

Minto Mine

Water Licence QZ14-031

Quartz Mining Licence QML-0001

2017 Annual Report

Prepared by:
Minto Explorations Ltd.
Minto Mine

March 2018

Table of Contents

| | | |
|----------|---|-----------|
| 1 | Introduction | 1 |
| 2 | Site Activities | 8 |
| 2.1 | Exploration | 8 |
| 2.2 | Maintenance, Infrastructure and Construction Projects | 8 |
| 2.2.1 | Tailings Diversion Ditch Portal Road Re-Alignment | 9 |
| 2.3 | Mining Activities | 9 |
| 2.3.1 | Open Pit Mining | 9 |
| 2.3.2 | Underground Mining | 10 |
| 2.3.3 | Waste Rock Management | 10 |
| 2.3.4 | Tailings Management | 11 |
| 2.3.5 | Ore Stockpiles | 12 |
| 2.3.6 | Operating Results | 14 |
| 2.3.7 | Concentrate Shipments | 14 |
| 2.4 | Mine Access Road | 15 |
| 2.4.1 | Traffic | 15 |
| 2.4.2 | Access Control Issues | 15 |
| 2.4.3 | Planned Access Road Maintenance for 2018 | 15 |
| 2.5 | Accidents and Incidents | 15 |
| 2.5.1 | Incidents | 15 |
| 2.5.2 | Wildlife Incidents | 15 |
| 2.5.3 | Reportable Spills | 16 |
| 2.5.4 | Spill Contingency Plan Review | 16 |
| 3 | Proposed Mining for 2018 | 17 |
| 3.1 | Proposed Open Pit Mining for 2018 | 17 |
| 3.2 | Proposed Underground Mining for 2018 | 17 |
| 4 | Mineral Resources and Reserves | 18 |
| 5 | Surface Water Quality Monitoring | 21 |
| 5.1 | Surface Water Quality Program | 21 |
| 5.1.1 | Water Quality Monitoring Conformance | 23 |
| 5.1.2 | Quality Assurance and Quality Control Program | 25 |
| 5.2 | Compliance | 27 |
| 5.2.1 | Discharge Compliance – WQ Effluent Standards | 27 |
| 5.2.2 | Discharge Compliance – Bioassays | 31 |
| 5.2.3 | Water Quality Objectives Compliance – Minto Creek | 31 |

| | | |
|--------|---|----|
| 5.3 | Surface Water Quality Surveillance Stations..... | 35 |
| 5.3.1 | W2 – Minto Creek at Lower Road Crossing Water Quality | 35 |
| 5.3.2 | W3 – Minto Creek, at the Federal (MMER) Compliance Point | 35 |
| 5.3.3 | W4 – Yukon River, Upstream of the confluence with Minto Creek | 37 |
| 5.3.4 | W5 – Yukon River, Downstream of the Confluence with Minto Creek..... | 38 |
| 5.3.5 | W6 – Tributary on the North side of Minto Creek | 39 |
| 5.3.6 | W7 – North Flowing Tributary to Minto Creek..... | 40 |
| 5.3.7 | W8 – Western Collection Sump from DSTSF..... | 41 |
| 5.3.8 | W8A – Eastern Collection Sump from DSTSF | 42 |
| 5.3.9 | W10 – Minto Creek Headwaters (South-West Fork)..... | 43 |
| 5.3.10 | W12 – Water in the Main Pit..... | 44 |
| 5.3.11 | W12A – Discharge in the Main Pit..... | 44 |
| 5.3.12 | W14 – Tailings Thickener Overflow..... | 45 |
| 5.3.13 | W15 – Upper Minto Creek Stormwater Collection Point..... | 46 |
| 5.3.14 | W16 – Water Storage Pond..... | 48 |
| 5.3.15 | W17 – Water Storage Pond Dam Seepage..... | 50 |
| 5.3.16 | W30 – Headwaters Minto Creek (northwest fork)..... | 50 |
| 5.3.17 | W33 – Above Tailings Diversion Ditches | 51 |
| 5.3.18 | W35 – Storm Water Collection Point – South Diversion Ditch | 52 |
| 5.3.19 | W36 – Minto Creek Detention Structure Pond | 54 |
| 5.3.20 | W37 – 100 m downstream of MCDS (W37 Collection Sump) and upstream of Water Storage Pond | 54 |
| 5.3.21 | W45– Area 2 Pit..... | 54 |
| 5.3.22 | W46 – Minto Creek, Downstream of W7 and W6..... | 55 |
| 5.3.23 | W47 – Area 118 Pit Water..... | 56 |
| 5.3.24 | W50 – Minto Creek, 50m Downstream of the Toe of the Water Storage Pond Dam | 56 |
| 5.3.25 | W51 – Area 2 Stage 3 Pit..... | 56 |
| 5.3.26 | W52 – Ridgetop North Pit | 56 |
| 5.3.27 | W53 – Ridgetop South Pit | 57 |
| 5.3.28 | W54 – Main Pit Dam Seepage | 57 |
| 5.3.29 | W55 – Tailings Diversion Ditch..... | 57 |
| 5.3.30 | W62 – Mill Valley Fill Extension Phase 2 Collection Sump..... | 58 |
| 5.3.31 | MC-1 – Minto Creek Upstream of Canyon near Km 8 on Mine Access Road..... | 59 |
| 5.3.32 | WTP and RO – Treated Water | 60 |
| 5.3.33 | C4 – Tributary on the south side of Minto Creek..... | 60 |
| 5.3.34 | C10 – Tributary on the south side of Minto Creek..... | 61 |

| | | |
|----------|--|-----------|
| 5.3.35 | MN – Minto North Pit Water..... | 62 |
| 5.3.36 | MN-0.2 – Upper West Arm of McGinty Creek..... | 63 |
| 5.3.37 | MN-0.5 – West Arm of McGinty Creek..... | 64 |
| 5.3.38 | MN-1.5 – Upper East Arm of McGinty Creek | 65 |
| 5.3.39 | MN-2.5 – East Arm of McGinty Creek | 66 |
| 5.3.40 | MN-4.5 – McGinty Creek near confluence with Yukon River..... | 67 |
| 5.3.41 | UG1 – Minto South Underground Mine Dewatering | 68 |
| 5.3.42 | UG2 – Wildfire Underground Mine Dewatering | 68 |
| 5.3.43 | UG3 – Copper Keel Underground Mine Dewatering..... | 68 |
| 5.3.44 | UG4 – Minto East Underground Mine Dewatering..... | 68 |
| 6 | Groundwater Monitoring Program | 69 |
| 6.1 | Groundwater Quality Monitoring Conformance..... | 69 |
| 6.2 | Groundwater Quality Control and Assurance | 72 |
| 6.3 | Groundwater Monitoring Stations | 72 |
| 6.3.1 | MW09-01..... | 74 |
| 6.3.2 | MW09-03..... | 74 |
| 6.3.3 | MW11-02..... | 76 |
| 6.3.4 | MW11-03..... | 76 |
| 6.3.5 | MW11-04A | 76 |
| 6.3.6 | MW12-DP1 | 76 |
| 6.3.7 | MW12-DP2 | 76 |
| 6.3.8 | MW12-DP3 | 77 |
| 6.3.9 | MW12-05..... | 77 |
| 6.3.10 | MW12-06..... | 84 |
| 6.3.11 | MW12-07..... | 90 |
| 6.3.12 | MW17-08..... | 91 |
| 6.3.13 | MW17-09..... | 95 |
| 6.3.14 | MW17-10..... | 96 |
| 6.3.15 | MW17-11..... | 97 |
| 6.3.16 | MW17-12..... | 100 |
| 6.4 | Vibrating Wire Piezometers | 104 |
| 6.4.1 | DSTSF Piezometers | 105 |
| 6.4.2 | Southwest Dump Piezometers | 108 |
| 6.4.3 | Water Storage Pond Dam Piezometers..... | 109 |
| 6.5 | Ground Temperature Cables..... | 110 |
| 6.5.1 | DSTSF Thermistors..... | 112 |

| | | |
|-----------|---|------------|
| 6.5.2 | Ridgetop Thermistors | 116 |
| 6.5.3 | Southwest Dump Thermistors..... | 116 |
| 6.5.4 | Water Storage Pond Dam Thermistors | 118 |
| 7 | Seepage Water Quality Monitoring Program | 119 |
| 7.1 | Mill Valley Fill..... | 121 |
| 7.2 | Southwest Dump | 126 |
| 7.3 | Minto Creek Detention Structure (MCDS) and Water Storage Pond | 141 |
| 7.4 | Water Storage Pond Dam Seep | 145 |
| 7.5 | Dry Stack Tailings Storage Facility (DSTSF) | 151 |
| 7.6 | Ore Stockpiles..... | 155 |
| 7.7 | Reclamation Overburden Dump (ROD) | 160 |
| 7.8 | Main Waste Dump..... | 160 |
| 7.9 | Mill Area | 164 |
| 7.10 | Pit Walls..... | 168 |
| 8 | Water Management | 169 |
| 8.1 | Water Storage and Conveyance Network | 169 |
| 8.2 | Water Storage Volumes Movement and Tracking | 171 |
| 8.2.1 | Water Conveyance Tracking..... | 172 |
| 8.2.2 | Water Storage Tracking..... | 173 |
| 8.2.3 | Water Conveyance Construction..... | 175 |
| 8.2.4 | Water Balance and Water Quality Predictions Modeling | 175 |
| 8.3 | Water treatment | 176 |
| 8.3.1 | Operations Overview..... | 176 |
| 8.4 | Water Discharge | 177 |
| 8.4.1 | Discharge Volumes | 177 |
| 8.4.2 | Compliance | 177 |
| 8.5 | Hydrology | 181 |
| 8.5.1 | Minto Creek Hydrology | 181 |
| 8.5.2 | McGinty Creek Hydrology | 181 |
| 8.5.3 | Hydrology QA/QC | 182 |
| 9 | Physical Monitoring Program..... | 183 |
| 9.1 | Physical Deformation Monitoring Instrumentation | 185 |
| 9.1.1 | Survey Hubs | 185 |
| 9.1.2 | Inclinometers..... | 189 |
| 9.2 | Engineer’s Annual Physical Inspection Reports..... | 196 |
| 10 | Adaptive Management Plan - Operations..... | 198 |

| | |
|--|------------|
| 10.1 Surface Water Quality – Minto Creek | 198 |
| 10.1.1 Minto Creek – W2..... | 198 |
| 10.1.2 Minto Creek – W50 | 200 |
| 10.2 Surface Water Quality – McGinty Creek | 200 |
| 10.3 Groundwater Quality – Minto Creek..... | 201 |
| 10.4 Groundwater Quality - McGinty Creek..... | 201 |
| 10.5 Water Management AMP | 201 |
| 10.6 Physical Monitoring Program AMP | 201 |
| 11 Aquatic Environmental Monitoring Program | 208 |
| 11.1 Metal Mine Effluent Regulations Monitoring Programs | 208 |
| 11.1.1 Effluent Monitoring Program | 208 |
| 11.1.2 Environmental Effects Monitoring Water Quality Monitoring | 208 |
| 11.1.3 Environmental Effects Monitoring Biological Monitoring..... | 209 |
| 11.2 Biological Monitoring Program | 209 |
| 11.2.1 Sediment Monitoring Program..... | 209 |
| 11.2.2 Periphyton Monitoring..... | 213 |
| 11.2.3 Benthic Invertebrate Community Monitoring..... | 215 |
| 11.2.4 Fisheries Monitoring Program..... | 218 |
| 11.3 Copper Toxicity Study..... | 218 |
| 11.4 Aquatic Environmental Monitoring Program (AEMP) Review | 219 |
| 12 Meteorological Monitoring Program..... | 220 |
| 12.1 Climate Monitoring Program..... | 220 |
| 12.2 Snow Survey Program | 225 |
| 12.3 Meteorology QA/QC..... | 225 |
| 13 Geochemistry..... | 226 |
| 13.1 Waste Rock Verification Program | 226 |
| 13.2 Acid-Base Accounting Program | 228 |
| 13.3 Leach Pads..... | 228 |
| 14 Terrestrial Monitoring Programs..... | 229 |
| 14.1 Wildlife Monitoring Program | 229 |
| 14.2 Erosion and Sedimentation Monitoring Program | 230 |
| 14.3 Invasive Plant Species Monitoring Program..... | 231 |
| 14.4 Vegetation Metal Uptake Plan | 233 |
| 15 Site Characterization Report | 234 |
| 16 Reclamation..... | 234 |
| 16.1 Recontouring and Overburden Placement..... | 234 |
| 16.1 2017 Reclamation Research | 242 |

| | |
|---|------------|
| 16.1.1 Passive Water Treatment | 242 |
| 16.2 Proposed Reclamation for 2018..... | 246 |
| 17 Socio-Economic Monitoring Program | 247 |
| 18 Closure | 247 |
| 19 References | 248 |

| m ³ | Cubic meter |
| mg/m ² | Milligrams per square meter |
| Mlb | Million pounds |
| Mt | Million tonnes |
| oz | ounce |
| V | Volt |

1 Introduction

This Annual Report has been prepared by Minto Explorations Ltd. (Minto) for the 2017 calendar year, as required by Type A Water Use Licence (WUL) QZ14-031-01 and Quartz Mining Licence (QML) QML-0001. Specific requirements for the Annual Report, as outlined in the respective licences, are summarized in Table 1-1.

This report provides a summary of activities at Minto Mine for the reporting year, including production summaries, construction activities, environmental monitoring studies, physical stability monitoring, water management, and progressive reclamation.

An aerial photo taken in August 2017, with updated site infrastructure labeled, is presented in Figure 1-1. For comparison, the 2016 site layout is shown in Figure 1-2.

Table 1-1: Reporting Requirements as per WUL and QML (2017)

| Licence | Section | Clause | Requirement | Annual Report Section |
|-----------------|---------|--------|--|-----------------------|
| WUL QZ14-031 | | | | |
| WUL QZ14-031 | 16 | | Summary of the review of the <i>Spill Contingency Plan</i> including any changes needed. | 2.5.4 App. B |
| WUL QZ14-031 | 18 | | Summary list of all spills for 2016 7 . | 2.5.3 |
| WUL QZ14-031 | 25 | | The Licensee shall submit Annual Reports to the Board no later than March 31 of the year following the reporting period. The reporting period is January 1 to December 31 of each year. | All |
| WUL QZ14-031 | 26 | a | Summary of all data collected as per the EMSRP, including analysis and interpretation by a qualified party and a discussion of any variances from baseline conditions, from previous years' data, and from expected performance. | 5-8, 11-14 |
| | | b | Summary of actions as per the Operations Adaptive Management Plan, including analysis and interpretation by a qualified party and a discussion of any variances from baseline conditions, from previous years' data, and from expected performance. | 10 App H |
| | | c | A record of any major maintenance carried out on any physical works. | 2.2 |
| | | d | Detailed data on the volume of water used during the year including water withdrawal from each water source, water routed around and through the site as part of the water conveyance system, water diverted around the site, water routed for storage in the pits, water deposited with mine wastes in waste storage facilities, water routed to the Water Storage Pond, water routed to the treatment plant and water discharged to Minto Creek. | 8 |

| Licence | Section | Clause | Requirement | Annual Report Section |
|-----------------|---------|--------|--|-----------------------|
| WUL QZ14-031 | | e | Detailed data on tailings deposition in each of the tailings management facilities, including volume and tonnage of tailings slurry deposited, cumulative volume of tailings solids stored in the pits, tailings solids surface elevation and pit water elevation. | 2.3.4 |
| | | f | Details of updates to the Water Balance and Water Quality Model. | 8.2.4 App. E |
| | | g | Results and interpretations of the QA/QC Program. | 5.1.2 |
| | | h | Any other reports that are required to be submitted as part of the Annual Report by this Licence. | See Below |
| WUL QZ14-031 | 70 | | The Licensee shall monitor, sample, and report on the maintenance and performance of the Mill Water Pond, in accordance with the procedures that are detailed in the Physical Monitoring Program, and include in the Annual Report | 9 |
| WUL QZ14-031 | 86 | | The Licensee shall include data relating to the Surface Water Surveillance Program in the Monthly and Annual Reports. | 5.3 |
| WUL QZ14-031 | 89 | | The results of these studies and programs in clauses 87 and 88 shall be submitted to the Board as part of the Annual Report along with and any additional studies or revisions to studies required under the MMER. | 11 |
| WUL QZ14-031 | 93 | | The results of the seepage program shall be compared to the source terms used in the Water Balance and Water Quality Model Report and summarized in the Annual Report. | 7 App. E |
| WUL QZ14-031 | 95 | | The Licensee shall implement the updated Geochemical Monitoring Program, including the Waste Rock Verification Program, and the results from this program are to be included in the Annual Report. | 13 App. O |
| WUL QZ14-031 | 97 | h | Reporting of all data obtained using physical monitoring instrumentation as a part of the Physical Monitoring Program in Monthly and Annual Reports. | 9 |
| WUL QZ14-031 | 98 | | The Physical Monitoring Program shall be updated annually to reflect the installation of new instrumentation, replacement of damaged instrumentation, and changes in monitoring methods and procedures. The updated Physical Monitoring Program shall be provided as part of the Annual Report, along with a summary table outlining revisions to the plan from previous versions. | App. G |
| WUL QZ14-031 | 99 | b | The Licensee shall submit these Geotechnical Engineer's Inspection and Data Reviews as part of the Annual Report. | 9 |

| Licence | Section | Clause | Requirement | Annual Report Section |
|--|---------|--------|--|------------------------|
| WUL QZ14-031 | 100 | f | For each operating year, the following information shall be provided as part of the Annual Report for the Physical Monitoring Program: | 9.2 |
| | | | i. interpretation of physical monitoring data, and summary of the stability, integrity and status of all the inspected structures, works, and installations inspected by the Professional Engineer; | 9.2 |
| | | | ii. a list of each of the Professional Engineer's recommendations for remedial action; | Table 9-1 |
| | | | iii. an explanation of how and when each recommendation was addressed, including supporting documentation, and | Table 9-1 |
| iv. a list of outstanding recommendations (including previous inspection reports) and associated approach and timelines to address them. | | | | |
| WUL QZ14-031 | 102 | | The Licensee shall review and evaluate the Aquatic Environmental Monitoring Program design every three (3) years and submit the findings to the Board, along with any recommendations for further refinements, as part of the Annual Report, starting in 2016. | 11.4 |
| WUL QZ14-031 | 104 | | Results and interpretations of the QA/QC program shall be provided in the Annual Report. | 5.1.2 |
| WUL QZ14-031 | 108 | a | The Licensee shall submit an updated Water Balance and Water Quality Model as part of the Annual Report. The updated models shall include without limitation all model assumptions. | App. E |
| | | b | Updated site data collected as per the EMSRP including: | 6 |
| | | | i. water quality results and water levels from all groundwater monitoring wells; | 12 |
| | | | ii. the most current climatic, environmental and operational conditions and data; | 5.3 |
| | | | iii. surface water quality and quantity data; | 7 |
| | | | iv. seepage monitoring quality and quantity data, and | App. E |
| v. geochemical source terms from tailings and waste rock. | | | | |
| | | c | A comparison of the updated geochemistry for Phase V/VI tailings and waste rock with that of previously-produced tailings and waste rock, and a comparison of model source term chemistry with equivalent operation monitoring results. | 13 App. O App. E |
| | | | | |
| | | d | Updated predictions for operations and Permanent Closure water quality, including discussion of any variances identified and associated implications on site water management. | App. E |
| WUL QZ14-031 | 109 | | Specifications for the Annual Report to include but not be limited to: | 10 8.5 App. H |
| | | | i. activities undertaken in relation to the Adaptive Management Plan; | |
| | | | ii. trend analysis and water levels in Minto and McGinty creeks; | |
| | | | iii. proposed updates and revisions to the Adaptive Management Plan, and | |
| | | | iv. any other revisions necessary to comply with the conditions of this Licence. | Through out |
| WUL QZ14-031 | 114 | a | Annual reporting on reclamation research activities. | 16.3 |

| Licence | Section | Clause | Requirement | Annual Report Section |
|----------|---------------------------------|--------|---|-----------------------|
| QML-0001 | | | | |
| QML-0001 | 13.5 | | On or before March 31 of each year of the term of this License, the Licensee must submit an annual report, in writing, containing the information set out in Schedule D, covering the period of January 1 to December 31 of the prior year | This Report |
| QML-0001 | D (Site Activities) | a | Summary of construction activities associated with the Undertaking | 2.2 |
| | | b | Summary of mining activities | 2.3 |
| | | c | Map showing the status of all structures, works, and installations associated with the Undertaking | Fig 1-1 |
| | | d | total amount of ore and waste removed from the underground workings and open pits for the year and for the life of the Undertaking | 2.3 |
| | | e | Total amount and the average head grade of ore milled | 2.3.6 |
| | | f | Total amount of concentrate produced and removed from the Undertaking | 2.3.6 |
| | | g | Total amount of tailings deposited in each of the tailings facilities | 2.3.4 |
| | | h | Total amount of waste rock removed from the mine and the amount deposited into each deposit location | 2.3.3 |
| | | i | Total amount of waste rock stored in each waste rock storage facility; | 2.3.3 |
| | | j | Details respecting any action taken as a result of the recommendations made by the engineer in relation to the inspection referred to in 13.2 of QML -0001 | 9.2 |
| | | k | Summary of any updates to estimates of ore reserves and the life of the mine, including reserve category, tonnage and grade | 4 |
| | | l | Total amount and the average grade of each ore stockpiled | 2.3.5 |
| | | m | remaining reserve life of the mine | 4 |

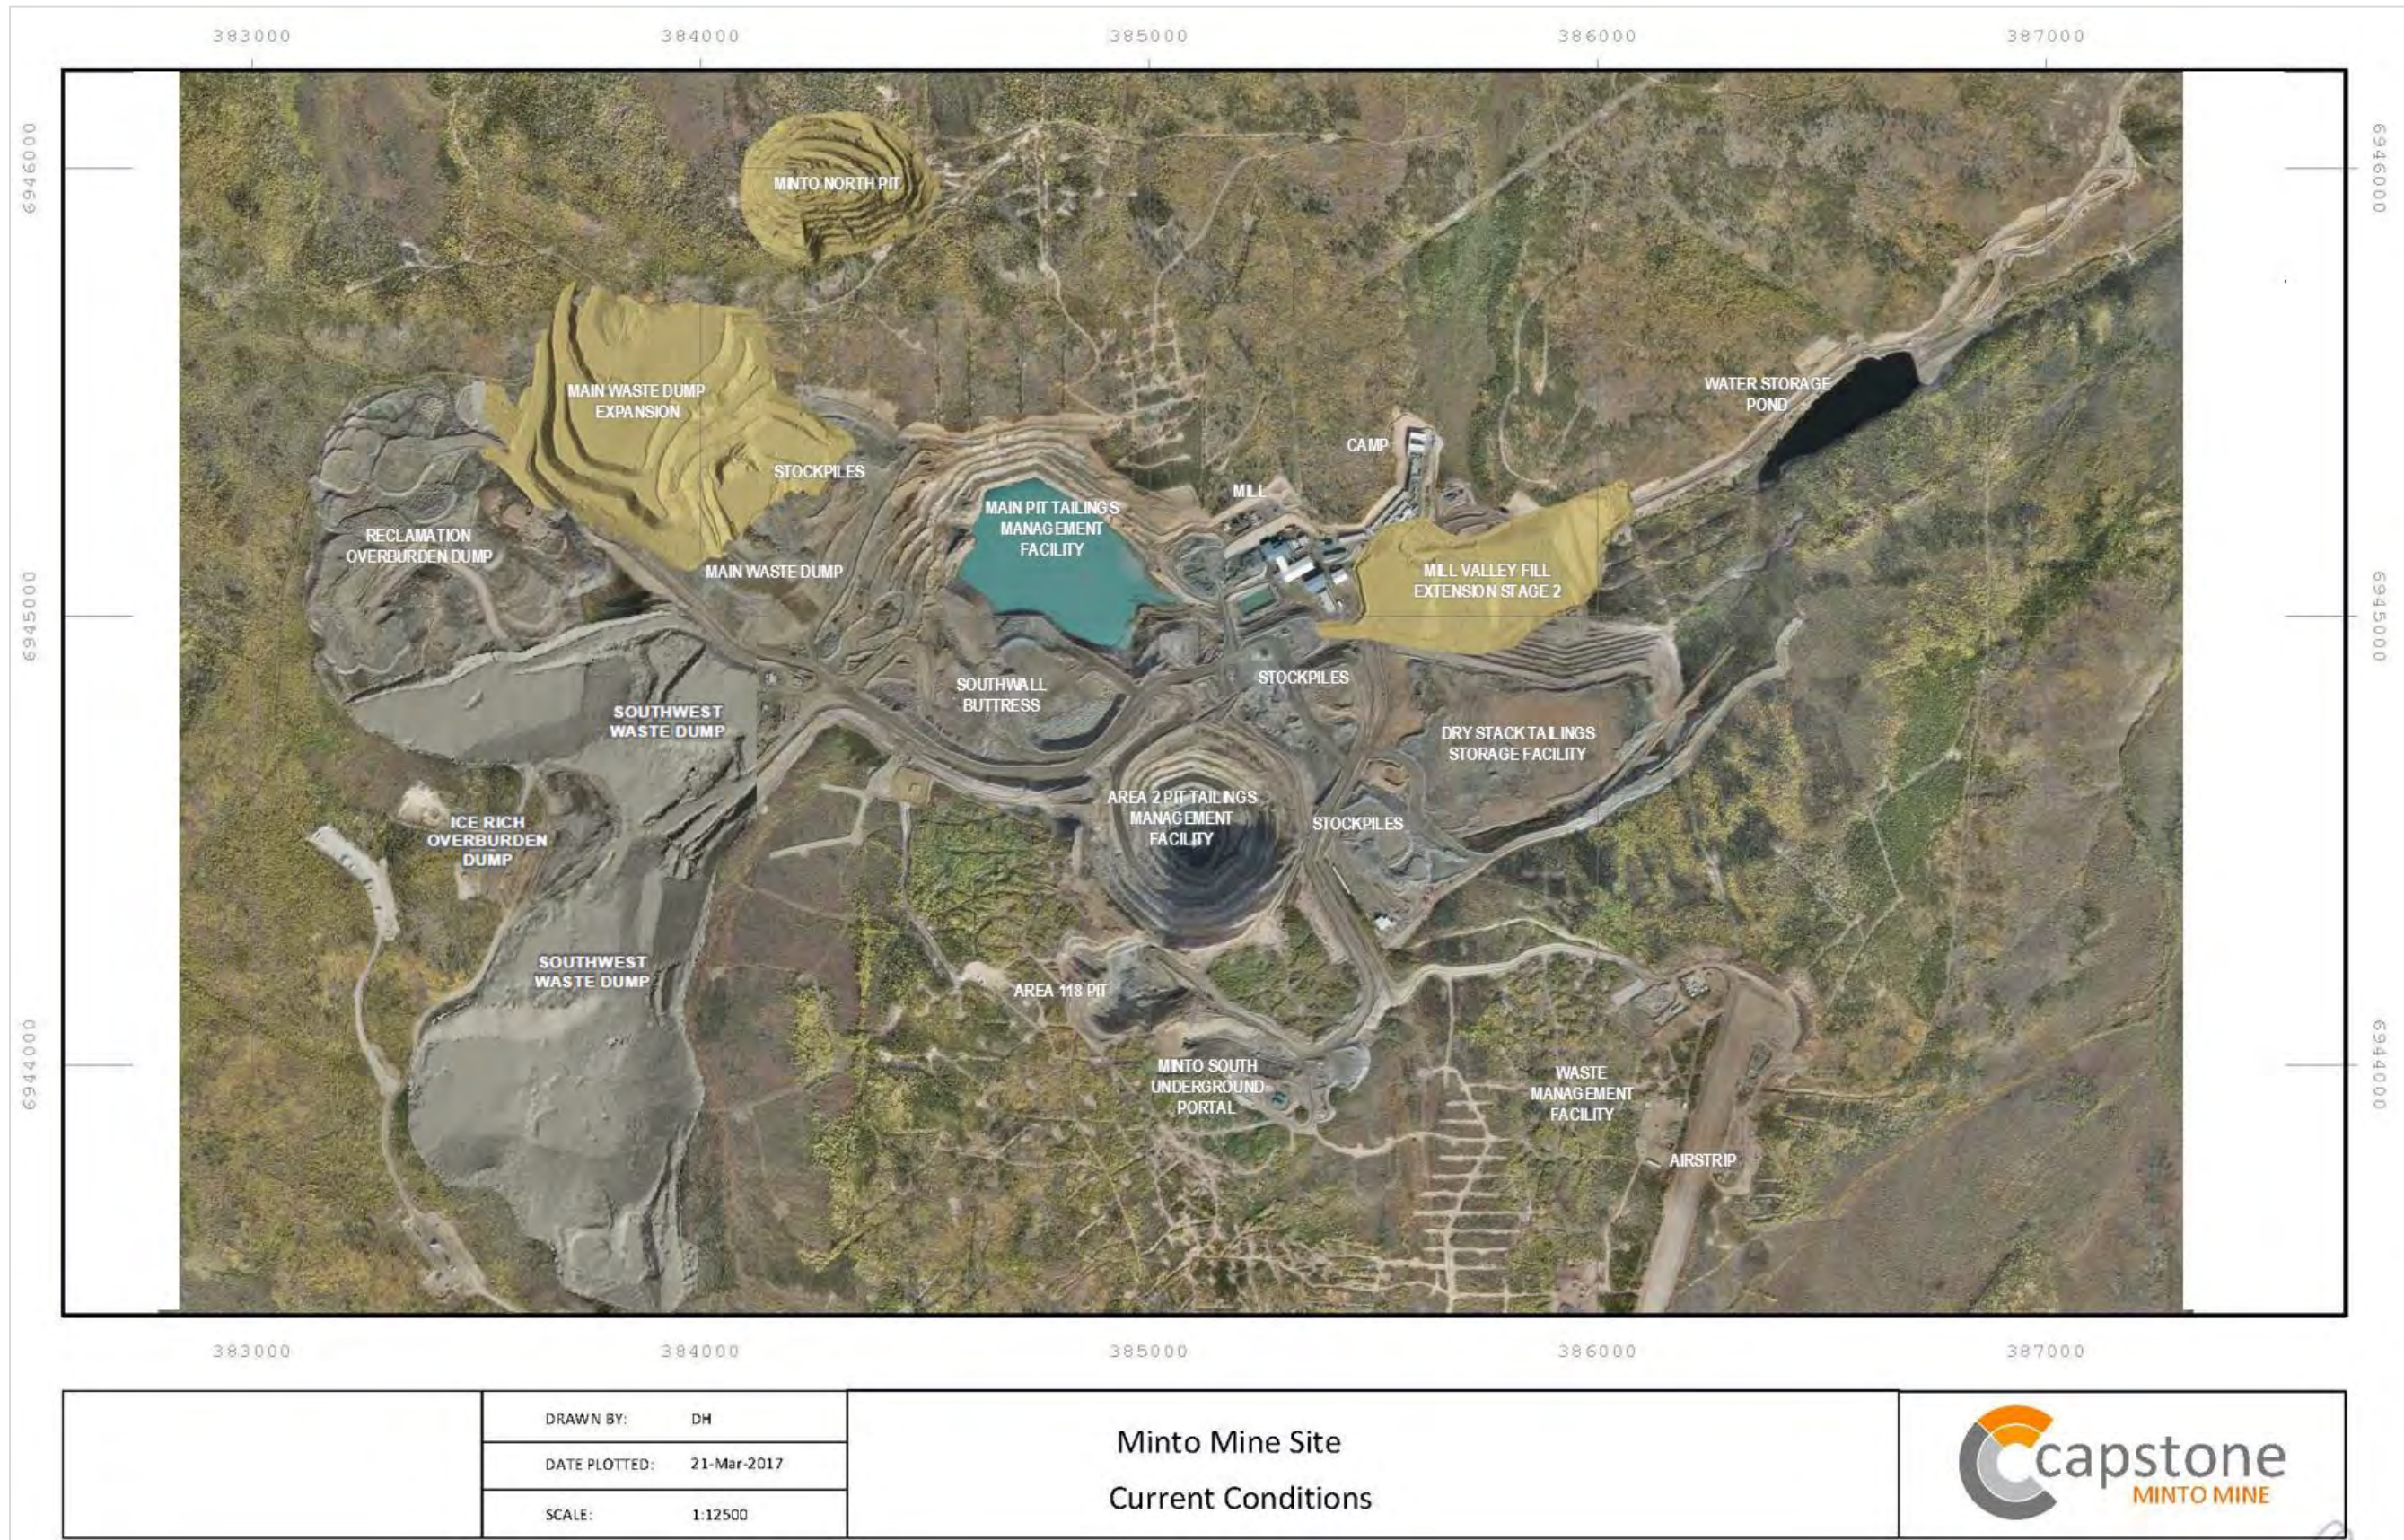

Figure 1-2: Site Layout (2016)

2 Site Activities

Operation of the Minto Mine continued in 2017, with the production of 36.0 million pounds (Mlb) of copper from the milling of 1.44 million tonnes (Mt) of ore.

Surface mining for the year totaled 3.80 million bank cubic meters (BCM). Surface mining took place in the Area 2 Stage 3 pit throughout the year.

Underground mining took place in the Area 2 and Minto East zones during 2017. Both zones are in the Minto South Underground.

Waste rock produced from mining activities was hauled to either the Main Pit Dump, Main Waste Dump Expansion, Main Pit Tailings Management Facility or Area 2 Tailings Management Facility as per the Waste Rock and Overburden Management Plan. Overburden produced from mining activities was hauled to the Area 118 Backfill Dump or closed facilities for progressive reclamation. Milling was a combination of run-of-mine ore from both surface and underground operations, as well as ore stockpiled from previous mining.

Tailings produced from the milling process were deposited into the Area 2 Pit Tailings Management Facility as per the licensed Tailings Management Plan.

2.1 Exploration

Although no exploration drilling occurred at Minto in 2017, a total of 5,468 meters were drilled in 46 holes targeting various ore lenses with the intent of upgrading resources to probable reserves and to provide geological confidence for the optimization of the mine design.

These totals include 410 meters of drilling in 5 underground targeting gaps in coverage on the fringe of the Area 2 lower ore lens. In addition, two surface holes, totaling 171m, were drilled at the eastern edge of the Area 2 Stage 3 pit primarily to confirm the depth of overburden. Both programs were conducted in February 2017.

Four holes, totaling 1,526m, were drilled in September 2017 targeting the Minto East ore lens. One of the holes was drilled to test ground conditions in advance of the planned Minto East ventilation raise, and 3 holes were drilled to test the ground conditions around the Minto East fault.

The final program was conducted in October-November and consisted of 35 holes, totaling 3,361m. This program targeted the Ridgetop deposit with the goal of improving drill coverage where any significant gaps existed.

2.2 Maintenance, Infrastructure and Construction Projects

There were no major maintenance activities conducted in 2017 on the physical works. One construction project was started in 2017, the Tailings Diversion Ditch (TDD) portal road re-alignment. The following is a summary of the project.

2.2.1 Tailings Diversion Ditch Portal Road Re-Alignment

As part of Phase V/VI development of the Area 2 Stage 3 Pit, a portion of the South Diversion Ditch was mined out. The water conveyance infrastructure was replaced by diverting routine flows to the Tailings Diversion Ditch (TDD) via an intake structure and pipeline. An overflow spillway into the Area 2 Stage 3 Pit was also required to divert event flows that exceed the pipeline capacity. The design details are discussed in a report prepared by SRK Consulting (SRK, 2017).

Construction of the Tailings Diversion Ditch Portal Road Re-Alignment began in July. The 4k cable and propane line were protected and buried. The area was grubbed of organic materials and construct grade waste material was utilized to establish the new portal haul road and airport access road. The water conveyance pipes were placed and covered. The intake channel was excavated, a geosynthetic clay liner was installed to limit seepage, with a non-woven geotextile placed overtop to provide a layer of protection. A layer of residuum provided an additional layer of protection and riprap was placed to provide protection against erosion. Water could be conveyed to the Tailings Diversion Ditch via the intake structure and pipeline prior to the freezing temperatures in October, however some additional work is required prior to freshet in 2018 before the project is considered complete.

2.3 Mining Activities

Section 2.3 discusses the mining activities for 2017 including open pit and underground mining, waste rock and tailings management, ore stockpiles, operating results, and concentrate shipments.

2.3.1 Open Pit Mining

In January 2017, mining of the Area 2 Stage 3 pit began with the removal and stockpiling of organic rich soil from within the pit footprint, followed by stripping of overburden and waste rock. The first ore release from the pit occurred in February. In July, the Area 2 Stage 3 pit design was revised based on current economic conditions, increasing the size of the pit. Mining activities in the expansion of Area 2 Stage 3 commenced in August, and ramped up to full production after the original Area 2 Stage 3 pit design was completed on September 12th, 2017. The first ore release from Area 2 Stage 3 Expansion occurred in November.

2017 total mined waste and ore quantities are summarized in Table 2-1, below.

Table 2-1: Open Pit Mined Quantities: Mining Waste Volume and Ore Volume (2017)

| | Waste / Overburden (BCM) | Ore (BCM) | Ore (t) |
|--------------------------|--------------------------|----------------|----------------|
| Area 2 Stage 3 | 2,124,554 | 299,119 | 800,344 |
| Area 2 Stage 3 Expansion | 1,326,603 | 52,766 | 140,777 |
| Total | 3,451,157 | 351,885 | 941,121 |

2.3.2 Underground Mining

Mining activities in the Minto South Underground continued throughout 2017. Production continued from the Area 2 zone, with ore release totaling 328,000 tonnes.

A ramp was developed to the Minto East ore zone, from which three level accesses, accesses to ventilation and escapeway raises, and supporting infrastructure such as sumps and an electrical substation were completed. Development within the ore zone itself did not begin in 2017. 142,000 tonnes of waste rock were hauled to surface. See Appendix A for the underground development map.

2.3.3 Waste Rock Management

Waste rock dump development continued in 2017, as per the *Minto Mine Waste Rock and Overburden Management Plan*. Table 2-2 summarizes the waste materials and ultimate destinations, and the volumes deposited. Current waste rock inventory in the various waste rock and overburden dumps at the Minto Mine site are summarized in Table 2-3.

Table 2-2: Waste Rock Destination and Volumes – Unreconciled truck counts (2017)

| Material Type | Destination | Volume (BCM) |
|----------------------------|---|------------------|
| Waste - Construction Grade | Roads/Ramps | 106,000 |
| Waste - Construction Grade | Tailings Diversion Ditch – Portal Road Re-Alignment | 39,000 |
| Waste | Main Pit Dump | 950,000 |
| Waste | Main Waste Dump | 148,000 |
| Waste Rock - SAT | Main Pit Buttress | 26,000 |
| Waste Rock - SAT | A2S2 In-Pit | 56,000 |
| Total | | 1,325,000 |

Table 2-3: Waste Dump Location and Storage Volumes (2017)

| Dump Location | Quantity Stored as of December 31, 2017 (m ³) |
|------------------------------|---|
| Main Pit Buttress | 4,230,000 |
| Main Pit Dump | 1,230,000 |
| Southwest Dump | 12,120,000 |
| Mill Valley Fill Extension | 1,440,000 |
| Reclamation Overburden Dump | 4,300,000 |
| Main Waste Dump | 8,360,000 |
| Main Waste Dump Expansion | 3,600,000 |
| Mill Valley Fill Extension 2 | 1,360,000 |
| Total Waste Dumped | 36,640,000 |

2.3.4 Tailings Management

All tailings produced in 2017 were deposited in the Area 2 Pit Tailings Management Facility (A2PTMF). The following table lists the deposition schedule.

Table 2-4: Tailings Deposition Schedule in 2017

| Tailings Management Facility | Date Range | Quantity Deposited (dry metric tonnes) |
|------------------------------|-------------------------|--|
| A2PTMF | January 1 – December 31 | 1,402,004 |
| Total 2017 Tailings | | 1,402,004 |

A total of 1,402,004 dry metric tonnes (dmt) of tailings were discharged to the A2PTMF in 2017. Since November 2012, the Main Pit Tailings Management Facility (MPTMF) has received 3,347,000 tonnes of tailings. Since March 2015, the Area 2 Pit has received 3,756,000 tonnes of tailings.

Deposition to the A2PTMF is from a point at the northeast corner of the pit. A discharge line runs from the pit crest at the 806m elevation to a point on the highwall passed the overburden contact, at 787m: this ensures that the tailings stream runs down solid rock and does not cause erosion. As of year-end, the highest point of the tailings beach is at the 774.0m elevation and the water level in A2PTMF was 771.1m.

Deposition in the MPTMF is possible from two locations, near the middle of the pit via a floating tailings line and near the north wall of the pit. The highest point of the tailings beach is at 787.5m elevation. At year-end, the water level was measured at 784.5m.

The pipeline and pump which transfers supernatant water from A2PTMF to MPTMF, where the mill's process water intake is located, was repositioned in November due to Area 2 Stage 3 Expansion pit mining activities.

As in previous years, tailings were not observed to remain ponded on the ice surface of either tailings management facility during the winter months. The relatively high tailings temperature, combined with the erosive effect of the tailings stream, melts through the ice at the discharge point.

Minto's filter press plant, previously used to prepare tailings for deposition to the Dry Stack Tailings Storage Facility (DSTS), has been deactivated and did not operate in 2017. While the filtration equipment is still in place, a substantial portion of the building's electrical supply has been re-routed to the Minto South Portal.

2.3.5 Ore Stockpiles

Several ore stockpiles exist on the property. Southeast of the mill complex, three adjacent stockpile pads exist:

1. Mill Pond Pad – Blended and crushed mill feed
2. East Stockpile –Sulfide and partially oxidized run-of-mine (ROM) ore stockpiles
3. South Stockpile –Partially oxidized run-of-mine (ROM) ore stockpiles

West of the Main Pit, adjacent to the Main Waste Dump, the Top of the World stockpile consisting of partially oxidized run-of-mine (ROM) ore is being actively depleted.

The stockpile areas are displayed in Figure 2-1.

Ore is segregated by copper grade and percentage of acid-soluble copper as shown in Table 2-5.

Table 2-5: Ore Stockpiles

| Material Type | Copper Grade Range | Soluble Copper |
|---|--------------------|----------------|
| Blue Sulfide Ore | 0.50 – 1.00% Cu | <15.0% |
| Green Sulfide Ore | 1.00 – 2.00% Cu | <15.0% |
| Yellow Sulfide Ore | >2.00% Cu | <15.0% |
| Partially Oxidized Ore (POX) | >1.50% Cu | >15.0% |
| Low-Grade Partially Oxidized Ore (LG POX) | 0.80 – 1.50% Cu | >15.0% |

The higher-grade ores are fed to the mill as they are mined to maintain the highest possible head grade while mining ore. The lower-grade and partially oxidized stockpiles are depleted gradually and are used to supplement mill feed during periods of waste stripping.

Table 2-6: Stockpile Inventory

| | December 31, 2016 | | | December 31, 2017 | | |
|------------------|-------------------|-------------|-------------|-------------------|-------------|-------------|
| | Mass (tonnes) | Cu (%) | Ag (g/t) | Mass (tonnes) | Cu (%) | Ag (g/t) |
| Red | 33,235 | 5.54 | 24.27 | - | - | - |
| Yellow | 30,427 | 2.76 | 12.36 | - | - | - |
| Green | 71,477 | 1.44 | 6.28 | - | - | - |
| Blue | 245,851 | 0.73 | 2.76 | 1,707 | 0.78 | 3.93 |
| POX | 0 | - | - | 235,296 | 1.21 | 3.50 |
| LG POX | 56,809 | 0.91 | 2.24 | 199,582 | 0.66 | 1.74 |
| Portal Ore Pad | 29,259 | 1.58 | 7.81 | 9,434 | 2.36 | 12.78 |
| Live Pile | 22,230 | 2.07 | 8.63 | 21,583 | 1.71 | 6.09 |
| Total Ore | 489,287 | 1.42 | 5.84 | 467,601 | 1.02 | 3.06 |

DATE PLOTTED: 03-AUG-17

Figure 2-1
Ore Stockpiles – 2017

2.3.6 Operating Results

Ore processing and metal production results for the 2017 calendar year are summarized in Table 2-7, below.

Table 2-7: Operating Results (2017)

| Metal Production | Quantity |
|------------------------------|-----------------|
| Copper (t) | 16,331.71 |
| Gold (kg) | 787.86 |
| Silver (kg) | 5,263.88 |
| Ore Milled | |
| Ore processed (t) | 1,439,374 |
| Copper grade (%) | 1.37 |
| Gold grade (g/t) | 0.79 |
| Silver grade (g/t) | 4.76 |
| Recoveries | |
| Copper (%) | 82.6 |
| Gold (%) | 59.3 |
| Silver (%) | 77.6 |
| Concentrates Produced | |
| Copper concentrate (dmt) | 37,372.0 |
| Copper (%) | 43.7 |
| Gold (g/t) | 18.01 |
| Silver (g/t) | 142.16 |

2.3.7 Concentrate Shipments

Minto produced 41,299 wet metric tonnes of concentrate at 9.51% moisture content, which corresponds to 37,372 dmt. The average concentrate grades are listed in Table 2-7, above. 996 truckloads of concentrate were shipped from Minto in 2017: 534 via the winter ice bridge and 462 during the summer barge season.

2.4 Mine Access Road

2.4.1 Traffic

From December 27th, 2016 to April 9th, 2017, access across the Yukon River was over an ice bridge during which time, heavy trucks made 700 round trips, medium trucks made 148 round trips, and light vehicles made 386 round trips across the ice bridge. Between April 10th and June 17th, 2017 there was no land access to the mine site. On June 18th, 2017, the summer tug and barge operation started for the season. During the barge operating season, heavy trucks made 621 round trips, medium trucks made 299.5 round trips, and light vehicles made 556.5 round trips to the Minto Mine via the mine access road. The barge operating season ended November 7, 2017. Establishment of the 2018 ice bridge started in December 2017.

2.4.2 Access Control Issues

No access control issues were experienced in 2017.

2.4.3 Planned Access Road Maintenance for 2018

Beyond routine maintenance work, no major projects or upgrades are planned for 2018 regarding the access road.

2.5 Accidents and Incidents

2.5.1 Incidents

In 2017, Minto Mine experienced three lost time accidents, seven medical aids and seven serious incidents reported to the Yukon Workers Compensation Health and Safety Board for the reporting period. In order to respond to incidents on site, Minto maintains a current Emergency Response Plan supported by a complement of emergency response personnel trained and certified in advanced first aid, firefighting and mine rescue along with equipment required for all response types. In addition, reporting and investigation of incidents is standard practice at the site.

2.5.2 Wildlife Incidents

The Conservation Officer was made aware of two events at Minto in 2017. The first incident was an aggressive black bear initially encountered on the access road on June 25th, 2017, then again by two hikers walking after work on July 23rd, 2017. A temporary ban on recreational outdoor activities was put in place on July 24th, 2017 due to the presence of the aggressive bear. The bear eventually left the area and was not seen again, resulting in the recreation ban being lifted. The second communication with the Conservation Officer was due to a porcupine being run over and killed by a haul truck on the mine site on September 28th, 2017. The porcupine was disposed of in the onsite incinerator, a method supported by the Conservation Officer.

2.5.3 Reportable Spills

There was one reportable spill that occurred at Minto Mine during 2017. The volume and causes of the spill are summarized below in Table 2-8.

Table 2-8: Reportable Spills (2017)

| Date | Amount | Substance | Cause |
|----------|--------|---------------------|---|
| 8-Jul-17 | 50 kg | Potassium Hydroxide | A pallet containing potassium hydroxide flakes had multiple broken bags that had spilled contaminant onto the ground. During the investigation, it was determined that the pallets had been stored there for up to 4 years, however, it was difficult to determine at what time the packaging had become uncovered and degraded to the point that the material spilled to the ground. |

The spill in Table 2-8 was reported as per the *Spills Regulations* of the Yukon Environment Act. The follow up spill report was submitted within 10-days of the occurrence. Additionally, non-reportable spills were tracked internally as per the WUL. Spills on site were cleaned up with a variety of methods including, but not limited to, absorbent spills pads, soil excavation, soil treatment in the LTF, and disposal in the Main Pit dump.

2.5.4 Spill Contingency Plan Review

An update to the Minto Mine Spill Contingency Plan is required annually as part of the Annual Report and the updated 2018 Minto Mine Spill Contingency Plan is provided in Appendix B.

3 Proposed Mining for 2018

Section 3 discusses the proposed mining for 2018 at the Minto Mine, including open pit and underground mining.

3.1 Proposed Open Pit Mining for 2018

The Area 2 Stage 3 Expansion is expected to be completed in April 2018.

A program of infill drilling was completed in Q4-2017 at the Ridgetop North pit. These results will be used to create an updated block model and to better define the boundaries between partially oxidized and sulfide ore. These changes, along with current market conditions and an updated slope stability analysis, will be incorporated into a pit optimization for the Ridgetop North pit. The pit optimization work is expected to be completed in March 2018, with mining activities commencing shortly after if economics determine that it is feasible.

The mine plan will be revisited whenever key inputs such as copper price, exchange rate, or fuel price change significantly.

3.2 Proposed Underground Mining for 2018

Mining of the Area 2 zone will continue, with completion expected in Q1. Production will begin in the Minto East zone, continuing throughout the year. Development toward the next ore zone, Copper Keel, will begin in Q1 and continue throughout the year; first ore is expected in Q4.

The new Minto East exhaust raise will be commissioned, reversing the airflow direction in the main ramp and improving ventilation efficiency.

4 Mineral Resources and Reserves

Minto Mine's updated mineral resources and reserves are provided in Tables 4-1 and 4-2 respectively, below. The most recent update is from December 31, 2016. There were no updates in 2017.

Table 4-1: Updated Mineral Resources for Minto Mine (most recent Dec. 31, 2016)

| Classification | Tonnes (kt) | Copper (%) | Silver (g/t) | Gold (g/t) | Contained Copper (kt) | Contained Silver (koz) | Contained Gold (koz) |

5 Surface Water Quality Monitoring

Environmental monitoring programs are outlined in the *Environmental Monitoring, Surveillance and Reporting Plan* (EMSRP2016-02) and the results for the surface water quality monitoring conducted in 2017 are provided in this section. Where possible, the 2017 results have been compared to historical results to identify trends and compare 2017 values with previous values.

5.1 Surface Water Quality Program

Details of the Surface Water Surveillance Program, including sampling station locations and monitoring frequency, are outlined in the EMSRP2016-02 and the results are presented in this section for water quality stations outlined in the WUL. Water quality result statistics including the mean, minimum and maximum are presented in summary tables. For the purposes of calculating the mean, minimum and maximum concentrations, values less than the detection limit were taken to be half of the detection limit.

The WUL effluent quality standards were compared to the water quality result statistic summaries at stations W16, W16A, W17, W50 and WTP/RO. The WUL water quality objectives were compared to the water quality result statistic summary at station W2, and at W50 when W35 and W15 are frozen.

As water quality stations may be adjusted from year-to-year because of environmental changes or modifications to infrastructure, an update to the water quality station locations listed in the WUL is provided in Table 5-1 below. All surveillance monitoring sites in use in 2017 are confirmed with a Global Positioning System (GPS) unit to determine current UTM coordinates. Coordinates presented in Table 5-1 are associated with the World Geodetic System 1984 (WGS 84) coordinate system.

Table 5-1: Water Quality Site Descriptions and UTM Coordinates

| Station | Description | UTM Coordinates – Zone 8 | |
|---------|---|--------------------------|----------|
| | | Easting | Northing |
| W1 | Lower Reach of Minto Creek | 392445 | 6948251 |
| W2 | Minto Creek, upstream of the Minto Creek/Yukon River confluence where the access road crosses Minto Creek | 392584 | 6948402 |
| W3 | Minto Creek, at the federal MMER compliance point | 387000 | 6945778 |
| W4 | Yukon River, upstream of the confluence with Minto Creek | 394070 | 6948203 |
| W5 | Yukon River, downstream of the confluence with Minto Creek | 392583 | 6949119 |
| W6 | Tributary on the North side of Minto Creek | 387583 | 6946392 |
| W7 | Mouth of the tributary on the south side of Minto Creek, approximately 0.8 km downstream of W3 | 387546 | 6946034 |
| W8 | Western collection sump from the DSTSF | 385629 | 6945076 |
| W8A | Eastern collection sump from the DSTSF | 385716 | 6945012 |
| W10 | Headwaters of Minto Creek (south-west fork at headwaters) | 383855 | 6943364 |
| W12 | Main Pit and Main Pit Tailings Management Facility | 384544 | 6945137 |
| W12A | Discharge from Main pit | * | * |
| W14 | Tailings thickener overflow | 385223 | 6945089 |
| W15 | Upper Minto Creek storm water collection sump, downstream of the overburden dump, just upstream of Main Pit | 384181 | 6944708 |
| W16 | Water Storage Pond | 386402 | 6945559 |
| W16A | Discharge from the Water Storage Pond | 386679 | 6945664 |
| W17 | Water Storage Pond dam seepage | 386679 | 6945664 |
| W30 | Headwaters Minto Creek (north-west fork) | 383693 | 6945026 |
| W33 | Up-gradient of South Diversion Ditch | 385351 | 6944072 |
| W35 | South Diversion Ditch | 385223 | 6944427 |
| W36 | Minto Creek detention structure (MCDS) – Decommissioned in 2015 | 385892 | 6945191 |
| W37 | 100 m downstream of MCDS (W36 collection sump) and upstream of Water Storage Pond – Decommissioned in 2015 | 386180 | 6945294 |
| W45 | Area 2 Pit and Area 2 Pit Tailings Management Facility | 384912 | 6944068 |
| W46 | Minto Creek, downstream of W7 and W6 tributaries | 387873 | 6946301 |
| W47 | Area 118 Pit water | 384775 | 6944153 |
| W50 | Minto Creek, approximately 50 m downstream of the toe of the Water Storage Pond Dam and downstream of the inflow of the treated water | 386747 | 6945682 |
| MC-1 | Minto Creek upstream of Canyon | 390967 | 6947528 |
| WTP | Treated water from water treatment plant when RO not operating | 385126 | 6945154 |
| RO | Treated water from RO | 385126 | 6945154 |
| W51 | Area 2 Stage 3 Pit | 385160 | 6944240 |
| W52 | Ridgetop North Pit and Ridgetop North Pit Tailings Management Facility | * | * |

| Station | Description | UTM Coordinates – Zone 8 | |
|---------|---|--------------------------|----------|
| | | Easting | Northing |
| W53 | Ridgetop South Pit | * | * |
| W54 | Main Dam seepage | * | * |
| W55 | Tailings Diversion Ditch | 386209 | 6945007 |
| W62 | MVFES2 Collection Sump | 386079 | 6945335 |
| C4 | Tributary on the south side of Minto Creek, downstream of W3 | 388407 | 6946571 |
| C10 | Tributary on the south side of Minto Creek, downstream of W3 | 391868 | 6947914 |
| MN | Minto North pit water | 384342 | 6946090 |
| MN-0.2 | Upper west arm of McGinty Creek (Reference Station) | 382267 | 6947299 |
| MN-0.5 | West arm of McGinty Creek just upstream of the confluence with the east arm | 385251 | 6951262 |
| MN-1.5 | Upper east arm of McGinty Creek downstream of the Minto North deposit | 384473 | 6947055 |
| MN-2.5 | East arm of McGinty Creek just upstream of confluence with the west arm | 385493 | 6950788 |
| MN-4.5 | Lower mainstream McGinty Creek near confluence with Yukon River | 386231 | 6952851 |
| UG 1 | Minto South underground mine dewatering | 384916 | 6944098 |
| UG 2 | Wildfire underground mine dewatering | * | * |
| UG 3 | Copper Keel underground mine dewatering | * | * |
| UG 4 | Minto East underground mine dewatering | * | * |

*Water quality sites not developed

5.1.1 Water Quality Monitoring Conformance

2017 conformance with the external water sampling requirements is summarized in Table 5-2, below. Flow monitoring at water quality surveillance sites is highly variable because of site and seasonal conditions and is not presented in Table 5-2, however, full details were provided in the Monthly Reports submitted to the YWB. Additionally, the specifics of non-conformance in relation to external and internal water sampling requirements are included in the Monthly Reports. Quality Assurance and Quality Control (QA/QC) sampling is not included in sampling events described in Table 5-2, but is provided in section 5.1.2.

Table 5-2: Water Quality Sampling Monitoring Conformance Summary (2017)

| Site Name | 2017 WQ sampling events | 2017 Reason(s) for non-conformance events |
|-----------|-------------------------|--|
| W1 | N/A | N/A |
| W2 | 37 | Site was frozen during the first and fourth quarter. Sampled as per schedule for remainder of 2017. |
| W3 | 56 | Sampled as per schedule. |
| W4 | 3 | Sampled as per schedule except for Q3 due to human error. |
| W5 | 2 | Inaccessible due to ice conditions in the first quarter. Sampled as per schedule for second and fourth quarter of 2017, but was missed in Q3 due to human error. |
| W6 | 6 | Site frozen for 6 months of the year. Sampled as per schedule for remainder of 2017. |
| W7 | 8 | Site frozen for 4 months of the year. Sampled as per schedule for remainder of 2017. |
| W8 | 0 | Site dry for all of 2017. |
| W8a | 45 | Weekly samples not collected once in March, all of May and once in June due to site being frozen. Sampled as per schedule otherwise. |
| W10 | 11 | Site frozen for March. Sampled as per schedule otherwise |
| W12 | 12 | Sampled as per schedule. |
| W12A | 0 | No discharge from W12A in 2017. |
| W14 | 12 | Sampled as per schedule. |
| W15 | 18 | Site frozen for March. Sampled as per schedule otherwise. |
| W16 | 37 | One weekly sample missed in June. Sampled as per schedule for remainder of 2017. |
| W16a | 12 | Sampled as per schedule. |
| W17 | 53 | Sampled as per schedule. |
| W30 | 8 | Site was frozen for first three months of 2017. Sampled as per schedule otherwise. |
| W33 | 7 | Site frozen for 5 months of the year. Sampled as per schedule otherwise. |
| W35 | 13 | Site frozen for 5 months of 2017. Sampled as per schedule otherwise. |
| W36 | 0 | Decommissioned in 2015. |
| W37 | 0 | Decommissioned in 2015. |
| W45 | 10 | Site was not sampled for two months due to pump being removed and unsafe access. Sampled as per schedule for remainder of 2017. |
| W46 | 8 | Site frozen for four months. Sampled as per schedule for remainder of 2017. |
| W47 | 0 | Decommissioned and backfilled in January 2017. |
| W50 | 12 | Site dry while not discharging. Sampled as per schedule during discharge in 2017. |
| MC-1 | 32 | Site frozen for 4 months. Sampled as per schedule for remainder of 2017. |
| WTP | 9 | Sampled as per schedule. |
| RO | | |
| W51 | 2 | Site sampled in September and October 2017. Was inaccessible the remainder of the year. |
| W52 | 0 | Site not established. |
| W53 | 0 | Site not established. |
| W54 | 0 | Site not established. |
| W55 | 4 | Flow present in April to July. Site dry for remainder of 2017. |

| Site Name | 2017 WQ sampling events | 2017 Reason(s) for non-conformance events |
|-----------|-------------------------|--|
| W62 | 14 | Sampled as per schedule. |
| C4 | 7 | Site frozen for 5 months. Sampled as per schedule for remainder of 2017. |
| C10 | 5 | Site frozen for 7 months. Sampled as per schedule for remainder of 2017. |
| MN | 1 | Sampled once during 2017. Access unsafe for remainder of 2017. |
| MN-0.2 | 6 | Site frozen for 6 months. Sampled as per schedule for remainder of 2017. |
| MN-0.5 | 7 | Site frozen for 5 months. Sampled as per schedule for remainder of 2017. |
| MN-1.5 | 6 | Site frozen for 6 months. Sampled as per schedule for remainder of 2017. |
| MN-2.5 | 7 | Site frozen for 5 months. Sampled as per schedule for remainder of 2017. |
| MN-4.5 | 7 | Site frozen for 5 months. Sampled as per schedule for remainder of 2017. |
| UG1 | 12 | Sampled as per schedule. |

5.1.2 Quality Assurance and Quality Control Program

As required by Clause 104 of the WUL, Minto is required to submit the results and interpretations of the Quality Assurance and Quality Control Program (QA/QC Program). The QA/QC program is directed through the EMSRP. Implementation of the Minto QA/QC Program occurred since November 2012.

The primary objective of the QA/QC Program is to ensure that data collected, analyzed and evaluated through the environmental monitoring programs at Minto are representative of the environmental conditions present at the time of sample collection.

The QA/QC Program has been developed using recognized QA/QC protocols. Specific procedures for data collection at the Minto Mine are detailed in Standard Operating Procedures (SOPs). SOPs are internal documents to the Minto Mine that may be modified or improved as required.

The main components of the QA/QC Program presented in the following sections include QA/QC with regards to water quality monitoring, external and on-site laboratory reporting, and environmental programs monitoring. QA/QC results and interpretations are presented in each Monthly Report.

5.1.2.1 Water Quality QA/QC

Procedures for water quality monitoring at the Minto Mine are described in the EMSRP and further detailed in the Minto Mine Surface Water Quality Monitoring Standard Operating Procedure. The SOP is reviewed at the start of each field season and signed off by Minto Environment department staff to help ensure consistency in sampling procedures.

In 2017, 728 water quality samples (surface and groundwater) were collected for the water quality monitoring programs. QC samples represented 22.1% of the total number of samples collected in 2017, and included 85 field duplicates, 6 field blanks, 6 trip blanks, and 64 field splits. The Minto Mine Surface Water Quality Monitoring Standard Operating Procedure describes a 1:10 quality control to routine sampling ratio and this ratio was achieved in 2017.

5.1.2.2 External Laboratory QA/QC

The 2017 external laboratory water quality analysis were performed by ALS Environmental in Burnaby, BC. As described in the EMSRP, all results provided by the external laboratory were accompanied by a Quality Control Report. If procedural deviations or exceedances in standard holding time occurred, the details of such nonconformities were included in each report. Additionally, each report contained QC batch numbers enhancing sample result traceability.

5.1.2.3 On-site Laboratory QA/QC

Procedures for analyzing water samples at the on-site laboratory are detailed in a variety of SOPs such as, but not limited to: The Laboratory QA/QC Guidelines SOP; Preparation of Dissolved and Total Metals (Cu, Al, Cd) SOP; Preparation of Dissolved and Total Selenium SOP; and Total Dissolved Solids SOP. All on-site laboratory equipment was calibrated per the manufacturer's specifications in 2017.

On-site laboratory analysis of water quality samples occurred at W2, W3, W8A, W16, W16A, W17 and W50 as per the WUL Schedule 1 – Part 2 monitoring requirements, as environmental conditions allowed. No internal samples were provided to the internal laboratory from W8 as the site remained dry throughout 2017. Additionally, the on-site laboratory analyzed water from sites W15, W35, RO, and WTP intake daily during discharge conditions to inform day-to-day discharge-related decisions. Samples from W12 were also analyzed.

The 2017 QC procedures performed by the on-site laboratory included spiked blanks and calibration checks. If two or more QC failures occurred, the 2017 QC procedures involved re-analyzing the entire batch of samples. Additionally, one replicate sample is analyzed for each batch analysis. In the event the replicate sample results do not match; the entire batch is reanalyzed.

On-site and external laboratory water quality results for water quality sites W2, W3, W8A, W16, W16A and W50 are presented in each Monthly Report submitted to the Water Board. In monthly reports, it was noted that discrepancies in results from the external and on-site laboratories occurred and were likely a result of different methods and/or equipment utilized in analyzing water samples, different processing times between sampling and processing the samples, and the associated use of non-preserved versus preserved samples.

5.2 Compliance

5.2.1 Discharge Compliance – WQ Effluent Standards

5.2.1.1 W16A – EQS Compliance Point

For the station W16A, copper, aluminum, cadmium and selenium concentrations, with corresponding standards (WUL Clause 9) are displayed in Table 5-3. This is shown graphically in Figure 5-1 and Figure 5-2. The TSS value that exceeded the EQS (5/14/2013) was re-run on the same day and had a value of 17 mg/L, this was prior to the station becoming a compliance point.

Table 5-3: W16A Water Quality Results Summary (2007-2017)

| W16A Parameters | Effluent Quality Standards (WUL Clause 9) | 2007 - 2016 Summary Statistics | | | 2017 Summary Statistics | | |
|--------------------------------|--|--------------------------------|------------|-------------|-------------------------|-----------|-----------|
| | | Mean | Min | Max | Mean | Min | Max |
| pH | 6.0-9.0 | 7.99 | 6.86 | 8.32 | 8.17 | 7.87 | 8.33 |
| TSS (mg/L) | 15 | 5.12 | <1.0 | 55.1 | 2.25 | <3.0 | 5.4 |
| Nutrients (mg/L) | | | | | | | |
| Ammonia Nitrogen | 0.75 | 0.1055 | 0.0169 | 0.430 | 0.0461 | 0.0071 | 0.146 |
| Nitrite Nitrogen | 0.18 | 0.02414 | <0.0050 | 0.0920 | 0.0493 | 0.0111 | 0.0808 |
| Nitrate Nitrogen | 27.3 | 3.372 | 0.549 | 6.30 | 2.18 | 1.75 | 2.77 |
| Dissolved Metals (mg/L) | | | | | | | |
| Aluminum | 0.3 | 0.01139 | <0.0030 | 0.0732 | 0.0091 | 0.0045 | 0.0149 |
| Arsenic | 0.015 | 0.000346 | 0.00023 | 0.00059 | 0.00035 | 0.00024 | 0.00049 |
| Cadmium | 0.00015* | 0.00001396 | <0.0000050 | 0.000089 | 0.0000127 | 0.0000056 | 0.0000273 |
| Chromium | 0.003 | 0.000371 | <0.00010 | <0.0010 | 0.000136 | <0.00010 | 0.00022 |
| Copper | 0.039 | 0.02118 | 0.00793 | 0.0349 | 0.0276 | 0.0237 | 0.0326 |
| Iron | 3.3 | 0.0653 | 0.0105 | 0.301 | 0.084 | 0.053 | 0.139 |
| Lead | 0.012 | 0.0001369 | <0.000050 | 0.00159 | 0.0002544 | <0.000050 | 0.00173 |
| Molybdenum | 0.219 | 0.00463 | 0.001 | 0.0098 | 0.00250 | 0.00221 | 0.00277 |
| Nickel | 0.33 | 0.00077 | <0.0010 | <0.0050 | 0.00085 | 0.00050 | 0.00111 |
| Selenium | 0.006 | 0.001267 | 0.00019 | 0.0021 | 0.000665 | 0.000568 | 0.000777 |
| Zinc | 0.09 | 0.00216 | <0.0010 | 0.0059 | 0.00108 | <0.0010 | 0.0023 |

Bold values indicate exceedances of the WUL standards

*Based on measured hardness

Figure 5-1: W16A Copper and Aluminum Concentrations (2012-2017)

*Note that the cadmium standard is based on a hardness of 63 mg/L which is a conservative estimate of hardness at the WQO station.

Figure 5-2: W16A Cadmium and Selenium Concentrations (2012-2017)

5.2.1.2 W50 – EQS Compliance Point

The Effluent Quality Standards (EQS) (Clause 9 of the WUL) were applied and met at W50 from the period of May 2nd to August 1st 2017 when water was encountered. The water quality statistics for 2017 where W50 was the EQS compliance point are summarized below in Table 5-4. The summary from 2009 to 2016 has some exceeded parameters, those were triggered prior to 2015, with different standards. The summary for dissolved aluminum, copper, cadmium and selenium are also presented graphically in Figure 5-3 and 5-4 below.

Table 5-4: W50 Water Quality Results Summary (2009-2017)

| W50 Parameters | Effluent Quality Standard (WUL Clause 9) | 2009 - 2016 Summary Statistics | | | 2017 Summary Statistics | | |
|------------------------------------|---|--------------------------------|-----------|----------------|-------------------------|-----------|-----------|
| | | Mean | Min | Max | Mean | Min | Max |
| pH | 6.0-9.0 | 8.03 | 6.82 | 8.4 | 8.16 | 7.99 | 8.29 |
| TSS (mg/L) | 15 | 5.14 | 0.5 | 42 | 2.92 | 1.5 | 6.6 |
| Nutrients (mg/L) | | | | | | | |
| Ammonia Nitrogen | 0.75 | 0.08750 | 0.0025 | 1 | 0.0400 | 0.0145 | 0.156 |
| Nitrite Nitrogen | 0.18 | 0.02405 | 0.0025 | 0.158 | 0.0412 | 0.0214 | 0.0717 |
| Nitrate Nitrogen | 27.3 | 3.8888 | 0.010 | 16.2 | 2.20 | 1.77 | 3.27 |
| Dissolved Metals (mg/L) | | | | | | | |
| Aluminum | 0.3 | 0.01605 | 0.0013 | 0.12 | 0.0078 | 0.0049 | 0.0125 |
| Arsenic | 0.015 | 0.000373 | 0.00012 | 0.0031 | 0.00036 | 0.00025 | 0.00050 |
| Cadmium | 0.00015* | 0.00001530 | 0.0000025 | 0.00028 | 0.00000841 | 0.0000025 | 0.0000239 |
| Chromium | 0.003 | 0.000467 | 0.00005 | 0.0017 | 0.000124 | 0.00005 | 0.00018 |
| Copper | 0.039 | 0.01529 | 0.0005 | 0.075 | 0.0249 | 0.0185 | 0.0281 |
| Iron | 3.3 | 0.05009 | 0.0025 | 0.3 | 0.067 | 0.048 | 0.095 |
| Lead | 0.012 | 0.0001317 | 0.000025 | 0.0008 | 0.0001499 | 0.000025 | 0.000593 |
| Molybdenum | 0.219 | 0.00609 | 0.0005 | 0.019 | 0.00262 | 0.00220 | 0.00336 |
| Nickel | 0.33 | 0.000894 | 0.00025 | 0.003 | 0.00080 | 0.00054 | 0.00110 |
| Selenium | 0.006 | 0.001200 | 0.00005 | 0.0049 | 0.000668 | 0.000567 | 0.000905 |
| Zinc | 0.09 | 0.00280 | 0.0005 | 0.018 | 0.00085 | 0.0005 | 0.0023 |

Bold values indicate exceedances of the current WUL standards

*Based on measured hardness

Figure 5-3: W50 Copper and Aluminum Concentrations (2009-2017)

*Note that the cadmium standard is based on a hardness of 63 mg/L which is a conservative estimate of hardness at the WQO station.

Figure 5-4: W50 Cadmium and Selenium Concentrations (2009-2017)

5.2.1.3 W17 – EQS Compliance Point

During 2017, there was no water discharged from W17 to the Minto Creek, therefore EQS were not applied to this station.

5.2.2 Discharge Compliance – Bioassays

Monthly and quarterly bioassays are conducted at several surface water quality sites, as per WUL requirements. These tests are to ensure the water is not toxic for aquatic organisms.

In August 2017, WUL bioassay sampling was scheduled with the external lab for August 8th, but unexpected low flows in Minto Creek discharge caused mine discharge to be stopped and Minto missed the opportunity to sample for LC50 tests within the 5 days of discharge at W16A, W50 and W3, this incident was discussed in the August Monthly Report. The remaining tests were conducted per the WUL requirements; and all tests passed in 2017 for all sample sites. Lab results were submitted with the monthly reports.

Bioassay compliance testing, as per the WUL requirements, were conducted at W3 during 2017. An LC50 bioassay was conducted at W3, 3 days after discharge stopped in August. All toxicity tests conducted in 2017 for W3 passed. Lab results were submitted with the respective monthly reports.

At W2 station, bioassay sampling was not completed in the first quarter of 2017, as the water quality station became ice-free with very low flows in the second week of April 2017, and hence did not allow for the monthly samples or the quarterly 30-day CT test to be conducted in Q1. In Q3, the W2 CT 30-day samples were collected and sent to the lab for testing; however, the lab cancelled the analysis after the second week due to a control failure. The test was re-started and cancelled again on the second week, the external lab was not ready to receive the samples, finally the Q3 CT 30-day test was completed mid-October. The Q4 CT 30-day analysis could not be completed due to no visible flow after October 31st, 2017. These incidents were discussed in the respective WUL monthly reports reflect the uncertainty around gamete availability and quality on a quarterly basis.

5.2.3 Water Quality Objectives Compliance – Minto Creek

5.2.3.1 W2 – WQO Compliance Point

As of April 11th, W15 and W35 were no longer frozen and W2 became the WQO station until W15 and W35 froze again on October 3rd, 2017. Following the date in October, W50 became the WQO station.

The Water Quality Objectives (WQO) (Clause 11 of the WUL) were met at the W2 during the period between April 11th and October 3rd, 2017. The water quality statistics during the period where W2 was the WQO compliance point are summarized below in Table 5-6. The maximum copper concentration was collected on April 30th 2017, the DOC for that sample was 32.3mg/L, and therefore did not exceed the WQO.

Table 5-5: W2 Water Quality Results Summary (2017)

| W2 Parameters | Water Quality Objective (WUL Clause 11) | 2007 - 2016 Summary Statistics | | | 2017 Summary Statistics | | |
|------------------------------------|---|--------------------------------|----------------|---------------|-------------------------|------------|-----------|
| | | Mean | Min | Max | Mean | Min | Max |
| pH | 6.0-9.0 | 8.11 | 7.03 | 8.46 | 8.17 | 7.86 | 8.42 |
| TSS (mg/L) | | 52.5 | <1.0 | 2600 | 40.3 | <3.0 | 529 |

Figure 5-6: W2 Cadmium and Selenium Concentrations (2007-2017)

5.2.3.2 W50 – WQO Compliance Point

From January 1st until April 11th, W15 and W35 were frozen and W50 was the WQO station. Following April 11th until October 3rd, W2 was then the WQO station. After which, W15 and W35 froze and W50 once again became the WQO station. During the period that W50 was the WQO compliance point, no water samples were collected from the station as it was dry.

5.2.3.3 Discharge Compliance – RO

On April 16th 2017, there was a 7 m³ unplanned discharge from the RO directly to the Minto Creek. This event was discussed and resolved in the Monthly Report and subsequently with regulators, RO results for this incident are presented below in Table 5-5. The results are from the discharge collected April 16th, 2017.

Table 5-6: RO Water Quality Results from April 16, 2017

| RO | Water Quality Objectives (WUL Clause 11) | Date |
|------------------------------------|--|------------|
| Parameters | | 4/16/2017 |
| pH-L | 6.0-9.0 | 7.44 |
| TSS | | <3.0 |

5.3 Surface Water Quality Surveillance Stations

5.3.1 W2 – Minto Creek at Lower Road Crossing Water Quality

The water quality statistics for W2 from 2007 to 2017 are presented in Section 5.2.3.1 above.

5.3.2 W3 – Minto Creek, at the Federal (MMER) Compliance Point

The water quality statistics for W3 from 2007 to 2017 are summarized below in Table 5-8. A total of 54 routine samples were collected from station W3 during the 2017 monitoring period. The results for dissolved copper, dissolved aluminum, dissolved cadmium, and dissolved selenium for W3 from 2007 to 2017 are also presented in Figure 5-7 and Figure 5-8 below. Three outlier data points dating from 2009 and early 2010 were removed from the W3 Cadmium and Selenium graph to better show the dataset on the graph (5/27/2009, 12/15/2009 and 1/11/2010).

Table 5-5: W3 Water Quality Results Summary (2007-2017)

| W3 Parameters | 2007 - 2016 Summary Statistics | | | 2017 Summary Statistics | | |
|--------------------------------|--------------------------------|------------|---------|-------------------------|------------|----------|
| | Mean | Min | Max | Mean | Min | Max |

5.3.3 W4 – Yukon River, Upstream of the confluence with Minto Creek

The water quality statistics for W4 from 2011 to 2017 are summarized below in Table 5-9. A total of three routine samples were collected from station W4 during the 2017 monitoring period. The Q3 sample was missed due to human error, resulting in changes to our management system to prevent recurrence.

Table 5-6: W4 Water Quality Results Summary (2011-2017)

| W4 Parameters | 2011 - 2016 Summary Statistics | | | 2017 Summary Statistics | | |
|--------------------------------|--------------------------------|------------|----------|-------------------------|------------|----------|
| | Mean | Min | Max | Mean | Min | Max |
| pH | 7.93 | 5.48 | 8.26 | 7.9 | 7.52 | 8.06 |

5.3.4 W5 – Yukon River, Downstream of the Confluence with Minto Creek

The water quality statistics for W5 from 2011 to 2017 are summarized below in Table 5-10. A total of two routine samples were collected from station W5 during the 2017 monitoring period. The Q1 sample was inaccessible due to freezing conditions, and the Q3 sample was missed due to human error, resulting in changes to our management system to prevent recurrence.

Table 5-7: W5 Water Quality Results Summary (2011-2017)

| W5 Parameters | 2011 - 2016 Summary Statistics | | | 2017 Summary Statistics | | |
|--------------------------------|--------------------------------|------------|----------|-------------------------|------------|----------|
| | Mean | Min | Max | Mean | Min | Max |

5.3.7 W8 – Western Collection Sump from DSTSF

W8 sump was dry throughout 2017 and was destroyed in mid-December during normal operations, buried under waste material. Water quality statistics for W8 from 2009 to 2013 are presented in Table 5-13 below. Trend analyses for seepage parameters results are presented in the Seepage section 7.1.

Table 5-10: Water Quality Result Summary (2009-2013)

| Station Name | 2009 - 2013 Summary Statistics | | |
|--------------------------------|--------------------------------|----------|---------|
| Parameters | Mean | Min | Max |
| pH | 7.98 | 7.49 | 8.4 |
| TSS (mg/L) | 45 | <2 | 660 |
| Nutrients (mg/L) | | | |
| Ammonia Nitrogen | 0.541 | 0.005 | 4.2 |
| Nitrite Nitrogen | 0.841 | <0.005 | 4.5 |
| Nitrate Nitrogen | 43.87 | <0.01 | 116 |
| Dissolved Metals (mg/L) | | | |
| Aluminum | 0.0135 | <0.0030 | 0.144 |

| Zinc | 0.306 | <0.001 | 9.49 |

5.3.8 W8A – Eastern Collection Sump from DSTSF

W8A was collected on a weekly basis per WUL requirements, a total of 46 samples were collected during the 2017 monitoring period; the sump was briefly frozen in March 2017 and dry in May 2017 for a 5-week period. Water quality statistics from 2009 to 2017 are summarized below in Table 5-14. Furthermore, trend analyses for seepage parameters results are presented in the Seepage section 7.1.

Table 5-11: Water Quality Result Summary (2009-2017)

| Station Name | 2009 - 2016 Summary Statistics | | | 2017 Summary Statistics | | |
|--------------------------------|--------------------------------|-----------|--------|-------------------------|-----------|----------|
| Parameters | Mean | Min | Max | Mean | Min | Max |
| pH | 8.00 | 5.04 | 8.6 | 7.85 | 7.31 | 8.36 |

5.3.11 W12A – Discharge in the Main Pit

There was no discharge from the Main Pit in 2017 and no discharge from the Main Pit in previous years.

5.3.12 W14 – Tailings Thickener Overflow

The water quality statistics for W14 from 2007 to 2017 are summarized below in Table 5-17. A total of twelve routine samples were collected from station W14 during the 2017 monitoring period.

Table 5-14: W14 Water Quality Results Summary (2007-2017)

| W14 | 2007 - 2016 Summary Statistics | | | 2017 Summary Statistics | | |
|--------------------------------|--------------------------------|------------|---------|-------------------------|-----------|----------|
| Parameters | Mean | Min | Max | Mean | Min | Max |

5.3.13 W15 – Upper Minto Creek Stormwater Collection Point

The water quality statistics for W15 from 2007 to 2017 are summarized below in Table 5-18. A total of eighteen routine samples were collected from station W15 during the 2017 monitoring period. The results for dissolved copper, dissolved aluminum, dissolved cadmium, and dissolved selenium for W15 from 2007 to 2017 are also presented in Figure 5-9 and Figure 5-10 below.

Table 5-15: W15 Water Quality Results Summary (2007-2017)

| W15 Parameters | 2007 - 2016 Summary Statistics | | | 2017 Summary Statistics | | |
|--------------------------------|--------------------------------|------------|---------|-------------------------|------------|----------|
| | Mean | Min | Max | Mean | Min | Max |

Figure 5-10: W15 Cadmium and Selenium Concentrations (2007-2017)

5.3.14 W16 – Water Storage Pond

The water quality statistics for W16 from 2007 to 2017 are summarized below in Table 5-19. A total of 37 routine samples were collected from station W16 during the 2017 monitoring period. The results for dissolved copper, dissolved aluminum, dissolved cadmium, and dissolved selenium for W16 from 2007 to 2017 are also presented in Figure 5-11 and Figure 5-12 below. An outlier in cadmium concentration for W16 collected on 5/5/2009 was removed for presenting the dataset in Figure 5-12.

Table 5-16: W16 Water Quality Results Summary (2007-2017)

| W16 Parameters | 2007 - 2016 Summary Statistics | | | 2017 Summary Statistics | | |
|--------------------------------|--------------------------------|------------|---------|-------------------------|------------|-----------|
| | Mean | Min | Max | Mean | Min | Max |

5.3.17 W33 – Above Tailings Diversion Ditches

The water quality statistics for W33 from 2009 to 2017 are summarized below in Table 5-21. A total of seven routine samples were collected from station W33 during the 2017 monitoring period. W33 was buried during construction at the end of December.

Table 5-18: W33 Water Quality Results Summary (2009-2017)

| W33 Parameters | 2007 - 2016 Summary Statistics | | | 2017 Summary Statistics | | |
|--------------------------------|--------------------------------|------------|---------|-------------------------|------------|-----------|

5.3.18 W35 – Storm Water Collection Point – South Diversion Ditch

The water quality statistics for W35 from 2012 to 2017 are summarized below in Table 5-22. A total of thirteen routine samples were collected from station W35 during the 2017 monitoring period. The results for dissolved copper, dissolved aluminum, dissolved cadmium, and dissolved selenium for W35 from 2012 to 2017 are also presented in Figure 5-13 and Figure 5-14 below. In September 2017, the SDD was removed due to changes in the construction of the A2S3 expansion. New conveyance infrastructure was installed to reroute water from W35 to the TDD or A2 Pit depending on water quality.

Table 5-19: W35 Water Quality Results Summary (2012-2017)

| W35 | 2012 - 2016 Summary Statistics | | | 2017 Summary Statistics | | |
|--------------------------------|--------------------------------|------------|----------|-------------------------|------------|-----------|
| Parameters | Mean | Min | Max | Mean | Min | Max |
| pH | 7.90 | 6.77 | 8.26 | 7.91 | 7.56 | 8.14 |

Figure 5-13: W35 Copper and Aluminum Concentrations (2012-2017)

Figure 5-14: W35 Cadmium and Selenium Concentrations (2012-2017)

5.3.19 W36 – Minto Creek Detention Structure Pond

W36 was decommissioned during the construction of the Mill Valley Fill Extension Phase 2 (MVFE2) in 2015. As such, no samples were taken in 2017.

5.3.20 W37 – 100 m downstream of MCDS (W37 Collection Sump) and upstream of Water Storage Pond

W37 was decommissioned during the construction of the Mill Valley Fill Extension Phase 2 (MVFE2) in 2015 and replaced by W62. As such, no samples were taken in 2017.

5.3.21 W45– Area 2 Pit

The water quality statistics for W45 from 2012 to 2017 are summarized below in Table 5-23. A total of ten routine samples were collected from station W45 during the 2017 monitoring period. Access was not permitted for two months when the pump was removed, due to safety reasons.

Table 5-20: W45 Water Quality Results Summary (2012-2017)

| W45 Parameters | 2012 - 2016 Summary Statistics | | | 2017 Summary Statistics | | |
|--------------------------------|--------------------------------|-----------|---------|-------------------------|----------|----------|
| | Mean | Min | Max | Mean | Min | Max |
| pH | 8.06 | 7.86 | 8.27 | 7.90 | 7.76 | 8.03 |
| TSS (mg/L) | 27.8 | <1.0 | 291 | 51.6 | 12.3 | 139 |

| Nickel | 0.00112 | 0.00068 | 0.0021 | 0.00111 | 0.00095 | 0.00135 |
| Selenium | 0.000232 | <0.00010 | 0.0009 | 0.000183 | 0.000115 | 0.000216 |
| Zinc | 0.0046 | <0.0010 | 0.0150 | 0.0021 | <0.0010 | <0.0050 |

5.3.23 W47 – Area 118 Pit Water

W47 was decommissioned and backfilled during the construction of the Area 2 Stage 3 pit in January 2017. As such, no samples were taken in 2017.

5.3.24 W50 – Minto Creek, 50m Downstream of the Toe of the Water Storage Pond Dam

The water quality statistics for W50 are presented in Section 5.2.1.2 above.

5.3.25 W51 – Area 2 Stage 3 Pit

The water quality statistics for W51 from 2017 are summarized below in Table 5-26. W51 was developed in 2017 with the mining activities in the Area 2 Stage 3 pit. A total of two routine samples were collected from station W51 during the 2017 monitoring period. No other samples were collected because the sump was inaccessible for safety reasons.

