Qualifiers for Individual Parameters Listed:

| Qualifier | Description |
|-----------|--|
| DLDS | Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity. |
| MS-B | Matrix Spike recovery could not be accurately calculated due to high analyte background in sample. |

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|---|--------|--|---------------------------------------|
| ALK-TITR-VA | Water | Alkalinity Species by Titration | APHA 2320 Alkalinity |
| This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values. | | | |
| ANIONS-N+N-CALC-VA | Water | Nitrite & Nitrate in Water (Calculation) | EPA 300.0 |
| Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N). | | | |
| BE-D-L-CCMS-VA | Water | Diss. Be (low) in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| BE-T-L-CCMS-VA | Water | Total Be (Low) in Water by CRC ICPMS | EPA 200.2/6020A (mod) |
| Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| CARBONS-DOC-VA | Water | Dissolved organic carbon by combustion | APHA 5310B TOTAL ORGANIC CARBON (TOC) |
| This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis. | | | |
| CL-IC-N-VA | Water | Chloride in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| EC-PCT-VA | Water | Conductivity (Automated) | APHA 2510 Auto. Conduc. |
| This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode. | | | |
| EC-SCREEN-VA | Water | Conductivity Screen (Internal Use Only) | APHA 2510 |
| Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc. | | | |
| HARDNESS-CALC-VA | Water | Hardness | APHA 2340B |
| Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO ₃ equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation. | | | |
| HG-D-CVAA-VA | Water | Diss. Mercury in Water by CVAAS or CVAFS | APHA 3030B/EPA 1631E (mod) |
| Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | | | |
| HG-T-CVAA-VA | Water | Total Mercury in Water by CVAAS or CVAFS | EPA 1631E (mod) |
| Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | | | |
| IONBALANCE-VA | Water | Ion Balance Calculation | APHA 1030E |
| Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero. | | | |

Reference Information

Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as:

$$\text{Ion Balance (\%)} = \frac{[\text{Cation Sum} - \text{Anion Sum}]}{[\text{Cation Sum} + \text{Anion Sum}]}$$

MET-D-CCMS-VA Water Dissolved Metals in Water by CRC ICPMS APHA 3030B/6020A (mod)

Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

MET-T-CCMS-VA Water Total Metals in Water by CRC ICPMS EPA 200.2/6020A (mod)

Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

NH3-F-VA Water Ammonia in Water by Fluorescence APHA 4500 NH3-NITROGEN (AMMONIA)

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NH3-F-VA Water Ammonia in Water by Fluorescence J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NO2-L-IC-N-VA Water Nitrite in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO3-L-IC-N-VA Water Nitrate in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H "pH Value"

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

SO4-IC-N-VA Water Sulfate in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

TDS-CALC-VA Water TDS (Calculated) APHA 1030E (20TH EDITION)

This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses". The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample.

TSS-VA Water Total Suspended Solids by Gravimetric APHA 2540 D - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location |
|----------------------------|---|
| VA | ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA |

Chain of Custody Numbers:

2017-05-24 A

Reference Information

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

| Matrix Spike | Manganese (Mn)-Total | MS-B | L1935320-1, -2, -3, -4, -5, -6 |
| Matrix Spike | Potassium (K)-Total | MS-B | L1935320-1, -2, -3, -4, -5, -6 |
| Matrix Spike | Sodium (Na)-Total | MS-B | L1935320-1, -2, -3, -4, -5, -6 |
| Matrix Spike | Strontium (Sr)-Total | MS-B | L1935320-1, -2, -3, -4, -5, -6 |
| Matrix Spike | Sulfur (S)-Total | MS-B | L1935320-1, -2, -3, -4, -5, -6 |

Qualifiers for Individual Parameters Listed:

| Qualifier | Description |
|-----------|--|
| DLM | Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity). |
| MS-B | Matrix Spike recovery could not be accurately calculated due to high analyte background in sample. |

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|--|--------|--|---------------------------------------|
| ALK-TITR-VA | Water | Alkalinity Species by Titration | APHA 2320 Alkalinity |
| This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values. | | | |
| ANIONS-N+N-CALC-VA | Water | Nitrite & Nitrate in Water (Calculation) | EPA 300.0 |
| Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N). | | | |
| BE-D-L-CCMS-VA | Water | Diss. Be (low) in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| BE-T-L-CCMS-VA | Water | Total Be (Low) in Water by CRC ICPMS | EPA 200.2/6020A (mod) |
| Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| CARBONS-DOC-VA | Water | Dissolved organic carbon by combustion | APHA 5310B TOTAL ORGANIC CARBON (TOC) |
| This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis. | | | |
| CL-IC-N-VA | Water | Chloride in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| EC-PCT-VA | Water | Conductivity (Automated) | APHA 2510 Auto. Conduc. |
| This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode. | | | |
| EC-SCREEN-VA | Water | Conductivity Screen (Internal Use Only) | APHA 2510 |
| Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc. | | | |
| HARDNESS-CALC-VA | Water | Hardness | APHA 2340B |
| Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO ₃ equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation. | | | |
| HG-D-CVAA-VA | Water | Diss. Mercury in Water by CVAAS or CVAFS | APHA 3030B/EPA 1631E (mod) |

Reference Information

Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.

HG-T-CVAA-VA Water Total Mercury in Water by CVAAS or CVAFS EPA 1631E (mod)

Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.

IONBALANCE-VA Water Ion Balance Calculation APHA 1030E

Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero.

Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as:

Ion Balance (%) = [Cation Sum-Anion Sum] / [Cation Sum+Anion Sum]

MET-D-CCMS-VA Water Dissolved Metals in Water by CRC ICPMS APHA 3030B/6020A (mod)

Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

MET-T-CCMS-VA Water Total Metals in Water by CRC ICPMS EPA 200.2/6020A (mod)

Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

NH3-F-VA Water Ammonia in Water by Fluorescence APHA 4500 NH3-NITROGEN (AMMONIA)

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NH3-F-VA Water Ammonia in Water by Fluorescence J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NO2-L-IC-N-VA Water Nitrite in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO3-L-IC-N-VA Water Nitrate in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

SO4-IC-N-VA Water Sulfate in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

TDS-CALC-VA Water TDS (Calculated) APHA 1030E (20TH EDITION)

This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses". The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample.

TSS-VA Water Total Suspended Solids by Gravimetric APHA 2540 D - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius.

Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location |
|----------------------------|---------------------|
|----------------------------|---------------------|

| | |
|----|---|
| VA | ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA |
|----|---|

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg ww - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Reference Information

QC Samples with Qualifiers & Comments:

| QC Type Description | Parameter | Qualifier | Applies to Sample Number(s) |
|---------------------|--------------------------|-----------|---|
| Matrix Spike | Dissolved Organic Carbon | MS-B | L1938367-10, -8, -9 |
| Matrix Spike | Barium (Ba)-Total | MS-B | L1938367-1, -10, -2, -3, -4, -5, -6, -7, -8, -9 |
| Matrix Spike | Calcium (Ca)-Total | MS-B | L1938367-1, -10, -2, -3, -4, -5, -6, -7, -8, -9 |
| Matrix Spike | Magnesium (Mg)-Total | MS-B | L1938367-1, -10, -2, -3, -4, -5, -6, -7, -8, -9 |
| Matrix Spike | Sodium (Na)-Total | MS-B | L1938367-1, -10, -2, -3, -4, -5, -6, -7, -8, -9 |
| Matrix Spike | Strontium (Sr)-Total | MS-B | L1938367-1, -10, -2, -3, -4, -5, -6, -7, -8, -9 |

Qualifiers for Individual Parameters Listed:

| Qualifier | Description |
|-----------|--|
| DLM | Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity). |
| MS-B | Matrix Spike recovery could not be accurately calculated due to high analyte background in sample. |

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|---|--------|--|---------------------------------------|
| ALK-TITR-VA | Water | Alkalinity Species by Titration | APHA 2320 Alkalinity |
| This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values. | | | |
| ANIONS-N+N-CALC-VA | Water | Nitrite & Nitrate in Water (Calculation) | EPA 300.0 |
| Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N). | | | |
| BE-D-L-CCMS-VA | Water | Diss. Be (low) in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| BE-T-L-CCMS-VA | Water | Total Be (Low) in Water by CRC ICPMS | EPA 200.2/6020A (mod) |
| Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| CARBONS-DOC-VA | Water | Dissolved organic carbon by combustion | APHA 5310B TOTAL ORGANIC CARBON (TOC) |
| This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis. | | | |
| CL-IC-N-VA | Water | Chloride in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| EC-PCT-VA | Water | Conductivity (Automated) | APHA 2510 Auto. Conduc. |
| This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode. | | | |
| EC-SCREEN-VA | Water | Conductivity Screen (Internal Use Only) | APHA 2510 |
| Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc. | | | |
| HARDNESS-CALC-VA | Water | Hardness | APHA 2340B |
| Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO ₃ equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation. | | | |
| HG-D-CVAA-VA | Water | Diss. Mercury in Water by CVAAS or CVAFS | APHA 3030B/EPA 1631E (mod) |
| Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | | | |
| HG-T-CVAA-VA | Water | Total Mercury in Water by CVAAS or CVAFS | EPA 1631E (mod) |
| Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | | | |
| IONBALANCE-VA | Water | Ion Balance Calculation | APHA 1030E |
| Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero. | | | |

Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as:

Reference Information

Ion Balance (%) = [Cation Sum-Anion Sum] / [Cation Sum+Anion Sum]

MET-D-CCMS-VA Water Dissolved Metals in Water by CRC ICPMS APHA 3030B/6020A (mod)

Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

MET-T-CCMS-VA Water Total Metals in Water by CRC ICPMS EPA 200.2/6020A (mod)

Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

NH3-F-VA Water Ammonia in Water by Fluorescence APHA 4500 NH3-NITROGEN (AMMONIA)

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NH3-F-VA Water Ammonia in Water by Fluorescence J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NO2-L-IC-N-VA Water Nitrite in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO3-L-IC-N-VA Water Nitrate in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

RA226-MMER-FC Water Ra226 by Alpha Scint, MDC=0.01 Bq/L EPA 903.1

SO4-IC-N-VA Water Sulfate in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

TDS-CALC-VA Water TDS (Calculated) APHA 1030E (20TH EDITION)

This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses".

The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample.

TSS-VA Water Total Suspended Solids by Gravimetric APHA 2540 D - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius.

Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location |
|----------------------------|---|
| FC | ALS ENVIRONMENTAL - FORT COLLINS, COLORADO, USA |
| VA | ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA |

Chain of Custody Numbers:

2017-06-07 A

Reference Information

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Re: ALS Workorder: 1706292
Project Name:
Project Number: L1938367

Dear Mr. Stack:

One water sample was received from ALS Environmental, on 6/13/2017. The sample was scheduled for the following analysis:

Radium-226

The results for these analyses are contained in the enclosed reports.

The data contained in the following report have been reviewed and approved by the personnel listed below. In addition, ALS certifies that the analyses reported herein are true, complete and correct within the limits of the methods employed.

Thank you for your confidence in ALS Environmental. Should you have any questions, please call.

Sincerely,

ALS Environmental
Shiloh J. Summy
Project Manager

ALS Environmental – Fort Collins is accredited by the following accreditation bodies for various testing scopes in accordance with requirements of each accreditation body. All testing is performed under the laboratory management system, which is maintained to meet these requirement and regulations. Please contact the laboratory or accreditation body for the current scope testing parameters.

Project Manager Signature / Date: Philob Jimmy

DEFINITIONS: On the Air Waybill "We", "Our", "us" and "FedEx" refer to Federal Express Corporation, its subsidiaries and branches and their respective employees, agents and independent contractors. "You" and "your" refer to the shipper, its employees, principals and agents. If your shipment originates outside the United States, your contract of carriage is with the Federal Express subsidiary, branch or independent contractor who originally accepts the shipment from you. "Package" means any container or envelope that is accepted by us for delivery, including any such items tendered by you utilizing our automated systems, meters, manifests or waybills. "Shipment" means all packages, which are tendered to and accepted by us on a single Air Waybill.

AGREEMENT TO TERMS: By giving us your shipment, you agree, regardless of whether you sign the front of this Air Waybill, for yourself and as agent for and on behalf of any other person having an interest in this shipment, to all terms on this NON-NEGOTIABLE Air Waybill, in any applicable tariff, and in our current Service Guide or Standard Conditions of Carriage, copies of which are available upon request. If there is a conflict between this Air Waybill and either the tariff, Service Guide or Standard Conditions then in effect, the tariff and the terms of any customer automation agreement between the shipper and Federal Express will control (the Service Guide or Standard Conditions have secondary priority). No one is authorized to alter or modify the terms of our agreement. This Air Waybill shall be binding on us when the shipment is accepted.

YOUR OBLIGATIONS: You warrant that each article in the shipment is properly described on this Air Waybill and is acceptable for transport by us, and that the shipment is properly marked, addressed (including postal codes) and packaged to ensure safe transportation with ordinary care in handling.

NOTE CONCERNING LIMITATIONS OF LIABILITY: Air Carriage Notice. If the carriage of your shipment by air involves an ultimate destination or stop in a country other than the country of departure, the Warsaw Convention, an international treaty relating to international carriage by air, may be applicable, which treaty would then govern and in most cases limit our liability for loss or delay of or damage to your shipment. In the U.S. the Warsaw Convention limits our liability to U.S. \$9.07 per pound (U.S. \$20.39 per kilogram). Unless you declare a higher value for carriage as described below. The interpretation of the Warsaw Convention liability limits may vary in other countries. There are no stopping places which are agreed at the time of tender of the shipment and we reserve the right to route shipments in any way we deem appropriate.

Road Transport Notice: Shipments transported partly or solely by road be it explicit agreement to do so or not, to, from a country which is party to the Convention on the Contract for the International Carriage of Goods by Road (the "CMR") are subject to the terms and conditions of the CMR, notwithstanding any other provisions of this Agreement to the contrary. For these shipments transported solely by road, if a conflict arises between the provisions of the CMR and this Air Waybill the terms of the CMR shall prevail.

Limitation of Liability: If not governed by the Warsaw Convention or the CMR as described above, our maximum liability for loss, damage or delay is limited by this Air Waybill to U.S. \$100 per shipment or U.S. \$9.07 per pound (U.S. \$20.39 per kilo) (or equivalent local currency), whichever is greater, unless you declare a higher value for carriage as described below. FedEx does not provide cargo liability or all-risk insurance, but you may pay an additional charge to each additional U.S. \$100 (or equivalent local currency) of declared value for carriage. If a higher value for carriage is declared and the additional charge is paid, FedEx maximum liability will be the lesser of the declared value for carriage or your actual damages.

LIABILITIES NOT ASSUMED: IN ANY EVENT, WE WON'T BE LIABLE FOR ANY DAMAGES WHETHER DIRECT, INCIDENTAL, SPECIAL OR CONSEQUENTIAL, IN EXCESS OF THE DECLARED VALUE FOR CARRIAGE (INCLUDING BUT NOT LIMITED TO LOSS OF INCOME OR PROFITS) WHETHER OR NOT WE HAD ANY KNOWLEDGE THAT SUCH DAMAGES MIGHT BE INCURRED, UNLESS SUCH DAMAGES WERE CAUSED BY OUR OWN WILLFUL MISCONDUCT OR GROSS NEGLIGENCE.

We won't be liable for your actions or omissions, including but not limited to incorrect declaration of cargo, improper or insufficient packing, securing, marking or addressing of the shipment, or for the acts or omissions of the recipient or anyone else with an interest in the shipment. Also we won't be liable if you (or the recipient) violate any of the terms of our agreement. We won't be liable for loss of or damage to shipments of cash, currency or other prohibited items. We won't be liable for loss, damage or delay caused by events we cannot control, including but not limited to acts of God, perils of the air, weather conditions, mechanical delays, acts of public enemies, war, strikes, civil commotions, or acts or omissions of public authorities (including customs and health officials) with actual or apparent authority.

NO WARRANTIES: We make no warranties, express or implied.

CLAIM FOR LOSS, DAMAGE FOR DELAY: ALL CLAIMS MUST BE NOTIFIED TO US WITHIN 15 DAYS AFTER DELIVERY OF THE SHIPMENT FAILING WHICH NO ACTION FOR DAMAGES MAY BE BROUGHT. All claims for loss, non-delivery or mis-delivery must be received by us within 90 days after the shipment is accepted by us. The right to damages against us shall be extinguished unless an action is brought within two years from the date of delivery of the shipment or from date on which the shipment should have been delivered. Within 30 days after notification to us (of the claim, it must be documented by sending us all relevant information about it. We are not obligated to act on any claim until all transportation charges have been paid; the claim amount may not be deducted from those charges. If the recipient accepts the shipment without noting any damage on the delivery record, we will assume the shipment was delivered in good condition. In order for us to consider a claim for damages, the contents, original shipping cartons, and packing must be available to us for inspection.

RIGHT TO INSPECT: Your shipment may, at our option or at the request of governmental authorities, be opened and inspected by us or such authorities at any time.

CUSTOMS CLEARANCE: It is your responsibility to provide proper customs documentation and confirmations, where required.

EXPORT CONTROL: You authorize Federal Express to act as forwarding agent for you for export control and customs purposes. You hereby certify that all statements and information contained in this air waybill relating to exportation are true and correct. Furthermore, you understand that civil and criminal penalties, including forfeiture and sale, may be imposed for making false or fraudulent statements or for the violation of any United States laws on exportation, including but not limited to, 13 USC Sec. 305; 22 USC Sec. 401; 18 USC Sec. 1001; 50 USC app. 2410.

MANDATORY LAW: Insofar as any provision contained or referred to in this air waybill may be contrary to any applicable international treaty, law government regulations, orders or requirements such provision shall remain in effect as a part of our agreement to the extent that it is not overridden. The liability or unenforceability of any provision shall not affect any other part of this Air Waybill. Unless otherwise indicated the Sender's address indicated on the face of this Waybill is the place of execution and the place of departure, and Recipient's address listed on the face of this Waybill is the place of destination. Unless otherwise indicated Federal Express Corporation, P.O. Box 727, Memphis, TN 38184 USA is the first carrier of this shipment.

- After printing this label:
CONSIGNEE COPY - PLEASE PLACE IN FRONT OF POUCH
 1. Fold the printed page along the horizontal line.
 2. Place label in shipping pouch and affix it to your shipment.

Percent Moisture:

| Analyses | Result | Qual | Report Limit | Units | Dilution Factor | Date Analyzed |
|----------|--------|------|--------------|-------|-----------------|---------------|
|----------|--------|------|--------------|-------|-----------------|---------------|

Explanation of Qualifiers

Radiochemistry:

- U or ND - Result is less than the sample specific MDC.
- Y1 - Chemical Yield is in control at 100-110%. Quantitative yield is assumed.
- Y2 - Chemical Yield outside default limits.
- W - DER is greater than Warning Limit of 1.42
- * - Aliquot Basis is 'As Received' while the Report Basis is 'Dry Weight'.
- # - Aliquot Basis is 'Dry Weight' while the Report Basis is 'As Received'.
- G - Sample density differs by more than 15% of LCS density.
- D - DER is greater than Control Limit
- M - Requested MDC not met.
- LT - Result is less than requested MDC but greater than achieved MDC.
- M3 - The requested MDC was not met, but the reported activity is greater than the reported MDC.
- L - LCS Recovery below lower control limit.
- H - LCS Recovery above upper control limit.
- P - LCS, Matrix Spike Recovery within control limits.
- N - Matrix Spike Recovery outside control limits
- NC - Not Calculated for duplicate results less than 5 times MDC
- B - Analyte concentration greater than MDC.
- B3 - Analyte concentration greater than MDC but less than Requested MDC.

Inorganics:

- B - Result is less than the requested reporting limit but greater than the instrument method detection limit (MDL).
- U or ND - Indicates that the compound was analyzed for but not detected.
- E - The reported value is estimated because of the presence of interference. An explanatory note may be included in the narrative.
- M - Duplicate injection precision was not met.
- N - Spiked sample recovery not within control limits. A post spike is analyzed for all ICP analyses when the matrix spike and or spike duplicate fail and the native sample concentration is less than four times the spike added concentration.
- Z - Spiked recovery not within control limits. An explanatory note may be included in the narrative.
- * - Duplicate analysis (relative percent difference) not within control limits.
- S - SAR value is estimated as one or more analytes used in the calculation were not detected above the detection limit.

Organics:

- U or ND - Indicates that the compound was analyzed for but not detected.
- B - Analyte is detected in the associated method blank as well as in the sample. It indicates probable blank contamination and warns the data user.
- E - Analyte concentration exceeds the upper level of the calibration range.
- J - Estimated value. The result is less than the reporting limit but greater than the instrument method detection limit (MDL).
- A - A tentatively identified compound is a suspected aldol-condensation product.
- X - The analyte was diluted below an accurate quantitation level.
- * - The spike recovery is equal to or outside the control criteria used.
- + - The relative percent difference (RPD) equals or exceeds the control criteria.
- G - A pattern resembling gasoline was detected in this sample.
- D - A pattern resembling diesel was detected in this sample.
- M - A pattern resembling motor oil was detected in this sample.
- C - A pattern resembling crude oil was detected in this sample.
- 4 - A pattern resembling JP-4 was detected in this sample.
- 5 - A pattern resembling JP-5 was detected in this sample.
- H - Indicates that the fuel pattern was in the heavier end of the retention time window for the analyte of interest.
- L - Indicates that the fuel pattern was in the lighter end of the retention time window for the analyte of interest.
- Z - This flag indicates that a significant fraction of the reported result did not resemble the patterns of any of the following petroleum hydrocarbon products:
 - gasoline
 - JP-8
 - diesel
 - mineral spirits
 - motor oil
 - Stoddard solvent
 - bunker C

| Matrix Spike | Barium (Ba)-Dissolved | MS-B | L1942313-1, -2, -3, -4, -5, -6, -7, -8 |
| Matrix Spike | Calcium (Ca)-Dissolved | MS-B | L1942313-1, -2, -3, -4, -5, -6, -7, -8 |
| Matrix Spike | Magnesium (Mg)-Dissolved | MS-B | L1942313-1, -2, -3, -4, -5, -6, -7, -8 |
| Matrix Spike | Sodium (Na)-Dissolved | MS-B | L1942313-1, -2, -3, -4, -5, -6, -7, -8 |
| Matrix Spike | Strontium (Sr)-Dissolved | MS-B | L1942313-1, -2, -3, -4, -5, -6, -7, -8 |

Qualifiers for Individual Parameters Listed:

| Qualifier | Description |
|-----------|---|
| DLM | Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity). |
| MB-LOR | Method Blank exceeds ALS DQO. Limits of Reporting have been adjusted for samples with positive hits below 5x blank level. |
| MS-B | Matrix Spike recovery could not be accurately calculated due to high analyte background in sample. |

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|--|--------|--|---------------------------------------|
| ALK-TITR-VA | Water | Alkalinity Species by Titration | APHA 2320 Alkalinity |
| This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values. | | | |
| BE-D-L-CCMS-VA | Water | Diss. Be (low) in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| BE-T-L-CCMS-VA | Water | Total Be (Low) in Water by CRC ICPMS | EPA 200.2/6020A (mod) |
| Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| CARBONS-DOC-VA | Water | Dissolved organic carbon by combustion | APHA 5310B TOTAL ORGANIC CARBON (TOC) |
| This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis. | | | |
| CL-IC-N-VA | Water | Chloride in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| EC-PCT-VA | Water | Conductivity (Automated) | APHA 2510 Auto. Conduc. |
| This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode. | | | |
| EC-SCREEN-VA | Water | Conductivity Screen (Internal Use Only) | APHA 2510 |
| Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc. | | | |
| HARDNESS-CALC-VA | Water | Hardness | APHA 2340B |
| Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation. | | | |
| HG-D-CVAA-VA | Water | Diss. Mercury in Water by CVAAS or CVAFS | APHA 3030B/EPA 1631E (mod) |
| Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | | | |
| HG-T-CVAA-VA | Water | Total Mercury in Water by CVAAS or CVAFS | EPA 1631E (mod) |
| Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | | | |
| IONBALANCE-VA | Water | Ion Balance Calculation | APHA 1030E |
| Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) | | | |

Reference Information

should be near-zero.

Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as:

$$\text{Ion Balance (\%)} = \frac{[\text{Cation Sum} - \text{Anion Sum}]}{[\text{Cation Sum} + \text{Anion Sum}]}$$

MET-D-CCMS-VA Water Dissolved Metals in Water by CRC ICPMS APHA 3030B/6020A (mod)

Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

MET-T-CCMS-VA Water Total Metals in Water by CRC ICPMS EPA 200.2/6020A (mod)

Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

NH3-F-VA Water Ammonia in Water by Fluorescence APHA 4500 NH3-NITROGEN (AMMONIA)

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NH3-F-VA Water Ammonia in Water by Fluorescence J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NO2-L-IC-N-VA Water Nitrite in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO3-L-IC-N-VA Water Nitrate in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

SO4-IC-N-VA Water Sulfate in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

TDS-CALC-VA Water TDS (Calculated) APHA 1030E (20TH EDITION)

This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses".

The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample.

TSS-VA Water Total Suspended Solids by Gravimetric APHA 2540 D - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius.

Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location |
|----------------------------|---|
| VA | ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA |

Chain of Custody Numbers:

2017-06-14 B

Reference Information

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

| Sample Number | Client Sample ID | Qualifier | Description |
|---------------|------------------|-----------|---|
| L1947077-3 | W16A | WSMT | Water sample(s) for total mercury analysis was not submitted in glass or PTFE container with HCl preservative. Results may be biased low. |

QC Samples with Qualifiers & Comments:

| QC Type | Description | Parameter | Qualifier | Applies to Sample Number(s) |
|--------------|-------------|--------------------------|-----------|--------------------------------|
| Matrix Spike | | Barium (Ba)-Dissolved | MS-B | L1947077-1, -2, -3, -4, -5, -6 |
| Matrix Spike | | Calcium (Ca)-Dissolved | MS-B | L1947077-1, -2, -3, -4, -5, -6 |
| Matrix Spike | | Magnesium (Mg)-Dissolved | MS-B | L1947077-1, -2, -3, -4, -5, -6 |
| Matrix Spike | | Manganese (Mn)-Dissolved | MS-B | L1947077-1, -2, -3, -4, -5, -6 |
| Matrix Spike | | Potassium (K)-Dissolved | MS-B | L1947077-1, -2, -3, -4, -5, -6 |
| Matrix Spike | | Sodium (Na)-Dissolved | MS-B | L1947077-1, -2, -3, -4, -5, -6 |
| Matrix Spike | | Strontium (Sr)-Dissolved | MS-B | L1947077-1, -2, -3, -4, -5, -6 |
| Matrix Spike | | Barium (Ba)-Total | MS-B | L1947077-1, -2, -3, -4, -5, -6 |
| Matrix Spike | | Calcium (Ca)-Total | MS-B | L1947077-1, -2, -3, -4, -5, -6 |
| Matrix Spike | | Magnesium (Mg)-Total | MS-B | L1947077-1, -2, -3, -4, -5, -6 |
| Matrix Spike | | Manganese (Mn)-Total | MS-B | L1947077-1, -2, -3, -4, -5, -6 |
| Matrix Spike | | Potassium (K)-Total | MS-B | L1947077-1, -2, -3, -4, -5, -6 |
| Matrix Spike | | Sodium (Na)-Total | MS-B | L1947077-1, -2, -3, -4, -5, -6 |
| Matrix Spike | | Strontium (Sr)-Total | MS-B | L1947077-1, -2, -3, -4, -5, -6 |
| Matrix Spike | | Sulfur (S)-Total | MS-B | L1947077-1, -2, -3, -4, -5, -6 |
| Matrix Spike | | Uranium (U)-Total | MS-B | L1947077-1, -2, -3, -4, -5, -6 |

Qualifiers for Individual Parameters Listed:

| Qualifier | Description |
|-----------|--|
| DLM | Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity). |
| MS-B | Matrix Spike recovery could not be accurately calculated due to high analyte background in sample. |

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|--|--------|--|---------------------------------------|
| ALK-TITR-VA | Water | Alkalinity Species by Titration | APHA 2320 Alkalinity |
| This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values. | | | |
| ANIONS-N+N-CALC-VA | Water | Nitrite & Nitrate in Water (Calculation) | EPA 300.0 |
| Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N). | | | |
| BE-D-L-CCMS-VA | Water | Diss. Be (low) in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| BE-T-L-CCMS-VA | Water | Total Be (Low) in Water by CRC ICPMS | EPA 200.2/6020A (mod) |
| Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| CARBONS-DOC-VA | Water | Dissolved organic carbon by combustion | APHA 5310B TOTAL ORGANIC CARBON (TOC) |
| This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis. | | | |
| CL-IC-N-VA | Water | Chloride in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| EC-PCT-VA | Water | Conductivity (Automated) | APHA 2510 Auto. Conduc. |
| This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode. | | | |
| EC-SCREEN-VA | Water | Conductivity Screen (Internal Use Only) | APHA 2510 |

Reference Information

Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc.

HARDNESS-CALC-VA Water Hardness APHA 2340B

Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO₃ equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation.

HG-D-CVAA-VA Water Diss. Mercury in Water by CVAAS or CVAFS APHA 3030B/EPA 1631E (mod)

Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.

HG-T-CVAA-VA Water Total Mercury in Water by CVAAS or CVAFS EPA 1631E (mod)

Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.

IONBALANCE-VA Water Ion Balance Calculation APHA 1030E

Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero.

Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as:

Ion Balance (%) = [Cation Sum-Anion Sum] / [Cation Sum+Anion Sum]

MET-D-CCMS-VA Water Dissolved Metals in Water by CRC ICPMS APHA 3030B/6020A (mod)

Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

MET-T-CCMS-VA Water Total Metals in Water by CRC ICPMS EPA 200.2/6020A (mod)

Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

NH3-F-VA Water Ammonia in Water by Fluorescence APHA 4500 NH3-NITROGEN (AMMONIA)

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NH3-F-VA Water Ammonia in Water by Fluorescence J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NO2-L-IC-N-VA Water Nitrite in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO3-L-IC-N-VA Water Nitrate in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

SO4-IC-N-VA Water Sulfate in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

TDS-CALC-VA Water TDS (Calculated) APHA 1030E (20TH EDITION)

This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses".

The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample.

TSS-VA Water Total Suspended Solids by Gravimetric APHA 2540 D - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius.

Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.

Reference Information

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location |
|----------------------------|---|
| VA | ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA |

Chain of Custody Numbers:

2017-06-21 A

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Reference Information

QC Samples with Qualifiers & Comments:

| QC Type Description | Parameter | Qualifier | Applies to Sample Number(s) |
|---------------------|--------------------------|-----------|-----------------------------|
| Matrix Spike | Barium (Ba)-Dissolved | MS-B | L1950514-1, -2, -3, -4, -5 |
| Matrix Spike | Boron (B)-Dissolved | MS-B | L1950514-1, -2, -3, -4, -5 |
| Matrix Spike | Calcium (Ca)-Dissolved | MS-B | L1950514-1, -2, -3, -4, -5 |
| Matrix Spike | Magnesium (Mg)-Dissolved | MS-B | L1950514-1, -2, -3, -4, -5 |
| Matrix Spike | Potassium (K)-Dissolved | MS-B | L1950514-1, -2, -3, -4, -5 |
| Matrix Spike | Sodium (Na)-Dissolved | MS-B | L1950514-1, -2, -3, -4, -5 |
| Matrix Spike | Strontium (Sr)-Dissolved | MS-B | L1950514-1, -2, -3, -4, -5 |
| Matrix Spike | Sulfur (S)-Dissolved | MS-B | L1950514-1, -2, -3, -4, -5 |
| Matrix Spike | Barium (Ba)-Total | MS-B | L1950514-1, -2, -3, -4, -5 |
| Matrix Spike | Calcium (Ca)-Total | MS-B | L1950514-1, -2, -3, -4, -5 |
| Matrix Spike | Magnesium (Mg)-Total | MS-B | L1950514-1, -2, -3, -4, -5 |
| Matrix Spike | Manganese (Mn)-Total | MS-B | L1950514-1, -2, -3, -4, -5 |
| Matrix Spike | Sodium (Na)-Total | MS-B | L1950514-1, -2, -3, -4, -5 |
| Matrix Spike | Strontium (Sr)-Total | MS-B | L1950514-1, -2, -3, -4, -5 |

Qualifiers for Individual Parameters Listed:

| Qualifier | Description |
|-----------|--|
| DLM | Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity). |
| MS-B | Matrix Spike recovery could not be accurately calculated due to high analyte background in sample. |

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|--|--------|--|---------------------------------------|
| ALK-TITR-VA | Water | Alkalinity Species by Titration | APHA 2320 Alkalinity |
| This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values. | | | |
| ANIONS-N+N-CALC-VA | Water | Nitrite & Nitrate in Water (Calculation) | EPA 300.0 |
| Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N). | | | |
| BE-D-L-CCMS-VA | Water | Diss. Be (low) in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| BE-T-L-CCMS-VA | Water | Total Be (Low) in Water by CRC ICPMS | EPA 200.2/6020A (mod) |
| Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| CARBONS-DOC-VA | Water | Dissolved organic carbon by combustion | APHA 5310B TOTAL ORGANIC CARBON (TOC) |
| This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis. | | | |
| CL-IC-N-VA | Water | Chloride in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| EC-PCT-VA | Water | Conductivity (Automated) | APHA 2510 Auto. Conduc. |
| This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode. | | | |
| EC-SCREEN-VA | Water | Conductivity Screen (Internal Use Only) | APHA 2510 |
| Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc. | | | |
| HARDNESS-CALC-VA | Water | Hardness | APHA 2340B |
| Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation. | | | |
| HG-D-CVAA-VA | Water | Diss. Mercury in Water by CVAAS or CVAFS | APHA 3030B/EPA 1631E (mod) |
| Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | | | |

Reference Information

| | | | |
|---|-------|--|---|
| HG-T-CVAA-VA | Water | Total Mercury in Water by CVAAS or CVAFS | EPA 1631E (mod) |
| Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | | | |
| IONBALANCE-VA | Water | Ion Balance Calculation | APHA 1030E |
| Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero. | | | |
| Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as: | | | |
| Ion Balance (%) = [Cation Sum-Anion Sum] / [Cation Sum+Anion Sum] | | | |
| MET-D-CCMS-VA | Water | Dissolved Metals in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| MET-T-CCMS-VA | Water | Total Metals in Water by CRC ICPMS | EPA 200.2/6020A (mod) |
| Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| NH3-F-VA | Water | Ammonia in Water by Fluorescence | APHA 4500 NH3-NITROGEN (AMMONIA) |
| This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al. | | | |
| NH3-F-VA | Water | Ammonia in Water by Fluorescence | J. ENVIRON. MONIT., 2005, 7, 37-42, RSC |
| This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al. | | | |
| NO2-L-IC-N-VA | Water | Nitrite in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| NO3-L-IC-N-VA | Water | Nitrate in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| PH-PCT-VA | Water | pH by Meter (Automated) | APHA 4500-H pH Value |
| This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode | | | |
| It is recommended that this analysis be conducted in the field. | | | |
| SO4-IC-N-VA | Water | Sulfate in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| TDS-CALC-VA | Water | TDS (Calculated) | APHA 1030E (20TH EDITION) |
| This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses". | | | |
| The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample. | | | |
| TSS-VA | Water | Total Suspended Solids by Gravimetric | APHA 2540 D - GRAVIMETRIC |
| This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples. | | | |

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location |
|----------------------------|---|
| VA | ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA |

Chain of Custody Numbers:

Reference Information

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Reference Information

QC Samples with Qualifiers & Comments:

| QC Type Description | Parameter | Qualifier | Applies to Sample Number(s) |
|---------------------|--------------------------|-----------|--|
| Matrix Spike | Dissolved Organic Carbon | MS-B | L1953755-4, -5, -6, -8, -9 |
| Matrix Spike | Barium (Ba)-Dissolved | MS-B | L1953755-1, -2, -3, -4, -5, -6, -7, -8, -9 |
| Matrix Spike | Calcium (Ca)-Dissolved | MS-B | L1953755-1, -2, -3, -4, -5, -6, -7, -8, -9 |
| Matrix Spike | Copper (Cu)-Dissolved | MS-B | L1953755-1, -2, -3, -4, -5, -6, -7, -8, -9 |
| Matrix Spike | Magnesium (Mg)-Dissolved | MS-B | L1953755-1, -2, -3, -4, -5, -6, -7, -8, -9 |
| Matrix Spike | Manganese (Mn)-Dissolved | MS-B | L1953755-1, -2, -3, -4, -5, -6, -7, -8, -9 |
| Matrix Spike | Sodium (Na)-Dissolved | MS-B | L1953755-1, -2, -3, -4, -5, -6, -7, -8, -9 |
| Matrix Spike | Strontium (Sr)-Dissolved | MS-B | L1953755-1, -2, -3, -4, -5, -6, -7, -8, -9 |
| Matrix Spike | Sulfur (S)-Dissolved | MS-B | L1953755-1, -2, -3, -4, -5, -6, -7, -8, -9 |
| Matrix Spike | Barium (Ba)-Total | MS-B | L1953755-1, -2, -3, -4, -5, -6, -7, -8, -9 |
| Matrix Spike | Calcium (Ca)-Total | MS-B | L1953755-1, -2, -3, -4, -5, -6, -7, -8, -9 |
| Matrix Spike | Magnesium (Mg)-Total | MS-B | L1953755-1, -2, -3, -4, -5, -6, -7, -8, -9 |
| Matrix Spike | Manganese (Mn)-Total | MS-B | L1953755-1, -2, -3, -4, -5, -6, -7, -8, -9 |
| Matrix Spike | Sodium (Na)-Total | MS-B | L1953755-1, -2, -3, -4, -5, -6, -7, -8, -9 |
| Matrix Spike | Strontium (Sr)-Total | MS-B | L1953755-1, -2, -3, -4, -5, -6, -7, -8, -9 |

Qualifiers for Individual Parameters Listed:

| Qualifier | Description |
|-----------|--|
| DLA | Detection Limit adjusted for required dilution |
| DLM | Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity). |
| MS-B | Matrix Spike recovery could not be accurately calculated due to high analyte background in sample. |

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|--|--------|--|---------------------------------------|
| ALK-TITR-VA | Water | Alkalinity Species by Titration | APHA 2320 Alkalinity |
| This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values. | | | |
| ANIONS-N+N-CALC-VA | Water | Nitrite & Nitrate in Water (Calculation) | EPA 300.0 |
| Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N). | | | |
| BE-D-L-CCMS-VA | Water | Diss. Be (low) in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| BE-T-L-CCMS-VA | Water | Total Be (Low) in Water by CRC ICPMS | EPA 200.2/6020A (mod) |
| Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| CARBONS-DOC-VA | Water | Dissolved organic carbon by combustion | APHA 5310B TOTAL ORGANIC CARBON (TOC) |
| This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis. | | | |
| CL-IC-N-VA | Water | Chloride in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| EC-PCT-VA | Water | Conductivity (Automated) | APHA 2510 Auto. Conduc. |
| This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode. | | | |
| EC-SCREEN-VA | Water | Conductivity Screen (Internal Use Only) | APHA 2510 |
| Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc. | | | |
| HARDNESS-CALC-VA | Water | Hardness | APHA 2340B |
| Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO ₃ equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation. | | | |
| HG-D-CVAA-VA | Water | Diss. Mercury in Water by CVAAS or CVAFS | APHA 3030B/EPA 1631E (mod) |

Reference Information

Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.

HG-T-CVAA-VA Water Total Mercury in Water by CVAAS or CVAFS EPA 1631E (mod)

Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.

IONBALANCE-VA Water Ion Balance Calculation APHA 1030E

Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero.

Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as:

Ion Balance (%) = [Cation Sum-Anion Sum] / [Cation Sum+Anion Sum]

MET-D-CCMS-VA Water Dissolved Metals in Water by CRC ICPMS APHA 3030B/6020A (mod)

Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

MET-T-CCMS-VA Water Total Metals in Water by CRC ICPMS EPA 200.2/6020A (mod)

Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

NH3-F-VA Water Ammonia in Water by Fluorescence APHA 4500 NH3-NITROGEN (AMMONIA)

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NH3-F-VA Water Ammonia in Water by Fluorescence J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NO2-L-IC-N-VA Water Nitrite in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO3-L-IC-N-VA Water Nitrate in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

SO4-IC-N-VA Water Sulfate in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

TDS-CALC-VA Water TDS (Calculated) APHA 1030E (20TH EDITION)

This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses". The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample.

TSS-VA Water Total Suspended Solids by Gravimetric APHA 2540 D - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location |
|----------------------------|---------------------|
|----------------------------|---------------------|

| | |
|----|---|
| VA | ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA |

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg ww - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Reference Information

QC Samples with Qualifiers & Comments:

| QC Type Description | Parameter | Qualifier | Applies to Sample Number(s) |
|---------------------|--------------------------|-----------|------------------------------------|
| Matrix Spike | Dissolved Organic Carbon | MS-B | L1957575-6, -7 |
| Matrix Spike | Dissolved Organic Carbon | MS-B | L1957575-6, -7 |
| Matrix Spike | Aluminum (Al)-Total | MS-B | L1957575-1, -2, -3, -4, -5, -6, -7 |
| Matrix Spike | Sodium (Na)-Total | MS-B | L1957575-1, -2, -3, -4, -5, -6, -7 |
| Matrix Spike | Sulfur (S)-Total | MS-B | L1957575-1, -2, -3, -4, -5, -6, -7 |

Qualifiers for Individual Parameters Listed:

| Qualifier | Description |
|-----------|--|
| DLM | Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity). |
| MS-B | Matrix Spike recovery could not be accurately calculated due to high analyte background in sample. |

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|---|--------|--|---------------------------------------|
| ALK-TITR-VA | Water | Alkalinity Species by Titration | APHA 2320 Alkalinity |
| This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values. | | | |
| ANIONS-N+N-CALC-VA | Water | Nitrite & Nitrate in Water (Calculation) | EPA 300.0 |
| Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N). | | | |
| BE-D-L-CCMS-VA | Water | Diss. Be (low) in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| BE-T-L-CCMS-VA | Water | Total Be (Low) in Water by CRC ICPMS | EPA 200.2/6020A (mod) |
| Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| CARBONS-DOC-VA | Water | Dissolved organic carbon by combustion | APHA 5310B TOTAL ORGANIC CARBON (TOC) |
| This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis. | | | |
| CL-IC-N-VA | Water | Chloride in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| EC-PCT-VA | Water | Conductivity (Automated) | APHA 2510 Auto. Conduc. |
| This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode. | | | |
| EC-SCREEN-VA | Water | Conductivity Screen (Internal Use Only) | APHA 2510 |
| Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc. | | | |
| HARDNESS-CALC-VA | Water | Hardness | APHA 2340B |
| Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation. | | | |
| HG-D-CVAA-VA | Water | Diss. Mercury in Water by CVAAS or CVAFS | APHA 3030B/EPA 1631E (mod) |
| Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | | | |
| HG-T-CVAA-VA | Water | Total Mercury in Water by CVAAS or CVAFS | EPA 1631E (mod) |
| Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | | | |
| IONBALANCE-VA | Water | Ion Balance Calculation | APHA 1030E |
| Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero. | | | |
| Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as: | | | |

Reference Information

Ion Balance (%) = [Cation Sum-Anion Sum] / [Cation Sum+Anion Sum]

MET-D-CCMS-VA Water Dissolved Metals in Water by CRC ICPMS APHA 3030B/6020A (mod)

Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

MET-T-CCMS-VA Water Total Metals in Water by CRC ICPMS EPA 200.2/6020A (mod)

Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

NH3-F-VA Water Ammonia in Water by Fluorescence APHA 4500 NH3-NITROGEN (AMMONIA)

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NH3-F-VA Water Ammonia in Water by Fluorescence J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NO2-L-IC-N-VA Water Nitrite in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO3-L-IC-N-VA Water Nitrate in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

SO4-IC-N-VA Water Sulfate in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

TDS-CALC-VA Water TDS (Calculated) APHA 1030E (20TH EDITION)

This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses".

The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample.

TSS-VA Water Total Suspended Solids by Gravimetric APHA 2540 D - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius.

Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location |
|----------------------------|---|
| VA | ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA |

Chain of Custody Numbers:

2017-07-12 A

Reference Information

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

Reference Information

QC Samples with Qualifiers & Comments:

| QC Type Description | Parameter | Qualifier | Applies to Sample Number(s) |
|---------------------|--------------------------|-----------|------------------------------------|
| Matrix Spike | Barium (Ba)-Dissolved | MS-B | L1961156-1, -2, -3, -4, -5, -6, -7 |
| Matrix Spike | Calcium (Ca)-Dissolved | MS-B | L1961156-1, -2, -3, -4, -5, -6, -7 |
| Matrix Spike | Copper (Cu)-Dissolved | MS-B | L1961156-1, -2, -3, -4, -5, -6, -7 |
| Matrix Spike | Magnesium (Mg)-Dissolved | MS-B | L1961156-1, -2, -3, -4, -5, -6, -7 |
| Matrix Spike | Manganese (Mn)-Dissolved | MS-B | L1961156-1, -2, -3, -4, -5, -6, -7 |
| Matrix Spike | Sodium (Na)-Dissolved | MS-B | L1961156-1, -2, -3, -4, -5, -6, -7 |
| Matrix Spike | Strontium (Sr)-Dissolved | MS-B | L1961156-1, -2, -3, -4, -5, -6, -7 |
| Matrix Spike | Aluminum (Al)-Total | MS-B | L1961156-1, -2, -3, -4, -5, -6, -7 |
| Matrix Spike | Barium (Ba)-Total | MS-B | L1961156-1, -2, -3, -4, -5, -6, -7 |
| Matrix Spike | Calcium (Ca)-Total | MS-B | L1961156-1, -2, -3, -4, -5, -6, -7 |
| Matrix Spike | Magnesium (Mg)-Total | MS-B | L1961156-1, -2, -3, -4, -5, -6, -7 |
| Matrix Spike | Manganese (Mn)-Total | MS-B | L1961156-1, -2, -3, -4, -5, -6, -7 |
| Matrix Spike | Molybdenum (Mo)-Total | MS-B | L1961156-1, -2, -3, -4, -5, -6, -7 |
| Matrix Spike | Nickel (Ni)-Total | MS-B | L1961156-1, -2, -3, -4, -5, -6, -7 |
| Matrix Spike | Potassium (K)-Total | MS-B | L1961156-1, -2, -3, -4, -5, -6, -7 |
| Matrix Spike | Silicon (Si)-Total | MS-B | L1961156-1, -2, -3, -4, -5, -6, -7 |
| Matrix Spike | Sodium (Na)-Total | MS-B | L1961156-1, -2, -3, -4, -5, -6, -7 |
| Matrix Spike | Strontium (Sr)-Total | MS-B | L1961156-1, -2, -3, -4, -5, -6, -7 |
| Matrix Spike | Sulfur (S)-Total | MS-B | L1961156-1, -2, -3, -4, -5, -6, -7 |
| Matrix Spike | Uranium (U)-Total | MS-B | L1961156-1, -2, -3, -4, -5, -6, -7 |

Qualifiers for Individual Parameters Listed:

| Qualifier | Description |
|-----------|--|
| DLM | Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity). |
| MS-B | Matrix Spike recovery could not be accurately calculated due to high analyte background in sample. |

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|--|--------|---|---------------------------------------|
| ALK-TITR-VA | Water | Alkalinity Species by Titration | APHA 2320 Alkalinity |
| This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values. | | | |
| ANIONS-N+N-CALC-WR | Water | Nitrite & Nitrate Nitrogen | EPA 300.1 |
| Nitrate and Nitrite Nitrogen is determined by calculation from the individual Nitrate and Nitrite Nitrogen analyses by Ion Chromatography with UV absorbance. | | | |
| BE-D-L-CCMS-VA | Water | Diss. Be (low) in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| BE-T-L-CCMS-VA | Water | Total Be (Low) in Water by CRC ICPMS | EPA 200.2/6020A (mod) |
| Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| CARBONS-DOC-VA | Water | Dissolved organic carbon by combustion | APHA 5310B TOTAL ORGANIC CARBON (TOC) |
| This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis. | | | |
| CL-L-IC-N-WR | Water | Chloride in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| EC-PCT-VA | Water | Conductivity (Automated) | APHA 2510 Auto. Conduc. |
| This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode. | | | |
| EC-SCREEN-VA | Water | Conductivity Screen (Internal Use Only) | APHA 2510 |

Reference Information

Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc.

HARDNESS-CALC-VA Water Hardness APHA 2340B

Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO₃ equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation.

HG-D-CVAA-VA Water Diss. Mercury in Water by CVAAS or CVAFS APHA 3030B/EPA 1631E (mod)

Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.

HG-T-CVAA-VA Water Total Mercury in Water by CVAAS or CVAFS EPA 1631E (mod)

Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.

IONBALANCE-VA Water Ion Balance Calculation APHA 1030E

Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero.

Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as:

Ion Balance (%) = $\frac{[\text{Cation Sum} - \text{Anion Sum}]}{[\text{Cation Sum} + \text{Anion Sum}]}$

MET-D-CCMS-VA Water Dissolved Metals in Water by CRC ICPMS APHA 3030B/6020A (mod)

Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

MET-T-CCMS-VA Water Total Metals in Water by CRC ICPMS EPA 200.2/6020A (mod)

Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

NH3-F-VA Water Ammonia in Water by Fluorescence APHA 4500 NH3-NITROGEN (AMMONIA)

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NH3-F-VA Water Ammonia in Water by Fluorescence J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NO2-L-IC-N-WR Water Nitrite in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO3-L-IC-N-WR Water Nitrate in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

SO4-IC-WR Water Sulfate in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

TDS-CALC-VA Water TDS (Calculated) APHA 1030E (20TH EDITION)

This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses".

The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample.

TSS-VA Water Total Suspended Solids by Gravimetric APHA 2540 D - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius.

Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.

Reference Information

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location |
|----------------------------|---|
| WR | ALS ENVIRONMENTAL - WHITEHORSE, YUKON, CANADA |
| VA | ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA |

Chain of Custody Numbers:

2017-07-18 A

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

| Matrix Spike | Barium (Ba)-Total | MS-B | L1964854-1, -2, -3, -4, -5 |
| Matrix Spike | Calcium (Ca)-Total | MS-B | L1964854-1, -2, -3, -4, -5 |
| Matrix Spike | Magnesium (Mg)-Total | MS-B | L1964854-1, -2, -3, -4, -5 |
| Matrix Spike | Manganese (Mn)-Total | MS-B | L1964854-1, -2, -3, -4, -5 |
| Matrix Spike | Sodium (Na)-Total | MS-B | L1964854-1, -2, -3, -4, -5 |
| Matrix Spike | Strontium (Sr)-Total | MS-B | L1964854-1, -2, -3, -4, -5 |
| Matrix Spike | Nitrate (as N) | MS-B | L1964854-1, -2, -3, -4, -5 |
| Matrix Spike | Sulfate (SO4) | MS-B | L1964854-1, -2, -3, -4, -5 |

Qualifiers for Individual Parameters Listed:

| Qualifier | Description |
|-----------|---|
| DLM | Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity). |
| DTC | Dissolved concentration exceeds total. Results were confirmed by re-analysis. |
| MB-LOR | Method Blank exceeds ALS DQO. Limits of Reporting have been adjusted for samples with positive hits below 5x blank level. |
| MS-B | Matrix Spike recovery could not be accurately calculated due to high analyte background in sample. |

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|--|--------|--|---------------------------------------|
| ALK-TITR-VA | Water | Alkalinity Species by Titration | APHA 2320 Alkalinity |
| This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values. | | | |
| ANIONS-N+N-CALC-VA | Water | Nitrite & Nitrate in Water (Calculation) | EPA 300.0 |
| Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N). | | | |
| BE-D-L-CCMS-VA | Water | Diss. Be (low) in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| BE-T-L-CCMS-VA | Water | Total Be (Low) in Water by CRC ICPMS | EPA 200.2/6020A (mod) |
| Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| CARBONS-DOC-VA | Water | Dissolved organic carbon by combustion | APHA 5310B TOTAL ORGANIC CARBON (TOC) |
| This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis. | | | |
| CL-IC-N-VA | Water | Chloride in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| EC-PCT-VA | Water | Conductivity (Automated) | APHA 2510 Auto. Conduc. |

Reference Information

This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode.

EC-SCREEN-VA Water Conductivity Screen (Internal Use Only) APHA 2510

Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc.

HARDNESS-CALC-VA Water Hardness APHA 2340B

Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO₃ equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation.

HG-D-CVAA-VA Water Diss. Mercury in Water by CVAAS or CVAFS APHA 3030B/EPA 1631E (mod)

Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.

HG-T-CVAA-VA Water Total Mercury in Water by CVAAS or CVAFS EPA 1631E (mod)

Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.

IONBALANCE-VA Water Ion Balance Calculation APHA 1030E

Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero.

Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as:

Ion Balance (%) = $\frac{[\text{Cation Sum} - \text{Anion Sum}]}{[\text{Cation Sum} + \text{Anion Sum}]}$

MET-D-CCMS-VA Water Dissolved Metals in Water by CRC ICPMS APHA 3030B/6020A (mod)

Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

MET-T-CCMS-VA Water Total Metals in Water by CRC ICPMS EPA 200.2/6020A (mod)

Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

NH3-F-VA Water Ammonia in Water by Fluorescence APHA 4500 NH3-NITROGEN (AMMONIA)

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NH3-F-VA Water Ammonia in Water by Fluorescence J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NO2-L-IC-N-VA Water Nitrite in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO3-L-IC-N-VA Water Nitrate in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

SO4-IC-N-VA Water Sulfate in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

TDS-CALC-VA Water TDS (Calculated) APHA 1030E (20TH EDITION)

This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses".

The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample.

TSS-VA Water Total Suspended Solids by Gravimetric APHA 2540 D - GRAVIMETRIC

Reference Information

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location |
|----------------------------|---|
| VA | ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA |

Chain of Custody Numbers:

2017-07-25 C

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Qualifiers for Individual Parameters Listed:

| Qualifier | Description |
|-----------|--|
| DLM | Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity). |
| MS-B | Matrix Spike recovery could not be accurately calculated due to high analyte background in sample. |

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|--|--------|--------------------------------------|------------------------|
| ALK-TITR-VA | Water | Alkalinity Species by Titration | APHA 2320 Alkalinity |
| This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values. | | | |
| ANIONS-N+N-CALC-WR | Water | Nitrite & Nitrate Nitrogen | EPA 300.1 |
| Nitrate and Nitrite Nitrogen is determined by calculation from the individual Nitrate and Nitrite Nitrogen analyses by Ion Chromatography with UV absorbance. | | | |
| BE-D-L-CCMS-VA | Water | Diss. Be (low) in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |

Reference Information

| | | | |
|---|-------|--|---|
| BE-T-L-CCMS-VA | Water | Total Be (Low) in Water by CRC ICPMS | EPA 200.2/6020A (mod) |
| Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| CARBONS-DOC-VA | Water | Dissolved organic carbon by combustion | APHA 5310B TOTAL ORGANIC CARBON (TOC) |
| This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis. | | | |
| CL-L-IC-N-WR | Water | Chloride in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| EC-PCT-VA | Water | Conductivity (Automated) | APHA 2510 Auto. Conduc. |
| This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode. | | | |
| EC-SCREEN-VA | Water | Conductivity Screen (Internal Use Only) | APHA 2510 |
| Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc. | | | |
| HARDNESS-CALC-VA | Water | Hardness | APHA 2340B |
| Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO ₃ equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation. | | | |
| HG-D-CVAA-VA | Water | Diss. Mercury in Water by CVAAS or CVAFS | APHA 3030B/EPA 1631E (mod) |
| Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | | | |
| HG-T-CVAA-VA | Water | Total Mercury in Water by CVAAS or CVAFS | EPA 1631E (mod) |
| Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | | | |
| IONBALANCE-VA | Water | Ion Balance Calculation | APHA 1030E |
| Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero. | | | |
| Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as: | | | |
| Ion Balance (%) = [Cation Sum-Anion Sum] / [Cation Sum+Anion Sum] | | | |
| MET-D-CCMS-VA | Water | Dissolved Metals in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| MET-T-CCMS-VA | Water | Total Metals in Water by CRC ICPMS | EPA 200.2/6020A (mod) |
| Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| NH3-F-VA | Water | Ammonia in Water by Fluorescence | APHA 4500 NH ₃ -NITROGEN (AMMONIA) |
| This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al. | | | |
| NH3-F-VA | Water | Ammonia in Water by Fluorescence | J. ENVIRON. MONIT., 2005, 7, 37-42, RSC |
| This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al. | | | |
| NO2-L-IC-N-WR | Water | Nitrite in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| NO3-L-IC-N-WR | Water | Nitrate in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| PH-PCT-VA | Water | pH by Meter (Automated) | APHA 4500-H pH Value |

Reference Information

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

| | | | |
|----------------------|-------|-------------------------------------|-----------------|
| RA226-MMER-FC | Water | Ra226 by Alpha Scint, MDC=0.01 Bq/L | EPA 903.1 |
| SO4-IC-WR | Water | Sulfate in Water by IC | EPA 300.1 (mod) |

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

| | | | |
|--------------------|-------|------------------|---------------------------|
| TDS-CALC-VA | Water | TDS (Calculated) | APHA 1030E (20TH EDITION) |
|--------------------|-------|------------------|---------------------------|

This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses".

The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample.

| | | | |
|---------------|-------|---------------------------------------|---------------------------|
| TSS-VA | Water | Total Suspended Solids by Gravimetric | APHA 2540 D - GRAVIMETRIC |
|---------------|-------|---------------------------------------|---------------------------|

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius.

Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location |
|----------------------------|---|
| FC | ALS ENVIRONMENTAL - FORT COLLINS, COLORADO, USA |
| WR | ALS ENVIRONMENTAL - WHITEHORSE, YUKON, CANADA |
| VA | ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA |

Chain of Custody Numbers:

2017-08-02 A

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Wednesday, August 23, 2017

Shane Stack

Re: ALS Workorder: 1708173
Project Name:
Project Number: L1969064

Dear Mr. Stack:

One water sample was received from ALS Environmental, on 8/9/2017. The sample was scheduled for the following analysis:

Radium-226

The results for these analyses are contained in the enclosed reports.

The data contained in the following report have been reviewed and approved by the personnel listed below. In addition, ALS certifies that the analyses reported herein are true, complete and correct within the limits of the methods employed.

Thank you for your confidence in ALS Environmental. Should you have any questions, please call.

Sincerely,

ALS Environmental

For Shiloh J. Summy
Project Manager

ALS Environmental – Fort Collins is accredited by the following accreditation bodies for various testing scopes in accordance with requirements of each accreditation body. All testing is performed under the laboratory management system, which is maintained to meet these requirement and regulations. Please contact the laboratory or accreditation body for the current scope testing parameters.

DEFINITIONS: On the Air Waybill 'We', 'Our', 'us' and 'FedEx' refer to Federal Express Corporation, its subsidiaries and branches and their respective employees, agents and independent contractors. 'You' and 'your' refer to the shipper, its employees, principals and agents. If your shipment originates outside the United States, your contract of carriage is with the Federal Express subsidiary, branch or independent contractor who originally accepts the shipment from you. 'Package' means any container or envelope that is accepted by us for delivery, including any such items tendered to you utilizing our automated systems, meters, manifests or waybills. 'Shipment' means all packages, which are tendered to and accepted by us on a single Air Waybill.

AGREEMENT TO TERMS. By giving us your shipment, you agree, regardless of whether you sign the front of this Air Waybill, for yourself and as agent for and on behalf of any other person having an interest in this shipment, to all terms on this NON-NEGOTIABLE Air Waybill. In any applicable tariff, and in our current Service Guide or Standard Conditions of Carriage, copies of which are available upon request. If there is a conflict between this Air Waybill and either the tariff, Service Guide or Standard Conditions then in effect, the tariff and the terms of any customer automation agreement between the shipper and Federal Express will control (the Service Guide or Standard Conditions have secondary priority). No one is authorized to alter or modify the terms of our agreement. This Air Waybill shall be binding on us when the shipment is accepted.

YOUR OBLIGATIONS: You warrant that each article in the shipment is properly described on this Air Waybill and is acceptable for transport by us, and that the shipment is properly marked, addressed (including postal codes) and packaged to ensure safe transportation with ordinary care in handling.

NOTE CONCERNING LIMITATIONS OF LIABILITY. Air Carriage Notice. If the carriage of your shipment by air involves an ultimate destination or stop in a country other than the country of departure, the Warsaw Convention, an International treaty relating to international carriage by air, may be applicable, which treaty would then govern and in most cases limit our liability for loss or delay of or damage to your shipment. In the U.S. the Warsaw Convention limits our liability to U.S. \$9.07 per pound (U.S. \$20.38 per kilogram). Unless you declare a higher value for carriage as described below. The interpretation of the Warsaw Convention liability limits may vary in other countries. There are no stopping places which are agreed at the time of tender of the shipment and we reserve the right to route shipments in anyway we deem appropriate.

Road Transport Notice. Shipments transported partly or solely by road be it explicit agreement to do so or not-to, to, from a country which is party to the Convention on the Contract for the International Carriage of Goods by Road (the 'CMR') are subject to the terms and conditions of the CMR, notwithstanding any other provisions of this Agreement to the contrary. For these shipments transported solely by road, if a conflict arises between the provisions of the CMR and this Air Waybill the terms of the CMR shall prevail.

Limitation of Liability, if not governed by the Warsaw Convention or the CMR as described above, our maximum liability for loss, damage or delay is limited by this Air Waybill to U.S. \$100 per shipment or U.S. \$9.07 per pound (U.S. \$20.38 per kilo) (or equivalent local currency), whichever is greater, unless you declare a higher value for carriage as described below. FedEx does not provide cargo liability or all-risk insurance, but you may pay an additional charge to each additional U.S. \$100 (or equivalent local currency) of declared value for carriage. If a higher value for carriage is declared and the additional charge is paid, FedEx maximum liability will be the lesser of the declared value for carriage or your actual damages.

LIABILITIES NOT ASSUMED. IN ANY EVENT, WE WON'T BE LIABLE FOR ANY DAMAGES WHETHER DIRECT, INCIDENTAL, SPECIAL OR CONSEQUENTIAL, IN EXCESS OF THE DECLARED VALUE FOR CARRIAGE (INCLUDING BUT NOT LIMITED TO LOSS OF INCOME OR PROFITS) WHETHER OR NOT WE HAD ANY KNOWLEDGE THAT SUCH DAMAGES MIGHT BE INCURRED, UNLESS SUCH DAMAGES WERE CAUSED BY OUR OWN WILLFUL MICONDUCT OR GROSS NEGLIGENCE.

We won't be liable for your actions or omissions, including but not limited to incorrect declaration of cargo, improper or insufficient packing, securing, marking or addressing of the shipment, or for the acts or omissions of the recipient or anyone else with an interest in the shipment. Also we won't be liable if you (or) the recipient violate any of the terms of our agreement. We won't be liable for loss of or damage to shipments of cash, currency or other prohibited items. We won't be liable for loss, damage or delay caused by events we cannot control, including but not limited to acts of God, perils of the air, weather conditions mechanical delays, acts of public enemies, war, strikes, civil commotions, or acts or omissions of public authorities (including customs and health officials) with actual or apparent authority.

NO WARRANTIES. We make no warranties, express or implied. CLAIM FOR LOSS, DAMAGE FOR DELAY. ALL CLAIMS MUST BE NOTIFIED TO US WITHIN 15 DAYS AFTER DELIVERY OF THE SHIPMENT FAILING WHICH NO ACTION FOR DAMAGES MAY BE BROUGHT. All claims for loss, non-delivery or mis-delivery must be received by us within 90 days after the shipment is accepted by us. The right to damages against us shall be extinguished unless an action is brought within two years from the date of delivery of the shipment or from date on which the shipment should have been delivered. Within 30 days after notification to us (of) the claim, it must be documented by sending us all relevant information about it. We are not obligated to act on any claim until all transportation charges have been paid; the claim amount may not be deducted from those charges. If the recipient accepts the shipment without noting any damage on the delivery record, we will assume the shipment was delivered in good condition. In order for us to consider a claim for damages, the contents, original shipping cartons, and packing must be available to us for inspection.

RIGHT TO INSPECT. Your shipment may, at our option or at the request of governmental authorities, be opened and inspected by us or such authorities or us at any time. CUSTOMS CLEARANCE. It is your responsibility to provide proper customs documentation and confirmation, where required. EXPORT CONTROL. You authorize Federal Express to act as forwarding agent for you for export control and customs purposes. You hereby certify that all statements and information contained in this air waybill relating to exportation are true and correct. Furthermore, you understand that civil and criminal penalties, including forfeiture and sale, may be imposed for making false or fraudulent statements or for the violation of any United States laws on exportation, including but not limited to, 13 USC Sec. 305, 22 USC Sec. 401; 18 USC Sec. 1001; 50 USC app. 2410.

MANDATORY LAW. Insofar as any provision contained or referred to in this air Waybill may be contrary to any applicable international treaty, law government regulations, orders or requirements such provision shall remain in effect as a part of our agreement to the extent that it is not overridden. The invalidity or unenforceability of any provision shall not affect any other part of this Air Waybill. Unless otherwise indicated the Sender's address indicated on the face of this Waybill is the place of execution and the place of departure, and Recipient's address listed on the face of this Waybill is the place of destination. Unless otherwise indicated Federal Express Corporation, P.O. Box 727, Memphis, TN 38194 USA is the first carrier of this shipment.

- After printing this label:
CONSIGNEE COPY - PLEASE PLACE IN FRONT OF POUCH
 1. Fold the printed page along the horizontal line.
 2. Place label in shipping pouch and affix it to your shipment.

Collection Date: 8/1/2017

Percent Moisture:

| Analyses | Result | Qual | Report Limit | Units | Dilution Factor | Date Analyzed |
|----------|--------|------|--------------|-------|-----------------|---------------|
|----------|--------|------|--------------|-------|-----------------|---------------|

Explanation of Qualifiers

Radiochemistry:

- U or ND - Result is less than the sample specific MDC.
- Y1 - Chemical Yield is in control at 100-110%. Quantitative yield is assumed.
- Y2 - Chemical Yield outside default limits.
- W - DER is greater than Warning Limit of 1.42
- * - Aliquot Basis is 'As Received' while the Report Basis is 'Dry Weight'.
- # - Aliquot Basis is 'Dry Weight' while the Report Basis is 'As Received'.
- G - Sample density differs by more than 15% of LCS density.
- D - DER is greater than Control Limit
- M - Requested MDC not met.
- LT - Result is less than requested MDC but greater than achieved MDC.
- M3 - The requested MDC was not met, but the reported activity is greater than the reported MDC.
- L - LCS Recovery below lower control limit.
- H - LCS Recovery above upper control limit.
- P - LCS, Matrix Spike Recovery within control limits.
- N - Matrix Spike Recovery outside control limits
- NC - Not Calculated for duplicate results less than 5 times MDC
- B - Analyte concentration greater than MDC.
- B3 - Analyte concentration greater than MDC but less than Requested MDC.

Inorganics:

- B - Result is less than the requested reporting limit but greater than the instrument method detection limit (MDL).
- U or ND - Indicates that the compound was analyzed for but not detected.
- E - The reported value is estimated because of the presence of interference. An explanatory note may be included in the narrative.
- M - Duplicate injection precision was not met.
- N - Spiked sample recovery not within control limits. A post spike is analyzed for all ICP analyses when the matrix spike and or spike duplicate fail and the native sample concentration is less than four times the spike added concentration.
- Z - Spiked recovery not within control limits. An explanatory note may be included in the narrative.
- * - Duplicate analysis (relative percent difference) not within control limits.
- S - SAR value is estimated as one or more analytes used in the calculation were not detected above the detection limit.

