1.0 SUMMARY

The Wels Gold Property located in west central Yukon, is comprised of 299 contiguous quartz claims covering an area of approximately 6250 hectares. The centre of the claim block is at Latitude 62° 29' 35.5" N; Longitude 139° 55' 40" W, shown on NTS map sheet 115 J/05. Gorilla Minerals Corp. is 100% owner of the Property subject to a 3% Net Smelter Royalty (NSR). Access can be gained by helicopter based in Whitehorse, 325 km SE or Dawson City or Carmacks, both approximately 190 kilometers distance. The property is within White River First Nation Traditional Territory.

The Wels Gold Property hosts reduced intrusion related gold mineralization in a 100 ± 0.04 Ma granite intrusion. The intrusion cuts quartzite and cherty quartzite of displaced Selwyn Basin (NAb) Terrane. To the south and east are rocks of the Yukon Tannana Terrane and to the east ophiolite rocks of Slide Mountain Terrane, these terranes are overlain by a younger overlap assemblage of Donjek Group volcanic rocks to the west-southwest side of the claims. A previously unrecognized elongate high level medium grained granite has been mapped within the Saddle zone and extending under cover and exposed or ridges to the south. The granite hosts gold mineralization of the RIRG (reduced intrusion related granite) deposit type.

Grid soil sampling in 2011 and 2012 outlined three Au, As, Sb and Bi anomalies named North Ridge, Saddle and Southwest Spur. One rock sample collected from Trench A on the Saddle zone returned 4.9 oz/ton gold. Trenching in 2014 (155 m) produced a weighted average 8.8 gm/t Au over 45 m. Visible gold was noted at 22.5 and 42.0 m of the same trench producing a nested interval of 21 m at 13.81 gm/t Au (Doherty, 2014).

Microscopic examination of panned concentrates of pulps from selected samples showed that gold is free, irregular shaped and attached to vitreous quartz, with minor oxidized sulphides. Crushing and panning trench samples in 2015 helped focus drilling by confirming gold in bedrock below soil anomalies west of the 2014 trenches.

The 2014 program determined that the Saddle zone is underlain by a biotite granite hosting high grade gold mineralization outlined by trenching that measures 50 by 30 m on an east west trend and is open in all directions. A second zone 25 m to the west at the base of the Saddle topography returned 11 g/t Au over 4.5 m.

In 2015, a short trenching program over nearby high gold in soil anomalies was followed by 442 m of NTW core drilling in five drill holes on two fences.

The drilling confirms the presence of intrusion related sheeted quartz vein systems along east-west trending brittle structures at depth under the high grade zone located by trenching. Drilling indicates parallel sheeted vein zones and extended the mineralized zone to the west.

All holes drilled to the north intersected ore grade mineralization. The holes drilled to the south (DDH 15-03 and DDH 15-05 returned anomalous zones and indicate that there is potential for parallel zones to the south.

2.0 INTRODUCTION

This report has been prepared primarily to fulfill the reporting requirements under the Yukon Energy Mines and Resources YMEP program (YMEP 2015-083) funding.

The author has supervised all exploration programs since 2013. Mapping on the property is currently not sufficient to provide accurate interpretations of the geology outside of the drilled and trenched area.

A 43-101 report by the Author dated November 20, 2014 is the most current report on the property and provides detailed exploration history and all data collected between 2011 and 2014. This report provides data and interpretation of core drilling results from the 2015 YMEP funded program.

3.0 PROPERTY DESCRIPTION AND LOCATION

The Wels Gold Property consists of 229 contiguous claims, covering an area of 4,789 hectares. The exploration area described (Saddle zone) is at the center of the area staked in 2011. The claim block is located 50 kilometers east of Beaver Creek and 180 kilometers south of Dawson City in west-central Yukon Territory, the Saddle Zone is at latitude 62° 26' 05" North and longitude 139° 56' 44" West on NTS map sheet 115J/05 (Figure 1). The Alaska Highway is 50 km west of the claim block. The 24 km Snag road provides access to a staging area within 25 Km of the work area.