Table 5-22: W51 Water Quality Results Summary (2017)

| W51 | 2017 Summary Statistics | | |
|--------------------------------|-------------------------|-----------|-----------|
| Parameters | Mean | Min | Max |
| pH | 8.27 | 8.12 | 8.41 |
| TSS (mg/L) | 36.9 | 3.1 | 70.7 |
| Nutrients (mg/L) | | | |
| Ammonia Nitrogen | 1.284 | 0.627 | 1.94 |
| Nitrite Nitrogen | 0.341 | 0.126 | 0.555 |
| Nitrate Nitrogen | 7.96 | 4.13 | 11.8 |
| Dissolved Metals (mg/L) | | | |
| Aluminum | 0.0034 | 0.0024 | 0.0045 |
| Arsenic | 0.00084 | 0.00083 | 0.00084 |
| Cadmium | 0.000038 | <0.000025 | <0.000050 |
| Chromium | 0.0001 | <0.00010 | <0.00010 |
| Copper | 0.0626 | 0.0354 | 0.0898 |
| Iron | 0.01 | <0.010 | <0.010 |
| Lead | 0.00005 | <0.000050 | <0.000050 |
| Molybdenum | 0.0301 | 0.0269 | 0.0333 |
| Nickel | 0.00050 | <0.00050 | <0.00050 |
| Selenium | 0.00296 | 0.002730 | 0.00319 |
| Zinc | 0.0014 | <0.0010 | 0.0017 |

5.3.26 W52 – Ridgetop North Pit

The Ridgetop North Pit was not developed in 2017; therefore, water quality results are not available.

5.3.27 W53 – Ridgetop South Pit

The Ridgetop South Pit was not developed in 2017; therefore, water quality results are not available.

5.3.28 W54 – Main Pit Dam Seepage

The Main Pit Dam was not developed in 2017; therefore, water quality results are not available.

5.3.29 W55 – Tailings Diversion Ditch

The water quality statistics for W55 from 2016 and 2017 are summarized below in Table 5-27. Four routine sample were collected from station W55 during the 2017 monitoring period.

Table 5-23: W55 Water Quality Results Summary (2016-2017)

| W55 Parameters | 2016 Summary Statistics | | | 2017 Summary Statistics | | |
|--------------------------------|-------------------------|-----------|-----------|-------------------------|-----------|-----------|
| | Mean | Min | Max | Mean | Min | Max |
| pH | 7.63 | 7.52 | 7.74 | 7.91 | 7.71 | 8.10 |
| TSS (mg/L) | 4.2 | <3.0 | 5.3 | 18.3 | 4.4 | 43.3 |

5.3.32 WTP and RO – Treated Water

An explanation of operations and water quality statistics for WTP and RO are presented in Section 5.2.3.3 above.

5.3.33 C4 – Tributary on the south side of Minto Creek

The water quality statistics for C4 from 2012 to 2017 are summarized below in Table 5-31. A total of seven routine samples were collected from station C4 during the 2017 monitoring period.

Table 5-26: C4 Water Quality Results Summary (2012-2017)

| C4 Parameters | 2012 - 2016 Summary Statistics | | | 2017 Summary Statistics | | |
|--------------------------------|--------------------------------|------------|----------|-------------------------|------------|-----------|
| | Mean | Min | Max | Mean | Min | Max |
| pH | 8.03 | 7.59 | 8.29 | 8.14 | 7.95 | 8.31 |
| TSS (mg/L) | 212.1 | 2.3 | 1260 | 4.3 | <3.0 | 9 |
| Nutrients (mg/L) | | | | | | |
| Ammonia Nitrogen | 0.0923 | 0.005 | 0.36 | 0.0132 | 0.0079 | 0.0225 |

| Zinc | 0.0071 | <0.0010 | 0.0603 | 0.0013 | <0.0010 | 0.0024 |

5.3.35 MN – Minto North Pit Water

The water quality statistics for MN from 2015 to 2017 are summarized below in Table 5-33. One routine sample was collected from station MN during the 2017 monitoring period, once safe access to the pit water could be established. The water was frozen at the end of the year.

Table 5-28: MN Water Quality Results Summary (2015-2017)

| MN | 2015 - 2016 Summary Statistics | | | 2017 Summary Statistics |
|--------------------------------|--------------------------------|-----------|----------|-------------------------|
| Parameters | Mean | Min | Max | Result |
| pH | 7.84 | 7.56 | 8.16 | 8.05 |
| TSS (mg/L) | 62.2 | <3.0 | 142 | 29.7 |
| Nutrients (mg/L) | | | | |
| Ammonia Nitrogen | 13.8 | 1.45 | 51 | 0.612 |
| Nitrite Nitrogen | 5.391 | 0.345 | 14.7 | 0.105 |

| Zinc | 0.022 | <0.0020 | 0.134 | 0.0105 | 0.006 | 0.0223 |

5.3.42 UG2 – Wildfire Underground Mine Dewatering

This station was not established in 2017.

5.3.43 UG3 – Copper Keel Underground Mine Dewatering

This station was not established in 2017.

5.3.44 UG4 – Minto East Underground Mine Dewatering

This station was not established in 2017.

6 Groundwater Monitoring Program

Groundwater monitoring program details are provided in section 2.2 of the Minto Mine Environmental Monitoring, Surveillance and Reporting Plan. The primary monitoring objective of the groundwater monitoring program is to identify potential impacts on groundwater from Minto Mine.

Mine facilities that are monitored for groundwater impacts include, but are not limited to the DSTSF, Mill area, Main Pit, Area 2 Pit, Minto North Pit, waste rock dumps, and the Water Storage Pond. Additionally, groundwater monitoring of hydrogeological conditions in areas of proposed future mine components including the Ridgetop North Pit and Ridgetop South Pit is also conducted. The Groundwater Monitoring Program is comprised of operational and baseline monitoring. Water quality samples for the program are collected according to standard procedures such as those summarized in the ASTM (2007) *Standard Guide for Sampling Ground-Water Monitoring Wells*. The main components of the groundwater monitoring program include groundwater quality, vibrating wire piezometers, and ground temperature cable monitoring.

In 2017, five new West-bay multi-port groundwater monitoring wells, and three new drive point wells were installed and developed. Groundwater samples were collected and the data analysis was conducted by an external lab.

Also in 2017, four Lysimeter installations were completed within each of the following facilities: Main Waste Dump, Southwest Dump, Dry Stack Tailings Storage Facility, and Mill Valley Fill. The Lysimeters record temperature and groundwater infiltration on a continual basis, with first results expected in spring of 2018. Additionally, water samples can be collected from the DSTSF Lysimeter.

6.1 Groundwater Quality Monitoring Conformance

Minto's 2017 conformance with groundwater sampling requirements is summarized in Table 6-1, below. Quality Assurance and Quality Control (QA/QC) sampling is not included in Table 6-1, but is described in Section 6-2.

Sampling of wells MW17-08, MW17-09, MW17-10, MW17-11, and MW17-12 was completed in Q3 and Q4 only since the wells were installed during July 2017. All other groundwater wells were sampled quarterly, as per the EMSRP and GW Plan 2016-02 requirements, which has been in effect since July 2016.

Table 6-1: Groundwater Quality Monitoring Conformance Summary (2017)

| Mine Project Component | Monitoring Installation | Quality | Level | Monitoring Frequency | 2017 Groundwater Compliance |
|--|-------------------------|---------|-------|----------------------|---|
| Up-gradient of Mine Activities | MW17-08-01 | X | X | Quarterly | Sampled as per schedule. Well was established in July 2017. |
| | MW17-08-02 | X | X | Quarterly | Sampled as per schedule. Well was established in July 2017. |
| | MW17-08-03 | X | X | Quarterly | Sampled as per schedule. Well was established in July 2017. |
| | MW17-08-04 | X | X | Quarterly | Sampled as per schedule. Well was established in July 2017. |
| Southwest Waste Dump | MW12-DP1 | X | X | Quarterly | Sampled as per schedule. Well was destroyed in August 2017. |
| | MW12-DP2 | X | X | Quarterly | Sampled as per schedule. |
| | MW12-DP3 | X | X | Quarterly | Sampled as per schedule. |
| | MW17-09-01 | X | X | Quarterly | Sampled as per schedule. Well was established in July 2017. |
| Main Waste Dump | MW09-01-01 | X | X | Quarterly | Sampled in Q1 and Q2. Since MW09-01 has been dry since October 2014 it was replaced by MW17-10. |
| | MW09-01-02 | X | X | Quarterly | Sampled in Q1 and Q2. Since MW09-01 has been dry since October 2014 it was replaced by MW17-10. |
| | MW09-01-03 | X | X | Quarterly | Sampled in Q1 and Q2. Since MW09-01 has been dry since October 2014 it was replaced by MW17-10. |
| | MW17-10-1 | X | X | Quarterly | Sampled as per schedule. Well was established in July 2017. |
| | MW17-10-2 | X | X | Quarterly | Sampled as per schedule. Well was established in July 2017. |
| | MW17-10-3 | X | X | Quarterly | Sampled as per schedule. Well was established in July 2017. |
| | MW17-10-4 | X | X | Quarterly | Q3 sample was missed due to human error. Well was established in July 2017. |
| Dry Stack Tailings Storage Facility and Mill Valley Fill Expansion | MW12-06-01 | | X | Quarterly | Sampled as per schedule. |
| | MW12-06-02 | X | X | Quarterly | Sampled as per schedule. |
| | MW12-06-03 | | X | Quarterly | Sampled as per schedule. |
| | MW12-06-04 | X | X | Quarterly | Sampled as per schedule. |
| | MW12-06-05 | | X | Quarterly | Sampled as per schedule. |
| | MW12-06-06 | X | X | Quarterly | Sampled as per schedule. |
| Main Pit | MW12-07-01 | X | X | Quarterly | Sampled as per schedule. |
| | MW12-07-02 | X | X | Quarterly | Sampled as per schedule. |
| | MW12-07-03 | | X | Quarterly | Sampled as per schedule. |

| Mine Project Component | Monitoring Installation | Quality | Level | Monitoring Frequency | 2017 Groundwater Compliance |
|------------------------|-------------------------|---------|-------|----------------------|---|
| Minto North Pit | MW09-03-01 | X | X | Quarterly | Sampled as per schedule. |
| | MW09-03-02 | X | X | Quarterly | Sampled as per schedule. |
| | MW09-03-03 | X | X | Quarterly | Sampled as per schedule. Port was dry during 2017 |
| | MW17-11-01 | X | X | Quarterly | Sampled as per schedule. Well was established in July 2017. |
| | MW17-11-02 | X | X | Quarterly | Sampled as per schedule. Well was established in July 2017. |
| | MW17-11-03 | X | X | Quarterly | Sampled as per schedule. Well was established in July 2017. |
| | MW17-11-04 | X | X | Quarterly | Sampled as per schedule. Well was established in July 2017. |
| | MW17-11-05 | X | X | Quarterly | Sampled as per schedule. Well was established in July 2017. |
| Water Storage Pond | MW12-05-01 | X | X | Quarterly | Sampled as per schedule. |
| | MW12-05-02 | X | X | Quarterly | Sampled as per schedule. |
| | MW12-05-03 | X | X | Quarterly | Sampled as per schedule. |
| | MW12-05-04 | X | X | Quarterly | Sampled as per schedule. |
| | MW12-05-05 | X | X | Quarterly | Sampled as per schedule. |
| | MW12-05-06 | X | X | Quarterly | Sampled as per schedule. |
| | MW12-05-07 | X | X | Quarterly | Sampled as per schedule. |
| | MW17-12-01 | X | X | Quarterly | Sampled as per schedule. Well was established in July 2017. |
| | MW17-12-02 | X | X | Quarterly | Sampled as per schedule. Well was established in July 2017. |
| | MW17-12-03 | X | X | Quarterly | Sampled as per schedule. Well was established in July 2017. |
| | MW17-12-04 | X | X | Quarterly | Sampled as per schedule. Well was established in July 2017. |
| | MW17-12-05 | X | X | Quarterly | Sampled as per schedule. Well was established in July 2017. |
| | MW17-12-06 | X | X | Quarterly | Sampled as per schedule. Well was established in July 2017. |
| | MW17-12-07 | X | X | Quarterly | Sampled as per schedule. Well was established in July 2017. |
| | MW17-12-08 | X | X | Quarterly | Sampled as per schedule. Well was established in July 2017. |

6.2 Groundwater Quality Control and Assurance

In 2017, 143 groundwater samples were taken at Minto. A total of 26 duplicate QC samples were taken from groundwater sampling sites, representing 18.2% of the total number of samples collected in 2017.

The EMSRP recommends field duplicate sampling be conducted at a frequency of one field duplicate sample per ten groundwater monitoring samples. The recommended rate of field duplicate sampling was achieved in 2017.

Minto currently employs compliance management system software to track programs and actions that meet licence requirements. To achieve the QA/QC objective of 1:10 samples, the compliance system was updated in 2016 and used successfully in 2017 to ensure that environmental staff completed the required field duplicates.

6.3 Groundwater Monitoring Stations

The EMSRP details the groundwater wells at the Minto Mine, including operative and inoperative wells. Figure 6-1 shows a location map of the operative wells, including new wells that were established in 2017. Stations that were collected more than three times in 2017 have results presented as follows: Mean, Minimum and Maximum values.

Wells MW09-01, MW11-02, MW11-03, MW12-DP1, MW12-DP2, and MW12-DP3 did not produce enough water during 2017 sampling events to sample, thus no results are presented.

Complete results for the 2017 Groundwater Monitoring Program groundwater wells are presented in [Appendix C](#).

Figure 6-1: Minto Mine Groundwater Well Locations (2017)

6.3.1 MW09-01

Groundwater well MW09-01 was dry during 2017, thus no results are presented. Historically, this is consistent with sampling data from that well, as there have only been two sampled successfully drawn from MW09-01 since 2013. A new well was installed in summer 2017, MW17-10, to capture groundwater at the Main Waste Dump.

6.3.2 MW09-03

Groundwater well MW09-03 water quality results from 2017 are summarized in Table 6-2 and Table 6-3, and compared to historical data. MW09-03 produced results from sampling zones 01 and 02, while zone 03 produced no water during 2017. As such, only results for zones 01 and 02 are presented.

Table 6-2: MW09-03-01 Water Quality Results Summary (2009 - 2017)

| MW09-03-01 | 2009 - 2016 Summary Statistics | | | 2017 Summary Statistics | | |

6.3.3 MW11-02

MW11-02 was dry during the 2017 sampling events, thus water quality results are not presented.

6.3.4 MW11-03

MW11-03 was dry during the 2017 sampling events, thus water quality results are not presented.

6.3.5 MW11-04A

One full suite sample was collected in March 2017 and one partial suite (Total Organic Nutrients and Dissolved Metal) in May 2017. The results presented below in Table 6-4 are the outcomes of the 2017 sampling season.

Table 6-4: MW11-04A Water Quality Results Summary (2012 – 2017)

| MW11-04A | 2012 - 2016 Summary Statistics | | | 2017 Summary Statistics | | |

6.3.6 MW12-DP1

Drivepoint well MW12-DP1 was dry or frozen during the 2017 Q1 and Q2 sampling events. The well was destroyed during Q3 when the permafrost into which the well had been installed, degraded; compromising the ground integrity and the well. As such, water quality results are not presented.

6.3.7 MW12-DP2

Drivepoint well MW12-DP2 was dry or frozen during the 2017 sampling events, thus water quality results are not presented.

6.3.8 MW12-DP3

Drivepoint well MW12-DP3 was dry or frozen during the 2017 sampling events, thus water quality results are not presented.

6.3.9 MW12-05

Groundwater well MW12-05 water quality results from 2017 are summarized in Table 6-5 through Table 6-11, and compared to historical data. Zones 02, 04, and 06 were not sampled prior to 2016, thus instead of presenting historical data, 2016 is presented next to 2017 for those zones. All zones (01 through 07) were sampled during 2017.

6.3.10 MW12-06

Groundwater well MW12-06 water quality results from 2017 are summarized in Table 6-12 through Table 6-17, and compared to historical data. Zones 02, 04, and 06 were sampled and analyzed during 2017 under the Groundwater Monitoring Plan, while Zones 01, 03, and 05 were also sampled in response to the Adaptive Management Plan.

Table 6-12: MW12-06-01 Water Quality Results Summary (2016 & 2017)

6.3.12 MW17-08

This well was installed in July 2017 to monitor groundwater up-gradient of the Southwest Waste Dump and other mine activities. Four zones were sampled and analyzed in 2017 on two occasions, the results are summarized in Table 6-20 to 6-23 below. Well 17-08 was installed to monitor the background water quality as such, additional parameters are presented in the result summary tables. On November 20th, 2017, MW17-08-04 was sampled but the port had very little water, only dissolved metal analysis could be conducted.

Table 6-20: MW17-08-01 Water Quality Results Summary (2017)

6.3.13 MW17-09

This well was installed in July 2017 to monitor groundwater down-gradient of the Southwest Waste Dump. One zone was identified below an ice-rich layer, it was sampled and analyzed once in 2017, and was found frozen in November 2017 during the Q4 sampling event; the results are summarized in Table 6-24 below.

Table 6-24: MW17-09-01 Water Quality Results Summary (2017)

| MW17-09-01 | 2017 Summary Statistics |
|--------------------------------|-------------------------|
| Parameters | Mean |

6.4 Vibrating Wire Piezometers

There are currently 21 operating vibrating wire piezometers installed on site, listed in Table 6-41. SDP-2A became inoperative in October 2017, there were no other changes to the operational status of any piezometers in 2017. Summaries of data collected from each piezometer are provided in the following sections.

Table 6-41: Vibrating Wire Piezometer Summary

| Vibrating Wire Piezometer | Location | Operational Status |
|---------------------------|------------------------|-------------------------|
| DSP-1 | DSTSF | Destroyed (2011) |

6.4.1 DSTSF Piezometers

Data collected from DSTSF vibrating wire piezometers are presented in Figure 6-2 to 6-5. Sensor DSP-6A is reading negative pressures and has not been included in the figure.

Pore water pressures in DSP-5A and DSP-5B have been gradually increasing since installation in 2013. Analysis carried out by SRK Consulting in 2015 to consider the increasing pressures indicated high FOS values ($FOS > 2$) even without consideration of the constructed MVFE2. DSP-7 and DSP-8 water pressures have been gradually increasing since installation in late 2015. Review of the data by SRK consulting in 2016 identified no stability concern. DSP-10 water pressures increased significantly upon installation, and the trend has gradually been increasing since March 2016. Review of DSP-10 data by SRK consulting in 2016 identified no stability concern.

DSP-05 and DSP-06 data are collected monthly, DSP-07 and DSP-08 data are collected bi-monthly, and DSP-10 data are collected weekly.

Figure 6-2: DSTSF Piezometer Data – DSP-05 and DSP-06 (2013-2017)

Figure 6-3: DSTSF Piezometer Data – DSP-07 (2015-2017)

Figure 6-4: DSTSF Piezometer Data – DSP-08 (2015-2017)

Figure 6-5: DSTSF Piezometer Data – DSP-09 and DSP-10 (2015-2017)

6.4.2 Southwest Dump Piezometers

Data collected from Southwest Dump vibrating wire piezometers are presented in Figure 6-6. Sensors SDP-3A and SDP-3B are reading negative pressures and have not been included in the figure. Data are collected monthly. Data indicate relatively consistent and indicate seasonal changes in pore pressure in 2017. Work on the dump in 2017 consisted primarily of re-sloping for closure.

Figure 6-6: Southwest Dump Piezometer Data (2010-2017)

6.4.3 Water Storage Pond Dam Piezometers

Data collected from WSP Dam vibrating wire piezometers are presented in Figure 6-7. WDP-2, WDP-3, WDP-5, and WDP-11 are reading negative pressures and have not been included in the figure. Data are collected monthly. Pressures in 2017 generally followed the trend of the water level in the water storage pond as in previous years.

Figure 6-7: WSP Dam Piezometer Data (2008-2017)

6.5 Ground Temperature Cables

There are currently 22 operating thermistors (ground temperature cables) installed on site, listed in Table 6-42. There were no changes to the operational status of any of the existing thermistors in 2017. Summaries of data collected from each thermistor are contained in the following sections.

Table 6-42: Thermistor Summary (2017)

| Thermistor | Location | Operational Status |
|------------|-----------------|--------------------|
| A2T-1 | DSTSF | Operational |
| DST-1 | DSTSF | Destroyed (2011) |

6.5.1 DSTSF Thermistors

Data collected from DSTSF thermistors are presented in Figure 6-8 through Figure 6-13. Data are collected quarterly. No major changes to ground temperatures at the DSTSF were observed in 2017.

Figure 6-8: Thermistor DST-10 (2015-2017)

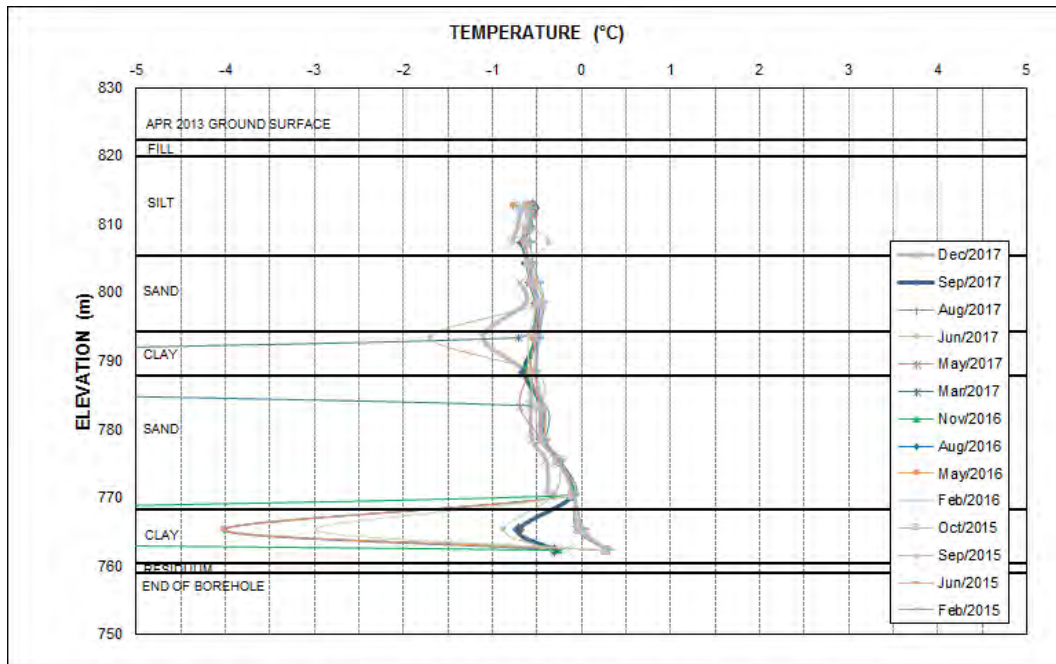

Figure 6-13: Thermistor AT2-1 (2015-2017)

6.5.2 Ridgetop Thermistors

Data collection has reduced to annually for both Ridgetop thermistors. No major changes to ground temperatures at the Ridgetop were observed in 2017.

6.5.3 Southwest Dump Thermistors

Data collected from SWD thermistors are presented in Figure 6-14 through 6-17. Data are collected quarterly. No major changes to ground temperatures at the SWD were observed in 2017.

Figure 6-14: Thermistor SDT-1 (2015-2017)

Figure 6-17: Thermistor SDT-4 (2014-2017)

6.5.4 Water Storage Pond Dam Thermistors

Data are collected monthly from all water retention dam thermistors. All thermistors continue to show temperatures well above zero since installation.

7 Seepage Water Quality Monitoring Program

Minto Mine implements a Seepage Monitoring Plan (SMP) to assess acid rock drainage and metal leaching conditions from several sources, including: pit wall seepage, ore stockpile areas, overburden dumps, waste rock dumps, DSTSF, Mill Valley Fill Extension 1 and 2, the mill area and other seepage locations.

Seepage monitoring conducted in 2017 was carried out in accordance with the EMSRP. The EMSRP states that seepage surveys will be conducted twice a year, during spring runoff and in early fall, by walking the toe of each waste dump, stockpile or other areas of interest. The survey route for each seepage monitoring event are recorded using the tracking function of a GPS. A map showing the 2017 survey routes and monitoring locations can be found in Figure 7-1.

WUL QZ14-031 identifies a Surface Water Surveillance Program which requires regular monitoring of seepage at several permanent seepage water quality stations. These stations include: W8, W8A, W17, (W36, W37 – destroyed in 2016), and W62. Prior to WUL QZ14-031, Minto operated under WUL QZ96-006 which included seepage monitoring sites W32, W38, W39 and W40 in the Surface Water Surveillance Program. The water quality results for these permanent seepage quality stations are additionally reported to the Yukon Water Board (YWB) monthly. Other seepage sites that have been located have been recorded by GPS to ensure continued monitoring. These additional sites are visited during the spring and fall and, if water is present, a sample is collected. Substantial variability in flow presence and/or volume has been observed at many seepage sites. All lab results for 2017 spring and fall seepage monitoring programs are provided in [Appendix D](#).

Seepage site locations are marked by GPS and data is stored in the Minto Mine Water Quality Database, along with results from WUL sampling stations. Minto will continue to monitor these seepage areas and monitor the site workings for seeps on a semi-annual basis.

Observations from the 2017 Seepage Monitoring Program indicate that many seepage sites identified are seasonally variable. It has also been observed that weather patterns have an impact, where snow melt or rain contribute to observable flows that are absent during warm, dry weather. Analysis of seepage results and water quality analysis assists in improving understanding of water chemistry, load, and water balance issuing from waste dumps, overburden dumps, ore stockpiles, and tailings facilities.

Constituents of concern, namely dissolved copper, dissolved cadmium, dissolved iron, dissolved selenium, ammonia, nitrate, and nitrite have been graphed below for each site sampled. In cases where a graph's trend is skewed due to visual outliers (i.e. data points that are larger than the mean by an order of magnitude), a second graph with outliers removed is provided and labelled as "Reduced Concentration."

Per current EMSRP, field data and observations including coordinates, weather, field measurements (pH, conductivity and temperature), a sketch of the location, water conditions and colour of sediment and number of filters used. The original field sheets are presented with the pictures that were obtained at each site in [Appendix D](#).

7.1 Mill Valley Fill

The first phase of the Mill Valley Fill (MVF) was completed in 2012 and vertical culverts were installed at both W8 and W8A to enable water quality monitoring at these locations. Obtaining water samples at W8 has been sporadic since the installation of the vertical culvert. The last time this station produced water was in late 2013. The second phase of the Mill Valley Fill Extension was completed in early 2016. Additional extensions were added to the vertical culverts of W8 and W8A to preserve the sampling stations. In fall 2017, W8 culvert was covered during reclamation operations and could no longer be accessed. Water quality results for W8 and W8A are outlined in Figure 7-2 through 7-10 and include 2017 results as well as historic data for dissolved copper, dissolved cadmium, dissolved iron, dissolved selenium, and nutrient levels for ammonia, nitrite, and nitrate.

7.2 Southwest Dump

Seepage was collected at stations SS1, SS28, SS29, SS30, SS31, SS43, SS44, SS48, SS49, SS51, and SS52, SS54, SS56, SS57 and SS63. Additionally, W32, W38, W39 and W40 were monitored during the summer season. Samples are taken within $\pm 5\text{m}$ of the original GPS point. If there is no seepage within the 5m buffer, the site is considered dry during that sampling session. SS54, SS56 and SS57 were seepage sites newly discovered in spring of 2017 and SS63 was discovered in fall 2017. Water quality results from the 2017 survey program for W38 and W39, as well as W32 and W40 historical data, are presented in Figure 7-11 to 7-18. Historical data and 2017 seepage water quality results for SS1, SS13, SS21, SS22, SS28, SS29, SS30, SS31, SS39, SS43, SS44, SS48, SS49, SS50, SS51, SS52, SS54, SS556 and SS57 are summarized in Figure 7-19 to Figure 7-39. Data was separated between the north (SS1, SS21, SS28, SS29, SS54 and SS56), the south end of the southwest dump (SS13, SS22, SS30, SS31, SS43, SS44, SS51, SS52, and SS57) and the ice rich overburden dump seep (SS48, SS49 and SS63). The figures include water quality results for dissolved copper, dissolved cadmium, dissolved iron, dissolved selenium, and nutrient levels for ammonia, nitrite, and nitrate.

7.3 Minto Creek Detention Structure (MCDS) and Water Storage Pond

The Mill Valley Fill Extension Stage 2 (MVFE2) collection sump (W62) was constructed during the period of November 9, 2015 to February 7, 2016 as a replacement for the Minto Creek Detention Structure (W37) used prior to 2016. W37 was decommissioned and buried in February, 2016 as part of the MVFE2 construction. W62 is approximately 30m downslope from W37 and collects runoff and seepage from the Dry Stack Tailing Storage Facility and the Mill Valley Fill.

Water collected at W62 is pumped to the Main Pit. Water quality results for W37 (historical) and W62 are outlined in Figure 7-40 through Figure 7-46 and include results for dissolved copper, dissolved cadmium, dissolved iron, dissolved selenium, and nutrient levels for ammonia, nitrite, and nitrate.

7.4 Water Storage Pond Dam Seep

Seepage water quality at the Water Storage Pond Dam is represented by station W17. Water quality at station W17 is relatively consistent due to its being fed by a large stable body of water (Water Storage Pond). All dam seepage is collected in a vertical culvert and pumped back to the WSP via a 4" insulated heat traced pipe. Water quality statistics for station W17 from 2007 to 2017 are summarized below in Table 7-1. A total of 62 samples were collected in the 2017 monitoring period. Water quality results for W17 are further outlined in Figure 7-47 through Figure 7-55 and include historic water quality results for dissolved copper, dissolved cadmium, dissolved iron, dissolved selenium, and nutrient levels for ammonia, nitrite, and nitrate.

Table 7-1: W17 Water Quality Results Summary (2007-2017)

| W17 Parameters | Effluent Quality Standards (WUL Clause 9) | 2007 - 2016 Summary Statistics | | | 2017 Summary Statistics | | |

7.5 Dry Stack Tailings Storage Facility (DSTSF)

Seepage flow was observed during the spring survey at SS9 and SS60. Previously, water has flowed along the tailings diversion ditch road and down the toe of the south side of the DSTSF. Historical water quality results, 2017 seepage surveys and historical results for the DSTSF-associated seepage sites (SS9, SS10, SS17, SS18, SS19, SS34, SS35, SS36, and SS45) are outlined in Figure 7-56 through Figure 7-62 and include results for dissolved copper, dissolved cadmium, dissolved iron, dissolved selenium, and nutrient levels for ammonia, nitrite, and nitrate.

Figure 7-62: SS9, SS10, SS17, SS18, SS19, SS34, SS35, SS36, SS45 and SS60 Nitrate

7.6 Ore Stockpiles

Surface seepage runs along the toe of the west ore stockpile and into the ditch parallel to the heavy vehicle road. All seeps in this area drain into the west ore stockpile sump and are pumped to the Main pit. Seepage monitoring stations SS5, SS6, SS7, SS8 and SS33 capture seepage from the stockpile during spring and fall sampling program, SS59 was discovered during Spring 2017. Seepage sites SS46 and SS47 at the toe of the underground ore stockpiles were discovered and added to the network in the fall of 2015. Water quality results are outlined in Figure 7-63 through Figure 7-70 and include historic water quality results for dissolved copper, dissolved cadmium, dissolved iron, dissolved selenium, and nutrient levels for ammonia, nitrite, and nitrate.

Figure 7-67: Ore Stockpile Dissolved Selenium

Figure 7-68: Ore Stockpile Dissolved Ammonia

Figure 7-69: Ore Stockpile Dissolved Nitrite

Figure 7-70: Ore Stockpile Dissolved Nitrate

7.7 Reclamation Overburden Dump (ROD)

In the 2017 Seepage Monitoring Survey, no water samples were collected from sites SS2, SS3, SS11, SS14, and SS15. All sites along the ROD were observed to be dry during the 2014, 2015, 2016 and 2017 surveys. Therefore, the Seepage Monitoring Program will no longer include surveys of the ROD.

7.8 Main Waste Dump

No new seeps were discovered along the toe of the Main Waste Dump (MWD), and existing seeps were observed to be dry during both sampling events in 2017. Historical data is presented in Figure 7-71 through Figure 7-77 and include water quality results for dissolved copper, dissolved cadmium, dissolved iron, dissolved selenium, and nutrient levels for ammonia, nitrite, and nitrate.

Figure 7-74: Main Waste Dump Dissolved Selenium

Figure 7-75: Main Waste Dump Ammonia

Figure 7-76: Main Waste Dump Nitrite

Figure 7-77: Main Waste Dump Nitrate

7.9 Mill Area

SS32 was discovered in 2014 behind the camp along the mill area survey route. SS32 was sampled in both the spring and fall of 2017 and the results for dissolved copper, dissolved cadmium, dissolved iron, dissolved selenium, and nutrient levels for ammonia, nitrite, and nitrate are displayed in Figure 7-78 through Figure 7-84 along with historical results. No other seeps were identified along the toe of the north ridge behind the camp and mill.

Figure 7-78: SS32 Dissolved Copper

Figure 7-81: SS32 Dissolved Selenium

Figure 7-82: SS32 Ammonia

Figure 7-83: SS32 Nitrite

Figure 7-84: SS32 Nitrate

7.10 Pit Walls

Seepage monitoring could not be conducted at the pit walls of the Main Pit, Area 2 Pit, and Minto North Pit; all pits were too unsafe to access during the fall 2017 seepage survey due to geotechnical instability. Records were taken for each pit where seeps were observable from a distance. SS62 is a new seep in area 2 stage 3 pit that was identified in an accessible location and hence was sampled on July 8th, 2017. Results for dissolved copper, cadmium, iron, selenium as well as ammonia, nitrite and nitrate are presented in Table 7-2.

Table 7-2: SS62 Seep Water Quality Results

| SS62 | Concentration (mg/L) |
|----------------------------|----------------------|
| Parameters | |
| Dissolved Copper (Cu) | 0.0142 |
| Dissolved Cadmium (Cd) | 0.0000135 |
| Dissolved Iron (Fe) | <0.010 |
| Dissolved Selenium (Se) | 0.00102 |
| Ammonia (NH ₃) | <0.0050 |
| Nitrite (NO ₂) | <0.0050 |
| Nitrate (NO ₃) | 0.521 |

8 Water Management

The water balance for the Minto Mine forms the basis of the water management strategy at the site. The water management strategy at the site is for conveyance structures to either divert or release clean surface water or direct impacted water to the Main Pit and eventually treatment.

The Minto Mine generally has a positive water balance, meaning that the site-wide annual runoff is greater than the volume of water required to operate the mine. Therefore, it is necessary to release water to Minto Creek. In the event surface runoff does not meet the discharge limits stipulated in the WUL, Minto Mine has the ability to treat and release water using a combination of active treatment, conveyance structures and water storage features. The following sections will summarize water treatment, conveyance and storage during the reporting period.

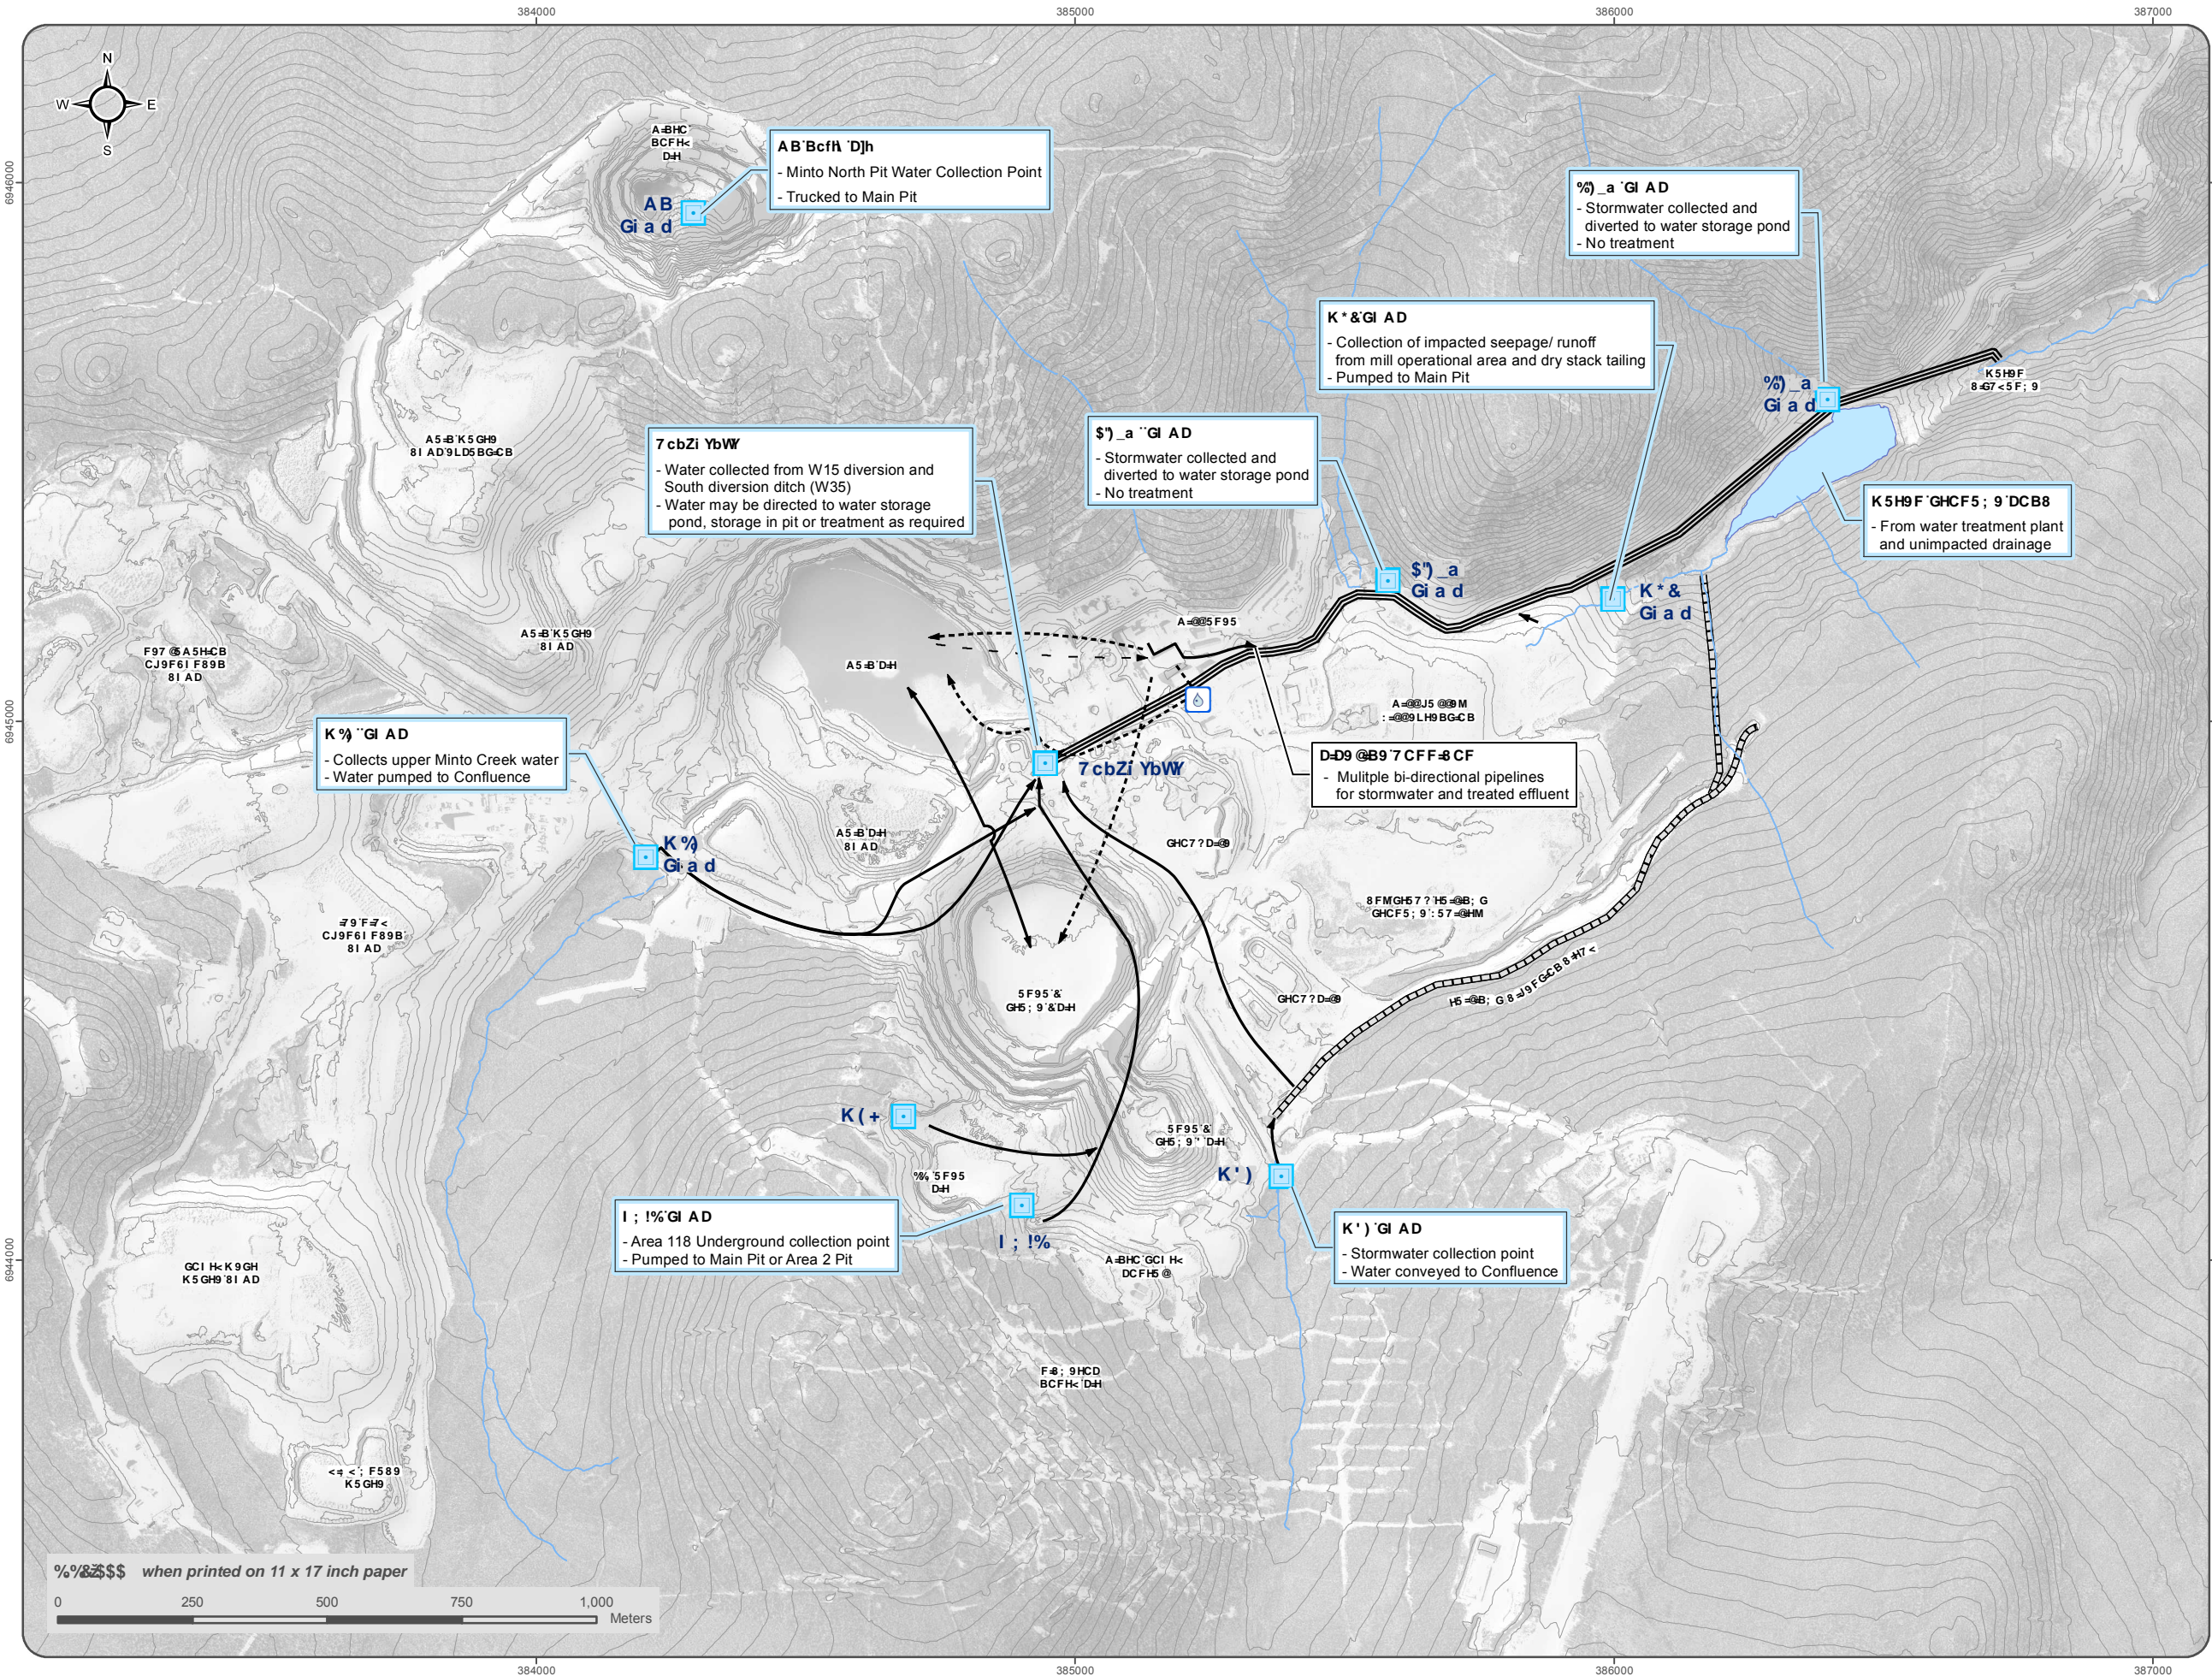

8.1 Water Storage and Conveyance Network

There were two major changes to Minto's conveyance structures in 2017.

- Due to A2S3 pit development the location of the W35 sampling station was relocated to the south, or upstream. W35 now reports via a pipe to the A2 pit or to the Tailings Diversion Ditch, the selection of which is controlled by a valve.
- Area 118 pit (W47) was backfilled with waste rock and off-spec overburden from A2S3 pit development. As such, it is no longer used for water storage.

The strategy for managing the mine water inventory was unchanged in 2017, and the water conveyance network is illustrated in Figure 8-1. Compliant (clean) surface water was collected and diverted to the WSP, and subsequently discharged to Minto Creek. Runoff from developed mine areas (mine water) was collected and stored in the Main Pit and Area 2 Pit, and was used for ore processing, deposition of tailings and feed water for the Water Treatment Plant.

In November 2017, the Main Pit and Area 2 Pit volume calculations were updated with current survey data to reflect changes in tailings and rock deposition from the previous bathymetry survey. Due to this adjustment, it is not possible to present meaningful data for water and tailings volume change over 2017. Instead, 2017 year end volumes are presented.

8.2 Water Storage Volumes Movement and Tracking

Water movement is tracked with flow meters on site, monitored and inspected on a weekly basis. Table 8-1 to 8-6 provide a summary of water volumes moved by conveyance structures around site in 2017. Please note that the total and net volume for each facility (WSP, MPTMF, A2PTMF) in the following tables only account for flow meter totals and do not account for evaporation and other losses/inputs.

Table 8-1: Water Storage Pond (WSP) Conveyance for 2017

| WSP | | |
|---------------------------------|--------|---------------|
| Input Volume (m ³) | | Total |
| W15 | 53,512 | 155,087 |
| W35 | 31,947 | |
| WTP | 36,877 | |
| W17 | 32,751 | |
| Output Volume (m ³) | | Total |
| WTP | 0 | 115,646 |
| W17 Seep | 32,751 | |
| Minto Creek (Environment) | 82,895 | |
| Net | | 39,441 |

| ERT | 1929.48 | |

8.2.1 Water Conveyance Tracking

Diversion of W35 water (SDD): Water was diverted from the south catchment (collected at station W35) to the Main Pit and the WSP. An estimated total of 62,960 m³ moved through the SDD in 2017 as measured by a Mace FloSeries® 3 open pipe flow measuring device. The Mace Flo Series device was calibrated to the pipe diameter size before operating, however due to ongoing issues with sediment deposit from haul road on the flow meter, readings were less accurate at times. During periods of heavy hauling in this area, the SDD was diverted to the Main Pit. In September 2017, the SDD was removed due to changes in the construction of the A2S3 pit. New conveyance infrastructure was installed to reroute water from W35 to the TDD or A2 Pit depending on water quality.

Diversion of W15 water: The W15 sump collects surface runoff from adjacent undisturbed catchments, the SWD and part of the MWD. A total of 115,977 m³ was conveyed through the W15 conveyance structure in 2017. The W15 flows were measured and recorded using a Seametrics® mag flow meter with digital head relay module.

Pump Back of W62 water (MVFES2 Sump): Water collected downstream of the mill area, ore stockpiles and DSTSF is collected at the MVFES2 Sump (which replaced the MCDS in 2016) and pumped back to the Main Pit for treatment. A total of 76,314 m³ was conveyed through this structure in 2017. The flow volumes were measured and recorded using a Seametrics® mag flow meter with digital head relay module.

8.2.2 Water Storage Tracking

Water storage on site is monitored for Minto reservoirs which include the Main Pit, the Area 2 Pit, their respective tailings management facilities, the Water Storage Pond (WSP), the Minto North Pit, and the Area 2 Stage 3 Sump. Appendix E provides a more comprehensive analysis of water movement, but presented below, Tables 8-7a and 8-7b provide a summary of their year-end storage volumes and the site-wide water yield.

Main Pit: The Main Pit was used as a reservoir to support the following: water use for the Mill process; collection of impacted runoff; supply feed water to the water treatment plant; and receive water from Area 2 Pit.

Area 2 Pit: The Area 2 Pit was used to support the following: supply water to the Mill via the Main Pit; collection of impacted site water; receiving water/tailings from the Mill.

WSP: The WSP worked effectively as a storage location for un-impacted water and maintained the water quality below effluent quality standards.

Table 8-7a: Minto Mine Water Storage Inventory, 2017

8.2.3 Water Conveyance Construction

Maintenance activities consisted of routine maintenance on water conveyance structures. In September 2017, the SDD was removed due to changes in the construction of the A2S3 pit. New conveyance infrastructure was installed to reroute water from W35 to the TDD or A2 Pit depending on water quality.

W47 (Area 118 Pit Sump) was backfilled with waste rock and off-spec overburden from the A2S3 pit.

At the end of 2017 the W45 piping from A2 pit to the Main pit was moved from the west side to the east side of the pit to improve access and facilitate pumping.

8.2.4 Water Balance and Water Quality Predictions Modeling

As per the WUL Clause 108, Minto is required to update the Water Balance and Water Quality Model. Minto retained SRK Consulting to complete a 2017 site water balance and water quality prediction model update. An updated 2017 Water Balance and Water Quality Model Summary for the Minto Mine is provided by SRK Consulting in [Appendix E](#).

8.3 Water treatment

Surface runoff that did not meet the WUL effluent standards was directed to the Main Pit through the W15 Pipeline, W35 SDD, or via the W62 pump back.

Minto has the option of treating for:

- Total suspended solids (TSS) only: clarification;
- TSS, copper and cadmium: clarification and chemical precipitation; or
- All water quality parameters present in the Main Pit: clarification and reverse osmosis (RO).

Water treatment by-products including TSS sludge and RO reject is pumped back to the Main Pit.

8.3.1 Operations Overview

The water treatment plant operated 62 days in 2017. From April 14 to May 31, 2017 and again from June 7 to June 21, 2017. The RO units operated for 729.6 hours producing 36,877.7 m³ of permeate. A total of 36,877.7 m³ of water was discharged to the WSP. The water treatment plant was shut down on June 21 because the nitrite concentrations in the effluent were above discharge criteria due to contaminant build up and membrane fouling.

Recovery for the water treatment plant in 2017 was low at 27.7% due to the high nitrite levels in the permeate.

Table 8-9: WTP Operating Statistics (2017)

| WTP Statistics 2017 | |
|---|---------|
| Plant Feed (m ³) | 132,910 |

8.4 Water Discharge

8.4.1 Discharge Volumes

Minto Mine discharged approximately 81,303.68 m³ of water to Minto Creek from the WSP via W16A in 2017. An additional 7 m³ was discharged from the WTP/RO to Minto Creek, this is discussed in the water quality section.

8.4.2 Compliance

As per WUL Clause 6 the rate of water discharge to Minto Creek is calculated based on daily creek flow measurements. The daily discharge volumes are presented below.

The calculated maximum allowable discharge was exceeded on one occasion in 2017. On May 31st the mine discharged 1554 m³ while the calculated allowable volume was 1553m³. This exceedance was believed to be due to a fluctuation in the pumping and was reported in the monthly WUL report. When the calculations were reviewed in July, the actual discharge was determined to be 1550 m³, with a maximum allowable discharge of 1379 m³. There were no other exceedances, before or after the

calculation correction. The 2017 daily discharge corrected values are presented in Table 8-10 and is presented graphically in Figure 8-2 below.

Table 8-11: 2017 Discharge Data

| Date | Daily flow rate in Minto Creek | Treated water from RO to Minto Creek, <i>day previous</i> | Daily water discharged WSP to Environment, <i>day previous</i> | Actual Daily Discharge | Qeff-c, Maximum Allowable Daily Discharge |
|-----------|--------------------------------|---|--|------------------------|---|

* not measured, not discharging

Water Quality monitoring stations are discussed in Section 5.2.

Figure 8-2: 2017 Discharge to Minto Creek

8.5 Hydrology

In 2017, and as part of the EMSRP, Minto monitored hydrological conditions at water quality stations including the following: stations within the operational mine area; stations downstream from the mine operational area that are influenced by mine effluent discharge; and reference stations downstream from the mine operational area that are not exposed to effluent. Hydrological monitoring is performed using a variety of methods including: manual discrete discharge measurements with combinations of flow meters, continuous stage measurements through the deployment of Solinst Level Loggers and Barometric Loggers and monitoring of an engineered flume.

8.5.1 Minto Creek Hydrology

Hydrological monitoring on Minto Creek is conducted in accordance with the requirements outlined in the WUL. During the 2017 monitoring period, Minto Mine maintained and collected data from the following four hydrometric stations along Minto Creek.

- W3: Flume downstream of the Water Storage Pond (WSP);
- MC-1: Located in Minto Canyon – mid-catchment;
- W1: Located approximately 1 km upstream of Yukon River – lower catchment; and
- W7: Tributary on the south side of Minto Creek.

At the hydrometric stations, Solinst Level Loggers and Barometric Loggers were used in conjunction with staff gauge readings and manual flow measurements to produce volumetric flow rates.

For details on the 2017 results of Minto Creek hydrology see the *Summary of Minto and McGinty Creek 2017 Surface Hydrology Memo* in [Appendix F](#).

8.5.2 McGinty Creek Hydrology

In 2017, hydrological monitoring on McGinty Creek was not conducted as per the schedule outlined in the EMSRP. It was noted late in the season that MN-1.5 was not monitored for continuous flow as there was no suitable location to set up a station in this area, however MN-0.5 was monitored instead. During the 2017 monitoring period, Minto Mine maintained and collected data from the following three hydrometric stations along McGinty Creek.

- MN-0.5: West Tributary of McGinty Creek
- MN-2.5: East Tributary of McGinty Creek
- MN-4.5: McGinty Creek near the Mouth

At the hydrometric stations, Solinst Level Loggers and Barometric Loggers were used in conjunction with staff gauge readings and manual flow measurements to produce volumetric flow rates.

For details on the 2017 results of McGinty Creek hydrology see the *Summary of Minto and McGinty Creek 2017 Surface Hydrology Memo* in [Appendix F](#).

8.5.3 Hydrology QA/QC

Detailed procedures for hydrology monitoring at the Minto Mine are detailed in the *Minto Mine Surface Water Hydrology SOP*. No changes were made to the hydrology SOP in 2017.

9 Physical Monitoring Program

Minto's physical monitoring program consists of a combination of instrumentation and visual inspections. Site wide inspections are carried out semi-annually - May/June post thaw and September pre freeze-up. Q2 inspection must be completed by an external geotechnical engineering consultant in accordance with Clause 13.2 of the QML. As specified in the WUL and *Minto Physical Monitoring Plan*, the following additional inspections are also performed:

- Active waste rock and overburden dumps – daily during construction;
- Active open pits – weekly;
- Diversion ditch – daily during water conveyance;
- Dry Stack Tailings Storage Facility, Mill Valley Fill Extension and Mill Valley Fill Extension 2 – monthly;
- Main Pit and Area 2 Pit tailings storage facilities – quarterly; and
- WSP dam – weekly (seepage), monthly (stability).

Deformation monitoring instrumentation includes survey hubs and borehole inclinometers, described in the following sections. A layout of physical monitoring instrumentation is provided in Figure 9-1, below. The updated *Physical Monitoring Plan* can be found in [Appendix G](#).

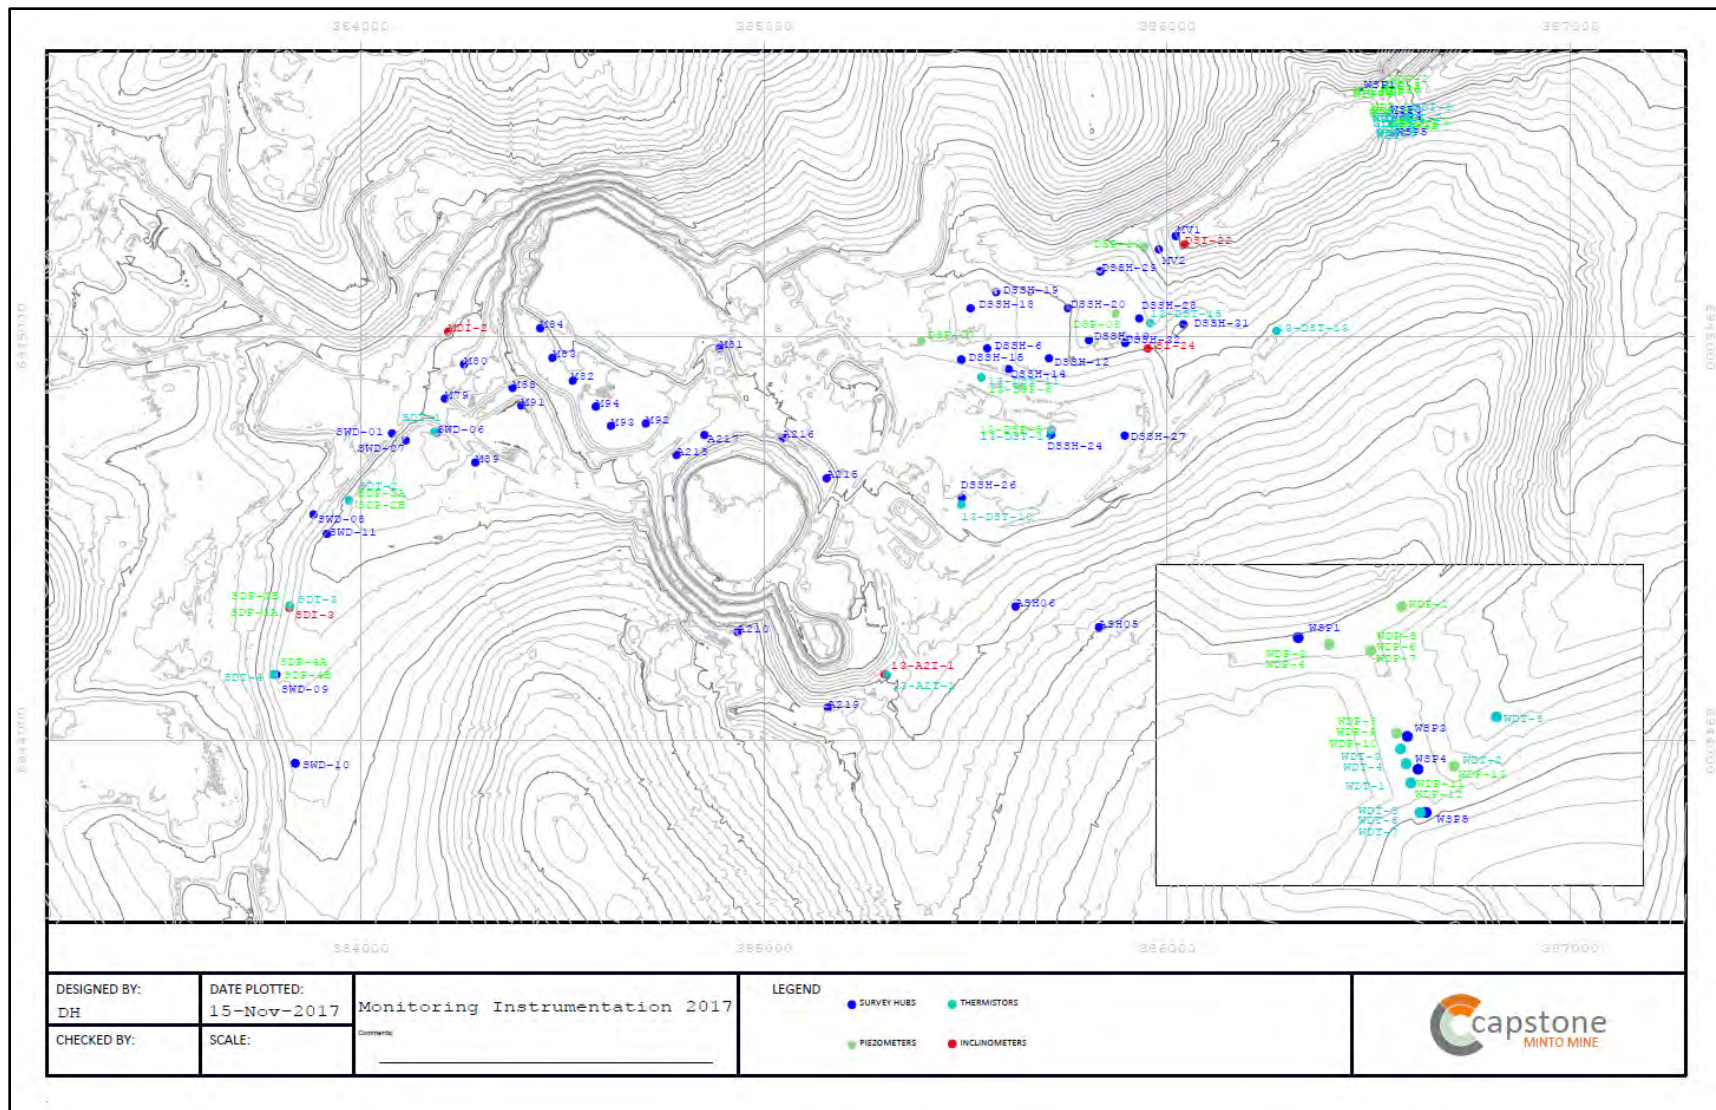

Figure 9-1: Physical Monitoring Program Installation (2017)

9.1 Physical Deformation Monitoring Instrumentation

9.1.1 Survey Hubs

Physical deformation monitoring consists of survey hubs at the Main Pit, Area 2 Pit, DSTSF, SWD and WSP dam. The monitoring results are summarized below.

9.1.1.1 Main Pit/South Wall Buttress Survey Hubs

There are currently 11 operating survey hubs on the Main Pit south wall buttress. Data collected are presented in Figure 9-2. Data was collected weekly for hubs M79, M80, M81, M89, M92, M93, M94. Data was collected weekly for hubs M82, M83, M84 and M88, and increased to twice-weekly when required as per the Adaptive Management Plan.

In general, the movement rates continued a gradual decrease in 2017, with rates now nearing zero movement in some of the hubs. The in-pit survey hubs indicated relatively consistent movement rates in 2017 as presented in Figure 9-3. M82 and M83 saw an increase in movement in May during the construction of the Main Pit Dump (MPD), prompting the installation of additional hubs and review of the data by the SRK Consulting (the Engineer of Record). This movement is associated with settlement of the in-pit dump, not part of the south wall buttress. M82, M83, M93, and M94 still show higher rates of movement, however, these rates are significantly less than those observed in survey hubs prior to the south wall failure and are not considered to be a stability concern.

Figure 9-2: Main Pit/South Wall Buttress Survey Hub Data (2011-2017)

Figure 9-3: Main Pit/South Wall Buttress Survey Hub Data (2014-2017)

9.1.1.2 Dry Stack Tailings Storage Facility/Mill Valley Fill Survey Hubs

There are currently 17 operating survey hubs on the DSTSF and MVFE2. Data collected are presented in Figures 9-4 and 9-5. Data are collected weekly. All hubs indicated a continued gradual decrease in movement rates in 2017. Most hubs have shown a decrease in movement rate since the construction of the MVFE2 in summer, 2016.

Figure 9-4: DSTSF Survey Hub Data (2012-2017)

Figure 9-5: DSTSF Survey Hub Data (2016-2017)

9.1.1.3 Southwest Dump Survey Hubs

There are currently 7 operating survey hubs on the SWD. SWD-03A and SWD-05A were replaced in July 2017 with SWD-10 and SWD-11. Data collected are presented in Figure 9-6. Data are collected monthly. Hubs indicated relatively consistent movement rates in 2017.

Figure 9-6: SWD Survey Hub Data (2011-2017)

9.1.1.4 Water Storage Pond Dam Survey Hubs

There are currently four operating survey hubs on the WSP dam. There was no change to the operational status of any the hubs in 2017. Data collected are presented in Figure 9-7. Data are collected monthly. Data continue to indicate no movement.

Figure 9-7: Water Retention Dam Survey Hub Data (2011-2017)

9.1.2 Inclinerometers

Physical deformation monitoring consists of monitoring of inclinometers at the DSTSF and Main Pit. The monitoring results are summarized below.

9.1.2.1 DSTSF Inclinometers

There are currently three operating inclinometers in the DSTSF area. DSI-23 sheared off in April 2017. The inclinometer probe was stuck in DSI-23 from April 2017 to July 2017 and was damaged in December 2017. Data collected are presented in Figure 9-8 through Figure 9-11. A2I-1 is monitored quarterly. DSI-22 and DSI-24 are monitored monthly.

Figure 9-8: DSTSF Inclinometer A2I-1 (2015-2017)

Figure 9-9: DSTSF Inclinometer DSI-22 (2017)

Figure 9-10: DSTSF Inclinometer DSI-23 (2017)

Figure 9-11: DSTSF Inclinometer DSI-24 (2017)

9.1.2.2 Main Pit Inclinometers

There is currently one operating inclinometer in the Main Pit west/south wall area. Readings recommenced in October 2013 after not having been recorded since November 2012. Data are collected quarterly. Data collected are presented in Figure 9-12.

Figure 9-12: Main Pit Inclinometer MDI-2 (2015-2017)

9.1.2.3 Southwest Dump Inclinometers

There is currently one operating inclinometer in the Southwest Dump area. Readings re-commenced in April 2014 after not having been recorded since November 2012. Data are collected quarterly. Data collected are presented in Figure 9-13.

Figure 9-13: Main Pit Inclinometer SDI-3 (2015-2017)

9.2 Engineer’s Annual Physical Inspection Reports

As required by the WUL and QML, the following structures are inspected semi-annually by Minto’s geotechnical engineer and annually by an external geotechnical engineering consultant:

- Big Creek Bridge;
- Mill and camp site;
- Dry Stack Tailings Storage Facility and Mill Valley Fill Extension (Stage 1 and 2);
- Fuel containment facility;
- Main Waste Dump;
- Ore stockpiles;
- Reclamation Overburden Dump;
- Ice Rich Overburden Dump;
- South Diversion Ditch;
- Tailings Diversion Ditch
- Southwest Waste Dump;
- Main Pit including South Wall Buttress and In-Pit Dumps;
- Water Storage Dam;
- Area 118 and Area 2 Pit; and,
- Minto North Pit.

Table 9-1 summarizes the recommendations from the most recent external inspection conducted June 26-28, 2017 and the associated planned actions.

Table 9-1: Annual Physical Inspection Report Summary (2017)

| Area | Recommendation | Action |
|---------------------------------|---|--|
| DSTSF/MVFE2 | <p>Two readings should be collected from DSI-24 on the same day confirm accuracy of the readings, and readings collected on a weekly basis until the quality of inclinometer data can be confirmed.</p> <p>Additional fill should be placed in the pooled depression at the south end of the facility to prevent ponding.</p> <p>Continue to monitor the exposed slope south of the Minto Creek Seepage Collection System for signs of retrogressive failure to determine if any slope stabilization measures are required.</p> | <p>Readings were collected on DSI-24 as per recommendation. No concerns about data quality, additional training of monitoring technicians was required.</p> <p>Additional fill was placed in August 2017.</p> <p>Slope has been monitored monthly during the MFE2 inspections. No changes have been noted.</p> |
| Tailings Diversion Ditch | <p>The vegetation in the western portion of the channel should be removed prior to the planned diversion of the South Diversion Ditch into the Tailings Diversion Ditch.</p> | <p>Completed in November 2017.</p> |

| Area | Recommendation | Action |
|--|---|--|
| Camp Site | Continue to monitor the slough at the west end of the camp area and the erosion channels below the camp pad following large rainfall events. | Monitoring of erosion channels already apart of the Camp Site inspection carried out bi-annually. |
| South Diversion Ditch | <p>No actions are required provided the SDD is decommissioned in August 2017, as planned. However, should the SDD not be decommissioned the followings actions are recommended:</p> <ul style="list-style-type: none"> o Clean the overflow spillway on both sides of the access road and clear the inlet to the culverts. o Clear the vegetation within the SDD prior to 2018 freshet. | SDD was decommissioned in August 2017. |
| WSP Dam | Continue regular monitoring of the dam as per the OMS Manual. | Monitored during monthly inspections as per OMS Manual. |
| South Wall Buttress / In Pit Dump | <p>Clear the loose rocks beneath M82</p> <p>During SAT material placement, truck traffic is to be maintained a minimum of 5 meters away from the dump face, or a spotter is to be present.</p> <p>Continue to limit access to the In-Pit Dump area near M84.</p> | <p>M82 was inspected and data reviewed. Determined there was no need to move the hub.</p> <p>Recommendations were already apart of the SAT dumping Safe Work Practice.</p> <p>Access has remained limited to the Geotechnical EITs and Mine Technical Assistants</p> |
| Area 2 pit | Review radar data of the Area 2 Stage 3 Pit to confirm any areas of movement and the rate of movement. Based on the results, establish a survey hub(s) to monitor area. | Radar date was reviewed in June 2017. No movement of the overburden was observed. One survey hub was installed along the pit crest to monitor for any movement. |
| Instrumentation | <p>More attention needs to be paid to the stability of the inclinometer readings during collection to ensure quality data is collected. Data should be reviewed following collection and new readings should be taken if data is of poor quality.</p> <p>All survey hubs mounted on lock-blocks should be inspected to determine if readings may be affected by uneven ground conditions. The ground should be level and clear of all debris/loose rocks.</p> | <p>Additional training of monitoring technicians was required; training was completed in July 2017.</p> <p>Inspection of all survey hubs completed in July 2017.</p> |

10 Adaptive Management Plan - Operations

The Operations Adaptive Management Plan has been in use since WUL QZ14-031 became active. Adaptive Management Plan 2017-01 (AMP 2017-01) is currently approved by Energy, Mines and Resources (EMR) under the current Quartz Mining License (QML-0001); while the Adaptive Management Plan 2017-02 (AMP 2017-02) is approved under by the Yukon Water Board under the current Water Use Licence (QZ41-031). This section includes the assessment to the AMP of 2017-02 specific thresholds.

The comparative tables and associated trigger levels for the adaptive management stations and the required trend analyses are included in the monthly WUL reports.

A summary of the AMP 2017-02 exceedances is included in the sections below. Not all threshold concentration exceedances result in the triggering of AMP responses, as determined by the AMP2017-02.

10.1 Surface Water Quality – Minto Creek

There were no triggers of the AMP in January, February, March, or September to December.

10.1.1 Minto Creek – W2

A summary of the W2 exceedances of the AMP are discussed below in Table 10-1. Trend analysis, evaluations and data has been presented in the monthly reports.

Table 10-1: Minto Creek Surface Water threshold exceedances, Station W2

| Date | Parameter | Exceedance Threshold Triggered | Context |
|-----------|-----------|--------------------------------|---|
| 30-Apr-17 | Al | SPT1 | 1 out of 37 samples exceeded threshold concentration, prior to the discharge period |
| 24-May-17 | As | SPT3 | 3 out of 37 samples exceeded threshold concentration, during the discharge period |
| 6-Jun-17 | | SPT3 | |
| 13-Jun-17 | | SPT3 | |
| 18-Apr-17 | Cu | SPT1 | 3 out of 37 samples exceeded threshold concentration, prior to the discharge period |
| 30-Apr-17 | | SPT3 | |
| 1-May-17 | | SPT1 | |
| 24-May-17 | Mo | SPT3 | 8 out of 37 samples exceeded threshold concentration, during the discharge period. |
| 31-May-17 | | SPT3 | |
| 13-Jun-17 | | SPT3 | |
| 20-Jun-17 | | SPT3 | |
| 27-Jun-17 | | SPT3 | |
| 11-Jul-17 | | SPT3 | |
| 27-Jul-17 | | SPT3 | |
| 1-Aug-17 | | SPT3 | |
| 13-Jun-17 | NH3 | SPT1 | 1 out of 37 samples exceeded threshold concentration, during a period of high precipitation |

Ongoing events are addressed specifically as follows:

Arsenic – Trend analysis and comparison to W3 results indicate the source of the As-D is not mine related, as presented in monthly reports. A trend analysis was conducted on arsenic concentrations at W2 and W3 over 2 years. W2 concentrations are higher than W3, indicating a natural source in the Minto Creek watershed. No further investigation is required.

Copper - The comparison of the W3 results, including trend analysis was conducted and showed W3 values to be stable and lower than those at W2 for dissolved copper. The mine was not actively discharging during April and the W3 values were lower than W2; therefore, mine loading is not indicated. Elevated levels did not continue into the discharge season. No further investigation is required.

Molybdenum - Minto applied the specific responses as detailed in Table 2-1 of the Adaptive Management Plan (AMP Dec 2015) following the first event in May 2016. An investigation was conducted, AMP1 - Molybdenum Investigation, the report has been submitted to the inspector and to SFN. Mo-D will continue to be monitored but no further investigation will occur unless there is an increased level equivalent to half the CCME guideline for the protection of aquatic life (0.0365 mg/L). The concentrations of Mo-D appear to have stabilized during discharge events.

10.1.2 Minto Creek – W50

Minto monitored the specific performance thresholds for surface water quality in Minto Creek at WQO station W50 after October 30, 2017. There was no water and therefore no samples collected after October 30th, 2017 at W50. No adaptive management was required.

10.2 Surface Water Quality – McGinty Creek

Minto monitored the specific performance thresholds for surface water quality in McGinty Creek.

A summary of the MN-4.5 exceedances of the AMP are discussed below. Trend analysis and data has been presented in the monthly reports.

Not all threshold concentration exceedances result in the triggering of AMP responses.

Table 10-2: McGinty Creek Surface Water threshold exceedances, MN-4.5

| Date | Parameter | Exceedance Threshold Triggered | Context |
|-----------|-----------|--------------------------------|--|
| 26-May-17 | Cu | SPT1 | 1 out of 7 samples exceeded threshold concentration |
| 21-Oct-17 | Mo | SPT1 | 1 out of 7 samples exceeded threshold concentration |

| 16-Sep-17 | | SPT3 | |
| 21-Oct-17 | | SPT3 | |
| 10-Nov-17 | | SPT3 | |
| 26-May-17 | TSS | SPT1 | 1 out of 7 samples exceeded threshold concentration, single event likely due to freshet conditions |

Ongoing events are addressed specifically as follows:

The 12-month average CTE for nitrates was an on-going threshold exceedance of the AMP Specific Threshold 3, however the monthly samples were below all thresholds, except for November. A consistent natural increase is observed during the summer months at both locations. The comparative examination of the results from MN-1.5 indicated mine loadings were not likely responsible for the exceedance, as MN-1.5 is closer to the mine than MN-4.5, yet values are consistently below all AMP thresholds. It was

determined that the source of nitrates is not likely mine related and therefore does not trigger Specific Response Threshold 3.

The 12-month average CTE for dissolved selenium remained above the AMP Specific Threshold 3 at the end of 2017. The comparative examination of the results from MN-1.5 indicated mine loadings were not likely responsible for the exceedance, as Station MN-1.5 is closer to the mine than MN-4.5, the source of selenium does not appear to be mine related, therefore the Specific Response Threshold 3 is not triggered. No further investigation is required at this time.

10.3 Groundwater Quality – Minto Creek

Various exceedances of AMP levels triggered a review of the groundwater data by the qualified professional. All groundwater data was forwarded to SRK Consulting for review and recommendations. See Appendix H, *2017 Minto Groundwater Quality AMP Review Memo - SRK*, for details.

10.4 Groundwater Quality - McGinty Creek

Minto monitored the specific performance thresholds for McGinty Creek groundwater. Various exceedances of AMP levels triggered a review of the groundwater data by the qualified professional. All groundwater data was forwarded to SRK Consulting for review and recommendations. See Appendix H, *2017 Minto Groundwater Quality AMP Review Memo - SRK*, for details.

10.5 Water Management AMP

Water storage capacity in the Main Pit Tailings Management Facility and the Area 2 Pit Tailings Management Facility exceeded 1,000,000 m³ during the operational period and as such, no responses from the adaptive management plan were applied.

10.6 Physical Monitoring Program AMP

The results of the Physical Monitoring Program are compared to the thresholds set out in the 2017 Adaptive Management Plan (AMP) on a weekly basis by the Geotechnical EIT. Table 10-3 and 10-4 below, summarize the threshold statuses for the Category 1 and Category 2 facilities.

Category 1 facilities are those found in areas of ice-rich periglacial foundations that have previously experienced deep seated foundation movement and include the Dry Stack Tailings Storage Facility, Mill Valley Fill Extension (Stages 1 and 2), Southwest Waste Dump, and South Wall Buttress/Main Pit Dump. Category 2 facilities are all other waste rock dumps, including the Main Waste Dump and Main Waste Dump Expansion, Reclamation Overburden Dump, and Ice-rich Overburden Dump.

Table 10-3: Category 1 Facilities – Threshold Status, December 2017

| Specific Performance Thresholds | Thresholds Exceeded | Response |
|--|---|--|
| <p>Specific Threshold 1</p> <ul style="list-style-type: none"> • Observation of unusual occurrence including: <ul style="list-style-type: none"> ○ tension cracks, settlement, or sloughing; ○ a seismic event that exceeds the 1:475 return period event¹; ○ abnormal seepage from any area of the slopes; ○ increased turbidity from seepage; • Physical damage. | <p>Main Pit In-Pit Dump/Main Pit Dump (MPD)</p> | <p>Tension cracking and settling has propagated for several years across the in-pit dump. The engineer of record (SRK) has reviewed and determined that the cracking is not a stability concern for the buttress. Cracking along NW corner noted on August 19, 2017, design engineer notified and monitoring plan put into place. SRK has reviewed and determined that the cracking is not a stability concern.</p> <p>Current conditions: Cracking is now covered in snow, no new cracking observed. The engineer of record (SRK) was notified and monitoring plan put in place</p> |
| <p>Specific Threshold 2</p> <ul style="list-style-type: none"> • One survey hub or inclinometer reading indicating an increase in the movement rate greater than the long-term trend and outside the range of instrumentation error. | <p>M82, M84</p> | <p>April 2016: Main Pit survey hubs M82 and M84 showing increase in long-term trend. SRK notified. M84 reading frequencies initially increased to daily, and have since been reduced to weekly. Inspections of the area daily during SAT dump construction.</p> <p>Current conditions: movement rate for M84 has decreased back to the long-term trend. Movement rates for M82 are greater than the long-term trend.</p> |
| <p>Specific Threshold 3</p> <ul style="list-style-type: none"> • For DSTSF and MVFE piezometers 13-DSP-05a, 13-DSP-06, 15-DSP-07, and 15-DSP-08, an increase in piezometric pressures under unfrozen or thawing conditions such that Ru^2 exceeds 0.44. • For MVFE2 piezometer 15-DSP-10, an increase in piezometric pressures under unfrozen or thawing conditions such that the equivalent water elevation is 3 m above the original ground surface. | <p>DSP-07 (2, 3, 4, 5, and 6)</p> | <p>December 2015: DSP-07 has displayed Ru values higher than 0.44 for sensors 2, 3, 4 and 5 since installation. This piezometer is outside the MVFE2 footprint and is not considered a stability concern. Reading frequency was increased to every two weeks (from monthly). High initial values may have been due to grout curing.</p> <p>Current conditions: Readings have been slowly increasing, sensor 2-6 have an $Ru > 0.44$.</p> |

¹ This size of a seismic event would be felt by most people on site. It would shake buildings, and rattle or break dishes, hanging objects, etc. Earthquake information may also be found online at: <http://www.earthquakescanada.nrcan.gc.ca/index-eng.php>

² Ru is the pore water pressure coefficient which is the ratio of piezometric pressure to the overburden pressure. A pore water pressure ratio of 0.5 would be similar to the effect of a groundwater table at surface. Conversions from Ru to equivalent water elevation are contained in Table 2-15 of the 2017 AMP.

| Specific Performance Thresholds | Thresholds Exceeded | Response |
|---|-----------------------------------|--|
| <p>Or</p> <p>Temperature greater than zero at a depth of 2 m below original ground (<i>all SWD ground temperature cables, and DSTSF ground temperature cables DST-10, DST-11, and DST-14 only</i>)</p> | <p>DSP-08 (1)</p> | <p>April 2016: DSP-08 displayed Ru values higher than 0.4 for sensor 1 (@5m depth). The design engineer was notified. No instability was noted during inspections. Reading frequency was increased to bi-weekly (from monthly), and increased to daily while dumping in the immediate vicinity.</p> <p>Current conditions: Ru value is still >0.44, however, has been decreasing since June 30, 2016.</p> |
| | <p>DSP-08 (2, 3, 5 and 6)</p> | <p>May 31, 2016: An additional spike was noted on sensors 2, 3, 5 and 6. Again, the design engineer was notified and no instability was noted on inspection.</p> <p>Current conditions: no change, readings have been slowly increasing. Sensors 2, 3, 5, and 6 have Ru values >0.44.</p> |
| | <p>DSP-10</p> | <p>DSP-10 has displayed a water elevation >1m above ground surface depth since March 8th, 2016. The design engineer was contacted, and reading frequencies were immediately increased to weekly. Reading frequency was further increased to daily on March 14. On Sept 1, 2016 reading frequency was reduced to weekly, see response to Specific Threshold 4 for more details.</p> <p>Current conditions: equivalent water level is >3m.</p> |
| <p>Specific Threshold 4</p> <ul style="list-style-type: none"> For DSTSF and MVFE piezometers 13-DSP-05, 13-DSP-06, 15-DSP-07, and 15-DSP-08, an increase in piezometric pressures under unfrozen or thawing conditions such that Ru exceeds 0.6. For MVFE2 piezometer 15-DSP-10, an increase in piezometric pressures under unfrozen or thawing conditions such that the equivalent water elevation is 10 m above the original ground surface | <p>DSP-07 (2, 3, 4, 5, and 6)</p> | <p>February 3, 2016: DSP-07 sensors 2 and 3 are above the 0.6 threshold.</p> <p>May 15, 2016: DSP-07 sensor 5 is above the 0.6 threshold.</p> <p>January 14, 2017: DSP-07 sensor 4 is above the 0.6 threshold.</p> <p>December 5, 2017: DSP-07 sensor 6 is above the 0.6 threshold.</p> <p>This piezometer is outside the MVFE2 footprint and is not considered a stability concern.</p> <p>Current conditions: no change, readings have been slowly increasing.</p> |
| | <p>DSP-08 (1)</p> | <p>April 29, 2016: DSP-08 sensor 1 is above 0.6 threshold. Review of conditions by the Geotechnical EIT and engineer of record, SRK Consulting. Conditions have stabilized. Construction complete, inspections reduced to monthly. Reading frequency maintained at bi-weekly. No stability concerns identified.</p> |

| Specific Performance Thresholds | Thresholds Exceeded | Response |
|---------------------------------|---------------------|---|
| | | Current conditions: Ru value is still >0.6, however, has been decreasing since June 30, 2016. |
| | DSP-08 (2) | <p>July 1, 2016: DSP-08 sensor 2 is above 0.6 threshold. Review of conditions by the Geotechnical EIT and engineer of record, SRK Consulting. Conditions have stabilized. Construction complete, inspections reduced to monthly. Reading frequency maintained at bi-weekly. No stability concerns identified.</p> <p>Current conditions: no change, readings have been slowly increasing.</p> |
| | DSP-08 (3) | <p>February 25, 2017: DSP-08 sensor 3 is above 0.6 threshold. Construction complete, inspections reduced to monthly. Reading frequency maintained at bi-weekly. No stability concerns identified.</p> <p>Current conditions: no change, readings have been slowly increasing.</p> |
| | DSP-08 (5) | <p>December 17, 2017: DSP-08 sensor 5 is above 0.6 threshold. No stability concerns identified.</p> <p>Current conditions: no change, readings have been slowly increasing.</p> |

| Specific Performance Thresholds | Thresholds Exceeded | Response |
|---|------------------------------|---|
| | DSP-10 | <p>DSP-10 has displayed an equivalent water level >3m above ground surface depth since April 1st, 2016. Since September 2016 the equivalent water level has been >10m above ground surface.</p> <p>Summary of actions below:</p> <ul style="list-style-type: none"> • April 1, 2016: Design engineer notified. Inspection frequency increased to daily. Dumping on the lower tier was suspended. • April 4, 2016: Two survey hubs were installed on the eastern slope to monitor for movement with a daily reading frequency. • April 5, 2016: The lower tier was re-opened for dumping after stabilization of piezometer values. Going forward, piezometer data was reviewed prior to dumping each subsequent lift. • May 3, 2016: Inspections were reduced to weekly, with a daily review of monitoring data. • When working along the eastern edge of the final lift, a daily inspection was conducted. • August 25, 2016: Survey hub reading frequency reduced to weekly as construction was complete. • Sept 1: Piezometer reading frequency was reduced to weekly as the data had stabilized and construction was complete. • Once the facility construction was complete, the inspections were reduced back to monthly. Piezometer readings remain on a weekly schedule. <p>Current conditions: equivalent water level is >10m.</p> |
| <p>Specific Threshold 5</p> <ul style="list-style-type: none"> • Three consecutive survey hub or inclinometer readings indicating an increase in the movement rate movement greater than the long-term trend. <p>Or</p> <ul style="list-style-type: none"> • Three consecutive survey hub readings indicating a change in horizontal direction of movement greater than 15 degrees from the long-term trend, | M82, M84 | <p>April 2016: Main Pit Dump survey hubs M82 and M84 showing increase in long-term trend. SRK notified. M84 reading frequencies initially increased to daily, and have since been reduced to weekly. Inspections of the area daily during SAT dump construction.</p> <p>Current conditions: movement rate for M84 has decreased back to the long-term trend. Movement rates for M82 are greater than the long-term trend</p> |
| | M82, M83, M88, M91, M93, M94 | <p>August 2017: High rates in both M82 and M83. SRK notified, reading frequency for all Main Pit hubs increased to daily. Six new survey hubs installed. There is some indication that rates are now decreasing. SRK has reviewed the current conditions and determined that the movement rates are not an immediate stability concern.</p> <p>Current conditions: Moderate movement rate for M82, M83, M88, M91, M93, and M94. Rates are</p> |

| Specific Performance Thresholds | Thresholds Exceeded | Response |
|---------------------------------|---------------------|--|
| | | greater than 1 mm/day but are significantly less than rates seen prior to the South wall failure (>20 mm/day). |
| | M81, M82, M83, M84 | <p>M81, M82, M83 and M84 have all displayed a change in horizontal movement greater than 15 degrees from the long-term trend. These directional changes occurred in January 2013 (M81), April 2016 (M82 and M83) and May 2016 (M84). Inspection of all hubs conducted with no change in conditions noted. Reading frequency increased to weekly. Increase in movement for M82 and M83 observed in May 2017. The engineer of record (SRK) was notified and monitoring plan has been put in place.</p> <p>Current conditions: no further change in the direction of movement observed. Movement rates for M82 and M83 have remained steady.</p> |
| | SWD-06 | <p>SWD-06 has displayed a change in horizontal movement greater than 15 degrees from the long-term trend.</p> <ul style="list-style-type: none"> • September 2016: the long-term trend changed from 132 degrees to 171 degrees. An inspection was conducted, and the change is likely due to differential settlement of the hub during spring thaw. • November 2016: the long-term trend changed from 171 to 85 degrees. An inspection was conducted, and the change is likely due to frost heave along the western edge of the survey hub; similar trend in movement was observed during the previous winter. • June 2017: the long-term trend changed from 085 to 180 degrees as glaciated ice melted below the western edge of the survey hub. <p>Current conditions: no further change in the direction of movement observed.</p> |

Table 10-4: Category 2 Facilities – Threshold Status, December 2017

| Specific Performance Thresholds | Thresholds Exceeded | Response |
|---|---------------------|---|
| <p>Specific Threshold 1</p> <ul style="list-style-type: none"> • Observation of unusual occurrence including: <ul style="list-style-type: none"> • tension cracks, settlement, or sloughing; • a seismic event that exceeds the 1:475 return period event; • abnormal seepage from any area of the slopes; • increased turbidity from seepage; • physical damage. | MWD | <p>1m-deep depression formed in May 2016 in on the 905m-elevation pad of the MWD, currently being used as a POX stockpile. No bulging noted at toe and no other stability concerns noted. Monthly inspections continued during active MWDE construction. MDI-2 showing no change in trend.</p> <p>Current conditions: no further changes observed. MWDE construction is now complete and progressive reclamation activities are underway.</p> |
| <p>Specific Threshold 2</p> <p>WSP Dam:</p> <ul style="list-style-type: none"> • One survey hub reading indicating an increase of movement outside range of instrumentation error. <p>All other Category 2 Facilities: Survey hub cumulative displacements between 150 mm and 500 mm.</p> | None | N/A |

| <p>Specific Threshold 4</p> <p>WSP Dam:</p> <ul style="list-style-type: none"> • Three consecutive survey hub readings indicating increase in movement outside range of instrumentation error. | None | N/A |

11 Aquatic Environmental Monitoring Program

The Aquatic Environmental Monitoring Program (AEMP) is composed of Minto's requirements under the MMER and biological monitoring of sediment, benthic invertebrates, fish and fish habitat. Monitoring under the MMER is presented in Section 11.1 and the biological monitoring of sediment, benthic invertebrates, fish and fish habitat is presented in Section 11.2.

