Isolated exceedances of SPT 1 and SPT 2 criteria occurred at multiple locations for a variety of parameters. SPT definitions were provided in Section 2.2. SPT 1 generally identifies significant change in concentration since the previous monitoring event but have not exceeded a concentration-based threshold. SPT 2 criteria generally identify concentrations that have exceeded a defined baseline or EQS concentration.

- Isolated SPT 1 exceedances in 2020 include: chromium and selenium in MW12-05-01 and MW12-05-02; zinc in MW12-05-02 and MW12-05-06; selenium in MW12-05-04; sulphate in MW12-05-03; arsenic in MW12-06-01; and, chromium in MW12-06-04.
- Arsenic and selenium exceeded SPT 2 in MW12-06-01 during one monitoring event and ammonia exceeded in two of the four monitoring events.

While the exact cause of these exceedances is uncertain, they occur as sporadic and, with the exception of ammonia in MW12-06-01, as isolated events. Continuous trends are not present for these parameters and are therefore not considered a risk at this time.

4.1.2 General Visual Trends

In addition to the exceedances discussed above, some parameters exhibit increasing trends at concentrations that are currently below thresholds, as outlined in Table 2-1.

While it is important to monitor these trends, they are not unexpected in the vicinity of active mining where the development of pits and underground workings depressurize the system and upset equilibrium conditions, and do not currently pose a risk to Minto Creek water quality.

4.1.3 Risk Context

Elevated concentrations of CoCs in groundwater are assessed to identify and mitigate potential risks to surface water quality in Minto Creek. At this time, elevated concentrations of CoCs in

groundwater are not considered a high risk to surface water quality. The following points summarize the rationale for this conclusion:

- Consistent exceedances are not widespread and are limited to only sulphate and chromium.
- Elevated concentrations of sulphate and chromium are isolated to the deepest zones of MW12-05 and MW12-06, with no known conduit connecting groundwater at these depths to Minto Creek at surface.
- Data suggest sulphate concentrations in MW12-05 are not related to mine activities.
- Data suggest chromium concentrations are a result of the groundwater equilibrium being disrupted by depressurization and not direct mine-water infiltration.
- Concentrations in Minto Creek have remained in the range of observed baseline conditions with no observed changes that reflect an influence from mine-affected groundwater.

The overall risk of mine-affected groundwater contributions to Minto Creek water quality is considered low; mitigation is not considered necessary at this time.

4.2 Groundwater Quality in McGinty Creek Catchment

4.2.1 SPT Exceedances

Trends in certain parameters within the groundwater monitoring network in the McGinty Creek catchment are present, as listed in Table 2-1; however, only arsenic in MW09-03-01 and cadmium, nitrate and zinc in MW09-03-02 have consistently exceeded SPTs. While the other parameters provide useful insight for interpretation of overall conditions at the Project and comparison with previously provided water quality predictions, they are not considered problematic at this time as concentrations remain below OAMP thresholds. Figures representing groundwater monitoring data for all CoCs are included in Attachment 2. A complete dataset for all monitoring wells along with key monitoring stations in McGinty Creek, Minto Creek and within the mine operations are provided in Attachment 3 and a description of each monitoring station is provided in Attachment 4.

For context, in 2019, zinc, molybdenum and selenium consistently exceeded thresholds in MW09-03-01. In 2020, concentrations decreased with only two exceedances for zinc, one for selenium and none for molybdenum.

Nitrate

Nitrate at MW09-03-02 has been increasing since the beginning of 2017 and has consistently exceeded SPT 2. The nitrate concentration of the deeper zone, MW09-03-01, remains stable and below both SPT 1 and SPT 2. Concentrations of the same magnitude observed at MW09-03-02 are consistently observed in MW17-11-05, which is at a similar elevation and adjacent to MW09-03-02 (Figure 10). Presently, the Minto North Pit acts as a hydraulic sink, with a hydraulic divide possible in the vicinity of MW09-03 and MW-17-11 and gradient towards the pit from both wells.

As the pit water level is much lower than water levels in the wells, migration of pit water is not the cause of the nitrate increase observed at MW09-03-02.

The increase in nitrate concentrations do coincide with development of the Minto North Pit, which resulted in a water level decrease in MW09-03 and subsequent changes in redox conditions which can cause an increase in nitrate (discussed below). The development of Minto North involved the construction of a haul road using blasted rock and may also contribute nitrogen load to the groundwater. Observed concentrations in MW09-03-02 may be the result of these two different mechanisms.

Nitrate is sensitive to changes in redox conditions. Other redox-sensitive elements were assessed to understand the observed concentrations in MW09-03. Concentrations of ammonia, iron and manganese decreased significantly and concurrently with an increase in oxidation-reduction potential (ORP) at the same time as the observed water level decrease (Figure 11). These observations suggest conditions in the aquifer changed from reducing to oxidizing, resulting in the formation of iron and manganese oxides/oxyhydroxides and a shift in nitrogen speciation from an ammonia dominated system to nitrate (Figure 12).

Blasted rock was used to construct the Minto North haul road which contains nitrogen compounds as residue from the process. These nitrogen compounds can be mobilized as nitrate by precipitation infiltrating through the blasted material. Seepage from nitrogen-containing blast residuals in the haul road material may also contribute an additional load of nitrate to the groundwater.

Arsenic

Arsenic concentrations in MW09-03-01 increased concurrent with the development of the Minto North Pit but appear to have reached equilibrium quickly, as concentrations have since stabilized. Concentrations are consistently above SPT 2 but, as Minto North Pit acts as a hydraulic sink, are not due to pit water infiltration. An inverse trend was observed in MW09-03-02, with an initial decrease followed by stabilization (Figure 13).

Similar to nitrate, arsenic is redox sensitive, and these trends may be attributed to a change in aquifer conditions as water levels dropped in 2015 following the onset of mining at Minto North.

Cadmium and Zinc

Zinc increased in concentration and variability in MW09-03-01 and MW09-03-02, beginning in 2015 when mining of the Minto North pit started (Figure 14). Cadmium showed similar behavior, particularly in MW09-03-02 (Figure 15). The dominant attenuation process for these ions is adsorption, and it is possible with a change in conditions, competition for adsorption sites caused the increased mobility of zinc and cadmium which have not yet reached equilibrium.

Other Parameters

In addition to the consistent exceedances discussed above, isolated exceedances to SPT 1 were observed: aluminum in MW09-03-01 and MW09-03-02; selenium in MW09-03-01; zinc in MW09-

03-01; and, copper in MW09-03-02. Cadmium exceeded SPT 1 twice in MW09-03-01 and SPT 2 once. Zinc in MW09-03-01 showed an isolated SPT 2 exceedance.

While the exact cause of these exceedances is uncertain, they occur sporadically and, with the exception of cadmium in MW09-03-01, as isolated events. Continuous trends are not present for these parameters and are therefore not discussed further at this time.

4.2.2 General Visual Trends

In addition to the exceedances discussed above, some parameters exhibit increasing trends at concentrations that are currently below thresholds, as outlined in Table 2-1.

While it is important to monitor these trends, they are not unexpected near active mining, where the development of pits abruptly depressurizes the groundwater system and upsets equilibrium conditions, and do not currently pose a risk to McGinty Creek water quality.

4.2.3 Risk Context

Elevated concentrations of CoCs in groundwater are assessed to identify and mitigate potential risks to surface water quality in Minto Creek. At this time, elevated concentrations of CoCs in groundwater are not considered a high risk to surface water quality. The following points summarize the rationale for this conclusion:

- Groundwater levels in all monitoring zones of MW09-03 and MW17-11 are at least 30 m higher than the Minto North Pit, creating a hydraulic barrier preventing pit water from migrating towards McGinty Creek.
- Concentrations in McGinty Creek have remained in the range of observed baseline conditions with no observed changes that reflect an influence from mine-affected groundwater.
- Loading calculations presented in SRK 2020 indicate groundwater concentrations would have to increase by at least one order of magnitude from the 2019 average to contribute enough load to McGinty Creek for SPT 1 to be exceeded, with the exception of selenium, which has been elevated in baseline data and already exceeds SPT 1 at MN-4.5 (Table 4-1). Additional context is provided below.

While the required nitrate concentration (37 mg/L) determined by the loading calculations is an order of magnitude higher than the 2019 average (7.9 mg/L), monitoring events during Q4 2020 had concentrations as high as 31.6 mg/L in MW09-03-02 with a 2020 average concentration of 13.7 mg/L. If nitrate continues to increase in MW09-03-02, the loading calculations suggest an impact could be seen in McGinty Creek. It is still uncertain, however, if the groundwater poses the highest risk of loading, or if surficial seeps from the Minto North haul road are more important. The overall estimated percentage of groundwater loading to McGinty Creek, which was calculated using an area percentage of the total McGinty Creek catchment, is low (0.45%) and as the Minto North Pit acts as a hydraulic sink, this is a conservative estimate of groundwater contributions. This method is also considered conservative compared to using observed

baseflows presented in the *Minto Mine Numerical Groundwater Model Report* (SRK 2014), which were considerably lower than the flows calculated for use in the loading assessment.

Apart from nitrate, the average concentrations from 2020 were not significantly different than 2019, and even decreased in some cases (Table 4-1).

The overall risk of mine-affected groundwater contributions to McGinty Creek water quality is considered low; mitigation is not considered necessary at this time.

Table 4-1: Results of McGinty Creek Loading Calculations

Parameter (mg/L)	Units	Minto Creek SPT 1	2019 Average Concentrations		2020 Average Concentrations		Total Concentration (C_{tot})	Groundwater Concentration Required to Exceed SPT 1

Notes:

red cell indicates surface water concentrations are historically higher than Minto Creek SPTs

"Groundwater concentration required to exceed SPT 1" are based on 2019 average concentrations. 2020 average concentrations are provided for comparison.

5 Conclusions

Groundwater exceedances of the OAMP SPTs in 2020 have been limited to a few parameters and consistent SPT exceedance is not widespread; most monitoring zones (~69%) did not exceed more than one OAMP SPT in 2020.

5.1 Minto Creek

- On-going exceedances in the Minto Creek catchment include sulphate in MW12-05-01 and MW12-05-02 and chromium in MW12-06-01.

- Sulphate concentrations exhibit an increasing trend with depth across the site and events have been restricted to the deepest monitoring zones at depths greater than 85 mbgs.
- The source of elevated sulphate in the groundwater has been examined in multiple investigations, all of which suggest elevated concentrations at MW12-05 are not related to mining activities and is instead likely due to interaction with sulphur-bearing minerals in the ore body.
- Changes in water levels and redox sensitive parameters indicate underground mine activities may disrupt the equilibrium conditions of groundwater at MW12-06-01, but elevated chromium concentrations are not a direct result of mine water infiltration.
- Concentrations in Minto Creek have remained in the range of observed baseline conditions with no observed changes that reflect an influence from mine-affected groundwater.

5.2 McGinty Creek

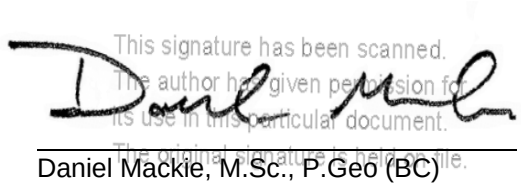
- On-going exceedances in the McGinty Creek catchment include arsenic in MW09-03-01 and cadmium, nitrate and zinc in MW09-03-02.
- Minto North Pit acts as a hydraulic sink and the migration of pit water is not responsible for elevated concentrations in groundwater.
- The system experienced a shift in redox conditions following a water level drop concurrent with the development of Minto North. This shift may be responsible in part for observed exceedances as equilibrium conditions were disrupted.
- Flushing of nitrogen-containing blast residuals from waste rock used to construct the Minto North haul road is considered another likely source of loading to the groundwater.
- Results of the groundwater loading calculations indicate most parameters would have to increase beyond current concentrations by at least one order of magnitude to contribute enough load into McGinty Creek for SPT 1 to be exceeded.
- The overall contribution of groundwater to McGinty Creek is low and a hydraulic barrier exists between Minto North Pit and McGinty Creek, preventing seepage from entering the surface water system from the pit itself.

Concentrations in Minto and McGinty Creeks have remained in the range of observed baseline conditions with no observed changes that reflect an influence from mine-affected groundwater. The overall risk of contact water migrating through the groundwater and negatively affecting McGinty and Minto Creeks is considered low and mitigation efforts are not necessary at this time.

6 Recommendations

Groundwater exceedances of the OAMP SPTs do not require mitigation as surface water bodies have not been impacted by elevated groundwater concentrations and several lines of evidence, along with water quality predictions for the overall project, suggest the overall risk of future impacts to surface water quality is low. Groundwater monitoring should continue as per the Minto

Mine Groundwater Monitoring Plan, and results should continue to be evaluated against the Operational Adaptive Management Plan SPTs and compared with other studies assessing natural background conditions. The following actions are also recommended to inform future mitigation efforts:



- Continue groundwater monitoring as per the Minto Groundwater Monitoring Plan.
- Continue efforts to sample seepage and surface runoff during high precipitation events along the Minto North haul road to better constrain seepage water quality.
- Conduct a mid to late summer flow and water quality accretion survey along McGinty Creek beginning at the headwaters and extending to MN-2.5 to better understand groundwater – surface water interactions and risk due to groundwater discharge and loading when conditions are appropriate.
  - This was also recommended in the 2019 Groundwater Review but plans were postponed as high flow conditions in McGinty Creek were thought to decrease the probability of seeing groundwater influences.
- Conduct opportunistic sampling of deep groundwater to assess sulphate trends with depth during exploratory drilling or from underground workings.

Legend

Sulphate (mg/L)

- 0-500
- 500-1000
- 1000-1500
- 1500-2000
- >2000
- No 2020 Data

- Surface Station
- Groundwater Well
- Seep Station

Notes:
1. Data presented in NAD 1983 UTM Zone 8N.
2. Base orthophoto provided by Minto Mine, 2017.
3. Posted sulphate concentrations are maximum observed at a given location in 2020.
4. Multi-level monitoring wells are presented as nested diamonds only if concentrations are variable between depths.
5. The inside marker in a nested diamond represents the deepest port, with diamond size increasing towards the ground surface.
6. Ports shallower than Zone 4 in MW12-05 have sulphate concentrations <500 mg/L and are not presented on the figure.
7. Maximum 2020 sulphate concentration in MW12-05-02 and MW12-05-01 were 2540 mg/L, all other concentrations were <1500 mg/L.

Attachment 4: Description of Monitoring Stations

Attachment 4: Monitoring Station Descriptions

Monitoring Station	Description
Surface Water	
MC1	Minto Creek - Minto Canyon
MN	Minto North Pit Water
MN-0.2	Upper West Arm of McGinty Creek
MN-0.5	West Arm McGinty Creek Upstream of Confluence with East Arm
MN-1.5	Upper East Arm of McGinty Creek down from Minto North Deposit
MN-2.5	East Arm of McGinty Creek Upstream of Confluence with West Arm
MN-4.5	Main Stem of McGinty Creek near Confluence of Yukon River
W2	Minto Creek - Near Confluence with Yukon River
W5	Yukon River 100 m Downstream of Minto Creek
W50	Minto Creek - Edge of Mine Property Boundary
W6	Minto Creek - Outside Mine Property Boundary
W7	Minto Creek - Outside Mine Property Boundary
Mine Facilities	
UG1	Underground Portal 1
UG4	Underground Portal 4
W12	Main Pit
W12N	North Pit Surface Water
W12S	South Pit Surface Water
W14	Tailings Thickener Overflow
W16	Main Water Storage Pond (includes W16S and W16DF)
W3	MMER Final Discharge Point (Flume)
W45	Area 2 Pit Water
W46	Minto Creek Tributary Outside Property Boundary
W62	Drystack Tailings Facility Drainage (replaced W8A)
W8	Drystack Tailings Facility Drainage West
W8A	Drystack Tailings Facility Drainage East (Dry)
Groundwater Wells	
MW09-01-01	MW09-01 Zone 1 - Southwest of Main Pit
MW09-01-02	MW09-01 Zone 2 - Southwest of Main Pit
MW09-01-03	MW09-01 Zone 3 - Southwest of Main Pit
MW09-01-04	MW09-01 Zone 4 - Southwest of Main Pit
MW09-01-05	MW09-01 Zone 5 - Southwest of Main Pit
MW09-02-01	MW09-02 Zone 1 - Dry Stack Tailings Facility (discontinued)
MW09-02-03	MW09-02 Zone 3 - Dry Stack Tailings Facility (discontinued)
MW09-03-01	MW09-03 Zone 1 - Minto North Haul Road
MW09-03-02	MW09-03 Zone 2 - Minto North Haul Road
MW09-03-03	MW09-03 Zone 3 - Minto North Haul Road
MW09-03-04	MW09-03 Zone 4 - Minto North Haul Road
MW09-03-05	MW09-03 Zone 5 - Minto North Haul Road
MW09-04-04	MW09-04 Zone 4 - Southeast of Main Pit (discontinued)
MW12-05-01	MW12-05 Zone 1 - Downstream of Water Storage Pond along Minto Creek
MW12-05-02	MW12-05 Zone 2 - Downstream of Water Storage Pond along Minto Creek
MW12-05-03	MW12-05 Zone 3 - Downstream of Water Storage Pond along Minto Creek
MW12-05-04	MW12-05 Zone 4 - Downstream of Water Storage Pond along Minto Creek
MW12-05-05	MW12-05 Zone 5 - Downstream of Water Storage Pond along Minto Creek
MW12-05-06	MW12-05 Zone 6 - Downstream of Water Storage Pond along Minto Creek
MW12-05-07	MW12-05 Zone 7 - Downstream of Water Storage Pond along Minto Creek
MW12-06-01	MW12-06 Zone 1 - Between DSTF and Water Storage Pond
MW12-06-02	MW12-06 Zone 2 - Between DSTF and Water Storage Pond
MW12-06-03	MW12-06 Zone 3 - Between DSTF and Water Storage Pond
MW12-06-04	MW12-06 Zone 4 - Between DSTF and Water Storage Pond
MW12-06-05	MW12-06 Zone 5 - Between DSTF and Water Storage Pond
MW12-06-06	MW12-06 Zone 6 - Between DSTF and Water Storage Pond
MW12-07-01	MW12-07 Zone 1 - Main Mine Facilities East of Main Pit
MW12-07-02	MW12-07 Zone 2 - Main Mine Facilities East of Main Pit
MW12-07-03	MW12-07 Zone 3 - Main Mine Facilities East of Main Pit
MW12-07-04	MW12-07 Zone 4 - Main Mine Facilities East of Main Pit
MW17-08-01	MW17-08 Zone 1 - Background Well West of Southwest Waste Dump
MW17-08-02	MW17-08 Zone 2 - Background Well West of Southwest Waste Dump
MW17-08-03	MW17-08 Zone 3 - Background Well West of Southwest Waste Dump
MW17-08-04	MW17-08 Zone 4 - Background Well West of Southwest Waste Dump
MW17-09-01	MW17-09 Zone 1 - East of Ice Rich Overburden Dump
MW17-10-01	MW17-10 Zone 1 - Between Main Waste Dump and Main Pit
MW17-10-02	MW17-10 Zone 2 - Between Main Waste Dump and Main Pit
MW17-10-03	MW17-10 Zone 3 - Between Main Waste Dump and Main Pit
MW17-11-01	MW17-11 Zone 1 - Minto North Pit
MW17-11-02	MW17-11 Zone 2 - Minto North Pit
MW17-11-03	MW17-11 Zone 3 - Minto North Pit
MW17-11-04	MW17-11 Zone 4 - Minto North Pit
MW17-12-01	MW17-12 Zone 1 - Downstream of Water Storage Pond along Minto Creek

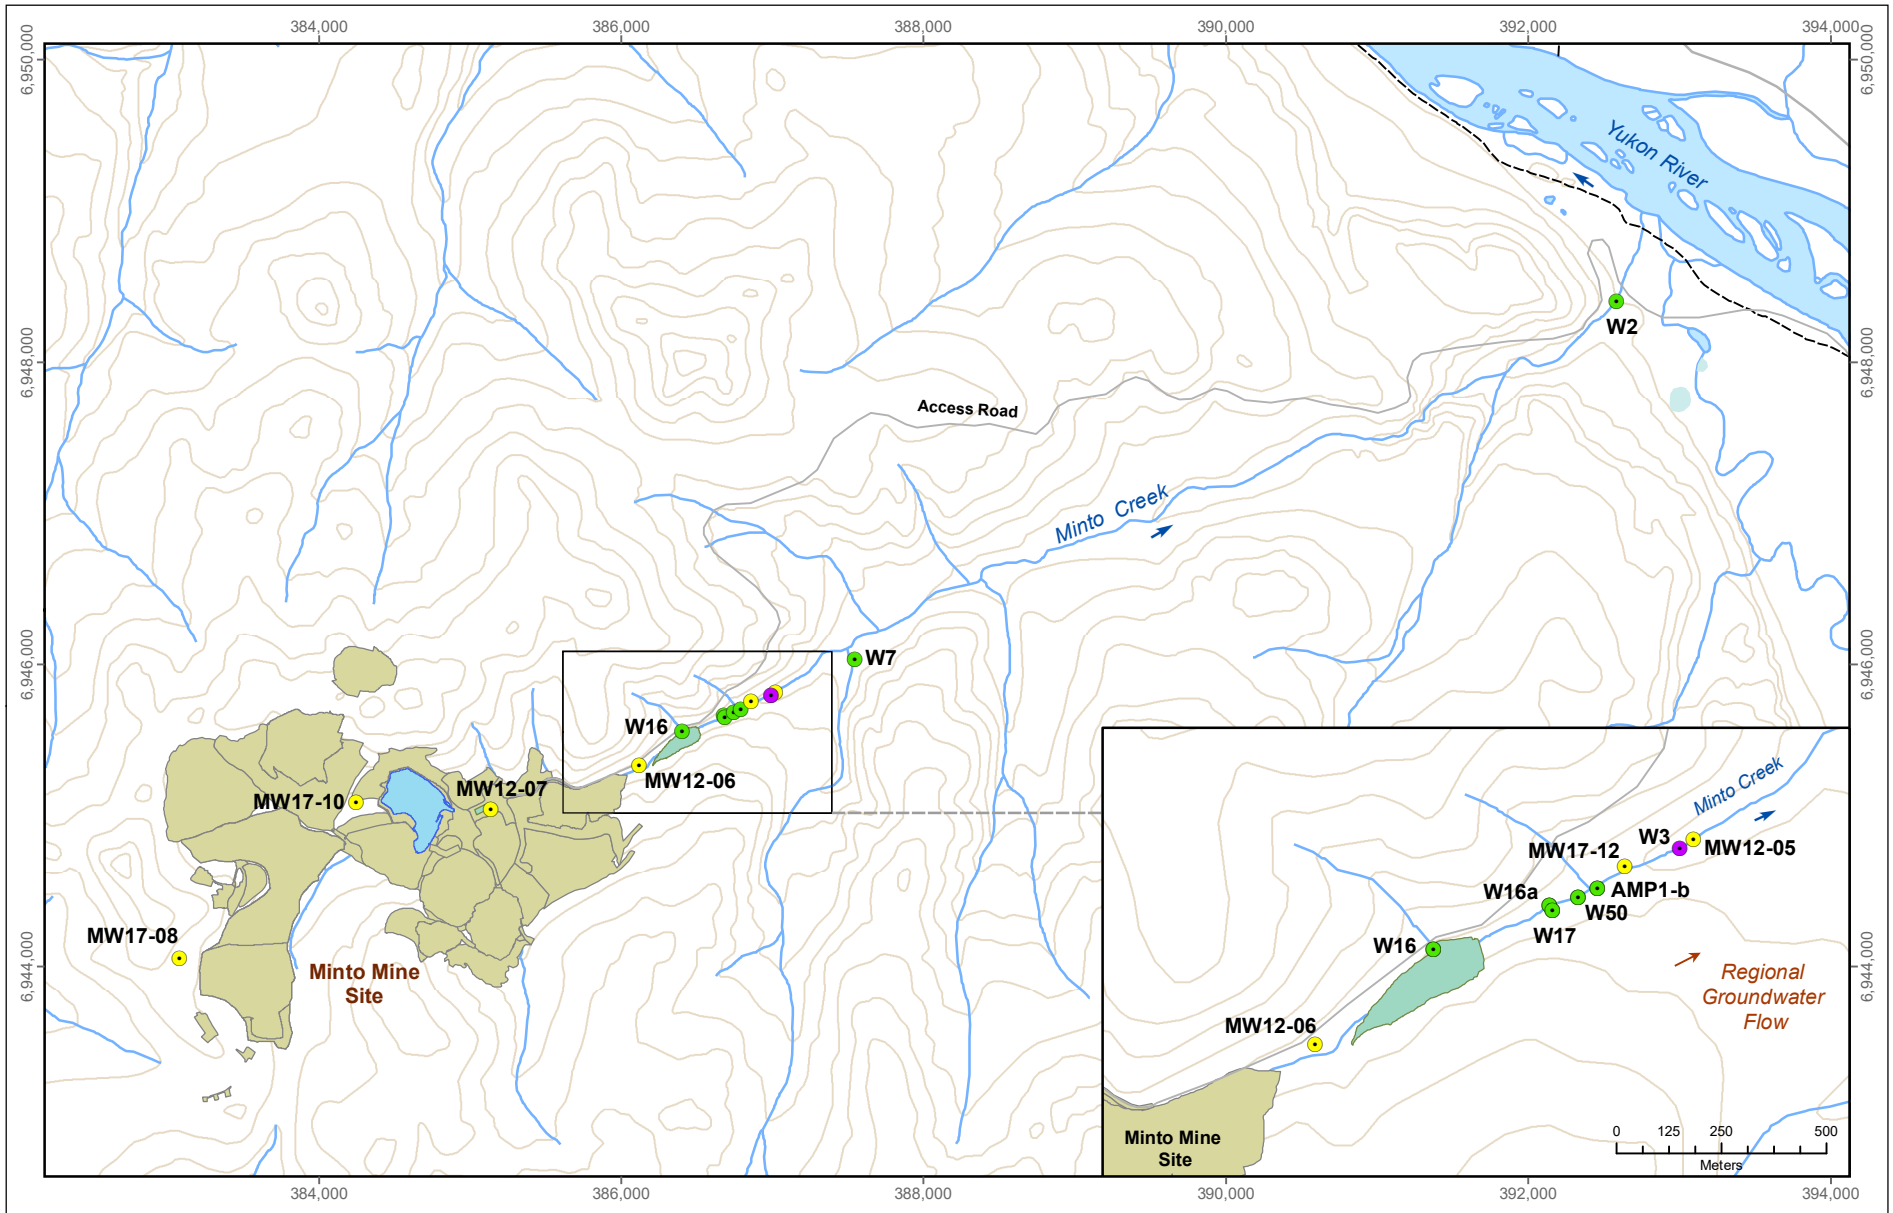
Dear Mr. Swenson,

Re: Technical Evaluation of Exceedances of Minto Mine AMP Specific Thresholds at Minto Creek Station W2



Minto Mine (Minto) retained Minnow Environmental Inc. (Minnow) as Qualified Professionals to evaluate exceedances of Adaptive Management Plan (AMP) Specific Performance Thresholds (SPTs) in lower Minto Creek (Station W2; Figure 1) in May and June 2020. The Minto Mine "Operations Adaptive Management Plan" (Minto 2017) describes the overall purpose of the AMP, presents the SPTs, and outlines the Specific Responses to exceedance of SPTs. As required under the AMP, this brief letter report provides an evaluation of whether the exceedances were mine-related, whether the exceedances are indicative of trends, and whether the exceedances were likely to have affected aquatic resources.

Background

Minto is a high-grade copper mine located within Selkirk First Nation (SFN) Category A Settlement Land Parcel R-6A approximately 240 km northwest of Whitehorse, Yukon. Mine development was initiated in 1997, commercial operations started in October 2007, and the mine entered temporary care and maintenance on October 19, 2018. Treated mine-impacted water and non-impacted water are collected in a Water Storage Pond (WSP) and periodically discharged to Minto Creek under conditions specified in Water Use Licence (WUL) QZ14-031 (August 2015). Minto Creek, in turn, flows into the Yukon River approximately 7.7 km south-east of the WSP (Figure 1).

Yukon Government Energy, Mines, and Resources (EMR) approved Minto's AMP 2017-01 under the current Quartz Mining License (QML-0001). The Yukon Water Board approved the updated AMP (AMP 2017-02) under the current Water Use Licence (QZ41-031). This assessment is relative to the AMP 2017-02 specific thresholds (Minto 2017).

The AMP for lower Minto Creek Station W2 includes the following SPTs: 1) expected case water quality predictions; 2) worst-case water quality predictions; and 3) water quality objectives (WQO). When these predictions or WQO are exceeded, they trigger Specific Responses (SRs). Each SPT is associated with SR steps, including notification, review, evaluation, and action (Table 1).

Table 1: Adaptive Management Plan Specific Indicators, Performance Thresholds, and Responses for Surface Water Quality at Station W2 in Lower Minto Creek

Specific Indicators	Specific Performance Thresholds	Specific Responses
Aqueous Concentrations at Station W2 for the following parameters with water quality objectives Parameters: • NH_4-N • NO_2-N • NO_3-N • pH • Quarterly Bioassay Dissolved: • Aluminum • Arsenic • Cadmium • Chromium • Copper • Iron • Lead • Molybdenum • Nickel • Silver • Selenium • Zinc (See Table 2 for specific threshold values for W2)	**Specific Threshold 1** • Exceedance of predicted expected case maximum for dissolved concentrations at W2. (Does not apply to pH, Bioassay, Arsenic, Iron, Lead, Molybdenum, Nickel, Silver, or Zinc)	**Notification** • Minto Management • Include in scheduled Water Use Licence monthly reporting **Review** • Follow QA/QC investigative protocol: ◦ Review laboratory QA/QC report ◦ Validate original result, or re-run sample if a laboratory error is indicated **Evaluation** • Compare with W3 results. • A trend analysis will be conducted by Minto's senior level environmental personnel. **Action** • If comparison with W3 result indicates mine loadings are responsible for exceedance then: ◦ Re-sample both W2 and W3 within 24 hours of original sample result review ◦ Actions will continue until performance thresholds are no longer exceeded.
	Specific Threshold 2 • Exceedance of predicted expected case maximum for dissolved concentrations in **2 consecutive samples (scheduled or re-sample) at W2** where evaluation confirmed mine loading responsible for first exceedance (Does not apply to pH, Bioassay, Arsenic, Iron, Lead, Molybdenum, Nickel, Silver, or Zinc)	**Notification** • Minto Management • Include in scheduled Water Use Licence reporting **Review** • Follow QA/QC investigative protocol: ◦ Review laboratory QA/QC report ◦ Validate original result, or re-run sample if a laboratory error is indicated **Evaluation** • Compare with W3 results. If comparison with W3 result indicates that mine loadings are responsible for exceedance; and validation confirms original result, then: ◦ Evaluate causes for load contributions and develop investigation plan; and • A trend analysis will be conducted by Minto's senior level environmental personnel. **Action** • Implement investigation plan, including at a minimum: ◦ Re-sampling both W2 and W3 within **24 hours** of original sample result review; and ◦ Site investigation of candidate load contributions. • Review results of investigation and prepare recommendations if appropriate. • Implement recommendations • Actions will continue until performance thresholds are no longer exceeded. • If trend analysis suggests WQO exceedance within one year, then initiate actions for Specific Threshold 3
	Specific Threshold 3 • Exceedance of predicted worst case maximum for dissolved concentrations at W2 **OR** • WQO exceeded at W2 in a single	**Notification** • Minto Management, SFN, YG Inspector • Include in scheduled Water Use Licence reporting **Review** • Follow QA/QC investigative protocol: ◦ Review laboratory QA/QC report ◦ Validate original result, or re-run sample if a laboratory error is indicated **Evaluation** • Compare with W3 results. If comparison with W3 result indicates that mine loadings responsible for exceedance – and verification confirms original result – then: ◦ Evaluate causes for load contributions and develop investigation plan; and • A trend analysis will be conducted by Minto's senior level environmental personnel. **Action** • Maintain weekly monitoring at W2 and W3 • Implement investigation plan, including any reviews/revisions, and at a minimum: ◦ Re-sampling both W2 and W3 within **24 hours** of original sample result review; and ◦ Site investigation of candidate load contributions; and ◦ Site investigation of candidate load contributions; and ◦ Engage a qualified individual for the evaluation of potential effects to aquatic resources (i.e. Compare to Predicted No Effect Concentration (PNEC) and apply Biotic Ligand Model (BLM) for D-Cu, invertebrate tissue for Se, compare with calculated acute guideline for D-Cd.) This may include but not be limited to the evaluation of existing data and results from effluent toxicity, surface water toxicity, sediment chemistry, sediment toxicity, benthic invertebrate community structure and fish health testing/programs. • Review results of investigation and prepare recommendations if appropriate • Implement recommendations • Actions will continue until performance thresholds are no longer exceeded
	Specific Threshold 4 • Exceedance of predicted worst case maximum for dissolved concentrations in 2 consecutive samples (scheduled or re-sample) at W2 where evaluation confirmed mine loading responsible for first exceedance	**Notification** • Minto Management, SFN, YG Inspector • Include in scheduled Water Use Licence reporting **Review** • Compare with W3 results • Follow QA/QC investigative protocol: **Evaluation** • Compare with W3 results. If comparison with W3 result indicates mine loadings responsible for exceedance; and verification confirms original result, then: ◦ Evaluate candidate causes for load contributions & develop investigation plan (or review/revise as appropriate) ◦ Provide investigation plan to SFN/YG Inspector • Evaluate potential for mine loadings to cause adverse effects to aquatic resources (i.e. redo BLM modeling) • A trend analysis will be conducted by Minto's senior level environmental personnel. **Action** • Maintain weekly monitoring and collect samples at greater frequency as required • Develop investigation plan, including at a minimum: ◦ Re-sampling both W2 and W3 within 24 hours of original sample result review; and ◦ Site investigation of load contributions ◦ Evaluation of potential effects to aquatic resources • Review results of investigation and prepare recommendations • Implement recommendations arising from investigations. **If threshold consistently exceeded for 2 months**, then: • Develop revised forecast for near-term (12 months) water quality in Minto Creek. • Develop and implement any additional mitigation measures to reduce loading from mine site, if necessary, with appropriate regulatory approvals. • Actions will continue until performance thresholds are no longer exceeded.
	Specific Threshold 5 • Exceedance WQO or PNEC exceeded in 2 consecutive samples (scheduled or re-sample) at W2 where evaluation confirmed mine loading responsible for first exceedance	**Notification** • Minto Management, SFN, YG Inspector • Include in scheduled Water Use Licence reporting **Review** • Compare with W3 results • Follow QA/QC investigative protocol: **Evaluation** • All evaluation measures for ST4 and: ◦ Consider ongoing WQ monitoring results in development of investigation plan • Evaluate potential for mine loadings to cause adverse effects to aquatic resources (i.e. redo BLM modeling) **Action** • Maintain weekly monitoring and collect samples at greater frequency as required. • Maintain weekly monitoring and collect samples at greater frequency as required. • Develop investigation plan, including at a minimum: ◦ Re-sampling both W2 and W3 within 24 hours of original sample result review; and ◦ Site investigation of load contributions ◦ Evaluation of potential effects to aquatic resources • Review results of investigation and prepare recommendations • Implement recommendations arising from investigations. • Implement necessary reasonable & practical measures to reduce contaminant loading from mine to Minto Creek. • Suspend discharge from the mine until water quality is appropriate for discharge. • Actions will continue until performance thresholds are no longer exceeded.

Methods

The Minto Mine's source and receiving water quality monitoring program includes stations in upper and lower Minto Creek (Figure 1). Minto Mine compared the results of individual grab samples to specific thresholds of the AMP (Table 2) and identified exceedances at lower Minto Creek station, W2. During the period April (after ice off) to June 30th, 2020 Minto Mine identified exceedances of either SPTs 1, 2, or 3 for dissolved concentrations of aluminum, cadmium, copper, and molybdenum. Following the Minto Mine's review of data, and as part of the AMP response framework, Minto Mine has retained Minnow Environmental as Qualified Professionals to verify the exceedances, evaluate, and provide an action plan, if necessary.

Concentration data for aluminum, copper, cadmium, and molybdenum were reviewed to verify the SPT exceedance level. Dissolved cadmium showed an exceedance at SPT level 1, dissolved copper exceeded SPT level 2, dissolved molybdenum and dissolved aluminum exceeded SPT level 3 (see Results Section).

At SPT levels 1 and 2, data were evaluated by comparing analyte concentrations at W2 to those at station W3 (the effluent quality monitoring station; Figure 1) for the same time point. Using this comparison, data were evaluated to determine if the exceedances were mine related (as per the AMP response framework). For example, if temporal changes in water quality at station W2 were entirely due to temporal changes in water associated with mining activity, patterns in concentration data with time would be expected to mirror those changes further upstream and closer to the mine (i.e., at station W3 and W50). In addition, station W2 also receives input from groundwater and run-off, and therefore concentrations of mine-associated analytes would be expected to be diluted at station W2 when compared to station W3 and W50. Deviations from these patterns may suggest influence/contribution from other water sources such as small tributaries or groundwater, and/or that the changes in water quality at station W2 are not mine related.

In addition, water quality data from station W50 were used to help distinguish mine-related influences to Minto Creek from the influence of reference tributaries. Station W50 is located upstream of the compliance point and is not subject to the W2 water quality predictions but is subject to effluent quality standards (Water Use Licence QZ14-031). While assessment of water quality of station W50 is not within the scope of this letter report, it should be noted that water quality at station W50 did not exceed any effluent quality standards for this reporting period (April to June 2020). Water quality data from reference station W7 was also investigated to help distinguish mine-influence to water quality from background.

A trend analysis was also conducted to determine if exceedances may be expected to continue. Two approaches to the trend analysis were taken. Firstly, a non-parametric seasonal Kendall test was undertaken to evaluate for monotonic increasing or decreasing trends. This quantitative test was conducted comparing monthly mean dissolved metal (aluminum, cadmium, copper, and molybdenum) concentrations over two time periods (2011 to 2020 and 2016 to 2020; Appendix Table A.3). The second approach was an analysis of variance (ANOVA) test among the last ten years (2011 to 2020) which tested for an overall difference among years and included a month term to control for seasonal effects within year. Details of the statistical analysis for both trend analyses is provided (Appendix B).

At SPT level 3 exceedances were first evaluated as per SPTs 1 and 2. In addition, exceedances were evaluated relative to effect thresholds protective of aquatic life. The potential for additional contributing factors that may have also influenced the exceedances were investigated. For example, the potential for contribution from groundwater or small tributaries. The results of these then informed any resulting recommendations.

Table 2: Specific Thresholds for Minto Creek, Station W2

Analytes		Units	W2 Water Quality Objective	Expected Case Water Quality Predictions at W2	Worst Case Water Quality Predictions at W2
Ammonia		mg/L	0.25	0.057	0.250
Nitrite		mg/L	0.060	0.015 [a]	0.057 [a]
Nitrate		mg/L	9.1	1.1	5.1
Dissolved Aluminum		mg/L	0.10	0.057	0.077
Dissolved Arsenic		mg/L	0.0050	n/a	0.00070
Dissolved Cadmium		mg/L	$e^{(0.736(\ln(\text{hardness})-4.943)}$	0.000027	0.00004
Dissolved Chromium		mg/L	0.0010	0.00062	0.00082
Dissolved Copper	When DOC at W2 > 10 mg/L	mg/L	0.020	0.0092	0.014
	When DOC at W2 ≤ 10 mg/L	mg/L	0.013	0.0092	0.014
Dissolved Iron		mg/L	1.1	n/a	0.37
Dissolved Lead		mg/L	0.0040	n/a	0.00044
Dissolved Molybdenum		mg/L	0.073	n/a	0.0015
Dissolved Nickel		mg/L	0.11	n/a	0.0021
Dissolved Selenium		mg/L	0.0020	0.00055	0.00087
Dissolved Silver		mg/L	0.00010	n/a	0.000042
Dissolved Zinc		mg/L	0.030	n/a	0.0065

Notes: Reproduced from Table 2-3 in the Operational AMP (Minto 2017). n/a = no action will be taken on expected case predictions.
[a] Prediction reduced by 75% to account for expected nitrification in Minto Creek.

Results

Dissolved Aluminum

Concentrations of dissolved aluminum exceeded the worst-case maximum prediction for lower Minto Creek station, W2, twice; once on 28th April and once on 5th May, 2020 (Table 3). On 5th May, dissolved aluminum concentrations also exceeded the W2 water quality objective (Table 3, Figure 2), triggering SPT level 3. However, there were three lines of evidence that showed that these elevated dissolved aluminum concentrations were not mine related.

(1) A comparison of dissolved aluminum concentrations at W2 to the effluent monitoring station W3 showed that both stations showed the same concentration pattern with time and that absolute concentrations were similar (Figure 2). The pattern of changing concentrations with time suggests that water quality at these stations (W2 and W3) were controlled by the same mechanism. However, station W2 which is further downstream is also influenced by dilution from more reference tributaries, and if the elevated aluminum concentrations were mine-related, it would be expected that aluminum would be at lower concentrations in water from station W2 compared to station W3.

(2) A small tributary joins upper Minto Creek downstream of the mine site but upstream of station W3 (Figure 1). Station W50 is upstream of this confluence, and downstream of the mine site (Figure 1), therefore W50 is equally or more representative of mining influence when compared to station W3. Any observed differences in water quality between station W3 and W50 are likely due to the influence of water from the small tributary and/or from additional surface runoff from the area between W50 and W3. One sample was collected at station W50 (27th April 2020) during the period when W2 dissolved aluminum concentrations exceeded the worst-case predictions for W2. This concentration was substantially lower compared to stations W2 and W3 (Figure 2). This suggested that the dissolved aluminum concentrations were not mine related and that it was more likely that the elevated aluminum was influenced by reference water and run-off (probably associated with spring freshet) at both stations.

(3) The lack of evidence for a mine-loading cause for the elevated aluminum at station W2 was also further validated by the elevated aluminum concentrations in water from the reference station W7, although these samples were collected after the spikes in aluminum (i.e., 19th May, 2020; Figure 2). The data showed that dissolved aluminum concentrations at station W2 were equal to concentrations at the reference station (and not likely mine-influenced at that time).

The non-parametric seasonal Kendall trend analysis for dissolved aluminum showed no significant increasing or decreasing temporal trend either from 2011 or from 2016 (Table 4). A comparison of dissolved aluminum by month (April to June) among years also showed a general decrease in concentration relative to 2011, but the decrease was not significant in 2020 (Table 5; Appendix Figure A.1). Therefore, there was no evidence that aluminum concentrations were increasing, and there was no evidence that the elevated dissolved aluminum concentrations were mine-related.

The short-term acute predicted no-effect concentration for dissolved aluminum at pH ≥6.5 (typical water pH in Minto Creek is 8) is 0.1 mg/L (BCMECCS 2020). This guideline was exceeded for one sampling event only (0.105 mg/L on 5th May 2020; Appendix Table A.1) and showed a sharp decline in concentration by the subsequent sampling event (i.e., 0.03 mg/L on 12th May 2020; Appendix Table A.1). Given that the exceedance of the water quality guideline

> 50% Increase in concentration.
> 75% Increase in concentration.
> 100% Increase in concentration.
*Bold Significant increase or decrease from base year (b).
Significantly less than all historical years (or 2018).
Significantly greater than all historical years (or 2018).

Notes: "-" indicates no available data or analysis not conducted due to >90% of the station data being below the Laboratory Reporting Limit (LRL).

[a] The presence of annual variation was determined by a significant Year term ($\alpha = 0.05$) using an ANOVA with factors Year and Month.

[b] Magnitude of Difference (MOD) was calculated as the concentrations in each year minus the concentration in the first year divided by the concentration in the fist year × 100.

[c] Significance between each year determined using all pairwise comparisons with Tukey correction.

was for one sampling event only, the elevated aluminum concentration was not considered to be mine-related, and was likely at background concentrations, it is recommended that no further investigation regarding this exceedance event is necessary and that frequency of monitoring continues to be weekly (as per the Water Use Licence).

Dissolved Cadmium

Concentrations of dissolved cadmium showed one exceedance of the expected case maximum prediction for lower Minto Creek station W2 on 28th April, 2020 (Table 2), triggering SPT level 1. This exceedance (0.0000287 mg/L; Table 3) was very close to the expected case prediction of 0.000027 mg/L (Table 2). The pattern of varying dissolved cadmium concentrations with time generally mirrored the pattern of dissolved cadmium concentrations at the effluent monitoring station, W3 (Figure 3). The one sample collected at station W50 (upstream of the effluent discharge monitoring point) was higher than at stations W3 and W2, suggesting that this exceedance could have been mine-related. Water sampling at station W50 helps to distinguish influence of mine-related water from influence of small reference tributaries and groundwater. However, conclusions around mine influence cannot be definitively made as there was only one data point at station W50. Concentrations have declined and remained below the expected case prediction for W2 since the one exceedance above the expected case for W2.

The non-parametric seasonal Kendall trend analysis for dissolved cadmium showed a significant decreasing temporal trend from 2011 but no trend from 2016 (Table 4). A comparison of dissolved cadmium by month (April to June) among years also showed a trend of significant decreases in most years, including 2020 relative to the baseline year (2011; Table 5; Appendix Figure A.1). Therefore, there was no evidence that cadmium concentrations were increasing (cadmium concentrations appeared to be decreasing), thus no further investigative action regarding this exceedance event is considered necessary and that frequency of monitoring continues to be weekly (as per the Water Use Licence).

Dissolved Copper

Concentrations of dissolved copper showed two consecutive exceedances of the expected case maximum prediction for lower Minto Creek station W2 on 28th April (0.013 mg/L) and 5th May, 2020 (0.0115 mg/L; Table 3), triggering SPT level 2. When compared to the effluent monitoring station (W3), the concentrations of copper at station W2 showed the same varying concentration patterns with time as at station W3 (Figure 4). This suggested that the exceedances at W2 were due to the high concentrations observed at the effluent monitoring point, W3. However, the dissolved copper concentration at station W50 was lower than both stations W3 and W2, which suggested that it was not mine-related. Likely the elevated copper was associated with spring freshet and input from the small reference tributary between stations W50 and W3 (Figure 1). Concentrations of dissolved copper at both W2 and W3 have since decreased to below the predicted expected case concentration for W2 (i.e., below 0.0092 mg/L; Table 2), and dissolved copper concentrations are now within the expected case range.

The non-parametric seasonal Kendall trend analysis for dissolved copper showed no significant increasing or decreasing temporal trends either from 2011 or from 2016 (Table 4). A comparison of dissolved copper by month (April to June) among years showed no clear increase or decrease in 2020 (Table 5; Appendix Figure A.1). Therefore, there was no evidence that copper concentrations were increasing, and there was little evidence that the elevated dissolved copper concentrations were mine-related, thus no further investigative action regarding this exceedance event is considered necessary, and weekly monitoring is sufficient.