The first claims, WELS 1-88, were located in March 23-25, 2011 and recorded on March 29, 2011, in accordance with the Yukon Quartz Mining Act, and are located in the Whitehorse Mining District. They are shown on claim sheet 115J/05 (Figure 2), and claim records are available for viewing at the Whitehorse Mining Records Office or can be viewed on-line at Yukon Mining Records web site. The Wels 137-188 claims were added to the block on March 15, 2012 and Wels 203-299 were added to the west on November 2014. The claims listed in Table 1 show ownership and expiry dates. They are registered (100%) in the names of Roger Hulstein or Gorilla Minerals Corp.

The original claims are owned 50/50 by Roger Hulstein and Farrell Andersen under a separate private agreement. The claims were staked to cover gold in soil anomalies of 33 and 55 ppb Au collected by YGS personnel and reported in Open File 2006-01 (Stroshein and Hulstein 2006).

Table 1. List of Claims Data

Claim name	Grant #	# of Claims	Registered Owner	Expiry Date
Wels 01-28	YE41635-YE41662	28	Roger Hulstein 100%	3/29/2018
Wels 31-56	YE41665-YE41690	26	Roger Hulstein 100%	3/29/2018
Wels 63-88	YE41697-YE41772	26	Roger Hulstein 100%	3/29/2018
Wels 137-188	YF35016-YF35067	52	Gorilla Minerals Corp 100%	3/23/2018
Wels 203-299	YF44103-YF44199	97	under Stakers names	11/25/2015
	Total claims	229		

The Wels Gold claims include Wels 1-28, Wels 31-56, Wels 63-88 and Wels 137-188 claims. The claims are currently registered in the name of Gorilla Minerals Corp. 100%, or Roger Hulstein 100%, for Wels 203-209 the claims are registered in the names of the claim stakers.

The property claims are located in the Traditional Territory of the White River First Nation.

In accordance with the Yukon Quartz Mining Act, yearly extensions to the expiry dates of quartz claims requires conducting \$100 of work per claim per year or paying the equivalent cash in lieu of work. A \$ 5 filing fee per claim year also applies to all work filed for assessment.

Exploration work is subject to the Mining Land Use Regulations of the Yukon Mining Quartz Act and to the Yukon Environmental and Socio-Economic Assessment Act (YESAA). Because the White River First Nation is an unsettled First Nation, a Class 1 Notice is required before any exploration work is conducted (OIC 61 April 1, 2013). Gorilla operated in 2015 under a Class I Notice valid to August 8, 2015. A Class 3 Mining Land Use Permit will be required.

The Wels Gold Property is not encumbered by First Nations Land Claims. The White River First Nation (WRFN) has a number of Site Specific and category B land selections in the area. WRFNR-8B is a large block that fringes the southwest side of Wels Gold claims. There are three other category B land selection on the north and west shores of Wellesley Lake and three small site specific selection on the south shore of Wellesley Lake.

Gorilla Minerals Corp has met and consulted with WRFN representatives and signed a mining exploration agreement for the Wels Gold Property for Class 1 activities which included all work recommended for the 2015 exploration season.

The claim block abuts on the south side with WRFN withdrawn lands Category B parcel (WRFN R-8B), shown in Figure 2.

There are no outstanding environmental liabilities associated with the property. As determined by the author. There are currently three plywood tent floors at camp site, two drill pads and one core logging platform at the drill site. The drilling equipment was left onsite as well as 5 stacks of core boxes. All trenches except the east-west high grade Trench 2, were reclaimed in 2015.

4.0 ACCESSIBILITY, CLIMATE, LOCAL RESOURCES, INFRASTRUCTURE AND PHYSIOGRAPHY

The Wels Gold Property is located approximately 50 Kilometers east of Beaver Creek and approximately 325 km NW of Whitehorse. It is 190 kilometers from helicopter bases in Dawson City and Carmacks, Yukon. The Property is located on map sheets NTS 115J/05 (Figure 1). The closest staging point is the abandoned Snag airstrip 25 km off the Alaska Highway on the north side of the White River; which is 25 km directly to the west of the Saddle zone. All mobilization and demobilization except direct flights from Dawson, Carmacks or Whitehorse is directly from the staging area to the property at the

specific request of Dave Dickson the local outfitter. Helicopter pilots are instructed to not fly over Wellesley Lake at the request of the lodge owner at Kluane Wilderness Lodge.

Topography in the region is characterized by a north trending ridge and a series of south trending ridges and valleys.

