Notes: no particle size data for Ref-1 were collected so this area was omitted from the analysis. PCA conducted on the correlation matrix.

Figure D.5: Scatterplot of Principal Component 2 (PC-2) vs. PC-1 for Reference (n = 9) and Mine-exposed (n = 5) Areas from a Principal Component Analysis of Habitat Variables (left) and the Loading (Scaled Coefficients) of Each Variable to each Principal Component are Plotted on the Scatterplot (right)

Note: No particle size data for Ref-1 were collected so this area was omitted from the analysis.

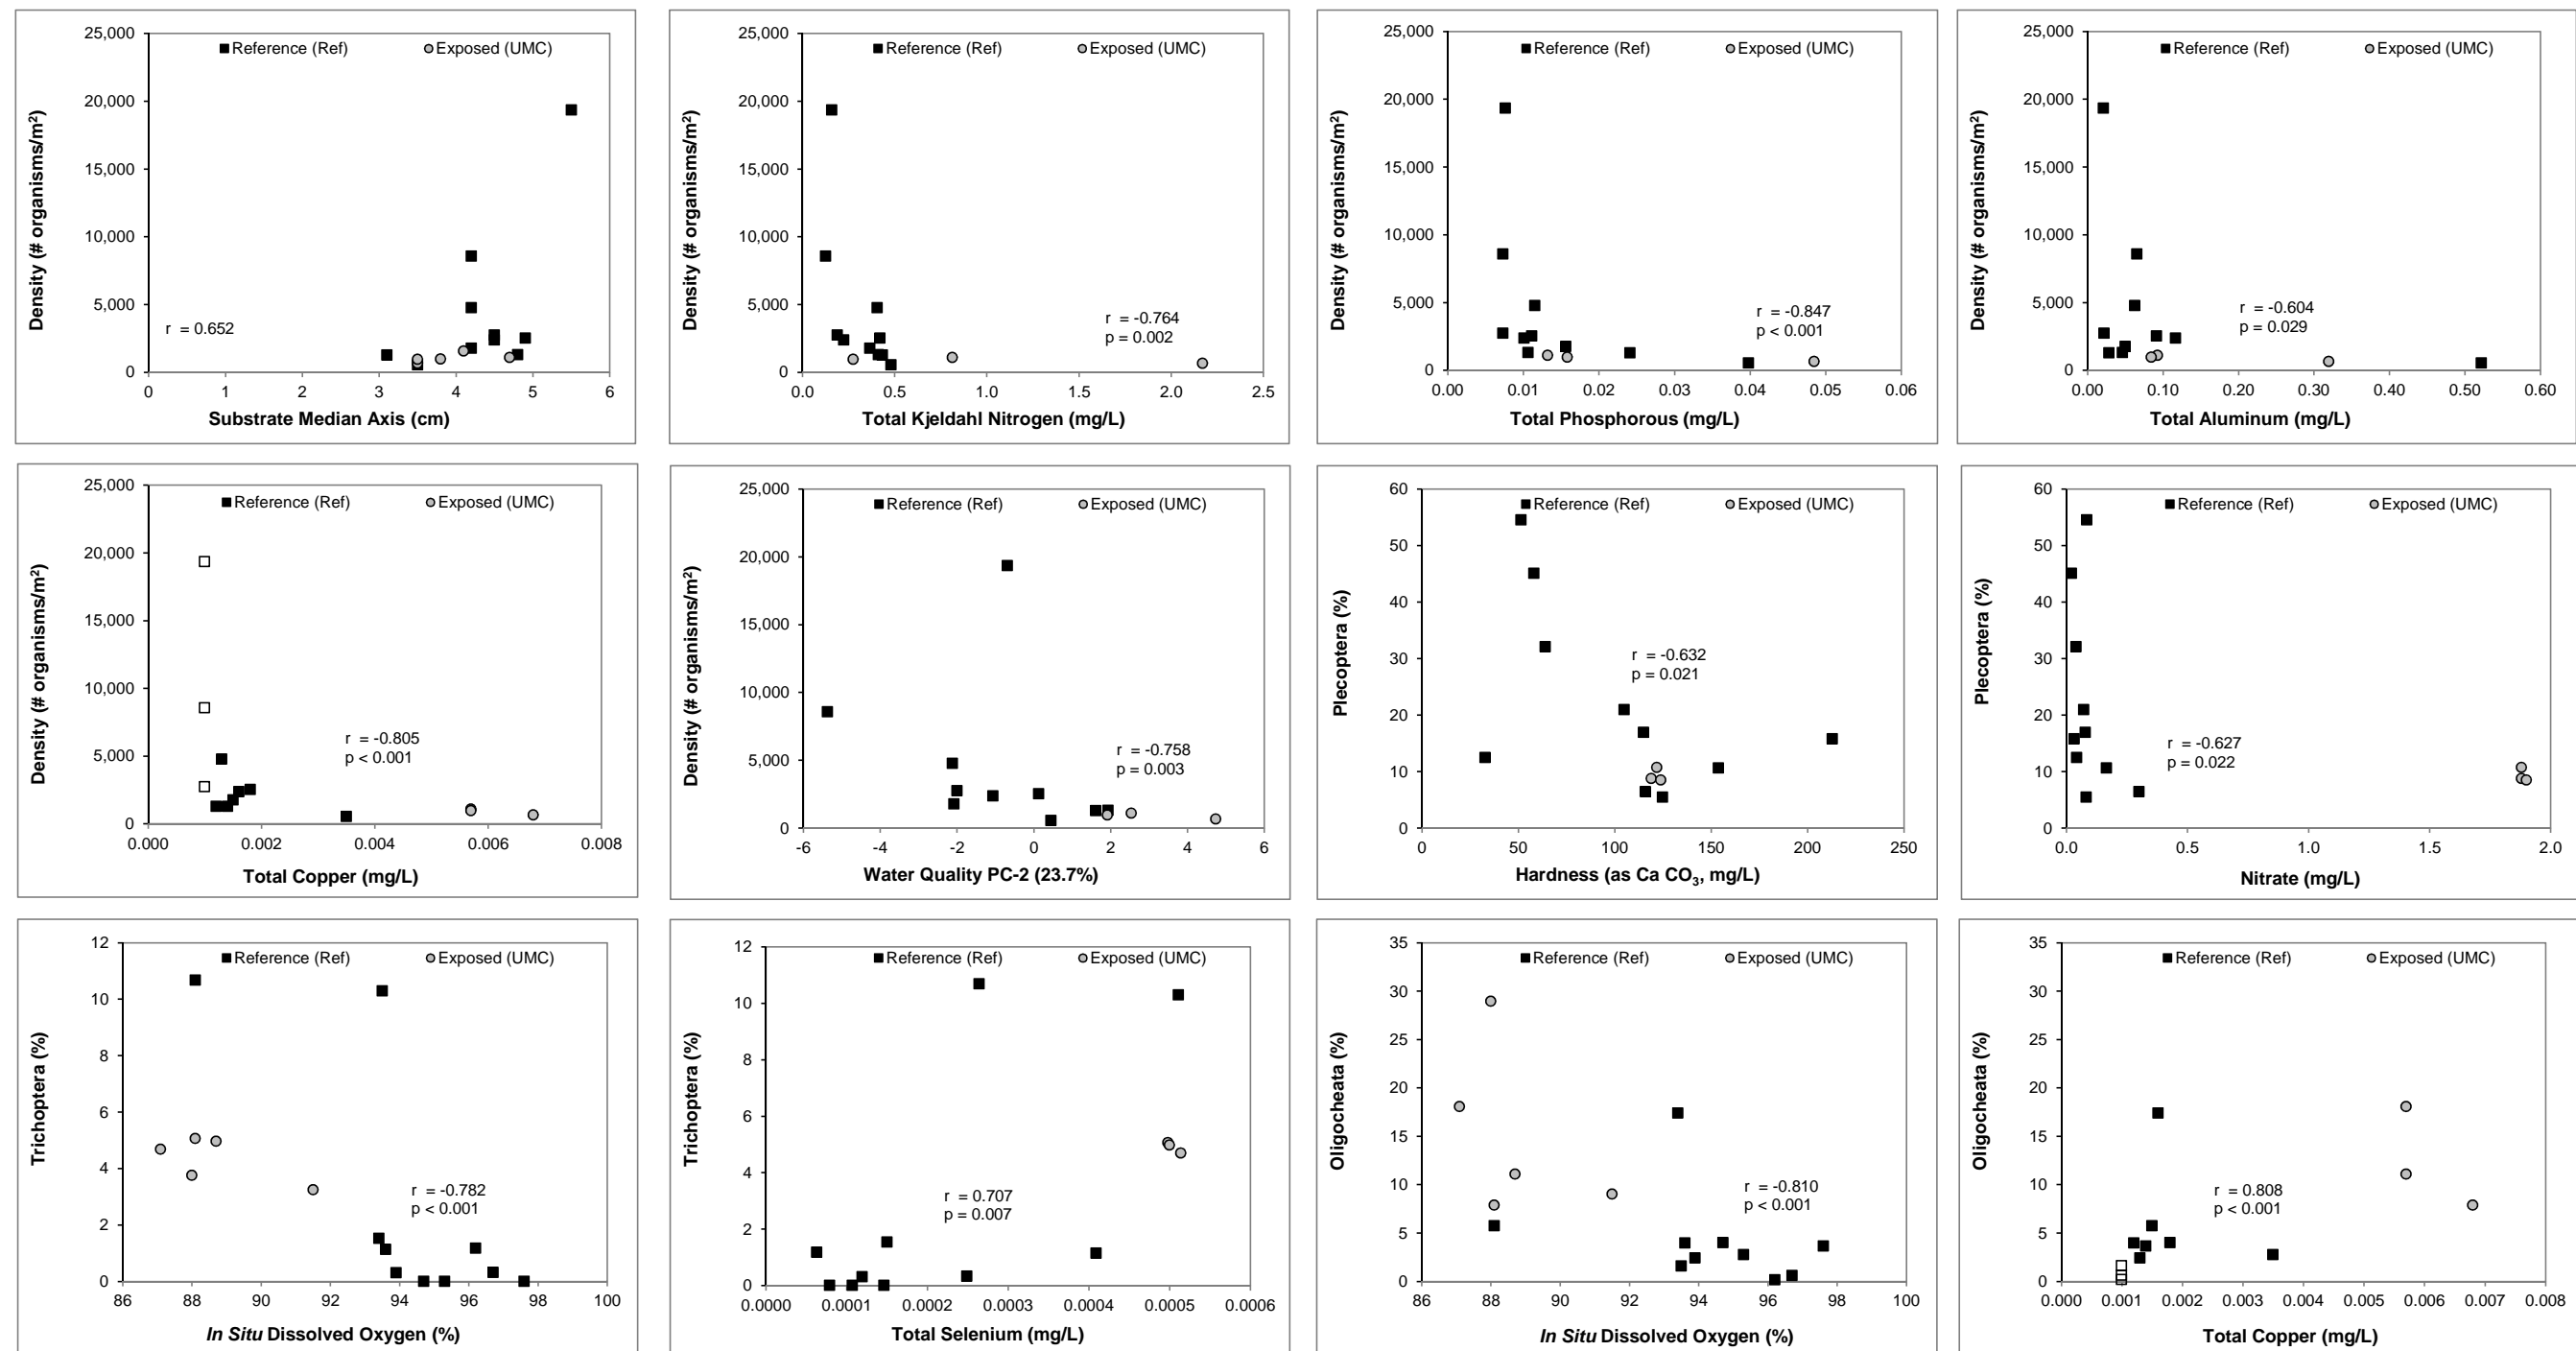

Figure D.6: Scatterplots of Significant Spearman's Rank Correlation Relationships between Benthic Invertebrate Community Metrics, and Water Quality, *In Situ*, and Principal Components Results, Minto Mine Cycle 4 EEM, 2016

Notes: Hollow symbols represent values below the Method Detection Limit (MDL). All correlations were calculated using data < MDL at the MDL value. N = 13 for all analyses of water quality (n = 10 for reference, n = 3 for exposed). N = 14 for all habitat analyses (n = 9 for reference due to exclusion of Ref-1, n = 5 for exposed). The Spearman's Rank Correlation coefficient is represented by "r" on the above plots.

Table D.12: Spearman Correlation of Benthic Invertebrate Endpoints vs. Principal Components Results, *In situ* Measures, and Water Quality Results, Minto Mine Phase 4 EEM, 2016

■ P-value < 0.05.

■ $r > 0.6$ or $r < -0.6$.

* = benthic invertebrate community endpoint that was one or more of: 1) out of reference condition (no instances); 2) inconclusive with respect to the reference condition; and/or 3) statistically different from reference following the Control-Impact comparison.

Notes: All correlations were calculated using data < Method Detection Limit (MDL) at the MDL value. N = 13 for all analyses of water quality (n = 10 for reference, n = 3 for exposed). N = 14 for all habitat analyses (n = 9 for reference due to exclusion of REF-1 and n = 5 for the effluent-exposed area). The Spearman's Rank Correlation coefficient is represented by "r" in the above table.

■ P-value < 0.05.

■ r > 0.6 or r < -0.6.

* = benthic invertebrate community endpoint that was inconclusive with respect to the Reference Condition Approach and/or difference from reference following the Control-Impact comparison.

Notes: All correlations were calculated using data < Method Detection Limit (MDL) at the MDL value. N = 13 for all analyses of water quality (n = 10 for reference, n = 3 for exposed). N = 14 for all habitat analyses (n = 9 for reference due to exclusion of REF-1 and n = 5 for the effluent-exposed area). The Spearman's Rank Correlation coefficient is represented by "r" in the above table.

APPENDIX E
FISH SURVEY DATA

Table E.1: Meristic Data for Juvenile Chinook Salmon Collected from Lower Minto Creek and Lower Big Creek, June to September 2016

| Lower Big Creek | | |
|-----------------|-------------|------------|
| Month | Length (mm) | Weight (g) |
| June | 48 | 1.1 |
| | 48 | 1.9 |
| July | 63 | 3.9 |
| | 58 | 2.8 |
| | 58 | 3.5 |
| | 62 | 4.7 |
| | 55 | 2.6 |
| | 56 | 2.8 |
| | 62 | 3.4 |
| | 60 | 2.8 |
| | 56 | 2.8 |
| | 57 | 3.4 |
| | 48 | 2.1 |
| | 57 | 2.7 |
| | 53 | 2.1 |
| | 65 | 3.9 |
| | 54 | 2.4 |
| | 57 | 2.3 |
| 55 | 2.0 | |
| 52 | 2.8 | |
| 65 | 4.2 | |
| 62 | 3.5 | |
| 61 | 3.3 | |

| Lower Big Creek | | |
|-----------------|-------------|------------|
| Month | Length (mm) | Weight (g) |
| August | 73 | 5.01 |
| | 67 | 2.75 |
| | 77 | 5.52 |
| | 69 | 3.47 |
| | 68 | 3.83 |
| | 62 | 2.60 |
| | 81 | 6.21 |

Table E.7: Statistical Differences on Day 0 between Exposure and Reference Kokanee Used in the Hatchery Exposure, Minto Mine Phase 4 EEM, 2016

| Indicator | Endpoint | Variables | | Comparison | Sample Size | | Test | ANCOVA Statistics | | | Summary Statistics | | | Test P-value | Magnitude of Difference Relative to Control (%) | Estimated Minimum Detectable Difference Between Groups (%) with $\alpha=\beta=0.1$ | |
|----------------|-------------------------------|-------------------------------------|--------------------------------------|------------|-------------|------------------|--------------|---------------------|-------------------|--|---------------------------|------|------|--------------|---|--|--------------|
| | | Response | Covariate | | Ref | Exp | | Interaction P-value | Covariate P-value | Covariate Value for Comparisons ^a | Statistic | Ref | Exp | | | Decrease (%) | Increase (%) |
| Survival | Length Frequency Distribution | Fork Length (cm) | - | E6 vs. Ref | 160 | 160 | 2-sample K-S | - | - | - | - | - | - | 0.759 | -6.9 ^b | - | - |
| | | | | E3 vs. Ref | 160 | 160 | 2-sample K-S | - | - | - | - | - | - | - | 0.400 | 3.8 ^b | - |
| Energy Usage | Fork Length | Fork Length (cm) | - | E6 vs. Ref | 160 | 160 | T-test | - | - | - | Mean | 7.24 | 7.28 | 0.361 | - | -2.1 | 2.1 |
| | | | | E3 vs. Ref | 160 | 160 | T-test | - | - | - | Mean | 7.24 | 7.23 | 0.918 | - | -2.0 | 2.0 |
| | Body Weight | Body Weight (g) | - | E6 vs. Ref | 160 | 160 | T-test | - | - | - | Mean | 3.51 | 3.60 | 0.228 | - | -6.6 | 6.6 |
| | | | | E3 vs. Ref | 160 | 160 | T-test | - | - | - | Mean | 3.51 | 3.50 | 0.902 | - | -6.7 | 6.7 |
| Energy Storage | Condition | Log ₁₀ [Body Weight (g)] | Log ₁₀ [Fork Length (cm)] | E6 vs. Ref | 160 | 159 ^c | ANCOVA | 0.499 | <0.001 | 7.24 | Adjusted Mean (Geometric) | 3.46 | 3.49 | 0.207 | - | -1.6 | 1.7 |
| | | | | E3 vs. Ref | 160 | 160 | ANCOVA | 0.964 | <0.001 | 7.22 | Adjusted Mean (Geometric) | 3.42 | 3.43 | 0.824 | - | -1.7 | 1.7 |

Notes:

 P-value < 0.05.

Bold text Magnitude of Difference > 25% (10% if compared to Condition).

^a Mean for all data with outliers removed. For log-transformed data, the geometric mean is reported.

^b Magnitude of difference is the largest difference (as a percentage) between the cumulative relative frequency distributions for the two sampling areas. A negative difference implies the exposure area has smaller fish compared to reference.

^c One fish was identified as an outlier (E6 Fish #110) with a Studentized residual of 5.786.

Table E.8: Statistical Differences on Day 26 between Exposure and Reference Kokanee Used in the Hatchery Exposure, Minto Mine Phase 4 EEM, 2016

| Indicator | Endpoint | Variables | | Comparison | Sample Size | | Test | ANCOVA Statistics | | | Summary Statistics | | | Test P-value | Magnitude of Difference Relative to Control (%) | Estimated Minimum Detectable Difference Between Groups (%) with $\alpha=\beta=0.1$ | |

1 INTRODUCTION

1.1 Site Description

The Minto Mine is a high-grade copper mine located within Selkirk First Nation (SFN) Category A Settlement Land Parcel R-6A approximately 240 km northwest of Whitehorse, Yukon Territory (62°37'N latitude and 137°15'W longitude; Figure 1.1). It is owned and operated by Minto Explorations Ltd. (MintoEx), a wholly owned subsidiary of Capstone Mining Corporation (Capstone). Mine development was initiated in 1997 and commercial operations started in October 2007. The facility is permitted to conduct open pit and underground mining with milling at a rate of 4,200 tonnes of copper/gold/silver ore per day, and produced 35.9 million pounds of copper in 2017. Mill tailings are stored in the Main Pit and in in the Area 2 Pit (Figure 1.2). Mine-impacted seepage from the dry stack TSF and under the Mill Valley Fill Extension (MVFE) is collected at the toe of the MVFE and pumped to the main pit (Figure 1.2). Non-impacted water and treated mine-impacted water are collected in a Water Storage Pond (WSP; Figure 1.2). Effluent from the WSP is periodically discharged to Minto Creek under conditions specified in Water Use Licence (WUL) QZ14-031 (August 2015). Minto Creek, in turn, discharges to the Yukon River approximately 7.7 km south-east of the WSP (Figure 1.2).

1.2 Background

Under the WUL, the Minto Mine implements an Environmental Monitoring, Surveillance, and Reporting Plan (EMSRP) that includes routine water quality monitoring during the ice-free period (typically from April to October or November) in Minto Creek and reference tributaries at sampling frequencies varying from weekly to monthly. In accordance with the WUL, the Minto Mine submits water quality data to the Yukon Water Board as original laboratory reports and monthly summary reports within 30 days of month-end. Water quality monitoring data indicates that total suspended solids concentrations can increase dramatically during high flow events and concurrent concentrations of many metals (including aluminum, chromium, copper and iron) are higher than Canadian Water Quality Guidelines (CWQGs) for the protection of aquatic life even under background and reference conditions (e.g., HKP 1994, Minnow 2009a, 2010a,b).

The Minto Mine also implements biological monitoring under the EMSRP, including Environmental Effects Monitoring (EEM) in accordance with federal requirements under the *Fisheries Act* and an Aquatic Environmental Monitoring Plan (AEMP). Biological monitoring under EEM is implemented every three years and Phase 4 of the EEM was recently completed (Minnow 2018). Some mine influence was observed in routine water quality monitoring and water samples collected in conjunction with benthic invertebrate sampling. Analytes with concentrations higher than reference (or the reference range) include conductivity, hardness, nitrate, total Kjeldahl

nitrogen, total phosphorous, aluminum, arsenic, copper, iron, molybdenum, and selenium. Concentrations of nitrate were most strongly associated with the release of water from the Water Storage Pond, but remained below the CWQG. Mean concentrations of aluminum and arsenic were above CWQG but at both reference and exposed areas. Copper exceeded CWQG but was lower than the site specific water quality objectives. Primary EEM metrics (density, taxon richness, Simpson's evenness, and Bray-Curtis index) were within reference condition at upper Minto Creek but density was significantly lower at upper Minto Creek than reference in a control-impact comparison (Minnow 2018). The magnitude of difference was below the critical effect size (CES) of ± 2 standard deviation and considered not to be ecologically meaningful (Minnow 2018). Fish exposed to the highest concentrations of Minto Mine effluent (25%) for 47 days were slightly larger, of better condition than reference fish, but differences were less than the CES of 10%, and considered not to be ecologically meaningful (Minnow 2018).

Biological monitoring under the AEMP is implemented annually, and includes monitoring of water, sediment, periphyton, benthic invertebrates, fish, and fish habitat. Data from 1994 (baseline) and 2006 to 2016 have been reported previously (e.g., Minnow 2017), with some program modification over time. AEMP water quality monitoring has indicated that analytes were all below WUL water quality objectives. Fluoride was above CWQG at both the exposed and reference areas. Total copper was above CWQG at upper and lower Minto creeks as well as at reference areas for lower Minto Creek. Concentrations of copper in upper and lower Minto Creek were greater than the Interim Sediment Quality Guidelines (ISQGs) for the protection of aquatic life and the reference areas. Similar concentrations were observed in previous years. In 2016, the periphyton community at lower Minto Creek had higher density/biomass and taxon richness but had a different community composition compared to the reference area (lower Wolverine Creek). Temporal variability was observed in periphyton community metrics and composition due to within year differences (i.e., differences in the number of taxa and Bray-Curtis index) between lower Minto and lower Wolverine creeks. Benthic invertebrate community Bray-Curtis index was significantly higher at lower Minto Creek compared to two reference areas. The high temporal variability observed was presumably due to inter-annual variability in environmental conditions.

1.3 Objectives

The objectives of this study and report are to characterize and interpret current (2017) sediment quality, periphyton and benthic invertebrate community condition, and tissue quality (periphyton and benthic invertebrate) of Minto Creek relative to reference and previous years' conditions. Supporting environmental data are also reported.

2 METHODS

Minnow Environmental Inc. implemented the Minto Creek sediment, periphyton, and benthic invertebrate assessment from September 20th to 26th, 2017 with the assistance of Minto Mine staff. The Minto Mine was not actively discharging during the study and had not been discharging since August 5th, 2017. The study was completed in accordance with specifications of the Minto Mine WUL (QZ14-031). Sediment sampling was undertaken in upper Minto Creek, lower Minto Creek, and corresponding reference areas (Table 2.1; Figure 2.1). Toxicity tests were run on sediment from lower Minto and lower Wolverine creeks (Table 2.1; Figure 2.1). Periphyton and benthic invertebrate community sampling were undertaken in erosional habitat of lower Minto Creek and their corresponding reference areas (Table 2.1; Figure 2.1). Tissue sampling (periphyton and benthic invertebrate) was undertaken in lower Minto Creek and corresponding reference areas (Table 2.1; Figure 2.1). Supporting measures (e.g., field meter measures, water quality samples, depth, flow, habitat observations) were collected at all sampling areas.

2.1 Supporting Measures

2.1.1 Field Collection

Many environmental variables were measured to support the sediment quality, periphyton community, benthic invertebrate community, and tissue chemistry data collected for the Minto Creek assessment. The location of each station was recorded using a handheld Geographic Positioning System (GPS) with coordinates recorded in Universal Transverse Mercator (UTM) units (using the North American Datum of 1983).

Supporting measures collected concurrent with sediment sampling (i.e., at depositional areas) included core penetration depth (lower creek areas only), sample texture, and the presence or absence of organic detritus. *In situ* measurements, including temperature, dissolved oxygen, specific conductance, and pH were taken at each station using either a YSI ProPlus field meter (Yellow Springs Instruments, Yellow Springs, OH) or a Hanna 4M multiparameter field meter (Woonsocket, RI).

At periphyton and benthic invertebrate stations (community and tissue), *in situ* water quality measurements (by field meter as described above), water depth (by meter stick), and water velocity (by HACH FH950 handheld flow meter [HACH Company, Loveland, CO]) were measured. Habitat was characterized at each periphyton and benthic invertebrate sampling area and included elevation, gradient, creek wetted and bankfull widths (by tape measure or range finder), water appearance, creek morphology, bank condition, substrate texture, instream cover, instream features, overhead canopy, aquatic vegetation, riparian vegetation, surrounding land use and anthropogenic disturbance. At each benthic invertebrate station, the intermediate axis lengths of

Figure 2.1

100 rocks that were washed during collection of the community sample were measured and the percent embeddedness of ten randomly selected rocks were evaluated and recorded. This type of substrate characterization is similar to those recommended under the Canadian Aquatic Biomonitoring Network (CABIN) protocol (CABIN 2012) for characterizing benthic invertebrate habitat. This provides additional information to assess and standardize habitat conditions among sampling stations and areas. Summary statistics of intermediate axis lengths (including the median and geometric mean) and median embeddedness were calculated for each station as per the CABIN protocol.

Water samples for chemical analysis were collected at all sampling areas (Table 2.1, Figure 2.1). Samples were collected using a master bottle from which the collected water was poured into pre-labeled sample bottles and preservatives were added, as required. A field duplicate was collected from one area using a split sample method; water from the master bottle was poured into one bottle and then into a duplicate bottle. Water samples for dissolved organic carbon (DOC) and for dissolved Inductively Coupled Plasma-Optical Emission Spectrophotometry (ICP-OES) metals were filtered in the field using 0.45 µm polypropylene filters. Immediately after collection, water samples were placed in a cooler and later into a refrigerator at approximately 4°C. They were later submitted to ALS Environmental in Whitehorse, YT, for analysis of alkalinity by auto titration, anions by ion chromatography, total and dissolved organic carbon by combustion, total inorganic carbon by CO₂ purge, total cyanide by Continuous Flow Analyzer (CFA), conductivity by electrode, hardness by calculation, total and dissolved mercury by Cold Vapour Atomic Fluorescence Spectrophotometry (CVAFS [low]), total and dissolved metals by Collision Cell Mass Spectrometry (CCMS) and ICP-OES, total and dissolved phosphorus by colour, total dissolved and suspended solids by gravimetrics, pH and turbidity by meter, and ammonia by fluorescence.

The productivity of lower Minto and lower Wolverine creeks was evaluated using measurements of chlorophyll-a in periphyton. Chlorophyll-a is the primary photosynthetic pigment of all oxygen-evolving photosynthetic organisms (Wetzel 2001) and therefore provides an indicator of the standing stock of photosynthetic organisms representing the lowest trophic level. Minto Creek is a lotic system and measuring chlorophyll-a in periphyton was considered more representative of productivity than measuring in water. A stainless steel razor blade was used to scrape periphyton from five rocks and then periphyton was transferred to filter paper which was placed in a pre-labeled opaque sampling jar. The surface area sampled was measured and recorded. All samples were maintained in coolers with ice packs during transport and then kept frozen on site until submission to ALS Environmental (Whitehorse, YT).

2.1.2 Data Analysis

A formal data quality report (DQR) was completed to assess the water data quality (Appendix A). The quality of the data were evaluated by comparing laboratory method detection limits (MDL) to target detection limits, which are ideally $\leq 1/10^{\text{th}}$ of guideline values. On a subset of samples, the laboratory conducted Quality Assurance/Quality Control (QA/QC) analysis, including method blanks, laboratory duplicates, matrix spikes, spiked blanks, and certified reference materials. Field duplicates were collected and analyzed as a part of the DQR.

Water quality of Minto Creek was evaluated relative to WUL objectives, concentrations measured at reference areas, applicable water quality guidelines, and historical water quality. Supporting field measures (temperature, dissolved oxygen, pH, and specific conductance) and chlorophyll-a results were tested for differences between lower Minto Creek and reference areas (lower Wolverine and lower Big creeks) using two-sample t-tests. The assumption of normality was assessed using the Shapiro Wilks' test ($\alpha = 0.05$) and homogeneity of variance was assessed using Levene's Test ($\alpha = 0.05$). If variances were unequal, then the two-sample t-test for unequal variances was conducted (Ruxton 2006). Data that could not be normalized were log, square root, or fourth root transformed. A value of 1 was added before taking the logarithm if values of zero were in the data set. If data could not be normalized after transformation, a non-parametric Mann-Whitney test was applied. The significant p-value was set at 0.050 for all tests of supporting field measures. Statistical comparisons were conducted in excel using Real Statistics (Zaiontz 2018). Chlorophyll-a was compared to the British Columbia Water Quality Guideline (BCWQG). Creek productivity was characterized by comparing chlorophyll-a concentrations to the Dodds et al. (1998) productivity classification system for temperate streams.

2.2 Sediment Quality

2.2.1 Sample Collection and Laboratory Analysis

Sediment samples were collected for particle size and chemical analysis at depositional areas within Minto Creek and reference creeks (Table 2.1, Figure 2.1). At lower Minto and lower Wolverine creeks, sediment samples for particle size analysis were collected using a 15.24 cm x 15.24 cm (6" x 6") stainless steel petite ponar grab sampler (0.023 m² sampling area). A composite sample was created by collecting the surficial 2 cm of sediment from each of three acceptable grabs (i.e., full to each edge of the sampler) using a stainless steel spoon. Each sample that formed the composite was added to a plastic bin and mixed together. The mixed composite samples was placed into pre-labeled glass sampling jars. Sediment samples for chemical analyses were collected using a 4.7 cm (2"; inside diameter) Lexan™ core tube, which was carefully inserted into sediment deposits, capped using a fitted plastic cap, and retrieved by

hand. From each acceptable core (i.e., each core containing an intact, representative sediment-water interface), the surficial 2 cm of sediment was manually extruded upwards into a graded core collar, cut with a stainless steel core knife, and placed into a pre-labeled glass sampling jar. Samples from three cores were composited to form a single sample from each station. At upper Minto and upper McGinty creeks, sediment deposits were rare and typically very shallow (i.e., deposits were less than one centimeters in depth). Collection of sediment by ponar or coring was ineffective in the upper creek areas and therefore sediments were collected using a stainless steel spoon. At locations of sediment deposition, surficial sediment was carefully collected by slowly spooning the sediment into a pre-labeled glass jar, with care taken to avoid the loss of fine material. In order to be as consistent as possible with the sediment collected in the lower creek areas, samples included no more than the top 1 cm of deposited sediment. Immediately after collection, sediment samples were placed in a cooler and later into a refrigerator at approximately 4°C. They were later submitted to ALS Environmental in Whitehorse, YT or Burnaby, BC, for analysis of particle size by dry and wet sieving and pipette sedimentation method, total organic carbon and loss on ignition by combustion, inorganic carbon was derived from a calculation, metals by collision/reaction cell-inductively coupled plasma mass spectrometry (CRC ICP-MS), mercury by CVAFS, total Kjeldahl nitrogen by colorimetric analysis, and pH by probe.

Survival and growth were measured in a 10-day *Chironomus dilutus* and a 14-day *Hyalella azteca* sediment toxicity tests at lower Minto and lower Wolverine creeks (Environment Canada 1997, 2013). Sediment for toxicity testing was collected using a 15.24 cm x 15.24 cm (6" x 6") stainless steel petite ponar grab sampler (0.023 m² sampling area) and the top 2 cm from three grabs were collected to form a composite sample from each station (five stations formed the replicates in the toxicity tests). Samples from each station were placed into a pre-labeled 1 L jar and mixed with a stainless steel spoon. Immediately after collection, samples were placed in a cooler, then later transferred to a refrigerator and stored at approximately 4°C until they were submitted to Nautilus Environmental Inc. in Burnaby, BC for sediment toxicity testing.

2.2.2 Data Analysis

A formal DQR was completed to assess the sediment data quality (Appendix A). The MDLs achieved by the laboratory were compared to target limits, generally $\leq 1/10^{\text{th}}$ guideline values. Laboratory QA/QC analysis included method blanks, laboratory duplicates, spiked blanks and certified reference materials (Appendix A). Sediment chemistry endpoints were summarized by reporting mean, standard deviation, minimum, and maximum for each area. Sediment quality data were evaluated relative to sediment quality guidelines (SQGs) for the protection of aquatic life (e.g., CCME 1999) and reference concentrations to identify metals with the potential to adversely affect aquatic life and/or that could be elevated due to mine activity. Sediment quality

data were also compared to results obtained in previous years of sampling (1994 and 2006 to 2016). Interpretation was conducted with careful consideration of a significant methodological change made in 2010 and carried through to 2017 (sediments collected as described in Section 2.2.1) relative to previous years. Sediments collected in years before 2010 were collected within the active channel of the creek using an aluminum or Teflon scoop. Samples were submitted whole for analysis of particle size distribution, which generally included significant quantities of gravel and sand. Only material passing through a 230 mesh sieve (<63 µm; silt and clay) was digested and analyzed for metals. While this approach does analyze the geochemically-relevant fine sediment (e.g., Horowitz 1991), it impedes with interpreting the biological significance of sediment chemistry. Organisms are exposed to whole sediment (not just fines) and SQGs for the protection of aquatic life (e.g., CCME 1999) apply to whole sediment.

The laboratory performed QA/QC on sediment toxicity tests by comparing results to reference toxicant tests. Ammonia was monitored in lower Wolverine Creek treatments to ensure concentrations stayed below 0.20 mg/L of un-ionized ammonia (as N). Sediment from lower Minto Creek was compared to lower Wolverine Creek and laboratory control sediment. Results were also compared to previous sediment toxicity testing conducted in 2011, 2015, and 2016 (Minnow 2012, 2016, 2017). The mean ± standard deviation were compared for the survival and growth toxicity tests. Statistical analysis were conducted and summarized in a report by Nautilus Environmental (Appendix C).

2.3 Periphyton Community

2.3.1 Sample Collection and Laboratory Analysis

Periphyton is the assemblage of algae, bacteria, fungi, and meiofauna attached to submerged substrate in freshwaters. However, periphyton communities are generally characterized based on the attached alga community, which represent the lowest trophic level and are indicators of primary productivity. Periphyton community samples were collected in erosional habitat of lower Minto, lower Wolverine, and lower Big creeks (Table 2.1, Figure 2.1). A stainless steel razor blade was used to scrape periphyton from five randomly selected rocks in each of the five replicate stations per area. The area sampled was measured and recorded. Samples preserved with Lugol's iodine solution were placed in pre-labeled sampling jars. The samples were placed in a cooler, then later transferred to a refrigerator and stored at approximately 4 °C until they were shipped to Plankton R Us Inc. (Winnipeg, MB) for analysis to species level.

2.3.2 Data Analysis

A formal DQR was completed to assess the periphyton community data quality (Appendix A). Laboratory duplicate samples were collected on 10% of the periphyton community samples.

Periphyton communities were compared between lower Minto Creek and reference areas, lower Wolverine and lower Big creeks. Temporal comparisons were made to data collected in 1994 and 2011 to 2017.

Total organism density (cells/cm²) and biomass (µg/cm²) were calculated for periphyton community samples. The diversity metric “number of taxa” (also known as taxon richness) included all separate taxa identified to the species level. Simpson’s Diversity and Simpson’s Evenness indices were computed according to formulae presented by Smith and Wilson (1996) and recommended by Environment Canada (2012). These indices take into account the relative abundance of taxa and number of taxa, with values ranging from 0 (low diversity or evenness) to 1 (high diversity or evenness). The Bray-Curtis index was also calculated according to Environment Canada (2012). This metric takes into account the abundance of each taxon at each station compared to the median reference abundance (lower Wolverine Creek), to compute an index of the relative “dissimilarity” of each station from the hypothetical reference median station. Larger Bray-Curtis index values indicate greater dissimilarity from reference.

Periphyton community endpoints were summarized by reporting mean, median, minimum, maximum, and standard deviation for each study area. Differences among Minto Creek and the reference areas were tested using a two-sample t-test, with a p-value <0.10. A p-value of 0.10 was used as per suggested EEM guidelines (Environment Canada 2012). The assumptions of normality was assessed using the Shapiro Wilks’ test ($\alpha = 0.05$) and homogeneity of variance was assessed using Levene’s Test ($\alpha = 0.05$). If variances were unequal, then the two-sample t-test for unequal variances was conducted (Ruxton 2006). Data that could not be normalized were log, square root, or fourth root transformed. A value of 1 was added before taking the logarithm if values of zero were in the data set. If data could not be normalized after transformation, a non-parametric Mann-Whitney test was applied. Statistical comparisons were conducted using Real Statistics in excel (Zaiontz 2018). An observed effect size was calculated for each community metric as:

$$\text{Observed Effect Size} = (\text{Exposed mean} - \text{Reference mean})/\text{SD}$$

where the SD is an estimate of the reference standard deviation. The estimate of the reference standard deviation was the pooled standard deviation in the two-sample t-test for equal variances or the reference standard deviation when the two-sample t-test for unequal variances was applied. The effect size calculations will be conducted on the transformed scale when the data are transformed for analysis. A study design with two areas and $n = 5$ samples per area has an approximate power of 0.9 to detect a two standard deviation difference between areas using $\alpha = 0.1$ (Environment Canada 2012).

