February 2007

Executive Summary

The Brewery Creek Mine, owned and operated by Alexco Resource Corp., is located in central Yukon approximately 55 kilometres east of Dawson City. The mine operates under Class 'A' Water Use License QZ96-007, originally issued as QZ94-003 in August 1995 and under Yukon Quartz Mining License A99-001 issued in 1999.

This report summarizes 2006 monitoring data and activities relevant to both the Water Use and Quartz Mining Licenses.

During 2006 no mining operations were conducted. The heap leach pad was detoxified in 2002 and drained down in 2003. At the end of 2006, the heap was fully detoxified and approximately 0.036 m³/hr was free draining from the heap.

During 2006, maintenance seeding and fertilization was completed on approximately 81 ha.

The large scale lysimeter constructed in the Blue WRSA was monitored for chemistry and infiltration during 2006.

In 2006, no fresh water was withdrawn from Laura Creek.

From May – June 2006, 24,750 m³ of treated process solution was directly released into the Laura Creek watershed. No land application of solution occurred in 2006. Approximately 34,196 m³ of fresh water from the surface of the heap and surrounding catchment was released as it was captured in the preg pond.

Whenever flow and climatic conditions permitted, all monitoring required under QZ96-007 was carried out.

There was no surface discharge of accumulated waters from any of the 6 pits (Pacific, Blue, Moosehead, Kokanee, South Golden and Lucky). All water in the pits either evaporates or infiltrates into the ground.

Stream sediment monitoring was conducted in conjunction with third quarter surface water sampling.

There was no benthic monitoring program in 2006.

A revegetation assessment was completed by Laberge Environmental Services in August 2006.

SRK Consulting completed an independent analysis of the reclamation activities and remaining liabilities in August 2006.

No recordable spills occurred in 2006.

1 INTRODUCTION

Brewery Creek Mine, owned and operated by Alexco Resource Corp., is located in central Yukon approximately 55 kilometers east of Dawson City. The mine is a conventional open pit heap leach operation that operated continuously from 1996 – 2001. The mine was permanently shut down in 2002. With the exception of some remaining site facilities, the mine has been fully reclaimed.

The mine operates under Class ‘A’ Water Use License QZ96-007, originally issued as QZ94-003 in August 1995 and under Quartz Mining License A99-001 issued in June 1999.

This report summarizes 2006 monitoring data and activities relevant to the Water Use and Quartz Mining Licenses.

2 2006 OVERVIEW OF ACTIVITIES

The following reclamation tasks and activities were completed in 2006:

January 2006

- Routine water quality monitoring was completed per the sites and conditions under Water License QZ96-007 and Quartz Mining License A99-001.
- Weekly site visits for security and wildlife protection were conducted on a weekly basis during the month.
- No other site activity was completed.

February 2006

- Routine water quality monitoring was completed per the sites and conditions under Water License QZ96-007 and Quartz Mining License A99-001.
- Weekly site visits for security and wildlife protection were conducted on a weekly basis during the month.
- No other site activity was completed.

March 2006

- Routine water quality monitoring was completed per the sites and conditions under Water License QZ96-007 and Quartz Mining License A99-001.

- March sampling included quarterly monitoring.
- Weekly site visits for security and wildlife protection were conducted on a weekly basis during the month.
- Alexco began a modest exploration program in March. 9 holes were drilled in the Blue, Bohemian and Classic zones, for a total of 1,184 metres. Exploration roads and drill pads were prepared in support of this drill program.
- No other site activity was completed.

April 2006

- Routine water quality monitoring was completed per the sites and conditions under Water License QZ96-007 and Quartz Mining License A99-001.
- The exploration drill program continued during the month and was completed by month's end. All exploration equipment was demobilized from the property.
- One fulltime position was hired in late April to begin daily monitoring activities in anticipation of the spring freshet.

May 2006

- Routine water quality monitoring was completed per the sites and conditions under Water License QZ96-007 and Quartz Mining License A99-001.
- Fresh water that was collected in the preg pond as the result of surface runoff during the spring freshet was released by siphoning from the pond.
- Discharge of heap effluent collected in the overflow pond was released during the month.
- Maintenance seeding and fertilizing began across several areas of the property.
- Maintenance was completed on the main access road to the property.

June 2006

- Routine water quality monitoring was completed per the sites and conditions under Water License QZ96-007 and Quartz Mining License A99-001.

- Repair of erosion damage on the west face of the heap was completed during the month. The repaired areas were seeded and fertilized.
- Construction of a new fence around the perimeter of the process ponds began. This is in response to a previous incident of wildlife entering the pond and becoming trapped on the frozen water surface the previous winter. The fence had been removed earlier as part of the approved reclamation and closure plan.
- The hydrocarbon treatment facility was scarified and 75 kg. of fertilizer was applied and mixed in the soil.

July 2006

- Routine water quality monitoring was completed per the sites and conditions under Water License QZ96-007 and Quartz Mining License A99-001.
- The new fence around the process ponds was completed.
- Reclamation was completed on drill pads and exploration roads constructed as part of the March/April exploration program.

August 2006

- Routine water quality monitoring was completed per the sites and conditions under Water License QZ96-007 and Quartz Mining License A99-001.
- The remaining inventory in the laydown area was removed from site. The area was ripped and seed and fertilizer was applied.
- An inspection was completed by SRK Consulting and SteveJan Consultants Inc. for the purposes of determining the remaining closure liability.

September 2006

- Routine water quality monitoring was completed per the sites and conditions under Water License QZ96-007 and Quartz Mining License A99-001.
- Sediment sampling was completed as part of the quarterly sampling.

- Additional work was completed on the ditch leading from the Cell 8-10 area across the road to the process ponds. The ditch was lined with additional rip rap material.

October 2006

- Routine water quality monitoring was completed per the sites and conditions under Water License QZ96-007 and Quartz Mining License A99-001.
- Site presence resumed back to weekly checks for security and wildlife protection.
- No other site activity was completed.

November 2006

- Routine water quality monitoring was completed per the sites and conditions under Water License QZ96-007 and Quartz Mining License A99-001.
- Weekly site visits for security and wildlife protection were conducted on a weekly basis during the month.
- No other site activity was completed.

December 2006

- Routine water quality monitoring was completed per the sites and conditions under Water License QZ96-007 and Quartz Mining License A99-001.
- Weekly site visits for security and wildlife protection were conducted on a weekly basis during the month.
- No other site activity was completed.

3 WATER USE

In 2006, no water was withdrawn from Laura Creek or BC-23.

4 MONITORING

4.1 Climate

Temperatures that are variable and extreme, with warm summers and prolonged extreme cold spells in winter characterize climate at the Brewery Creek Mine site. Typical of northern interior regions, most precipitation occurs as summer rain.

The 2006 climate monitoring data is summarized in Appendix A-1. 2006 climate data was collected manually during the period from January through December.

4.1.1 Temperature

June was the warmest month of the year with a high of 30°C. January was the coldest month with a minimum temperature of -42.5°C. 2006 monthly climate data is presented in Appendix A-2.

Brewery Creek data, collected since 1991, is summarized in Appendix A-3 (table and graph).

4.1.2 Precipitation

Total 2006 precipitation measured at the mine site was 351 mm (see Appendix A-1). 2006 was slightly above the long-term average precipitation at Brewery Creek of 329 mm.