11.1 Metal Mine Effluent Regulations Monitoring Programs

The Metal Mine Effluent Regulations (MMER) outline requirements for monitoring and reporting of discharged effluent volume and quality under the MMER to Environment Canada. Details of the Metal Mine Effluent Program, including sampling station locations and monitoring frequency, are outlined in the EMSRP and the results are submitted on a quarterly and annual basis to Environment Canada.

11.1.1 Effluent Monitoring Program

The MMER Program requires effluent monitoring and sampling at the final discharge point (FDP) station W3, downstream of the end of pipe discharge. The W3 sampling station is collected when there is a discharge of water at W3; testing occurs weekly for deleterious substances.

Weekly effluent monitoring samples are tested for the deleterious substances as described in the MMER including total metals (arsenic, copper, lead, nickel and zinc), total suspended solids (TSS), and pH. Weekly samples are collected at least 24 hours apart and not more than 7 days apart. Minto is striving for consistency and has internally scheduled MMER sampling to occur on Tuesdays.

Radium 226 and acute lethality tests are conducted quarterly due to the reduced frequency guidelines outlined in the MMER.

The Effluent Monitoring Program results are submitted to Environment Canada quarterly and are presented in [Appendix I](#).

11.1.2 Environmental Effects Monitoring Water Quality Monitoring

The EEM Water Quality Monitoring Program is designed to characterize water quality at the exposure area, the receiving environment and in reference (un-impacted) area. Water quality samples must be collected four times a year, not less than one month apart, while the mine is discharging effluent at the Final Discharge Point (FDP) of W3. Samples are collected at the exposure area (W3), receiving environment station (W2) and reference station (W7). Effluent toxicity testing is required annually using a total of four tests; one each of a fish, invertebrate, algae and plant species.

The EEM Water Quality Monitoring Program results submitted to Environment Canada annually, are presented in [Appendix I](#).

11.1.3 Environmental Effects Monitoring Biological Monitoring

The EEM Biological Monitoring Program outlines fish population, fish tissue and benthic invertebrate tests conducted under Schedule 5, Part 2 of the MMER. Minto Mine has submitted the results of the Phase 4 EEM Study Design Report as required to Environment Canada in January 2018. The *Phase 4 EEM Interpretive Report* is included in [Appendix J](#).

11.2 Biological Monitoring Program

Clause 71 and 72 of the WUL requires an Annual Biological Monitoring Program that includes monitoring of sediment, periphyton, benthic invertebrates, fish, and fish habitat. The following sections summarize the monitoring programs and more detailed reports can be found in [Appendix K](#) and [Appendix L](#). [Appendix K](#) contains information with respect to the sediment, periphyton, and benthic invertebrate monitoring programs and [Appendix L](#) contains information relative to the fish monitoring programs.

11.2.1 Sediment Monitoring Program

The objectives of the sediment monitoring program were to characterize particle size, total organic carbon content, and concentrations of metals, metalloids, and nutrients in sediments. A 10-day *Chironomus dilutus* and a 14-day *Hyalella azteca* sediment toxicity test were conducted in 2017 to evaluate survival and growth.

Sediments collected in 2017 were largely composed of fine particles in the silt and sand size categories (Table 11-1). Mean total organic carbon (TOC) content of sediment collected from upper Minto Creek (2.8%) was slightly higher than at the upper McGinty Creek (2.6%) reference area (Table 11-1). Lower Minto Creek had lower TOC (5.2%) than the reference area, lower Wolverine Creek (6.5%; Table 11-1). Arsenic and copper were the only analytes with mean concentrations greater than Interim Sediment Quality Guidelines (ISQG) for the protection of aquatic life (CCME 1999) in an effluent-exposed area (upper and/or lower Minto Creek; Table 11-1). However, mean arsenic concentrations in upper Minto Creek were below ISQG and lower than the reference area, upper McGinty Creek (which was greater than ISQG). This suggests that arsenic concentrations were unrelated to the mine. Mean copper concentrations in upper and lower Minto Creek were greater than the ISQG, and maximum copper concentration at upper Minto Creek was above the Probable Effect Level (PEL). Both areas had higher concentrations than the corresponding reference areas, which were lower than the ISQG (Figure 11-1). With progression from upper to lower Minto Creek, sediment copper concentrations decreased from a mean of 155 to 49 mg/kg, indicating improvement with distance downstream. Due to the predominantly erosional habitat in upper Minto Creek, relatively few areas had deposited sediment and even this occurred only in small quantities that likely wash away each year during freshet. Therefore, elevated sediment copper in fine sediment in the upper reaches of Minto Creek may be of limited importance in terms of exposure and potential effects to biota. In lower Minto Creek, fine sediment deposits are somewhat more common and therefore more relevant to aquatic life.

No effects to *H. azteca* survival or growth were observed during the sediment toxicity testing (Table 11-2). Survival of *C. dilutus* was significantly lower in sediment collected from lower Minto Creek than in laboratory control sediment (sand) and field reference sediment (lower Wolverine Creek; Table 11-2). Growth of *C. dilutus* was significantly greater in lower Minto Creek sediment compared to the reference sediment. In 2016, growth of *C. dilutus* was greater at lower Minto Creek but not significantly so. *H. azteca* results (no effects in 2017) were similar to those of 2011, 2015, and 2016 (Minnow 2012, 2016, 2017). Differences from previous years observed at lower Minto Creek in *C. dilutus* survival and growth suggest a possible adverse effect, but are not consistent with the results of previous years despite similar sediment chemistry.

Table 11-1: Sediment Chemistry Data Collected at Exposed and Reference Areas, Minto Mine (2017)

| Analytes | Units | CSQG ^a | | Upper McGinty Creek (Reference) | | | | Upper Minto Creek (Exposed) | | | | Lower Wolverine Creek (Reference) | | | | Lower Minto Creek (Exposed) | | | | |

- Indicates sediment concentration exceeding CSQG ISQG.
- Indicates sediment concentration exceeding CSQG PEL.
- Indicates sediment concentration exceeding higher reference mean by more than two times.

^a Canadian Sediment Quality Guidelines: ISQG = interim sediment quality guideline; PEL = probable effect level (CCME 1999).

Figure 11-1: Mean Copper Concentrations in Sediment Collected in Minto Creek and Reference Locations (mean ± standard deviation) (1994-2017)

Notes:

¹ Methods were not specified, fine sediment was collected in triplicate in the mainstem of Minto Creek (HKP 1994).

² Reference 1 = Station W6 (south-flowing tributary) in 2006 to 2008 and McGinty Creek in 2010 to 2017; Reference 2 = Station W7 (north-flowing tributary) in 2006 to 2009 and Wolverine Creek in 2010 to 2017.

* = no data.

TEL = Threshold Effect Levels.

Table 11-2: Minto Mine Sediment Toxicity Test Results Collected for Lower Wolverine and lower Minto Creeks, September 2017

| Area | <i>Hyalella azteca</i> | | <i>Chironomus dilutus</i> | |
|-----------------------------------|------------------------|-----------------|---------------------------|-----------------|
| | Survival (%) | Dry Weight (mg) | Survival (%) | Dry Weight (mg) |
| Control Sediment | 96 ± 5.5 | 0.11 ± 0.020 | 86 ± 8.9 | 1.2 ± 0.25 |
| Lower Wolverine Creek (Reference) | 94 ± 5.5 | 0.13 ± 0.030 | 90 ± 17 | 2.0 ± 0.24 |
| Lower Minto Creek (Exposed) | 92 ± 13 | 0.11 ± 0.020 | 48 ± 38 | 1.6 ± 0.32 |

- Significantly different than control sediment.
- Significantly different than reference sediment.
- Significantly different than reference and control sediment.

Note: Data presented as mean ± standard deviation.

11.2.2 Periphyton Monitoring

Periphyton production and community data were collected at lower Minto and lower Wolverine creeks. Productivity was assessed through measurements of chlorophyll-a in periphyton (used as a surrogate for the productivity of photosynthetic organisms).

Concentration of chlorophyll-a in periphyton was significantly higher at lower Minto Creek than at lower Wolverine Creek but both areas had concentrations below the British Columbia Water Quality Guideline (BCWQG) of 100 mg/m² for the protection of aquatic life (BCMOE 1985; Figure 11-2). In most years, production of both creeks was classified as low (oligotrophic), except in 2016 when lower Minto Creek was eutrophic and lower Wolverine Creek was mesotrophic. Production was classified based on the system of Dodds et al. (1998), which sets the oligotrophic-mesotrophic boundary for benthic chlorophyll-a at 20 mg/m² and the mesotrophic-eutrophic boundary was set at 70 mg/m². In 2017, production was classified as mesotrophic at lower Minto Creek (51 mg/m²) and oligotrophic at lower Wolverine Creek (13 mg/m²). Based on only total phosphorus, both creeks would be defined as oligotrophic as was observed in previous years (Dodds et al. 1998).

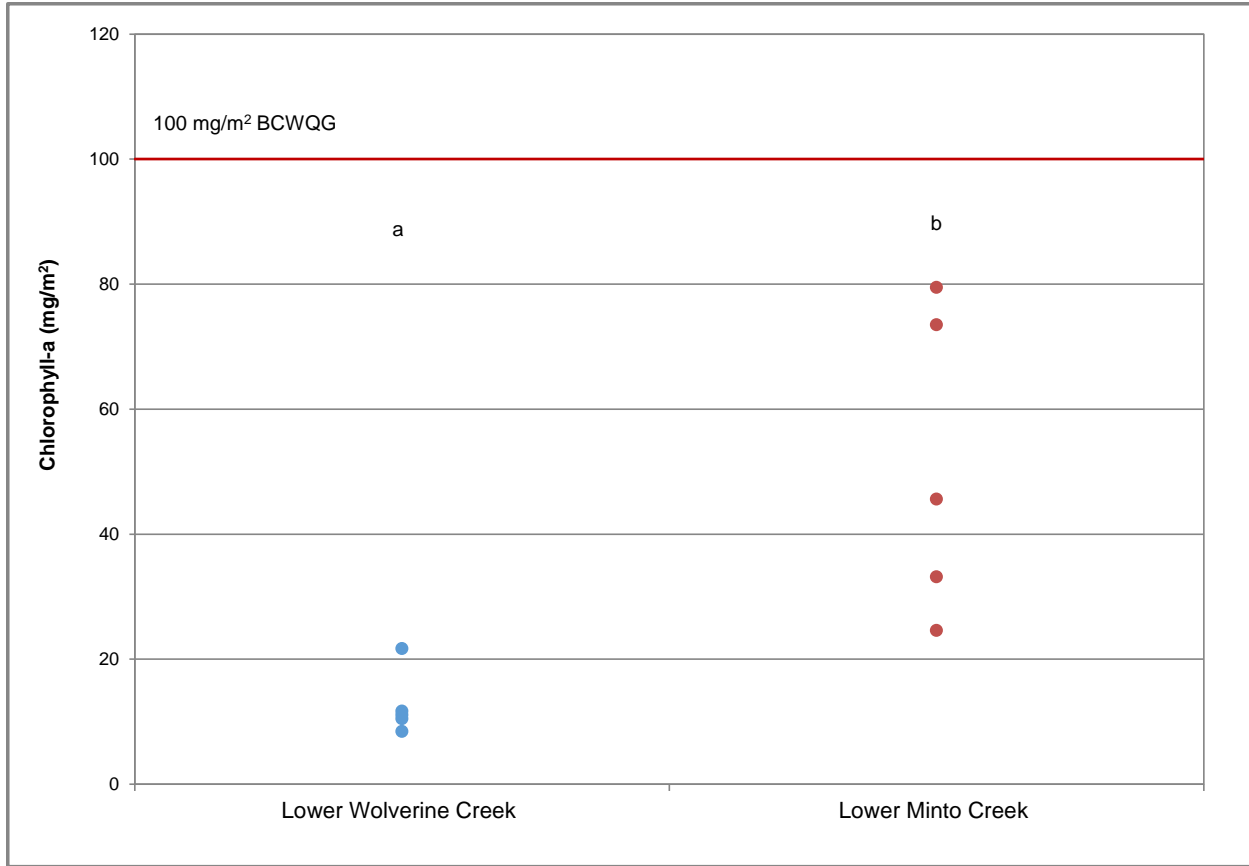

Figure 11-2: Concentration of Chlorophyll a in Periphyton Measured at Five Benthic Invertebrate Stations in Lower Wolverine and lower Minto Creeks, Minto Mine WUL, 2017

*Different letters represent significant differences between sites.

The periphyton community of lower Minto Creek was evaluated and compared to that of lower Wolverine Creek in order to evaluate any potential mine-related effects. Dominant phyla in lower Minto and Wolverine creeks were Bacillariophyceae (diatoms) and Cyanophyta (blue-green algae). Cyanophyta was dominant at lower Minto Creek (51% of community) and Bacillariophyceae was dominant at lower Wolverine Creek (95% of the community). Temporal variability in community composition has been high in both exposure and reference areas (Figure 11-3). For example, at lower Minto Creek, Bacillariophyceae were dominant in 1994, 2013, 2014, and 2016; Rhodophyta (red algae) in 2012 and Cyanophyta in 2011, 2015, and 2017 (Figure 11-3). This lack of temporal consistency was also observed at lower Wolverine Creek, with Cyanophyta dominant in 2011 and 2013 and Bacillariophyceae in 2012, 2014 to 2017 (Figure 11-3; Minnow 2013, 2014, 2015, 2016, 2017).

Note: Data presented as mean ± standard deviation

Figure 11-3: Periphyton Community Composition in Lower Minto Creek (1994, 2011 to 2017) and Lower Wolverine Creek (2011 to 2017), Minto Mine WUL, 2017

11.2.3 Benthic Invertebrate Community Monitoring

Benthic invertebrate communities at erosional areas of lower Minto Creek were summarized and compared to erosional areas of lower Wolverine Creek and lower Big Creek in order to evaluate any potential mine-related effects.

Benthic invertebrate community metrics of density, Simpson’s diversity, and Simpson’s evenness were not significantly different among areas (Table 11-3). Number of taxa and Bray-Curtis index showed significant differences among areas, but lower Minto Creek was intermediate between the reference areas (Table 11-3). This suggests a limited mine influence. Percent EPT did not differ significantly among areas but differences were seen with abundances of chironomids and oligochaetes (Table 11-3). The higher proportion of chironomids suggest a mine influence, but in combination with the lower proportion of oligochaetes and similar percent EPT taxa suggest limited influence of the mine on the benthic invertebrate community (Chapman et al. 1982a,b; Rosenberg and Resh 1993; Taylor and Bailey 1997). A potential decrease in number of taxa from 2012 to 2014 was not supported by the 2015 to 2017 data and appears to represent natural variability (Minnow 2015, 2016, 2017). The similarity of the benthic

community of lower Minto Creek to reference communities and the temporal stability in the benthic community of lower Minto Creek suggest limited mine influence.

Table 11-3: Statistical comparisons of Benthic Invertebrate Community Metrics, Minto Mine WUL, 2017

| Metric | Comparison | | Area Means | | Statistical Contrasts | | |
|---------------------------------------|-------------------|-----------------------|------------|------|---------------------------------------|-------------------|----------------------|
| | Exposure Site | Reference Site | | | Significant Difference between areas? | Direction | P-value ^a |
| Density (organisms/m ²) | lower Minto Creek | lower Wolverine Creek | 345 | 174 | NO | - | 0.208 |
| | | lower Big Creek | | 229 | NO | - | |
| Number of Taxa | lower Minto Creek | lower Wolverine Creek | 18 | 16 | NO | - | 0.813 |
| | | lower Big Creek | | 24 | NO | - | 0.213 |
| Simpson's Diversity ^b | lower Minto Creek | lower Wolverine Creek | 0.70 | 0.48 | NO | - | 0.105 |
| | | lower Big Creek | | 0.78 | NO | - | |
| Simpson's Evenness ^b | lower Minto Creek | lower Wolverine Creek | 0.22 | 0.18 | NO | - | 0.555 |
| | | lower Big Creek | | 0.20 | NO | - | |
| BC Index to Combined Reference Median | lower Minto Creek | lower Wolverine Creek | 0.79 | 0.82 | NO | - | 0.847 |
| | | lower Big Creek | | 0.67 | NO | - | 0.192 |
| EPT (%) ^c | lower Minto Creek | lower Wolverine Creek | 48 | 25 | NO | - | 0.161 |
| | | lower Big Creek | | 47 | NO | - | |
| Chironomids (%) | lower Minto Creek | lower Wolverine Creek | 31 | 4.7 | YES | Minto > Wolverine | 0.004 |
| | | lower Big Creek | | 27 | NO | - | 0.800 |
| Oligochaetes (%) | lower Minto Creek | lower Wolverine Creek | 6.8 | 65 | YES | Minto < Wolverine | 0.001 |
| | | lower Big Creek | | 15 | NO | - | 0.389 |
| CA Axis-1 (34.8%) | lower Minto Creek | lower Wolverine Creek | 224 | -212 | YES | Minto > Wolverine | 0.011 |
| | | lower Big Creek | | -214 | YES | Minto > Wolverine | 0.006 |
| CA Axis-2 (28.9%) | lower Minto Creek | lower Wolverine Creek | 10 | 190 | YES | Minto < Wolverine | 0.007 |
| | | lower Big Creek | | -169 | YES | Minto < Wolverine | 0.007 |

■ Indicates a statistically significant difference between exposed and reference areas, p = 0.10.

^a The overall p-value of the 3 group comparison used if there were no significant differences between all areas.

^b Calculated as recommended by Environment Canada 2012.

^c Percent Ephemeroptera (mayfly), Plecoptera (stonefly), Trichoptera (caddisfly).

Comparisons of benthic invertebrate community metrics in 2017 to those documented in previous years indicated substantial temporal variability (also observed with periphyton communities) at both the receiving environment and reference areas. Benthic invertebrate density in 2017 was lower than or similar to densities in 2012 (500 µm) and 2014 to 2016 but higher than in 2013 (Figure 11-4). Number of taxa at lower Minto Creek in 2017 was lower than in 1994 and within the historical range from 2006 onwards (Figure 11-4).

Notes: Data presented as mean ± standard deviation where replicated. Asterisk (*) indicates a year the mine was not discharging.

Figure 11-4: Primary Benthic Invertebrate Community Density and Taxon Richness at Lower Minto Creek, 1994 to 2017

11.2.4 Fisheries Monitoring Program

The objectives of the 2017 Fisheries Monitoring Program were to monitor, assess and characterize fish usage in Minto Creek during open water season, and to provide data allowing interpretation of the potential role and influence of the Minto Mine on the fish community. The 2017 fisheries program was a continuation of the previous year's components, and targeted all species that have previously been encountered as well as any new species. As part of the 2017 monitoring program, assessments at Big Creek were made concurrently with sampling in Minto Creek, to compare fish use in a neighbouring system relative to Minto Creek. Fish monitoring studies were conducted as per the EMSRP.

Fish monitoring of Minto Creek and Big Creek was conducted monthly during open water season, from June to September 2017, at trapping sites consistent with the 2010 mark-recapture study and the 2011 to 2016 fish monitoring programs. Capture effort included the use of Gee-type Minnow traps with 0.635 cm wire mesh size baited with Yukon River origin Chinook salmon roe. A total of six to fourteen minnow traps were set each time in Minto Creek, depending on water levels and availability of pools and backwater areas. Three to four traps were set each time in Big Creek, near the Minto road bridge.

All fish captured were identified, enumerated and measured for fork length or total length (± 1 mm), inspected for abnormalities, and released near their trapping location. Juvenile Chinook Salmon were also weighed (± 0.1 g) prior to being released.

Additional supporting information collected included photo documentation of the creek, water level readings at W1 staff gauge, in situ water parameters in Minto Creek, Big Creek and the Yukon River (temperature, dissolved oxygen, conductivity, pH, Oxidation-Reduction Potential), discharge at W1, as well as weather conditions at time of sampling. Supporting variables also included monitoring of the previously identified fish barrier (1.2 km upstream of the Yukon River confluence) and/or any new barriers that may have developed.

For details on the 2017 results of Fisheries Monitoring Program see [Appendix L](#).

11.3 Copper Toxicity Study

The copper toxicity study was initiated in 2015, due to a mild freshet and no major rainfalls, a turbid flow sampling could not be completed in 2016. The turbid flow sample was successfully collected in 2017. See [Appendix M](#) for a letter regarding the status of the program and the report on the copper toxicity for a turbid flow stream.

11.4 Aquatic Environmental Monitoring Program (AEMP) Review

As required by clause 102 of the WUL, a review and evaluation of the AEMP program was conducted in 2016. The next review is not required until 2019.

12 Meteorological Monitoring Program

Meteorological monitoring at the Minto Mine consists of data collection for the following parameters: rainfall, snowfall, temperature, evaporation, wind speed and direction, barometric pressure, relative humidity, and solar radiation (incoming and reflected). The Meteorological Monitoring Program includes the Climate Monitoring Program (EMSRP Section 4.1) and the Snow Survey Program (EMSRP Section 4.2). Data collected under the Meteorological Monitoring Program, along with baseline climatic data, provides input for the following mine projects:

- Site water management;
- Prediction for yearly water events (e.g. freshet);
- Design of water storage, conveyance and discharge systems; and
- Design of flood control structures on the road network.

12.1 Climate Monitoring Program

The 2017 Climate Monitoring Program data are presented below in Figure 12-1 through Figure 12-7. During 2017, Minto Mine had one meteorological station located approximately 70 m northeast of the north end of the airstrip, in an area that allows ample meteorological exposure from all directions. Trees are cleared for a radius of 30 m from the meteorology station and beyond that radius is a sparse growth of 2 m tall conifers.

The meteorology station is a research grade Campbell Scientific station that records the following parameters: maximum wind speed, minimum wind speed, average wind speed, wind direction, precipitation (rain and snow), temperature, relative humidity, pan evaporation, barometric pressure, solar radiation, and calculated evapotranspiration. Data are averaged over the one-hour archiving period and then saved to the datalogger.

The outgoing short wave radiation sensor and evaporation pan were operational in 2017.

At some point during February 2017 the power supply to the meteorology station became disconnected. It is uncertain how this occurred. The issue was not discovered until February 17th, 2017 as an intermittent communications error was thought to be the cause of the inability to communicate with the station. When the power supply was reconnected on February 17th, 2017, all data from January 25th to February 16th was lost, and partial data was lost from January 26th and February 17th.

12.2 Snow Survey Program

As required by the WUL Clause 96 and as part of the EMSRP, Minto collects snow data at the mine. The objective of the Snow Survey Program is to collect data used for calculating the snow water equivalent at the Minto Mine site. Snow water equivalents are inputs for the Minto Mine Site Water Balance models. Three courses are surveyed during the first week of February, March & April each year, a new course was added on the Dry Stack Tailings facility in 2017. If conditions permit, Minto will additionally survey the snow courses in May. These courses are East-facing (near the Dyno compound), North-facing (near the airstrip) and South-facing (above the Tank Farm), as detailed in Table 12-1. Along each course, ten stations are sampled using a machined core tube with cutting end and scale assembly. The parameters collected during the surveys include snow depth, core length, core weight, snow density, weather, site conditions, snowpack conditions, crust layers, and snow temperature. Multi-year results to 2017 (averaged across the three snow courses) are presented in [Appendix E – 2017 Water Balance and Water Quality Model Summary for the Minto Mine](#).

Table 12-1: Snow Survey Course Locations

| Course Location | Description | Aspect | UTM | |
|-----------------------------|--|--------------|------------|----------|
| | | | Easting | Northing |
| Dyno | East of the Dyno compound on an east facing slope along a cut line surrounded by moderately densely tree area. | East Facing | 8V 383 594 | 694 3377 |
| Fuel Farm | North of the Minto Mine fuel farm on a south facing slope in a sparse to moderately densely treed area. | South Facing | 8V 385 061 | 694 5318 |
| Airstrip | Northeast of the Minto Mine airstrip on a north facing slope in a sparsely treed area. | North Facing | 8V 386 255 | 694 4284 |
| Dry stack Tailings facility | Directly on top of the Dry stack storage facility. | Flat | 8V 385 525 | 694 4786 |

12.3 Meteorology QA/QC

Procedures for meteorology monitoring at the Minto Mine are detailed in the Meteorology Station Standard Operating Procedures. Minto has installed a satellite connection to the Met Station 2 to enable real time viewing of the weather station data. The meteorology data is downloaded and reviewed twice monthly by Environmental Department staff and routine visual inspections of the monitoring stations occur on a weekly basis.

13 Geochemistry

13.1 Waste Rock Verification Program

The Waste Rock Verification Program was initiated in 2014 to support and monitor waste rock handling procedures at the Minto Mine. The program was developed to address Clause 95 of the WUL, with the results of the program to be included in the Annual Report. The program consists of detailed record keeping on the type and quantity of waste rock placed at each location, and monitoring and verification of the characteristics of the waste rock stored at each location as per the Waste Rock and Overburden Management Plan.

Minto's Technical Services Department tracks all waste dispatched between the source and the destination using the mine's computer database system. The dispatch data are based on load count sheets compiled by the mining contractor.

Samples are taken by Minto geology personnel on dump crests that had been active in the previous month as determined by the production tracking database. The grab sample consists of one shovel full of material taken at twenty-five individual one meter intervals over the distance of the recently placed waste. Particles greater than a pebble (64-80 mm) in size are manually rejected, the sample is then labelled and delivered to Minto's onsite assay lab.

Each sample is analyzed for total copper (Cu (T)), total sulfur (S (T)), and total carbon (C (T)) content using an Eltra CS-800 induction furnace. S (T) and C (T) values are converted into equivalent Acid Potential (AP-S (T)) and Neutralization Potential (NP-C (T)) values, and NP-C (T): AP-S (T) ratios (NP/AP) are calculated for each sample. The resulting (NP-C (T)): (AP-C (T)) ratios are compared to the segregation criteria and assigned "pass" or "fail" designations, which is a 3:1 ratio at Minto.

During the year 2017, seventy-four grab samples of waste (WST) were collected from the Main Pit Waste Dump (MPD), twenty-four samples were collected from the Main Waste Dump Wrap (MWDW) and twenty-one samples from the 118-overburden dump. All the overburden and rock placed in these dumps during this period consisted of waste material from the Area 2 Stage 3 pit and the expansion.

Of the one hundred and nineteen sample taken from the three destinations, one hundred and eighteen met the pass criteria based on the NP/AP segregation criteria. The one failure, which occurred in June in the MPD, was determined to be an isolated event and therefore no additional sampling was required. The average monthly values of the Acid-Base Accounting (ABA) parameters for each dump location are summarized in Table 13-1, below. For a complete summary of the sample results, please refer to Appendix N.

Table 13-1: Waste Rock Management Verification Program Summary (2017)

| Average ABA Parameter Values: Month By Location | | | | | | | | |
|---|-------|------------|-------|----------|----------|-------|------|-------|
| Location | Month | Waste Type | Cu% | C% (Tot) | S% (Tot) | NP | AP | NP/AP |
| MPD | Jan | WST | 0.010 | 0.216 | 0.011 | 17.97 | 0.34 | 52 |
| | Feb | WST | 0.119 | 0.230 | 0.014 | 19.18 | 0.44 | 44 |

13.2 Acid-Base Accounting Program

The EMSRP commits to the submission of results of the ABA Program that was conducted during the reporting year. The ABA program determines the Neutralizing Potential Ratio ((defined as Neutralizing Potential divided by Acid Potential [NP/AP]) (NPR)) for overburden and waste rock to confirm that the NPR is greater than three. An NPR value of three or greater is generally considered indication of non-acid generating material. A separate, parallel program was initiated to determine the NPR of the tailings solids.

The following is a summary of results from the ABA program for the monitoring period of January to December 2017.

A total of 284 samples were collected from the Area 2 Stage 3 (A2S3), Area 2 Underground (A2 UG) and the Minto East Underground (ME UG) deposits and sent to an accredited laboratory (ALS Minerals) during the 2017 monitoring period. The samples were analyzed according to the MEND Modified NP Method as noted in the EMSRP.

The mean NP:mean AP results for waste rock samples was 15.26 for the duration of the monitoring period. 33 samples during the 2017 monitoring period were below the NPR threshold of 3 for waste rock. The mean paste pH values for all samples tested in 2017 was 8.50. The mean sulfide sulfur ($S(S^{-2})$) content for waste rock samples during the 2017 monitoring period was 0.082%. In 2017, 17 samples exceeded the $S(S^{-2})$ content threshold of 0.30% for construction grade waste rock.

15 tailings samples were analyzed in this period and had a mean NP:mean AP of 10.66. All tailings samples were well above a NPR of 4. All 15 samples of tailings were also below 0.30% $S(S^{-2})$ content and had a paste pH between 7.8 and 8.2.

A full report including lab results and analysis can be found in Appendix O.

13.3 Leach Pads

In 2017, two field scale leach pads were constructed and filled with Partially Oxidized Ore (POX – Leach Pad #1) and Low Grade Sulfide Ore (Green sulfide ore – Leach Pad #2), as per the EMSRP. The Pads were constructed in October, and the first leachate samples are expected to be collected in the spring of 2018.

14 Terrestrial Monitoring Programs

14.1 Wildlife Monitoring Program

The *Minto Mine Wildlife Protection Plan* (a component of the EMSRP) establishes guidelines for minimizing wildlife disturbance at the Minto Mine site and along the development corridor and includes a monitoring program to yield information about wildlife use in the area. The 2017 activities under the Wildlife Monitoring Program including the area and frequency of monitoring, are summarized in Table 14-1, below.

Table 14-1: Wildlife Monitoring Activities (2017)

| Area Monitored | Monitoring Activities | Frequency |
|-----------------------------|--|--|
| Wildlife Monitoring | Wildlife monitoring consisted of maintaining a wildlife observation log onsite and reporting wildlife encounters. Environmental personnel on site monitored project activities in order to address wildlife concerns. | Ongoing |
| Migratory Birds | Monitoring to determine if waterfowl and shorebirds settle on impacted water bodies, such as the Main or Area 2 Pits. Environmental personnel on site monitor project activities and modify operations to address wildlife concerns. | Seasonal, Daily during migratory periods |
| Species at risk/ of concern | Any caribou observations are reported to the Conservation Officer in Carmacks. Bank swallows have been observed to nest in residuum piles in the summer months, in which case these piles are cordoned off and left undisturbed until after the late summer migration. | As necessary |

In addition to the Wildlife Monitoring Activities listed in Table 14-1, the Minto Environmental Department gathered observations from mine site staff with Wildlife Observation forms. These forms were posted at many accessible locations around site and employees were encouraged to record all wildlife observations. The forms were collected periodically and the sightings entered in a wildlife tracking sheet, which is included in [Appendix P](#).

In 2017, 209 wildlife sightings were recorded. The majority of these sightings were comprised of mammals: 106 individual bear sightings, 31 foxes, 28 deer, 5 moose, 10 wolves, 9 lynxes, and 6 porcupines. Other animals observed on site included but were not limited to, hares, ermine, grouse, ptarmigan, sheep, dunlin, eagles, ducks and geese.

The most active animal observation month was August and the most common sighting was bears. Most the animal hazing activities occurred between June and August.

Additional activities that took place on site included wildlife education (including bear awareness training) and safety flashes concerning the prevention of wildlife habituation on site.

14.2 Erosion and Sedimentation Monitoring Program

As part of the EMSRP, Minto has developed and implemented a *Sediment and Erosion Control Plan* (SECP). The objective of the SECP is to minimize local site impacts from erosion and prevent sedimentation to the receiving environment of Minto Creek. The 2017 activities associated with the Erosion and Sedimentation Monitoring Program are identified in Table 14-2, below. There were no significant issues in 2017.

Table 14-2: Erosion and Sedimentation Monitoring Activities (2017)

| Activity | Location | Frequency |
|---|--|---|
| Visual inspections | Bottoms of slopes and depressions of large structures. | As needed following heavy rain events, and during freshet. |
| | Road routes: ditches and outlets of culverts and pipes. | As needed following heavy rain events, and during freshet. |
| Water quality monitoring for total suspended solids (TSS) | Water quality monitoring stations W2, W3, W50 and W17 | Weekly and during heavy runoff periods. |
| Physical inspection of surface facilities by a Yukon registered Engineer. | Water Storage Pond Dam, Mill Water Pond, all waste rock and overburden dumps, all water diversion and conveyance structures and the dry stack tailings storage facility. | After the spring thaw period in May/June of each year and again prior to the on-set of winter in September of each year |

14.3 Invasive Plant Species Monitoring Program

As part of the EMSRP, Minto developed an *Invasive Species Monitoring Standard Operating Procedure* in 2015. The Invasive Species Monitoring Plan, created in 2014, was the basis for the SOP. The SOP details how the monitoring program will be conducted.

The 2017 invasive species program focused primarily on the site access road. The Minto Environmental Department completed an invasive plant survey of the twenty-seven kilometer access road, focusing primarily on the high-risk species as listed by the Yukon Invasive Species Council (YISC) (Table 14-3). During the access road survey, one high-risk species (Common Tansy, *Tanacetum vulgare*) was observed growing along the access road. As per the EMSRP, the observed high-risk species was reported to the Yukon Invasive Species Council (YISC) Spotter’s Network. For a summary of the access road invasive species survey results, please refer to Table 14-4, below.

In accordance with the EMSRP, invasive plant surveys will continue through 2018, particularly along invasive species pathways such as roads with high visitor traffic, recently exposed areas, and areas that have been recently reclaimed.

Table 14-3: High Priority Invasive Species as determined by the Yukon Invasive Species Council, 2017

| Common Name | Latin Name |
|-----------------------|----------------------------------|
| Leafy Spurge | <i>Euphorbia esula</i> |
| Orange Hawkweed | <i>Hieracium aurantiacum</i> |
| Tall Hawkweed | <i>Hieracium piloselloides</i> |
| Perennial Sow Thistle | <i>Sonchus arvensis</i> |
| Scentless Chamomile | <i>Tripleurospermum inodorum</i> |
| Oxeye Daisy | <i>Leucanthemum vulgare</i> |
| Spotted Knapweed | <i>Centaurea stoebe</i> |
| Creeping Thistle | <i>Cirsium arvense</i> |
| Common Tansy | <i>Tanacetum vulgare</i> |
| Bird Vetch | <i>Vicia cracca</i> |

Table 14-4: Minto Mine Invasive Species Monitoring Program Results, 2017

| Survey Date | Location | Observed Species and Occurrence |
|-------------|--------------------------------------|---------------------------------|
| 19-Jul-17 | Access Road, Right Side, km 0.5-0.75 | Hawksbeard, Sporadic |
| 19-Jul-17 | Access Road, Right Side, km 1.5-2.5 | Hawksbeard, Sporadic |
| 19-Jul-17 | Access Road, Right Side, km 2.5 | Toadflax, Rare |
| 19-Jul-17 | Access Road, Right Side, km 3.25-3.5 | Hawksbeard, Sporadic |
| 19-Jul-17 | Access Road, Right Side, km 3.5-4.0 | Toadflax, Rare |
| 19-Jul-17 | Access Road, Right Side, km 4.25-5.0 | Hawksbeard, Continuous |
| 19-Jul-17 | Access Road, Right Side, km 5.75 | Toadflax, Rare |
| 19-Jul-17 | Access Road, Right Side, km 6.75-7.0 | Hawksbeard, Sporadic |

| Survey Date | Location | Observed Species and Occurrence |
|-------------|--|---------------------------------|
| 19-Jul-17 | Access Road, Right Side, km 6.75-7.25 | Toadflax, Rare |
| 19-Jul-17 | Access Road, Right Side, km 7.75-10.0 | Toadflax, Sporadic |
| 19-Jul-17 | Access Road, Right Side, km 10.0 | Common Tansy, Rare |
| 19-Jul-17 | Access Road, Right Side, km 10.5-10.75 | Toadflax, Sporadic |
| 19-Jul-17 | Access Road, Right Side, km 11.5 | Common Tansy, Rare |
| 19-Jul-17 | Access Road, Right Side, km 12.25-15.5 | Hawksbeard, Sporadic |
| 19-Jul-17 | Access Road, Right Side, km 12.25 | Toadflax, Rare |
| 19-Jul-17 | Access Road, Right Side, km 12.25 | Common Tansy, Rare |
| 19-Jul-17 | Access Road, Right Side, km 13.5 | Toadflax, Rare |
| 19-Jul-17 | Access Road, Right Side, km 15.0-17.25 | Sweet Clover, Continuous |
| 19-Jul-17 | Access Road, Right Side, km 15.75-16.5 | Hawksbeard, Rare |
| 19-Jul-17 | Access Road, Right Side, km 18.25-18.5 | Hawksbeard, Rare |
| 19-Jul-17 | Access Road, Right Side, km 18.25 | Toadflax, Rare |
| 19-Jul-17 | Access Road, Right Side, km 19.0-20.0 | Toadflax, Sporadic |
| 19-Jul-17 | Access Road, Right Side, km 19.5-19.75 | Hawksbeard, Sporadic |
| 19-Jul-17 | Access Road, Right Side, km 20.0 | Common Tansy, Rare |
| 19-Jul-17 | Access Road, Right Side, km 20.25-23.0 | Toadflax, Rare |
| 19-Jul-17 | Access Road, Right Side, km 23.25-23.5 | Hawksbeard, Rare |
| 19-Jul-17 | Access Road, Right Side, km 23.25-24.0 | Toadflax, Sporadic |
| 19-Jul-17 | Access Road, Right Side, km 24.25-27.0 | Toadflax, Rare |
| 19-Jul-17 | Access Road, Right Side, km 25.0 | Common Tansy, Rare |
| 19-Jul-17 | Access Road, Right Side, km 25.75 | Common Tansy, Sporadic |
| 19-Jul-17 | Access Road, Right Side, km 26.0 | Hawksbeard, Rare |
| 19-Jul-17 | Access Road, Right Side, km 27.0 | Hawksbeard, Rare |
| 20-Jul-17 | Access Road, Left Side, km 0.5 | Common Tansy, Rare |
| 20-Jul-17 | Access Road, Left Side, km 1.25-2.0 | Hawksbeard, Rare |
| 20-Jul-17 | Access Road, Left Side, km 1.5 | Sweet Clover, Rare |
| 20-Jul-17 | Access Road, Left Side, km 2.5-2.75 | Hawksbeard, Rare |
| 20-Jul-17 | Access Road, Left Side, km 2.5-2.75 | Toadflax, Rare |
| 20-Jul-17 | Access Road, Left Side, km 3.25-3.75 | Hawksbeard, Rare |
| 20-Jul-17 | Access Road, Left Side, km 4.75-5.75 | Hawksbeard, Rare |
| 20-Jul-17 | Access Road, Left Side, km 5.0 | Toadflax, Rare |
| 20-Jul-17 | Access Road, Left Side, km 6.25-6.75 | Hawksbeard, Rare |
| 20-Jul-17 | Access Road, Left Side, km 6.25 | Toadflax, Rare |
| 20-Jul-17 | Access Road, Left Side, km 7.0-8.75 | Toadflax, Rare |
| 20-Jul-17 | Access Road, Left Side, km 8.0 | Hawksbeard, Rare |
| 20-Jul-17 | Access Road, Left Side, km 8.5 | Hawksbeard, Sporadic |
| 20-Jul-17 | Access Road, Left Side, km 9.0 | Common Tansy, Rare |
| 20-Jul-17 | Access Road, Left Side, km 9.25-10.0 | Common Tansy, Rare |
| 20-Jul-17 | Access Road, Left Side, km 9.25-9.5 | Toadflax, Rare |

| Survey Date | Location | Observed Species and Occurrence |
|-------------|--|---------------------------------|
| 20-Jul-17 | Access Road, Left Side, km 9.75-10.25 | Toadflax, Sporadic |
| 20-Jul-17 | Access Road, Left Side, km 10.5-11.5 | Hawksbeard, Rare |
| 20-Jul-17 | Access Road, Left Side, km 12.0 | Hawksbeard, Rare |
| 20-Jul-17 | Access Road, Left Side, km 11.5-12.0 | Toadflax, Rare |
| 20-Jul-17 | Access Road, Left Side, km 12.25-12.75 | Common Tansy, Rare |
| 20-Jul-17 | Access Road, Left Side, km 13.0-14.75 | Toadflax, Rare |
| 20-Jul-17 | Access Road, Left Side, km 14.0 | Common Tansy, Rare |
| 20-Jul-17 | Access Road, Left Side, km 14.0-14.75 | Sweet Clover, Sporadic |
| 20-Jul-17 | Access Road, Left Side, km 15.5-16.75 | Sweet Clover, Continuous |
| 20-Jul-17 | Access Road, Left Side, km 16.25-16.75 | Hawksbeard, Sporadic |
| 20-Jul-17 | Access Road, Left Side, km 18.25 | Hawksbeard, Rare |
| 20-Jul-17 | Access Road, Left Side, km 18.75-19.0 | Toadflax, Sporadic |
| 20-Jul-17 | Access Road, Left Side, km 19.0-19.5 | Hawksbeard, Rare |
| 20-Jul-17 | Access Road, Left Side, km 19.25 | Common Tansy, Rare |
| 20-Jul-17 | Access Road, Left Side, km 20.0-20.5 | Hawksbeard, Rare |
| 20-Jul-17 | Access Road, Left Side, km 20.0 | Toadflax, Rare |
| 20-Jul-17 | Access Road, Left Side, km 21.0 | Hawksbeard, Rare |
| 20-Jul-17 | Access Road, Left Side, km 21.25 | Toadflax, Rare |
| 20-Jul-17 | Access Road, Left Side, km 21.75-22.0 | Hawksbeard, Rare |
| 20-Jul-17 | Access Road, Left Side, km 21.75 | Toadflax, Rare |
| 20-Jul-17 | Access Road, Left Side, km 22.5-23.0 | Toadflax, Rare |
| 20-Jul-17 | Access Road, Left Side, km 23.0-23.25 | Hawksbeard, Rare |
| 20-Jul-17 | Access Road, Left Side, km 23.5-24.0 | Toadflax, Rare |
| 20-Jul-17 | Access Road, Left Side, km 24.0 | Hawksbeard, Rare |
| 20-Jul-17 | Access Road, Left Side, km 24.75 | Hawksbeard, Rare |
| 20-Jul-17 | Access Road, Left Side, km 25.25-25.5 | Hawksbeard, Rare |
| 20-Jul-17 | Access Road, Left Side, km 25.5-27.0 | Toadflax, Sporadic |
| 20-Jul-17 | Access Road, Left Side, km 25.5 | Common Tansy, Rare |
| 20-Jul-17 | Access Road, Left Side, km 25.5 | Sweet Clover, Rare |
| 20-Jul-17 | Access Road, Left Side, km 26.25 | Hawksbeard, Rare |
| 20-Jul-17 | Access Road, Left Side, km 27.0 | Hawksbeard, Rare |
| 20-Jul-17 | Access Road, Left Side, km 27.0 | Sweet Clover, Sporadic |

14.4 Vegetation Metal Uptake Plan

The Vegetation Metal Uptake (VMU) program was not required in 2017. The next scheduled program is in 2019.

15 Site Characterization Report

The Site Characterization Report was submitted to EMR in January 2018. As per Clause 13.1 of the QML, the report will be updated in three years from the effective date of the licence. The submission date for the update was December 2017. An extension was granted to January to ensure a comprehensive report was completed. This report was also submitted to the Yukon Water Board in January 2018.

16 Reclamation

Reclamation activities at Minto Mine progressed throughout the monitoring period with the primary progressive reclamation focused on the following facilities:

- Mill Valley Fill Stage 2 (MVFES2);
- Dry Stack Tailings Storage Facility (DSTSF);
- Main Waste Dump Expansion (MWDE); and
- Southwest Waste Dump (SWD)

Reclamation research regarding the use of constructed wetland treatment systems as a closure water treatment option continued throughout the year. Details regarding the program for 2017 can be found in Section 16.2 or [Appendix Q](#).

16.1 Recontouring and Overburden Placement

Recontouring continued from 2016 with the primary efforts for recontouring spent on the MWDE and the SWD. SRK continued to work on refining the closure designs with Minto engineers to guide the construction of the final closure landform designs for facilities that are no longer required by the operation.

The MWDE recontouring started again in April after the waste rock thawed and could be pushed to final slope angle. The upper west slopes were the primary targeted and largely completed by the end of August. The recontouring at the SWD was primarily focused on the Ice Rich Overburden Dump and the overburden area, north of the medium grade waste pile. The Ice Rich Overburden Dump was recontoured and blended into west side of the SWD and is now full integrated with the SWD. The overburden area was backfilled and recontoured to allow for positive drainage in the area.

The stripping of the Area 2 Stage 3 released a total volume of 1.14M BCM (unreconciled) of overburden that met the soil cover specification. That material was directly hauled and placed on the four facilities throughout the entire year. Figure 16-1 to 16-6 show the extent of the overburden placement on the targeted facilities. The reclamation overburden was dispatched from the pit using the soil cover material criteria outlined in the Reclamation and Closure Plan (2016-01). The overburden was visually inspected by Minto environment and mine operations personnel, who were familiar with the cover material criteria. Overburden material that did not meet the soil cover criteria was hauled to the Area 118 backfill dump

while the material that met the reclamation cover specification was directly hauled to one of the four targeted facilities.

After spring thaw the majority of the soil cover material was spread out at a targeted thickness of 0.50cm. The spreading was focused on the flat sections of the facilities as well as the slopes of the DSTSF and the MVFE. Near the end of August, after all the overburden was placed it was determined that additional overburden would be required and so additional material was hauled to the targeted facilities in October through December. The additional material will have to be spread out in the spring/summer of 2018.

Figure 16-1: Minto Mine – Mill Valley Fill Extension Stage 2 completed in 2016.

Figure 16-2: Minto Mine – Overburden cover pushed into place on the MVFE and DSTSF.

Figure 16-3: Minto Mine - MVFE and DSTSF progressive reclamation, overburden cover placement (2017 overburden placement highlighted in red).

Figure 16-4: Minto Mine – Southwest dump progressive reclamation, overburden placement and stockpiling (highlighted in red).

Figure 16-5: Minto Mine – MWDE and Low Grade Waste progressive reclamation, overburden cover placement (highlighted in red).

Figure 16-6: Minto Mine – Site overview, all facilities.

16.1 2017 Reclamation Research

Reclamation research in 2017 focused primarily on carryover research of passive treatment technologies which started in 2014 and carried through 2017.

16.1.1 Passive Water Treatment

The demonstration-scale constructed wetland treatment system (CWTS) was constructed at Minto in 2014 and commissioned from 2015 through mid-2017 during which time the system matured and operational adjustments were made. Commissioning successfully established plant and microbial populations and achieved conditions conducive for treatment of constituents of concern. The demonstration-scale CWTS operational period ran for 35 days from mid-August to mid-September 2017.

Various aspects of the system were measured in 2017 and have been detailed under a separate report including operating conditions, water treatment performance, fate and distribution of treated metals, evapotranspiration, detritus decomposition rates, microbial community characterization (catalyzing treatment reactions), and pest control. The key findings of each phase of this research project are presented in table 16-2 below. A full detailed report can be found in [Appendix Q](#).

Table 16-1: Demonstration Scale Constructed Wetland 2017 Work Summary

| Item | Date | Activities | Actual |
|------------------------------|------------------|---|--|
| Construction | June 1-14 2014 | Identify potential location for demonstration scale CWTS (Contango site visit – 1 scientist) | Completed |
| | June - July 2014 | Engineering and geotechnical (Minto) | Completed |
| | July 2014 | Construction (Minto) | Completed |
| | August 2014 | Planting and bringing system online (Contango site visit – 1 scientist, 1 technologist), coordinate for local students to assist | Completed (no students available, brought 2 technologists) |
| Commissioning A | 2014 | Acclimation and maturation at constant flow rate, ~20 hr HRT | Completed |
| | | September - Contango site visit/checkup (1 technologist, 1 scientist) | Did not occur because construction was last week of August |
| | 2015 | Continued commissioning. Operation at constant flow rate, ~20 hr HRT | Completed (at shorter HRT) |
| | | Spring – Contango site visit/checkup (1 technologist, 1 scientist), includes micro sampling | Completed |
| | | Summer - Increase depth from 10 cm to 20 cm (1 technologist), includes micro sampling | Completed (scientist) |
| | | Fall – Contango site visit/checkup (1 technologist), includes micro sampling | Completed (scientist) |
| | 2016 | Minto to add sandbags prior to first site visit and begin W15 creek monitoring | Completed May/June 2016 |
| | | Spring – Contango site visit (1 scientist, 1 technologist), includes microbial sampling and tasks outlined in Table 2 of report. HRT tracer study completed, outlined in section 7 of report. | Completed June 2016 |
| | | Summer - Contango site visit/checkup (1 scientist, 1 technologist), includes microbial sampling and tasks outlined in Table 2 of report. Evapotranspiration study completed as outlined in section 5.5 of report. Organics were added to the CWTS as outlined in section 5.2.3 of report. | Completed July 2016 |
| | | Fall - Contango site visit/checkup (1 technologist), includes microbial sampling and tasks outlined in Table 2 of report | Completed September 2016 |
| Commissioning B ¹ | 2017 | Spring – Minto established low flow steady state in May. Contango site visit (1 scientist, 1 technologist), includes microbial sampling and tasks outlined in Table 2 of report. Continued commissioning/testing of CWTS including evapotranspiration and salt tracer studies. | Completed June 2017 |
| | | Summer – Contango site visit (1 scientist), includes microbial sampling and tasks outlined in Table 2 of the report., detritus collections | Completed July 2017 |
| Operational | 2017 | Fall – Operational testing completed by Minto: Water sampling, microbial, soils, water, biomass, detritus. | Completed September 2017 |

Table 16-2: Passive Water Treatment Research Key Findings (2015-2017)

| Objective | Purpose | Key Findings or Changes for Full-scale |
|--|---|---|
| Monitor explanatory parameters and performance | Determine when commissioning is complete and the operational period has begun | <ul style="list-style-type: none"> - Dissolved oxygen (DO) decreased from an average of 8.4 mg/L during commissioning- B in 2016, to an average of 5.3 mg/L during operations in 2017. The DO in the water column is likely the result of photosynthesis of algae and mosses. - Despite this DO level in the water column being in oxidizing ranges, stable reducing conditions were achieved in the CWTS soils within the targeted soil redox range (-100 to -250 mV). |
| Assess removal of constituents from the water | Develop Removal Rate Coefficients for application to Reclamation Closure Plan and Full-Scale treatment system | <ul style="list-style-type: none"> - Copper treatment in the CWTS was masked by leaching from the soils used in construction of the CWTS into the water, but this has mostly been remedied now by the wetland treating this copper and turning it into more stable sulfide forms in the soil. - During the operational period the demonstration-scale CWTS successfully achieved an average decrease in concentrations of 0.0169 µg/L for cadmium (from 0.0261 µg/L to 0.0092 µg/L), 31.8 µg/L for copper (from 49.1 µg/L to 17.3 µg/L), 3.6 µg/L for molybdenum (from 6.3 µg/L to 2.7 µg/L), 3.5 µg/L for selenium (from 4.0 µg/L to 0.5 µg/L), and 47.3 µg/L for zinc (from 49.2 µg/L to 1.9 µg/L). - Molybdenum and selenium treatment in the operational period is notable as the removal rates were negligible within the margins of error of the testing method in the commissioning-A period. |
| Determine the hydraulic retention time (HRT) | Use tracer trial and associated correction factor to apply to the nominal (calculated) HRT | <ul style="list-style-type: none"> - The tracer study effectively demonstrated the HRT (2.25 days) and flow symmetry through the CWTS. - There was a single flow path in the CWTS (shown by a single peak in the tracer study) - Water is incorporating into the CWTS soils (shown by the long tail for depletion of the tracer). - The nominal HRT is calculated from the area of the CWTS and the depth at the in-situ measuring points. This nominal HRT does not account for depth variations, embankment slopes, vegetation (using space in the water), or substrate pore space involvement. It was found that once all of these factors are in play, the correction factor from nominal to actual is only 0.01 added to the depth of the CWTS, which is incorporated into the HRT calculation as expressed in Equation 3. |
| Evaluate CWTS performance | determine achievable concentrations of contaminants of concern (thermodynamic minimums) | <ul style="list-style-type: none"> - Constituents are being treated by mineralization and sequestered to the soils (minimal plant uptake). - The lowest concentrations consistently achievable for the treatment design (thermodynamic minimums) were reached by the end of the A cells for cadmium and copper. - RRCs for cadmium and zinc in the 2017 demonstration-scale CWTS were artificially low because low flow rates did not provide the resolution needed to determine a RRC. - Removal rate coefficients (RRCs, <i>k</i>) have been developed that can be used for fullscale sizing. - Copper leaching from soils has decreased but is still likely making the RRC artificially low in this CWTS; however, the RRC is expected to improve once copper leaching has subsided. |

| Objective | Purpose | Key Findings or Changes for Full-scale |
|--|---|--|
| Update site-specific removal rate coefficients (from commissioning period) with data from operational period | Apply information to Reclamation Closure Plan and Full-Scale treatment system | <ul style="list-style-type: none"> - In pilot-scale testing specific for the Minto CWTS, the RRC for selenium was a zero-order reaction kinetic, however, optimizations of the operation of the system through the demonstration-scale commissioning have enabled a first-order RRC to be maintained. Therefore, cadmium, copper, selenium, zinc, and nitrate are calculated as first-order kinetics, but molybdenum followed a zero-order kinetic. In other words, the reaction rate for molybdenum is a constant rate and does not depend on concentration, whereas the reaction rates for cadmium, copper, selenium, zinc, and nitrate are proportional to concentration (a half-life type of reaction). |
| Determine amount of water loss due to evapotranspiration and effect on outflow concentrations | Design considerations for Full-Scale system | <ul style="list-style-type: none"> - The evapotranspiration studies revealed a significant loss of water, which will impact calculations of loads to the receiving environment (making them lower than previously estimated). - In May and June, an average water loss of 5.3 L/day/m² was observed, which is equivalent to 18-20% of water (~700 L/day lost in the demonstration CWTS). - During the evapotranspiration trials, copper leached into the water as it was transformed from an oxide mineral to a sulfide mineral (because of the copper in the soils used for construction). This is not representative of what would occur during periods with no flow in a full-scale CWTS, where soils with minimal leachable copper are used and copper is deposited in sulfide form (fraction 4) by the biogeochemical activity of the CWTS (Section 5.6). |
| Assess stability of constituents of concern in soils | Affects overall theoretical treatment capabilities of Full-Scale system | <ul style="list-style-type: none"> - In 2017, leachable copper concentrations in soils decreased in the top 0-10cm while total copper concentrations increased. - Most constituents, including copper, have shifted primarily into stable reduced and residual minerals fractions in the soil. - Acid volatile sulfides (AVS) were non-detectable in the CWTS in 2016. In 2017 small amounts of AVS were detected in cells 1A and 2A which indicates that residual sulfides are starting to become available for metal treatment and that copper in the soils are becoming rendered inert through sulfide mineralization. |
| Determine the rate and extent of detritus decomposition (<i>C. aquatilis</i> leaves) in the CWTS over time | Design considerations for Full-Scale system | <ul style="list-style-type: none"> - The detritus study suggested that algae growth on the assay devices had reached a steady state (growth vs decomposition) by ~23 days of the study. - After 83 days submerged in the CWTS, <i>C. aquatilis</i> decomposed on average 64%. |
| Assess treatment mechanisms (including microbes) | Apply information to Reclamation Closure Plan and Full-Scale treatment system | <ul style="list-style-type: none"> - Establishment of sulfide-producing bacteria (SPB) increased throughout 2017 and was highest after commissioning was completed. - SPB were found in highest abundance in root and soil samples. - The average number of different types of sulfide-producing bacteria increased over time in all sample types tested (root, soil, detritus, and moss). - Selenium-reducing and nitrate-reducing bacteria increased over time with the highest abundances found in <i>C. aquatilis</i> roots. |

| Objective | Purpose | Key Findings or Changes for Full-scale |
|--|---|---|
| Determine an appropriate method for insect pest control (aphids) in the CWTS | Optimize Operational success of Demonstration-Scale CWTS. | <ul style="list-style-type: none"> - Aphids were again found in abundance on <i>C. aquatilis</i> in 2017. - Efforts to control the aphid population on-site were made but an ongoing spraying regiment was not maintained and, therefore, aphids remained. However, no short term detrimental effect on <i>C. aquatilis</i> viability was observed, despite the persistence of aphids. - Damage to the above water vegetation was observed however new shoots were emerging in the CWTS and treatment COCs was not impacted by damage to the above water vegetation. - Effects of aphids on <i>C. aquatilis</i> did not affect treatment. - These issues with aphids are likely owing to the isolated nature of the demonstration scale CWTS and not expected to affect the full-scale CWTS. |

16.2 Proposed Reclamation for 2018

Proposed reclamation for 2018 includes the following:

- Contouring work on soil cover on the Mill Valley Fill Stage 2 Extension;
- Contouring work on soil cover on the Dry Stack Tailings Storage Facility;
- Contouring work on soil cover on the Southwest Waste Rock Dump;
- Contouring work on soil cover on the Main Waste Dump Expansion;
- Completion of Main Waste Dump Wrap;
- Minor recontouring work as required;
- Phase 1 seeding of soil cover; and
- Continuation of the Passive Water Treatment Research.

17 Socio-Economic Monitoring Program

The Minto Mine Socio-Economic Monitoring Program defines a framework for monitoring direct and indirect socio-economic effects from the Minto Mine. In 2017, as per the framework, Minto tracked and collected administrative data and other information relating to the mine's direct employment, training and procurement; worker safety; and Minto contributions to cultural well-being and community wellness. The 2017 socio-economic data which Minto tracked is summarized in [Appendix R](#).

18 Closure

Minto trusts this document fulfills the 2017 annual reporting requirements of Minto Mine's WUL and QML.

1 Introduction

Minto Mine (administered by Minto Explorations Ltd. (Minto)) is a high-grade copper and gold mine that is located 240 km north of Whitehorse, Yukon. Operations started in October 2007. The mineral deposits mined at the site were identified during exploration programs occurring in the area in the 1970's; exploration activities occurred sporadically since that time until construction of the mine and related facilities began in earnest in 2006.

This Spill Contingency Plan (SCP) is an update to the previous SCP, drafted in February 2017. The content of this SCP is derived from the *Plan Requirement Guidance for Quartz Mining Projects* (Yukon Government, 2013). The SCP has been updated annually and submitted as part of Minto's Water Use Licence and Quartz Mining Licence annual reports.

The purpose of the SCP is to establish guidelines for staff, contractors and suppliers working at the site with a formal framework of actions to be taken when responding to spills during mine operation. The SCP includes practices and planning of future efforts to further reduce the potential for environmental contamination and other spill-related impacts. The SCP describes the fuels, chemicals and other materials used at the Minto Mine, reporting thresholds for those materials, a spill action plan for responding to unintentional spills of those materials, reporting sequences and forms, training requirements, spill prevention activities and routine monitoring and maintenance.

1.1 Project Description

Minto Explorations Ltd. (Minto), a wholly owned subsidiary of Capstone Mining Corporation (Capstone), owns and operates the Minto Project located 240 km (150 miles) northwest of Whitehorse, Yukon. The Minto Mine is a high-grade copper and gold mine with ongoing operations since October 2007. The Project area encompasses the Minto Creek Valley which collects and drains in to the Yukon River (Figure 1-1). The Minto Mine is currently in Phase V/VI of surface operations. An overview of major infrastructure at the Minto Mine and the expansion of Phase V/VI is shown on Figure 1-2.

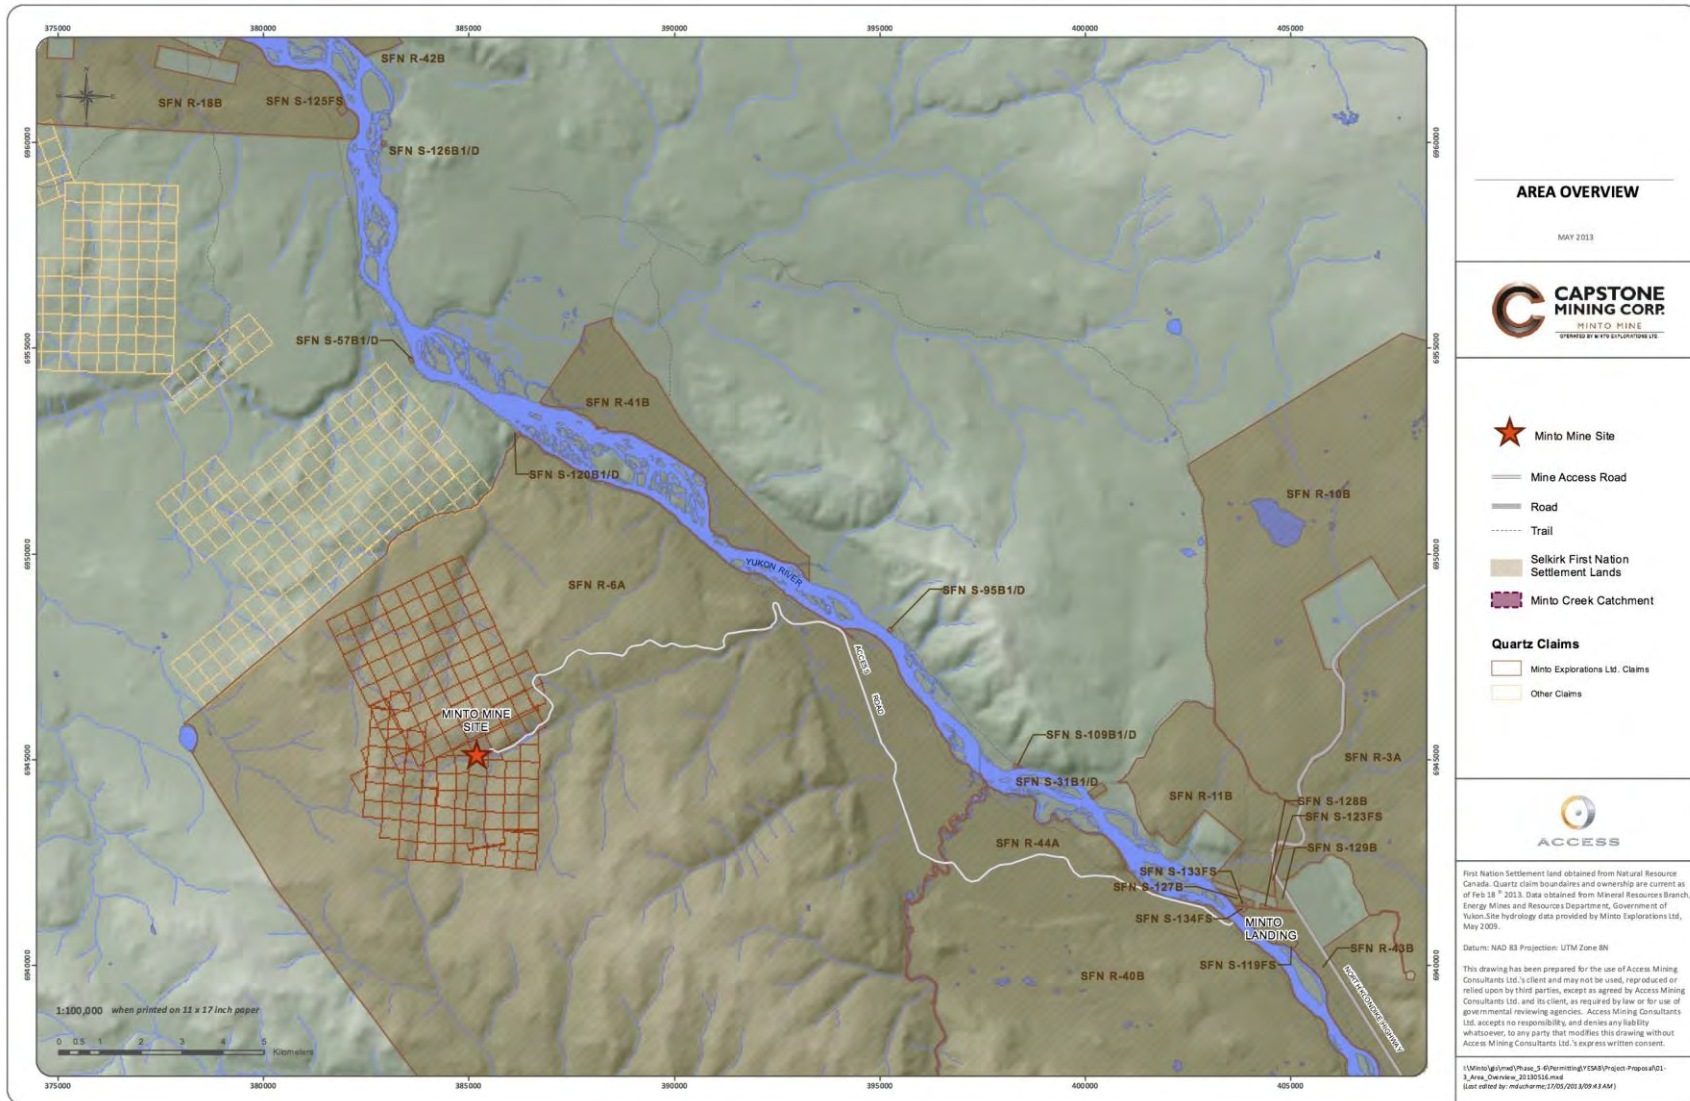

Figure 1-1: Minto Mine Area Overview

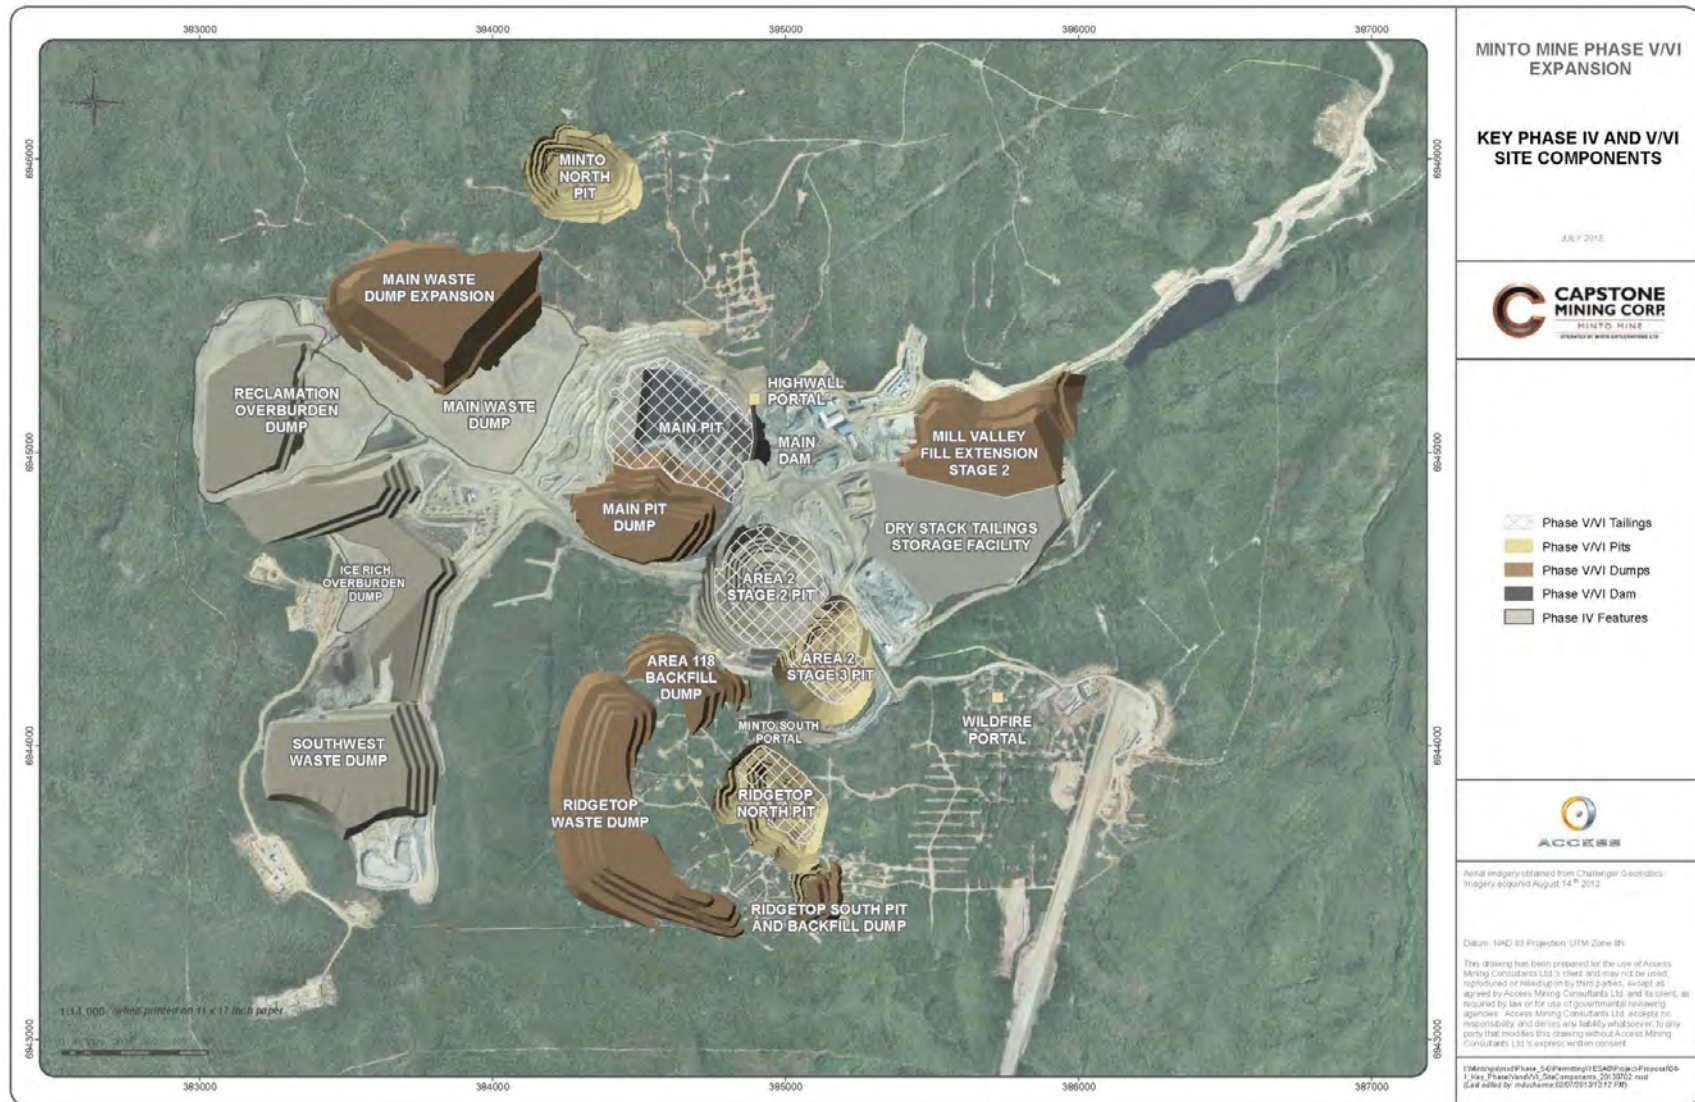

Figure 1-2: Minto Mine Area Overview – Existing and Phase V/VI Proposed Infrastructure

2 Definitions

The following definitions apply to the components of the SCP outlined herein.

Dangerous Good - A product, substance or organism included by its nature or by the regulations in any of the classes listed in the schedule to the act (*Yukon Transportation of Dangerous Goods Act*).

Deposit out of the normal course of events - A deposit that can reasonably be expected to occur at the mine and that can reasonably be expected to result in damage or danger to fish habitat or fish or the use by man of fish, and the identification of the damage or danger (*Metal Mining Effluent Regulations, Part 3, SOR/2002-222*).

Discoverer - The person that discovers an incident that could possibly result in a spill or has resulted in a spill.

Spill - A release of a substance in to the natural environment that is abnormal in quantity or quality in light of all circumstances of the release; or is in excess of an amount specified in the regulations (*Yukon Environment Act, Part 11*):

Emergency Spill - A release of a hazardous product where there is potential for that product to enter a waterway or cause significant danger to life, health or environment.

Non-Emergency Spill - All spills that do not meet criteria of an *emergency spill* and that the responsible party is competent to manage safely and efficiently in terms of assessment, prevention, containment and clean-up.

Substance - A hazardous substance, pesticide, contaminant or special waste often referred to as a “deleterious substance”.

3 Purpose and Scope

Minto will ensure that all requirements related to Spill Response and reporting within these documents are implemented throughout the property for the life of mine. If statutory and regulatory responsibilities change over time updating of this Plan will result.

This SCP is prepared in support of:

- Minto’s Type “A” Water Use License QZ14-031 (WUL) and Type “B” Water Use License MS15-094, which state that:

“The Licensee shall apply the relevant procedures in the Spill Contingency Plan. The Licensee shall review the spill contingency plan annually and shall provide a summary of that review, including any revisions to the plan, as a component of the annual report.”

- *Part 3 – Deposits Out of the Normal Course of Events, Section 30 of the Metal Mining Effluent Regulations (MMER), which indicates that:*

“The owner or operator of a mine shall prepare an emergency response that describes the measures to be taken in respect of a deleterious substance within the meaning of subsection 34(1) of the Act to prevent any deposit out of the normal course of events of such a substance or to mitigate the effects of such a deposit.”

- *Part 7 – Emergency Response Assistance Plans and Security Plans of the Transportation of Dangerous Goods Act:*

“No person shall import, offer for transport, handle or transport dangerous goods in a quantity or concentration that is specified by regulation — or that is within a range of quantities or concentrations that is specified by regulation — unless the person has an emergency response assistance plan that is approved under this section.”

- Satisfying the requirements of the Quartz Mining License QML-0001 Schedule B, that requires:

“A plan that describes the measures designed to minimize the potential impact to the environment following a fuel or chemical spill.”

The SCP will apply to Minto Mine and the main access route for one year, whereby the owner or operator shall update and test the SCP to ensure it continues to meet the requirements of both the WUL, subsection 30(2) of the MMER, and the QML.

3.1 Purpose

The purpose of the SCP is to outline a general set of procedures to be followed to assess, prevent, contain and clean-up a spill at the Minto Mine. For procedures to be effective, Minto must ensure that employees and contractors, through experience and training, possess the skills necessary to safely assess, prevent, contain and clean-up a spill or potential spill. These procedures are necessary to ensure continuity and develop the foundation for a robust and effective SCP. The SCP is also designed to establish clear reporting and clean-up procedures as they apply to emergency and non-emergency spills and incidents.

This document also addresses opportunities to improve spill preparedness, response, and mitigation for deposits out of the normal course of events that have the potential to impact the Yukon River and its tributaries within the project site.

All Minto employees and contract staff must be familiar with the general spill reporting procedures outlined in this document and will be introduced to them as part of their site orientation.

3.2 Scope

The objectives of the SCP are to:

- identify potentially hazardous materials located on site;
- identify spill prevention measures;

- establish a high order of preparedness in the event that a spill occurs;
- ensure an orderly and timely decision-making, response and reporting process; and
- describe current and planned protective measures for all areas of the Mine Site

The *Minto Mine Emergency Response Plan* (Minto, 2017) contains other information that relates to Emergency spill procedures. The Emergency Response Team (ERT) and members of the Environmental Department have been trained on responding to Hazmat Spills. It is beyond the scope of this document to define the specific Spill Response Procedures and decision loops involved in an ERT response. Any details pertaining to a response from ERT to assess, prevent, contain and clean-up a spill at a spill incident is the responsibility of the Site Safety Department. General procedures for spill response procedures to emergency spills will be detailed herein.

3.2.1 Hardcopy Locations

Copies of the SCP are kept on-site at all times in the following locations: Mill Control Room; Site Safety Office; Environmental Office; General Manager's Office; Site Services Office; and on the Copper Queen Tug. Contact information is provided in

Table 4-2.

4 Communication and Spill Reporting

Any spill that occurs at the Minto Mine site must be reported through the internal reporting chain of command and follow the procedures for assessment, prevention, containment and clean-up and reporting. Should a spill exceed the thresholds set by the Yukon Government (Table 4-1) then it must be reported to external authorities.

A spill in excess of the thresholds outlined in Table 4-1 or any spill that is abnormal in quality or quantity is considered a "reportable spill" under the *Yukon Spill Regulations* (O.I.C. 1996/193), pursuant to the *Environment Act*.

Table 4-1: Reportable Spill Thresholds

| Product | TDG ¹ Code | Threshold Quantity |
|-------------------------------|-----------------------|----------------------|
| Explosives | 1 | Any amount |
| Flammable gases | 2.1 | > 100 litres |
| Non-flammable gases | 2.2 | > 100 litres |
| Poisonous gases | 2.3 | Any amount |
| Corrosive gases | 2.4 | Any amount |
| Flammable liquids | 3 | > 200 litres |
| Flammable solids | 4 | > 25 kg |
| Spontaneously combustibles | 4 | > 25 kg |
| Dangerous when wet | 4 | > 25 kg |
| Oxidizers | 5.1 | > 50 kg or 50 litres |
| Organic peroxides | 5.2 | > 1 kg or 1 litre |
| Poisonous substances | 6.1 | > 5 kg or 5 litres |
| Corrosive materials | 8 | > 5 kg or 5 litres |
| Miscellaneous Dangerous Goods | 9.1 | > 50 kg or 50 litres |
| Special wastes | 9.3 | > 5 kg or 5 litres |

1. TDG = *Transportation of Dangerous Good Regulations* (Government of Canada, 1985)

4.1 Internal Reporting (All Spills)

All spills (whether reportable externally or not) must be reported by the discoverer to their immediate supervisor and then to either Site Safety or the Environmental Department by radio or telephone following assessment of the scene. The supervisor of the responsible department will issue an Environmental Incident Notification, with assistance from the Environment department, to notify the site and its directors including senior management. This typically occurs concurrently with spill response (prevention, containment and clean-up) activities.

Following the spill response, responsible department supervisors are required to document the spill on an Environmental Incident Report, available through the Environmental Department, and provided in Appendix A. The report requires inclusion of photos, a description of clean-up activities, subsequent actions, identifies root cause and determines any required corrective actions.

4.2 External Reporting (Reportable Spills Only)

Under federal and territorial regulations, the environmental lead will call the 24-hour Yukon Spill Report line should a spill of a reportable quantity occur (Table 4-1). Although several government agencies at the federal, territorial and municipal levels may ultimately be informed, only the Yukon 24-Hour Spill Report line is required for reporting purposes. The environmental lead will ensure that the appropriate information is collected before reporting to the Spill Report line.

Any spill of an amount greater than those listed in Table 4-1 or a spill of any amount that enters the Yukon River or a tributary of the river is a “reportable spill”.

The following information should be provided to the 24-Hour Spill Report line:

- Name
- Phone number
- Product spilled
- Quantity spilled
- Quality of product (thin, viscous etc.)
- Location of spill
- Distance to water
- Distance to drinking water wells
- What happened
- Responsible party
- Actions to contain the spill

When reporting the spill to the Spill Report line, the environment lead will obtain the Environment Yukon Spill Reporting Number and first/last name of the person whom the report has been made to (in the event of a reporting discrepancy).

Minto will also contact: the Selkirk First Nation Lands Director; and Energy Mines and Resources Client Services and Inspections via email or phone after discovery of a reportable spill. Should the spill enter a waterway or be categorized as a major spill, Minto will also contact Environment Canada. A detailed written report will be submitted to the regulatory authorities within 10 days after the event. The contact information for the various Minto employees, emergency response and external reporting personnel is provided in

5 Spill Action Plan

Implementation of the spill action plan requires knowledge of spill response supplies and locations, spill response procedures (Sections 5.1 and 5.2) and clean-up protocols (Section 5.3). In addition to the internal and external reporting requirements, spills must further be categorized as “emergency” or “non-emergency” incidents as the action plans and reporting requirements will differ according to the type of spill.

5.1 Spill Response Procedures: Non-Emergency

The majority of spills that are likely to occur on the Minto Mine Site will include a simple stepwise process initiated by the discoverer. If the safety at the scene is in doubt, then it is imperative that the Site Safety department is notified immediately. A “non-emergency” spill is defined as a spill of any product that the discoverer, or other personnel within close proximity of the incident can competently, safely, and efficiently manage in terms of assessment, prevention, containment and clean-up. This typically includes fuels, blasting agents, oils, lubricants or coolants and many of the reagents involved in mill operations. Once the scene is assessed for safety by the discoverer or supervisor and deemed non-emergency, they will prevent, contain and clean-up and contact the environmental team as soon as practical. If assistance is required to deal with the incident, the environmental team is to be notified by radio/telephone immediately.

