Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Biota**

Reference Material (RM) Report

A Reference Material (RM) is a homogenous material with known and well-established analyte concentrations. RMs are processed in an identical manner to test samples, and are used to monitor and control the accuracy and precision of a test method for a typical sample matrix. RM results are expressed as percent recovery of the target analyte concentration. RM targets may be certified target concentrations provided by the RM supplier, or may be ALS long-term mean values (for empirical test methods).

Sub-Matrix: **Biota**

					Reference Material (RM) Report

Quote number	: Q75875		
No. of samples received	: 16		
No. of samples analysed	: 15		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Evan Ben-Oliel	Metal Analyst	Metals, Burnaby, British Columbia
Kim Jensen	Department Manager - Metals	Metals, Burnaby, British Columbia
Kinny Wu	Lab Analyst	Metals, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
%	percent
mg/kg	milligrams per kilogram
mg/kg wwt	milligrams per kilogram wet weight

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in reports identified as "Preliminary Report" are considered authorized for use.

QUALITY CONTROL INTERPRETIVE REPORT

Work Order	: **WR2000903**	Page	: 1 of 13
Client	: **Minnow Environmental Inc.**	Laboratory	: Whitehorse - Environmental
Contact	: Lisa Bowron	Account Manager	: Heather McKenzie
Address	: 204 – 1006 Fort Street Victoria BC Canada V8V 3K4	Address	: #12 151 Industrial Road Whitehorse, Yukon Canada Y1A 2V3
Telephone	: 250 595 1627	Telephone	: +1 867 668 6689
Project	: Minnow Project 20-70	Date Samples Received	: 18-Sep-2020 11:45
PO	: ----	Issue Date	: 10-Nov-2020 18:22
C-O-C number	: 1 of 2, 2 of 2		
Sampler	: Pierre Stecko		
Site	: ----		
Quote number	: Q75875		
No. of samples received	: 16		
No. of samples analysed	: 15		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- No Analysis Holding Time Outliers exist.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 15:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 15:00 is used for calculation purposes.

Legend & Qualifier Definitions

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Biota**

Evaluation: × = *QC frequency outside specification*; ✓ = *QC frequency within specification.*

Quality Control Sample Type			Count		Frequency (%)		
Analytical Methods	*Method*	*QC Lot #*	*QC*	*Regular*	*Actual*	*Expected*	*Evaluation*
Laboratory Control Samples (LCS)

Moisture Content by Gravimetry (Biopsy)	E144A	110478	1	15	6.6	5.0	✓

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Moisture Content by Gravimetry (Biopsy)	E144A Vancouver - Environmental	Biota	Puget Sound Water Quality Authority/CCME PHC in Soil - Tier 1	This analysis is carried out gravimetrically by drying the sample at < 60 deg. C for a minimum of three days.
Metals by CRC ICPMS (DRY units, Biopsy)	E475 Vancouver - Environmental	Biota	EPA 200.3/6020B (mod)	Samples are digested with nitric acid, hydrochloric acid, and hydrogen peroxide. Analysis is by Collision/Reaction Cell ICPMS: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.
Metals in Biota by CRC ICPMS (WET units, Biopsy)	E475A Vancouver - Environmental	Biota	EPA 200.3/6020B (mod)	Samples are digested with nitric acid, hydrochloric acid, and hydrogen peroxide. Analysis is by Collision/Reaction Cell ICPMS. Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.
Mercury in Biota by CVAAS (DRY units, Biopsy)	E512 Vancouver - Environmental	Biota	EPA 200.3/1631E (mod)	Samples are digested with nitric acid, hydrochloric acid, and hydrogen peroxide. Analysis is by CVAAS.
Mercury in Biota by CVAAS (WET units, Biopsy)	E512A Vancouver - Environmental	Biota	EPA 200.3/1631E (mod)	Samples are homogenized digested with nitric acid, hydrochloric acid, and hydrogen peroxide. Analysis is by CVAAS.

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Metals and Mercury Biota Digestion (Micro)	EP472 Vancouver - Environmental	Biota	EPA 200.3	This method, designed for small sample amounts, uses a heated strong acid digestion with HNO3, HCl, and H2O2 and is intended to provide a conservative estimate of bio-available metals.
Metals and Mercury Biota Digestion (Biopsy)	EP475 Vancouver - Environmental	Biota	EPA 200.3/200.8 (mod)	Samples are digested with nitric acid, hydrochloric acid, and hydrogen peroxide. Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits
- Reference Material (RM) Report; Recovery and Acceptance Limits
- Method Blank (MB) Report; Recovery and Acceptance Limits
- Laboratory Control Sample (LCS) Report; Recovery and Acceptance Limits

Kinny Wu	Lab Analyst	Metals, Burnaby, British Columbia

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percentage Difference
# = Indicates a QC result that did not meet the ALS DQO.

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Sub-Matrix: **Biota**

Analyte	CAS Number	Method	LOR	Unit	Result	Qualifier
Physical Tests (QCLot: 110478)

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Biota**

Reference Material (RM) Report

A Reference Material (RM) is a homogenous material with known and well-established analyte concentrations. RMs are processed in an identical manner to test samples, and are used to monitor and control the accuracy and precision of a test method for a typical sample matrix. RM results are expressed as percent recovery of the target analyte concentration. RM targets may be certified target concentrations provided by the RM supplier, or may be ALS long-term mean values (for empirical test methods).

Sub-Matrix: **Biota**

Indicates sediment concentration exceeding CSQG ISQG.

Indicates sediment concentration exceeding CSQG PEL.

Notes: CSQG = Canadian Sediment Quality Guidelines; ISQG = interim sediment quality guideline; PEL = probable effect level; - = no guideline available or no data available.

[a] CSQG (CCME 1999 plus updates) and BC Sediment Quality Guideline for Selenium (BCMOE 2014).

Indicates benthic tissue concentration exceeding the higher reference mean by more than two times.

Indicates benthic tissue concentration exceeding the BCMOE interim selenium guideline for invertebrate tissue (4 µg/g dw; BCMOE 2014).

Notes: - = no data available. dw = dry weight.

Laboratory Reports

APPENDIX E

BENTHIC INVERTEBRATE COMMUNITY DATA

Figures and Tables

Figure E.1: Intermediate Axis Length of 100 Rocks Measured at Five Benthic Stations in Lower Wolverine Creek, Lower Big Creek, and Lower Minto Creek, Minto Mine, 2020

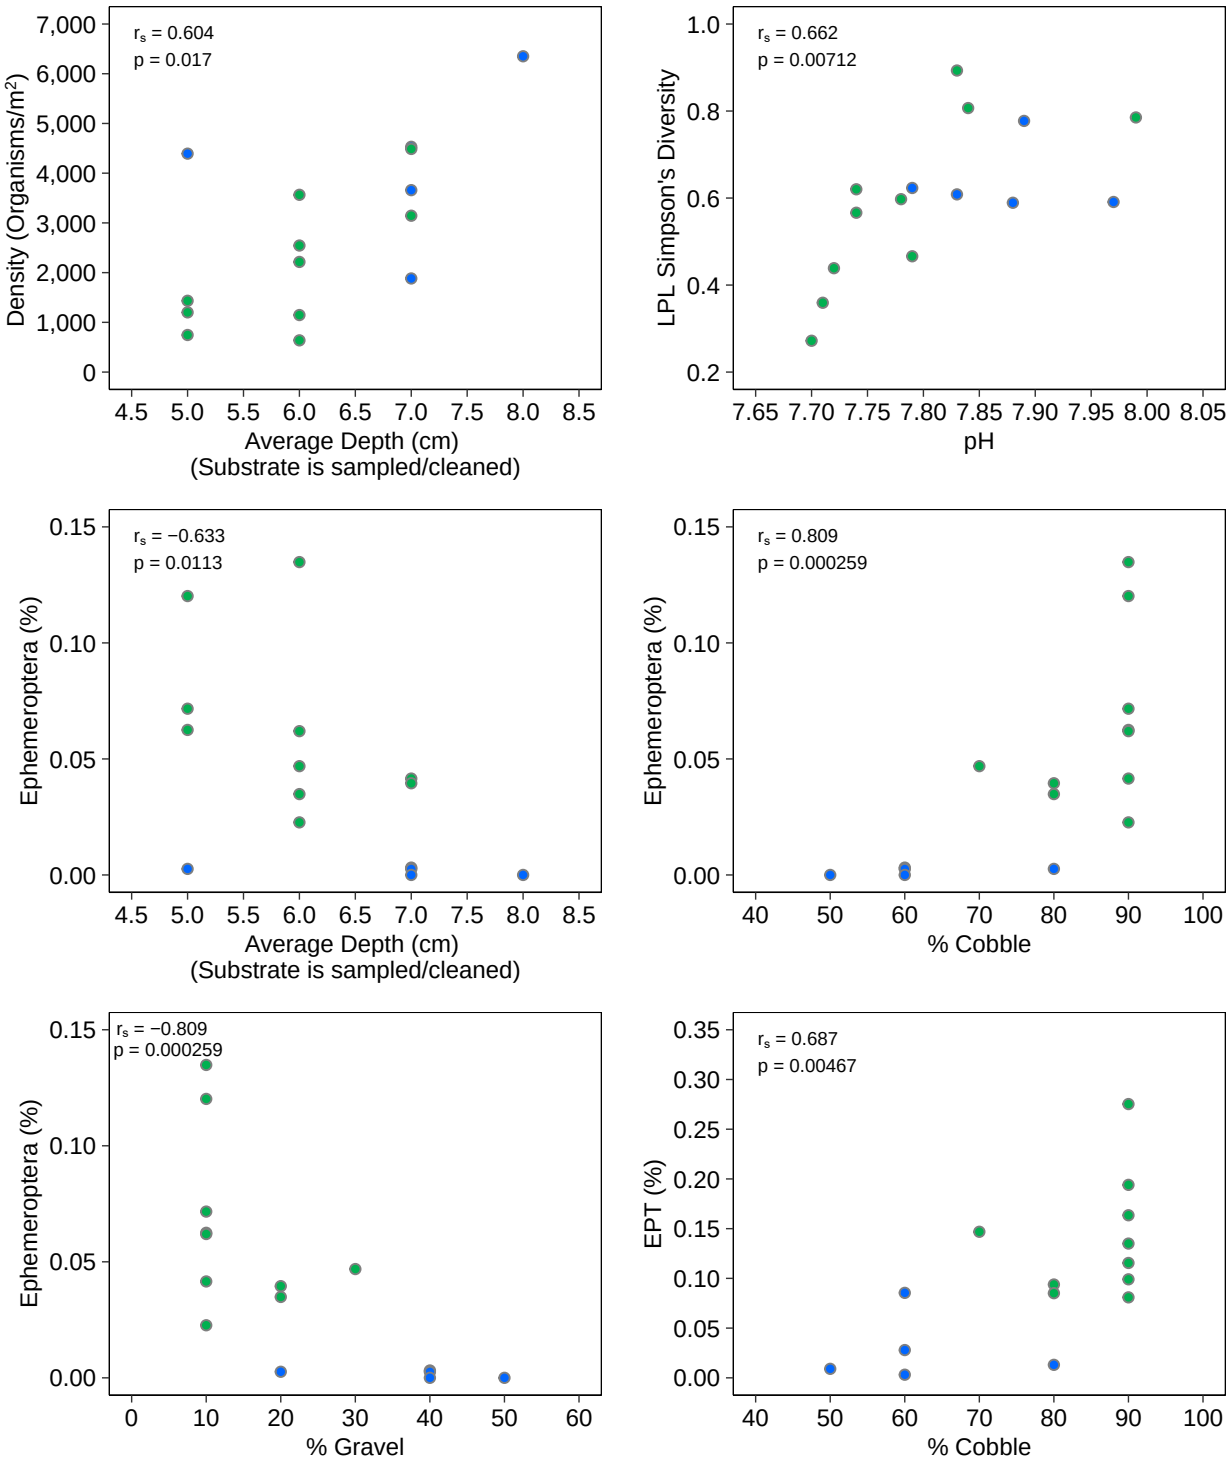

Figure E.2: Correlations between Selected Benthic Invertebrate Environmental Measurements and Biological Endpoints, Minto Mine, 2020

Notes: Green dots represent reference stations (LWC, LBC) and blue dots represent the mine−exposed station, LMC. EPT = Ephemeroptera, Plecoptera, Trichoptera. Correlations that were significantly different (p−value < 0.05) and strongly correlated between environmental measures and biological endpoints (r_s >= 0.6 or <= −0.6) were presented.

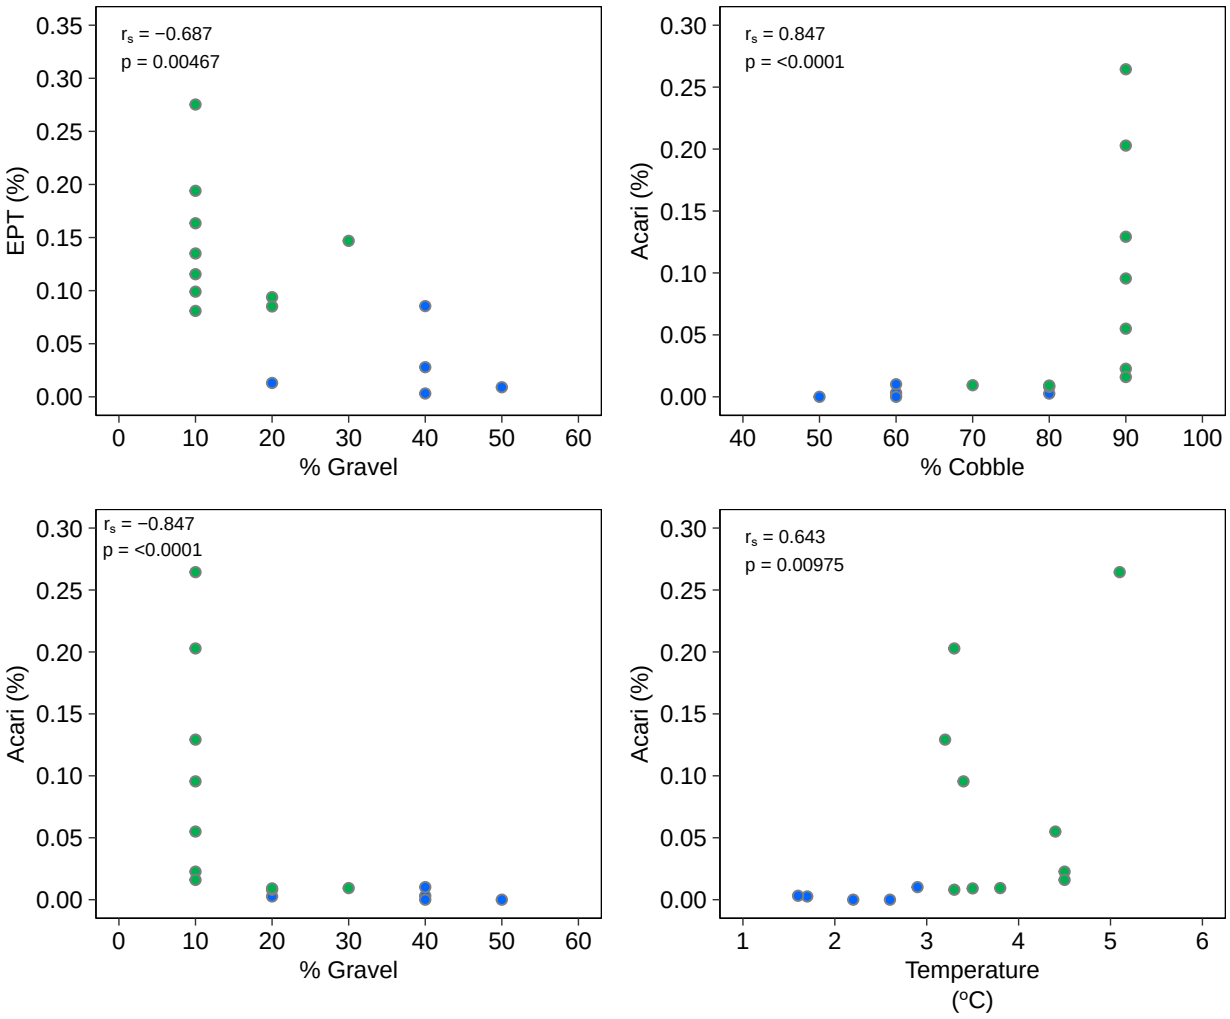

Figure E.2: Correlations between Selected Benthic Invertebrate Environmental Measurements and Biological Endpoints, Minto Mine, 2020

Notes: Green dots represent reference stations (LWC, LBC) and blue dots represent the mine−exposed station, LMC. EPT = Ephemeroptera, Plecoptera, Trichoptera. Correlations that were significantly different (p−value < 0.05) and strongly correlated between environmental measures and biological endpoints (r_s >= 0.6 or <= −0.6) were presented.

Table E.1: Benthic Invertebrates (Organisms per Sample) Collected by Surber Sampler (500 µm Sieve), Minto Mine AEMP, 2020

				LBC	LWC	<0.001	5.6

Notes: Magnitude of Difference = (group 1 mean - group 2 mean)/pooled standard deviation. Test p-values and MODs are only displayed for endpoints that had a 3 group comparison p-value < 0.1. EPT = Ephemeroptera, Plecoptera, Trichoptera.

P-value < 0.1

P-value < 0.1 and MOD < -2

P-value < 0.1 and MOD > 2

[a] ANOVA = Analysis of Variance; K-W = Kruskal-Wallis.

[b] Pairwise comparisions calculated using Least-squares means with Tukey's adjustment for multiple comparisions for ANOVAs and Dunn's Test with no adjustment for K-W.

Table E.4: Correspondence Analysis (CA) Axis Station Scores Using Benthic Invertebrate Abundances at the Lowest Practical Level of Taxonomic Resolution, Minto Mine, 2020

Notes: Intermediate axis length is the second longest axis on a cobble. Embeddedness refers to how deeply the cobble is surrounded or buried by other substrate. Embeddedness was measured for every 10th (n=10) cobble.

Table E.6: Intermediate Axis Length and Embeddedness of 100 Cobble Washed at Benthic Invertebrate Sampling Stations, Minto Mine, September 2020

Sample Reception

On September 24, 2020, Cordillera Consulting received 15 benthic samples from Minnow Environmental. When samples arrived to Cordillera Consulting, exterior packaging was initially inspected for damage or wet spots that would have indicated damage to the interior containers.

Samples were logged into a proprietary software database (INSTAR1) where the clients assigned sample name was recorded along with a Cordillera Consulting (CC) number for cross-reference. Each sample was checked to ensure that all sites and replicates recorded on field sheets or packing lists were delivered intact and with adequate preservative. Any missing, mislabelled or extra samples were reported to the client immediately to confirm the total numbers and correct names on the sample jars. The client representative was notified of the arrival of the shipment and provided a sample inventory once intake was completed.
See table below for sample inventory:

Table 1: Summary of sample information including Cordillera Consulting (CC) number

Site	Sample	CC#	Date	Size	# of Jars
LMC	LMC-1	CC210753	9/15/2020	500µM	1

Sample Sorting

- Using a gridded Petri dish, fine forceps and a low power stereo-microscope (Olympus, Nikon, Leica) the sorting technicians removed the invertebrates and sorted them into family/orders.
- The sorting technician kept a running tally of total numbers excluding organisms from Porifera, Nemata, Platyhelminthes, Ostracoda, Copepoda, Cladocera and terrestrial drop-ins such as aphids. These organisms were marked for their presence

(given a value of 1) only and left in the sample. They were not included towards the 300-organism subsample count.

- Where specimens are broken or damaged, only heads were counted.
- Subsampling was conducted with the use of a Marchant Box.
- When using the Marchant box, cells were extracted at the same time in the order indicated by a random number table. If the 300th organism was found part way into sorting a cell then the balance of that cell was sorted. If the organism count had not reached 300 by the 50th cell then the entire sample was sorted.
- The total number of cells sorted and the number of organisms removed were recorded manually on a bench sheet and then recorded into INSTAR1
- Organisms were stored in vials containing 80% ethanol and an interior label indicating the site names, date of sampling, site code numbers and portion subsampled. This information was also recorded on the laboratory bench sheet and on INSTAR1.
- The sorted portion of the debris was preserved and labeled separately from the unsorted portion and was tested for sorting efficiency (Sorting Quality Control – Sorting Efficiency). The unsorted portion was also labeled and preserved in separate jars.

Percent sub-sampled and total countable invertebrates pulled from the samples were summarized in the table below.

Table 2: Percent sub-sample and invertebrate count for each sample

Site	Sample	Date	CC#	500 micron fraction	
				% Sampled	# Invertebrates
LMC	LMC-1	15-Sep-20	CC210753	31.25%	383
LMC	LMC-2	14-Sep-20	CC210754	25%	316
LMC	LMC-3	11-Sep-20	CC210755	75%	394
LMC	LMC-4	11-Sep-20	CC210756	31.25%	319
LMC	LMC-5	11-Sep-20	CC210757	25%	443
LWC	LWC-1	13-Sep-20	CC210758	37.5%	373
LWC	LWC-2	12-Sep-20	CC210759	50%	309
LWC	LWC-3	12-Sep-20	CC210760	25%	313
LWC	LWC-4	12-Sep-20	CC210761	100%	320
LWC	LWC-5	12-Sep-20	CC210762	37.5%	329
LBC	LBC-1	16-Sep-20	CC210763	100%	208
LBC	LBC-2	16-Sep-20	CC210764	100%	400
LBC	LBC-3	16-Sep-20	CC210765	100%	335
LBC	LBC-4	16-Sep-20	CC210766	100%	178
LBC	LBC-5	16-Sep-20	CC210767	50%	355

Sorting Quality Control - Sorting Efficiency

As a part of Cordillera's laboratory policy, all projects undergo sorting efficiency checks.

- As sorting progresses, 10% of samples were randomly chosen by senior members of the sorting team for resorting.
- All sorters working on a project had at least 1 sample resorted by another sorter.
- An efficiency of 90 % was expected (95% for CABIN samples).
- If 90/95% efficiency was not met, samples from that sorter were resorted.
- To calculated sorting efficiency the following formula was used:

$$\frac{\#OrganismsMissed}{TotalOrganismsFound} * 100 = \%OM$$

Table 3 Summary of sorting efficiency

			Total from Sample	Percent Efficiency
Site - QC, Sample - QC1, CC# - CC210762, Percent sampled = 37.5%, Sieve size = 500				
No Invertebrates Found	None	0		
	Total:	**0**	**329**	**100%**
Site - QC, Sample - QC2, CC# - CC210765, Percent sampled = 100%, Sieve size = 500				
No Invertebrates Found	None	0		
	Total:	**0**	**335**	**100%**

Sorting Quality Control - Sub-Sampling QC

Certain Provincial and Mining projects require additional sorting checks in the form of sub-sampling QC, (Environmental Effects Monitoring (EEM) protocol). This ensured that any fraction of the total sample that was examined was actually an accurate representation of the number of total organisms. Organisms from the additional sub-samples were not identified; rather total organism count only was compared.

Sub-Sampling efficiency was measured on 10% of the number of sub-sampled samples in the project. Ex. In a project where 50 of 100 total samples were processed through

subsampling using a Marchant box, then 10% of 50; or 5 samples were used for sub sampling efficiency.

Sub-Sampling efficiency was performed by fractioning the entire sample into sub-sample percentages. On each sub-sampled portion, a total organism count was recorded and compared to the rest of the sub-samples. In order to pass, all fractions were required to be within 20% of total organism count.

Example: If 300 organisms are found in 10% of the sample, the sorter will continue to sample in 10% fractions until the entire sample is separated. They will then count the total number of organisms in each of the 10 fractions of 10% and compare the organism count.

When divergence is >20% the sorting manager examines for the source of the problem and takes steps to correct it. With the Marchant box, the problem typically rested with how the box is flipped back to the upright position. For this reason, subsampling was performed by experienced employees only. Another common source of error would be the type of debris in the sample. Samples with algae or heavy with periphyton have a higher incident of failure due to clumping than clear samples.

Table 4 Summary of Sub Sample efficiency

Station ID		Organisms in Subsample																			Sorter		Actual Total	Precision		Accuracy	
CC#	Sample Name	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	By	Time		Percent Range		Min	Max
210759	LWC-2	310	250																			CM	240	560	19.35	19.35	10.71	10.71

Taxonomic Effort

The next procedure was the identification to genus-species level where possible of all the organisms in the sample.

- Identifications were made at the genus/species level for all insect organisms found including Chironomidae (Based on CABIN protocol).
- Non-insect organisms (except those not included in CABIN count) were identified to genus/species where possible and to a minimum of family level with intact and mature specimens.
- The Standard Taxonomic Effort lists compiled by the CABIN manual[1], SAFIT[2] , and PNAMP[3] were used as a guide line for what level of identification to achieve where the condition and maturity of the organism enabled.
- Organisms from the same families/order were kept in separate vials with 80% ethanol and an interior label of printed laser paper.
- Chironomidae was identified to genus/species level where possible and was aided by slide mounts. CMC-10 was used to clear and mount the slide.
- Oligochaetes was identified to family/genus level with the aid of slide mounts. CMC-10 was used to clear and mount the slide.
- Other Annelida (leeches, polychaetes) were identified to the family/genus/species level with undamaged, mature specimens.
- Mollusca was identified to family and genus/species where possible
- Decapoda, Amphipoda and Isopoda were identified at family/genus/species level where possible.
- Bryozoans and Nemata remained at the phylum level
- Hydrachnidae and Cnidaria were identified at the family/genus level where possible.
- When requested, reference collections were made containing at least one individual from each taxa listed. Organisms represented will have been identified to the lowest practical level.
- Reference collection specimens were stored in 55 mm glass vials with screw-cap lids with polyseal inserts (museum quality). They were labeled with taxa name, site code, date identified and taxonomist name. The same information was applied to labels on the slide mounts.

Taxonomists

The taxonomists for this project were certified by the Society of Freshwater Science (SFS) Taxonomic Certification Program at level 2 which is the required certification for CABIN projects:

Scott Finlayson: Group 1 General Arthropods (East/West); Group 2 EPT (East/West); Group 3 Chironomidae (East/West); Group 4 Oligochaeta

Adam Bliss: Group 1 General Arthropods (East/West); Group 2 EPT (East/West); Group 3 Chironomidae
Rita Avery: Group 1 General Arthropods (East/West); Group 2 EPT (East/West)

Taxonomic QC

Taxonomic QC was performed in house by someone other than the original taxonomist.

- Quality control protocol involved complete, blind re-identification and re-enumeration of at least 10% of samples by a second SFS-certified taxonomist.
- Samples for taxonomic quality control were randomly selected and quality control procedures were conducted as the project progresses through the laboratories.

- The second (QC) taxonomist will calculate and record four types of errors:
    1. Misidentification error
    2. Enumeration error
    3. Questionable taxonomic resolution error
    4. Insufficient taxonomic resolution error

The QC coordinator then calculates the following estimates of taxonomic precision.

1. The percent total identification error rate is calculated as:

$$\frac{Sum\ of\ incorrect\ identifications}{total\ organisms\ counted\ in\ audit} * (100)$$

The average total identification error rate of audited samples did not exceed 5%. All samples that exceed a 5% error rate were re-evaluated to determine whether repeated errors or patterns in error contributed.

2. The percent difference in enumeration (PDE) to quantify the consistency of specimen counts.

$$PDE = \frac{|n_1 - n_2|}{n_1 + n_2} x100$$

3. The percent taxonomic disagreement (PTD) to quantify the shared precision between two sets of identifications.

$$PTD = \left(1 - \left[\frac{a}{N}\right]\right) x100$$

4. Bray Curtis dissimilarity Index to quantify the differences in identifications.

$$BC_{ij} = 1 - \frac{2C_{ij}}{S_j + S_i}$$

Error Summary

All samples report errors within the acceptable limits for CABIN Laboratory methods (less than 5% error).

Table 5 Summary of taxonomic error following QC

Site	Taxa Identified	% Error	PDE	PTD	Bray - Curtis Dissimilarity index
Site - LMC, Sample - LMC-2, CC# - CC210754, Percent sampled = 25%, Sieve size = 500	316	0.00	0	0.3164557	0.00316456
Site - LWC, Sample - LWC-4, CC# - CC210761, Percent sampled = 100%, Sieve size = 500	319	0.00	0.15649452	0.3125	0.00156495

There will always be disagreements between taxonomists regarding the degree of taxonomic resolution in immature specimens and when laboratories make use of different keys for certain groups (Mollusks is an especially disputed group). It is always possible that some taxa found by the original taxonomist were overlooked in QC.

All of the Taxonomic QC samples that were observed passed testing according to the CABIN misidentification protocols. See the tables below for results from taxonomic QC audit.

Error Rationale

Site - LMC, Sample - LMC-2, CC# - CC210754, Percent sampled = 25%, Sieve size = 500	Laboratory Count	QC Audit Count	Agreement	Misidentification	Questionable Taxonomic Resolution	Enumeration	Insufficient Taxonomic Resolution	Comments

Taxonomic Keys

Below is a reference list of taxonomic keys utilized by taxonomists at Cordillera Consulting. Cordillera taxonomists routinely seek out new literature to ensure the most accurate identification keys are being utilized. This is not reflective of the exhaustive list of resources that we use for identification. A more complete list of taxonomic resources can be found at Southwest Association of Freshwater Invertebrate Taxonomists. (2015).

ND designation of a taxa represents a non-distinct taxa. This adjusts where the associated taxa fall in the metrics for this sample because the individuals are likely represented by Genus or Species level identifications.

Appendix M – Minto Creek Fish Monitoring Program Review and Recommendations

Technical Memo

Date: November 17th, 2020

RE: Minto Mine AEMP Fisheries Monitoring Program Evaluation

Background

Minto Explorations Ltd. (MEL), owns and operates the Minto Mine, a high-grade copper mine, located approximately 240 km northwest of Whitehorse, Yukon, within Selkirk First Nation (SFN) Category A Settlement Land Parcel R6A (Figure 1). The Minto Mine commenced commercial operation in October 2007 and is permitted to conduct mining and milling operations at a rate of 4,200 tonnes of ore per day. Some of the Minto ore deposits (copper/gold/silver) currently being mined are located in the upper reaches of the Minto Creek watershed, approximately 12 km to the west of the Minto Creek confluence with the Yukon River (Figure 2).

MEL is required, under the terms of its water use license (WUL) #QZ14-031 (Amendment 1), to conduct an aquatic environmental monitoring program (AEMP) which includes annual fisheries monitoring in Minto Creek. Under the WUL, the AEMP is reviewed every three years and changes or modifications to the program are considered or recommended. Based on a recent review by Minnow Environmental Inc. (Minnow), it was recommended that the AEMP fisheries monitoring program (FMP) be reduced from annually to once every three years, coinciding with the Environmental Effects Monitoring (EEM) program that MEL is required to undertake as prescribed under the Metal and Diamond Mining Effluent Regulations (MDMER) of the federal *Fisheries Act*; additional monitoring would be considered in response to meaningful changes in effluent discharge (quantity or quality) from the mine. Also recommended was a formal statistical evaluation and interpretation of the FMP data to support decisions regarding FMP frequency, specifically the recommendation to reduce monitoring to once every three years. Minnow has been retained by MEL to conduct the Minto Mine FMP evaluation.

Minto Creek Fisheries Monitoring

The Minto Creek FMP has been undertaken annually since 2008 (Table 1). Every three years, the FMP is supported by field sampling conducted under the Minto Mine EEM program; additional studies have also been undertaken over time (e.g., ACG 2010) and together with the FMP and EEM have provided a foundational understanding of fish use in Minto Creek.

The majority of fish documented during monitoring in Minto Creek are juvenile chinook salmon (JCS; *Onchoryhnchus tshawytscha*) which use the creek for brief periods as they out-migrate from natal streams to the Bering Sea. Use of Minto Creek by JCS is transient and likely short-lived (i.e., residency time for most fish is two weeks or less; ACG 2010), as has been found in other non-natal chinook salmon rearing creeks (Walker 1976; Scrivener et al. 1994). JCS have not been documented in Minto Creek during every annual monitoring event (MEL 2020); when present, JCS have rarely been observed in the creek before July with peak numbers generally observed in late August or early September. Slimy sculpin (*Cottus cognatus*) are the only other fish caught regularly in Minto Creek although at much lower numbers; round whitefish (*Prosopium cylindraceum*), arctic grayling (*Thymallus arcticus*), and burbot (*Lota lota*) have also been caught occasionally in low numbers.

Fish habitat in Minto Creek is restricted to the lower 2.0 km of the system by a canyon which acts as a permanent high-gradient barrier to fish passage. Since 2010, a temporary barrier has further restricted fish to the lower 1.2 km section of the creek (Figure 2). Despite substantial effort, no fish have been captured upstream of the temporary barrier since it was first observed. With regards to habitat suitability for fish, Minto Creek does not provide preferred spawning or overwintering habitat; the substrate is primarily silt and sand with limited substrate suitable for salmon spawning (i.e., cobble and gravel) and the creek freezes to the bottom during winter with no flow in the lower portion of the creek (CCL 2006). There is also no spawning habitat at the confluence of Minto Creek with the Yukon River; during aerial surveys for spawning chinook salmon conducted from 2011 to 2014, no adult fish or evidence of spawning (e.g., redds, carcasses) was observed near the mouth of Minto Creek. In general, there is no evidence or traditional knowledge indicating that spawning occurs in Minto Creek (HKP 1994; R&D 2006, 2007).

In addition to providing poor spawning and overwintering habitat, Minto Creek is a “losing stream” system which has likely limited the opportunity for resident fish populations to become established in the creek. During summer dry periods, surface flows in lower Minto Creek can be very low to zero while flow is still observed in upper sections of the creek, likely due to infiltration of Minto Creek flows into the alluvial materials of the Yukon River floodplain (CCL 2006). Water temperatures also tend to remain cooler in Minto Creek than in the Yukon River and fluctuate

more widely throughout the day (up to 5°C or more) which likely deters fish from entering the system.

Monitoring conducted since 2008 has suggested that JCS presence in Minto Creek may also be influenced by mine water discharge. Abundance and catch-per-unit-effort (CPUE) of JCS during two major emergency discharge events in 2009 and 2010 was 10 or more times higher in the system than during the baseline year or years when little or no effluent was discharged (see Table 2); it has been hypothesized that higher flow and higher water temperature in the creek (i.e., water temperatures more consistent with temperatures observed in the Yukon River) resulting from the discharge may have made conditions more attractive for use by JCS. No JCS have been caught in Minto Creek since 2016 coinciding with tighter restrictions on discharge under the WUL and no additional emergency discharge; this provides further evidence that use of the creek by JCS may be influenced by flow and the subsequent temperature difference between the Yukon River and Minto Creek.

Objective

Subject to the background provided above, the primary objective of the FMP evaluation is to determine if ongoing monitoring as currently undertaken is providing value to the Minto Mine and includes:

- a statistical analysis and integrated interpretation of data collected from 2007 to 2019; and
- a critical examination of the program with recommendations for future monitoring.

Interpretation will specifically consider whether an annual monitoring frequency is justified, whether an alternate approach might be warranted, and whether relationships between seasonal fish use of lower Minto Creek with habitat conditions (i.e., flow and temperature) are sufficiently clear to allow their use in defining when additional fisheries monitoring would enhance understanding of fish occupancy in Minto Creek.

