SUMMARY

The RC Property (the "Property") consists of 132 quartz mining claims (RC, BEE and BOP claim groups) located in the Dawson and Mayo Mining Districts. A newly constructed gravel access road to Big Creek has significantly improved access to the southern portion of the Property.

The Property lies within the Tombstone Gold Belt where Fort Knox style mineralization is known to be associated with Tombstone Suite intrusions (Hart, et.al. 2002). The headwaters of Clear Creek a historically significant placer gold bearing creek, and Big Creek drain from the property. Recent prospecting (Coe, 2017) has discovered gold mineralization in quartz veins related to the Big Creek Stock, within the Property.

The Property is underlain by metasedimentary rocks of the Yusezyu Formation of the Upper Proterozoic to Cambrian Hyland Group. These have been intruded by the Tombstone-aged (Mid-Cretaceous) Big Creek diorite stock. The area also covers the drainage of a historic Minfile occurrence where mineralized samples collected by Murphy and Heon assayed 377 ppb Au and 478 ppm Mn from a quartz vein, 435 ppb Au, 72 ppm Bi, 88 ppm As, 15.3 ppm Ag, 242 ppm Pb and 303 ppm W from a vein and associated disseminated mineralization and 20 ppb Au and 789 ppm As from a breccia sample (Minfile occurrence 115 061, BIG). Initial reconnaissance prospecting on the property identified quartz monzonite and quartz vein float assaying 115 and 244 ppb Au respectively (Coe, 2017).

In 2017, Pacific Ridge Resources optioned the Property and carried out a program of prospecting, mapping, soil sampling and a small geophysical program. The program defined four priority target areas defined by multi-element soil geochemical anomalies supported locally by mineralized grab samples of float and bedrock (Carlson, 2017).

In 2018, Pacific Ridge carried out a program of prospecting, mapping, soil sampling and a small geophysical program. The program further defined the four priority target areas identified by multi-element soil geochemical anomalies supported locally by mineralized grab samples of float and bedrock in 2017 (Carlson, 2018). Pacific Ridge terminated its option on the Property in December, 2018.

Sitka Gold Corp. optioned the Property in mid-2019 and conducted further soil sampling, geological mapping, prospecting and extended the geophysics IP survey lines done in 2018.

The 2019 follow-up program, described in this report, included two lines of reconnaissance Induced Polarization (IP) geophysical surveying that extended the 2018 IP lines, soil sampling and additional prospecting and geological mapping.

The IP survey, supported by surface mapping and sampling, suggests that the Far Grid and Big Creek anomaly could represent intrusive related gold mineralization associated with sheeted veins and stockworks adjacent to the Rhosgobel and Big Creek stocks (Carlson, G., 2018). Drilling is recommended to test this mineralization at depth.

INTRODUCTION

The RC Project (the "Property") consists of the 100 RC quartz mining claims and the 24 BEE quartz mining claims located in the Dawson Mining District and the 8 BOP quartz mining claims located in the Mayo Mining District. This report discusses the results of a surface exploration program carried out on the Property during August 2018.

The Property covers a target area that includes the Big Creek Stock and historic plus recent anomalous gold occurrences. In 2017, Pacific Ridge Exploration Ltd. ("Pacific Ridge") optioned the RC claims from Fox Exploration Ltd. At the same time, Pacific Ridge optioned the adjoining BEE and BOP claims from Mr. William Mann. The Property has seen relatively little documented exploration activity, yet it adjoins two other highly explored properties: Clear Creek, now owned by Victoria Gold Corp. lies on the west and Mahtin, owned by Strikepoint Gold Inc., lies on the east. In 2017 and 2018, Pacific Ridge completed a preliminary prospecting, geological mapping and soil geochemical program on the Property. In late 2018, Pacific Ridge terminated its option on the RC Property.

In 2019, Sitka Gold Corp. ("Sitka") optioned the RC Property from the underlying owners and conducted a follow-up exploration program including additional geological mapping, prospecting and soil geochemical sampling, plus a 2.2 km reconnaissance IP program that extended the IP lines completed in 2018. The program was designed to extend the existing mapping and soil geochemistry around the targets defined by the 2017 and 2018 exploration programs and, with the Induced Polarization geophysical survey, to close off high chargeability anomalies that were identified from the geophysics done in 2018 plus extend the lines to the southern claim boundary to test for disseminated sulphide mineralization at depth that could be related to Fort Knox style mineralization. The soil survey and camp support were provided by Fox Exploration Ltd. ("Fox").

Total expenditures for the program are $155,667.09 The following report describes and interprets the 2019 field program which was carried out over the Property during the period from July 6th to August 11th, 2019.

PROJECT LOCATION

The RC and BEE claim groups, comprising the majority of the RC Property, are in the Dawson Mining District in the Yukon, approximately 120 kilometres east of Dawson City. The property is located on NTS map sheet 115P14 and centered at latitude 63o 50' 00" N and longitude 137o 00' 45" W, or UTM coordinates 401,000 E and 7,080,000 N (NAD 83, Zone 8) (Figure 1).

ACCESS

Access to the Property is via Highway 2, the Klondike Highway, for 425 km north and west from Whitehorse or 100 kilometers east from Dawson to the Clear Creek road. At this point, turn to the northeast along Clear Creek road for 33 km where the road meets the Left Fork of Clear Creek. To the right, follow the Left Fork of Clear Creek downstream and then upstream on the Right Fork to the southern part of the Property along the new Big Creek road. The camp 1 site from the 2017 field program is located 25 km along this route. To the left, up the Left Fork of Clear Creek, Camp 2, used for both the 2017 and 2018 field programs (with permission from Victoria Gold Corp., on whose claims the camp site lies), is a further 10 km, just beyond the placer camp of Nels Harper. Roads beyond Camp 2 provide access to the western portion of the Property (see Figure 3).

Figure 1 - RC Gold project location

PROJECT DESCRIPTION

The Property consists of three contiguous claim groups acquired under two option agreements, including the RC 1 to 100 claims in the Dawson Mining District owned by Fox Exploration Ltd., the BEE 1 to 24 claims in the Dawson Mining District owned by William Mann ("Mann") and the BOP 1 to 8 claims in the Mayo Mining District owned by Mann (Table 1 and Figure 2).

The Company has the right to acquire a 100% interest in the BEE and BOP claims from William Mann, a veteran geologist with a lifetime of experience working and prospecting in the Yukon, by paying $100,000, issuing 500,000 Sitka shares and completing $630,000 in exploration work over 5.5 years. Sitka will pay an additional bonus of $250,000 in cash, shares or any combination thereof, at Sitka's option, upon receiving a resource calculation of at least 1.0 million ounces of gold in any category

within the RC Gold Property. The BEE and BOP claims are subject to a 2% NSR, half of which can be purchased for $2,000,000.

The Company has the right to acquire a 100% interest in the RC claims from Fox Exploration Ltd. ("Fox") by paying $300,000, issuing 1,500,000 shares and completing $1,870,000 in exploration work over 5.5 years. Sitka will pay an additional bonus of $250,000 in cash, shares, or any combination thereof, at Sitka's option, upon receiving a resource calculation of at least 1.0 million ounces of gold in any category within the RC Gold Property. The RC Claims are subject to a 2% NSR, half of which can be purchased for $2,000,000.

The Company also staked 28 new claims that are contiguous with the claim block and cover additional highly prospective ground. This brings the total number of claims at the RC Gold Property to 132 covering an area of approximately 2600 hectares (6425 acres).

YD61309-YD61332	Bee 1-24	William Mann - 100%	16-Oct-23

PHYSIOGRAPHY AND CLIMATE

The Property covers moderate terrain, with elevations ranging from 1200 metres to 1,600 metres. Much of the property extends above tree line and is covered by sparse tundra vegetation; ridgelines are covered by talus and felsenmeer with little vegetation. Forest cover on lower slopes consists mostly of black and white spruce. Loess is observed in many areas can mask geochemical responses from underlying bedrock.

The climate is generally dry during the summer months with most precipitation occurring in July and August. Temperatures range from -45° C in the winter months to 30° C in the summer. Snow accumulation begins generally in late September and is mostly melted by mid-May. The regional area was subject to weak glaciation and the surrounding area is known to have accumulations of loess up to 20 metres thick.

PROJECT HISTORY

Placer Mining first began on Clear Creek in the late 1800's and the first quartz claims were staked in the early 1900's. Placer mining has continued to the present, with a dredge operating on Clear Creek from 1943 to 1954 and again between 1981 and 1987.

The first modern hard rock exploration in the area took place in the 1970's, targeting silver, tin and tungsten, metals commonly associated with Intrusion Related Gold deposits. High grade gold-silver and silver-lead-zinc veins have also been prospected.

In the 1990's, exploration shifted to bulk tonnage gold after the discovery of the Fort Knox gold deposit in Alaska, in a similar geological environment. Explorers near the Property included Noranda, Ivanhoe Goldfields, Kennecott and Newmont. These companies carried out geological mapping, geochemical and geophysical surveys and several campaigns of drilling. More recently, in the 2000's, Thor Explorations, StrataGold and Golden Predator have explored on the west side of the RC Property, while Ryan Gold (now StrikePoint) explored to the east.

The RC Property area was staked as the Far claims by R. Wongda after a mineralized showing in the area was discovered by Murphy and Heon during 1:50,000 scale geological mapping in 1993. The mineralized samples collected by Murphy and Heon assayed 377 ppb gold and 478 ppm manganese (vein), 435 ppb gold, 72 ppm bismuth, 88 ppm arsenic, 15.3 ppm silver, 242 ppm lead and 303 ppm tungsten (vein, disseminated) and 20 ppb gold and 789 ppm arsenic (breccia) (Minfile occurrence # 115 061; name: BIG).

In 1994, Wongda carried out minor geological mapping and sampling on claims Far 65-70. L. Hart re-staked the showing in December 1994. Thor Explorations Ltd. optioned the Far and other neighbouring claims from Hart. In September 2003 Thor Explorations carried out soil sampling and prospecting on Far claims 31-34, and 51-54 and other neighbouring claims. In 2005 Thor Explorations Ltd carried out an additional reconnaissance exploration program.

In 2010, Bearing Resources acquired the BIG claims centred on the Big Creek Stock and carried out a small soil and rock sampling program. They identified quartz-tourmaline breccia in altered metasediments within the stock, with one grab sample running 2.91 gpt Au taken from several rusty float boulders with quartz-arsenopyrite veining (Mann, 2011).

