EXECUTIVE SUMMARY

BMC Minerals (No.1) Ltd. (BMC) is proposing to develop the Kudz Ze Kayah (KZK) Project (the Project), which is located approximately 110 km southeast of Ross River, Yukon Territory. The Project is currently undergoing a Screening Assessment by the Yukon Environmental and Socio-economic Assessment Board's (YESAB) Executive Committee, under the *Yukon Environmental and Socio-economic Assessment Act.* During the Adequacy stage of the Assessment, YESAB requested that BMC submit a number of updated water related reports, prior to YESAB preparing the draft Screening Report. This Surface Water Quality Baseline report is an update to the Kudz Ze Kayah Surface Water Quality Baseline Report (AEG, 2016) that was submitted as Appendix D-1 of the Project Proposal (BMC, 2017).

Alexco Environmental Group Inc. (AEG) was retained by BMC to conduct baseline water quality sampling for the Project in April 2015 and the program is ongoing. The program currently consists of monthly water quality sampling at twelve surface water stations located on South Creek, Fault Creek, Geona Creek, Finlayson Creek, and East Creek. This report presents the data collected between April 2015 and March 2018. These data were combined with the historical Cominco water quality surveys in 1994-1995 and subsequent water licence biannual sampling between 2002 and 2016 to evaluate the natural background chemistry of the major watercourses located on the KZK property. All creek waters were circumneutral to mildly alkaline (pH 6.7 – 8.7; median 7.7), with hardness increasing from moderately hard (South Creek and Fault Creek) to hard (Geona Creek) in the upper watershed to very hard (Finlayson Creek and East Creek) in the lower watershed.

Water quality was compared against the most recently revised water quality guidelines for protection of aquatic life established by the Canadian Council of Ministers of the Environment (CCME) or British Columbia Ministry of the Environment (BCMoE). Comparison to the guidelines indicated sporadic exceedances for fluoride, phosphorus, aluminum, arsenic, cadmium, chromium, copper, iron, selenium, and zinc. In general, more water quality guideline exceedances were noted for total metal concentrations than their dissolved counterparts, suggesting that a significant portion of the metals were particulate-bound, especially during freshet and/or other periods characterized by elevated total suspended solids (TSS) levels. The much less frequent water quality guideline exceedances observed for dissolved metals is important since it is the dissolved fraction that is the most bioavailable.

Higher total metal concentrations were measured during spring freshet due to the high run-off and associated stream flow which increased the particulate content of the streams. The exceptions to this trend were concentrations of fluoride, total selenium, uranium, and hardness, which were lowest during spring freshet and summer. Selenium, uranium, and hardness concentrations rose throughout the late fall and winter months, suggesting that groundwater is an important contributor to the surface water concentrations of these constituents. Elevated concentrations of these constituents are observed in shallow groundwaters of the Project area.

A comparison of the 1994 to 1995 results with those from April 2015 to March 2018 showed that the majority of parameters had a similar concentration range, suggesting the site water quality has remained largely unchanged in the past two decades of monitoring. Only total chromium and selenium exhibited clear differences between

the datasets, which may be attributable to differences in sampling frequency, flow conditions at the time of sampling, and pre-concentration used to improve the detection limits of these two elements in the historical dataset.

A higher frequency, five samples in 30 days sampling program was carried out at most monitoring locations in May-June 2017 and February-March 2018. Concentrations were broadly within the range of concentrations observed in May-June of 2015 and 2016 and peak concentrations in May 2017 were comparable to historical May peak concentrations. A similar observation was made for the February-March 2018 dataset, which exhibited limited variability for most parameters and returned concentrations comparable to those observed in February-March 2016 and 2017.

Overall, the three years of monthly water quality data collected between April 2015 and March 2018 have returned similar annual concentration spans and (where observed) seasonal trends at all sites. Only KZ-17 exhibited a marked difference, which is attributed to upstream beaver activity and an associated change in Geona Creek flow through a beaver dam located upstream.

LIST OF ACRONYMS

AEG	Alexco Environmental Group Inc.
BCMoE	British Columbia Ministry of Environment
BMC	BMC Minerals (No.1) Ltd.
CAEAL	Canadian Association for Environmental Analytical Laboratories
CCME	Canadian Council of Ministers of the Environment
COC	Chain of Custody
DL	Detection Limit
DOC	Dissolved Organic Carbon
IEE	Initial Environmental Evaluation
km	Kilometre
KZK	Kudz Ze Kayah
m	Metre
ORP	Oxidation-Reduction Potential
PAL	Protection of Aquatic Life
PQL	Practical Quantitation Limit
RPD	Relative Percent Difference
TCU	True Colour Unit
TSS	Total Suspended Solids
WAD	Weak Acid Dissociable

GLOSSARY

Canadian Association for Environmental Analytical Laboratories: body that oversees the accreditation of analytical laboratories in Canada.

Chain of Custody: paperwork that chronologically documents the collection, transportation, processing, and analysis of a sample.

Detection Limit: the lowest quantity of a constituent that can be distinguished from the absence of that constituent using the analytical technique employed, generally at a 1% confidence limit (i.e., it is the smallest amount of a constituent that can be measured with a 99% certainty of detection).

Dissolved Organic Carbon: concentration of organic carbon present in a water sample that has been filtered (<0.45 µm) prior to analysis.

EQWin: database management software that is used to archive and interrogate water quality data collected for the Kudz Ze Kayah Project.

Initial Environmental Evaluation: document produced by Cominco in 1996 that summarises baseline studies at the Kudz Ze Kayah property, describes the Mine plan, waste material characterization, closure plan, environmental management, potential impacts and associated mitigation measures, and socio-economic impacts associated with the Project as it was defined in 1996.

Kudz Ze Kayah: exploration property owned by BMC Minerals (No. 1) Ltd. situated in southeast Yukon, Canada.

Oxidation-Reduction Potential: a measure of how oxidizing or reducing a water sample is and can shed light on the geochemical conditions of the water body from which the water sample was collected.

Protection of Aquatic Life: subset of the CCME guidelines for the protection of freshwater aquatic life.

Practical Quantitation Limit: defined here as five times the detection limit.

Relative Percent Difference: calculated as the difference between the constituent concentrations of two replicate samples divided by the average of the two constituent concentrations, expressed as a percentage.

True Colour Unit: units used to express colour measurements.

Total Suspended Solids: concentration of particulate material of size >2 µm present in water sample.

Weak Acid Dissociable: WAD-cyanide refers to the metal cyanide species that dissociate (i.e., release free cyanide) under weakly acidic conditions (pH 4.5 to 6). Such WAD-cyanide, alongside free cyanide, is considered to be the most toxic fraction of the total cyanide concentration present in a sample.

1. INTRODUCTION

BMC Minerals (No.1) Ltd. (BMC) is proposing to develop the Kudz Ze Kayah (KZK) Project (the Project), which is located approximately 110 km southeast of Ross River, Yukon Territory (Figure 1-1). The Project is currently undergoing a Screening Assessment by the Yukon Environmental and Socio-economic Assessment Board's (YESAB) Executive Committee, under the *Yukon Environmental and Socio-economic Assessment Act.* During the Adequacy stage of the Assessment, YESAB requested that BMC submit a number of updated water related reports, prior to YESAB preparing the draft Screening Report. Subsequently, this Surface Water Quality Baseline report is an update to the Kudz Ze Kayah Surface Water Quality Baseline Report (AEG, 2016) that was submitted as Appendix D-1 of the Project Proposal (BMC, 2017).

In March 2015, a gap analysis was undertaken to review the historical baseline surface water quality data available (described in Section 1.1) and based on the review of historical data and current regulatory requirements, the baseline water quality program was designed to update the dataset and fill in any data gaps. The baseline surface water quality program was implemented in April 2015 and monthly baseline monitoring is ongoing. This report discusses data collected between April 2015 and March 2018 (Figure 1-2). This report also presents and discusses the historical surface water quality collected as part of the baseline studies in 1994 and 1995 and previously presented in the Initial Environmental Evaluation (IEE) (Cominco, 1996). Surface water quality monitoring undertaken for the Project's Type A Water Licence QZ97-026-01 as part of the bi-annual aquatic monitoring program from 2002-2016 (Laberge Environmental Services and Can-Nic-A-Nick Environmental, 2003, 2005, 2007, 2009, 2011, 2013, 2015, 2017) is also included.

Given that site activities performed to date have centred around exploration activity and associated minimal infrastructure construction (accommodation, offices, core storage and equipment laydown areas), this baseline water quality monitoring documents the natural background chemistry of the surface watercourses in the Project's local and regional study area.

1.1 BACKGROUND

1.1.1 INITIAL ENVIRONMENTAL EVALUATION BASELINE DATA

Baseline studies for surface water quality were undertaken in 1994 and 1995 by Cominco Ltd. and included in the IEE. Table 1-1, Table 1-2, and Table 1-3 present the stations sampled in 1994 and 1995, their sampling frequency, and the parameters analyzed, respectively. The sampling methods and analytical techniques employed in the 1994-1995 Cominco work were performed to industry standard and are deemed fit for use here. The detection limits reported for many constituents in the 1994 through 1995 Cominco water quality dataset are comparable to those reported in the current (April 2015 through March 2018) baseline water quality program.

The surface water quality data collected by Cominco was imported into the KZK EQWin database and a data quality assessment was performed. Some data points from Cominco were removed from the database where it was determined they did not meet the data quality assessment guidelines (i.e., detection limit above regulatory guideline). For example, although thallium was analyzed for in 1994 and 1995, all results have been removed from the database due to laboratory detection limits above the applicable guideline. Most antimony results have also been removed due to high detection limits, with the exception of a few dissolved measurements in August 1994. These amended 1994 through 1995 surface water quality data have been included in APPENDIX A.

Table 1-1: Surface Water Quality Monitoring Stations from 1994 and 1995

Station Name	Description
KZ-1	South Creek headwaters between two lakes
KZ-2	Fault Creek
KZ-3	Unnamed west-side tributary to upper lake in Geona Creek
KZ-4	Geona Creek over ABM deposit (between two small lakes)
KZ-5	Geona Creek downstream of ABM deposit
KZ-6	Unnamed east-side trib. of Geona Creek downstream of ABM deposit
KZ-7	Upper Geona Creek
KZ-8	Geona Creek 0.5 km of KZ-7
KZ-9	Lower Geona Creek
KZ-10	Lowermost small lake in upper Geona Creek
KZ-11	Uppermost headwater lake in Geona Creek
KZ-12	Uppermost lake in South Creek
KZ-13	South Creek near mouth
KZ-14	North River downstream of South Creek confluence
KZ-15	Finlayson Creek 100 m downstream of confluence with Geona Creek
KZ-16	Finlayson Creek upstream of confluence with Geona Creek
KZ-17	Geona Creek at mouth
KZ-18	Unnamed east-side tributary to Geona Creek
KZ-19	Upper East Creek
KZ-20	Middle East Creek
KZ-21	East Creek at mouth
KZ-22	Finlayson Creek 100 m downstream of East Creek
KZ-23	Lower (southern) North Lake
KZ-24	Second small lake in upper South Creek
KZ-25	Second small lake in upper Geona Creek
KZ-26	Finlayson Creek at Robert Campbell Highway
KZ-27	North River below Upper North Lake upstream of South Lake
KZ-28	Small lake in mid-reach of East Creek

1.1.2 WATER LICENCE QZ09-026-01 MONITORING

Surface water monitoring was also conducted by Cominco at stations KZ-7, KZ-9, KZ-15, KZ-16, KZ-17, KZ-21, KZ-26 and KZ-27 in August every two years between 2002 and 2016 to fulfill Water Licence QZ97-026-01 requirements. The 2016 Water Licence Monitoring report was submitted to the Yukon Water Board in February 2017 by BMC. As with the 1994 and 1995 data, some results from the Water Licence monitoring between 2002 and 2016 were removed from the database if they did not meet the data quality assessment guidelines (i.e., detection limit above regulatory guideline). These data have been included in APPENDIX A.

2. METHODOLOGY

2.1 SAMPLE LOCATIONS

The surface water quality monitoring program was re-evaluated and re-initiated in April 2015 and is currently being conducted monthly at 12 surface water sample stations (Table 2-1). Initially the current baseline program included 10 stations on South Creek, Fault Creek, Geona Creek, Finlayson Creek and East Creek (Figure 1-2). Station KZ-6, located on a Geona Creek tributary, was added to the program in December 2015. Station KZ-18, also located on a Geona Creek tributary, was added to the program in September 2016. Station KZ-37, located on Geona Creek downstream of the unnamed Geona Creek KZ-18 tributary, was added to the program in February 2017. Monitoring at station KZ-7 on upper Geona Creek was discontinued after the March 2017 sampling event. Groundwater seeps were also sampled during June, July and October 2015, and monthly June through October 2016, but were not sampled in 2017.

In addition to the regular monthly sampling, a "five samples in 30 days" sampling program was undertaken in May through June 2017 in Fault Creek (KZ-2), Geona Creek watershed (KZ-6, KZ-9, KZ-18, KZ-37, KZ-17), Finlayson Creek (KZ-16, KZ-15, KZ-22, KZ-26) and East Creek (KZ-21) to assess variability in the concentrations of major and trace constituents during the time of year when snowmelt and freshet typically causes high and variable stream flow rates. The results of these events are incorporated in the overall monitoring results and are discussed with respect to variability in Section 3.7.

A second "five samples in 30 days" sample program was carried out between February and March 2018 at seven monitoring stations on Fault Creek (KZ-2), South Creek (KZ-13), Geona Creek watershed (KZ-9, KZ-18, KZ-37) and Finlayson Creek (KZ-15, KZ-26) to assess variability of major and trace constituent concentrations during winter low flow conditions. The results of these events are also incorporated in the overall monitoring results and are discussed with respect to variability in Section 3.8.

Table 2-1 summarizes the sampling locations and their respective UTM coordinates are displayed as NAD83 UTM Zone 9.

Table 2-1: KZK Surface Water Quality Monitoring Locations

Station	Description	UTM Easting	UTM Northing
KZ-26	Finlayson Creek at Robert Campbell Highway	419,893	6,835,692
KZ-22	Finlayson Creek 100 m downstream of East Creek	417,372	6,827,796
KZ-21	East Creek at Mouth	417,494	6,827,454
KZ-16	Finlayson Creek immediately upstream of confluence with Geona Creek	414,622	6,822,352
KZ-15	Finlayson Creek 100 m downstream of confluence with Geona Creek	414,802	6,822,418
KZ-17	Geona Creek at Mouth. A new sampling station was re-established as close as possible to the original KZ-17 site. The original site is currently flooded due to a beaver dam constructed since 2008.	414,727	6,822,357
KZ-7	Upper Geona Creek near proposed ABM open pit (discontinued in April of 2017)	415,225	6,817,163
KZ-9	Geona Creek near proposed discharge location	414,686	6,819,717

Station	Description	UTM Easting	UTM Northing
KZ-18	Unnamed East tributary to Geona Creek	414,698	6,819,726
KZ-37	Geona Creek downstream of unnamed East tributary (KZ-18)	414,649	6,819,890
KZ-2	Fault Creek	414,726	6,814,654
KZ-13	South Creek near mouth	416,482	6,811,653
KZ-6	Tributary to Geona Creek	415,325	6,816,659
Seeps			
KZ-9 Seep East	Seep approximately 50 m east of Geona Creek at KZ-9	414,745	6,819,667
KZ-9 Seep West	Seep approximately 50 m west of Geona Creek at KZ-9	414,660	6,819,670
Seep 3	20 m wide seep located on west side of Geona Creek downstream of KZ-7	414,741	6,818,473
Seep 4	Wide seep network located on west side of Geona Creek upstream of KZ-7	415,123	6,816,538
Seep 5	Seep coming inside side channel of Geona Creek upstream of KZ-9	414,767	6,819,178

2.2 FIELD METHODOLOGY

Water sampling was conducted according to AEG's sampling protocols, developed following the "*Standard methods for the examination of water and wastewater*" (Rice et al., 2012), which was co-produced by the American Public Health Association, the American Water Works Association, and the Water Environment Federations. At each of the surface water monitoring stations, samples were collected midstream for analysis of general chemical parameters, total and dissolved metals, and nutrients. Samples for total and dissolved metals were filled to the brim with minimal headspace and were preserved and/or filtered. Samples for nutrients were collected and preserved with laboratory-supplied sulphuric acid. Samples for cyanide were preserved in the field with laboratory supplied sodium hydroxide.

Samples were collected in clean, laboratory prepared sample bottles appropriate for each analysis parameter. Sample collectors wore clean and new nitrile gloves at each sampling location. Bottles were capped immediately after filling. All samples were collected in labelled bottles that identified the sample location, date and time of collection, field filtering and/or preservation and analysis requested. Blind field replicates were collected during all sampling events. Trip blanks and field blanks were also collected at each sampling event.

Chain of Custody (COC) forms were completed at the time of sampling and contained all information from the sample bottle labels. COCs signed by the sampler were packed inside the coolers used to transport samples to the laboratory.

In situ water pH, specific conductance, dissolved oxygen, ORP, and temperature were measured and recorded at each surface water station using a YSI probe and multimeter calibrated according to the manufacturer's instructions on the morning of each sampling day. Water and substrate appearance was also noted for surface water stations. Field data are presented in APPENDIX A.

All samples were stored in coolers with freezer packs to remain cold (4°C), but not frozen, during sampling and during transport to Maxxam Analytics (Maxxam) in Burnaby, BC.

2.3 ANALYSES

During each of the sampling events from April 2015 to March 2018, surface water samples were analyzed for general chemical parameters, as well as total and dissolved metals, and nutrients. A list of the parameters is provided below. Stream flow measurements or stream flow estimates were made for all sites where possible. Field replicate samples were collected during each field visit to document variability between simultaneous grab samples. Photographic records of the sampling sites are provided in APPENDIX B.

Field parameters:

- pH;
- Specific conductivity;
- Temperature;
- Oxidation-reduction potential (ORP);
- Dissolved oxygen; and
- Turbidity.

Parameters measured in the laboratory:

- pH;
- Specific conductivity;
- Total suspended solids;
- Colour;
- Anion scan (chloride, fluoride, sulphate, nitrate, nitrite);
- Alkalinity and acidity;
- Ammonia;
- Dissolved organic carbon (DOC);
- Total metals (ultra-low level metals package including hardness, phosphorus and mercury);
- Dissolved metals (ultra-low level metals package including hardness, phosphorus and mercury); and
- Total and Weak Acid Dissociable (WAD) cyanide.

On March 15, 2018 monthly samples were collected to include dissolved selenium speciation (selenite [Se(IV)] and selenite [Se(VI)] for all sites. Samples were also collected at KZ-15 and KZ-37 for dissolved arsenic speciation, comprising arsenite [As(III)], arsenate [As(V)], monomethylarsonic acid (MMAs), and dimethylarsinic acid (DMAs). Brooks Applied Labs (Bothell, WA, USA) performed the selenium and arsenic speciation analysis on behalf of

Maxxam Analytics (Maxxam) in Burnaby, BC, which performed all other laboratory analyses since 2006. Maxxam is certified with the Canadian Association for Environmental Analytical Laboratories (CAEAL). The certificates of analysis provided by Maxxam for the April 2015 to March 2018 samples have been included in APPENDIX G.

The March 2018 selenium and arsenic speciation analysis was performed by ion chromatography coupled to an inductively coupled plasma collision reaction cell mass spectrometer (IC-ICP-CRC-MS). A summary of the analytical techniques used for the main constituents and the source method upon which the analyses were based are presented in Table 2-2 and Table 2-3.

Table 2-2: Analytical Methods used for Physical, Anion, and Nutrient Constituents Analyzed in the Laboratory

Constituent	Units	Reporting Detection Limit	Analytical Method	Source Method
Acidity	mg/L	0.5	Titration	2310 B (Rice et al., 2012)
Alkalinity	mg/L	0.5	Titration	2320 B (Rice et al., 2012)
True Colour	Colour units	5	Visual Comparison	2120 B (Rice et al., 2012)

2.4 QUALITY ASSURANCE/QUALITY CONTROL

Quality assurance/quality control measures implemented as part of this program generally consisted of:

- Collection, handling, storage and chemical analysis in accordance with "Standard Methods for Examination of Water and Wastewater" (Rice et al., 2012) and AEG Protocols; and
- Establishment of Data Quality Objectives and documentation of sample variability due to natural variability and analytical variability.

Relative Percent Difference (RPD) was used to determine field variability and is the difference between the sample result and replicate result, divided by the average of the sample result and replicate result and expressed as a percentage. Where analyte results have RPD greater than 25% a subsequent check was completed against the laboratory detection limit (DL) to establish if the practical quantitation limit (PQL) was met. The PQL is five times the DL and is defined as the minimum concentration that can be measured within specified limits of precision and accuracy. Both results need to be above the PQL for the analyte to be considered as 'meeting the PQL'. If one result from the sample or duplicate is greater than five times the DL and the other result is less than five times the DL then the 'PQL is not met'. An analyte with results not meeting the PQL indicates that the constituent being analyzed is not present in a sufficient amount to be reliably quantified. Typically, as parameters approach their detection limit, high variability is more likely to occur. The RPD of 25% can be used as a benchmark whereby an RPD greater than 25% warrants further comment or consideration.

2.4.1 LABORATORY QUALITY CONTROL SAMPLE ANALYSIS

Overall quality control sample analysis from method blanks, laboratory duplicates, matrix spikes and blank spikes met the Maxxam laboratory acceptability criteria and consequently the data were issued.

2.4.2 FIELD VARIABILITY

During the monitoring program, field replicates were collected to measure field variability between simultaneous grab samples. A total of 43 field replicates were collected over 36 months between April 2015 and March 2018 as part of the surface water quality monitoring program. Extra monitoring events and duplicate collection took place during spring freshet in 2016 and 2017 and during winter low flow February and March 2018. The highest variability was observed in June 2015 for a duplicate collected from KZ-9; twenty analytes had an RPD greater than 25% of which 16 met the PQL. In January 2017, duplicate analysis from KZ-26 showed 26 analytes with RPD greater than 25%, 16 of which met the PQL. The next highest variability was observed in February and August 2016 where 11 and 10 duplicate analytes met the PQL at stations KZ-7 and KZ-22, respectively. The remaining 39 duplicate samples had between zero and five analytes with RPD greater than 25% that satisfied the PQL.

For all 43 field replicates, analytes with RPD greater than 25% and meeting the PQL are provided in Table 2-4 whereas analytes that had an RPD greater than 25% and did not meet the PQL are listed in Table 2-5.

Except for the June 2015, February and August 2016, and January 2017 sampling events, there is relatively low variability between simultaneous grab samples; however, results indicate that there is natural variability at any

given sampling location. This natural variability appears to be more than the variability resulting from laboratory analytical methods. More variability was typically noted in total than dissolved samples, particularly for total aluminum (14 instances where the PQL was met; Table 2-4), total iron (13 instances), and total lead and manganese (10 instances each).

Table 2-4: Duplicate Analytes with RPD greater than 25% that met the PQL

Analyte	Number of times RPD >25% and PQL met
Aluminum (Al), total	14
Iron (Fe), total	13

2.4.3 FIELD AND TRAVEL BLANKS

Additional field quality control samples include field blanks and trip blanks, where de-ionized water is handled, processed and analyzed in the same manner as the site water samples. Blanks can provide an indication of sample contamination occurring in the field (field blank) or lab (method blanks) and at some point between these locations (trip blanks).

Concentrations of parameters should not be detectable, though a PQL of less than or equal to twice the reportable detection limit allows for slight "noise" around the detection limit.

Field blanks were processed by taking de-ionized water (analyte free media) to the sample station, opening it and exposing it to ambient air and 'collecting' it in the sample bottles. These samples were treated the same as the actual water samples, preserved and filtered as necessary, and their analysis can provide an indication of contamination that may affect the actual samples.

Forty-three field blanks were collected between April 2015 and March 2018. Field blank analytes with concentrations greater than twice the DL are shown in Table 2-6. Ammonia and alkalinity (bicarbonate) were the most frequently detected analytes greater than twice the DL in the field blanks (eleven and twelve instances, respectively). Total aluminum and zinc were detected at greater than twice the DL in eight and nine instances, respectively. Total barium and lead, and dissolved strontium were each detected in six instances at greater than twice the DL. Alkalinity (bicarbonate) was not calculated to be more than three times the DL and ammonia was also typically between two and four times the DL, with a couple of slightly higher results. Total zinc concentrations were typically between two and five times the DL in the field blanks. Aluminum concentrations in the field blanks were typically more than an order of magnitude below their respective CCME and BCMoE guidelines for the pH range of the surface waters draining the KZK Project area. Only the October 2015 field blank had a total aluminum concentration (0.017 mg/L) that was within an order of magnitude of the CCME guideline (0.1 mg/L). Nevertheless, all the samples collected for this sampling event were well below the CCME guideline, and had concentrations that spanned the blank result (0.011 – 0.028 mg/L), suggesting they were not significantly impacted by this elevated blank result. In addition, total aluminum concentrations observed across the watershed for sampling events where total aluminum was detected in the field blanks were consistent with those measured in samples collected at other non-freshet times of the year where the field blanks contained no detectable aluminum. Such contamination is likely related to the bottles, preservative and/or laboratory handling, although sporadic contamination during fieldwork cannot be ruled out.

Field blank re-analysis requests to Maxxam have indicated that sample carry-over during laboratory analysis had impacted the January, February, March and April 2016 field blank samples. Subsequent re-analysis returned fewer analytes present at twice the detection limit in these field blanks (data reported in Table 2-6). Older field blanks were not available for re-analysis and it is possible that such laboratory carry-over may have also impacted the 2015 field blank samples. This laboratory issue has been identified by Maxxam and appears to be rectified. It is AEG's opinion that the contaminant concentrations observed in the field blanks collected as part of the water quality monitoring program do not affect the data quality.

Trip blanks (sample of de-ionized water) are supplied and prepared by the lab and accompany the sample bottles provided by the lab for the monitoring program. The trip blank travels with the sample bottles to the sample stations and is returned unopened back to the lab with the collected samples. The purpose of the trip blank is to identify any potential contamination (e.g. cross contamination from other samples or ambient air conditions) to which the samples may be exposed.

Forty-three trip blanks were analyzed between April 2015 and March 2018. Seven of these trip blanks in September 2015, December 2015, May 2016, February 2017, November 2017, January 2018 and March 15, 2018 had alkalinity concentrations present at slightly greater than twice the DL. The October 2016 trip blank also showed total mercury at 2.2 times the DL. The second trip blank from June 2017 showed dissolved phosphorus at 2.2 times the DL. Dissolved barium was detected at 3.2 times the DL in the July 2017 field blank while total barium was detected at 5.9 and 7.2 times the DLs in the September and November 2017 trip blanks respectively. The remaining travel blanks had no analyte concentrations greater than twice the DL.

Since laboratory method blanks showed no notable results greater than twice the DL, it can be assumed that the original lab water is not a source of contamination. For the purposes of this data quality assessment, periodic field and trip blank results greater than twice the DL do not call sample results into question; rather the relevance and potential for actual sample results to have been affected have been considered when interpreting results.

Table 2-6: Field Blank Analytes with Concentrations Greater than twice the DL

Parameter	Units	Result	DL	Result / DL (where >2)
April 2015				
Alkalinity, bicarbonate HCO3	mg/L	1.12	0.5	2.2
Ammonia (N)	mg/L	0.0106	0.005	2.1
Nickel (Ni), total	mg/L	0.000102	0.00002	5.1
May 2015				
Dissolved Organic Carbon	mg/L	1.38	0.5	2.8
Nickel (Ni), dissolved	mg/L	0.000042	0.00002	2.1
June 2015

2.5 SURFACE WATER QUALITY GUIDELINES

Surface water quality guidelines for protection of aquatic life have been published both by Canadian Council of Ministers of the Environment (CCME, 2018) and British Columbia's Ministry of Environment (BCMoE, 2017). Both CCME and BCMoE guidelines have been considered in the discussion of the KZK surface water quality data, with preference given to the most recently revised guideline, since this will reflect the most recent science used to derive the guideline (Table 2-7).

Table 2-7: Generic Water Quality Guidelines for the Protection of Aquatic Life

Parameter	Guideline	Source
pH	6.5-9	CCME
Nitrate as N	3 mg/L	CCME
Nitrite as N	0.02 mg/L-0.2 (chloride dependent)	BCMoE
Ammonia as N	pH and temperature dependent	CCME
Free CN	0.005 mg/L	CCME
Chloride	120 mg/L	CCME
Fluoride	0.12 mg/L	CCME
Sulphate	128 – 429 mg/L (hardness dependent)	BCMoE
Total Phosphorus	>0.035 mg/L classed as eutrophic	CCME
Total Metals		
Aluminum	0.005 mg/L if pH < 6.5 0.1 mg/L if pH ≥ 6.5	CCME
Antimony	0.009 mg/L	BCMoE
Arsenic	0.005 mg/L	CCME
Boron	1.5 mg/L	CCME
Cadmium	0.00006 - 0.00037 mg/L (hardness dependent)	CCME
Chromium	0.001 mg/L (hexavalent chromium)	CCME
Copper	0.002 - 0.01 mg/L (hardness dependent)	BCMoE
Iron	0.3 mg/L	CCME
Lead	0.0034- 0.020 mg/L (hardness dependent)	BCMoE
Manganese	0.77 – 2.6 mg/L (hardness dependent)	BCMoE
Mercury	0.000026 mg/L	CCME
Molybdenum	0.073 mg/L	CCME
Nickel	0.025 – 0.15 mg/L (hardness dependent)	CCME
Selenium	0.002 mg/L	BCMoE
Silver	0.00025 mg/L	CCME
Thallium	0.0008 mg/L	CCME
Uranium	0.015 mg/L	CCME
Zinc	0.0075 – 0.188 mg/L (hardness dependent)	BCMoE
Dissolved Metals		

Parameter	Guideline	Source
Aluminum	pH dependent	BCMoE
Cadmium	0.00012 – 0.00046 mg/L (hardness dependent)	BCMoE

Concentrations of water quality analytes were examined for each station to determine percent exceedance of the associated guideline. Analytes that exhibited frequent (i.e., greater than 10% of samples collected) water quality guideline exceedances were:

- Fluoride: KZ-15 (11%), KZ-21 (80%), KZ-22 (53%), KZ-26 (24%);
- Total phosphorus (colourimetric): KZ-18 (60%), KZ-21 (10.2%);
- Total aluminum: KZ-13 (12%), KZ-26 (21%), KZ-37 (15%), KZ-9 (13%);
- Total arsenic: KZ-21 (11%);
- Total cadmium: KZ-2 (88%), KZ-7 (32%);
- Dissolved cadmium: KZ-2 (44%);
- Total chromium: KZ-13 (14%), KZ-7 (11%);
- Total copper: KZ-2 (12%);
- Total iron: KZ-21 (91%), KZ-22 (52%), KZ-26 (29%), KZ-37 (85%), KZ-9 (76%), KZ-7 (51%);
- Total selenium: KZ-2 (36%); and
- Total zinc: KZ-2 (58%), KZ-7 (37%), KZ-37 (20%), KZ-9 (11%).

2.6 DATA QUALITY ASSESSMENT

All water quality data, including the historical data collected prior to 2015, have been compiled into an EQWin database. This continually growing database allows for the assessment of temporal water quality trends for specific parameters of interest, although it is noted that higher detection limits for some parameters in the historical data limit the value of some of the older data.

An assessment of outliers has been carried out for water quality data from monitoring stations from July 1994 to March 2018. Outliers for a station dataset are considered to be results exceeding the average concentration ±3 standard deviations. There were many outliers in the historical data where the DLs were greater than the 2015 to 2018 dataset range and those values were removed from the database (not used in statistical analysis or graphs). Suspect outlier results affected by poor DLs that were within three times the detection limit were also removed from the database. It is not unexpected for historical data that have poorer detection limits relative to present standards to have a relatively high number of outliers.

Water quality data are reviewed after each monthly monitoring event in comparison to the historical data. Results that show variance from historical data are reviewed in detail to determine if lab rechecks may be required or whether or not they are representative of the station water quality.

The initial outlier assessment showed high numbers of outliers or maxima in the May 2015 spring freshet sample event for most stations, accompanied by maximum total suspended solids (TSS) concentrations for the sites. Nitrite DLs in May 2015 were raised due to sample matrix interference, subsequently these elevated DLs appeared as outliers/maxima and were removed from the dataset. Such maxima are also typical in the historical May sample event in 1995, which also had higher associated TSS concentrations. Compared to the May 2016 and May 2017 sample events, May 2015 generally had the higher discharge measurements accompanied by higher TSS and total metal concentrations. May 2016 water quality data did not vary greatly in comparison to previous samples in the six month seasonal window queried (results typically less than 3 standard deviations in comparison to historical results in the seasonal window). May 2017 water quality data showed some higher concentrations observed at several stations, particularly for sites KZ-18 and KZ-37 for which this was the first May sampling event. These observations are shown on the water quality graphs provided in APPENDIX C. Station KZ-13 had a notable outlier event on August 31, 1994 with many results establishing maximum analyte concentrations for the station detected to date. No TSS analysis was available for this event but this outlier sample could be due to a precipitation and run-off event.

The August 2008 sample event was noted to contain elevated cadmium results, many of which were also outliers, for all sites sampled with the exception of KZ-26. The reasons for this are unclear since the reported detection limit (0.00001 mg/L) was adequate; however, the field duplicate returned an RPD of 28%, suggesting there was relatively high natural variability in the sample collected. No field or trip blank data are available for this sampling event, so cadmium contamination also cannot be ruled out.

In March 2016, maxima for total acidity were observed for a number of stations (KZ-13, KZ-16, KZ-17, KZ-21 and KZ-22); however, these circumneutral to mildly alkaline waters have low acidity (less than 10 mg/L) and the majority of these maxima were within an order of magnitude of the detection limit (0.5 mg/L).

During the August 2016 sampling event, high water levels and increased discharge were noted at many stations along with turbid water. Consistent with the high flow conditions, turbidity maxima were observed at sites KZ-15, KZ-17, KZ-2, KZ-21, KZ-22, KZ-7 and KZ-9. Sites KZ-2, KZ-7, KZ-9, KZ-21, KZ-22 and KZ-26 experienced elevated TSS during the August 2016 sampling event and most of these sites also had outliers or maxima established for several total metals and a few of the dissolved counterparts as well.

Outliers for ammonia concentrations were also observed during the October 2016 sample event (KZ-15, KZ-16, KZ-17, KZ-22 and KZ-26). These samples, alongside KZ-21 which also returned an elevated ammonia concentration relative to its dataset, comprised the entire sample submission, suggesting that laboratory error may have been responsible for these high ammonia levels. These results were reported after the hold time for ammonia (10 days) had elapsed, therefore, a re-run was not requested; however, the ammonia data for these samples should be treated with caution.

On December 19, 2016 KZ-26 showed elevated TSS for this site (32.1 mg/L) with associated elevated total aluminum and iron. While TSS remains in the database the elevated aluminum and iron results were deemed non-representative and removed from the database.

In February 2017, due to sediment disturbance by the ice auger at KZ-15, notably elevated results for total metals and colourimetric phosphorus were deemed non-representative and removed from the dataset.

On February 21, 2018, site KZ-26 was visited in the morning with no water located. The site was revisited in the afternoon with water located between layers of overflow further upstream. Prior to KZ-26 being revisited, salt slug flow measurements were conducted several kilometers upstream earlier in the day. Water quality results appeared to be non-representative with the upstream salt slug having affected sample results, therefore, KZ-26 water quality results from February 21, 2018 were removed from the database.

Results removed from the database are typically historic data that are less than an elevated DL or near to these poor DLs between 1994 and 2010. Some outlier historic results have also been removed due to suspected contamination as noted by the lab. As noted above, challenges with winter sampling can also result in non-representative water quality data that is removed from the database.

3. RESULTS AND DISCUSSION

To simplify the discussion of water quality data, results are delineated by geography in terms of the major watercourse. The in situ and CCME/BCMoE-regulated anion (sulphate, chloride, fluoride, cyanide, nitrite, nitrate) and nutrient (ammonia, phosphorus) parameters are discussed for each watercourse. Constituents such as hardness and dissolved organic carbon that act as modifiers of metal toxicity are also discussed, whereas only those elements that exhibited BCMoE or CCME exceedances in greater than 10% of samples collected at any site across the KZK surface water quality monitoring locations are examined (aluminum, arsenic, cadmium, chromium, copper, iron, selenium, and zinc). Ongoing waste rock geochemical testing has indicated that antimony and uranium may be constituents of concern from a waste rock metal leaching perspective, so they have also been included in the summary statistic tables; however, they have not exceeded the applicable BCMoE/CCME guidelines in surface water quality sampling performed to date. All the summary statistics tables are based on the water quality dataset collated from the Cominco sampling (1994 and 1995), water licence sampling (biannual sampling in August between 2002 and 2016), and currently available baseline water quality sampling data (April 2015 to March 2018). Where results were below laboratory detection levels one half the detection limit was used in the calculation of summary statistics, as well as presented on graphs. Figures that present the temporal changes in the concentration of metals of interest are present in APPENDIX C.

3.1 SOUTH CREEK

3.1.1 SETTING

South Creek is approximately 5 km long and originates upstream of two small ponds located at the watershed divide between South Creek and Geona Creek (Figure 1-2). The creek flows south through two small ponds before entering a scrub-birch and subalpine fir dominated area before finally entering the North River. The creek has been influenced by historical beaver activity, but still maintains a main channel that runs from the outlet of the second pond until it reaches the North River. One water quality station is located on South Creek at KZ-13, which is situated at the mouth of South Creek before entering the North River. Photos of KZ-13 can be found in APPENDIX B (page B-1).

3.1.2 PHYSICAL PARAMETERS AND NUTRIENTS

South Creek waters, monitored at KZ-13, were circumneutral (pH range 6.82 to 8.08; median pH 7.7; Table 3-1) and well oxygenated (68 to 110% saturated). Water sampled at KZ-13 was also relatively dilute (median field specific conductance 158 µS/cm and total hardness of 71 mg/L) compared to the other surface water quality monitoring sites that are regularly sampled as part of the Project. Temperature ranged seasonally between 0°C and 10°C.

No CCME or BCMoE exceedances were recorded for any of the anions or nutrients monitored at KZ-13. Nitrogen species (nitrate, nitrite, cyanide, and ammonia) were typically below or marginally above the detection limit, with the exception of nitrate-N, which was detected in the majority of samples (0.0046 to 0.16 mg/L, median 0.062 mg/L; Table 3-2), but well below its CCME guideline (3 mg/L). Nitrate-N concentrations were typically

highest during the winter months; primary producers are significant consumers of nitrate in aquatic systems, therefore, lower primary productivity due to winter conditions may be responsible for the higher nitrate-N levels observed at this time.

Dissolved organic carbon (DOC) has only been monitored since 2015 and ranged between less than 0.5 and 11 mg/L (median 3.3 mg/L). DOC peaked during the May 2015 and 2017 freshets as snowmelt rinsed the surrounding organic soils, flushing organic carbon into the streams. The freshet DOC peak in 2015 coincided with the peak in colour (122 true colour units (TCU); median 17 TCU), likely due to the presence of humic substances in the DOC that lend a brown colouration to the water.

[a] Indicates lowest detection limit available for BMC fieldwork (i.e., April 2015 to March 2018). Occasional samples had higher detection limits due to dilution required for some analyses.
[b] Blue bold highlighted entries indicate a CCME or BCMoE guideline exceedance; hardness/pH/temperature-dependent guidelines indicated by a range.

3.1.3 METALS

Total concentrations of arsenic, cadmium, copper, iron and zinc showed sporadic water quality guidelines exceedances (Table 3-3). Exceedances were typically coincident with elevated levels of particulate; the exceedances on May 12, 2015 (0.00011 mg/L cadmium, 1.34 mg/L iron, 0.0026 mg/L copper) were accompanied by a relatively high TSS measurement. While there was no TSS measurement in the August 31, 1994, total arsenic (0.007 mg/L), iron (9.43 mg/L), and copper (0.022 mg/L) were over an order of magnitude higher than their dissolved counterpart, indicating significant particulate transport at the time of sampling (APPENDIX A). Sporadic BCMoE exceedances for total zinc were also observed during high TSS conditions during the freshet events of 1995 (May and June) and 2015 (May). Dissolved zinc concentrations for these three sampling events were markedly lower than their total counterparts and below the BCMoE threshold. Such elevated TSS is related to higher amounts of run-off during snowmelt and precipitation, resulting in a higher particulate load due to erosive transport and potential resuspension of stream sediments during higher flows.

More frequent exceedances (12 to 14% of samples) were observed for total aluminum and chromium (Table 3-3). The average total aluminum concentration was in exceedance of its guideline, although it should be noted that the maximum total aluminum concentration observed (3.25 mg/L) was almost an order of magnitude higher than the next highest concentration, which has skewed the average concentration. The guideline exceedances observed for total aluminum concentrations generally occurred during periods of elevated TSS, typically during freshet (May-June). Although total chromium concentrations also exceeded the CCME guideline during high TSS sampling events, total chromium was also elevated at other sampling events that were not characterized by high levels of TSS or discharge. In general, more water quality guideline exceedances were noted for total metal concentrations than their dissolved counterparts, suggesting that a significant portion of the metals were particulate-bound, especially during freshet and/or other periods characterized by elevated TSS levels.

Overall, total concentrations of most elements of interest (with the exception of selenium) were at their highest during freshet, when enhanced run-off and associated higher flow rates resulted in erosive transport of particulate material. The concentration of most elements did not follow a clear seasonal trend for the remainder of the year with the exception of selenium, uranium, and hardness. Concentrations of total selenium, uranium, and hardness were typically at their lowest over freshet and summer, then increased over the late fall and winter months (APPENDIX C, Figures C-18, C-24, and C-22, respectively). This suggests that selenium, uranium, and hardness levels are influenced by groundwater, since the groundwater contribution to surface waters is highest during winter baseflow conditions. Indeed, groundwater monitoring data from wells installed on the Project site indicate that selenium (less than 0.00004 to 0.0032 mg/L), uranium (0.0006 to 0.014 mg/L), and hardness (96 to 750 mg/L) concentrations in shallow groundwater either overlap or markedly exceed the range of concentrations observed in South Creek. Speciation analysis of the March 15, 2018 KZ-13 sample indicated that dissolved selenium was exclusively present in its oxidized form, selenate.

3.2 GEONA CREEK WATERSHED

3.2.1 SETTING

Geona Creek is approximately 8 km in length, originating on the north side of the watershed divide of South Creek and Geona Creek (Figure 1-2). Geona Creek's headwaters consist of a series of small ponds that flow north for approximately 2 km before eventually entering a well-defined channel. This channel flows north for approximately 6 km through a broad valley until it eventually converges with Finlayson Creek. A few small ponds can be found intermittently throughout Geona Creek and are suspected to be the result of historical beaver activity. Four water quality stations are located on Geona Creek: KZ-17, KZ-37, KZ-9, and KZ-7 (discontinued after March 2017). KZ-17 is located at the mouth of Geona Creek, KZ-37 is located downstream of the tributary monitored at KZ-18, KZ-9 is located near the proposed discharge location, and KZ-7 is located in upper Geona Creek near the proposed open pit. Water quality station KZ-6 is located on a tributary to Geona Creek, upstream of KZ-7. Station KZ-18 is located on a tributary which enters Geona Creek approximately 100 m downstream of KZ-9. Photos of KZ-18, KZ-17, KZ-37, KZ-9, KZ-7 and KZ-6 can be found in APPENDIX B (pages B-2 to B-7).

Fault Creek is approximately 2 km in length and is a mountainous alpine stream confined by a narrow valley. Fault Creek converges with Geona Creek near its headwaters and is highly braided before entering Geona Creek. One water quality station is located on Fault Creek at KZ-2. Photos of KZ-2 can be found in APPENDIX B (page B-8).

3.2.2 PHYSICAL PARAMETERS AND NUTRIENTS

Geona Creek waters (KZ-7, KZ-9, KZ-37 and KZ-17) and its tributaries (KZ-6 and KZ-18) were circumneutral (pH range 6.7 to 8.7; Table 3-4 to Table 3-9) and well oxygenated (median 78 to 92% saturated). The median pH at KZ-9 (pH 7.42) was lower than that of the upstream sites KZ-7 and KZ-6 (median pH 7.67 and 7.95, respectively), perhaps due to the influence of the nearby KZ-9 East Seep, which had a much lower pH range (pH 5.78 to 5.99; Table 3-25). Seep 5, located upstream of KZ-9, also had sporadically low pH waters (pH 5.95 to 7.85; median pH 6.73) which may contribute to the lower pH observed at KZ-9 relative to the upstream Geona Creek waters. Temperature varied seasonally between -0.5 and 12°C. The pH in Geona Creek at KZ-37 (median pH 7.42), downstream of KZ-9 and the confluence with the unnamed creek monitored at KZ-18, was comparable to that at KZ-9.

Fault Creek waters, as monitored at KZ-2, were also circumneutral (pH 7.2 to 8.2) and typically well oxygenated (median 90% saturation; Table 3-10). Fault Creek was more dilute than Geona Creek, as indicated by its lower conductivity (median 223 µS/cm at KZ-2 compared to median 276 – 336 µS/cm at sites on Geona Creek) and lower total hardness (median 111 mg/L compared to median 148 to 189 mg/L in Geona Creek).

[a] **Blue bold highlighted entries indicate a CCME or BCMoE guideline exceedance.**

Fluoride and phosphorus were the only anions or nutrients monitored on Geona Creek to exceed the CCME or BCMoE guidelines. Fluoride marginally exceeded the CCME guideline (0.12 mg/L) for the April 2015 sampling event at KZ-17 (0.14 mg/L). The median fluoride concentration at this site was 0.086 mg/L (Table 3-16). Phosphorus marginally exceeded the CCME eutrophic total phosphorus threshold (0.035 mg/L) for the May 2017 sampling event at KZ-9 (0.035 mg/L) and at KZ-37 (0.045 mg/L). The median phosphorus concentrations at KZ-9 and KZ-37 were 0.0044 and 0.0090 mg/L, respectively.

No water quality guideline exceedances were noted for anions or nutrients in either of the tributaries to Geona Creek, with the exception of total phosphorus at station KZ-18 (Table 3-14). The CCME phosphorus threshold was exceeded in 60% of the samples at KZ-18 (median 0.036 mg/L). Phosphorus loading to Geona Creek from this tributary is reflected in the increase in phosphorus concentrations from KZ-9 to KZ-37, which are upstream and downstream of the tributary, respectively.

Nitrogen species (nitrate, nitrite, cyanide, ammonia) were typically below or marginally above the detection limit, with the exception of nitrate-N, which was detected in the majority of samples collected at the Geona Creek sites (less than 0.010 – 0.72 mg/L, median 0.06 – 0.17 mg/L; Table 3-11 to Table 3-16), but well below its CCME guideline (3 mg/L). Nitrate-N concentrations were close to an order of magnitude higher during the winter months, likely due to a lack of primary productivity over these months, which would otherwise limit dissolved nitrate concentrations.

DOC, monitored only since 2015, ranged from less than 0.5 and 24.6 mg/L (median 1.4 to 1.8 mg/L) for the Geona Creek and associated tributary sites. DOC peaked during the May 2015 and May 2017 freshets as snow melt rinsed the surrounding organic soils, flushing organic carbon into the streams. The May 2015 freshet DOC peak coincided with the peak in colour measurements in Geona Creek (218 to 242 TCU; median 8.0 to 15 TCU), due to the high DOC concentrations (colour measurements were not obtained in 2017). A spike in DOC and colour levels was also observed in May 2016, however, the DOC peaks were more muted than in 2015 and 2017. It is hypothesized that the higher DOC levels observed in May 2015 and 2017 likely reflect sampling closer to peak freshet conditions, whereas the May 2016 sampling event possibly captured early freshet conditions.

No CCME or BCMoE exceedances were recorded for any of the anions or nutrients monitored on Fault Creek (Table 3-17). As noted for Geona Creek, the nitrogen species concentrations in Fault Creek were typically below the detection limit or slightly above it (Table 3-17). Only nitrate-N was consistently detected, with higher concentrations observed during the winter months. DOC concentrations in Fault Creek (median 0.9 mg/L), which were approximately two-fold lower than those observed in Geona Creek, exhibited a peak during freshet (5.8, 2.5, and 6.7 mg/L in May 2015, 2016 and 2017, respectively), coincident with the peak colour observed at these periods (APPENDIX A).

3.2.3 METALS

The tributary sites exhibited the fewest water quality guideline exceedances (one total aluminum and chromium exceedance at KZ-18 and three for total aluminum, two for total iron and one each of cadmium, chromium, and zinc for KZ-6; Table 3-21 and Table 3-18). The total aluminum, iron and zinc exceedances for KZ-6 in the May 1995 sampling event coincided with elevated TSS levels related to freshet. The total cadmium exceedance (0.000135 mg/L) at KZ-6 occurred in May 2017 along with a total aluminum and iron exceedance and relatively high flow and somewhat elevated TSS related to freshet. The dissolved cadmium concentration was two-fold lower than the total concentration in this sample indicating particulate transport by high spring flows was significant. The high chromium concentrations for KZ-6 and KZ-18 were observed in the August 1994 and August 1995 sampling events, respectively. The high total aluminum concentration at KZ-18 was observed in May 2017 during freshet.

Moving downstream, occasional exceedances were observed for total aluminum and copper at site KZ-7 (Table 3-19). These typically occurred during high flow periods such as freshet (April 1995, iron; May 2015, aluminum and copper) or following high rainfall events (August 2016, aluminum) when TSS levels were high and the particulate fraction hosted a significant portion of the metal load. The elevated total aluminum concentration (0.128 mg/L) observed at KZ-7 for the January 2017 sampling event was also associated with TSS (21 mg/L) and the dissolved aluminum concentration was approximately two orders of magnitude lower.

More frequent (greater than 10%) water quality guideline exceedances were observed at KZ-7 for total chromium (11% of samples), cadmium (32% of samples), zinc (37% of samples), and iron (51% of samples; Table 3-19). No clear seasonal trend was observed for these exceedances, although the lack of exceedances for dissolved chromium, and fewer exceedances observed for dissolved cadmium (8% of samples), dissolved zinc (12% of samples), and dissolved iron (3% of samples) suggests that particulate-associated metal was responsible for the majority of these exceedances (APPENDIX A). Total chromium exceedances were confined to the 1995 dataset.

Further downstream at site KZ-9, the same suite of elements exceeded their respective water quality guideline for at least one sampling event. Total concentrations in excess of their respective water quality guidelines were observed for aluminum (seven times, or 13% of samples), cadmium (three times, 6%), chromium (two, 4%), copper (two, 4%), iron (42, 76%), selenium (three, 6%), and zinc (six, 11%) (Table 3-20). High flow conditions associated with freshet (May 2015, 2016 and 2017 and June 2017) or heavy precipitation (August 2016) accounted for the majority of these exceedances. Dissolved metals were generally present at levels below their water quality guidelines for these sampling events, indicating the total exceedances were largely related to particulates. More total iron exceedances were noted for KZ-9 (76% of samples) than at upstream sites on Geona Creek (4%, 5%, and 51% of samples at KZ-17, KZ-6, and KZ-7, respectively). The high total iron concentrations were less freshet-dependent than other elements and may be related to inputs from the KZ-9 East Seep, which had particularly high concentrations of dissolved iron (0.5 to 13 mg/L, median 4.2 mg/L; Table 3-27). It is also important to note that a significant proportion of the iron at KZ-9 is particulate-bound as dissolved iron concentrations (median 0.11 mg/L) only exceeded the CCME guideline in three of 55 samples (6%).

Similar water quality was observed farther down Geona Creek at KZ-37, downstream of the unnamed tributary monitored by KZ-18, where total aluminum, cadmium, copper, and zinc concentrations were in excess of their respective guidelines in one to four samples (Table 3-22). These four elements all exceeded their respective guidelines in the May 17, 2017 sampling event when high flow and high TSS related to freshet was also observed. Additional aluminum and zinc exceedances were confined to May and June 2017 samples and were also related to relatively high flow and TSS conditions associated with freshet and snowmelt. Total iron concentrations were also commonly in excess of the CCME guideline (0.3 mg/L). As discussed for KZ-9, the higher iron concentrations are less dependent on freshet and high TSS events and could be related to inputs from the KZ-9 East Seep upstream. Like at KZ-9, particulate-bound iron contributes a high proportion of total iron at KZ-37; no dissolved iron concentrations exceeded the CCME guideline at KZ-37.

KZ-17, located farther downstream on Geona Creek, exhibited occasional exceedances for total aluminum (one), arsenic (one), cadmium (two), chromium (three), copper (one), iron (two), and zinc (one; Table 3-23). The majority of these guideline exceedances occurred in the May 2015 sampling event. As observed at other sites, the dissolved concentrations of these elements were markedly lower for this sampling event, pointing towards the particulate nature of these exceedances. The few other total cadmium and chromium exceedances did not appear to follow a seasonal trend.

Overall, total concentrations of most constituents of interest (with the exception of hardness, selenium and uranium) were at their highest during freshet or following the high rainfall event in August 2016, when enhanced run-off and associated higher flow rates resulted in erosive transport of particulate material. The concentration of most elements did not follow a clear seasonal trend for the remainder of the year with the exception of total iron, arsenic, selenium, uranium, and hardness. Total iron and arsenic concentrations broadly appeared to rise over the winter months for sites KZ-9 and KZ-18, and, to a lesser degree, downstream at KZ-37 (APPENDIX C, Figure C-14), which may be related to the greater proportional input of load from the iron-rich seeps located immediately upgradient of KZ-9 (Seep 5 and KZ-9 East Seep) during the lower flow winter period. Concentrations of total selenium, uranium, and hardness were typically at their lowest at freshet, then increased over the winter months (APPENDIX C, Figures C-18, C-24, and C-22, respectively). This suggests that selenium, uranium, and hardness levels are influenced by groundwater, since the groundwater contribution to surface waters is highest during winter baseflow conditions. Speciation analysis of the March 15, 2018 surface water samples indicated that dissolved selenium was exclusively present in its oxidized form, selenate, at all sites. Arsenic speciation conducted on the KZ-37 sample also indicated that arsenate, the most oxidized form of arsenic, was the only species that was detected.

Interestingly, although the concentrations and seasonal trends of most constituents were comparable for all three years of sampling, total concentrations of arsenic, aluminum, cadmium, iron, and zinc at KZ-17 appeared to be lower in the September 2016 to March 2018 sampling period than in the prior April 2015 to August 2016 sampling period (Figures C-3, C-7, C-9, C-15, and C-21). This was most pronounced for total iron (Figure C-15). This is ascribed to beaver activity immediately upstream of this site and a change in the flow of Geona Creek through a beaver dam located upstream of KZ-17. It is hypothesized that the retention of any Geona Creek water in the beaver dam was increased from September 2016 onwards, resulting in greater opportunity for removal of constituents via precipitation and adsorption.

Fault Creek waters showed sporadic exceedances for total chromium, aluminum (one sample each), and copper (six samples) with more frequent exceedances observed for total selenium (36% of samples), total zinc (58% of samples) and total cadmium (88% of samples). Total selenium exceedances appeared to occur during the winter months (April 2015, January to May 2016, December 2016 to April 2017, and December 2017 to March 2018), whereas total zinc concentrations generally did not exceed its water quality guideline during winter since the hardness-dependent BCMoE threshold was highest over winter due to the higher hardness observed during that time. Total cadmium exceedances occurred throughout the year. Dissolved zinc and cadmium concentrations showed a similar exceedance frequency to their total counterparts and comprised the bulk of the total concentration, indicating that both zinc and cadmium were primarily transported in dissolved form.

