LANDSAT Imagery — A Canadian Listing

V. R. SLANEY

The LANDSAT program was originated and funded by the National Aeronautics and Space Administration (NASA) of the United States of America. It was described by NASA officials as 'a research and development tool to demonstrate that remote sensing from space is a feasible and practical approach to efficient management of the earth's resources'.

From the start, the Canadian Government was interested in the project and negotiated an agreement with NASA which permitted access to direct transmissions from the satellite while over Canada. The first images from the satellite were received in Canada on July 26th 1972 and have continued to be received to the present day.

The Geological Survey of Canada is concerned with the potential applications of remotely-sensed data. To help survey geologists become familiar with this new class of image and to provide geologists with easy access to good examples of it, a collection of Canadian images was established in Ottawa. This reference collection of Multi-Spectral Scanner imagery includes all the material produced from the whole of Canada with less than 20 per cent cloud cover and of technically good quality. There are more than 15 000 black and white prints representing bands from about 6000 scenes. The scale of the prints is 1:1 000 000. The collection was begun soon after the first satellite was put into orbit in July 1972. The latest additions were made in April, 1976. The collection also includes some 500 colour composite prints chosen from the collection of the National Air Photo Library in Ottawa for their quality and for their geological interest. Many of the images are snow scenes and many are affected by atmospheric haze which serves to reduce — sometimes drastically — image contrast. Cloud, may also be present anywhere within the image. So far most of the interest shown by geologists has been in locating images with little or no snow, with little or no cloud and with a clear atmosphere.

In 1975 it was decided to establish a collection of very high quality images. About 25 per cent of the full collection (1500 scenes) meets the "high quality" guidelines. The present listing is the "high quality" imagery.

The criteria used to select imagery for this listing are as follows:

1. Absence or near absence of perennial snow cover. In areas where there is a permanent snow or ice cover the period of minimum snow is usually judged to be in August or early September as close as possible to the first snowfall of the oncoming winter season. There are a few images with snow from a single storm occupying only a few per cent of the image area. Rather more images, usually ones from the arctic, have snow lying on sheltered slopes and along river valleys. Where either of these conditions exist, mention is made in the 'notes' column of the image concerned.
2. Relatively free of haze. The presence of moisture and particulates in the atmosphere increases the amount of non-image forming light (haze) to reach the satellite-borne scanner. This results in a

reduction in density contrasts within the image. Band 4 is always most strongly affected by haze, while band 5 is less so. Bands 6 and 7 are usually not affected except when there is smog or smoke present. The criteria for "haze free" imagery, is that band 4 should show reasonable contrast when compared with bands 5, 6 and 7 of the same image.

3. Less than 10 per cent cloud within 1½ inches of the edge of the image. The location of cloud is mentioned in the listing. More than 10 per cent cloud is accepted where it lies over a lake or over the ocean. Mention is made of this in the accompanying notes. There are a few images with one or more small clouds near the centre of the image. Again, mention of this is made in the notes. When calculating the amount of cloud present, one square inch is taken to represent 2 per cent of the image.
4. Good technical quality. This is indicated by an absence or near absence of dropped lines or other imperfections derived from the original tape. The negatives from which the prints are made are also expected to be of good photographic quality i.e. with no blemishes and with a reasonable range of grey tones.

The images are listed using the Fleming system of notation, which is based on the number of the orbit track and position of the image centre along the track.

The accompanying map shows the location of all image centres. All images represented in this selection are indicated on this map by a black dot.

More than 90 per cent of Canada is represented. There are still a few areas where coverage is poor, the most notable of which lie in Newfoundland, Labrador and eastern Quebec.

Basic Facts About LANDSAT

LANDSAT I was launched on July 23rd, 1972, the first Canadian images being received on July 26th. The satellite was originally called the Earth Resources Technology Satellite (ERTS) receiving its present title in the spring of 1975. LANDSAT II was launched on January 22nd, 1975. Both satellites are still in orbit and transmitting data to ground reception stations.

Both satellites have a nearly identical orbit revolving around the poles every 103.26 minutes at an altitude of 900 to 950 km (560-590 statute miles). Global coverage between 81°N and 81°S is achieved every 18 days taking 251 orbits to complete.

Both LANDSAT satellites carry two kinds of image producing sensors.

1. A 3-camera Return Beam Vidicon (RBV) system. This consists of three television cameras bore-sighted to see the same area of the ground. The RBV cameras on LANDSAT I were turned off on August 15th, 1972 because of a malfunction. The RBV cameras on LANDSAT II are functioning but except for experimental purposes, images from them are not produced in Canada.

Each camera is sensitive to a different part of the energy spectrum.