In 2014, Mann staked the BEE claims and in 2015 carried out a program of rock and soil sampling. In 2017, he added the BOP claim group on the southeast side of the RC claim group.

In August 2016, Fox took three rock grab samples exposed along the newly constructed Big Creek road that cuts across the south side of the Property, one of which returned 180 ppb gold (Coe, 2017). The RC claims were subsequently staked for Fox to cover a target area that includes the Big Creek Stock and historic plus recent anomalous gold occurrences. Brief reconnaissance prospecting on the property in October 2016, identified quartz monzonite and quartz vein float assaying 115 and 244 ppb gold respectively (Coe, 2017).

In 2017, Pacific Ridge carried out a program of prospecting, geological mapping, soil sampling (564 samples) and three short lines of mag/VLF ground geophysical surveying, supported by YMEP Project 17-026. The 2017 mapping program identified quartz-arsenopyrite veining in the Bee grid area. Three grab samples of quartz vein and breccia material from this area ran 0.317 gpt Au (with 4.6 gpt Ag and 3,383 ppm As), 0.511 gpt Au and 0.257 gpt Au (with 3,292 ppm As). A gossan area corresponding to a calc-silicate altered zone of limy metasedimentary rock occurs within the Big Creek stock (Big Creek Anomaly). A grab sample of rusty quartz breccia ran 3.6 gpt gold with 2.6 gpt Ag and 3,938 ppm As. A second grab of similar quartz breccia assayed 1.919 gpt Au with 3 gpt Ag and 769 ppm As.

The soil survey defined four strong geochemical anomalies. The BEE North Au-As-Sb-Bi anomaly may be related to the nearby Contact Zone on the adjacent Clear Creek property. Three grab samples of vein material assayed 0.511 ppm Au, 0.257 ppm Au and 0.317 ppm Au. The BEE South Au-Ag-Sb-Pb-As anomaly is defined by four adjacent gold soil values ranging from 0.227 to 0.998 ppm Au. The linear nature of the anomaly suggests that this anomaly is reflecting the presence of a subcropping gold-silver vein or shear. The Big Creek Au-As-Ag-Cu-W-Pb-Zn anomaly appears to be related to rusty and altered quartz breccia related to pyrrhotite skarn. Gold values of 3.571 ppm and 1.919 ppm Au were returned from two grab samples. The Far Grid Au-Bi-Cu-W-Ag-As-Sb anomaly correlates with and extends an Au-As-Cu anomaly first defined by Thor Explorations (Lueck, 1995). The anomaly has a strike length of over 1 km and is immediately adjacent to the intrusive hosted Juno sheeted vein zone on the Clear Creek property drilled by Kennecott in 1995. The 2017 RC Gold project exploration program successfully defined four strong targets for follow-up exploration. The 2018 program focused on further defining and expanding the Big Creek and Far Grid targets, as well as filling in a previously unexplored area in the central part of the target area.

In 2018, Pacific Ridge carried out a program of prospecting, mapping, soil sampling and a small geophysical program. The program further defined the four priority target areas identified by multi-element soil geochemical anomalies supported locally by mineralized grab samples of float and bedrock in 2017 (Carlson, 2017). Pacific Ridge terminated its option on the Property in December, 2018.

Sitka Gold Corp. optioned the Property in mid-2019 and conducted further soil sampling, geological mapping, prospecting and extended the geophysics IP survey lines done in 2018.

The 2019 follow-up program, described in this report, included two lines of reconnaissance Induced Polarization (IP) geophysical surveying that extended the 2018 IP lines, soil sampling and additional prospecting and geological mapping.

A total of 288 soil and 16 rock samples were collected to infill between two strong gold-in-soil anomalies that were discovered in 2018. The geophysics program entailed two lines of IP surveys to test the southward continuity of chargeability anomalies that were also discovered in 2018. The geochemical infill sampling between the Far Grid and Big Creek anomalies (Figure 1) returned anomalous gold values and suggests that these zones are contiguous, representing an Intrusion Related gold target that is approximately 2 km long by 0.5 km wide. Further soil sampling around the Big Creek East anomaly also expanded and strengthened this drill target (Figure 1). In both cases, the pathfinder elements typically associated with Intrusion Related Gold Deposits were very strong.

REGIONAL GEOLOGY

The Clear Creek property is located within the Selwyn Basin, a sequence of shelf and off-shelf sedimentary and lesser volcanic strata along the margin of the Mackenzie Platform to the northeast (Gordey and Anderson, 1993), deposited from late Precambrian to Triassic time. The environment was predominantly subaqueous, with some episodes of uplift. In the Cretaceous, the Selwyn Basin strata were intruded by the 92 Ma Tombstone Plutonic Suite, forming an arcuate belt of intrusions extending east-southeast from the Fairbanks area across the Yukon. Mayo Suite? A second intrusive suite, the Late Cretaceous - early Tertiary McQuesten suite, extends east-west along the southern margins of the Clear Creek area.

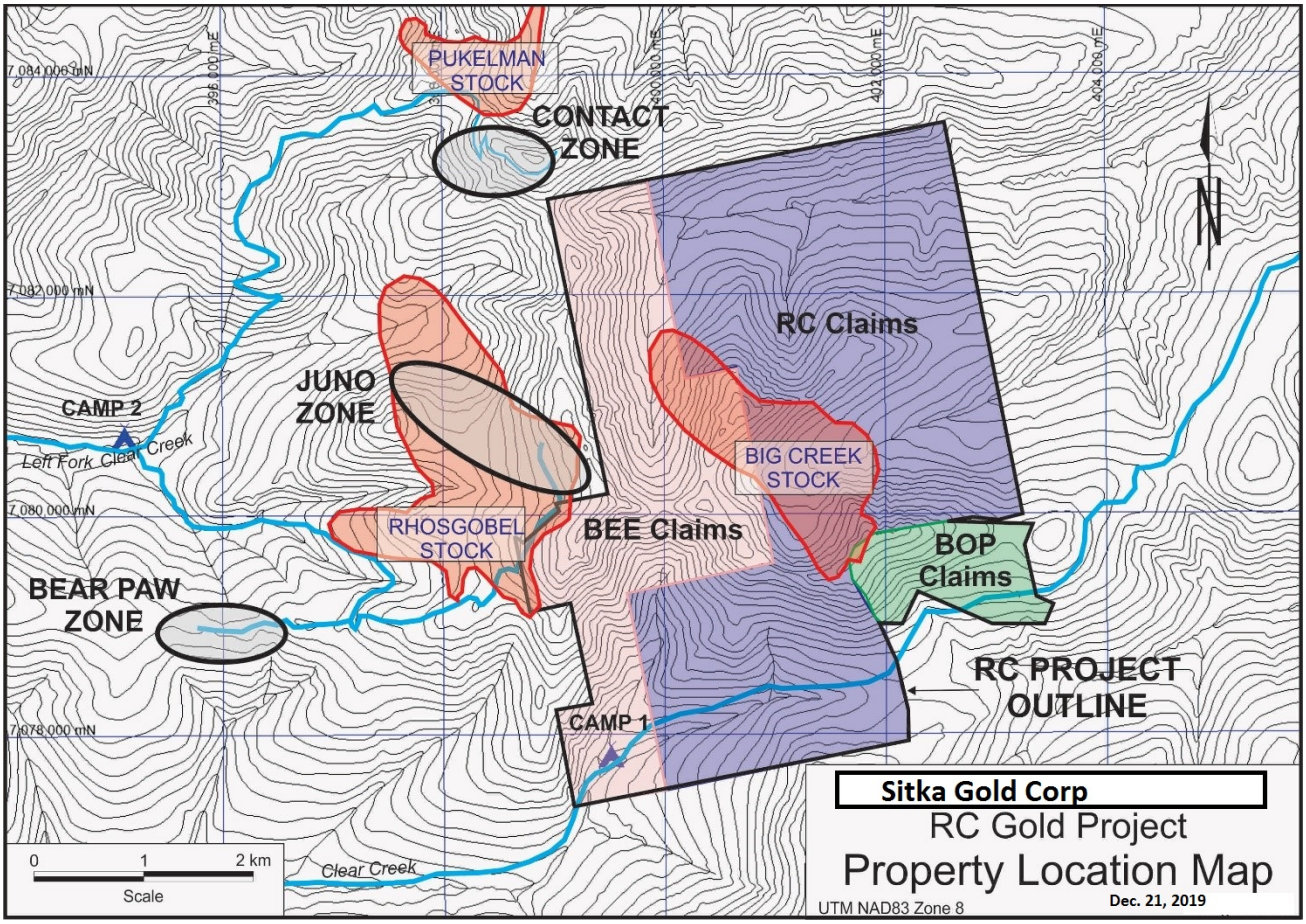

Figure 3 - RC Gold property map showing Tombstone-aged intrusions (red outlines) and mineralized zones (Contact, Juno and Bear Paw) on the adjacent Clear Creek property

The Clear Creek area is underlain by basal Selwyn Basin strata belonging to the Yusezyu Formation of the Upper Proterozoic to Lower Cambrian Hyland Group. Yusezyu Formation sediments consist largely of pelites, psammites, coarse clastic "grits" and quartzites, with lesser limestone and marble, calcareous elastic sediments and chemical and elastic sediments. The "Tombstone Strain Zone", a broad zone of complex deformation, resulting in multi- episodic folding and prominent foliation and lineation development within the sediments, extends roughly east-west just north of the project area (Murphy and Heon, 1996).

Tombstone Suite stocks in the area include the Rhosgobel, Big Creek, Pukelman, Josephine and Eiger stocks (see Figure 3 – Josephine and Eiger stocks are just off the map to the north). The Josephine and Big Creek stocks are dioritic, the Eiger stock is granodiorite and the Rhosgobel and Pukelman stocks are quartz monzonite to granite. The intrusions are surrounded by a broad zone of hornfels. The McQuesten Suite intrusions, including the Vancouver Creek stock, are mostly of biotite-muscovite granite to quartz monzonite, medium to coarse grained and locally porphyritic.

Valley floors are covered by unconsolidated Quaternary sediments.

PROPERTY GEOLOGY

The Property is underlain mostly by Yusezyu Formation metasedimentary rocks exhibiting multi-episodic deformation that results in a pervasive foliation and locally several styles of folding. Areas proximal to the Clear Creek intrusions exhibit hornfelsing and contact metamorphic and metasomatic fabrics. Stephens et. al. (2003) have divided the hornfels aureole into two zones: an inner aureole of contact metasomatism with skarn development, strong foliation and a strong contact metamorphic overprint of biotite-andalusite; and an outer aureole characterized by a contact metamorphic overprint of biotite and andalusite.