Similar to Geona Creek, the total concentrations of most analytes in Fault Creek exhibited maxima during periods of high flow (spring freshet, heavy rainfall events) with the exception of selenium, uranium, and hardness. These parameters were at their lowest between the spring and summer, then increased steadily through the late fall and winter. This suggests that selenium, uranium, and hardness levels are influenced by groundwater, since the groundwater contribution to surface waters is highest during winter baseflow conditions. Indeed, groundwater monitoring data from wells installed on the Project site indicate that selenium (less than 0.00004 to 0.0032 mg/L), uranium (0.0006 to 0.014 mg/L), and hardness (96 to 750 mg/L) concentrations in shallow groundwater either overlap or markedly exceed the range of concentrations observed in both Geona Creek and Fault Creek.

[a] Indicates lowest detection limit available for BMC fieldwork (i.e., April 2015 to March 2018). Occasional samples had higher detection limits due to dilution required for some analyses.

[b] Blue bold highlighted entries indicate a CCME or BCMoE guideline exceedance; hardness-dependent guidelines indicated by a range.

[a] Indicates lowest detection limit available for BMC fieldwork (i.e., April 2015 to March 2018). Occasional samples had higher detection limits due to dilution required for some analyses.

[b] Blue bold highlighted entries indicate a CCME or BCMoE guideline exceedance; hardness-dependent guidelines indicated by a range.

3.3 GEONA CREEK SEEPS

3.3.1 SETTING

Numerous seeps can be observed along the Geona Creek drainage, five of which were sampled between June 2015 and October 2016 to gain an understanding of their chemistry and how it compares to that of Geona Creek. KZ-9 East Seep and West Seep are located near water quality station KZ-9 on the east and west side of Geona Creek at about 50 m and 30 m from the creek, respectively (Figure 1-2). KZ-9 East Seep has an orange colour and bubbles can be seen coming up, whereas KZ-9 West Seep does not have a distinctive colouration or noticeable bubbles. Moving upstream along Geona Creek, Seep 5 is located on the east side of Geona Creek, and enters as a side channel of Geona Creek. It has a distinct orange colour and bubbles can be observed coming up. Further upstream, Seep 3 is located on the West side of Geona Creek and is approximately 20 m wide. It is located further up the hillside compared to the previous three seeps (about 100 m from the creek) and has no distinct colouration or noticeable bubbles. Finally, Seep 4 is located upstream of water quality station KZ-7 and about 140 m from Geona Creek, and is part of a wide seep network on the west side of Geona Creek; algae growth can be observed in some of the more stagnant areas. Photos of all seeps can be found in APPENDIX B (page B-9).

3.3.2 PHYSICAL PARAMETERS AND NUTRIENTS

Seep 3, Seep 4 and the KZ-9 West Seep shared similar circumneutral to mildly alkaline pH (pH 7.3 to 8.1) and oxygen content (72 to 98% saturation) ranges (Table 3-25). In contrast, the KZ-9 East Seep, and to a lesser extent Seep 5, had a lower pH range (pH 5.8 to 6.0 for KZ-9 East Seep and pH 6.0 to 7.9 for Seep 5) and lower oxygen content (21 to 54% saturation for KZ-9 East Seep and 26 to 128% saturation for Seep 5). Both of these seeps were also characterized by orange precipitates, likely composed of poorly crystalline iron oxyhydroxides. The measurable dissolved iron concentrations in these waters (Table 3-27 and Table 3-31), and typically lower dissolved oxygen content relative to the other seeps suggest that suboxic groundwater discharges here. Upon exposure to the atmosphere, the dissolved ferrous iron oxidizes rapidly to precipitates, producing the orange ochreous precipitates observed at the KZ-9 East Seep and Seep 5. This process also produces acidity, leading to the lower pH observed at both these sites.

No CCME or BCMoE guideline exceedances were recorded for any of the anions or nutrients monitored in the five seeps with the exception of fluoride in the KZ-9 East Seep (0.86 to 0.97 mg/L; Table 3-26), which was seven times higher than the CCME guideline (0.12 mg/L).

3.3.3 METALS

The dissolved concentrations of metals of interest in the seep waters are presented in Table 3-27 to Table 3-31. Dissolved aluminum and dissolved iron exceeded their respective BCMoE guidelines in the majority of KZ-9 East Seep samples (Table 3-27). The aluminum exceedance is partly due to the relatively low pH of the seep waters, which enhances aluminum solubility. Seep 5 waters also returned samples with dissolved iron exceedances (Table 3-31). The elevated iron concentrations (0.5 to 13 mg/L) observed in both these seeps are likely due to iron(III)-reducing conditions present in the aquifer which feeds them. This is evidenced by the low dissolved oxygen, low nitrate concentration, and elevated manganese concentrations (1.8 to 2.2 mg/L for KZ-9 East Seep and 0.016 to 0.58 mg/L for Seep 5) relative to the other seeps that were not characterized by an orange precipitate. Nitrate- and manganese(IV)-reduction are thermodynamically more favourable than iron(III)-reduction, hence the relatively low nitrate concentrations and elevated dissolved manganese (due to the reductive dissolution of oxidized manganese minerals) would be expected as precursors to iron(III)-reduction. Under iron(III)-reducing conditions, poorly crystalline ferric oxyhydroxide phases undergo reductive dissolution, resulting in the elevated levels of dissolved ferrous iron observed. Upon exposure to the atmosphere, oxidation of the dissolved ferrous iron and subsequent precipitation of ferric oxyhydroxide precipitates is rapid, giving rise to the orange colouration observed at these sites and the lower pH, since hydrolysis of ferric iron is an acid-producing reaction.

As noted in Section 3.2.2, the lower pH of the KZ-9 East Seep and Seep 5 may contribute to the slightly lower pH of Geona Creek water observed immediately downgradient at site KZ-9 relative to the upstream site KZ-7. The relatively high iron content of these two seeps, particularly KZ-9 East Seep, may also contribute to the rising trend in total iron concentrations noted at KZ-9 over the winter months. This is when the relative contribution of these seeps and other groundwater sources to Geona Creek might be expected to peak under the winter low surface flow conditions.

Seep 5 samples also showed occasional exceedances for dissolved cadmium, zinc, and copper (Table 3-31). The KZ-9 West Seep returned dissolved selenium concentrations (0.0020 – 0.0036 mg/L) that were marginally above the BCMoE guideline (0.002 mg/L). No parameters of interest in samples collected from Seeps 3 and 4 exceeded any water quality guidelines (Table 3-29 and Table 3-30).

3.4 FINLAYSON CREEK

3.4.1 SETTING

Finlayson Creek in its entirety is approximately 38 km in length, with 28 km of its reach located downstream of the potential zone of influence of the Project (Figure 1-2). Finlayson Creek originates west of the Project area and flows northeast until eventually draining into the Finlayson River. Four water quality stations are located on Finlayson Creek: KZ-16, KZ-15, KZ-22, and KZ-26. KZ-16 is located immediately upstream of the confluence with Geona Creek, KZ-15 is located 100 m downstream of the confluence with Geona Creek, KZ-22 is located 100 m downstream of the confluence with East Creek and KZ-26 is located at the convergence of Finlayson Creek and the Robert Campbell Highway. Photos of Finlayson Creek can be found in APPENDIX B (pages B-10 to B-13).

3.4.2 PHYSICAL PARAMETERS AND NUTRIENTS

Finlayson Creek waters (KZ-16, KZ-15, KZ-22, and KZ-26) were circumneutral to mildly alkaline (pH range 6.9 to 8.5; Table 3-32 to Table 3-35) and well oxygenated (median 91 to 95% saturation). Temperature varied seasonally between -0.6 and 11.5°C. The median pH at KZ-26 (pH 8.04), the most downstream station, was higher than that of the three upstream sites (median pH 7.64 to 7.81), suggesting downstream input(s) of alkalinity, likely from tributaries to Finlayson Creek (i.e., Geona Creek, East Creek, and others) that enter upstream of KZ-26, as concentrations of both hardness and alkalinity increased progressively at each monitoring site along the reach of Finlayson Creek (Figure 1-2, Table 3-40 to Table 3-43, and APPENDIX A).

No CCME or BCMoE exceedances were recorded for any of the anions or nutrients monitored on Finlayson Creek with the exception of total phosphorus and fluoride. Total phosphorus CCME eutrophic (greater than 0.035 mg/L) exceedances were observed for the two farthest downstream sites (KZ-22 and KZ-26) and coincided with elevated TSS levels. Three sampling events returned elevated total phosphorus concentrations in May 2015 (0.051 mg/L), August 2016 (0.068 mg/L), and May 2017 (0.043 mg/L) at site KZ-22. These events were associated with elevated TSS (6.8 to 34 mg/L vs median of 1.6 mg/L) due to high flow conditions associated with freshet (May 2015, 2017) and following heavy rain (August 2016). Five sampling events at site KZ-26 returned total phosphorus concentrations that were marginally above the CCME eutrophic threshold in May 1995 (0.042 mg/L), July 2016 (0.036 mg/L), August 2016 (0.037 mg/L), June 2017 (0.061 mg/L), and July 2017 (0.095 mg/L). All five sampling events were associated with high TSS and high flow periods. The dissolved phosphorus concentrations for all these events were below the CCME threshold, indicating the total phosphorus exceedances were largely particulate in nature.

No fluoride CCME exceedances were observed at KZ-16. Five samples (11%; ranging from 0.13 to 0.14 mg/L) exceeded the fluoride CCME guideline at KZ-15, all of which were collected during the intensive five samples in 30 days event in February to March 2018. Ten samples at KZ-26 (24%; ranging from 0.13 to 0.14 mg/L) marginally exceeded the CCME guideline (0.12 mg/L). Site KZ-22 returned 21 (53%) CCME exceedances (0.13 to 0.20 mg/L; Table 3-38), due to the impact of higher fluoride water from East Creek (0.07 to 0.29 mg/L; median 0.17 mg/L; Table 3-45) which flows into Finlayson Creek approximately 100 m upstream of site KZ-22.

Nitrogen species were typically below the detection limit (nitrite-N, cyanide), or present at levels that were well below their respective CCME guidelines (ammonia-N, nitrate-N). Nitrate-N levels were lowest in summer and highest over winter, likely linked to when primary productivity, which consumes nitrate, was highest and lowest, respectively. DOC ranged from less than 0.5 to 14.9 mg/L at all four sites on Finlayson Creek, and increased progressively moving downstream from KZ-16 (median 1.5 mg/L) to the mouth at KZ-26 (median 3.3 mg/L), reflecting inputs from the higher DOC waters of Geona Creek, East Creek and likely the other tributaries to Finlayson Creek located over its northernmost reach. As observed at other sites, DOC concentrations peaked markedly during periods of high flow (freshet and following high rainfall events), which was also reflected in the peak colour measurements observed at all sites at these times.

3.4.3 METALS

KZ-16, located the farthest upstream on Finlayson Creek, exhibited one water quality guideline exceedance each for total aluminum, iron and total zinc (Table 3-40). The aluminum and zinc exceedances occurred during the May 1995 sampling event, when freshet was likely responsible for flushing aluminum-bearing particulates into the watercourse, as evidenced by the much lower dissolved aluminum concentration (0.12 mg/L total vs 0.053 mg/L dissolved aluminum; APPENDIX A). The total and dissolved zinc concentrations were comparable, perhaps suggesting that flushing of a soluble zinc-bearing source occurred upgradient of KZ-15; however, the total zinc concentration observed on May 15, 1995 (0.063 mg/L) was significantly higher than the rest of the data set as a result of spring freshet conditions. The iron exceedance occurred in May 2017 and was likely related to particulate mobilized by high freshet flows.

The only other parameter that displayed a CCME exceedance at KZ-16 was total chromium, which was present at levels greater than 0.001 mg/L in four samples (7%), all of which were collected in the 1994-1995 sampling program. Total chromium has been below the detection limit in all but four samples collected since 2004, perhaps suggesting a contamination or analytical issues associated with this analyte in the 1994-1995 dataset.

More elements displayed at least one water quality guideline exceedance at site KZ-15 (Table 3-41), likely due to the contribution of Geona Creek water which flows into Finlayson Creek approximately 100 m upstream of this site. Two and one exceedances were observed for total aluminum and copper at KZ-15, respectively. These exceedances occurred in one or both of the May 2015 and May 2017 sampling events and were related to the high particulate load present due to freshet; dissolved levels of these constituents were significantly lower, pointing towards the particulates mobilized by freshet as the cause for these exceedances at site KZ-15. Total cadmium, iron, zinc, and chromium concentrations presented between two and four exceedances (Table 3-41). All of the total chromium exceedances were marginal (0.0010 to 0.0014 mg/L) compared to the CCME guideline (0.001 mg/L), and the corresponding dissolved chromium concentrations were either below the detection limit (greater than 0.0001 mg/L) or less than half of the total chromium level, suggesting that such chromium is largely particulate. Similarly, the total iron and zinc exceedances occurred during the freshet conditions of May 1995, 2015, and 2017 and had companion dissolved iron and zinc levels that were below the water quality guideline. The May 2015 cadmium exceedance was also particulate related as the dissolved cadmium concentration was over an order of magnitude lower (APPENDIX A); the second total cadmium exceedance was observed for the August 2008 monitoring event. The presence of only two cadmium CCME exceedances from a pool of 53 samples which span 13 years of monitoring including four years (1995 and 2015 to 2017) of detailed monthly sampling suggests these exceedances are not frequent.

Site KZ-22, located approximately 100 m downstream of the confluence with East Creek, showed between one and three water quality guideline exceedances for total concentrations of aluminum, arsenic, and cadmium, and 23 exceedances for total iron (Table 3-42). The May 2015 and August 2016 sampling events accounted for two of the exceedances of aluminum, arsenic and iron, when all three constituents were primarily associated with particulates during these high TSS events. The third total aluminum exceedance (July 2017, 0.164 mg/L) also occurred during a relatively high flow and TSS event. Similarly, the total cadmium exceedance observed for the August 1995 sampling event had a significant particulate component, as did the other total iron exceedances such

that the median dissolved iron proportion of the total iron concentration was 18%. The higher total iron concentrations at KZ-22 were likely due to contribution from East Creek (KZ-21) where total iron concentrations were commonly in excess of the CCME guideline.

Finally, KZ-26, located at the mouth of Finlayson Creek, exhibited water quality guideline exceedance for total concentrations of zinc (one sample), chromium (four samples), iron (16 samples) and aluminum (12 samples; Table 3-43). Two of the chromium exceedances occurred in two of the three August 1995 sampling events and the more recent two occurred in June and July 2017, along with two iron exceedances and two aluminum exceedances. The fact that the companion dissolved chromium concentrations were much lower (less than 22% of the total concentration) and were below the CCME guideline suggests that the particulate chromium is responsible for this exceedance, which is likely less bioavailable than its dissolved counterpart (Prothro, 1993). The majority of total aluminum and iron exceedances occurred during high flow conditions around freshet or following periods of elevated precipitation as evidenced by elevated levels of flow and TSS. The two highest iron concentrations in June and July 2017 (1.2 and 1.0 mg/L) occurred with relatively high TSS (54.7 to 73.8 mg/L vs median 2.2 mg/L TSS); the counterpart dissolved iron concentrations were one to two orders of magnitude lower. Like at KZ-22, the higher total iron concentrations observed at KZ-26 are likely due to contributions from East Creek where iron was often elevated relative to the CCME guideline. The solitary total zinc exceedance occurred in the May 1995 freshet sample whereas its companion dissolved concentration was below detection and over an order of magnitude lower.

Speciation analysis of the March 15, 2018 surface water samples indicated that dissolved selenium was exclusively present in its oxidized form, selenate, at all sites. Arsenic speciation conducted on the KZ-15 sample also indicated that arsenate, the most oxidized form of arsenic, was the only species that was detected.

The concentration of the majority of constituents of interest peaked during high flow periods such as freshet and following heavy summer rain events, largely associated with the high levels of particulate material that were present in the watercourse due to the enhanced run-off and streamflow present at such times. Fluoride, selenium, uranium, and hardness concentrations were the exception; their concentrations were lowest at all Finlayson Creek sites between freshet and fall, and increased over winter.

3.5 EAST CREEK

3.5.1 SETTING

East Creek is approximately 18 km in length and flows northwest into Finlayson Creek (Figure 1-2). East Creek originates at the southeast end of the property and contains a small pond midway through its reach. One water quality station is located on East Creek at KZ-21, which is immediately upstream with the confluence with Finlayson Creek. Photos of KZ-21 can be found in APPENDIX B (page B-14).

3.5.2 PHYSICAL PARAMETERS AND NUTRIENTS

East Creek waters, as monitored at KZ-21, were also circumneutral (pH 6.81 to 8.21) and well oxygenated (median 94% saturation; Table 3-44). East Creek waters were of higher ionic strength than those of Finlayson Creek, reflected in its higher conductivity (median 421 µS/cm at KZ-21 compared to median 295 to 423 µS/cm at sites on Finlayson Creek) and higher total hardness (median 247 mg/L compared to median 147 to 217 mg/L in Finlayson Creek).

Fluoride concentrations exceeded the CCME guideline (0.12 mg/L) for 32 of 40 samples collected (median 0.17 mg/L; Table 3-45), suggesting that East Creek drains an area of fluoride-bearing rocks. CCME eutrophic exceedances for total phosphorus were also noted on five occasions in May 1995, August 2016, and April, May and July 2017 during high flow and relatively high TSS events. In all instances, the dissolved phosphorus concentrations were below the CCME guideline (APPENDIX A), and total iron concentrations were also generally elevated, suggesting that phosphorus was largely transported in particulate form. Nitrogen species (cyanide, ammonia-N, nitrite-N, nitrate-N) were largely either below the detection limit, or present at concentrations within an order of magnitude of the detection limit. Where detected, all such parameters were well below their respective CCME guideline. As observed elsewhere, nitrate concentrations tended to be highest during winter due to the depressed primary productivity at this time and the associated lower demand for nitrate. DOC concentrations ranged between 1.4 and 14.5 mg/L (median 4.8 mg/L), with the maximum concentration observed for the May 2017 freshet event. The highest May 2015 DOC concentration (11.2 mg/L) was coincident with the highest colour measurement observed to date (182 TCU; median 58 TCU) likely related to the organic material washed into the watercourse during freshet.

[a] Indicates lowest detection limit available for BMC fieldwork (i.e., April 2015 to March 2018). Occasional samples had higher detection limits due to dilution required for some analyses.
[b] Blue bold highlighted entries indicate a CCME or BCMoE guideline exceedance; hardness-dependent guidelines are indicated by a range.

3.5.3 METALS

Solitary water quality guideline exceedances were observed for total concentrations of cadmium and zinc at site KZ-21 (Table 3-46). None of these exceedances were observed in the dissolved fraction, suggesting that they were largely particulate-related, which is of lower bioavailability (Prothro, 1993).

CCME exceedances were observed for total aluminum (five samples), total arsenic (six samples) and total chromium (four samples). Total iron also exceeded the CCME guideline (0.3 mg/L) in the majority of samples (51 of 56). The majority of aluminum, arsenic and chromium excursions occurred during the high flow May 1995, 2015 and 2017 (freshet), and August 2016 and July 2017 (rainfall) events, and are related to the high TSS and particulate material present at these times. For the other sampling occasions, the total concentrations of arsenic and iron in samples that exceeded their respective CCME guidelines typically exceeded their companion dissolved concentrations by an order of magnitude. In all cases, none of the dissolved concentrations of aluminum, arsenic and chromium exceeded their water quality guidelines and dissolved iron exceeded in only 3 of 56 samples, indicating these constituents were largely transported as particulates. Speciation analysis of the March 15, 2018 sample indicated that dissolved selenium was exclusively present in its oxidized form, selenate.

Most constituents exhibited a peak in May during freshet as increased run-off and associated higher creek flow flushed particulate metals into the watercourse. Only fluoride, selenium, uranium, and hardness deviated from this trend; their concentrations were lowest between spring freshet and summer before gradually rising through the late fall and winter (APPENDIX C, Figures C-1, C-19, C-25, and C-23), perhaps suggestive of a groundwater contribution to these constituents.

3.6 COMPARISON OF HISTORICAL AND RECENT WATER QUALITY DATA

Sample collection has regularly occurred in August with three sampling events in 1995, biannual August sampling between 2002 and 2016, and the August 2015, 2016, and 2017 sampling events making it the best month over which to compare the water quality data collected to date. APPENDIX D presents graphical comparisons of the August sampling events for a range of constituents of interest.

The majority of elements displayed a comparable concentration range across the different water quality sampling campaigns. Only total selenium and chromium appeared anomalous. The total selenium and chromium detection limits reported for the 1994-1995 data (0.00005 mg/L and 0.0002 mg/L, respectively) are comparable to those employed in the post-2010 dataset (0.00004 mg/L and 0.0001 mg/L, respectively). Higher detection limits for both elements were reported for the 2004 – 2010 data (0.001 mg/L for both total selenium and chromium) and are not considered in this comparison; however, they are instructive. Sample pre-concentration was used to achieve a ten-fold improvement in the detection limit of a number of trace elements in the 1994-95, including selenium and chromium. Without this ten-fold improvement, the detection limits would be similar to those used in the 2004 – 2010 data. Furthermore, higher analytical error can be expected to be associated with the historical data given the use of 10 times pre-concentration.

Total selenium concentrations appeared to be higher in the samples collected since 2010 compared to those collected in 1994-1995. Three sampling events took place at a number of sites in August 1995, which exhibited a large span in the concentration of a number of analytes including total selenium concentration in both the upper (South, Fault, and Geona Creeks) and lower watersheds (Finlayson and East Creeks; Figure D-6, in APPENDIX D). These three sampling events also displayed a range of TSS values at some sites, although a more detailed understanding of TSS trends in the historical Cominco data is hindered by the relatively high TSS detection limit (4 mg/L). Sites KZ-13 and KZ-7 returned TSS measurements of less than 4, 7, and less than 4 mg/L for August 15, 22, and 30 in 1995, respectively (median 1.6 and 1.7 mg/L for KZ-13 and KZ-7, respectively). The elevated TSS observed on August 22, 1995 is consistent with the rain event recorded on August 22, 1995 of 7 mm (Cominco, 1996), and implies that higher flow was present at these two sites for the August 22, 1995 sample. Similarly, site KZ-26 returned TSS of less than 4, 5, and 14 mg/L moving through August 1995 (median 2 mg/L), suggesting that this site experienced varying flow conditions through the month likely related to precipitation events. This site is the farthest downstream, perhaps explaining the delayed response in the TSS levels following the August 22, 1995 rain event, although the 1995 climate record also reports 17 mm of rain falling between August 23 and September 1, 1995 (Cominco, 1996) which likely contributed to the TSS high observed at KZ-26 on August 30, 1995. For the three August 1995 sampling events, the highest TSS concentration (and by implication, the highest flow) at two of the sites (KZ-13 and KZ-26) corresponded to the lowest of the three selenium concentrations measured. Since selenium concentrations appear to be susceptible to dilution following high run-off events such as freshet, this may explain the range in selenium concentrations observed over August 1995. The highest selenium concentration observed in August 1995 at those sites where three samples were collected is largely in line with the selenium concentration in samples collected since 2004. As such, the apparent disparity between some of the historical selenium concentrations and those measured in more recent samples may be related to a combination of different flow conditions at the time of sampling and larger analytical error associated with the ten-fold sample pre-concentration employed for the historical selenium analyses.

Conversely, total chromium concentrations measured in samples collected since 2012 at sites located in both the upper watershed (South Creek, Fault Creek, and Geona Creek) and lower watershed (Finlayson Creek and East Creek) were typically lower than those collected in 1994-1995. The number of total chromium CCME exceedances were three times higher than that for dissolved chromium, suggesting that the discrepancy may be related to flow conditions since elevated chromium concentrations were largely present in the particulate fraction which may be expected to be higher under higher flow conditions that follow extended precipitation events.

With the exception of selenium and chromium, overall, the three water quality datasets (Cominco 1994-1995, biannual water licence sampling 2002-2016, and 2015-present) are in broad agreement, suggesting that the site water quality has not changed substantively in the past two decades of monitoring.

3.7 FIVE SAMPLES IN 30 DAYS EVENT MAY – JUNE 2017

In May and June 2017, five sampling events were carried out in a span of 30 days at KZ-2, KZ-6, KZ-9, KZ-18, KZ-37, KZ-17, KZ-16, KZ-15, KZ-22, KZ-26 and KZ-21 to assess variability in water quality data over the period when snowmelt and freshet commonly results in higher stream flow rates. Temperature in the monitoring locations increased approximately 2 to 6°C over the 30 day period. Summary statistics for select parameters of interest (those that were found to be in excess of their respective CCME or BCMoE guideline in more than 10% of collected samples at any monitoring location) in the five sampling events are shown for each monitoring location in Table 3-47 through Table 3-57. Concentrations of these select parameters in the five May-June 2017 sampling events are plotted and provided in APPENDIX E.

In Geona Creek at KZ-9 and KZ-37 and the KZ-18 tributary, concentrations of constituents of interest typically were highest in the first sampling event (May 16-18) and showed good correlation with TSS concentrations. These high concentrations were due to mobilization of particulate by high flows during freshet which were highest in the first event. Concentrations in KZ-9 and KZ-37 were lower and relatively stable through the rest of the 30 days. Exceptions to this pattern included fluoride and selenium which are likely derived from groundwater and were thus likely diluted by meltwater resulting in fairly stable or increasing concentrations through the sampling period as flow rates and dilution by freshet decreased. Water quality in Fault Creek (KZ-2) differed from Geona Creek sites in that concentrations of cadmium and zinc broadly increased over the 30-day period. Flow rate was higher in the June 7 sampling event than in the May 18 sampling event indicating freshet occurred later in Fault Creek than in the Upper Geona Creek and high flow-associated transport was relatively delayed. This relatively delayed freshet at the higher altitude Fault Creek is evident in past years when higher flows were observed in June rather than May in 2015 and 2016.

In the Finlayson Creek watershed at KZ-15, KZ-16 and KZ-22, similar to KZ-9 and KZ-37 in Geona Creek, concentrations for the majority of constituents of interest were typically highest in the first sample (May 16), lower in the next sample and remained fairly stable through the rest of the 30-day period. Further downstream in Finlayson Creek at KZ-26, concentrations of several parameters were high in the first sample, lower in the second and third samples and increased in the fourth and fifth sampling events with total aluminum, cadmium, chromium, copper, iron reaching their highest concentrations of the 30-day period in the fifth sample (June 14). The high initial concentrations were likely freshet-related whereas the high concentrations in the June 14 sample reflect a major precipitation event recorded on June 10, 11, and 12. The precipitation event likely caused a spike in TSS and total metals concentrations that was most evident at KZ-26 and less so upstream. Similar to the Geona Creek watershed monitoring stations, fluoride and selenium concentrations were relatively stable throughout the 30-day monitoring period at Finlayson and East Creek monitoring stations.

Correlations between TSS and several total metals concentrations (e.g. aluminum, iron, etc.) have been identified throughout all monitoring locations, with annual maxima in TSS and metals concentrations typically occurring in May or June during freshet. Despite the increased frequency of sampling in May-June 2017, concentrations of constituents of interest were generally within the range of concentrations observed in 2015 and 2016, as shown in the 2015-2017 water quality plots in APPENDIX C. The maximum concentration of constituents that commonly peak during high flow events during the May-June 2017 sampling were typically similar to peak freshet

concentrations observed in 2015 and 2017. For several metals, peak concentrations in May 2017 were lower than concentrations observed in the May 2015 sampling event (see APPENDIX C). Concentrations of high flow and TSS correlated metals were often higher in the May-June 2017 sampling than in May-June 2016 sampling. This could indicate that 2016 sampling did not capture the peak flows of freshet or that snowmelt in 2016 occurred more gradually over a longer period of time and thus freshet-related peaks were more muted or delayed. Annual maxima of several constituents in 2016 were observed in August and were attributed to a high precipitation event that preceded the sampling; many of the concentrations recorded during this event were of comparable magnitude to the maxima observed in May-June 2017. The collection of five samples in a 30 day period during spring allows for both the measurement of the short term freshet event to aid in the development of site specific water quality objectives and to determine long term monthly average for use in the water quality model. Previous monthly samples collected in May show that freshet can be captured if site conditions are closely monitored, which at remote sites can be logistically challenging.

3.8 FIVE SAMPLES IN 30 DAYS EVENT FEBRUARY – MARCH 2018

A second "five samples in 30 days" campaign occurred between February 13 and March 15, 2018 at KZ-2, KZ-13, KZ-9, KZ-18, KZ-37, KZ-15, and KZ-26. This period was selected to assess variability in water quality parameters under winter low flow conditions. Summary statistics for select parameters of interest (those that were found to be in excess of their respective CCME or BCMoE guideline in more than 10% of collected samples at any monitoring location) in the five sampling events are shown for each monitoring location in Table 3-58 through Table 3-64. Concentrations of these select parameters in the five May-June 2017 sampling events are plotted and provided in APPENDIX F.

In general, most constituents of interest displayed relatively limited variation (Figure F-1 to F-10; APPENDIX F) over the sampling period, reflecting the low flow, quiescent conditions at this time of year. Only the following parameters displayed an order of magnitude difference between their minimum and maximum concentrations:

- Total iron at KZ-2 and KZ-9;
- TSS at KZ-9;
- Total copper at KZ-9; and
- Total aluminum at KZ-26.

The total iron concentrations measured at KZ-2 (Fault Creek) were relatively low (0.0011 to 0.011 mg/L; Table 3-58) and are consistent with historical total iron concentrations measured in February and March of 2016 and 2017 (0.0016 to 0.052 mg/L). The wide range in total iron concentrations observed at KZ-9 (Geona Creek; 0.017 to 0.84 mg/L; Table 3-59) is related to two low concentrations observed for the March 1 sample (0.017 mg/L and 0.026 mg/L, respectively) compared to the higher concentrations returned for the February 14, 21, and March 15 samples (0.84, 0.51, and 0.53 mg/L, respectively). These three higher total iron concentrations are compatible with the total iron concentrations typically observed at KZ-9 (0.24 to 2.8 mg/L; Figure C-15); however, it is interesting to note that the lowest total iron concentration recorded at KZ-9 (0.0028 mg/L) occurred in March 2016. This is considerably lower than the total iron concentrations returned in February 2016, February 2017, and March 2017 (2.8, 0.74, and 0.92 mg/L, respectively). The three samples that contained low total iron concentrations also returned low concentrations of other constituents of interest (e.g., aluminum, arsenic, cadmium copper, zinc), but had the highest selenium, uranium, and hardness concentrations. Given that these constituents are inferred to have a large groundwater component, the variation in total iron concentrations (and other constituents of interest) at KZ-9 may be related to changes in the groundwater contribution to the flowing surface water at KZ-9.

The TSS concentrations over the 30 days sampling period at KZ-9 were relatively consistent except for one high measurement on March 7 (11 mg/L) compared to the other four sampling events (1.0 to 3.4 mg/L). High TSS is typically restricted to higher flow times of year (i.e., spring freshet or following high rainfall events in summer and fall); historical February and March TSS levels have ranged between less than 1.0 and 4.5 mg/L. The high TSS

concentration observed on March 7 may be erroneous or related to the overflow conditions noted at site where water flows up over the ice and in doing so may pick up particulate material deposited on the ice.

Similar to TSS, the total copper concentrations recorded at KZ-9 were relatively consistent except for one high measurement for total copper on February 21 (0.0025 mg/L) compared to the other four sampling events (0.00017 to 0.00056 mg/L). Dissolved copper was also elevated for this sample (0.0031 mg/L) and consistent with the total copper concentration, suggesting sample or laboratory error is unlikely. Historical total copper concentrations recorded in February and March (0.00007 to 0.00038 mg/L) are consistent with the majority of samples collected in the 30-day February to March 2018 monitoring period and much lower than the single high copper value. The February 21 high total copper concentration is comparable to those observed during higher flow events (spring freshet and late summer rain events; Figure C-13), and may reflect sporadic natural variation at this site.

Finally, total aluminum at KZ-26 on Finlayson Creek ranged between 0.00066 and 0.0099 mg/L (Table 3-64). Although this spans an order of magnitude, they are in line with the historical February and March data (0.0016 to 0.042 mg/L) and reflect natural variability.

Overall, with the few exceptions described above, there was limited variability in parameter concentrations measured in the five samples collected over 30 days in February and March 2018. The variability observed was largely captured by the previous historical monthly monitoring in February and March 2016 and 2017. As such, it appears that monthly water quality sampling over this time of year has adequately captured constituent variability and further intensive sampling during this low flow winter period may be of limited utility.

4. SUMMARY

Creeks that drain the KZK property were circumneutral to alkaline (pH 6.8 to 8.7; median 7.7) and had hardness ranging from moderately hard (Fault Creek and South Creek) to hard (Geona Creek) in the upper watershed and very hard in the lower watershed (Finlayson Creek and East Creek). Water quality guideline exceedances were observed sporadically for a number of constituents including fluoride, and total concentrations of phosphorus, aluminum, arsenic, cadmium, chromium, copper, iron, selenium, and zinc. Of these, only fluoride and total cadmium, iron and zinc exceedances occurred in 10% or more of the samples collected in the sample locations.

Total concentrations of cadmium and zinc were highest in the headwaters of Geona Creek at site KZ-7, and in Fault Creek (KZ-2) which flows into Geona Creek, likely related to the mineralized nature of this location. Indeed, concentrations of these elements linked to the local mineralization were elevated in the upper watershed (primarily Geona Creek) relative to the lower watershed waters (Finlayson Creek).

The fluoride CCME exceedances were primarily localized to East Creek (KZ-21), where 79% of samples were in exceedance, and site KZ-22 on Finlayson Creek, which is immediately downstream of the confluence with East Creek (50% of samples exceeded the CCME fluoride guideline).

Total chromium exceedances were observed at sites located throughout the property but were largely confined to the historical 1994-1995 sampling events.

Total selenium concentrations were also notable in that although only 3% of samples exceeded the BCMoE water quality guideline (0.002 mg/L), a further 29% of samples were within a factor of two of this guideline. In general, more water quality guideline exceedances were noted for total metal concentrations than their dissolved counterparts, suggesting that a significant portion of the metals were particulate-bound, especially during freshet and/or other periods characterized by elevated TSS levels. That dissolved metal concentrations exhibited much less frequent water quality guideline exceedances is important since it is the dissolved fraction that is the most bioavailable (Prothro, 1993).

The majority of constituent concentrations peaked during spring as the high run-off and associated stream flow during freshet increased the particulate content of the streams, leading to higher total metal concentrations. Conversely, concentrations of fluoride, total selenium, uranium, and hardness were lowest between freshet and summer. The levels of these parameters subsequently increased through the late fall and winter months, suggesting that groundwater may be an important contributor to surface water concentrations of these four constituents. This is supported by groundwater monitoring data from wells installed on the Project site in which fluoride (0.01 to 1.1 mg/L), selenium (less than 0.00004 to 0.0032 mg/L), uranium (0.0006 to 0.014 mg/L), and hardness (96 to 750 mg/L) concentrations in shallow groundwater either overlap or markedly exceed the range of concentrations observed in both Geona Creek and Fault Creek.

Monitoring of seeps in the upper watershed indicated they may play a small role in slightly lowering the pH and raising the total iron content of waters in Geona Creek at KZ-9 due to inputs from the mildly acidic, ferruginous waters of Seep 5 and the KZ-9 East Seep.

A comparison of the Cominco 1994-1995 water quality dataset with that collected during the more recent baseline water quality monitoring conducted since 2015 indicated that the majority of constituents shared a similar concentration span, suggesting there were no obvious differences between the two datasets. Two exceptions were total selenium and total chromium. Total chromium concentrations were typically lower in the 2015-2018 dataset compared to the historical sampling, perhaps due to a preponderance of higher flow sampling events in the historical samples which may have resulted in higher particulate chromium concentrations. However, the CCME exceedances for total chromium were relatively marginal, with dissolved chromium concentrations exhibiting three-fold lower incidence of CCME exceedance. Conversely, total selenium concentrations were generally higher in the more recently collected samples than in the 1994-1995 survey. Selenium concentrations appear to be sensitive to flow conditions, exhibiting minima during periods of high flow (i.e., dilution during freshet and following extended precipitation events) and elevated levels during baseflow winter conditions. The paucity of winter sampling in the 1994-1995 dataset allied with likely high precipitation events in the August 1995 samples, may have low-biased the historical dataset.

A higher frequency, five samples over 30 days sampling program was carried out at the majority of monitoring stations in May-June 2017 and February-March 2018 to assess variance in during freshet and low flow winter conditions, respectively. Geona Creek (KZ-9, KZ-37, KZ-17) and upper Finlayson Creek (KZ-15, KZ-16, KZ-22) monitoring stations typically returned higher concentrations of constituents that typically are higher with high TSS and flow (i.e. particulate transported; aluminum, iron, etc.) earlier in May and lower concentrations in June. The peak concentrations in May 2017 for many stations were similar to peak concentrations observed in May 2015 at the majority of stations. Concentrations for several parameters peaked in the final June 2017 sample at stations further downstream in Finlayson Creek (KZ-26) and East Creek (KZ-21), likely due to a high precipitation event that preceded the sampling. In Fault Creek (KZ-2), freshet appeared to arrive later on in June 2017, likely due to its more isolated and high-altitude locale. Relatively limited variation was observed for the majority of parameters measured during February-March 2018, suggesting the previous monthly monitoring had adequately captured natural variation at the sampling sites during this time of year.

Overall, the constituent annual concentration ranges and any observed seasonality appeared consistent over the recent sampling period of record (i.e., April 2015 to March 2018). Only KZ-17 (Geona Creek at mouth) exhibited any observable difference, with total concentrations of arsenic, aluminum, cadmium, iron, and zinc observable lower since September 2016. This is likely related to beaver activity and a change in the water flow through the beaver dam located upstream of this site.

APPENDIX B.

Surface Water Monitoring Photo Log

1. SOUTH CREEK

1.1 KZ-13

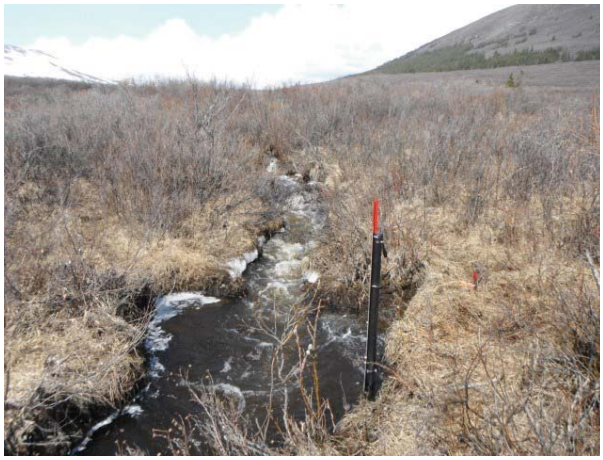

Photo 1: KZ-13 looking upstream, May 2015.

Photo 2: KZ-13 looking downstream, July 2015.

Photo 3: KZ-13 looking downstream, September 2015.

Photo 4: KZ-13 looking downstream, February 2016

2. GEONA CREEK

2.1 KZ-6

Photo 5: KZ-6 looking upstream, January 2016.

Photo 6: KZ-6 looking upstream, April 2016.

Photo 7: KZ-6 looking downstream, April 2016.

2.2 KZ-7

Photo 8: KZ-7 looking downstream, May 2015.

Photo 9: KZ-7 looking downstream, August 2015.

Photo 10: KZ-7 looking upstream, October 2015.

Photo 11: KZ-7 looking downstream, February 2016.

2.3 KZ-9

Photo 12: KZ-9 looking upstream, May 2015.

Photo 13: KZ-9 looking downstream, July 2015.

Photo 14: KZ-9 looking upstream, September 2015.

Photo 15: KZ-9 looking upstream, March 2016.

2.4 KZ-17

Photo 16: KZ-17 looking upstream, July 2015.

Photo 17: KZ-17 looking upstream, March 2016.

2.5 KZ-18

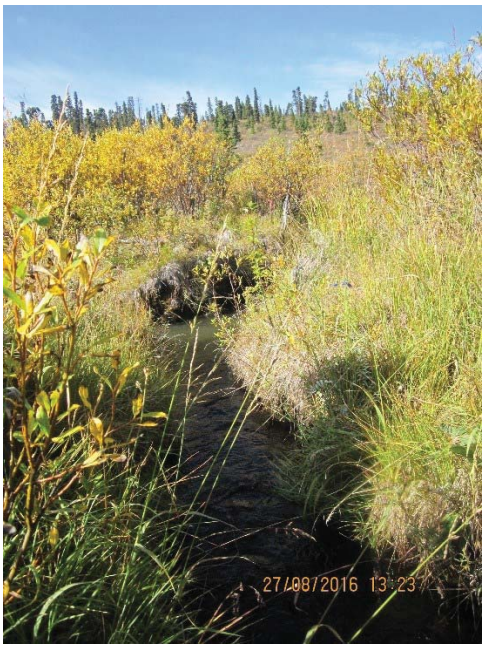

Photo 18: KZ-18 looking upstream, August 2016.

Photo 19: KZ-18 looking upstream, September 2016.

Photo 20: KZ-18 looking upstream, November 2016.

2.6 KZ-37

Photo 21: KZ-37 Looking downstream, May 2017

Photo 22: KZ-37 Looking downstream, July 2017.

Photo 23: KZ-37 Looking downstream, October 2017.

Photo 24: KZ-37 Looking downstream, December 2017

3. FAULT CREEK

3.1 KZ-2

Photo 25: KZ-2 looking downstream, May 2015.

Photo 26: KZ-2 looking upstream, July 2015.

Photo 27: KZ-2 looking upstream, October 2015.

Photo 28: KZ-2 looking downstream, March 2016.

4. GEONA CREEK SEEPS

Photo 29: KZ-9 West Seep, July 2015.

Photo 30: KZ-9 East Seep, July 2016.

Photo 31: Seep 3, July 2015.

Photo 32: Seep 4, July 2015.

Photo 33: Seep 5, July 2015.

5. FINLAYSON CREEK

5.1 KZ-16

Photo 34: KZ-16 looking downstream, May 2015.

Photo 35: KZ-16 looking downstream, June 2015.

Photo 36: KZ-16 looking downstream, October 2015.

Photo 37: KZ-16 looking downstream, February 2016.

5.2 KZ-15

Photo 38: KZ-15 looking downstream, May 2015.

Photo 39: KZ-15 looking upstream, July 2015.

Photo 40: KZ-15 looking downstream, October 2015.

Photo 41: KZ-15 looking downstream, March 2016.

5.3 KZ-22

Photo 42: KZ-38 looking downstream, May 2015.

Photo 43: KZ-22 looking downstream, July 2015.

Photo 44: KZ-22 looking upstream from hydrometric station, September 2015.

Photo 45: KZ-22 looking downstream, March 2016.

5.4 KZ-26

Photo 46: KZ-26 looking downstream from Robert Campbell Highway, May 2015.

Photo 47: KZ-26 looking upstream from Robert Campbell Highway, July 2015.

Photo 48: KZ-26 looking upstream from hydrometric station, October 2015.

Photo 49: KZ-26 looking downstream approximately 200 meters upstream of Robert Campbell Highway, February 2016.

6. EAST CREEK

6.1 KZ-21

Photo 50: KZ-21 looking upstream, May 2015.

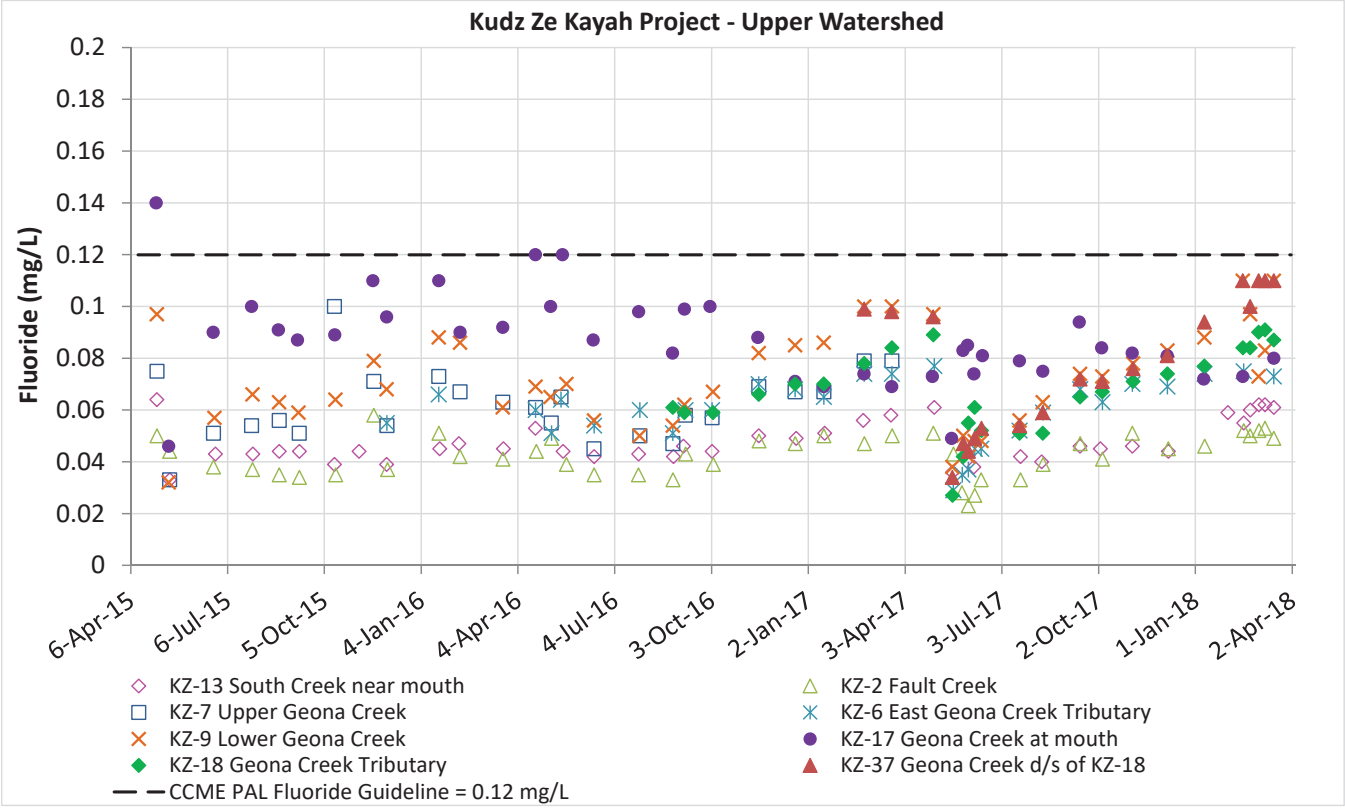
Photo 51: KZ-21 looking downstream August 2015.

Photo 52: KZ-21 looking upstream, October 2015.

Photo 53: KZ-21 looking downstream, January 2016.

APPENDIX C.

Historic and April 2015 to March 2018 Surface Water Graphs



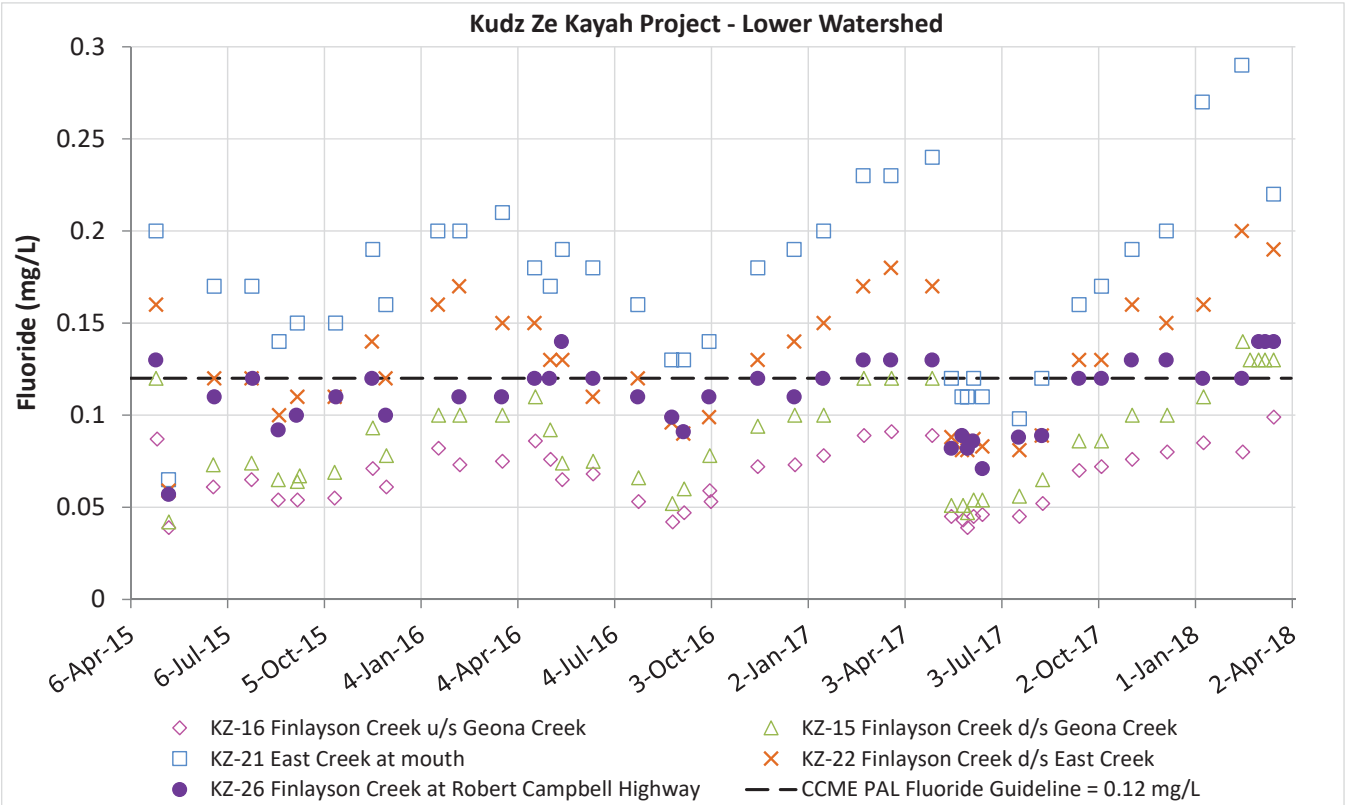


Figure C-1: Temporal Variation in Dissolved Fluoride Concentration in Upper (South, Fault, and Geona Creeks) and Lower (Finlayson and East Creeks) Watershed of Kudz Ze Kayah Project

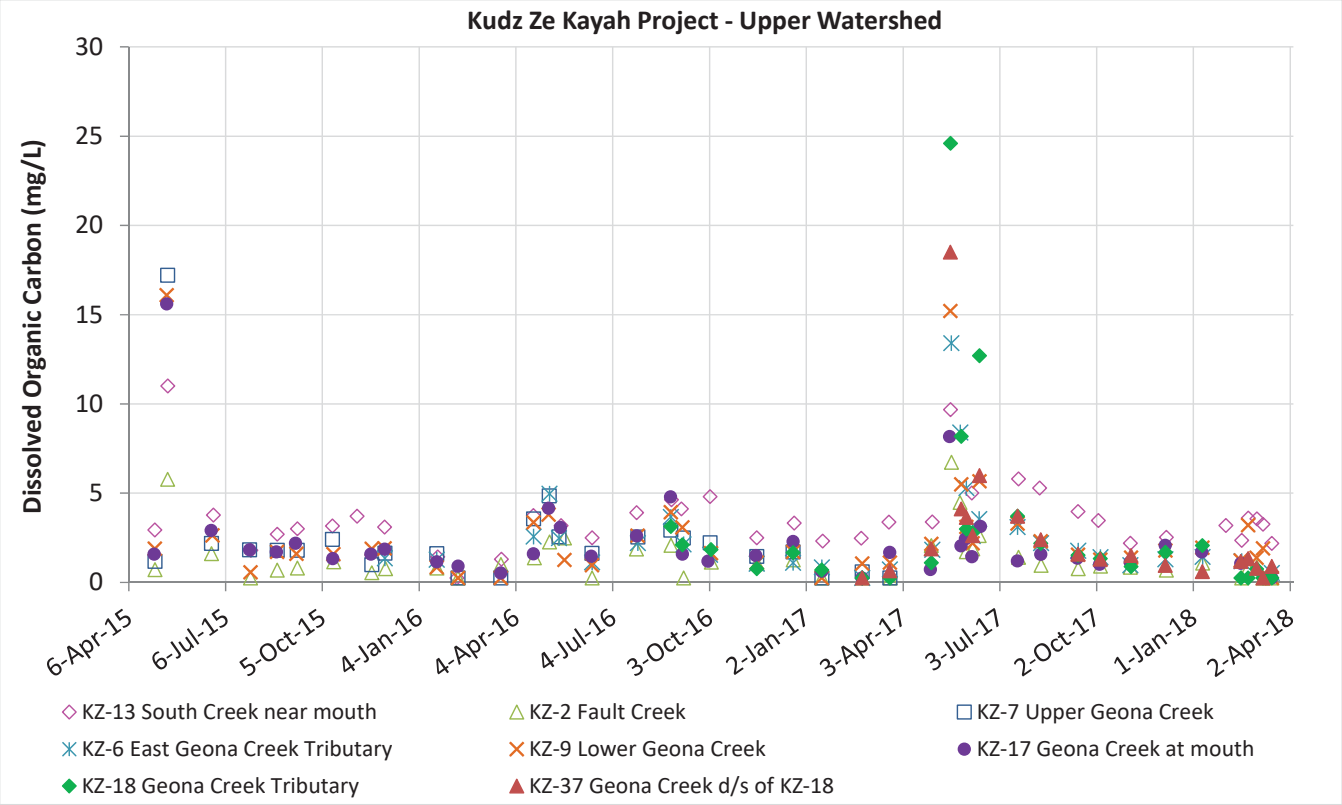

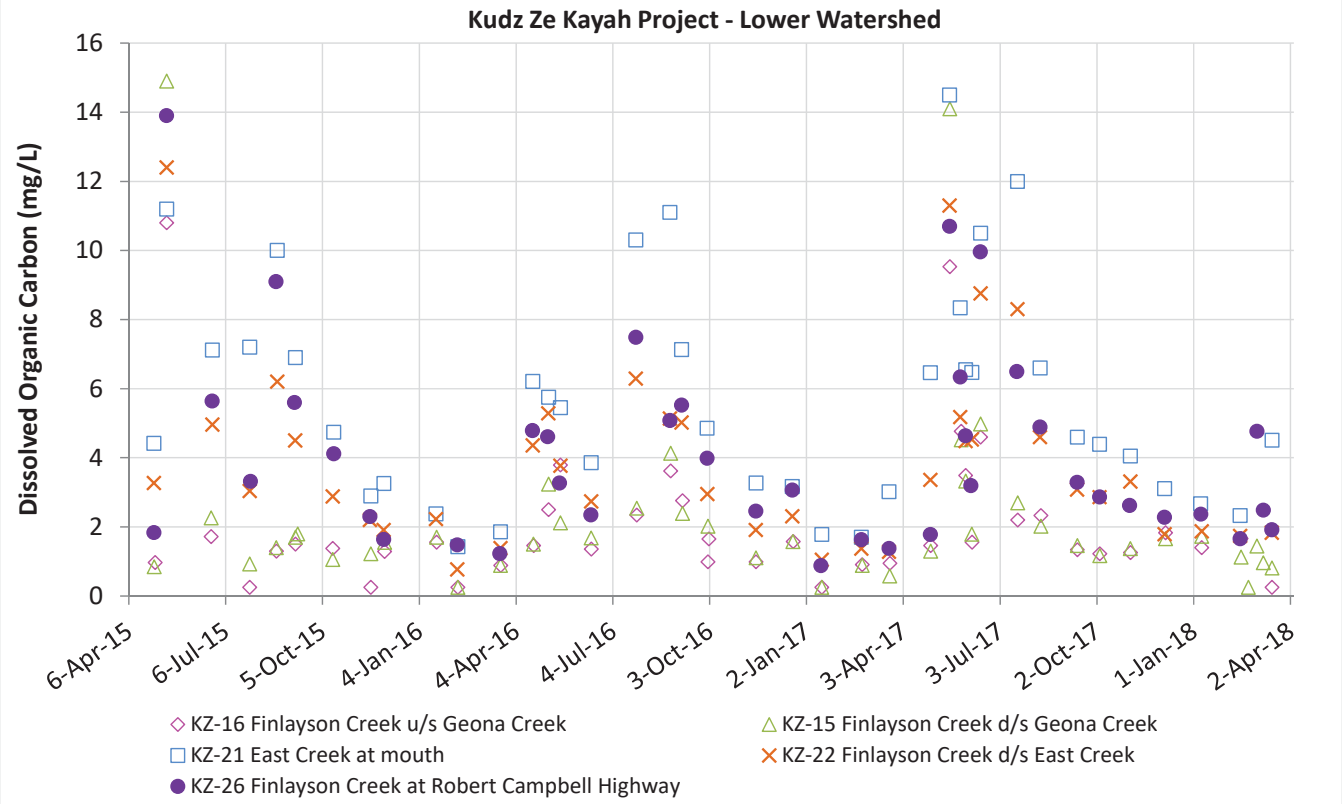

Figure C-2: Temporal Variation in Dissolved Organic Carbon Concentration in Upper (South, Fault, and Geona Creeks) and Lower (Finlayson and East Creeks) Watershed of Kudz Ze Kayah Project