Band 1 (Green) .46 to .6 micrometres

Band 2 (Red) .57 to .68 micrometres

Band 3 (Solar or Reflected Infrared) .66 to .82 micrometres

2. The Multi-Spectral Scanner (MSS) is a line-scanning device which uses an oscillating mirror to continuously scan the ground perpendicular to the direction of travel of the satellite. The movement of the satellite provides for the build up of a continuous strip of imagery. Light energy reflected from the ground is reflected by the mirror onto four detectors, each of which accepts energy from one of four different parts of the spectrum.

Band 4 (Green) 0.5 to 0.6 micrometres

Band 5 (Red) 0.6 to 0.7 micrometres

Band 6 (Reflective or Solar Infared) 0.7 to 0.8 micrometres

Band 7 (Reflective or Solar Infared) 0.8 to 1.1 micrometres

Output voltages from the 3 RBV cameras and the 4 MSS detectors are digitized and transmitted to ground stations.

At present there is one ground station in Canada, located at Prince Albert, Saskatchewan. A second station at Pouch Cove, Newfoundland was to be placed in operation in the latter part of 1976. Data recorded on magnetic tape by these stations is flown to Ottawa for conversion to black and white images for each spectral band. Colour composites are produced by registering and exposing three black and white spectral bands through appropriate colour filters onto colour film. Monochrome negatives are returned to Prince Albert for reproduction and distribution. Colour material is distributed from Ottawa.

The United States has three ground receiving centres, at Fairbanks, Alaska, Goldstone, California and at Greenbelt, Maryland. Each station forwards magnetic tape data to Goddard Space Flight Centre in Maryland for conversion to film, which is then sent to the EROS Data Centre in Sioux Falls, South Dakota for storage and reproduction.

The continuous strip imagery received on magnetic tape is separated into individual frames at the time negatives are produced. Each frame repeats 10 per cent of the image which precedes it and includes 10 per cent of the frame which follows.

Each image represents an area of 185 by 185 km (115 by 115 statute miles).

Sidelap between adjacent orbits varies with latitude. At the equator there is 14 per cent sidelap. In southern Canada at 50°N there is 45 per cent sidelap and in northern Canada at 70°N the sidelap is 71 per cent.

In its most usual form, each MSS scene is represented by four paper prints or transparencies at a scale of 1:1 000 000. Each print measures 24 cm by 24 cm (9½ inches by 9½ inches). This includes the image itself, which occupies an area of 19 by 19 cm (7½ inches by 7½ inches), a comprehensive descriptive data block and tick marks with latitude and longitude annotations located on two sides of the image.

At each corner of the image there is a cross to facilitate registration of the different bands.

Images on 70 mm film are also obtainable as a standard product from the EROS Data Centre, but are not easily obtainable in Canada. Enlargements of all kinds can be ordered from both Canadian and American facilities.

Ordering LANDSAT Images

All black and white paper prints, transparencies and enlargements of Canadian imagery can be purchased from:

Integrated Satellite Information Services,
P. O. Box 1630,
PRINCE ALBERT, Saskatchewan,
S6V 5T2

Telephone: (306) 764-3602

ISIS also produces LANDSAT imagery in microfiche form.

Colour prints, transparencies and colour enlargements can be ordered from:

Canada Centre for Remote Sensing,
717 Belfast Road,
OTTAWA, Ontario,
K1A 0Y7

Telephone: (613) 994-9916

The Canada Centre for Remote Sensing also provides a number of special services. These include the preparation of mosaics and the production of computer compatible tapes. There is also a large print reference library. Computer listings of imagery from specific areas can be obtained on demand.

Some Canadian imagery is also recorded by the United States receiver stations, for which enquiries should be addressed to:

EROS Data Centre,
SIOUX FALLS, South Dakota,
U. S. A.

The following publications provide more detailed information about technical aspects of the LANDSAT program.

EARTH RESOURCES TECHNOLOGY SATELLITE DATA USERS HANDBOOK:

Published by Goddard Space Flight Centre, Greenbelt, Maryland, 20771.
NASA Document 715 D 4249. A detailed description of the LANDSAT Programme.

EARTH RESOURCES TECHNOLOGY SATELLITE DATA USERS HANDBOOK:

Published by the Canada Centre for Remote Sensing. A Canadian text bringing together NASA material with a description of the Canadian data handling and distribution system.

ERTS IMAGERY CATALOGUE:

Canada Centre for Remote Sensing, Department of Energy, Mines and Resources, December 1975. A comprehensive listing of available Canadian imagery.

Mr. J. Carson and Miss F. Wright of the Geological Survey were responsible for the computer program and Miss Wright assisted in preparing this listing.