The Big Creek Stock underlies much of the southern portion of the RC claim block (Figure 3). A hornfels zone extends more than 200 m from the intrusive contact. Minor limonitic granitic dykes extend up to 500 metres from the stock (Schulze, 2005). It has been suggested that and adjacent intrusions such as Rhosgobel and Pukelman may be related as variously fractionated magma from a single parent source at depth, as they are approximately the same age and occur within a single large halo of hornfels (Schulze, 2005).

MINERALIZATION

The target at RC Gold is an Intrusion Related Gold deposit like Eagle Gold (Victoria Gold), Brewery Creek (Golden Predator) and Red Mountain in Yukon and Fort Knox, True North, Pogo and Donlin Creek in Alaska.

Coombes (1995) reports three styles of mineralization on the adjoining Clear Creek property, including gold-bearing stockwork to sheeted vein zones hosted by felsic to intermediate intrusions and adjacent hornfels zones; auriferous pyrite within fault zones cutting metasedimentary rocks; and scheelite-bearing calc-silicate skarns. The mineralization at Bear Paw on the Clear Creek property (see Figure 2) is mainly breccia hosted with only minor felsic dikes and may be in the cupola zone of an intrusion at shallow depth below the known mineralized zone.

On the Property, a sample of quartz-arsenopyrite veining within brecciated phyllite returning a value of 0.112 opt (3.48 g/tonne) gold was obtained by Bema Industries Ltd. in 1981 near the eastern boundary of the claim block (Schulze, 2005). In the same general area, Murphy and Heon (2006) report a breccia zone where mineralized samples assayed 377 ppb gold, now known as the BIG Minfile occurrence (115 061). Coe (2017) reported quartz vein float along the new Big Creek road with gold values ranging from 115 to 244 ppb.

During the 2017 mapping program, quartz-arsenopyrite veining was observed in the Bee grid area. Three grab samples of quartz vein and breccia material from this area ran 0.317 gpt Au (with 4.6 gpt Ag and 3,383 ppm As), 0.511 gpt Au and 0.257 gpt Au (with 3,292 ppm As). A gossan area corresponding to a calc-silicate altered zone of limy metasedimentary rock occurs within the Big Creek stock (Big Creek Anomaly). A grab sample of rusty quartz breccia ran 3.6 gpt gold with 2.6 gpt Ag and 3,938 ppm As. A second grab of similar quartz breccia assayed 1.919 gpt Au with 3 gpt Ag and 769 ppm As (Carlson, G., 2018).

2019 EXPLORATI0N PROGRAM

On July 7th, 2019 Fox's crew mobilized by truck from Whitehorse to the Camp 1 site (Figure 3) located on the claims next to the newly constructed road from Clear Creek to Big Creek. From July 7th to August