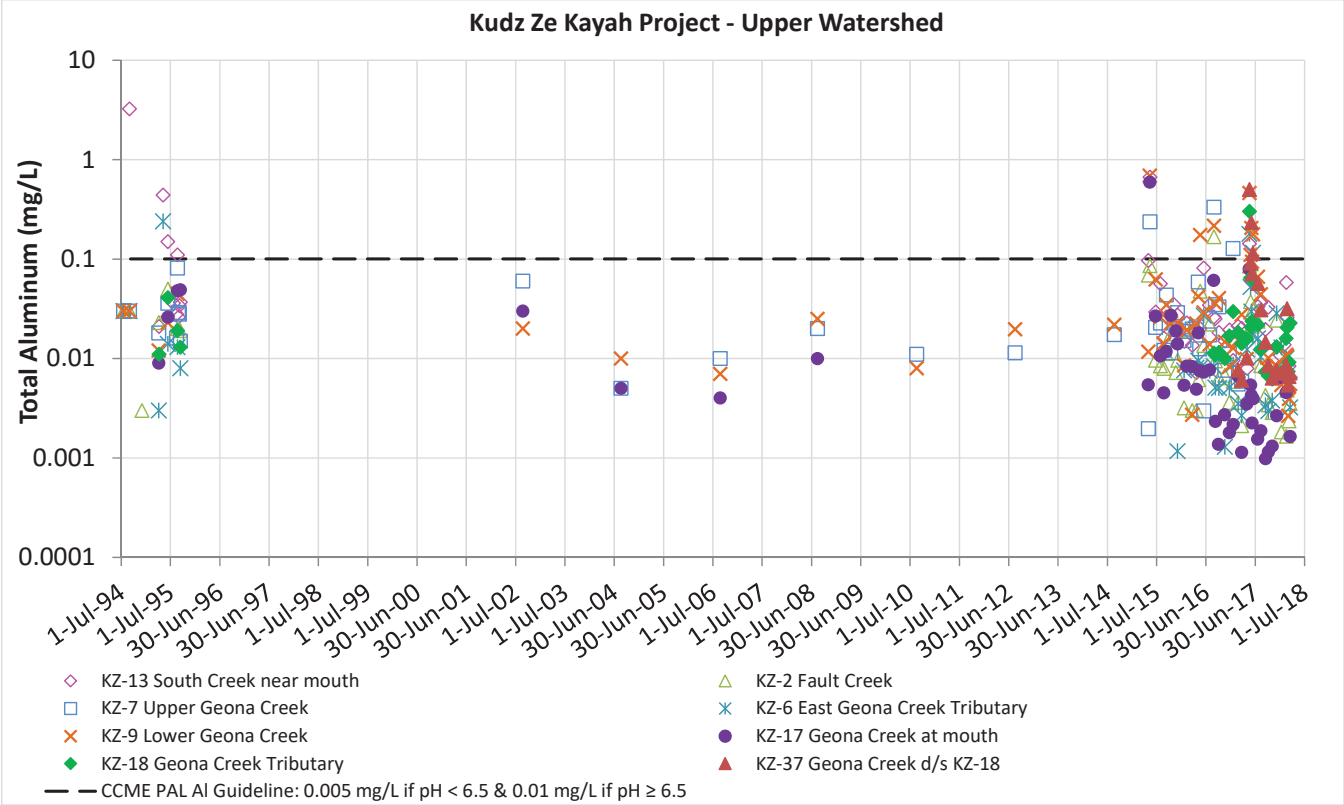

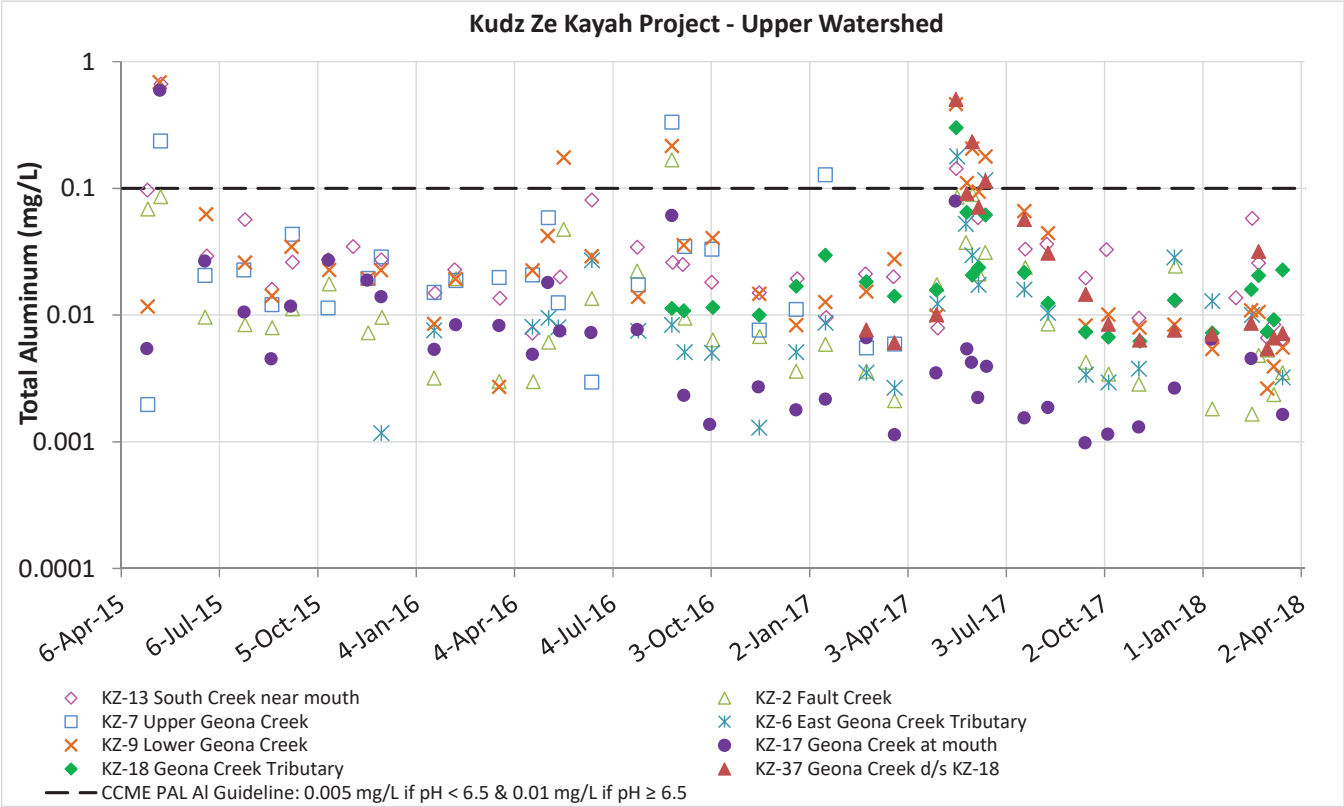

Figure C-3: Temporal Variation in Total Aluminum Concentration in Upper Watershed (South, Fault, and Geona Creeks) of Kudz Ze Kayah Project since 1994 (top) and since 2015 (bottom)

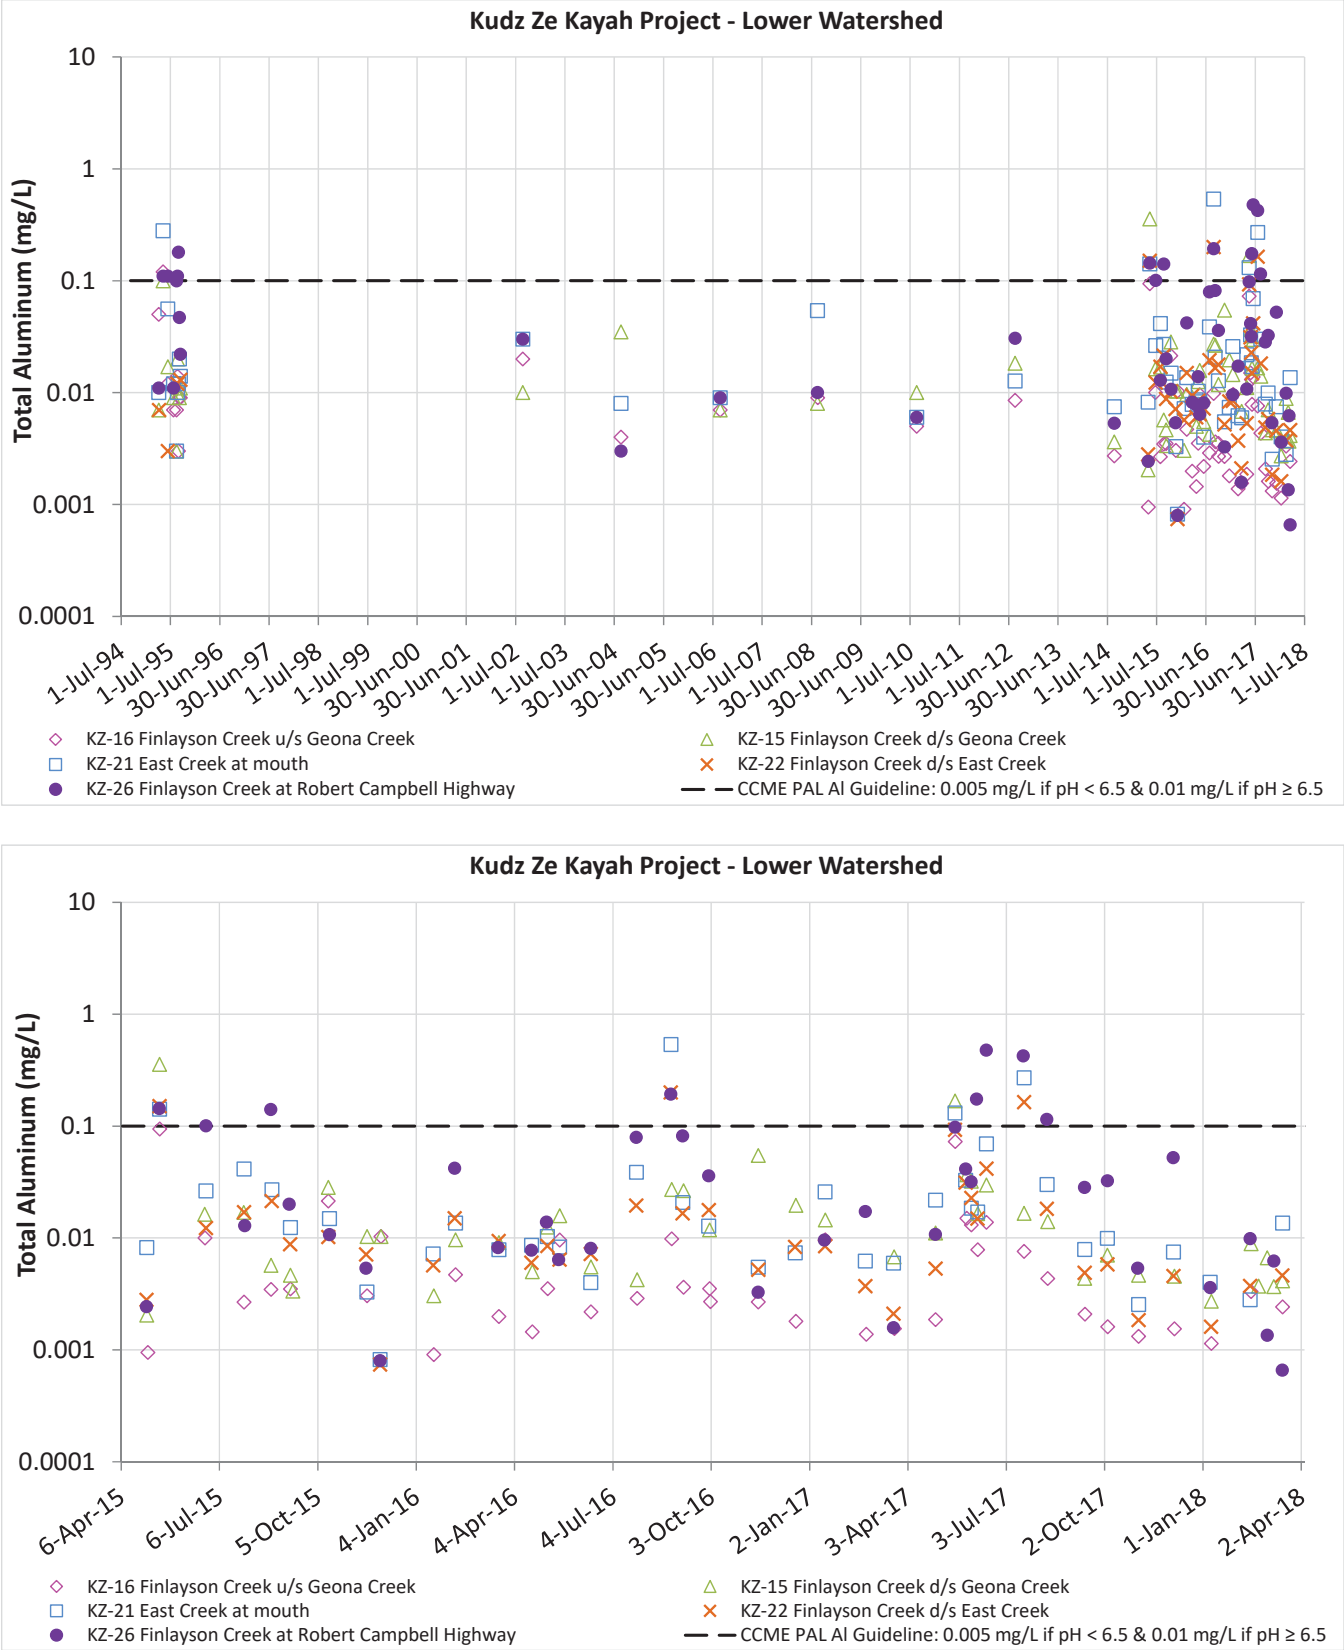

Figure C-4: Temporal Variation in Total Aluminum Concentration in Lower Watershed (Finlayson and East Creeks) of Kudz Ze Kayah Project since 1994 (top) and since 2015 (bottom)

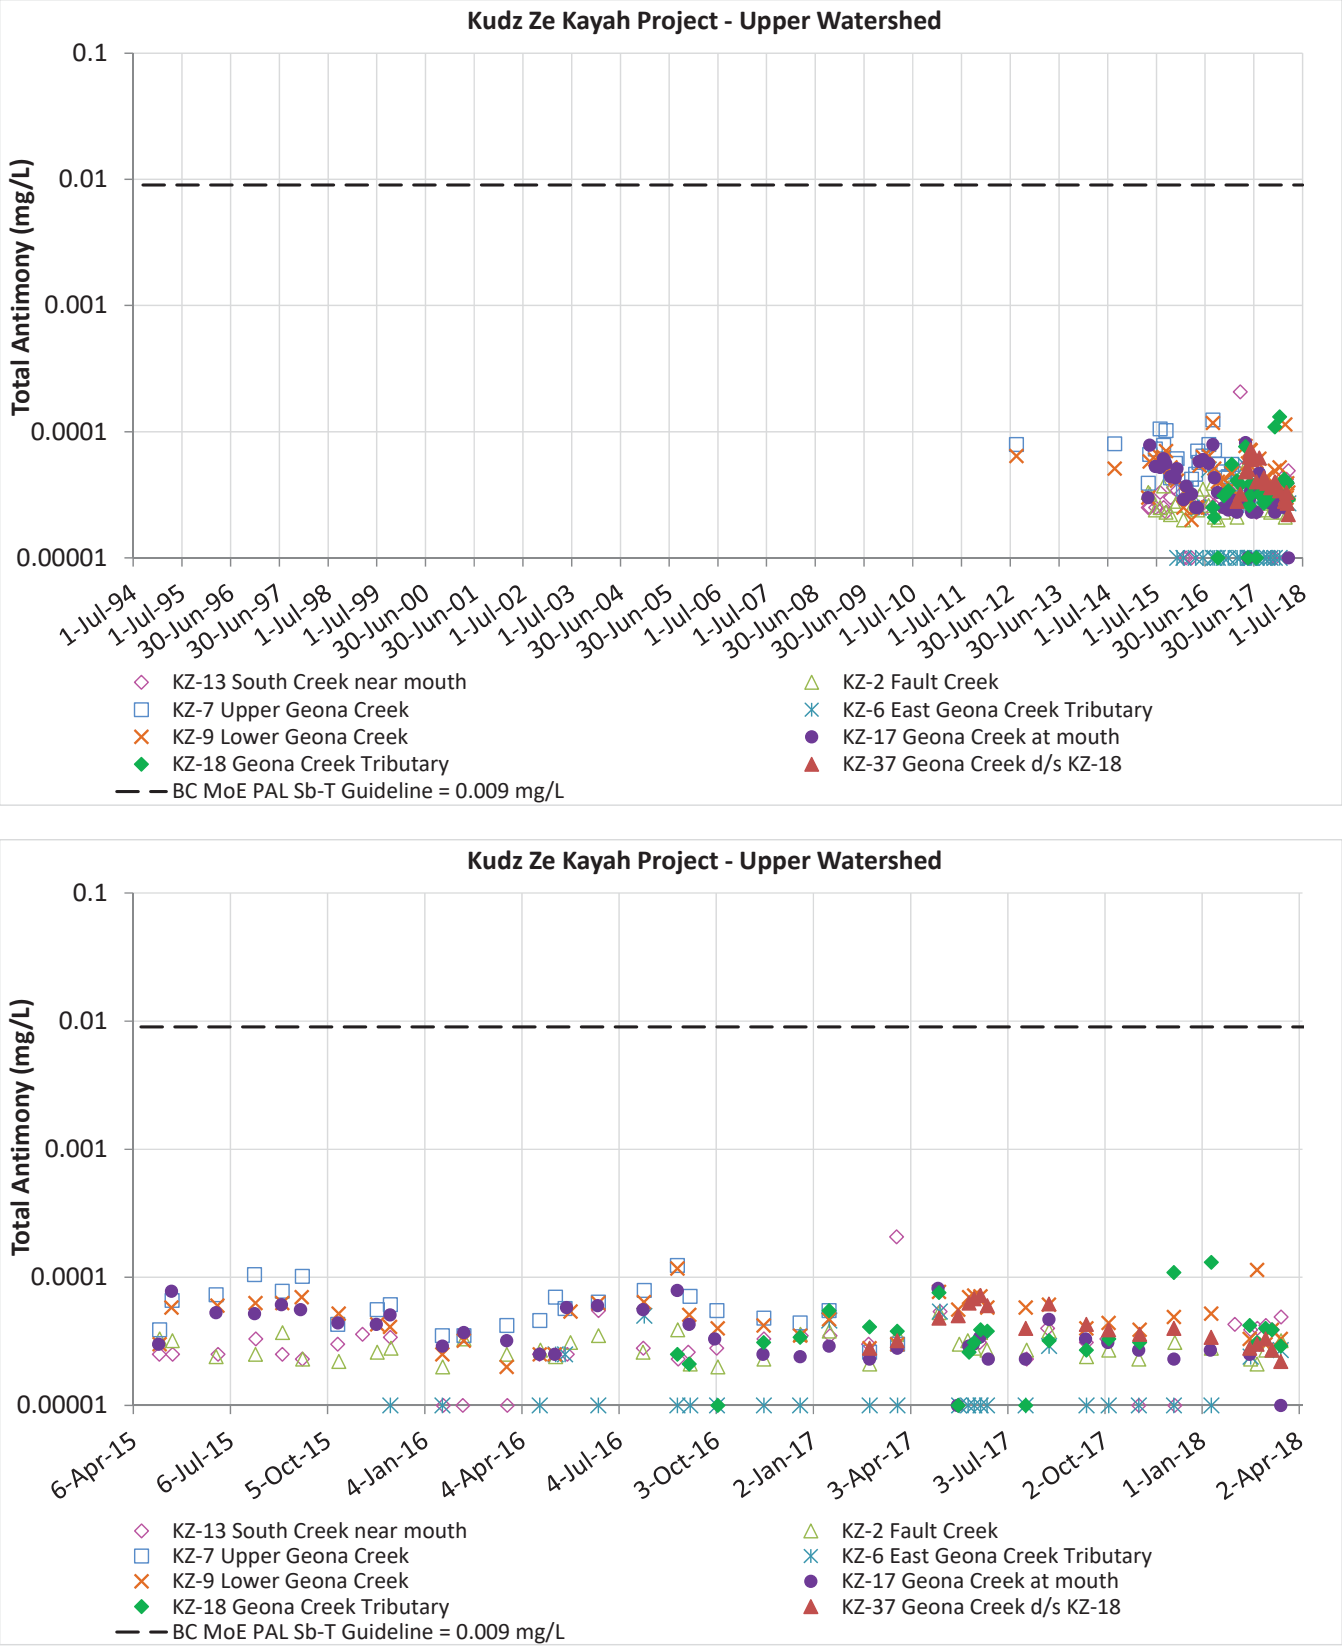

Figure C-5: Temporal Variation in Total Antimony Concentration in Upper Watershed (South, Fault, and Geona Creeks) of Kudz Ze Kayah Project since 1994 (top) and since 2015 (bottom)

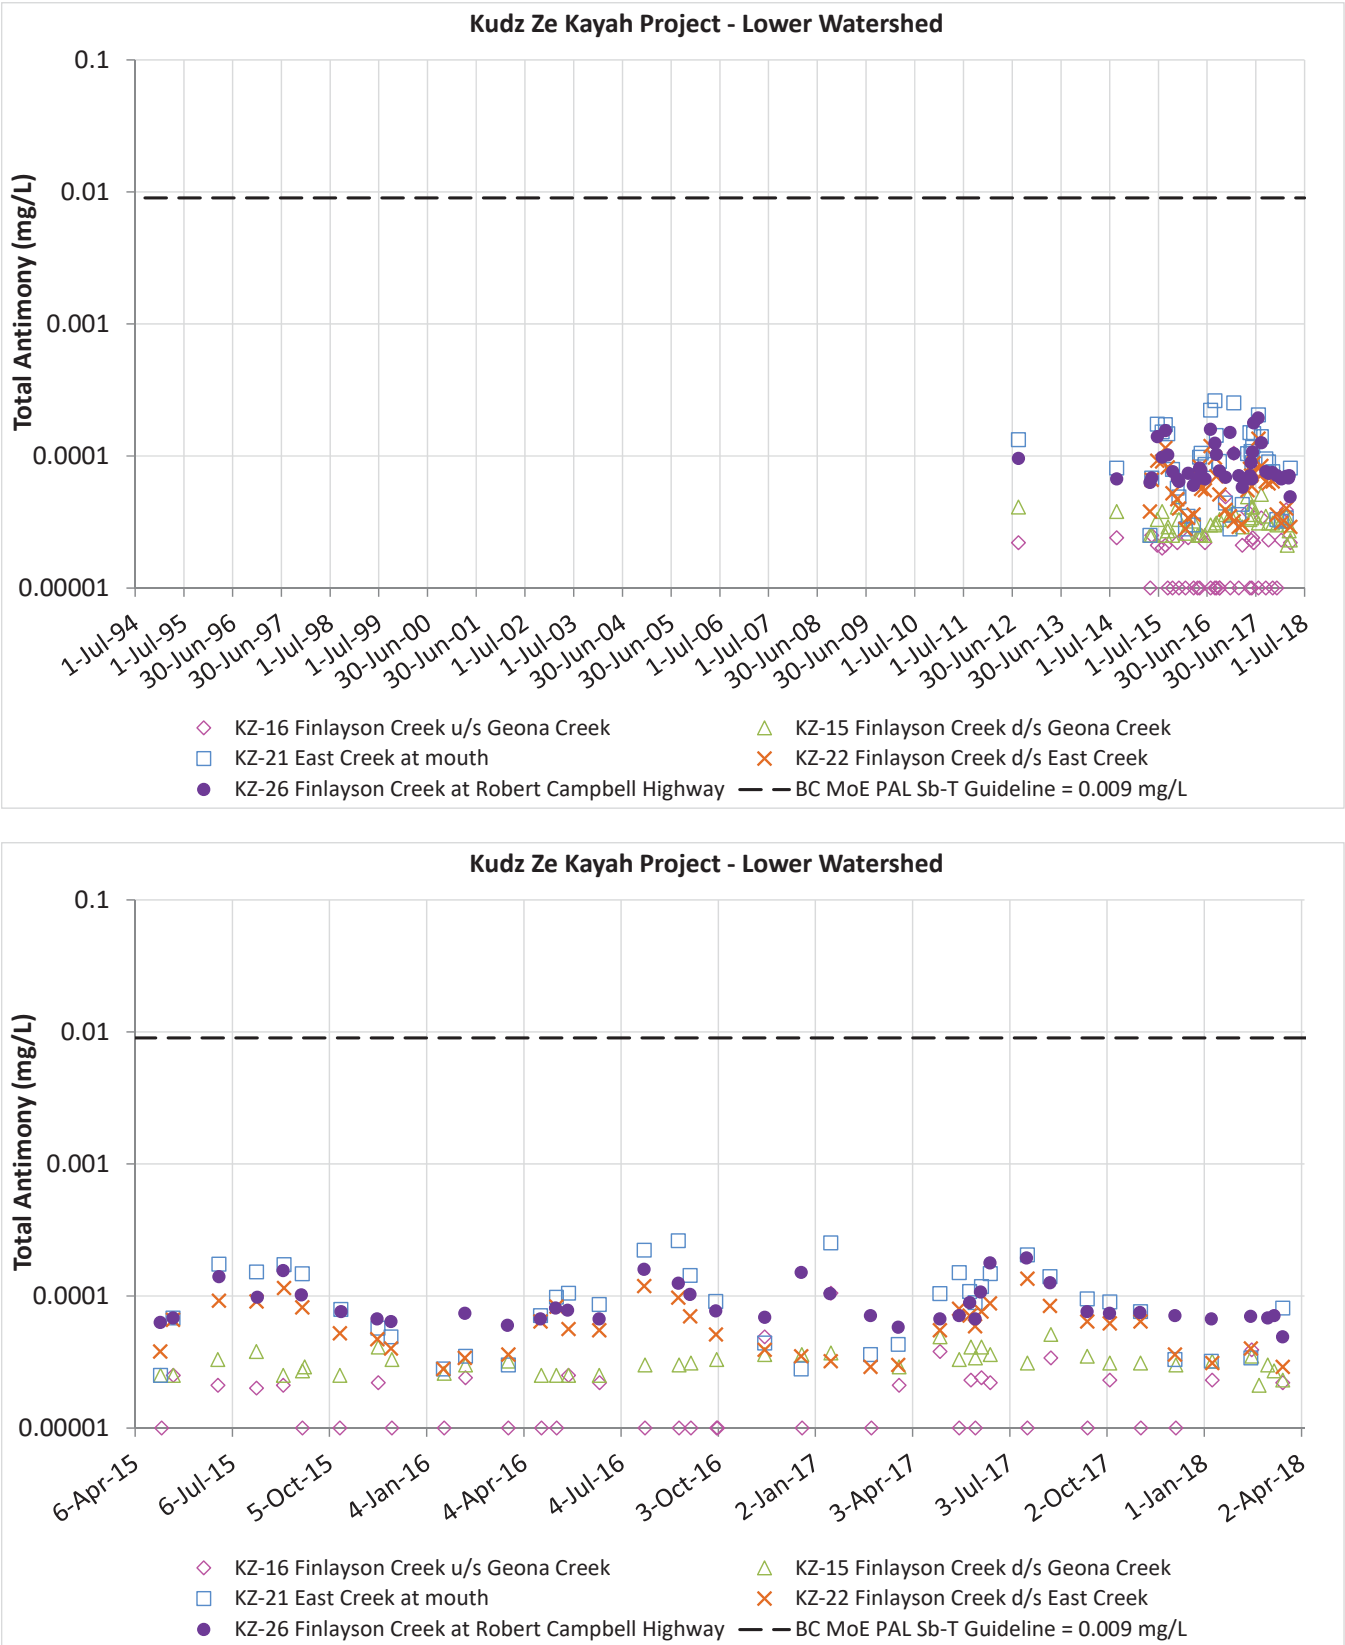

Figure C-6: Temporal Variation in Total Antimony Concentration in Lower Watershed (Finlayson and East Creeks) of Kudz Ze Kayah Project since 1994 (top) and since 2015 (bottom)

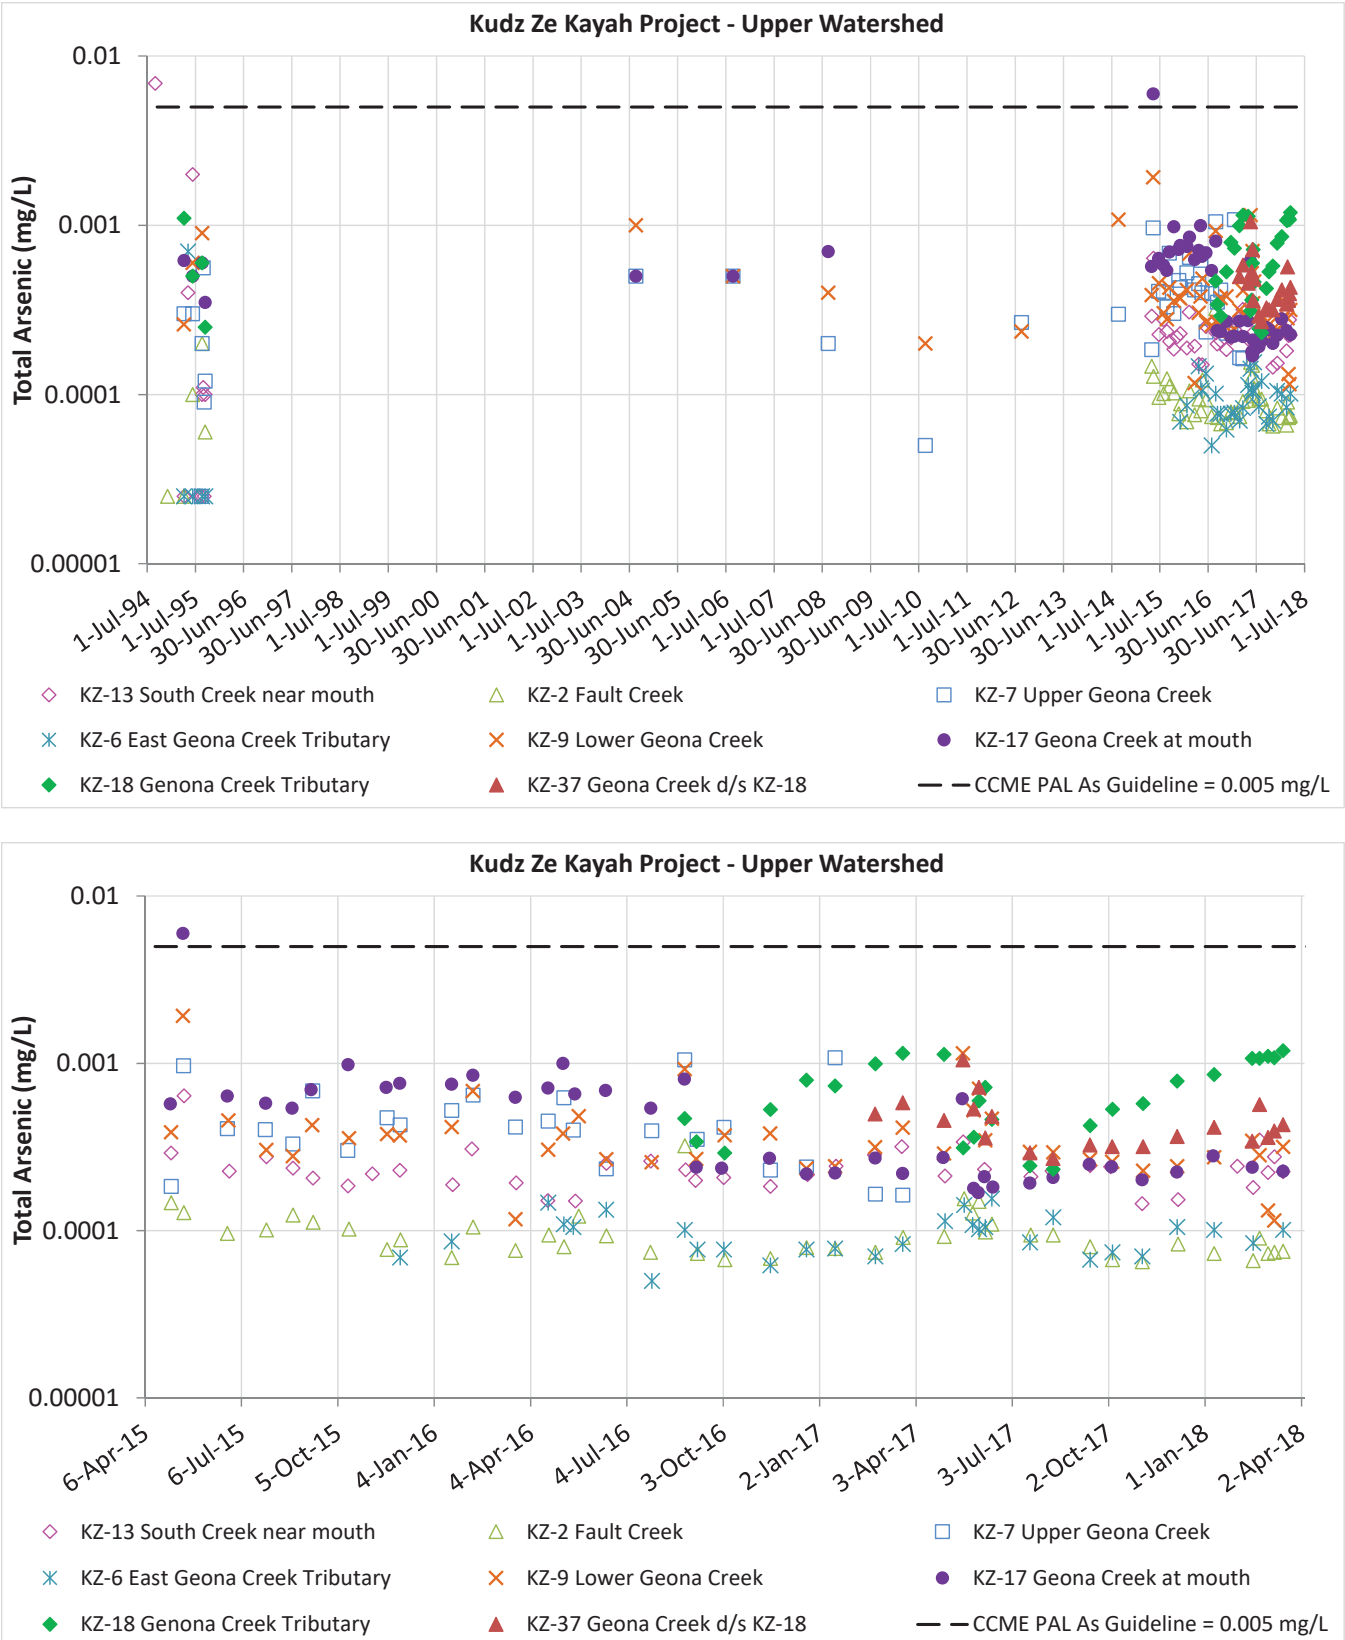

Figure C-7: Temporal Variation in Total Arsenic Concentration in Upper Watershed (South, Fault, and Geona Creeks) of Kudz Ze Kayah Project since 1994 (top) and since 2015 (bottom)

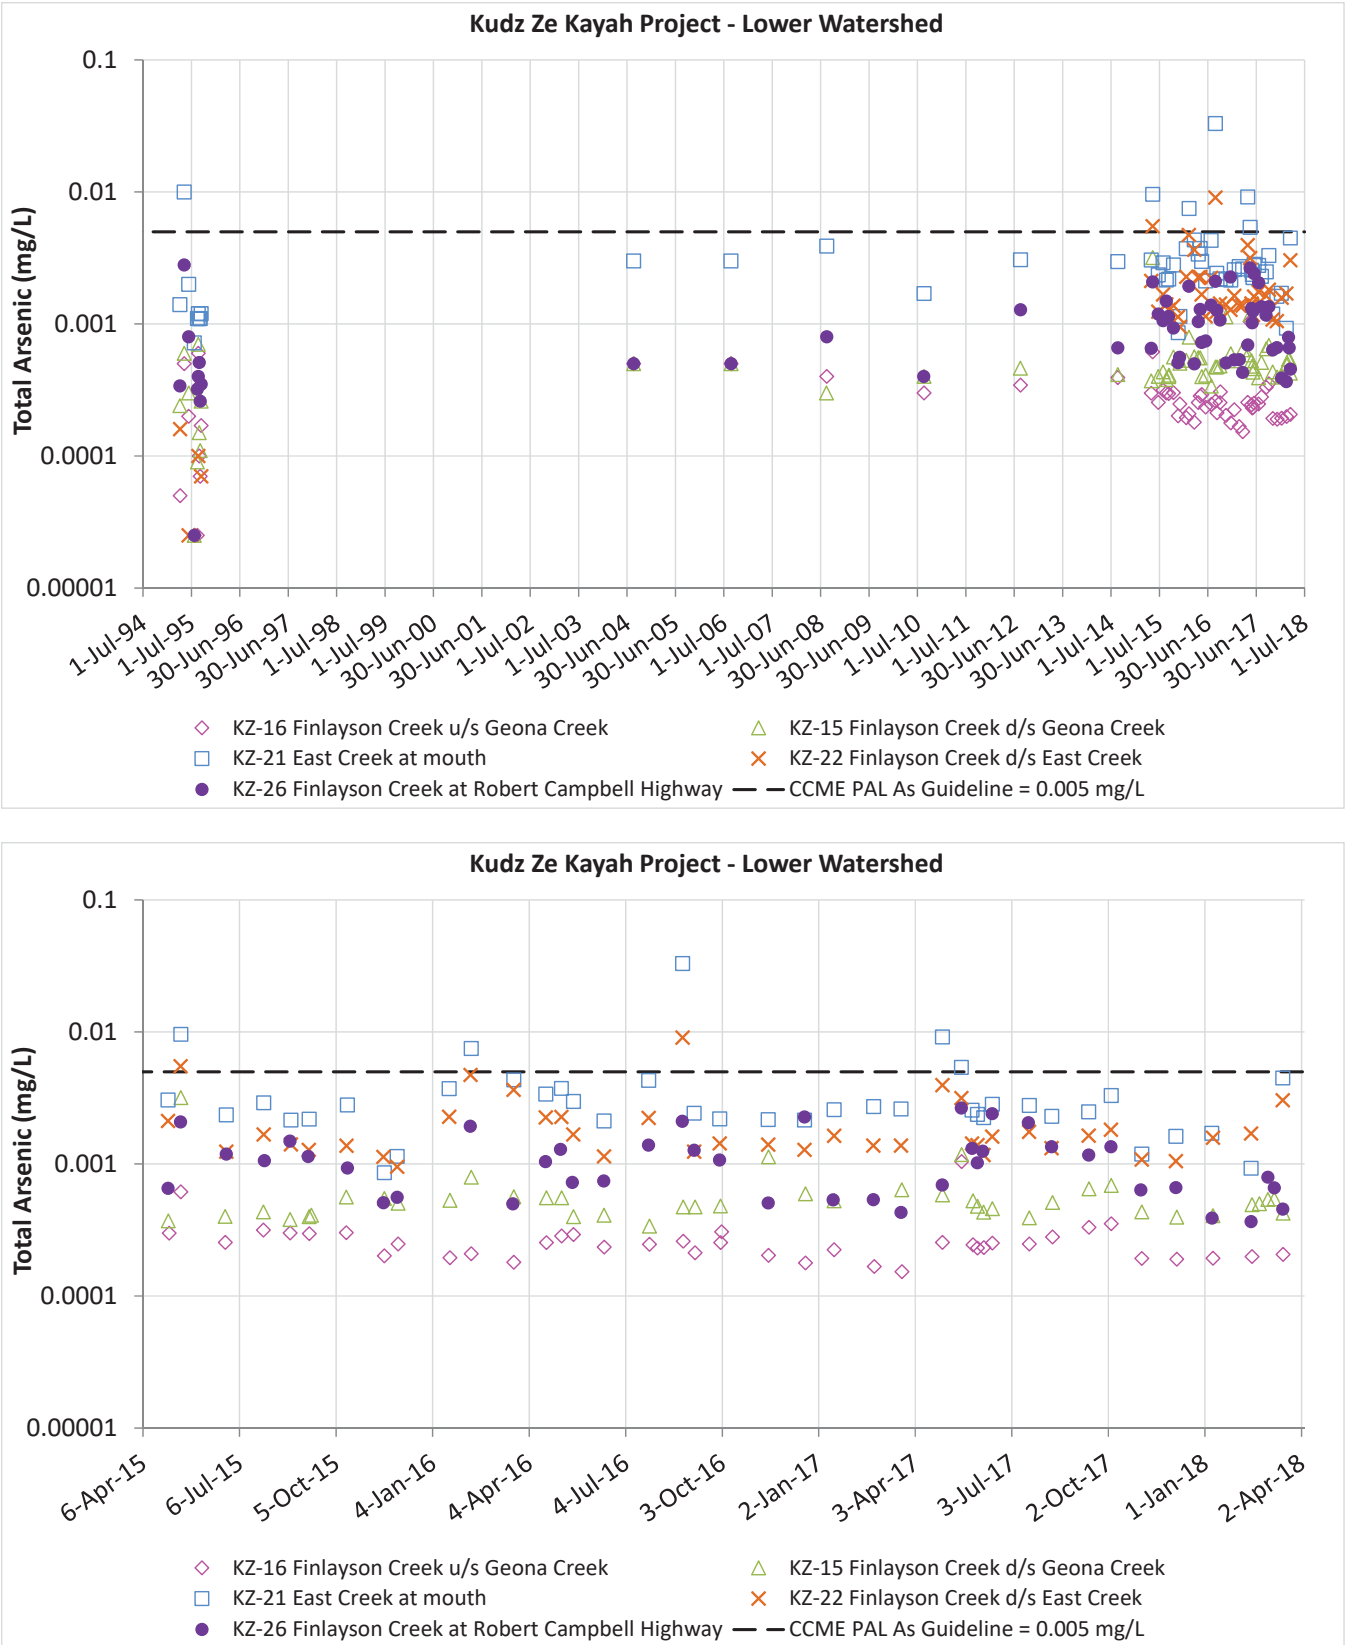

Figure C-8: Temporal Variation in Total Arsenic Concentration in Lower Watershed (Finlayson and East Creeks) of Kudz Ze Kayah Project since 1994 (top) and since 2015 (bottom)

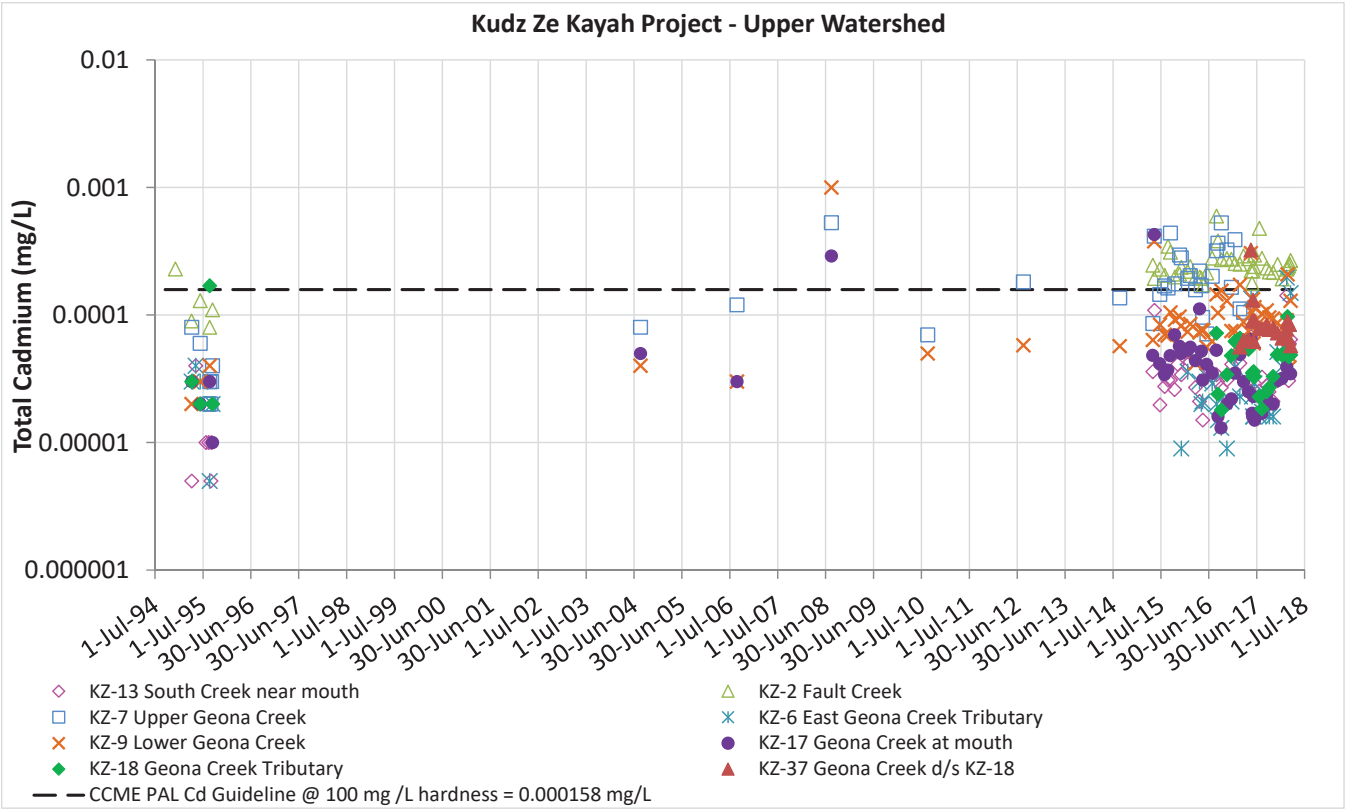

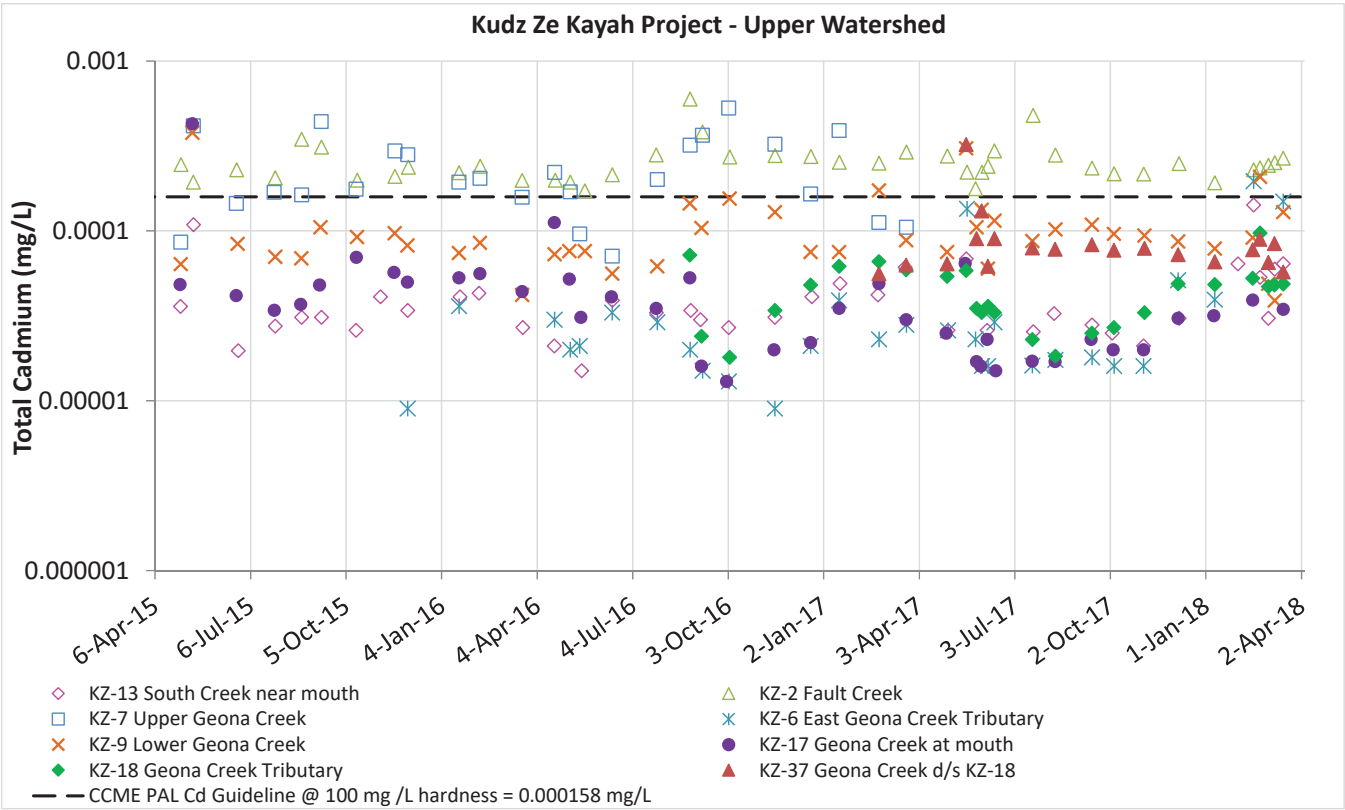

Figure C-9: Temporal Variation in Total Cadmium Concentration in Upper Watershed (South, Fault, and Geona Creeks) of Kudz Ze Kayah Project since 1994 (top) and since 2015 (bottom)

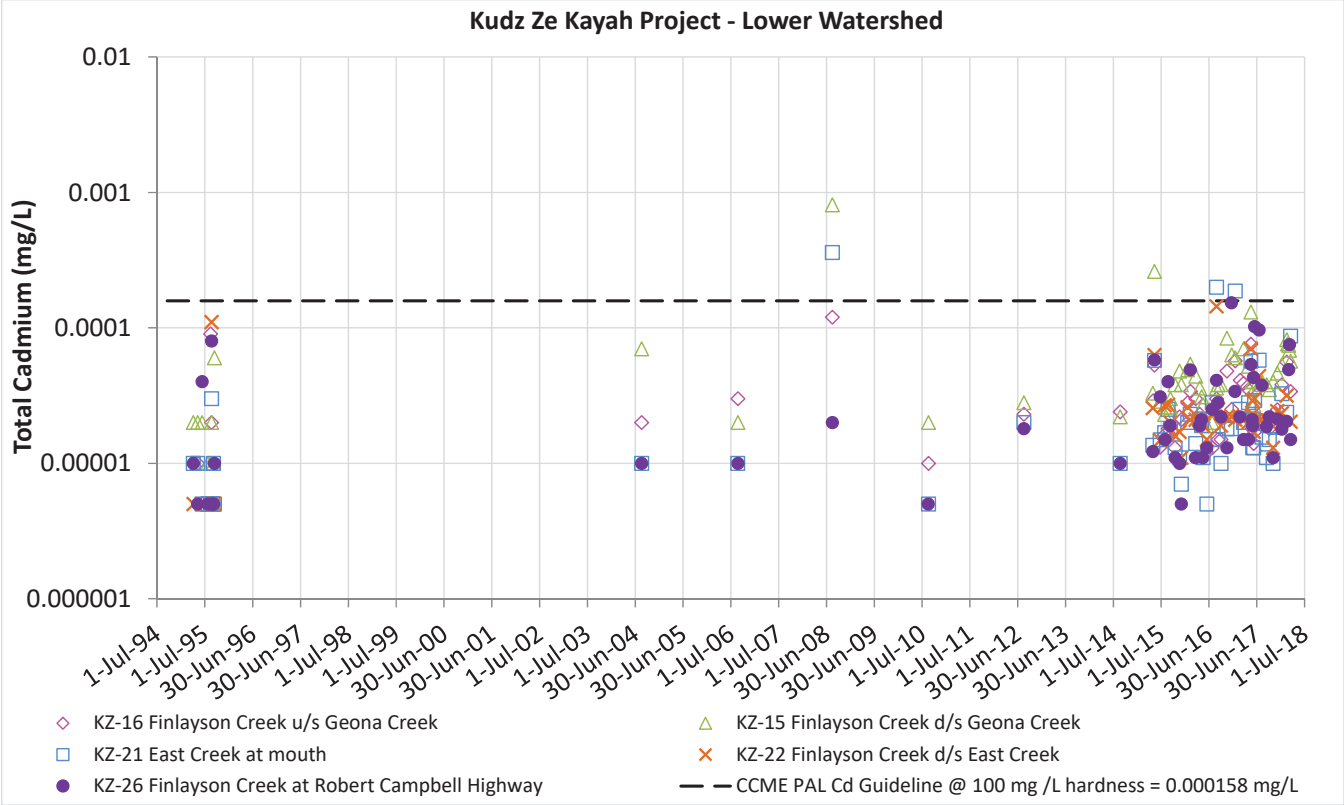

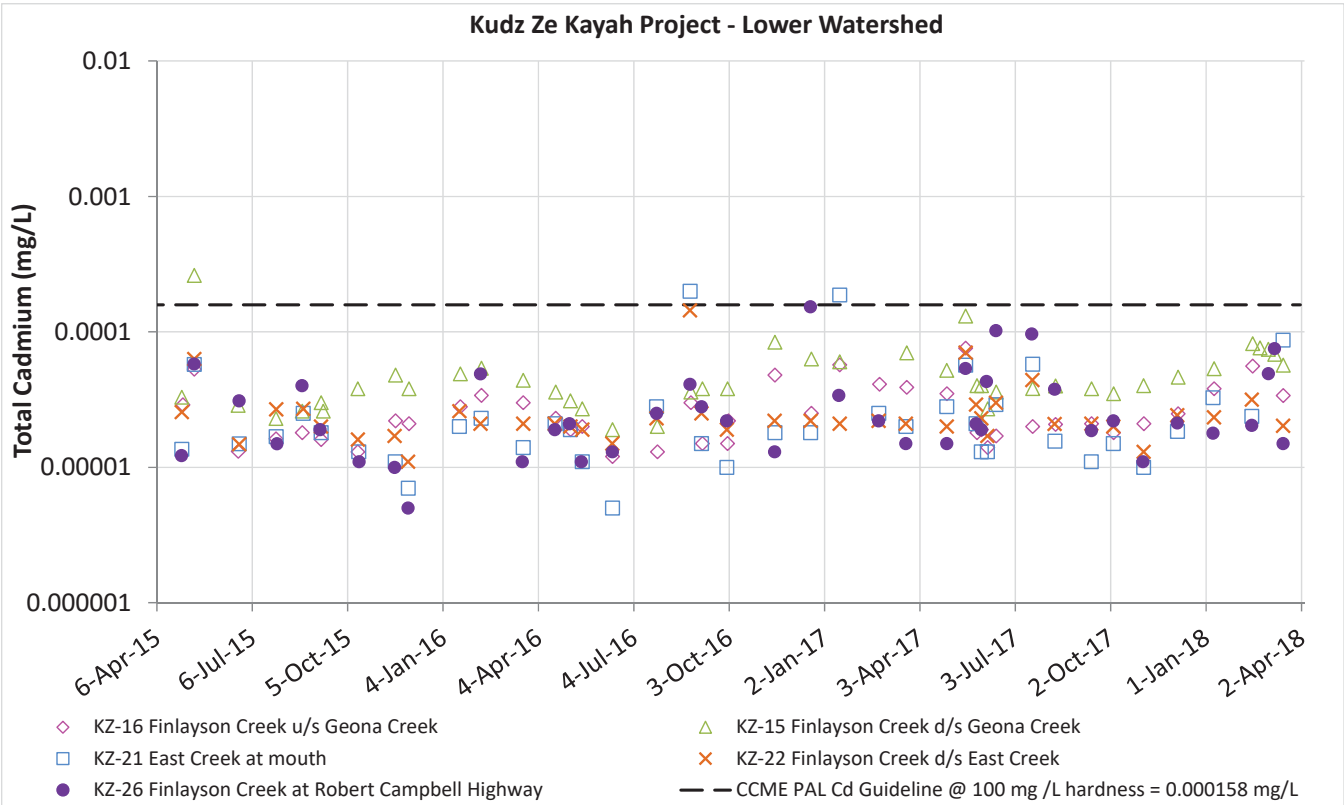

Figure C-10: Temporal Variation in Total Cadmium Concentration in Lower Watershed (Finlayson and East Creeks) of Kudz Ze Kayah Project since 1994 (top) and since 2015 (bottom)