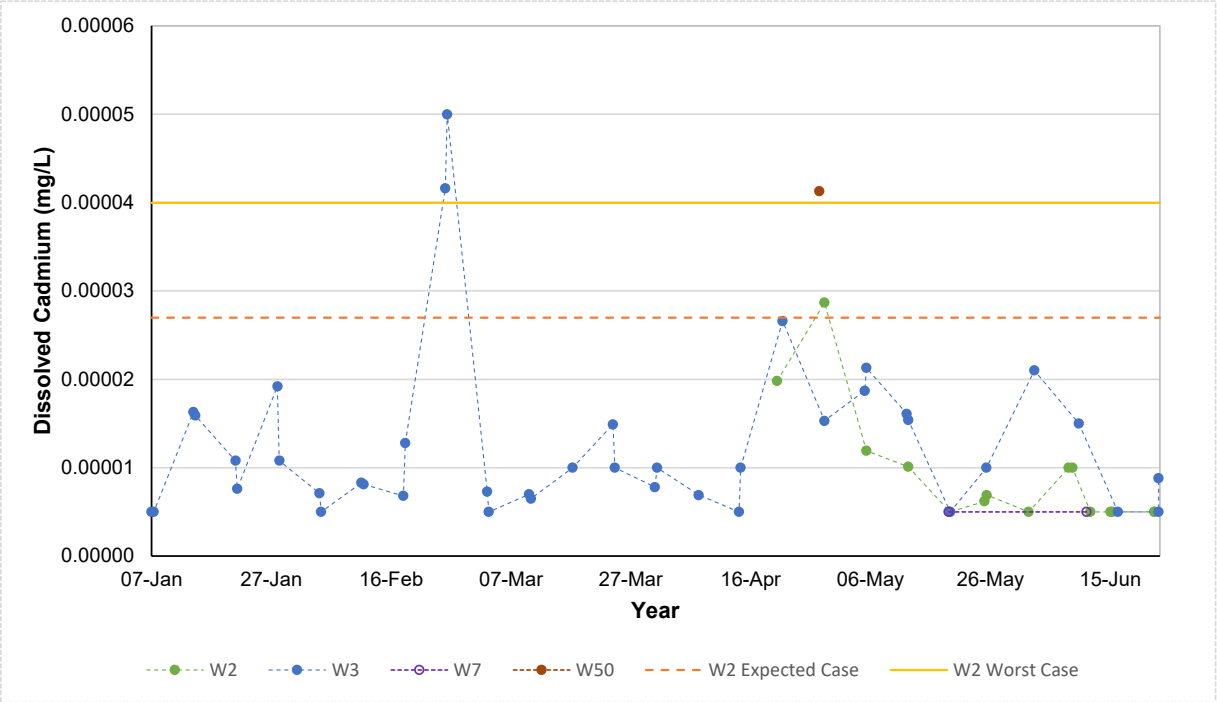

Figure 3: Dissolved cadmium concentrations in lower Minto Creek Monitoring Station, W2, compared to the W2 Water Quality Predictions and Water Quality at the Effluent Monitoring Station, W3, January to June, 2020

Note: open circles represented data that were less than the reporting limit.

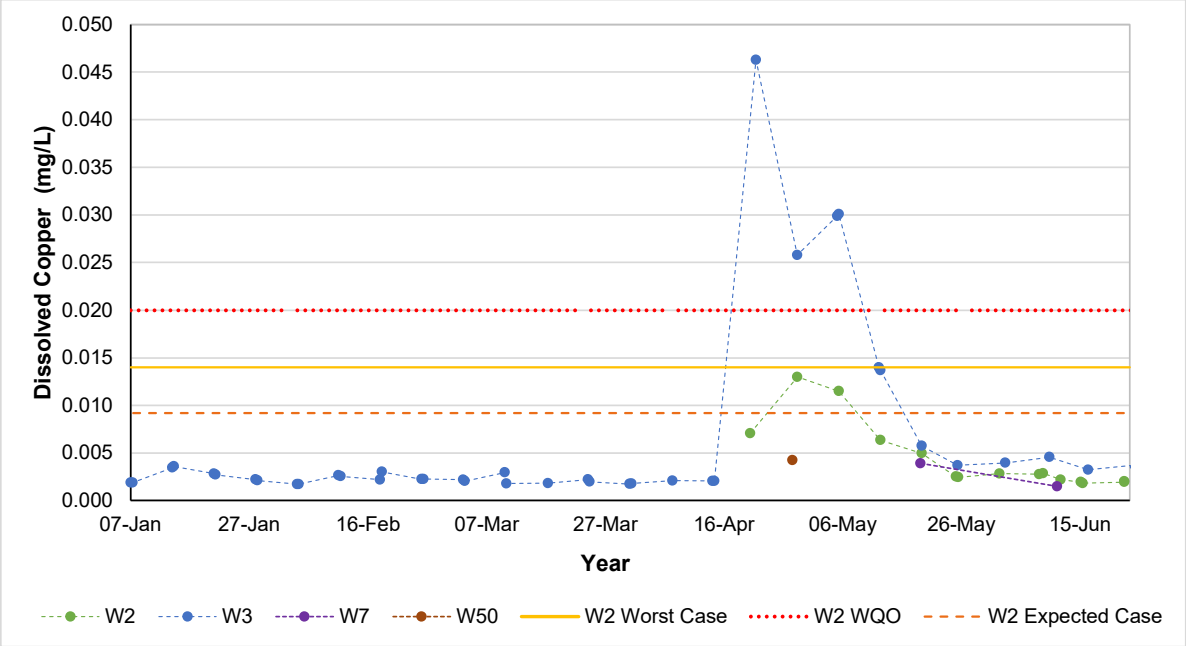

Figure 4: Dissolved copper concentrations in lower Minto Creek Monitoring Station, W2, compared to the W2 Water Quality Predictions and Water Quality at the Effluent Monitoring Station, W3, January to June, 2020

Dissolved Molybdenum

Concentrations of dissolved molybdenum exceeded the predicted worst-case maximum at lower Minto Creek station W2 on June 8th, 11th, 16th, and 23rd, 2020 (Table 3), triggering SPT level 3. When compared to the effluent monitoring station (W3), the concentrations of dissolved molybdenum at station W2 showed the same varying concentration patterns with time as at station W3 (Figure 5). This suggested that the exceedances at W2 were due to the high concentrations observed at the effluent monitoring point, W3.

Concentrations of dissolved molybdenum were higher at Station W3 (the effluent discharge monitoring point) than at Station W2 (Table 3, Figure 5), likely due to dilution from reference tributaries. However, at reference station W7 (located on a tributary of upper Minto Creek), the dissolved molybdenum concentration (at the same time as the exceedances at W2), was also higher than the predicted worst-case maximum (Appendix Table A.2, Figure 5) during one of two sampling events (for the time period April to June, 2020).

While the dissolved molybdenum concentration at station W50 (0.006 mg/L on 27th April, 2020; Appendix Table A.2) was higher than at station W2 and W3, as would be expected, it was also well below the effluent quality standard outlined in the water use licence (0.219 mg/L; Licence QZ14-031). The sampling event at station W50 was also during spring freshet, and water flow rates during spring freshet likely diluted dissolved molybdenum concentrations at both stations W2 and W3. After spring freshet, dissolved molybdenum concentrations at both stations (W2 and W3) started to increase, as well as at reference station W7. This suggested that the molybdenum concentrations that were above the predicted worst-case maximum were due to high reference molybdenum concentrations. There have been two previous investigations that have looked at additional sources of molybdenum to Minto Creek downstream of station W50:

(1) In 2016, a previous study has also investigated additional sources of dissolved molybdenum to Minto Creek. The study showed that station AMP1-b, a station where groundwater surfaces located downstream of W50 (Figure 1), had consistently higher concentrations of molybdenum than anywhere else in the Minto Creek catchment (Minto 2016). This surfacing groundwater, had high concentrations of molybdenum at the onset of the exceedance period for station W2 (i.e., 8th June, 2020; Appendix Table A.2; Figure 5), and thus may also have contributed to the above W2 worst case level predictions for dissolved Molybdenum.

(2) In 2019, a previous investigation into the influence of groundwater at station W2 associated with June 2019 exceedances showed that groundwater was naturally elevated in molybdenum and likely influences water quality at station W2 (Minnow 2020). There is no new information to suggest a different conclusion for the current exceedances.

Therefore, the elevated dissolved molybdenum observed in 2020 was also not likely mine-related, rather it is likely that the W2 station is influenced by contributions from groundwater (and/or surfacing groundwater) with naturally elevated dissolved molybdenum.

The non-parametric seasonal Kendall trend analysis for dissolved molybdenum showed no significant increasing or decreasing temporal trends either from 2011 or from 2016 (Table 4). A comparison of dissolved molybdenum by month (April to June) showed no clear increase or decrease among years, including a non-significant decrease in 2020 (relative to 2011; Table 5; Appendix Figure A.1). Therefore, there was no evidence that molybdenum concentrations were increasing, and there was some evidence that the elevated dissolved molybdenum concentrations were due to naturally elevated molybdenum concentrations in groundwater and at the reference station, W7. Thus, no further investigative action regarding this exceedance event is considered necessary, and weekly monitoring is sufficient.

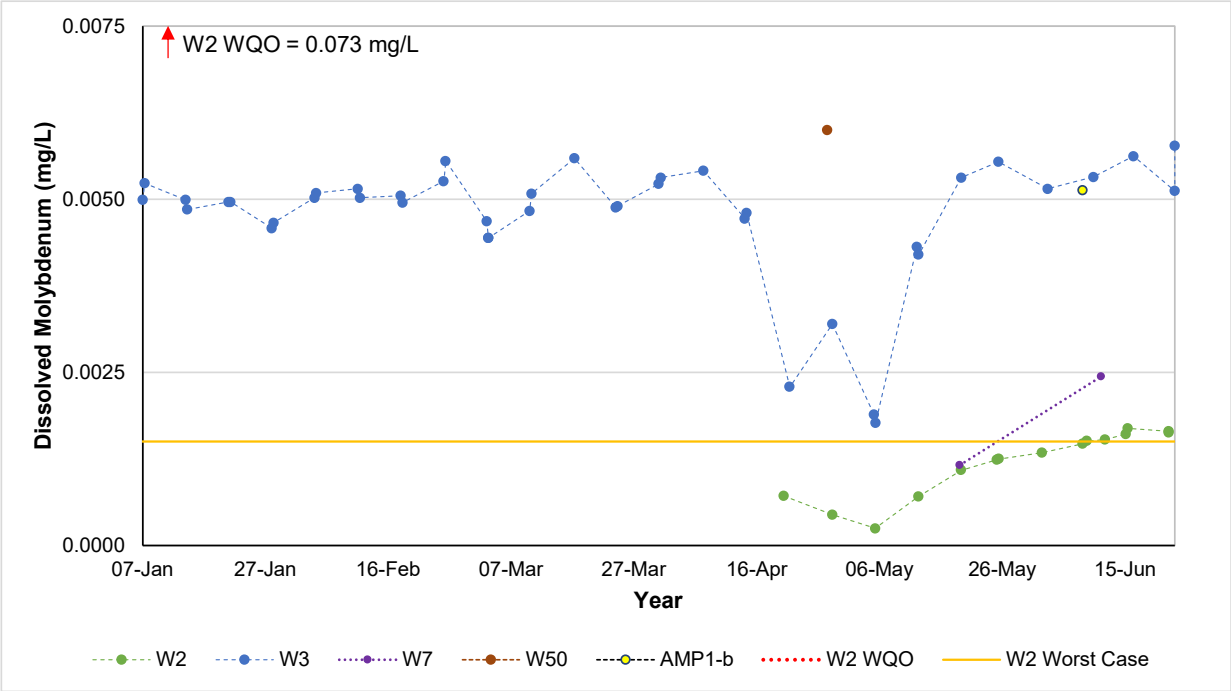

Figure 5: Dissolved molybdenum concentrations in lower Minto Creek Monitoring Station, W2, compared to the W2 Water Quality Predictions and Water Quality at the Effluent Monitoring Station, W3, January to June, 2020

The dissolved molybdenum concentrations at all monitoring stations, including W2, were well below the Minto Mine water quality objective (0.073 mg/L) and below reference conditions, so effects to aquatic life would not be expected.

Conclusions and Recommendations

For the period April to June, 2020, dissolved concentrations of cadmium showed an exceedance at SPT level 1, dissolved copper at SPT level 2, and dissolved molybdenum and dissolved aluminum exceeded at SPT level 3.

The exceedances above expected or worst-case maximum predictions for dissolved aluminum, copper, and molybdenum were not mine-related. Instead, exceedances in dissolved aluminum and copper concentrations were more likely associated with elevated concentrations in tributaries that influence water quality at stations W2 and W3. The exceedances that occurred for dissolved molybdenum were also associated with reference concentrations, and it is likely that station W2 is influenced by contributions from groundwater with naturally elevated dissolved molybdenum (Minnow 2020). Dissolved molybdenum did exceed the water criteria outlined in the AMP Level 3 trigger. However dissolved molybdenum concentrations were well below guidelines protective of aquatic life. Dissolved aluminum concentrations exceeded the guideline protective of aquatic life for one sampling event only, and this event was followed by a sharp decline to well below the guideline, however given that the aluminum exceedance was not mine-related no further action was recommended.

The exceedance observed for dissolved cadmium may have been mine-related, however the exceedance occurred over one sampling event only, and has since decreased. In addition, trend analyses showed that in general, cadmium concentrations at station W2 have been decreasing.

It is recommended that sampling continue as scheduled at stations W2 and W3 since concentrations are not expected to affect aquatic life. Increased monitoring frequency is not required at this time at stations W2 and W3.

The AMP outlines an action of resampling within 24 hours of reviewing a sample result, if an exceedance has occurred and is associated with mine loadings (Minto 2017). Given that water quality results typically take two weeks to acquire, and that sampling is conducted weekly at stations W2 and W3, sampling 24 hours after two weeks of an exceedance is impractical. It is recommended that, when an exceedance associated with mine loadings occurs, instead of sampling 24 hours after reviewing an exceedance result, that the next sample (collected one week after the original exceedance) is expedited to determine if the exceedance is continuing into a second week.

It is recommended that station W7 is monitored more frequently than the current sampling frequency (monthly), ideally at the same frequency as monitoring stations W2, W3, and W50 (i.e., weekly). Stations W7 and W50 provided insight into the contributions from background relative to any mine influence. It is also recommended that the predicted expected case and worst-case maximum concentrations for molybdenum are re-evaluated in light of the naturally high background levels of molybdenum in groundwater that influences water quality at station W2, and possibly at station W7.

Sincerely,

Minnow Environmental Inc.

APPENDIX B
STATISTICAL METHODS

APPENDIX B STATISITICAL METHODS

Method 1: Seasonal Kendall Test for Increasing or Decreasing Trends

Quantitative tests for temporal trends in monthly mean concentrations at station W2 were conducted over two time periods (2011 to 2020 and 2016 to 2020) using the non-parametric seasonal Kendall test described by Hirsch et al. (1982). First monthly mean concentrations were estimated using the Kaplan-Meier method. The method involves transforming the left censored (i.e., < value) dataset to a right censored (i.e., > value) dataset, and then using the K-M estimator (used to estimate the mean survival time in survival analysis) to estimate the mean. The calculation was conducted using the survfit() function in the survival package (Therneau 2017) in R (R Core Team, 2019) and involved calculating the area under the K-M survival curve. The K-M method is non-parametric and can accommodate multiple LRLs. The method of estimating the mean is equivalent to using the distribution of detectable values below the LRL to represent values that are < LRL. For example, the mean of the data set {1, 2, <4, 5} is estimated as the mean of 1, 2, [½×1 + ½×2], and 5 which is 2.375. The value <4 is replaced by the distribution of values below 4 (i.e., 1 and 2 with equal weight of ½). Similarly, the mean of the data set {1, 1.6, 2, 2.1, <4, 5} is estimated as the mean of 1, 1.6, 2, 2.1, [¼×1 + ¼×1.6 + ¼×2 + ¼×2.1], and 5 which is 2.229. Again, the value <4 is replaced by the distribution of values below 4 (i.e., 1, 1.6, 2, and 2.1 with equal weight of ¼). If there is only one LRL and no detected values below the LRL, then the K-M estimate of the mean is equivalent to replacing the value below the LRL with the LRL (i.e., the best estimate for the values < LRL is the LRL).

The seasonal Kendall test assesses temporal trends separately for each season (or month in this case) and combines the results for each season into an overall test for trend. The test is non-parametric and assesses whether there is a monotonic increasing or monotonic decreasing trend over time. The test is conducted by calculating the test statistic S_i which is equal to the sum of the number of increases and decreases from a time period t to all time periods after t for each observation in season i. The overall test statistic S is computed as the sum of S_i for all seasons. The significance of the observed S is determined by comparing it to a critical value of S (at the significance level $\alpha = 0.05$) determined from the exact sampling distribution of S (calculated by determining all possible permutations and combinations of S based on the increases and decreases from the number of pairwise comparisons made; Hirsch et al. 1982). If more than 45 pairwise comparisons are made (equivalent to the number of

pairwise comparisons for n = 10 in a single season), then the normal approximation is used to calculate a p-value and to assess significance (Hirsch et al. 1982). The standard normal deviate Z is calculated as:

$$Z = \begin{cases} \frac{S-1}{\sqrt{\sigma_S}} if\ S > 0 \\ 0 \quad if\ S = 0 \\ \frac{S+1}{\sqrt{\sigma_S}} if\ S < 0 \end{cases}$$

where $\sigma_S = \sum_{i=1}^{k} \frac{n_i(n_i-1)(2n_i+5)-\sum_{T_i} t_i(t_i-1)(2t_i+5)}{18}$ and n_i is the number of samples in month i, t_i is the number of tied values for each tied value T_i, and k is the number of seasons (Hirsch et al. 1982).

An estimate of the trend slope over time is estimated by computing the median of all slopes between data pairs within the same month (Helsel and Hirsch 2002). The slope is reported as a change in concentration per year and as a percentage change in concentration per year. The intercept of a line through the time series is estimated as the median intercept of all lines through each point with the estimated slope (Pohlert 2016). The trend analysis was only conducted with a minimum number of 5 pairwise comparisons, the minimum number required for all consecutive increases or decrease to be significant at α = 0.05. The tests were conducted using scripts written in R software (R Core Team 2019).

Method 2: ANOVA comparison among years (10 years)

Temporal changes in water concentrations were also evaluated for station W2 from 2011 to 2020 using an Analysis of Variance (ANOVA). Only data collected from April to June were included in the analysis given that these were the only months consistently sampled across all years. Because of the presence of LRLs for many parameters, a censored regression ANOVA model with factors *Year* and *Month* and assuming a log-normal distribution of the response variable was fit with maximum likelihood estimation for each station. The significance of each term in the model was assessed using likelihood-ratio tests to determine if there is a significant change in log-likelihood with the addition of the term in the model. This tests for an overall difference among years and including the *month* term in the model controlled for seasonal effects within a year. If the year term was significant (α = 0.05) then post-hoc contrasts were conducted to test for all pairwise differences among years with an α = 0.05 in a Tukey's Honestly Significant Difference test (HSD) which corrects for the number of comparisons.

Magnitudes of difference (MOD) was calculated as the percent change from the concentration in the first year in the time series relative to the concentrations in the first year (2011):

$$MOD = \frac{Year_i - Year_1}{Year_1} x100\%$$

Note:

Due to external lab issues, W3 quarterly Trout LC50 had to be resampled on August 11th with W2 & W3 water quality samples. W7 water quality was collected on August 20th. Since the reference site (W7) did not thaw until May this meant we were only able to collect samples from all three stations for three of the required four EEM sampling occasions. Data below includes some sample days when only two of three stations could be sampled.

Effluent Characterization

Certificates of Analysis (COA's)

ALS Environmental

CERTIFICATE OF ANALYSIS

Work Order	: **WR2000225**	Page	: 1 of 18
Client	: **Minto Explorations Ltd.**	Laboratory	: Whitehorse - Environmental
Contact	: Minto Environment - Coordinator	Account Manager	: Heather McKenzie
Address	: Suite 2100- 510 West Georgia St Vancouver BC Canada V6B 0M3	Address	: #12 151 Industrial Road Whitehorse YT Canada Y1A 2V3
Telephone	: ----	Telephone	: +1 867 668 6689
Project	: Minto Mine Monitoring	Date Samples Received	: 19-May-2020 15:29
PO	: 232817 (WUL)	Date Analysis Commenced	: 20-May-2020
C-O-C number	: 202-05-19 A	Issue Date	: 04-Jun-2020 13:09
Sampler	: ----		
Site	: ----		
Quote number	: Q54721-Standing Offer		
No. of samples received	: 17		
No. of samples analysed	: 17		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Angelo Salandanan	Lab Assistant	Metals, Burnaby, British Columbia
Bruna Botti	Analyst	Inorganics - Water Quality, Burnaby, British Columbia
Dee Lee	Analsyt	Metals, Burnaby, British Columbia
Kevin Duarte	Team Leader - Inorganics	Inorganics - Water Quality, Burnaby, British Columbia
Matthew Woods	Lab Assistant	Metals, Burnaby, British Columbia
Owen Cheng		Metals, Burnaby, British Columbia
Robin Weeks	Team Leader - Metals	Inorganics - Water Quality, Burnaby, British Columbia
Robin Weeks	Team Leader - Metals	Metals, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
%	percent
µS/cm	Microsiemens per centimetre
meq/L	milliequivalents per litre
mg/L	milligrams per litre
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in reports identified as "Preliminary Report" are considered authorized for use.

Qualifiers

Qualifier	*Description*
DLM	*Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).*
DTC	*Dissolved concentration exceeds total. Results were confirmed by re-analysis.*
DTMF	*Dissolved concentration exceeds total for field-filtered metals sample. Metallic contaminants may have been introduced to dissolved sample during field filtration.*

Analytical Results

CERTIFICATE OF ANALYSIS

Work Order	: **WR2000482**	Page	: 1 of 14
Client	: **Minto Explorations Ltd.**	Laboratory	: Whitehorse - Environmental
Contact	: Minto Environment - Coordinator	Account Manager	: Heather McKenzie
Address	: Suite 2100- 510 West Georgia St Vancouver BC Canada V6B 0M3	Address	: #12 151 Industrial Road Whitehorse YT Canada Y1A 2V3
Telephone	: ----	Telephone	: +1 867 668 6689
Project	: Minto Mine Monitoring	Date Samples Received	: 14-Jul-2020 14:20
PO	: 232817	Date Analysis Commenced	: 15-Jul-2020
C-O-C number	: 2020-07-14 A	Issue Date	: 21-Jul-2020 13:40
Sampler	: ----		
Site	: ----		
Quote number	: Q54721-Standing Offer		
No. of samples received	: 14		
No. of samples analysed	: 14		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Angela Ren	Team Leader - Metals	Metals, Burnaby, British Columbia
Angelo Salandanan	Lab Assistant	Metals, Burnaby, British Columbia
Bruna Botti	Analyst	Inorganics - Water Quality, Burnaby, British Columbia
Ken Chan	Supervisor - Metals Prep & Mercury	Metals, Burnaby, British Columbia
Kevin Duarte	Team Leader - Inorganics	Inorganics - Water Quality, Burnaby, British Columbia
Kinny Wu	Laboratory Analyst	Metals, Burnaby, British Columbia
Lindsay Gung	Supervisor - Water Chemistry	Inorganics - Water Quality, Burnaby, British Columbia
Muneeb Alam	Analyst	Metals, Burnaby, British Columbia
Robin Weeks	Team Leader - Metals	Inorganics - Water Quality, Burnaby, British Columbia
Robin Weeks	Team Leader - Metals	Metals, Burnaby, British Columbia
Woochan Song	Lab Assistant	Metals, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
%	percent
µS/cm	Microsiemens per centimetre
meq/L	milliequivalents per litre
mg/L	milligrams per litre
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in reports identified as "Preliminary Report" are considered authorized for use.

Qualifiers

Qualifier	*Description*
DLA	*Detection Limit adjusted for required dilution.*
DLM	*Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).*

Client	: **Minto Explorations Ltd.**	Laboratory	: Whitehorse - Environmental
Contact	: Minto Environment - Coordinator	Account Manager	: Heather McKenzie
Address	: Suite 2100- 510 West Georgia St Vancouver BC Canada V6B 0M3	Address	: #12 151 Industrial Road Whitehorse YT Canada Y1A 2V3
Telephone	: ----	Telephone	: +1 867 668 6689
Project	: Minto Mine Monitoring	Date Samples Received	: 11-Aug-2020 15:05
PO	: 232817	Date Analysis Commenced	: 12-Aug-2020
C-O-C number	: 2020-08-11 B	Issue Date	: 21-Aug-2020 14:53
Sampler	: ----		
Site	: ----		
Quote number	: Q54721-Standing Offer		
No. of samples received	: 12		
No. of samples analysed	: 12		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Amy Liang	Analsyt	Inorganics - Water Quality, Burnaby, British Columbia
Angela Ren	Team Leader - Metals	Metals, Burnaby, British Columbia
Bruna Botti	Team Leader - Inorganics	Inorganics - Water Quality, Burnaby, British Columbia
Dee Lee	Analyst	Metals, Burnaby, British Columbia
Kevin Duarte	Team Leader - Inorganics	Inorganics - Water Quality, Burnaby, British Columbia
Lindsay Gung	Supervisor - Water Chemistry	Inorganics - Water Quality, Burnaby, British Columbia
Monica Ko	Lab Assistant	Metals, Burnaby, British Columbia
Muneeb Alam	Analyst	Metals, Burnaby, British Columbia
Omar Beydoun	Lab Assistant	Metals, Burnaby, British Columbia
Robin Weeks	Team Leader - Metals	Metals, Burnaby, British Columbia
Shaneel Dayal	Analyst	Metals, Burnaby, British Columbia
Tracy Harley	Supervisor - Water Quality Instrumentation	Inorganics - Water Quality, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
%	percent
µS/cm	Microsiemens per centimetre
meq/L	milliequivalents per litre
mg/L	milligrams per litre
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in reports identified as "Preliminary Report" are considered authorized for use.

Qualifiers

Qualifier	*Description*
DLA	*Detection Limit adjusted for required dilution.*
DLM	*Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).*
DTMF	*Dissolved concentration exceeds total for field-filtered metals sample. Metallic contaminants may have been introduced to dissolved sample during field filtration.*
DTSE	*Dissolved Se concentration exceeds total. Positive bias on D-Se suspected due to signal enhancement from volatile selenium species. Contact ALS if an alternative test to address this interference is needed.*
HTD	*Hold time exceeded for re-analysis or dilution, but initial testing was conducted within hold time.*
RRV	*Reported result verified by repeat analysis.*

QUALITY CONTROL INTERPRETIVE REPORT

Work Order	: **WR2000667**	Page	: 1 of 29
Client	: **Minto Explorations Ltd.**	Laboratory	: Whitehorse - Environmental
Contact	: Minto Environment - Coordinator	Account Manager	: Heather McKenzie
Address	: Suite 2100- 510 West Georgia St Vancouver BC Canada V6B 0M3	Address	: #12 151 Industrial Road Whitehorse, Yukon Canada Y1A 2V3
Telephone	: ----	Telephone	: +1 867 668 6689
Project	: Minto Mine Monitoring	Date Samples Received	: 11-Aug-2020 15:05
PO	: 232817	Issue Date	: 21-Aug-2020 14:53
C-O-C number	: 2020-08-11 B		
Sampler	: ----		
Site	: ----		
Quote number	: Q54721-Standing Offer		
No. of samples received	: 12		
No. of samples analysed	: 12		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 15:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 15:00 is used for calculation purposes.

Legend & Qualifier Definitions

EHTR-FM: Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended

EHTL: Exceeded ALS recommended hold time prior to analysis. Sample was received less than 24 hours prior to expiry.

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Water**

Evaluation: × = QC frequency outside specification; ✓ = QC frequency within specification.

Quality Control Sample Type			Count		Frequency (%)		
Analytical Methods	*Method*	*QC Lot #*	*QC*	*Regular*	*Actual*	*Expected*	*Evaluation*
Laboratory Duplicates (DUP)							
Alkalinity Species by Titration	E290	71228	2	18	11.1	5.0	✓
Ammonia by Fluorescence	E298	73490	1	20	5.0	5.0	✓

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Conductivity in Water	E100 Vancouver - Environmental	Water	APHA 2510 (mod)	Conductivity, also known as Electrical Conductivity (EC) or Specific Conductance, is measured by immersion of a conductivity cell with platinum electrodes into a water sample. Conductivity measurements are temperature-compensated to 25°C.
pH by Meter	E108 Vancouver - Environmental	Water	APHA 4500-H (mod)	pH is determined by potentiometric measurement with a pH electrode, and is conducted at ambient laboratory temperature (normally 20 ± 5°C). For high accuracy test results, pH should be measured in the field within the recommended 15 minute hold time.
TSS by Gravimetry	E160-H Vancouver - Environmental	Water	APHA 2540 D (mod)	Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, following by drying of the filter at 104 ± 1°C, with gravimetric measurement of the filtered solids. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.
Chloride in Water by IC (Low Level)	E235.Cl-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrite in Water by IC (Low Level)	E235.NO2-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrate in Water by IC (Low Level)	E235.NO3-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Sulfate in Water by IC	E235.SO4 Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Alkalinity Species by Titration	E290 Vancouver - Environmental	Water	APHA 2320 B (mod)	Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.
Ammonia by Fluorescence	E298 Vancouver - Environmental	Water	J. Environ. Monit., 2005, 7, 37-42 (mod)	Ammonia in water is analyzed by flow-injection analysis with fluorescence detection after reaction with orthophthaldialdehyde (OPA).

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Dissolved Organic Carbon by Combustion (Low Level)	E358-L Vancouver - Environmental	Water	APHA 5310 B (mod)	Dissolved Organic Carbon (Non-Purgeable), also known as NPOC (dissolved), is a direct measurement of DOC after a filtered (0.45 micron) sample has been acidified and purged to remove inorganic carbon (IC). Analysis is by high temperature combustion with infrared detection of CO2. NPOC does not include volatile organic species that are purged off with IC. For samples where the majority of DC (dissolved carbon) is comprised of IC (which is common), this method is more accurate and more reliable than the DOC by subtraction method (i.e. DC minus DIC).
Total Metals in Water by CRC ICPMS	E420 Vancouver - Environmental	Water	EPA 200.2/6020B (mod)	Water samples are digested with nitric and hydrochloric acids, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.
Total Chromium in Water by CRC ICPMS (Low Level)	E420.Cr-L Vancouver - Environmental	Water	EPA 200.2/6020B (mod)	Water samples are digested with nitric and hydrochloric acids, and analyzed by Collision/Reaction Cell ICPMS.
Dissolved Metals in Water by CRC ICPMS	E421 Vancouver - Environmental	Water	APHA 3030B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.
Dissolved Chromium in Water by CRC ICPMS (Low Level)	E421.Cr-L Vancouver - Environmental	Water	APHA 3030 B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS
Total Mercury in Water by CVAAS	E508 Vancouver - Environmental	Water	EPA 1631E (mod)	Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS
Dissolved Mercury in Water by CVAAS	E509 Vancouver - Environmental	Water	APHA 3030B/EPA 1631E (mod)	Water samples are filtered (0.45 um), preserved with HCl, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS.
Dissolved Hardness (Calculated)	EC100 Vancouver - Environmental	Water	APHA 2340B	“Hardness (as CaCO3), dissolved” is calculated from the sum of dissolved Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. “Total Hardness” refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations.
Hardness (Calculated) from Total Ca/Mg	EC100A Vancouver - Environmental	Water	APHA 2340B	“Hardness (as CaCO3), from total Ca/Mg” is calculated from the sum of total Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. “Total Hardness” refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations. Hardness from total Ca/Mg is normally comparable to Dissolved Hardness in non-turbid waters.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Ion Balance using Dissolved Metals	EC101 Vancouver - Environmental	Water	APHA 1030E	Cation Sum, Anion Sum, and Ion Balance are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Dissolved species are used where available. Minor ions are included where data is present. Ion Balance cannot be calculated accurately for waters with very low electrical conductivity (EC).
TDS in Water (Calculation)	EC103 Vancouver - Environmental	Water	APHA 1030E (mod)	Total Dissolved Solids is calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Dissolved species are used where available. Minor ions are included where data is present.
Nitrate and Nitrite (as N) (Calculation)	EC235.N+N Vancouver - Environmental	Water	EPA 300.0	Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N).

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Dissolved Metals Water Filtration	EP421 Vancouver - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HNO3.
Dissolved Mercury Water Filtration	EP509 Vancouver - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HCl.

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percentage Difference
# = Indicates a QC result that did not meet the ALS DQO.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test specific).

Sub-Matrix: **Water**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Water**

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

SHIPMENT RELEASE (client use)		
Released by: Ian Smith	Date: 2020-08-11	Time:

INITIAL SHIPMENT RECEPTION (lab use only)		
Received by:	Date: AUG 11 20	Time: 15:05

FINAL SHIPMENT RECEPTION (lab use only)		
Received by: JC ice pack	Date: AUG 12 2020	Time: 1350

Select Service Level Below - Please confirm all E&P TATs with your AM - surcharges will apply

Regular [R] ☑ Standard TAT if received by 3 pm - business days - no surcharges apply

PRIORITY (Business Days)			EMERGENCY	
	4 day [P4]	☐	1 Business day [E1]	☐
	3 day [P3]	☐	Same Day, Weekend or Statutory holiday [E0]	☐
	2 day [P2]	☐		

Date and Time Required for all E&P TATs:

For tests that can not be performed according to the service level selected, you will be contacted.

CERTIFICATE OF ANALYSIS

Work Order	: **WR2000607**	Page	: 1 of 14
Client	: **Minto Explorations Ltd.**	Laboratory	: Whitehorse - Environmental
Contact	: Minto Environment - Coordinator	Account Manager	: Heather McKenzie
Address	: Suite 2100- 510 West Georgia St Vancouver BC Canada V6B 0M3	Address	: #12 151 Industrial Road Whitehorse YT Canada Y1A 2V3
Telephone	: ----	Telephone	: +1 867 668 6689
Project	: Minto Mine Monitoring	Date Samples Received	: 04-Aug-2020 14:50
PO	: 232817 (WUL)	Date Analysis Commenced	: 07-Aug-2020
C-O-C number	: 2020-08-04	Issue Date	: 12-Aug-2020 15:51
Sampler	: ----		
Site	: ----		
Quote number	: Q54721-Standing Offer		
No. of samples received	: 11		
No. of samples analysed	: 11		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Angela Ren	Team Leader - Metals	Metals, Burnaby, British Columbia
Bruna Botti	Analyst	Inorganics - Water Quality, Burnaby, British Columbia
Cristina Alexandre	Supervisor - Metals ICP Instrumentation	Metals, Burnaby, British Columbia
Dee Lee	Analyst	Metals, Burnaby, British Columbia
Ken Chan	Supervisor - Metals Prep & Mercury	Metals, Burnaby, British Columbia
Kevin Duarte	Team Leader - Inorganics	Inorganics - Water Quality, Burnaby, British Columbia
Kinny Wu	Laboratory Analyst	Metals, Burnaby, British Columbia
Lindsay Gung	Supervisor - Water Chemistry	Inorganics - Water Quality, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
%	percent
µS/cm	Microsiemens per centimetre
meq/L	milliequivalents per litre
mg/L	milligrams per litre
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in reports identified as "Preliminary Report" are considered authorized for use.

Qualifiers

Qualifier	*Description*
DLA	*Detection Limit adjusted for required dilution.*
DLDS	*Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity.*
DLM	*Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).*
DTMF	*Dissolved concentration exceeds total for field-filtered metals sample. Metallic contaminants may have been introduced to dissolved sample during field filtration.*

Analytical Results

Client	: **Minto Explorations Ltd.**	Laboratory	: Whitehorse - Environmental
Contact	: Minto Environment - Coordinator	Account Manager	: Heather McKenzie
Address	: Suite 2100- 510 West Georgia St Vancouver BC Canada V6B 0M3	Address	: #12 151 Industrial Road Whitehorse YT Canada Y1A 2V3
Telephone	: ----	Telephone	: +1 867 668 6689
Project	: ----	Date Samples Received	: 01-Sep-2020 14:25
PO	: 232817	Date Analysis Commenced	: 04-Sep-2020
C-O-C number	: 2020-09-01 A	Issue Date	: 10-Sep-2020 14:57
Sampler	: ----		
Site	: ----		
Quote number	: Q54721-Standing Offer		
No. of samples received	: 12		
No. of samples analysed	: 12		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Angelo Salandanan	Lab Assistant	Metals, Burnaby, British Columbia
Bruna Botti	Team Leader - Inorganics	Inorganics - Water Quality, Burnaby, British Columbia
Dee Lee	Analyst	Metals, Burnaby, British Columbia
Kim Jensen	Department Manager - Metals	Metals, Burnaby, British Columbia
Lindsay Gung	Supervisor - Water Chemistry	Inorganics - Water Quality, Burnaby, British Columbia
Shaneel Dayal	Analyst	Metals, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
%	percent
µS/cm	Microsiemens per centimetre
meq/L	milliequivalents per litre
mg/L	milligrams per litre
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in reports identified as "Preliminary Report" are considered authorized for use.

Qualifiers

Qualifier	*Description*
DLA	*Detection Limit adjusted for required dilution.*
DLM	*Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).*
DTMF	*Dissolved concentration exceeds total for field-filtered metals sample. Metallic contaminants may have been introduced to dissolved sample during field filtration.*

No. of samples received	: 12		
No. of samples analysed	: 12		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Matrix Spike outliers occur.
- Laboratory Control Sample (LCS) outliers occur - please see following pages for full details.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **Water**

Analyte Group	Laboratory sample ID	Client/Ref Sample ID	Analyte	CAS Number	Method	Result	Limits	Comment
Laboratory Control Sample (LCS) Recoveries								
Dissolved Metals	QC-MRG2-8207700 2	----	sodium, dissolved	7440-23-5	E421	129 % MES	80.0-120%	Recovery greater than upper control limit

Result Qualifiers

Qualifier	Description
MES	*Data Quality Objective was marginally exceeded (by < 10% absolute) for < 10% of analytes in a Multi-Element Scan / Multi-Parameter Scan (considered acceptable as per OMOE & CCME).*

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 15:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 15:00 is used for calculation purposes.

Legend & Qualifier Definitions

EHTR-FM: Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended

EHTR: Exceeded ALS recommended hold time prior to sample receipt.

EHTL: Exceeded ALS recommended hold time prior to analysis. Sample was received less than 24 hours prior to expiry.

EHT: Exceeded ALS recommended hold time prior to analysis.

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Water**

Evaluation: × = QC frequency outside specification; ✓ = QC frequency within specification.

Quality Control Sample Type			Count		Frequency (%)		
Analytical Methods	*Method*	*QC Lot #*	*QC*	*Regular*	*Actual*	*Expected*	*Evaluation*
Laboratory Duplicates (DUP)							
Alkalinity Species by Titration	E290	81618	1	12	8.3	5.0	✓

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Conductivity in Water	E100 Vancouver - Environmental	Water	APHA 2510 (mod)	Conductivity, also known as Electrical Conductivity (EC) or Specific Conductance, is measured by immersion of a conductivity cell with platinum electrodes into a water sample. Conductivity measurements are temperature-compensated to 25°C.
pH by Meter	E108 Vancouver - Environmental	Water	APHA 4500-H (mod)	pH is determined by potentiometric measurement with a pH electrode, and is conducted at ambient laboratory temperature (normally 20 ± 5°C). For high accuracy test results, pH should be measured in the field within the recommended 15 minute hold time.
TSS by Gravimetry	E160-H Vancouver - Environmental	Water	APHA 2540 D (mod)	Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, following by drying of the filter at 104 ± 1°C, with gravimetric measurement of the filtered solids. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.
Chloride in Water by IC (Low Level)	E235.Cl-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrite in Water by IC (Low Level)	E235.NO2-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrate in Water by IC (Low Level)	E235.NO3-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Sulfate in Water by IC	E235.SO4 Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Alkalinity Species by Titration	E290 Vancouver - Environmental	Water	APHA 2320 B (mod)	Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.
Ammonia by Fluorescence	E298 Vancouver - Environmental	Water	J. Environ. Monit., 2005, 7, 37-42 (mod)	Ammonia in water is analyzed by flow-injection analysis with fluorescence detection after reaction with orthophthaldialdehyde (OPA).

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Dissolved Organic Carbon by Combustion (Low Level)	E358-L Vancouver - Environmental	Water	APHA 5310 B (mod)	Dissolved Organic Carbon (Non-Purgeable), also known as NPOC (dissolved), is a direct measurement of DOC after a filtered (0.45 micron) sample has been acidified and purged to remove inorganic carbon (IC). Analysis is by high temperature combustion with infrared detection of CO2. NPOC does not include volatile organic species that are purged off with IC. For samples where the majority of DC (dissolved carbon) is comprised of IC (which is common), this method is more accurate and more reliable than the DOC by subtraction method (i.e. DC minus DIC).
Total Metals in Water by CRC ICPMS	E420 Vancouver - Environmental	Water	EPA 200.2/6020B (mod)	Water samples are digested with nitric and hydrochloric acids, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.
Total Chromium in Water by CRC ICPMS (Low Level)	E420.Cr-L Vancouver - Environmental	Water	EPA 200.2/6020B (mod)	Water samples are digested with nitric and hydrochloric acids, and analyzed by Collision/Reaction Cell ICPMS.
Dissolved Metals in Water by CRC ICPMS	E421 Vancouver - Environmental	Water	APHA 3030B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.
Dissolved Chromium in Water by CRC ICPMS (Low Level)	E421.Cr-L Vancouver - Environmental	Water	APHA 3030 B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS
Total Mercury in Water by CVAAS	E508 Vancouver - Environmental	Water	EPA 1631E (mod)	Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS
Dissolved Mercury in Water by CVAAS	E509 Vancouver - Environmental	Water	APHA 3030B/EPA 1631E (mod)	Water samples are filtered (0.45 um), preserved with HCl, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS.
Dissolved Hardness (Calculated)	EC100 Vancouver - Environmental	Water	APHA 2340B	“Hardness (as CaCO3), dissolved” is calculated from the sum of dissolved Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. “Total Hardness” refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations.
Hardness (Calculated) from Total Ca/Mg	EC100A Vancouver - Environmental	Water	APHA 2340B	“Hardness (as CaCO3), from total Ca/Mg” is calculated from the sum of total Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. “Total Hardness” refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations. Hardness from total Ca/Mg is normally comparable to Dissolved Hardness in non-turbid waters.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Ion Balance using Dissolved Metals	EC101 Vancouver - Environmental	Water	APHA 1030E	Cation Sum, Anion Sum, and Ion Balance are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Dissolved species are used where available. Minor ions are included where data is present. Ion Balance cannot be calculated accurately for waters with very low electrical conductivity (EC).
TDS in Water (Calculation)	EC103 Vancouver - Environmental	Water	APHA 1030E (mod)	Total Dissolved Solids is calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Dissolved species are used where available. Minor ions are included where data is present.
Nitrate and Nitrite (as N) (Calculation)	EC235.N+N Vancouver - Environmental	Water	EPA 300.0	Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N).

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Dissolved Metals Water Filtration	EP421 Vancouver - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HNO3.
Dissolved Mercury Water Filtration	EP509 Vancouver - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HCl.

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits
- Reference Material (RM) Report; Recovery and Acceptance Limits
- Method Blank (MB) Report; Recovery and Acceptance Limits
- Laboratory Control Sample (LCS) Report; Recovery and Acceptance Limits

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percentage Difference
# = Indicates a QC result that did not meet the ALS DQO.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test specific).

Sub-Matrix: **Water**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Water**

					Laboratory Control Sample (LCS) Report				
					Spike	Recovery (%)	Recovery Limits (%)

Qualifiers

Qualifier	Description
MES	Data Quality Objective was marginally exceeded (by < 10% absolute) for < 10% of analytes in a Multi-Element Scan / Multi-Parameter Scan (considered acceptable as per OMOE & CCME).

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Sub-Matrix: **Water**

No. of samples analysed	: 9		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Angela Ren	Team Leader - Metals	Metals, Burnaby, British Columbia
Bruna Botti	Team Leader - Inorganics	Inorganics - Water Quality, Burnaby, British Columbia
Clarie Tejano		Metals, Burnaby, British Columbia
Dan Gebert	Laboratory Analyst	Metals, Burnaby, British Columbia
Dee Lee	Analyst	Metals, Burnaby, British Columbia
Gloria Chan	Lab Analyst	Metals, Burnaby, British Columbia
Kim Jensen	Department Manager - Metals	Metals, Burnaby, British Columbia
Omar Beydoun	Lab Assistant	Metals, Burnaby, British Columbia
Robin Weeks	Team Leader - Metals	Metals, Burnaby, British Columbia
Shaneel Dayal	Analyst	Metals, Burnaby, British Columbia
Tracy Harley	Supervisor - Water Quality Instrumentation	Inorganics - Water Quality, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
%	percent
µS/cm	Microsiemens per centimetre
meq/L	milliequivalents per litre
mg/L	milligrams per litre
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in reports identified as "Preliminary Report" are considered authorized for use.

Qualifiers

Qualifier	*Description*
DLDS	*Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity.*

QUALITY CONTROL INTERPRETIVE REPORT

Work Order	: **WR2001038**	Page	: 1 of 24
Client	: **Minto Explorations Ltd.**	Laboratory	: Whitehorse - Environmental
Contact	: Minto Environment - Coordinator	Account Manager	: Heather McKenzie
Address	: 4838 Richard Rd. SW, Suite 300 Calgary AB Canada T3E 6L1	Address	: #12 151 Industrial Road Whitehorse, Yukon Canada Y1A 2V3
Telephone	: ----	Telephone	: +1 867 668 6689
Project	: Minto Mine Monitoring	Date Samples Received	: 06-Oct-2020 13:45
PO	: 232817	Issue Date	: 21-Oct-2020 18:47
C-O-C number	: 2020-10-06 A		
Sampler	: ----		
Site	: ----		
Quote number	: Q54721-Standing Offer		
No. of samples received	: 9		
No. of samples analysed	: 9		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 15:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 15:00 is used for calculation purposes.

Legend & Qualifier Definitions

EHTR-FM: Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Water**

Evaluation: × = QC frequency outside specification; ✓ = QC frequency within specification.

Quality Control Sample Type			Count		Frequency (%)		
Analytical Methods	*Method*	*QC Lot #*	*QC*	*Regular*	*Actual*	*Expected*	*Evaluation*
Laboratory Duplicates (DUP)							
Alkalinity Species by Titration	E290	99316	1	17	5.8	5.0	✓
Ammonia by Fluorescence	E298	103061	1	9	11.1	5.0	✓
Chloride in Water by IC (Low Level)	E235.Cl-L	99314	1	9	11.1	5.0	✓

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Conductivity in Water	E100 Vancouver - Environmental	Water	APHA 2510 (mod)	Conductivity, also known as Electrical Conductivity (EC) or Specific Conductance, is measured by immersion of a conductivity cell with platinum electrodes into a water sample. Conductivity measurements are temperature-compensated to 25°C.
pH by Meter	E108 Vancouver - Environmental	Water	APHA 4500-H (mod)	pH is determined by potentiometric measurement with a pH electrode, and is conducted at ambient laboratory temperature (normally 20 ± 5°C). For high accuracy test results, pH should be measured in the field within the recommended 15 minute hold time.
TSS by Gravimetry	E160-H Vancouver - Environmental	Water	APHA 2540 D (mod)	Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, following by drying of the filter at 104 ± 1°C, with gravimetric measurement of the filtered solids. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.
Chloride in Water by IC (Low Level)	E235.Cl-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrite in Water by IC (Low Level)	E235.NO2-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrate in Water by IC (Low Level)	E235.NO3-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Sulfate in Water by IC	E235.SO4 Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Alkalinity Species by Titration	E290 Vancouver - Environmental	Water	APHA 2320 B (mod)	Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.
Ammonia by Fluorescence	E298 Vancouver - Environmental	Water	J. Environ. Monit., 2005, 7, 37-42 (mod)	Ammonia in water is analyzed by flow-injection analysis with fluorescence detection after reaction with orthophthaldialdehyde (OPA).