4.1.3 Evaporation Pan

In 1997 a galvanized pan conforming to Evaporation Pan Class 'A' dimensions (1219mm diameter by 254mm high), and a precipitation gauge were placed between the overflow and intermediate ponds. 2006 monitoring was conducted from May through September (Appendix A-7.1). Results are tabulated in Appendix A-7.2. The maximum monthly net evaporation was 138.8 mm, and occurred in June. Total net evaporation in 2006 was 507.3 mm. This compares to the average evaporation between 1999 – 2005 of 486 mm.

4.2 Water Quality and Hydrology

4.2.1 Water Quality Monitoring

Water quality sampling was performed as required by Schedule B of Water License QZ96-007. Appendix B-1 presents a monthly summary of compliance sampling, and Table 4.1 a tabulation of samples obtained.

Table 4.1 2006 Compliance Water Quality Sampling

| | Surface Water | Ground water | In-Pit | Solution Discharge | Heap Effluent | Land Application Lysimeters |
|---------------------------|---------------|--------------|--------|--------------------|---------------|-----------------------------|
| Number of Samples in 2006 | 71 | 34 | 22 | 1 | 12 | 0 |

Components and procedures of the Brewery Creek Mine (BCM) water quality sampling program are summarized below.

Water Quality Laboratories:

ALS Environmental
Vancouver, BC

The ALS Environmental Certificate of Accreditation is attached.

Norwest Labs

Burnaby, BC

The Norwest Labs Certificate of Accreditation is attached.

Sampling Equipment:

Bottles: Bottles are supplied by the principal laboratory, arrive on site in coolers, and are stored in coolers. A running inventory of approximately 50 (1L) CN, 50 (1L) standard analytical, and 50 (250 ml) metals sample bottles are maintained on open shelves in the administration building warehouse. Bottles for cyanide analysis are specially labeled, and have been pre-preserved by the lab. Occasionally BCM staff has used a standard 1-litre bottle for cyanide sampling, and have added the NaOH pellet preservative from the on-site supply.

Gloves: Sampling gloves are often used when taking surface water samples. Either neoprene, or rubber panner's gloves are used.

Groundwater Bailers: Single Sample™ disposable polyethylene bailers, 0.75" to 1.5" diameter are used.

Groundwater pump: Grundfos™ Redi-Flow 2 pump, with 200 foot REEL E-Z teflon-lined polyethylene hose is used for well purging and sampling.

Sampling Procedure:

Surface Water Sampling:

Both the outside of cyanide sampling bottle, and the sampling glove, are rinsed prior to opening the sample bottle. The bottle is opened; care is taken to not touch bottle rim or inside of cap. If stream depth permits, bottle is submerged with top facing upstream and allowed to fill. For shallower sites, the bottle is only partially submerged. Non-cyanide bottles and cap are rinsed twice with water from the sampling site. Rinse water is discarded downstream. Cyanide bottles are not rinsed prior to filling. The bottle is filled and tightly capped. Prior to capping total metals sample, a nitric acid preservative (supplied by the principal analysis lab) is added to the bottle.

Groundwater Sampling, Using Bailers:

The sample bottle is opened, and care is taken to not touch bottle rim or inside of cap. The bailer is emptied through the top of the bailer, into the bottle. Non-cyanide bottles and cap are rinsed twice with water from the sampling site. Rinse water is discarded on the ground. Cyanide bottles are not rinsed prior to filling. The bottle is filled, and cap is placed tightly on bottle.

Dissolved metals samples are filtered in the field using a disposable filter apparatus. The filter apparatus is attached to a sterile collection bottle. Once filtered, a nitric acid preservative is added to the filtrate, and the cap is placed tightly on the bottle.

Occasionally the principal analysis lab performs the filtering and preserving of dissolved metals samples.

Groundwater Sampling BC 65, 66.

In conjunction with YG Water Resources a low flow passive sampling system was installed in 2005 for groundwater wells BC-65 and 66. This is an accepted method for deep wells, and involves leaving dedicated sampling gear down the hole (bellows pump, tubing), directly adjacent to the screened interval of the well. To withdraw a sample, one uses a controller and compressed gas at the surface to operate the bellows pump and extract the water through a return line to the surface - the compressed gas is not actually released, it simply cycles and operates the bellows. The equipment is left in the well between sampling events and not removed.

Groundwater Sampling, from Pump Discharge:

The sample bottle is opened, and care is taken to not touch bottle rim or inside of cap. Non-cyanide bottles and cap are rinsed twice with water from the pump discharge hose. Rinse water is discarded on the ground. Cyanide bottles are not rinsed prior to filling. The bottle is filled, and the cap is placed tightly on bottle.

Dissolved metals samples are either filtered in the field using a disposable filter apparatus or filtered at the onsite mine environmental laboratory. The filter apparatus is attached to a sterile collection bottle. Once filtered, a nitric acid preservative is added to the filtrate, and the cap is placed tightly on the bottle.

Occasionally the principal analysis lab performs the filtering and preserving of dissolved metals samples.

Sample Labeling:

Sample bottles are labeled with the sample location, site name, date sampled, company name and parameter to be analyzed for.

Sample Storage:

Samples are stored in a refrigerator at the mine site until shipping.

Sample Shipping:

Surface and groundwater compliance samples are shipped either the day of, or the day following sampling. Samples are placed in coolers with one or more refrigeration packs, and shipped via courier, or with the samplers when they return to Whitehorse, and airfreight to Vancouver. The coolers are delivered to the principal laboratory.

CERTIFICATE OF ACCREDITATION

Standards Council of Canada
Conseil canadien des normes

CERTIFICAT D'ACCÉDITATION

NORWEST LABS (SURREY)

#104-19575-55A Avenue, Surrey, British Columbia

having been assessed under the authority of the *Standards Council of Canada Act* and found to conform with the requirements of ISO/IEC 17025 and the conditions established by the SCC is hereby recognized as an

ACCREDITED TESTING LABORATORY

for specific tests or types of tests listed in the scope of accreditation approved by the Standards Council of Canada.

ayant été soumis à une évaluation selon la *Loi sur le Conseil canadien des normes* et ayant été trouvé conforme aux prescriptions d'ISO/CEI 17025 et aux conditions établies par le CCN est de fait reconnu comme étant un

LABORATOIRE D'ESSAIS ACCRÉDITÉ

pour les essais ou types d'essais déterminés inscrits dans la portée d'accréditation approuvée par le Conseil canadien des normes.

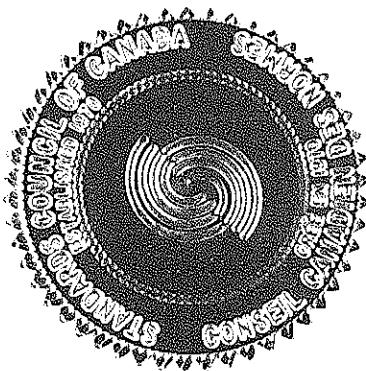

Accredited Laboratory No. / Numéro de laboratoire accrédité : 188

Accreditation date. / Date d'accréditation : 1995-03-06

Issued on: January 3, 2005 Expiry Date: January 3, 2008

President

I, the undersigned, as the president of Canadian Association for Environmental Analytical Laboratories Inc., and having been requested to reproduce it on my letterhead, do hereby certify that the following guidelines are in place:

1. All tests and services offered by this laboratory are performed in accordance with the applicable test methods and procedures specified in the relevant standard or specification.

2. All tests and services offered by this laboratory are performed in accordance with the applicable test methods and procedures specified in the relevant standard or specification.