2009). The most current geology for the Wellesley Lake area is shown on the Yukon Bedrock Geology Map (YGS Open File 2001-1 and 2006-1). The most recent update published on March, 2015, incorporates the most recent mapping by Murphy and others.

The Geological Survey of Canada has flown a regional (1/2 mile line spacing) aeromagnetic survey over the area. Results show a dominant arcuate northerly trend. Canil and Johnston (2003) interpret this arcuate aeromagnetic high that trends through the Wels Gold as an ophiolite belt. The property area is also on GSC Airborne EM and magnetometer survey YYGS Open File 2009-2.

The Wels Gold Property was staked based on information first published in 2006 that reported on a 2001 mineral assessment panel review, followed by one day of field work by YGS geologists in 2002. The field work consisted of a single day helicopter-assisted site visit by a four person geological team. Traverses by the team covered a regional high – low magnetic anomaly and investigated geology on ridge tops supplemented by stream, rock and soil geochemistry. The assessment was primarily done to gather data on a proposed Special Management Area requested by the White River First Nation.

The YGS mineral assessment crew sampling located spot soil anomalies (including an analytical duplicate) returning between 33.5 and 56.7 ppb gold. Seven samples returned between 65.3 – 210.3 ppm arsenic and five samples contained 5 – 41.9 ppm antimony. Soil sampling in 2002 noted that most float consisted of quartzite, siltstone, chert, and 'brown weathered intrusive' at two stations. Both of these 'brown weathered intrusive' samples are highly anomalous in arsenic and one sample contained 56.7 ppb Au and 12.5 ppm Sb suggesting an intrusive and anomalous gold-arsenic-antimony connection.

The results of the mineral assessment were published in 2006, (Stroshein and Hulstein, 2006).

2011 YMIP 2011-046

Hulstein and Andersen staked the Wels 1-88 claims in March, 2011 based on the 33 and 56 ppb Au anomalies located along the ridge and associated arsenic and antimony anomalies in creeks draining the same area.

On June 6, 2011, Gorilla Resources Corp. optioned the claims from Hulstein and Andersen and conducted reconnaissance grid soil sampling (684 auger soils, 200 m x 100 m) over the claims. This produced three distinct Au, As, Sb anomalies along the ridge, Stroshein 2012.

2012 YMIP 2012-24

Gorilla Resources Corp. added the Wels 88-137 claims in March 15, 2012 on the north and east sides of the Wels Gold Property after receiving positive soil sample results in 2011. Infill soil over the sampling and grid extension to the west. Infill sampling of 892 Soil samples (to 100 m x 50 m sample spacing) over the central part of the 2011 sample grid.

One hand trench (Trench A) was dug, three soils collected from the trench bottom returned 5204, 3740 and 1984 ppb Au. After the soil sample results were received, a single rock sample returned 4.9 oz/t Au (Doherty, 2013)

2013 YMIP 2013-064

Resample Trench A

Analyses from 5 rock samples collected from Trench A returned an average grade of 19 gm/t Au, (Doherty 2014a).

2014 YMIP 2014-006

Airborne geophysical survey (Magnetic and Radiometric) by Precision Geosurveys Ltd, over a 3.5 by 3.3 km area

Trenching, 155.5 m of mechanized trenching in four trenches centered over Trench A on the Saddle Zone gold anomaly. Trench 2 returned a weighted assay of 8.8 gm/t Au over 45.0 m (Doherty 2014b).

Reconnaissance sampling was completed on the North Ridge and Southwest Spur Zones. Anomalies were confirmed but no granite outcrop was recognized.

Age date on intrusion 100.94 ± 0.04 Ma (D. Murphy and J. Crowley, pers. comm.).

There are no historical mineral occurrences or prior exploration on the Wels Gold Property before it was staked in 2011. There is no record of any prior documented exploration or staking in the immediate area of the claims.

Gorilla Minerals Corp. has analyzed a total of 1690 grid soil samples and 493 rock samples and from the Wels Gold Property from 2011 to 2015.

The trenches were excavated with a Can-Dig hoe. Dimensions were approximately 50 cm wide by up to 1.5 m deep. The trenches were not backfilled until 2015 but wintered very well with little collapse and only minor infilling (5-10%). All trenches except Trench 14-2 and Trench A were backfilled and reclaimed in 2015.

