

The regional geochemical trend map displayed above utilized a moving weighted average using an inverse distance function (1/d²) to filter out minor irregularities and emphasize broad-scale regional features. Single point anomalies may be suppressed or eliminated, however, geological units which are chemically enriched, or large metallic deposits undergoing weathering would be expected to produce identifiable anomalies.

- SURFICIAL GEOLOGY**
- Thermokarst depression developed on alluvial floodplain
 - Pits and kettles developed on gravelly glaciofluvial plain
 - Organic deposits mantling lacustrine floodplain, glaciofluvial plain, or less commonly, moraine deposits
 - Undivided surficial deposits; includes alluvium, glacial till, glaciofluvial and glaciolacustrine deposits, ice contact deposits, colluvium, volcanic ash, loess, and scattered bedrock exposures.
 - Colluvium; poorly sorted blanket of rubble commonly <3m thick overlying bedrock, ubiquitous in unglaciated terrain.
 - Bedrock exposures; includes discontinuous veneer of undivided glacial drift, local alpine glaciation features.

- Symbols**
- Surficial deposit boundary
 - Limit of Reid ice advance, maximum extent of glaciation
 - Major meltwater channels, outwash deposits, indicating direction of flow
 - Drumlinoid form; rock drumlin, crag and tail, fluted bedrock or till, direction of movement not inferred
 - Esker, direction of flow indicated

CONCENTRATION	FREQUENCY
481 to 1500	N = 25 (1.9%)
331 to 480	N = 36 (2.8%)
191 to 330	N = 68 (5.3%)
111 to 190	N = 214 (16.5%)
26 to 110	N = 951 (73.5%)

Elevation in feet above mean sea level
Mean magnetic declination 1987, 29°37' East, decreasing 13.4' annually. Readings vary from 29°37'E in the SE corner to 29°32'E in the NW corner of the map area
