material 3 – Structural Fill. A sperate test fill should be performed to determine if these phyllitic materials can be used as the predominant component of a Material 7 lift.

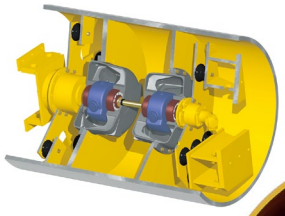
Smooth Drum
Vibratory Soil Compactors

Comfort to Operate with Confidence



- NEW • *Comfortable redesigned cab with best-in-class climate control, multi-position windows*
- NEW • *Control console and display are integrated with pivoting seat* (optional deluxe cloth seat available)*
- NEW • *Display provides instrumentation data and diagnostics at a glance**
- • *Exceptional visibility to tires and drum edge*
- NEW – *Larger mirrors for enhanced rear visibility*
- NEW – *Narrower rear frame*
- NEW • *Optional light package upgrade provides four additional lights for excellent low light visibility*

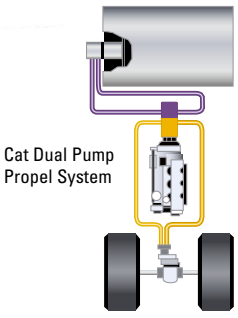
Do More

- NEW • *Exclusive Cat® dual pump propel system with electronic control† provides:*
  - *– Exceptional traction and gradeability*
  - *– Plenty of power for leveling blade*
- *Optional equipment:*
  - *– Leveling blade*
  - *– Oval pad or square pad shell kit*

Work Smarter with Optional Compaction Measurement Technology

- NEW • *Cat Compaction Control*
  - *– Factory installed, dealer supported; integrated with machine for better protection from theft, vandalism*
  - *– Two sensor options available:*
    - NEW *- Machine Drive Power (MDP): exclusive Cat technology, rolling resistance-based*
    - *- Compaction Meter Value (CMV), accelerometer-based*
  - *– Mapping/Positioning option*
    - *- SBAS GNSS; upgradeable to RTK*
    - *- Includes seperate display, GNSS antenna*

Cat® Pod-style Vibratory System



Cat Compaction Control with GNSS Mapping (SBAS)

Achieve Quality Compaction Faster

- • *Enhanced compaction force*

Re: Material 3 Test Fill 01 and 02

1.0 INTRODUCTION AND OBJECTIVE

On July 27, 2018 BGC developed and oversaw two test fills to evaluate the engineering properties of Material 3 – Structural Fill for use in the embankment construction. The material was generated from the ADR excavation.

2.0 TEST FILL CONSTRUCTION AND EXECUTION

BGC's representative, Roy Morlan, developed the test fills and was present during the execution. Two tests were conducted using Material 3 – Structural Fill. The test fills were constructed and surveyed by Pelly Construction. Material sampling and testing was performed by Tetra Tech. The following sections discuss the execution of the test fill.

2.1. Test Fill Materials and Borrow Description

The material used in the test fills was generated by Pelly as borrow from excavation of the ADR plant foundation and the area labeled as ADR West. Gradation testing was performed on the finer (3" minus) fraction of the material by Tetra Tech. Mid-fraction material (3" to 8") was estimated by Tetra Tech by scalping this material from the 3" sample. Moisture content for the finer fraction of material was analyzed by Tetra Tech. The results from this testing are included in ***Attachment 1***. The material generally consists of a well graded gravel and sand matrix with approximately 15% rock between 3" and 8". Moisture content was measured at approximately 5%. (***Photograph 1***)

Photograph 1: Photograph of loose material used in both test fills.

The 3” to 8” rocks in the test fill material were mostly quartzite, which is the predominant rock type at this borrow. The quartzite material properties are mostly fine grained, orange brown, some banding present, slightly weathered (W2), strong to very strong (R4 to R5), and hard (H3). Rocks were resistant to scratching and broke after several blows with a hammer (***Photograph 2***).

Photograph 2: Example of material between 3” and 8”.

Phyllitic material is present in the Material 3 mixture. The phyllitic material content is approximately 20 to 30% and mostly present in particle sizes less than 0.5”. This material is platy, very fine grained (aphanitic), micaceous, has a significant amount of graphite, is gray, slightly weathered (W2), with rock quality ranging from (R1 to R3), and varies from soft (H6) to moderate hard (H4).

2.2. Test Fill Foundation

An area on top of the ADR Material 3 Stockpile was used as the test location because it was close to the source material and relatively traffic free (***Figure 1***). The test location was hard, dry and previously compacted by heavy equipment traffic. No deflection from roller passes was noted in the foundation.

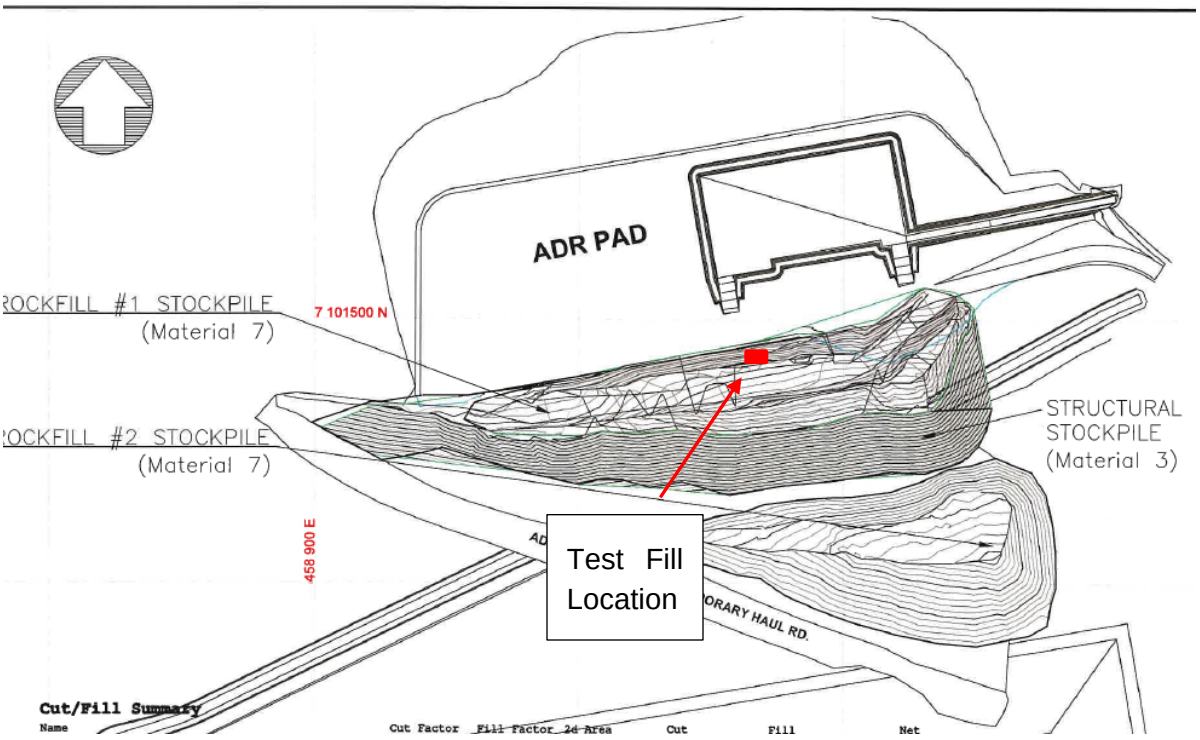

Figure 1: Test Fill Location

2.3. Test Fill Lift Placement and Compaction

Both test fills were constructed by pushing the material from the stockpile to the prepared foundation using a CAT D7 track mounted dozer. For Test Fill 01 material was placed in a 0.5m loose lifts. For Test Fill 02 material was placed in a 0.75 m loose lift. Lift thickness was measured by Pelly's surveyor using a mobile station. The test fill measured approximately 8m x 6m.

2.4. Moisture Conditioning

Moisture was not added to Test Fill 01 or Test Fill 02.

2.5. Test Fill 01 Compaction and Settlement Measurements

To perform compaction tracking three steel plates were placed in a row down the center of the lift and used as a monitoring points (***Figure 2***). Initial survey of the settlement monitoring points was collected using a GPS surveying rod. Test fill surfaces were compacted with one cycle (1 forward pass and 1 reverse pass) of a CAT CS78 B vibratory compactor with an effective drum weight of 13,440 kg. After completion of one compaction cycle, settlement was measured at the settlement points. This compaction/survey procedure was repeated for 3 full compaction cycles for Test Fill 01 and 4 full cycles for Test Fill 2. Specifications for the CAT CS78 B compactor are included in ***Attachment 1***.

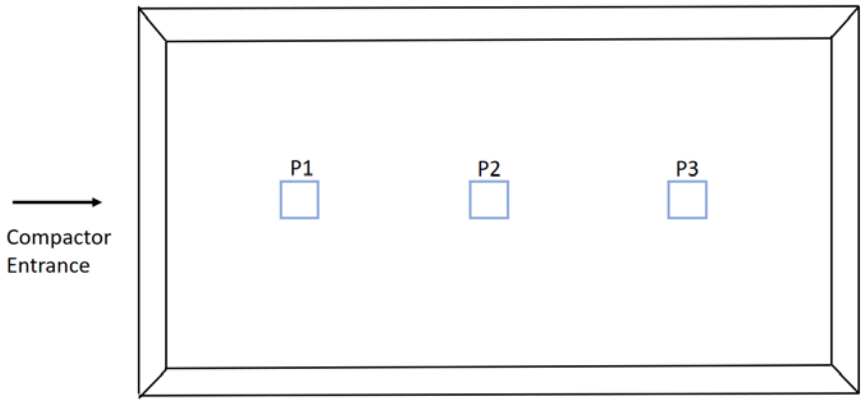

Figure 2**:** Approximation of test fill pad and survey points

Settlement data collected is included in ***Table 1***. Settlement graphs are shown in ***Figure 3 and 4***.

	Pre-Compaction (m)	Pass 1 (m)	Pass 2 (m)	Pass 3 (m)	Pass 4 (m)
Test Fill 01					
Survey Point 1 (P1)	948.80	948.79	948.76	948.75	NA
Survey Point 2 (P2)	948.80	948.79	948.75	948.74	NA

Table 1: Survey elevation data collected during settlement tracking.

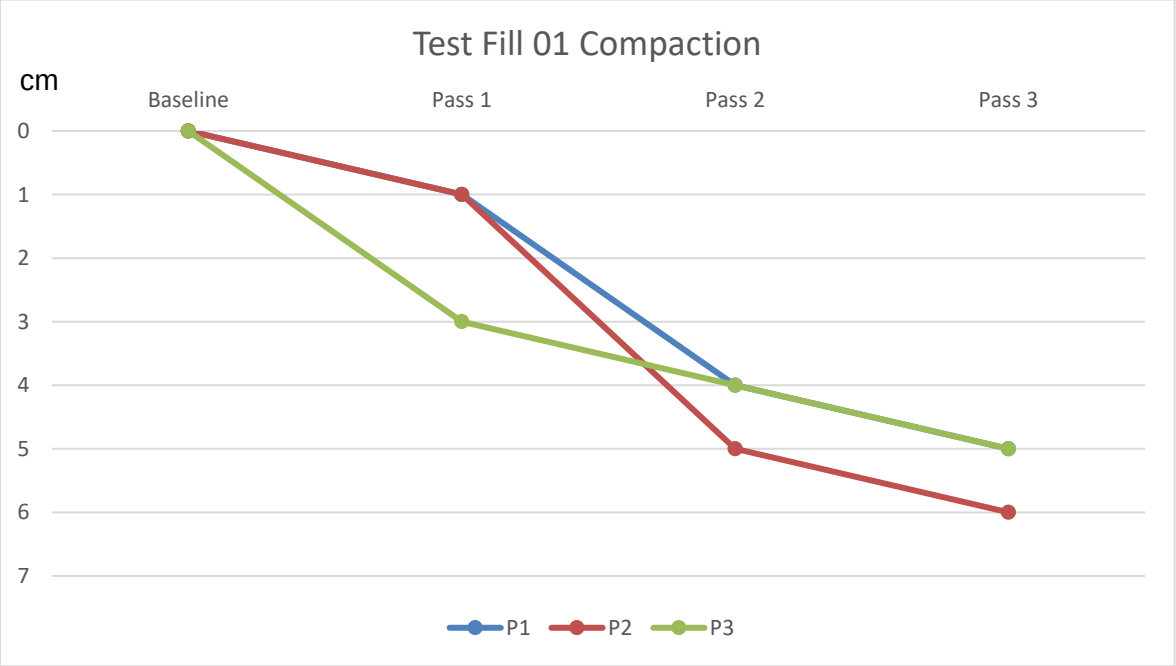

Figure 3: Test Fill 01 settlement recorded for each cycle.

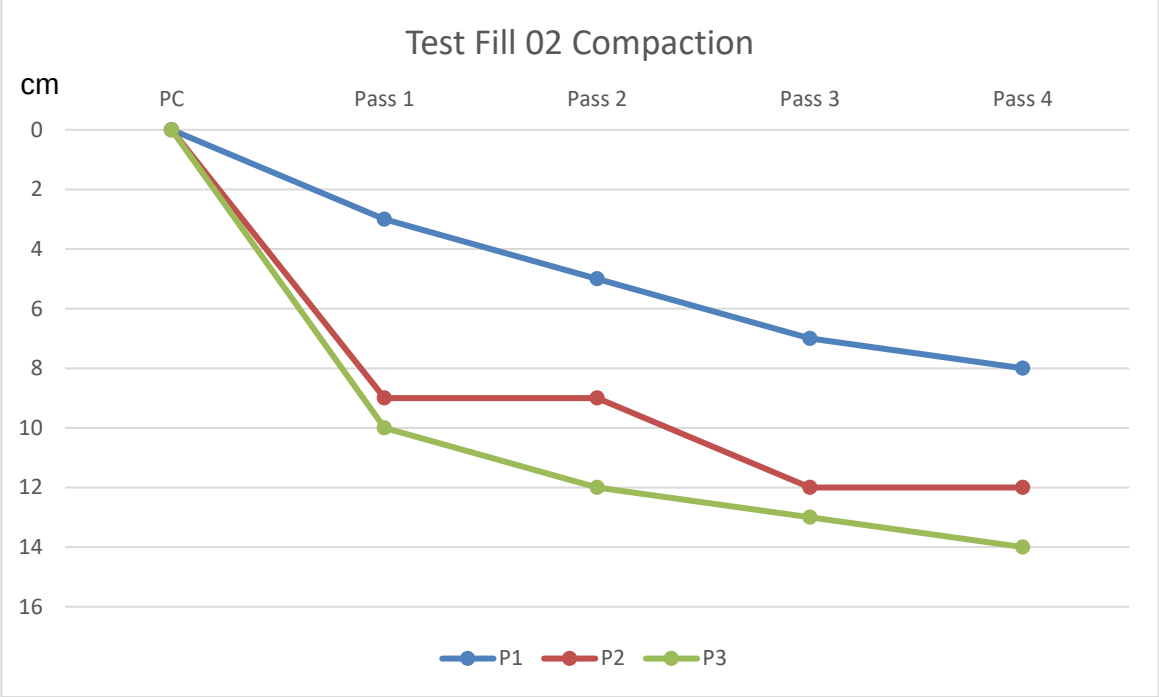

Figure 4: Test Fill 02 settlement recorded for each cycle.

2.5.1. In-situ Density and Moisture Testing

In-situ density and moisture testing was collected by Tetra Tech using a nuclear density gauge. Results were compared to the proctor for this material performed by Tetra Tech. The sample was scalped at material greater than 3". A rock correction was applied to the results by Tetra Tech. Optimum moisture was reported as 6.5% and density at this moisture was reported as 2,270 kg/m^3. Density and moistures reported by Tetra Tech are included in ***Table 2***. Tetra Tech's data report for this testing is included in ***Attachment 1***.

	Depth (cm)	Dry Density (kg/m^3)	Moisture (%)
Test Fill 01			
Test 1 (uncompacted)	30	2037	5.3
Test 2 (1 pass cycle)	30	2235	6.0
Test 3 (2 pass cycles)	30	2286	5.6
Test 4 (3 pass cycles)	30	2281	5.9
Test Fill 02			
Test 1 (uncompacted)	30	2,015	5.0
Test 2 (1 pass cycle)	30	2,160	5.4
Test 3 (2 pass cycles)	30	2,272	5.4
Test 4 (3 pass cycles)	30	2,271	5.2
Test 5 (4 pass cycles)	30	2,236	5.1
Test 6 (4 pass cycles)	70	1,812	5.3

Table 2: Tetra Tech nuclear density gauge testing results

2.5.2. Field Testing Observations

Some surface yield was observed in both test fills after the initial compaction pass. Excavations through each compacted test fill revealed a well compacted, well graded matrix with little void space. Moisture within the lift was spread evenly. Rock was predominantly supported by the sandy gravel matrix. No material degradation or pulverization was observed. A trench was photograph of Test Fill 01 is included as ***Photo 3***. A trench wall photograph of Test Fill 02 is included as ***Photo 4***.

Photo 3: Trench wall photograph from Test Fill 01.

Photo 04: Trench wall photograph from Test Fill 02.

3.0 CONCLUSIONS

The results of the test fills indicate that the Material 3 tested can achieve sufficient densities with a minimum of 2 passes of a minimum 13,000 kg compactor with vibration, and in lifts of up to 0.50m. These results were obtained with an average moisture of approximately 5.7%. Test Fill 02 did not achieve sufficient compaction below 0.5m even after 4 passes.

BGC recommends that the following criteria be used for placement and compaction of the Material 3 within the embankment:

- A maximum loose lift thickness of 0.45m should be used.
- Moisture content should be maintained between 5% and 7%. This will likely require moisture conditioning at the stockpile during loading for placement.
- Gradation of the material should not vary significantly from the material used in this test fill. If gradation varies significantly additional testing may be required.

- A minimum of two pass cycles (1 forward pass and 1 back pass per cycle) using a 13,000 kg vibrating compactor should be used. Use of lighter compactors should be approved by the Engineer and may require additional testing.
- Material should be sourced from a stockpile approved by the Engineer.
- QC should be performed by tracking and reporting the above. In-situ QC testing using a nuclear density gauge should also be performed. Testing should report density and moisture. A minimum of 6 tests per compacted lift should be performed. The amount of test can be reduced by the engineer after observing placement and compaction of the first several lifts and all criteria appear consistent. The average of the tests should determine to either pass or fail: 95% of 2,270 kg/m^3; moisture between 5% and 7%.

If general gradation or material composition (quartzite content) varies significantly within this material an additional test fill will be required. If moisture content of the rockfill is below 5 % the Engineer may reject the material until it is moisture conditioned. Overly wet samples may require the removal of moisture before placement. The Engineer will inspect the material during borrowing or placement and review QC reports to make these determinations.

BGC recommends that the above criteria be used on material produced from the zones of harder quartzite formations, which are more predominant at this borrow. Small zones of phyllitic material should be blended within the quartzite before use. Phyllitic rich material (25% to 100% phyllitic material) should be used on the upstream side of the lift. Phyllitic rich material should not constitute an entire lift or along the downstream face of the embankment.

Re: Material 3 Test Fill 03

1.0 INTRODUCTION AND OBJECTIVE

On August 21, 2018 BGC developed and oversaw a test fill to evaluate the engineering properties of Material 3 – Structural Fill generated from the Event Pond excavation.

2.0 TEST FILL CONSTRUCTION AND EXECUTION

BGC's representative, Troy Meyer, developed the test fills and was present during the execution. The test fill was constructed and surveyed by Pelly Construction. Material sampling and testing was performed by Tetra Tech. The following sections discuss the execution of the test fill.

2.1. Test Fill Materials and Borrow Description

The material used in the test fills was generated by Pelly as borrow from excavation of the Event Pond and Spillway. This material has been designated as Material 3 Structural Fill. Gradation, moisture, and proctor testing was performed by Tetra Tech. The results from this testing are included in ***Attachment 1***. Material 3 was generated from a portion of the stratigraphy below the organic rich topsoil and the colluvial overburden in an area where bedrock is becoming more competent with depth. The material generally consists of broken weak rock in a matrix of gravel and sand with few fines (***Photograph 1***).

Photograph 1: Photograph of loose material used in the test fill.

2.2. Test Fill Foundation

A cleared area at the Event Pond excavation was used as the test location because it was close to the source material and relatively traffic free (***Figure 1***). The test foundation was compacted with 5 forward and 5 backwards passes with a vibratory compactor. The resulting foundation was hard and dry (***Photograph 2***). No significant deflection from roller passes was noted in the foundation.

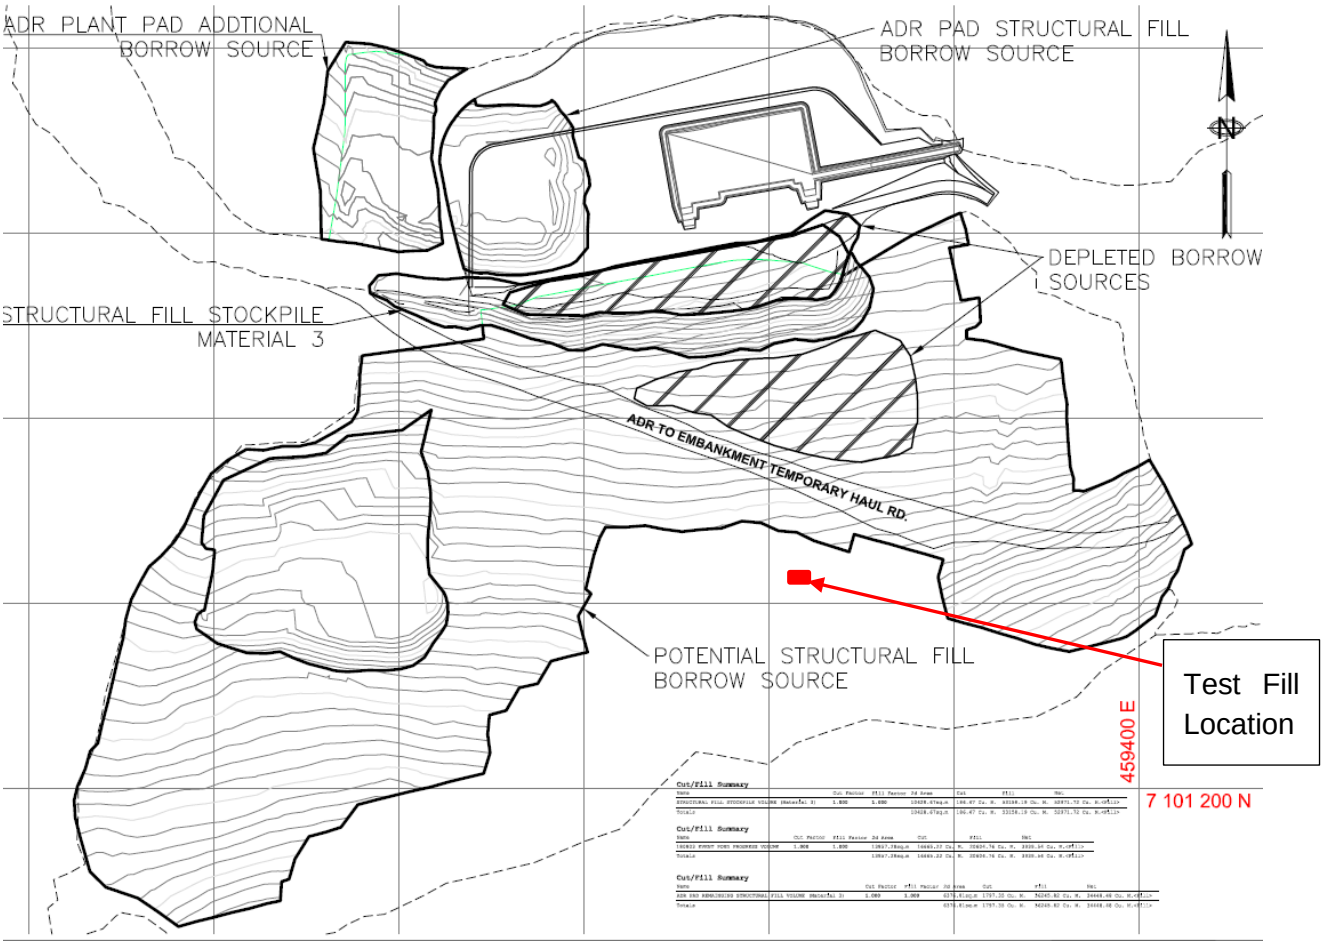

Figure 1: Test Fill Location

Photograph 2: Compaction of the test fill foundation.

2.3. Test Fill Lift Placement and Compaction

The test fill was constructed by a CAT 3751 track mounted excavator as a 0.5m loose lift. Lift thickness was measured by Pelly's surveyor using a mobile station. The test fill measured approximately 8m x 6m.

2.4. Moisture Conditioning

Moisture was not added to the test fill material.

2.5. Test Fill Compaction and Settlement Measurements

To perform compaction tracking three steel plates were placed in a row down the center of the lift and used as a monitoring points (***Figure 2***). Initial survey of the settlement monitoring points was collected using a GPS surveying rod. Test fill surface was compacted with one cycle (1 forward pass and 1 reverse pass) of a Volvo CS68B vibratory compactor with an effective drum weight of 9,150 kg. After completion of one compaction cycle, settlement was measured at the settlement

points. This compaction/survey procedure was repeated for 4 full compaction cycles. Specifications for the Volvo CS68B compactor are included in ***Attachment 1***.

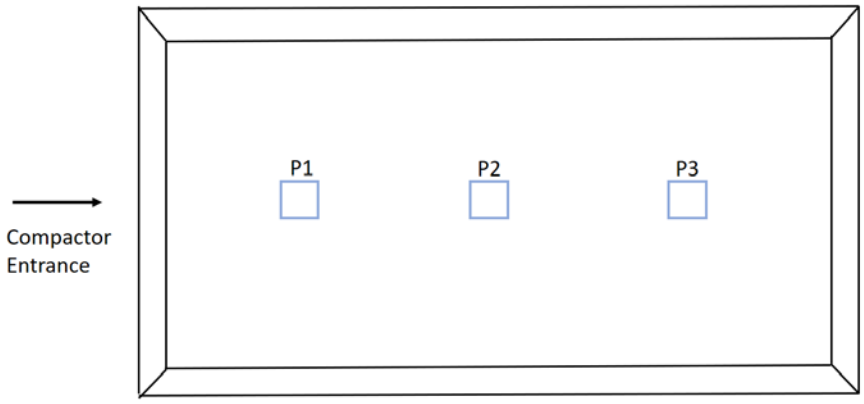

Figure 2**:** Approximation of test fill pad and survey points

Settlement data collected is included in ***Table 1***. A settlement graph is shown in ***Figure 3***.

	Pre-Compaction (m)	Pass 1 (m)	Pass 2 (m)	Pass 3 (m)	Pass 4 (m)
Survey Point 1 (P1)	905.884	905.834	905.819	905.814	905.812
Survey Point 2 (P2)	905.903	905.854	905.836	905.826	905.825
Survey Point 3 (P3)	905.956	905.881	905.867	905.853	905.852

Table 1: Survey elevation data collected during settlement tracking.

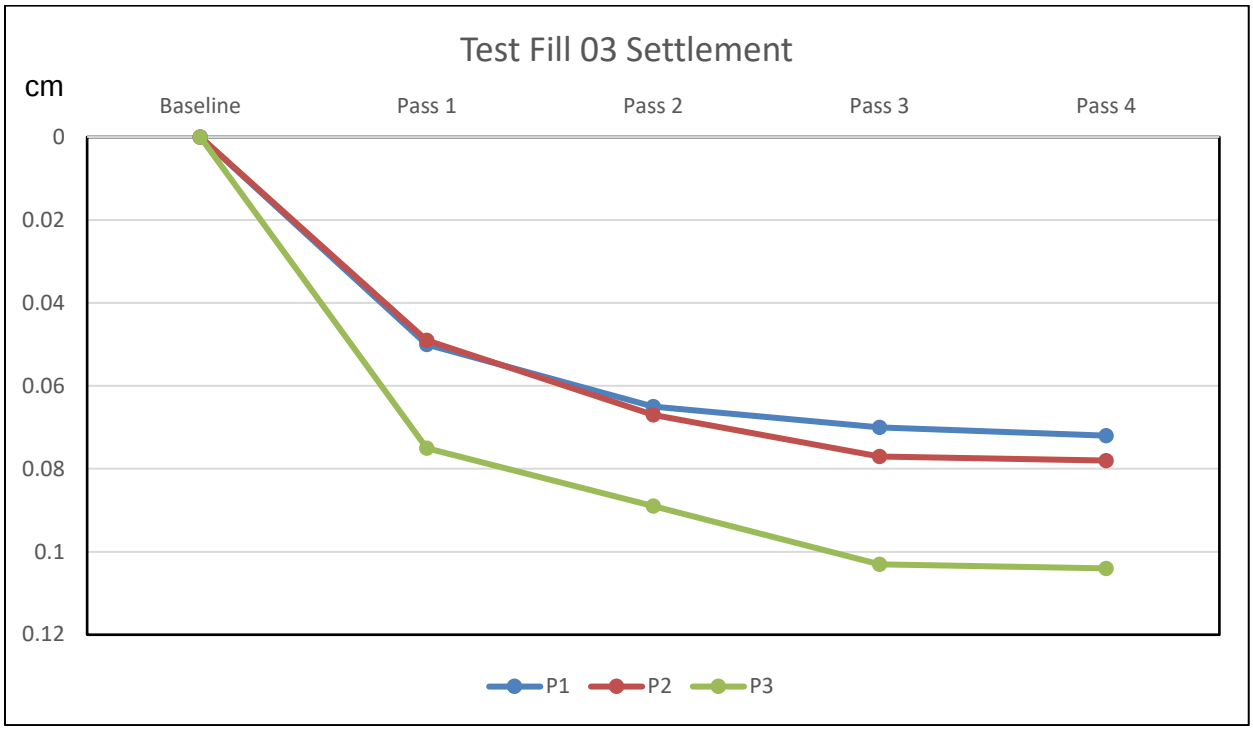

***Figure 3*:** Test Fill 03 settlement recorded for each cycle.

2.5.1. In-situ Density and Moisture Testing

In-situ density and moisture testing was collected by Tetra Tech using a nuclear density gauge. Results were compared to the proctor for this material performed by Tetra Tech. The standard proctor performed on the material reported a maximum dry density of 2,185 kg/m^3 at an optimum moisture of 8.7%. Density and moistures reported by Tetra Tech are included in ***Table 2***. The values represent over 96% of maximum dry density. Tetra Tech's data report for this testing is included in ***Attachment 1***.

	Depth (cm)	Dry Density (kg/m^3)	Moisture (%)
Test 1 (4 pass cycles)	30	2126	5.1
Test 2 (4 pass cycles)	30	2116	6.2

Table 2: Tetra Tech nuclear density gauge testing results

2.5.2. Field Testing Observations

Some surface yield was observed in the compaction pass. Excavations through the compacted test fill revealed a well compacted, well graded matrix with little void space. Moisture within the lift was spread evenly. No material degradation or pulverization was observed.

A lens of phyllitic material was observed in the shallow excavation made to produce the test fill material **Photograph 3**. A deeper excavation was later made, and the material was observed to become more competent and rocky with depth **Photograph 4**.

Photograph 3: Shallow excavation made for test fill material.

Photograph 4: Deeper excavation into Event Pond borrow material.

3.0 CONCLUSIONS

The results of the test fill indicates that Material 3 excavated from the Event Pond area can achieve sufficient densities with a minimum of 3 passes of a minimum 9,000 kg compactor with vibration, and in lifts of up to 0.50m.

BGC recommends that the following criteria be used for placement and compaction of the Material 3-4 within the embankment:

- A maximum loose lift thickness of 0.50m should be used.
- Moisture content should be maintained between 3% and 8%. This is not expected to require moisture conditioning at the active face of the borrow excavation if direct loading is performed. If the material is stockpiled, moisture conditioning may be needed upon loading. Moisture conditioning should be avoided in freezing air temperatures.
- Gradation of the material may vary significantly from the material used in this test fill. The rock is expected to become gradually more competent with depth. Based on experience

with material from the ADR cut and ADR West borrow located above the event pond, the rock is expected to be moderately weathered at depth and will and will produce a coarser structural fill. Additional testing is not anticipated since previous test fills on this type of material have been completed. Approved finer grained Material 3 from the Event Pond should be placed and spread at the HLF embankment in such a manner to blend with the ADR Material 3. This can be accomplished by dumping piles of each material and pushing together with a dozer during spreading. As the material at the Event Pond becomes more competent and coarser with depth, blending may not be needed.

- A minimum of three (3) pass cycles (1 forward pass and 1 back pass per cycle) using a minimum 9,000 kg vibrating compactor should be used. Use of heavier compactors should follow the recommendations from previous test fills on structural fill (generally 2 passes for vibrating compactors heavier than 11,000 kg).
- Material 3 excavated from the Event Pond should be free of soft phyllitic material. Localized lenses of this material may be encountered in the excavation. This material is weak and unsuitable as structural fill.
- Stockpiles of topsoil and overburden material are being generated at the Event Pond area. Segregation of usable material from unsuitable material should be carefully managed to avoid cross-contamination. The colluvial overburden and highly weathered (soil-like) rock has been tested in a separate test fill and found to be suitable as Material 1 (Site Grading Fill). This material can be used for general fills but shall not be used in construction of the HLF or Event Pond embankments.
- QC should be performed by tracking and reporting the above. In-situ QC testing using a nuclear density gauge should also be performed. Testing should report density and moisture. A minimum of 1 tests per compacted lift should be performed. The number of tests can be reduced by the engineer after observing placement and compaction of the first several lifts and all criteria appear consistent. The average of the tests should determine to either pass or fail. The rock-corrected values from the Proctor test should be used: 95% of 2,236 kg/m^3; moisture between 4% and 8%.

Cat® CS68B

Smooth Drum Vibratory Soil Compactor

Features:

The Cat® CS68B features a smooth drum and is ideally suited for granular soil applications:

- **Comfortable and ergonomic operator station** features pivoting seat with integrated multifunction LCD display and control console, outstanding visibility to the front and rear of machine, low sound levels and vibration for greater operator comfort and productivity.
- **World-class propel system** built around the exclusive Cat dual pump propel system, two pumps provide separate dedicated flow to drum drive motor and rear axle motor for exceptional gradeability and traction in forward and reverse. New electronic propel control enables more precise machine control.
- **Virtually maintenance free** due to maintenance-free hitch bearings and extended maintenance intervals for vibratory system and hydraulic system, providing more uptime and lower maintenance costs.
- **Enhanced compaction performance** due to more weight at the drum and greater amplitude. Automated propel and vibratory system functions make it easy to ensure consistent, high quality.
- **Optional Cat® Compaction Control** helps the operator determine when compaction has been completed to specification for greater productivity and uniform compaction quality.

Re: Material 7 Test Fill 02

1.0 INTRODUCTION AND OBJECTIVE

On November 5, 2018 BGC developed and oversaw a test fill to evaluate the engineering properties of Material 7 – Compacted Rockfill for use in the embankment construction. The rockfill was generated from the required excavation of the Event Pond and from blasted rock at the ADR West borrow.

2.0 TEST FILL CONSTRUCTION AND EXECUTION

The test fill was performed on November 5, 2018. BGC's representative, Troy Meyer developed the test fill and was present during the test fills execution. Material 7 – Rockfill was placed in a 0.9m loose lifts. The test fills were constructed and survey control was provided by Pelly Construction. Material sampling and testing was performed by Tetra Tech. Field density testing was overseen by BGC. The following sections discuss the execution of the test fill.

2.1. Test Fill Materials and Borrow Description

Two separate sources of rockfill were used in two separate test fills. The material referred to as "ADR Blast Rock" was generated by Pelly construction as borrow from blasting and excavation at the borrow located west of the ADR plant. he material referred to as "Event Pond Cut" was generated by Pelly construction from required excavations at the eastern end of the event pond.

The material generally consists of quartzite rock with low to moderate strength and a maximum size of 60 cm. The quartzite material properties are mostly fine grained, orange brown, some banding present, slightly weathered (W2), strong to very strong (R4 to R5), and hard (H3).

The ADR Blast Rock contains a higher percentage of large rock than the Event Pond Cut material, which is more well-graded with a gravel and sand matrix. Both materials classify as Material 7 – Rockfill having more than 30 percent particles larger than 19. Moisture content of the minus 6-inch fraction was reported as 3.2 % for ADR Blast Rock and 4.6 % for Event Pond Cut.

Although not used in the test fill, zones of a weaker phyllitic rock (potentially phyllite or phyllonite) are also present within each source area. This material is platy, very fine grained (aphantic), micaceous, has a significant amount of graphite, is gray, slightly weathered (W2), with rock quality ranging from (R1 to R3), and varies from soft (H6) to moderate hard (H4).

2.2. Test Fill Foundation

An area on top of the south Event Pond embankment crest was used as the test location. ***Figure 1*** shows the locations of the test pad and the borrow areas. The test location was frozen, hard and previously compacted by heavy equipment traffic. ***Photo 1*** shows initial placement of fill on the test pad.

Photograph 1: ADR Blast Rock Test fill construction.

Figure 1: Test Fill and Borrow Locations

Photograph 3: Event Pond Cut material as delivered.

2.3. Test Fill Lift Placement

The test fill lift was placed by dumping and spreading with a GPS enabled D6 dozer. Both test fills were placed in one 0.9 m loose lift. Lift thickness was controlled by the Dozer and spot checked by Pelly's surveyor using a mobile station. Each test fill measured approximately 8m x 10m.

2.4. Moisture Conditioning and Temperature

Moisture was not added to the material prior or during the test fill. The ambient air temperature was -19 deg C. The delivered material temperature was measured with a thermal gun:

- ADR Blast Rock +10 deg C
- Event Pond Cut +4 deg C

The temperature of both materials reduced to -5 to -10 deg C at the time of compaction.

2.5. Compaction Testing and Settlement Surveying

To perform compaction tracking three steel plates were placed in a row down the center of the lift and used as a monitoring points (***Figure 2***). Initial survey of the settlement monitoring points was collected using a GPS surveying rod. The entire test fill surface was then compacted with one cycle (1 forward pass and 1 reverse pass) of a CAT CS68 B vibratory compactor with an effective drum weight of 9,150 kg. After completion of one compaction cycle, settlement was measured at the settlement points. This compaction/survey procedure was repeated for 4 full compaction cycles.

A loaded CAT777 haul truck was also used for compaction on adjacent sections of the test pads. The truck was trafficked at a slow speed over the plates and settlement measure by survey after each single pass.

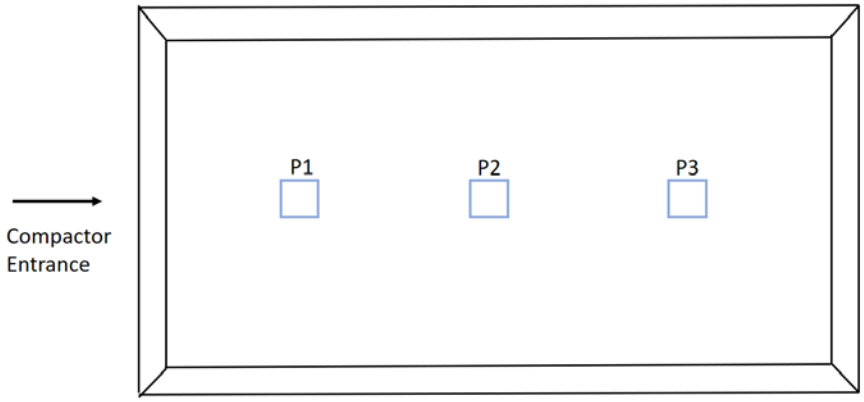

***Figure 2*:** Approximation of test fill pad and survey points

Settlement data collected is included in Table 1 through 4 and settlement graphs are shown as Figures 3 through 6.

Table 4: Survey Data for Event Pond Cut with Loaded Haul Truck.

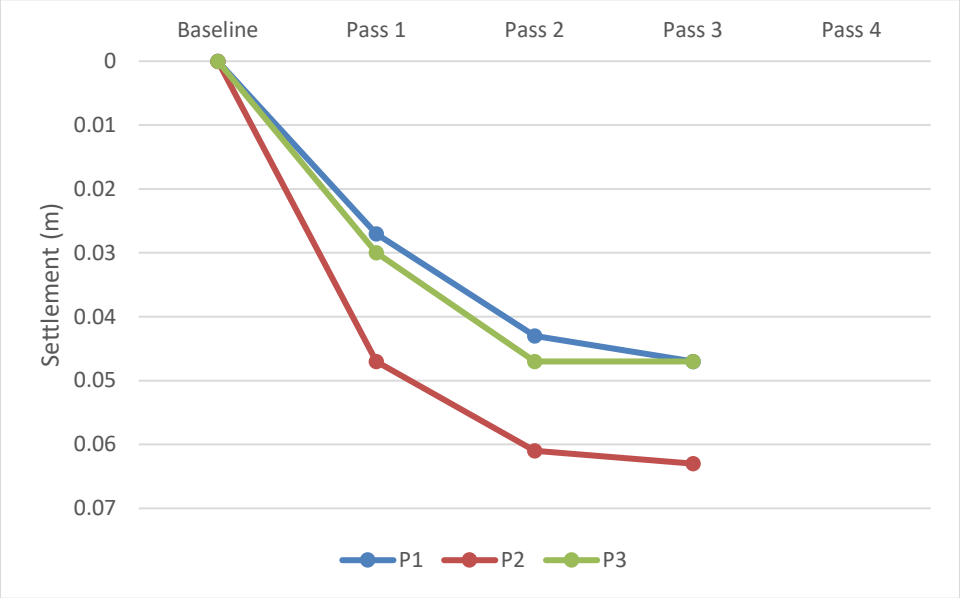

***Figure 6*:** Settlement for Event Pond Cut with Loaded Haul Truck.

2.6. In-situ Density and Moisture Testing

A volumetric test was performed to determine the density of the compacted soil (***Photo 4***). A test pit was dug in the compacted lift. Material excavated from the pit was placed in three super sacks and weighed using a digital scale suspended by a forklift. The test pit volume was determined from drone surveys by Underhill Surveyors.

Test Fill	Weight (kg)	Volume (m3)	Calculated Wet Density (kg/m3)	Estimated Moisture Content (%)	Calculated Dry Density (kg/m3)
ADR Blast Rock	2485	0.96	2588	3.2%	2508
Event Pond Cut	2766	1.1	2515	4.6%	2404

Table 5: Density data.

The dry density of the compacted rockfill was determined to be 2,508 kg/m^3 and 2,404 kg/m^3 for the ADR Blast Rock and Event Pond Cut material, respectively.

Photograph 5: Filling sacks for weighing.

3.0 CONCLUSIONS

The results of the test fill indicate that the rockfill produced from a mostly quartzite source at the ADR borrow and Event Pond cut can achieve sufficient densities with a minimum of 3 passes of a minimum 9,000 kg compactor with vibration, and in lifts of up to 0.90m. Alternatively, one pass with a loaded haul truck will provide adequate compaction. These results were obtained with a material moisture of under 6% within the fill's fine fraction matrix.

BGC recommends these criteria be used for placement and compaction of the rockfill within the Event Pond embankment. If rock size or general gradation varies significantly within this material an additional test fill will be required. If moisture content of the rockfill is above 6% the compaction may be inhibited by frost. Recommendations for placement of winter fills is provided in FM18-020 issued by BGC and dated October 27, 2018.

As the rockfill generated from both the ADR borrow area and Event Pond cut is variable due to the presence of weaker zones of phyllitic material, BGC recommends that the above criteria be used on rockfill produced from the zones of harder quartzite formations. Small zones of phyllitic material should be blended within the quartzite rockfill before use since these zones are more prone to material breakdown and frost. Phyllitic material should not be allowed to be placed in a manner that would create lifts or zones within a lift composed of predominately this material.

The Engineer will inspect the rockfill material during borrowing or placement to make these determinations. Quality control and assurance will be performed by BGC and Tetra Tech based on visual observations of material characteristics and proof rolling with loaded CAT777 trucks. Modifications to lift thickness may be recommended based on observations and additional field density tests may be required by the Engineer to verify compaction, as needed.

Cat®
CS68B

Smooth Drum
Vibratory Soil Compactor

Features:
The Cat® CS68B features a smooth drum and is ideally suited for granular soil applications:

- **Comfortable and ergonomic operator station** features pivoting seat with integrated multifunction LCD display and control console, outstanding visibility to the front and rear of machine, low sound levels and vibration for greater operator comfort and productivity.
- **World-class propel system** built around the exclusive Cat dual pump propel system, two pumps provide separate dedicated flow to drum drive motor and rear axle motor for exceptional gradeability and traction in forward and reverse. New electronic propel control enables more precise machine control.
- **Virtually maintenance free** due to maintenance-free hitch bearings and extended maintenance intervals for vibratory system and hydraulic system, providing more uptime and lower maintenance costs.
- **Enhanced compaction performance** due to more weight at the drum and greater amplitude. Automated propel and vibratory system functions make it easy to ensure consistent, high quality.
- **Optional Cat® Compaction Control** helps the operator determine when compaction has been completed to specification for greater productivity and uniform compaction quality.

Specifications

Engine - Power Train

Engine Model	Cat® C4.4 with ACERT™	
Global Emissions	US EPA Tier 4i/EU Stage IIIB	
Gross Power ISO 14396	117 kW	157 hp

STANDARD EQUIPMENT *Varies by market- contact your Dealer for specifics.*

ELECTRICAL
- 24 volt Electrical System
- 100 ampere Alternator
- 750 Cold-cranking Amps Battery Capacity

OPERATOR ENVIRONMENT
- ROPS/FOPS Cab with Climate Control (Heat, Air Conditioning)
- Cloth Adjustable Pivoting Seat with Integrated Console and LCD Display, Seat Belt
- Multifunction LCD Display with gauges and/or audible warning alarm for: *Hydraulic oil temperature, Engine oil pressure, Engine coolant temperature, Alternator charge, Fuel level, Service hour meter, Engine RPM, Ground speed, Vibe frequency, Fuel rate, Air filter constriction, Engine load and Optional Cat Compaction Control*
- Adjustable Tilting Steering Column with Integrated Cup Holders
- 12-volt Power Outlet
- Floor Mat
- Interior Rear View Mirror
- Horn, Backup Alarm
- Radio-ready

POWER TRAIN
- Cat® C4.4 Diesel Engine
- Air Cleaner, Dual Element
- Three-speed Throttle Switch w/ Eco-mode, Automatic Speed Control
- Dual Propel Pumps; One for Drum Drive, One for Rear Axle
- Fuel Filter, Water Separator, Electronic Priming Pump, Water Indicator
- Tilting Radiator/Hydraulic Oil Cooler
- Dual Braking System
- Two-speed Hydrostatic Transmission

VIBRATORY SYSTEM
- Smooth Drum
- Dual Amplitude, Single Frequency
- Dual Pod-Style Eccentric Weight Housings
- Auto-vibe Function
- Front Adjustable Steel Scraper

OTHER
- Hydraulic Oil Level Sight Gauge
- Radiator Coolant Level Sight Gauge
- Cat® ToughGuard™ Hose
- S·O·S℠ Sampling Valves, Engine Oil and Hydraulic Oil

OPTIONAL EQUIPMENT
- Padfoot Shell Kit
- Leveling Blade
- Variable Vibration Frequency
- Beacon, Rotating
- Polyurethane Drum Scrapers
- Steel Rear-side Drum Scraper
- Bio-oil Factory Fill
- Sun Visor
- Deluxe High-back Air-ride Pivoting Seat
- Cat Compaction Control, Machine Drive Power or CMV
- SBAS GNSS Mapping for Cat Compaction Control (RTK available)
- Upgraded Halogen Light Package
- Cab Internal Rear View Mirrors
- Cab Internal Roll-down Sun Screen
- Product Link
- Additional Rear View Mirrors

Victoria Gold Corporation

Phase 1 (1A/1B)Stability Memo

1.0 INTRODUCTION

The purpose of this report is to present recent laboratory test results and updated liner interface slope stability analyses completed for the Phase 1 (A&B) Heap Leach Facility (HLF) at Victoria Gold Corporation's (VGC) Eagle Gold Project located in Yukon Territory, Canada.

The Eagle Gold HLF consists of an embankment that lies across the Ann Gulch valley about 200 m upstream of the confluence with Dublin Gulch. The ore will be stacked behind the embankment within Ann Gulch. The embankment provides confinement of the ore and creates an In-Heap Pond for temporary storage of pregnant solution, which is pumped to the recovery plant.

Limit-equilibrium slope stability 2-dimensional (2D) analyses were performed for the HLF as part of the detailed design (BGC, 2018) for the Phase 1 HLF and indicated acceptable factors of safety for all analyzed cases based on the data and parameters available at that time. BGC also followed up with (BGC 2019-Sept) stability report given construction materials and final surfaces known at that time.

This report incorporates previous studies and presents results from additional laboratory testing of the installed liner components, ore properties, and asbuilt survey of lined surfaces in the 3-dimensional (3D) slope stability analyses developed to further investigate stability of the proposed ore pile on the Phase 1 facility, particularly with respect to factors of safety for potential failure surfaces along the liner interface. The use of 3D analyses allows more comprehensive investigation of stability for sites with relatively complex geometries and possible lateral confinement of the sliding mass, such as valley fill heap leach facilities.

These analyses are limited to evaluation of the ore pile stability for potential failures along the liner interface and do not consider the stability of the embankment or foundation materials alone or as a component of the overall facility. Previous engineering studies (BGC, 2018) provide properties for the foundation and embankment materials and results of related stability analyses. The results and conclusions presented herein do not invalidate the previous work but provide a more comprehensive picture of the HLF Phase 1 ore pile stability as a basis for managing the ore stacking and for planning of future analyses.

© Forte Dynamics, Inc. 2020 All rights reserved, including all rights relating to the use of this document or its contents.

The primary reason for updated stability model was to update with actual data, from materials that were placed both in construction and in operations, and to ensure that the ultimate surface proposed for Phase 1 (1A &1B), was still adequate based on these updates. The information provided below presents that the configuration provided by Forte (adopted from BGC) is adequate.

2.0 DESIGN CRITERIA

The HLF embankment has been classified as a "Significant" hazard according to Canadian Dam Association (CDA) dam classification guidelines (CDA, 2014). The detailed design report (BGC, 2018) presents the classification rationale. Forte Dynamics has reviewed both the CDA Guidelines and BGC's recommendations and also concludes that the embankment is considered as High in hazard analysis. CDA recommendations for high hazard dams include consideration of the Earthquake Design Ground Motion (EDGM) with an annual exceedance probability of 1 in 2,475, and factors of safety as summarized in Table 1.

Table 1. Target factors of safety for slope stability, after CDA (2014).

Loading Condition	Minimum Factor of Safety (FoS)
Static, Long-term	1.5
Pseudo-static	1.0
Post-earthquake	1.2

2.1. Seismicity

According to the site-specific seismic hazard analysis previously performed for this site (Tetra Tech, 2012), a design peak ground acceleration (PGA) of 0.35 g should be used for facilities requiring low-probability (e.g., 1 in 5,000-year, or 1 in 10,000-year) or maximum design earthquake (MDE) ground motions, and a PGA of 0.25 g should be used for facilities requiring 1 in 2,475-year design basis earthquake (DBE) ground motions.

Pseudo-static analyses were performed to evaluate the stability of the HLF under seismic (earthquake) loading. A pseudo-static stability analysis incorporates the effects of seismic loads by subjecting the 3D sliding mass to a horizontal acceleration equal to a seismic coefficient based on the PGA expected during an earthquake. The pseuedo static analysis was completed at 2/3 PGA utilizing peak strengths for both liner interface and ore materials.

