1997 Hard rock Exploration D.C.K. Claims

LOCATION

The D.C.K. claim block is located approximately 50 miles north-northwest of Mayo, Yukon. It is accessible by a 4-wheel drive road which branches off the South McQuesten road and follows upstream on Ross Creek.

GEOLOGY

Recent 1:50 000 scale mapping by Murphey and Heon (1995) shows that the property lies in the immediate hanging wall of the Robert Service Thrust Fault, which has emplaced phyllite and meta-quartzite of the late Proterozoic-Early Cambrian Hyland group over Keno Hill Quartzite of Mississippian age. (see fig.#2)

All of the rocks on the property are mapped as Highland Group. They lie on the south limb of the east, north-east trending Antic line, the axis of which runs along the McQuesten River Valley 8.5 km north of the property. Foliation strikes generally east, north-east, parallel to the McQuesten Antic line. Discordant foliations and several strong air photo lineaments indicate that the property is cut by north south faults or fracture zones which may have localised mineralising fluids.

The western property boundary lies approximately 1.3 km east of the Morrison Creek stock, a biotite granite body of Creataceous age. Results of a regional aeromagnetic survey suggest that a buried intrusion or associated hornfels zone may extend beneath the south part of the property. (see fig. #2)

Between April 1 and Oct. 31/97, approximately 6 miles of shallow trenches were completed on the D.C.K. claim block.

WORK PERFORMED

Work performed during July beside the head waters in Seattle Creek valley proved to be too difficult to travel during the summer and fall, therefore, a narrow ridge road had to be constructed to the east of Seattle Creek head waters (see fig. #1)

In Oct. access to the ridges above the anomalous valley soil samples, collected in 1996, was possible with the bulldozers, as soft swampy areas were capped with frost.

The D8K and D6C bulldozer constructed a shallow trench heading south up the east ridge of the D.C.K. block. (The trench, approximately 14 ft. wide, ranges in depth between 6" and 6' deep). After reaching the summit, bulldozing continued west to the central ridge (or main ridge) of the D.C.K. block. The trench was then constructed down hill North on the central ridge. A hillside switch back was cut with the dozer above the camp at Seattle Creek (see fig. # 1) allowing quad and skidoo access

SOIL SAMPLING

Sixty-one (61) soil and rock samples were collected off east and central ridges. Due to excessively soft terrain access to the anomalous areas exposed, in the previous years exploration (Grassroots 1996), were difficult to access.

Due to poor ground conditions mentioned, the soil sampling was a bit more difficult than usual, skidoos were used to access sample sites. The author broke through the 6" frozen crust with a mallet or pick, then Mr. Bob Busch would use a 1 1/2" Idelman Auger down to the depths of 1 to 3 feet deep. Several samples nearest the summit may not be accurate due to the frost. However, the remainder of the samples were well in the "B" horizon mineral soil.

This soils encounter ranged in colour from red to tan-orange overlaid by an orange to grey phyllite streaked by quartz or quartzite.

Two rock outcrops protruded on each ridge near stations #A97016 & BB97019. The rock exposed at these locations is phyllite with quartz veining exposed. Sparsely populated spruce, willows and moss covers the rest of the prospect area.

INTERPRETATION OF DATA COLLECTED

The 61 soils samples were shipped to CHEMEX LABS in Vancouver B.C. The soils samples as well as 3 rock samples and a nugget of sulphide float were analysed I.C.P.32 element +gold. The rock samples contained no gold values. The sulphide sample was too small to get an exact gold reading but was very high with antimony 3970 ppm. (see Chemex Lab results)

Results from the ridge geochem samples are very positive. The 150 ppb gold discovered on the central ridge fills in an interesting piece of the puzzle and creates an anomalous area approximately 2 km by 1 km. (see colour digitised maps)

Elevated arsenic and antimony values in the same area indicate an extremely interesting target. The anomalous soils samples fall in an area associated with a magnetic low that seems to be associated with many other high geochem samples. Additional exploration is definitely required on the D.C.K. block.