A complete inventory of Dangerous Goods stored and used at the Minto Mine, including details on material handling and clean-up, reporting thresholds, special precautions, PPE requirements, and disposal methods is provided for reference during spill response activities (Appendix B).

5.2 Spill Response Procedures: Emergency

An “emergency spill” is a release of a hazardous product where there is potential for that product to enter a waterway or cause significant danger to life, health or environment. When a spill is discovered, the first step is to assess the scene for safety and **if safe to do so** immediately control and contain the spill by any means necessary. If the discoverer or other personnel within close proximity of the incident do not have the required training, resources or equipment to deal with the incident then the individual must report a “Code 1” callout. This protocol will initiate response of the Safety Department, Environmental Lead and the Emergency Response Team. The Emergency Spill Response Command Structure and General Spill Procedure are detailed in Figure 5-1 and Figure 5-2, respectively. If the scene is safe and the discoverer and the immediate supervisor have the means necessary to control, contain and recover the spill then they should proceed as such.

Once called via a “Code 1” the Safety Coordinator/Medic will respond to the scene and conduct an initial assessment and assume command of the scene. If the Safety Coordinator/Medic is required to treat patients, command is transferred to the Health and Safety Superintendent/Officer or Emergency

Response Team Captain. Unified Command Structure will be initiated once the General Manager, Area Manager, or Environmental Lead is on scene. The Unified Command Structure is a cooperative effort command between the General Manager, Health and Safety Superintendent/Officer, Area Manager of involved Department and the Environmental Lead. Transfer of command includes a detailed verbal report of the incident and activities conducted and underway.

A “Code 1” Protocol initiated by an emergency spill will trigger the specific spill response procedure based on the product type, quantity and environmental and safety conditions.

Initial spill response will be conducted in accordance to *Transport Canada’s 2016 Emergency Response Guidebook* (Transport Canada, 2016). This Guidebook will assist Incident Command with information to identify the material, use the guide to reference potential hazards, public safety and emergency response information. The *Table of Initial Isolation and Protective Action Distances* will be used to dictate isolation and protection for large and small spills. However, this is not a comprehensive spill mitigation and response document and will only assist responders in making initial decisions upon arriving at the scene of a dangerous goods incident. It should not be considered as a substitute for emergency response training, knowledge or sound judgment. The *Emergency Response Guidebook* does not address all possible circumstances that may be associated with a dangerous goods incident. The *Minto Mine Emergency Response Plan* (Appendix C) has additional specific procedures for responding to the most commonly transported and hazardous materials including Nitric Acid, Gasoline, Diesel, Ammonium Nitrate, Sodium Sulfide and Propane.

In addition to on-site response, Minto, through its carriers of dangerous goods, has contracts in place with spill responders. These are full service response agencies that have commitments to mobilize fully trained emergency response teams and equipment 24 hours a day, 7 days a week.

5.2.1 CANUTEC Transport Canada

In the event that a spill requires additional technical resources Minto is registered with CANUTEC, a division of Transport Canada, for 24-hour Spill Response support and information to deal with emergency situations. If a spill occurs beyond the boundaries of the Minto property, the owner of the transportation firm and the owner or consignor of the dangerous goods will communicate with the regulators. For incidents that occur on the Minto property, the Environmental Department will ensure reporting to regulators is performed accordingly.

5.2.2 Surrounding and Downstream Communities

Notification of downstream water users of a spill, if required, is the responsibility of the Yukon Government, Environmental Protection Branch. Minto will additionally notify the authorities including police and fire departments and the Selkirk First Nation community of Pelly Crossing.

5.2.3 Public Relations

The General Manager is the designated spokesman for Minto. The General Manager may delegate his responsibility for public relations if required to do so by the scale of the incident.

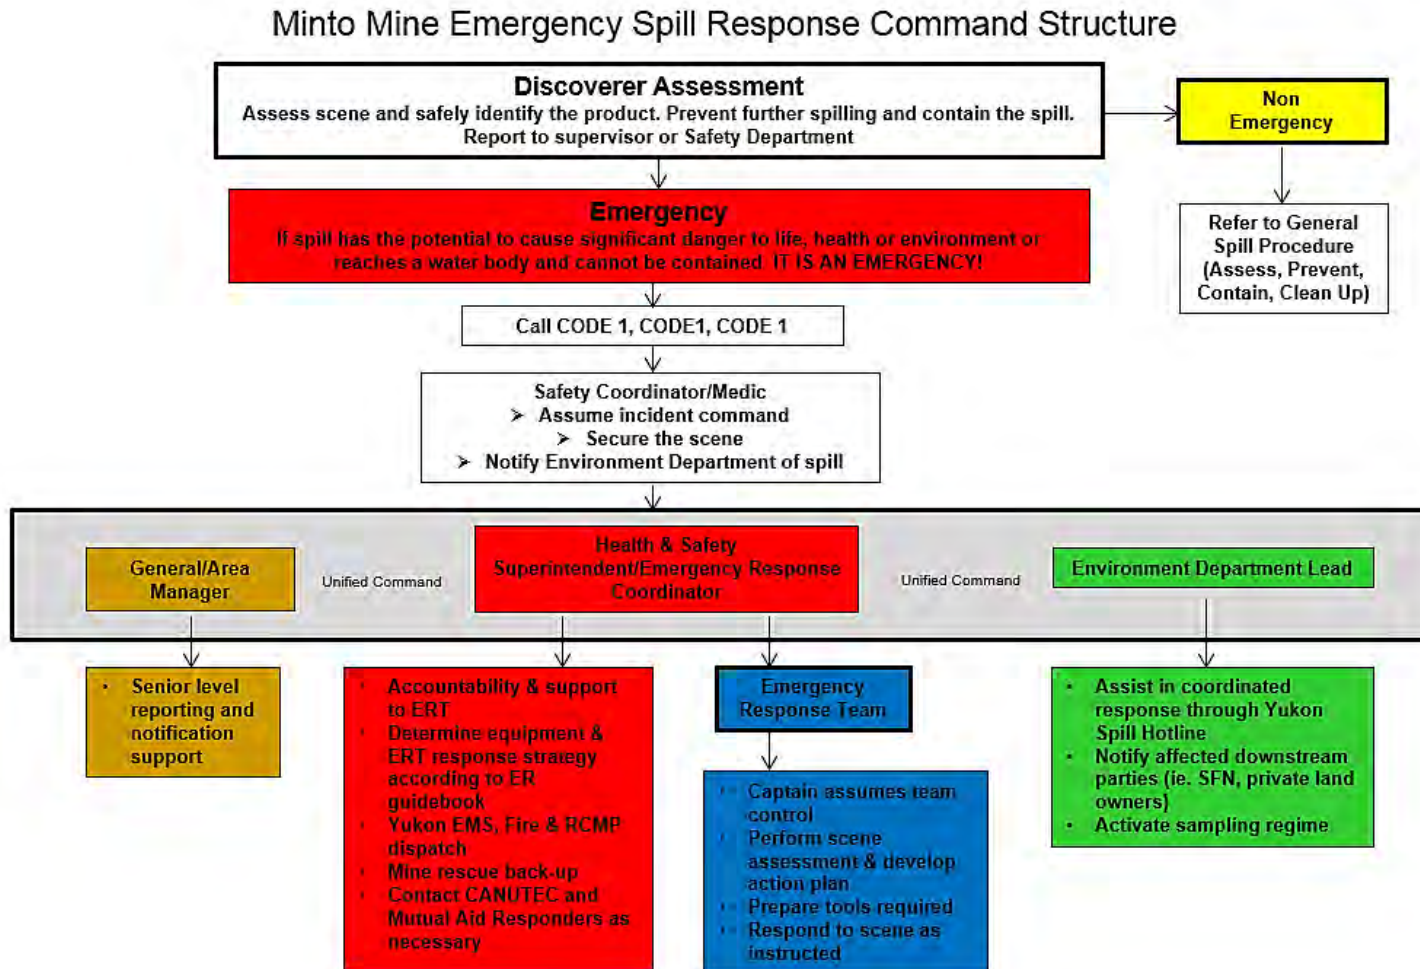

Figure 5-1: Minto Mine Emergency Spill Response Command Structure

Minto Mine General Spill Procedure (Assessment Prevention Containment Clean-up)

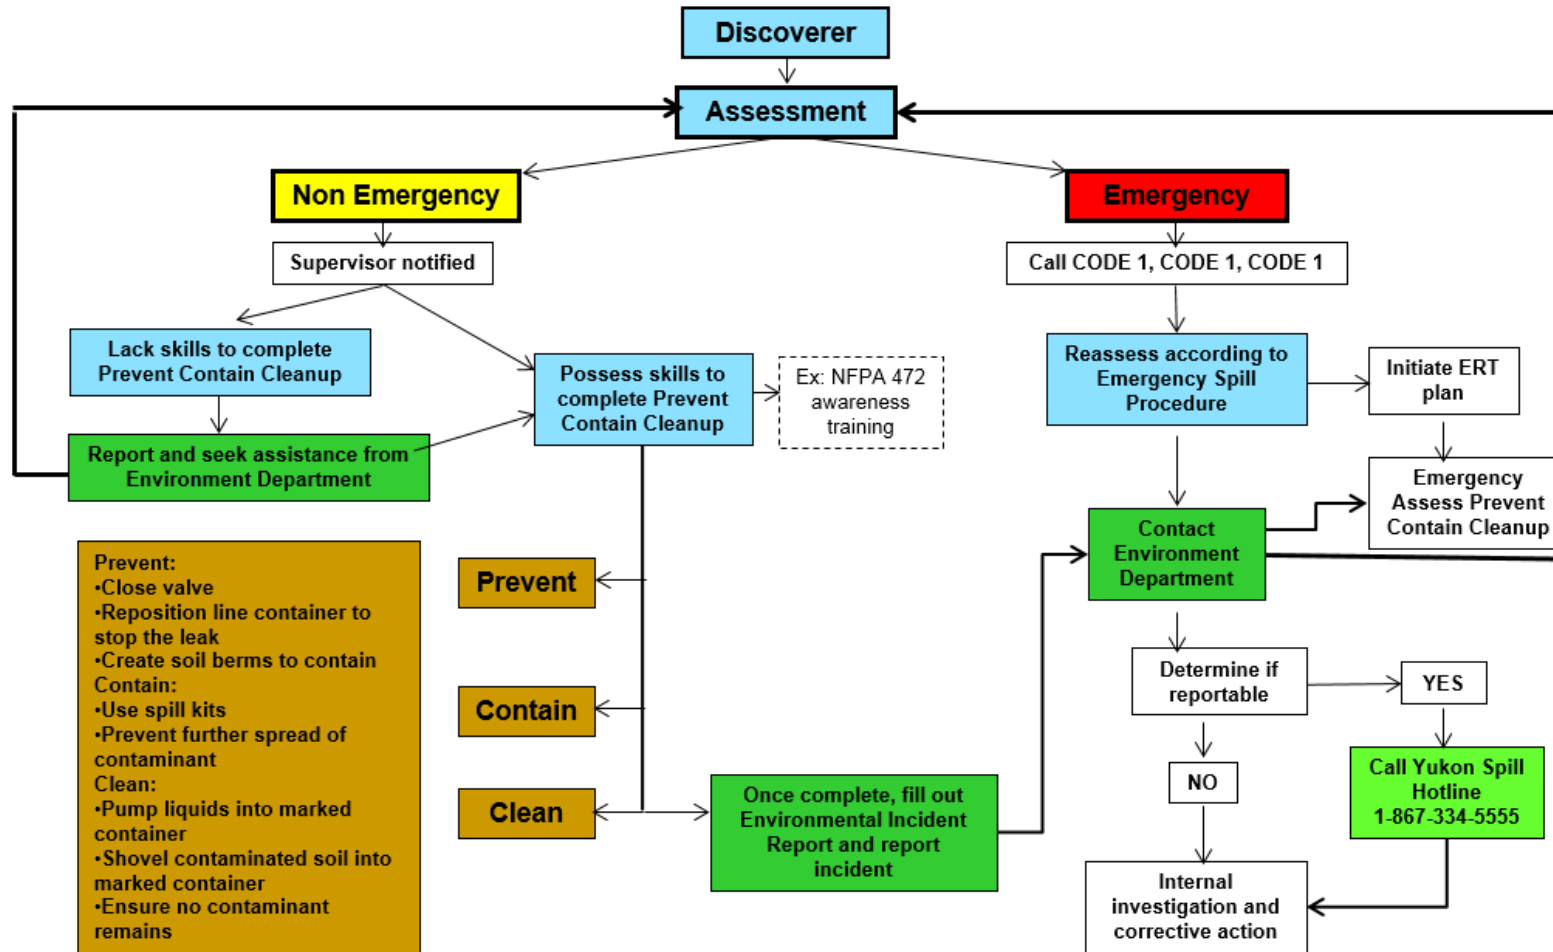

Figure 5-2: Minto Mine General Spill Procedure

5.3 Disposal and clean-up

Disposal and treatment methods of contaminated material are outlined below, and are further detailed in the *Minto Mine Spill Response Procedure: Non-emergency spills on soil* and the *Minto Mine Land Treatment Facility Standard Operating Procedure* documents. The Minto Mine Site has a Land Treatment Facility to accept incoming contaminated material from petroleum hydrocarbon and ethylene glycol spills. Depending on the state and substrate of the surface material, the clean-up and disposal location will differ. Brief practical descriptions of the clean-up procedures are summarized in Table 5-1.

Table 5-1: Disposal and Movement of Contaminated Material from Spill Sites

| WASTE TYPE | DESCRIPTION | MOVEMENT OF MATERIAL FROM SPILLS |
|--|---|--|
| Oil or Glycol Contaminated Soil | Soil, Organics, and granular material (avoid coarse rock) contaminated as a result of a hydrocarbon or glycol spill | Contaminated soil will be transferred to the Land Treatment Facility. Contaminated soil will first be placed in the staging cell and labelled to be later categorized and treated. Contact Environment dept. before dropping off material in the Land Treatment Facility. Small spills will be stored in a composite pile in the staging area. Larger spills will be stored separately in staging while waiting for lab results. |
| Oil or Glycol Contaminated Rock | Blasted rock and coarse material and/or bedrock, contaminated as result of a hydrocarbon spill or glycol spill | If blasted rock contains ore and has been cleared by Mill operations ore will be processed through the mill. Non-ore containing rock will be placed in the main pit and in-situ bioremediation will be applied to the pile. |
| Oil or Glycol Contaminated Snow/ Ice/Water | Snow, Ice, and/or Water that has been contaminated as a result of a hydrocarbon spill or glycol spill | Contaminated snow/water will be transferred to the Land Treatment Facility. The contaminated product will be placed in a separate pile in the cell. |

**** Any amount of material that has more than 30,000 ppm oil or glycol is considered special waste and must be disposed of off-site to a Special Waste Facility**

6 Spill Response Supplies

Spill kits (yellow and blue drums) are located throughout the Minto Mine Property at locations indicated in Figure 6-1. Additionally, there are blue drums located at the km 12 gravel pit, Big Creek and at the east and west terminals of Minto Landing. The contents of the yellow and blue barrels are summarized in Table 6-1. Spill kits are also supplied for each heavy and light truck at the Minto Mine. Contractor supervisor trucks have spill kits permanently affixed to the truck body. All contract trucking agencies coming to the mine are required to carry spill kits within or affixed to the truck. Spill kits are loaned to short term visitors if required.

Table 6-1: Spill Kit Contents

| Spill Kit Item | Yellow Barrel | Blue Barrel | Yellow Truck Bag | Loaner Spill Kit (20 L Pail) |
|-------------------------------|---------------|-------------|------------------|------------------------------|
| Tyvek splash suits | 2 | 2 | | |
| Chemical master gloves | 2 | 2 | 1 | 2 |
| Garbage bags with ties | 5 | 5 | 3 | 1 |
| Oil only booms (5" x 10') | 2 | 4 | 1 | |
| Oil only mats (16" x 20") | 50 | 50 | | 10 |
| Universal sorbent mat | 20 | 20 | 10 | 5 |
| Sorbent socks | 10 | 10 | | 1 |
| Tarp | 1 | 1 | | |
| Duct tape | 1 | 1 | | |
| Utility knife | 1 | 1 | | |
| Field notebook and pencil | 1 | 1 | | |
| Instruction sheet (laminated) | 1 | 1 | 1 | 1 |

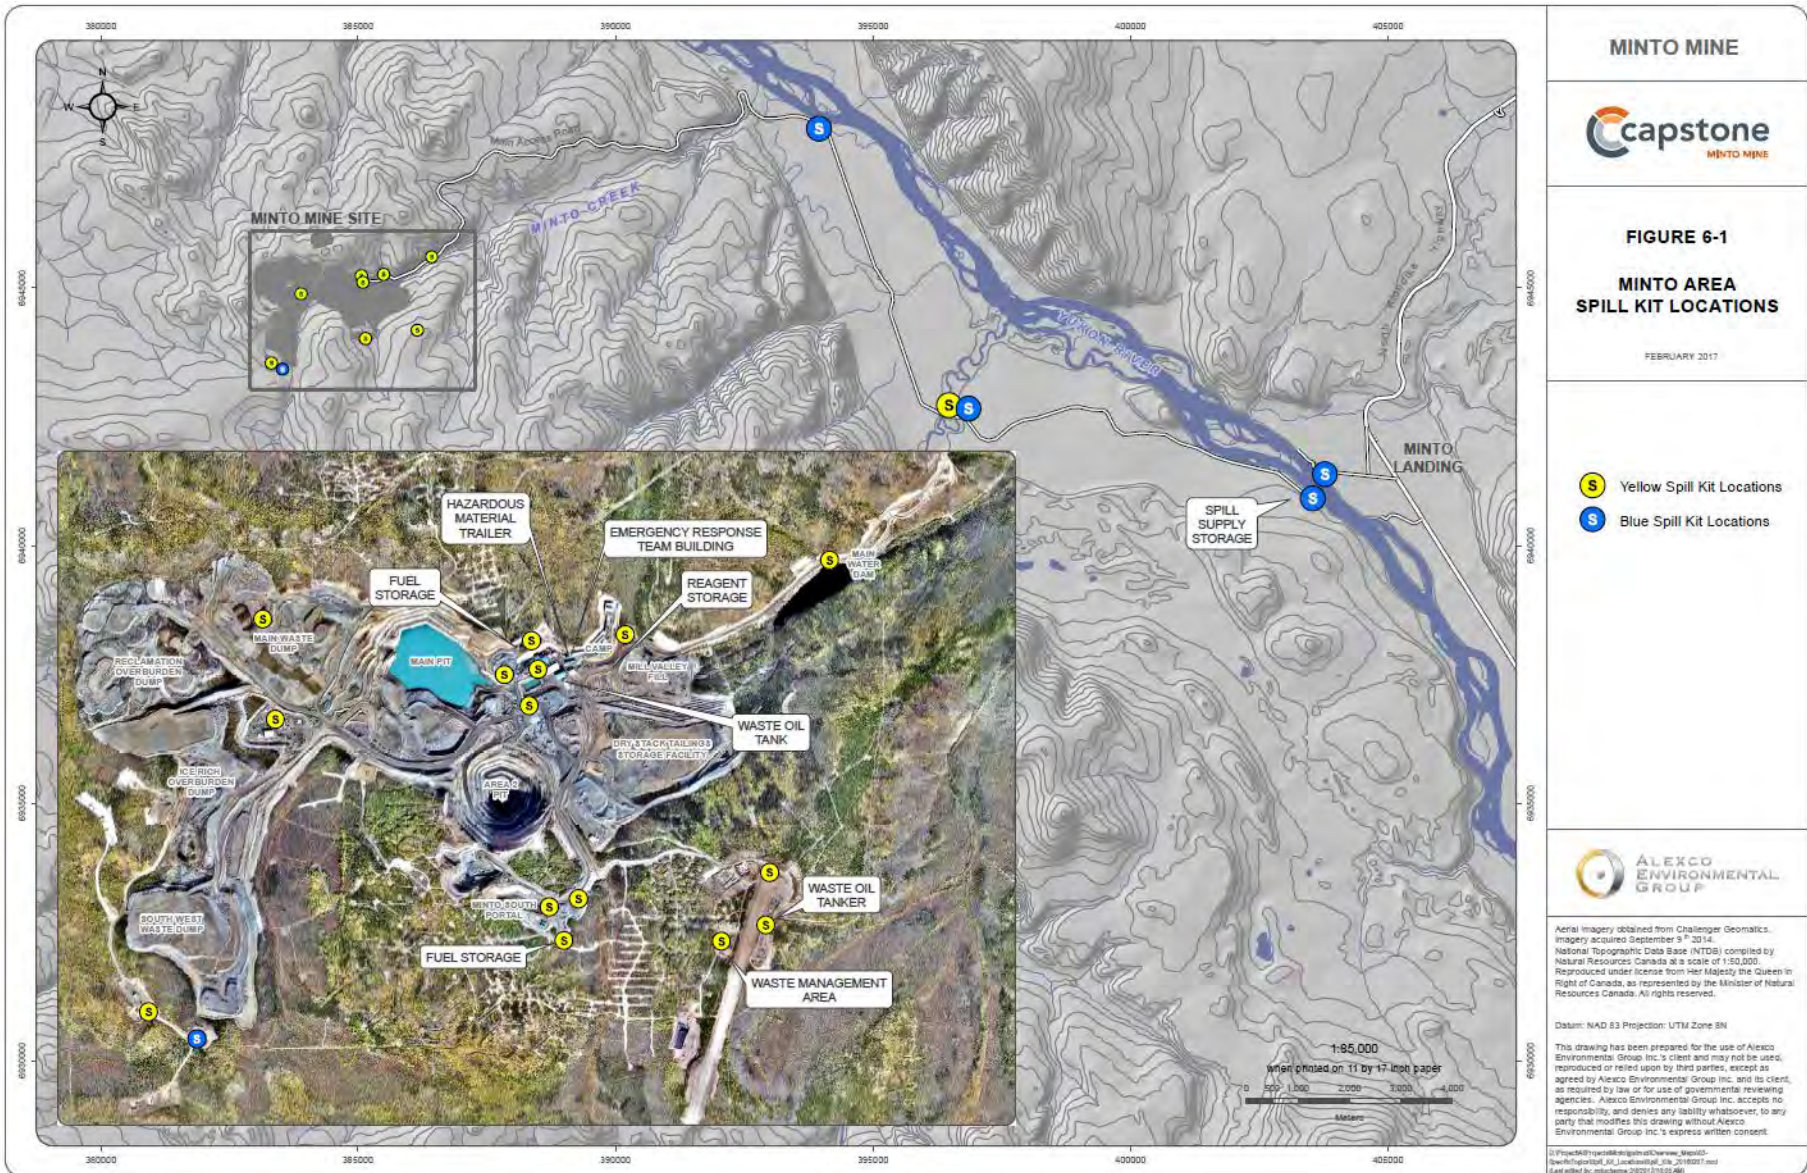

Figure 6-1: Minto Mine Area Overview – Hazmat Storage and Spill Supplies

Heavy machinery at the mine site is available for use in spill response and clean-up, as required under contract. Additionally, Minto has a 1991 Chevrolet Top Kick Fire truck with a 3200 litre/minute pump with 3800 litre supply tank and 3000 litre drop tank. This truck can support all spill response activities with SCBA, Class A and B foam capabilities, decontamination needs, as well as fire suppression/protection tools and equipment common to a truck of this nature. All ERT members are competent with the operation of this fire truck and related equipment in accordance with NFPA standards.

In 2013, Minto, on advice from Emergency Response Action Plan providers, procured a 20 foot Hazmat trailer and a helicopter-portable In-Viro-Drum vacuum unit (Figure 6-2) capable of being transported to locations not reachable with a vacuum truck. It has a liquid cooled three cylinder Kubota diesel engine and 250 CFM non-sparking blower, which makes it safe to vacuum flammable liquids and solids from water or dry land. It comes with a Double Port Vac Drum that allows for transfer of product from the drum to one of our 9500 litre bladders, while the drum continues to be filled. This system allows for quick, efficient and effective clean-up of hazardous products from hard to reach locations.

In 2016, Minto purchased a S.S. Alpha Adjustable Folding Weir Skimmer. Weir skimmers float on the surface of water and are designed to remove pollutants from the surface of calm or sheltered waters and shore line areas. Connected to a shore-based portable pump (e.g. Honda), contaminants can be removed from the water surface and transferred to a drum or other container for proper disposal.

Figure 6-2: In-Viro Drum and vacuum unit, 24' Packman vessel, and Alpha Skimmer for spill response operations.

Minto Mine also acquired a 24-foot Packman man boat, which is described, further in the “Barge Emergency Contingency Plan” (Appendix D).

Spill contingency equipment and earth moving equipment located at Minto Mine are listed in Table 6-2. All contractor equipment is available for use in spills and clean-up operations.

Table 6-2: Spill contingency equipment located at Minto Mine

| Quantity of Units | Equipment | Quantity of Units | Equipment |
|-------------------|-----------------------------------|-------------------|---|
| 1 | 416 Backhoe | 1 | Assorted Wooden Plugs |
| 1 | 3800 Litre Vacuum Truck | 4 | 773DTruck |
| Various | Dozers, Excavator, Loaders | 9 | 777 Truck |
| 1 | In-Viro Drum Portable Vacuum unit | 1 | Hazmat trailer 20' |
| 2 | 9500 Litre bladders | 1 | Top Kick fire truck |
| 1 | 24' Packman Response Vessel | 500' | Sorbent Boom (various sizes) |
| 2 | 10,000 Litre Fuel Trucks | 1 | Storage Sea Can at Landing |
| 1 | Roll Over Kit | 3 | Trash pumps |
| 1 | Pipe Plug kit | 1 | S.S. Alpha Adjustable Folding Weir Skimmer Pump |

7 Spill Prevention and Response Training

Education and training are critical to the success of any site-wide initiative, and the most important tool to ensuring the success of the SCP. Minto has a comprehensive training program in place that ensures all workers and supervisors are aware of their responsibilities and the practices that personnel and contractors must adhere to. Records are kept of the names of all employees or contractors that receive training, tracked through either the Simply Safety software program or in the Environmental Department tracking sheets. Annual re-training is scheduled for all Minto and major contractor employees.

7.1 Existing Spill Prevention and Response Training

Employees are trained to understand the potentially hazardous situations that spills can create with respect to the health and safety of workers and the environment. They are trained to understand responsibilities as employees to Assess, Prevent, Contain, and Clean-up as well as to report any spills. The SCP is made available to all employees and employees will be advised of revisions or changes to the SCP.

7.1.1 Orientation

Employees and visitors are required to sign off on the environmental policy as part of the employee, contractor and visitor orientations that include a summary of the response required when a spill has occurred. The orientation has a strong focus on ensuring proper reporting of spills, so that the appropriate response and clean-up can occur.

7.1.2 “Big 7” Training

As part of the orientation, all Minto employees and major contractors receive training that is a computer based PowerPoint presentation, followed by a written test. The “Big 7” package focuses on some of the most common safety training required for site, which includes WHMIS (Workplace Hazardous Material Information System), fall protection, confined spaces, lock out, hot work, Explosives awareness training and Environmental Awareness. The Environmental Awareness portion of the training is comprised of four modules, with one module dedicated to Spill Response covering reporting and basic steps for assessing, preventing, containing and cleaning-up spills.

7.1.3 Targeted Practical Training

Training sessions are put on by the Environmental Department, and efforts are made to tailor the training to the attending group (i.e. underground miners, surface contractors, site services, etc.). Smaller groups are identified and targeted for specialised spill prevention training that is more job-specific. These include, but are not be limited to; maintenance personnel (mechanics), waste and water truck operators, fuelling personnel, and warehouse workers. Training in smaller groups focusses on spill prevention techniques.

7.1.4 Training for Fuel Handling Employees

Currently there are Safe Work Practices (SWP) designed for bulk fueling at the fuel farm and for fueling of equipment in the field. These SWPs include descriptions of the stepwise procedure for safely performing the task and also includes steps to take for emergency shut-off. Both the procedure and the equipment are audited during Workplace Inspections and Planned Job Observations by immediate supervisors and the Environmental Department.

7.1.5 ERT Training

An Emergency Response Team (ERT) has been established to, among other duties, respond to emergency spills. The Emergency Response Team periodically receives training to the National Fire Protection Association (NFPA) 472 Hazardous Material awareness level, and are required to thoroughly understand this document in order to respond to spills or incidents of a specific nature. This training is required as a foundation to develop site specific contingency planning for response tactics in areas specific to the Minto Mine associated activities that present a risk to the Yukon River and its tributaries.

7.1.6 Emergency Spill Response Drills

Table top exercises and/or field drills will help to prepare the ERT and other mine staff to respond to a major spill safely by identifying any deficiencies in the equipment or processes in place. On October 26th, 2014, a combined field and table top exercise took place with the following objectives:

- Help individuals become more knowledgeable with the ERP and SCP;
- Identify gaps in the plan;
- Improve communication between stakeholders and departments; and
- Learn new ways and better ways to execute the plan.

The announced exercise was initiated to test part of the Emergency Response Plan as it applies to Spills and the SCP. It focused on the crisis, interaction and escalation of problems within:

- Administrative;
- Operational;
- Managerial; and
- Facilities.

The scenario was as follows:

- A tanker truck with pup and trailer of diesel overturns on Oct 26th on icy roads at 3:20pm at south end of Big Creek. It is still dark and it is a Sunday and roads are icy and snowing lightly.

The exercise lasted approximately 2 hours and involved management staff onsite and offsite, the ERT, major contractors, The Yukon Spill Hotline, CANUTEC, Transnorth Helicopters, WCB, Parkland Fuel, and

Quantum Murray. A post-incident debrief revealed both opportunities and successes at the field operations and management level.

7.1.7 Training KPI's

Individuals who receive training are tracked, and training numbers are used as a key performance indicator (KPI) with annual targets. In addition, tracking is used to ensure annual retraining is delivered and statistics measured against key performance indicators.

8 Routine Maintenance and Monitoring

The Fuel Farm is inspected twice monthly for any leakages and, through the Human Machine Interface (HMI) readout, regular inventory is tracked daily to identify any incidental losses. An overfill protection system is installed on the two main diesel tanks using a visual indicator and a relay to the control room that will alarm on the HMI to alert maintenance personnel. The area also receives inspections by a qualified engineer and recommendations are recorded and deficiencies corrected as per the *CCME Environmental Code of Practice for Aboveground and Underground Storage Tank Systems Containing Petroleum and Allied Petroleum Products* (Canadian Council of Ministers of the Environment, 2003).

The tug and barge receive frequent inventory inspections for spill equipment and have had major overhauls in the last few years to ensure that the operation is continually improving. Maintenance activities are also carried out regularly and systems are inspected as per Transport Canada Regulations. The daily start-up procedure includes checking for leaks and ensuring all systems are performing to specifications. Annual maintenance activities have included the following: propeller repairs, controls work, system checks and repairs. Substantive refits have included: cylinder heads, exhaust manifold seals, motor mounts, transmission mounts and replacement of water pumps. A new transmission, propulsion seals and propellers have been installed and aligned. Other improvements have included welding reinforcements on the bow of the barge for landings, electrical upgrades, and the installation of an anchor with hawser.

The open pit mining equipment is outfitted with Wiggins Fast Fuel Systems on newer contractor open pit equipment that is a fail-safe system for overflow protection. All fuel trucks receive a daily walk-around inspection to ensure emergency shutoffs and hatches and tank valves are operating properly and are free of leaks. These are recorded daily.

The Waste Management Area (WMA) is restricted to access between 10-3 pm every Sunday by an attendant familiar with the protocols for waste segregation, incineration, special waste handling and landfilling. The attendant will inspect all loads that come into the WMA to ensure that waste has been properly sorted before any material is off loaded. The Environmental Department is directly responsible for the administration, compliance and procedures associated with the management of waste. They are also responsible for providing support and manpower to prepare shipments for backhauling and to ensure the WMA is maintained in accordance with the Commercial Dump Permit (# 81-005). The Environmental Monitors are responsible for conducting weekly inspections to ensure that the WMA is in compliance.

Appendix B: Reporting Threshold, Special Precautions, PPE Requirements, and Cleanup and Disposal Methods

Minto Mine - Inventory of Dangerous Goods

Reporting Threshold, Special Precautions, PPE Requirements, and Cleanup and Disposal Methods

| Common Name (Synonyms) | Chemical Name | Manufacture / Supplier | Phase | TDG Class | WHMIS Class | NFPA Rating | Reporting Threshold | Use | Special Precautions | PPE Required | Special Cleanup and Disposal Info |
|-------------------------------|---|------------------------|---------------------------|---------------|------------------------------|-------------|------------------------------------|-------------------------|---|--|---|
| Acetone | 2-Propanone | Anachemia | Liquid | 3 | B-2, D-2B | 1, 3, 0 | 200 L | Solvent | Extremely Flammable | Goggles, gloves. SCBA if in confined space | Eliminate all sources of ignition. Ventilate area if required. Use absorbent. In case of fire, use dry chemical, CO2, Alcohol-resistant foam. Do not allow into waterway or drains. Contain spread of spill and soak up with absorbent pads. Clear up using non-sparking tools. Place liquid and absorbents into tightly sealed container, label clearly and dispose of as hazardous waste offsite. |
| Acetylene | C ₂ H ₂ | AIRGAS INC | Pressurized gas dissolved | 2.1 | A, B-1, F | 1, 4, 3 | any if container larger than 100 L | Welding/cutting gas | Extremely flammable, pressurized gas dissolved in an extremely flammable liquid (Acetone) | Goggles, gloves. Respirator or SCBA if in confined space | Eliminate all sources of ignition, if possible without risk, shut off bottles. If bottle is ruptured after the gas has been expelled, the bottle will release the Acetone. At that point treat as an Acetone spill. |
| AERO 6493 Promoter | Alkyl hydroxamate | Cytec Canada | Liquid above 15C | 9 | | 2, 1, 2 | 5 L | Metal flotation in mill | | | Soak up with absorbent (do NOT use sawdust. Use PLASTIC tools). In case of fire, use dry chemical, CO2, Alcohol-resistant Foam or water spray. Place recovered spill liquid in labelled drums for disposal as Special waste. Incinerate used absorbent pads. |
| AERO MX-5149 | Modified Thionocarbamate 15-40% Xanthate ester 40-70% | Cytec Canada | Liquid | 3 | B3, D-1B, D-2B | 3,2,0 | 200 L | Metal flotation in mill | Flammable | Closed system, safety glasses, gloves | Remove sources of ignition. Cover spills with some inert absorbent material; sweep up and place in a waste disposal container. Flush spill area with water. |
| Aerodri 100 Dewatering Agent | | Cytec Canada | Liquid | 3 | B3, B-2, D-2A | 2, 3, 0 | 200 L | | Avoid contact with strong oxidizers or acids. | Safety Glasses, Gloves | Eliminate all sources of ignition. Ventilate area if required. Use absorbent. In case of fire, use dry chemical, CO2, Alcohol-resistant Foam or water spray. Incinerate waste. Soak up with absorbent materials and dispose of offsite in clearly labeled containers |
| Alconox | | Anachemia | solid | not regulated | D-2B | 1, 0, 0 | 50 kg | | | Safety Glasses, Gloves | Clean up uncontaminated material for reuse. Incinerate waste. |
| ALIQUAT 336 | Methytriocetyl-ammonium Chloride | Sigma-Aldrich Canada | Liquid | 6 | D-2B | 2, 1, 1 | 5 kg | | Toxic if swallowed. Very corrosive. Will burn skin and eyes. Avoid contact with strong oxidizers. Hygroscopic; avoid contact with moist air. | Safety Glasses, Gloves | Eliminate all sources of ignition. Ventilate area if required. Use absorbent. In case of fire, use dry chemical, CO2, Alcohol-resistant Foam or water spray. Incinerate waste. |
| AlphaSolve II | >50% Sodium Hydroxide <50% Silicate | Alpha Resources | Solid | | | | | | Avoid contact with strong oxidizers. | Safety Glasses, Impervious Gloves. | Highly caustic. Will produce heat and steam on contact with water. May boil and spatter. May generate hydrogen gas on contact with metals. Sweep or vacuum and, if not re-useable, send offsite as hazardous waste, in tightly closed, well labeled containers. |
| Aluminex 5 | Aluminum Chloride Hydroxide Sulphate 15% | NALCO | Liquid | 8 | E | | 5 L | Coagulant | | Safety Glasses, Gloves | Soak up with absorbent materials. These can be incinerated. Any remaining spill liquid should be stored in closed container, labelled and disposed of off-site as Special Waste. |
| Aluminum Standard - AA | | Anachemia | Liquid | 8 | E | 4, 0, 0 | 5 L | | Dilute Nitric Acid <5% | Safety Glasses, Gloves | Neutralize with soda ash or lime. Contain spill, do not allow un-neutralized acid to enter water systems. Neutralized spill can be pumped to the pit or tailings system. |
| AM28 Flotation Reagent | Mixture of Potassium Hydroxide Alkyl hydroxamate | Axis House (Pty) Ltd. | Liquid | not regulated | D-2B | 2,1,0 | | Flotation Reagent | corrosive solid. | Safety Glasses, Gloves | Soak up with absorbent (do NOT use sawdust. Use PLASTIC tools). In case of fire, use dry chemical, CO2, Alcohol-resistant Foam or water spray. Place recovered spill liquid in labelled drums for disposal as Special waste. Incinerate used absorbent pads. |
| Amco Clear Turbidity Standard | | GFS Chemicals | Liquid | not regulated | not regulated | | | | | Safety Glasses, Gloves | Contain spill. Incinerate waste or place in landfill |
| Ammonia, Refrigerant | Ammonia, Anhydrous | GT&S, INC | Liquefied Gas | 2.3, 8 | does not appear classified?? | 3, 0, 0 | any amount | | Liquefied gas, will produce extreme cold when released. Death has occurred at 5000ppm exposure for 5 minutes. Evacuate release area upwind and avoid low areas. | Goggles, gloves. SCBA. | Toxic gas and will react with a large number of substances, many in a violent manner, Gas will dissipate quickly in air. Small spills can be dissolved in water at ratio of 1:10 Not very flammable. Do not attempt to neutralise. |

Minto Mine - Inventory of Dangerous Goods

Reporting Threshold, Special Precautions, PPE Requirements, and Cleanup and Disposal Methods

| Common Name (Synonyms) | Chemical Name | Manufacture / Supplier | Phase | TDG Class | WHMIS Class | NFPA Rating | Reporting Threshold | Use | Special Precautions | PPE Required | Special Cleanup and Disposal Info |
|--|--|------------------------------|-----------------|------------------|---------------------------------|-------------|------------------------------------|--------------------|---|--|--|
| Ammonium Nitrate prill | Ammonium Nitrate | Agrium | solid | 5.1 | C, D-2B | 1.0.3 | 50 kg | | Oxidizing material, does not burn but may contribute to combustion of materials that can burn | Safety Glasses, Gloves | In case of fire, cool containing vessels with water jet in order to prevent pressure build-up/explosion. Use flooding quantities of water. Evacuate surrounding area. If fumes or gases present, fire fighters should wear self-contained breathing apparatus. In event of spill, prevent from entering waterways. Will dissolve and disperse in water. |
| Ammonium Nitrate Emulsion | Ammonium Nitrate Emulsion | on-site | Liquid | 5.1 | | 2,0,3 | 50 kg | Explosive | Oxidizing material, does not burn but may contribute to combustion of materials that can burn | Safety Glasses, Gloves, chemical suits, SCBA may be required | In case of fire, cool containing vessels with water jet in order to prevent pressure build-up/explosion. Use flooding quantities of water. Evacuate surrounding area. If fumes or gases present, fire fighters should wear self-contained breathing apparatus. In event of spill, prevent from entering waterways. Use non-combustible material to soak up. |
| Arsenic Standard - AA | | Anachemia | Liquid | 8 | D-2A, E | 4, 0, 0 | 5 L | | Dilute Nitric Acid <5% | Safety Glasses, Gloves | Neutralize with soda ash or lime. Contain spill, do not allow un-neutralized acid to enter water systems. Neutralized spill can be pumped to the pit or tailings system. |
| Ascorbic Acid | L-Ascorbic Acid (Vitamin C) | Anachemia | solid | not regulated | not regulated | 1, 1, 1 | 5 kg | | also known as Vitamin C | Safety Glasses, Gloves | Contain spill. Incinerate waste or place in landfill |
| Brake & Electrical Parts Kleen | CO ₂ aerosol of Heptane and Isopropyl alcohol | Kleen-Flo Tumbler Industries | aerosol | Limited quantity | Consumer commodity; A, B5, D2-B | 1, 3, 0 | | | Highly flammable | Safety Glasses, Gloves | Eliminate all sources of ignition. Ventilate area if required. Use absorbent. In case of fire, use dry chemical, CO ₂ , Alcohol-resistant Foam or water spray. Incinerate waste. |
| Buffer Solution pH 10 | | Anachemia | Liquid | not regulated | D-2A | 1, 0, 0 | | Analytical Lab use | Dilute Sodium Hydroxide | Safety Glasses, Gloves | Contain spill. Absorb with sand, vermiculite or sorbal. Incinerate waste. |
| Buffer Solution pH 4 | | Anachemia | Liquid | not regulated | not regulated | 1, 0, 0 | | Analytical Lab use | | Safety Glasses, Gloves | Contain spill. Absorb with sand, vermiculite or sorbal. Incinerate waste. |
| Buffer Solution pH 7 | | Anachemia | Liquid | not regulated | not regulated | 1, 0, 0 | | Analytical Lab use | | Safety Glasses, Gloves | Contain spill. Absorb with sand, vermiculite or sorbal. Incinerate waste. |
| Cadmium Standard - AA | | Anachemia | Liquid | 8 | D-2A, E | 4, 0, 0 | 5 L | | Dilute Nitric Acid <5% | Safety Glasses, Gloves | Eliminate all sources of ignition. Ventilate area if required. Use absorbent. In case of fire, use flooding quantities of water. Contributes to combustion of other materials. Neutralize with soda ash or lime. Contain spill, keep from entering ground water. Neutralized spill can be pumped to the pit or tailings system. |
| Calcium Chloride | | J.T. Baker | solid | not regulated | D-2B | 1, 0, 2, 3 | any amount | | Road Salt, will corrode metals | Safety Glasses, Gloves | Sweep up spilled material and it may be deposited in dilute form to the pit or tailings system. In case of fire use appropriate measures for surrounding fire. |
| Carbon Dioxide in Argon | | Mittler Supply Inc. | Pressurized gas | 2.2 | A, D-2B | 1, 0, 0 | any if container larger than 100 L | | Non-Flammable but will replace the O ₂ in confined space | Goggles, gloves, SCBA if in confined space | close valve if possible without risk, or allow the vent. In case of fire use any media suitable for surrounding fire. Use water spray to cool fire exposed containers. |
| Caustic Soda (solid) | Sodium Hydroxide | Fisher Scientific | solid | 8 | E | 3, 0, 1 | 5 kg | | very corrosive solid | Safety Glasses, Gloves | Sweep up spilled material for reuse. In case of fire use appropriate measures for the surrounding fire. Minimise direct water spray on material. This material melts and 318°C and when molten reacts violently with water. Neutralize the residue with a dilute solution of acetic acid. Neutralized solution can be disposed of in the pit or tailings system. |
| Caustic Soda (solution) | | DOW | Liquid | 8 | E | 3, 0, 1 | 5 L | | very corrosive liquid | Safety Glasses, Gloves | Contain spill and pump to plastic barrel for re-use. In case of fire use appropriate measures for the surrounding fire. Neutralize the residue with a dilute solution of acetic acid. Neutralized solution can be disposed of in the pit or tailings system. |
| Caustic Potash | Potassium Hydroxide | Brenntag Canada | Solid | 8 | D-1B, E | 3,0,1 | 5 kg | | water reactive, contact with metals may evolve flammable hydrogen gas. | Safety Glasses, Gloves, fume hood | Sweep up or vacuum spillage, collect in suitable container for disposal. Avoid dust formation. |
| Chevron 2-Cycle Oil | | Chevron Lubricants Canada | Liquid | not regulated | B-3 | 1, 2, 0 | 100 L | | flammable oil for 2-stroke fuel | Safety Glasses, Gloves | contain spill and use absorbent and incinerate waste |
| Chevron ATF+3 Automatic Transmission Fluid | | Chevron Lubricants Canada | Liquid | not regulated | not regulated | 1, 1, 0 | 100 L | | | Safety Glasses, Gloves | contain spill. Small amounts can use absorbent and incinerate waste. Larger material pumped into plastic drums and used in a waste oil heating system. |
| Chevron Automatic Transmission Fluid MD-3 | | Chevron Lubricants Canada | Liquid | not regulated | not regulated | 1, 1, 0 | 100 L | | | Safety Glasses, Gloves | contain spill. Small amounts can use absorbent and incinerate waste. Larger material pumped into plastic drums and used in a waste oil heating system. |
| Chevron Clarity Synthetic Machine Oil | | Chevron Lubricants Canada | Liquid | not regulated | not regulated | 1, 1, 0 | 100 L | | | Safety Glasses, Gloves | contain spill. Small amounts can use absorbent and incinerate waste. Larger material pumped into plastic drums and used in a waste oil heating system. |

Minto Mine - Inventory of Dangerous Goods

Reporting Threshold, Special Precautions, PPE Requirements, and Cleanup and Disposal Methods

| Common Name (Synonyms) | Chemical Name | Manufacture / Supplier | Phase | TDG Class | WHMIS Class | NFPA Rating | Reporting Threshold | Use | Special Precautions | PPE Required | Special Cleanup and Disposal Info |
|--|------------------------------|---------------------------|------------|------------------------------|-----------------|-------------|---------------------|--------------|---|--|---|
| Chevron Compressor Oil 260 | | Chevron Lubricants Canada | Liquid | not regulated | not regulated | 1, 1, 0 | 100 L | | | Safety Glasses, Gloves | contain spill. Small amounts can use absorbent and incinerate waste. Larger material pumped into plastic drums and used in a waste oil heating system. |
| Chevron Coupling Grease | Grease | Chevron Lubricants Canada | Semi-Solid | not regulated | not regulated | 1, 1, 0 | 100 L or 100 kg | | | Safety Glasses, Gloves | contain spill. Small amounts can use absorbent and incinerate waste. Larger absorbent material in plastic drums and shipped off site for disposal. |
| Chevron Delo 300 Motor Oil | | Chevron Lubricants Canada | Liquid | not regulated | not regulated | 1, 1, 0 | 100 L | | | Safety Glasses, Gloves | contain spill. Small amounts can use absorbent and incinerate waste. Larger material pumped into plastic drums and used in a waste oil heating system. |
| Chevron Delo Grease EP | Grease | Chevron Lubricants Canada | Semi-Solid | not regulated | not regulated | 1, 1, 0 | 100 L or 100 kg | | | Safety Glasses, Gloves | contain spill. Small amounts can use absorbent and incinerate waste. Larger absorbent material in plastic drums and shipped off site for disposal. |
| Chevron Diesel Engine Oil Delo 6170 CFO | | Chevron Lubricants Canada | Liquid | not regulated | not regulated | 1, 1, 0 | 100 L | | | Safety Glasses, Gloves | contain spill. Small amounts can use absorbent and incinerate waste. Larger material pumped into plastic drums and used in a waste oil heating system. |
| Chevron Drive Train Fluid HD | | Chevron Lubricants Canada | Liquid | not regulated | not regulated | 1, 1, 0 | 100 L | | | Safety Glasses, Gloves | contain spill. Small amounts can use absorbent and incinerate waste. Larger material pumped into plastic drums and used in a waste oil heating system. |
| Chevron ECO Hydraulic Oil AW | | Chevron Lubricants Canada | Liquid | not regulated | not regulated | 0, 1, 0 | 100 L | | | Safety Glasses, Gloves | contain spill. Small amounts can use absorbent and incinerate waste. Larger material pumped into plastic drums and used in a waste oil heating system. |
| Chevron Gas Engine Oil 930 and 940 | | Chevron Lubricants Canada | Liquid | not regulated | not regulated | 0, 1, 0 | 100 L | | | Safety Glasses, Gloves | contain spill. Small amounts can use absorbent and incinerate waste. Larger material pumped into plastic drums and used in a waste oil heating system. |
| Chevron Mid-grade unleaded gasoline | | Chevron Products | Liquid | 3 | B-2, D-2A, D-2B | 2, 3, 0 | 200 L | | Extremely Flammable, Vapours are harmful and they may be explosive. Non-sparking tools required. Vapours will collect in low areas and travel along the ground to an ignition source. | Goggles, gloves. Respirator or SCBA if in confined space | Eliminate all sources of ignition. Ventilate area if required. Dike the spill and pump to containers for recycling. Use absorbent. In case of fire, use dry chemical, CO2, Alcohol-resistant Foam or water spray. Allow waste absorbent to evaporate and then incinerate waste. |
| Chevron NWS Manual Transmission Fluid 6044GR | | Chevron Lubricants Canada | Liquid | not regulated | not regulated | 1, 1, 0 | 100 L | | | Safety Glasses, Gloves | contain spill. Small amounts can use absorbent and incinerate waste. Larger material pumped into plastic drums and used in a waste oil heating system. |
| Chevron RPM Universal Gear Lubricant | | Chevron Lubricants Canada | Liquid | not regulated | not regulated | 1, 1, 0 | 100 L | | | Safety Glasses, Gloves | contain spill. Small amounts can use absorbent and incinerate waste. Larger material pumped into plastic drums and used in a waste oil heating system. |
| Chevron Supreme Antifreeze/Coolant | Ethylene Glycol | Chevron Lubricants Canada | Liquid | not regulated under 5000 lb. | D-2A | 1, 1, 0 | 25 L | | may be fatal by ingestion | Safety Glasses, Gloves | contain spill. Can be pumped, filtered and reused. Small amounts can use absorbent and incinerate waste. Larger absorbent material in plastic drums and shipped off site for disposal. |
| Chevron Ulti-Plex® Grease EP | | Chevron Lubricants Canada | Semi-Solid | not regulated | not regulated | 1, 1, 0 | 100 L | | | Safety Glasses, Gloves | contain spill. Small amounts can use absorbent and incinerate waste. Larger absorbent material in plastic drums and shipped off site for disposal. |
| Chloramine T | Chloramine-T trihydrate | Fisher | solid | 8 | D-2A, E | 3, 1, 1 | 5 kg | | Container may explode under fire conditions. Will release toxic fumes with fire or when mixed with strong oxidizers or acids | Goggles, gloves. SCBA if in confined space | Eliminate all sources of ignition. Ventilate area if required. In case of fire, Material by itself is non-flammable, may decompose violently >100°C, use dry chemical, CO2 foam or water spray. DISPOSAL mix with flammable solvent and incinerate. |
| Chromium Standard - AA | | Anachemia | Liquid | 8 | D-2A, E | 3, 0, 0 | 5 L | | Dilute Nitric Acid <5% | Safety Glasses, Gloves | Neutralize with soda ash or lime. Contain spill, do not allow un-neutralized acid to enter water systems. Neutralized spill can be pumped to the pit or tailings system. |
| Citric Acid | Citric Acid, Monohydrate | Anachemia | solid | not regulated | E | 2, 1, 0 | 5 L | | Will cause severe eye damage. Avoid oxidizers, acids, bases and bleach. | Safety Glasses, Gloves | Eliminate all sources of ignition. Ventilate area if required. In case of fire, use flooding quantities of water. Will decompose at high temperatures and emit acrid smoke and fumes. |
| Copper Standard - AA | | Anachemia | Liquid | 8 | E | 4, 0, 0 | 5 L | | Dilute Nitric Acid <5% | Safety Glasses, Gloves | Neutralize with soda ash or lime. Contain spill, do not allow un-neutralized acid to enter water systems. Neutralized spill can be pumped to the pit or tailings system. |
| Crystal 78 | Sodium Silicate | Quadra Chemicals | Liquid | not regulated | D-2B | | 25 L | | Caustic solution. Avoid mixing with strong acids. Contact with metals such as aluminum, tin, lead and zinc generates hydrogen gas. | Goggles, gloves. Respirator | solution can be pumped into plastic drum and possibly recycled in mill circuit, or shipped off site. In case of fire use appropriate measures for surrounding fire. |
| Cyquest DP-6 | Sodium polyacrylate in water | Cytec Canada | Liquid | not regulated | not regulated | 1,1,0 | | Mill reagent | Slippery | Goggles, Impervious gloves | Soak up with absorbent materials. These can be incinerated. Any remaining spill liquid should be stored in closed container, labelled and disposed of off-site as Special Waste. |

Minto Mine - Inventory of Dangerous Goods

Reporting Threshold, Special Precautions, PPE Requirements, and Cleanup and Disposal Methods

| Common Name (Synonyms) | Chemical Name | Manufacture / Supplier | Phase | TDG Class | WHMIS Class | NFPA Rating | Reporting Threshold | Use | Special Precautions | PPE Required | Special Cleanup and Disposal Info |
|---|---|---------------------------|--------|---------------|-----------------------|-------------|---------------------|------------------|---|--|---|
| Delo Diesel Fuel System Cleaner | | Chevron Lubricants Canada | Liquid | 3 | B-3, D-2A, D-2B | | 200 L | | | Safety Glasses, Gloves | Eliminate all sources of ignition. Ventilate area if required. Use absorbent. In case of fire, use dry chemical, CO2, Alcohol-resistant Foam or water spray. Incinerate waste. |
| Diesel Fuel No. 2 | | Chevron Products Company | Liquid | 3 | B-3, D-2A, D-2B | 0, 2, 0 | 200 L | | | Safety Glasses, Gloves | contain spill. Small amounts can use absorbent and incinerate waste. Larger material pumped into plastic drums and used in a waste oil heating system. |
| DIISOBUTYL KETONE | 2,6-Dimethyl-4-heptanone | J.T. Baker | Liquid | 3 | B-2, D-2A | 2, 2, 0 | 200 L | | Avoid contact with strong oxidizers or acids. | Safety Glasses, Gloves | Eliminate all sources of ignition. Ventilate area if required. Use absorbent. In case of fire, use dry chemical, CO2, Alcohol-resistant Foam or water spray. Incinerate waste. |
| Drierite, indicating | | Anachemia | solid | not regulated | D-2A | 1, 0, 1 | | | | Safety Glasses, Gloves | Eliminate all sources of ignition. In case of fire use measures dictated by surrounding fire. Will decompose at 1450°C liberating Cl ₂ and SO ₂ . This product can be dried and reused, recycled. |
| Envirobind KFZ | | Power Chemicals Ltd. | Liquid | not regulated | not regulated | 1, 0, 0 | | Dust Suppression | Avoid contact with oxidizing agents or strong acids. | Goggles, Gloves | Do not use absorbents. Contain spill using noncombustible materials such as vermiculite, earth or sand. |
| Envirobind KTF | | Power Chemicals Ltd. | Liquid | not regulated | not regulated | 1, 0, 0 | | Dust Suppression | Avoid contact with oxidizing agents or strong acids. | Goggles/Glasses, Gloves | Do not use absorbents. Contain spill using noncombustible materials such as vermiculite, earth or sand. |
| Envirobind PCW | | Power Chemicals Ltd. | Liquid | not regulated | not regulated | 1, 0, 0 | | Dust Suppression | Avoid contact with strong oxidizing materials. | Goggles/Glasses, Gloves | Dike or contain. Absorb irrecoverable material onto inert oil absorbent medium, package, and label for legal disposal. Wash hard surfaces with water. Contaminated absorbent material may be disposed of in an approved landfill |
| FLEET CHARGE 50/50 Antifreeze | Ethylene Glycol | OLD WORLD INDUSTRIES | Liquid | 9 | D-2A | 1, 1, 0 | 25 L | | may be fatal by ingestion | Safety Glasses, Gloves | contain spill. Can be pumped, filtered and reused. Small amounts can use absorbent and incinerate waste. Larger absorbent material in plastic drums and shipped off site for disposal. |
| Fleet Charge PG Antifreeze/Coolant | Propylene Glycol | OLD WORLD INDUSTRIES | Liquid | not regulated | not regulated | 0, 1, 0 | 25 L | | | Safety Glasses, Gloves | contain spill. Can be pumped, filtered and reused. Small amounts can use absorbent and incinerate waste. Larger absorbent material in plastic drums and shipped off site for disposal. |
| Flomin C 3505 Collector | Potassium amyl xanthate (PAX) | Flomin Inc. | solid | 4 | not regulated | 2, 2, 1 | 25 kg | | Product is spontaneously combustible. Avoid contact with heat, moist air, and water. | Safety Glasses, Gloves | Sweep up spilled material and place in closed container for reuse. Solutions of product may be disposed of on the pit or tailings system. In case of fire use appropriate measures for surrounding fire. |
| Flomin F 500 Frother | 4-METHYL-2-PENTANOL (Methyl isobutyl carbinol - MIBC) | Flomin Inc. | Liquid | 3 | B-2, D-2B | 2, 2, 0 | 200 L | | Acids, acid chlorides, alkalis, oxidizing agents. Will attack some forms of plastics, rubber and coatings | Goggles, gloves. Respirator or SCBA if in confined space | Eliminate all sources of ignition. Ventilate area if required. Use absorbent. In case of fire, use dry chemical, CO2, Alcohol-resistant Foam or water spray. Incinerate waste. |
| Floran Catalyst | Proprietary Inorganic Peroxide Blend | Floran Technologies | Liquid | 5 | C, D-2B | 2, 0, 1, OX | 50 L | | Non-Flammable but will aid combustion of other materials | Safety Glasses, Gloves | Eliminate all sources of ignition. Ventilate area if required. Use absorbent. In case of fire, use flooding quantities of water. Contributes to combustion of other materials. Contain spill, keep from entering ground water. Absorbed pill can be disposed in the pit or tailings system. |
| Frost Killer (Tannergas) | Methyl alcohol | TANNER SYSTEMS, INC. | Liquid | 3, 6.1 | B-2, D-1B, D-2A, D-2B | 1, 3, 0 | 200 L | | Extremely Flammable, Vapours are harmful and solution is poisonous | Goggles, gloves. Respirator or SCBA if in confined space | Eliminate all sources of ignition. Ventilate area if required. Use absorbent. In case of fire, use dry chemical, CO2, Alcohol-resistant Foam or water spray. Incinerate waste. |
| FUEL INJECTOR CLEANER | | Radiator Specialty Co | Liquid | 3 | B-3, D-2A, D-2B | | 200 L | | | Safety Glasses, Gloves | Eliminate all sources of ignition. Ventilate area if required. Use absorbent. In case of fire, use dry chemical, CO2, Alcohol-resistant Foam or water spray. Incinerate waste. |
| Gasoline, Unleaded | | Petro-Canada | Liquid | 3 | B-2, D-2A, D-2B | 2, 3, 0 | 200 L | | Extremely Flammable, Vapours are harmful and they may be explosive. Non-sparking tools required. Vapours will collect in low areas and travel along the ground to an ignition source. | Goggles, gloves. Respirator or SCBA if in confined space | Eliminate all sources of ignition. Ventilate area if required. Dike the spill and pump to containers for recycling. Use absorbent. In case of fire, use dry chemical, CO2, Alcohol-resistant Foam or water spray. Allow waste absorbent to evaporate and then incinerate waste. |
| Glycerin | IPAC | Power Chemicals Ltd. | Liquid | Not regulated | Not regulated | | | | Avoid contact with reducing agents and oxidizing agents. | Goggles, gloves. | Dike spilled product to prevent runoff |
| Havoline DEX-COOL Extended Life 50/50 Anti-Freeze/Coolant | Ethylene Glycol | Chevron Lubricants Canada | Liquid | not regulated | D-1b, D-2A | 2, 0, 0 | 25 L | | may be fatal by ingestion | Safety Glasses, Gloves | contain spill. Can be pumped, filtered and reused. Small amounts can use absorbent and incinerate waste. Larger absorbent material in plastic drums and shipped off site for disposal. |

Minto Mine - Inventory of Dangerous Goods

Reporting Threshold, Special Precautions, PPE Requirements, and Cleanup and Disposal Methods

| Common Name (Synonyms) | Chemical Name | Manufacture / Supplier | Phase | TDG Class | WHMIS Class | NFPA Rating | Reporting Threshold | Use | Special Precautions | PPE Required | Special Cleanup and Disposal Info |
|---|--|--------------------------------------|--------|---------------|-----------------------|-------------|---------------------|-----------------------|--|---|---|
| HAVOLINE DEX-COOL extended life anti-freeze/coolant-B | Ethylene Glycol | Chevron Lubricants Canada | Liquid | not regulated | D-1b, D-2A | 2, 1, 0 | 25 L | | may be fatal by ingestion | Safety Glasses, Gloves | contain spill. Can be pumped, filtered and reused. Small amounts can use absorbent and incinerate waste. Larger absorbent material in plastic drums and shipped off site for disposal. |
| Havoline Power Steering Fluid | | Chevron Products | Liquid | not regulated | not regulated | 0, 1, 0 | | | | Safety Glasses, Gloves | contain spill. Small amounts can use absorbent and incinerate waste. Larger material pumped into plastic drums and used in a waste oil heating system. |
| Hot 4-in-1 Heating Oil Treatment | Proprietary Blend | FPPF Chemical Company, Inc. | Liquid | 3 | B-3, D-1A, D-2A, D-2B | 3, 2, 0 | 200 L | | Fuel Additive, fumes will collect in low area's. | Safety Glasses, Gloves | Eliminate all sources of ignition. Ventilate area if required. Use absorbent. In case of fire, use dry chemical, CO2, Alcohol-resistant Foam or water spray. Incinerate waste. |
| Hydrated Lime | Ca(OH) ₂ | Chemical Lime Company of Canada Inc. | Solid | not regulated | D-2A, E | | | | Will cause severe caustic burns. Avoid strong acids, and aluminum | Safety Glasses, Gloves | sweep up uncontaminated material for reuse. Neutralize with dilute acid and may be disposed of in pit or tailings system. |
| Hydraulic Oil SAE 10W | | EXXON MOBIL | Liquid | not regulated | not regulated | 0, 1, 0 | 200 L | | | Safety Glasses, Gloves | Eliminate all sources of ignition. Ventilate area if required. Use absorbent. In case of fire, use dry chemical, CO2, Alcohol-resistant Foam or water spray. Incinerate waste. |
| Hydrex 3223 | | Veolia | Liquid | 8 | E | 1, 0, 0 | 5kg or 5L | Coagulant in the WTP | | Safety glasses with side shields or goggles, face shield, chemical resistant gloves. Suitable respiratory equipment in poorly ventilated areas. | Contain spill. Ventilate area if required. Use absorbent. Place contaminated materials in sealed container for disposal and dispose of via a licensed waste disposal contractor. |
| Hydrex 6186 | | Veolia | Solid | not regulated | not regulated | 0, 1, 0 | | Flocculant in the WTP | | Safety glasses with side shields or goggles. | Sweep or vacuum spilled material. Do not get water on spilled material. Flush area with water after product recovery. Place recovered material in sealed container and dispose of via a licensed waste disposal contractor. |
| Hydrochloric Acid | | Anachemia | Liquid | 8 | D-1A, E | 3, 0, 1 | 5 L | | Concentrated acid, Extremely corrosive. Ventilate or stay upwind | Goggles, gloves. Respirator or SCBA if in confined space | Neutralize with soda ash or lime. Contain spill, do not allow un-neutralized acid to enter water systems. Neutralized spill can be pumped to the pit or tailings system. |
| Hydrofluoric acid, 47 - 51% | | Fisher | Liquid | 8, 6.1 | D-1A, D-2A, E | 4, 0, 1 | 5 L | | Extremely corrosive and Toxic acid. Causes very severe acid burns with symptoms being delayed. Skin contact of <10% can be fatal from cardiopulmonary problems. IMMEDIATE medical attention is required for all exposures. | Goggles, gloves. Respirator or SCBA if in confined space (Actually SCBA should be used anywhere unless spill is in a fumehood) | Neutralize with soda ash. Contain spill, do not allow un-neutralized acid to enter water systems. Neutralized spill can be pumped to a plastic barrel and then disposed of in the pit or tailings system. |
| IPAC 6832 | | Quadra Chemicals | Liquid | not regulated | not regulated | | | | water soluble | Safety Glasses, Gloves | No special clean up procedures, |
| Iron Standard - AA | | Anachemia | Liquid | 8 | E | 1, 0, 0 | 5 L | | Dilute Nitric Acid <5% | Safety Glasses, Gloves | Neutralize with soda ash or lime. Contain spill, do not allow un-neutralized acid to enter water systems. Neutralized spill can be pumped to the pit or tailings system. |
| Isopropylxanthic acid sodium salt (SIPX) | | Quadra Chemicals Ltd. | Solid | 4.2 | B-6, D-1B, D-2B | | 25 kg | Collector in Mill | Keep away from water - contact with water liberates extremely flammable gases. Keep away from heat, sparks and flame - fine dust clouds may form explosive mixtures with air. Use only with adequate ventilation. | Goggles, Gloves, Respirator (air-purifying or air-fed) | Move containers from spill area. Avoid allowing the spilled material to get wet or using water to clean up spillages or residues, unless the quantity remaining is very small. Vacuum or sweep up material and place in a designated, labeled waste container. Use spark-proof tools and explosion-proof equipment. Dispose of via a licensed waste disposal contractor. |
| Javex Liquid Bleach | NaOCl | Colgate Palmolive | Liquid | not regulated | E, D-2B, C | | | | Self heating and may catch fire. | Safety Glasses, Gloves, SCBA | Ventilate area and allow qualified personnel to stop/control spill. Small spills: flush area with plenty of water and mop up. Large spills: dike the ingredient and transfer to appropriate containers. Consult Federal, Provincial and Municipal regulations for disposal. May be neutralized with sodium bisulphite or dilute hydrogen peroxide. |
| KAX 51 | Proprietary Blend (mix of isoamyl alcohol, potassium amyl xanthate, and potassium hydroxide) | Prospec Chemicals | Solid | 4.2 | B-6, D-1B, E | | 25 kg | Collector in Mill | | Safety Glasses, Face Shield, Gloves, SCBA | If in the liquid state: Stop spill at source. Contain any spilled material to prevent discharge into the environment. Eliminate all sources of ignition. Persons not wearing protective equipment should be excluded from the area. Absorb with inert dry material. Put into an approved metal salvage drum for disposal. If in the solid state: Eliminate all sources of ignition. Restrict access to area until completion of clean-up. Ensure clean-up is conducted by trained personnel only. Do not touch spilled material. Do not use water on spilled material as heat will be generated. Put spilled material into approved salvage drums for disposal. Flush cleaned area with water, making sure no water enters xanthate containers. |

Minto Mine - Inventory of Dangerous Goods

Reporting Threshold, Special Precautions, PPE Requirements, and Cleanup and Disposal Methods

| Common Name (Synonyms) | Chemical Name | Manufacture / Supplier | Phase | TDG Class | WHMIS Class | NFPA Rating | Reporting Threshold | Use | Special Precautions | PPE Required | Special Cleanup and Disposal Info |
|---|---|--------------------------------------|---------------|-----------------------|-----------------------|-------------|------------------------------------|-----------------|--|---|--|
| KOPR-KOTE | Graphite, Cu & MoS ₂ mixture | Jet-Lube of Canada | paste | not regulated | not regulated | 1,1,1 | | | | Safety Glasses, Gloves | Wipe up spill with rags and incinerate waste. |
| Lead Standard - AA | | Anachemia | Liquid | 8 | D-2A, E | 4, 0, 0 | 5 L | | Dilute Nitric Acid <5% | Safety Glasses, Gloves | Neutralize with soda ash or lime. Contain spill, do not allow un-neutralized acid to enter water systems. Neutralized spill can be pumped to the pit or tailings system. |
| Lime | | Chemical Lime Company of Canada Inc. | powder | not regulated | E | 3, 0, 1 | | | Will cause severe caustic burns. Avoid strong acids, and aluminum | Safety Glasses, Gloves | sweep up uncontaminated material for reuse. Neutralize with dilute acid and may be disposed of in pit or tailings system. |
| Liquid Nitrogen | Nitrogen | Praxair Canada Inc. | Liquefied Gas | 2.2 Non-flammable gas | A | 3, 0, 2 | any if container larger then 100 L | | Use air supplied respirator when working in confined space, Loose-fitting cryogenic gloves, Metatarsal shoes for cylinder handling. Protective clothing where needed. Cuff less trousers should be worn outside of shoes | Extremely cold liquefied gas, Will cause severe frost bite Use SCBA when working in confined space, | Evacuate all personnel from danger area. Allow spilled liquid to evaporate. Use self contained breathing apparatus where needed. Shut off flow if you can do so without risk. Ventilate area or move cylinder to a well-ventilated area. Test for sufficient oxygen, especially in confined spaces, before allowing re-entry |
| LIQUID WRENCH SUPER LUBRICANT (AEROSOL) | Proprietary Blend | Radiator Specialty Co | aerosol | 2.1 | A, B5, D-1A, D2-B | | any if container larger then 100 L | | containers may rupture if exposed to high temperatures. | Safety Glasses, Gloves | Allow container to completely discharge while eliminating ignitions sources. Wipe up spill with rags and incinerate waste. |
| Loctite Belt Dressing | Proprietary Blend | Henkel Canada, Inc. | aerosol | 2.2 | A, D-2A, D-2B | | any if container larger then 100 L | | containers may rupture if exposed to high temperatures. | Safety Glasses, Gloves | Allow container to completely discharge Wipe up spill with rags and incinerate waste. |
| LPS 2 Spray Lubricant | Proprietary Blend | LPS Laboratories | aerosol | 2.2 | A, D-2A, D-2B | | any if container larger then 100 L | | containers may rupture if exposed to high temperatures. | Safety Glasses, Gloves | Allow container to completely discharge Wipe up spill with rags and incinerate waste. |
| Magnesium Nitrate Matrix Modifier | | Spex CertiPrep | Liquid | 8 | D-2A, E | 3, 0, 0 | 5 L | | Dilute Nitric Acid <5% | Safety Glasses, Gloves | Neutralize with soda ash or lime. Contain spill, do not allow un-neutralized acid to enter water systems. Neutralized spill can be pumped to the pit or tailings system. |
| MAXGOLD™ 900 Promoter | Proprietary Blend | Cytec Canada | Liquid | 3 | B-3, D-2A | 3, 2, 0 | 200 L | | slightly yellow liquid that has a slight sulphur smell. In confined space use respirator with organic vapour cartridges | Goggles, gloves. Respirator or SCBA if in confined space | eliminate ignition sources, use absorbent on small spills, for large spill pump to plastic drum for shipment off site. In case of fire use dry chemical extinguisher, CO ₂ or foam. Water likely not effective. |
| MERCSORB Mercury Amalgamation Powder | | NPS Corporation | solid | 4 | | 0, 1, 1 | 25 kg | | Dry zinc dust will not ignite spontaneously, but once ignited, it may burn readily in air | Safety Glasses, Gloves | Sweep up spilled material and place in closed container for reuse. In case of fire use appropriate measures for surrounding fire. |
| Mercury Indicator Powder | Proprietary Blend | NPS Corporation | solid | not regulated | | 2, 1, 0 | | | Odorless, yellowish-tan to gray powder. Dust may form a flammable or explosive mixture in air. When heated to decomposition, toxic fumes of sulfur oxides are produced | Safety Glasses, Gloves | Sweep up spilled material and place in closed container for reuse. In case of fire use appropriate measures for surrounding fire. This product in itself is considered to be non-hazardous. |
| Mercury Standard - AA | | Anachemia | Liquid | 8 | D-2A, E | 3, 0, 0 | 5 L | | Dilute Nitric Acid <5% | Safety Glasses, Gloves | Neutralize with soda ash or lime. Contain spill, do not allow un-neutralized acid to enter water systems. Neutralized spill can be pumped to the pit or tailings system. |
| Mercury Vapor Suppressor | Proprietary Blend | NPS Corporation | solid | not regulated | | 2, 1, 0 | | | Odorless, black, irregular, dry granular solid. Wet activated carbon removes oxygen from the air causing a severe hazard to workers in confined space. | Safety Glasses, Gloves | Sweep up spilled material and place in closed container for reuse. Contaminated waste can be incinerated. In case of fire use appropriate measures for surrounding fire. This product in itself is considered to be non-hazardous. |
| Methanol | | Anachemia | Liquid | 3, 6.1 | B-2, D-1B, D-2A, D-2B | 1, 3, 0 | 200 L | | Extremely Flammable, Vapours are harmful and solution is poisonous | Goggles, gloves. Respirator or SCBA if in confined space | Eliminate all sources of ignition. Ventilate area if required. Use absorbent. In case of fire, use dry chemical, CO ₂ , Alcohol-resistant Foam or water spray. Incinerate waste. |
| MIBC | Methyl Isobutyl Carbinol | Flomin Inc. | Liquid | 3 | | 2, 2, 0 | 200 L | Frother in Mill | Product liquid and vapor are flammable. Keep away from heat and sources of ignition. Product vapors or mist may be irritating to eyes and respiratory system. Product liquid may cause eye and skin burns. Harmful if swallowed. | Goggles or Face Shield, Gloves, Respirator (NIOSH/MSA) | Dike spill and collect for disposal or reuse. Use adsorbents on residual material. Flush spill area with water. Keep flush material out of waterways. Dispose of cleanup material in an approved manner. |
| MIBK | 4-Methyl-2-pentanone | Fisher Scientific | Liquid | 3 | B-2 | 2, 3, 0 | 200 L | | clear liquid that has a slightly sweet smell. In confined space use respirator with organic vapour cartridges | Safety Glasses, Gloves | Clear liquid that is immiscible with water. Use absorbent for small spills and incinerate waste. Large spills, eliminate ignitions sources and pump to plastic drum for shipment off site. |
| Molybdenum Standard - AA | | Anachemia | Liquid | not regulated | not regulated | 0, 0, 0 | | | | Safety Glasses, Gloves | Contain spill. Incinerate waste or place in landfill |
| Mucosal universal detergent | | Sigma-Aldrich Canada | Liquid | not regulated | D-2B | 2, 0, 0 | | | | Safety Glasses, Gloves | |

Minto Mine - Inventory of Dangerous Goods

| Nickel Standard - AA | | Anachemia | Liquid | 8 | D-2A, E | 1, 0, 0 | 5 L | | Dilute Nitric Acid <5% | Safety Glasses, Gloves | Neutralize with soda ash or lime. Contain spill, do not allow un-neutralized acid to enter water systems. Neutralized spill can be pumped to the pit or tailings system. |
| Nitric Acid | | Anachemia | Liquid | 8 | C, D-1A, E | 4, 0, 0, OX | 5 L | | Concentrated acid, Extremely corrosive. Ventilate or stay upwind. Strong Oxidizer | Goggles, gloves. Respirator or SCBA if in confined space | Neutralize with soda ash or lime. Contain spill, do not allow un-neutralized acid to enter water systems. Neutralized spill can be pumped to the pit or tailings system. |
| Nitric Acid 40% | | Quadra Chemicals | Liquid | 8 | C, D-1A, E | 4, 0, 0, OX | 5 L | | Concentrated acid, Extremely corrosive. Ventilate or stay upwind. Strong Oxidizer | Goggles, gloves. Respirator or SCBA if in confined space | Neutralize with soda ash or lime. Contain spill, do not allow un-neutralized acid to enter water systems. Neutralized spill can be pumped to the pit or tailings system. |
| Oxygen | | BOC Canada Limited (Linde) | Pressurized gas | 2.2 | A, C | 0, 3, 0, OX | any if container larger than 100 L | | Strong Oxidizer will Contribute to combustion of other materials. | Safety Glasses, Gloves | close valve if possible without risk, or allow the vent. In case of fire use any media suitable for surrounding fire. Use water spray to cool fire exposed containers. |
| Oxygen Refrigerant | | Air Liquide Canada | Liquefied Gas | 2.2 | A, C | 0, 3, 0, OX | any if container larger than 100 L | | Strong Oxidizer will Contribute to combustion of other materials. Liquefied gas, will produce extreme cold when released. | Safety Glasses, Gloves | close valve if possible without risk, or allow the vent. In case of fire use any media suitable for surrounding fire. Use water spray to cool fire exposed containers. |
| Palladium Nitrate Matrix Modifier | | Spex CertiPrep | Liquid | 8 | D-2A, E | 3, 0, 0 | 5 L | | Dilute Nitric Acid <5% | Safety Glasses, Gloves | Neutralize with soda ash or lime. Contain spill, do not allow un-neutralized acid to enter water systems. Neutralized spill can be pumped to the pit or tailings system. |
| Phosphoric acid | | Sigma-Aldrich Canada | Liquid | 8 | D-1A, D-2B, E | | 5 L | | Concentrated acid, Extremely corrosive. Ventilate or stay upwind. | Goggles, gloves. Respirator | Neutralize with soda ash or lime. Contain spill, do not allow un-neutralized acid to enter water systems. Neutralized spill can be pumped to the pit or tailings system. |
| Pine Oil (Terpene SW Blend) | | Quadra Chemicals Ltd. | Liquid | not regulated | B-3, D-2B | | | Frother in Mill | Combustible liquid and vapor. Causes respiratory tract, eye and skin irritation. Use only with adequate ventilation. Keep container tightly closed and sealed until ready for use. Wash thoroughly after handling. Avoid oxidizing materials. | Goggles, Gloves, Respirator (air-purifying or air-fed) | Stop leak if without risk. Move containers from spill area. Dilute with water and mop up if water-soluble or absorb with an inert dry material and place in an appropriate waste disposal container. Use spark-proof tools and explosion-proof equipment. Dispose of via a licensed waste disposal contractor. |
| PAX | Potassium Amyl Xanthate | Quadra Chemicals Ltd. | Solid | 4.2 | B-6, D-2B | | 25 kg | Collector in Mill | Keep away from water - contact with water liberates extremely flammable gases. Keep away from heat, sparks and flame - fine dust clouds may form explosive mixtures with air. Use only with adequate ventilation. | Goggles, Gloves, Respirator (air-purifying or air-fed) | Move containers from spill area. Avoid allowing the spilled material to get wet or using water to clean up spillages or residues, unless the quantity remaining is very small. Vacuum or sweep up material and place in a designated, labeled waste container. Use spark-proof tools and explosion-proof equipment. Dispose of via a licensed waste disposal contractor. |
| Polyclear A2501 | | Quadra Chemicals Ltd. | Solid | not regulated | not regulated | | | Tailings thickener flocculant | Keep away from heat, sparks and flame- fine dust clouds may form explosive mixtures with air. Take precautionary measures against electrostatic discharges. Use only with adequate ventilation. Avoid oxidizing materials. | Safety Glasses, Gloves | Move containers from spill area. Vacuum or sweep up material and place in a designated, labeled waste container. Use spark-proof tools and explosion-proof equipment. In case of fire use appropriate measures for surrounding fire. Place in sealed container and dispose of via a licensed waste disposal contractor. |
| Polyclear 2528 | Polyclear Floc | Quadra Chemicals Ltd. | solid | not regulated | not regulated | | | | concentrated solution is extremely slippery, use caution | Safety Glasses, Gloves, respiratory equipment if risk assesment deems necessary | Sweep up spilled material and it may be deposited of in dilute form to the pit or tailings system. In case of fire use appropriate measures for surrounding fire. |
| Polyclear 31080C | | Quadra Chemicals Ltd. | Liquid | 9 | D-2B | | | Dewatering Aid in Mill | Use only with adequate ventilation. Avoid contact with strong oxidizers or halogens | Goggles, Gloves, Respirator (air-purifying or air-fed) | Stop leak if without risk. Move containers from spill area. Dilute with water and mop up if water-soluble or absorb with an inert dry material and place in an appropriate waste disposal container. Dispose of via a licensed waste disposal contractor. |
| Polyfroth W31 | | Quadra Chemicals Ltd. | Liquid | not regulated | not regulated | | | Frother in Mill | Harmful or fatal if swallowed. Can enter lungs and cause damage. May cause target organ damage | Goggles, Gloves, Respirator (air-purifying or air-fed) | Stop leak if without risk. Move containers from spill area. Dilute with water and mop up if water-soluble or absorb with an inert dry material and place in an appropriate waste disposal container. Dispose of via a licensed waste disposal contractor. |
| Potassium hydroxide | KOH | Science lab | Solid | 8 | D-1B | 3, 0, 1 | 5 kg | | very corrosive solid | Safety Glasses, Gloves | Use appropriate tools to put the spilled solid in a convenient waste disposal container. If necessary; Neutralize the residue with a dilute solution of acetic acid. |
| Potassium Iodide | | Anachemia | solid | not regulated | D-2A | 1, 1, 1 | | | light and water exposure will cause breakdown | Safety Glasses, Gloves | Eliminate all sources of ignition. In case of fire use measures dictated by surrounding fire. Will decompose at high temperatures and emit toxic I ₂ fumes. Use appropriate SCBA. |
| Potassium permanganate | | CAIROX | Solid | 5.1 | C, E | 1, 0, 0, OX | 50 kg | | corrosive solid. Oxidizing solid | Safety Glasses, Gloves | Sweep up solid spill for possible reuse. If necessary reduce material in aqueous solution with sodium thiosulfate (hypo). In case of fire use flooding quantities of water, material will contribute to combustion. |
| Propane | | Superior Propane | Liquefied Gas | 2.1 | A, B-1 | | any if container larger than 100 L | | Extremely flammable. Liquefied gas, will produce extreme cold when released. | Goggles, gloves. SCBA if in confined space | close valve if possible without risk, or allow the vent. In case of fire use any media suitable for surrounding fire. Use water spray to cool fire exposed containers. |
| Selenium Standard - AA | | Anachemia | Liquid | 8 | E | 1, 0, 0 | 5 L | | Dilute Nitric Acid <5% | Safety Glasses, Gloves | Neutralize with soda ash or lime. Contain spill, do not allow un-neutralized acid to enter water systems. Neutralized spill can be pumped to the pit or tailings system. |

Minto Mine - Inventory of Dangerous Goods

Reporting Threshold, Special Precautions, PPE Requirements, and Cleanup and Disposal Methods

| Common Name (Synonyms) | Chemical Name | Manufacture / Supplier | Phase | TDG Class | WHMIS Class | NFPA Rating | Reporting Threshold | Use | Special Precautions | PPE Required | Special Cleanup and Disposal Info |
|--|--|------------------------|--------|--|-------------------|-------------|---------------------|--------------------|--|--|--|
| Sodium Borohydride | | Anachemia | solid | 4.3 | B-6, B-4, D-1B, E | 3, 1, 2 | 25 kg | | Flammable solid. Reacts violently with water and acids to produce flammable H ₂ gas. Strong reducing agent. | Safety Glasses, Gloves | Eliminate ignition sources, sweep up dry material. In case of fire use only dry chemical extinguisher, DO NOT USE WATER OR CO ₂ |
| Sodium Hydroxide Solutions (various strengths) | NaOH (The Anachemia MSDS is current, treat all solutions in the same manner regardless of strength.) | Various Suppliers | Liquid | 8 | E | 3, 0, 1 | 5 L | | Caustic solution. Avoid mixing with strong acids. Contact with metals such as aluminum, tin, lead and zinc generates hydrogen gas. | Safety Glasses, Gloves | Neutralize the residue with a dilute solution of acetic acid. Neutralized solution can be disposed of in the pit or tailings system. |
| Sodium Nitrite | | Anachemia | solid | 5.1, 6.1 | C, D-1B, D-2A | 3, 0, 2, OX | 50 kg | | Strong Oxidizer will contribute to combustion of other materials. | Safety Glasses, Gloves | Eliminate all sources of ignition. In case of fire, use flooding quantities of water. Will decompose at high temperatures and emit acrid smoke. Strong oxidizer, may form compound that are sensitive to shock, friction. Sweep up solid spill for disposal. Dispose of contaminated solution in the pit or tailings system. |
| sodium sulphide Flakes | Sodium sulphide Hydrated | Quadra Chemicals | solid | 8 | D-1B, E | | 5 kg | | caustic, very corrosive solid | Goggles, gloves. And a respirator, avoid creating dust and avoid any acids. Contact with acids liberate toxic H ₂ S | Sweep up spilled material in place in plastic sealed container for shipment off site. |
| TMT 15% | trisodium salt | Quadra Chemicals | Liquid | not regulated (treated as Cl. 9 Miscellaneous) | D-2B | | 25 L | | water soluble | Safety Glasses, Gloves | No special clean up procedures, treated as Class 9 Miscellaneous as product does not meet Class 6 Toxicity standards but is an environmental hazard. |
| Urea | Carbamide | Anachemia | solid | not regulated | not regulated | 1, 0, 0 | | | Avoid contact with strong oxidizers. In fire conditions it can produce oxides of nitrogen. Also ammonia, and HCN | Safety Glasses, Gloves | Sweep up spilled material and it may be deposited in dilute form to the pit or tailings system. In case of fire use appropriate measures for surrounding fire. |
| Vitec 7000 | | Avista Technologies | Liquid | not regulated | 2A | 1, 0, 0 | | Antiscalant in WTP | Avoid mixing with strong bases, strong oxidizers, very strong acids, water reactive materials | SCBA or SABA in confined space, Safety goggles/glasses, Chemical impervious gloves | Soak up or wet vacuum spilled liquid. Neutralize residue with sodium bicarbonate or other neutralizing agent for very dilute acids. Decontaminate the area thoroughly. Place all spill residues in suitable container and dispose of via a licensed waste disposal contractor. |
| VAR SOL 3139 SOLVENT | Petroleum Hydrocarbons | Imperial Oil Chemicals | Liquid | 3 | B-3, D-2B | 1, 2, 0 | 200 L | | Flammable solvent | Safety Glasses, Gloves | Clean up uncontaminated material for reuse. Incinerate waste. |
| VoltEsso 35 | | Imperial Oil Chemicals | Liquid | not regulated | not regulated | 1, 1, 0 | | | electrical insulating oil | Safety Glasses, Gloves | Clean up uncontaminated material for reuse. Incinerate waste. |
| Zinc Standard - AA | | Anachemia | Liquid | 8 | E | 1, 0, 0 | 5 L | | Dilute Nitric Acid <5% | Safety Glasses, Gloves | Neutralize with soda ash or lime. Contain spill, do not allow un-neutralized acid to enter water systems. Neutralized spill can be pumped to the pit or tailings system. |

Appendix C: ERT Response to HazMat Spills

ERT Response to Hazmat Spill

Spill Contact: Yukon Territory Spill Line 1-867-667-7244

1.0 Overall HAZMAT Response Procedures

1.1 Site Management and Control

Initial responders will :

- Approach the scene from uphill and upwind.
- Establish command uphill and upwind of spill at an appropriate distance.
- Establish 2 isolation perimeters: one that separates the hot zone from the warm zone and another that separates the warm zone from the cold zone. Emergency Response Guide or Canutec shall be referenced for perimeter size.
- Evacuate affected area or 'protect in place', as req'd. Emergency Response Guide or Canutec shall be referenced for evacuation zone.
- Identify contaminated persons and ensure they remain isolated until they can be decontaminated.
- Establish a staging area.
- Designate an information officer.
- Possible unification of command.