Periphyton data collected in 2017 were compared to data collected in baseline studies (HKP 1994) and from 2011 to 2016. Due to differences in reporting of periphyton community data in the 1994 baseline report (e.g., taxa were only identified as present, common or dominant), a non-statistical comparison was performed against 1994 data using proportional abundances at the taxonomic level of Phylum.

2.4 Benthic Invertebrate Community

2.4.1 Sample Collection and Laboratory Analysis

Benthic invertebrate community samples were collected in erosional habitat of lower Minto, lower Wolverine, and lower Big creeks as required under the WUL (Table 2.1, Figure 2.1). Benthic invertebrate community samples were collected from riffle/run habitat with cobble and gravel substrate using a Hess sampler (0.10 m²) outfitted with 500 µm mesh. Three grab composites (0.30 m² area in total) were collected at five replicate stations within each sampling area. For each grab, the substrate within the sampler was disturbed and scrubbed (by hand and nail brush) with care taken to ensure that all dislodged organic material was swept into the sampler collection net. The substrate was disturbed to a depth of approximately 5 cm over a period of approximately ten minutes. This procedure was repeated for the second and third grab, following which all of the material contained in the collection net was carefully transferred to a pre-labeled 2 L wide-mouth plastic jar using a stainless steel spoon and a wash bottle while working over a plastic bin to avoid any potential loss of organisms. Any organisms that adhered to the sieve bag were removed by hand and added to the sample. All samples were labeled internally (using wooden sticks) and externally with the station number, area identifier, Minnow project number, date and field personnel in order to ensure correct identification at the laboratory. Samples were preserved within six hours of collection using buffered formalin solution to a nominal concentration of 10% in ambient water.

All benthic invertebrate samples were shipped to Cordillera Consulting in Summerland, BC. Each sample was elutriated to remove sand, gravel and clay, and the remaining organic material was preserved in 70% ethanol. Elutriate was examined for any mollusc or Trichoptera cases, then each sample was examined to estimate the total number of invertebrates. If the estimated number of organisms were greater than 600 and the sample was fine and non-clumping, a subsample was taken using a Folsom Plankton Splitter (Motodo 1959, Van Guelpen et al. 1982). Empty snail or bivalve shells, empty caddisfly cases, and invertebrate fragments such as legs, gills, antennae etc. were kept but excluded from the count. When organism fragments were encountered, only the heads were counted towards the total. Larval and pupal exuviae were excluded while terrestrial stages and terrestrial drop-ins were indicated as such but excluded from the total count. Benthic invertebrates were identified to the “lowest practicable taxonomic level” (which in most

cases were genus) and counted. Following identification and counting, representative specimens of each new taxon were preserved in a museum quality vial with a polyseal lid and added to the Minto Mine voucher collection. Internal labels were used to identify the taxa, the client, date collected, site code, and the project.

2.4.2 Data Analysis

A formal DQR was completed to assess the benthic invertebrate community data quality (Appendix A). Laboratory QA/QC included an assessment of sub-sampling error and sorting efficiency on at least 10% of the samples (Appendix A). Benthic invertebrate communities were evaluated using summary metrics, including invertebrate density (number of organisms per m², calculated based on a sample area of 0.30 m²), number of taxa, Simpson's Diversity and Evenness, and Bray-Curtis index. Before these endpoints could be calculated, abundances of organisms identified to a less-specific level were first added to abundances of organisms within that grouping identified to a more-specific level (e.g. abundances of organisms only identified to Order were added to abundances of organisms identified to Family, Genus, or Species within that Order). This process is referred to as data compression and assess benthic invertebrate taxonomic richness without redundancy. Abundance of a less-specific taxon was redistributed within that taxon proportionally according to abundances of organisms identified to more-specific levels. Data compression was conducted proportionally because the distribution of organisms identified beyond the Family-level likely reflect the proportional distribution of organisms identified to associated less-specific levels, because those organisms are frequently at early developmental stages and lack some differentiating features. Total organism density (individuals/m²), taxon richness, Simpson's Diversity and Evenness, and Bray-Curtis index were calculated in the same manner as periphyton community data (Section 2.3.2). Bray-Curtis index was calculated based on the median of each reference area as well as the combined reference median. The combined reference median was presented within the text, as this is the optimal method for determining potential effluent effects, since using a reference median value calculated from only one area biases the outcome toward detecting a difference between two areas regardless of potential anthropogenic stressors. This occurs because the area used to calculate the median was inherently more similar to itself than any other area (Huebert et al. 2011), even if the two areas in question are 'natural-pristine' areas.

The relative proportions of the most abundant taxa were calculated relative to the total number of organisms in the sample. Dominant taxon groups were defined as groups representing greater than 10% of total organism abundance in one or more areas or any groups considered important indicators of environmental stress. In this study, relative proportions of the major groups, such as chironomids and EPT taxa (Ephemeroptera [mayfly], Plecoptera [stonefly], Trichoptera

[caddisfly] taxa) were examined. It is often possible to relate low relative abundance of sensitive taxonomic groups (e.g., EPT taxa) to environmental stress (e.g., Taylor and Bailey 1997). Similarly, high relative abundance of tolerant taxonomic groups (e.g., oligochaetes) may also indicate higher environmental stress (Chapman et al. 1982a,b).

Differences among Minto Creek and the reference areas were tested using ANOVA with a post hoc test (Tukey's), with significance set at a p-value of <0.10, as per suggested EEM guidelines (Environment Canada 2012). Prior to ANOVA, all data were transformed (log, square root, or fourth root transformation) as necessary to meet assumptions of normality (Shapiro Wilks' test; $\alpha = 0.05$) and homogeneity of variance (Levene's test; $\alpha = 0.05$). A value of 1 was added before taking the logarithm if values of zero were in the data set. If data failed the assumptions of normality and homogeneity of variance, then a non-parametric Kruskal-Wallis test was conducted using a Dunn's post hoc test. All statistical comparisons were conducted using Real Statistics in excel (Zaiontz 2018). An observed effect size was calculated for each community metric as:

$$\text{Observed Effect Size} = (\text{Group 1 mean} - \text{Group 2 mean})/\text{SD}$$

where the SD is an estimate of the reference standard deviation.

Benthic invertebrate community data were also evaluated in comparison to results obtained in previous years of sampling (1994, 2006, 2008, and 2010 to 2016). Summary metrics from earlier years were previously re-calculated (Minnow 2011) to ensure consistency and appropriate comparisons over time.

2.5 Tissue Chemistry

2.5.1 Sample Collection and Laboratory Analysis

Periphyton and benthic invertebrate tissue samples were collected from lower Minto (exposed), lower Wolverine (reference), and lower Big creeks (reference; Table 2.1, Figure 2.1). Periphyton samples were collected by scraping submerged cobble-size rocks with a stainless steel razor blade. Scraped material (periphyton) was placed in pre-labeled sample jars. Benthic invertebrate tissue samples were collected in areas with cobble substrate using a kick-net, and by overturning rocks and collecting organisms by hand. Periphyton and benthic invertebrate tissue samples (2 to 5 grams) were placed into pre-labeled sample jars and Whirl-Pak™ bags, respectively. A total of five periphyton and five benthic invertebrate samples were collected at each area. Immediately after collection, all tissue samples were placed in a cooler, and later in a freezer until they were submitted to ALS Environmental in Burnaby, BC. Samples were analyzed for percent moisture and for metals by High-Resolution ICP-MS, and later converted to dry weight using percent moisture.

2.5.2 Data Analysis

A formal DQR was completed to assess the periphyton and benthic invertebrate tissue data quality (Appendix A). The MDLs achieved were compared to the detection limits quoted by the laboratory. Method blanks, laboratory duplicates, spiked blanks, and certified reference materials were included in the DQR for both tissue types (Appendix A). Tissue chemistry data were summarized (mean and standard deviation). Any analyte that had values with poor detection limits (a value below the detection limit that exceeds the maximum detected value) were removed from the data set when they consisted of fewer than 80% of the data values. The removal of the poor detection limits is irrelevant to the estimation of the mean or standard deviation, but does influence the overall sample size. Analytes with one or more values below a detection limit or with poor detection limits were analyzed using the non-parametric Kaplan-Meier method using a data analysis package (NADA: non-detects and data analysis for environmental data; Helsel 2012) in R statistical software (R Core Team 2016). This method involves transforming the left censored (i.e., < value) dataset to a right censored (i.e., > value) dataset, and then using the Kaplan-Meier estimator (used to estimate the mean survival time in survival analysis) to estimate the mean. The calculation was conducted using the `survfit()` function in the survival package (Therneau 2017) in R and involves calculating the area under the Kaplan-Meier survival curve. The Kaplan-Meier method is non-parametric and can accommodate multiple detection limits. This method of estimating the mean is equivalent to using the distribution of detectable values below the detection limit to represent values that are <MDL. If the minimum value in the data set was below the detection limit, then it was replaced with the detection limit. Therefore, if there was only one detection limit and no detected values <MDL, then the Kaplan-Meier estimate of the mean was equivalent to replacing the value below the detection limit with the detection limit (i.e., the best estimate for the values <MDL is the detection limit). The standard deviation was also estimated using the Kaplan-Meier method using the `survfit()` function in the survival package. When a standard deviation could not be estimated, it was reported as NA (not available). This can occur with a data set with a high proportion of censored values.

The primary objective of tissue collection was to support a selenium assessment reported under a separate cover. Accordingly, data are reported herein for future reference with limited interpretation. Tissue quality data were interpreted by statistically comparing metal concentrations at the exposed area to those collected at the reference areas using ANOVA with post-hoc testing (Tukey's) with a p-value of 0.050. Data were first tested for normality (Shapiro Wilks' test; $\alpha = 0.05$) and equality of variance (Levene's test; $\alpha = 0.05$) and if data were not normally distributed, data were transformed by either log, square root, or fourth root transformations. A value of 1 was added before taking the logarithm if values of zero were in the data set. Some analytes were could not be normalized, and a non-parametric Kruskal-Wallis test

with a Dunn's post-hoc was conducted. All statistical tests were conducted using Real Statistics in excel (Zaiontz 2018). When one or more values were below a detection limit, the data were analyzed using the generalized Wilcoxon score test as described in Helsel (2012). The test is nonparametric, accommodates multiple detection limits, and compares the survival curves for two or more groups. If a significant difference among groups was detected for three-group comparisons, then pairwise comparisons were conducted using two-group generalized Wilcoxon score tests. The tests were conducted using cendiff function in the NADA package (Lee 2017) in R (R Core Team 2016).

3 SUPPORTING MEASURES

3.1 Field Measures

Mean temperature at the sediment sampling area of upper Minto Creek (2.7 °C) was significantly higher than in upper McGinty Creek (1.6 °C; Figure 3.1, Appendix Table B.3). Lower Minto Creek (3.9 °C) had significantly lower temperature compared to the reference area, lower Wolverine Creek (6.2 °C; Figure 3.1, Appendix Table B.3). Specific conductance was significantly higher in upper Minto Creek (602 µS/cm) than in upper McGinty Creek (174 µS/cm). Lower Minto Creek (430 µS/cm) had significantly higher specific conductance than compared to the lower Wolverine Creek reference (247 µS/cm; Figure 3.1). Dissolved oxygen was significantly higher at lower Minto Creek (68.1% saturation) than at lower Wolverine Creek (36.6% saturation; Figure 3.1, Appendix Table B.3). Lower dissolved oxygen at lower Wolverine Creek could be attributed to sampling in back eddies, which were the only areas that support sediment deposition. No significant differences were observed between exposed areas and associated reference areas for pH (Figure 3.1, Appendix Table B.3).

Physico-chemical measurements were also taken in erosional areas of lower Minto, lower Wolverine, and lower Big creeks in support of benthic invertebrate community sampling. Temperature was significantly lower at lower Minto Creek (2.0 °C) compared to lower Big Creek (6.4 °C) but were similar to lower Wolverine Creek (3.8 °C; Figure 3.2, Appendix Table B.4). Specific conductance was the only parameter measured that was significantly higher at lower Minto Creek (412 µS/cm) compared to both reference areas, lower Wolverine (259 µS/cm) and lower Big (248 µS/cm) creeks, which was consistent with the measures supporting the sediment collections and suggest a mine influence on water quality. No significant differences were observed between lower Minto Creek and reference creeks for dissolved oxygen and pH. All areas were within the range of the WUL objective for pH.

3.2 Water Chemistry and Chlorophyll-a

Water chemistry data quality were assessed prior to data analysis and interpretation, and were judged to be of good quality (Appendix A). Fluoride exceeded the interim CWQG in Minto Creek and associated reference areas (Table 3.1). Total copper concentrations (a metal of particular interest at the Minto Mine) were above CWQG at upper Minto Creek but dissolved copper was well below water quality objectives set out in the WUL (Table 3.1, Appendix Table B.7).

Chlorophyll-a data quality was assessed prior to data analysis and interpretation, and was judged to be of good quality (Appendix A). Concentration of chlorophyll-a in periphyton was significantly higher at lower Minto Creek (51 mg/m²) than at lower Wolverine Creek (13 mg/m²; Figure 3.3) but was below the BCWQG of 100 mg/m² for the protection of aquatic life (BCMOE 1985).

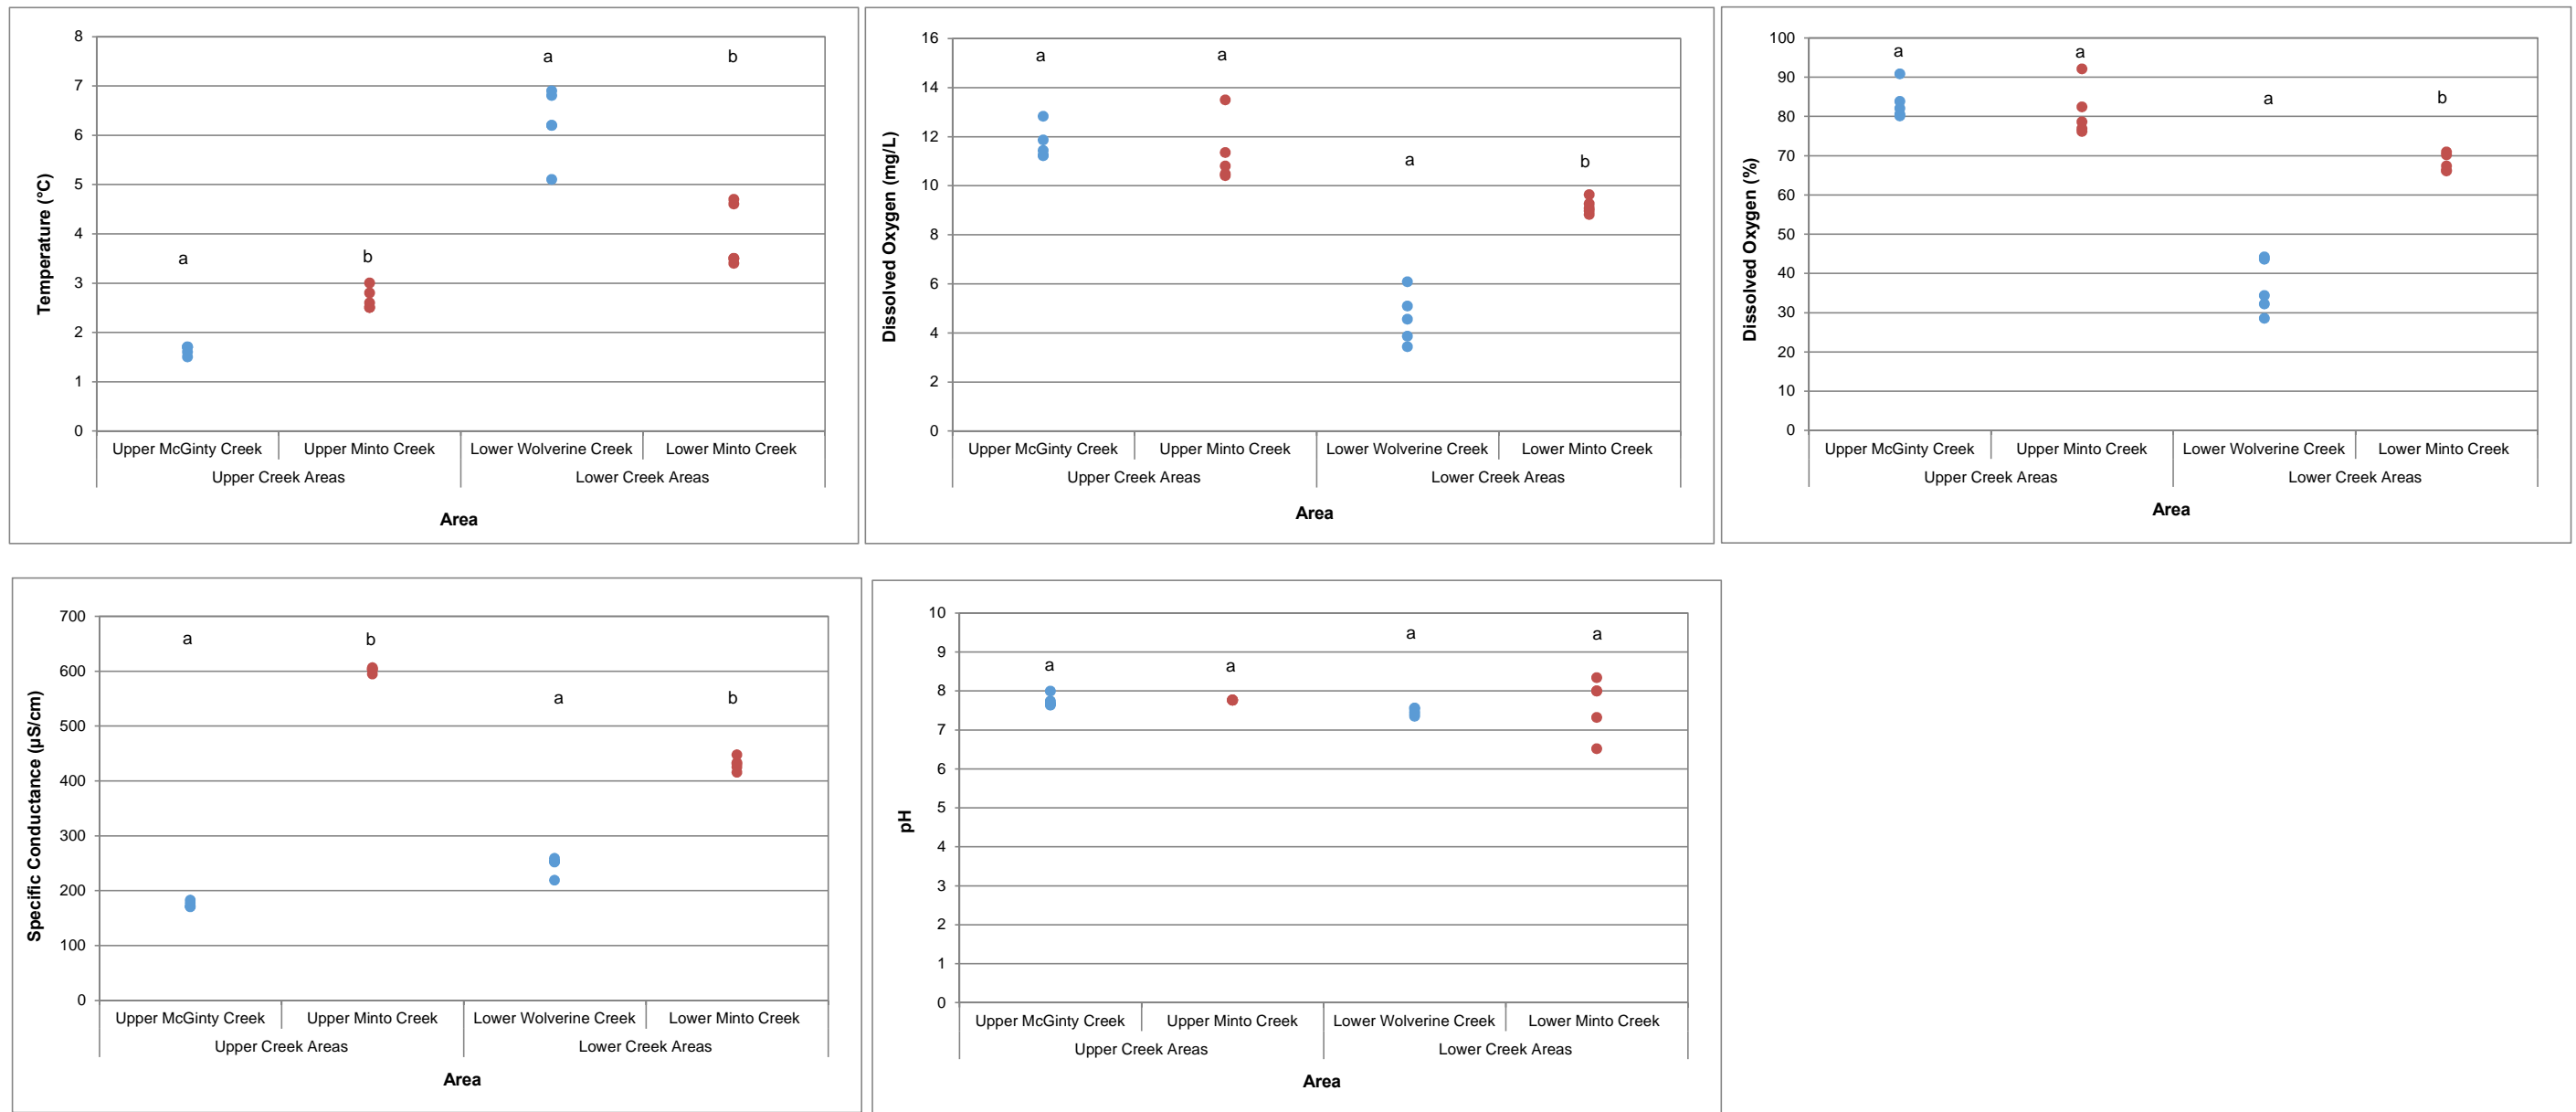

Figure 3.1: Physico-chemical Measurements in Depositional Areas of Upper and Lower Minto Creek Relative to Reference Areas, Minto Mine, 2017

Notes: Samples sizes were n = 5 in all areas (except for pH at upper Minto Creek, n = 4). Different letters represent a significant difference between areas within each creek area.

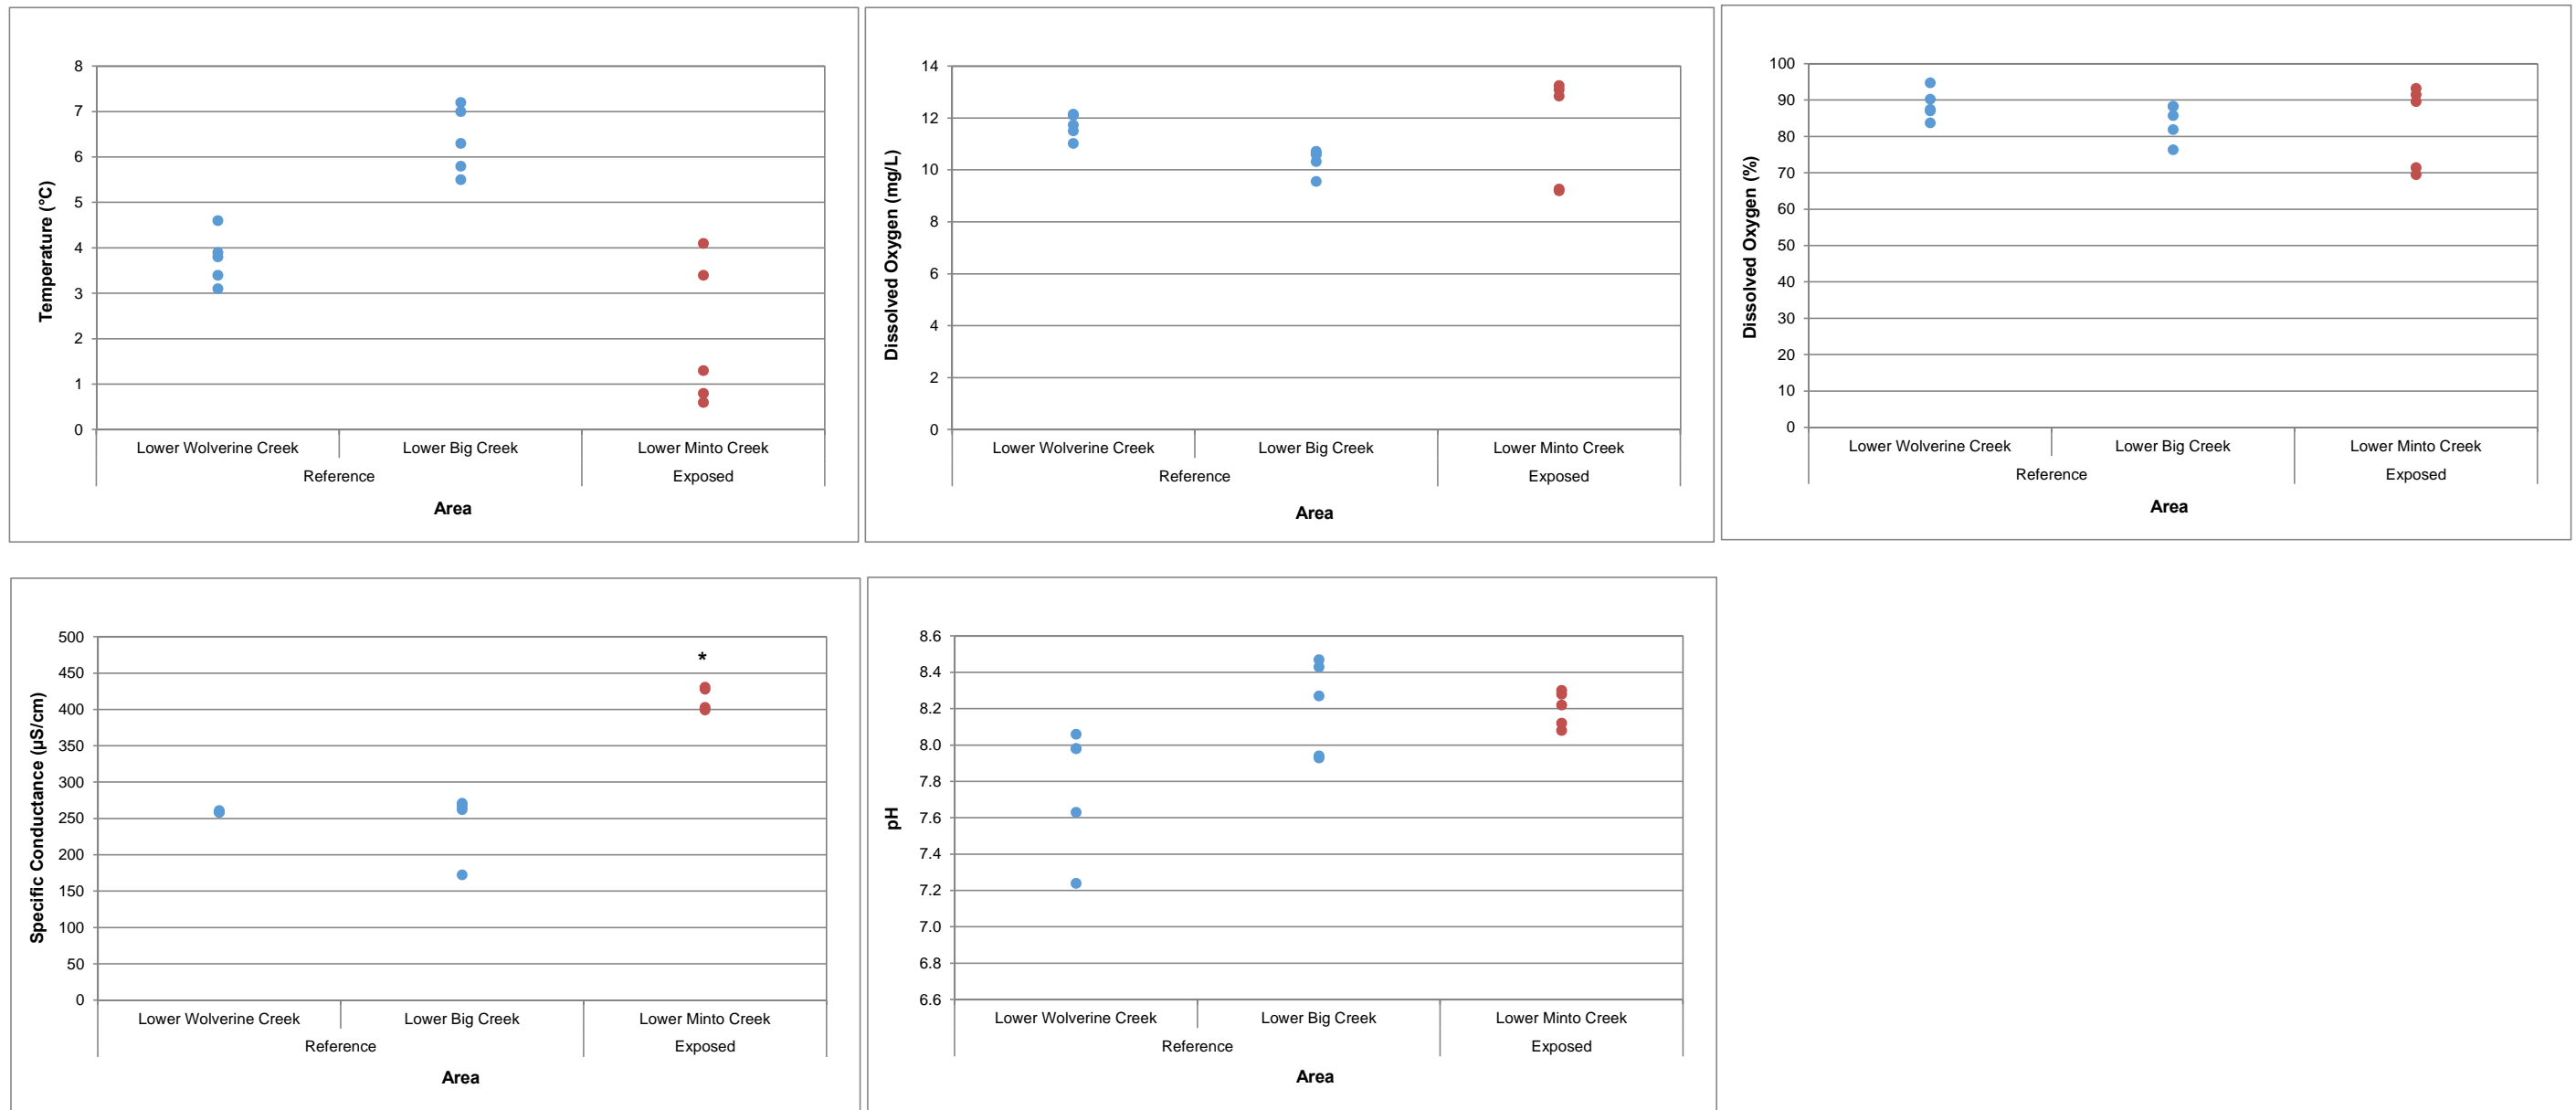

Figure 3.2: Physico-chemical Measurements in Erosional Areas in Lower Minto Creek and Reference Areas, Minto Mine, 2017

Notes: Samples sizes were n = 5 in all areas. Asterisk (*) indicate when lower Minto Creek was significantly different from lower Wolverine and lower Big creeks.

Water use licence objectives not met.

Water quality guideline not met.

^a CCME (Canadian Council of Ministers of the Environment). 1999. Canadian Environmental Quality Guidelines. 1999 (plus updates), Canadian Council of Ministers of the Environment Winnipeg. See Appendix Table B.6 for explanatory notes on selected water quality guidelines.

^b Based on lowest guideline using highest temperature and pH

^c Based on lowest guideline using highest pH

^d Based on lowest guideline using lowest hardness

^e Dissolved Cadmium (µg/L) guidelines based on the following formula using the lowest hardness: $e(0.736(\ln(\text{Hardness})-4.943))$

^f Dissolved Copper water quality objective depends on concentration of dissolved organic carbon (DOC). If DOC is > 10 mg/L/ DOC is ≤ 10 mg/L.

Figure 3.3: Concentrations of Chlorophyll-a in Periphyton Measured at Five Benthic Stations in Lower Wolverine and Lower Minto Creeks, Minto Mine WUL, 2017

Note: Different letters represent significant differences between areas.

Chlorophyll-a concentrations have been variable over time and between areas but concentrations are often higher (not always significantly different) and below BCWQG at lower Minto Creek (Appendix Figure B.1). Dodd's et al (1998) classification system sets the trophic status of lower Minto Creek (51 mg/m²) as mesotrophic and lower Wolverine Creek (13 mg/m²) as oligotrophic. Based on only total phosphorus, both creeks would be defined as oligotrophic as was observed in previous years (Dodds et al. 1998).

3.3 Summary

Supporting measures collected in September 2017 indicated good Minto Creek water quality. Influence of the Minto Mine was evident in higher specific conductance than in reference creeks, however, water quality parameter concentrations were lower than WUL water quality objectives. Concentration of total copper at upper Minto Creek was higher than CWQG and the reference area but dissolved copper was much lower than the WUL water quality objectives. Moving downstream, total copper concentrations were lower than CWQG at lower Minto Creek indicating natural elevation in upper Minto Creek. Mean concentrations of chlorophyll-a was significantly higher at lower Minto Creek compared to lower Wolverine Creek but were below BCWQG. Compared to 2016, production at the exposure and reference areas were different than in 2017; Minto Creek was defined as mesotrophic and lower Wolverine was oligotrophic.

4 SEDIMENT QUALITY

4.1 Sediment Particle Size and Chemistry

Sediment data quality were assessed prior to data analysis and interpretation, and were judged to be of good quality (Appendix A). Sediments collected in 2017 were largely composed of fine particles in the silt and sand size categories (Figure 4.1, Table 4.1, Appendix Table C.1). Mean total organic carbon (TOC) content of sediment collected from upper Minto Creek (2.8%) was slightly higher than at the upper McGinty Creek reference area (2.6%; Table 4.1). Lower Minto Creek (5.2%) had lower TOC than the lower Wolverine Creek reference area (6.5%; Table 4.1). Arsenic and copper were the only analytes with mean concentrations greater than Interim Sediment Quality Guidelines (ISQG) for the protection of aquatic life (CCME 1999) in an effluent-exposed area (Table 4.1, Appendix Table C.1). However, mean arsenic concentration in upper Minto Creek was below ISQG and lower than the reference area, upper McGinty Creek (which was greater than ISQG). This suggests that arsenic concentrations were unrelated to the mine. Mean copper concentrations in upper and lower Minto Creek were greater than the ISQG, and maximum copper concentration at upper Minto Creek was above the Probable Effect Level (PEL). Both areas had higher concentrations than the corresponding reference areas, which were lower than the ISQG (Figure 4.2, Table 4.1). With progression from upper to lower Minto Creek, sediment copper concentrations decreased from a mean of 155 to 49 mg/kg, respectively, indicating improvement with distance downstream.

Due to the predominantly erosional habitat in upper Minto Creek, relatively few areas had deposited sediment and even this only occurred in small quantities that likely wash away each year during freshet. Therefore, elevated copper in fine sediment in the upper reaches of Minto Creek may be of limited importance in terms of exposure and potential effects to biota. In lower Minto Creek, fine sediment deposits were somewhat more common and therefore more relevant to aquatic life.