6.0 GEOLOGICAL SETTING AND MINERALIZATION

6.1 Regional Geology

The Wels Gold Property lies within a complex, poorly understood area underlain by rocks of Yukon-Tanana terrane (YTT); displaced North American Basin Terrain (Nab) comprising

trenches located thin very hard dark grey mafic dykes with olivine and pyroxene phenocrysts.

In drill core, there is obvious Fe-Oxide weathering and staining associated with fractures and as patchy alteration areas extending to approximately 25 m depth. The alteration is typical of the reduced intrusion related gold systems (i.e. Dublin Gulch, Red Mountain, Scheelite Dome, Clear Creek, Ida-Oro). Thin vitreous

The reduced intrusion related gold deposit model is one of intrusive hosted gold genetically related to porphyritic granite to quartz monzonite stocks and composite plutons, generally intruded into stable Proterozoic cover. The Wels Gold project is well out board of any similar deposits in the Yukon all northeast of the Tintina fault.

Several features are common to most deposits. They are: hosted in metaluminous, sub-alkaline intrusions of intermediate to felsic composition; display strong carbonate alteration by carbonic hydrothermal solutions; are sulphide deficient; gold is associated with sheeted quartz veins and stockworks; sulphides present are pyrite, pyrrhotite, arsenopyrite, and occasionally bismuthinite and stibnite associated with the veins. Total sulphide content rarely exceeds one percent.

Mineralization is primarily within quartz veinlets, veins, and shears within the intrusive although gold is also found in the country rock metasediments in a number of occurrences (Red Mountain, Dublin Gulch). Associated minerals are molybdenite, scheelite, arsenopyrite, pyrite, bismuthinite and rarely tetradymite ($\text{Bi}_2\text{Te}_2\text{S}$).

Generally, small amounts of potassium feldspar, sericite, and or clay minerals are found as thin selvages adjacent to the mineralized quartz veins. Post mineral veins consist of calcite, calcite-quartz, and clay.

Work and data to date combined with the trench sampling in 2014 clearly show that the Saddle Zone mineralization is of the reduced intrusion related type and in the author's opinion is very similar to the Red Mountain and Dublin Gulch deposit and others in the belt. The location of the intrusion is well to the south of any known reduced intrusion related deposit on the southwest side of the Tintina Fault (Fort Knox and Pogo). A sample of the intrusion from the Saddle Zone produced a U/Pb date on zircon at 100 ± 0.4 Ma.

One sample of granite was submitted for thin section and the rock is a true granite but of more interest is the presence of Rapikivi textured feldspars which have not been reported in this deposit type. Current thinking invokes either magma mixing or magma decompression as the cause of the rare Rapikivi Texture. Further work is required on the Wels Gold Property to further define and document this new high grade high grade mineralization.

8.0 EXPLORATION

8.1 Introduction

The Wels Gold property has been worked each season since 2011. The soil sampling programs 2011 and 2012 clearly outlined three anomalous areas (Au, As, Sb, Bi) named the Saddle, North Ridge and Southwest Spur anomalies. Since 2012, most work, except for three days of re-sampling soil anomalies on the North Ridge and Southwest Spur, has focused on the Saddle Zone within a 100 by 100 m area, over the center of the Saddle soil anomaly.

Work in 2015 consisted of some 90 m of follow up trenching on three spot gold anomalies just outside the 2014 trenched areas, followed by 442 m of NTW core drilling in 5 holes from two drill pads. All prior work is documented in a NI 43-10 report (Doherty, 2014).

A hand held XRF gun was used to measure As values in trenches and selected samples were crushed and panned. Trench 15-1 to the west of the 2014 trenches returned visible gold in panned concentrate and based on this result, a second drill fence was selected and located 65 m west of the first drill fence. Analytical results from Trench 15-1 returned 556 ppb Au over the 30 m trench including 3 samples 1.5 m long each returning greater than 1 gm/t Au. Significant trench intercepts are plotted in Figure 7 and trench logs are found in Appendix B. Analytical Certificates are provided in Appendix C.