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Dissolved Organic Carbon by Combustion (Low Level)	E358-L Vancouver - Environmental	Water	APHA 5310 B (mod)	Dissolved Organic Carbon (Non-Purgeable), also known as NPOC (dissolved), is a direct measurement of DOC after a filtered (0.45 micron) sample has been acidified and purged to remove inorganic carbon (IC). Analysis is by high temperature combustion with infrared detection of CO2. NPOC does not include volatile organic species that are purged off with IC. For samples where the majority of DC (dissolved carbon) is comprised of IC (which is common), this method is more accurate and more reliable than the DOC by subtraction method (i.e. DC minus DIC).
Total Metals in Water by CRC ICPMS	E420 Vancouver - Environmental	Water	EPA 200.2/6020B (mod)	Water samples are digested with nitric and hydrochloric acids, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.
Total Chromium in Water by CRC ICPMS (Low Level)	E420.Cr-L Vancouver - Environmental	Water	EPA 200.2/6020B (mod)	Water samples are digested with nitric and hydrochloric acids, and analyzed by Collision/Reaction Cell ICPMS.
Dissolved Metals in Water by CRC ICPMS	E421 Vancouver - Environmental	Water	APHA 3030B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.
Dissolved Chromium in Water by CRC ICPMS (Low Level)	E421.Cr-L Vancouver - Environmental	Water	APHA 3030 B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS
Total Mercury in Water by CVAAS	E508 Vancouver - Environmental	Water	EPA 1631E (mod)	Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS
Dissolved Mercury in Water by CVAAS	E509 Vancouver - Environmental	Water	APHA 3030B/EPA 1631E (mod)	Water samples are filtered (0.45 um), preserved with HCl, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS.
Dissolved Hardness (Calculated)	EC100 Vancouver - Environmental	Water	APHA 2340B	“Hardness (as CaCO3), dissolved” is calculated from the sum of dissolved Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. “Total Hardness” refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations.
Hardness (Calculated) from Total Ca/Mg	EC100A Vancouver - Environmental	Water	APHA 2340B	“Hardness (as CaCO3), from total Ca/Mg” is calculated from the sum of total Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. “Total Hardness” refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations. Hardness from total Ca/Mg is normally comparable to Dissolved Hardness in non-turbid waters.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Ion Balance using Dissolved Metals	EC101 Vancouver - Environmental	Water	APHA 1030E	Cation Sum, Anion Sum, and Ion Balance are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Dissolved species are used where available. Minor ions are included where data is present. Ion Balance cannot be calculated accurately for waters with very low electrical conductivity (EC).
TDS in Water (Calculation)	EC103 Vancouver - Environmental	Water	APHA 1030E (mod)	Total Dissolved Solids is calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Dissolved species are used where available. Minor ions are included where data is present.
Nitrate and Nitrite (as N) (Calculation)	EC235.N+N Vancouver - Environmental	Water	EPA 300.0	Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N).

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Dissolved Metals Water Filtration	EP421 Vancouver - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HNO3.
Dissolved Mercury Water Filtration	EP509 Vancouver - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HCl.

Site	: ----		
Quote number	: Q54721-Standing Offer		
No. of samples received	: 9		
No. of samples analysed	: 9		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits
- Reference Material (RM) Report; Recovery and Acceptance Limits
- Method Blank (MB) Report; Recovery and Acceptance Limits
- Laboratory Control Sample (LCS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*

Robin Weeks	Team Leader - Metals	Metals, Burnaby, British Columbia
Shaneel Dayal	Analyst	Metals, Burnaby, British Columbia
Tracy Harley	Supervisor - Water Quality Instrumentation	Inorganics - Water Quality, Burnaby, British Columbia

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percentage Difference
# = Indicates a QC result that did not meet the ALS DQO.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test specific).

Sub-Matrix: **Water**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Sub-Matrix: **Water**

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Water**

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Sub-Matrix: **Water**

Muneeb Alam	Analyst	Metals, Burnaby, British Columbia
Robin Weeks	Team Leader - Metals	Metals, Burnaby, British Columbia
Shaneel Dayal	Analyst	Metals, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
%	percent
µS/cm	Microsiemens per centimetre
meq/L	milliequivalents per litre
mg/L	milligrams per litre
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in reports identified as "Preliminary Report" are considered authorized for use.

Qualifiers

Qualifier	*Description*
DLM	*Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).*
DTC	*Dissolved concentration exceeds total. Results were confirmed by re-analysis.*
DTMF	*Dissolved concentration exceeds total for field-filtered metals sample. Metallic contaminants may have been introduced to dissolved sample during field filtration.*

QUALITY CONTROL INTERPRETIVE REPORT

Work Order	: **WR2000752**	Page	: 1 of 39
Client	: **Minto Explorations Ltd.**	Laboratory	: Whitehorse - Environmental
Contact	: Minto Environment - Coordinator	Account Manager	: Heather McKenzie
Address	: Suite 2100- 510 West Georgia St Vancouver BC Canada V6B 0M3	Address	: #12 151 Industrial Road Whitehorse, Yukon Canada Y1A 2V3
Telephone	: ----	Telephone	: +1 867 668 6689
Project	: 232817 (WUL)	Date Samples Received	: 25-Aug-2020 14:26
PO	: ----	Issue Date	: 01-Sep-2020 21:09
C-O-C number	: 2020-08-25 A, 1 OF 2 AND 2 OF		
Sampler	: ----		
Site	: ----		
Quote number	: Q54721-Standing Offer		
No. of samples received	: 17		
No. of samples analysed	: 17		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Matrix Spike outliers occur.
- Laboratory Control Sample (LCS) outliers occur - please see following pages for full details.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **Water**

Analyte Group	Laboratory sample ID	Client/Ref Sample ID	Analyte	CAS Number	Method	Result	Limits	Comment
Laboratory Control Sample (LCS) Recoveries								
Dissolved Metals	QC-MRG2-7765600 2	----	bismuth, dissolved	7440-69-9	E421	121 % MES	80.0-120%	Recovery greater than upper control limit

Result Qualifiers

Qualifier	*Description*
MES	*Data Quality Objective was marginally exceeded (by < 10% absolute) for < 10% of analytes in a Multi-Element Scan / Multi-Parameter Scan (considered acceptable as per OMOE & CCME).*

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 15:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 15:00 is used for calculation purposes.

Matrix: **Water**

Evaluation: × = Holding time exceedance ; ✓ = Within Holding Time

Legend & Qualifier Definitions

EHTR-FM: Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended

EHTR: Exceeded ALS recommended hold time prior to sample receipt.

EHTL: Exceeded ALS recommended hold time prior to analysis. Sample was received less than 24 hours prior to expiry.

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Water**

Evaluation: × = QC frequency outside specification; ✓ = QC frequency within specification.

Quality Control Sample Type			Count		Frequency (%)		
Analytical Methods	*Method*	*QC Lot #*	*QC*	*Regular*	*Actual*	*Expected*	*Evaluation*
Laboratory Duplicates (DUP)							
Alkalinity Species by Titration	E290	77595	1	17	5.8	5.0	✓
Ammonia by Fluorescence	E298	77806	2	17	11.7	5.0	✓
Chloride in Water by IC (Low Level)	E235.Cl-L	77592	1	17	5.8	5.0	✓
Conductivity in Water	E100	77593	1	17	5.8	5.0	✓
Dissolved Chromium in Water by CRC ICPMS (Low Level)	E421.Cr-L	77657	3	33	9.0	5.0	✓
Dissolved Mercury in Water by CVAAS	E509	78314	3	51	5.8	5.0	✓

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Conductivity in Water	E100 Vancouver - Environmental	Water	APHA 2510 (mod)	Conductivity, also known as Electrical Conductivity (EC) or Specific Conductance, is measured by immersion of a conductivity cell with platinum electrodes into a water sample. Conductivity measurements are temperature-compensated to 25°C.
pH by Meter	E108 Vancouver - Environmental	Water	APHA 4500-H (mod)	pH is determined by potentiometric measurement with a pH electrode, and is conducted at ambient laboratory temperature (normally 20 ± 5°C). For high accuracy test results, pH should be measured in the field within the recommended 15 minute hold time.
TSS by Gravimetry	E160-H Vancouver - Environmental	Water	APHA 2540 D (mod)	Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, following by drying of the filter at 104 ± 1°C, with gravimetric measurement of the filtered solids. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.
Chloride in Water by IC (Low Level)	E235.Cl-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrite in Water by IC (Low Level)	E235.NO2-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrate in Water by IC (Low Level)	E235.NO3-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Sulfate in Water by IC	E235.SO4 Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Alkalinity Species by Titration	E290 Vancouver - Environmental	Water	APHA 2320 B (mod)	Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.
Ammonia by Fluorescence	E298 Vancouver - Environmental	Water	J. Environ. Monit., 2005, 7, 37-42 (mod)	Ammonia in water is analyzed by flow-injection analysis with fluorescence detection after reaction with orthophthaldialdehyde (OPA).

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Dissolved Organic Carbon by Combustion (Low Level)	E358-L Vancouver - Environmental	Water	APHA 5310 B (mod)	Dissolved Organic Carbon (Non-Purgeable), also known as NPOC (dissolved), is a direct measurement of DOC after a filtered (0.45 micron) sample has been acidified and purged to remove inorganic carbon (IC). Analysis is by high temperature combustion with infrared detection of CO2. NPOC does not include volatile organic species that are purged off with IC. For samples where the majority of DC (dissolved carbon) is comprised of IC (which is common), this method is more accurate and more reliable than the DOC by subtraction method (i.e. DC minus DIC).
Total Metals in Water by CRC ICPMS	E420 Vancouver - Environmental	Water	EPA 200.2/6020B (mod)	Water samples are digested with nitric and hydrochloric acids, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.
Total Chromium in Water by CRC ICPMS (Low Level)	E420.Cr-L Vancouver - Environmental	Water	EPA 200.2/6020B (mod)	Water samples are digested with nitric and hydrochloric acids, and analyzed by Collision/Reaction Cell ICPMS.
Dissolved Metals in Water by CRC ICPMS	E421 Vancouver - Environmental	Water	APHA 3030B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.
Dissolved Chromium in Water by CRC ICPMS (Low Level)	E421.Cr-L Vancouver - Environmental	Water	APHA 3030 B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS
Total Mercury in Water by CVAAS	E508 Vancouver - Environmental	Water	EPA 1631E (mod)	Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS
Dissolved Mercury in Water by CVAAS	E509 Vancouver - Environmental	Water	APHA 3030B/EPA 1631E (mod)	Water samples are filtered (0.45 um), preserved with HCl, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS.
Dissolved Hardness (Calculated)	EC100 Vancouver - Environmental	Water	APHA 2340B	“Hardness (as CaCO3), dissolved” is calculated from the sum of dissolved Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. “Total Hardness” refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations.
Hardness (Calculated) from Total Ca/Mg	EC100A Vancouver - Environmental	Water	APHA 2340B	“Hardness (as CaCO3), from total Ca/Mg” is calculated from the sum of total Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. “Total Hardness” refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations. Hardness from total Ca/Mg is normally comparable to Dissolved Hardness in non-turbid waters.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Ion Balance using Dissolved Metals	EC101 Vancouver - Environmental	Water	APHA 1030E	Cation Sum, Anion Sum, and Ion Balance are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Dissolved species are used where available. Minor ions are included where data is present. Ion Balance cannot be calculated accurately for waters with very low electrical conductivity (EC).
TDS in Water (Calculation)	EC103 Vancouver - Environmental	Water	APHA 1030E (mod)	Total Dissolved Solids is calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Dissolved species are used where available. Minor ions are included where data is present.
Nitrate and Nitrite (as N) (Calculation)	EC235.N+N Vancouver - Environmental	Water	EPA 300.0	Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N).

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Dissolved Metals Water Filtration	EP421 Vancouver - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HNO3.
Dissolved Mercury Water Filtration	EP509 Vancouver - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HCl.

QUALITY CONTROL REPORT

Work Order	: **WR2000752**	Page	: 1 of 30
Client	: Minto Explorations Ltd.	Laboratory	: Whitehorse - Environmental
Contact	: Minto Environment - Coordinator	Account Manager	: Heather McKenzie
Address	: Suite 2100- 510 West Georgia St Vancouver BC Canada V6B 0M3	Address	: #12 151 Industrial Road Whitehorse, Yukon Canada Y1A 2V3
Telephone	: ----	Telephone	: +1 867 668 6689
Project	: 232817 (WUL)	Date Samples Received	: 25-Aug-2020 14:26
PO	: ----	Date Analysis Commenced	: 26-Aug-2020
C-O-C number	: 2020-08-25 A, 1 OF 2 AND 2 OF	Issue Date	: 01-Sep-2020 21:09
Sampler	: ----		
Site	: ----		
Quote number	: Q54721-Standing Offer		
No. of samples received	: 17		
No. of samples analysed	: 17		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits
- Reference Material (RM) Report; Recovery and Acceptance Limits
- Method Blank (MB) Report; Recovery and Acceptance Limits
- Laboratory Control Sample (LCS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Muneeb Alam	Analyst	Metals, Burnaby, British Columbia
Robin Weeks	Team Leader - Metals	Metals, Burnaby, British Columbia
Shaneel Dayal	Analyst	Metals, Burnaby, British Columbia

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percentage Difference
# = Indicates a QC result that did not meet the ALS DQO.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test specific).

Sub-Matrix: **Water**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Water**

					Laboratory Control Sample (LCS) Report				
					Spike	Recovery (%)	Recovery Limits (%)		
Analyte	CAS Number	Method	LOR	Unit	Concentration	LCS	Low	High	Qualifier
Physical Tests (QCLot: 77593)

Qualifiers

Qualifier	Description
MES	*Data Quality Objective was marginally exceeded (by < 10% absolute) for < 10% of analytes in a Multi-Element Scan / Multi-Parameter Scan (considered acceptable as per OMOE & CCME).*

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Drinking Water (DW) Samples[1] (client use) — Criteria to add on report by clicking on the drop-down list below (electronic COC only)

Are samples taken from a Regulated DW System?
☐ YES ☑ NO

Are samples for human drinking water use?
☐ YES ☑ NO

SAMPLE CONDITION AS RECEIVED (lab use only)

Frozen ☐ SIF Observations Yes ☐ No ☐
Ice Packs ☑ Ice Cubes ☐ Custody seal intact Yes ☐ No ☐
Cooling Initiated ☐

INITIAL COOLER TEMPERATURES °C			FINAL COOLER TEMPERATURES °C
5.1			10 (aw on 8)

SHIPMENT RELEASE (client use)		
Released by: Chris Wall	Date: 2020-08-25	Time:

INITIAL SHIPMENT RECEPTION (lab use only)		
Received by: CC	Date: Aug 25 2020	Time: 2:26 pm

FINAL SHIPMENT RECEPTION (lab use only)		
Received by:	Date: Aug 28	Time: 9:05

Growth IC50	>95.2

IC = Inhibition Concentration

1.0 INTRODUCTION

Nautilus Environmental Company Inc. conducted a sub-lethal toxicity test for ALS Environmental on a sample identified as WR2000049. The sample was collected on February 18, 2020 and delivered to the Nautilus Environmental laboratory in Burnaby, BC on February 20, 2020. The sample was transported in one 1-L container and was received at a temperature of 7.5°C. The sample was stored in the dark at 4 ± 2°C prior to testing.

This report describes the results of the toxicity test using *Pseudokirchneriella subcapitata*. Copies of raw laboratory data sheets and statistical analyses are provided in Appendix A. The chain-of-custody form is provided in Appendix B.

2.0 METHODS

Methods for the toxicity test are summarized in Table 1. Testing using *P. subcapitata* was conducted according to procedures described by Environment Canada (2007) and statistical analyses was performed using CETIS (Tidepool Scientific Software, 2013).

Table 1. Summary of test conditions: 72-h *Pseudokirchneriella subcapitata* growth inhibition test.

Test species	*Pseudokirchneriella subcapitata*, strain CPCC #37
Organism source	In-house axenic culture, obtained from Canadian Phycological Culture Center, and originally isolated from Nivelta River, Norway.
Organism age	3-to 7-day old culture in logarithmic growth phase
Test type	Static
Test duration	72 hours
Test vessel	Microplate
Test volume	220 µL
Test concentrations	Seven concentrations, plus laboratory control
Test replicates	4 per treatment; 8 for laboratory control
Number of organisms	10,000 cells/mL
Control/dilution water	Deionized water supplemented with nutrients
Test solution renewal	None
Test temperature	24 ± 2°C
Feeding	None
Light intensity	3600 to 4400 lux
Photoperiod	24 hours light
Aeration	None
Test measurements	Test area temperature measured daily; temperature and pH measured at test initiation; pH of two control wells measured at test termination
Test protocol	Environment Canada (2007), EPS 1/RM/25
Statistical software	CETIS Version 1.9.4
Test endpoint	Algal cell growth inhibition
Test acceptability criteria for controls	>16-fold increase in number of algal cells; CV ≤ 20%; no trend when analyzed using Mann-Kendall test
Reference toxicant	Zinc (added as $ZnSO_4$)

3.0 RESULTS

Results of the toxicity test are summarized in Table 2. There were no adverse effects observed on cell yield of *P. subcapitata*, resulting in IC values that were greater than the highest concentration tested. In addition, stimulatory effects were observed for *P. subcapitata* cell yield in test concentrations 3% to 95.2% (v/v).; percent stimulation for algal cell growth in these concentrations ranged from 44.3% to 259.8%.

Table 2. Results: 72-h *Pseudokirchneriella subcapitata* growth inhibition test.

Concentration (% v/v)	Cell Yield (x 10^4 cells/mL) (Mean ± SD)	Stimulation (%)
Laboratory Control	27.4 ± 2.2	--
1.5	33.5 ± 2.4	22.4
3.0	39.5 ± 3.7 *	44.3
6.0	43.2 ± 4.3 *	58.0
11.9	61.2 ± 3.1 *	123.7
23.8	83.8 ± 6.2 *	205.9
47.6	98.5 ± 10.8 *	259.8
95.2	47.0 ± 7.9 *	71.7
Test Endpoint (% v/v)		
IC25	>95.2	--
IC50	>95.2	--

SD = Standard Deviation, IC = Inhibition Concentration
* = indicates the cell yield was significantly greater than the lab control

4.0 QA/QC

The health history of the test organisms used in the exposure was acceptable and met the requirements of the Environment Canada protocol. The test met all control acceptability criteria and water quality parameters remained within ranges specified in the protocol throughout the test. Uncertainty associated with the test is best described by the standard deviation around the mean and/or the confidence intervals around the point estimates.

Results of the reference toxicant test conducted during the testing program are summarized in Table 3. Results for this test fell within the ranges for organism performance of the mean and two standard deviations, based on historical results obtained by the laboratory with this test. Thus, the sensitivity of the organisms used in this test was appropriate. The reference toxicant test was performed under the same conditions as those used for the sample.

Table 3. Reference toxicant test results.

Test Species	Endpoint	Historical Mean (2 SD Range)	CV (%)	Test Date
P. subcapitata	Growth (IC50): 31.5 µg/L Zn	30.9 (24.9 – 38.4)	11	February 21, 2020

SD = Standard Deviation, CV = Coefficient of Variation, IC = Inhibition Concentration

APPENDIX A – Summary of test conditions

Table 1. Summary of test conditions: 96-h rainbow trout (*Oncorhynchus mykiss*) LC50 test.

Test species	*Oncorhynchus mykiss*
Organism source	Hatchery
Organism age	Juvenile
Test type	Static
Test duration	96 hours
Test vessel	20-L glass aquarium
Test volume	10 to 20 L (depending on size of fish)
Test solution depth	≥15 cm
Test concentrations	Five concentrations, plus laboratory control
Test replicates	1 per treatment
Number of organisms	10 per replicate
Control/dilution water	Dechlorinated Metro Vancouver municipal tapwater
Test solution renewal	None
Test temperature	15 ± 1°C
Feeding	None
Light intensity	100 to 500 lux
Photoperiod	16 hours light / 8 hours dark
Aeration	6.5 ± 1 mL/min/L
Test measurements	Temperature, dissolved oxygen and pH measured daily; salinity measured in the undiluted sample at test initiation; conductivity measured at test initiation and termination; survival checked daily
Test protocol	Environment Canada (2000), EPS 1/RM/13, with 2007 & 2016 amendments
Statistical software	CETIS Version 1.9.4
Test endpoints	Survival (96-hour LC50)
Test acceptability criterion for controls	Survival ≥90%
Reference toxicant	Zinc (added as $ZnSO_4$)

Table 2. Summary of test conditions: 48-h *Daphnia magna* LC50 test.

Test species	*Daphnia magna*
Organism source	In-house culture
Organism age	<24-hour old neonates
Test type	Static
Test duration	48 hours
Test vessel	250-mL glass beaker
Test volume	200 mL
Test solution depth	6 cm
Test concentrations	Five concentrations, plus laboratory control
Test replicates	1 per treatment
Number of organisms	10 per replicate
Control/dilution water	Moderately-hard reconstituted water + 2.5 µg/L Se
Test solution renewal	None
Test temperature	20 ± 2°C
Feeding	None
Light intensity	400 to 800 lux
Photoperiod	16 hours light / 8 hours dark
Aeration	None
Test measurements	Temperature, dissolved oxygen and pH measured daily; salinity, hardness and alkalinity measured in the undiluted sample at test initiation; conductivity measured at test initiation and termination; survival checked daily
Test protocol	Environment Canada (2000), EPS 1/RM/14, with 2016 amendments
Statistical software	CETIS Version 1.9.4
Test endpoints	Survival (48-hour LC50)
Test acceptability criterion for controls	Survival ≥90%
Reference toxicant	Sodium chloride (NaCl)

APPENDIX A – Summary of test conditions

Table 1. Summary of test conditions: 48-h *Daphnia magna* LC50 test.

Test species	*Daphnia magna*
Organism source	In-house culture
Organism age	<24-hour old neonates
Test type	Static
Test duration	48 hours
Test vessel	250-mL glass beaker
Test volume	200 mL
Test solution depth	6 cm
Test concentrations	Five concentrations, plus laboratory control
Test replicates	1 per treatment
Number of organisms	10 per replicate
Control/dilution water	Moderately-hard reconstituted water + 2.5 µg/L Se
Test solution renewal	None
Test temperature	20 ± 2°C
Feeding	None
Light intensity	400 to 800 lux
Photoperiod	16 hours light / 8 hours dark
Aeration	None
Test measurements	Temperature, dissolved oxygen and pH measured daily; salinity, hardness and alkalinity measured in the undiluted sample at test initiation; conductivity measured at test initiation and termination; survival checked daily
Test protocol	Environment Canada (2000), EPS 1/RM/14, with 2016 amendments
Statistical software	CETIS Version 1.9.4
Test endpoint	Survival (48-hour LC50)
Test acceptability criterion for controls	Survival ≥90%
Reference toxicant	Sodium chloride (NaCl)

Summary of Results

Cell Yield	% v/v
Growth IC25	>95.2
Growth IC50	>95.2

IC = Inhibition Concentration

1.0 INTRODUCTION

Nautilus Environmental Company Inc. conducted a 72-h *Pseudokirchneriella subcapitata* growth inhibition toxicity test for ALS Environmental on a sample identified as WR2000227-001 W3. The sample was collected on May 19, 2020 and delivered to the Nautilus Environmental laboratory in Burnaby, BC on May 21, 2020. The sample was transported in three 1L plastic containers and was received at a temperature of 6.9-7.2°C. The sample was stored in the dark at 4 ± 2°C prior to testing.

This report describes the results of the toxicity test. Copies of raw laboratory data sheets and statistical analyses are provided in Appendix A. The chain-of-custody form is provided in Appendix B.

2.0 METHODS

Methods for the toxicity test are summarized in Table 1. Testing was conducted according to procedures described by Environment Canada (2007). Statistical analyses were performed using CETIS (Tidepool Scientific Software, 2013).

Table 1. Summary of test conditions: 72-h *Pseudokirchneriella subcapitata* growth inhibition test.

Test species	*Pseudokirchneriella subcapitata*, strain CPCC #37
Organism source	In-house axenic culture, obtained from Canadian Phycological Culture Center, and originally isolated from Nivelta River, Norway.
Organism age	3-to 7-day old culture in logarithmic growth phase
Test type	Static
Test duration	72 hours
Test vessel	Microplate
Test volume	220 µL
Test concentrations	Seven concentrations, plus laboratory control
Test replicates	4 per treatment; 8 for laboratory control
Number of organisms	10,000 cells/mL
Control/dilution water	Deionized water supplemented with nutrients
Test solution renewal	None
Test temperature	24 ± 2°C
Feeding	None
Light intensity	3600 to 4400 lux
Photoperiod	24 hours light
Aeration	None
Test measurements	Test area temperature measured daily; temperature and pH measured at test initiation; pH of two control wells measured at test termination
Test protocol	Environment Canada (2007), EPS 1/RM/25
Statistical software	CETIS Version 1.9.4
Test endpoint	Algal cell growth inhibition
Test acceptability criteria for controls	>16-fold increase in number of algal cells; CV ≤ 20%; no trend when analyzed using Mann-Kendall test
Reference toxicant	Zinc (added as $ZnSO_4$)

3.0 RESULTS

Results of the toxicity test on sample WR2000227-001 W3 are summarized in Table 2. There were no adverse effects on cell yield of *P. subcapitata*, resulting in IC25 and IC50 values of >95.2%. In addition, stimulatory effects were observed in all test concentrations; stimulation ranged from 45.4 to 214.5%.

Table 2. Results: *Pseudokirchneriella subcapitata* growth inhibition test.

Concentration (% v/v)	Cell Yield (x 10^4 cells/mL) (Mean ± SD)	Stimulation (%)
Laboratory Control	42.1 ± 3.1	--
1.5	61.2 ± 4.3*	45.4
3.0	81.5 ± 4.8*	93.5
6.0	108.5 ± 8.6*	157.6
11.9	132.5 ± 7.9*	214.5
23.8	129.2 ± 6.4*	206.8
47.6	119.5 ± 3.9*	183.7
95.2	105.2 ± 3.3*	149.9
Test Endpoint (% v/v)		
IC25	>95.2	--
IC50	>95.2	--

SD = Standard Deviation, IC = Inhibition Concentration
* = Indicates cell yield was significantly greater than the laboratory control

4.0 QA/QC

The health history of the test organisms used in the exposure was acceptable and met the requirements of the Environment Canada protocol. The test met all control acceptability criteria and water quality parameters remained within ranges specified in the protocol throughout the tests. Uncertainty associated with the test is best described by the standard deviation around the mean and/or the confidence intervals around the point estimates.

Results of the reference toxicant test conducted during the testing program are summarized in Table 3. Results for this test fell within the range for organism performance of the mean and two standard deviations, based on historical results obtained by the laboratory with this test. Thus, the sensitivity of the organisms used in the test was appropriate. The reference toxicant test was performed under the same conditions as those used for the sample.

Table 3. Reference toxicant results.

Test Species	Endpoint	Historical Mean (2 SD Range)	CV (%)	Test Date
P. subcapitata	Growth (IC50): 32.0 µg/L Zn	30.4 (24.5 – 37.8)	11	May 14, 2020

SD = Standard Deviation, CV = Coefficient of Variation, IC = Inhibition Concentration

APPENDIX A – Summary of test conditions

Table 1. Summary of test conditions: 96-h rainbow trout (*Oncorhynchus mykiss*) LC50 test.

Test species	*Oncorhynchus mykiss*
Organism source	Hatchery
Organism age	Juvenile
Test type	Static
Test duration	96 hours
Test vessel	20-L glass aquarium
Test volume	10 to 20 L (depending on size of fish)
Test solution depth	≥15 cm
Test concentrations	Five concentrations, plus laboratory control
Test replicates	1 per treatment
Number of organisms	10 per replicate
Control/dilution water	Dechlorinated Metro Vancouver municipal tapwater
Test solution renewal	None
Test temperature	15 ± 1°C
Feeding	None
Light intensity	100 to 500 lux
Photoperiod	16 hours light / 8 hours dark
Aeration	6.5 ± 1 mL/min/L
Test measurements	Temperature, dissolved oxygen and pH measured daily; salinity measured in the undiluted sample at test initiation; conductivity measured at test initiation and termination; survival checked daily
Test protocol	Environment Canada (2000), EPS 1/RM/13, with 2007 & 2016 amendments
Statistical software	CETIS Version 1.9.4
Test endpoints	Survival (96-hour LC50)
Test acceptability criterion for controls	Survival ≥90%
Reference toxicant	Zinc (added as $ZnSO_4$)

Table 2. Summary of test conditions: 48-h *Daphnia magna* LC50 test.

Test species	*Daphnia magna*
Organism source	In-house culture
Organism age	<24-hour old neonates
Test type	Static
Test duration	48 hours
Test vessel	250-mL glass beaker
Test volume	200 mL
Test solution depth	6 cm
Test concentrations	Five concentrations, plus laboratory control
Test replicates	1 per treatment
Number of organisms	10 per replicate
Control/dilution water	Moderately-hard reconstituted water + 2.5 µg/L Se
Test solution renewal	None
Test temperature	20 ± 2°C
Feeding	None
Light intensity	400 to 800 lux
Photoperiod	16 hours light / 8 hours dark
Aeration	None
Test measurements	Temperature, dissolved oxygen and pH measured daily; salinity, hardness and alkalinity measured in the undiluted sample at test initiation; conductivity measured at test initiation and termination; survival checked daily
Test protocol	Environment Canada (2000), EPS 1/RM/14, with 2016 amendments
Statistical software	CETIS Version 1.9.4
Test endpoints	Survival (48-hour LC50)
Test acceptability criterion for controls	Survival ≥90%
Reference toxicant	Sodium chloride (NaCl)

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
Bq/L	Becquerels per litre

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in reports identified as "Preliminary Report" are considered authorized for use.

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 15:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 15:00 is used for calculation purposes.

Matrix: **Water**

Evaluation: × = Holding time exceedance ; ✓ = Within Holding Time

Analyte Group / Container / Client Sample ID(s)	Method	Sampling Date	Extraction / Preparation				Analysis			
			Preparation Date	Holding Times Rec	Holding Times Actual	Eval	Analysis Date	Holding Times Rec	Holding Times Actual	Eval

Legend & Qualifier Definitions

EHT: Exceeded ALS recommended hold time prior to analysis.

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

- **No Quality Control data available for this section.**

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percentage Difference
# = Indicates a QC result that did not meet the ALS DQO.

Re: ALS Workorder: 2008199
Project Name:
Project Number: WR2000608

Dear Ms. McKenzie:

One water sample was received from ALS Environmental, on 8/10/2020. The sample was scheduled for the following analysis:

Radium-226

The results for these analyses are contained in the enclosed reports.

The data contained in the following report have been reviewed and approved by the personnel listed below. In addition, ALS certifies that the analyses reported herein are true, complete and correct within the limits of the methods employed. Should this laboratory report need to be reproduced, it should be reproduced in full unless written approval has been obtained from ALS Environmental.

Thank you for your confidence in ALS Environmental. Should you have any questions, please call.

Sincerely,

ALS Environmental
Katie M. OBrien
Project Manager

ALS Environmental – Fort Collins is accredited by the following accreditation bodies for various testing scopes in accordance with requirements of each accreditation body. All testing is performed under the laboratory management system, which is maintained to meet these requirement and regulations. Please contact the laboratory or accreditation body for the current scope testing parameters.

Legal Location:		**Matrix:**	WATER
Collection Date:	8/4/2020 07:10	**Percent Moisture:**	

Analyses	Result	Qual	Report Limit	Units	Dilution Factor	Date Analyzed

Explanation of Qualifiers

Radiochemistry:

- "Report Limit" is the MDC

U or ND - Result is less than the sample specific MDC.

Y1 - Chemical Yield is in control at 100-110%. Quantitative yield is assumed.

Y2 - Chemical Yield outside default limits.

W - DER is greater than Warning Limit of 1.42

* - Aliquot Basis is 'As Received' while the Report Basis is 'Dry Weight'.
# - Aliquot Basis is 'Dry Weight' while the Report Basis is 'As Received'.
G - Sample density differs by more than 15% of LCS density.
D - DER is greater than Control Limit

M - Requested MDC not met.

M3 - The requested MDC was not met, but the reported activity is greater than the reported MDC.

L - LCS Recovery below lower control limit.

H - LCS Recovery above upper control limit.

P - LCS, Matrix Spike Recovery within control limits.

N - Matrix Spike Recovery outside control limits

NC - Not Calculated for duplicate results less than 5 times MDC

B - Analyte concentration greater than MDC.

B3 - Analyte concentration greater than MDC but less than Requested MDC.

Inorganics:

B - Result is less than the requested reporting limit but greater than the instrument method detection limit (MDL).

U or ND - Indicates that the compound was analyzed for but not detected.

E - The reported value is estimated because of the presence of interference. An explanatory note may be included in the narrative.

M - Duplicate injection precision was not met.

N - Spiked sample recovery not within control limits. A post spike is analyzed for all ICP analyses when the matrix spike and or spike duplicate fail and the native sample concentration is less than four times the spike added concentration.

Z - Spiked recovery not within control limits. An explanatory note may be included in the narrative.

* - Duplicate analysis (relative percent difference) not within control limits.

S - SAR value is estimated as one or more analytes used in the calculation were not detected above the detection limit.

Organics:

U or ND - Indicates that the compound was analyzed for but not detected.

B - Analyte is detected in the associated method blank as well as in the sample. It indicates probable blank contamination and warns the data user.

E - Analyte concentration exceeds the upper level of the calibration range.

J - Estimated value. The result is less than the reporting limit but greater than the instrument method detection limit (MDL).

A - A tentatively identified compound is a suspected aldol-condensation product.

X - The analyte was diluted below an accurate quantitation level.

* - The spike recovery is equal to or outside the control criteria used.

+ - The relative percent difference (RPD) equals or exceeds the control criteria.

G - A pattern resembling gasoline was detected in this sample.

D - A pattern resembling diesel was detected in this sample.

M - A pattern resembling motor oil was detected in this sample.

C - A pattern resembling crude oil was detected in this sample.

4 - A pattern resembling JP-4 was detected in this sample.

5 - A pattern resembling JP-5 was detected in this sample.

H - Indicates that the fuel pattern was in the heavier end of the retention time window for the analyte of interest.

L - Indicates that the fuel pattern was in the lighter end of the retention time window for the analyte of interest.

Z - This flag indicates that a significant fraction of the reported result did not resemble the patterns of any of the following petroleum hydrocarbon products:
- gasoline
- JP-8
- diesel
- mineral spirits
- motor oil
- Stoddard solvent
- bunker C

IC = Inhibition Concentration

1.0 INTRODUCTION

Nautilus Environmental Company Inc. conducted a 72-h *Pseudokirchneriella subcapitata* growth inhibition toxicity test for ALS Environmental on a sample identified as WR2000608-001 W3. The sample was collected on August 4, 2020 and delivered to the Nautilus Environmental laboratory in Burnaby, BC on August 6, 2020. The sample was transported in three 1L plastic containers and was received at a temperature of 10.7 – 11.4°C. The sample was stored in the dark at 4 ± 2°C prior to testing.

This report describes the results of the toxicity test. Copies of raw laboratory data sheets and statistical analyses are provided in Appendix A. The chain-of-custody form is provided in Appendix B.

2.0 METHODS

Methods for the toxicity test are summarized in Table 1. Testing was conducted according to procedures described by Environment Canada (2007). Statistical analyses were performed using CETIS (Tidepool Scientific Software, 2013).

Table 1. Summary of test conditions: 72-h *Pseudokirchneriella subcapitata* growth inhibition test.

Test species	*Pseudokirchneriella subcapitata*, strain CPCC #37
Organism source	In-house axenic culture, obtained from Canadian Phycological Culture Center, and originally isolated from Nivelta River, Norway.
Organism age	3-to 7-day old culture in logarithmic growth phase
Test type	Static
Test duration	72 hours
Test vessel	Microplate
Test volume	220 µL
Test concentrations	Seven concentrations, plus laboratory control
Test replicates	4 per treatment; 8 for laboratory control
Number of organisms	10,000 cells/mL
Control/dilution water	Deionized water supplemented with nutrients
Test solution renewal	None
Test temperature	24 ± 2°C
Feeding	None
Light intensity	3600 to 4400 lux
Photoperiod	24 hours light
Aeration	None
Test measurements	Test area temperature measured daily; temperature and pH measured at test initiation; pH of two control wells measured at test termination
Test protocol	Environment Canada (2007), EPS 1/RM/25
Statistical software	CETIS Version 1.9.4
Test endpoint	Algal cell growth inhibition
Test acceptability criteria for controls	>16-fold increase in number of algal cells; CV ≤ 20%; no trend when analyzed using Mann-Kendall test
Reference toxicant	Zinc (added as $ZnSO_4$)

3.0 RESULTS

Results of the toxicity test on sample WR2000608-001 W3 are summarized in Table 2. There were no adverse effects on cell yield of *P. subcapitata*, resulting in IC25 and IC50 values of >95.2%. In addition, stimulatory effects were observed in all test concentrations; stimulation ranged from 23.3 to 240.4%.

Table 2. Results: *Pseudokirchneriella subcapitata* growth inhibition test.

Concentration (% v/v)	Cell Yield (x 10^4 cells/mL) (Mean ± SD)	Stimulation (%)
Laboratory Control	48.2 ± 4.2	--
1.5	59.5 ± 2.6*	23.3
3.0	77.2 ± 6.2*	60.1
6.0	86.8 ± 5.4*	79.8
11.9	107.8 ± 4.6*	123.3
23.8	164.2 ± 5.9*	240.4
47.6	154.0 ± 6.7*	219.2
95.2	149.0 ± 8.3*	208.8
Test Endpoint (% v/v)		
IC25	>95.2	--
IC50	>95.2	--

SD = Standard Deviation, IC = Inhibition Concentration
* = Indicates cell yield was significantly greater than the laboratory control

4.0 QA/QC

The health history of the test organisms used in the exposure was acceptable and met the requirements of the Environment Canada protocol. The test met all control acceptability criteria and water quality parameters remained within ranges specified in the protocol throughout the tests. Uncertainty associated with the test is best described by the standard deviation around the mean and/or the confidence intervals around the point estimates.

Results of the reference toxicant test conducted during the testing program are summarized in Table 3. Results for this test fell within the range for organism performance of the mean and two standard deviations, based on historical results obtained by the laboratory with this test. Thus, the sensitivity of the organisms used in the test was appropriate. The reference toxicant test was performed under the same conditions as those used for the sample.

Table 3. Reference toxicant results.

Test Species	Endpoint	Historical Mean (2 SD Range)	CV (%)	Test Date
P. subcapitata	Growth (IC50): 29.7 µg/L Zn	30.4 (24.4 – 37.8)	11	August 11, 2020

SD = Standard Deviation, CV = Coefficient of Variation, IC = Inhibition Concentration

collected August 4, 2020

Final Report

August 20, 2020

Submitted to: **ALS Environmental**
Burnaby, BC

8664 Commerce Court, Burnaby, BC V5A 4N7

SAMPLE INFORMATION

Sample ID	Dates				Receipt temperature
	Collected	Received	Rainbow trout test initiation	*Daphnia magna* test initiation	
WR2000608-001 W3	04-Aug-20 at 0610h	06-Aug-20 at 1629h	n/t	07-Aug-20 at 1245h	10.7 – 11.4°C

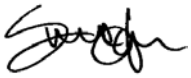
N/t = Not tested (insufficient suitable fish at laboratory; client will resample)

TESTS

- *Daphnia magna* 48-h LC50 test

RESULTS

Toxicity test results



Sample ID	LC50 (% v/v)
WR2000608-001 W3	>100

LC = Lethal Concentration

QA/QC

QA/QC summary	*Daphnia magna*
Reference toxicant LC50 (95% CL)	6.8 (5.7 – 8.1) g/L NaCl[1]
Reference toxicant historical mean (2 SD range)	6.4 (4.9 – 8.4) g/L NaCl
Reference toxicant CV	13%
Organism health history	Acceptable
Protocol deviations	Yes (see below)
Water quality range deviations	None
Control performance	Acceptable
Test performance	Valid

[1] Test date: July 28, 2020, LC = Lethal Concentration, SD = Standard Deviation, CL = Confidence Limits, CV = Coefficient of Variation

This report has been prepared by Nautilus Environmental Company Inc. based on data and/or samples provided by our client and the results of this study are for their sole benefit. Any reliance on the data by a third party is at the sole and exclusive risk of that party. The results presented here relate only to the samples tested.

APPENDIX A – Summary of test conditions

Table 1. Summary of test conditions: 48-h *Daphnia magna* LC50 test.

Test species	*Daphnia magna*
Organism source	In-house culture
Organism age	<24-hour old neonates
Test type	Static
Test duration	48 hours
Test vessel	250-mL glass beaker
Test volume	200 mL
Test solution depth	6 cm
Test concentrations	Five concentrations, plus laboratory control
Test replicates	1 per treatment
Number of organisms	10 per replicate
Control/dilution water	Moderately-hard reconstituted water + 2.5 µg/L Se
Test solution renewal	None
Test temperature	20 ± 2°C
Feeding	None
Light intensity	400 to 800 lux
Photoperiod	16 hours light / 8 hours dark
Aeration	None
Test measurements	Temperature, dissolved oxygen and pH measured daily; salinity, hardness and alkalinity measured in the undiluted sample at test initiation; conductivity measured at test initiation and termination; survival checked daily
Test protocol	Environment Canada (2000), EPS 1/RM/14, with 2016 amendments
Statistical software	CETIS Version 1.9.4
Test endpoint	Survival (48-hour LC50)
Test acceptability criterion for controls	Survival ≥90%
Reference toxicant	Sodium chloride (NaCl)

APPENDIX B – Toxicity test data

Daphnia magna Summary Sheet

Client: ALS Environmental
Work Order No.: 201492

Start Date/Time: Aug 07/2020 @ 1245h
Test Species: *Daphnia magna*
Set up by: MK

Sample Information:

Sample ID: WR2000608-001 W3
Sample Date: Aug 04/2020
Date Received: Aug 06/2020
Sample Volume: 2 x 1L

Test Validity Criteria:

≥ 90% mean control survival and/or mobility and ≤2 daphnids exibit immobility and/or mortality in any single control replicate.

WQ Ranges:

T (°C) = 20 ± 2; DO (mg/L) = 3.6 to 9.4; pH = 6 to 8.5

Test Organism Information:

Broodstock No.:	071520B
Age of young (Day 0):	<24 h
Avg No. young per brood in previous 7 d:	24
Mortality (%) in previous 7 d:	0
Days to first brood:	6

NaCl Reference Toxicant Results:

Reference Toxicant ID:	DmDC54
Stock Solution ID:	20 NaCl 3
Date Initiated:	July 28/2020
48-h LC50 (95% CL):	6.8 (5.7 - 8.1) g/L NaCL

Reference Toxicant Mean and Historical Range: 6.4 (4.9 - 8.4) g/L NaCL
Reference Toxicant CV (%): 13

Test Results: The 48 h LC50 is estimated to be >100 % (v/v)

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
Bq/L	Becquerels per litre

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in reports identified as "Preliminary Report" are considered authorized for use.

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 15:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 15:00 is used for calculation purposes.

Matrix: **Water**

Evaluation: × = Holding time exceedance ; ✓ = Within Holding Time

Analyte Group / Container / Client Sample ID(s)	Method	Sampling Date	Extraction / Preparation				Analysis			
			Preparation Date	Holding Times Rec	Holding Times Actual	Eval	Analysis Date	Holding Times Rec	Holding Times Actual	Eval

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percentage Difference
# = Indicates a QC result that did not meet the ALS DQO.

Re: ALS Workorder: 2008199
Project Name:
Project Number: WR2000608

Dear Ms. McKenzie:

One water sample was received from ALS Environmental, on 8/10/2020. The sample was scheduled for the following analysis:

Radium-226

The results for these analyses are contained in the enclosed reports.

The data contained in the following report have been reviewed and approved by the personnel listed below. In addition, ALS certifies that the analyses reported herein are true, complete and correct within the limits of the methods employed. Should this laboratory report need to be reproduced, it should be reproduced in full unless written approval has been obtained from ALS Environmental.

Thank you for your confidence in ALS Environmental. Should you have any questions, please call.

Sincerely,

ALS Environmental
Katie M. OBrien
Project Manager

ALS Environmental – Fort Collins is accredited by the following accreditation bodies for various testing scopes in accordance with requirements of each accreditation body. All testing is performed under the laboratory management system, which is maintained to meet these requirement and regulations. Please contact the laboratory or accreditation body for the current scope testing parameters.

Collection Date:	8/4/2020 07:10	**Percent Moisture:**	

Analyses	Result	Qual	Report Limit	Units	Dilution Factor	Date Analyzed

Explanation of Qualifiers

Radiochemistry:

- "Report Limit" is the MDC

U or ND - Result is less than the sample specific MDC.

Y1 - Chemical Yield is in control at 100-110%. Quantitative yield is assumed.

Y2 - Chemical Yield outside default limits.

W - DER is greater than Warning Limit of 1.42

* - Aliquot Basis is 'As Received' while the Report Basis is 'Dry Weight'.
# - Aliquot Basis is 'Dry Weight' while the Report Basis is 'As Received'.
G - Sample density differs by more than 15% of LCS density.
D - DER is greater than Control Limit

M - Requested MDC not met.

M3 - The requested MDC was not met, but the reported activity is greater than the reported MDC.

L - LCS Recovery below lower control limit.

H - LCS Recovery above upper control limit.

P - LCS, Matrix Spike Recovery within control limits.

N - Matrix Spike Recovery outside control limits

NC - Not Calculated for duplicate results less than 5 times MDC

B - Analyte concentration greater than MDC.

B3 - Analyte concentration greater than MDC but less than Requested MDC.

Inorganics:

B - Result is less than the requested reporting limit but greater than the instrument method detection limit (MDL).

U or ND - Indicates that the compound was analyzed for but not detected.

E - The reported value is estimated because of the presence of interference. An explanatory note may be included in the narrative.

M - Duplicate injection precision was not met.

N - Spiked sample recovery not within control limits. A post spike is analyzed for all ICP analyses when the matrix spike and or spike duplicate fail and the native sample concentration is less than four times the spike added concentration.

Z - Spiked recovery not within control limits. An explanatory note may be included in the narrative.

* - Duplicate analysis (relative percent difference) not within control limits.

S - SAR value is estimated as one or more analytes used in the calculation were not detected above the detection limit.

Organics:

U or ND - Indicates that the compound was analyzed for but not detected.

B - Analyte is detected in the associated method blank as well as in the sample. It indicates probable blank contamination and warns the data user.

E - Analyte concentration exceeds the upper level of the calibration range.

J - Estimated value. The result is less than the reporting limit but greater than the instrument method detection limit (MDL).

A - A tentatively identified compound is a suspected aldol-condensation product.

X - The analyte was diluted below an accurate quantitation level.

* - The spike recovery is equal to or outside the control criteria used.

+ - The relative percent difference (RPD) equals or exceeds the control criteria.

G - A pattern resembling gasoline was detected in this sample.

D - A pattern resembling diesel was detected in this sample.

M - A pattern resembling motor oil was detected in this sample.

C - A pattern resembling crude oil was detected in this sample.

4 - A pattern resembling JP-4 was detected in this sample.

5 - A pattern resembling JP-5 was detected in this sample.

H - Indicates that the fuel pattern was in the heavier end of the retention time window for the analyte of interest.

L - Indicates that the fuel pattern was in the lighter end of the retention time window for the analyte of interest.

Z - This flag indicates that a significant fraction of the reported result did not resemble the patterns of any of the following petroleum hydrocarbon products:
- gasoline
- JP-8
- diesel
- mineral spirits
- motor oil
- Stoddard solvent
- bunker C

1.0 INTRODUCTION

Nautilus Environmental Company Inc. conducted a 72-h *Pseudokirchneriella subcapitata* growth inhibition toxicity test for ALS Environmental on a sample identified as WR2000608-001 W3. The sample was collected on August 4, 2020 and delivered to the Nautilus Environmental laboratory in Burnaby, BC on August 6, 2020. The sample was transported in three 1L plastic containers and was received at a temperature of 10.7 – 11.4°C. The sample was stored in the dark at 4 ± 2°C prior to testing.