Organics:

- U or ND - Indicates that the compound was analyzed for but not detected.
- B - Analyte is detected in the associated method blank as well as in the sample. It indicates probable blank contamination and warns the data user.
- E - Analyte concentration exceeds the upper level of the calibration range.
- J - Estimated value. The result is less than the reporting limit but greater than the instrument method detection limit (MDL).
- A - A tentatively identified compound is a suspected aldol-condensation product.
- X - The analyte was diluted below an accurate quantitation level.
- * - The spike recovery is equal to or outside the control criteria used.
- + - The relative percent difference (RPD) equals or exceeds the control criteria.
- G - A pattern resembling gasoline was detected in this sample.
- D - A pattern resembling diesel was detected in this sample.
- M - A pattern resembling motor oil was detected in this sample.
- C - A pattern resembling crude oil was detected in this sample.
- 4 - A pattern resembling JP-4 was detected in this sample.
- 5 - A pattern resembling JP-5 was detected in this sample.
- H - Indicates that the fuel pattern was in the heavier end of the retention time window for the analyte of interest.
- L - Indicates that the fuel pattern was in the lighter end of the retention time window for the analyte of interest.
- Z - This flag indicates that a significant fraction of the reported result did not resemble the patterns of any of the following petroleum hydrocarbon products:
 - gasoline
 - JP-8
 - diesel
 - mineral spirits
 - motor oil
 - Stoddard solvent
 - bunker C

Reference Information

QC Samples with Qualifiers & Comments:

| QC Type Description | Parameter | Qualifier | Applies to Sample Number(s) |
|---------------------|----------------------|-----------|-----------------------------|
| Method Blank | Zinc (Zn)-Dissolved | MB-LOR | L1972393-1, -2, -3, -4, -5 |
| Matrix Spike | Aluminum (Al)-Total | MS-B | L1972393-1, -2, -3, -4, -5 |
| Matrix Spike | Calcium (Ca)-Total | MS-B | L1972393-1, -2, -3, -4, -5 |
| Matrix Spike | Magnesium (Mg)-Total | MS-B | L1972393-1, -2, -3, -4, -5 |
| Matrix Spike | Manganese (Mn)-Total | MS-B | L1972393-1, -2, -3, -4, -5 |
| Matrix Spike | Potassium (K)-Total | MS-B | L1972393-1, -2, -3, -4, -5 |
| Matrix Spike | Sodium (Na)-Total | MS-B | L1972393-1, -2, -3, -4, -5 |
| Matrix Spike | Strontium (Sr)-Total | MS-B | L1972393-1, -2, -3, -4, -5 |
| Matrix Spike | Sulfur (S)-Total | MS-B | L1972393-1, -2, -3, -4, -5 |

Qualifiers for Individual Parameters Listed:

| Qualifier | Description |
|-----------|---|
| DLA | Detection Limit adjusted for required dilution |
| DLB | Detection Limit Raised. Analyte detected at comparable level in Method Blank. |
| DLM | Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity). |
| MB-LOR | Method Blank exceeds ALS DQO. Limits of Reporting have been adjusted for samples with positive hits below 5x blank level. |
| MS-B | Matrix Spike recovery could not be accurately calculated due to high analyte background in sample. |

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|--|--------|--|---------------------------------------|
| ALK-TITR-VA | Water | Alkalinity Species by Titration | APHA 2320 Alkalinity |
| This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values. | | | |
| ANIONS-N+N-CALC-WR | Water | Nitrite & Nitrate Nitrogen | EPA 300.1 |
| Nitrate and Nitrite Nitrogen is determined by calculation from the individual Nitrate and Nitrite Nitrogen analyses by Ion Chromatography with UV absorbance. | | | |
| BE-D-L-CCMS-VA | Water | Diss. Be (low) in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| BE-T-L-CCMS-VA | Water | Total Be (Low) in Water by CRC ICPMS | EPA 200.2/6020A (mod) |
| Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| CARBONS-DOC-VA | Water | Dissolved organic carbon by combustion | APHA 5310B TOTAL ORGANIC CARBON (TOC) |
| This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis. | | | |
| CL-L-IC-N-WR | Water | Chloride in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| EC-PCT-VA | Water | Conductivity (Automated) | APHA 2510 Auto. Conduc. |
| This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode. | | | |
| EC-SCREEN-VA | Water | Conductivity Screen (Internal Use Only) | APHA 2510 |
| Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc. | | | |
| HARDNESS-CALC-VA | Water | Hardness | APHA 2340B |
| Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation. | | | |
| HG-D-CVAA-VA | Water | Diss. Mercury in Water by CVAAS or CVAFS | APHA 3030B/EPA 1631E (mod) |
| Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | | | |
| HG-T-CVAA-VA | Water | Total Mercury in Water by CVAAS or CVAFS | EPA 1631E (mod) |

Reference Information

Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.

IONBALANCE-VA Water Ion Balance Calculation APHA 1030E

Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero.

Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as:

Ion Balance (%) = [Cation Sum-Anion Sum] / [Cation Sum+Anion Sum]

MET-D-CCMS-VA Water Dissolved Metals in Water by CRC ICPMS APHA 3030B/6020A (mod)

Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

MET-T-CCMS-VA Water Total Metals in Water by CRC ICPMS EPA 200.2/6020A (mod)

Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

NH3-F-VA Water Ammonia in Water by Fluorescence APHA 4500 NH3-NITROGEN (AMMONIA)

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NH3-F-VA Water Ammonia in Water by Fluorescence J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NO2-L-IC-N-WR Water Nitrite in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO3-L-IC-N-WR Water Nitrate in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

SO4-IC-WR Water Sulfate in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

TDS-CALC-VA Water TDS (Calculated) APHA 1030E (20TH EDITION)

This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses". The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample.

TSS-MAN-WR Water Total Suspended Solids by Gravimetric APHA 2540 D

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids are determined by filtering a sample through a glass fibre filter and drying the filter at 104 degrees celsius.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location |
|----------------------------|---|
| WR | ALS ENVIRONMENTAL - WHITEHORSE, YUKON, CANADA |
| VA | ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA |

Chain of Custody Numbers:

2017-08-09 A

Reference Information

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Chain of Custody (COC) / Analytical Request Form

Reference Information

QC Samples with Qualifiers & Comments:

| QC Type Description | Parameter | Qualifier | Applies to Sample Number(s) |
|---------------------|--------------------------|-----------|-----------------------------|
| Matrix Spike | Dissolved Organic Carbon | MS-B | L1976078-1, -2, -3, -4 |
| Matrix Spike | Barium (Ba)-Dissolved | MS-B | L1976078-1, -2, -3, -4 |
| Matrix Spike | Calcium (Ca)-Dissolved | MS-B | L1976078-1, -2, -3, -4 |
| Matrix Spike | Copper (Cu)-Dissolved | MS-B | L1976078-1, -2, -3, -4 |
| Matrix Spike | Magnesium (Mg)-Dissolved | MS-B | L1976078-1, -2, -3, -4 |
| Matrix Spike | Manganese (Mn)-Dissolved | MS-B | L1976078-1, -2, -3, -4 |
| Matrix Spike | Potassium (K)-Dissolved | MS-B | L1976078-1, -2, -3, -4 |
| Matrix Spike | Sodium (Na)-Dissolved | MS-B | L1976078-1, -2, -3, -4 |
| Matrix Spike | Strontium (Sr)-Dissolved | MS-B | L1976078-1, -2, -3, -4 |
| Matrix Spike | Sulfur (S)-Dissolved | MS-B | L1976078-1, -2, -3, -4 |
| Matrix Spike | Barium (Ba)-Total | MS-B | L1976078-1, -2, -3, -4 |
| Matrix Spike | Calcium (Ca)-Total | MS-B | L1976078-1, -2, -3, -4 |
| Matrix Spike | Copper (Cu)-Total | MS-B | L1976078-1, -2, -3, -4 |
| Matrix Spike | Magnesium (Mg)-Total | MS-B | L1976078-1, -2, -3, -4 |
| Matrix Spike | Manganese (Mn)-Total | MS-B | L1976078-1, -2, -3, -4 |
| Matrix Spike | Sodium (Na)-Total | MS-B | L1976078-1, -2, -3, -4 |
| Matrix Spike | Strontium (Sr)-Total | MS-B | L1976078-1, -2, -3, -4 |
| Matrix Spike | Sulfur (S)-Total | MS-B | L1976078-1, -2, -3, -4 |

Qualifiers for Individual Parameters Listed:

| Qualifier | Description |
|-----------|--|
| DTC | Dissolved concentration exceeds total. Results were confirmed by re-analysis. |
| MS-B | Matrix Spike recovery could not be accurately calculated due to high analyte background in sample. |

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|--|--------|---|---------------------------------------|
| ALK-TITR-VA | Water | Alkalinity Species by Titration | APHA 2320 Alkalinity |
| This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values. | | | |
| ANIONS-N+N-CALC-WR | Water | Nitrite & Nitrate Nitrogen | EPA 300.1 |
| Nitrate and Nitrite Nitrogen is determined by calculation from the individual Nitrate and Nitrite Nitrogen analyses by Ion Chromatography with UV absorbance. | | | |
| BE-D-L-CCMS-VA | Water | Diss. Be (low) in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| BE-T-L-CCMS-VA | Water | Total Be (Low) in Water by CRC ICPMS | EPA 200.2/6020A (mod) |
| Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| CARBONS-DOC-VA | Water | Dissolved organic carbon by combustion | APHA 5310B TOTAL ORGANIC CARBON (TOC) |
| This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis. | | | |
| CL-IC-N-WR | Water | Chloride in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| EC-PCT-VA | Water | Conductivity (Automated) | APHA 2510 Auto. Conduc. |
| This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode. | | | |
| EC-SCREEN-VA | Water | Conductivity Screen (Internal Use Only) | APHA 2510 |
| Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc. | | | |
| HARDNESS-CALC-VA | Water | Hardness | APHA 2340B |

Reference Information

Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO₃ equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation.

HG-D-CVAA-VA Water Diss. Mercury in Water by CVAAS or CVAFS APHA 3030B/EPA 1631E (mod)

Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.

HG-T-CVAA-VA Water Total Mercury in Water by CVAAS or CVAFS EPA 1631E (mod)

Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.

IONBALANCE-VA Water Ion Balance Calculation APHA 1030E

Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero.

Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as:

Ion Balance (%) = [Cation Sum-Anion Sum] / [Cation Sum+Anion Sum]

MET-D-CCMS-VA Water Dissolved Metals in Water by CRC ICPMS APHA 3030B/6020A (mod)

Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

MET-T-CCMS-VA Water Total Metals in Water by CRC ICPMS EPA 200.2/6020A (mod)

Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

NH3-F-VA Water Ammonia in Water by Fluorescence APHA 4500 NH3-NITROGEN (AMMONIA)

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NH3-F-VA Water Ammonia in Water by Fluorescence J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NO2-L-IC-N-WR Water Nitrite in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO3-L-IC-N-WR Water Nitrate in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

SO4-IC-WR Water Sulfate in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

TDS-CALC-VA Water TDS (Calculated) APHA 1030E (20TH EDITION)

This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses". The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample.

TSS-MAN-WR Water Total Suspended Solids by Gravimetric APHA 2540 D

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids are determined by filtering a sample through a glass fibre filter and drying the filter at 104 degrees celsius.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location |
|----------------------------|---------------------|
|----------------------------|---------------------|

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Reference Information

QC Samples with Qualifiers & Comments:

| QC Type Description | Parameter | Qualifier | Applies to Sample Number(s) |
|---------------------|--------------------------|-----------|--|
| Matrix Spike | Dissolved Organic Carbon | MS-B | L1980621-1, -10, -11, -12, -13, -3, -5, -6, -7, -8, -9 |
| Matrix Spike | Chloride (Cl) | MS-B | L1980621-10, -11, -13, -5, -6, -8, -9 |
| Matrix Spike | Barium (Ba)-Dissolved | MS-B | L1980621-1, -10, -11, -12, -13, -2, -3, -4, -5, -6, -7, -8, -9 |
| Matrix Spike | Calcium (Ca)-Dissolved | MS-B | L1980621-1, -10, -11, -12, -13, -2, -3, -4, -5, -6, -7, -8, -9 |
| Matrix Spike | Magnesium (Mg)-Dissolved | MS-B | L1980621-1, -10, -11, -12, -13, -2, -3, -4, -5, -6, -7, -8, -9 |
| Matrix Spike | Manganese (Mn)-Dissolved | MS-B | L1980621-1, -10, -11, -12, -13, -2, -3, -4, -5, -6, -7, -8, -9 |
| Matrix Spike | Sodium (Na)-Dissolved | MS-B | L1980621-1, -10, -11, -12, -13, -2, -3, -4, -5, -6, -7, -8, -9 |
| Matrix Spike | Strontium (Sr)-Dissolved | MS-B | L1980621-1, -10, -11, -12, -13, -2, -3, -4, -5, -6, -7, -8, -9 |
| Matrix Spike | Barium (Ba)-Total | MS-B | L1980621-5 |
| Matrix Spike | Calcium (Ca)-Total | MS-B | L1980621-5 |
| Matrix Spike | Magnesium (Mg)-Total | MS-B | L1980621-5 |
| Matrix Spike | Sodium (Na)-Total | MS-B | L1980621-5 |
| Matrix Spike | Strontium (Sr)-Total | MS-B | L1980621-5 |

Qualifiers for Individual Parameters Listed:

| Qualifier | Description |
|-----------|--|
| DLA | Detection Limit adjusted for required dilution |
| DLDS | Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity. |
| DLM | Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity). |
| MS-B | Matrix Spike recovery could not be accurately calculated due to high analyte background in sample. |

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|--|--------|--|---------------------------------------|
| ALK-TITR-VA | Water | Alkalinity Species by Titration | APHA 2320 Alkalinity |
| This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values. | | | |
| ANIONS-N+N-CALC-VA | Water | Nitrite & Nitrate in Water (Calculation) | EPA 300.0 |
| Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N). | | | |
| BE-D-L-CCMS-VA | Water | Diss. Be (low) in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| BE-T-L-CCMS-VA | Water | Total Be (Low) in Water by CRC ICPMS | EPA 200.2/6020A (mod) |
| Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| CARBONS-DOC-VA | Water | Dissolved organic carbon by combustion | APHA 5310B TOTAL ORGANIC CARBON (TOC) |
| This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis. | | | |
| CL-IC-N-VA | Water | Chloride in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| EC-PCT-VA | Water | Conductivity (Automated) | APHA 2510 Auto. Conduc. |
| This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode. | | | |
| EC-SCREEN-VA | Water | Conductivity Screen (Internal Use Only) | APHA 2510 |
| Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc. | | | |
| HARDNESS-CALC-VA | Water | Hardness | APHA 2340B |
| Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation. | | | |
| HG-D-CVAA-VA | Water | Diss. Mercury in Water by CVAAS or CVAFS | APHA 3030B/EPA 1631E (mod) |

Reference Information

Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.

HG-T-CVAA-VA Water Total Mercury in Water by CVAAS or CVAFS EPA 1631E (mod)

Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.

IONBALANCE-VA Water Ion Balance Calculation APHA 1030E

Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero.

Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as:

$$\text{Ion Balance (\%)} = \frac{[\text{Cation Sum} - \text{Anion Sum}]}{[\text{Cation Sum} + \text{Anion Sum}]}$$

MET-D-CCMS-VA Water Dissolved Metals in Water by CRC ICPMS APHA 3030B/6020A (mod)

Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

MET-T-CCMS-VA Water Total Metals in Water by CRC ICPMS EPA 200.2/6020A (mod)

Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

NH3-F-VA Water Ammonia in Water by Fluorescence APHA 4500 NH3-NITROGEN (AMMONIA)

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NH3-F-VA Water Ammonia in Water by Fluorescence J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NO2-L-IC-N-VA Water Nitrite in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO3-L-IC-N-VA Water Nitrate in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

SO4-IC-N-VA Water Sulfate in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

TDS-CALC-VA Water TDS (Calculated) APHA 1030E (20TH EDITION)

This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses". The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample.

TSS-VA Water Total Suspended Solids by Gravimetric APHA 2540 D - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius.

Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location |
|----------------------------|---------------------|
|----------------------------|---------------------|

| | |
|----|---|
| VA | ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA |
|----|---|

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg ww - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

| Matrix Spike | Magnesium (Mg)-Total | MS-B | L1983900-1, -2, -3 |
| Matrix Spike | Strontium (Sr)-Total | MS-B | L1983900-1, -2, -3 |
| Matrix Spike | Sulfate (SO4) | MS-B | L1983900-1, -2, -3 |

Qualifiers for Individual Parameters Listed:

| Qualifier | Description |
|-----------|--|
| MS-B | Matrix Spike recovery could not be accurately calculated due to high analyte background in sample. |

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|--|--------|--|---------------------------------------|
| ALK-TITR-VA | Water | Alkalinity Species by Titration | APHA 2320 Alkalinity |
| This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values. | | | |
| ANIONS-N+N-CALC-VA | Water | Nitrite & Nitrate in Water (Calculation) | EPA 300.0 |
| Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N). | | | |
| BE-D-L-CCMS-VA | Water | Diss. Be (low) in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| BE-T-L-CCMS-VA | Water | Total Be (Low) in Water by CRC ICPMS | EPA 200.2/6020A (mod) |
| Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS. | | | |
| CARBONS-DOC-VA | Water | Dissolved organic carbon by combustion | APHA 5310B TOTAL ORGANIC CARBON (TOC) |
| This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis. | | | |
| CL-IC-N-VA | Water | Chloride in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| EC-PCT-VA | Water | Conductivity (Automated) | APHA 2510 Auto. Conduc. |
| This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode. | | | |
| EC-SCREEN-VA | Water | Conductivity Screen (Internal Use Only) | APHA 2510 |
| Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc. | | | |
| HARDNESS-CALC-VA | Water | Hardness | APHA 2340B |
| Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation. | | | |
| HG-D-CVAA-VA | Water | Diss. Mercury in Water by CVAAS or CVAFS | APHA 3030B/EPA 1631E (mod) |
| Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | | | |
| HG-T-CVAA-VA | Water | Total Mercury in Water by CVAAS or CVAFS | EPA 1631E (mod) |

Reference Information

Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.

IONBALANCE-VA Water Ion Balance Calculation APHA 1030E

Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero.

Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as:

$$\text{Ion Balance (\%)} = \frac{[\text{Cation Sum} - \text{Anion Sum}]}{[\text{Cation Sum} + \text{Anion Sum}]}$$

MET-D-CCMS-VA Water Dissolved Metals in Water by CRC ICPMS APHA 3030B/6020A (mod)

Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

MET-T-CCMS-VA Water Total Metals in Water by CRC ICPMS EPA 200.2/6020A (mod)

Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

NH3-F-VA Water Ammonia in Water by Fluorescence APHA 4500 NH3-NITROGEN (AMMONIA)

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NH3-F-VA Water Ammonia in Water by Fluorescence J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NO2-L-IC-N-VA Water Nitrite in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO3-L-IC-N-VA Water Nitrate in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

SO4-IC-N-VA Water Sulfate in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

TDS-CALC-VA Water TDS (Calculated) APHA 1030E (20TH EDITION)

This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses". The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample.

TSS-VA Water Total Suspended Solids by Gravimetric APHA 2540 D - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location |
|----------------------------|---|
| VA | ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA |

Chain of Custody Numbers:

2017-08-30 A

Reference Information

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

* Please refer to the Reference Information section for an explanation of any qualifiers detected.