Property work in 2015 was started on June 3 and completed on June 22, 2015. A small helicopter supported camp was located above the Saddle zone. Adrian Smith, P.Geo

and panned to inspect for visible gold. Trench 15-3 located over a 692 ppb gold anomaly showed visible gold from the panned sample and anomalous Arsenic using the XRF Gun. Based on this result, a second drill pad was located 60 m to the west of the firsts drill pad. Drill holes collared at each pad were drilled both to the north under the center of the 2014 trench result of 8.8 g/t over 40 m and to the south to intersect an interpreted parallel mineralized zone approximately 30 m to the south of Trench A. Drill holes were inclined at dips of -45, -50 and -75. Drill collar locations, azimuths and dips are provided in Table 2.

Table 2. Wels Gold 2015 Drill Collars

A drill plan is provided in Figure 0

In core, increasing alteration with veining and pyrite and arsenopyrite on vein selvages and disseminated in the alteration halo near veins $\pm$ visible gold, best correlates with mineralized sections. Although evidence of minor faults are found near some intercepts, there is not a clearly defined fault zone intersected on the drill fences but rather a number of smaller possibly en-echelon faults within a broader fault/fracture zone.

Selected intercepts from the drilling program are shown in Table 3.

All drill holes intersected anomalous to ore-grade mineralization.

10.0 SAMPLE PREPARATION, ANALYSIS AND SECURITY

Rock samples were collected either as 1.5 m continuous trench intervals from either the bottom, sides and in some cases from the windrow of excavated material at the side of the trench.. Samplers weighed each sample to maintain a sample weigh of 5 kg per 1.5 m interval to submit a sample of similar size to HW core samples from similar deposit types.

Core samples were collected by splitting core in 1.5 m intervals.

Rock samples were prepared by crushing either 250 gm or 500 gm (for selected samples) to 70% passing 10 mesh (2mm), sample is then homogenized, riffle split and pulverized to 85 % passing 200 mesh (75 µm). Crusher and pulveriser only are cleaned by brush and compressed air between routine samples. Granite /Quartz is crushed and pulverized as first sample in sample sequence and carried through to analysis. Prepared sample (30 gm) is digested with a modified Aqua Regia solution of equal parts concentrated HCL, HNO₃ and Distilled H₂O for one hour in a heating block or hot water bath. Sample splits of 0.5 gm are analysed with ICP-MS analysis for Au and 35 additional elements.

A commercially prepared standards CDN-GS-1PC was submitted for every ten samples for most of the core samples.es.

Core is initially analyses using Bureau Veritas Aq202 ICP-MS Packge Rock samples returning >1000 to 9900 ppb and for 1>10000 ppb by ICP-MS methods will be rerun by Fire Assay by FA430 for 1000-9999 ppb results and by FA530 Metallic screen Assays for samples returning >10000ppb Au.

The author has relied upon the internal quality control procedures employed by Acme Analytical Laboratories Ltd. that includes periodic duplication of sample analysis as standard operating procedures. The author also examined the assay certificate results to ensure consistent reported values to ensure that there are no notable outliers in the results. The soil sample results show dispersion of the elements around peak high values.

The quality control measures by Gorilla Minerals Corp. on the property are sufficient to meet the standards as set out in National Instrument 43-101. It is the Author's opinion that the sample collection, preparation, transport, security and analytical procedures for work conducted on the Wels Gold Property during the 2011-2014 seasons, meet the standards as set out in National Instrument 43-101.

11.0 DATA VERIFICATION

In examining and verifying the sample data for this report, the Author performed the following tasks:

The soil sample Analytical Certificates were reviewed and checked against sample database for accuracy and against geochemical plots for location accuracy. The range of reported results and their geographic distribution were checked against the geochemical plots.

The author conducted and supervised field work on the Wels Gold Property in 2013-2015. Field duplicates, standards and blanks were submitted in the sample chain to monitor sampling and laboratory results.

Soil sampling provides an indirect indication of underlying mineralization that is adequate for regional scale exploration and detailed investigations and only hindered by local areas of permafrost or low marshy areas. The density of reconnaissance sampling has proven effective with the discovery of multi-element anomalies. The analytical data has been reliable at highlighting potential mineralization.

12.0 INTERPRETATIONS AND CONCLUSIONS

The 2015 drilling program on the Wels Gold property confirmed that mineralization is of the reduced–intrusion related gold model.

Mineralization is localized along a through going east - west brittle structural trend that was first noted on air photos. Fractured and slickensides in bedrock in trenches and obvious fracture controlled sheeted veins and minor fault zones in drill core confirm the structural interpretation.