4.2.2 Surface Water Quality Results

Locations and descriptions of surface water quality stations are given in Appendix B. 2006 surface water quality results are tabulated by station. Certain key parameters including total suspended solids (TSS), nitrogen species (ammonia), and selected metals are graphically compared to historical data. A major forest fire came through the Brewery Creek Mine in 2004 and most notably burned extremely hot through the Laura Creek watershed. The sampling results for total suspended solids (TSS) are evidence of the influence of the forest fires on water quality in the Laura Creek stations in 2005. TSS at stations BC-1, 2 and 3 are all elevated over historic levels. TSS at these stations during 2006 show an overall reduction but remain elevated from previous years, before the fire occurred. This indicates that natural recovery is occurring from the fire damaged areas but release of sediments is still occurring from this natural event. Stations such as BC-04 that were not influenced by the forest fire show typical TSS values as expected with historic levels.

Ammonia levels at stations BC-1, 2 and 3 continued a downtrend from 2005 levels. Most all stations showed an increase in ammonia in 2005 from previous years, including background stations such as BC-6. This increase is attributed to the 2005 forest fire, similar to the increases in TSS. The same trend is appearing at stations BC-4 and 5 which are in the Lee Creek drainage.

Arsenic and zinc concentrations at stations BC-1, 2 and 3 are similar to levels experienced in 2005. No significant trends either up or down appear in any of the stations for the parameters arsenic and zinc. Occasional spikes occur at various stations but these are not associated with any trends.

Copper and lead levels at most stations are within historic levels and there is evidence that past spikes have diminished. Results at stations BC-16, 4, 5, 3 and 34 is evidence of this trend.

Selenium levels at stations BC-1, 2 and 3 show consistent trends from previous years. Selenium at station BC-39 continues to be well below the site specific criteria established (3.8 ug/l) for that station. The average selenium concentration at BC-39 during the year was 1.2 ug/l. The highest selenium value reported at station BC-39 in 2006 was 1.7 ug/l. The actual levels are also below the predicted levels presented during the licensing process.

4.2.3 Groundwater Quality Results

Locations and descriptions of groundwater quality stations are given in Appendix B. Water quality sampling from the groundwater stations is required on a quarterly basis as per the Water License. There are 7 groundwater piezometers and 1 deep groundwater well (BC-23) located downgradient of the leach pad. Stations BC-19, 21, 22 are still operational and samples collected on a quarterly basis. Station BC-20 contains frozen water on year round basis. This station historically collected water but it became permanently frozen a few years ago. Attempts are made each quarter to collect a sample and the condition is continuously noted. The remaining 4 piezometers (BC-20, 24, 25 and 26) have collapsed over the past several years and no samples can be obtained from these stations. This condition has been noted on previous annual reports. Antimony, arsenic and cadmium levels at BC-19 showed no increasing trends in 2006. Copper levels at BC-19 have increased marginally over 2005 levels, but remain lower than historic concentrations samples at this location. Other parameters of note including mercury, nickel, silver, lead, iron, zinc and selenium continue to show no trends of increasing levels in BC-19.

Antimony, arsenic and cadmium levels at BC-21 showed no increasing trends in 2006 and are comparable to previous years. Copper levels at BC-21 exhibited a similar increase in values over 2005, similar to BC-19. Other parameters of note including mercury, nickel, silver, lead, iron, zinc and selenium continue to show no trends of increasing levels in BC-21.

Arsenic, nickel and iron concentrations at station BC-27 (Golden) show an increased level over previous years. Other parameters at BC-27 such as antimony, cadmium, copper, silver, lead and selenium exhibit the same or a decreasing trend from previous years.

4.2.4 In-Pit Monitoring Stations Water Quality Results

There was no mining activity in 2006 and mined out pits were used effectively as sediment control basins. Snow melt and precipitation run-off was directed to the closest inactive pit. Samples from all pits were taken from surface standing water within each pit.

In-pit samples were taken from the west end of Pacific Pit (BC-51), Blue (BC-12), Moosehead Pit (BC-15), Kokanee Phase 3 (BC-10), South Golden Pit (BC-17), and Lucky (BC-18).

Samples collected from the Kokanee Phase 3 and Golden pits (BC-10 and BC-17 respectively), show no abnormal values. Pacific Pit (BC-51) showed a lower pH and ranged from 3.4 – 4.4 during the sampling periods. High aluminum levels were associated with the lower pH during the same sampling periods. These lower pH levels for the Pacific Pit are consistent with previous years. PH values in the Blue Pit (BC-12) ranged from 4.2 – 6.7 throughout the 12 month sampling period. Increased levels of aluminum and iron were observed. These pH values are consistent with historic levels in the

Blue Pit. Neither the Pacific or Blue Pits discharges to surface and all water infiltrates through the pit bottom. Previous years sampling in Moosehead showed higher levels of selenium. This trend appears to have reversed and selenium levels in Moosehead during 2006 continued to be at or below 0.05 mg/l. As is the case for all other pits, the water is contained in the pit and either exfiltrates or evaporates. The Lucky Pit (station BC-18) has generally been dry during the scheduled quarterly sampling events. There was only one sampling period where there was any water contained in the small catchment at BC-18. Overall, the results of the pit water sampling indicates no trends or changes from previous years.

4.2.5 Monitoring Conformance

Throughout the year certain monitoring stations or frequencies were not sampled due to various reasons. The following summarizes stations, frequencies or parameters that were not achieved in 2006:

BC-1: Flow measurements were not recorded during the winter months due to very low or no water and significant ice and glacial cover.

BC-2: Flow measurements were not recorded during the winter months due to very low or no water and significant ice and glacial cover.

BC-3: Flow measurements were not recorded during the winter months due to very low or no water and significant ice and glacial cover.

BC-4: Flow measurements were not recorded during the winter months due to significant ice and glacial cover.

BC-5: Flow measurements were not recorded during the winter months due to significant ice and glacial cover.

BC-6: Flow measurements were not recorded during the winter months due to significant ice cover. Flow measurements were not recorded in the open water season because of the impractical methods required to monitor flow in such a large flow of water in the South Klondike River.

BC-9: This in pit station is Fosters Pit and has not had any water for several years and is therefore not sampled.

BC-11: This station is an intermittent seep at the toe of the Blue WRSA and there was no visible flow during the scheduled quarterly monitoring periods.

BC-13: This station is the Moosehead West Waste Dump and no longer exists and there is no visible flow to monitor.

BC-14: This station is the Moosehead East Waste Dump and no longer exists and there is no visible flow to monitor.

BC-16: This station is an intermittent surface flow below the Pacific Pit. There was only visible flow during the second quarterly period.

BC-18: This station is water in the Lucky Pit. It is generally dry and no sample can be obtained. Three out of the 4 sampling periods it was dry.

BC-20: This station is a piezometer below the leach pad and has been non-functional for several years and not sampled.

BC-23: This station is a deep well below the process area. The pump installed in BC-23 stopped functioning in 2004. An attempt was made to remove the pump and discharge pipe using the company's crane. During this exercise, the discharge pipe broke approximately 20 feet below the casing elevation. Further attempts to remove the pipe and pump have not been successful. Consequently there are no samples reported for BC-23.

BC-24: This station is a piezometer below the leach pad and has been non-functional (collapsed, plugged) for several years and not sampled.

BC-25: This station is a piezometer below the leach pad and has been non-functional (collapsed, plugged) for several years and not sampled.

BC-26: This station is a piezometer below the leach pad and has been non-functional (collapsed, plugged) for several years and not sampled.