Methods

Data Collection

AEMP fisheries monitoring in Minto Creek was conducted monthly during the open water season (i.e., May to October; Table 1) from 2008 to 2019. In 2007 and 2009, fish sampling was also conducted to the support development of the EEM Cycle 1 Study Design and Minto Creek fish re-location project, respectively. Sampling from 2007 to 2019 was primarily conducted using Gee-type minnow traps (42 cm length, 0.6 cm mesh, 2.5 cm diameter opening) that were baited and deployed at locations downstream of the permanent fish barrier (i.e., the canyon located 2.0 km

upstream from the confluence of Minto Creek with the Yukon River). Trap sites were consistent from 2011 to 2019 with most sites located downstream of the temporary fish barrier. The number of minnow traps set during each FMP monthly sampling event ranged from 2 to 15 depending on water level and the availability of pools and backwater areas that were suitable for setting traps. Supplementary electrofishing was also conducted in Minto Creek in 2008, 2012, and 2013 but since there were only a small number of data points associated with electrofishing, this data was excluded from the analysis.

All JCS captured in minnow traps during sampling events were enumerated and released live near their trapping location. CPUE was calculated as number of fish caught per trap day.

In situ water temperature was collected in Minto Creek at station W2 (Figure 2) during each of the monthly sampling events using a calibrated YSI Professional Plus multimeter; *in situ* temperature was not collected in Minto Creek during monthly sampling events when no flow was observed in the creek. Additionally, a Levelogger was used to collect continuous water temperature and water level data at station W1 in Minto Creek (Figure 2); water level data was used to calculate continuous flow in Minto Creek. Instantaneous discharge was also measured at W1 during each monthly sampling event if flow was present using a Hach FH950 electromagnetic flow meter.

Data Analysis

CPUE data from minnow trapping during monthly monitoring events from 2007 to 2011 and 2013 to 2019 were combined with corresponding routine temperature and flow data from Minto Creek for the same time period. No CPUE data was available for fisheries monitoring conducted in 2012. CPUE data was matched with the average temperature and flow for the two weeks prior to the date of the CPUE data collection. Two weeks was chosen since mark-recapture data from Minto Creek suggests that 90% of the population may only spend up to approximately two weeks in the system (ACG 2010). Of the 282 total JCS CPUE records, one CPUE record from 2007 and five records from 2010 were excluded from the analysis because there was no date associated with the records. Additionally, 25 CPUE records were excluded from the CPUE vs. temperature analysis because there was no corresponding temperature data available, and 96 CPUE records were excluded from the CPUE vs. flow analysis because there was no corresponding flow data. Thus, 89% and 64% of CPUE records were used in the analysis of CPUE with temperature and flow, respectively.

Using the combined data set, statistical comparison of CPUE with temperature or flow was conducted using a two-way Analysis of Covariance (ANCOVA) with $\log_{10}$-transformed CPUE as the response variable, *Month* as a factor, *Temperature* or *Flow* as a covariate, and a *Month* × *Temperature* or *Flow* interaction term. Significance of the model terms was assessed using α =

0.05 werein a p-value of less than 0.05 for the covariate (i.e., temperature or flow) suggested a statistical relationship between the covariate and CPUE; a significant interaction term suggested that the relationship of the covariate with CPUE differed by month. If the interaction term was significant, post-hoc contrasts were conducted to test for a significant relationship between CPUE and the covariate for each month. Since the dataset contained an excess of zero values for CPUE (i.e., no fish were caught) the residuals were non-normally distributed and violated the assumptions of the ANCOVA model; transformation of the data did not improve normality. Therefore, non-parametric models were run using rank-transformation to confirm the results.

Results

Across years, JCS were documented in Minto Creek from May to November but were caught very infrequently in May, June, and November (n = 3 minnow trap CPUE records from 2007 to 2019; Figure 3, Appendix Table A.1). During the seasonal period where most JCS were captured (i.e., from July to October), mean CPUE was highest in July (3.3 fish/trap day from 2007 to 2019; Figure 3, Appendix Table A.1) primarily as a result of the two major discharge events that substantially increased flow and temperature in Minto Creek in 2009 and 2010. Mean CPUE in September and October was similarly driven by the fish re-location project undertaken in 2009 which resulted in the capture of 987 JCS (Figure 3). In years without emergency discharge (i.e., excluding CPUE records from 2009 and 2010), JCS have been caught most regularly in September (43% of remaining records with CPUE greater than zero) although this still constitutes a small number of records overall (3.4% of all CPUE records; Appendix Table A.1).

Mean annual CPUE for JCS ranged from 0.0 to 14.5 fish/trap day from 2007 to 2019 (Figure 4, Appendix Table A.1); JCS mean CPUE was highest in 2010 (Figure 4) during one of the two major discharge events. In years without emergency discharge, JCS mean CPUE was highest in 2007 (mean CPUE = 3.3 fish/trap day). No JCS were caught in Minto Creek during FMP monitoring from 2017 to 2019 and only 12 JCS have been caught in the creek since 2015 (Figure 4, Appendix Table A.1).

Using the combined dataset, JCS CPUE was significantly related to temperature in Minto Creek and the *Temperature* × *Month* interaction term was also significant, indicating that the relationship of temperature and CPUE varied seasonally (Figure 5, Table 3, and Appendix Table A.2). Results of post-hoc comparisons indicated that CPUE increased significantly with increasing temperature in July, September, and October but the relationship was not significant in either June or August (there was insufficient data to determine the relationship of CPUE and temperature for May; Figure 6). Results of non-parametric models using rank transformed CPUE data were similar to the results of the ANCOVA models. JCS CPUE was not significantly related to flow in Minto Creek from 2007 to 2019 (Figure 5, Table 3) although a higher proportion of JCS CPUE records

were greater than zero at flows above 0.1 m/s than at flows below this threshold (27% versus 5% of CPUE records greater than zero; Figure 5).

Summary

JCS occupy Minto Creek for brief periods (i.e., residency time for most fish is likely two weeks or less based on mark-recapture data; ACG 2010) as they out-migrate from natal streams to the Bering Sea. The use of non-natal streams by JCS has been documented frequently in the literature; JCS were observed using upper and lower Fraser River tributaries in which there was no record of spawning adults (Delaney et al. 1982; Russell et al. 1983; Murray and Rosenau 1989; Scrivener et al. 1994) and environmental studies related to mining or pipeline projects in the Yukon basin have suggested that JCS make extensive use of small, non-natal tributaries in summer for rearing (Bradford et al. 2001).

Non-natal streams may act as valuable JCS rearing habitat by providing a temporary refuge from high flows and suspended sediments in main stem habitats as well as by increasing overall available habitat, thereby reducing competition and possibly also predation risk (Scrivener et al. 1994; Bourret et al. 2016). For example, concentrations of suspended sediment in Hawks Creek, a small tributary of the Fraser River, were lower than those of the river main stem, coinciding with increasing densities of JCS in the creek (Scrivener et al. 1994). High concentrations of sediments are known to reduce feeding efficiency in juvenile salmonids (Berg and Northcote 1985; Gregory 1990), reduce growth rates and lead to downstream displacement of salmon and trout (Sigler et al. 1984; Lloyd 1987), and reduce resistance to pathogens (Herbert and Merkens 1961; Neitzel et al. 1985). In Minto Creek, mean concentrations of total suspended solids (TSS) in spring are frequently as high or higher than TSS in nearby monitoring stations in the Yukon River (Figure 7), including concentrations that have been reported to reduce feeding efficiently in salmonids (Scrivener et al. 1994); this may partially explain the observation that JCS are rarely observed in Minto Creek before July.

From 2007 to 2019, CPUE of JCS in Minto Creek was not significantly related to flow although there was a higher probability of JCS presence at flows above 0.1 m/s. Conversely, JCS CPUE was significantly related to temperature wherein CPUE generally increased with increasing water temperature although the relationship was not consistent across all months. JCS CPUE was substantially higher during the major discharge event in 2009 when water temperature reached approximately 10^{o}C, however CPUE increased significantly with increasing temperature even when data from 2009 was removed from the analysis. This suggests that the substantial increase in JCS CPUE observed during the major discharge events in 2009 and 2010 was driven by the higher than normal creek temperatures rather than flow, and more generally that habitat in the creek may be more attractive to JCS as temperatures increase. Water temperature is a primary

factor affecting juvenile life history diversity (Brett 1979; Connor et al. 2002, 2005) influencing metabolic rate, physiological processes, and maximum scope for growth (Bourret et al. 2016) where warmer temperatures typically enhance juvenile growth within a certain range (Sommer et al. 2001). In a study comparing JCS use of shoreline and offshore habitat in the mainstem of the Columbia River, the difference between shoreline and offshore water temperature was the most important predictor of JCS use of shoreline habitats (Tiffan et al. 2006); each 0.1°C increase in temperature difference in the shoreline over the offshore habitat increased the likelihood of JCS presence by 5.3 times (Tiffan et al. 2006).

Overall, JCS use of Minto Creek is likely controlled by a combination of factors. Lack of overwintering habitat, concentrations of suspended sediments in spring that are frequently as high or higher than the Yukon River, and water temperatures in summer that are much lower on average than the main stem limits the suitability of the habitat for JCS rearing throughout the year. Further, JCS prefer deeper waters in small streams (e.g., Everest and Chapman 1972; Hillman et al. 1987; Roper et al. 1994; Bradford et al. 2001) such that the capacity of small streams to support JCS in summer is likely related to the availability of pool habitat. In Minto Creek, surface flows in the lower portion of the creek during summer dry periods can be very low to zero due to the infiltration of Minto Creek flows into the alluvial materials of the Yukon River floodplain upstream of the temporary fish barrier. Thus, although JCS may be more attracted to the creek as the temperature differential with the Yukon River decreases, Minto Creek likely does not provide preferred rearing habitat for migrating JCS; no JCS have been caught in the creek since 2016 under the more restrictive WUL and excluding data from the two major discharge events in 2009 and 2010, only 341 JCS have been caught in Minto Creek since 2007.

Recommendations

Considering the results of the Minto Mine FMP evaluation outlined above, FMP monitoring as currently undertaken is providing limited value to Minto Mine. Further, continuing FMP monitoring on an annual basis will likely not provide any substantial new information to enhance understanding of JCS occupancy and use of Minto Creek and may present some risk for the small number of fish that do use the creek (e.g., incidental mortality from sampling). Therefore, the following recommendations are made regarding FMP monitoring in Minto Creek:

- reduce FMP monitoring in Minto Creek to once every three years coinciding with EEM monitoring;
- continue monitoring TSS and continuous temperature and flow in Minto Creek and TSS and continuous temperature in the Yukon River;

- additional FMP monitoring should be considered if/when flows in Minto Creek exceed 0.1 m/s after July 1st;
- additional FMP monitoring should be considered if/when water temperatures in Minto Creek approach 10°C; and
- additional fisheries monitoring should be conducted under conditions of emergency discharge from Minto Mine.

Monitoring programs conducted annually or more frequently that will provide an additional safeguard for the aquatic resources of Minto Creek include:

- Compliance water quality and toxicity monitoring under WUL #QZ14-031;
- Benthic invertebrate monitoring program under WUL #QZ14-031;
- Compliance water quality and toxicity monitoring required under the MDMER; and
- MDMER EEM sub-lethal toxicity testing.

These ongoing monitoring programs will provide an early warning system for degrading aquatic environmental conditions and, combined with FMP monitoring every three years, will provide substantial protection for the fish resources of Minto Creek.

2011	July - October	Compliance Monitoring; Cycle 2 EEM	ACG 2011; Minnow and ACG 2012
2011	July, August	Cycle 2 EEM – Growth Trials	Minnow and ACG 2012
2012	May - September	Compliance Monitoring; Tissue Selenium Study	ACG 2013
2013	May - October	Compliance Monitoring	ACG 2014a
2014	May - October	Compliance Monitoring	ACG 2014b
2015	May - October	Compliance Monitoring	AEG 2015
2016	June - September	Compliance Monitoring	MEL 2017a
2017	June - September	Compliance Monitoring	MEL 2017b
2018	June - September	Compliance Monitoring	MEL 2018
2019	June - September	Compliance Monitoring	MEL 2020

Notes: HKP = Hallam Knight Piesold; ACG = Access Consulting Group; Minnow = Minnow Environmental Inc.; MEL = Minto Exploration Ltd.

Table 2: Maximum Catch-per-Unit-Effort of Juvenile Chinook Salmon in Relation to Conditions in Minto Creek, 1994 to 2019

Year	Month	CPUE [a]	Minto Creek Conditions
1994	September	0.00	Pre-development – no discharge
2008	September	0.90	Operational – no discharge
2009	September/October	20.0	Emergency Discharge
2010	August	30.0	Emergency Discharge
2011	September	0.43	No discharge – high TSS contribution from tributary
2012	September	0.19	No discharge – high TSS contribution from tributary
2013	October	5.01	Operational – no discharge
2014	September	5.05	Operational – no discharge
2015	July	0.30	Operational – no discharge
2016	July	0.30	Operational – no discharge
2017	June-September	0.00	Discharge only during June trapping
2018	June-September	0.00	Discharge only during June trapping
2019	June-September	0.00	Operational – no discharge

[a] CPUE = no. fish /trap day

Table 3: Relationship of Juvenile Chinook Salmon Catch-per-Unit-Effort with Temperature and Flow in Minto Creek, 2007 to 2019

Covariate	Significance of ANCOVA Terms		
	Month	Covariate	Covariate x Month
Temperature	<0.001	<0.001	<0.001
Flow	<0.001	0.304	0.493

Notes: CPUE was $\log_{10}$ transformed. Model residuals were not normally distributed, but results were consistent with an ANCOVA model using a rank transformation of CPUE (i.e., non-parametric test).

APPENDIX A
DATA

Notes: "-" = Missing Data

[a] In Situ temperature measured once per monthly sampling event at station W2.

[b] Instantaneous flow measured once per monthly sampling event at station W1.

[c] Mean of continuous temperature and flow data for two weeks prior to the date of the CPUE data collection from station W1.

[d] Sample size of continuous temperature and flow data from station W1 used to calculate mean temperature and flow.

Notes: "-" = Missing Data

[a] In Situ temperature measured once per monthly sampling event at station W2.

[b] Instantaneous flow measured once per monthly sampling event at station W1.

[c] Mean of continuous temperature and flow data for two weeks prior to the date of the CPUE data collection from station W1.

[d] Sample size of continuous temperature and flow data from station W1 used to calculate mean temperature and flow.

Table A.2: Juvenile Chinook Salmon Catch and Catch-per-Unit-Effort from Minnow Traps Matched With Corresponding Temperature and Flow Data from Minto Creek, 2007 to 2019

Year	Month	Date	Catch	CPUE	*In Situ* Temperature[a]	Instantaneous Flow[b]	Mean Temperature[c]	Mean Temperature *n*[d]	Mean Flow[c]	Mean Flow *n*[d]

Notes: "-" = Missing Data

[a] In Situ temperature measured once per monthly sampling event at station W2.

[b] Instantaneous flow measured once per monthly sampling event at station W1.

[c] Mean of continuous temperature and flow data for two weeks prior to the date of the CPUE data collection from station W1.

[d] Sample size of continuous temperature and flow data from station W1 used to calculate mean temperature and flow.

Reference Information

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
ABA-OA-VOL08-AX	Soil	Acid Base Accounting	OA-VOL08
CARBON-C-GAS05-AX	Soil	Carbon, TOC and CO2	C-GAS05
ME-MS41-AX	Soil	Aqua Regia ICPMS	Aqua Regia ICPMS

A prepared sample (0.50 g) is digested with aqua regia in a graphite heating block. After cooling, the resulting solution is diluted to with deionized water, mixed and analyzed by inductively coupled plasma-atomic emission spectrometry. Following this analysis, the results are reviewed for high concentrations of bismuth, mercury, molybdenum, silver and tungsten and diluted accordingly. Samples are then analysed by ICP-MS for the remaining suite of elements. The analytical results are corrected for inter-element spectral interferences.

PH-OA-ELE07-AX	Soil	pH	OA-ELE07
SULPHUR-S-CAL06A-AX	Soil	Sulfide Sulfur Calc from HCl Leach	ALS Minerals S-CAL06A

Sulfide Sulfur (as S) is calculated by subtracting the HCl Leachable Sulfate Sulfur (as S) from the Total Sulfur (as S) obtained from combustion.

SULPHUR-S-GRA06-AX	Soil	Sulfate Sulfur in Soil (Carbonate Leach)	ALS Minerals S-GRA06

A prepared sample is boiled with a sodium carbonate solution for 30 minutes. Any insoluble materials are removed by filtration and ferric iron is reduced to ferrous iron by the addition of hydroxylamine hydrochloride. The sulfate in the resulting filtrate is then precipitated with barium chloride in a dilute hydrochloric acid medium. The barium sulfate precipitate is filtered, ignited, weighed and the Sulfate Sulfur is calculated (as S).

SULPHUR-S-GRA06A-AX	Soil	Sulfate Sulfur in Soil (HCl Leach)	ALS Minerals S-GRA06A

A prepared sample is heated with dilute hydrochloric acid for 30 minutes. Silica and any acid-insoluble materials are removed by filtration and ferric iron is reduced to ferrous iron by the addition of hydroxylamine hydrochloride. The sulfate in the resulting filtrate is then precipitated with barium chloride in a dilute hydrochloric acid medium. The barium sulfate precipitate is filtered, ignited, weighed and the Sulfate Sulfur is calculated (as S).

SULPHUR-S-IR08-AX	Soil	Total Sulfur in Soil by Combustion	ALS Minerals S-IR08

The sample is heated to approximately 1350 °C in an induction furnace while passing a stream of oxygen through the sample. Sulfur dioxide released from the sample is measured by an IR detection system and the Total Sulfur result is provided.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location

Chain of Custody Numbers:

1 of 1

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.
mg/kg - milligrams per kilogram based on dry weight of sample.
mg/kg wwt - milligrams per kilogram based on wet weight of sample.
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.
mg/L - milligrams per litre.
< - Less than.
D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Dear: Laura Battison,

RE: Price Quotation for ABA Testing

We are pleased to present our technical and price quotation to carry out the work as outlined under the above referenced project.

Our price quotation and a list of ALS Environmental's unique technical and service advantages are attached.

Thank you for requesting our quotation. We look forward to the prospect of providing you with the quality service you require. Please call us at (604) 253-4188 or 1-800-668-9878 if you require any additional information.

Sincerely,

Heather McKenzie
Account Manager

Reference Information

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
ABA-OA-VOL08-AX	Soil	Acid Base Accounting	OA-VOL08
CARBON-C-GAS05-AX	Soil	Carbon, TOC and CO2	C-GAS05
ME-MS41-AX	Soil	Aqua Regia ICPMS	Aqua Regia ICPMS

A prepared sample (0.50 g) is digested with aqua regia in a graphite heating block. After cooling, the resulting solution is diluted to with deionized water, mixed and analyzed by inductively coupled plasma-atomic emission spectrometry. Following this analysis, the results are reviewed for high concentrations of bismuth, mercury, molybdenum, silver and tungsten and diluted accordingly. Samples are then analysed by ICP-MS for the remaining suite of elements. The analytical results are corrected for inter-element spectral interferences.

PH-OA-ELE07-AX	Soil	pH	OA-ELE07
SULPHUR-S-CAL06A-AX	Soil	Sulfide Sulfur Calc from HCl Leach	ALS Minerals S-CAL06A

Sulfide Sulfur (as S) is calculated by subtracting the HCl Leachable Sulfate Sulfur (as S) from the Total Sulfur (as S) obtained from combustion.

SULPHUR-S-GRA06-AX	Soil	Sulfate Sulfur in Soil (Carbonate Leach)	ALS Minerals S-GRA06

A prepared sample is boiled with a sodium carbonate solution for 30 minutes. Any insoluble materials are removed by filtration and ferric iron is reduced to ferrous iron by the addition of hydroxylamine hydrochloride. The sulfate in the resulting filtrate is then precipitated with barium chloride in a dilute hydrochloric acid medium. The barium sulfate precipitate is filtered, ignited, weighed and the Sulfate Sulfur is calculated (as S).

SULPHUR-S-GRA06A-AX	Soil	Sulfate Sulfur in Soil (HCl Leach)	ALS Minerals S-GRA06A

A prepared sample is heated with dilute hydrochloric acid for 30 minutes. Silica and any acid-insoluble materials are removed by filtration and ferric iron is reduced to ferrous iron by the addition of hydroxylamine hydrochloride. The sulfate in the resulting filtrate is then precipitated with barium chloride in a dilute hydrochloric acid medium. The barium sulfate precipitate is filtered, ignited, weighed and the Sulfate Sulfur is calculated (as S).

SULPHUR-S-IR08-AX	Soil	Total Sulfur in Soil by Combustion	ALS Minerals S-IR08

The sample is heated to approximately 1350 °C in an induction furnace while passing a stream of oxygen through the sample. Sulfur dioxide released from the sample is measured by an IR detection system and the Total Sulfur result is provided.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
AX	ALS MINERALS - VANCOUVER, B.C., CANADA

Chain of Custody Numbers:

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.
mg/kg - milligrams per kilogram based on dry weight of sample.
mg/kg wwt - milligrams per kilogram based on wet weight of sample.
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.
mg/L - milligrams per litre.
< - Less than.
D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
%	percent
kg	kilograms
pH units	pH units
ppm	parts per million
tCaCO3/kt	tons CaCO3 per kiloton

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in reports identified as "Preliminary Report" are considered authorized for use.

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
%	percent
kg	kilograms
pH units	pH units
ppm	parts per million
tCaCO3/kt	tons CaCO3 per kiloton

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in reports identified as "Preliminary Report" are considered authorized for use.

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Kaitlyn Gardner	Account Manager Assistant	Internal Subcontracting, North Vancouver, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
%	percent
kg	kilograms
pH units	pH units
ppm	parts per million
tCaCO3/kt	tons CaCO3 per kiloton

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in reports identified as "Preliminary Report" are considered authorized for use.

No. of samples analysed	: 4		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- No Analysis Holding Time Outliers exist.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 15:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 15:00 is used for calculation purposes.

Matrix: **Soil/Solid**

- **No Quality Control data available for this section.**

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
C by HClO4 digestion and titration	C-GAS05 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals C-GAS05	Determine Total Inorganic Carbon (TIC) by using diluted perchloric acid to react with metal carbonate and yield carbon dioxide. Concentration of carbon dioxide is determined by colour titration. TOC is determined by this method and C-IR07 (TC).
51 Elements by Aqua Regia digestion and ICP-AES/MS	ME-MS41 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals ME-MS41	A prepared sample is digested with aqua regia in a graphite heating block. After cooling, the resulting solution is diluted to with deionized water, mixed and analyzed by ICP-AES. Samples are then analyzed by ICP-MS for the remaining suite of elements.
Saturated Paste pH	OA-ELE07 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals OA-ELE07	Sample mix with water in 1:1 ratio to make a paste, pH is then determined.
Acid Base Accounting	OA-VOL08 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals OA-VOL08	Determine the acid generation power of a sample as tonne CaCO3 per kilo-tonne.
Sulfates by HCl Leaching and Gravimetry with Sulfide S Calc.	S-GRA06A ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals S-GRA06A	A prepared sample is heated with dilute HCl and then filtered. The sulfate in the filtrate is precipitated with BaCl2 in a dilute HCl. The BaSO4 precipitate is filtered, ignited, weighed and the Sulfate Sulfur is determined (as S). Sulfide sulfur is calculated by Total Sulfur from combustion minus Sulfate Sulfur from the HCl leach.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Total S by LECO and IR	S-IR08 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals S-IR08	A prepared sample is heated to approximately 1350°C in an induction furnace with oxygen stream. Sulfur dioxide released from the sample are measured by IR (Leco analyzer) and the Total Sulfur result is provided.
Received Sample Weight	WEI-21 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals WEI-21	Weigh out sample received.

Kaitlyn Gardner	Account Manager Assistant	Internal Subcontracting, North Vancouver, British Columbia

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percentage Difference
# = Indicates a QC result that did not meet the ALS DQO.

Kaitlyn Gardner	Account Manager Assistant	Internal Subcontracting, North Vancouver, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
%	percent
kg	kilograms
pH units	pH units
ppm	parts per million
tCaCO3/kt	tons CaCO3 per kiloton

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in reports identified as "Preliminary Report" are considered authorized for use.

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
%	percent
kg	kilograms
pH units	pH units
ppm	parts per million
tCaCO3/kt	tons CaCO3 per kiloton

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in reports identified as "Preliminary Report" are considered authorized for use.

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- No Analysis Holding Time Outliers exist.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 15:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 15:00 is used for calculation purposes.

Matrix: **Soil/Solid**

Evaluation: × = Holding time exceedance ; ✓ = Within Holding Time

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
C by HClO4 digestion and titration	C-GAS05 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals C-GAS05	Determine Total Inorganic Carbon (TIC) by using diluted perchloric acid to react with metal carbonate and yield carbon dioxide. Concentration of carbon dioxide is determined by colour titration. TOC is determined by this method and C-IR07 (TC).
51 Elements by Aqua Regia digestion and ICP-AES/MS	ME-MS41 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals ME-MS41	A prepared sample is digested with aqua regia in a graphite heating block. After cooling, the resulting solution is diluted to with deionized water, mixed and analyzed by ICP-AES. Samples are then analyzed by ICP-MS for the remaining suite of elements.
Saturated Paste pH	OA-ELE07 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals OA-ELE07	Sample mix with water in 1:1 ratio to make a paste, pH is then determined.
Acid Base Accounting	OA-VOL08 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals OA-VOL08	Determine the acid generation power of a sample as tonne CaCO3 per kilo-tonne.
Sulfates by NaCO3 Leaching and Gravimetry with Sulfide S Calc.	S-GRA06 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals S-GRA06	A preppared sample is heated with diluted Na□CO□ and then filtered. The sulfate in the filtrate is precipitated with BaCl2 in a dilute HCl. The BaSO4 precipitate is filtered, ignited, weighed and the Sulfate Sulfur is determined (as S). Sulfide Sulfur (as S) is calculated by Total Sulfur from combustion minus Sulfate Sulfur from the Na□CO□ leach.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Sulfates by HCl Leaching and Gravimetry with Sulfide S Calc.	S-GRA06A ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals S-GRA06A	A prepared sample is heated with dilute HCl and then filtered. The sulfate in the filtrate is precipitated with $BaCl_2$ in a dilute HCl. The $BaSO_4$ precipitate is filtered, ignited, weighed and the Sulfate Sulfur is determined (as S). Sulfide sulfur is calculated by Total Sulfur from combustion minus Sulfate Sulfur from the HCl leach.
Total S by LECO and IR	S-IR08 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals S-IR08	A prepared sample is heated to approximately 1350°C in an induction furnace with oxygen stream. Sulfur dioxide released from the sample are measured by IR (Leco analyzer) and the Total Sulfur result is provided.
Received Sample Weight	WEI-21 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals WEI-21	Weigh out sample received.

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percentage Difference
# = Indicates a QC result that did not meet the ALS DQO.

OCTOBER 2019 FRONT

Appendix O – 2020 Leach Pad Sampling Program Report

Minto Mine

Leach Pad Sampling Summary Report

2018 – 2020

Prepared by:
Minto Explorations Ltd.
Minto Mine
February 2020

1 Introduction

This report presents a summary of monitoring activities conducted by Minto Explorations Ltd. (Minto) at the two leach pads which were constructed from August 2017 to Match 2018. Leachate monitoring and sampling was conducted from May to October 2020.

The objective of the monitoring and sampling program is to geochemically characterize the waste and leachate being generated at the leach pads.

1.1 Background

The Geochemical Monitoring Program, is a requirement outlined in Minto's Water Use Licence QZ14-031, which outlines the requirement for geochemical characterization of waste, including leachate quality as presented in Section 5.1.5, Article 94and summarized as follows:

> *"The Licensee shall update the Geochemical Monitoring Program to include a monitoring and geochemical characterization program that will produce detailed metals leaching*
> *characterization from the low-grade ore and oxide ore."*

The monitoring and sampling program satisfies this condition and is included in the Environmental Monitoring, Surveillance, and Reporting Plan (EMSRP). The plan included construction of the leach pads in the summer of 2017 and subsequent sampling of the leachate for one year, starting in September 2017. Minto conducted previous monitoring and sampling from March 2018 to October 2019.

2 Construction Activities

Details of the Construction Activities are included in Appendix LPS-A.

3 Sampling Methodology

Samples were collected from the Leach pads beginning in May 2018, and continued through 2018, 2019 and 2020 during unfrozen seasons. It should be noted that this is

longer than the 12-month sampling requirement identified in the EMSRP. Water quality parameters chosen for analysis were the same as those used for groundwater monitoring at Minto.

A detailed SOP for Leach Pad sample collection is included in Appendix LPS-B.

4 Sampling results and analysis

The following Table 4.1 outlines the sampling effort and success for the Leach Pads from May 2018 to September 2020.

Table 4-1: Leach Pad Sampling Effort, 2018-2020

5 Results Presentation and Discussion

The data presented in Table 4.2 above has been presented in the following figures for ease of interpretation, along with comments regarding apparent trends. Green dotted lines represent Minto's Effluent Release Limits, while blue dotted lines represent the trend line.

5.1 pH

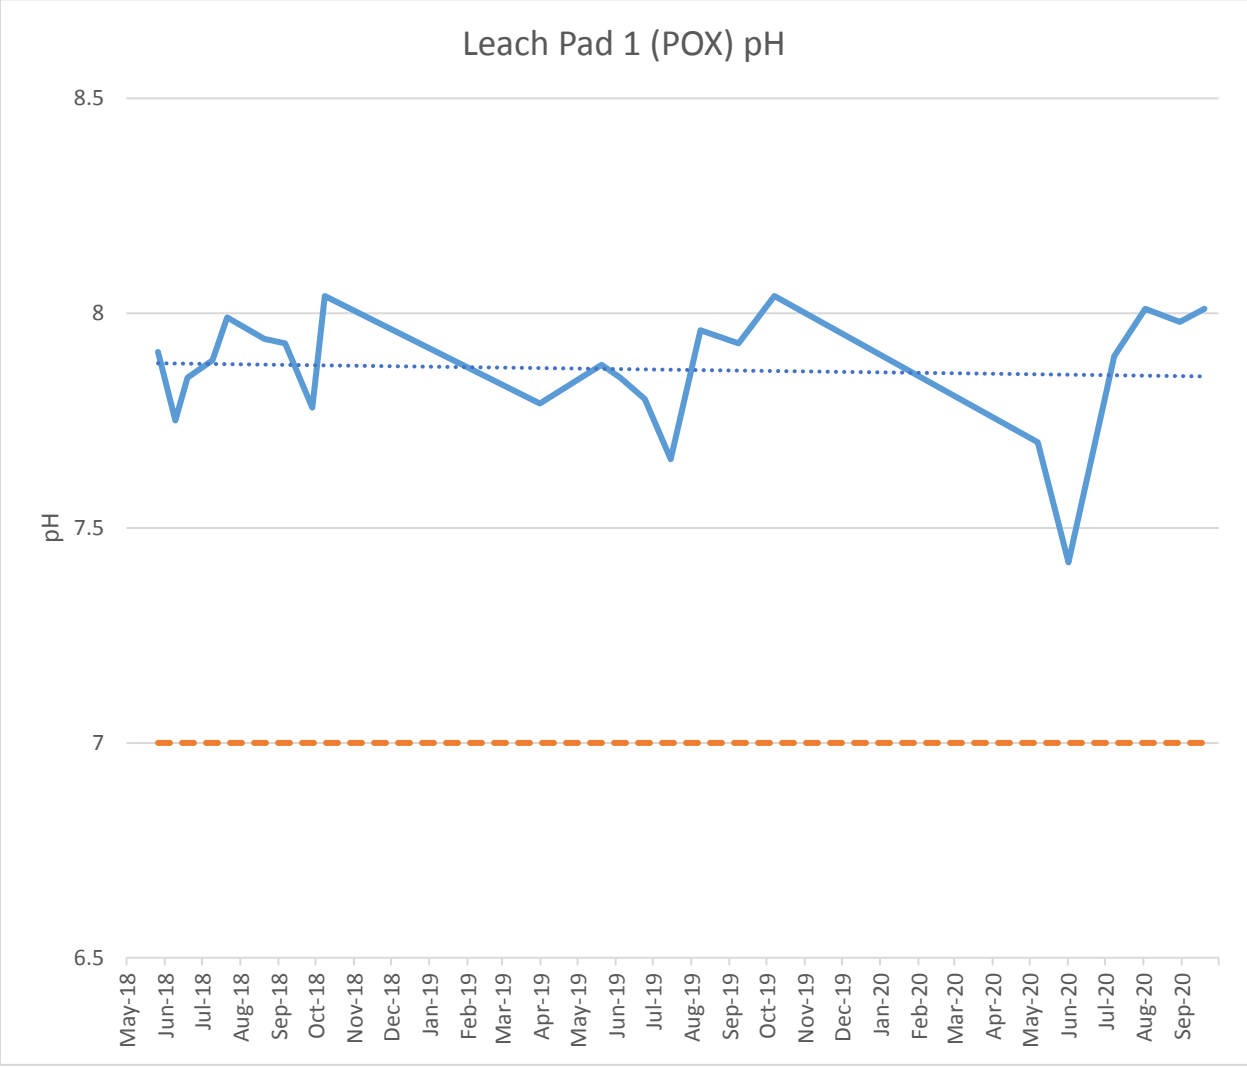

Figure 5-1: Leach Pad 1 pH

(Orange dotted line represents neutral pH)

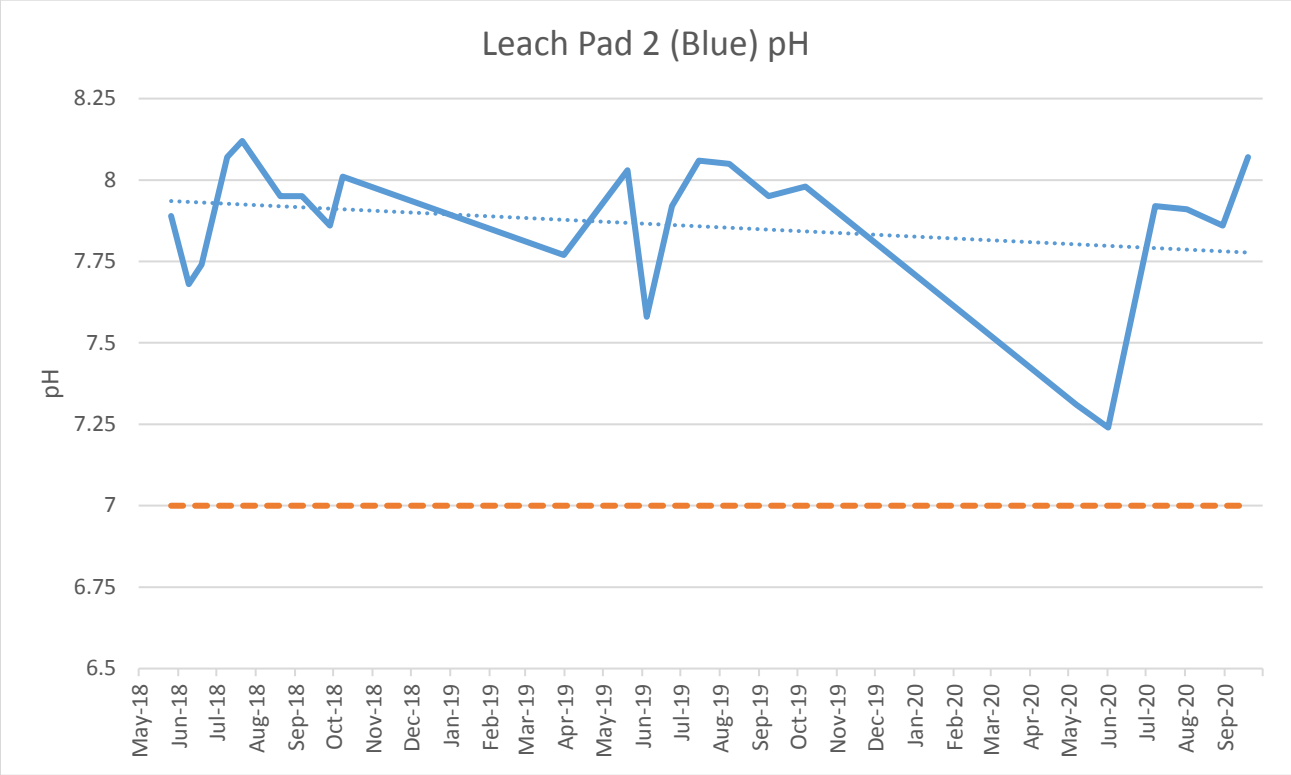

Figure 5-2: Leach Pad 2 pH

(Orange dotted line represents neutral pH)

The pH of leachate from both leach pads ranged from 7.24 to 8.07 which suggest the results are currently non-acid generating. These trends also suggest a stable neutralizing potential.