Drilling confirms a steeply dipping fracture fault control on veining but no major structure has been intersected. A number of small scale faults were intersected in core but indications of parallel structure south of the main mineralized zone are apparent in drill core. Fracturing, veining and mineralization at the bottom of both south dipping holes, DDH15-3 and DDH 15-5 cut minor fracturing with clay, slickensides, broken core and veining at the end of both the south dipping holes, suggesting more faulting and mineralization may be found south of the current drill fences.

Mineralized intercepts in the north dipping drill holes indicate that the mineralizing veins have a strike of 110° with a steep south dip.

The property is an excellent exploration target based on exploration results to date and only a small 100 m by 100 m area has been tested by trenching and drilling within a large 1000 m by 350 m wide soil anomaly covering the Saddle. The property warrants an aggressive well planned exploration program for the 2016 exploration season.

The mineralized zone is located entirely within the granite, associated with an increase in iron oxide staining, and with micro-quartz veining in trenches and in core.

There is a coarse gold or “Nugget Effect” confirmed by screened metallic assays and also by inspection of panned concentrates from lab crushed rejects. The nugget affect and higher grades in trench sampling vs core sampling suggest that there may be a mechanical weathering effect increasing gold grades at surface.

13.0 RECOMMENDATIONS

A track mounted RC rig should be considered to collect larger samples for analyses. RC drilling may be more cost effective but savings may well be offset by the requirement to fly all fuel and gear to the property.

Reconnaissance exploration should continue on the North Ridge and Southwest Spur Zones. Mapping and prospecting on these zones and the entire claim block should be completed.

Oriented core should be considered for future core drilling in order to fully define the structural attitude of the sheeted veins in the mineralized zone.

Continued drilling is recommended.

R. Allan Doherty, P. Geo

15. CERTIFICATE

To Accompany the Report title:
"YMEP 2015-083 REPORT, Core Drill Program, Trenching and Reclamation Work
Saddle Zone, Wels Gold Property, Whitehorse Mining District, Yukon, Canada.

For
Gorilla Minerals Corp. dated December 4, 2015

I, R. Allan Doherty, hereby certify that:

1. I reside at 106A Granite Road, Whitehorse, Yukon, Y1A 2V9.
2. I am a graduate of the University of New Brunswick, with a B.Sc. Degree in Geology (Honours, 1977). I have been involved in geological mapping and mineral exploration primarily in the Yukon continuously since 1980.
3. I am a member in good standing of the Association of Professional Engineers and Geoscientists of the Province of British Columbia, Registration No. 20564, and have been registered as a Professional Geologist since 1993.
4. I am the owner of Aurum Geological Consultants Inc., a firm of consulting geologists and I am authorized to practice professional geology by The Association of Professional Engineers and Geoscientists of British Columbia.
5. I am a "Qualified Person" as defined in Sec 1.2 of National Instrument 43-101.
6. I am independent of the Issuer, and I am the author of this report on the 2015 exploration program. The report is based on a review of all prior work and data prior to a first property visit in 2013 and a work program August 25 to September 2, 2014 and this drilling program June 9-22, 2015.
7. I am not aware of any material fact or material change with respect to the subject matter of this technical report, which is not reflected in the technical report; where such omission to disclose makes the technical report misleading.
8. Neither I, nor any affiliated entity of mine, is at present, under an agreement, arrangement or understanding or expects to become, an insider, associate, affiliated entity or employee of Gorilla Minerals Corp., any associated or affiliated entities.
9. Neither I, nor any affiliated entity of mine own, directly or indirectly, nor expect to receive, any interest in the properties or securities that may be issued by Gorilla Minerals Corp, or any associated or affiliated companies.

10. Neither I, nor any affiliated entity of mine, have earned the majority of our income during the preceding three years from the current claim holders or any associated or affiliated companies.
11. I have read NI 43-101 and Form 43-101F1 and have prepared the technical report on the Wels Gold property in compliance with NI 43-101 and Form 43-101F1; and in conformity with generally accepted Canadian mining industry practice, and as of the date of the certificate, to the best of my knowledge, information and belief, the technical report contains all scientific and technical information that is required to be disclosed to make the technical report not misleading.