BC-65: This station is a piezometer that is sampled using a specialized well purging pump supplied to the site by the Yukon government. During the December quarterly sampling event this pump malfunctioned and therefore samples could not be taken.

BC-66: This station is a piezometer that is sampled using a specialized well purging pump supplied to the site by the Yukon government. During the December quarterly sampling event this pump malfunctioned and therefore samples could not be taken.

4.2.6 Hydrology

Stream flow measurements for Laura Creek, Carolyn Creek, Lucky Creek, Lee Creek, and Pacific Creek stations were measured in 2006. All data are presented in Appendix C-1. Flowrates at the

pumphouse station are included in Appendix C. Both tabular and graphical forms of flow are presented. Heap solution discharge rates are regulated by measured flows at the pumphouse station.

4.3 Benthic Monitoring

As specified in Part F, Clause 45, of Water License QZ96-007 benthic monitoring is required on a bi-annual basis. No benthic monitoring was required in 2006.

4.4 Sediment Monitoring

Annual stream sediment sampling was conducted in September 2006. Sediment samples were collected from within the active channel of the streams, using an aluminum scoop. The samples were dried and screened using stainless steel sieves at ASTM mesh number 10, 20, 40, 60, 100, 140 and 270. Fraction weights were recorded. A minus 100-mesh sub-sample was analyzed for 33-element ultratrace ICP at Norwest Labs, Surrey British Columbia. Loss-on-ignition (LOI) was determined by heating the sample to 600°C. Results are tabulated in Appendix D.

Some obvious and notable decreasing trends are exhibited across a number of stations. Many parameters show levels have decreased back to pre mining conditions and baseline conditions. Arsenic, antimony and mercury are some of the best indicators and examples of decreasing metals in sediments over the past 6 years since mining ceased and the last 3 years since the major reclamation and stabilization work was completed.

4.5 Revegetation Monitoring

A revegetation monitoring and assessment report was completed by Laberge Environmental Consultants in July 2006. The assessment included permanent monitoring plots and other revegetated areas across the property. The Laberge report is included in Appendix F. Conclusions and recommendations are included in the report.

4.6 Leak Detection and Recovery Systems

Monitoring of (LDRS) systems was discontinued in 2005, consistent with long-term closure plans and the fact the heap has been fully decommissioned and drained. The leak detection piping and collection system remains intact however.

4.7 Air Quality

No air quality monitoring for mercury emissions was conducted in 2006 due to the dismantling of the ADR facility in 2004 and the cessation of refining. No further air quality monitoring is anticipated.

4.8 Effects on Wildlife

4.8.1 Process-Related Mortalities

Wildlife mortalities in 2006 included 2 young moose calves discovered in the overflow pond in May 2006. Upon discovery, the local Conservation Officer was notified. The fence around the process ponds had been removed earlier as a condition of the approved reclamation and closure plan. A new fence was constructed in June 2006 to prevent future wildlife incidents. The new fence will remain in place until the liners have been removed from the ponds.

4.9 Reclamation Activities Report

An inspection of the reclamation activities and remaining liabilities was completed by SRK Consulting (company engineer) and SteveJan Consultants (government engineer) during August 2006. This report has been submitted in a separate cover. In previous years, the annual geotechnical inspection was completed by the company's consultant and registered professional engineer in conjunction with the reclamation inspection. Due to a scheduling conflict at the last moment, the company's consultant could not attend the inspection but instead another professional with SRK attended the site inspection. The alternative SRK representative is not a registered professional engineer and therefore the annual geotechnical inspection report has not been provided.

5 RECLAMATION

No major earthwork activity took place in 2006 and the majority of site activity consisted of the boneyard and erosion maintenance in the reclaimed areas.

A summary of the maintenance work completed is shown in Table 5.1

Table 5.1 2006 Reclamation Summary

| Area | hectares | Description of Work |
|-----------------------------------|----------|-------------------------------|
| Edge of haul road Blue-Lucky | 25 | Seeded |
| Equipment Yard | 4 | Scarified, seeded, fertilized |
| Old camp yard | 1 | Scarified, seeded, fertilized |
| ADR Plant | 2 | Seeded, fertilized |
| Laura Creek Road and Pumphouse | 2 | Seeded, fertilized |
| Borrow Pit Laura Creek Road | 1 | Seeded, fertilized |
| Road to Land App lysimeters | 1 | Seeded, fertilized |
| Old Plant road to top of heap | 1 | Seeded, fertilized |
| Top of valve houses | 1 | Seeded, fertilized |
| Leach pad dyke road | 2 | Seeded, fertilized |
| Cell 8-10 patchy areas | 4 | Seeded, fertilized |
| Moosehead haul road | 4 | Scarified, seeded, fertilized |
| Moosehead landfill | 1 | Seeded, fertilized |
| Behind leach pad, shale hill | 1 | Seeded, fertilized |
| Blue WRSA | 6 | Seeded, fertilized |
| Blue WRSA access road | 2 | Scarified, seeded, fertilized |
| Low Grade Stockpile | 3 | Seeded, fertilized |
| Lower Fosters | 5 | Seeded, fertilized |
| Upper Fosters WRSA | 4 | Seeded, fertilized |
| Kokanee ditch | 1 | Seeded, fertilized |
| North Golden silt stockpile | 6 | Seeded, fertilized |
| Backside North Golden WRSA | 2 | Seeded, fertilized |
| Lucky Haul Road - crossing to pit | 4 | Seeded, fertilized |
| Total | 81 | |

Appendix E presents a number of pictures showing the progress of reclamation across several areas of the property.

6 REAGENT AND WASTE MANAGEMENT

6.1 Spill Occurrence and Response

No reportable spills occurred in 2006.

6.2 Reagent Storage and Handling

As the leaching process ceased in 2001, the majority of chemical reagents have already been disposed of and reported in previous annual reports. The remaining assay lab cupels and slag were buried on the top end of Cell 7. This was done with written permission from the Chief Mines Inspector and the local EMR inspector. The following table summarizes the remaining quantities of reagents and chemicals stored on site during 2006.

Table 6.1 Storage of Major Reagents During 2006

| Product | Quantity Used 2006/Stored at end of Year | Storage Location | Storage Method |
|-------------------|---|-------------------------|-------------------------------|
| Hydrochloric Acid | 6 drums stored | Adjacent to Preg Pond | 238 kilo drums (45 imp. gal.) |
| Hydrogen Peroxide | 6 drums stored | Adjacent to Preg Pond | 45 imp. Gal. drums |
| BTC Nutrients | 10,000 liter stored | Adjacent to Preg Pond | 25,000 liter storage tank |

6.3 Waste Management

6.3.1 Waste Oil

The previous lined oil drum storage area adjacent to the main administration building has been converted into a hydrocarbon soils treatment facility. After all of the remaining hydrocarbons were removed or burned off at site, the soil in the containment area was scarified and fertilizer applied. This practice was continued in 2006 and the soil was again scarified and 75 kg. of fertilizer was mixed into the soil in May 2006. Additional fertilizer will continue to be applied and resampled in the future. All transporters of waste oil are required to fully comply with the Yukon Special Waste Regulations, the Transportation of Dangerous Goods and the Yukon Spill Reporting Regulations.

6.3.2 Waste Storage and Disposal

Disposal of major waste products at the mine site is summarized in Table 6.2.