Reference Information

QC Samples with Qualifiers & Comments:

| QC Type Description | Parameter | Qualifier | Applies to Sample Number(s) |
|---------------------|--------------------------|-----------|--|
| Matrix Spike | Dissolved Organic Carbon | MS-B | L1986966-1, -10, -11, -12, -13, -14, -15, -16, -17, -18, -19, -7 |
| Matrix Spike | Barium (Ba)-Dissolved | MS-B | L1986966-12, -13, -14, -2 |
| Matrix Spike | Calcium (Ca)-Dissolved | MS-B | L1986966-12, -13, -14, -2 |
| Matrix Spike | Magnesium (Mg)-Dissolved | MS-B | L1986966-12, -13, -14, -2 |
| Matrix Spike | Sodium (Na)-Dissolved | MS-B | L1986966-12, -13, -14, -2 |
| Matrix Spike | Strontium (Sr)-Dissolved | MS-B | L1986966-12, -13, -14, -2 |
| Matrix Spike | Barium (Ba)-Total | MS-B | L1986966-1, -10, -11, -12, -13, -14, -15, -16, -17, -18, -19, -2, -3, -4, -5, -6, -7, -8, -9 |
| Matrix Spike | Calcium (Ca)-Total | MS-B | L1986966-1, -10, -11, -12, -13, -14, -15, -16, -17, -18, -19, -2, -3, -4, -5, -6, -7, -8, -9 |
| Matrix Spike | Magnesium (Mg)-Total | MS-B | L1986966-1, -10, -11, -12, -13, -14, -15, -16, -17, -18, -19, -2, -3, -4, -5, -6, -7, -8, -9 |
| Matrix Spike | Manganese (Mn)-Total | MS-B | L1986966-1, -10, -11, -12, -13, -14, -15, -16, -17, -18, -19, -2, -3, -4, -5, -6, -7, -8, -9 |
| Matrix Spike | Sodium (Na)-Total | MS-B | L1986966-1, -10, -11, -12, -13, -14, -15, -16, -17, -18, -19, -2, -3, -4, -5, -6, -7, -8, -9 |
| Matrix Spike | Strontium (Sr)-Total | MS-B | L1986966-1, -10, -11, -12, -13, -14, -15, -16, -17, -18, -19, -2, -3, -4, -5, -6, -7, -8, -9 |

Qualifiers for Individual Parameters Listed:

| Qualifier | Description |
|-----------|--|
| DLA | Detection Limit adjusted for required dilution |
| DLDS | Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity. |
| DLM | Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity). |
| MS-B | Matrix Spike recovery could not be accurately calculated due to high analyte background in sample. |

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|--|--------|---|---------------------------------------|
| ALK-TITR-VA | Water | Alkalinity Species by Titration | APHA 2320 Alkalinity |
| This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values. | | | |
| ANIONS-N+N-CALC-WR | Water | Nitrite & Nitrate Nitrogen | EPA 300.1 |
| Nitrate and Nitrite Nitrogen is determined by calculation from the individual Nitrate and Nitrite Nitrogen analyses by Ion Chromatography with UV absorbance. | | | |
| BE-D-L-CCMS-VA | Water | Diss. Be (low) in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| BE-T-L-CCMS-VA | Water | Total Be (Low) in Water by CRC ICPMS | EPA 200.2/6020A (mod) |
| Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS. | | | |
| CARBONS-DOC-VA | Water | Dissolved organic carbon by combustion | APHA 5310B TOTAL ORGANIC CARBON (TOC) |
| This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis. | | | |
| CL-IC-N-WR | Water | Chloride in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| EC-PCT-VA | Water | Conductivity (Automated) | APHA 2510 Auto. Conduc. |
| This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode. | | | |
| EC-SCREEN-VA | Water | Conductivity Screen (Internal Use Only) | APHA 2510 |
| Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc. | | | |
| HARDNESS-CALC-VA | Water | Hardness | APHA 2340B |
| Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation. | | | |

Reference Information

| | | | |
|---|-------|--|---|
| HG-D-CVAA-VA | Water | Diss. Mercury in Water by CVAAS or CVAFS | APHA 3030B/EPA 1631E (mod) |
| Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | | | |
| HG-T-CVAA-VA | Water | Total Mercury in Water by CVAAS or CVAFS | EPA 1631E (mod) |
| Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | | | |
| IONBALANCE-VA | Water | Ion Balance Calculation | APHA 1030E |
| Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero. | | | |
| Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as: | | | |
| Ion Balance (%) = [Cation Sum-Anion Sum] / [Cation Sum+Anion Sum] | | | |
| MET-D-CCMS-VA | Water | Dissolved Metals in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| MET-T-CCMS-VA | Water | Total Metals in Water by CRC ICPMS | EPA 200.2/6020A (mod) |
| Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| NH3-F-VA | Water | Ammonia in Water by Fluorescence | APHA 4500 NH3-NITROGEN (AMMONIA) |
| This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al. | | | |
| NH3-F-VA | Water | Ammonia in Water by Fluorescence | J. ENVIRON. MONIT., 2005, 7, 37-42, RSC |
| This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al. | | | |
| NO2-L-IC-N-WR | Water | Nitrite in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| NO3-L-IC-N-WR | Water | Nitrate in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| PH-PCT-VA | Water | pH by Meter (Automated) | APHA 4500-H pH Value |
| This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode | | | |
| It is recommended that this analysis be conducted in the field. | | | |
| SO4-IC-WR | Water | Sulfate in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| TDS-CALC-VA | Water | TDS (Calculated) | APHA 1030E (20TH EDITION) |
| This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses". | | | |
| The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample. | | | |
| TSS-MAN-WR | Water | Total Suspended Solids by Gravimetric | APHA 2540 D |
| This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids are determined by filtering a sample through a glass fibre filter and drying the filter at 104 degrees celsius. | | | |

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location |
|----------------------------|---|
| WR | ALS ENVIRONMENTAL - WHITEHORSE, YUKON, CANADA |
| | ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA |

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

1.0 INTRODUCTION

Nautilus Environmental Company Inc. conducted sub-lethal toxicity tests for ALS Environmental. Sample L1990955-1 W3 was collected on September 12, 2017 and delivered to the Nautilus Environmental laboratory in Burnaby, BC on September 14, 2017. Testing was initiated on September 14, 2017 for *C. dubia* and *P. subcapitata*. The sample was transported in eight 1-L plastic containers and was received at a temperature of 9.5°C. The sample was stored in the dark at $4 \pm 2^\circ\text{C}$ prior to testing. The following toxicity tests were performed on the sample:

- *Ceriodaphnia dubia* survival and reproduction
- 72-h *Pseudokirchneriella subcapitata* growth inhibition

This report describes the results of these toxicity tests. Copies of raw laboratory data sheets and statistical analyses for each test species are provided in Appendices A and B. The chain-of-custody form is provided in Appendix C.

2.0 METHODS

Methods for the toxicity tests are summarized in Tables 1 and 2. Testing using *C. dubia*, and *P. subcapitata* were conducted according to procedures described by Environment Canada (2007a and 2007b). Statistical analyses for all the tests were performed using CETIS (Tidepool Scientific Software, 2013).

Table 1. Summary of test conditions: *Ceriodaphnia dubia* survival and reproduction test.

| | |
|--|---|
| Test species | <i>Ceriodaphnia dubia</i> |
| Organism source | In-house culture |
| Organism age | <24 hour old neonates, produced within a 12 hour window |
| Test type | Static-renewal |
| Test duration | 7 ± 1 day |
| Test vessel | 20-mL glass test tube |
| Test volume | 15 mL |
| Test solution depth | 10 cm |
| Test concentrations | Seven concentrations, plus laboratory control |
| Test replicates | 10 per treatment |
| Number of organisms | 1 per replicate |
| Control/dilution water | 20% Perrier water and 80% deionized water + 5 µg/L Se and 2 µg/L vitamin B12 |
| Test solution renewal | Daily (100% renewal) |
| Test temperature | 25 ± 1°C |
| Feeding | Daily with <i>Pseudokirchneriella subcapitata</i> and YCT (3:1 ratio) |
| Light intensity | 100 to 600 lux at water surface |
| Photoperiod | 16 hours light / 8 hours dark |
| Aeration | None |
| Test measurements | Temperature, dissolved oxygen, pH and conductivity measured daily; hardness and alkalinity of undiluted sample measured at test initiation; survival and reproduction checked daily |
| Test protocol | Environment Canada (2007a), EPS 1/RM/21 |
| Statistical software | CETIS Version 1.8.7 |
| Test endpoints | Survival and reproduction ≥80% survival; ≥15 young per surviving control producing three broods; ≥60% of controls producing three or more broods; no ephippia present |
| Test acceptability criteria for controls | |
| Reference toxicant | Sodium chloride (NaCl) |

Table 2. Summary of test conditions: *Pseudokirchneriella subcapitata* growth inhibition test.

| | |
|---|--|
| Test species | <i>Lemna minor</i> , strain CPCC# 490 |
| Organism source | In-house axenic culture, obtained from Canadian Phycological Culture Centre, and originally isolated from Wainfleet, Stinking Barn, Niagara Peninsula, Ontario, Canada |
| Organism age | 7- to 10-day old culture |
| Test type | Static |
| Test duration | 7 days |
| Test vessel | 250-mL glass container |
| Test volume | 100 mL |
| Test solution depth | 4 cm |
| Test concentrations | Seven concentrations, plus laboratory control |
| Test replicates | 4 per treatment |
| Number of organisms | Two 3-frond plants per replicate |
| Control/dilution water | Modified APHA media (deionized water plus 1% of each APHA stock solution A, B and C) |
| Test solution renewal | None |
| Test temperature | 25 ± 2°C |
| Feeding | None |
| Light intensity | 4000 to 5600 lux |
| Photoperiod | 24 hours light |
| Aeration | None |
| Test measurements | Test area temperature measured daily; temperature, pH and conductivity measured in all concentrations at test initiation; dissolved oxygen of highest concentration measured at test initiation; temperature and pH measured at test termination |
| Test protocol | Environment Canada (2007b), EPS 1/RM/37 |
| Statistical software | CETIS Version 1.8.7 |
| Test endpoints | Number of fronds and dry weight |
| Test acceptability criterion for controls | ≥ 8-fold increase in number of fronds |
| Reference toxicant | Potassium chloride (KCl) |

3.0 RESULTS

Results of the toxicity tests are summarized in Tables 3 and 4. There were no adverse effects observed on survival and reproduction of *C. dubia* (Table 3), or cell yield of *P. subcapitata* (Table 4). The LC and IC values were therefore greater than the highest test concentration for each of these endpoints in the toxicity tests. Stimulatory effects were observed for *P. subcapitata* cell yield; percent stimulation ranged from 6.72 to 363.9%.

Table 3. Results: *Ceriodaphnia dubia* survival and reproduction test.

| Concentration (% v/v) | Survival (%) | Reproduction (Mean ± SD) |
|------------------------------|--------------|--------------------------|
| Laboratory Control | 100 | 18.3 ± 11.5 |
| 1.56 | 100 | 18.1 ± 7.5 |
| 3.12 | 100 | 23.4 ± 4.1 |
| 6.25 | 100 | 21.0 ± 8.4 |
| 12.5 | 90 | 21.8 ± 8.6 |
| 25 | 100 | 22.0 ± 12.5 |
| 50 | 80 | 13.2 ± 14.7 |
| 100 | 100 | 18.4 ± 11.9 |
| Test Endpoint (% v/v) | | |
| LC50 | >100 | -- |
| IC25 | -- | >100 |
| IC50 | -- | >100 |

SD = Standard Deviation, LC = Lethal Concentration, IC = Inhibition Concentration

Table 4. Results: *Pseudokirchneriella subcapitata* growth inhibition test.

| Concentration (% v/v) | Cell Yield (x 10 ⁴ cells/mL) (Mean ± SD) | Stimulation (%) |
|------------------------------|--|-----------------|
| Laboratory Control | 29.8 ± 2.4 | -- |
| 1.5 | 31.8 ± 3.3 | 6.72 |
| 3.0 | 31.8 ± 1.3 | 6.72 |
| 6.0 | 40.2 ± 3.0* | 35.29 |
| 11.9 | 81.8 ± 4.5* | 174.8 |
| 23.8 | 135.3 ± 5.7* | 354.6 |
| 47.6 | 138.0 ± 8.3* | 363.9 |
| 95.2 | 127.0 ± 3.2* | 326.9 |
| Test Endpoint (% v/v) | | |
| IC25 | >95.2 | -- |
| IC50 | >95.2 | -- |

SD = Standard Deviation, IC = Inhibition Concentration

* = Indicates cell yield that were significantly greater than the control

4.0 QA/QC

The health history of the test organisms used in the exposure was acceptable and met the requirements of the Environment Canada protocol. The tests met all control acceptability criteria and water quality parameters remained within ranges specified in the protocol throughout the tests. There were no deviations from the test methodology. Uncertainty associated with the tests is best described by the standard deviation around the mean and/or the confidence intervals around the point estimates.

Results of the reference toxicant tests conducted during the testing program are summarized in Table 5. These tests were performed under the same conditions as the sample tested. Results for *P. subcapitata* fell within the acceptable range for organism performance of mean and two standard deviation range, based on historical results obtained by the laboratory with these tests. Thus, the sensitivity of the organisms used in this test was appropriate.

Reproduction results fell within the range of mean and two standard deviations in the reference toxicant test with *C. dubia*. However, survival results fell slightly outside of three standard deviations range. A thorough investigation was performed and the results indicated that proper

procedures were followed and that no technical errors occurred during testing. Thus, this may indicate that survival in this batch of organisms used in this test may have been more sensitive compared to previous batches of *C. dubia*.

Table 5. Reference toxicant test results.

| Test Species | Endpoint | Historical Mean (2 SD Range) | CV (%) | Test Date |
|-----------------------|-----------------------------------|---------------------------------|-----------|--------------------|
| <i>C. dubia</i> | Survival (LC50): 1.7 g/L NaCl | 2.0 (1.9 – 2.2) | 5 | September 25, 2017 |
| | Reproduction (IC50): 1.4 g/L NaCl | 1.5 (1.0 – 2.1) | 20 | |
| <i>P. subcapitata</i> | Growth (IC50): 34.9 µg/L Zn | 32.8 (26.5 – 40.5) | 11 | September 22, 2017 |

SD = Standard Deviation, CV = Coefficient of Variation, LC = Lethal Concentration, IC = Inhibition Concentration

APPENDIX A – *Ceriodaphnia dubia* Toxicity Test Data

Ceriodaphnia dubia Summary Sheet

Client: Ais/Minto
 Work Order No.: 170989

Start Date/Time: Sept 14/17 @ 1700h
 Set up by: JS

Sample Information:

Sample ID: L1990955-1 W3
 Sample Date: Sept 12/17
 Date Received: Sept 13/17
 Sample Volume: 8 x 1L^{JS}

Test Validity Criteria:

- 1) Mean survival of first generation controls is $\geq 80\%$
- 2) At least 60% of controls have produced three broods within 8 days
- 3) An average of ≥ 15 live young produced per surviving female in the control solutions during the first three broods.
- 4) Invalid if ephippia observed in any control solution at any time.

WQ Ranges:

T ($^{\circ}$ C) = 25 ± 1 ; DO (mg/L) = 3.3 to 8.4 ; pH = 6.0 to 8.5

Test Organism Information:

Broodstock No.: 090617B
 Age of young (Day 0): <24-h (within 12-h)
 Avg No. young in first 3 broods of previous 7 d: 21
 Mortality (%) in previous 7 d: 0
 Individual female # used ≥ 8 young on test day: 21-29, 31-34, 40, 37, 40
^{JS}
_{JS}

NaCl Reference Toxicant Results:

Reference Toxicant ID: CD167165
 Stock Solution ID: 17NaO5
 Date Initiated: Oct 4/17 Sept 25/17
 7-d LC50 (95% CL): 1.7 (1.3-2.1)^{em} g/L NaCl
 7-d IC50 (95% CL): 1.9 (1.6-2.1)^{em} g/L NaCl
 7-d LC50 Reference Toxicant Mean and Historical Range: 2.0 (1.6-2.5)^{em} g/L NaCl CV (%): 12.5^{em}
 7-d IC50 Reference Toxicant Mean and Historical Range: 1.9 (1.0-2.1)^{em} g/L NaCl CV (%): 20

Test Results:

| | Survival | Reproduction |
|-----------------------|----------|--------------|
| LC50 % (v/v) (95% CL) | 2100 | |
| IC25 % (v/v) (95% CL) | | 7100 |

APPENDIX B – *Pseudokirchneriella subcapitata* Toxicity Test Data

Pseudokirchneriella subcapitata Summary Sheet

Client: ALS/minto
Work Order No.: 170990

Start Date: SEPT 15/17
Set up by: MLI

Sample Information:

Sample ID: L1990955-1 W3
Sample Date: Sept 12/15th 17
Date Received: Sept 14/17
Sample Volume: 8x1L

Test Organism Information:

Culture Date: Sept 8/17
Age of culture (Day 0): 7d

Zinc Reference Toxicant Results:

Reference Toxicant ID: SC161
Stock Solution ID: 17Zn03
Date Initiated: Sept 22/17

72-h IC50 (95% CL): 34.9 (32.9-37.0) µg/L Zn

72-h IC50 Reference Toxicant Mean and Range: 32.8 (26.5-40.5) µg/L Zn CV (%): 11

Test Results:

| | Algal Growth |
|----------------------|--------------|
| IC25 %(v/v) (95% CL) | <u>795.2</u> |
| IC50 %(v/v) (95% CL) | <u>795.2</u> |

72-h Algal Growth Inhibition Toxicity Test Water Quality Measurements

Client: ALS/minto Setup by: MLG
 Sample ID: L1990955-1 WS Test Date/Time: Sept 15/17 @ 0805h
 Work Order No.: 170990 CER #: 4
 Test Species: Pseudokirchneriella subcapitata
 Culture Date: Sept 8/17 Age of Culture: 7d Culture Health: Good
 Culture Count: 1 460 2 445 Average: 452.5 Culture Cell Density (c1): 452.5 x 10⁴ cells/mL

$$v1 = \frac{220,000 \text{ cells/ml} \times 100 \text{ ml}}{(c1) \quad 452.5 \times 10^4 \text{ cells/ml}} = 4.86 \text{ mL}$$

Time Zero Counts: 1 22 2 23 Average: 22.5 #^{10⁴}

No. of Cells/mL: 22.5 x 10⁴ Initial Density: # cells/mL ÷ 220 µL x 10 µL = 10227 cells/mL

Reference Information

QC Samples with Qualifiers & Comments:

| QC Type Description | Parameter | Qualifier | Applies to Sample Number(s) |
|---------------------|--------------------------|-----------|------------------------------------|
| Matrix Spike | Dissolved Organic Carbon | MS-B | L1990965-1, -2, -3, -4, -5, -6, -7 |
| Matrix Spike | Barium (Ba)-Dissolved | MS-B | L1990965-1, -2, -3, -4, -5, -6, -7 |
| Matrix Spike | Calcium (Ca)-Dissolved | MS-B | L1990965-1, -2, -3, -4, -5, -6, -7 |
| Matrix Spike | Copper (Cu)-Dissolved | MS-B | L1990965-1, -2, -3, -4, -5, -6, -7 |
| Matrix Spike | Magnesium (Mg)-Dissolved | MS-B | L1990965-1, -2, -3, -4, -5, -6, -7 |
| Matrix Spike | Manganese (Mn)-Dissolved | MS-B | L1990965-1, -2, -3, -4, -5, -6, -7 |
| Matrix Spike | Potassium (K)-Dissolved | MS-B | L1990965-1, -2, -3, -4, -5, -6, -7 |
| Matrix Spike | Sodium (Na)-Dissolved | MS-B | L1990965-1, -2, -3, -4, -5, -6, -7 |
| Matrix Spike | Strontium (Sr)-Dissolved | MS-B | L1990965-1, -2, -3, -4, -5, -6, -7 |
| Matrix Spike | Sulfur (S)-Dissolved | MS-B | L1990965-1, -2, -3, -4, -5, -6, -7 |
| Matrix Spike | Barium (Ba)-Total | MS-B | L1990965-1, -2, -3, -4, -5, -6, -7 |
| Matrix Spike | Calcium (Ca)-Total | MS-B | L1990965-1, -2, -3, -4, -5, -6, -7 |
| Matrix Spike | Copper (Cu)-Total | MS-B | L1990965-1, -2, -3, -4, -5, -6, -7 |
| Matrix Spike | Magnesium (Mg)-Total | MS-B | L1990965-1, -2, -3, -4, -5, -6, -7 |
| Matrix Spike | Potassium (K)-Total | MS-B | L1990965-1, -2, -3, -4, -5, -6, -7 |
| Matrix Spike | Sodium (Na)-Total | MS-B | L1990965-1, -2, -3, -4, -5, -6, -7 |
| Matrix Spike | Strontium (Sr)-Total | MS-B | L1990965-1, -2, -3, -4, -5, -6, -7 |
| Matrix Spike | Sulfur (S)-Total | MS-B | L1990965-1, -2, -3, -4, -5, -6, -7 |
| Matrix Spike | Uranium (U)-Total | MS-B | L1990965-1, -2, -3, -4, -5, -6, -7 |

Qualifiers for Individual Parameters Listed:

| Qualifier | Description |
|-----------|--|
| DLM | Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity). |
| DTC | Dissolved concentration exceeds total. Results were confirmed by re-analysis. |
| MS-B | Matrix Spike recovery could not be accurately calculated due to high analyte background in sample. |

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|--|--------|---|---------------------------------------|
| ALK-TITR-VA | Water | Alkalinity Species by Titration | APHA 2320 Alkalinity |
| This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values. | | | |
| ANIONS-N+N-CALC-WR | Water | Nitrite & Nitrate Nitrogen | EPA 300.1 |
| Nitrate and Nitrite Nitrogen is determined by calculation from the individual Nitrate and Nitrite Nitrogen analyses by Ion Chromatography with UV absorbance. | | | |
| BE-D-L-CCMS-VA | Water | Diss. Be (low) in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| BE-T-L-CCMS-VA | Water | Total Be (Low) in Water by CRC ICPMS | EPA 200.2/6020A (mod) |
| Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS. | | | |
| CARBONS-DOC-VA | Water | Dissolved organic carbon by combustion | APHA 5310B TOTAL ORGANIC CARBON (TOC) |
| This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis. | | | |
| CL-IC-N-WR | Water | Chloride in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| EC-PCT-VA | Water | Conductivity (Automated) | APHA 2510 Auto. Conduc. |
| This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode. | | | |
| EC-SCREEN-VA | Water | Conductivity Screen (Internal Use Only) | APHA 2510 |
| Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc. | | | |
| HARDNESS-CALC-VA | Water | Hardness | APHA 2340B |

Reference Information

Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO₃ equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation.

HG-D-CVAA-VA Water Diss. Mercury in Water by CVAAS or CVAFS APHA 3030B/EPA 1631E (mod)

Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.

HG-T-CVAA-VA Water Total Mercury in Water by CVAAS or CVAFS EPA 1631E (mod)

Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.

IONBALANCE-VA Water Ion Balance Calculation APHA 1030E

Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero.

Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as:

Ion Balance (%) = [Cation Sum-Anion Sum] / [Cation Sum+Anion Sum]

MET-D-CCMS-VA Water Dissolved Metals in Water by CRC ICPMS APHA 3030B/6020A (mod)

Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

MET-T-CCMS-VA Water Total Metals in Water by CRC ICPMS EPA 200.2/6020A (mod)

Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

NH3-F-VA Water Ammonia in Water by Fluorescence APHA 4500 NH3-NITROGEN (AMMONIA)

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NH3-F-VA Water Ammonia in Water by Fluorescence J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NO2-L-IC-N-WR Water Nitrite in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO3-L-IC-N-WR Water Nitrate in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

SO4-IC-WR Water Sulfate in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

TDS-CALC-VA Water TDS (Calculated) APHA 1030E (20TH EDITION)

This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses". The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample.

TSS-MAN-WR Water Total Suspended Solids by Gravimetric APHA 2540 D

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids are determined by filtering a sample through a glass fibre filter and drying the filter at 104 degrees celsius.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location |
|----------------------------|---------------------|
|----------------------------|---------------------|

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

| Qualifier | Description |
|-----------|--|
| DLM | Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity). |
| MS-B | Matrix Spike recovery could not be accurately calculated due to high analyte background in sample. |

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|--|--------|--|---------------------------------------|
| ALK-TITR-VA | Water | Alkalinity Species by Titration | APHA 2320 Alkalinity |
| This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values. | | | |
| ANIONS-N+N-CALC-VA | Water | Nitrite & Nitrate in Water (Calculation) | EPA 300.0 |
| Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N). | | | |
| BE-D-L-CCMS-VA | Water | Diss. Be (low) in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| BE-T-L-CCMS-VA | Water | Total Be (Low) in Water by CRC ICPMS | EPA 200.2/6020A (mod) |
| Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS. | | | |
| CARBONS-DOC-VA | Water | Dissolved organic carbon by combustion | APHA 5310B TOTAL ORGANIC CARBON (TOC) |
| This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis. | | | |
| CL-IC-N-VA | Water | Chloride in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| EC-PCT-VA | Water | Conductivity (Automated) | APHA 2510 Auto. Conduc. |
| This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode. | | | |
| EC-SCREEN-VA | Water | Conductivity Screen (Internal Use Only) | APHA 2510 |
| Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc. | | | |
| HARDNESS-CALC-VA | Water | Hardness | APHA 2340B |
| Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation. | | | |
| HG-D-CVAA-VA | Water | Diss. Mercury in Water by CVAAS or CVAFS | APHA 3030B/EPA 1631E (mod) |
| Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | | | |
| HG-T-CVAA-VA | Water | Total Mercury in Water by CVAAS or CVAFS | EPA 1631E (mod) |
| Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | | | |
| IONBALANCE-VA | Water | Ion Balance Calculation | APHA 1030E |
| Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) | | | |

Reference Information

should be near-zero.

Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as:

$$\text{Ion Balance (\%)} = \frac{[\text{Cation Sum} - \text{Anion Sum}]}{[\text{Cation Sum} + \text{Anion Sum}]}$$

MET-D-CCMS-VA Water Dissolved Metals in Water by CRC ICPMS APHA 3030B/6020A (mod)

Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

MET-T-CCMS-VA Water Total Metals in Water by CRC ICPMS EPA 200.2/6020A (mod)

Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

NH3-F-VA Water Ammonia in Water by Fluorescence APHA 4500 NH3-NITROGEN (AMMONIA)

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NH3-F-VA Water Ammonia in Water by Fluorescence J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NO2-L-IC-N-VA Water Nitrite in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO3-L-IC-N-VA Water Nitrate in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

SO4-IC-N-VA Water Sulfate in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

TDS-CALC-VA Water TDS (Calculated) APHA 1030E (20TH EDITION)

This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses".

The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample.

TSS-VA Water Total Suspended Solids by Gravimetric APHA 2540 D - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius.

Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

1.0 INTRODUCTION

Nautilus Environmental Company Inc. conducted a *Lemna minor* growth inhibition toxicity test for Minto Explorations Ltd. as part of their requirements under the Metal Mining Effluent Regulations (MMER) and Environmental Effects Monitoring (EEM) program. Sample L1998015-1 W3 was collected on September 26, 2017 and delivered to the Nautilus Environmental laboratory in Burnaby, BC on September 28, 2017. Testing was initiated on September 28, 2017. The sample was transported in two 1-L plastic containers and was received at a temperature of 11°C. The sample was stored in the dark at $4 \pm 2^\circ\text{C}$ prior to testing.

This report describes the results of the *L. minor* toxicity test. Copies of raw laboratory data sheets and statistical analyses are provided in Appendix A. The chain-of-custody form is provided in Appendix B.

2.0 METHODS

Methods for the toxicity tests are summarized in Table 1. Testing was conducted according to procedures described by Environment Canada (2007). Statistical analyses for the test were performed using CETIS (Tidepool Scientific Software, 2013).

Table 1. Summary of test conditions: *Lemna minor* growth inhibition test.

| | |
|---|--|
| Test species | <i>Lemna minor</i> , strain CPCC# 490 |
| Organism source | In-house axenic culture, obtained from Canadian Phycological Culture Centre, and originally isolated from Wainfleet, Stinking Barn, Niagara Peninsula, Ontario, Canada |
| Organism age | 7- to 10-day old culture |
| Test type | Static |
| Test duration | 7 days |
| Test vessel | 250-mL glass container |
| Test volume | 100 mL |
| Test solution depth | 4 cm |
| Test concentrations | Seven concentrations, plus laboratory control |
| Test replicates | 4 per treatment |
| Number of organisms | Two 3-frond plants per replicate |
| Control/dilution water | Modified APHA media (deionized water plus 1% of each APHA stock solution A, B and C) |
| Test solution renewal | None |
| Test temperature | 25 ± 2°C |
| Feeding | None |
| Light intensity | 4000 to 5600 lux |
| Photoperiod | 24 hours light |
| Aeration | None |
| Test measurements | Test area temperature measured daily; temperature, pH and conductivity measured in all concentrations at test initiation; dissolved oxygen of highest concentration measured at test initiation; temperature and pH measured at test termination |
| Test protocol | Environment Canada (2007), EPS 1/RM/37 |
| Statistical software | CETIS Version 1.8.7 |
| Test endpoints | Number of fronds and dry weight |
| Test acceptability criterion for controls | ≥ 8-fold increase in number of fronds |
| Reference toxicant | Potassium chloride (KCl) |

3.0 RESULTS

Results of the toxicity test conducted on sample L1998015-1 W3 are provided in Table 2. There were no adverse effects on frond growth or dry weight, resulting in IC25 and IC50 values of >97% (v/v) for both endpoints. Significant stimulation on dry weight were observed in test concentrations 48.5 and 97% (v/v); percent stimulation ranged between 30.4 and 33.2%.

Table 2. Results: *Lemna minor* growth inhibition test.

| Concentration (% v/v) | Frond Growth (No. of Fronds) (Mean ± SD) | Stimulation (%) | Dry Weight (mg) (Mean ± SD) | Stimulation (%) |
|------------------------------|--|--------------------|-----------------------------------|--------------------|
| Laboratory Control | 110.3 ± 9.5 | -- | 9.3 ± 0.7 | -- |
| 1.5 | 107.3 ± 13.4 | -- | 8.6 ± 1.0 | -- |
| 3.0 | 105.3 ± 22.7 | -- | 8.6 ± 1.6 | -- |
| 6.1 | 111.5 ± 7.0 | 1.1 | 9.2 ± 0.9 | -- |
| 12.1 | 118.8 ± 8.2 | 7.7 | 9.3 ± 0.6 | 0.65 |
| 24.2 | 121.5 ± 18.6 | 10.2 | 10.8 ± 1.7 | 17.0 |
| 48.5 | 129.3 ± 3.6 | 17.2 | 12.1 ± 0.9* | 30.4 |
| 97 | 120.0 ± 17.1 | 8.8 | 12.3 ± 1.8* | 33.2 |
| Test Endpoint (% v/v) | | | | |
| IC25 | >97 | | >97 | |
| IC50 | >97 | | >97 | |

SD = Standard Deviation, IC = Inhibition Concentration

* = Indicates dry weight that were significantly greater than the control

4.0 QA/QC

The health history of the test organisms used in the exposure was acceptable and met the requirements of the Environment Canada protocol. The test met all control acceptability criteria and water quality parameters remained within ranges specified in the protocol throughout the test. There were no deviations from the test methodology. Uncertainty associated with the test is best described by the standard deviation around the mean and/or the confidence intervals around the point estimates.

Results of the reference toxicant test conducted during the testing program are summarized in Table 3. Results for this test fell within the range for organism performance of the mean and two standard deviations, based on historical results obtained by the laboratory with this test. Thus, the sensitivity of the organisms used in this test was appropriate. The reference toxicant test was performed under the same conditions as those used for the sample.

Table 3. Reference toxicant test results.

| Test Species | Endpoint | Historical Mean (2 SD Range) | CV (%) | Test Date |
|---------------------|--------------------------------|---|-------------------|--------------------|
| <i>L. minor</i> | No. Fronds (IC50): 3.8 g/L KCl | 3.7 (3.0 – 4.6) | 11 | September 29, 2017 |

SD = Standard Deviation, CV = Coefficient of Variation, IC = Inhibition Concentration,

Reference Information

QC Samples with Qualifiers & Comments:

| QC Type Description | Parameter | Qualifier | Applies to Sample Number(s) |
|---------------------------|--------------------------|-----------|------------------------------------|
| Laboratory Control Sample | Manganese (Mn)-Total | MES | L1998026-1, -2, -3, -7 |
| Matrix Spike | Dissolved Organic Carbon | MS-B | L1998026-1, -2, -3, -4, -5, -6, -7 |
| Matrix Spike | Dissolved Organic Carbon | MS-B | L1998026-1, -2, -3, -4, -5, -6, -7 |
| Matrix Spike | Barium (Ba)-Dissolved | MS-B | L1998026-1, -2, -3, -5, -7 |
| Matrix Spike | Calcium (Ca)-Dissolved | MS-B | L1998026-1, -2, -3, -5, -7 |
| Matrix Spike | Magnesium (Mg)-Dissolved | MS-B | L1998026-1, -2, -3, -5, -7 |
| Matrix Spike | Sodium (Na)-Dissolved | MS-B | L1998026-1, -2, -3, -5, -7 |
| Matrix Spike | Strontium (Sr)-Dissolved | MS-B | L1998026-1, -2, -3, -5, -7 |
| Matrix Spike | Barium (Ba)-Total | MS-B | L1998026-1, -2, -3, -7 |
| Matrix Spike | Calcium (Ca)-Total | MS-B | L1998026-1, -2, -3, -7 |
| Matrix Spike | Magnesium (Mg)-Total | MS-B | L1998026-1, -2, -3, -7 |
| Matrix Spike | Sodium (Na)-Total | MS-B | L1998026-1, -2, -3, -7 |
| Matrix Spike | Strontium (Sr)-Total | MS-B | L1998026-1, -2, -3, -7 |

Qualifiers for Individual Parameters Listed:

| Qualifier | Description |
|-----------|---|
| DLM | Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity). |
| MES | Data Quality Objective was marginally exceeded (by < 10% absolute) for < 10% of analytes in a Multi-Element Scan / Multi-Parameter Scan (considered acceptable as per OMOE & CCME). |
| MS-B | Matrix Spike recovery could not be accurately calculated due to high analyte background in sample. |
| RRV | Reported Result Verified By Repeat Analysis |

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|--|--------|--|---------------------------------------|
| ALK-TITR-VA | Water | Alkalinity Species by Titration | APHA 2320 Alkalinity |
| This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values. | | | |
| ANIONS-N+N-CALC-WR | Water | Nitrite & Nitrate Nitrogen | EPA 300.1 |
| Nitrate and Nitrite Nitrogen is determined by calculation from the individual Nitrate and Nitrite Nitrogen analyses by Ion Chromatography with UV absorbance. | | | |
| BE-D-L-CCMS-VA | Water | Diss. Be (low) in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| BE-T-L-CCMS-VA | Water | Total Be (Low) in Water by CRC ICPMS | EPA 200.2/6020A (mod) |
| Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS. | | | |
| CARBONS-DOC-VA | Water | Dissolved organic carbon by combustion | APHA 5310B TOTAL ORGANIC CARBON (TOC) |
| This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis. | | | |
| CL-IC-N-WR | Water | Chloride in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| EC-PCT-VA | Water | Conductivity (Automated) | APHA 2510 Auto. Conduc. |
| This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode. | | | |
| EC-SCREEN-VA | Water | Conductivity Screen (Internal Use Only) | APHA 2510 |
| Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc. | | | |
| HARDNESS-CALC-VA | Water | Hardness | APHA 2340B |
| Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation. | | | |
| HG-D-CVAA-VA | Water | Diss. Mercury in Water by CVAAS or CVAFS | APHA 3030B/EPA 1631E (mod) |
| Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | | | |

Reference Information

| | | | |
|---|-------|--|---|
| HG-T-CVAA-VA | Water | Total Mercury in Water by CVAAS or CVAFS | EPA 1631E (mod) |
| Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | | | |
| IONBALANCE-VA | Water | Ion Balance Calculation | APHA 1030E |
| Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero. | | | |
| Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as: | | | |
| Ion Balance (%) = [Cation Sum-Anion Sum] / [Cation Sum+Anion Sum] | | | |
| MET-D-CCMS-VA | Water | Dissolved Metals in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| MET-T-CCMS-VA | Water | Total Metals in Water by CRC ICPMS | EPA 200.2/6020A (mod) |
| Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| NH3-F-VA | Water | Ammonia in Water by Fluorescence | J. ENVIRON. MONIT., 2005, 7, 37-42, RSC |
| This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al. | | | |
| NO2-L-IC-N-WR | Water | Nitrite in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| NO3-L-IC-N-WR | Water | Nitrate in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| PH-PCT-VA | Water | pH by Meter (Automated) | APHA 4500-H pH Value |
| This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode | | | |
| It is recommended that this analysis be conducted in the field. | | | |
| SO4-IC-WR | Water | Sulfate in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| TDS-CALC-VA | Water | TDS (Calculated) | APHA 1030E (20TH EDITION) |
| This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses". The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample. | | | |
| TSS-VA | Water | Total Suspended Solids by Gravimetric | APHA 2540 D - GRAVIMETRIC |
| This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples. | | | |

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location |
|----------------------------|---|
| WR | ALS ENVIRONMENTAL - WHITEHORSE, YUKON, CANADA |
| VA | ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA |

Chain of Custody Numbers:

2017-09-26 B

Reference Information

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Minto Explorations Ltd.
ATTN: Minto Environment - Coordinator
Suite 2100- 510 West Georgia St
Vancouver BC V6B 0M3

Date Received: 04-OCT-17
Report Date: 19-OCT-17 18:24 (MT)
Version: FINAL

Client Phone: 604-759-4659

Certificate of Analysis

Lab Work Order #: L2002445
Project P.O. #: 226973 (WUL)

| Matrix Spike | Sodium (Na)-Total | MS-B | L2002445-1, -2, -3, -4, -5, -6, -7 |
| Matrix Spike | Sodium (Na)-Total | MS-B | L2002445-3 |
| Matrix Spike | Strontium (Sr)-Total | MS-B | L2002445-1, -2, -3, -4, -5, -6, -7 |
| Matrix Spike | Strontium (Sr)-Total | MS-B | L2002445-3 |
| Matrix Spike | Sulfur (S)-Total | MS-B | L2002445-1, -2, -3, -4, -5, -6, -7 |
| Matrix Spike | Sulfur (S)-Total | MS-B | L2002445-3 |
| Matrix Spike | Uranium (U)-Total | MS-B | L2002445-1, -2, -3, -4, -5, -6, -7 |

Qualifiers for Individual Parameters Listed:

| Qualifier | Description |
|-----------|--|
| DLM | Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity). |
| MS-B | Matrix Spike recovery could not be accurately calculated due to high analyte background in sample. |

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|--|--------|--|---------------------------------------|
| ALK-TITR-VA | Water | Alkalinity Species by Titration | APHA 2320 Alkalinity |
| This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values. | | | |
| ANIONS-N+N-CALC-VA | Water | Nitrite & Nitrate in Water (Calculation) | EPA 300.0 |
| Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N). | | | |
| BE-D-L-CCMS-VA | Water | Diss. Be (low) in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| BE-T-L-CCMS-VA | Water | Total Be (Low) in Water by CRC ICPMS | EPA 200.2/6020A (mod) |
| Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS. | | | |
| CARBONS-DOC-VA | Water | Dissolved organic carbon by combustion | APHA 5310B TOTAL ORGANIC CARBON (TOC) |
| This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis. | | | |
| CL-IC-N-VA | Water | Chloride in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| EC-PCT-VA | Water | Conductivity (Automated) | APHA 2510 Auto. Conduc. |
| This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode. | | | |
| EC-SCREEN-VA | Water | Conductivity Screen (Internal Use Only) | APHA 2510 |

Reference Information

Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc.

HARDNESS-CALC-VA Water Hardness APHA 2340B

Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO₃ equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation.

HG-D-CVAA-VA Water Diss. Mercury in Water by CVAAS or CVAFS APHA 3030B/EPA 1631E (mod)

Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.

HG-T-CVAA-VA Water Total Mercury in Water by CVAAS or CVAFS EPA 1631E (mod)

Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.

IONBALANCE-VA Water Ion Balance Calculation APHA 1030E

Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero.

Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as:

Ion Balance (%) = [Cation Sum-Anion Sum] / [Cation Sum+Anion Sum]

MET-D-CCMS-VA Water Dissolved Metals in Water by CRC ICPMS APHA 3030B/6020A (mod)

Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

MET-T-CCMS-VA Water Total Metals in Water by CRC ICPMS EPA 200.2/6020A (mod)

Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

NH3-F-VA Water Ammonia in Water by Fluorescence J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NO2-L-IC-N-VA Water Nitrite in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO3-L-IC-N-VA Water Nitrate in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

SO4-IC-N-VA Water Sulfate in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

TDS-CALC-VA Water TDS (Calculated) APHA 1030E (20TH EDITION)

This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses".

The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample.

TSS-VA Water Total Suspended Solids by Gravimetric APHA 2540 D - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius.

Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

* Please refer to the Reference Information section for an explanation of any qualifiers detected.

Reference Information

Qualifiers for Sample Submission Listed:

| Qualifier | Description |
|-----------|---|
| WSMT | Water sample(s) for total mercury analysis was not submitted in glass or PTFE container with HCl preservative. Results may be biased low. |

QC Samples with Qualifiers & Comments:

| QC Type Description | Parameter | Qualifier | Applies to Sample Number(s) |
|---------------------|--------------------------|-----------|---|
| Matrix Spike | Dissolved Organic Carbon | MS-B | L2006096-1, -10, -2, -3, -4, -5, -8, -9 |
| Matrix Spike | Nitrate (as N) | MS-B | L2006096-7 |
| Matrix Spike | Sulfate (SO4) | MS-B | L2006096-1, -2, -3, -4, -5, -6 |

Qualifiers for Individual Parameters Listed:

| Qualifier | Description |
|-----------|--|
| DLDS | Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity. |
| DLM | Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity). |
| MS-B | Matrix Spike recovery could not be accurately calculated due to high analyte background in sample. |

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|---|--------|--|---------------------------------------|
| ALK-TITR-VA | Water | Alkalinity Species by Titration | APHA 2320 Alkalinity |
| This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values. | | | |
| ANIONS-N+N-CALC-VA | Water | Nitrite & Nitrate in Water (Calculation) | EPA 300.0 |
| Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N). | | | |
| BE-D-L-CCMS-VA | Water | Diss. Be (low) in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| BE-T-L-CCMS-VA | Water | Total Be (Low) in Water by CRC ICPMS | EPA 200.2/6020A (mod) |
| Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS. | | | |
| CARBONS-DOC-VA | Water | Dissolved organic carbon by combustion | APHA 5310B TOTAL ORGANIC CARBON (TOC) |
| This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis. | | | |
| CL-IC-N-VA | Water | Chloride in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| EC-PCT-VA | Water | Conductivity (Automated) | APHA 2510 Auto. Conduc. |
| This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode. | | | |
| EC-SCREEN-VA | Water | Conductivity Screen (Internal Use Only) | APHA 2510 |
| Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc. | | | |
| HARDNESS-CALC-VA | Water | Hardness | APHA 2340B |
| Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation. | | | |
| HG-D-CVAA-VA | Water | Diss. Mercury in Water by CVAAS or CVAFS | APHA 3030B/EPA 1631E (mod) |
| Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | | | |
| HG-T-CVAA-VA | Water | Total Mercury in Water by CVAAS or CVAFS | EPA 1631E (mod) |
| Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | | | |
| IONBALANCE-VA | Water | Ion Balance Calculation | APHA 1030E |
| Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero. | | | |

Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are

Reference Information

included where data is present. Ion Balance is calculated as:

$$\text{Ion Balance (\%)} = \frac{[\text{Cation Sum} - \text{Anion Sum}]}{[\text{Cation Sum} + \text{Anion Sum}]}$$

MET-D-CCMS-VA Water Dissolved Metals in Water by CRC ICPMS APHA 3030B/6020A (mod)

Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

MET-T-CCMS-VA Water Total Metals in Water by CRC ICPMS EPA 200.2/6020A (mod)

Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

NH3-F-VA Water Ammonia in Water by Fluorescence J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NO2-L-IC-N-VA Water Nitrite in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO3-L-IC-N-VA Water Nitrate in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

SO4-IC-N-VA Water Sulfate in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

TDS-CALC-VA Water TDS (Calculated) APHA 1030E (20TH EDITION)

This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses".

The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample.

TSS-VA Water Total Suspended Solids by Gravimetric APHA 2540 D - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius.

Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location |
|----------------------------|---|
| VA | ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA |

Chain of Custody Numbers:

2017-10-11 A

Reference Information

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Reference Information

QC Samples with Qualifiers & Comments:

| QC Type Description | Parameter | Qualifier | Applies to Sample Number(s) |
|---------------------|--------------------------|-----------|-----------------------------|
| Matrix Spike | Dissolved Organic Carbon | MS-B | L2009424-1, -3, -4, -5 |
| Matrix Spike | Barium (Ba)-Dissolved | MS-B | L2009424-1, -2, -3, -4, -5 |
| Matrix Spike | Calcium (Ca)-Dissolved | MS-B | L2009424-1, -2, -3, -4, -5 |
| Matrix Spike | Magnesium (Mg)-Dissolved | MS-B | L2009424-1, -2, -3, -4, -5 |
| Matrix Spike | Manganese (Mn)-Dissolved | MS-B | L2009424-1, -2, -3, -4, -5 |
| Matrix Spike | Sodium (Na)-Dissolved | MS-B | L2009424-1, -2, -3, -4, -5 |
| Matrix Spike | Strontium (Sr)-Dissolved | MS-B | L2009424-1, -2, -3, -4, -5 |
| Matrix Spike | Barium (Ba)-Total | MS-B | L2009424-1, -2, -3, -4, -5 |
| Matrix Spike | Calcium (Ca)-Total | MS-B | L2009424-1, -2, -3, -4, -5 |
| Matrix Spike | Magnesium (Mg)-Total | MS-B | L2009424-1, -2, -3, -4, -5 |
| Matrix Spike | Manganese (Mn)-Total | MS-B | L2009424-1, -2, -3, -4, -5 |
| Matrix Spike | Sodium (Na)-Total | MS-B | L2009424-1, -2, -3, -4, -5 |
| Matrix Spike | Strontium (Sr)-Total | MS-B | L2009424-1, -2, -3, -4, -5 |
| Matrix Spike | Sulfate (SO4) | MS-B | L2009424-5 |

Qualifiers for Individual Parameters Listed:

| Qualifier | Description |
|-----------|--|
| DTC | Dissolved concentration exceeds total. Results were confirmed by re-analysis. |
| MS-B | Matrix Spike recovery could not be accurately calculated due to high analyte background in sample. |

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|---|--------|--|---------------------------------------|
| ALK-TITR-VA | Water | Alkalinity Species by Titration | APHA 2320 Alkalinity |
| <p>This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.</p> | | | |
| ANIONS-N+N-CALC-WR | Water | Nitrite & Nitrate Nitrogen | EPA 300.1 |
| <p>Nitrate and Nitrite Nitrogen is determined by calculation from the individual Nitrate and Nitrite Nitrogen analyses by Ion Chromatography with UV absorbance.</p> | | | |
| BE-D-L-CCMS-VA | Water | Diss. Be (low) in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| <p>Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.</p> | | | |
| BE-T-L-CCMS-VA | Water | Total Be (Low) in Water by CRC ICPMS | EPA 200.2/6020A (mod) |
| <p>Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.</p> | | | |
| CARBONS-DOC-VA | Water | Dissolved organic carbon by combustion | APHA 5310B TOTAL ORGANIC CARBON (TOC) |
| <p>This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis.</p> | | | |
| CL-L-IC-N-WR | Water | Chloride in Water by IC (Low Level) | EPA 300.1 (mod) |
| <p>Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.</p> | | | |
| EC-PCT-VA | Water | Conductivity (Automated) | APHA 2510 Auto. Conduc. |
| <p>This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode.</p> | | | |
| EC-SCREEN-VA | Water | Conductivity Screen (Internal Use Only) | APHA 2510 |
| <p>Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc.</p> | | | |
| HARDNESS-CALC-VA | Water | Hardness | APHA 2340B |
| <p>Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation.</p> | | | |
| HG-D-CVAA-VA | Water | Diss. Mercury in Water by CVAAS or CVAFS | APHA 3030B/EPA 1631E (mod) |
| <p>Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.</p> | | | |
| HG-T-CVAA-VA | Water | Total Mercury in Water by CVAAS or CVAFS | EPA 1631E (mod) |

Reference Information

Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.