4.2 Temporal Comparisons

Particle size distribution in 2017 was similar to distribution observed from 2010 to 2016 but was notably different from data collected prior to 2010, which employed different sampling methodology (Figure 4.1). Mean copper concentration at upper Minto Creek in 2017 was greater than the ISQG as was the case in all previous years, including the 1994 baseline (Figure 4.2). At lower Minto Creek, mean copper concentration in 2017 was greater than ISQG as was the case during most years, and was greater than 1994 baseline (Figure 4.2, Table 4.1, Appendix Table C.1). This does not necessarily indicate an influence of the Minto Mine as concentrations were within the historical range and sampling methodology applied in 1994 was

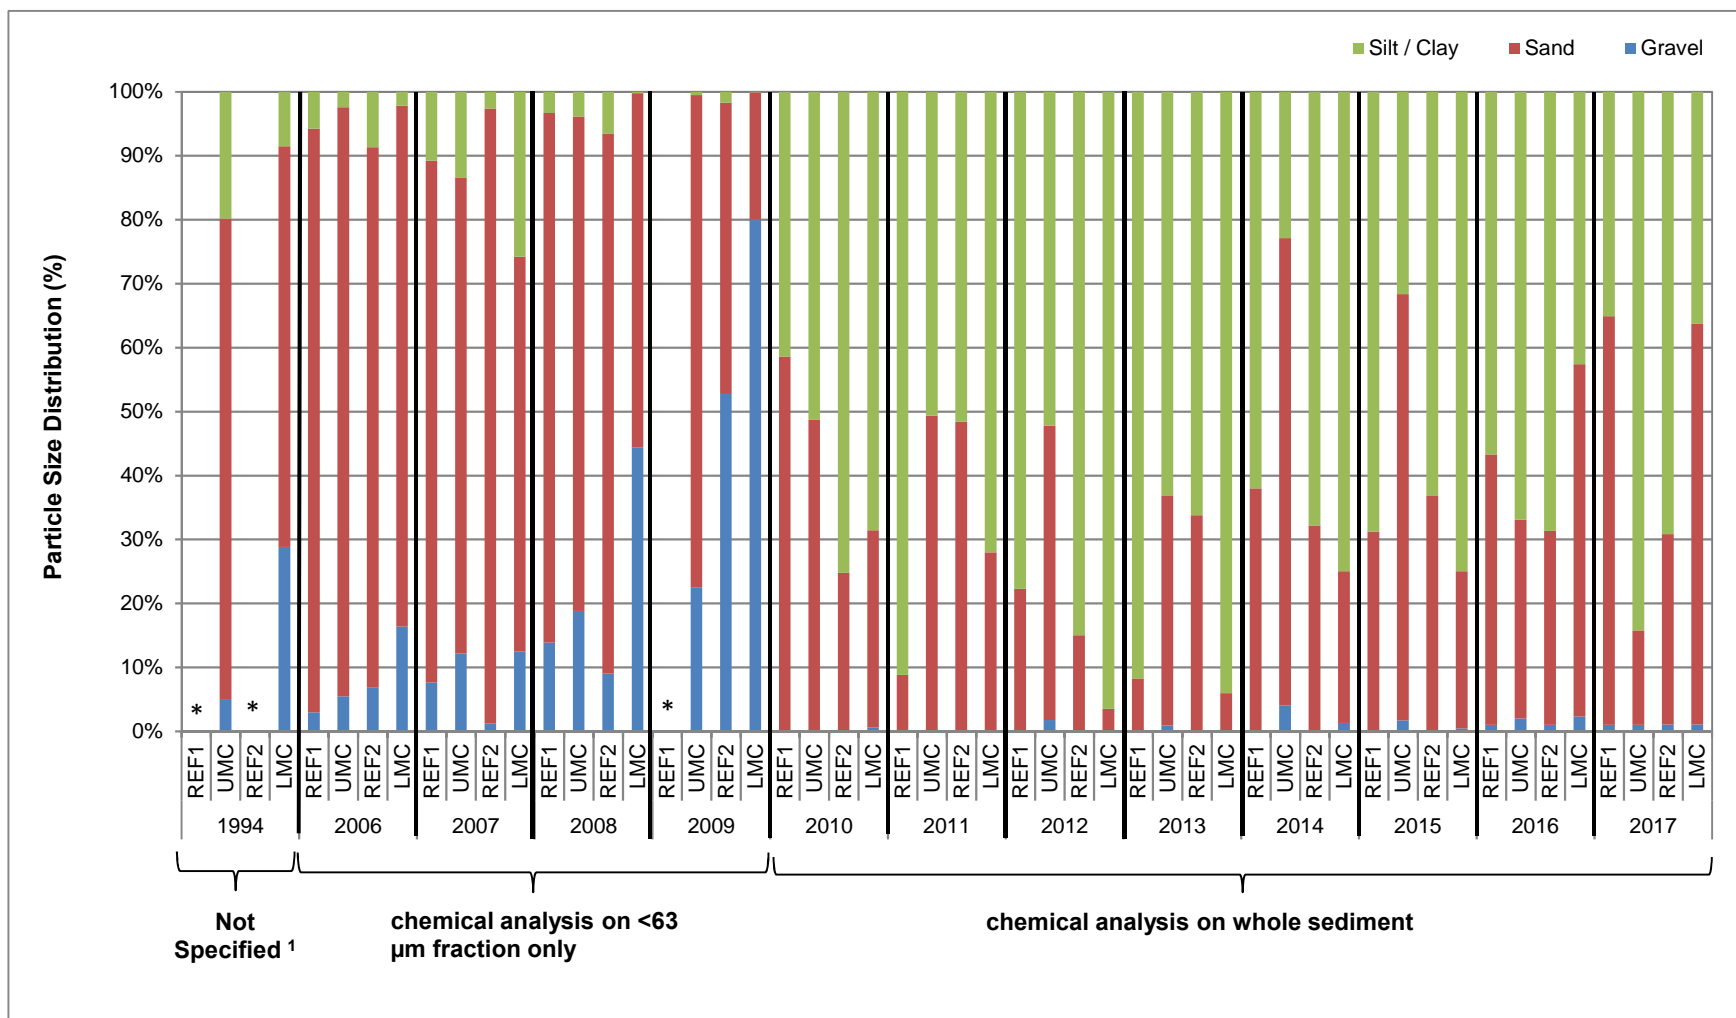

Figure 4.1: Particle Size Distribution of Sediment Collected in Minto Creek and Reference Locations, 1994 to 2017 ²

¹ Methods were not specified, fine sediment was collected in triplicate in the mainstem of Minto Creek (HKP 1994).

² REF1 = Station W6 (south-flowing tributary) in 2006 to 2008 and McGinty Creek in 2010 to 2017; UMC = Upper Minto Creek; REF2 = Station W7 (north-flowing tributary) in 2006 to 2009 and Wolverine Creek in 2010 to 2017; LMC = Lower Minto Creek.

* No data.

Figure 4.2: Copper Concentrations (Mean ± Standard Deviation) in Sediment Collected in Minto Creek and Reference Locations, 1994 to 2017²

¹ Methods were not specified, fine sediment was collected in triplicate in the mainstem of Minto Creek (HKP 1994).

² Reference 1 = Station W6 (south-flowing tributary) in 2006 to 2008 and McGinty Creek in 2010 to 2017; Reference 2 = Station W7 (north-flowing tributary) in 2006 to 2009 and Wolverine Creek in 2010 to 2017.

* = no data.

TEL = Threshold Effect Level.

unspecified.

4.3 Sediment Toxicity

Sediment toxicity test conditions and associated supporting water quality parameters were all within the range outlined in the test protocols, and testing was judged to be acceptable (Appendix A). Survival and growth were evaluated using the 10-day test of *C. dilutus* (midge) and the 14-day test of *H. azteca* (amphipod).

No effects to *H. azteca* survival or growth were observed (Table 4.2). Survival of *C. dilutus* was significantly lower in sediment collected from lower Minto Creek than in laboratory control sediment (sand) and field reference sediment (lower Wolverine Creek) (Table 4.2). Growth of *C. dilutus* was significantly greater in lower Minto Creek sediment compared to the reference sediment. In 2016, growth of *C. dilutus* was greater at lower Minto Creek but not significantly so. *H. azteca* results (no effects in 2017) were similar to those of 2011, 2015, and 2016 (Minnow 2012, 2016, 2017). Differences from previous years observed at lower Minto Creek in *C. dilutus* survival and growth suggest a possible adverse effect, but are not consistent with the results of previous years despite similar sediment chemistry.

4.4 Summary

Overall, concentrations of metals in Minto Creek sediments were similar to reference and lower than sediment quality guidelines with the exception of copper. Concentrations of copper in Minto Creek (both upper and lower) were greater than the sediment quality guideline and reference. Copper concentrations in sediment were similar to results seen after the methodology change and lower than concentrations in 2008. Sediment toxicity testing of *C. dilutus* suggested adverse effects to survival or growth in lower Minto Creek sediment when compared to the laboratory control (no significant difference for growth) and the field reference (lower Wolverine Creek). No effects to *H. azteca* were observed.

Table 4.2: Minto Mine Effluent Sediment Toxicity Test Results Collected for Lower Wolverine and Lower Minto Creeks, September 2017

| Area | <i>Hyalella azteca</i> | | <i>Chironomus dilutus</i> | |
|-----------------------------------|------------------------|-----------------|---------------------------|-----------------|

| Control Sediment | 96 ± 5.5 | 0.11 ± 0.020 | 86 ± 8.9 | 1.2 ± 0.25 |
| Lower Wolverine Creek (Reference) | 94 ± 5.5 | 0.13 ± 0.030 | 90 ± 17 | 2.0 ± 0.24 |
| Lower Minto Creek (Exposed) | 92 ± 13 | 0.11 ± 0.020 | 48 ± 38 | 1.6 ± 0.32 |

- Significantly different than control sediment.
- Significantly different than reference sediment.
- Significantly different than reference and control sediment.

Note: Data presented as mean ± standard deviation.

5 PERIPHYTON COMMUNITY

5.1 Primary Metrics and Community Composition

Quality of periphyton community data was assessed prior to data analysis and interpretation, and close agreement was shown between field duplicate samples except for Rhodophyta, due to low abundance of this group (Appendix A). Analysis of periphyton community density (cells/cm²) indicated that four of the five periphyton community metrics (density, Simpson's Diversity, Simpson's Evenness and Bray-Curtis index) were significantly higher at lower Minto Creek than at lower Wolverine Creek (Table 5.1a, Appendix Table D.1, D.3). Only taxon richness was not significantly different between areas. This indicates that the lower Minto Creek benthic invertebrate community had higher density and a different community structure than the reference areas.

Analysis of periphyton community biomass (µg/cm²) indicated that one out of five metrics (Bray-Curtis index) was significantly higher at lower Minto Creek compared to lower Wolverine Creek, both areas had similar density, taxon richness, and Simpson's diversity and evenness (Table 5.1b, Appendix Table D.2, D.4).

Dominant phyla in lower Minto and Wolverine creeks were Bacillariophyceae and Cyanophyta (blue-green algae). Cyanophyta were dominant at lower Minto Creek (51% of community) and Bacillariophyceae (95% of the community; Figure 5.1) dominated lower Wolverine Creek. Little information is available regarding specific periphyton taxon group sensitivities and tolerances to mining activities to assist in interpretation (Deniseger et al. 1986, De Jonge et al. 2008).

5.2 Temporal Comparisons

Substantial temporal variability in periphyton community composition was evident among samples taken in Minto Creek and reference since 1994 (Figure 5.1). For example, at lower Minto Creek, Bacillariophyceae (diatoms) were dominant in 1994, 2013, 2014, and 2016, Rhodophyta (red algae) in 2012, and Cyanophyta (blue-green algae) in 2011, 2015, and 2017 (Figure 5.1). This lack of temporal consistency was also observed at lower Wolverine Creek, with Cyanophyta dominant in 2011 and 2013 and Bacillariophyceae in 2012 and 2014 to 2017 (Minnow 2013a, 2014, 2015, 2016, 2017).

5.3 Summary

Evaluation of periphyton community density (cells/cm²) and biomass (µg/cm²) indicated significant differences in a number of metrics in lower Minto Creek relative to the lower Wolverine Creek reference. In general, the periphyton community of lower Minto Creek and lower Wolverine Creek had different community structures. However, differences in periphyton community summary

Table 5.1: Statistical Contrasts of Periphyton Density (cells/cm²) and Biomass (µg/cm²) Community Metrics between Lower Wolverine Creek and Lower Minto Creek Areas, Minto Mine WUL, 2017

Notes: Observed effect size = (exposure mean - reference mean)/pooled standard deviation.

T = Two-sample t-test.

MW = Mann Whitney test.

^a For transformed data, the back-transformed mean is reported; for ranked data, the median is reported.

Figure 5.1: Periphyton Community (cells/cm²) Composition in Lower Minto Creek (1994, 2011 to 2017) and Lower Wolverine Creek (2011 to 2017)

Note: Data presented as mean ± standard deviation.

metrics and community composition were apparent among years at both lower Minto Creek and lower Wolverine Creek, indicating substantial temporal variability. The differences observed in the periphyton communities of lower Minto Creek and lower Wolverine Creek in 2017 were within natural temporal variability and do not provide any resolution of potential mine influence.

6 BENTHIC INVERTEBRATE COMMUNITY

6.1 Primary Metrics and Community Composition

Benthic invertebrate community data quality were assessed prior to data analysis and interpretation, and were judged to be of good quality (Appendix A). Benthic invertebrate community metrics of density, Simpson's diversity, and Simpson's evenness were not significantly different among areas (Table 6.1, Appendix Table E.3). Number of taxa and Bray-Curtis index showed significant differences among areas, but lower Minto Creek was intermediate between the reference areas (Table 6.1, Figure 6.1). This suggests a limited mine influence (Table 6.1, Appendix Table E.3).

Dominant taxonomic groups in lower Minto, lower Wolverine and lower Big creeks included EPT taxa, chironomids (non-biting midges) and oligochaetes (worms; only dominant at reference areas). Percent EPT did not differ significantly among areas, but there were differences in the abundances of chironomids and oligochaetes (Figure 6.2, Table 6.1, Appendix Table E.1 to E.3). The relative abundance of chironomids was significantly greater at lower Minto Creek (31%) compared to lower Wolverine Creek (4.7%; Figure 6.2, Table 6.1, Appendix Table E.1 to E.3). Oligochaetes were a small proportion of the community at lower Minto Creek (6.8%) compared to higher proportions at lower Wolverine (68%; significantly higher) and lower Big creeks (15%; not significantly higher). The higher proportion of chironomids suggests a potential mine influence, but in combination with the lower proportion of oligochaetes together with similar percent EPT taxa between areas, suggests a limited influence of the mine on benthic invertebrate community (Chapman et al. 1982a,b, Rosenberg and Resh 1993, Taylor and Bailey 1997).

Correspondence Analysis (CA) explained 63.7 percent of the total community variance in the first two CA axes (Appendix Table E.5). The first CA axis explained 34.8 percent of the total variation in the original benthic abundance data, and significantly separated lower Minto Creek from lower Wolverine and lower Big creeks (Table 6.1, Figure 6.3). Lower Minto Creek had strong positive CA Axis-1 scores and were separated from lower Wolverine and lower Big creeks by high relative abundance of the Plecoptera (stonefly) *Nemoura*, chironomids *Eukiefferiella*, the mite *Sperchon*, and the crane fly *Antocha* (Figure 6.3, Appendix Table E.4, E.5). The reference areas had strong negative CA Axis-1 scores and was dominated by the Ephemeroptera (mayflies) Family Heptageiidae (Figure 6.3, Appendix Table E.4, E.5). The reference areas were separated on CA Axis-2 (which explained 28.9% of the total variation) and lower Minto Creek was significantly different and intermediate between both reference areas. (Table 6.1, Figure 6.3).

Table 6.1: Statistical Comparisons of Benthic Invertebrate Community Metrics, Minto Mine WUL, 2017

| Metric | Comparison | | Area Means | | Statistical Contrasts | | |
|---------------------------------------|-------------------|-----------------------|------------|------|---------------------------------------|-------------------|----------------------|

Notes: An Asterisk (*) above lower Minto Creek indicates exposed area was significantly different ($p < 0.10$) from both reference areas.

Figure 6.3: Correspondence Analysis (CA) Ordination Biplot Displaying CA Axis-1 and CA Axis-2 of Benthic Invertebrate Community Lower Minto Creek and Associated Reference Areas, Minto Mine, 2017

6.2 Correlation Analysis

Correlation analysis between eight benthic indices and six supporting measurements resulted in 16 significant correlations at a p-level of 0.050, of which four were significant at the Bonferroni-corrected p-level of 0.0010 (Table 6.2). It is important to consider that illustration of a significant or suggestive degree of correlation between two variables does not necessarily imply a cause-and-effect relationship, although it is cause to investigate further and to consider known biological responses to environmental differences.

Of the four correlations significant at the Bonferroni-corrected p-level, two were with specific conductance (Table 6.2, Figure 6.4). Percent Ephemeroptera was positively correlated and CA Axis-1 was negatively correlated with specific conductance (Table 6.2, Figure 6.4). CA Axis-1 scores were negatively correlated with depth and percent oligochaetes were negatively correlated with average depth Hess was pushed into the substrate (Table 6.2, Figure 6.4). High specific conductance is a mine influence but the CA Axis-1 score indicates a high proportion of the chironomid *Eukiefferiella*. Chironomid taxa are typically tolerant, but this taxon can be associated with very good to fair water quality in terms of organic pollution (Mandeville 2002).

6.3 Temporal Comparisons

Temporal comparisons of the benthic invertebrate community condition of lower Minto Creek were made in order to augment data interpretation, but their power was tempered by temporal changes in sampling location, sampling methodology, level of replication and analytical processing techniques. Baseline data (1994) were collected near the mouth of Minto Creek as three single grab samples, 2006 data were collected at Station W2 in the same manner, 2008 and 2010 data were collected at Station W2 as three-grab composites whereas 2011 to 2017 data were collected as five replicate three-grab samples from a large area upstream of Station W2. Only in the later years (2011 to 2017) do data represent an area (i.e., lower Minto Creek) rather than a station. In addition, data collected in 2013 to 2017 were sieved using 500 µm mesh as recommended for federal EEM (Environment Canada 2012), whereas all years prior to 2011 used 250 µm (both mesh sizes were used in 2012 to assist in transition). This was expected to result in lower densities in 2013 and later.

Benthic invertebrate density at lower Minto Creek in 2017 was lower than or similar to densities in 2012 (500 µm) and 2014 to 2016 but higher than in 2013 (Figure 6.5). Number of taxa at lower Minto Creek in 2017 was lower than in 1994 and within the historical range from 2006 onwards (Figure 6.5). Simpson's Evenness was within the historical range documented after methodological change in 2011 (Figure 6.5). Over the 2012 to 2017 period, benthic invertebrate community metrics were stable.

Table 6.2: Correlations between Benthic Invertebrate Metrics and Supporting Environmental Measurements at Minto Mine WUL, 2017

| | | Depth (m) | Water Velocity (m/s) | Temperature (°C) | Specific Conductivity (µS/cm) | pH | Average Depth HESS into substrate (cm) |

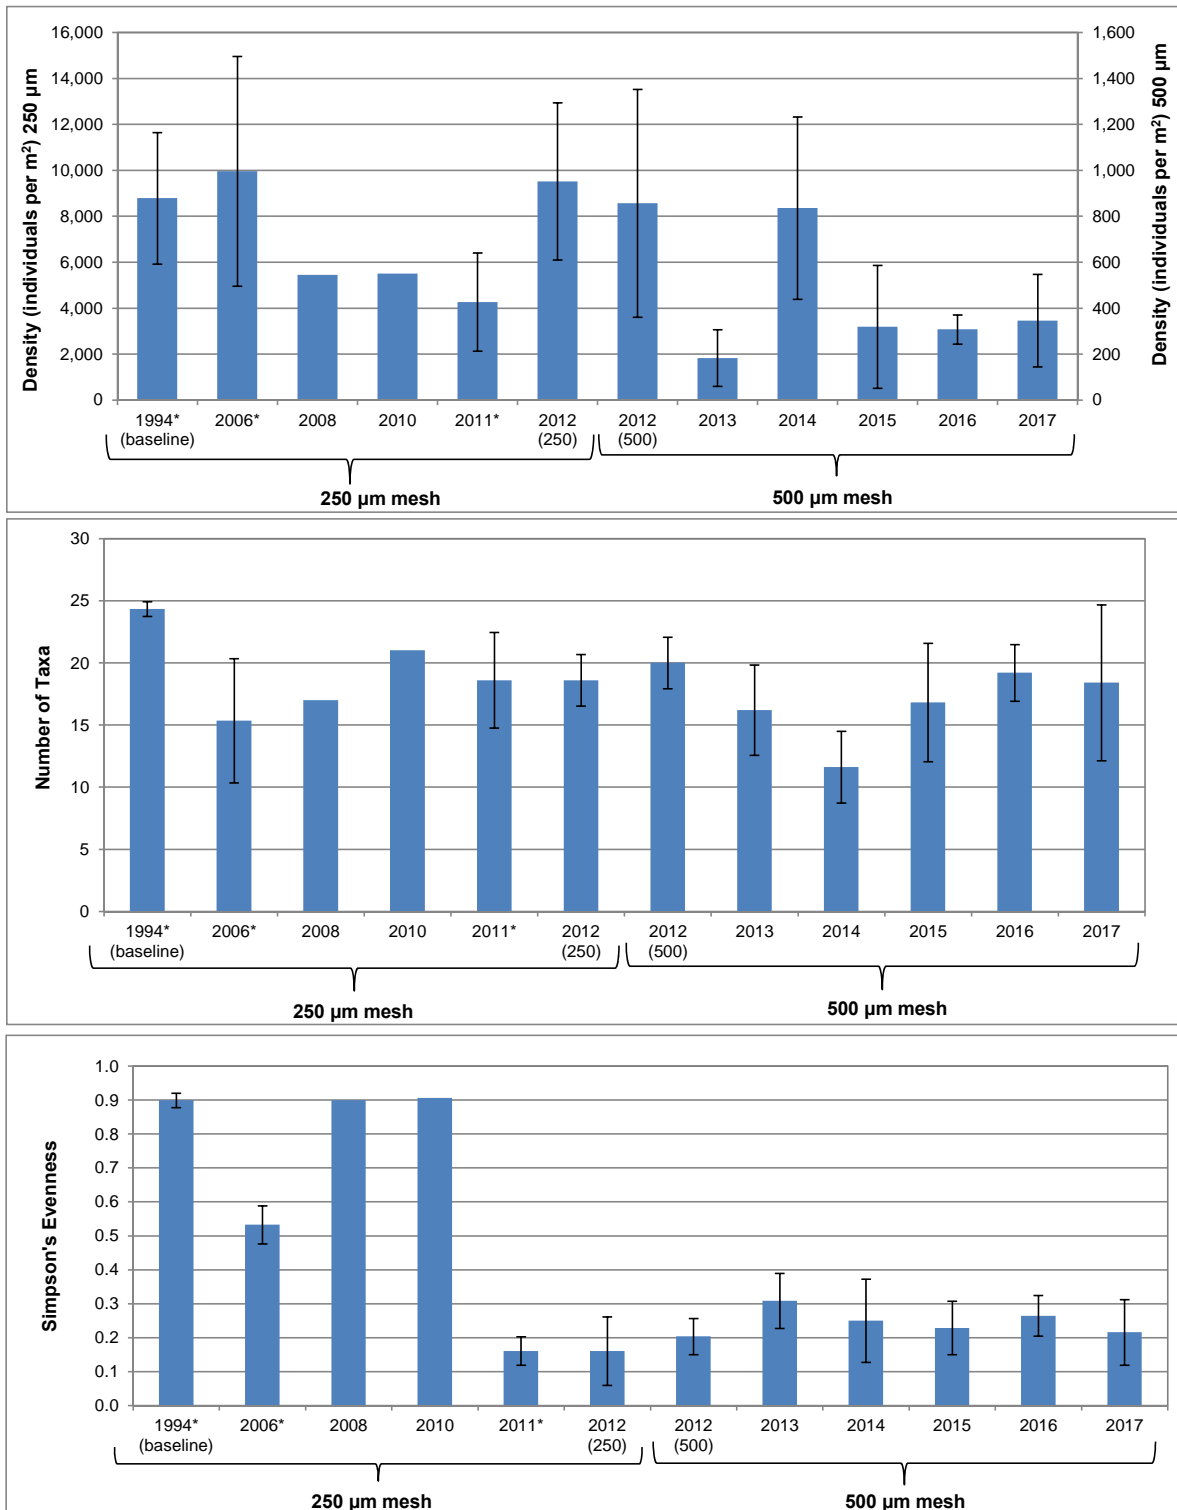

Figure 6.5: Primary Benthic Invertebrate Community Metrics at Lower Minto Creek, 1994 to 2017

Notes: Data presented as mean ± standard deviation where replicated. Asterisk (*) indicates a year the mine was not discharging.

6.4 Summary

The erosional benthic invertebrate community of lower Minto Creek did not differ from reference communities, or was intermediate between reference communities, for all metrics. A potential decrease in number of taxa from 2012 to 2014 identified in previous reporting (Minnow 2015) was not supported by the higher number of taxa in 2015 to 2017 and appears to represent natural variability (Minnow 2015, 2016, 2017). The similarity of the benthic community of lower Minto Creek to reference communities and the temporal stability in the benthic community of lower Minto Creek suggest limited mine influence.

7 TISSUE CHEMISTRY

As indicated in Section 2.5, tissue chemistry data are provided here simply to report the ancillary data collected along with the selenium data reported separately. Data interpretation were therefore limited to basic comparisons of metal concentrations in tissue collected at the exposure area (lower Minto Creek) to those collected at reference creeks (lower Wolverine and lower Big creeks).

7.1 Periphyton Tissue

Periphyton tissue data quality were assessed prior to data analysis and interpretation, and field duplicates showed poor agreement for seven analytes (Appendix A). However, none of these seven analytes differed between lower Minto Creek and both reference areas (Table 7.1, Appendix A).

Periphyton tissue concentrations were significantly greater at lower Minto Creek than at both reference areas for eight analytes (Table 7.1, Appendix Table C.2). Analytes of concern such as copper were significantly different from both reference areas whereas selenium was only significantly different from lower Minto Creek and lower Big Creek (Table 7.1). No significant differences were observed between areas for selenium in 2013 (Figure 7.1), whereas from 2014 to 2017, periphyton selenium concentrations were significantly greater at lower Minto Creek than at the reference areas (only between lower Big Creek in 2017; Figure 7.1). Significantly higher concentrations of selenium at lower Minto Creek compared to reference areas over the last three years suggest an influence of the mine on Minto Creek.

7.2 Benthic Invertebrate Tissue

Benthic invertebrate tissue data quality were assessed prior to data analysis and interpretation, and were judged to be of good quality, with the exception that field duplicate samples lacked close agreement for several analytes (Appendix A). Of the analytes that lacked close agreement, only eight analytes differed significantly at lower Minto Creek compared to both reference areas (Figure 7.1, Appendix A).

Benthic invertebrate tissue concentrations were significantly higher at lower Minto Creek compared to both reference areas for ten analytes, significantly lower for sodium, and intermediate between reference for two analytes (Table 7.1, Appendix Table C.3). Only selenium has been identified as strongly mine-related (Sections 3.0 and 4.0) and was significantly higher at lower Minto Creek than at lower Wolverine and lower Big creeks (Table 7.1, Appendix Table C.3). Concentration of copper at lower Minto Creek was also significantly higher than at lower Wolverine and lower Big creeks. Variability in concentrations of copper in benthic invertebrate

Table 7.1: Periphyton and Benthic Invertebrate Tissue Chemistry Results, Minto Mine WUL, September 2017

Indicates a mean concentration in lower Minto Creek that is significantly different than the mean concentration in lower Wolverine Creek (ANOVA; p = 0.050).
 Indicates a mean concentration in lower Minto Creek that is significantly different than the mean concentration in lower Big Creek (ANOVA; p = 0.050).
 Indicates a mean concentration in lower Minto Creek that is significantly different than the mean concentration in lower Wolverine and lower Big creeks (ANOVA; p = 0.050).

Note: Standard deviation was not calculated if all samples are < MDL.

^a Benthic invertebrate tissue data were analyzed using a non-parametric Wilcoxon Score Test (p = 0.050)

^b Benthic invertebrate tissue data were normalized by log transformation (ANOVA, p = 0.050)

^c Periphyton tissue data were normalized by square root transformation (ANOVA, p = 0.050)

^d Periphyton tissue data were analyzed using a non-parametric Wilcoxon Score Test (p = 0.050)

^e Periphyton tissue data were normalized by log transformation (ANOVA, p = 0.050)

^f Benthic invertebrate tissue data were analyzed using a non-parametric Mann-Whitney U-test (p = 0.050)

^g Benthic invertebrate tissue data were normalized by fourth root transformation (ANOVA, p = 0.050)

Figure 7.1: Periphyton Tissue Selenium Concentrations, 2012 to 2017

Notes: Mean concentrations at exposure areas that differ significantly ($p < 0.05$) within year from a reference area are marked with an "a" for differences between lower Wolverine Creek and "b" for differences between lower Big Creek, $n = 5$, except in lower Minto and lower Big creeks in 2012 ($n = 1$). Unfilled circles represents samples < method detection limits.

tissue has been high among years. In 2013, 2016, and 2017 copper was significantly higher in benthic invertebrates from lower Minto Creek compared to lower Wolverine Creek, but in 2014 copper was non-significantly different among areas (Figure 7.2). In 2015, copper was significantly lower at lower Minto Creek compared to lower Big Creek (Figure 7.2). This lack of consistency suggests observed differences likely represent natural variability.

Figure 7.2: Benthic Invertebrate Tissue Copper Concentrations, 2012 to 2017

Notes: Mean concentrations at exposure areas that differ significantly ($p < 0.05$) within year from a reference area are marked with an "a" for differences between lower Wolverine Creek and "b" for differences between lower Big Creek, $n = 5$, except in 2012 ($n = 1$). Statistics not conducted in 2012 due to low sample size. Unfilled circles represents samples $<$ method detection limits.

8 CONCLUSIONS AND RECOMMENDATIONS

8.1 Conclusions

The Minto Mine sediment, periphyton, and benthic assessment undertaken from September 20th to 26th, 2017 serves to quantitatively compare water quality (field measures and chemistry), sediment quality, periphyton and benthic invertebrate community, and tissue quality of Minto Creek to reference creeks and previous data.

Supporting measures collected in September 2017 indicated good Minto Creek water quality. The influence of the Minto Mine was evident in higher specific conductance than in reference creeks; however, water quality met WUL water quality objectives. Concentration of total copper at upper Minto Creek was above CWQG and reference areas but dissolved copper was below the WUL water quality objective. Moving downstream, copper concentration at lower Minto Creek and associated reference areas were below CWQG. Mean concentrations of chlorophyll-a at lower Minto and lower Wolverine creeks were significantly different but were below BCWQG. Trophic status in 2017 was different from previous years since lower Minto Creek was classified as mesotrophic (Dodds et al. 1998).

Concentrations of metals in Minto Creek sediments were similar to reference and lower than sediment quality guidelines with the exception of arsenic and/or copper. Concentrations of copper in Minto Creek (both upper and lower) were greater than the sediment quality guideline and reference, but were similar to concentrations observed in previous years. Sediment toxicity testing of *C. dilutus* indicated adverse effects to survival and growth in lower Minto Creek sediment when compared to the laboratory control and the field reference (lower Wolverine Creek) sediment. However, no effects on survival or growth occurred in tests of *H. azteca*.

Periphyton community density (cells/cm²) and biomass (µg/cm²) indicated significant differences in a number of metrics in lower Minto Creek relative to the lower Wolverine Creek reference. In general, lower Minto Creek had a different community structure compared to lower Wolverine Creek. However, differences in periphyton community summary metrics and community composition were apparent among years at both lower Minto Creek and lower Wolverine Creek, indicating substantial temporal variability. The differences observed in the periphyton communities of lower Minto Creek and lower Wolverine Creek in 2017 were within natural temporal variability and do not provide any resolution of potential mine influence.

The erosional benthic invertebrate community of lower Minto Creek did not differ from both references, or was intermediate between references, for all community metrics. High temporal variability has been observed at the exposure and reference areas (Minnow 2009b, 2011, 2012,

2013b, 2014, 2015, 2016, 2017), presumably due to inter-annual variability in environmental conditions (e.g., flow, ice scour).

The chemical quality of biological tissues (periphyton and benthic invertebrates) collected at mine-exposed lower Minto Creek and reference areas indicated selenium concentrations were significantly different between areas. Significantly higher concentrations of selenium at lower Minto Creek compared to either reference areas over the last three years could indicate an influence of the mine on Minto Creek. Copper concentration in benthic invertebrate tissue was significantly higher at lower Minto Creek than at lower Wolverine and lower Big creeks.

8.2 Recommendations

Based on results and conclusions of the 2017 Minto Mine sediment, periphyton, and benthic assessment, it is recommended the program be repeated in 2018. It is recommended that both lower Wolverine Creek and lower Big Creek continue to be sampled as reference areas for the benthic invertebrate community assessment to provide better perspective on whether any of the observed differences are actually due to mine influence or simply due to natural differences among creeks. It is also recommended that periphyton community monitoring be removed from the WUL monitoring program as results are highly variable and are not effective in determining potential mine-related effects.

A1 INTRODUCTION

This Data Quality Report (DQR) provides an evaluation of data collected as part of the 2017 Minto Creek Sediment, Periphyton, and Benthic Invertebrate Community Assessment Report. The objective of the DQR is to define the overall quality of the data presented in the report, and, by extension, the confidence with which the data can be used to derive conclusions.

A1.1 Background

A variety of factors can influence the chemical and biological measurements made in an environmental study and thus affect the accuracy and/or precision of the data. Inconsistencies in sampling or laboratory methods, use of instruments that are inadequately calibrated or which cannot measure to the desired level of accuracy or precision, and contamination of samples in the field or laboratory are just some of the potential factors that can lead to the reporting of data that do not accurately reflect actual environmental conditions. Depending on the magnitude of the problem, inaccuracy or imprecision have the potential to affect the reliability of any conclusions made from the data. Therefore, it is important to ensure that monitoring programs incorporate appropriate steps to control the non-natural sources of data variability (i.e., minimize the variability that does not reflect natural spatial and temporal variability in the environment) and thus assure the quality of the data.

Data quality as a concept is meaningful only when it relates to the intended use of the data. That is, one must know the context in which the data will be interpreted in order to establish a relevant basis for judging whether or not the data set is adequate. The DQR involves comparison of actual field and laboratory measurement performance to data quality objectives (DQOs) established for a particular study, such as evaluation of method detection limits, blank sample data, data precision (based on field and laboratory duplicate samples), and data accuracy (based on matrix spike recoveries and/or analysis of standards or certified reference materials). A trusted analytical laboratory certified by Canadian Association for Laboratory Accreditation (CALA) with a rigorous internal quality assurance program was selected to ensure the highest possible quality.

DQOs were established either at the outset of the field program or by the laboratory (e.g., ALS Environmental) and reflect reasonable and achievable performance expectations. The method detection limit (MDL) was set at the outset of the field program for water, sediment, and tissue quality. Only samples that were below the laboratory detection limits were evaluated against target detection limits. Target detection limits should be at least as low as applicable guidelines, ideally $\leq 1/10$ th guideline values. Tissue samples are compared to the detection limit the laboratory quoted they could achieve. Programs involving a large number of samples

and analytes usually result in some analytes that exceed the DQOs. This is particularly so for multi-element scans (e.g., ICP scans for metals) since the analytical conditions are not necessarily optimal for every element included in the scan. Generally, scan results may be considered acceptable if no more than 20% of the parameters fail to meet the DQOs. Overall, the intent of comparing data to DQOs was not to reject any measurement that did not meet the DQO, but to ensure that any questionable data received more scrutiny to determine what effect, if any, this had on interpretation of results within the context of this project.

A1.2 Types of Quality Control Samples

Several types of quality control (QC) samples were assessed based on samples collected (or prepared) in the field and laboratory. These samples include the following:

- **Blanks** are samples of de-ionized water and/or appropriate reagent(s) that are handled and analyzed the same way as regular samples. These samples will reflect any contamination that occurred in the field (in the case of field or travel blanks) or the laboratory (in the case of laboratory or method blanks). Analyte concentrations should be non-detectable although a DQO of twice the method detection limit allows for slight “noise” around the detection limit.
- **Field Duplicates** are sub-sample pairs collected from a randomly selected field station using identical collection and handling methods that are then analyzed separately in the laboratory. The duplicate samples are handled and analyzed in an identical manner in the laboratory. The data from field duplicate samples reflect natural variability, as well as the variability associated with sample collection methods, and therefore provide a measure of field precision.
- **Laboratory Duplicates** are sub-sample pairs created in the laboratory from randomly selected field samples which are sub-sampled and then analyzed independently using identical analytical methods. The laboratory duplicate sample results reflect any variability introduced during laboratory sample handling and analysis and thus provide a measure of laboratory precision.
- **Spike Recovery Samples** are created in the laboratory by adding a known amount/concentration of a given analyte (or mixture of analytes) to a randomly selected test sample previously divided to create two sub-samples. The spiked and regular sub-samples are then analyzed in an identical manner. The spike recovery represents the difference between the measured spike amount (total amount in spiked sample minus amount in original sample) relative to the known spike amount (as a percentage). Two types of spike recovery samples are commonly analyzed. Spiked blanks (or blank spikes) are created using laboratory control materials whereas matrix spikes are

created using field-collected samples. The analysis of spiked samples provides an indication of the accuracy of analytical results.

- **Certified Reference Materials** are samples containing known chemical concentrations that are processed and analyzed along with batches of environmental samples. The sample results are then compared to target results to provide a measure of analytical accuracy. The results are reported as the percent of the known amount that was recovered in the analysis.

The following QC was applied to benthic invertebrate community samples as follows:

- **Organism Recovery Checks** for benthic invertebrate community samples involve the re-processing of previously sorted material from a randomly selected sample to determine the number of invertebrates that were not recovered during the original sample processing. The reprocessing is conducted by an analyst not involved during the original processing to reduce any bias. This check allows the determination of accuracy through assessment of recovery efficiency.

A2 WATER SAMPLES

A2.1 Method Detection Limits

The MDL for total mercury was higher than targeted detection limits but was lower than guideline levels (Table A.1). Therefore, data for this project can be reliably interpreted relative to guidelines.

A2.2 Laboratory Blank Samples Analysis

All blank samples contained non-detectable analyte concentrations indicating no inadvertent contamination of samples within the laboratory during analysis (Appendix B).

A2.3 Data Precision

Relative percent differences (RPDs) between field duplicate samples were greater than 25% for five analytes: total suspended solids, total phosphorus, total cadmium, total mercury, and dissolved zinc (Table A.2). Fewer than 20% of the field duplicate samples failed the DQO, therefore the samples were associated with good field precision.

Agreement was achieved between all laboratory duplicate samples (Appendix B). This indicates that samples were associated with good analytical precision.

A2.4 Data Accuracy

Analyte recoveries for spiked blanks all met the DQO indicating excellent analytical accuracy for the water sample analyses (Appendix B).

The analyte recoveries for matrix spiked samples met the DQO for all analytes except for dissolved organic carbon, total inorganic carbon and total organic carbon. Recovery of these analytes could not be accurately calculated due to high analyte background in the samples. The matrix spiked samples indicate good analytical accuracy for the water sample analyses (Appendix B).

Recoveries of certified reference materials all met the DQO indicating excellent analytical accuracy (Appendix B).

Table A.1: Laboratory Method Detection Limits (MDLs) Relative to Targets and Water Quality Guidelines, Minto Mine, 2017^a

A3 SEDIMENT SAMPLES

A3.1 Method Detection Limits

Results for seven analytes were reported as <MDL but did not have any guidelines associated with them. Analytes with guidelines were all detectable indicating that the data can be reliably interpreted.

A3.2 Laboratory Blank Samples Analysis

All blank samples contained non-detectable analyte concentrations indicating no inadvertent contamination of samples within the laboratory during analysis (Appendix C).

A3.3 Data Precision

The RPD between field duplicate samples all showed close agreement, as they were lower than the DQO (40% RPD; Table A.3). This indicates that the results were associated with excellent field precision.

Agreement was achieved between all laboratory duplicate samples as the RPD were lower than the laboratory set DQO (Appendix C). This indicates that reported sample results were associated with excellent analytical precision.