1.2 Identification of the problem

I/C will identify the:

- Spilled product, as per witness testimony, placards, labels, bill of lading, type of container, etc. If product cannot be identified from command position, then a recon team will be tasked with identification.
- Size of container.
- Size and nature of release.
- Conditions and # of victims at accident site.
- Topography of area, and exposures threatened.

1.3 Hazard & Risk Evaluation

A risk evaluation will be conducted, taking into consideration:

- Product hazards
- Access & Egress
- Size of Spill
- Condition of container
- Proximity of exposures
- Personnel available to perform operations, and their level of training/experience
- Information from MSDS, ERG, Canutec, etc., minimum 3 sources

1.4 Personal Protective Equipment

PPE will be selected for Ops, RIT, and Decon teams, considering:

- Flammability/explosiveness of product
- Toxicity of product
- Route of entry of product
- Permeation rate of PPE
- Breakthrough time of PPE
- Availability of PPE
- Visibility and workability while wearing PPE

1.5 Information Management and Resource Coordination

The information officer will begin to gather information about the product once it has been identified. The information officer can use the MSDS, ERG, Canutec, or many other resources to gather information, such as:

- Properties of the product
- Hazards of the product
- Expected travel of product released
- Populations/ environment in jeopardy
- PPE req'd by responders
- Decontamination requirements

Command will prioritize the information and ensure that the correct people receive the correct information.

1.6 Implementing Response Objectives

Command will develop an overall strategy, which may be offensive (entry of hot zone to gain quick control), defensive (contain from the cold zone to prevent spread), or passive (isolate only, and wait for incident to run its course), considering:

- Life safety
- Incident stabilization
- Environmental protection
- Property salvage

Command will delegate tactics to operations teams, such as:

- Reconnaissance for unknown product
- Evacuation for toxic gas leak, fire, or explosive hazard
- Fire control for flammable gas, flammable liquid, or oxidizer
- Search and rescue
- Leak control
- Neutralization of corrosives
- Deployment of boom, drain covers, etc.
- Building of dams, dykes, etc.

To follow: specific tactic options will be discussed in more detail, pertaining to hazardous materials that are commonly found in large quantities at the Minto Mine.

Entry teams will enter with a clear objective, but must assess for the next team's objective. For example, the 1st entry team may be tasked with rescuing the driver of a fuel truck that rolled down a bank and is spilling fuel. Although their objective is to rescue, while they are on scene they should observe where the leak is, consider what could be used to stop it, where the fuel is going, and what is needed to contain it. They should bring a camera, so that pictures can be brought back to command. This will give command crucial information and better prepare the next team for their task.

1.7 Decontamination

Considerations for decontamination should begin at the outset of the incident. A decontamination construct will exist in the warm zone prior to any team entering the hot zone. It will typically consist of a large berm fashioned out of a large chemical resistant tarp, wrapped over a charged 2 ½" hose-line. There will be a charged 1 ½" hose-line nearby for emergency decontamination. Within the berm, there will be a series of smaller berms, in which, personnel will stand while being decontaminated. Personnel conducting the decontamination will be wearing the appropriate PPE (typically 1 class below ops) and will use detergent and water to gently scrub and rinse ops personnel and rescuees as they exit the hot zone. Tools and anything else exiting the hot zone will be decontaminated as well.

Once decontamination is complete, all product collected by the berms, will be handled as per the MSDS.

1.8 Termination

Once emergency operations are complete, the scene will be handed over to clean-up & recovery operations. Command will ensure that the hand-off includes all pertinent information about the spilled product:

- Properties
- Hazards
- Location
- Safe-handling
- Exposure signs and symptoms
- Req'd PPE
- Disposal procedures

Command will conduct an on-site debrief. As well, a more formal debrief will be conducted, with all parties involved, at a later time. The incident will be documented, including exposure records for all personnel that entered the warm and/or hot zones.

2.0 Specific Chemical Responses

2.1 Ammonium Nitrate

Site management and control

- Set up perimeter with at least 25m radius.
- Command, staging, & decon shall be positioned upwind.
- Eliminate sources of ignition.
- Unify command with Safety Superintendent, Mine Manager, Environmental Dept, Dyno Nobel, product carrier (if spill occurs during delivery to mine).

Identification

- UN# 1942.
- Solid state. Prills or granules.
- White.
- Odorless.
- Is there threat to a stream?

Hazard & risk evaluation

- Oxidizer .
- Exposure to high heat may evolve toxic, flammable gases.
- Explosive when confined and exposed to high heat.
- Ingestion and inhalation hazard.
- Toxic to aquatic life.

PPE

- If there is a fire situation, PPE will consist of full turn-out gear with SCBA.
Otherwise
- Class C suit with long sleeves.
- Dust mask.
- Oil resistant gloves & boots

Information management and resource coordination

- See MSDS for product information.

- Work closely with Dyno.
- Standard decon set-up will be constructed.
- Have tools cribbed for entry teams.
- Ensure there is enough PPE at the site to complete the task.
- Ensure there is drinking water for responders.
- Have hazmat trailer, ambulance & fire truck in staging area, as req'd
- Have Site Services staged for digging, damming, product extraction, as req'd.

Implementing Response Objectives

- Rescue injured personnel.
- Fire-fighting: If flame impingement on tank, use unmanned ground monitor to supply flooding quantities of water via straight-stream, to cool tank. Then, evacuate area 800m in all directions. If signs of imminent explosion are present prior to setting up ground monitor, do not attempt to set it up, just evacuate for 800m in all directions.
- Prevent from entering streams.
- Once in stream, may be unrecoverable. Underflow dams should be constructed, and surface can be skimmed.
- If possible, stop anymore product from being spilled.
- Follow Dyno's recommendations for recovery and clean-up of product.

Decontamination

Standard decon set-up will be utilized in warm zone:

- Large berm fashioned out of large chemical resistant tarp, wrapped over charged 2 ½" hose-line, 2 small berms, will be in series, within the large berm.
- Decon personnel shall don class C suits without need for respiratory or splash protection, other than safety glasses.
- Ensure all personnel that entered hot zone are properly decontaminated.
- Ensure that all tools that entered the hot zone are properly decontaminated.

Termination

- Once operation complete, vac-truck can be utilized to clean up solution contained with the decon berms.
- Safe and proper disposal of all spent PPE.
- Transition of command.
- Debrief.

2.2 Emulsion

Site management and control

- Consider initial perimeter of 800m.
- Command, staging, & decon shall be positioned upwind.
- Eliminate sources of ignition.
- Unify command with Safety Superintendent, Mine Manager, Environmental Dept, Dyno Nobel, product carrier (if spill occurs during delivery to mine).

Identification

- UN# 0332.
- Viscous liquid.
- Pink, opaque.
- Slight fuel oil odour.
- Shipped in bulk by tanker truck.

Hazard & risk evaluation

- Emulsion explosives.
- Stable under normal conditions.
- May explode under fire conditions.
- Eye & skin irritant.
- Slight ingestion & inhalation hazard.
- Avoid contact with corrosives.
- Is there threat to a stream?

PPE

- Class C suit with long sleeves.
- Standard PPE

Information management and resource coordination

- See MSDS for product information.
- Work closely with Dyno.
- Standard decon set-up will be constructed.
- Have tools cribbed for entry teams.
- Ensure there is enough PPE at the site to complete the task.

- Ensure there is drinking water for responders.
- Have hazmat trailer, ambulance & fire truck in staging area, as req'd
- Have Site Services staged for digging, damming, product extraction, as req'd.

Implementing Response Objectives

- Rescue injured personnel.
- Fire-fighting: If fire reaches cargo, DO NOT ATTEMPT TO FIGHT FIRE. Cargo may explode. Evacuate in all directions for 1600m.
- Prevent from entering streams.
- If possible, stop anymore product from being spilled.
- Follow Dyno's recommendations for recovery and clean-up of product.

Decontamination

Standard decon set-up will be utilized in warm zone:

- Large berm fashioned out of large chemical resistant tarp, wrapped over charged 2 ½" hose-line, 2 small berms, will be in series, within the large berm.
- Decon personnel shall don class C suits without need for respiratory or splash protection, other than safety glasses.
- Ensure all personnel that entered hot zone are properly decontaminated.
- Ensure that all tools that entered the hot zone are properly decontaminated.

Termination

- Once operation complete, clean out berms under direction of Dyno.
- Safe and proper disposal of all spent PPE.
- Transition of command.
- Debrief.

2.3 Diesel, Kerosene, CFE 150

Note: LEL sensor will not detect presence of long-chain hydrocarbon vapour. Photo-ionization detector (PID) should be used, if available.

Site management and control

- Set up perimeter with at least 50m radius.
- Command, staging, & decon shall be positioned uphill and upwind.
- Eliminate sources of ignition.
- Unify command with Safety Superintendent, Mine Manager, Environmental Dept, Dyno Nobel (if spilled product is CFE 150), product carrier (if spill occurs during delivery to mine).

Identification

- UN# 1202.
- Liquid state.
- Colour varies.
- Petroleum odour.
- Transported by B-train, tidy-tanks.
- Stored in 5 large tanks at fuel farm (total volume of 3,282,000 L), one 70,000 l Tank by UG portal, and one tank at Dyno (45,000 L).
- What is downhill from spill??
- Is there threat to life??
- Is there threat to a stream?

Hazard & risk evaluation

- Combustible liquid.
- Vapour could be ignited by any source of ignition.
- Extraction methods could create static if not bonded/grounded, and serve as an ignition source.
- Ambient temperature relevant.
- Irritant to eyes and skin
- Ingestion and inhalation hazard
- Toxic to aquatic life.

PPE

- If there is a fire situation, PPE will consist of full turn-out gear with SCBA.
Otherwise
- For offensive strategies, such as rescue or plugging, full turn-out gear with SCBA
- For defensive strategies, such as diverting, damming, booming, diking, class B suit.

- Respirator with OV cartridges.
- Oil resistant gloves & boots

Information management and resource coordination

- See MSDS for product information.
- Know the product's route of travel.
- Standard decon set-up will be constructed.
- Ensure tools are cribbed for entry teams.
- Ensure there is enough PPE at the site to complete the task.
- Ensure there is drinking water for responders.
- Have hazmat trailer, ambulance & fire truck in staging area, as req'd.
- Have Site Services staged for digging, damming, product extraction, as req'd.

Implementing Response Objectives

- Rescue injured personnel.
- Consider using fog stream to protect rescuers.
- Fire-fighting: Use dry chemical, CO2, Class B foam, or water with fog pattern.
- If using fog, considering increased run-off hazard
- Prevent from entering streams.
- If possible, stop the leak: close valves, use plugs, plug n' dyke, gaskets, straps, jacks, cribbing, etc.
- Containment berm at source, 'Surrey Condom'.
- If possible, contain by covering drains/culverts, diking, diverting to a berm, absorbing, etc.
- If product has entered a stream, use booms, hydrocarbon-only absorbent socks and pads, under-flow dams, diversion-booms, skimmers to contain and extract, as per instructions found later in this document.
- If transfer of product req'd, ensure entire system is bonded/grounded.
- Use non-sparking tools, such as pneumatics.
- Site Services Vac-truck is an option for cleaning up product.

Decontamination

Standard decon set-up will be utilized in warm zone:

- Large berm fashioned out of large chemical resistant tarp, wrapped over charged 2 ½" hose-line, 2 small berms, will be in series, within the large berm.
- Decon personnel shall don class C suits without need for respiratory or splash protection, other than safety glasses.
- Ensure all personnel that entered hot zone are properly decontaminated.
- Ensure that all tools that entered the hot zone are properly decontaminated.

Termination

- Once operation complete, vac-truck can be utilized to clean up solution contained with the decon berms.
- Safe and proper disposal of all spent PPE.
- Transition of command.
- Debrief

2.4 Gasoline

Note: Minto gas detectors are calibrated to pentane and are suitable for use during gasoline spill mitigation

Site management and control

- Set up perimeter. Consider radius up to 800m depending on amount of product and level of explosion hazard.
- Command, staging, & decon shall be positioned uphill and upwind.
- Eliminate sources of ignition.
- Unify command with Safety Superintendent, Mine Manager, Environmental Dept., product carrier (if spill occurs during delivery to mine).

Identification

- UN# 1203.
- Liquid state.
- Colourless to slightly yellow.
- Recognizable odour.
- Transported by B-train, tidy-tanks.
- Stored in 2 tank at fuel farm (34,150 L combined).
- What is downhill from spill??
- Is there threat to life?
- Is there threat to a stream?

Hazard & risk evaluation

- Flammable liquid. Extremely flammable in presence of ignition source, at nearly any temperature.
- Vapour could be ignited by any source of ignition.
- Vapour is heavier than air and may travel considerable distance to an ignition source, and flash back.
- Product extraction methods could create static if not bonded/grounded, and serve as an ignition source.
- Explosion hazard where flame impingement on tank.
- Irritant to eyes.
- Ingestion and inhalation hazard
- Toxic to aquatic life.

PPE

- If there is a fire situation, PPE will consist of full turn-out gear with SCBA.
Otherwise
- For offensive strategies, such as rescue or plugging, full turn-out gear with SCBA
- For defensive strategies, such as diverting, damming, booming, diking, fire resistant class B suit.
- Respirator with OV cartridges, only if LEL's are being monitored, otherwise, do not dampen sense of smell. Rather, move upwind of product vapour.

Information management and resource coordination

- See MSDS for product information.
- Know the product's route of travel.
- Standard decon set-up will be constructed.
- Ensure tools are cribbed for entry teams.
- Ensure there is enough PPE at the site to complete the task.
- Ensure there is drinking water for responders.
- Have hazmat trailer, ambulance & fire truck in staging area, as req'd
- Have Site Services staged for digging, damming, product extraction, as req'd.

Implementing Response Objectives

- Offensive tactics for rescue of injured personnel only.
- Consider blanketing affected area with class B foam, prior to rescuers entering hot zone.
- Use fog stream to suppress vapours and protect rescuers.
- Rescuers will carry intrinsically-safe radios and gas-detector.
- Prevent from entering streams
- If possible, stop the leak.
- If possible, contain by covering drains/culverts, diking, diverting to a berm, absorbing, etc.
- If product can or has entered a stream, use booms, hydrocarbon-only absorbent socks and pads, under-flow dams, diversion-booms, as per instructions found later in this document.
- Safe handling and disposal of all waste product.

Decontamination

Standard decon set-up will be utilized in warm zone:

- Large berm fashioned out of large chemical resistant tarp, wrapped over charged 2 ½" hose-line, 2 small berms, will be in series, within the large berm.
- Decon personnel shall don class C suits without need for respiratory or splash protection, other than safety glasses.
- Ensure all personnel that entered hot zone are properly decontaminated.
- Ensure that all tools that entered the hot zone are properly decontaminated.

Termination

- Once operation complete, safe disposal of decon berm contents
- Safe and proper disposal of all spent PPE
- Hand-over command of operation to Environmental Dept.
- Debrief

2.5 LPG (Propane)

Note: Minto gas detectors are calibrated to pentane, and require no correction prior to use during propane leak mitigation.

Site management and control

- Set up initial perimeter of at least 100m. For large tank where there is fire, set up perimeter of at least 1600m.
- Command, staging, & decon shall be positioned uphill and upwind.
- Eliminate sources of ignition.
- Unify command with Safety Superintendent, Mine Manager, Environmental Dept., product carrier (if spill occurs during delivery to mine).

Identification

- UN# 1075
- Colourless liquid and vapour while stored under pressure.
- Colourless and odourless gas in natural state at any concentration.
- Commercial propane has an odorant added which is commonly ethyl.
- Transported by tanker truck.
- Stored in 6 113,000L tanks West of the Main Pit, One 12,000L tank at the refill station near the airport, twin 3,000L tanks at Pelly, and twin 18,000L tanks at Km 0 of the access road.
- What is downhill from spill?
- Is there threat to life?
- Is there threat to a stream?

Hazard & risk evaluation

- Extremely flammable gas.
- Vapour could be ignited by any source of ignition.
- Vapour is heavier than air and may travel considerable distance to an ignition source, and flash back.
- Stored under pressure, as a liquid.
- Product extraction methods could create static if not bonded/grounded, and serve as an ignition source.
- Massive explosion hazard where flame impingement on tank.

PPE

- Full turn-out gear with SCBA.

Information management and resource coordination

- See SDS for product information.
- Consider contacting Canutec.
- Know the product's route of travel.
- Ensure tools are cribbed for entry teams.
- Have fire truck at scene and ambulance in staging area, as req'd

Implementing Response Objectives Leak in an enclosed space

- Evacuate structure.
- Close supply valve remotely if possible.
- Eliminate any source of ignition.
- Use positive pressure to ventilate space, ensure that it is exhausting to safe location.

If no remote isolation valve:

- Entry team (2 ERT members) & RIT team (2 ERT members) will don full turn-out gear & SCBA.
- Any electronic equipment being carried, such as radio or gas detector, must be intrinsically safe.
- Entry team will enter with charged 1 ½" hose-line and gas detector equipped with LEL sensor, while RIT stages in the cold zone .
- Once entry team is at 'reach of stream' distance from the leak, the nozzleman (Entry member 1) will set-up, with nozzle fixed on Entry member 2. Entry member 2 will continue toward valve, with gas detector.

If LEL sensor rises above 20%, entry team will retreat until ventilation can be made adequate.

- Once Entry member 2 reaches the valve, he will close the valve, then back away until he reaches entry member 1.
- Entry team will exit the structure, until it has been adequately ventilated.
- Once adequately ventilated, ERT members, wearing appropriate PPE, will sweep the structure with gas detector(s), to ensure there are no pockets of gas, before deeming the structure 'safe to enter'.

****** If no remote shut-off is available or accessible, the main propane lines can be shut off by cutting the Underground Power feed in the Tailings Building.***

2.5.1 LPG line on fire, with no impingement

Note: a propane leak that is burning is safer than one that is not burning, as long as there is no impingement on a tank or structure. Therefore, in this scenario, gas will be allowed to burn until the valve can be shut off.

- Evacuate immediate area.
- If possible, close isolation valve from remote location.

If no remote isolation valve:

- Eliminate any further source of ignition.
- 2 or more ERT members in full turn-out gear & SCBA will be on 1 ½" hose-line.
- Nozzle will be turned to full fog, which will create a water-curtain between the fire and the fire fighters.
- The fire team will approach the isolation valve, keeping the water-curtain between themselves and the fire at all times, being careful not to put the fire out with the stream
- When the valve is reached by the team, the 2nd member on the line will let go of the hose and approach the valve, while the nozzleman maintains the water-curtain between the fire and the valve/fire team.
- The 2nd member will close the valve then back away from the fire until he regains his position on the hose.
- The team will maintain the water-curtain while they back away from the damaged gas-line.
- Once the team is at a safe distance, a 45 degree pattern can be fixed on the broken gas-line to cool it, and disperse any residual gases.

2.5.2 LPG leak, not enclosed, not on fire

Note: LPG has a very high vapour pressure (1013 kPa) so it wants to be a gas, a high vapour density (1.52) so it's heavier than air, and a low flash point (-103.4 C). This combination means that it can form an explosive gas cloud that will stay close to the ground, may linger in incident area, or migrate downwind and/or downhill, possibly settling in low lying areas.

- Evacuate immediate area as well as areas downwind/downhill as per ERG recommendations.
- If possible, close isolation valve from remote location.
- From 'reach of stream', set up ground monitor and fix a 45 degree fog pattern on area of concern. This will push gas cloud away from area and disperse it. Be sure to push it to a safe location.

If no remote isolation valve:

- Entry team (2 ERT members) & RIT team (2 ERT members) will don full turn-out gear & SCBA.
- Any electronic equipment being carried, such as radio or gas detector, must be intrinsically safe.
- Entry team will enter with charged 1 ½" hose-line and gas detector equipped with LEL sensor, while RIT stages in the cold zone.
- While ground monitor continues to 'make it rain' in the hot zone, nozzleman (entry member 1) will fix nozzle on entry member 2, as entry member 2 approaches the isolation valve, with gas detector.

If LEL sensor rises above 20%, entry team will retreat until water stream can be made more effective

- Once Entry member 2 reaches the valve, he will close the valve, then back away until he reaches entry member 1.
- Entry team will retreat to the cold zone until gases are adequately dispersed
- Once the gas is adequately dispersed, ERT members, wearing appropriate PPE, will sweep the area with gas detector(s), including low-lying areas where gas may have migrated to, before deeming the area 'safe to enter'.

2.5.3 Fire where there is flame impingement on LPG tank

- Evacuate all non-ERT members for at least 1,800 m where there is flame impingement on either the 12,000 L tank or the tandem 18,000 L tanks.
- Command will know and understand the signs of imminent BLEVE.
- If Command witnesses signs of imminent BLEVE from an upright tank, there shall be no attempt made to cool tanks, rather, all focus shall be on a rapid evacuation of all personnel, at least 1,800m.
- If tank has been knocked over, there may be little or no warning signs of BLEVE, therefore no attempt shall be made to cool, rather, all focus shall be on a rapid evacuation of all personnel, at least 1,800m.
- If a BLEVE is not imminent, an attempt will be made to connect a ground monitor to the stand-pipe at the Tailings bldg.
- A narrow fog stream will be fixed on the tank at the area of flame impingement.
- The monitor will be left unmanned and the remaining ERT will evacuate at least 1,800m.

Where a tanker truck carrying propane has over-turned on the access road, causing damage to the tank trailer and subsequent rapid release of propane, the strategy for the hazmat portion of the incident response, will be passive and conducted from an upwind/uphill location, at a safe distance, as per the ERG. Transfer of residual product for the scenario, will be conducted by outside resource.

Decontamination

- 1 ½" charged hose-line, as emergency decon

Termination

- Debrief

BW GasAlert Micro 5 is intrinsically safe, as per: http://directories.csa-international.org/xml_transform.asp?xml=certxml%5C080259_0_000-4828-82.xml&xsl=xsl/certrec.xsl

- GasAlert Micro 5 Portable Gas Detector, Model M5-xwt1t2-r-p-d-a-b-cc & M5PID-xwt1t2-r-p-d-a-b-cc; utilizing electrochemical, catalytic bead and photo-ionization sensors; Intrinsically Safe when powered by one of the following AA Size Batteries / Battery Pack
 - Duracell MN1500; T-Code T4; Ambient -20 to +40°C; T-Code 139.8°C (T3C); Ambient -20 to +50°C
 - Energizer E91; T-Code 153°C(T3C); Ambient -20 to +40°C; T-Code 163°C (T3B); Ambient -20 to +50°C
 - NiMH Rechargeable Battery Pack "M5-BAT01"; T-code T4; Ambient -20 to +50°C
 - Lithium Polymer Rechargeable Battery pack "M5-BAT07B"; T-Code T4; Ambient -20 to +50°C

2.6 Nitric Acid 40%

Note: when it comes to corrosives such as Nitric Acid, the solution to pollution is NOT dilution. For a spill of 1 45 gal drum, it would take over 450,000 gal of pure water to make the solution habitable for fish. It would take over 45,000,000 gal of pure water to neutralize it.

Site management and control

- Set up perimeter with at least 50m radius.
- Command, staging, & decon shall be positioned uphill.
- Unify command with Safety Superintendent, Mine Manager, Environmental Dept., product Carrier (if spill occurs during delivery to mine).

Identification

- UN# 2031
- Liquid state
- Colourless to yellow
- Transported in 45 gallon drums
- # of 45 gal drums possibly damaged will help estimate size of spill.
- What is downhill from spill? Could acid reach a stream?

Hazard & risk evaluation

- Strong acid, very corrosive.
- Severely hazardous to eyes and skin
- Ingestion could cause death
- Inhalation hazard, although low vapour pressure 1.3kPa (wants to be a liquid).
- Could be devastating to stream life.
- Strong oxidizer, could have explosive reaction with organic or combustible materials

PPE

- If there is a fire situation, PPE will consist of full turn-out gear and SCBA.
Otherwise
- Know and heed permeability rate and breakthrough times of all PPE.
- Acid resistant, class B suit with hood.
- Full-face respirator with appropriate chemical cartridges.
- Chemical resistant gloves & boots
- Chemical resistant tape used to seal between boots/suit, gloves/suit, and mask/hood.

Information management and resource coordination

- See MSDS for product information.
- Know the product's route of travel.
- Was anyone exposed?
- Will non-human life be exposed?
- Standard decon set-up will be constructed.
- Have tools cribbed for entry teams.
- Ensure there is enough PPE at the site to complete the task.
- Ensure there is enough neutralizing agent at the site to complete the task. *See below for chart*
- Ensure there is drinking water for responders.
- Have hazmat trailer, ambulance & fire truck in staging area, as req'd
- Have Site Services staged for digging, damming, product extraction, as req'd.

Implementing Response Objectives

- Rescue injured/exposed personnel.
- Prevent from entering streams
- Prevent from contacting combustibles and organics.
- If possible, stop the leak.
- If possible, contain by covering drains/culverts, damming, diverting to a berm, etc.
- Use over-pack to contain leaking drums that still contain product.
- Neutralize spilled product with weak caustic – primary neutralizing agent is Ansul Spill X-A, alternatively hydrated lime or baking soda (if available). Be cautious of chemical reaction.
- Use Litmus paper to test for pH when neutralizing with lime or baking soda.
- Site Services Vac-truck is an option for cleaning up product before or after neutralized, as necessary.

Decontamination

Standard decon set-up will be utilized in warm zone:

- Large berm fashioned out of large chemical resistant tarp, wrapped over charged 2 ½" hose-line, 2 small berms, will be in series, within the large berm.
- Decon personnel shall don class C suits without need for respiratory or splash protection, other than safety glasses.
- Ensure all personnel that entered hot zone are properly decontaminated.
- Ensure that all tools that entered the hot zone are properly decontaminated.

Termination

- Once operation complete, vac-truck can be utilized to clean up solution contained with the decon berms.
- Safe and proper disposal of all spent PPE.
- Transition of command.
- Debrief

2.6.1 Chart for Estimating Caustic Req'd to Neutralize 40% Nitric Acid

For **Spill X-A**, use 1:1 ratio by volume, or 10lbs Spill X-A per 1 gal Nitric Acid.

| Amount of Nitric Acid Spilled (in Gal.) | Amount of Baking Soda Req'd (in Lbs.) |
|---|---------------------------------------|
| 1 | 5.6 |
| 2 | 11 |
| 5 | 28 |
| 10 | 56 |
| 20 | 110 |
| 45 | 252 |
| 90 | 504 |
| 135 | 756 |
| 180 | 1,008 |

| Amount of Nitric Acid Spilled (in Gal.) | Amount of Lime Req'd (in Lbs.) |
|---|--------------------------------|
| 1 | 2.4 |
| 2 | 4.8 |
| 5 | 12 |
| 10 | 24 |
| 20 | 48 |
| 45 | 108 |
| 90 | 216 |
| 135 | 324 |
| 180 | 432 |

Charts derived from formulas below

Specific Gravity Nitric Acid: 1.2455

Concentration: 40%

1 gal HNO₃ x 1.24 x 8.34 lbs/gal x 0.40 = 4.14 lbs HNO₃

HNO₃ + NaHCO₃ → NaNO₃ + H₂O + CO₂ Therefore 1 mol Nitric Acid per 1 mol Sodium Bicarb (Baking Soda)

$2\text{HNO}_3 + \text{Ca}(\text{OH})_2 \rightarrow \text{Ca}(\text{NO}_3)_2 + 2\text{H}_2\text{O}$ Therefore 2 mol Nitric Acid per 1 mol Calcium Hydroxide (Lime)

$\text{HNO}_3 = 63 \text{ amu}$

$\text{NaHCO}_3 = 85 \text{ amu}$

$\text{Ca}(\text{NO}_3)_2 = 74 \text{ amu}$

$(4.14 \text{ lbs HNO}_3 / 63 \text{ amu-HNO}_3) \times 85 \text{ amu-NaHCO}_3 = 5.6 \text{ lbs NaHCO}_3$

Therefore 1 gallon of Nitric Acid req's 5.6 lbs of baking soda

$(4.14 \text{ lbs HNO}_3 / (2(63) \text{ amu-HNO}_3)) \times 74 \text{ amu-Ca}(\text{OH})_2 = 2.4 \text{ lbs Ca}(\text{NO}_3)_2$

Neutralization Formulas and Quick Access Charts Formulas

The key to effective and efficient neutralization, is knowing how to use the following formulas.

1. The first formula indicates how much acid is spilled in weight.

Step #1- Determine the quantity of acid spilled, usually in gallons.

Step #2- Determine the specific gravity of the acid usually provided in MSDS.

Step #3- Determine the concentration of the acid spilled usually in %.

Step #4- The weight of water is 8.34 pounds per gallon.

After the above figures are known plug them into the following formula:

$\text{Quantity of spill} \times \text{specific gravity} \times \text{weight of water} \times \text{concentration}$
 $= \text{weight of the spill}$

Example:

One gallon of sulfuric X 1.84 X 8.34 X 98% = 15.04 pounds of sulfuric

2. The second formula will determine the quantity of the neutralizer needed. The type of neutralizer needs to be selected based on costs and availability. Plug numbers into the following formula:

$\text{Weight of the acid spilled} \times \text{number in the chart for the selected neutralizer.}$

Example :

15.04 pounds of sulfuric X 1.06 for Soda Ash = 15.94 pounds of Soda Ash

Determination through Chemistry

To calculate the amount of neutralization agent needed the balanced chemical reaction must be written and the equivalent weights of acid and base determined.

Example: 1,000 gallons of 38% hydrochloric acid will be neutralized with lime.

Step #1 – Write the complete balanced neutralization reaction:

This equation shows that 2 moles of HCl are required in the reaction with one mole of calcium oxide (lime).

Step #2 – Calculate the molecular weight of each compound:

HCl – H = 1, Cl = 35.5, Total = 36.5 amu

CaO – Ca = 40, O = 16, Total = 56

Step #3 – Calculate the weight of the HCl spill:

1,000 gallons X 1.20 X 8.34 X 0.38 = 3,803.04 pounds of HCl

Step #4 – Calculate the amount of neutralizer needed:

From Step #1 it was found that 2 moles of HCl are needed to react with 1 mole of CaO. From Step #2 it was found that 1 mole of HCl weighs 36.5 amu's so 2 moles weigh 73.0 amu's. The formula is;
weight of acid/formula weight of acid X formula weight of base = pounds of the neutralizer needed.

$3,803.04/73 \times 56 = 2,917.4$ pounds of lime

Finer Points

The final amount is an approximation and in actual practice more neutralizing agent should be obtained. The neutralization process needs to be checked at several spots to assure pH levels are acceptable and uniform.

Neutralization Precautions

Remember, the neutralization process is exothermic and it may involve splashing of product. Safety is paramount and proper protective equipment is very important. Also, the neutralizer is hazardous in its own right and needs to be handled with care. Consider expense and availability in selecting neutralizer. Other weak bases that may be used and their molecular weights are; sodium bicarbonate (NaHCO_3)- 85, and magnesium hydroxide (Mg(OH)_2)-58.

Neutralization Chart Information

Acids

Hydrochloric Acid, HCl, MW = 36.5, density/specific gravity is 1.19, weight of a gallon is 3.77 pounds at 38% concentration. Synonyms are chlorohydric acid and muriatic acid.

Nitric Acid, HNO_3 , MW = 63, density/specific gravity is 1.41, weight of a gallon is 8.23 pounds at 70% concentration. Synonyms are Aqua Fortis and Azotic Acid. (Aqua Regia is a mixture of nitric and hydrochloric acids).

Phosphoric Acid, H_3PO_4 , MW = 98, density/specific gravity is 1.69, weight of a gallon is 11.98 pounds at 85% concentration. Synonyms are orthophosphoric acid.

Sulfuric Acid, H_2SO_4 , MW = 98, density/specific gravity is 1.84, weight of a gallon is 15.04 pounds at 98% concentration. Synonyms are Oil of vitriol and "oleum" is fuming sulfuric acid.

Bases

Ammonium hydroxide, NH_4OH , MW = 35, clear solution, synonyms are ammonia solution and aqua ammonia.

Strong ammonia odor evolves from liquid. High vapor pressure.

Calcium carbonate, CaCO_3 , MW = 100, white powder, synonyms are crushed limestone and dolomite. Low heat of reaction that gives off carbon dioxide gas.

Calcium hydroxide, Ca(OH)_2 , MW = 74, white powder, synonyms are slaked lime, hydrated lime, and calcium hydrate.

Calcium oxide, CaO , MW = 56, white powder, synonyms are quicklime, lime, and unslaked lime. Most economical, lowest cost, neutralizer. **Best choice!** Maximum pH is 12.45 at 25C.

Magnesium carbonate, MgCO_3 , MW = 84, synonyms are magnesia alba and carbonate magnesium.

Magnesium hydroxide, Mg(OH)_2 , MW = 58, white powder, synonyms are milk of magnesia and magnesia hydrate.

Good neutralization agent. Maximum pH is 10.6 at 25C.

Potassium hydroxide, KOH , MW = 56, white flakes, synonyms are caustic potash. High heat of reaction with toxic fumes. Maximum pH is 14 at 25C.

Sodium bicarbonate, NaHCO_3 , MW = 85, white powder, synonyms are baking soda and sodium acid carbonate.

Low heat of reaction with carbon dioxide gas evolution.

Sodium Carbonate, Na_2CO_3 , MW = 106, white powder, synonyms are soda ash. **Second most economical neutralization agent next to lime.** Maximum pH is approximately 11 at 25C.

Sodium hydroxide, NaOH , MW = 40, white powder, synonyms are caustic soda, soda lye, caustic, and lye. High heat of reaction with toxic fumes. Maximum pH is 14 at 25C.

2.6.2 Quick Access Charts for Neutralizing Various Acids with Baking Soda

2.6.2.1 *Sulfuric Acid neutralization using Baking Soda (Sodium Bicarbonate)*

| Amount of Sulfuric Acid spilled | Amount of Baking Soda needed in pounds |
|---------------------------------|--|
| 1 gallon | 25.6 |
| 2 gallons | 51.2 |
| 3 gallons | 76.8 |
| 4 gallons | 102.4 |
| 5 gallons | 128.0 |
| 10 gallons | 256.0 |
| 50 gallons | 1280.0 |
| 55 gallons | 1408.0 |
| 100 gallons | 2560.0 |

2.6.2.2 *Hydrochloric Acid neutralization using Baking Soda*

| Amount of Hydrochloric Acid spilled | Amount of Baking Soda needed in pounds |
|--|---|
| 1 gallon | 5.5 |
| 2 gallons | 11.0 |
| 3 gallons | 16.5 |
| 4 gallons | 22.0 |
| 5 gallons | 27.5 |
| 10 gallons | 55.0 |
| 50 gallons | 275.0 |
| 55 gallons | 302.5 |
| 100 gallons | 550.0 |

2.6.2.3 *Nitric Acid neutralization using Baking Soda*

| Amount of Nitric Acid spilled | Amount of Baking Soda needed in pounds |
|--------------------------------------|---|
| 1 gallon | 7.4 |
| 2 gallons | 14.8 |
| 3 gallons | 22.2 |
| 4 gallons | 29.6 |
| 5 gallons | 37.0 |
| 10 gallons | 74.0 |
| 50 gallons | 370.0 |
| 55 gallons | 407.0 |
| 100 gallons | 740.0 |

2.7 Sodium Sulphide

Site management and control

- Set up perimeter with at least 50m radius if water introduced, or 25m if solid.
- Command, staging, & decon shall be position upwind and uphill.
- Unify command with Safety Superintendent, Mine Manager, Environmental Dept., product carrier (if spill occurs during delivery to mine).

Identification

- UN# 1849
- Solid state
- Yellow
- Smell sulfurous or like rotten eggs with introduction of moisture.
- Transported in 1000 Kg 'Super-Sacks'.
- # of super-sacks possibly damaged, will help estimate size of spill.
- Is water being introduced to the spill? If so, what is downhill from the spill? Could run-off reach a stream?
- Are corrosives being introduced to spill? If so, what is downwind?

Hazard & risk evaluation

- Strong caustic.
- Severely corrosive to digestive tract, respiratory system, eyes, and skin.
- Dust is powerful systemic poison. Inhalation could cause headache, dizziness, unconsciousness, pulmonary edema, asphyxiation, death.
- Contact with acid releases toxic and flammable Hydrogen Sulfide.
- Routes of entry include absorption, inhalation, and ingestion.
- Keep spilled product dry
- If water introduced, avoid run-off, contact with soil, waterways.

PPE

- If there is a fire situation, PPE will consist of full turn-out gear and SCBA.
Otherwise
- Know and heed permeability rate and breakthrough times of all PPE.
- SCBA if significant H₂S release, otherwise, full-face respirator & OV cartridges with pre-filter.
- Corrosive resistant, class B suit with hood.
- Chemical resistant gloves & boots
- Chemical resistant tape used to seal between boots/suit, gloves/suit, and mask/suit.

Information management and resource coordination

- See MSDS for product information.
- Was anyone exposed?
- Will non-human life be exposed?
- Standard decon set-up will be constructed.
- Have tools cribbed for entry team.
- Ensure there is enough PPE at the site to complete the task.
- Ensure there is drinking water for responders.
- Have hazmat trailer, ambulance & fire truck in staging area, as req'd
- Have Site Services staged for digging, damming, product extraction, as req'd.

Implementing Response Objectives

- Rescue injured/exposed personnel.
- Keep product dry.
- Monitor atmosphere for H₂S and SO₂.
- If water introduced, contain run-off by covering drains/culverts, damming, diverting to a berm, etc. Solution collected can be mixed with oxidizing agent, such as hydrogen peroxide or sodium hypochlorite to prevent evolution of H₂S.
- If product has entered a stream, consider using over-flow dams to contain product, for extraction.
- Vacuum or sweep up dry product
- Disposal as per Environmental Dept. recommendations

Decontamination

Standard decon set-up will be utilized in warm zone:

- Large berm fashioned out of large chemical resistant tarp, wrapped over charged 2 ½" hose-line, 2 small berms, will be in series, within the large berm.
- Decon personnel shall don class C suits without need for respiratory or splash protection, other than safety glasses.
- Ensure all personnel that entered hot zone are properly decontaminated.
- Ensure that all tools that entered the hot zone are properly decontaminated.

Termination

- Once operation complete, solution in decon berms to be disposed of, as per Environmental recommendations.
- Safe and proper disposal of all spent PPE.
- Transition of command.
- Debrief

Appendix D: Tug and Barge Emergency Contingency Plan

Minto Mine
Tug and Barge Emergency Contingency Plan
2017-01

List of Appendices

Appendix A: Man Boat Specifications

Appendix B: Safe Job Procedure for Loading and Unloading the Barge.

1 Introduction

Minto Mine (Minto) a subsidiary of Capstone Mining Corporation is pleased to submit the following contingency plan (plan) as per requirements of the Selkirk First Nation Access and Land Use Permit “Minto Landing Ice Bridge and Marshalling Area and West Side Barge Landing and Marshalling Area” (the permit). It is Minto’s intention that this plan will fulfill the requirement as stated in Schedule 2, Section 9.0 Contingency Plan of the permit. It is not Minto’s objective for this plan to mitigate all possible accidents or malfunction in regards to the in stream operation of the Copper Queen tug and barge.

The plan as prepared is adaptive and will be amended as is practicable. This plan is intended to deliver the best possible means of mitigating an accident or malfunction of the loading/unloading or in-stream operation of the tug and barge with the resources available at Minto. Preventing such an occurrence requires a combination of: procedural and engineering controls, based on an awareness of at risk conditions. These documents exist in the form of the Spill Contingency Plan, Emergency Response Plan, and any procedures or plans on the tug or barge from Site Services. This document serves as a contingency plan in the event that an accident or malfunction occurs when loading, unloading, and in-stream operations of the Copper Queen tug and barge (CQTB).

2 General Procedures

Any Response to an Emergency condition will be based on a priority sequence of Life, Environment and Property. Therefore every event will be regarded with these priorities in mind. Initial on scene assessment of the accident or malfunction will be called out on channel one as a “Code 1”. The Emergency Response Team will be dispatched, communication established and the barge operator and deckhand will respond to control the scene.

Deckhands will mitigate all emergencies on the barge to the best of their ability given the resources available. General procedure in the event of an emergency would have the barge move to the west landing if possible or practical unless otherwise communicated to the barge captain. To mitigate an emergency in offloading or loading vehicles onto the barge the deckhand will utilize the anchor points on both landings. Slack will be left in the rope to ensure the barge captain is able to maneuver when docked at the landing. Tying off to the anchor points will mitigate complete catastrophe if the barge loses power during loading and offloading and will be discussed further under the specific procedures section of this plan.

To mitigate the risk of losing control of the barge downstream Minto will be installing an anchor on the barge. In the event of an emergency the deckhand would be able to deploy the anchor allowing the barge a safety contingency if control was lost.

3 Specific Procedures

Below is a list of the current on site procedures for dealing with various emergencies in regards to the CQTB at Minto Mine.

1. Emergency Response to Sinking
2. Emergency Response to Loss of Power or Control
3. Emergency Response to Fire Onboard
4. Emergency Response to Man Overboard
5. Emergency Response to Freight or Vehicle Overboard
6. Emergency Response to Medical Emergency on Board of the Barge
7. Emergency Response to Spill Response

3.1 Emergency Response to Sinking of CQTB

1. Activation of Emergency Protocol onboard CQTB calling code 1 to initiate ERT response.
2. Captain and deckhand will deploy Canadian Coast Guard approved life rafts.
3. As per Emergency Response Plan, Incident command (IC) will communicate with Deckhand by radio to determine any further details of events, number of injured or trapped people, risks to property and environment.
4. IC will respond to scene in one emergency vehicle ahead of remaining ERT. IC will upon arrival to scene provide initial scene assessment and gather any additional information available. Minimum ERT response will include full ERT member compliment, Environmental Lead, Hazardous materials response trailer, fire truck, ambulance and all associated equipment. ERT operations to be under the control of the ERT Captain. Additional response needs based on initial assessment and

evaluation by IC will be communicated to the Emergency Communications Center (ECC) as per Emergency Response Plan.

5. Incident Accountability will be established and adhered to throughout the operation.
6. IC will determine the need for rescue of people downstream. Option to deploy rescue ropes via launcher considered for KM 12.
7. Alternate access to river to be determined by nature of incident, KM 20 provides a second potential access. All other access would require trail cutting which is possible but would take more time.
8. IC, ERT Captain, and Environmental Lead (Unified Incident Command Support) will assess ongoing situation and need for additional or fewer resources.
9. Alternate man boat (see Appendix A for details on man boat) will be deployed from landing as needed to support rescue and/or to gain more information regarding location of sunken vessel and determine possible plan for retrieval/securing. Man boat operator will work under the direction of IC.
10. Once rescued, all patients will be treated as per OFA3/EMR protocols transported as per Yukon EMS dispatch confirmation aligned with Minto Emergency Response Plan.

3.2 Emergency Response to Loss of Power or Control of CQTB

The tug operates on two engines so total loss of power is not likely; however, is still possible and below is the emergency procedure that would be activated in the event that total loss or control of the CQTB was to occur.

11. Activation of Emergency Protocol onboard CQTB calling code 1 to initiate ERT response. Captain will also communicate freight details and passenger numbers on board.
12. Passengers and crew will follow instructions from Captain and remaining on board if deemed safe. The Captain and deckhand will follow MED protocol in decision making in regards to passenger safety.
13. Captain and deckhand will deploy Canadian Coast Guard approved life rafts if deemed unsafe to stay on board by Captain.

14. IC will respond to scene or as close to it, in one emergency vehicle ahead of remaining ERT. IC will upon arrival to scene provide initial scene assessment and gather any additional information available. Minimum ERT response will include full ERT member compliment, Environmental Lead, Hazardous materials response trailer, fire truck, ambulance and all associated equipment. ERT operations to be under the control of the ERT Captain. Additional response needs and downstream communication and reporting requirements based on initial assessment and evaluation by IC will be communicated to the Emergency Communications Center (ECC) as per Emergency Response Plan.
15. Incident Accountability will be established and adhered to throughout the operation.
16. Captain will navigate to the best of his ability to the safest downstream location possible. Under the direction of the Captain the deckhand may deploy the anchor to assist in stopping the barge and tug.
17. Captain will communicate to IC location and details of condition of vessel and people and assist in determining plans for action.
18. Once vessel is secured to shore or where landed in river, Man boat will be deployed to assist with additional securing and remove non-essential people to location where they can be transferred back to site or alternate safe location.
19. If available and a benefit, Minto would exercise the use of the mutual aid agreement with JDS.
20. Plan for retrieval will be based appropriate to the conditions and location of vessel. Plan to be developed cooperatively through Barge Captain, Minto ECC and Mutual Aid resources. Equipment and additional resources will be sourced through ECC as per Minto Emergency Response Plan.

3.3 Emergency Response to Fire on the CQTB

21. Activation of Emergency Protocol onboard CQTB calling code 1 to initiate ERT response.
22. If safe to do so, deckhand will attempt to suppress fire using equipment on board following Marine Emergency Duty (MED) protocol.

23. Captain and deckhand will deploy Canadian Coast Guard approved life rafts if vessel in immediate danger. If possible and practical the Captain will position barge so that wind is blowing port to starboard, to keep smoke/flames away from life raft.
24. If able to do so Barge will cross to West Bank of crossing and continue to use barge supplied fire suppression equipment. All passengers will disembark under direction of deckhand.
25. IC will respond to scene in one emergency vehicle ahead of remaining ERT. IC will upon arrival to scene provide initial scene assessment and gather any additional information available. Minimum ERT response will include full ERT member compliment, Environmental Lead, Hazardous materials response trailer, fire truck, ambulance and all associated equipment. ERT operations to be under the control of the ERT Captain. Additional response needs based on initial assessment and evaluation by IC will be communicated to the Emergency Communications Center (ECC) as per Emergency Response Plan.
26. Incident Accountability will be established and adhered to throughout the operation.
27. Once IC on scene and vessel safely secured, fire suppression will be conducted under the direction of the IC following NFPA 1081 standards. Industrial Fire Brigade.
28. Consideration of environmental sensitivity need to be considered by IC in cooperation with the Environmental Lead (unified incident command support).
29. Defensive spill containment methods to be utilized to control run off and releases from firefighting operations. This may include tactics such as extinguishing agent selection, damming and berming on barge, boom placement around vessel, removal of burning equipment once fire controlled, etc.

3.4 Emergency Response to Man Overboard

30. Activation of Emergency Protocol onboard CQTB calling code 1 to initiate ERT response.
31. Captain and deckhand will throw out provided Canadian Coast Guard approved life-rings to all personnel overboard. The response from the barge crew will conducted as per their MED training.
32. If able to successfully rescue person overboard, deckhand will treat person based on marine first aid protocols awaiting response by ERT and site Medic.

33. If unable to successfully achieve rescue, vessel will continue to West landing and man boat deployed for downstream rescue. Communication to IC on Radio Channel 1 must be available at all times. Man boat operation will be conducted under the direction of IC once in place.
34. Captain will communicate to IC of possible downstream rescue requirement.
35. IC will instruct ERT to stage at KM 12 with option to deploy rescue ropes via launcher considered for KM 12.
36. Incident Accountability will be established and adhered to throughout the operation.
37. IC to stage ambulance for patient pick up.
38. IC will communicate the need for mutual aid to ECC who will follow the Minto ERP by contacting local agencies for assistance on East side of river.
39. Once rescued, all patients will be treated as per OFA3/EMR protocols transported as per Yukon EMS dispatch confirmation aligned with Minto Emergency Response Plan.

3.5 Emergency Response to Freight or Vehicle Overboard of the CQTB

40. Activation of Emergency Protocol onboard CQTB calling code 1 to initiate ERT response. Captain will also communicate freight details and passenger numbers on board.
41. Passengers and crew will follow instructions from Captain (Captain will respond as per MED training) remaining on board if deemed safe.
42. Captain and deckhand will deploy Canadian Coast Guard approved life rafts if deemed unsafe to stay on board by Captain. If at landing passengers will be offloaded to safe location on shore.
43. IC will respond to scene or as close to it, in one emergency vehicle ahead of remaining ERT. IC will upon arrival to scene provide initial scene assessment and gather any additional information available. Minimum ERT response will include full ERT member compliment, Environmental Lead, Hazardous materials response trailer, fire truck, ambulance and all associated equipment. ERT operations to be under the control of the ERT Captain. Additional response needs and downstream communication and reporting requirements based on initial assessment and evaluation by IC will be communicated to the Emergency Communications Center (ECC) as per Emergency Response Plan.

44. Incident Accountability will be established and adhered to throughout the operation.
45. Captain will navigate to the best of his ability to the landing, preferably west landing.
46. Once vessel is secured to shore, man boat will be deployed by deckhand or ERT members to assist with additional securing of vessel and freight, and deployment of containment booms located at landing and on vessel. Man boat operation under the direction of IC once in place.
47. Plan for retrieval of freight will be determined appropriate to the condition and location of freight. Plan developed cooperatively through Barge Captain, Minto ECC and Mutual Aid resources.
48. Equipment and additional resources will be sourced through ECC as per Minto Emergency Response Plan including manpower, expertise, heavy equipment, etc.
49. Special considerations for support in the event of incident occurring on East side of river to include Yukon Emergency Measures Organization, local first responders and alternate equipment operations contractor.

3.6 Emergency Response to Medical Emergency on board CQTB

50. Activation of Emergency Protocol onboard CQTB calling code 1 to initiate ERT response.
51. For serious injury as defined in the ERP, Yukon EMS will be notified immediately.
52. Deckhand will treat patient per Marine Emergency First Aid protocols.
53. Captain will navigate barge to west bank of Yukon River and all vehicles will offload on west bank, giving clear passage for Ambulance.
54. ERT response will include medic, ambulance, fire truck and compliment of team members to assist with patient transfer and packaging.
55. Incident Accountability will be established and adhered to throughout the operation.
56. Yukon EMS dispatch will be updated of situation once history and assessment confirmed.
57. Upon arrival, Minto Medic will take control of scene and advise ERT Captain of resources needed on scene.

58. Upon history and assessment, patient will be treated, packaged and transferred as per OFA3/ERM protocols transported as per Yukon EMS dispatch confirmation aligned with Minto Emergency Response Plan.

3.7 Emergency Response to a Spill

59. Activation of Emergency Protocol onboard CQTB calling code 1 to initiate ERT response.
60. Deckhand will attempt to contain spill using on board spill kit, to prevent spill into Yukon River.
61. IC will respond to scene in one emergency vehicle ahead of remaining ERT. IC will upon arrival to scene provide initial scene assessment and gather any additional information available. Minimum ERT response will include full ERT member compliment, Environmental Lead, Hazardous materials response trailer, fire truck, ambulance and all associated equipment. ERT operations to be under the control of the ERT Captain. Additional response needs, downstream communication, communication with CANUTEC and reporting requirements based on initial assessment and evaluation by IC will be communicated to the ECC as per Emergency Response Plan and Spill Contingency Plan.
62. Incident Accountability will be established and adhered to throughout the operation.
63. If practical the barge captain will navigate the barge to west landing.
64. All passengers will disembark vessel.
65. All vehicles and machinery that is not in the spill zone will disembark.
66. Deckhand and ERT members under the direction of IC will use the man boat to deploy containment booms around the barge.
67. IC with advice from the Environment Lead will develop and implement the SCP for stopping the spill if possible.
68. If the spill cannot be stopped a plan to mitigate the quantity of contaminant spilt to environment will be developed and implemented.
69. If safe and practical to do so Environment Lead will deploy environment staff to sample downstream of spill to measure contamination concentration.

70. IC with advice from the Environment Lead will oversee cleanup of the spill.

71. Special considerations for support in the event of incident occurring on East side of river to access the barge with ERT by man boat.

4 Minto Mine Training

The barge crew were trained and certified in Marine Emergency Duties (MED) A1 and A2 in 2012. The MED course meets the standards of training, certification and watch-keeping, and is run by Transport Canada. The A1 MED course covers basic safety with a focus on hazards and emergencies awareness, firefighting, emergency response, lifesaving appliances and abandonment, survival and rescue. The A2 MED course covers small passenger-carrying vessel safety with the same focus as A1 with the addition of maintenance and inspection of emergency equipment and passenger control. As well the barge crew is trained in Marine First Aid.

The ERT team has been trained to National Fire Protection Association (NFPA) 472 Hazardous Materials awareness level for responders. In 2014, Minto conducted a table top and field exercise in regards to Yukon River response. The table top and field exercise was held in conjunction with ERT, barge crew, environment department, management, major contractors, the Yukon Spill Hotline, CANUTEC, Transnorth Helicopters, WCB, Parkland Fuel, and Quantum Murray. A post-incident debrief revealed both opportunities and successes at the field operations and management level.

Appendix A: Man Boat Specifications

- Brand/Model: Munson Packman Landing Craft
- Hull Length: 24 feet (7.3 meters)
- Beam: 8 feet 6 inches (2.6 meters)
- Hull Type: Packman mono hull
- Power: Twin Yamaha 150hp
- Propulsion: Outboard (25" shaft)
- Outfitting: 52" bow door

Appendix B: Safe Work Procedure for Loading and Unloading the Barge.

Capstone Minto Safe Work Practice

Barge Loading and Offloading

Purpose: To ensure the safe practice of loading and offloading the barge at the Yukon River. To educate workers on the hazards of loading and offloading the barge, and working on landings.

Scope: This Safe Work Practice pertains to the Captain and the crew of the Minto Mine property who are exposed to operating the barge for transport across river.

Definitions:

Certified Flotation Device – Personal Flotation Devices marked "Approved by Department of Transport Canada" or "Approved by Canadian Coast Guard, Department of Fisheries and Oceans"

Hypothermia - A potentially fatal condition that occurs when the body core temperature falls below 95°F (35°C). This can occur quickly when immersed in cold water.

Responsibilities

Employer / Supervisor Responsibilities

- Make sure appropriate training and assistance are provided to crew.
- Make sure appropriate rescue devices such as a life hook and flotation devices are available to workers

Safety Department Responsibilities

- Ensure this SWP is in alignment with the Yukon Health and Safety Act and Regulations

Worker Responsibilities

- Read, understand, and follow this safe work practice
- If unsure then stop work and ask for assistance
- Wear appropriate PPE defined to their work area.
- Provide training for proper use of PFD to passengers

Reference to Legislative and Site Requirements

- Yukon Occupational Health and Safety Regulations – Part 1 – section 1.34 – Each worker shall be provided with and be required to use an appropriate personal flotation device with the required buoyancy where a worker is employed in a situation where there is a risk of drowning

Safe Work Practice:

The captain and crew will give direction in regards to the following.

1. Landings.

- 1.1. Assess landing and vehicles to be loaded and unloaded. The use of wooden ramps may be needed. (For more information reference safe work practice for wooden ramps.)
- 1.2. Use gauge on apron ram to determine the need for landing to be rebuilt. This gauge is located on the ram closest to deckhand shed and has a max angle marked on the gauge. If the apron should go past the marked max angle stop and fix landing. (For more information reference safe work practice for landing maintenance and apron angle.)

2. Transportation.

- 2.1. Due to landing and vehicle loads ask driver to back on or drive on. This may be determined by many factors, such as:
 - Angle and length of landing
 - Apron angle and how it contacts the landing
 - Underwater debris
 - Drivers skill
 - Extra low trailers
 - Frozen or icy landings
 - Load weights
- 2.2. Deckhand must communicate with captain any concerns about previously mention conditions. It is ultimately the captains' decision on how the barge is loaded.

3. Priority Boarding

- 3.1. Emergency vehicles on medical runs are given the top priority. Compassionate reasons or special circumstances are considered when loading vehicle traffic. The bus will also be given high priority

along with con trucks. Loading priority will be determined by the Captain or the Supervisor.

- 3.2.** Priority may change from day to day and we ask that drivers cooperate and be patient. Ultimately the captain will make the decision based on information available at the time.

4. Communication.

- 4.1.** Drivers are given a handout of standard hand signals as endorsed by WCB and a signature logbook is maintained to who has received the handout and when.
- 4.2.** The deckhand is in charge of directing and communicating with all traffic. Radios, hand signals, face to face communication are all used. An air horn is used as warning to stop the drivers quickly.

5. Hazards.

- 5.1.** Working at or near water has its inherent risks. A JHA should be conducted for any new or unusual work being conducted on or near the water. Some hazards to be aware of are:

- Exposure to the environmental elements of the season
- Slips, trips and falls on uneven ground
- Slipping on slippery rocks and surfaces
- Eroding shore line sloughing or slipping on ice along shoreline
- Falling into cold water
- Ice flows and ice jams
- Swift current
- Drowning
- Hypothermia
- Wildlife
- Slippery deck

6. Emergency Equipment.

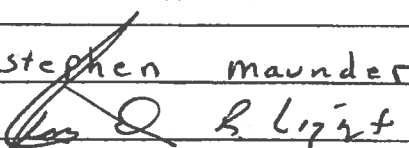

- 6.1.** Life ring with rope and pole must be available on the barge. An emergency response container complete with first aid kit, oxygen therapy unit, spare dry coveralls and several blankets is located on the tug. This container is used to reduce the effects of hypothermia until emergency response arrives.

- 6.2. As the river is 27kms from the mine site emergency response will take at least 40 minutes to arrive at the scene. Deckhands should have marine first aid training and clear knowledge of where all safety equipment is and its condition.
- 6.3. Honda pump & fire hose along with fire extinguishers are also in place. Deckhands should be well train in this area and will instruct people as needed on what to do in case of an emergency.

7. Training.

- 7.1. All workers must be trained and competent to operate or run any equipment that pertains to their job.
- 7.2. At least one worker must have a valid marine first aid ticket in the event of an emergency due to the location of this worksite and the anticipated delay on response time by ERT.

Reference Information

QC Samples with Qualifiers & Comments:

| QC Type Description | Parameter | Qualifier | Applies to Sample Number(s) |
|---------------------|--------------------------|-----------|------------------------------------|
| Matrix Spike | Calcium (Ca)-Dissolved | MS-B | L2041421-1, -2, -3, -4, -5, -6, -7 |
| Matrix Spike | Magnesium (Mg)-Dissolved | MS-B | L2041421-1, -2, -3, -4, -5, -6, -7 |
| Matrix Spike | Manganese (Mn)-Dissolved | MS-B | L2041421-1, -2, -3, -4, -5, -6, -7 |
| Matrix Spike | Sodium (Na)-Dissolved | MS-B | L2041421-1, -2, -3, -4, -5, -6, -7 |
| Matrix Spike | Strontium (Sr)-Dissolved | MS-B | L2041421-1, -2, -3, -4, -5, -6, -7 |

Qualifiers for Individual Parameters Listed:

| Qualifier | Description |
|-----------|--|
| DLDS | Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity. |
| MS-B | Matrix Spike recovery could not be accurately calculated due to high analyte background in sample. |

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|---|--------|--|---|
| ALK-TITR-VA | Water | Alkalinity Species by Titration | APHA 2320 Alkalinity |
| This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values. | | | |
| ANIONS-N+N-CALC-VA | Water | Nitrite & Nitrate in Water (Calculation) | EPA 300.0 |
| Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N). | | | |
| BE-D-L-CCMS-VA | Water | Diss. Be (low) in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| BR-L-IC-N-VA | Water | Bromide in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| CL-IC-N-VA | Water | Chloride in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| EC-PCT-VA | Water | Conductivity (Automated) | APHA 2510 Auto. Conduc. |
| This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode. | | | |
| EC-SCREEN-VA | Water | Conductivity Screen (Internal Use Only) | APHA 2510 |
| Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc. | | | |
| HARDNESS-CALC-VA | Water | Hardness | APHA 2340B |
| Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation. | | | |
| HG-D-CVAA-VA | Water | Diss. Mercury in Water by CVAAS or CVAFS | APHA 3030B/EPA 1631E (mod) |
| Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | | | |
| IONBALANCE-VA | Water | Ion Balance Calculation | APHA 1030E |
| Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero. | | | |
| Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as: | | | |
| Ion Balance (%) = [Cation Sum-Anion Sum] / [Cation Sum+Anion Sum] | | | |
| MET-D-CCMS-VA | Water | Dissolved Metals in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| NH3-F-VA | Water | Ammonia in Water by Fluorescence | J. ENVIRON. MONIT., 2005, 7, 37-42, RSC |
| This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al. | | | |

Reference Information

| | | | |
|--|-------|---------------------------------------|---------------------------|
| NO2-L-IC-N-VA | Water | Nitrite in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| NO3-L-IC-N-VA | Water | Nitrate in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| PH-PCT-VA | Water | pH by Meter (Automated) | APHA 4500-H pH Value |
| This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode | | | |
| It is recommended that this analysis be conducted in the field. | | | |
| SO4-IC-N-VA | Water | Sulfate in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| TDS-CALC-VA | Water | TDS (Calculated) | APHA 1030E (20TH EDITION) |
| This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses". The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample. | | | |
| TSS-VA | Water | Total Suspended Solids by Gravimetric | APHA 2540 D - GRAVIMETRIC |
| This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples. | | | |

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location |
|----------------------------|---|
| VA | ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA |

Chain of Custody Numbers:

2018-01-03 C

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

| Matrix Spike | Sulfur (S)-Total | MS-B | L2034344-1 |
| Matrix Spike | Nitrate (as N) | MS-B | L2034344-1 |
| Matrix Spike | Sulfate (SO4) | MS-B | L2034344-1 |

Qualifiers for Individual Parameters Listed:

| Qualifier | Description |
|-----------|--|
| B | Method Blank exceeds ALS DQO. Associated sample results which are < Limit of Reporting or > 5 times blank level are considered reliable. |
| DLDS | Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity. |
| DLM | Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity). |
| MS-B | Matrix Spike recovery could not be accurately calculated due to high analyte background in sample. |

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|---------------|--------|------------------|--------------------|
|---------------|--------|------------------|--------------------|

Reference Information

| | | | |
|---|-------|--|---|
| ALK-TITR-VA | Water | Alkalinity Species by Titration | APHA 2320 Alkalinity |
| This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values. | | | |
| ANIONS-N+N-CALC-VA | Water | Nitrite & Nitrate in Water (Calculation) | EPA 300.0 |
| Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N). | | | |
| BE-D-L-CCMS-VA | Water | Diss. Be (low) in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| BE-T-L-CCMS-VA | Water | Total Be (Low) in Water by CRC ICPMS | EPA 200.2/6020A (mod) |
| Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS. | | | |
| BR-L-IC-N-VA | Water | Bromide in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| CARBONS-DOC-VA | Water | Dissolved organic carbon by combustion | APHA 5310B TOTAL ORGANIC CARBON (TOC) |
| This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis. | | | |
| CL-IC-N-VA | Water | Chloride in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| EC-PCT-VA | Water | Conductivity (Automated) | APHA 2510 Auto. Conduc. |
| This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode. | | | |
| EC-SCREEN-VA | Water | Conductivity Screen (Internal Use Only) | APHA 2510 |
| Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc. | | | |
| HARDNESS-CALC-VA | Water | Hardness | APHA 2340B |
| Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO ₃ equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation. | | | |
| HG-D-CVAA-VA | Water | Diss. Mercury in Water by CVAAS or CVAFS | APHA 3030B/EPA 1631E (mod) |
| Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | | | |
| HG-T-CVAA-VA | Water | Total Mercury in Water by CVAAS or CVAFS | EPA 1631E (mod) |
| Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | | | |
| IONBALANCE-VA | Water | Ion Balance Calculation | APHA 1030E |
| Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero. | | | |
| Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as: | | | |
| Ion Balance (%) = [Cation Sum-Anion Sum] / [Cation Sum+Anion Sum] | | | |
| MET-D-CCMS-VA | Water | Dissolved Metals in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| MET-T-CCMS-VA | Water | Total Metals in Water by CRC ICPMS | EPA 200.2/6020A (mod) |
| Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| NH3-F-VA | Water | Ammonia in Water by Fluorescence | J. ENVIRON. MONIT., 2005, 7, 37-42, RSC |
| This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et | | | |

Reference Information

al.

NO2-L-IC-N-VA Water Nitrite in Water by IC (Low Level) EPA 300.1 (mod)
 Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO3-L-IC-N-VA Water Nitrate in Water by IC (Low Level) EPA 300.1 (mod)
 Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H pH Value
 This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

SO4-IC-N-VA Water Sulfate in Water by IC EPA 300.1 (mod)
 Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

TDS-CALC-VA Water TDS (Calculated) APHA 1030E (20TH EDITION)
 This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses".
 The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample.

TSS-VA Water Total Suspended Solids by Gravimetric APHA 2540 D - GRAVIMETRIC
 This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location |
|----------------------------|---|
| VA | ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA |

Chain of Custody Numbers:

2017-12-12 B

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Reference Information

QC Samples with Qualifiers & Comments:

| QC Type Description | Parameter | Qualifier | Applies to Sample Number(s) |
|---------------------|--------------------------|-----------|-----------------------------|
| Matrix Spike | Barium (Ba)-Dissolved | MS-B | L2033487-1, -2, -4 |
| Matrix Spike | Calcium (Ca)-Dissolved | MS-B | L2033487-1, -2, -4 |
| Matrix Spike | Iron (Fe)-Dissolved | MS-B | L2033487-1, -2, -4 |
| Matrix Spike | Magnesium (Mg)-Dissolved | MS-B | L2033487-1, -2, -4 |
| Matrix Spike | Manganese (Mn)-Dissolved | MS-B | L2033487-1, -2, -4 |
| Matrix Spike | Potassium (K)-Dissolved | MS-B | L2033487-1, -2, -4 |
| Matrix Spike | Silicon (Si)-Dissolved | MS-B | L2033487-1, -2, -4 |
| Matrix Spike | Sodium (Na)-Dissolved | MS-B | L2033487-1, -2, -4 |
| Matrix Spike | Strontium (Sr)-Dissolved | MS-B | L2033487-1, -2, -4 |

Qualifiers for Individual Parameters Listed:

| Qualifier | Description |
|-----------|--|
| MS-B | Matrix Spike recovery could not be accurately calculated due to high analyte background in sample. |

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|---|--------|--|----------------------------|
| ALK-TITR-VA | Water | Alkalinity Species by Titration | APHA 2320 Alkalinity |
| This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values. | | | |
| BE-D-L-CCMS-VA | Water | Diss. Be (low) in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| BR-L-IC-N-VA | Water | Bromide in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| CL-IC-N-VA | Water | Chloride in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| EC-PCT-VA | Water | Conductivity (Automated) | APHA 2510 Auto. Conduc. |
| This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode. | | | |
| EC-SCREEN-VA | Water | Conductivity Screen (Internal Use Only) | APHA 2510 |
| Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc. | | | |
| F-IC-N-VA | Water | Fluoride in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| HARDNESS-CALC-VA | Water | Hardness | APHA 2340B |
| Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation. | | | |
| HG-D-CVAA-VA | Water | Diss. Mercury in Water by CVAAS or CVAFS | APHA 3030B/EPA 1631E (mod) |
| Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | | | |
| IONBALANCE-VA | Water | Ion Balance Calculation | APHA 1030E |
| Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero. | | | |
| Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as: | | | |
| Ion Balance (%) = [Cation Sum-Anion Sum] / [Cation Sum+Anion Sum] | | | |
| MET-D-CCMS-VA | Water | Dissolved Metals in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |

Reference Information

| | | | |
|---|-------|---------------------------------------|---|
| NH3-F-VA | Water | Ammonia in Water by Fluorescence | J. ENVIRON. MONIT., 2005, 7, 37-42, RSC |
| This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al. | | | |
| NO2-L-IC-N-VA | Water | Nitrite in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| NO3-L-IC-N-VA | Water | Nitrate in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| PH-PCT-VA | Water | pH by Meter (Automated) | APHA 4500-H pH Value |
| This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode | | | |
| It is recommended that this analysis be conducted in the field. | | | |
| SO4-IC-N-VA | Water | Sulfate in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| TDS-CALC-VA | Water | TDS (Calculated) | APHA 1030E (20TH EDITION) |
| This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses". The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample. | | | |
| TSS-VA | Water | Total Suspended Solids by Gravimetric | APHA 2540 D - GRAVIMETRIC |
| This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples. | | | |

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location |
|----------------------------|---|
| VA | ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA |

Chain of Custody Numbers:

2017-12-08 B

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

of Custody (COC) / Analytical

Reference Information

QC Samples with Qualifiers & Comments:

| QC Type Description | Parameter | Qualifier | Applies to Sample Number(s) |
|---------------------|--------------------------|-----------|--|
| Matrix Spike | Barium (Ba)-Dissolved | MS-B | L2025311-1, -2, -3, -4, -5, -6, -7, -8 |
| Matrix Spike | Calcium (Ca)-Dissolved | MS-B | L2025311-1, -2, -3, -4, -5, -6, -7, -8 |
| Matrix Spike | Magnesium (Mg)-Dissolved | MS-B | L2025311-1, -2, -3, -4, -5, -6, -7, -8 |
| Matrix Spike | Sodium (Na)-Dissolved | MS-B | L2025311-1, -2, -3, -4, -5, -6, -7, -8 |
| Matrix Spike | Strontium (Sr)-Dissolved | MS-B | L2025311-1, -2, -3, -4, -5, -6, -7, -8 |

Qualifiers for Individual Parameters Listed:

| Qualifier | Description |
|-----------|--|
| MS-B | Matrix Spike recovery could not be accurately calculated due to high analyte background in sample. |

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|---|--------|--|---|
| ALK-TITR-VA | Water | Alkalinity Species by Titration | APHA 2320 Alkalinity |
| This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values. | | | |
| ANIONS-N+N-CALC-WR | Water | Nitrite & Nitrate Nitrogen | EPA 300.1 |
| Nitrate and Nitrite Nitrogen is determined by calculation from the individual Nitrate and Nitrite Nitrogen analyses by Ion Chromatography with UV absorbance. | | | |
| BE-D-L-CCMS-VA | Water | Diss. Be (low) in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| BR-L-IC-N-WR | Water | Bromide in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| CL-L-IC-N-WR | Water | Chloride in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| EC-PCT-VA | Water | Conductivity (Automated) | APHA 2510 Auto. Conduc. |
| This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode. | | | |
| EC-SCREEN-VA | Water | Conductivity Screen (Internal Use Only) | APHA 2510 |
| Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc. | | | |
| HARDNESS-CALC-VA | Water | Hardness | APHA 2340B |
| Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation. | | | |
| HG-D-CVAA-VA | Water | Diss. Mercury in Water by CVAAS or CVAFS | APHA 3030B/EPA 1631E (mod) |
| Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | | | |
| IONBALANCE-VA | Water | Ion Balance Calculation | APHA 1030E |
| Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero. | | | |
| Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as: | | | |
| Ion Balance (%) = [Cation Sum-Anion Sum] / [Cation Sum+Anion Sum] | | | |
| MET-D-CCMS-VA | Water | Dissolved Metals in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| NH3-F-VA | Water | Ammonia in Water by Fluorescence | J. ENVIRON. MONIT., 2005, 7, 37-42, RSC |
| This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al. | | | |
| NO2-L-IC-N-WR | Water | Nitrite in Water by IC (Low Level) | EPA 300.1 (mod) |

Reference Information

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO3-L-IC-N-WR Water Nitrate in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

SO4-IC-WR Water Sulfate in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

TDS-CALC-VA Water TDS (Calculated) APHA 1030E (20TH EDITION)

This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses".

The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample.

TSS-MAN-WR Water Total Suspended Solids by Gravimetric APHA 2540 D

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids are determined by filtering a sample through a glass fibre filter and drying the filter at 104 degrees celsius.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location |
|----------------------------|---|
| WR | ALS ENVIRONMENTAL - WHITEHORSE, YUKON, CANADA |
| VA | ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA |

Chain of Custody Numbers:

2017-11-21 A

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Reference Information

QC Samples with Qualifiers & Comments:

| QC Type Description | Parameter | Qualifier | Applies to Sample Number(s) |
|---------------------|---------------------------|-----------|--------------------------------|
| Matrix Spike | Barium (Ba)-Dissolved | MS-B | L2024714-1, -2, -3, -4, -5, -6 |
| Matrix Spike | Calcium (Ca)-Dissolved | MS-B | L2024714-1, -2, -3, -4, -5, -6 |
| Matrix Spike | Magnesium (Mg)-Dissolved | MS-B | L2024714-1, -2, -3, -4, -5, -6 |
| Matrix Spike | Manganese (Mn)-Dissolved | MS-B | L2024714-1, -2, -3, -4, -5, -6 |
| Matrix Spike | Molybdenum (Mo)-Dissolved | MS-B | L2024714-1, -2, -3, -4, -5, -6 |
| Matrix Spike | Sodium (Na)-Dissolved | MS-B | L2024714-1, -2, -3, -4, -5, -6 |
| Matrix Spike | Strontium (Sr)-Dissolved | MS-B | L2024714-1, -2, -3, -4, -5, -6 |

Qualifiers for Individual Parameters Listed:

| Qualifier | Description |
|-----------|--|
| MS-B | Matrix Spike recovery could not be accurately calculated due to high analyte background in sample. |

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|---|--------|--|----------------------------|
| ALK-TITR-VA | Water | Alkalinity Species by Titration | APHA 2320 Alkalinity |
| This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values. | | | |
| ANIONS-N+N-CALC-WR | Water | Nitrite & Nitrate Nitrogen | EPA 300.1 |
| Nitrate and Nitrite Nitrogen is determined by calculation from the individual Nitrate and Nitrite Nitrogen analyses by Ion Chromatography with UV absorbance. | | | |
| BE-D-L-CCMS-VA | Water | Diss. Be (low) in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| BR-L-IC-N-VA | Water | Bromide in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| CL-L-IC-N-WR | Water | Chloride in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| EC-PCT-VA | Water | Conductivity (Automated) | APHA 2510 Auto. Conduc. |
| This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode. | | | |
| EC-SCREEN-VA | Water | Conductivity Screen (Internal Use Only) | APHA 2510 |
| Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc. | | | |
| F-IC-N-WR | Water | Fluoride in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| HARDNESS-CALC-VA | Water | Hardness | APHA 2340B |
| Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation. | | | |
| HG-D-CVAA-VA | Water | Diss. Mercury in Water by CVAAS or CVAFS | APHA 3030B/EPA 1631E (mod) |
| Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | | | |
| IONBALANCE-VA | Water | Ion Balance Calculation | APHA 1030E |
| Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero. | | | |
| Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as: | | | |
| Ion Balance (%) = [Cation Sum-Anion Sum] / [Cation Sum+Anion Sum] | | | |
| MET-D-CCMS-VA | Water | Dissolved Metals in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |

Reference Information

| | | | |
|---|-------|---------------------------------------|---|
| NH3-F-VA | Water | Ammonia in Water by Fluorescence | J. ENVIRON. MONIT., 2005, 7, 37-42, RSC |
| This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al. | | | |
| NO2-L-IC-N-WR | Water | Nitrite in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| NO3-L-IC-N-WR | Water | Nitrate in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| PH-PCT-VA | Water | pH by Meter (Automated) | APHA 4500-H pH Value |
| This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode | | | |
| It is recommended that this analysis be conducted in the field. | | | |
| SO4-IC-WR | Water | Sulfate in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| TDS-CALC-VA | Water | TDS (Calculated) | APHA 1030E (20TH EDITION) |
| This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses". The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample. | | | |
| TSS-MAN-WR | Water | Total Suspended Solids by Gravimetric | APHA 2540 D |
| This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids are determined by filtering a sample through a glass fibre filter and drying the filter at 104 degrees celsius. | | | |

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location |
|-----------------------------------|---|
| WR | ALS ENVIRONMENTAL - WHITEHORSE, YUKON, CANADA |
| VA | ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA |

Chain of Custody Numbers:

2017-11-20 A

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Reference Information

QC Samples with Qualifiers & Comments:

| QC Type Description | Parameter | Qualifier | Applies to Sample Number(s) |
|---------------------|--------------------------|-----------|------------------------------------|
| Method Blank | Zinc (Zn)-Dissolved | MB-LOR | L2023142-1, -2, -3, -4, -5, -6, -7 |
| Matrix Spike | Barium (Ba)-Dissolved | MS-B | L2023142-1, -2, -3, -4, -5, -6, -7 |
| Matrix Spike | Boron (B)-Dissolved | MS-B | L2023142-1, -2, -3, -4, -5, -6, -7 |
| Matrix Spike | Calcium (Ca)-Dissolved | MS-B | L2023142-1, -2, -3, -4, -5, -6, -7 |
| Matrix Spike | Magnesium (Mg)-Dissolved | MS-B | L2023142-1, -2, -3, -4, -5, -6, -7 |
| Matrix Spike | Manganese (Mn)-Dissolved | MS-B | L2023142-1, -2, -3, -4, -5, -6, -7 |
| Matrix Spike | Sodium (Na)-Dissolved | MS-B | L2023142-1, -2, -3, -4, -5, -6, -7 |
| Matrix Spike | Strontium (Sr)-Dissolved | MS-B | L2023142-1, -2, -3, -4, -5, -6, -7 |

Qualifiers for Individual Parameters Listed:

| Qualifier | Description |
|-----------|---|
| DLB | Detection Limit Raised. Analyte detected at comparable level in Method Blank. |
| DLM | Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity). |
| MB-LOR | Method Blank exceeds ALS DQO. Limits of Reporting have been adjusted for samples with positive hits below 5x blank level. |
| MS-B | Matrix Spike recovery could not be accurately calculated due to high analyte background in sample. |

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|---|--------|--|----------------------------|
| ALK-TITR-VA | Water | Alkalinity Species by Titration | APHA 2320 Alkalinity |
| This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values. | | | |
| ANIONS-N+N-CALC-WR | Water | Nitrite & Nitrate Nitrogen | EPA 300.1 |
| Nitrate and Nitrite Nitrogen is determined by calculation from the individual Nitrate and Nitrite Nitrogen analyses by Ion Chromatography with UV absorbance. | | | |
| BE-D-L-CCMS-VA | Water | Diss. Be (low) in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| BR-L-IC-N-WR | Water | Bromide in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| CL-L-IC-N-WR | Water | Chloride in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| EC-PCT-VA | Water | Conductivity (Automated) | APHA 2510 Auto. Conduc. |
| This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode. | | | |
| EC-SCREEN-VA | Water | Conductivity Screen (Internal Use Only) | APHA 2510 |
| Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc. | | | |
| F-IC-N-WR | Water | Fluoride in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| HARDNESS-CALC-VA | Water | Hardness | APHA 2340B |
| Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation. | | | |
| HG-D-CVAA-VA | Water | Diss. Mercury in Water by CVAAS or CVAFS | APHA 3030B/EPA 1631E (mod) |
| Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | | | |
| IONBALANCE-VA | Water | Ion Balance Calculation | APHA 1030E |
| Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero. | | | |

Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as:

$$\text{Ion Balance (\%)} = \frac{[\text{Cation Sum} - \text{Anion Sum}]}{[\text{Cation Sum} + \text{Anion Sum}]}$$

Reference Information

| | | | |
|---|-------|--|---|
| MET-D-CCMS-VA | Water | Dissolved Metals in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| NH3-F-VA | Water | Ammonia in Water by Fluorescence | J. ENVIRON. MONIT., 2005, 7, 37-42, RSC |
| This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al. | | | |
| NO2-L-IC-N-WR | Water | Nitrite in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| NO3-L-IC-N-WR | Water | Nitrate in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| PH-PCT-VA | Water | pH by Meter (Automated) | APHA 4500-H pH Value |
| This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode | | | |
| It is recommended that this analysis be conducted in the field. | | | |
| SO4-IC-WR | Water | Sulfate in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| TDS-CALC-VA | Water | TDS (Calculated) | APHA 1030E (20TH EDITION) |
| This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses". The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample. | | | |
| TSS-MAN-WR | Water | Total Suspended Solids by Gravimetric | APHA 2540 D |
| This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids are determined by filtering a sample through a glass fibre filter and drying the filter at 104 degrees celsius. | | | |

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location |
|----------------------------|---|
| WR | ALS ENVIRONMENTAL - WHITEHORSE, YUKON, CANADA |
| VA | ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA |

Chain of Custody Numbers:

2017-11-15 C

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Reference Information

QC Samples with Qualifiers & Comments:

| QC Type Description | Parameter | Qualifier | Applies to Sample Number(s) |
|---------------------|--------------------------|-----------|--|
| Method Blank | Zinc (Zn)-Dissolved | MB-LOR | L2023138-1, -2, -3, -4, -5, -6, -7, -8 |
| Matrix Spike | Barium (Ba)-Dissolved | MS-B | L2023138-1, -2, -3, -4, -5, -6, -7, -8 |
| Matrix Spike | Boron (B)-Dissolved | MS-B | L2023138-1, -2, -3, -4, -5, -6, -7, -8 |
| Matrix Spike | Calcium (Ca)-Dissolved | MS-B | L2023138-1, -2, -3, -4, -5, -6, -7, -8 |
| Matrix Spike | Magnesium (Mg)-Dissolved | MS-B | L2023138-1, -2, -3, -4, -5, -6, -7, -8 |
| Matrix Spike | Manganese (Mn)-Dissolved | MS-B | L2023138-1, -2, -3, -4, -5, -6, -7, -8 |
| Matrix Spike | Sodium (Na)-Dissolved | MS-B | L2023138-1, -2, -3, -4, -5, -6, -7, -8 |
| Matrix Spike | Strontium (Sr)-Dissolved | MS-B | L2023138-1, -2, -3, -4, -5, -6, -7, -8 |
| Matrix Spike | Sulfate (SO4) | MS-B | L2023138-1, -2, -3, -4, -5, -6, -7, -8 |

Qualifiers for Individual Parameters Listed:

| Qualifier | Description |
|-----------|---|
| DLDS | Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity. |
| MB-LOR | Method Blank exceeds ALS DQO. Limits of Reporting have been adjusted for samples with positive hits below 5x blank level. |
| MS-B | Matrix Spike recovery could not be accurately calculated due to high analyte background in sample. |

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|---|--------|--|----------------------------|
| ALK-TITR-VA | Water | Alkalinity Species by Titration | APHA 2320 Alkalinity |
| This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values. | | | |
| BE-D-L-CCMS-VA | Water | Diss. Be (low) in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| BR-L-IC-N-VA | Water | Bromide in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| CL-IC-N-VA | Water | Chloride in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| EC-PCT-VA | Water | Conductivity (Automated) | APHA 2510 Auto. Conduc. |
| This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode. | | | |
| EC-SCREEN-VA | Water | Conductivity Screen (Internal Use Only) | APHA 2510 |
| Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc. | | | |
| F-IC-N-VA | Water | Fluoride in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| HARDNESS-CALC-VA | Water | Hardness | APHA 2340B |
| Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation. | | | |
| HG-D-CVAA-VA | Water | Diss. Mercury in Water by CVAAS or CVAFS | APHA 3030B/EPA 1631E (mod) |
| Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | | | |
| IONBALANCE-VA | Water | Ion Balance Calculation | APHA 1030E |
| Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero. | | | |
| Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as: | | | |
| Ion Balance (%) = [Cation Sum-Anion Sum] / [Cation Sum+Anion Sum] | | | |
| MET-D-CCMS-VA | Water | Dissolved Metals in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |

Reference Information

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

| | | | |
|---|-------|---------------------------------------|---|
| NH3-F-VA | Water | Ammonia in Water by Fluorescence | J. ENVIRON. MONIT., 2005, 7, 37-42, RSC |
| This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al. | | | |
| NO2-L-IC-N-VA | Water | Nitrite in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| NO3-L-IC-N-VA | Water | Nitrate in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| PH-PCT-VA | Water | pH by Meter (Automated) | APHA 4500-H pH Value |
| This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode | | | |
| It is recommended that this analysis be conducted in the field. | | | |
| SO4-IC-N-VA | Water | Sulfate in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| TDS-CALC-VA | Water | TDS (Calculated) | APHA 1030E (20TH EDITION) |
| This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses". | | | |
| The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample. | | | |
| TSS-VA | Water | Total Suspended Solids by Gravimetric | APHA 2540 D - GRAVIMETRIC |
| This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples. | | | |

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location |
|----------------------------|---|
| VA | ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA |

Chain of Custody Numbers:

2017-11-15 B

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Reference Information

QC Samples with Qualifiers & Comments:

| QC Type Description | Parameter | Qualifier | Applies to Sample Number(s) |
|---------------------|--------------------------|-----------|------------------------------------|
| Method Blank | Zinc (Zn)-Dissolved | MB-LOR | L2023110-1, -2, -3, -4 |
| Matrix Spike | Barium (Ba)-Dissolved | MS-B | L2023110-1, -2, -3, -4 |
| Matrix Spike | Boron (B)-Dissolved | MS-B | L2023110-1, -2, -3, -4 |
| Matrix Spike | Calcium (Ca)-Dissolved | MS-B | L2023110-1, -2, -3, -4 |
| Matrix Spike | Magnesium (Mg)-Dissolved | MS-B | L2023110-1, -2, -3, -4 |
| Matrix Spike | Manganese (Mn)-Dissolved | MS-B | L2023110-1, -2, -3, -4 |
| Matrix Spike | Potassium (K)-Dissolved | MS-B | L2023110-1, -2, -3, -4 |
| Matrix Spike | Sodium (Na)-Dissolved | MS-B | L2023110-1, -2, -3, -4 |
| Matrix Spike | Strontium (Sr)-Dissolved | MS-B | L2023110-1, -2, -3, -4 |
| Matrix Spike | Sulfur (S)-Dissolved | MS-B | L2023110-1, -2, -3, -4 |
| Matrix Spike | Sulfate (SO4) | MS-B | L2023110-1, -2, -3, -4, -5, -6, -7 |

Qualifiers for Individual Parameters Listed:

| Qualifier | Description |
|-----------|---|
| DLB | Detection Limit Raised. Analyte detected at comparable level in Method Blank. |
| DLDS | Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity. |
| MB-LOR | Method Blank exceeds ALS DQO. Limits of Reporting have been adjusted for samples with positive hits below 5x blank level. |
| MS-B | Matrix Spike recovery could not be accurately calculated due to high analyte background in sample. |

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|---|--------|--|----------------------------|
| ALK-TITR-VA | Water | Alkalinity Species by Titration | APHA 2320 Alkalinity |
| This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values. | | | |
| ANIONS-N+N-CALC-VA | Water | Nitrite & Nitrate in Water (Calculation) | EPA 300.0 |
| Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N). | | | |
| BE-D-L-CCMS-VA | Water | Diss. Be (low) in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| BR-L-IC-N-VA | Water | Bromide in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| CL-IC-N-VA | Water | Chloride in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| EC-PCT-VA | Water | Conductivity (Automated) | APHA 2510 Auto. Conduc. |
| This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode. | | | |
| EC-SCREEN-VA | Water | Conductivity Screen (Internal Use Only) | APHA 2510 |
| Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc. | | | |
| F-IC-N-VA | Water | Fluoride in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| HARDNESS-CALC-VA | Water | Hardness | APHA 2340B |
| Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation. | | | |
| HG-D-CVAA-VA | Water | Diss. Mercury in Water by CVAAS or CVAFS | APHA 3030B/EPA 1631E (mod) |
| Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | | | |
| IONBALANCE-VA | Water | Ion Balance Calculation | APHA 1030E |
| Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero. | | | |

Reference Information

Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as:

$$\text{Ion Balance (\%)} = \frac{[\text{Cation Sum} - \text{Anion Sum}]}{[\text{Cation Sum} + \text{Anion Sum}]}$$

MET-D-CCMS-VA Water Dissolved Metals in Water by CRC ICPMS APHA 3030B/6020A (mod)

Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

NH3-F-VA Water Ammonia in Water by Fluorescence J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NO2-L-IC-N-VA Water Nitrite in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO3-L-IC-N-VA Water Nitrate in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

SO4-IC-N-VA Water Sulfate in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

TDS-CALC-VA Water TDS (Calculated) APHA 1030E (20TH EDITION)

This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses". The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample.