Table 6.2 Waste Disposal During 2006

| Product | Quantity Disposed 2006 | Disposal Method |
|-------------------------------|-----------------------------------|---|
| Metal, heavy scrap | ~ 2,000 kg. | Sold, given to local contractors and residents |
| Boneyard Equipment | +10,000 kg. | Sold to local contractors or shipped to Alexco's UKHM property for alternative use. |

7 WATER MANAGEMENT

7.1 Direct Release

A total volume of 24,750 m³ of compliant process solution and 34,196 m³ of heap surface runoff was directly released in 2006. No solution was land applied in 2006. Water quality analysis and sampling was conducted and solution released was compliant with the water license criteria and conditions. Bioassays were completed on the heap surface water runoff (preg pond water) and the discharge waster (BC-28). These bioassays passed and the solution was demonstrated to be non toxic. Results of the bioassays are included in Appendix G. All samples from BC-28a (heap effluent) were below 2.0 ppm total cyanide in 2006. The first sample from the heap below 2.0 ppm total cyanide was in February 2002. All samples subsequently taken have returned a total cyanide value below 2.0 ppm. This constitutes 60 consecutive months where the total cyanide from the heap has been less than 2.0 ppm. Because the lined facilities and ponds have not been removed and reclaimed, fresh water from the surface of the heap during spring freshet is directed and contained in the preg pond and is not directly released. Removal of the liner and final reclamation of the ponds cannot be completed without authorization under the company's Quartz Mining License (A99-001). The company's water license condition for process solution release is an annual limit of 25,000 m³. The 25,000 m³ limit was not intended to limit the amount of fresh surface water runoff released from the heap since this is an uncontrollable quantity and directly related to annual precipitation. Since the fresh water is contained separately from the leach pad underdrain, the release of the fresh water is not counted against the 25,000 m³ limit and is recorded separately. This condition will be rectified once the ponds are removed and the surface drainage reestablished. A summary of the volumes by month is shown in Table 7.1. The volume of land application released solution is included.

Table 7.1 Solution Release 2006

| Month | Process Solution Direct Release (m ³) | Fresh Water Direct Release (m ³) | Land App Release (m ³) | TOTAL (m³) |
|------------------------------|---|--|------------------------------------|------------------------------|
| January | | | | |
| February | | | | |

| December | | | | |
| Totals 2006 | 24,750 | 34,196 | | 58,946 |
| Totals To 2002 - 2005 | 134,697 | 69,507 | 151,796 | 356,000 |
| Remaining Permitted | na | na | 248,204 | |

7.2 Selenium Criteria

Water quality results for BC-39 are indicated in Appendix B. All sampling periods at BC-39 returned a selenium concentration below the water license criteria for site specific levels. The site specific selenium criteria for compliance at station BC-39 is 3.8 ug/l. The highest selenium measured at station BC-39 during the year was 1.7 ug/l and the lowest was 0.4 ug/l.

7.3 Heap Cover Infiltration

The water balance model used in all previous Brewery Creek assessments has been modified and updated to determine the estimated infiltration of precipitation through the heap cover. The model uses actual snowpack and precipitation data, pond volumes and release volumes to determine the amount of solution that infiltrates through the cover. The model results are included in Table 7.2. The model differentiates and separates surface runoff from water that infiltrates through the cover. It is anticipated that this model will be modified and calibrated as time goes on and more actual field performance of the cover is realized. The model uses the basic water balance assumption of:

$$\text{Starting Pond Volume} + \text{Water In} - \text{Water Out} = \text{Ending Pond Volume}$$

The starting and ending pond volumes can be measured at the end of each reporting period. For the basis of the model, a monthly period is used.

Water IN is measured by actual precipitation measurements. The amount of precipitation falling over the leach pad is separated from the amount falling over the ponds.

Water OUT is directly measurable from land application and direct discharge flowmeters. The model balances the Water IN and OUT and calculates the "missing" amount of water that has left the system. This amount is assumed to be the volume that has been lost through evapotranspiration and uptake by vegetation.

The estimated infiltration through the heap for 2006 is estimated at 27.3%. Details of the monthly inputs and calculations are found in Table 7.2. This calculated infiltration rate compares with the 30.0% infiltration rate estimated by the soil cover design modeling. Based on the water quality measured at BC-28a and the demonstrated infiltration rates through the cover, the remediation measures implemented on the heap are demonstrated to be effective.

7.4 Blue WRSA Lysimeter

A large scale lysimeter was constructed in 2003 to measure and collect precipitation as it passed through the 0.5 meter soil cover. Water quality samples are collected and analyzed. These results are included in Appendix B. The water quality from the large scale lysimeter is consistent with predictions made by SRK Consulting and there is no evidence of metal leaching or transport from the Blue WRSA material within the lysimeter.

The lysimeter also provides a mechanism to measure the overall level of precipitation infiltrating through the soil cover. A tank installed at the base of the Blue WRSA captures and measures the volume of solution that has passed through the cover. Precipitation levels throughout the year are measured and the percent infiltration can be calculated. Table 7.3 summarizes the infiltration rates through the lysimeter cover over the period March 2004 – December 2006. The overall infiltration during this period is estimated at approximately 6% which is significantly less than the predicted rates from the modeling. Figures 7.1 and 7.2 present graphically the infiltration rates through the Blue WRSA cover.

Based on the water quality from the lysimeter and the infiltration rate through the cover, the remediation measures implemented in the Blue WRSA are demonstrated to be effective.

LEGEND

ICP metals to include Ca, Mg, Na, K, Cu, As, Sb, Hg, Zn, Se, Pb, Al Bi, Cd, Cr, Fe, Mn, Mo, Ni, Ag and S.

Q = Quarterly

M/Q = Monthly in years 2005, 2006 and 2007, and quarterly in years 2008 and 2009

C = Continuous

MWA=Monthly when active

MA/Q=Monthly when active and quarterly when not active

BC-18 includes BC-18S and BC-18N

(2) denotes static water elevation

QZ96-007 - Amendment 7 (Application QZ03-062)

Special Instructions/Comments

page 3 of 3.

Sediment Instructions:

The samples shall be dried and screened, using sieves at ASTM mesh numbers 10, 20, 40, 60, 100, 140 and 270 (ASTM-E11-61) and the fraction weights shall be recorded.

A sub-sample composed of material passing through the 100 mesh number sieve shall be analyzed for metals by a 33 element ICP scan. Loss on ignition (LOI) shall also be determined by heating the sample to 600 C. There are 3 samples from each site.

NOTE: All hazardous samples must be labeled according to WHMIS guidelines.

Accredited by the Standards Council of Canada for specific tests

LIST OF TABLES

Table No.

| | | |
|---|----------------------|---|
| 1 | Blue Zone WRSA Plots | 4 |
| 2 | Leach Pad Plots | 5 |
| 3 | Control Plots | 6 |

1.0 Background

A revegetation program has been ongoing at the Brewery Creek Mine since 1996. Several seed mixes have been used. Earlier revegetation efforts were focused on the recontoured Canadian Zone waste rock dump and haul road, an area to the west of the Pacific Zone, and an area below the leach pad and reclaim ponds.

Two seed mixes were acquired by Viceroy Minerals Corporation in 2003.