This report describes the results of the toxicity test. Copies of raw laboratory data sheets and statistical analyses are provided in Appendix A. The chain-of-custody form is provided in Appendix B.

2.0 METHODS

Methods for the toxicity test are summarized in Table 1. Testing was conducted according to procedures described by Environment Canada (2007). Statistical analyses were performed using CETIS (Tidepool Scientific Software, 2013).

Table 1. Summary of test conditions: 72-h *Pseudokirchneriella subcapitata* growth inhibition test.

Test species	*Pseudokirchneriella subcapitata*, strain CPCC #37
Organism source	In-house axenic culture, obtained from Canadian Phycological Culture Center, and originally isolated from Nivelta River, Norway.
Organism age	3-to 7-day old culture in logarithmic growth phase
Test type	Static
Test duration	72 hours
Test vessel	Microplate
Test volume	220 µL
Test concentrations	Seven concentrations, plus laboratory control
Test replicates	4 per treatment; 8 for laboratory control
Number of organisms	10,000 cells/mL
Control/dilution water	Deionized water supplemented with nutrients
Test solution renewal	None
Test temperature	24 ± 2°C
Feeding	None
Light intensity	3600 to 4400 lux
Photoperiod	24 hours light
Aeration	None
Test measurements	Test area temperature measured daily; temperature and pH measured at test initiation; pH of two control wells measured at test termination
Test protocol	Environment Canada (2007), EPS 1/RM/25
Statistical software	CETIS Version 1.9.4
Test endpoint	Algal cell growth inhibition
Test acceptability criteria for controls	>16-fold increase in number of algal cells; CV ≤ 20%; no trend when analyzed using Mann-Kendall test
Reference toxicant	Zinc (added as $ZnSO_4$)

3.0 RESULTS

Results of the toxicity test on sample WR2000608-001 W3 are summarized in Table 2. There were no adverse effects on cell yield of *P. subcapitata*, resulting in IC25 and IC50 values of >95.2%. In addition, stimulatory effects were observed in all test concentrations; stimulation ranged from 23.3 to 240.4%.

Table 2. Results: *Pseudokirchneriella subcapitata* growth inhibition test.

Concentration (% v/v)	Cell Yield (x 10^4 cells/mL) (Mean ± SD)	Stimulation (%)
Laboratory Control	48.2 ± 4.2	--
1.5	59.5 ± 2.6*	23.3
3.0	77.2 ± 6.2*	60.1
6.0	86.8 ± 5.4*	79.8
11.9	107.8 ± 4.6*	123.3
23.8	164.2 ± 5.9*	240.4
47.6	154.0 ± 6.7*	219.2
95.2	149.0 ± 8.3*	208.8
Test Endpoint (% v/v)		
IC25	>95.2	--
IC50	>95.2	--

SD = Standard Deviation, IC = Inhibition Concentration
* = Indicates cell yield was significantly greater than the laboratory control

4.0 QA/QC

The health history of the test organisms used in the exposure was acceptable and met the requirements of the Environment Canada protocol. The test met all control acceptability criteria and water quality parameters remained within ranges specified in the protocol throughout the tests. Uncertainty associated with the test is best described by the standard deviation around the mean and/or the confidence intervals around the point estimates.

Results of the reference toxicant test conducted during the testing program are summarized in Table 3. Results for this test fell within the range for organism performance of the mean and two standard deviations, based on historical results obtained by the laboratory with this test. Thus, the sensitivity of the organisms used in the test was appropriate. The reference toxicant test was performed under the same conditions as those used for the sample.

Table 3. Reference toxicant results.

Test Species	Endpoint	Historical Mean (2 SD Range)	CV (%)	Test Date
P. subcapitata	Growth (IC50): 29.7 µg/L Zn	30.4 (24.4 – 37.8)	11	August 11, 2020

SD = Standard Deviation, CV = Coefficient of Variation, IC = Inhibition Concentration

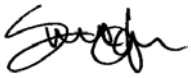
TESTS

- *Daphnia magna* 48-h LC50 test

RESULTS

Toxicity test results



Sample ID	LC50 (% v/v)
WR2000608-001 W3	>100

LC = Lethal Concentration

QA/QC

QA/QC summary	*Daphnia magna*
Reference toxicant LC50 (95% CL)	6.8 (5.7 – 8.1) g/L NaCl[1]
Reference toxicant historical mean (2 SD range)	6.4 (4.9 – 8.4) g/L NaCl
Reference toxicant CV	13%
Organism health history	Acceptable
Protocol deviations	None
Water quality range deviations	None
Control performance	Acceptable
Test performance	Valid

[1] Test date: July 28, 2020, LC = Lethal Concentration, SD = Standard Deviation, CL = Confidence Limits, CV = Coefficient of Variation

APPENDIX A – Summary of test conditions

Table 1. Summary of test conditions: 48-h *Daphnia magna* LC50 test.

Test species	*Daphnia magna*
Organism source	In-house culture
Organism age	<24-hour old neonates
Test type	Static
Test duration	48 hours
Test vessel	250-mL glass beaker
Test volume	200 mL
Test solution depth	6 cm
Test concentrations	Five concentrations, plus laboratory control
Test replicates	1 per treatment
Number of organisms	10 per replicate
Control/dilution water	Moderately-hard reconstituted water + 2.5 µg/L Se
Test solution renewal	None
Test temperature	20 ± 2°C
Feeding	None
Light intensity	400 to 800 lux
Photoperiod	16 hours light / 8 hours dark
Aeration	None
Test measurements	Temperature, dissolved oxygen and pH measured daily; salinity, hardness and alkalinity measured in the undiluted sample at test initiation; conductivity measured at test initiation and termination; survival checked daily
Test protocol	Environment Canada (2000), EPS 1/RM/14, with 2016 amendments
Statistical software	CETIS Version 1.9.4
Test endpoint	Survival (48-hour LC50)
Test acceptability criterion for controls	Survival ≥90%
Reference toxicant	Sodium chloride (NaCl)

APPENDIX B – Toxicity test data

Daphnia magna Summary Sheet

Client: ALS Environmental
Work Order No.: 201492

Start Date/Time: Aug 07/2020 @ 1245h
Test Species: *Daphnia magna*
Set up by: MK

Sample Information:

Sample ID: WR2000608-001 W3
Sample Date: Aug 04/2020
Date Received: Aug 06/2020
Sample Volume: 2 x 1L

Test Validity Criteria:

≥ 90% mean control survival and/or mobility and ≤2 daphnids exibit immobility and/or mortality in any single control replicate.

WQ Ranges:

T (°C) = 20 ± 2; DO (mg/L) = 3.6 to 9.4; pH = 6 to 8.5

Test Organism Information:

Broodstock No.:	071520B
Age of young (Day 0):	<24 h
Avg No. young per brood in previous 7 d:	24
Mortality (%) in previous 7 d:	0
Days to first brood:	6

NaCl Reference Toxicant Results:

Reference Toxicant ID:	DmDC54
Stock Solution ID:	20 NaCl 3
Date Initiated:	July 28/2020
48-h LC50 (95% CL):	6.8 (5.7 - 8.1) g/L NaCL

Reference Toxicant Mean and Historical Range: 6.4 (4.9 - 8.4) g/L NaCL
Reference Toxicant CV (%): 13

Test Results: The 48 h LC50 is estimated to be >100 % (v/v)

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in reports identified as "Preliminary Report" are considered authorized for use.

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- No Analysis Holding Time Outliers exist.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 15:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 15:00 is used for calculation purposes.

Matrix: **Water**

Evaluation: × = Holding time exceedance ; ✓ = Within Holding Time

APPENDIX A – Summary of test conditions

Table 1. Summary of test conditions: 96-h rainbow trout (*Oncorhynchus mykiss*) LC50 test.

Test species	*Oncorhynchus mykiss*
Organism source	Hatchery
Organism age	Juvenile
Test type	Static
Test duration	96 hours
Test vessel	20-L glass aquarium
Test volume	10 to 20 L (depending on size of fish)
Test solution depth	≥15 cm
Test concentrations	Five concentrations, plus laboratory control
Test replicates	1 per treatment
Number of organisms	10 per replicate
Control/dilution water	Dechlorinated Metro Vancouver municipal tapwater
Test solution renewal	None
Test temperature	15 ± 1°C
Feeding	None
Light intensity	100 to 500 lux
Photoperiod	16 hours light / 8 hours dark
Aeration	6.5 ± 1 mL/min/L
Test measurements	Temperature, dissolved oxygen and pH measured daily; salinity measured in the undiluted sample at test initiation; conductivity measured at test initiation and termination; survival checked daily
Test protocol	Environment Canada (2000), EPS 1/RM/13, with 2007 & 2016 amendments
Statistical software	CETIS Version 1.9.4
Test endpoints	Survival (96-hour LC50)
Test acceptability criterion for controls	Survival ≥90%
Reference toxicant	Zinc (added as $ZnSO_4$)

APPENDIX B – Toxicity test data

Rainbow Trout Summary Sheet

Client: ALS Environmental

Start Date/Time: August 14, 2020; 1728h

Work Order No.: 201527

Test Species: *Oncorhynchus mykiss*

Test Validity Criteria:
≥ 90% control survival
WQ Ranges:
T (°C) = 15 ± 1; DO (mg/L) = 7.0 to 10.3; pH = 5.5 to 8.5

Sample Information:

Sample ID: WR2000664-001 W3
Sample Date: August 11, 2020
Date Received: August 12, 2020
Sample Volume: 2x30L
Other: -

Dilution Water:

Type: Dechlorinated Municipal Tap Water
Hardness (mg/L $CaCO_3$): 13
Alkalinity (mg/L $CaCO_3$): 16

Test Organism Information:

Batch No.: 072420
Source: Aqua Farms
No. Fish/Volume (L): 10/12L
Loading Density (g/L): 0.29
Mean Length ± SD (mm): 36 ± 4 Range: 30 – 42
Mean Weight ± SD (g): 0.35 ± 0.10 Range: 0.23 – 0.51

Zinc Reference Toxicant Results:

Reference Toxicant ID: RTZn191
Stock Solution ID: 20Zn02
Date Initiated: August 10, 2020
96-h LC50 (95% CL): 93.3 (75.3 – 115.7) µg/L Zn

Reference Toxicant Mean and Historical Range: 84.4 (32.0 – 222.5) µg/L Zn
Reference Toxicant CV (%): 51%

Test Results: The 96 hour LC50 is estimated to be >100% (v/v).

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
%	percent
Bq/L	Becquerels per litre
mg	milligram

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in reports identified as "Preliminary Report" are considered authorized for use.

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- No Analysis Holding Time Outliers exist.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 15:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 15:00 is used for calculation purposes.

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percentage Difference
# = Indicates a QC result that did not meet the ALS DQO.

1.0 INTRODUCTION

Nautilus Environmental Company Inc. conducted sub-lethal toxicity tests for ALS Environmental on a sample identified as WR2001039-001 W3. The sample was collected on October 6, 2020 and delivered to the Nautilus Environmental laboratory in Burnaby, BC on October 8, 2020. The sample was transported in seven 20-L plastic containers and were received at temperatures ranging between 8.4 and 8.9 °C. The sample was stored in the dark at 4 ± 2°C prior to testing. The following sub-lethal toxicity tests were performed:

- *Ceriodaphnia dubia* survival and reproduction
- 7-d rainbow trout (*Oncorhynchus mykiss*) embryo viability
- 7-d *Lemna minor* growth inhibition
- 72-h *Pseudokirchneriella subcapitata* growth inhibition

Testing for all species was initiated on October 8, 2020. This report describes the results of these toxicity tests. Copies of raw laboratory data sheets and statistical analyses for each test species are provided in Appendices A to D. The chain-of-custody form is provided in Appendix E.

2.0 METHODS

Methods for the toxicity tests are summarized in Tables 1 to 4. Testing using *C. dubia*, *L. minor* and *P. subcapitata* were conducted according to procedures described by Environment Canada (2007a, 2007b and 2007c). The rainbow trout embryo viability test followed procedures described by Environment Canada (1998) and modified by Canaria et al. (1999). Statistical analyses for all the tests were performed using CETIS (Tidepool Scientific Software, 2013).

Table 1. Summary of test conditions: *Ceriodaphnia dubia* survival and reproduction test.

Test species	*Ceriodaphnia dubia*
Organism source	In-house culture
Organism age	<24 hour old neonates, produced within a 12 hour window
Test type	Static-renewal
Test duration	7 ± 1 day
Test vessel	20-mL glass test tube
Test volume	15 mL
Test solution depth	10 cm
Test concentrations	Seven concentrations, plus laboratory control
Test replicates	10 per treatment
Number of organisms	1 per replicate
Control/dilution water	20% Perrier water and 80% deionized water + 5 µg/L Se and 2 µg/L vitamin B12
Test solution renewal	Daily (100% renewal)
Test temperature	25 ± 1°C
Feeding	Daily with *Pseudokirchneriella subcapitata* and TCC (3:1 ratio)
Light intensity	100 to 600 lux at water surface
Photoperiod	16 hours light / 8 hours dark
Aeration	None
Test measurements	Temperature, dissolved oxygen, pH and conductivity measured daily; hardness and alkalinity of undiluted sample measured at test initiation; survival and reproduction checked daily
Test protocol	Environment Canada (2007a), EPS 1/RM/21
Statistical software	CETIS Version 1.9.4
Test endpoints	Survival and reproduction
Test acceptability criteria for controls	≥80% survival; ≥15 young per surviving control producing three broods; ≥60% of controls producing three or more broods; no ephippia present
Reference toxicant	Sodium chloride (NaCl)

Table 2. Summary of test conditions: rainbow trout (*Oncorhynchus mykiss*) embryo viability test.

Test species	*Oncorhynchus mykiss*
Organism source	Hatchery
Organism age	<30 minutes post fertilization, <24 hour old gametes
Test type	Static-renewal
Test duration	7 days
Test vessel	2-L plastic container
Test volume	2 L
Test solution depth	17 cm
Test concentrations	Five concentrations, plus laboratory control
Test replicates	4 per treatment
Number of organisms	30 per replicate
Control/dilution water	Dechlorinated Metro Vancouver municipal tapwater
Test solution renewal	Daily (80% renewal)
Test temperature	14 ± 1°C
Feeding	None
Light intensity	Dark
Photoperiod	24 hours dark
Aeration	Continuous gentle aeration
Test measurements	Temperature, dissolved oxygen, pH and conductivity measured daily; hardness and alkalinity of undiluted sample measured at test initiation; survival checked daily
Test protocol	Environment Canada (1998), EPS 1/RM/28; Canaria et al. (1999)
Statistical software	CETIS Version 1.9.4
Test endpoint	Embryo viability
Test acceptability criterion for controls	Embryo viability ≥70%
Reference toxicant	Sodium dodecyl sulphate (SDS)

Table 3. Summary of test conditions: *Lemna minor* growth inhibition test.

Test species	*Lemna minor*, strain CPCC# 490
Organism source	In-house axenic culture, obtained from Canadian Phycological Culture Centre, and originally isolated from Wainfleet, Stinking Barn, Niagara Peninsula, Ontario, Canada
Organism age	7- to 10-day old culture
Test type	Static
Test duration	7 days
Test vessel	250-mL glass container
Test volume	100 mL
Test solution depth	4 cm
Test concentrations	Seven concentrations, plus laboratory control
Test replicates	4 per treatment
Number of organisms	Two 3-frond plants per replicate
Control/dilution water	Modified APHA media (deionized water plus 1% of each APHA stock solution A, B and C)
Test solution renewal	None
Test temperature	25 ± 2°C
Feeding	None
Light intensity	4000 to 5600 lux
Photoperiod	24 hours light
Aeration	None
Test measurements	Test area temperature measured daily; temperature, pH and conductivity measured in all concentrations at test initiation; dissolved oxygen of highest concentration measured at test initiation; temperature and pH measured at test termination
Test protocol	Environment Canada (2007b), EPS 1/RM/37
Statistical software	CETIS Version 1.9.4
Test endpoints	Number of fronds and dry weight
Test acceptability criterion for controls	≥ 8-fold increase in number of fronds
Reference toxicant	Potassium chloride (KCl)

Table 4. Summary of test conditions: *Pseudokirchneriella subcapitata* growth inhibition test.

Test species	*Pseudokirchneriella subcapitata*, strain CPCC# 37
Organism source	In-house axenic culture, obtained from Canadian Phycological Culture Center, and originally isolated from Nivelta River, Norway.
Organism age	3-to 7-day old culture in logarithmic growth phase
Test type	Static
Test duration	72 hours
Test vessel	Microplate
Test volume	220 µL
Test concentrations	Seven concentrations, plus laboratory control
Test replicates	4 per treatment; 8 for laboratory control
Number of organisms	10,000 cells/mL
Control/dilution water	Deionized water supplemented with nutrients
Test solution renewal	None
Test temperature	24 ± 2°C
Feeding	None
Light intensity	3600 to 4400 lux
Photoperiod	24 hours light
Aeration	None
Test measurements	Test area temperature measured daily; temperature and pH measured at test initiation; pH of two control wells measured at test termination
Test protocol	Environment Canada (2007c), EPS 1/RM/25
Statistical software	CETIS Version 1.9.4
Test endpoint	Algal cell growth inhibition
Test acceptability criteria for controls	>16-fold increase in number of algal cells; CV ≤ 20%; no trend when analyzed using Mann-Kendall test
Reference toxicant	Zinc (added as $ZnSO_4$)

3.0 RESULTS

Results of the toxicity tests are summarized in Tables 5 to 8. There were no adverse effects observed on survival and reproduction of *C. dubia* (Table 5), embryo viability of *O. mykiss* (Table 6), frond count and dry weight of *L. minor* (Table 7) or cell yield of *P. subcapitata* (Table 8), resulting in LC, IC and EC values greater than the highest concentration tested.

Significant stimulation was observed in the growth of *P. subcapitata* and *L. minor*. Percent stimulation values are provided in detail in Tables 7 and 8.

Table 5. Results: *Ceriodaphnia dubia* survival and reproduction test.

Concentration (% v/v)	Survival (%)	Reproduction (Mean ± SD)
Laboratory Control	100	17.1 ± 4.3
1.56	100	23.0 ± 4.6
3.12	100	21.6 ± 6.3
6.25	100	20.3 ± 6.7

97	129.2 ± 11.2 *	46.9	12.5 ± 2.2 *	80.6
Test endpoint (% v/v)				
IC25	>97	--	>97	--
IC50	>97	--	>97	--

SD = Standard Deviation, IC = Inhibition Concentration, CL = Confidence Limits
* = Indicates cell yield that are significantly greater than the laboratory control

Table 8. Results: *Pseudokirchneriella subcapitata* growth inhibition test.

Concentration (% v/v)	Cell Yield (x 10^4 cells/mL) (Mean ± SD)	Stimulation (%)
Laboratory Control	32.2 ± 2.1	--
1.5	52.8 ± 4.5 *	63.6
3.0	60.0 ± 5.7 *	86.0
6.0	63.5 ± 2.9 *	96.9
11.9	115.8 ± 5.3 *	258.9
23.8	154.5 ± 5.3 *	379.1
47.6	142.5 ± 6.2 *	341.9
95.2	149.2 ± 7.2 *	362.8
Test endpoint (% v/v)		
IC25	>95.2	--
IC50	>95.2	--

SD = Standard Deviation, IC = Inhibition Concentration

* = Indicates cell yield that are significantly greater than the laboratory control

4.0 QA/QC

The health history of the test organisms used in the exposures were acceptable and met the requirements of the Environment Canada protocols. There were no deviations from the test methodology. The tests met all control acceptability criteria and water quality parameters remained within ranges specified in the protocols throughout the tests. Uncertainty associated with these tests is best described by the standard deviation around the mean and/or the confidence intervals around the point estimates.

Results of the reference toxicant tests conducted during the testing program are summarized in Table 9. Results for these tests fell within the range for organism performance of the mean and two standard deviations, based on historical results obtained by the laboratory with these tests. Thus, the sensitivity of the organisms used in these tests was appropriate. The reference toxicant tests were performed under the same conditions as those used for the samples.

Table 9. Reference toxicant test results.

Test Species	Endpoint	Historical Mean (2 SD Range)	CV (%)	Test Date
C. dubia	Survival (LC50): 2.0 g/L NaCl	2.0 (1.9 – 2.2)	4	October 13, 2020
	Reproduction (IC50): 1.7 g/L NaCl	1.9 (1.5 – 2.3)	12	
O. mykiss	Viability (EC50): 6.8 mg/L SDS	4.4 (2.1 – 9.3)	38	October 8, 2020
L. minor	No. Fronds (IC50): 3.3 g/L KCl	3.4 (3.0 – 3.8)	6	October 16, 2020
P. subcapitata	Growth (IC50): 30.4 µg/L Zn	30.5 (24.6 – 37.8)	11	October 16, 2020

SD = Standard Deviation, CV = Coefficient of Variation, LC = Lethal Concentration, IC = Inhibition Concentration, EC = Effective Concentration

APPENDIX A – *Ceriodaphnia dubia* Toxicity Test Data

Ceriodaphnia dubia Summary Sheet

Client: ALS Environmental
Work Order No.: 201947

Start Date/Time: Oct 8/2020 @ 1130h
Set up by: SAK.

Sample Information:

Sample ID: WR20010I9-001 W3
Sample Date: Oct 6/2020
Date Received: Oct 8/2020
Sample Volume: 7 x 20 L

Test Validity Criteria:

1) Mean survival of first generation controls is ≥80 %
2) At least 60% of controls have produced three broods within 8 days
3) An average of ≥15 live young produced per surviving female in the control solutions during the first three broods.
4) Invalid if ephippia observed in any control solution at any time.

WQ Ranges:

T (°C) = 25 ± 1; DO (mg/L) = 3.3 to 8.4 ; pH = 6.0 to 8.5

Test Organism Information:

Broodstock No.: BB 100120 A+B
Age of young (Day 0): <24-h (within 12-h)
Avg No. young in first 3 broods of previous 7 d: 22
Mortality (%) in previous 7 d: 5
Individual female # used ≥8 young on test day: # 1, 5, 7, 10, 12-17, 19-24

NaCl Reference Toxicant Results:

Reference Toxicant ID: Cd263
Stock Solution ID: 20NaCl4
Date Initiated: Oct. 13/20

7-d LC50 (95% CL): 2.0 (1.7 - 2.3) g/L NaCl
7-d IC50 (95% CL): 1.7 (1.3 - 1.9) g/L NaCl

7-d LC50 Reference Toxicant Mean and Historical Range: 2.0 (1.9 - 2.2) g/L NaCl CV (%): 4
7-d IC50 Reference Toxicant Mean and Historical Range: 1.9 (1.5 - 2.3) g/L NaCl CV (%): 12

Test Results:

	Survival	Reproduction
LC50 % (v/v) (95% CL)	>100	
IC25 % (v/v) (95% CL)		>100
IC50 % (v/v) (95% CL)		>100

Rainbow Trout Early Life Stage Summary Sheet

Client: ALS Environmental Start Date/Time: October 8, 2020 @ 1330h

Work Order No.: 201946 Test Species: *Oncorhynchus mykiss*

Sample Information:

Sample ID: WR200[illegible]1039-001 W3
Sample Date: October 6, 2020
Date Received: October 8, 2020
Sample Volume: 7 x 20L

Dilution Water:

Type: Dechlorinated Tap Water
Hardness (mg/L $CaCO_3$): 6
Alkalinity (mg/L $CaCO_3$): 12

Test Organism Information:

Batch No.: 100820
Source: Lyndon Trout Hatchery, New Dundee, ON
Loading Density: 1.01 g/L

Number of male broodstock used: 4
Number of female broodstock used: 4
Sperm motility check: Verification of sperm motility using a compound microscope

SDS Reference Toxicant Results:

Reference Toxicant ID: RTE141
Stock Solution ID: 20502
Date Initiated: October 8, 2020
7-d EC50 (95% CL): 6.8 (6.5 - 7.1) mg/L SDS

Reference Toxicant Mean and Range: 4.4 (2.1 - 9.3) mg/L SDS
Reference Toxicant CV (%): 38

APPENDIX C – *Lemna minor* Toxicity Test Data

Lemna minor Summary Sheet

Client: ALS
Work Order No.: 201948

Start Date: 8-Oct-20
Set up by: MLT

Sample Information:

Sample ID: WR 200 (W) 1039-001 W3
Sample Date: 6-Oct-20
Date Received: 8-Oct-20
Sample Volume: 7 x 20L

Test Organism Information:

Culture Date: 30-Sep-20
Age of culture (Day 0): 8 days
>8X growth in APHA?: Y (48 fronds)

KCl Reference Toxicant Results:

Reference Toxicant ID: Lm 196
Date Initiated: 16-Oct-20

7-d No. of Fronds IC50 (95% CL): 3.3 (3.0-3.7) g/L KCl

7-d No. Fronds IC50 Reference Toxicant Mean (2 SD Range): 3.4 (3.0-3.8) g/L KCl CV (%): 6

Test Results:

	Number of Fronds	Dry Weight
IC25 %(v/v) (95% CL)	>97	>97
IC50 %(v/v) (95% CL)	>97	>97

APPENDIX D – *Pseudokirchneriella subcapitata* Toxicity Test Data

Pseudokirchneriella subcapitata Summary Sheet

Client: ALS
Work Order No.: 201949

Start Date: Oct 8/20
Set up by: MN

Sample Information:

Sample ID: ~~WR200138-001~~ MT WR200138-001 W3
Sample Date: Oct 6/20
Date Received: Oct 8/20
Sample Volume: 5 x 1L

Test Organism Information:

Culture Date: Oct 2/20
Age of culture (Day 0): 6d

Zinc Reference Toxicant Results:

Reference Toxicant ID: SC207
Stock Solution ID: 20Zn01
Date Initiated: Oct 16/20

72-h IC50 (95% CL): ~~30.3~~ JN 30.4 (26.9 - 33.6) mg/L Zn

72-h IC50 Reference Toxicant Mean and Range: 30.5 (24.6 - 37.8) mg/L Zn CV (%): 11

Test Results:

	Algal Growth
IC25 %(v/v) (95% CL)	>95.2
IC50 %(v/v) (95% CL)	>95.2

72-h Algal Growth Inhibition Toxicity Test
Water Quality Measurements

Client: ALS (Minto) | Setup by: MD

Sample ID: WR2001038-001 W3 | Test Date/Time: Oct 8/20 @ 1000h

Work Order No.: 201949 | CER #: 4

Test Species: *Pseudokirchneriella subcapitata*

Culture Date: Oct 2/20 | Age of Culture: 6d | Culture Health: Good

Culture Count: 1 275 2 250 | Average: 262.5 | Culture Cell Density (c1): 262.5 x 10⁴ cells/mL

v1 = 220,000 cells/ml x 100 ml / (c1) 262.5x10⁴ cells/ml = 8.38 mL

Time Zero Counts: 1 20 2 24 | Average: 22

No. of Cells/mL: 22 x 10⁴ | Initial Density: # cells/mL ÷ 220 µL x 10 µL = 10000 cells/mL

Concentration %(v/v)	Water Quality pH 0 h	Water Quality Temp (°C) 0 h	Incubator Temperature (°C) 0 h	24 h	48 h	72 h	Microplates rotated 2X per day? 0 h	24 h	48 h	72 h

APPENDIX A – Summary of test conditions

Table 1. Summary of test conditions: 96-h rainbow trout (*Oncorhynchus mykiss*) LC50 test.

Test species	*Oncorhynchus mykiss*
Organism source	Hatchery
Organism age	Juvenile
Test type	Static
Test duration	96 hours
Test vessel	20-L glass aquarium
Test volume	10 to 20 L (depending on size of fish)
Test solution depth	≥15 cm
Test concentrations	Five concentrations, plus laboratory control
Test replicates	1 per treatment
Number of organisms	10 per replicate
Control/dilution water	Dechlorinated Metro Vancouver municipal tapwater
Test solution renewal	None
Test temperature	15 ± 1°C
Feeding	None
Light intensity	100 to 500 lux
Photoperiod	16 hours light / 8 hours dark
Aeration	6.5 ± 1 mL/min/L
Test measurements	Temperature, dissolved oxygen and pH measured daily; salinity measured in the undiluted sample at test initiation; conductivity measured at test initiation and termination; survival checked daily
Test protocol	Environment Canada (2000), EPS 1/RM/13, with 2007 & 2016 amendments
Statistical software	CETIS Version 1.9.4
Test endpoints	Survival (96-hour LC50)
Test acceptability criterion for controls	Survival ≥90%
Reference toxicant	Zinc (added as $ZnSO_4$)

Table 2. Summary of test conditions: 48-h *Daphnia magna* LC50 test.

Test species	*Daphnia magna*
Organism source	In-house culture
Organism age	<24-hour old neonates
Test type	Static
Test duration	48 hours
Test vessel	250-mL glass beaker
Test volume	200 mL
Test solution depth	6 cm
Test concentrations	Five concentrations, plus laboratory control
Test replicates	1 per treatment
Number of organisms	10 per replicate
Control/dilution water	Moderately-hard reconstituted water + 2.5 µg/L Se
Test solution renewal	None
Test temperature	20 ± 2°C
Feeding	None
Light intensity	400 to 800 lux
Photoperiod	16 hours light / 8 hours dark
Aeration	None
Test measurements	Temperature, dissolved oxygen and pH measured daily; salinity, hardness and alkalinity measured in the undiluted sample at test initiation; conductivity measured at test initiation and termination; survival checked daily
Test protocol	Environment Canada (2000), EPS 1/RM/14, with 2016 amendments
Statistical software	CETIS Version 1.9.4
Test endpoints	Survival (48-hour LC50)
Test acceptability criterion for controls	Survival ≥90%
Reference toxicant	Sodium chloride (NaCl)

1 INTRODUCTION

1.1 Site Description

The Minto Mine is a high-grade copper mine owned and operated by Minto Explorations Ltd. and located within Selkirk First Nation (SFN) Category A Settlement Land Parcel R-6A approximately 240 km northwest of Whitehorse, Yukon Territory (62°37'N latitude and 137°15'W longitude; Figure 1.1). Development of the Minto Mine was initiated in 1997 and commercial operations started in October 2007. The mine was in continuous production from October 2007 to October 2018 when it was placed on temporary care and maintenance. Operations recommenced in October 2019. The facility was permitted to conduct open pit and underground mining with milling at a rate of 4,200 tonnes per day of copper/gold/silver ore. Minto Mine produced 17.8 million pounds of copper in 2020. Copper reserves are approximately 15 million tonnes (measured and indicated). Mill tailings are stored in the Main Pit, Area 2 Pit, and the Dry Stack Tailing Storage Facility (DSTSF; Figure 1.2). Mine-impacted seepage from the DSTSF and under the Mill Valley Fill Extension (MVFE) is collected at the toe of the MVFE and pumped to the Main Pit (Figure 1.2). Non-impacted water and treated mine-impacted water are collected in a Water Storage Pond (WSP; Figure 1.2).

Effluent from the WSP is periodically discharged to Minto Creek under conditions specified in Water Use Licence (WUL; QZ14-031; Yukon Water Board 2015). Minto Creek, in turn, discharges to the Yukon River approximately 7.7 km south-east of the WSP (Figure 1.2).

1.2 Overview of Aquatic Environmental Monitoring

Under Minto Mine's WUL, the Minto Mine implements an Environmental Monitoring, Surveillance, and Reporting Plan (EMSRP). The EMSRP is completed by the mine and includes routine water quality monitoring during the ice-free period (typically from April to October or November) in Minto Creek and reference tributaries at sampling frequencies varying from weekly to monthly. In accordance with the WUL, the Minto Mine submits water quality data to the Yukon Water Board as original laboratory reports and monthly summary reports within 30 days of month end. The WUL specifies effluent discharge concentrations and volumes based on the receiving aquatic environment assessment (WUL; QZ14-031; August 2015). Additionally, site specific water quality objectives (SSWQO) have been developed for Minto Creek based on background geological conditions, bioavailability considerations, and behavioral impact studies (Minnow 2009; Kennedy et al. 2012). These SSWQO are used to evaluate water quality from the EMSRP and the Aquatic Effects Monitoring Program (AEMP), and act as triggers under the operational Adaptive Management Plan (AMP).

Biological monitoring is implemented under the EMSRP and includes the AEMP and Environmental Effects Monitoring (EEM) which is required under the federal *Fisheries Act*.

The AEMP evaluates potential mine-related effects to Minto Creek, with sampling areas located in upper Minto Creek and lower Minto Creek. These Minto Creek areas are evaluated in comparison to matching reference areas: upper McGinty Creek as reference for upper Minto Creek and lower Wolverine Creek and lower Big Creek as references for lower Minto Creek (Table 1.1; Figure 1.3). The annual AEMP includes monitoring of water, sediment, periphyton, benthic invertebrates, fish, and fish habitat. Data from 1994 (baseline) and 2006 to 2019 have been reported previously (e.g., HKP 1994), including annually since 2006 (e.g., Minnow 2020), with some program modifications over time.

EEM is required by the mine under the federal Metal and Diamond Mining Effluent Regulations (MDMER; Environment Canada 2012) and includes additional effluent characterization, sublethal toxicity testing (Environment Canada 1997, 2013) and biological monitoring in Minto Creek. Biological monitoring under EEM is implemented every three years and the Phase 5 EEM was completed in the fall of 2019 and an Interpretive Report was submitted in January 2021 (Minnow 2021a).

1.3 Overview of Previous Findings

The Minto Mine has implemented the AEMP annually since 2006. AEMP monitoring in 2019 (Minnow 2020) was limited by an absence of flow in lower Minto Creek and no mine effluent discharge. No periphyton or benthic invertebrate community monitoring was possible and the program therefore served to compare water quality (field measures and chemistry) and sediment quality of upper Minto Creek (the only wetted area of Minto Creek) to the corresponding upper creek reference (McGinty Creek) and previous data.

Supporting field measures collected in September 2019 indicated relatively good Minto Creek water quality. The influence of the Minto Mine was evident with higher specific conductance and pH than reference as also observed in previous years. All water quality measures met WUL objectives and Canadian Water Quality Guidelines for the protection of aquatic life (CWQG; CCME 1999). Concentrations of total copper at upper Minto Creek were higher than concentrations at the reference creek, as observed in previous years, but were below the CWQG. Dissolved copper concentrations were well below the WUL site-specific water quality objective (SSWQO), as observed in all previous years of monitoring. Based on levels of chlorophyll-a, Minto Creek has been classified as mesotrophic (e.g., Minnow 2019a).

Concentrations of several metals in upper Minto Creek sediments were significantly higher than those in the upper reference site sediments in 2019, particularly copper, molybdenum,

and cadmium. Average concentrations of copper in Minto Creek sediment were greater than the Interim Sediment Quality Guideline (ISQG; CCME 1999) and the reference creek sediment. Copper concentration in one sediment sample in Minto Creek (one of five) was above the probable effect level. Similar concentrations were observed in previous years (Minnow 2019) and low sediment volume within predominantly erosional habitat limits the exposure of aquatic biota. Minto Creek sediment has consistently shown elevated copper concentrations relative to reference and guideline (including occasional exceedances of the probable effect level), but concentrations have been stable over time (Minnow 2019a). Sediment toxicity testing completed to date has shown some influence on the survival (but not growth) of *Chironomus dilutus* relative to reference sediments but no influence on *Hyalella azteca* (e.g., Minnow 2019).

Periphyton biomass, density, and community characteristics have shown high spatial and temporal variability and no consistent differences between lower Minto Creek and reference (lower Wolverine Creek and lower Big Creek; Minnow 2019). Benthic invertebrate community monitoring has shown limited influence of the Minto Mine on communities in lower Minto Creek and high temporal variability in lower Minto Creek and the reference creek (lower Wolverine Creek). The benthic invertebrate community of lower Minto Creek has typically been moderately different than reference based on Bray-Curtis Index, which was mainly due to more EPT taxa (Ephemeroptera-mayflies, Plecoptera-stoneflies, and Trichoptera-caddisflies). Although there appeared to have been some decreases in benthic invertebrate density from 2012 to 2014, numbers have increased subsequent to that (2015 to 2018). Lastly, concentrations of selenium have been slightly higher in periphyton and benthic invertebrate tissue in lower Minto Creek than lower Wolverine Creek, but at concentrations below effect levels (e.g., BCMOE 2014).

The Minto Mine has now completed five phases of EEM. Under Phase 5 of the EEM (Minnow 2021a), some mine influence was observed in routine water quality monitoring and water samples collected in conjunction with benthic invertebrate sampling. Analytes with concentrations higher than reference (or the range of 10 reference sites; Minnow 2021a), included conductivity, chloride, and sulphate, which were the only analytes with mean concentrations in 2017, 2018, and/or 2019 greater than the reference 95th percentile (Minnow 2021a). These analytes indicated no pattern of higher concentrations at the exposed Minto Creek station (Station W2) during periods of discharge, suggesting that concentrations of these analytes may have been associated with base, surface, and/or groundwater inputs. Concentrations of chloride and sulphate were well below Canadian Water Quality Guidelines (CWQG; CCME 1999) for the protection of aquatic life at the effluent-exposed station and the reference station. Annual mean total concentrations of several metals were greater than CWQG or SSWQO at the effluent-exposed station and the reference station (aluminum, chromium, copper, iron,

and thallium), with concentrations at the effluent-exposed station generally lower than at the reference station suggesting no or very limited effluent-related influence in Minto Creek.

Under EEM, benthic invertebrate communities have been evaluated using a Reference Condition Approach (RCA) and Control-Impact (CI) comparisons (e.g., Minnow 2021a). Based on RCA, none of the primary EEM metrics (density, taxon richness, Simpson's Evenness, and Bray-Curtis index) were identified as impaired relative to the reference condition (Minnow 2021a). However, for taxon richness and Simpson's evenness, one of the five effluent-exposed sites was classified as "uncertain" based on relatively lower family level (FL) richness at UMC-2 and lower FL richness at UMC-3. Evaluation by CI indicated that mean density and taxon richness at upper Minto Creek did not differ from reference area REF-2. Simpson's evenness of the upper Minto Creek benthic invertebrate community was significantly lower than REF-2 at FL taxonomy, but not at lowest practicable level taxonomy (LPL), at a magnitude of -1.3 reference standard deviations, which is within the applicable Critical Effect Size (CES) for EEM. Bray-Curtis index of dissimilarity differed significantly between upper Minto Creek and REF-2 at both FL and LPL taxonomy. This appeared to be due to proportions of EPT that were significantly lower at upper Minto Creek than at REF-2, whereas proportions of Chironomidae were significantly higher. The difference in percent EPT was primarily driven by Plecoptera (stoneflies), which were sparse at upper Minto Creek but dominant at REF-2. The combination of lower percent EPT and higher percent Chironomidae at upper Minto Creek, as was also observed at a subset of stations in the RCA evaluation, were in directions consistent with some impairment. Correlation analysis did not yield strong evidence of an effluent-related chemical effect to the benthic invertebrate community of upper Minto Creek (physical and chemical factors were of similar importance in their influence on benthic invertebrate communities). Overall, the results of the Phase 5 EEM benthic invertebrate studies were consistent with previous phases and indicated that Minto Creek benthic invertebrate communities are temporally variable and within the reference range.

The Phase 5 EEM laboratory-based fish study indicated that fish exposed to effluent concentrations of 14% and 25% were significantly larger (13% longer and 60 to 72% heavier) and of better condition (12 to 16%) than those reared in reference water, suggesting a stimulatory influence of Minto Mine effluent on fish growth and condition at magnitudes greater than CES. However, observations of unusual behaviour and physical condition in the reference group fish (including fish with peduncle disease) suggested possible myxobacterial infection in the reference group. The magnitude of the differences observed in the Phase 5 EEM were inconsistent with previous EEM results which indicated a very slight growth stimulation in mine effluent (Minnow 2012, 2018b).

1.4 Aquatic Effects Monitoring Program Components and Objectives

The AEMP implemented by Minto Mine on an annual basis is more comprehensive than specified under the WUL. The portion of the AEMP that Minnow Environmental Inc. (Minnow) conducts (as reported herein) includes:

1. sediment (chemistry and toxicity testing);
2. periphyton (chlorophyll-a, community, and tissue quality); and
3. benthic invertebrate (community and tissue quality).

Separate monitoring of the use of Minto Creek (and a reference creek) by fish is completed by the Minto Mine. Thus, this program is referred to as the Sediment, Periphyton, and Benthic Assessment and it is conducted every year in September. Supporting conditions (e.g., field meter measures, water quality samples, depth, flow, habitat observations) are collected at all sampling areas. Under the WUL, the AEMP program design is reviewed every three years and refined through annual recommendations.

The objectives of this AEMP study and report are to characterize and interpret current (2020) sediment quality, periphyton and benthic invertebrate community condition, and tissue quality (periphyton and benthic invertebrate) of Minto Creek relative to reference and previous years' conditions. Supporting environmental data are also reported.

2 METHODS

2.1 Overview

Minnow Environmental Inc. implemented the Minto Creek AEMP sediment, periphyton, and benthic invertebrate assessment from September 10 to 16, 2020. Due to dry conditions in 2019, the last discharge by Minto Mine prior to implementation of the 2020 AEMP was August 31, 2018 and the mine did not resume discharge until October 2020 (i.e., after the AEMP had been completed). The study was completed in accordance with specifications of the Minto Mine WUL (QZ14-031; Table 1.1; Figure 1.3). Sediment sampling was undertaken in upper and lower Minto Creek, and corresponding reference areas. Toxicity tests were run on sediment from lower Minto and lower Wolverine creeks. Periphyton and benthic invertebrate community and tissue sampling were undertaken in erosional habitat of lower Minto Creek and their corresponding reference areas, lower Wolverine and Big creeks. Supporting measures (e.g., field meter measures, water quality samples, depth, flow, habitat observations) were collected at all biological sampling areas.

2.2 Supporting Measures

2.2.1 Field Collection

Many environmental variables were measured to support the data collected for the AEMP. The location of each station was recorded using a handheld Global Positioning System (GPS) with coordinates recorded in Universal Transverse Mercator (UTM) units (using the North American Datum of 1983).

Supporting measures collected concurrent with sediment sampling (i.e., at depositional areas) included core penetration depth (lower creek areas only), sample texture, and the presence or absence of organic detritus. *In situ* measurements including temperature, dissolved oxygen, specific conductance, and pH were taken at each station using a YSI field meter (Yellow Springs Instruments, Yellow Springs, OH).

At periphyton and benthic invertebrate stations (community and tissue), *in situ* water quality measurements (by field meter as described above), water depth (by meter stick) and water velocity (by HACH FH950 handheld flow meter [HACH Company, Loveland, CO]) were measured. Habitat was characterized at each periphyton and benthic invertebrate sampling area and included elevation, gradient (clinometer), creek wetted and bankfull widths (by tape measure or range finder), water appearance, creek morphology, bank condition, substrate texture, instream cover and features, overhead canopy, aquatic vegetation, riparian vegetation, and surrounding land use.

Water samples for chemical analysis were collected at each sampling area (Table 1.1; Figure 1.3). Samples were collected using a master bottle from which the collected water was poured into pre-labeled sample bottles and preservatives were added, as required. A field duplicate was collected from one area using a split sample method; water from the master bottle was poured into one bottle and then into a duplicate bottle. Water samples for dissolved organic carbon (DOC) and for dissolved metals were filtered in the field using 0.45 micrometer (µm) polypropylene filters. Immediately after collection, water samples were placed in a cooler and refrigerated at approximately 4 degrees Celsius (°C) until submission to ALS Environmental in Whitehorse, YT, for analysis (refer to Appendix C for analytical methods).

The productivity of lower Minto and lower Wolverine creeks was evaluated using measurements of chlorophyll-a in periphyton. Chlorophyll-a is the primary photosynthetic pigment of all oxygen-evolving photosynthetic organisms (Wetzel 2001) and therefore provides an indicator of the standing stock of photosynthetic organisms representing the lowest trophic level. Minto Creek is a lotic system and measuring chlorophyll-a in periphyton was considered more representative of productivity than measuring it in water. A stainless-steel razor blade was used to scrape periphyton from five rocks and then periphyton was transferred to filter paper which was placed in a prelabeled opaque sampling jar. The surface area sampled was measured and recorded. All samples were maintained in coolers with ice packs during transport and then kept frozen on site until submission to ALS Environmental (Whitehorse, YT).

2.2.2 Data Analysis

A formal data quality review (DQR) was completed to assess data quality and by extension, the confidence with which the data can be used to derive conclusions relative to the program objectives (Appendix A). The quality of the data was evaluated by comparing laboratory reporting limits (LRLs) to pre-determined program targets (LRLs are ideally ≤ 1/10th of guideline values) observing relative percent differences of field duplicates and reviewing field blanks for potential contamination during sampling or transport. The accredited laboratory conducted their own Quality Assurance/Quality Control (QA/QC) analysis, including method blanks, laboratory duplicates, matrix spikes, spiked blanks, and certified reference materials.

Water quality from Minto Creek was evaluated relative to: WUL objectives, concentrations measured at reference areas, applicable Canadian Water Quality Guidelines (CWQG; CCME 1999), and historical water quality conditions. Sample-specific toxicity modifying factors, such as hardness, alkalinity, pH, DOC and temperature were used to calculate environmental quality guidelines for the protection of aquatic health where required. Seasonal summary statistics for mine related indicators in upper Minto Creek were also reviewed for context .

2.2.2.1 Water Chemistry

Supporting field measures (temperature, dissolved oxygen, pH, and specific conductance) were tested for differences between lower Minto Creek and reference areas (lower Wolverine and lower Big creeks) using two-sample t-tests. The assumption of normality was assessed using the Shapiro Wilks' test (α = 0.05) and homogeneity of variance was assessed using Levene's Test (α = 0.05). Data were $\log_{10}$ transformed when required to meet the assumption of normality. A value of 1 was added before taking the logarithm if values of zero were in the data set. When the assumption of normality could not be met, a non-parametric Mann–Whitney test was used. If variances were unequal, then the two-sample t-test for unequal variances was conducted (Ruxton 2006). A significance level (α) of 0.05 was used for all statistical tests. Statistical comparisons were conducted in R Studio version 1.2.5001 (2020). A magnitude of difference (MOD) was reported for statistical comparisons that were significant as:

$$MOD = \frac{\left(MCT_{Exp} - MCT_{Ref}\right)}{MCT_{Ref}} \times 100\%$$

where *MCT* is the measure of central tendency (i.e., mean for the t-test after back-transforming to original data units when a transformation was used).

Summary statistics (means and standard deviations) were calculated using R and the Kaplan-Meir (K-M) method to accommodate values for analytes with values at the LRL value (non-detections). This method was applied to avoid bias introduced by substitution methods (Helsel 2012; Lee 2017). The K-M method involves transforming the left censored (i.e., < value) dataset to a right censored (i.e., > value) dataset, and then using the K-M estimator (used to estimate the mean survival time in survival analysis) to estimate the mean. The calculation was conducted using the survfit function in the survival package (Therneau 2017) in R and involves calculating the area under the K-M survival curve. The K-M method is non-parametric and can accommodate multiple LRLs. This method of estimating the mean is equivalent to using the distribution of detectable values below the LRL to represent values that are < LRL. When a standard deviation could not be estimated (e.g., when all data were below the LRL), it was not reported. When a value was reported below a poor LRL (defined as a LRL that exceeded the maximum detected value), it was removed from the dataset.

2.2.2.2 Chlorophyll-a

Chlorophyll-a in periphyton was compared to the British Columbia Water Quality Guideline (BC WQG) for streams. Creek productivity was characterized by comparing chlorophyll-a concentrations to the Dodds et al. (1998) productivity classification system for temperate streams.