A total of 16 rock samples were collected from the leach pads while they were constructed which were analyzed for percent copper and silver (concentrations in grams/tonne), percent carbon, percent sulfur, neutralizing potential, and acid generating potential.

The results of these samples are presented in table 5-1, below.

Results indicate that the PO_X material, sourced from the "Top of the World PO_X pile, are non-acid generating with an Average NP:AP of over the cut-off value of 3.0 (Mean of 5.41). The Blue Ore pile, is considered potentially acid generating with an average

NP:AP below the 3.0 cut-off (mean of 1.50). The Blue Ore pile, currently, is not acid generating.

6 Conclusions and Recommendations

Overall, with the exception of selenium, the measured parameters are at, near, or below the effluent release limits from both leachate sources. The selenium concentrations over the effluent release limits may indicate that the leachate from PO_X material contained the on surface could have a slight influence runoff waters reporting to the pits. Selenium concentrations may be the only parameter of concern.

The blue ore pile's NP:AP indicates this material requires milling or aqueous disposal within the pits.

Data from the leach pad trials has been shared with SRK for addition to the water balance. Further testing and analysis is recommended for another two years, to monitor the selenium concentrations.

1 Introduction

The following report presents a record of construction for the Leach Pads, constructed from August 2017 to March 2018. The Geochemical Monitoring Program detailed in the Water Use Licence QZ14-031 includes as one of the conditions the requirement for geochemical characterization of waste, including leachate quality (Section 5.1.5, Article 94):

> *The Licensee shall update the Geochemical Monitoring Program to include a monitoring and geochemical characterization program that will produce detailed metals leaching characterization from the low-grade ore and oxide ore.*

Implementation of a monitoring program that satisfies this condition was included in the Environmental Monitoring, Surveillance, and Reporting Plan (EMSRP). The plan included construction of the leach pads in the summer of 2017 and sampling of the leachate for one year, starting in September 2017.

2 Construction Activities

The Design drawings for the construction of the Leach Pads were provided by SRK in late July, and construction began in August and September, proceeding intermittently due to high competitive demand for the necessary equipment during aggressive production mining activity in the Area 2 Phase 4 Pit.

2.1 Work Site Preparation

Work site preparation began with the initial excavation of the ground surface for the placement of residuum for the base construction and shaping, and was undertaken in August of 2017. Construction of outfall channels and the placement of 100 mm HDPE leachate collection pipes in the bottom of the pads was completed prior to the placement and shaping of residuum base material to the design dimensions from the design drawings provided by SRK (See Figure 1).

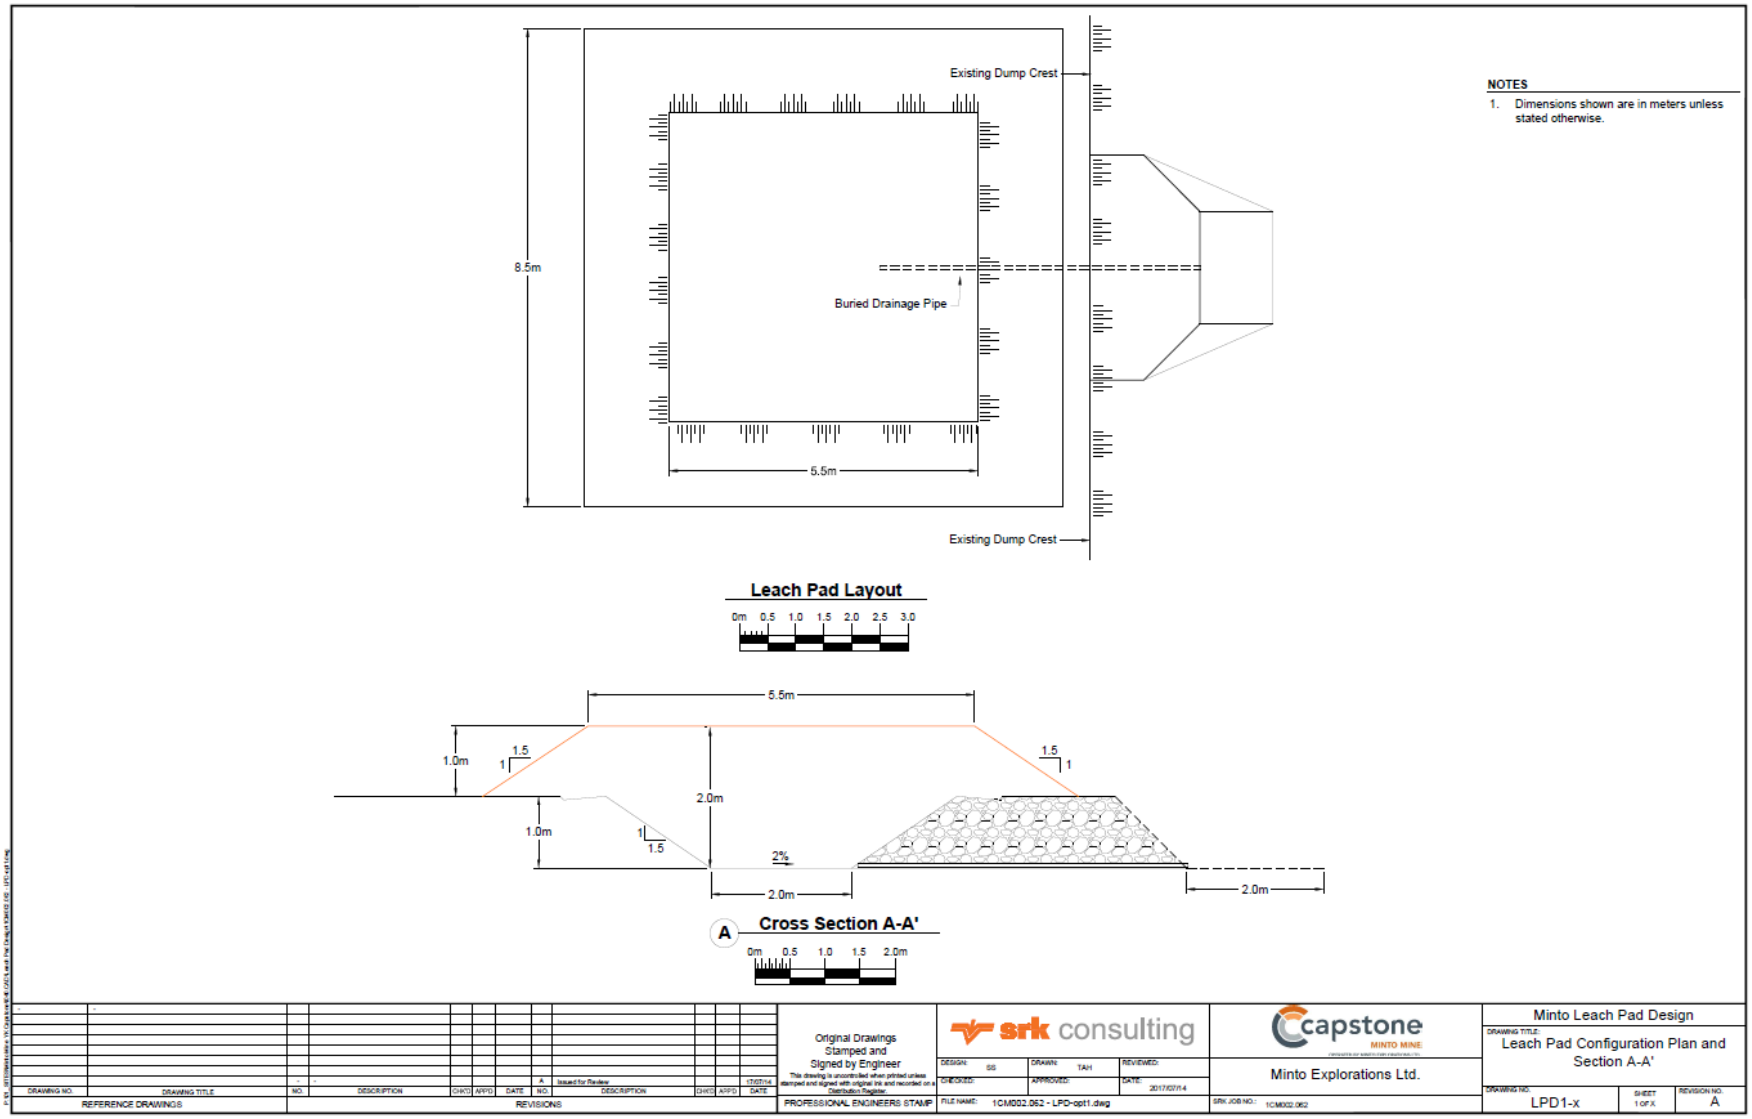

Figure 1: Leach Pad Design Drawing

Photo 1: Pad #2 under construction using Residuum. Pad 1 in Foreground – looking southeast

The initial Shaping of Pad #1 was completed in it's entirety before Pad #2 construction began. Placement of Residuum and shaping of the berms prior to liner installation was completed on October 6th (See Photos 1&2).

Photo 2: Leach Pad #1 residuum placement completed. Pipe in bottom visible

Photo 3: Outfall for leachate collection pipe placement

2.2 Liner Placement

A 4.0 mm Bituminous Geomebrane Liner (BGM Liner) was selected for the Leach Pads due to relative ease of installation, requiring no specialized tools or skills to weld the seams. A liner installation plan was supplied by SRK (See Figure 2), however it was not deemed practical for field installation due to the difficulty in installing the largest piece of liner by hand due to it's weight, as well as the number of seams requiring sealing and the propensity for smaller liner pieces to shift and move while being walked on. Each liner was installed in 5 pieces; one for the bottom, and one for each of the sides. All liner pieces overlapped the next piece by at least 150 mm as per the manufacturers recommendations. The installed liners are shown in Photos 4, 5, and 6.

All seams were welded using a "tiger torch", with pressure applied to the seams ensuring full bonding of both layers. Quality Control was completed during seam welding on at least 10% of each seam and in random locations following completion of each weld. Particular attention was paid to areas where three layers converged, ensuring a strong, water tight bond between all layers.

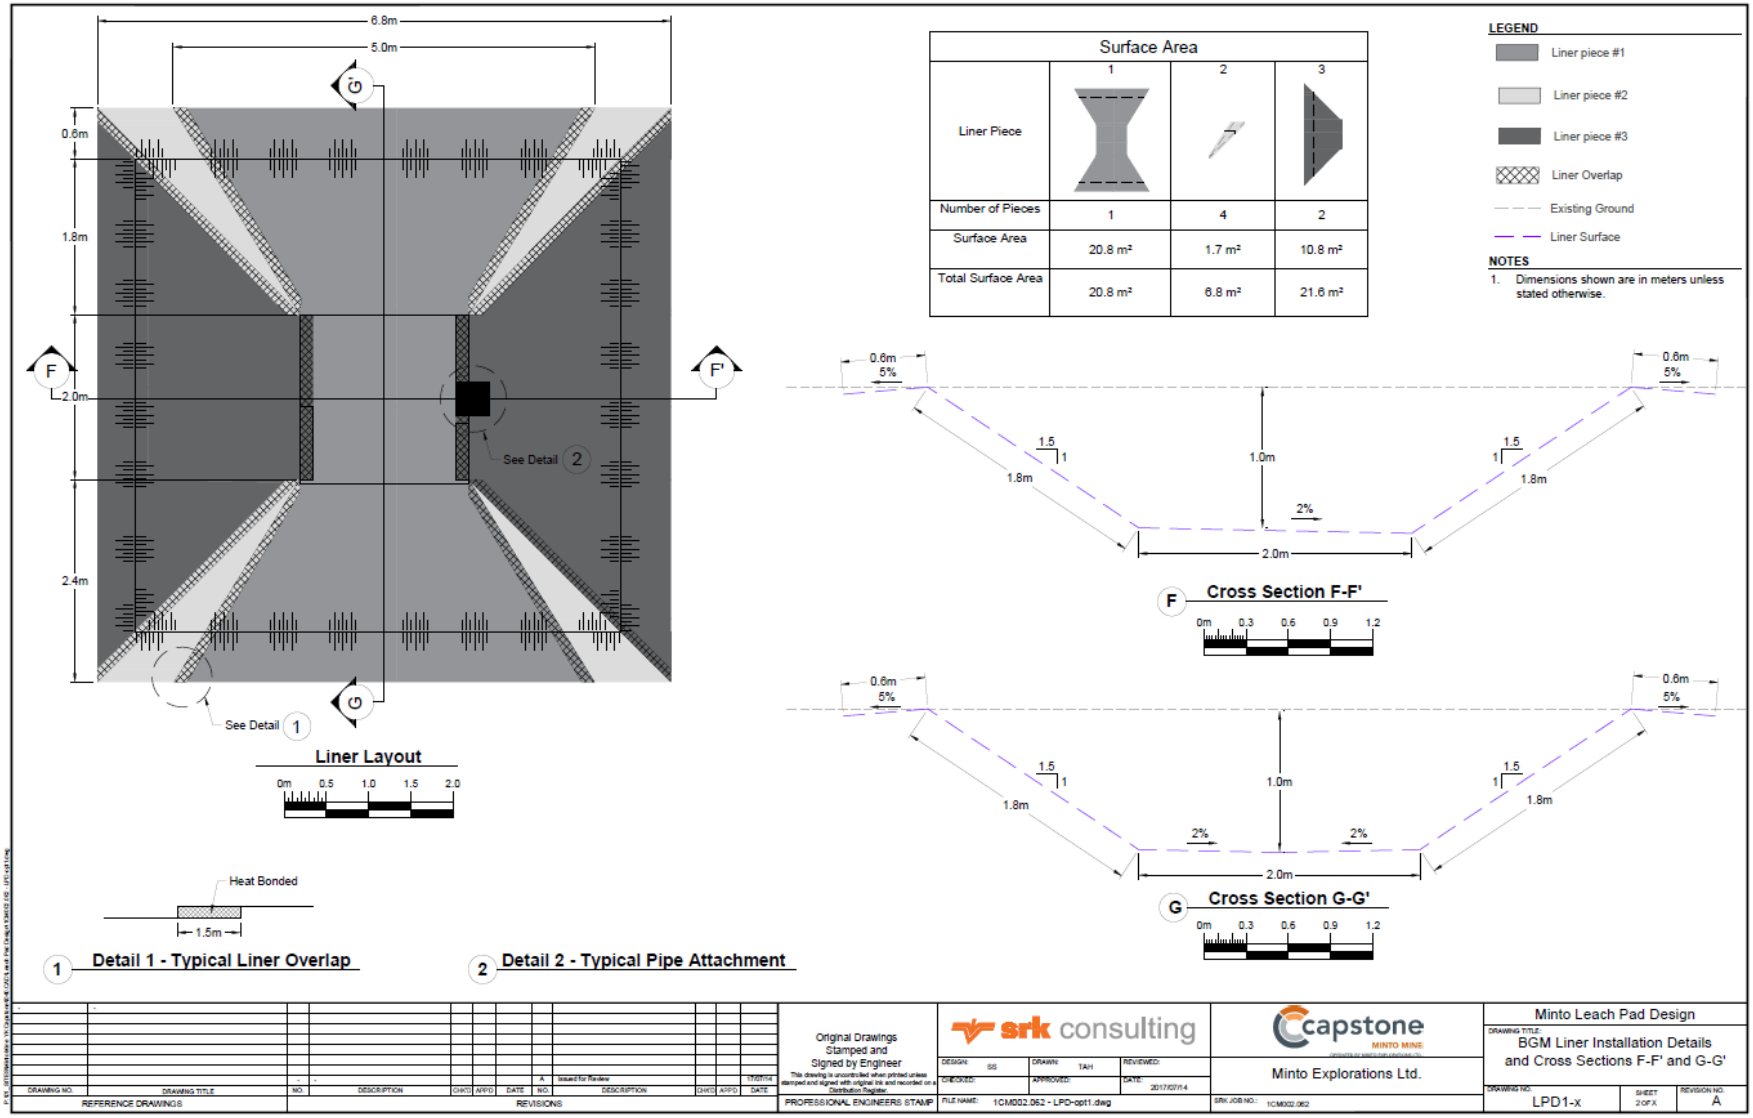

Figure 2: Liner Installation Design Drawings

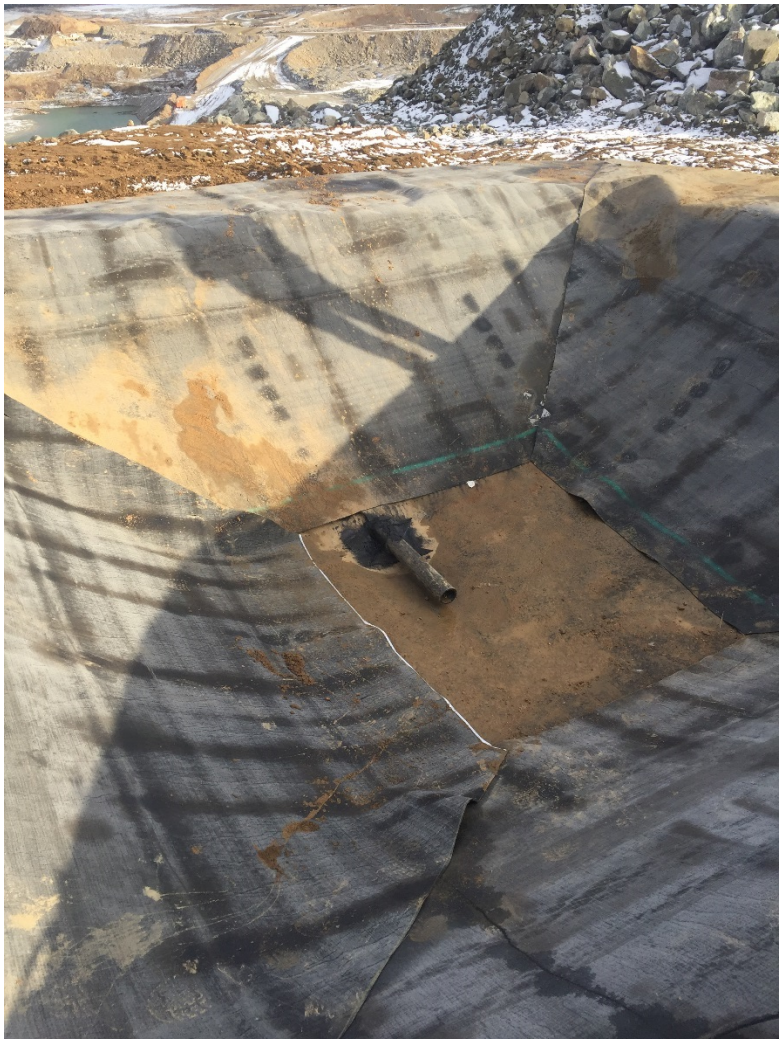

Photo 4: BGM liner install: bottom not yet sealed

Photo 5: Leachate collection pipe boot seal detail

2.3 Pad Filling

The Leach pads were designed to be filled with a nominal depth of 2.0 meters of ore. Pad #1 was to be filled with Partially Oxidized Ore (POX), and Pad #2 was to be filled with Low Grade Sulphide (Blue) Ore. SRK provided fill design plans (See Figure 3), and these were roughly adhered to in the field resulting in a nominal depth of 2.5 meters of POX on Pad #1, and a nominal depth of 2.1 meters of Blue Ore on Pad #2. The final measured volume of material placed on Pad 1 was 143 m3, and on Pad 2 was 126 m3. Because placement of both materials occurred during the winter, the pads had to be cleared of snow before the ore could be placed. This activity and the completed placement of ore can be seen in Photos 6 -8.

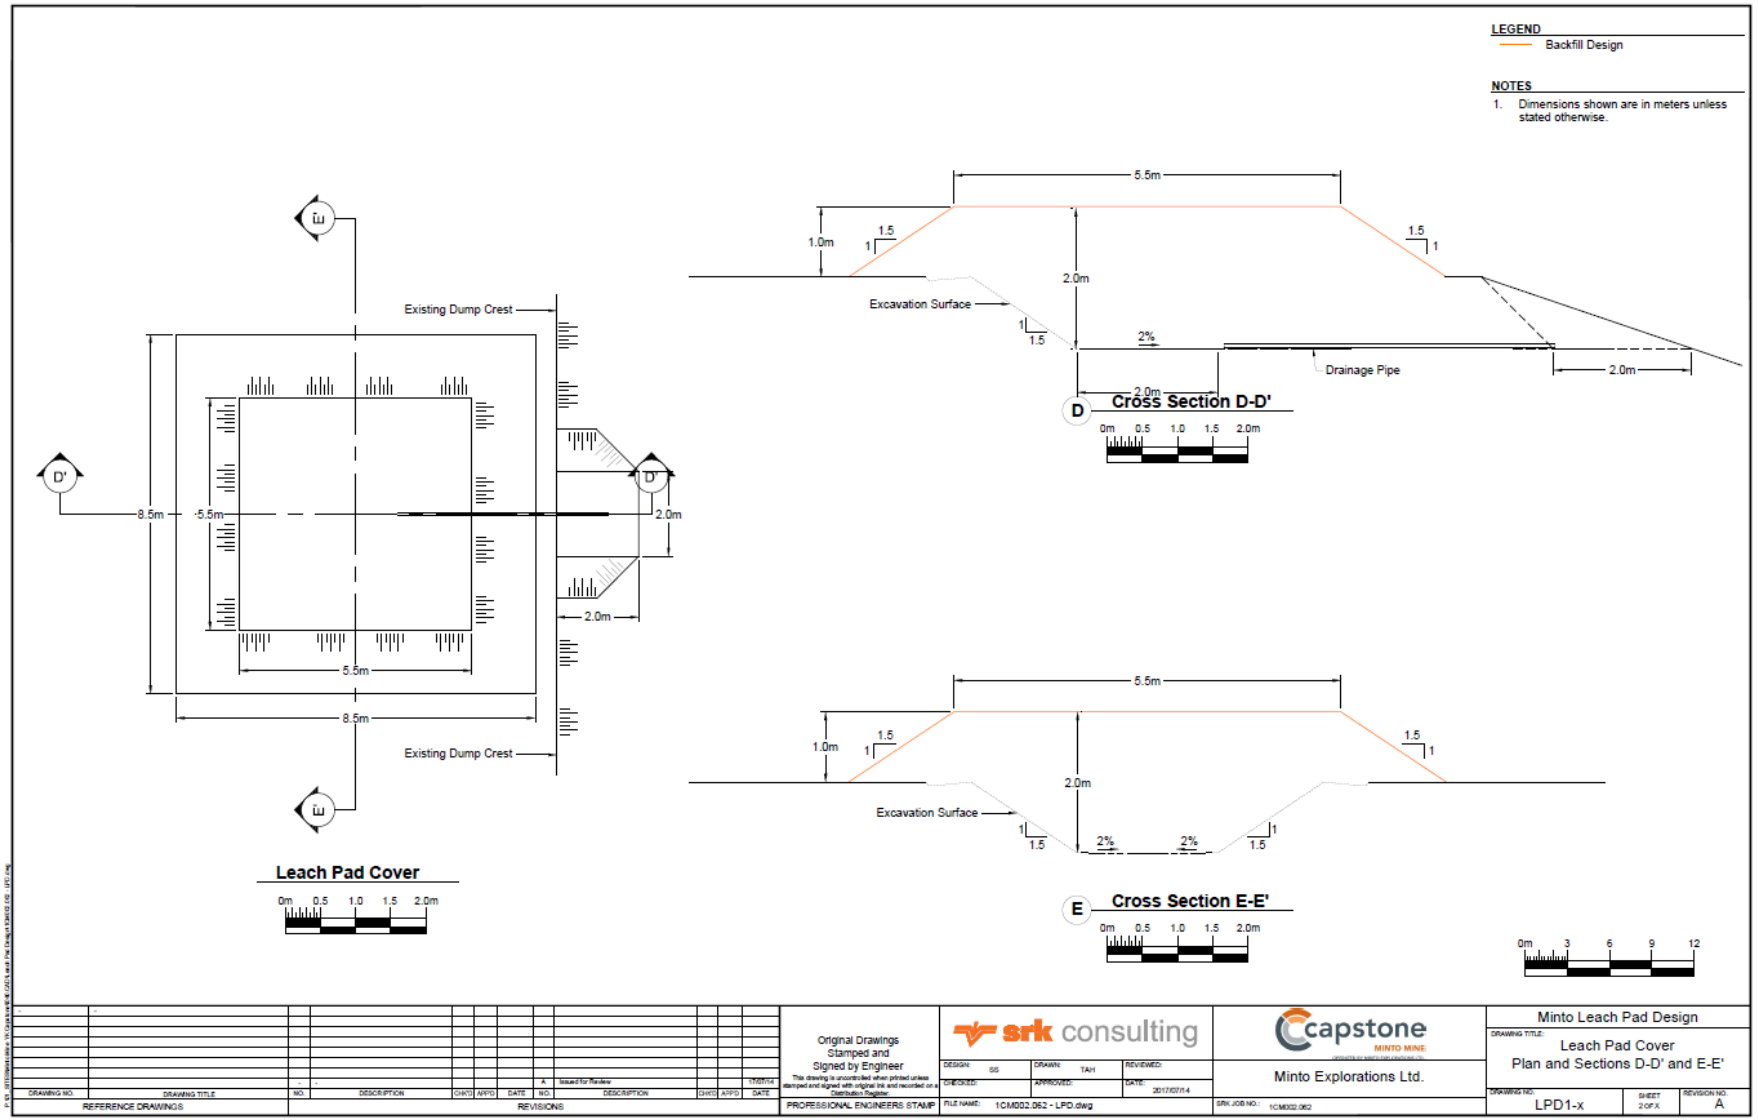

Figure 3: Leachate Pad Cover/Fill Design

Photo 7: Leach Pad #1 filled with POX

Photo 8: Leach Pads #1 and #2 Completed (Spring 2018 photo)

Figure 4 shows Survey scans of the completed Leach Pads before and after placement of materials in plan view. Figure 5 shows a cross-section of each leach pad as-constructed in the field.

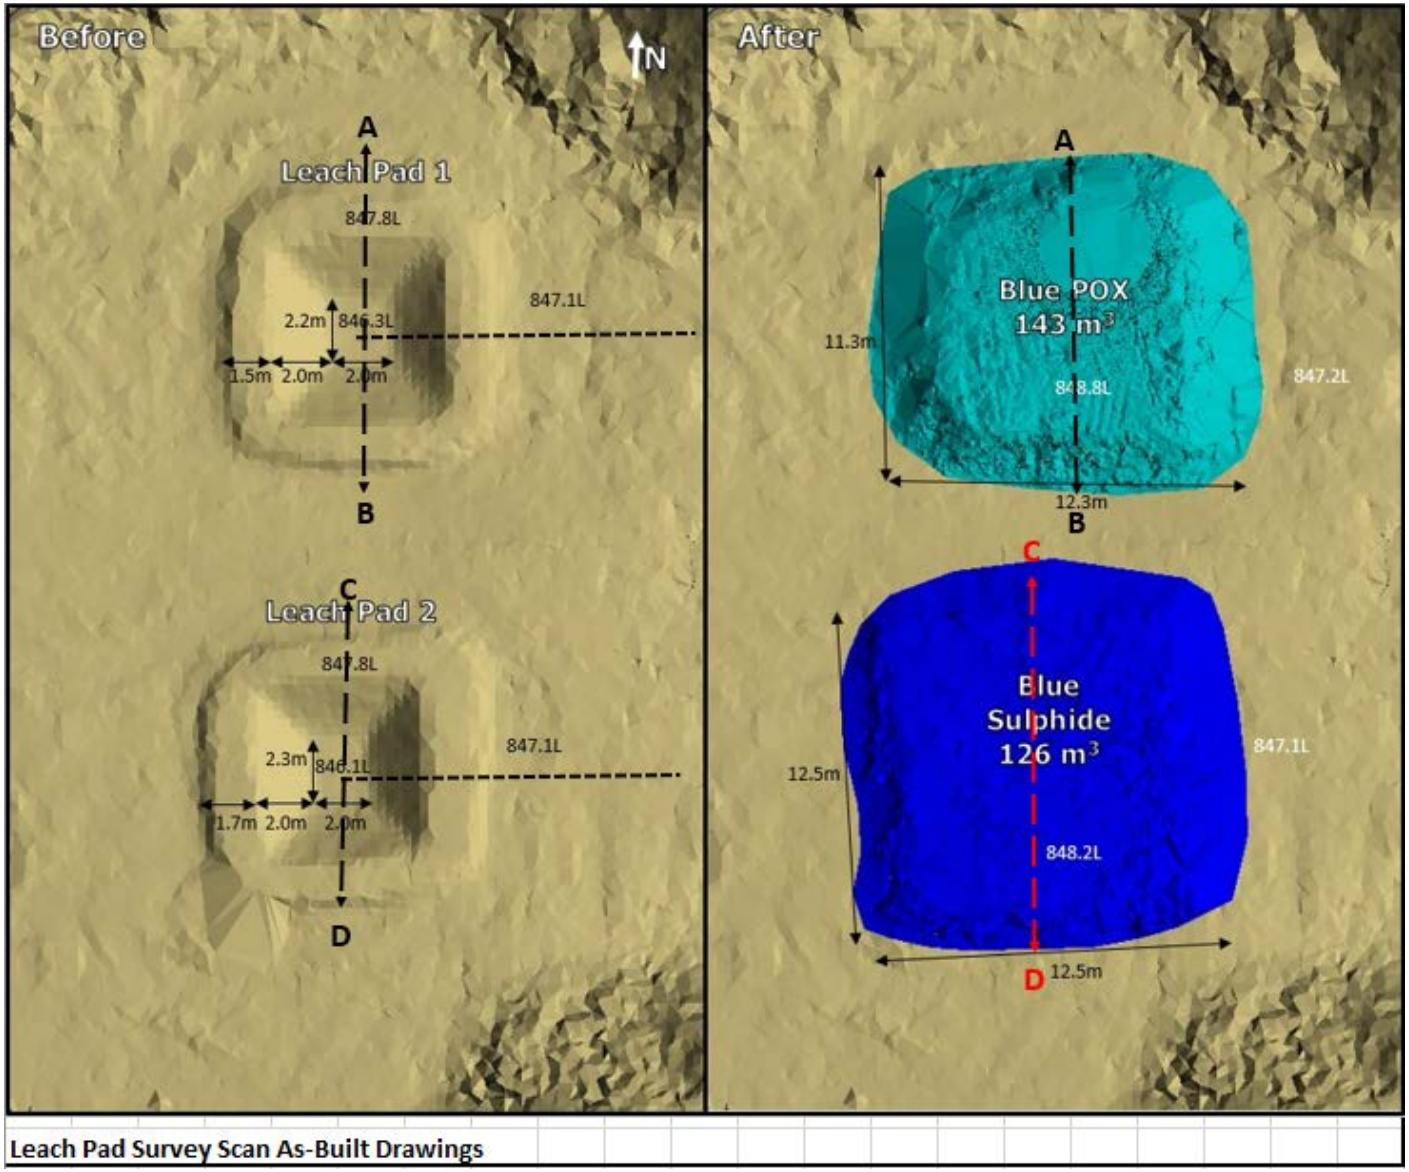

Figure 4 – Plan View of Pads before and after material placement

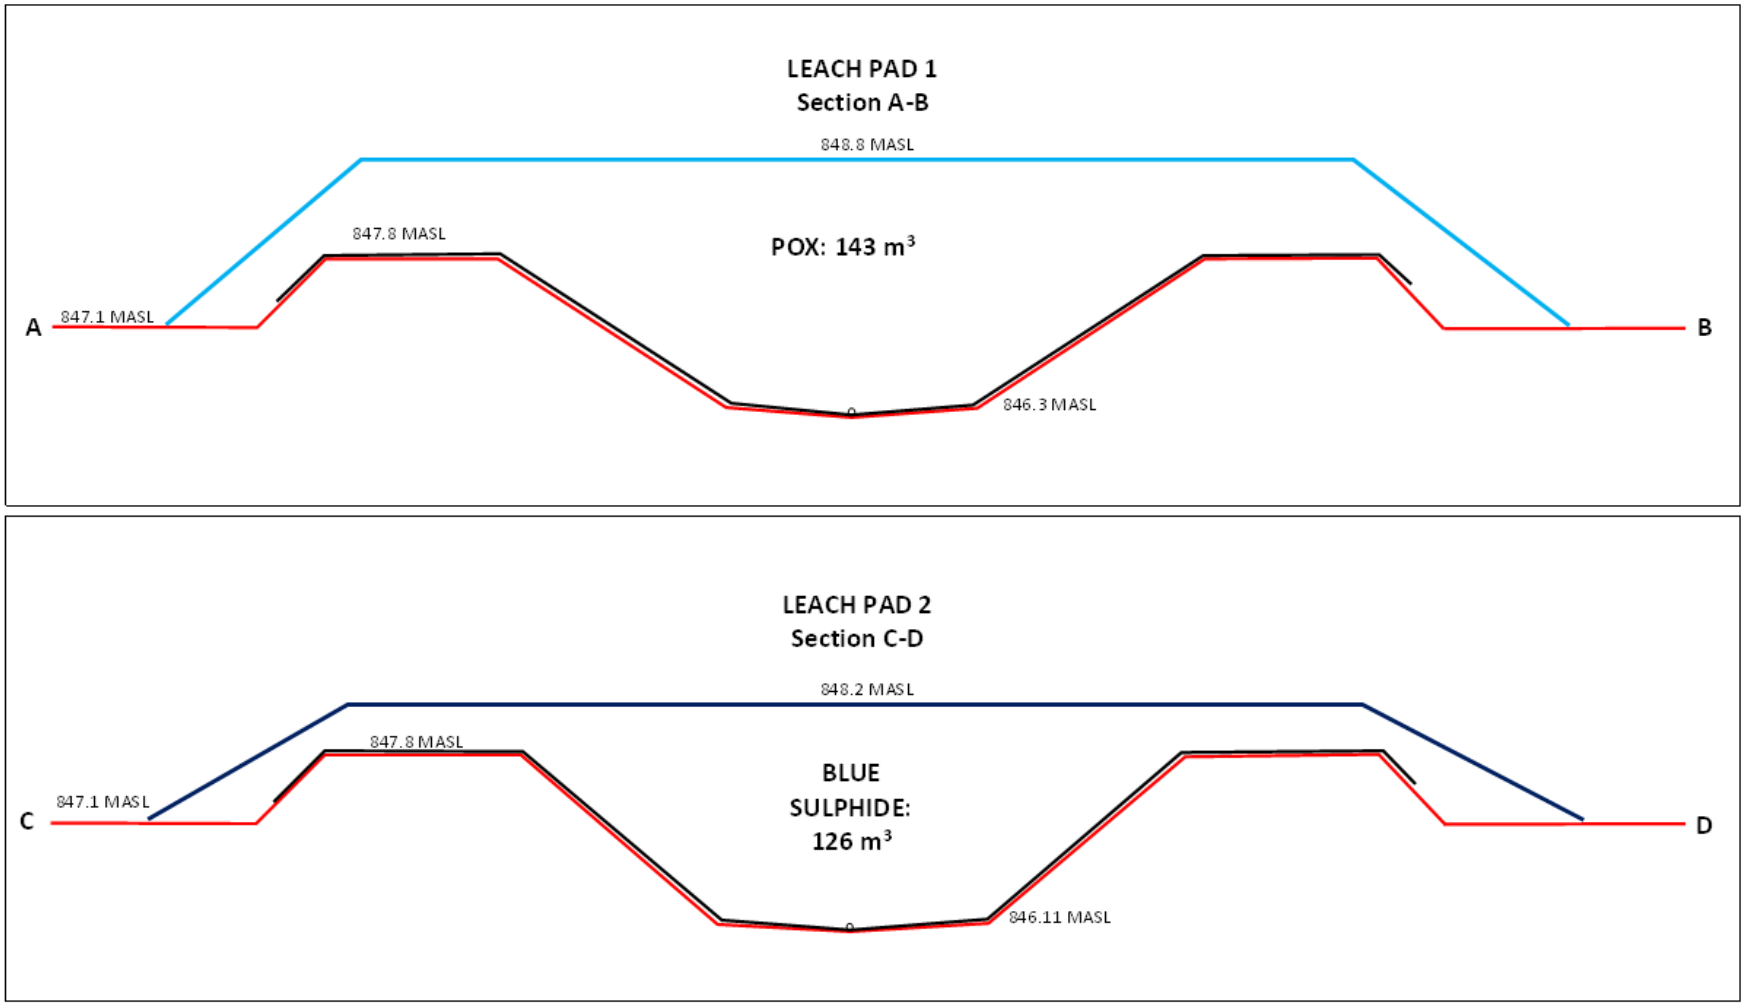

Figure 5: Cross Sections A-B and C-D of Pads 1 and 2.