3.0 METHODS OF ANALYSIS

Limit Equilibrium (LE) geotechnical analyses were performed around the Phase 1 HLF using 3D methods. Materials were defined using shear-normal functions with input values for strength derived from laboratory testing results. The analyses were conducted using SVSLOPE: 3D Limit Equilibrium Slope Stability Analysis (Version 10.04.000.135) software by Bentley Software. SVSLOPE allows for multi-plane slope stability analysis of complex 3D geometry using triangulated surfaces from asbuilts of Phase 1A and 1B.

© Forte Dynamics, Inc. 2020 All rights reserved, including all rights relating to the use of this document or its contents.

Three different conditions were analyzed:

- Operational static with peak interface strength and estimated ore material strength from multiple lab tests.
- Operational pseudo-static with peak interface strength and estimated ore material strength from multiple lab tests.
- Post-earthquake static with residual interface strength and estimated ore material strength from multiple lab tests.

The horizontal ground acceleration produced by the DBE event (see Section 2.1) was used in the pseudo-static analysis. The post-earthquake analyses used the residual (large-displacement) liner strength, which is described further in Section 4.0.

4.0 MATERIAL PROPERTIES

The material properties used in the slope stability analyses are shown in Table 2.

Table 2. Material properties used in slope stability analyses.

Material Description	Strength Model	Unit Weight (kN/m3)	Comment
Crushed Ore	Shear-Normal	20	See Note 1
Foundation and Embankment	Shear-Normal	23	See Note 2
Liner Interface	Shear-Normal	12	See Note 3

Notes:
1. Shear-normal function, see Section 4.1.
2. Bedrock is modelled as impenetrable for the purpose of forcing failure surfaces along liner interface.
3. Bilinear functions for post-earthquake analysis, see Section 4.2.

4.1. Ore

Shear strength for the crushed ore was based on material received from site and tested at varying normal pressures. Figure 1 below presents all curves of ore strength considered for this analysis. The 2018/19 BGC curve is what was utilized in their associated reports based on data at the time. Forte Dynamics completed further ore testing based on what was placed on the heap in December 2019. The ore strengths were tested at varying moisture contents (9%), mas operational active leaching, and an assumed weakened strength at saturation of approximately (11.8%). Counterintuitively, lab results indicated that material strengths of the ore were higher at higher moisture content.

In considering this and all test work the current ore strength curve utilized in this analysis was achieved by a curve that follows the HLF sample at 9% to the 691 kPa level, at which pint the curve is extrapolated based on parallels with the BGC test work.

4.2. Liner System

During construction, BGC performed laboratory multi-interface shear testing on the installed composite liner materials for Phase 1A, and Forte composed testing during Phase 1B. The lining system for the HLF pad comprises the following, from top to bottom:

- Overliner drain fill – minus 38 mm gravel (Phase 1A), similar material from HLF for Phase (1B)
- Textured geomembrane – 2.0 mm linear low-density polyethylene (LLDPE) - Solmax manufactured for Phase 1A and Enviroliner manufactured for Phase 1 B
- Geosynthetic clay liner (GCL) (Solmax for both Phase 1A and 1B)
- Prepared subgrade

Bulk samples of representative subgrade and overliner drain fill (ODF) material were collected from the site. The subgrade material was tested for index properties and classified as non-plastic silty sand with gravel. The ODF was described as angular to subangular, poorly graded gravel.

The geomembrane and GCL products samples were provided by the project liner supplier(s). The GCL samples were BentoLiner NWL-60 manufactured by GSE Environmental (GSE). The geomembrane sample was double- side textured LLDPE manufactured by Solmax for Phase 1A and Layfield for Phase 1B.

Phase 1A lab tests included:

GCL samples were also sent to TRI Environmental Inc. for peel strength and hydrated internal shear strength testing as part of conformance testing for the project. Laboratory test results are provided in Appendix A-1 and data sheets for the geosynthetic products are provided in Appendix B.

Phase 1B lab tests included:

GCL and LLDPE samples were sent to BGC labs shear strength test for this composite system and are presented in Appendix A2. Data sheets for the LLDPE are presented in Appendix B.

The weakest layer of the composite liner system was found to be the GCL interface with the textured geomembrane. At normal stresses higher than 400 kPa, the GCL/Geomembrane interface strength decreased from the peak strength resulting in a limiting residual strength value of about 100 kPa. Additional discussion of interpretation of laboratory results are presented in Section 6. Table 4 and Figure 2 present the interpreted results of the peak and residual (large displacement, or LD) shear strength based on the laboratory testing. These values were input as shear-normal strength envelopes in the stability model.

5.0 RESULTS

The results of the slope stability analyses for Phase 1, including asbuilt survey and lab results of actual liner systems placed, are presented in Appendix C. Results shown on the figures are shaded to correspond with the following FoS ranges shown in the key on the left side of each sheet.

Results for static conditions (with peak interface strength and reduced material strength), pseudo-static (with peak interface strength and reduced material strength) and post-earthquake conditions (with residual liner interface strength) indicate acceptable factors for safety for all analyzed areas. The area of Phase 1 exhibited a minimum FoS value of about 2.21 for the modeled post-earthquake condition, 1.48 for the pseudo-static case and 2.24 for the static case.

Table 5 presents a summary of results compared of the stability analysis results..

Table 5. Summary of results.

Case	2021 3D Minimum FoS [4]
Static	2.24
Pseudo-static	1.48
Post-earthquake	2.21

Notes:

1. Minimum critical FoS from all 3D stability results.

6.0 CONCLUSIONS AND RECOMMENDATIONS

The multi-interface laboratory shear testing conducted for the project utilized standard methods and site-specific materials and is considered valid. The sample preparation included hydration under low confinement of the GCL with 24 hours of inundation prior to normal loading in the direct shear apparatus. This procedure is not representative of the field condition which typically involves gradual hydration of GCL in a confined (loaded) condition. Forte and previous engineer of record BGC considers the results of the liner interface testing somewhat conservative due to the fully saturated bentonite material noted on the geomembrane liner following the test. Some saturated bentonite apparently squeezed through the GCL cloth material between the GCL and geomembrane upon loading which reduced the interface strength upon shearing. BGC recommends further testing to investigate the possible effects of bentonite squeezing on interface strength and GCL hydration under confining stress prior to shearing.

These analyses were based on asbuilt Phase 1A and 1B pad and embankment asbuilt surfaces and updated testing of material strengths as a continuation of the analysis done in 2019. Additional stability analyses using continued material ore strength material test work that correspond to varying ore characteristics, such as ore particle size distribution, are recommended, as well as, continuing updates of surveyed asbuilt Phase 2-3, etc. To expand flexibility of approved liner systems for future phasing, it is also recommended that additional liner interface

test work is completed on other manufacturer's materials. The dynamics of this facility are such that the ultimate configuration may require adjustments as data is obtained and analyzed by the Engineer of Record.

1 Background

1.1 Water Management Infrastructure

1.1.1 Overview

A number of water management facilities including ponds and sediment basins, diversions and interceptor ditches, as well as pumping and piping systems have been developed to proactively manage sediment-laden, contact and non-contact water throughout the life of the Eagle Gold Mine. Details regarding the development and operation of the water management facilities are found in the Water Management Plan Version 2020-01 (SGC, 2020).

Surface water routing for the Mine involves the use of 3 primary ditches as shown in Figure 1 and described below:

Ditch A Located downslope from the open pit, the Platinum Gulch WRSA, the 90-day stockpile and the open pit access road. Ditch A runs north from the drainage basin of the Platinum Gulch WRSA (PG WRSA) across the site and into the Lower Dublin South Pond (LDSP or Control Pond). Construction of Ditch A was completed in 2019.

Ditch B When the entire stretch of Ditch B is completed it will generally follow the natural Eagle Creek watercourse, and receive runoff from the Eagle Pup WRSA, and Suttles Gulch which contains the crusher installations and part of the Eagle Pit. Ditch B will flow west across site from the northern end of the Eagle Pup WRSA to the LDSP. Currently only the reach from Suttles Gulch to the LDSP is complete. Full construction of Ditch B is expected to be complete in 2021.

Ditch C Located downslope of the LDSP, it conveys the outflow from the pond to Haggart Creek. Ditch C flows generally west to a discharge location downstream of Dublin Gulch and upstream of a surface water monitoring station known as W4. Construction of Ditch C was completed in 2019.

Figure 1 - Major Water Management Infrastructure

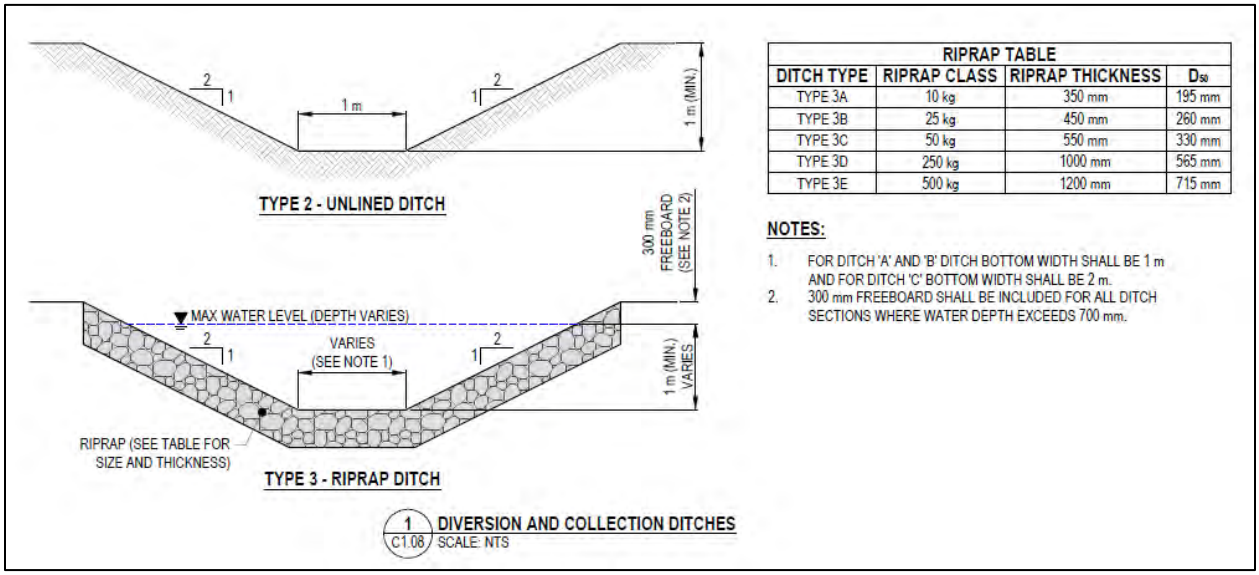
1.1.2 Ditch A Challenges and Improvement Project

This As-built Report provides a summary of actions taken to improve the operation of Ditch A after implementing changes to address some lessons learned from two freshet seasons. Minor modifications to the design of the ditch were necessary after certain ditch characteristics were impeding its function and operability. In particular, the design did not fully meet the requirements for collecting contact water and sediment laden water during freshet and summer rain events due to sediment build-up at the sump, while at the same time specific maintenance activities (e.g., sediment clean out) in the ditch were impractical due the presence of the 28-inch pipleine.

In addition, during construction of the ditch in February and March 2018, a large icing developed at the the designed location for the PG sump due to the intersection of groundwater. Large icings formed in the sump and along the upper portion of Ditch A which made it not feasible to build the sump at the design location. The sump location was moved to a location about 200 m downgradient from the original design location, although Ditch A still extended to the design toe of the PG WRSA. The presence of potential icing development precludes the use of the design location for a sump.

As noted above, sediment build up occurred along many sections of the ditch, including the sump, which reduced the effective capacity of the ditch. The Issued for Construction configuration of Ditch A (i.e., the installation of HDPE pipe in the ditch) provided poor access for routine and thorough removal of the accumulated sediment. This configuration also increased the likelihood of the pipe joins and the pipe itself being damaged during attempts at moving the pipeline to access more of the ditch to remove sediment.

1.1.3 Inspector's Direction



In response to water management challenges experienced on the site that were documented by Victoria Gold (Yukon) Corp. (VGC), the Inspector for the Major Mines, Compliance Monitoring and Inspections Branch of the Department of Energy, Mines and Resources issued an Inspector's Direction pursuant to section 35 (1) of the Waters Act.

The Inspector's Direction, dated July 10, 2020, required VGC to:

> *Test, reconfigure and repair the performance problems with Ditch A and the 24" Pipeline within the Platinum Gulch Water Management System (PGWMS). Complete and document all engineering modification in compliance with WUL QZ14-041, Part C - Design, Construction and Modification. All modifications must be updated in the Construction and Operations Water Management Plan and appended to the next Annual Report.*

1.2 Initial Ditch A Design

The Engineer of Record (EOR) for the Issued for Construction design of Ditch A was Mauricio Herrera of Tetra Tech EBA. The design included a typical cross section which had a 2:1 side slope, a 1 m bottom width, and non-woven geotextile overlain by rip rap (with varying specifications based on hydrologic analysis) as shown below in Figure 2. To ensure that there were no seepage losses of contact water emanating for the PG WRSA, the Issued for Construction and As-built configuration of Ditch A included a 28“ diameter HDPE Pipe within the ditch as shown in Figure 3.

RIPRAP TABLE			
DITCH TYPE	RIPRAP CLASS	RIPRAP THICKNESS	D_{50}
TYPE 3A	10 kg	350 mm	195 mm
TYPE 3B	25 kg	450 mm	260 mm
TYPE 3C	50 kg	550 mm	330 mm
TYPE 3D	250 kg	1000 mm	565 mm
TYPE 3E	500 kg	1200 mm	715 mm

NOTES:

1. FOR DITCH 'A' AND 'B' DITCH BOTTOM WIDTH SHALL BE 1 m AND FOR DITCH 'C' BOTTOM WIDTH SHALL BE 2 m.
2. 300 mm FREEBOARD SHALL BE INCLUDED FOR ALL DITCH SECTIONS WHERE WATER DEPTH EXCEEDS 700 mm.

Figure 2 - Tetra Tech EBA Issued for Construction Ditch Specifications

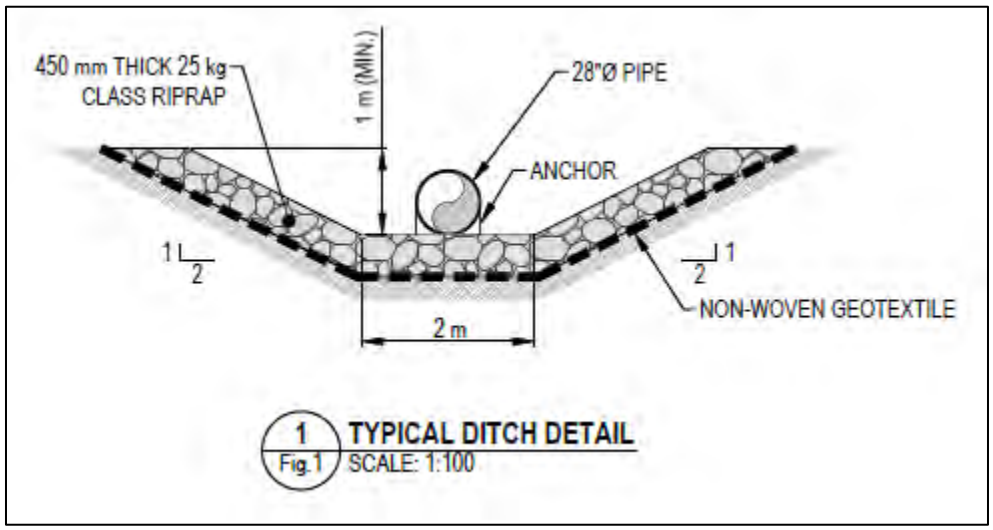


Figure 3 - Tetra Tech EBA Issued for Construction Typical Ditch with Pipe Detail

Water infiltrating the PG WRSA and intercepted by the rock drain was to be captured by a sump that was connected to the pipe installed within Ditch A as shown in Figure 4.

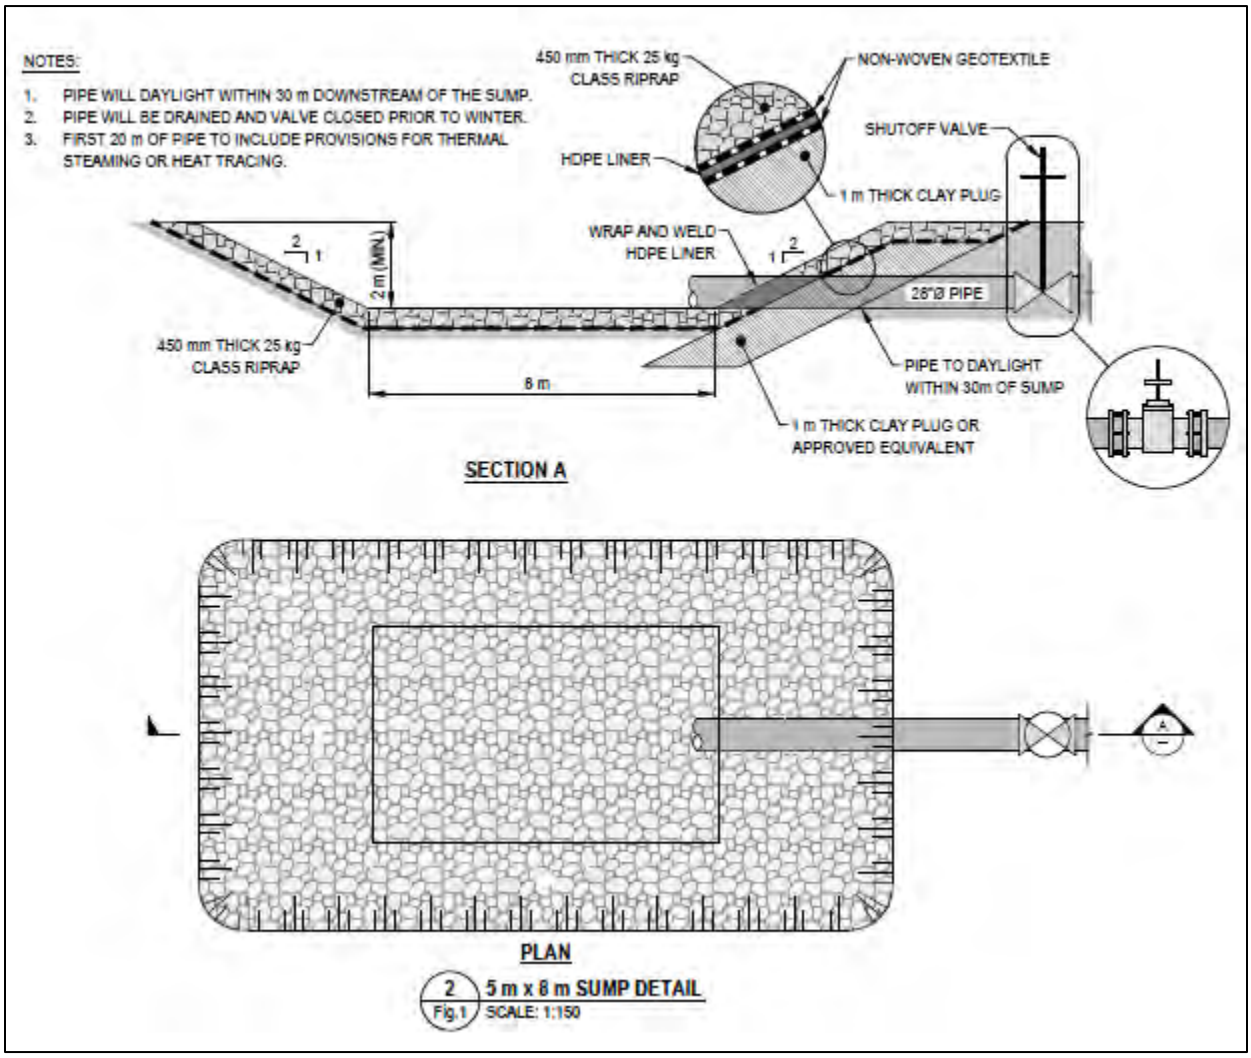

Figure 4 - Tetra Tech EBA Issued for Construction Sump Detail

1.3 Initial Ditch A Construction

Ditch A was constructed under the supervision of Field Engineers and Earthworks Superintendents of JDS Energy & Mining Inc. (JDS). Minor modifications to the design suggested by JDS field engineers were approved by the EOR. Underhill Geomatics Ltd. (Underhill) performed all layout and survey work for the ditch construction. Ewing Transport Ltd. (Ewing) completed all earthworks including excavation, ditch shaping, installation of geotextile, culvert installation, and riprap installation. Layfield Canada Inc. (Layfield) completed the installation of the impermeable liner lining the PG sump, and sealed the liner to the 28" HDPE pipe. The HDPE pipe was supplied by Sandale Inc. (Sandale). Nuway Crushing Ltd. (Nuway) completed all aggregate production for the ditch. A construction report was completed by JDS for all works completed on Ditch A which included As-built drawings provided by Maurico Herrera of Tetra Tech EBA (JDS, 2019).

Relevant As-built configurations are provided below in Figure 5, Figure 6 and 7.

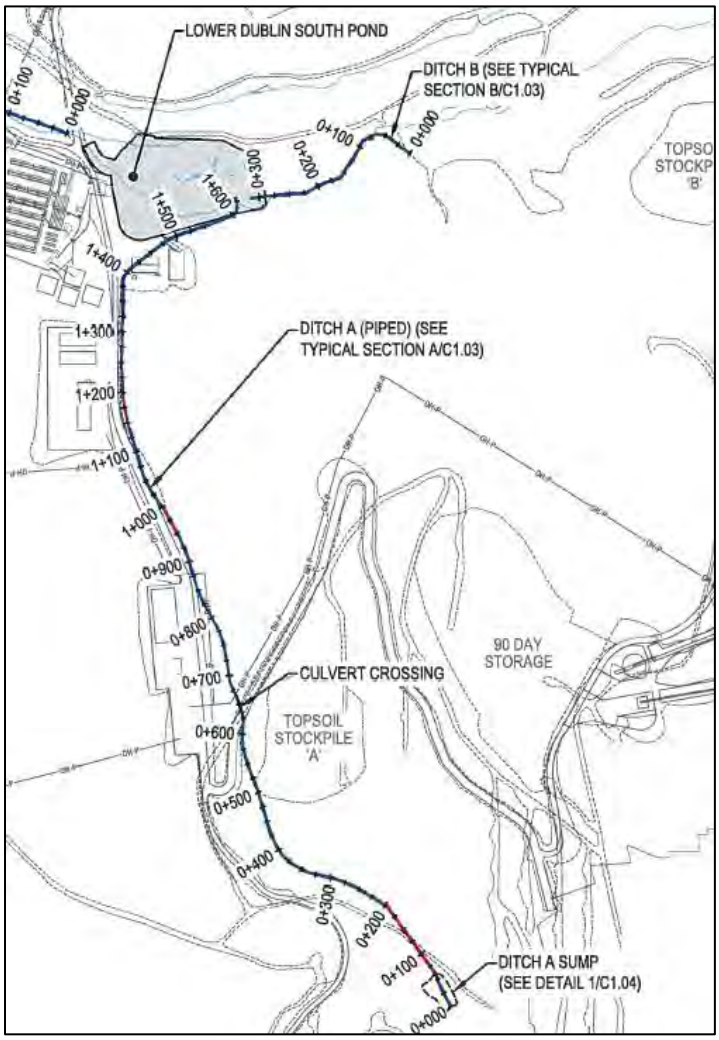

Figure 5 - Tetra Tech EBA As-built Ditch A Alignment

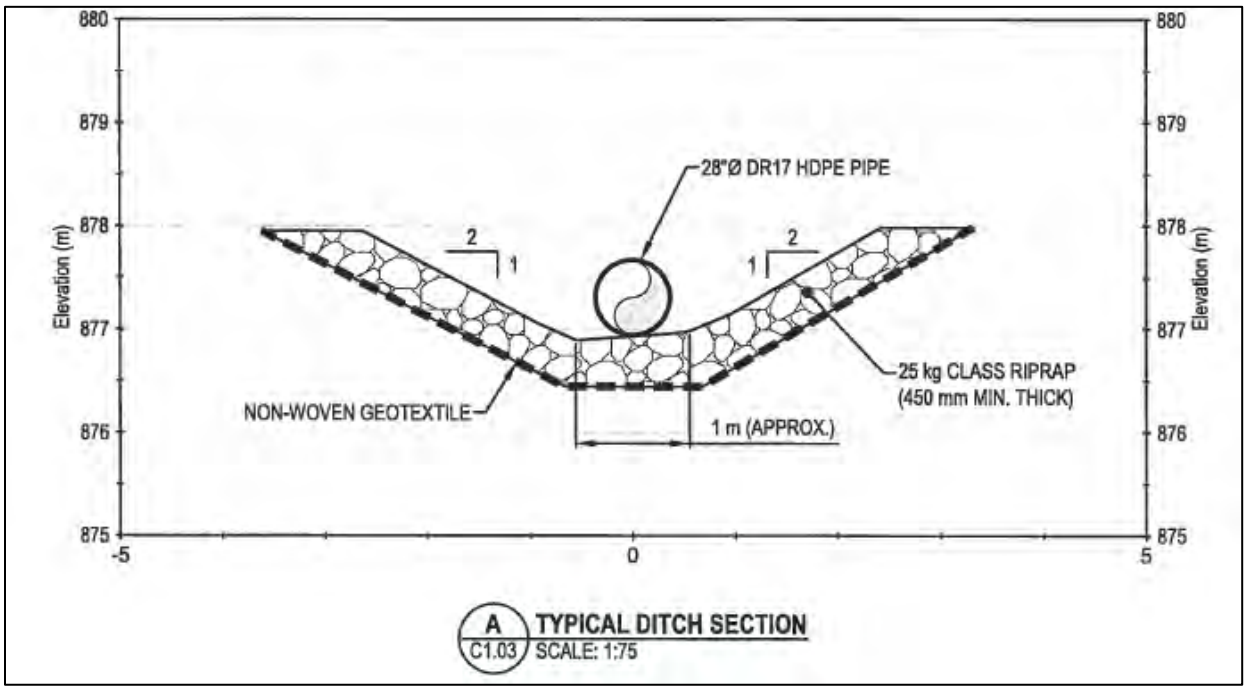

Figure 6 - Tetra Tech EBA As-built Ditch A Typical Cross Section

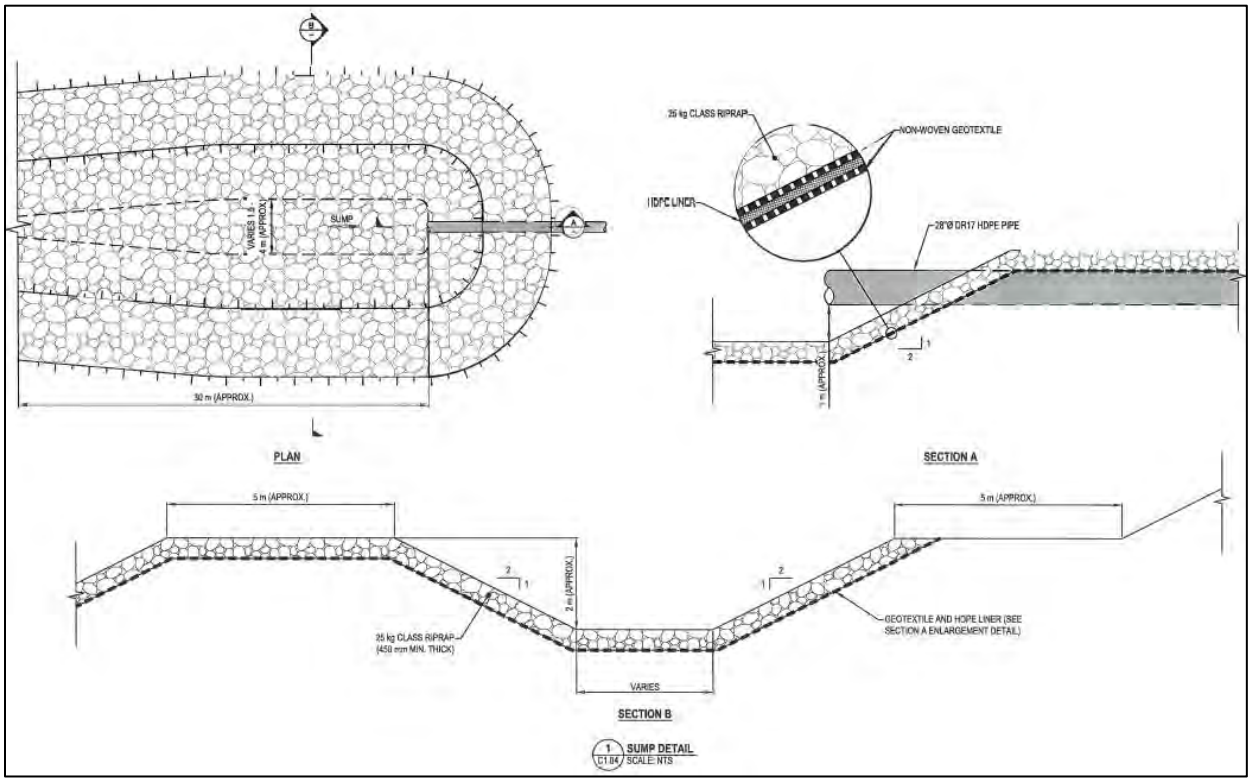

Figure 7 - Tetra Tech EBA As-built Ditch A Inlet Sump

1.4 Ditch A and Inlet Sump Construction and Operational Issues

During construction in winter 2018 – 2019, the designed location for the PG sump was excavated and groundwater was intersected. Large icings formed in the sump and along the upper portion of Ditch A which made the original sump location impractical (Photo 1).

Photo 1 - Large icing formed in the excavation at the original PG Sump location (Feb 9, 2019)

A field decision was made to re-establish the sump about 200 m northwest downhill from the original design location, and a rip-rap filled ditch was constructed uphill connecting the sump to the design toe of the PG WRSA. This section was not lined with geotextile.

Along many sections of Ditch A, sediment build up reduced the effective capacity of the ditch (Photo 2). The Issued for Construction configuration of Ditch A (i.e., the installation of HDPE pipe in the ditch) provided poor access for routine and thorough removal of the accumulated sediment. This configuration also increased the likelihood of the pipe joints and the pipe itself being damaged.

It is currently assumed that ongoing sediment build up will remain an issue until vegetation is re-established to assist with the stabilization of areas disturbed during construction activities. Silt fences were installed along most of the uphill side of Ditch A, however they were overwhelmed in certain locations and reduced their effectivity (Photo 3) and required regular maintenance and repair.

Photo 2 - Sediment build up in Ditch A

Photo 3 - Overwhelmed Silt Fences (prior to maintenance)

1.5 Ditch A Minor Modifications to Satisfy the Inspector's Direction

To comply with the Inspector's Direction, three options were considered by the Technical Services team, in their capacity as the responsible department for engineering modifications to the structure and under the supervision of the Engineer of Record established for this work, Mr. Richard Tuohey:

(1) Temporarily relocate the pipe out of the ditch prior to freshet and lay it adjacent to the ditch line, clean out the ditch prior to freshet, then replace pipe after freshet.

(2) Remove the pipe and bury it underneath or adjacent to the ditch, and clean the ditch as needed.

(3) Remove pipe entirely and reline ditch with an impermeable liner and replace the rip rap.

Option 3 was selected as it was determined that it would allow for Ditch A to function as designed (i.e., for capturing and conveying sediment laden and for conveying contact water without seepage losses to the LDSP).

2 Ditch A Improvement Construction Summary

2.1 Responsibilities

Ditch A Improvement construction was supervised by the Site Services department at VGC under the direction of the VGC EOR Mr. Richard Tuohey, P.Eng. Day-to-day supervision of the ditch progression was completed by Clint Abel, JDS's representative on site. Ewing completed all earthworks, liner placement, and rip rap sorting and placement in the ditch. Underhill completed an as-built survey of the ditch in the form of ditch slope surveys and survey of placed liner and rip rap. The Technical Services team completed QA/QC of rip rap placement using Wipfrag Software (Wipware, 2020). Wipfrag is a tool used for particle size analysis using size-referenced photos from the field. Final engineering sign-off on the ditch construction is provided by Richard Tuohey, VGC's Technical Services Superintendent.

2.2 Construction Material Sources

The impermeable liner installed in the ditch was sourced from unused liner available from the ongoing heap leach pad construction program. The liner is 2 mm Linear Low-Density Polyethylene (LLDPE) black textured geomembrane. Manufacturing documentation for the liner can be seen in Appendix A.

Most of the rip rap used to complete the ditch upgrades was sourced from the ditch itself and reused. If supplemental rip rap was required, sources of rock used were:

- Metasediment/granodiorite waste rock from the open pit
- Leftover rip rap from other Mine construction areas sourced from the Dublin Gulch valley

All additional rip rap used for the Ditch A works were tested for compliance with the construction grade waste rock requirements of the Quartz Mining License QML-0011 and Water Use Licence QZ14-041-1 and were deemed suitable. Certificates of analysis for the testing undertaken on the additional rip rap placed in Ditch A are provided in Appendix B.

2.3 Construction Summary

The modifications to Ditch A were completed between September 12 and October 23, 2020. All liner installation was completed by Oct 5 and final rip rap placement was completed on Oct 23. A follow up inspection of the mine was undertaken by the Inspector on October 20, 2020 and no concerns were raised with VGC site representatives at that time.

The alignment of Ditch A was not altered during the improvement works. The ditch alignment remains from the final toe of the PG WRSA and extends parallel to the Crusher Access Road into the Control Pond (Figure 1). The new as-built Ditch A extends about 260 m upstream from the as-built PG sump to the final toe of the PG WRSA and is keyed in under the ultimate termination point of the PG WRSA rock drain. For construction record purposes, the alignment extended upstream from the original 0+000 chainage start includes reverse chainage (e.g., 0-100, 0-200 chainage). The last 150 m of the alignment upstream that was ditched with rip rap to the original designed location of the PG sump was left in place.

The cross section of Ditch A also remains unchanged and includes a minimum 1 m wide base and 2:1 side slopes.

The 28-in HDPE pipe within the ditch was dissembled and removed. The ditch is now completely lined with impermeable liner thus the pipe is no longer necessary. As the pipe is no longer a component of the ditch system the as-built PG sump was also removed as the lined ditch now extends to the ultimate termination point of the PG WRSA rock drain.

Rip rap and accumulated silt in the ditch was removed with an excavator until the original base of the ditch was found. The material taken out of the ditch was sorted with a grizzly so fines were removed. The non-woven geotextile that was installed as part of the initial construction of Ditch A was removed and re-placed in areas where additional protection was deemed required.

The ditch was dammed when the impermeable liner was being placed, and liner strips were placed in shingles with at least 1 m overlap. Once liner was placed the original rip rap from the ditch or supplemental rock was placed back in the ditch.

The entirety of Ditch A is 1,872 m long, and the total length of lined ditch, according to the survey as-built, is 1830 m long. The 42 m long section of the ditch that does not include LLDPE liner is a culvert that is installed under Switchback 1 of the Crusher Access Road. The liner was tied in to the culvert under this switchback.

The following table is a summary of the rip rap type used for the length of Ditch A.

Table 1 - Rip Rap Class by Chainage

Chainage	Rip Rap Class
0-260 to 0+000	Class 10kg
0+000 to 0+600	Class 10kg
0+600 to 1+000	Class 25kg
1+000 to 1+500	Class 10kg
1+500 to 1+612	Class 50kg

Appendix C provides the daily reports completed by Ewing and documents all liner placement, materials removed from the ditch, materials replaced in the ditch, and supplemental rock placed in the ditch from additional sources.

A selection of construction photos is provided in Appendix D.

The as-built alignment with chainage and cross sections can be seen in Appendix E.

QA/QC test results can be seen in Appendix F.

3 Letter of Assurance

I hereby confirm that:

- I am a Professional Engineer registered with the Association of Professional Engineers of Yukon, and licensed to practice in the Yukon Territory;
- I have utilized the standards of care, skill and diligence that, in accordance with the standards of my professional, are required of Professional Engineers in the Yukon Territory;
- I am the Engineer of Record (EoR) for the Eagle Gold Mine Ditch A;
- I consider the construction improvements described within this report as "Minor Modifications", as defined in the Water Use Licence QZ14-041-1, to the submitted final designs of Ditch A and that these improvements do not affect the functionality of Ditch A to meets its design criteria or environmental performance requirements and do not affect the ability of an other Engineered Structure to meet their design and performance criteria.;
- All Quality Assurance and Quality Controls during construction were conducted to my satisfaction.

LAYFIELD

Geomembrane [EL4280, 2-sided Coarse Textured]

Our Enviro Liner 4000 coarse textured series Geomembranes have better interface friction capabilities compared to our standard textured geomembranes. Texturing can be accomplished either on one side or on both sides. Enviro Liner 4000 coarse textured product can be manufactured to custom asperity heights and is available by special order. Layfield is capable of supplying the friction and strength properties you require for your design build project. Enviro Liner 4280 Coarse Textured Geomembrane meets or exceeds the requirements of Table 2(B) GRI GM 17 specification for textured Linear Low-Density Polyethylene Geomembranes.

Property	ASTM	EL4280[1] 2-sided Coarse Textured	Frequency
Thickness nominal	D5994	2.00 mm	
- min.ave -lowest individual for 8 out of 10 values -lowest individual for any of the 10 values	D5994	1.90 mm 1.80 mm 1.70 mm	Every Roll
Sheet Density	D792	≤0.939 g/cc	Every 10 rolls
Dimensional Stability	D1204	±2%	Once per formulation
Tensile Properties (min. avg) Strength @ Break Elongation @ Break	D6693, Type IV Die	 31 kN/m 380%	Every 2 rolls
Asperity Height (min.ave)	D7466	0.50 mm	Every roll
Tear Resistance (min. avg)	D1004	200 N	Every 5 rolls
Puncture Resistance (min. avg)	D4833	500 N	Every 5 rolls
Multi-axial Elongation (typical)	D5617	30%	Once per formulation
Carbon Black Content	D4280	2.0-3.0%	Every 2 rolls
Carbon Black Dispersion	D5596	9 in Cat 1/ Cat 2 1 in Cat 3	Every 10 rolls
Oxidative Induction Time (OIT) High Pressure Oxidative Induction Time (HPOIT)	D5885	100 mins 400 mins	Per resin batch
Oven aging, 85 deg C, HOPIT % retained after 90 days	D5721 D5885	60%	Once per formulation
UV Resistance, HPOIT retained after 1600 hrs	D7238 D5885	35%	Once per formulation
Low Temperature Brittleness	D746	-70°C	Once per formulation
Roll Width	-	6.85 mtrs	
Roll Length	-	128 mtrs

Suite 320, Fort Collins, Co 80528

Dear Mr. Green,

Re: Forte Dynamics Lab Testing

1.0 INTRODUCTION

BGC Engineering Inc. (BGC) was retained by Forte Dynamics Inc. to conduct a series of liner interface shear tests for the expansion phases of the Victoria Gold Corp Project "Eagle Gold Mine". The results of these tests are attached herein.

2.0 BACKGROUND

On January 20th, 2020, BGC received a shipment of geosynthetic clay liners (GCL) and geomembranes from Layfield Group LTD. The product name associated with the GCL and the geomembrane was GSE BentoLiner NWL-60 and Layfield Enviro Liner 4280 CT, respectively.

During the first three tests, BGC observed lower than expected shear strengths between the GCL and the geomembrane. When comparing the 2020 GCL with the GCL tested by BGC in 2018 and 2019 (also GSE BentoLiner NWL-60), the results were incongruent. BGC observed that the 2020 GCL swelled approximately twice as much when compared to the GCL tested in 2018 and 2019 GCL. The lower internal shear strength of the 2020 GCL was attributed to the higher water content of the bentonite.

BGC notified Forte Dynamics Inc. of the apparent discrepancy in GCL types, and Forte Dymamics said they would reach out to Layfield and arrange to have new GCL sent to the BGC laboratory for testing.

On March 4th, 2020, BGC received the new shipment of GCL with product name GSE BentoLiner NWL-60. A second round of liner interface testing was completed using this GCL. The new GCL swelled to a similar water content and hydrated thickness as the GSE BentoLiner NWL-60 tested in 2018 and 2019.

In addition to completing the liner interface shear tests, BGC also completed Standard Proctor and particle size distribution tests on subgrade and overliner materials.

Individual laboratory reports for the completed tests are included in Appendix A. This work was conducted in general accordance with the scope of work provided in an email sent by Clint Green of Forte Dynamics Inc. to David Oldford of BGC on January 13, 2020 entitled "VGC-Eagle-Interface Shear", and according to the terms and conditions provided in Appendix B.

3.0 STANDARDS FOLLOWED

The index tests and the liner interface samples were tested in accordance with the latest editions of applicable American Society for Testing and Materials (ASTM) standards and recognized good practice. The following ASTM Standards were utilized:

- ASTM D5321 - Standard Test Method for Determining the Shear Strength of Soil-Geosynthetic and Geosynthetic-Geosynthetic Interfaces by Direct Shear.
- ASTM D6913 - Standard Test Methods for Particle-Size Distribution (Gradation) of Soils Using Sieve Analysis.
- ASTM D698 - Standard Test Methods for Laboratory Compaction Characteristics of Soil Using Standard Effort (12,400 ft-lbf/ft^3 (600 kN-m/m^3).

4.0 EQUIPMENT

The liner interface tests were completed using BGC's large direct shear box apparatus. The shear box has horizontal dimensions of 40 cm x 40 cm and a height of 51 cm, and allows testing to be completed at vertical stresses of up to 5.5 MPa. The vertical stress is applied to a top plate by means of two 50 ton jacks. A horizontal force is applied by means of a single 50 ton jack. Vertical and horizontal displacements are measured and logged continuously throughout the test by means of Liner Variable Displacement Transducers (LVDT). The use of two vertical jacks and LVDT's allows adjustment of the top plate throughout the test. This ensures that the top plate remains parallel while maintaining a constant vertical stress. The horizontal force is continuously measured and logged by means of a load cell. A photograph of the equipment is provided in Figure 4-1.

Figure 4-1. BGC's Large Direct Shear Apparatus

5.0 METHODOLOGY

The liner interface tests were conducted by placing a subgrade material into the bottom half of the shear box. The subgrade was compacted to a minimum of 92% of the maximum Standard Proctor dry density as requested by Forte Dynamics. Next, a pre-soaked GCL was placed on top of the subgrade, followed by a geomembrane. The top half of the shear box was placed over the geomembrane and was filled with the overliner material. Finally, a top plate was placed above the overliner material. For each GCL type tested, two rounds of testing were completed at vertical stresses 400, 800 and 1200 kPa. The vertical stresses were applied to the system until the vertical deformation had stabilized. After consolidation, the liner systems were sheared at an average displacement rate of approximately 0.28 cm/min while maintaining a constant vertical stress.

6.0 CLOSURE

BGC Engineering Inc. (BGC) prepared this document for the account of Forte Dynamics Inc. The material in it reflects the judgment of BGC staff in light of the information available to BGC at the time of document preparation. Any use which a third party makes of this document or any reliance on decisions to be based on it is the responsibility of such third parties. BGC accepts no responsibility for damages, if any, suffered by any third party as a result of decisions made or actions based on this document.

As a mutual protection to our client, the public, and ourselves, all documents are submitted for the confidential information of our client for a specific project. Authorization for any use and/or publication of this document or any data, statements, conclusions or abstracts from or regarding our documents, through any form of print or electronic media, including without limitation, posting or reproduction of same on any website, is reserved pending BGC's written approval. A record copy of this document is on file at BGC. That copy takes precedence over any other copy or reproduction of this document.

Yours sincerely,

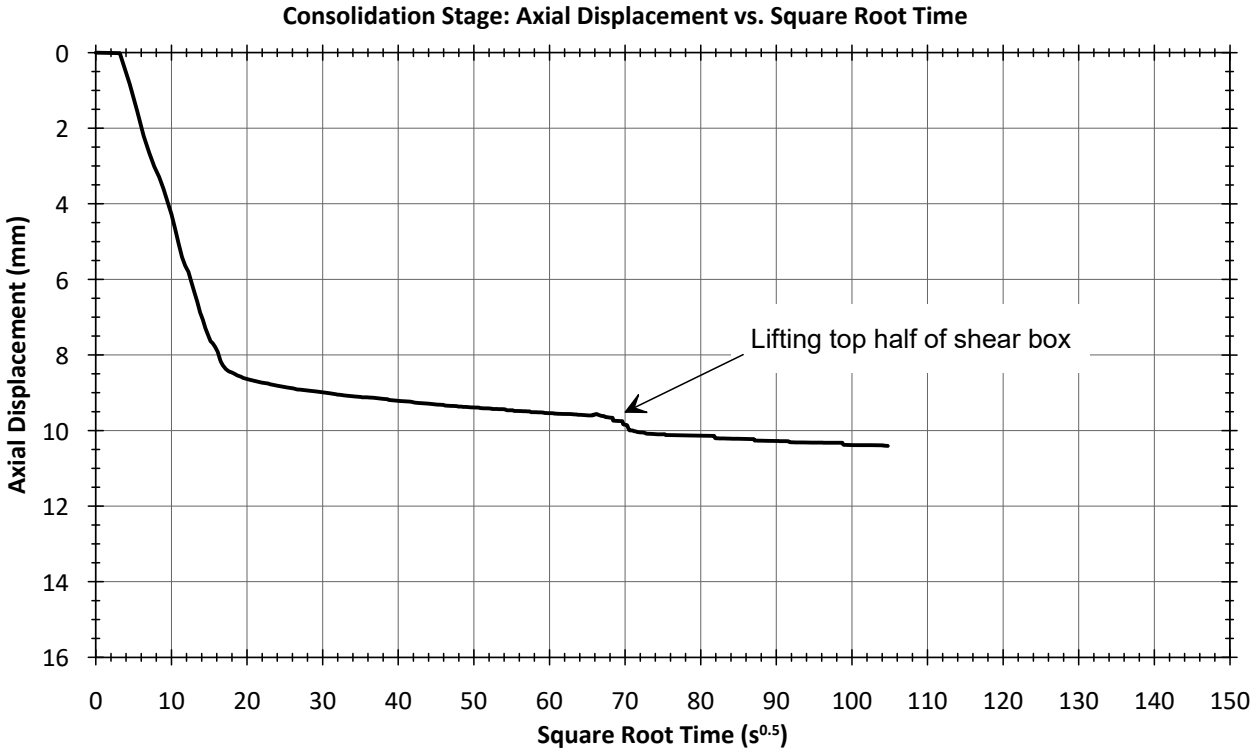
Initial Water Content (%)	108.9
Final Water Content (%)	86.7



SHEARING PARAMETERS	
Vertical Stress σ'_v (kPa)	800
Displacement Rate (cm/min)	0.48

RESULTS	
τ_{max} (kPa)	302
τ_{res} (kPa)	95

Note: The liner system failed between the geosynethetic clay liner (GCL) and Geomembrane. No failure was observed in the GCL. There was no evidence that any shearing occurred in either the subgrade or overliner.

APPENDIX B
BGC's STANDARD TERMS AND CONDITIONS

AGREEMENT FOR LABORATORY TESTING SERVICES

Dated as of this 21 day of February, 2020, is made by and between:

Client: Forte Dynamics ("the **Client**"),

Address: 3003 E. Harmony Road, Suite 320
Fort Collins, Co 80528

AND:

BGC ENGINEERING INC. ("**BGC**")
Suite 500 – 980 Howe Street
Vancouver BC, V6Z 0C8
Canada

The Client and BGC agree as follows:

1. THE LABORATORY SERVICES

1.1 BGC will provide Client certain Laboratory Services (as defined below) for the following project:

(Insert brief description of the project (the "Project").

1.2 The Laboratory Services BGC will provide Client for the Project are either described below, or are described in the following document: SEE ATTACHED SCOPE OF WORK FOR LINER INTERFACE SHEAR

(Either add a description of the lab testing work BGC will perform, or insert the date and description/title of a document that contains the scope of work. Note whether the document is attached to this Agreement – e.g., see attached Proposal for Laboratory Services dated September 24, 2019) (the "Scope of Services Document")

2. AGREEMENT DOCUMENTS

2.1 The following documents form part of and are incorporated into this Agreement:

- This *Agreement For Laboratory Testing Services*
- Definitions
- General Conditions
- Scope of Services Document

If there is any conflict or inconsistency between or among the documents listed above, then the provision in the document listed closer to the top of the list will prevail.

[Rest of page intentionally blank. Signature page follows.]

3. SUCCESSION

3.1 This Agreement will inure to the benefit of and be binding upon the Parties, and their respective administrators, successors, and permitted assigns.

IN WITNESS THEREOF, the Parties hereto have executed this Agreement as of the day and year indicated on page one of this Agreement.

CLIENT: Forte Dynamics

ACCEPTED FOR **CLIENT** by:

(signature)

Name: Clint Green
(print)

Title: Principal Engineer

Date: Feb. 21, 2020

BGC ENGINEERING INC.

ACCEPTED FOR **BGC ENGINEERING INC.** by:

(signature)

Name: SIMON DICKINSON
(print)

Title: CTO

Date: Feb 22, 2020.

DEFINITIONS

In addition to any other terms defined elsewhere in this Agreement, the following terms have the meanings set forth below when capitalized and used in this Agreement:

"**Affiliate**" means any Person which directly or indirectly controls, is controlled by, or is under common control with, a Party to this Agreement. For purposes of the preceding sentence, "**control**" means the power to direct or manage affairs through ownership of voting securities, contract, voting trust, or any other means.

"**BGC**" means BGC Engineering Inc., a British Columbia, Canada corporation.

"**BGC Group**" refers collectively to BGC, BGC's Affiliates, BGC's sub-contractors, BGC's sub-consultants, and each of their respective Personnel.

"**Claim**" means any claim, action, legal proceeding, lawsuit, claim through arbitration, or other cause of action of any kind, including third party claims for contribution or indemnity.

"**Client**" means the Person identified as the "Client" in the *Agreement For Laboratory Testing Services*.

"**Client Group**" refers collectively to Client and Client's Affiliates.

"**Damages**" means any of the following: damages, losses, liabilities, costs, expenses, arbitration awards, penalties, fines, or assessments.

"Laboratory Services" means the laboratory testing and analysis that BGC performs for Client on one or more Samples, as well as the preparation of any Work Product related to such testing and analysis.

"Party" refers to either of BGC or Client, and **"Parties"** refers to both of BGC and Client.

"Person" means, as applicable, a natural person or an entity, including a partnership, corporation, company, limited liability company, joint venture, trust, government agency, unincorporated organization or other form of entity.

"Personnel" means current, former and future directors, officers, employees, shareholders, agents, and representatives.

"Sample" means any specimen of soil, rock, material, or other substance that BGC evaluates or tests for Client pursuant to the terms of this Agreement.

"Third Party" means any Person other than a member of BGC Group or a member of Client Group.

"Work Product" means any report or deliverable that BGC generates in connection with the Laboratory Services.

GENERAL CONDITIONS

1. STANDARD OF CARE

BGC will perform the Laboratory Services in accordance with the prevailing standard of care, skill, and diligence ordinarily exercised by a consulting engineering firm when performing similar services under comparable circumstances at the same or a similar location. BGC provides no other warranty, guarantee, representation, or covenant with respect to the Laboratory Services, either express or implied.

2. COMPENSATION

2.1 BGC will charge Client for the Laboratory Services in accordance with *BGC's Schedule of Fees and Disbursements,* as updated from time to time. Unless otherwise agreed, all charges are payable in Canadian Dollars (CAD). or US Dollars,

2.2 BGC may charge Client for any applicable sales taxes, value-added taxes, import duty, and any other transactional taxes arising, accruing, or collectable with respect to the Laboratory Services. The Client bears all costs and risks of carrying out customs formalities related to the Samples, including but not limited to payment of duties, taxes, and import fees before the Samples are delivered to BGC's laboratory.