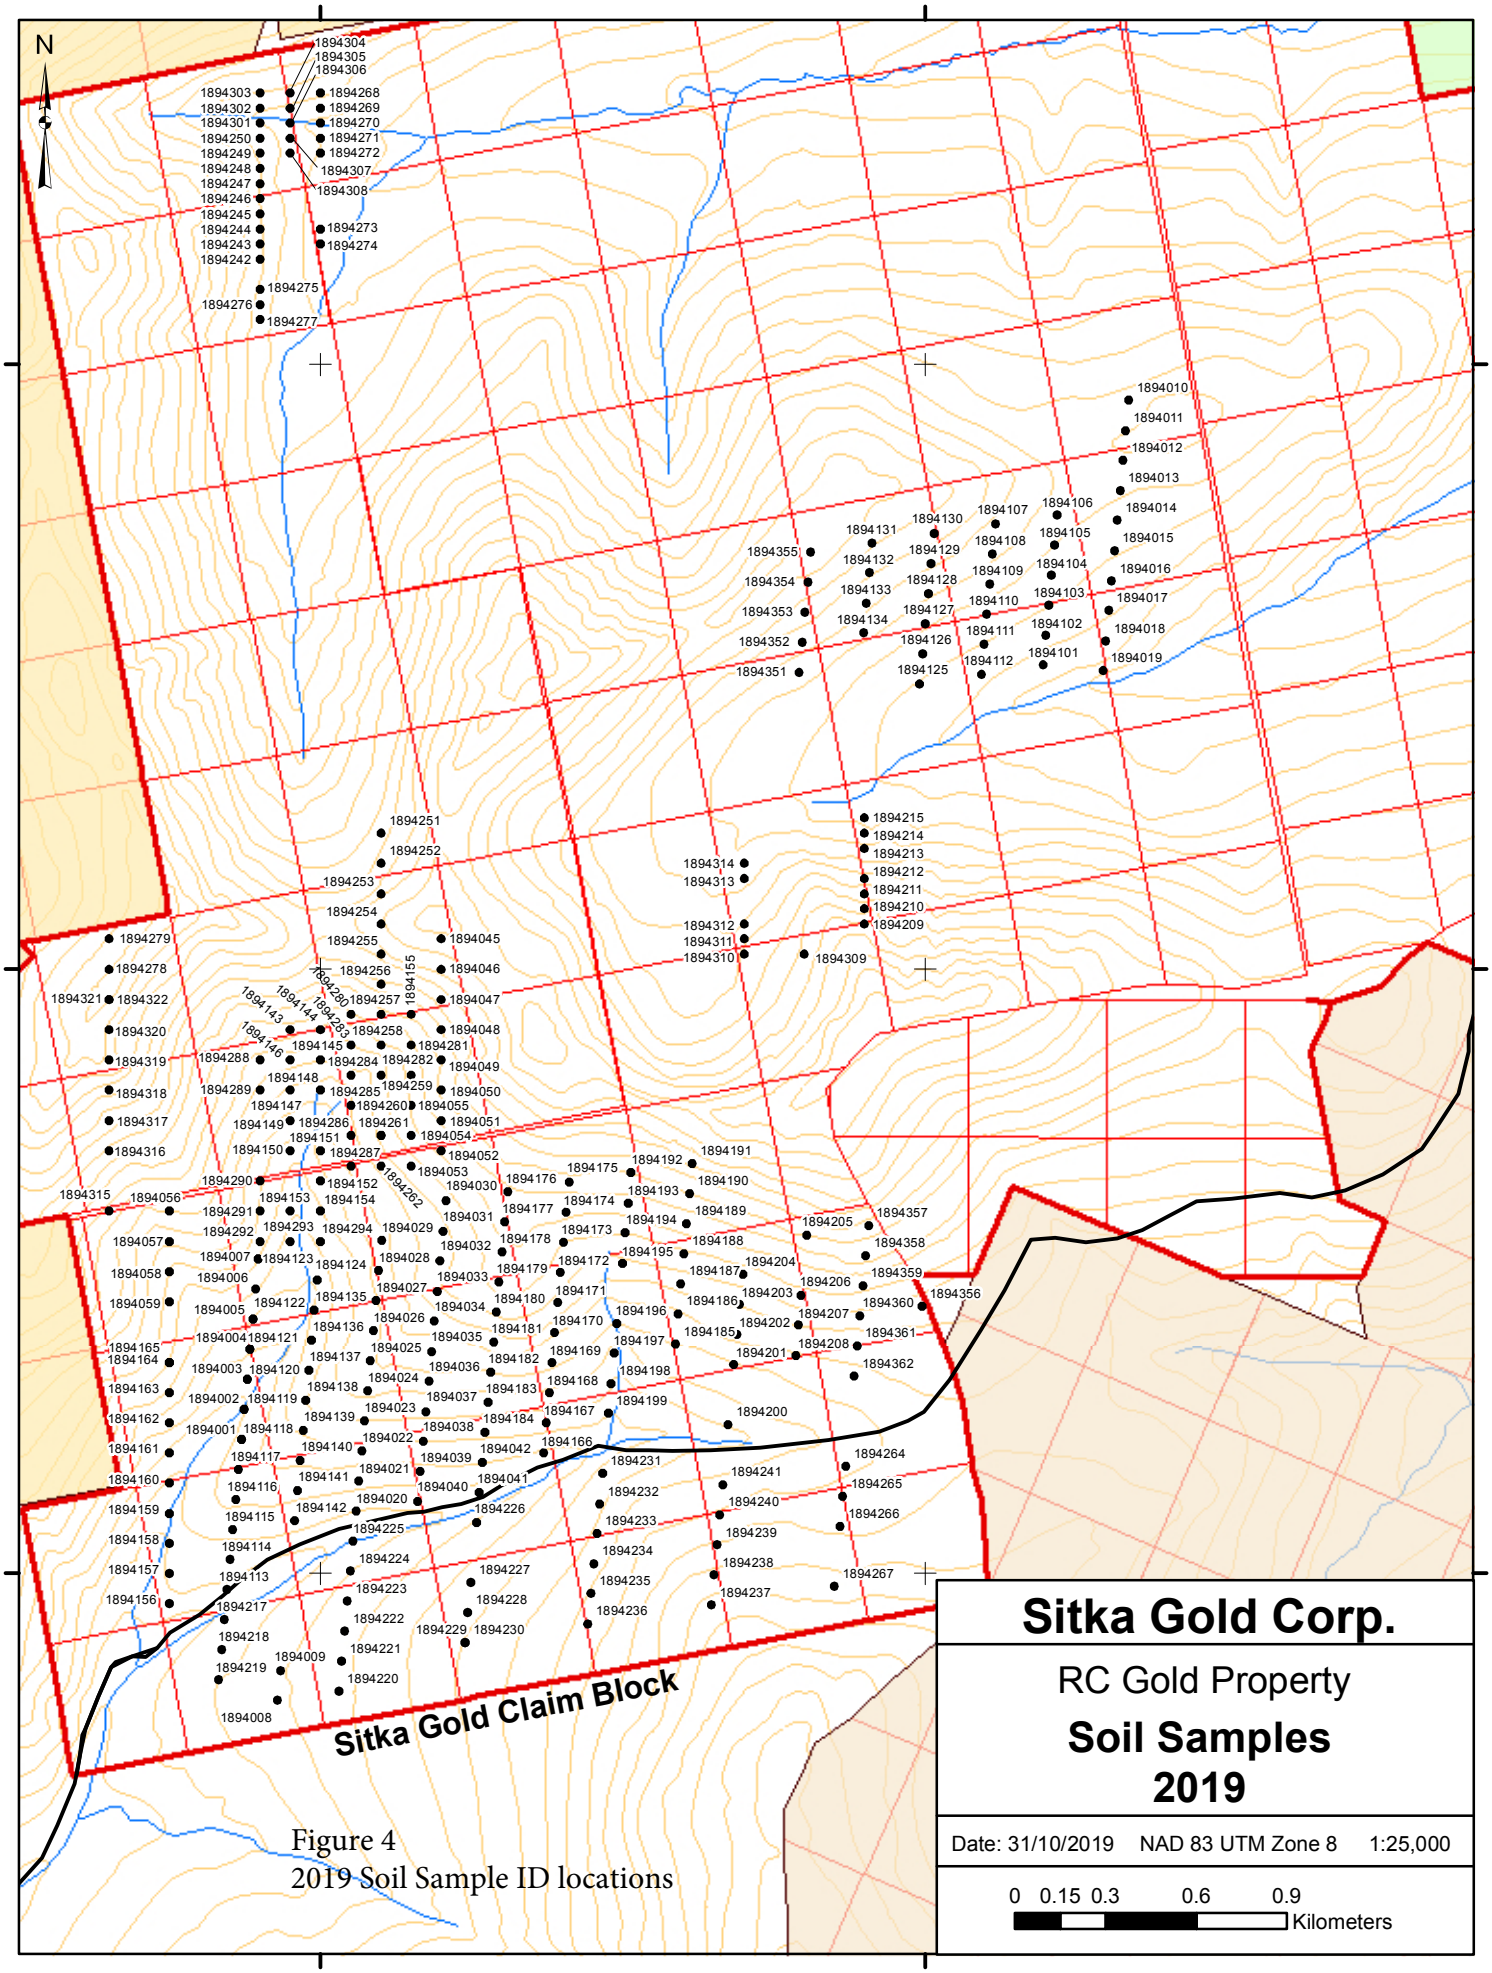

Figure 4
2019 Soil Sample ID locations

In addition to providing camp services and supervising and assisting the SJ Geophysics IP survey, the Fox crew collected 288 soil samples on several 100 m spaced lines at 50 m intervals (see Figure 4)

Four documented traverses were conducted on the property and a total of 16 grab samples were taken (Figure 5 and 6). Table 2 shows the rock sample descriptions and assay results. Sample # 1894456 returned 639.6 PPB gold in a grab sample of diorite with mineralized quartz veining (Figure 7).
SJV Geophysics crew completed two lines of IP surveying, each approximately 1.6 km in length (see Figure 17).

Soil Geochemical Survey

The soil survey was designed to fill in an area of potential mineralization that had not been covered in previous surveys. 288 soils were collected at 50 m spacing on several lines spaced 100 m apart (see Figure 8). Soil sample location information is included in Appendix IV, summary results in Appendix V and Analytical Certificates in Appendix VI.

Sampling Protocol and Data Handling Procedures

A C-Horizon sample is collected using a hand auger at a depth of between 10 cm and 60 cm. Where necessary, in rocky or frozen ground, a mattock is used to obtain the sample. Typically, 400 to 500 g of soil is placed in a pre-labeled kraft sample bag. An aluminum metal tag inscribed with the sample identification number is attached to a rock or branch in a visible area at the sample site along with a length of pink flagging tape that is also labelled with the sample identification number. The GPS location of the sample site is recorded in UTM NAD 83 format, and the waypoint is labeled with the project name and the sample identification number. Samples are sealed in rice bags and secured for shipping to the assay lab.

Samples were shipped to the Bureau Veritas Lab ("BV") in Vancouver for analysis. Samples were dried at <60°C to140°F and then sieved to -180 micron (80 mesh). Analysis for a suite of trace elements (AQ252) use a 0.5 g sample dissolved in aqua regia with ICP-AES finish. A 30 g sample was assayed for gold by fire assay with ICP-AES finish. A DVD containing all digital files from BV has been submitted with this assessment report.

2019 Soil Geochemical Survey Results

The results for gold from the 2019 survey are plotted in Figure 9. However, to provide a more comprehensive interpretation of the results from the 2019 survey, several relevant elements have been plotted along with results from adjacent sampling during the period 2011 to 2019. Bubble plots for Au, Ag, As, Bi, Sb, Pb, Zn, Cu and Mo are shown in Figures 10 to 18, below. Threshold values for the bubble levels have been calculated at the 98th, 95th, 90th and 70th percentiles, as shown below in Table 2. Four of the target zones shown in the figures, Bee North, Bee South, Big Creek and Far Grid, were originally defined in Carlson (2017). Big Vein Extension was defined in 2018.

Table 3. Percentile levels used for soil geochemical bubble plots.

The combined soil geochemical results, over the 2019 sampling grid and adjacent areas, have shown four anomalous trends. The geochemical infill sampling between the Far Grid and Big Creek anomalies (Figure 1) returned anomalous gold values and suggests that these zones are contiguous, representing an Intrusion Related gold target that is approximately 2 km long by 0.5 km wide. Further soil sampling around the Big Creek East anomaly also expanded and strengthened this drill target (Figure 1). In both cases, the pathfinder elements typically associated with Intrusion Related Gold Deposits were very strong. The first, including Au, Ag, As, Bi, and Cu, confirm and extend the Big Creek and Far Grid anomalies defined by the 2018 program. The Big Creek anomaly has been extended to the west and the Far Grid anomaly has been extended to the northeast. It is believed that these zones represent sheeted vein style mineralization related to the Big Creek and Rhosgobel stocks respectively although, in both cases, the mineralization appears to be mostly in the wall rocks (Carlson, G., 2018). The second, the Big Vein Extension, is only weakly defined by Au. Local veining was noted as an apparent eastern extension of the Big Vein on the adjacent Clear Creek property (Carlson, G., 2018) . The third trend includes Sb, Pb and Zn (Carlson, G., 2018). These anomalous trends are distal to the first trend. The fourth trend, as defined by Mo, and to a lesser extent, Cu, is not strongly anomalous, but is distinctly defined and occurs along the western margin of the 2018 grid. It is possible that this anomaly is associated with intrusion related, porphyry-style within the Rhosgobel stock on the adjacent Victoria Gold Clear Creek property (Carlson, G., 2018).

Induced Polarization Survey

The IP crew from SJV Geophysics Ltd. ("SJV"), including a Crew Chief and three Technicians, arrived on the Property August 6th, completed 5 days of surveying and returned to Whitehorse August 11th. The crew completed 3.2 km of IP surveying along two parallel lines spaced 400 m apart. The survey utilized a pole-dipole array with 100 m station spacing for n = 1-10. The purpose of the survey was to detect disseminated sulphide mineralization that could be associated with a bulk tonnage, Fort Knox style gold target. The SJV report describing the survey details and presenting the survey results is included as Appendix VII in this report. Digital files including all data from the survey have been included in a DVD submitted with this assessment report.