IONBALANCE-VA Water Ion Balance Calculation APHA 1030E

Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero.

Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as:

$$\text{Ion Balance (\%)} = \frac{[\text{Cation Sum} - \text{Anion Sum}]}{[\text{Cation Sum} + \text{Anion Sum}]}$$

MET-D-CCMS-VA Water Dissolved Metals in Water by CRC ICPMS APHA 3030B/6020A (mod)

Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

MET-T-CCMS-VA Water Total Metals in Water by CRC ICPMS EPA 200.2/6020A (mod)

Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

NH3-F-VA Water Ammonia in Water by Fluorescence J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NO2-L-IC-N-WR Water Nitrite in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO3-L-IC-N-WR Water Nitrate in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

SO4-IC-WR Water Sulfate in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

TDS-CALC-VA Water TDS (Calculated) APHA 1030E (20TH EDITION)

This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses".

The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample.

TSS-VA Water Total Suspended Solids by Gravimetric APHA 2540 D - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius.

Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location |
|----------------------------|---|
| WR | ALS ENVIRONMENTAL - WHITEHORSE, YUKON, CANADA |
| VA | ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA |

Reference Information

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

1.0 INTRODUCTION

Nautilus Environmental Company Inc. conducted an early life stage embryo toxicity test on rainbow trout (*Oncorhynchus mykiss*) for ALS Environmental. Sample L2011956-1 W3 was collected on October 22, 2017 and delivered to the Nautilus Environmental laboratory in Burnaby, BC on October 24, 2017. The sample was transported in five 20-L plastic containers and was received at a temperature of 8.0°C. The sample was stored in the dark at $4 \pm 2^\circ\text{C}$ prior to testing.

This report describes the results of these toxicity tests. Copies of raw laboratory data sheets and statistical analysis for each species are provided in Appendix A. The chain-of-custody form is provided in Appendix B.

2.0 METHODS

Methods for the toxicity test using rainbow trout are summarized in Table 1. The rainbow trout embryo viability test followed procedures described by Environment Canada (1998) and modified by Canaria *et al.* (1999). Statistical analyses were performed using CETIS (Tidepool Scientific Software, 2013).

Table 1. Summary of test conditions: 7-d rainbow trout (*Oncorhynchus mykiss*) embryo viability test.

| | |
|---|--|
| Test species | <i>Oncorhynchus mykiss</i> |
| Organism source | Hatchery |
| Organism age | <30 minutes post fertilization, <24 hour old gametes |
| Test type | Static-renewal |
| Test duration | 7 days |
| Test vessel | 2-L plastic container |
| Test volume | 2 L |
| Test solution depth | 17 cm |
| Test concentrations | Five concentrations, plus laboratory control |
| Test replicates | 4 per treatment |
| Number of organisms | 30 per replicate |
| Control/dilution water | Dechlorinated Metro Vancouver municipal tapwater |
| Test solution renewal | Daily (80% renewal) |
| Test temperature | 14 ± 1°C |
| Feeding | None |
| Light intensity | Dark |
| Photoperiod | 24 hours dark |
| Aeration | Continuous gentle aeration |
| Test measurements | Temperature, dissolved oxygen, pH and conductivity measured daily; hardness and alkalinity of undiluted sample measured at test initiation; survival checked daily |
| Test protocol | Environment Canada (1998), EPS 1/RM/28; Canaria <i>et al.</i> (1999) |
| Statistical software | CETIS Version 1.8.7 |
| Test endpoint | Embryo viability |
| Test acceptability criterion for controls | Embryo viability ≥70% |
| Reference toxicant | Sodium dodecyl sulphate (SDS) |

3.0 RESULTS

Results of the toxicity test for sample L2011956-1 W3 are summarized in Table 2. Embryo viability in all test treatments was $\geq 90\%$ and there were no adverse effects observed on embryo viability.

Table 2. Results: 7-d rainbow trout (*Oncorhynchus mykiss*) embryo viability test.

| Concentration (% v/v) | Embryo Viability (%) (Mean \pm SD) |
|----------------------------------|--|
| Laboratory Control | 93.3 \pm 9.0 |
| 6.25 | 94.2 \pm 9.6 |
| 12.5 | 94.2 \pm 5.7 |
| 25 | 90.8 \pm 12.0 |
| 50 | 95.8 \pm 3.2 |
| 100 | 94.2 \pm 7.4 |
| Test Endpoint (% v/v) | |
| EC25 | >100 |
| EC50 | >100 |

SD = Standard Deviation, EC = Effective Concentration

4.0 QA/QC

The health history of the test organisms used in the exposure was acceptable and met the requirements of the Environment Canada protocol. The test met all control acceptability criteria and water quality parameters remained within ranges specified in the protocol throughout the test. Uncertainty associated with the test is best described by the standard deviation around the mean and/or the confidence intervals around the point estimates.

The eggs were exposed using a blocked design; eggs from each of the four female fish were used in each of replicates A, B, C and D. This approach deviated from the Environment Canada method, which specifies that all the eggs should be pooled for testing. However, this modification was used because the egg quality from each female varied considerably and blocking would minimize the effects of poor quality eggs from any one particular female fish. However, the results were not affected as the control criterion was still met at the end of the test.

Results of the reference toxicant tests conducted during the testing program are summarized in Table 3. Result for this test fell within the acceptable range for organism performance of mean and two standard deviations, based on historical results obtained by the laboratory with this test. Thus, the sensitivity of the organisms used in these tests was appropriate. The reference toxicant was performed under the same conditions as those used for the samples.

Table 3. Reference toxicant test results.

| Test Species | Endpoint | Historical Mean (2 SD Range) | CV (%) | Test Date |
|------------------|--------------------------------|------------------------------|--------|------------------|
| <i>O. mykiss</i> | Viability (EC50): 4.0 mg/L SDS | 4.3 (2.0 – 9.0) | 45 | October 24, 2017 |

SD = Standard Deviation, CV = Coefficient of Variation, EC = Effective Concentration

* Please refer to the Reference Information section for an explanation of any qualifiers detected.

Reference Information

QC Samples with Qualifiers & Comments:

| QC Type Description | Parameter | Qualifier | Applies to Sample Number(s) |
|---------------------|--------------------------|-----------|-----------------------------|
| Matrix Spike | Dissolved Organic Carbon | MS-B | L2013198-1, -2, -3, -4, -5 |
| Matrix Spike | Dissolved Organic Carbon | MS-B | L2013198-1, -2, -3, -4, -5 |
| Matrix Spike | Barium (Ba)-Dissolved | MS-B | L2013198-1, -2, -3, -4, -5 |
| Matrix Spike | Calcium (Ca)-Dissolved | MS-B | L2013198-1, -2, -3, -4, -5 |
| Matrix Spike | Magnesium (Mg)-Dissolved | MS-B | L2013198-1, -2, -3, -4, -5 |
| Matrix Spike | Sodium (Na)-Dissolved | MS-B | L2013198-1, -2, -3, -4, -5 |
| Matrix Spike | Strontium (Sr)-Dissolved | MS-B | L2013198-1, -2, -3, -4, -5 |
| Matrix Spike | Barium (Ba)-Total | MS-B | L2013198-1, -2, -3, -4, -5 |
| Matrix Spike | Calcium (Ca)-Total | MS-B | L2013198-1, -2, -3, -4, -5 |
| Matrix Spike | Magnesium (Mg)-Total | MS-B | L2013198-1, -2, -3, -4, -5 |
| Matrix Spike | Manganese (Mn)-Total | MS-B | L2013198-1, -2, -3, -4, -5 |
| Matrix Spike | Sodium (Na)-Total | MS-B | L2013198-1, -2, -3, -4, -5 |
| Matrix Spike | Strontium (Sr)-Total | MS-B | L2013198-1, -2, -3, -4, -5 |
| Matrix Spike | Sulfate (SO4) | MS-B | L2013198-1, -2, -3, -4, -5 |

Qualifiers for Individual Parameters Listed:

| Qualifier | Description |
|-----------|--|
| DLM | Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity). |
| MS-B | Matrix Spike recovery could not be accurately calculated due to high analyte background in sample. |

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|--|--------|--|---------------------------------------|
| ALK-TITR-VA | Water | Alkalinity Species by Titration | APHA 2320 Alkalinity |
| This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values. | | | |
| BE-D-L-CCMS-VA | Water | Diss. Be (low) in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| BE-T-L-CCMS-VA | Water | Total Be (Low) in Water by CRC ICPMS | EPA 200.2/6020A (mod) |
| Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS. | | | |
| BR-L-IC-N-VA | Water | Bromide in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| CARBONS-DOC-VA | Water | Dissolved organic carbon by combustion | APHA 5310B TOTAL ORGANIC CARBON (TOC) |
| This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis. | | | |
| CL-IC-N-VA | Water | Chloride in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| EC-PCT-VA | Water | Conductivity (Automated) | APHA 2510 Auto. Conduc. |
| This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode. | | | |
| EC-SCREEN-VA | Water | Conductivity Screen (Internal Use Only) | APHA 2510 |
| Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc. | | | |
| F-IC-N-VA | Water | Fluoride in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| HARDNESS-CALC-VA | Water | Hardness | APHA 2340B |
| Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation. | | | |
| HG-D-CVAA-VA | Water | Diss. Mercury in Water by CVAAS or CVAFS | APHA 3030B/EPA 1631E (mod) |
| Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | | | |

Reference Information

| | | | |
|---|-------|--|---|
| HG-T-CVAA-VA | Water | Total Mercury in Water by CVAAS or CVAFS | EPA 1631E (mod) |
| Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | | | |
| IONBALANCE-VA | Water | Ion Balance Calculation | APHA 1030E |
| Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero. | | | |
| Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as: | | | |
| Ion Balance (%) = [Cation Sum-Anion Sum] / [Cation Sum+Anion Sum] | | | |
| MET-D-CCMS-VA | Water | Dissolved Metals in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| MET-T-CCMS-VA | Water | Total Metals in Water by CRC ICPMS | EPA 200.2/6020A (mod) |
| Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| NH3-F-VA | Water | Ammonia in Water by Fluorescence | J. ENVIRON. MONIT., 2005, 7, 37-42, RSC |
| This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al. | | | |
| NO2-L-IC-N-VA | Water | Nitrite in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| NO3-L-IC-N-VA | Water | Nitrate in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| PH-PCT-VA | Water | pH by Meter (Automated) | APHA 4500-H pH Value |
| This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode | | | |
| It is recommended that this analysis be conducted in the field. | | | |
| SO4-IC-N-VA | Water | Sulfate in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| TDS-CALC-VA | Water | TDS (Calculated) | APHA 1030E (20TH EDITION) |
| This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses". The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample. | | | |
| TSS-VA | Water | Total Suspended Solids by Gravimetric | APHA 2540 D - GRAVIMETRIC |
| This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples. | | | |

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location |
|----------------------------|---|
| VA | ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA |

Chain of Custody Numbers:

2017-10-25 A

Reference Information

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

| Matrix Spike | Strontium (Sr)-Dissolved | MS-B | L2016822-1 |
| Matrix Spike | Sulfur (S)-Dissolved | MS-B | L2016822-1, -2, -3 |
| Matrix Spike | Uranium (U)-Dissolved | MS-B | L2016822-1, -2, -3 |

Qualifiers for Individual Parameters Listed:

| Qualifier | Description |
|-----------|---|
| DLB | Detection Limit Raised. Analyte detected at comparable level in Method Blank. |
| DLM | Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity). |
| DUP-H | Duplicate results outside ALS DQO, due to sample heterogeneity. |
| MB-LOR | Method Blank exceeds ALS DQO. Limits of Reporting have been adjusted for samples with positive hits below 5x blank level. |
| MS-B | Matrix Spike recovery could not be accurately calculated due to high analyte background in sample. |

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|--|--------|--|----------------------|
| ALK-TITR-VA | Water | Alkalinity Species by Titration | APHA 2320 Alkalinity |
| This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values. | | | |
| ANIONS-N+N-CALC-VA | Water | Nitrite & Nitrate in Water (Calculation) | EPA 300.0 |

Reference Information

Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N).

BE-D-L-CCMS-VA Water Diss. Be (low) in Water by CRC ICPMS APHA 3030B/6020A (mod)

Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.

BE-T-L-CCMS-VA Water Total Be (Low) in Water by CRC ICPMS EPA 200.2/6020A (mod)

Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.

CARBONS-DOC-VA Water Dissolved organic carbon by combustion APHA 5310B TOTAL ORGANIC CARBON (TOC)

This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis.

CL-IC-N-VA Water Chloride in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

EC-PCT-VA Water Conductivity (Automated) APHA 2510 Auto. Conduc.

This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode.

EC-SCREEN-VA Water Conductivity Screen (Internal Use Only) APHA 2510

Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc.

HARDNESS-CALC-VA Water Hardness APHA 2340B

Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO₃ equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation.

HG-D-CVAA-VA Water Diss. Mercury in Water by CVAAS or CVAFS APHA 3030B/EPA 1631E (mod)

Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.

HG-T-CVAA-VA Water Total Mercury in Water by CVAAS or CVAFS EPA 1631E (mod)

Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.

IONBALANCE-VA Water Ion Balance Calculation APHA 1030E

Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero.

Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as:

Ion Balance (%) = [Cation Sum-Anion Sum] / [Cation Sum+Anion Sum]

MET-D-CCMS-VA Water Dissolved Metals in Water by CRC ICPMS APHA 3030B/6020A (mod)

Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

MET-T-CCMS-VA Water Total Metals in Water by CRC ICPMS EPA 200.2/6020A (mod)

Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

NH3-F-VA Water Ammonia in Water by Fluorescence J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NO2-L-IC-N-VA Water Nitrite in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO3-L-IC-N-VA Water Nitrate in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

Reference Information

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H pH Value
This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

SO4-IC-N-VA Water Sulfate in Water by IC EPA 300.1 (mod)
Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

TDS-CALC-VA Water TDS (Calculated) APHA 1030E (20TH EDITION)
This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses".
The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample.

TSS-VA Water Total Suspended Solids by Gravimetric APHA 2540 D - GRAVIMETRIC
This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location |
|----------------------------|---|
| VA | ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA |

Chain of Custody Numbers:

2017-11-01 A

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Reference Information

QC Samples with Qualifiers & Comments:

| QC Type Description | Parameter | Qualifier | Applies to Sample Number(s) |
|---------------------|--------------------------|-----------|--|
| Method Blank | Chromium (Cr)-Total | MB-LOR | L2020109-1, -2, -3, -4, -5, -6, -8, -9 |
| Matrix Spike | Dissolved Organic Carbon | MS-B | L2020109-1, -3 |
| Matrix Spike | Barium (Ba)-Dissolved | MS-B | L2020109-1, -2, -3, -4, -5, -6, -7, -8, -9 |
| Matrix Spike | Calcium (Ca)-Dissolved | MS-B | L2020109-1, -2, -3, -4, -5, -6, -7, -8, -9 |
| Matrix Spike | Copper (Cu)-Dissolved | MS-B | L2020109-1, -2, -3, -4, -5, -6, -7, -8, -9 |
| Matrix Spike | Magnesium (Mg)-Dissolved | MS-B | L2020109-1, -2, -3, -4, -5, -6, -7, -8, -9 |
| Matrix Spike | Manganese (Mn)-Dissolved | MS-B | L2020109-1, -2, -3, -4, -5, -6, -7, -8, -9 |
| Matrix Spike | Potassium (K)-Dissolved | MS-B | L2020109-1, -2, -3, -4, -5, -6, -7, -8, -9 |
| Matrix Spike | Sodium (Na)-Dissolved | MS-B | L2020109-1, -2, -3, -4, -5, -6, -7, -8, -9 |
| Matrix Spike | Strontium (Sr)-Dissolved | MS-B | L2020109-1, -2, -3, -4, -5, -6, -7, -8, -9 |
| Matrix Spike | Sulfur (S)-Dissolved | MS-B | L2020109-1, -2, -3, -4, -5, -6, -7, -8, -9 |
| Matrix Spike | Barium (Ba)-Total | MS-B | L2020109-1, -2, -3, -4, -5, -6, -8, -9 |
| Matrix Spike | Calcium (Ca)-Total | MS-B | L2020109-1, -2, -3, -4, -5, -6, -8, -9 |
| Matrix Spike | Magnesium (Mg)-Total | MS-B | L2020109-1, -2, -3, -4, -5, -6, -8, -9 |
| Matrix Spike | Manganese (Mn)-Total | MS-B | L2020109-1, -2, -3, -4, -5, -6, -8, -9 |
| Matrix Spike | Molybdenum (Mo)-Total | MS-B | L2020109-1, -2, -3, -4, -5, -6, -8, -9 |
| Matrix Spike | Silicon (Si)-Total | MS-B | L2020109-1, -2, -3, -4, -5, -6, -8, -9 |
| Matrix Spike | Sodium (Na)-Total | MS-B | L2020109-1, -2, -3, -4, -5, -6, -8, -9 |
| Matrix Spike | Strontium (Sr)-Total | MS-B | L2020109-1, -2, -3, -4, -5, -6, -8, -9 |
| Matrix Spike | Sulfur (S)-Total | MS-B | L2020109-1, -2, -3, -4, -5, -6, -8, -9 |
| Matrix Spike | Sulfate (SO4) | MS-B | L2020109-1, -2, -3, -4, -5, -6, -7, -8 |

Qualifiers for Individual Parameters Listed:

| Qualifier | Description |
|-----------|---|
| DLA | Detection Limit adjusted for required dilution |
| DLDS | Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity. |
| DLM | Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity). |
| DTMF | Dissolved concentration exceeds total for field-filtered metals sample. Metallic contaminants were likely introduced to dissolved sample during field filtration. |
| HTD | Hold time exceeded for re-analysis or dilution, but initial testing was conducted within hold time. |
| MB-LOR | Method Blank exceeds ALS DQO. Limits of Reporting have been adjusted for samples with positive hits below 5x blank level. |
| MS-B | Matrix Spike recovery could not be accurately calculated due to high analyte background in sample. |

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|--|--------|--|---------------------------------------|
| ALK-TITR-VA | Water | Alkalinity Species by Titration | APHA 2320 Alkalinity |
| This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values. | | | |
| ANIONS-N+N-CALC-VA | Water | Nitrite & Nitrate in Water (Calculation) | EPA 300.0 |
| Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N). | | | |
| BE-D-L-CCMS-VA | Water | Diss. Be (low) in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| BE-T-L-CCMS-VA | Water | Total Be (Low) in Water by CRC ICPMS | EPA 200.2/6020A (mod) |
| Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS. | | | |
| BR-L-IC-N-WR | Water | Bromide in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| CARBONS-DOC-VA | Water | Dissolved organic carbon by combustion | APHA 5310B TOTAL ORGANIC CARBON (TOC) |
| This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis. | | | |

Reference Information

| | | | |
|-------------------------|-------|--|---|
| CL-IC-N-VA | Water | Chloride in Water by IC Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | EPA 300.1 (mod) |
| CL-L-IC-N-WR | Water | Chloride in Water by IC (Low Level) Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | EPA 300.1 (mod) |
| EC-PCT-VA | Water | Conductivity (Automated) This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode. | APHA 2510 Auto. Conduc. |
| EC-SCREEN-VA | Water | Conductivity Screen (Internal Use Only) Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc. | APHA 2510 |
| F-IC-N-WR | Water | Fluoride in Water by IC Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | EPA 300.1 (mod) |
| HARDNESS-CALC-VA | Water | Hardness Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO ₃ equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation. | APHA 2340B |
| HG-D-CVAA-VA | Water | Diss. Mercury in Water by CVAAS or CVAFS Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | APHA 3030B/EPA 1631E (mod) |
| HG-T-CVAA-VA | Water | Total Mercury in Water by CVAAS or CVAFS Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | EPA 1631E (mod) |
| IONBALANCE-VA | Water | Ion Balance Calculation Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero. Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as: Ion Balance (%) = [Cation Sum-Anion Sum] / [Cation Sum+Anion Sum] | APHA 1030E |
| MET-D-CCMS-VA | Water | Dissolved Metals in Water by CRC ICPMS Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | APHA 3030B/6020A (mod) |
| MET-T-CCMS-VA | Water | Total Metals in Water by CRC ICPMS Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | EPA 200.2/6020A (mod) |
| NH3-F-VA | Water | Ammonia in Water by Fluorescence This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al. | J. ENVIRON. MONIT., 2005, 7, 37-42, RSC |
| NO2-L-IC-N-VA | Water | Nitrite in Water by IC (Low Level) Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | EPA 300.1 (mod) |
| NO2-L-IC-N-WR | Water | Nitrite in Water by IC (Low Level) Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | EPA 300.1 (mod) |
| NO3-L-IC-N-VA | Water | Nitrate in Water by IC (Low Level) Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | EPA 300.1 (mod) |
| NO3-L-IC-N-WR | Water | Nitrate in Water by IC (Low Level) Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | EPA 300.1 (mod) |
| PH-PCT-VA | Water | pH by Meter (Automated) | APHA 4500-H pH Value |

Reference Information

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

SO4-IC-N-VA Water Sulfate in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

SO4-IC-WR Water Sulfate in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

TDS-CALC-VA Water TDS (Calculated) APHA 1030E (20TH EDITION)

This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses". The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample.