2.3 Invoices are due and payable by the Client within thirty (30) days of the invoice date.

3. RIGHT OF ENTRY AND PROJECT INFORMATION

3.1 On a timely basis, the Client shall permit, or arrange for permission, for the BGC Group to enter onto and pass over all properties to which access is necessary for the Laboratory Services. However, BGC will only visit the Project site if both Parties agree that it is necessary for BGC to do so.

3.2 The Client shall promptly provide BGC all available documents, data, and other information relevant to either the Samples or the Laboratory Services. BGC may assume that all documents, information, and data provided to BGC by the Client, the Client's Personnel or the Client's other consultants are accurate and complete. The Client will immediately notify BGC if any such document, data, or information changes or is discovered to be incomplete or unreliable.

4. SCOPE OF WORK

4.1 The Scope of Services Document will specify the scope and nature of Laboratory Services (including the applicable testing standards) that BGC will perform on a Sample. BGC is only required to prepare a report as part of the Laboratory Services if the Scope of Services Document states that BGC will prepare a report. Otherwise, BGC may only provide the raw data resulting from any tests performed during the Laboratory Services.

4.2 If BGC and the Client do not confirm in writing the scope and nature of Laboratory Services that BGC is required to perform on a Sample, then BGC may perform such tests and analyses as BGC deems appropriate, based on information the Client previously provided BGC.

4.3 Unless BGC expressly agrees otherwise in writing, BGC is not required to evaluate the Samples for pollution, radioactivity, volatile organic compounds, or toxicity. Client must notify BGC immediately if Client determines or suspects that any Sample may contain unsafe levels of pollution, radioactivity, volatile organic compounds, or toxicity.

4.4 BGC is committed to the safety of its Personnel. BGC complies with occupational safety and environmental protection codes. To safely conduct the Laboratory Services, BGC requires compliance with the conditions listed below. Failure to comply with those conditions will cause delay or refusal of a Sample delivery:

4.4.1 A Safety Data Sheet (SDS) must accompany all Samples. At a minimum, the SDS must provide the following information for all Samples:

a. Responsible Person and phone number
b. Chemical name (for mixtures list percentage composition)
c. Specific gravity, appearance, color and odor
d. Explosion hazards or reactivity
e. Health hazards
f. Personal protective equipment and any special procedures required for safe handling.

4.4.2 If any material in a Sample is known or suspected to be carcinogenic, radioactive, pathogenic, infectious, or extremely hazardous, then Client must email the SDS for the Sample to BGC at least five (5) business days before Client intends to ship the Sample to BGC. BGC may decline to accept or test any such Sample.

4.4.3 All samples must be transported in suitable containers not larger than ten (10) gallons unless BGC approves another sample size and appropriate container.

4.5 Unless BGC expressly agrees otherwise in writing, BGC is not responsible for either: (a) collecting or gathering any Samples; (b) shipping or handling for any Samples while in transit to BGC's laboratory testing facility; or (c) any loss, damage, or deterioration of any Samples while in transit to BGC's laboratory testing facility.

4.6 Client is solely responsible, at the Client's expense, for: (a) properly collecting the Samples, (b) appropriately labelling the Samples, and (c) carefully shipping the Samples to BGC's laboratory facility.

4.7 **Client acknowledges that Samples may not be fully representative of the Project's actual site conditions. Project site conditions may vary from place to place. BGC does not represent, warrant or guarantee that the results of the Laboratory Services will provide a full, complete, or representative summary of actual Project site conditions.**

4.8 Unless the Parties agree otherwise in writing, BGC may destroy or permanently dispose of any Sample one hundred eighty (180) days after BGC first receives the Sample. Until BGC is permitted to dispose of a Sample, BGC will make reasonable efforts to follow accepted industry practice for storing the Sample. If BGC agrees to return a Sample to Client, then Client will reimburse BGC for all costs incurred to do so. A disposal fee will apply if BGC is required to dispose of a Sample.

5. INTELLECTUAL PROPERTY

5.1 BGC retains sole and exclusive ownership of all right, title, and interest for, in, and to all inventions, software, programs, processes, innovations, and other intellectual property in any form that BGC creates, invents, conceives of, or acquires while performing the Laboratory Services or as a result of the Laboratory Services.

6. WORK PRODUCT

6.1 Only qualified geotechnical experts should review and interpret the Work Product. BGC will not be responsible or liable for any Claims or Damages arising from any misinterpretation of the Work Product.

6.2 BGC is entitled to retain a file copy of any Work Product and all documents the Client provides BGC.

6.3 The Client agrees to use the Work Product solely for the specific purpose(s) for which BGC prepared or disclosed such Work Product. Any alteration or other use of Work Product not authorized by BGC shall be at the Client's sole risk.

7. INSURANCE

BGC shall carry the following insurance:

a. Such coverage as may be required pursuant to applicable Worker's Compensation legislation, or satisfactory employer's liability insurance;

b. Commercial general liability insurance for bodily injury and property damages in the amount of Two Million Canadian Dollars ($2,000,000.00 CAD) per occurrence and in the aggregate; and

c. Professional liability insurance, which insures BGC against liability arising from negligent acts, errors, and omissions in BGC's professional services, in the amount of Five Hundred Thousand Canadian Dollars ($500,000.00 CAD) per claim and in the aggregate.

8. ABSOLUTE LIMIT OF LIABILITY

8.1 Claims by Client Group

8.1.1 The absolute maximum aggregate liability of the BGC Group, or any of them, to the Client Group for Claims or Damages arising out of the Laboratory Services or related in any way to the Project shall not exceed **TWO HUNDRED FIFTY THOUSAND CANADIAN DOLLARS ($250,000.00 CAD)**. For greater certainty, this liability limitation applies whether all or any of the Client Group bring one or more Claims against all or any of BGC Group in any way related to this Agreement, the Project, or the Laboratory Services. This limit of liability shall apply to all Claims and Damages including, but not limited to, those arising due to breach of contract, tort, negligence, negligent misrepresentation, errors, omissions, breach of warranty, strict liability, breach of any statutory or regulatory requirement, or under any other theory of recovery or liability at law or in equity.

8.1.2 The Client, for itself and as agent for and on behalf of the other entities of the Client Group, hereby releases the BGC Group, and each of them, from any and all past, present and future liability for Claims or Damages arising from the Laboratory Services or the Project in excess of $250,000.00 CAD.

8.1.3 The Client confirms and expressly acknowledges that it has authority to act as agent for the other entities in the Client Group for the purposes of providing the liability limitation and release noted above.

8.1.4 The Client waives and releases any right to assert any Claims against the individual Personnel of either BGC, BGC's Affiliates, or BGC's subcontractors, even if Claims or Damages arise due to the negligence, errors, omissions, or other fault of such individuals.

8.2 Claims by Third Parties

8.2.1 The Client agrees to limit the total aggregate liability of the BGC Group, or any of them, to Third Parties for Claims or Damages arising out of the Laboratory Services to **TWO HUNDRED FIFTY THOUSAND CANADIAN DOLLARS ($250,000.00 CAD)** (the "Third Party Liability Limit"). If the total aggregate liability of all or any of the BGC Group for Third Parties' Claims or Damages exceeds the Third Party Liability Limit, then the Client will indemnify the BGC Group, and each of them, for all liability above the Third Party Liability Limit.

8.2.2 The indemnity in section 8.2.1 shall apply to all Claims or Damages including, but not limited to, those arising due to breach of contract, tort, negligence, negligent misrepresentation, errors, omissions, breach of warranty, strict liability, breach of any statutory or regulatory requirement, or under any other theory of recovery or liability at law or in equity.

9. EXCLUSIONS OF LIABILITY, AGREEMENTS TO DEFEND, AND INDEMNITIES

9.1 The Client agrees to defend, indemnify and hold harmless the BGC Group, and each of them, against any Claim asserted, brought, or prosecuted by a Third Party against the BGC Group, or any of them, that relates, in whole or in part, to any of the following:

9.1.1 the negligence, breach of contract, breach of duty, or any other fault of the Client, the Client's Affiliates, the Client's other contractors, the Client's other consultants, or any of their respective Personnel;

9.1.2 defects in data or Samples supplied to BGC by the Client or the Client's contractors or other consultants; or

9.1.3 use of any Work Product by the Client, its Affiliates, or their respective Personnel for any purpose other than the specific purpose or Project for which BGC prepared such Work Product.

9.2 All the Client's obligations to defend, release, and indemnify BGC Group in this Agreement shall survive any termination or expiry of this Agreement.

10. MUTUAL WAIVER OF PUNITIVE, EXEMPLARY, INDIRECT, INCIDENTAL, AND CONSEQUENTIAL DAMAGES

10.1 Each Party, for itself and as agent on behalf of its Affiliates, hereby releases the other Party, such other Party's Affiliates, and their respective Personnel from all liability for any punitive, exemplary, aggravated, indirect, incidental, and consequential damages that may arise in connection with the performance, purported performance, or non-performance of this Agreement or the Laboratory Services, howsoever caused, and whether arising due to breach of contract, tort (including negligence), strict liability, or under any other theory of liability at law or in equity. This waiver and release applies even if the possibility of

such losses or damages was known or foreseeable. Examples of such waived damages include, but are not limited to, lost profits, lost revenue, loss of contracts, loss of production, loss of business opportunity, costs of capital, business interruptions, loss of goodwill, loss of work, and loss of Project use. Each Party confirms and acknowledges that it has authority to act as agent for its Affiliates for the purposes of providing this waiver and release.

11. TERMS FAIRLY NEGOTIATED IN CONSIDERATION OF RELATIVE RISKS AND BENEFITS

11.1 The Parties acknowledge and agree that the exclusions of liability, limitations of liability, agreements to defend, indemnities, and waivers in this Agreement were fairly negotiated between them in consideration of the relative risks and benefits of the Laboratory Services to the Parties.

12. EARLY TERMINATION

12.1 Either Party may terminate this Agreement for any reason upon thirty (30) days written notice to the other Party.

12.2 Either Party may terminate this Agreement upon ten (10) days written notice to the other Party if the other Party is in default of its obligations under this Agreement and has failed within five (5) business days after receiving a default notice to cure such default, or to take reasonable steps towards curing such default.

12.3 Either Party may immediately terminate this Agreement if the other Party becomes insolvent, takes the benefit of any insolvency or bankruptcy law without providing prompt assurance that it will perform the balance of its obligations under this Agreement, makes a general assignment for the benefit of its creditors, or enters into a plan or arrangement for the benefit of its creditors.

12.4 If this Agreement is terminated for any reason, the Client shall forthwith pay BGC all amounts the Client owes BGC for satisfactorily performed Laboratory Services.

13. ASSIGNMENT

13.1 Except as otherwise agreed in writing, no Party may assign this Agreement without the other Party's written consent. The Parties' permitted successors and assigns are entitled to the benefit of, and shall be bound by, this Agreement.

14. FORCE MAJEURE

14.1 BGC shall not be in breach of this Agreement or liable for any Claims or Damages caused by delay or failure to perform, in full or in part, any of its obligations under this Agreement when such delay or failure to perform is due to any circumstance beyond BGC's reasonable control, including, without limitation: any strikes, walk-outs, riots, unavoidable incidents, floods, fires, earthquakes, natural disasters, inclement weather, acts of God or a public enemy, or a lawful order issued by a governmental authority.

15. NOTICES

15.1 Required written notices between the Parties shall be considered to have been received by the addressee on the date of delivery if personally delivered by hand during normal business hours to the addressee, or to a member of the addressee's firm, or to an officer of the corporation for whom the notice is intended. If sent by regular post, such written notice shall be deemed to have been delivered five (5) business days from the date of mailing. Notices sent by email or facsimile shall be deemed delivered upon completed transmission if properly directed and sent before 4:30pm Atlantic Time on a normal workday that is not a federal Canadian holiday, provided that the sending Party has an electronic acknowledgement that the facsimile or e-mail was received by the other Party.

15.2 Each Party shall designate a representative who is authorized to act on behalf of that Party and to receive notices under this Agreement. In the absence of such designation of an authorized representative, a Party's signatory to this Agreement is deemed to be that Party's representative. If this Agreement has not been signed, then the notice shall be provided by delivering written notice in accordance with section 15.1 to a Party's place of business.

16. SURVIVAL

16.1 All rights and obligations between the Parties under Sections 5 (Intellectual Property), 6 (Work Product), 8 (Absolute Limit of Liability), 9 (Exclusions of Liability, Agreements to Defend and Indemnities), 10 (Mutual Waiver of Punitive, Exemplary, Indirect, Incidental and Consequential Damages) shall survive and remain binding on the Parties after completion of the Laboratory Services or the expiry or any termination of this Agreement.

17. GENERAL PROVISIONS

17.1 This Agreement is governed by the law of British Columbia, Canada, without regard to any conflicts of law principles or any international treaty that may direct the application of the substantive law of another jurisdiction.

17.2 A Party's waiver of any breach of the other Party's obligations under this Agreement shall not be binding unless the waiver is in writing and signed by an authorized representative of the waiving Party.

17.3 If a court of competent jurisdiction determines that any part or provision of this Agreement is illegal, invalid, or unenforceable, then any such part or provision shall be limited or modified to the minimum extent necessary to make it and the remainder of this Agreement enforceable, and the provisions of this Agreement as so amended shall remain in full force and effect.

17.4 In this Agreement, the singular includes the plural and vice versa. All headings in this Agreement are for convenience only, and shall not be used to interpret this Agreement. This Agreement may be executed in separate counterparts, including electronically or by facsimile, and all such counterparts taken together shall be deemed the same original instrument.

SCOPE OF WORK FOR LINER INTERFACE SHEAR

Approved Project Number	Current Short Description	Synthetic Liner Genral Description	Synthetic Liner Short Description	Testing Required(y/n)[1]	Estimated Cost ($CAD)	LLDPE Sample Required (m2)-0.5x0.7	ODF Sample Required (# 20L buckets)	Subgrade Sample Required	Notes

GEOCHEMICAL TEST RESULTS

ALS Environmental

CERTIFICATE OF ANALYSIS

Work Order	: **WR2000964**	Page	: 1 of 6
Client	: **Victoria Gold (Yukon) Corp.**	Laboratory	: Whitehorse - Environmental
Contact	: Helena Kuikka	Account Manager	: Hilary Woods
Address	: Suite 1000 - 1050 W. Pender St Vancouver BC Canada V6E 3S7	Address	: #12 151 Industrial Road Whitehorse YT Canada Y1A 2V3
Telephone	: ----	Telephone	: +1 867 668 6689
Project	: Construction Materials	Date Samples Received	: 28-Sep-2020 09:57
PO	: 14723	Date Analysis Commenced	: 19-Oct-2020
C-O-C number	: 20200925a	Issue Date	: 03-Nov-2020 16:03
Sampler	: BB, FL, KT		
Site	: ABA		
Quote number	: Q67596		
No. of samples received	: 5		
No. of samples analysed	: 5		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Brieanna Allen	Department Manager - Organics	Organics, Burnaby, British Columbia
Cristina Alexandre	Supervisor - Metals ICP Instrumentation	Metals, Burnaby, British Columbia
Janice Pearson	Account Manager Assistant	Internal Subcontracting, North Vancouver, British Columbia
Kevin Duarte	Team Leader - Inorganics	Inorganics - Water Quality, Burnaby, British Columbia
Shaneel Dayal	Analyst	Metals, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
%	percent
kg	kilograms
mg/L	milligrams per litre
pH units	pH units
ppm	parts per million
tCaCO3/kt	tons CaCO3 per kiloton

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in reports identified as "Preliminary Report" are considered authorized for use.

QUALITY CONTROL INTERPRETIVE REPORT

Work Order	: **WR2000964**	Page	: 1 of 14
Client	: **Victoria Gold (Yukon) Corp.**	Laboratory	: Whitehorse - Environmental
Contact	: Helena Kuikka	Account Manager	: Hilary Woods
Address	: Suite 1000 - 1050 W. Pender St Vancouver BC Canada V6E 3S7	Address	: #12 151 Industrial Road Whitehorse, Yukon Canada Y1A 2V3
Telephone	: ----	Telephone	: +1 867 668 6689
Project	: Construction Materials	Date Samples Received	: 28-Sep-2020 09:57
PO	: 14723	Issue Date	: 03-Nov-2020 16:03
C-O-C number	: 20200925a		
Sampler	: BB, FL, KT		
Site	: ABA		
Quote number	: Q67596		
No. of samples received	: 5		
No. of samples analysed	: 5		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 15:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 15:00 is used for calculation purposes.

Legend & Qualifier Definitions

EHT: Exceeded ALS recommended hold time prior to analysis.

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Soil/Solid**

Evaluation: × = *QC frequency outside specification*; ✓ = *QC frequency within specification.*

Quality Control Sample Type			Count		Frequency (%)		
Analytical Methods	*Method*	*QC Lot #*	*QC*	*Regular*	*Actual*	*Expected*	*Evaluation*
Laboratory Duplicates (DUP)

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
C by HClO4 digestion and titration	C-GAS05 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals C-GAS05	Determine Total Inorganic Carbon (TIC) by using diluted perchloric acid to react with metal carbonate and yield carbon dioxide. Concentration of carbon dioxide is determined by colour titration. TOC is determined by this method and C-IR07 (TC).
pH by electrode (Shakeflask, 3:1 Ratio with Water)	E116 Vancouver - Environmental	Soil/Solid	MEND (mod)/APHA 4500-H (mod)	pH is determined by potentiometric measurement with a pH electrode, and is conducted at ambient laboratory temperature (normally 20 ± 5°C) on an extract from a soil sample that has been added in a 3:1 ratio of deionized water to soil, then leached and the extract filtered prior to analysis. The pH is then measured by a standard pH probe. .
Moisture Content by Gravimetry	E144 Vancouver - Environmental	Soil/Solid	CCME PHC in Soil - Tier 1	Moisture is measured gravimetrically by drying the sample at 105°C. Moisture content is calculated as the weight loss (due to water) divided by the wet weight of the sample, expressed as a percentage.
Metals by CRC ICPMS (Shakeflask, 3:1 Ratio with Water)	E446 Vancouver - Environmental	Soil/Solid	BC MINISTRY OF ENERGY AND MINES/EPA 6020B (mod)	A sample is extracted with water at a 3:1 liquid to solid ratio for 24 hours, then filtered through a 0.45 micron membrane filter. Analysis is by Collision/Reaction Cell ICPMS. This extraction is an empirical procedure with pre-defined characteristics. Recovery of some elements (Ag, Bi, and Sn) by this method can be variable due to the neutral pH of the extraction fluid, and therefore the LCS DQOs has been established at 50-130% for these elements.
Mercury by CVAAS (Shakeflask, 3:1 Ratio with Water)	E515 Vancouver - Environmental	Soil/Solid	BC MINISTRY OF ENERGY AND MINES/EPA 245.7	A sample is extracted with water at a 3:1 liquid to solid ratio for 24 hours, then filtered through a 0.45 micron membrane filter. Analysis is by CVAAS. This extraction is an empirical procedure with pre-defined characteristics. Recovery of mercury can be variable due to the neutral pH of the extraction fluid, and therefore the LCS DQO has been established at 50-130%.
51 Elements by Aqua Regia digestion and ICP-AES/MS	ME-MS41 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals ME-MS41	A prepared sample is digested with aqua regia in a graphite heating block. After cooling, the resulting solution is diluted to with deionized water, mixed and analyzed by ICP-AES. Samples are then analyzed by ICP-MS for the remaining suite of elements.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Saturated Paste pH	OA-ELE07 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals OA-ELE07	Sample mix with water in 1:1 ratio to make a paste, pH is then determined.
Acid Base Accounting	OA-VOL08 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals OA-VOL08	Determine the acid generation power of a sample as tonne CaCO3 per kilo-tonne.
Sulfide S (as S) Calc. (Total-S - SO4-S)	S-CAL06 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals S-CAL06	Sulfide Sulfur (as S) is calculated by subtracting the Carbonate Leachable Sulfate Sulfur (as S) from the Total Sulfur (as S) obtained from combustion.
Sulfates by NaCO3 Leaching and Gravimetry with Sulfide S Calc.	S-GRA06 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals S-GRA06	A preppared sample is heated with diluted Na□CO□ and then filtered. The sulfate in the filtrate is precipitated with BaCl2 in a dilute HCl. The BaSO4 precipitate is filtered, ignited, weighed and the Sulfate Sulfur is determined (as S). Sulfide Sulfur (as S) is calculated by Total Sulfur from combustion minus Sulfate Sulfur from the Na□CO□ leach.
Sulfates by HCl Leaching and Gravimetry with Sulfide S Calc.	S-GRA06A ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals S-GRA06A	A prepared sample is heated with dilute HCl and then filtered. The sulfate in the filtrate is precipitated with BaCl2 in a dilute HCl. The BaSO4 precipitate is filtered, ignited, weighed and the Sulfate Sulfur is determined (as S). Sulfide sulfur is calculated by Total Sulfur from combustion minus Sulfate Sulfur from the HCl leach.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Total S by LECO and IR	S-IR08 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals S-IR08	A prepared sample is heated to approximately 1350°C in an induction furnace with oxygen stream. Sulfur dioxide released from the sample are measured by IR (Leco analyzer) and the Total Sulfur result is provided.
Received Sample Weight	WEI-21 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals WEI-21	Weigh out sample received.

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Shakeflask Leachate Preparation (3:1 Ratio with Water)	EP446 Vancouver - Environmental	Soil/Solid	BC MINISTRY OF ENERGY AND MINES	A sample is extracted with water at a 3:1 liquid to solids ratio for 24 hours, then filtered through a 0.45 micron membrane filter.

No. of samples analysed	: 5		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits
- Reference Material (RM) Report; Recovery and Acceptance Limits
- Method Blank (MB) Report; Recovery and Acceptance Limits
- Laboratory Control Sample (LCS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Brieanna Allen	Department Manager - Organics	Organics, Burnaby, British Columbia
Cristina Alexandre	Supervisor - Metals ICP Instrumentation	Metals, Burnaby, British Columbia
Janice Pearson	Account Manager Assistant	Internal Subcontracting, North Vancouver, British Columbia
Kevin Duarte	Team Leader - Inorganics	Inorganics - Water Quality, Burnaby, British Columbia
Shaneel Dayal	Analyst	Metals, Burnaby, British Columbia

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percentage Difference
# = Indicates a QC result that did not meet the ALS DQO.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test specific).

Sub-Matrix: **Soil/Solid**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Sub-Matrix: **Soil/Solid**

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Soil/Solid**

					Laboratory Control Sample (LCS) Report

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Sub-Matrix: **Soil/Solid**

Label	Ditch A- day 11
	Eagle Gold
	Wednesday, September 23rd 2020, 1:11 AM (GMT +00:00)

Daily Report

Job:	*Reclaim Ditch A*
Location:	*0+025*
Project Name:	*Ditch A*
Description of Work:	*Excavation and removal of rip rap* *Prepare subgrade and install liner and geotextile* *Placement of rip rap for 7 hrs* *Screen rock* *Hauling waste* *Water diversion*
Contract Ref. NO.: e.g. (WO, PO, CWP)	*17486*
Weather(AM):	*-1c cloudy*
Weather(PM):	*0c cloudy*
Date:	*September 22, 2020*

Reported By:

Russell Noksana

Onsite Rep: Bill, Lea, Matt, Mike

Daily Report must be Supplied to Vic Gold by 9:00am

SAFETY TOPICS FOR YESTERDAY

Topics:

Risk assessment for every new tasks
Slippery roads- slow down
Obey posted signs

Incident(s)

None

Total Incidents

0

QUALITY TOPICS FOR YESTERDAY

Topics:

Rip rap from ditch to silty and muddy- unsuitable for reuse
Bottom of ditch very saturated

EXTRAS

ACTIVITIES COMPLETED YESTERDAY

Activities:

Install 22 panels of liner amd geotextile
Excavation and removal of rip rap
Hauling waste and rip rap
Screening rock
Install rip rap
Water diversion

ACTIVITIES COMPLETED TODAY

Activities:

Install 10 panels of liner
Excavation and removal of rip rap for 150 m
Hauling waste and rip rap
Screening rock
Install rip rap
Water diversion
Site housekeeping
Grizzly repair

Site service onsite at 1:30 pm with excavator assist with ditching at 1+000

Site service assist with ditch A

ACTIVITIES COMPLETED TODAY

Activities:

No comments

Continue with excavation south of old PG sump

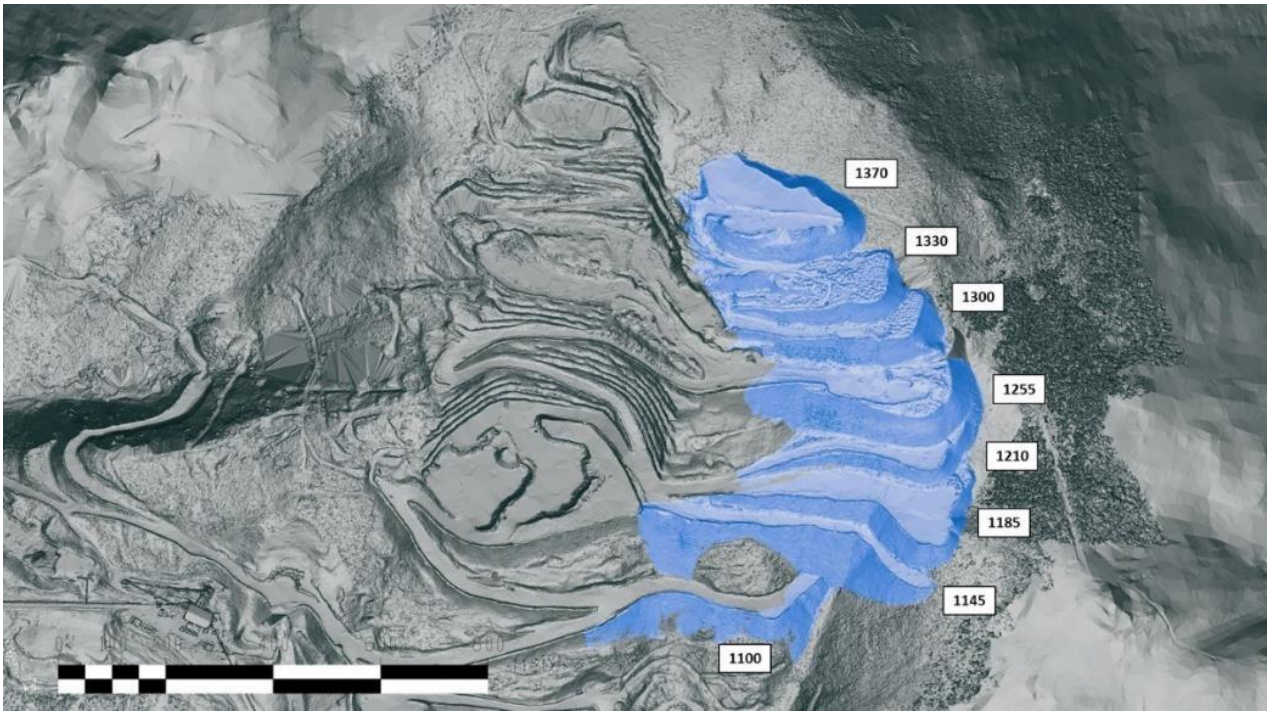
APPENDIX B1

EOR Certification – PG WRSA

VICTORIA GOLD CORP
TSX | VGCX



MEMO

Date	March 31, 2021
To	File
From	Richard Tuohey – Technical Services Superintendent Eagle Gold Mine
Subject	2020 Engineer of Record Summary Report for the Platinum Gulch Waste Rock Storage area (PG WRSA)

As identified in the Eagle Gold Project Water Management Plan Version 2020-01 with an effective date of January 2020, I am the designated Engineer of Record for the Waste Rock Storage Areas associated with the Eagle Gold Mine.

During 2020, a total of approximately 20 million tonnes (Mt) of material was removed from the Eagle Zone open pit by standard drill, blast and haul methods. Of the material removed from the pit, roughly 12.5 Mt was classified as waste rock which was subsequently placed in the PG WRSA. Waste rock was deposited to 8 different lifts in the PG WRSA ranging from the 1100 lift up to the 1370 lift. The PG WRSA was built in lifts using the end-dumped method for the majority of construction and occasionally using the free-dump method.

At December 31, 2020, the PG WRSA configuration was as shown below.

The PG WRSA has been developed, and is performing, in accordance with the design intent, performance objectives and indicators, applicable guidelines, standards and legal requirements, and relevant clauses of the Type A Water Use license QZ14-041-1.

The configuration of the WRSA at the end of 2020 achieved all planned operational requirements. During 2020, active and non-active lifts of the PG WRSA were monitored for movement using extensometers. All extensometers deployed in the PG WRSA showed movement rates below the monitoring thresholds.

VICTORIA GOLD CORP
TSX | VGCX

MEMO

There are currently no plans, nor requirement, to conduct any major maintenance work within the PG WRSA in 2021.

The is currently no damaged or faulting monitoring or control equipment associated with the PG WRSA and thus no requirement to repair or replace any equipment.

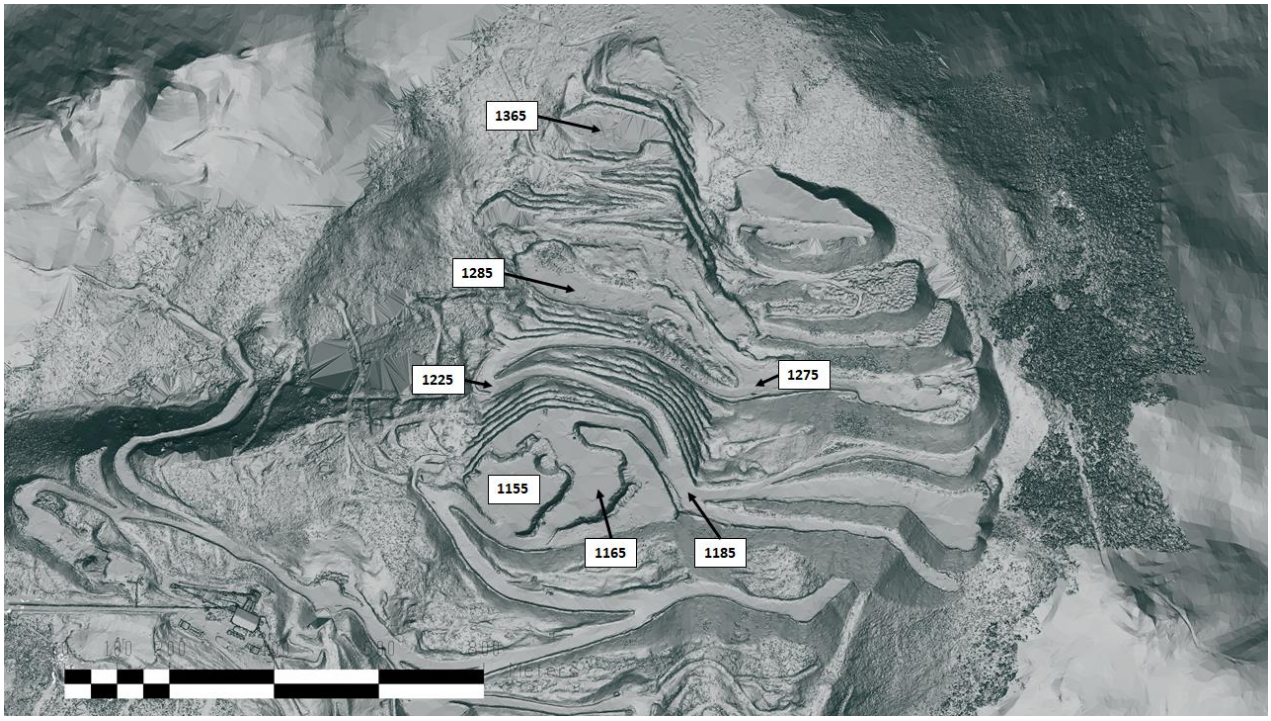
_____
Richard Tuohey P.Eng.

APPENDIX B2

EOR Certification – Open Pit

VICTORIA GOLD CORP
TSX | VGCX

MEMO



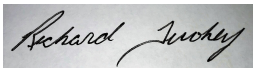
Date	March 31, 2021
To	File
From	Richard Tuohey – Technical Services Superintendent Eagle Gold Mine
Subject	2020 Engineer of Record Summary report for the Eagle Zone Open Pit

As identified in the Eagle Gold Project Water Management Plan Version 2020-01 with an effective date of January 2020, I am the designated Engineer of Record for the Eagle Zone Open Pit.

During 2020, a total of approximately 20 million tonnes (Mt) of material was removed from the open pit by standard drill, blast and haul methods. Of the material removed from the pit, roughly 7.5 Mt was ore and 12.5 Mt of was classified as waste rock.

The pit has been developed, and is performing, in accordance with the design intent, performance objectives and indicators, applicable guidelines, standards and legal requirements, and relevant clauses of the Type A Water Use License QZ14-041-1.

At December 31, 2020, the pit configuration was as shown below.



Mining in 2020 focused on Phase 1 single benching and the development of Phase 2 with single and double benches. During 2020 pit development, visual monitoring of the pit walls was actively conducted during regular pit inspections. A majority of the pit consists of single benches with 10 m bench heights and 6 m wide berms, and one wall in Phase 2 is double benched with 20 m bench heights and 10 m wide berms. The lithologies exposed in Phase 1 display equal portions of metasedimentary and granodiorite. Phase 2 is predominantly metasedimentary rock. Most rock within the pit was oxidized, weathered, and blocky.

A fairly dominant NE-SW trending fault zone in Phase 2, in combination with the exposed weathered metasedimentary rock, caused a localized instability along one of the Phase 2 haul ramps in September 2020. The area was bermed off and monitored using extensometers. Movement rates were measured to be consistently low. Access to the haul road was not required at the time of the instability, so the area is set to be remediated once heavy traffic access is required in 2021.

The configuration of the open pit at the end of 2020 included some final pit walls on the south wall of the pit and all planned operational requirements were achieved at the end of 2020.

The is currently no damaged or faulting monitoring or control equipment associated with the open pit and thus no requirement to repair or replace any equipment.

Richard Tuohey P.Eng.

APPENDIX B3

EOR Inspection and Certification - HLF

VICTORIA GOLD CORP

Project No. 109005
2020 Annual Inspection of Eagle Gold HLF
Document No. 109005-51100-01-EDR-F002

REV A	19 MAR 21	Issued for Use	W. Reinhardt	C. Green	B. Carlson

Statement of Report

The report enclosed entitled “2020 EOR Annual Inspection Report” has been prepared for the exclusive use of Victoria Gold Corporation (VGC). No third party shall be entitled to use of this report without written consent of VGC and Forte Dynamics, Inc (Forte). The use of any and all information contained herein shall be at the sole risk of the user regardless of any fault or negligence of VGC or Forte.

This report has been prepared under the direct supervision of Barry Carlson, P. Eng. of Forte, with the assistance of Clint Green, P.E. and Will Reinhardt, P.E. of Forte. The 2020 annual inspection was completed by Mr. Clint Green, P.E. of Forte Dynamics on October 14, 2020. The annual inspection was conducted in accordance with the Eagle Gold Project Heap Leach Facility Operations and Maintenance Manual and the findings presented in this report are accurate to the best of our knowledge.

1. Introduction

1.1 General

Forte Dynamics Inc. (Forte) was retained by Victoria Gold Corporation (VGC) to carry out an annual geotechnical inspection of the Heap Leach Facility (HLF) at the Eagle Gold Mine located in Yukon Territory, Canada. The general site layout of the HLF is shown in Appendix A.

The 2019 Engineering of Record (EoR) annual inspection was completed by Mr. Troy Meyer, P. Eng. of BGC Engineering, Inc. on October 2nd and 3rd, 2019 [Ref 1]. In late Fall of 2019, Mr. Meyer transferred his title as EoR to Mr. Barry Carlson, P. Eng. of Forte Dynamics, Inc. As EoR for the HLF, Forte has been involved with completion of outstanding items related to Phase 1A pad construction and final design and oversight for Phase 1B pad expansion. Record of construction (ROC) reports will be completed by Forte Dynamics under a separate scope. The 2020 inspection of the HLF was conducted on October 14th, 2020 as global travel was affected due to the COVID-19 pandemic. Going forward, the annual inspections will normally be conducted by July 1.

The inspection took place on site and was in general conformance with the monitoring plan outlined in the Operations, Maintenance, and Surveillance (OMS) Manual [Ref 2]. The scope of this annual dam inspection work was limited to:

- Visual inspection of the HLF and dam by the EOR, including taking appropriate photographs of the observed conditions;
- Review of routine inspection records prepared by operating personnel in the past year;
- Review whether or not recommendations from previous year's inspection had been addressed, and any incidents or actions arising from those previous recommendations;
- Review of instrumentation and monitoring data
- Review of the previous year's operations including reports of any incidents (and remedial measures) that may have occurred;
- Evaluation of the structural performance of the embankment and related components and identify any potential safety deficiencies or recommended items that need to be addressed in the coming year;
- Review of construction records, quality assurance and quality control (QA/QC) data and as-built information on facility construction; and
- Evaluation of the OMS Manual to assess the need for updating.

During the course of the site reconnaissance, check list type inspection forms were completed, documenting the visible condition of each of the above noted structures at the time of the site visit. The inspection forms are included in Appendix B. In addition, several photographs were taken of each of the above-mentioned structures, a selection of which are presented in Appendix C. The approximate location of the photos taken are shown in Appendix A. The inspection record includes recommendations for follow-up actions, where required.

1.2 Background

The Eagle Gold Mine is an open pit gold mine and heap leach operation. The Eagle Gold Heap Leach Facility (HLF) consists of an embankment that lies across the Ann Gulch valley about 200m upstream of the confluence with Dublin Gulch. The ore is stacked behind an embankment within Ann Gulch. The embankment provides confinement of the crushed ore and creates an In-Heap Pond for temporary storage of pregnant solution, which is pumped to the recovery plant.

The major design components for the HLF include the following: the embankment; a composite liner system; the In-Heap Pond; solution recovery wells; associated piping network for solution collection and distribution; a leak detection and recovery system (LDRS); and a downstream Event Pond to contain excess solution that could result from extreme precipitation or emergency events. An overflow spillway connects the HLF In-Heap Pond to the Event Pond and an emergency spillway allows overflow from the Event Pond to environment. Appendix A presents aerial photographs of the site provided by VGC and taken September 28, 2020.

The HLF will be progressively developed in phases: one phase during initial construction (pre-mining), and subsequent phases during mining operations as needed to provide HLF pad space for ore stacking operations. The HLF will occupy an area of 106 ha and contain about 86 MT of crushed ore at the end of the facility life.

Construction of Eagle Gold Mine Phase 1A HLF was completed in September 2019 with initial operations starting in July 2019 by stacking and leaching of ore in lower pad area while the upper pad area was completed. Phase 1B HLF was completed in September 2020 extending the liner from the 990m elevation to the Phase 1 interceptor ditch at approximate elevation 1050m.

The HLF pad consists of two liner systems, the up-gradient liner system and the in-heap pond liner system. The single composite liner system in the upper portion of the pad (above the in-heap solution storage area) is comprised of a double-side textured 80 mil linear low-density, polyethylene (LLDPE) liner over a geosynthetic clay liner (GCL) system. The double composite liner system in the lower portion of the pad (forming the in-heap solution storage area) is comprised of two discrete layers of LLDPE liner, separated by a layer of geonet material to form the LDRS, over a GCL system.

The In-Heap Pond (essentially a saturated zone within the lower extent of the HLF ore pile) at the spillway invert elevation of 937.5 m) contains up to 117,141 m3 of solution within the pore spaces of the stacked ore. Typical In-heap Pond operational volume will be about 57,763 m3. Storage of PLS in the In-Heap Pond is a cold-weather mitigation and has the added benefit that PLS will not be exposed during normal operations.

Process (barren) solution containing cyanide is applied to the ore via a drip irrigation system (buried during winter). The resultant PLS is captured in the solution collection system and flow to the In-Heap Pond. The PLS is recovered via a well system using pumps and standpipes. The PLS is transferred to the ADR plant for gold recovery.

The heap leach pad is constructed with a network of pipes that is distributed throughout the limits of the facility at the base of the ore pile. This pipe network collects and conveys PLS and any infiltrated stormwater to the In-Heap Pond area where it is pumped to the process plant via the solution collection wells. The pipe network was designed to accommodate stormwater volume from a 100-year, 24-hour storm event in addition to 150 percent of the design capacity of the anticipated PLS solution flow (150 percent PLS flow + 100-year, 24-hour storm event).

The downstream Events Pond serves as an overflow containment area that provides additional solution storage in case the In-Heap Pond capacity is exceeded. The Events Pond is sized to provide containment storage for the Probable Maximum Flood (PMF) Event assuming the In- Heap Pond solution storage is at maximum capacity. As designed, the Events Pond has an operational storage capacity of approximately 299,900 m3 to the spillway invert at elevation 894.5m.

Inspection and monitoring systems are included in the HLF to assess the ongoing performance of the facility. The In-Heap Pond fluid levels are monitored using a network of vibrating wire piezometers. The Events Pond fluid levels are monitored visually with level gauges or survey.

Liner Integrity is monitored by regular inspection flows into the LDRS monitoring sumps for both the In-Heap Pond and the Events Pond. The HLF design includes an underdrain system for the collection and drainage of subsurface water beneath the lined facility to limit upward pressure on the HLF liner. The underdrain system conveys subsurface flows to a monitoring vault. Flows reporting to the monitoring vault can either be released to environment or pumped back to the facility for make-up water.

The HLF confining embankment has been classified as a high hazard dam. A full description of the HLF design criteria and the currently defined monitoring approach is presented in the Operation, Surveillance and Maintenance (OMS) manual (VGC, 2020). Embankment integrity is to be monitored using a network of survey monuments (to be installed) and inclinometers. Dam safety inspections are required annually by the EoR and more comprehensive dam safety review is required by a qualified third-party every five years.

The parameters and criteria presented in Table 1-1 below form the basis of design for the HLF taken from the OMS Manual (VGC, 2020).

Table 1-1 Engineering Design Criteria

General	Quantity/Criteria
Heap ore capacity	45,847,770 m^3
Ore processing	Estimated 10.8 Mt/a of crushed ore over p.a. Three-stage crushing - primary crushing 365 days (29,500 tpd), secondary/tertiary 275 days per year (39,154 tpd)
Leach pad type	Permanent, multiple lift
Stacking Rate	Approximately 40,000-45,000 tpd
Stacking method	Conveyor-stacker or alternate
Stacked dry density of ore	1.72 t/m^3 (Varies)
Stack/lift height	Nominal 10 m lifts
Overall slope angle of stacked ore	2.5:1 (H:V), 22 degrees
Ore Setback	5 m from perimeter road 10 m from dam
Leach schedule	365 days per year
Solution application method	Drip emitters (buried during cold weather)
Solution application rate	10 $L/hr/m^2$ (7 L/hr/m2 nominal operations application rate)
Leach cycle time	90-day primary leach (45-day primary leach planned for operations)
Solution application flow	1,500 m3/hour nominal operations rate, additional capacity available for additional dynamic storage purposes
Geotechnical Stability	**Quantity/Criteria**
Design Basis Earthquake (DBE)	PGA = 0.25g (1 in 2475-year return period; applies to the operation condition of the HLF only; does not apply to the confining embankment
Maximum Design Earthquake (MDE)	PGA = 0.35g (corresponds to the Maximum Credible Earthquake or MCE event); applies to the confining embankment and long-term stability of the post-closure heap pile
Minimum Embankment and Ore Pile Factor of Safety	Static Loading - 1.5 (impounding),1.3 (non-impounding), Seismic Loading - 1.0 (pseudo-static methods) Post-Earthquake – 1.2
Permafrost	Ice-rich materials encountered in the embankment foundation will be removed; ice-rich material in the pad or pond, if thaw unstable, will be removed.

Confining Embankment	Quantity/Criteria
General	To provide stable confinement of the ore and create an In-Heap Pond
Overflow spillway	Sized to pass the PMF peak flow with 0.5 m of freeboard assuming heap storage is at capacity at the start of the event.
Groundwater	**Quantity/Criteria**
General	A drainage system is required beneath the liner system to control groundwater pressures. The system is to collect and monitor groundwater in a controlled manner before discharge downslope of the containment embankment if discharge criteria from permit requirements are met.
Pad Liner System	**Quantity/Criteria**
Overliner Drain Fill (ODF)	Crushed clean rock to provide a free draining layer under the placed ore and to protect the lining system from damage by ore placement while not impacting the conveyance of solution to the recovery wells. ODF will consist of a minimum 1.0-meter thickness (within the In-Heap Pond, minimum of 0.6 m otherwise) of minus 38 mm clean durable rock with less than 5 percent fines passing the No. 200 ASTM sieve size if the minimum in place hydraulic conductivity is greater than 2x10- 2 cm/s, or 5-10% passing the No 200 ASTM sieve size if the minimum in place hydraulic conductivity is greater than 5x10-2 cm/s.
Geosynthetic (geomembrane) liner	Suitable liner material to provide required puncture resistance, elastic strain range and resistance to solution attack and chemical breakdown along with cold weather performance for the Project's climate conditions (refer to LLDPE project standard specifications).
Geosynthetic Clay Liner (GCL)	Geosynthetic clay liner below the geosynthetic liner to provide a composite liner to minimize leakage. Objective maximum permeability 1×10^{-5} cm/s or 1×10^{-6} cm/s in the absence of a leachate detection and removal system.
Leachate collection and recovery system	A system to collect leachate and convey it to solution recovery wells. System to comprise ODF and a network of collection pipes to convey solution to the In-Heap Pond area while limiting solution head on liner.
Leak detection and recovery system (LDRS)	A system within the In-Heap Pond and Events Pond to collect leakage through the composite liner and convey it to monitoring points. The system to comprise geonet or similar synthetic drainage product to collect and convey any leaked solution to a gravel filled sump and pumping system.
LDRS monitoring	Monitoring of the flow into the LDRS to ensure that allowable rates (determined by permitting authorities) are not exceeded.
Solution Recovery Wells	**Quantity/Criteria**
General	Solution is to be recovered from the heap through inclined well casings equipped with submersible pumps installed in the In-Heap Pond solution storage area along the upstream dam slope. Adequate access for installing and recovering pumps from well casings will be provided on the dam crest.

Events Pond	Quantity/Criteria
General	The purpose of the Events Pond (constructed downstream of the embankment) is to temporarily store excess inflows that cannot be stored in the In-Heap Pond. Any overflow into the events pond will be evacuated, and used as make-up water, as fresh ore is added to the HLF. During the initial heap operation, the Events Pond may also be used as temporary storage for make-up water. Otherwise, the Events Pond will be kept dry.
Overflow spillway	Sized for routed PMF peak flow with 0.5 m of freeboard.
Storage Capacity	Sized to contain the runoff volume from the PMF event assuming the In-Heap Pond is full.
Liner system	Lining to comprise a double composite geosynthetic liner system with LDRS

2. 2020 Annual Inspection

2.1 Construction Follow Up Items

2.1.1 Phase 1A HLF

As part of the 2020 annual inspection, the construction follow up items previously identified by BGC were inspected by Forte Dynamics and reviewed with VGC personnel on site. The status of the Phase 1A HLF construction follow up items are included in Table 2-2.

At the time of the 2019 annual inspection the pregnant leach solution (PLS) pipework and overliner drain fill (ODF) had been advanced to approximately the 970m elev. VGC had accepted the responsibility of construction oversight and quality assurance (QA) for the advancement of the ODF and PLS pipework after June 30, 2019. The PLS pipework and ODF placement had continued ahead of stacking of ore on the pad, and at the time of the 2020 annual inspection the PLS pipework had been completed through Phase 1A and the ODF had been advanced to the 995m along the east perimeter and 1005m elev. into Phase 1B footprint along the west. Upon completion of the ODF placement in Phase 1A, Forte Dynamics will produce a ROC report for the remaining PLS pipework and ODF that was not included in BGC's report dated September 2019.

2.1.2 Phase 1B HLF

Phase 1B HLF construction was managed by JDS Energy and Mining (JDS) with the work completed by various contractors and sub-contractors. Tetra Tech performed on-site QA during construction of Phase 1B of the HLF. These services were performed between February 2020 and September 15, 2020. Off-site engineering support was performed by Forte Dynamics throughout this period. All documentation related to this work will be compiled in a ROC report. Similar to Phase 1A, the PLS pipework and ODF will be advanced ahead of the ore pile and VGC has accepted the responsibility of construction oversight and quality assurance

(QA). No additional construction follow-up items were identified at the time of inspection. Upon completion of the PLS pipework and ODF placement in Phase 1B a second ROC report will be submitted by Forte Dynamics.

2.2 Site Reconnaissance

The 2020 annual inspection was completed by Mr. Clint Green, P.E. of Forte Dynamics on October 14, 2020.

2.2.1 Heap Leach Facility

The HLF site inspection included walking along the embankment crest, downhill toe, and portions of the pad area, as well as observing the respective abutments, spillway, diversion channel and outlets of the underdrain pipelines.

The downhill slope of the dam was smooth, and a layer of growth medium planted last year had begun sprouting (Photo # VGC-EOR 31). The top liner in Phase 1A was almost entirely covered with ODF and ore had been stacked to the 985m elevation with operations beginning to stack the 995m elev. lift at the time of the inspection (Photo # VGC-EOR 3). A crushed ore transport system consisting of mobile “grasshopper” conveyors and a radial stacker was utilized for the stacking operations. The recently completed Phase 1B liner was still mostly exposed with ODF and PLS pipework placement along the western slope commencing (Photo # VGC-EOR 1).

At the time of the visual inspection, water was not being discharged to the environment from the HLF underdrain flows but was being pumped back into the process circuit (Photo # VGC-EOR 15). The underdrain monitoring vault pump was observed turning on and off in frequent intervals that could create operability issues since the pump is not designed to be operated in such a manner. This is discussed further in Section 2.3.3. Some erosion gullies along the crest of the underdrain containment area that appeared to be caused by rainfall runoff were observed (Photo # VGC-EOR 19 and VGC-EOR 21). The gullies were noted in last year’s inspection but appeared to have worsened since then, and therefore Forte recommends that VGC place additional coarse fill on the dam toe to limit ponding and construct a small rip-rap lined ditch along the crest of the underdrain containment area to direct surface water flows to the west edge of the monitoring vault area (Appendix E).

The PLS pipeline was observed along the HLF dam crest in the same location as noted in last year’s inspection (Photo # VGC-EOR 5 and VGC-EOR 29) From discussions with VGC personnel the plan is to place a large HDPE half-pipe shell around the PLS pipeline to provide better containment and protection of the dam in case of a spill. The barren pipeline was observed along the western edge of the HLF inside containment (Photo # VGC-EOR 6).

At the time of the inspection, VGC personnel were in the process of burying the powerline along the embankment crest that had previously routed above ground along the downstream edge of the embankment

crest (Photo # VGC-EOR 33). By burying the powerline, it should reduce risk to personnel traveling along the road and provide protection to the powerline.

It is understood that in July of 2020, a spill was reported by VGC that occurred due to a seep near the Heap Transfer Tower (CV-023) [Appendix D]. Remedial measures were performed by VGC personnel at site to pull the ore extents back onto HLF liner and meet the designed 10 m setback between the toe of the heap and the perimeter berm to prevent the potential for a future release of process solution outside of containment.

