

CRETACEOUS

uKCC	Cody Creek Formation: sandstone; shale; minor siltstone; coal; marine and non-marine.
uKBC	Burnhill Creek Formation: shale; dark grey to black; siltstone laminae; minor sandstone; marine.
KFB	Fishing Branch Formation: sandstone; siltstone; shale; interbedded; marine shelf.
KP	Parkin Formation: shale; siltstone; sandstone; conglomerate; marine (Albian).
KPS	Sandstone member (informal): sandstone; conglomerate; siltstone; marine.
KWR	Whitestone River Formation: shale; siltstone; sandstone; marine (Albian).
KWR-r	Resistant beds within the Whitestone River Formation.

CARBONIFEROUS

CHR	Hart River Formation: limestone; dolostone; chert; brown-weathering; marine.
CE	Ettrah Formation: limestone; grey, skeletal, micritic; shale; sandstone; calcareous, locally present at the base; marine.
CF	Ford Lake Shale: shale; calcareous, pyritic; marine. May be Upper Devonian in part.

Abstract

The southeast quadrant of Porcupine River (NTS 116-J) has been mapped only once previously, during Operation Porcupine (1962-1976). The resulting reconnaissance map was issued in 1982 at 1:250 000 scale. This new preliminary GIS map and geodatabase, compiled at 1:50 000 scale, incorporates modern stratigraphic nomenclature, new biostratigraphic data and more accurately located structures and contacts based on air photo analysis, satellite imagery and up-to-date basemaps. Two extensive areas are underlain by very poor exposure. In the southeast, broad expanses underlain by Cody Creek Formation reveal little stratigraphic or structural information. Several structures that appeared on the original reconnaissance map in this area have yet to be corroborated. On the west side of the map, a large area was previously mapped as a broad pediment landform where underlying bedrock was largely unexposed. This map attempts to project the stratigraphy and structure beneath this poorly exposed area.

Résumé

Le quadrant sud est de la rivière Porcupine (NTS 116-J) a été cartographié précédemment une seule fois pendant l'opération Porcupine (1962-1976). La carte de reconnaissance qui en résulte a été émise en 1982 sur une échelle de 1:250 000. Cette nouvelle carte et base de données préliminaire SIG, établie sur une échelle de 1:50 000, constitue la nomenclature stratigraphique moderne, des nouvelles données biostratigraphiques, et plus spécifiquement des structures et des contacts relevés sur l'analyse de photos aériennes, l'imagerie satellite, et des cartographies mises à jour récentes. Deux régions importantes bénéficient d'une exposition très pauvre. Dans le sud est, de vastes étendues sous jacentes situées au dessus de la formation Cody Creek révèlent peu d'informations stratigraphiques ou structurales. Plusieurs structures qui sont représentées sur la carte originale de reconnaissance dans cette région doivent être confirmées. Sur le côté ouest du carte, une grande région a été précédemment cartographiée en tant que vaste relief de pédiment où le sous-bassement du substrat rocheux n'était largement exposé. Cette carte essaie de planifier la stratigraphie et la structure sous cette région pauvrement exposé.