3 Conclusion

This report has been prepared to satisfy the as-built construction report for the metals leaching characterization test pads as per Article 34 of Water Licence QZ14-031.

Appendix LPS B – Sampling Methodology

Background

The collection of leachate samples from two Leach Characterization Testing Pads (Leach Pads) at Minto Mine (Minto) was first required by the approved 2017-02 EMSRP. Leach Pad 1 is filled with POX material. Leach Pad 2 is filled with blue ore. Water quality samples are required monthly from both leach pads.

Field staff are responsible for coordinating all sampling events in accordance with the requirements of the current EMSRP, including sampling locations, sampling frequency, and parameter requirements.

All sampling and documentation must be conducted in accordance with the Surface WQ Sampling SOP and the QA/QC protocols.

Preparation for Leach Pad sampling must also include provision for quality control samples. Due to the short term of this sampling project, a duplicate sample will be collected from one of the Leach Pads each month.

Safety Precautions

It is particularly important for employees to be aware they are working in proximity to a sheer rock face. It is important they remain aware of where they are, stay as far away from the cliff face as possible, and remain conscious of their footing when approaching the sampling sites.

Leach Pad water quality sampling and related tasks can be carried out by an employee working alone.

Equipment

- Sample bottles, labels, and seepage WQ field forms
- pH Pen
- Nitrile gloves
- Syringes and filters
- Sample preservatives
- Cooler and sufficient ice packs

Procedure

1. Clearly label all sample bottles with station name (LP1 or LP2), date, time (24-hour clock). See Figure 1 below for the location of the leach pads.
2. Put on clean nitrile gloves prior to collecting the sample.
3. For each leach pad, shown in Figure 1, collect a WQ sample as listed in Table 1 and send to ALS Environmental labs.

Table 1: Leach Pad WQ Sample Requirements

Analysis Name	Parameters (not inclusive)	Bottle	Filter	Preservative
Physical Parameters (General)	pH, Conductivity, TSS, TDS, Alkalinity, Anions	500 mL (Plastic)	Not required	Not required
Dissolved Metals	Metals	125 mL (Plastic)	Required	Required
Ammonia/Phosphorus	P, NH_3	125 mL (Glass)	Not Required	Required

4. All bottles will be triple-rinsed.
    a. Ensure that samples requiring filtering are rinsed with filtered water only.
5. Collect water directly from the sampling bucket using a syringe.
6. Use new syringes and filters for every station
7. Filter and add preservatives to the required samples as soon as possible after sample collection and filtering, at the sampling location.
8. **COLLECT A DUPLICATE sample from one of the Leach Pads every sampling event.**
    a. If sufficient water is available, collect the duplicate from Pad #1 on odd numbered months, and from Pad #2 on even numbered months.
    b. Alternatively collect the duplicate from whichever pad collection sump (bucket) has the most water present.
9. Field measurements can be made either in situ (in the water bucket) or using a sub-sample taken in a separate container which is discarded once the measurements are recorded.

a. Sub-samples are not used for further chemical analyses, and must be taken after the sample collection has been completed.

b. Instrumentation must display stable in-situ parameters before field staff record parameters.

10. Once Sampling is complete, the buckets should be tipped over and drained, allowing for new leachate to enter the bucket for the next sampling session, and ensuring the same leachate water is not being sampled twice.

11. Complete the seepage field form at the station, including

    a. Station Name (LP1 or LP2)

    b. Date and time of sample collection;

    c. Weather at time of sample collection;

    d. Field measurements of pH, conductivity, temperature;

    e. Water colour, turbidity, and presence of any precipitates or mineral staining; and

    f. Record the quantity of filters used and the colour of the sediment contained, photograph the filters.

12. Enter the sample data into the water quality tracking sheet (WQTS) and file the field form.

13. Ship the samples to ALS Environmental at the earliest opportunity, as per the regular shipping process.

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
%	percent
µS/cm	Microsiemens per centimetre
meq/L	milliequivalents per litre
mg/L	milligrams per litre
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in reports identified as "Preliminary Report" are considered authorized for use.

Client	: **Minto Explorations Ltd.**	Laboratory	: Whitehorse - Environmental
Contact	: Minto Environment - Coordinator	Account Manager	: Heather McKenzie
Address	: Suite 2100- 510 West Georgia St Vancouver BC Canada V6B 0M3	Address	: #12 151 Industrial Road Whitehorse YT Canada Y1A 2V3
Telephone	: ----	Telephone	: +1 867 668 6689
Project	: ----	Date Samples Received	: 02-Jun-2020 14:40
PO	: 232824	Date Analysis Commenced	: 04-Jun-2020
C-O-C number	: 2020-06-02 C	Issue Date	: 16-Jun-2020 14:12
Sampler	: ----		
Site	: ----		
Quote number	: Q54721-Standing Offer		
No. of samples received	: 9		
No. of samples analysed	: 9		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Angela Ren	Team Leader - Metals	Metals, Burnaby, British Columbia
Clarie Tejano		Metals, Burnaby, British Columbia
Dee Lee	Analsyt	Metals, Burnaby, British Columbia
Lindsay Gung	Supervisor - Water Chemistry	Inorganics - Water Quality, Burnaby, British Columbia
Robin Weeks	Team Leader - Metals	Inorganics - Water Quality, Burnaby, British Columbia
Robin Weeks	Team Leader - Metals	Metals, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
%	percent
µS/cm	Microsiemens per centimetre
meq/L	milliequivalents per litre
mg/L	milligrams per litre
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in reports identified as "Preliminary Report" are considered authorized for use.

Workorder Comments

Water sample SS22 for mercury analysis was not submitted in glass or PTFE container with HCl preservative. Results may be biased low.

Qualifiers

Qualifier	*Description*
DLA	*Detection Limit adjusted for required dilution.*
DLM	*Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).*

Client	: **Minto Explorations Ltd.**	Laboratory	: Whitehorse - Environmental
Contact	: Minto Environment - Coordinator	Account Manager	: Heather McKenzie
Address	: Suite 2100- 510 West Georgia St Vancouver BC Canada V6B 0M3	Address	: #12 151 Industrial Road Whitehorse YT Canada Y1A 2V3
Telephone	: ----	Telephone	: +1 867 668 6689
Project	: Minto Mine Monitoring	Date Samples Received	: 14-Jul-2020 14:20
PO	: 232824 (Seepage)	Date Analysis Commenced	: 15-Jul-2020
C-O-C number	: 2020-07-14 C	Issue Date	: 23-Jul-2020 11:36
Sampler	: ----		
Site	: ----		
Quote number	: Q54721-Standing Offer		
No. of samples received	: 3		
No. of samples analysed	: 3		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Bruna Botti	Analyst	Inorganics - Water Quality, Burnaby, British Columbia
Ilnaz Badbezanchi	Team Leader - Metals preparation	Metals, Burnaby, British Columbia
Kevin Duarte	Team Leader - Inorganics	Inorganics - Water Quality, Burnaby, British Columbia
Kinny Wu	Laboratory Analyst	Metals, Burnaby, British Columbia
Robin Weeks	Team Leader - Metals	Inorganics - Water Quality, Burnaby, British Columbia
Robin Weeks	Team Leader - Metals	Metals, Burnaby, British Columbia
Woochan Song	Lab Assistant	Metals, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
%	percent
µS/cm	Microsiemens per centimetre
meq/L	milliequivalents per litre
mg/L	milligrams per litre
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in reports identified as "Preliminary Report" are considered authorized for use.

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
%	percent
µS/cm	Microsiemens per centimetre

Sampler	: ----		
Site	: ----		
Quote number	: Q54721-Standing Offer		
No. of samples received	: 3		
No. of samples analysed	: 3		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 15:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 15:00 is used for calculation purposes.

Legend & Qualifier Definitions

EHTR-FM: Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Water**

Evaluation: × = QC frequency outside specification; ✓ = QC frequency within specification.

Quality Control Sample Type			Count		Frequency (%)

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Conductivity in Water	E100 Vancouver - Environmental	Water	APHA 2510 (mod)	Conductivity, also known as Electrical Conductivity (EC) or Specific Conductance, is measured by immersion of a conductivity cell with platinum electrodes into a water sample. Conductivity measurements are temperature-compensated to 25°C.
pH by Meter	E108 Vancouver - Environmental	Water	APHA 4500-H (mod)	pH is determined by potentiometric measurement with a pH electrode, and is conducted at ambient laboratory temperature (normally 20 ± 5°C). For high accuracy test results, pH should be measured in the field within the recommended 15 minute hold time.
TSS by Gravimetry	E160-H Vancouver - Environmental	Water	APHA 2540 D (mod)	Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, following by drying of the filter at 104 ± 1°C, with gravimetric measurement of the filtered solids. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.
Chloride in Water by IC (Low Level)	E235.Cl-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrite in Water by IC (Low Level)	E235.NO2-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrate in Water by IC (Low Level)	E235.NO3-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Sulfate in Water by IC	E235.SO4 Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Alkalinity Species by Titration	E290 Vancouver - Environmental	Water	APHA 2320 B (mod)	Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.
Ammonia by Fluorescence	E298 Vancouver - Environmental	Water	J. Environ. Monit., 2005, 7, 37-42 (mod)	Ammonia in water is analyzed by flow-injection analysis with fluorescence detection after reaction with orthophthaldialdehyde (OPA).

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Dissolved Metals in Water by CRC ICPMS	E421 Vancouver - Environmental	Water	APHA 3030B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.
Dissolved Chromium in Water by CRC ICPMS (Low Level)	E421.Cr-L Vancouver - Environmental	Water	APHA 3030 B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS
Dissolved Mercury in Water by CVAAS	E509 Vancouver - Environmental	Water	APHA 3030B/EPA 1631E (mod)	Water samples are filtered (0.45 um), preserved with HCl, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS.
Dissolved Hardness (Calculated)	EC100 Vancouver - Environmental	Water	APHA 2340B	"Hardness (as CaCO3), dissolved" is calculated from the sum of dissolved Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. "Total Hardness" refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations.
Ion Balance using Dissolved Metals	EC101 Vancouver - Environmental	Water	APHA 1030E	Cation Sum, Anion Sum, and Ion Balance are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Dissolved species are used where available. Minor ions are included where data is present. Ion Balance cannot be calculated accurately for waters with very low electrical conductivity (EC).
TDS in Water (Calculation)	EC103 Vancouver - Environmental	Water	APHA 1030E (mod)	Total Dissolved Solids is calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Dissolved species are used where available. Minor ions are included where data is present.
Nitrate and Nitrite (as N) (Calculation)	EC235.N+N Vancouver - Environmental	Water	EPA 300.0	Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N).

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Dissolved Metals Water Filtration	EP421 Vancouver - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HNO3.
Dissolved Mercury Water Filtration	EP509 Vancouver - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HCl.

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percentage Difference
# = Indicates a QC result that did not meet the ALS DQO.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test specific).

Sub-Matrix: **Water**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Water**

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Sub-Matrix: **Water**

Miles Gropen	Department Manager - Inorganics	Inorganics - Water Quality, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
%	percent
µS/cm	Microsiemens per centimetre
meq/L	milliequivalents per litre
mg/L	milligrams per litre
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in reports identified as "Preliminary Report" are considered authorized for use.

Qualifiers

Qualifier	*Description*
DLDS	*Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity.*
DLM	*Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).*

No. of samples received	: 3		
No. of samples analysed	: 3		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 15:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 15:00 is used for calculation purposes.

Legend & Qualifier Definitions

EHTR-FM: Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended

EHTL: Exceeded ALS recommended hold time prior to analysis. Sample was received less than 24 hours prior to expiry.

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Water**

Evaluation: × = QC frequency outside specification; ✓ = QC frequency within specification.

Quality Control Sample Type			Count		Frequency (%)		
Analytical Methods	*Method*	*QC Lot #*	*QC*	*Regular*	*Actual*	*Expected*	*Evaluation*

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Conductivity in Water	E100 Vancouver - Environmental	Water	APHA 2510 (mod)	Conductivity, also known as Electrical Conductivity (EC) or Specific Conductance, is measured by immersion of a conductivity cell with platinum electrodes into a water sample. Conductivity measurements are temperature-compensated to 25°C.
pH by Meter	E108 Vancouver - Environmental	Water	APHA 4500-H (mod)	pH is determined by potentiometric measurement with a pH electrode, and is conducted at ambient laboratory temperature (normally 20 ± 5°C). For high accuracy test results, pH should be measured in the field within the recommended 15 minute hold time.
TSS by Gravimetry	E160-H Vancouver - Environmental	Water	APHA 2540 D (mod)	Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, following by drying of the filter at 104 ± 1°C, with gravimetric measurement of the filtered solids. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.
Chloride in Water by IC (Low Level)	E235.Cl-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrite in Water by IC (Low Level)	E235.NO2-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrate in Water by IC (Low Level)	E235.NO3-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Sulfate in Water by IC	E235.SO4 Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Alkalinity Species by Titration	E290 Vancouver - Environmental	Water	APHA 2320 B (mod)	Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.
Ammonia by Fluorescence	E298 Vancouver - Environmental	Water	J. Environ. Monit., 2005, 7, 37-42 (mod)	Ammonia in water is analyzed by flow-injection analysis with fluorescence detection after reaction with orthophthaldialdehyde (OPA).

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Dissolved Metals in Water by CRC ICPMS	E421 Vancouver - Environmental	Water	APHA 3030B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.
Dissolved Chromium in Water by CRC ICPMS (Low Level)	E421.Cr-L Vancouver - Environmental	Water	APHA 3030 B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS
Dissolved Hardness (Calculated)	EC100 Vancouver - Environmental	Water	APHA 2340B	"Hardness (as CaCO3), dissolved" is calculated from the sum of dissolved Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. "Total Hardness" refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations.
Ion Balance using Dissolved Metals	EC101 Vancouver - Environmental	Water	APHA 1030E	Cation Sum, Anion Sum, and Ion Balance are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Dissolved species are used where available. Minor ions are included where data is present. Ion Balance cannot be calculated accurately for waters with very low electrical conductivity (EC).
TDS in Water (Calculation)	EC103 Vancouver - Environmental	Water	APHA 1030E (mod)	Total Dissolved Solids is calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Dissolved species are used where available. Minor ions are included where data is present.
Nitrate and Nitrite (as N) (Calculation)	EC235.N+N Vancouver - Environmental	Water	EPA 300.0	Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N).

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Dissolved Metals Water Filtration	EP421 Vancouver - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HNO3.

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percentage Difference
# = Indicates a QC result that did not meet the ALS DQO.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test specific).

Sub-Matrix: **Water**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Water**

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Sub-Matrix: **Water**

Failure to complete all portions of this form may delay analysis. Please fill in this form LEGIBLY. By the use of this form the user acknowledges and agrees with the Terms and Conditions as specified on the back page of the white - report copy.

1. If any water samples are taken from a **Regulated Drinking Water (DW) System**, please submit using an **Authorized DW COC form**.

Appendix Q – Wildlife and Hazing Tracking Report

Date	Time	Type of animal	Number of animals	Location	Description: Size/Color/Markings and Additional Notes	Was the animal hazed?
29-Jan-20	13:00	Porcupine	1	Fresh Air Raise	Adult, Healthy	No
15-Mar-20	13:00	Wolf	1	Access Road KM 24-25	Black	No
20-Apr-20	15:45	Black Bear	1	Dyno Yard, near office	Young, light brown	Yes
4-May-20	15:30	Black Bear	1	Access Road above WSP	Young, light brown	No
5-May-20	14:00	Black Bear	1	MWD into the bush	Dark fur, Healthy	No
5-May-20	19:30	Black Bear	1	Ridge above Camp	Dark fur, Healthy	Yes
6-May-20	12:45	Black Bear	1	UG shop laydown	Young, dark fur	No
7-May-20	16:00	Black Bear	1	Fuel Farm to ERT	Light brown	No
8-May-20	12:30	Black Bear	1	Mine tech past ERT to bush	Light brown	Yes
9-May-20	21:30	Black Bear	1	Camp parking lot to DSTF	Dark fur, Healthy	No
11-May-20	7:50	Black Bear	1	Airport road	Dark fur, Healthy	No
11-May-20		Black Bear	1	Warehouse yard up through camp past ERT	Dark fur, Healthy	Yes
13-May-20	6:50	Black Bear	1	Below Airstrip Propane Farm	Light brown, Healthy	Yes
14-May-20	6:30	Black Bear	1	Road/Field East of Cobalt Parking.	Dark fur, Healthy	Yes
14-May-20	8:30	Black Bear	1	W35 Sump Area	Dark fur, Healthy	Yes
18-May-20	23:00	Black Bear	1	Near Dyno Yard	Thin	No
20-May-20	9:45	Black Bear	1	Near Main Pit	Dark fur, Healthy	Yes
20-May-20	10:30	Black Bear	1	Behind Underground Shop	Light brown, Healthy	Yes
20-May-20	11:30	Black Bear	1	On Dry Stack	Dark fur, Healthy	No
21-May-20	9:50	Black Bear	1	By W35	Light brown, Healthy	No
21-May-20	11:30	Lynx	1	Drill road behind core shack	Small, young	No
21-May-20	1:55	Black Bear	1	Haul Road between Main Pit and A2P	Dark fur, Healthy	No
24-May-20	12:55	Black Bear	1	Near Yellow Stockpile	Dark fur, Healthy	No
25-May-20	9:30	Black Bear	2	Near Airport road	Light Brown, healthy/Dark Fur, healthy	No
25-May-20	12:30	Black Bear	1	Near Kode Crusher	Light fur	Yes
26-May-20	8:30	Black Bear	1	Behind U/G Shop	Dark fur, healthy	No
26-May-20	2:00	Black bear	1	Fuel Farm to ERT	Light fur	No
19-May-20	5:00	Black Bear	1	Haul Road at airpot interection	medium sized black healthy	Yes
8-Jun-20	9:00	fox	1	Mill	skinny, it came close, tame	No
12-Jun-20	8:30	Porcupine	1	Propane farm	large, light blond/grayish	Yes
12-Jun-20	9:00	fox	1	Hall road	Black and orange, skinny	No
1-Jun-20	2:00	Fox	1	Kode		No
7-Jun-20	10:00	Fox		Mine Rescue/ERT building North side	Light brown	No
8-Jun-20	18:00	Black Bear	3	WSP	Mother very black, cubs dark brown	No
20-Jun-20	1:40	Black Bear	1	Road to Dump	Black with a dark dirty brown face	no
22-Jun-20	9:00	Grizzly bear	1	Trail to W1 from KM11		No
24-Jun-20	16:30	Black Bear	1	CWTS	Light brown	Yes
10-Jul-20	2:00	Grizzlies	2	fighting over territory KM10	both medium sized very healthy looking	No
11-Jul-20	3:30	deer	1	U/G Fuel Farm	large healthy looking	Yes
13-Jul-20	11:00	bear	2	Access Road, KM 4	mother and cub, both very black. Cub very small, born this year.	No

17-Jul-20	15:00	deer	2	MWD, off Minto North Road	doe and fawn	No
20-Jul-20	8:30	bear	2	Acces Road, KM 3	mother and cub, same from June 8th but only saw one cub	Yes
21-Jul-20		Grizzly bear	1	W6 access trail	Younger male	No
23-Jul-20	15:00	bear	2	DSTF	mother and cub	No
24-Jul-20	16:00	bear	?	W3	Bear vocalized while remaining in bush, When DA shouted to alert the bear to his position the vocalization/ barking continued	Yes
27-Jul-20	18:10	Black Bear	2	ERT building	mother and cub	No
9-Jul-20	9:30	Deer	1	Selkirk		No
17-Jul-20	9:00	Fox	1	Back Of Kitchen	Mangy Looking	No
24-Aug-20	8:15	Black Bear	1	Hill Behind Selkirk Tower		No
21-Sep-20	14:50	Black Bear	1	W17	Dark fur- healthy	No
1-Oct-20	7:30	Porcupine	1	In WTP discharge pipe @ W17	Just small enough to fit in an 18-20" pipe	No
2-Oct-20	18:30	Black Bear	2	CWTS area	Mother and cub	No
4-Oct-20	14:45	Black Bear	1	Warehouse yard up through camp past ERT	Dark fur, Healthy	Yes
1-Nov-20	8:30	Fox	1	SWA in WMA	Red coat, healthy	Yes
6-Dec-20	5:15	Lynx	1	Selkirk, near east emergency exits		No

attn.: Todd Swenson and Journey Paulus

Dear Todd Swenson and Journey Paulus:

Regarding: Minto 2020 Reclamation Research

Please find the enclosed Minto 2020 Reclamation Research Report which reports the findings of the Phase 1 bench-scale *in situ* pit lake treatment trials and 2020 research associated with the demonstration-scale constructed wetland treatment system.

Sincerely,
Ensero Solutions

Rachel Martz
Environmental Manager

EXECUTIVE SUMMARY

The Minto Mine (the "Mine"), owned and operated by Minto Explorations Ltd., is a copper mine located 240 km northwest of Whitehorse on the west side of the Yukon River. A Reclamation and Closure Plan (RCP) is required for the Minto Mine under both the Water Use License (QZ14-031) and the Quartz Mining License (QML-0001). As a part of the RCP, the Mine has retained Ensero Solutions (Ensero, formerly Contango Strategies and Alexco Environmental Group) to conduct research associated with a Constructed Wetland Treatment System (CWTS) and *in situ* pit lake treatment for water treatment. Additional details of the reclamation research plan can be found in Section 2.2 of the RCP.

The *in situ* pit lake treatment research is being completed in phases, with the first phase comprising an off-site bench-scale trial to determine the effectiveness of different organic carbon amendments (glycerol, ethanol, molasses) to treat constituents of concern (COCs) in the Main Pit water currently (nitrite, nitrate, copper, selenium, and ammonia) at the Minto Mine. These trials are intended to investigate the feasibility of *in situ* pit lake treatment during closure and operations for the Site. Near quantitative removal of nitrate and nitrite (>99.9%) to below both the effluent quality standard (EQS) and Minto Creek water quality objective (WQO) for all three soluble carbon sources tested was observed. While marked ammonia removal was not expected in these experiments, considerable ammonia removal was observed such that 51% to 74% of the cumulative ammonia added to the trials was removed at the end of the experiment. Removal of copper (89% to 98%), selenium (61% to 74%), and other chalcophile metals (cadmium, molybdenum, zinc) at the end of the experiment was observed below the WQO for the three soluble carbon dosed trials. Leaching of constituents from the woodchips and/or waste rock and tailings was assessed. Leachable constituents were not concerning as they were either in low concentrations, were removed through treatment, or in the case of iron and manganese can be managed via passive aeration and/or filtration in downstream waterbodies. The bench-scale pit lake data overall indicate that carbon amendment to the Main Pit would likely result in marked decreases in COCs.

A phased approach is also being used to guide the site-specific design and implementation of a CWTS at closure for the Minto Mine. The phased approach was initiated with a site assessment in 2013 followed by pilot-scale testing to confirm and provide proof-of-concept before constructing the on-site demonstration-scale CWTS at Minto in 2014. Commissioning and testing of the on-site demonstration-scale CWTS occurred between 2015 and 2019. Testing in 2019 showed that high nitrate concentrations resulted in slower treatment of certain COCs such as selenium. In 2020, a small test program was performed to evaluate a forebay with organics (straw) upstream of the demonstration-scale CWTS to decrease nitrate loads. The nitrate concentrations going to the demonstration-scale CWTS in 2020 were higher than previously observed. Treatment of cadmium, copper, and zinc were similar to previous years of operations, whereas treatment of selenium and molybdenum continued to show impacts due to the higher nitrate concentrations. Pilot-scale CWTS trials have demonstrated improved selenium removal in the low nitrate testing scenario. Nitrate concentrations are expected to decrease through closure, and opportunities such as *in situ* pit lake treatment could markedly decrease nitrate concentrations prior to the CWTS in closure. The continued reclamation research program may therefore include a test program which incorporates treated pit water into the CWTS to evaluate a treatment train combining these two technologies.

Given the success of the bench-scale *in situ* pit lake treatment (Phase 1), progression to Phase 2 studies is recommended, either through on-site limnocorral tests or full pit lake treatment. Targeted ammonia treatment

through a separate oxidizing system may be needed during operations to achieve ammonia concentrations below the EQS.

1 INTRODUCTION

The Minto Mine (the "Mine"), owned and operated by Minto Explorations Ltd., is a copper mine located 240 km northwest of Whitehorse on the west side of the Yukon River. A Reclamation and Closure Plan (RCP) is required for the Minto Mine under both the Water Use License (QZ14-031) and the Quartz Mining License (QML-0001). As a part of the RCP, the Mine has retained Ensero Solutions (Ensero, formerly Contango Strategies an AEG Company) to conduct research associated with a Constructed Wetland Treatment System (CWTS) and *in situ* pit lake treatment for water treatment. Additional details of the reclamation research plan can be found in Section 2.2 of the RCP. The CWTS is the primary technology selected for Minto in closure, with secondary contingency measures including *in situ* pit lake treatment. This report summarizes the RRP research results from 2020 for the CWTS and *in situ* pit lake treatment technologies.

The *in situ* pit lake treatment research has been proposed in phases, with the first phase comprising an off-site bench-scale trial, followed by on-site trials planned within the Main Pit at the Minto Mine. This report summarizes the off-site bench-scale experiments for *in situ* pit lake treatment evaluation that were performed in 2020 to evaluate treatment opportunities during closure and operations for the Site (Section 2).

The CWTS research to date includes a demonstration-scale system that was constructed at the Minto Mine in 2014, based on the design that was evaluated through pilot-scale testing (Contango, 2014). Two series were constructed in parallel, each with two cells planted with local *Carex aquatilis* (*C. aquatilis*) and moss (Contango, 2015). This report provides an update on the demonstration-scale CWTS activities in 2020 where a simple test program was initiated to evaluate the use of a forebay with straw for the CWTS (Section 3).

2 PIT LAKE TREATMENT RESEARCH

2.1 BACKGROUND

The treatment of flooded pits (and underground mine workings) via semi-passive methods has garnered increased attention in recent years as a viable tool for both the closure of mine sites and for the management of contaminant loads to downstream conventional treatment operations. *In situ* pit lake treatment is a biological-based technology that relies on stimulation of indigenous microorganisms that are ubiquitous in the environment. This approach has been applied for treatment of mine pit lakes to remove a broad array of constituents. The amendment of soluble organic carbon to the pit lake creates sulphate-reducing conditions via the stimulation of naturally occurring sulphide-producing bacteria. Under such conditions, chalcophile elements (e.g., cadmium, copper, lead, molybdenum, and zinc) will precipitate as sulphide minerals and be removed via sedimentation. Other constituents such as nitrite, nitrate, and selenium are also treated under such reducing conditions, through denitrification and selenium reduction, respectively.

2.1.1 Carbon Amendment of Pit Lakes

The use of soluble organic carbon injections to significantly lower contaminant concentrations in pit lakes, underground mine workings, and shallow groundwater has been described in detail in numerous reports at locations across North America (e.g., Lindsay, 2009; Murphy et al., 2008; Houston et al., 2005; Addison et al., 2005; Harrington, 2002; Harrington et al., 1999, 2004, 2009, 2015; ITRC, 2010; Morie et al., 2004; Paulson et al., 2004; Saunders et al., 2004) including northern Canada (Gault et al., 2018). In particular, *in situ* treatment has been successfully implemented at numerous flooded open pits (Harrington, 2002; Harrington et al., 2004, 2009; ITRC, 2010; Paulson et al., 2004). Here, *in situ* treatment uses the flooded open pit (or a portion thereof) as the reaction vessel for biologically reductive processes, treating water directly at the source of contamination. *In situ* treatment is performed through injection or placement of reagents into the flooded pit (e.g., organic carbon and nutrients) with pumping to circulate the reagents through the desired water volume. This results in the formation of a reductive zone within the flooded pit, creating the conditions necessary for microbial denitrification and dissimilatory sulphate reduction conducted by denitrifying or sulphide producing bacteria (SPB), respectively. Denitrifying bacteria facilitate the transfer of electrons from the organic carbon supplied to the system (e.g., alcohol, molasses) to nitrate and nitrite, resulting in nitrogen gas. Similarly, SPB facilitate the transfer of electrons from the organic carbon to reduce sulphate to sulphide. The sulphide then binds to the dissolved fraction of chalcophile metals and metalloids such as cadmium, copper, molybdenum, and zinc, removing them from solution via precipitation as insoluble metal sulphide phases. Under such reducing conditions, elements such as selenium are largely transformed to less soluble forms (e.g., elemental selenium phases). Such phases form particulates that settle to the base of the pit and will become buried over time as sediment naturally accumulates. The stability of these phases become enhanced by burial, or co-deposition of bulk iron sulphide phases in the sediment.

In situ treatment systems require minimal construction and have low capital and operational costs. Treatment occurs quickly (within months) and is suitable for batch or periodic treatment of large volumes of mine-impacted water and high concentrations of metals. Treatment effects continue year-round and associated maintenance is minimal; however, periodic addition of reagents (e.g., alcohol, molasses) may be needed to sustain treatment.

By treating water at the source in the flooded pit, potential contaminants of concern are retained in the pit lake sediment rather than being exposed to the surface environment. *In situ* treatment also provides an ancillary benefit of improving groundwater and seepage chemistry in the receiving environment should the flooded pit be a major source of such loading. Pit walls or waste materials placed in the pit can be stabilized by the creation of saturated biochemically reducing conditions where oxidative leaching is avoided or minimized.

2.1.2 Technology Suitability for Cold Climate

The Minto Mine site is in the Yukon; therefore, any proposed *in situ* pit lake technology must take into consideration the cold climate challenges associated with this location and allow for continued treatment over the cold winter months.

Longer-term data are available for organic carbon injections to pit lakes, where treatment has extended over winter (e.g., Sweetwater and Barite Hill pit lakes; Paulson et al., 2004; Harrington et al., 2009; Park et al., 2009), and in some instances many years after the last carbon injection event (e.g., Sweetwater; Paulson et al., 2004). It is important to note that both the Anchor Hill and Sweetwater pit lake locations experience cold winters, with the Sweetwater pit lake frozen/ice covered from early December until March. The pit lakes both freeze over during winter, but this has not impeded the target constituent removal obtained by *in situ* treatment. Indeed, the ice cover may be viewed as beneficial in that it acts as a barrier to the mixing and diffusion of oxygen from the atmosphere into the lake. As such, carbon additions at both Anchor Hill and Sweetwater pit lakes were typically performed in the late summer or fall to prolong the period that the lake would remain reducing and therefore maximize removal of target constituents. Furthermore, the water temperature of the flooded mine workings at the Silver King mine (Keno Hill, central Yukon) typically varies between 2 and 5°C year-round and has demonstrated prolonged *in situ* treatment (cadmium and zinc; ≥75% removal over long term; Gault et al., 2018). This indicates that treatment of cold waters is feasible using this technology, likely due to the presence of psychrophilic (i.e., adapted to cold conditions) bacteria in the mine workings, which are also expected to be present in the flooded pits of the Minto Mine site.

2.1.3 Treatment Process

The pilot-scale *in situ* treatment test work outlined herein has been designed to treat constituents of concern (COCs) that are transformed or insoluble under sulphate-reducing conditions, specifically nitrate/nitrite, cadmium, copper, molybdenum, selenium, and zinc. The *in situ* treatment is designed to stimulate microbes in the system that naturally occur in/on the water, rock, and soil in the system through addition of organic carbon. The microbes oxidize the reduced carbon "food" source (e.g., ethanol, glycerol) and transfer the electrons released to a terminal electron acceptor (TEA). The TEAs are generally used in the order most energetically favorable (i.e., most energy generated) by microbes. Of the major TEAs typically present in mine-impacted surface waters and soils/sediments, dissolved oxygen (DO) is utilised first followed by nitrate (NO_3), then selenate (Se(VI)), manganate (Mn(IV)), ferric iron (Fe(III)), uranyl (U(VI)), and sulphate (SO_4) (Borch et al., 2010), creating a "redox (reduction-oxidation) ladder" (Figure 2-1). The order of TEA utilization can also be influenced by pH and TEA concentration.