In the previous year's inspection, moderate cracking was observed on the HLF spillway access road. The cracks were up to 2 cm wide and about 10 m long. The cracks noted at the time did not pose a threat to the HLF embankment but could affect the access road and possibly the HLF spillway if not mitigated. In VGC's annual update report, it was noted that the spillway access road creep was being monitored during routine HLF inspections by site personnel, however no inspections forms were provided to Forte to review, and snow on the ground obscured the ability to verify cracks in the location. Forte recommends continued monitoring of the cracks.

During Forte's inspection, there appeared to be shallow rills created by rainfall runoff where the HLF spillway access road downstream face meets the downstream face of HLF embankment (Photo # VGC-EOR 23). This is just below where cracks were identified in the previous year's inspection. Forte agrees with BGC's previous recommendation to excavate a trench along the toe of the access road fill down to competent frost-free material and placing imported fill (structural or rock fill) into the trench and onto at least the bottom half of the access road slope to form a buttress. Additionally, placement of riprap along the groin to mitigate further rill or gullies from forming would be recommended. VGC should document this work and report back to Forte and this area should be monitored during routine HLF inspections by VGC personnel. Additionally, rills appeared on the slope between the Process Plant and the Event Pond (VGC-EOR 18). Forte recommends placement of additional fill along the berm on the south side of the Process Plant to divert runoff and regrading the spillway access road to drain into the HLF Spillway. VGC should document this work and report back to Forte and this area should be monitored during routine HLF inspections by VGC personnel.

Other than the observations indicated above, the dam, spillway, and the outlets of the discharge pipelines, based on the visual inspection, were observed to be functional and in good condition. A summary of recommended maintenance and monitoring action items is presented in Section 0.

2.2.2 Event Pond

The Event Pond was inspected by walking along the south embankment toe, up the emergency spillway and around the pond crest. The Event Pond is currently being used for temporary water storage. Ballasting of the Event Pond is required to prevent liner uplift. If using water as a ballast, Forte recommends a minimum of 0.6m of water depth always remain in the pond for wind ballasting.

In the previous year's inspection, minor cracking and settlement was observed along the Event Pond access road adjacent to the emergency spillway outfall. In VGC's annual update report, it was noted that the access road cracking was mitigated during access road improvements and no cracks were identified during Forte's visual inspection.

Flow from the Event Pond underdrain was not observed at the assumed outlet location. The outlet still needs to be located and clearly marked with signage (Photo # VGC-EOR 25).

2.3 Monitoring

2.3.1 In-Heap Pond Solution Inventory

The In-Heap Pond fluid level is tracked by a vibrating wire piezometer (VWP) installed in the inclined PLS riser pipe (Photo # VGC-EOR 27). The fluid level is being recorded daily and the In-Heap Pond elevation was at the approximate elevation of 932.4m on September 27, 2020. This elevation is approximately 5.1m below the HLF spillway invert and approximately 20.9m above the bottom of the PLS sump. Figure 2-1 below illustrates the In-Heap Pond level from data provided by the site team. It was observed that the In-Heap Pond level stayed below the spillway invert and never discharged to the HLF spillway. There were several instances where the In-Heap Pond crossed the Orange Alert threshold, but it appears Operations reacted appropriately by reducing the In-Heap Pond level before reaching the Red Alert level [Ref 2].

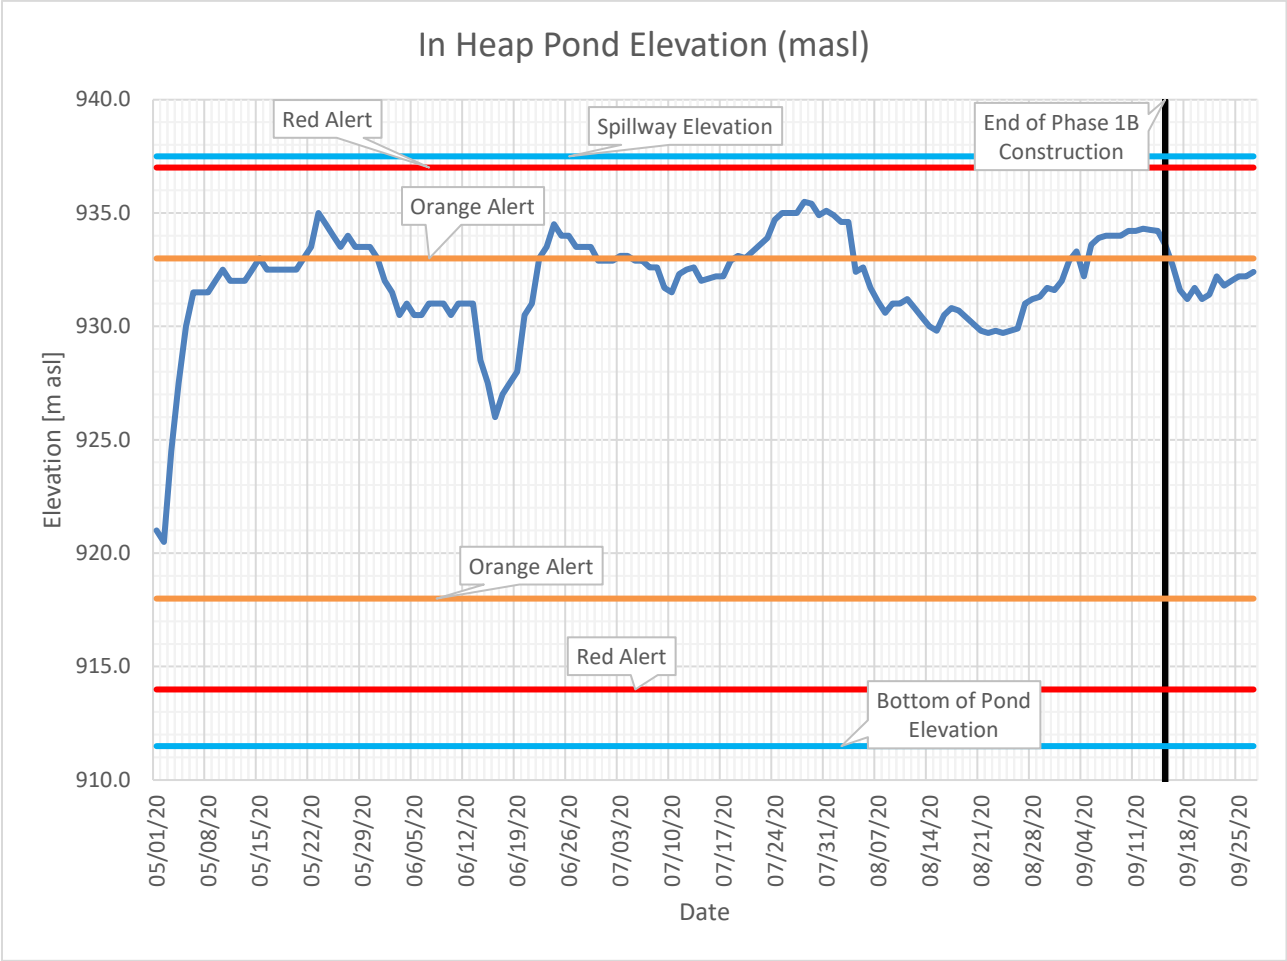

Figure 2-1: In-Heap Pond Elevation

2.3.2 HLF LDRS

The HLF LDRS sump level as of May 24, 2020 is being tracked via VWP in the LDRS sump and LDRS pump is activated manually once per week to evacuate any leakage and total volume pumped recorded via a local totalizer (Photo # VGC-EOR 27). Figure 2-2 shows the recorded leakage rates compared to the allowable leakage rates which affirms that the HLF liner system is functioning as designed.

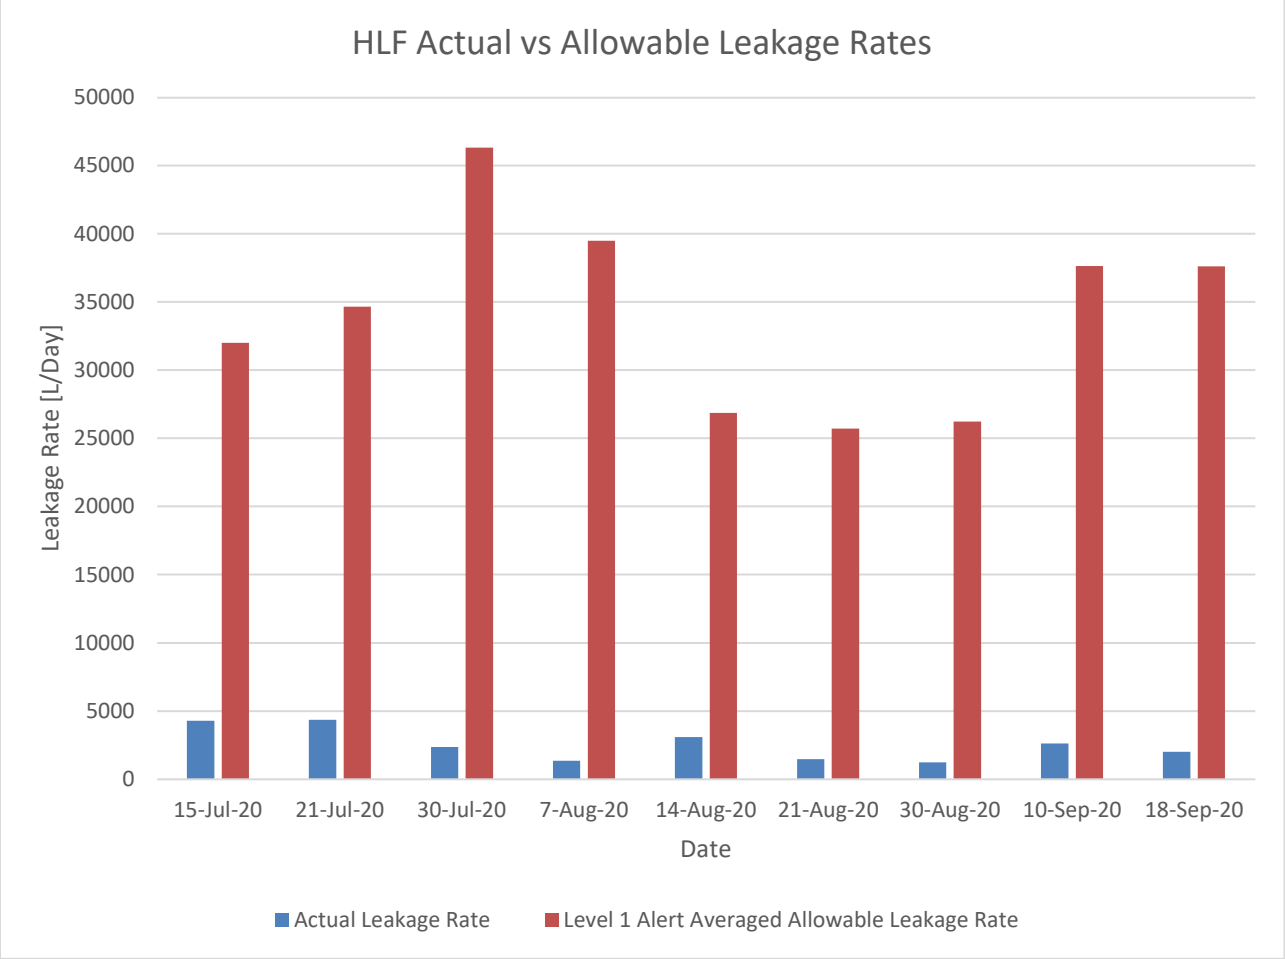

Figure 2-2: HLF LDRS Actual vs Allowable Leakage Rates

Forte recommends the HLF LDRS sump be evacuated by a level-actuated pumping system to automate the evacuation of the LDRS sump. Generally, sumps should be pumped prior to the water level reaching 0.5 m above the bottom of the LDRS end of pipe elevation. This will limit the hydraulic head on the bottom liner. Pumped flow volumes and water level readings should be recorded per the OMS manual [Ref 2].

2.3.3 Underdrain Monitoring Vault

The underdrain monitoring vault seepage and flow pumped back to the process circuit is being tracked daily by VGC site personnel. Figure 2-3 below illustrates the groundwater seepage that was pumped from the UMV to the Event Pond (Photo # VGC-EOR 15). Groundwater seepage is typically greater in the Springtime during freshet and lower in the Fall, but due to the liner installed during Phase 1, this has likely created a lag in response time for when seepage is seen at the UMV. Further data collection and analysis through the end of 2020 and into 2021 should confirm this assertion.

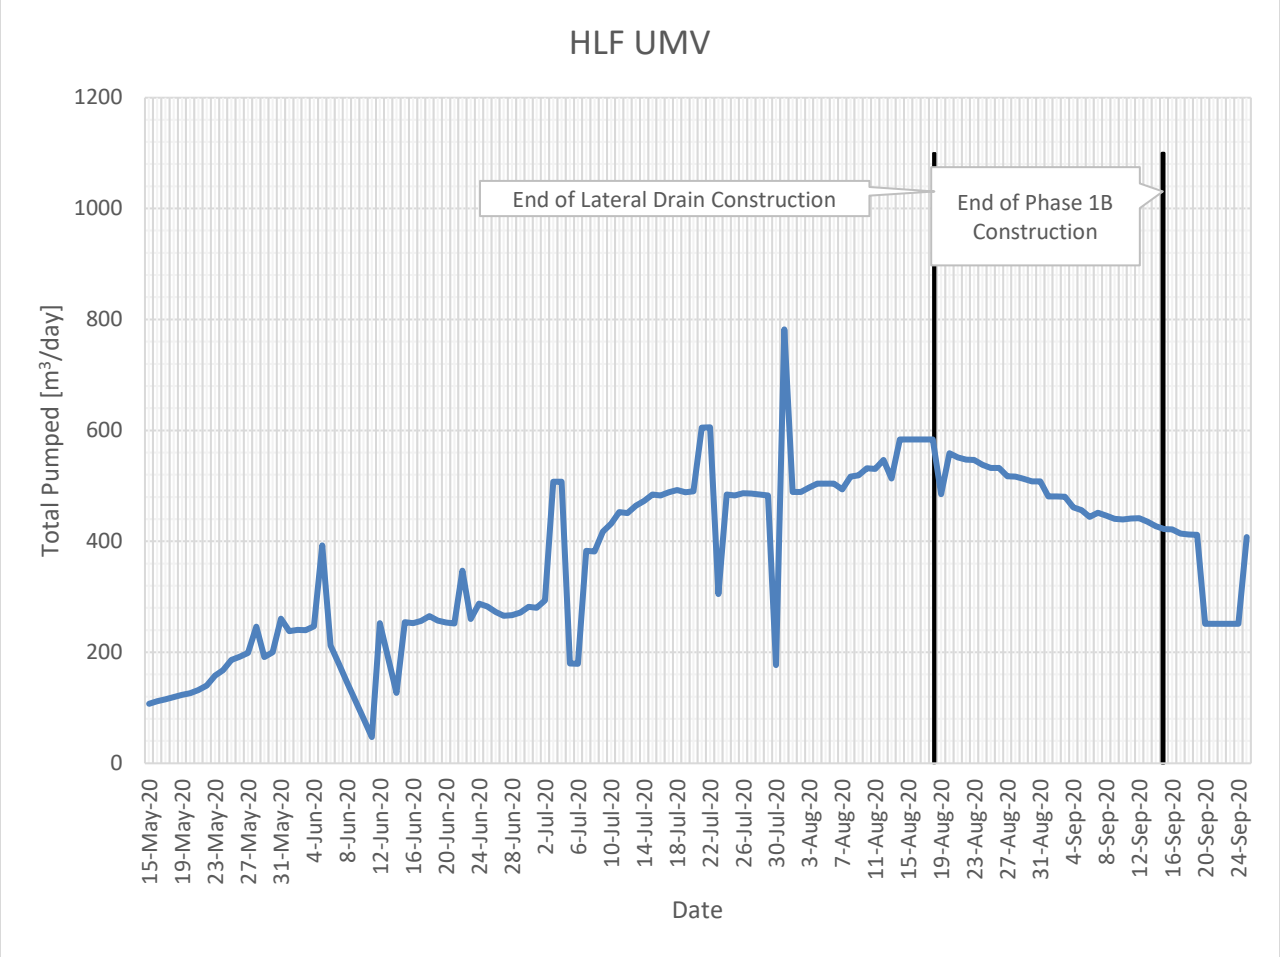

Figure 2-3: HLF UMV Pumped Daily

Figure 2-4below shows the UMV average daily pumping rate to the Event Pond which ranged between 2 m^3/hr and 32.6 m^3/hr. The pump data provided showed the pump has a maximum pumping capacity of 150 m^3/hr putting the operating point outside recommended operating envelope and explains why the pump was observed turning on and off frequently during the inspection. As a near term solution, Forte recommends procuring a spare pump to reduce downtime if the UMV pump were to fail. As a long-term solution, Forte recommends implementing a surge tank or other means of reducing the pumps cycling is needed, or procuring a new pump better suited for the application.

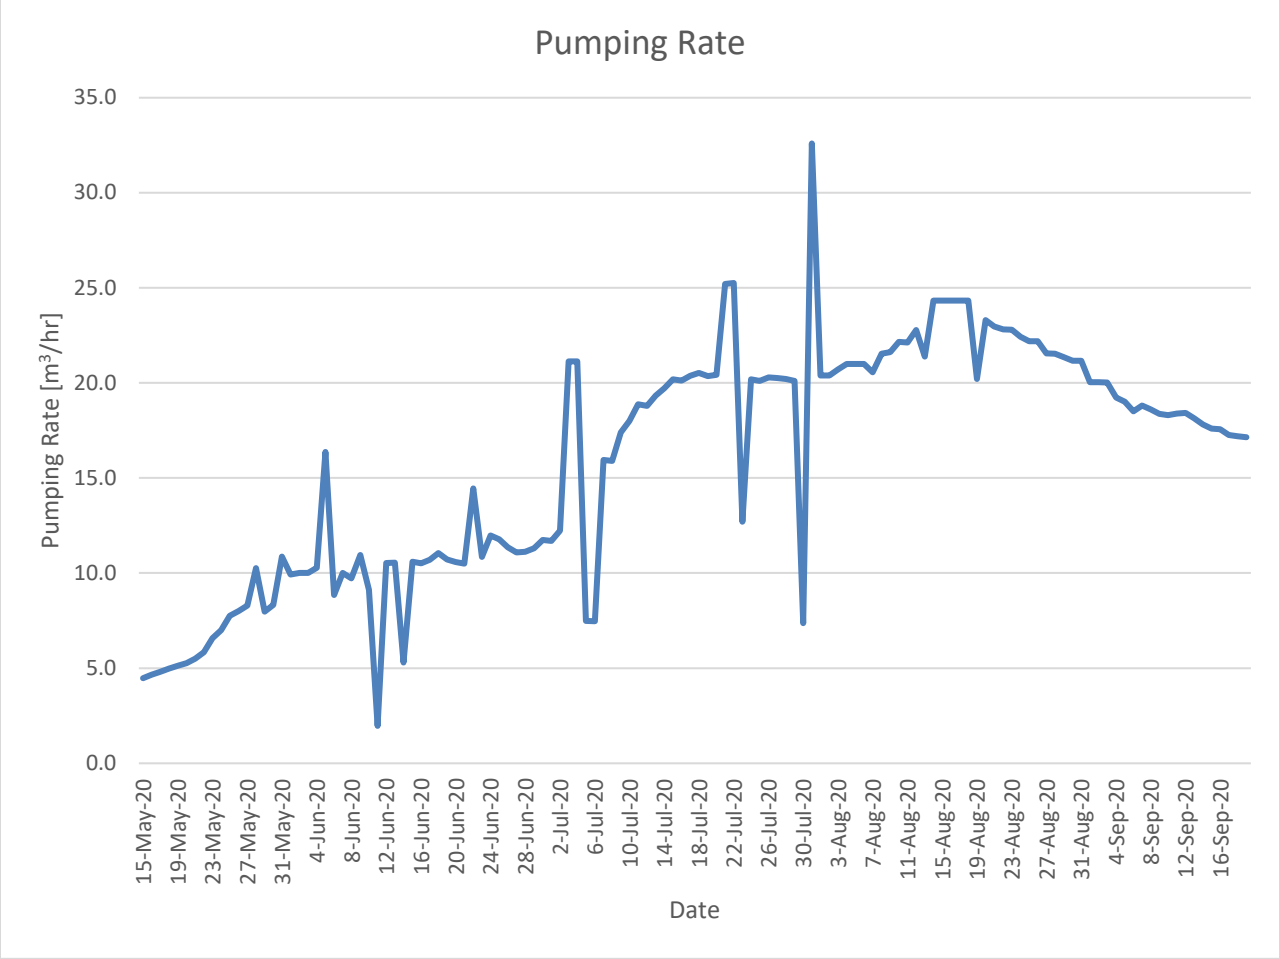

Figure 2-4: UMV Pumping Rate

2.3.4 Event Pond Storage

The Event Pond elevation was at approximate elevation 888.4 m, based on data provided by VGC at the time of the inspection (Photo # VGC-EOR 7). This elevation is approximately 6.1 m below the Event Pond emergency spillway invert. Event Pond level monitoring data collected from the site team was analyzed and Figure 2-5 presents the Event Pond available storage compared to the desired available storage that is required to be maintained in the Event Pond. The actual available storage was less than the desired available storage for some time in Spring of 2020 before the pond level was reduced. The volume stored in the Event Pond is non-contact water that was either collected from precipitation, pumped from the Lower Dublin South Pond (LDSP) or a small amount pumped from the underdrain monitoring vault. Figure 2-1 above shows that the In-Heap Pond level never reached the elevation of the spillway invert and therefore no PLS solution was conveyed to the Event Pond. Forte recommends utilizing the available water for HLF make-up water demands and maintain the desired available storage in the Event Pond.

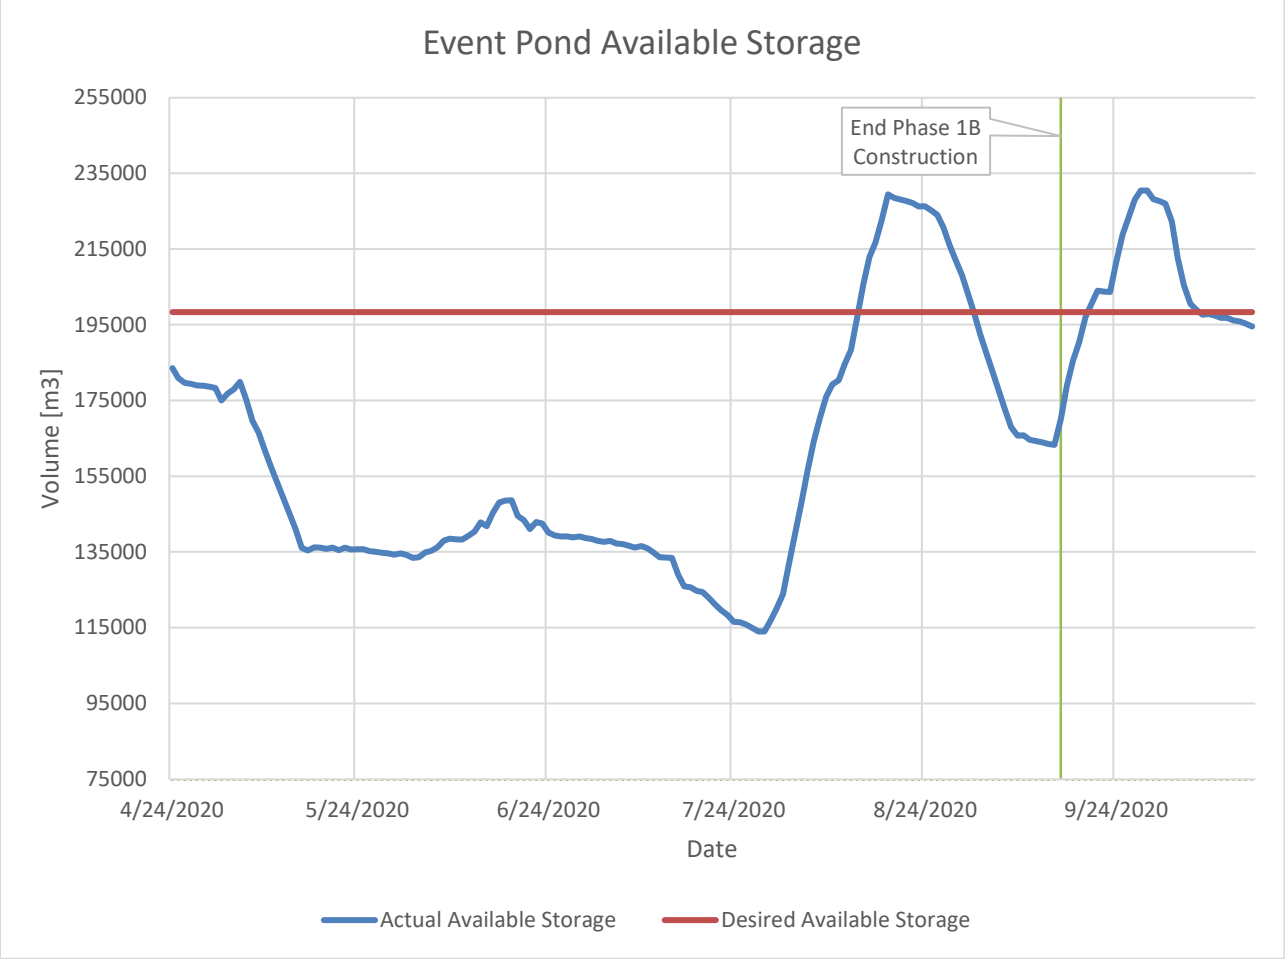

Figure 2-5: Event Pond Available Storage

2.3.5 Event Pond LDRS

The water level in the Event Pond LDRS sump was not known at the time of inspection and it was understood that the level was not being actively tracked but the piezometer trace shows that it is being evacuated once a week regardless of level (see Figure 2-6). Between November 18, 2019 and January 30, 2020, the water level in the Event Pond LDRS sump rose to a peak of 5.8m before being evacuated on January 31, 2020. This is likely due to Operators not pumping routinely during the colder months. Like the HLF LDRS, Forte recommends the Event Pond LDRS sump be evacuated based on observation of LDRS sump water level readings with a level switch installed that turns the pump on and off. Pumped flow volumes and water level readings should be recorded per the OMS manual.

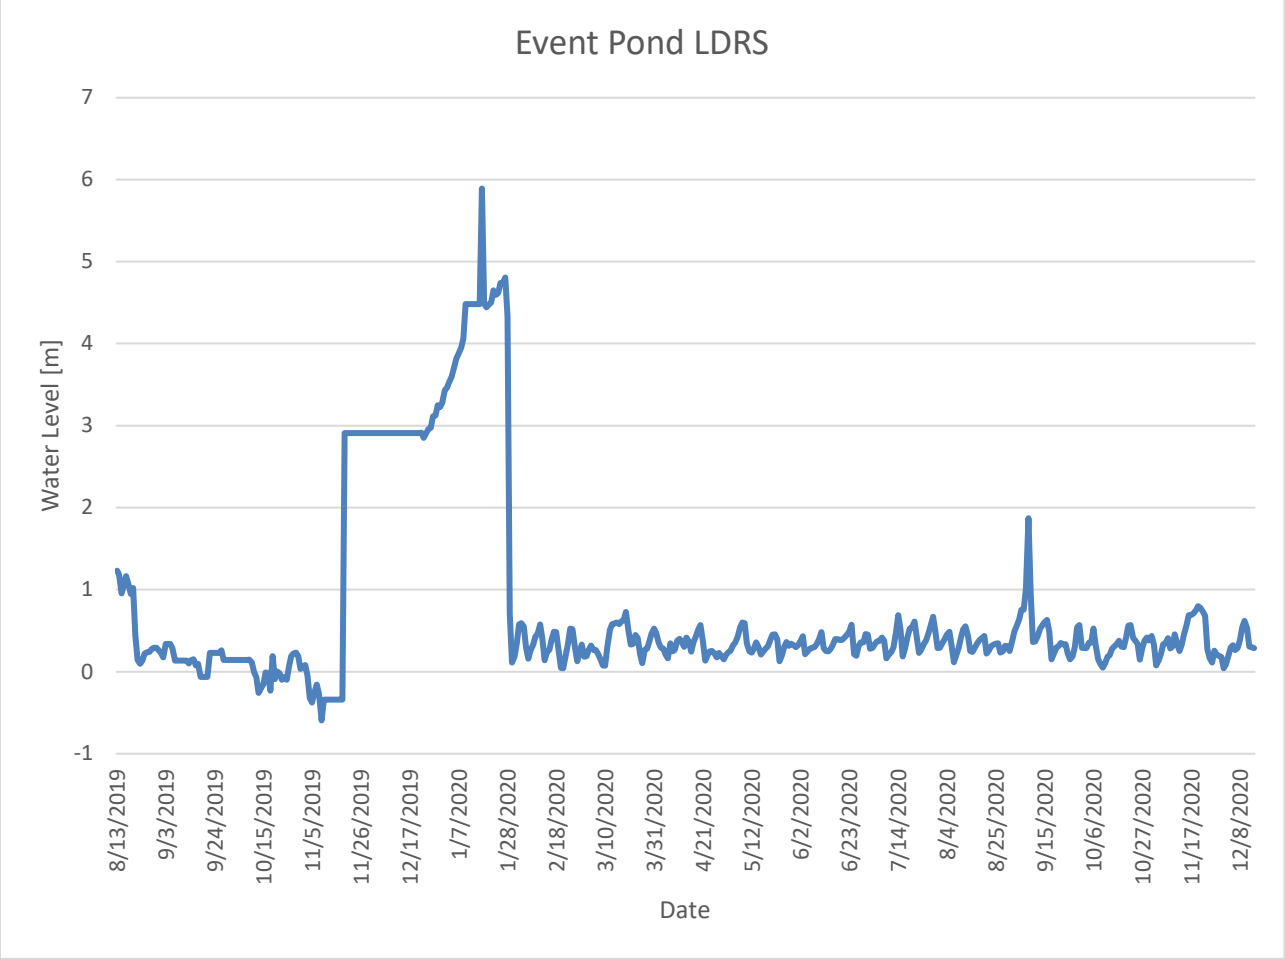

Figure 2-6: Event Pond LDRS Level

2.3.6 HLF Embankment Integrity

Three standpipes with VWPs are installed through the HLF dam crest. Piezometer P1 was installed into the dam foundation bedrock and Piezometers P2 and P3 were installed in the dam fill just above the western and eastern underdrains, respectively. The piezometer readings for P1, P2, and P3 are provided in Figure 2-7, Figure 2-8, and Figure 2-9 respectively. The P1 level data appears to have remained unchanged from previous readings taken during the 2019 annual inspection. The P2 and P3 sensors still appear to be dry and small fluctuations are likely attributed to the changes in barometric pressure seen. The P2 VWP sensor may have moved as the water level is below the sensor install depth or calibration is off. Additionally, the P3 VWP hole may have a small amount of mud that has collected at bottom where sensor is installed. Both sensors should be further investigated by the site team.

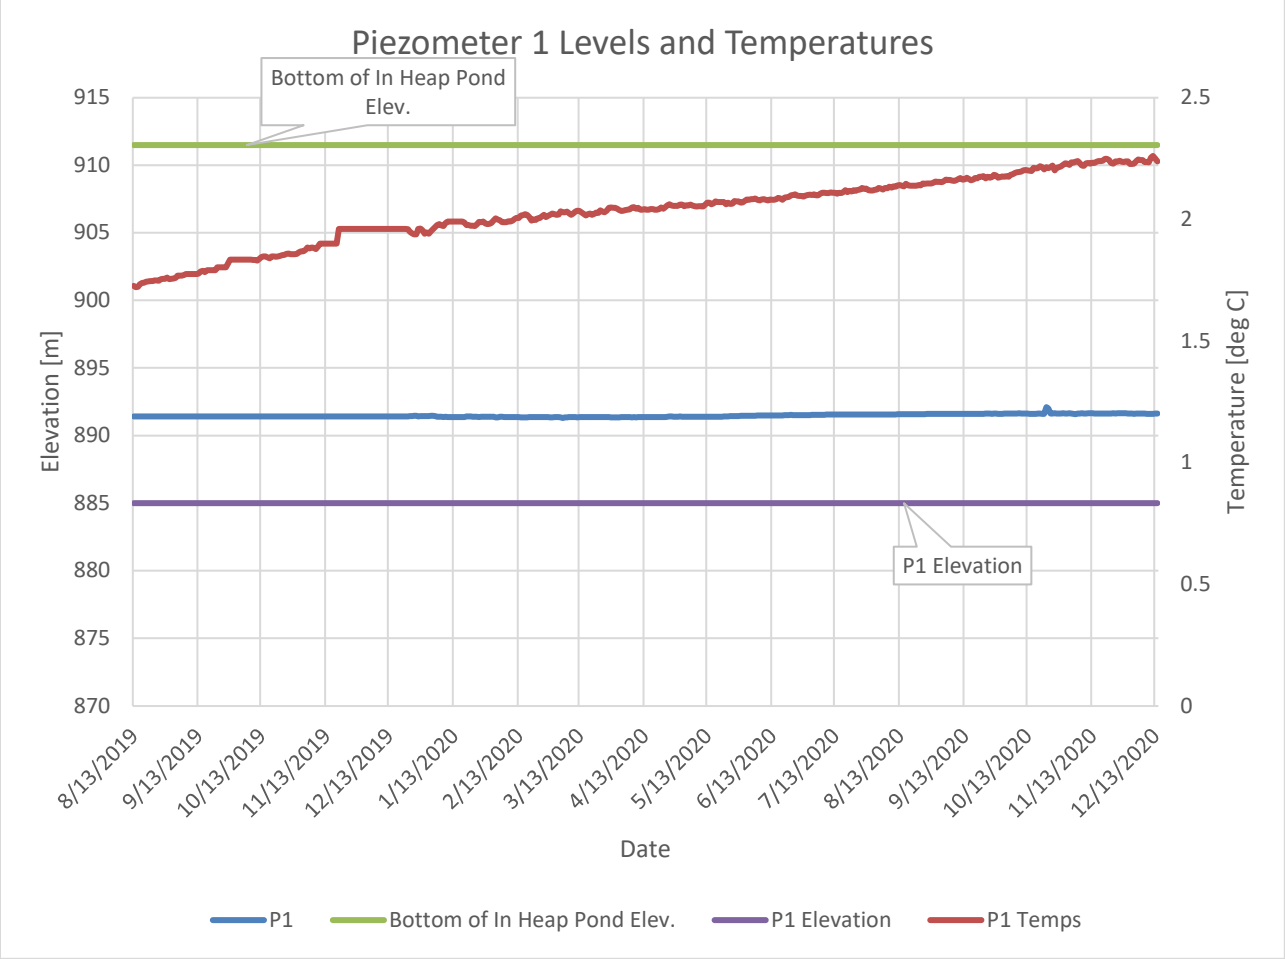

Figure 2-7: P1 Piezo Level and Temperatures

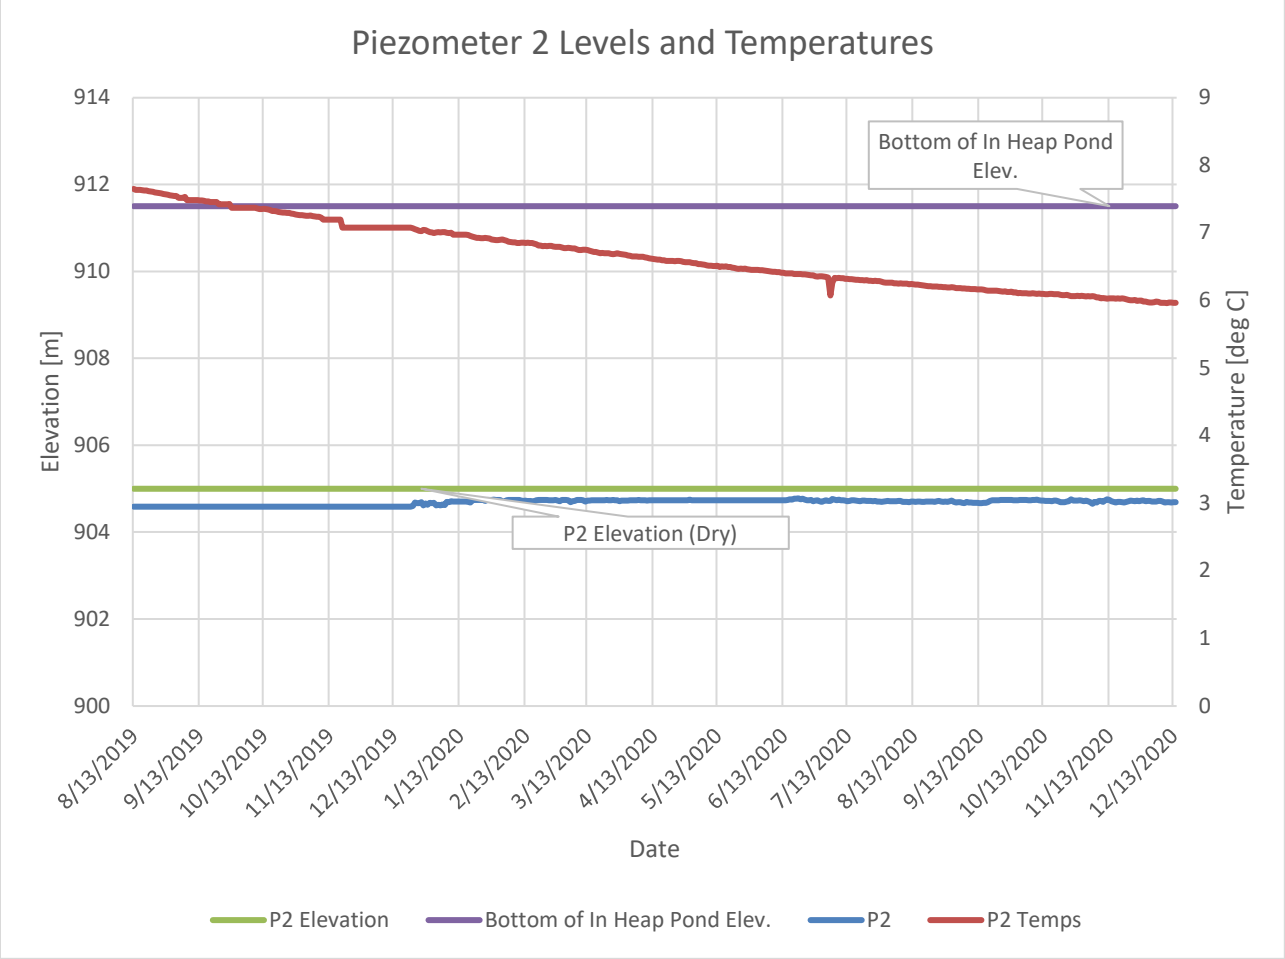

Figure 2-8: P2 Piezo Level and Temperatures

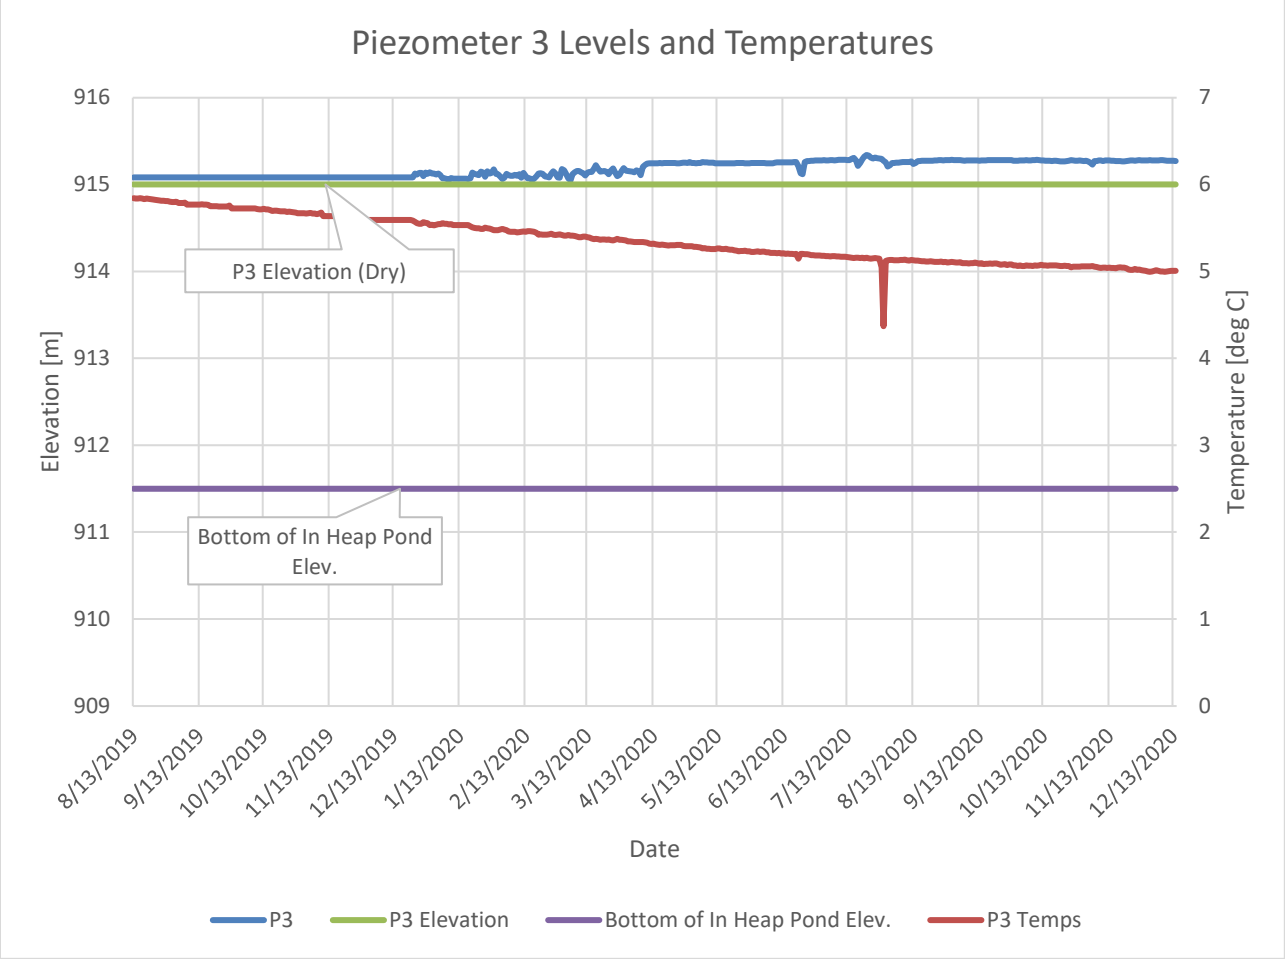

Figure 2-9: P3 Piezo Level and Temperatures

The OMS and instrumentation plan also called for eight (8) survey monuments to be installed at the completion of construction and prior to operation. The locations and installation details for the survey monuments can be found on drawings EGHLF-XD-09-01 and EGHLF-XD-09-02 [Ref 4]. The survey monuments were planned to be placed at 50m intervals along the embankment crest to monitor settlement and/or horizontal movements. These survey monuments have not been installed and therefore embankment settlement cannot be accurately monitored.

An RST MEMS Digital Inclinometer system was procured by VGC to measure lateral movements of the HLF embankment dam. The initial readings taken on the embankment began on June 26, 2020 with additional readings taken ahead of the annual inspection in July and August. The inclinometer takes measurements along two different axes; the A axis which is oriented perpendicular to the embankment crest and the B axis in parallel to the embankment crest. The inclinometer casing was completed to a depth of 54m within the embankment and measurements were taken every 0.5m from the bottom of the hole back to the surface. Results indicate negligible movement or deformation of the embankment as shown in Figure 2-10 through Figure 2-13 below.

2.4 HLF Operations, Maintenance and Surveillance Manual

An updated Operation, Maintenance and Surveillance (OMS) Manual dated January 2020 was prepared by VGC and presents roles and responsibilities, reference documents and reports, HLF description, operation, design basis, maintenance, dam surveillance program, emergency identification and evaluation, and emergency planning and response [Ref 2]. The OMS Manual accounts for the initial construction phase and start-up operations and includes the details of the facility layout, current VGC personnel, and the HLF operational plan. Forte reviewed the OMS Manual and have provided our required actions and recommendations in Table 2-1 below.

Table 2-1: OMS Manual Review Items

Item	Description	Action or Recommendation
Table 2.1-3	Update Contact Info for Process Manager	Action Required
Figure 4.3-1	Update Heap Leach Facility Cross-Section to Remove 55m bench at EL. 985.0m	Action Required
Table 6.3-1	Update Heap Ore Capacity based on volumetric capacity rather than tonnage	Recommendation
Table 6.3-1	Stacked dry density of ore – note that this parameter is variable	Recommendation
Table 6.3-1	Overliner Drain Fill (ODF) – update spec based on criteria used on Phase 1B construction	Action Required
Section 7.3.3	Update In-Heap Pond available storage capacity, operational volume, and combined storage volume of In-Heap Pond and Event Pond	Action Required
Table 7.3-1	Update Table based on Forte modeling input	Action Required
Table 7.4-1	Remove Table from OMS as the leaching plan should be updated with each mine plan update	Recommendation
Table 9.1-1	Revise frequency of inclinometer to quarterly	Action Required

2.5 2020 Recommendations

Table 2-2 below provides a summary of our recommended maintenance and monitoring action items for the HLF. Each action item has been assigned a priority ranking level from 1 to 3. 1 indicating highest priority and 3 indicating lowest priority. A ranking of 3 was generally assigned to items that would be considered routine inspection or monitoring.

These recommendations are based on a review of the pending construction items, outstanding action items from BGC's October 2019 site inspection and new action items from Forte's October 2020 site inspection.

As discussed in Section 2.2, Forte recommends as a priority the remediation and engineering review of the following two areas:

1. Remediation of the gullies along the crest of the underdrain containment area (Photo # VGC-EOR 19 and VGC-EOR 21)

2. Remediation of the HLF upper spillway access road slope creep and rills along groin between access road and HLF embankment (Photo # VGC-EOR 23)

Other action items listed on the inspection forms in Appendix B indicate areas that should continue to be monitored, but do not require specific action at this time.

Table 2-2: Recommended maintenance and monitoring action items – 2020 Annual HLF Inspection

Name of Structures	Maintenance/Monitoring Actions Required				
	Routine Monitoring/ Maintenance	Increased Monitoring/ Maintenance	Remediation and Engineering Review Necessary	Priority Level[(1)]	Recommendations
Heap Leach Facility (HLF)	Yes	-	Yes	3	• Continue the routine inspection and monitoring of the dam, abutments, emergency spillway, discharge outlet areas, LDRS sump, PLS sump, pad liner, PLS and barren pipes, monitoring wells (P-1, P-2, P-3), and pond level as per the current OMS manual.
				2	• Document using routine inspection forms all unusual/adverse conditions observed, as well as maintenance work undertaken.
				1	• Install pad cell piezometers in Phase 1B footprint per drawing 109005-51100-03-CV-F005 Rev 2 (August 2020)
				1	• Continue collecting inclinometer readings in casing INC-1 quarterly per OMS.
				2	• Instrument setup for continuous data download
				1	• Automate the evacuation of the LDRS sump based on water level readings (no greater than 0.5m above bottom end of LDRS pipe should be allowed).
				1	• Place additional coarse fill on the dam crest to limit ponding and construct a small swale (see Appendix E) along the crest of the underdrain containment area to direct surface water flows to the west edge of the monitoring vault area.
				2	• Install signage to clearly mark the HLF east underdrain outlet. – Not primary outlet for underdrain seepage as water is pumped back to process, however the underdrain outlet still requires marking.
				1	• Review of the underdrain monitoring vaults pumps' design. Procure spare pump for underdrain monitoring vault and store on site
				1	• Install survey monuments along embankment crest and take initial readings
				1	• Place additional coarse fill along the berm on the south side of the Process Plant to divert runoff and re-grade the spillway access road to drain into the HLF Spillway.
Event Pond (EP)	Yes	-	-	3	• Continue the routine inspection and monitoring of the embankment, abutments, pond liner, LDRS sump, and pond level as per the current OMS manual.
				2	• Instrument setup for continuous data download
				2	• Document using routine inspection forms all unusual/adverse conditions observed, as well as maintenance work undertaken.
				1	• Automate the evacuation of the LDRS sump based on water level readings (no greater than 0.5m above bottom end of LDRS pipe should be allowed).
				2	• Install signage to clearly mark the Event Pond underdrain outlet (See Appendix E)
HLF Spillway	Yes	-	Yes	3	• Continue the routine inspection and monitoring of the spillway armoring, adjacent access road, seepage collection pipe outlet as per the current OMS manual.
				2	• Document using routine inspection forms all unusual/adverse conditions observed, as well as maintenance work undertaken.
				1	• Remediation of the significant surface erosion along the downstream face of the HLF spillway access road
				1	• Placement of riprap along the groin between HLF spillway access road and HLF embankment to mitigate further rill or gullies from forming
Emergency Spillway	Yes	-	-	3	• Continue the routine inspection and monitoring of the spillway armoring, adjacent access road, seepage collection pipe outlet as per the current OMS manual.
				2	• Document using routine inspection forms all unusual/adverse conditions observed, as well as maintenance work undertaken.

Note 1: Priority Levels are assigned from 1 to 3. 1 indicating highest priority and 3 indicating lowest priority. A ranking of 3 was generally assigned to items that would be considered routine inspection or monitoring.

3. Closure

Forte Dynamics Inc. (Forte) prepared this document for the account of Victoria Gold Corporation. The material in it reflects the judgment of Forte staff considering the information available to Forte at the time of document preparation. Any use which a third party makes of this document or any reliance on decisions to be based on it is the responsibility of such third parties. Forte accepts no responsibility for damages, if any, suffered by any third party as a result of decisions made or actions based on this document.

As a mutual protection to our client, the public, and ourselves, all documents and drawings are submitted for the confidential information of our client for a specific project. Authorization for any use and/or publication of this document or any data, statements, conclusions or abstracts from or regarding our documents and drawings, through any form of print or electronic media, including without limitation, posting or reproduction of same on any website, is reserved pending Forte's written approval. A record copy of this document is on file at Forte. That copy takes precedence over any other copy or reproduction of this document.

Note the conclusions provided herein will change as the recommended maintenance measures are undertaken.

We trust the above satisfies your requirements at this time. Should you have any questions or comments, please do not hesitate to contact us.

Yours sincerely,

1 INTRODUCTION

This report summarizes the events that occurred during the early hours of July 11, 2020 that resulted in a release of process solution from the lined footprint for the Heap Leach Facility (HLF) to soils outside of containment. This report also summarizes the subsequent responses implemented to mitigate this release and to prevent possible reoccurrence. **At the time of this report there has been no detection of total or WAD cyanide in monitored surface water or groundwater downgradient of the HLF.** A low-level detection of total cyanide was received for one soil sample downgradient of the CV-022 road access road. The total cyanide (which includes free cyanide) concentration detected is below all soil quality guidelines for free cyanide provided in the Canadian Soil Quality Guidelines for the Protection of Environmental and Human Health (Canadian Council of Ministers of the Environment, 1999).

On July 11, 2020, at 01:30, during heavy rains, pooling water was reported on the HLF loadout area. At 04:00, inspections of the HLF area identified a channelized flow of rainwater mixed with process solution seeping from the base of the loadout pile adjacent to the Heap Transfer Tower (CV-023) pad. The seep was located about 2 metres above the main east-west access roadway (the HLF Perimeter Road) just to the west of the transformer and E house area, which are situated below the conveyors. The seep emerged outside of the lined containment of the HLF and was observed to commingle with the roadway runoff; however, due to the very low flow of the seep, it was not distinguishable on the roadway.

