

- SURFICIAL GEOLOGY**
- Thermokarst depression developed on alluvial floodplain
 - Organic deposits mantling lacustrine floodplain of silt and clay, or less commonly, moraine or eolian deposits
 - Undivided surficial deposits; includes alluvium, glacial till, glaciofluvial and glaciolacustrine deposits, ice contact deposits, colluvium, volcanic ash, loess, and scattered bedrock exposures.
 - Glacial ice, snow, and firn veneer with seasonal bedrock exposures.
 - Bedrock exposures; includes discontinuous veneer of undivided glacial drift, local alpine glaciation features.

- Symbols**
- Surficial deposit boundary
 - Major meltwater channels, outwash deposits, indicating direction of flow
 - Glacial lineation parallel to ice flow direction, includes fluting, crag and tail, roches moutonnées and drumlinoid forms, direction of flow indicated
 - Drumlinoid form; rock drumlin, crag and tail, fluted bedrock or till, direction of movement inferred, not inferred
 - Esker, direction of flow indicated

The regional geochemical trend map displayed above utilized a moving weighted average using an inverse distance function (1/d²) to filter out minor irregularities and emphasize broad-scale regional features. Single point anomalies may be suppressed or eliminated, however, geological units which are chemically enriched, or large metallic deposits undergoing weathering would be expected to produce identifiable anomalies.

CONCENTRATION	FREQUENCY
124 to 416	N = 19 (1.9%)
98 to 123	N = 31 (3.1%)
78 to 97	N = 50 (5.0%)
45 to 77	N = 200 (20.0%)
<2 to 44	N = 699 (70.0%)

Elevation in feet above mean sea level
 Mean magnetic declination 1987, 28°52' East, decreasing 13.3' annually. Readings vary from 28°52'E in the SE corner to 28°46'E in the NW corner of the map area