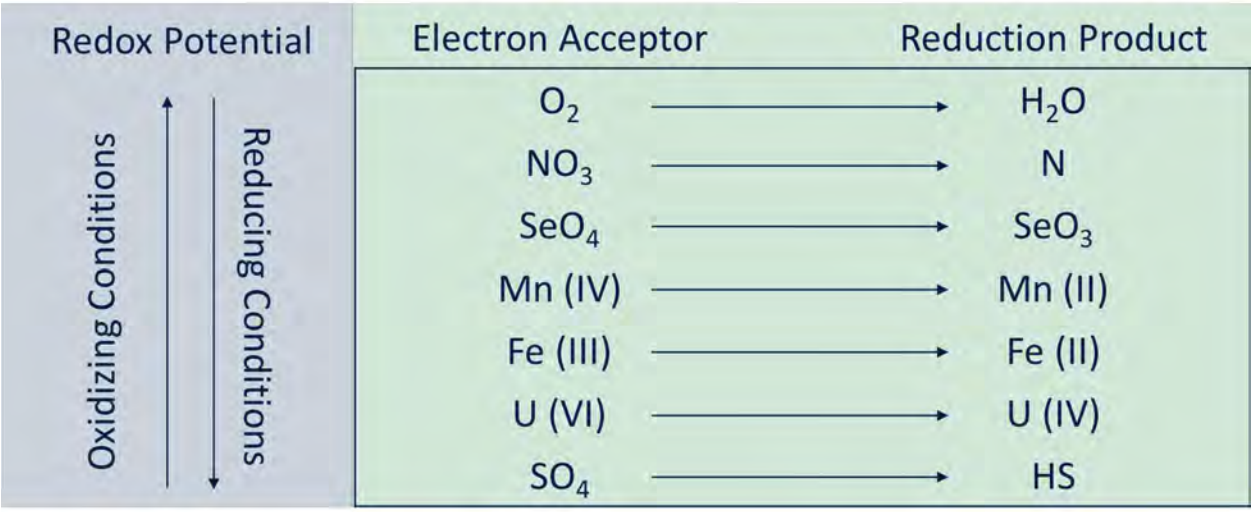

Figure 2-1 Redox Potential and Terminal Electron Acceptors

Summarized based on theoretical redox ladder (Borch et al., 2010)

TEAs are monitored through the *in situ* pilot-scale trials in order to evaluate conditions that are established in the systems. The theoretical order of TEA consumption is not absolute, but it is a useful to guide treatment design and performance evaluation. The *in situ* pilot-scale trials have been designed to target sulphate-reducing conditions, to remove TEAs above sulphate in the redox ladder (e.g., nitrate, selenium; Figure 2-1).

Parameters such as dissolved iron and dissolved manganese can provide insight into the conditions in the pit lake trials, with increased concentrations of these parameters showing targeted reducing conditions have been achieved based on the theoretical redox ladder (Borch et al., 2010). TEA consumption can be influenced by numerous factors including the overall concentrations of reduced and oxidized TEA species, spatial distribution of organic electron donors and TEAs, and the abundance and diversity of TEA-metabolizing microbial populations. The specific mechanisms for treatment of the COCs are described in Section 2.1.4.

2.1.4 Treatment Mechanisms

2.1.4.1 Denitrifying Bacteria

Nitrate is typically more desired as an electron acceptor by microbes over selenium and sulphate, so microbes therefore tend to preferentially reduce nitrate (Borch et al., 2010; Tan et al., 2016). Nitrate and nitrite can be removed from water through the denitrification activity of different types of microbes, including nitrate-reducing bacteria which can reduce nitrate (NO_3) to nitrite (NO_2), and other denitrifying organisms that are capable of fully reducing nitrate to nitric oxide (NO), nitrous oxide (N_2O), and subsequently to dinitrogen gas (N_2), which is the most abundant gas in air.

2.1.4.2 Selenium-reducing Bacteria

The targeted selenium treatment pathway is the reduction of selenate (Se(VI)) and selenite (Se(IV)) to insoluble elemental selenium (Se(0)). There are several different types of selenate- and selenite-reducing bacteria that can reduce these soluble forms of selenium to insoluble elemental selenium (e.g., Gonzalez-Gil et al., 2016; Nancharaiah and Lens, 2015; Sharma et al., 2015).

2.1.4.3 Sulphide-producing Bacteria

Sulphate-reducing conditions are encountered when the above processes have advanced such that the TEAs higher than sulphate on the redox ladder have either been consumed. Under such conditions, sulphate is reduced by bacteria to form sulphide, which may then react with chalcophile elements to form insoluble sulphide minerals. The insoluble sulphide minerals then precipitate from the water column as authigenic precipitates prior to settling on the pit lake bottom. Sulphide production is carried out by sulphide-producing bacteria (SPB) through the reduction of sulphur-containing compounds.

2.2 OBJECTIVES

The first phase of the test work, reported herein, consisted of an off-site bench-scale trial to determine the effectiveness of different organic carbon amendments (glycerol, ethanol, molasses) to treat COCs in the Main Pit water at the Minto Mine (sample station W12). The primary COC in the Main Pit currently is nitrite, although nitrate, ammonia, copper, and selenium are also considered COCs for the Site. The trials were also used to assess the carbon dosing requirements (frequency and amounts) and examine constituent leaching from submerged waste rock and tailings during *in situ* treatment. Data from these laboratory-based experiments will be used to guide the second phase, which is expected to consist of field-based trials within the Main Pit. These trials are intended to investigate the feasibility of *in situ* pit lake treatment during closure and operations for the Site.

2.3 METHODS

2.3.1 Bench-scale trial set-up

Four trials were set up in 100 L barrels to test three different liquid carbon sources. Three of the trials were amended with soluble carbon (glycerol, ethanol, or molasses) while one trial was not dosed with liquid carbon to serve as a control (Table 2-1). Each trial contained 67.5 L of water, 7 L of waste rock, and 15.5 L of tailings sourced from the Main Pit (station W12), where waste rock and tailings were excavated from below the water line. All three components were delivered to Ensero's facilities in Saskatoon from the Minto Mine. In addition, 4.5 L of woodchips were added to each of the trials to provide a (slow-release) source of carbon, an anchor upon which beneficial microbes can colonize, and a barrier to reduce interaction with atmospheric oxygen. The woodchips were a mixture of pine and spruce and were sourced locally in the Saskatoon area from Saskatoon Woodchips. Spruce woodchips were preferred since previous work indicated they have a lower metal leaching potential (Janin, 2014); however, only a pine and spruce woodchip mixture was available at the time of the experiment setup. The trials were operated at 10°C in a temperature-controlled facility.

Table 2-1 Phase 1 Trials

Trial	Soluble Carbon Amendment (mL)	Temperature (°C)	Woodchip Volume (L)	Water Volume (L)	Waste Rock Volume (L)	Tailings Volume (L)
E1	Ethanol (9.4)	~10°C	4.5	67.5	7	15.5
G2	Glycerol (10.1)	~10°C	4.5	67.5	7	15.5
M3	Molasses (15.9)	~10°C	4.5	67.5	7	15.5
C4	Control (none)	~10°C	4.5	67.5	7	15.5

Prior to shipment of the water from the mine site, samples were taken for alkalinity, dissolved organic carbon (DOC), nitrogen species (ammonia, nitrate, and nitrite), total and dissolved metals, and sulphate. Upon arrival of the water at Ensero on June 30, 2020, (6 days from initial sampling), samples were sent to ALS for DOC, dissolved metals, nitrogen species (ammonia, nitrate, and nitrite), and sulphate to confirm the initial water chemistry post-shipment and assess potential changes in nitrogen species during shipment. There were no significant changes to the nitrogen species concentrations during transit, therefore ammonia, nitrite, or nitrate were not added at the start of the trials.

After the trials were assembled (combining waste rock, tailings, and water), the water was sampled from each trial for DOC. Following sample collection, soluble carbon and woodchips were added to each of the trials and a DOC sample was collected immediately upon addition. The soluble carbon added to each trial was calculated based on the carbon required to reduce the main terminal electron acceptors in the water column such as dissolved oxygen (including additional carbon to compensate for atmospheric re-oxygenation in the short-term), nitrate, nitrite, and 50 mg/L of sulphate to provide sulphide for precipitation of chalcophile metals (e.g., copper, cadmium, zinc). The estimated reducible iron and manganese present in the waste rock and tailings was also included in the carbon dosing calculation. An additional 10 mg/L of carbon, in the form of molasses, was also added at the start of the trials to stimulate microbial growth.

Barrels remained sealed with a lid and metal ring for the duration of the trials. To keep the trials as free from oxygen as possible, water quality sampling was performed through a bung cap in the lid.

2.3.2 Nitrogen Species Dosing

All trials were dosed with ammonia, nitrate, and nitrite stock solutions at Weeks 2, 4, and 6 for a total of three top-up events. The target ammonia, nitrate, and nitrite concentrations for each top-up were 1.6, 9.1, and 2.2 mg/L as N, respectively. The cumulative nitrogen species added over the three top-up events (4.8, 27.3, and 6.6 mg/L as N for ammonia, nitrate, and nitrite, respectively) was based on the 90th percentile ammonia-N, nitrate-N, and nitrite-N concentrations at station W12 when mining was ongoing (i.e., 2016 to 2018 and 2020). This approach mimics nitrogen species addition to the lake water as runoff from waste rock piles and the highwall, while the use of the 90th percentile concentration provides some conservatism to the approach. Ammonia, nitrate, and nitrite were added using ammonium chloride, calcium nitrate tetrahydrate, and sodium nitrite, respectively.

2.3.3 Routine Water Sampling/Schedule

Water quality sampling was conducted at the start of trials following carbon addition. Trials were sampled weekly for nitrogen species (ammonia, nitrate, and nitrite) and additional samples were collected bi-weekly for DOC, dissolved metals, sulphate, and sulphide for 13 weeks. Samples were collected in sample bottles appropriate for each analysis parameter, as provided by ALS (Saskatoon, SK). Sample collectors wore new, clean nitrile gloves when collecting samples. Bottles were capped immediately after filling. Samples were filtered and/or preserved according to the analytical service provider's instructions (ALS).

Water was sampled through a bung cap in the lid of the barrel in efforts to introduce the least amount of air as possible to the trials. Water was collected at approximately mid-way down the water column into sampling containers using a peristaltic pump and tubing.

In situ dissolved oxygen (DO), temperature, pH, conductivity, and oxidation-reduction potential (ORP) were measured following the collection of routine water samples. Measurements were conducted with a YSI Professional Plus handheld unit calibrated according to the manufacturer's instructions. *In situ* parameters were measured mid-way down the water column through the bung cap of each barrel.

Water was not topped up during the trials, since a minimal volume of water was taken at each sampling event. Over the duration of the bench-scale test work, approximately 6.5% of the total water volume was removed for analysis during the 13 weeks of testing. Trials were taken down following receival of week 13 ALS results on November 17, 2020.

A sample of the W12 water that was left over following the experiment setup and stored at room temperature was also sampled at week 13. This provided a second control comparator for conditions in the absence of any soluble carbon or woodchip amendment.

2.3.4 Woodchip Trial

A small trial consisting of 1 L of woodchips and 15 L of W12 water was created to inform on whether the woodchips added as a source of organic carbon would cause any leaching of metals into the trials. The water was sampled prior to addition of woodchips, 24 hours post addition, and 6 days after addition for dissolved organic carbon, dissolved metals, and nitrogen species.

2.4 PIT LAKE RESULTS

2.4.1 Constituent Leaching from Woodchips

Woodchips were added to each of the trials to provide a slow-release source of carbon and an anchor upon which beneficial microbes can colonize. Leaching of parameters from the woodchips was assessed (Section 2.3.4) since the potential for substantial constituent leaching could increase treatment demands within the bench-scale experiments or in future applications in the Main Pit (Janin 2014). Parameters showing marked changes in dissolved concentration compared to the initial W12 water (i.e., >25% relative percent difference) are presented in Table 2-2 along with the percent change in concentrations over time. Positive

percent changes indicate an increase in concentration over time and were observed for barium, cadmium, manganese, potassium, rubidium, and zinc (Table 2-2). Where concentration increases were observed, the day 1 and day 6 concentrations were similar. This indicates that most constituent release occurred within the first 24 hours of the experiment and suggests that marked longer-term leaching is not expected. In most cases the absolute concentrations observed were low and all were below water quality guidelines. Cadmium and zinc released by the woodchips is expected to be removed under the sulphate-reducing conditions produced following soluble carbon addition.

Negative percent changes in concentration indicate a decrease in dissolved concentration over time. This was observed for ammonia, copper, lithium, nitrate, nitrite (by day 6), and tungsten. Removal of the nitrogen species likely resulted from some microbial activity stimulated by the DOC released by the woodchips. Since sulphate-reducing conditions were not observed in this experiment, the copper removal is likely due to sorption on the woodchips.

Table 2-2 Parameters leached or treated during woodchip leaching experiment

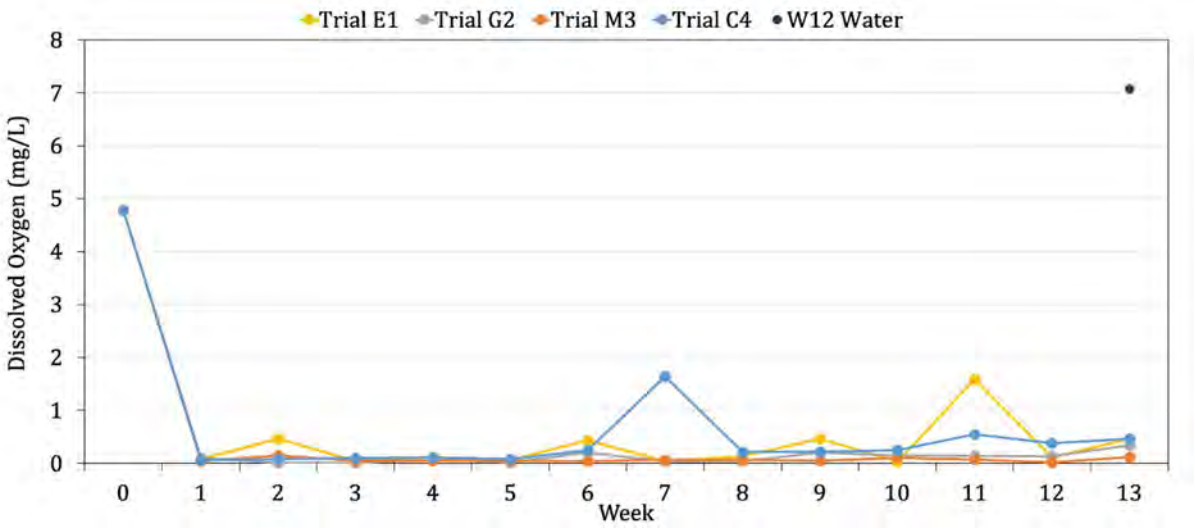
Parameter	Initial Concentration (mg/L)	Day 1 Concentration (mg/L)	Day 6 Concentration (mg/L)	Day 1 Change [1]	Day 6 Change [1]
Ammonia (as N)	1.4	0.85	0.050	-41%	-97%
Dissolved Barium	0.065	0.13	0.16	102%	143%
Dissolved Cadmium	0.000094	0.00018	0.00017	86%	78%
Dissolved Copper	0.086	0.053	0.033	-38%	-62%
Dissolved Lithium	0.0069	0.0050	0.0051	-28%	-26%
Dissolved Manganese	0.25	0.52	0.65	112%	162%
Nitrate (as N)	6.8	3.3	0.10	-52%	-99%
Nitrite (as N)	3.7	6.1	0.050	63%	-99%
Dissolved Potassium	14.2	18.9	20.1	33%	42%
Dissolved Rubidium	0.013	0.018	0.019	37%	46%
Dissolved Tungsten	0.0010	0.00073	0.00070	-28%	-31%
Dissolved Zinc	0.0099	0.036	0.038	265%	284%

[1] Negative percent change in concentration indicate a decrease in concentration (green) whereas a positive percent change indicates an increase in concentration (red) from the initial concentration.

2.4.2 Pit Lake Treatment Trials

Concentration changes during the 13 week trials are discussed for both COCs and parameters that provide additional information regarding the chemical reactions occurring in the experiment. Where a parameter has an effluent quality standard (EQS) and Minto Creek water quality objective (WQO) as defined in water licence QZ14-031, these are also displayed for reference purposes.

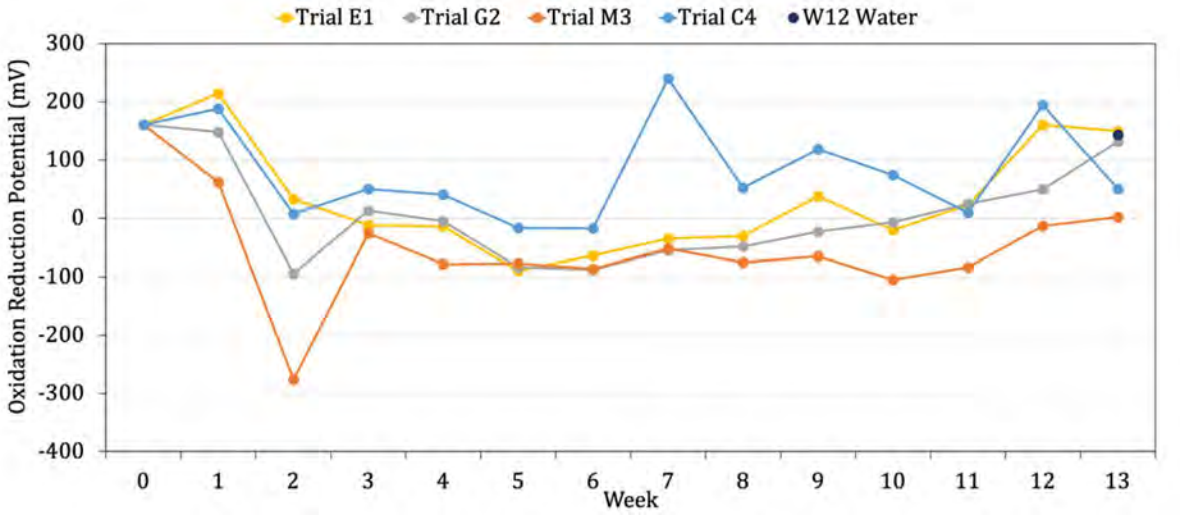
2.4.2.1 Explanatory Parameters



Explanatory parameters such as DO, ORP, DOC, and pH describe conditions of the environment and provide indirect information on the chemical reactions taking place. These parameters, when in specific ranges, can be used to predict and/or promote certain reactions in the aquatic environment.

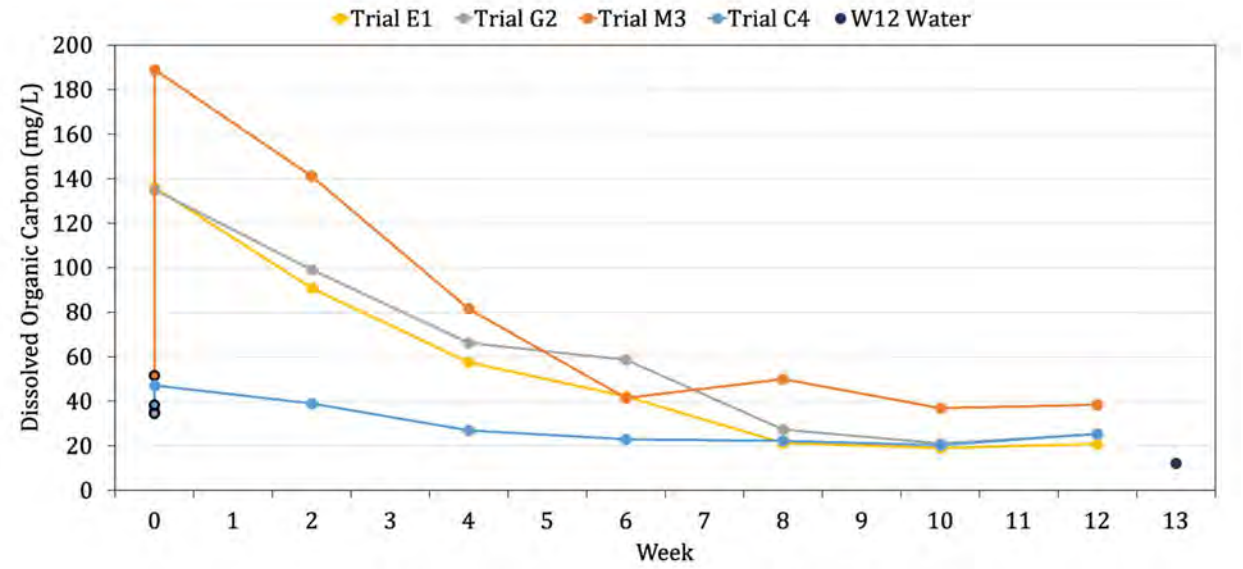
In the Phase 1 bench-scale trials, reducing conditions are targeted to promote the reduction of nitrate, nitrite, sulphate, and selenium. Chalcophile metal COCs (e.g. cadmium, copper, molybdenum, zinc) are also treated under sulphate-reducing conditions through reaction with dissolved sulphide and subsequent precipitation as metal sulphide minerals. Reducing conditions are indicated by low DO concentrations (typically less than 1 mg/L) and depressed ORP values (Christensen et al., 2000). At the start of the experiment, the water sourced from W12 was characterized as aerobic (oxidizing) (DO greater than 1 mg/L and ORP greater than +50 mV). DO concentrations in all trials declined well below 1 mg/L by the first sampling event (week 1; Figure 2-2). Reducing conditions were achieved for all trials by the second sampling event (week 2), with DO concentrations and ORP ranging from 0.04 to 0.09 mg/L (Figure 2-2) and -276 to +33 mV (Figure 2-3), respectively. Trials dosed with molasses or glycerol (Trial M3 or G2, respectively) were the most reducing at week 2 and remained more reducing than other trials for most of the experiment. Strongly reducing conditions were maintained throughout the 13 weeks for the molasses Trial M3, whereas the glycerol Trial G2 maintained reducing conditions until week 12.

All trials, including the control Trial C4 had elevated initial DOC concentrations of about 35 to 52 mg/L (week 0 in Figure 2-4) as the W12 water received from site likely contained residual glycerol (although rinsed out before collection of W12 water, the tote used to ship the main pit water previously contained glycerol). The woodchips also provided carbon as seen by the small increase in DOC concentration in the control Trial C4 at week 0 post carbon addition and the approximate 20 mg/L plateau in DOC concentrations from week 6 until the end of the experiment. DOC concentrations in the molasses dosed Trial M3 also plateaued at week 6 at about 40 mg/L. Trials E1 and G2 fully consumed soluble DOC by week 8, matching the DOC concentration of the control. W12 water showed oxidizing conditions compared to the control Trial C4 by the end of the experiment (DO and ORP were about 7 mg/L and 144 mV in W12 water, respectively; Figure 2-2 and Figure 2-3), confirming that the woodchips supplied some additional DOC to the trials as intended. Some of the initial 38.4 mg/L of DOC in the W12 water was consumed, however after 13 weeks, 12.2 mg/L of DOC remained. The DOC in the original W12 water was slowly consumed by microbes and not capable of reducing DO compared to the control Trial C4.



The pH declined in all trials by week 2, followed by an increase back to circumneutral pH, in particular for Trials M3 and G2 (Figure 2-5). This decline is likely due to the formation of organic acids (e.g., acetate) during the oxidation of molasses and glycerol. Acidity from the formation of these intermediate organic acids was adequately buffered by the alkalinity formed as a by-product of the mineralization of organic carbon by

sulphate-reducing bacteria. Furthermore, minimal pH decrease is expected in the field following carbon addition since it would take place over a number of weeks allowing the system to adequately buffer the effects of any intermediate organic acid production, versus the pulse addition used in the pilot-scale trials.



Trials E1, G2 and M3 are ethanol, glycerol and molasses dosed trials, respectively. Trial C4 is the control trial. W12 water was sampled at week 13 and is the same W12 water used to set up the experiment but stored at room temperature without any soluble carbon or woodchips addition.

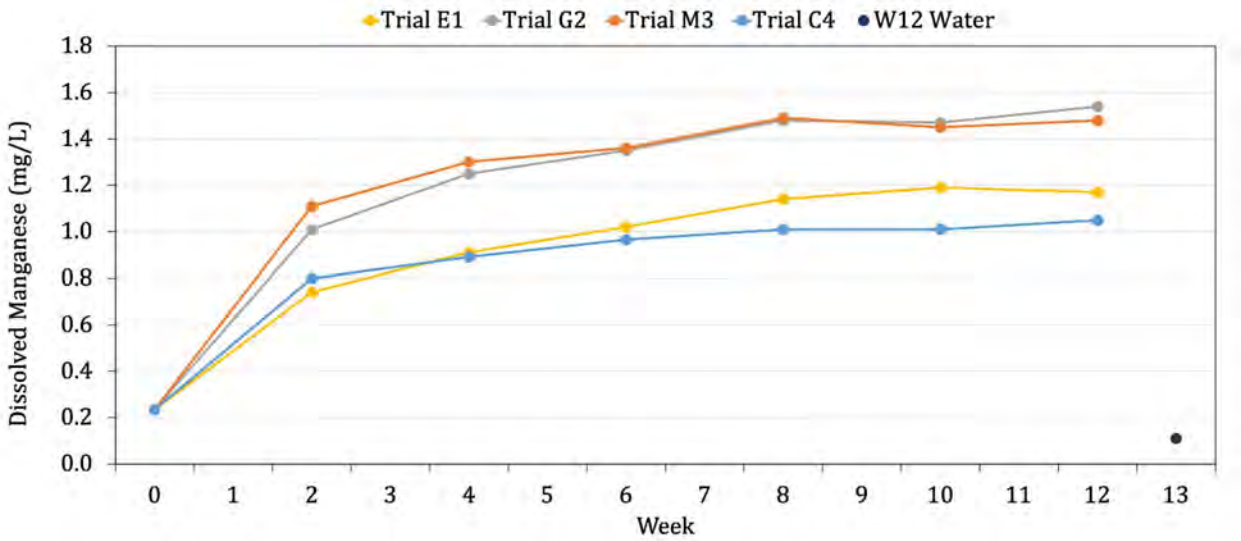
Figure 2-5 pH in the Bench-scale Trials from Weeks 0 to 13

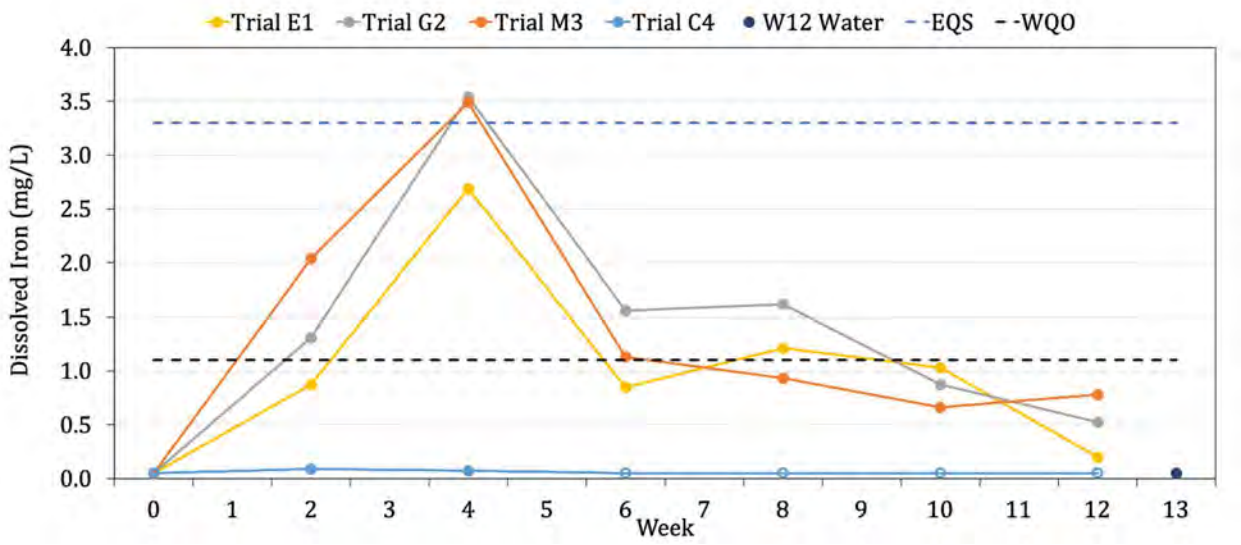
2.4.2.1.1 Manganese and Iron



Manganese and iron are important indicators of microbial activity and of the achievement of reducing conditions, shown by increases in dissolved manganese and ferrous iron concentrations (Londry, 2013). As manganese and iron are held in the substrate (i.e., waste rock, tailings) as (hydr)oxides, the development of more reducing conditions typically results in their transient release as the host phases are dissolved under manganese- and iron- reducing conditions.

Dissolved manganese concentrations increased by week 2 in all trials and slowly continued to increase until the end of the experiment (Figure 2-6). Trials M3 and G2 had the highest dissolved manganese concentrations by the end of the experiment of about 1.5 mg/L. The woodchip leaching trials resulted in an increase in manganese concentration of approximately 0.4 mg/L over one week (Table 2-2). The manganese concentration in the control Trial C4 increase by approximately 0.5 mg/L over the first two weeks of the experiment, likely due to leaching from the woodchips, and by approximately 0.8 mg/L by week 12. The additional manganese release observed in later weeks may be due to some partial manganese reduction fuelled by the DOC released by the woodchips. Nevertheless, it is likely that approximately one third of the manganese concentration observed at the end of the soluble carbon amended trials is derived from the woodchips rather than from reductive mobilization of the waste rock and/or tailings. It should be noted that manganese does not have an EQS or WQO defined in QZ14-031.

Dissolved iron concentrations in the trials are presented in Figure 2-7. Dissolved iron increased in concentration by week 2 and peaked by week 4 for trials dosed with soluble carbon (Trials E1, G2 and M3) (Figure 2-7). Concentrations subsequently decreased in these trials through the remainder of the 13 weeks and were below the EQS and WQO by weeks 6 and 10, respectively. Dissolved iron in the control Trial C4 remained near the detection limit for most of the trial with marginal increases observed at week 2 and 4.

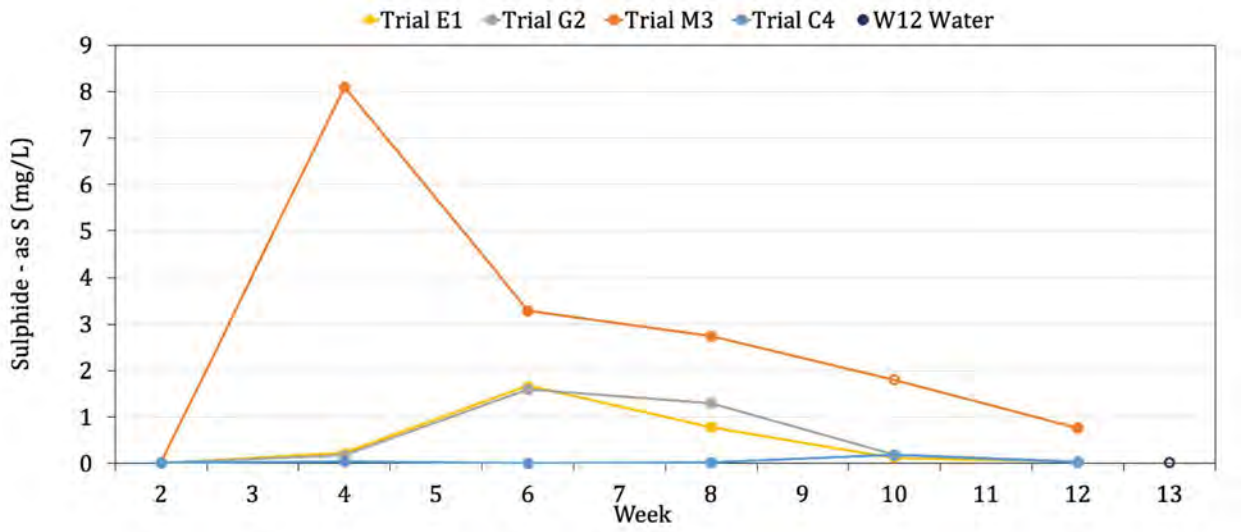


The dissolved manganese and iron mobilization confirm the reducing conditions observed through DO and ORP (Section 2.4.2), and coincide with the majority of DOC being consumed by week 4 in the liquid carbon dosed trials and the lower amount of DOC provided by the control Trial C4 (Figure 2-4). The changes in dissolved iron concentrations in the soluble carbon dosed trials are explained by conversion of insoluble iron (hydr)oxides to soluble ferrous iron as the trials became reducing and then precipitation of reduced iron into sulphide minerals. This is supported by the black coloration to the water of the carbon amended trials observed when dismantling the experiments, suggestive of iron sulphides. The low and unchanged concentration of dissolved iron throughout the experiment in the control Trial C4 is likely because iron-reducing conditions were not achieved. Dissolved manganese and iron did not increase in W12 water after 13 weeks because the water was oxidizing and there was no substrate to leach significant amounts of iron or manganese.

Dissolved iron and manganese are susceptible to oxidation and precipitation under oxidizing conditions at circumneutral pH. As such, elevated iron and manganese concentrations can be managed via passive aeration and/or filtration in downstream waterbodies (e.g., the water storage pond or constructed wetland treatment system).

Trials E1, G2 and M3 are ethanol, glycerol and molasses dosed trials, respectively. Trial C4 is the control trial. W12 water was sampled at week 13 and is the same W12 water used to set up the experiment but stored at room temperature without any soluble carbon or woodchips addition. Manganese does not have an EQS or WQO defined in QZ14-031.

Figure 2-6 Dissolved Manganese Concentrations in the Bench-scale Trials from Weeks 0 to 13



Trials E1, G2 and M3 are ethanol, glycerol and molasses dosed trials, respectively. Trial C4 is the control trial. W12 water was sampled at week 13 and is the same W12 water used to set up the experiment but stored at room temperature without any soluble carbon or woodchips addition. Open circles indicate concentrations were below detection (<0.05 mg/L).

Figure 2-7 Dissolved Iron Concentrations in the Bench-scale Trials from Weeks 0 to 13

2.4.2.1.2 Sulphide

The sulphide concentrations in the water are an important marker to identify chalcophile metals removal (e.g. cadmium, copper, molybdenum, zinc), which is driven by sulphide mineral precipitation. The molasses

Trial M3 produced the highest sulphide concentrations, which peaked at 8.1 mg/L (as S) by week 4 before being slowly consumed, likely by precipitation with iron and chalcophile metals (Figure 2-8). Sulphide production coincided with the majority of DOC consumption at week 4 and the low ORP measured through the experiment (Section 2.4.2). Trials E1 and G2 produced sulphide by week 6, which was partly consumed by iron or re-oxidized to sulphate by week 10. Sulphide production in Trials E1 and G2 coincided with a decrease in dissolved iron (indicating iron sulphide formation) and strongly reducing conditions similar to the molasses Trial M3 (Section 2.4.2). The control Trial C4 produced minimal sulphide as sulphate reducing conditions were not achieved. No sulphide was observed in the W12 water at week 13 because the water was oxidizing.

Trials E1, G2 and M3 are ethanol, glycerol and molasses dosed trials, respectively. Trial C4 is the control trial. W12 water was sampled at week 13 and is the same W12 water used to set up the experiment but stored at room temperature without any soluble carbon or woodchips addition. Open circles indicate concentrations were below detection (<0.018 to <1.8 mg/L).