Investigations during and since the incident indicate a combination of a damaged solution distribution pipe on an upper ore lift of the HLF, heavy rainfall and the extension of the loadout pile beyond lined containment were the primary root causes of the release.

The damaged solution distribution pipeline was isolated and flow shutoff upon discovery. Earthworks (berm construction and ditching) was initiated to contain and stop the source of the seep, as well as contain the release of the seep. The seep was fully contained by 09:00 that morning, and directed back into the lined containment of the HLF. The estimated volume of fluid (i.e., comingled rainfall and process solution) released outside of containment is approximately 4.5m^3. Based on both surface and ground water samples taken, there is no evidence that any potential receiving water bodies or groundwater were affected by process solution. Onsite analyses for free cyanide concentrations in samples collected on the morning of the release from streams downgradient of the seep and HLF showed values below the onsite method detection limit. External laboratory analysis was also actioned on samples collected, and yielded non-detect results for Total or WAD cyanide.

On July 12, 2020, notification was provided to regulators and the First Nation of Nacho Nyak Dun (FNNND) regarding the incident. The following were notified:

- Natural Resource Officer, Inspector Major Mines - Compliance Monitoring and Inspection, Department of Energy, Mines and Resources (EMR)
- Director - Minerals Resource Branch, EMR,
- Enforcement Officer - Enforcement Branch, Environment and Climate Change Canada (ECCC), and
- FNNND Lands and Resources Manager.

Section 1: Introduction

This report provides a detailed chronological event summary, release details, important environmental and site factors that led to the incident, concurrent and post-incident responses, and reporting.

2 CHRONOLOGICAL EVENT SUMMARY

2.1 RELEASE RECOGNITION AND IMMEDIATE RESPONSES

Features relevant to this event summary are provided in Figure 2-1 and Figure 2-2.

July 10, 2020

Heavy rains commenced just prior to midnight on July 10. Approximately 43.5 mm of precipitation fell at the Camp Climate Station (located approximately 1,500 metres from the seepage location) between 21:00 July 10 and 21:00 July 11. The highest intensity of rain recorded during the incident time frame was between 23:00 July 10 and 02:00 July 11, at one point reaching an intensity of approximately 7.2 mm/hr. Prior to the incident and earlier that same day, rainfall intensity peaked at 10 mm/hr between 20:00 and 21:00 on July 10. The weather data indicate that the HLF and Eagle Site sustained high intensity microbursts of rainfall throughout July 10 and July 11, leading up to and throughout the incident timeline.

July 11, 2020

01:30 Pooling water was reported on the heap leach pad CV-023 loadout area (on the 950 lift) from a loader operator and was investigated by the Process foreman. Water was observed cascading down from the 975 lift, accumulating on the 950 bench in the stockpile-loadout. It was believed at that time that the pooling water was sourced from the precipitation event. A berm was constructed from the crushed ore within the HLF across the loadout area to contain the pooling water up against the toe of the 965 lift, and keep water away from the stockpile and the loadout operations.

03:45 The heavy rain had stopped, however pooling water on the loadout area continued to increase in volume and depth, so a berm across the loadout was raised. The Process General Foreman was called out to help investigate. It was determined that solution flow from the 8” process solution distribution line on the 975 lift directly uphill from the stockpile-loadout area was leaking and contributing to the flow of water to the pooled area on the 950 lift. The leaking distribution line was immediately turned off.

03:45 to 04:30 Investigation was turned to areas downgradient of the stockpile-loadout area. The HLF perimeter road was wet and muddy throughout. A small channelized flow (or rivulet) was noticed seeping about 2 metres above the driving surface of the road from the base of the crushed ore pile below the stockpile-loadout area. The rivulet was observed to distribute down to the roadway into a small ponded area which had formed in a low area west of, and immediately adjacent to, the westernmost transformer of the E-House. Once the rivulet reached the roadway it could not be discerned in the mud and rainwater that covered the roadway. An excavator was mobilized and dispatched to this area to commence immediate remedial earthworks.

04:30 – 05:30 Remedial earthworks outside of the lined containment area commenced; over the next hour, three berms were constructed. One berm was built adjacent to the transformer area across the rivulet to contain water upgradient of the roadway. A second berm was built across the junction of the

Dublin Gulch access road and the HLF perimeter road, and a third berm was built across the junction of the HLF perimeter road and the CV-022 Road.

Additionally, the Process Manager designate and Site General Manager were informed of the incident and the remedial measures being taken. As a precaution, all ADR processes feeding all the distribution lines were shutdown.

07:00 to 09:00 Inspections of the incident area were undertaken by the General Manager, and managers/superintendents from the Environment, Process, and Health and Safety Departments. During the inspection:

- Water was observed to continue to emerge from the seep.
- Water was pooling behind the bermed area west of the transformer. The berm was observed to be containing the pool and deemed to be providing appropriate containment thereof.
- A suction pumping system was established to collect all pooling water and pump it back into the HLF containment area.
- Additional earthworks were undertaken and a liner was installed in the seep area to direct the pooling water back to lined containment.
- Visual assessment of other areas of HLF was undertaken and no concerns were noted.
- Offsite Senior Management was notified.
- Emergency Operations Centre (EOC) was activated and the Emergency Response Plan and Cyanide Management Plan was initiated.
- Incident management team meeting was conducted to coordinate, release response, further remediation and sampling efforts.

Photo 2-1: Seep Location Looking North - July 11, 2020 @ 07:00

Photo 2-2: Containment Berm Construction Adjacent to HLF Perimeter Road Looking West - July 11, 2020 @ 07:00

09:00 Berms, ditches, liners and pumping set-ups were completed, directing all fluid back to lined containment. The seep was still flowing but was fully contained.

09:00 to 15:00 The seep was sampled and on-site analysis for cyanide confirmed that the water was diluted solution (approximately 175 parts per million {ppm} free cyanide was detected compared to the 250 ppm in the process solution as it is distributed to the HLF). Flow was estimated at seepage location at approximately 10 L/min. Based on initial observations from when the seep was suspected to begin flowing (01:30) and when the flow from the seep was fully contained (09:00), the estimated volume of potential infiltrated rainwater and process solution released outside of containment is 4.5 m^3. This equates to a release of less than 1kg of free cyanide.

Further, as part of the Cyanide Management Plan (specifically the Environmental (Soil/Water Quality) Monitoring Procedures SOP), water quality samples were collected at standard Environmental Monitoring, Surveillance and Adaptive Management Plan locations (see Figure 2-3) and other locations above and downgradient of the incident area including:

- Two stations on Dublin Gulch
- One station on Eagle Creek, and
- Three stations on Haggart Creek.

2.2 FOLLOW-UP REMEDIAL MEASURES

Work continued on July 12, 2020 to mitigate the condition. Surveys were conducted to confirm the perimeter of the liner. Ground and overhead drone photos were taken and compared to construction period photos to establish

the critical components of the work zone (i.e., the liner perimeter, the liner base elevations, and the CV-023 foundation).

On July 13, 2020, using a surveyed line as a guide, an excavator was utilized to pull the crushed ore pile from the conveyor away from the edge of the lined HLF containment facility with the material cast to the north (fully within the HLF) and then loaded and trucked to another portion of the HLF for more even distribution. When the crushed ore pile had been excavated closer to the liner edge, a smaller excavator was utilized to prevent any damage to the liner.

By July 19, 2020, the edge of the HLF liner perimeter was exposed (see Photo 2-3 to 2-5) from the roadway to approximately 5 metres below the CV-023 tower supports. The excavation cannot move further until the stacker can be moved as part of the full grasshopper HLF move project (scheduled to commence within three weeks of the date of this report); otherwise the stacker would be undermined and unstable. More specifically, if the liner trench is excavated all the way up to the stacker elevation there will be insufficient material to establish a safe slope grade/area for workers to perform final clean on the liner in the trench. Also, in excavating the trench up to the stacker, the stability of the stacker would be compromised. Currently, there is sufficient containment to capture any leakage from the pile and convey it towards the In-heap Pond. Prior to the stacker and grasshopper move, the area will be continually monitored for seepage.

3 RELEASE DETAILS

3.1 FLOW ESTIMATE

Flow from the seep was estimated using the bucket method as the flow was too low for any alternate accurate measurements. Two separate measurements were conducted. Each measurement was conducted by filling up a 1 liter wide-mouth bottle five times from the seep flow that was dribbling over rocks in the pile. The two measurements were conducted at 10:00 and 10:10 on July 11, 2020. The overall flow rate was approximated to be 10 liters/minute based on an average of the two measurements.

The seep is estimated to have begun around 01:30 (based on when the pool began to form on the loadout). The seep was fully contained and flowing back into the pad by 09:00 on the same day. Thus, the seep was flowing for 7.5 hours, which resulted in approximately 4.5 m^3 of diluted process solution leaving containment.

Photo 3-1 shows the seep around 07:00 July 11. Based on when the seep was first observed at 04:00 and when the seep flow was contained at 09:00, there was little variability observed in the rate of flow.

Photo 3-1: Seep Flow Looking North - July 11, 2020

3.2 SEEP SAMPLING

A sample was collected from the seep on the morning of July 11 at 08:17. Onsite analyses was performed on the sample for free cyanide using a silver nitrate test, which yielded a concentration of 175 ppm. External (off-site third party) analyses were also actioned with ALS Burnaby where a sample was analyzed for total cyanide, weak acid dissociable (WAD) cyanide, cyanate, and thiocyanate. Preliminary results yielded a concentration of 199 ppm total Cyanide.

Based on the quantity of solution released (4.5 m^3 or 4,500 kg) and a seep concentration of 195 g/kg yields a total of ~880 g of cyanide released outside of containment. Converting to NaCN (sodium cyanide) and assuming the molecular masses of NaCN and CN yields approximately 1.6 kg of NaCN in solution released outside of containment.

3.3 RECEIVING ENVIRONMENT MONITORING

3.3.1 Surface Water Quality Sampling

The receiving water body related to the Project is Haggart Creek. The Type A Water Use Licence (WUL), and VGC monitoring programs under the EMSAMP has established monitoring locations and water quality objectives on Haggart Creek. The following locations considered in the WUL and the EMSAMP as shown on Figure 2-3 were sampled on July 11:

- Upstream of the seep on Dublin Gulch at W1;
- On Haggart Creek upstream of Dublin Gulch at W22;
- Downstream on Dublin Gulch at W21;
- On Haggart Creek downstream of Dublin Gulch at W4; and,
- On Haggart Creek further downstream at W29.

In addition, water samples were collected at two additional sites:

- Downstream of the seep on Dublin Gulch at DG1 (referred to as HLFDG1 in the chain-of-custody and laboratory report)
- On Eagle Creek at W61 and upstream of the confluence with Dublin Gulch (referred to as HLFEP1).

There was no detection of total or WAD cyanide in surface water quality samples. The preliminary reports from ALS are provided as Appendix A.

3.3.2 Groundwater Quality Sampling

On July 13, water quality samples were taken from two groundwater wells immediately downgradient of the HLF (MW19 HLF-1b and MW10-AG6 as shown on Figure 2-3). There was no detection of Total or WAD cyanide in either groundwater quality sample. The preliminary report from ALS is provided as Appendix B.

3.3.3 Soil Sampling

On July 16, 2020, in order to determine if cyanide was present in the surrounding soils, soil samples were collected at three locations downgradient of the seep (in potential depositional areas) as shown in Figure 3-1. The samples were analyzed for the presence of total and WAD cyanide. Preliminary laboratory results indicate the presence of cyanide in one of the sampled locations; however, the concentration shown in the preliminary report for total cyanide is below all soil quality guidelines for free cyanide (which is consider in total cyanide results) provided in the Canadian Soil Quality Guidelines for the Protection of Environmental and Human Health (Canadian Council of Ministers of the Environment, 1999). The preliminary report from ALS is provided as Appendix C.

3.3.4 Acute Lethality Testing

In the absence of receipt of the laboratory results confirming that no process solution was detected in surface waters, VGC undertook sampling for acute lethality single concentration tests for 96 hr rainbow trout and 48 hr Daphnia magna in addition to full suite water chemistry on July 11, 2020 at W1, W21, W4, W22 and W29.

The results for acute toxicity tests are included in Appendix D. The results for these tests show that water quality in the receiving environment was not acutely lethal, (Table 3-4).

Table 3-1: Acute Lethality Testing Results

Soil Sample Locations

4 IMPORTANT ENVIRONMENTAL AND SITE FACTORS (ROOT CAUSES)

4.1 ROOT CAUSE

The primary root cause of the release was the stockpile of crushed ore material in the loadout area building up such that the pile went beyond liner containment. While active leaching does not occur on the ore discharge pile it created a potential flow path during rainfall events that have the potential to overwhelm the infiltration rate of the material.

Figure 4-1 provides a cross section which depicts the area of concern on July 17, and indicates that the stockpile had been pushed southward towards the HLF Perimeter Road, towards the E-House and passed the edge of the liner.

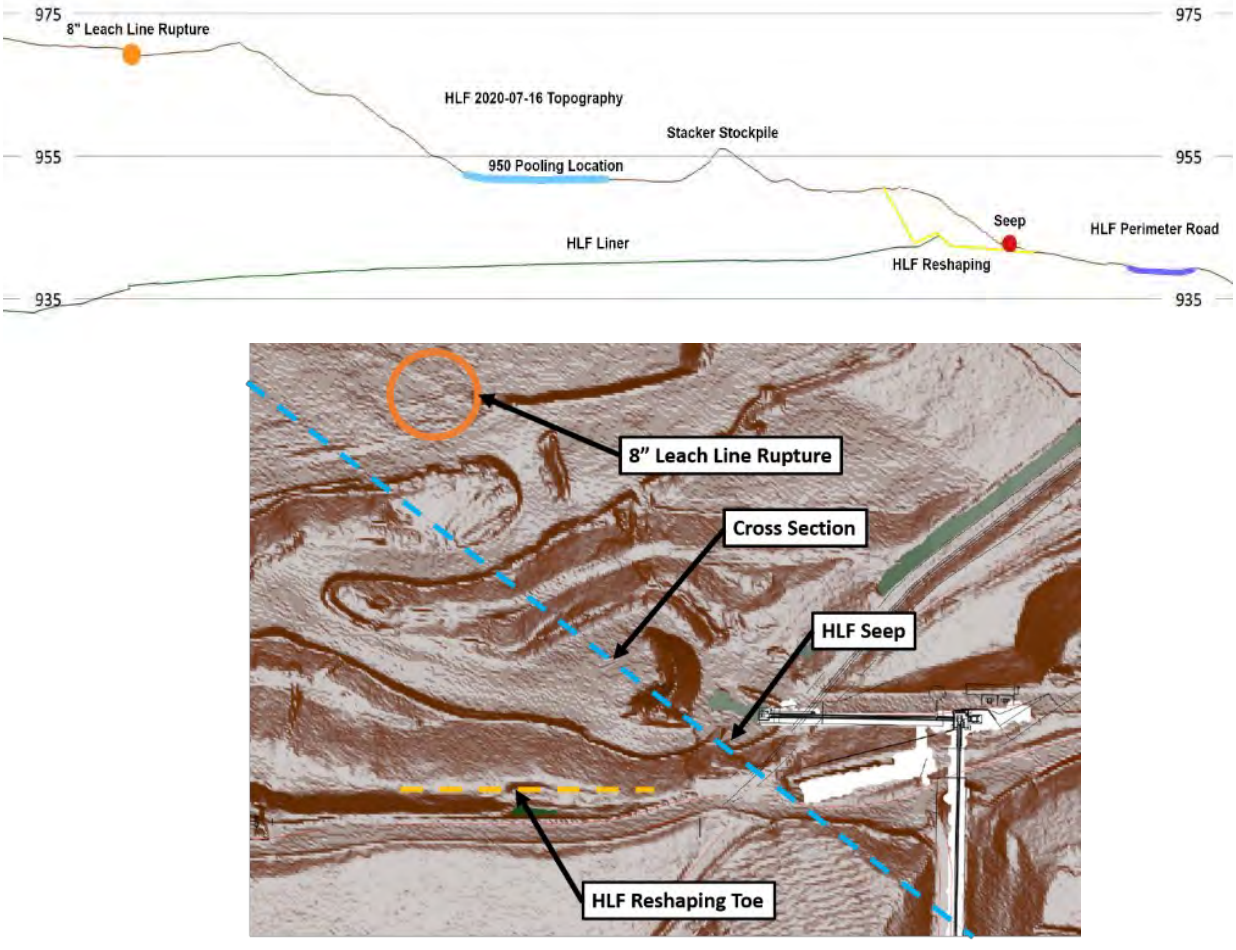

Figure 4-1: HLF South West Corner Cross Section and Plan View Map

Photo 4-1 depicts the location of liner with respect to the July 11 pile location, and illustrates the pile was extended beyond liner containment. The southern edge of the crushed ore pile from the conveyor discharge was pushed approximately 20 metres to south, where there was no lined ditch between the roadway and ore pile.

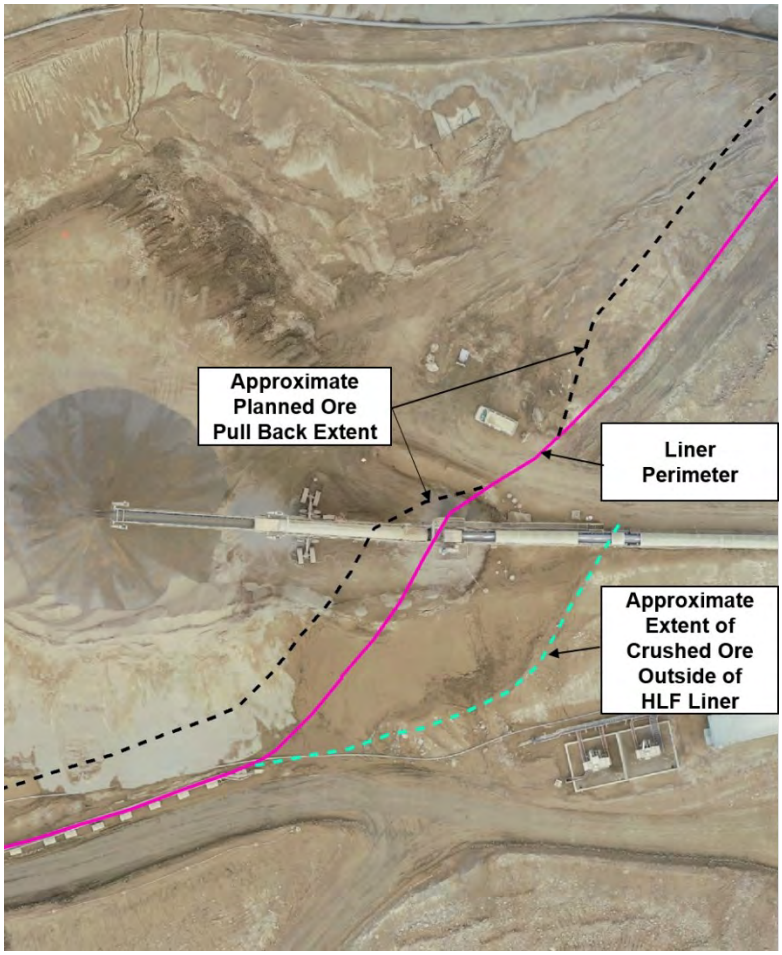

Photo 4-1: Crushed Ore Configuration Relative to HLF Liner - June 30, 2020

The ore pile extended southwards during winter operations in an effort to manage snow on the loadout area, and had not been pulled back fully after freshet. Although the loadout area is not in an active leaching zone, the volume of leakage from the damaged distribution line on the 975 lift and the heavy rainfall resulted in pooling water in a low spot on the 950 lift (shown north of the stockpile on the figure). A temporary berm was constructed to prevent the pool from flowing into the stockpile. While the depth of the pool grew behind the berm, the head in the pool first pushed water into the pad and vertically down to the liner and ultimately to the In-Heap Pond. However, the head also likely created a subsurface water mounding effect leading to sub-horizontal flow in all directions including to the south. As the volume of solution built up behind the liner edge, the solution began to leak over the liner berm wall following preferential pathways until eventual emergence at the seep location.

4.2 CONTRIBUTING FACTORS

A number of contributing environmental and site factors occurred that led to the incident. These included:

- Heavy rains from 23:00 to around 02:00 (~17.6 mm and ~7.2 mm/hr through peak intensity) resulting in additional water pooling on the 950 bench (Table 4-1). Further, substantial rain fell during the previous week that led to wet antecedent moisture conditions and low percolation rates. The Camp Climate Station has recorded ~91.3 mm of precipitation from July 3 to July 21 (Table 4-1) and, examining hourly data, recorded approximately ~43.5 mm of precipitation between 20:00 July 10 and 20:00 July 11, contributing to the onset of the incident. Comparison of Camp and Potato Hills hourly precipitation data supports that the Camp and HLF area received localized microbursts of severe precipitation leading up to and during the incident.

Table 4-1: Climate Station Rainfall Records

Date	Camp Station		Potato Hills

19-Jul-20	0.00	91.30	0.18	50.52

NOTES
1 - Daily rainfall values are calculated by Geonor Precipitation Gauge. Negative values have been replaced by "zeros". Negative values are reported by Geonor from interference with wind or vibrations.

- 28 spin locks were crushed during road and pad development and distribution line deployment on the 975 lift (Photo 4-2). While the leaked solution originated from the 8-inch distribution line, if the damage to the lines was recognized earlier, or if it occurred on a different location of the pad, the leak from containment likely would not have occurred.

Photo 4-2: Damaged Spin Locks Decoupled from 8" Distribution Line - July 12, 2020

- Extended periods of loadout area use resulted in layers of compacted ore and possibly snow lensing, resulting in lateral preferential pathways of infiltrating water.
- Pooling of loadout area (held behind berm). The berm was built to ~1.5 m high while the pool was at least 1.0 deep; this constant head boundary formed a groundwater mound which resulted in vertical and lateral migration (using preferential pathways) rather than primarily downward migration of solution (see Figure 4-1)

5 SPILL REPORTING

5.1 YUKON GOVERNMENT AND FNNND

On July 12, 2020, the day following the solution release, notification was provided to regulators and the FNNND of the release of HLF solution outside of primary containment. The following people and/or agencies were included in these notifications:

- Yukon Spill Reporting hotline
- Natural Resource Officer, Inspector Major Mines - Compliance Monitoring and Inspection, Department of Energy, Mines and Resources (EMR)
- Director - Minerals Resource Branch, EMR,
- Enforcement Officer - Enforcement Branch, Environment and Climate Change Canada (ECCC), and
- FNNND Lands and Resources Manager.

A copy of this report will be provided to all parties contacted during the preliminary event.

6 FINAL REMEDIATION MEASURES

To ensure that there is no recurrence of this issue, the ore stack discharge from the CV-023 conveyor will continue to be pulled back from the HLF lined footprint to negate the ability for a flow path to be formed. The extent of the push back is depicted in Photo 6-1. This work is currently ongoing. In the meantime, berms and trenches have been constructed to prevent the potential for a future release of process solution and rainwater outside of containment. A Standard Operating Procedure will be developed to ensure that potential ore stack creep is captured in routine surveillance of the HLF.

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
%	percent
µS/cm	Microsiemens per centimetre
meq/L	milliequivalents per litre
mg/L	milligrams per litre
NTU	nephelometric turbidity units
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in reports identified as "Preliminary Report" are considered authorized for use.

CERTIFICATE OF ANALYSIS

Work Order	: **VA20B0234**	Page	: 1 of 6
Amendment	: **(Preliminary Report)**		
Client	: **Victoria Gold (Yukon) Corp.**	Laboratory	: Vancouver - Environmental
Contact	: Bill Bowden	Account Manager	: Hilary Woods
Address	: Suite 1000 - 1050 W. Pender St Vancouver BC Canada V6E 3S7	Address	: 8081 Lougheed Highway Burnaby BC Canada V5A 1W9
Telephone	: 867.456.7700 ext. 6381	Telephone	: +1 604 253 4188
Project	: HLF Dublin Haggart - Jul 11	Date Samples Received	: 13-Jul-2020 11:10
PO	: 15673	Date Analysis Commenced	: 13-Jul-2020
C-O-C number	: 20200711e	Issue Date	: 20-Jul-2020 10:46
Sampler	: KB/KT		
Site	: ----		
Quote number	: Q68199		
No. of samples received	: 5		
No. of samples analysed	: 5		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Angelo Salandanan	Lab Assistant	Metals, Burnaby, British Columbia
Annabelle Prasad	Analyst	Metals, Burnaby, British Columbia
Bruna Botti	Analyst	Inorganics - Water Quality, Burnaby, British Columbia
Dee Lee	Analyst	Metals, Burnaby, British Columbia
Jon Fisher	Department Manager - Inorganics	Inorganics, Waterloo, Ontario
Kevin Duarte	Team Leader - Inorganics	Inorganics - Water Quality, Burnaby, British Columbia
Lindsay Gung	Supervisor - Water Chemistry	Inorganics - Water Quality, Burnaby, British Columbia
Muneeb Alam	Analyst	Metals, Burnaby, British Columbia
Owen Cheng		Metals, Burnaby, British Columbia
Robin Weeks	Team Leader - Metals	Inorganics - Water Quality, Burnaby, British Columbia
Robin Weeks	Team Leader - Metals	Metals, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
%	percent
µS/cm	Microsiemens per centimetre
meq/L	milliequivalents per litre
mg/L	milligrams per litre
NTU	nephelometric turbidity units
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in reports identified as "Preliminary Report" are considered authorized for use.

Sample Comments

Sample	Client Id	*Comment*
VA20B0234-001	W4	Sample(s) W4, W21, W29 and W22: Water sample(s) for dissolved mercury analysis was not submitted in glass or PTFE container with HCl preservative. Results may be biased low.

Qualifiers

Qualifier	*Description*
DTC	*Dissolved concentration exceeds total. Results were confirmed by re-analysis.*

CERTIFICATE OF ANALYSIS

Work Order	: **VA20B0441**	Page	: 1 of 4
Amendment	: **(Preliminary Report)**		
Client	: **Victoria Gold (Yukon) Corp.**	Laboratory	: Vancouver - Environmental
Contact	: Lindsay Rear	Account Manager	: Hilary Woods
Address	: Suite 1000 - 1050 W. Pender St Vancouver BC Canada V6E 3S7	Address	: 8081 Lougheed Highway Burnaby BC Canada V5A 1W9
Telephone	: ----	Telephone	: +1 604 253 4188
Project	: GWQ (HLF)	Date Samples Received	: 15-Jul-2020 16:50
PO	: 14043	Date Analysis Commenced	: 15-Jul-2020
C-O-C number	: 20200714a	Issue Date	: 20-Jul-2020 09:43
Sampler	: KT/KB/JJ/SB		
Site	: ----		
Quote number	: Q68199		
No. of samples received	: 2		
No. of samples analysed	: 2		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Angelo Salandanan	Lab Assistant	Metals, Burnaby, British Columbia
Dee Lee	Analyst	Metals, Burnaby, British Columbia
Kevin Duarte	Team Leader - Inorganics	Inorganics - Water Quality, Burnaby, British Columbia
Kim Jensen	Department Manager - Metals	Metals, Burnaby, British Columbia
Tracy Harley	Supervisor - Water Quality Instrumentation	Inorganics - Water Quality, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
µS/cm	Microsiemens per centimetre
mg/L	milligrams per litre
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in reports identified as "Preliminary Report" are considered authorized for use.

Qualifiers

Qualifier	*Description*
SFT	*Sample was filtered due to turbidity interference. Result reflects soluble analyte concentration.*

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Lindsay Gung	Supervisor - Water Chemistry	Inorganics - Water Quality, Burnaby, British Columbia
Ophelia Chiu	Supervisor - Organics Instrumentation	Organics, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
%	percent
mg/kg	milligrams per kilogram

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in reports identified as "Preliminary Report" are considered authorized for use.

APPENDIX A – Summary of test conditions

Table 1. Summary of test conditions: 96-h rainbow trout (*Oncorhynchus mykiss*) single concentration test.

Test species	*Oncorhynchus mykiss*
Organism source	Hatchery
Organism age	Juvenile
Test type	Static
Test duration	96 hours
Test vessel	20-L glass aquarium
Test volume	10 to 20 L (depending on size of fish)
Test solution depth	≥15 cm
Test concentrations	100% (undiluted) sample, plus laboratory control
Test replicates	1 per treatment
Number of organisms	10 per replicate
Control/dilution water	Dechlorinated Metro Vancouver municipal tapwater
Test solution renewal	None
Test temperature	15 ± 1°C
Feeding	None
Light intensity	100 to 500 lux
Photoperiod	16 hours light / 8 hours dark
Aeration	6.5 ± 1 mL/min/L
Test measurements	Temperature, dissolved oxygen and pH measured daily; salinity measured in the undiluted sample at test initiation; conductivity measured at test initiation and termination; survival checked daily
Test protocol	Environment Canada (2000), EPS 1/RM/13, with 2007 & 2016 amendments
Test endpoints	Survival
Test acceptability criterion for controls	Survival ≥90%
Reference toxicant	Zinc (added as $ZnSO_4$)

Table 2. Summary of test conditions: 48-h *Daphnia magna* single concentration test.

Test species	*Daphnia magna*
Organism source	In-house culture
Organism age	<24-hour old neonates
Test type	Static
Test duration	48 hours
Test vessel	250-mL glass beaker
Test volume	200 mL
Test solution depth	6 cm
Test concentrations	100% (undiluted) sample, plus laboratory control
Test replicates	3 per treatment
Number of organisms	10 per replicate
Control/dilution water	Moderately-hard reconstituted water + 2.5 µg/L Se
Test solution renewal	None
Test temperature	20 ± 2°C
Feeding	None
Light intensity	400 to 800 lux
Photoperiod	16 hours light / 8 hours dark
Aeration	None
Test measurements	Temperature, dissolved oxygen and pH measured daily; salinity, hardness and alkalinity measured in the undiluted sample at test initiation; conductivity measured at test initiation and termination; survival checked daily
Test protocol	Environment Canada (2000), EPS 1/RM/14, with 2016 amendments
Test endpoint	Survival
Test acceptability criterion for controls	Survival ≥90%
Reference toxicant	Sodium chloride (NaCl)

Rainbow Trout Summary Sheet

Client: ALS Environmental

Start Date/Time: 14 Jul 20 @ 1708h

Work Order No.: 201300

Test Species: *Oncorhynchus mykiss*

Test Validity Criteria:
≥ 90% control survival
WQ Ranges:
T (°C) = 15 ± 1; DO (mg/L) = 7.0 to 10.3; pH = 5.5 to 8.5

Sample Information:

Sample ID: VA20B0234-005 W22
Sample Date: 11 Jul 20
Date Received: 14 Jul 20
Sample Volume: 2 x 10L
Other: —

Dilution Water:

Type: Dechlorinated Municipal Tap Water
Hardness (mg/L $CaCO_3$): 13
Alkalinity (mg/L $CaCO_3$): 16

Test Organism Information:

Batch No.: 062220a
Source: Lyndon Fish Hatcheries
No. Fish/Volume (L): 10/12L
Loading Density (g/L): 0.28
Mean Length ± SD (mm): 33 ± 3 Range: 28 - 36
Mean Weight ± SD (g): 0.34 ± 0.08 Range: 0.21 - 0.48

Zinc Reference Toxicant Results:

Reference Toxicant ID: RTZnL063
Stock Solution ID: 20Zn02
Date Initiated: 14 Jul 20
96-h LC50 (95% CL): 70.7 (51.9 - 96.1) µg/L Zn

Reference Toxicant Mean and Historical Range: 88.2 (35.4 - 219.9) µg/L Zn
Reference Toxicant CV (%): 48%

Test Results: 100% survival at 96h in the 100% (v/v) undiluted sample.

1 INTRODUCTION

This discharge exceedance report summarizes the implementation of certain water management strategies that were necessary to address rapid snowmelt, reduction of the main control pond capacity and the decision to discharge pond water above WUL discharge criteria to an exfiltration sump during the period of April 20-28, 2020. The exfiltration sump is located approximately 300 meters upgradient of the Lower Dublin South Pond (LDSP) (also referred to as the Control Pond), in the lower Dublin Gulch Valley. The sump area is occupied by a thick (over 20 m) sequence of placer deposits and alluvium that overlies bedrock. The sump was previously used successfully in 2018 during construction activities, and at that time was deemed to be an acceptable measure for addressing an excess of runoff water collected from construction activities. Thus, in this case, exfiltrating the water to ground was ascertained to have the lowest potential for an adverse response in the receiving environment as it allows for natural mitigation of total suspended solids (TSS), the main parameter of concern, through natural filtration, as opposed to direct discharge to receiving waters (e.g., Haggart Creek).

On April 20, 2020, prior to any discharge, notification was provided to regulators and the FNNND regarding the planned discharge of water from the control pond to the exfiltration sump. The following were notified:

- Yukon Energy Mines and Resources (EMR) Compliance Inspector,
- Environment and Climate Change Canada (ECCC) Compliance Inspector, and
- FNNND Lands and Resources Manager.

On April 30, 2020, and within 24 hours of receiving the analytical laboratory results, notification was provided to the Yukon Spill Reporting hotline for water quality exceeding licence criteria (total suspended solids [TSS] and total arsenic) from the discharge water pumped to the exfiltration sump. Subsequent to the notification provided to the Yukon Spill Reporting hotline, additional laboratory results were received and an exceedance of licence criteria for total iron was also identified.

This report provides an event summary, release details, environmental factors and pre-discharge responses leading up to the release, and spill reporting.

2 EVENT SUMMARY

Through the winter of 2019-2020, Victoria Gold (Yukon) Corp. (VGC) developed a water management strategy for the 2020 freshet period at the Eagle Gold Project (Project) that involved the controlled release of site contact waters through the LDSP in accordance with the terms of the Type A Water Use Licence QZ14-041-1 (WUL). In addition to the controlled discharge, a portion of the water within the LDSP was also to be transferred to the Events Pond for use as process water. In preparation for the execution of this strategy, a number of pre-discharge water quality samples were sent for analysis at ALS Laboratories to confirm that the water quality within the LDSP was suitable for release in accordance with WUL criteria. The laboratory results for samples taken April 9 to April 15, 2020 showed water quality within the LDSP was acceptable for discharge.

The water management strategy involving a release of water from the LDSP, instead of full retention for use as process water, was in response to the highest recorded snowfall since measurements began in 2007 (about 45% higher than previous maximum).

In the days prior to the planned execution of the controlled discharge, above average seasonal temperatures in mid-April 2020 were experienced, leading to a substantial amount of snowmelt runoff, which resulted in high flow rates and high total suspended solids (TSS) within site ditches draining to the LDSP. The high flows caused a minor breach along ditch A (on the afternoon of April 15) and, as a result, water reported directly into the LDSP rather than into the forebay, thereby shortening the circuit for settling. During the short term that the breach was open, inflow water bypassed the forebay, degrading the overall water quality at the planned discharge point (i.e., the low level outlet or LLO of the LDSP). Plans were in place to transfer water to the Events Pond, but based on the recorded pond fill rate, additional measures such as exfiltration were deemed necessary to avoid a direct discharge from the LDSP to Haggart Creek. As noted above, exfiltrating the water to ground was ascertained to have the lowest potential for an adverse response in the receiving environment as opposed to a direct discharge to Haggart Creek.

Pumping was initiated first to the Events Pond at a rate of approximately 150 m^3/hr at 14:00 on April 19, 2020, and then pumping to the exfiltration sump was initiated at a rate of approximately 185 m^3/hr at 16:00 on April 20, 2020. Daily monitoring of the LDSP water levels, pump outflows and ditch inflows continued and demonstrated that continued pumping to both the Events Pond and the sump would allow a return to a safe operating capacity (deemed to be sufficient to hold a 5-year rainfall runoff event) in the LDSP over time. The time period required was dependent on weather conditions (and ultimately snowmelt rate) and pumping rates.

Based on monitoring data results, discharge into an exfiltration sump for a period of nine days (April 20-28, 2020), was undertaken at which time the safe operating capacity of the pond was reached. While the exfiltration pumps were turned off, pumping to the Events Pond has continued to be necessary to address continuing high snowmelt runoff rates and to maintain the safe operating capacity.

In general, during a discharge the WUL requires daily monitoring of flow and field parameters (e.g., pH, specific conductance, dissolved oxygen and temperature), a weekly collection of water samples to be analyzed for a full suite of parameters and a monthly collection of water samples for acute lethality testing. Water quality results for this discharge event indicated that WUL Effluent Quality Standards (EQS) were exceeded for three parameters, TSS, total arsenic and total iron.

3 RELEASE DETAILS

3.1 PRE-DISCHARGE SAMPLING

In preparation for the planned release of contact water from the LDSP water quality samples were collected for lab analyses on April 9, 13, 14, 15, and 16 at station LDSPs (i.e., the LDSP shoreline adjacent to the pump caisson low level outlet which is a pre-discharge sampling location). The sample collected on April 16 was taken after the breach of Ditch A. Pertinent water quality results are shown in Table 3-1 (full results in Appendix A), and shows that TSS of the April 16 sample was above WUL criterion of 15 mg/L and had increased significantly (2.6X) from the previous day reflecting water quality deterioration associated with the low residence time. Based on visual observations of the deteriorating water clarity in the pond (and before final lab results were received), the planned discharge to Haggart Creek was cancelled.

NOTES:
N/S – not sampled

To comply with the requirements of the *Metals and Diamond Mining Effluent* (MDMER) and the WUL, a pre-discharge sample for acute lethality single concentration test for 96 hr rainbow trout and 48 hr Daphnia magna (was taken on April 9, 2020 and sent to Nautilus Environmental Labs in Burnaby, BC. The results for these tests are included in Appendix B. The results for these tests indicated that the contact water within the LDSP was not acutely lethal, and showed 100% survival for both rainbow trout and Daphnia magna.

3.2 EVENT DESCRIPTION

During the few days leading up to the release, it became apparent through daily monitoring of the LDSP water levels that the available capacity of the pond was decreasing rapidly. While considering the volume of the remaining snowpack on north facing areas of the Project, and to ensure that a controlled discharge could be undertaken with the lowest potential for environmental impact, the decision was made to pump water from the LDSP to the exfiltration sump in the Dublin Gulch valley used previously during the construction phase of the Project (identified as FDP#5 under MDMER filings made by VGC). Pumping to the exfiltration sump commenced on April 20, 2020 at 16:30 and continued to April 28, 2020 at 07:30. Water quality sampling and flow monitoring at the frequencies and scope required by the WUL and the MDMER for effluent and the receiving water bodies were collected during the discharge from April 20 – 28, 2020. As per WUL criteria, a full suite of parameters was

collected at FDP#5 twice during the nine days (April 21 and April 27), while all other days only field parameters were collected. No water samples were collected before the pump was shut off in the early morning of April 28, 2020.

The analytical results for discharge at FDP#5 are provided in Table 3-2 below for April 20-27, 2020. Analytical results are included in Appendix A.

Notes:
N/S – Not required under WUL - not sampled

Laboratory results indicated that on April 20, 21 and 27, 2020 the EQS for this discharge event exceeded WUL criteria for TSS and total arsenic, and exceeded WUL criteria for total iron on April 27, 2020. All other parameters were within WUL criteria.

During discharge to the exfiltration sump, water from the LDSP continued to be pumped to the Events Pond as per the freshet management strategy noted above. When exfiltration pumps were turned off in the early morning of April 28, water transfers from the LDSP to the Events Pond were still necessary and have been ongoing to the present day.

3.3 RECEIVING ENVIRONMENT MONITORING

The receiving water body related to the Project is Haggart Creek. The WUL, and VGC monitoring programs under the Environmental Monitoring, Surveillance and Adaptive Management Plan (EMSAMP), consider monitoring locations and water quality objectives on Haggart Creek. The locations considered in the WUL and the EMSAMP were monitored throughout the discharge event at the following locations:

- Upstream of the Project influence (W22);
- Within the Project influence downstream of the Dublin Gulch and Ditch C (W4) confluences; and,
- Downstream of inflows from Eagle Creek (W29) (downstream of W4).

Dublin Gulch was also monitored at upstream (W1) and downstream (W21) locations on April 21, 2020 to evaluate how background freshet runoff was impacting downstream water quality in Haggart Creek. The analytical results for receiving water body compliance locations are provided in Table 3-3 below for April 20-27, 2020.

Table 3-3: Receiving Environment and Project Area Watercourse Water Quality Results

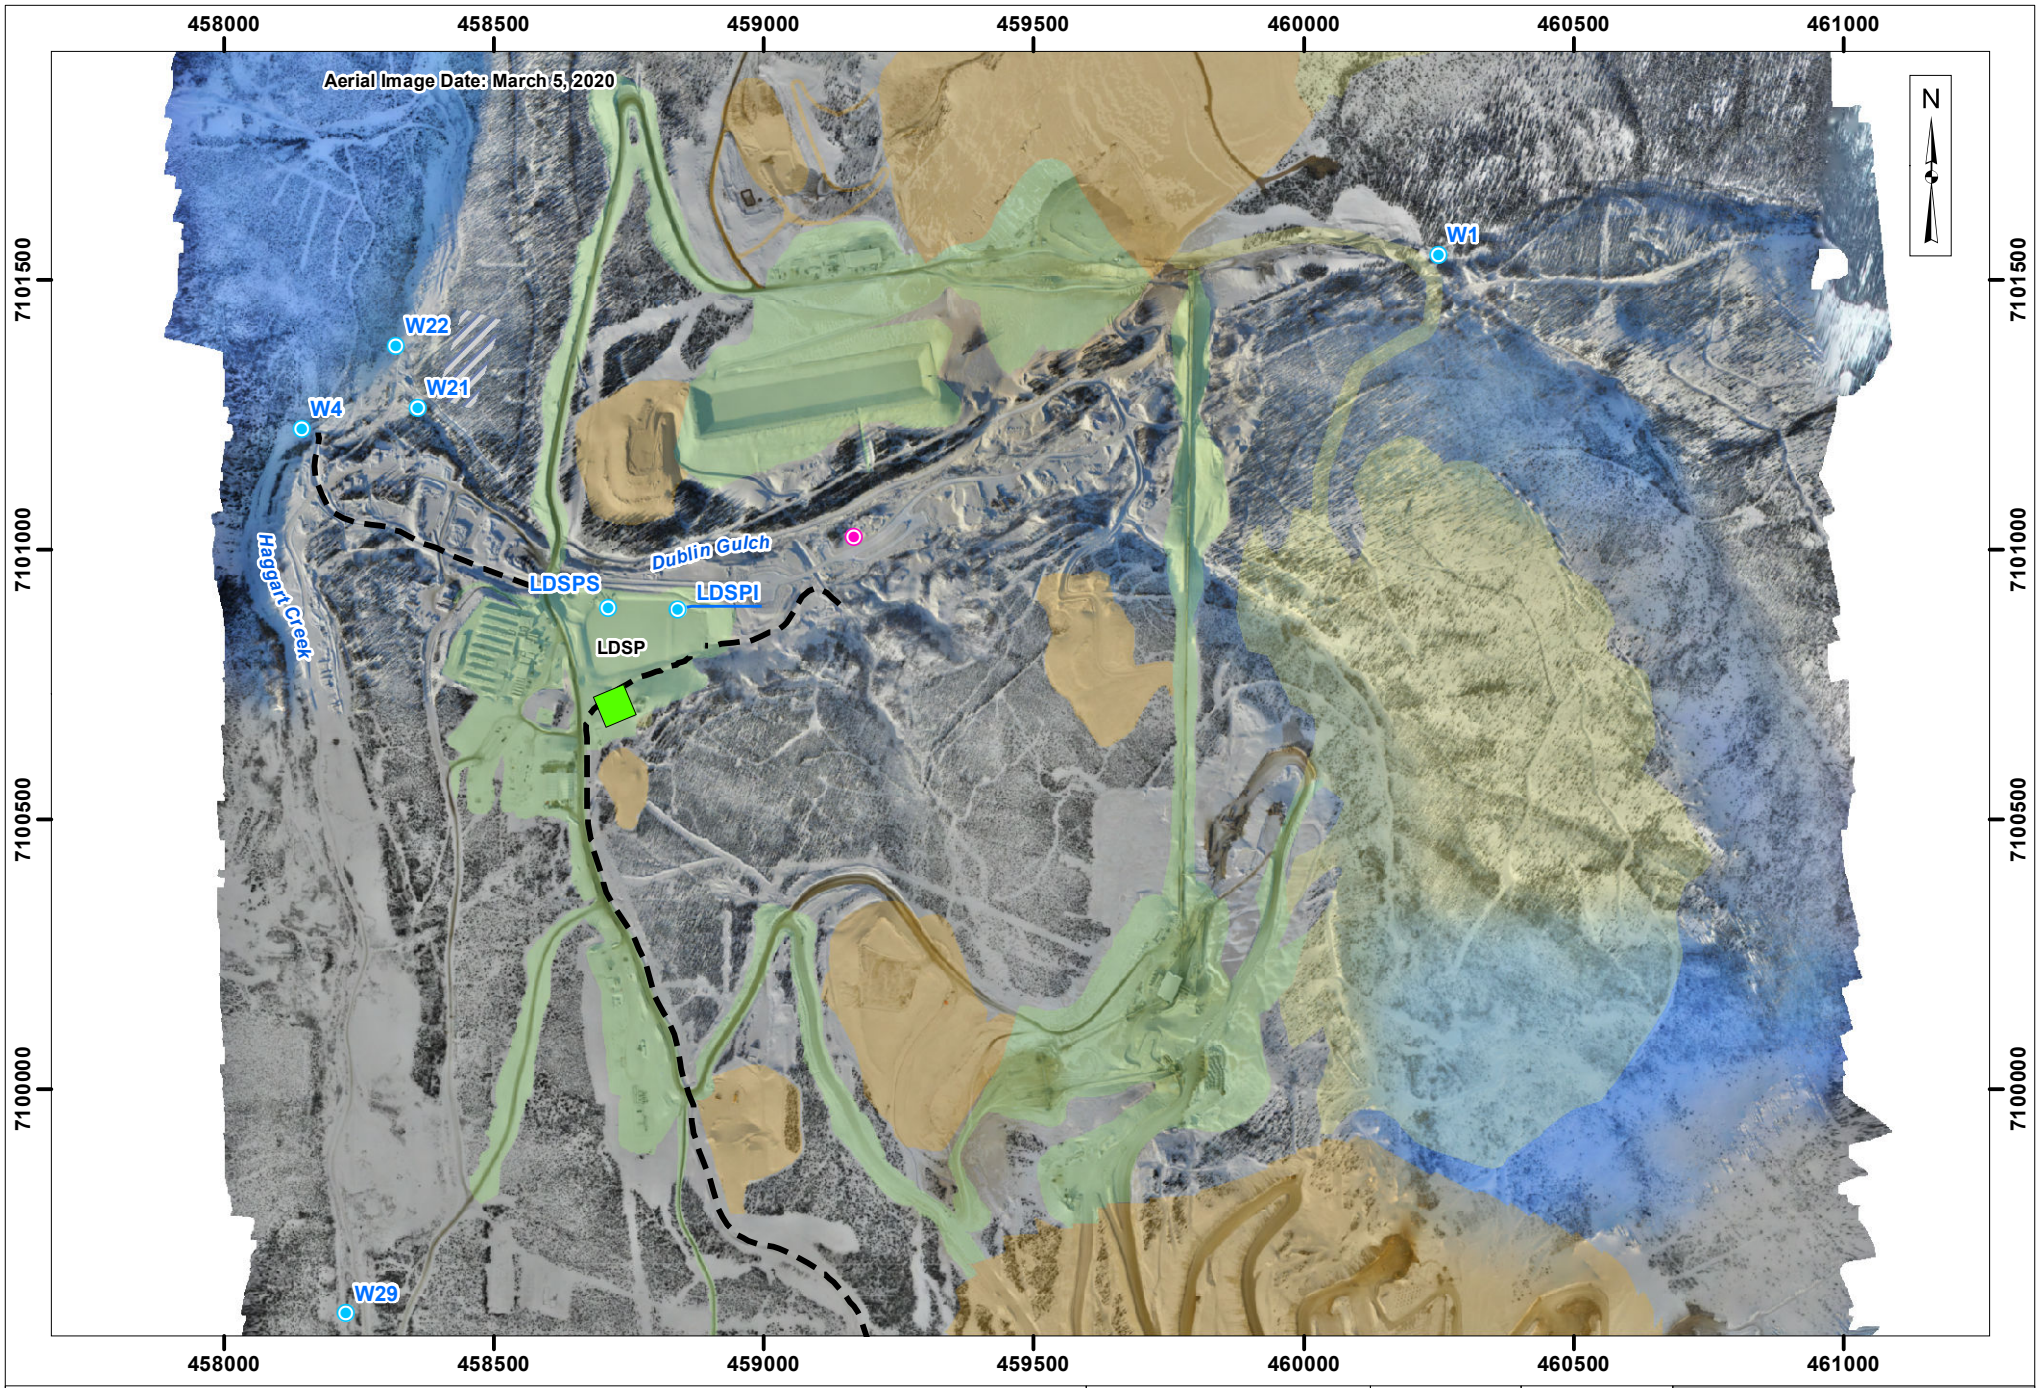
Notes:
N/S – Not required under WUL - not sampled

Water quality in Haggart showed an increase in TSS and total arsenic between the upstream (W22) and downstream (W4) sites. On April 21, dissolved and total arsenic in W21 was 2.9X and 2.4X, respectively, the concentration in W4, indicating that the high concentrations of dissolved and total As in W1 and W21 are the chief reasons for the increase in dissolved and total As in W4; also the dissolved As concentration (i.e., most likely the bioavailable form) does not increase from W1 to W21 (both about 30 ppb), indicating that the main source of dissolved arsenic in Haggart Creek and Dublin Gulch originates in upper Dublin Gulch.



Based on April 21 sampling, TSS in Dublin Gulch W21 (940 mg/L) is the chief reason for the increase in TSS in Haggart Creek between W22 (<3.0 mg/L) and W4 (308 mg/L); also the total TSS concentration increases substantially from W1 to W21, indicating that the main source of TSS in the streams originates from the reaches along Dublin Gulch between W1 and W21. Importantly, at the same time (April 21), the TSS in the water discharged to the exfiltration sump was only 53 mg/L, substantially lower than the TSS in W21.This data most likely reflects the difficulty in managing snowmelt generated sediment-laden runoff coming from the Dublin Gulch road (and not any effect from the discharge to the sump), which has been documented in previous years to have high TSS during freshet.

3.4 ACUTE LETHALITY TESTING

A full suite water sample including an acute lethality single concentration test for 96 hr rainbow trout and 48 hr Daphnia magna and a sublethal toxicity test was taken on April 21, 2020 of the water being exfiltrated to the sump (FDP#5). The same sample suite was conducted at the inlet to the control pond (i.e., LDSPI). The results for acute toxicity tests are included in Appendix B. The results for these tests show that the discharged water and LDSP inflow were not acutely lethal, and showed 100% survival for both rainbow trout and Daphnia magna for the exfiltrated water and 97% survival for Daphnia magna for the LDSP inflow water (Table 3-4). Sublethal test results are still pending.

Table 3-4: Acute Lethality Testing Results

Sample Location on April 21, 2020	Percent survival in 100% (v/v) sample	
	Rainbow Trout	*Daphnia magna*
LDSPI (Work Order #VA20A5149)	100	97
FDP#5 (Work Order #VA20A5153)	100	100

FDP#5 Effluent Deposit Location

4 IMPORTANT ENVIRONMENTAL AND SITE FACTORS

Despite early planning efforts by VGC, a number of environmental and site factors occurred that influenced the field decision to discharge contact water to ground. These included:

- Record snowfall about 45% above previously recorded maximum resulted in extremely high volumes of snowmelt reporting to the LDSP.
- As demonstrated in Figure 4-1, unseasonably warm temperatures were sustained from April 15 to April 22, where it was the first time in the year that temperatures ranged up to 10ºC and when both day and night temperatures were essentially above freezing. This condition occurred after a lengthy cold period that extended to April 12. While above zero temperatures occurred during the short period from April 12 to April 15, overall temperatures were not warm enough over a long enough stretch to generate significant snowmelt. Based on the temperature data alone, snowmelt rates would have increased substantially during April 15 to 22, especially during the 18th and 19th of April.