Statistical analyses were conducted using chlorophyll-a concentrations from lower Minto Creek (LMC; exposed) and reference areas, lower Wolverine Creek (LWC) and lower Big Creek (LBC). Analyses were used to determine whether concentrations of chlorophyll-a, an indicator of primary productivity, have changed at these areas over time and/or the differences from reference have changed over time. Spatial and temporal statistical comparisons were conducted using Analysis of Variance (ANOVA) with factors *Year* and *Area* and their interaction. Residuals of the ANOVA were tested for normality using the Shapiro Wilks' test ($\alpha = 0.05$) and homogeneity of variance was assessed using a Levene's Test ($\alpha = 0.05$). Concentrations were $\log_{10}$-transformed when required to meet the assumptions of normality and homogeneity of variances or rank-transformed when these assumptions could not be met. The significance of the main effects and interaction terms were assessed, and the results determined the post-hoc comparisons that were conducted. When the interaction between *Year* and *Station* was significant, it suggested that the differences between the stations changed in each year and post-hoc comparisons were conducted to:

1. test for differences between the first year of sampling and all other years for both stations individually; and
2. test for differences between the stations in each year.

For all significant comparisons, a magnitude of difference (MOD) was calculated as a percent difference using: (Exposed – Reference) x 100% with back-transformed least-squares means (or medians for rank-transformations). When the *Year* term was significant in the absence of an interaction, post-hoc comparisons were conducted to test for differences between the first year of sampling and all other years for both stations combined. Temporal MODs were then calculated by pooling over stations for significant comparisons. Similarly, when *Area* was significant, without an interaction, it suggested that the difference between the stations was consistent among years and a MOD was calculated using pooled, back-transformed least-squares means (or medians for rank-transformations) across all years. An α of 0.05 was used for these temporal comparisons, as was used for statistical analyses of all chemical data in this report. Post-hoc comparisons were corrected for the number of comparisons using Tukey's honestly significant differences method.

2.3 Sediment Quality

2.3.1 Sample Collection and Laboratory Analysis

Sediment samples were collected for particle size and chemical analysis at depositional areas within Minto Creek and reference creeks (Table 1.1, Figure 1.3). At lower Minto and lower Wolverine creeks, sediment samples for particle size analysis were collected using a 15.24 centimetre (cm) x 15.24 cm (6 inches [“] x 6”) stainless steel petite ponar grab sampler

(0.023 square metres [m^2] sampling area). A composite sample was created by collecting the surficial 2 cm of sediment from each of three acceptable grabs (i.e., full to each edge of the sampler) using a stainless-steel spoon. Each sample that formed the composite was added to a plastic bin and mixed together. The mixed composite samples were placed into pre-labeled glass sampling jars. Sediment samples for chemical analyses were collected by carefully inserting a 4.7 cm (2"; inside diameter) Lexan™ core tube into sediment deposits, capping the end with a fitted plastic cap, and retrieving by hand. From each acceptable core (i.e., each core containing an intact, representative sediment-water interface), the surficial 2 cm of sediment was manually extruded upwards into a graded core collar, cut with a stainless-steel core knife, and placed into a pre-labeled glass sampling jar. Samples from three cores were composited to form a single sample from each station.

At upper Minto and upper McGinty creeks, sediment deposits were rare and typically very shallow (i.e., deposits were less than 1 centimeter in depth). Sediment was therefore collected using a stainless-steel spoon instead of a ponar or coring equipment and only one composite sample was collected for particle size analysis (versus five samples for all other analytes). At locations of sediment deposition, surficial sediment was carefully collected by slowly spooning the sediment into a pre-labeled glass jar, with care taken to avoid the loss of fine material. In order to be as consistent as possible with the sediment collected in the lower creek areas, samples included no more than the top 2 cm of deposited sediment. Immediately after collection, sediment samples were placed in a cooler and later into a refrigerator at approximately 4°C. They were later submitted to ALS Environmental in Whitehorse, YT or Burnaby, BC, for analysis of particle size by dry and wet sieving and pipette sedimentation method, total organic carbon and loss on ignition by combustion, inorganic carbon derived from a calculation, metals by collision/reaction cell-inductively coupled plasma mass spectrometry (CRC ICP-MS), mercury by Cold Vapor Generation Atomic Fluorescence Spectrometry (CVAFS), total Kjeldahl nitrogen by colorimetric analysis, and pH by probe (refer to Appendix C for methods, laboratory certificates, and field notes).

Toxicity tests (10-day *Chironomus dilutus* and 14-day *Hyalella azteca* survival and growth) at lower Minto and lower Wolverine creeks (Environment Canada 1997, 2013). Sediment for toxicity testing at lower Wolverine Creek was collected using a 15.24 cm x 15.24 cm (6" x 6") stainless steel petite ponar grab sampler (0.023 m^2 sampling area) and the top 2 cm from three grabs was collected to form a composite sample from each station (five stations formed the replicates in the toxicity tests). Sediment for toxicity testing at lower Minto Creek was collected using a stainless-steel spoon instead of ponar equipment as sediment deposits were shallow. At locations of sediment deposition, the top 2 cm of sediment was collected by slowly spooning the sediment into a pre-labeled bag. Sediment was composited from each station (five stations

formed the replicates in the toxicity tests), mixed with a stainless-steel spoon, and samples from each station were placed into a pre-labeled 1 L jar. Immediately after collection, samples were placed in a cooler, then later transferred to a refrigerator and stored at approximately 4°C until they were submitted to Nautilus Environmental Inc. in Burnaby, BC for sediment toxicity testing.

2.3.2 Data Analysis

A formal DQR was completed to assess sediment data quality (Appendix A). LRLs were compared to study target limits and were generally defined as ≤ 1/10th guideline values for the analytes of interest. The relative percent difference of field duplicates for various analytes were also collected and compared as a part of the DQR as a measure of field precision. Laboratory QA/QC analysis included method blanks, laboratory duplicates, spiked blanks, and certified reference materials (Appendix A).

Sediment chemistry data were summarized by reporting mean, standard deviation, minimum, and maximum for each area. Sediment quality data were evaluated relative to sediment quality guidelines (SQGs) for the protection of aquatic life (e.g., CCME 1999) and reference concentrations to identify metals with the potential to adversely affect aquatic life and/or that could be elevated due to mine activity. Sediment chemistry data were also generally compared to historical data for analytes of interest (1994, and 2006 to 2019). Interpretation was focused on results using the whole sediment data collection methods (described above in Section 2.2.1) used in the program from 2010 to 2019 and SQGs for the protection of aquatic life (e.g., CCME 1999) apply to whole sediment. Sediment collection methods prior to 2010 were either not specified (1994) or only focused on the fraction of sediment that passed through a mesh sieve (< 63 µm; silt and clay). Details of this historical method and rationale for the method change are previously described in earlier annual reports (e.g., Minnow 2019a).

The laboratory performed QA/QC on sediment toxicity tests by comparing results to reference toxicant tests. Total ammonia was monitored in lower Minto and lower Wolverine sediment toxicity test vessels. If un-ionized ammonia (as N) rose above 0.20 milligram per litre (mg/L) in reference treatments (lower Wolverine Creek) renewal of overlying water was required. Sediment toxicity from lower Minto Creek were compared to lower Wolverine Creek and laboratory control sediment. Results were also compared to previous sediment toxicity testing conducted in 2011 and 2015 to 2018 (Minnow 2012, 2016, 2017, 2018a, 2019a). Statistical analyses were conducted and summarized in a report by Nautilus Environmental (Nautilus 2020; Appendix C).

2.3.2.1 Statistics for 2020 Results

Differences between 2020 sediment samples from Minto Creek and the reference area were tested using a two-sample t-test, with a p-value < 0.05 for statistical tests. The assumption of normality was assessed using the Shapiro Wilks' test (α = 0.05) and homogeneity of variance was assessed using Levene's Test (α = 0.05). If variances were unequal, then the two-sample t-test for unequal variances was conducted (Ruxton 2006). Data that could not be normalized were log transformed. A value of 1 was added before taking the logarithm if values of zero were in the data set. If data could not be normalized after transformation, a non-parametric Mann-Whitney test was applied. Statistical comparisons were conducted using R (R Core Team 2020). A magnitude of difference (MOD) was calculated for each metric as:

$$MOD = \frac{\left(MCT_{Exp} - MCT_{Ref}\right)}{MCT_{Ref}} \times 100\%$$

Where the measures of central tendency (MCT) were means (untransformed), geometric means (log_{10} transformed), or medians (Mann-Whitney test).

In cases where there was a value below the reported detection limit, the value was replaced with the detection limit and a non-parametric Mann-Whitney test was conducted. If all values for a parameter were below the detection limit, no statistical analysis was conducted.

2.3.2.2 Statistics for Temporal Analysis

Statistical analyses of sediments from upper Minto Creek (UMC; exposed) and Upper McGinty Creek (URC; reference) areas were conducted to evaluate whether concentrations of copper, an analyte of interest, have changed at these areas over time and/or the differences from reference have changed over time. Spatial and temporal statistical comparisons were conducted using Analysis of Variance (ANOVA) with factors *Year* and *Area* and their interaction using the same approach as described for Chlorophyll-a in section 2.2.2.2. For all significant comparisons, a magnitude of difference (MOD) was calculated in number of reference standard deviations using:

$$MOD = \frac{\left(MCT_{Exp} - MCT_{Ref}\right)}{SD}$$

where MCTs were means (untransformed), geometric means (log_{10} transformed), or medians (rank transformation) and the standard deviation (SD) is an estimate of the reference area standard deviation, or median absolute deviation (MAD) for rank transformations. When the Year

term was significant in the absence of an interaction, post-hoc comparisons were conducted to test for differences between the first year of sampling and all other years for both stations combined. Temporal MODs were calculated by pooling over stations for significant comparisons.

2.4 Hydrology

During the 2019 AEMP, lower Minto Creek was dry so monitoring was limited to sediment and water quality sampling at upper sites. The 2019 AEMP report included flow and local climate data for regional context in data interpretation. For the 2020 AEMP, flow and climate data were also presented, as the dry conditions in 2019 could possibly impact findings in 2020. A summary of flow conditions for lower Minto Creek Stations was provided by Minto Mine staff (Minto Mine 2021; Appendix B). Climate data (i.e., temperature and precipitation) for 2020 were compared to Climate Normals (1981 to 2010) recorded at the Pelly Ranch weather station (Government of Canada 2021, Minnow 2020).

2.5 Periphyton Community

2.5.1 Sample Collection and Laboratory Analysis

Periphyton is the assemblage of algae, bacteria, fungi, and meiofauna attached to submerged substrate in freshwaters. However, periphyton communities are generally characterized based on the attached algal community, which represent the lowest trophic level and are indicators of primary productivity. Periphyton community samples were collected in erosional habitat of lower Minto, lower Wolverine, and lower Big creeks (Table 1.1, Figure 1.3). A stainless-steel razor blade was used to scrape periphyton from five randomly selected rocks in each of the five replicate stations per area. The area sampled was measured and recorded. Samples preserved with Lugol's iodine solution were placed in pre-labeled sampling jars. The samples were placed in a cooler, then later transferred to a refrigerator and stored at approximately 4°C until they were shipped to Plankton R Us Inc. (Winnipeg, MB) for analysis to species level.

2.5.2 Data Analysis

A formal DQR was completed to assess the quality of the periphyton community data (Appendix A). Laboratory duplicate samples were collected on 10% of the periphyton community samples. Periphyton communities were compared between lower Minto Creek and reference areas, lower Wolverine Creek, and lower Big Creek. Temporal comparisons were made between 2020 data and historical data from 1994, 2011 to 2018 (sampling did not occur in 2019 due to dry conditions).

Total organism density (cells per centimetre squared [cells/cm^2]) and biomass (microgram per centimetre squared [µg/cm^2]) were calculated for periphyton community samples. The diversity metric "number of taxa" (also known as taxon richness) included all separate taxa identified to the species level. Simpson's Diversity and Evenness indices were computed according to formulae presented by Smith and Wilson (1996) and recommended by Environment Canada (2012). These indices take into account the relative abundance of taxa and number of taxa, with values ranging from 0 (low diversity or evenness) to 1 (high diversity or evenness). The Bray-Curtis index was also calculated according to Borcard and Legendre (2013). This metric considers the abundance of each taxon at each station compared to the median reference abundance (lower Wolverine Creek), to compute an index of the relative "dissimilarity" of each station from the hypothetical reference median station. Larger Bray-Curtis index values indicate greater dissimilarity from reference.

2.5.2.1 Statistics for 2020 Results

Periphyton community endpoints were summarized by reporting mean, median, minimum, maximum, and standard deviation for each study area. Differences among Minto Creek and the reference areas were tested using a two-sample t-test, with a p-value <0.10. A p-value of 0.10 was used as per suggested EEM guidelines (Environment Canada 2012). The assumption of normality was assessed using the Shapiro Wilks' test ($\alpha = 0.05$) and homogeneity of variance was assessed using Levene's Test ($\alpha = 0.05$). If variances were unequal, then the two-sample t-test for unequal variances was conducted (Ruxton 2006). Data that could not be normalized were log, square root, or fourth root transformed. A value of 1 was added before taking the logarithm if values of zero were in the data set. If data could not be normalized after transformation, a non-parametric Mann-Whitney test was applied. Statistical comparisons were conducted using R (R Core Team 2020). A magnitude of difference (MOD) was calculated for each community metric as:

$$MOD = \frac{\left(\bar{X}_{Exp} - \bar{X}_{Ref}\right)}{SD}$$

where the SD is an estimate of the reference standard deviation. The estimate of the reference standard deviation was the pooled standard deviation in the two-sample t-test for equal variances or the reference standard deviation when the two-sample t-test for unequal variances was applied.

The MOD for the Mann-Whitney test was calculated using medians instead of means and the pooled median absolute deviation (MAD) instead of the SD. The MAD is calculated as the median of the absolute values of the differences between each observation and the median observation for that area (and corrected by a factor of 1.4826 to scale the MAD to a comparable magnitude to the SD). A study design with two areas and n = 5 samples per area has an approximate power

of 0.9 to detect a two standard deviation difference between areas using $\alpha = 0.1$ (Environment Canada 2012).

Periphyton data collected in 2020 were compared to data collected in from 2011 to 2018. Due to differences in reporting of periphyton community data in the 1994 baseline report (e.g., taxa were only identified as present, common, or dominant), 1994 data was omitted form tables and figures.

2.6 Benthic Invertebrate Community

2.6.1 Sample Collection and Laboratory Analysis

Benthic invertebrate community samples were collected in erosional habitat of lower Minto, lower Wolverine, and lower Big creeks as required under the WUL (Table 1.1, Figure 1.3). Benthic invertebrate community samples were collected from riffle/run habitat with cobble and gravel substrate using a Surber sampler (0.093 m^2) outfitted with 500 µm mesh. Three grab composites (0.279 m^2 area in total) were collected at five replicate stations within each sampling area. For each grab, the substrate within the sampler was disturbed and scrubbed (by hand rake and nail brush) with care taken to ensure that all dislodged organic material was swept into the sampler collection net. The substrate was disturbed to a depth of approximately 5 to 8 cm over a period of approximately eight minutes. This procedure was repeated at new subsampling locations for the second and third grab, following which all of the material contained in the collection net was carefully transferred to a pre-labeled 1 litre (L) wide-mouth plastic jar using a stainless-steel spoon and a wash bottle while working over a plastic bin to avoid any potential loss of organisms. Any organisms that adhered to the sieve bag were removed by hand and added to the sample. All samples were labeled internally (using wooden sticks) and externally with the station number, area identifier, Minnow project number, date, and field personnel in order to ensure correct identification at the laboratory. Samples were preserved within six hours of collection using buffered formalin solution to a nominal concentration of 10% in ambient water.

All benthic invertebrate samples were shipped to Cordillera Consulting in Summerland, BC. Each sample was elutriated to remove sand, gravel, clay, and the remaining organic material was preserved in 70% ethanol. Elutriate was examined for any mollusc or Trichoptera cases, then each sample was examined to estimate the total number of invertebrates. If the estimated number of organisms were greater than 600 and the sample was fine and non-clumping, a subsample was taken using a Folsom Plankton Splitter (Motodo 1959; Van Guelpen et al. 1982). Empty snail or bivalve shells, empty caddisfly cases, and invertebrate fragments such as legs, gills, antennae etc. were kept but excluded from the count. When organism fragments were encountered, only the heads were counted towards the total. Larval and pupal exuviae were excluded while terrestrial stages and terrestrial drop-ins were indicated as such but excluded from the total count.

Benthic invertebrates were identified to the LPL (which in most cases were genus) and counted. Following identification and counting, representative specimens of each new taxon were preserved in a museum quality vial with a polyseal lid and added to the Minto Mine voucher collection. Internal labels were used to identify the taxa, the client, date collected, site code, and the project.

2.6.2 Data Analysis

A formal DQR was completed to assess the benthic invertebrate community data quality (Appendix A). Laboratory QA/QC included an assessment of sub-sampling error and sorting efficiency on at least 10% of the samples (Appendix A). Benthic invertebrate communities were evaluated using summary metrics, including invertebrate density (number of organisms per m^2, calculated based on a sample area of 0.279 m^2), number of taxa, Simpson's Diversity and Evenness, and Bray-Curtis index.

One consequence of the LPL of taxonomic resolution is that the "species list" from any site contains a mixture of taxonomic resolutions, some as low as species, others at the family, order or class level, resulting in redundant or "ambiguous" taxa. Redundant or "ambiguous" taxa occur when the same taxon is identified to different levels of resolution, for instance, some specimens may be identified to a higher or *parent* level (e.g., *Baetis*) while others are identified to a lower or child level (e.g., *Baetis tricaudatus*). Such instances can occur when complete taxonomic keys only exist for certain life stages, damaged specimens are present, or when limited resources result in only a subset of a sample being fully identified to species. The presence of these ambiguous taxa may result in inflated estimates of richness or distorted patterns of diversity across sites (Cuffney *et al.* 2007; Meredith *et al.* 2019). If ambiguous taxa are not resolved, then the coarser-resolution taxon (i.e., the parent, *Baetis*) is counted as a unique taxon when it may actually be the same species as one of the lower-level taxa (i.e., the child, *B. tricaudatus*). Two commonly applied solutions for dealing with ambiguous taxa are:

1. apportion them among the identified organisms according to the ratio of abundances (i.e. distribute parent taxa among children); or
2. sum them to the lowest consistently identified taxon (i.e. merge children with parent taxa).

The preferred option for analysis depends on the distribution of the organisms among taxa. For instance, with option two, *B. tricaudatus* and *B. bicaudatus* might be lumped together and analyzed as *Baetis*. If identified specimens in the two species constitute only 10% of the total abundance, it may be most appropriate to lump them together with the other 90% in the unidentified *Baetis*. Conversely, if 90% of the identified organisms fall into the two species, it is more parsimonious to apportion the remainder among them. We implemented a decisions key

for resolving ambiguously identified taxa that uses abundance and richness criteria for when options 1 (roll-down) and 2 (roll-up) are applied for each level in the taxonomic hierarchy. This method preserves as much detailed taxonomic information as possible, while addressing issues of taxonomic ambiguities. The decision key was modified from Weakland et al. (2018).

Total organism density (individuals/m^2), taxon richness, Simpson's Diversity and Evenness, and Bray-Curtis index were calculated in the same manner as periphyton community data (Section 2.5.1). It was noted that in previous years total organism density did not always account for area sampled (2013 to 2017). All density samples were re-calculated to include area and total organism density now represents individuals/m^2. Bray-Curtis dissimilarity was compared against each reference area at both the family and lowest-practical-level using Mantel and distance-based Redundancy Analysis (dbRDA), as outlined in Borcard and Legendre (2013).

The relative proportions of the most abundant taxa were calculated relative to the total number of organisms in the sample. Dominant taxon groups were defined as groups representing greater than 10% of total organism abundance in one or more areas or any groups considered important indicators of environmental stress. In this study, relative proportions of the major groups, such as chironomids, EPT taxa (Ephemeroptera [mayfly], Plecoptera [stonefly], Trichoptera [caddisfly] taxa), Oligochaetes (worms), and Acari (mites) were examined. It is often possible to relate low relative abundance of sensitive taxonomic groups (e.g., EPT taxa) to environmental stress (e.g., Taylor and Bailey 1997). Similarly, high relative abundance of tolerant taxonomic groups (e.g., oligochaetes) may also indicate higher environmental stress (Chapman et al. 1982a,b).

2.6.2.1 Statistics for 2020 Results

Differences among Minto Creek and the reference areas were tested using ANOVA with $\alpha = 0.1$ as per EEM guidelines (Environment Canada 2012). Prior to ANOVA, all data were $\log_{10}$ transformed as necessary to meet assumptions of normality (Shapiro Wilks' test; $\alpha = 0.05$) and homogeneity of variance (Levene's test; $\alpha = 0.05$). If these assumptions were not met the equivalent non-parametric test was conducted. A value of 1 was added before taking the logarithm if values of zero were in the data set. If data failed the assumptions of normality and homogeneity of variance, then a non-parametric Kruskal-Wallis test was conducted. Post-hoc contrasts following the ANOVA were conducted between the exposed area and each reference area using the contrast methods described in Oehlert (2010). Contrasts following the Kruskal-Wallis test were conducted using Dunn's test using the *dunn.test* package in R (Dinno 2017; R Core Team 2020). A magnitude of difference (MOD) for each comparison and community metric was calculated using the same approach as described for the periphyton (Section 2.5.2).

Correspondence Analyses (CA; a multivariate ordination method) was used to further examine the 2020 benthic invertebrate community structure at the lower areas. CA is a multivariate ordination method that is used to reduce complex multivariate data into a smaller number of independent variables (Gauch 1984; Pielou 1984). The analysis extracts theoretical values (CA axis scores) that capture the variation in the abundance of benthic taxa. The CA ordination produces axis scores for each station. Taxa scores are also produced as the sum of weighted averages of their abundances across stations. The structure of the data can then be depicted in scatter plots of one CA axis against another, showing both taxa and station scores. Taxa that tend to co-occur plot together and those that rarely co-occur plot farther apart. Thus, CA can be used to describe which benthic invertebrate taxa best account for observed differences in the overall benthic invertebrate community between stations. The CA analysis was conducted at the LPL of taxonomic organization using $ln_{(x+1)}$-transformed density data. CA is sensitive to the presence of rare taxa (Legendre and Legendre 1983; Poos and Jackson 2012). Taxa occurring in two or fewer samples or those that made up less than 15% of the total abundance of the dataset were excluded from the analysis (Dolédec and Chessel 1991). The ordination was conducted using the cca() function in the vegan package (Oksanen et al. 2020) of R statistical software (R Core Team 2020). Results of the CA were summarized by sampling area in 2020. Taxa with the highest magnitude weights on the CA axes were identified and used in interpretation of the separation of areas on the CA axes.

Spearman rank correlations were conducted between benthic invertebrate community endpoints that differed among areas and in-situ habitat conditions that differed among areas. Benthic community endpoints of density, richness, Simpson's Diversity, % Ephemeroptera, % Plecoptera, % EPT, % Chironomidae, % Acari, CA1, and CA2) were evaluated relative to *in situ* parameters of depth sampler pushed into substrate, depth of substrate sampled, % cobble, % gravel, temperature, specific conductivity, and pH. Significance was determined by comparing p-values against an unadjusted p-value (p=0.05) and a Bonferroni-corrected p-value for 77 tests (p=0.00065).

2.6.2.2 Statistics for Temporal Analysis

Benthic invertebrate community data were also evaluated in comparison to results obtained in previous years of sampling (1994, 2006, 2008, and 2010 to 2018). Summary metrics from earlier years were previously re-calculated (Minnow 2011) to ensure consistency and appropriate comparisons over time.

Statistical analyses of benthic community endpoints from lower Minto Creek (LMC) and reference areas (LWC and LBC) were conducted to evaluate whether community composition has changed at these areas over time and/or the differences from reference have changed

over time. Spatial and temporal statistical comparisons were conducted using Analysis of Variance (ANOVA) with factors *Year* and *Area* and their interaction using the same approach as described for Chlorophyll-a in Section 2.2.2.2. For all significant comparisons, a magnitude of difference (MOD) was calculated in number of reference standard deviations using:

$$MOD = \frac{(MCT_{Exp} - MCT_{Ref})}{SD}$$

where MCTs were means (untransformed), geometric means (log_{10} transformed), or medians (rank transformation) and the SD is an estimate of the reference area standard deviation, or MAD for rank transformations (see periphyton community statistics in Section 2.5.2.1). When the *Year* term was significant in the absence of an interaction, post-hoc comparisons were conducted to test for differences between the first year of sampling and all other years for both stations combined. Temporal MODs were calculated by pooling over stations for significant comparisons. Similarly, when *Area* was significant, without an interaction, it suggested that the difference between the stations was consistent among years and a MOD was calculated using pooled, back-transformed least-squares means across all years. An α of 0.10 was used for these temporal comparisons. Post-hoc comparisons were corrected for the number of comparisons using Tukey's honestly significant differences method.

2.7 Tissue Chemistry

2.7.1 Sample Collection and Laboratory Analysis

Periphyton and benthic invertebrate tissue samples were collected from lower Minto (exposed), lower Wolverine (reference), and lower Big creeks (reference; Table 1.1, Figure 1.3). Periphyton samples were collected by scraping submerged cobble-size rocks with a stainless-steel razor blade. Scraped material (periphyton) was placed in pre-labeled sample jars. Benthic invertebrate tissue samples were collected in areas with cobble substrate using a kick-net, and by overturning rocks and collecting organisms by hand. Periphyton and benthic invertebrate tissue samples (1 to 3 grams [g]) were placed into pre-labeled sample jars and Whirl-Pak™ bags, respectively. A total of five periphyton and five benthic invertebrate samples were collected at each area. Immediately after collection, all tissue samples were placed in a cooler, and later in a freezer until they were submitted to ALS Environmental in Burnaby, BC. Samples were analyzed for percent moisture and for metals by High-Resolution ICP-MS, and later converted to dry weight using percent moisture.

2.7.2 Data Analysis

Summary statistics were calculated for each metal by area and tissue type (periphyton and benthic invertebrates). The follow summary statistics were reported: sample size, percent of

values below the LRL, mean, standard deviation, minimum value, median, and maximum value. Commonly used substitution methods (e.g., substituting values < LRL with half the LRL) for censored data introduces bias in summary statistics (Helsel 2012). Means and standard deviations were therefore estimated used the Kaplan-Meier (K-M) method. This method involves transforming the left censored (i.e., < value) dataset to a right censored (i.e., > value) dataset, and then using the K-M estimator (used to estimate the mean survival time in survival analysis) to estimate the mean. The calculation was conducted using the *survfit* function in the *survival* package (Therneau 2017) in R and involves calculating the area under the K-M survival curve. The K-M method is non-parametric and can accommodate multiple LRLs. This method of estimating the mean is equivalent to using the distribution of detectable values below the LRL to represent values that are < LRL. For example, the mean of the data set {1, 2, < 4, 5} is estimated as the mean of 1, 2, [½×1 + ½×2], and 5 which is 2.375. The value < 4 is replaced by the distribution of values below 4 (i.e., 1 and 2 with equal weight of ½). Similarly, the mean of the data set {1, 1.6, 2, 2.1, < 4, 5} is estimated as the mean of 1, 1.6, 2, 2.1, [¼×1 + ¼×1.6 + ¼×2 + ¼×2.1], and 5 which is 2.229. Again, the value < 4 is replaced by the distribution of values below 4 (i.e., 1, 1.6, 2, and 2.1 with equal weight of ¼). If the minimum value in the data set is below the LRL then it is replaced with the LRL. Therefore, if there is only one LRL and no detected values below the LRL, then the K-M estimate of the mean is equivalent to replacing the value below the LRL with the LRL (i.e., the best guess for the values < LRL is the LRL). When a standard deviation could not be estimated (e.g., when all data were below the LRL), it was not reported. When a value was reported below a poor LRL (defined as a LRL that exceeded the maximum detected value), the value was removed from the dataset.

2.7.2.1 Statistics for 2020 Results

The primary objective of tissue collection was to support a selenium assessment reported under a separate cover. Accordingly, data are reported herein for future reference with limited interpretation. Tissue metal concentrations for periphyton and benthic invertebrates from lower Minto Creek (LMC; exposed) were compared relative to LWC and LBC (lower Wolverine and lower Big Creeks, respectively; reference) using analysis of variance (ANOVA). The comparisons were conducted using ANOVA on untransformed or $\log_{10}$-transformed data (whichever best fit the data identified using Shapiro-Wilk's test). When assumptions of normality and homogeneity of variances were not met (Shapiro-Wilk's test and Levene's test on the median, respectively), the Kruskal-Wallis test was used. Post-hoc contrasts following the ANOVA were conducted between the exposed area and each reference area using the contrast methods described in Oehlert (2010). Contrasts following the Kruskal-Wallis test were conducted using Dunn's test using the *dunn.test* package in R (Dinno 2017; R Core Team 2020). P-values for the

contrasts were corrected for the number of comparisons using Tukey's honestly significant differences method.

A magnitude of difference (MOD) was reported for statistical comparisons that were significant as:

$$MOD = \frac{(MCT_{Exp} - MCT_{Ref})}{MCT_{Ref}} \times 100\%$$

where MCT is the measure of central tendency (i.e., mean for the ANOVA after back-transforming to original data units when a transformation was used, and median for the Mann-Whitney test). In cases where there was a value below the reported detection limit, the value was replaced with the detection limit and a non-parametric Mann-Whitney test was conducted.

2.7.2.2 Statistics for Temporal Analysis

Statistical analyses of metal concentrations in tissue samples collected at lower Minto Creek (LMC; exposed) and reference areas, lower Wolverine Creek (LWC) and lower Big Creek (LBC), were conducted to evaluate whether concentrations of copper and selenium, analytes of interest, have changed at these areas over time and/or become more similar to reference over time. Spatial and temporal statistical comparisons were conducted using Analysis of Variance (ANOVA) with factors *Year* and *Area* and their interaction using the same approach as described for Chlorophyll-a in Section 2.2.2.2

3 SUPPORTING MEASURES

3.1 Hydrology and Climate

In September of 2020, the field crew was able to complete sampling at the lower Minto Creek and reference creek areas as there was sufficient water depth (unlike in 2019). Water flow was measured by Minto Mine staff from April 26 and October 13, 2020, with the latter date representing freeze up (Minto Mine 2021b). Flow and gage height decreased significantly at Station W1 (located just upstream of water quality monitoring Stations W2) after spring freshet, with a maximum of 0.519 m^3/s on May 3, 2020 which had dropped to 0.167 m^3/s by May 12, 2020 (Appendix B). There were small fluctuations in flow from May 25, 2020 (0.0224 m^3/s) onwards, until October 13, 2020 (0.0334 m^3/s). Compared to the Climate Normals collected from 1981 to 2010 (Appendix B; Government of Canada 2021), 2020 temperatures were comparable, and precipitation was generally lower, except for April, July, and August (Figure 3.1).

3.2 Field Measures

Mean specific conductance at the sediment sampling area of upper Minto Creek (508.4 micro Siemens per centimeter [µS/cm]) was significantly higher than in upper McGinty Creek (96.1 µS/cm) while dissolved oxygen (mg/L) was significantly lower (10.05 mg/L vs.10.90 mg/L; Figure 3.2, Table 3.1; Appendix Table B.3). Mean temperature, pH, and dissolved oxygen (percent saturation) were not statistically different between upper Minto Creek and upper McGinty Creek (Figure 3.2, Table 3.1; Appendix Table B.3).

Temperature at the sediment sampling area of lower Minto Creek (2.2°C) was significantly lower than in lower Wolverine Creek (5.50°C). Specific conductance and pH at lower Minto Creek (306 µS/cm, 7.92) were significantly higher compared to lower Wolverine Creek (168 µS/cm, 7.41). Mean dissolved oxygen at the sediment sampling area of lower Minto Creek (79.9% saturation and 11.0 mg/L) was significantly higher compared to lower Wolverine Creek (45.2% saturation and 5.70 mg/L; Figure 3.2, Table 3.2; Appendix Table B.3). Lower dissolved oxygen at lower Wolverine Creek could be attributed to sampling in side-channel areas, which were the only areas that support sediment deposition (but receive less flow and have consequent lower dissolved oxygen concentrations). Lower Minto Creek had significantly higher pH (7.92) than lower Wolverine Creek (7.41; Figure 3.2, Table 3.2; Appendix Table B.3).

Physico-chemical measurements were also taken in erosional areas of lower Minto, lower Wolverine, and lower Big creeks in support of benthic invertebrate community sampling. Temperature was significantly lower at lower Minto Creek (2.2°C) compared to both reference areas, lower Wolverine (3.9°C) and lower Big Creek (3.9°C; Figure 3.3, Table 3.3; Appendix Table B.4). Specific conductivity and pH at lower Minto Creek (264.3 µS/cm, 7.87)

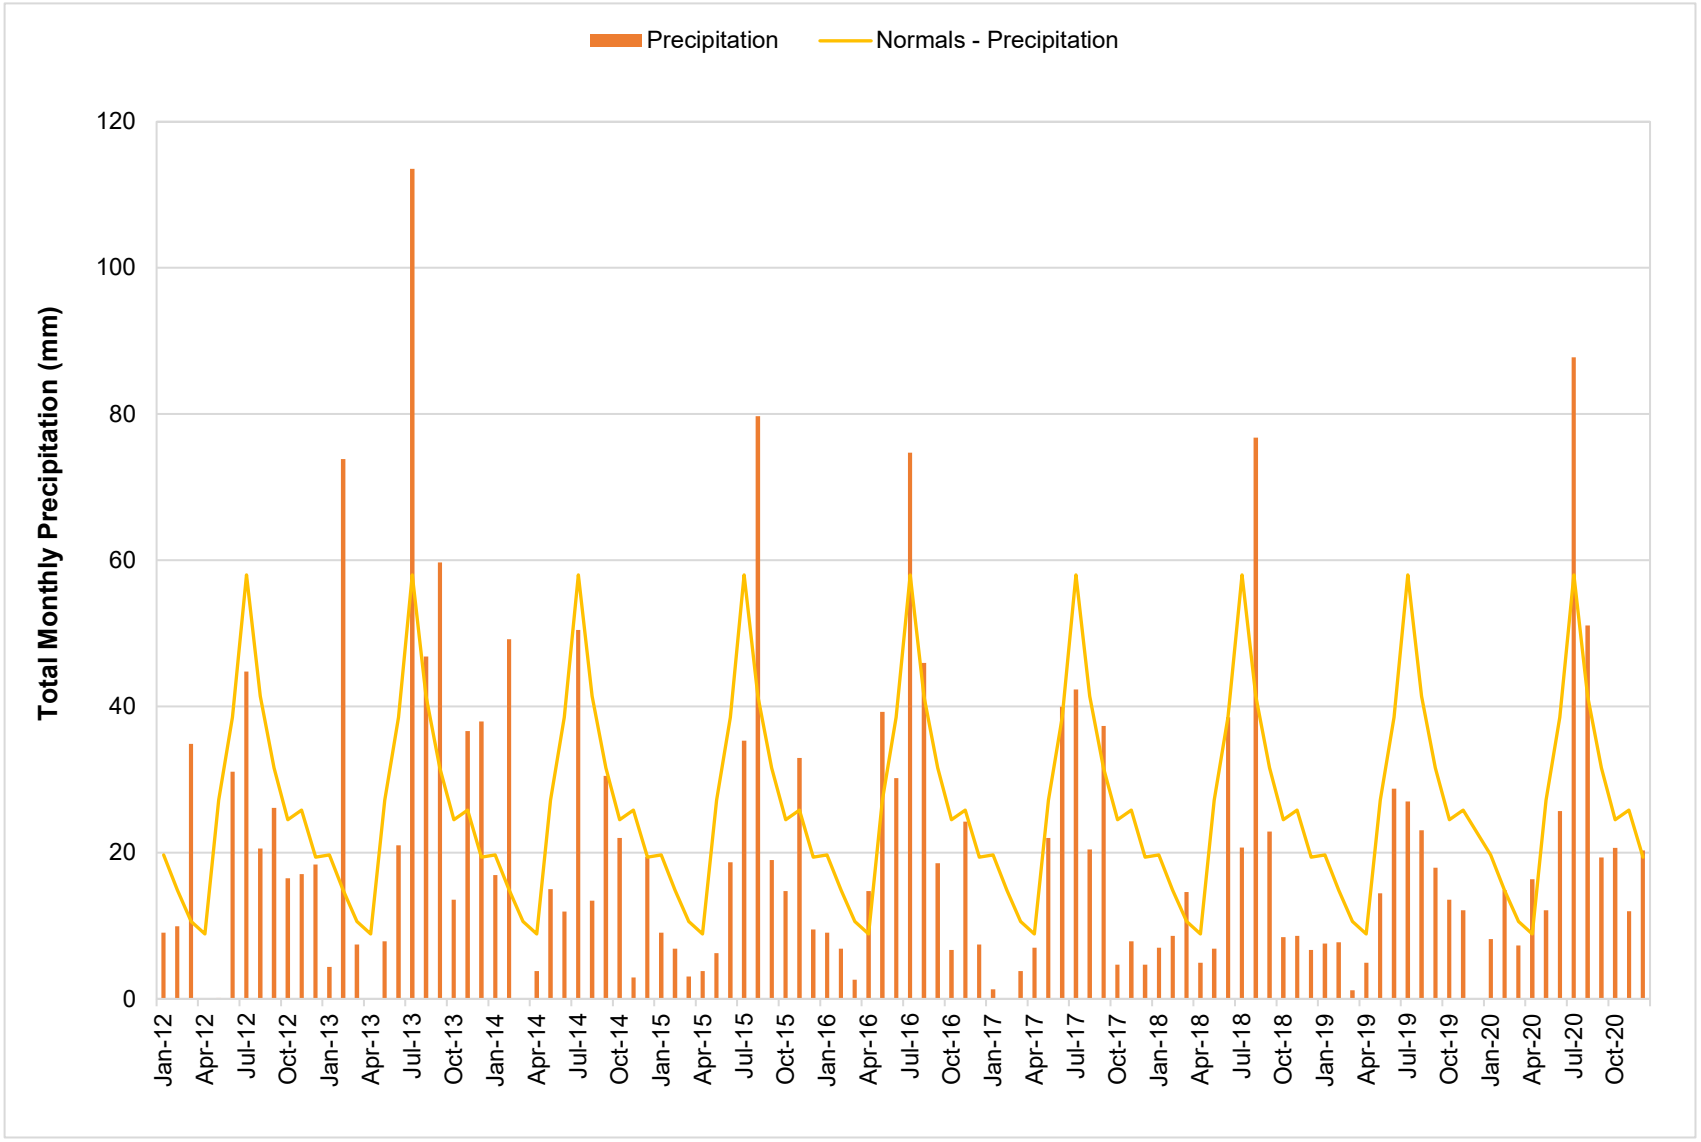

Figure 3.1: Total Monthly Precipitation at Minto Mine Compared to Canada Climate Normals, 2012 to 2020

Notes: Canada Climate Normals from 1981 to 2010 (Government of Canada 2019). Climate normals are from the Pelly Ranch weather station.

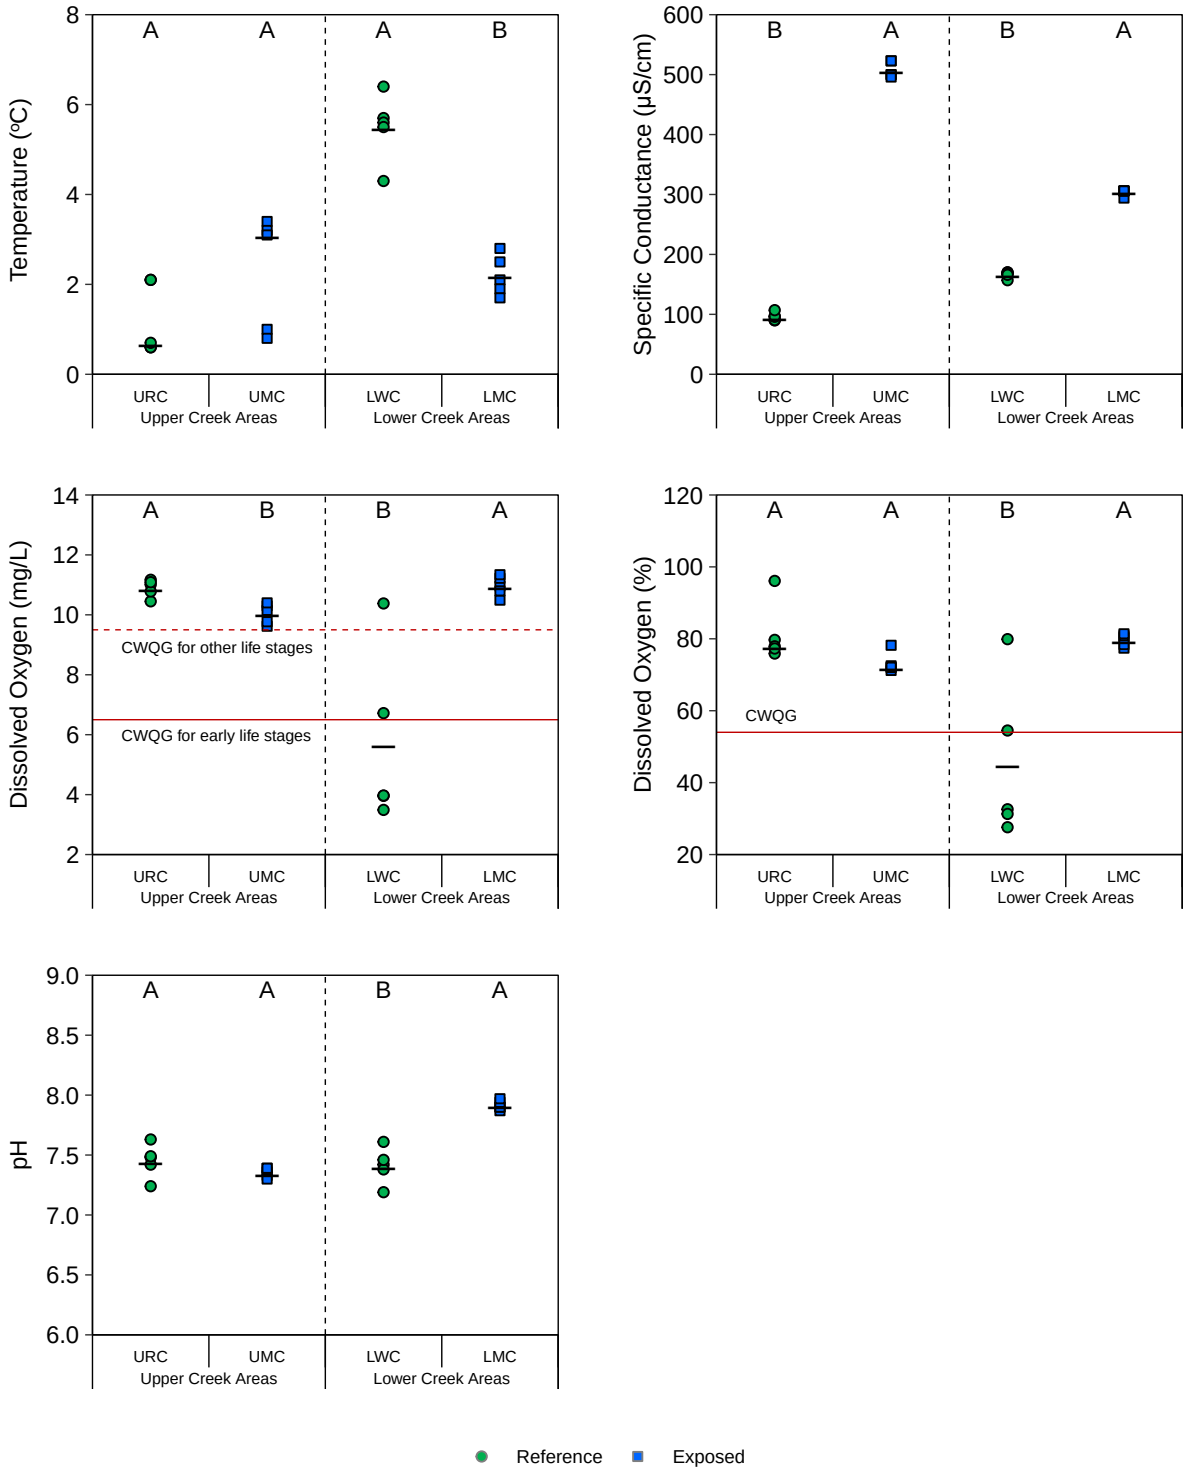

Figure 3.2: Physico−chemical Measurements in Depositional Areas of Upper and Lower Minto Creek Relative to Reference Areas, Minto Mine, 2020

Notes: Different letters indicate areas are significantly different ($p < 0.05$) within each creek area. Horizontal bars indicate the measure of central tendency (MCT). MCT is the mean for parameters where statistics were conducted on the raw scale, the geometric mean when statistics were $\log_{10}$ transformed to meet the assumptions of normality, and the median when rank transformed. Numbers indicate the number of overlapping points. URC = upper McGinty Creek. UMC = upper Minto Creek. LWC = lower Wolverine Creek. LMC = lower Minto Creek.

[a] Measure of Central Tendency (MCT) is the mean for parameters where statistics were conducted on the raw scale, the geometric mean when statistics were log $_{10}$ transformed to meet the assumptions of normality, and the median when rank transformed.

[b] MOD = magnitude of difference. MOD = MCT_{exp} - MCT_{ref}/MCT_{ref}*100.

was significantly higher compared to lower Wolverine Creek (264.3 µS/cm, 7.73) but not lower Big Creek. No significant differences were observed between lower Minto Creek and reference creeks for dissolved oxygen (percentage and mg/L; Figure 3.3; Table 3.3). All areas were within the range of the CWQG guidelines and WUL objectives for pH and dissolved oxygen.

3.3 Water Chemistry and Chlorophyll-a

The quality of water chemistry data was assessed prior to data analysis and interpretation, which was judged as good based on good analyte detectability, precision, and accuracy, and an absence of contamination (Appendix A). All analytes were below the CWQG except for total copper, a metal of particular interest at the Minto Mine. Total copper concentrations exceeded the CWQG at upper Minto Creek, lower Minto Creek, and at both lower and upper reference sites (Table 3.4). However, dissolved copper was well below SSWQO set out in the WUL (Table 3.4, Appendix Table B.7).

Hardness, total dissolved solids, and total alkalinity in 2020 were generally higher in upper Minto Creek than in McGinty Creek (Table 3.4). However, hardness, total dissolved solids, and total alkalinity in Lower Minto Creek were lower than both reference areas while dissolved organic carbon (DOC) was higher. Hardness, dissolved organic carbon (DOC), and alkalinity can modify (reduce) the toxicity of certain metals (e.g., copper).

Chlorophyll-a data quality was assessed prior to data analysis and interpretation and was judged as good based on good analyte detectability, precision, and accuracy, and an absence of contamination (Appendix A). The mean chlorophyll-a concentration in 2018 was higher (but not significantly so), at lower Minto Creek (55 mg/m^2) than at lower Wolverine Creek (43 mg/m^2). In 2020, mean concentrations of periphyton chlorophyll-a were significantly lower at lower Minto Creek (16 mg/m^2) than at lower Wolverine Creek (32 mg/m^2; Figure Appendix Figure B.1, Appendix Table B.8).

When comparing chlorophyll-a concentrations over the years, lower Minto creek had higher chlorophyll-a concentrations than lower Wolverine Creek in 2014, 2015, 2017, and 2018 while results were not significantly different in 2013 and 2016 (Table B.8). Since monitoring commenced in 2012, concentrations have been statistically lower at Minto Creek than Wolverine Creek in only two years: 2012 and 2020 (Table B.8). Significance of the interaction term *Area x Year* confirms that differences among years varied. Overall, this suggests no mine-related influence beyond natural variability.