TSS-VA Water Total Suspended Solids by Gravimetric APHA 2540 D - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location |
|----------------------------|---|
| VA | ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA |

Chain of Custody Numbers:

2017-11-15 A

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Chain of Custody (COC) / Analytical Request Form

Reference Information

QC Samples with Qualifiers & Comments:

| QC Type Description | Parameter | Qualifier | Applies to Sample Number(s) |
|---------------------|--------------------------|-----------|-----------------------------|
| Matrix Spike | Barium (Ba)-Dissolved | MS-B | L2021805-1, -2, -3, -4, -5 |
| Matrix Spike | Calcium (Ca)-Dissolved | MS-B | L2021805-1, -2, -3, -4, -5 |
| Matrix Spike | Magnesium (Mg)-Dissolved | MS-B | L2021805-1, -2, -3, -4, -5 |
| Matrix Spike | Manganese (Mn)-Dissolved | MS-B | L2021805-1, -2, -3, -4, -5 |
| Matrix Spike | Sodium (Na)-Dissolved | MS-B | L2021805-1, -2, -3, -4, -5 |
| Matrix Spike | Strontium (Sr)-Dissolved | MS-B | L2021805-1, -2, -3, -4, -5 |
| Matrix Spike | Sulfur (S)-Dissolved | MS-B | L2021805-1, -2, -3, -4, -5 |
| Matrix Spike | Ammonia, Total (as N) | MS-B | L2021805-3 |

Qualifiers for Individual Parameters Listed:

| Qualifier | Description |
|-----------|--|
| DLDS | Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity. |
| MS-B | Matrix Spike recovery could not be accurately calculated due to high analyte background in sample. |

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|---|--------|--|----------------------------|
| ALK-TITR-VA | Water | Alkalinity Species by Titration | APHA 2320 Alkalinity |
| This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values. | | | |
| ANIONS-N+N-CALC-WR | Water | Nitrite & Nitrate Nitrogen | EPA 300.1 |
| Nitrate and Nitrite Nitrogen is determined by calculation from the individual Nitrate and Nitrite Nitrogen analyses by Ion Chromatography with UV absorbance. | | | |
| BE-D-L-CCMS-VA | Water | Diss. Be (low) in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| BR-L-IC-N-WR | Water | Bromide in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| CL-L-IC-N-WR | Water | Chloride in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| EC-PCT-VA | Water | Conductivity (Automated) | APHA 2510 Auto. Conduc. |
| This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode. | | | |
| EC-SCREEN-VA | Water | Conductivity Screen (Internal Use Only) | APHA 2510 |
| Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc. | | | |
| HARDNESS-CALC-VA | Water | Hardness | APHA 2340B |
| Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation. | | | |
| HG-D-CVAA-VA | Water | Diss. Mercury in Water by CVAAS or CVAFS | APHA 3030B/EPA 1631E (mod) |
| Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | | | |
| IONBALANCE-VA | Water | Ion Balance Calculation | APHA 1030E |
| Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero. | | | |
| Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as: | | | |
| Ion Balance (%) = [Cation Sum-Anion Sum] / [Cation Sum+Anion Sum] | | | |
| MET-D-CCMS-VA | Water | Dissolved Metals in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |

Reference Information

| | | | |
|---|-------|---------------------------------------|---|
| NH3-F-VA | Water | Ammonia in Water by Fluorescence | J. ENVIRON. MONIT., 2005, 7, 37-42, RSC |
| This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al. | | | |
| NO2-L-IC-N-WR | Water | Nitrite in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| NO3-L-IC-N-WR | Water | Nitrate in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| PH-PCT-VA | Water | pH by Meter (Automated) | APHA 4500-H pH Value |
| This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode | | | |
| It is recommended that this analysis be conducted in the field. | | | |
| SO4-IC-WR | Water | Sulfate in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| TDS-CALC-VA | Water | TDS (Calculated) | APHA 1030E (20TH EDITION) |
| This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses". The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample. | | | |
| TSS-MAN-WR | Water | Total Suspended Solids by Gravimetric | APHA 2540 D |
| This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids are determined by filtering a sample through a glass fibre filter and drying the filter at 104 degrees celsius. | | | |

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location |
|-----------------------------------|---|
| WR | ALS ENVIRONMENTAL - WHITEHORSE, YUKON, CANADA |
| VA | ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA |

Chain of Custody Numbers:

2017-11-11 A

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Reference Information

QC Samples with Qualifiers & Comments:

| QC Type Description | Parameter | Qualifier | Applies to Sample Number(s) |
|---------------------|--------------------------|-----------|-----------------------------|
| Matrix Spike | Barium (Ba)-Dissolved | MS-B | L2012848-1, -2, -5, -6 |
| Matrix Spike | Calcium (Ca)-Dissolved | MS-B | L2012848-1, -2, -5, -6 |
| Matrix Spike | Magnesium (Mg)-Dissolved | MS-B | L2012848-1, -2, -5, -6 |
| Matrix Spike | Sodium (Na)-Dissolved | MS-B | L2012848-1, -2, -5, -6 |
| Matrix Spike | Strontium (Sr)-Dissolved | MS-B | L2012848-1, -2, -5, -6 |
| Matrix Spike | Ammonia, Total (as N) | MS-B | L2012848-5 |
| Matrix Spike | Sulfate (SO4) | MS-B | L2012848-1, -2, -5, -6 |

Qualifiers for Individual Parameters Listed:

| Qualifier | Description |
|-----------|--|
| DLDS | Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity. |
| MS-B | Matrix Spike recovery could not be accurately calculated due to high analyte background in sample. |

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|---|--------|--|----------------------------|
| ALK-TITR-VA | Water | Alkalinity Species by Titration | APHA 2320 Alkalinity |
| This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values. | | | |
| ANIONS-N+N-CALC-VA | Water | Nitrite & Nitrate in Water (Calculation) | EPA 300.0 |
| Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N). | | | |
| BE-D-L-CCMS-VA | Water | Diss. Be (low) in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| BR-L-IC-N-VA | Water | Bromide in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| CL-IC-N-VA | Water | Chloride in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| EC-PCT-VA | Water | Conductivity (Automated) | APHA 2510 Auto. Conduc. |
| This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode. | | | |
| EC-SCREEN-VA | Water | Conductivity Screen (Internal Use Only) | APHA 2510 |
| Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc. | | | |
| F-IC-N-VA | Water | Fluoride in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| HARDNESS-CALC-VA | Water | Hardness | APHA 2340B |
| Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation. | | | |
| HG-D-CVAA-VA | Water | Diss. Mercury in Water by CVAAS or CVAFS | APHA 3030B/EPA 1631E (mod) |
| Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | | | |
| IONBALANCE-VA | Water | Ion Balance Calculation | APHA 1030E |
| Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero. | | | |
| Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as: | | | |
| Ion Balance (%) = [Cation Sum-Anion Sum] / [Cation Sum+Anion Sum] | | | |
| MET-D-CCMS-VA | Water | Dissolved Metals in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |

Reference Information

| | | | |
|---|-------|---------------------------------------|---|
| NH3-F-VA | Water | Ammonia in Water by Fluorescence | J. ENVIRON. MONIT., 2005, 7, 37-42, RSC |
| This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al. | | | |
| NO2-L-IC-N-VA | Water | Nitrite in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| NO3-L-IC-N-VA | Water | Nitrate in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| PH-PCT-VA | Water | pH by Meter (Automated) | APHA 4500-H pH Value |
| This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode | | | |
| It is recommended that this analysis be conducted in the field. | | | |
| SO4-IC-N-VA | Water | Sulfate in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| TDS-CALC-VA | Water | TDS (Calculated) | APHA 1030E (20TH EDITION) |
| This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses". The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample. | | | |
| TSS-VA | Water | Total Suspended Solids by Gravimetric | APHA 2540 D - GRAVIMETRIC |
| This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples. | | | |

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location |
|----------------------------|---|
| VA | ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA |

Chain of Custody Numbers:

2017-10-24 B

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

| Matrix Spike | Calcium (Ca)-Total | MS-B | L2011870-2, -3 |
| Matrix Spike | Magnesium (Mg)-Total | MS-B | L2011870-2, -3 |
| Matrix Spike | Manganese (Mn)-Total | MS-B | L2011870-2, -3 |
| Matrix Spike | Sodium (Na)-Total | MS-B | L2011870-2, -3 |
| Matrix Spike | Strontium (Sr)-Total | MS-B | L2011870-2, -3 |
| Matrix Spike | Sulfate (SO4) | MS-B | L2011870-1, -2, -3 |

Qualifiers for Individual Parameters Listed:

| Qualifier | Description |
|-----------|---|
| DLDS | Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity. |
| DLM | Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity). |
| DTMF | Dissolved concentration exceeds total for field-filtered metals sample. Metallic contaminants were likely introduced to dissolved sample during field filtration. |
| MS-B | Matrix Spike recovery could not be accurately calculated due to high analyte background in sample. |

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|--|--------|--|---------------------------------------|
| ALK-TITR-VA | Water | Alkalinity Species by Titration | APHA 2320 Alkalinity |
| This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values. | | | |
| ANIONS-N+N-CALC-VA | Water | Nitrite & Nitrate in Water (Calculation) | EPA 300.0 |
| Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N). | | | |
| BE-D-L-CCMS-VA | Water | Diss. Be (low) in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| BE-T-L-CCMS-VA | Water | Total Be (Low) in Water by CRC ICPMS | EPA 200.2/6020A (mod) |
| Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS. | | | |
| BR-L-IC-N-VA | Water | Bromide in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| CARBONS-DOC-VA | Water | Dissolved organic carbon by combustion | APHA 5310B TOTAL ORGANIC CARBON (TOC) |
| This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are | | | |

Reference Information

determined by filtering the sample through a 0.45 micron membrane filter prior to analysis.

CL-IC-N-VA Water Chloride in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

EC-PCT-VA Water Conductivity (Automated) APHA 2510 Auto. Conduc.

This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode.

EC-SCREEN-VA Water Conductivity Screen (Internal Use Only) APHA 2510

Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc.

F-IC-N-VA Water Fluoride in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

HARDNESS-CALC-VA Water Hardness APHA 2340B

Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO₃ equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation.

HG-D-CVAA-VA Water Diss. Mercury in Water by CVAAS or CVAFS APHA 3030B/EPA 1631E (mod)

Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.

HG-T-CVAA-VA Water Total Mercury in Water by CVAAS or CVAFS EPA 1631E (mod)

Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.

IONBALANCE-VA Water Ion Balance Calculation APHA 1030E

Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero.

Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as:

Ion Balance (%) = [Cation Sum-Anion Sum] / [Cation Sum+Anion Sum]

MET-D-CCMS-VA Water Dissolved Metals in Water by CRC ICPMS APHA 3030B/6020A (mod)

Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

MET-T-CCMS-VA Water Total Metals in Water by CRC ICPMS EPA 200.2/6020A (mod)

Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

NH3-F-VA Water Ammonia in Water by Fluorescence J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NO2-L-IC-N-VA Water Nitrite in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO3-L-IC-N-VA Water Nitrate in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

SO4-IC-N-VA Water Sulfate in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

Reference Information

TDS-CALC-VA Water TDS (Calculated) APHA 1030E (20TH EDITION)

This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses".
The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample.

TSS-VA Water Total Suspended Solids by Gravimetric APHA 2540 D - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location |
|----------------------------|---|
| VA | ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA |

Chain of Custody Numbers:

2017-10-20 A

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Reference Information

QC Samples with Qualifiers & Comments:

| QC Type Description | Parameter | Qualifier | Applies to Sample Number(s) |
|---------------------|--------------------------|-----------|--|
| Matrix Spike | Boron (B)-Dissolved | MS-B | L1983905-1, -2, -3, -4, -5, -6, -7, -8 |
| Matrix Spike | Cadmium (Cd)-Dissolved | MS-B | L1983905-1, -2, -3, -4, -5, -6, -7, -8 |
| Matrix Spike | Calcium (Ca)-Dissolved | MS-B | L1983905-1, -2, -3, -4, -5, -6, -7, -8 |
| Matrix Spike | Magnesium (Mg)-Dissolved | MS-B | L1983905-1, -2, -3, -4, -5, -6, -7, -8 |
| Matrix Spike | Manganese (Mn)-Dissolved | MS-B | L1983905-1, -2, -3, -4, -5, -6, -7, -8 |
| Matrix Spike | Sodium (Na)-Dissolved | MS-B | L1983905-1, -2, -3, -4, -5, -6, -7, -8 |
| Matrix Spike | Strontium (Sr)-Dissolved | MS-B | L1983905-1, -2, -3, -4, -5, -6, -7, -8 |
| Matrix Spike | Sulfur (S)-Dissolved | MS-B | L1983905-1, -2, -3, -4, -5, -6, -7, -8 |
| Matrix Spike | Zinc (Zn)-Dissolved | MS-B | L1983905-1, -2, -3, -4, -5, -6, -7, -8 |

Qualifiers for Individual Parameters Listed:

| Qualifier | Description |
|-----------|--|
| DLM | Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity). |
| MS-B | Matrix Spike recovery could not be accurately calculated due to high analyte background in sample. |

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|---|--------|--|----------------------------|
| ALK-TITR-VA | Water | Alkalinity Species by Titration | APHA 2320 Alkalinity |
| This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values. | | | |
| ANIONS-N+N-CALC-WR | Water | Nitrite & Nitrate Nitrogen | EPA 300.1 |
| Nitrate and Nitrite Nitrogen is determined by calculation from the individual Nitrate and Nitrite Nitrogen analyses by Ion Chromatography with UV absorbance. | | | |
| BE-D-L-CCMS-VA | Water | Diss. Be (low) in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| BR-L-IC-N-VA | Water | Bromide in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| CL-IC-N-VA | Water | Chloride in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| CL-L-IC-N-WR | Water | Chloride in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| EC-PCT-VA | Water | Conductivity (Automated) | APHA 2510 Auto. Conduc. |
| This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode. | | | |
| EC-SCREEN-VA | Water | Conductivity Screen (Internal Use Only) | APHA 2510 |
| Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc. | | | |
| HARDNESS-CALC-VA | Water | Hardness | APHA 2340B |
| Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation. | | | |
| HG-D-CVAA-VA | Water | Diss. Mercury in Water by CVAAS or CVAFS | APHA 3030B/EPA 1631E (mod) |
| Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | | | |
| IONBALANCE-VA | Water | Ion Balance Calculation | APHA 1030E |
| Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero. | | | |
| Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as: | | | |
| Ion Balance (%) = [Cation Sum-Anion Sum] / [Cation Sum+Anion Sum] | | | |
| MET-D-CCMS-VA | Water | Dissolved Metals in Water by CRC ICPMS | APHA 3030B/6020A (mod) |

Reference Information

Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

| | | | |
|---|-------|---------------------------------------|---|
| NH3-F-VA | Water | Ammonia in Water by Fluorescence | APHA 4500 NH3-NITROGEN (AMMONIA) |
| This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al. | | | |
| NH3-F-VA | Water | Ammonia in Water by Fluorescence | J. ENVIRON. MONIT., 2005, 7, 37-42, RSC |
| This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al. | | | |
| NO2-L-IC-N-VA | Water | Nitrite in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| NO2-L-IC-N-WR | Water | Nitrite in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| NO3-L-IC-N-WR | Water | Nitrate in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| PH-PCT-VA | Water | pH by Meter (Automated) | APHA 4500-H pH Value |
| This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode | | | |
| It is recommended that this analysis be conducted in the field. | | | |
| SO4-IC-WR | Water | Sulfate in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| TDS-CALC-VA | Water | TDS (Calculated) | APHA 1030E (20TH EDITION) |
| This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses". The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample. | | | |
| TSS-MAN-WR | Water | Total Suspended Solids by Gravimetric | APHA 2540 D |
| This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids are determined by filtering a sample through a glass fibre filter and drying the filter at 104 degrees celsius. | | | |

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location |
|----------------------------|---|
| WR | ALS ENVIRONMENTAL - WHITEHORSE, YUKON, CANADA |
| VA | ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA |

Chain of Custody Numbers:

2017-08-30 B

Reference Information

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Reference Information

QC Samples with Qualifiers & Comments:

| QC Type Description | Parameter | Qualifier | Applies to Sample Number(s) |
|---------------------|--------------------------|-----------|-----------------------------|
| Matrix Spike | Antimony (Sb)-Dissolved | MS-B | L1976082-1, -2, -3 |
| Matrix Spike | Barium (Ba)-Dissolved | MS-B | L1976082-1, -2, -3 |
| Matrix Spike | Calcium (Ca)-Dissolved | MS-B | L1976082-1, -2, -3 |
| Matrix Spike | Magnesium (Mg)-Dissolved | MS-B | L1976082-1, -2, -3 |
| Matrix Spike | Sodium (Na)-Dissolved | MS-B | L1976082-1, -2, -3 |
| Matrix Spike | Strontium (Sr)-Dissolved | MS-B | L1976082-1, -2, -3 |
| Matrix Spike | Sulfur (S)-Dissolved | MS-B | L1976082-1, -2, -3 |
| Matrix Spike | Uranium (U)-Dissolved | MS-B | L1976082-1, -2, -3 |
| Matrix Spike | Zinc (Zn)-Dissolved | MS-B | L1976082-1, -2, -3 |

Qualifiers for Individual Parameters Listed:

| Qualifier | Description |
|-----------|--|
| DLDS | Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity. |
| MS-B | Matrix Spike recovery could not be accurately calculated due to high analyte background in sample. |

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|---|--------|--|----------------------------|
| ALK-TITR-VA | Water | Alkalinity Species by Titration | APHA 2320 Alkalinity |
| This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values. | | | |
| ANIONS-N+N-CALC-VA | Water | Nitrite & Nitrate in Water (Calculation) | EPA 300.0 |
| Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N). | | | |
| ANIONS-N+N-CALC-WR | Water | Nitrite & Nitrate Nitrogen | EPA 300.1 |
| Nitrate and Nitrite Nitrogen is determined by calculation from the individual Nitrate and Nitrite Nitrogen analyses by Ion Chromatography with UV absorbance. | | | |
| BE-D-L-CCMS-VA | Water | Diss. Be (low) in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| CL-IC-N-VA | Water | Chloride in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| CL-IC-N-WR | Water | Chloride in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| EC-PCT-VA | Water | Conductivity (Automated) | APHA 2510 Auto. Conduc. |
| This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode. | | | |
| EC-SCREEN-VA | Water | Conductivity Screen (Internal Use Only) | APHA 2510 |
| Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc. | | | |
| HARDNESS-CALC-VA | Water | Hardness | APHA 2340B |
| Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation. | | | |
| HG-D-CVAA-VA | Water | Diss. Mercury in Water by CVAAS or CVAFS | APHA 3030B/EPA 1631E (mod) |
| Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | | | |
| IONBALANCE-VA | Water | Ion Balance Calculation | APHA 1030E |
| Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero. | | | |
| Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as: | | | |

Reference Information

Ion Balance (%) = [Cation Sum-Anion Sum] / [Cation Sum+Anion Sum]

| | | | |
|--|-------|--|---|
| MET-D-CCMS-VA | Water | Dissolved Metals in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| NH3-F-VA | Water | Ammonia in Water by Fluorescence | APHA 4500 NH3-NITROGEN (AMMONIA) |
| This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al. | | | |
| NH3-F-VA | Water | Ammonia in Water by Fluorescence | J. ENVIRON. MONIT., 2005, 7, 37-42, RSC |
| This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al. | | | |
| NO2-L-IC-N-VA | Water | Nitrite in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| NO2-L-IC-N-WR | Water | Nitrite in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| NO3-L-IC-N-VA | Water | Nitrate in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| NO3-L-IC-N-WR | Water | Nitrate in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| PH-PCT-VA | Water | pH by Meter (Automated) | APHA 4500-H pH Value |
| This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode | | | |
| It is recommended that this analysis be conducted in the field. | | | |
| SO4-IC-N-VA | Water | Sulfate in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| SO4-IC-WR | Water | Sulfate in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| TDS-CALC-VA | Water | TDS (Calculated) | APHA 1030E (20TH EDITION) |
| This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses". The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample. | | | |
| TSS-MAN-WR | Water | Total Suspended Solids by Gravimetric | APHA 2540 D |
| This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids are determined by filtering a sample through a glass fibre filter and drying the filter at 104 degrees celsius. | | | |
| TSS-VA | Water | Total Suspended Solids by Gravimetric | APHA 2540 D - GRAVIMETRIC |
| This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples. | | | |

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location |
|----------------------------|---|
| WR | ALS ENVIRONMENTAL - WHITEHORSE, YUKON, CANADA |
| VA | ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA |

Chain of Custody Numbers:

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

QC Samples with Qualifiers & Comments:

| QC Type Description | Parameter | Qualifier | Applies to Sample Number(s) |
|---------------------|--------------------------|-----------|-----------------------------|
| Method Blank | Copper (Cu)-Dissolved | MB-LOR | L1975619-1, -3 |
| Method Blank | Lead (Pb)-Dissolved | MB-LOR | L1975619-1, -3 |
| Method Blank | Zinc (Zn)-Dissolved | MB-LOR | L1975619-1, -3 |
| Matrix Spike | Barium (Ba)-Dissolved | MS-B | L1975619-1, -2, -3 |
| Matrix Spike | Barium (Ba)-Dissolved | MS-B | L1975619-2 |
| Matrix Spike | Boron (B)-Dissolved | MS-B | L1975619-1, -2, -3 |
| Matrix Spike | Calcium (Ca)-Dissolved | MS-B | L1975619-1, -2, -3 |
| Matrix Spike | Calcium (Ca)-Dissolved | MS-B | L1975619-2 |
| Matrix Spike | Magnesium (Mg)-Dissolved | MS-B | L1975619-1, -2, -3 |
| Matrix Spike | Magnesium (Mg)-Dissolved | MS-B | L1975619-2 |
| Matrix Spike | Manganese (Mn)-Dissolved | MS-B | L1975619-1, -2, -3 |
| Matrix Spike | Sodium (Na)-Dissolved | MS-B | L1975619-1, -2, -3 |
| Matrix Spike | Strontium (Sr)-Dissolved | MS-B | L1975619-1, -2, -3 |
| Matrix Spike | Strontium (Sr)-Dissolved | MS-B | L1975619-2 |
| Matrix Spike | Sulfur (S)-Dissolved | MS-B | L1975619-2 |

Qualifiers for Individual Parameters Listed:

| Qualifier | Description |
|-----------|---|
| DLB | Detection Limit Raised. Analyte detected at comparable level in Method Blank. |
| MB-LOR | Method Blank exceeds ALS DQO. Limits of Reporting have been adjusted for samples with positive hits below 5x blank level. |
| MS-B | Matrix Spike recovery could not be accurately calculated due to high analyte background in sample. |

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|---|--------|--|----------------------------|
| ALK-TITR-VA | Water | Alkalinity Species by Titration | APHA 2320 Alkalinity |
| This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values. | | | |
| ANIONS-N+N-CALC-WR | Water | Nitrite & Nitrate Nitrogen | EPA 300.1 |
| Nitrate and Nitrite Nitrogen is determined by calculation from the individual Nitrate and Nitrite Nitrogen analyses by Ion Chromatography with UV absorbance. | | | |
| BE-D-L-CCMS-VA | Water | Diss. Be (low) in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| CL-IC-N-WR | Water | Chloride in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| EC-PCT-VA | Water | Conductivity (Automated) | APHA 2510 Auto. Conduc. |
| This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode. | | | |
| EC-SCREEN-VA | Water | Conductivity Screen (Internal Use Only) | APHA 2510 |
| Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc. | | | |
| HARDNESS-CALC-VA | Water | Hardness | APHA 2340B |
| Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation. | | | |
| HG-D-CVAA-VA | Water | Diss. Mercury in Water by CVAAS or CVAFS | APHA 3030B/EPA 1631E (mod) |
| Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | | | |
| IONBALANCE-VA | Water | Ion Balance Calculation | APHA 1030E |
| Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero. | | | |

Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are

Reference Information

included where data is present. Ion Balance is calculated as:

$$\text{Ion Balance (\%)} = \frac{[\text{Cation Sum} - \text{Anion Sum}]}{[\text{Cation Sum} + \text{Anion Sum}]}$$

MET-D-CCMS-VA Water Dissolved Metals in Water by CRC ICPMS APHA 3030B/6020A (mod)

Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

NH3-F-VA Water Ammonia in Water by Fluorescence APHA 4500 NH3-NITROGEN (AMMONIA)

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NH3-F-VA Water Ammonia in Water by Fluorescence J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NO2-L-IC-N-WR Water Nitrite in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO3-L-IC-N-WR Water Nitrate in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

SO4-IC-WR Water Sulfate in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

TDS-CALC-VA Water TDS (Calculated) APHA 1030E (20TH EDITION)

This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses". The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample.

TSS-MAN-WR Water Total Suspended Solids by Gravimetric APHA 2540 D

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids are determined by filtering a sample through a glass fibre filter and drying the filter at 104 degrees celsius.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location |
|----------------------------|---|
| WR | ALS ENVIRONMENTAL - WHITEHORSE, YUKON, CANADA |
| VA | ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA |

Chain of Custody Numbers:

2017-08-15 A

Reference Information

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Reference Information

QC Samples with Qualifiers & Comments:

| QC Type Description | Parameter | Qualifier | Applies to Sample Number(s) |
|---------------------|--------------|-----------|-----------------------------|
| Matrix Spike | Fluoride (F) | MS-B | L1968910-1, -2 |

Qualifiers for Individual Parameters Listed:

| Qualifier | Description |
|-----------|--|
| DLDS | Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity. |
| DLM | Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity). |
| MS-B | Matrix Spike recovery could not be accurately calculated due to high analyte background in sample. |

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|---|--------|--|----------------------------|
| ALK-TITR-VA | Water | Alkalinity Species by Titration | APHA 2320 Alkalinity |
| This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values. | | | |
| ANIONS-N+N-CALC-VA | Water | Nitrite & Nitrate in Water (Calculation) | EPA 300.0 |
| Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N). | | | |
| ANIONS-N+N-CALC-WR | Water | Nitrite & Nitrate Nitrogen | EPA 300.1 |
| Nitrate and Nitrite Nitrogen is determined by calculation from the individual Nitrate and Nitrite Nitrogen analyses by Ion Chromatography with UV absorbance. | | | |
| BE-D-L-CCMS-VA | Water | Diss. Be (low) in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| CL-IC-N-VA | Water | Chloride in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| CL-L-IC-N-WR | Water | Chloride in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| EC-PCT-VA | Water | Conductivity (Automated) | APHA 2510 Auto. Conduc. |
| This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode. | | | |
| EC-SCREEN-VA | Water | Conductivity Screen (Internal Use Only) | APHA 2510 |
| Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc. | | | |
| F-IC-N-VA | Water | Fluoride in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| F-IC-N-WR | Water | Fluoride in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| HARDNESS-CALC-VA | Water | Hardness | APHA 2340B |
| Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation. | | | |
| HG-D-CVAA-VA | Water | Diss. Mercury in Water by CVAAS or CVAFS | APHA 3030B/EPA 1631E (mod) |
| Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | | | |
| IONBALANCE-VA | Water | Ion Balance Calculation | APHA 1030E |
| Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero. | | | |
| Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as: | | | |
| Ion Balance (%) = [Cation Sum-Anion Sum] / [Cation Sum+Anion Sum] | | | |
| MET-D-CCMS-VA | Water | Dissolved Metals in Water by CRC ICPMS | APHA 3030B/6020A (mod) |

Reference Information

Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

| | | | |
|---|-------|---------------------------------------|---|
| NH3-F-VA | Water | Ammonia in Water by Fluorescence | APHA 4500 NH3-NITROGEN (AMMONIA) |
| This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al. | | | |
| NH3-F-VA | Water | Ammonia in Water by Fluorescence | J. ENVIRON. MONIT., 2005, 7, 37-42, RSC |
| This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al. | | | |
| NO2-L-IC-N-VA | Water | Nitrite in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| NO2-L-IC-N-WR | Water | Nitrite in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| NO3-L-IC-N-VA | Water | Nitrate in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| NO3-L-IC-N-WR | Water | Nitrate in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| PH-PCT-VA | Water | pH by Meter (Automated) | APHA 4500-H pH Value |
| This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode | | | |
| It is recommended that this analysis be conducted in the field. | | | |
| SO4-IC-N-VA | Water | Sulfate in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| SO4-IC-WR | Water | Sulfate in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| TDS-CALC-VA | Water | TDS (Calculated) | APHA 1030E (20TH EDITION) |
| This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses". The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample. | | | |
| TSS-VA | Water | Total Suspended Solids by Gravimetric | APHA 2540 D - GRAVIMETRIC |
| This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples. | | | |

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location |
|----------------------------|---|
| WR | ALS ENVIRONMENTAL - WHITEHORSE, YUKON, CANADA |
| VA | ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA |

Chain of Custody Numbers:

2017-08-01 B

Reference Information

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

* Please refer to the Reference Information section for an explanation of any qualifiers detected.

Reference Information

QC Samples with Qualifiers & Comments:

| QC Type Description | Parameter | Qualifier | Applies to Sample Number(s) |
|---|---|-----------|-----------------------------|
| Qualifiers for Individual Parameters Listed: | | | |
| Qualifier | Description | | |
| DLDS | Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity. | | |

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|---|--------|--|---|
| ALK-TITR-VA | Water | Alkalinity Species by Titration | APHA 2320 Alkalinity |
| This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values. | | | |
| ANIONS-N+N-CALC-VA | Water | Nitrite & Nitrate in Water (Calculation) | EPA 300.0 |
| Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N). | | | |
| BE-D-L-CCMS-VA | Water | Diss. Be (low) in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| CL-IC-N-VA | Water | Chloride in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| EC-PCT-VA | Water | Conductivity (Automated) | APHA 2510 Auto. Conduc. |
| This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode. | | | |
| EC-SCREEN-VA | Water | Conductivity Screen (Internal Use Only) | APHA 2510 |
| Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc. | | | |
| HARDNESS-CALC-VA | Water | Hardness | APHA 2340B |
| Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation. | | | |
| HG-D-CVAA-VA | Water | Diss. Mercury in Water by CVAAS or CVAFS | APHA 3030B/EPA 1631E (mod) |
| Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | | | |
| IONBALANCE-VA | Water | Ion Balance Calculation | APHA 1030E |
| Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero. | | | |
| Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as: | | | |
| Ion Balance (%) = [Cation Sum-Anion Sum] / [Cation Sum+Anion Sum] | | | |
| MET-D-CCMS-VA | Water | Dissolved Metals in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| NH3-F-VA | Water | Ammonia in Water by Fluorescence | APHA 4500 NH3-NITROGEN (AMMONIA) |
| This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al. | | | |
| NH3-F-VA | Water | Ammonia in Water by Fluorescence | J. ENVIRON. MONIT., 2005, 7, 37-42, RSC |
| This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al. | | | |
| NO2-L-IC-N-VA | Water | Nitrite in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| NO3-L-IC-N-VA | Water | Nitrate in Water by IC (Low Level) | EPA 300.1 (mod) |

Reference Information

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

SO4-IC-N-VA Water Sulfate in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

TDS-CALC-VA Water TDS (Calculated) APHA 1030E (20TH EDITION)

This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses".

The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample.

TSS-VA Water Total Suspended Solids by Gravimetric APHA 2540 D - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius.

Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location |
|----------------------------|---------------------|
|----------------------------|---------------------|

| | |
|----|---|
| VA | ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA |
|----|---|

Chain of Custody Numbers:

2017-06-23 A

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Reference Information

QC Samples with Qualifiers & Comments:

| QC Type Description | Parameter | Qualifier | Applies to Sample Number(s) |
|---------------------|--------------------------|-----------|-----------------------------|
| Matrix Spike | Barium (Ba)-Dissolved | MS-B | L1929689-1, -2, -3, -4 |
| Matrix Spike | Calcium (Ca)-Dissolved | MS-B | L1929689-1, -2, -3, -4 |
| Matrix Spike | Magnesium (Mg)-Dissolved | MS-B | L1929689-1, -2, -3, -4 |
| Matrix Spike | Manganese (Mn)-Dissolved | MS-B | L1929689-1, -2, -3, -4 |
| Matrix Spike | Strontium (Sr)-Dissolved | MS-B | L1929689-1, -2, -3, -4 |
| Matrix Spike | Nitrite (as N) | MS-B | L1929689-1, -2, -3, -4 |

Qualifiers for Individual Parameters Listed:

| Qualifier | Description |
|-----------|--|
| DLA | Detection Limit adjusted for required dilution |
| DLDS | Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity. |
| MS-B | Matrix Spike recovery could not be accurately calculated due to high analyte background in sample. |

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|---|--------|--|----------------------------------|
| ALK-TITR-VA | Water | Alkalinity Species by Titration | APHA 2320 Alkalinity |
| This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values. | | | |
| ANIONS-N+N-CALC-WR | Water | Nitrite & Nitrate Nitrogen | EPA 300.1 |
| Nitrate and Nitrite Nitrogen is determined by calculation from the individual Nitrate and Nitrite Nitrogen analyses by Ion Chromatography with UV absorbance. | | | |
| BE-D-L-CCMS-VA | Water | Diss. Be (low) in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| CL-IC-N-WR | Water | Chloride in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| EC-PCT-VA | Water | Conductivity (Automated) | APHA 2510 Auto. Conduc. |
| This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode. | | | |
| EC-SCREEN-VA | Water | Conductivity Screen (Internal Use Only) | APHA 2510 |
| Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc. | | | |
| HARDNESS-CALC-VA | Water | Hardness | APHA 2340B |
| Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation. | | | |
| HG-D-CVAA-VA | Water | Diss. Mercury in Water by CVAAS or CVAFS | APHA 3030B/EPA 1631E (mod) |
| Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | | | |
| IONBALANCE-VA | Water | Ion Balance Calculation | APHA 1030E |
| Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero. | | | |
| Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as: | | | |
| $\text{Ion Balance (\%)} = \frac{[\text{Cation Sum} - \text{Anion Sum}]}{[\text{Cation Sum} + \text{Anion Sum}]}$ | | | |
| MET-D-CCMS-VA | Water | Dissolved Metals in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| NH3-F-VA | Water | Ammonia in Water by Fluorescence | APHA 4500 NH3-NITROGEN (AMMONIA) |
| This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et | | | |

Reference Information

| | | | |
|---|-------|---------------------------------------|---|
| NH3-F-VA | Water | Ammonia in Water by Fluorescence | J. ENVIRON. MONIT., 2005, 7, 37-42, RSC |
| This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al. | | | |
| NO2-L-IC-N-WR | Water | Nitrite in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| NO3-L-IC-N-WR | Water | Nitrate in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| PH-PCT-VA | Water | pH by Meter (Automated) | APHA 4500-H "pH Value" |
| This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode | | | |
| It is recommended that this analysis be conducted in the field. | | | |
| PH-PCT-VA | Water | pH by Meter (Automated) | APHA 4500-H pH Value |
| This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode | | | |
| It is recommended that this analysis be conducted in the field. | | | |
| SO4-IC-N-WR | Water | Sulfate in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| TDS-CALC-VA | Water | TDS (Calculated) | APHA 1030E (20TH EDITION) |
| This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses". The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample. | | | |
| TSS-MAN-WR | Water | Total Suspended Solids by Gravimetric | APHA 2540 D |
| This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids are determined by filtering a sample through a glass fibre filter and drying the filter at 104 degrees celsius. | | | |

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location |
|----------------------------|---|
| WR | ALS ENVIRONMENTAL - WHITEHORSE, YUKON, CANADA |
| VA | ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA |

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

| Matrix Spike | Sodium (Na)-Dissolved | MS-B | L1917619-1, -2, -3, -4, -5, -6, -7 |
| Matrix Spike | Sodium (Na)-Dissolved | MS-B | L1917619-1, -2, -3, -4, -5, -6, -7 |
| Matrix Spike | Strontium (Sr)-Dissolved | MS-B | L1917619-1, -2, -3, -4, -5, -6, -7 |
| Matrix Spike | Strontium (Sr)-Dissolved | MS-B | L1917619-1, -2, -3, -4, -5, -6, -7 |
| Matrix Spike | Sulfur (S)-Dissolved | MS-B | L1917619-1, -2, -3, -4, -5, -6, -7 |
| Matrix Spike | Uranium (U)-Dissolved | MS-B | L1917619-1, -2, -3, -4, -5, -6, -7 |

Qualifiers for Individual Parameters Listed:

| Qualifier | Description |
|-----------|--|
| DLDS | Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity. |
| DLM | Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity). |
| MS-B | Matrix Spike recovery could not be accurately calculated due to high analyte background in sample. |

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|---|--------|--|----------------------------|
| ALK-TITR-VA | Water | Alkalinity Species by Titration | APHA 2320 Alkalinity |
| This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values. | | | |
| ANIONS-N+N-CALC-VA | Water | Nitrite & Nitrate in Water (Calculation) | EPA 300.0 |
| Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N). | | | |
| BE-D-L-CCMS-VA | Water | Diss. Be (low) in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| BR-L-IC-N-VA | Water | Bromide in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| CL-IC-N-VA | Water | Chloride in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| EC-PCT-VA | Water | Conductivity (Automated) | APHA 2510 Auto. Conduc. |
| This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode. | | | |
| EC-SCREEN-VA | Water | Conductivity Screen (Internal Use Only) | APHA 2510 |
| Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc. | | | |
| HARDNESS-CALC-VA | Water | Hardness | APHA 2340B |
| Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation. | | | |
| HG-D-CVAA-VA | Water | Diss. Mercury in Water by CVAAS or CVAFS | APHA 3030B/EPA 1631E (mod) |
| Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | | | |
| IONBALANCE-VA | Water | Ion Balance Calculation | APHA 1030E |
| Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero. | | | |
| Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as: | | | |

Reference Information

Ion Balance (%) = [Cation Sum-Anion Sum] / [Cation Sum+Anion Sum]

MET-D-CCMS-VA Water Dissolved Metals in Water by CRC ICPMS APHA 3030B/6020A (mod)

Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

NH3-F-VA Water Ammonia in Water by Fluorescence APHA 4500 NH3-NITROGEN (AMMONIA)

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NH3-F-VA Water Ammonia in Water by Fluorescence J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NO2-L-IC-N-VA Water Nitrite in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO3-L-IC-N-VA Water Nitrate in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H "pH Value"

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

SO4-IC-N-VA Water Sulfate in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

TDS-VA Water Total Dissolved Solids by Gravimetric APHA 2540 C - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, TDS is determined by evaporating the filtrate to dryness at 180 degrees celsius.

TSS-VA Water Total Suspended Solids by Gravimetric APHA 2540 D - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location |
|----------------------------|---|
| VA | ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA |

Chain of Custody Numbers:

2017-04-25 A

Reference Information

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

WHITE - LABORATORY COPY YELLOW - CLIENT COPY

OCTOBER 2015 FRONT

Failure to complete all portions of this form may delay analysis. Please fill in this form LEGIBLY. By the use of this form the user acknowledges and agrees with the Terms and Conditions as specified on the back page of the white - report copy.

1. If any water samples are taken from a Regulated Drinking Water (DW) System, please submit using an Authorized DW COC form.

Minto Explorations Ltd.

Reference Information

QC Samples with Qualifiers & Comments:

| QC Type Description | Parameter | Qualifier | Applies to Sample Number(s) |
|---------------------|--------------------------|-----------|---|
| Matrix Spike | Barium (Ba)-Dissolved | MS-B | L1916507-1, -10, -11, -12, -13, -14, -2, -3, -4, -5, -6, -7, -8, -9 |
| Matrix Spike | Boron (B)-Dissolved | MS-B | L1916507-1, -10, -11, -12, -13, -14, -2, -3, -4, -5, -6, -7, -8, -9 |
| Matrix Spike | Calcium (Ca)-Dissolved | MS-B | L1916507-1, -10, -11, -12, -13, -14, -2, -3, -4, -5, -6, -7, -8, -9 |
| Matrix Spike | Magnesium (Mg)-Dissolved | MS-B | L1916507-1, -10, -11, -12, -13, -14, -2, -3, -4, -5, -6, -7, -8, -9 |
| Matrix Spike | Manganese (Mn)-Dissolved | MS-B | L1916507-1, -10, -11, -12, -13, -14, -2, -3, -4, -5, -6, -7, -8, -9 |
| Matrix Spike | Sodium (Na)-Dissolved | MS-B | L1916507-1, -10, -11, -12, -13, -14, -2, -3, -4, -5, -6, -7, -8, -9 |
| Matrix Spike | Strontium (Sr)-Dissolved | MS-B | L1916507-1, -10, -11, -12, -13, -14, -2, -3, -4, -5, -6, -7, -8, -9 |
| Matrix Spike | Nitrite (as N) | MS-B | L1916507-1, -10, -11, -12, -13, -14, -2, -3, -4, -5, -6, -7, -8, -9 |

Qualifiers for Individual Parameters Listed:

| Qualifier | Description |
|-----------|--|
| DLA | Detection Limit adjusted for required dilution |
| DLCI | Detection Limit Raised: Chromatographic Interference due to co-elution. |
| DLDS | Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity. |
| MS-B | Matrix Spike recovery could not be accurately calculated due to high analyte background in sample. |

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|---|--------|--|----------------------------|
| ALK-TITR-VA | Water | Alkalinity Species by Titration | APHA 2320 Alkalinity |
| This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values. | | | |
| ANIONS-N+N-CALC-VA | Water | Nitrite & Nitrate in Water (Calculation) | EPA 300.0 |
| Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N). | | | |
| BE-D-L-CCMS-VA | Water | Diss. Be (low) in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| BR-L-IC-N-VA | Water | Bromide in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| CL-IC-N-VA | Water | Chloride in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| EC-PCT-VA | Water | Conductivity (Automated) | APHA 2510 Auto. Conduc. |
| This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode. | | | |
| EC-SCREEN-VA | Water | Conductivity Screen (Internal Use Only) | APHA 2510 |
| Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc. | | | |
| HARDNESS-CALC-VA | Water | Hardness | APHA 2340B |
| Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation. | | | |
| HG-D-CVAA-VA | Water | Diss. Mercury in Water by CVAAS or CVAFS | APHA 3030B/EPA 1631E (mod) |
| Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | | | |
| IONBALANCE-VA | Water | Ion Balance Calculation | APHA 1030E |
| Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero. | | | |

Reference Information

Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as:

Ion Balance (%) = [Cation Sum-Anion Sum] / [Cation Sum+Anion Sum]

MET-D-CCMS-VA Water Dissolved Metals in Water by CRC ICPMS APHA 3030B/6020A (mod)

Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

NH3-F-VA Water Ammonia in Water by Fluorescence APHA 4500 NH3-NITROGEN (AMMONIA)

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NH3-F-VA Water Ammonia in Water by Fluorescence J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NO2-L-IC-N-VA Water Nitrite in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO3-L-IC-N-VA Water Nitrate in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H "pH Value"

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

SO4-IC-N-VA Water Sulfate in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

TDS-VA Water Total Dissolved Solids by Gravimetric APHA 2540 C - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, TDS is determined by evaporating the filtrate to dryness at 180 degrees celsius.

TSS-VA Water Total Suspended Solids by Gravimetric APHA 2540 D - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius.

Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location |
|----------------------------|---------------------|
|----------------------------|---------------------|

| | |
|----|---|
| VA | ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA |
|----|---|

Chain of Custody Numbers:

2017-04-24 B

Reference Information

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

OCTOBER 2015 FORM

Failure to complete all portions of this form may delay analysis. Please fill in this form LEGIBLY. By the use of this form the user acknowledges and agrees with the Terms and Conditions as specified on the back page of the white - report copy.

1. If any water samples are taken from a Regulated Drinking Water (DW) System, please submit using an Authorized DW COC form.

Reference Information

QC Samples with Qualifiers & Comments:

| QC Type Description | Parameter | Qualifier | Applies to Sample Number(s) |
|---------------------|--------------------------|-----------|-----------------------------|
| Matrix Spike | Aluminum (Al)-Dissolved | MS-B | L1907261-1, -2 |
| Matrix Spike | Arsenic (As)-Dissolved | MS-B | L1907261-1, -2 |
| Matrix Spike | Cadmium (Cd)-Dissolved | MS-B | L1907261-1, -2 |
| Matrix Spike | Calcium (Ca)-Dissolved | MS-B | L1907261-1, -2 |
| Matrix Spike | Copper (Cu)-Dissolved | MS-B | L1907261-1, -2 |
| Matrix Spike | Iron (Fe)-Dissolved | MS-B | L1907261-1, -2 |
| Matrix Spike | Magnesium (Mg)-Dissolved | MS-B | L1907261-1, -2 |
| Matrix Spike | Manganese (Mn)-Dissolved | MS-B | L1907261-1, -2 |
| Matrix Spike | Strontium (Sr)-Dissolved | MS-B | L1907261-1, -2 |
| Matrix Spike | Sulfur (S)-Dissolved | MS-B | L1907261-1, -2 |
| Matrix Spike | Zinc (Zn)-Dissolved | MS-B | L1907261-1, -2 |
| Matrix Spike | Nitrate (as N) | MS-B | L1907261-1, -2 |

Qualifiers for Individual Parameters Listed:

| Qualifier | Description |
|-----------|--|
| DLDS | Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity. |
| MS-B | Matrix Spike recovery could not be accurately calculated due to high analyte background in sample. |

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|---|--------|--|----------------------------|
| ALK-TITR-VA | Water | Alkalinity Species by Titration | APHA 2320 Alkalinity |
| <p>This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.</p> | | | |
| ANIONS-N+N-CALC-VA | Water | Nitrite & Nitrate in Water (Calculation) | EPA 300.0 |
| <p>Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N).</p> | | | |
| BE-D-L-CCMS-VA | Water | Diss. Be (low) in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| <p>Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.</p> <p>Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.</p> | | | |
| CL-IC-N-VA | Water | Chloride in Water by IC | EPA 300.1 (mod) |
| <p>Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.</p> | | | |
| EC-PCT-VA | Water | Conductivity (Automated) | APHA 2510 Auto. Conduc. |
| <p>This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode.</p> | | | |
| EC-SCREEN-VA | Water | Conductivity Screen (Internal Use Only) | APHA 2510 |
| <p>Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc.</p> | | | |
| HARDNESS-CALC-VA | Water | Hardness | APHA 2340B |
| <p>Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation.</p> | | | |
| HG-D-CVAA-VA | Water | Diss. Mercury in Water by CVAAS or CVAFS | APHA 3030B/EPA 1631E (mod) |
| <p>Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.</p> | | | |
| IONBALANCE-VA | Water | Ion Balance Calculation | APHA 1030E |
| <p>Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero.</p> <p>Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as:</p> <p style="margin-left: 20px;">Ion Balance (%) = [Cation Sum - Anion Sum] / [Cation Sum + Anion Sum]</p> | | | |
| MET-D-CCMS-VA | Water | Dissolved Metals in Water by CRC ICPMS | APHA 3030B/6020A (mod) |

Reference Information

Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

| | | | |
|---|-------|---------------------------------------|---|
| NH3-F-VA | Water | Ammonia in Water by Fluorescence | APHA 4500 NH3-NITROGEN (AMMONIA) |
| This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al. | | | |
| NH3-F-VA | Water | Ammonia in Water by Fluorescence | J. ENVIRON. MONIT., 2005, 7, 37-42, RSC |
| This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al. | | | |
| NO2-L-IC-N-VA | Water | Nitrite in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| NO3-L-IC-N-VA | Water | Nitrate in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| PH-PCT-VA | Water | pH by Meter (Automated) | APHA 4500-H "pH Value" |
| This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode | | | |
| It is recommended that this analysis be conducted in the field. | | | |
| PH-PCT-VA | Water | pH by Meter (Automated) | APHA 4500-H pH Value |
| This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode | | | |
| It is recommended that this analysis be conducted in the field. | | | |
| SO4-IC-N-VA | Water | Sulfate in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| TDS-VA | Water | Total Dissolved Solids by Gravimetric | APHA 2540 C - GRAVIMETRIC |
| This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, TDS is determined by evaporating the filtrate to dryness at 180 degrees celsius. | | | |
| TSS-VA | Water | Total Suspended Solids by Gravimetric | APHA 2540 D - GRAVIMETRIC |
| This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples. | | | |

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location |
|----------------------------|---|
| VA | ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA |

Chain of Custody Numbers:

2017-03-30 B

Reference Information

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Reference Information

QC Samples with Qualifiers & Comments:

| QC Type Description | Parameter | Qualifier | Applies to Sample Number(s) |
|---|---|-----------|-----------------------------|
| Qualifiers for Individual Parameters Listed: | | | |
| Qualifier | Description | | |
| RRV | Reported Result Verified By Repeat Analysis | | |

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|---|--------|--|---|
| ALK-TITR-VA | Water | Alkalinity Species by Titration | APHA 2320 Alkalinity |
| <p>This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.</p> | | | |
| BE-D-L-CCMS-VA | Water | Diss. Be (low) in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| <p>Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.</p> <p>Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.</p> | | | |
| CL-IC-N-VA | Water | Chloride in Water by IC | EPA 300.1 (mod) |
| <p>Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.</p> | | | |
| EC-PCT-VA | Water | Conductivity (Automated) | APHA 2510 Auto. Conduc. |
| <p>This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode.</p> | | | |
| EC-SCREEN-VA | Water | Conductivity Screen (Internal Use Only) | APHA 2510 |
| <p>Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc.</p> | | | |
| HARDNESS-CALC-VA | Water | Hardness | APHA 2340B |
| <p>Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation.</p> | | | |
| HG-D-CVAA-VA | Water | Diss. Mercury in Water by CVAAS or CVAFS | APHA 3030B/EPA 1631E (mod) |
| <p>Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.</p> | | | |
| IONBALANCE-VA | Water | Ion Balance Calculation | APHA 1030E |
| <p>Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero.</p> <p>Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as:</p> <p style="margin-left: 20px;">Ion Balance (%) = [Cation Sum-Anion Sum] / [Cation Sum+Anion Sum]</p> | | | |
| MET-D-CCMS-VA | Water | Dissolved Metals in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| <p>Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.</p> <p>Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.</p> | | | |
| NH3-F-VA | Water | Ammonia in Water by Fluorescence | APHA 4500 NH3-NITROGEN (AMMONIA) |
| <p>This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.</p> | | | |
| NH3-F-VA | Water | Ammonia in Water by Fluorescence | J. ENVIRON. MONIT., 2005, 7, 37-42, RSC |
| <p>This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.</p> | | | |
| NO2-L-IC-N-VA | Water | Nitrite in Water by IC (Low Level) | EPA 300.1 (mod) |
| <p>Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.</p> | | | |
| NO3-L-IC-N-VA | Water | Nitrate in Water by IC (Low Level) | EPA 300.1 (mod) |
| <p>Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.</p> | | | |
| PH-PCT-VA | Water | pH by Meter (Automated) | APHA 4500-H "pH Value" |

Reference Information

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

SO4-IC-N-VA Water Sulfate in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

TDS-VA Water Total Dissolved Solids by Gravimetric APHA 2540 C - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, TDS is determined by evaporating the filtrate to dryness at 180 degrees celsius.

TSS-VA Water Total Suspended Solids by Gravimetric APHA 2540 D - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location |
|----------------------------|---|
| VA | ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA |

Chain of Custody Numbers:

2017-03-15B

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Reference Information

QC Samples with Qualifiers & Comments:

| QC Type Description | Parameter | Qualifier | Applies to Sample Number(s) |
|---|---|-----------|-----------------------------|
| Qualifiers for Individual Parameters Listed: | | | |
| Qualifier | Description | | |
| DLA | Detection Limit adjusted for required dilution | | |
| DLDS | Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity. | | |

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|---|--------|--|---|
| ALK-TITR-VA | Water | Alkalinity Species by Titration | APHA 2320 Alkalinity |
| This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values. | | | |
| ANIONS-N+N-CALC-VA | Water | Nitrite & Nitrate in Water (Calculation) | EPA 300.0 |
| Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N). | | | |
| BE-D-L-CCMS-VA | Water | Diss. Be (low) in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| CL-IC-N-VA | Water | Chloride in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| EC-PCT-VA | Water | Conductivity (Automated) | APHA 2510 Auto. Conduc. |
| This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode. | | | |
| EC-SCREEN-VA | Water | Conductivity Screen (Internal Use Only) | APHA 2510 |
| Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc. | | | |
| HARDNESS-CALC-VA | Water | Hardness | APHA 2340B |
| Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation. | | | |
| HG-D-CVAA-VA | Water | Diss. Mercury in Water by CVAAS or CVAFS | APHA 3030B/EPA 1631E (mod) |
| Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | | | |
| IONBALANCE-VA | Water | Ion Balance Calculation | APHA 1030E |
| Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero. | | | |
| Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as: | | | |
| $\text{Ion Balance (\%)} = \frac{[\text{Cation Sum} - \text{Anion Sum}]}{[\text{Cation Sum} + \text{Anion Sum}]}$ | | | |
| MET-D-CCMS-VA | Water | Dissolved Metals in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| NH3-F-VA | Water | Ammonia in Water by Fluorescence | APHA 4500 NH3-NITROGEN (AMMONIA) |
| This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al. | | | |
| NH3-F-VA | Water | Ammonia in Water by Fluorescence | J. ENVIRON. MONIT., 2005, 7, 37-42, RSC |
| This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al. | | | |
| NO2-L-IC-N-VA | Water | Nitrite in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |

Reference Information

| | | | |
|---|-------|---------------------------------------|---------------------------|
| NO3-L-IC-N-VA | Water | Nitrate in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| PH-PCT-VA | Water | pH by Meter (Automated) | APHA 4500-H "pH Value" |
| This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode | | | |
| It is recommended that this analysis be conducted in the field. | | | |
| PH-PCT-VA | Water | pH by Meter (Automated) | APHA 4500-H pH Value |
| This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode | | | |
| It is recommended that this analysis be conducted in the field. | | | |
| SO4-IC-N-VA | Water | Sulfate in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| TDS-CALC-VA | Water | TDS (Calculated) | APHA 1030E (20TH EDITION) |
| This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses". The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample. | | | |
| TSS-VA | Water | Total Suspended Solids by Gravimetric | APHA 2540 D - GRAVIMETRIC |
| This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples. | | | |

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location |
|----------------------------|---|
| VA | ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA |

Chain of Custody Numbers:

2017-02-22 A

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

| QC Type Description | Parameter | Qualifier | Applies to Sample Number(s) |
|---|---|-----------|-----------------------------|
| Qualifiers for Individual Parameters Listed: | | | |
| Qualifier | Description | | |
| DLDS | Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity. | | |

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|---|--------|--|---|
| ALK-TITR-VA | Water | Alkalinity Species by Titration | APHA 2320 Alkalinity |
| This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values. | | | |
| ANIONS-N+N-CALC-VA | Water | Nitrite & Nitrate in Water (Calculation) | EPA 300.0 |
| Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N). | | | |
| BE-D-L-CCMS-VA | Water | Diss. Be (low) in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| CL-IC-N-VA | Water | Chloride in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| EC-PCT-VA | Water | Conductivity (Automated) | APHA 2510 Auto. Conduc. |
| This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode. | | | |
| EC-SCREEN-VA | Water | Conductivity Screen (Internal Use Only) | APHA 2510 |
| Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc. | | | |
| HARDNESS-CALC-VA | Water | Hardness | APHA 2340B |
| Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation. | | | |
| HG-D-CVAA-VA | Water | Diss. Mercury in Water by CVAAS or CVAFS | APHA 3030B/EPA 1631E (mod) |
| Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | | | |
| IONBALANCE-VA | Water | Ion Balance Calculation | APHA 1030E |
| Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero. | | | |
| Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as: | | | |
| $\text{Ion Balance (\%)} = \frac{[\text{Cation Sum} - \text{Anion Sum}]}{[\text{Cation Sum} + \text{Anion Sum}]}$ | | | |
| MET-D-CCMS-VA | Water | Dissolved Metals in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| NH3-F-VA | Water | Ammonia in Water by Fluorescence | APHA 4500 NH3-NITROGEN (AMMONIA) |
| This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al. | | | |
| NH3-F-VA | Water | Ammonia in Water by Fluorescence | J. ENVIRON. MONIT., 2005, 7, 37-42, RSC |
| This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al. | | | |
| NO2-L-IC-N-VA | Water | Nitrite in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| NO3-L-IC-N-VA | Water | Nitrate in Water by IC (Low Level) | EPA 300.1 (mod) |

Reference Information

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H "pH Value"

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

SO4-IC-N-VA Water Sulfate in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

TDS-CALC-VA Water TDS (Calculated) APHA 1030E (20TH EDITION)

This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses". The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample.

TSS-VA Water Total Suspended Solids by Gravimetric APHA 2540 D - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location |
|----------------------------|---|
| VA | ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA |

Chain of Custody Numbers:

2016-02-18 A

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

| QC Type Description | Parameter | Qualifier | Applies to Sample Number(s) |
|---------------------|-----------|-----------|-----------------------------|
|---------------------|-----------|-----------|-----------------------------|

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|---|--------|--|---|
| ALK-TITR-VA | Water | Alkalinity Species by Titration | APHA 2320 Alkalinity |
| This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values. | | | |
| ANIONS-N+N-CALC-VA | Water | Nitrite & Nitrate in Water (Calculation) | EPA 300.0 |
| Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N). | | | |
| BE-D-L-CCMS-VA | Water | Diss. Be (low) in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| CL-IC-N-VA | Water | Chloride in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| EC-PCT-VA | Water | Conductivity (Automated) | APHA 2510 Auto. Conduc. |
| This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode. | | | |
| EC-SCREEN-VA | Water | Conductivity Screen (Internal Use Only) | APHA 2510 |
| Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc. | | | |
| HARDNESS-CALC-VA | Water | Hardness | APHA 2340B |
| Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation. | | | |
| HG-D-CVAA-VA | Water | Diss. Mercury in Water by CVAAS or CVAFS | APHA 3030B/EPA 1631E (mod) |
| Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | | | |
| IONBALANCE-VA | Water | Ion Balance Calculation | APHA 1030E |
| Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero. | | | |
| Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as: | | | |
| Ion Balance (%) = [Cation Sum-Anion Sum] / [Cation Sum+Anion Sum] | | | |
| MET-D-CCMS-VA | Water | Dissolved Metals in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| NH3-F-VA | Water | Ammonia in Water by Fluorescence | APHA 4500 NH3-NITROGEN (AMMONIA) |
| This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al. | | | |
| NH3-F-VA | Water | Ammonia in Water by Fluorescence | J. ENVIRON. MONIT., 2005, 7, 37-42, RSC |
| This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al. | | | |
| NO2-L-IC-N-VA | Water | Nitrite in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| NO3-L-IC-N-VA | Water | Nitrate in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| PH-PCT-VA | Water | pH by Meter (Automated) | APHA 4500-H "pH Value" |
| This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode | | | |

Reference Information

It is recommended that this analysis be conducted in the field.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

SO4-IC-N-VA Water Sulfate in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

TDS-CALC-VA Water TDS (Calculated) APHA 1030E (20TH EDITION)

This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses".
The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample.

TSS-VA Water Total Suspended Solids by Gravimetric APHA 2540 D - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Reference Information

QC Samples with Qualifiers & Comments:

| QC Type Description | Parameter | Qualifier | Applies to Sample Number(s) |
|---------------------|--------------------------|-----------|-----------------------------|
| Matrix Spike | Barium (Ba)-Dissolved | MS-B | L1885861-1, -2 |
| Matrix Spike | Calcium (Ca)-Dissolved | MS-B | L1885861-1, -2 |
| Matrix Spike | Magnesium (Mg)-Dissolved | MS-B | L1885861-1, -2 |
| Matrix Spike | Manganese (Mn)-Dissolved | MS-B | L1885861-1, -2 |
| Matrix Spike | Sodium (Na)-Dissolved | MS-B | L1885861-1, -2 |
| Matrix Spike | Strontium (Sr)-Dissolved | MS-B | L1885861-1, -2 |

Qualifiers for Individual Parameters Listed:

| Qualifier | Description |
|-----------|--|
| DLDS | Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity. |
| DLM | Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity). |
| MS-B | Matrix Spike recovery could not be accurately calculated due to high analyte background in sample. |

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|---|--------|--|----------------------------------|
| ALK-TITR-VA | Water | Alkalinity Species by Titration | APHA 2320 Alkalinity |
| This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values. | | | |
| ANIONS-N+N-CALC-VA | Water | Nitrite & Nitrate in Water (Calculation) | EPA 300.0 |
| Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N). | | | |
| BE-D-L-CCMS-VA | Water | Diss. Be (low) in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| CL-IC-N-VA | Water | Chloride in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| EC-PCT-VA | Water | Conductivity (Automated) | APHA 2510 Auto. Conduc. |
| This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode. | | | |
| EC-SCREEN-VA | Water | Conductivity Screen (Internal Use Only) | APHA 2510 |
| Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc. | | | |
| HARDNESS-CALC-VA | Water | Hardness | APHA 2340B |
| Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation. | | | |
| HG-D-CVAA-VA | Water | Diss. Mercury in Water by CVAAS or CVAFS | APHA 3030B/EPA 1631E (mod) |
| Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | | | |
| IONBALANCE-VA | Water | Ion Balance Calculation | APHA 1030E |
| Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero. | | | |
| Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as: | | | |
| Ion Balance (%) = [Cation Sum-Anion Sum] / [Cation Sum+Anion Sum] | | | |
| MET-D-CCMS-VA | Water | Dissolved Metals in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| NH3-F-VA | Water | Ammonia in Water by Fluorescence | APHA 4500 NH3-NITROGEN (AMMONIA) |
| This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Weston et | | | |

| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| PH-PCT-VA | Water | pH by Meter (Automated) | APHA 4500-H "pH Value" |
| This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode | | | |
| It is recommended that this analysis be conducted in the field. | | | |
| PH-PCT-VA | Water | pH by Meter (Automated) | APHA 4500-H pH Value |
| This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode | | | |
| It is recommended that this analysis be conducted in the field. | | | |
| SO4-IC-N-VA | Water | Sulfate in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| TDS-CALC-VA | Water | TDS (Calculated) | APHA 1030E (20TH EDITION) |
| This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses". The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample. | | | |
| TSS-VA | Water | Total Suspended Solids by Gravimetric | APHA 2540 D - GRAVIMETRIC |
| This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples. | | | |

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Memo

| | | | |
|-----------------|--|--------------------|-------------------------|
| To: | Deborah Flemming, Ryan Herbert | Client: | Minto Explorations Ltd. |
| From: | Soren Jensen, Kaitlyn Kooy | Project No: | 1CM002.024 |
| Cc: | Dylan MacGregor (SRK) | Date: | March 28, 2018 |
| Subject: | 2017 Water Balance and Water Quality Model Summary for the Minto Mine Site | | |

1 Introduction and Background

This memorandum provides a summary of the 2017 water balance and water quality model updates for the Minto Mine site. The update covers the period January 1, 2017 through December 31, 2017.

The water balance update includes a review and summary of precipitation, flow and water inventory data for the Mine site. The water quality update includes a comparison of water quality data collected in 2017 to water quality model predictions for Phase VII of the Mine development, which were recently updated as part of a revised Reclamation and Closure Plan. Water quality predictions for the Main Pit Tailings Management Facility (MPTMF) and the Water Storage Pond (WSP) are provided for 2017, 2018 and for the post-closure period when predicted concentrations are the same from year to year (steady state concentrations).

2 Water Balance Update

2.1 Precipitation

Table 1 shows a summary of monthly precipitation measured at the Mine site between October 2016 and December 2017 along with precipitation data from the regional station at Carmacks, YT (Climate ID: 2100301)¹, which is located 77 km Southwest of the Minto Mine. In the past, the meteorological station at Pelly Ranch (Climate ID 2100880)¹ located 25 km north of Minto was used as a regional reference station. However, the published data record from Pelly Ranch ends in March 2015 so the Carmacks Station was used instead.

Approximately 210 mm of precipitation was measured at the Mine site in the 2017 hydrological year, which was lower than total precipitation measured in 2015 (243 mm) and 2016 (242 mm). Total annual precipitation of 210 mm roughly corresponds to a 1 in 50 to a 1 in 100 dry year.

¹ Data obtained from Meteorological Service of Canada, Environment Canada.

Source: Minto Site Data: X:\01_SITES\Minto\1CM002.024_Water_Balance_Support\2015_Water_Balance_Update\Minto Water Balance\2017 Met Station Data Summary.xlsx

Notes:

A: Data obtained from Meteorological Service of Canada, Environment Canada.

Minto's Campbell Scientific meteorological station measures total precipitation using a Geonor gauge and a tipping bucket rain gauge. From October through May, the tipping bucket is equipped with a snowfall conversion adaptor, which allows it to measure snowfall as snow water equivalent. The Geonor precipitation gauge collects precipitation in a bucket and records precipitation by measuring the weight of the bucket. In the winter months, the bucket is partially filled with an antifreeze solution that melts any snow collected. Figure 1 shows monthly precipitation recorded by the two gauges as well as total precipitation recorded at Carmacks.

Precipitation measured by the tipping bucket gauge and Geonor gauge were in good agreement on the total annual precipitation measurements (see Table 1) so the measured annual precipitation was assumed to be reliable for use in the annual summary. However, considerable discrepancy was noted in monthly precipitation measurements between January and June (Figure 1). Agreement is better in the second half of the year. Precipitation measured at Carmacks was much higher in June and July than at the Minto Mine.

Figure 1: 2017 Monthly Total Precipitation Measurements at Minto and at Carmacks

2.2 Snow Course Data

Snow course surveys were completed at the three established snow survey stations at the Mine site in 2017. Table 2 shows a summary of the snow survey data (i.e. an average of the results from the three stations) from 2009 to 2017. The depth and water equivalent of the snow pack provides an indication of the volume of surface runoff that must be managed the following freshet. In March, April and May 2017, approximately 210,000 m³ of surface runoff was collected from catchments at the Mine site upstream of the Water Storage Dam. This volume corresponds to roughly 20 mm of runoff, which was slightly less than the estimated 25 mm of runoff observed in 2016.

Table 2: Summary of Snow Survey Data for the Minto Mine Site

| Year | February | March | April |
|------|-----------------------|-----------------------|-----------------------|
| | Water Equivalent (mm) | Water Equivalent (mm) | Water Equivalent (mm) |
| 2009 | 92.7 | 110.0 | 150.7 |
| 2010 | 107.7 | 120.7 | 56.0 |
| 2011 | 106.0 | 141.7 | 111.7 |
| 2012 | 111.0 | 127.0 | 132.7 |
| 2013 | 91.3 | 106.0 | 62.7 |
| 2014 | 84.3 | 99.7 | 67.3 |
| 2015 | 90.3 | 76.6 | 67.8 |
| 2016 | 80.3 | 80.7 | n/a |
| 2017 | 79.0 | 72.7 | 59.3 |

Source: X:\01_SITES\Minto\1CM002.024_Water_Balance_Support\2017_Water_Balance_Update\MintoSnowMaster_2017.xlsx

2.3 Water Management

Water that is suitable for release into Minto Creek is conveyed to the Water Storage Pond (WSP), while water collected from active mine areas is routed to the Main Pit Tailings Management Facility (MPTMF) or the Area 2 Pit Tailings Management Facility (A2PTMF). Since November 2012, the MPTMF has also been used for subaqueous deposition of tailings. Deposition of mine water and tailings (subaqueous) to the A2PTMF commenced in April 2015.

Other water management features on the Mine site include:

- W15 sump: collects surface runoff and seepage from:
 - The Southwest Waste Dump;
 - Part of the Main Waste Dump; and
 - Adjacent undisturbed catchments.

In 2017, water collected at W15 was routed to the Main Pit TMF from April until late May and when water quality met discharge criteria, W15 was re-routed to the WSP. Approximately 50% of the catchment that report to W15 is covered by waste rock.

- W35 sump: collects surface runoff from the minimally disturbed southern catchments. Water collected at W35 in 2017 was piped to the Main Pit TMF from April until early May, then to the WSP from May until July once water quality met release criteria. Water quality was closely monitored and W35 sump water was re-routed to the Main Pit periodically throughout the summer. Construction of the re-alignment of the South Diversion Ditch (SDD) in July necessitated the routing of W35 water to the Main Pit TMF for the rest of the year.
- W62 sump (formerly known as W36 or W37 sump): collects surface runoff and seepage from the mill valley, including contributions from the Dry Stack Tailings Storage Facility. Water collected at the W62 sump is pumped to the MPTMF.
- South Diversion Ditch: diverts water from (W35 Sump) minimally disturbed southern catchments to the WSP (can also be routed to the MPTMF).
- WSP: reservoir for water that meets discharge criteria and is destined for discharge to Minto Creek.

2.4 2017 Water Balance

Table 3 summarizes the monthly water and tailings inventory in Minto's MPTMF and A2PTMF as well as water inventory in the WSP. In 2017, the water inventory in the MPTMF was reduced by approximately 22,000 m³, while the water inventory in A2PTMF increased by roughly 501,000 m³. The increase in water inventory in the A2PTMF roughly corresponds to the volume of pore water in the sub-aqueously deposited tailings in 2017. Therefore, the free water volume in the pits should be unchanged from last year. The WSP water inventory increased by about 6,000 m³ between January 1 and December 31, 2017.

Table 4 shows a summary of the 2017 water balance for the Mine site. The total surface runoff collected on site was estimated to be 565,000 m³ based on the change in the water inventory and the known volume of water released to Minto Creek. Including an estimated inflow of 30,000 m³ of groundwater, the total site-wide yield was estimated at about 595,000 m³ for the year. The total catchment upstream of the Water Storage Dam measures approximately 1,040 ha. Therefore, 595,000 m³ of runoff from 1,040 ha gives a unit yield of approximately 57 mm/year.

The water and load balance model used for forecasting surface runoff volumes uses a site-wide annual average runoff coefficient, which has been derived based on previous years' water balance results. The runoff coefficient is estimated based on the total annual precipitation as follows:

- For dry years with less than 190 mm total precipitation: runoff coefficient = 0.15.
- For average to wet years with more than 309 mm total precipitation: runoff coefficient = 0.30.
- Runoff coefficients for years with total precipitation between 190 mm and 309 mm: interpolated values between 0.15 and 0.30.

In 2017 (hydraulic year) the estimated total precipitation was 210 mm (Table 1), which corresponds to a modelled runoff coefficient of 0.18. The site-wide runoff coefficient, based on the 2017 water balance (measured flows, water inventory and total precipitation), is:

$$\text{Annual Yield} / \text{Total Annual Precipitation} = \text{Runoff Coefficient} \rightarrow 57 \text{ mm} / 210 \text{ mm} = \mathbf{0.27}$$

The calculated value for the annual site-wide runoff coefficient is higher than the runoff coefficient estimated by the water balance model. However, the site-wide runoff coefficient is similar to the coefficient calculated in previous, slightly wetter years. Therefore, the method used by the water balance model to estimate runoff in dry years is likely too conservative (i.e. conservatively dry).

Table 3: 2017 Water Inventory and Release to Minto Creek

3 Water Quality Model Update

3.1 Solid Phase Geochemistry

The neutralization potential ratio (NPR) and copper content of waste rock and tailings were reviewed in order to identify any new trends in the solid phase geochemistry that may have developed since the last source term update. Significant changes in the solid phase geochemistry would indicate a need for further analysis of the waste rock and tailings to generate new source terms that reflect the observed changes in the geochemistry.

The NPR and copper content of waste rock and tailings are shown in Figure 2 to Figure 5. The NPR of tailings solids appear to show a decreasing trend in 2017 and copper concentrations an increasing trend. However, measured NPR was greater than 3 for all samples, which indicates that the tailings are not potentially acid generating and the lower NPRs are therefore not expected to affect source terms. Copper concentrations increased only to the levels measured in 2015. This range of copper concentrations has already been accounted for in the existing source terms. No significant changes in geochemistry were observed in the properties of the waste rock in 2017 compared to similar materials produced in prior years. Therefore, no further evaluation of 2017 solid phase geochemistry was warranted.

3.2 Comparison of Measured Water Quality Data to Source Terms

3.2.1 Source Terms – Dry Stack Tailings Storage Facility

The Dry Stack Tailings Storage Facility (DSTSF) source terms used in the water and load balance model for the Minto were developed based on the observed water chemistry of samples collected at station W8 and W8A. This station was chosen because it had the highest concentrations of copper, cadmium, selenium, and sulfate during the period of record. The following points describe the source terms:

- Best Estimate source term: 50th percentile dissolved concentrations from W8A;
- Reasonable Worst Case source term: 95th percentile dissolved concentrations from W8A.

The Best Estimate and Reasonable Worst Case source terms were updated to include data to 2017 for comparison to the existing source terms. It was found that the updated source terms did not differ from the source terms used in the latest model revision, which included data up to and including 2016. Therefore, for consistency the original DSTSF source terms was be used in this 2017 update of the water balance and water quality model.

3.2.2 Source Terms – Waste Rock

The Main Waste Dump and the Southwest Waste Dump source terms used in the water and load balance model were defined based on observed water chemistry at station W15, which collects runoff from the Southwest Waste Dump. The latest model revision assigned Best Estimate waste

rock source term as the 50th percentile dissolved concentrations at W15 until the end of 2016 and the Reasonable Worst Case waste rock source term was the 95th percentile dissolved concentrations. Water quality data collected at W15 in 2017 followed the same trends as the historical data. Therefore, the original source term was used for the updated predictions presented here.

3.2.3 Source Term – Tailings Slurry

In 2017, sulfate concentrations in the Area 2 and Main Pit water increased at a greater rate than in previous years. After investigating possible causes, it was concluded that variability in sulfate loadings from tailings slurry was the most likely cause of the concentration increases.

In order to properly represent the variability in the mill effluent water quality in the water and load balance model, the tailings slurry source term was divided into two parts: sulfide ore tailings source term and oxide ore (referred to as POX) tailings source term. Typically, just sulfide ore or a blend of sulfide ore and POX ore are processed in the mill. Elevated concentrations of sulfate in the mill effluent coincided with processing of POX. Accordingly, the tailings slurry source terms for sulfide ore and POX ore were developed based on measured sulfate concentrations in the tailings thickener when sulfide ore and POX ore were milled.

The loading rates associated with POX processing are highly variable. To maintain conservatism in the model predictions, the Expected Case and Worst Case POX ore slurry source term that represents the highest sulfate loading rates was used for all model scenarios.

3.3 Water Quality Model Results

Table 5 and 6 show revised model outputs from the updated water and load balance model for water quality in the Water Storage Pond (WSP) for 2017, 2018, and post-closure (best estimate and worst case) along with concentrations measured in 2017. Table 7 and 8 show revised model predictions of water quality in the MPTMF for 2017, 2018 and post-closure. Predictions for 2018 and post-closure were selected to provide representative short-term and long-term indications of water quality trends. Predictions are for average precipitation conditions. The Water Use Licence (QZ14-031) effluent limits are also listed in the tables. Model runs started on 1 January 2016 and ended on 1 January 2045, at which point concentrations in the model roughly have reached steady state.

The MPTMF was historically the primary water reservoir on site. In the model, the free water in the MPTMF and A2PTMF are more or less considered to belong to the same reservoir due to the high rate of flow between the two reservoirs. Reclaim water is drawn from the MPTMF and excess free water in the A2PTMF is pumped back to the MPTMF.

Therefore, a comparison of measured MPTMF water quality with concentrations predicted for pit water for the Phase V/VI environmental assessment provides a good measure of actual vs. expected geochemical performance of the site. Water collected in the WSP includes clean (non-contact) runoff and effluent from Minto's water treatment plant.

Median measured concentrations in the WSP in 2017 were lower than or comparable to the revised model predictions using best estimate source terms (Table 5), except for dissolved

copper, for which the measured median concentration was 27 µg/L compared to expected median concentrations of approximately 18 µg/L. Dissolved copper concentrations in the WSP shows a decreasing trend between 2011 and 2015 followed by an increasing trend between 2015 and 2017 (Figure 6). The increase in copper concentrations in the WSP in 2017 was due to a reduction in the volume of treated MPTMF water that was pumped to the WSP. MPTMF water is treated using reverse osmosis, which removes nearly all dissolved copper.

Figure 6 Dissolved Copper Concentrations in WSP (Station W16)

The overall favorable agreement in the results tables below indicates that the revised source terms are appropriate for describing the existing geochemical performance and the actual water management practices on site. Best estimate source terms are intended to provide an indication of the general trend in water quality parameter concentrations, but are not intended to capture maximum or outlier concentration values. Therefore, the median values of best estimate model predictions are compared to measured median values.

Revised model predictions using reasonable worst case source terms are generally higher than comparable median and maximum measured values for the WSP, except for copper (Table 6).

Revised model predictions for water quality in the MPTMF (and by extension the A2PTMF) using the best estimate source terms are in reasonable agreement with median measured concentrations in 2017 (Table 7) except for dissolved cadmium and nitrite. Median measured cadmium concentrations are approximately a factor of 2 greater than expected concentration but still well below the concentrations predicted based on reasonable worst case source terms (Table 8). Nitrite is relatively unstable and is produced and consumed by biological activity in the pit water. An investigation of the matter indicated that it may be the activity of heterotrophic microorganisms in the MPTMF water that is responsible for producing the elevated nitrite concentrations.

Water quality model predictions using reasonable worst-case source terms are higher than measured median and maximum concentrations, with the exception of nitrite (Table 8).

| Subject: | 2017 Water Balance and Water Quality Model Summary for the Minto Mine Site | | |

1 Introduction and Background

This memorandum provides a summary of the 2017 water balance and water quality model updates for the Minto Mine site. The update covers the period January 1, 2017 through December 31, 2017.

The water balance update includes a review and summary of precipitation, flow and water inventory data for the Mine site. The water quality update includes a comparison of water quality data collected in 2017 to water quality model predictions for Phase VII of the Mine development, which were recently updated as part of a revised Reclamation and Closure Plan. Water quality predictions for the Main Pit Tailings Management Facility (MPTMF) and the Water Storage Pond (WSP) are provided for 2017, 2018 and for the post-closure period when predicted concentrations are the same from year to year (steady state concentrations).

2 Water Balance Update

2.1 Precipitation

Table 1 shows a summary of monthly precipitation measured at the Mine site between October 2016 and December 2017 along with precipitation data from the regional station at Carmacks, YT (Climate ID: 2100301)¹, which is located 77 km Southwest of the Minto Mine. In the past, the meteorological station at Pelly Ranch (Climate ID 2100880)¹ located 25 km north of Minto was used as a regional reference station. However, the published data record from Pelly Ranch ends in March 2015 so the Carmacks Station was used instead.

Approximately 210 mm of precipitation was measured at the Mine site in the 2017 hydrological year, which was lower than total precipitation measured in 2015 (243 mm) and 2016 (242 mm). Total annual precipitation of 210 mm roughly corresponds to a 1 in 50 to a 1 in 100 dry year.

¹ Data obtained from Meteorological Service of Canada, Environment Canada.

Source: Minto Site Data: X:\01_SITES\Minto\1CM002.024_Water_Balance_Support\2015_Water_Balance_Update\Minto Water Balance\2017 Met Station Data Summary.xlsx

Notes:

A: Data obtained from Meteorological Service of Canada, Environment Canada.

Minto's Campbell Scientific meteorological station measures total precipitation using a Geonor gauge and a tipping bucket rain gauge. From October through May, the tipping bucket is equipped with a snowfall conversion adaptor, which allows it to measure snowfall as snow water equivalent. The Geonor precipitation gauge collects precipitation in a bucket and records precipitation by measuring the weight of the bucket. In the winter months, the bucket is partially filled with an antifreeze solution that melts any snow collected. Figure 1 shows monthly precipitation recorded by the two gauges as well as total precipitation recorded at Carmacks.

Precipitation measured by the tipping bucket gauge and Geonor gauge were in good agreement on the total annual precipitation measurements (see Table 1) so the measured annual precipitation was assumed to be reliable for use in the annual summary. However, considerable discrepancy was noted in monthly precipitation measurements between January and June (Figure 1). Agreement is better in the second half of the year. Precipitation measured at Carmacks was much higher in June and July than at the Minto Mine.

Figure 1: 2017 Monthly Total Precipitation Measurements at Minto and at Carmacks

2.2 Snow Course Data

Snow course surveys were completed at the three established snow survey stations at the Mine site in 2017. Table 2 shows a summary of the snow survey data (i.e. an average of the results from the three stations) from 2009 to 2017. The depth and water equivalent of the snow pack provides an indication of the volume of surface runoff that must be managed the following freshet. In March, April and May 2017, approximately 210,000 m³ of surface runoff was collected from catchments at the Mine site upstream of the Water Storage Dam. This volume corresponds to roughly 20 mm of runoff, which was slightly less than the estimated 25 mm of runoff observed in 2016.

Table 2: Summary of Snow Survey Data for the Minto Mine Site

| Year | February | March | April |
|------|-----------------------|-----------------------|-----------------------|
| | Water Equivalent (mm) | Water Equivalent (mm) | Water Equivalent (mm) |
| 2009 | 92.7 | 110.0 | 150.7 |
| 2010 | 107.7 | 120.7 | 56.0 |
| 2011 | 106.0 | 141.7 | 111.7 |
| 2012 | 111.0 | 127.0 | 132.7 |

| 2014 | 84.3 | 99.7 | 67.3 |
| 2015 | 90.3 | 76.6 | 67.8 |
| 2016 | 80.3 | 80.7 | n/a |
| 2017 | 79.0 | 72.7 | 59.3 |

Source: X:\01_SITES\Minto\1CM002.024_Water_Balance_Support\2017_Water_Balance_Update\MintoSnowMaster_2017.xlsx

2.3 Water Management

Water that is suitable for release into Minto Creek is conveyed to the Water Storage Pond (WSP), while water collected from active mine areas is routed to the Main Pit Tailings Management Facility (MPTMF) or the Area 2 Pit Tailings Management Facility (A2PTMF). Since November 2012, the MPTMF has also been used for subaqueous deposition of tailings. Deposition of mine water and tailings (subaqueous) to the A2PTMF commenced in April 2015.

Other water management features on the Mine site include:

- W15 sump: collects surface runoff and seepage from:
 - The Southwest Waste Dump;
 - Part of the Main Waste Dump; and
 - Adjacent undisturbed catchments.

In 2017, water collected at W15 was routed to the Main Pit TMF from April until late May and when water quality met discharge criteria, W15 was re-routed to the WSP. Approximately 50% of the catchment that report to W15 is covered by waste rock.