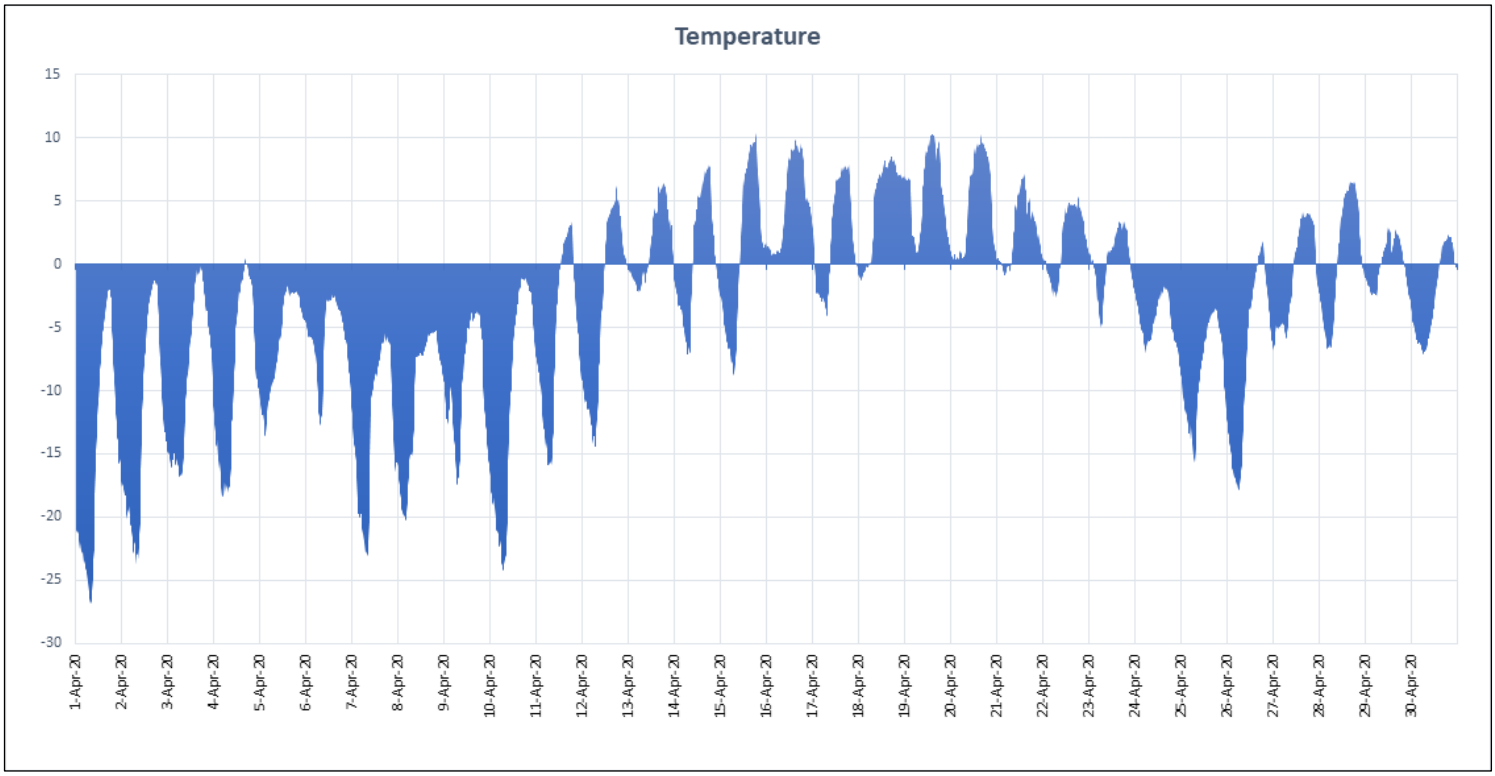

Figure 4.1: Camp Weather Station Temperature Data - April 2020

- The COVID-19 pandemic situation reduced staff capacity and restricted access to the site for potential replacement workers, either through isolation or health requirements mandated by the Yukon Chief

Medical Officer. This made it difficult for workers to proactively respond to necessary water management set up required through March and April as travel and health restrictions came into effect across the Yukon during this time.

- LDSP pumping infrastructure to the Events Pond:
    - An 8-inch pipeline and pump was previously installed in 2019, but had been decommissioned for the winter. Re-installation of the line in 2020 was challenging with frozen conditions, high snowpack and a reduced workforce delaying the overall progress, thus not allowing sufficient time to reduce LDSP water levels by pumping to the Events Pond prior to the onset of the snowmelt. The pipeline is now a permanent installation and will remain in place for next spring freshet and ongoing management of LDSP water levels.
    - The 150 m^3/hr submersible pump located in the LDSP was not fully winterized and required maintenance before it could convey water to the Events Pond this spring. This pump will receive pre-winterization maintenance in 2020, and will be tested next spring prior to freshet.
    - Additional pumping infrastructure from the LDSP to the Events Pond was required to keep up with the substantial inflows to the LDSP due to the high snowpack and fast melt. The additional line and pump will be made available next spring prior to freshet.
- Ditch A infrastructure:
    - Ditch A is a riprap lined ditch designed to convey the 100-year runoff event. During the amendment of the WUL, a management strategy requiring the use of pipes to address potential seepage losses in the ditch was required by the Yukon Water Board. To address this requirement, a 24-inch pipe was placed in the ditch to convey flows from the Ditch A sump at the base of the Platinum Gulch Waste Rock Storage Area to the LDSP. The pipe and ditch configuration has reduced the carrying capacity of the ditch and also limits efficient cleanout of the ditch. The inability to effectively remove sediment from Ditch A due to the presence of the pipe contributed to the breach of the ditch and the subsequent release of sediment laden runoff into the lined portion of the LDSP, bypassing the forebay inlet and thus losing the settling time required for the runoff to achieve discharge criteria.

Photo 1: LDSP is still frozen with no documented inflow from ditches, April 14, 2020

5 SPILL REPORTING

5.1 YUKON GOVERNMENT AND FNNND

On April 20, 2020, prior to any discharge, notification was provided to regulators and the FNNND of the planned discharge of mine contact water from the control pond to an exfiltration sump located east of the control pond. The following people were included in these notifications:

- Yukon Energy Mines and Resources (EMR) Compliance Inspector.
- Environment and Climate Change Canada (ECCC) Compliance Inspector.
- FNNND Lands and Resources Manager.

On April 30, 2020 upon receipt of analytical laboratory results, notification was provided within 24 hours to the Yukon Spill Reporting hotline for water quality exceeding regulatory criteria (total suspended solids [TSS] and total arsenic) within discharge water to the exfiltration sump. Follow up notification was provided to the above regulators and the FNNND with information on the water quality exceedance.

Richard Chong		Inorganics - Water Quality, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
%	percent
µS/cm	Microsiemens per centimetre
Bq/L	Becquerels per litre
meq/L	milliequivalents per litre
mg/L	milligrams per litre
NTU	nephelometric turbidity units
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in reports identified as "Preliminary Report" are considered authorized for use.

ALS ENVIRONMENTAL ANALYTICAL REPORT

	Sample ID	L2437811-1	L2437811-2	L2437811-3		
	Description	Water	Water	Water		
	Sampled Date	13-APR-20	14-APR-20	15-APR-20		
	Sampled Time					
	Client ID	LDSPS	LDSPS	LDSPS		
Grouping	**Analyte**					
WATER						
Physical Tests	pH (pH)	8.23	8.22	8.21		
	Total Suspended Solids (mg/L)	4.8	8.4	10.4		
	Total Dissolved Solids (mg/L)	425	372	314		
	Turbidity (NTU)	1.28	5.07	10.0		

Reference Information

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
EC-SCREEN-VA	Water	Conductivity Screen (Internal Use Only)	APHA 2510
Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc.			
PH-PCT-VA	Water	pH by Meter (Automated)	APHA 4500-H pH Value
This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode It is recommended that this analysis be conducted in the field.			
TDS-VA	Water	Total Dissolved Solids by Gravimetric	APHA 2540 C - GRAVIMETRIC
This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, TDS is determined by evaporating the filtrate to dryness at 180 degrees celsius.			
TSS-VA	Water	Total Suspended Solids by Gravimetric	APHA 2540 D - GRAVIMETRIC
This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.			
TURBIDITY-VA	Water	Turbidity by Meter	APHA 2130 Turbidity
This analysis is carried out using procedures adapted from APHA Method 2130 "Turbidity". Turbidity is determined by the nephelometric method.			

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
VA	ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA

Chain of Custody Numbers:

1 OF 1

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.
mg/kg - milligrams per kilogram based on dry weight of sample.
mg/kg wwt - milligrams per kilogram based on wet weight of sample.
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.
mg/L - milligrams per litre.
< - Less than.
D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Select Service Level Below - Contact your AM to confirm all E&P TATs (surcharges may apply)

Regular [R] ☑ Standard TAT if received by 3 pm - business days - no surcharges apply

(Business days)
- 4 day [P4-20%] ☐
- 3 day [P3-25%] ☐
- 2 day [P2-50%] ☐

EMERGENCY
- 1 Business day [E1 - 100%] ☑
- Same Day, Weekend or Statutory holiday [E2 -200% (Laboratory opening fees may apply)] ☐

Date and Time Required for all E&P TATs:

For tests that can not be performed according to the service level selected, you will be contacted.

Analysis Request

Indicate Filtered (F), Preserved (P) or Filtered and Preserved (F/P) below

Drinking Water (DW) Samples[1] (client use)

Are samples taken from a Regulated DW System? ☐ YES ☑ NO

Are samples for human consumption/ use? ☐ YES ☑ NO

Special Instructions / Specify Criteria to add on report by clicking on the drop-down list below (electronic COC only)

Please include Yukon Government EQWin format

SAMPLE CONDITION AS RECEIVED (lab use only)

Frozen ☐ SIF Observations Yes ☐ No ☐

Ice Packs ☐ Ice Cubes ☐ Custody seal intact Yes ☐ No ☐

Cooling Initiated ☐

INITIAL COOLER TEMPERATURES °C	FINAL COOLER TEMPERATURES °C

Site	: ----		
Quote number	: Q68199		
No. of samples received	: 2		
No. of samples analysed	: 2		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Angelo Salandanan	Lab Assistant	Metals, Burnaby, British Columbia
Bruna Botti	Analyst	Inorganics - Water Quality, Burnaby, British Columbia
Caitlin Macey	Team Leader - Inorganics	Inorganics - Water Quality, Burnaby, British Columbia
Cristina Alexandre	Supervisor - Metals ICP Instrumentation	Metals, Burnaby, British Columbia
Erick Magalhaes	Laboratory Analyst	Inorganics - Water Quality, Burnaby, British Columbia
Evan Ben-Oliel	Metal Analyst	Metals, Burnaby, British Columbia
Kevin Duarte	Team Leader - Inorganics	Inorganics - Water Quality, Burnaby, British Columbia
Lindsay Gung	Supervisor - Water Chemistry	Inorganics - Water Quality, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
%	percent
µS/cm	Microsiemens per centimetre
meq/L	milliequivalents per litre
mg/L	milligrams per litre
NTU	nephelometric turbidity units
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in reports identified as "Preliminary Report" are considered authorized for use.

Qualifiers

Qualifier	*Description*
DTS	*Dissolved Sulfur concentration exceeds total. Negative bias on Total Sulfur suspected due to presence of volatile sulfur species lost during digestion.*

Analytical Results

No. of samples analysed	: 6		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Aaron Yu	Laboratory Analyst	Metals, Burnaby, British Columbia
Angela Ren	Team Leader - Metals	Metals, Burnaby, British Columbia
Bruna Botti	Analyst	Inorganics - Water Quality, Burnaby, British Columbia
Caitlin Macey	Team Leader - Inorganics	Inorganics - Water Quality, Burnaby, British Columbia
Ilnaz Badbezanchi	Team Leader - Metals preparation	Metals, Burnaby, British Columbia
Jon Fisher	Department Manager - Inorganics	Inorganics, Waterloo, Ontario
Kim Jensen	Department Manager - Metals	Metals, Burnaby, British Columbia
Kinny Wu	Laboratory Analyst	Metals, Burnaby, British Columbia
Lindsay Gung	Supervisor - Water Chemistry	Inorganics - Water Quality, Burnaby, British Columbia
Robin Weeks	Team Leader - Metals	Inorganics - Water Quality, Burnaby, British Columbia
Robin Weeks	Team Leader - Metals	Metals, Burnaby, British Columbia
Shaneel Dayal	Metal Analyst	Metals, Burnaby, British Columbia
Tracy Harley	Supervisor - Water Quality Instrumentation	Inorganics - Water Quality, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
%	percent
µS/cm	Microsiemens per centimetre
meq/L	milliequivalents per litre
mg/L	milligrams per litre
NTU	nephelometric turbidity units
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in reports identified as "Preliminary Report" are considered authorized for use.

Qualifiers

Qualifier	*Description*
DLM	*Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).*
DTC	*Dissolved concentration exceeds total. Results were confirmed by re-analysis.*

CERTIFICATE OF ANALYSIS

Work Order	: **VA20A5185**	Page	: 1 of 6
Client	: **Victoria Gold (Yukon) Corp.**	Laboratory	: Vancouver - Environmental
Contact	: Bill Bowden	Account Manager	: Hilary Woods
Address	: Suite 1000 - 1050 W. Pender St Vancouver BC Canada V6E 3S7	Address	: 8081 Lougheed Highway Burnaby BC Canada V5A 1W9
Telephone	: 867.456.7700 ext. 6381	Telephone	: +1 604 253 4188
Project	: LDSP (April 21)	Date Samples Received	: 22-Apr-2020 14:15
PO	: 14043	Date Analysis Commenced	: 22-Apr-2020
C-O-C number	: 20200420B	Issue Date	: 29-Apr-2020 16:48
Sampler	: PE		
Site	: ----		
Quote number	: Q68199		
No. of samples received	: 1		
No. of samples analysed	: 1		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Aaron Yu	Laboratory Analyst	Metals, Burnaby, British Columbia
Angela Ren	Team Leader - Metals	Metals, Burnaby, British Columbia
Bruna Botti	Analyst	Inorganics - Water Quality, Burnaby, British Columbia
Caitlin Macey	Team Leader - Inorganics	Inorganics - Water Quality, Burnaby, British Columbia
Ilnaz Badbezanchi	Team Leader - Metals preparation	Metals, Burnaby, British Columbia
Kinny Wu	Laboratory Analyst	Metals, Burnaby, British Columbia
Lindsay Gung	Supervisor - Water Chemistry	Inorganics - Water Quality, Burnaby, British Columbia
Robin Weeks	Team Leader - Metals	Inorganics - Water Quality, Burnaby, British Columbia
Robin Weeks	Team Leader - Metals	Metals, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
%	percent
µS/cm	Microsiemens per centimetre
meq/L	milliequivalents per litre
mg/L	milligrams per litre
NTU	nephelometric turbidity units
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in reports identified as "Preliminary Report" are considered authorized for use.

CERTIFICATE OF ANALYSIS

Work Order	: **VA20A5153**	Page	: 1 of 7
Client	: **Victoria Gold (Yukon) Corp.**	Laboratory	: Vancouver - Environmental
Contact	: Bill Bowden	Account Manager	: Hilary Woods
Address	: Suite 1000 - 1050 W. Pender St Vancouver BC Canada V6E 3S7	Address	: 8081 Lougheed Highway Burnaby BC Canada V5A 1W9
Telephone	: 867.456.7700 ext. 6381	Telephone	: +1 604 253 4188
Project	: LDSP (April 21)	Date Samples Received	: 22-Apr-2020 14:15
PO	: 14043	Date Analysis Commenced	: 22-Apr-2020
C-O-C number	: 20200421a	Issue Date	: 07-May-2020 15:26
Sampler	: PE		
Site	: ----		
Quote number	: Q68199		
No. of samples received	: 1		
No. of samples analysed	: 1		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Bruna Botti	Analyst	Inorganics - Water Quality, Burnaby, British Columbia
Caitlin Macey	Team Leader - Inorganics	Inorganics - Water Quality, Burnaby, British Columbia
Cindy Tang	Team Leader - Inorganics	Inorganics - Water Quality, Burnaby, British Columbia
Erick Magalhaes	Laboratory Analyst	Inorganics - Water Quality, Burnaby, British Columbia
Evan Ben-Oliel	Metal Analyst	Metals, Burnaby, British Columbia
Hilary Woods	Account Manager	Internal Subcontracting, Fort Collins, Colorado
Ilnaz Badbezanchi	Team Leader - Metals preparation	Metals, Burnaby, British Columbia
Kaitlyn Gardner	Account Manager Assistant	External Subcontracting, Burnaby, British Columbia
Kevin Duarte	Team Leader - Inorganics	Inorganics - Water Quality, Burnaby, British Columbia
Kim Jensen	Department Manager - Metals	Metals, Burnaby, British Columbia
Kinny Wu	Laboratory Analyst	Metals, Burnaby, British Columbia
Lindsay Gung	Supervisor - Water Chemistry	Inorganics - Water Quality, Burnaby, British Columbia
Robin Weeks	Team Leader - Metals	Inorganics - Water Quality, Burnaby, British Columbia
Robin Weeks	Team Leader - Metals	Metals, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
%	percent
µS/cm	Microsiemens per centimetre
Bq/L	Becquerels per litre
meq/L	milliequivalents per litre
mg/L	milligrams per litre
NTU	nephelometric turbidity units
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in reports identified as "Preliminary Report" are considered authorized for use.

Workorder Comments

A matrix spike was carried out for at least one analytical batch of E358 analysis, but is not found in the attached QC report. ALS Data Quality Objectives for recovery were met

A matrix spike was carried out for at least one analytical batch of E375-T analysis, but is not found in the attached QC report. ALS Data Quality Objectives for recovery were met

CERTIFICATE OF ANALYSIS

Work Order	: **VA20A5149**	Page	: 1 of 7
Client	: **Victoria Gold (Yukon) Corp.**	Laboratory	: Vancouver - Environmental
Contact	: Bill Bowden	Account Manager	: Hilary Woods
Address	: Suite 1000 - 1050 W. Pender St Vancouver BC Canada V6E 3S7	Address	: 8081 Lougheed Highway Burnaby BC Canada V5A 1W9
Telephone	: 867.456.7700 ext. 6381	Telephone	: +1 604 253 4188
Project	: WUL SWQ Discharge	Date Samples Received	: 22-Apr-2020 14:15
PO	: 14043	Date Analysis Commenced	: 22-Apr-2020
C-O-C number	: 20200421b	Issue Date	: 07-May-2020 15:23
Sampler	: PE		
Site	: ----		
Quote number	: Q68199		
No. of samples received	: 2		
No. of samples analysed	: 2		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Angela Ren	Team Leader - Metals	Metals, Burnaby, British Columbia
Brieanna Allen	Department Manager - Organics	Metals, Burnaby, British Columbia
Bruna Botti	Analyst	Inorganics - Water Quality, Burnaby, British Columbia
Caitlin Macey	Team Leader - Inorganics	Inorganics - Water Quality, Burnaby, British Columbia
Dan Gebert		Metals, Burnaby, British Columbia
Erick Magalhaes	Laboratory Analyst	Metals, Burnaby, British Columbia
Evan Ben-Oliel	Metal Analyst	Metals, Burnaby, British Columbia
Hilary Woods	Account Manager	Internal Subcontracting, Fort Collins, Colorado
Ilnaz Badbezanchi	Team Leader - Metals preparation	Metals, Burnaby, British Columbia
Jon Fisher	Department Manager - Inorganics	Inorganics, Waterloo, Ontario
Kaitlyn Gardner	Account Manager Assistant	External Subcontracting, Burnaby, British Columbia
Kinny Wu	Laboratory Analyst	Metals, Burnaby, British Columbia
Lindsay Gung	Supervisor - Water Chemistry	Inorganics - Water Quality, Burnaby, British Columbia
Miles Gropen	Department Manager - Inorganics	Inorganics - Water Quality, Burnaby, British Columbia
Robin Weeks	Team Leader - Metals	Metals, Burnaby, British Columbia
Tracy Harley	Supervisor - Water Quality Instrumentation	Inorganics - Water Quality, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
%	percent
µS/cm	Microsiemens per centimetre
Bq/L	Becquerels per litre
meq/L	milliequivalents per litre
mg/L	milligrams per litre
NTU	nephelometric turbidity units
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in reports identified as "Preliminary Report" are considered authorized for use.

Qualifiers

Qualifier	*Description*
DLA	*Detection Limit adjusted for required dilution.*

CERTIFICATE OF ANALYSIS

Work Order	: **VA20A5167**	Page	: 1 of 7
Client	: **Victoria Gold (Yukon) Corp.**	Laboratory	: Vancouver - Environmental
Contact	: Bill Bowden	Account Manager	: Hilary Woods
Address	: Suite 1000 - 1050 W. Pender St Vancouver BC Canada V6E 3S7	Address	: 8081 Lougheed Highway Burnaby BC Canada V5A 1W9
Telephone	: 867.456.7700 ext. 6381	Telephone	: +1 604 253 4188
Project	: Receiving /Reference Apr 21	Date Samples Received	: 22-Apr-2020 14:15
PO	: 14043	Date Analysis Commenced	: 22-Apr-2020
C-O-C number	: 20200421b	Issue Date	: 07-May-2020 15:57
Sampler	: PE		
Site	: ----		
Quote number	: Q68199		
No. of samples received	: 3		
No. of samples analysed	: 2		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Aaron Yu	Laboratory Analyst	Metals, Burnaby, British Columbia
Bruna Botti	Analyst	Inorganics - Water Quality, Burnaby, British Columbia
Caitlin Macey	Team Leader - Inorganics	Inorganics - Water Quality, Burnaby, British Columbia
Evan Ben-Oliel	Metal Analyst	Metals, Burnaby, British Columbia
Hilary Woods	Account Manager	Internal Subcontracting, Fort Collins, Colorado
Ilnaz Badbezanchi	Team Leader - Metals preparation	Metals, Burnaby, British Columbia
Jon Fisher	Department Manager - Inorganics	Inorganics, Waterloo, Ontario
Kevin Duarte	Team Leader - Inorganics	Inorganics - Water Quality, Burnaby, British Columbia
Kinny Wu	Laboratory Analyst	Metals, Burnaby, British Columbia
Lindsay Gung	Supervisor - Water Chemistry	Inorganics - Water Quality, Burnaby, British Columbia
Matthew Woods	Lab Assistant	Metals, Burnaby, British Columbia
Robin Weeks	Team Leader - Metals	Inorganics - Water Quality, Burnaby, British Columbia
Robin Weeks	Team Leader - Metals	Metals, Burnaby, British Columbia
Tracy Harley	Supervisor - Water Quality Instrumentation	Inorganics - Water Quality, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
%	percent
µS/cm	Microsiemens per centimetre
Bq/L	Becquerels per litre
meq/L	milliequivalents per litre
mg/L	milligrams per litre
NTU	nephelometric turbidity units
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in reports identified as "Preliminary Report" are considered authorized for use.

CERTIFICATE OF ANALYSIS

Work Order	: **WR2000145**	Page	: 1 of 6
Client	: **Victoria Gold (Yukon) Corp.**	Laboratory	: Whitehorse - Environmental
Contact	: Bill Bowden	Account Manager	: Hilary Woods
Address	: Suite 1000 - 1050 W. Pender St Vancouver BC Canada V6E 3S7	Address	: #12 151 Industrial Road Whitehorse YT Canada Y1A 2V3
Telephone	: 867.456.7700 ext. 6381	Telephone	: +1 867 668 6689
Project	: SWQ APR	Date Samples Received	: 23-Apr-2020 09:00
PO	: 14043	Date Analysis Commenced	: 26-Apr-2020
C-O-C number	: 20200421	Issue Date	: 04-May-2020 13:51
Sampler	: JW, PS		
Site	: ----		
Quote number	: Q68199		
No. of samples received	: 2		
No. of samples analysed	: 2		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Angela Ren	Team Leader - Metals	Metals, Burnaby, British Columbia
Angelo Salandanan	Lab Assistant	Metals, Burnaby, British Columbia
Bruna Botti	Analyst	Inorganics - Water Quality, Burnaby, British Columbia
Caitlin Macey	Team Leader - Inorganics	Inorganics - Water Quality, Burnaby, British Columbia
Evan Ben-Oliel	Metal Analyst	Metals, Burnaby, British Columbia
Ilnaz Badbezanchi	Team Leader - Metals preparation	Metals, Burnaby, British Columbia
Lindsay Gung	Supervisor - Water Chemistry	Inorganics - Water Quality, Burnaby, British Columbia
Robin Weeks	Team Leader - Metals	Inorganics - Water Quality, Burnaby, British Columbia
Robin Weeks	Team Leader - Metals	Metals, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
%	percent
µS/cm	Microsiemens per centimetre
meq/L	milliequivalents per litre
mg/L	milligrams per litre
NTU	nephelometric turbidity units
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in reports identified as "Preliminary Report" are considered authorized for use.

Qualifiers

Qualifier	*Description*
DTC	*Dissolved concentration exceeds total. Results were confirmed by re-analysis.*

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Aaron Yu	Laboratory Analyst	Metals, Burnaby, British Columbia
Angela Ren	Team Leader - Metals	Metals, Burnaby, British Columbia
Bruna Botti	Analyst	Inorganics - Water Quality, Burnaby, British Columbia
Caitlin Macey	Team Leader - Inorganics	Inorganics - Water Quality, Burnaby, British Columbia
Cristina Alexandre	Supervisor - Metals ICP Instrumentation	Metals, Burnaby, British Columbia
Erick Magalhaes	Laboratory Analyst	Metals, Burnaby, British Columbia

Walt Kippenhuck	Team Leader - Inorganics	Inorganics, Waterloo, Ontario

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
%	percent
µS/cm	Microsiemens per centimetre
meq/L	milliequivalents per litre
mg/L	milligrams per litre
NTU	nephelometric turbidity units
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in reports identified as "Preliminary Report" are considered authorized for use.

Workorder Comments

Sample W4 dissolved mercury analysis was submitted in empty glass vial. Will be run from the plastic bottle provided. Results may be biased low.

Sample Comments

Sample	Client Id	*Comment*
WR2000154-004	W4	Sample 4: Water sample for dissolved mercury analysis was not submitted in glass or PTFE container with HCl preservative. Results may be biased low.

Qualifiers

Qualifier	*Description*

RRV	*Reported result verified by repeat analysis.*

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in reports identified as "Preliminary Report" are considered authorized for use.

CERTIFICATE OF ANALYSIS

Work Order	: **WR2000152**	Page	: 1 of 18
Client	: **Victoria Gold (Yukon) Corp.**	Laboratory	: Whitehorse - Environmental
Contact	: Hugh Coyle	Account Manager	: Hilary Woods
Address	: Suite 1000 - 1050 W. Pender St Vancouver BC Canada V6E 3S7	Address	: #12 151 Industrial Road Whitehorse YT Canada Y1A 2V3
Telephone	: 604 682 5122	Telephone	: +1 867 668 6689
Project	: WUL SWQ Discharge	Date Samples Received	: 27-Apr-2020 12:05
PO	: 14043	Date Analysis Commenced	: 29-Apr-2020
C-O-C number	: 20200426	Issue Date	: 07-May-2020 14:18
Sampler	: ----		
Site	: ----		
Quote number	: Q68199		
No. of samples received	: 16		
No. of samples analysed	: 16		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Angela Ren	Team Leader - Metals	Metals, Burnaby, British Columbia
Bruna Botti	Analyst	Inorganics - Water Quality, Burnaby, British Columbia
Caitlin Macey	Team Leader - Inorganics	Inorganics - Water Quality, Burnaby, British Columbia
Cristina Alexandre	Supervisor - Metals ICP Instrumentation	Metals, Burnaby, British Columbia
Erick Magalhaes	Laboratory Analyst	Metals, Burnaby, British Columbia
Evan Ben-Oliel	Metal Analyst	Metals, Burnaby, British Columbia
Kevin Duarte	Team Leader - Inorganics	Inorganics - Water Quality, Burnaby, British Columbia
Lindsay Gung	Supervisor - Water Chemistry	Inorganics - Water Quality, Burnaby, British Columbia
Matthew Woods	Lab Assistant	Metals, Burnaby, British Columbia
Tracy Harley	Supervisor - Water Quality Instrumentation	Inorganics - Water Quality, Burnaby, British Columbia
Walt Kippenhuck	Team Leader - Inorganics	Inorganics, Waterloo, Ontario

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
%	percent
µS/cm	Microsiemens per centimetre
meq/L	milliequivalents per litre
mg/L	milligrams per litre
NTU	nephelometric turbidity units
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in reports identified as "Preliminary Report" are considered authorized for use.

Qualifiers

Qualifier	*Description*
DTMF	*Dissolved concentration exceeds total for field-filtered metals sample. Metallic contaminants may have been introduced to dissolved sample during field filtration.*

CERTIFICATE OF ANALYSIS

Work Order	: **WR2000165**	Page	: 1 of 6
Client	: **Victoria Gold (Yukon) Corp.**	Laboratory	: Whitehorse - Environmental
Contact	: Hugh Coyle	Account Manager	: Hilary Woods
Address	: Suite 1000 - 1050 W. Pender St Vancouver BC Canada V6E 3S7	Address	: #12 151 Industrial Road Whitehorse YT Canada Y1A 2V3
Telephone	: 604 682 5122	Telephone	: +1 867 668 6689
Project	: WUL SWQ Discharge	Date Samples Received	: 29-Apr-2020 10:03
PO	: 14043	Date Analysis Commenced	: 30-Apr-2020
C-O-C number	: 20200427	Issue Date	: 19-May-2020 12:51
Sampler	: PE		
Site	: ----		
Quote number	: Q68199		
No. of samples received	: 5		
No. of samples analysed	: 5		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Angela Ren	Team Leader - Metals	Metals, Burnaby, British Columbia
Bruna Botti	Analyst	Inorganics - Water Quality, Burnaby, British Columbia
Caitlin Macey	Team Leader - Inorganics	Inorganics - Water Quality, Burnaby, British Columbia
Evan Ben-Oliel	Metal Analyst	Metals, Burnaby, British Columbia
Hilary Woods	Account Manager	Internal Subcontracting, Fort Collins, Colorado
Kevin Duarte	Team Leader - Inorganics	Inorganics - Water Quality, Burnaby, British Columbia
Lindsay Gung	Supervisor - Water Chemistry	Inorganics - Water Quality, Burnaby, British Columbia
Matthew Woods	Lab Assistant	Metals, Burnaby, British Columbia
Robin Weeks	Team Leader - Metals	Inorganics - Water Quality, Burnaby, British Columbia
Robin Weeks	Team Leader - Metals	Metals, Burnaby, British Columbia
Tracy Harley	Supervisor - Water Quality Instrumentation	Inorganics - Water Quality, Burnaby, British Columbia
Walt Kippenhuck	Team Leader - Inorganics	Inorganics, Waterloo, Ontario

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
%	percent
µS/cm	Microsiemens per centimetre
Bq/L	Becquerels per litre
meq/L	milliequivalents per litre
mg/L	milligrams per litre
NTU	nephelometric turbidity units
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in reports identified as "Preliminary Report" are considered authorized for use.

Qualifiers

Qualifier	*Description*
DLM	*Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).*
SP	*Sample was preserved at the laboratory.*

APPENDIX A – Summary of test conditions

Table 1. Summary of test conditions: 96-h rainbow trout (*Oncorhynchus mykiss*) single concentration test.

Test species	*Oncorhynchus mykiss*
Organism source	Hatchery
Organism age	Juvenile
Test type	Static
Test duration	96 hours
Test vessel	20-L glass aquarium
Test volume	10 to 20 L (depending on size of fish)
Test solution depth	≥15 cm
Test concentrations	100% (undiluted) sample, plus laboratory control
Test replicates	1 per treatment
Number of organisms	10 per replicate
Control/dilution water	Dechlorinated Metro Vancouver municipal tapwater
Test solution renewal	None
Test temperature	15 ± 1°C
Feeding	None
Light intensity	100 to 500 lux
Photoperiod	16 hours light / 8 hours dark
Aeration	6.5 ± 1 mL/min/L
Test measurements	Temperature, dissolved oxygen and pH measured daily; salinity measured in the undiluted sample at test initiation; conductivity measured at test initiation and termination; survival checked daily
Test protocol	Environment Canada (2000), EPS 1/RM/13, with 2007 & 2016 amendments
Test endpoint	Survival
Test acceptability criterion for controls	Survival ≥90%
Reference toxicant	Zinc (added as $ZnSO_4$)

Table 2. Summary of test conditions: 48-h *Daphnia magna* single concentration test.

Test species	*Daphnia magna*
Organism source	In-house culture
Organism age	<24-hour old neonates
Test type	Static
Test duration	48 hours
Test vessel	250-mL glass beaker
Test volume	200 mL
Test solution depth	6 cm
Test concentrations	100% (undiluted) sample, plus laboratory control
Test replicates	3 per treatment
Number of organisms	10 per replicate
Control/dilution water	Moderately-hard reconstituted water + 2.5 µg/L Se
Test solution renewal	None
Test temperature	20 ± 2°C
Feeding	None
Light intensity	400 to 800 lux
Photoperiod	16 hours light / 8 hours dark
Aeration	None
Test measurements	Temperature, dissolved oxygen and pH measured daily; salinity, hardness and alkalinity measured in the undiluted sample at test initiation; conductivity measured at test initiation and termination; survival checked daily
Test protocol	Environment Canada (2000), EPS 1/RM/14, with 2016 amendments
Test endpoint	Survival
Test acceptability criterion for controls	Survival ≥90%
Reference toxicant	Sodium chloride (NaCl)

APPENDIX A – Summary of test conditions

Table 1. Summary of test conditions: 96-h rainbow trout (*Oncorhynchus mykiss*) single concentration test.

Test species	*Oncorhynchus mykiss*
Organism source	Hatchery
Organism age	Juvenile
Test type	Static
Test duration	96 hours
Test vessel	20-L glass aquarium
Test volume	10 to 20 L (depending on size of fish)
Test solution depth	≥15 cm
Test concentrations	100% (undiluted) sample, plus laboratory control
Test replicates	1 per treatment
Number of organisms	10 per replicate
Control/dilution water	Dechlorinated Metro Vancouver municipal tapwater
Test solution renewal	None
Test temperature	15 ± 1°C
Feeding	None
Light intensity	100 to 500 lux
Photoperiod	16 hours light / 8 hours dark
Aeration	6.5 ± 1 mL/min/L
Test measurements	Temperature, dissolved oxygen and pH measured daily; salinity measured in the undiluted sample at test initiation; conductivity measured at test initiation and termination; survival checked daily
Test protocol	Environment Canada (2000), EPS 1/RM/13, with 2007 & 2016 amendments
Test endpoint	Survival
Test acceptability criterion for controls	Survival ≥90%
Reference toxicant	Zinc (added as $ZnSO_4$)

Table 2. Summary of test conditions: 48-h *Daphnia magna* single concentration test.

Test species	*Daphnia magna*
Organism source	In-house culture
Organism age	<24-hour old neonates
Test type	Static
Test duration	48 hours
Test vessel	250-mL glass beaker
Test volume	200 mL
Test solution depth	6 cm
Test concentrations	100% (undiluted) sample, plus laboratory control
Test replicates	3 per treatment
Number of organisms	10 per replicate
Control/dilution water	Moderately-hard reconstituted water + 2.5 µg/L Se
Test solution renewal	None
Test temperature	20 ± 2°C
Feeding	None
Light intensity	400 to 800 lux
Photoperiod	16 hours light / 8 hours dark
Aeration	None
Test measurements	Temperature, dissolved oxygen and pH measured daily; salinity, hardness and alkalinity measured in the undiluted sample at test initiation; conductivity measured at test initiation and termination; survival checked daily
Test protocol	Environment Canada (2000), EPS 1/RM/14, with 2016 amendments
Test endpoint	Survival
Test acceptability criterion for controls	Survival ≥90%
Reference toxicant	Sodium chloride (NaCl)

1 INTRODUCTION

This discharge exceedance report summarizes the implementation of water management strategies that were necessary to address rapid snowmelt, which led to a reduction of the Lower Dublin South Pond (LDSP) available capacity, and the decision to discharge water from the LDSP to the LDSP Contingency Sump during the period of April 20-28, 2020. The water discharged subsequently yielded results above the *Metal and Diamond Mining Effluent Regulations* (MDMER) Schedule 4 deleterious substance criteria.

The LDSP Contingency Sump is registered with Environment and Climate Change Canada (ECCC) as Final Discharge Point #5 (FDP#5), and is located approximately 300 meters upgradient of the LDSP, in the lower Dublin Gulch Valley. FDP#5 is an exfiltration sump and is located in an area occupied by a thick (over 20 m) sequence of placer deposits and alluvium that overlies bedrock. Thus, in this case, exfiltrating the water to ground at FDP#5 was ascertained to have the lowest potential for an adverse response in potential receiving environments as it allows for natural mitigation of total suspended solids (TSS), the main parameter of concern, through natural filtration, as opposed to direct discharge via FDP#3 to receiving waters (i.e., Haggart Creek).

On April 20, 2020, prior to any discharge, notification was provided to ECCC regarding the planned discharge of water from the LDSP to FDP #5.

On April 30, 2020, and within 24 hours of receiving the analytical laboratory results, notification was provided to the Yukon Spill Reporting hotline of the discharge of water to FDP#5 with TSS concentrations exceeding MDMER criteria (TSS). With the exception of TSS, monitoring during the discharge demonstrated compliance with all other monthly mean and grab sample deleterious substance authorised limits.

This report provides an event summary, discharge details, environmental factors and pre-discharge responses leading up to the controlled discharge, and spill reporting.

2 EVENT SUMMARY

Through the winter of 2019-2020, Victoria Gold (Yukon) Corp. (VGC) developed a water management strategy for the 2020 freshet period at the Eagle Gold Project (Project) that involved the controlled discharge of site contact waters through the LDSP in accordance with the MDMER. In addition to the controlled discharge, a portion of the water within the LDSP was also to be transferred to the Events Pond for use as process water. In preparation for the execution of this strategy, a number of pre-discharge water quality samples were sent for analysis at ALS Laboratories to confirm that the water quality within the LDSP was suitable for release in accordance with Schedule 4, deleterious substance criteria. The laboratory results for samples taken April 9 to April 15, 2020 showed water quality within the LDSP was acceptable for discharge.

The water management strategy involving a release of water from the LDSP, instead of full retention for use as process water, was in response to an expected large volume of snowmelt that would be generated from the highest recorded snowfall since measurements began at the Project site in 2007 (about 45% higher than previous maximum).

In the days prior to the planned execution of the controlled discharge, a relatively quick change from cold (below freezing) to unseasonably warm temperatures occurred in mid-April 2020, leading to a rapid increase in snowmelt runoff, high flow rates in site ditches and water with elevated TSS draining to the LDSP. The high flows caused a minor breach along ditch A (on the afternoon of April 15) and, as a result, water reported directly into the LDSP rather than into the forebay, thereby shortening the designed treatment circuit for settling solids in the LDSP. During the short term that the breach was open, inflow water bypassed the forebay, degrading the overall water quality at the planned discharge point (i.e., the low-level outlet or LLO of the LDSP identified as FDP#3). Plans were in place to transfer water to the Events Pond, but based on the recorded pond fill rate, an additional measure, such as exfiltration to FDP#5, was deemed necessary to avoid a direct discharge from the LDSP to Haggart Creek through FDP#3. As noted above, exfiltrating the water to ground was ascertained to have the lowest potential for an adverse response in potential receiving environments as opposed to a direct discharge to Haggart Creek.

Pumping was initiated first to the Events Pond at 14:00 on April 19, 2020, and then pumping to FDP#5 was initiated at 16:00 on April 20, 2020. Verbal notification was given to an Enforcement Officer from ECCC, on the morning of April 20, prior to discharge to FDP#5 commencing, and a follow up written notification was provided later that day. Monitoring of the LDSP water levels, pump outflows and ditch inflows continued over the next week and demonstrated that continued pumping to both the Events Pond and the sump would allow a return to a safe operating capacity (deemed to be sufficient to hold a 5-year rainfall runoff event) in the LDSP over time. The time period required was dependent on weather conditions (and ultimately snowmelt rate) and pumping rates.

Based on monitoring data, discharge to ground at FDP#5 for a period of nine days (April 20-28, 2020), was undertaken at which time the safe operating capacity of the pond was reached. Following cessation of discharge to FDP #5 on April 28, pumping to the Events Pond continued to be necessary to address continuing high snowmelt runoff rates and to maintain the safe operating capacity.

The MDMER requires a weekly collection of water samples to be analyzed for Schedule 4, deleterious substance criteria and a monthly collection of water samples for effluent characterisation and acute lethality testing. Water quality results for these sample events indicated that Schedule 4 criteria were exceeded for the monthly mean and grab sample TSS criteria. The water quality results characterised the discharge water prior to filtering though sump alluvium.

3 RELEASE DETAILS

3.1 PRE-DISCHARGE SAMPLING

In preparation for the planned release of contact water from the LDSP, water quality samples were collected on April 9, 13, 14, 15, and 16 at station LDSPs (i.e., the LDSP shoreline adjacent to the pump caisson low level outlet which is a pre-discharge sampling location) for lab analyses. The sample collected on April 16 was taken after the breach of Ditch A. Pertinent water quality results are shown in Table 3-1 (full results in Appendix A), and shows that TSS of the April 16 sample had increased significantly (2.6X) from the previous day reflecting water quality deterioration at the LLO after the breach. Based on visual observations of the water clarity in the pond (and before final lab results were received), the planned discharge to Haggart Creek, through FDP#3, was cancelled.

Table 3-1: LDSPs Pre-Discharge TSS Water Quality Results

Date of Sample	Time Sampled	Analysis Type	TSS (mg/L)	Result Receipt Date	ALS Sample ID
April 9, 2020	10:00	ALS Full Suite	3.1	Prelim April 16, 2020 Final April 27, 2020	VA20A4682-002

April 16, 2020	11:55	ALS Full Suite	27.2	Final April 27, 2020	VA20A5041-001

In preparation for the initially planned discharge to FDP#3, a pre-discharge sample was collected on April 9, 2020 from LDSPs and an acute lethality single concentration test for 96 hr rainbow trout and 48 hr Daphnia magna was performed by Nautilus Environmental Labs in Burnaby, BC. The results for these tests are included in Appendix B. The results for these tests indicated that the contact water within the LDSP was not acutely lethal, and showed 100% survival for both rainbow trout and Daphnia magna.

3.2 EVENT DESCRIPTION

During the few days leading up to the release, it became apparent through daily monitoring of the LDSP water levels that the available capacity of the pond was rapidly decreasing. While considering the volume of the remaining snowpack on north facing areas of the Project, and to ensure that a controlled discharge could be undertaken with the lowest potential for environmental impact, the decision was made to pump water from the LDSP to FDP#5 in the Dublin Gulch valley in concert with the transfer of a portion of the LDSP water to the Events Pond. Pumping to FDP#5 commenced on April 20, 2020 at 16:30 and continued to April 28, 2020 at 07:30. Water quality sampling and flow monitoring at the frequencies and scope required by the MDMER for effluent and the potential receiving water body were collected during the discharge from April 20 – 28, 2020., A deleterious substance sample was collected at FDP#5 twice during the nine days (April 20 and April 27, once per week). The quarterly effluent characterisation sample, along with the monthly acute lethality sample for Daphnia Magna and

Rainbow Trout was taken on April 21. The acute lethality sample was taken as soon as practicable subject to sample logistics and holding time considerations. Field parameters were collected on all other days.

The discharge volumes and TSS Schedule 4 exceedances at FDP#5 are provided in Table 3-2 below for April 20-28, 2020. Analytical results are included in Appendix A.

Table 3-2: Summary of Water Volumes Deposited to FDP#5 and TSS Schedule 4 Authorised Limit Exceedances

Date of Sample Collection	Time Sampled	TSS (mg/L)	MDMER TSS Limit (mg/L)	Estimated Discharge Quantity (m^3)	Sample Designation	Result Receipt Date	ALS Sample ID
April 20, 2020	18:30	61.9	30.00	2,960	Deleterious Substance Sample	Final June 10, 2020	VA20A5185-001
April 21, 2020	13:40	52.9		8,880	Effluent Characterisation Sample	Prelim April 30, 2020 Final May 7, 2020	VA20A5153
April 22, 2020	14:41	N/S		6,720	-	-	-

April 27, 2020	10:40	52.8		4,355	Deleterious Substance Sample	Prelim May 7, 2020 Final May 19, 2020	WR2000165-001
April 28, 2020	-	N/S		940	-	-	-
Mean Monthly TSS		55.9	15	-			
Total Discharge Volume				**43,130**			

Notes:
N/S – Not sampled, parameter analysis not required under MDMER

Laboratory results indicated that on April 20, 21 and 27, 2020 the Schedule 4 authorized discharge limits for the controlled discharge exceeded MDMER criteria for grab and monthly mean TSS. All other parameters were within Schedule 4 deleterious substance criteria.

During discharge to FDP#5, water from the LDSP continued to be pumped to the Events Pond, minimizing total discharge to FDP#5, as per the freshet management strategy noted above. When the exfiltration pumps were turned off in the early morning of April 28, water transfers from the LDSP to the Events Pond continued, to restore desired available storage capacity within the LDSP.

3.3 RECEIVING ENVIRONMENT MONITORING

Quarterly effluent characterisation water quality samples were taken at the Project reference and exposure stations on Haggart Creek shown below for Effluent and Water Quality Monitoring Studies under the MDMER:

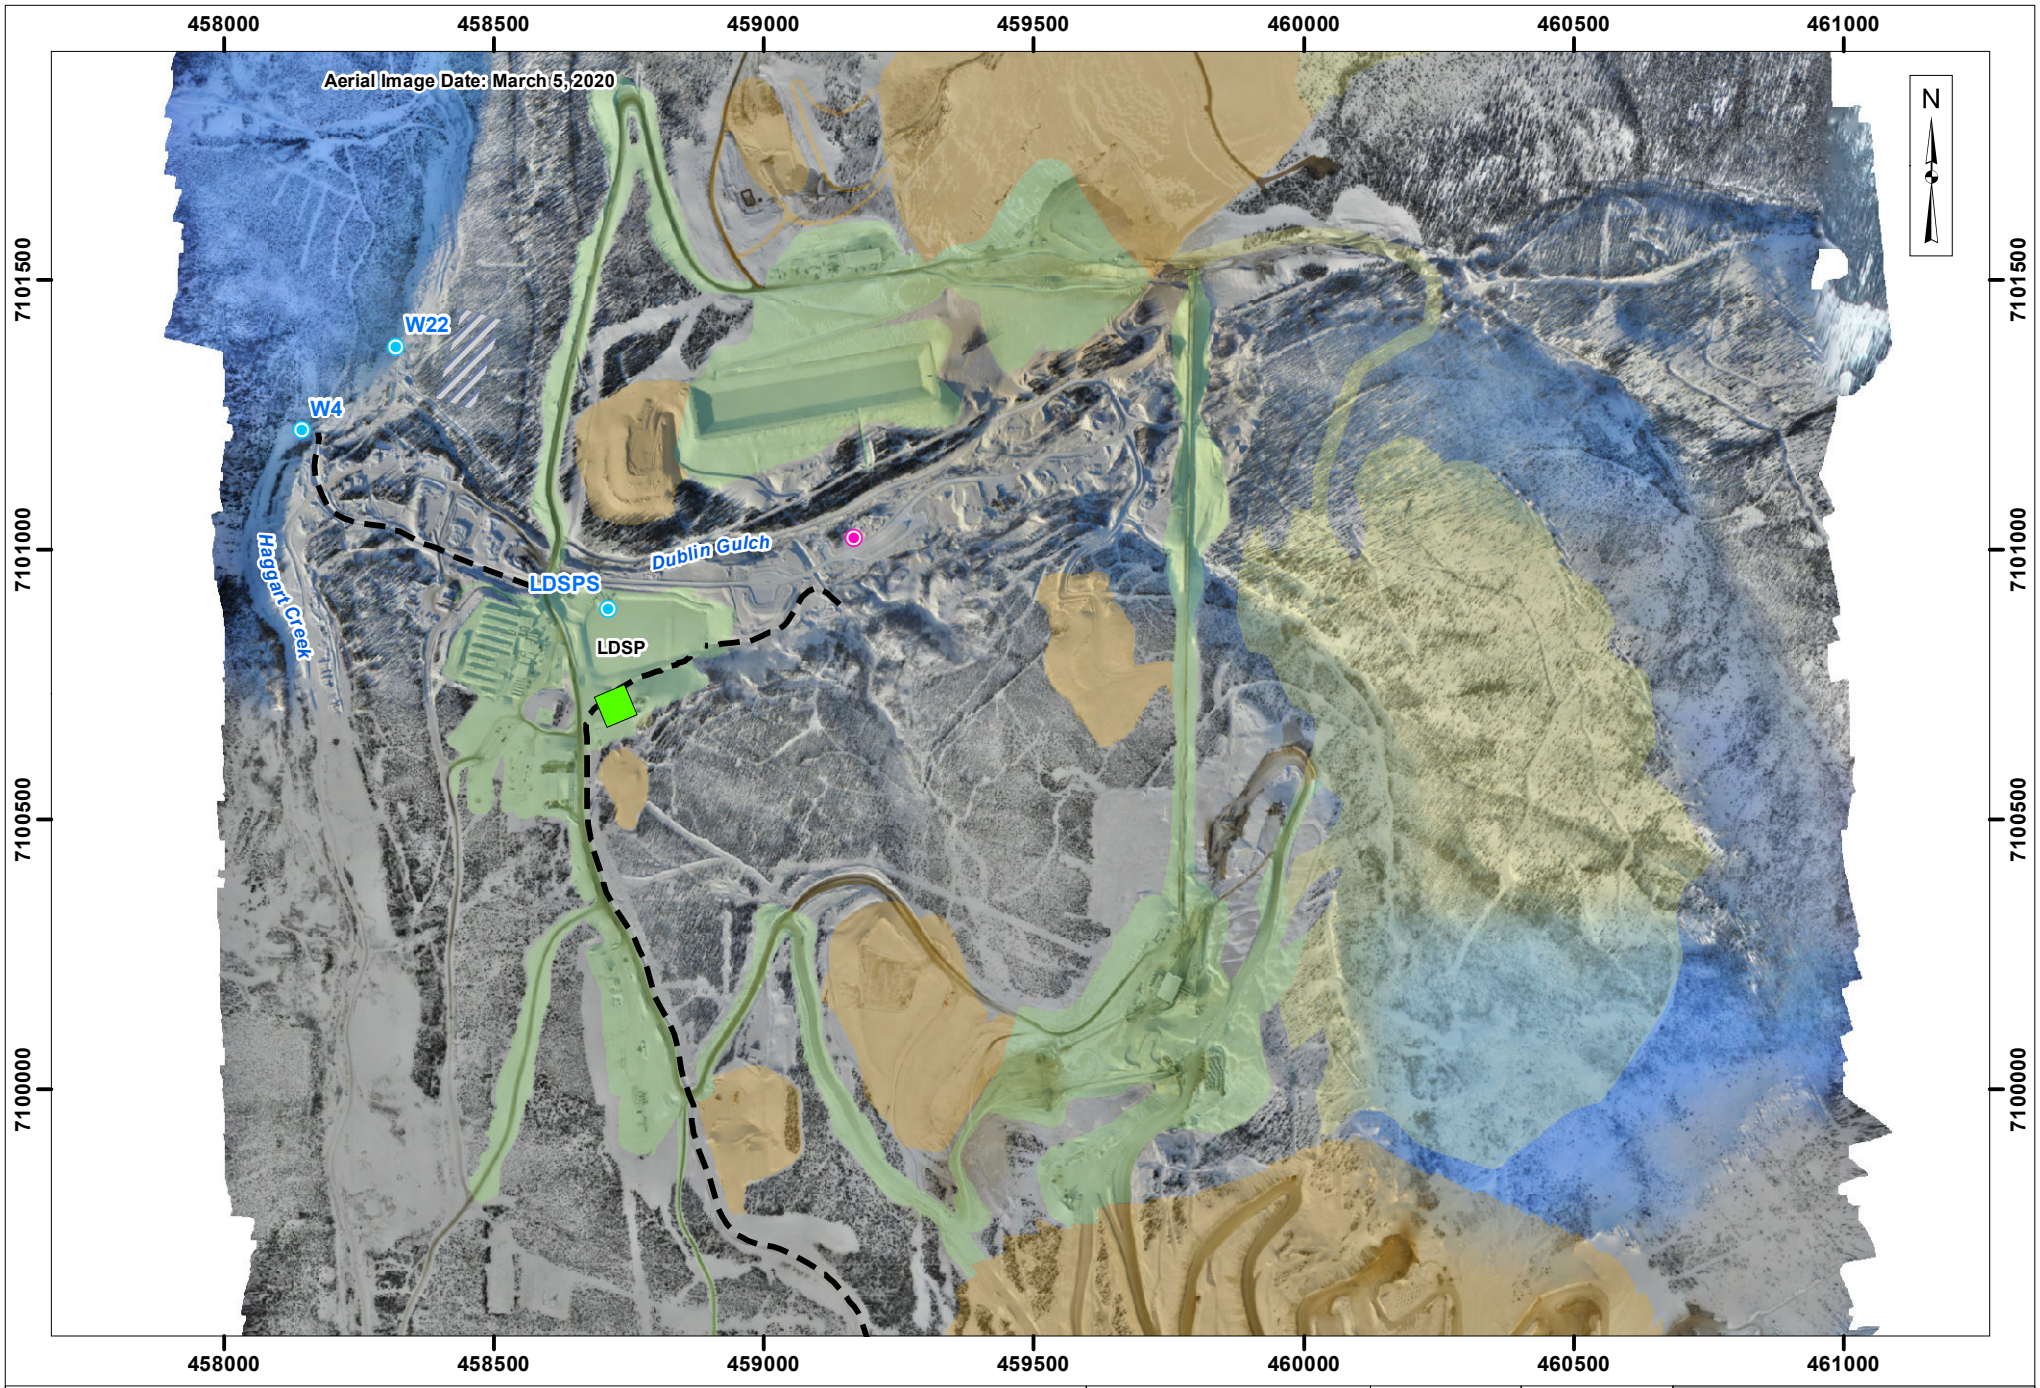
- Upstream of the Project influence (W22); and,
- Within the Project influence downstream of the Dublin Gulch and Ditch C (W4) confluences

The field parameter and TSS analytical results for the April 21 samples on W4 and W22 are provided in Table 3-3 below.