In 2020, results at both areas were lower than 2018 concentrations and were well below the BCWQG of 100 mg/m^2 for the protection of aquatic life (BCMOE 1985). Dodds et al. (1998) classification system sets the trophic status of lower Minto (16 mg/m^2) as oligotrophic and lower

Table 3.4: Water Quality Results at Exposed and Reference Areas, Minto Mine AEMP, September 2020

Exceeds CCME long-term Water Quality Guideline
Exceeds CCME short-term Water Quality Guideline
Exceeds Water Use Licence objectives
Exceeds both Water Quality Guideline (short- or long-term) and Water Use Licence objectives

Note: "-" = no guideline available / no data available.

[a] CCME (Canadian Council of Ministers of the Environment; 1999). See Appendix Table B.5 for values and explanatory notes on selected water quality guidelines.

[b] Guideline based on field temperature and pH at each area.

[c] Guideline based on field pH at each area. If pH < 6.5 = 5 µg/L and if pH ≥ 6 = 100 µg/L.

[d] Total cadmium long-term guideline is based on hardness (as $CaCO_3$). At hardness ≥ 17 to ≤ 280 mg/L, the equation is CWQG (µg/L) = $10^{\{0.83(\log[\text{hardness}]) - 2.46\}}$.

[e] Total cadmium short-term guideline is based on hardness at hardness (as $CaCO_3$). At hardness ≥ 5.3 to ≤ 360 mg/ the equation is CWQG (µg/L) = $10^{\{1.016(\log[\text{hardness}]) - 1.71\}}$.

[f] Total chromium guideline is for hexavalent chromium, Cr(VI).

[g] Total copper guideline is based on hardness and is calculated using the equation CWQG (µg/L) = 0.2 x $e^{\{0.8545[\ln(\text{hardness})]-1.465\}}$.

[h] Total lead guideline is based on hardness (as $CaCO_3$). At hardness 0 to ≤ 60 mg/L, the CWQG is 1 µg/L. At hardness > 60 to ≤ 180 mg/L the equation is CWQG (µg/L)= $e^{[(1.273\{\ln[\text{hardness}]\}-4.705)]}$. At hardness > 180 mg/L, CWQG = 7 µg/L.

[i] Total nickel guideline is based on hardness (as $CaCO_3$). At hardness 0 to ≤ 60 mg/L the CWQG is 25 µg/L. At hardness > 60 to ≤ 180 mg/L the CWQG is calculated using the equation CWQG (µg/L) = $e^{\{0.76[\ln(\text{hardness})]+1.06\}}$. At hardness > 180 mg/L, the CWQG is 150 µg/L.

[j] Dissolved cadmium (µg/L) objective is based on the following formula using the lowest hardness: $e^{(0.736(\ln(\text{hardness}))-4.943)}$.

[k] Dissolved copper objective is based on dissolved organic carbon (DOC). If DOC is > 10 mg/L, objective is 0.02 mg/L Cu. If DOC≤ 10 mg/L, objective is 0.013 mg/L Cu.

[l] Dissolved manganese long-term guideline is calculated using CCME benchmark calculator or look-up table. Values dependent on hardness and field pH

[m] Dissolved manganese short-term guideline is based on hardness and is calculated using the equation CWQG (µg/L) = $e^{(0.878[\ln(\text{hardness})] + 4.76)}$.

[n] Dissolved zinc long-term guideline is based on hardness, pH, and DOC. For hardness 23.4 and 399 mg/L, pH 6.5 to 8.13, and DOC 0.3 to 22.9 mg/L, the equation is CWQG (µg/L) = $e^{(0.947[\ln(\text{hardness mg/L})] - 0.815[\text{pH}] + 0.398[\ln(\text{DOC mg/L})] + 4.625}$

[o] Dissolved zinc short-term benchmark is based on hardness and DOC. For hardness 13.8 to 250.5 mg/L and DOC 0.3 and 17.3 mg/L, the equation is CWQG (µg/L)= $e^{(0.833[\ln(\text{hardness mg/L})] + 0.240[\ln(\text{DOC mg/L})] + 0.526)}$.

Wolverine creeks (32 mg/m^2) as mesotrophic. Based on only total phosphorus, both creeks would be defined as oligotrophic as was observed in previous years (Dodds et al. 1998).

3.4 Summary

Supporting measures collected in September 2020 indicated good Minto Creek water quality. Influence of the Minto Mine was evident through higher specific conductance and pH in Minto Creek in comparison to in the reference creeks. However, water quality concentrations were lower than SSWQO. Total copper concentrations exceeded the CWQG at all sites while dissolved copper concentrations were all below the SSWQO. Total copper concentrations exceeded the CWQG at all sites, including the reference, indicating that high copper concentrations might be natural (as observed in previous years).

Mean concentrations of chlorophyll-a were significantly different between areas and were below BCWQG. Temporal variability in chlorophyll-a concentrations was evident among samples taken from Minto Creek and the reference. Historically, chlorophyll-a values have been below the BCWQG of 100 mg/m^2 and concentrations have been (generally) higher at Minto Creek than the reference. Concentrations at both areas were lower in 2020 than in 2018 but this was especially noticeable at lower Minto (55 mg/m^2 to 16 mg/m^2). It is difficult to determine the cause of the lowered concentrations, but it is possible that the dry conditions at lower Minto in 2019 contributed to lower concentrations. Production classification at the exposure and reference areas (lower Minto Creek as oligotrophic and lower Wolverine Creek as mesotrophic) were different from 2017 (when lower Minto Creek was mesotrophic and lower Wolverine Creek was oligotrophic) and 2018 (both Minto and Wolverine creeks were mesotrophic).

4 SEDIMENT QUALITY

4.1 Sediment Particle Size and Chemistry

Sediment data quality was assessed prior to data analysis and interpretation and was judged as excellent based on good analyte detectability, precision, and accuracy for metals and other analytes (Appendix A). It should be noted that duplicates for particle size were not taken due to low volumes of sediment available for sampling (Appendix A). At lower creek stations, particle size samples were collected at each station and particle size composition is expressed as the mean of five replicates.

Sediments collected in 2020 were largely composed of fine particles of silt/clay (>60%) and sand (>23%) (Figure 4.1; Appendix C). There were relatively fewer fine particles (silt /clay category) at the upper Minto Creek depositional area than at the upper reference area, upper McGinty Creek (60.5% vs 72%; Figure 4.1, Appendix C). Lower Minto Creek and the lower reference area, Wolverine Creek, had similar mean proportions of fine particles (76.8% vs. 71.9%; Figure 4.1, Appendix C).

Mean total organic carbon (TOC) content, loss on ignition (LOI), and total carbon content of sediment collected from upper Minto Creek were slightly lower than at the upper McGinty Creek reference area, but the differences were not significant (Table 4.1). Similarly, lower Minto Creek had lower TOC, LOI, and total carbon than the lower Wolverine Creek reference area but the difference was not significant (Table 4.2).

Concentrations of several metals were significantly higher in upper Minto Creek than in upper McGinty Creek sediments (Table 4.1). Sediment concentrations of copper, strontium, and potassium had the highest magnitude of difference between the upper creeks (798%, 109%, and 103%, respectively). Arsenic concentrations were not significantly different between upper Minto Creek and upper McGinty Creek (Table 4.1). Concentrations of several metals were found to be significantly higher in lower Minto Creek than lower Wolverine Creek sediments (Table 4.2). Sediment concentrations of manganese, copper, and selenium had the highest magnitude of difference between the upper creeks (156%, 95%, and 76%, respectively).

Though several analytes were higher at exposed (Minto Creek) versus reference areas (upper McGinty Creek reference for upper Minto Creek and lower Wolverine Creek and lower Big Creek references for lower Minto Creek), only arsenic and copper had mean concentrations greater than Interim Sediment Quality Guidelines (ISQG) for the protection of aquatic life (CCME 1999) in Minto Creek (Table 4.3, Appendix Table C.1). Mean arsenic concentration in upper Minto Creek was above the Interim Sediment Quality Guideline (ISQG) but below the Probable Effect Level (PEL) and lower than 2x the mean at upper McGinty Creek reference area.

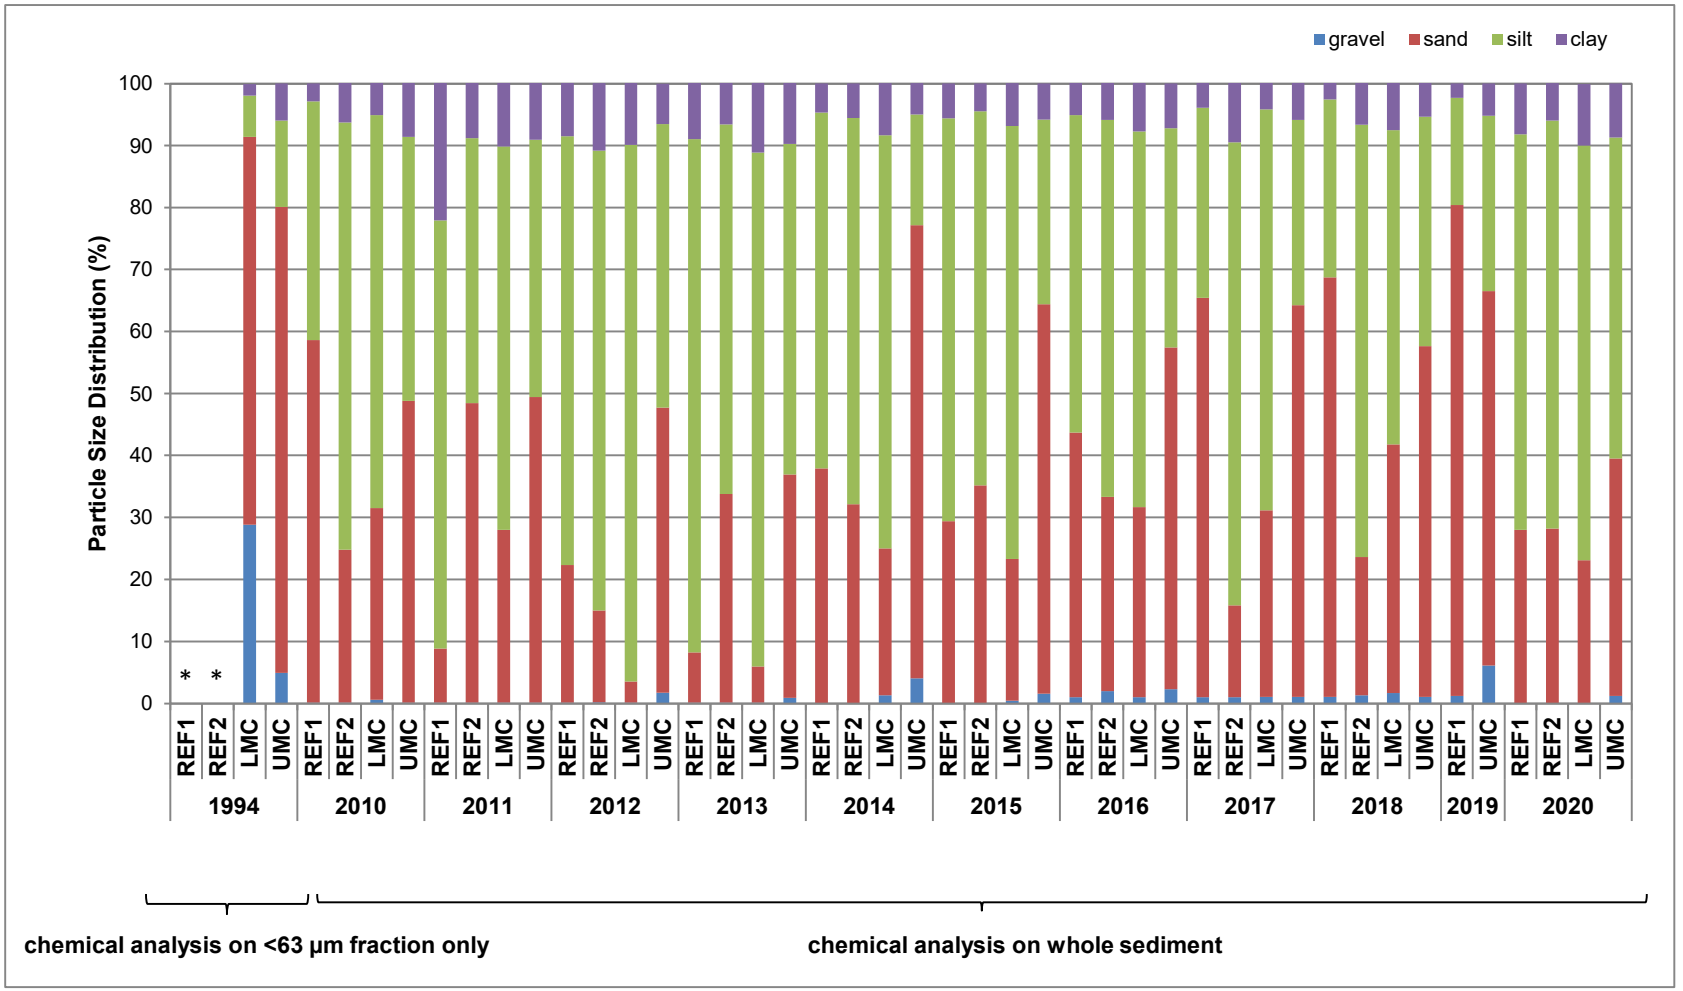

Figure 4.1: Particle Size Distribution of Sediment Collected in Upper Minto Creek and Reference Location, 1994 to 2020[a,b]

Notes: Methods used in 1994 were not specified, fine sediment was collected in triplicate in the mainstem of Minto Creek (HKP 1994), * = no data.

[a] REF1 = Station W6 (south-flowing tributary) in 2006 to 2008 and McGinty Creek in 2010 to 2020; UMC = Upper Minto Creek.

[b] REF2 = Station W7 (north-flowing tributary) in 2006 to 2009 and Wolverine Creek in 2010 to 2020; LMC = Lower Minto Creek.

P-value < 0.05

Magnitude of Difference (MOD) > 0

Magnitude of Difference (MOD) < 0

Notes: "-" indicates not significant. M-W = Mann-Whitney test. tequal = t-test for equal variance. tunequal = t-test for unequal variance.

[a] Measure of Central Tendency (MCT) is the mean for parameters where statistics were conducted on the raw scale, the geometric mean when statistics were $\log_{10}$ transformed to meet the assumtions of normality, and the median when rank tranformed.

[b] MOD = magnitude of difference. MOD = MCT_{EXP} - MCT_{REF}/MCT_{REF}*100.

Table 4.3: Summary of Sediment Chemistry Data, Minto Mine, September 2020

Indicates sediment concentration exceeding CSQG ISQG or BCMOE Se guideline.
Indicates sediment concentration exceeding CSQG PEL.
Indicates sediment concentration exceeding higher reference mean by more than two times.
Indicates sediment concentration exceeding higher reference mean by more than two times and higher than CSQG ISQG, PEL, or BCMOE Se guideline.

Note: "-" = no guideline or not possible to calculate from non detectable data.

[a] CSQG (CCME 1999, plus updates) and BC Sediment Quality Guideline for Selenium (BCMOE 2014). ISQG = interim sediment quality guideline. PEL = probably effect level.

This suggests that arsenic concentrations were unrelated to the Minto Mine. Mean copper concentration in upper Minto Creek was above the ISQG as well as the PEL; the PEL is considered to be a level above which adverse biological effects are likely to occur[1]. However, due to the predominantly erosional habitat in upper Minto Creek, there are few areas of deposited sediment which may have only occurred in small quantities that likely washed away each year during freshet. Therefore, elevated copper in fine sediment in the upper reaches of Minto Creek may be of limited importance in terms of exposure and potential effects to biota (i.e., sediment copper is of limited importance as an exposure route in this erosional environment where sediment sparsely distributed). In lower Minto Creek, fine sediment deposits were somewhat more common and therefore more relevant to aquatic life.

Mean concentrations of arsenic and copper in lower Minto Creek were greater than the ISQG but below the PEL. Mean concentrations of arsenic and copper in lower Minto Creek were less than 2x the mean at lower Wolverine Creek. With progression from upper to lower Minto Creek, sediment copper concentrations decreased from a mean of 213 to 53.5 milligram per kilogram (mg/kg), respectively, indicating improvement with distance downstream.

4.2 Temporal Comparisons

Particle size distribution in 2020 indicated more fine particles in the silt/clay category than in previous years (Figure 4.1). Sand was generally the dominant particle size in upper Minto Creek as observed over the more recent historical data (post-2010). Particle size distribution observed from 2010 onwards was notably different from data collected prior to 2010, which employed different sampling methodology (described in Minnow 2019a). Upper McGinty particle distribution is noticeably more variable in clay and sand percentages (Appendix B), perhaps reflecting more dynamic hydrology in this system.

Mean concentrations of copper at upper Minto Creek have not changed significantly since 2011. Concentrations in upper McGinty Creek have fluctuated over the years but have not differed significantly during the 2011 to 2020 period (Figure 4.2a; Table 4.4). Mean copper concentration in upper Minto Creek has been significantly higher than upper McGinty Creek since 2011. The magnitude of difference between upper Minto Creek and upper McGinty Creek in 2020 was lowest it has been since 2015, but this difference was not statistically significant (Figure 4.2a; Table 4.4) and results were within the range observed since 2011.

Mean concentrations of copper in lower Minto Creek have fluctuated over the years but have not changed significantly since 2012. Concentrations in lower Wolverine Creek have not changed

[1] It is recognized that guideline exceedances, even of probable effect levels, can occur naturally in highly mineralized areas.

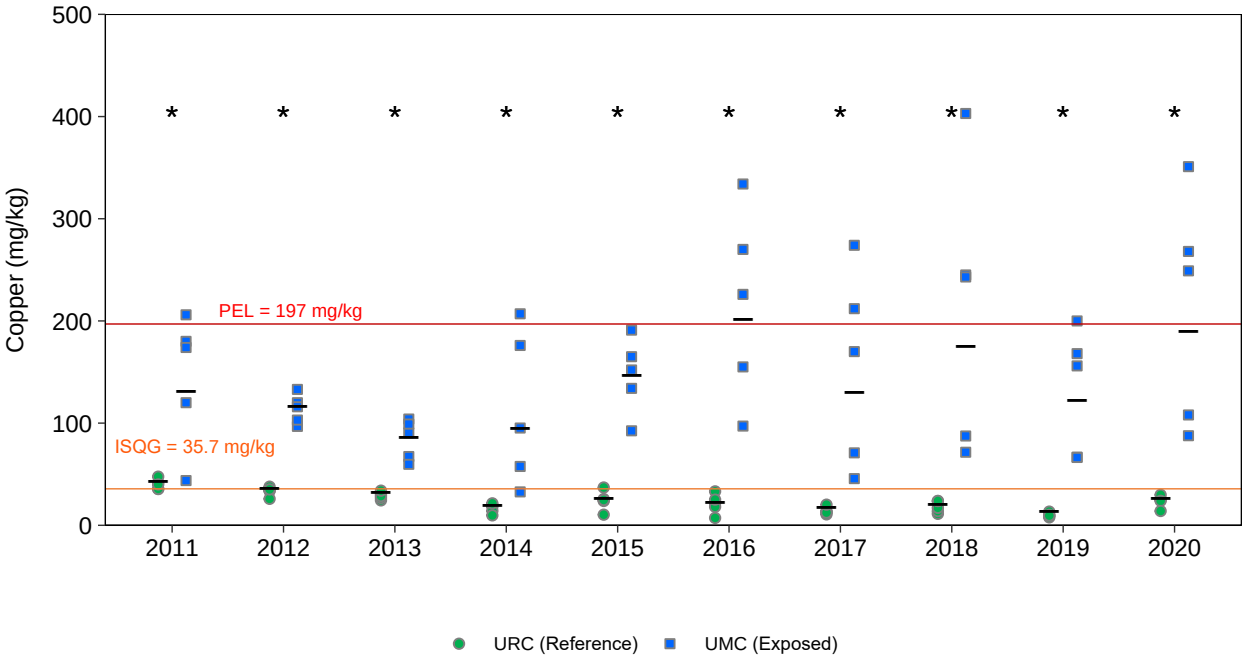

Figure 4.2a: Sediment Copper Concentrations Over Time for Upper Areas, 2011 to 2020

Notes: Black horizontal bars indicate the Measure of Central Tendency (MCT). The MCT is the mean for non−transformed data, geometric mean for $\log_{10}$ transformed data and median for rank transformed data. An * indicates stations were significantly different for that year. Interim Sediment Quality Guideline (ISQG) = 35.7 mg/kg is shown in orange and Probable Effect Limit (PEL) = 197 mg/kg is shown in red. URC = Upper McGinty Creek. UMC = Upper Minto Creek.

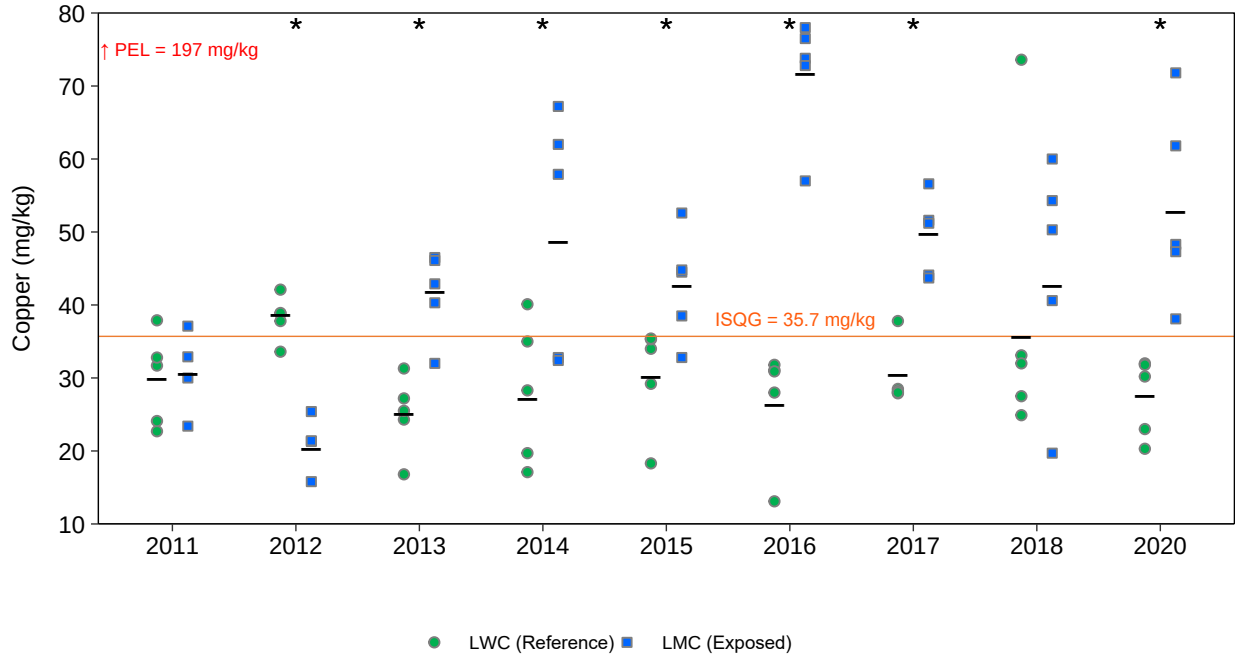

Figure 4.2b: Sediment Copper Concentrations Over Time for Lower Areas, 2011 to 2020[a]

Notes: Black horizontal bars indicate the Measure of Central Tendency (MCT). The MCT is the mean for non−transformed data, geometric mean for $\log_{10}$ transformed data and median for rank transformed data. An * indicates stations were significantly different for that year. Interim Sediment Quality Guideline (ISQG) = 35.7 mg/kg is shown in orange and Probable Effect Limit (PEL) = 197 mg/kg is shown in red. LWC = Lower Wolverine Creek. LMC = Lower Minto Creek.

[a] Sampling was not completed in 2019 due to dry conditions.

Table 4.4: Statistical Comparison Sediment Metal Concentrations, Upper Areas, Minto, 2011 to 2020

Endpoint	ANOVA Model				Year	Do Concentrations Differ Among Years for Each Area?[a]		Do Concentrations Differ Between Areas?
	Transformation	Area	Year	Area x Year		URC (Reference)	UMC (Exposed)	MOD (%)[b]
Copper (mg/kg)	log10	<0.001	0.006	0.001	2011	A	A	220
					2012	AB	A	242
					2013	AB	A	187
					2014	ABC	A	472
					2015	ABC	A	533
					2016	ABC	A	953
					2017	BC	A	819
					2018	ABC	A	899
					2019	C	A	1,097
					2020	ABC	A	708

P-value < 0.05

Magnitude of Difference (MOD) > 0

Magnitude of Difference (MOD) < 0

Notes: "-" indicates no data for comparison, "ns" indicates a non-significant post-hoc contrast.

[a] Years that do not share a letter were significantly different from each other in a Tukey's Honestly Significant Difference post-hoc test ($\alpha = 0.05$).

[b] MOD = $(MCT_{UMC}-MCT_{URC})/MCT_{URC}$ *100; where the measures of central tendency (MCT) were geometric means because the data was $\log_{10}$ transformed.

significantly since 2011 (Figure 4.2b; Table 4.5). The mean concentration of copper at lower Minto Creek has been significantly higher than lower Wolverine Creek since 2013 (Figure 4.2b; Table 4.5). The highest magnitude of difference (MOD) between lower Minto and lower Wolverine was observed in 2016.

Historically, higher copper concentrations (than observed in 2020) have been measured and reported in both upper and lower Minto Creek sediments (Figure 4.2a,b; Minnow 2019a). Mean copper concentrations in upper Minto Creek have historically (2016, 2018) exceeded the probable effect level (Figure 4.2a). Mean copper concentrations have also been historically greater than the ISGQ in lower Minto Creek sediment during most years (Figure 4.2a,b; Table 4.1; Appendix Table C) and have generally been stable since 2011 or 2012.

4.3 Sediment Toxicity

Sediment toxicity test conditions and supporting water quality parameters were all within the range outlined in the test protocols, and testing was judged to be acceptable (Appendix A). Survival and growth were evaluated using the 10-day test of *Chironomus dilutus* (midge) and the 14-day test of *Hyalella azteca* (amphipod).

Some reductions in survival but not growth were observed for both test organisms (Table 4.4). Survival of *C. dilutus* was significantly lower in sediment collected from lower Minto Creek than in laboratory control sediment (sand) but was not significantly different than field reference sediment (lower Wolverine Creek; Table 4.6). Mean survival at lower Minto Creek was leveraged by the result at one station that had a higher mortality rate (60%), while the remaining four replicates had mortality ≤20%. The absence of a significant difference from the field reference suggests no significant effect of lower Minto Creek sediment on *C. dilutus*. Low mortalities were observed in both lab control and field reference sediment (Nautilus Environmental [Appendix C]).

Survival of *H. azteca* in lower Minto sediment was significantly lower than both laboratory control and field reference sediment (lower Wolverine Creek; Table 4.4), indicating a significant effect of lower Minto Creek sediment on *H. azteca*. However, mean survival at lower Minto Creek was leveraged by two stations that had mortalities ≥60%. The remaining three stations did not have any mortalities. No mortalities were not observed in lab control or field reference sediment (Nautilus Environmental [Appendix C]).

In previous monitoring, effects on survival of *C. dilutus* were also observed in 2017 and 2018, and an effect on growth has only been observed in 2017 (Minnow 2019a)[2]. Average mortality in 2020 was lower than in 2018. No effects to *H. azteca* were observed in 2018, which was similar

[2] Sediment toxicity tests were not conducted in 2019 due to low flows and associated creek drying.

Table 4.5: Statistical Comparison Sediment Metal Concentrations, Lower Creek Areas, Minto, 2011 to 2020

Endpoint	ANOVA Model				Year	Do Concentrations Differ Among Years for Each Area?[a]		Do Concentrations Differ Between Areas?
	Transformation	Area	Year	Area x Year		LWC (Reference)	LMC (Exposed)	MOD (%)[b]
Copper (mg/kg)	log10	<0.001	0.009	<0.001	2011	A	CD	ns
					2012	A	D	-48
					2013	A	BC	68
					2014	A	ABC	81
					2015	A	ABC	42
					2016	A	A	177
					2017	A	ABC	65
					2018	A	ABC	ns
					2020	A	AB	93

P-value < 0.05
Magnitude of Difference (MOD) > 0
Magnitude of Difference (MOD) < 0

Notes: "-" indicates no data for comparison, "ns" indicates a non-significant post-hoc contrast.

[a] Years that do not share a letter were significantly different from each other in a Tukey's Honestly Significant Difference post-hoc test (α = 0.05).

[b] MOD = $(MCT_{LMC}-MCT_{LWC})/MCT_{LWC}$ *100; where the measures of central tendency (MCT) were geometric means because the data was log_{10} transformed.

Table 4.6: Minto Mine Sediment Toxicity Test Results Collected for Lower Wolverine and Lower Minto Creeks, September 2020

Area	*Hyalella azteca*		*Chironomus dilutus*	
	Survival (%)	**Dry Weight (mg)**	**Survival (%)**	**Dry Weight (mg)**
Control Sediment	100 ± 0.0	0.14 ± 0.02	90.0 ± 10.0	1.74 ± 0.18
Lower Wolverine Creek (Reference)	100 ± 0.0	0.14 ± 0.01	94.0 ± 13.4	2.40 ± 0.31
Lower Minto Creek (Exposed)	74.0 ± 35.8	0.13 ± 0.01	76.0 ± 20.7	2.65 ± 0.27

Significantly different than control sediment
Significantly different than reference sediment
Significantly different than reference and control sediment

Note: Data presented as mean ± standard deviation.

to results from 2011, 2015 to 2017 (Minnow 2019a). Temporal comparisons show differences in responses despite similar sediment chemistry.

4.4 Summary

Overall, the concentrations of metals in upper Minto Creek sediments were generally higher than those in McGinty Creek but lower than sediment quality guidelines, with the exception of arsenic (which exceeded ISQG) and copper (which exceeded ISQG and PEL). Copper at upper Minto Creek also exceeded the reference mean concentration by more than two times. Metal concentrations in lower Minto Creek sediments were generally similar to those in lower Wolverine Creek with the exception of arsenic, copper, and manganese (of which arsenic and copper were greater than ISQG but lower than PEL).

Copper concentrations at both upper Minto and lower Minto Creek have been statistically higher than their respective reference areas since 2011 and 2013, respectively. Although concentrations of arsenic and copper in both upper and lower Minto Creek exceeded sediment quality guidelines, temporal analyses of copper concentrations since 2011 indicate that there has not been a significant increase in copper over the years at either upper or lower Minto Creek.

Sediment toxicity testing indicated an effect of lower Minto Creek sediment on *H. azteca* survival, but not on *H. azteca* growth or the survival and growth of *C. dilutus*. However, survival of *H. azteca* was spatially variable, with ≥60% mortality at two stations and no mortality at the remaining three stations.

5 PERIPHYTON COMMUNITY

5.1 Primary Metrics and Community Composition

The quality of periphyton community data, assessed prior to data analysis and interpretation, was judged as good based on precision (Appendix A). Analysis of the periphyton community on the basis of density (cells/cm^2) and biomass (µg/cm^2) indicated that three out of five periphyton community metrics (taxon richness, Simpson's Diversity, and Simpson's Evenness) were not significantly different between lower Minto and lower Wolverine creeks.

Density was found to be significantly lower at lower Minto Creek than at lower Wolverine Creek (Table 5.1a,b, Appendix Tables D.1 and D.3). The Bray-Curtis index for periphyton community based on both density and biomass indicated a significant difference between lower Minto Creek and lower Wolverine Creek (Table 5.2). This indicates that periphyton community composition at lower Minto Creek differed from reference (Table 5.1a,b, Appendix Tables D.2 and D.4).

Dominant phyla in lower Minto and Wolverine creeks were Bacillariophycae (diatoms) and Cyanophyta (blue-green algae). Cyanophyta were dominant at lower Minto Creek (63%) with Bacillariophycae as the sub-dominant (29%). Bacillariophycae were dominant at lower Wolverine Creek (54% of the community; Figure 5.1). Little information is available regarding sensitivities of specific periphyton taxon groups and tolerances to mining activities to assist in interpretation of these data based on relative proportions of taxon groups (Deniseger et al. 1986, De Jonge et al. 2008).

5.2 Temporal Comparisons

Substantial temporal variability in periphyton community composition was evident among samples taken in Minto Creek and reference since 1994 (Figure 5.1). For example, at lower Minto Creek, Bacillariophycae (diatoms) were dominant in 1994, 2013, 2014, 2016, and 2018, Rhodophyta (red algae) in 2012, and Cyanophyta (blue-green algae) in 2011, 2015, 2017, and 2020 (Figure 5.1). Similar temporal variability was also observed at the lower Wolverine Creek reference area, with Cyanophyta dominant in 2011 and 2013 and Bacillariophycae in 2012, 2014 to 2018, and 2020 (Figure 5.1).

5.3 Summary

Evaluation of both periphyton community biomass (µg/cm^2) and density (cell/cm^2) indicated that three of five community metrics were not significantly different in lower Minto Creek relative to the lower Wolverine Creek reference. Density and the Bray-Curtis Index were the only metrics that differed between the two areas. It is possible that the lower density at lower Minto Creek and community dissimilarities between lower Minto Creek and lower Wolverine Creek can be partially

P-Value < 0.1

Notes: n = sample size, dbRDA = distance-based redundancy analysis, See Section 2.5.2 for statistical analysis details.

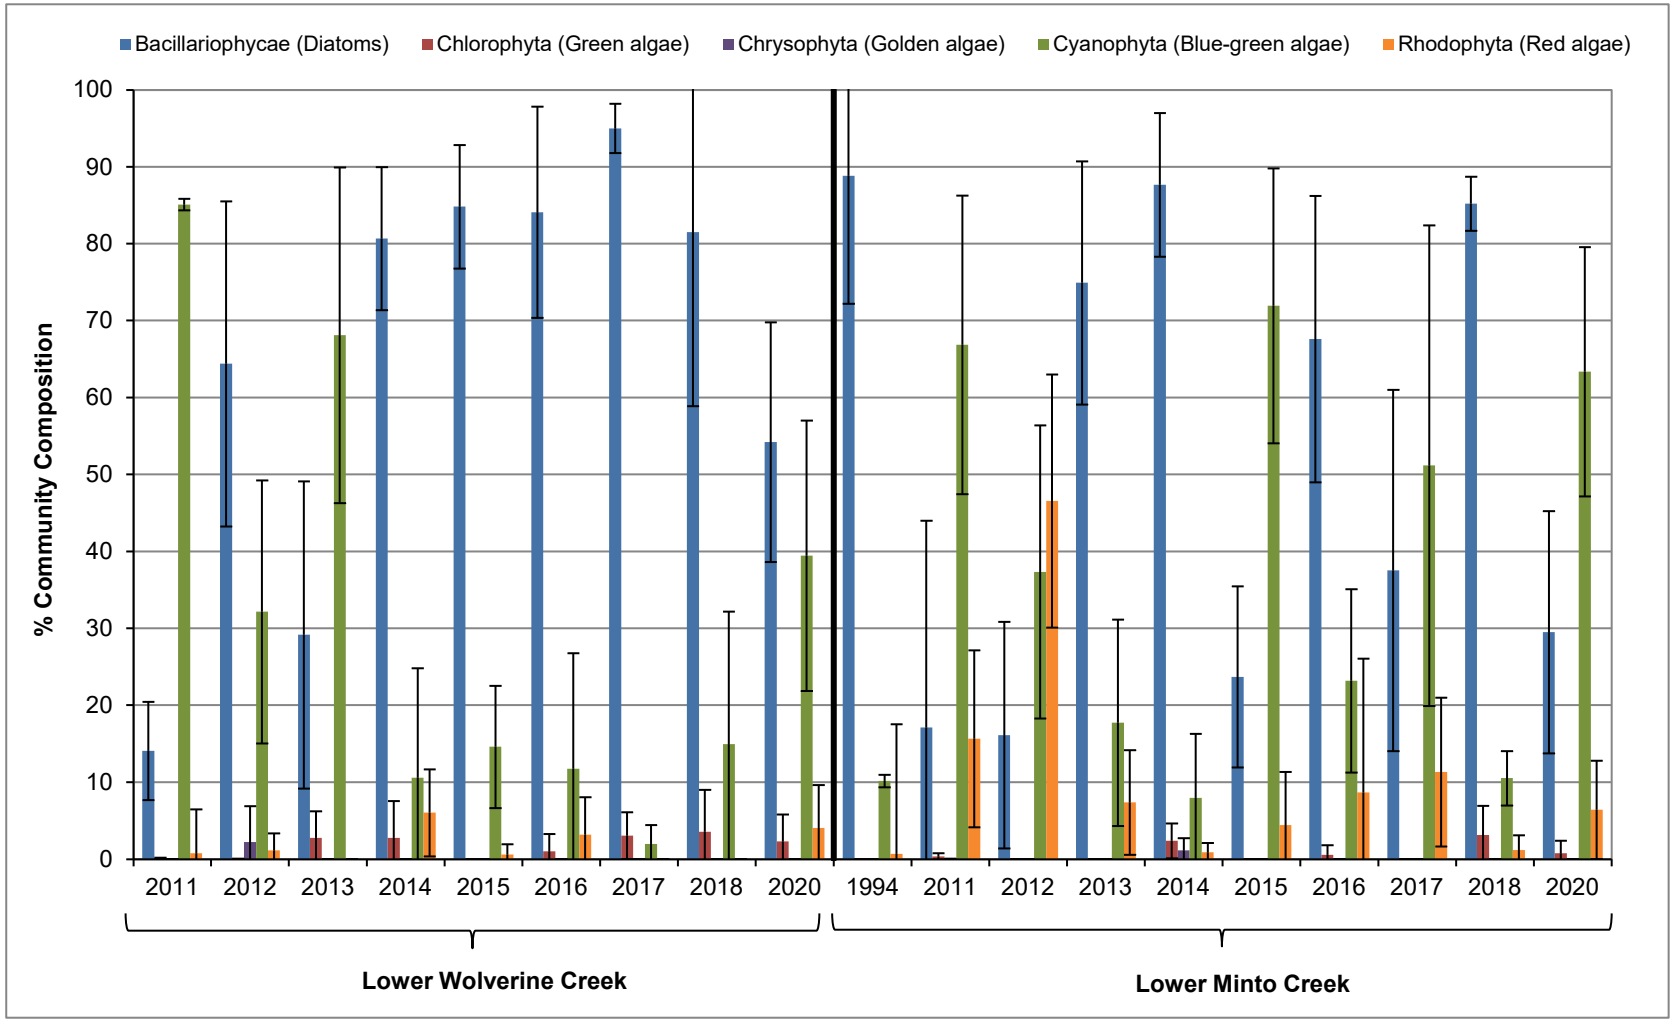

Figure 5.1: Periphyton Community Composition in Lower Wolverine Creek (2011 to 2020) and Lower Minto Creek (1994, 2011 to 2020[a])

Note: Data presented as mean ± standard deviation.
[a] Due to dry conditions at lower Minto Creek in 2019, sampling was not conducted.

explained by the dry conditions in 2019 (i.e., environmental stress). Apart from the dry conditions, substantial differences in periphyton community summary metrics and community composition were apparent over the years at both lower Minto and lower Wolverine creeks, indicating substantial temporal variability. The differences observed in the periphyton communities of lower Minto Creek and lower Wolverine Creek in 2020 were within natural temporal variability and do not suggest a mine influence.

6 BENTHIC INVERTEBRATE COMMUNITY

6.1 Primary Metrics and Community Composition

Benthic invertebrate community data quality, assessed prior to data analysis and interpretation, was judged as good based on organism recovery and sub-sampling precision (Appendix A). All endpoints were evaluated at the LPL. Benthic invertebrate community metrics of density, richness (number of taxa), and Simpson's Diversity differed significantly among areas (lower Minto Creek and the two reference areas), while there was no significant different in Simpson's Evenness (Table 6.1, Figure 6.1, Appendix Table E.3). Post-hoc testing indicated that density, richness, and Simpson's Diversity of lower Minto Creek did not differ from both reference areas (lower Wolverine Creek and lower Big Creek; Table 6.1; Appendix Table E.3). Bray-Curtis index was the only community metric that differed significantly at lower Minto Creek relative to both reference areas (Table 6.2, Figure 6.2). Overall, the primary metrics suggest limited mine influence (Table 6.1, Appendix Table E.3).

The dominant taxonomic group in lower Minto, lower Wolverine, and lower Big creeks was chironomids (non-biting midges), except for one station. Oligochaetes (worms), acari (mites), and EPT (Ephemeroptera - mayflies, Plecoptera - stoneflies, and Trichoptera - caddisflies) were subdominant at individual stations. Percent chironomids was significantly higher at lower Minto Creek than at lower Big Creek (but not lower Wolverine Creek), while percent EPT was significantly lower at lower Minto Creek than both reference areas (Figure 6.3, Table 6.1, Appendix Tables E.1 to E.3). The significantly higher proportion of chironomids and lower proportion of EPT taxa could suggest mine influence on benthic invertebrate community (Chapman et al. 1982b, Rosenberg and Resh 1993, Taylor and Bailey 1997). However, given that the mine was not actively discharging between August 2018 and October 2020 (i.e., after the 2020 field campaign), it is unlikely that mine effluent was the cause; rather this may be a result of the creek drying observed in 2019.

Correspondence Analysis (CA) explained 63.1% of the total community variance in the first two CA axes (Appendix Table E.5). The first CA axis explained 47.5% of the total variation in the original benthic abundance data, and significantly separated lower Minto Creek from lower Wolverine and lower Big creeks (Appendix Table E.3, Figure 6.4). Lower Minto Creek had positive CA Axis-1 scores and stations were separated from lower Wolverine and lower Big creeks by high relative abundance of Collembola, *Cardiocladius* (Family Chironomidae), Hydrophilidae (Coleoptera), *Limnophyes* (Family Chironomidae), and *Hydrobaenus* (Family Chironomidae; Figure 6.4, Appendix Tables E.4 and E.5). The reference areas (lower Wolverine and lower Big creeks) had strong negative CA Axis-1 scores that were

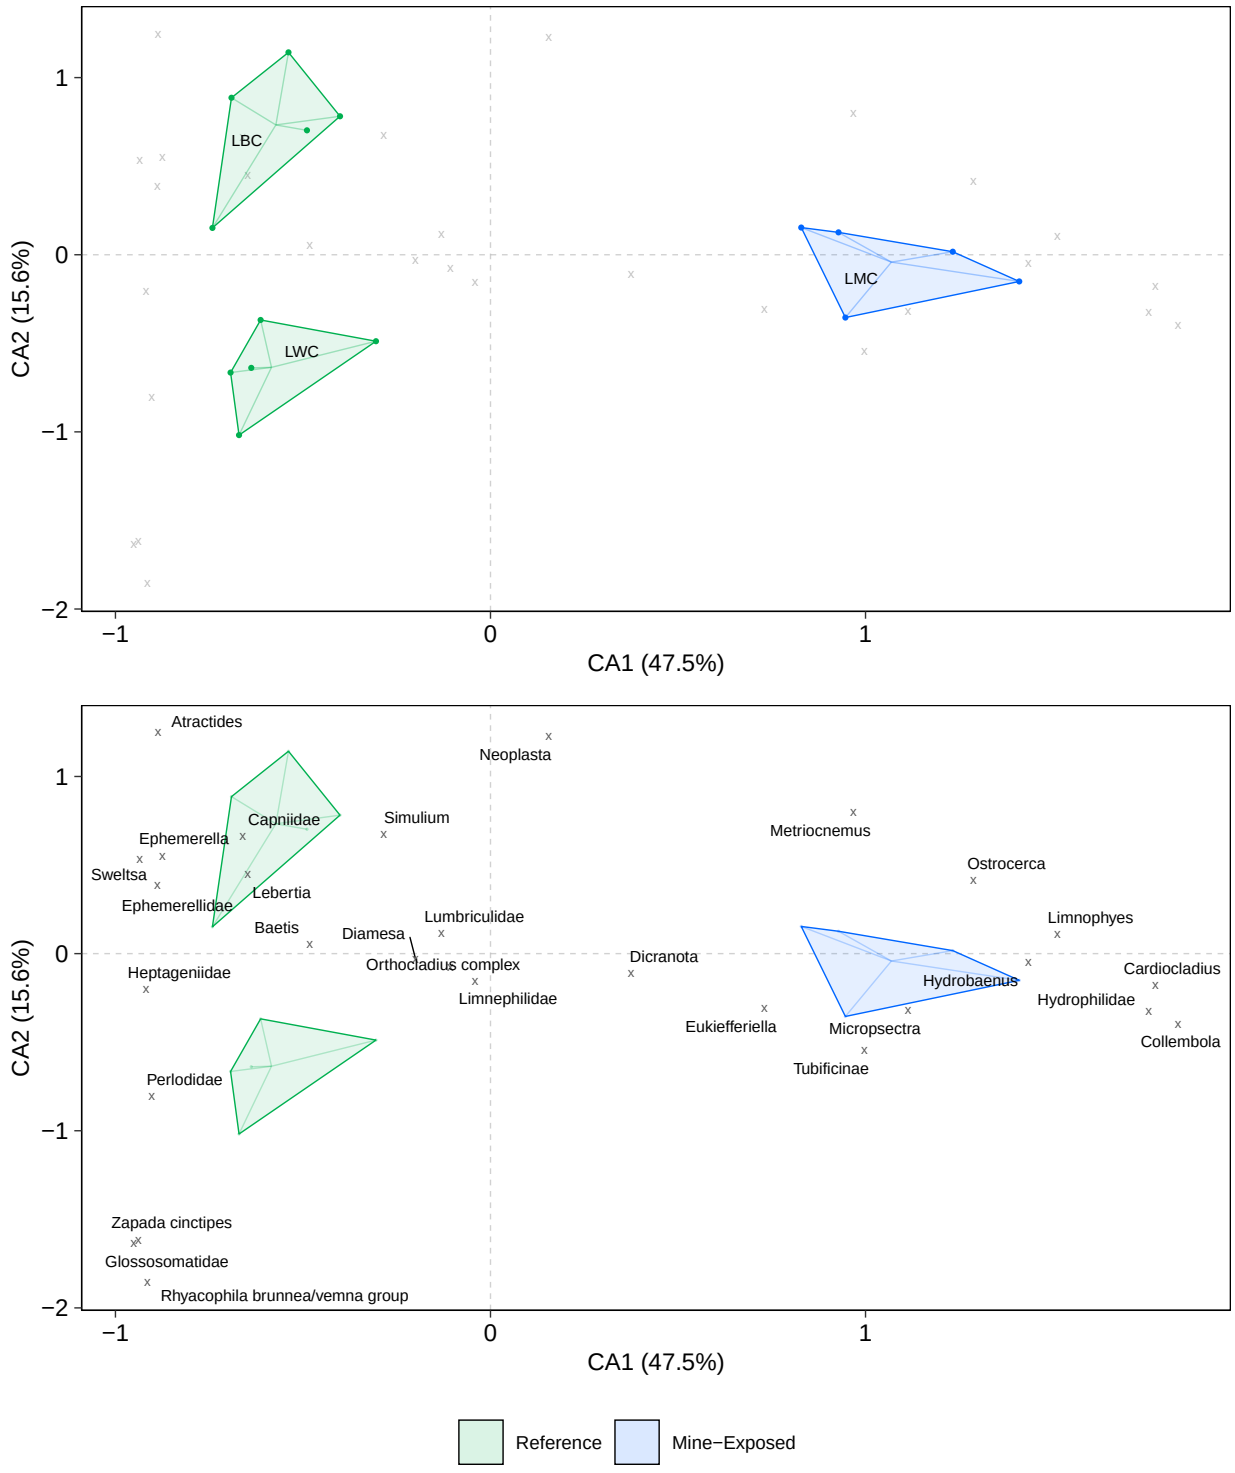

Figure 6.4: Correspondence Analysis (CA) Scatterplot for Benthic Invertebrate Relative Densities at Lower Minto Creek and Associated Reference Areas, Minto Mine, 2020

Notes: Taxa densities were ln(x+1)−transformed before CA calculations. Taxa present at two or fewer samples or accounted for less than 15% of the total abundance at any area were removed from the analysis. LMC = lower Minto Creek. LBC = lower Big Creek. LWC = lower Wolverine Creek.

dominated by Glossosomatidae (caddisfly), *Zapada cinctipes* (stonefly), *Sweltsa* (stonefly), and Heptageniidae (mayfly; Figure 6.4, Appendix Tables E.4 and E.5). The reference areas were separated on CA Axis-2 (which explained 15.6% of the total variation) and lower Minto Creek had significantly lower CA Axis-2 scores compared to lower Big Creek and significantly higher CA Axis-2 scores compared to lower Wolverine Creek (Appendix Table E.3). CA Axis-1 shows that lower Minto Creek and the reference areas are separated by different taxa: largely Collembola and chironomids for lower Minto and several taxa belonging to the orders Trichoptera, Plecoptera, and Ephemeroptera for the reference areas. The former are generally more tolerant than the latter (Mandaville 2002) and the CA results generally re-capitulate what was seen with the relative proportions of chironomids and EPT taxa.