A3.4 Data Accuracy

Analyte recoveries for spiked blanks all met the DQO indicating excellent analytical accuracy for the sediment sample analyses (Appendix C).

Recoveries of all analytes in certified reference materials met the DQO (Appendix C). These data indicated excellent analytical accuracy associated with the analysis of sediment samples.

Table A.3: Field Duplicate Results for Analysis of Sediment Quality, Minto Mine, 2017

| Analytes | | Units | Lab Report L1998308 | | |
|--------------------|--|-------|---------------------|-------------|---------|
| | | | LWC-5 | LWC-5X | RPD (%) |
| | | | 24-Sep-2017 | 24-Sep-2017 | |

| Total Zinc (Zn) | mg/kg | 63.5 | 64.4 | 1.4 | |

 > 40% Relative Percent Difference (RPD).

A4 SEDIMENT TOXICITY TESTING

Results for the reference toxicant tests for both the 10-day *Chironomus dilutus* and the 14-day *Hyalella azteca* tests were within the acceptability range for organism performance of mean and two standard deviations (Appendix C – Nautilus Environmental Report). Water quality parameters remained within the acceptability criteria throughout testing. The sensitivity of the organisms was deemed to be appropriate when compared to historical results obtained by the laboratory (Appendix C – Nautilus Environmental Report).

A5 PERIPHYTON COMMUNITY

Close agreement was achieved between laboratory duplicate samples for both density (cells/cm²; Table A.4) and biomass (µg/cm²; Table A.5), except for Rhodophyta. The RPD between duplicate samples and Rhodophyta (density and biomass) was 46% (Tables A.4 and A.5). The higher magnitude of difference between the duplicate samples could be due to the low abundance of Rhodophyta present. Data can be reliably interpreted.

Table A.4: Laboratory Duplicate Results for Analysis of Periphyton Group Density (cells/cm²)

| Algal Density (cells/cm²) | LMC-5 | LMC-5R | RPD (%) |
|---|--------------|---------------|----------------|
| Cyanobacteria | 76,371 | 79,242 | 3.7 |
| Bacillariophyceae | 29,859 | 28,424 | 4.9 |
| Rhodophyta | 2,871 | 4,594 | 46 |
| Total | 109,101 | 112,260 | 2.9 |

 > 30% Relative Percent Difference (RPD).

Table A.5: Laboratory Duplicate Results for Analysis of Periphyton Group Biomass (µg/cm²)

| Algal Biomass (µg/cm²) | LMC-4 | LMC-4R | RPD (%) |
|--|--------------|---------------|----------------|
| Cyanobacteria | 12 | 15 | 22 |
| Bacillariophyceae | 18.6 | 19.0 | 2.0 |
| Rhodophyta | 2.1 | 3.4 | 46 |
| Total | 32 | 37 | 13 |

 > 30% Relative Percent Difference (RPD).

A6 BENTHIC INVERTEBRATE COMMUNITY

Two re-sorted samples met the objective for percent organism recovery, with a percent recovery of 99% and 100% (Table A.6). All benthic invertebrate samples were analyzed whole (Table A.7), and therefore no analysis of sub-sampling variability was required. This indicates that the data can be reliably interpreted.

Table A.6: Percent Sorting Efficiency of Benthic Invertebrates, Minto Mine, 2017

| Station | Initial Sort | Re-sort | Percent sorting efficiency ^a |
|---------|--------------|---------|---|
| LMC-4 | 186 | 1 | 99% |
| LWC-2 | 73 | 0 | 100% |

^a Percent sorting efficiency = $(1 - (\# \text{ in QA/AC re-sort} / (\# \text{ sorted originally} + \# \text{ in QA/QC re-sort}))) * 100$.

■ Sorting efficiency < 90%.

Table A.7: Percent of Benthic Invertebrate Sample Analyzed for Each Station

| Area | Station | | | | |
|------|---------|------|------|------|------|
| | 1 | 2 | 3 | 4 | 5 |
| LWC | 100% | 100% | 100% | 100% | 100% |
| LBC | 100% | 100% | 100% | 100% | 100% |
| LMC | 100% | 100% | 100% | 100% | 100% |

A7 TISSUE SAMPLES

A7.1 Method Detection Limits

For periphyton tissue samples, only one analyte (total mercury) was below laboratory detection limits and greater than the targeted detection limit (Table A.8). Target concentrations are not based on guidelines; rather represent detection limits the laboratory quoted were achievable.

Eight benthic invertebrate tissue analytes were below the laboratory detection limits and did not meet targets: total antimony, bismuth, boron, lithium, selenium, sodium, tellurium, and tin. For each analyte only 3 out of 16 samples exceeded targets (Table A.9). Target concentrations are not guidelines but represent detection limits quoted by the laboratory. Data for this project can be reliably interpreted.

All chlorophyll-a periphyton samples were detectable and interpretable.

A7.2 Laboratory Blank Samples Analysis

Periphyton (chlorophyll-a, tissue) and benthic invertebrate tissue blank samples contained non-detectable analyte concentrations indicating no inadvertent contamination of samples within the laboratory during analysis (Appendix C).

A7.3 Data Precision

Periphyton field duplicate samples showed close agreement among analytes except for seven analytes: Calcium, magnesium, manganese, mercury, nickel, selenium, and uranium. This represents 20% of the analytes measured and will be considered when interpreting the results (Table A.10).

Laboratory duplicate periphyton tissue samples showed good agreement among all duplicate analyte concentrations (Appendix C). Periphyton samples were associated with good analytical precision.

Benthic invertebrate field duplicate samples did not meet the DQO for most analytes (Table A.11). Tissue samples can be highly variable and this will be considered when analyzing the data.

Laboratory benthic invertebrate duplicate samples showed good agreement among all comparisons as they were all below the DQO set out by the laboratory (Appendix C). Benthic invertebrate samples were associated with good analytical precision.

The RPD between the field duplicate periphyton chlorophyll-a samples was 14%, indicating that the data was associated with good laboratory precision (Table A.12).

Table A.8: Laboratory Method Detection Limits (MDL) for Periphyton Tissue Samples Relative to Targets, Minto Mine, 2017 ^a

| Analyte | Units | Method Detection Limits | |
|----------------------|-----------|-------------------------|----------------|
| | | Target | Achieved |
| Total Boron (B) | mg/kg wwt | 0.20 | 0.20 |
| Total Mercury (Hg) | mg/kg wwt | 0.0010 | 0.0010 - 0.014 |
| Total Tellurium (Te) | mg/kg wwt | 0.0040 | 0.0040 |
| Total Tin (Sn) | mg/kg wwt | 0.020 | 0.020 |

 Target MDL were exceeded.

^a Only analytes with any reported values less than MDL were presented.

Table A.9: Laboratory Method Detection Limits (MDL) for Benthic Invertebrate Tissue Samples Relative to Targets, Minto Mine, 2017 ^a

| Analyte | Units | Method Detection Limits | |
|----------------------|-----------|-------------------------|----------------|
| | | Target | Achieved |
| Total Antimony (Sb) | mg/kg wwt | 0.0020 | 0.0020 - 0.050 |
| Total Bismuth (Bi) | mg/kg wwt | 0.0020 | 0.0020 - 0.050 |
| Total Boron (B) | mg/kg wwt | 0.20 | 0.20 - 5.0 |

 > 30% Relative Percent Difference (RPD).

A7.4 Data Accuracy

Analyte recoveries for spiked blanks all met the DQO indicating excellent analytical accuracy for periphyton (chlorophyll-a, tissue) and benthic invertebrate tissue (Appendix C).

Certified reference material met the DQO for periphyton and benthic invertebrate tissue indicating good analytical accuracy (Appendix C).

A8 DATA QUALITY STATEMENT

Water, sediment, and benthic community data were all of good quality compared to DQO indicating that they can be reliably interpreted. Periphyton community showed close agreement between duplicate samples except for Rhodophyta samples. The RPD was 46% and differences could be due to the low abundance of Rhodophyta. Lack of agreement between duplicate tissue samples (periphyton, benthic invertebrate) were observed. Over 20% of the analytes measured for periphyton and benthic invertebrate duplicate tissue samples had RPDs that were greater than 30%, failing the DQO. This will be considered when analyzing the data. The overall quality of data for this project was good to serve the project objectives.

Water use licence objectives not met.
 Water quality guideline not met.

^a CCME (Canadian Council of Ministers of the Environment). 1999. Canadian Environmental Quality Guidelines. 1999 (plus updates), Canadian Council of Ministers of the Environment, Winnipeg. See Appendix Table B.6 for explanatory notes on selected water quality guidelines.

^b Based on lowest guideline using highest pH.

^c Based on lowest guideline using lowest hardness.

^d Dissolved Cadmium (µg/L) guidelines based on the following formula using the lowest hardness: $e^{(0.736(\ln(\text{Hardness})-4.943)}$.

^e Dissolved copper water quality objective depends on concentration of dissolved organic carbon (DOC). If DOC is > 10 mg/L/ DOC is ≤ 10 mg/L.

 Water use licence objectives not met.

 Water quality guideline not met.

^a CCME (Canadian Council of Ministers of the Environment). 1999. Canadian Environmental Quality Guidelines. 1999 (plus updates), Canadian Council of Ministers of the Environment, Winnipeg. See Appendix Table B.6 for explanatory notes on selected water quality guidelines.

^b Based on lowest guideline using highest pH.

^c Based on lowest guideline using lowest hardness.

^d Dissolved Cadmium (µg/L) guidelines based on the following formula using the lowest hardness: $e^{(0.736(\ln(\text{Hardness})-4.943))}$.

^e Dissolved copper water quality objective depends on concentration of dissolved organic carbon (DOC). If DOC is > 10 mg/L/ DOC is ≤ 10 mg/L.

Table B.8: Concentration of Chlorophyll-a Measured at Five Benthic Stations in Lower Wolverine and Lower Minto Creeks, Minto Mine WUL, 2017

| Lower Wolverine Creek (Reference) | | Lower Minto Creek (Exposed) | |
|--------------------------------------|-------------------|--------------------------------|-------------------|
| Station | mg/m ² | Station | mg/m ² |
| LWC-1 | 8.4 | LMC-1 | 25 |
| LWC-2 | 11 | LMC-2 | 80 |
| LWC-3 | 22 | LMC-3 | 46 |
| LWC-4 | 11 | LMC-4 | 33 |
| LWC-5 | 12 | LMC-5 | 74 |
| Mean | 13 | Mean | 51 |
| Standard Deviation | 5.2 | Standard Deviation | 24 |

 Chlorophyll-a exceeded the BCWQG of 100 mg/m².

Reference Information

QC Samples with Qualifiers & Comments:

| QC Type Description | Parameter | Qualifier | Applies to Sample Number(s) |
|---------------------|--------------------------|-----------|-----------------------------|
| Matrix Spike | Dissolved Organic Carbon | MS-B | L1998023-1, -2 |
| Matrix Spike | Total Inorganic Carbon | MS-B | L1998023-1, -2 |
| Matrix Spike | Total Inorganic Carbon | MS-B | L1998023-1, -2 |
| Matrix Spike | Total Organic Carbon | MS-B | L1998023-1, -2 |
| Matrix Spike | Total Organic Carbon | MS-B | L1998023-1, -2 |

Qualifiers for Individual Parameters Listed:

| Qualifier | Description |
|-----------|--|
| DTC | Dissolved concentration exceeds total. Results were confirmed by re-analysis. |
| MS-B | Matrix Spike recovery could not be accurately calculated due to high analyte background in sample. |

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|---|--------|--|---------------------------------------|
| ALK-TITR-VA | Water | Alkalinity Species by Titration | APHA 2320 Alkalinity |
| This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values. | | | |
| BR-L-IC-N-WR | Water | Bromide in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| CARBONS-DOC-VA | Water | Dissolved organic carbon by combustion | APHA 5310B TOTAL ORGANIC CARBON (TOC) |
| This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis. | | | |
| CARBONS-TIC-VA | Water | Total inorganic carbon by CO2 purge | APHA 5310B TOTAL ORGANIC CARBON (TOC) |
| This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". | | | |
| CARBONS-TOC-VA | Water | Total organic carbon by combustion | APHA 5310B TOTAL ORGANIC CARBON (TOC) |
| This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". | | | |
| CL-L-IC-N-WR | Water | Chloride in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| CN-T-CFA-VA | Water | Total Cyanide in water by CFA | ISO 14403:2002 |
| This analysis is carried out using procedures adapted from ISO Method 14403:2002 "Determination of Total Cyanide using Flow Analysis (FIA and CFA)". Total or strong acid dissociable (SAD) cyanide is determined by in-line UV digestion along with sample distillation and final determination by colourimetric analysis. Method Limitation: This method is susceptible to interference from thiocyanate (SCN). If SCN is present in the sample, there could be a positive interference with this method, but it would be less than 1% and could be as low as zero. | | | |
| EC-PCT-VA | Water | Conductivity (Automated) | APHA 2510 Auto. Conduc. |
| This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode. | | | |
| F-IC-N-WR | Water | Fluoride in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| HARDNESS-CALC-VA | Water | Hardness | APHA 2340B |
| Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation. | | | |
| HG-D-CVAA-VA | Water | Diss. Mercury in Water by CVAAS or CVAFS | APHA 3030B/EPA 1631E (mod) |
| Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | | | |
| HG-T-CVAA-VA | Water | Total Mercury in Water by CVAAS or CVAFS | EPA 1631E (mod) |
| Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | | | |
| MET-D-CCMS-VA | Water | Dissolved Metals in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| MET-T-CCMS-VA | Water | Total Metals in Water by CRC ICPMS | EPA 200.2/6020A (mod) |

Reference Information

Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

| | | | |
|---|-------|---------------------------------------|---|
| NH3-F-VA | Water | Ammonia in Water by Fluorescence | APHA 4500 NH3-NITROGEN (AMMONIA) |
| This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al. | | | |
| NH3-F-VA | Water | Ammonia in Water by Fluorescence | J. ENVIRON. MONIT., 2005, 7, 37-42, RSC |
| This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al. | | | |
| NO2-L-IC-N-WR | Water | Nitrite in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| NO3-L-IC-N-WR | Water | Nitrate in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| P-T-PRES-COL-VA | Water | Total P in Water by Colour | APHA 4500-P Phosphorus |
| This analysis is carried out using procedures adapted from APHA Method 4500-P "Phosphorus". Total Phosphorus is determined colourimetrically after persulphate digestion of the sample. | | | |
| Samples with very high dissolved solids (i.e. seawaters, brackish waters) may produce a negative bias by this method. Alternate methods are available for these types of samples. | | | |
| Arsenic (5+), at elevated levels, is a positive interference on colourimetric phosphate analysis. | | | |
| P-TD-COL-VA | Water | Total Dissolved P in Water by Colour | APHA 4500-P Phosphorous |
| This analysis is carried out using procedures adapted from APHA Method 4500-P "Phosphorus". Total Dissolved Phosphorus is determined colourimetrically after persulphate digestion of a sample that has been lab or field filtered through a 0.45 micron membrane filter. | | | |
| Samples with very high dissolved solids (i.e. seawaters, brackish waters) may produce a negative bias by this method. Alternate methods are available for these types of samples. | | | |
| Arsenic (5+), at elevated levels, is a positive interference on colourimetric phosphate analysis. | | | |
| PH-PCT-VA | Water | pH by Meter (Automated) | APHA 4500-H pH Value |
| This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode | | | |
| It is recommended that this analysis be conducted in the field. | | | |
| SO4-IC-WR | Water | Sulfate in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| TDS-VA | Water | Total Dissolved Solids by Gravimetric | APHA 2540 C - GRAVIMETRIC |
| This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, TDS is determined by evaporating the filtrate to dryness at 180 degrees celsius. | | | |
| TSS-VA | Water | Total Suspended Solids by Gravimetric | APHA 2540 D - GRAVIMETRIC |
| This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius. | | | |
| Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples. | | | |
| TURBIDITY-VA | Water | Turbidity by Meter | APHA 2130 Turbidity |
| This analysis is carried out using procedures adapted from APHA Method 2130 "Turbidity". Turbidity is determined by the nephelometric method. | | | |

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location |
|----------------------------|---|
| WR | ALS ENVIRONMENTAL - WHITEHORSE, YUKON, CANADA |
| VA | ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA |

Chain of Custody Numbers:

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Reference Information

QC Samples with Qualifiers & Comments:

| QC Type Description | Parameter | Qualifier | Applies to Sample Number(s) |
|---------------------|--------------------------|-----------|-----------------------------|
| Matrix Spike | Dissolved Organic Carbon | MS-B | L1998329-1, -2, -3, -4 |
| Matrix Spike | Total Inorganic Carbon | MS-B | L1998329-1, -2, -3, -4 |
| Matrix Spike | Total Inorganic Carbon | MS-B | L1998329-1, -2, -3, -4 |
| Matrix Spike | Total Organic Carbon | MS-B | L1998329-1, -2, -3, -4 |
| Matrix Spike | Total Organic Carbon | MS-B | L1998329-1, -2, -3, -4 |

Qualifiers for Individual Parameters Listed:

| Qualifier | Description |
|-----------|--|
| DLM | Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity). |
| MS-B | Matrix Spike recovery could not be accurately calculated due to high analyte background in sample. |

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|---|--------|--|---------------------------------------|
| ALK-TITR-VA | Water | Alkalinity Species by Titration | APHA 2320 Alkalinity |
| This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values. | | | |
| BR-L-IC-N-WR | Water | Bromide in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| CARBONS-DOC-VA | Water | Dissolved organic carbon by combustion | APHA 5310B TOTAL ORGANIC CARBON (TOC) |
| This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis. | | | |
| CARBONS-TIC-VA | Water | Total inorganic carbon by CO2 purge | APHA 5310B TOTAL ORGANIC CARBON (TOC) |
| This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". | | | |
| CARBONS-TOC-VA | Water | Total organic carbon by combustion | APHA 5310B TOTAL ORGANIC CARBON (TOC) |
| This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". | | | |
| CL-L-IC-N-WR | Water | Chloride in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| CN-T-CFA-VA | Water | Total Cyanide in water by CFA | ISO 14403:2002 |
| This analysis is carried out using procedures adapted from ISO Method 14403:2002 "Determination of Total Cyanide using Flow Analysis (FIA and CFA)". Total or strong acid dissociable (SAD) cyanide is determined by in-line UV digestion along with sample distillation and final determination by colourimetric analysis. Method Limitation: This method is susceptible to interference from thiocyanate (SCN). If SCN is present in the sample, there could be a positive interference with this method, but it would be less than 1% and could be as low as zero. | | | |
| EC-PCT-VA | Water | Conductivity (Automated) | APHA 2510 Auto. Conduc. |
| This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode. | | | |
| F-IC-N-WR | Water | Fluoride in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| HARDNESS-CALC-VA | Water | Hardness | APHA 2340B |
| Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation. | | | |
| HG-D-CVAA-VA | Water | Diss. Mercury in Water by CVAAS or CVAFS | APHA 3030B/EPA 1631E (mod) |
| Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | | | |
| HG-T-CVAA-VA | Water | Total Mercury in Water by CVAAS or CVAFS | EPA 1631E (mod) |
| Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | | | |
| MET-D-CCMS-VA | Water | Dissolved Metals in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| MET-T-CCMS-VA | Water | Total Metals in Water by CRC ICPMS | EPA 200.2/6020A (mod) |

Reference Information

Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

| | | | |
|--|-------|---------------------------------------|---|
| NH3-F-VA | Water | Ammonia in Water by Fluorescence | APHA 4500 NH3-NITROGEN (AMMONIA) |
| This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al. | | | |
| NH3-F-VA | Water | Ammonia in Water by Fluorescence | J. ENVIRON. MONIT., 2005, 7, 37-42, RSC |
| This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al. | | | |
| NO2-L-IC-N-WR | Water | Nitrite in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| NO3-L-IC-N-WR | Water | Nitrate in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| P-T-PRES-COL-VA | Water | Total P in Water by Colour | APHA 4500-P Phosphorus |
| This analysis is carried out using procedures adapted from APHA Method 4500-P "Phosphorus". Total Phosphorus is determined colourimetrically after persulphate digestion of the sample. Samples with very high dissolved solids (i.e. seawaters, brackish waters) may produce a negative bias by this method. Alternate methods are available for these types of samples. | | | |
| Arsenic (5+), at elevated levels, is a positive interference on colourimetric phosphate analysis. | | | |
| P-TD-COL-VA | Water | Total Dissolved P in Water by Colour | APHA 4500-P Phosphorous |
| This analysis is carried out using procedures adapted from APHA Method 4500-P "Phosphorus". Total Dissolved Phosphorus is determined colourimetrically after persulphate digestion of a sample that has been lab or field filtered through a 0.45 micron membrane filter. Samples with very high dissolved solids (i.e. seawaters, brackish waters) may produce a negative bias by this method. Alternate methods are available for these types of samples. | | | |
| Arsenic (5+), at elevated levels, is a positive interference on colourimetric phosphate analysis. | | | |
| PH-PCT-VA | Water | pH by Meter (Automated) | APHA 4500-H pH Value |
| This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode | | | |
| It is recommended that this analysis be conducted in the field. | | | |
| SO4-IC-WR | Water | Sulfate in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| TDS-VA | Water | Total Dissolved Solids by Gravimetric | APHA 2540 C - GRAVIMETRIC |
| This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, TDS is determined by evaporating the filtrate to dryness at 180 degrees celsius. | | | |
| TSS-VA | Water | Total Suspended Solids by Gravimetric | APHA 2540 D - GRAVIMETRIC |
| This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples. | | | |
| TURBIDITY-VA | Water | Turbidity by Meter | APHA 2130 Turbidity |
| This analysis is carried out using procedures adapted from APHA Method 2130 "Turbidity". Turbidity is determined by the nephelometric method. | | | |

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location |
|----------------------------|---|
| WR | ALS ENVIRONMENTAL - WHITEHORSE, YUKON, CANADA |
| VA | ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA |

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Reference Information

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|-----------------|--------|---------------------------------------|--------------------|
| AREA SAMPLED-VA | Biota | Area Sampled (cm2) | Not Applicable |
| CHLOROA-F-VA | Biota | Chlorophyll a in Biota by Fluorometer | EPA 445.0 |

This analysis is done using procedures adapted from EPA Method 445.0. Chlorophyll-a is determined by a routine acetone extraction followed with analysis by fluorometry using the non-acidification procedure. This method is not subject to interferences from chlorophyll b. Note: Biota samples are typically submitted as scrapings on a filter.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

QC Samples with Qualifiers & Comments:

| QC Type Description | Parameter | Qualifier | Applies to Sample Number(s) |
|---|---|-----------|-----------------------------|
| Qualifiers for Individual Parameters Listed: | | | |
| Qualifier | Description | | |
| DLHC | Detection Limit Raised: Dilution required due to high concentration of test analyte(s). | | |

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|----------------------------|--------|---|---|
| C-TIC-PCT-SK | Soil | Total Inorganic Carbon in Soil | CSSS (2008) P216-217 |
| | | A known quantity of acetic acid is consumed by reaction with carbonates in the soil. The pH of the resulting solution is measured and compared against a standard curve relating pH to weight of carbonate. | |
| C-TOC-CALC-SK | Soil | Total Organic Carbon Calculation | CSSS (2008) 21.2 |
| | | Total Organic Carbon (TOC) is calculated by the difference between total carbon (TC) and total inorganic carbon. (TIC) | |
| C-TOT-LECO-SK | Soil | Total Carbon by combustion method | CSSS (2008) 21.2 |
| | | The sample is ignited in a combustion analyzer where carbon in the reduced CO2 gas is determined using a thermal conductivity detector. | |
| HG-200.2-CVAF-VA | Soil | Mercury in Soil by CVAFS | EPA 200.2/1631E (mod) |
| | | Soil samples are digested with nitric and hydrochloric acids, followed by analysis by CVAFS. | |
| IC-CACO3-CALC-SK | Soil | Inorganic Carbon as CaCO3 Equivalent | Calculation |
| LOI-420-SK | Soil | Loss on Ignition @ 420 C | CSSS (1978) METHOD 3.81 |
| | | The dry-ash method involves the removal of organic matter by combustion at 420OC for 2 hours. Samples are dried prior to combustion. | |
| | | Reference: McKeague, J.A. Soil Sampling and Methods of Analysis. Can. Soc. Soil Sci.(1978) method 3.81 | |
| MET-200.2-CCMS-VA | Soil | Metals in Soil by CRC ICPMS | EPA 200.2/6020A (mod) |
| | | This method uses a heated strong acid digestion with HNO3 and HCl and is intended to liberate metals that may be environmentally available. Silicate minerals are not solubilized. Dependent on sample matrix, some metals may be only partially recovered, including Al, Ba, Be, Cr, Sr, Ti, Tl, V, W, and Zr. Volatile forms of sulfur (including sulfide) may not be captured, as they may be lost during sampling, storage, or digestion. Analysis is by Collision/Reaction Cell ICPMS. | |
| N-TOTKJ-COL-SK | Soil | Total Kjeldahl Nitrogen | CSSS (2008) 22.2.3 |
| | | The soil is digested with sulfuric acid in the presence of CuSO4 and K2SO4 catalysts. Ammonia in the soil extract is determined colorimetrically at 660 nm. | |
| PH-1:2-VA | Soil | pH in Soil (1:2 Soil:Water Extraction) | BC WLAP METHOD: PH, ELECTROMETRIC, SOIL |
| | | This analysis is carried out in accordance with procedures described in the pH, Electrometric in Soil and Sediment method - Section B Physical/Inorganic and Misc. Constituents, BC Environmental Laboratory Manual 2007. The procedure involves mixing the dried (at <60°C) and sieved (No. 10 / 2mm) sample with deionized/distilled water at a 1:2 ratio of sediment to water. The pH of the solution is then measured using a standard pH probe. | |
| PSA-PIPET+GRAVEL-SK | Soil | Particle size - Sieve and Pipette | SSIR-51 METHOD 3.2.1 |
| | | Particle size distribution is determined by a combination of techniques. Dry sieving is performed for coarse particles, wet sieving for sand particles and the pipette sedimentation method for clay particles. | |

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

(α) Indicates a statistically significant effect relative to reference sediment LWC

1.0 INTRODUCTION

Nautilus Environmental Company Inc. conducted freshwater sediment toxicity tests for Minnow Environmental Inc. on samples identified as LMC and LWC. The samples were collected on September 20, 21, and 24, 2017; each sample was transported in one 500-mL plastic container and delivered to laboratory in Burnaby, BC on September 28, 2017. The samples had a temperature of 11°C on receipt and were stored in the dark at $4 \pm 2^\circ\text{C}$ prior to testing. The following toxicity tests were performed on the samples:

- 14-d *Hyaella azteca* survival and growth
- 10-d *Chironomus dilutus* survival and growth

This report describes the results of these toxicity tests. Copies of raw laboratory data sheets and statistical analyses for each test species are provided in Appendices A and B. Analytical chemistry results and chain-of-custody form are provided in Appendices C and D, respectively.

2.0 METHODS

Methods for the toxicity tests are summarized in Tables 1 and 2. Testing was conducted according to procedures described by Environment Canada (1997 and 2013). Statistical analyses for all tests were performed using CETIS (Tidepool Scientific Software, 2013).

Ammonia concentrations were measured in-house three times per week on reference sediment sample LWC to ensure that un-ionized ammonia was below 0.2 mg/L (Environment Canada, 2013). Samples of overlying water were also collected at test initiation and termination and sent to ALS Environmental, Burnaby, BC for measurements of total ammonia concentration. Analytical results are provided in Appendix C.

Table 1. Summary of test conditions: *Hyalella azteca* survival and growth test.

| | |
|--|---|
| Test species | <i>Hyalella azteca</i> |
| Organism source | Aquatic Research Organisms, Hampton, NH |
| Organism age | 2- to 9-days old |
| Test type | Static |
| Test duration | 14 days |
| Test vessel | 375-mL glass container |
| Test volume | 100 mL sediment; 175 mL overlying water |
| Test replicates | 5 per sample |
| Number of organisms | 10 per replicate |
| Control/dilution water | Reconstituted water |
| Test solution renewal | None |
| Test temperature | 23 ± 1°C |
| Feeding | 0.75 mL of YCT and 1.35 mg of Tetramin per replicate daily |
| Light intensity | 500 to 1000 lux at water surface |
| Photoperiod | 16 hours light/8 hours dark |
| Aeration | Continuous gentle aeration |
| Test measurements | Temperature, dissolved oxygen, pH and conductivity of overlying water measured daily; hardness, alkalinity and total ammonia of overlying water measured at test initiation and termination; unionized ammonia measured three times weekly in overlying water of reference sample |
| Test protocol | Environment Canada (2013), EPS 1/RM/33 |
| Statistical software | CETIS Version 1.8.7 |
| Test endpoints | Survival and dry weight |
| Test acceptability criteria for controls | ≥80% survival and ≥0.1 mg/amphipod dry weight |
| Reference toxicant | Sodium chloride (NaCl) |

Table 2. Summary of test conditions: *Chironomus dilutus* survival and growth test.

| | |
|--|---|
| Test species | <i>Chironomus dilutus</i> |
| Organism source | Aquatic BioSystems, Fort Collins, CO |
| Organism age | Third instar |
| Test type | Static |
| Test duration | 10 days |
| Test vessel | 375-mL glass container |
| Test volume | 100 mL sediment; 175 mL overlying water |
| Test replicates | 5 per sample |
| Number of organisms | 10 per replicate |
| Control/dilution water | Reconstituted water |
| Test solution renewal | None |
| Test temperature | 23 ± 1°C |
| Feeding | 6 mg of Tetramin per replicate daily |
| Light intensity | 500 to 1000 lux at water surface |
| Photoperiod | 16 hours light/8 hours dark |
| Aeration | Continuous gentle aeration |
| Test measurements | Temperature, dissolved oxygen, pH and conductivity of overlying water measured daily; hardness, alkalinity and total ammonia of overlying water measured at test initiation and termination |
| Test protocol | Environment Canada (1997), EPS 1/RM/32 |
| Statistical software | CETIS Version 1.8.7 |
| Test endpoints | Survival and dry weight |
| Test acceptability criteria for controls | ≥70% survival and ≥0.6 mg/worm dry weight |
| Reference toxicant | Potassium chloride (KCl) |

3.0 RESULTS

Sample LMC did not show any adverse effects on either survival or dry weight of *H. azteca* relative to the control sediment or the reference sediment LWC (Table 3).

A significant difference in survival of *C. dilutus* was observed in sample LMC when compared to either the laboratory control and the reference sediment LWC (Table 4). A significant decrease in dry weight of *C. dilutus* was also observed in the sample LMC relative to the reference sediment LWC.

Measured total ammonia concentrations in the *H. azteca* and *C. dilutus* tests are summarized in Tables 5. These concentrations are at levels that are not expected to cause adverse effects to either species. Un-ionized ammonia measurements on the reference sediment sample were below 0.2 mg/L throughout the *H. azteca* test, therefore, no water change was required as specified by Environment Canada (2013).

Table 3. Results: *Hyaella azteca* survival and growth test.

| Sample ID | Mean ± SD | |
|------------------|--------------|-----------------------------|
| | Survival (%) | Average Dry Weight (mg/org) |
| Control Sediment | 96.0 ± 5.5 | 0.11 ± 0.02 |
| LWC | 94.0 ± 5.5 | 0.13 ± 0.03 |
| LMC | 92.0 ± 13.0 | 0.11 ± 0.02 |

SD = Standard Deviation

Table 4. Results: *Chironomus dilutus* survival and growth test.

| Sample ID | Mean ± SD | |
|------------------|-----------------------------|-----------------------------|
| | Survival (%) | Average Dry Weight (mg/org) |
| Control Sediment | 86.0 ± 8.9 | 1.22 ± 0.25 |
| LWC | 90.0 ± 17.3 | 1.92 ± 0.24 |
| LMC | 48.0 ± 38.3 ^{*, α} | 1.57 ± 0.32 ^α |

SD = Standard Deviation

(*) Indicates a statistically significant effect relative to the control sediment

(α) Indicates a statistically significant effect relative to reference sediment LWC

Table 5. Summary of total overlying ammonia concentrations (mg/L N) measured in the toxicity tests.

| Sample ID | <i>Hyaella azteca</i> | | <i>Chironomus dilutus</i> | |
|------------------|-----------------------|--------|---------------------------|--------|
| | Day 0 | Day 14 | Day 0 | Day 10 |
| Control Sediment | 0.137 | 1.920 | 0.137 | 0.682 |
| LWC | 0.335 | 0.091 | 0.335 | 0.882 |
| LMC | 0.084 | 0.066 | 0.084 | 0.123 |

4.0 QA/QC

The health histories of the test organisms used in the exposures were acceptable and met the requirements of the Environment Canada protocols. The tests met all control acceptability criteria and water quality parameters remained within ranges specified in the protocols throughout the tests. There were no deviations from the test methodologies. Uncertainty associated with these tests is best described by the standard deviations around the means.

Results of the reference toxicant tests conducted during the testing program are summarized in Table 7. Results for these tests fell within the acceptable range for organism performance of mean and two standard deviations, based on historical results obtained by the laboratory with these tests. Thus, the sensitivity of the organisms used in these tests was appropriate.

Table 6. Reference toxicant test results.

| Test Species | Endpoint | Historical Mean (2 SD Range) | CV (%) | Test Date |
|-------------------|-------------------------------|---------------------------------|-----------|------------------|
| <i>H. azteca</i> | Survival (LC50): 5.2 g/L NaCl | 5.8 (5.2–6.5) | 6 | October 13, 2017 |
| <i>C. dilutus</i> | Survival (LC50): 2.9 g/L KCl | 4.8 (2.7 – 8.7) | 34 | October 13, 2017 |

SD = Standard Deviation, CV = Coefficient of Variation, LC = Lethal Concentration

APPENDIX A – *Hyaella azteca* Toxicity Test Data

Hyalella azteca Sediment Test Summary Sheet

Client: Minnow
 Work Order No.: 171052

Start Date: Oct 13/17
 Set up by: EC

Sample Information:

Sample ID: Various (see below)
 Sample Date: Sept 20, 21/17
 Date Received: Sept 29/17
 Sample Volume: 1 x 500mL per sample

Test Organism Information:

Species: Hyalella azteca
 Supplier: Aquatic Biosystems, CO
 Date received: Oct 13/17
 Age or size (Day 0): 2-9 days

NaCl Reference Toxicant Results:

Reference Toxicant ID: HA141
 Stock Solution ID: n/a
 Date Initiated: Oct 13/17

96-h LC50 (95% CL): 5.2(4.3-6.4)g/L NaCl

96-h LC50 Reference Toxicant Mean and Range: 5.8(5.2-6.5)g/L NaCl CV (%): 6

Test Results:

| Sample ID | Survival ± SD (%) | Average Dry Wt. ± SD (mg) |
|------------------|-------------------|---------------------------|
| Control Sediment | 96.0 ± 5.5 | 0.0911 ± 0.0032 |
| LMC | 92.0 ± 13.0 | 0.11 ± 0.02 |
| LWC | 94.0 ± 5.5 | 0.13 ± 0.0043 |

APPENDIX B – *Chironomus dilutus* Toxicity Test Data

Chironomus dilutus Sediment Test Summary Sheet

Client: Minnow
 Work Order No.: 171051

Start Date: Oct 13 / 17
 Set up by: EV

Sample Information:

Sample ID: Various (See below)
 Sample Date: Sept 20, 21 / 2017
 Date Received: Sept 28 / 17
 Sample Volume: 1 x 550mL per sample

Test Organism Information:

Species: C. dilutus
 Supplier: Aquatic Biosystems, CO
 Date received: Oct 13 / 17
 Age or size (Day 0): 3rd in-star

① indicates there is a significant survival difference as compared to Control sediment.

② indicates there is a significant survival difference as compared to LWC (reference site).

③ indicates there is a significant dry weight difference as compared to LWC.