The ‘wet site’ seed mix consisted of:

| Common Name | Scientific Name | Percentage by Weight |
|-------------------|-------------------------------|----------------------|
| Violet Wheatgrass | <i>Agropyron violaceum</i> | 33% |
| Fowl Bluegrass | <i>Poa palustris</i> | 33% |
| Alkaligrass | <i>Puccinellia distans</i> | 13% |
| Tufted Hairgrass | <i>Deschampsia caespitosa</i> | 13% |
| White Clover | <i>Trifolium repens</i> | 8% |

The ‘leach pad’ mix consisted of:

| Common Name | Scientific Name | Percentage by Weight |
|--------------------|-------------------------------|----------------------|
| Slender Wheatgrass | <i>Agropyron trachycaulus</i> | 50% |
| Kentucky Bluegrass | <i>Poa pratensis</i> | 20% |
| Red Fescue | <i>Festuca rubra</i> | 20% |
| Alfalfa | <i>Medicago sativa</i> | 10% |

These two seed mixes were used to revegetate a number of areas of the mine site between 2003 and 2006 (see Sections 2.0 and 3.0).

Alexco Resources Inc. acquired a new seed mix in early 2006.

The ‘Brewery Creek Blend’ consisted of:

| Common Name | Scientific Name | Percentage by Weight |
|-----------------------|----------------------------|----------------------|
| Violet Wheatgrass | <i>Agropyron violaceum</i> | 36% |
| Ticklegrass | <i>Agrostis scabra</i> | 15% |
| Sheep Fescue | <i>Festuca ovina</i> | 14% |
| Rocky Mountain Fescue | <i>Festuca saximontana</i> | 14% |
| Glaucous Bluegrass | <i>Poa glauca</i> | 11% |
| Alfalfa | <i>Medicago sativa</i> | 10% |

This seed mix was used to revegetate a number of areas of the mine site in 2006 (see Section 3.0).

As detailed in Section 7 of the Heap Leach Pad Cover and Facilities Monitoring Program, and Section 6 of the Blue Zone Monitoring and Assessment Program, annual terrestrial monitoring is to be conducted on the vegetation on the Leach Pad and in the Blue Zone

WRSA. Three 5m X 5m permanent monitoring plots were therefore established in 2005 at each of the following locations:

Blue Zone WRSA
Leach Pad
Control (West of Pacific Zone)

The Blue Zone WRSA and the Leach Pad were both seeded in the fall of 2003 with the ‘leach pad’ seed mix. The control plot was seeded in the fall of 2001 with the ‘Brewery Creek’ seed mix (see Section 2.2).

A survey of the permanent monitoring plots and other revegetated areas was carried out in July 2005. Survey methods and results are presented in a report by Laberge Environmental Services (2006). The permanent monitoring plots and other revegetated areas were resurveyed on July 19th and 20th, 2006. The results of the 2006 survey are presented in this report.

2.0 2006 Survey of Permanent Monitoring Plots

2.1 Survey Methods

At each plot the following information was recorded:

- UTM coordinates
- Elevation, slope and aspect
- Vegetative cover using the following 5 grades:
 - 0-1%
 - 1-12.5%
 - 12.5-25%
 - 25-50%
 - 50-100%
- Seeded species composition
- Natural colonization by other plant species
- Root depth penetration of seeded species
- In-situ soil pH
- In-situ soil moisture (% relative saturation at bottom of test pit)
- Evidence of erosion

Site photographs were also taken.

2.2 Survey Results

Photographs of all the assessed sites are presented in Appendix A. Although at first glance it may appear that patches of the vegetated sites are dead, this is due to the pinkish-brown colour of fescue grasses, which are common throughout most of the seeded areas, and the beige colour of the wheatgrasses, ticklegrass and tufted hairgrass.

Blue WRSA - Seeded in the Fall of 2003

| | | | |

2.3 Discussion

- The pH of the soil samples from the plots were slightly more alkaline than in 2005, ranging from 6.7 to 7.0.
- The soil was significantly wetter in 2006 at the Blue Zone WRSA and the Leach Pad plots, but very similar at the control plots.
- The grades of vegetative cover remained the same at each of the plots except for an increase in cover at Plot 3 on the Leach Pad.
- The species composition of each plot was generally the same as in 2005 although at some of the plots the first two species were exchanged.
- There was a significant increase in the root depths of all the species at most of the plots.
- Overall there was an increase in the number of native species invading the plots. However, tufted hairgrass was documented in some of the plots in the Blue Zone WRSA and on the Leach Pad in 2005 but was absent in 2006.
- It appears that the eroded gullies documented in the Blue Zone WRSA plots in 2005 have been filling in.

3.0 Survey of Other Revegetated Areas

3.1 Survey Methods

A brief visual survey of other recently seeded areas of the mine site was carried out. These areas were located with the assistance of the site manager. The survey included an estimation of the overall vegetative cover, a non-quantitative seeded species composition and a record of other plant species observed colonizing the area.

3.2 Survey Results

Blue Inpit Backfill

Approximately 4.9 ha were drill-seeded in the fall of 2003 using the wet area seed mix.

Overall vegetative cover is about 80%, although a few areas have a thinner cover and a few spots were missed by the seeder.

The seeded cover is mostly Violet Wheatgrass and Tufted Hairgrass, with very little Fowl Bluegrass. White Clover is sparse and there was no evidence of Alkaligrass in 2006.

Colonizing species observed included Raspberry (*Rubus idaeus*), Lamb's-quarters (*Chenopodium album*), Common Timothy (*Phleum pratense*), Foxtail Barley (*Hordeum jubatum*) and Red Fescue (*Festuca rubra*).

Moosehead

Approximately 3.0 ha were broadcast-seeded by ATV in the fall of 2003 using the wet area seed mix.

The vegetative cover is variable, ranging from near-bare patches to 80%.

The seeded cover is mostly Tufted Hairgrass, with much less Violet Wheatgrass and Fowl Bluegrass. Alkaligrass and White Clover are sparse. In 2005 Violet Wheatgrass was the dominant species.

Colonizing species observed included Black Spruce (*Picea mariana*), Alaska Birch (*Betula neoalaskana*), Raspberry (*Rubus idaeus*), Prickly Rose (*Rosa acicularis*), Fireweed (*Epilobium angustifolium*), Arctic Lupine (*Lupinus arcticus*), Rock Harlequin (*Corydalis semipervirens*), Annual Hawk's-beard (*Crepis tectorum*), Blue-joint Reedgrass (*Calamagrostis canadensis*), Foxtail Barley (*Hordeum jubatum*) and Alpine Bluegrass (*Poa alpina*).

Moosehead Road and Main Haul Road West of Moosehead Zone

This area was seeded in the spring of 2006 with the new Brewery Creek Blend.

The area still has a very sparse vegetative cover (about 5% mainly in depressions). At the time of the survey the seeded plants were not yet sufficiently developed for identification.

Kokanee Above Pit

Approximately 11.0 ha were broadcast-seeded by ATV in the fall of 2003 using the wet area seed mix.

The vegetative cover is variable, ranging from 60 to 80%.

The seeded cover is dominated by a heavy growth of White Clover, along with Violet Wheatgrass, Fowl Bluegrass and Tufted Hairgrass. There is little evidence of Alkaligrass.

Colonizing species observed included Fireweed (*Epilobium angustifolium*), Annual Hawk's-beard (*Crepis tectorum*), Wormwood (*Artemisia* sp.) and Blue-joint Reedgrass (*Calamagrostis canadensis*).

Kokanee Inpit Backfill

Approximately 5.0 ha were broadcast-seeded by ATV in the fall of 2003 using the wet area seed mix.

The vegetative cover is variable, ranging from 60 to 80%.