6.2 Correlation Analysis

Correlation analysis between 11 benthic invertebrate community indices and seven supporting physical and chemical measurements (those for which significant differences among areas were observed) resulted in ten significant correlations at a p-level of 0.05 and an r-value of >0.6 (Table 6.3). It is important to consider that illustration of a significant or suggestive degree of correlation between two variables does not necessarily imply a cause-and-effect relationship, although it is a basis for further investigation and to consider known biological responses to environmental differences.

Of the ten significant correlations, six were associated with the proportion of substrate cobble and gravel (Table 6.3). These indicated a positive relationship between percent cobble and the proportion of EPT taxa, Ephemeroptera, and Acari and associated negative relationships with percent gravel (Appendix Figure E.2). These relationships are generally consistent with preference of EPT taxa for cobble substrate. A positive relationship was observed between density and the depth to which substrate was cleaned and a negative relationship between % Ephemeroptera and the depth to which substrate was cleaned (Table 6.3; Appendix Figure E.2). The former was leveraged by one data point and the latter showed some anomalies, consistent with lower p-values supporting these relationships (Table 6.3; Appendix Figure E.2). Furthermore, there is no clear mechanistic explanation for these relationships. Lastly, two relationships with water quality were observed: there was a positive relationship between % Acari and water temperature and a positive relationship between Simpson's diversity and water pH (Table 6.3; Appendix Figure E.2). The positive relationship between % Acari and water temperature was highly leveraged, while the positive relationship between Simpson's diversity and water pH showed a better distribution of data points that suggested a common influence on diversity and pH (Appendix Figure E.2), perhaps associated

Note: Correlations only conducted with endpoints and physiochemical parameters that were signficantly different among areas.

with the mine. Overall, relationships suggestive of plausible cause were limited to differences in substrate among creeks.

6.3 Temporal Comparisons

Temporal comparisons of benthic invertebrate community condition of lower Minto Creek were made in order to augment data interpretation, but their power was tempered by temporal changes in sampling location, sampling methodology, level of replication, and analytical processing techniques. Baseline data (1994) were collected near the mouth of Minto Creek as three single grab samples, 2006 data were collected at Station W2 in the same manner, 2008 and 2010 data were collected at Station W2 as three-grab composites whereas 2011 to 2018 data were collected as five replicate three-grab samples from a large area upstream of Station W2. Only in the later years (2011 to 2018, and 2020) do data represent an area (i.e., lower Minto Creek) rather than a station. In addition, data collected in 2013 to 2018 and 2020 were sieved using 500 µm mesh as recommended for federal EEM (Environment Canada 2012), whereas all years prior to 2011 used 250 µm (both mesh sizes were used in 2012 to assist in transition). This was expected to result in lower densities from 2013 and later.

Mean benthic invertebrate density at lower Minto Creek increased between 2017 and 2018. The 2020 density was the highest it has been in the 2012 to 2020 period but was not significantly higher than in 2018 (Figure 6.1; Table 6.1). Mean density also increased at lower Wolverine from 2018 to 2020, while lower Big Creek remained similar. There was no significant difference between density at lower Minto Creek compared to lower Wolverine Creek. Lower Minto Creek had significantly higher 2020 densities than lower Big Creek (Figure 6.1; Table 6.1).

Mean LPL richness, and LPL Simpson's Evenness at lower Minto Creek have not changed significantly over the 2012 to 2020 period. LPL richness was not significantly different between lower Minto Creek and either reference area (lower Wolverine Creek and lower Big Creek) over the 2012 to 2020 period, with the exception of 2012 (LWC) and 2016 (LBC; Figure 6.1; Table 6.1). LPL Simpson's Evenness at lower Minto Creek has only been significantly different from both reference areas for one year (2017) and was not significant relative to either reference area in 2020 (Figure 6.1; Table 6.1).

The mean density proportions of EPT (mayflies, stoneflies, and caddisflies) which are considered to be sensitive taxa (e.g., Lenat 1988, Herman and Nejadhashemi 2015) were significantly lower at lower Minto Creek in 2020 compared to previous years. EPT proportion at lower Minto Creek was not significantly different from that at lower Wolverine Creek but was significantly lower than lower Big Creek (MOD = 3.4%; Table 6.1). Similar to lower Minto Creek, lower Wolverine Creek had lower EPT proportion than in previous years while the proportion at lower Big Creek did not

change significantly over the years. Historically, lower Minto Creek has not been significantly different from lower Big Creek but has occasionally had a statistically higher EPT proportion when compared to lower Wolverine Creek (Figure 6.3; Table 6.1).

The mean density proportion of chironomids, considered to be a tolerant taxonomic group, was significantly higher at lower Minto Creek in 2020 compared to previous years but was comparable to historic values in 2012, 2013, and 2016 (Figure 6.3; Table 6.1). Chironomid proportion at lower Minto Creek was not significantly different from that at lower Wolverine Creek but was significantly lower than lower Big Creek (1.3%; Table 6.1). Both lower Wolverine and lower Big creeks had chironomid proportions comparable to those in 2018, which were higher than prior years. (Figure 6.3; Table 6.1)

6.4 Summary

The erosional benthic invertebrate community of lower Minto Creek differed from both reference (lower Wolverine Creek and lower Big Creek) communities for Bray-Curtis index and percent Ephemeroptera only. The benthic community differed from one of the two reference areas in percent EPT (LBC only), Trichoptera (LWC only), and Chironomids (LBC only). A potential decrease in number of taxa from 2012 to 2014 identified in previous reporting (Minnow 2015) appears to have been natural variability since number of taxa increased from 2014 to 2017, decreased in 2018, and increased again in 2020 (Minnow 2015, 2016, 2017, Minnow 2019a). Bray-Curtis index indicated that lower Minto Creek had a different community composition than the reference areas, and examination of taxon composition and CA results indicated that this difference was largely due to a higher proportion of chironomids and lower proportion of EPT taxa. Although this difference is indicative of a potential influence on the benthic invertebrate community, it may not be mine related as the mine was not discharging for more than a year prior to sampling; rather it is likely at least partly related to creek drying in 2019.

High temporal variability in benthic invertebrate community density, richness, and composition has been observed at the exposure and reference areas, presumably due to inter-annual variability in environmental conditions (e.g., flow, ice scour, water levels). Densities in 2020 were the highest they have been over the 2012 to 2020 period. None of the primary community endpoints at lower Minto Creek differed significantly compared to both reference stations. There was a statistically significant upwards trend in chironomid proportion and downwards trend in EPT proportion at lower Minto Creek. This community shift could possibly be attributed to the dry conditions at lower Minto Creek in 2019. Since chironomids are more tolerant and EPT taxa are more sensitive, it would make sense to see more chironomids and fewer EPT taxa following a dry year (i.e., environmental stress).

Overall, benthic invertebrate community metrics show that lower Minto Creek is generally similar to reference, but subtle differences in proportions of chironomids and EPT taxa were present, likely due to a combination of subtle habitat differences, dry conditions in 2019, and potential mine influence[3].

[3] Although a potential mine influence may exist, the absence of discharge in 2019 and 2020 indicates that the potential is not effluent related. A low level of influence to water quality of upper Minto Creek appears to occur in the absence of effluent discharge.

7 TISSUE CHEMISTRY

7.1 Overview

As indicated in Section 2.7, tissue chemistry data are provided here simply to report the ancillary data collected along with the selenium data reported separately. Data interpretation was therefore limited to basic comparisons of metal concentrations in tissue collected at the exposure area (lower Minto Creek) to those collected at reference creeks (lower Wolverine and lower Big creeks).

7.2 Periphyton Tissue

The quality of periphyton tissue data, assessed prior to data analysis and interpretation, was assessed as good based on good analyte detectability, precision, and accuracy (Appendix A). Concentrations of eleven analytes in periphyton tissue were significantly greater at lower Minto Creek than at both reference areas (Table 7.1, Appendix Table C.2). Analytes of concern such as copper and selenium were significantly greater in periphyton tissue from lower Minto Creek than in tissue from both reference areas (Table 7.1). No significant differences were observed between areas for selenium in 2013 (Figure 7.1), whereas from 2014 to 2018 and 2020, periphyton selenium concentrations were significantly greater at lower Minto Creek than at the reference areas (only between lower Big Creek in 2017; Figure 7.1). Significantly higher concentrations of selenium at lower Minto Creek compared to reference areas over the last three years suggest an influence of the mine on Minto Creek.

7.3 Benthic Invertebrate Tissue

Benthic invertebrate tissue data quality, assessed prior to data analysis and interpretation, were judged to be of good quality based on good analyte detectability, precision, and accuracy (Appendix A). Concentrations of one analyte in benthic invertebrate tissue, boron, was greater at lower Minto Creek compared to both reference areas (Table 7.1, Appendix Table C.3). Arsenic, copper, mercury, phosphorus, rubidium, and uranium concentrations were significantly lower at Minto Creek than lower Big Creek, while antimony, arsenic, lead, and tin were significantly higher at Minto Creek than lower Wolverine (Table 7.1, Appendix Table C.3). Selenium concentrations did not differ among areas in 2020 (Table 7.1).

Selenium in benthic invertebrate tissue in 2020 was not significantly different at lower Minto Creek compared to reference areas. Selenium concentrations at the reference areas were higher than those in 2018 (Figure 7.2, Appendix Table C.3) but significant changes in selenium concentrations at lower Minto Creek have not been observed since 2014 (Table 7.1, Figure 7.2). Historically, selenium concentrations at lower Minto Creek have been significantly higher than lower Big Creek, with the exception of 2014. Since 2013, concentrations of selenium in benthic

P-value < 0.05
MOD > 0
MOD < 0

Notes: "-" indicates analysis was not completed because all data was below the LRL. ns = not significant. ANOVA = analysis of variance. K-W = Kruskal-Wallis test. All values are expressed in mg/kg dry weight.

[a] Measure of Central Tendency is the mean for parameters where statistics were conducted on the raw scale, the geometric mean when statistics were log $_{10}$ transformed to meet the assumtions of normality, and the median when rank tranformed.

[b] Magnitude of difference (MOD) = $(MCT_{EXP}-MCT_{REF})/MCT_{REF}$ *100

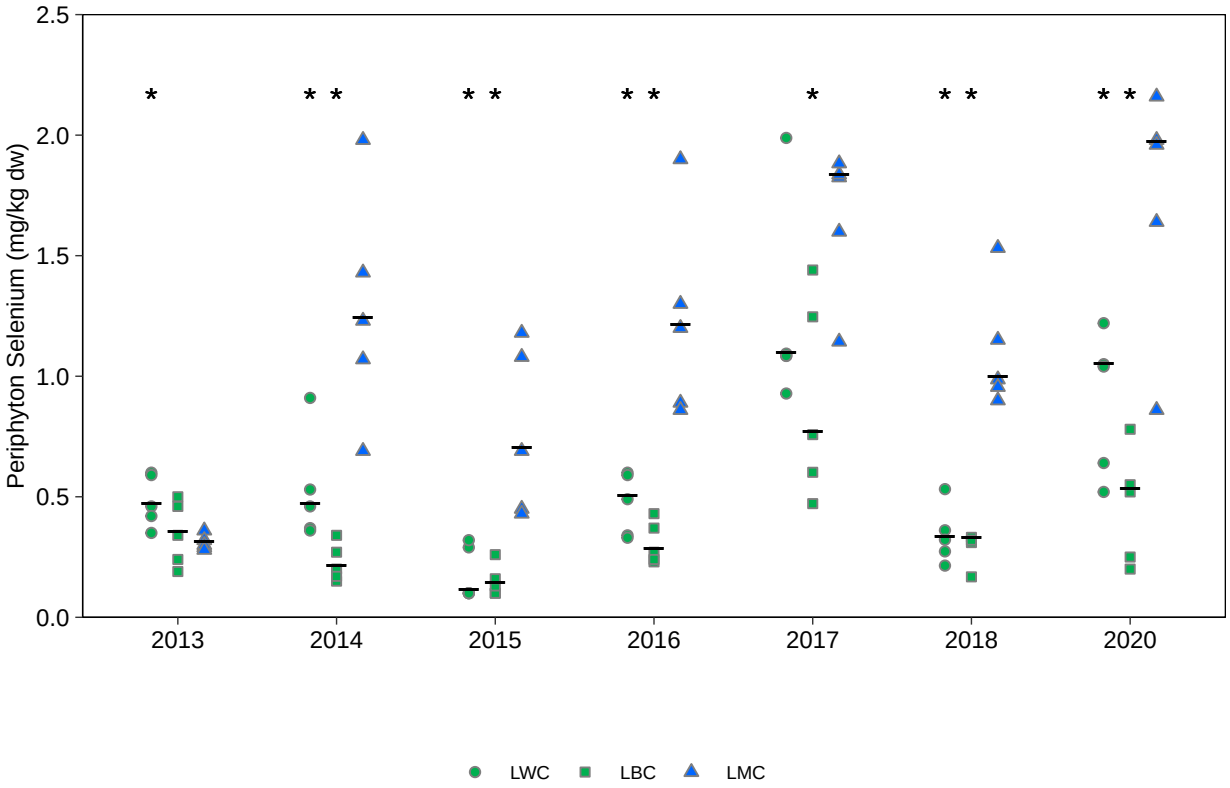

Figure 7.1: Periphyton Tissue Selenium Concentration Over Time, 2013 to 2020[a]

Notes: dw = dry weight. LWC = Lower Wolverine Creek (reference). LBC = Lower Big Creek (reference). LMC = Lower Minto Creek (exposed). Black horizontal bars indicate the Measure of Central Tendency (MCT). The MCT is the mean for non-transformed data, geometric mean for $\log_{10}$ transformed data and median for rank transformed data. An * indicates the reference station was significantly different from the exposed station for that year.
[a] Due to dry conditions at lower Minto Creek in 2019, sampling was not conducted.

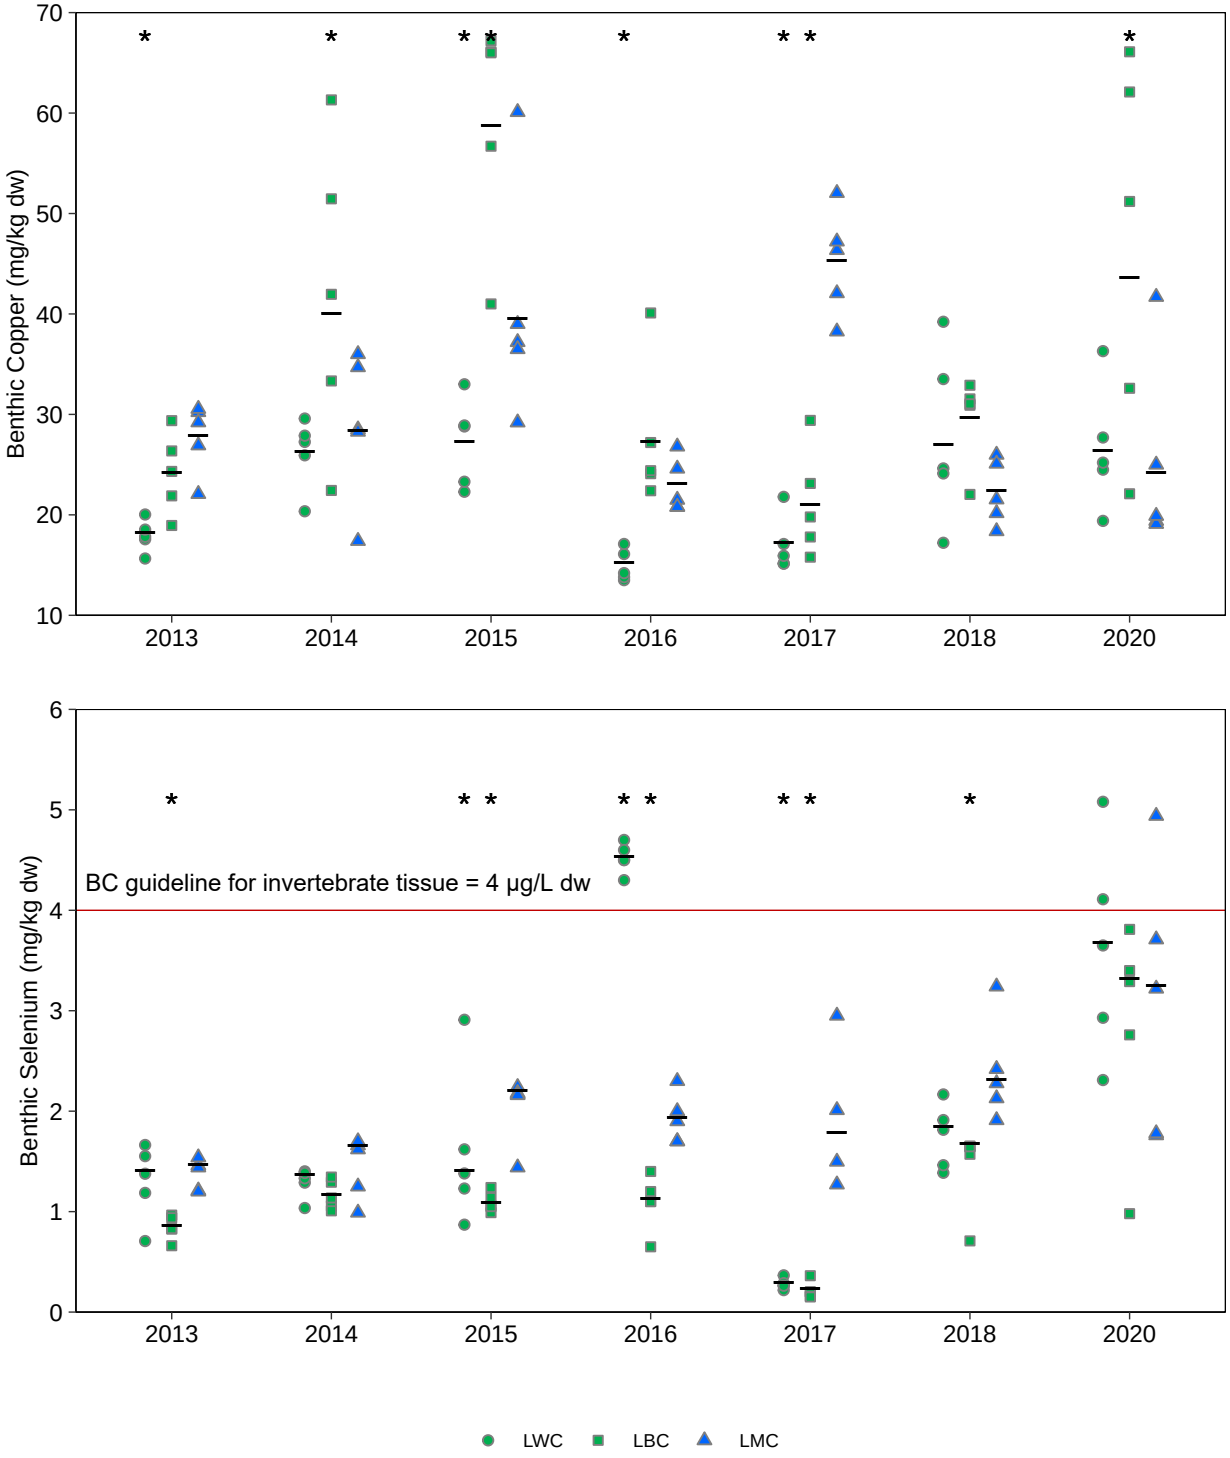

Figure 7.2: Benthic Tissue Metal Concentration, 2013 to 2020[a]

Notes: dw = dry weight. LWC = Lower Wolverine Creek (reference). LBC = Lower Big Creek (reference). LMC = Lower Minto Creek (exposed). British Columbia (BC) Benthic Invertebrate Tissue Guideline for Selenium is shown with a red line. Black horizontal bars indicate the Measure of Central Tendency (MCT). The MCT is the mean for non−transformed data, geometric mean for $\log_{10}$ transformed data and median for rank transformed data. An * indicates the reference station was significantly different from the exposed station for that year.

[a] Due to dry conditions at lower Minto Creek in 2019, sampling was not conducted.

invertebrate tissue from lower Minto Creek have only been statistically different than in lower Wolverine Creek from 2015 to 2017 (Table 7.2; Figure 7.2). With the exception of three samples (LWC-1, LWC-4, and LMC-5), selenium concentrations were below the interim guideline, suggesting limited mine influence.

In 2020, the mean copper concentration in benthic invertebrate tissue from lower Minto Creek was not significantly different from that at lower Wolverine Creek and was significantly lower when compared to lower Big Creek (Table 7.1, Figure 7.2). Since 2013, there has been no significant trend in mean copper concentrations in benthic invertebrate tissue. Values in 2020 were comparable to all years except for higher results observed in 2015 and 2017. Variability in concentrations of copper in benthic invertebrate tissue has been high over the years. In 2013, 2016, and 2017, copper was significantly higher in benthic invertebrates from lower Minto Creek compared to lower Wolverine Creek, but in 2014 and 2018 copper was not significantly different between areas (Figure 7.2). In 2015, copper was significantly lower at lower Minto Creek compared to lower Big Creek (Figure 7.2). This lack of consistency suggests observed differences likely represent natural variability.

8 CONCLUSIONS AND RECOMMENDATIONS

8.1 Conclusions

The Sediment, Periphyton, and Benthic Assessment component of the Minto Mine AEMP evaluated potential mine related effects to Minto Creek. Water quality (field measures and chemistry), sediment quality (chemistry and toxicity testing), periphyton (community and tissue quality), and benthic invertebrates (community and tissue quality) of Minto Creek were evaluated relative to reference creeks and previous data.

Supporting field measures collected in September 2020 indicated relatively good Minto Creek water quality. Higher conductance and pH values were observed in Minto Creek compared reference areas, suggesting a possible influence from the Minto Mine. All water quality measures met WUL objectives and CWQG guidelines for the protection of aquatic life except for total copper. Total copper exceeded the CWQG short-term guideline for both upper and lower exposed areas (upper Minto Creek and lower Minto Creek) and two of three reference areas (upper McGinty Creek and lower Wolverine Creek, but not lower Big Creek). Concentrations of total copper at upper Minto Creek were higher than concentrations at the upper McGinity Creek reference while total copper concentrations at lower Minto Creek were higher than concentrations at the lower Big Creek reference but lower than concentrations at the lower Wolverine Creek reference. Moving downstream, copper concentrations at lower Minto Creek were lower than those at upper Minto Creek but were still greater than the CWQG. Concentrations of dissolved copper remained below the SSWQO in all samples. In 2020, trophic status was oligotrophic in lower Minto Creek and mesotrophic in lower Wolverine Creek on the basis of chlorophyll-a concentrations (Dodds et al. 1998). This differed from 2018 (both classified as mesotrophic) and 2017 (lower Minto and lower Wolverine creeks classified as mesotrophic and oligotrophic, respectively).

Concentrations of metals in upper Minto Creek sediments were generally higher than those in McGinty Creek but lower than sediment quality guidelines. Exceptions were arsenic (which exceeded ISQG) and copper (which exceeded ISQG and PEL). Metal concentrations in lower Minto Creek sediments were generally similar to those in lower Wolverine Creek with the exception of arsenic, copper, and manganese (of which arsenic and copper were greater than ISQG but lower than PEL and arsenic has not been identified as elevated in water). Copper concentrations at both upper Minto and lower Minto Creek have been statistically higher than their respective reference areas since 2011 and 2013, respectively. Although concentrations of arsenic and copper in both upper and lower Minto Creek exceeded sediment quality guidelines, temporal analyses of copper concentrations since 2011 indicate that there has not been a significant increase in copper over the years at either upper or lower

Minto Creek. Sediment toxicity testing indicated an effect of lower Minto Creek sediment on *H. azteca* survival, but not on *H. azteca* growth or the survival and growth of *C. dilutus*. However, survival of *H. azteca* was spatially variable, with ≥60% mortality at two lower Minto Creek stations and no mortality at the remaining three stations.

Periphyton community evaluated on the basis of density (cells/m^2) and biomass (µg/cm^2) indicated significant differences in density (lower) and community structure compared to lower Wolverine Creek. Substantial temporal variability has been observed in periphyton community composition in both creeks, and the observed differences were within natural temporal variability and do not provide resolution of potential mine influence.

The erosional benthic invertebrate community of lower Minto Creek differed from both reference communities on the basis of Bray-Curtis index and percent Ephemeroptera only, indicating only subtle differences in community composition. Bray-Curtis index indicated that lower Minto Creek had a different community composition than the reference areas, and examination of taxon composition and CA results indicated that this difference was largely due to a higher proportion of chironomids and a lower proportion of EPT taxa. Although this difference is indicative of a potential influence on the benthic invertebrate community, it is likely related to creek drying in 2019. As the mine had not discharged since 2018 prior to sampling and water quality was correspondingly good in 2019 and 2020, it is unlikely that this difference is due to mine activities.

High temporal variability in benthic invertebrate community density, richness, and composition has been observed at the exposure and reference areas, presumably due to inter-annual variability in environmental conditions (e.g., flow, ice scour, water levels). Benthic invertebrate densities in 2020 were the highest they have been over the 2012 to 2020 period. There was a statistically significant upwards trend in chironomid proportion and downwards trend in EPT proportion at lower Minto Creek. This community shift could be due to the dry conditions at lower Minto Creek in 2019.

Concentrations of copper and selenium in periphyton tissue collected at lower Minto Creek were significantly higher than at both reference areas. There were no similar differences in copper or selenium concentrations in benthic invertebrate tissue. Furthermore, selenium concentrations in benthic invertebrate tissue were lower than the guideline for the protection of aquatic life indicating that no associated effects would be expected.

8.2 Recommendations

Based on the results and conclusions of the 2020 Minto Mine Sediment, Periphyton, and Benthic Assessment, it is recommended that the program is repeated in 2021. Given the continued

elevated copper concentrations in surface water and sediment in Minto Creek in 2020 (no discharge prior to sampling), the following recommendations are provided:

- Continue to monitor for potential adverse effects on the aquatic ecosystem (through sediment toxicity testing and benthic invertebrate community monitoring).
- Continue to monitor flow conditions in the open water season at lower Minto Creek prior to fall field work such that program adjustment can be made and communicated as early as possible if drying is observed (as in 2019).
- Continue to sample both lower Wolverine Creek and lower Big Creek as reference areas for the sediment toxicity and benthic invertebrate community assessment to provide perspective on whether any of the observed differences are due to mine influence or natural differences among creeks.

The above information is recommended for AEMP optimization as well as to optimize the connection between the AEMP data and the adaptive management plan.

A1 INTRODUCTION

This Data Quality Review (DQR) provides an evaluation of data collected as part of the 2020 AEMP Minto Creek Sediment, Periphyton, and Benthic Invertebrate Community Assessment Report. The objective of the DQR is to define the overall quality of the data presented in the report, and, by extension, the confidence with which the data can be used to derive conclusions.

A1.1 Background

A variety of factors can influence the chemical and biological measurements made in an environmental study and thus affect the accuracy and/or precision of the data. Inconsistencies in sampling or laboratory methods, use of instruments that are inadequately calibrated or which cannot measure to the desired level of accuracy or precision, and contamination of samples in the field or laboratory are just some of the potential factors that can lead to the reporting of data that do not accurately reflect actual environmental conditions. Depending on the magnitude of the problem, inaccuracy or imprecision have the potential to affect the reliability of any conclusions made from the data. Therefore, it is important to ensure that monitoring programs incorporate appropriate steps to control the non-natural sources of data variability (i.e., minimize the variability that does not reflect natural spatial and temporal variability in the environment) and thus assure the quality of the data.

Data quality as a concept is meaningful only when it relates to the intended use of the data. That is, one must know the context in which the data will be interpreted in order to establish a relevant basis for judging whether or not the data set is adequate. The DQR involves comparison of actual field and laboratory measurement performance to data quality objectives (DQOs) established for a particular study, such as evaluation of laboratory reporting limits (LRL), blank sample data, data precision (based on laboratory duplicate samples), and data accuracy (based on matrix spike recoveries and/or analysis of standards or certified reference materials). Trusted analytical laboratories certified by Canadian Association for Laboratory Accreditation (CALA) with rigorous internal quality assurance programs were selected to ensure the highest possible quality.

DQOs were established either at the outset of the field program or by the laboratories and reflect reasonable and achievable performance expectations. The LRLs were set at the outset of the field program for water, sediment, and tissue quality. Only results that were below the LRL were evaluated against target detection limits. Target detection limits should be at least as low as applicable guidelines, ideally ≤ 1/10th guideline values. Programs involving a large number of samples and analytes usually result in some analytes that exceed the DQOs. This is

particularly so for multi-element scans (e.g., ICP scans for metals) since the analytical conditions are not necessarily optimal for every element included in the scan. Generally, scan results may be considered acceptable if no more than 25% of the parameters fail to meet the DQOs. Overall, the intent of comparing data to DQOs was not to reject any measurement that did not meet the DQO, but to ensure that any questionable data received more scrutiny to determine what effect, if any, this had on interpretation of results within the context of this project.

A1.2 Types of Quality Control Samples

Several types of quality control (QC) samples were assessed based on samples collected (or prepared) in the field and laboratory. These samples included the following:

- **Blanks** are samples of de-ionized water and/or appropriate reagent(s) that are handled and analyzed the same way as regular samples. These samples will reflect any contamination that occurred in the field (in the case of field or travel blanks) or the laboratory (in the case of laboratory or method blanks). Analyte concentrations should be non-detectable although a DQO of twice the LRL allows for slight "noise" around the LRL.
- **Laboratory Duplicates** are sub-sample pairs created in the laboratory from randomly selected field samples which are sub-sampled and then analyzed independently using identical analytical methods. The laboratory duplicate sample results reflect any variability introduced during laboratory sample handling and analysis and thus provide a measure of laboratory precision.
- **Spike Recovery Samples** are created in the laboratory by adding a known amount/concentration of a given analyte (or mixture of analytes) to a randomly selected test sample previously divided to create two sub-samples. The spiked and regular sub-samples are then analyzed in an identical manner. The spike recovery represents the difference between the measured spike amount (total amount in spiked sample minus amount in original sample) relative to the known spike amount (as a percentage). Two types of spike recovery samples are commonly analyzed. Spiked blanks (or blank spikes) are created using laboratory control materials whereas matrix spikes are created using field-collected samples. The analysis of spiked samples provides an indication of the accuracy of analytical results.
- **Internal Reference Materials** are samples containing known chemical concentrations that are processed and analyzed along with batches of environmental samples. The sample results are then compared to target results to provide a measure of

analytical accuracy. The results are reported as the percent of the known amount that was recovered in the analysis.

A2 WATER SAMPLES

A2.1 Laboratory Reporting Limits

All 2020 laboratory reporting limits were within target limits (≤ 1/10th guideline or water use license objectives), except for total cadmium (Table A.1). Only one cadmium sample out of five exceeded the target. Laboratory reporting limits for total cadmium were still good (i.e., below the guidelines), and therefore results were considered appropriate for the program evaluation.

A2.2 Laboratory Blank Sample Analysis

The laboratory blank analysis detected one sample of total manganese (0.00011 mg/L; Appendix B) but no other analytes were detectable. Only 1.03% of the laboratory blanks failed the DQO, therefore the samples were associated with minimal inadvertent contamination of samples within the laboratory during analysis.

A2.3 Data Precision

Due to internal laboratory practices, laboratory duplicate results were not performed on samples from this project, except forone laboratory duplicate sample, ammonia at Lower Wolverine Creek (Appendix B). Agreement was achieved between all laboratory duplicate samples (Appendix B). This indicates that samples were associated with good analytical precision.

A2.4 Laboratory Data Accuracy

Analyte recoveries for spiked blanks all met the DQO indicating excellent analytical accuracy for the water sample analyses (Appendix B).

Analyte recoveries for matrix spiked samples met DQOs for all analytes. The matrix spiked samples indicate good analytical accuracy for parameters of interest in the water sample analyses (Appendix B).

Table A.1: Laboratory Reporting Limits (LRLs) Relative to Targets and Water Quality Guidelines, Minto Mine, 2020[a]

Analyte		Units	Laboratory Reporting Limit		Water Use Licence Objectives	CCME Water Quality Guidelines[b]	
			Target	Achieved		Long-term	Short-term
Physical Tests	Total Suspended Solids	mg/L	-	3.0	-	-	-

	Dissolved Zirconium (Zr)	mg/L	-	-	-	-	-

Value greater than target i.e., ≤ 1/10th guideline values

Notes: "-" = no guideline, target, or objective applicable. For range of guideline values, see Appendix Table B.5.

[a] Only analytes with reported values less than LRL were presented.

[b] CCME (Canadian Council of Ministers of the Environment). 1999. Canadian Environmental Quality Guidelines. 1999 (plus updates), Canadian Council of Ministers of the Environment, Winnipeg.

[c] Based on guideline using field temperature and pH.

[d] Total cadmium long-term guideline is based on hardness (as $CaCO_3$). At hardness ≥ 17 to ≤ 280 mg/L, the equation is CWQG (µg/L) = $10^{\{0.83(\log[\text{hardness}]) - 2.46\}}$.

[e] Total cadmium short-term guideline is based on hardness at hardness (as $CaCO_3$). At hardness ≥ 5.3 to ≤ 360 mg/ the equation is CWQG (µg/L) = $10^{\{1.016(\log[\text{hardness}]) - 1.71\}}$.

[f] Total lead guideline is based on hardness (as $CaCO_3$). At hardness 0 to ≤ 60 mg/L, the CWQG is 1 µg/L. At hardness ≥60 to ≤ 180 mg/L the equation is CWQG (µg/L)= $e^{[(1.273\{\ln[\text{hardness}]\}-}$

[g] Dissolved cadmium (µg/L) objective is based on the following formula using the lowest hardness: $e^{(0.736(\ln(\text{hardness}))-4.943)}$.

[h] Dissolved zinc long-term guideline is based on hardness, pH, and DOC. For hardness 23.4 and 399 mg/L, pH 6.5 to 8.13, and DOC 0.3 to 22.9 mg/L, the equation is CWQG (µg/L) = $e^{(0.947[\ln(\text{hardness mg/L})] - 0.815[\text{pH}] + 0.398[\ln(\text{DOC mg/L})] + 4.625}$

[i] Dissolved zinc short-term benchmark is based on hardness and DOC. For hardness 13.8 to 250.5 mg/L and DOC 0.3 and 17.3 mg/L, the equation is CWQG (µg/L)= $e^{(0.833[\ln(\text{hardness mg/L})] + 0.240[\ln(\text{DOC mg/L})] + 0.526)}$.

A3 SEDIMENT SAMPLES

A3.1 Laboratory Reporting Limits

Results for eight analytes were reported as less than LRL but only mercury had an associated guideline (Table A.2). Mercury LRLs were below the Canadian Sediment Quality Guideline (CSQG; CCME 1999) but did not meet the target (≤ 1/10th guideline; Table A.2). Analytes with guidelines were all detectable indicating that the data can be reliably interpreted.

A3.2 Laboratory Blank Sample Analysis

All blank samples contained non-detectable analyte concentrations indicating no inadvertent contamination of samples within the laboratory during analysis (Appendix C).

A3.3 Data Precision

Agreement was achieved between all laboratory duplicate samples except for one sample, total Kjeldahl nitrogen (Appendix C). This indicates good analytical precision.

A3.4 Laboratory Data Accuracy

Analyte recoveries for spiked blanks all met the DQO indicating excellent analytical accuracy for the sediment sample analyses (Appendix C).

Recoveries of all analytes in certified reference materials met the DQO (Appendix C). These data indicated excellent analytical accuracy associated with the analysis of sediment samples.

Table A.2: Laboratory Reporting Limits (LRLs) Relative to Targets and Sediment Guidelines, Minto Mine, 2020[a]

Analyte		Units	Laboratory Reporting Limit (LRL)		CSQG[b]	
			Target	Achieved	ISQG	PEL
Particle Size	Gravel (> 2 mm)	%	-	1.0	-	-
	Sand (2.0mm - 0.063mm)	%	-	1.0	-	-

Value greater than target i.e., ≤ 1/10th guideline values.

Note: "-" = no applicable target or applicable guideline.

[a] Only analytes with reported values less than LRL were presented.

[b] CSQG = Canadian Sediment Quality Guidelines; ISQG = interim sediment quality guideline; PEL = probable effect level.

A4 SEDIMENT TOXICITY TESTING

The 10-day *Chironomus dilutus* test was within all control acceptability criteria and water quality parameters (Appendix C – Nautilus Environmental Report). Results of the 10-day *C. dilutus* test were compared to the historical range (mean ± two standard deviation) and were slightly outside of the lower end of the range (Appendix C – Nautilus Environmental Report). This did not appear to affect test results and were thought to be due to variability. The 14-day *Hyalella azteca* test was within the acceptability range for organism performance of mean and two standard deviations (Appendix C – Nautilus Environmental Report). Water quality parameters remained within the acceptability criteria throughout testing, with one exception. For the 14-day *H. azteca* test, pH was outside of the acceptable range for several days (Appendix C – Nautilus Environmental Report). When pH is outside the acceptable range water renewals should be conducted but were not in this case. Despite this reference sediment preformed similarly to control sediment and appears this did not affect test results. Furthermore, despite being outside of standard test protocol range, the higher pH values observed in the tests were similar to those observed *in situ*.

A5 PERIPHYTON COMMUNITY

Close agreement was achieved between laboratory duplicate samples for both density (cells/cm^2; Table A.3) and biomass (µg/cm^2; Table A.4). This indicates that data can be reliably interpreted.

Table A.3: Laboratory Duplicate Results for Analysis of Periphyton Group Density (cells/cm^2)

Algal Density (cells/cm^2)	Common Name	LWC-2	LWC-2R	RPD (%)
Cyanobacteria	Blue Green Algae	51,392	45,650	11.8
Rhodophytes	Red Algae	4,881	5,455	11.1
Bacillariophycae	Diatoms	72,639	69,767	4.03
	Total	128,912	120,873	6.44

> 30% Relative Percent Difference (RPD).

Table A.4: Laboratory Duplicate Results for Analysis of Periphyton Group Biomass (µg/cm^2)

Algal Biomass (µg/cm^2)	Common Name	LWC-2	LWC-2R	RPD (%)
Cyanobacteria	Blue Green Algae	37.4	42.5	12.7
Rhodophytes	Red Algae	1.28	1.43	11.1
Bacillariophycae	Diatoms	18.8	18.3	2.7
	Total	57.5	62.2	7.90

> 30% Relative Percent Difference (RPD).

A6 BENTHIC INVERTEBRATE COMMUNITY

Two re-sorted samples met the objective for percent organism recovery; both of which had a percent recovery of 100% (Table A.5). Of 15 benthic invertebrate community samples analyzed, five samples were analyzed whole. The remaining ten samples were subsampled at percentages ranging from 25% to 75% (Table A.6), and sub-sampling variability was required. Sub-sampling of LWC-2 met the DQO of 20% (Table A.7). This indicates that the data can be reliably interpreted.

Table A.5: Percent Sorting Efficiency of Benthic Invertebrates, Minto Mine, 2020

Station	Initial Sort	Re-sort	Percent Sorting Efficiency [a]
LWC-5	329	0	100%
LBC-3	335	0	100%

Sorting efficiency < 90%.

[a] Percent sorting efficiency = (1-(# in QA/AC re-sort / (# sorted originally + # in QA/QC re-sort)))* 100.

Table A.6: Percent of Benthic Invertebrate Sample Analyzed for Each Station, Minto Mine, 2020

Area	Station				
	1	2	3	4	5
LWC	38%	50%	25%	100%	38%
LBC	100%	100%	100%	100%	50%
LMC	31%	25%	75%	31%	25%

Note: LWC = Lower Wolverine Creek (reference), LBC = Lower Big Creek (reference), LMC = Lower Minto Creek (exposed).

Table A.7: Percent Subsampling Error for Benthic Invertebrate Samples, Minto Mine, 2020

Sample	Number of Organisms in Fraction 1 (50%)	Number of Organisms in Fraction 2 (50%)	Actual Density	Precision (RPD %)[a]	Accuracy (%)[b]
LWC-2	310	250	560	19.4	10.7

Value exceeded the < 20% data quality objective.

[a] Relative percent difference (RPD) among subsamples.

[b] Range of deviation of abundance estimates derived from sub-samples compared to analysis of entire sample (expressed as % of total organisms present).

A7 TISSUE SAMPLES

A7.1 Laboratory Reporting Limits

All chlorophyll-a periphyton samples were detectable and interpretable (Appendix B).

One periphyton tissue analyte, total tellurium, was below the LRL and did not meet target detection limits (Table A.8). Five out of 15 samples exceeded target concentrations. Target concentrations are not based on guidelines; rather represent detection limits quoted by the laboratory.

Four benthic invertebrate tissue analytes were below LRLs and did not meet targets: total bismuth (three of 15 samples), boron (eight of 15 samples), tellurium (all 15 samples), and tin (14 of 15 samples; Table A.9). Target concentrations are not guidelines but represent detection limits quoted by the laboratory. Data for this project can be reliably interpreted.

A7.2 Laboratory Blank Sample Analysis

Periphyton (chlorophyll-a [Appendix B], tissue [Appendix C]) and benthic invertebrate tissue (Appendix C) blank samples contained non-detectable analyte concentrations indicating no inadvertent contamination of samples within the laboratory during analysis.

A7.3 Data Precision

Laboratory duplicate periphyton tissue samples showed good agreement among all duplicate analyte concentrations (Appendix C). Periphyton samples were associated with good analytical precision.

A7.4 Data Accuracy

Analyte recoveries for spiked blanks all met the DQO indicating excellent analytical accuracy for periphyton (chlorophyll-a [Appendix B], tissue [Appendix C]) and benthic invertebrate tissue (Appendix C).

Certified reference material met the DQO for periphyton and benthic invertebrate tissue indicating excellent analytical accuracy (Appendix C).

Table A.8: Laboratory Reporting Limits (LRL) for Periphyton Tissue Samples Relative to Targets, Minto Mine, 2020[a]

Analyte	Units	Laboratory Reporting Limit (LRL)	
		Target	Achieved
Total Tellurium (Te)	mg/kg wwt	0.0040	0.0040 - 0.0065[b]

Target LRL was exceeded.

Notes: wwt = wet weight, mg/kg = milligrams per kilogram.

[a] Only analytes with reported values less than LRL were presented.

[b] Only one sample (LMC-5) had a detection limit higher than the target value.

Table A.9: Laboratory Reporting Limits (LRL) for Benthic Invertebrate Tissue Samples Relative to Targets, Minto Mine, 2020[a]

Analyte	Units	Laboratory Reporting Limit (LRL)	
		Target	Achieved
Bismuth (Bi)	mg/kg wwt	0.0020	0.0020
Boron (B)	mg/kg wwt	0.20	0.20 - 0.24[b]
Tellurium (Te)	mg/kg wwt	0.0040	0.0040
Tin (Sn)	mg/kg wwt	0.020	0.020

Target LRL was exceeded.

Notes: wwt = wet weight, mg/kg = milligrams per kilogram.

[a] Only analytes with reported values less than LRL were presented.

[b] Only one sample (LMC-5) had a detection limit higher than the target value.

A8 DATA QUALITY STATEMENT

Water chemistry results were considered appropriate for this program as they met the DQO for all samples, except for one sample of total cadmium (target limits exceeded guidelines) and one laboratory blank was detectable. Sediment chemistry data quality was considered good as all samples met the DQO, except for mercury reporting limits. However, all applicable guidelines could be met with the 2020 laboratory limits. The sediment toxicity test showed some pH results above 8.0 (the standard upper target range for testing), but pH values were consistent with *in situ* conditions and the reference results (i.e., the samples in which the slightly elevated pH results were observed) did not differ from the laboratory control. Accordingly, the laboratory deemed the tests to be acceptable and we agree that these data are of good quality.

All data quality objectives for periphyton community and benthic invertebrate community were met. Chlorophyll-a met all data quality objectives and was deemed acceptable. For periphyton and benthic tissue chemistry, the LRL target values were met for all analytes except for tellurium in one periphyton tissue sample and bismuth, boron, tellurium, and tin in four benthic invertebrate tissue samples. However, all applicable guidelines could be met with the 2020 laboratory limits.

Laboratory accuracy and precision was considered excellent across all components. Where applicable, method blanks, duplicates, matrix spikes, and laboratory control samples met the laboratory data quality objectives.

The overall quality of data for this project was considered good and can serve to meet the project objectives.