KCI Reference Toxicant Results:

Reference Toxicant ID: CT63
 Stock Solution ID: n/a
 Date Initiated: Oct 13 / 17

96-h LC50 (95% CL): 2.9 (2.1 - 4.0) g/L KCl

96-h LC50 Reference Toxicant Mean and Range: 4.8 (2.7 - 8.7) g/L KCl CV (%): 34

Test Results:

| Sample ID | Survival ± SD (%) | Average Dry Wt. ± SD (mg) |
|------------------|--------------------------|---------------------------|
| Control Sediment | 86.0 ± 8.9 ^{EV} | 1.22 ± 0.25 |
| LMC | ②① 48.0 ± 38.3 | ③ 1.57 ± 0.32 |
| LWC | 90.0 ± 17.3 | 1.92 ± 0.24 |

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Reference Information

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|--|--------|--|------------------------------------|
| HG-WET-MICR-CVAF-VA | Tissue | Mercury in Tissue by CVAFS Micro (WET) | EPA 200.3, EPA 245.7 |
| <p>This method is adapted from US EPA Method 200.3 "Sample Procedures for Spectrochemical Determination of Total Recoverable Elements in Biological Tissues" (1996). Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with repeated additions of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7.</p> | | | |
| MET-WET-MICR-HRMS-VA | Tissue | Metals in Tissue by HR-ICPMS Micro (WET) | EPA 200.3/200.8 |
| <p>Trace metals in tissue are analyzed by high resolution inductively coupled plasma mass spectrometry (HR-ICPMS) modified from US EPA Method 200.8, (Revision 5.5). The sample preparation procedure is modified from US EPA 200.3. Analytical results are reported on wet weight basis.</p> <p>Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.</p> | | | |
| MOISTURE-BIOPSY-VA | Tissue | Moisture Content (low weight) in tissue | Puget Sound WQ Authority, Apr 1997 |
| <p>This analysis is carried out gravimetrically by drying the sample at <60 deg. C for a minimum of three days.</p> | | | |
| MOISTURE-MICR-VA | Tissue | Moisture in Tissue | Puget Sound WQ Authority, Apr 1997 |
| <p>This analysis is carried out gravimetrically by drying the sample at <60 deg. C.</p> | | | |

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Reference Information

Qualifiers for Individual Parameters Listed:

| Qualifier | Description |
|-----------|--|
| DLA | Detection Limit adjusted for required dilution |

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|--|--------|--|------------------------------------|
| HG-WET-CVAFS-N-VA | Tissue | Mercury in Tissue by CVAFS (WET) | EPA 200.3, EPA 245.7 |
| <p>This method is conducted following British Columbia Lab Manual method "Metals in Animal Tissue and Vegetation (Biota) - Prescriptive". Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with addition of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7.</p> | | | |
| HG-WET-MICR-CVAF-VA | Tissue | Mercury in Tissue by CVAFS Micro (WET) | EPA 200.3, EPA 245.7 |
| <p>This method is adapted from US EPA Method 200.3 "Sample Procedures for Spectrochemical Determination of Total Recoverable Elements in Biological Tissues" (1996). Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with repeated additions of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7.</p> | | | |
| MET-WET-CCMS-N-VA | Tissue | Metals in Tissue by CRC ICPMS (WET) | EPA 200.3/6020A |
| <p>This method is conducted following British Columbia Lab Manual method "Metals in Animal Tissue and Vegetation (Biota) - Prescriptive". Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with addition of hydrogen peroxide. Instrumental analysis is by collision cell inductively coupled plasma - mass spectrometry (modified from EPA Method 6020A).</p> <p>Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.</p> | | | |
| MET-WET-MICR-HRMS-VA | Tissue | Metals in Tissue by HR-ICPMS Micro (WET) | EPA 200.3/200.8 |
| <p>Trace metals in tissue are analyzed by high resolution inductively coupled plasma mass spectrometry (HR-ICPMS) modified from US EPA Method 200.8, (Revision 5.5). The sample preparation procedure is modified from US EPA 200.3. Analytical results are reported on wet weight basis.</p> <p>Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.</p> | | | |
| MOISTURE-MICR-VA | Tissue | Moisture in Tissue | Puget Sound WQ Authority, Apr 1997 |
| <p>This analysis is carried out gravimetrically by drying the sample at <60 deg. C.</p> | | | |
| MOISTURE-TISS-VA | Tissue | % Moisture in Tissues | Puget Sound WQ Authority, Apr 1997 |
| <p>This analysis is carried out gravimetrically by drying the sample at 105 C for a minimum of six hours.</p> | | | |

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location |
|----------------------------|---|
| VA | ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA |

Chain of Custody Numbers:

1 of 2 2 of 2

Reference Information

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Epilithic algal species data for Minto WUL Monitoring 2017 - (Project 1739) (for Lisa Minnow Environmental Inc.)

** 1st number in species code = group 1=cyanophyte 2=chlorophyte 5=diatoms 8= red algae

** total daily biomass is sum of all species on a date

| Project | Location | Date | Species Code | Species name | density cells/cm ² | biomass µg/cm ² | length µ | width µ | cell volume µ ³ |

Highlighted values indicate significance at the $p < 0.10$ level.

Effect size magnitude > 2 relative to both reference areas.

Note: Observed effect size = (group 1 mean - group 2 mean)/pooled standard deviation.

Table E.4: Correspondence Analysis Axes Results and Station Scores Using Benthic Invertebrate Abundances at the Lowest Practical Level of Taxonomic Resolution

| Median | 4.4 | 13 | 4.3 | 25 | 3.4 | 0 | 3.7 | 0 | 3.9 | 0 |

Note: intermediate axis length is the second longest axis on a rock. Embeddedness refers to how deeply the rock is surrounded or buried by other substrate.

Table E.6: Intermediate Axis Length and Embeddedness of 100 Rocks Washed during Hess Sampling at Benthic Invertebrate Stations, Minto Mine WUL, 2017

| Rock Number | Lower Big Creek (Reference) | | | | | | | | | |
|----------------|-------------------------------|------------------|-------------------------------|------------------|-------------------------------|------------------|-------------------------------|------------------|-------------------------------|------------------|
| | LBC-1 | | LBC-2 | | LBC-3 | | LBC-4 | | LBC-5 | |

1 Introduction

Minto Explorations Ltd. (MEL), a wholly owned subsidiary of Capstone Mining Corp., owns and operates the Minto Mine, a high-grade copper mine, located approximately 240 km northwest of Whitehorse, Yukon Territory (Figure 1). The project is located within Selkirk First Nation (SFN) Category A Settlement Land Parcel R6A, and is centered at approximately 62°37'N latitude and 137°15'W longitude. The Minto Mine commenced commercial operation in October 2007 and is permitted to conduct mining and milling operations at a rate of 4,200 tonnes of ore per day (tpd). Some of the Minto ore deposits (copper/gold/silver) currently being mined are located in the upper reaches of the Minto Creek watershed approximately 12 km to the west of the Minto Creek confluence with the Yukon River (Figure 2). MEL is required, under the terms of its water use license #QZ14-031 (Amendment 1), to conduct an aquatic environmental monitoring program, of which, this fisheries monitoring program in Minto Creek is a component. This current report provides details of the monitoring conducted during the open water season in 2017 and the results of the work undertaken. This program was carried out under DFO Scientific Collection Licence number XR 154 2017.

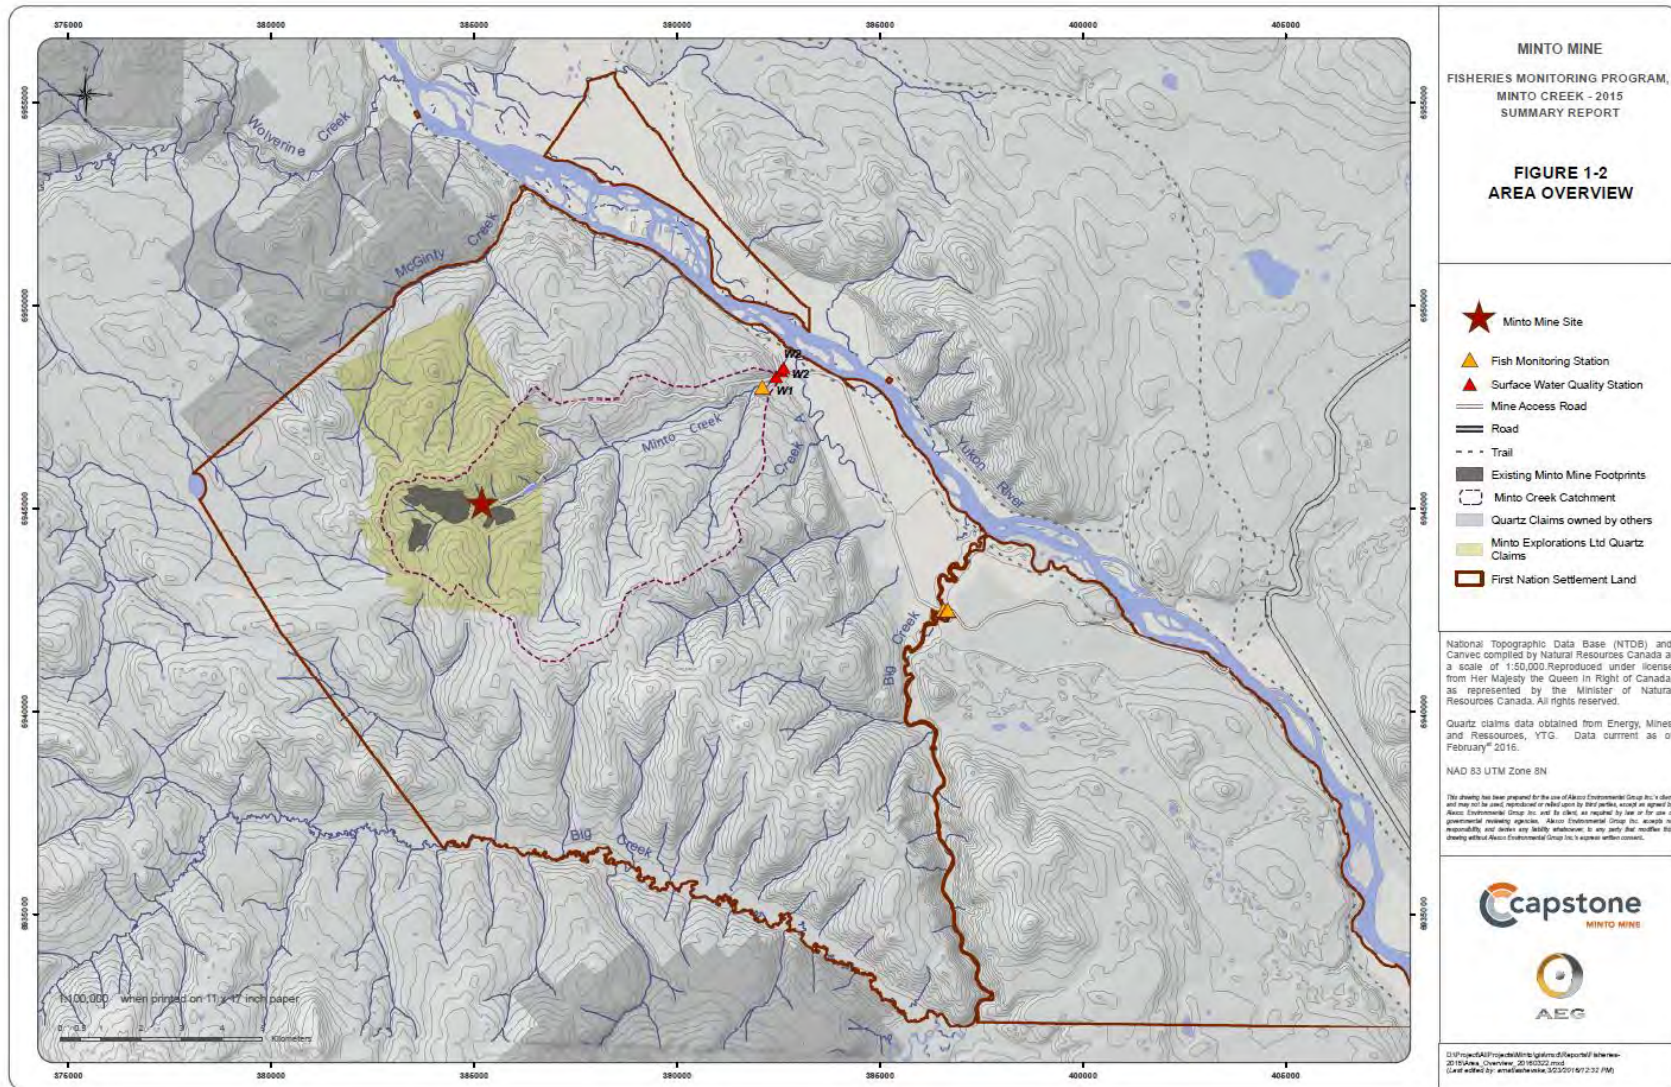

Figure 2: Project Overview

2 Previous Studies

Numerous studies on fisheries and fish habitat have been conducted over the recent history of the Minto Mine. These studies are summarized chronologically in Table 1, below.

Table 1: Minto Creek Fish Investigations

| Year | Months | Purpose of Study | Conducted by |
|-----------|------------------------------|---|-------------------------------------|
| 1994 | June, August, September | Baseline Collection | Hallam Knight Piesold (HKP) |
| 2006 | September | Baseline Collection | Access Consulting Group (ACG) |
| 2007 | May, June, August, September | Environmental Effects Monitoring Study Design Development | ACG / Minnow Environmental (Minnow) |
| 2008 | June, September | Environmental Effects Monitoring, Cycle I | ACG / Minnow |
| 2009 | June, July | Monitoring | ACG |
| 2009 | September, October | Fish Re-location | ACG |
| 2010 | June - October | Juvenile Chinook Salmon Mark-recapture program, compliance Monitoring | ACG |
| 2011 | July - October | Environmental Effects Monitoring Cycle II, Compliance Monitoring | ACG, Minnow |
| 2011 | July, August | EEM Cycle II – Growth Trials | ACG, Minnow |
| 2012 | May - September | Compliance Monitoring Se in tissue study | ACG, MEL (Minto Exploration Ltd.) |
| 2013-2015 | May - October | Compliance Monitoring | ACG/AEG, MEL |
| 2016 | June - September | Compliance Monitoring | MEL, AEG |
| 2017 | June – September | Compliance Monitoring | MEL |

Attempts to collect fish in lower Minto Creek while conducting the Phase 1 Metal Mining Effluent Regulation, Environmental Effects Monitoring (EEM) study in 2008 resulted in the capture of no fish during the month of June and very few fish during the month of September. This is consistent with the findings of previous fish investigations conducted in the creek (HKP 1994; R&D 2006, 2007). Fish use of Minto Creek is transient and likely short-lived, as has been found in other non-natal chinook rearing creeks (Walker 1976; Scrivener et al. 1994).

The majority of fish using the system are juvenile chinook salmon (*Onchoryhnchus tshawytscha*), as determined by the above investigations. Other species that have been found in the creek in low numbers include round whitefish (*Prosopium cylindraceum*), Arctic grayling (*Thymallus arcticus*), Slimy sculpin (*Cottus cognatus*) and Burbot (*Lota lota*). Of these, only slimy sculpin have been captured on a regular basis.

Juvenile chinook salmon (JCS) have never been encountered in the creek before July and their numbers tend to peak in late August or early September. Moreover, the mark-recapture investigation conducted in 2010 on JCS indicates that use of the creek is transient. The majority of JCS using the system stay in the creek for about two to three weeks or less.

A summary of past fish sampling results in Minto Creek is presented in Table 2.

Table 2: Summary of Fish captures in Minto Creek between 2008 and 2016

| Year | Method | Effort | Summary Statistics | Units | Juvenile Chinook Salmon | All Other Species |
|-------|----------------------------|------------|--------------------|----------|-------------------------|-------------------|
| 2008 | Backpack Electrofishing | 796 secs | Catch | # | 1 | 0 |

| | | | CPUE | Fish/day | 1.94 | 0.11 |
| 2014 | Baited Gee Minnow Trapping | 70.2 days | Catch | # | 151 | 3 |
| | | | CPUE | Fish/day | 2.15 | 0.04 |
| 2015 | Baited Gee Minnow Trapping | 67.3 days | Catch | # | 6 | 0 |
| | | | CPUE | Fish/day | 0.089 | 0 |
| 2016 | Baited Gee Minnow Trapping | 69.3 days | Catch | # | 6 | 0 |
| | | | CPUE | Fish/day | 0.086 | 0 |

JCS presence in Minto creek was observed to be influenced by mine water discharge. During non-discharge periods, and prior to operations (baseline), numbers of JCS and other species of fish in the system were found to be very low. In contrast, during the two major discharge events (2009 and 2010), numbers of JCS were 20 to 30 times higher in the system (see Table 3 below), indicating that they may have been attracted into the system as a likely result of a more consistent temperature and flow regime associated with mine water discharge. Numbers of other species of fish during discharge events did not increase. It is important to note however, that numbers of other species using the system has been consistently very low, prior to mine development and during operations.

Table 3: Maximum Catch per Unit Effort (CPUE) of Juvenile Chinook Salmon in Minto Creek using baited Minnow traps 1994-2017

| Year | Month | JCS – CPUE (#fish/trap-day)* | Minto Creek Conditions |
|------|-------------------|---------------------------------|---|
| 1994 | September | 0 | Pre-development – no discharge |
| 2008 | September | 0.9 | Operational – no discharge |
| 2009 | September/October | 20.0 | Discharge |
| 2010 | August | 30.0 | Discharge |
| 2011 | September | 0.43 | No discharge – high TSS contribution from tributary |
| 2012 | September | 0.19 | No discharge – high TSS contribution from tributary |
| 2013 | October | 5.01 | Operational – no discharge |
| 2014 | September | 5.05 | Operational – no discharge |
| 2015 | July | 0.30 | Operational – no discharge |
| 2016 | July | 0.30 | Operational – no discharge |
| 2017 | June-September | 0.00 | Discharge only during June trapping |

*CPUE calculated for actual 24-hr period (rather than nominal 24-hr period)

Minto Creek does not provide preferred spawning habitat for fish because it completely freezes during winter months with no flow in lower Minto Creek. Accordingly, there is no evidence of spawning in Minto Creek (HKP 1994; R&D 2006, 2007), nor is there traditional knowledge indicating spawning occurring in the system (HKP 1994). Lower Minto Creek is also subject to low or zero flow conditions during periods in the summer when a portion (or all) of the flow sometimes infiltrates the ground, preventing the establishment of resident fish populations in this section of the stream. A natural barrier to fish passage exists at approximately km 1.2 upstream in Minto Creek from the Yukon River, therefore limiting fish use upstream of the barrier. This barrier is largely comprised of organic debris and can be considered to be temporary as it will likely degrade over time, although it has been consistently observed since it was first characterized in 2010. Sampling effort has been applied upstream of the barrier during every sampling event since 2010 and resulted in no fish capture. New temporary barriers may also be established in any given year and could occur both upstream and further downstream of the current barrier location. The canyon located upstream of the current barrier however, is a permanent barrier to fish passage due to its high gradient, thus limiting fish habitat to the lower 2.0 km of the system.

Water temperatures tend to remain cooler in Minto Creek than in the Yukon River. This likely deters fish, in particular JCS, from entering the system until creek temperatures approach or equilibrate with the Yukon River. Minto Creek is subject to large diurnal fluctuations in temperature (up to 5°C or more) throughout the open water season. This daily variation is not ideal for fish and may limit their interest in using the creek for rearing.

Creek bottom substrate is comprised mostly of fines (silt/sand) with limited cobble/gravel sections which are more desirable for fish. In addition, significant input of suspended solids from a tributary in 2011 and 2012 may have further limited the use of the system by JCS during those years.

Bottom substrate at the mouth of Minto Creek and at the Yukon River confluence consists primarily of silt and mud which is not considered suitable substrate for salmonid spawning (grayling, salmon etc.). Aerial surveys for spawning fish were conducted in 2011, 2012, 2013 and 2014, and no adult fish were observed spawning in the vicinity of the Minto Creek/Yukon River confluence. No signs were present during the surveys that this area is used for spawning (such as redds or carcasses).

Starting in 2012, the compliance monitoring program included sampling efforts in Big Creek, which serves as a reference site. The same fish species as in Minto Creek were generally observed in Big Creek, and the CPUE has normally been slightly higher in Big Creek. Table 4 summarizes fish captures in Big Creek from 2012 to 2016.

Table 4: Summary of Fish captures in Big Creek in 2012 to 2016

| Year | Method | Effort | Summary Statistics | Units | Juvenile Chinook Salmon | All Other Species |
|------|----------------------------|-----------|--------------------|----------|-------------------------|-------------------|
| 2012 | Backpack Electrofishing | 273 secs | Catch | # | 1 | 23 |

| 2016 | Baited Gee Minnow Trapping | 22.2 | Catch | # | 51 | 11 |
| | | | CPUE | Fish/day | 2.30 | 0.49 |

3 Objectives

The objectives of the 2017 Fisheries Monitoring Program were to monitor, assess and characterize fish usage in Minto Creek during the open water season, and to provide data for the interpretation of the potential role and influence of the Minto Mine on the fish community. The 2017 fisheries program was a continuation of the previous year's components and targeted all species that have previously been encountered, as well as any new species. As part of the monitoring program since 2012, assessments at Big Creek were made concurrently with sampling in Minto Creek, to compare fish use in a neighboring system relative to Minto Creek. Fish monitoring studies were conducted in support of the requirements of Water Use License QZ14-031.

4 Methodology

4.1 Fish Monitoring

Fish monitoring of Minto Creek and Big Creek was conducted monthly during open water season, from June to September 2017, at trapping sites consistent with the 2010 mark-recapture study and the 2011 to 2016 fish monitoring programs (Figure 3). Capture effort included the use of Gee-type Minnow traps with 0.635 cm wire mesh size, baited with Yukon River origin chinook salmon roe. A total of 9 to 20 minnow traps were set during each sampling event in Minto Creek, depending on water levels and availability of pools and backwater areas. Four traps were set during each event in Big Creek, in the vicinity of the Minto access road bridge.

All fish captured were identified, enumerated and measured for fork length or total length (± 1 mm), inspected for abnormalities, and released in the vicinity of their trapping location. JCS were also weighed (± 0.01 g) prior to being released.

Additional supporting information collected included:

- photo-documentation of the creek,
- water level readings at station W1 staff gauge,
- in situ water parameters in Minto Creek, Big Creek and the Yukon River - temperature, dissolved oxygen, conductivity, pH, ORP,
- flow discharge measured at W1, and
- weather conditions at time of sampling.

Continuous temperature loggers (TidbiT) were deployed in the Yukon River and Big Creek for the duration of the project, however ice formation in early October on Big creek had removed the Tidbit from its location and it could not be recovered. A Levellogger recorded continuous temperature and stage in Minto Creek. Supporting variables also included monitoring of the previously identified fish barrier (1.2 km upstream of the Yukon River confluence) and/or any new barriers that may have developed.

Selected photographs documenting field activities and site conditions are presented in Appendix A.

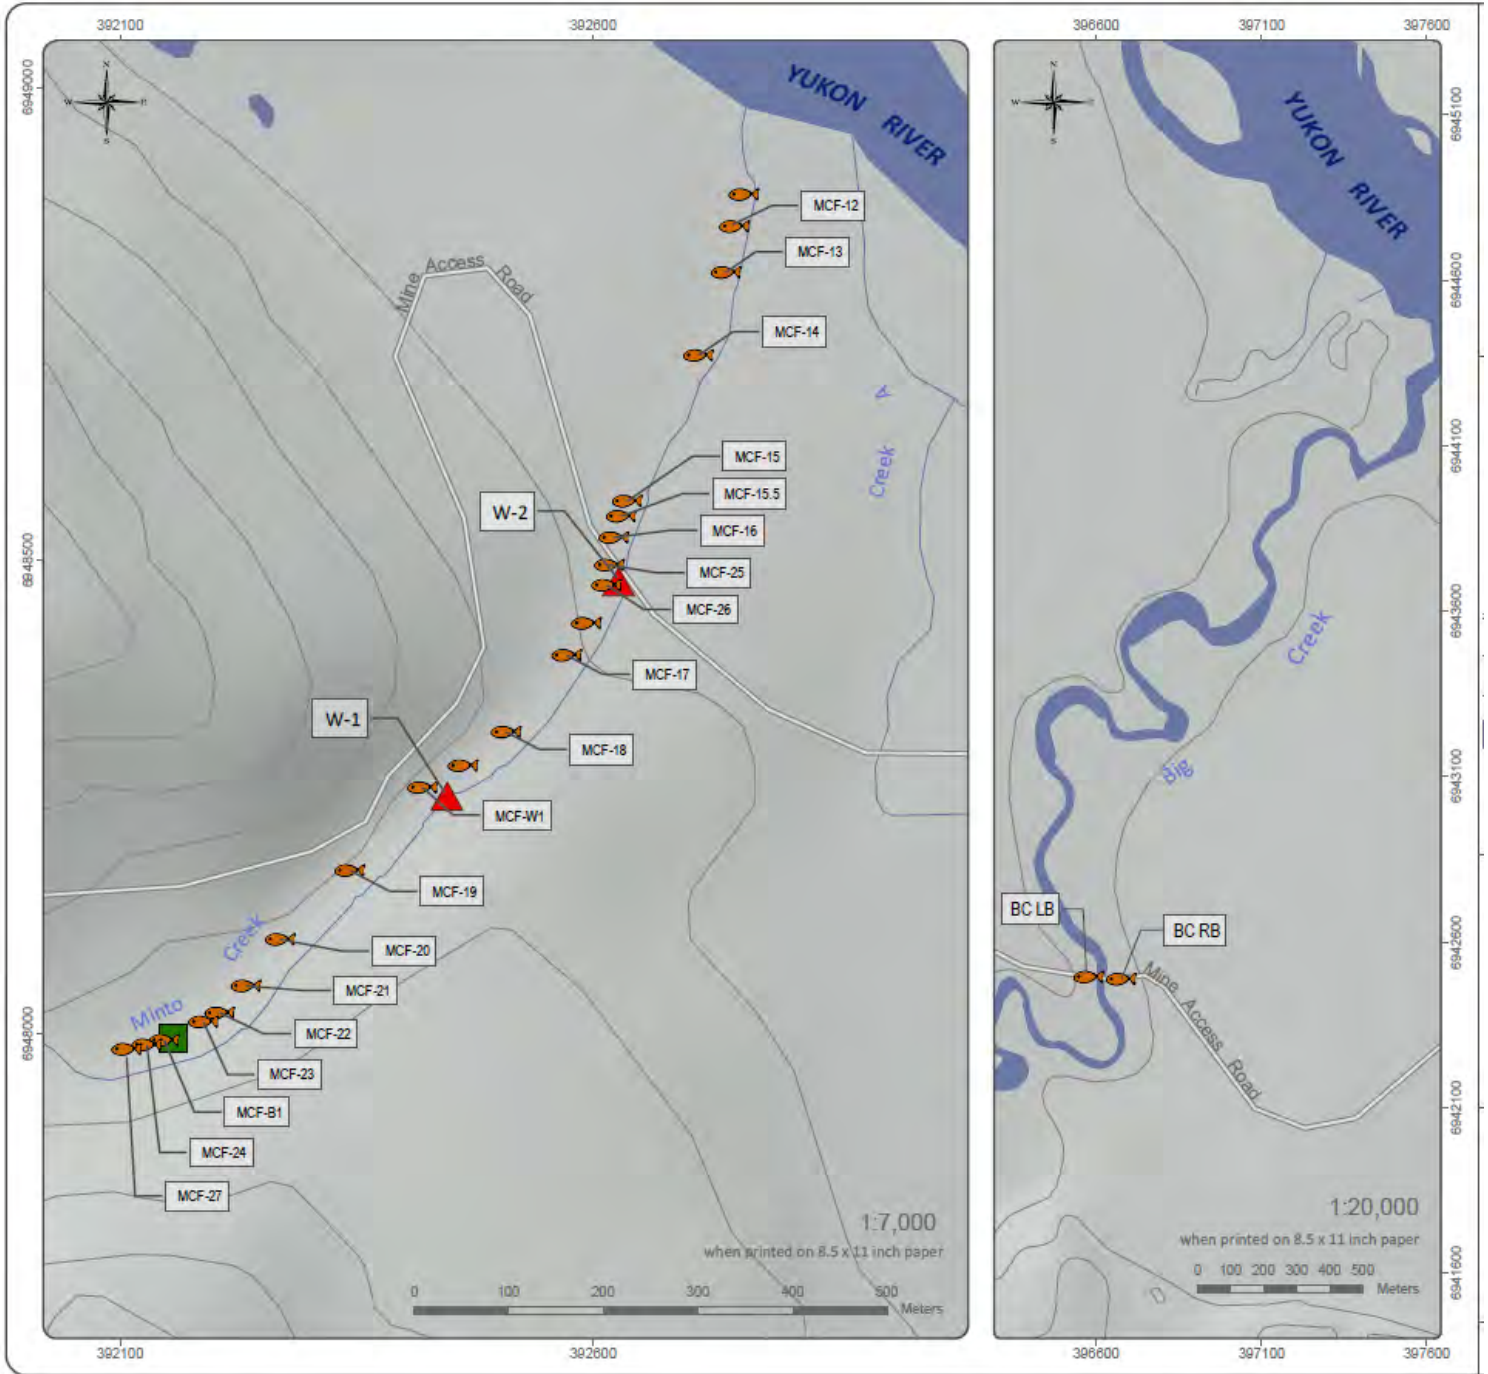

Figure 3: Minto Creek and Big Creek Fisheries Monitoring stations

5 Results

The following sections present the fisheries statistics and effort in Minto Creek and Big Creek between June and September 2017.

5.1 Fish Usage and Distribution

5.1.1 Minto Creek

Minto Creek was assessed monthly between June and September 2017. No fish were captured in Minto Creek in 2017. A portion of Minto Creek was found to be dry during the fish monitoring event in July and August 2017, which could have played an important role in preventing fish movement up and down Minto Creek. The following table (Table 5) presents the effort applied and the summary of fish capture in Minto Creek in 2017.

Table 5: Summary Statistics of Minnow Trapping in Minto Creek

| Month | Effort (trap-hours) | Effort(trap-days) | Juvenile Chinook Salmon (<i>Onchoryhnchus tshawytscha</i>) | |
|-----------|---------------------|-------------------|--|-------|
| | | | Results | CPUE* |
| June | 320 | 13.3 | 0 | 0 |
| July | 140 | 5.8 | 0 | 0 |
| August | 272.4 | 11.4 | 0 | 0 |
| September | 306.6 | 12.8 | 0 | 0 |
| Total | 1039 | 43.3 | 0 | 0 |

* CPUE = fish/trap-day (for actual 24-hr period)

5.1.2 Big Creek

Fisheries sampling effort in Big Creek was initiated in June, and conducted monthly until September, concurrent with sampling in Minto Creek, resulting in the capture of 35 fish, 27 of which were JCS. JCS were captured in all but the June sampling event in 2017, with highest numbers (11) captured in August. In addition, six (6) slimy sculpin and two (2) Burbot were captured during the 2017 sampling season.

The average catch per unit effort for JCS in Big Creek was 0.090 JCS/trap-day and was highest in August (0.165 JCS/trap-day). In comparison, the average JCS CPUE (June to September) in 2016 was higher at 0.747 JCS/trap-day and was as high as 1.288 JCS/trap-day in July 2016. The following table (Table 6) presents the effort undertaken and the resulting fish capture in Big Creek in 2017.

Due to unknown circumstances during the evening of the July 19th sampling session, 1 of the 6 JCS caught in Big Creek was dead upon retrieval (see Appendix A).

Table 6: Summary Statistics of Minnow Trapping in Big Creek in 2017

| Month | Effort (trap-hours) | Effort (trap-days) | Juvenile Chinook Salmon (<i>Onchoryhnchus tshawytscha</i>) | | Slimy Sculpin (<i>Cottus cognatus</i>) | | Burbot (<i>Lota lota</i>) | |
|-----------|---------------------|--------------------|--|-------|--|-------|-----------------------------|-------|
| | | | Results | CPUE* | Results | CPUE* | Results | CPUE* |
| June | 93 | 3.9 | 0 | 0 | 4 | 0.395 | 0 | 0 |
| July | 69 | 2.9 | 6** | 0.087 | 0 | 0 | 1 | 0.015 |
| August | 66.6 | 2.8 | 11 | 0.165 | 1 | 0.015 | 0 | 0 |
| September | 92.4 | 3.9 | 10 | 0.108 | 1 | 0.015 | 1 | 0.011 |
| Total | 320 | 13.5 | 27 | 0.084 | 6 | 0.019 | 2 | 0.006 |

*CPUE = fish/trap-day (for actual 24-hr period)

**One JCS found deceased upon trap retrieval

Figure 4 presents a comparison between monthly JCS capture and CPUE in Minto Creek and Big Creek for 2017.

Figure 4: Monthly JCS capture in Minto Creek and Big Creek, 2017

5.2 Fish Metrics

Fork lengths of JCS captured in Big Creek ranged from 48 to 85 mm and their weights ranged from 2.07 to 9.72 g. There was a notable difference between the JCS lengths and widths during each sampling event. The JCS observed in July were smaller than the JCS captured in September. The lengths and weights observed throughout the season were consistent with 0+ aged fish (young of year).

Figure 5 presents the monthly averages for both creeks. Individual results for all fish captured are presented in Appendix B.

Figure 5: Average JCS length (fork) in Big Creek, 2017

5.3 Water Quality Parameters

In situ data was collected in Minto Creek at station W2, and Big Creek (bridge) during each site visit and results are summarized in Table 7. In situ data was also collected at the Yukon River (W4) during the June, July and September sampling events. In situ parameters were collected with a YSI Professional Plus multimeter, which was calibrated prior to each trip.

Table 7: In situ data from Minto Creek, Big Creek, and Yukon River, 2017

| Site | Date | Time | Temperature (°C) | Dissolved Oxygen (%) | Dissolved Oxygen (m/L) | Specific Conductance (µS/cm) | pH |

Tidbit water temperature loggers were deployed in the Yukon River at station W4 (between the barge landing and the mouth of Minto Creek) and in Big Creek (near the bridge) during the open water season, while a continuous logger located at W1 records the water temperature and stage of lower Minto Creek.

Due to ice formation in early October 2017, the Tidbit logger at Big Creek was unable to be retrieved. The water temperature data for Big Creek was collected with a YSI Professional Plus multimeter during each of the sampling events.

Figure 6 presents the two temperature curves. This figure indicates that the temperatures of Minto Creek is generally colder than that of the Yukon River. The average difference in water temperature over this period between the Yukon River and Big Creek was 2.79°C, while the difference between Big Creek and Minto Creek was 5.29°C.

The 2017 data record does not indicate that the water temperature of Minto Creek equilibrated with that of the Yukon River during the 2017 open water season, although this has occasionally been observed to happen for a short period in June in the past. In 2013 for example, the maximum water temperature observed in Minto Creek was 15.7°C in late June, at which time the temperature of the Yukon River was

very similar. In 2014 and 2015 however, the water temperature in Minto Creek did not exceed 10.6°C and 9.7°C respectively, and did not reach equilibrium with the Yukon River. In 2017 the maximum water temperature observed in Minto Creek was 13.1 °C.

Figure 6: Water Temperature, Minto Creek and Yukon River, 2017

Turbidity in Minto Creek was noted to be higher in June due to a significant rain event. Figure 7 presents Total Suspended Solids (TSS) values measured at W2 from June 6th to September 26th, 2017; the dotted line indicates the decreasing trend.

Figure 7: Total Suspended Solids (mg/L) measured at W2 in 2017

W2 TSS records for the open water season from 2011 to 2017 are presented in Figure 8 for comparison.

Figure 8: Total Suspended Solids (mg/L) measured at W2 during open water, 2011 to 2017

5.4 Stage and Discharge

The staff gauge located at W1 in Minto Creek was read during each trip, and discharge was measured at W1 with a Marsh McBirney Flo-Mate electromagnetic flow meter or a with a Hach FH950 electromagnetic flow meter. A continuously logging water level recorder is also located at W1.

Water levels and discharge for Minto Creek and Big Creek are presented in Table 8 below, for dates when fisheries surveys occurred. Big Creek values were obtained through the Water Survey of Canada on-line database (Water Survey Canada, 2017) and are subject to change as they have not yet been validated by Water Survey Canada.

Table 8: Stage and Discharge in Minto Creek and Big Creek, 2017

| Date | Time (PDT) | Minto Creek | | Big Creek | |
|-----------|------------|-------------|-------------------------------|-----------|-------------------------------|
| | | Stage (m) | Discharge (m ³ /s) | Stage (m) | Discharge (m ³ /s) |
| 6/9/2017 | 17:00 | 0.270 | 0.040 | 6.329 | 14.8 |
| 7/19/2017 | 15:42 | 0.117 | 0.005 | 6.377 | 17.4 |

| 9/26/2017 | 14:18 | 0.146 | 0.009 | 6.166 | 7.43 |

Figure 9 displays the continuous record available from April to early October in Minto Creek.

Figure 9 Stage and discharge in Minto Creek at monitoring station W1, 2017

The Big Creek hydrometric station (Water Survey of Canada station ID # 09AH003) is located downstream of the Minto access road bridge, near its confluence with the Yukon River, at the following coordinates: 62° 34' 07" N; 137° 00' 58" W. It records continuous water level and discharge. Figure 10 presents data from June to October 2017.

Figure 10: Water Level Discharge in Big Creek 2017 (Source: Water Survey of Canada, 2017)

5.5 Fish Barrier

The fish barrier located approximately 1.2 km upstream of the Yukon River (MCF-B1 on Figure 3), which was documented in previous years, was re-confirmed in 2017. Another fish barrier exists approximately 200m downstream of MCF-B1 at MCF-21. Fish use upstream of the barriers, which consists of a log jam (Figure 11), was assessed by setting traps upstream of it during each sampling event. No fish were captured upstream of the barrier during 2017.

Figure 12: Fish barrier at MCF-21

6 Discussion

A section of lower Minto Creek (downstream of MCF-14) was dry during the July and August 2017 sampling events, preventing fish movement up the system. The period which this section of the creek was going dry is unknown, however this could have occurred on other occasions throughout the summer.

In 2017, no JCS were captured in Minto Creek during all sampling events. This may be related in part to the higher water temperatures observed in Big Creek and the lower temperatures observed in Minto Creek during this season. More generally this supports previous findings that JCS do not tend to enter Minto Creek (or Big Creek) until the water temperature has equilibrated with that of the Yukon River or reached a minimum threshold temperature, which was not observed in 2017.

The highest JCS catch per unit effort (CPUE) was observed in August in Big Creek. Figure 12 shows the CPUE trends since 2008 for JCS (Minnow trapping only) in Minto Creek and since 2012 in Big Creek. The average CPUE in Minto Creek has shown some variability since 2008 but has generally been relatively low. One exception is the year 2010 where the average CPUE in Minto Creek was 15.7 JCS/trap-day and some trapping events returned over 400 JCS. Those high numbers are thought to be associated with mine water discharge occurring throughout the open water season in Minto Creek that year (ACG, 2010), the more consistent temperature and flow regimes possibly acting as attractants to fish.

No fish were caught in Minto Creek in 2017. This could be explained by a section of the lower creek going dry in July and August, preventing fish movement up or down the creek, combined with a relatively low temperature profile in 2017. In some years, water temperature of Minto Creek and Yukon River reach equilibrium for a short period in June, however this did not happen from 2014 to 2017. In 2017, Minto Creek's maximum water temperature stayed below 11°C, whereas the Yukon River minimum temperature largely stayed above 11°C throughout the summer. The colder temperature profile of Minto Creek in 2017 may have deterred the movement of JCS into the system.

In Big Creek, the average CPUE for 2017 was the lowest recording since 2012. The CPUE was generally higher in Big Creek than in Minto Creek, except in 2013 where it was the opposite. A higher CPUE in Big Creek than in Minto Creek could be explained by the fact that Big Creek is a larger system, with a higher water temperature, generally providing better rearing conditions for JCS. The CPUE has also been noted as following the same trend within both Minto Creek and Big Creek since 2008.