The upper slopes are dominated by Fowl Bluegrass with some Tufted Hairgrass. Violet Wheatgrass is sparse. There is a heavy, although patchy, growth of White Clover. The west side of the slope has a considerable growth of Red Fescue and Kentucky Bluegrass (leach pad mix?).

Colonizing species observed included Annual Hawk's-beard (*Crepis tectorum*) and Shepherd's-purse (*Capsella bursa-pastoris*).

North Golden Inpit Backfill

Approximately 11.2 ha were broadcast-seeded by ATV in the fall 2003 using the wet area seed mix. The upper slopes were seeded in the fall of 2005 with the wet area seed mix and in the spring of 2006 with the new Brewery Creek blend.

The area has good cover, ranging from 70-90%, with the exception of a few small patches on the slope that were missed by the seeder.

The seeded cover is dominated by Violet Wheatgrass and White Clover, with lesser amounts of Fowl Bluegrass and Tufted Hairgrass. A few patches have lots of Violet Wheatgrass, Fowl Bluegrass and Tufted Hairgrass but no White Clover. Alkaligrass was not observed at this site. There are also patches of Kentucky Bluegrass and Red Fescue (leach pad mix?).

The newly seeded upper slopes have a cover ranging from 20% to 60%.

This seeded cover is dominated by Violet Wheatgrass and Alfalfa, with lesser amounts of Fowl Bluegrass, Tufted Hairgrass and Sheep Fescue.

Colonizing species observed include Balsam Poplar (*Populus balsamifera*), Felt-leaf Willow (*Salix alexensis*), Annual Hawk's-beard (*Crepis tectorum*), Fireweed (*Epilobium angustifolium*), Alpine Bluegrass (*Poa alpina*) and Ticklegrass (*Agrostis scabra*).

Lucky

Approximately 4.3 ha were broadcast-seeded by ATV in the fall 2003 using the wet area seed mix.

The area has good cover, up to 100% in most areas.

The seeded cover is dominated by Tufted Hairgrass, Violet Wheatgrass and White Clover, with lesser amounts of Fowl Bluegrass. There is no evidence of Alkaligrass but a small amount was present in 2005.

Colonizing species observed include Alaska Birch (*Betula neoalaskana*), Willow (*Salix* sp.), Raspberry (*Rubus idaeus*), Annual Hawk's-beard (*Crepis tectorum*), Fireweed (*Epilobium angustifolium*), Arctic Dock (*Rumex arcticus*), Common Yarrow (*Achillea millefolium*), Siberian Yarrow (*Achillea sibirica*), Fleabane (*Erigeron* sp.), Common Timothy (*Phleum pratense*), Blue-joint Reed Grass (*Calamagrostis Canadensis*), Ticklegrass (*Agrostis scabra*) and Horsetail (*Equisetum* sp.).

Upper Fosters

Approximately 8.0 ha were broadcast-seeded by ATV in the fall 2003 using the wet area seed mix.

The area has good cover on the lower flats, up to 90%, with a much thinner growth (about 50%) on the upper slopes.

The seeded cover is dominated by Violet Wheatgrass, Tufted Hairgrass and Fowl Bluegrass with thick patches of White Clover. Alkaligrass was not observed at this site.

Colonizing species observed include Alaska Birch (*Betula neoalaskana*), Willow (*Salix* sp.), Raspberry (*Rubus idaeus*), Annual Hawk's-beard (*Crepis tectorum*), Fleabane (*Erigeron* sp.), Common Timothy (*Phleum pratense*), Blue-joint Reed Grass (*Calamagrostis Canadensis*), Ticklegrass (*Agrostis scabra*), Bearded Wheatgrass (*Agropyron subsecundum*), Foxtail Barley (*Hordeum jubatum*) and Wood Rush (*Luzula parviflora*).

Canadian Stockpile

Approximately 1.0 ha was drill-seeded in the fall 2003 using the wet area seed mix.

The area has very good cover, nearing 100% overall.

The seeded cover is dominated by Violet Wheatgrass and White Clover, with lesser amounts of Fowl Bluegrass and Tufted Hairgrass. Alkaligrass occurs only at the base of the slope.

Colonizing species observed include Annual Hawk's-beard (*Crepis tectorum*), Common Yarrow, (*Achillea millefolium*), Blue-joint Reed Grass (*Calamagrostis Canadensis*) Foxtail Barley (*Hordeum jubatum*) and Brome Grass (*Bromus pumpellianus*).

Canadian Waste Rock Storage Area

Approximately 9.2 ha were seeded in the fall of 1997 with a bulk mixer truck using the 'Brewery Creek' seed mix. This mix included:

| | | |
|--------------------|--------------------------|-----|
| Fowl Bluegrass | (<i>Poa palustris</i>) | 17% |
| Kentucky Bluegrass | (<i>Poa pratensis</i>) | 16% |
| Wild Rye | (<i>Elymus</i> sp) | 16% |

| | | |
|----------------|-------------------------------|-----|
| Sheep Fescue | (<i>Festuca ovina</i>) | 16% |
| Red Fescue | (<i>Festuca rubra</i>) | 12% |
| Common Timothy | (<i>Phleum pratense</i>) | 10% |
| Alsike Clover | (<i>Trifolium hybridum</i>) | 8% |
| Alfalfa | (<i>Medicago sativa</i>) | 5% |

This area has a variable cover, ranging from a few nearly bare patches to 100%.

The seeded cover is dominated by Fowl Bluegrass, Red Fescue and Common Timothy, with lesser amounts of Sheep Fescue, which occurs in patchy, dense clumps. There are also large patches of Alsike Clover and Alfalfa. There was no evidence of Kentucky Bluegrass or Wild Rye.

Colonizing species observed include Trembling Aspen (*Populus tremuloides*), Willow (*Salix* sp.), Fireweed (*Epilobium angustifolium*), Annual Hawk's-beard, (*Crepis tectorum*), Common Yarrow (*Achillea millefolium*), Smooth Brome (*Bromus inermis*) and Blue-joint Reed Grass (*Calamagrostis canadensis*).

Pacific

Approximately 11.7 ha were broadcast-seeded in the fall of 2001 using the second 'Brewery Creek' seed mix. This mix included:

| | | |
|-----------------------|-----------------------------------|-----|
| Violet Wheatgrass | (<i>Agropyron violaceum</i>) | 35% |
| Slender Wheatgrass | (<i>Agropyron trachycaulus</i>) | 13% |
| Fowl Bluegrass | (<i>Poa palustris</i>) | 16% |
| Alpine Bluegrass | (<i>Poa alpina</i>) | 13% |
| Sheep Fescue | (<i>Festuca ovina</i>) | 13% |
| Rocky Mountain Fescue | (<i>Festuca saximontana</i>) | 10% |

This steep slope has a variable cover, ranging from 50-100%.

The seeded cover is dominated by Fowl Bluegrass, Violet and Slender Wheatgrass, Sheep and Rocky Mountain Fescue, with lesser amounts of Alpine Bluegrass.

Colonizing species observed include Fireweed (*Epilobium angustifolium*), Arctic Dock (*Rumex arcticus*), Common Timothy (*Phleum pratense*) and Blue-joint Reed Grass (*Calamagrostis canadensis*).

Main Haul Road

Approximately 24.0 ha were broadcast-seeded by ATV in the spring of 2005 using the leach pad seed mix.

The main haul road now has good cover ranging from 70-100%.

The main haul road cover is a fairly even mix of Slender Wheatgrass, Kentucky Bluegrass, Red Fescue and Alfalfa.

