
The regional geochemical trend map displayed above utilized a moving weighted average using an inverse distance function ($1/d^3$) to filter out minor irregularities and emphasize broad-scale regional features. Single point anomalies may be suppressed or eliminated, however, geological units which are chemically enriched, or large metallic deposits undergoing weathering would be expected to produce identifiable anomalies

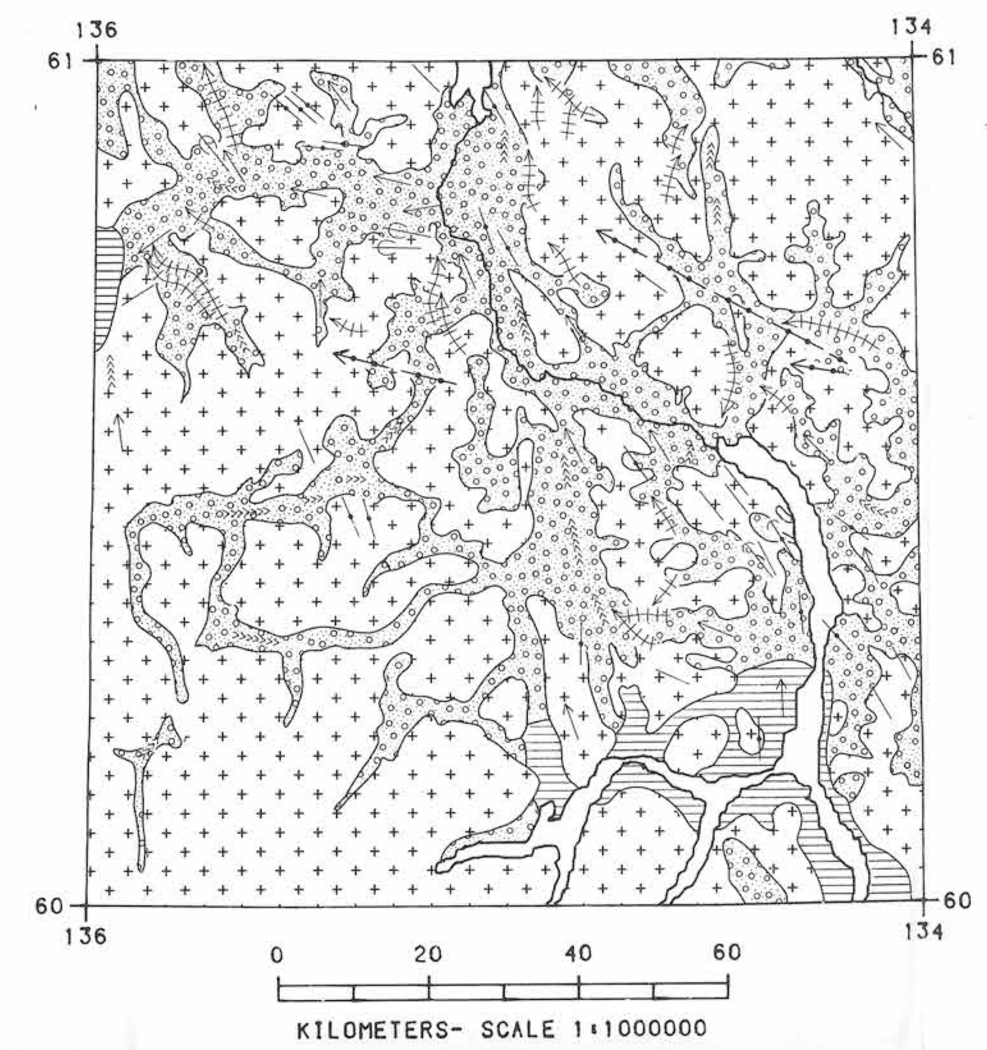
HISTOGRAM



SURFICIAL GEOLOGY

Glaciolacustrine deposits

Undivided surficial deposits; alluvium, glacial till and moraine, outwash and ice contact deposits, volcanic ash, loess, colluvium

Bedrock exposures; includes discontinuous veneer of undivided glacial drift, local alpine glaciation features

SYMBOLS

Surficial deposit boundary . . . .

Meltwater channels, outwash deposits, indicating direction of flow . .

Glaciation lineation parallel to ice flow direction, includes fluting, crag and tail, roches moutonees and drumlinoid forms, direction of flow known, unknown . . . .

Drumlinoid form, direction of movement inferred, not inferred . . . .

Glacial striae, direction inferred . . . .

Esker and/or kame complex . . . .

Boulder train, direction of movement . . . .