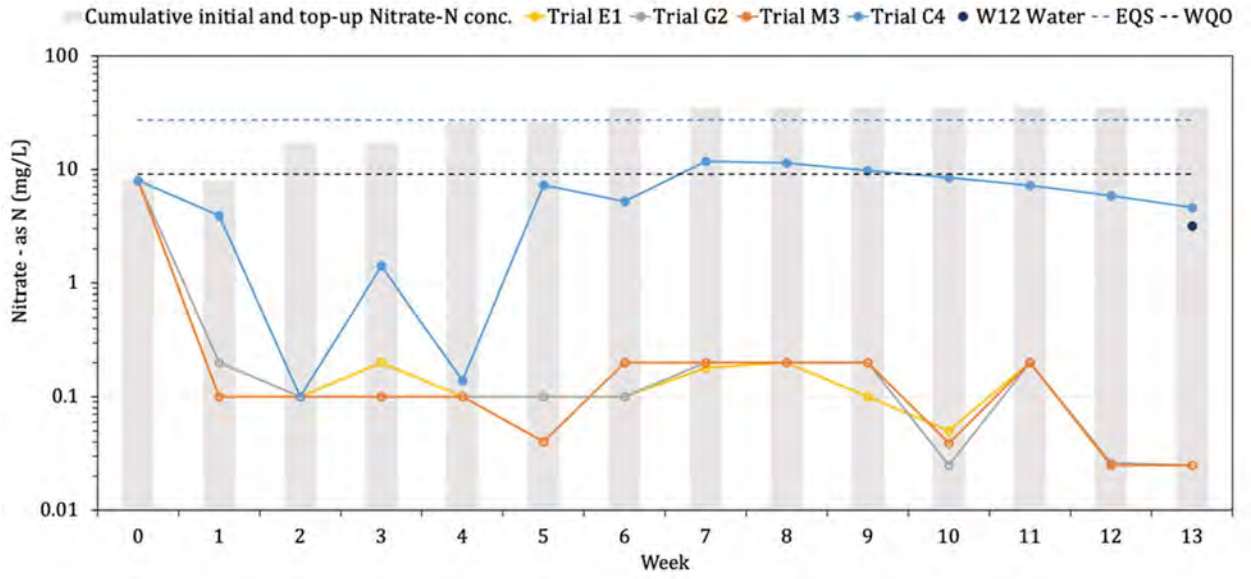


Figure 2-8 Sulphide Concentrations in the Bench-scale Trials from Week 2 to 13

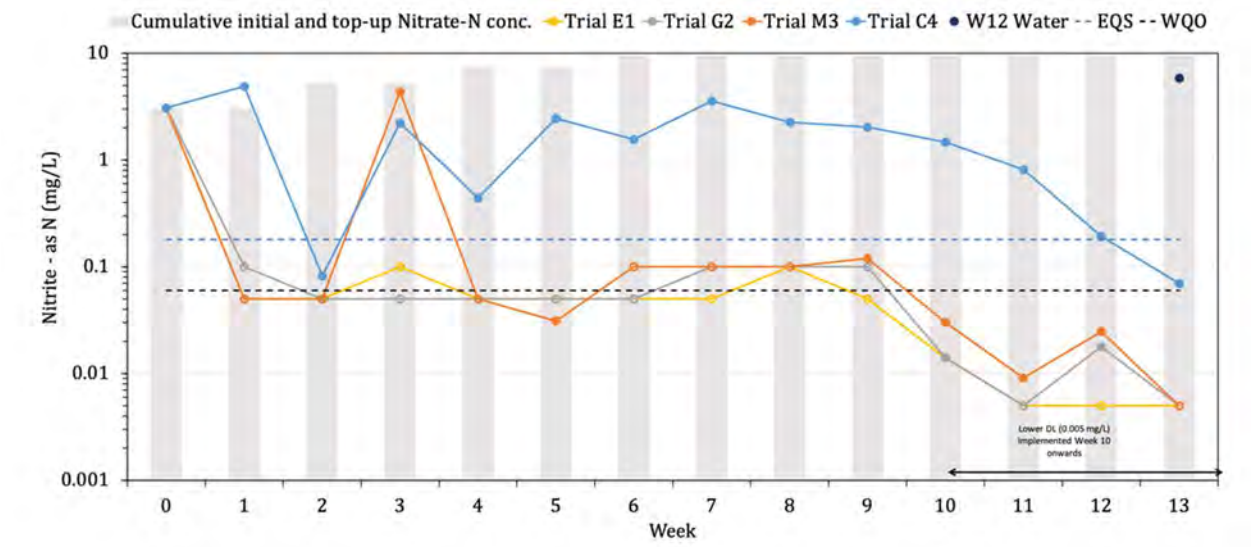
2.4.2.2 Nitrite and Nitrate Removal

An important aspect of this work was to evaluate nitrogen species treatment in the Main Pit. It is recognized that during operations and into early post-closure, nitrogen species will be continually supplied to the pit water as waste rock deposited both within the pit and in subaerial piles located within the pit catchment is flushed, releasing nitrogen present from blast residues. To approximate this, nitrogen species in all four trials were topped up at weeks 2, 4, and 6 following the initial carbon amendment at week 0. The cumulative nitrogen species concentration added over these three top-up events was equivalent to the 90th percentile concentration present in the Min Pit between 2016 and 2018, and 2020 (i.e., during operations, when nitrogen species concentrations were elevated), and therefore presents a conservative basis for evaluating nitrogen removal through the trials.



Changes in nitrate and nitrite concentrations for each trial are displayed in Figure 2-9 and Figure 2-10, respectively. The water licence QZ14-031 EQS and Minto Creek WQO for both nitrogen species are also displayed for reference purposes. Rapid removal of both nitrate and nitrite was observed in all three trials dosed with soluble organic carbon (i.e., Trials E1, G2, and M3) such that the concentrations of both nitrogen species were below detection at the week 1 sampling event (Figure 2-9 and Figure 2-10). Slower removal was observed in the control Trial C4 due to the lower DOC content of this trial (supplied by the woodchips and residual DOC from the W12 water received). Nitrate and nitrite concentrations rebounded in the control Trial C4, but remained below detection or below the water quality objective (WQO) by week 13 for the three carbon amended trials (Trials E1, G2, and M3) despite the addition of nitrate and nitrite top ups at weeks 2, 4, and 6 (Figure 2-9 and Figure 2-10). Note that elevated detection limits were encountered for nitrite-N (0.1 mg/L) for some sampling events; a lower detection limit (0.005 mg/L) was implemented as of week 10 which demonstrated that treated nitrite concentrations were well below the WQO and commonly below detection (Figure 2-10). All carbon amended trials (Trials E1, G2, and M3) removed nitrate and nitrite to a similar extent.

There was only slight treatment of nitrate (decreased by 4.8 mg/L-N) in the unamended W12 water sample that was stored at room temperature. This was likely due to some partial denitrification driven by the residual DOC present in this sample and some reduction of nitrate to nitrite, as evidence by the 2.8 mg/L increase in nitrite-N concentration. However concentrations of nitrate and nitrite were much higher in sample W12 at week 13 compared to the three carbon amended trials (Trials E1, G2, and M3), which were below detection.

Trials E1, G2 and M3 are ethanol, glycerol and molasses dosed trials, respectively. Trial C4 is the control trial. W12 water was sampled at week 13 and is the same W12 water used to set up the experiment but stored at room temperature without any soluble carbon or woodchips addition. Open circles indicate concentrations were below detection (<0.025 to <0.2 mg/L).

Figure 2-9 Nitrate Concentrations in the Bench-scale Trials from Weeks 0 to 13 (Note Log Scale)

Trials E1, G2 and M3 are ethanol, glycerol and molasses dosed trials, respectively. Trial C4 is the control trial. W12 water was sampled at week 13 and is the same W12 water used to set up the experiment but stored at room temperature without any soluble carbon or woodchips addition. Open circles indicate concentrations were below detection (<0.005 to <0.1 mg/L).

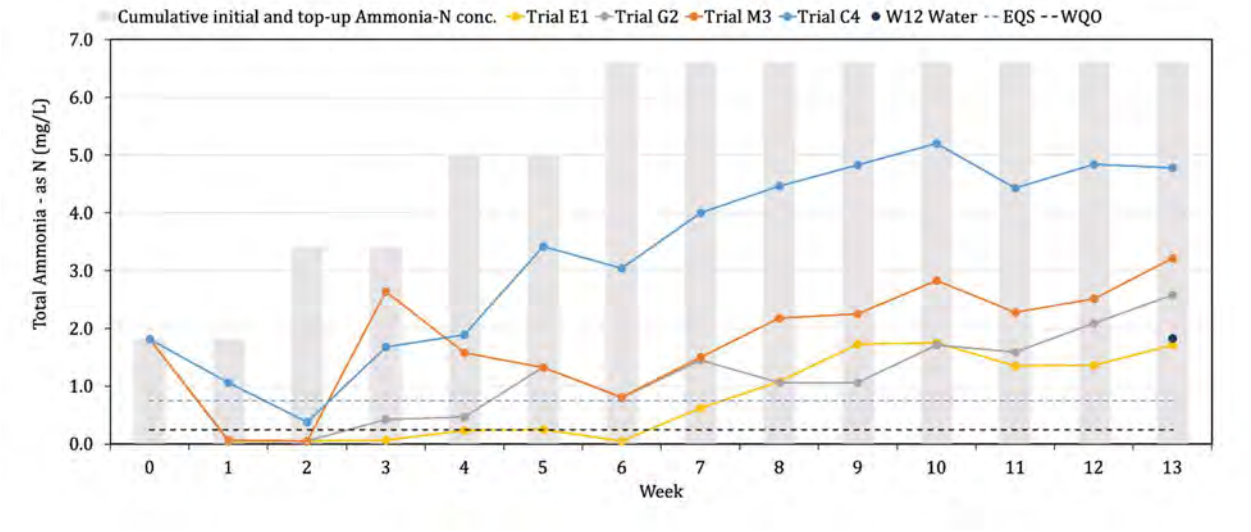


Figure 2-10 Nitrite Concentrations in the Bench-scale Trials from Weeks 0 to 13 (Note Log Scale)

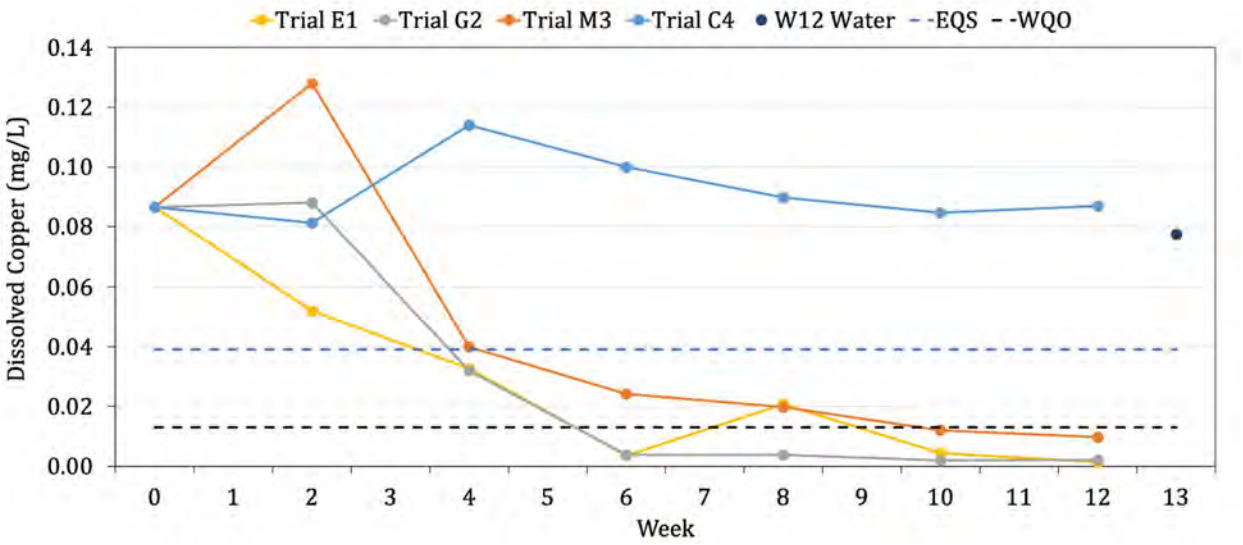
2.4.2.3 Ammonia Removal

Removal of ammonia occurred over the first few weeks for all four trials to below the EQS (Figure 2-11). Marked ammonia removal was not expected in these experiments as the primary route of removal is likely via microbial assimilation rather than the denitrification pathway for nitrate and nitrite. Nevertheless, considerable ammonia removal was observed in the trials amended with soluble organic carbon, notably in the ethanol (Trial E1) and glycerol (Trial G2) spiked experiments (Figure 2-11). Treatment to below the WQO (0.25 mg/L) was observed at weeks 1 and 2 for all three carbon amended trials prior to the ammonia top up events, which resulted in increased ammonia concentrations above both the WQO and EQS as the trials progressed (Figure 2-11). In addition to assimilation of ammonia during microbial growth, anaerobic ammonia oxidizing microbes may also have facilitated the ammonia removal observed; however, microbiological analyses were outside the scope of this bench scale study.

No significant change in the ammonia concentration of the W12 water was observed at the end of the 13 week experiment.

Although significant ammonia removal was observed in the soluble carbon amended trials, further actions may be necessary in order to achieve concentrations below the EQS.

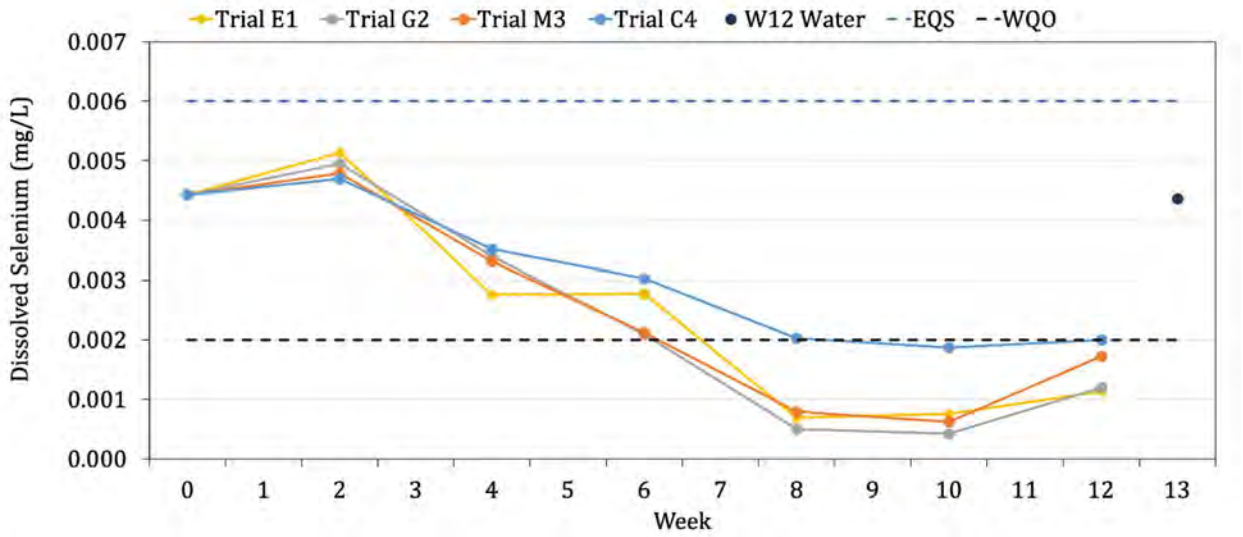


Trials E1, G2 and M3 are ethanol, glycerol and molasses dosed trials, respectively. Trial C4 is the control trial. W12 water was sampled at week 13 and is the same W12 water used to set up the experiment but stored at room temperature without any soluble carbon or woodchips addition. Open circles indicate concentrations were below detection (<0.05 mg/L).

Figure 2-11 Ammonia Concentrations in the Bench-scale Trials from Weeks 0 to 13

2.4.2.4 Copper Removal

Copper concentrations increased initially in the molasses amended Trial M3 (Figure 2-12). The peak observed at week 2 in this trial is likely related to the lowest pH observed at this stage across all trials (pH 5.6; Figure 2-5), which may have facilitated copper leaching from the waste rock and/or tailings. Strongly reducing conditions (i.e., sulphate-reducing) in the three carbon amended trials were established by weeks 4 to 6, combined with a return to circumneutral pH. This coincided with a marked decline in dissolved copper concentrations such that concentrations were below the EQS (0.039 mg/L for DOC<10 mg/L at station W2) by week 6 (Figure 2-12). Copper concentrations in the glycerol Trial G2 were also lower than the WQO (0.013 mg/L for DOC<10 mg/L at station W2) for week 6 onwards. The dissolved copper concentration in the ethanol Trial E1 were below the WQO for weeks 6, 10, and 12, whereas dissolved copper levels in the molasses Trial M3 declined more slowly and were below the WQO for the final two sampling events (weeks 10 and 12) (Figure 2-12). By contrast, no copper removal was observed in the control, Trial C4, reflecting the lack of sulphate-reducing conditions in this experiment. This also suggests that sorption of copper on woodchips is minimal in these larger water volume experiments (and higher water to woodchip ratio) compared to the smaller woodchip leaching experiment (Section 2.4.1).



Trials E1, G2 and M3 are ethanol, glycerol and molasses dosed trials, respectively. Trial C4 is the control trial. W12 water was sampled at week 13 and is the same W12 water used to set up the experiment but stored at room temperature without any soluble carbon or woodchips addition. The EQS and WQO are determined based on the DOC measured at station W2; the lowest EQS and WQO (i.e., DOC <10 mg/L at station W2) are displayed for comparitive purposes.

Figure 2-12 Dissolved Copper Concentrations in the Bench-scale Trials from Weeks 0 to 13

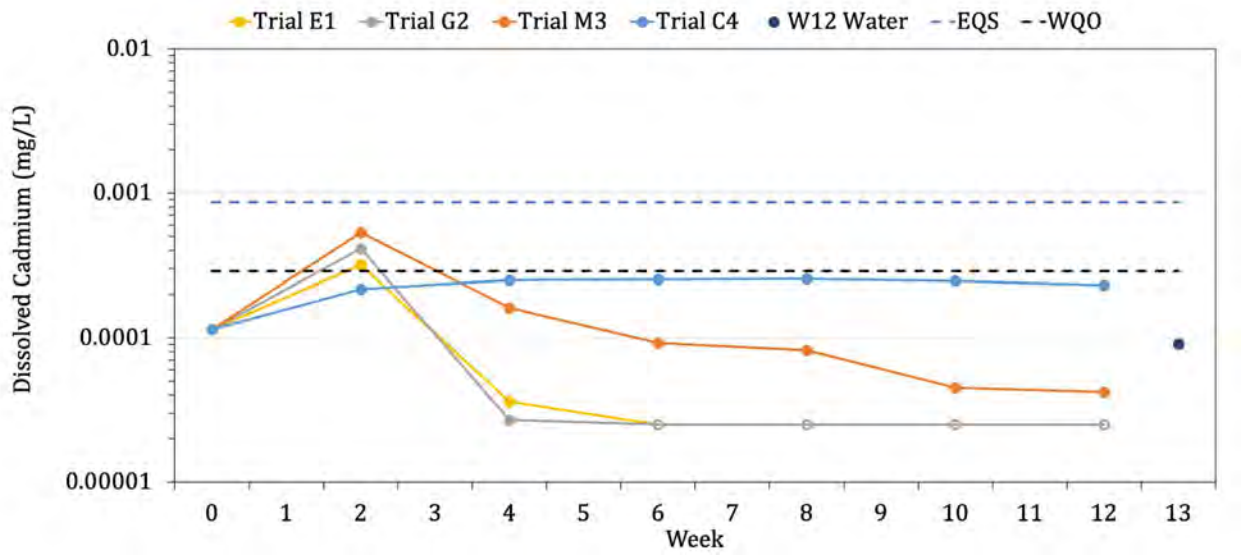
2.4.2.5 Selenium Removal

Selenium concentrations declined over time for all four trials, with the largest decrease observed for the liquid carbon spiked trials (Figure 2-13). By week 8, selenium concentrations were below the WQO (0.002 mg/L) for all three carbon amended trials, with the glycerol amended experiment (Trial G2) showing the lowest selenium concentrations at weeks 8 (0.0005 mg/L) and 10 (0.00042 mg/L). All carbon amended trials (Trials E1, G2, and M3) treated well below the selenium concentrations in the oxidizing W12 water by the end of the experiment. The selenium, removal observed is likely due to reduction of selenate and/or selenite to elemental selenium [Se(0)] and subsequent removal of the insoluble Se(0) from the water column. Given that selenate reduction is situated close to the redox potential of nitrate and manganese reduction in the "redox ladder" (Figure 2-1), and that reduction of both nitrate and manganese was inferred to occur in Control C4, the selenium treatment noted in Trial C4 is also likely also due to reductive precipitation to Se(0).

Trials E1, G2 and M3 are ethanol, glycerol and molasses dosed trials, respectively. Trial C4 is the control trial. W12 water was sampled at week 13 and is the same W12 water used to set up the experiment but stored at room temperature without any soluble carbon or woodchips addition.

Figure 2-13 Dissolved Selenium Concentrations in the Bench-scale Trials from Weeks 0 to 13

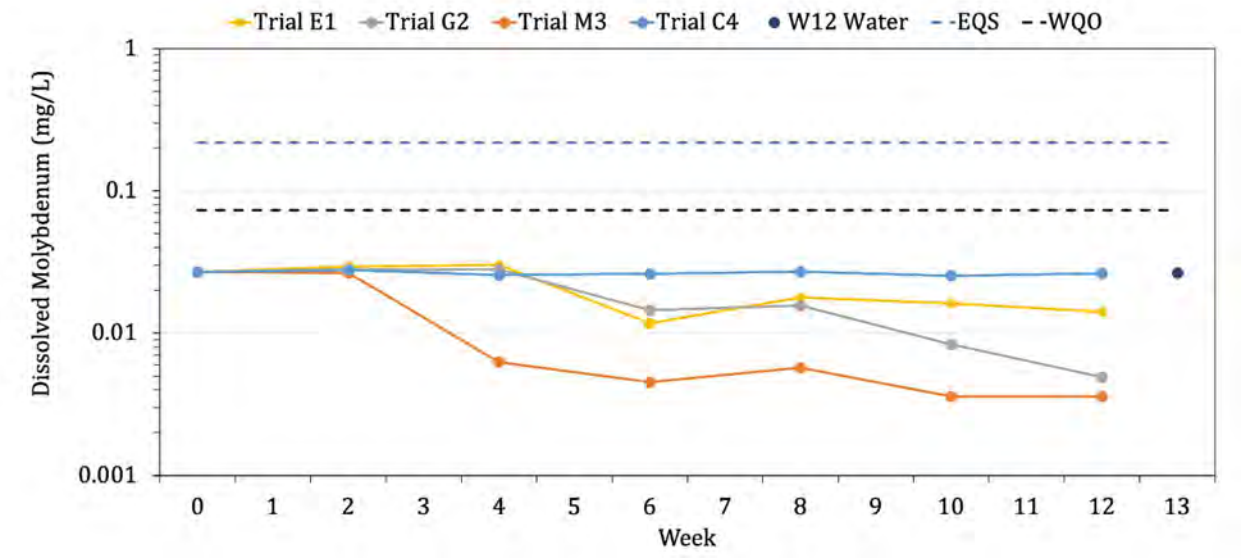
2.4.2.6 Other Constituents of Interest



Treatment was also observed for the other chalcophile metals such as cadmium, molybdenum, and zinc, which have defined EQS and WQOs. Dissolved cadmium concentrations initially increased, perhaps due to leaching of cadmium from the woodchips as observed in the leaching experiment (Section 2.4.2); however, release from the tailings and/or waste rock added to the trials cannot be excluded given the pH was lowest for Trials G2 and M3 at week 2. The maximum cadmium concentrations stayed below the EQS (Figure 2-14). Trials E1 and G2 treated cadmium to the detection limit (<0.000025 mg/L) by week 6 to the end of the experiment as strong sulphate-reducing conditions were formed. The molasses dosed Trial M3 treated cadmium to a lesser extent and the control Trial C4 showed no cadmium removal.

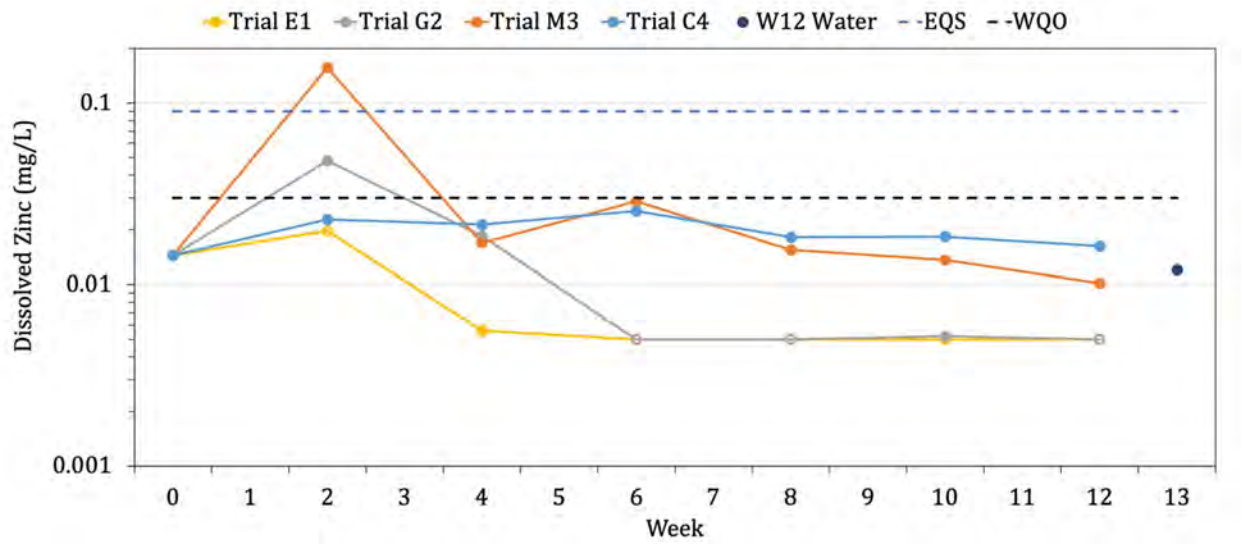
Dissolved molybdenum concentrations declined fastest in the molasses Trial M3, in which treated concentrations broadly stabilized after week 4 ranging between 0.0036 and 0.0063 mg/L compared to an initial concentration of 0.027 mg/L (Figure 2-15). Molybdenum concentrations declined more slowly in the glycerol Trial G2, requiring 12 weeks to reach similar concentrations (0.0049 mg/L) to Trial M3. The ethanol Trial E1 treated molybdenum to a lesser degree compared to Trials M3 and G2, whereas the control Trial C4 showed no treatment. Concentrations of molybdenum were below the WQO for the whole experiment.

Dissolved zinc concentrations initially increased above both the WQO (0.03 mg/L) and EQS (0.09 mg/L) in the molasses Trial M3 and above the WQO in the glycerol Trial G2 at week 2 (Figure 2-16). This may be due to leaching from the woodchips and/or substrate, although no marked increase was observed in the control or ethanol dosed trials. The low pH observed at week 2 for these trials likely also resulted in some zinc leaching from the waste rock and/or tailings. Regardless, zinc concentrations declined by week 4 and showed removal in the soluble carbon dosed trials over the course of the experiment. Trials G2 and E1 treated zinc to below or near the detection limit (0.005 mg/L) from week 6 until the end of the experiment. The molasses Trial M3 showed more moderate zinc removal compared to the ethanol or glycerol amended trials with concentrations slightly below the W12 water at the end of the experiment (Figure 2-16). The control Trial C4 showed no removal with similar zinc concentrations observed throughout the trial.



While arsenic is not a COC at the Minto Mine Site, it was evaluated since the observed mobilization of dissolved iron (Section 2.4.2.1.1), likely via reductive dissolution of iron (hydr)oxides in the waste rock and tailings, has potential for concomitant release of arsenic. No release of significant concentrations of arsenic were observed during the experiment (Figure 2-17).

Cobalt and phosphorus showed some leaching during the early weeks of the bench-scale experiment (Figure 2-18and Figure 2-19), likely from the waste rock and/or tailings, as there was no leaching of these parameters in the woodchip leaching experiment. Nevertheless, both elements were treated to the detection limit of (<0.0005 and <0.25 mg/L, respectively) by week 10 or sooner in Trials E1 and G2. Cobalt and phosphorus do not have an EQS or WQO under in water licence QZ14-031.



Trials E1, G2 and M3 are ethanol, glycerol and molasses dosed trials, respectively. Trial C4 is the control trial. W12 water was sampled at week 13 and is the same W12 water used to set up the experiment but stored at room temperature without any soluble carbon or woodchips addition. Open circles indicate concentrations were below detection (<0.000025 mg/L). The EQS and WQO are hardness dependent. The first quartile hardness (152 mg/L) for station W2 (AEG, 2018) was used to calculate the EQS and WQO, which are displayed for comparitive purposes

2.5 PIT LAKE TREATMENT SUMMARY

2.5.1 Constituent Removal

The maximum constituent removal observed during the trials and the removal maintained at the end of the experiment is summarized in Table 2-3. The Phase 1 trial demonstrated:

- Near quantitative removal of nitrate and nitrite (>99.9%) to below both EQS and WQO for all three soluble carbon sources tested;
- Copper treatment for all three soluble carbon types to below both the EQS and WQO with 89% (molasses) to 98% removal (ethanol & glycerol) observed at the end of the three month experiment;
- Sustained selenium removal of 61% (molasses) to 74% (ethanol and glycerol) at the end of the experiment, below both the EQS and WQO;
- Removal of other chalcophile metals (cadmium, molybdenum, zinc) due to precipitation as metal sulphide minerals; and
- Marked ammonia removal was not expected in these experiments as the primary route of removal is likely via microbial assimilation rather than the denitrification pathway for nitrate and nitrite; nevertheless, considerable ammonia removal was observed such that 51% to 74% of the cumulative ammonia added to the trials was removed at the end of the experiment;
- Glycerol and ethanol generally exhibited superior COC removal compared to molasses.

Table 2-3 Percent Removal of Constituents of Concern

Constituent	Percent Removal[1]							
	Trial E1		Trial G2		Trial M3		Trial C4	
	Max[2]	Week 12/13[3]	Max[2]	Week 12/13[3]	Max[2]	Week 12/13[3]	Max[2]	Week 12/13[3]
Ammonia (as N)	99%	74%	97%	61%	97%	51%	79%	28%
Nitrate (as N)	99.9%	99.9%	99.9%	99.9%	99.9%	99.9%	99.2%	87%
Nitrite (as N)	99.9%	99.9%	99.9%	99.9%	99.9%	99.9%	99.3%	99.3%
Dissolved Copper	98%	98%	98%	98%	89%	89%	6%	-1%
Dissolved Selenium	84%	74%	91%	73%	86%	61%	58%	55%
Dissolved Cadmium	78%	78%	78%	78%	63%	63%	0%	-103%
Dissolved Molybdenum	56%	47%	82%	82%	87%	87%	6%	1%
Dissolved Zinc	65%	65%	65%	65%	29%	29%	0%	-13%

[1] Percent removal for each Trial calculated against Week 0 Concentrations for dissolved Cd, Cu, Mo, Se and Zn and the cumulative N-species added for ammonia, nitrate and nitrite. Negative percent removals indicate concentration was greater than at week 0.
[2] Maximum observed COC removal throughout trial.
[3] COC removal at end of experiment (week 12 for dissolved Cd, Cu, Mo, Se and Zn or week 13 for ammonia, nitrate and nitrite).

2.5.2 Constituent Release During Trials

Strongly reducing conditions were achieved within a few weeks of soluble carbon amendment. In addition to the COC removal indicated, mobilization of dissolved iron and manganese was also observed due to reductive dissolution of iron and manganese phases in waste rock, tailings and/or leaching from the woodchips (manganese). Iron concentrations declined as iron was subsequently sequestered by iron sulphide formation under sulphate-reducing conditions; however, dissolved manganese concentrations remained elevated. Both iron and manganese are susceptible to oxidative precipitation under circumneutral to mildly alkaline pH conditions and can be managed via passive aeration and/or filtration in downstream waterbodies (e.g., the water storage pond or constructed wetland treatment system) should in pit treatment be envisaged for the Main Pit or Area 2 Pit in operations or post-closure. Despite the release of iron under the reducing conditions observed in the trials, no solubilization of arsenic occurred, suggesting arsenic mobilization is of limited concern for this setting.

Barium, cadmium, manganese, potassium, rubidium, and zinc were observed to be released to solution during the first 24 hours of the woodchip leaching experiment. In general, the concentrations leached were not considerable and in the case of cadmium and zinc, were effectively treated under the sulphate-reducing conditions that following soluble organic carbon amendment.

Although significant ammonia removal was observed in the soluble carbon amended trials, further actions may be necessary in order to achieve concentrations below the EQS.

3 DEMONSTRATION-SCALE CONSTRUCTED WETLAND TREATMENT SYSTEM 2020 RESEARCH

3.1 BACKGROUND AND METHODS

Details regarding construction, commissioning, and operations of the demonstration-scale CWTS leading up to and including 2019 can be found in previous annual reports (Contango, 2015, 2016, 2017a, 2017b, 2019, 2020). Treatment processes and a comprehensive overview of the results from the demonstration-scale CWTS operations (2017-2019) can be found in the Minto Demonstration-scale 2019 Update Report (Contango, 2020).

A small test program was performed in 2020 on the demonstration-scale CWTS. The action plan for operating and testing the demonstration-scale CWTS in 2020 included:

- Addition of a tote to the inflow of the CWTS as a forebay where a carbon source (straw) was added. This was done to evaluate options to decrease nitrate concentrations during early closure where higher nitrate loads may be present. Higher nitrate loads can interfere with COC treatment such as selenium and molybdenum. This test work was paired with bench-scale pit lake treatment trials to evaluation nitrate removal in the pit lakes, as described in Section 2.

- Testing of the straw at the beginning and end of the operating season to evaluate decomposition rates.

- Operating the CWTS at a hydraulic retention time (HRT) that mimics the full-scale system (1.2 to 2.5 days retention).

- Periodic monitoring of the CWTS performance, including *in situ* YSI and soil redox, as well as analytical testing with ALS including but not limited to total and dissolved metals, nitrate, nitrite, sulphate, dissolved organic carbon (DOC). A total of 5 timepoints were evaluated.

3.2 RESEARCH RESULTS

3.2.1 Forebay Straw Addition and Decomposition

The quantity of straw to be added to the forebays was estimated based on the anticipated nitrate load according to concentrations observed in 2019 (~7 mg/L). Based on the tote size available, ~35-40% of the estimated amount of straw was added. In 2020, the average nitrate concentration was unexpectedly roughly double (16 mg/L) the concentrations in 2019 (i.e., higher electron demand). The 2020 nitrate concentrations were similar to nitrate concentrations predicted during the later part of Post Closure 1 (2018 water quality predictions; SRK, 2018).

The rate at which straw decomposes in the wetland was evaluated. The straw in the forebay decomposed 6-32% (average 17%) after 91 days, with the majority of the straw decomposition occurring within the first 30 days. This decomposition rate is slower than *C. aquatilis* (as anticipated) which decomposed on average 48% in 82 days (Contango, 2020).

3.2.2 Performance Monitoring

Explanatory parameters were measured in the wetland through 2020. Dissolved oxygen and oxidation-reduction potential were higher in 2020 than 2019, while soil redox was similar to 2019 measurements. The less reducing conditions in the water column are likely due to the higher nitrate load in 2020 compared to 2019. However, the soil redox conditions were maintained with the higher nitrate load indicating stability of these conditions in the CWTS. Soil redox probes were also evaluated to validate measurements and confirm probes (installed in 2014) were functioning properly. All probes but one were identified as functional after six years of operation. Excess DOC was not observed in the CWTS, with concentrations similar from the Feed through the CWTS.