Table 3-3: Receiving Environment and Project Area Watercourse Water Quality Results

STATION	DATE	TIME	Temp °C	DO mg/L	SPC uS/cm	pH	Turbidity NTU	TSS mg/L
			Field Parameters Internal					External
W22	21-Apr-20	11:50	0.0	11.71	297.6	7.26	2.39	<3.0
W4	21-Apr-20	11:15	0.1	12.36	253.2	7.39	137	308

Water quality in Haggart showed an increase in TSS between the reference (W22) and exposure (W4) Water Quality monitoring sites. Measured TSS from the FDP#5 effluent characterization sample on April 21 (53 mg/L) was well below the TSS levels seen at the potential receiving environment monitoring station W4 (308 mg/L), supporting the assumption that water discharged to FDP#5 would represent an insignificant source of TSS loading to the downgradient exposure site compared to TSS loadings released from the existing area.



Furthermore, TSS results from the April 21 effluent characterization samples at the reference and exposure Water Quality monitoring stations, W22 (<3.0mg/L) and W4 (308mg/L), respectively, supports the assumption that the main source of TSS in the streams originates from the reaches along Dublin Gulch which discharges into Haggart Creek between W22 and W4. This data is indicative of melt water interacting with the historical Dublin Gulch Road, and remaining placer tailings and material within the Dublin Gulch Valley, which has been documented in previous years to have high TSS during freshet.

3.4 ACUTE LETHALITY TESTING

An effluent characterisation sample was collected on April 21, 2020 from water to be exfiltrated to FDP#5, and analyzed for an acute lethality single concentration test for 96-hour Rainbow trout and 48-hour Daphnia magna, and a sublethal toxicity test. The toxicity tests were taken as soon as practicable, subject to sample holding times and logistical constraints, within 24 hours of discharge commencement. The results for acute toxicity tests are included in Appendix B. The results for these tests show that the discharged water from the LDSP was not acutely lethal, and showed 100% survival for both Rainbow trout and Daphnia magna for the exfiltrated water (Table 3-4). Sublethal test results will be uploaded to the Environmental Effects Monitoring Electronic Reporter (EEMER) upon submittal of the Annual Report.

Table 3-4: Acute Lethality Testing Results

4 IMPORTANT ENVIRONMENTAL AND SITE FACTORS

Despite early planning efforts by VGC, a number of environmental and site factors occurred that influenced the field decision to discharge contact water to ground at FDP#5. These included:

- Record snowfall about 45% above previously recorded maximum resulted in extremely high volumes of snowmelt reporting to the LDSP.
- As demonstrated in Figure 4-1, unseasonably warm temperatures were sustained from April 15 to April 22, where it was the first time in the year that temperatures ranged up to 10ºC and when both day and night temperatures were essentially above freezing. This condition occurred after a lengthy cold period that extended to April 12. While above zero temperatures occurred during the short period from April 12 to April 15, overall temperatures were not warm enough over a long enough stretch to generate significant snowmelt. Based on the temperature data alone, snowmelt rates would have increased substantially during April 15 to 22, especially during the 18th and 19th of April.

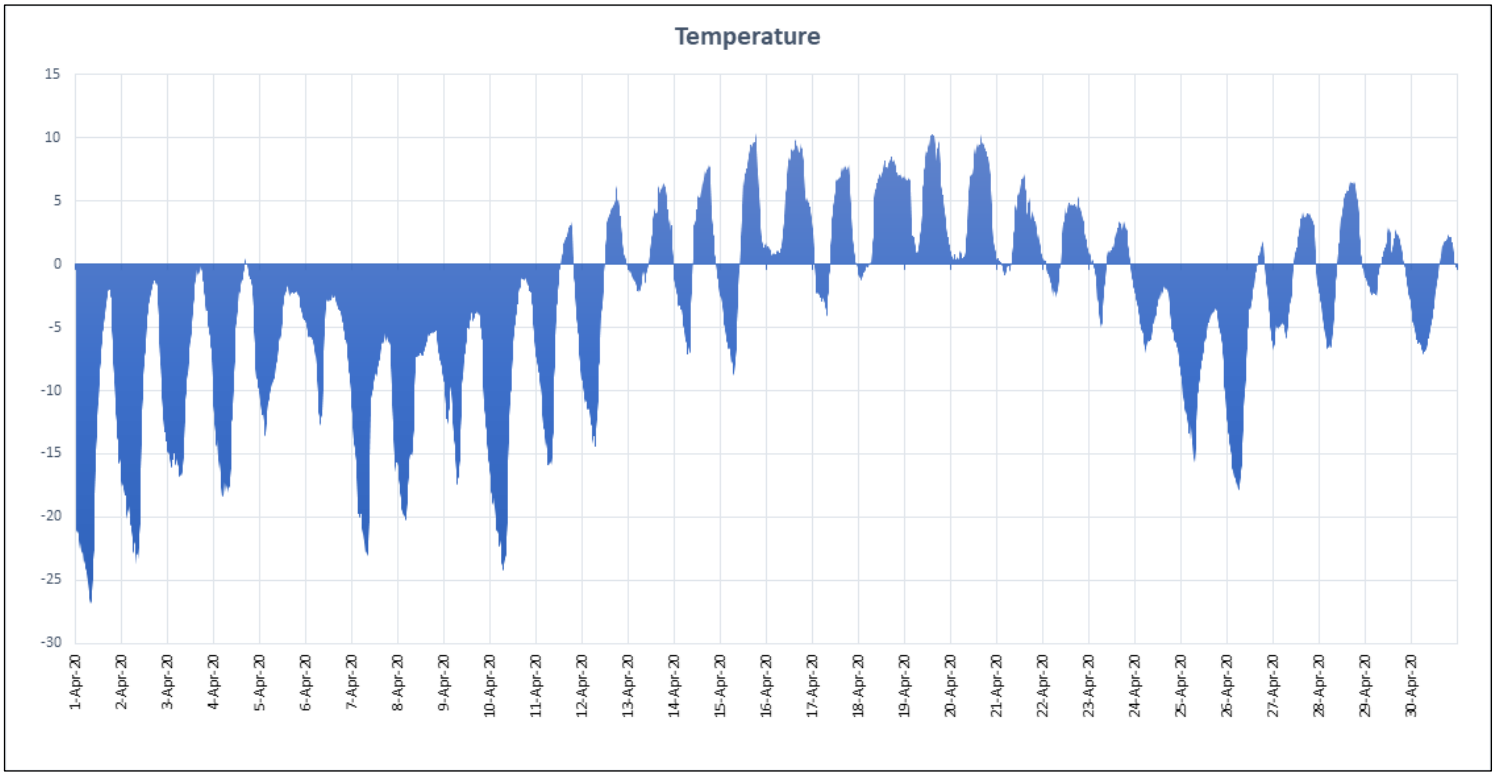

Figure 4.1: Camp Weather Station Temperature Data - April 2020

- Frozen conditions and ice cover in the LDSP prior to and during the rapid onset of freshet and ditch inflows severely impacted the ability to set up in pond flocculant treatment capabilities. Flocculant treatment

options that have the potential to be operable during freshet and LDSP ice cover conditions will be further investigated in 2020.

- The COVID-19 pandemic situation reduced staff capacity and restricted access to the site for potential replacement workers, either through isolation or health requirements mandated by the Yukon Chief Medical Officer. This made it harder for workers to proactively respond to necessary water management set up during late March and throughout April.
- LDSP pumping infrastructure to the Events Pond:
    - An 8-inch pipeline and pump was previously installed in 2019, but had been decommissioned for the winter. Re-installation of the line in 2020 was challenging with frozen conditions, high snowpack and a reduced workforce delaying the overall progress, thus not allowing sufficient time to reduce LDSP water levels by pumping to the Events Pond prior to the onset of the snowmelt. The pipeline is now a permanent installation and will remain in place for next spring freshet and ongoing management of LDSP water levels.
    - The 150 m^3/hr submersible pump located in the LDSP was not fully winterized and required maintenance before it could convey water to the Events Pond this spring. This pump will receive pre-winterization maintenance in 2020, and will be tested next spring prior to freshet.
    - Additional pumping infrastructure from the LDSP to the Events Pond was required to keep up with the substantial inflows to the LDSP due to the high snowpack and fast melt. The additional line and pump will be made available next spring prior to freshet.
- Snowpack and non-contact water management:
    - Snow pack management and non-contact surface water diversion was undertaken where possible at various locations around the Project prior to freshet. These efforts reduced the generation of mine contact water and the overall volume of water reporting to the LDSP. Snow was stockpiled away from sensitive water courses and LDSP infrastructure.

Photo 1: LDSP is still frozen with no documented inflow from ditches, April 14, 2020

5 SPILL REPORTING

5.1 YUKON GOVERNMENT, ECCC AND FNNND

On April 20, 2020, prior to any discharge, notification was provided to regulators and the First Nation of Na-Cho Nyak Dun (FNNND) of the planned discharge of mine contact water from the control pond to FDP#5 located east of the LDSP. The following people were included in these notifications:

- Yukon Energy Mines and Resources (EMR) Compliance Inspector.
- ECCC Enforcement Officer.
- FNNND Lands and Resources Manager.

On April 30, 2020, upon receipt of analytical laboratory results, notification was provided to the Yukon Spill Reporting hotline of water quality exceeding regulatory criteria discharged to the exfiltration sump. Follow up notification was provided to the above regulators and the FNNND with information on the water quality exceedance.

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Aaron Yu	Laboratory Analyst	Metals, Burnaby, British Columbia
Amy Liang	Analsyt	Inorganics - Water Quality, Burnaby, British Columbia
Courtney Cox	Analsyt	Inorganics - Water Quality, Burnaby, British Columbia
Dan Gebert		Metals, Burnaby, British Columbia
Harsha Attanayake	Analsyt	Inorganics - Water Quality, Burnaby, British Columbia
Hilary Woods	Account Manager	Internal Subcontracting, Fort Collins, Colorado
Janice Pearson	Account Manager Assistant	External Subcontracting, Burnaby, British Columbia
Jashan Kaur	Lab Assistant	Metals, Burnaby, British Columbia
Kenson Lo		Metals, Burnaby, British Columbia
Kim Jensen	Department Manager - Metals	Inorganics - Water Quality, Burnaby, British Columbia
Lindsay Gung	Supervisor - Water Chemistry	Inorganics - Water Quality, Burnaby, British Columbia
Richard Chong		Inorganics - Water Quality, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
%	percent
µS/cm	Microsiemens per centimetre
Bq/L	Becquerels per litre
meq/L	milliequivalents per litre
mg/L	milligrams per litre
NTU	nephelometric turbidity units
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in reports identified as "Preliminary Report" are considered authorized for use.

ALS ENVIRONMENTAL ANALYTICAL REPORT

	Sample ID	L2437811-1	L2437811-2	L2437811-3		
	Description	Water	Water	Water		
	Sampled Date	13-APR-20	14-APR-20	15-APR-20		
	Sampled Time					
	Client ID	LDSPS	LDSPS	LDSPS		
Grouping	**Analyte**					
WATER						
Physical Tests	pH (pH)	8.23	8.22	8.21		
	Total Suspended Solids (mg/L)	4.8	8.4	10.4		
	Total Dissolved Solids (mg/L)	425	372	314		
	Turbidity (NTU)	1.28	5.07	10.0		

Reference Information

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
EC-SCREEN-VA	Water	Conductivity Screen (Internal Use Only)	APHA 2510
Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc.			
PH-PCT-VA	Water	pH by Meter (Automated)	APHA 4500-H pH Value
This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode It is recommended that this analysis be conducted in the field.			
TDS-VA	Water	Total Dissolved Solids by Gravimetric	APHA 2540 C - GRAVIMETRIC
This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, TDS is determined by evaporating the filtrate to dryness at 180 degrees celsius.			
TSS-VA	Water	Total Suspended Solids by Gravimetric	APHA 2540 D - GRAVIMETRIC
This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.			
TURBIDITY-VA	Water	Turbidity by Meter	APHA 2130 Turbidity
This analysis is carried out using procedures adapted from APHA Method 2130 "Turbidity". Turbidity is determined by the nephelometric method.			

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
VA	ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA

Chain of Custody Numbers:

1 OF 1

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.
mg/kg - milligrams per kilogram based on dry weight of sample.
mg/kg wwt - milligrams per kilogram based on wet weight of sample.
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.
mg/L - milligrams per litre.
< - Less than.
D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

ALS Sample # (lab use only)	Sample Identification and/or Coordinates (This description will appear on the report)	Date (dd-mmm-yy)	Time (hh:mm)	Sample Type	pH, TSS, TDS, Turb	SAMPLES ON HOLD	Sample is hazardous (please provide further detail)	NUMBER OF CONTAINERS
	LDSPS	13-Apr-20		water	E1			1
	LDSPS	14-Apr-20		water	E1			1
	LDSPS	15-Apr-20		water	E1			1

Select Service Level Below - Contact your AM to confirm all E&P TATs (surcharges may apply)

Regular [R] ☑ Standard TAT if received by 3 pm - business days - no surcharges apply

(Business days)
- 4 day [P4-20%] ☐
- 3 day [P3-25%] ☐
- 2 day [P2-50%] ☐

EMERGENCY
- 1 Business day [E1 - 100%] ☑
- Same Day, Weekend or Statutory holiday [E2 -200% (Laboratory opening fees may apply)] ☐

Date and Time Required for all E&P TATs:

For tests that can not be performed according to the service level selected, you will be contacted.

Analysis Request

Indicate Filtered (F), Preserved (P) or Filtered and Preserved (F/P) below

Drinking Water (DW) Samples[1] (client use)

Are samples taken from a Regulated DW System? ☐ YES ☑ NO

Are samples for human consumption/ use? ☐ YES ☑ NO

Special Instructions / Specify Criteria to add on report by clicking on the drop-down list below (electronic COC only)

Please include Yukon Government EQWin format

SAMPLE CONDITION AS RECEIVED (lab use only)

Frozen ☐ SIF Observations Yes ☐ No ☐

Ice Packs ☐ Ice Cubes ☐ Custody seal intact Yes ☐ No ☐

Cooling Initiated ☐

INITIAL COOLER TEMPERATURES °C	FINAL COOLER TEMPERATURES °C
13.0	5°C (Avg of 7)

SHIPMENT RELEASE (client use)

Released by:		Time:
Bill Bowden	April 15 2020	16:00

INITIAL SHIPMENT RECEPTION (lab use only)

Received by:	Date:	Time:
	16/4/2020	2:45

FINAL SHIPMENT RECEPTION (lab use only)

Received by:	Date:	Time:
JG	17 April	3:30 PM

PO	: 14043	Date Analysis Commenced	: 20-Apr-2020
C-O-C number	: 20200416	Issue Date	: 27-Apr-2020 09:54
Sampler	: JW, PS		
Site	: ----		
Quote number	: Q68199		
No. of samples received	: 2		
No. of samples analysed	: 2		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Angelo Salandanan	Lab Assistant	Metals, Burnaby, British Columbia
Bruna Botti	Analyst	Inorganics - Water Quality, Burnaby, British Columbia
Caitlin Macey	Team Leader - Inorganics	Inorganics - Water Quality, Burnaby, British Columbia
Cristina Alexandre	Supervisor - Metals ICP Instrumentation	Metals, Burnaby, British Columbia
Erick Magalhaes	Laboratory Analyst	Inorganics - Water Quality, Burnaby, British Columbia
Evan Ben-Oliel	Metal Analyst	Metals, Burnaby, British Columbia
Kevin Duarte	Team Leader - Inorganics	Inorganics - Water Quality, Burnaby, British Columbia
Lindsay Gung	Supervisor - Water Chemistry	Inorganics - Water Quality, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
%	percent
µS/cm	Microsiemens per centimetre
meq/L	milliequivalents per litre
mg/L	milligrams per litre
NTU	nephelometric turbidity units
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in reports identified as "Preliminary Report" are considered authorized for use.

Qualifiers

Qualifier	*Description*
DTS	*Dissolved Sulfur concentration exceeds total. Negative bias on Total Sulfur suspected due to presence of volatile sulfur species lost during digestion.*

No. of samples analysed	: 1		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Robin Weeks	Team Leader - Metals	Inorganics - Water Quality, Burnaby, British Columbia
Robin Weeks	Team Leader - Metals	Metals, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
%	percent
µS/cm	Microsiemens per centimetre
meq/L	milliequivalents per litre
mg/L	milligrams per litre
NTU	nephelometric turbidity units
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in reports identified as "Preliminary Report" are considered authorized for use.

CERTIFICATE OF ANALYSIS

Work Order	: **VA20A5153**	Page	: 1 of 7
Client	: **Victoria Gold (Yukon) Corp.**	Laboratory	: Vancouver - Environmental
Contact	: Bill Bowden	Account Manager	: Hilary Woods
Address	: Suite 1000 - 1050 W. Pender St Vancouver BC Canada V6E 3S7	Address	: 8081 Lougheed Highway Burnaby BC Canada V5A 1W9
Telephone	: 867.456.7700 ext. 6381	Telephone	: +1 604 253 4188
Project	: LDSP (April 21)	Date Samples Received	: 22-Apr-2020 14:15
PO	: 14043	Date Analysis Commenced	: 22-Apr-2020
C-O-C number	: 20200421a	Issue Date	: 07-May-2020 15:26
Sampler	: PE		
Site	: ----		
Quote number	: Q68199		
No. of samples received	: 1		
No. of samples analysed	: 1		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Bruna Botti	Analyst	Inorganics - Water Quality, Burnaby, British Columbia
Caitlin Macey	Team Leader - Inorganics	Inorganics - Water Quality, Burnaby, British Columbia
Cindy Tang	Team Leader - Inorganics	Inorganics - Water Quality, Burnaby, British Columbia
Erick Magalhaes	Laboratory Analyst	Inorganics - Water Quality, Burnaby, British Columbia
Evan Ben-Oliel	Metal Analyst	Metals, Burnaby, British Columbia
Hilary Woods	Account Manager	Internal Subcontracting, Fort Collins, Colorado
Ilnaz Badbezanchi	Team Leader - Metals preparation	Metals, Burnaby, British Columbia
Kaitlyn Gardner	Account Manager Assistant	External Subcontracting, Burnaby, British Columbia
Kevin Duarte	Team Leader - Inorganics	Inorganics - Water Quality, Burnaby, British Columbia
Kim Jensen	Department Manager - Metals	Metals, Burnaby, British Columbia
Kinny Wu	Laboratory Analyst	Metals, Burnaby, British Columbia
Lindsay Gung	Supervisor - Water Chemistry	Inorganics - Water Quality, Burnaby, British Columbia
Robin Weeks	Team Leader - Metals	Inorganics - Water Quality, Burnaby, British Columbia
Robin Weeks	Team Leader - Metals	Metals, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
%	percent
µS/cm	Microsiemens per centimetre
Bq/L	Becquerels per litre
meq/L	milliequivalents per litre
mg/L	milligrams per litre
NTU	nephelometric turbidity units
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in reports identified as "Preliminary Report" are considered authorized for use.

Workorder Comments

A matrix spike was carried out for at least one analytical batch of E358 analysis, but is not found in the attached QC report. ALS Data Quality Objectives for recovery were met

A matrix spike was carried out for at least one analytical batch of E375-T analysis, but is not found in the attached QC report. ALS Data Quality Objectives for recovery were met

CERTIFICATE OF ANALYSIS

Work Order	: **VA20A5167**	Page	: 1 of 7
Client	: **Victoria Gold (Yukon) Corp.**	Laboratory	: Vancouver - Environmental
Contact	: Bill Bowden	Account Manager	: Hilary Woods
Address	: Suite 1000 - 1050 W. Pender St Vancouver BC Canada V6E 3S7	Address	: 8081 Lougheed Highway Burnaby BC Canada V5A 1W9
Telephone	: 867.456.7700 ext. 6381	Telephone	: +1 604 253 4188
Project	: Receiving /Reference Apr 21	Date Samples Received	: 22-Apr-2020 14:15
PO	: 14043	Date Analysis Commenced	: 22-Apr-2020
C-O-C number	: 20200421b	Issue Date	: 07-May-2020 15:57
Sampler	: PE		
Site	: ----		
Quote number	: Q68199		
No. of samples received	: 3		
No. of samples analysed	: 2		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Aaron Yu	Laboratory Analyst	Metals, Burnaby, British Columbia
Bruna Botti	Analyst	Inorganics - Water Quality, Burnaby, British Columbia
Caitlin Macey	Team Leader - Inorganics	Inorganics - Water Quality, Burnaby, British Columbia
Evan Ben-Oliel	Metal Analyst	Metals, Burnaby, British Columbia
Hilary Woods	Account Manager	Internal Subcontracting, Fort Collins, Colorado
Ilnaz Badbezanchi	Team Leader - Metals preparation	Metals, Burnaby, British Columbia
Jon Fisher	Department Manager - Inorganics	Inorganics, Waterloo, Ontario
Kevin Duarte	Team Leader - Inorganics	Inorganics - Water Quality, Burnaby, British Columbia
Kinny Wu	Laboratory Analyst	Metals, Burnaby, British Columbia
Lindsay Gung	Supervisor - Water Chemistry	Inorganics - Water Quality, Burnaby, British Columbia
Matthew Woods	Lab Assistant	Metals, Burnaby, British Columbia
Robin Weeks	Team Leader - Metals	Inorganics - Water Quality, Burnaby, British Columbia
Robin Weeks	Team Leader - Metals	Metals, Burnaby, British Columbia
Tracy Harley	Supervisor - Water Quality Instrumentation	Inorganics - Water Quality, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
%	percent
µS/cm	Microsiemens per centimetre
Bq/L	Becquerels per litre
meq/L	milliequivalents per litre
mg/L	milligrams per litre
NTU	nephelometric turbidity units
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in reports identified as "Preliminary Report" are considered authorized for use.

CERTIFICATE OF ANALYSIS

Work Order	: **WR2000165**	Page	: 1 of 6
Client	: **Victoria Gold (Yukon) Corp.**	Laboratory	: Whitehorse - Environmental
Contact	: Hugh Coyle	Account Manager	: Hilary Woods
Address	: Suite 1000 - 1050 W. Pender St Vancouver BC Canada V6E 3S7	Address	: #12 151 Industrial Road Whitehorse YT Canada Y1A 2V3
Telephone	: 604 682 5122	Telephone	: +1 867 668 6689
Project	: WUL SWQ Discharge	Date Samples Received	: 29-Apr-2020 10:03
PO	: 14043	Date Analysis Commenced	: 30-Apr-2020
C-O-C number	: 20200427	Issue Date	: 19-May-2020 12:51
Sampler	: PE		
Site	: ----		
Quote number	: Q68199		
No. of samples received	: 5		
No. of samples analysed	: 5		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Angela Ren	Team Leader - Metals	Metals, Burnaby, British Columbia
Bruna Botti	Analyst	Inorganics - Water Quality, Burnaby, British Columbia
Caitlin Macey	Team Leader - Inorganics	Inorganics - Water Quality, Burnaby, British Columbia
Evan Ben-Oliel	Metal Analyst	Metals, Burnaby, British Columbia
Hilary Woods	Account Manager	Internal Subcontracting, Fort Collins, Colorado
Kevin Duarte	Team Leader - Inorganics	Inorganics - Water Quality, Burnaby, British Columbia
Lindsay Gung	Supervisor - Water Chemistry	Inorganics - Water Quality, Burnaby, British Columbia
Matthew Woods	Lab Assistant	Metals, Burnaby, British Columbia
Robin Weeks	Team Leader - Metals	Inorganics - Water Quality, Burnaby, British Columbia
Robin Weeks	Team Leader - Metals	Metals, Burnaby, British Columbia
Tracy Harley	Supervisor - Water Quality Instrumentation	Inorganics - Water Quality, Burnaby, British Columbia
Walt Kippenhuck	Team Leader - Inorganics	Inorganics, Waterloo, Ontario

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
%	percent
µS/cm	Microsiemens per centimetre
Bq/L	Becquerels per litre
meq/L	milliequivalents per litre
mg/L	milligrams per litre
NTU	nephelometric turbidity units
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in reports identified as "Preliminary Report" are considered authorized for use.

Qualifiers

Qualifier	*Description*
DLM	*Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).*
SP	*Sample was preserved at the laboratory.*

APPENDIX A – Summary of test conditions

Table 1. Summary of test conditions: 96-h rainbow trout (*Oncorhynchus mykiss*) single concentration test.

Test species	*Oncorhynchus mykiss*
Organism source	Hatchery
Organism age	Juvenile
Test type	Static
Test duration	96 hours
Test vessel	20-L glass aquarium
Test volume	10 to 20 L (depending on size of fish)
Test solution depth	≥15 cm
Test concentrations	100% (undiluted) sample, plus laboratory control
Test replicates	1 per treatment
Number of organisms	10 per replicate
Control/dilution water	Dechlorinated Metro Vancouver municipal tapwater
Test solution renewal	None
Test temperature	15 ± 1°C
Feeding	None
Light intensity	100 to 500 lux
Photoperiod	16 hours light / 8 hours dark
Aeration	6.5 ± 1 mL/min/L
Test measurements	Temperature, dissolved oxygen and pH measured daily; salinity measured in the undiluted sample at test initiation; conductivity measured at test initiation and termination; survival checked daily
Test protocol	Environment Canada (2000), EPS 1/RM/13, with 2007 & 2016 amendments
Test endpoint	Survival
Test acceptability criterion for controls	Survival ≥90%
Reference toxicant	Zinc (added as $ZnSO_4$)

Table 2. Summary of test conditions: 48-h *Daphnia magna* single concentration test.

Test species	*Daphnia magna*
Organism source	In-house culture
Organism age	<24-hour old neonates
Test type	Static
Test duration	48 hours
Test vessel	250-mL glass beaker
Test volume	200 mL
Test solution depth	6 cm
Test concentrations	100% (undiluted) sample, plus laboratory control
Test replicates	3 per treatment
Number of organisms	10 per replicate
Control/dilution water	Moderately-hard reconstituted water + 2.5 µg/L Se
Test solution renewal	None
Test temperature	20 ± 2°C
Feeding	None
Light intensity	400 to 800 lux
Photoperiod	16 hours light / 8 hours dark
Aeration	None
Test measurements	Temperature, dissolved oxygen and pH measured daily; salinity, hardness and alkalinity measured in the undiluted sample at test initiation; conductivity measured at test initiation and termination; survival checked daily
Test protocol	Environment Canada (2000), EPS 1/RM/14, with 2016 amendments
Test endpoint	Survival
Test acceptability criterion for controls	Survival ≥90%
Reference toxicant	Sodium chloride (NaCl)

APPENDIX B – Toxicity test data

Rainbow Trout Summary Sheet

Client: ALS Environmental

Start Date/Time: 23Apr20 @ 1124h

Work Order No.: 206676

Test Species: *Oncorhynchus mykiss*

Test Validity Criteria:
≥ 90% control survival
WQ Ranges:
T (°C) = 15 ± 1; DO (mg/L) = 7.0 to 10.3; pH = 5.5 to 8.5

Sample Information:

Sample ID: VA20A5153
Sample Date: 21Apr20
Date Received: 22Apr20
Sample Volume: 6 x 10L
Other: —

Dilution Water:

Type: Dechlorinated Municipal Tap Water
Hardness (mg/L $CaCO_3$): 12
Alkalinity (mg/L $CaCO_3$): 12

Test Organism Information:

Batch No.: 040120b
Source: Lyndon Fish Hatcheries
No. Fish/Volume (L): 10/12L
Loading Density (g/L): 0.30
Mean Length ± SD (mm): 36 ± 3 Range: 34 - 41
Mean Weight ± SD (g): 0.36 ± 0.08 Range: 0.27 - 0.53

Zinc Reference Toxicant Results:

Reference Toxicant ID: RTZnL052
Stock Solution ID: 20Zn02
Date Initiated: 20Apr20
96-h LC50 (95% CL): 57.9 (43.4 - 77.2) µg/L Zn

Reference Toxicant Mean and Historical Range: 96.8 (53.0 - 176.8) µg/L Zn
Reference Toxicant CV (%): 31%

Test Results: 100% survival at 96h in the 100% (v/v) undiluted sample.

Table of Contents

TABLE OF CONTENTS I

1. INTRODUCTION
- 1.1 SCOPE OF REPORT 1-1
- 1.2 PREVIOUS REPORTS 1-1
- 1.3 PROJECT AREA CHARACTERISTICS 1-2

2. STREAMFLOW MONITORING PROGRAM
- 2.1 DATA SOURCES 2-1
- 2.2 PROJECT SITE HYDROMETRIC STATIONS 2-1
  - 2.2.1 HYDROMETRIC STATION SUMMARY 2-5
  - 2.2.2 MANUAL DISCHARGE MEASUREMENTS 2-7
  - 2.2.3 STAGE MEASUREMENTS AND CORRECTIONS 2-8

3. STREAMFLOW RECORD DEVELOPMENT
- 3.1 GENERAL APPROACH 3-1
- 3.2 RATING CURVE DEVELOPMENT 3-1
- 3.3 RATING CURVE ERROR 3-2
- 3.4 WINTER STREAMFLOW INTERPOLATION 3-25

4. RESULTS
- 4.1 STREAMFLOW RECORDS – DISCHARGE 4-1
- 4.2 STREAMFLOW RECORDS – UNIT YIELDS 4-8

1. Introduction

1. Introduction

1.1 Scope of Report

This report presents a summary of all streamflow data (i.e., baseline, construction and operational data) collected for the Eagle Gold Project (Project) since August 2007, including hydrometric information summarized in previous reports (Jacques Whitford 2008; Stantec 2010; Stantec 2011; Stantec 2012; Knight Piésold 2013, Lorax 2017, Lorax 2018, Lorax 2019 and Lorax 2020).

An overview of the streamflow monitoring program is provided in Section 2. Methods for the measurement of streamflow and stage (both spot and continuous) are presented in Section 3, along with the approach used to develop the rating curves for each station, the paired stage-discharge measurements and associated rating curve error. Stage record corrections (*e.g.*, due to station relocation, frost jacking of the staff gauge, channel aggradation, *etc*.) are also presented.

In Section 4, streamflow data are presented in the following formats:

- Monthly tables showing average, maximum and minimum 15-minute discharge values (m^3/s);
- Monthly tables showing average discharge (m^3/s), average unit yields ($L/s/km^2$) and total runoff (mm);
- Time-series plots of continous average daily discharge (m^3/s) and spot flow measurements (m^3/s), and;
- Time series plots of average daily unit yields ($L/s/km^2$), by year.

1.2 Previous Reports

The streamflow data collected at the Eagle Gold Project site from 2007 up to and including 2018, has been previously summarized in the following reports:

- *Dublin Gulch Project – Climate and Hydrology Environmental Baseline Report* (2008), prepared by Jacques Whitford AXYS (Burnaby, BC) for Strata Gold Corp. (Vancouver, BC).
- *Eagle Gold Project, Environmental Baseline Report: Hydrology* (2010), prepared by Stantec (Burnaby, BC) for Victoria Gold Corp., February 2010.

- *Eagle Gold Project, Environmental Data Summary Report: Hydrology 2011 Update* (2011), prepared by Stantec (Burnaby, BC) for Victoria Gold Corp., June 2011.
- *Eagle Gold Project, Surface Water Balance Model Report* (2011), prepared by Stantec (Burnaby, BC) for Victoria Gold Corp., June 2011.
- *Eagle Gold Project, Environmental Baseline Data Report: Hydrology 2011 Update* (2012), prepared by Stantec (Burnaby, BC) for Victoria Gold Corp., June 2012.
- *Victoria Gold Corp., Eagle Gold Project – Hydrology Baseline Data Summary. VA101-290/6-10,* prepared by Knight Piésold Ltd. (Vancouver, BC) for Victoria Gold Corp., August 2013.
- *Victoria Gold Corp., Eagle Gold Project – Indirect Discharge Measurement at W-29 and Repair of Stream gauges at W-22, W-5 and W-29* (2013), prepared by Laberge Environmental Services (Whitehorse, YT) for Victoria Gold Corp., September 2013.
- *Victoria Gold Corp., Eagle Gold Project – Hydrology Baseline Report* (2017), prepared by Lorax Environmental Ltd. (Vancouver, BC) for Victoria Gold Corp., March 2017.
- *Victoria Gold Corp. Eagle Gold Project – Hydrometeorology Report.* A413-3, prepared by Lorax Environmental Services Ltd. (Vancouver, BC) for Victoria Gold Corp., March 2017.
- *Victoria Gold Corp., Eagle Gold Project – Hydrology Baseline Report* (2018), prepared by Lorax Environmental Ltd. (Vancouver, BC) for Victoria Gold Corp., March 2018.
- *Victoria Gold Corp., Eagle Gold Project – Streamflow Monitoring Report* (2019), prepared by Lorax Environmental Ltd. (Vancouver, BC) for Victoria Gold Corp., March 2019.
- *Victoria Gold Corp., Eagle Gold Project – Streamflow Monitoring Report – 2019 Update* (2020), prepared by Lorax Environmental Ltd. (Vancouver, BC) for Victoria Gold Corp., March 2020.

1.3 Project Area Characteristics

The majority of the Project site lies within the Dublin Gulch watershed, a second order tributary to the larger Haggart Creek watershed, which is a major tributary of the South

McQuesten River. The South McQuesten River joins the Stewart River, which flows west to its eventual confluence with the Yukon River.

The hydrology of the region is characterized by a dominant snowmelt driven freshet signature, which typically peaks between early May and early June. The recession limb of the freshet tapers to a lower summer flow regime reflective of groundwater primarily, which is punctuated by periodic rainfall driven runoff events, typically one to four days in duration. Base flows are lowest in the winter and flow sub-ice; in the smaller creeks, groundwater is depleted in the winter and no flow conditions under the ice are typical of second and third order tributaries.

In larger tributaries, groundwater discharge maintains limited amounts of streamflow below the ice throughout the winter (*i.e.*, November through end March). Aufeis (*i.e.*, groundwater that seeps and freezes onto- and adjacent to local watercourses) is present in several places throughout streams at the Project site. As with shelf ice in the streams, aufeis melts during the freshet, but may in some cases persist into the early summer.

Historical placer mining activities in the Project site streams have altered the natural channel conditions, and in some cases, have also altered the drainage areas of several sub-watersheds. More information is provided in Stantec (2012) as it relates to placer mining near the Project.

2. Streamflow Monitoring Program

Victoria GOLD CORP

2. Streamflow Monitoring Program

2.1 Data Sources

Data collection was originally undertaken by Hallam Knight Piésold (1993 to 1995), then a new program was initiated in 2007 by Jacques Whitford AXYS (now Stantec Consulting Ltd., or Stantec). Field support for this program was provided by Laberge Environmental Services (Laberge), through to 2018. All streamflow data collected at the Project site up to the end of 2018 has been previously summarized in the reports per Section 1.2.

Laberge continued to participate in the field program, conducting field visits with Victoria Gold staff during freshet and early summer. Since then, Victoria Gold site staff have assumed all hydrometric monitoring activities, with the exception of routine benchmark levelling surveys which were conducted by Laberge in the autumn of 2020. Initial QA/QC of the streamflow data collected in 2020 and associated development and updates of rating curves were undertaken by Lorax Environmental. At the time report preparation, there are eleven continuously recording hydrometric stations operating at the Project site. Of these, continuous data for ten stations are presented in this report, including the W99 station which was installed on Haggart Creek downstream of all Project activity in 2019. The eleventh station, W45, has only a water level record for 2018 through 2020, as the stage and discharge record is not sufficient at this time to develop a preliminary rating curve and a continuous discharge record. A rating curve and continuous discharge time-series will be developed for this station and reported once sufficient data exists with which to do so.

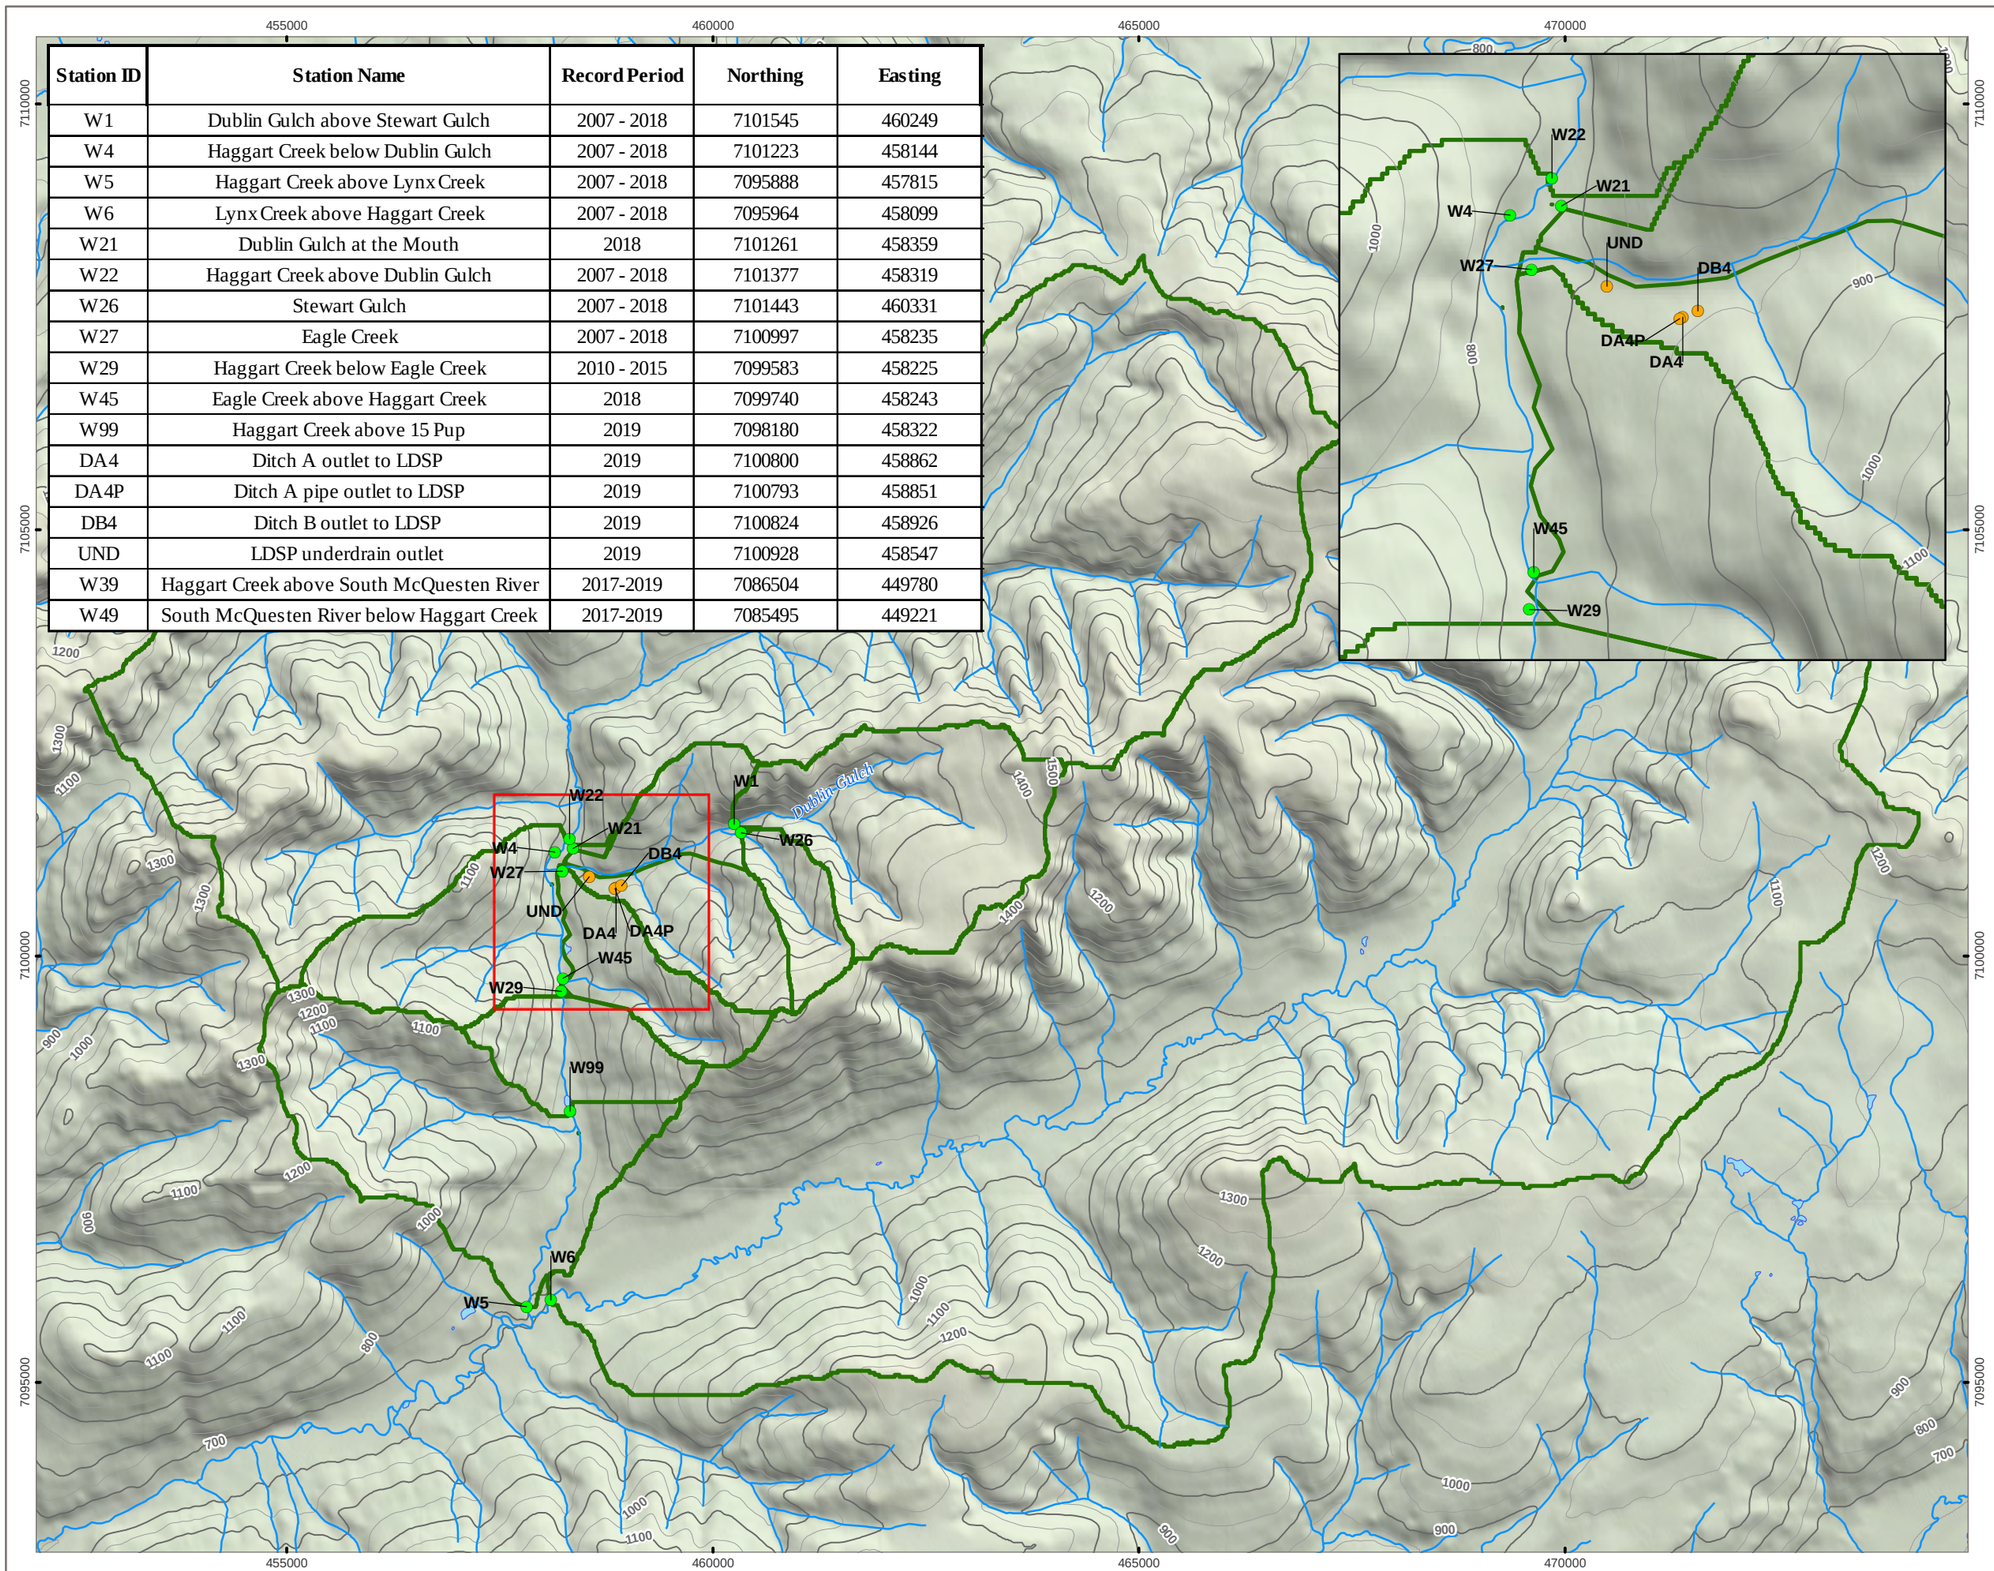
2.2 Project Site Hydrometric Stations

The number of continuously recording hydrometric stations has varied over the period of record, but nine of the eleven stations presented in this report update have the most complete records (the ninth, W21, was installed in 2018, and the tenth, W99 was installed in 2019). In addition, several more stations are monitored as required by the Environmental Monitoring, Surveillance and Adaptive Management Plan (EMSAMP) and Water Use Licence QZ14-041-1. The continuous hydrometric stations and the associated metadata are presented in Table 2-1 and shown in Figure 2-1, while the additional spot flow stations are described in Table 2-2.

Additional manual streamflow measurements have been collected (often concurrently with water quality samples) at an additional 20 locations at the Project site. Previously collected continuous streamflow records for the Eagle Creek Pond (WECP), W13, W20 and W31 stations span shorter durations (1 to 3 years), and are presented in previous reports.

Table 2-1:
Eagle Gold Project continuous hydrometric stations

Station ID	Station Name	Record Period	Northing	Easting	Drainage Area (km^2)	Median Basin Elevation (m)	Notes
W1	Dublin Gulch above Stewart Gulch	2007 – 2020	7,101,545	460,249	7.0	1,303	Continuous discharge time-series 2020 logging period: May 20 to Oct 13
W4	Haggart Creek below Dublin Gulch	2007 – 2020	7,101,223	458,144	76.8	1,125	Continuous discharge time-series 2020 logging period: Apr 18 to Oct 13
W5	Haggart Creek above Lynx Creek	2007 – 2020	7,095,888	457,815	97.7	1,091	Continuous discharge time-series 2020 logging period: May 5 to Oct 17
W6	Lynx Creek above Haggart Creek	2007 – 2020	7,095,964	458,099	100.9	1,049	Continuous discharge time-series 2020 logging period: Jun 4 to Oct 17
W21[2]	Dublin Gulch near the Mouth	2018 - 2020	7,101,261	458,359	10.1	1,216	Continuous discharge time-series 2020 logging period: May 8 to Oct 13
W22	Haggart Creek above Dublin Gulch	2007 – 2020	7,101,377	458,319	66.5	1,113	Continuous discharge time-series 2020 logging period: May 8 to Oct 13
W26	Stewart Gulch	2007 – 2020	7,101,443	460,331	1.4	1,183	Continuous discharge time-series, manual data only for 2007 - 2009, 2011. 2020 logging period: May 20 to Oct 13
W27	Eagle Creek near Camp	2007 – 2020	7,100,997	458,235	2.6	1,037	Continuous discharge time-series, manual data only for 2007 and 2018 2020 logging period: May 20 to Oct 13
W29[3]	Haggart Creek below Eagle Creek	2010 – 2015, 2020	7,099,583	458,225	86.1	1,112	Manual measurements for 2010, continuous data thereafter 2020 logging period: Aug 8 to Oct 13
W45	Eagle Creek at mouth	2018 – 2020	7,099,740	458,243	3.9	1,018	Continuous water level time-series, manual measurements 2020 logging period: May 8 to Oct 13
W99	Haggart Creek above 15 Pup	2019 – 2020	7,098,180	458,322	88.3	1,116	Continuous discharge time-series 2020 logging period: Apr 18 to Oct 13



Notes:
1. Source of UTM co-ordinates, drainage area and median basin elevation (Knight-Piésold, 2013).
2. Water level sensor malfunctioned in 2019, therefore no continuous water level data are available for this year.
3. No continuous water level data are available for this station for 2016-2019, however manual measurements continue. See Section 2.2.3 for details.