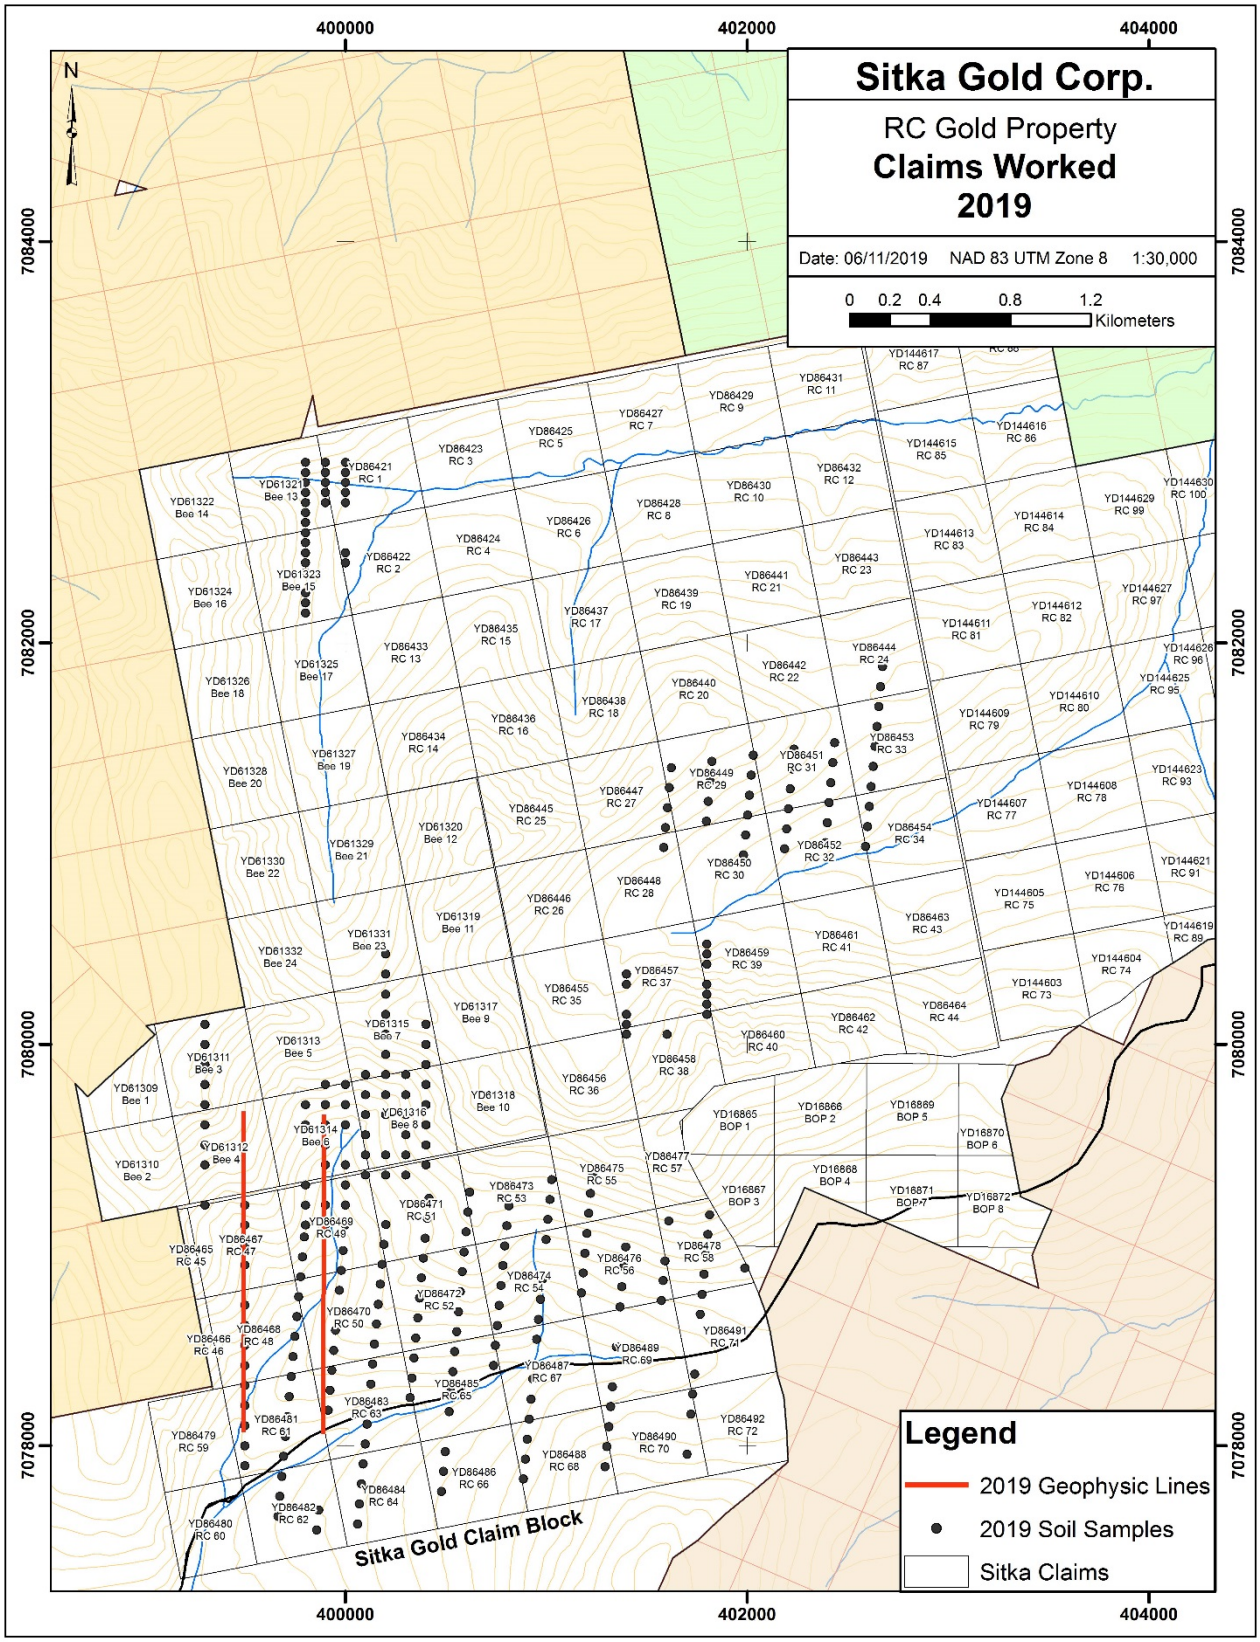

Figure 18 - 2019 IP Lines

IP Survey Results

Chargeability anomalies appear at the south end of both Lines 1 and 2 from the 2018 IP survey (Carlson, G., 2018).

The 2019 geophysics program entailed two lines of IP surveys to test the southward continuity of chargeability anomalies that were also discovered in 2018. Some overlap was done with the 2018 IP lines to provide continuity in interpretation.

The IP survey consisted of 2 lines, each 1.6 km long, that are southward extensions of IP lines surveyed by previous operators in 2018. The results of the 2019 survey show strong chargeability values greater than 36 milliseconds that may reflect Intrusion Related gold mineralization dipping gently to the south (Figure 2). High resistivity associated with the high chargeability may indicate silicification in the areas of potential mineralization. This coincides with strong gold-in-soil signatures at the north and south ends of Line 1000E (Carlson, G., 2018).

CONCLUSIONS

The 2019 exploration program at RC Gold was successful in further delineating several strong Intrusion Relation gold targets. RC Gold is located in a highly-prospective region that is home to several multi-million ounce Intrusion Related Gold Deposits, including Victoria Gold's newly constructed Eagle Gold mine and Golden Predator's Brewery Creek Gold mine, and these surface results endorse our view that the Property exhibits the geological characteristics required for an Intrusion Related Gold Deposit to exist at depth. The area is seeing renewed interest from Juniors and Majors alike.

A total of 288 soil and 16 rock samples were collected to infill between two strong gold-in-soil anomalies that were discovered in 2018. The geophysics program entailed two lines of IP surveys to test the southward continuity of chargeability anomalies that were also discovered in 2018. The geochemical infill sampling between the Far Grid and Big Creek anomalies (Figure 1) returned anomalous gold values and suggests that these zones are contiguous, representing an Intrusion Related gold target that is approximately 2 km long by 0.5 km wide. Further soil sampling around the Big Creek East anomaly also expanded and strengthened this drill target (Figure 1). In both cases, the pathfinder elements typically associated with Intrusion Related Gold Deposits were very strong. The Company intends to drill test these areas in the upcoming 2020 field season.

The IP survey consisted of 2 lines, each 1.6 km long, that are southward extensions of IP lines surveyed by previous operators in 2018. The results of the 2019 survey show strong chargeability values greater than 36 milliseconds that may reflect Intrusion Related gold mineralization dipping gently to the south (Figure 2). High resistivity associated with the high chargeability may indicate silicification in the areas of potential mineralization. This coincides with strong gold-in-soil signatures at the north and south ends of Line 1000E (Carlson, G., 2018).

The target at RC Gold is an Intrusion Related Gold deposit like Eagle Gold (Victoria Gold), Brewery Creek (Golden Predator) and Red Mountain in Yukon and Fort Knox, True North, Pogo and Donlin Creek in Alaska.

The Property lies within the Tombstone Gold Belt where Fort Knox style mineralization is known to be associated with Tombstone Suite intrusions (Hart, et.al., 2002). The headwaters of Clear Creek a historically significant placer gold bearing creek, and Big Creek drain from the property. Recent prospecting (Coe, 2017) has discovered gold mineralization in quartz veins related to the Big Creek Stock, within the Property. The Property is underlain by metasedimentary rocks of the Yusezyu Formation of the Upper Proterozoic to Cambrian Hyland Group. These have been intruded by the Tombstone-aged (Mid-Cretaceous) Big Creek diorite stock.

Prospecting and Geology

Four documented traverses were conducted on the property and a total of 16 grab samples were taken (Figure 5 and 6). Table 2 shows the rock sample descriptions and assay results. Sample # 1894456 returned 639.6 PPB gold in a grab sample of diorite with mineralized quartz veining (Figure 7).

Soil Geochemistry

The combined soil geochemical results, over the 2019 sampling grid and adjacent areas, have shown four anomalous trends. The geochemical infill sampling between the Far Grid and Big Creek anomalies (Figure 1) returned anomalous gold values and suggests that these zones are contiguous, representing an Intrusion Related gold target that is approximately 2 km long by 0.5 km wide. Further soil sampling around the Big Creek East anomaly also expanded and strengthened this drill target (Figure 1). In both cases, the pathfinder elements typically associated with Intrusion Related Gold Deposits were very strong. The first, including Au, Ag, As, Bi, and Cu, confirm and extend the Big Creek and Far Grid anomalies defined by the 2018 program. The Big Creek anomaly has been extended to the west and the Far Grid anomaly has been extended to the northeast. It is believed that these zones represent sheeted vein style mineralization related to the Big Creek and Rhosgobel stocks respectively although, in both cases, the mineralization appears to be mostly in the wall rocks (Carlson, G., 2018). The second, the Big Vein Extension, is only weakly defined by Au. Local veining was noted as an apparent eastern extension of the Big Vein on the adjacent Clear Creek property (Carlson, G., 2018) . The third trend includes Sb, Pb and Zn (Carlson, G., 2018). These anomalous trends are distal to the first trend. The fourth trend, as defined by Mo, and to a lesser extent, Cu, is not strongly anomalous, but is distinctly defined and occurs along the western margin of the 2018 grid. It is possible that this anomaly is associated with intrusion related, porphyry-style within the Rhosgobel stock on the adjacent Victoria Gold Clear Creek property (Carlson, G., 2018).

Induced Polarization Survey

The IP survey consisted of 2 lines, each 1.6 km long, that are southward extensions of IP lines surveyed by previous operators in 2018. The results of the 2019 survey show strong chargeability values greater than 36 milliseconds that may reflect Intrusion Related gold mineralization dipping gently to the south (Figure 2). High resistivity associated with the high chargeability may indicate silicification in the areas of potential mineralization. This coincides with strong gold-in-soil signatures at the north and south ends of Line 1000E and provides excellent drill targets for the 2020 field season.

RECOMMENDATIONS

The 2019 exploration program at RC Gold was successful in further delineating several strong Intrusion Relation gold targets. RC Gold is located in a highly-prospective region that is home to several multi-million ounce Intrusion Related Gold Deposits, including Victoria Gold's newly constructed Eagle Gold mine and Golden Predator's Brewery Creek Gold mine, and these surface results endorse our view that the Property exhibits the geological characteristics required for an Intrusion Related Gold Deposit to exist at depth. The area is seeing renewed interest from Juniors and Majors alike and we look forward to the 2020 field season when we intend to drill test these targets with what will be the first ever drilling conducted on the Property.

The IP survey consisted of 2 lines, each 1.6 km long, that are southward extensions of IP lines surveyed by previous operators in 2018. The results of the 2019 IP survey show strong chargeability values greater than 36 milliseconds that may reflect Intrusion Related gold mineralization dipping gently to the south (Figure 2). High resistivity associated with the high chargeability may indicate silicification in the areas of potential mineralization. This coincides with strong gold-in-soil signatures at the north and south ends of Line 1000E and provides excellent drill targets for the 2020 field season.

EXPENDITURES

The following table lists expenditures for the entire RC Gold project, spent on the BEE and RC claims. Invoices are included in Appendix VIII.

Table 4 - Expenditure Summary

Company	Description	Amount
Fox Exploration Ltd.	Supervision, soil sampling, camp, crew, consumables, claim staking, final report	$115,080.00
SJ Geophysics Ltd.	IP Survey	$25,580.13
SJ Geophysics Ltd.	IP Survey Report	$3,144.75
Bureau Veritas	Analytical (Rocks)	$754.36
Bureau Veritas	Analytical (Soils)	$11,107.85
TOTAL		**$155,667.09**

CERTIFICATE OF QUALIFICATIONS

1) I, Corwin Edward Coe, of 1701 Robert Lang Drive, Courtenay, B.C., V9N 1A2, and am self-employed as a contract and consultant geologist and am the author of this report.

2) I am a graduate from Simon Fraser University, Burnaby, B.C., with a Bachelor of Science degree in Earth Sciences (2006).