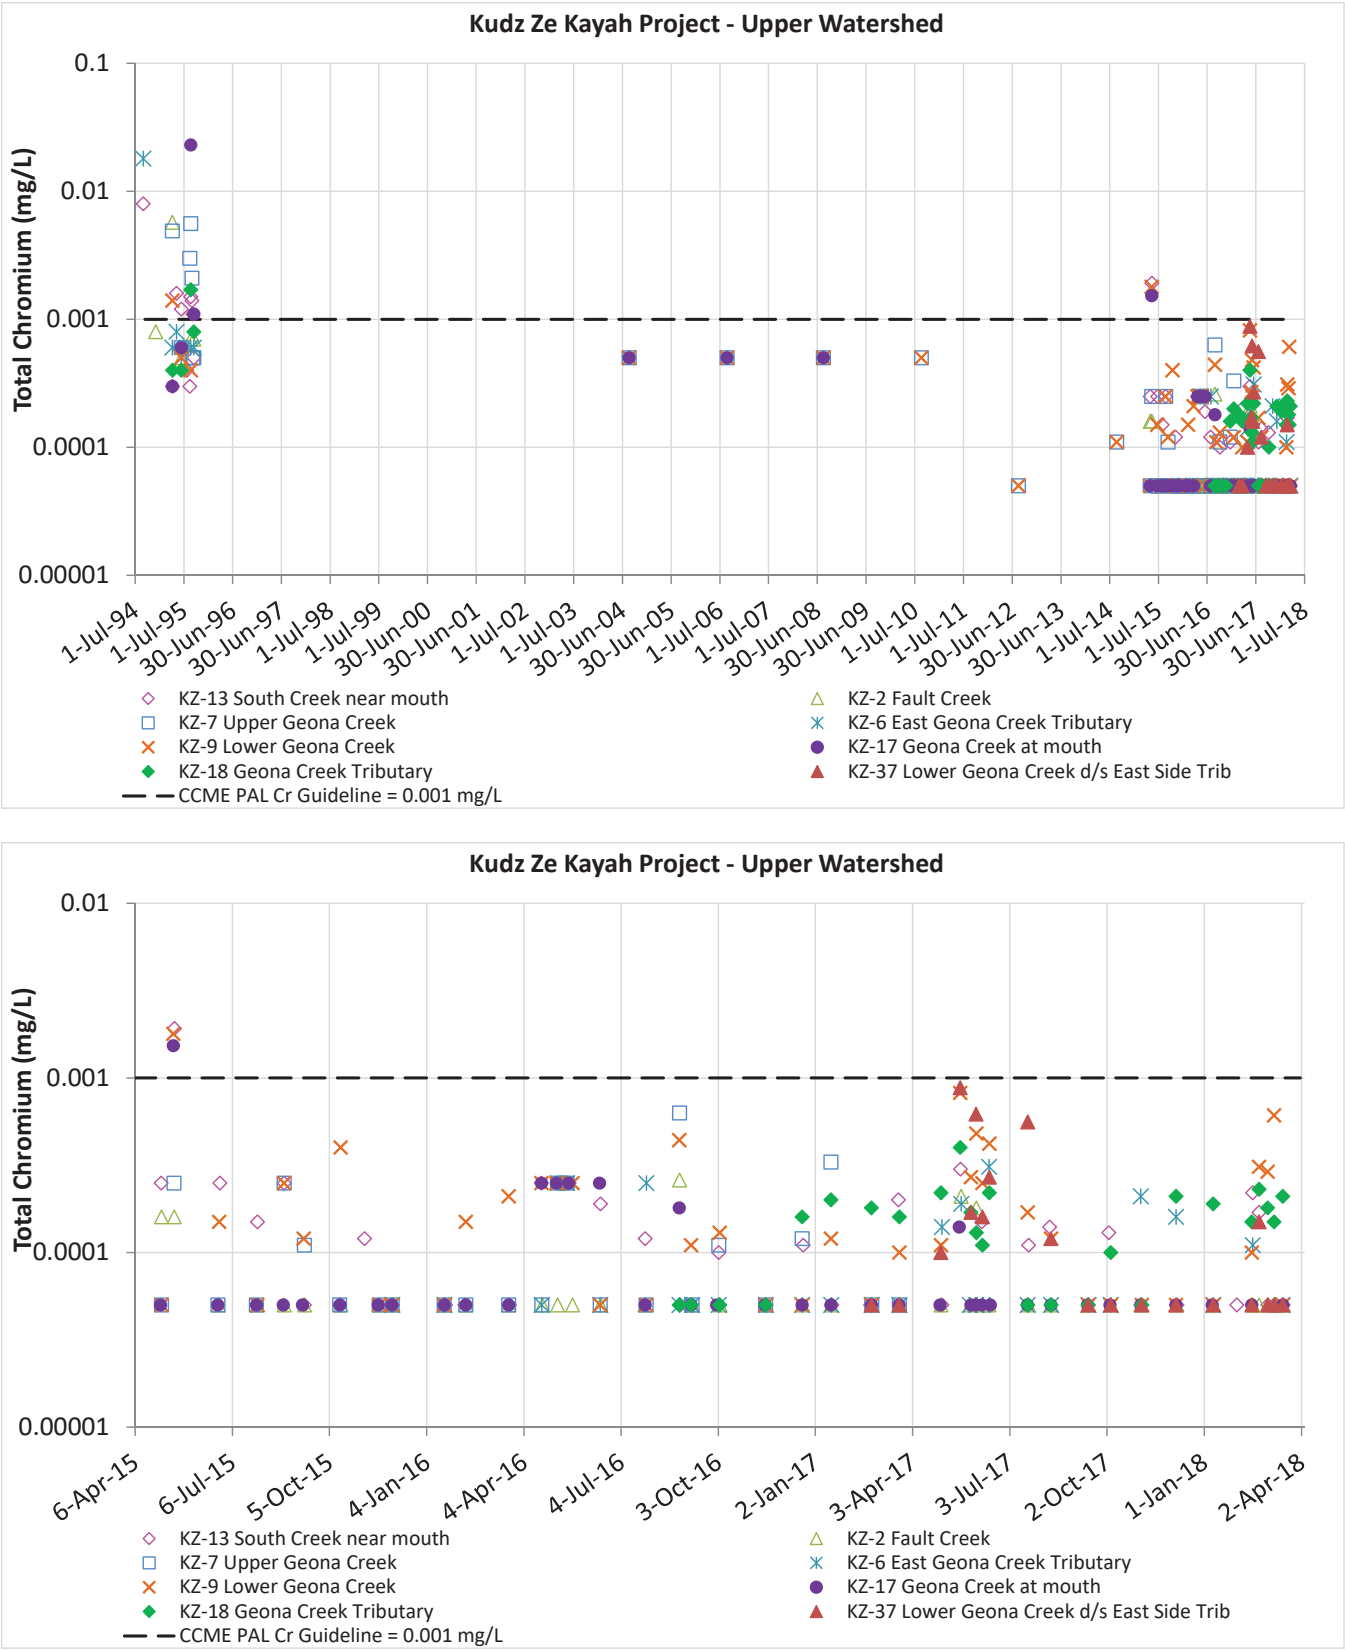

Figure C-11: Temporal Variation in Total Chromium Concentration in Upper Watershed (South, Fault, and Geona Creeks) of Kudz Ze Kayah Project since 1994 (top) and since 2015 (bottom)

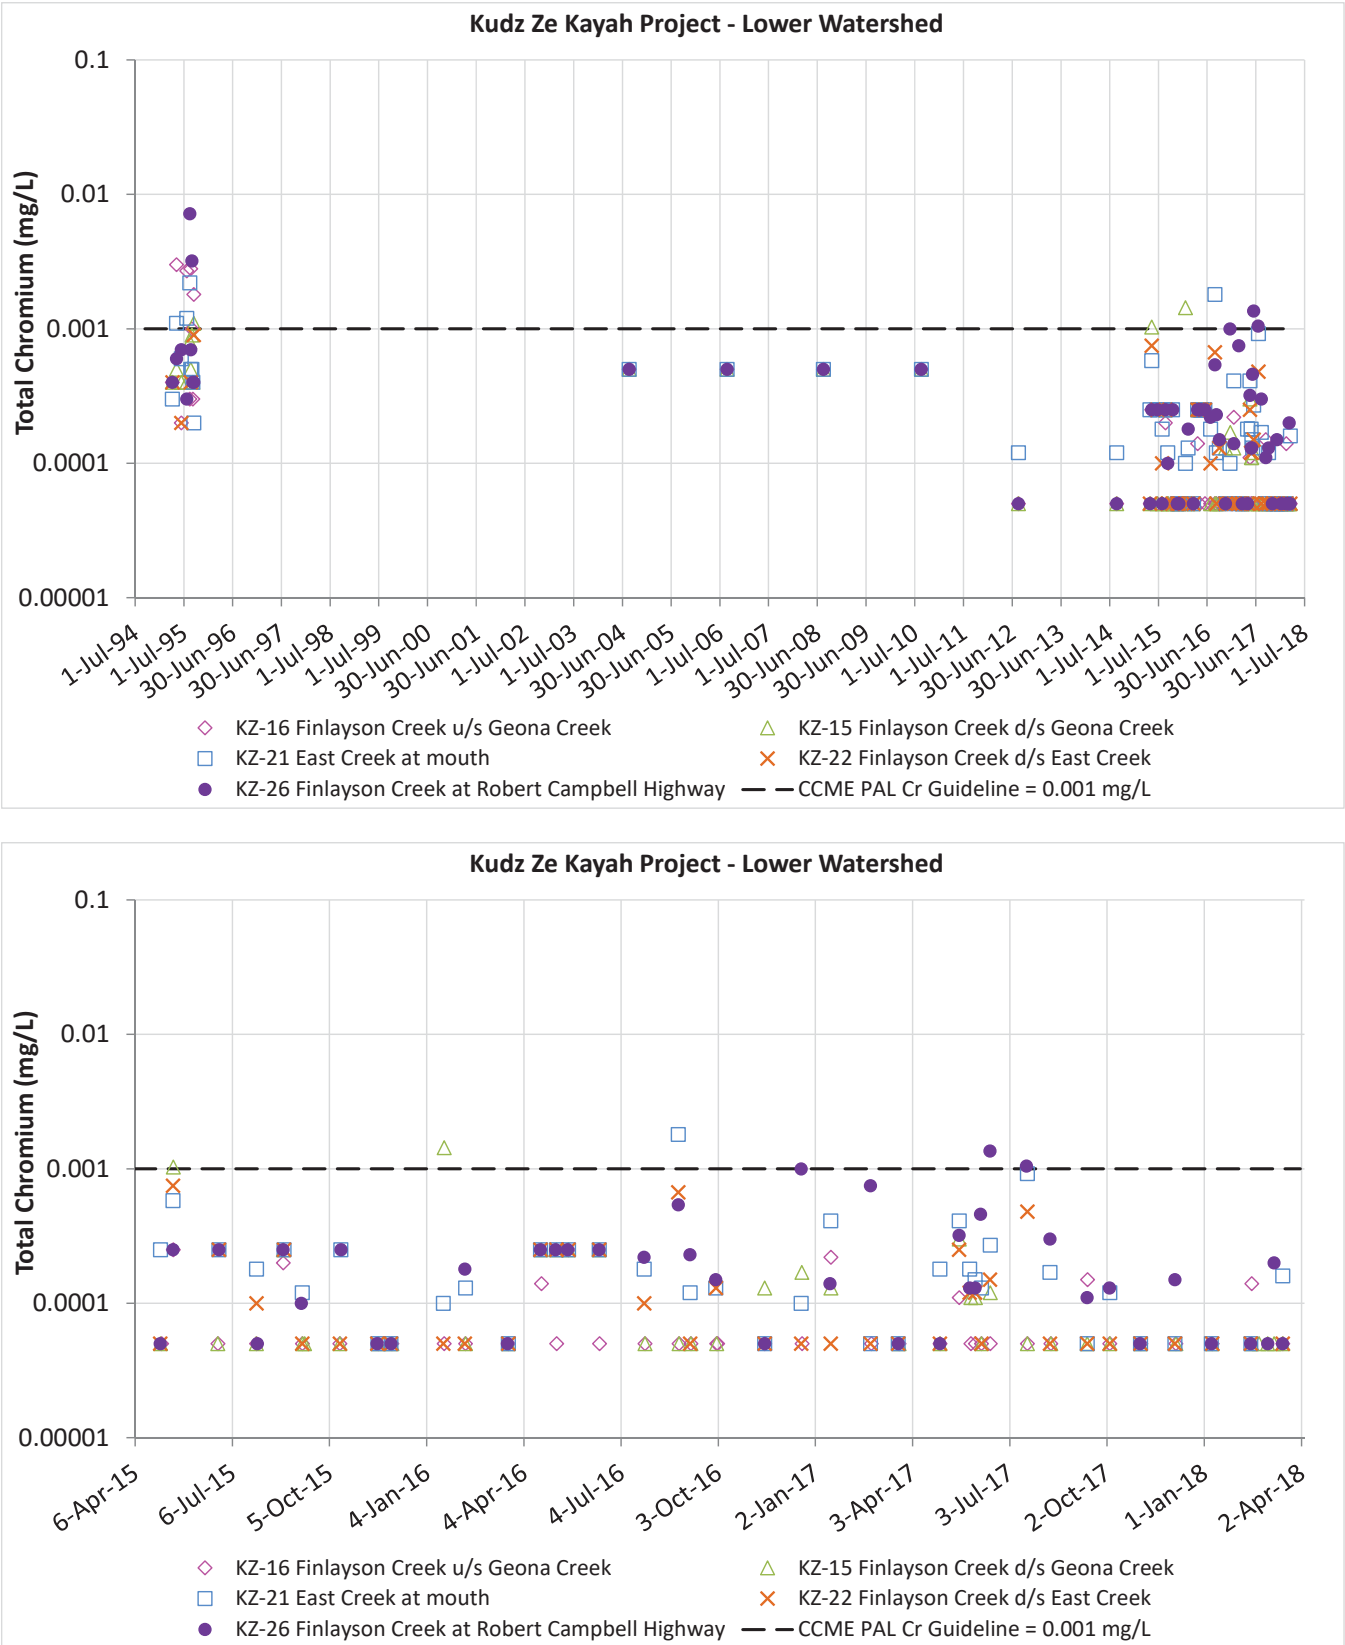

Figure C-12: Temporal Variation in Total Chromium Concentration in Lower Watershed (Finlayson and East Creeks) of Kudz Ze Kayah Project since 1994 (top) and since 2015 (bottom)

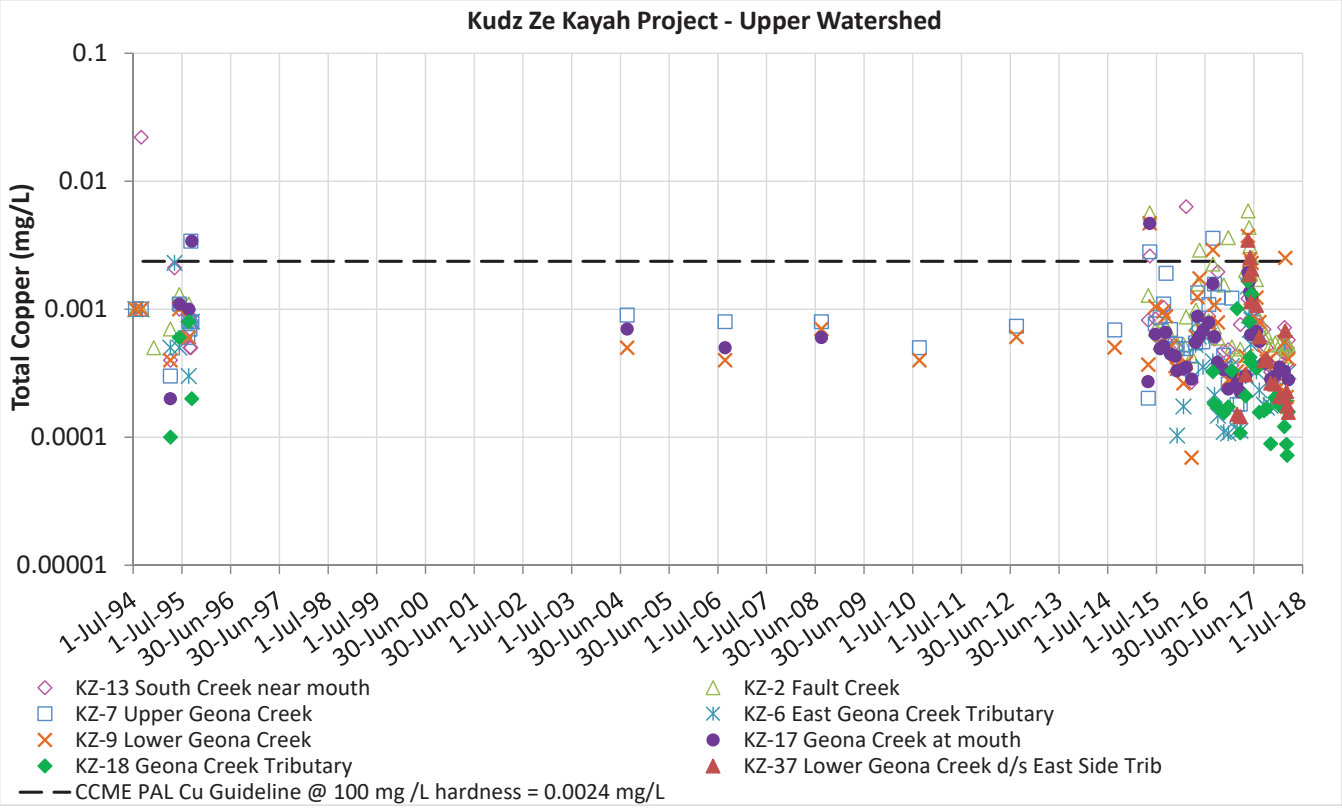

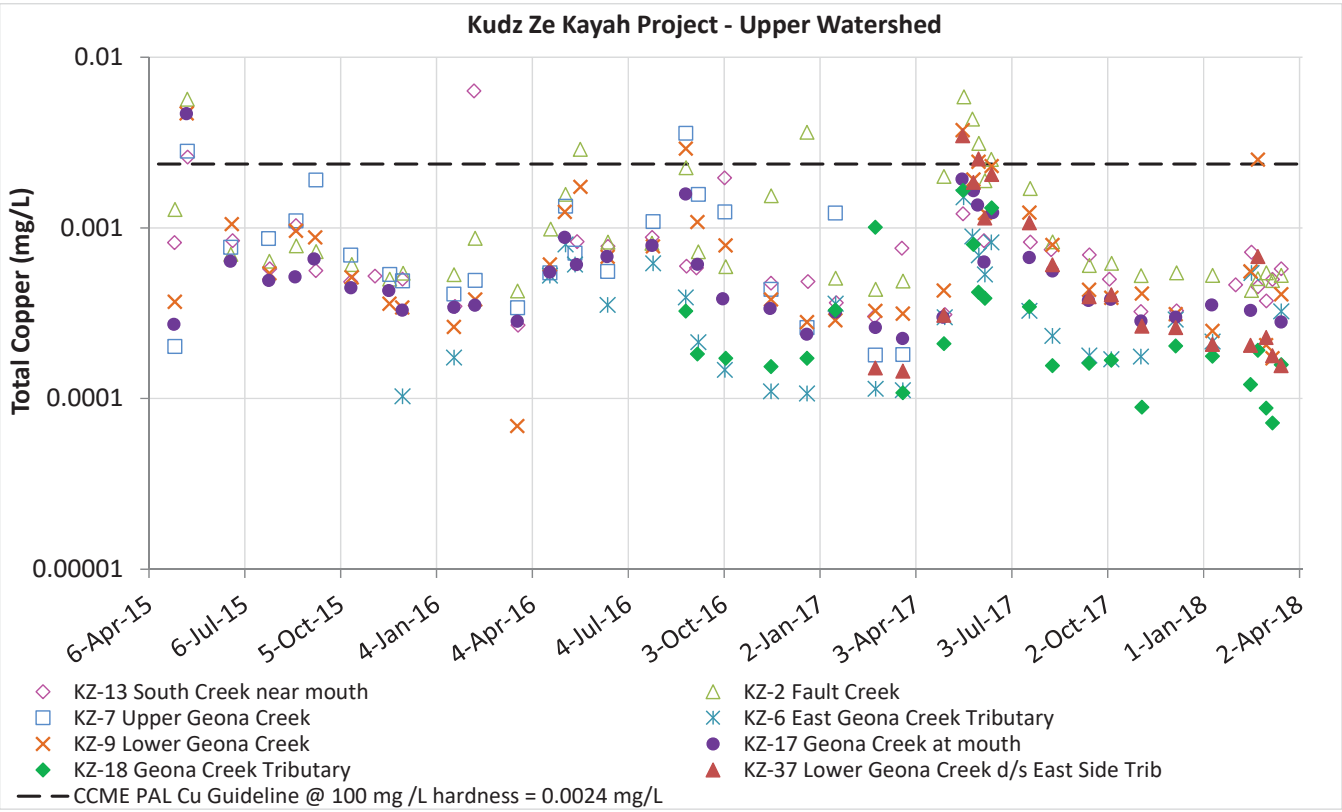

Figure C-13: Temporal Variation in Total Copper Concentration in Upper Watershed (South, Fault, and Geona Creeks) of Kudz Ze Kayah Project since 1994 (top) and since 2015 (bottom)

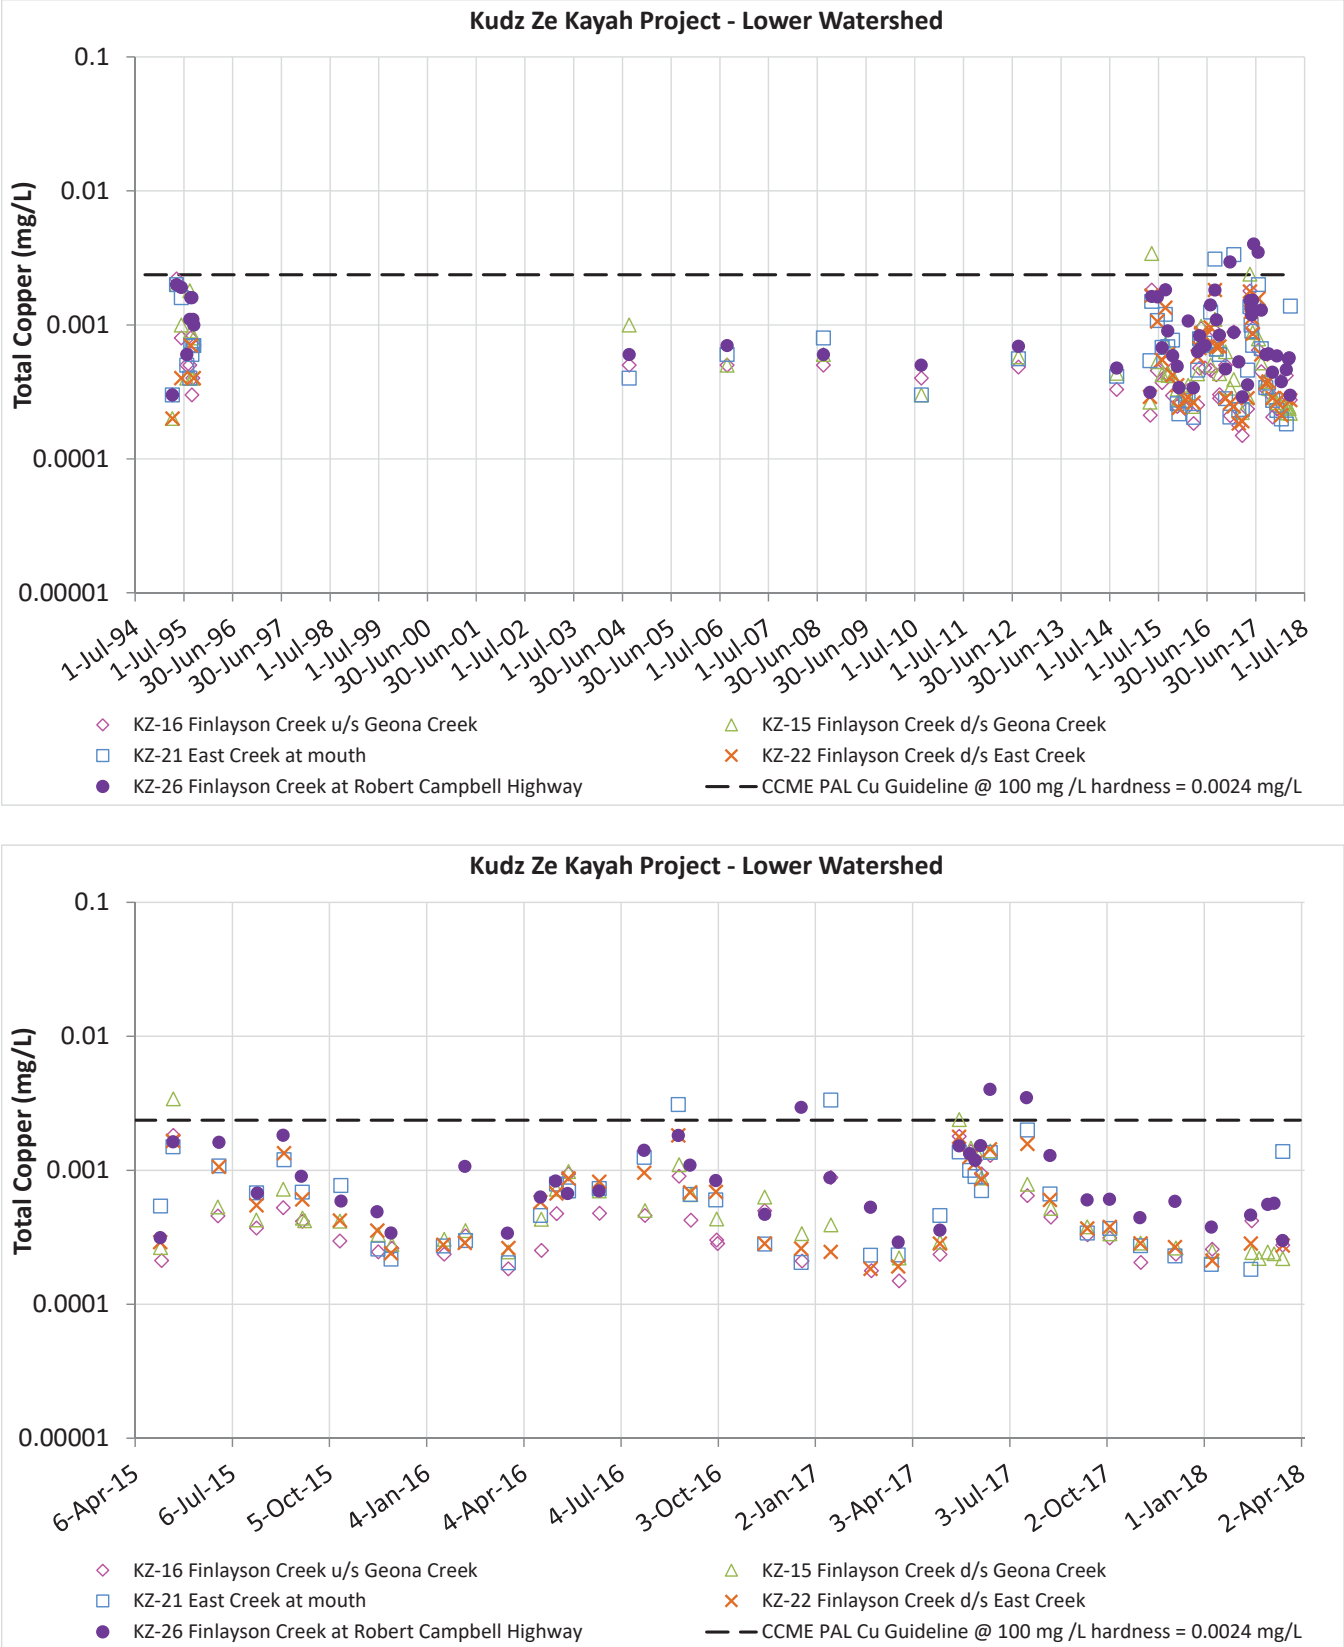

Figure C-14: Temporal Variation in Total Copper Concentration in Lower Watershed (Finlayson and East Creeks) of Kudz Ze Kayah Project since 1994 (top) and since 2015 (bottom)

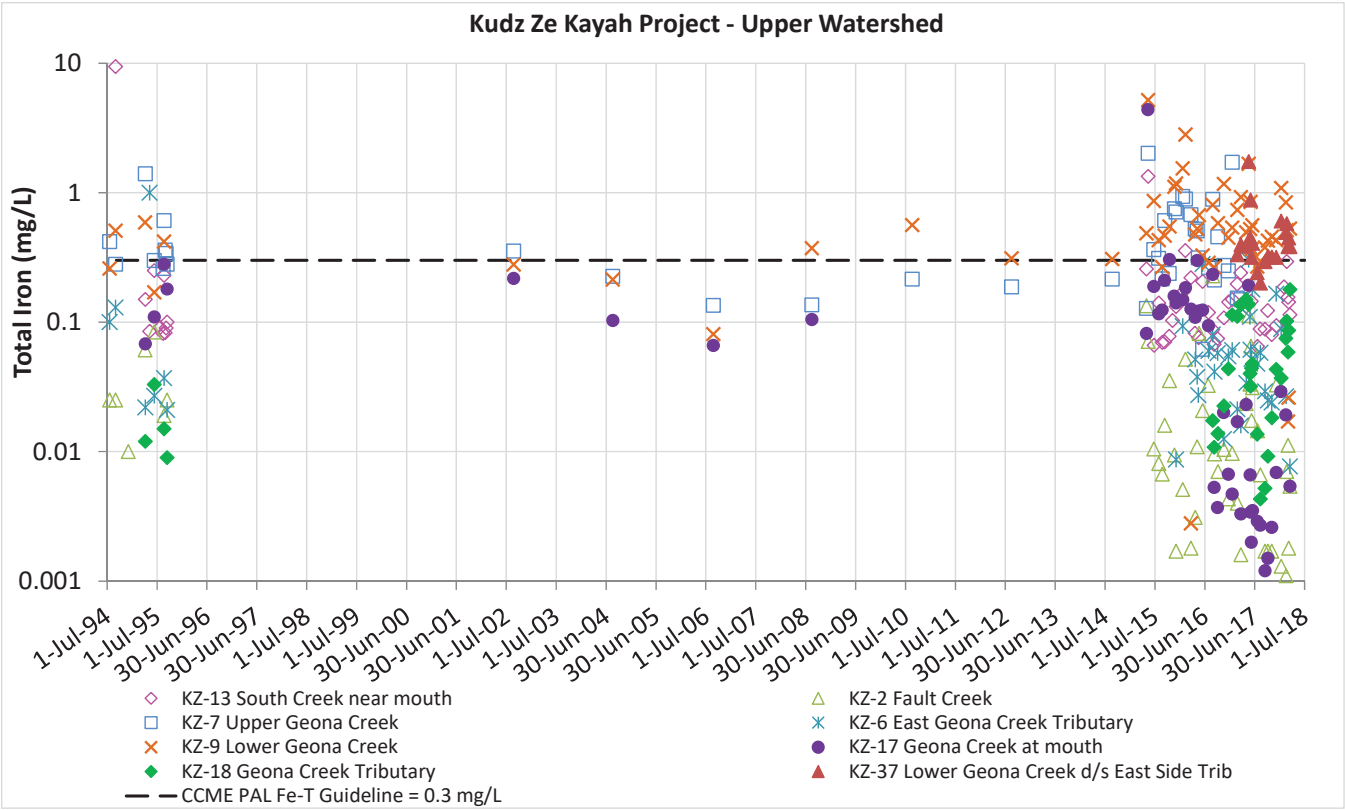

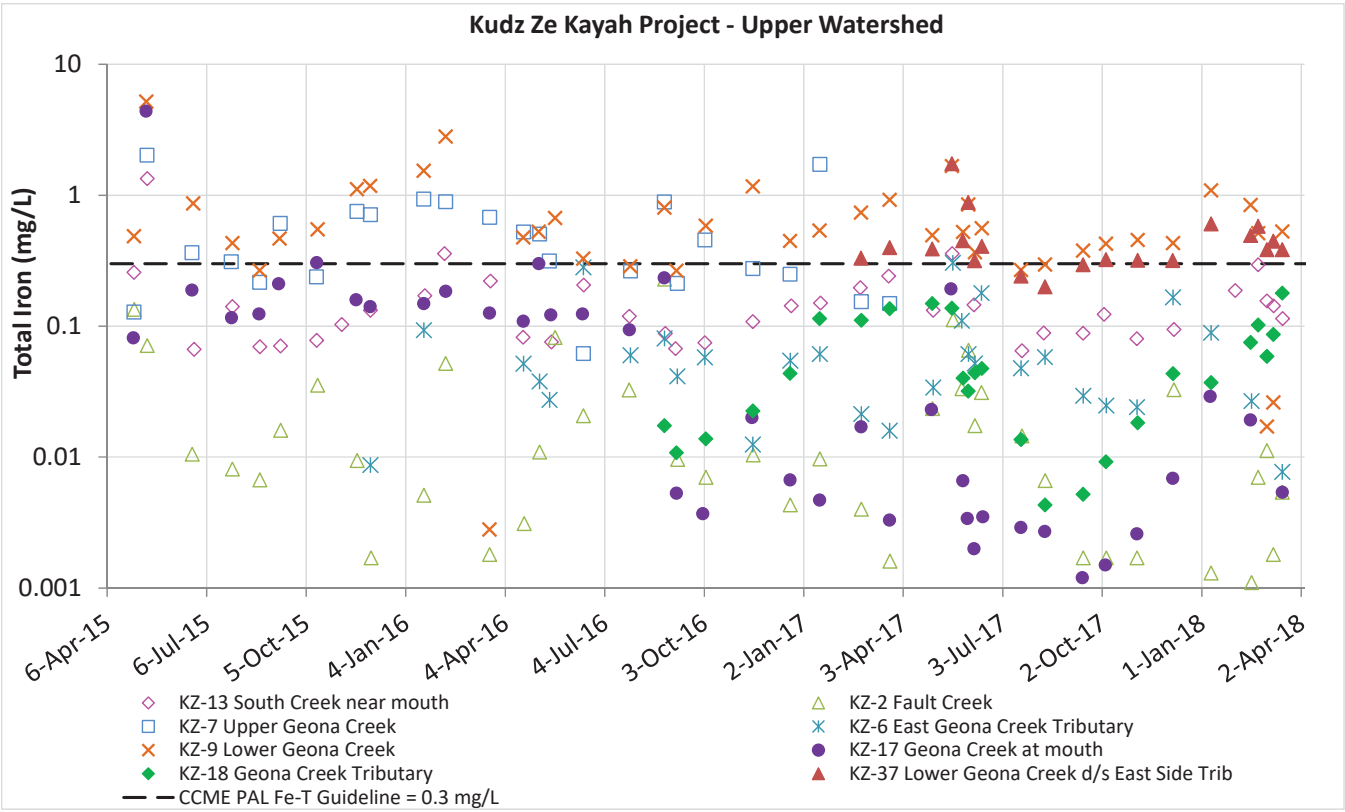

Figure C-15: Temporal Variation in Total Iron Concentration in Upper Watershed (South, Fault, and Geona Creeks) of Kudz Ze Kayah Project since 1994 (top) and since 2015 (bottom)

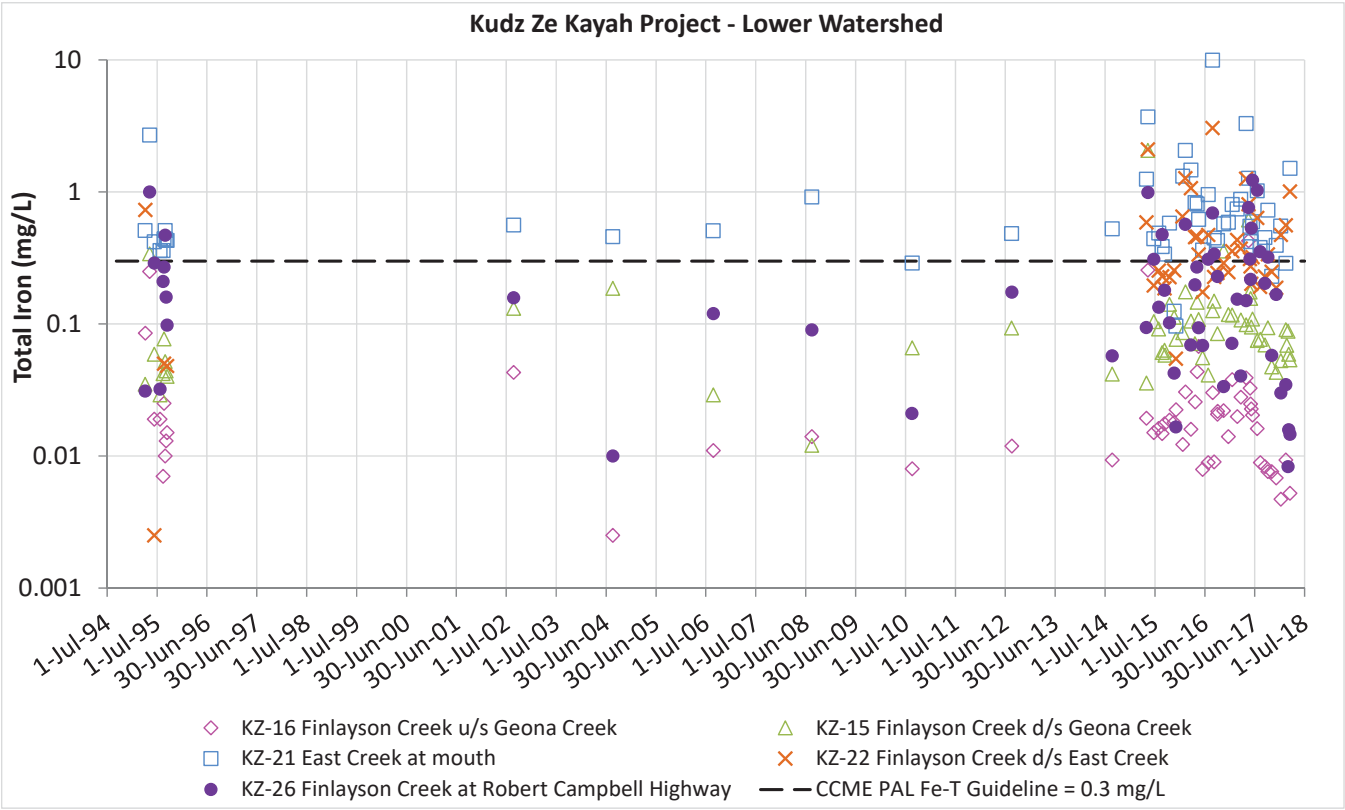

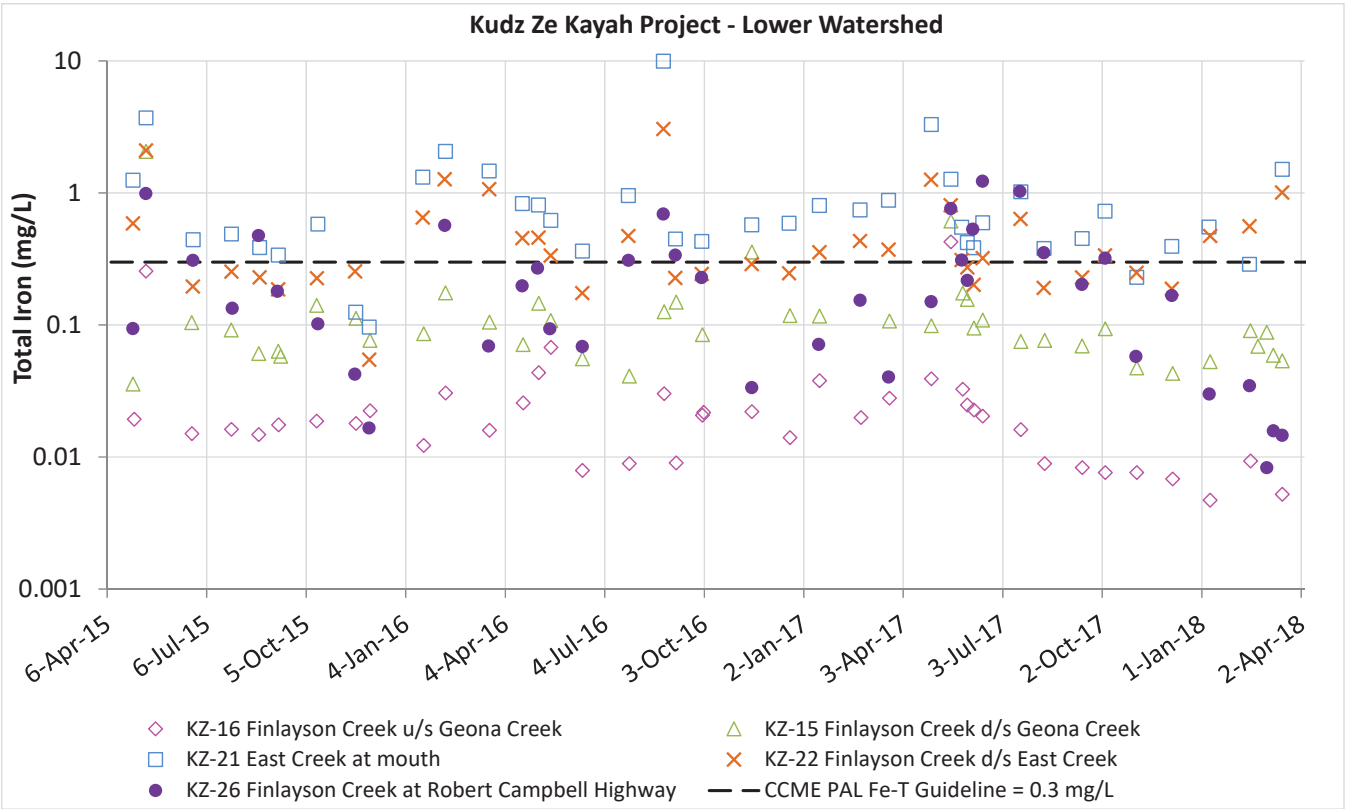

Figure C-16: Temporal Variation in Total Iron Concentration in Lower Watershed (Finlayson and East Creeks) of Kudz Ze Kayah Project since 1994 (top) and since 2015 (bottom)

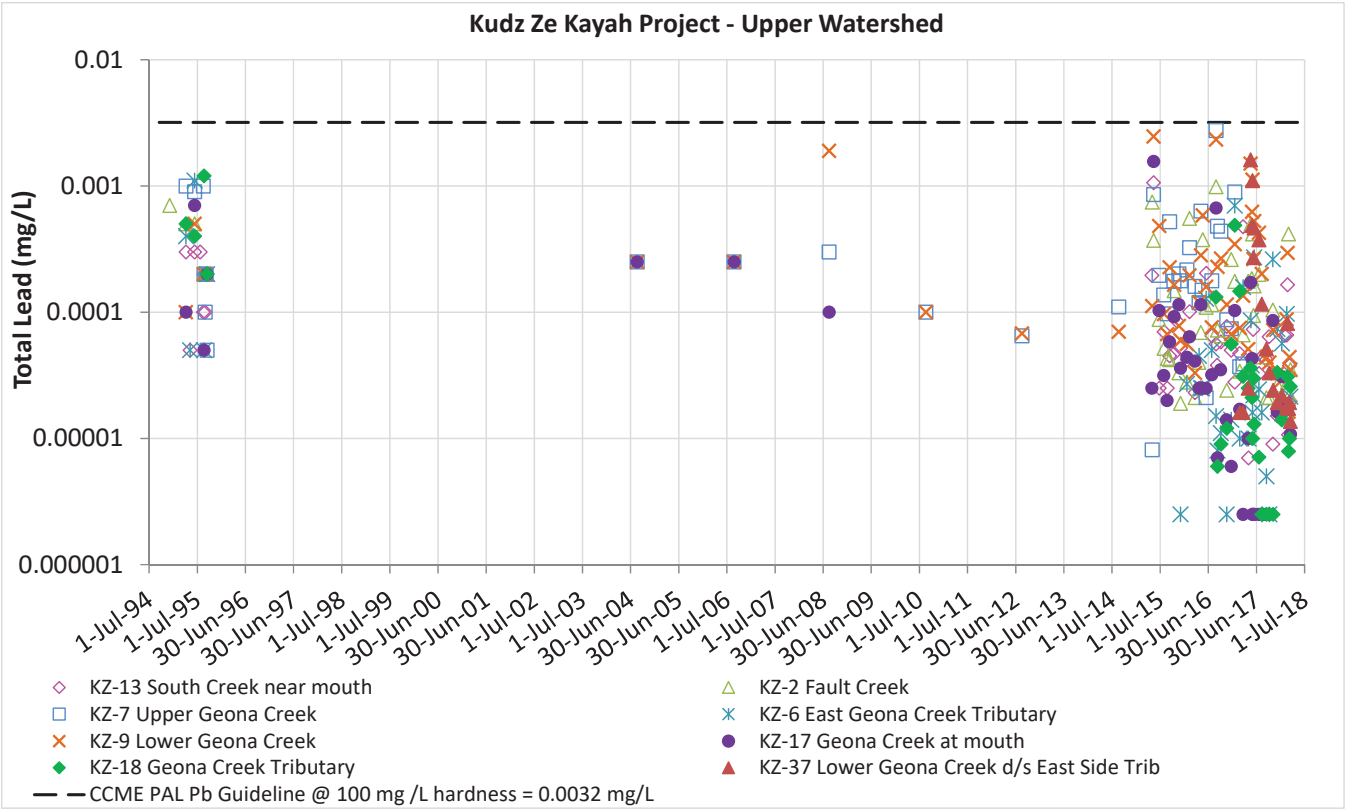

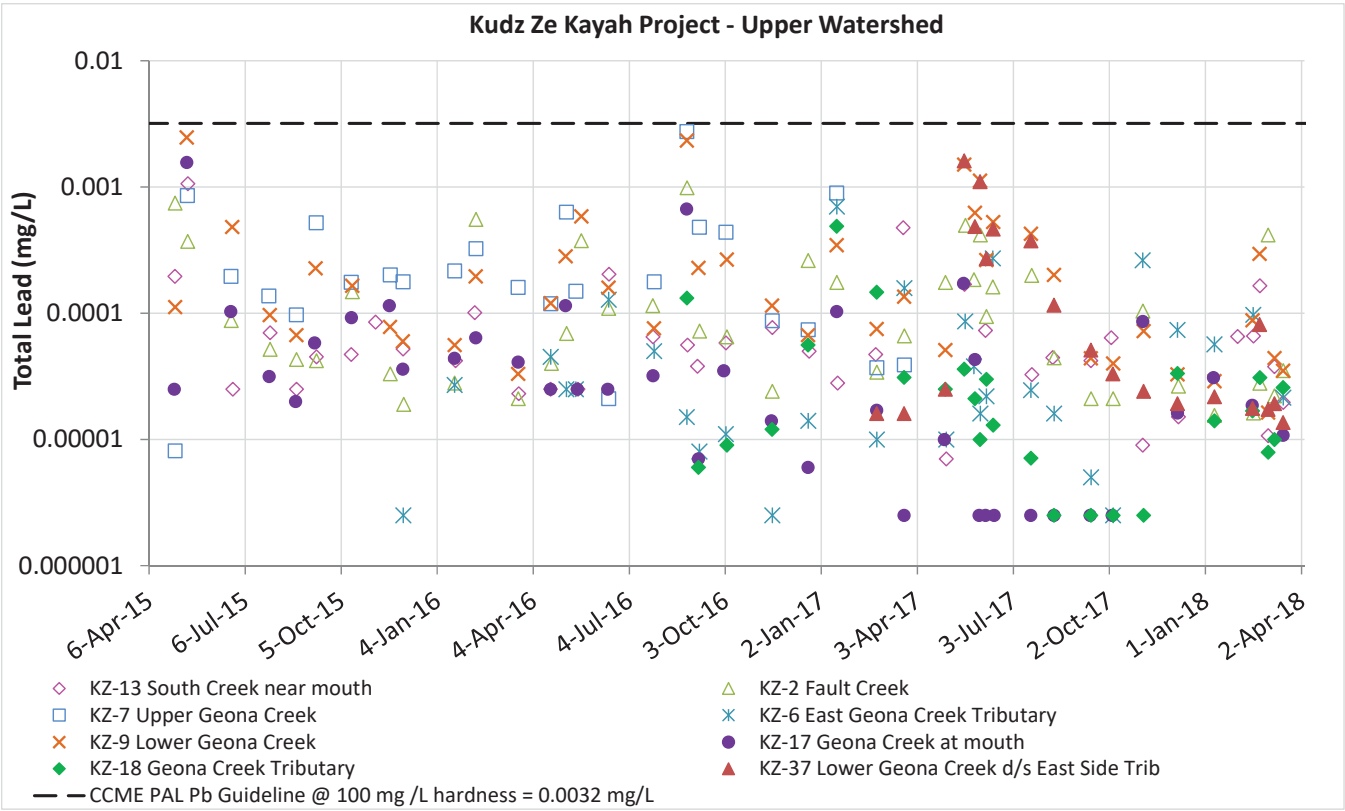

Figure C-17: Temporal Variation in Total Lead Concentration in Upper Watershed (South, Fault, and Geona Creeks) of Kudz Ze Kayah Project since 1994 (top) and since 2015 (bottom)