Table 2-2:
Eagle Gold Project spot flot hydrometric stations

Station ID	Station Name	UTM N	UTM E	Description
PDI*	Ditch A outlet to LDSP	7,100,800	458,862	Transfer between engineered structures
PGS*	Ditch A pipe outlet to LDSP	7,100,793	458,851	Transfer between engineered structures
EPS*	Ditch B outlet to LDSP	7,100,824	458,926	Transfer between engineered structures
UND	LDSP underdrain outlet	7,100,928	458,547	Water management infrastructure
W20	Bawn Boy Gulch	7,101,961	461,945	Receiving Environment
W23	Haggart Creek below Lynx Creek	7,095,683	457,790	Receiving Environment
W39	Haggart Creek above South McQuesten River	7,086,504	449,780	Receiving Environment
W49	South McQuesten River below Haggart Creek	7,085,495	449,221	Receiving Environment

Notes:
- *PDI + PGS + EPS= LDSPI (Lower Dublin Sediment Pond inflow)
- PDI and PGS locations are currently surrogate sites until the Platinum Gulch WRSA rock drain is completed
- EPS location is currently a surrogate site for Ditch B inflow until the full length of Ditch B and the Eagle Pup WRSA rock drain are completed

Station ID	Station Name	Record Period	Northing	Easting
W1	Dublin Gulch above Stewart Gulch	2007 - 2018	7101545	460249

2.2.1 Hydrometric Station Summary

A brief summary of the hydrometric network history is provided below. Further details are available in the previous baseline reports listed in Section 1.2.

W1

- Installed in 2007 with a continuous water level recorder, staff gauge, and stilling well and survey benchmarks
- Transducer malfunctions in 2013 and 2014 resulted in loss of data
- Channel bed can be unstable at high flows; channel condition reflects historical placer mining activity.
- The water level recorder returned inaccurate stage data for extended periods of time in 2019, and thus no continuous water level record is available from which to calculate discharge prior to August 5, 2019.

W4

- Installed in 2007 with a continuous water level recorder, staff gauge, and stilling well and survey benchmarks
- Datalogger failure resulted in no continuous water level data for 2016

W5

- Installed in 2007 with a continuous water level recorder, staff gauge, and stilling well and survey benchmarks
- Staff gauge was knocked over in the 2013 freshet and repaired in July 2013

W6

- Installed in 2007 with a continuous water level recorder, staff gauge, and stilling well and survey benchmarks
- A portion of the 2014 record is influenced by a beaver dam located downstream of the control section – influence is minimal and it was possible to correct for the artificially elevated stage.

W21

- A staff gauge, stilling well and water level logger were installed on June 13, 2018.
- Six paired staff gauge:discharge measurements are available for this site, therefore the rating curve and estimated discharges are considered preliminary.

- The W21 water level logger experienced a malfunction in 2019 and no usable continuous water level data were collected for this year or in 2020.

W22

- Installed in 2007 with a continuous water level recorder, staff gauge, and stilling well and survey benchmarks
- No data was available for 2011 due to a pressure transducer malfunction. The water level record estimated by Stantec was carried forward in this report.
- Staff gauge was knocked over in the 2013 freshet and repaired in July 2013.
- Technical issues with the datalogger resulted in a data gap from August 11 to September 7, 2020.

W26

- Manual measurements from 2007 to 2009, instrumented with a continuous water level recorder, staff gauge, and stilling well and survey benchmarks in 2009.
- V-notch weir installed in 2009, and replaced with a Parshall flume in August 2011
- Technical issues with datalogger installation in 2011 resulted in loss of continous data – only manual measurements are available for this year.

W27

- Installed in 2007 with a continuous water level recorder, staff gauge, and stilling well and survey benchmarks however data is not reported due to apparent sedimentation in the stilling well resulting in a continuously rising water level
- V-notch weir installed in 2009, and replaced with a Parshall flume in August 2011
- Malfunction of pressure transducer in August 2015 resulted in loss of data for remainder of this year.
- Technical issues with datalogger and/or flume installation in 2018 resulted in loss of continous water level data. Therefore, only manual measurements are available for this year.
- Issues with the datalogger resulted in loss of continuous water level data for the period of July 23 – August 31, 2019.

W29

- Manual measurements in 2010, instrumented with a continuous water level recorder, staff gauge, and stilling well and survey benchmarks in 2011

- Station was destroyed in the 2013 freshet, and a replacement pressure transducer was deployed on an anchor in the streambed just upstream; water levels were surveyed at the old location and the temporary installation to determine the required offset. A new stilling well was installed in July 2015 at the original gauge location.
- Datalogger malfunctions and channel stability issues, including frost jacking of the stilling well resulted in the loss of continuous water level data for 2016 through 2018.
- The stilling well and datalogger were decomissioned in 2019. W99 utilized as a surrogate station by Victoria Gold.
- The station was re-commissioned in July 2020 as a backup for the W99 record and to maintain site in accordance with licence terms.
- Manual measurements continue to be reported for this station in Table 3-12.

W45

- A staff gauge, stilling well and water level logger were installed on June 13, 2018
- Fourteen paired staff gauge:discharge measurements are available for this site, however there is not sufficient range in flow and stage data to develop a rating curve; thus only the stage data are provided with spot discharge measurements.
- As such, a continuous discharge record has not yet been developed for this station. Further refinement of the stage:discharge relationship is required to develop a robust rating curve from which to derive a continuous discharge time-series.

W99

- A staff gauge, stilling well and water level logger were installed on June 7, 2019
- Eleven paired staff gauge:discharge measurements are available for this site, and a stable rating curve has been developed.

W20

- Station re-established in 2016 and has water level records for 2016 and 2017, but not continued in 2018 through 2020.
- Manual flow and stage measurements conducted when access allows.
- Data is not sufficient to develop a rating curve.

2.2.2 Manual Discharge Measurements

Over time, manual discharge measurements have been conducted using the following methods:

- Velocity area techniques using a current meter;
- Salt dilution;
- Calibrated V-notch weir;
- Calibrated Parshall flume;
- Bucket/Bag and stopwatch, and;
- Float-area method.

The majority of the manual discharge measurements were conducted using the velocity-area method, with approximately one quarter made using the salt dilution technique. Most winter measurements were made while ice encroached on the channel, and therefore salt dilution was the preferred method for winter flow measurements. Typically, one discharge measurement was made at each visit, however efforts were made to conduct multiple same-day measurements in 2020 at select stations to further refine the estimates of measurement accuracy.

2.2.3 Stage Measurements and Corrections

All stations were instrumented with metric staff gauges, mounted to vertical angle iron in the stream channel, and regularly surveyed to nearby benchmarks. Continuously recording HOBO pressure transducers were installed in stilling wells and set to record water level every 15 minutes. These readings were corrected for fluctuations in barometric pressure in a post-processing step. During each site visit, the water level was noted on the staff gauge. These readings formed the basis for the continuous water level records, which were adjusted to match the manual stage readings. Regular benchmark surveys were conducted to determine the staff gauge zero datum and water level, and these measurements were used to correct the station records for changes due to shifts in the channel bed (*i.e.*, aggradation or scour), frost-jacking or station relocation following a high-magnitude flood event.

At each station, an annual offset was developed to bring the staff gauge measurements into line with the reference datum from the 2012 benchmark surveys. W27 was the exception, as no survey information was available for 2012, so 2009 was used as the benchmark reference year for this station following Knight Piésold (2013). In this way, the reference datum at each station was kept consistent for the duration of the record period, regardless of station location or streambed conditions.

No notable issues were encountered with the stage records in 2020 at any of the continuous hydrometric stations, noting that flows were significantly higher than the baseline median for the majority of the open water season. Benchmark surveys were conducted for

operating hydrometric stations in September, to allow for stage corrections to be made if evidence of staff gauge shifts was found. There are 4.5 consecutive years with no continuous water level at W29, as channel instability led to the rejection of the 2016 water level record, and in June 2017, the stilling well frost jacked completely out of the streambed. This station was located in a highly mobile channel that has not reached equilibrium yet, following historical placer mining disturbances, and is therefore challenging to gauge. This station was decommissioned and replaced by the new W99 station in 2019, and then recommissioned in July 2020 as a backup to W99 and to satisfy QZ14-041-1 requirements.

3. Streamflow Record Development

Victoria
GOLD CORP

3. Streamflow Record Development

3.1 General Approach

To develop continuous time-series of discharge for the Project streams, spot measurements of stage and discharge are combined with continuous water level records collected by the pressure transducers. Mathematical relationships are derived to describe the relationship between water level and discharge, and then applied to the continuous water level records to estimate discharge. By convention, assembled stage and discharge relationships are commonly referred to as rating curves, where the relationship between stage and discharge are unique and specific to each monitoring station.

3.2 Rating Curve Development

Adjustments for stage (Section 2.2.3) were made prior to the assembly of rating curves. Winter spot flow measurements provided information on the magnitude of winter discharge, but due to ice effects and greater measurement uncertainty for both stage and discharge, these measurements were not employed in the rating curve development process.

Rating curves were developed using the standard rating equation, and the coefficient, offset and exponent were selected to conform to hydraulic theory (*e.g.*, Maidment, 1993) and the stream channel properties.

$$Q = C(h - a)^n$$

Where:

Q = discharge (m^3/s)

C = coefficient (function of channel geometry)

h = stage (m)

a = stage at point of zero flow, offset (m)

n = exponent (function of channel geometry)

The term C is usually 0.5 to 2.5 times the channel width at the control section, and n is often between 1.6 and 3 for moderate gradient streams. The BC RISC standards (RISC, 2009) state that ideally, a rating curve will be based on a minimum of 10 stage-discharge measurements. Given the long duration of monitoring activities at the Project site, all stations meet these guiding criteria. More recently installed stations now have sufficient data with which to construct rating curves, including W21 and W99. W21 was installed in

2018, and now has fifteen paired measurements, noting that there is relatively high average and standard error in the rating curve (Table 3-6 and Table 3-7), and thus it is still considered preliminary. W99 was installed in 2019 and there are now eleven paired flow and stage measurements with relatively low average and standard errors (Table 3-14), indicating that the rating curve is stable. Survey benchmarks are installed at both stations, and will continue to be surveyed annually to confirm stability of the staff gauge, and thus the rating curves.

3.3 Rating Curve Error

The overall quality of the discharge record can be assessed by reviewing the average and standard errors calculated from the differences between the measured discharges, and those estimated from the rating equation. A positive rating curve error is defined where the discharge calculated from the rating curve overestimates the value when compared to the measured discharge, and vice-versa for a negative error. A summary of the error metrics for all stations is presented in Table 3-1, with reporting for each station in Table 3-2 through Table 3-10. Table 3-1 also reports rating curve control percentages by monitoring station. These values indicate the percent of time that a continuously recorded observation (15-minute intervals) falls between the highest and lowest manually recorded measurements for each monitoring station. For example, at the W6 station, 96% of the 15-minute water level measurements are lower than the highest recorded manual stage measurement. Therefore, the measurements used in the rating curve development are able to represent 96% of the entire continuous water level record, and only 4% of the continuous discharge data derived from the rating curve are based on an extrapolation beyond the highest manually recorded stage-discharge measurement.

For monitoring stations where effort is limited to manual flow measurements, period of record data for the stations are presented in Table 3-12 through Table 3-15.

Overall, the rating curves provide reasonable estimates of discharge across a wide range of flows at most of the Project stations. The rating curve errors presented in Table 3-1 indicate that the average errors are relatively low, ranging from -10% (W29) to 4% (W5). The standard error, or the degree of variability about the average error values varies more between stations, from a high of 32% for station W21, to a low of 7% for station W99. Note that continuous discharge data are not currently generated for W21 due to a lack of water level data, and that the W29 data, due to bank and stream section instabilities, are considered only as a potential backup in regards to adaptive management evaluations in the event that data from W99 are not available.

Rating curves for the site hydrometric stations are presented in Figure 3-1 through Figure 3-8. For the 2017 update, the rating equations were compared to those previously

developed for each station to ensure that the coefficients and exponents were consistent through time. After examining the 2018 data, no further updates to the rating curves developed in 2017 were necessary, and the same curves were applied to the 2018 or 2019 continuous water level data. A similar conclusion was drawn based on inclusion of field data collected in 2020 within the rating relations per monitoring station. Note that because stations W26 and W27 are instrumented with Parshall flumes, rating curves were not developed for these stations. The rating curve plot and error table for the relatively new hydrometric station W99, are presented in Figure 3-8 and Table 3-14, and based on measurements collected in 2019 and 2020.

Table 3-1:
Rating curve error metric summary for Eagle Gold Project site hydrometric stations

Station	Measurements (n)	Average Error (%)	Standard Error (%)	Rating Curve Control
W1	52	-4%	22%	97%
W4	55	0%	14%	100%
W5	45	4%	17%	96%
W6	36	-1%	9%	94%
W21	15	4%	32%	79%
W22	46	0%	14%	100%
W26	37	--	--	100%
W27	77	--	--	100%
W29	26	-10%	21%	95%
W99	11	-1%	7%	96%
Average	43	-1%	17%	96%

Notes:
1. Stations W26 and W27 currently have Parshall flumes installed, and therefore rating curves have not been developed for these sites as part of this baseline streamflow update.

Notes:
1. Measurements highlighted in grey were conducted in ice-affected waters, and were not employed in rating curve development.
2. Stage measurements for the period 2007 to 2012 are as reported in Knight Piésold (2013). Stage measurements for the period 2013 to 2019 are the staff gauge readings relative to the staff gauge datum from 2012.

Table 3-4:

2020-12-05	Salt Dilution	-	0.580	-	-	Stage measurement not available
Average Error (%)					-1%	
Standard Error (%)					9%	

Notes:
1. Measurements highlighted in grey were conducted in ice-affected waters, and were not employed in rating curve development.
2. Stage measurements for the period 2007 to 2012 are as reported in Knight Piésold (2013). Stage measurements for the period 2013 to 2019 are the staff gauge readings relative to the staff gauge datum from 2012.

Table 3-6:
Station W20 – Discharge Measurement Summary

Date	Method	Stage (m)	Discharge (m^3/s)	Comments
2007-08-14	Current Meter	-	0.025	No staff gauge reading available
2007-08-29	Current Meter	-	0.033	No staff gauge reading available

Notes:
[1]A rating curve for W21 was not developed in 2009, and no continuous discharge record is available for 2007-2009, therefore no error metrics are reported for this period.

Table 3-8:
Station W22 – Discharge Measurement Summary

Date	Method	Stage (m)	Discharge (m^3/s)	Rating Curve Discharge (m^3/s)	Rating Curve Error (%)	Comments

Standard Error (%)					21%	

Notes:
1. Measurements highlighted in grey were conducted in ice-affected waters, and were not employed in rating curve development.
2. Stage measurements for the period 2007 to 2012 are as reported in Knight Piésold (2013). Stage measurements for the period 2013 to 2018 are the staff gauge readings relative to the staff gauge datum from 2012.
3. Station measurements considered unreliable. Measurements continued to comply with QZ14-041-1 requirements.

		2020-11-05	8.9

Notes:
[1]Due to the limited number of measurements for these stations, no rating curves have been developed.
[2]Q1 and Q2 W39 measurements were not achievable due to winter site access restrictions. W39 was relocated to a more accessible location on Haggart creek in July to mitigate this in the future.

3.4 Winter Streamflow Interpolation

Due to extensive channel icing and complete freezing to the bed in some cases, reliable continuous water level data is not available for the winter season (mid-October to early May in most years). However, spot flow measurements collected during the winter water quality sampling trips are available for most years. Where these measurements span the majority of the winter season, streamflows were estimated by interpolating between the spot flow measurements. This was done by assuming that mid-winter melt or rain events do not occur at site, and that the streamflows are a result of recession from the open-water season discharge regime to a steady-state baseflow driven by the local groundwater system discharging to the stream channel. This recession curve is defined by the equation (Maidment, 1993):

$$Q_t = Q_0\, e^{-kt}$$

Where:

Q_t = discharge at time t (m^3/s)

Q_0 = initial discharge (both Q_t and Q_0 are measured within the same straight segment

k = decay rate (negative for declining flows)

t = number of days between spot measurements (interpolation period)

The decay rate, denoted k, was unique to each pair of subsequent discharge measurements, and was commonly in the range of -1×10^{-3} to -0.5×10^{-5}.

4. Results

4. Results

4.1 Streamflow Records – Discharge

The computed flow records for all site stations listed in Table 2-1 are presented as average daily discharge time-series and plotted with spot discharge measurements and interpolated baseflows in Figure 4-1 through Figure 4-11. As a rating curve for W45 has not yet been developed, continuous water level data are presented for this station in Figure 4-10. The same flow records are also presented as unit yield plots, with each plot showing annual data for all stations on a single plot (refer to Figure 4-12 to Figure 4-25).

While discharge magnitude varies with watershed area (*i.e.*, larger basin areas result in higher discharge values), it is more often instructive to compare runoff and/or unit yields to remove the influence of watershed area. The variation in runoff and yields across the gauged basins at the Project site is relatively low, with unit yields averaging 14 ± 2 L/s/km^2 and an average runoff of 184 ± 44 mm for the open water season (Table 4-1).

W4 and W27 display slightly lower average unit yields than the other stations, and W1, W5, W29 and W99 yield slightly more water on average. There appears to be lower than average yields at W26, however, this result is biased lower by the absence of data for the month of May, which is typically the month with the highest proportion of annual runoff. W1 appears to experience the highest overall yields, and in particular, the highest magnitude freshet (in yield terms). Higher than average yields at this station are sustained throughout the seasonal falling limb from September through November.

Table 4-2 through Table 4-21 present the monthly summaries of streamflow as discharge, unit yields and runoff, by station. As noted in Section 2.2.3, reliable continuous water level data is not available for W29 for 2016 through 2019, and much of 2020.

Table 4-1:
Summary of monthly average discharge, unit yield and runoff for Project site hydrometric stations.

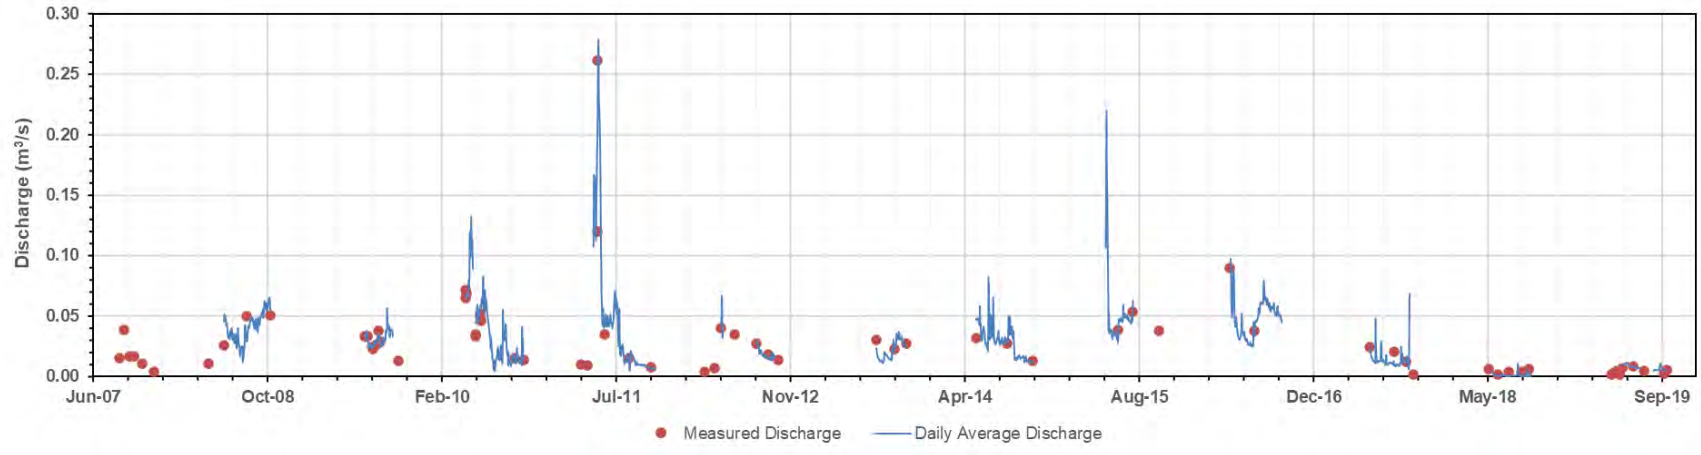

Figure 4-8: W27 Average daily discharge record (2007 to 2020)

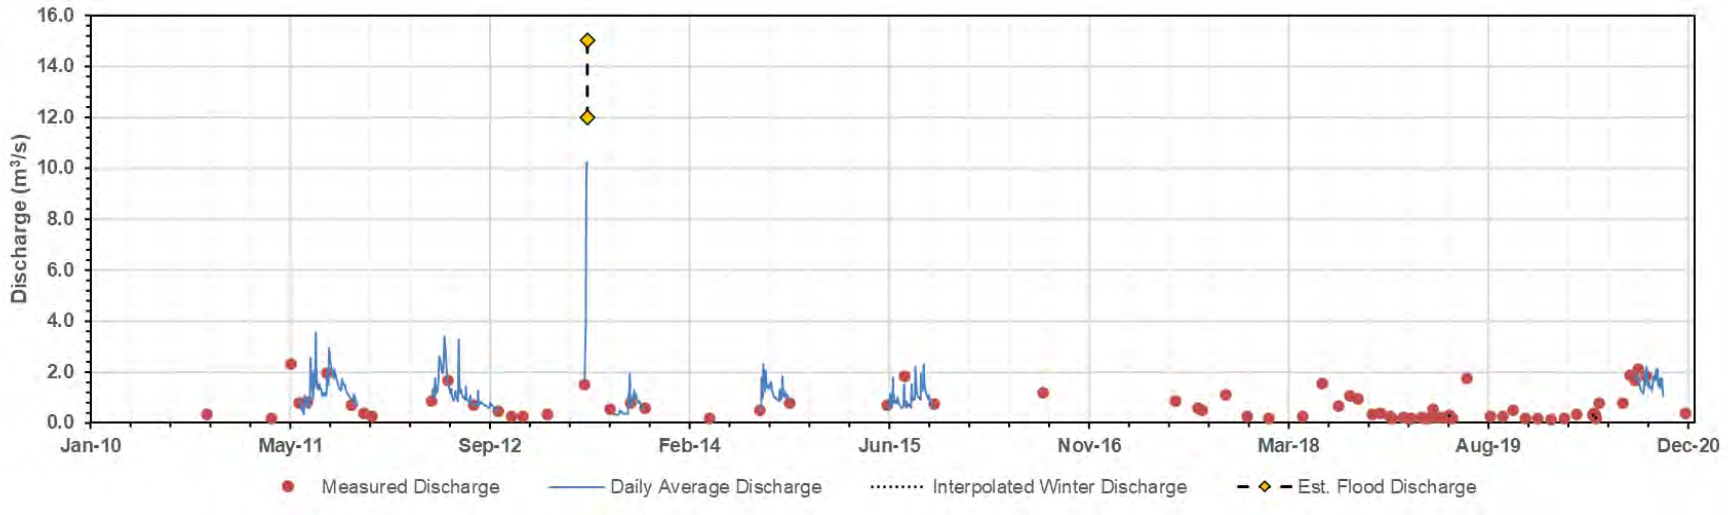

Figure 4-9: W29 Average daily discharge record (2011 to 2020). Note that values for May 29, 2013 are estimates based on high water marks and channel surveys at W29 (Laberge, 2013).

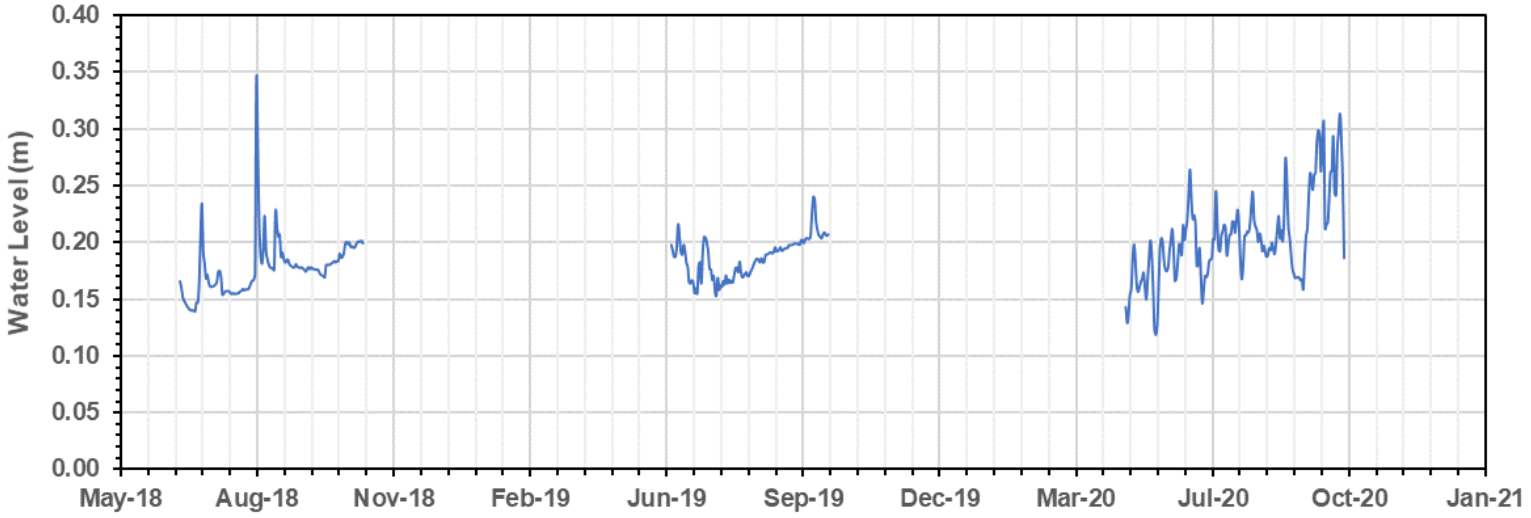

Figure 4-10: W45 Average daily water level record (2018 to 2020).

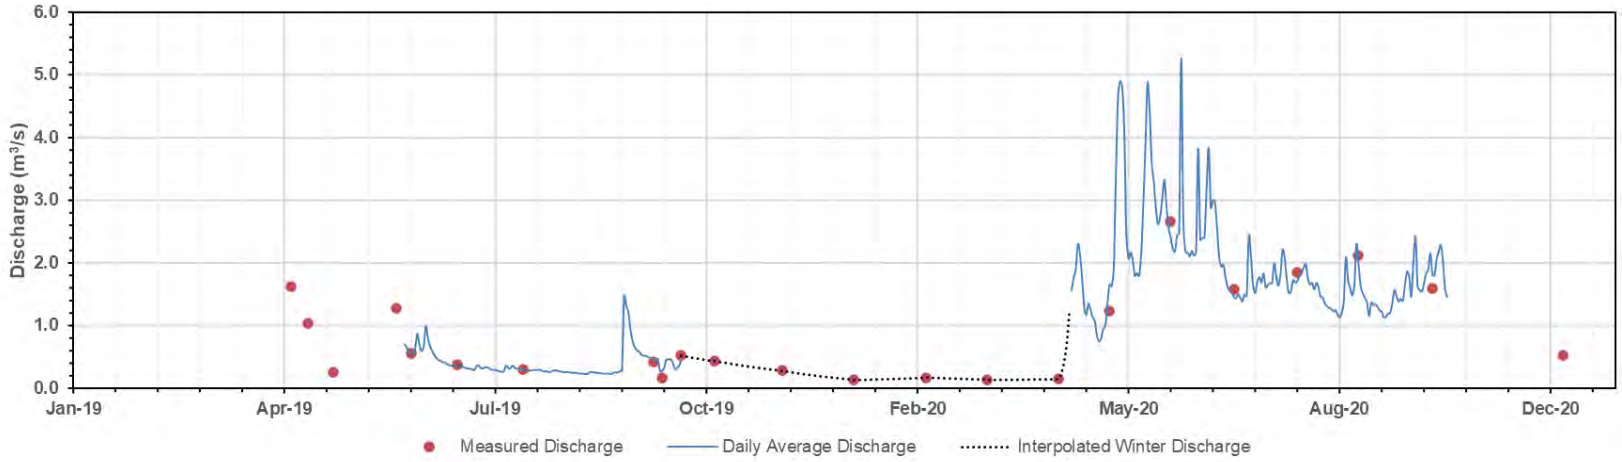

Figure 4-11: W99 Average daily discharge record (2019 to 2020).

4.2 Streamflow Records – Unit Yields

Period of record (Figure 4-12) and unit yield plots per year (Figure 4-13 through Figure 4-26) are presented for the eight hydrometric stations in this section.

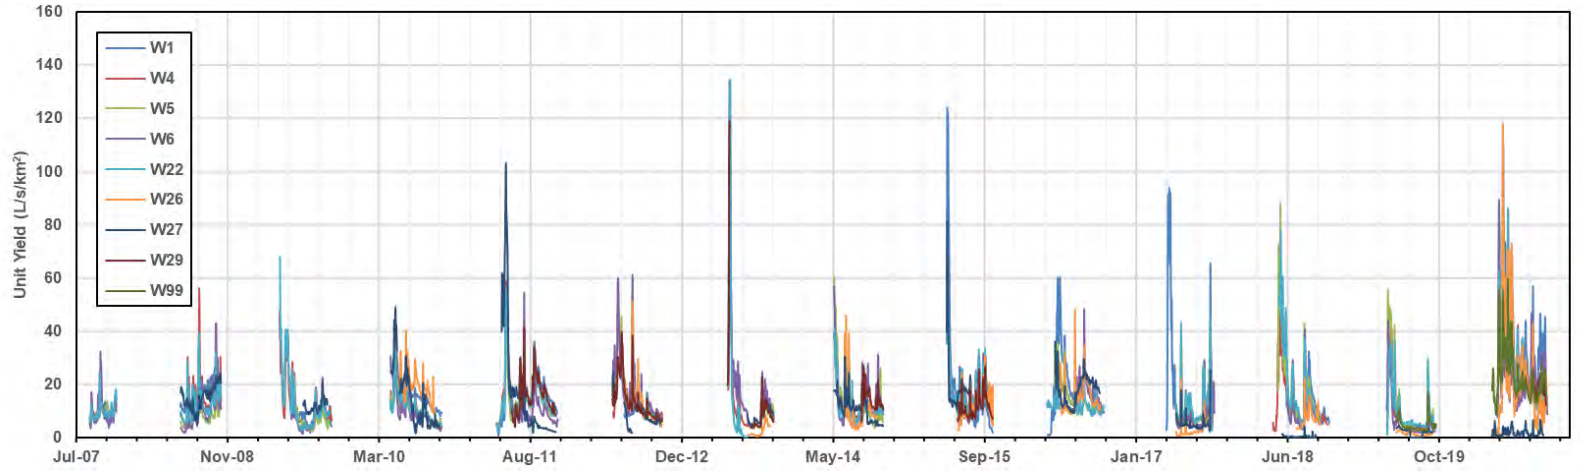

Figure 4-12: Average daily unit yield time-series for Project stations (2007-2020)

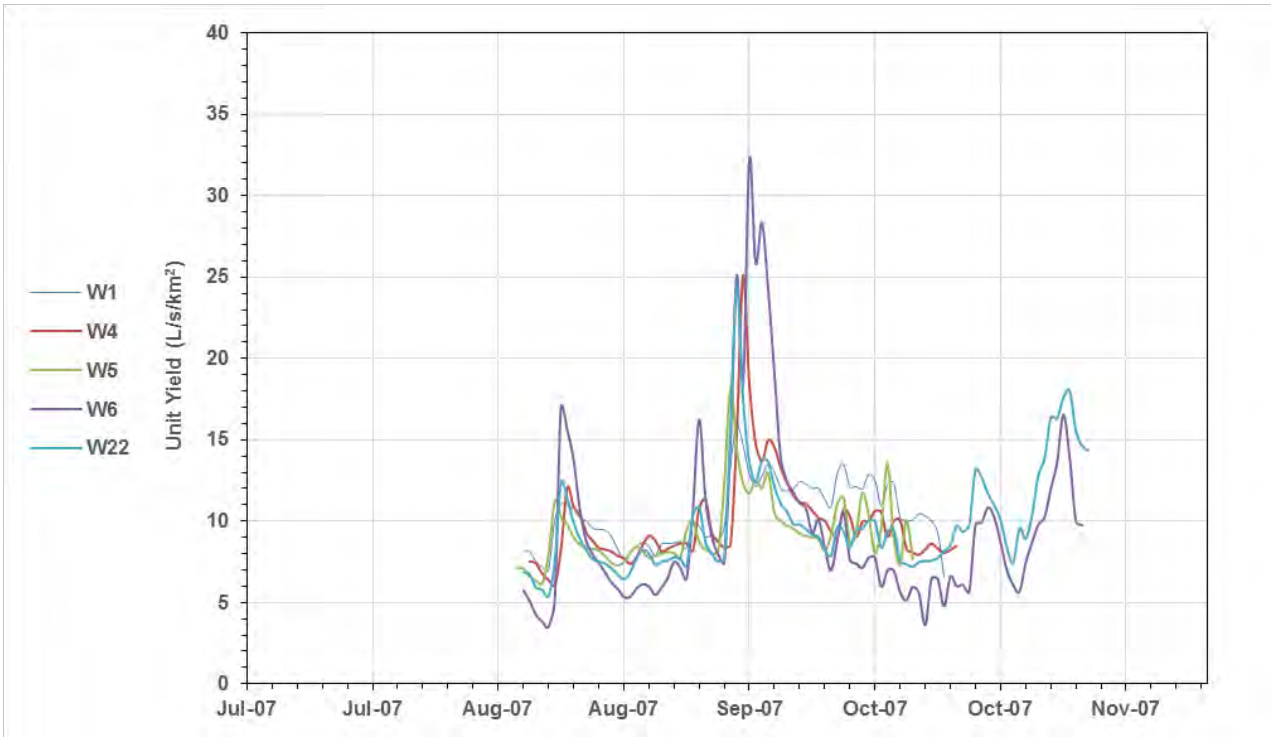

Figure 4-13: Average daily unit yield time-series for Project stations (2007)

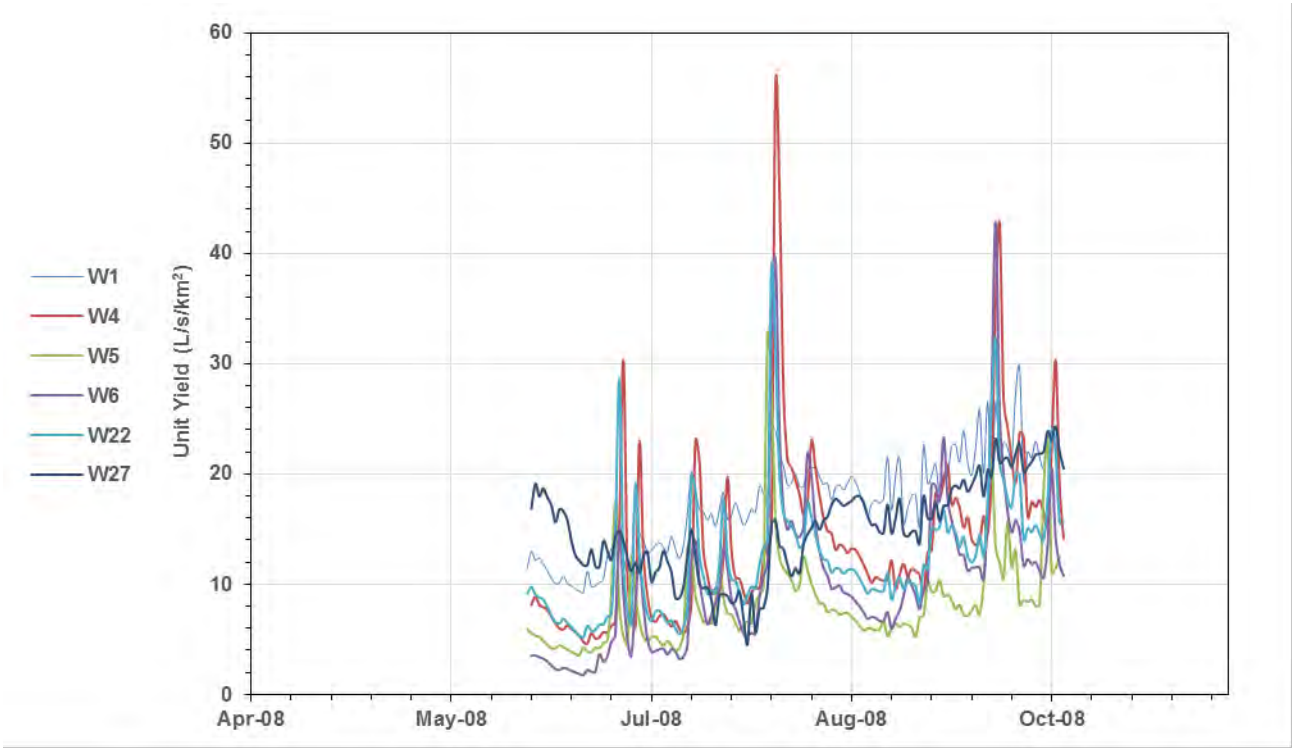

Figure 4-14: Average daily unit yield time-series for Project stations (2008)

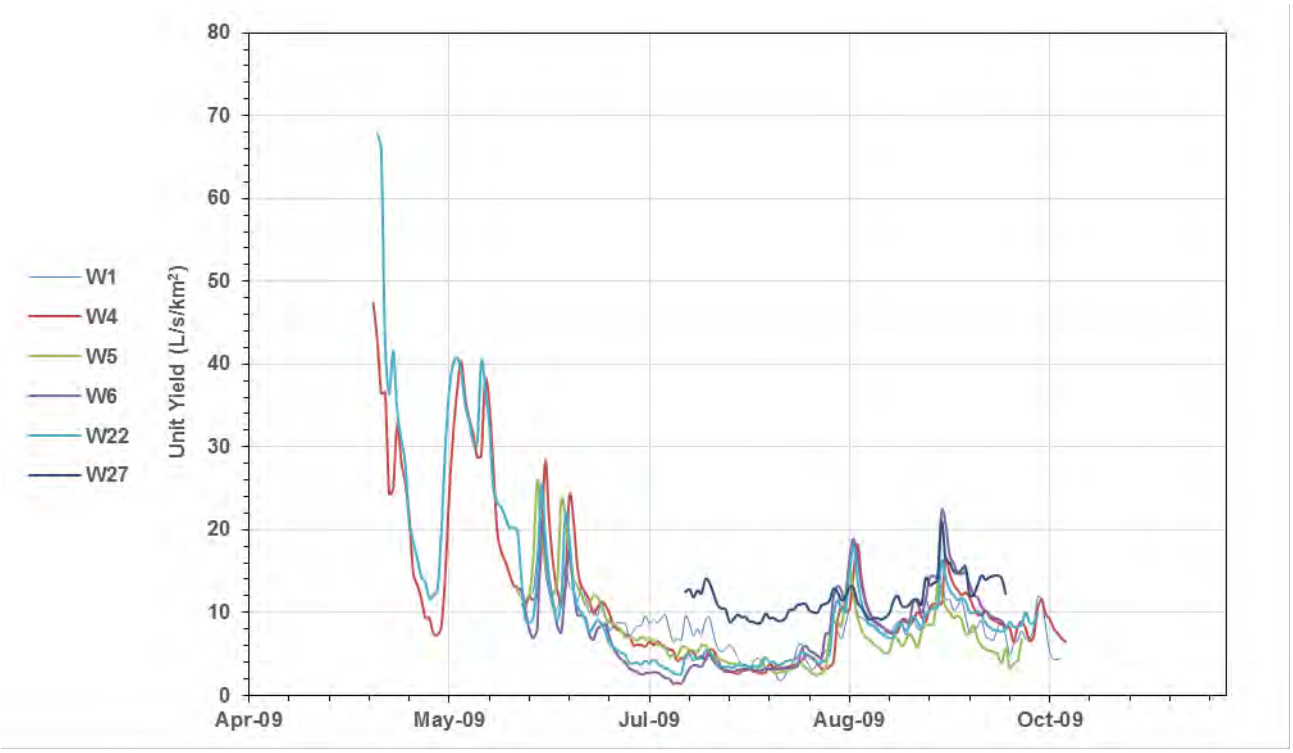

Figure 4-15: Average daily unit yield time-series for Project stations (2009)

4.3 Streamflow Records – Monthly Summary Tables

Monthly summary tables are presented for the ten hydrometric stations in this section.

Table 4-2:
W1 Summary statistics for 15-minute discharge record. All values are in m^3/s.

Year	Variable	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec

5. Effluent Discharge

Victoria
GOLD CORP

5. Effluent Discharge

Water management infrastructure for the Project is designed to convey site contact water via Ditch C, which joins Haggart Creek above the W4 station. Flows in Ditch C are monitored continuously when discharging with a V-notch weir, staff gauge and pressure transducer. Total monthly discharge volumes are confirmed by calculating the pond volume changes from daily surveys of the pond water level during the periods of active discharge (Table 5-1). There is close correspondence in the values derived from the two methods, with relative percent differences (RPD) of 0.1% to 9.3%, averaging 6.4% over the three months with active discharges in 2020. Finally, salt dilution measurements are made periodically downstream of the weir to confirm the instantaneous discharge values as calculated from the weir equation and staff gauge reading.

Table 5-1:
Monthly Discharge Totals from Lower Dublin South Pond (2020)

Month	Survey (m^3)	Weir (m^3)	RPD %
July	7,689	7,693	0.1
August	118,368	107,903	9.3
September	73,038	71,209	2.5
Total	199,095	186,805	6.4

Note:
RPD = Relative Percent Difference

In April 2020, approximately 43,130 m^3 of water was discharged from the Lower Dublin South Pond to an exfiltration sump. The temporary impact to surface water flows from this discharge event are uncertain and assumed to be negligible.

6. Adaptive Management Reporting

Victoria
GOLD CORP

6. Adaptive Management Reporting

The Water Use License (WUL) QZ14-041-1 requires that all streamflow and discharge data collected in accordance with the Environmental Monitoring, Surveillance and Adaptive Management Plan (EMSAMP) be presented in the annual report. To capture any potential alterations to the baseline streamflow signature in Haggart Creek, a three-tiered threshold scheme has been developed for the adaptive management of surface water flow. The thresholds provided in Table 2.4-1 of the EMSAMP are different for the ice-free and ice-affected seasons, and are based on the median baseflows established for hydrometric stations W4 and W29 over the baseline period that encompassed the period August 2007 to August 2017. Note that the W29 station has been replaced by the W99 station, which has a 3% larger drainage area (Table 4-1). To account for this difference, the W29 baseline values have been adjusted upward by a factor of 1.03 to represent baseline conditions at W99.

The table describes four types of responses (*i.e.*, notification, review, evaluation and action) when each threshold is reached. The thresholds are based on an assumed level of effect to the wetted useable area in the stream channel based on the measured flow reduction from the median monthly baseflows at Haggart Creek hydrometric stations W4 and W99 (for comparison to W29 baseline). While the affect of flow reduction, measured as a decrease in river stage, will be different for each channel reach due to varying width:depth ratios (as reflected in a stage rating curve, for example), generally streams with high width:depth ratios (such as Haggart Creek) have small changes in wetted useable area (or width) per unit decrease in flow. Thus, the three-tiered thresholds of 30%, 40% and 50% in reduction in flow from the median baseflow during the ice-free season reflect the affect of channel morphology on flow and wetted useable area (VGC, 2020).

For the ice covered season, the three performance thresholds are set as a 20% reduction (from baseline) in median monthly baseflow for two consecutive monitoring events (Threshold 1), 20% for three consecutive events (Threshold 2), and 25% for two consecutive monitoring months (Threshold 3).

Flow values presented in Table 6-1 and Figure 6-1 for the months of May through September inclusive are median values, derived from continuous time-series discharge data. Flow data for October are still representative of open water conditions, however ice begins to form on local streams mid-month, and therefore the October value is the median of the first 10-14 days of the month, prior to freezing. The flow values reported for the months of November through April are based on one to two manual measurements (when possible), and therefore the deviation between baseline values and reported values for the

current year may be higher due to limited baseline records and infrequent flow measurements taken in challenging conditions (*i.e.*, under ice). Note that there is much less inter- and intra-annual variability in the winter low flows, as they are primarily driven by groundwater discharge to the stream channels.

Table 6-1:
Median monthly streamflows for the baseline (2007-2017) period and for 2020, for Haggart Creek stations W4 and W99.

Month	Baseline (2007-2017)		2020		Percent Difference[1]	
	W4	W99	W4	W99	W4	W99
Jan	0.187	N/A	0.143	0.130	-24%	N/A
Feb	0.193	0.361	0.174	0.172	-10%	-52%
Mar	0.133	0.206	0.236	0.132	77%	-36%
Apr	0.159	0.202	0.254	1.319	60%	553%
May	1.826	1.817	1.544	2.456	-15%	35%
Jun	0.922	0.995	2.933	2.425	218%	144%
Jul	0.756	1.126	1.842	1.646	144%	46%
Aug	0.739	0.938	1.771	1.611	140%	72%
Sep	0.812	1.050	1.454	1.412	79%	34%
Oct	0.729	0.866	1.328	1.835	82%	112%
Nov	0.333	0.330	N/A[2]	N/A[2]	N/A[2]	N/A[2]
Dec	0.248	0.283	0.381	0.521	54%	84%

Notes:
Shaded areas in Table indicate ice covered season, when flow measurements are limited to monthly manual data
[1]Percent difference calculated as (2020 – Baseline)/Baseline. Positive values indicate that flows were higher than baseline in 2020, and *vice versa*.
[2]Manual flow measurements were not made in November 2020.

While streamflows were lower than the median baseline condition in January and February (both stations) and March (W99 only), flows were consistently elevated above the median baseline condition in 2020 due to the much higher than average spring snowmelt and subsequent rainfall throughout the summer months. Threshold 3 was surpassed at W99 in in February and March 2020, but not at W4, indicating that the exceedance was potentially an artefact of the limited monitoring frequency and challenging flow gauging conditions, rather than from mine water management practices. If flow reductions were due to the latter, similar (and relatively higher) reductions would be expected at the W4 station. Also worth noting is that baseflows were lower than average at the end of 2019, as a result of reduced snowmelt and precipitation, and thus streamflows in 2019 (see Figure 4-12, Figure 4-25 and Table 4-4). Therefore, the noted reductions in streamflow in Haggart Creek relative to the baseline condition in early 2020 were likely the result of the regional hydro-meteorological conditions rather than mine water management. Following the first quarter of 2020, stream discharges generally began to rise well above EMSAMP thresholds, as the significant 2019 winter snow pack began to melt and record summer 2020 precipitation values began to impact drainages around the Project.

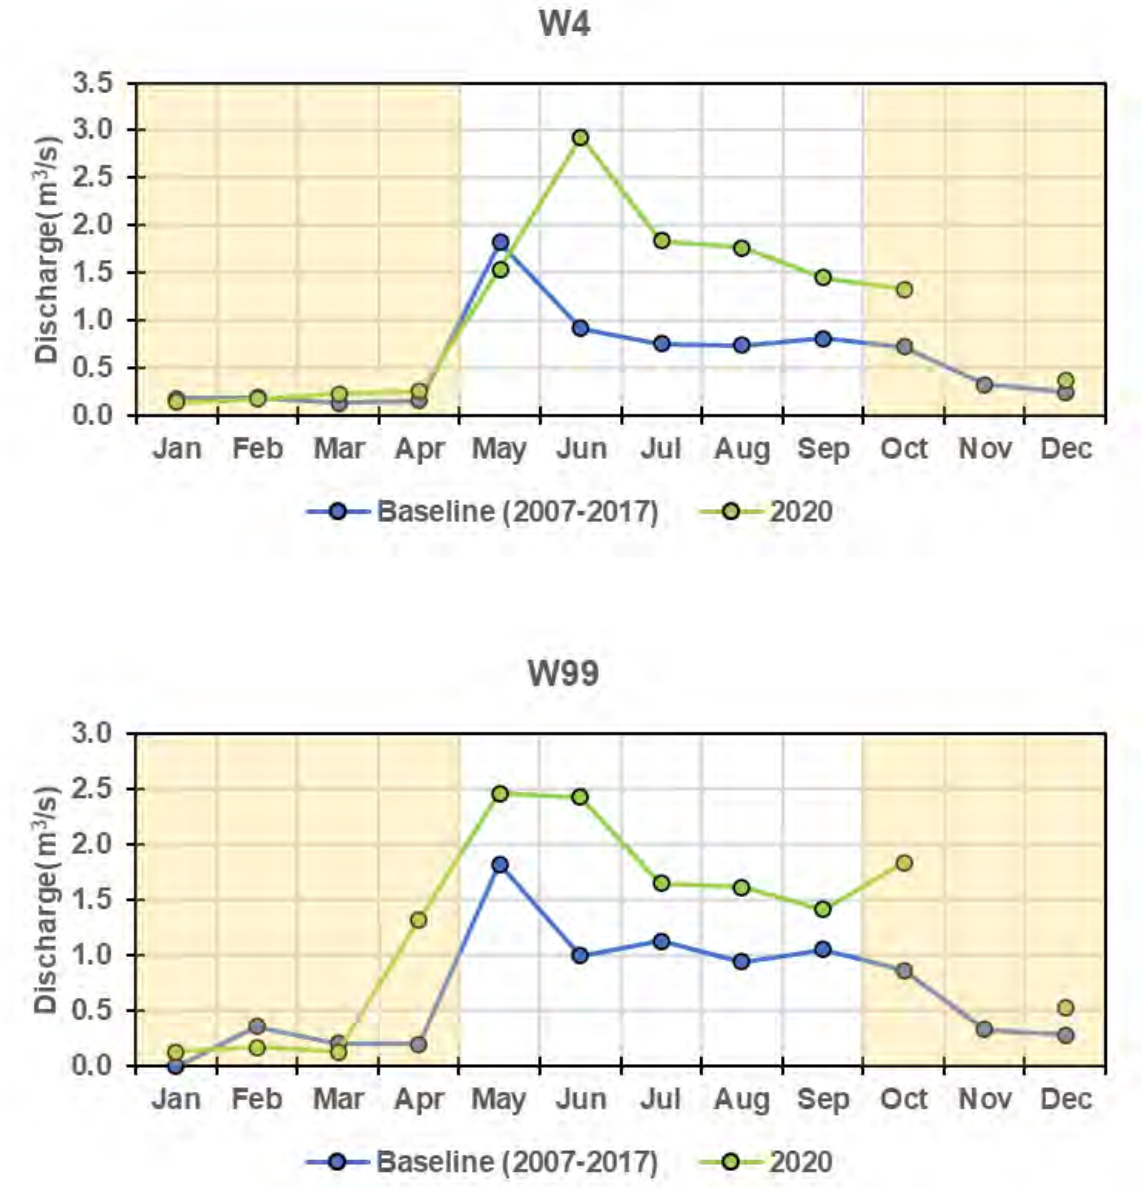

Figure 6-1: Median monthly streamflow for the baseline (2007-2017) period and for 2020, for Haggart Creek stations W4 (top) and W99 (bottom). Shaded areas indicate ice covered season, when flow measurements are limited to monthly manual data.