3) I am a Professional Geoscientist (P.Geo.) registered with the Association of Professional Engineers and Geoscientists of British Columbia (#33451) and the Nunavut and Northwest Territories Association of Professional Engineers and Geoscientists (#L3268).

4) I am a graduate Mining Technologist with a diploma in Mining Technology from the British Columbia Institute of Technology (1976).

5) I am an Applied Science Technologist (A.Sc.T.) registered with the Association of Applied Science Technologists and Technicians of British Columbia (#8127).

6) I have worked in the Yukon in mineral exploration for over 40 years.

Corwin (Cor) Coe, P.Geo.
Project Geologist

Appendix II Rock and Soil Samples – Analytical Certificates

BUREAU VERITAS MINERAL LABORATORIES Canada

www.bureauveritas.com/um

Bureau Veritas Commodities Canada Ltd.
9050 Shaughnessy St Vancouver British Columbia V6P 6E5 Canada
PHONE (604) 253-3158

Client: **Fox Exploration Ltd.**
1701 Robert Lang Dr.
Courtenay British Columbia V9N 1A2 Canada

Submitted By: Ryan Coe/Cor Coe
Receiving Lab: Canada-Whitehorse
Received: August 09, 2019
Report Date: August 24, 2019

CERTIFICATE OF ANALYSIS WHI19000347.1

CLIENT JOB INFORMATION

Project: RC Gold
Shipment ID:
P.O. Number
Number of Samples: 16

SAMPLE DISPOSAL

DISP-PLP Dispose of Pulp After 90 days
DISP-RJT Dispose of Reject After 60 days

Bureau Veritas does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

SAMPLE PREPARATION AND ANALYTICAL PROCEDURES

Procedure Code	Number of Samples	Code Description	Test Wgt (g)	Report Status	Lab
PRP70-250	16	Crush, split and pulverize 250 g rock to 200 mesh			WHI
AQ252	16	1:1:1 Aqua Regia digestion Ultratrace ICP-MS analysis	30	Completed	VAN
SHP01	16	Per sample shipping charges for branch shipments			VAN
BAT01	1	Batch charge of <20 samples			VAN

Appendix IV IP Report – SJV Geophysics

LOGISTICS REPORT PREPARED

FOR

SITKA GOLD CORP.

Volterra-2DIP

ON THE

RC GOLD PROPERTY

CLEAR CREEK, YUKON TERRITORY, CANADA

SURVEY CONDUCTED BY SJ GEOPHYSICS LTD.
AUGUST 2019

REPORT PREPARED
AUGUST 2019

Table of Contents

Index of Figures

Index of Tables

1. Survey Summary

SJ Geophysics Ltd. was contracted by Sitka Gold Corp. to acquire Volterra-2DIP data on their RC Gold Property in the Yukon Territory. The 2DIP data was acquired on two survey lines. Table 1 provides a brief summary of the project.

Client	Sitka Gold Corp.
Project Name	RC Gold
Project Number	SJ838
Location (approx. centre of each grid)	Latitude: 63º 49' 21" N Longitude: 137º 02' 18"W 399704E 7079580N; NAD83 UTM Zone 8N
Total Line Kilometres	3.2
Production Dates	August 7 – August 10, 2019

Table 1: Survey Summary

The RC Gold project is located within the Tintina Gold Belt, Yukon, among several intrusion-related gold deposits. Soil and rock sampling have identified six large areas with anomalous concentrations of gold. Recent work on the property includes soil sampling and a previous IP survey. This 2DIP survey was designed to be an extension of the 2018 IP survey, performed by Aurora Geosciences. The RC property is situated within the Selwyn Basin, adjacent to the Tombstone Suite Intrusion complex (the Big Creek Stock). Typical mineralization and pathfinder metals associated with intrusion related gold deposits are found on the RC Gold project.

The objective of the survey was to map the geophysical properties, resistivity and chargeability, of the subsurface in order to investigate the potential for deeper mineralization.

2. Location and Access

The RC Gold project is located in central Yukon Territory and is situated approximately 62 km northwest of the town of Mayo and 350 km north of Whitehorse (Figure 1).

Figure 1: Overview map of the RC Gold project

The RC Gold project was accessed by truck from Whitehorse with the following directions:

- From Whitehorse, take YT-2 N for approximately 420 km; passing through Pelly Crossing
- At Stewart Crossing continue heading northwest towards Dawson City
- Approximately 75 km from Stewart Crossing turn right onto a dirt road signed for Clear Creek, follow this road for approximately 50 km to reach the grid

A map of the project area, along with road access, is shown in Figure 2.

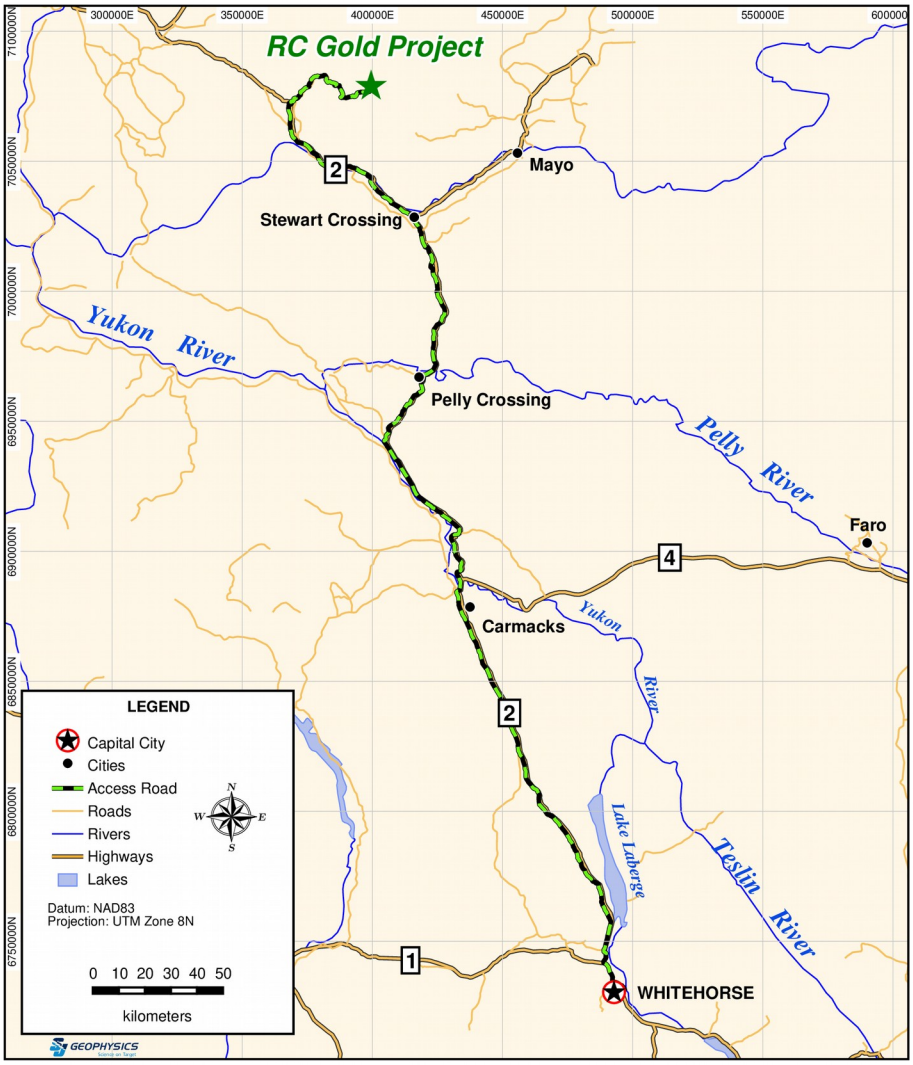

Figure 2: Location map for the RC Gold project

3. Survey Grid

The RC Gold project consisted of two survey lines, each 1600 m in length. The line spacing was 400 m. No line preparations were completed in advance of the survey. All stations were located in the field in real-time using handheld GPS units. Stations were not flagged or marked. Location data at each survey station was collected with Garmin GPSMap 64s handheld GPS units. The GPS data was collected in the NAD83 UTM Zone 8N coordinate system. The survey grid parameters are summarized in Table 2 and displayed in Figure 3.

Grid	RC Gold
Number of Surveyed Lines	2
Survey Line Azimuth	0º
Line Spacing	400 m

Table 2: Grid parameters

The station labels for the grid were based on the UTM coordinates. The station labels were represented by the last four digits of the UTM northing. Refer to Appendix A for a detailed breakdown of the survey lines.