Figure 13: JCS Average CPUE, Minnow Trapping, Minto Creek (2008-2017), and Big Creek (2012-2017)

In 2009 and 2010, the mine was discharging water throughout the open water season into Minto Creek, causing higher and more consistent flow and temperature regimes in lower Minto Creek, conditions which may have been more attractive to JCS. Mine water discharge only occurred during spring freshet from 2012 to 2015 and no discharge occurred in 2011. In 2016 the new permitted discharge rate (Q_{EFF}), as per the WUL QZ14-031, was calculated as follows:

- a) Initial discharge rate: $1/3 (Q_{MC} + Q_{RO}) \geq Q_{EFF-C}$
- b) Rate after discharge has commenced: $1/3 (Q_{MC} + Q_{RO} - Q_{EFF-M}) \geq Q_{EFF-C}$

Where:

Q_{MC} = daily flow rate in Lower Minto Creek (represented by either W1 or MC1),

Q_{RO} = daily flow rate of discharged from the RO

Q_{EFF-M} = measured daily rate of discharge from mine site

Q_{EFF-C} = calculated rate of water discharge from mine site

In 2017 Minto mine was discharging throughout the open water season. However, this year's discharge was at much lower rates than in 2009 and 2010 because of the new discharge formula.

Following a forest fire in 2010, more sediment entered Minto Creek through runoff in 2011 and 2012, thereby increasing turbidity. A small landslide was also documented by Minto personnel in an upstream

tributary in May 2012, likely contributing to high TSS levels observed downstream. The elevated turbidity may have deterred fish from entering Minto Creek. Average TSS values at W2 in 2016 were the lowest since 2011, with the highest being observed in 2012 (see Appendix C for details). Average TSS values at W2 in 2017 were the lowest since 2011, with the highest being observed in 2012 (see Figure 8 for details). Turbidity and TSS did not likely influence fish presence or absence in Minto Creek in 2017 as values remained low throughout the season.

The natural fish barrier identified in Minto Creek in previous years was again confirmed in 2017, as well as a second natural fish barrier 200m downstream. Therefore, the area of usable fish habitat in Minto Creek is limited to the lower 1 km of the creek.

Aerial surveys for spawning fish were carried out in the vicinity of the Minto Creek/Yukon River confluence from 2010 to 2014 and no spawning activity was ever observed or suspected. Bottom substrate in the confluence area consists primarily of silt and mud which is not suitable substrate for salmon spawning.

Appendix M – Copper Toxicity in Turbid Flow Report (Minnow)

January 31, 2018

Mr. Ryan Herbert
Environmental Manager
Capstone Mining Corporation - Minto Mine
PO Box 11
Whitehorse Central PO
Whitehorse, Yukon, Y1A 2V3

Dear Mr. Herbert,

Re: Turbid Flow Water Toxicity Testing to Verify the Minto Mine Water Quality Objective for Copper in Minto Creek

This brief letter report provides a summary and interpretation of the results of toxicity testing undertaken to verify the Minto Mine's water quality objective (WQO) for copper in lower Minto Creek. As required under the Minto Mine Water Use Licence (WUL; QZ14-031), turbid flow conditions were tested (on a sample collected in early May 2017).

Background

In August 2015, the Yukon Water Board (YWB) issued an amended WUL to the Minto Mine that included a WQO of 20 µg/L dissolved copper when dissolved organic carbon (DOC) concentrations exceed 10 mg/L and 13 µg/L dissolved copper when DOC concentrations are 10 mg/L or lower¹ (YWB 2015). The amended WUL also included Clause 105 stipulating that "the licensee shall complete the study generally described in the document entitled Study Plan for Evaluating the Toxicity of Copper to Selected Aquatic Organisms in Minto Creek Water Version 3 and shall submit the results to the Board by March 31, 2017 for Review and Approval." The Study Plan (Appendix A) was designed by MacDonald Environmental Sciences Limited (MESL) and reviewed by Minnow Environmental Inc. (Minnow) prior to a YWB public hearing in March 2015.

The Study Plan was designed to determine if the WQO is protective of sensitive organisms and endpoints (survival, growth, and reproduction) under a range of water quality conditions. The Study Plan includes laboratory testing with site water collected during clear and turbid flow

¹ WQOs apply at Station W2 in lower Minto Creek when water is flowing at the mine site (Stations W15 and W35) and apply to water leaving the site at Station W16 when there is no flow at Stations W15 and W35 (see Figure 1 for station locations). The former condition is the focus of this document, as WQOs are intended to be protective of lower Minto Creek.

conditions. Clear flow is defined as flowing water with less than 25 mg/L total suspended solids (TSS) and turbid flow as flowing water with greater than 25 mg/L TSS.

Minto's WQO for copper was based on evaluations which identified high background copper concentrations and high concentrations of DOC (approximately 12 mg/L, on average) which is known to limit the bioavailability and toxicity of copper. Minto's WQO for copper was based on a combination of background concentration characterization (e.g., Minnow 2009), toxicity testing in site water (e.g., Minnow 2009), application of scientific literature-based quantitative relationships between copper toxicity and DOC, biotic ligand modelling (e.g., Minnow 2009, 2013, 2014) and testing of potential effects to fish olfaction (Kennedy et al. 2012). The WQO was supported through the Yukon Environmental and Socio-economic Assessment Board (YESAB) environmental assessment, when independent evaluation suggested that 40 µg/L could potentially be used as the WQO for copper in lower Minto Creek (Ecometrix 2014).

In late September 2015, copper toxicity testing was conducted under clear flow conditions. A downward revision of WQO was unnecessary since there were no endpoints for which the 20th percentile effect concentration was below 20 µg/L and the 20 µg/L (or lower) copper concentration treatments also differed significantly from the laboratory control (Minnow 2016).

Methods

Site water for turbid flow testing was collected on May 5th 2017 from lower Minto Creek (W2) and the water storage pond (WSP; W16; Figure 1). The original decision path developed for the Study Plan implementation guided the timing of collection (Figure 2; Minnow 2015). Appropriate turbid flow conditions did not occur in 2016 (due, at least in part, to a mild snow melt/spring freshet). The water collected on May 5th 2017 arrived at the Nautilus Environmental (Nautilus) toxicity testing laboratory (Calgary, AB) on May 12th, 2017. A 3:1 ratio of Minto Creek water to effluent (W2:W16) was mixed at the laboratory. This ratio mimics the expected ratio at maximum effluent discharge. In accordance with the Study Plan (Appendix A) and standard protocols (Appendix B - Nautilus 2017), four long-term (i.e., chronic) static-renewal toxicity tests were completed:

- a 48-h rotifer (*Brachionus calyciflorus*) toxicity test (intrinsic rate of population increase);
- a 21-d cladoceran (*Daphnia magna*) toxicity test (survival, reproduction);
- a 32-d fathead minnow (*Pimephales promelas*) toxicity test (hatching success, total post-hatch survival, overall survival, length, and biomass); and

- a 42-d amphipod (*Hyalella azteca*) toxicity test (survival, growth², and reproduction).

Mixed site water was spiked with copper at the following nominal copper concentrations: 5, 10, 20, 40, 80, and 160 µg/L (Appendix B - Nautilus 2017). Each test evaluated the six exposure concentrations, an un-spiked mixed site water control, and a laboratory control. Dissolved and total copper concentrations were measured in all test vessels on a weekly basis. Major ions (calcium, magnesium, potassium, sodium, sulphate, and chloride) and alkalinity were measured in the site and laboratory control waters, and DOC was measured in the mixed site water control (Appendix B – Nautilus 2017).

Lethal concentrations (LC) or inhibitory concentrations (IC) were determined for all 13 endpoints associated with the four toxicity tests. All LC and IC values were calculated at the 10th, 20th, and 50th percentiles (Appendix B – Nautilus 2017). Mean survival, growth, and/or reproduction associated with each treatment was statistically contrasted with the laboratory control. Criteria for interpreting suitability of the WQO were defined a-priori (MESL 2015). The WQO for copper is considered protective if 20th percentile effect concentrations (LC20 and IC20) are greater than 20 µg/L and endpoints (i.e., survival, growth, and/or reproduction) associated with copper concentrations of 20 µg/L (and lower) do not differ significantly from those of the control ($p = 0.05$; Appendix A). Conversely, if one or more of the 20th percentile effect concentrations is less than or equal to 20 µg/L and that endpoint (or those endpoints) associated with copper concentrations of 20 µg/L (or lower) also differ significantly from the control ($p = 0.05$), the WQO would be revised downward to establish a level protective of aquatic organisms in site water (Appendix A).

Results

The mean concentration of DOC in mixed test waters collected on May 5, 2017 (29.1 ± 3.0 mg/L) was higher than 10 mg/L, and therefore the objective of 20 µg/L of dissolved copper would apply as outlined in Minto's WUL.

Evaluation of toxicity test results as reported in Appendix B (Nautilus 2017) indicated that the 20th percentile effect concentrations were well above the SSWQO of 20 µg/L dissolved copper for 12 of 13 endpoints (Table 1 and Figure 3). The IC20 for "intrinsic rate of population increase" of *B. calyciflorus* was 150 µg/L dissolved copper (161 µg/L total; Table 1). Only the highest exposure concentration (168 µg/L dissolved copper; 180 µg/L total) resulted in a growth rate significantly lower than the laboratory control (Appendix B – Nautilus 2017). *D. magna* survival and reproduction LC20s and IC20s were greater than the highest concentration tested

² Survival and growth of *Hyalella azteca* were evaluated after 28-days and after 42-days

(nominally 160 µg/L and measured as 149 µg/L dissolved copper and 167 µg/L total copper) and neither survival nor reproduction in any treatment differed from the laboratory control (Table 1). Similarly, all five endpoints for *P. promelas* yielded LC20 or IC20 values greater than the highest concentration tested (nominally 160 µg/L and measured as either 144 µg/L or 158 µg/L dissolved copper and 168 µg/L or 170 µg/L total copper) and neither survival nor growth in any treatment differed from the laboratory control (Table 1). *H. azteca* survival LC20 was also greater than the highest concentration tested in 28-day and in 42-day exposures, and there were no significant differences between any of the treatments and the laboratory control (Table 1; Appendix B – Nautilus 2017). The IC20 for *H. azteca* biomass was 97.0 µg/L dissolved copper (106 µg/L total) in the 28-day exposure and 96.6 µg/L dissolved copper (102 µg/L total) in the 42-day exposure (Table 1). The only treatment that differed significantly from the laboratory control (over both exposure durations) was the nominal 160 µg/L treatment (measured as 154 µg/L dissolved and 167 µg/L total in the 28-day exposure and 160 µg/L dissolved and 169 µg/L total in the 42-day exposure; Table 1; Appendix B – Nautilus 2017).

The reproductive endpoint in the 42-day test of *H. azteca* was the most sensitive endpoint and was the only endpoint (as reported in Appendix B – Nautilus 2017) with a reported IC20 lower than the SSWQO of 20 µg/L (Table 1 and Figure 3). Despite good *H. azteca* survival and growth at nominal copper concentrations up to approximately 80 µg/L (measured as 86.4 µg/L dissolved copper and 92.7 µg/L total copper), the IC20 for the *H. azteca* reproductive endpoint was <14.9 µg/L dissolved copper (<17.5 µg/L total copper) and mean reproduction was significantly lower than that associated with the laboratory control (Table 2; Figure 4). Reproductive output associated with all exposure concentrations were significantly lower than the laboratory control with the exception of the nominal 5 µg/L treatment (19.8 µg/L dissolved copper and 22.3 µg/L total copper; Figure 4).

Expression of the IC20 as a “<” (Table 1; Appendix B – Nautilus 2017) prompted a review of the test data and the associated statistical analysis. Review of the test data (Appendix B – Nautilus 2017) and statistical examination of the data (Appendix C) revealed three primary issues contributing to the “<” result: 1) extreme reproductive output associated with two of eight laboratory control organisms (43, 30, 16, 12, 12, 11, 11, and 7 neonates); 2) an unusual dose-response curve (e.g., reproductive output in the nominal 5 µg/L treatment was higher than that of the site control, reproductive output in the nominal 20 µg/L treatment was greater than that of the 10 µg/L treatment; Figure 4); and 3) strong heterogeneity of variance that violated the assumptions of the log-linear regression model applied in the data analysis. Re-analysis was conducted to address some of these issues (Table 2; Appendix C). The approach addressed the leveraging effect of the two unusually high reproductive outputs by basing analysis upon the

median lab control (12 neonates per organism versus a leveraged mean of 17.8 neonates per organism), identified and eliminated on outlier (associated with the nominal 10 µg/L treatment), and eliminated the violation of the assumption of homogeneity of variance by data transformation (Appendix C). The regression models with the best overall fit indicated IC20 values for *H. azteca* reproduction of 27.6 µg/L dissolved copper and 30.1 µg/L total copper (Figure 5; Appendix C).

Comparisons to Clear Flow Toxicity Testing

The concentration of DOC was substantially higher during turbid flow conditions (29.1 ± 3.0 mg/L) than during clear flow conditions (9.2 ± 0.5 mg/L). During clear flow conditions, the only endpoints with effect concentrations lower than 20 µg/L were survival of *D. magna* and reproduction of *H. azteca*. Neither of these endpoints differed significantly from the laboratory control at the 20 µg/L exposure concentration (or lower). During turbid flow conditions, survival of *D. magna* was not impacted by even the highest test concentration (149 µg/L dissolved copper), a substantial difference from the LC20 observed during clear flow testing (18.3 µg/L dissolved copper). The difference is consistent with amelioration of copper toxicity by DOC (e.g., Grosell 2012). The difference between clear- and turbid-flow IC20 values for *H. azteca* reproduction was much smaller than for *D. magna* survival (27.6 µg/L dissolved copper in turbid-flow testing versus 17.6 µg/L copper in clear-flow testing). Reproduction is typically highly correlated with biomass (e.g., Ivey et al. 2016), and was 2.5-times more sensitive than biomass in the clear water testing and 3.5-times more sensitive than biomass in the turbid water testing. Similarly, sensitivity of the *H. azteca* reproduction endpoint was almost identical to that of *D. magna* survival in clear water testing, but was 5.4-times more sensitive in turbid water testing. Although the reproductive endpoint in *H. azteca* tests is known to be among the more variable test endpoints, this suggests that *H. azteca* reproduction may not respond to concentrations of copper and DOC in the same manner as *D. magna* survival.

Conclusion and Closure

As defined in the Study Plan (Appendix A), the SSWQO for copper (20 µg/L dissolved copper when DOC is greater than 10 mg/L) would be considered protective of aquatic organisms in site water if the reported 20th percentile effect concentrations are greater than 20 µg/L and copper concentrations of 20 µg/L (and lower) also do not differ significantly from the control. This was the case for all endpoints in the clear flow testing (sample collected on September 28th 2015; Minnow 2017) and in turbid flow testing (sample collected May 5th 2017). Specifically, in the clear flow testing, two 20th percentile endpoints were less than 20 µg/L dissolved copper (the LC20 for *D. magna* [18.3 µg/L dissolved copper] and the IC20 for *H. azteca* reproduction

[17.6 µg/L dissolved copper]), but neither differed significantly from the laboratory control (Minnow 2016). In the turbid flow testing, all lowest 20th percentile effect endpoints were greater than 20 µg/L dissolved copper (the lowest IC20 value [by far] was for reproduction in the 42-day test of *H. azteca* [27.6 µg/L dissolved copper]). Therefore, the SSWQO for copper, as defined in Minto's Water Use Licence (WUL), appears to be protective of the aquatic life of Minto Creek.

Sincerely,
Minnow Environmental Inc.

STUDY PLAN FOR EVALUATING THE
TOXICITY OF COPPER TO SELECTED
AQUATIC ORGANISMS IN MINTO CREEK
WATER – VERSION 3
(MESL 2015)

Attachment 1:

Study Plan for Evaluating the Toxicity of Copper to Selected Aquatic Organisms in Minto Creek Water Version 3

Prepared by: MESL/PERC, with comments by Minnow Environmental
Version 3 Prepared: January 14, 2015

Purpose: The purpose of this study is to determine if the proposed water quality objective (WQO) for copper in Minto Creek (20 µg/L) would be protective of aquatic organisms.

Approach: The protectiveness of the proposed WQO for copper would be evaluated by conducting a series of laboratory toxicity tests with selected species of fish and invertebrates. A resident species approach could be applied to evaluate the protectiveness of the proposed WQO (which could involve toxicity testing with chinook salmon, slimy sculpin, Yukon floaters, and various crustaceans and/or insect larvae). However, it is more practical to utilize an indicator species approach that involves conducting toxicity tests with a number of commonly-tested fish and invertebrate species that are likely to be representative of sensitive species that utilize aquatic habitats within Minto Creek. Application of this approach would involve:

- Collecting site water (i.e., Minto Creek at W2) during two periods of the hydrological regime (i.e., clear flow; TSS < 25 mg/L; and, turbid flow: TSS ≥ 25 mg/L);
- Transporting sufficient quantities of site water to the toxicity testing laboratory to support toxicity testing;
- Spiking site water with copper chloride to achieve five exposure concentrations, as well as a negative control (Lab water), site control (i.e., unspiked site water);
- Conducting a total of four long-term (i.e., chronic) static-renewal toxicity tests to evaluate the effects of copper on aquatic organisms in site water, including:
 1. 42-d toxicity test with the amphipod, *Hyaella azteca* (Endpoints: Survival, growth, and reproduction);

2. 21-d toxicity test with the cladoceran, *Daphnia magna* (Endpoints: Survival and reproduction);
 3. 48-h toxicity test with the rotifer, *Brachionus calyciflorus* (Endpoint: Intrinsic rate of population increase); and,
 4. 32-d toxicity test with fathead minnows, *Pimephales promelas* (Endpoints: Hatching success, total post-hatch survival, overall survival, and dry weight);
- Conducting a reference toxicity test with each species to confirm that sensitivity is within the expected range;
 - Measuring the concentrations of total and dissolved copper in each treatment for each toxicity test at the beginning of the test, the end of the test, and periodically during the test (i.e., depending on when new batches of site water are used and/or when dilution water is prepared. Note our preference would be to have all of the tests conducted with a single batch of homogenized site water);
 - Characterizing water quality in each treatment at the beginning of the test, the end of the test, and periodically during the test (i.e., depending on when new batches of site water are used);
 - Calculating EC₁₀ and EC₂₀ values; and,
 - Compiling and reporting the results of the toxicity testing program.

Interpretation: The WQO for copper will be considered to be protective if the reported EC₂₀ values are greater than 20 µg/L for all tested species and the 20 µg/L treatment does not differ significantly from the control (p = 0.05). If one or more of the EC₂₀ values is less than or equal to the proposed WQO and the 20 µg/L treatment is significantly impaired relative to control (p = 0.05), the WQO would be revised downward to establish a level that is protective of aquatic organisms in site water.

Note: This general approach can be modified to evaluate the protectiveness of the WQOs that have been proposed for all of the COPCs. In this case, site water would be spiked with all of the identified COPCs at levels equivalent to the WQOs (i.e., in site water collected during clear-flow and turbid flow periods).

Note: Add Table of Test Conditions for Each Toxicity Test to complete Study Plan.

This report has been prepared by Nautilus Environmental Company Inc. based on data and/or samples provided by our client and the results of this study are for their sole benefit. Any reliance on the data by a third party is at the sole and exclusive risk of that party. The results presented here relate only to the samples tested.

SUMMARY

A summary of sample information and test results from the *Brachionus calyciflorus*, *Daphnia magna*, *Pimephales promelas* and *Hyaella azteca* toxicity tests are provided in the tables below for the samples W2 and W16 amended with copper. Testing was initiated for *B. calyciflorus* on May 23, 2017 at the Nautilus Burnaby laboratory. Testing was initiated for *D. magna* on May 24, 2017 and for *P. promelas* and *H. azteca* on May 25, 2017 at the Nautilus Calgary laboratory.

1.0 INTRODUCTION

Nautilus Environmental Company Inc. (Nautilus Environmental) conducted sub-lethal toxicity tests for Minnow Environmental Inc. (Minnow Environmental) to investigate the effects of copper in site water collected from Minto Creek by Minto Mine. This investigation was conducted on site water with elevated total suspended solids and the purpose was to determine if the proposed water quality objective for copper in Minto Creek would be protective of aquatic life.

The following sub-lethal toxicity tests were performed:

- 48-hour *Brachionus calyciflorus* population growth test
- 21-day *Daphnia magna* survival and reproduction test
- 32-day *Pimephales promelas* survival and growth test
- 42-day *Hyaella azteca* survival, reproduction and growth test

The *B. calyciflorus* test was performed at the Nautilus Environmental Burnaby, BC location, while all other testing took place at the Nautilus Environmental Calgary, AB location.

2.0 METHODS

Water samples were collected on May 5, 2017 from stations W2 and W16 and were submitted by Minto Mine to Nautilus Environmental in Calgary, AB on May 12, 2017. The samples were delivered in 200-L plastic drums and were received in good condition.

Test water was prepared in the laboratory by mixing the two site waters in a 3:1 ratio of W2:W16. The site water was then amended with copper using a stock solution of copper chloride dihydrate. The nominal concentrations of copper tested were 5, 10, 20, 40, 80 and 160 µg/L. In addition to un-amended site water, laboratory control water was also evaluated in each test. Total and dissolved copper was measured weekly in each test concentration and calcium, magnesium, potassium, sodium, sulfate, chloride and alkalinity were measured in the site and laboratory controls. The site control water was also analyzed weekly for dissolved organic carbon. Chemical analysis was performed by ALS Laboratories.

Testing was conducted following standard protocols that are currently employed in Canada and the United States and are described in further detail below. Statistical analyses for all tests were performed using CETIS (Tidepool Scientific Software, 2015) and are based on average measured total or dissolved copper. Where possible, linear or non-linear regression models were used to

calculate point estimates. In cases where the data did not fit these models, linear interpolation of log-transformed data was used.

The *B. calyciflorus* tests followed procedures outlined in Snell and Moffat (1992) and APHA (2012) and are summarized in Table 1. The test was a 48-hour growth test that measured the intrinsic rate of population increase. The test was conducted at $25 \pm 1^\circ\text{C}$ and *B. calyciflorus* were fed green algae (*Pseudokirchneriella subcapitata*) at test initiation.

The *D. magna* test followed methods described in ASTM (2012), which are summarized in Table 2. The test involved a 21-day exposure under static-renewal conditions, with solutions being renewed three times per week and survival and reproduction being monitored. The test was conducted at $20 \pm 1^\circ\text{C}$ and daphnids were fed a mixture of green algae (*P. subcapitata*) and digested yeast, cerophyll and trout chow (YCT).

The *P. promelas* test followed methods described in USEPA (1996) and ASTM (2013), which are summarized in Table 3. The test evaluated hatch, survival and growth during a 32-day static-renewal exposure, with solutions being renewed daily. The test was conducted at $25 \pm 1^\circ\text{C}$ and minnows were fed daily with *Artemia nauplii*. The test used four replicates for each test concentration with 15 eggs in each test container. After 48 hours of exposure, undeveloped eggs in each replicate (i.e., unfertilized eggs) were replaced with eggs contained in two additional sacrificial test containers that were initiated for each test concentration for this purpose.

The *H. azteca* tests followed methods described by USEPA (2000), with modifications described recently by the *Hyaella* Advisory Group, headed by Dr. Chris Ingersoll of USGS. A description of test conditions is provided in Table 4. The test involved a 42 day exposure of 7- to 8-day old organisms using twelve replicates of ten amphipods. Four replicates were terminated at Day 28 to assess biomass and survival, and the remaining eight were continued to Day 42 and were used to evaluate survival, biomass and reproduction. The test organisms were fed a ramped diet of Tetramin and YCT, with increased feeding rates as the test progressed. The test was conducted under static renewal conditions, with one water renewal three times per week. The control and test waters for the *H. azteca* tests contained at least 0.02 mg/L Br and 15 mg/L Cl. Reproduction was assessed on days 35 and 42. On day 42, the number of adult females was evaluated in each replicate so that reproduction could be reported on the basis of the number of female amphipods.

Table 1. Summary of test conditions: *Brachionus calyciflorus* growth test.

| | |
|---|---|
| Test organism | <i>Brachionus calyciflorus</i> |
| Test organism age | < 2 h-post hatch |
| Test type | Static |
| Test duration | 48 h |
| Test chamber | Test tube |
| Test solution volume | 12 mL |
| Test concentrations | Six concentrations, plus site water and laboratory controls |
| Number of replicates | 7 |
| Control water | Moderately-hard reconstituted water (hardness 80-100 mg/L) |
| Test solution renewal | None |
| Test temperature | 25 ± 1°C |
| Number of organisms/chamber | 6 |
| Feeding | <i>Pseudokirchneriella subcapitata</i> at test initiation |
| Photoperiod | Continuous darkness |
| Aeration | None |
| Test protocol | Snell and Moffat (1992); APHA (2012) |
| Test endpoints | Growth rate (intrinsic rate of population increase; r) |
| Test acceptability criterion for controls | r ≥ 0.7 |

Table 2. Summary of test conditions: *Daphnia magna* survival and reproduction test.

| | |
|---|---|
| Test organism | <i>Daphnia magna</i> |
| Test organism source | In-house culture |
| Test organism age | <24-h old neonates |
| Test type | Static-renewal |
| Test duration | 21 days |
| Test chamber | 120-mL plastic cup |
| Test solution volume | 100 mL |
| Test concentrations | Six concentrations, plus site water and laboratory controls |
| Number of replicates | 10 |
| Control/dilution water | Moderately hard water (hardness 80-100 mg/L CaCO ₃) |
| Test solution renewal | Three times weekly |
| Test temperature | 20 ± 2°C |
| Number of organisms/chamber | 1 |
| Feeding | Daily, with <i>Pseudokirchneriella subcapitata</i> and digested yeast, cerophyll and trout chow |
| Light intensity | 400 to 800 lux |
| Photoperiod | 16 hours light/8 hours dark |
| Aeration | None |
| Test protocol | ASTM E1193 – 97 |
| Test endpoints | Survival and reproduction |
| Test acceptability criterion for controls | ≥70% survival; average of ≥60 young per surviving control female |
| Reference Toxicant | Sodium chloride |

Table 3. Summary of test conditions: *Pimephales promelas* early life stage test.

| | |
|---|---|
| Test organism | <i>Pimephales promelas</i> |
| Test organism age | < 24-h old fertilized eggs |
| Test type | Static-renewal |
| Test duration | ~32 days |
| Test chamber | 1-L glass jars |
| Test solution volume | 1 L |
| Test concentrations | Six concentrations, plus site water and laboratory controls |
| Number of replicates | 4 |
| Control water | Dechlorinated tap water amended with 4 mg/L KCl |
| Test solution renewal | Daily |
| Test temperature | 25 ± 1°C |
| Number of organisms/chamber | 15 |
| Feeding | Twice daily, with <i>Artemia</i> nauplii |
| Light intensity | 100 to 600 lux |
| Photoperiod | 16 hours light/8 hours dark |
| Aeration | None unless required to maintain DO >50% saturation |
| Test protocol | USEPA (1996); ASTM (2013) |
| Test endpoints | Survival, hatch, growth |
| Test acceptability criterion for controls | >66% hatch; ≥70% post-hatch survival |

Table 4. Summary of test conditions: *Hyalella azteca* survival, growth and reproduction test.

| | |
|--|--|
| Test organism | <i>Hyalella azteca</i> |
| Test organism age | 7-8 days old |
| Test type | Static-renewal |
| Test duration | 42 days |
| Test vessel | 375 mL glass container with a 5 cm disc of Nitex for substrate |
| Test volume | 200 mL of water |
| Test concentrations | Six concentrations, plus site water and laboratory controls |
| Test replicates | 12 test replicates per treatment; 4 terminated at day 28 |
| Number of organisms | 10 per replicate |
| Control water | Borgman's water (Environment Canada 2011) containing >25 mg/L Cl and supplemented with 0.02 mg/L Br. |
| Test solution renewal | 3 x per week |
| Test temperature | 23 ± 1°C |
| Feeding | 1 mL of YCT daily to each container. Tetramin daily, with amounts in each test container increasing weekly: Week 1, 0.25 mg; Week 2, 0.5 mg; Week 3, 1 mg; Week 4, 1 mg; Week 5, 1.5 mg; Week 6, 2.0 mg. |
| Light intensity | 500 to 1000 lux at water surface |
| Photoperiod | 16 hours light/8 hours dark |
| Aeration | None |
| Test protocol | Modified from US EPA (2000) |
| Test endpoint | Survival, dry weight, reproduction |
| Test acceptability criteria for controls | Mean control survival of ≥80% survival, >6 young/female |
| Reference toxicant | Copper |

3.0 RESULTS

The nominal and mean measured concentration are presented in Table 5. The site control was included in the statistical analysis as an additional treatment level due to the concentration of copper that was present.

Table 5. Measured copper concentration for each test species.

| Nominal Concentration (µg/L Cu) | Mean measured concentration (total, dissolved µg/L Cu) | | | | |
|------------------------------------|--|-----------------|--------------------|---------------------------|---------------------------|
| | <i>B. calyciflorus</i> | <i>D. magna</i> | <i>P. promelas</i> | <i>H. azteca</i> – day 28 | <i>H. azteca</i> – day 42 |
| Site Control | 23.6, 20.0 | 16.6, 13.8 | 18.1, 15.3 | 17.6, 14.7 | 17.5, 14.9 |
| 5 | 28.4, 24.6 | 20.9, 18.0 | 23.0, 20.1 | 22.1, 19.1 | 22.3, 19.8 |
| 10 | 34.0, 30.0 | 25.6, 22.8 | 27.0, 24.5 | 25.9, 23.7 | 26.4, 24.3 |
| 20 | 43.6, 39.0 | 35.6, 31.3 | 37.5, 33.4 | 35.6, 32.4 | 37.1, 33.0 |
| 40 | 63.4, 56.4 | 53.8, 49.0 | 54.7, 50.9 | 53.3, 49.7 | 54.0, 51.6 |
| 80 | 97.6, 90.3 | 94.2, 83.6 | 93.1, 86.9 | 92.7, 84.7 | 92.7, 86.4 |
| 160 | 180, 168 | 167, 149 | 170, 158 | 167, 154 | 169, 160 |

The results of the *B. calyciflorus* test are presented in Table 6. There was an adverse effect observed on the population growth of *B. calyciflorus*, resulting in an IC20 of 161 µg/L total copper.

The results of the *D. magna* test are presented in Table 7. No adverse effects were observed for either survival or reproduction, resulting in endpoints of >167 µg/L total copper for both the LC20 and IC20.

The results of the *P. promelas* test are presented in Tables 8 and 9. No adverse effects were observed on the three survival endpoints in the test (hatch, post hatch survival and overall survival), resulting in an EC20 of >168 µg/L total copper for hatch and >170 µg/L total copper for both post hatch survival and overall survival. The IC20 endpoints for length and biomass were also >170 µg/L total copper. The IC10 reported for biomass is likely an unreliable estimate, as the test was likely not able to statistically detect this level of effect with a reasonable degree of confidence. This is supported by the fact that the NOEC was 169 µg/L and LOEC was >169 µg/L total copper, indicating that there were no statistically significant adverse effects when compared to the laboratory control in any of the concentrations tested.

The results of the *H. azteca* test are presented in Tables 10 and 11. There were no adverse effects observed on survival after 28 and 42 days resulting in LC20 endpoints of >167 and >169 µg/L total copper, respectively. There were adverse effects observed for both biomass and reproduction endpoints. Biomass IC20 endpoints after 28 and 42 days were 106 and 102 µg/L total copper, respectively. The highest test concentration at both time points for biomass was significantly adversely affected when compared to the laboratory control. Reproduction was also adversely affected resulting in an IC20 of <17.5 µg/L total copper; all concentrations, with the exception of 22.3 µg/L total copper, were statistically significantly adversely affected relative to the control.

The low reproduction endpoint observed with *H. azteca* may partially be attributed to the exceptional performance of the laboratory control (average of 17.8 young per female); the site control had an average of 6.8 young per female. Both of these controls met the requirement for control performance of at least 6 offspring per female. It is possible that the difference observed between the two controls reflects random chance, or some influence of differences in water chemistry on the reproductive rate of this species. When the statistical analysis for reproduction was performed in comparison to the site control instead of the laboratory control, the IC20 (and 95% confidence intervals) increased to 33.1 (15.0 – 48.9) µg/L total copper.

Table 6. Results: *B. calyciflorus* toxicity test using copper.

| Copper Concentration (µg/L) | | | Growth rate (r) (Mean ± SD) |

4.0 QA/QC

The health histories of the test organisms used in the exposures were acceptable and met the requirements of the test protocols. The tests met all control acceptability criteria and water quality parameters remained within ranges specified in the protocols throughout the tests. Uncertainty associated with these tests is best described by the standard deviations around the means.

Results of the reference toxicant tests conducted during the testing program are summarized in Table 12. Results for these tests fell within the acceptable range for organism performance of mean and two standard deviations, based on historical results obtained by the laboratory for the *D. magna* and *H. azteca* tests. In the test using *P. promelas*, the reference toxicant results fell outside of the historical range for the test, indicating that the test organisms used for this species may have been more sensitive than usual. The test was reviewed and testing and culturing procedures were considered to have been followed appropriately. The results of the control performance from the test was acceptable. Thus, despite not falling within the two standard deviation historical range, the test with the sample was considered to be a useful measure of sensitivity to copper, particularly since there was no evidence of adverse effects from copper in the test. There were not sufficient historical data with which to prepare a historical reference toxicant range for the *B. calyciflorus* test.

Table 12. Reference toxicant test results.

| Test Species | Endpoint | Historical Mean (2 SD Range) | CV (%) | Test Date |
|------------------------|--|---------------------------------|-----------|--------------|
| <i>P. promelas</i> | Survival (LC50): 3.3 g/L NaCl | 7.3 (5.4-9.8) | 9.6 | May 29, 2017 |
| | Biomass (IC25): 2.3 g/L NaCl | 4.4 (3.1-6.3) | 12 | |
| <i>D. magna</i> | Survival (LC50): 5.4 g/L NaCl | 4.9 (4.2-5.8) | 5.3 | May 31, 2017 |
| <i>B. calyciflorus</i> | Survival (IC50) 1.6 (0.6-2.0) g/L NaCl | NA | NA | May 23, 2107 |
| <i>H. azteca</i> | Survival (LC50): 416 µg/L Cu | 631 (251-1259) | 33 | May 25, 2017 |

SD = Standard Deviation, CV = Coefficient of Variation, LC = Lethal Concentration, IC = Inhibition Concentration, EC = Effect Concentration, NA = Not Available

APPENDIX A – *Brachionus calyciflorus* Toxicity Test Data

Brachionus calyciflorus Summary Sheet

Client: Calgary Nautilus (Minnow Environmental)
Work Order No.: 170494

Start Date/Time: May 23, 2017 @ 14:00
Test Species: Brachionus calyciflorus
Set up by: EMM

Sample Information:

Sample ID: W2:W16 mixture
Sample Date: n/a
Date Received: May 23/17
Sample Volume: W2 - 2 x 2L and W16 - 1 x 2L

Test Organism Information:

Age of young (Day 0): <2 hours

NaCl Reference Toxicant Results:

Reference Toxicant ID: BC04
Stock Solution ID: 17Na02
Date Initiated: May 23/17
48-h IC50 (95% CL): 1.6 (0.6 - 2.0) g/L NaCl

Reference Toxicant Mean \pm 2 SD: n/a
Reference Toxicant CV (%): n/a

1 -
Test Results: The resulting IC25 and IC50 values were >179.5 μ g/L Cu.
The NOEC and LOEC was 97.6 and 179.5 μ g/L Cu, respectively.
1 - endpoints were calculated using laboratory control as the negative control against total copper values.

Brachionus calyciflorus Summary Sheet

Client: Calgary Nautilus (Minnow Environmental)
Work Order No.: 170494

Start Date/Time: May 23, 2017 @ 14:00
Test Species: Brachionus calyciflorus
Set up by: EMM

Sample Information:

Sample ID: W2:W16 mixture
Sample Date: n/a
Date Received: May 23/17
Sample Volume: W2 - 2 x 2L and W16 - 1 x 2L

Test Organism Information:

Age of young (Day 0): <2 hours

NaCl Reference Toxicant Results:

Reference Toxicant ID: BC04
Stock Solution ID: 17Na02
Date Initiated: May 23/17
48-h IC50 (95% CL): 1.6 (0.6 - 2.0) g/L NaCl

Reference Toxicant Mean \pm 2 SD: n/a
Reference Toxicant CV (%): n/a

1 -

Test Results: The resulting IC25 and IC50 values were >168 μ g/L Cu.
The NOEC and LOEC was 90.3 and 168.0 μ g/L Cu, respectively.
1 - endpoints were calculated using laboratory control as the negative control against dissolved copper values.

Reviewed by: JCA

Date reviewed: Sep. 27/17

Culture

 Young jars D1 Jar(s) mortality 7 days prior to test (must be ≤25%) 01.
QA (previous month)

 Days to first brood (≤12 days) 7
 Average number of young produced (≥15 young) 29.8
Sample

 Duration of pre-aeration (rate of 37.5 ± 12.5 mL/min.L-1) -
 Hardness adjustment of sample (must be between 25 - 30 mg CaCO₃/L) 120-250
Lab Control Water

Comments:

20-8 = 34
 20-9 = 20

Day 19 death (5-8 + 40-9) → normal mortality observations, nothing stand-out.