R. Allan Doherty, P. Geo.

PHONE (604) 253-3158

Client: **Gorilla Minerals Corp.**
1177 West Hastings Street
Suite 2000
Vancouver BC V6E 2K3 CANADA

Submitted By: Scott Sheldon
Receiving Lab: Canada-Whitehorse
Received: June 25, 2015
Report Date: August 21, 2015
Page: 1 of 4

CERTIFICATE OF ANALYSIS

WHI15000039.2

CLIENT JOB INFORMATION

Project: WELS GOLD
Shipment ID: WG-15-01
P.O. Number
Number of Samples: 69

SAMPLE DISPOSAL

RTRN-PLP Return
PICKUP-RJT Client to Pickup Rejects

Bureau Veritas does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

Invoice To: Gorilla Minerals Corp.
1177 West Hastings Street
Suite 2000
Vancouver BC V6E 2K3
CANADA

CC: Al Doherty

SAMPLE PREPARATION AND ANALYTICAL PROCEDURES

Procedure Code	Number of Samples	Code Description	Test Wgt (g)	Report Status	Lab
PRP70-250	65	Crush, split and pulverize 250 g rock to 200 mesh			WHI
SPTRF	12	Split samples by riffle splitter			WHI
AQ202	69	1:1:1 Aqua Regia digestion ICP-MS analysis	30	Completed	VAN
FA430	14	Lead Collection Fire - Assay Fusion - AAS Finish	30	Completed	VAN
FA530-Au	1	Lead collection fire assay fusion - Grav finish	30	Completed	VAN

ADDITIONAL COMMENTS

Version 2: AQ202 data for Sample 582801 revised/FA430 & FA530 included.

This report supersedes all previous preliminary and final reports with this file number dated prior to the date on this certificate. Signature indicates final approval; preliminary reports are unsigned and should be used for reference only. All results are considered the confidential property of the client. Bureau Veritas assumes the liabilities for actual cost of analysis only. Results apply to samples as submitted.
*** asterisk indicates that an analytical result could not be provided due to unusually high levels of interference from other elements.

CC: Al Doherty

SAMPLE PREPARATION AND ANALYTICAL PROCEDURES

Procedure Code	Number of Samples	Code Description	Test Wgt (g)	Report Status	Lab
PRP70-250	63	Crush, split and pulverize 250 g rock to 200 mesh			WHI
SPTRF	26	Split samples by riffle splitter			WHI
AQ202	70	1:1:1 Aqua Regia digestion ICP-MS analysis	30	Completed	VAN
FA430	4	Lead Collection Fire - Assay Fusion - AAS Finish	30	Completed	VAN

ADDITIONAL COMMENTS

Version 2: FA430 included.

This report supersedes all previous preliminary and final reports with this file number dated prior to the date on this certificate. Signature indicates final approval; preliminary reports are unsigned and should be used for reference only. All results are considered the confidential property of the client. Bureau Veritas assumes the liabilities for actual cost of analysis only. Results apply to samples as submitted.
*** asterisk indicates that an analytical result could not be provided due to unusually high levels of interference from other elements.

CERTIFICATE OF ANALYSIS

WHI15000041.1

CLIENT JOB INFORMATION

Project: WELS GOLD
Shipment ID: WG-15-01
P.O. Number
Number of Samples: 49

SAMPLE DISPOSAL

RTRN-PLP Return
PICKUP-RJT Client to Pickup Rejects

Bureau Veritas does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

Invoice To: Gorilla Minerals Corp.
1177 West Hastings Street
Suite 2000
Vancouver BC V6E 2K3
CANADA

CC: Al Doherty

SAMPLE PREPARATION AND ANALYTICAL PROCEDURES

Procedure Code	Number of Samples	Code Description	Test Wgt (g)	Report Status	Lab
PRP70-250	45	Crush, split and pulverize 250 g rock to 200 mesh			WHI
SPTRF	12	Split samples by riffle splitter			WHI
AQ202	49	1:1:1 Aqua Regia digestion ICP-MS analysis	30	Completed	VAN

ADDITIONAL COMMENTS

This report supersedes all previous preliminary and final reports with this file number dated prior to the date on this certificate. Signature indicates final approval; preliminary reports are unsigned and should be used for reference only. All results are considered the confidential property of the client. Bureau Veritas assumes the liabilities for actual cost of analysis only. Results apply to samples as submitted.
*** asterisk indicates that an analytical result could not be provided due to unusually high levels of interference from other elements.