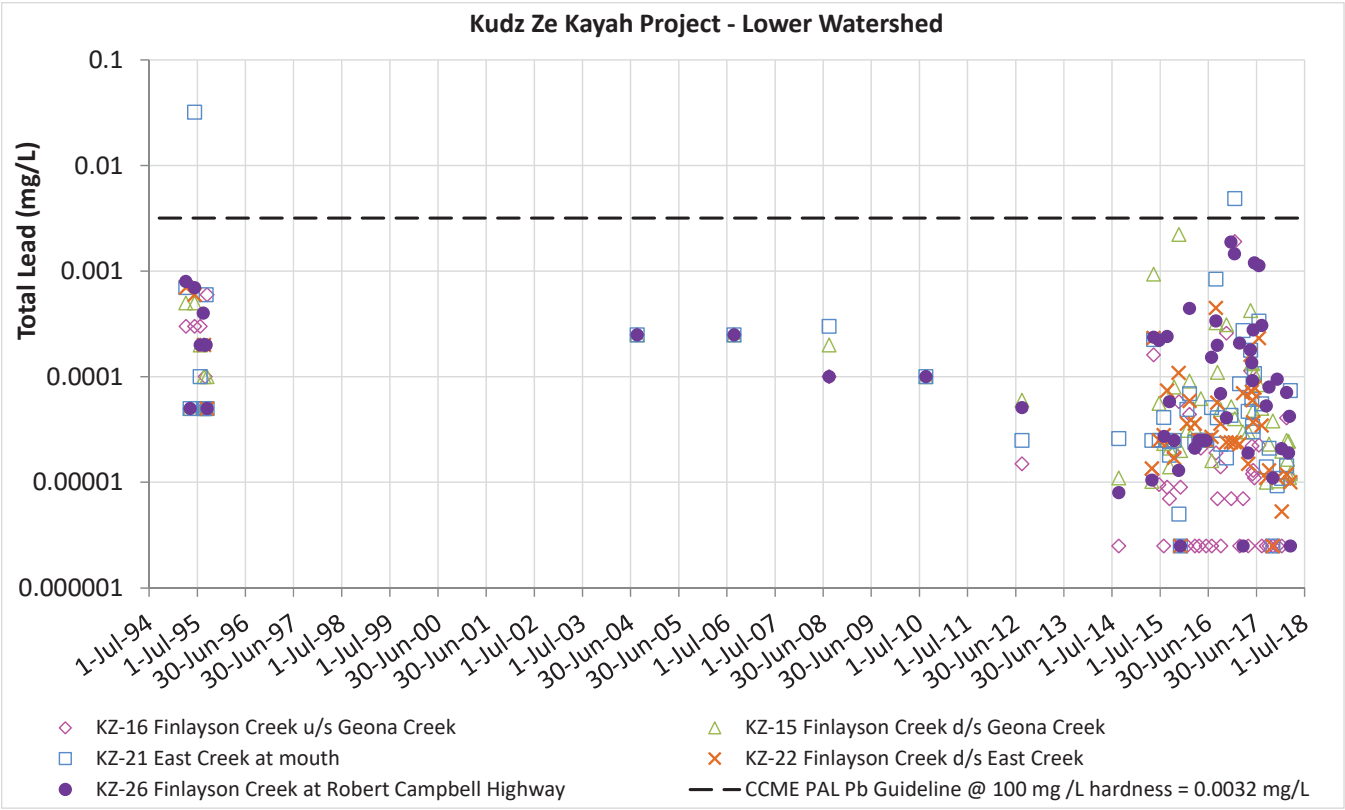

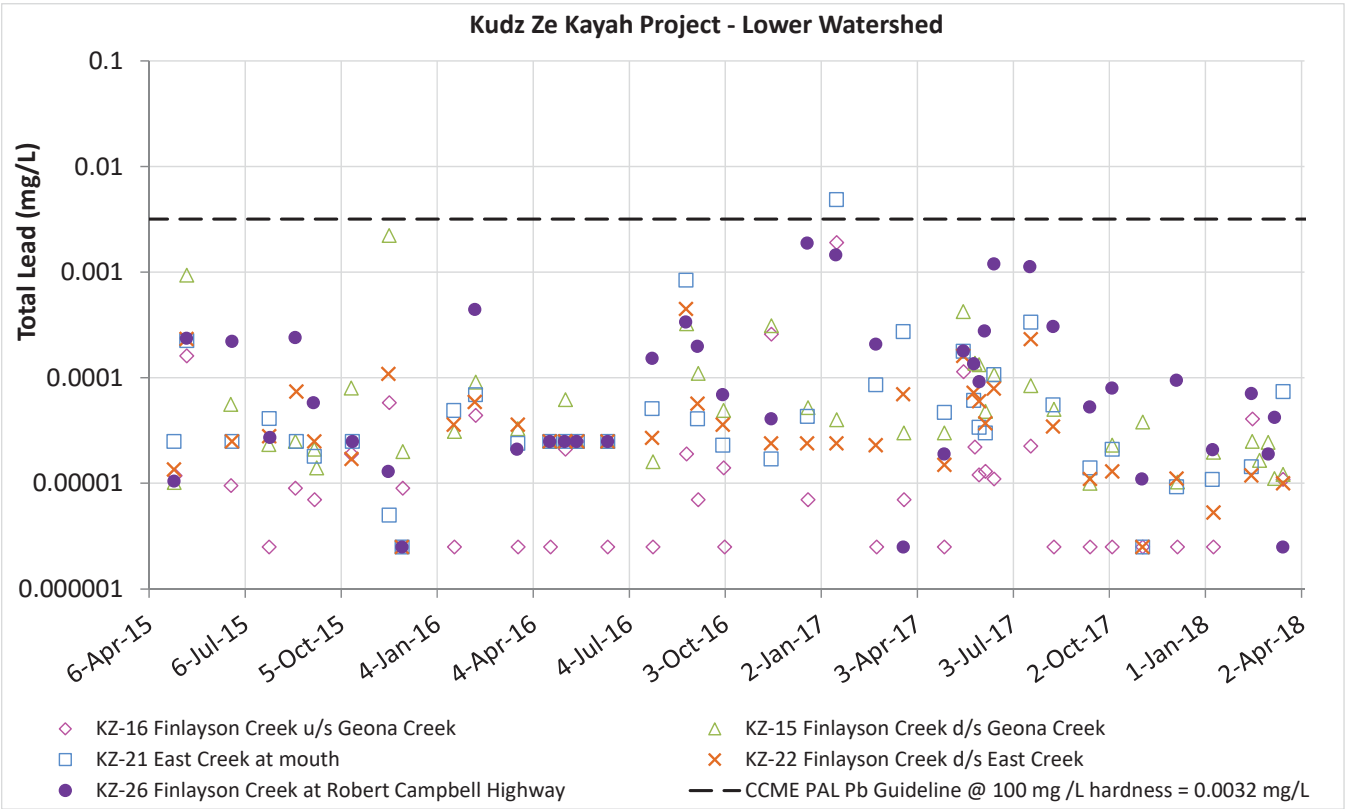

Figure C-18: Temporal Variation in Total Lead Concentration in Lower Watershed (Finlayson and East Creeks) of Kudz Ze Kayah Project since 1994 (top) and since 2015 (bottom)

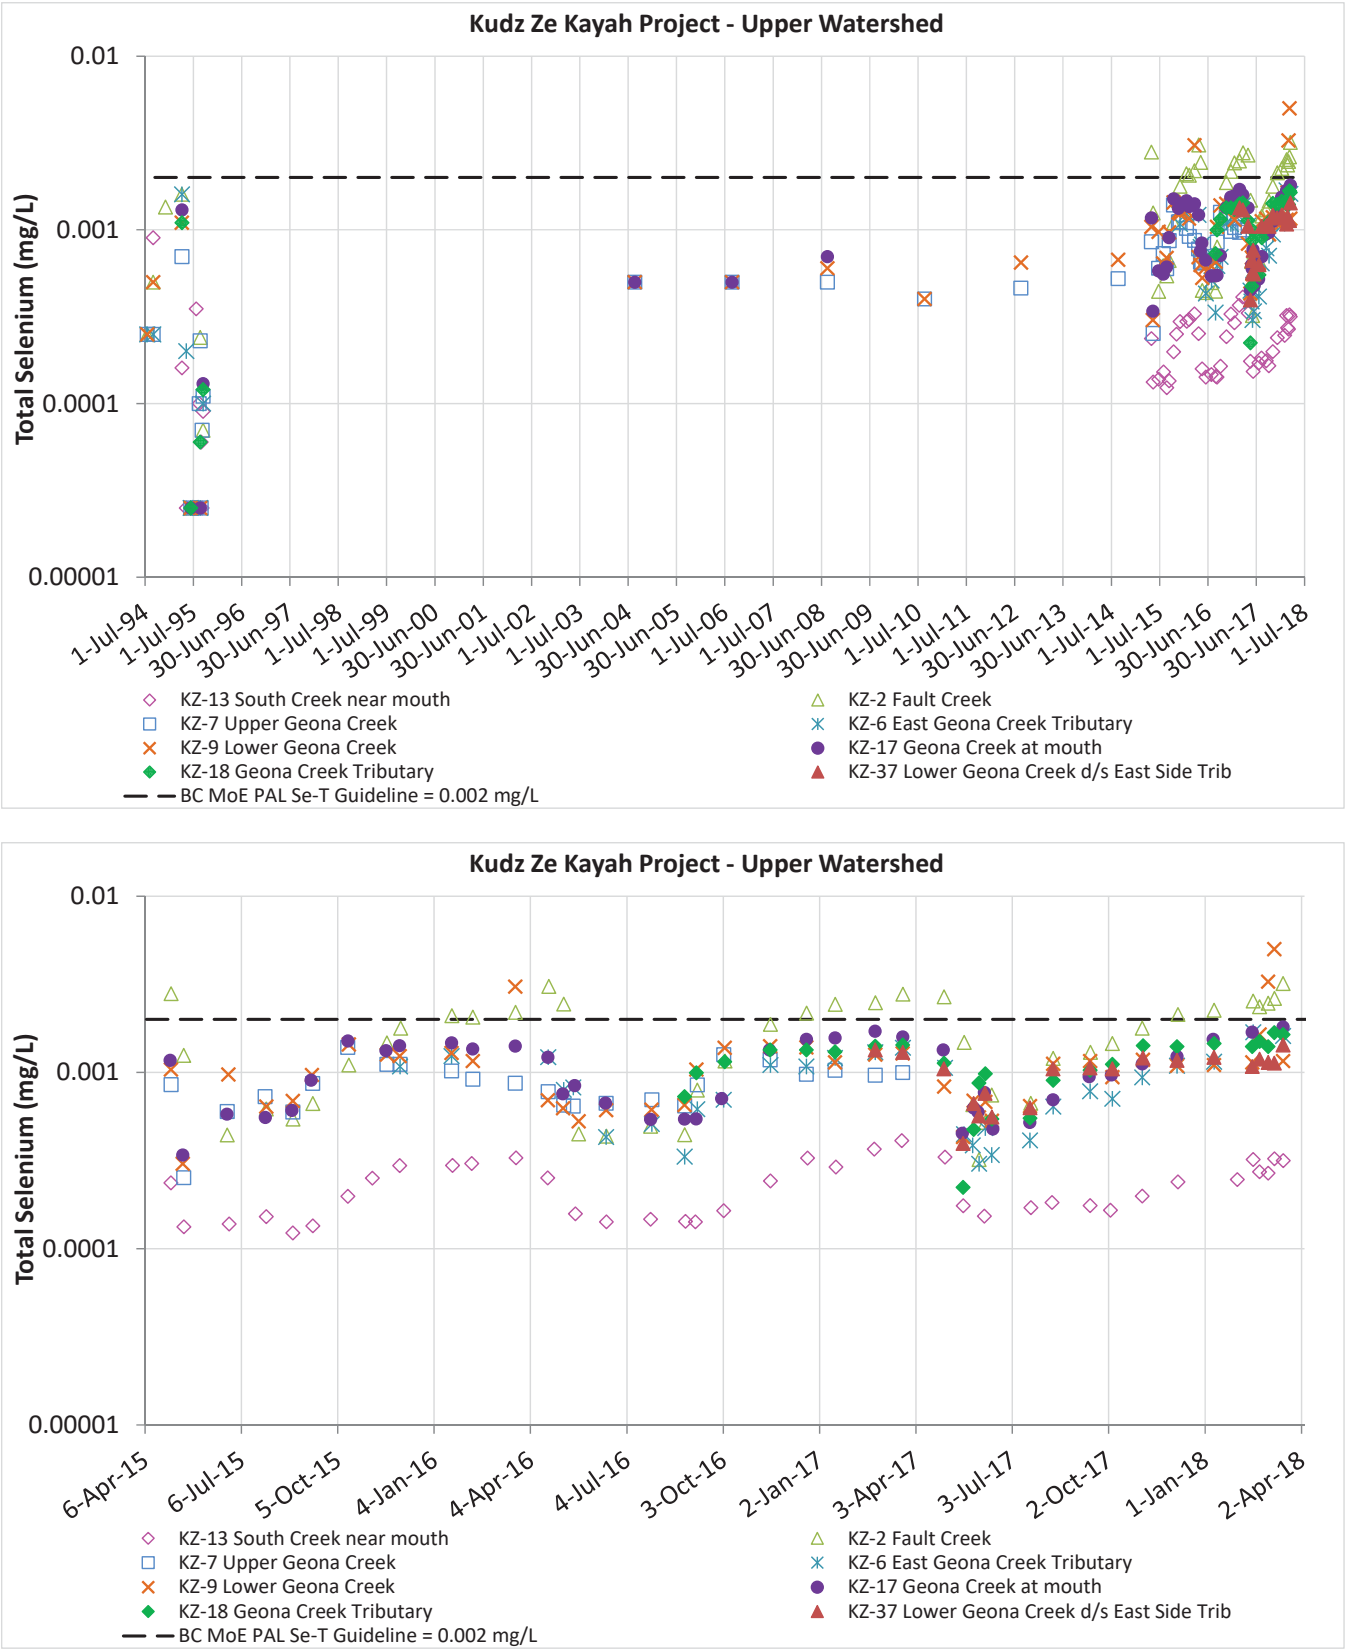

Figure C-19: Temporal Variation in Total Selenium Concentration in Upper Watershed (South, Fault, and Geona Creeks) of Kudz Ze Kayah Project since 1994 (top) and since 2015 (bottom)

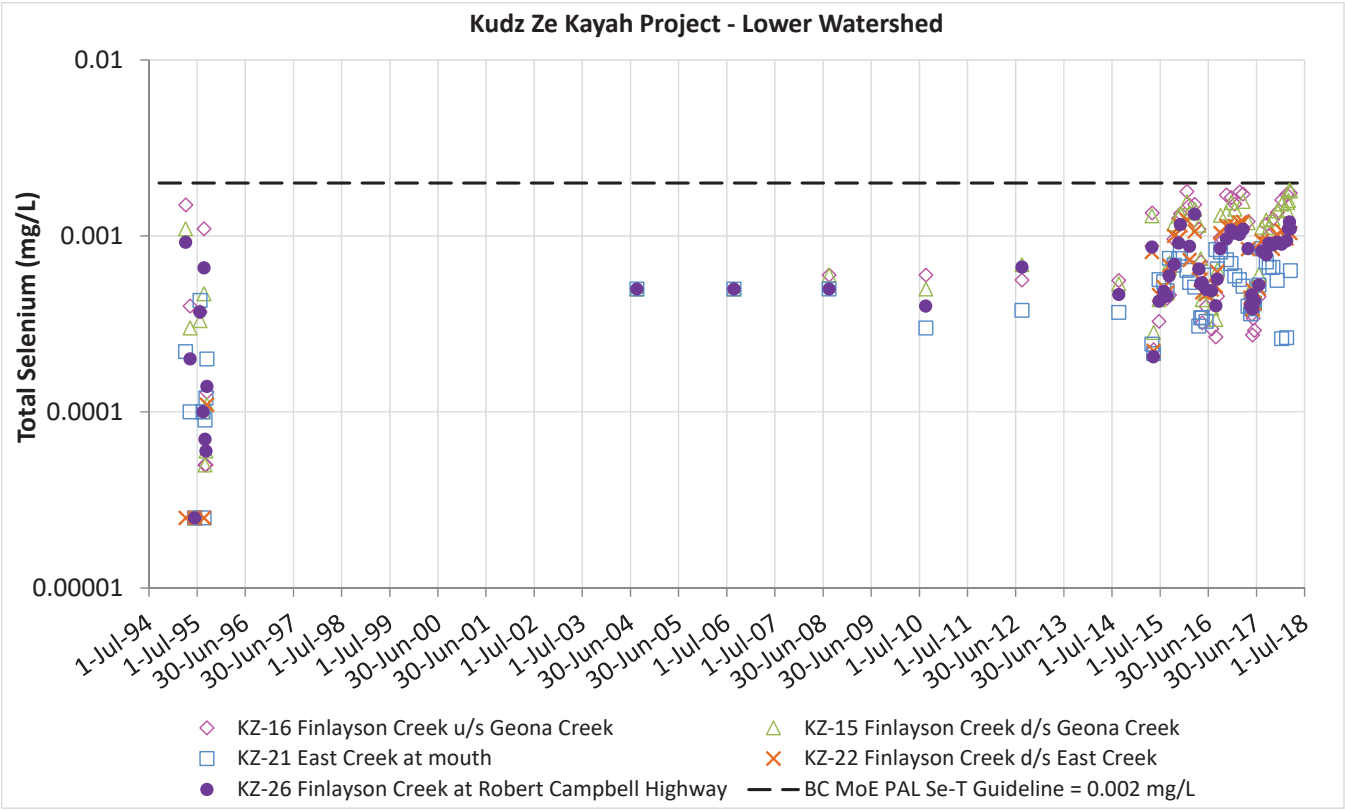

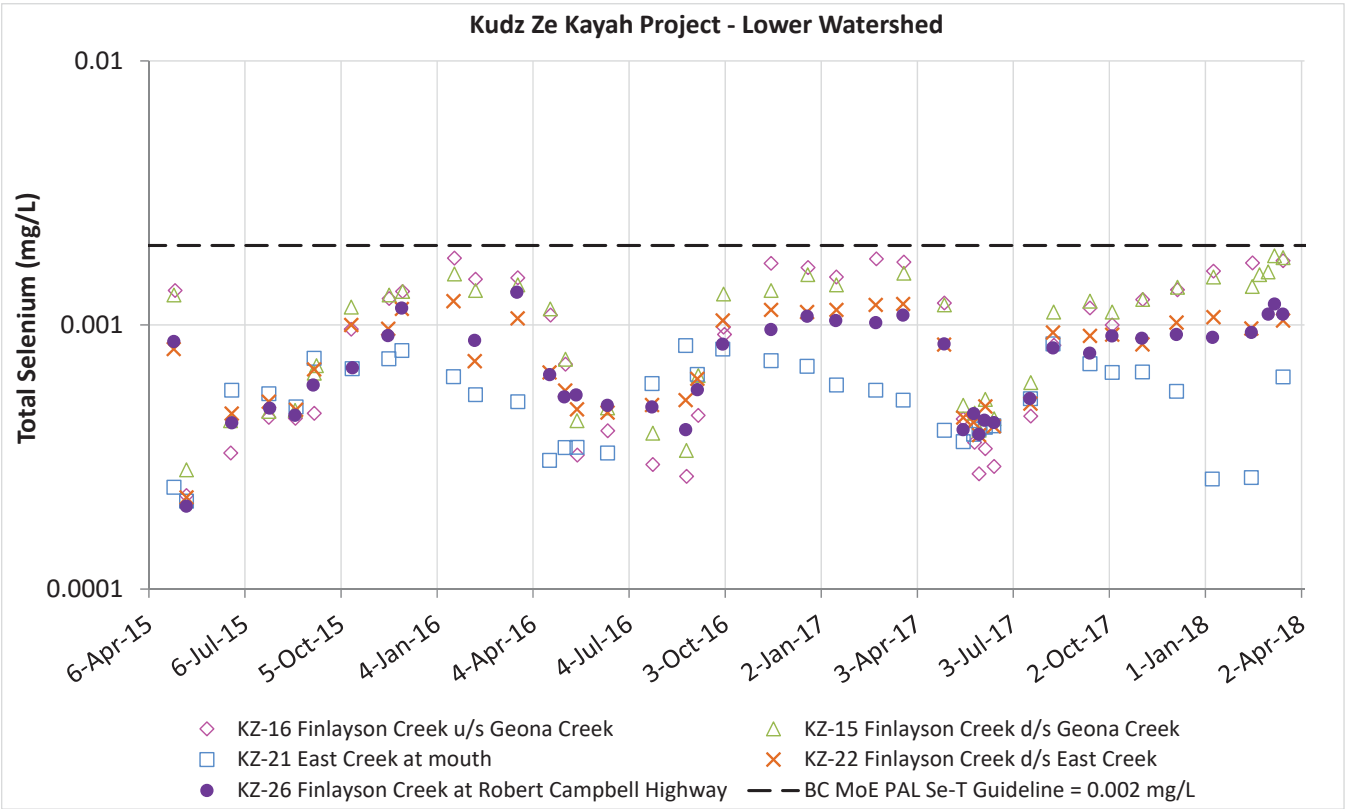

Figure C-20: Temporal Variation in Total Selenium Concentration in Lower Watershed (Finlayson and East Creeks) of Kudz Ze Kayah Project since 1994 (top) and since 2015 (bottom)

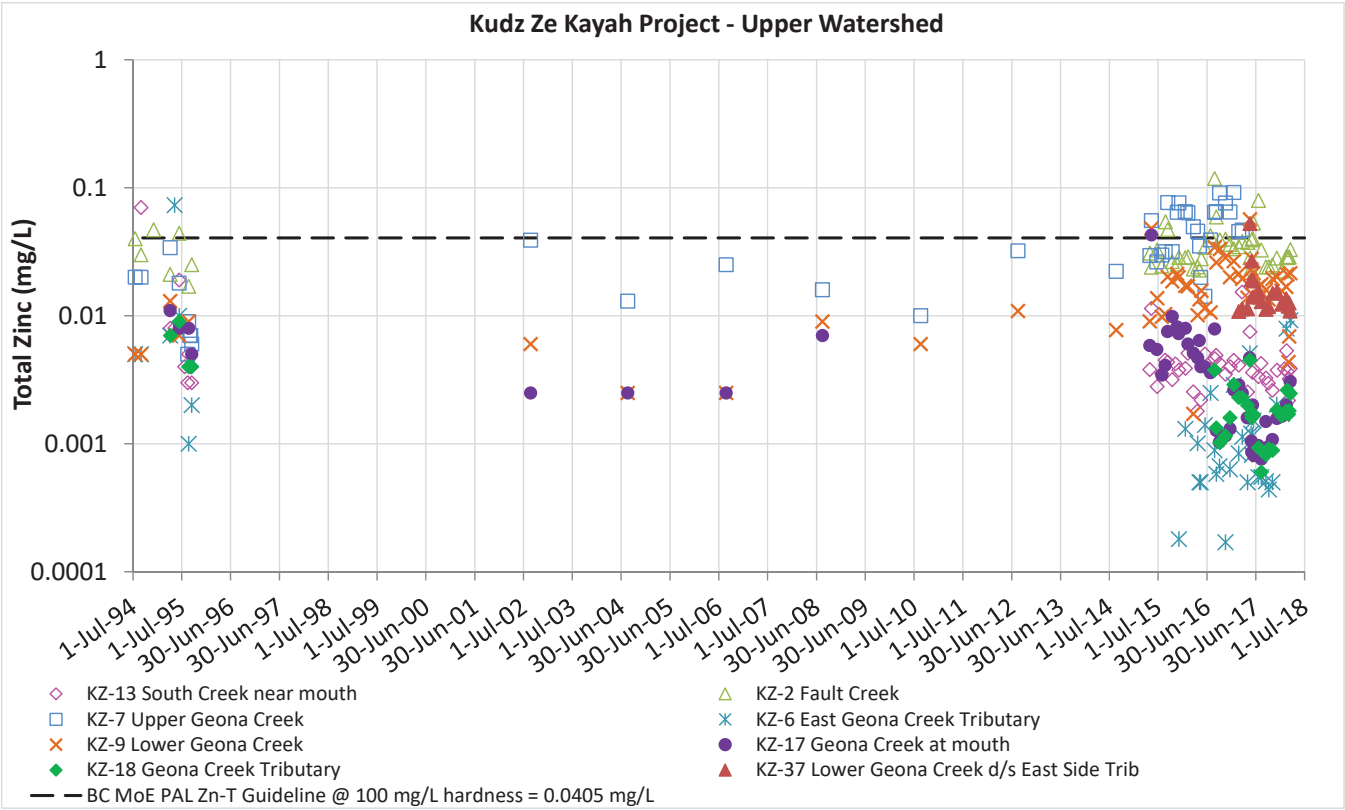

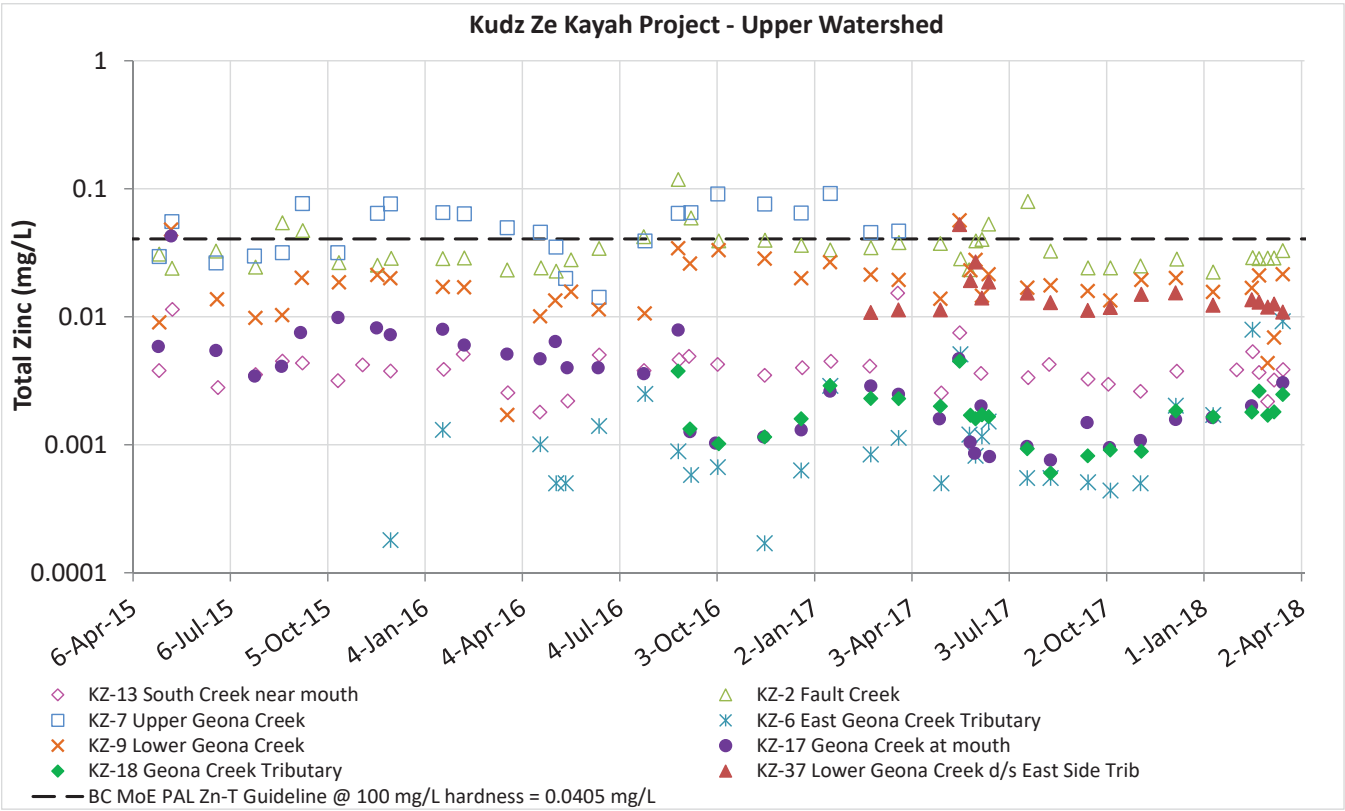

Figure C-21: Temporal Variation in Total Zinc Concentration in Upper Watershed (South, Fault, and Geona Creeks) of Kudz Ze Kayah Project since 1994 (top) and since 2015 (bottom)

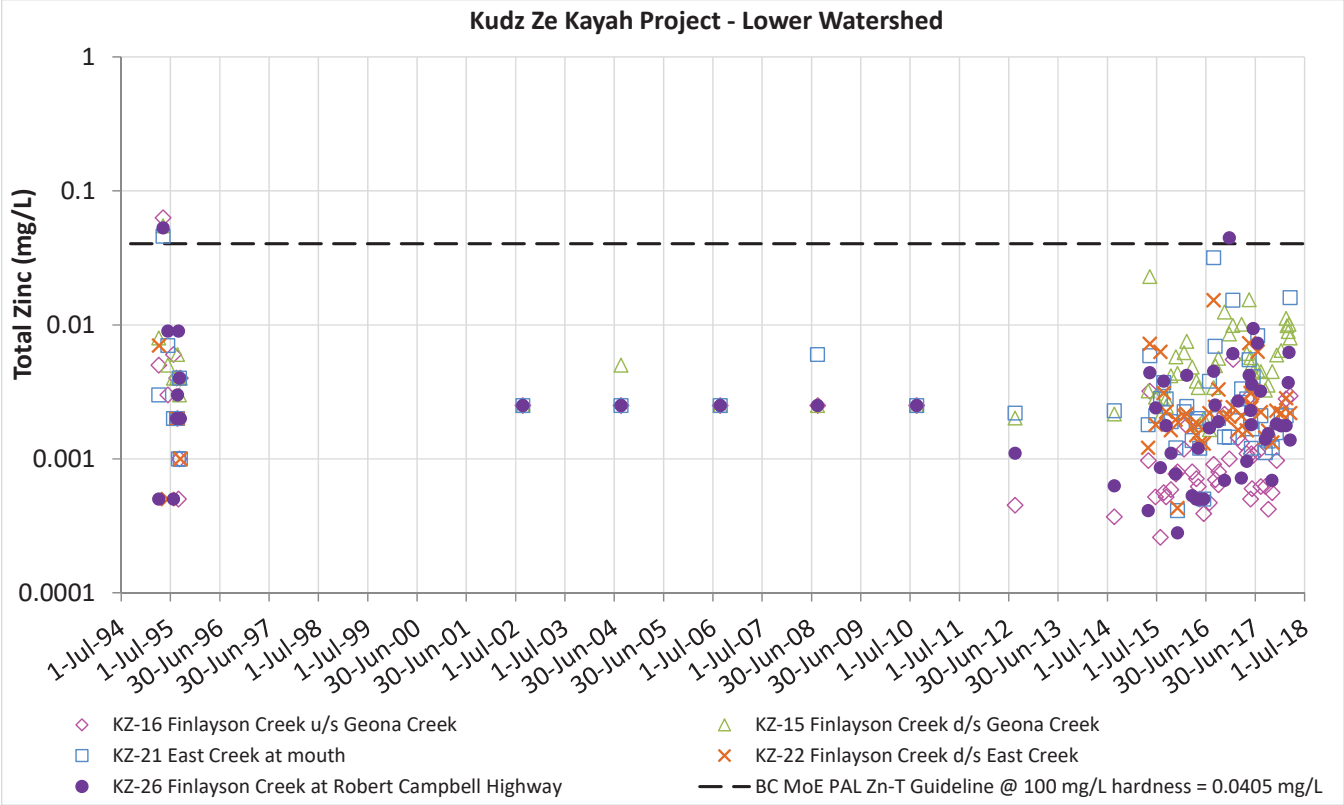

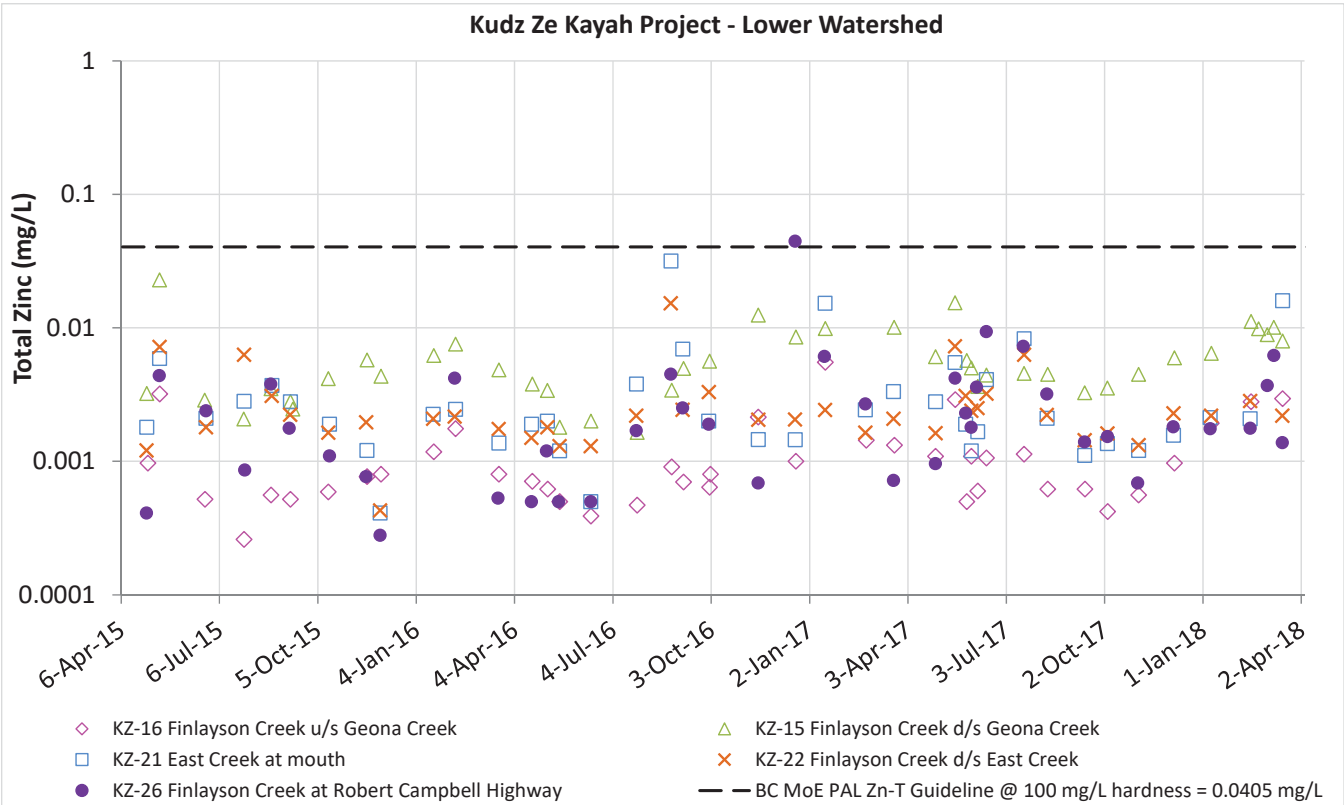

Figure C-22: Temporal Variation in Total Zinc Concentration in Lower Watershed (Finlayson and East Creeks) of Kudz Ze Kayah Project since 1994 (top) and since 2015 (bottom)

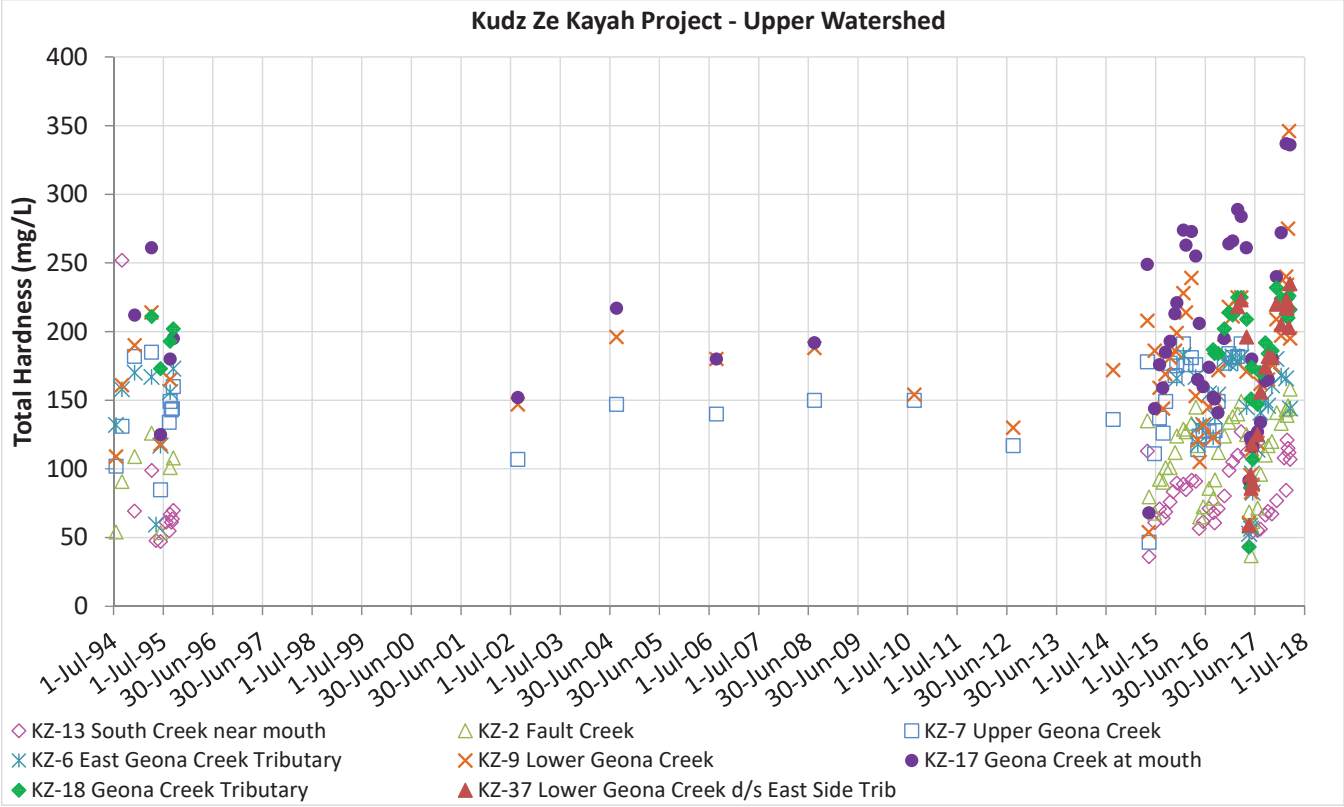

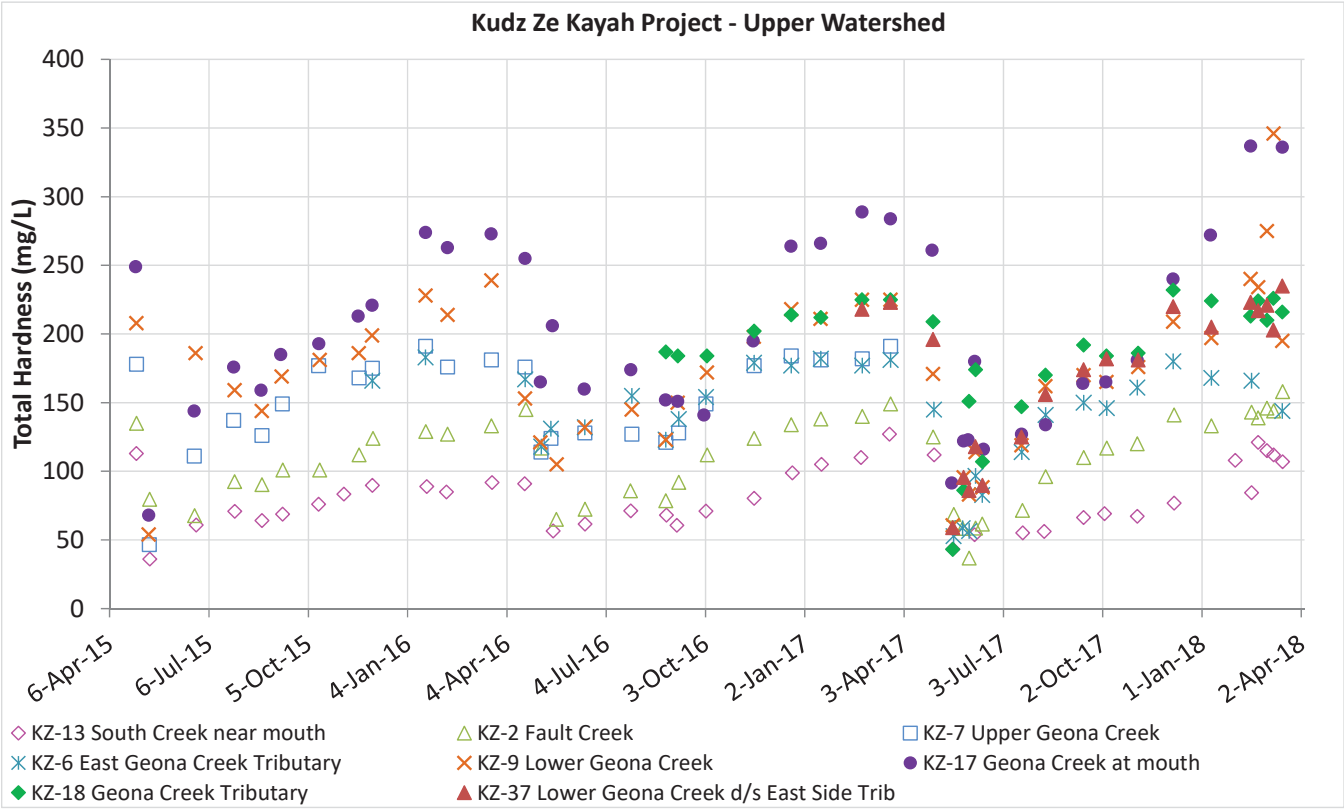

Figure C-23: Temporal Variation in Total Hardness Concentration in Upper Watershed (South, Fault, and Geona Creeks) of Kudz Ze Kayah Project since 1994 (top) and since 2015 (bottom)

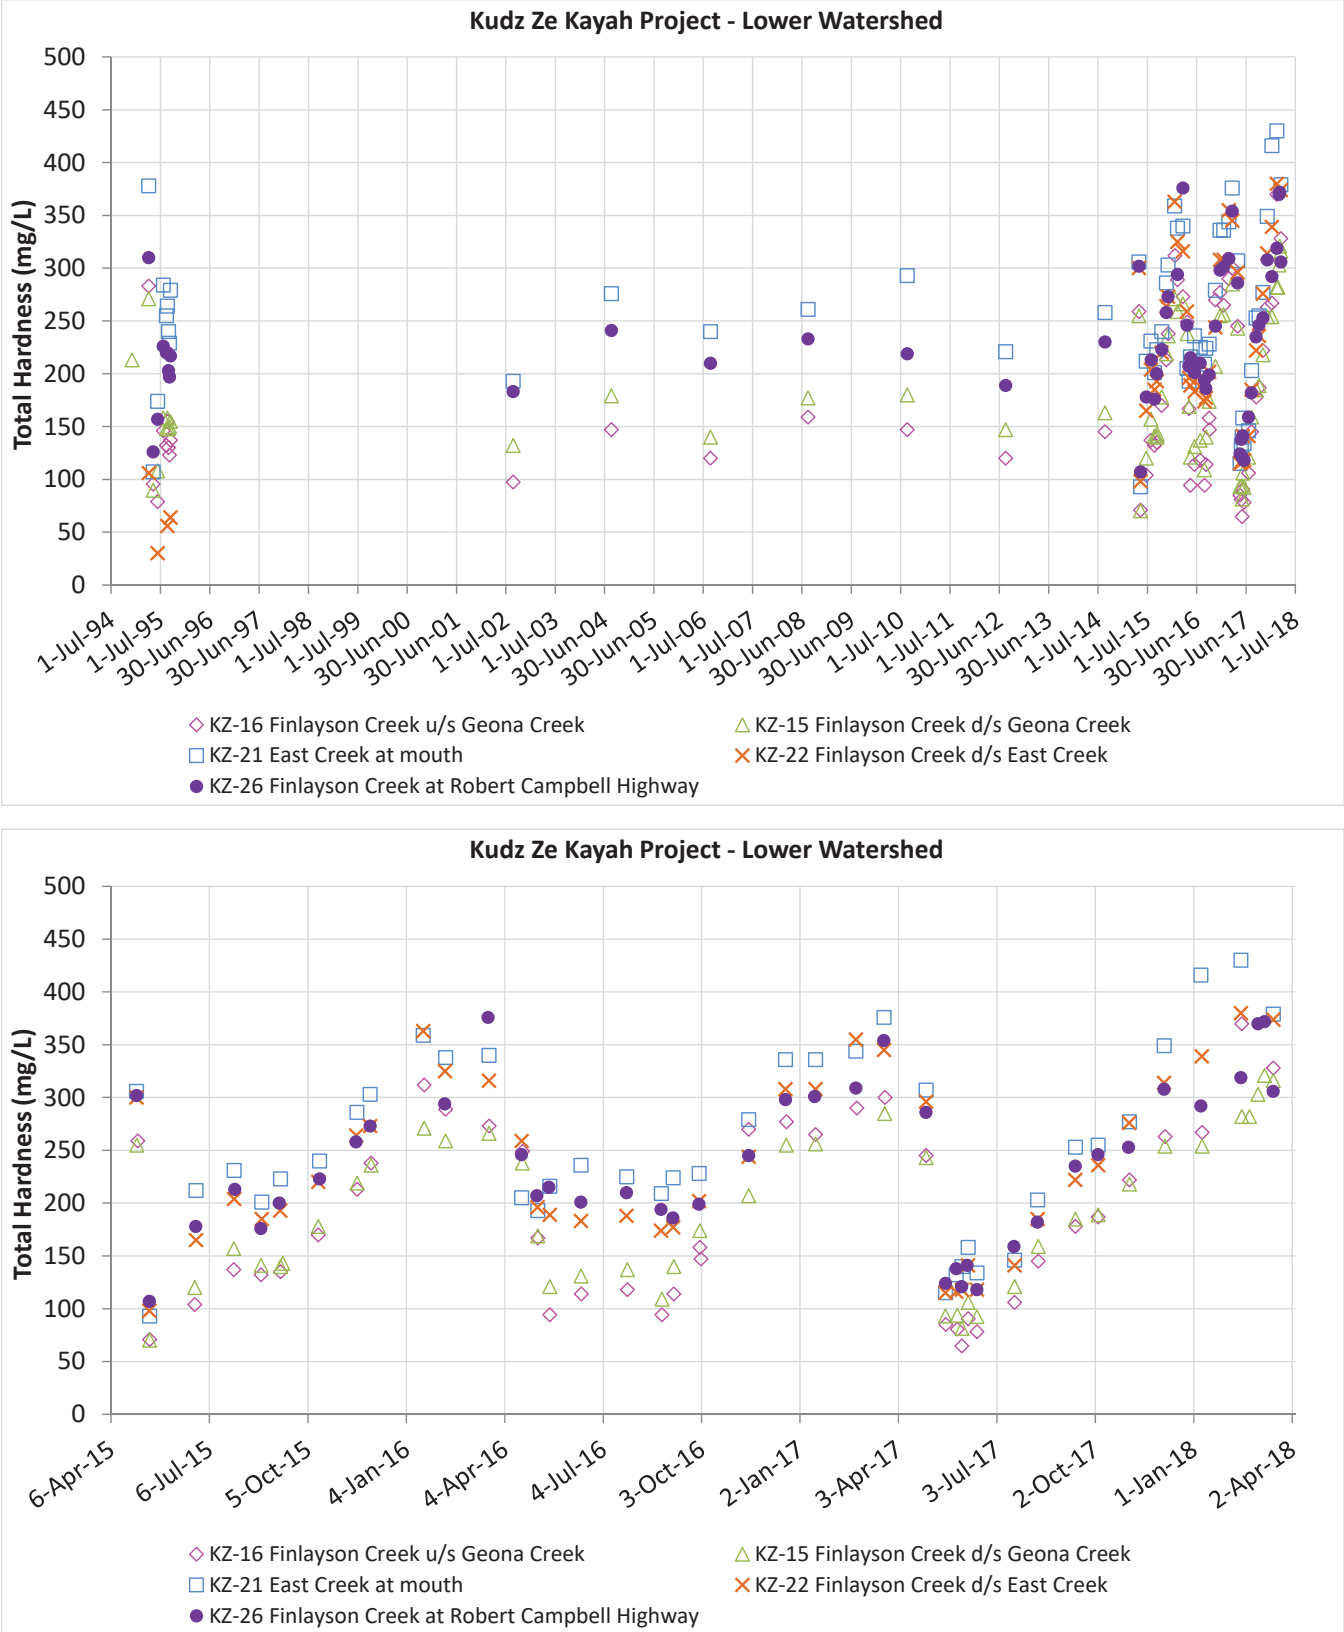

Figure C-24: Temporal Variation in Total Hardness Concentration in Lower Watershed (Finlayson and East Creeks) of Kudz Ze Kayah Project since 1994 (top) and since 2015 (bottom)

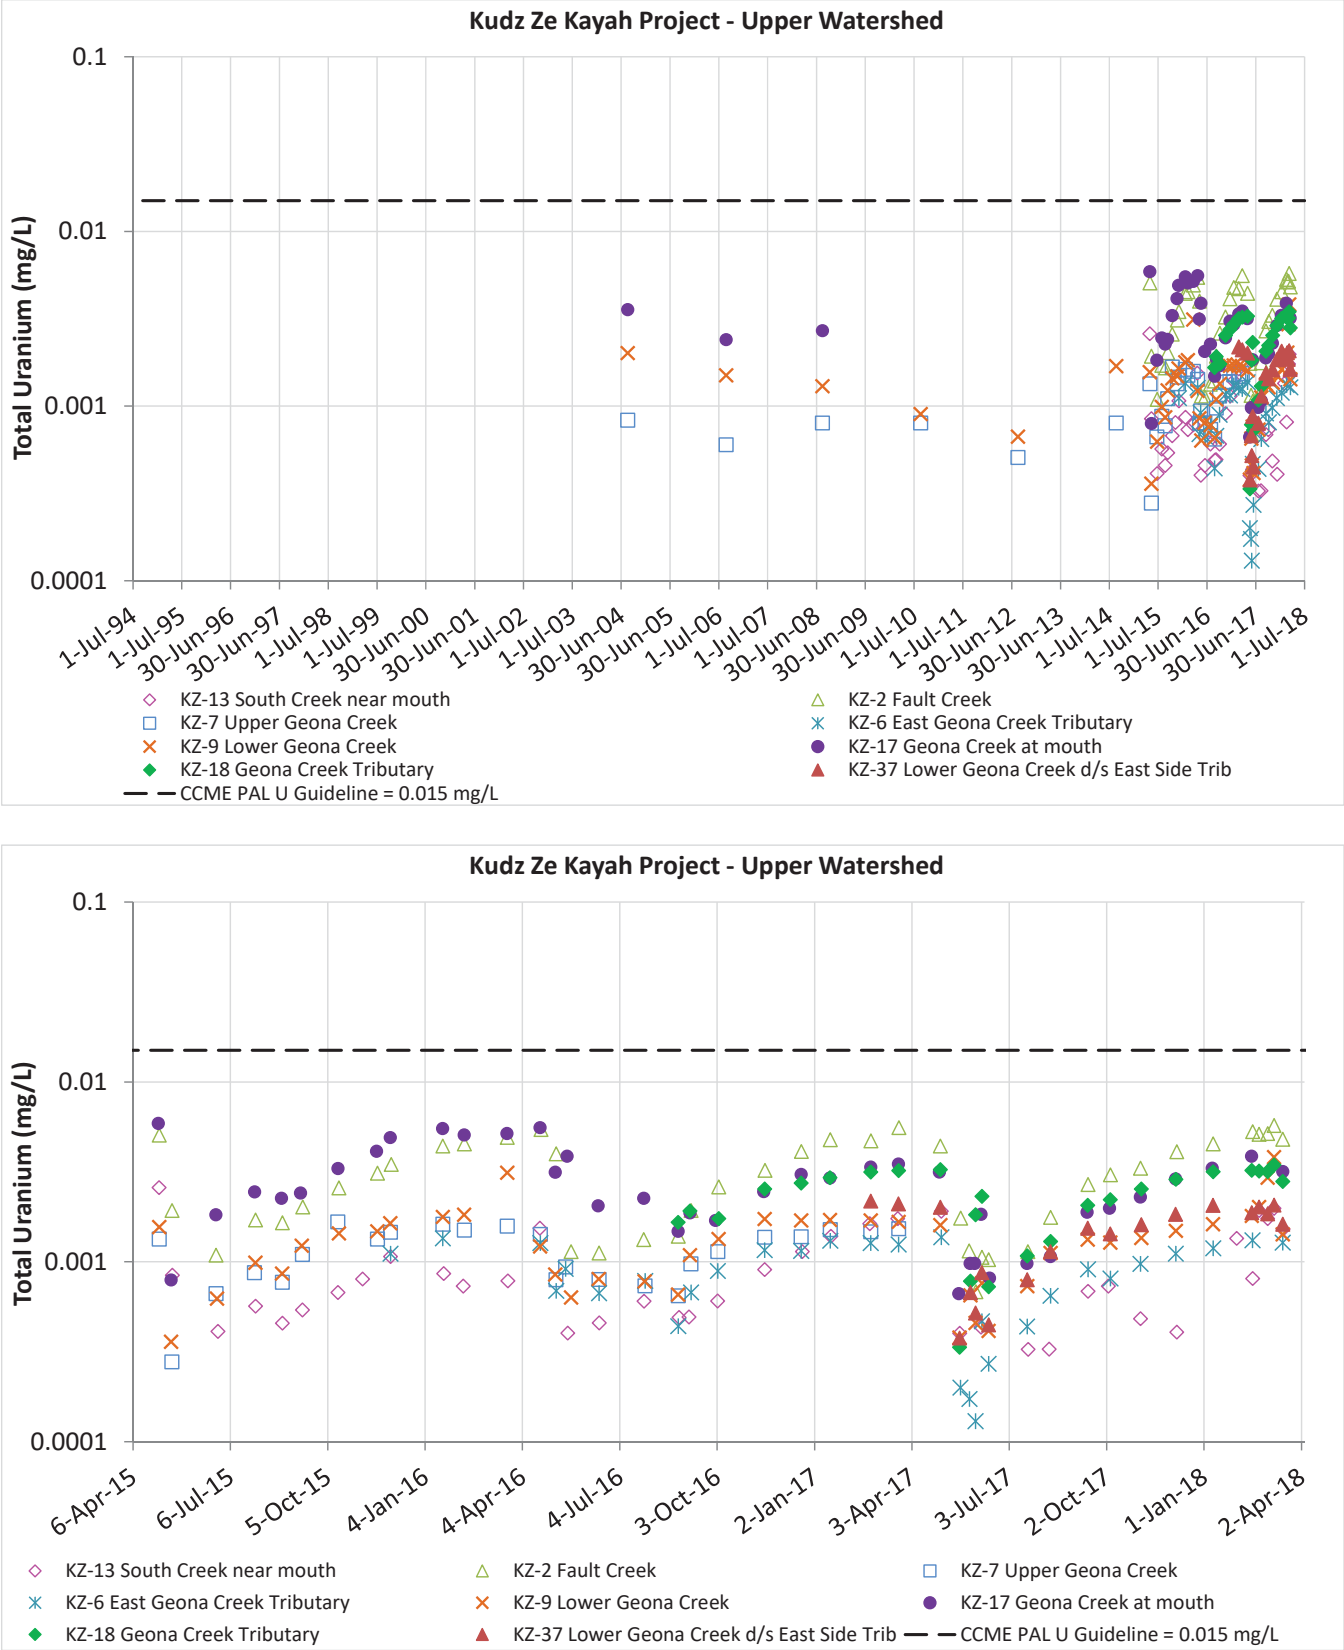

Figure C-25: Temporal Variation in Total Uranium Concentration in Upper Watershed (South, Fault, and Geona Creeks) of Kudz Ze Kayah Project since 1994 (top) and since 2015 (bottom)

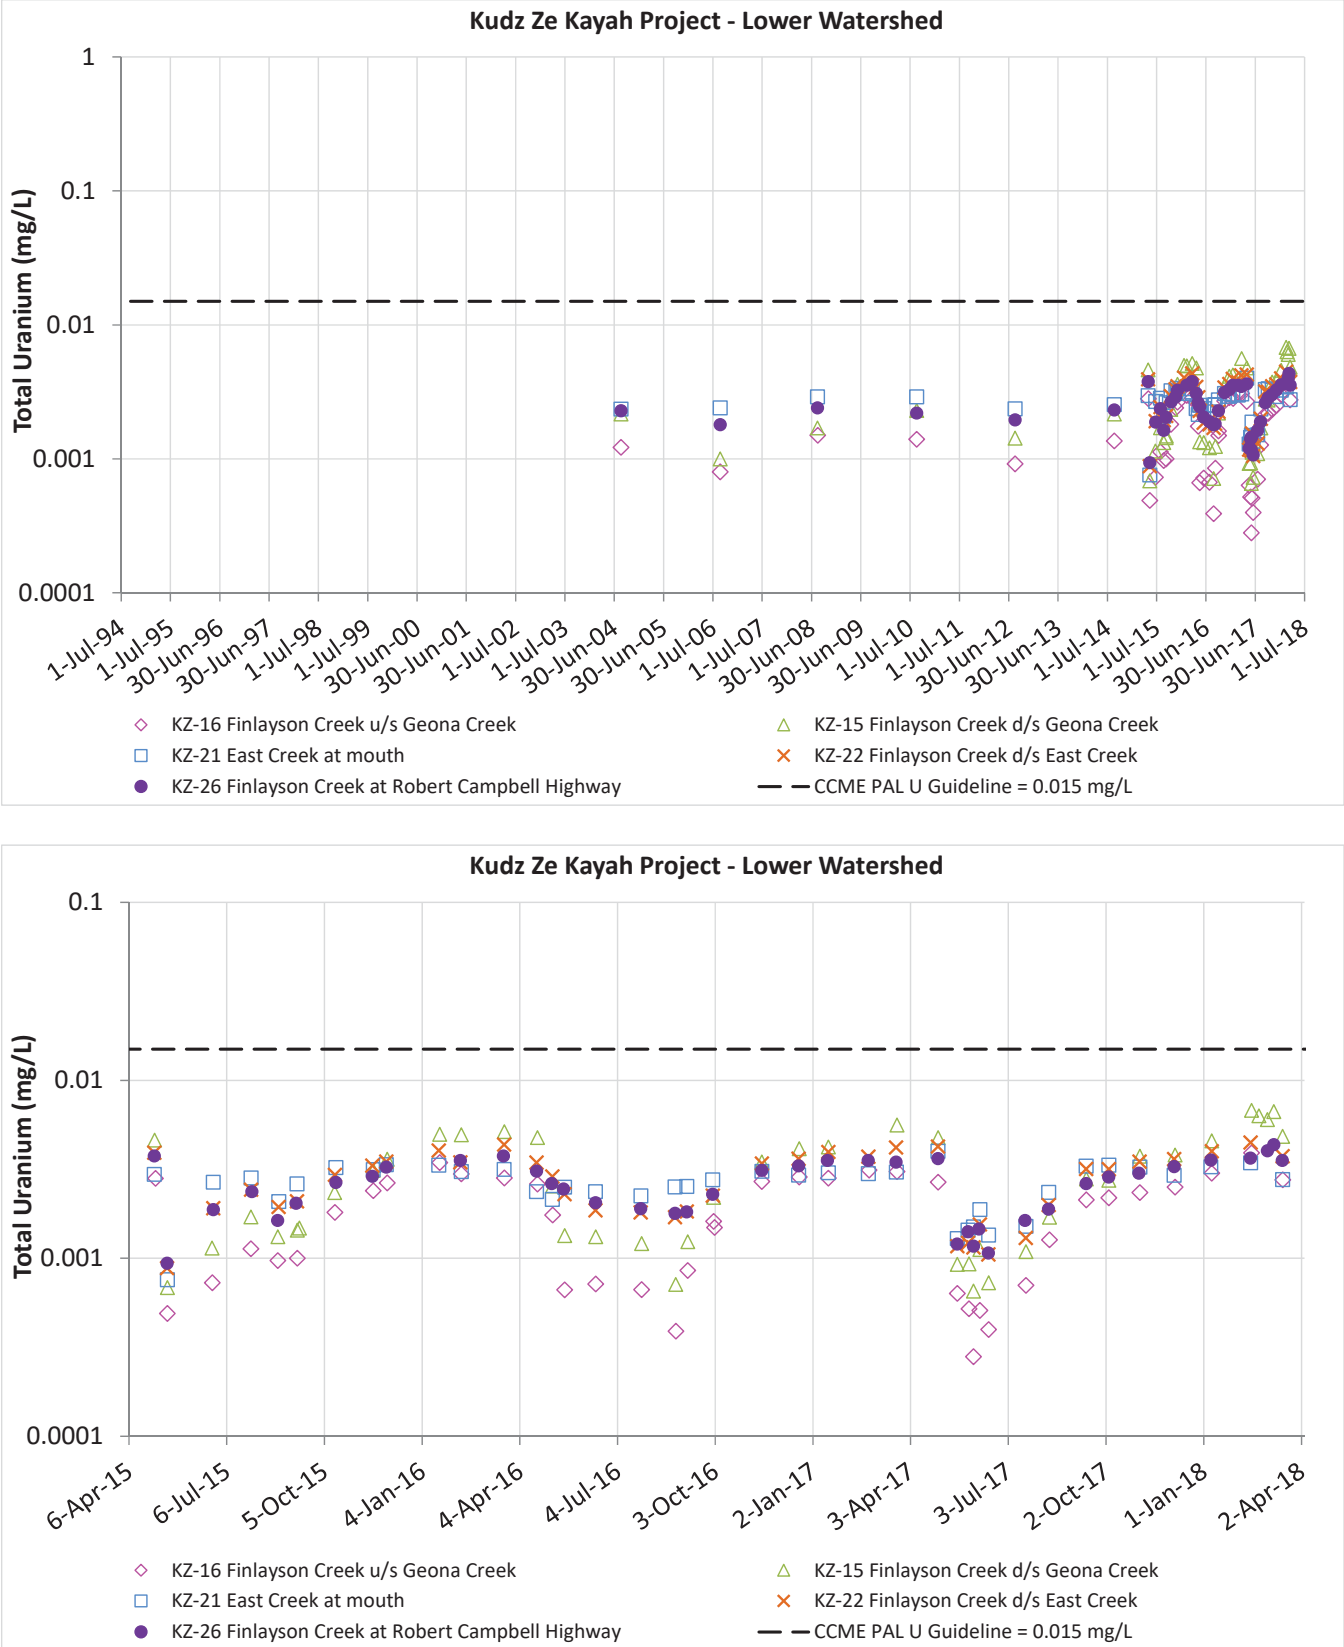

Figure C-26: Temporal Variation in Total Uranium Concentration in Lower Watershed (Finlayson and East Creeks) of Kudz Ze Kayah Project since 1994 (top) and since 2015 (bottom)

APPENDIX D.