Monopotassium phosphate was also added to the CWTS in 2020 to evaluate consumption through the wetland. The CWTS was dosed to a targeted concentration of 0.7 to 0.9 mg/L as P. After 24 hours at an HRT of 1.2 days, the concentrations at the midpoint and outflow of the CWTS were similar to levels historically observed in the CWTS (and stayed as such for the remainder of the season), supporting that phosphorous was readily consumed in the wetland. The treatment of COCs remained similar after monopotassium phosphate was added as a fertilizer.

3.2.2.1 Constituent Removal

Although nitrate is not a primary constituent for CWTS treatment at the Mine, removal was evaluated as it can impact treatment of other COCs as described in Section 3.1. Nitrate concentrations in 2020 were higher than any previous year of operation of the demonstration-scale CWTS (~10-22 mg/L). Nitrate treatment improved through the season, while at the beginning of the season concentrations were generally unchanged or showed little treatment (Figure 3-1). The nitrate concentrations that were removed in the CWTS are in line with what would be expected based on the straw that was added and the decomposition rate that was determined through the season.

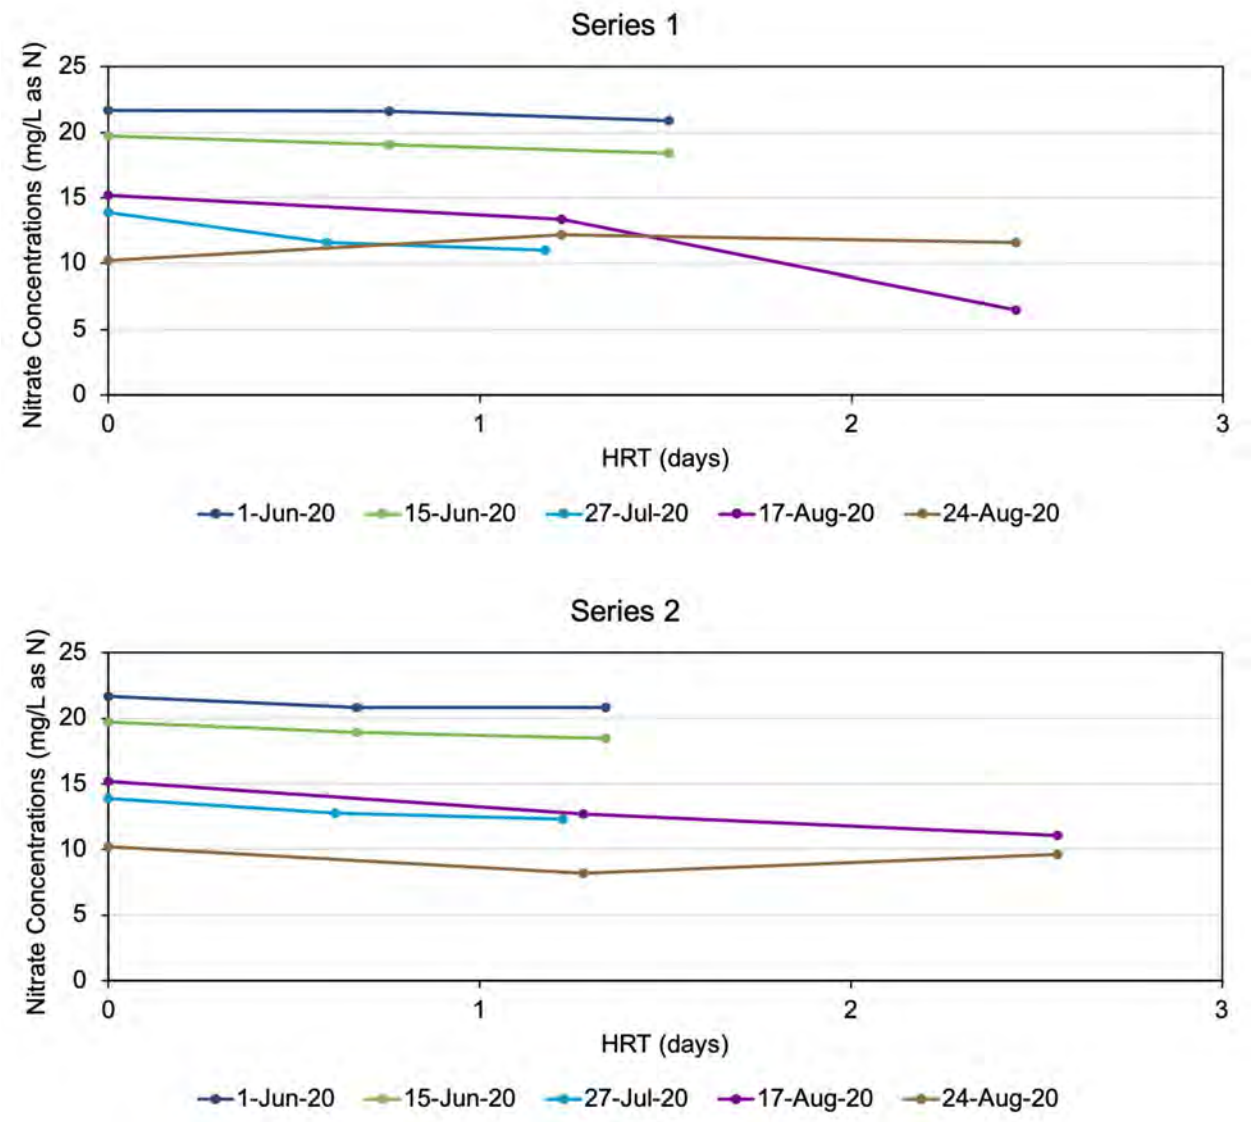

Figure 3-1 Nitrate concentrations (mg/L as N) over the 2020 CWTS operational period for Series 1 (top) and Series 2 (bottom)

Dissolved copper and cadmium removal rate coefficients (RRC) in 2020 were similar to 2019 (Table 3-1). Dissolved copper was treated in the CWTS to similar outflow concentrations as in 2019 from an average Feed concentration of 0.036 mg/L to an average outflow concentration of 0.019 mg/L. Dissolved cadmium was generally treated from an average Feed concentration of 0.000030 mg/L, near or to a raised detection limit by the outflow of the CWTS (0.000010-0.000015 mg/L).

The dissolved zinc RRC in 2020 was lower than the 2019 RRC but similar to those presented in 2017 and 2018 (Table 3-1). While dissolved zinc was not treated quite as low in 2020 at the lower flow rate tested (targeting a 2.5 day HRT), outflow concentrations were still low overall through the treatment season. The average dissolved zinc Feed concentration in 2020 was 0.012 mg/L and treated to an average outflow concentration of 0.0046 mg/L.

As anticipated with the higher nitrate concentrations going to the CWTS in 2020, the treatment of molybdenum and selenium was impacted and therefore the RRCs for selenium and molybdenum were lower than 2019 (Table 3-1). Dissolved selenium in the Feed of the CWTS was also higher in 2020 (0.0078 mg/L) compared to 2019. There was little to no selenium treatment in early 2020, however, as nitrate treatment improved over time, so did selenium treatment with an average outflow concentration of 0.0060 mg/L observed. Molybdenum concentrations in the Feed of the CWTS were low overall, although higher in 2020 (0.011 mg/L) compared to 2019. There was little to no treatment of molybdenum throughout 2020, similar to what was observed in 2019.

Rapid and significant removal of nitrate and nitrite was observed in the bench-scale pit lake treatment trials (Section 2.4.2.2). Similarly, improved selenium removal was observed in pilot-scale CWTS trials in the low nitrate test scenario (Contango, 2014). A promising option for treatment of water in early closure when higher nitrate concentrations are predicted to occur may therefore include a treatment train where pit lake treatment is performed to remove nitrate, followed by the CWTS for further COC removal. Design considerations and/or the need for a forebay in the full-scale CWTS may also be revisited in the future.

Table 3-1 Removal rate coefficients (k*day^{-1}) for dissolved COC during the 2017-2020 demonstration-scale CWTS operational periods compared to pilots-scale CWTS

COC	Minto Pilot[1]	Other Yukon Cu Pilot	Demonstration-Scale CWTS						
			2017	**2018**		**2019**		**2020**	
	Total COC		**Avg Series 1&2**	**Series 1**	**Series 2**	**Series 1**	**Series 2**	**Series 1**	**Series 2**
First order removal rate coefficients unless noted otherwise									
Cd	1.14	0.50	>0.52[2]	>0.42[2]	>0.41[2]	0.54	0.66	0.58	0.77
Cu	1.17	0.50	>0.31[3]	>0.22[3]	>0.35[3]	0.52	0.57	0.49	0.42
Mo (Zero)	0.101 (First)	N/A	0.0006	0.0011	0.0010	0.0005[6]	0.0003[6]	0.0002[6]	0.0003[6]
Se	0.0018 (Zero)	0.46	0.32	-[4]	0.29	0.20[5]	0.23[5]	0.09[8]	0.08[8]
Zn[7]	1.14	0.48	>0.51[2]	0.57	0.45	1.04	1.08	0.44	0.58
Nitrate	0.56	N/A	0.59	-[4]	0.57	0.33	0.41	0.13[8]	0.07[8]

RRC – removal rate coefficient; N/A – RRC is not available.

[1] Values calculated from total concentration data in Contango, 2014 for C. aquatilis + moss design with low nitrogen scenario (0.86 mg/L nitrate as N). These RRC are therefore included for reference purposes only and are not directly comparable to other RRC reported here.

[2] Data for Cd or Zn had most sample points at the detection limit in 2017/2018, resulting in insufficient resolution and artificially low RRC for cadmium and zinc in 2017 and cadmium in 2018.

[3] RRCs for copper in demonstration-scale CWTS are artificially low due to copper leaching from soils used in construction of the system.

[4] RRC was not calculated for NO_3 and Se in Series 1 as described in Contango, 2019.

[5] RRC for selenium based on total concentrations instead of dissolved in 2019 as described in Appendix A of Contango, 2020.

[6] Mo concentration at outflow of B cell was typically within 20% method error of inflow in 2019 and 2020. RRC have been estimated here, with instances of no treatment included as 0.

[7] Dissolved Zn concentrations used for RRC calculations in 2019 do not include data of low feed concentrations from August 21-September 5, 2019 and August 24, 2020 as treatment is difficult to observe when feed concentrations are so low.

[8] Average of all 2020 sampling events. RRC improved overtime as nitrate treatment improved.

4 RECOMMENDATIONS

4.1 PIT LAKE TREATMENT

The bench-scale pit lake treatment data overall indicate that carbon amendment to the Main Pit would likely result in marked decreases in nitrogen species, copper, and selenium concentrations to levels that would meet the EQS, and likely the WQO. Treatment of other chalcophile metals such as cadmium, molybdenum, and zinc would also occur.

Given the success of Phase 1, progression to Phase 2 studies is recommended, either through on-site limnocorral tests or full pit lake treatment if desired. Glycerol may be preferred as a carbon source for Phase 2 based on the extent of COC treatment and lack of flammability issues that ethanol has for large-scale storage and handling. Targeted ammonia treatment through a separate oxidizing system or commingling with "clean" water may be needed during operations to achieve ammonia concentrations below the EQS.

4.2 DEMONSTRATION-SCALE CWTS TREATMENT

The removal rate coefficients evaluated to date in the demonstration-scale system have been in the presence of higher nitrate concentrations. Nitrate concentrations are expected to decrease substantially over 18 years after closure. While nitrate is not a primary constituent for CWTS treatment at the Mine, removal is targeted to subsequently achieve treatment of constituents such as selenium. Pending on-site *in situ* pit lake treatment trials (Phase 2) in 2021, further research of a CWTS treatment train option could be explored where treated pit lake water (low nitrate concentrations) would report to the demonstration-scale CWTS to further demonstrate CWTS performance under low nitrate conditions.

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
%	percent
meq/L	milliequivalents per litre
mg/L	milligrams per litre
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in reports identified as "Preliminary Report" are considered authorized for use.

* Refer to Referenced Information for Qualifiers (if any) and Methodology.

Reference Information

Sample Parameter Qualifier Key:

Qualifier	Description
DLDS	Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity.
DLHC	Detection Limit Raised: Dilution required due to high concentration of test analyte(s).
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
C-DIS-ORG-CL	Water	Dissolved Organic Carbon	APHA 5310 B-Instrumental
Filtered (0.45 um) sample is acidified and purged to remove inorganic carbon, then injected into a heated reaction chamber where organic carbon is oxidized to CO2 which is then transported in the carrier gas stream and measured via a non-dispersive infrared analyzer.			
MET-D-CCMS-SK	Water	Dissolved Metals in Water by CRC ICPMS	APHA 3030B / EPA 6020A
This procedure involves preliminary filtration through a 0.45 um filter followed by instrumental analysis using collision cell inductively coupled plasma - mass spectrometry (modifed from EPA Method 6020A).			
NH3-F-CL	Water	Ammonia by Fluorescence	J. ENVIRON. MONIT., 2005, 7, 37-42, RSC
This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.			
NO2-IC-N-SK	Water	Nitrite in Water by IC	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
NO3-IC-N-SK	Water	Nitrate in Water by IC	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
SO4-IC-N-SK	Water	Sulfate in Water by IC	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
SK	ALS ENVIRONMENTAL - SASKATOON, SASKATCHEWAN, CANADA
CL	ALS ENVIRONMENTAL - CALGARY, ALBERTA, CANADA

Chain of Custody Numbers:

GLOSSARY OF REPORT TERMS

Surrogates are compounds that are similar in behaviour to target analyte(s), but that do not normally occur in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery. In reports that display the D.L. column, laboratory objectives for surrogates are listed there.
mg/kg - milligrams per kilogram based on dry weight of sample
mg/kg wwt - milligrams per kilogram based on wet weight of sample
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight
mg/L - unit of concentration based on volume, parts per million.
< - Less than.
D.L. - The reporting limit.
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

CCV	Continuing Calibration Verification
CVS	Calibration Verification Standard
LCSD	Laboratory Control Sample Duplicate

Hold Time Exceedances:

All test results reported with this submission were conducted within ALS recommended hold times.

ALS recommended hold times may vary by province. They are assigned to meet known provincial and/or federal government requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by the US EPA, APHA Standard Methods, or Environment Canada (where available). For more information, please contact ALS.

The ALS Quality Control Report is provided to ALS clients upon request. ALS includes comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against pre-determined data quality objectives to provide confidence in the accuracy of associated test results.

Please note that this report may contain QC results from anonymous Sample Duplicates and Matrix Spikes that do not originate from this Work Order.

* Refer to Referenced Information for Qualifiers (if any) and Methodology.

Reference Information

Sample Parameter Qualifier Key:

Qualifier	Description
DLDS	Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity.
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
C-DIS-ORG-CL	Water	Dissolved Organic Carbon	APHA 5310 B-Instrumental
Filtered (0.45 um) sample is acidified and purged to remove inorganic carbon, then injected into a heated reaction chamber where organic carbon is oxidized to CO2 which is then transported in the carrier gas stream and measured via a non-dispersive infrared analyzer.			
MET-D-CCMS-SK	Water	Dissolved Metals in Water by CRC ICPMS	APHA 3030B / EPA 6020A
This procedure involves preliminary filtration through a 0.45 um filter followed by instrumental analysis using collision cell inductively coupled plasma - mass spectrometry (modifed from EPA Method 6020A).			
MET-T-CCMS-SK	Water	Total Metals in Water by CRC ICPMS	EPA 200.2/6020A (mod)
This procedure involves preliminary digestion with concentrated nitric acid followed by instrumental analysis using collision cell inductively coupled plasma - mass spectrometry (modifed from EPA Method 6020A).			
NO2-IC-N-SK	Water	Nitrite in Water by IC	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
NO3-IC-N-SK	Water	Nitrate in Water by IC	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
SK	ALS ENVIRONMENTAL - SASKATOON, SASKATCHEWAN, CANADA
CL	ALS ENVIRONMENTAL - CALGARY, ALBERTA, CANADA

Chain of Custody Numbers:

GLOSSARY OF REPORT TERMS

Surrogates are compounds that are similar in behaviour to target analyte(s), but that do not normally occur in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery. In reports that display the D.L. column, laboratory objectives for surrogates are listed there.
mg/kg - milligrams per kilogram based on dry weight of sample
mg/kg wwt - milligrams per kilogram based on wet weight of sample
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight
mg/L - unit of concentration based on volume, parts per million.
< - Less than.
D.L. - The reporting limit.
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Qualifier	Description
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.
RPD-NA	Relative Percent Difference Not Available due to result(s) being less than detection limit.

Hold Time Exceedances:

All test results reported with this submission were conducted within ALS recommended hold times.

ALS recommended hold times may vary by province. They are assigned to meet known provincial and/or federal government requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by the US EPA, APHA Standard Methods, or Environment Canada (where available). For more information, please contact ALS.

The ALS Quality Control Report is provided to ALS clients upon request. ALS includes comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against pre-determined data quality objectives to provide confidence in the accuracy of associated test results.

Please note that this report may contain QC results from anonymous Sample Duplicates and Matrix Spikes that do not originate from this Work Order.

Dissolved Organic Carbon	47.1		1.0	mg/L		13-AUG-20	R5188462

* Refer to Referenced Information for Qualifiers (if any) and Methodology.

Reference Information

Sample Parameter Qualifier Key:

Qualifier	Description
DLHC	Detection Limit Raised: Dilution required due to high concentration of test analyte(s).

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
C-DIS-ORG-CL	Water	Dissolved Organic Carbon	APHA 5310 B-Instrumental

Filtered (0.45 um) sample is acidified and purged to remove inorganic carbon, then injected into a heated reaction chamber where organic carbon is oxidized to CO2 which is then transported in the carrier gas stream and measured via a non-dispersive infrared analyzer.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
CL	ALS ENVIRONMENTAL - CALGARY, ALBERTA, CANADA

Chain of Custody Numbers:

GLOSSARY OF REPORT TERMS

Surrogates are compounds that are similar in behaviour to target analyte(s), but that do not normally occur in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery. In reports that display the D.L. column, laboratory objectives for surrogates are listed there.
mg/kg - milligrams per kilogram based on dry weight of sample
mg/kg wwt - milligrams per kilogram based on wet weight of sample
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight
mg/L - unit of concentration based on volume, parts per million.
< - Less than.
D.L. - The reporting limit.
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Reference Information

Sample Parameter Qualifier Key:

Qualifier	Description
DLDS	Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity.
DLHC	Detection Limit Raised: Dilution required due to high concentration of test analyte(s).
DLM	Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).
K	Matrix Spike recovery outside ALS DQO due to sample matrix effects.
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
MET-D-CCMS-SK	Water	Dissolved Metals in Water by CRC ICPMS	APHA 3030B / EPA 6020A
This procedure involves preliminary filtration through a 0.45 um filter followed by instrumental analysis using collision cell inductively coupled plasma - mass spectrometry (modifed from EPA Method 6020A).			
N-T-CALC-CL	Water	Total Nitrogen (Calculation)	APHA 4500 N-Calculated
Total Nitrogen is a calculated parameter. Total Nitrogen = Total Kjeldahl Nitrogen + [Nitrate and Nitrite (as N)]			
N2N3-CALC-CL	Water	Nitrate+Nitrite	CALCULATION
NH3-F-CL	Water	Ammonia by Fluorescence	J. ENVIRON. MONIT., 2005, 7, 37-42, RSC
This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.			
NO2-IC-N-SK	Water	Nitrite in Water by IC	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
NO3-IC-N-SK	Water	Nitrate in Water by IC	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
TKN-F-CL	Water	Total Kjeldahl Nitrogen by Fluorescence	APHA 4500-NORG (TKN)
This analysis is carried out using procedures adapted from APHA Method 4500-Norg D. "Block Digestion and Flow Injection Analysis". Total Kjeldahl Nitrogen is determined using block digestion followed by Flow-injection analysis with fluorescence detection.			

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
SK	ALS ENVIRONMENTAL - SASKATOON, SASKATCHEWAN, CANADA
CL	ALS ENVIRONMENTAL - CALGARY, ALBERTA, CANADA

Chain of Custody Numbers:

GLOSSARY OF REPORT TERMS

Surrogates are compounds that are similar in behaviour to target analyte(s), but that do not normally occur in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery. In reports that display the D.L. column, laboratory objectives for surrogates are listed there.
mg/kg - milligrams per kilogram based on dry weight of sample
mg/kg wwt - milligrams per kilogram based on wet weight of sample
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight
mg/L - unit of concentration based on volume, parts per million.
< - Less than.
D.L. - The reporting limit.
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

CCV	Continuing Calibration Verification
CVS	Calibration Verification Standard
LCSD	Laboratory Control Sample Duplicate

Sample Parameter Qualifier Definitions:

Qualifier	Description
RPD-NA	Relative Percent Difference Not Available due to result(s) being less than detection limit.

Hold Time Exceedances:

ALS Product Description	Sample ID	Sampling Date	Date Processed	Rec. HT	Actual HT	Units	Qualifier
Anions and Nutrients							
Nitrate in Water by IC							
	1	07-AUG-20 13:30	21-AUG-20 02:00	3	14	days	EHTR
Nitrite in Water by IC							
	1	07-AUG-20 13:30	21-AUG-20 02:00	3	14	days	EHTR

Legend & Qualifier Definitions:

EHTR-FM:	Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended.
EHTR:	Exceeded ALS recommended hold time prior to sample receipt.
EHTL:	Exceeded ALS recommended hold time prior to analysis. Sample was received less than 24 hours prior to expiry.
EHT:	Exceeded ALS recommended hold time prior to analysis.
Rec. HT:	ALS recommended hold time (see units).

Notes*:
Where actual sampling date is not provided to ALS, the date (& time) of receipt is used for calculation purposes.
Where actual sampling time is not provided to ALS, the earlier of 12 noon on the sampling date or the time (& date) of receipt is used for calculation purposes. Samples for L2488530 were received on 13-AUG-20 15:30.

ALS recommended hold times may vary by province. They are assigned to meet known provincial and/or federal government requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by the US EPA, APHA Standard Methods, or Environment Canada (where available). For more information, please contact ALS.

The ALS Quality Control Report is provided to ALS clients upon request. ALS includes comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against pre-determined data quality objectives to provide confidence in the accuracy of associated test results.

Please note that this report may contain QC results from anonymous Sample Duplicates and Matrix Spikes that do not originate from this Work Order.

* Refer to Referenced Information for Qualifiers (if any) and Methodology.

Reference Information

Sample Parameter Qualifier Key:

Qualifier	Description
DLHC	Detection Limit Raised: Dilution required due to high concentration of test analyte(s).
DLM	Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).
K	Matrix Spike recovery outside ALS DQO due to sample matrix effects.
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
C-DIS-ORG-CL	Water	Dissolved Organic Carbon	APHA 5310 B-Instrumental
Filtered (0.45 um) sample is acidified and purged to remove inorganic carbon, then injected into a heated reaction chamber where organic carbon is oxidized to CO2 which is then transported in the carrier gas stream and measured via a non-dispersive infrared analyzer.			
MET-D-CCMS-SK	Water	Dissolved Metals in Water by CRC ICPMS	APHA 3030B / EPA 6020A
This procedure involves preliminary filtration through a 0.45 um filter followed by instrumental analysis using collision cell inductively coupled plasma - mass spectrometry (modifed from EPA Method 6020A).			
NH3-F-CL	Water	Ammonia by Fluorescence	J. ENVIRON. MONIT., 2005, 7, 37-42, RSC
This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.			
NO2-IC-N-SK	Water	Nitrite in Water by IC	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
NO3-IC-N-SK	Water	Nitrate in Water by IC	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
SK	ALS ENVIRONMENTAL - SASKATOON, SASKATCHEWAN, CANADA
CL	ALS ENVIRONMENTAL - CALGARY, ALBERTA, CANADA

Chain of Custody Numbers:

GLOSSARY OF REPORT TERMS

Surrogates are compounds that are similar in behaviour to target analyte(s), but that do not normally occur in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery. In reports that display the D.L. column, laboratory objectives for surrogates are listed there.
mg/kg - milligrams per kilogram based on dry weight of sample
mg/kg wwt - milligrams per kilogram based on wet weight of sample
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight
mg/L - unit of concentration based on volume, parts per million.
< - Less than.
D.L. - The reporting limit.
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Hold Time Exceedances:

All test results reported with this submission were conducted within ALS recommended hold times.

ALS recommended hold times may vary by province. They are assigned to meet known provincial and/or federal government requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by the US EPA, APHA Standard Methods, or Environment Canada (where available). For more information, please contact ALS.

The ALS Quality Control Report is provided to ALS clients upon request. ALS includes comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against pre-determined data quality objectives to provide confidence in the accuracy of associated test results.

Please note that this report may contain QC results from anonymous Sample Duplicates and Matrix Spikes that do not originate from this Work Order.

* Refer to Referenced Information for Qualifiers (if any) and Methodology.

Reference Information

Sample Parameter Qualifier Key:

Qualifier	Description
DLDS	Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity.
DLHC	Detection Limit Raised: Dilution required due to high concentration of test analyte(s).
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
C-DIS-ORG-CL	Water	Dissolved Organic Carbon	APHA 5310 B-Instrumental
Filtered (0.45 um) sample is acidified and purged to remove inorganic carbon, then injected into a heated reaction chamber where organic carbon is oxidized to CO2 which is then transported in the carrier gas stream and measured via a non-dispersive infrared analyzer.			
MET-D-CCMS-SK	Water	Dissolved Metals in Water by CRC ICPMS	APHA 3030B / EPA 6020A
This procedure involves preliminary filtration through a 0.45 um filter followed by instrumental analysis using collision cell inductively coupled plasma - mass spectrometry (modifed from EPA Method 6020A).			
NH3-F-CL	Water	Ammonia by Fluorescence	J. ENVIRON. MONIT., 2005, 7, 37-42, RSC
This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.			
NO2-IC-N-SK	Water	Nitrite in Water by IC	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
NO3-IC-N-SK	Water	Nitrate in Water by IC	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
SK	ALS ENVIRONMENTAL - SASKATOON, SASKATCHEWAN, CANADA
CL	ALS ENVIRONMENTAL - CALGARY, ALBERTA, CANADA

Chain of Custody Numbers:

GLOSSARY OF REPORT TERMS

Surrogates are compounds that are similar in behaviour to target analyte(s), but that do not normally occur in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery. In reports that display the D.L. column, laboratory objectives for surrogates are listed there.
mg/kg - milligrams per kilogram based on dry weight of sample
mg/kg wwt - milligrams per kilogram based on wet weight of sample
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight
mg/L - unit of concentration based on volume, parts per million.
< - Less than.
D.L. - The reporting limit.
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

CVS	Calibration Verification Standard
LCSD	Laboratory Control Sample Duplicate

Hold Time Exceedances:

All test results reported with this submission were conducted within ALS recommended hold times.

ALS recommended hold times may vary by province. They are assigned to meet known provincial and/or federal government requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by the US EPA, APHA Standard Methods, or Environment Canada (where available). For more information, please contact ALS.

The ALS Quality Control Report is provided to ALS clients upon request. ALS includes comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against pre-determined data quality objectives to provide confidence in the accuracy of associated test results.

Please note that this report may contain QC results from anonymous Sample Duplicates and Matrix Spikes that do not originate from this Work Order.

Reference Information

Sample Parameter Qualifier Key:

Qualifier	Description
DLDS	Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity.
DLHC	Detection Limit Raised: Dilution required due to high concentration of test analyte(s).
DLM	Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
C-DIS-ORG-CL	Water	Dissolved Organic Carbon	APHA 5310 B-Instrumental
Filtered (0.45 um) sample is acidified and purged to remove inorganic carbon, then injected into a heated reaction chamber where organic carbon is oxidized to CO2 which is then transported in the carrier gas stream and measured via a non-dispersive infrared analyzer.			
MET-D-CCMS-SK	Water	Dissolved Metals in Water by CRC ICPMS	APHA 3030B / EPA 6020A
This procedure involves preliminary filtration through a 0.45 um filter followed by instrumental analysis using collision cell inductively coupled plasma - mass spectrometry (modifed from EPA Method 6020A).			
NH3-F-CL	Water	Ammonia by Fluorescence	J. ENVIRON. MONIT., 2005, 7, 37-42, RSC
This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.			
NO2-IC-N-SK	Water	Nitrite in Water by IC	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
NO3-IC-N-SK	Water	Nitrate in Water by IC	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
SO4-IC-N-SK	Water	Sulfate in Water by IC	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
SULPHIDE-CFA-ED	Water	Sulphide	APHA 4500 -S E-Auto-Colorimetry
A continuous flow manifold adds HCl to the sample which converts sulphide to a gas, then the sulphide is separated from the flow using a gas dialysis membrane. A colorimetric reaction produces a methylene blue compound which is measured at 660 nm. This follows the Standard Methods procedure 4500 S-E.			

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
SK	ALS ENVIRONMENTAL - SASKATOON, SASKATCHEWAN, CANADA
ED	ALS ENVIRONMENTAL - EDMONTON, ALBERTA, CANADA
CL	ALS ENVIRONMENTAL - CALGARY, ALBERTA, CANADA

GLOSSARY OF REPORT TERMS

Surrogates are compounds that are similar in behaviour to target analyte(s), but that do not normally occur in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery. In reports that display the D.L. column, laboratory objectives for surrogates are listed there.
mg/kg - milligrams per kilogram based on dry weight of sample
mg/kg wwt - milligrams per kilogram based on wet weight of sample
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight
mg/L - unit of concentration based on volume, parts per million.
< - Less than.
D.L. - The reporting limit.
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Hold Time Exceedances:

ALS Product Description	Sample ID	Sampling Date	Date Processed	Rec. HT	Actual HT	Units	Qualifier
Anions and Nutrients							
Sulphide							
	2	20-AUG-20 11:00	28-AUG-20 13:00	7	8	days	EHT
	3	20-AUG-20 11:10	28-AUG-20 13:00	7	8	days	EHT
	4	20-AUG-20 11:20	28-AUG-20 13:00	7	8	days	EHT
	5	20-AUG-20 11:30	28-AUG-20 13:00	7	8	days	EHT

Legend & Qualifier Definitions:

EHTR-FM:	Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended.
EHTR:	Exceeded ALS recommended hold time prior to sample receipt.
EHTL:	Exceeded ALS recommended hold time prior to analysis. Sample was received less than 24 hours prior to expiry.
EHT:	Exceeded ALS recommended hold time prior to analysis.
Rec. HT:	ALS recommended hold time (see units).

Notes*:
Where actual sampling date is not provided to ALS, the date (& time) of receipt is used for calculation purposes.
Where actual sampling time is not provided to ALS, the earlier of 12 noon on the sampling date or the time (& date) of receipt is used for calculation purposes. Samples for L2491965 were received on 20-AUG-20 15:30.

ALS recommended hold times may vary by province. They are assigned to meet known provincial and/or federal government requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by the US EPA, APHA Standard Methods, or Environment Canada (where available). For more information, please contact ALS.

The ALS Quality Control Report is provided to ALS clients upon request. ALS includes comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against pre-determined data quality objectives to provide confidence in the accuracy of associated test results.

Please note that this report may contain QC results from anonymous Sample Duplicates and Matrix Spikes that do not originate from this Work Order.

* Refer to Referenced Information for Qualifiers (if any) and Methodology.

Reference Information

Sample Parameter Qualifier Key:

Qualifier	Description
DLDS	Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity.
DLHC	Detection Limit Raised: Dilution required due to high concentration of test analyte(s).

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
NH3-F-CL	Water	Ammonia by Fluorescence	J. ENVIRON. MONIT., 2005, 7, 37-42, RSC
This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.			
NO2-IC-N-SK	Water	Nitrite in Water by IC	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
NO3-IC-N-SK	Water	Nitrate in Water by IC	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
SK	ALS ENVIRONMENTAL - SASKATOON, SASKATCHEWAN, CANADA
CL	ALS ENVIRONMENTAL - CALGARY, ALBERTA, CANADA

Chain of Custody Numbers:

GLOSSARY OF REPORT TERMS

Surrogates are compounds that are similar in behaviour to target analyte(s), but that do not normally occur in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery. In reports that display the D.L. column, laboratory objectives for surrogates are listed there.
mg/kg - milligrams per kilogram based on dry weight of sample
mg/kg wwt - milligrams per kilogram based on wet weight of sample
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight
mg/L - unit of concentration based on volume, parts per million.
< - Less than.
D.L. - The reporting limit.
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Hold Time Exceedances:

All test results reported with this submission were conducted within ALS recommended hold times.

ALS recommended hold times may vary by province. They are assigned to meet known provincial and/or federal government requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by the US EPA, APHA Standard Methods, or Environment Canada (where available). For more information, please contact ALS.

The ALS Quality Control Report is provided to ALS clients upon request. ALS includes comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against pre-determined data quality objectives to provide confidence in the accuracy of associated test results.

Please note that this report may contain QC results from anonymous Sample Duplicates and Matrix Spikes that do not originate from this Work Order.

* Refer to Referenced Information for Qualifiers (if any) and Methodology.

Reference Information

Sample Parameter Qualifier Key:

Qualifier	Description
DLDS	Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity.
DLHC	Detection Limit Raised: Dilution required due to high concentration of test analyte(s).
DLM	Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
C-DIS-ORG-CL	Water	Dissolved Organic Carbon	APHA 5310 B-Instrumental
Filtered (0.45 um) sample is acidified and purged to remove inorganic carbon, then injected into a heated reaction chamber where organic carbon is oxidized to CO2 which is then transported in the carrier gas stream and measured via a non-dispersive infrared analyzer.			
MET-D-CCMS-SK	Water	Dissolved Metals in Water by CRC ICPMS	APHA 3030B / EPA 6020A
This procedure involves preliminary filtration through a 0.45 um filter followed by instrumental analysis using collision cell inductively coupled plasma - mass spectrometry (modifed from EPA Method 6020A).			
NH3-F-CL	Water	Ammonia by Fluorescence	J. ENVIRON. MONIT., 2005, 7, 37-42, RSC
This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.			
NO2-IC-N-SK	Water	Nitrite in Water by IC	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
NO3-IC-N-SK	Water	Nitrate in Water by IC	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
S2-T>H2S-CALC-WT	Water	Total Sulphide Calculated as H2S	Calculation
This calculation converts Total Sulphide as (S2-) and reports it as Total Sulphide as (H2S). Total Sulphide as (S2-) is determined using procedures adapted from APHA 4500-S2 "Sulphide".			
SO4-IC-N-SK	Water	Sulfate in Water by IC	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
SULPHIDE-WT	Water	Sulphide (as S)	APHA 4500S2D
This analysis is carried out using procedures adapted from APHA Method 4500-S2-D "Methylene Blue Method". Sulphide is determined colourmetrically.			

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
SK	ALS ENVIRONMENTAL - SASKATOON, SASKATCHEWAN, CANADA
WT	ALS ENVIRONMENTAL - WATERLOO, ONTARIO, CANADA
CL	ALS ENVIRONMENTAL - CALGARY, ALBERTA, CANADA

GLOSSARY OF REPORT TERMS

Surrogates are compounds that are similar in behaviour to target analyte(s), but that do not normally occur in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery. In reports that display the D.L. column, laboratory objectives for surrogates are listed there.
mg/kg - milligrams per kilogram based on dry weight of sample
mg/kg wwt - milligrams per kilogram based on wet weight of sample
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight
mg/L - unit of concentration based on volume, parts per million.
< - Less than.
D.L. - The reporting limit.
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Sample Parameter Qualifier Definitions:

Qualifier	Description
RPD-NA	Relative Percent Difference Not Available due to result(s) being less than detection limit.