- W35 sump: collects surface runoff from the minimally disturbed southern catchments. Water collected at W35 in 2017 was piped to the Main Pit TMF from April until early May, then to the WSP from May until July once water quality met release criteria. Water quality was closely monitored and W35 sump water was re-routed to the Main Pit periodically throughout the summer. Construction of the re-alignment of the South Diversion Ditch (SDD) in July necessitated the routing of W35 water to the Main Pit TMF for the rest of the year.
- W62 sump (formerly known as W36 or W37 sump): collects surface runoff and seepage from the mill valley, including contributions from the Dry Stack Tailings Storage Facility. Water collected at the W62 sump is pumped to the MPTMF.
- South Diversion Ditch: diverts water from (W35 Sump) minimally disturbed southern catchments to the WSP (can also be routed to the MPTMF).
- WSP: reservoir for water that meets discharge criteria and is destined for discharge to Minto Creek.

2.4 2017 Water Balance

Table 3 summarizes the monthly water and tailings inventory in Minto's MPTMF and A2PTMF as well as water inventory in the WSP. In 2017, the water inventory in the MPTMF was reduced by approximately 22,000 m³, while the water inventory in A2PTMF increased by roughly 501,000 m³. The increase in water inventory in the A2PTMF roughly corresponds to the volume of pore water in the sub-aqueously deposited tailings in 2017. Therefore, the free water volume in the pits should be unchanged from last year. The WSP water inventory increased by about 6,000 m³ between January 1 and December 31, 2017.

Table 4 shows a summary of the 2017 water balance for the Mine site. The total surface runoff collected on site was estimated to be 565,000 m³ based on the change in the water inventory and the known volume of water released to Minto Creek. Including an estimated inflow of 30,000 m³ of groundwater, the total site-wide yield was estimated at about 595,000 m³ for the year. The total catchment upstream of the Water Storage Dam measures approximately 1,040 ha. Therefore, 595,000 m³ of runoff from 1,040 ha gives a unit yield of approximately 57 mm/year.

The water and load balance model used for forecasting surface runoff volumes uses a site-wide annual average runoff coefficient, which has been derived based on previous years' water balance results. The runoff coefficient is estimated based on the total annual precipitation as follows:

- For dry years with less than 190 mm total precipitation: runoff coefficient = 0.15.
- For average to wet years with more than 309 mm total precipitation: runoff coefficient = 0.30.
- Runoff coefficients for years with total precipitation between 190 mm and 309 mm: interpolated values between 0.15 and 0.30.

In 2017 (hydraulic year) the estimated total precipitation was 210 mm (Table 1), which corresponds to a modelled runoff coefficient of 0.18. The site-wide runoff coefficient, based on the 2017 water balance (measured flows, water inventory and total precipitation), is:

$$\text{Annual Yield} / \text{Total Annual Precipitation} = \text{Runoff Coefficient} \rightarrow 57 \text{ mm} / 210 \text{ mm} = \mathbf{0.27}$$

The calculated value for the annual site-wide runoff coefficient is higher than the runoff coefficient estimated by the water balance model. However, the site-wide runoff coefficient is similar to the coefficient calculated in previous, slightly wetter years. Therefore, the method used by the water balance model to estimate runoff in dry years is likely too conservative (i.e. conservatively dry).

Table 3: 2017 Water Inventory and Release to Minto Creek

3 Water Quality Model Update

3.1 Solid Phase Geochemistry

The neutralization potential ratio (NPR) and copper content of waste rock and tailings were reviewed in order to identify any new trends in the solid phase geochemistry that may have developed since the last source term update. Significant changes in the solid phase geochemistry would indicate a need for further analysis of the waste rock and tailings to generate new source terms that reflect the observed changes in the geochemistry.

The NPR and copper content of waste rock and tailings are shown in Figure 2 to Figure 5. The NPR of tailings solids appear to show a decreasing trend in 2017 and copper concentrations an increasing trend. However, measured NPR was greater than 3 for all samples, which indicates that the tailings are not potentially acid generating and the lower NPRs are therefore not expected to affect source terms. Copper concentrations increased only to the levels measured in 2015. This range of copper concentrations has already been accounted for in the existing source terms. No significant changes in geochemistry were observed in the properties of the waste rock in 2017 compared to similar materials produced in prior years. Therefore, no further evaluation of 2017 solid phase geochemistry was warranted.

3.2 Comparison of Measured Water Quality Data to Source Terms

3.2.1 Source Terms – Dry Stack Tailings Storage Facility

The Dry Stack Tailings Storage Facility (DSTSF) source terms used in the water and load balance model for the Minto were developed based on the observed water chemistry of samples collected at station W8 and W8A. This station was chosen because it had the highest concentrations of copper, cadmium, selenium, and sulfate during the period of record. The following points describe the source terms:

- Best Estimate source term: 50th percentile dissolved concentrations from W8A;
- Reasonable Worst Case source term: 95th percentile dissolved concentrations from W8A.

The Best Estimate and Reasonable Worst Case source terms were updated to include data to 2017 for comparison to the existing source terms. It was found that the updated source terms did not differ from the source terms used in the latest model revision, which included data up to and including 2016. Therefore, for consistency the original DSTSF source terms was be used in this 2017 update of the water balance and water quality model.

3.2.2 Source Terms – Waste Rock

The Main Waste Dump and the Southwest Waste Dump source terms used in the water and load balance model were defined based on observed water chemistry at station W15, which collects runoff from the Southwest Waste Dump. The latest model revision assigned Best Estimate waste

rock source term as the 50th percentile dissolved concentrations at W15 until the end of 2016 and the Reasonable Worst Case waste rock source term was the 95th percentile dissolved concentrations. Water quality data collected at W15 in 2017 followed the same trends as the historical data. Therefore, the original source term was used for the updated predictions presented here.

3.2.3 Source Term – Tailings Slurry

In 2017, sulfate concentrations in the Area 2 and Main Pit water increased at a greater rate than in previous years. After investigating possible causes, it was concluded that variability in sulfate loadings from tailings slurry was the most likely cause of the concentration increases.

In order to properly represent the variability in the mill effluent water quality in the water and load balance model, the tailings slurry source term was divided into two parts: sulfide ore tailings source term and oxide ore (referred to as POX) tailings source term. Typically, just sulfide ore or a blend of sulfide ore and POX ore are processed in the mill. Elevated concentrations of sulfate in the mill effluent coincided with processing of POX. Accordingly, the tailings slurry source terms for sulfide ore and POX ore were developed based on measured sulfate concentrations in the tailings thickener when sulfide ore and POX ore were milled.

The loading rates associated with POX processing are highly variable. To maintain conservatism in the model predictions, the Expected Case and Worst Case POX ore slurry source term that represents the highest sulfate loading rates was used for all model scenarios.

3.3 Water Quality Model Results

Table 5 and 6 show revised model outputs from the updated water and load balance model for water quality in the Water Storage Pond (WSP) for 2017, 2018, and post-closure (best estimate and worst case) along with concentrations measured in 2017. Table 7 and 8 show revised model predictions of water quality in the MPTMF for 2017, 2018 and post-closure. Predictions for 2018 and post-closure were selected to provide representative short-term and long-term indications of water quality trends. Predictions are for average precipitation conditions. The Water Use Licence (QZ14-031) effluent limits are also listed in the tables. Model runs started on 1 January 2016 and ended on 1 January 2045, at which point concentrations in the model roughly have reached steady state.

The MPTMF was historically the primary water reservoir on site. In the model, the free water in the MPTMF and A2PTMF are more or less considered to belong to the same reservoir due to the high rate of flow between the two reservoirs. Reclaim water is drawn from the MPTMF and excess free water in the A2PTMF is pumped back to the MPTMF.

Therefore, a comparison of measured MPTMF water quality with concentrations predicted for pit water for the Phase V/VI environmental assessment provides a good measure of actual vs. expected geochemical performance of the site. Water collected in the WSP includes clean (non-contact) runoff and effluent from Minto's water treatment plant.

Median measured concentrations in the WSP in 2017 were lower than or comparable to the revised model predictions using best estimate source terms (Table 5), except for dissolved

copper, for which the measured median concentration was 27 µg/L compared to expected median concentrations of approximately 18 µg/L. Dissolved copper concentrations in the WSP shows a decreasing trend between 2011 and 2015 followed by an increasing trend between 2015 and 2017 (Figure 6). The increase in copper concentrations in the WSP in 2017 was due to a reduction in the volume of treated MPTMF water that was pumped to the WSP. MPTMF water is treated using reverse osmosis, which removes nearly all dissolved copper.

Figure 6 Dissolved Copper Concentrations in WSP (Station W16)

The overall favorable agreement in the results tables below indicates that the revised source terms are appropriate for describing the existing geochemical performance and the actual water management practices on site. Best estimate source terms are intended to provide an indication of the general trend in water quality parameter concentrations, but are not intended to capture maximum or outlier concentration values. Therefore, the median values of best estimate model predictions are compared to measured median values.

Revised model predictions using reasonable worst case source terms are generally higher than comparable median and maximum measured values for the WSP, except for copper (Table 6).

Revised model predictions for water quality in the MPTMF (and by extension the A2PTMF) using the best estimate source terms are in reasonable agreement with median measured concentrations in 2017 (Table 7) except for dissolved cadmium and nitrite. Median measured cadmium concentrations are approximately a factor of 2 greater than expected concentration but still well below the concentrations predicted based on reasonable worst case source terms (Table 8). Nitrite is relatively unstable and is produced and consumed by biological activity in the pit water. An investigation of the matter indicated that it may be the activity of heterotrophic microorganisms in the MPTMF water that is responsible for producing the elevated nitrite concentrations.

Water quality model predictions using reasonable worst-case source terms are higher than measured median and maximum concentrations, with the exception of nitrite (Table 8).

Table 5: WSP Water Quality Model Predictions and Measured Concentrations in 2017, Best Estimate

| | | WUL Effluent Limits (QZ14-031) | WSP Measured Water Quality (Station W16) | Modelling Predictions of Quality in WSP (Station W16) | | |

4 Closing

The summary of the updated water balance and water quality model for the Minto Mine was prepared in support of annual reporting. SRK would be pleased to address any questions or comments.

Appendix F – Minto and McGinty Creek 2017 Surface Hydrology Update

Hydrology

1. Introduction

In 2017, and as part of the EMSRP, Minto monitored hydrological conditions at water quality stations including the following: stations within the operational mine area; stations downstream from the mine operational area that are influenced by mine effluent discharge; and reference stations downstream from the mine operational area that are not exposed to effluent. Hydrological monitoring is performed using a variety of methods including: manual discrete discharge measurements with combinations of flow meters, continuous stage measurements through the deployment of Solinst Level Loggers and Barometric Loggers and monitoring of an engineered flume.

Minto maintained and monitored 7 hydrometric stations located on Minto Creek and McGinty Creek as listed below and shown in Figure 1.

- Minto Creek
 1. W3: Flume downstream of the Water Storage Pond (WSP);
 2. MC1: Located in Minto Canyon – mid-catchment;
 3. W1: Located approximately 1 km upstream of Yukon River – lower catchment; and
 4. W7: Tributary on the south side of Minto Creek.
- McGinty Creek
 5. MN-0.5: West Tributary of McGinty Creek
 6. MN-2.5: East Tributary of McGinty Creek
 7. MN-4.5: McGinty Creek near the Mouth

The following sections will present the methods used to measure flow at the hydrometric program, the summary of each station's hydrometric program and recommendations for future monitoring.

2. Methods

Minto personnel conduct regular discrete discharge measurements and maintenance at the stations listed below. Additionally, these stations are equipped with Solinst Level Logger and Barometric Logger for continuous measurements. Table 2-1 provides an overview of instrumentation available and discrete measurement frequency at these stations.

Table 2-1: Summary of Hydrometric Program

| Station | Watershed | Years Monitored | Frequency of Discrete Measurement | Instrumentation Available |
|---------|---------------|-----------------|-----------------------------------|---------------------------|
| W3 | Minto Creek | 2012-2017 | Weekly | Flume, Data Logger |
| MC1 | Minto Creek | 2012-2017 | Weekly | Staff Gauge, Data Logger |
| W1 | Minto Creek | 2012-2017 | Weekly | Staff Gauge, Data Logger |
| W7 | Minto Creek | 2013-2017 | Monthly | Staff Gauge, Data Logger |
| MN-0.5 | McGinty Creek | 2014-2017 | Monthly | Staff Gauge, Data Logger |
| MN-2.5 | McGinty Creek | 2014-2017 | Monthly | Staff Gauge, Data Logger |
| MN-4.5 | McGinty Creek | 2011-2017 | Monthly | Staff Gauge, Data Logger |

Stream-gauge data is collected and managed throughout the open water season by the Minto personnel. Velocities are measured using a Hach FH950 handheld electromagnetic flowmeter. Velocity and water depth measurements are converted to flows using the area-velocity relationship methods. All hydrometric data, calculated flows and the time-series of recorded water levels and temperature data from the loggers were processed by Minto personnel under SRK guidance.

Level logger data were compared to the staff gauge readings, logger records for water level may have shifted over the course of the season due to repositioning, and data were corrected to match staff gauge measurements.

Stage-discharge relationships (rating curves) were created with discrete flow measurements and staff gauge readings. For stations with level loggers, discharges were determined over the course of the 2017 hydrometric season to calculate mean monthly flows and total monthly runoff.

3. Minto Creek

3.1 Station W3 – Flume below the Water Storage Pond Dam

W3 is located about 500 meters downstream of the water storage pond dam and consist of a built flume. Solinst loggers record water levels and atmospheric pressure every 30 minutes, in addition water level at the flume are recorded daily for most of the year. In mid-November, the barologger’s battery ran out, by the time it was discovered 3 weeks of barometric pressure were lost. To compensate for this data, the barometric pressure at the Minto Weather Station were used, slightly skewing the results. A summary of the level and flow data recorded at W3 are presented in Figure 2 to 5. This data provided the necessary information to correct the recorded stage data and in turn generate a stage discharge relationship which is used to calculate the creek discharge, the stage-discharge relationship is presented in Figure 3.

Figure 2 presents the Solinst recorded water levels and water temperature for Minto Creek at W3 from January to December 2017.

W3 is directly influenced by discharge from the Water Storage Pond to Minto Creek. Figure 4 shows the 2017 hydrograph and discrete flow measurements conducted. A comparison of monthly flows at W3 and the discharge from the WSP is presented in Figure 5. As expected the flows recorded at W3 are slightly larger than the rate of discharge because of baseflow and runoff at W3. In mid-March, the station overflowed and froze, causing a lack of data for the following weeks leading into April. There is an incomplete dataset for records of flow at W3 from mid-March to the beginning of April. Overflow at the flume during the colder months, creates a pressure on the Levellogger that is not representative of the actual discharge occurring, months of November to March are difficult to obtain accurate water level readings.

Water was discharged from the WSP intermittently from April 30th to August 6th, 2017, the water level changed and flow fluctuations during the discharge period

Table 3-1 provides a summary of the average water temperature, flow and total flow volume in 2017. The higher temperatures recorded from November to March indicate the important influence of the heater at the flume on minimal flow or stagnant overflow discharge. Table 3-2 summarizes the historical mean monthly flows to previous years of the hydrometric program.

Table 3-1: W3 2017 Hydrometric Data and Temperature Summary

3.2 MC1 - Minto Creek Mid-Catchment

The hydrometric station MC1 on Minto Creek is located downstream of the W3 Flume and immediately upstream of the canyon along Minto Creek. The pressure transducer installed at this station recorded temperature and water levels at 15 minute intervals from May 2nd to October 19th (150 days). Figure 6 shows water level and temperature data for Minto Creek at MC1 from May 20th to October 16th, 2017. On May 19th, the level logger was discovered out of the water and replaced.

Over the course of the hydrometric program in 2017, numerous discrete discharge measurements were recorded in conjunction with water level readings recorded by both the pressure transducer and the staff gauge. This data provides the information necessary to generate a stage-discharge relationship which enables the computation of creek discharge for the recorded stage data. The stage-discharge relationship is presented in Figure 7.

The 2017 hydrograph and discrete measurements for MC1 are shown in Figure 8. In 2017, the maximum measured flow of 0.23 m³/s occurred on June 13th, 2017.

Table 3-3 provides a summary of the average water temperature, flow and total flow volume in 2017. The negative temperatures recorded in October indicate the start of the freeze-up period. Table 3-4 summarizes the historical mean monthly flows to previous years of the hydrometric program. During the August 11-14th period, the logger could have been partially out of the water as seen in negative pressure differences, hence the negative values recorded were purposefully removed for the data presentation in these tables.

Table 3-3: MC1 2017 Hydrometric Data and Temperature Summary

3.3 W1 – Lower Minto Creek above Road Crossing

W1 station is located on the lower reach of Minto Creek before flowing into the Yukon River. In 2017, water level and temperature data were continuously measured and recorded every 15 minutes by the pressure transducer/data logger. Figure 9 shows Minto Creek at W1 water level and temperature data for the 167-day record from May 2 to October 16, 2017.

The stage-discharge relationship for W1 is presented in Figure 10. The 2017 hydrograph and discrete measurements for W1 are shown in Figure 11. In 2017, the maximum measured flow of 0.379 m³/s occurred on May 5th, 2017. Figure 12 shows W1 and MC1 flows. W1 is located downstream of MC1 and it is expected that flows would be larger because it has a much larger catchment area than MC1. W1 flows are lower than MC1 because it has been observed through the monitoring program that upstream of W1 is a losing reach. Water downstream of MC1 passes through a preferential pathway and by-passes W1.

Table 3-5 provides a summary of the average water temperature, flow and total flow volume in 2017. The negative temperatures recorded in October indicates the start of the freeze-up period. Table 3-6 summarizes the historical mean monthly flows to previous years of the hydrometric program. The history shows that freeze-up begins in October and that freshet typically occurs in April/May.

Table 3-5: W1 2017 Hydrometric Data and Temperature Summary

| Month | Period of Record (Day) | Mean Water Temperature (°C) | Mean Flow (m ³ /s) | Total Flow (m ³) |

Note: 1 - Data based on previous Annual Surface water Hydrology Analysis.

Note: Shaded cells indicate incomplete months of data

In 2017, Minto personnel noticed the undercutts growing at the stream gauging transect, it is recommended to re-evaluate the location for discrete measurements in 2018.

3.4 W7 – Tributary of Minto Creek

A staff gauge was installed at this station in the summer of 2013. Before the installation of the staff gauge, this station was regularly monitored for surface water quality. The staff gauge was damaged during the winter 2014 and repaired for the hydrometric program running in 2015. In 2016, no stage measurements were continuously recorded but several discrete discharge measurements were conducted during the open water season. In early June 2017, a staff gauge and loggers were installed at this site, a continuous water level and temperature were recorded as presented in Figure 13. Table 3-7 provides a summary of the average water temperature, flow and total flow volume in 2017.

Table 3-8 presents the summary of historically measured flows at W7, based on discrete measurements. A rating curve was initiated in the 2017 hydrometric season, with limited data points the curve showed inconsistencies between discrete and pressure logger measurements, and was therefore not included in this year’s report; with more data being collected the curve will become more accurate over the years. The loggers were installed June 23rd and recorded water level and temperature every 30 minutes until October 3rd.

As this was a re-established station, it is recommended for 2018 to conduct stream gauging measurements more frequently to build a larger dataset and a more accurate rating curve.

Table 3-7: W7 2017 Hydrometric Data and Temperature Summary

4. McGinty Creek Hydrology

In 2017, hydrological monitoring on McGinty Creek was not conducted as per the schedule outlined in the EMSRP, it was noted late in the season that MN-1.5 was not monitored for continuous flow. Station MN-0.5 was monitored in place of MN-1.5 throughout the season. During the 2017 monitoring period, Minto Mine maintained and collected data from the following three hydrometric stations along McGinty Creek.

At the hydrometric stations, Solinst Level Loggers and Barometric Loggers were used in conjunction with staff gauge readings and manual flow measurements to produce volumetric flow rates conducted monthly during flow season.

4.1 Station MN-0.5 – West Tributary of McGinty Creek

MN-0.5 station is located on the upper west stem of McGinty Creek. In 2017, water level and temperature data were continuously measured and recorded every 30 minutes by a pressure transducer/data logger. Figure 14 shows McGinty Creek at MN-0.5 water level and temperature data for the 117-day record from June 24 to October 21, 2016.

A stage-discharge relationship was established for MN-0.5 but it has limited flow data and corresponding staff gauge reading, hence it was not very accurate, the stage curve is presented in Figure 15. Additional flow measurements through the years will be required to establish a stage-discharge curve for the station with greater accuracy.

Table 4-1 provides a summary historical measured flows at MN-0.5. These flows are based on discrete measurements only.

Table 4-1: MN-0.5 Historical Mean Monthly Flow (m³/s)

| Year | Jan | Feb | Mar | Apr | May | Jun | Jul | Aug | Sep | Oct | Nov | Dec |
|-------------------|-----|-----|-----|-----|-------|-------|-------|-------|-------|-------|-----|-----|

Note: 1 - Data based on previous Annual Surface water Hydrology Analysis.

Note: Shaded cells indicate incomplete months of data

4.2 Station MN-1.5 – Upper East Tributary of McGinty Creek

As previously mentioned, MN-1.5 was not monitored continuously but Minto personnel conducted discrete flow measurement on a monthly frequency. Results are presented in Table 4-2; July measurement could not be conducted due to low flows. As required by the EMSRP, MN-1.5 will be monitored continuously for the 2018 hydrometric season.

Table 4-2: MN-1.5 2017 Recorded Discrete Flow Measurement (m³/s)

| | May | Jun | Jul | Aug | Sep |
|------|-------|-------|-----|--------|-------|
| Flow | 0.007 | 0.001 | - | 0.0004 | 0.001 |

4.2 Station MN-2.5 – East Tributary of McGinty Creek

MN-2.5 station is located on the lower stem of McGinty Creek. In 2017, water level and temperature data were continuously measured and recorded every 30 minutes by a pressure transducer/data logger. Figure 16 shows McGinty Creek at MN-2.5 water level and temperature data for the 149-day record from May 26 to October 21, 2017.

A stage-discharge relationship could not be established for MN-2.5 because of limited data flow and corresponding staff gauge reading.

Table 4-3 provides a summary of historical measured flows at MN-2.5. These flows are based on discrete measurements only.

Table 4-3: MN-2.5 Historical Mean Monthly Flow (m³/s)

Note: 1 - Data based on previous Annual Surface water Hydrology Analysis.

Note: Shaded cells indicate incomplete months of data

4.3 Station MN-4.5 - McGinty Creek near the Mouth

MN-4.5 station is located on the lower reach of McGinty Creek before flowing into the Yukon River. In 2017, water level and temperature data were continuously measured and recorded every 30 minutes by the pressure transducer/data logger. Figure 17 shows McGinty Creek at MN-4.5 water level and temperature data for the 140-day record from May 26 to October 12, 2017.

The stage-discharge relationship for MN-4.5 is presented in Figure 18. The 2017 hydrograph and discrete measurements for MN-4.5 are shown in Figure 19. In 2017, the maximum measured flow of 0.08 m³/s occurred on July 29, 2017.

Table 4-4 provides a summary of the average water temperature, flow and total flow volume in 2017. Table 4-5 summarizes the historical mean monthly flows to previous years of the hydrometric program.

Table 4-4: MN-4.5 2017 Hydrometric Data and Temperature Summary

Note: 1 - Data based on previous Annual Surface water Hydrology Analysis.

Note: Shaded cells indicate incomplete months of data

In 2017, Minto personnel noticed undercuts eroding on both sides on the stream gauging transect, it is recommended to re-evaluate the location of the transect for the 2018 hydrology season.

5. Hydrology QA/QC

Detailed procedures for hydrology monitoring at the Minto Mine are detailed in the *Minto Mine Surface Water Hydrology SOP*. In 2017, Minto implemented permanent discrete measurement locations at each station to ensure consistent results, on a few occasions due to changing stream bed conditions, locations were modified.

Appendix B: Data Collection and Input Manuals

1 Introduction

The following document describes the instrumentation and monitoring program currently in place at Minto to monitor the stability of mining structures including waste rock, tailings, and water storage facilities. The program consists of two main components: instrumentation to measure ground conditions and deformation, and regular geotechnical inspections. The following sections summarize inspection and data collection frequencies, instrument installation details and locations, and data collection procedures.

Mining and monitoring activities at Minto included in this plan are licensed under the following:

- Type A Water Licence QZ14-031, August, 2015
- Type B Water Licence MS15-094, July 2016
- Quartz Mining Licence QML-0001, December, 2014

Existing mine structures at Minto are shown in Figure 1-1, and described in the following section.

Figure 1-1: Minto site plan (August 2017)

2 Mine Structures

Mine structures currently being monitored at Minto as well as future structures included in the Phase V/VI plan are listed in Table 1.

Table 1: Description of Mine Structures at Minto

| Structure | Description | Instrumentation |
|---|---|--|
| Area 2 Pit and Area 2 Pit Tailings Management Facility (A2PTMF) | <p>The Area 2 Pit was completed in 2015 to the extents licensed under Phase IV (Stages 1 and 2); the pit was extended to the south as part of Phase V/VI (Stage 3 and Stage 3 Expansion), scheduled to be complete in 2018.</p> <p>Tailings deposition into Area 2 Stage 2 pit (A2S2) began in March, 2015 and the pit is now maintained as a tailings management facility.</p> <p>Dumping of NP:AP<3 waste rock (SAT), intended to be below the final water table at closure, has commenced into the pit.</p> | <ul style="list-style-type: none"> Survey hubs GroundProbe radar (during active mining) |
| Area 2 Underground | The Area 2 underground began development in 2016 and is accessed by a portal and decline south of the Area 2 and Area 118 Pits. Production mining is currently taking place using a longhole stoping method and is expected to be completed in 2018. | None |
| Area 118 Pit | Mining of the Area 118 Pit was carried out in 2014. As part of Area 2 Stage 3 pit mining, overburden is being dispatched to the Area 118 pit, referred to as the Area 118 Backfill Dump. | <ul style="list-style-type: none"> Survey hubs |
| Area 118 Backfill Dump | The Area 118 Backfill Dump is included in the Phase V/VI licence and commenced in 2017. Construction will continue for the duration of the Area 2 Stage 3 Pit. The dump will fill in the Area 118 Pit. | None |
| Area 118 Underground | The Area 118 underground began development in 2013 and was completed in 2016. It is accessed by a portal and decline south of the Area 2 and Area 118 Pits. Production mining took place using a longhole stoping method. | None |
| Big Creek Bridge | Bridge on the Minto access road crossing Big Creek, located at Km 19. Licenced under Type B water licence MS15-094. | None |
| Barge Landings | Barge landings on the Minto access road at the Yukon river. Licensed under Type B water license MS15-094. | None |
| Camp | The camp consists of several connected bunkhouse buildings (Sherwood, Minto, Selkirk), a kitchen building, and several separate buildings including the gym and Site Services offices. | None |
| Copper Keel and Wildfire Underground | The Copper Keel and Wildfire underground are in the phase V/VI mining plan and have not commenced yet. | N/A |
| Dry Stack Tailings Storage Facility (DSTSF) | Construction of the DSTSF with filtered tailings placement was carried out from 2007 to November 2011. As part of progressive reclamation activities in 2012-2013, the DSTSF was covered with a layer of overburden approximately one to four meters thick. The DSTSF began showing deformation in 2009, interpreted as primarily horizontal sliding towards the north/northeast on an ice-rich layer in the underlying overburden, several meters above bedrock. The movement has continued since then but at a decreasing rate in response to construction of both the Mill Valley Fill waste rock buttress and the Mill Valley Fill Extension 2 waste rock buttress. | <ul style="list-style-type: none"> Survey hubs Thermistors Inclinometers Piezometers |

| Structure | Description | Instrumentation |
|---|---|---|
| Ice Rich Overburden Dump (IROD) | Originally constructed as a free-standing rockfill structure to contain ice-rich overburden. The IROD is no longer active and is now entirely surrounded by the Southwest Waste Dump rockfill. The area has been reclaimed with the Southwest Waste Dump in 2017. | None |
| Main Pit (Area 1 Pit) and Main Pit Tailings Management Facility (MPTMF) | <p>Mining in the Main Pit was completed in 2011. Instability in the south wall of the pit occurred in 2009 during mining of Stage 3 of the pit, and subsequently a larger failure occurred in 2011 after completion of Stage 5. Continued sloughing and creep movement of the south wall led to the design and construction of a waste rock buttress, known as the South Wall Buttress, completed in 2013.</p> <p>Slurry tailings deposition into the pit began in 2012 and the pit is now maintained as a tailings management facility.</p> <p>Dumping of NP:AP<3 waste rock (SAT) below the final water table at closure, is not currently active but remains an alternate dispatch location to the Area 2 Pit Tailings Management Facility.</p> | <ul style="list-style-type: none"> • Survey hubs • Inclinometer |
| Main Pit Dump | The Main Pit Dump is included in the Phase V/VI licence. Construction commenced in 2017. The dump is located on the southwest side of the Main Pit. | <ul style="list-style-type: none"> • Survey hubs |
| Main Waste Dump (MWD) | The Main Waste Dump stores waste rock released during the mining of the first three stages of the Main Pit. The dump is no longer active. | <ul style="list-style-type: none"> • Inclinometer |
| Main Waste Dump Expansion (MWDE) | This dump is an extension of the MWD that stores waste rock released from the Minto North Pit. The dump is no longer active. Reclamation re-sloping began in 2016. | None |
| Main Waste Dump Wrap (MWDW) | This dump is a reclamation feature to shallow the slopes of the Main Waste Dump for reclamation purposes. | None |
| Mill Site | The mill site consists of the mill building, crusher and crusher stockpile pad. | None |
| Mill Valley Fill Extension (MFVE) | A waste rock buttress to the north of the DSTSF, constructed from January 2012 to March 2013 to prevent or decrease movement of the DSTSF. | <ul style="list-style-type: none"> • Survey hubs |
| Mill Valley Fill Extension 2 (MVFE2) | An extension of the MVFE waste rock buttress to the northeast, constructed from November 2015 to August 2016 to further decrease movement of the DSTSF. | <ul style="list-style-type: none"> • Piezometers • Survey hubs • Inclinometers |
| Mill Valley Fill Extension 2 Collection Sump | A replacement sump for the Minto Creek Detention Structure (MCDS), constructed in 2016. It detains surface water considered impacted from upstream sub-catchment areas and directs it to the MPTMF or water treatment plant. | None |
| Minto Access Road | Road from the Yukon River barge crossing to the mine site. Licenced under Type B water licence MS15-094. | None |
| Minto East Underground | Ramping to the Minto East underground began development in 2017 and is accessed by a portal and decline south of the Area 2 and Area 118 Pits. Production will use a longhole stoping method and is expected to start in 2018. | None |

| Structure | Description | Instrumentation |
|---|---|--|
| Minto North Pit | Mining of the North Pit was completed in September 2016. The pit is currently inactive and the access is barricaded. | None |
| Ore Stockpiles | There are two primary ore stockpiles on site – North and South stockpile. These are located south of the crusher and east of the Area 2 pit. | None |
| Reclamation Overburden Dump (ROD) | Received the bulk of the overburden released as part of Phase IV and earlier mining of the Main Pit. The material in the ROD is available for use in reclamation of the mine at closure. | None |
| Ridgetop Pit (Ridgetop North Pit, Ridgetop South Pit) | The Ridgetop Pits are included in the Phase V/VI licence and has not commenced yet. Mining is planned to start in 2018. | GroundProbe radar (during mining) |
| Ridgetop Waste Dump | The Ridgetop Waste Dump is included in the Phase V/VI licence and has not commenced yet. Dumping is planned to start in 2018. | N/A |
| South Diversion Ditch | This structure was decommissioned in 2017 to allow for Area 2 Stage 3 Expansion mining activities. | None |
| South Wall Buttress (SWB) | Waste rock buttress constructed against the Main Pit south wall from 2009-2011 as a result of instability in the south wall of the pit. | <ul style="list-style-type: none"> Survey hubs |
| Southwest Waste Dump (SWD) | The Southwest Waste Dump (SWD) stores waste rock released during phase IV mining. Dumping at the SWD is now complete and reclamation re-sloping began in 2015. Re-sloping is expected to be completed in 2018. | <ul style="list-style-type: none"> Survey hubs Inclinometers Thermistors Piezometers |
| Tailings Diversion Ditch (TDD) | A diversion ditch located south of the DSTSF to divert unimpacted water around the tailings facility. The intake structure was extended in 2017 to allow for the decommissioning of the South Diversion Ditch with A2S3 Expansion mining. | None |
| Water Storage Pond Dam (WSP) | The Water Storage Pond and Dam are located east of the mine along Minto Creek. The dam was constructed in 2006 as a clay-core water retention dam for collecting precipitation and surface water runoff at the site. Maximum depth of water at the face of the dam is approximately 15 m. | <ul style="list-style-type: none"> Survey hubs Thermistors Piezometers |

3 Design and Monitoring References

Table 2 lists the design reports for each structure and the monitoring/inspection guidance reports used to develop the inspection (Section 5) and instrumentation (Section 6) programs for each structure.

4 Roles and Responsibilities

Table 3 lists the roles and responsibilities for physical monitoring on the site.

Table 3: Roles and Responsibilities

| Role | Responsibilities |
|-----------------------------|--|
| Mine Technician Assistants | <ul style="list-style-type: none"> • Collect instrumentation data at specified frequencies • Input data into monitoring spreadsheets/databases • Internal reporting of monitoring data • Maintain equipment |
| Geotechnical Engineers/EITs | <ul style="list-style-type: none"> • QA/QC of data collection • Ensure compliance with license requirements • Monthly and annual Water Licence reporting • Visual inspections at specified frequencies • Communicate with consultants as required • Review and update Physical Monitoring Plan |
| Environmental Officers | <ul style="list-style-type: none"> • Compile monthly and annual Water Licence reports • Visual inspections of water diversion/collection structures |
| Chief Engineer | <ul style="list-style-type: none"> • Review monthly and annual Water Licence reports • Ensure compliance with licence requirements |

5 Inspections

Table 4 lists the regular, required inspections.

Table 4: Inspections

| Structure | Frequency | Description |
|---|---|---|
| Area 2 Pit and Area 2 Pit Tailings Management Facility (A2PTMF) | Quarterly | Visual inspection by Geotechnical Engineer/EIT and review of monitoring data as per OMS Manual. |
| Area 2 Stage 3 Pit and Area 2 Stage 3 Pit Expansion | Weekly (during active mining) | Weekly visual inspection by Geotechnical Engineer/EIT during active pit mining. Documented in weekly wall inspection report and two-week operating plan documents. |
| Area 2 Underground | Quarterly | Visual inspection by Geotechnical Engineer/EIT as per Underground Ground Control Plan. |
| Area 118 Pit | N/A | No longer accessible. |
| Area 118 Backfill Dump | Minimum every 4 hours during active dumping | Visual inspection by the supervisor or other competent person (typically the Pelly Shifter or Minto Operations Supervisor) as per O.I.C. 2006/178 Clause 15.44. |
| Area 118 Underground | N/A | No longer accessible. |
| Big Creek Bridge | Annually | Visual inspection by a Professional Engineer as per MS15-094. |
| Camp | Semi-Annually – May/June post thaw, and September pre freeze-up | Included in site-wide geotechnical inspection - Inspection and data review by Professional Engineer as per QZ14-031 (Clause 100) and QML-0001 (Clause 13.2). Q2 inspection must be completed by an independent engineer by June 30 each year. |
| Copper Keel, Wildfire Underground | N/A | N/A – structure does not exist yet. |
| Dry Stack Tailings Storage Facility (DSTSF) | Monthly | Visual inspection by Geotechnical Engineer/EIT and review of monitoring data as per OMS Manual. |
| Ice Rich Overburden Dump (IROD) | Semi-Annually – May/June post thaw, and September pre freeze-up | Included in site-wide geotechnical inspection - Inspection and data review by Professional Engineer as per QZ14-031 (Clause 100) and QML-0001 (Clause 13.2). Q2 inspection must be completed by an independent engineer by June 30 each year. |
| Main Pit (Area 1 Pit) and Main Pit Tailings Management Facility (MPTMF) | Quarterly | Visual inspection by Geotechnical Engineer/EIT and review of monitoring data as per OMS Manual. |

| Structure | Frequency | Description |
|--|---|---|
| Main Pit Dump | Minimum every 4 hours during active dumping | Visual inspection by the supervisor or other competent person (typically the Pelly Shifter or Minto Operations Supervisor) as per O.I.C. 2006/178 Clause 15.44. |
| Main Waste Dump (MWD) | Semi-Annually – May/June post thaw, and September pre freeze-up | Included in site-wide geotechnical inspection - Inspection and data review by Professional Engineer as per QZ14-031 (Clause 100) and QML-0001 (Clause 13.2). Q2 inspection must be completed by an independent engineer by June 30 each year. |
| Main Waste Dump Expansion (MWDE) | Semi-Annually – May/June post thaw, and September pre freeze-up | Included in site-wide geotechnical inspection - Inspection and data review by Professional Engineer as per QZ14-031 (Clause 100) and QML-0001 (Clause 13.2). Q2 inspection must be completed by an independent engineer by June 30 each year. |
| Main Waste Dump Wrap (MWDW) | Minimum every 4 hours during active dumping | Visual inspection by the supervisor or other competent person (typically the Pelly Shifter or Minto Operations Supervisor) as per O.I.C. 2006/178 Clause 15.44. |
| Mill Site | Semi-Annually – May/June post thaw, and September pre freeze-up | Included in site-wide geotechnical inspection - Inspection and data review by Professional Engineer as per QZ14-031 (Clause 100) and QML-0001 (Clause 13.2). Q2 inspection must be completed by an independent engineer by June 30 each year. |
| Mill Valley Fill Extension (MFVE) | Monthly | Visual inspection by Geotechnical Engineer/EIT and review of monitoring data as part of DSTSF monthly inspection. |
| Mill Valley Fill Extension 2 (MVFE2) | Monthly | Visual inspection by Geotechnical Engineer/EIT and review of monitoring data as part of DSTSF monthly inspection. |
| Mill Valley Fill Extension 2 Collection Sump | Monthly | Visual inspection by Geotechnical Engineer/EIT and review of monitoring data as part of DSTSF monthly inspection. |
| Minto Access Road | Annually | Visual inspection by a Professional Engineer as per MS15-094. |
| Minto East Underground | Quarterly | Structure does not exist yet. Once development commences, a visual inspection by Geotechnical Engineer/EIT as per Underground Ground Control Plan. |
| Minto North Pit | Semi-Annually – May/June post thaw, and September pre freeze-up | Included in site-wide geotechnical inspection - Inspection and data review by Professional Engineer as per QZ14-031 (Clause 100) and QML-0001 (Clause 13.2). Q2 inspection must be completed by an independent engineer by June 30 each year. |
| Ore Stockpiles | Semi-Annually – May/June post thaw, and September pre freeze-up | Included in site-wide geotechnical inspection - Inspection and data review by Professional Engineer as per QZ14-031 (Clause 100) and QML-0001 (Clause 13.2). Q2 inspection must be completed by an independent engineer by June 30 each year. |
| Reclamation Overburden Dump (ROD) | Semi-Annually – May/June post thaw, and | Included in site-wide geotechnical inspection - Inspection and data review by Professional Engineer as per QZ14-031 (Clause 100) and QML-0001 (Clause 13.2). Q2 inspection must be completed by an independent engineer by June 30 each year. |

| Structure | Frequency | Description |
|---|---|---|
| | September pre freeze-up | |
| Ridgetop Pit (Ridgetop North Pit, Ridgetop South Pit) | Weekly (during active mining) | Weekly visual inspection by Geotechnical Engineer/EIT during active pit mining. Documented in weekly wall inspection report and two-week operating plan documents. |
| Ridgetop Waste Dump | Minimum every 4 hours during active dumping | Visual inspection by the supervisor or other competent person (typically the Pelly Shifter or Minto Operations Supervisor) as per O.I.C. 2006/178 Clause 15.44. |
| South Wall Buttress (SWB) | Quarterly | Visual inspection by Geotechnical Engineer/EIT and review of monitoring data as part of the MPTMF quarterly inspection. |
| Southwest Waste Dump (SWD) | Semi-Annually – May/June post thaw, and September pre freeze-up | Included in site-wide geotechnical inspection - Inspection and data review by Professional Engineer as per QZ14-031 (Clause 100) and QML-0001 (Clause 13.2). Q2 inspection must be completed by an independent engineer by June 30 each year. |
| Tailings Diversion Ditch (TDD) | Semi-Annually – May/June post thaw, and September pre freeze-up | Included in site-wide geotechnical inspection - Inspection and data review by Professional Engineer as per QZ14-031 (Clause 100) and QML-0001 (Clause 13.2). Q2 inspection must be completed by an independent engineer by June 30 each year. |
| Water Storage Pond Dam (WSP) | Monthly | Visual inspection by Geotechnical Engineer/EIT as per OMS Manual. |

6 Instrumentation

A map of site wide active instrumentation is shown in Appendix A. Installation information and data collection schedules are contained in the following sections. Instruments with a strikethrough shown were destroyed in 2017 or are no longer operational.

Inclinometers

Inclinometers are used to measure lateral, differential ground movement in a borehole. Inclinometer stations consist of grouted, slotted PVC pipe into which the inclinometer probe is lowered and deflection is measured at 0.5m intervals. The current probe used on site is an RST digital MEMS inclinometer system.

Table 5: Inclinometers

| Area | ID | Northing (m) | Easting (m) | Elevation (m) | A0 Azimuth | Hole Depth (m) | Date Installed | Reading Frequency |
|---|-------------------|--------------------|---------------------|--------------------|----------------|----------------|-----------------------|-------------------|
| Area 2 Pit | A2I-1 | 6944164.73 | 385298.95 | 822.46 | 302 | 55.5 | 2013-04-26 | Quarterly |
| Dry Stack Tailings Storage Facility and Mill Valley Fill Extension 2 | DSI-22 | 6945229 | 386043.4 | 723.471 | 034 | 14 | 2016-12-12 | Bi-weekly |
| Dry Stack Tailings Storage Facility and Mill Valley Fill Extension 2 | DSI-23 | 6945119 | 385886.8 | 765.679 | 070 | 49 | 2016-12-17 | NA |
| Dry Stack Tailings Storage Facility and Mill Valley Fill Extension 2 | DSI-24 | 6944971 | 385951.4 | 774.416 | 005 | 108 | 2017-02-01 | Bi-weekly |
| Main Pit (Area 1 Pit) and Main Pit Tailings Management Facility (MPTMF) | MDI -2 | 6945013.08 | 384217.20 | 858.67 | 93 | 50.5 | 2010-02-10 | Quarterly |
| Southwest Waste Dump | SDI-3 | 6944591.11 | 383966.00 | 847.42 | 90 | 46.5 | 2010-02-11 | Quarterly |

Survey Hubs

Survey hubs are used to monitor surface movement of structures and are comprised of steel posts cemented into waste rock or bedrock and equipped with a threaded base to which a high precision RTK-corrected GPS instrument is attached. The GPS currently used on site is a Trimble R8.

Table 6: Survey Hubs

| Area | ID | Northing (m) | Easting (m) | Elevation (m) | Date Installed | Frequency |
|-------------------------------------|---------|--------------|-------------|---------------|----------------|-----------|
| Area 2 Pit | A210 | 6944268.42 | 384934.69 | 861.28 | 2011-07-01 | Monthly |
| Area 2 Pit | A215 | 6944649.45 | 385155.49 | 808.72 | 2015-09-17 | Monthly |

Thermistors

Thermistor strings are used to measure ground temperature profiles in boreholes, and in particular permafrost conditions at Minto. Thermistor strings consist of multiple temperature sensor nodes distributed along a single multi-conductor cable, installed within or attached to the outside of grouted PVC pipe. EBA and RST thermistor strings have been installed on site. EBA thermistors are read using a basic ohmmeter and RST thermistors are read using a RST TH2016B readout unit.

Vibrating Wire Piezometers

Vibrating wire piezometer strings are used to measure piezometric pressure profiles in boreholes. They consist of multiple vibrating wire sensors installed on PVC pipe in grouted boreholes. RST vibrating wire piezometers are installed on site and data is collected with an RST VW2106 readout unit.

Table 8: Vibrating Wire Piezometers

7 Instrumentation Procedures and Documentation

Data collection manuals for all monitoring devices are included in Appendix B.

After collection, data is input into a series of spreadsheets and databases used for storing, tracking and interpreting instrumentation data. Instructions for data input are contained in the instrumentation manuals in Appendix B.

8 Quality Assurance/Quality Control

Planned job observations (PJO's) are routinely performed and documented on Mine Technician Assistants to verify data collection is consistent with the designed procedures.

Data collection equipment is returned to the manufacturers as per their recommended calibration schedules, typically annually.

All data is reviewed and summarized by the Geotechnical Engineer/EIT monthly as part of the Water Licence reporting.

9 Reporting

Regular processing and review of monitoring data is completed and presented in the following documents.

Table 9: Reporting

| Report | Frequency | Submission |
|---|---|---|
| Pit Wall Inspection Reports | Weekly | Submitted internally each week |
| Minto Mine Type A Water Licence QZ14-031 Monthly Report (Clause 4.4) | Monthly | Submitted to Yukon Water Board maximum 30 days following each month |
| DSTSF Inspection Reports | Monthly | Filed internally within one week of the inspection |
| Water Storage Pond Dam Inspection Reports | Monthly | Filed internally within one week of the inspection |
| Area 2 and Main Pit Tailings Storage Facility Inspection Reports | Quarterly | Filed internally within one month of the inspection |
| Semi-Annual Site-wide Geotechnical Inspection Report | After spring melt (May/June) and before freeze-up (September) | Submitted to Yukon Water Board within 60 days of inspection. |
| Minto Mine Type A Water Licence QZ14-031 Annual Report (Clause 4.5) | Annually | Submitted to Yukon Water Board by March 31 each year |
| Minto Mine Type B Water Licence MS15-094 Annual Inspection Report (Clause 34) | Annually | Submitted to Yukon Water Board with the Annual Report |

Appendix A: Instrumentation Map

Appendix B: Data Collection and Input Manuals

Inclinometer Measurements

Please refer to RST MEMS Digital Inclinometer System Instruction Manual for complete instruction.

System Overview:

Figure 1 – System Overview

1. Soft Shell Case
2. Digital Inclinometer Probe (w/ protective end cap)
3. Reel Battery Charger
4. 70mm/2.75" OD Cable Grip
5. 85mm/3.34" OD Cable Grip
6. Ultra-Rugged Field PC
7. 12V DC car adapter for Reel Battery Charger or Ultra-Rugged Field PC
8. Spare Reel Battery
9. Silicone Lubricant (for use on connectors)
10. USB Cable for Ultra-Rugged Field PC
11. AC Adapter (110-240V) for Reel Battery Charger
12. AC Adapter (110-240V) for Ultra-Rugged Field PC
13. Cable Reel with Wireless Communication System and protective end cap
14. Reel Carrying Case

1. Make sure the battery for the reel and the Field PC are charged.
2. Lift up protective box with two hands and put it on side as a work bench.

3. Remove cap from inclinometer casing and look for A_0 marking (black mark).

4. Remove excess water inside the probe and the cable connector.
Probe is very sensitive and susceptible to vibration. **DO NOT BANG THE PROBE.** Use a paper towel to wipe it.
5. Apply silicon lubricant to probe and cable connector when needed.

6. Connect the inclinometer cable to the probe by aligning the keyways and threading the connector onto the probe. Turn the threaded ring, but not the cable.

7. Turn on the power of the reel. A green light indicates that the power is on. This energizes the accelerometers and makes them less susceptible to shock.

8. Check the depth of the hole. Turn on Field PC and select the hole you are going to measure.

9. Always start with **UPPER** Wheel in the A_0 direction.

10. Lower the probe gently and carefully. When it gets close to the bottom lower it very gently to avoid bouncing the probe off the bottom of the hole. The cable has aluminum sleeve marks which are spaced at 0.5m and it has a red measure mark with label every 5m.

11. Lower the probe gently to ensure the bottom of the hole is encountered. (Slightly passed the designated depth). Double check your correct depth by pulling out reel to the next 5m mark and counting back each 0.5m for each increment.
12. Place the cable grip on top of the casing and hang the cable by the aluminum crimps.

13. Connect the Field PC to the reel. Use the pen attached to the field PC and press "Connections".

14. Once connected, hit "Readings".

15. At each depth allow the A and B readings as well as the noise level become stabilized before you accept the readings. Ideally noise level should be at or below 30 μ V.

16. Wear gloves as the Envirobind inside the inclinometer casing can be sticky and irritable. Pull up gently to the next marker and let the aluminum crimp to sit on the metal grip. Wait for the readings and noise level to stabilize and then hit "Accept".

17. If you accidentally pull the probe too far (more than an inch), lower the probe back down to the previous bead then pull up to the bead you want to measure. This will ensure that the readings remain consistent.

18. At each 5m mark, check that you are at the right location. If you miss or overpass a reading, go back to the previous 5m depth. For examples, if something goes wrong at 41.5m, go back to 45m and drop the cable to 45.5m. Then gently pull up to 45m and hit "Accept" again. There are arrow keys on the Field PC which allow you to adjust your depth.

19. Once the last reading (0.5m) is taken, gently take out the probe and turn it 180° so that the **Lower** wheel

is now in the A_0 direction.

20. Go back gently to the bottom of hole and take the second set of readings.

21. During the measurement of the second set of readings, checksum data will appear in a smaller font below the current readings. Checksum should be reasonably small and consistent. Ideally it should be somewhere between -0.0035m to +0.0045m.

22. If the checksum is large ($> 0.01\text{m}$) and inconsistent, check the following:
 - Is the probe at the right depth?
 - Is the probe in the correct direction?
 - Lower the probe to the previous depth and retake the reading again.

It is possible that checksum is high due to differential pressure in the ground. In that case continue measurement and keep monitoring checksum.

23. Once readings are completed, take out the probe and wipe away the Envirobind gently. Put the caps back onto the probe and connector.

Data Input

Note: Windows Mobile Device Center must be installed on the computer in order to collect the readout unit to the computer.

1. Connect the USB cable from the readout unit to the computer and turn the power on.
2. Open DMM for Windows

3. *File – Open – Project Database*

The database for all inclinometer data is stored here:

<X:\Mine Technical\03 - Monitoring\! Inclinometers\Master Database>

4. *File – Import – Import RPP file*

Navigate to the mobile device and select the .rpp file for the appropriate monitoring station and date. The data will then import and save in the database automatically.

Thermistor Readings

Two different types of thermistors are currently installed on site – RST and EBA thermistors.

To read RST thermistors:

1. Connect adapter cord to the TH2016B Readout Box.
2. Record the resistivity (Ohms) for each thermistor node on paper or store the data in the readout box with the following steps:
 - a. Scroll with the Up/Down arrows to the **Memory** screen and press enter (arrow key)

- b. Scroll with the Up/Down arrows to the **Store Data** screen and press enter

- c. Scroll with the Up/Down arrows to the station being monitored and press enter to store the reading

- d. The data is now stored and the readbox can be turned off by pressing the escape button (ESC) three times to get back to the main menu and scrolling to Power Off.

To read EBA thermistors:

1. Connect the EBA 16 Point Ground Temperature Dial into the thermistor cable.
2. Connect the multi-meter to the EBA 16 Point Ground Temperature Dial.
3. Record on paper the resistance in Ohm's (Ω) for each point.

Data Downloading

1. Connect USB cord from computer to the readout box.
2. Open the software Multi Readout Host.

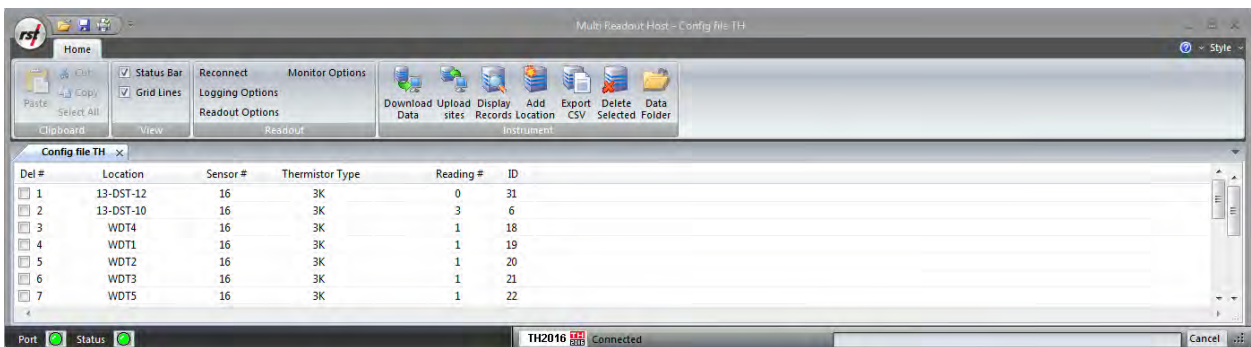

3. Turn on the power on the readout box.
4. The software will recognize the readout unit and prompt to download data. Choose "Yes" to download the data from the readout unit.

5. Once data is downloaded you will have the option to save all data as .csv file. Choose "Yes" and the data will be stored in My Documents in a folder named "TH2016data".

6. The software can be used to setup new locations or view data but no further steps are required.

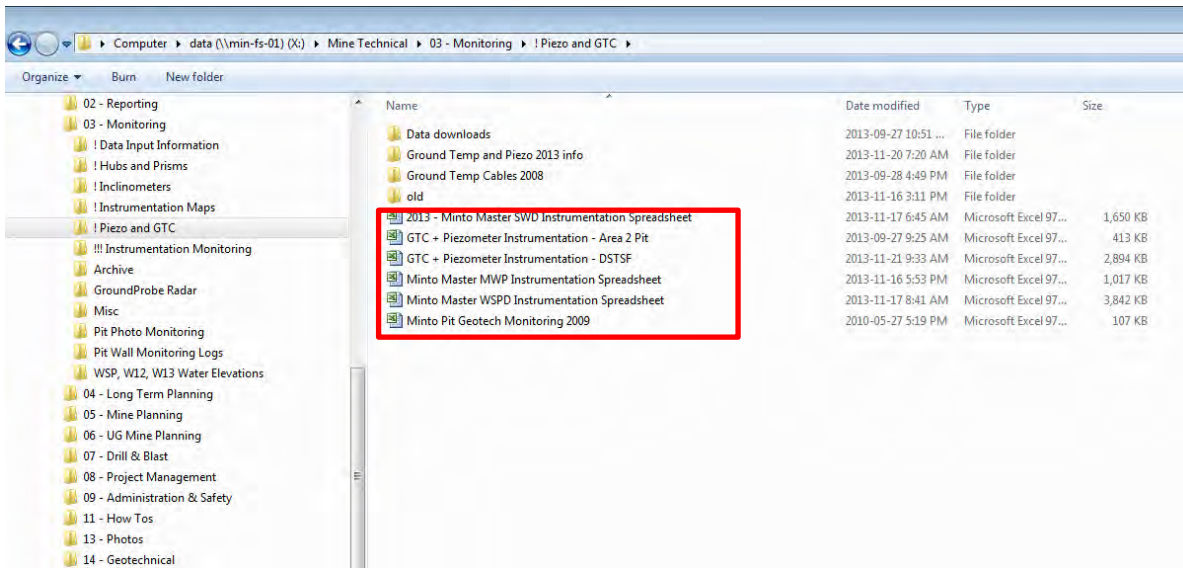

Data Input

Spreadsheets for piezometer data input and tracking are stored here:

X:\Mine Technical\03 - Monitoring\! Piezo and GTC

1. Open the spreadsheet for the area monitored

2. Open the tab "GTC Readings"

- In a new column enter the date and copy the resistivity data (Ohms) from the paper records, or from the .csv file saved in either "TH2016data" or "VW2016data" saved in My Documents.

Vibrating Wire Piezometer Readings

1. Connect adapter cord to the VW2106 Readout Box.
2. Connect the coloured wires to the correct wire clips on the extension cable. Make sure the wires do not touch each other.
3. Record the **DATE** and **TIME** as barometric pressure will be needed to calibrate the water level.
4. Record the measurement (between 7000B to 9000B) and the temperature (°C) for each piezometer. The piezometer ID should be labeled on the wire (eg. P5a and P5b).

5. Alternatively the data can be stored in the readout box:
 - a. Scroll with the Up/Down arrows to the **Memory** screen and press enter (arrow key)

- b. Scroll with the Up/Down arrows to the **Store Data** screen and press enter

- c. Scroll with the Up/Down arrows to the station being monitored and press enter to store the reading

- d. The data is now stored and the readout box can be turned off by pressing the escape button (ESC) three times to get back to the main menu and scrolling to Power Off.

Data Downloading

7. Connect USB cord from computer to the readout box.
8. Open the software Multi Readout Host.

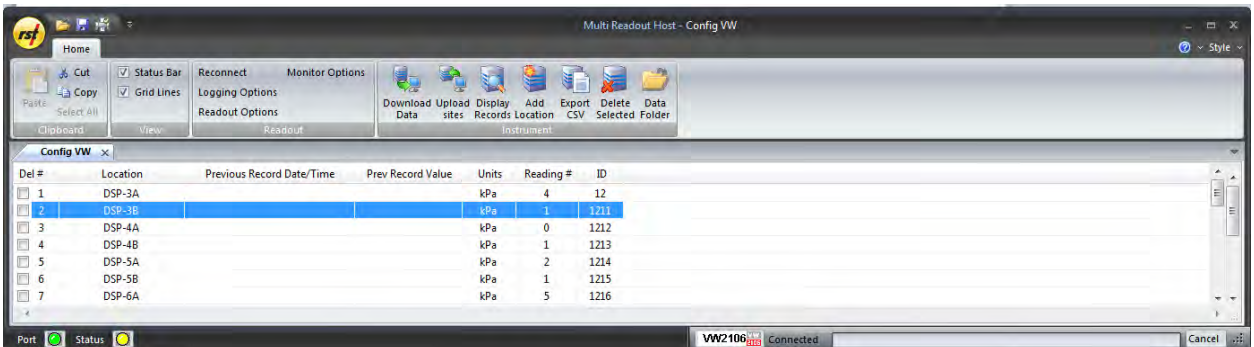

9. Turn on the power on the readout box.
10. The software will recognize the readout unit and prompt to download data. Choose "Yes" to download the data from the readout unit.

11. Once data is downloaded you will have the option to save all data as .csv file. Choose "Yes" and the data will be stored in My Documents in a folder named "VW2016data".

12. The software can be used to setup new locations or view data but no further steps are required.

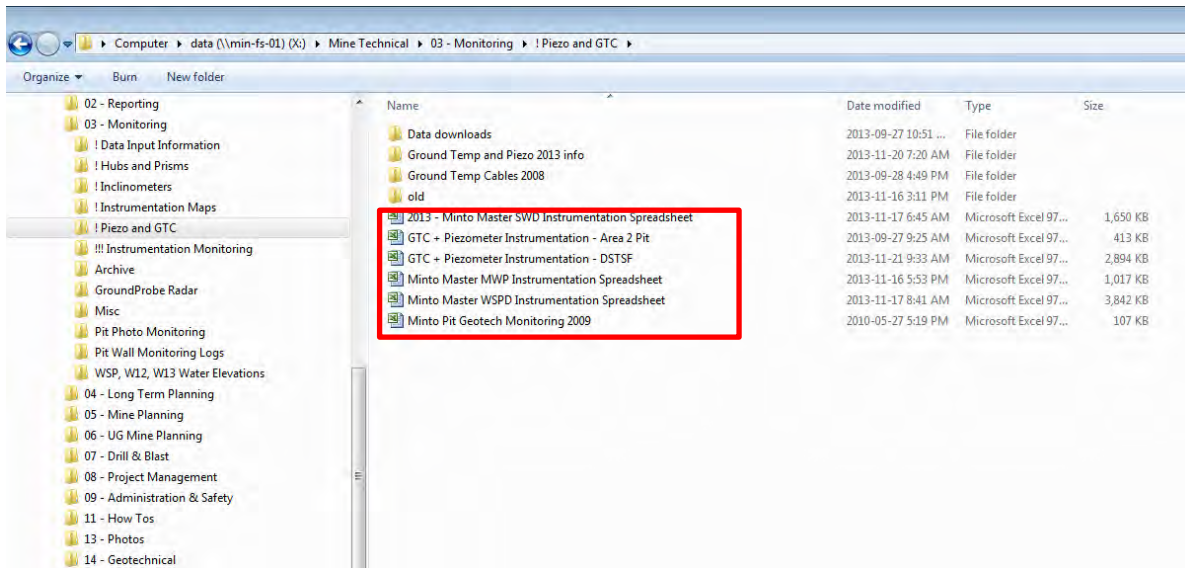

Data Input

Spreadsheets for piezometer data input and tracking are stored here:

X:\Mine Technical\03 - Monitoring\! Piezo and GTC

4. Open the spreadsheet for the area monitored

5. Open the tab "Piezo Readings"

- In a new row, input the date, time, barometric pressure, B-unit and temperature readings for each instrument.

MINTO MINE: DRY STACK TAILINGS STORAGE FACILITY

Tab Use Instructions:

Appendix H – 2017 AMP Groundwater SRK Memo

Memo

| | | | |
|-----------------|---|--------------------|-------------------------|
| To: | Ryan Herbert, Minto Explorations Ltd. | Client: | Minto Explorations Ltd. |
| From: | Dan Mackie, PGeo Ryan Burgess, MSc | Project No: | 1CM002.057 |
| Cc: | | Date: | January 31, 2018 |
| Subject: | Minto Mine – Summary of 2017 Groundwater OAMP SPT Exceedances | | |

1 Purpose

Groundwater monitoring at the Minto Mine, Yukon, is conducted and reviewed through the Minto Mine Groundwater Monitoring Plan (Minto, 2016) and the Operational Adaptive Management Plan (OAMP; Minto, 2017). The purpose of this memo is to summarize groundwater quality (and locations) at Minto that have exceeded a specific performance threshold (SPT) of the OAMP in 2017.

2 Background

The groundwater monitoring network at Minto includes 10 active multi-level monitoring wells that have been installed between 2009 and 2017. The monitoring wells are located across the site, both outside of the current mining footprint and topographically (and hydraulically) down gradient of mining activities. Monitoring locations are shown on Figure 1. All of these monitoring wells were installed after the start of mining (except MW09-03, which was installed after the main Minto operations began, but before mining at the adjacent Minto North Pit started). Details of groundwater monitoring locations can be found in SRK (2018).

Groundwater monitoring is conducted as required by the Groundwater Monitoring Plan. Review of groundwater monitoring results is carried out as part of the OAMP. In the OAMP, performance thresholds have been defined to establish changes in concentration and concentration values for specific constituents of concern (CoCs) at which actions may need to be taken by Minto to avoid potential impacts to the environment. Specifically, the OAMP states:

Specific Performance Thresholds (SPTs) are defined for each of the Effluent Quality Standards (EQS) parameters identified in Clause 9 (a), Table 1 of Water Use Licence QZ14-031, with the exception of pH, oil and grease, iron and nitrite.

There are three SPT levels for groundwater quality defined in the OAMP for the Minto Creek Catchment, and two for the McGinty Creek Catchment. Of the 10 multi-port monitoring wells active in the monitoring network, only three are compared to the SPT in the AMP. They are MW12-05 and MW12-06 (Minto Creek Catchment), and MW09-03 (McGinty Creek Catchment). All three of these monitoring wells are located hydraulically or topographically down gradient of certain mine components:

- MW09-03 – topographically down gradient of the Minto North Pit in the McGinty Creek catchment;
- MW12-06 – hydraulically and/or topographically down gradient of the Main and Area 2 open pits, DSTSF and MVFE, in the Minto Creek catchment;
- MW12-05 – hydraulically and topographically down gradient of all mine activities in the Minto Creek catchment.

Attachment 1 provides table of SPT threshold concentrations. SPTs for each catchment are summarized below:

Minto Creek Catchment

1. SPT-1 corresponds to a trend-based assessment designed to flag potential rapidly-increasing groundwater concentrations that have not yet exceeded concentration-based thresholds.
2. SPT-2 generally corresponds to the EQS concentrations defined in the OAMP (with four exceptions: Cr-D, Cu-D, Ni-D and sulphate).
3. SPT-3 generally corresponds to the estimated concentrations in groundwater that would be necessary to cause exceedance of the Water Quality Objectives in lower Minto Creek under long term steady state conditions.

McGinty Creek Catchment

1. SPT-1 is triggered when there are three consecutive exceedances of the 75th percentile background level in a single monitoring port.
2. SPT-2 is triggered when there are three consecutive exceedances of the 95th percentile background level in a single monitoring port.

Groundwater monitoring results are reviewed monthly and, if a SPT is reached or exceeded, data are reviewed, interpretations are made, the risk narrative is assessed (in terms of the receiving environment), and management actions are defined. If an OAMP SPT has not been reached for any parameter at any location, no further action is taken on the assumption that there has been no change of significance from defined baseline conditions. Monthly OAMP reports are provided to the Yukon Government as per the OAMP.

3 Groundwater AMP SPT Events

Table 1 and Table 2 summarize groundwater locations and parameters for which OAMP SPTs have been reached for the 2017 monitoring year. CoCs at any groundwater monitoring location that are not identified in this table are assumed to not have changed by a significant amount relative to established baseline conditions. Baseline groundwater conditions are defined in the OAMP based on data from MW09-03 prior to 2015 (start of Minto North mining).

Groundwater monitoring data for all CoCs are included in Attachment 2.

Table 1 Minto Creek Catchment threshold exceedances

| Monitoring Well Zone | Parameter | SPT | Context |
|----------------------|-----------------|-----|---|
| MW12-05-01 | SO ₄ | 2 | 4 out of 4 samples exceeded threshold concentration |
| MW12-05-02 | | 2 | 4 out of 4 samples exceeded threshold concentration |
| MW12-05-03 | | 1 | Increase in concentration has stabilized |
| MW12-06-01 | Se | 1 | Isolated variation in data resulted in exceedance; see Attachment 2 |
| | As | 1 | Isolated variation in data resulted in exceedance; see Attachment 2 |
| | Cr | 3 | 3 out of 3 samples exceeded threshold concentration |

Table 2 McGinty Creek Catchment threshold exceedances

| Monitoring Well Zone | Parameter | SPT | Context |
|----------------------|-----------------|---|---|
| MW09-03-01 | As | 1 | 9 out of 9 samples exceeded threshold concentration |
| | | 2 | 4 out of 9 samples exceeded threshold concentration |
| | Zn | 1 | 5 out of 9 samples exceeded threshold concentration |
| | | 2 | 3 out of 9 samples exceeded threshold concentration |
| | Mo | 1 | 2 out of 9 samples exceeded threshold concentration |
| Se | 1 | 3 out of 9 samples exceeded threshold concentration | |
| MW09-03-02 | SO ₄ | 1 | 6 out of 9 samples exceeded threshold concentration but concentration is < 5 mg/L |
| | NO ₃ | 2 | 9 out of 9 samples exceeded threshold concentration |
| | Cd | 1 | 5 out of 9 samples exceeded threshold concentration |
| | Zn | 1 | 8 out of 9 samples exceeded threshold concentration |
| | Zn | 2 | 7 out of 9 samples exceeded threshold concentration |

4 Discussion

Monitoring results for CoCs are routinely reviewed to provide context on potential impacts of mining activities to groundwater. Groundwater SPT exceedances (events) have occurred for a limited number of parameters and do not necessarily correlate with distance from mining activities (i.e., events have not necessarily all occurred at monitoring wells in relatively close proximity to mining activities). Some of these events may reflect elevated background concentrations that were not identified prior to start of mining because monitoring wells were not in place at that time.

Ongoing events are addressed specifically as follows:

- Sulphate SPT events in MW12-05 have been restricted to the deeper zones (MW12-05-01, MW12-05-02, and MW12-05-03) which monitor depths greater than 85 meters below ground surface (m bgs). Recently, the MW12-05-03 sulphate trend appears to have stabilised at a concentration below that of Minto Creek catchment SPT-2. The sulphate trend at MW12-05-01 continues to increase, but at a slower rate than previously. This may suggest that Zone 1 may be approaching equilibrium with groundwater. Zones shallower than Zone 3 all record stable and far lower sulphate concentrations (<100 mg/L). Surface water stations in the Minto Creek catchment downstream of the mine footprint (e.g. MC1) display stable trends in sulphate at similar concentrations to those observed in the shallow zones at MW12-05 (SRK, 2018).
- Nitrate at MW09-03-02 has increased recently, and has exceeded the McGinty Creek SPT-2. The nitrate concentration of the deeper zone, MW09-03-01, remains stable and below both SPTs. Presently, the Minto North Pit acts as a hydraulic sink, capturing (locally) groundwater topographically downgradient (including MW09-03). Therefore, migration of pit water is not the cause of the nitrate increase observed at MW09-03-02. The likely explanation for the observed water quality at MW09-03 is flushing of blasting residuals from the rock used to construct the mine haul road on the topographically downgradient side of the Minto North Pit, and immediately adjacent to the monitoring well. This effect is expected to be relatively short-lived, as blasting residuals will flush out over time. Data from the nearest McGinty Creek surface water monitoring station (MN-1.5) indicate nitrate concentrations remain within the range observed during baseline monitoring (SRK, 2018).
- As with nitrate, since the Minto North Pit is acting as a hydraulic sink, the other SPT events at MW09-03 (As, Cd, Se, Mo, sulphate, and Zn) are also likely to be caused by flushing of the rock used to construct the mine haul road. The concentration of these parameters at MN-1.5 are within pre-mining conditions, indicating no identifiable impact from SPT events.
- Events occurring at MW12-06-01 (As, Se and Cr) are likely caused by parameter concentrations that are reflective of background concentrations. MW12-06-01 was not sampled prior to October 2016, and only sampled four times in total since. In addition, the data are rather scattered (As and Se) or display a possible decreasing trend (Cr). Further regular sampling, as per the OAMP, will provide further information to assess changes over time.

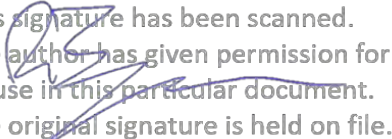

5 Conclusions

Groundwater exceedances of the OAMP SPTs in 2017 have been limited. SPT exceedance is not widespread; most wells (~70%) did not exceed OAMP SPTs in 2017.

Where regular exceedances have been identified (As and Zn at MW09-03-01; Cd, Zn, nitrate, and sulphate at MW09-03-02; sulphate at MW12-05-01; Cr at MW12-06-01), the likely cause is either a lack of characterization or the range of pre-mining groundwater concentrations (MW12-05-01 and MW12-06-01), or local, temporary mine-related sources of CoCs (i.e., apparent influence of the haul road rock on groundwater in the MW09-03 zones).

Overall, the groundwater CoC exceedances of the OAMP SPTs have not required mitigation. Groundwater monitoring should continue as per the Minto Mine Groundwater Monitoring Plan, and results should continue to be evaluated against the Operational Adaptive Management Plan SPTs and compared with other studies assessing natural background conditions.

| 2017-08-08 | 0 | 0 |
| 2017-10-24 | 0 | 0 |
| 2017-10-24 | | |

Non-Compliance Information

If effluent was non-compliant with the authorized limits set out in Schedule 4, indicate the cause(s) of non-compliance and remedial measures planned or implemented in response to the failure of acute lethality tests.

Notes:

Date Modified: 2014-03-27

Close

This section summarizes data collected for MMER requirements during the 2017 reporting year. Table 1 to 4 Present the EEM results from 2017, and Table 5 presents the Radon 226 results from quarterly samples collected in 2017. And finally, ALS Laboratory Results files are presented at the end.

| Matrix Spike | Sodium (Na)-Total | MS-B | L1876399-1, -2, -4 |
| Matrix Spike | Strontium (Sr)-Total | MS-B | L1876399-1, -2, -4 |
| Matrix Spike | Sulfur (S)-Total | MS-B | L1876399-1, -2, -4 |

Qualifiers for Individual Parameters Listed:

| Qualifier | Description |
|-----------|---|
| B | Method Blank exceeds ALS DQO. All associated sample results are at least 5 times greater than blank levels and are considered reliable. |
| DLA | Detection Limit adjusted for required dilution |
| HTC | Hardness was calculated from Total Ca and/or Mg concentrations and may be biased high (dissolved Ca/Mg results unavailable). |
| MS-B | Matrix Spike recovery could not be accurately calculated due to high analyte background in sample. |

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|--|--------|--|---------------------------------------|
| ALK-TITR-VA | Water | Alkalinity Species by Titration | APHA 2320 Alkalinity |
| This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values. | | | |
| ANIONS-N+N-CALC-VA | Water | Nitrite & Nitrate in Water (Calculation) | EPA 300.0 |
| Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N). | | | |
| BE-D-L-CCMS-VA | Water | Diss. Be (low) in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| BE-T-L-CCMS-VA | Water | Total Be (Low) in Water by CRC ICPMS | EPA 200.2/6020A (mod) |
| Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| CARBONS-DOC-VA | Water | Dissolved organic carbon by combustion | APHA 5310B TOTAL ORGANIC CARBON (TOC) |
| This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis. | | | |
| CL-IC-N-VA | Water | Chloride in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| EC-PCT-VA | Water | Conductivity (Automated) | APHA 2510 Auto. Conduc. |
| This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode. | | | |
| EC-SCREEN-VA | Water | Conductivity Screen (Internal Use Only) | APHA 2510 |

Reference Information

Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc.

HARDNESS-CALC-VA Water Hardness APHA 2340B

Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO₃ equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation.

HG-D-CVAA-VA Water Diss. Mercury in Water by CVAAS or CVAFS APHA 3030B/EPA 1631E (mod)

Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.

HG-T-CVAA-VA Water Total Mercury in Water by CVAAS or CVAFS EPA 1631E (mod)

Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.

IONBALANCE-VA Water Ion Balance Calculation APHA 1030E

Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero.

Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as:

Ion Balance (%) = $\frac{[\text{Cation Sum} - \text{Anion Sum}]}{[\text{Cation Sum} + \text{Anion Sum}]}$

MET-D-CCMS-VA Water Dissolved Metals in Water by CRC ICPMS APHA 3030B/6020A (mod)

Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

MET-T-CCMS-VA Water Total Metals in Water by CRC ICPMS EPA 200.2/6020A (mod)

Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

NH3-F-VA Water Ammonia in Water by Fluorescence APHA 4500 NH3-NITROGEN (AMMONIA)

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NH3-F-VA Water Ammonia in Water by Fluorescence J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NO2-L-IC-N-VA Water Nitrite in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO3-L-IC-N-VA Water Nitrate in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H "pH Value"

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

SO4-IC-N-VA Water Sulfate in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

TDS-CALC-VA Water TDS (Calculated) APHA 1030E (20TH EDITION)

This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses".

The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample.

Reference Information

TSS-VA Water Total Suspended Solids by Gravimetric APHA 2540 D - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location |
|----------------------------|---|
| VA | ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA |

Chain of Custody Numbers:

2017-01-04 A

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Reference Information

QC Samples with Qualifiers & Comments:

| QC Type Description | Parameter | Qualifier | Applies to Sample Number(s) |
|---------------------|--------------------------|-----------|-----------------------------|
| Matrix Spike | Dissolved Organic Carbon | MS-B | L1878946-2, -3, -4 |
| Matrix Spike | Barium (Ba)-Total | MS-B | L1878946-1, -2, -3, -4 |
| Matrix Spike | Boron (B)-Total | MS-B | L1878946-1, -2, -3, -4 |
| Matrix Spike | Calcium (Ca)-Total | MS-B | L1878946-1, -2, -3, -4 |
| Matrix Spike | Magnesium (Mg)-Total | MS-B | L1878946-1, -2, -3, -4 |
| Matrix Spike | Silicon (Si)-Total | MS-B | L1878946-1, -2, -3, -4 |
| Matrix Spike | Sodium (Na)-Total | MS-B | L1878946-1, -2, -3, -4 |
| Matrix Spike | Strontium (Sr)-Total | MS-B | L1878946-1, -2, -3, -4 |
| Matrix Spike | Sulfur (S)-Total | MS-B | L1878946-1, -2, -3, -4 |
| Matrix Spike | Uranium (U)-Total | MS-B | L1878946-1, -2, -3, -4 |

Qualifiers for Individual Parameters Listed:

| Qualifier | Description |
|-----------|--|
| MS-B | Matrix Spike recovery could not be accurately calculated due to high analyte background in sample. |
| RRV | Reported Result Verified By Repeat Analysis |

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|--|--------|--|---------------------------------------|
| ALK-TITR-VA | Water | Alkalinity Species by Titration | APHA 2320 Alkalinity |
| This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values. | | | |
| ANIONS-N+N-CALC-VA | Water | Nitrite & Nitrate in Water (Calculation) | EPA 300.0 |
| Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N). | | | |
| BE-D-L-CCMS-VA | Water | Diss. Be (low) in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| BE-T-L-CCMS-VA | Water | Total Be (Low) in Water by CRC ICPMS | EPA 200.2/6020A (mod) |
| Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| CARBONS-DOC-VA | Water | Dissolved organic carbon by combustion | APHA 5310B TOTAL ORGANIC CARBON (TOC) |
| This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis. | | | |
| CL-IC-N-VA | Water | Chloride in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| EC-PCT-VA | Water | Conductivity (Automated) | APHA 2510 Auto. Conduc. |
| This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode. | | | |
| EC-SCREEN-VA | Water | Conductivity Screen (Internal Use Only) | APHA 2510 |
| Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc. | | | |
| HARDNESS-CALC-VA | Water | Hardness | APHA 2340B |
| Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation. | | | |
| HG-D-CVAA-VA | Water | Diss. Mercury in Water by CVAAS or CVAFS | APHA 3030B/EPA 1631E (mod) |
| Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | | | |
| HG-T-CVAA-VA | Water | Total Mercury in Water by CVAAS or CVAFS | EPA 1631E (mod) |
| Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | | | |
| IONBALANCE-VA | Water | Ion Balance Calculation | APHA 1030E |

Reference Information

Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero.

Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as:

$$\text{Ion Balance (\%)} = \frac{[\text{Cation Sum} - \text{Anion Sum}]}{[\text{Cation Sum} + \text{Anion Sum}]}$$

MET-D-CCMS-VA Water Dissolved Metals in Water by CRC ICPMS APHA 3030B/6020A (mod)

Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

MET-T-CCMS-VA Water Total Metals in Water by CRC ICPMS EPA 200.2/6020A (mod)

Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

NH3-F-VA Water Ammonia in Water by Fluorescence APHA 4500 NH3-NITROGEN (AMMONIA)

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NH3-F-VA Water Ammonia in Water by Fluorescence J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NO2-L-IC-N-VA Water Nitrite in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO3-L-IC-N-VA Water Nitrate in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H "pH Value"

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

SO4-IC-N-VA Water Sulfate in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

TDS-CALC-VA Water TDS (Calculated) APHA 1030E (20TH EDITION)

This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses".

The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample.

TSS-VA Water Total Suspended Solids by Gravimetric APHA 2540 D - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius.

Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location |
|----------------------------|---------------------|
|----------------------------|---------------------|

| | |
|----|---|
| VA | ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA |
|----|---|

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg ww - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Reference Information

QC Samples with Qualifiers & Comments:

| QC Type Description | Parameter | Qualifier | Applies to Sample Number(s) |
|---------------------|--------------------------|-----------|-----------------------------|
| Matrix Spike | Barium (Ba)-Dissolved | MS-B | L1880962-1, -2, -3 |
| Matrix Spike | Calcium (Ca)-Dissolved | MS-B | L1880962-1, -2, -3 |
| Matrix Spike | Copper (Cu)-Dissolved | MS-B | L1880962-1, -2, -3 |
| Matrix Spike | Magnesium (Mg)-Dissolved | MS-B | L1880962-1, -2, -3 |
| Matrix Spike | Manganese (Mn)-Dissolved | MS-B | L1880962-1, -2, -3 |
| Matrix Spike | Potassium (K)-Dissolved | MS-B | L1880962-1, -2, -3 |
| Matrix Spike | Sodium (Na)-Dissolved | MS-B | L1880962-1, -2, -3 |
| Matrix Spike | Strontium (Sr)-Dissolved | MS-B | L1880962-1, -2, -3 |
| Matrix Spike | Sulfur (S)-Dissolved | MS-B | L1880962-1, -2, -3 |
| Matrix Spike | Aluminum (Al)-Total | MS-B | L1880962-1, -2, -3 |
| Matrix Spike | Barium (Ba)-Total | MS-B | L1880962-1, -2, -3 |
| Matrix Spike | Calcium (Ca)-Total | MS-B | L1880962-1, -2, -3 |
| Matrix Spike | Iron (Fe)-Total | MS-B | L1880962-1, -2, -3 |
| Matrix Spike | Magnesium (Mg)-Total | MS-B | L1880962-1, -2, -3 |
| Matrix Spike | Manganese (Mn)-Total | MS-B | L1880962-1, -2, -3 |
| Matrix Spike | Silicon (Si)-Total | MS-B | L1880962-1, -2, -3 |
| Matrix Spike | Sodium (Na)-Total | MS-B | L1880962-1, -2, -3 |
| Matrix Spike | Strontium (Sr)-Total | MS-B | L1880962-1, -2, -3 |
| Matrix Spike | Titanium (Ti)-Total | MS-B | L1880962-1, -2, -3 |

Qualifiers for Individual Parameters Listed:

| Qualifier | Description |
|-----------|--|
| DTC | Dissolved concentration exceeds total. Results were confirmed by re-analysis. |
| MS-B | Matrix Spike recovery could not be accurately calculated due to high analyte background in sample. |

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|--|--------|--|---------------------------------------|
| ALK-TITR-VA | Water | Alkalinity Species by Titration | APHA 2320 Alkalinity |
| This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values. | | | |
| ANIONS-N+N-CALC-VA | Water | Nitrite & Nitrate in Water (Calculation) | EPA 300.0 |
| Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N). | | | |
| BE-D-L-CCMS-VA | Water | Diss. Be (low) in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| BE-T-L-CCMS-VA | Water | Total Be (Low) in Water by CRC ICPMS | EPA 200.2/6020A (mod) |
| Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| CARBONS-DOC-VA | Water | Dissolved organic carbon by combustion | APHA 5310B TOTAL ORGANIC CARBON (TOC) |
| This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis. | | | |
| CL-IC-N-VA | Water | Chloride in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| EC-PCT-VA | Water | Conductivity (Automated) | APHA 2510 Auto. Conduc. |
| This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode. | | | |
| EC-SCREEN-VA | Water | Conductivity Screen (Internal Use Only) | APHA 2510 |
| Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc. | | | |
| | | Hardness | APHA 2340B |

Reference Information

| | | | |
|---|-------|--|---|
| HARDNESS-CALC-VA | Water | | |
| Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO ₃ equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation. | | | |
| HG-D-CVAA-VA | Water | Diss. Mercury in Water by CVAAS or CVAFS | APHA 3030B/EPA 1631E (mod) |
| Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | | | |
| HG-T-CVAA-VA | Water | Total Mercury in Water by CVAAS or CVAFS | EPA 1631E (mod) |
| Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | | | |
| IONBALANCE-VA | Water | Ion Balance Calculation | APHA 1030E |
| Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero. | | | |
| Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as: | | | |
| Ion Balance (%) = [Cation Sum-Anion Sum] / [Cation Sum+Anion Sum] | | | |
| MET-D-CCMS-VA | Water | Dissolved Metals in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| MET-T-CCMS-VA | Water | Total Metals in Water by CRC ICPMS | EPA 200.2/6020A (mod) |
| Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| NH3-F-VA | Water | Ammonia in Water by Fluorescence | APHA 4500 NH3-NITROGEN (AMMONIA) |
| This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al. | | | |
| NH3-F-VA | Water | Ammonia in Water by Fluorescence | J. ENVIRON. MONIT., 2005, 7, 37-42, RSC |
| This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al. | | | |
| NO2-L-IC-N-VA | Water | Nitrite in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| NO3-L-IC-N-VA | Water | Nitrate in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| PH-PCT-VA | Water | pH by Meter (Automated) | APHA 4500-H "pH Value" |
| This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode | | | |
| It is recommended that this analysis be conducted in the field. | | | |
| PH-PCT-VA | Water | pH by Meter (Automated) | APHA 4500-H pH Value |
| This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode | | | |
| It is recommended that this analysis be conducted in the field. | | | |
| SO4-IC-N-VA | Water | Sulfate in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| TDS-CALC-VA | Water | TDS (Calculated) | APHA 1030E (20TH EDITION) |
| This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses". The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample. | | | |
| TSS-VA | Water | Total Suspended Solids by Gravimetric | APHA 2540 D - GRAVIMETRIC |

Reference Information

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location |
|----------------------------|---|
| VA | ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA |

Chain of Custody Numbers:

2017-01-18A

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Reference Information

QC Samples with Qualifiers & Comments:

| QC Type Description | Parameter | Qualifier | Applies to Sample Number(s) |
|---------------------|------------------------------|-----------|-----------------------------|
| Method Blank | Alkalinity, Total (as CaCO3) | B | L1883599-4 |
| Matrix Spike | Dissolved Organic Carbon | MS-B | L1883599-1, -2, -4 |
| Matrix Spike | Calcium (Ca)-Dissolved | MS-B | L1883599-1, -2, -3, -4 |
| Matrix Spike | Magnesium (Mg)-Dissolved | MS-B | L1883599-1, -2, -3, -4 |
| Matrix Spike | Manganese (Mn)-Dissolved | MS-B | L1883599-1, -2, -3, -4 |
| Matrix Spike | Sodium (Na)-Dissolved | MS-B | L1883599-1, -2, -3, -4 |
| Matrix Spike | Strontium (Sr)-Dissolved | MS-B | L1883599-1, -2, -3, -4 |
| Matrix Spike | Sulfur (S)-Dissolved | MS-B | L1883599-1, -2, -3, -4 |
| Matrix Spike | Aluminum (Al)-Total | MS-B | L1883599-1, -2, -3, -4 |
| Matrix Spike | Barium (Ba)-Total | MS-B | L1883599-1, -2, -3, -4 |
| Matrix Spike | Calcium (Ca)-Total | MS-B | L1883599-1, -2, -3, -4 |
| Matrix Spike | Magnesium (Mg)-Total | MS-B | L1883599-1, -2, -3, -4 |
| Matrix Spike | Manganese (Mn)-Total | MS-B | L1883599-1, -2, -3, -4 |
| Matrix Spike | Potassium (K)-Total | MS-B | L1883599-1, -2, -3, -4 |
| Matrix Spike | Silicon (Si)-Total | MS-B | L1883599-1, -2, -3, -4 |
| Matrix Spike | Sodium (Na)-Total | MS-B | L1883599-1, -2, -3, -4 |
| Matrix Spike | Strontium (Sr)-Total | MS-B | L1883599-1, -2, -3, -4 |
| Matrix Spike | Sulfur (S)-Total | MS-B | L1883599-1, -2, -3, -4 |
| Matrix Spike | Sulfate (SO4) | MS-B | L1883599-1, -2, -3, -4 |

Qualifiers for Individual Parameters Listed:

| Qualifier | Description |
|-----------|---|
| B | Method Blank exceeds ALS DQO. All associated sample results are at least 5 times greater than blank levels and are considered reliable. |
| MS-B | Matrix Spike recovery could not be accurately calculated due to high analyte background in sample. |

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|--|--------|--|---------------------------------------|
| ALK-TITR-VA | Water | Alkalinity Species by Titration | APHA 2320 Alkalinity |
| This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values. | | | |
| ANIONS-N+N-CALC-VA | Water | Nitrite & Nitrate in Water (Calculation) | EPA 300.0 |
| Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N). | | | |
| BE-D-L-CCMS-VA | Water | Diss. Be (low) in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| BE-T-L-CCMS-VA | Water | Total Be (Low) in Water by CRC ICPMS | EPA 200.2/6020A (mod) |
| Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| CARBONS-DOC-VA | Water | Dissolved organic carbon by combustion | APHA 5310B TOTAL ORGANIC CARBON (TOC) |
| This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis. | | | |
| CL-IC-N-VA | Water | Chloride in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| EC-PCT-VA | Water | Conductivity (Automated) | APHA 2510 Auto. Conduc. |
| This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode. | | | |
| EC-SCREEN-VA | Water | Conductivity Screen (Internal Use Only) | APHA 2510 |
| Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc. | | | |

Reference Information

| | | | |
|---|-------|--|---|
| HARDNESS-CALC-VA | Water | Hardness | APHA 2340B |
| Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO ₃ equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation. | | | |
| HG-D-CVAA-VA | Water | Diss. Mercury in Water by CVAAS or CVAFS | APHA 3030B/EPA 1631E (mod) |
| Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | | | |
| HG-T-CVAA-VA | Water | Total Mercury in Water by CVAAS or CVAFS | EPA 1631E (mod) |
| Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | | | |
| IONBALANCE-VA | Water | Ion Balance Calculation | APHA 1030E |
| Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero. | | | |
| Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as: | | | |
| Ion Balance (%) = [Cation Sum-Anion Sum] / [Cation Sum+Anion Sum] | | | |
| MET-D-CCMS-VA | Water | Dissolved Metals in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| MET-T-CCMS-VA | Water | Total Metals in Water by CRC ICPMS | EPA 200.2/6020A (mod) |
| Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| NH3-F-VA | Water | Ammonia in Water by Fluorescence | APHA 4500 NH3-NITROGEN (AMMONIA) |
| This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al. | | | |
| NH3-F-VA | Water | Ammonia in Water by Fluorescence | J. ENVIRON. MONIT., 2005, 7, 37-42, RSC |
| This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al. | | | |
| NO2-L-IC-N-VA | Water | Nitrite in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| NO3-L-IC-N-VA | Water | Nitrate in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| PH-PCT-VA | Water | pH by Meter (Automated) | APHA 4500-H "pH Value" |
| This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode | | | |
| It is recommended that this analysis be conducted in the field. | | | |
| PH-PCT-VA | Water | pH by Meter (Automated) | APHA 4500-H pH Value |
| This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode | | | |
| It is recommended that this analysis be conducted in the field. | | | |
| SO4-IC-N-VA | Water | Sulfate in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| TDS-CALC-VA | Water | TDS (Calculated) | APHA 1030E (20TH EDITION) |
| This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses". The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample. | | | |
| TSS-VA | Water | Total Suspended Solids by Gravimetric | APHA 2540 D - GRAVIMETRIC |

Reference Information

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location |
|----------------------------|---|
| VA | ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA |

Chain of Custody Numbers:

2017-01-25 A

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

QC Samples with Qualifiers & Comments:

| QC Type Description | Parameter | Qualifier | Applies to Sample Number(s) |
|---------------------|--------------------------|-----------|-----------------------------|
| Method Blank | Silicon (Si)-Total | MB-LOR | L1886060-1, -2, -3, -4 |
| Matrix Spike | Dissolved Organic Carbon | MS-B | L1886060-1, -2, -4 |
| Matrix Spike | Dissolved Organic Carbon | MS-B | L1886060-1, -2, -4 |
| Matrix Spike | Barium (Ba)-Dissolved | MS-B | L1886060-1, -2, -3, -4 |
| Matrix Spike | Calcium (Ca)-Dissolved | MS-B | L1886060-1, -2, -3, -4 |
| Matrix Spike | Magnesium (Mg)-Dissolved | MS-B | L1886060-1, -2, -3, -4 |
| Matrix Spike | Manganese (Mn)-Dissolved | MS-B | L1886060-1, -2, -3, -4 |
| Matrix Spike | Sodium (Na)-Dissolved | MS-B | L1886060-1, -2, -3, -4 |
| Matrix Spike | Strontium (Sr)-Dissolved | MS-B | L1886060-1, -2, -3, -4 |
| Matrix Spike | Barium (Ba)-Total | MS-B | L1886060-1, -2, -3, -4 |
| Matrix Spike | Calcium (Ca)-Total | MS-B | L1886060-1, -2, -3, -4 |
| Matrix Spike | Magnesium (Mg)-Total | MS-B | L1886060-1, -2, -3, -4 |
| Matrix Spike | Strontium (Sr)-Total | MS-B | L1886060-1, -2, -3, -4 |

Qualifiers for Individual Parameters Listed:

| Qualifier | Description |
|-----------|---|
| MB-LOR | Method Blank exceeds ALS DQO. Limits of Reporting have been adjusted for samples with positive hits below 5x blank level. |
| MS-B | Matrix Spike recovery could not be accurately calculated due to high analyte background in sample. |

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|--|--------|--|---------------------------------------|
| ALK-TITR-VA | Water | Alkalinity Species by Titration | APHA 2320 Alkalinity |
| This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values. | | | |
| ANIONS-N+N-CALC-VA | Water | Nitrite & Nitrate in Water (Calculation) | EPA 300.0 |
| Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N). | | | |
| BE-D-L-CCMS-VA | Water | Diss. Be (low) in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| BE-T-L-CCMS-VA | Water | Total Be (Low) in Water by CRC ICPMS | EPA 200.2/6020A (mod) |
| Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| CARBONS-DOC-VA | Water | Dissolved organic carbon by combustion | APHA 5310B TOTAL ORGANIC CARBON (TOC) |
| This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis. | | | |
| CL-IC-N-VA | Water | Chloride in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| EC-PCT-VA | Water | Conductivity (Automated) | APHA 2510 Auto. Conduc. |
| This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode. | | | |
| EC-SCREEN-VA | Water | Conductivity Screen (Internal Use Only) | APHA 2510 |
| Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc. | | | |
| HARDNESS-CALC-VA | Water | Hardness | APHA 2340B |
| Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation. | | | |
| HG-D-CVAA-VA | Water | Diss. Mercury in Water by CVAAS or CVAFS | APHA 3030B/EPA 1631E (mod) |
| Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | | | |
| HG-T-CVAA-VA | Water | Total Mercury in Water by CVAAS or CVAFS | EPA 1631E (mod) |

Reference Information

Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.

IONBALANCE-VA Water Ion Balance Calculation APHA 1030E

Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero.

Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as:

$$\text{Ion Balance (\%)} = \frac{[\text{Cation Sum} - \text{Anion Sum}]}{[\text{Cation Sum} + \text{Anion Sum}]}$$

MET-D-CCMS-VA Water Dissolved Metals in Water by CRC ICPMS APHA 3030B/6020A (mod)

Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

MET-T-CCMS-VA Water Total Metals in Water by CRC ICPMS EPA 200.2/6020A (mod)

Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

NH3-F-VA Water Ammonia in Water by Fluorescence APHA 4500 NH3-NITROGEN (AMMONIA)

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NH3-F-VA Water Ammonia in Water by Fluorescence J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NO2-L-IC-N-VA Water Nitrite in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO3-L-IC-N-VA Water Nitrate in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H "pH Value"

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

SO4-IC-N-VA Water Sulfate in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

TDS-CALC-VA Water TDS (Calculated) APHA 1030E (20TH EDITION)

This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses". The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample.

TSS-VA Water Total Suspended Solids by Gravimetric APHA 2540 D - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location |
|----------------------------|---------------------|
|----------------------------|---------------------|

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

| Matrix Spike | Magnesium (Mg)-Total | MS-B | L1889375-1, -2, -3 |
| Matrix Spike | Manganese (Mn)-Total | MS-B | L1889375-1, -2, -3 |
| Matrix Spike | Potassium (K)-Total | MS-B | L1889375-1, -2, -3 |
| Matrix Spike | Sodium (Na)-Total | MS-B | L1889375-1, -2, -3 |
| Matrix Spike | Strontium (Sr)-Total | MS-B | L1889375-1, -2, -3 |
| Matrix Spike | Sulfur (S)-Total | MS-B | L1889375-1, -2, -3 |
| Matrix Spike | Uranium (U)-Total | MS-B | L1889375-1, -2, -3 |
| Matrix Spike | Sulfate (SO4) | MS-B | L1889375-1, -2, -3 |

Qualifiers for Individual Parameters Listed:

| Qualifier | Description |
|-----------|---|
| DLB | Detection Limit Raised. Analyte detected at comparable level in Method Blank. |
| DLDS | Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity. |
| DTC | Dissolved concentration exceeds total. Results were confirmed by re-analysis. |
| MB-LOR | Method Blank exceeds ALS DQO. Limits of Reporting have been adjusted for samples with positive hits below 5x blank level. |
| MS-B | Matrix Spike recovery could not be accurately calculated due to high analyte background in sample. |

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|--|--------|--|---------------------------------------|
| ALK-TITR-VA | Water | Alkalinity Species by Titration | APHA 2320 Alkalinity |
| This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values. | | | |
| ANIONS-N+N-CALC-VA | Water | Nitrite & Nitrate in Water (Calculation) | EPA 300.0 |
| Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N). | | | |
| BE-D-L-CCMS-VA | Water | Diss. Be (low) in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| BE-T-L-CCMS-VA | Water | Total Be (Low) in Water by CRC ICPMS | EPA 200.2/6020A (mod) |
| Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| BR-L-IC-N-VA | Water | Bromide in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| CARBONS-DOC-VA | Water | Dissolved organic carbon by combustion | APHA 5310B TOTAL ORGANIC CARBON (TOC) |
| This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis. | | | |
| CL-IC-N-VA | Water | Chloride in Water by IC | EPA 300.1 (mod) |

Reference Information

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

EC-PCT-VA Water Conductivity (Automated) APHA 2510 Auto. Conduc.

This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode.

EC-SCREEN-VA Water Conductivity Screen (Internal Use Only) APHA 2510

Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc.

F-IC-N-VA Water Fluoride in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

HARDNESS-CALC-VA Water Hardness APHA 2340B

Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO₃ equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation.

HG-D-CVAA-VA Water Diss. Mercury in Water by CVAAS or CVAFS APHA 3030B/EPA 1631E (mod)

Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.

HG-T-CVAA-VA Water Total Mercury in Water by CVAAS or CVAFS EPA 1631E (mod)

Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.

IONBALANCE-VA Water Ion Balance Calculation APHA 1030E

Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero.

Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as:

Ion Balance (%) = [Cation Sum-Anion Sum] / [Cation Sum+Anion Sum]

MET-D-CCMS-VA Water Dissolved Metals in Water by CRC ICPMS APHA 3030B/6020A (mod)

Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

MET-T-CCMS-VA Water Total Metals in Water by CRC ICPMS EPA 200.2/6020A (mod)

Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

NH3-F-VA Water Ammonia in Water by Fluorescence APHA 4500 NH3-NITROGEN (AMMONIA)

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NH3-F-VA Water Ammonia in Water by Fluorescence J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NO2-L-IC-N-VA Water Nitrite in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO3-L-IC-N-VA Water Nitrate in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H "pH Value"

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H pH Value

Reference Information

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

SO4-IC-N-VA Water Sulfate in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

TDS-VA Water Total Dissolved Solids by Gravimetric APHA 2540 C - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, TDS is determined by evaporating the filtrate to dryness at 180 degrees celsius.

TSS-VA Water Total Suspended Solids by Gravimetric APHA 2540 D - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location |
|----------------------------|---|
| VA | ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA |

Chain of Custody Numbers:

2017-02-08 A

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

| Matrix Spike | Strontium (Sr)-Total | MS-B | L1891149-1, -2, -3, -4, -5 |

Qualifiers for Individual Parameters Listed:

| Qualifier | Description |
|-----------|---|
| DLA | Detection Limit adjusted for required dilution |
| DLDS | Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity. |
| HTD | Hold time exceeded for re-analysis or dilution, but initial testing was conducted within hold time. |
| MS-B | Matrix Spike recovery could not be accurately calculated due to high analyte background in sample. |

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|--|--------|--|---------------------------------------|
| ALK-TITR-VA | Water | Alkalinity Species by Titration | APHA 2320 Alkalinity |
| This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values. | | | |
| ANIONS-N+N-CALC-VA | Water | Nitrite & Nitrate in Water (Calculation) | EPA 300.0 |
| Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N). | | | |
| BE-D-L-CCMS-VA | Water | Diss. Be (low) in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| BE-T-L-CCMS-VA | Water | Total Be (Low) in Water by CRC ICPMS | EPA 200.2/6020A (mod) |
| Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| CARBONS-DOC-VA | Water | Dissolved organic carbon by combustion | APHA 5310B TOTAL ORGANIC CARBON (TOC) |
| This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis. | | | |
| CL-IC-N-VA | Water | Chloride in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| EC-PCT-VA | Water | Conductivity (Automated) | APHA 2510 Auto. Conduc. |
| This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode. | | | |
| EC-SCREEN-VA | Water | Conductivity Screen (Internal Use Only) | APHA 2510 |

Reference Information

Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc.

HARDNESS-CALC-VA Water Hardness APHA 2340B

Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO₃ equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation.

HG-D-CVAA-VA Water Diss. Mercury in Water by CVAAS or CVAFS APHA 3030B/EPA 1631E (mod)

Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.

HG-T-CVAA-VA Water Total Mercury in Water by CVAAS or CVAFS EPA 1631E (mod)

Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.

IONBALANCE-VA Water Ion Balance Calculation APHA 1030E

Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero.

Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as:

Ion Balance (%) = $\frac{[\text{Cation Sum} - \text{Anion Sum}]}{[\text{Cation Sum} + \text{Anion Sum}]}$

MET-D-CCMS-VA Water Dissolved Metals in Water by CRC ICPMS APHA 3030B/6020A (mod)

Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

MET-T-CCMS-VA Water Total Metals in Water by CRC ICPMS EPA 200.2/6020A (mod)

Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

NH3-F-VA Water Ammonia in Water by Fluorescence APHA 4500 NH3-NITROGEN (AMMONIA)

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NH3-F-VA Water Ammonia in Water by Fluorescence J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NO2-L-IC-N-VA Water Nitrite in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO3-L-IC-N-VA Water Nitrate in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H "pH Value"

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

SO4-IC-N-VA Water Sulfate in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

TDS-VA Water Total Dissolved Solids by Gravimetric APHA 2540 C - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, TDS is determined by evaporating the filtrate to dryness at 180 degrees celsius.

Reference Information

TSS-VA Water Total Suspended Solids by Gravimetric APHA 2540 D - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location |
|----------------------------|---|
| VA | ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA |

Chain of Custody Numbers:

2017-02-15 A

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

| Method Blank | Chromium (Cr)-Total | MB-LOR | L1893598-1, -2, -3 |
| Matrix Spike | Aluminum (Al)-Total | MS-B | L1893598-1, -2, -3 |
| Matrix Spike | Barium (Ba)-Total | MS-B | L1893598-1, -2, -3 |
| Matrix Spike | Calcium (Ca)-Total | MS-B | L1893598-1, -2, -3 |
| Matrix Spike | Magnesium (Mg)-Total | MS-B | L1893598-1, -2, -3 |
| Matrix Spike | Manganese (Mn)-Total | MS-B | L1893598-1, -2, -3 |
| Matrix Spike | Sodium (Na)-Total | MS-B | L1893598-1, -2, -3 |
| Matrix Spike | Strontium (Sr)-Total | MS-B | L1893598-1, -2, -3 |

Qualifiers for Individual Parameters Listed:

| Qualifier | Description |
|-----------|---|
| DLA | Detection Limit adjusted for required dilution |
| DLB | Detection Limit Raised. Analyte detected at comparable level in Method Blank. |
| HTD | Hold time exceeded for re-analysis or dilution, but initial testing was conducted within hold time. |
| MB-LOR | Method Blank exceeds ALS DQO. Limits of Reporting have been adjusted for samples with positive hits below 5x blank level. |
| MS-B | Matrix Spike recovery could not be accurately calculated due to high analyte background in sample. |

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|--|--------|--|---------------------------------------|
| ALK-TITR-VA | Water | Alkalinity Species by Titration | APHA 2320 Alkalinity |
| This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values. | | | |
| ANIONS-N+N-CALC-VA | Water | Nitrite & Nitrate in Water (Calculation) | EPA 300.0 |
| Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N). | | | |
| BE-D-L-CCMS-VA | Water | Diss. Be (low) in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| BE-T-L-CCMS-VA | Water | Total Be (Low) in Water by CRC ICPMS | EPA 200.2/6020A (mod) |
| Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| CARBONS-DOC-VA | Water | Dissolved organic carbon by combustion | APHA 5310B TOTAL ORGANIC CARBON (TOC) |
| This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis. | | | |
| CL-IC-N-VA | Water | Chloride in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| EC-PCT-VA | Water | Conductivity (Automated) | APHA 2510 Auto. Conduc. |
| This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode. | | | |
| EC-SCREEN-VA | Water | Conductivity Screen (Internal Use Only) | APHA 2510 |
| Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc. | | | |
| HARDNESS-CALC-VA | Water | Hardness | APHA 2340B |
| Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation. | | | |
| HG-D-CVAA-VA | Water | Diss. Mercury in Water by CVAAS or CVAFS | APHA 3030B/EPA 1631E (mod) |
| Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | | | |
| HG-T-CVAA-VA | Water | Total Mercury in Water by CVAAS or CVAFS | EPA 1631E (mod) |
| Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | | | |

Reference Information

| | | | |
|---|-------|--|---|
| IONBALANCE-VA | Water | Ion Balance Calculation | APHA 1030E |
| <p>Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero.</p> <p>Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as:</p> <p style="margin-left: 20px;">Ion Balance (%) = [Cation Sum-Anion Sum] / [Cation Sum+Anion Sum]</p> | | | |
| MET-D-CCMS-VA | Water | Dissolved Metals in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| <p>Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.</p> <p>Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.</p> | | | |
| MET-T-CCMS-VA | Water | Total Metals in Water by CRC ICPMS | EPA 200.2/6020A (mod) |
| <p>Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.</p> <p>Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.</p> | | | |
| NH3-F-VA | Water | Ammonia in Water by Fluorescence | APHA 4500 NH3-NITROGEN (AMMONIA) |
| <p>This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.</p> | | | |
| NH3-F-VA | Water | Ammonia in Water by Fluorescence | J. ENVIRON. MONIT., 2005, 7, 37-42, RSC |
| <p>This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.</p> | | | |
| NO2-L-IC-N-VA | Water | Nitrite in Water by IC (Low Level) | EPA 300.1 (mod) |
| <p>Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.</p> | | | |
| NO3-L-IC-N-VA | Water | Nitrate in Water by IC (Low Level) | EPA 300.1 (mod) |
| <p>Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.</p> | | | |
| PH-PCT-VA | Water | pH by Meter (Automated) | APHA 4500-H "pH Value" |
| <p>This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode</p> <p>It is recommended that this analysis be conducted in the field.</p> | | | |
| PH-PCT-VA | Water | pH by Meter (Automated) | APHA 4500-H pH Value |
| <p>This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode</p> <p>It is recommended that this analysis be conducted in the field.</p> | | | |
| SO4-IC-N-VA | Water | Sulfate in Water by IC | EPA 300.1 (mod) |
| <p>Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.</p> | | | |
| TDS-VA | Water | Total Dissolved Solids by Gravimetric | APHA 2540 C - GRAVIMETRIC |
| <p>This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, TDS is determined by evaporating the filtrate to dryness at 180 degrees celsius.</p> | | | |
| TSS-VA | Water | Total Suspended Solids by Gravimetric | APHA 2540 D - GRAVIMETRIC |
| <p>This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.</p> | | | |

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location |
|----------------------------|---|
| VA | ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA |

Reference Information

Chain of Custody Numbers:

2017-02-22 B

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg ww - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Reference Information

QC Samples with Qualifiers & Comments:

| QC Type Description | Parameter | Qualifier | Applies to Sample Number(s) |
|---------------------|---------------------------|-----------|-----------------------------|
| Matrix Spike | Barium (Ba)-Dissolved | MS-B | L1896303-1, -2, -3, -4 |
| Matrix Spike | Calcium (Ca)-Dissolved | MS-B | L1896303-1, -2, -3, -4 |
| Matrix Spike | Magnesium (Mg)-Dissolved | MS-B | L1896303-1, -2, -3, -4 |
| Matrix Spike | Manganese (Mn)-Dissolved | MS-B | L1896303-1, -2, -3, -4 |
| Matrix Spike | Molybdenum (Mo)-Dissolved | MS-B | L1896303-1, -2, -3, -4 |
| Matrix Spike | Potassium (K)-Dissolved | MS-B | L1896303-1, -2, -3, -4 |
| Matrix Spike | Sodium (Na)-Dissolved | MS-B | L1896303-1, -2, -3, -4 |
| Matrix Spike | Strontium (Sr)-Dissolved | MS-B | L1896303-1, -2, -3, -4 |
| Matrix Spike | Sulfur (S)-Dissolved | MS-B | L1896303-1, -2, -3, -4 |
| Matrix Spike | Calcium (Ca)-Total | MS-B | L1896303-1, -2, -3, -4 |
| Matrix Spike | Magnesium (Mg)-Total | MS-B | L1896303-1, -2, -3, -4 |
| Matrix Spike | Strontium (Sr)-Total | MS-B | L1896303-1, -2, -3, -4 |
| Matrix Spike | Sulfur (S)-Total | MS-B | L1896303-1, -2, -3, -4 |

Qualifiers for Individual Parameters Listed:

| Qualifier | Description |
|-----------|--|
| DLA | Detection Limit adjusted for required dilution |
| DLDS | Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity. |
| MS-B | Matrix Spike recovery could not be accurately calculated due to high analyte background in sample. |

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|--|--------|--|---------------------------------------|
| ALK-TITR-VA | Water | Alkalinity Species by Titration | APHA 2320 Alkalinity |
| This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values. | | | |
| ANIONS-N+N-CALC-VA | Water | Nitrite & Nitrate in Water (Calculation) | EPA 300.0 |
| Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N). | | | |
| BE-D-L-CCMS-VA | Water | Diss. Be (low) in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| BE-T-L-CCMS-VA | Water | Total Be (Low) in Water by CRC ICPMS | EPA 200.2/6020A (mod) |
| Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| BR-L-IC-N-VA | Water | Bromide in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| CARBONS-DOC-VA | Water | Dissolved organic carbon by combustion | APHA 5310B TOTAL ORGANIC CARBON (TOC) |
| This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis. | | | |
| CL-IC-N-VA | Water | Chloride in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| EC-PCT-VA | Water | Conductivity (Automated) | APHA 2510 Auto. Conduc. |
| This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode. | | | |
| EC-SCREEN-VA | Water | Conductivity Screen (Internal Use Only) | APHA 2510 |
| Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc. | | | |
| F-IC-N-VA | Water | Fluoride in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |

Reference Information

| | | | |
|---|-------|--|---|
| HARDNESS-CALC-VA | Water | Hardness | APHA 2340B |
| Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO ₃ equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation. | | | |
| HG-D-CVAA-VA | Water | Diss. Mercury in Water by CVAAS or CVAFS | APHA 3030B/EPA 1631E (mod) |
| Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | | | |
| HG-T-CVAA-VA | Water | Total Mercury in Water by CVAAS or CVAFS | EPA 1631E (mod) |
| Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | | | |
| IONBALANCE-VA | Water | Ion Balance Calculation | APHA 1030E |
| Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero. | | | |
| Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as: | | | |
| Ion Balance (%) = [Cation Sum-Anion Sum] / [Cation Sum+Anion Sum] | | | |
| MET-D-CCMS-VA | Water | Dissolved Metals in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| MET-T-CCMS-VA | Water | Total Metals in Water by CRC ICPMS | EPA 200.2/6020A (mod) |
| Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| NH3-F-VA | Water | Ammonia in Water by Fluorescence | APHA 4500 NH3-NITROGEN (AMMONIA) |
| This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al. | | | |
| NH3-F-VA | Water | Ammonia in Water by Fluorescence | J. ENVIRON. MONIT., 2005, 7, 37-42, RSC |
| This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al. | | | |
| NO2-L-IC-N-VA | Water | Nitrite in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| NO3-L-IC-N-VA | Water | Nitrate in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| PH-PCT-VA | Water | pH by Meter (Automated) | APHA 4500-H "pH Value" |
| This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode | | | |
| It is recommended that this analysis be conducted in the field. | | | |
| PH-PCT-VA | Water | pH by Meter (Automated) | APHA 4500-H pH Value |
| This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode | | | |
| It is recommended that this analysis be conducted in the field. | | | |
| SO4-IC-N-VA | Water | Sulfate in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| TDS-VA | Water | Total Dissolved Solids by Gravimetric | APHA 2540 C - GRAVIMETRIC |
| This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, TDS is determined by evaporating the filtrate to dryness at 180 degrees celsius. | | | |
| TSS-VA | Water | Total Suspended Solids by Gravimetric | APHA 2540 D - GRAVIMETRIC |

Reference Information

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location |
|----------------------------|---|
| VA | ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA |

Chain of Custody Numbers:

2017-03-01 A

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

| Matrix Spike | Sodium (Na)-Total | MS-B | L1898839-1, -7, -8 |
| Matrix Spike | Strontium (Sr)-Total | MS-B | L1898839-3, -4, -5, -6 |
| Matrix Spike | Strontium (Sr)-Total | MS-B | L1898839-1, -7, -8 |

Qualifiers for Individual Parameters Listed:

| Qualifier | Description |
|-----------|--|
| DLA | Detection Limit adjusted for required dilution |
| DLM | Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity). |
| MS-B | Matrix Spike recovery could not be accurately calculated due to high analyte background in sample. |
| RRV | Reported Result Verified By Repeat Analysis |

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|--|--------|--|---------------------------------------|
| ALK-TITR-VA | Water | Alkalinity Species by Titration | APHA 2320 Alkalinity |
| This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values. | | | |
| ANIONS-N+N-CALC-VA | Water | Nitrite & Nitrate in Water (Calculation) | EPA 300.0 |
| Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N). | | | |
| BE-D-L-CCMS-VA | Water | Diss. Be (low) in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| BE-T-L-CCMS-VA | Water | Total Be (Low) in Water by CRC ICPMS | EPA 200.2/6020A (mod) |
| Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| CARBONS-DOC-VA | Water | Dissolved organic carbon by combustion | APHA 5310B TOTAL ORGANIC CARBON (TOC) |
| This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis. | | | |
| CL-IC-N-VA | Water | Chloride in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| EC-PCT-VA | Water | Conductivity (Automated) | APHA 2510 Auto. Conduc. |
| This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode. | | | |

Reference Information

| | | | |
|---|-------|--|---|
| EC-SCREEN-VA | Water | Conductivity Screen (Internal Use Only) | APHA 2510 |
| Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc. | | | |
| HARDNESS-CALC-VA | Water | Hardness | APHA 2340B |
| Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO ₃ equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation. | | | |
| HG-D-CVAA-VA | Water | Diss. Mercury in Water by CVAAS or CVAFS | APHA 3030B/EPA 1631E (mod) |
| Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | | | |
| HG-T-CVAA-VA | Water | Total Mercury in Water by CVAAS or CVAFS | EPA 1631E (mod) |
| Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | | | |
| IONBALANCE-VA | Water | Ion Balance Calculation | APHA 1030E |
| Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero. | | | |
| Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as: | | | |
| $\text{Ion Balance (\%)} = \frac{[\text{Cation Sum} - \text{Anion Sum}]}{[\text{Cation Sum} + \text{Anion Sum}]}$ | | | |
| MET-D-CCMS-VA | Water | Dissolved Metals in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| MET-T-CCMS-VA | Water | Total Metals in Water by CRC ICPMS | EPA 200.2/6020A (mod) |
| Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| NH3-F-VA | Water | Ammonia in Water by Fluorescence | APHA 4500 NH3-NITROGEN (AMMONIA) |
| This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al. | | | |
| NH3-F-VA | Water | Ammonia in Water by Fluorescence | J. ENVIRON. MONIT., 2005, 7, 37-42, RSC |
| This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al. | | | |
| NO2-L-IC-N-VA | Water | Nitrite in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| NO3-L-IC-N-VA | Water | Nitrate in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| PH-PCT-VA | Water | pH by Meter (Automated) | APHA 4500-H "pH Value" |
| This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode | | | |
| It is recommended that this analysis be conducted in the field. | | | |
| PH-PCT-VA | Water | pH by Meter (Automated) | APHA 4500-H pH Value |
| This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode | | | |
| It is recommended that this analysis be conducted in the field. | | | |
| SO4-IC-N-VA | Water | Sulfate in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| TDS-VA | Water | Total Dissolved Solids by Gravimetric | APHA 2540 C - GRAVIMETRIC |

Reference Information

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, TDS is determined by evaporating the filtrate to dryness at 180 degrees celsius.

TSS-VA Water Total Suspended Solids by Gravimetric APHA 2540 D - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location |
|----------------------------|---|
| VA | ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA |

Chain of Custody Numbers:

2017-03-08A

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

L1898839-COFC

Qualifiers for Individual Parameters Listed:

| Qualifier | Description |
|-----------|--|
| DLA | Detection Limit adjusted for required dilution |
| DTC | Dissolved concentration exceeds total. Results were confirmed by re-analysis. |
| MS-B | Matrix Spike recovery could not be accurately calculated due to high analyte background in sample. |

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|---|--------|--|---------------------------------------|
| ALK-TITR-VA | Water | Alkalinity Species by Titration | APHA 2320 Alkalinity |
| This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values. | | | |
| ANIONS-N+N-CALC-VA | Water | Nitrite & Nitrate in Water (Calculation) | EPA 300.0 |
| Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N). | | | |
| BE-D-L-CCMS-VA | Water | Diss. Be (low) in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| BE-T-L-CCMS-VA | Water | Total Be (Low) in Water by CRC ICPMS | EPA 200.2/6020A (mod) |
| Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| CARBONS-DOC-VA | Water | Dissolved organic carbon by combustion | APHA 5310B TOTAL ORGANIC CARBON (TOC) |
| This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis. | | | |
| CL-IC-N-VA | Water | Chloride in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| EC-PCT-VA | Water | Conductivity (Automated) | APHA 2510 Auto. Conduc. |
| This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode. | | | |
| EC-SCREEN-VA | Water | Conductivity Screen (Internal Use Only) | APHA 2510 |
| Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc. | | | |
| HARDNESS-CALC-VA | Water | Hardness | APHA 2340B |
| Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation. | | | |
| HG-D-CVAA-VA | Water | Diss. Mercury in Water by CVAAS or CVAFS | APHA 3030B/EPA 1631E (mod) |
| Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | | | |
| HG-T-CVAA-VA | Water | Total Mercury in Water by CVAAS or CVAFS | EPA 1631E (mod) |
| Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | | | |
| IONBALANCE-VA | Water | Ion Balance Calculation | APHA 1030E |
| Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero. | | | |

Reference Information

Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as:

$$\text{Ion Balance (\%)} = \frac{[\text{Cation Sum} - \text{Anion Sum}]}{[\text{Cation Sum} + \text{Anion Sum}]}$$

MET-D-CCMS-VA Water Dissolved Metals in Water by CRC ICPMS APHA 3030B/6020A (mod)

Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

MET-T-CCMS-VA Water Total Metals in Water by CRC ICPMS EPA 200.2/6020A (mod)

Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

NH3-F-VA Water Ammonia in Water by Fluorescence APHA 4500 NH3-NITROGEN (AMMONIA)

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NH3-F-VA Water Ammonia in Water by Fluorescence J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NO2-L-IC-N-VA Water Nitrite in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO3-L-IC-N-VA Water Nitrate in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H "pH Value"

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

RA226-MMER-FC Water Ra226 by Alpha Scint, MDC=0.01 Bq/L EPA 903.1

SO4-IC-N-VA Water Sulfate in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

TDS-VA Water Total Dissolved Solids by Gravimetric APHA 2540 C - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, TDS is determined by evaporating the filtrate to dryness at 180 degrees celsius.

TSS-VA Water Total Suspended Solids by Gravimetric APHA 2540 D - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location |

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Re: ALS Workorder: 1703321
Project Name:
Project Number: L1901651

Dear Ms. Worku:

One water sample was received from ALS Environmental, on 3/17/2017. The sample was scheduled for the following analysis:

Radium-226

The results for these analyses are contained in the enclosed reports.

The data contained in the following report have been reviewed and approved by the personnel listed below. In addition, ALS certifies that the analyses reported herein are true, complete and correct within the limits of the methods employed.

Thank you for your confidence in ALS Environmental. Should you have any questions, please call.

Sincerely,

ALS Environmental
Shiloh J. Summy
Project Manager

ALS Environmental – Fort Collins is accredited by the following accreditation bodies for various testing scopes in accordance with requirements of each accreditation body. All testing is performed under the laboratory management system, which is maintained to meet these requirement and regulations. Please contact the laboratory or accreditation body for the current scope testing parameters.

1703321

Radium-226:

The sample was prepared and analyzed according to the current revision of SOP 783.

All acceptance criteria were met, with the following exception:

The requested MDC for ^{226}Ra was not met for RE170322-2MB. The activity for the sample is 5 times greater than the achieved MDC of the method blank. Results are submitted without further qualification.

DEFINITIONS: On the Air Waybill 'We', 'Our', 'us' and 'FedEx' refer to Federal Express Corporation, its subsidiaries and branches and their respective employees, agents and independent contractors. 'You' and 'your' refer to the shipper, its employees, principals and agents. If your shipment originates outside the United States, your contract of carriage is with the Federal Express subsidiary, branch or independent contractor who originally accepts the shipment from you. 'Package' means any container or envelope that is accepted by us for delivery, including any such items tendered by you utilizing our automated systems, meters, manifests or waybills. 'Shipment' means all packages, which are tendered to and accepted by us on a single Air Waybill.

AGREEMENT TO TERMS: By giving us your shipment, you agree, regardless of whether you sign the front of this Air Waybill, for yourself and as agent for and on behalf of any other person having an interest in this shipment, to all terms on this NON-NEGOTIABLE Air Waybill. In any applicable tariff, and in our current Service Guide or Standard Conditions of Carriage, copies of which are available upon request. If there is a conflict between this Air Waybill and either the tariff, Service Guide or Standard Conditions then in effect, the tariff and the terms of any customer automation agreement between the shipper and Federal Express will control (the Service Guide or Standard Conditions have secondary priority). No one is authorized to alter or modify the terms of our agreement. This Air Waybill shall be binding on us when the shipment is accepted.

YOUR OBLIGATIONS: You warrant that each article in the shipment is properly described on this Air Waybill and is acceptable for transport by us, and that the shipment is properly marked, addressed (including postal codes) and packaged to ensure safe transportation with ordinary care in handling.

NOTE CONCERNING LIMITATIONS OF LIABILITY - Air Carriage Notice. If the carriage of your shipment by air involves an ultimate destination or stop in a country other than the country of departure, the Warsaw Convention, an international treaty relating to international carriage by air, may be applicable, which treaty would then govern and in most cases limit our liability for loss or delay of or damage to your shipment. In the U.S. the Warsaw Convention limits our liability to U.S. \$8.07 per pound (U.S. \$20.38 per kilogram). Unless you declare a higher value for carriage as described below. The interpretation of the Warsaw Convention liability limits may vary in other countries. There are no stopping places which are agreed at the time of tender of the shipment and we reserve the right to route shipments in any way we deem appropriate.

Road Transport Notice. Shipments transported partly or solely by road be it explicit agreement to do so or not-in, to, from a country which is party to the Convention on the International Carriage of Goods by Road (the 'CMR') are subject to the terms and conditions of the CMR, notwithstanding any other provisions of this Agreement to the contrary. For these shipments transported solely by road, if a conflict arises between the provisions of the CMR and this Air Waybill the terms of the CMR shall prevail.

Limitation of Liability, if not governed by the Warsaw Convention or the CMR as described above, our maximum liability for loss, damage or delay is limited by this Air Waybill to U.S. \$100 per shipment or U.S. \$9.07 per pound (U.S. \$20.38 per kilogram) (or equivalent local currency), whichever is greater, unless you declare a higher value for carriage as described below. FedEx does not provide cargo liability or all-risk insurance, but you may pay an additional charge to each additional U.S. \$100 (or equivalent local currency) of declared value for carriage. If a higher value for carriage is declared and the additional charge is paid, FedEx maximum liability will be the lesser of the declared value for carriage or your actual damages.

LIABILITIES NOT ASSUMED, IN ANY EVENT, WE WON'T BE LIABLE FOR ANY DAMAGES WHETHER DIRECT, INCIDENTAL, SPECIAL OR CONSEQUENTIAL, IN EXCESS OF THE DECLARED VALUE FOR CARRIAGE (INCLUDING BUT NOT LIMITED TO LOSS OF INCOME OR PROFITS) WHETHER OR NOT WE HAD ANY KNOWLEDGE THAT SUCH DAMAGES MIGHT BE INCURRED, UNLESS SUCH DAMAGES WERE CAUSED BY OUR OWN WILLFUL MICONDUCT OR GROSS NEGLIGENCE.

We won't be liable for your actions or omissions, including but not limited to incorrect declaration of cargo, improper or insufficient packing, securing, marking or addressing of the shipment, or for the acts or omissions of the recipient or anyone else with an interest in the shipment. Also we won't be liable if you (or) the recipient violate any of the terms of our agreement. We won't be liable for loss of or damage to shipments of cash, currency or other prohibited items. We won't be liable for loss, damages or delay caused by events we cannot control, including but not limited to acts of God, perils of the air, weather conditions mechanical delays, acts of public enemies, war, strikes, civil commotions, or acts or omissions of public authorities (including customs and health officials) with actual or apparent authority.

NO WARRANTIES. We make no warranties, express or implied.
CLAIM FOR LOSS, DAMAGE FOR DELAY. ALL CLAIMS MUST BE NOTIFIED TO US WITHIN 15 DAYS AFTER DELIVERY OF THE SHIPMENT FAILING WHICH NO ACTION FOR DAMAGES MAY BE BROUGHT. All claims for loss, non-delivery or mis-delivery must be received by us within 90 days after the shipment is accepted by us. The right to damages against us shall be extinguished unless an action is brought within two years from the date of delivery of the shipment or from date on which the shipment should have been delivered. Within 30 days after notification to us (of) the claim, it must be documented by sending us all relevant information about it. We are not obligated to act on any claim until all transportation charges have been paid; the claim amount may not be deducted from those charges. If the recipient accepts the shipment without noting any damage on the delivery record, we will assume the shipment was delivered in good condition. In order for us to consider a claim for damages, the contents, original shipping cartons, and packing must be available to us for inspection.

RIGHT TO INSPECT. Your shipment may, at our option or at the request of governmental authorities, be opened and inspected by us or such authorities or us at any time.
CUSTOMS CLEARANCE. It is your responsibility to provide proper customs documentation and confirmation, where required.
EXPORT CONTROL. You authorize Federal Express to act as forwarding agent for you for export control and customs purposes. You hereby certify that all statements and information contained in this air waybill relating to exportation are true and correct. Furthermore, you understand that civil and criminal penalties, including forfeiture and sale, may be imposed for making false or fraudulent statements or for the violation of any United States laws on exportation, including but not limited to, 13 USC Sec. 305; 22 USC Sec. 401; 19 USC Sec. 1001; 50 USC app. 2410.
MANDATORY LAW. Insofar as any provision contained or referred to in this air Waybill may be contrary to any applicable international treaty, law government regulations, orders or requirements such provision shall remain in effect as a part of our agreement to the extent that it is not overridden. The invalidity or unenforceability of any provision shall not affect any other part of this Air Waybill. Unless otherwise indicated the Sender's address indicated on the face of this Waybill is the place of execution and the place of departure, and Recipient's address listed on the face of this Waybill is the place of destination. Unless otherwise indicated Federal Express Corporation, P.O. Box 727, Memphis, TN 38194 USA is the first carrier of this shipment.

After printing this label:
CONSIGNEE COPY - PLEASE PLACE IN FRONT OF POUCH
 1. Fold the printed page along the horizontal line.
 2. Place label in shipping pouch and affix it to your shipment.

| Analyses | Result | Qual | Report Limit | Units | Dilution Factor | Date Analyzed |
|----------|--------|------|--------------|-------|-----------------|---------------|
|----------|--------|------|--------------|-------|-----------------|---------------|

Explanation of Qualifiers

Radiochemistry:

- U or ND - Result is less than the sample specific MDC.
- Y1 - Chemical Yield is in control at 100-110%. Quantitative yield is assumed.
- Y2 - Chemical Yield outside default limits.
- W - DER is greater than Warning Limit of 1.42
- * - Aliquot Basis is 'As Received' while the Report Basis is 'Dry Weight'.
- # - Aliquot Basis is 'Dry Weight' while the Report Basis is 'As Received'.
- G - Sample density differs by more than 15% of LCS density.
- D - DER is greater than Control Limit
- M - Requested MDC not met.
- LT - Result is less than requested MDC but greater than achieved MDC.
- M3 - The requested MDC was not met, but the reported activity is greater than the reported MDC.
- L - LCS Recovery below lower control limit.
- H - LCS Recovery above upper control limit.
- P - LCS, Matrix Spike Recovery within control limits.
- N - Matrix Spike Recovery outside control limits
- NC - Not Calculated for duplicate results less than 5 times MDC
- B - Analyte concentration greater than MDC.
- B3 - Analyte concentration greater than MDC but less than Requested MDC.

Inorganics:

- B - Result is less than the requested reporting limit but greater than the instrument method detection limit (MDL).
- U or ND - Indicates that the compound was analyzed for but not detected.
- E - The reported value is estimated because of the presence of interference. An explanatory note may be included in the narrative.
- M - Duplicate injection precision was not met.
- N - Spiked sample recovery not within control limits. A post spike is analyzed for all ICP analyses when the matrix spike and or spike duplicate fail and the native sample concentration is less than four times the spike added concentration.
- Z - Spiked recovery not within control limits. An explanatory note may be included in the narrative.
- * - Duplicate analysis (relative percent difference) not within control limits.
- S - SAR value is estimated as one or more analytes used in the calculation were not detected above the detection limit.

Organics:

- U or ND - Indicates that the compound was analyzed for but not detected.
- B - Analyte is detected in the associated method blank as well as in the sample. It indicates probable blank contamination and warns the data user.
- E - Analyte concentration exceeds the upper level of the calibration range.
- J - Estimated value. The result is less than the reporting limit but greater than the instrument method detection limit (MDL).
- A - A tentatively identified compound is a suspected aldol-condensation product.
- X - The analyte was diluted below an accurate quantitation level.
- * - The spike recovery is equal to or outside the control criteria used.
- + - The relative percent difference (RPD) equals or exceeds the control criteria.
- G - A pattern resembling gasoline was detected in this sample.
- D - A pattern resembling diesel was detected in this sample.
- M - A pattern resembling motor oil was detected in this sample.
- C - A pattern resembling crude oil was detected in this sample.
- 4 - A pattern resembling JP-4 was detected in this sample.
- 5 - A pattern resembling JP-5 was detected in this sample.
- H - Indicates that the fuel pattern was in the heavier end of the retention time window for the analyte of interest.
- L - Indicates that the fuel pattern was in the lighter end of the retention time window for the analyte of interest.
- Z - This flag indicates that a significant fraction of the reported result did not resemble the patterns of any of the following petroleum hydrocarbon products:
 - gasoline
 - JP-8
 - diesel
 - mineral spirits
 - motor oil
 - Stoddard solvent
 - bunker C

* Please refer to the Reference Information section for an explanation of any qualifiers detected.

Reference Information

QC Samples with Qualifiers & Comments:

| QC Type Description | Parameter | Qualifier | Applies to Sample Number(s) |
|---------------------|--------------------------|-----------|-----------------------------|
| Matrix Spike | Dissolved Organic Carbon | MS-B | L1904255-1, -2, -3, -4 |
| Matrix Spike | Barium (Ba)-Total | MS-B | L1904255-1, -2, -3, -4 |
| Matrix Spike | Boron (B)-Total | MS-B | L1904255-1, -2, -3, -4 |
| Matrix Spike | Calcium (Ca)-Total | MS-B | L1904255-1, -2, -3, -4 |
| Matrix Spike | Iron (Fe)-Total | MS-B | L1904255-1, -2, -3, -4 |
| Matrix Spike | Magnesium (Mg)-Total | MS-B | L1904255-1, -2, -3, -4 |
| Matrix Spike | Manganese (Mn)-Total | MS-B | L1904255-1, -2, -3, -4 |
| Matrix Spike | Potassium (K)-Total | MS-B | L1904255-1, -2, -3, -4 |
| Matrix Spike | Sodium (Na)-Total | MS-B | L1904255-1, -2, -3, -4 |
| Matrix Spike | Strontium (Sr)-Total | MS-B | L1904255-1, -2, -3, -4 |

Qualifiers for Individual Parameters Listed:

| Qualifier | Description |
|-----------|--|
| DLDS | Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity. |
| MS-B | Matrix Spike recovery could not be accurately calculated due to high analyte background in sample. |

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|--|--------|--|---------------------------------------|
| ALK-TITR-VA | Water | Alkalinity Species by Titration | APHA 2320 Alkalinity |
| This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values. | | | |
| ANIONS-N+N-CALC-VA | Water | Nitrite & Nitrate in Water (Calculation) | EPA 300.0 |
| Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N). | | | |
| BE-D-L-CCMS-VA | Water | Diss. Be (low) in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| BE-T-L-CCMS-VA | Water | Total Be (Low) in Water by CRC ICPMS | EPA 200.2/6020A (mod) |
| Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| CARBONS-DOC-VA | Water | Dissolved organic carbon by combustion | APHA 5310B TOTAL ORGANIC CARBON (TOC) |
| This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis. | | | |
| CL-IC-N-VA | Water | Chloride in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| EC-PCT-VA | Water | Conductivity (Automated) | APHA 2510 Auto. Conduc. |
| This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode. | | | |
| EC-SCREEN-VA | Water | Conductivity Screen (Internal Use Only) | APHA 2510 |
| Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc. | | | |
| HARDNESS-CALC-VA | Water | Hardness | APHA 2340B |
| Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation. | | | |
| HG-D-CVAA-VA | Water | Diss. Mercury in Water by CVAAS or CVAFS | APHA 3030B/EPA 1631E (mod) |
| Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | | | |
| HG-T-CVAA-VA | Water | Total Mercury in Water by CVAAS or CVAFS | EPA 1631E (mod) |
| Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | | | |
| IONBALANCE-VA | Water | Ion Balance Calculation | APHA 1030E |

Reference Information

Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero.

Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as:

$$\text{Ion Balance (\%)} = \frac{[\text{Cation Sum} - \text{Anion Sum}]}{[\text{Cation Sum} + \text{Anion Sum}]}$$

MET-D-CCMS-VA Water Dissolved Metals in Water by CRC ICPMS APHA 3030B/6020A (mod)

Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

MET-T-CCMS-VA Water Total Metals in Water by CRC ICPMS EPA 200.2/6020A (mod)

Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

NH3-F-VA Water Ammonia in Water by Fluorescence APHA 4500 NH3-NITROGEN (AMMONIA)

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NH3-F-VA Water Ammonia in Water by Fluorescence J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NO2-L-IC-N-VA Water Nitrite in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO3-L-IC-N-VA Water Nitrate in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H "pH Value"

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

SO4-IC-N-VA Water Sulfate in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

TDS-VA Water Total Dissolved Solids by Gravimetric APHA 2540 C - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, TDS is determined by evaporating the filtrate to dryness at 180 degrees celsius.

TSS-MAN-WR Water Total Suspended Solids by Gravimetric APHA 2540 D

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids are determined by filtering a sample through a glass fibre filter and drying the filter at 104 degrees celsius.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location |
|----------------------------|---|
| WR | ALS ENVIRONMENTAL - WHITEHORSE, YUKON, CANADA |
| VA | ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA |

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

| Matrix Spike | Sulfate (SO4) | MS-B | L1906733-1, -2, -3, -4 |

Qualifiers for Individual Parameters Listed:

| Qualifier | Description |
|-----------|--|
| DLA | Detection Limit adjusted for required dilution |
| HTC | Hardness was calculated from Total Ca and/or Mg concentrations and may be biased high (dissolved Ca/Mg results unavailable). |
| MS-B | Matrix Spike recovery could not be accurately calculated due to high analyte background in sample. |

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|--|--------|--|---------------------------------------|
| ALK-TITR-VA | Water | Alkalinity Species by Titration | APHA 2320 Alkalinity |
| This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values. | | | |
| ANIONS-N+N-CALC-VA | Water | Nitrite & Nitrate in Water (Calculation) | EPA 300.0 |
| Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N). | | | |
| BE-D-L-CCMS-VA | Water | Diss. Be (low) in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| BE-T-L-CCMS-VA | Water | Total Be (Low) in Water by CRC ICPMS | EPA 200.2/6020A (mod) |
| Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| CARBONS-DOC-VA | Water | Dissolved organic carbon by combustion | APHA 5310B TOTAL ORGANIC CARBON (TOC) |
| This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis. | | | |
| CL-IC-N-VA | Water | Chloride in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| EC-PCT-VA | Water | Conductivity (Automated) | APHA 2510 Auto. Conduc. |
| This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode. | | | |
| EC-SCREEN-VA | Water | Conductivity Screen (Internal Use Only) | APHA 2510 |
| Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc. | | | |
| HARDNESS-CALC-VA | Water | Hardness | APHA 2340B |

Reference Information

Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO₃ equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation.

HG-D-CVAA-VA Water Diss. Mercury in Water by CVAAS or CVAFS APHA 3030B/EPA 1631E (mod)

Water samples are filtered (0.45 µm), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.

HG-T-CVAA-VA Water Total Mercury in Water by CVAAS or CVAFS EPA 1631E (mod)

Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.

IONBALANCE-VA Water Ion Balance Calculation APHA 1030E

Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero.

Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as:

Ion Balance (%) = [Cation Sum-Anion Sum] / [Cation Sum+Anion Sum]

MET-D-CCMS-VA Water Dissolved Metals in Water by CRC ICPMS APHA 3030B/6020A (mod)

Water samples are filtered (0.45 µm), preserved with nitric acid, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

MET-T-CCMS-VA Water Total Metals in Water by CRC ICPMS EPA 200.2/6020A (mod)

Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

NH3-F-VA Water Ammonia in Water by Fluorescence APHA 4500 NH3-NITROGEN (AMMONIA)

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NH3-F-VA Water Ammonia in Water by Fluorescence J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NO2-L-IC-N-VA Water Nitrite in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO3-L-IC-N-VA Water Nitrate in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H "pH Value"

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

SO4-IC-N-VA Water Sulfate in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

TDS-VA Water Total Dissolved Solids by Gravimetric APHA 2540 C - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, TDS is determined by evaporating the filtrate to dryness at 180 degrees celsius.

TSS-VA Water Total Suspended Solids by Gravimetric APHA 2540 D - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius.

Reference Information

Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location |
|----------------------------|---|
| VA | ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA |

Chain of Custody Numbers:

2017-03-29 A

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Reference Information

QC Samples with Qualifiers & Comments:

| QC Type Description | Parameter | Qualifier | Applies to Sample Number(s) |
|---------------------|--------------------------|-----------|------------------------------------|
| Matrix Spike | Dissolved Organic Carbon | MS-B | L1909606-1, -2, -8 |
| Matrix Spike | Dissolved Organic Carbon | MS-B | L1909606-1, -2, -8 |
| Matrix Spike | Barium (Ba)-Dissolved | MS-B | L1909606-1, -2, -3, -5, -6, -7, -8 |
| Matrix Spike | Calcium (Ca)-Dissolved | MS-B | L1909606-1, -2, -3, -5, -6, -7, -8 |
| Matrix Spike | Magnesium (Mg)-Dissolved | MS-B | L1909606-1, -2, -3, -5, -6, -7, -8 |
| Matrix Spike | Manganese (Mn)-Dissolved | MS-B | L1909606-1, -2, -3, -5, -6, -7, -8 |
| Matrix Spike | Sodium (Na)-Dissolved | MS-B | L1909606-1, -2, -3, -5, -6, -7, -8 |
| Matrix Spike | Strontium (Sr)-Dissolved | MS-B | L1909606-1, -2, -3, -5, -6, -7, -8 |
| Matrix Spike | Ammonia, Total (as N) | MS-B | L1909606-1, -2, -3, -5, -6, -7, -8 |

Qualifiers for Individual Parameters Listed:

| Qualifier | Description |
|-----------|--|
| DLA | Detection Limit adjusted for required dilution |
| DLM | Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity). |
| DTC | Dissolved concentration exceeds total. Results were confirmed by re-analysis. |
| HTD | Hold time exceeded for re-analysis or dilution, but initial testing was conducted within hold time. |
| MS-B | Matrix Spike recovery could not be accurately calculated due to high analyte background in sample. |

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|--|--------|--|---------------------------------------|
| ALK-TITR-VA | Water | Alkalinity Species by Titration | APHA 2320 Alkalinity |
| This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values. | | | |
| ANIONS-N+N-CALC-VA | Water | Nitrite & Nitrate in Water (Calculation) | EPA 300.0 |
| Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N). | | | |
| BE-D-L-CCMS-VA | Water | Diss. Be (low) in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| BE-T-L-CCMS-VA | Water | Total Be (Low) in Water by CRC ICPMS | EPA 200.2/6020A (mod) |
| Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| CARBONS-DOC-VA | Water | Dissolved organic carbon by combustion | APHA 5310B TOTAL ORGANIC CARBON (TOC) |
| This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis. | | | |
| CL-IC-N-VA | Water | Chloride in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| EC-PCT-VA | Water | Conductivity (Automated) | APHA 2510 Auto. Conduc. |
| This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode. | | | |
| EC-SCREEN-VA | Water | Conductivity Screen (Internal Use Only) | APHA 2510 |
| Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc. | | | |
| HARDNESS-CALC-VA | Water | Hardness | APHA 2340B |
| Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation. | | | |
| HG-D-CVAA-VA | Water | Diss. Mercury in Water by CVAAS or CVAFS | APHA 3030B/EPA 1631E (mod) |
| Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | | | |
| HG-T-CVAA-VA | Water | Total Mercury in Water by CVAAS or CVAFS | EPA 1631E (mod) |

Reference Information

Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.

IONBALANCE-VA Water Ion Balance Calculation APHA 1030E

Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero.

Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as:

$$\text{Ion Balance (\%)} = \frac{[\text{Cation Sum} - \text{Anion Sum}]}{[\text{Cation Sum} + \text{Anion Sum}]}$$

MET-D-CCMS-VA Water Dissolved Metals in Water by CRC ICPMS APHA 3030B/6020A (mod)

Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

MET-T-CCMS-VA Water Total Metals in Water by CRC ICPMS EPA 200.2/6020A (mod)

Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

NH3-F-VA Water Ammonia in Water by Fluorescence APHA 4500 NH3-NITROGEN (AMMONIA)

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NH3-F-VA Water Ammonia in Water by Fluorescence J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NO2-L-IC-N-VA Water Nitrite in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO3-L-IC-N-VA Water Nitrate in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H "pH Value"

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

SO4-IC-N-VA Water Sulfate in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

TDS-VA Water Total Dissolved Solids by Gravimetric APHA 2540 C - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, TDS is determined by evaporating the filtrate to dryness at 180 degrees celsius.

TSS-VA Water Total Suspended Solids by Gravimetric APHA 2540 D - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius.

Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location |
|----------------------------|---------------------|
|----------------------------|---------------------|

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Reference Information

QC Samples with Qualifiers & Comments:

| QC Type Description | Parameter | Qualifier | Applies to Sample Number(s) |
|---------------------|----------------------|-----------|--|
| Matrix Spike | Aluminum (Al)-Total | MS-B | L1912879-1, -2, -3, -4, -5, -6, -7, -8, -9 |
| Matrix Spike | Barium (Ba)-Total | MS-B | L1912879-1, -2, -3, -4, -5, -6, -7, -8, -9 |
| Matrix Spike | Calcium (Ca)-Total | MS-B | L1912879-1, -2, -3, -4, -5, -6, -7, -8, -9 |
| Matrix Spike | Magnesium (Mg)-Total | MS-B | L1912879-1, -2, -3, -4, -5, -6, -7, -8, -9 |
| Matrix Spike | Sodium (Na)-Total | MS-B | L1912879-1, -2, -3, -4, -5, -6, -7, -8, -9 |
| Matrix Spike | Strontium (Sr)-Total | MS-B | L1912879-1, -2, -3, -4, -5, -6, -7, -8, -9 |
| Matrix Spike | Sulfur (S)-Total | MS-B | L1912879-1, -2, -3, -4, -5, -6, -7, -8, -9 |

Qualifiers for Individual Parameters Listed:

| Qualifier | Description |
|-----------|--|
| DLDS | Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity. |
| DLM | Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity). |
| DTC | Dissolved concentration exceeds total. Results were confirmed by re-analysis. |
| HTD | Hold time exceeded for re-analysis or dilution, but initial testing was conducted within hold time. |
| MS-B | Matrix Spike recovery could not be accurately calculated due to high analyte background in sample. |

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|---|--------|--|---------------------------------------|
| ALK-TITR-VA | Water | Alkalinity Species by Titration | APHA 2320 Alkalinity |
| <p>This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.</p> | | | |
| ANIONS-N+N-CALC-WR | Water | Nitrite & Nitrate Nitrogen | EPA 300.1 |
| <p>Nitrate and Nitrite Nitrogen is determined by calculation from the individual Nitrate and Nitrite Nitrogen analyses by Ion Chromatography with UV absorbance.</p> | | | |
| BE-D-L-CCMS-VA | Water | Diss. Be (low) in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| <p>Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.</p> <p>Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.</p> | | | |
| BE-T-L-CCMS-VA | Water | Total Be (Low) in Water by CRC ICPMS | EPA 200.2/6020A (mod) |
| <p>Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.</p> <p>Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.</p> | | | |
| CARBONS-DOC-VA | Water | Dissolved organic carbon by combustion | APHA 5310B TOTAL ORGANIC CARBON (TOC) |
| <p>This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis.</p> | | | |
| CL-IC-N-WR | Water | Chloride in Water by IC | EPA 300.1 (mod) |
| <p>Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.</p> | | | |
| EC-PCT-VA | Water | Conductivity (Automated) | APHA 2510 Auto. Conduc. |
| <p>This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode.</p> | | | |
| EC-SCREEN-VA | Water | Conductivity Screen (Internal Use Only) | APHA 2510 |
| <p>Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc.</p> | | | |
| HARDNESS-CALC-VA | Water | Hardness | APHA 2340B |
| <p>Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation.</p> | | | |
| HG-D-CVAA-VA | Water | Diss. Mercury in Water by CVAAS or CVAFS | APHA 3030B/EPA 1631E (mod) |
| <p>Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.</p> | | | |
| HG-T-CVAA-VA | Water | Total Mercury in Water by CVAAS or CVAFS | EPA 1631E (mod) |
| <p>Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.</p> | | | |
| IONBALANCE-VA | Water | Ion Balance Calculation | APHA 1030E |

Reference Information

Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero.

Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as:

$$\text{Ion Balance (\%)} = \frac{[\text{Cation Sum} - \text{Anion Sum}]}{[\text{Cation Sum} + \text{Anion Sum}]}$$

MET-D-CCMS-VA Water Dissolved Metals in Water by CRC ICPMS APHA 3030B/6020A (mod)

Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

MET-T-CCMS-VA Water Total Metals in Water by CRC ICPMS EPA 200.2/6020A (mod)

Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

NH3-F-VA Water Ammonia in Water by Fluorescence APHA 4500 NH3-NITROGEN (AMMONIA)

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NH3-F-VA Water Ammonia in Water by Fluorescence J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NO2-L-IC-N-WR Water Nitrite in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO3-L-IC-N-VA Water Nitrate in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO3-L-IC-N-WR Water Nitrate in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H "pH Value"

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

SO4-IC-N-WR Water Sulfate in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

TDS-VA Water Total Dissolved Solids by Gravimetric APHA 2540 C - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, TDS is determined by evaporating the filtrate to dryness at 180 degrees celsius.

TSS-MAN-WR Water Total Suspended Solids by Gravimetric APHA 2540 D

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids are determined by filtering a sample through a glass fibre filter and drying the filter at 104 degrees celsius.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location |
|----------------------------|---|
| WR | ALS ENVIRONMENTAL - WHITEHORSE, YUKON, CANADA |

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Reference Information

QC Samples with Qualifiers & Comments:

| QC Type Description | Parameter | Qualifier | Applies to Sample Number(s) |
|---------------------|--------------------------|-----------|---|
| Matrix Spike | Dissolved Organic Carbon | MS-B | L1914885-10, -9 |
| Matrix Spike | Dissolved Organic Carbon | MS-B | L1914885-1, -4, -5, -7, -8 |
| Matrix Spike | Dissolved Organic Carbon | MS-B | L1914885-1, -4, -5, -7, -8 |
| Matrix Spike | Dissolved Organic Carbon | MS-B | L1914885-1, -4, -5, -7, -8 |
| Matrix Spike | Dissolved Organic Carbon | MS-B | L1914885-3, -6 |
| Matrix Spike | Barium (Ba)-Dissolved | MS-B | L1914885-1, -10, -2, -3, -4, -5, -6, -7, -8, -9 |
| Matrix Spike | Calcium (Ca)-Dissolved | MS-B | L1914885-1, -10, -2, -3, -4, -5, -6, -7, -8, -9 |
| Matrix Spike | Copper (Cu)-Dissolved | MS-B | L1914885-1, -10, -2, -3, -4, -5, -6, -7, -8, -9 |
| Matrix Spike | Magnesium (Mg)-Dissolved | MS-B | L1914885-1, -10, -2, -3, -4, -5, -6, -7, -8, -9 |
| Matrix Spike | Manganese (Mn)-Dissolved | MS-B | L1914885-1, -10, -2, -3, -4, -5, -6, -7, -8, -9 |
| Matrix Spike | Potassium (K)-Dissolved | MS-B | L1914885-1, -10, -2, -3, -4, -5, -6, -7, -8, -9 |
| Matrix Spike | Sodium (Na)-Dissolved | MS-B | L1914885-1, -10, -2, -3, -4, -5, -6, -7, -8, -9 |
| Matrix Spike | Strontium (Sr)-Dissolved | MS-B | L1914885-1, -10, -2, -3, -4, -5, -6, -7, -8, -9 |
| Matrix Spike | Nickel (Ni)-Total | MS-B | L1914885-10, -7, -8, -9 |
| Matrix Spike | Silicon (Si)-Total | MS-B | L1914885-1, -2, -3, -4, -5, -6 |
| Matrix Spike | Sodium (Na)-Total | MS-B | L1914885-1, -2, -3, -4, -5, -6 |
| Matrix Spike | Nitrate (as N) | MS-B | L1914885-1, -10, -2, -3, -4, -5, -6, -7, -8, -9 |

Qualifiers for Individual Parameters Listed:

| Qualifier | Description |
|-----------|--|
| DLA | Detection Limit adjusted for required dilution |
| DLDS | Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity. |
| DLM | Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity). |
| DTC | Dissolved concentration exceeds total. Results were confirmed by re-analysis. |
| MS-B | Matrix Spike recovery could not be accurately calculated due to high analyte background in sample. |

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|--|--------|--|---------------------------------------|
| ALK-TITR-VA | Water | Alkalinity Species by Titration | APHA 2320 Alkalinity |
| This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values. | | | |
| ANIONS-N+N-CALC-VA | Water | Nitrite & Nitrate in Water (Calculation) | EPA 300.0 |
| Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N). | | | |
| BE-D-L-CCMS-VA | Water | Diss. Be (low) in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| BE-T-L-CCMS-VA | Water | Total Be (Low) in Water by CRC ICPMS | EPA 200.2/6020A (mod) |
| Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| CARBONS-DOC-VA | Water | Dissolved organic carbon by combustion | APHA 5310B TOTAL ORGANIC CARBON (TOC) |
| This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis. | | | |
| CL-IC-N-VA | Water | Chloride in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| EC-PCT-VA | Water | Conductivity (Automated) | APHA 2510 Auto. Conduc. |
| This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode. | | | |
| EC-SCREEN-VA | Water | Conductivity Screen (Internal Use Only) | APHA 2510 |

Reference Information

Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc.

HARDNESS-CALC-VA Water Hardness APHA 2340B

Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO₃ equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation.

HG-D-CVAA-VA Water Diss. Mercury in Water by CVAAS or CVAFS APHA 3030B/EPA 1631E (mod)

Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.

HG-T-CVAA-VA Water Total Mercury in Water by CVAAS or CVAFS EPA 1631E (mod)

Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.

IONBALANCE-VA Water Ion Balance Calculation APHA 1030E

Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero.

Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as:

Ion Balance (%) = $\frac{[\text{Cation Sum} - \text{Anion Sum}]}{[\text{Cation Sum} + \text{Anion Sum}]}$

MET-D-CCMS-VA Water Dissolved Metals in Water by CRC ICPMS APHA 3030B/6020A (mod)

Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

MET-T-CCMS-VA Water Total Metals in Water by CRC ICPMS EPA 200.2/6020A (mod)

Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

NH3-F-VA Water Ammonia in Water by Fluorescence APHA 4500 NH3-NITROGEN (AMMONIA)

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NH3-F-VA Water Ammonia in Water by Fluorescence J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NO2-L-IC-N-VA Water Nitrite in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO3-L-IC-N-VA Water Nitrate in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H "pH Value"

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

SO4-IC-N-VA Water Sulfate in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

TDS-VA Water Total Dissolved Solids by Gravimetric APHA 2540 C - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, TDS is determined by evaporating the filtrate to dryness at 180 degrees celsius.

Reference Information

TSS-VA Water Total Suspended Solids by Gravimetric APHA 2540 D - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location |
|----------------------------|---|
| VA | ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA |

Chain of Custody Numbers:

2017-04-19A

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Reference Information

QC Samples with Qualifiers & Comments:

| QC Type Description | Parameter | Qualifier | Applies to Sample Number(s) |
|---------------------|--------------------------|-----------|--|
| Matrix Spike | Dissolved Organic Carbon | MS-B | L1917913-1, -3, -5, -6, -7 |
| Matrix Spike | Dissolved Organic Carbon | MS-B | L1917913-2 |
| Matrix Spike | Dissolved Organic Carbon | MS-B | L1917913-2 |
| Matrix Spike | Dissolved Organic Carbon | MS-B | L1917913-2 |
| Matrix Spike | Aluminum (Al)-Dissolved | MS-B | L1917913-1, -2, -3, -4, -5, -6, -7, -8, -9 |
| Matrix Spike | Calcium (Ca)-Dissolved | MS-B | L1917913-1, -2, -3, -4, -5, -6, -7, -8, -9 |
| Matrix Spike | Magnesium (Mg)-Dissolved | MS-B | L1917913-1, -2, -3, -4, -5, -6, -7, -8, -9 |
| Matrix Spike | Manganese (Mn)-Dissolved | MS-B | L1917913-1, -2, -3, -4, -5, -6, -7, -8, -9 |
| Matrix Spike | Sodium (Na)-Dissolved | MS-B | L1917913-1, -2, -3, -4, -5, -6, -7, -8, -9 |
| Matrix Spike | Strontium (Sr)-Dissolved | MS-B | L1917913-1, -2, -3, -4, -5, -6, -7, -8, -9 |
| Matrix Spike | Sulfur (S)-Dissolved | MS-B | L1917913-1, -2, -3, -4, -5, -6, -7, -8, -9 |
| Matrix Spike | Barium (Ba)-Total | MS-B | L1917913-1, -2, -3, -4, -5, -6, -7, -8, -9 |
| Matrix Spike | Calcium (Ca)-Total | MS-B | L1917913-1, -2, -3, -4, -5, -6, -7, -8, -9 |
| Matrix Spike | Magnesium (Mg)-Total | MS-B | L1917913-1, -2, -3, -4, -5, -6, -7, -8, -9 |
| Matrix Spike | Manganese (Mn)-Total | MS-B | L1917913-1, -2, -3, -4, -5, -6, -7, -8, -9 |
| Matrix Spike | Sodium (Na)-Total | MS-B | L1917913-1, -2, -3, -4, -5, -6, -7, -8, -9 |
| Matrix Spike | Strontium (Sr)-Total | MS-B | L1917913-1, -2, -3, -4, -5, -6, -7, -8, -9 |
| Matrix Spike | Sulfur (S)-Total | MS-B | L1917913-1, -2, -3, -4, -5, -6, -7, -8, -9 |

Qualifiers for Individual Parameters Listed:

| Qualifier | Description |
|-----------|--|
| DLDS | Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity. |
| DLM | Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity). |
| MS-B | Matrix Spike recovery could not be accurately calculated due to high analyte background in sample. |

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|--|--------|--|---------------------------------------|
| ALK-TITR-VA | Water | Alkalinity Species by Titration | APHA 2320 Alkalinity |
| This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values. | | | |
| ANIONS-N+N-CALC-VA | Water | Nitrite & Nitrate in Water (Calculation) | EPA 300.0 |
| Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N). | | | |
| BE-D-L-CCMS-VA | Water | Diss. Be (low) in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| BE-T-L-CCMS-VA | Water | Total Be (Low) in Water by CRC ICPMS | EPA 200.2/6020A (mod) |
| Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| CARBONS-DOC-VA | Water | Dissolved organic carbon by combustion | APHA 5310B TOTAL ORGANIC CARBON (TOC) |
| This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis. | | | |
| CL-IC-N-VA | Water | Chloride in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| EC-PCT-VA | Water | Conductivity (Automated) | APHA 2510 Auto. Conduc. |
| This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode. | | | |
| EC-SCREEN-VA | Water | Conductivity Screen (Internal Use Only) | APHA 2510 |
| Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc. | | | |

Reference Information

| | | | |
|---|-------|--|---|
| HARDNESS-CALC-VA | Water | Hardness | APHA 2340B |
| Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO ₃ equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation. | | | |
| HG-D-CVAA-VA | Water | Diss. Mercury in Water by CVAAS or CVAFS | APHA 3030B/EPA 1631E (mod) |
| Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | | | |
| HG-T-CVAA-VA | Water | Total Mercury in Water by CVAAS or CVAFS | EPA 1631E (mod) |
| Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | | | |
| IONBALANCE-VA | Water | Ion Balance Calculation | APHA 1030E |
| Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero. | | | |
| Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as: | | | |
| Ion Balance (%) = [Cation Sum-Anion Sum] / [Cation Sum+Anion Sum] | | | |
| MET-D-CCMS-VA | Water | Dissolved Metals in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| MET-T-CCMS-VA | Water | Total Metals in Water by CRC ICPMS | EPA 200.2/6020A (mod) |
| Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| NH3-F-VA | Water | Ammonia in Water by Fluorescence | APHA 4500 NH3-NITROGEN (AMMONIA) |
| This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al. | | | |
| NH3-F-VA | Water | Ammonia in Water by Fluorescence | J. ENVIRON. MONIT., 2005, 7, 37-42, RSC |
| This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al. | | | |
| NO2-L-IC-N-VA | Water | Nitrite in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| NO3-L-IC-N-VA | Water | Nitrate in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| PH-PCT-VA | Water | pH by Meter (Automated) | APHA 4500-H "pH Value" |
| This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode | | | |
| It is recommended that this analysis be conducted in the field. | | | |
| PH-PCT-VA | Water | pH by Meter (Automated) | APHA 4500-H pH Value |
| This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode | | | |
| It is recommended that this analysis be conducted in the field. | | | |
| SO4-IC-N-VA | Water | Sulfate in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| TDS-VA | Water | Total Dissolved Solids by Gravimetric | APHA 2540 C - GRAVIMETRIC |
| This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, TDS is determined by evaporating the filtrate to dryness at 180 degrees celsius. | | | |
| TSS-VA | Water | Total Suspended Solids by Gravimetric | APHA 2540 D - GRAVIMETRIC |

Reference Information

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location |
|----------------------------|---|
| VA | ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA |

Chain of Custody Numbers:

2017-04-26 A

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

| Matrix Spike | Potassium (K)-Total | MS-B | L1921497-1 |
| Matrix Spike | Sodium (Na)-Total | MS-B | L1921497-1 |
| Matrix Spike | Sodium (Na)-Total | MS-B | L1921497-10, -11, -2, -3, -4, -5, -6, -7, -8, -9 |
| Matrix Spike | Strontium (Sr)-Total | MS-B | L1921497-1 |
| Matrix Spike | Strontium (Sr)-Total | MS-B | L1921497-10, -11, -2, -3, -4, -5, -6, -7, -8, -9 |
| Matrix Spike | Sulfur (S)-Total | MS-B | L1921497-1 |
| Matrix Spike | Uranium (U)-Total | MS-B | L1921497-1 |

Qualifiers for Individual Parameters Listed:

| Qualifier | Description |
|-----------|--|
| DLM | Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity). |
| MS-B | Matrix Spike recovery could not be accurately calculated due to high analyte background in sample. |

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|--|--------|--|---------------------------------------|
| ALK-TITR-VA | Water | Alkalinity Species by Titration | APHA 2320 Alkalinity |
| This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values. | | | |
| ANIONS-N+N-CALC-VA | Water | Nitrite & Nitrate in Water (Calculation) | EPA 300.0 |
| Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N). | | | |
| BE-D-L-CCMS-VA | Water | Diss. Be (low) in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| BE-T-L-CCMS-VA | Water | Total Be (Low) in Water by CRC ICPMS | EPA 200.2/6020A (mod) |
| Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| CARBONS-DOC-VA | Water | Dissolved organic carbon by combustion | APHA 5310B TOTAL ORGANIC CARBON (TOC) |
| This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis. | | | |

Reference Information

| | | | |
|---|-------|--|---|
| CL-IC-N-VA | Water | Chloride in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| EC-PCT-VA | Water | Conductivity (Automated) | APHA 2510 Auto. Conduc. |
| This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode. | | | |
| EC-SCREEN-VA | Water | Conductivity Screen (Internal Use Only) | APHA 2510 |
| Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc. | | | |
| HARDNESS-CALC-VA | Water | Hardness | APHA 2340B |
| Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO ₃ equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation. | | | |
| HG-D-CVAA-VA | Water | Diss. Mercury in Water by CVAAS or CVAFS | APHA 3030B/EPA 1631E (mod) |
| Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | | | |
| HG-T-CVAA-VA | Water | Total Mercury in Water by CVAAS or CVAFS | EPA 1631E (mod) |
| Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | | | |
| IONBALANCE-VA | Water | Ion Balance Calculation | APHA 1030E |
| Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero. | | | |
| Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as: | | | |
| Ion Balance (%) = [Cation Sum-Anion Sum] / [Cation Sum+Anion Sum] | | | |
| MET-D-CCMS-VA | Water | Dissolved Metals in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| MET-T-CCMS-VA | Water | Total Metals in Water by CRC ICPMS | EPA 200.2/6020A (mod) |
| Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| NH3-F-VA | Water | Ammonia in Water by Fluorescence | APHA 4500 NH ₃ -NITROGEN (AMMONIA) |
| This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al. | | | |
| NH3-F-VA | Water | Ammonia in Water by Fluorescence | J. ENVIRON. MONIT., 2005, 7, 37-42, RSC |
| This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al. | | | |
| NO2-L-IC-N-VA | Water | Nitrite in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| NO3-L-IC-N-VA | Water | Nitrate in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| PH-PCT-VA | Water | pH by Meter (Automated) | APHA 4500-H "pH Value" |
| This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode | | | |
| It is recommended that this analysis be conducted in the field. | | | |
| PH-PCT-VA | Water | pH by Meter (Automated) | APHA 4500-H pH Value |
| This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode | | | |

Reference Information

It is recommended that this analysis be conducted in the field.

SO4-IC-N-VA Water Sulfate in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

TDS-VA Water Total Dissolved Solids by Gravimetric APHA 2540 C - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, TDS is determined by evaporating the filtrate to dryness at 180 degrees celsius.

TSS-VA Water Total Suspended Solids by Gravimetric APHA 2540 D - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location |
|----------------------------|---|
| VA | ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA |

Chain of Custody Numbers:

2017-05-03 B

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

L1921497-COFC

Qualifiers for Individual Parameters Listed:

| Qualifier | Description |
|-----------|--|
| DLM | Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity). |
| MS-B | Matrix Spike recovery could not be accurately calculated due to high analyte background in sample. |

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|--|--------|--|---------------------------------------|
| ALK-TITR-VA | Water | Alkalinity Species by Titration | APHA 2320 Alkalinity |
| This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values. | | | |
| ANIONS-N+N-CALC-VA | Water | Nitrite & Nitrate in Water (Calculation) | EPA 300.0 |
| Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N). | | | |
| BE-D-L-CCMS-VA | Water | Diss. Be (low) in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| BE-T-L-CCMS-VA | Water | Total Be (Low) in Water by CRC ICPMS | EPA 200.2/6020A (mod) |
| Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| CARBONS-DOC-VA | Water | Dissolved organic carbon by combustion | APHA 5310B TOTAL ORGANIC CARBON (TOC) |
| This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis. | | | |
| CL-IC-N-VA | Water | Chloride in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| EC-PCT-VA | Water | Conductivity (Automated) | APHA 2510 Auto. Conduc. |

Reference Information

This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode.

EC-SCREEN-VA Water Conductivity Screen (Internal Use Only) APHA 2510

Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc.

HARDNESS-CALC-VA Water Hardness APHA 2340B

Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO₃ equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation.

HG-D-CVAA-VA Water Diss. Mercury in Water by CVAAS or CVAFS APHA 3030B/EPA 1631E (mod)

Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.

HG-T-CVAA-VA Water Total Mercury in Water by CVAAS or CVAFS EPA 1631E (mod)

Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.

IONBALANCE-VA Water Ion Balance Calculation APHA 1030E

Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero.

Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as:

$$\text{Ion Balance (\%)} = \frac{[\text{Cation Sum} - \text{Anion Sum}]}{[\text{Cation Sum} + \text{Anion Sum}]}$$

MET-D-CCMS-VA Water Dissolved Metals in Water by CRC ICPMS APHA 3030B/6020A (mod)

Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

MET-T-CCMS-VA Water Total Metals in Water by CRC ICPMS EPA 200.2/6020A (mod)

Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

NH3-F-VA Water Ammonia in Water by Fluorescence APHA 4500 NH3-NITROGEN (AMMONIA)

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NH3-F-VA Water Ammonia in Water by Fluorescence J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NO2-L-IC-N-VA Water Nitrite in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO3-L-IC-N-VA Water Nitrate in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H "pH Value"

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

SO4-IC-N-VA Water Sulfate in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

| Matrix Spike | Sulfur (S)-Total | MS-B | L1928294-2 |
| Matrix Spike | Titanium (Ti)-Total | MS-B | L1928294-1 |
| Matrix Spike | Nitrite (as N) | MS-B | L1928294-1, -2, -3, -4, -5, -6 |
| Matrix Spike | Nitrate (as N) | MS-B | L1928294-1, -2, -3, -4, -5, -6 |
| Matrix Spike | Sulfate (SO4) | MS-B | L1928294-1, -2, -3, -4, -5, -6 |

Qualifiers for Individual Parameters Listed:

| Qualifier | Description |
|-----------|--|
| DLM | Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity). |
| MS-B | Matrix Spike recovery could not be accurately calculated due to high analyte background in sample. |

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|--|--------|--------------------------------------|------------------------|
| ALK-TITR-VA | Water | Alkalinity Species by Titration | APHA 2320 Alkalinity |
| This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values. | | | |
| ANIONS-N+N-CALC-WR | Water | Nitrite & Nitrate Nitrogen | EPA 300.1 |
| Nitrate and Nitrite Nitrogen is determined by calculation from the individual Nitrate and Nitrite Nitrogen analyses by Ion Chromatography with UV absorbance. | | | |
| BE-D-L-CCMS-VA | Water | Diss. Be (low) in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| BE-T-L-CCMS-VA | Water | Total Be (Low) in Water by CRC ICPMS | EPA 200.2/6020A (mod) |
| Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS. | | | |

Reference Information

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

CARBONS-DOC-VA Water Dissolved organic carbon by combustion APHA 5310B TOTAL ORGANIC CARBON (TOC)
 This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis.

CL-IC-N-WR Water Chloride in Water by IC EPA 300.1 (mod)
 Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

EC-PCT-VA Water Conductivity (Automated) APHA 2510 Auto. Conduc.
 This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode.

EC-SCREEN-VA Water Conductivity Screen (Internal Use Only) APHA 2510
 Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc.

HARDNESS-CALC-VA Water Hardness APHA 2340B
 Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO₃ equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation.

HG-D-CVAA-VA Water Diss. Mercury in Water by CVAAS or CVAFS APHA 3030B/EPA 1631E (mod)
 Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.

HG-T-CVAA-VA Water Total Mercury in Water by CVAAS or CVAFS EPA 1631E (mod)
 Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.

IONBALANCE-VA Water Ion Balance Calculation APHA 1030E
 Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero.

Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as:

$$\text{Ion Balance (\%)} = \frac{[\text{Cation Sum} - \text{Anion Sum}]}{[\text{Cation Sum} + \text{Anion Sum}]}$$

MET-D-CCMS-VA Water Dissolved Metals in Water by CRC ICPMS APHA 3030B/6020A (mod)
 Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

MET-T-CCMS-VA Water Total Metals in Water by CRC ICPMS EPA 200.2/6020A (mod)
 Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

NH3-F-VA Water Ammonia in Water by Fluorescence APHA 4500 NH3-NITROGEN (AMMONIA)
 This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NH3-F-VA Water Ammonia in Water by Fluorescence J. ENVIRON. MONIT., 2005, 7, 37-42, RSC
 This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NO2-L-IC-N-WR Water Nitrite in Water by IC (Low Level) EPA 300.1 (mod)
 Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO3-L-IC-N-WR Water Nitrate in Water by IC (Low Level) EPA 300.1 (mod)
 Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H "pH Value"
 This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

Reference Information

It is recommended that this analysis be conducted in the field.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H pH Value
 This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

SO4-IC-N-VA Water Sulfate in Water by IC EPA 300.1 (mod)
 Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

SO4-IC-N-WR Water Sulfate in Water by IC EPA 300.1 (mod)
 Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

TDS-CALC-VA Water TDS (Calculated) APHA 1030E (20TH EDITION)
 This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses".
 The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample.

TSS-MAN-WR Water Total Suspended Solids by Gravimetric APHA 2540 D
 This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids are determined by filtering a sample through a glass fibre filter and drying the filter at 104 degrees celsius.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location |
|----------------------------|---|
| WR | ALS ENVIRONMENTAL - WHITEHORSE, YUKON, CANADA |
| VA | ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA |

Chain of Custody Numbers:

2017-05-17 C

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

| | Vanadium (V)-Dissolved (mg/L) | <0.00050 | 0.00096 | | |
| | Zinc (Zn)-Dissolved (mg/L) | <0.0010 | <0.0010 | | |
| | Zirconium (Zr)-Dissolved (mg/L) | <0.00030 | <0.00030 | | |

* Please refer to the Reference Information section for an explanation of any qualifiers detected.

Reference Information

QC Samples with Qualifiers & Comments:

| QC Type Description | Parameter | Qualifier | Applies to Sample Number(s) |
|---------------------|--------------------------|-----------|------------------------------------|
| Matrix Spike | Dissolved Organic Carbon | MS-B | L1930879-2, -3, -4, -5, -6, -7 |
| Matrix Spike | Dissolved Organic Carbon | MS-B | L1930879-2, -3, -4, -5, -6, -7 |
| Matrix Spike | Calcium (Ca)-Dissolved | MS-B | L1930879-1, -2, -3, -4, -5, -6, -7 |
| Matrix Spike | Magnesium (Mg)-Dissolved | MS-B | L1930879-1, -2, -3, -4, -5, -6, -7 |
| Matrix Spike | Manganese (Mn)-Dissolved | MS-B | L1930879-1, -2, -3, -4, -5, -6, -7 |
| Matrix Spike | Sodium (Na)-Dissolved | MS-B | L1930879-1, -2, -3, -4, -5, -6, -7 |
| Matrix Spike | Strontium (Sr)-Dissolved | MS-B | L1930879-1, -2, -3, -4, -5, -6, -7 |
| Matrix Spike | Sulfur (S)-Dissolved | MS-B | L1930879-1, -2, -3, -4, -5, -6, -7 |