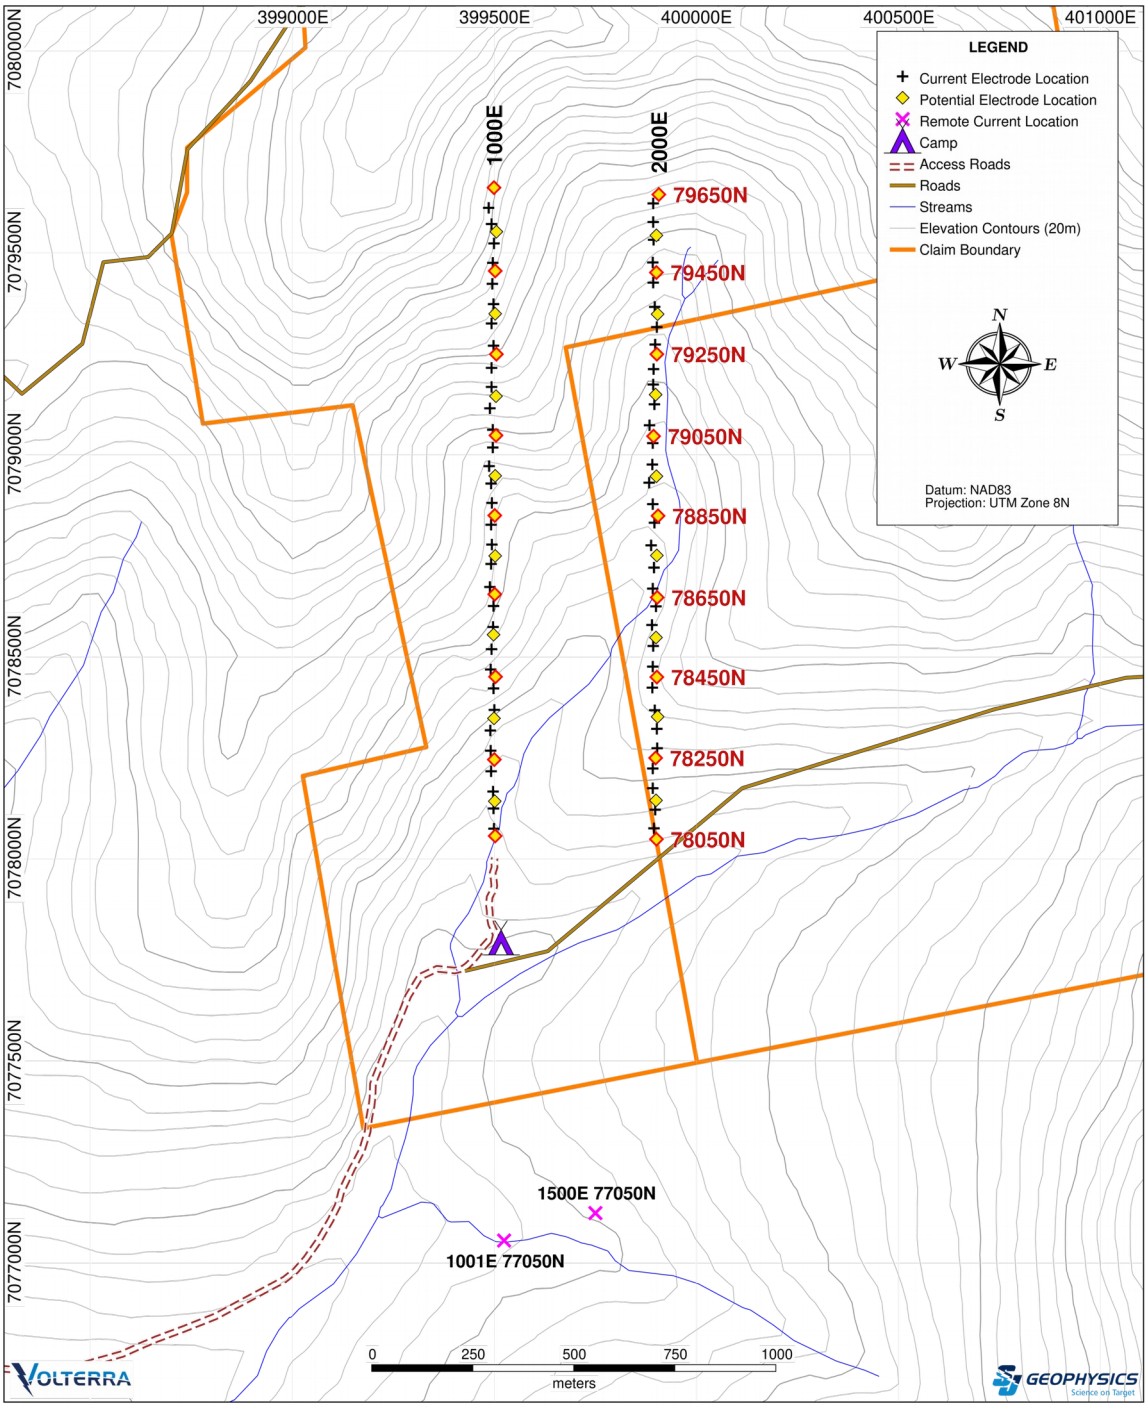

Figure 3: Grid map showing the RC Gold project

4. Survey Parameters and Instrumentation

4.1. Volterra Distributed Acquisition System

The Volterra Distributed Acquisition System was utilized to acquire the geophysical data. Each four-channel Volterra acquisition unit records the full waveform signal from a series of dipoles. The full-waveform data is then passed through proprietary signal processing software to calculate the relevant geophysical attributes; apparent resistivity and chargeability.

Data acquisition units utilized for the survey were Volterra acquisition unit 8000 and 8200 series models. The current injections were controlled using a GDD TxII 3600 W transmitter. The full instrument specifications are listed in Appendix B.

4.2. Volterra-2DIP Survey Design

The Volterra-2DIP survey utilized an in-line array consisting of 100 m dipoles. Along each receiver line, potential electrodes were setup every 100 m utilizing common poles between adjacent dipoles. A Volterra acquisition unit was setup in the centre of each set of four dipoles, corresponding to a unit every 400 m, as shown in Figure 4. Current injections occurred every 50 m, offset by 25 m from the receiver electrodes. The length of a receiver line was 1600 m, while the current injection total line length was 1550 m. For each current injection, all receiver channels connecting to all 16 dipoles for that line were active.

Receiver dipoles were set up using 50 cm long and 10 mm diameter stainless steel electrodes hammered into the ground and connected into the array by single and double conductor wire. The electrodes used for current injections were 100 cm long and 15 mm in diameter with two electrodes used at each injection site to improve ground contact. Current electrodes were connected to the current transmitter by a single conductor wire.

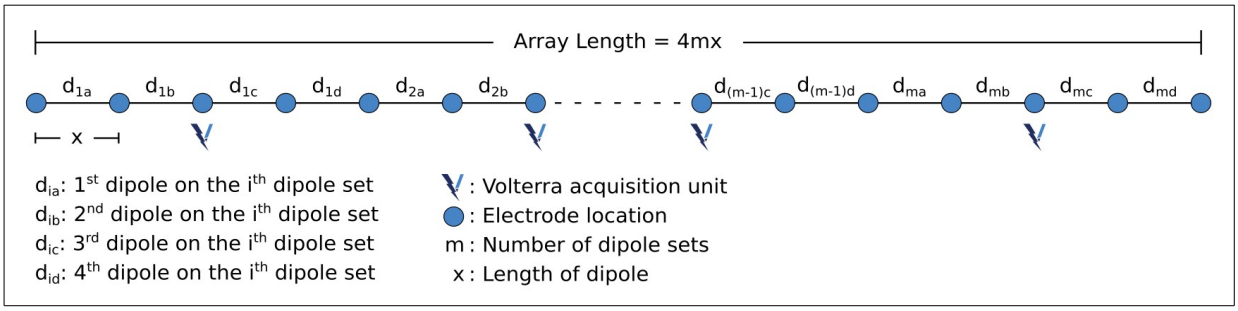

Figure 4: Schematic representation of the in-line array

4.3. Acquisition Parameters

The recording and processing parameters used for the survey are described in Table 5.

IP Transmitter	GDD TxII 3600W (SN # 433, 436)
Duty Cycle and Waveform	50%; Square
Cycle and Period	2 sec on / 2 sec off; 8 second
IP Signal Recording	Volterra Acquisition Unit (Dabtube 8000/8200 Series)
Reading Length	120 seconds
IP Signal Processing	CSProc (SJ Geophysics proprietary software)
Vp Delay, Vp Integration	1200 ms, 600 ms
Mx Delay, # of Windows Width (Window Width)	50 ms, 26 26, 28, 30, 32, 34, 36, 39, 42, 45, 48, 52, 56, 60, 65, 70, 75, 81, 87, 94, 101, 109, 118, 128, 140, 154, 150 (50–1950 ms)
Mx Integration (Inversion)	50 – 1950 ms (windows 1 – 26)
Properties Calculated	Vp, Mx, Sp, Apparent Resistivity and Chargeability

Table 3: IP transmitter and reading parameters

Two remote electrode stations were utilized during the survey. The locations of the remote current electrodes are listed in Table 4 below.

Name	Label	Easting	Northing
Remote for 1000E	1001E 77050N	399524	7077056
Remote for 2000E	1500E 77050N	399750	7077124
NAD83 UTM Zone 8N			

Table 4: Location of IP remote sites

5. Field Logistics

The SJ Geophysics field crew consisted of two field geophysicists, and one field technician to perform the day-to-day operations of the survey. This team oversaw all operational aspects including field logistics, data acquisition and initial field data quality control. Table 5 lists the SJ Geophysics crew members on this project. The client's field representative, Ryan Coe, assisted with data acquisition for the duration of the survey, along with his assistant Dylan.

Crew Member Name	Role	Dates on Site
Nathan Anderson	Field Geophysicist	August 7 to 10, 2019
Erica Veglio	Field Geophysicist	August 7 to 10, 2019
Jeff Moorcroft	Field Technician	August 7 to 10, 2019

Table 5: Details of the SJ Geophysics crew on site

The SJ Geophysics crew mobilized to Whitehorse, Yukon Territory from Vancouver, British Columbia on August 6 and demobilized from the project site on August 10.

The SJ Geophysics crew was accommodated by the client in a camp along the side of a placer mining road. The crew had a wall tent, heated by wood stove. Groceries were purchased for all meals by the client. Wireless internet was provided by the client's satellite internet. Communication with the SJ Geophysics office occurred by a combination of email and satellite phone.

A Ford F250 Super Duty truck was utilized for the duration of the project. The crew drove the equipment from Whitehorse to the survey area. The client assisted with transporting equipment to and from the survey area. Trucks were not necessary to use when getting around the survey area, though the road was in good condition.

The SJ Geophysics crew conducted a safety meeting on the first morning as well as daily tailgate meetings. The safety meeting included a comprehensive review of safe work practices specific to our geophysical survey and field operations. At the tailgate meetings, personnel discussed issues relating to weather conditions (including ramifications on the survey/personal

safety), encounters with or sightings of potentially problematic wildlife, efficient organization of daily tasks, and any other work-related questions or concerns.

The first day in the field was August 7. L1000E was completely set up with receiver and current wire, and L2000E was setup with receiver wire. On August 8, the crew surveyed L1000E while the client laid out current wire on L2000E. Training of the field assistants occurred throughout the project, including wire layout, current injection safety, and radio protocols. Two data acquisition units (at stations 78250N and 79050N) stopped recording during the survey of L1000E due to the low battery level. The related sections required a re-survey which took place on the next day. L2000E was also completely surveyed on August 9, and a majority of the wires was picked up on the same day.

On the morning of August 10, the crew picked up the remaining wires, completed inventory and packed up the trucks for demobilization. The SJ Geophysics crew demobilized from the RC Gold property on the afternoon of August 10, arrived in Whitehorse in the late evening. The client, with remaining SJ Geophysics gear, returned to Whitehorse on August 11, where the gear was packed in storage.

During the Volterra-2DIP survey, each acquisition day began with the setup of the Volterra acquisition units along the receiver lines and the setup of the transmitter site. Prior to field data acquisition, a contact resistivity test was performed at each acquisition units using a small waveform generator attached in parallel to a given Volterra acquisition channel. This was done for each dipole in the array, and allowed the operator to identify areas of poor ground contact which could degrade input signal quality. Furthermore, this test allowed the operator to inspect the raw signal, ensuring that the Volterra acquisition units were functioning correctly, and to ensure that the receiver was synchronizing with the correct GPS time. Upon completion of these tasks, acquisition would begin. During acquisition stages, a dedicated 'transmitter' Volterra acquisition unit and a current monitor were used to measure the current being injected at each station. An Android tablet with an in-house Volterra software application was used to record the current injection start time and duration.