Test Validity Met: Yes/No/NA

Results are Logical**: Yes/No

**no negative numbers, consistent values across replicates

*Same balance must be used for initial and final weights

*For FM/HA/CT must use scale with 0.01 mg accuracy

| Balance Calibration Check: | | Initial | Final |
|-----------------------------|--|---------|---------|
| first pan weighed: | | CTL D | CTL B |
| weight of first pan: | | 1011.77 | 1019.93 |
| re-weigh of first pan after | | | |
| all weights measured : | | 1011.73 | 1019.87 |
| % difference <5%: | | Yes/No | Yes/No |

Calculation: % difference = [(initial weight-reweight)/((initial weight+reweight)/2)]x100

If "no" is circled for any parameter, notify Lab Supervisor/QA Group to determine appropriate action

Test Validity Met: Yes/No/NA

Results are Logical**: Yes/No

**no negative numbers, consistent values across replicates

*Same balance must be used for initial and final weights

*For FM/HA/CT must use scale with 0.01 mg accuracy

Balance Calibration Check:

| Initial | Final |
|--|--|
| first pan weighed: <input type="text"/> | first pan+org weighed: <input type="text"/> |
| weight of first pan: <input type="text"/> | weight of first pan + org: <input type="text"/> |
| re-weigh of first pan after | re-weigh of first pan + org |
| all weights measured: <input type="text"/> | after all weights measured: <input type="text"/> |
| % difference <5%: Yes/No | % difference <5%: Yes/No |

Calculation: % difference = [(initial weight-reweight)/((initial weight+reweight)/2)]x100

If "no" is circled for any parameter, notify Lab Supervisor/QA Group to determine appropriate action

Reference Information

Qualifiers for Individual Samples Listed:

| Sample Number | Client Sample ID | Qualifier | Description |
|---------------|------------------|-----------|---|
| L1931693-7 | 160 UG/L | LPMB | Lab-Preserved for Total Metals. Sample received with pH > 2 and preserved at the lab. Total Metals results may be biased low. |
| L1931693-8 | SITE CONTROL | LPMB | Lab-Preserved for Total Metals. Sample received with pH > 2 and preserved at the lab. Total Metals results may be biased low. |

QC Samples with Qualifiers & Comments:

| QC Type | Description | Parameter | Qualifier | Applies to Sample Number(s) |
|--------------|-------------|-----------------------|-----------|--------------------------------|
| Matrix Spike | | Copper (Cu)-Dissolved | MS-B | L1931693-1, -2, -3, -4, -5, -6 |

Qualifiers for Individual Parameters Listed:

| Qualifier | Description |
|-----------|--|
| MS-B | Matrix Spike recovery could not be accurately calculated due to high analyte background in sample. |

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|--|--------|--|------------------------|
| MET-D-CCMS-VA | Water | Dissolved Metals in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| MET-T-CCMS-VA | Water | Total Metals in Water by CRC ICPMS | EPA 200.2/6020A (mod) |
| Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location |
|----------------------------|---|
| VA | ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA |

Chain of Custody Numbers:

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Reference Information

Qualifiers for Sample Submission Listed:

| Qualifier | Description |
|-----------|---|
| SFPL | DOC, MET-DISS - Sample was Filtered and Preserved at the laboratory |
| EXTEMP10 | 12C (SAME DAY SAMPLING) - Samples Received with temperature >10 Degrees C |

Sample Parameter Qualifier Key:

| Qualifier | Description |
|-----------|--|
| DLM | Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity). |

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|---|--------|--|--------------------------|
| C-DIS-ORG-CL | Water | Dissolved Organic Carbon | APHA 5310 B-Instrumental |
| <p>This method is applicable to the analysis of ground water, wastewater, and surface water samples. The form detected depends upon sample pretreatment: Unfiltered sample = TC, 0.45um filtered = TDC. Samples are injected into a combustion tube containing an oxidation catalyst. The carrier gas containing the combustion product from the combustion tube flows through an inorganic carbon reactor vessel and is then sent through a halogen scrubber into a sample cell set in a non-dispersive infrared gas analyzer (NDIR) where carbon dioxide is detected. For total inorganic carbon and dissolved inorganic carbon, the sample is injected into an IC reactor vessel where only the IC component is decomposed to become carbon dioxide.</p> <p>The peak area generated by the NDIR indicates the TC/TDC or TIC/DIC as applicable. The total organic carbon content of the sample is calculated by subtracting the TIC from the TC. TOC = TC-TIC, DOC = TDC-DIC, Particulate = Total - Dissolved.</p> | | | |
| CL-IC-N-CL | Water | Chloride in Water by IC | EPA 300.1 (mod) |
| <p>Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.</p> | | | |
| F-IC-N-CL | Water | Fluoride in Water by IC | EPA 300.1 (mod) |
| <p>Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.</p> | | | |
| IONBALANCE-CL | Water | Ion Balance Calculation | APHA 1030E |
| MET-D-CCMS-CL | Water | Dissolved Metals in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| <p>Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.</p> <p>Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.</p> | | | |
| MET-DIS-ICP-CL | Water | Dissolved Metals by ICPOES | APHA 3030B/EPA 6010B |
| <p>"This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedure involves filtration (APHA Method 3030B) and analysis by inductively coupled plasma - optical emission spectrophotometry (EPA Method 6010B).</p> | | | |
| MET-T-CCMS-CL | Water | Total Metals in Water by CRC ICPMS | EPA 200.2/6020A (mod) |
| <p>Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.</p> <p>Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.</p> | | | |
| N2N3-CALC-CL | Water | Nitrate+Nitrite | CALCULATION |
| NO2-IC-N-CL | Water | Nitrite in Water by IC | EPA 300.1 (mod) |
| <p>Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.</p> | | | |
| NO3-IC-N-CL | Water | Nitrate in Water by IC | EPA 300.1 (mod) |
| <p>Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.</p> | | | |
| PH/EC/ALK-CL | Water | pH, Conductivity and Total Alkalinity | APHA 4500H,2510,2320 |
| <p>All samples analyzed by this method for pH will have exceeded the 15 minute recommended hold time from time of sampling (field analysis is recommended for pH where highly accurate results are needed) pH measurement is determined from the activity of the hydrogen ions using a hydrogen electrode and a reference electrode. Alkalinity measurement is based on the sample's capacity to neutralize acid Conductivity measurement is based on the sample's capacity to convey an electric current</p> | | | |
| SO4-IC-N-CL | Water | Sulfate in Water by IC | EPA 300.1 (mod) |
| <p>Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.</p> | | | |

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

Reference Information

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|---------------|--------|------------------|--------------------|
|---------------|--------|------------------|--------------------|

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location |
|----------------------------|--|
| CL | ALS ENVIRONMENTAL - CALGARY, ALBERTA, CANADA |

Chain of Custody Numbers:
GLOSSARY OF REPORT TERMS

Surrogates are compounds that are similar in behaviour to target analyte(s), but that do not normally occur in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery. In reports that display the D.L. column, laboratory objectives for surrogates are listed there.

mg/kg - milligrams per kilogram based on dry weight of sample

mg/kg wwt - milligrams per kilogram based on wet weight of sample

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight

mg/L - unit of concentration based on volume, parts per million.

< - Less than.

D.L. - The reporting limit.

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Quality Control Report

Workorder: L1930675

Report Date: 31-MAY-17

Page 5 of 5

Legend:

| | |
|-------|---|
| Limit | ALS Control Limit (Data Quality Objectives) |
| DUP | Duplicate |
| RPD | Relative Percent Difference |
| N/A | Not Available |
| LCS | Laboratory Control Sample |
| SRM | Standard Reference Material |
| MS | Matrix Spike |
| MSD | Matrix Spike Duplicate |
| ADE | Average Desorption Efficiency |
| MB | Method Blank |
| IRM | Internal Reference Material |
| CRM | Certified Reference Material |
| CCV | Continuing Calibration Verification |
| CVS | Calibration Verification Standard |
| LCSD | Laboratory Control Sample Duplicate |

Sample Parameter Qualifier Definitions:

| Qualifier | Description |
|-----------|---|
| J | Duplicate results and limits are expressed in terms of absolute difference. |
| RPD-NA | Relative Percent Difference Not Available due to result(s) being less than detection limit. |

Hold Time Exceedances:

All test results reported with this submission were conducted within ALS recommended hold times.

ALS recommended hold times may vary by province. They are assigned to meet known provincial and/or federal government requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by the US EPA, APHA Standard Methods, or Environment Canada (where available). For more information, please contact ALS.

The ALS Quality Control Report is provided to ALS clients upon request. ALS includes comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against pre-determined data quality objectives to provide confidence in the accuracy of associated test results.

Please note that this report may contain QC results from anonymous Sample Duplicates and Matrix Spikes that do not originate from this Work Order.

Reference Information

Qualifiers for Sample Submission Listed:

| Qualifier | Description |
|-----------|--|
| SFPL | DISSOLVED CU (EXCEPT FOR -5), DOC FOR -4-5 - Sample was Filtered and Preserved at the laboratory |

Sample Parameter Qualifier Key:

| Qualifier | Description |
|-----------|--|
| BL:INT | Balance Reviewed: Interference Or Non-Measured Component |
| DLA | Detection Limit adjusted for required dilution |
| DLHC | Detection Limit Raised: Dilution required due to high concentration of test analyte(s). |
| DLM | Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity). |

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|--|--------|--|--------------------------|
| C-DIS-ORG-CL | Water | Dissolved Organic Carbon | APHA 5310 B-Instrumental |
| This method is applicable to the analysis of ground water, wastewater, and surface water samples. The form detected depends upon sample pretreatment: Unfiltered sample = TC, 0.45um filtered = TDC. Samples are injected into a combustion tube containing an oxidation catalyst. The carrier gas containing the combustion product from the combustion tube flows through an inorganic carbon reactor vessel and is then sent through a halogen scrubber into a sample cell set in a non-dispersive infrared gas analyzer (NDIR) where carbon dioxide is detected. For total inorganic carbon and dissolved inorganic carbon, the sample is injected into an IC reactor vessel where only the IC component is decomposed to become carbon dioxide. | | | |
| The peak area generated by the NDIR indicates the TC/TDC or TIC/DIC as applicable. The total organic carbon content of the sample is calculated by subtracting the TIC from the TC. TOC = TC-TIC, DOC = TDC-DIC, Particulate = Total - Dissolved. | | | |
| CL-IC-N-CL | Water | Chloride in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| F-IC-N-CL | Water | Fluoride in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| IONBALANCE-CL | Water | Ion Balance Calculation | APHA 1030E |
| MET-D-CCMS-CL | Water | Dissolved Metals in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| MET-DIS-ICP-CL | Water | Dissolved Metals by ICPOES | APHA 3030B/EPA 6010B |
| "This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedure involves filtration (APHA Method 3030B) and analysis by inductively coupled plasma - optical emission spectrophotometry (EPA Method 6010B). | | | |
| MET-T-CCMS-CL | Water | Total Metals in Water by CRC ICPMS | EPA 200.2/6020A (mod) |
| Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| N2N3-CALC-CL | Water | Nitrate+Nitrite | CALCULATION |
| NO2-IC-N-CL | Water | Nitrite in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| NO3-IC-N-CL | Water | Nitrate in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| PH/EC/ALK-CL | Water | pH, Conductivity and Total Alkalinity | APHA 4500H,2510,2320 |
| All samples analyzed by this method for pH will have exceeded the 15 minute recommended hold time from time of sampling (field analysis is recommended for pH where highly accurate results are needed) pH measurement is determined from the activity of the hydrogen ions using a hydrogen electrode and a reference electrode. Alkalinity measurement is based on the sample's capacity to neutralize acid Conductivity measurement is based on the sample's capacity to convey an electric current | | | |
| SO4-IC-N-CL | Water | Sulfate in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |

Reference Information

Test Method References:

|---------------|--------|------------------|--------------------|

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location |
|----------------------------|--|
| CL | ALS ENVIRONMENTAL - CALGARY, ALBERTA, CANADA |

Chain of Custody Numbers:

GLOSSARY OF REPORT TERMS

Surrogates are compounds that are similar in behaviour to target analyte(s), but that do not normally occur in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery. In reports that display the D.L. column, laboratory objectives for surrogates are listed there.

mg/kg - milligrams per kilogram based on dry weight of sample

mg/kg wwt - milligrams per kilogram based on wet weight of sample

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight

mg/L - unit of concentration based on volume, parts per million.

< - Less than.

D.L. - The reporting limit.

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

| CCV | Continuing Calibration Verification |
| CVS | Calibration Verification Standard |
| LCSD | Laboratory Control Sample Duplicate |

Sample Parameter Qualifier Definitions:

| Qualifier | Description |
|-----------|---|
| RPD-NA | Relative Percent Difference Not Available due to result(s) being less than detection limit. |

Hold Time Exceedances:

All test results reported with this submission were conducted within ALS recommended hold times.

ALS recommended hold times may vary by province. They are assigned to meet known provincial and/or federal government requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by the US EPA, APHA Standard Methods, or Environment Canada (where available). For more information, please contact ALS.

The ALS Quality Control Report is provided to ALS clients upon request. ALS includes comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against pre-determined data quality objectives to provide confidence in the accuracy of associated test results.

Please note that this report may contain QC results from anonymous Sample Duplicates and Matrix Spikes that do not originate from this Work Order.

Reference Information

Qualifiers for Sample Submission Listed:

| Qualifier | Description |
|-----------|---|
| EXTEMP | 17C (SAME DAY SAMPLING) - Samples Received with temperature >15 Degrees C |
| SFPL | DISSOLVED CU (EXCEPT -5) - Sample was Filtered and Preserved at the laboratory |
| SFPL | DOC FOR -4-5 - Sample was Filtered and Preserved at the laboratory |

Sample Parameter Qualifier Key:

| Qualifier | Description |
|-----------|--|
| BL:INT | Balance Reviewed: Interference Or Non-Measured Component |
| DLHC | Detection Limit Raised: Dilution required due to high concentration of test analyte(s). |
| DLM | Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity). |

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|--|--------|--|--------------------------|
| C-DIS-ORG-CL | Water | Dissolved Organic Carbon | APHA 5310 B-Instrumental |
| <p>This method is applicable to the analysis of ground water, wastewater, and surface water samples. The form detected depends upon sample pretreatment: Unfiltered sample = TC, 0.45um filtered = TDC. Samples are injected into a combustion tube containing an oxidation catalyst. The carrier gas containing the combustion product from the combustion tube flows through an inorganic carbon reactor vessel and is then sent through a halogen scrubber into a sample cell set in a non-dispersive infrared gas analyzer (NDIR) where carbon dioxide is detected. For total inorganic carbon and dissolved inorganic carbon, the sample is injected into an IC reactor vessel where only the IC component is decomposed to become carbon dioxide.</p> <p>The peak area generated by the NDIR indicates the TC/TDC or TIC/DIC as applicable. The total organic carbon content of the sample is calculated by subtracting the TIC from the TC. TOC = TC-TIC, DOC = TDC-DIC, Particulate = Total - Dissolved.</p> | | | |

Reference Information

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|---------------|--------|------------------|--------------------|
|---------------|--------|------------------|--------------------|

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location |
|----------------------------|--|
| CL | ALS ENVIRONMENTAL - CALGARY, ALBERTA, CANADA |

Chain of Custody Numbers:

GLOSSARY OF REPORT TERMS

Surrogates are compounds that are similar in behaviour to target analyte(s), but that do not normally occur in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery. In reports that display the D.L. column, laboratory objectives for surrogates are listed there.

mg/kg - milligrams per kilogram based on dry weight of sample

mg/kg wwt - milligrams per kilogram based on wet weight of sample

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight

mg/L - unit of concentration based on volume, parts per million.

< - Less than.

D.L. - The reporting limit.

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

| CVS | Calibration Verification Standard |
| LCSD | Laboratory Control Sample Duplicate |

Sample Parameter Qualifier Definitions:

| Qualifier | Description |
|-----------|---|
| J | Duplicate results and limits are expressed in terms of absolute difference. |
| RPD-NA | Relative Percent Difference Not Available due to result(s) being less than detection limit. |

Hold Time Exceedances:

All test results reported with this submission were conducted within ALS recommended hold times.

ALS recommended hold times may vary by province. They are assigned to meet known provincial and/or federal government requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by the US EPA, APHA Standard Methods, or Environment Canada (where available). For more information, please contact ALS.

The ALS Quality Control Report is provided to ALS clients upon request. ALS includes comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against pre-determined data quality objectives to provide confidence in the accuracy of associated test results.

Please note that this report may contain QC results from anonymous Sample Duplicates and Matrix Spikes that do not originate from this Work Order.

Reference Information

Qualifiers for Sample Submission Listed:

| Qualifier | Description |
|-----------|--|
| SFPL | DOC (-3, -4) Diss-Metals (except -4) - Sample was Filtered and Preserved at the laboratory |

Sample Parameter Qualifier Key:

| Qualifier | Description |
|-----------|--|
| BL:INT | Balance Reviewed: Interference Or Non-Measured Component |
| DLM | Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity). |
| RRV | Reported Result Verified By Repeat Analysis |

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|---|--------|--|--------------------------|
| C-DIS-ORG-CL | Water | Dissolved Organic Carbon | APHA 5310 B-Instrumental |
| <p>This method is applicable to the analysis of ground water, wastewater, and surface water samples. The form detected depends upon sample pretreatment: Unfiltered sample = TC, 0.45um filtered = TDC. Samples are injected into a combustion tube containing an oxidation catalyst. The carrier gas containing the combustion product from the combustion tube flows through an inorganic carbon reactor vessel and is then sent through a halogen scrubber into a sample cell set in a non-dispersive infrared gas analyzer (NDIR) where carbon dioxide is detected. For total inorganic carbon and dissolved inorganic carbon, the sample is injected into an IC reactor vessel where only the IC component is decomposed to become carbon dioxide.</p> <p>The peak area generated by the NDIR indicates the TC/TDC or TIC/DIC as applicable. The total organic carbon content of the sample is calculated by subtracting the TIC from the TC. TOC = TC-TIC, DOC = TDC-DIC, Particulate = Total - Dissolved.</p> | | | |

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|---------------|--------|------------------|--------------------|
|---------------|--------|------------------|--------------------|

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location |
|----------------------------|--|
| CL | ALS ENVIRONMENTAL - CALGARY, ALBERTA, CANADA |

Chain of Custody Numbers:

GLOSSARY OF REPORT TERMS

Surrogates are compounds that are similar in behaviour to target analyte(s), but that do not normally occur in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery. In reports that display the D.L. column, laboratory objectives for surrogates are listed there.

mg/kg - milligrams per kilogram based on dry weight of sample

mg/kg wwt - milligrams per kilogram based on wet weight of sample

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight

mg/L - unit of concentration based on volume, parts per million.

< - Less than.

D.L. - The reporting limit.

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

| LCSD | Laboratory Control Sample Duplicate |

Sample Parameter Qualifier Definitions:

| Qualifier | Description |
|-----------|---|
| RPD-NA | Relative Percent Difference Not Available due to result(s) being less than detection limit. |

Hold Time Exceedances:

All test results reported with this submission were conducted within ALS recommended hold times.

ALS recommended hold times may vary by province. They are assigned to meet known provincial and/or federal government requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by the US EPA, APHA Standard Methods, or Environment Canada (where available). For more information, please contact ALS.

The ALS Quality Control Report is provided to ALS clients upon request. ALS includes comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against pre-determined data quality objectives to provide confidence in the accuracy of associated test results.

Please note that this report may contain QC results from anonymous Sample Duplicates and Matrix Spikes that do not originate from this Work Order.

Reference Information

Qualifiers for Sample Submission Listed:

| Qualifier | Description |
|-----------|--|
| SFPL | DOC (-3, -4) Diss-CU (all except -4) - Sample was Filtered and Preserved at the laboratory |

Sample Parameter Qualifier Key:

| Qualifier | Description |
|-----------|--|
| DLM | Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity). |

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|---|--------|--|--------------------------|
| C-DIS-ORG-CL | Water | Dissolved Organic Carbon | APHA 5310 B-Instrumental |
| <p>This method is applicable to the analysis of ground water, wastewater, and surface water samples. The form detected depends upon sample pretreatment: Unfiltered sample = TC, 0.45um filtered = TDC. Samples are injected into a combustion tube containing an oxidation catalyst. The carrier gas containing the combustion product from the combustion tube flows through an inorganic carbon reactor vessel and is then sent through a halogen scrubber into a sample cell set in a non-dispersive infrared gas analyzer (NDIR) where carbon dioxide is detected. For total inorganic carbon and dissolved inorganic carbon, the sample is injected into an IC reactor vessel where only the IC component is decomposed to become carbon dioxide.</p> <p>The peak area generated by the NDIR indicates the TC/TDC or TIC/DIC as applicable. The total organic carbon content of the sample is calculated by subtracting the TIC from the TC. TOC = TC-TIC, DOC = TDC-DIC, Particulate = Total - Dissolved.</p> | | | |
| CL-IC-N-CL | Water | Chloride in Water by IC | EPA 300.1 (mod) |
| <p>Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.</p> | | | |

| <p>Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.</p> | | | |
| IONBALANCE-CL | Water | Ion Balance Calculation | APHA 1030E |
| MET-D-CCMS-CL | Water | Dissolved Metals in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| <p>Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.</p> <p>Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.</p> | | | |
| MET-DIS-ICP-CL | Water | Dissolved Metals by ICPOES | APHA 3030B/EPA 6010B |
| <p>"This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedure involves filtration (APHA Method 3030B) and analysis by inductively coupled plasma - optical emission spectrophotometry (EPA Method 6010B).</p> | | | |
| MET-T-CCMS-CL | Water | Total Metals in Water by CRC ICPMS | EPA 200.2/6020A (mod) |
| <p>Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.</p> <p>Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.</p> | | | |
| N2N3-CALC-CL | Water | Nitrate+Nitrite | CALCULATION |
| NO2-IC-N-CL | Water | Nitrite in Water by IC | EPA 300.1 (mod) |
| <p>Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.</p> | | | |
| NO3-IC-N-CL | Water | Nitrate in Water by IC | EPA 300.1 (mod) |
| <p>Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.</p> | | | |
| PH/EC/ALK-CL | Water | pH, Conductivity and Total Alkalinity | APHA 4500H,2510,2320 |
| <p>All samples analyzed by this method for pH will have exceeded the 15 minute recommended hold time from time of sampling (field analysis is recommended for pH where highly accurate results are needed) pH measurement is determined from the activity of the hydrogen ions using a hydrogen electrode and a reference electrode. Alkalinity measurement is based on the sample's capacity to neutralize acid Conductivity measurement is based on the sample's capacity to convey an electric current</p> | | | |
| SO4-IC-N-CL | Water | Sulfate in Water by IC | EPA 300.1 (mod) |
| <p>Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.</p> | | | |

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

GLOSSARY OF REPORT TERMS

Surrogates are compounds that are similar in behaviour to target analyte(s), but that do not normally occur in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery. In reports that display the D.L. column, laboratory objectives for surrogates are listed there.

mg/kg - milligrams per kilogram based on dry weight of sample

mg/kg wwt - milligrams per kilogram based on wet weight of sample

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight

mg/L - unit of concentration based on volume, parts per million.

< - Less than.

D.L. - The reporting limit.

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Hold Time Exceedances:

All test results reported with this submission were conducted within ALS recommended hold times.

ALS recommended hold times may vary by province. They are assigned to meet known provincial and/or federal government requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by the US EPA, APHA Standard Methods, or Environment Canada (where available). For more information, please contact ALS.

The ALS Quality Control Report is provided to ALS clients upon request. ALS includes comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against pre-determined data quality objectives to provide confidence in the accuracy of associated test results.

Please note that this report may contain QC results from anonymous Sample Duplicates and Matrix Spikes that do not originate from this Work Order.

Drinking Water (DW) Samples (client use)

Are samples taken from a Regulated DW System?
 Yes No

Are samples for human drinking water use?
 Yes No

SHIPMENT RELEASE (client use)
 Released by: [Signature] Date: 20160621 Time: 11:00

INITIAL SHIPMENT RECEPTION (lab use only)
 Received by: KC Date: 21-JUN-17 Time: 12:32pm

Special Instructions / Specify Criteria to add on report (client use)
 ****For total metals, samples have been preserved. For dissolved parameters (DOC, dissolved metals), samples have not been filtered or preserved; please sub-sample and filter/preserve at the lab (SFPL)****

SAMPLE CONDITION AS RECEIVED (lab use only)
 Frozen SIF Observations Yes No
 Ice packs Yes No Custody seal intact Yes No
 Cooling initiated

INITIAL COOLER TEMPERATURES °C: 7.2
 FINAL COOLER TEMPERATURES °C: _____

FINAL SHIPMENT RECEPTION (lab use only)
 Received by: _____ Date: _____ Time: _____

Failure to complete all portions of this form may delay analysis. Please fill in this form LEGIBLY. By the use of this form the user acknowledges and agrees with the Terms and Conditions as specified on the back page of the white - report copy.

1. If any water samples are taken from a Regulated Drinking Water (DW) System, please submit using an Authorized DW COC form.

Reference Information

Qualifiers for Sample Submission Listed:

| Qualifier | Description |
|-----------|---|
| EXTEMP10 | 12.3C (SAME DAY SAMPLING) - Samples Received with temperature >10 Degrees C |
| SFPL | DOC,MET-D - Sample was Filtered and Preserved at the laboratory |

Sample Parameter Qualifier Key:

| Qualifier | Description |
|-----------|--|
| DLHC | Detection Limit Raised: Dilution required due to high concentration of test analyte(s). |
| DLM | Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity). |

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|---|--------|--|--------------------------|
| C-DIS-ORG-CL | Water | Dissolved Organic Carbon | APHA 5310 B-Instrumental |
| <p>This method is applicable to the analysis of ground water, wastewater, and surface water samples. The form detected depends upon sample pretreatment: Unfiltered sample = TC, 0.45um filtered = TDC. Samples are injected into a combustion tube containing an oxidation catalyst. The carrier gas containing the combustion product from the combustion tube flows through an inorganic carbon reactor vessel and is then sent through a halogen scrubber into a sample cell set in a non-dispersive infrared gas analyzer (NDIR) where carbon dioxide is detected. For total inorganic carbon and dissolved inorganic carbon, the sample is injected into an IC reactor vessel where only the IC component is decomposed to become carbon dioxide.</p> <p>The peak area generated by the NDIR indicates the TC/TDC or TIC/DIC as applicable. The total organic carbon content of the sample is calculated by subtracting the TIC from the TC. TOC = TC-TIC, DOC = TDC-DIC, Particulate = Total - Dissolved.</p> | | | |
| CL-IC-N-CL | Water | Chloride in Water by IC | EPA 300.1 (mod) |
| <p>Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.</p> | | | |
| F-IC-N-CL | Water | Fluoride in Water by IC | EPA 300.1 (mod) |
| <p>Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.</p> | | | |
| IONBALANCE-CL | Water | Ion Balance Calculation | APHA 1030E |
| MET-D-CCMS-CL | Water | Dissolved Metals in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| <p>Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.</p> <p>Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.</p> | | | |
| MET-DIS-ICP-CL | Water | Dissolved Metals by ICPOES | APHA 3030B/EPA 6010B |
| <p>"This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedure involves filtration (APHA Method 3030B) and analysis by inductively coupled plasma - optical emission spectrophotometry (EPA Method 6010B).</p> | | | |
| MET-T-CCMS-CL | Water | Total Metals in Water by CRC ICPMS | EPA 200.2/6020A (mod) |
| <p>Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.</p> <p>Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.</p> | | | |
| N2N3-CALC-CL | Water | Nitrate+Nitrite | CALCULATION |
| NO2-IC-N-CL | Water | Nitrite in Water by IC | EPA 300.1 (mod) |
| <p>Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.</p> | | | |
| NO3-IC-N-CL | Water | Nitrate in Water by IC | EPA 300.1 (mod) |
| <p>Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.</p> | | | |
| PH/EC/ALK-CL | Water | pH, Conductivity and Total Alkalinity | APHA 4500H,2510,2320 |
| <p>All samples analyzed by this method for pH will have exceeded the 15 minute recommended hold time from time of sampling (field analysis is recommended for pH where highly accurate results are needed) pH measurement is determined from the activity of the hydrogen ions using a hydrogen electrode and a reference electrode. Alkalinity measurement is based on the sample's capacity to neutralize acid Conductivity measurement is based on the sample's capacity to convey an electric current</p> | | | |
| SO4-IC-N-CL | Water | Sulfate in Water by IC | EPA 300.1 (mod) |
| <p>Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.</p> | | | |

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

|---------------|--------|------------------|--------------------|

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location |
|----------------------------|--|
| CL | ALS ENVIRONMENTAL - CALGARY, ALBERTA, CANADA |

Chain of Custody Numbers:

GLOSSARY OF REPORT TERMS

Surrogates are compounds that are similar in behaviour to target analyte(s), but that do not normally occur in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery. In reports that display the D.L. column, laboratory objectives for surrogates are listed there.

mg/kg - milligrams per kilogram based on dry weight of sample

mg/kg wwt - milligrams per kilogram based on wet weight of sample

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight

mg/L - unit of concentration based on volume, parts per million.

< - Less than.

D.L. - The reporting limit.

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Hold Time Exceedances:

All test results reported with this submission were conducted within ALS recommended hold times.

ALS recommended hold times may vary by province. They are assigned to meet known provincial and/or federal government requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by the US EPA, APHA Standard Methods, or Environment Canada (where available). For more information, please contact ALS.

The ALS Quality Control Report is provided to ALS clients upon request. ALS includes comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against pre-determined data quality objectives to provide confidence in the accuracy of associated test results.

Please note that this report may contain QC results from anonymous Sample Duplicates and Matrix Spikes that do not originate from this Work Order.

END OF REPORT

APPENDIX C
RE-ANALYSIS OF DATA REPORTED FOR
REPRODUCTION IN THE 42-DAY TOXICITY
TEST OF *HYALELLA AZTECA*

APPENDIX C – STATISTICAL RE-ANALYSIS OF THE 42-DAY *HYALELLA AZTECA* REPRODUCTION DATA (AS REPORTED IN APPENDIX B – NAUTILUS 2017)

C1 Background

Verification of the Minto Mine's Water Quality Objective (WQO) for copper in Minto Creek was undertaken on water collected from Minto Creek and the Minto Mine Water Storage Pond (WSP) on May 5th 2017. These waters were mixed in a proportion equivalent to those expected at the Mine's maximum permissible rate of discharge (one part WSP water to three parts Minto Creek water), spiked with copper at nominal concentrations of 5, 10, 20, 40, 80, and 160 µg/L, and tested for toxicity with four test organisms (Appendix B – Nautilus 2017). One of the test endpoints – reproduction of *Hyalella azteca* in a 42-day test – yielded Inhibitory Concentrations (10th, 20th, and 50th percentiles) that were all reported as a "less than" (" $<$ ") values (<14.9 µg/L dissolved copper and <17.5 µg/L total copper; Appendix B – Nautilus 2017).

Inhibitory concentrations associated with the *H. azteca* 42-d reproduction endpoint were generated by Nautilus using the Comprehensive Environmental Toxicity Information System (CETIS) software. Inhibitory concentrations were estimated using a three parameter log-logistic regression model of reproduction (number of young per test organism; $n=8$) on copper concentration (page 154 of Appendix B). The residuals plots (page 155 of Appendix B) show strong heterogeneity of variance in the residuals versus concentration (confirmed by a Levene's test on the residuals of the model using treatment group as a factor; $p < 0.001$), a violation of the assumption of homogeneity of variance required for defensible regression. A data transformation can be used to meet the assumptions of homogeneity of variance. In addition, the laboratory control data set had two unusually large values (30 and 43 young) which have a strong leveraging influence on the laboratory mean value used in the IC_{20} estimate. In comparison, previous testing under clear water conditions yielded a maximum reproductive output of 8 young per female (Minnow 2016) and recent published studies have indicated reproductive output between 0 young per female and 28.4 young per female (Soucek et al. 2016; Ivey et al. 2016).

C2 Approach

To address violation of the assumption of homogeneity of variance, Minnow conducted a regression analysis for the *H. azteca* 42-d toxicity test reproduction endpoint (i.e., number of young per female) versus concentrations of dissolved and total copper. The regressions were conducted by adding a value of 1 to the response variable and then \log_{10} -transforming the

variable to homogenize the variances (confirmed by a Levene's test on the residuals of the model using treatment group as a factor). The following regression models were fit following guidance from Environment Canada (2005):

$$\text{Linear: } Y = \beta_0 + \beta_1 x + \epsilon$$

$$\text{Exponential: } Y = \beta_0 \exp(\beta_1 x) + \epsilon$$

$$\text{Gompertz: } Y = \beta_0 \exp(-\exp(\beta_1 - \beta_2 x)) + \epsilon$$

$$\text{Logistic: } Y = \beta_0 / (1 + \exp(\frac{x - \beta_1}{\beta_2})) + \epsilon$$

Outliers were assessed by comparing Standardized residuals to a cut-off of 3.5 (values based on sample size following formula in Dohoo et al. [2009] for a significance level of 0.05). The model of best fit was determined using Akaike's Information Criteria (AIC). A comparison of AIC values is used to determine which regression model is more likely to be correct (Motulsky and Christopoulos 2004) and is used to compare linear and non-linear models generated with the same response variable. A second order AIC (AIC_C) was used and was calculated as:

$$AIC_C = n \cdot \ln(\widehat{\sigma}^2) + 2K + 2K(K+1)/(n-K-1)$$

where n is the sample size, $\ln()$ is the natural logarithm, $\widehat{\sigma}^2$ is the residual sum of squares from the regression model divided by the sample size, and K is the number of parameters (including the constant and error term) in the model.

The AIC_C is recommended for small sample sizes ($n/K < 40$) and as n gets larger, the last term in the AIC_C formula approaches zero and the AIC_C approaches the general AIC formula (Burnham and Anderson 2002). The AIC_C is used to compare models that were generated with the same response variable data. The model with the smallest AIC_C is more likely to be correct (i.e., it is more likely that the data were generated by the model with the smallest AIC_C). The magnitude of the AIC_C cannot be interpreted and comparisons among AIC_C values can only be made when the values of the response variables are identical. Comparison of AIC_C values is therefore not appropriate for comparing models with different sample sizes (e.g., AIC_C values cannot be compared between models with and without outliers removed).

C3 Results

Inhibitory Concentration (IC) estimates were generated for a 20% decrease in the response variable (no. of young per female) relative to the laboratory control mean and the laboratory control median (Table C1) based on the regression models (Figures C1 and C2). The IC_{20} estimates relative to the laboratory control median remove the influence of the two unusually

large values for the laboratory control group on the estimate of the IC₂₀. The best fit regression model for reproduction and dissolved copper was a linear regression model (Table C1; Figure C1), and the best-fit regression model for reproduction and total copper was also a linear regression model (Table C1; Figure C2). Based on these models, IC₂₀ estimates of 15.9 µg/L dissolved copper and 17.8 µg/L total copper were obtained relative to the laboratory control mean (which was leveraged by two extreme values), and IC₂₀ estimates of 27.6 µg/L dissolved copper and 30.1 µg/L total copper were obtained relative to the laboratory control median. It is noteworthy that there is evidence that the regression models reported in Table C1 do not fit the data based on the lack of fit test (Table C1). This is because the test results (mean reproduction) do not monotonically decrease at each increasing copper concentration (Table C2) as would be expected under an ideal dose-response curve. This results in the estimated means values of all regression models not fitting the observed mean values and suggests that factors other than copper may have influenced the observed responses.

Model with smallest AIC_c (best fit).

^a Levene's test for homogeneity of variances performed on the model residuals with copper treatment group as the factor. Values > 0.05 indicate within-treatment residual variances are not significantly different.

^b P-value < α (0.05) implies that the model does not fit the data (the mean values at each copper treatment are not well estimated by the regression model).

^c Outliers identified as observations with Standardized residuals greater than 3.5 (based on α = 0.05; Dohoo et al. 2009).

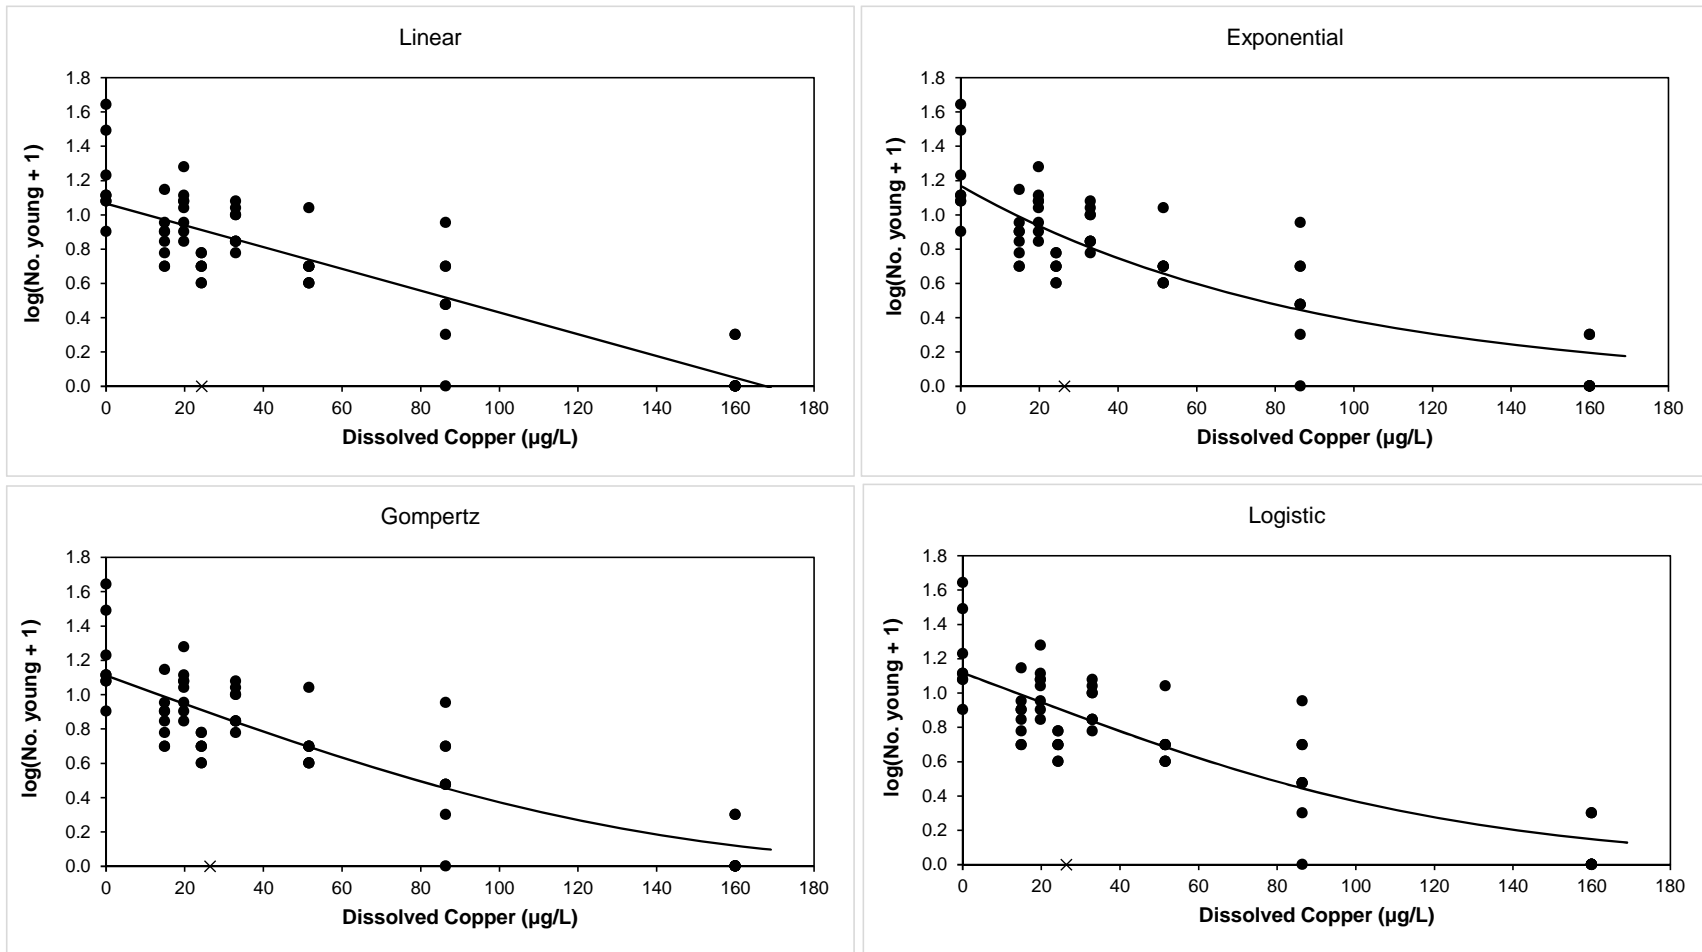

Figure C.1: Scatterplots and Regression Models for *Hyalella azteca* 42-d Reproduction versus Concentration of Dissolved Copper, Minto Turbid Flow, May 5th 2017

Notes: Outliers removed from analysis denoted by an x.