Nutrients	Total Ammonia	CWQG long-term guideline	Long-term guideline is calculated using CCME look-up table. Table values are for ammonia ion; convert to Ammonia (as N) by multiplying by 0.8224.		1.92	6.02	1.27	1.27	1.27
Total Metals	Aluminum	CWQG long-term guideline	pH < 6.5 = 5 µg/L and if pH ≥ 6 = 100 µg/L		0.100				
	Cadmium	CWQG long-term guideline	At hardness ≥ 17 to ≤ 280 mg/L $CaCO_3$, the equation is CWQG (µg/L) = $10^{\{0.83(\log[\text{hardness}]) - 2.46\}}$		0.0000953	0.000346	0.000223	0.000145	0.000137
		CWQG short-term guideline	At hardness ≥ 5.3 to ≤ 360 mg/L $CaCO_3$ the equation is CWQG (µg/L) = $10^{\{1.016(\log[\text{hardness}]) - 1.71\}}$		0.00113	0.00545	0.00319	0.00188	0.00175
	Copper	CWQG long-term guideline	CWQG (µg/L) = 0.2 x $e^{\{0.8545[\ln(\text{hardness})]-1.465\}}$		0.00200	0.00400	0.00336	0.00216	0.00203
	Lead	CWQG long-term guideline[a]	At hardness 0 to ≤ 60 mg/L $CaCO_3$, the CWQG is 1 µg/L. At hardness ≥ 60 to ≤ 180 mg/L the equation is CWQG (µg/L)= $e^{[(1.273\{\ln[\text{hardness}]\}-4.705)]}$. At hardness >180 mg/L $CaCO_3$, the CWQG is 7 µg/L		0.00100	0.00700	0.00538	0.00278	0.00254
	Nickel	CWQG long-term guideline[b]	At hardness 0 to ≤ 60 mg/L $CaCO_3$ the CWQG is 25 µg/L. At hardness > 60 to ≤ 180 mg/L $CaCO_3$ the CWQG is calculated using the equation CWQG (µg/L) = $e^{\{0.76[\ln(\text{hardness})]+1.06\}}$. At hardness >180 mg/L $CaCO_3$, the CWQG is 150 µg/L.		0.0250	0.150	0.131	0.0881	0.0836
Dissolved Metals	Cadmium	WUL Objective	WUL objective =$e^{(0.736(\ln(\text{hardness}))-4.943).}$		0.135	0.422	0.286	0.196	0.186
	Copper	WUL Objective	DOC is > 10 mg/L, objective is 0.02 mg/L Cu. If DOC ≤ 10 mg/L, objective is 0.013 mg/L Cu		all DOC values >10 mg/L. Guideline value = 0.020 mg/L				
	Manganese	CWQG long-term guideline	Long-term guideline is calculated using CCME benchmark calculator or look-up table. Values dependent on hardness and field pH		0.390	0.640	0.400	0.350	0.350
		CWQG short-term guideline	CWQG (µg/L) = $e^{(0.878[\ln(\text{hardness})] + 4.76)}$		3.89	15.2	9.56	6.06	5.70
	Zinc	CWQG long-term guideline[c]	For hardness 23.4 and 399 mg/L $CaCO_3$, pH 6.5 to 8.13, and DOC 0.3 to 22.9 mg/L, the equation is CWQG (µg/L) = $e^{(0.947[\ln(\text{hardness mg/L})] - 0.815[\text{pH}] + 0.398[\ln(\text{DOC mg/L})] + 4.625)}$		0.0310	0.125	0.0601	0.0294	0.0361
		CWQG short-term guideline[d]	For hardness 13.8 to 250.5 mg/L $CaCO_3$ and DOC 0.3 and 17.3 mg/L, the equation is CWQG (µg/L) = $e^{(0.833[\ln(\text{hardness mg/L})] + 0.240[\ln(\text{DOC mg/L})] + 0.526)}$		0.0933	0.298	0.205	0.128	0.134

Notes: CWQG = Canadian Water Quality Guideline. CCME = Canadian Council of Ministers of the Environment. WUL = water use licence.

[a] Hardness at upper McGinty Creek was outside of the validity range for calculation of total lead long-term guideline. As such, the maximum value for the guideline equation were applied (i.e., hardness of 60 mg/L $CaCO_3$).

[b] Hardness at upper McGinty Creek was outside of the validity range for calculation of total nickel long-term guideline. As such, the maximum value for the guideline equation were applied (i.e., hardness of 60 mg/L $CaCO_3$).

[c] DOC at upper Minto McGinty Creek and pH at upper Minto Creek were outside of the validity range for calculation of dissolved zinc long-term guideline. As such, the maximum values for the guideline equation were applied (i.e., DOC of 22.9 mg/L $CaCO_3$ and pH of 8.13).

[d] Hardness at upper McGinty Creek and DOC at upper and lower Minto Creek were outside of the validity range for calculation of dissolved zinc long-term guideline. As such, the maximum values for the guideline equation were applied (Hardness of 250.5 mg/L $CaCO_3$ and DOC of 17.3 mg/L).

Water quality guideline not met.

Water use licence objectives not met.

Notes: "-" = no applicable guidelines / no data available. Guidelines for 2018 and 2019 results can be found in Minnow 2019a and Minnow 2020.

[a] CCME (Canadian Council of Ministers of the Environment). 1999. Canadian Environmental Quality Guidelines. 1999 (plus updates), Canadian Council of Ministers of the Environment, Winnipeg. See Appendix Table B.5 for values and explanatory notes on selected water quality guidelines.

[b] Due to dry conditions at lower Minto Creek, only upper sites were sampled. at each area.

[c] Guideline based on field pH at each area. If pH < 6.5 = 5 µg/L and if pH ≥ 6 = 100 µg/L.

[d] Total cadmium long-term guideline is based on hardness (as $CaCO_3$). At hardness ≥ 17 to ≤ 280 mg/L, the equation is CWQG (µg/L) = $10^{\{0.83(\log[\text{hardness}]) - 2.46\}}$.

[e] Total cadmium short-term guideline is based on hardness at hardness (as $CaCO_3$). At hardness ≥ 5.3 to ≤ 360 mg/ the equation is CWQG (µg/L) = $10^{\{1.016(\log[\text{hardness}]) - 1.71\}}$.

[f] Total chromium guideline is for hexavalent chromium, Cr(VI).

[g] Total copper guideline is based on hardness and is calculated using the equation CWQG (µg/L) = 0.2 x $e^{\{0.8545[\ln(\text{hardness})]-1.465\}}$.

[h] Total lead guideline is based on hardness (as $CaCO_3$). At hardness 0 to ≤ 60 mg/L, the CWQG is 1 µg/L. At hardness >60 to ≤ 180 mg/L the equation is CWQG (µg/L)= $e^{\{(1.273[\ln[\text{hardness}]]-4.705)\}}$. At hardness >180 mg/L, the CWQG is 7 µg/L.

[i] Total nickel guideline is based on hardness (as $CaCO_3$). At hardness 0 to ≤ 60 mg/L, the CWQG is 25 µg/L. At hardness >60 to ≤ 180 mg/L the CWQG is calculated using the equation CWQG (µg/L) = $e^{\{0.76[\ln(\text{hardness})]+1.06\}}$. At hardness >180 mg/L, the CWQG is 150 µg/L.

[j] Dissolved cadmium (µg/L) objective is based on the following formula using hardness as mg/L $CaCO_3$: $e^{(0.736(\ln(\text{hardness}))-4.943)}$.

[k] Dissolved copper objective is based on dissolved organic carbon (DOC). If DOC is > 10 mg/L, objective is 0.02 mg/L Cu. If DOC ≤ 10 mg/L, objective is 0.013 mg/L Cu.

[l] Dissolved manganese long-term guideline is calculated using CCME benchmark calculator or look-up table. Values dependent on hardness and pH.

[m] Dissolved manganese short-term guideline is based on hardness and is calculated using the equation CWQG (µg/L) = $e^{(0.878[\ln(\text{hardness})] + 4.76)}$.

[n] Dissolved zinc long-term guideline is based on hardness and DOC. For hardness 13.8 to 250.5 mg/L and DOC 0.3 and 17.3 mg/L, the equation is CWQG (µg/L)= $e^{(0.833[\ln(\text{hardness mg/L})] + 0.240[\ln(\text{DOC mg/L})] + 0.526)}$.

[o] Dissolved zinc short-term benchmark is based on hardness, pH, and DOC. For pH between 6.5 and 8.13, DOC between 0.3 to 22.9 mg/L, and hardness between 23.4 and 399 mg/L, the equation is CWQG (µg/L) = $e^{(0.833[\ln(\text{hardness mg/L})] + 0.240[\ln(\text{DOC mg/L})] + 0.526)}$.

Water quality guideline not met.

Water use licence objectives not met.

Notes: "-" = no applicable guidelines / no data available. Guidelines for 2018 and 2019 results can be found in Minnow 2019a and Minnow 2020.

[a] CCME (Canadian Council of Ministers of the Environment). 1999. Canadian Environmental Quality Guidelines. 1999 (plus updates), Canadian Council of Ministers of the Environment, Winnipeg. See Appendix Table B.5 for values and explanatory notes on selected water quality guidelines.

[b] Due to dry conditions at lower Minto Creek, only upper sites were sampled. at each area.

[c] Guideline based on field pH at each area. If pH < 6.5 = 5 µg/L and if pH ≥ 6 = 100 µg/L.

[d] Total cadmium long-term guideline is based on hardness (as $CaCO_3$). At hardness ≥ 17 to ≤ 280 mg/L, the equation is CWQG (µg/L) = $10^{\{0.83(\log[\text{hardness}]) - 2.46\}}$.

[e] Total cadmium short-term guideline is based on hardness at hardness (as $CaCO_3$). At hardness ≥ 5.3 to ≤ 360 mg/ the equation is CWQG (µg/L) = $10^{\{1.016(\log[\text{hardness}]) - 1.71\}}$.

[f] Total chromium guideline is for hexavalent chromium, Cr(VI).

[g] Total copper guideline is based on hardness and is calculated using the equation CWQG (µg/L) = 0.2 x $e^{\{0.8545[\ln(\text{hardness})]-1.465\}}$.

[h] Total lead guideline is based on hardness (as $CaCO_3$). At hardness 0 to ≤ 60 mg/L, the CWQG is 1 µg/L. At hardness >60 to ≤ 180 mg/L the equation is CWQG (µg/L)= $e^{\{(1.273[\ln[\text{hardness}]]-4.705)\}}$. At hardness >180 mg/L, the CWQG is 7 µg/L.

[i] Total nickel guideline is based on hardness (as $CaCO_3$). At hardness 0 to ≤ 60 mg/L, the CWQG is 25 µg/L. At hardness >60 to ≤ 180 mg/L the CWQG is calculated using the equation CWQG (µg/L) = $e^{\{0.76[\ln(\text{hardness})]+1.06\}}$. At hardness >180 mg/L, the CWQG is 150 µg/L.

[j] Dissolved cadmium (µg/L) objective is based on the following formula using hardness as mg/L $CaCO_3$: $e^{\{0.736(\ln(\text{hardness}))-4.943\}}$.

[k] Dissolved copper objective is based on dissolved organic carbon (DOC). If DOC is > 10 mg/L, objective is 0.02 mg/L Cu. If DOC ≤ 10 mg/L, objective is 0.013 mg/L Cu.

[l] Dissolved manganese long-term guideline is calculated using CCME benchmark calculator or look-up table. Values dependent on hardness and pH.

[m] Dissolved manganese short-term guideline is based on hardness and is calculated using the equation CWQG (µg/L) = $e^{(0.878[\ln(\text{hardness})] + 4.76)}$.

[n] Dissolved zinc long-term guideline is based on hardness and DOC. For hardness 13.8 to 250.5 mg/L and DOC 0.3 and 17.3 mg/L, the equation is CWQG (µg/L)= $e^{(0.833[\ln(\text{hardness mg/L})] + 0.240[\ln(\text{DOC mg/L})] + 0.526)}$.

[o] Dissolved zinc short-term benchmark is based on hardness, pH, and DOC. For pH between 6.5 and 8.13, DOC between 0.3 to 22.9 mg/L, and hardness between 23.4 and 399 mg/L, the equation is CWQG (µg/L) = $e^{(0.833[\ln(\text{hardness mg/L})] + 0.240[\ln(\text{DOC mg/L})] + 0.526)}$.

Table B.7: Concentration of Chlorophyll-a Measured at Five Benthic Stations in Lower Wolverine and Lower Minto Creeks, Minto Mine AEMP, 2020

Lower Wolverine Creek (Reference)		Lower Minto Creek (Exposed)	
Station	mg/m^2	Station	mg/m^2
LWC-1	25.1	LMC-1	8.25
LWC-2	40.6	LMC-2	9.10
LWC-3	35.2	LMC-3	16.3
LWC-4	27.6	LMC-4	24.8
LWC-5	34.0	LMC-5	22.3
Mean	32.5	Mean	16.1
Standard Deviation	6.19	Standard Deviation	7.48
Standard Error	2.77	Standard Error	3.35

Chlorophyll-a exceeded the BCWQG of 100 mg/m^2.

Table B.8: Statistical Comparison on Chlorophyll-a, Minto Mine, 2012 to 2020[a]

Endpoint	ANOVA Model				Year	Do Endpoints Differ Between Years for Each Area?[b]		Do Endpoints Differ Between Areas?
	Transformation	Area	Year	Area x Year		LWC (Reference)	LMC (Exposed)	MOD (%)[c]
Chlorophyll-a	rank	<0.001	<0.001	<0.001	2012	CD	CD	-97
					2013	E	D	ns
					2014	DE	B	1,473
					2015	E	BC	8,352
					2016	A	A	ns
					2017	C	A	311
					2018	BC	A	478
					2020	AB	B	-52

P-value < 0.1.

Magnitude of Difference (MOD) < 0.

Magnitude of Difference (MOD) > 0.

Notes: "-" indicates no data for comparison, "ns" indicates a non-significant contrast. LWC = lower Wolverine Creek, LMC = lower Minto Creek.

[a] Sampling was not completed in 2019 due to dry conditions.

[b] Years that do not share a letter were significantly different from each other in a Tukey's Honestly Significant Difference post-hoc test (α = 0.1).

[c] MOD = $(MCT_{LMC}-MCT_{LWC})/MCT_{LWC}*100$; where the measures of central tendency (MCT) were medians because data were rank-transformed.

Table B.9: Stage Height and Total Discharge at Station W1 on Minto Creek, 2019 and 2020

SUPPORTING INFORMATION AND DATA

Laboratory Reports

ALS Environmental

CERTIFICATE OF ANALYSIS

Work Order	: **WR2000877**	Page	: 1 of 6
Client	: **Minto Explorations Ltd.**	Laboratory	: Whitehorse - Environmental
Contact	: Minto Environment - Coordinator	Account Manager	: Heather McKenzie
Address	: Suite 2100- 510 West Georgia St Vancouver BC Canada V6B 0M3	Address	: #12 151 Industrial Road Whitehorse YT Canada Y1A 2V3
Telephone	: ----	Telephone	: +1 867 668 6689
Project	: Minto Mine Monitoring	Date Samples Received	: 15-Sep-2020 14:20
PO	: 232817 (WUL)	Date Analysis Commenced	: 18-Sep-2020
C-O-C number	: 2020-09-15 F	Issue Date	: 24-Sep-2020 16:55
Sampler	: ----		
Site	: ----		
Quote number	: Q54721-Standing Offer		
No. of samples received	: 5		
No. of samples analysed	: 5		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Angela Ren	Team Leader - Metals	Metals, Burnaby, British Columbia
Bruna Botti	Team Leader - Inorganics	Inorganics - Water Quality, Burnaby, British Columbia
Clarie Tejano		Metals, Burnaby, British Columbia
Cristina Alexandre	Supervisor - Metals ICP Instrumentation	Metals, Burnaby, British Columbia
Kevin Duarte	Team Leader - Inorganics	Inorganics - Water Quality, Burnaby, British Columbia
Lindsay Gung	Supervisor - Water Chemistry	Inorganics - Water Quality, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
%	percent
µS/cm	Microsiemens per centimetre
meq/L	milliequivalents per litre
mg/L	milligrams per litre
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in reports identified as "Preliminary Report" are considered authorized for use.

Qualifiers

Qualifier	*Description*
DLM	*Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).*

No. of samples received	: 5		
No. of samples analysed	: 5		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Summary of Outliers

Outliers : Quality Control Samples

- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- Method Blank value outliers occur - please see following pages for full details.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **Water**

Analyte Group	Laboratory sample ID	Client/Ref Sample ID	Analyte	CAS Number	Method	Result	Limits	Comment
Method Blank (MB) Values								
Total Metals	QC-MRG2-8928200 1	----	manganese, total	7439-96-5	E420	0.00011 B mg/L	0.0001 mg/L	Blank result exceeds permitted value

Result Qualifiers

Qualifier	Description
B	*Method Blank exceeds ALS DQO. Associated sample results which are < Limit of Reporting or > 5 times blank level are considered reliable.*

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 15:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 15:00 is used for calculation purposes.

HDPE total (nitric acid) URC	E420	14-Sep-2020	----	----	----		23-Sep-2020	180 days	9 days	✓

Legend & Qualifier Definitions

EHTR-FM: Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended

EHTL: Exceeded ALS recommended hold time prior to analysis. Sample was received less than 24 hours prior to expiry.

EHT: Exceeded ALS recommended hold time prior to analysis.

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Water**

Evaluation: × = QC frequency outside specification; ✓ = QC frequency within specification.

Quality Control Sample Type			Count		Frequency (%)		
Analytical Methods	*Method*	*QC Lot #*	*QC*	*Regular*	*Actual*	*Expected*	*Evaluation*
Laboratory Duplicates (DUP)							
Alkalinity Species by Titration	E290	88013	2	12	16.6	5.0	✓
Ammonia by Fluorescence	E298	88540	2	8	25.0	5.0	✓
Chloride in Water by IC (Low Level)	E235.Cl-L	88001	2	7	28.5	5.0	✓

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Conductivity in Water	E100 Vancouver - Environmental	Water	APHA 2510 (mod)	Conductivity, also known as Electrical Conductivity (EC) or Specific Conductance, is measured by immersion of a conductivity cell with platinum electrodes into a water sample. Conductivity measurements are temperature-compensated to 25°C.
pH by Meter	E108 Vancouver - Environmental	Water	APHA 4500-H (mod)	pH is determined by potentiometric measurement with a pH electrode, and is conducted at ambient laboratory temperature (normally 20 ± 5°C). For high accuracy test results, pH should be measured in the field within the recommended 15 minute hold time.
TSS by Gravimetry	E160-H Vancouver - Environmental	Water	APHA 2540 D (mod)	Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, following by drying of the filter at 104 ± 1°C, with gravimetric measurement of the filtered solids. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.
Chloride in Water by IC (Low Level)	E235.Cl-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrite in Water by IC (Low Level)	E235.NO2-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrate in Water by IC (Low Level)	E235.NO3-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Sulfate in Water by IC	E235.SO4 Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Alkalinity Species by Titration	E290 Vancouver - Environmental	Water	APHA 2320 B (mod)	Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.
Ammonia by Fluorescence	E298 Vancouver - Environmental	Water	J. Environ. Monit., 2005, 7, 37-42 (mod)	Ammonia in water is analyzed by flow-injection analysis with fluorescence detection after reaction with orthophthaldialdehyde (OPA).

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Dissolved Organic Carbon by Combustion (Low Level)	E358-L Vancouver - Environmental	Water	APHA 5310 B (mod)	Dissolved Organic Carbon (Non-Purgeable), also known as NPOC (dissolved), is a direct measurement of DOC after a filtered (0.45 micron) sample has been acidified and purged to remove inorganic carbon (IC). Analysis is by high temperature combustion with infrared detection of CO2. NPOC does not include volatile organic species that are purged off with IC. For samples where the majority of DC (dissolved carbon) is comprised of IC (which is common), this method is more accurate and more reliable than the DOC by subtraction method (i.e. DC minus DIC).
Total Metals in Water by CRC ICPMS	E420 Vancouver - Environmental	Water	EPA 200.2/6020B (mod)	Water samples are digested with nitric and hydrochloric acids, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.
Total Chromium in Water by CRC ICPMS (Low Level)	E420.Cr-L Vancouver - Environmental	Water	EPA 200.2/6020B (mod)	Water samples are digested with nitric and hydrochloric acids, and analyzed by Collision/Reaction Cell ICPMS.
Dissolved Metals in Water by CRC ICPMS	E421 Vancouver - Environmental	Water	APHA 3030B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.
Dissolved Chromium in Water by CRC ICPMS (Low Level)	E421.Cr-L Vancouver - Environmental	Water	APHA 3030 B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS
Dissolved Hardness (Calculated)	EC100 Vancouver - Environmental	Water	APHA 2340B	“Hardness (as CaCO3), dissolved” is calculated from the sum of dissolved Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. “Total Hardness” refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations.
Hardness (Calculated) from Total Ca/Mg	EC100A Vancouver - Environmental	Water	APHA 2340B	“Hardness (as CaCO3), from total Ca/Mg” is calculated from the sum of total Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. “Total Hardness” refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations. Hardness from total Ca/Mg is normally comparable to Dissolved Hardness in non-turbid waters.
Ion Balance using Dissolved Metals	EC101 Vancouver - Environmental	Water	APHA 1030E	Cation Sum, Anion Sum, and Ion Balance are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Dissolved species are used where available. Minor ions are included where data is present. Ion Balance cannot be calculated accurately for waters with very low electrical conductivity (EC).
TDS in Water (Calculation)	EC103 Vancouver - Environmental	Water	APHA 1030E (mod)	Total Dissolved Solids is calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Dissolved species are used where available. Minor ions are included where data is present.

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Dissolved Metals Water Filtration	EP421 Vancouver - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HNO3.

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percentage Difference
# = Indicates a QC result that did not meet the ALS DQO.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test specific).

Sub-Matrix: **Water**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Qualifiers

Qualifier	Description
B	*Method Blank exceeds ALS DQO. Associated sample results which are < Limit of Reporting or > 5 times blank level are considered reliable.*

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Water**

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Sub-Matrix: **Water**

CERTIFICATE OF ANALYSIS

Work Order	: **WR2000901**	Page	: 1 of 3
Client	: **Minnow Environmental Inc.**	Laboratory	: Whitehorse - Environmental
Contact	: Lisa Bowron	Account Manager	: Heather McKenzie
Address	: 204 – 1006 Fort Street Victoria BC Canada V8V 3K4	Address	: #12 151 Industrial Road Whitehorse YT Canada Y1A 2V3
Telephone	: 250 595 1627	Telephone	: +1 867 668 6689
Project	: Minnow Project 20-70	Date Samples Received	: 18-Sep-2020 11:45
PO	: ----	Date Analysis Commenced	: 25-Oct-2020
C-O-C number	:	Issue Date	: 03-Nov-2020 14:32
Sampler	: Pierre Stecko		
Site	: ----		
Quote number	: Q75875		
No. of samples received	: 10		
No. of samples analysed	: 10		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Caitlin Macey	Team Leader - Inorganics	Inorganics - Water Quality, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
µg	micrograms

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in reports identified as "Preliminary Report" are considered authorized for use.

No. of samples analysed	: 10		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 15:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 15:00 is used for calculation purposes.

Matrix: **Biota**

Evaluation: × = Holding time exceedance ; ✓ = Within Holding Time

Legend & Qualifier Definitions

EHT: Exceeded ALS recommended hold time prior to analysis.

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Biota**

Evaluation: × = *QC frequency outside specification*; ✓ = *QC frequency within specification.*

Quality Control Sample Type			Count		Frequency (%)		
Analytical Methods	*Method*	*QC Lot #*	*QC*	*Regular*	*Actual*	*Expected*	*Evaluation*
Laboratory Control Samples (LCS)							
Chlorophyll-a by Fluorometry	E870	95123	1	10	10.0	5.0	✓
Method Blanks (MB)							
Chlorophyll-a by Fluorometry	E870	95123	1	10	10.0	5.0	✓

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Chlorophyll-a by Fluorometry	E870 Vancouver - Environmental	Biota	EPA 445.0 (mod)	Chlorophyll-a is determined by a routine acetone/ethanol extraction followed with analysis by fluorometry using the non-acidification procedure.

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Chlorophyll-a Extraction	EP870 Vancouver - Environmental	Biota	EPA 445.0 (mod)	Chlorophyll-a is determined by a routine acetone/ethanol extraction followed with analysis by fluorometry using the non-acidification procedure.

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percentage Difference
# = Indicates a QC result that did not meet the ALS DQO.

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Sub-Matrix: **Biota**

Analyte	CAS Number	Method	LOR	Unit	Result	Qualifier
Plant Pigments (QCLot: 95123)						
chlorophyll a	479-61-8	E870	0.01	µg	<0.010	----

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Biota**

					Laboratory Control Sample (LCS) Report				
					Spike	Recovery (%)	Recovery Limits (%)

Indicates benthic tissue concentration exceeding the higher reference mean by more than two times.

Indicates benthic tissue concentration exceeding the BCMOE interim selenium guideline for invertebrate tissue (4 µg/g dw; BCMOE 2014).

Notes: - = no data available. dw = dry weight.

Sampler	: ----		
Site	: ----		
Quote number	: Q54721-Standing Offer		
No. of samples received	: 32		
No. of samples analysed	: 32		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Dee Lee	Analyst	Metals, Burnaby, British Columbia
Dwayne Bennett	Technical Specialist	Inorganics, Saskatoon, Saskatchewan
Hedy Lai	Team Leader - Inorganics	Inorganics, Saskatoon, Saskatchewan
Kim Jensen	Department Manager - Metals	Metals, Burnaby, British Columbia
Nancy Cruse	Laboratory _ Supervisor	Inorganics, Saskatoon, Saskatchewan
Ophelia Chiu	Supervisor - Organics Instrumentation	Organics, Burnaby, British Columbia
Xihua Yao	Laboratory Analyst	Inorganics, Saskatoon, Saskatchewan

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
%	percent
mg/kg	milligrams per kilogram
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in reports identified as "Preliminary Report" are considered authorized for use.

Qualifiers

Qualifier	*Description*
DLHC	*Detection Limit Raised: Dilution required due to high concentration of test analyte(s).*

QUALITY CONTROL INTERPRETIVE REPORT

Work Order	: **WR2000904**	Page	: 1 of 23
Client	: **Minnow Environmental Inc.**	Laboratory	: Whitehorse - Environmental
Contact	: Pierre Stecko	Account Manager	: Heather McKenzie
Address	: 204 – 1006 Fort Street Victoria BC Canada V8V 3K4	Address	: #12 151 Industrial Road Whitehorse, Yukon Canada Y1A 2V3
Telephone	: ----	Telephone	: +1 867 668 6689
Project	: Minnow Project 20-70	Date Samples Received	: 18-Sep-2020 11:45
PO	: ----	Issue Date	: 13-Oct-2020 18:00
C-O-C number	:		
Sampler	: ----		
Site	: ----		
Quote number	: Q54721-Standing Offer		
No. of samples received	: 32		
No. of samples analysed	: 32		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- No Analysis Holding Time Outliers exist.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 15:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 15:00 is used for calculation purposes.

Matrix: **Soil/Solid**

Evaluation: × = Holding time exceedance ; ✓ = Within Holding Time

Legend & Qualifier Definitions

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Soil/Solid**

Evaluation: × = *QC frequency outside specification*; ✓ = *QC frequency within specification.*

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
pH by Meter (1:2 Soil:Water Extraction)	E108 Vancouver - Environmental	Soil/Solid	BC Lab Manual	pH is determined by potentiometric measurement with a pH electrode at ambient laboratory temperature (normally 20 ± 5°C), and is carried out in accordance with procedures described in the BC Lab Manual (prescriptive method). The procedure involves mixing the dried (at <60 ºC) and sieved (10mesh/2mm) sample with ultra pure water at a 1:2 ratio of sediment to water. The pH is then measured by a standard pH probe.
Particle Size Analysis - Sieve <2mm	E182 Saskatoon - Environmental	Soil/Solid	ASTM D6913-04	Soil samples are disaggregated and sieved through a 2mm sieve. Material passed through the sieve is then further disaggregated using calgon solution and passed through a series of sieves. The amount passing through the sieves is measured gravimetrically.
Loss On Ignition (420°C)	E205C Saskatoon - Environmental	Soil/Solid	CSSS (1978) 3.81 (mod)	Loss On Ignition (LOI) is determined by drying a portion of an air dried and ground sampld at 105°C, then igniting at 420°C for 2 hours. The weight loss after ignition is reported as % loss on ignition. LOI is reported on a dry weight basis. LOI at 420°C can be considered an estimation of Organic Matter Content according to Alberta Agriculture (1988).
Total Kjeldahl Nitrogen by Colourimetry	E319 Saskatoon - Environmental	Soil/Solid	CSSS (2008) 22.2.3	The soil is digested with sulfuric acid in the presence of $CuSO_4$ and K_2SO_4 catalysts. Ammonia in the soil extract is determined colrimetrically at 660 nm.
Total Carbon by Combustion	E351 Saskatoon - Environmental	Soil/Solid	CSSS (2008) 21.2 (mod)	Total Carbon is determined by the high temperature combustion method with measurement by an infrared detector.
Total Inorganic Carbon by Acetic Acid pH Standard Curve	E354 Saskatoon - Environmental	Soil/Solid	CSSS (2008) 20.2	Total Inorganic Carbon is determined by acetic acid pH standard curve, where a known quantity of acetic acid is consumed by reaction with carbonates in the soil. The pH of the resulting solution is measured and compared against a standard curve relating pH to weight of carbonate.
Metals in Soil/Solid by CRC ICPMS	E440 Vancouver - Environmental	Soil/Solid	EPA 6020B (mod)	Samples are dried, then sieved through a 2 mm sieve, and digested with HNO_3 and HCl. This method is intended to liberate metals that may be environmentally available. Silicate minerals are not solubilized. Dependent on sample matrix, some metals may be only partially recovered, including Al, Ba, Be, Cr, Sr, Ti, Tl, V, W, and Zr. Volatile forms of sulfur (including sulfide) may not be captured, as they may be lost during sampling, storage, or digestion. Analysis is by Collision/Reaction Cell ICPMS.
Mercury in Soil/Solid by CVAAS	E510 Vancouver - Environmental	Soil/Solid	EPA 200.2/1631 Appendix (mod)	Samples are dried, then sieved through a 2 mm sieve, and digested with HNO_3 and HCl, followed by CVAAS analysis.
Particle Size Analysis (Pipette) - MMER Classification	EC184E Saskatoon - Environmental	Soil/Solid	Metal Mining Technical Guidance for Environmental Effects Monitoring (2012)	The particle size determination is performed by various methods to generate a Grain Size curve. The data from the curve is then used to produce particle size ranges based on the Metal Mining Effluent Regulations (MMER) classification system for Environmental Effects Monitoring.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Total Organic Carbon (Calculated) in soil	EC356 Saskatoon - Environmental	Soil/Solid	CSSS (2008) 21.2	Total Organic Carbon (TOC) is calculated by the difference between total carbon (TC) and total inorganic carbon (TIC).

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Leach 1:2 Soil:Water for pH	EP108 Vancouver - Environmental	Soil/Solid	BC WLAP METHOD: PH, ELECTROMETRIC, SOIL	The procedure involves mixing the dried (at <60°C) and sieved (No. 10 / 2mm) sample with deionized/distilled water at a 1:2 ratio of sediment to water.
Kjeldahl Digestion for soils	EP319 Saskatoon - Environmental	Soil/Solid	CSSS (2008) 22.2.3	The soil is digested with sulfuric acid in the presence of CuSO4 and K2SO4 catalysts.
Digestion for Metals and Mercury	EP440 Vancouver - Environmental	Soil/Solid	EPA 200.2 (mod)	Samples are dried, then sieved through a 2 mm sieve, and digested with HNO3 and HCl. This method is intended to liberate metals that may be environmentally available.
Dry and Grind	EPP442 Saskatoon - Environmental	Soil/Solid	Soil Sampling and Methods of Analysis, Carter 2008	After removal of any coarse fragments and reservation of wet subsamples a portion of homogenized sample is set in a tray and dried at less than 60 C until dry. The sample is then particle size reduced with an automated crusher or mortar and pestle, typically to <2 mm. Further size reduction may be needed for particular tests.

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percentage Difference
# = Indicates a QC result that did not meet the ALS DQO.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test specific).

Sub-Matrix: **Soil/Solid**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Soil/Solid**

Reference Material (RM) Report

A Reference Material (RM) is a homogenous material with known and well-established analyte concentrations. RMs are processed in an identical manner to test samples, and are used to monitor and control the accuracy and precision of a test method for a typical sample matrix. RM results are expressed as percent recovery of the target analyte concentration. RM targets may be certified target concentrations provided by the RM supplier, or may be ALS long-term mean values (for empirical test methods).

Sub-Matrix: **Soil/Solid**

					Reference Material (RM) Report				
					RM Target	Recovery (%)	Recovery Limits (%)		
Laboratory sample ID	Reference Material ID	Analyte	CAS Number	Method	Concentration	RM	Low	High	Qualifier
Physical Tests (QCLot: 91914)

1.0 INTRODUCTION

Nautilus Environmental Company Inc. conducted freshwater sediment toxicity tests for Minnow Environmental Inc. on samples identified as LWC and LMC. The samples were collected on September 13 and 15, 2020; each sample was transported in two Ziploc bags and delivered to laboratory in Burnaby, BC on September 22, 2020. The samples had a temperature of 8.5°C on receipt and were stored in the dark at 4 ± 2°C prior to testing. A 14-d *Hyalella azteca* and 10-d *Chironomus dilutus* survival and growth sediment toxicity test were conducted on the samples and the test results provided in this report. Copies of laboratory data sheets and printouts of statistical analyses for the tests are provided in Appendices A and B, analytical chemistry is provided in Appendix C and the chain-of-custody form is provided in Appendix D.

2.0 METHODS

Methods for the toxicity tests are summarized in Tables 1 and 2. Testing was conducted according to procedures described by Environment Canada (1997 and 2017). Statistical analyses for all tests were performed using CETIS (Tidepool Scientific Software, 2013).

Ammonia concentrations were measured in-house three times per week on reference sediment sample LWC to ensure that un-ionized ammonia was below 0.2 mg/L (Environment Canada, 2017). Samples of overlying water were also collected at test initiation and termination, and sent to ALS Environmental, Burnaby, BC for measurements of total ammonia concentration. Analytical results are provided in Appendix C.

Table 1. Summary of test conditions: *Hyalella azteca* survival and growth test.

Test species	*Hyalella azteca*
Organism source	Aquatic Research Organisms, Hampton, NH
Organism age	2- to 9-days old
Test type	Static
Test duration	14 days
Test vessel	375-mL glass container
Test volume	100 mL sediment; 175 mL overlying water
Test replicates	5 field replicates per sample
Number of organisms	10 per replicate
Control/dilution water	Reconstituted water
Test solution renewal	None
Test temperature	23 ± 1°C
Feeding	0.75 mL of YCT and 1.35 mg of Tetramin per replicate daily
Light intensity	500 to 1000 lux at water surface
Photoperiod	16 hours light/8 hours dark
Aeration	Continuous gentle aeration
Test measurements	Temperature, dissolved oxygen, pH and conductivity of overlying water measured daily; hardness, alkalinity and total ammonia of overlying water measured at test initiation and termination; unionized ammonia measured three times weekly in overlying water of reference sample
Test protocol	Environment Canada (2017), EPS 1/RM/33
Statistical software	CETIS Version 1.9.4
Test endpoints	Survival and dry weight
Test acceptability criteria for controls	≥80% survival and ≥0.1 mg/amphipod dry weight
Reference toxicant	Sodium chloride (NaCl)

Table 2. Summary of test conditions: *Chironomus dilutus* survival and growth test.

Test species	*Chironomus dilutus*
Organism source	Aquatic BioSystems, Fort Collins, CO
Organism age	Third instar
Test type	Static
Test duration	10 days
Test vessel	375-mL glass container
Test volume	100 mL sediment; 175 mL overlying water
Test replicates	5 field replicates per sample
Number of organisms	10 per replicate
Control/dilution water	Reconstituted water
Test solution renewal	None
Test temperature	23 ± 1°C
Feeding	6 mg of Tetramin per replicate daily
Light intensity	500 to 1000 lux at water surface
Photoperiod	16 hours light/8 hours dark
Aeration	Continuous gentle aeration
Test measurements	Temperature, dissolved oxygen, pH and conductivity of overlying water measured daily; hardness, alkalinity and total ammonia of overlying water measured at test initiation and termination
Test protocol	Environment Canada (1997), EPS 1/RM/32
Statistical software	CETIS Version 1.9.4
Test endpoints	Survival and dry weight
Test acceptability criteria for controls	≥70% survival and ≥0.6 mg/worm dry weight
Reference toxicant	Potassium chloride (KCl)

3.0 RESULTS

Adverse effects were observed on the survival of *H. azteca* in the exposure sediment (LMC) compared to both the control sediment and the reference sediment (LWC) (Table 3). The survival of *C. dilutus* was also significantly reduced in the exposure sediment compared to the reference sediment only (Table 4). No significant effects were observed on growth for either *H. azteca* or *C. dilutus*.

Measured total ammonia concentrations are summarized in Table 5. These concentrations were at levels that are not expected to cause adverse effects to the species. Un-ionized ammonia measurements on the reference sediment sample were below 0.2 mg/L throughout the *H. azteca* test; therefore, renewal of the overlying water was not required (Environment Canada, 2017).

Table 3. Results: *Hyalella azteca* survival and growth test.

Sample ID	Mean ± SD	
	Survival (%)	Average Dry Weight (mg/org)
Control Sediment	100 ± 0.0	0.14 ± 0.02
LWC	100 ± 0.0	0.14 ± 0.01
LMC	74.0 ± 35.8 *,α	0.13 ± 0.01

SD = Standard Deviation

(*) Indicates a statistically significant effect relative to control sediment

(α) Indicates a statistically significant effect relative to reference sediment LWC

Table 4. Results: *Chironomus dilutus* survival and growth test.

Sample ID	Mean ± SD	
	Survival (%)	Average Dry Weight (mg/org)
Control Sediment	90.0 ± 10.0	1.74 ± 0.18
LWC	94.0 ± 13.4	2.40 ± 0.31
LMC	76.0 ± 20.7 α	2.65 ± 0.27

SD = Standard Deviation

(α) Indicates a statistically significant effect relative to reference sediment LWC

Table 5. Summary of total overlying ammonia concentrations (mg/L N) measured in the toxicity tests.

Sample ID	*Hyalella azteca*		*Chironomus dilutus*	
	Day 0	Day 14	Day 0	Day 10
Control Sediment	0.228	0.292	0.228	1.13
LWC	0.050	0.087	0.050	0.295
LMC	0.188	0.080	0.188	0.289

4.0 QA/QC

The health history of the test organisms used in the exposures was acceptable and met the requirement of the Environment Canada protocol. The test met all control acceptability criteria and water quality parameters of the *C. dilutus* test remained within ranges specified in the protocol throughout the test. The pH measurements of the reference sediment in the *H. azteca* test were 8.1 and 8.2 on Days 8 to 14 of the test; water renewals were not conducted, which is required if the pH of the reference sediment is outside of the acceptable range of 6.0 to 8.0. This deviation did not appear to affect test results, as the reference sediment performed equally as well and was not significantly different compared to the control sediment. There were no other deviations from the test methodology. Uncertainty associated with the tests are best described by the standard deviations around the mean.

Results of the reference toxicant test conducted during the testing program are summarized in Table 6. Results for the *H. azteca* test fell within the acceptable range for organism performance of mean and two standard deviations, based on historical results obtained by the laboratory with this test. Thus, the sensitivity of the organisms used in the test was appropriate. Results for the *C. dilutus* test was slightly outside of two standard deviations, was likely due to variability and did not appear to affect test results.

Table 6. Reference toxicant test results.

Test Species	Endpoint	Historical Mean (2 SD Range)	CV (%)	Test Date
H. azteca	Survival (LC50): 4.5 g/L NaCl	5.7 (4.0 – 8.1)	18	September 25, 2020
C. dilutus	Survival (LC50): 4.3 g/L KCl	5.8 (4.4 – 7.8)	15	September 25, 2020

SD = Standard Deviation, CV = Coefficient of Variation, LC = Lethal Concentration

Site	: Tissue, Water and Sediment Testing		
Quote number	: Q69439		
No. of samples received	: 3		
No. of samples analysed	: 3		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Ruth Morrison		Inorganics, Calgary, Alberta

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
mg/L	milligrams per litre

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in reports identified as "Preliminary Report" are considered authorized for use.

QUALITY CONTROL INTERPRETIVE REPORT

Work Order	: **VA20B6904**	Page	: 1 of 5
Client	: **Nautilus Environmental Company Inc.**	Laboratory	: Vancouver - Environmental
Contact	: Karen Lee	Account Manager	: Hilary Woods
Address	: 8664 Commerce Court Imperial Square Lake City Burnaby BC Canada V5A 4N7	Address	: 8081 Lougheed Highway Burnaby, British Columbia Canada V5A 1W9
Telephone	: 604 420 8773	Telephone	: +1 604 253 4188
Project	: ----	Date Samples Received	: 30-Sep-2020 17:30
PO	: ----	Issue Date	: 15-Oct-2020 09:43
C-O-C number	: ----		
Sampler	: ----		
Site	: Tissue, Water and Sediment Testing		
Quote number	: Q69439		
No. of samples received	: 3		
No. of samples analysed	: 3		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- No Analysis Holding Time Outliers exist.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 15:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 15:00 is used for calculation purposes.

Matrix: **Water**

Evaluation: × = Holding time exceedance ; ✓ = Within Holding Time

Analyte Group / Container / Client Sample ID(s)	Method	Sampling Date	Extraction / Preparation				Analysis			
			Preparation Date	Holding Times Rec	Holding Times Actual	Eval	Analysis Date	Holding Times Rec	Holding Times Actual	Eval

Quote number	: Q69439		
No. of samples received	: 3		
No. of samples analysed	: 3		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- No Analysis Holding Time Outliers exist.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 15:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 15:00 is used for calculation purposes.

Matrix: **Water**

Evaluation: × = Holding time exceedance ; ✓ = Within Holding Time

Analyte Group / Container / Client Sample ID(s)	Method	Sampling Date	Extraction / Preparation				Analysis			
			Preparation Date	Holding Times Rec	Holding Times Actual	Eval	Analysis Date	Holding Times Rec	Holding Times Actual	Eval
Anions and Nutrients : Ammonia by Fluorescence

Legend & Qualifier Definitions

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Water**

Evaluation: × = *QC frequency outside specification*; ✓ = *QC frequency within specification.*

Quality Control Sample Type			Count		Frequency (%)		
Analytical Methods	*Method*	*QC Lot #*	*QC*	*Regular*	*Actual*	*Expected*	*Evaluation*
Laboratory Duplicates (DUP)							
Ammonia by Fluorescence	E298	106662	1	20	5.0	5.0	✓
Laboratory Control Samples (LCS)							
Ammonia by Fluorescence	E298	106662	1	20	5.0	5.0	✓
Method Blanks (MB)							
Ammonia by Fluorescence	E298	106662	1	20	5.0	5.0	✓
Matrix Spikes (MS)							
Ammonia by Fluorescence	E298	106662	1	20	5.0	5.0	✓

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Ammonia by Fluorescence	E298 Calgary - Environmental	Water	J. Environ. Monit., 2005, 7, 37-42 (mod)	Ammonia in water is analyzed by flow-injection analysis with fluorescence detection after reaction with orthophthaldialdehyde (OPA).

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Cristina Alexandre	Supervisor - Metals ICP Instrumentation	Metals, Burnaby, British Columbia
Evan Ben-Oliel	Metal Analyst	Metals, Burnaby, British Columbia
Kinny Wu	Lab Analyst	Metals, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
%	percent
mg/kg	milligrams per kilogram
mg/kg wwt	milligrams per kilogram wet weight

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in reports identified as "Preliminary Report" are considered authorized for use.

Qualifiers

Qualifier	*Description*
DLA	*Detection Limit adjusted for required dilution.*

QUALITY CONTROL INTERPRETIVE REPORT

Work Order	: **WR2000902**	Page	: 1 of 13
Client	: **Minnow Environmental Inc.**	Laboratory	: Whitehorse - Environmental
Contact	: Lisa Bowron	Account Manager	: Heather McKenzie
Address	: 204 – 1006 Fort Street Victoria BC Canada V8V 3K4	Address	: #12 151 Industrial Road Whitehorse, Yukon Canada Y1A 2V3
Telephone	: 250 595 1627	Telephone	: +1 867 668 6689
Project	: Minnow Project 20-70	Date Samples Received	: 18-Sep-2020 11:45
PO	: ----	Issue Date	: 10-Nov-2020 18:14
C-O-C number	: 1 of 2, 2 of 2		
Sampler	: Pierro Stecko		
Site	: ----		
Quote number	: Q75875		
No. of samples received	: 15		
No. of samples analysed	: 15		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- No Analysis Holding Time Outliers exist.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 15:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 15:00 is used for calculation purposes.

Legend & Qualifier Definitions

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Biota**

Evaluation: × = *QC frequency outside specification*; ✓ = *QC frequency within specification.*

Quality Control Sample Type			Count		Frequency (%)		
Analytical Methods	*Method*	*QC Lot #*	*QC*	*Regular*	*Actual*	*Expected*	*Evaluation*
Laboratory Duplicates (DUP)							
Mercury in Biota by CVAAS (DRY units, Micro)	E511	110393	1	15	6.6	5.0	✓
Mercury in Biota by CVAAS (WET units, Micro)	E511A	110396	1	15	6.6	5.0	✓
Metals in Biota by CRC ICPMS (DRY units, Micro)	E472	110395	1	15	6.6	5.0	✓
Metals in Biota by CRC ICPMS (WET units, Micro)	E472A	110394	1	15	6.6	5.0	✓
Moisture Content by Gravimetry (Micro)	E144-H	107441	1	15	6.6	5.0	✓
Laboratory Control Samples (LCS)							
Mercury in Biota by CVAAS (DRY units, Micro)	E511	110393	2	15	13.3	10.0	✓
Mercury in Biota by CVAAS (WET units, Micro)	E511A	110396	2	15	13.3	10.0	✓

Metals in Biota by CRC ICPMS (WET units, Micro)	E472A	110394	1	15	6.6	5.0	✓
Moisture Content by Gravimetry (Micro)	E144-H	107441	1	15	6.6	5.0	✓

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Moisture Content by Gravimetry (Micro)	E144-H Vancouver - Environmental	Biota	Puget Sound Water Quality Authority/BC MOE Lab Manual	Moisture is measured gravimetrically by drying the sample at <60°C for a minimum of 3 days to constant weight. Moisture content is calculated as the weight loss (due to water) divided by the wet weight of soil, expressed as a percentage.
Metals in Biota by CRC ICPMS (DRY units, Micro)	E472 Vancouver - Environmental	Biota	EPA 200.3/6020B (mod)	Tissue samples are homogenized and sub-sampled prior to hotblock digestion with HNO3, HCl, and H2O2. Analysis is by Collision/Reaction Cell ICPMS. Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.
Metals in Biota by CRC ICPMS (WET units, Micro)	E472A Vancouver - Environmental	Biota	EPA 200.3/6020B (mod)	Tissue samples are homogenized and sub-sampled prior to hotblock digestion with HNO3, HCl, and H2O2. Analysis is by Collision/Reaction Cell ICPMS. Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.
Mercury in Biota by CVAAS (DRY units, Micro)	E511 Vancouver - Environmental	Biota	EPA 200.3/1631E (mod)	Samples are homogenized and sub-sampled prior to hotblock digestion with nitric acid, hydrochloric acid, and hydrogen peroxide. Analysis is by CVAAS.
Mercury in Biota by CVAAS (WET units, Micro)	E511A Vancouver - Environmental	Biota	EPA 200.3/1631E (mod)	Samples are homogenized and sub-sampled prior to hotblock digestion with nitric acid, hydrochloric acid, and hydrogen peroxide. Analysis is by CVAAS.

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Metals and Mercury Biota Digestion (Micro)	EP472 Vancouver - Environmental	Biota	EPA 200.3	This method, designed for small sample amounts, uses a heated strong acid digestion with HNO3, HCl, and H2O2 and is intended to provide a conservative estimate of bio-available metals.

QUALITY CONTROL REPORT

Work Order	: **WR2000902**	Page	: 1 of 14
Client	: Minnow Environmental Inc.	Laboratory	: Whitehorse - Environmental
Contact	: Lisa Bowron	Account Manager	: Heather McKenzie
Address	: 4838 Richard Rd. SW, Suite 300 Calgary AB Canada T3E 6L1	Address	: #12 151 Industrial Road Whitehorse, Yukon Canada Y1A 2V3

PO	: ----	Date Analysis Commenced	: 23-Oct-2020
C-O-C number	: 1 of 2, 2 of 2	Issue Date	: 10-Nov-2020 18:14
Sampler	: Pierro Stecko		
Site	: ----		
Quote number	: Q75875		
No. of samples received	: 15		
No. of samples analysed	: 15		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits
- Reference Material (RM) Report; Recovery and Acceptance Limits
- Method Blank (MB) Report; Recovery and Acceptance Limits
- Laboratory Control Sample (LCS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Kinny Wu	Lab Analyst	Metals, Burnaby, British Columbia

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percentage Difference
# = Indicates a QC result that did not meet the ALS DQO.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test specific).

Sub-Matrix: **Biota**

					Laboratory Duplicate (DUP) Report						
Laboratory sample ID	Client sample ID	Analyte	CAS Number	Method	LOR	Unit	Original Result	Duplicate Result	RPD(%) or Difference	Duplicate Limits	Qualifier