6. Data Quality

6.1. Locations

The location data collected was of good quality. GPS signals were moderate to strong across the survey area. The location data for each survey station was collected with Garmin GPSMap 64s handheld GPS units. The GPS data was collected in the NAD83 UTM Zone 8N coordinate system. The majority of the survey area consisted of short shrubbery and with open views to the sky, which allowed for good GPS accuracy with an error of approximately 3 metres. While GPS signal was less reliable in areas of thick forest canopy with an error of approximately 9 metres.

Elevations for the survey stations were also derived from the Canadian Digital Elevation Model (CDEM) data, gridded at 20 metres. The elevation data from both CDEM and handheld GPS show consistency with an average difference of 1.3 metres. However, the GPS elevation profiles illustrate less variation between adjacent stations. The GPS elevation data were utilized for the 2D inversion modeling.

6.2. Volterra-2DIP Data

Overall, the IP data collected was of good quality. The ground contact resistance was high throughout the survey area. Several of the receiver electrodes were adjusted in the morning during Volterra receiver acquisition unit setup to improve contact with the ground. The injected currents were good throughout the survey grid with current amplitudes averaging 150 mA. In areas of talus or loose large boulder fields, the current electrodes were moved to obtain better ground contact.

Signal strength, as indicated by the voltage potential (Vp), showed a wide range of values depending on the specific line, local ground conditions, and dipole distance from the current injection. The measured voltage potential's (Vp) were good, with values in the 10s to 1000s of mV. The apparent chargeabilities averaged between approximately 20 to 25 ms. The IP decay curves were of good quality.

7. Deliverables

This logistics report and maps are provided as two paper copies and digitally in PDF format. The geophysical survey data is provided digitally on the included CD. A brief description of the provided data is below.

- 2DIP Data – Raw DCIP data export as a .txt file
- Locations – Locations of survey stations with both GPS and DEM elevations
- Maps
  - grid map
  - 2D Inversion Maps (Resistivity and chargeability maps along survey lines)
- Logistics report
- 2D Inversion Models
  - UBC – Inverted models in UBC-GIF standard format (UTM coordinates), all model files are provided (msh, con, res, chg, sensitivity)
  - XYZ – ASCII format of models converted from UBC-GIF inversion models. The value at the centre of each model cell is given
  - VTK – Inverted models in open-source vtk format: con, res, and chg files

Respectfully submitted,

Erica Veglio, Msc GIT
Field Geophysicist
SJ Geophysics Ltd.

Appendix B: Instrument Specifications

Volterra Acquisition Unit (Dabtube 8000 Series)

Technical:

Input impedance:	100 MΩ
Input overvoltage protection:	5.6
ADC bit resolution:	24-bit
Internal memory:	Storage Capacity 32 GB
Number of inputs:	4
Synchronization:	GPS
Selectable Sampling Rates (samples/second):	128000, 64000, 32000, 16000, 8000, 4000, 2000, 1000
Common mode rejection:	More than 80 dB (for Rs=0)
Voltage sensitivity:	Range: -5.0 to +5.0 V (24 bit)
Features	Programmable Gain

General:

Dimensions:	Diameter: 43 mm, Length: 405 mm
Weight:	0.5 kg
Battery:	5.0 VDC nominal
Operating temperature range:	-40 ºC to 40 ºC

Volterra Acquisition Unit (Dabtube 8200 Series)

Technical:

Input impedance:	20 MΩ
Input overvoltage protection:	5.6 V
ADC bit resolution:	24-bit
Internal memory:	Storage Capacity 64 GB
Number of inputs:	4
Synchronization:	GPS
Selectable Sampling Rates (samples/second):	128000, 64000, 32000, 16000, 8000, 4000, 2000, 1000
Common mode rejection:	More than 80 dB (for Rs=0)
Voltage sensitivity:	Range: -5.0 to +5.0 V (24 bit)
Features	Programmable Gain, AC/DC coupling

General:

Dimensions:	Diameter: 43 mm, Length: 405 mm
Weight:	0.5 kg
Battery:	5.0 VDC nominal
Operating temperature range:	-40 ºC to 40 ºC

GDD IP Transmitter TxII-3600W

Size:	TxII-3600W with a blue carrying case: 70 x 28 x 49 cm TxII-3600W only: 55 x 44 x 21 cm
Weight:	TxII-3600W with a blue carrying case: ~ 44 kg TxII-3600W only: ~ 32 kg
Operating Temperature:	-40ºC to 65ºC (-40ºF to 150ºF)
Time Base:	ON+, OFF, ON-, OFF DC, 1, 2, 4, 8 or 16 s
Output current:	0.030A to 15A (standard operation) 0.0A to 15A (open loop protection disabled) Maximum of 5A in DC mode
Rated Output Voltage:	150V to 2400V Up to 7.2KW and 4800V in a master/slave configuration
LCD Display:	Output current, 0.001A resolution Output power Ground resistance (when the transmitter is turned off)
Power source:	220-240V / 50-60Hz

Appendix C: Geophysical Techniques

IP Method

The time domain IP technique energizes the ground by injecting square wave current pulses via a pair of current electrodes. During current injection, the apparent (bulk) resistivity of the ground is calculated from the measured primary voltage and the input current. Following current injection, a time decaying voltage is also measured at the receiver electrodes. This IP effect measures the amount of polarizable (or "chargeable") particles in the subsurface rock.

Under ideal circumstances, high chargeability corresponds to disseminated metallic sulfides. Unfortunately, IP responses are rarely uniquely interpretable as other rock materials are also chargeable, such as some graphitic rocks, clays, and some metamorphic rocks (e.g., serpentinite). Therefore, it is prudent from a geological perspective to incorporate other data sets to assist in interpretation.

IP and resistivity measurements are generally considered repeatable to within about five percent. However, changing field conditions, such as variable water content or electrode contact, reduce the overall repeatability. These measurements are influenced to a large degree by the rock materials near the surface or, more precisely, near the measurement electrodes. In the past, interpretation of a traditional IP pseudosection was often uncertain because strong responses located near the surface could mask a weaker one at depth. Geophysical inversion techniques help to overcome this uncertainty.

Volterra-2DIP Data

The Volterra-IP data go through a series of quality assurance checks both in the field and in the office to ensure that the data are of good quality. At the end of each acquisition day the recorded signal was downloaded from the Volterra acquisition units to a personal computer. The signals were then clipped to the GPS time windows of each current injection, lightly filtered for noise, and imported into SJ Geophysics' proprietary QA/QC software package called JavIP. This software package integrates location data with DCIP data in order to calculate the apparent resistivity and apparent chargeability values. JavIP contains interactive quality control tools to allow the field geophysicist to display decay curves, view a dot plot of the calculated parameters, and manually reject bad data points.

The majority of data points flagged for removal are due to null-coupling, a phenomena typical in IP surveys related to survey configuration. Null-coupling occurs when a receiver dipole is sub-parallel to lines of constant potential, leading to a significant decrease in signal strength and corresponding poor data quality. Additional data can also be deemed untrustworthy due to low signal quality or dipoles being inadvertently disconnected (usually due to animal activity).

After the first data quality review in the field, the database was delivered to SJ Geophysics' head office for a second review. The data were then carefully checked to ensure that erroneous data points had been removed and were not passed along to the final stage of processing: the inversion.

Appendix D: Field Data Processing & Quality Assurance Procedures

Volterra-IP Data

The Volterra-IP data go through a series of quality assurance checks both in the field and in the office to ensure that the data are of good quality. At the end of each acquisition day the recorded signal is downloaded from the Volterra acquisition units to a personal computer. The signals are then clipped to the GPS time windows of each current injection, lightly filtered for noise, and imported into SJ Geophysics' proprietary QA/QC software package called JavIP. This software package integrates location data with DCIP data in order to calculate the apparent resistivity and apparent chargeability values. JavIP contains interactive quality control tools to allow the field geophysicist to display decay curves, view a dot plot of the calculated parameters, and manually reject bad data points.

The majority of the data points flagged for removal are due to null-coupling, a phenomena typical in IP surveys related to the survey configuration. Null-coupling occurs when a receiver dipole is sub-parallel to lines of constant potential, leading to a significant decrease in signal strength and corresponding poor data quality. Additional data can also be deemed untrustworthy due to low signal quality or dipoles being inadvertently disconnected (usually due to animal activity).

After the first data quality review in the field, the database is delivered to SJ Geophysics' head office for a second review. The data is then carefully checked to ensure that erroneous data points had been removed and are not passed along to the final stage of processing: the inversion.

Appendix E: Geophysical Inversion

The purpose of geophysical inversion is to estimate the 3D distribution of subsurface physical properties (density, resistivity, chargeability, and magnetic susceptibility) from a series of geophysical measurements collected at the surface. Unfortunately this is a challenging problem – the subsurface distribution of physical properties is complex and only a finite number of measurements can be collected. These complications lead to an under-determined problem. As a result, there are many different possible 3D physical property models that can be obtained which mathematically fit the observed data. Utilizing known geological and geophysical information to evaluate the model allows the best or most geologically realistic model to be selected and leads to a better understanding of the subsurface.

Geophysical inversions are commonly performed for every survey carried out by SJ Geophysics. Several inversion programs are available, but SJ Geophysics primarily uses the UBC-GIF algorithms (e.g. DCIP2D, DCIP3D, MAG3D, GRAV3D) which were developed by a consortium of major mining companies under the auspices of the University of British Columbia's Geophysical Inversion Facility.

In general, multiple inversions are carried out for each dataset and the resultant inversion models are compared with known information to evaluate the model. For example, known geology, drill assays, the estimated depth of investigation, and the quality of the input data are all used during the evaluation. The most geologically reasonable model that fits the data is then chosen as the best model. When available, additional information such as geological boundaries and down-hole geophysical data can be incorporated into the inversion in order to constrain the inversion model.

Once the final inversion model is selected, the model is gridded and mapped for interpretation. Typically, cross-sections and plan maps are created, sliced at different depths beneath the surface. The inversion results can be visualized in 3D using open source software packages such as Mayavi and Paraview in both 2D and 3D views. Additional data can then be overlain to aid in interpretation and help facilitate the identification of potential drilling targets.