August Historic and 2015-2017 Surface Water Graphs

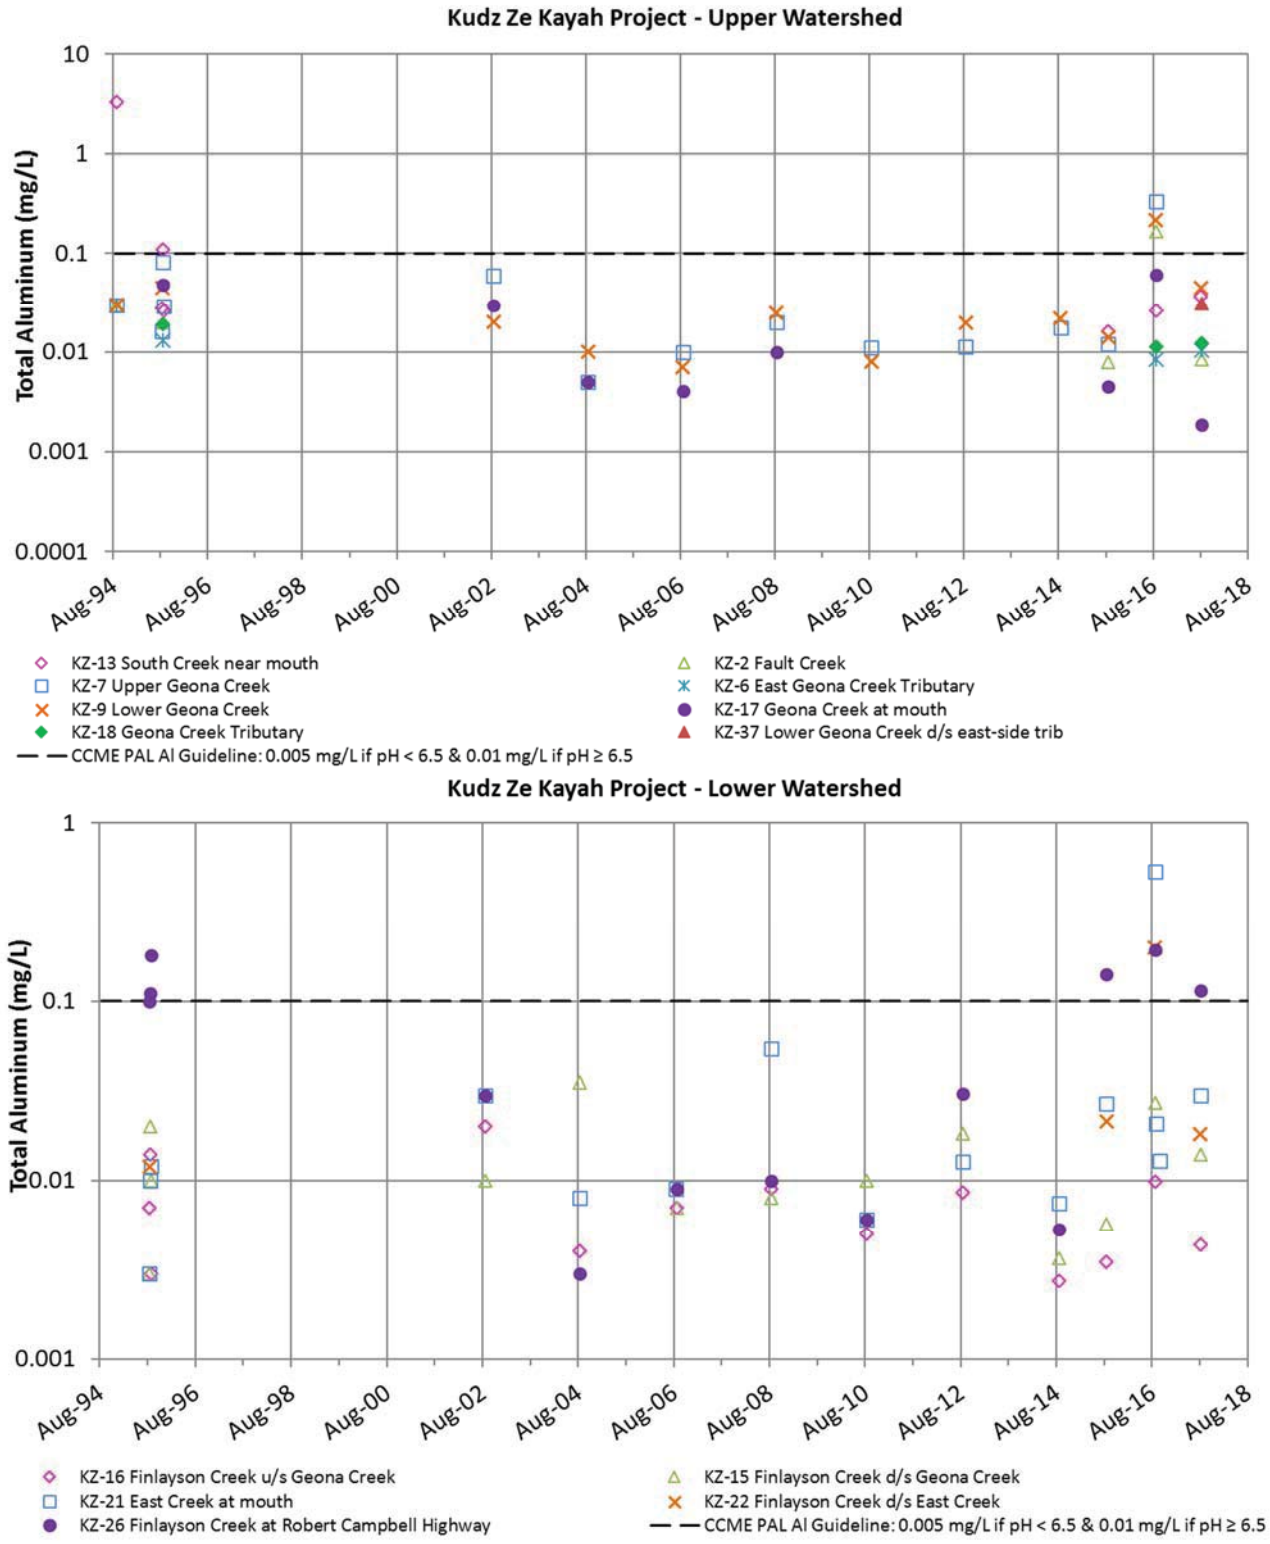

Figure D-1: Variation in Total Aluminum Concentration in the Upper (South, Fault, and Geona Creeks) and Lower (Finlayson and East Creeks) Watershed of Kudz Ze Kayah Project in Samples Collected in August since 1994

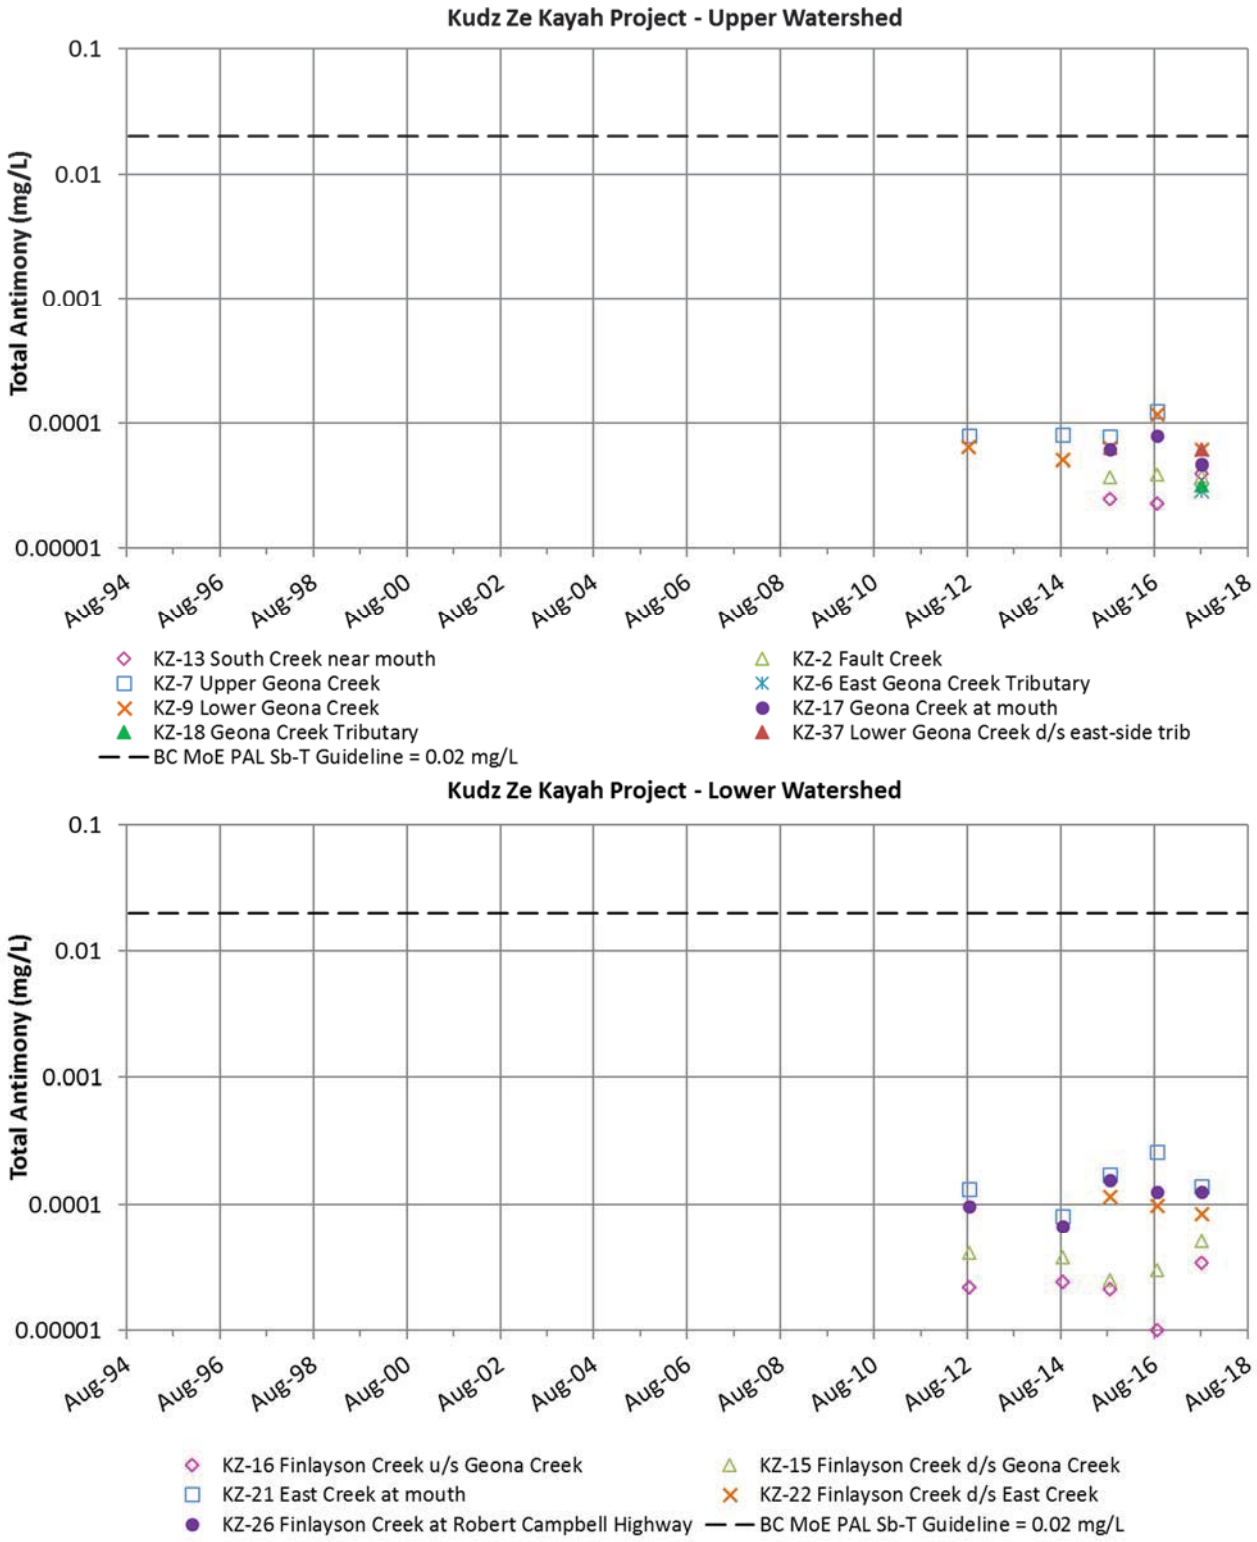

Figure D-2: Variation in Total Antimony Concentration in the Upper (South, Fault, and Geona Creeks) and Lower (Finlayson and East Creeks) Watershed of Kudz Ze Kayah Project in Samples Collected in August since 1994

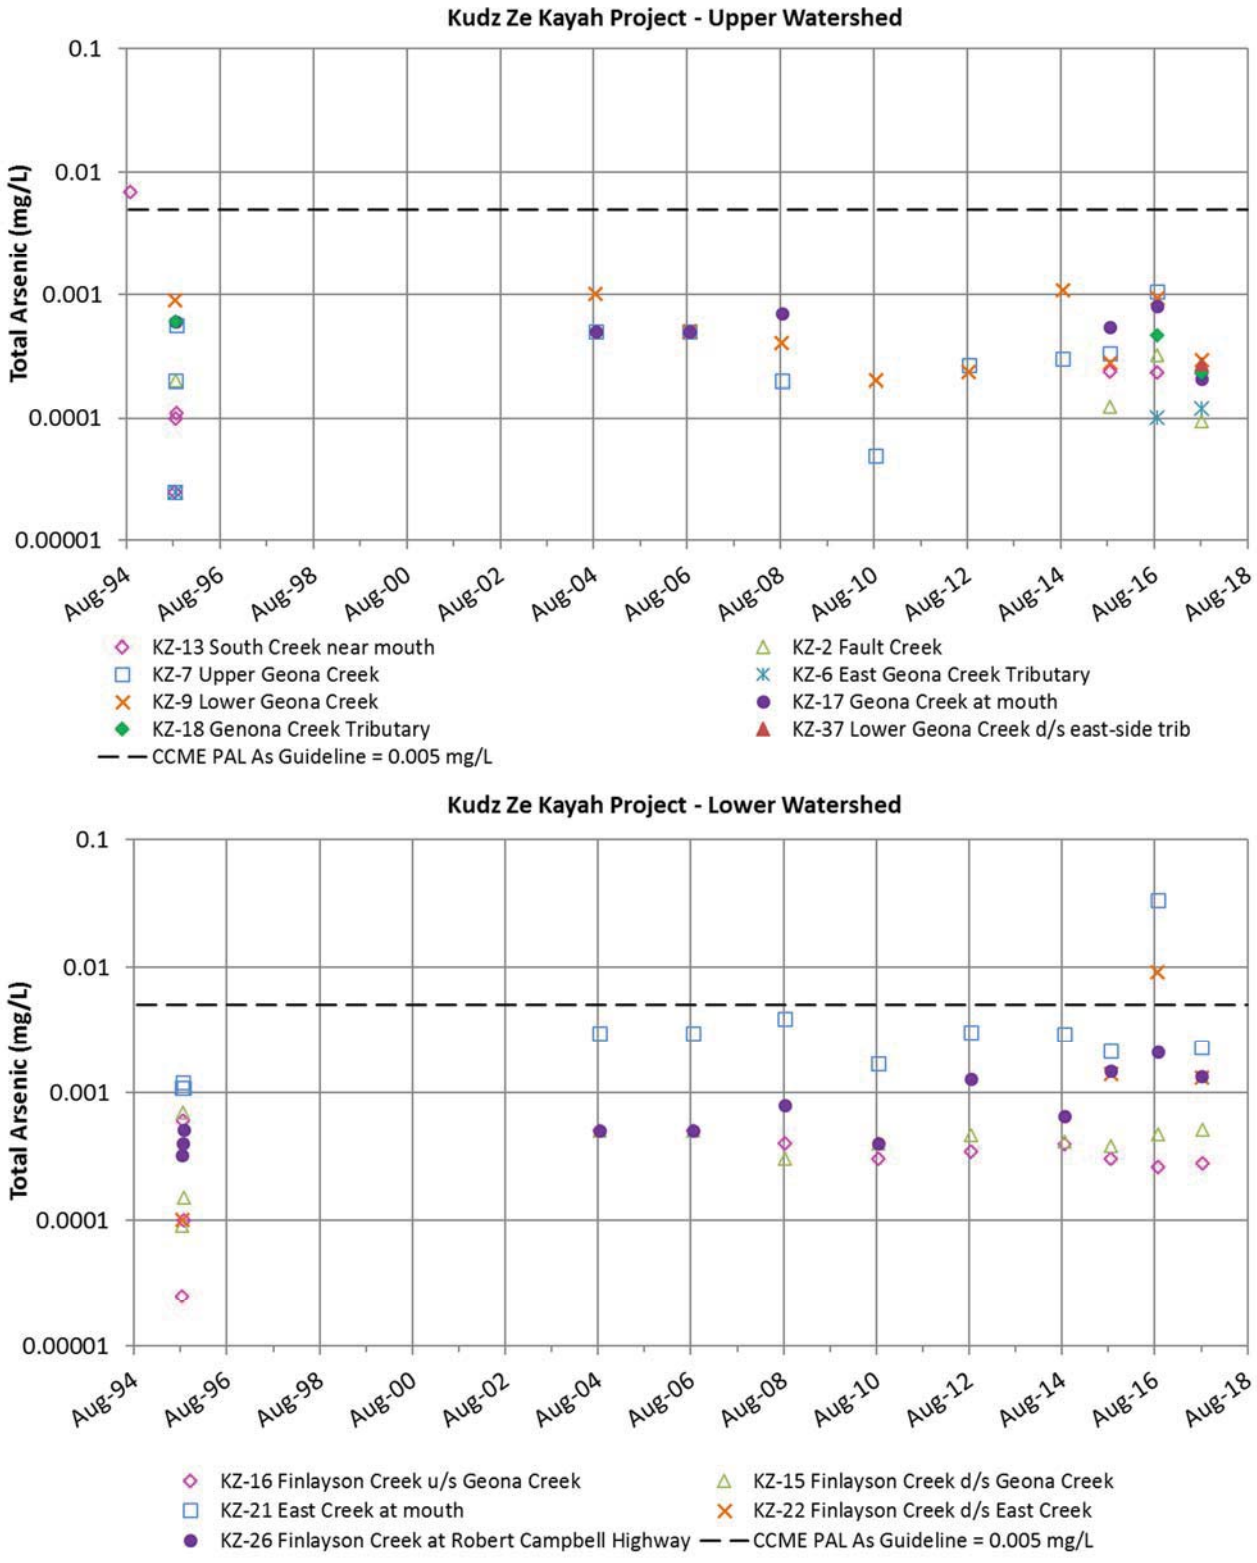

Figure D-3: Variation in Total Arsenic Concentration in the Upper (South, Fault, and Geona Creeks) and Lower (Finlayson and East Creeks) Watershed of Kudz Ze Kayah Project in Samples Collected in August since 1994

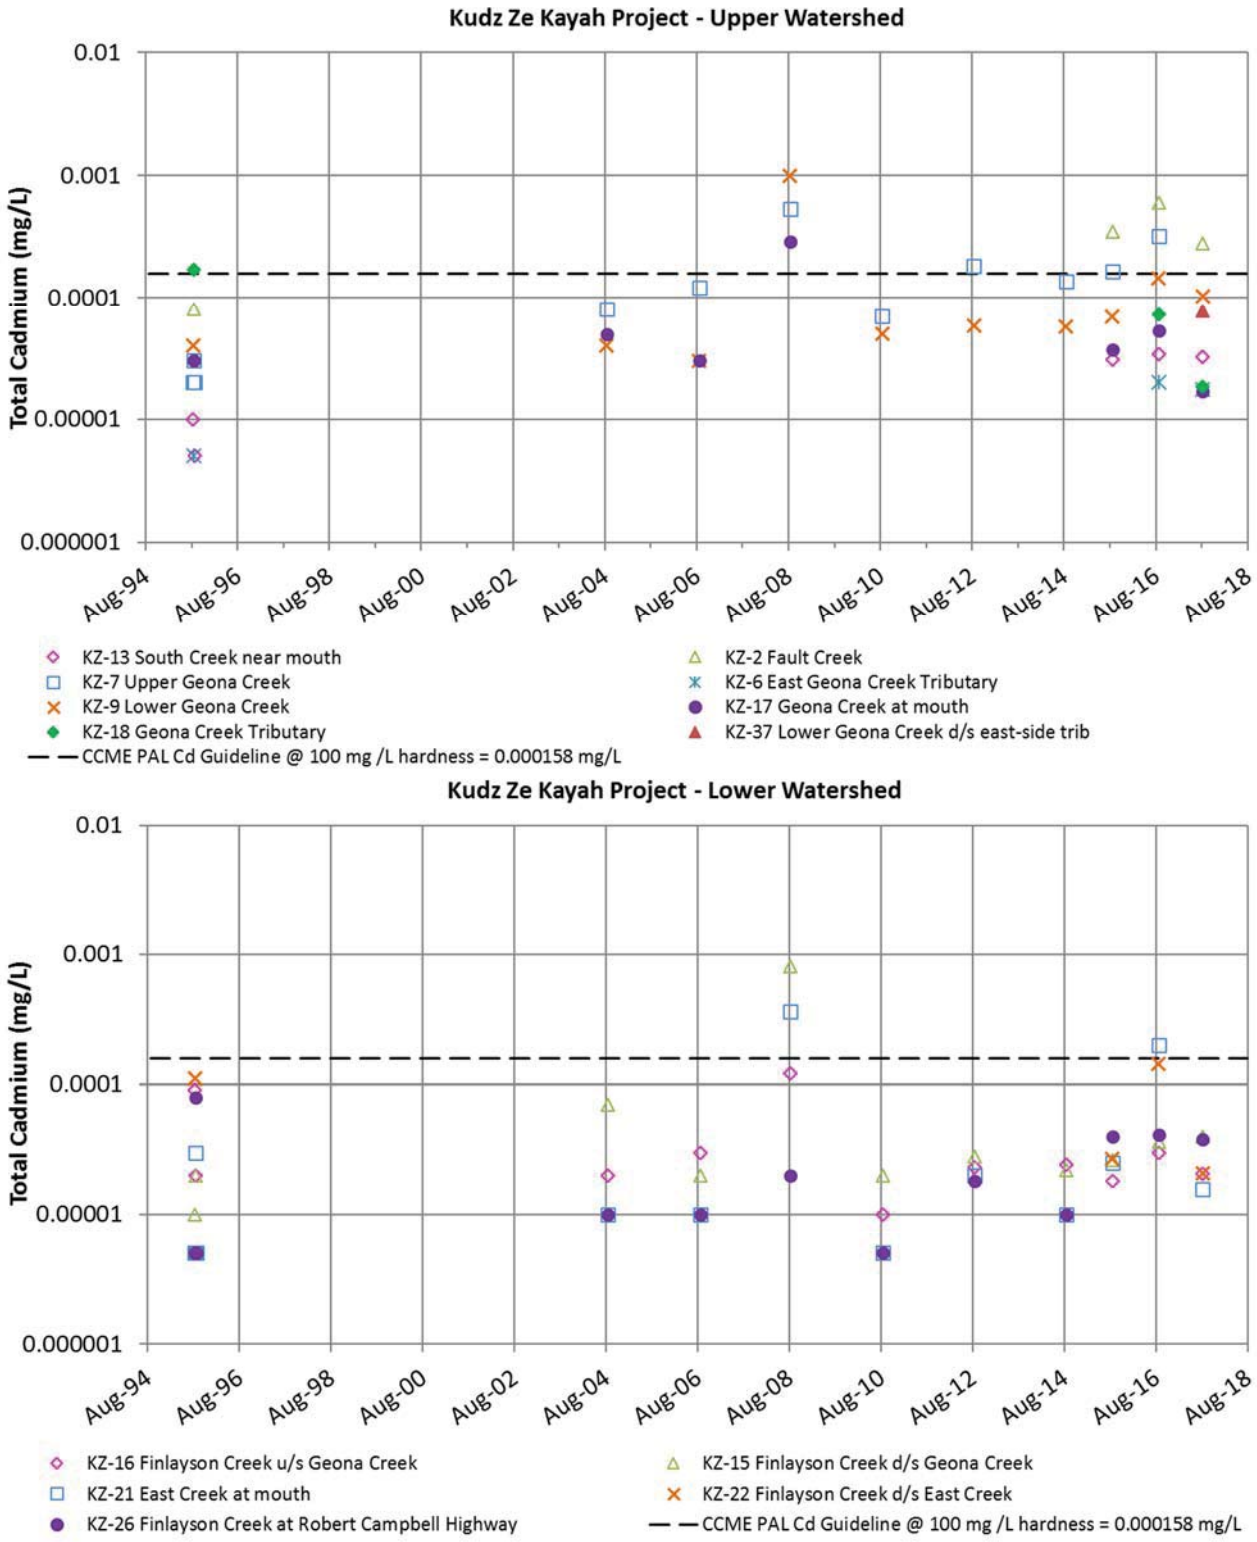

Figure D-4: Variation in Total Cadmium Concentration in the Upper (South, Fault, and Geona Creeks) and Lower (Finlayson and East Creeks) Watershed of Kudz Ze Kayah Project in Samples Collected in August since 1994

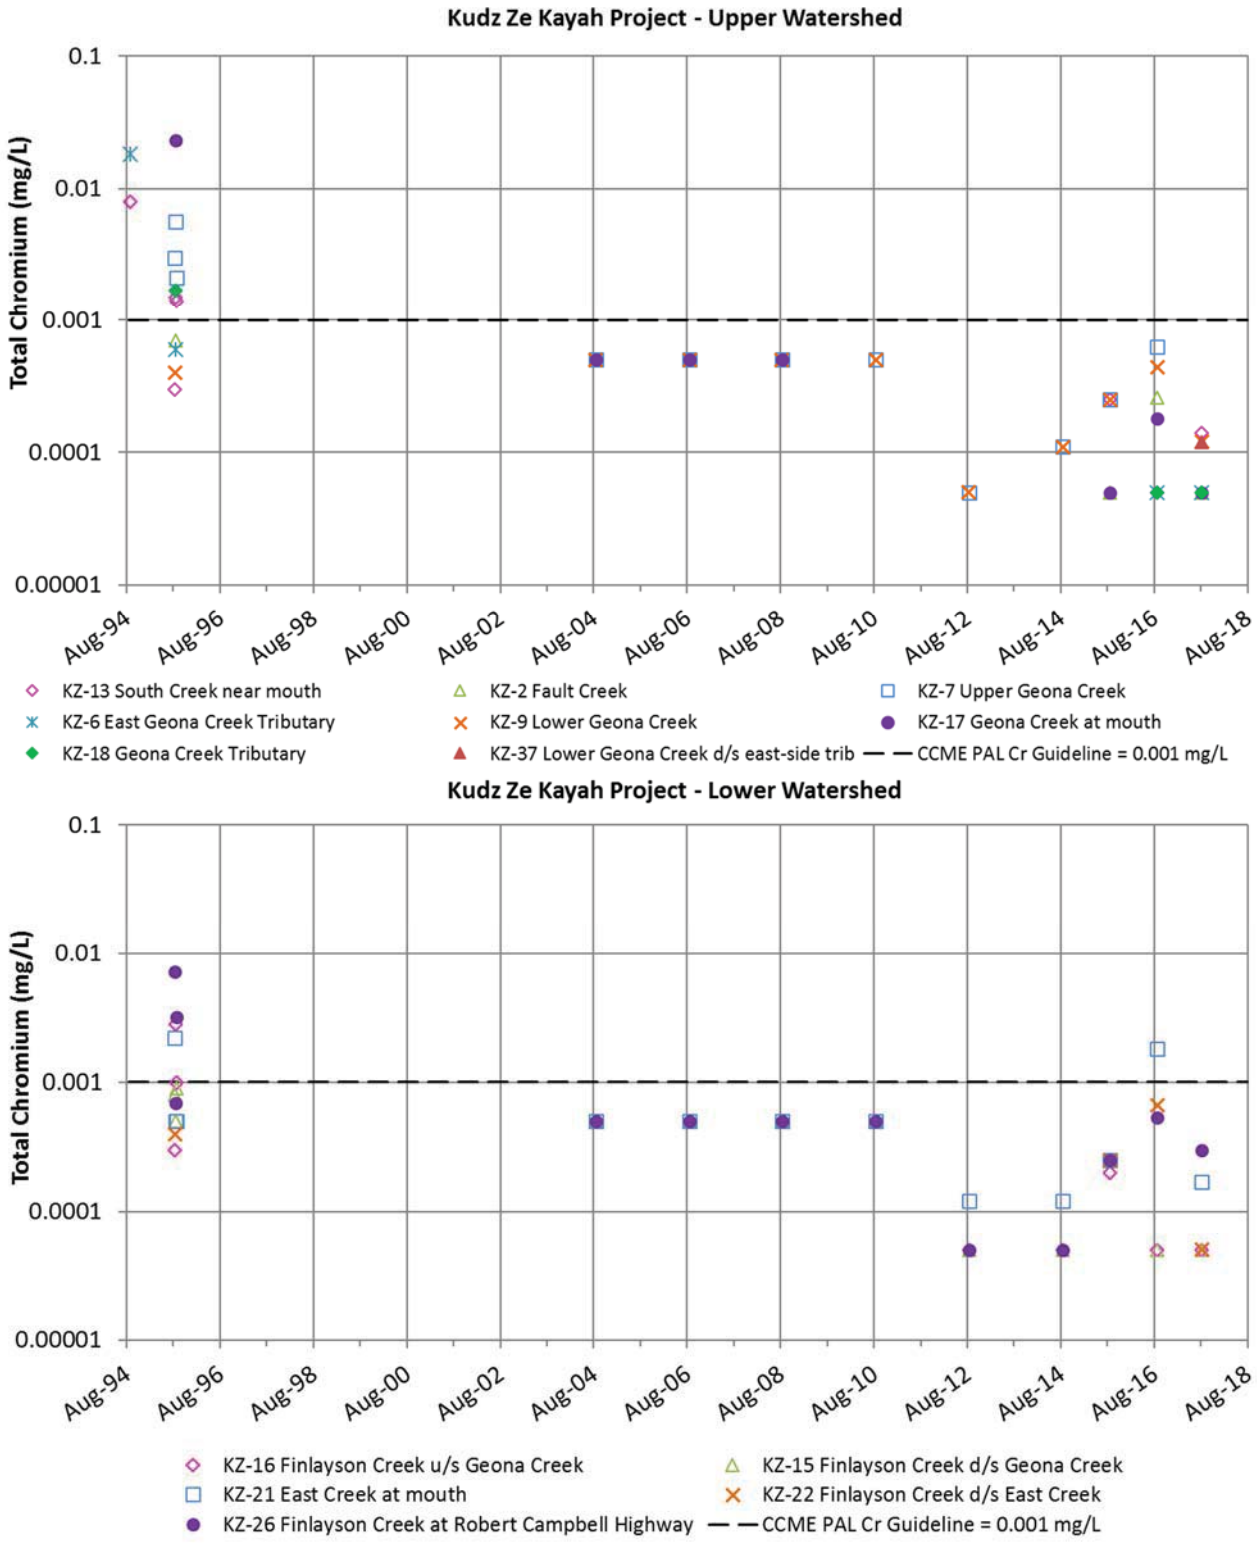

Figure D-5: Variation in Total Chromium Concentration in the Upper (South, Fault, and Geona Creeks) and Lower (Finlayson and East Creeks) Watershed of Kudz Ze Kayah Project in Samples Collected in August since 1994

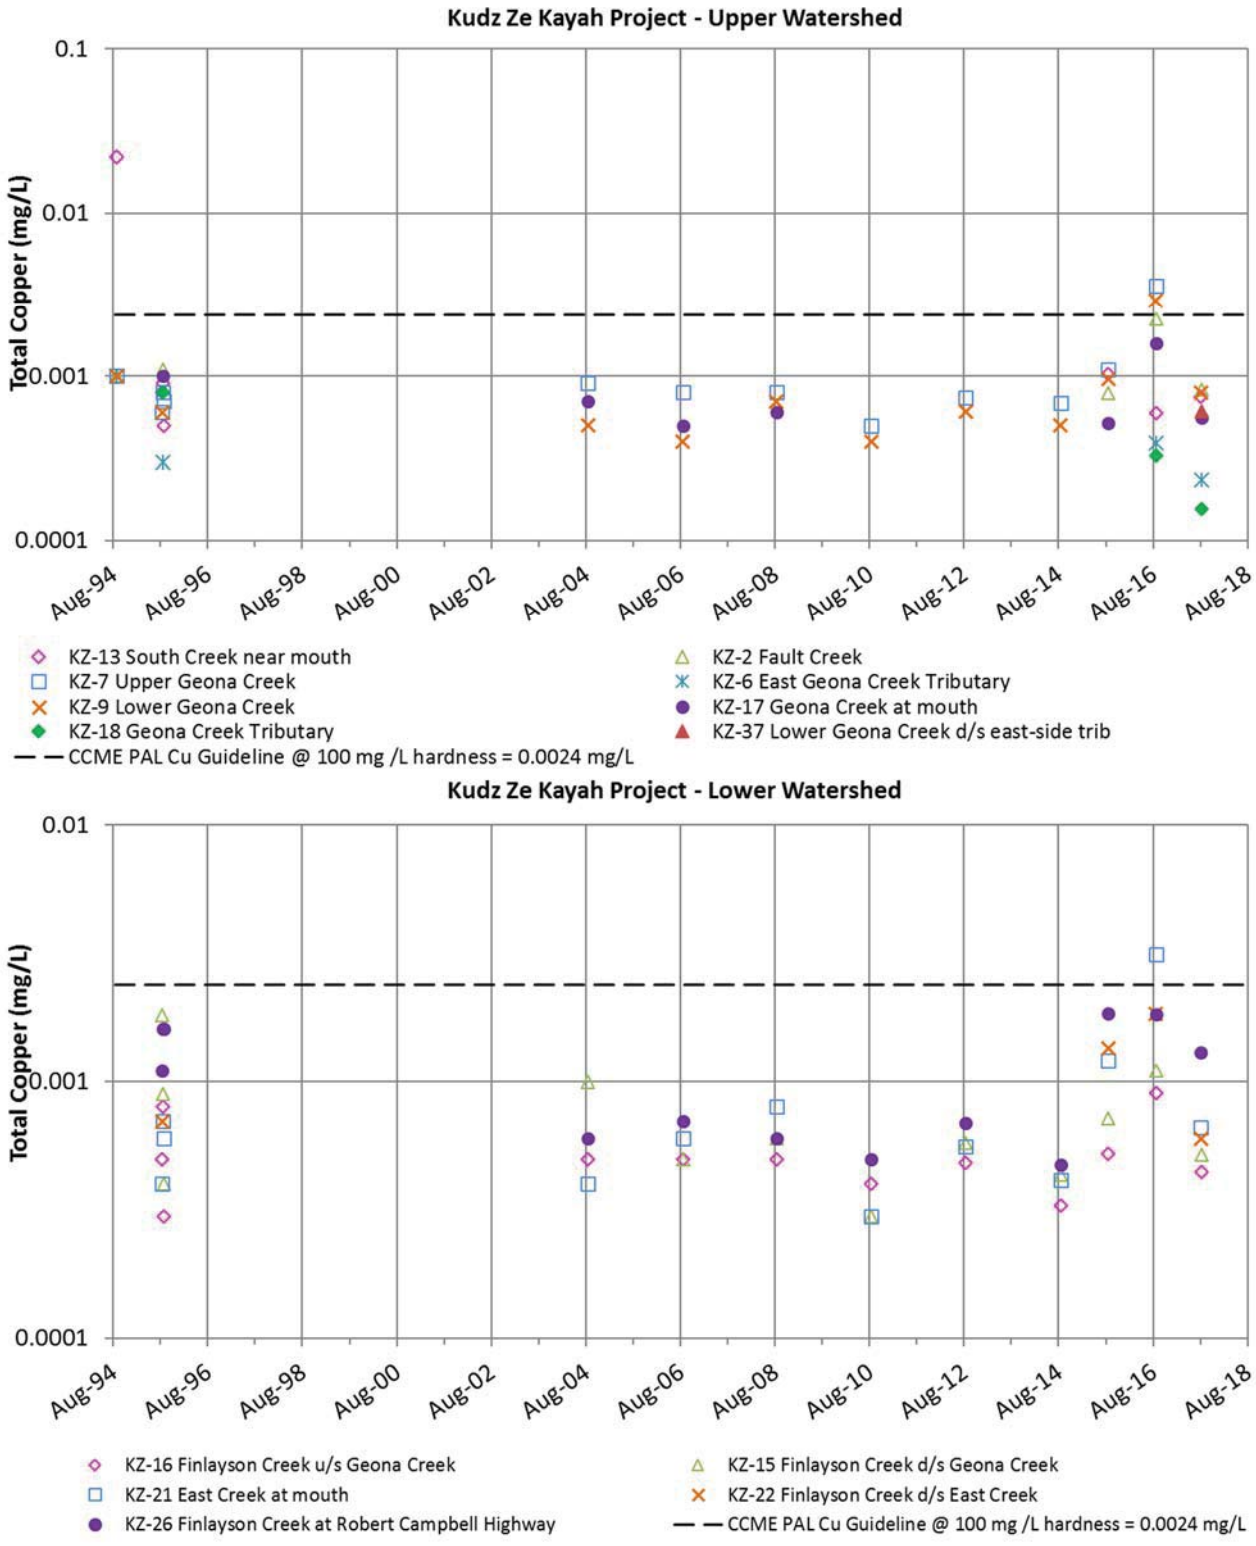

Figure D-6: Variation in Total Copper Concentration in the Upper (South, Fault, and Geona Creeks) and Lower (Finlayson and East Creeks) Watershed of Kudz Ze Kayah Project in Samples Collected in August since 1994

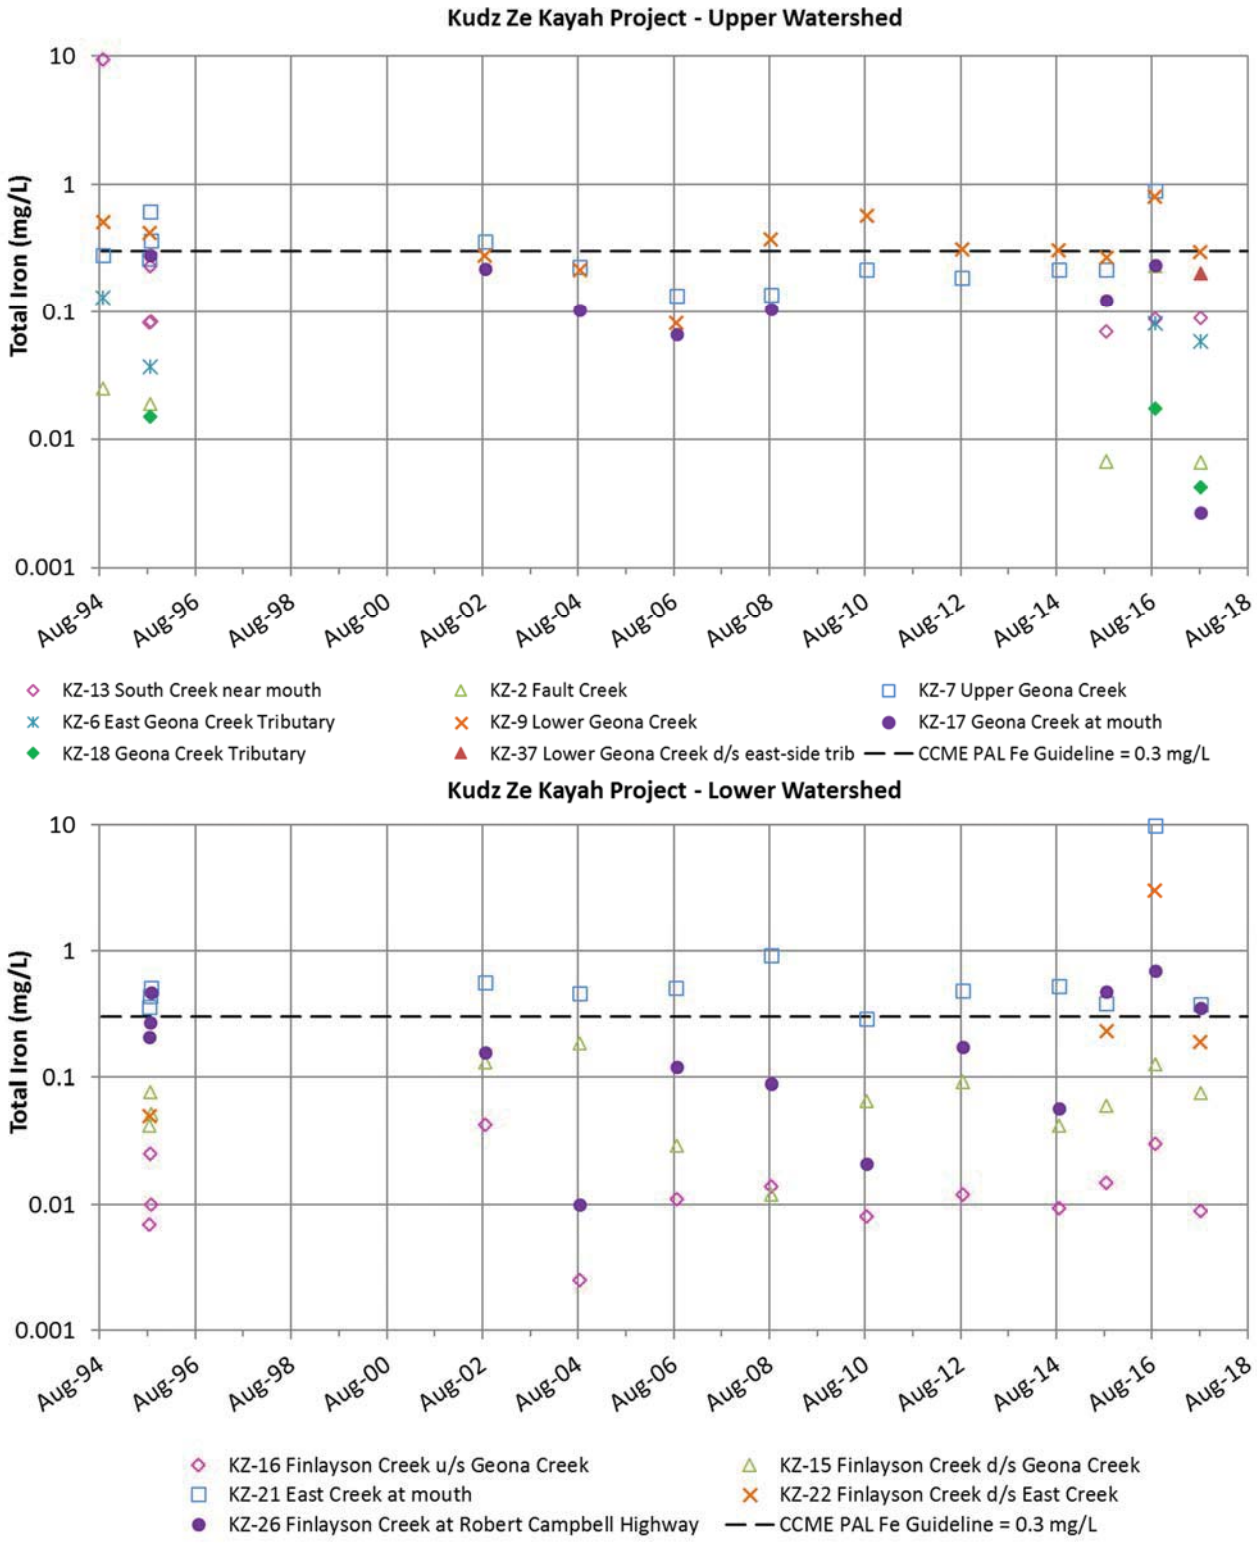

Figure D-7: Variation in Total Iron Concentration in the Upper (South, Fault, and Geona Creeks) and Lower (Finlayson and East Creeks) Watershed of Kudz Ze Kayah Project in Samples Collected in August since 1994

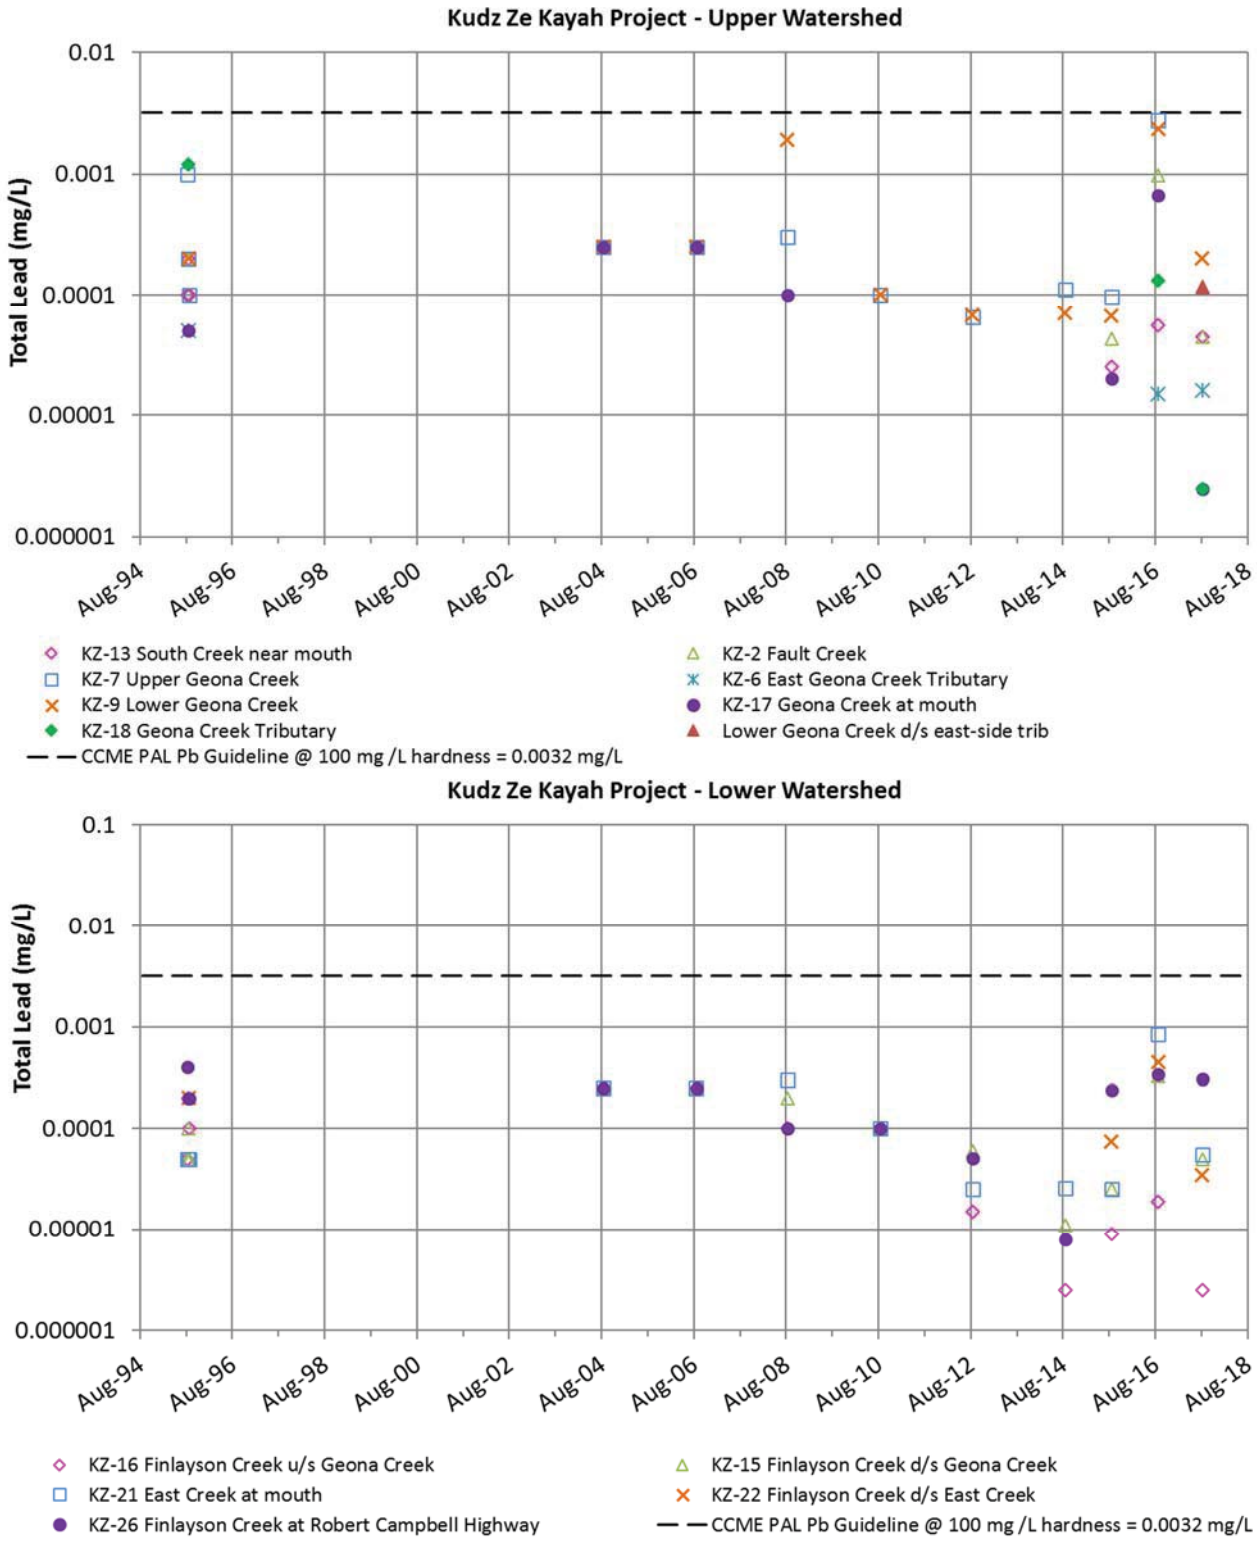

Figure D-8: Variation in Total Lead Concentration in the Upper (South, Fault, and Geona Creeks) and Lower (Finlayson and East Creeks) Watershed of Kudz Ze Kayah Project in Samples Collected in August since 1994