Colonizing species observed include Annual Hawk's-beard (*Crepis tectorum*), Shepherd's-purse (*Capsella bursa-pastoris*) and Fireweed (*Epilobium angustifolium*).

Flanks of Main Haul Road West of Canadian Zone at Stream Crossing

This area was seeded in the fall of 2005 with the leach pad mix and in the spring of 2006 with the new Brewery Creek blend.

It has a good vegetative cover (up to 70%).

The seeded cover is dominated by a heavy cover of Alfalfa and Violet/Slender Wheatgrass with a little Red Fescue and Kentucky Bluegrass.

Colonizing species include patches of Annual Hawk's-beard (*Crepis tectorum*).

Valve House Road

This area was seeded in the fall of 2005 and the spring of 2006 with the wet area seed mix. It already has a good vegetative cover (up to 90%).

The seeded cover is dominated by Violet Wheatgrass and White Clover, with some Fowl Bluegrass and Tufted Hairgrass. There no evidence of Alkaligrass.

Colonizing species include Annual Hawk's-beard (*Crepis tectorum*), Tansy Mustard (*Descurainia incana*), Common Timothy (*Phleum pratense*) and Foxtail Barley (*Hordeum jubatum*).

Pipe Laydown Area

This area was seeded in the spring of 2006 with the new Brewery Creek blend.

The area now has a vegetative cover of about 40%. At the time of the survey the seeded plants were not yet sufficiently developed for identification.

Colonizing species include Annual Hawk's-beard (*Crepis tectorum*), Tansy Mustard (*Descurainia incana*), Shepherd's-purse (*Capsella bursa-pastoris*), Common Timothy (*Phleum pretense*) and Foxtail Barley (*Hordeum jubatum*).

Laura Creek Road and Lysimeter Access

This area was seeded in the spring of 2006 with the new Brewery Creek blend.

The area has a sparse vegetative cover of about 20%. At the time of the survey the seeded plants were not yet sufficiently developed for identification.

Colonizing species include Fireweed (*Epilobium angustifolium*), Shepherd's-purse (*Capsella bursa-pastoris*), Alaskan Knotweed (*Polygonum alaskanum*), Pineappleweed (*Matricaria matricarioides*) and Common Horsetail (*Equisetum arvense*).

Pond Bypass Road

This area was seeded in the spring of 2006 with the wet area seed mix.

The area has a vegetative cover of about 70%.

The seeded cover includes dense patches of White Clover with some Violet Wheatgrass, Tufted Hairgrass and Fowl Bluegrass. There is no evidence of Alkaligrass.

Colonizing species include Annual Hawk's-beard (*Crepis tectorum*), Common Yarrow (*Achillea millefolium*), Red Clover (*Trifolium pratense*), Common Timothy (*Phleum pratense*) and Smooth Brome (*Bromus inermis*).

ADR Building Site

This area was seeded in the spring of 2006 with the wet area seed mix.

The area has a vegetative cover of about 60% on the level ground but only 5% on the slope above.

The seeded cover includes patches of White Clover with some Violet Wheatgrass, Tufted Hairgrass and Fowl Bluegrass. There is no evidence of Alkaligrass.

Colonizing species include Annual Hawk's-beard (*Crepis tectorum*), Common Yarrow (*Achillea millefolium*), White Sweet Clover (*Melilotus alba*), Tansy Mustard (*Descurainia incana*) and Foxtail Barley (*Hordeum jubatum*).

Treatment Pond Area

This area was seeded in the fall of 2005 with the wet area seed mix.

The area has a variable vegetative cover ranging from 20% to 60%,

The seeded cover consists of patches of White Clover with some Fowl Bluegrass. There is no evidence of the other seeded species.

Colonizing species include Raspberry (*Rubus idaeus*), Annual Hawk's-beard (*Crepis tectorum*), Red Clover (*Trifolium pratense*), Fireweed (*Epilobium angustifolium*), Rock Harlequin (*Corydalis sempervirens*), Sheep Fescue (*Festuca ovina*), Smooth Brome (*Bromus inermis*) and Common Timothy (*Phleum pratense*).

Shale Hill

This area was seeded in the spring of 2006 with the new Brewery Creek Blend.

The area still has a very sparse vegetative cover (about 5%). At the time of the survey the seeded plants were not yet sufficiently developed for identification.

No naturally colonizing plant species were observed.

Corner of ER and Main Haul Road

This area was seeded in the spring of 2006 with the new Brewery Creek Blend.

The area still has a very sparse vegetative cover (about 5%). At the time of the survey the seeded plants were not yet sufficiently developed for identification.

Colonizing species include Annual Hawk's-beard (*Crepis tectorum*), Fireweed (*Epilobium angustifolium*), Rock Harlequin (*Corydalis sempervirens*), Arctic Lupine (*Lupinus arcticus*) and Foxtail Barley (*Hordeum jubatum*).

3.3 DISCUSSION

- The areas seeded in 2003 generally had a good vegetative cover at the time of the 2006 survey. The cover at some sites was patchy, particularly on the steeper slopes. This probably results from the increased difficulty in seeding these steeper sites and the erodability of seeds by wind and water before germination can occur.
- At the time of the 2006 survey, it was too early to properly assess the revegetation at the newly seeded sites (seeded in the fall of 2005 and the spring of 2006). The 2007 survey should provide a better indication of the success rate in these areas.
- Good colonization of native plants at all of the seeded areas, including those seeded in the spring of 2006 was observed in July 2006. The only exception to this was Shale Hill where no invading plants were observed.

4.0 RECOMMENDATIONS

As mentioned in the 2005 assessment report, new control test plots should be established farther from the mine site (possibly along the main access road). The new plots should be seeded with the same seed mix that was applied to the test plots on the Blue Zone WRSA and the Leach Pad. These new plots would assist in the investigation into the uptake of metals by seeded plant species (to be analyzed again in 2009).

Attention: Mr. Brad Thrall

**RE: TOXICITY TESTING ON SAMPLES IDENTIFIED AS BC-28 AND
PREG POND (COLLECTED ON MAY 30, 2006)
WORK ORDER: 0600232**

Dear Mr. Thrall:

We have conducted two 96-h LC50 toxicity tests using rainbow trout on the above samples, received at Golder Associates Ltd. North Vancouver Toxicology Laboratory on May 31, 2006. The tests were performed according to the Environment Canada protocol for conducting acute toxicity tests using rainbow trout (EPS 1/RM/13, Second Edition, 2000). The results of these tests are based on the appended data and are presented in Table 1.

If you wish to schedule additional testing or have any questions regarding the data presented in this report, please do not hesitate to contact me by e-mail (rharrison@golder.com) or telephone.

Yours very truly,

GOLDER ASSOCIATES LTD.

TABLE 1:
96-h Toxicity Test Results

| Sample Identification | Sample Collection Date (Time) | (95% Confidence Limits) [% vol/vol] |
|-----------------------|----------------------------------|---|
| BC-28 | May 30, 2006 (1150h) | > 100 |
| Preg Pond | May 30, 2006 (1200h) | > 100 |

Toxicity testing was carried out in accordance with applicable test methodologies and/or standards of practice. Our liability is limited solely to the cost of re-testing in the event of non-compliance with such test specifications or standards of practice. Golder accepts no responsibility or liability for the interpretation or use of these testing results by others, nor for any delay, loss, damage or interruptions of testing, collection, preparation, and delivery of samples or test results resulting from events or circumstances beyond our control.