Hold Time Exceedances:

All test results reported with this submission were conducted within ALS recommended hold times.

ALS recommended hold times may vary by province. They are assigned to meet known provincial and/or federal government requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by the US EPA, APHA Standard Methods, or Environment Canada (where available). For more information, please contact ALS.

The ALS Quality Control Report is provided to ALS clients upon request. ALS includes comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against pre-determined data quality objectives to provide confidence in the accuracy of associated test results.

Please note that this report may contain QC results from anonymous Sample Duplicates and Matrix Spikes that do not originate from this Work Order.

* Refer to Referenced Information for Qualifiers (if any) and Methodology.

Reference Information

Sample Parameter Qualifier Key:

Qualifier	Description
DLDS	Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity.
DLHC	Detection Limit Raised: Dilution required due to high concentration of test analyte(s).
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
NH3-F-CL	Water	Ammonia by Fluorescence	J. ENVIRON. MONIT., 2005, 7, 37-42, RSC
This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.			
NO2-IC-N-SK	Water	Nitrite in Water by IC	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
NO3-IC-N-SK	Water	Nitrate in Water by IC	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
SK	ALS ENVIRONMENTAL - SASKATOON, SASKATCHEWAN, CANADA
CL	ALS ENVIRONMENTAL - CALGARY, ALBERTA, CANADA

Chain of Custody Numbers:

GLOSSARY OF REPORT TERMS

Surrogates are compounds that are similar in behaviour to target analyte(s), but that do not normally occur in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery. In reports that display the D.L. column, laboratory objectives for surrogates are listed there.
mg/kg - milligrams per kilogram based on dry weight of sample
mg/kg wwt - milligrams per kilogram based on wet weight of sample
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight
mg/L - unit of concentration based on volume, parts per million.
< - Less than.
D.L. - The reporting limit.
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

LCSD	Laboratory Control Sample Duplicate

Hold Time Exceedances:

All test results reported with this submission were conducted within ALS recommended hold times.

ALS recommended hold times may vary by province. They are assigned to meet known provincial and/or federal government requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by the US EPA, APHA Standard Methods, or Environment Canada (where available). For more information, please contact ALS.

The ALS Quality Control Report is provided to ALS clients upon request. ALS includes comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against pre-determined data quality objectives to provide confidence in the accuracy of associated test results.

Please note that this report may contain QC results from anonymous Sample Duplicates and Matrix Spikes that do not originate from this Work Order.

Reference Information

Sample Parameter Qualifier Key:

Qualifier	Description
DLDS	Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity.
DLHC	Detection Limit Raised: Dilution required due to high concentration of test analyte(s).
DLM	Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
C-DIS-ORG-CL	Water	Dissolved Organic Carbon	APHA 5310 B-Instrumental
Filtered (0.45 um) sample is acidified and purged to remove inorganic carbon, then injected into a heated reaction chamber where organic carbon is oxidized to CO2 which is then transported in the carrier gas stream and measured via a non-dispersive infrared analyzer.			
MET-D-CCMS-SK	Water	Dissolved Metals in Water by CRC ICPMS	APHA 3030B / EPA 6020A
This procedure involves preliminary filtration through a 0.45 um filter followed by instrumental analysis using collision cell inductively coupled plasma - mass spectrometry (modifed from EPA Method 6020A).			
NH3-F-CL	Water	Ammonia by Fluorescence	J. ENVIRON. MONIT., 2005, 7, 37-42, RSC
This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.			
NO2-IC-N-SK	Water	Nitrite in Water by IC	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
NO3-IC-N-SK	Water	Nitrate in Water by IC	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
SO4-IC-N-SK	Water	Sulfate in Water by IC	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
SULPHIDE-CFA-ED	Water	Sulphide	APHA 4500 -S E-Auto-Colorimetry
A continuous flow manifold adds HCl to the sample which converts sulphide to a gas, then the sulphide is separated from the flow using a gas dialysis membrane. A colorimetric reaction produces a methylene blue compound which is measured at 660 nm. This follows the Standard Methods procedure 4500 S-E.			

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
SK	ALS ENVIRONMENTAL - SASKATOON, SASKATCHEWAN, CANADA
ED	ALS ENVIRONMENTAL - EDMONTON, ALBERTA, CANADA
CL	ALS ENVIRONMENTAL - CALGARY, ALBERTA, CANADA

GLOSSARY OF REPORT TERMS

Surrogates are compounds that are similar in behaviour to target analyte(s), but that do not normally occur in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery. In reports that display the D.L. column, laboratory objectives for surrogates are listed there.
mg/kg - milligrams per kilogram based on dry weight of sample
mg/kg wwt - milligrams per kilogram based on wet weight of sample
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight
mg/L - unit of concentration based on volume, parts per million.
< - Less than.
D.L. - The reporting limit.
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Legend:

Limit	ALS Control Limit (Data Quality Objectives)
DUP	Duplicate
RPD	Relative Percent Difference
N/A	Not Available
LCS	Laboratory Control Sample
SRM	Standard Reference Material
MS	Matrix Spike
MSD	Matrix Spike Duplicate
ADE	Average Desorption Efficiency
MB	Method Blank
IRM	Internal Reference Material
CRM	Certified Reference Material
CCV	Continuing Calibration Verification
CVS	Calibration Verification Standard
LCSD	Laboratory Control Sample Duplicate

Sample Parameter Qualifier Definitions:

Qualifier	Description
J	Duplicate results and limits are expressed in terms of absolute difference.
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.
RPD-NA	Relative Percent Difference Not Available due to result(s) being less than detection limit.

Hold Time Exceedances:

All test results reported with this submission were conducted within ALS recommended hold times.

ALS recommended hold times may vary by province. They are assigned to meet known provincial and/or federal government requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by the US EPA, APHA Standard Methods, or Environment Canada (where available). For more information, please contact ALS.

The ALS Quality Control Report is provided to ALS clients upon request. ALS includes comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against pre-determined data quality objectives to provide confidence in the accuracy of associated test results.

Please note that this report may contain QC results from anonymous Sample Duplicates and Matrix Spikes that do not originate from this Work Order.

ALS Test Code	Matrix	Test Description	Method Reference**
NH3-F-CL	Water	Ammonia by Fluorescence	J. ENVIRON. MONIT., 2005, 7, 37-42, RSC
This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.			
NO2-IC-N-SK	Water	Nitrite in Water by IC	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
NO3-IC-N-SK	Water	Nitrate in Water by IC	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
SK	ALS ENVIRONMENTAL - SASKATOON, SASKATCHEWAN, CANADA
CL	ALS ENVIRONMENTAL - CALGARY, ALBERTA, CANADA

Chain of Custody Numbers:

GLOSSARY OF REPORT TERMS

Surrogates are compounds that are similar in behaviour to target analyte(s), but that do not normally occur in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery. In reports that display the D.L. column, laboratory objectives for surrogates are listed there.
mg/kg - milligrams per kilogram based on dry weight of sample
mg/kg wwt - milligrams per kilogram based on wet weight of sample
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight
mg/L - unit of concentration based on volume, parts per million.
< - Less than.
D.L. - The reporting limit.
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

LCSD	Laboratory Control Sample Duplicate

Hold Time Exceedances:

All test results reported with this submission were conducted within ALS recommended hold times.

ALS recommended hold times may vary by province. They are assigned to meet known provincial and/or federal government requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by the US EPA, APHA Standard Methods, or Environment Canada (where available). For more information, please contact ALS.

The ALS Quality Control Report is provided to ALS clients upon request. ALS includes comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against pre-determined data quality objectives to provide confidence in the accuracy of associated test results.

Please note that this report may contain QC results from anonymous Sample Duplicates and Matrix Spikes that do not originate from this Work Order.

* Refer to Referenced Information for Qualifiers (if any) and Methodology.

Reference Information

Sample Parameter Qualifier Key:

Qualifier	Description
DLDS	Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity.
DLHC	Detection Limit Raised: Dilution required due to high concentration of test analyte(s).
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.
SP	Sample was Preserved at the laboratory

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
C-DIS-ORG-CL	Water	Dissolved Organic Carbon	APHA 5310 B-Instrumental
Filtered (0.45 um) sample is acidified and purged to remove inorganic carbon, then injected into a heated reaction chamber where organic carbon is oxidized to CO2 which is then transported in the carrier gas stream and measured via a non-dispersive infrared analyzer.			
MET-D-CCMS-SK	Water	Dissolved Metals in Water by CRC ICPMS	APHA 3030B / EPA 6020A
This procedure involves preliminary filtration through a 0.45 um filter followed by instrumental analysis using collision cell inductively coupled plasma - mass spectrometry (modifed from EPA Method 6020A).			
NH3-F-CL	Water	Ammonia by Fluorescence	J. ENVIRON. MONIT., 2005, 7, 37-42, RSC
This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.			
NO2-IC-N-SK	Water	Nitrite in Water by IC	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
NO3-IC-N-SK	Water	Nitrate in Water by IC	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
S2-T>H2S-CALC-WT	Water	Total Sulphide Calculated as H2S	Calculation
This calculation converts Total Sulphide as (S2-) and reports it as Total Sulphide as (H2S). Total Sulphide as (S2-) is determined using procedures adapted from APHA 4500-S2 "Sulphide".			
SO4-IC-N-SK	Water	Sulfate in Water by IC	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
SULPHIDE-WT	Water	Sulphide (as S)	APHA 4500S2D
This analysis is carried out using procedures adapted from APHA Method 4500-S2-D "Methylene Blue Method". Sulphide is determined colourmetrically.			

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
SK	ALS ENVIRONMENTAL - SASKATOON, SASKATCHEWAN, CANADA
WT	ALS ENVIRONMENTAL - WATERLOO, ONTARIO, CANADA
CL	ALS ENVIRONMENTAL - CALGARY, ALBERTA, CANADA

Chain of Custody Numbers:

GLOSSARY OF REPORT TERMS

Surrogates are compounds that are similar in behaviour to target analyte(s), but that do not normally occur in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery. In reports that display the D.L. column, laboratory objectives for surrogates are listed there.
mg/kg - milligrams per kilogram based on dry weight of sample
mg/kg wwt - milligrams per kilogram based on wet weight of sample
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight
mg/L - unit of concentration based on volume, parts per million.
< - Less than.
D.L. - The reporting limit.
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Qualifier	Description
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.
RPD-NA	Relative Percent Difference Not Available due to result(s) being less than detection limit.

Hold Time Exceedances:

All test results reported with this submission were conducted within ALS recommended hold times.

ALS recommended hold times may vary by province. They are assigned to meet known provincial and/or federal government requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by the US EPA, APHA Standard Methods, or Environment Canada (where available). For more information, please contact ALS.

The ALS Quality Control Report is provided to ALS clients upon request. ALS includes comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against pre-determined data quality objectives to provide confidence in the accuracy of associated test results.

Please note that this report may contain QC results from anonymous Sample Duplicates and Matrix Spikes that do not originate from this Work Order.

* Refer to Referenced Information for Qualifiers (if any) and Methodology.

Reference Information

Sample Parameter Qualifier Key:

Qualifier	Description
DLDS	Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity.
DLHC	Detection Limit Raised: Dilution required due to high concentration of test analyte(s).
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
NH3-F-CL	Water	Ammonia by Fluorescence	J. ENVIRON. MONIT., 2005, 7, 37-42, RSC
This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.			
NO2-IC-N-SK	Water	Nitrite in Water by IC	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
NO3-IC-N-SK	Water	Nitrate in Water by IC	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
SK	ALS ENVIRONMENTAL - SASKATOON, SASKATCHEWAN, CANADA
CL	ALS ENVIRONMENTAL - CALGARY, ALBERTA, CANADA

Chain of Custody Numbers:

GLOSSARY OF REPORT TERMS

Surrogates are compounds that are similar in behaviour to target analyte(s), but that do not normally occur in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery. In reports that display the D.L. column, laboratory objectives for surrogates are listed there.
mg/kg - milligrams per kilogram based on dry weight of sample
mg/kg wwt - milligrams per kilogram based on wet weight of sample
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight
mg/L - unit of concentration based on volume, parts per million.
< - Less than.
D.L. - The reporting limit.
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

* Refer to Referenced Information for Qualifiers (if any) and Methodology.

Reference Information

Sample Parameter Qualifier Key:

Qualifier	Description
B	Method Blank exceeds ALS DQO. Associated sample results which are < Limit of Reporting or > 5 times blank level are considered reliable.
DLDS	Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity.
DLHC	Detection Limit Raised: Dilution required due to high concentration of test analyte(s).
DLM	Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).
HTDC	Hold time exceeded for dilution or re-analysis. Reported results are consistent with initial results (tested within hold time), and are valid and defensible.
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
C-DIS-ORG-CL	Water	Dissolved Organic Carbon	APHA 5310 B-Instrumental
Filtered (0.45 um) sample is acidified and purged to remove inorganic carbon, then injected into a heated reaction chamber where organic carbon is oxidized to CO2 which is then transported in the carrier gas stream and measured via a non-dispersive infrared analyzer.			
MET-D-CCMS-SK	Water	Dissolved Metals in Water by CRC ICPMS	APHA 3030B / EPA 6020A
This procedure involves preliminary filtration through a 0.45 um filter followed by instrumental analysis using collision cell inductively coupled plasma - mass spectrometry (modifed from EPA Method 6020A).			
NH3-F-CL	Water	Ammonia by Fluorescence	J. ENVIRON. MONIT., 2005, 7, 37-42, RSC
This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.			
NO2-L-IC-N-SK	Water	Nitrite in Water by IC (Low Level)	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
NO3-L-IC-N-SK	Water	Nitrate in Water by IC (Low Level)	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
S2-T>H2S-CALC-WT	Water	Total Sulphide Calculated as H2S	Calculation
This calculation converts Total Sulphide as (S2-) and reports it as Total Sulphide as (H2S). Total Sulphide as (S2-) is determined using procedures adapted from APHA 4500-S2 "Sulphide".			
SO4-IC-N-SK	Water	Sulfate in Water by IC	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
SULPHIDE-WT	Water	Sulphide (as S)	APHA 4500S2D
This analysis is carried out using procedures adapted from APHA Method 4500-S2-D "Methylene Blue Method". Sulphide is determined colourmetrically.			

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
SK	ALS ENVIRONMENTAL - SASKATOON, SASKATCHEWAN, CANADA
WT	ALS ENVIRONMENTAL - WATERLOO, ONTARIO, CANADA
CL	ALS ENVIRONMENTAL - CALGARY, ALBERTA, CANADA

GLOSSARY OF REPORT TERMS

Surrogates are compounds that are similar in behaviour to target analyte(s), but that do not normally occur in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery. In reports that display the D.L. column, laboratory objectives for surrogates are listed there.
mg/kg - milligrams per kilogram based on dry weight of sample
mg/kg wwt - milligrams per kilogram based on wet weight of sample
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight
mg/L - unit of concentration based on volume, parts per million.
< - Less than.
D.L. - The reporting limit.
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Legend & Qualifier Definitions:

EHTR-FM:	Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended.
EHTR:	Exceeded ALS recommended hold time prior to sample receipt.
EHTL:	Exceeded ALS recommended hold time prior to analysis. Sample was received less than 24 hours prior to expiry.
EHT:	Exceeded ALS recommended hold time prior to analysis.
Rec. HT:	ALS recommended hold time (see units).

Notes*:
Where actual sampling date is not provided to ALS, the date (& time) of receipt is used for calculation purposes.
Where actual sampling time is not provided to ALS, the earlier of 12 noon on the sampling date or the time (& date) of receipt is used for calculation purposes. Samples for L2517662 were received on 15-OCT-20 15:45.

ALS recommended hold times may vary by province. They are assigned to meet known provincial and/or federal government requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by the US EPA, APHA Standard Methods, or Environment Canada (where available). For more information, please contact ALS.

The ALS Quality Control Report is provided to ALS clients upon request. ALS includes comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against pre-determined data quality objectives to provide confidence in the accuracy of associated test results.

Please note that this report may contain QC results from anonymous Sample Duplicates and Matrix Spikes that do not originate from this Work Order.

* Refer to Referenced Information for Qualifiers (if any) and Methodology.

Reference Information

Sample Parameter Qualifier Key:

Qualifier	Description
DLDS	Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity.
DLHC	Detection Limit Raised: Dilution required due to high concentration of test analyte(s).

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
NH3-F-CL	Water	Ammonia by Fluorescence	J. ENVIRON. MONIT., 2005, 7, 37-42, RSC
This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.			
NO2-IC-N-SK	Water	Nitrite in Water by IC	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
NO2-L-IC-N-CL	Water	Nitrite in Water by IC (Low Level)	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
NO3-IC-N-SK	Water	Nitrate in Water by IC	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
SK	ALS ENVIRONMENTAL - SASKATOON, SASKATCHEWAN, CANADA
CL	ALS ENVIRONMENTAL - CALGARY, ALBERTA, CANADA

Chain of Custody Numbers:

GLOSSARY OF REPORT TERMS

Surrogates are compounds that are similar in behaviour to target analyte(s), but that do not normally occur in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery. In reports that display the D.L. column, laboratory objectives for surrogates are listed there.
mg/kg - milligrams per kilogram based on dry weight of sample
mg/kg wwt - milligrams per kilogram based on wet weight of sample
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight
mg/L - unit of concentration based on volume, parts per million.
< - Less than.
D.L. - The reporting limit.
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Legend & Qualifier Definitions:

EHTR-FM:	Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended.
EHTR:	Exceeded ALS recommended hold time prior to sample receipt.
EHTL:	Exceeded ALS recommended hold time prior to analysis. Sample was received less than 24 hours prior to expiry.
EHT:	Exceeded ALS recommended hold time prior to analysis.
Rec. HT:	ALS recommended hold time (see units).

Notes*:
Where actual sampling date is not provided to ALS, the date (& time) of receipt is used for calculation purposes.
Where actual sampling time is not provided to ALS, the earlier of 12 noon on the sampling date or the time (& date) of receipt is used for calculation purposes. Samples for L2520403 were received on 22-OCT-20 14:10.

ALS recommended hold times may vary by province. They are assigned to meet known provincial and/or federal government requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by the US EPA, APHA Standard Methods, or Environment Canada (where available). For more information, please contact ALS.

The ALS Quality Control Report is provided to ALS clients upon request. ALS includes comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against pre-determined data quality objectives to provide confidence in the accuracy of associated test results.

Please note that this report may contain QC results from anonymous Sample Duplicates and Matrix Spikes that do not originate from this Work Order.

* Refer to Referenced Information for Qualifiers (if any) and Methodology.

Reference Information

Sample Parameter Qualifier Key:

Qualifier	Description
DLHC	Detection Limit Raised: Dilution required due to high concentration of test analyte(s).
DLM	Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
C-DIS-ORG-CL	Water	Dissolved Organic Carbon	APHA 5310 B-Instrumental
Filtered (0.45 um) sample is acidified and purged to remove inorganic carbon, then injected into a heated reaction chamber where organic carbon is oxidized to CO2 which is then transported in the carrier gas stream and measured via a non-dispersive infrared analyzer.			
MET-D-CCMS-SK	Water	Dissolved Metals in Water by CRC ICPMS	APHA 3030B / EPA 6020A
This procedure involves preliminary filtration through a 0.45 um filter followed by instrumental analysis using collision cell inductively coupled plasma - mass spectrometry (modifed from EPA Method 6020A).			
NH3-F-CL	Water	Ammonia by Fluorescence	J. ENVIRON. MONIT., 2005, 7, 37-42, RSC
This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.			
NO2-L-IC-N-CL	Water	Nitrite in Water by IC (Low Level)	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
NO3-L-IC-N-CL	Water	Nitrate in Water by IC (Low Level)	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
S2-T>H2S-CALC-WT	Water	Total Sulphide Calculated as H2S	Calculation
This calculation converts Total Sulphide as (S2-) and reports it as Total Sulphide as (H2S). Total Sulphide as (S2-) is determined using procedures adapted from APHA 4500-S2 "Sulphide".			
SO4-IC-N-CL	Water	Sulfate in Water by IC	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
SULPHIDE-WT	Water	Sulphide (as S)	APHA 4500S2D
This analysis is carried out using procedures adapted from APHA Method 4500-S2-D "Methylene Blue Method". Sulphide is determined colourmetrically.			

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
SK	ALS ENVIRONMENTAL - SASKATOON, SASKATCHEWAN, CANADA
WT	ALS ENVIRONMENTAL - WATERLOO, ONTARIO, CANADA
CL	ALS ENVIRONMENTAL - CALGARY, ALBERTA, CANADA

GLOSSARY OF REPORT TERMS

Surrogates are compounds that are similar in behaviour to target analyte(s), but that do not normally occur in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery. In reports that display the D.L. column, laboratory objectives for surrogates are listed there.
mg/kg - milligrams per kilogram based on dry weight of sample
mg/kg wwt - milligrams per kilogram based on wet weight of sample
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight
mg/L - unit of concentration based on volume, parts per million.
< - Less than.
D.L. - The reporting limit.
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Legend:

Limit	ALS Control Limit (Data Quality Objectives)
DUP	Duplicate
RPD	Relative Percent Difference
N/A	Not Available
LCS	Laboratory Control Sample
SRM	Standard Reference Material
MS	Matrix Spike
MSD	Matrix Spike Duplicate
ADE	Average Desorption Efficiency
MB	Method Blank
IRM	Internal Reference Material
CRM	Certified Reference Material
CCV	Continuing Calibration Verification
CVS	Calibration Verification Standard
LCSD	Laboratory Control Sample Duplicate

Sample Parameter Qualifier Definitions:

Qualifier	Description
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.
RPD-NA	Relative Percent Difference Not Available due to result(s) being less than detection limit.

Hold Time Exceedances:

ALS Product Description	Sample ID	Sampling Date	Date Processed	Rec. HT	Actual HT	Units	Qualifier
Anions and Nutrients							
Nitrate in Water by IC (Low Level)							
	2	29-OCT-20 09:10	03-NOV-20 08:19	3	5	days	EHT
	3	29-OCT-20 09:20	03-NOV-20 08:19	3	5	days	EHT
	4	29-OCT-20 09:30	03-NOV-20 08:19	3	5	days	EHT
Nitrite in Water by IC (Low Level)							
	2	29-OCT-20 09:10	03-NOV-20 08:19	3	5	days	EHT
	3	29-OCT-20 09:20	03-NOV-20 08:19	3	5	days	EHT
	4	29-OCT-20 09:30	03-NOV-20 08:19	3	5	days	EHT

Legend & Qualifier Definitions:

EHTR-FM:	Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended.
EHTR:	Exceeded ALS recommended hold time prior to sample receipt.
EHTL:	Exceeded ALS recommended hold time prior to analysis. Sample was received less than 24 hours prior to expiry.
EHT:	Exceeded ALS recommended hold time prior to analysis.
Rec. HT:	ALS recommended hold time (see units).

Notes*:
Where actual sampling date is not provided to ALS, the date (& time) of receipt is used for calculation purposes.
Where actual sampling time is not provided to ALS, the earlier of 12 noon on the sampling date or the time (& date) of receipt is used for calculation purposes. Samples for L2523537 were received on 29-OCT-20 15:30.

ALS recommended hold times may vary by province. They are assigned to meet known provincial and/or federal government requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by the US EPA, APHA Standard Methods, or Environment Canada (where available). For more information, please contact ALS.

The ALS Quality Control Report is provided to ALS clients upon request. ALS includes comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against pre-determined data quality objectives to provide confidence in the accuracy of associated test results.

Please note that this report may contain QC results from anonymous Sample Duplicates and Matrix Spikes that do not originate from this Work Order.

Reference Information

Sample Parameter Qualifier Key:

Qualifier	Description
DLDS	Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity.
DLHC	Detection Limit Raised: Dilution required due to high concentration of test analyte(s).
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
C-DIS-ORG-CL	Water	Dissolved Organic Carbon	APHA 5310 B-Instrumental
Filtered (0.45 um) sample is acidified and purged to remove inorganic carbon, then injected into a heated reaction chamber where organic carbon is oxidized to CO2 which is then transported in the carrier gas stream and measured via a non-dispersive infrared analyzer.			
MET-D-CCMS-SK	Water	Dissolved Metals in Water by CRC ICPMS	APHA 3030B / EPA 6020A
This procedure involves preliminary filtration through a 0.45 um filter followed by instrumental analysis using collision cell inductively coupled plasma - mass spectrometry (modifed from EPA Method 6020A).			
NH3-F-CL	Water	Ammonia by Fluorescence	J. ENVIRON. MONIT., 2005, 7, 37-42, RSC
This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.			
NO2-L-IC-N-CL	Water	Nitrite in Water by IC (Low Level)	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
NO3-L-IC-N-CL	Water	Nitrate in Water by IC (Low Level)	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
S2-T>H2S-CALC-WT	Water	Total Sulphide Calculated as H2S	Calculation
This calculation converts Total Sulphide as (S2-) and reports it as Total Sulphide as (H2S). Total Sulphide as (S2-) is determined using procedures adapted from APHA 4500-S2 "Sulphide".			
SO4-IC-N-SK	Water	Sulfate in Water by IC	EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.			
SULPHIDE-WT	Water	Sulphide (as S)	APHA 4500S2D
This analysis is carried out using procedures adapted from APHA Method 4500-S2-D "Methylene Blue Method". Sulphide is determined colourmetrically.			

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
SK	ALS ENVIRONMENTAL - SASKATOON, SASKATCHEWAN, CANADA
WT	ALS ENVIRONMENTAL - WATERLOO, ONTARIO, CANADA
CL	ALS ENVIRONMENTAL - CALGARY, ALBERTA, CANADA

Chain of Custody Numbers:

GLOSSARY OF REPORT TERMS

Surrogates are compounds that are similar in behaviour to target analyte(s), but that do not normally occur in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery. In reports that display the D.L. column, laboratory objectives for surrogates are listed there.
mg/kg - milligrams per kilogram based on dry weight of sample
mg/kg wwt - milligrams per kilogram based on wet weight of sample
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight
mg/L - unit of concentration based on volume, parts per million.
< - Less than.
D.L. - The reporting limit.
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

EHTR-FM:	Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended.
EHTR:	Exceeded ALS recommended hold time prior to sample receipt.
EHTL:	Exceeded ALS recommended hold time prior to analysis. Sample was received less than 24 hours prior to expiry.
EHT:	Exceeded ALS recommended hold time prior to analysis.
Rec. HT:	ALS recommended hold time (see units).

Notes*:
Where actual sampling date is not provided to ALS, the date (& time) of receipt is used for calculation purposes.
Where actual sampling time is not provided to ALS, the earlier of 12 noon on the sampling date or the time (& date) of receipt is used for calculation purposes. Samples for L2526515 were received on 05-NOV-20 15:40.

ALS recommended hold times may vary by province. They are assigned to meet known provincial and/or federal government requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by the US EPA, APHA Standard Methods, or Environment Canada (where available). For more information, please contact ALS.

The ALS Quality Control Report is provided to ALS clients upon request. ALS includes comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against pre-determined data quality objectives to provide confidence in the accuracy of associated test results.

Please note that this report may contain QC results from anonymous Sample Duplicates and Matrix Spikes that do not originate from this Work Order.

Appendix S – 2020 Socio-Economic Report

2020 Socio-economic Report

Prepared by:
Minto Explorations Ltd.
March 2021

1.0 Introduction

This report has been prepared by Minto Explorations Ltd. in regard to the Minto Mine property (Mine), located in central Yukon. The following report summarizes the results of the socio-economic monitoring activities at Minto for 2020, as required by the Socio-Economic Monitoring Program Framework.

The Minto Mine Socio-economic Monitoring Program (Minto Explorations, Yukon Government, Selkirk First Nation, 2014) is a program that was developed collaboratively between the Selkirk First Nation and the Yukon Government to monitor the socio-economic effects of Minto Mine. The Minto Mine Socio-economic Monitoring Program (SEMP) is a multi-year monitoring program that includes an implementation plan, baseline information and a community-based survey (conducted by SFN and YG) and information from SFN and YG relating to Policy Crossing in the Yukon. Information collected through the SEMP is reviewed in the event of the preparation of an assessment report pursuant to a new quartz mining licence.

Not all of the data that has been requested from historical records is available. Going forward, Minto will collect the required information and ensure that it is stored in a manner which facilitates information for the annual reports. Minto has given direct effects a critical and citizen historical perspective to the socio-economic effects of the mine and to the implementation of the SEMP.

1.1 Factors at Minto that may have a socio-economic impact

The Minto Mine is located approximately 160 km northwest of the communities north of Whitehorse in the Yukon Territory. The Minto Mine is owned by Minto Metals Corp. (MMC). The Minto Mine operation agreement (OA) between Selkirk First Nation and Minto was signed upon and effective as of the commencement of commercial production on January 1, 2007. The agreement addresses a number of socio-economic issues including employment, and royalties at the Minto Mine as Selkirk First Nation land.

The economics of Policy Crossing is located along the Klondike Highway on the banks of the Pelly River, 350 kilometres northwest of Whitehorse. Pelly Crossing is home to 299 people (Yukon Bureau of Statistics, 2016) and is the largest community in the Selkirk First Nation (SFN) traditional territory. Other communities in the Selkirk First Nation traditional territory are Mayo (402 residents total additional incumbent of population 2016 years and over in Pelly Crossing is 2016 census), Carmacks (504 residents) and Faro (365 residents). The Selkirk First Nation has a population of approximately 1,000 people and is one of eight self-governing First Nations in the Yukon.

The city of Whitehorse is the capital of Yukon and is the largest community in the territory with a population of 30,000 (2019 Bank Canada) at 70,000 in the Whitehorse Census Subdivision. The remote location and access to Minto Whitehorse is fly in fly out (FIFO) camp operation. In Yukon, the Minto Mine is the largest private sector employer and contributor to the GDP. The mine also contributes to the economy with many transferred goods and services.

The advanced and post-secondary education and training opportunities available in Yukon are generally lower than opportunities available in southern Canada. Yukon College is the territory's only post-secondary institution. Yukon College is a community college that provides a wide range of academic and vocational programs. Yukon College has campuses in Whitehorse, Dawson City, Mayo, Pelly Crossing and Watson Lake. Yukon College is the territory's only post-secondary institution. Yukon College is a community college that provides a wide range of academic and vocational programs. Yukon College has campuses in Whitehorse, Dawson City, Mayo, Pelly Crossing and Watson Lake.

1.2 Mines and Surrounding Activity Statistics

The below table (Table 1.1) summarizes the activity statistics for Minto Whitehorse and other mines in the Yukon Territory. Minto Whitehorse is the only mine in the Yukon that, while also property changed, had minimum that could have resulted in an incident, medical aid that. Others mines in the Yukon Territory are all underground mines, with the exception of Minto Whitehorse, which is an open pit mine.

Table 1.1 Mines and Surrounding Activity Statistics

Incident Type	Total Incidents	Mine	Contractors
Lost Time	0	0	0
Medical Aid	0	0	0
Environmental	0	0	0
Property	0	0	0
Serious	0	0	0

2.1.1 Average employment income by residence for Minto employees (2016)

Mine	Policy Crossing	Whitehorse	Yukon	Rest of Canada
Full November 31, 2020	44	28	16	31

3.0 Employment

Minto Mine has a preferential hiring recruitment approach as outlined in our Cooperation Agreement (CA) with the Selkirk First Nation. Selkirk First Nation hiring receives the following Numbers are then advertised and offered in the following order of priority: SFN, NTT (Northern Tutchone), Other Incoming Members, Other Yukon First Nations.

3.1 Employment Income and Distribution

The following tables and graphs provide trend figures that demonstrate salaries are higher for those who are in major centres and lowest for residents of small communities, such as Pelly Crossing.

At the end of 2019, 32 of the 79 employees who are the management staff majority live in Whitehorse.

The professional and paraprofessional staff have been residents of the rest of Canada (Non-Yukon) and Whitehorse. Pelly Crossing has the lowest number of staff. Most of the employees who live in Whitehorse are professional and paraprofessional staff. Most of the employees who live in Pelly Crossing have been hiring their progress and only employed locally.

Other factors for this trend statistics are the lack of potential candidates pools in Yukon of professional and managerial experienced staff. Further, the post-secondary education opportunities available in Yukon are limited.

The Company operates a fly in fly out (FIFO) camp which is attractive to employees who live outside of the Yukon. The Minto Whitehorse camp is a fly in fly out (FIFO) camp. Employees in Minto Whitehorse camp are provided with room and board without rotation, driving a team way hotels, new however, they are committed to living from the Yukon. Studies has 90% of their staff from the Yukon and 10% from outside the Yukon (Minto Mine, 2020).

3.2 Annual employment income for Mines and subsidiaries

Contractor	Policy Crossing	YTN	Whitehorse	Yukon	Rest of Canada	Average
Full-time	$72,000	0%	$72,000	$72,000	$72,000	$72,000
Part-time	$0	0%	$0	$0	$0	$0
Mines	$60,00	0%	$72,00	$72,00	$72,00	$78,00
Subsidiaries	$72,00	0%	$72,00	$72,00	$72,00	$72,00
Total	$72,00	0%	$72,00	$72,00	$72,00	$72,00

3.3 Mine Employment by Various Incidents

Mines is located in eastern Canada including that their talent pool in the Southern Governor, Northern Territories, Nunavut, Northwest Territories, Yukon and Alaska.

Most Yukon residents are employed in the mining and related industries, driving a team way hotels, new however, they are committed to living from the Yukon. Studies has 90% of their staff from the Yukon and 10% from outside the Yukon (Minto Mine, 2020).

3.3 Annual employment income for Mines and subsidiaries

Contractor	Policy Crossing	YTN	Whitehorse	Yukon	Rest of Canada	Average
Full-time	$72,000	0%	$72,000	$72,000	$72,000	$72,000
Part-time	$0	0%	$0	$0	$0	$0
Mines	$60,00	0%	$72,00	$72,00	$72,00	$78,00
Subsidiaries	$72,00	0%	$72,00	$72,00	$72,00	$72,00
Total	$72,00	0%	$72,00	$72,00	$72,00	$72,00

Semi-skilled	0	0	0	0	0	0	0
Entry-level	0	0	0	0	0	0	0
Total	0	0	0	0	0	0	0

3.2 Voluntary Exits

From the June 2019 acquisition and to the end of 2019, there was only 1 voluntary exit which was a Yukon resident. There were no exits in 2020. Minto has a low turnover rate and has had no exits since the mine was first in June since transition in 2019 and continued in the staffing at the camp as period at Minto. We had several employees return who previously worked at the mine and have since moved to other jurisdictions.

4.0 Business

As part of Mines and SFN's cooperation agreement there is a requirement for the company to provide preferred opportunity notification to SFN to negotiate and potentially be awarded a contract for goods and services. Minto Mine has established a procurement process to ensure that SFN is aware of the benefits of business opportunities that Minto is not privy to. As such, this section summarizes expenditures by the company that is the primary vendor and does not account for SFN business opportunities or joint ventures.

The six rights of procurement must be met in selection of such vendor relationships.

Right Price (cost effectiveness)
Right Person (value proposition)
Right Quantity and Quality (high quality and ability to supply)
Right Time (ability to meet schedule and delivery, however, value added service)
Right Location (proximity to value added)
Right price (competitive commercial price)