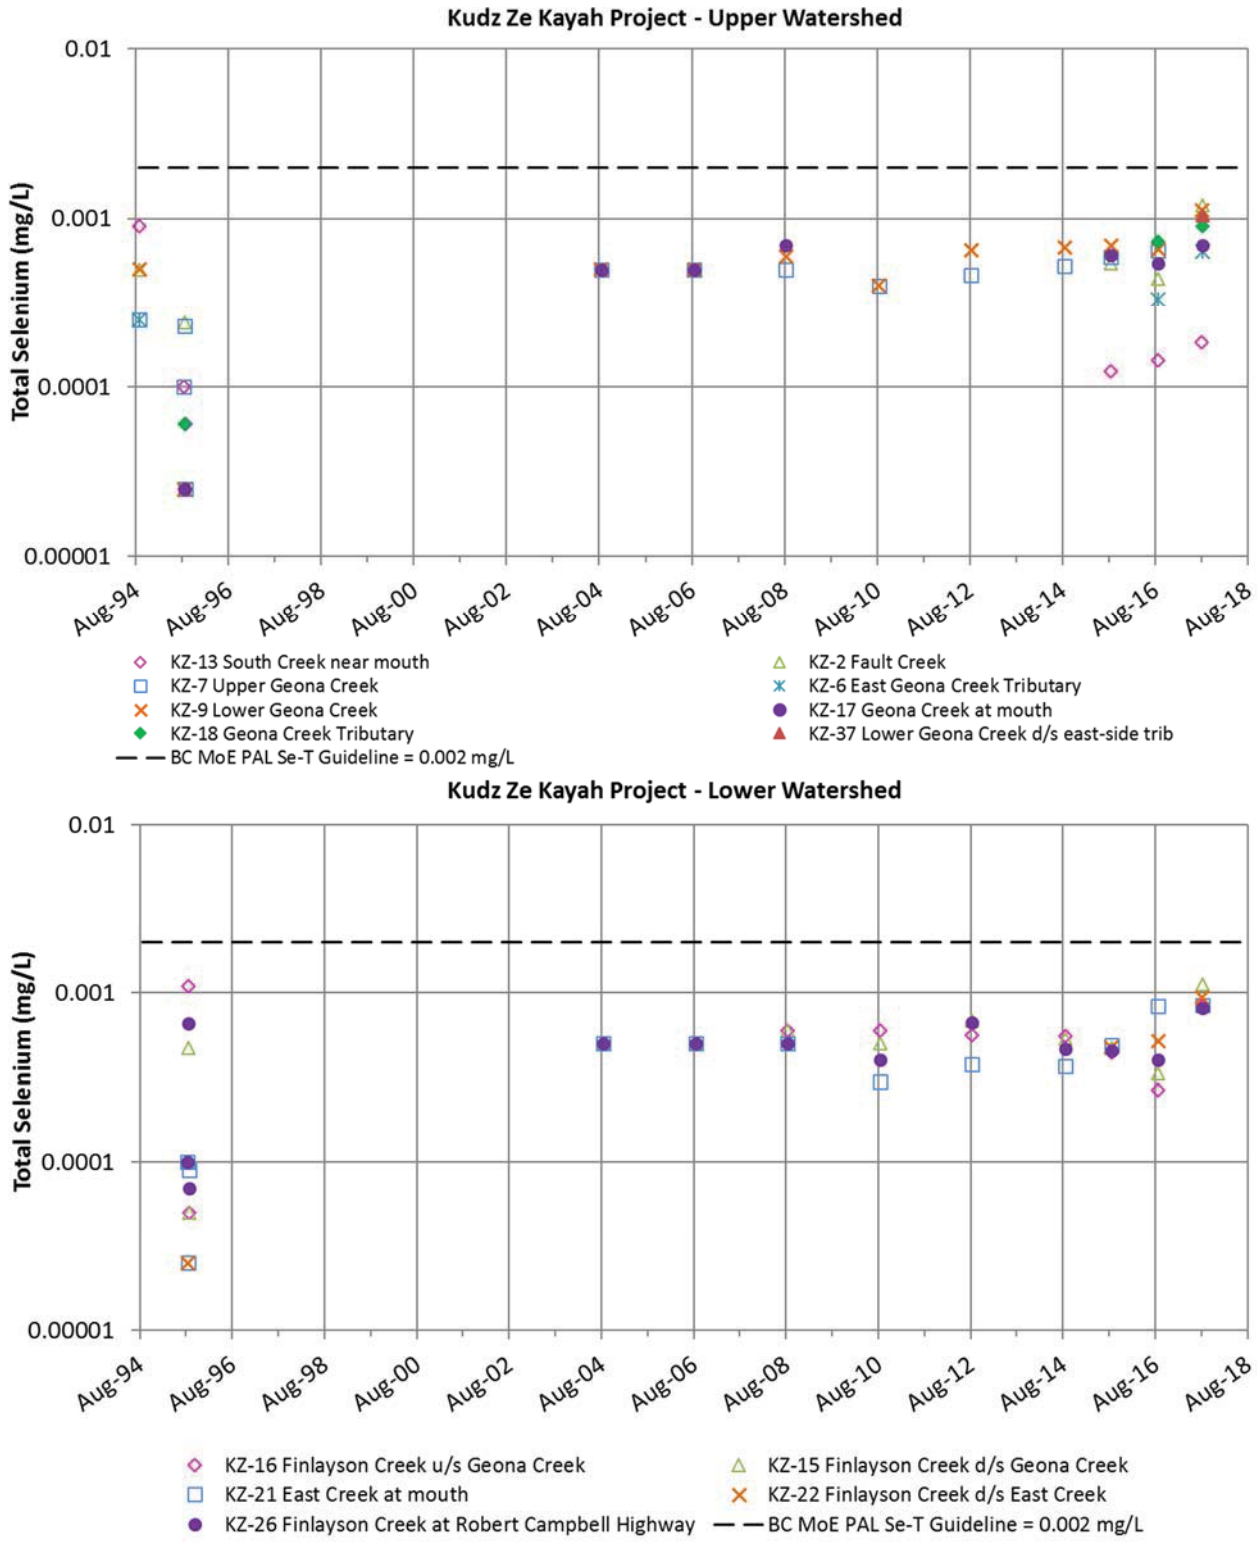

Figure D-9: Variation in Total Selenium Concentration in the Upper (South, Fault, and Geona Creeks) and Lower (Finlayson and East Creeks) Watershed of Kudz Ze Kayah Project in Samples Collected in August since 1994

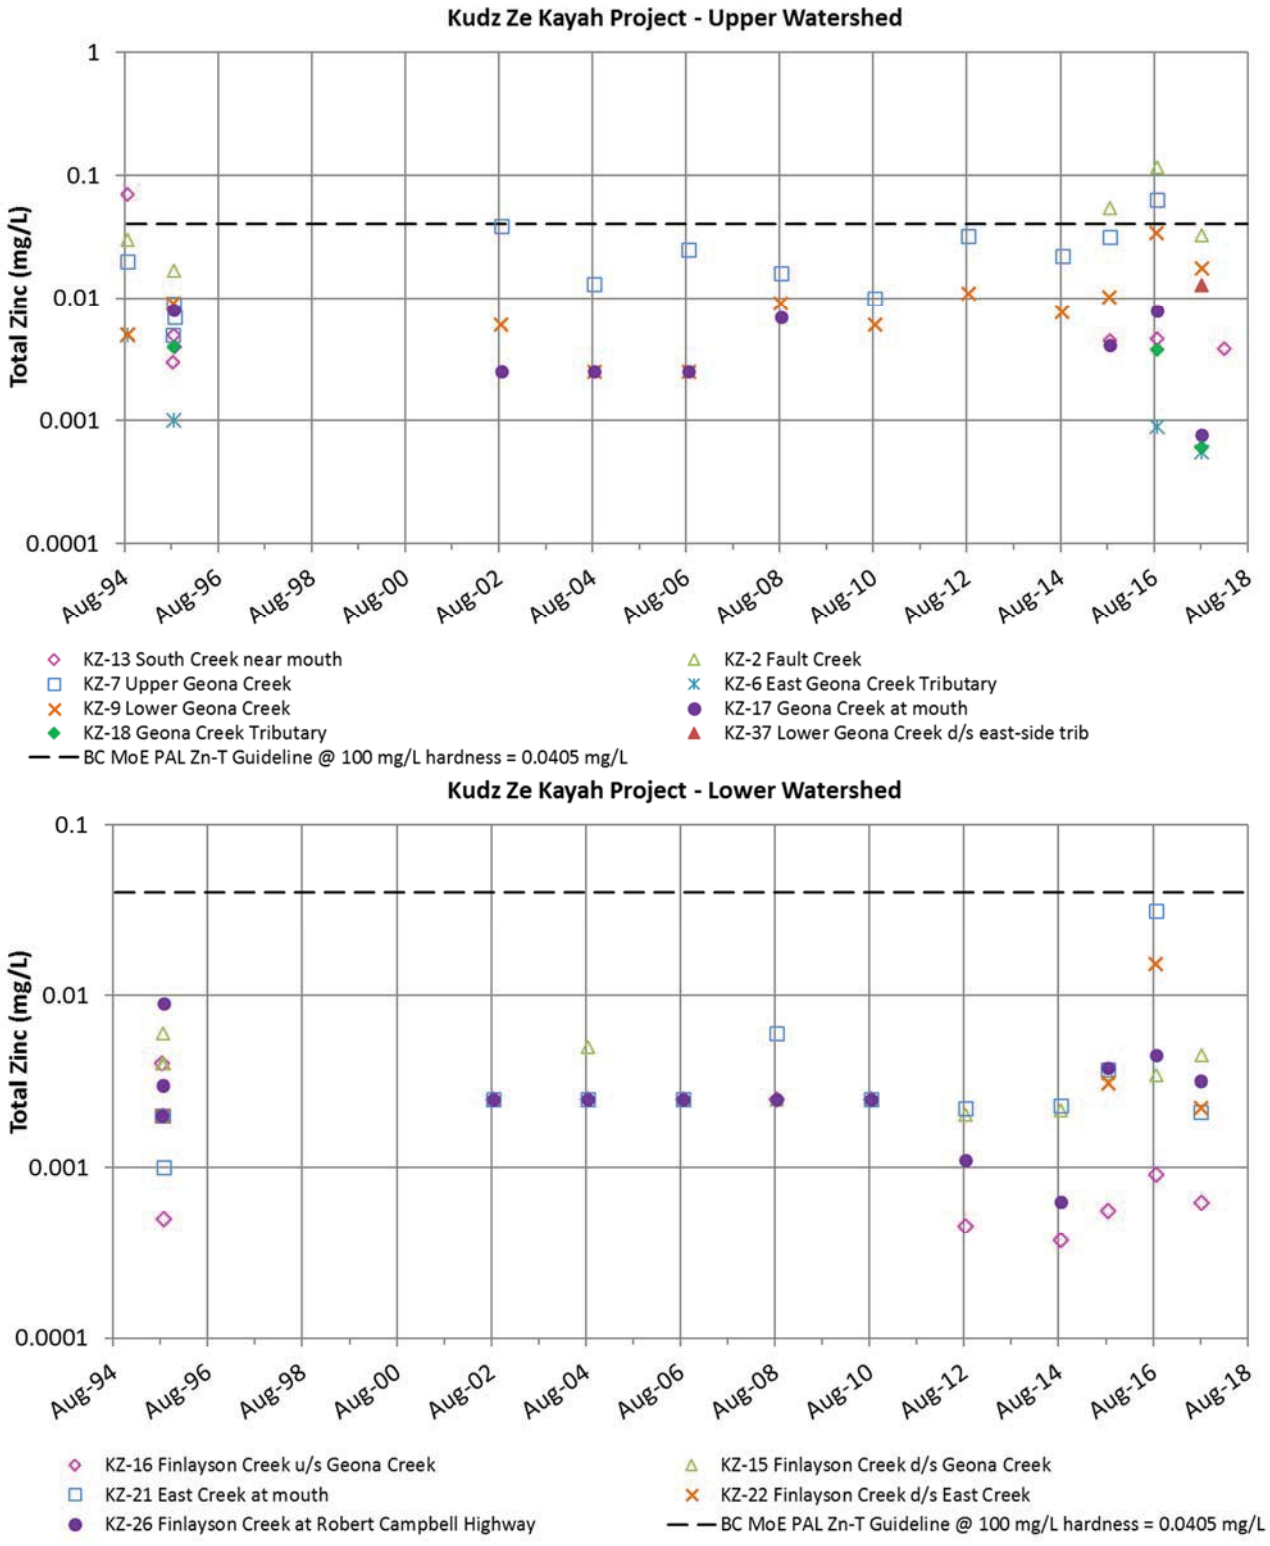

Figure D-10: Variation in Total Zinc Concentration in the Upper (South, Fault, and Geona Creeks) and Lower (Finlayson and East Creeks) Watershed of Kudz Ze Kayah Project in Samples Collected in August since 1994

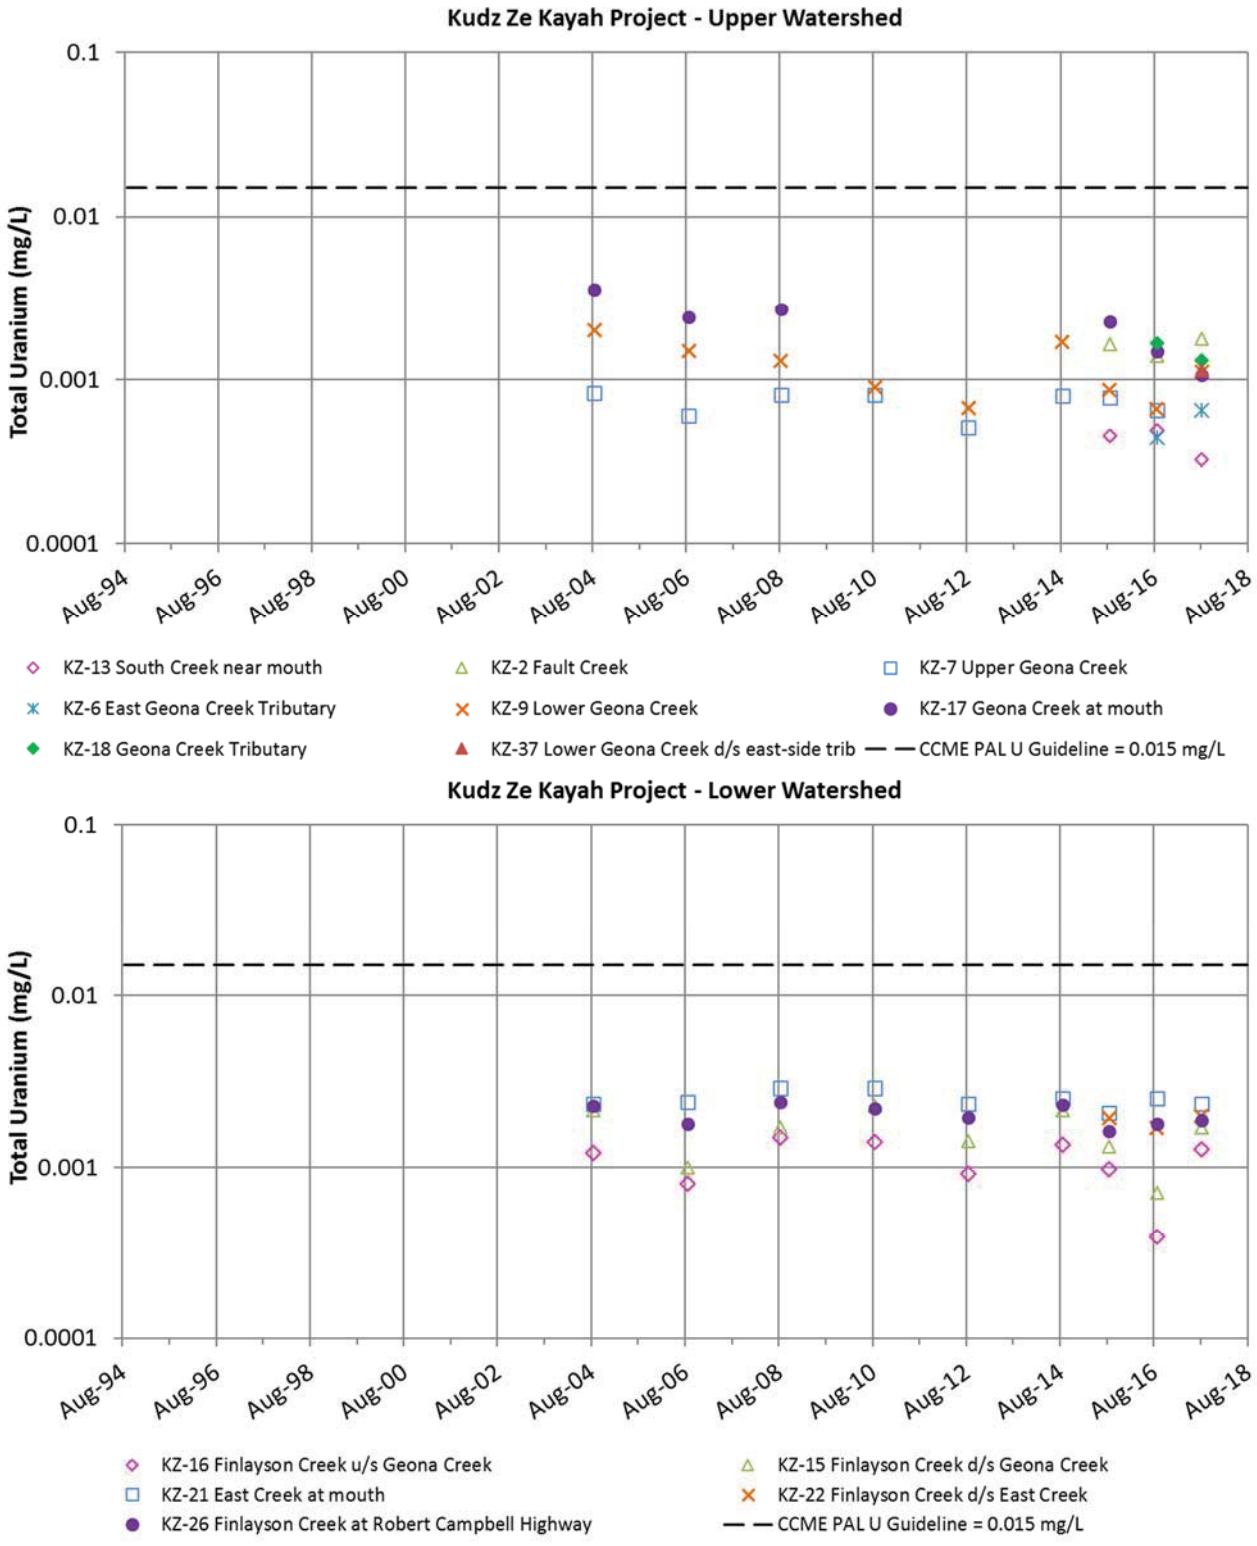

Figure D-11: Variation in Total Uranium Concentration in the Upper (South, Fault, and Geona Creeks) and Lower (Finlayson and East Creeks) Watershed of Kudz Ze Kayah Project in Samples Collected in August since 1994

APPENDIX E.

Five Samples in 30 Days May and June 2017 Surface Water Plots

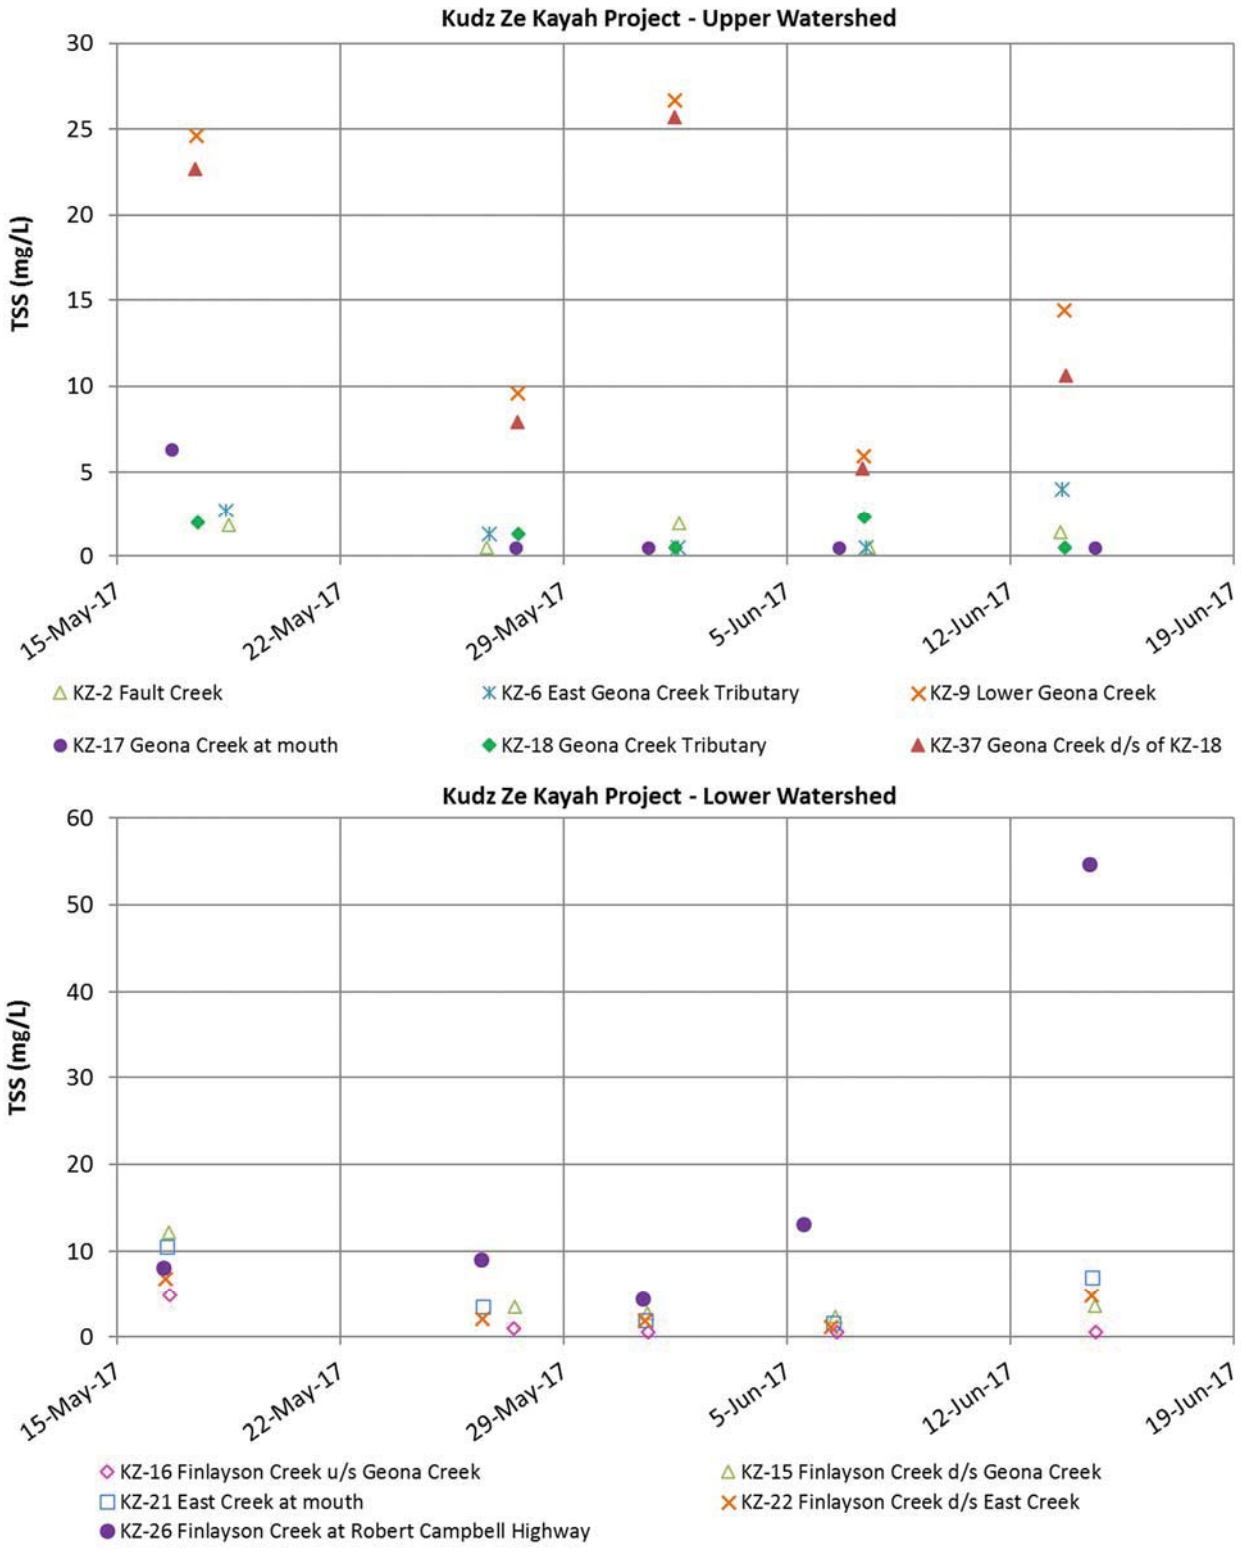

Figure E-1: Variation in Total Suspended Solids (TSS) Concentration in the Upper (South, Fault, and Geona Creeks) and Lower (Finlayson and East Creeks) Watershed of Kudz Ze Kayah Project in Samples Collected in May-June 2017

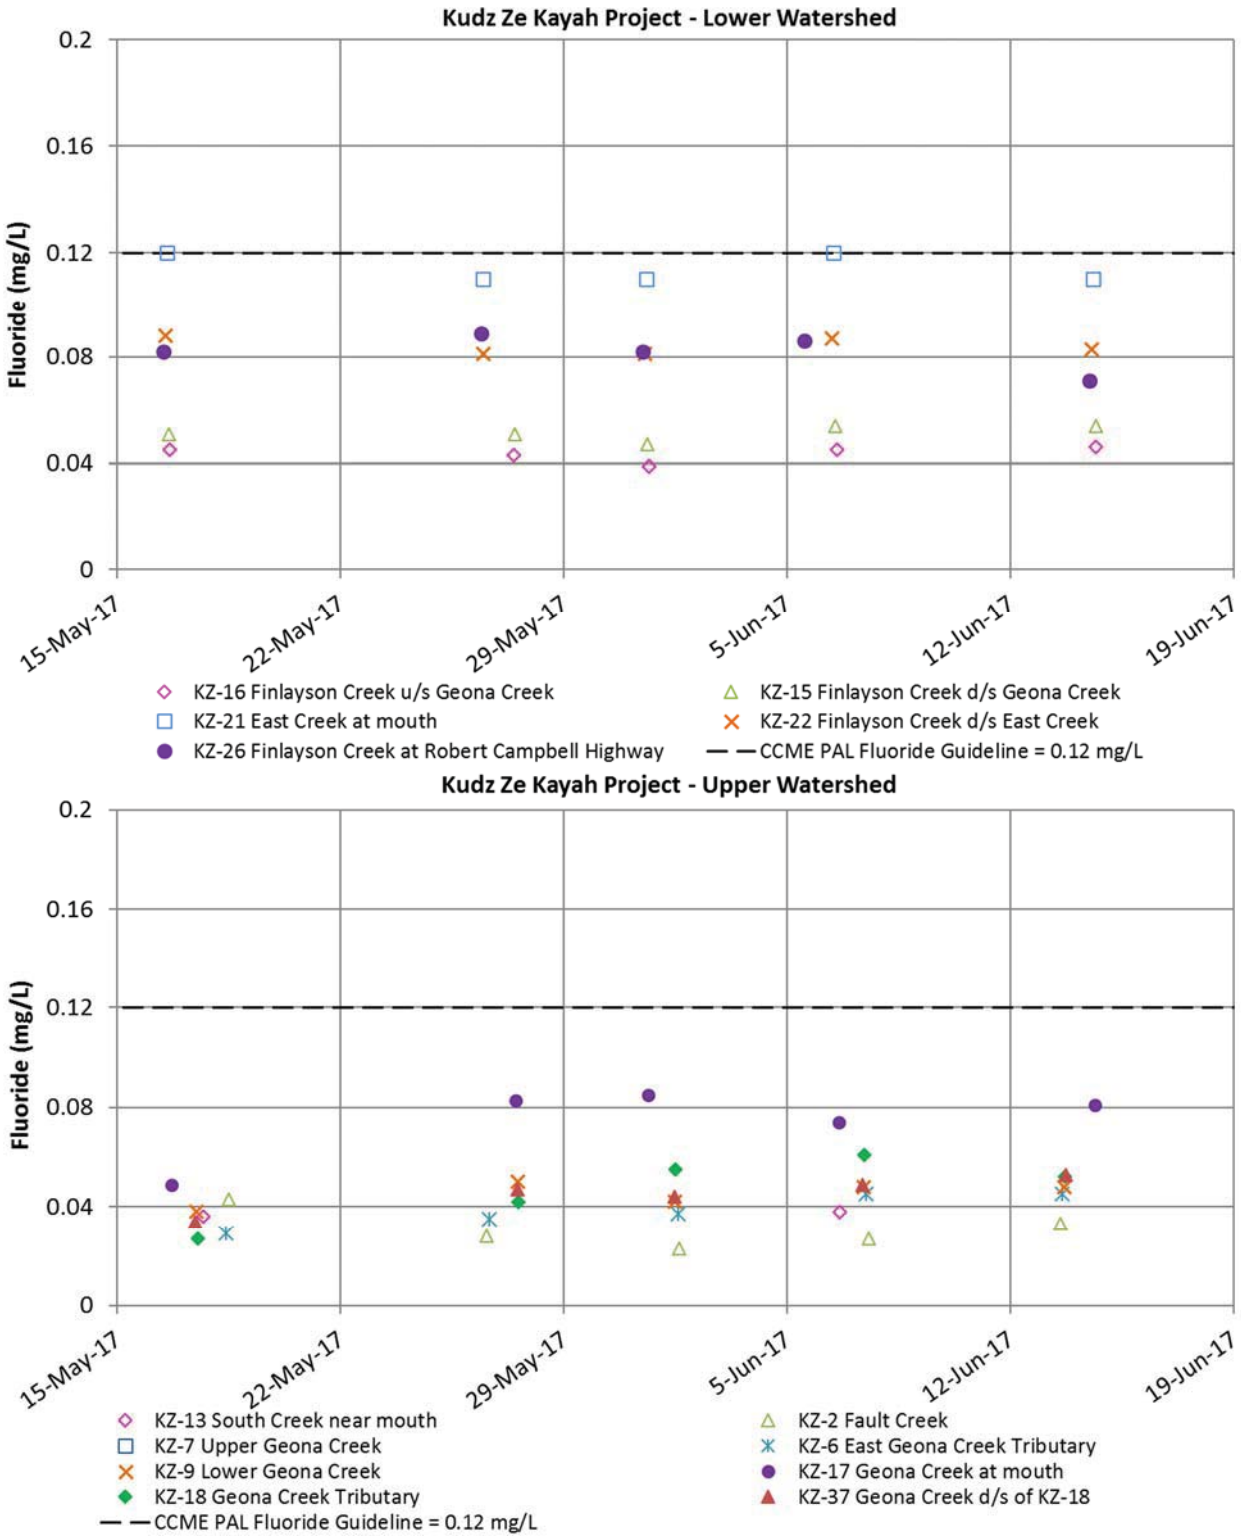

Figure E-2: Variation in Total Fluoride Concentration in the Upper (South, Fault, and Geona Creeks) and Lower (Finlayson and East Creeks) Watershed of Kudz Ze Kayah Project in Samples Collected in May-June 2017

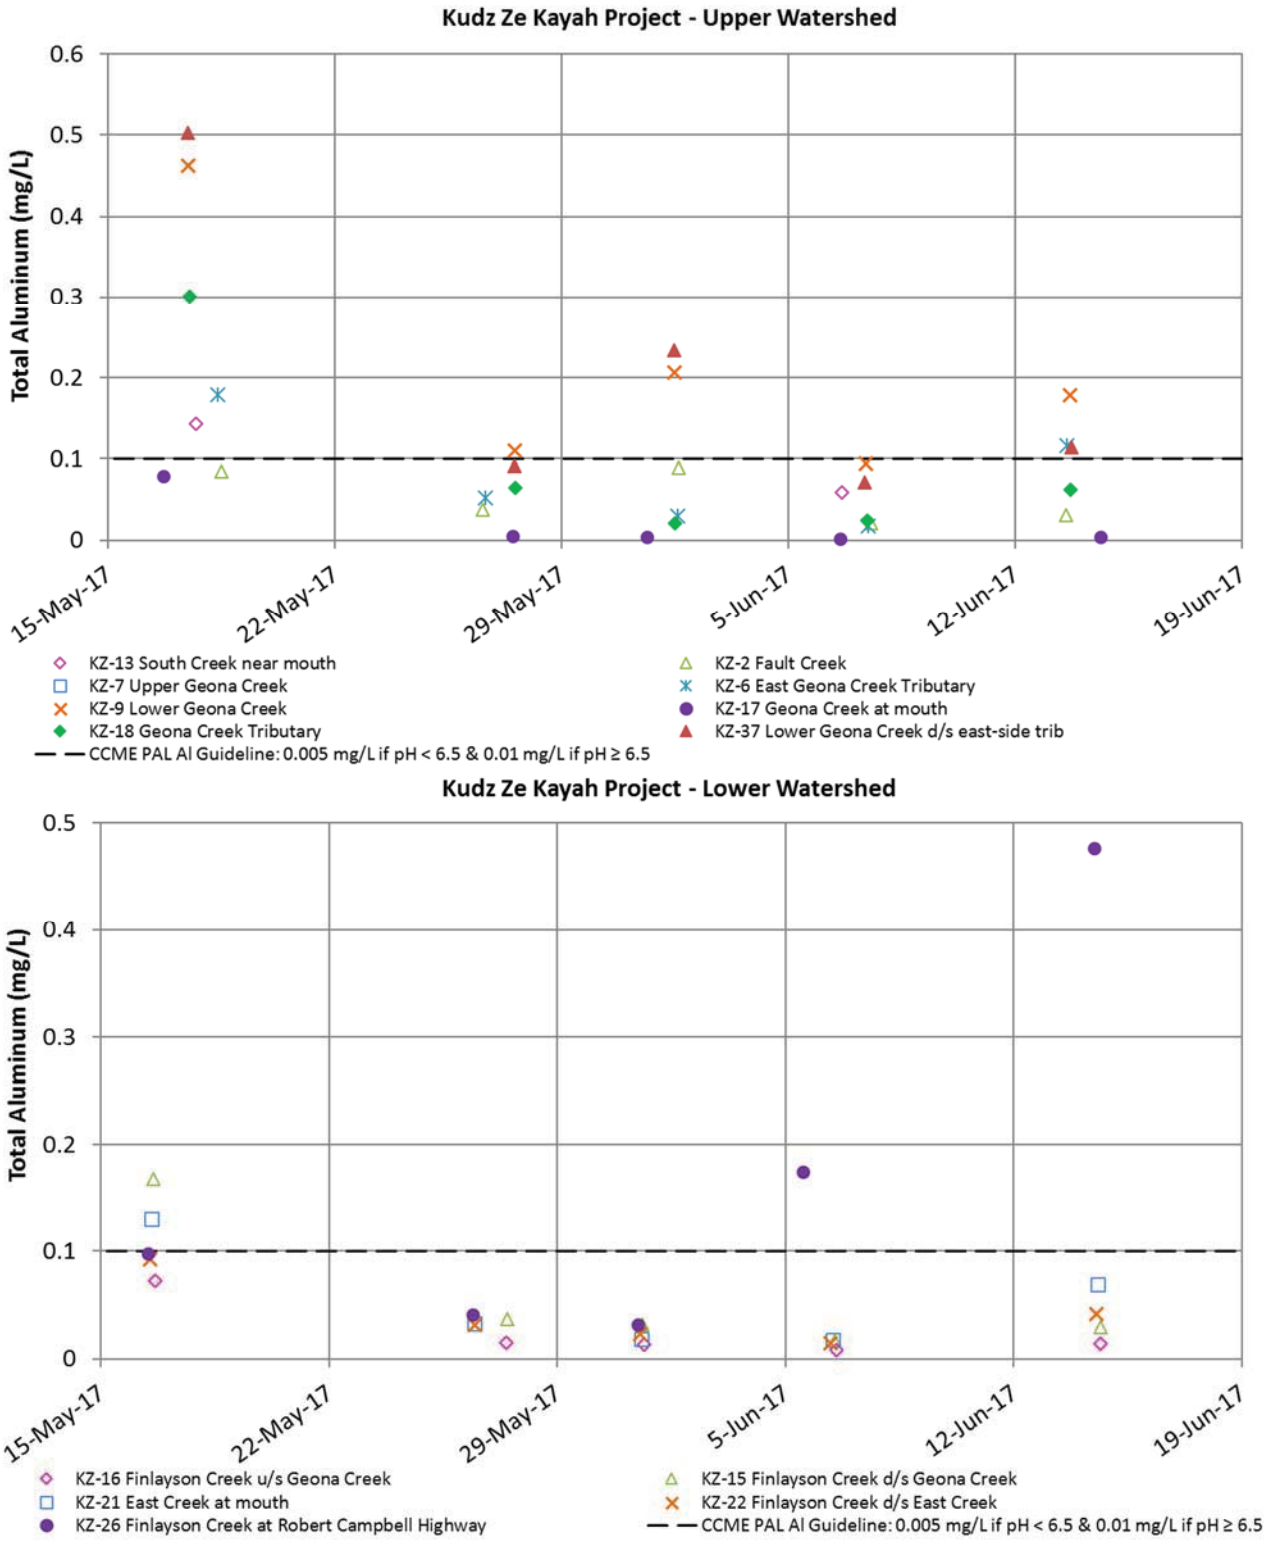

Figure E-3: Variation in Total Aluminum Concentration in the Upper (South, Fault, and Geona Creeks) and Lower (Finlayson and East Creeks) Watershed of Kudz Ze Kayah Project in Samples Collected in May-June 2017

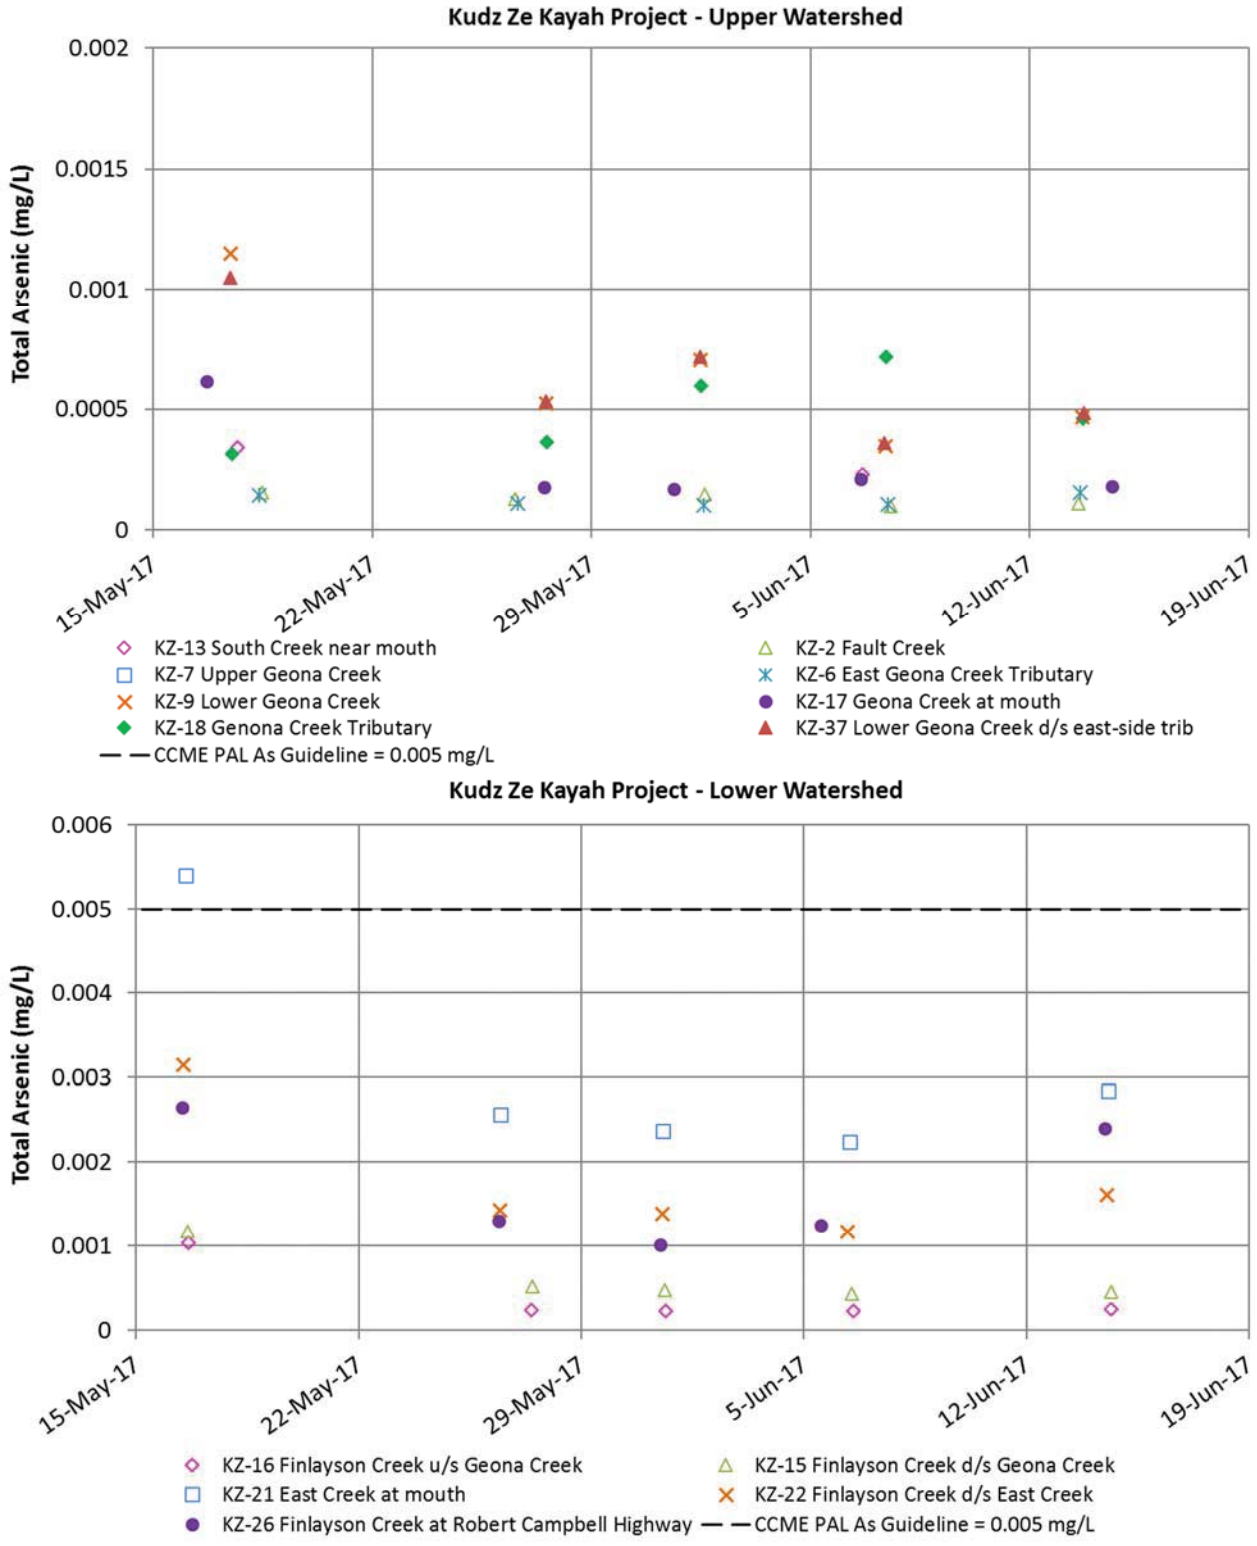

Figure E-4: Variation in Total Arsenic Concentration in the Upper (South, Fault, and Geona Creeks) and Lower (Finlayson and East Creeks) Watershed of Kudz Ze Kayah Project in Samples Collected in May-June 2017

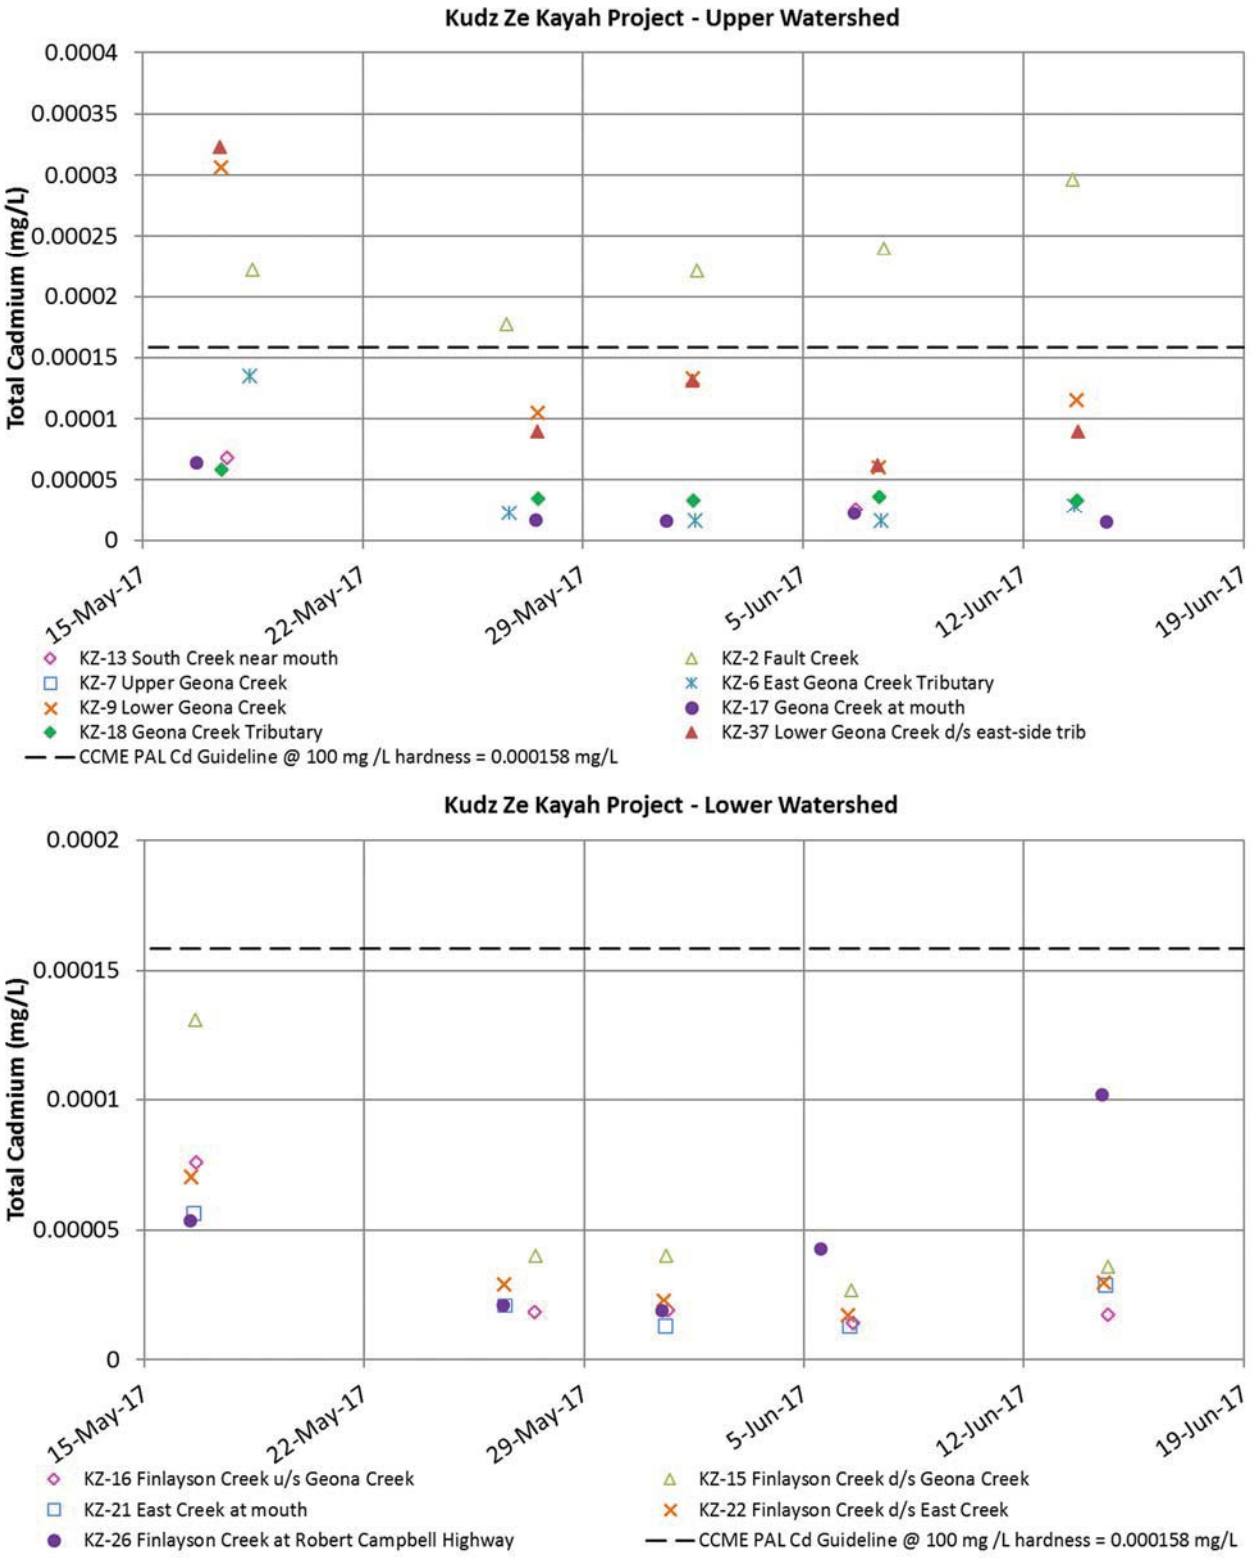

Figure E-5: Variation in Total Cadmium Concentration in the Upper (South, Fault, and Geona Creeks) and Lower (Finlayson and East Creeks) Watershed of Kudz Ze Kayah Project in Samples Collected in May-June 2017

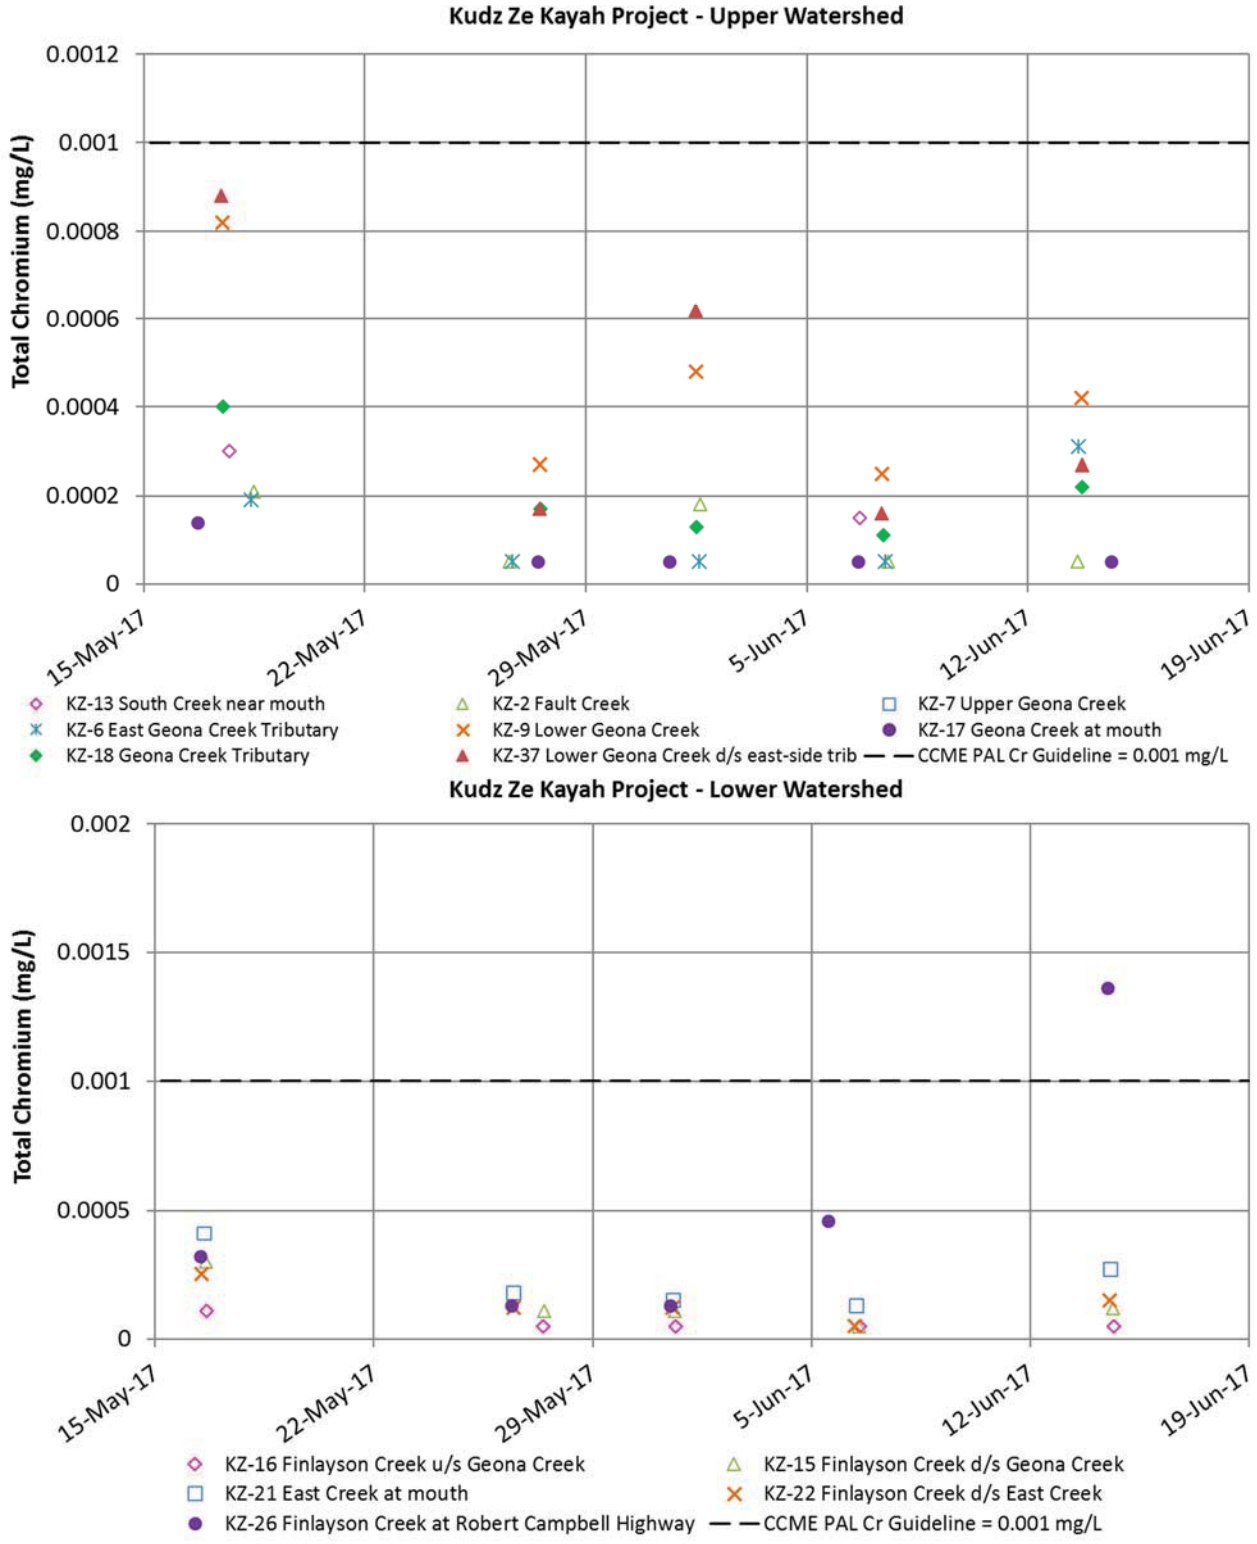

Figure E-6: Variation in Total Chromium Concentration in the Upper (South, Fault, and Geona Creeks) and Lower (Finlayson and East Creeks) Watershed of Kudz Ze Kayah Project in Samples Collected in May-June 2017