Solid border indicates model with the best fit (lowest AIC_c value as reported in Table C.1).

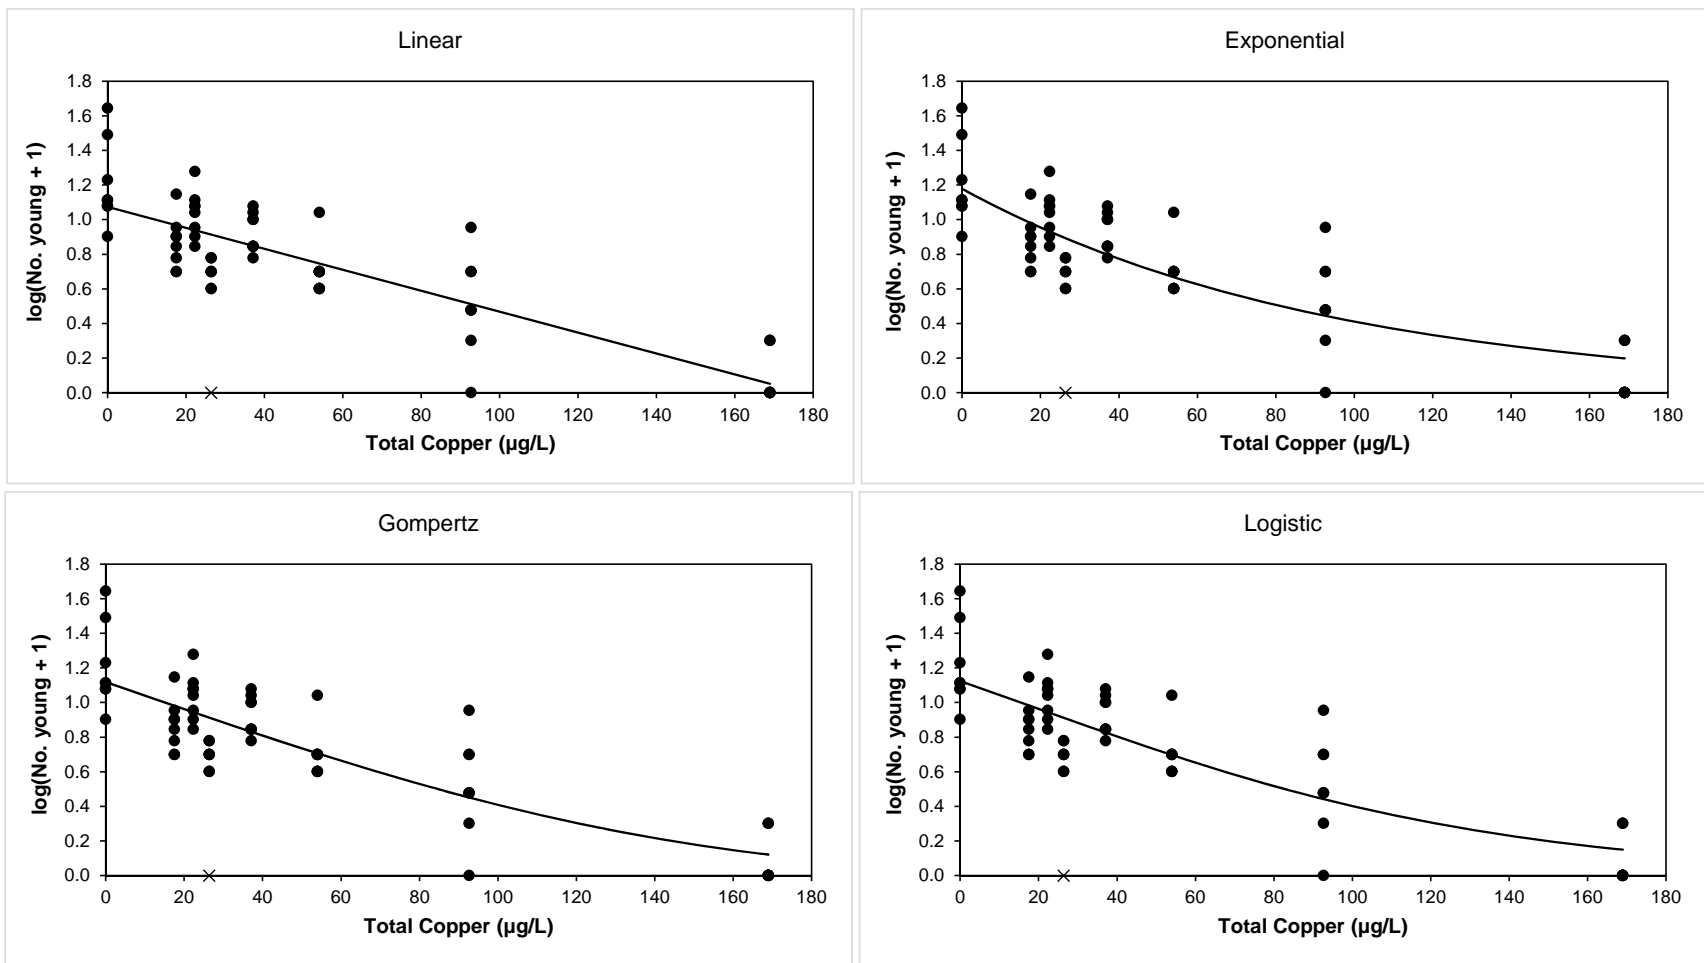

Figure C.2: Scatterplots and Regression Models for *Hyalella azteca* 42-d Reproduction versus Concentration of Total Copper, Minto Turbid Flow, May 5th 2017

Notes: Outliers removed from analysis denoted by an x.

Solid border indicates model with the best fit (lowest AIC_c value as reported in Table C.1).

Table C.2: Mean *Hyalella azteca* 42-d Reproduction by Treatment Group of Concentration Copper, Minto Turbid Flow, May 5th 2017

| Treatment Group | Total Copper (µg/L) | Dissolved Copper (µg/L) | Mean Reproduction | Mean Reproduction (outlier removed) |
|-----------------|---------------------|-------------------------|-------------------|-------------------------------------|
| Lab Control | 0 | 0 | 17.8 | 17.8 |
| Site Control | 17.5 | 14.9 | 6.8 | 6.8 |
| 5 | 22.3 | 19.8 | 10.4 | 10.4 |
| 10 | 26.4 | 24.3 | 3.5 | 4.0 |
| 20 | 37.1 | 33 | 7.8 | 7.8 |

1 Geochemical Monitoring Program Objectives

This report is submitted to meet requirements under Minto Explorations Ltd., (a subsidiary of Capstone Mining Corporation), Minto Mine (Minto) Type “A” Water Licence QZ14-031-1 (WUL) and Quartz Mining Licence QML-0001.

The WUL specifically addresses the requirement in clause 95 which states *“The Licensee shall implement the updated Geochemical Monitoring Program, including the Waste Rock Verification Program, and the results from this program are to be included in the Annual Report.”*

The QML addresses the requirement in Schedule D – Annual Reporting Requirements, under the Environmental Monitoring section, subsection a) which states *“a summary of the programs undertaken for environmental monitoring and surveillance as outlined in the Environmental Monitoring, Surveillance and Reporting Plan”*.

Details regarding the Geochemical Monitoring Program can be found in Minto’s Environmental Monitoring, Surveillance and Reporting Plan (EMSRP) that was approved by the Yukon Water Board and Yukon Government, Energy Mines and Resources Branch on October 4th, 2016 and December 13th, 2016 respectively. In general, the Geochemical Monitoring Program is comprised of the following components:

- The Acid Base Accounting (ABA) Program, the primary focus of this document;
- The Waste Rock Management Verification Program; and
- Low Grade and Oxide Ore Metals Leaching Characterization Program (currently not implemented).

The objective of the ABA Program is to determine the Neutralization Potential Ratio, otherwise referred to as the NPR (Neutralizing Potential divided by Acid Potential [NP/AP]) for overburden and waste rock. An NPR value of 3 or greater generally indicates non-acid generating material. During 2017, 265 waste rock and overburden samples were collected and analyzed from the Area 2 Stage 3 Pit, and another 19 samples of waste rock was sampled from the Minto East and Area 2 underground development.

A separate, parallel ABA program was administered to determine the NPR of the tailings solids. During 2017, 15 Tailing samples were collected and analyzed. A sample was analyzed for each month except January 2017. April 2017 had one composition and one supplementary tailing sample collected on April 10th and May 2017 had 2 separate tailings sample. June composition was not a mixture but rather a weekly tailings sample. The third and fourth quarter months were sampled as per scheduled.

The objective of the Waste Rock Management Verification Program is to verify that the on-site waste rock segregation system is performing as expected. The results of the Waste Rock Management Verification Program are available in a separate report and will therefore not be discussed further in this document.

There are currently no details or results for the Low Grade and Oxide Ore Metals Leaching Characterization Program. The leach pad structures were built in August 2017, and ore was added in November 2017 and January 2018. Results from this program are expected in 2018 and will not be discussed further in this document.

2 ABA Program - Waste Rock and Overburden

2.1 Internal Frequency of Sampling – On-site Analysis

On-site total carbon (C(T)) and total sulphur (S(T)) analysis are carried out on drill cuttings from every blast hole. Samples are collected for grade control purposes, and a portion of each sample is sent for S(T) and total carbon C(T) analyses at the on-site laboratory.

2.2 External Frequency of Sampling

External laboratory analysis were completed for composites samples from open pit mining. A sample of drill cuttings was collected from waste blasts with a frequency of approximately one sample for every seven holes drilled. Composite samples from each waste class for each blast are formed from approximately 4-5 individual samples.

External analysis were also carried out for underground ABA samples. The sampling procedure assembles a composite sample every 3300 tonnes (equivalent to approximately 50 m of development) using a grab sample or wall chipping technique.

2.3 Sample Preparation

All composite samples were reduced to 1-2 kg in mass using a riffle splitter. The resulting split sample was labeled according to the ABA Program sample naming standards and shipped to an accredited laboratory. The labeling methodology was consistent with the Mine Environmental ABA Database throughout the reporting period.

2.4 Test Work and Evaluation

Internal samples are analyzed for S(T) and C(T) using an Eltra CS-800 inducition furnace with infrared detectors. The resultant S(T) and C(T) data are converted to equivalent acid and neutralization potential and ultimately, NP:AP ratios are calculated. The calculated NP:AP ratios are used for characterization and segregation of waste rock on-site. This data is used for internal classification and waste rock segregation only, therefore, the results of that program will not be reported in this report.

In 2017, ALS Minerals conducted ABA analysis using the MEND (1991) Modified NP method as detailed in the EMSRP for all external samples. Reported results were entered into the Mine Environmental ABA Database. Waste rock and overburden composite samples were also analyzed for total metals for the entire duration of the reporting period.

For the reporting period, the results obtained from ALS were compared against past results found in the Mine Environmental ABA Database and the results are presented in Section 2.5. Sulphide sulphur ($S(S^{-2})$) results from ALS Minerals were calculated using the difference between total sulphur and sulphate sulphur (HCl Leach). In the event that the $S(S^{-2})$ value was zero or negative, the detection limit of <0.01% was used. The acid potential (AP) results from ALS Mineral were calculated using the calculated $S(S^{-2})$ value.

2.5 Discussion

Blasts are numbered by bench (denoted by the toe elevation) and by the sequential blast number for that bench (e.g. 784-01; 784 being the toe elevation of the bench and 01 being the first blast of the bench). Images depicting the location of all surface samples collecting during the reporting period are provided in Appendix A.

The primary lithology of the deposit is granodiorite. The granodiorite is divided into sub-units and classified as equigranular granodiorite (eG), porphyroblastic granodiorite (pG), and foliated granodiorite (fG). Locally, very highly-weathered granodiorite near the surface is described as residuum, and surface materials comprised of organics and soil is termed overburden. Other minor lithological units are described as pegmatite (Peg), Andesite (And) and Aplite (Ap).

2.6 Results

The 304 samples collected in the reporting period were analyzed by ALS Minerals and results were reported according to the Modified NP method (MEND 1991). In the reporting period, the NPR values ranged from 0.67 to 208.0 with a mean NP/mean AP of 41.09 and a median of 28.80. A summary of the results for ABA analysis are attached as Appendix B. Additionally, the ALS raw lab result files are provided in Appendix C.

2.6.1 NPR

The 2017 NPR results are compared to the results from 2014-2016 in Table 1, below.

Table 1. NPR Results Summary for 2014 to 2017.

| NPR Values | | | | |
|---|---------------|---------------|---------------------|--------------|
| Period Ending | Minimum (NPR) | Maximum (NPR) | (Mean NP)/(Mean AP) | Median (NPR) |
| 2014 (January to December, 2014) | 0.60 | 167.20 | 5.31 | 23.80 |
| 2015 (January to December, 2015) | -6.10 | 102.10 | 5.08 | 18.70 |
| 2016 (January to December, 2016) | 0.80 | 134.40 | 14.49 | 35.20 |
| 2017 (January to December, 2017) | 0.67 | 208.0 | 15.26 | 28.80 |

During the reporting period, 33 samples returned NPR values below the threshold of 3.0. Of the 33 samples with a NPR value less than 3:

- 17 were found to have an increased sulphide sulphur content (and therefore AP) consequently decreasing the NPR;

And of the remaining samples:

- 5 samples represented material classified as NAG (or waste);
- 7 samples represented material that was placed in the SAT dump;
- 4 samples represented material that was placed in the overburden;

All waste rock and overburden was dispatched based on Minto's *Waste Rock and Overburden Management Plan*.

2.6.2 Paste pH

The paste pH results for 2017 were between 7.50 and 9.20 with a mean value of 8.50 and a median value of 8.50. The paste pH results for 2017 are compared to 2014-2016 and displayed in Table 2, below.

Table 2. Paste pH Results Summary for 2014 to 2017.

| Paste pH from SGS (2014-2016) and from ALS (2016-2017) | | | | |
|---|---------------------|---------------------|------------------|--------------------|
| Period Ending | Minimum (pH) | Maximum (pH) | Mean (pH) | Median (pH) |
| 2014 (January to December, 2014) | 6.44 | 9.43 | 8.56 | 8.66 |
| 2015 (January to December, 2015) | 5.23 | 9.47 | 8.70 | 8.78 |
| 2016 (January to December, 2016) | 7.61 | 9.39 | 8.75 | 8.77 |
| 2017 (January to December, 2017) | 7.50 | 9.20 | 8.50 | 8.50 |

The results from 2017 are comparable to previous years results.

2.6.3 Sulphide Sulphur

The sulphide sulphur content $S(S^{2-})$ results for 2017 ranged from <0.01 to 1.38%, with a mean value of 0.082% and a median value of 0.03% as summarized and compared with 2014-2016 values in Table 3.

Table 3. Sulphide Sulphur Results Summary for 2014 to 2017

| Sulphide-Sulphur % from SGS (2014-2016) and from ALS (2016-2017) | | | | |
|---|---|---|--------------------------------------|--|
| Period Ending | Minimum ($S(S^{2-})$) | Maximum ($S(S^{2-})$) | Mean ($S(S^{2-})$) | Median ($S(S^{2-})$) |
| 2014 (January to December, 2014) | 0.01 | 3.26 | 0.12 | 0.02 |
| 2015 (January to December, 2015) | <0.01 | 1.09 | 0.09 | 0.02 |
| 2016 (January to December, 2016) | <0.01 | 0.75 | 0.05 | 0.02 |
| 2017 (January to December, 2017) | <0.01 | 1.38 | 0.082 | 0.03 |

A total of 21 samples exceeded the sulphide sulphur threshold for construction rock of 0.3% during 2017. Furthermore, 17 samples also had a NPR of less than 3 and therefore represented SAT material. The 4 remaining samples had an NPR greater than 3 and exceeded the sulphide sulphur threshold (2 MEUG and 2 A2S3).

Figure 1, below, is a plot of sulphide sulphur versus (vs) NPR for all samples analyzed during 2017. Figure 1 illustrates that 21 samples had sulphide sulphur content greater than 0.3% and 33 samples had a NPR threshold of less than 3.

Figure 1. Minto Waste Rock and Overburden Sulphide Sulfur vs NPR, 2017

3 Tailings

3.1 Frequency of Sampling and Sample Preparation

Minto collects a weekly sample of final tailings. The weekly samples have been filtered and dried in the onsite lab and then combined into a monthly sample which is then riffled down to produce a 1-2 kg composite. Samples are labelled according to the labeling protocol established in the Mine Environmental ABA Database.

3.2 Test work and Evaluation

Mirroring the waste rock and overburden analysis, ALS Minerals conducted ABA analysis using the MEND (1991) Modified NP method as detailed in the EMSRP. Reported results were entered into the Mine Environmental ABA Database. Monthly tailings composite samples were also analyzed for total metals for the 11 months of available samples.

3.3 Results

The results from the ALS Minerals laboratory analyses indicate that 2017 tailings samples were within the threshold of NPR greater than 4 and contain lower than 0.3% sulphide sulphur content as presented in Figure 2, below. The tailings results are summarized in Appendix D and the raw lab results are presented in Appendix C.

Figure 2. Tailings Sulphide Sulphur vs NPR, 2017

4 Conclusion

The results displayed in this report combined with the previous reporting periods are the foundation for the Mine Environmental ABA Database. Overburden and waste rock development will continue through the subsequent phases of mining and milling and will be sampled, analyzed and reported as required by the WUL and QML and in accordance with the EMSRP.

Appendix C: ALS Minerals Raw Lab Results

Minto Explorations Ltd.
ATTN: Minto Environment
Suite 2100- 510 West Georgia St
Vancouver BC V6B 0M3

Date Received: 27-FEB-17
Report Date: 24-MAR-17 16:21 (MT)
Version: FINAL

Client Phone: 604-759-0860

Certificate of Analysis

Lab Work Order #: L1895090
Project P.O. #: 220826
Job Reference:
C of C Numbers: 15-13
Legal Site Desc:

Comments: Mar 24 2017: Please note, the results from ALS Minerals division can be found at the end of this attachment.

Shane Stack
Account Manager

Reference Information

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|---|--------|--|-----------------------|
| ABA-OA-VOL08-AX | Soil | Acid Base Accounting | OA-VOL08 |
| CARBON-C-GAS05-AX | Soil | Carbon, TOC and CO2 | C-GAS05 |
| ME-MS41-AX | Soil | Aqua Regia ICPMS | Aqua Regia ICPMS |
| <p>A prepared sample (0.50 g) is digested with aqua regia in a graphite heating block. After cooling, the resulting solution is diluted to with deionized water, mixed and analyzed by inductively coupled plasma-atomic emission spectrometry. Following this analysis, the results are reviewed for high concentrations of bismuth, mercury, molybdenum, silver and tungsten and diluted accordingly. Samples are then analysed by ICP-MS for the remaining suite of elements. The analytical results are corrected for inter-element spectral interferences.</p> | | | |
| PH-OA-ELE07-AX | Soil | pH | OA-ELE07 |
| SULPHUR-S-CAL06-AX | Soil | Sulfide Sulfur Calc from Carbonate Leach | ALS Minerals S-CAL06 |
| <p>Sulfide Sulfur (as S) is calculated by subtracting the Carbonate Leachable Sulfate Sulfur (as S) from the Total Sulfur (as S) obtained from combustion.</p> | | | |
| SULPHUR-S-GRA06-AX | Soil | Sulfate Sulfur in Soil (Carbonate Leach) | ALS Minerals S-GRA06 |
| <p>A prepared sample is boiled with a sodium carbonate solution for 30 minutes. Any insoluble materials are removed by filtration and ferric iron is reduced to ferrous iron by the addition of hydroxylamine hydrochloride. The sulfate in the resulting filtrate is then precipitated with barium chloride in a dilute hydrochloric acid medium. The barium sulfate precipitate is filtered, ignited, weighed and the Sulfate Sulfur is calculated (as S).</p> | | | |
| SULPHUR-S-GRA06A-AX | Soil | Sulfate Sulfur in Soil (HCl Leach) | ALS Minerals S-GRA06A |
| <p>A prepared sample is heated with dilute hydrochloric acid for 30 minutes. Silica and any acid-insoluble materials are removed by filtration and ferric iron is reduced to ferrous iron by the addition of hydroxylamine hydrochloride. The sulfate in the resulting filtrate is then precipitated with barium chloride in a dilute hydrochloric acid medium. The barium sulfate precipitate is filtered, ignited, weighed and the Sulfate Sulfur is calculated (as S).</p> | | | |
| SULPHUR-S-IR08-AX | Soil | Total Sulfur in Soil by Combustion | ALS Minerals S-IR08 |
| <p>The sample is heated to approximately 1350 °C in an induction furnace while passing a stream of oxygen through the sample. Sulfur dioxide released from the sample is measured by an IR detection system and the Total Sulfur result is provided.</p> | | | |

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location |
|----------------------------|--|
| AX | ALS MINERALS - VANCOUVER, B.C., CANADA |

Chain of Custody Numbers:

15-13

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

| A prepared sample (0.50 g) is digested with aqua regia in a graphite heating block. After cooling, the resulting solution is diluted to with deionized water, mixed and analyzed by inductively coupled plasma-atomic emission spectrometry. Following this analysis, the results are reviewed for high concentrations of bismuth, mercury, molybdenum, silver and tungsten and diluted accordingly. Samples are then analysed by ICP-MS for the remaining suite of elements. The analytical results are corrected for inter-element spectral interferences. | | | |
| PH-OA-ELE07-AX | Soil | pH | OA-ELE07 |
| SULPHUR-S-CAL06-AX | Soil | Sulfide Sulfur Calc from Carbonate Leach | ALS Minerals S-CAL06 |
| Sulfide Sulfur (as S) is calculated by subtracting the Carbonate Leachable Sulfate Sulfur (as S) from the Total Sulfur (as S) obtained from combustion. | | | |
| SULPHUR-S-GRA06-AX | Soil | Sulfate Sulfur in Soil (Carbonate Leach) | ALS Minerals S-GRA06 |
| A prepared sample is boiled with a sodium carbonate solution for 30 minutes. Any insoluble materials are removed by filtration and ferric iron is reduced to ferrous iron by the addition of hydroxylamine hydrochloride. The sulfate in the resulting filtrate is then precipitated with barium chloride in a dilute hydrochloric acid medium. The barium sulfate precipitate is filtered, ignited, weighed and the Sulfate Sulfur is calculated (as S). | | | |
| SULPHUR-S-GRA06A-AX | Soil | Sulfate Sulfur in Soil (HCl Leach) | ALS Minerals S-GRA06A |
| A prepared sample is heated with dilute hydrochloric acid for 30 minutes. Silica and any acid-insoluble materials are removed by filtration and ferric iron is reduced to ferrous iron by the addition of hydroxylamine hydrochloride. The sulfate in the resulting filtrate is then precipitated with barium chloride in a dilute hydrochloric acid medium. The barium sulfate precipitate is filtered, ignited, weighed and the Sulfate Sulfur is calculated (as S). | | | |
| SULPHUR-S-IR08-AX | Soil | Total Sulfur in Soil by Combustion | ALS Minerals S-IR08 |
| The sample is heated to approximately 1350 °C in an induction furnace while passing a stream of oxygen through the sample. Sulfur dioxide released from the sample is measured by an IR detection system and the Total Sulfur result is provided. | | | |

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location |
|----------------------------|--|
| AX | ALS MINERALS - VANCOUVER, B.C., CANADA |

Chain of Custody Numbers:

15-14

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Reference Information

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|--|--------|--|-----------------------|
| ABA-OA-VOL08-AX | Soil | Acid Base Accounting | OA-VOL08 |
| CARBON-C-GAS05-AX | Soil | Carbon, TOC and CO2 | C-GAS05 |
| ME-MS41-AX | Soil | Aqua Regia ICPMS | Aqua Regia ICPMS |
| A prepared sample (0.50 g) is digested with aqua regia in a graphite heating block. After cooling, the resulting solution is diluted to with deionized water, mixed and analyzed by inductively coupled plasma-atomic emission spectrometry. Following this analysis, the results are reviewed for high concentrations of bismuth, mercury, molybdenum, silver and tungsten and diluted accordingly. Samples are then analysed by ICP-MS for the remaining suite of elements. The analytical results are corrected for inter-element spectral interferences. | | | |
| PH-OA-ELE07-AX | Soil | pH | OA-ELE07 |
| SULPHUR-S-CAL06-AX | Soil | Sulfide Sulfur Calc from Carbonate Leach | ALS Minerals S-CAL06 |
| Sulfide Sulfur (as S) is calculated by subtracting the Carbonate Leachable Sulfate Sulfur (as S) from the Total Sulfur (as S) obtained from combustion. | | | |
| SULPHUR-S-GRA06-AX | Soil | Sulfate Sulfur in Soil (Carbonate Leach) | ALS Minerals S-GRA06 |
| A prepared sample is boiled with a sodium carbonate solution for 30 minutes. Any insoluble materials are removed by filtration and ferric iron is reduced to ferrous iron by the addition of hydroxylamine hydrochloride. The sulfate in the resulting filtrate is then precipitated with barium chloride in a dilute hydrochloric acid medium. The barium sulfate precipitate is filtered, ignited, weighed and the Sulfate Sulfur is calculated (as S). | | | |
| SULPHUR-S-GRA06A-AX | Soil | Sulfate Sulfur in Soil (HCl Leach) | ALS Minerals S-GRA06A |
| A prepared sample is heated with dilute hydrochloric acid for 30 minutes. Silica and any acid-insoluble materials are removed by filtration and ferric iron is reduced to ferrous iron by the addition of hydroxylamine hydrochloride. The sulfate in the resulting filtrate is then precipitated with barium chloride in a dilute hydrochloric acid medium. The barium sulfate precipitate is filtered, ignited, weighed and the Sulfate Sulfur is calculated (as S). | | | |
| SULPHUR-S-IR08-AX | Soil | Total Sulfur in Soil by Combustion | ALS Minerals S-IR08 |
| The sample is heated to approximately 1350 °C in an induction furnace while passing a stream of oxygen through the sample. Sulfur dioxide released from the sample is measured by an IR detection system and the Total Sulfur result is provided. | | | |

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location |
|----------------------------|--|
| AX | ALS MINERALS - VANCOUVER, B.C., CANADA |

Chain of Custody Numbers:

15-15

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Reference Information

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|---|--------|--|-----------------------|
| ABA-OA-VOL08-AX | Soil | Acid Base Accounting | OA-VOL08 |
| CARBON-C-GAS05-AX | Soil | Carbon, TOC and CO2 | C-GAS05 |
| ME-MS41-AX | Soil | Aqua Regia ICPMS | Aqua Regia ICPMS |
| <p>A prepared sample (0.50 g) is digested with aqua regia in a graphite heating block. After cooling, the resulting solution is diluted to with deionized water, mixed and analyzed by inductively coupled plasma-atomic emission spectrometry. Following this analysis, the results are reviewed for high concentrations of bismuth, mercury, molybdenum, silver and tungsten and diluted accordingly. Samples are then analysed by ICP-MS for the remaining suite of elements. The analytical results are corrected for inter-element spectral interferences.</p> | | | |
| PH-OA-ELE07-AX | Soil | pH | OA-ELE07 |
| SULPHUR-S-CAL06-AX | Soil | Sulfide Sulfur Calc from Carbonate Leach | ALS Minerals S-CAL06 |
| <p>Sulfide Sulfur (as S) is calculated by subtracting the Carbonate Leachable Sulfate Sulfur (as S) from the Total Sulfur (as S) obtained from combustion.</p> | | | |
| SULPHUR-S-GRA06-AX | Soil | Sulfate Sulfur in Soil (Carbonate Leach) | ALS Minerals S-GRA06 |
| <p>A prepared sample is boiled with a sodium carbonate solution for 30 minutes. Any insoluble materials are removed by filtration and ferric iron is reduced to ferrous iron by the addition of hydroxylamine hydrochloride. The sulfate in the resulting filtrate is then precipitated with barium chloride in a dilute hydrochloric acid medium. The barium sulfate precipitate is filtered, ignited, weighed and the Sulfate Sulfur is calculated (as S).</p> | | | |
| SULPHUR-S-GRA06A-AX | Soil | Sulfate Sulfur in Soil (HCl Leach) | ALS Minerals S-GRA06A |
| <p>A prepared sample is heated with dilute hydrochloric acid for 30 minutes. Silica and any acid-insoluble materials are removed by filtration and ferric iron is reduced to ferrous iron by the addition of hydroxylamine hydrochloride. The sulfate in the resulting filtrate is then precipitated with barium chloride in a dilute hydrochloric acid medium. The barium sulfate precipitate is filtered, ignited, weighed and the Sulfate Sulfur is calculated (as S).</p> | | | |
| SULPHUR-S-IR08-AX | Soil | Total Sulfur in Soil by Combustion | ALS Minerals S-IR08 |
| <p>The sample is heated to approximately 1350 °C in an induction furnace while passing a stream of oxygen through the sample. Sulfur dioxide released from the sample is measured by an IR detection system and the Total Sulfur result is provided.</p> | | | |

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location |
|----------------------------|--|
| AX | ALS MINERALS - VANCOUVER, B.C., CANADA |

Chain of Custody Numbers:

15-16

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

CERTIFICATE COMMENTS

ANALYTICAL COMMENTS

Applies to Method: Gold determinations by this method are semi-quantitative due to the small sample weight used (0.5g).
 ME-MS41

LABORATORY ADDRESSES

Applies to Method: Processed at ALS Vancouver located at 2103 Dollarton Hwy, North Vancouver, BC, Canada.

Reference Information

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|---|--------|--|-----------------------|
| ABA-OA-VOL08-AX | Soil | Acid Base Accounting | OA-VOL08 |
| CARBON-C-GAS05-AX | Soil | Carbon, TOC and CO2 | C-GAS05 |
| ME-MS41-AX | Soil | Aqua Regia ICPMS | Aqua Regia ICPMS |
| <p>A prepared sample (0.50 g) is digested with aqua regia in a graphite heating block. After cooling, the resulting solution is diluted to with deionized water, mixed and analyzed by inductively coupled plasma-atomic emission spectrometry. Following this analysis, the results are reviewed for high concentrations of bismuth, mercury, molybdenum, silver and tungsten and diluted accordingly. Samples are then analysed by ICP-MS for the remaining suite of elements. The analytical results are corrected for inter-element spectral interferences.</p> | | | |
| PH-OA-ELE07-AX | Soil | pH | OA-ELE07 |
| SULPHUR-S-CAL06-AX | Soil | Sulfide Sulfur Calc from Carbonate Leach | ALS Minerals S-CAL06 |
| <p>Sulfide Sulfur (as S) is calculated by subtracting the Carbonate Leachable Sulfate Sulfur (as S) from the Total Sulfur (as S) obtained from combustion.</p> | | | |
| SULPHUR-S-GRA06-AX | Soil | Sulfate Sulfur in Soil (Carbonate Leach) | ALS Minerals S-GRA06 |
| <p>A prepared sample is boiled with a sodium carbonate solution for 30 minutes. Any insoluble materials are removed by filtration and ferric iron is reduced to ferrous iron by the addition of hydroxylamine hydrochloride. The sulfate in the resulting filtrate is then precipitated with barium chloride in a dilute hydrochloric acid medium. The barium sulfate precipitate is filtered, ignited, weighed and the Sulfate Sulfur is calculated (as S).</p> | | | |
| SULPHUR-S-GRA06A-AX | Soil | Sulfate Sulfur in Soil (HCl Leach) | ALS Minerals S-GRA06A |
| <p>A prepared sample is heated with dilute hydrochloric acid for 30 minutes. Silica and any acid-insoluble materials are removed by filtration and ferric iron is reduced to ferrous iron by the addition of hydroxylamine hydrochloride. The sulfate in the resulting filtrate is then precipitated with barium chloride in a dilute hydrochloric acid medium. The barium sulfate precipitate is filtered, ignited, weighed and the Sulfate Sulfur is calculated (as S).</p> | | | |
| SULPHUR-S-IR08-AX | Soil | Total Sulfur in Soil by Combustion | ALS Minerals S-IR08 |
| <p>The sample is heated to approximately 1350 °C in an induction furnace while passing a stream of oxygen through the sample. Sulfur dioxide released from the sample is measured by an IR detection system and the Total Sulfur result is provided.</p> | | | |

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location |
|----------------------------|--|
| AX | ALS MINERALS - VANCOUVER, B.C., CANADA |

Chain of Custody Numbers:

17-16

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

CERTIFICATE COMMENTS

ANALYTICAL COMMENTS

Applies to Method: Gold determinations by this method are semi-quantitative due to the small sample weight used (0.5g).
 ME-MS41

LABORATORY ADDRESSES

Applies to Method: Processed at ALS Vancouver located at 2103 Dollarton Hwy, North Vancouver, BC, Canada.

Reference Information

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|--|--------|--|-----------------------|
| ABA-OA-VOL08-AX | Soil | Acid Base Accounting | OA-VOL08 |
| CARBON-C-GAS05-AX | Soil | Carbon, TOC and CO2 | C-GAS05 |
| ME-MS41-AX | Soil | Aqua Regia ICPMS | Aqua Regia ICPMS |
| A prepared sample (0.50 g) is digested with aqua regia in a graphite heating block. After cooling, the resulting solution is diluted to with deionized water, mixed and analyzed by inductively coupled plasma-atomic emission spectrometry. Following this analysis, the results are reviewed for high concentrations of bismuth, mercury, molybdenum, silver and tungsten and diluted accordingly. Samples are then analysed by ICP-MS for the remaining suite of elements. The analytical results are corrected for inter-element spectral interferences. | | | |
| PH-OA-ELE07-AX | Soil | pH | OA-ELE07 |
| SULPHUR-S-CAL06-AX | Soil | Sulfide Sulfur Calc from Carbonate Leach | ALS Minerals S-CAL06 |
| Sulfide Sulfur (as S) is calculated by subtracting the Carbonate Leachable Sulfate Sulfur (as S) from the Total Sulfur (as S) obtained from combustion. | | | |
| SULPHUR-S-GRA06-AX | Soil | Sulfate Sulfur in Soil (Carbonate Leach) | ALS Minerals S-GRA06 |
| A prepared sample is boiled with a sodium carbonate solution for 30 minutes. Any insoluble materials are removed by filtration and ferric iron is reduced to ferrous iron by the addition of hydroxylamine hydrochloride. The sulfate in the resulting filtrate is then precipitated with barium chloride in a dilute hydrochloric acid medium. The barium sulfate precipitate is filtered, ignited, weighed and the Sulfate Sulfur is calculated (as S). | | | |
| SULPHUR-S-GRA06A-AX | Soil | Sulfate Sulfur in Soil (HCl Leach) | ALS Minerals S-GRA06A |
| A prepared sample is heated with dilute hydrochloric acid for 30 minutes. Silica and any acid-insoluble materials are removed by filtration and ferric iron is reduced to ferrous iron by the addition of hydroxylamine hydrochloride. The sulfate in the resulting filtrate is then precipitated with barium chloride in a dilute hydrochloric acid medium. The barium sulfate precipitate is filtered, ignited, weighed and the Sulfate Sulfur is calculated (as S). | | | |
| SULPHUR-S-IR08-AX | Soil | Total Sulfur in Soil by Combustion | ALS Minerals S-IR08 |
| The sample is heated to approximately 1350 °C in an induction furnace while passing a stream of oxygen through the sample. Sulfur dioxide released from the sample is measured by an IR detection system and the Total Sulfur result is provided. | | | |

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location |
|----------------------------|--|
| AX | ALS MINERALS - VANCOUVER, B.C., CANADA |

Chain of Custody Numbers:

17-17

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.