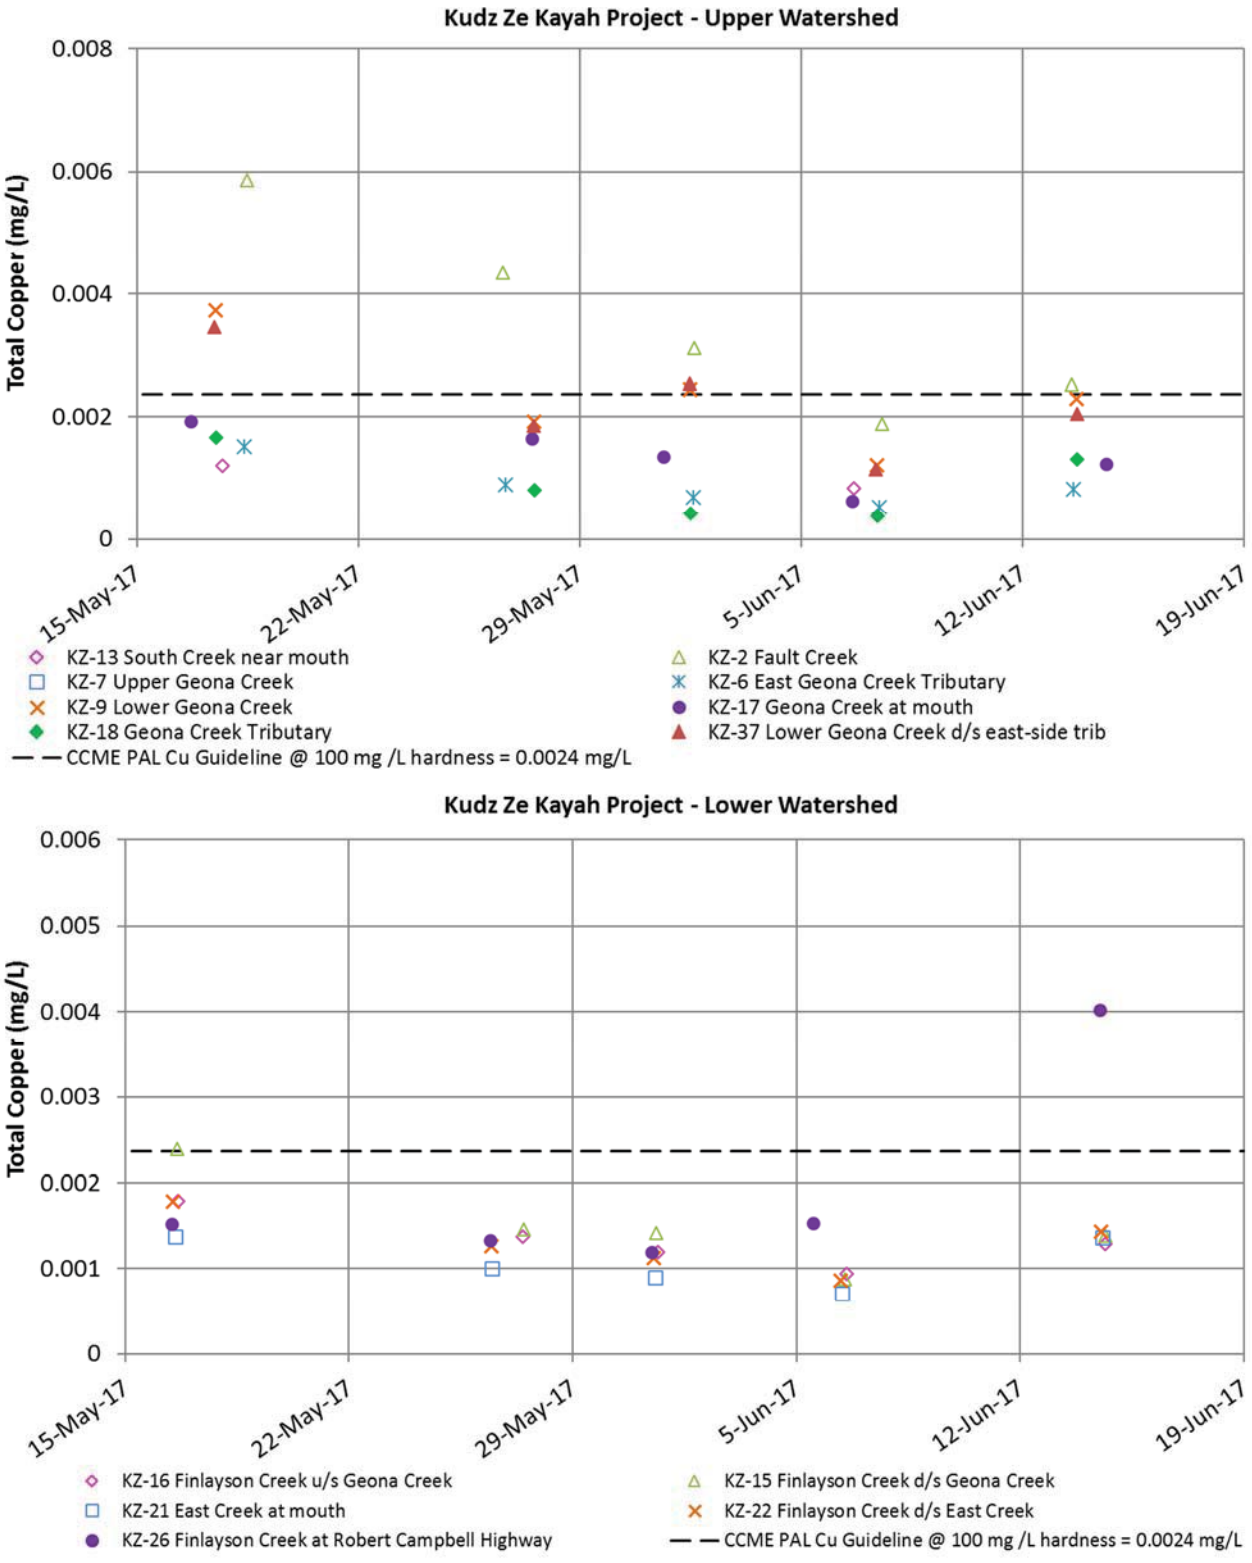

Figure E-7: Variation in Total Copper Concentration in the Upper (South, Fault, and Geona Creeks) and Lower (Finlayson and East Creeks) Watershed of Kudz Ze Kayah Project in Samples Collected in May-June 2017

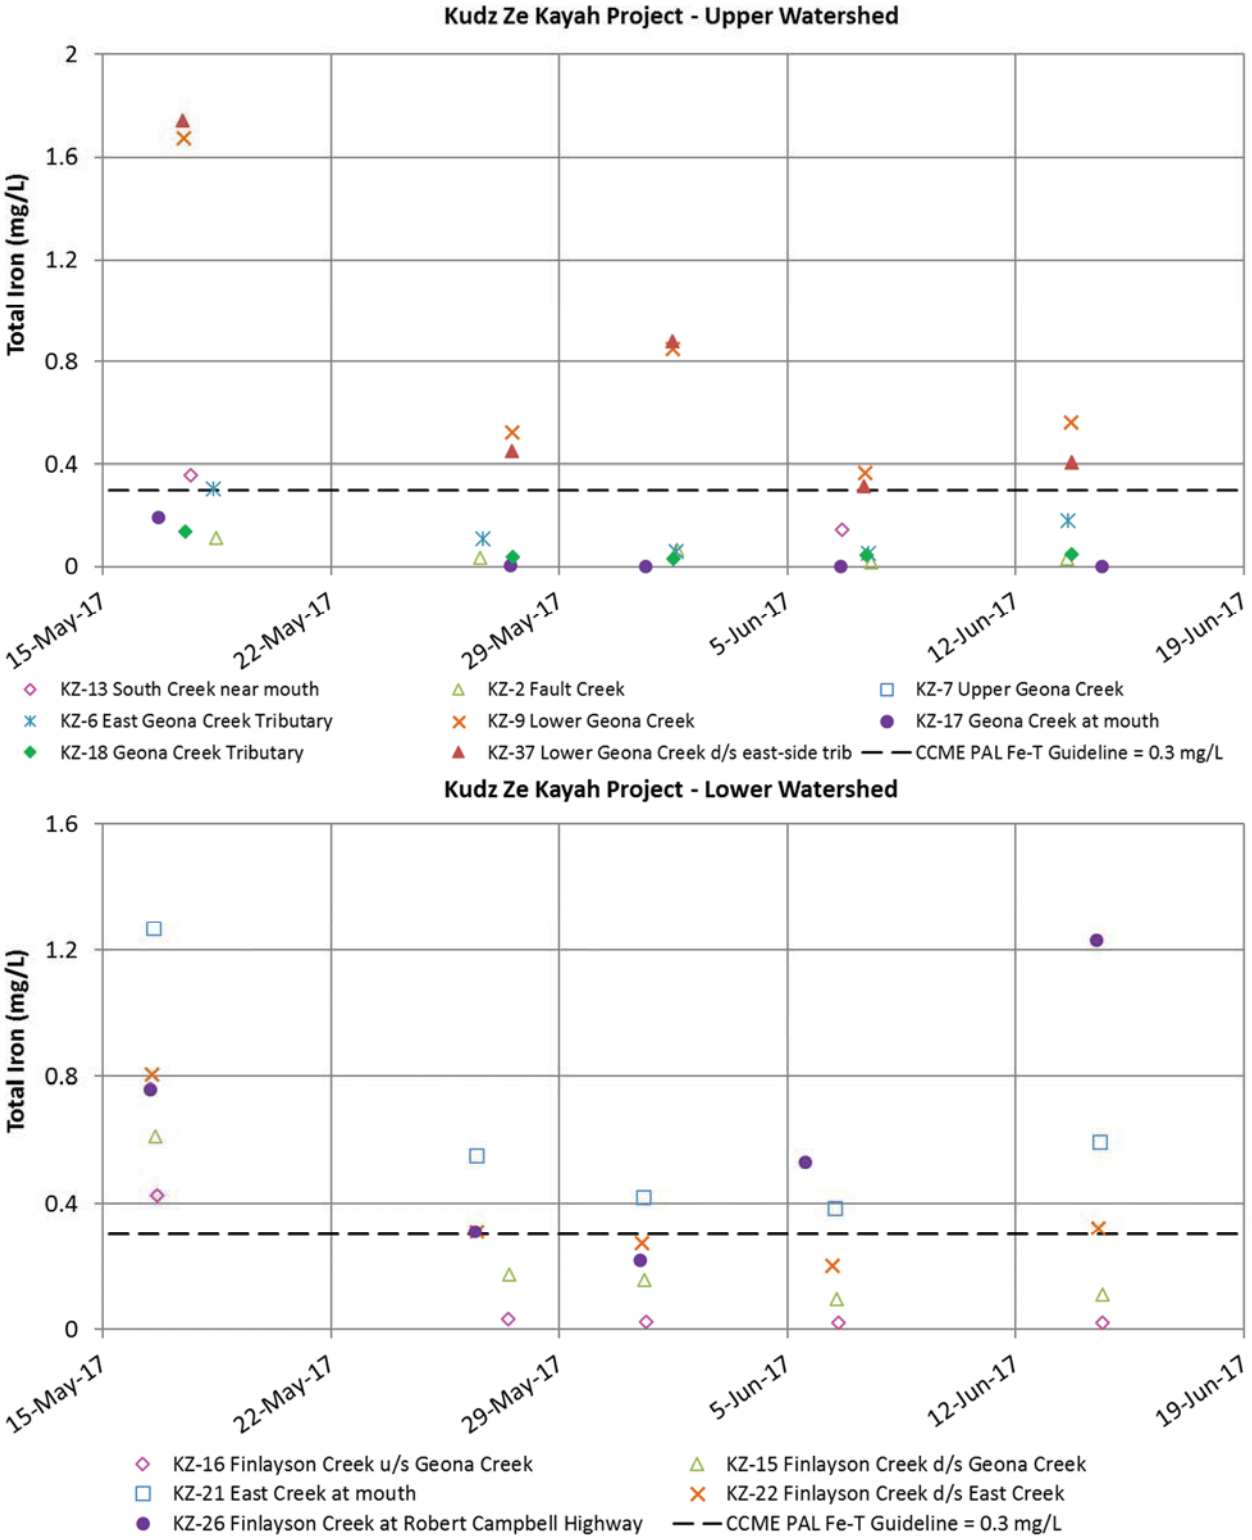

Figure E-8: Variation in Total Iron Concentration in the Upper (South, Fault, and Geona Creeks) and Lower (Finlayson and East Creeks) Watershed of Kudz Ze Kayah Project in Samples Collected in May-June 2017

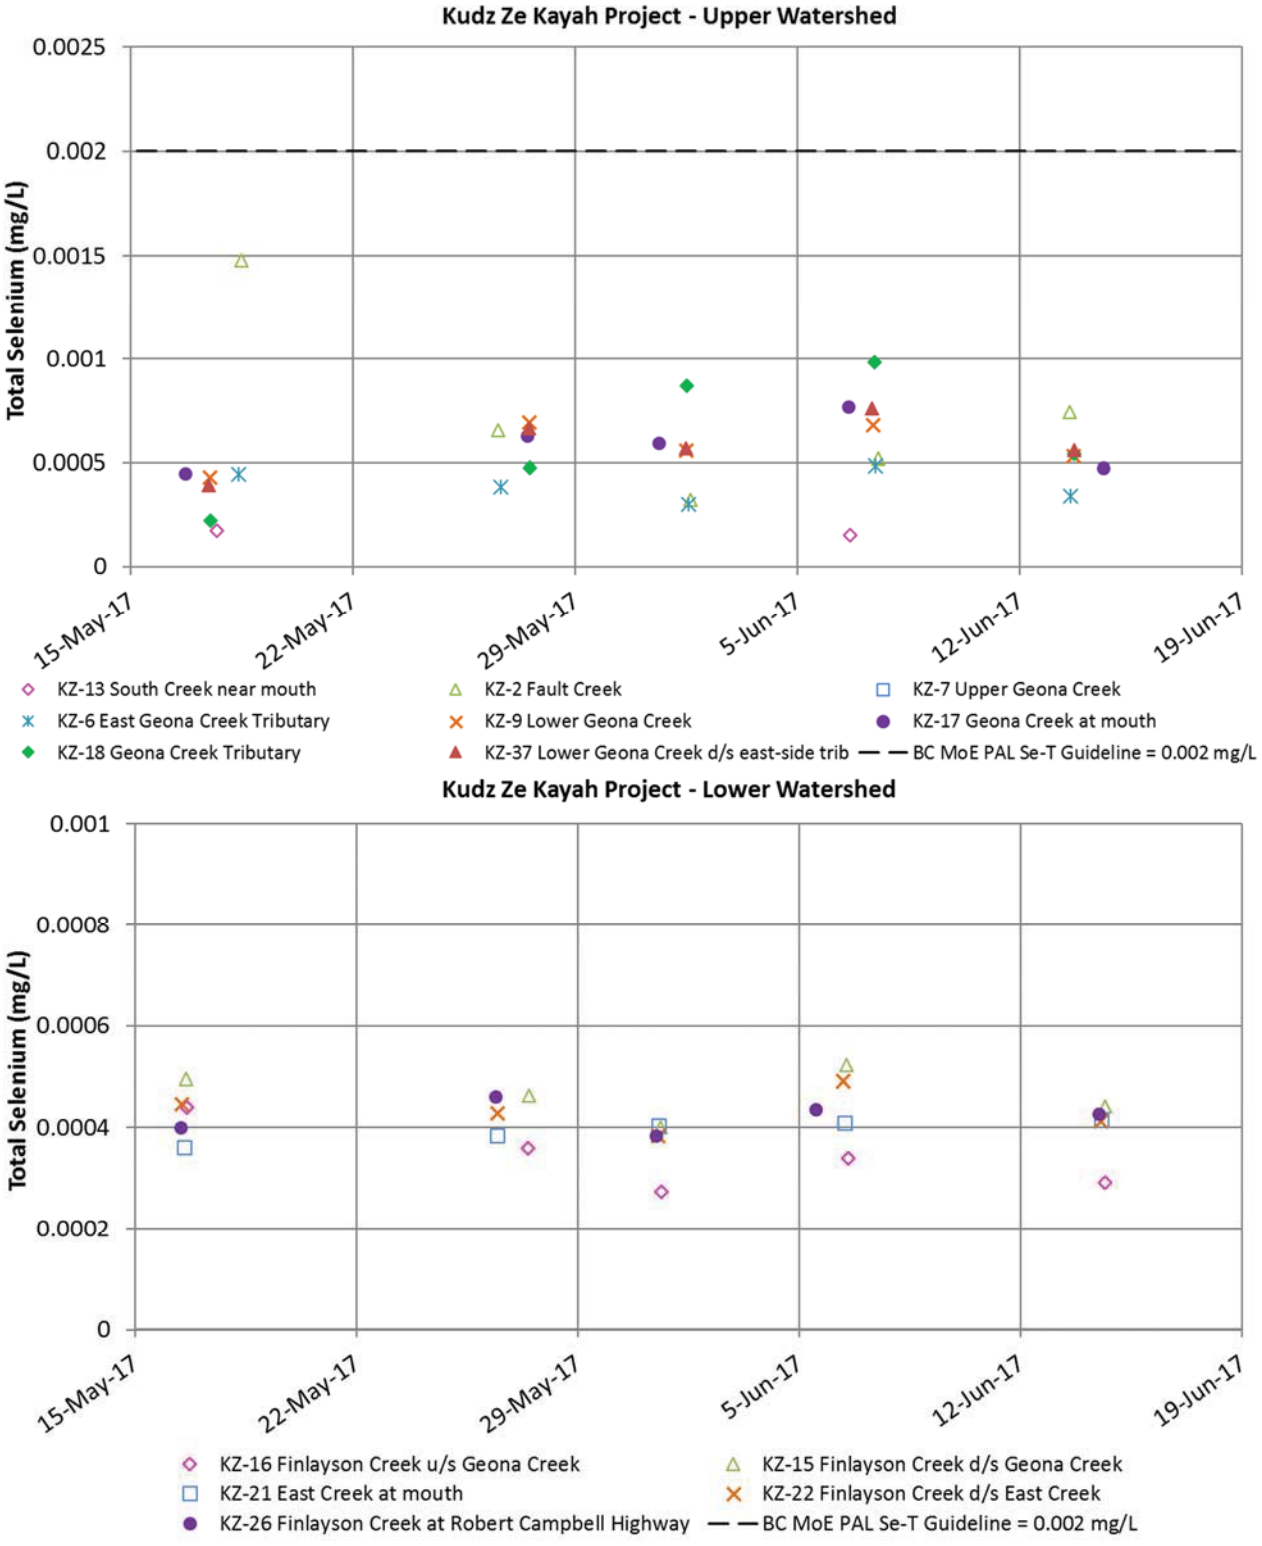

Figure E-9: Variation in Total Selenium Concentration in the Upper (South, Fault, and Geona Creeks) and Lower (Finlayson and East Creeks) Watershed of Kudz Ze Kayah Project in Samples Collected in May-June 2017

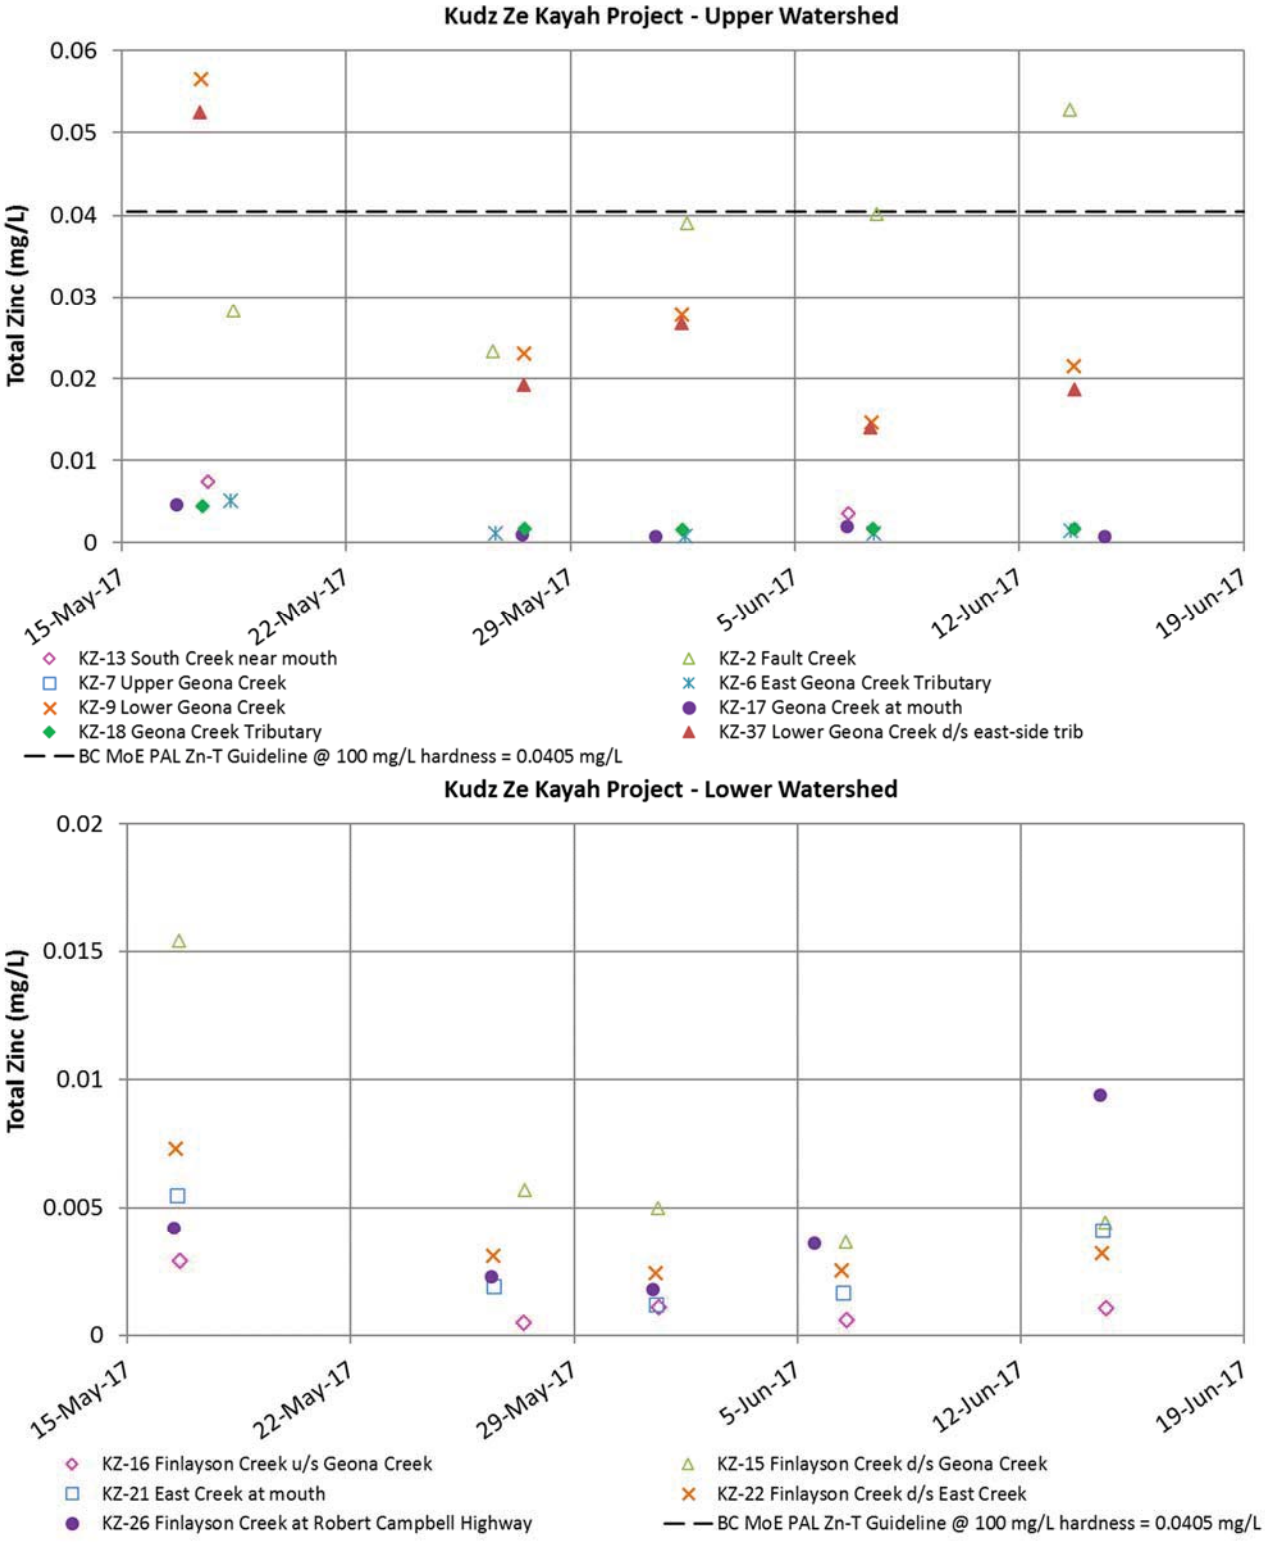

Figure E-10: Variation in Total Zinc Concentration in the Upper (South, Fault, and Geona Creeks) and Lower (Finlayson and East Creeks) Watershed of Kudz Ze Kayah Project in Samples Collected in May-June 2017

Total Suspended Solids-Low Level	1	2015/05/06	2015/05/06	BBY6SOP-00034	SM 22 2540 D

Reference Method suffix “m” indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) DOC present in the sample should be considered as non-purgeable DOC.
(2) The BC-MOE and APHA Standard Method require pH to be analysed within 15 minutes of sampling and therefore field analysis is required for compliance. All Laboratory pH analyses in this report are reported past the BC-MOE/APHA Standard Method holding time.

Your Project #: BMC-15-01
Site Location: KUDZ ZE KAYAH
Your C.O.C. #: 08406559, 08406560

Attention:KAI WOLOSHYN

RDL = Reportable Detection Limit
N/A = Not Applicable
(1) Ion balance out of optimal range due to high measurement uncertainty at this level (Ion Sum < 0.4 meq/L for both cations and anions).
(2) Ion Balance: NC = Not Calculable due to low ion sum [< 0.4 meq/L].
(3) Sample analysed past recommended hold time.

GENERAL COMMENTS

Each temperature is the average of up to three cooler temperatures taken at receipt

Package 1	5.7°C
Package 2	7.7°C

Revised Report R2 (2015/05/11): Reporting units have been changed as per client request and report comments have been amended (MM4).

Sample ME0566-01 : Ion Balance: NC = Not Calculable due to low ion sum [< 0.4 meq/L].
Sample MD8814, Elements by ICPMS Low Level (dissolved): Test repeated.
Sample MD8814, Na, K, Ca, Mg, S by CRC ICPMS (diss.): Test repeated.
Sample MD8815, Elements by ICPMS Low Level (dissolved): Test repeated.
Sample MD8816, Elements by ICPMS Low Level (dissolved): Test repeated.
Sample MD8817, Elements by ICPMS Low Level (dissolved): Test repeated.
Sample MD8818, Elements by ICPMS Low Level (dissolved): Test repeated.
Sample MD8819, Elements by ICPMS Low Level (dissolved): Test repeated.
Sample MD8820, Elements by ICPMS Low Level (dissolved): Test repeated.
Sample MD8821, Elements by ICPMS Low Level (dissolved): Test repeated.
Sample MD8822, Elements by ICPMS Low Level (dissolved): Test repeated.
Sample MD8836, Elements by ICPMS Low Level (dissolved): Test repeated.

Results relate only to the items tested.

N/A = Not Applicable

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spiked amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than 2x that of the native sample concentration).

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (one or both samples < 5x RDL).

(1) Recovery or RPD for this parameter is outside control limits. The overall quality control for this analysis meets acceptability criteria.

(2) Blank Spike outside acceptance criteria (10% of analytes failure allowed).

Reference Method suffix “m” indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) DOC present in the sample should be considered as non-purgeable DOC.
(2) The BC-MOE and APHA Standard Method require pH to be analysed within 15 minutes of sampling and therefore field analysis is required for compliance. All Laboratory pH analyses in this report are reported past the BC-MOE/APHA Standard Method holding time.

RDL = Reportable Detection Limit

N/A = Not Applicable

(1) Ionic imbalance due to high level of iron which may precipitate out over time and affect the results for alkalinity.

(2) Sample preserved to extend hold time.

(3) Sample was originally analysed within hold time. Data quality required investigation. Re-analysis was completed past recommended hold time.

(4) RDL raised due to sample matrix interference.

RDL = Reportable Detection Limit
N/A = Not Applicable
(1) Ion balance out of optimal range due to high measurement uncertainty at this level (Ion Sum < 0.4 meq/L for both cations and anions).
(2) Ionic imbalance due to high level of iron which may precipitate out over time and affect the results for alkalinity.
(3) Sample preserved to extend hold time.
(4) RDL raised due to sample matrix interference.

GENERAL COMMENTS

Each temperature is the average of up to three cooler temperatures taken at receipt

Package 1	4.3°C
Package 2	3.7°C
Package 3	3.0°C

Sample MF9657, Elements by ICPMS Low Level (total): Test repeated.

Results relate only to the items tested.

N/A = Not Applicable

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spiked amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than 2x that of the native sample concentration).

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (one or both samples < 5x RDL).

(1) Recovery or RPD for this parameter is outside control limits. The overall quality control for this analysis meets acceptability criteria.

Report Date: 2015/06/30
Report #: R1986607
Version: 1 - Final

CERTIFICATE OF ANALYSIS

MAXXAM JOB #: B553386
Received: 2015/06/24, 11:07

Sample Matrix: Water
Samples Received: 5

Analyses	Quantity	Date Extracted	Date Analyzed	Laboratory Method	Analytical Method
pH Water (2)	1	N/A	2015/06/26	BBY6SOP-00026	SM 22 4500-H+ B m
Sulphate by Automated Colourimetry	5	N/A	2015/06/25	BBY6SOP-00017	SM 22 4500-SO42- E m
Phosphorus-P (LL Tot, dissolved) - UF/UP	5	2015/06/25	2015/06/26	BBY6SOP-00013	SM 22 4500-P E m
Total Phosphorus - unpreserved	5	N/A	2015/06/26	BBY6SOP-00013	SM 22 4500-P E m
Total Suspended Solids-Low Level	5	2015/06/25	2015/06/26	BBY6SOP-00034	SM 22 2540 D

Reference Method suffix “m” indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) DOC present in the sample should be considered as non-purgeable DOC.
(2) The BC-MOE and APHA Standard Method require pH to be analysed within 15 minutes of sampling and therefore field analysis is required for compliance. All Laboratory pH analyses in this report are reported past the BC-MOE/APHA Standard Method holding time.

GENERAL COMMENTS

Each temperature is the average of up to three cooler temperatures taken at receipt

Package 1	5.3°C

Sample MN1920, Elements by ICPMS Low Level (dissolved): Test repeated.
Sample MN1922, Elements by ICPMS Low Level (dissolved): Test repeated.
Sample MN1923, Elements by ICPMS Low Level (dissolved): Test repeated.
Sample MN1924, Elements by ICPMS Low Level (dissolved): Test repeated.

Results relate only to the items tested.

N/A = Not Applicable

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spiked amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than 2x that of the native sample concentration).

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (one or both samples < 5x RDL).

(1) Recovery or RPD for this parameter is outside control limits. The overall quality control for this analysis meets acceptability criteria.

Report Date: 2015/07/03
Report #: R1989596
Version: 1 - Final

CERTIFICATE OF ANALYSIS

MAXXAM JOB #: B553960
Received: 2015/06/25, 13:25

Sample Matrix: Water
Samples Received: 13

Analyses	Quantity	Date Extracted	Date Analyzed	Laboratory Method	Analytical Method
Filter and HNO3 Preserve for Metals	12	N/A	2015/06/26	BBY7 WI-00004	BCMOE Reqs 08/14
pH Water (2)	13	N/A	2015/06/27	BBY6SOP-00026	SM 22 4500-H+ B m
Sulphate by Automated Colourimetry	8	N/A	2015/06/26	BBY6SOP-00017	SM 22 4500-SO42- E m
Phosphorus-P (LL Tot, dissolved) - UF/UP	8	2015/06/27	2015/06/29	BBY6SOP-00013	SM 22 4500-P E m
Total Phosphorus - unpreserved	8	N/A	2015/06/29	BBY6SOP-00013	SM 22 4500-P E m
Total Suspended Solids-Low Level	8	2015/06/27	2015/06/29	BBY6SOP-00034	SM 22 2540 D

Reference Method suffix “m” indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) DOC present in the sample should be considered as non-purgeable DOC.

(2) The BC-MOE and APHA Standard Method require pH to be analysed within 15 minutes of sampling and therefore field analysis is required for compliance. All Laboratory pH analyses in this report are reported past the BC-MOE/APHA Standard Method holding time.

RDL = Reportable Detection Limit
(1) Dissolved greater than total. Reanalysis yields similar results.

GENERAL COMMENTS

Each temperature is the average of up to three cooler temperatures taken at receipt

Package 1	7.7°C
Package 2	8.7°C

Sample MN5102, Elements by ICPMS Low Level (dissolved): Test repeated.
Sample MN5103, Elements by ICPMS Low Level (dissolved): Test repeated.
Sample MN5104, Elements by ICPMS Low Level (dissolved): Test repeated.
Sample MN5140, Elements by ICPMS Low Level (dissolved): Test repeated.

Results relate only to the items tested.

QUALITY ASSURANCE REPORT(CONT'D)

ALEXCO ENVIRONMENTAL GROUP INC.
Client Project #: BMC-15-01
Site Location: KUDZ ZE KAYAH

			Matrix Spike		Spiked Blank		Method Blank		RPD	
QC Batch	Parameter	Date	% Recovery	QC Limits	% Recovery	QC Limits	Value	Units	Value (%)	QC Limits
7953116	Dissolved Silicon (Si)	2015/07/02					<0.050	mg/L		

N/A = Not Applicable

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spiked amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than 2x that of the native sample concentration).

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (one or both samples < 5x RDL).

(1) Blank Spike outside acceptance criteria (10% of analytes failure allowed).

Reference Method suffix “m” indicates test methods incorporate validated modifications from specific reference methods to improve performance.
* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.
(1) DOC present in the sample should be considered as non-purgeable DOC.
(2) The BC-MOE and APHA Standard Method require pH to be analysed within 15 minutes of sampling and therefore field analysis is required for compliance. All Laboratory pH analyses in this report are reported past the BC-MOE/APHA Standard Method holding time.

(1) Weak Acid Dissociable CN > Strong Acid Dissociable CN. Results are within limits of uncertainty(MU).
(2) Sample analysed past recommended hold time.
(3) Sample preserved to extend hold time.

GENERAL COMMENTS

Each temperature is the average of up to three cooler temperatures taken at receipt

Package 1	7.3°C
Package 2	9.7°C
Package 3	9.3°C

In order to provide the lowest possible reporting limits, the analytical techniques for cyanide have been pushed to their absolute limit. At low levels, it is sometimes observed that WAD cyanide values are > SAD values. In general, the difference is due to the statistical variability of the analysis.

There is an analytical uncertainty (Mu) associated with every measurement. The uncertainty is expressed as a 95% confidence interval. (If a measurement is repeated 20 times, 19 of the results would fall within the interval). At levels near the detection limit, the uncertainty for SAD cyanide is ± 0.0008 mg/L and 0.0007 mg/L for WAD cyanide. The combined uncertainty for the 2 measurements is ± 0.001 mg/L. For clarity, if a sample containing 0.001 mg/L WAD cyanide was analyzed 20 times, 19 of the results would be normally distributed between 0.0017 and 0.0003 mg/L.

If the true SAD and WAD values are the same, there is a 50% probability the measured WAD value will be greater than the SAD value and statistically, by chance alone, by as much as 0.001 mg/L. Thus, in this data set, in cases where WAD > SAD, the difference is not statistically significant.

Sample MU0677-01 : Effective October 1, 2013, the BC MOE SAMPLE PRESERVATION & HOLDING TIME REQUIREMENTS states that Mercury in water requires a glass or PTFE container with Hydrochloric Acid (HCl) preservation. Sample container and preservation received was not in compliance. Maxxam added HCl to stabilize Mercury in this sample prior to analysis. Ion Balance: NC = Not Calculable due to low ion sum [< 0.4 meq/L].

Sample MU0693-01 : Ion Balance: NC = Not Calculable due to low ion sum [< 0.4 meq/L].

Sample MU0670, Elements by ICPMS Low Level (dissolved): Test repeated.

Results relate only to the items tested.

N/A = Not Applicable

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spiked amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than 2x that of the native sample concentration).

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (one or both samples < 5x RDL).

(1) pH result is less than the lowest calibration standard of pH 4.00

Reference Method suffix “m” indicates test methods incorporate validated modifications from specific reference methods to improve performance.
* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.
(1) This test was performed by Maxxam Edmonton Environmental
(2) DOC present in the sample should be considered as non-purgeable DOC.
(3) The BC-MOE and APHA Standard Method require pH to be analysed within 15 minutes of sampling and therefore field analysis is required for compliance. All Laboratory pH analyses in this report are reported past the BC-MOE/APHA Standard Method holding time.

GENERAL COMMENTS

Each temperature is the average of up to three cooler temperatures taken at receipt

Package 1	6.0°C
Package 2	5.3°C
Package 3	5.7°C

Sample MZ0031-01 : Sample analyzed for digested low level metals due to sediment in sample. This results in an increased reportable detection limit for Al B Ba Bi Cr Co Cu Fe Mn Ni P Pb Sb Si Ti U V and Zn.

Sample MZ0032-01 : Sample analyzed for digested low level metals due to sediment in sample. This results in an increased reportable detection limit for Al B Ba Bi Cr Co Cu Fe Mn Ni P Pb Sb Si Ti U V and Zn.

Sample MZ0033-01 : Sample analyzed for digested low level metals due to sediment in sample. This results in an increased reportable detection limit for Al B Ba Bi Cr Co Cu Fe Mn Ni P Pb Sb Si Ti U V and Zn.

Sample MZ0034-01 : Sample analyzed for digested low level metals due to sediment in sample. This results in an increased reportable detection limit for Al B Ba Bi Cr Co Cu Fe Mn Ni P Pb Sb Si Ti U V and Zn.

Sample MZ0038-01 : Sample analyzed for digested low level metals due to sediment in sample. This results in an increased reportable detection limit for Al B Ba Bi Cr Co Cu Fe Mn Ni P Pb Sb Si Ti U V and Zn.

Sample MZ0039-01 : Sample analyzed for digested low level metals due to sediment in sample. This results in an increased reportable detection limit for Al B Ba Bi Cr Co Cu Fe Mn Ni P Pb Sb Si Ti U V and Zn.

Sample MZ0055-01 : Sample analyzed for digested low level metals due to sediment in sample. This results in an increased reportable detection limit for Al B Ba Bi Cr Co Cu Fe Mn Ni P Pb Sb Si Ti U V and Zn.

Sample MZ0032, Elements by ICPMS Low Level (dissolved): Test repeated.
Sample MZ0036, Elements by ICPMS Low Level (dissolved): Test repeated.

Results relate only to the items tested.

N/A = Not Applicable

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spiked amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than 2x that of the native sample concentration).

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (one or both samples < 5x RDL).

Phosphorus-P (LL Tot, dissolved) - UF/UP	14	2015/09/15	2015/09/15	BBY6SOP-00013	SM 22 4500-P E m
Total Phosphorus - unpreserved	14	N/A	2015/09/15	BBY6SOP-00013	SM 22 4500-P E m
Total Suspended Solids-Low Level	14	2015/09/15	2015/09/16	BBY6SOP-00034	SM 22 2540 D

Reference Method suffix “m” indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) This test was performed by Maxxam Calgary Environmental
(2) DOC present in the sample should be considered as non-purgeable DOC.
(3) The BC-MOE and APHA Standard Method require pH to be analysed within 15 minutes of sampling and therefore field analysis is required for compliance. All Laboratory pH analyses in this report are reported past the BC-MOE/APHA Standard Method holding time.

N/A = Not Applicable

(1) Sample analysed past hold time: sample was received on the hold time expiry date which did not allow sufficient time for preparation and analysis.

(2) Sample arrived to laboratory past recommended hold time.

(3) Sample analysed past recommended hold time.

RDL = Reportable Detection Limit

N/A = Not Applicable

(1) Ion balance out of optimal range due to high measurement uncertainty at this level (Ion Sum < 0.4 meq/L for both cations and anions).

(2) Sample arrived to laboratory past recommended hold time.

(3) Sample analysed past hold time: sample was received on the hold time expiry date which did not allow sufficient time for preparation and analysis.

GENERAL COMMENTS

Each temperature is the average of up to three cooler temperatures taken at receipt

Package 1	2.3°C
Package 2	5.0°C
Package 3	4.3°C

Sample NC8380, Elements by ICPMS Low Level (dissolved): Test repeated.
Sample NC8381, Elements by ICPMS Low Level (dissolved): Test repeated.
Sample NC8382, Elements by ICPMS Low Level (dissolved): Test repeated.
Sample NC8414, Elements by ICPMS Low Level (dissolved): Test repeated.

Results relate only to the items tested.

N/A = Not Applicable

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spiked amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than 2x that of the native sample concentration).

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (one or both samples < 5x RDL).

(1) Recovery or RPD for this parameter is outside control limits. The overall quality control for this analysis meets acceptability criteria.

			Spiked Blank		Method Blank	
QC Batch	**Parameter**	**Date**	**% Recovery**	**QC Limits**	**Value**	**UNITS**
8038919	Chlorophyll a	2015/09/17	108	80 - 120	<0.50	ug/L

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

Version: 1 - Final

CERTIFICATE OF ANALYSIS

MAXXAM JOB #: B591947
Received: 2015/10/17, 08:40

Sample Matrix: Water
Samples Received: 18

Analyses	Quantity	Date Extracted	Date Analyzed	Laboratory Method	Analytical Method
Nitrate+Nitrite (N) (low level)	18	N/A	2015/10/17	BBY6SOP-00010	SM 22 4500-NO3- I m
Nitrite (N) (low level)	18	N/A	2015/10/17	BBY6SOP-00010	SM 22 4500-NO3- I m
Nitrogen - Nitrate (as N)	18	N/A	2015/10/17	BBY6SOP-00010	SM 22 4500-NO3- I m
Filter and HNO3 Preserve for Metals	17	N/A	2015/10/19	BBY7 WI-00004	BCMOE Reqs 08/14
pH Water (2)	10	N/A	2015/10/20	BBY6SOP-00026	SM 22 4500-H+ B m
pH Water (2)	8	N/A	2015/10/21	BBY6SOP-00026	SM 22 4500-H+ B m
Sulphate by Automated Colourimetry	17	N/A	2015/10/19	BBY6SOP-00017	SM 22 4500-SO42- E m
Sulphate by Automated Colourimetry	1	N/A	2015/10/20	BBY6SOP-00017	SM 22 4500-SO42- E m
Phosphorus-P (LL Tot, dissolved) - FF/FP	12	2015/10/19	2015/10/20	BBY6SOP-00013	SM 22 4500-P E m
Phosphorus-P (LL Tot, dissolved) - UF/UP	1	2015/10/19	2015/10/20	BBY6SOP-00013	SM 22 4500-P E m
Total Phosphorus - unpreserved	13	N/A	2015/10/20	BBY6SOP-00013	SM 22 4500-P E m
Total Suspended Solids-Low Level	8	2015/10/20	2015/10/21	BBY6SOP-00034	SM 22 2540 D
Total Suspended Solids-Low Level	5	2015/10/21	2015/10/21	BBY6SOP-00034	SM 22 2540 D

Reference Method suffix “m” indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) DOC present in the sample should be considered as non-purgeable DOC.
(2) The BC-MOE and APHA Standard Method require pH to be analysed within 15 minutes of sampling and therefore field analysis is required for compliance. All Laboratory pH analyses in this report are reported past the BC-MOE/APHA Standard Method holding time.

Encryption Key

Please direct all questions regarding this Certificate of Analysis to your Project Manager.

GENERAL COMMENTS

Each temperature is the average of up to three cooler temperatures taken at receipt

Package 1	2.7°C
Package 2	3.3°C
Package 3	3.3°C
Package 4	4.0°C

Sample NK2712-01 : Sample analyzed for digested low level metals due to sediment in sample. This results in an increased reportable detection limit for Al B Ba Bi Cr Co Cu Fe Mn Ni P Pb Sb Si Ti U V and Zn.

Sample NK2724-01 : Sample analyzed for digested low level metals due to sediment in sample. This results in an increased reportable detection limit for Al B Ba Bi Cr Co Cu Fe Mn Ni P Pb Sb Si Ti U V and Zn.

Sample NK2725-01 : Sample analyzed for digested low level metals due to sediment in sample. This results in an increased reportable detection limit for Al B Ba Bi Cr Co Cu Fe Mn Ni P Pb Sb Si Ti U V and Zn.

Sample NK2726-01 : Ion Balance: NC = Not Calculable due to low ion sum [< 0.4 meq/L].

Results relate only to the items tested.

N/A = Not Applicable

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spiked amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than 2x that of the native sample concentration).

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (one or both samples < 5x RDL).

(1) Recovery or RPD for this parameter is outside control limits. The overall quality control for this analysis meets acceptability criteria.

CERTIFICATE OF ANALYSIS

MAXXAM JOB #: B5A0442
Received: 2015/11/10, 09:20

(1) DOC present in the sample should be considered as non-purgeable DOC.
(2) The BC-MOE and APHA Standard Method require pH to be analysed within 15 minutes of sampling and therefore field analysis is required for compliance. All Laboratory pH analyses in this report are reported past the BC-MOE/APHA Standard Method holding time.

Encryption Key

N/A = Not Applicable

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spiked amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than 2x that of the native sample concentration).

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (one or both samples < 5x RDL).

Total Suspended Solids-Low Level	12	2015/11/24	2015/11/25	BBY6SOP-00034	SM 22 2540 D

Reference Method suffix “m” indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) DOC present in the sample should be considered as non-purgeable DOC.
(2) The BC-MOE and APHA Standard Method require pH to be analysed within 15 minutes of sampling and therefore field analysis is required for compliance. All Laboratory pH analyses in this report are reported past the BC-MOE/APHA Standard Method holding time.

GENERAL COMMENTS

Each temperature is the average of up to three cooler temperatures taken at receipt

Package 1	3.7°C

Sample NR8578, Elements by ICPMS Low Level (dissolved): Test repeated.
Sample NR8578, Na, K, Ca, Mg, S by CRC ICPMS (diss.): Test repeated.
Sample NR8643, Elements by ICPMS Low Level (dissolved): Test repeated.

Results relate only to the items tested.

N/A = Not Applicable

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spiked amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than 2x that of the native sample concentration).

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (one or both samples < 5x RDL).

CERTIFICATE OF ANALYSIS

MAXXAM JOB #: B5A8198
Received: 2015/12/04, 13:40

Sample Matrix: Water
Samples Received: 14

Analyses	Quantity	Date Extracted	Date Analyzed	Laboratory Method	Analytical Method
Total Suspended Solids-Low Level	5	2015/12/07	2015/12/08	BBY6SOP-00034	SM 22 2540 D
Total Suspended Solids-Low Level	9	2015/12/08	2015/12/08	BBY6SOP-00034	SM 22 2540 D

Reference Method suffix “m” indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) DOC present in the sample should be considered as non-purgeable DOC.

(2) The BC-MOE and APHA Standard Method require pH to be analysed within 15 minutes of sampling and therefore field analysis is required for compliance. All Laboratory pH analyses in this report are reported past the BC-MOE/APHA Standard Method holding time.

N/A = Not Applicable

(1) Ion balance out of optimal range due to high measurement uncertainty at this level (Ion Sum < 0.4 meq/L for both cations and anions).

(2) Sample analysed past hold time: sample was received on the hold time expiry date which did not allow sufficient time for preparation and analysis.

(3) Sample preserved to extend hold time.

GENERAL COMMENTS

Each temperature is the average of up to three cooler temperatures taken at receipt

Package 1	1.3°C
Package 2	3.0°C
Package 3	1.7°C
Package 4	2.0°C

Sample NU0021, Elements by ICPMS Low Level (dissolved): Test repeated.
Sample NU0024, Elements by ICPMS Low Level (dissolved): Test repeated.
Sample NU0025, Elements by ICPMS Low Level (dissolved): Test repeated.
Sample NU0032, Elements by ICPMS Low Level (dissolved): Test repeated.

Results relate only to the items tested.

N/A = Not Applicable

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spiked amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than 2x that of the native sample concentration).

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (one or both samples < 5x RDL).

Report #: R2193597
Version: 3 - Revision

CERTIFICATE OF ANALYSIS – REVISED REPORT

MAXXAM JOB #: B605186
Received: 2016/01/22, 12:50

Sample Matrix: Water
Samples Received: 13

Analyses	Quantity	Date Extracted	Date Analyzed	Laboratory Method	Analytical Method
Total Suspended Solids-Low Level	13	2016/01/25	2016/01/26	BBY6SOP-00034	SM 22 2540 D

Reference Method suffix “m” indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) DOC present in the sample should be considered as non-purgeable DOC.
(2) The BC-MOE and APHA Standard Method require pH to be analysed within 15 minutes of sampling and therefore field analysis is required for compliance. All Laboratory pH analyses in this report are reported past the BC-MOE/APHA Standard Method holding time.

Encryption Key

Please direct all questions regarding this Certificate of Analysis to your Project Manager.
Name, Phone and Fax Redacted

==========

Maxxam has procedures in place to guard against improper use of the electronic signature and have the required "signatories", as per section 5.10.2 of ISO/IEC 17025:2005(E), signing the reports. For Service Group specific validation please refer to the Validation Signature Page.

GENERAL COMMENTS

Each temperature is the average of up to three cooler temperatures taken at receipt

Package 1	4.7°C
Package 2	4.0°C
Package 3	5.7°C

Revised report V2 (2016/05/19): Due to client request, samples were reanalyzed for Total Barium. Corrected values for sample NZ7226 are included in this report (MM4).

Revised report V3 (2016/06/08): Corrected values for NZ7226 are included in this report for Total Strontium and Uranium, after review of all metals data greater than 3 times the RDL.

Sample NZ7218, Elements by ICPMS Low Level (dissolved): Test repeated.
Sample NZ7224, Elements by ICPMS Low Level (dissolved): Test repeated.
Sample NZ7226, Elements by ICPMS Low Level (dissolved): Test repeated.
Sample NZ7226, Elements by ICPMS Low Level (total): Test repeated.

Results relate only to the items tested.

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spiked amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than 2x that of the native sample concentration).

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (one or both samples < 5x RDL).

(1) Recovery or RPD for this parameter is outside control limits. The overall quality control for this analysis meets acceptability criteria.

CERTIFICATE OF ANALYSIS – REVISED REPORT

MAXXAM JOB #: B610526
Received: 2016/02/10, 16:00

Sample Matrix: Water
Samples Received: 13

Analyses	Quantity	Date Extracted	Date Analyzed	Laboratory Method	Analytical Method
Total Phosphorus - unpreserved	13	N/A	2016/02/13	BBY6SOP-00013	SM 22 4500-P E m
Total Suspended Solids-Low Level	4	2016/02/12	2016/02/12	BBY6SOP-00034	SM 22 2540 D
Total Suspended Solids-Low Level	9	2016/02/12	2016/02/13	BBY6SOP-00034	SM 22 2540 D

Reference Method suffix “m” indicates test methods incorporate validated modifications from specific reference methods to improve performance.

* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

(1) DOC present in the sample should be considered as non-purgeable DOC.
(2) The BC-MOE and APHA Standard Method require pH to be analysed within 15 minutes of sampling and therefore field analysis is required for compliance. All Laboratory pH analyses in this report are reported past the BC-MOE/APHA Standard Method holding time.

GENERAL COMMENTS

Each temperature is the average of up to three cooler temperatures taken at receipt

Package 1	6.3°C
Package 2	5.7°C

Revised report V2 (2016/05/19): Due to client request, samples were reanalyzed for Total Barium. Corrected values for sample OC5504 are included in this report (MM4).

Revised report V3 (2016/05/30): Report issued with no changes to metals analysis, in error (MM4).

Revised report V (2016/06/08): Corrected values for OC5504 are included in this report for Total Iron, Strontium and Uranium, after review of all metals data greater than 3 times the RDL (MM4).

Sample OC5504-01 : Ion Balance: NC = Not Calculable due to low ion sum [< 0.4 meq/L].

Sample OC5510-01 : Ion Balance: NC = Not Calculable due to low ion sum [< 0.4 meq/L].
Sample OC5496, Elements by ICPMS Low Level (dissolved): Test repeated.
Sample OC5508, Elements by ICPMS Low Level (dissolved): Test repeated.
Sample OC5504, Elements by ICPMS Low Level (total): Test repeated.

Results relate only to the items tested.

N/A = Not Applicable

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spiked amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than 2x that of the native sample concentration).

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (one or both samples < 5x RDL).

(1) Recovery or RPD for this parameter is outside control limits. The overall quality control for this analysis meets acceptability criteria.