TSS-MAN-WR Water Total Suspended Solids by Gravimetric APHA 2540 D

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids are determined by filtering a sample through a glass fibre filter and drying the filter at 104 degrees celsius.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location |
|----------------------------|---|
| WR | ALS ENVIRONMENTAL - WHITEHORSE, YUKON, CANADA |
| VA | ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA |

Chain of Custody Numbers:

2017-11-08 A

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

- mg/kg - milligrams per kilogram based on dry weight of sample.*
- mg/kg wwt - milligrams per kilogram based on wet weight of sample.*
- mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.*
- mg/L - milligrams per litre.*
- < - Less than.*

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

*Test results reported relate only to the samples as received by the laboratory.
 UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
 Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.*

Reference Information

QC Samples with Qualifiers & Comments:

| QC Type Description | Parameter | Qualifier | Applies to Sample Number(s) |
|---------------------|--------------------------|-----------|-----------------------------|
| Matrix Spike | Barium (Ba)-Dissolved | MS-B | L2023151-1, -2, -3 |
| Matrix Spike | Calcium (Ca)-Dissolved | MS-B | L2023151-1, -2, -3 |
| Matrix Spike | Magnesium (Mg)-Dissolved | MS-B | L2023151-1, -2, -3 |
| Matrix Spike | Sodium (Na)-Dissolved | MS-B | L2023151-1, -2, -3 |
| Matrix Spike | Strontium (Sr)-Dissolved | MS-B | L2023151-1, -2, -3 |
| Matrix Spike | Sulfur (S)-Dissolved | MS-B | L2023151-1, -2, -3 |
| Matrix Spike | Barium (Ba)-Total | MS-B | L2023151-1, -2, -3 |
| Matrix Spike | Calcium (Ca)-Total | MS-B | L2023151-1, -2, -3 |
| Matrix Spike | Copper (Cu)-Total | MS-B | L2023151-1, -2, -3 |
| Matrix Spike | Magnesium (Mg)-Total | MS-B | L2023151-1, -2, -3 |
| Matrix Spike | Manganese (Mn)-Total | MS-B | L2023151-1, -2, -3 |
| Matrix Spike | Sodium (Na)-Total | MS-B | L2023151-1, -2, -3 |
| Matrix Spike | Strontium (Sr)-Total | MS-B | L2023151-1, -2, -3 |
| Matrix Spike | Sulfur (S)-Total | MS-B | L2023151-1, -2, -3 |

Qualifiers for Individual Parameters Listed:

| Qualifier | Description |
|-----------|--|
| MS-B | Matrix Spike recovery could not be accurately calculated due to high analyte background in sample. |

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|---------------------------|--------|--|--|
| ALK-TITR-VA | Water | Alkalinity Species by Titration | APHA 2320 Alkalinity This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values. |
| ANIONS-N+N-CALC-WR | Water | Nitrite & Nitrate Nitrogen | EPA 300.1 Nitrate and Nitrite Nitrogen is determined by calculation from the individual Nitrate and Nitrite Nitrogen analyses by Ion Chromatography with UV absorbance. |
| BE-D-L-CCMS-VA | Water | Diss. Be (low) in Water by CRC ICPMS | APHA 3030B/6020A (mod) Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. |
| BE-T-L-CCMS-VA | Water | Total Be (Low) in Water by CRC ICPMS | EPA 200.2/6020A (mod) Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS. |
| BR-L-IC-N-WR | Water | Bromide in Water by IC (Low Level) | EPA 300.1 (mod) Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. |
| CARBONS-DOC-VA | Water | Dissolved organic carbon by combustion | APHA 5310B TOTAL ORGANIC CARBON (TOC) This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis. |
| CL-L-IC-N-WR | Water | Chloride in Water by IC (Low Level) | EPA 300.1 (mod) Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. |
| EC-PCT-VA | Water | Conductivity (Automated) | APHA 2510 Auto. Conduc. This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode. |
| EC-SCREEN-VA | Water | Conductivity Screen (Internal Use Only) | APHA 2510 Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc. |
| F-IC-N-WR | Water | Fluoride in Water by IC | EPA 300.1 (mod) Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. |
| HARDNESS-CALC-VA | Water | Hardness | APHA 2340B Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation. |
| HG-D-CVAA-VA | Water | Diss. Mercury in Water by CVAAS or CVAFS | APHA 3030B/EPA 1631E (mod) |

Reference Information

Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.

HG-T-CVAA-VA Water Total Mercury in Water by CVAAS or CVAFS EPA 1631E (mod)

Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.

IONBALANCE-VA Water Ion Balance Calculation APHA 1030E

Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero.

Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as:

Ion Balance (%) = [Cation Sum-Anion Sum] / [Cation Sum+Anion Sum]

MET-D-CCMS-VA Water Dissolved Metals in Water by CRC ICPMS APHA 3030B/6020A (mod)

Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

MET-T-CCMS-VA Water Total Metals in Water by CRC ICPMS EPA 200.2/6020A (mod)

Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

NH3-F-VA Water Ammonia in Water by Fluorescence J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NO2-L-IC-N-WR Water Nitrite in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO3-L-IC-N-WR Water Nitrate in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

SO4-IC-WR Water Sulfate in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

TDS-CALC-VA Water TDS (Calculated) APHA 1030E (20TH EDITION)

This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses".

The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample.

TSS-MAN-WR Water Total Suspended Solids by Gravimetric APHA 2540 D

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids are determined by filtering a sample through a glass fibre filter and drying the filter at 104 degrees celsius.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location |
|----------------------------|---|
| WR | ALS ENVIRONMENTAL - WHITEHORSE, YUKON, CANADA |
| VA | ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA |

Chain of Custody Numbers:

2017-11-15 D

Reference Information

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

* Please refer to the Reference Information section for an explanation of any qualifiers detected.

Reference Information

QC Samples with Qualifiers & Comments:

| QC Type Description | Parameter | Qualifier | Applies to Sample Number(s) |
|---------------------|---------------------------|-----------|-----------------------------|
| Method Blank | Sulfur (S)-Total | B | L2027459-1, -2, -3 |
| Matrix Spike | Barium (Ba)-Dissolved | MS-B | L2027459-1, -2, -3 |
| Matrix Spike | Calcium (Ca)-Dissolved | MS-B | L2027459-1, -2, -3 |
| Matrix Spike | Copper (Cu)-Dissolved | MS-B | L2027459-1, -2, -3 |
| Matrix Spike | Magnesium (Mg)-Dissolved | MS-B | L2027459-1, -2, -3 |
| Matrix Spike | Manganese (Mn)-Dissolved | MS-B | L2027459-1, -2, -3 |
| Matrix Spike | Molybdenum (Mo)-Dissolved | MS-B | L2027459-1, -2, -3 |
| Matrix Spike | Potassium (K)-Dissolved | MS-B | L2027459-1, -2, -3 |
| Matrix Spike | Sodium (Na)-Dissolved | MS-B | L2027459-1, -2, -3 |
| Matrix Spike | Strontium (Sr)-Dissolved | MS-B | L2027459-1, -2, -3 |
| Matrix Spike | Sulfur (S)-Dissolved | MS-B | L2027459-1, -2, -3 |
| Matrix Spike | Uranium (U)-Dissolved | MS-B | L2027459-1, -2, -3 |
| Matrix Spike | Barium (Ba)-Total | MS-B | L2027459-1, -2, -3 |
| Matrix Spike | Calcium (Ca)-Total | MS-B | L2027459-1, -2, -3 |
| Matrix Spike | Magnesium (Mg)-Total | MS-B | L2027459-1, -2, -3 |
| Matrix Spike | Manganese (Mn)-Total | MS-B | L2027459-1, -2, -3 |
| Matrix Spike | Sodium (Na)-Total | MS-B | L2027459-1, -2, -3 |
| Matrix Spike | Strontium (Sr)-Total | MS-B | L2027459-1, -2, -3 |
| Matrix Spike | Sulfur (S)-Total | MS-B | L2027459-1, -2, -3 |

Qualifiers for Individual Parameters Listed:

| Qualifier | Description |
|-----------|--|
| B | Method Blank exceeds ALS DQO. Associated sample results which are < Limit of Reporting or > 5 times blank level are considered reliable. |
| DLM | Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity). |
| MS-B | Matrix Spike recovery could not be accurately calculated due to high analyte background in sample. |

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|--|--------|--|---------------------------------------|
| ALK-TITR-VA | Water | Alkalinity Species by Titration | APHA 2320 Alkalinity |
| This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values. | | | |
| ANIONS-N+N-CALC-VA | Water | Nitrite & Nitrate in Water (Calculation) | EPA 300.0 |
| Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N). | | | |
| BE-D-L-CCMS-VA | Water | Diss. Be (low) in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| BE-T-L-CCMS-VA | Water | Total Be (Low) in Water by CRC ICPMS | EPA 200.2/6020A (mod) |
| Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS. | | | |
| CARBONS-DOC-VA | Water | Dissolved organic carbon by combustion | APHA 5310B TOTAL ORGANIC CARBON (TOC) |
| This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis. | | | |
| CL-L-IC-N-WR | Water | Chloride in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| EC-PCT-VA | Water | Conductivity (Automated) | APHA 2510 Auto. Conduc. |
| This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode. | | | |
| EC-SCREEN-VA | Water | Conductivity Screen (Internal Use Only) | APHA 2510 |
| Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc. | | | |
| HARDNESS-CALC-VA | Water | Hardness | APHA 2340B |

Reference Information

Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO₃ equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation.

HG-D-CVAA-VA Water Diss. Mercury in Water by CVAAS or CVAFS APHA 3030B/EPA 1631E (mod)

Water samples are filtered (0.45 µm), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.

HG-T-CVAA-VA Water Total Mercury in Water by CVAAS or CVAFS EPA 1631E (mod)

Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.

IONBALANCE-VA Water Ion Balance Calculation APHA 1030E

Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero.

Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as:

Ion Balance (%) = [Cation Sum-Anion Sum] / [Cation Sum+Anion Sum]

MET-D-CCMS-VA Water Dissolved Metals in Water by CRC ICPMS APHA 3030B/6020A (mod)

Water samples are filtered (0.45 µm), preserved with nitric acid, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

MET-T-CCMS-VA Water Total Metals in Water by CRC ICPMS EPA 200.2/6020A (mod)

Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

NH3-F-VA Water Ammonia in Water by Fluorescence J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NO2-L-IC-N-WR Water Nitrite in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO3-L-IC-N-WR Water Nitrate in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

SO4-IC-WR Water Sulfate in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

TDS-CALC-VA Water TDS (Calculated) APHA 1030E (20TH EDITION)

This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses".

The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample.

TSS-MAN-WR Water Total Suspended Solids by Gravimetric APHA 2540 D

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids are determined by filtering a sample through a glass fibre filter and drying the filter at 104 degrees celsius.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location |
|----------------------------|---|
| WR | ALS ENVIRONMENTAL - WHITEHORSE, YUKON, CANADA |
| VA | ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA |

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Reference Information

QC Samples with Qualifiers & Comments:

| QC Type Description | Parameter | Qualifier | Applies to Sample Number(s) |
|---------------------------|-------------------------|-----------|-----------------------------|
| Method Blank | Barium (Ba)-Dissolved | MB-LOR | L2029332-1, -2, -3, -5 |
| Method Blank | Chromium (Cr)-Dissolved | MB-LOR | L2029332-1, -2, -3, -5 |
| Laboratory Control Sample | Titanium (Ti)-Dissolved | MES | L2029332-4 |
| Matrix Spike | Aluminum (Al)-Total | MS-B | L2029332-1, -2, -3, -4, -5 |
| Matrix Spike | Barium (Ba)-Total | MS-B | L2029332-1, -2, -3, -4, -5 |
| Matrix Spike | Calcium (Ca)-Total | MS-B | L2029332-1, -2, -3, -4, -5 |
| Matrix Spike | Iron (Fe)-Total | MS-B | L2029332-1, -2, -3, -4, -5 |
| Matrix Spike | Magnesium (Mg)-Total | MS-B | L2029332-1, -2, -3, -4, -5 |
| Matrix Spike | Manganese (Mn)-Total | MS-B | L2029332-1, -2, -3, -4, -5 |
| Matrix Spike | Nickel (Ni)-Total | MS-B | L2029332-1, -2, -3, -4, -5 |
| Matrix Spike | Sodium (Na)-Total | MS-B | L2029332-3 |
| Matrix Spike | Strontium (Sr)-Total | MS-B | L2029332-1, -2, -3, -4, -5 |
| Matrix Spike | Sulfur (S)-Total | MS-B | L2029332-1, -2, -3, -4, -5 |
| Matrix Spike | Tin (Sn)-Total | MS-B | L2029332-3 |
| Matrix Spike | Titanium (Ti)-Total | MS-B | L2029332-1, -2, -3, -4, -5 |
| Matrix Spike | Nitrite (as N) | MS-B | L2029332-1, -2, -3, -4, -5 |
| Matrix Spike | Nitrate (as N) | MS-B | L2029332-1, -2, -3, -4, -5 |

Qualifiers for Individual Parameters Listed:

| Qualifier | Description |
|-----------|---|
| DLA | Detection Limit adjusted for required dilution |
| DLB | Detection Limit Raised. Analyte detected at comparable level in Method Blank. |
| DLDS | Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity. |
| DLM | Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity). |
| HTD | Hold time exceeded for re-analysis or dilution, but initial testing was conducted within hold time. |
| MB-LOR | Method Blank exceeds ALS DQO. Limits of Reporting have been adjusted for samples with positive hits below 5x blank level. |
| MES | Data Quality Objective was marginally exceeded (by < 10% absolute) for < 10% of analytes in a Multi-Element Scan / Multi-Parameter Scan (considered acceptable as per OMOE & CCME). |
| MS-B | Matrix Spike recovery could not be accurately calculated due to high analyte background in sample. |

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|--|--------|---|---------------------------------------|
| ALK-TITR-VA | Water | Alkalinity Species by Titration | APHA 2320 Alkalinity |
| This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values. | | | |
| BE-D-L-CCMS-VA | Water | Diss. Be (low) in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| BE-T-L-CCMS-VA | Water | Total Be (Low) in Water by CRC ICPMS | EPA 200.2/6020A (mod) |
| Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS. | | | |
| CARBONS-DOC-VA | Water | Dissolved organic carbon by combustion | APHA 5310B TOTAL ORGANIC CARBON (TOC) |
| This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis. | | | |
| CL-IC-N-VA | Water | Chloride in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| EC-PCT-VA | Water | Conductivity (Automated) | APHA 2510 Auto. Conduc. |
| This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode. | | | |
| EC-SCREEN-VA | Water | Conductivity Screen (Internal Use Only) | APHA 2510 |
| Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc. | | | |

Reference Information

| | | | |
|---|-------|--|---|
| HARDNESS-CALC-VA | Water | Hardness | APHA 2340B |
| Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO ₃ equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation. | | | |
| HG-D-CVAA-VA | Water | Diss. Mercury in Water by CVAAS or CVAFS | APHA 3030B/EPA 1631E (mod) |
| Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | | | |
| HG-T-CVAA-VA | Water | Total Mercury in Water by CVAAS or CVAFS | EPA 1631E (mod) |
| Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | | | |
| IONBALANCE-VA | Water | Ion Balance Calculation | APHA 1030E |
| Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero. | | | |
| Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as: | | | |
| Ion Balance (%) = [Cation Sum-Anion Sum] / [Cation Sum+Anion Sum] | | | |
| MET-D-CCMS-VA | Water | Dissolved Metals in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| MET-T-CCMS-VA | Water | Total Metals in Water by CRC ICPMS | EPA 200.2/6020A (mod) |
| Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| NH3-F-VA | Water | Ammonia in Water by Fluorescence | J. ENVIRON. MONIT., 2005, 7, 37-42, RSC |
| This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al. | | | |
| NO2-L-IC-N-VA | Water | Nitrite in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| NO3-L-IC-N-VA | Water | Nitrate in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| PH-PCT-VA | Water | pH by Meter (Automated) | APHA 4500-H pH Value |
| This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode | | | |
| It is recommended that this analysis be conducted in the field. | | | |
| SO4-IC-N-VA | Water | Sulfate in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| TDS-CALC-VA | Water | TDS (Calculated) | APHA 1030E (20TH EDITION) |
| This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses". The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample. | | | |
| TSS-VA | Water | Total Suspended Solids by Gravimetric | APHA 2540 D - GRAVIMETRIC |
| This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples. | | | |

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location |
|----------------------------|---|
| VA | ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA |

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Reference Information

QC Samples with Qualifiers & Comments:

| QC Type Description | Parameter | Qualifier | Applies to Sample Number(s) |
|---------------------|--------------------------|-----------|--|
| Method Blank | Zinc (Zn)-Dissolved | MB-LOR | L2032801-1, -2, -3, -4, -5, -6, -7, -8, -9 |
| Matrix Spike | Dissolved Organic Carbon | MS-B | L2032801-1, -3, -4, -7, -8, -9 |
| Matrix Spike | Dissolved Organic Carbon | MS-B | L2032801-1, -3, -4, -7, -8, -9 |
| Matrix Spike | Barium (Ba)-Dissolved | MS-B | L2032801-1, -2, -3, -4, -5, -6, -7, -8, -9 |
| Matrix Spike | Calcium (Ca)-Dissolved | MS-B | L2032801-1, -2, -3, -4, -5, -6, -7, -8, -9 |
| Matrix Spike | Magnesium (Mg)-Dissolved | MS-B | L2032801-1, -2, -3, -4, -5, -6, -7, -8, -9 |
| Matrix Spike | Potassium (K)-Dissolved | MS-B | L2032801-1, -2, -3, -4, -5, -6, -7, -8, -9 |
| Matrix Spike | Sodium (Na)-Dissolved | MS-B | L2032801-1, -2, -3, -4, -5, -6, -7, -8, -9 |
| Matrix Spike | Strontium (Sr)-Dissolved | MS-B | L2032801-1, -2, -3, -4, -5, -6, -7, -8, -9 |
| Matrix Spike | Sulfur (S)-Dissolved | MS-B | L2032801-1, -2, -3, -4, -5, -6, -7, -8, -9 |
| Matrix Spike | Barium (Ba)-Total | MS-B | L2032801-1, -2, -3, -4, -5, -6, -7, -8, -9 |
| Matrix Spike | Calcium (Ca)-Total | MS-B | L2032801-1, -2, -3, -4, -5, -6, -7, -8, -9 |
| Matrix Spike | Magnesium (Mg)-Total | MS-B | L2032801-1, -2, -3, -4, -5, -6, -7, -8, -9 |
| Matrix Spike | Manganese (Mn)-Total | MS-B | L2032801-1, -2, -3, -4, -5, -6, -7, -8, -9 |
| Matrix Spike | Sodium (Na)-Total | MS-B | L2032801-1, -2, -3, -4, -5, -6, -7, -8, -9 |
| Matrix Spike | Strontium (Sr)-Total | MS-B | L2032801-1, -2, -3, -4, -5, -6, -7, -8, -9 |
| Matrix Spike | Sulfur (S)-Total | MS-B | L2032801-1, -2, -3, -4, -5, -6, -7, -8, -9 |
| Matrix Spike | Sulfate (SO4) | MS-B | L2032801-1, -2, -3, -4, -5, -6, -7, -8, -9 |

Qualifiers for Individual Parameters Listed:

| Qualifier | Description |
|-----------|---|
| DLA | Detection Limit adjusted for required dilution |
| DLB | Detection Limit Raised. Analyte detected at comparable level in Method Blank. |
| DLDS | Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity. |
| DLM | Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity). |
| DTMF | Dissolved concentration exceeds total for field-filtered metals sample. Metallic contaminants were likely introduced to dissolved sample during field filtration. |
| MB-LOR | Method Blank exceeds ALS DQO. Limits of Reporting have been adjusted for samples with positive hits below 5x blank level. |
| MS-B | Matrix Spike recovery could not be accurately calculated due to high analyte background in sample. |

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|--|--------|---|---------------------------------------|
| ALK-TITR-VA | Water | Alkalinity Species by Titration | APHA 2320 Alkalinity |
| This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values. | | | |
| BE-D-L-CCMS-VA | Water | Diss. Be (low) in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| BE-T-L-CCMS-VA | Water | Total Be (Low) in Water by CRC ICPMS | EPA 200.2/6020A (mod) |
| Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS. | | | |
| CARBONS-DOC-VA | Water | Dissolved organic carbon by combustion | APHA 5310B TOTAL ORGANIC CARBON (TOC) |
| This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis. | | | |
| CL-IC-N-VA | Water | Chloride in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| EC-PCT-VA | Water | Conductivity (Automated) | APHA 2510 Auto. Conduc. |
| This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode. | | | |
| EC-SCREEN-VA | Water | Conductivity Screen (Internal Use Only) | APHA 2510 |
| Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc. | | | |

Reference Information

| | | | |
|---|-------|--|---|
| HARDNESS-CALC-VA | Water | Hardness | APHA 2340B |
| Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO ₃ equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation. | | | |
| HG-D-CVAA-VA | Water | Diss. Mercury in Water by CVAAS or CVAFS | APHA 3030B/EPA 1631E (mod) |
| Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | | | |
| HG-T-CVAA-VA | Water | Total Mercury in Water by CVAAS or CVAFS | EPA 1631E (mod) |
| Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | | | |
| IONBALANCE-VA | Water | Ion Balance Calculation | APHA 1030E |
| Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero. | | | |
| Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as: | | | |
| Ion Balance (%) = [Cation Sum-Anion Sum] / [Cation Sum+Anion Sum] | | | |
| MET-D-CCMS-VA | Water | Dissolved Metals in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| MET-T-CCMS-VA | Water | Total Metals in Water by CRC ICPMS | EPA 200.2/6020A (mod) |
| Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| NH3-F-VA | Water | Ammonia in Water by Fluorescence | J. ENVIRON. MONIT., 2005, 7, 37-42, RSC |
| This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al. | | | |
| NO2-L-IC-N-VA | Water | Nitrite in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| NO3-L-IC-N-VA | Water | Nitrate in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| PH-PCT-VA | Water | pH by Meter (Automated) | APHA 4500-H pH Value |
| This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode | | | |
| It is recommended that this analysis be conducted in the field. | | | |
| SO4-IC-N-VA | Water | Sulfate in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| TDS-CALC-VA | Water | TDS (Calculated) | APHA 1030E (20TH EDITION) |
| This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses". The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample. | | | |
| TSS-MAN-WR | Water | Total Suspended Solids by Gravimetric | APHA 2540 D |
| This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids are determined by filtering a sample through a glass fibre filter and drying the filter at 104 degrees celsius. | | | |

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location |
|----------------------------|---|
| WR | ALS ENVIRONMENTAL - WHITEHORSE, YUKON, CANADA |
| VA | ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA |

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg ww - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

| Matrix Spike | Nitrite (as N) | MS-B | L2035054-1 |
| Matrix Spike | Nitrate (as N) | MS-B | L2035054-1 |
| Matrix Spike | Sulfate (SO4) | MS-B | L2035054-1 |

Qualifiers for Individual Parameters Listed:

| Qualifier | Description |
|-----------|---|
| MB-LOR | Method Blank exceeds ALS DQO. Limits of Reporting have been adjusted for samples with positive hits below 5x blank level. |
| MES | Data Quality Objective was marginally exceeded (by < 10% absolute) for < 10% of analytes in a Multi-Element Scan / Multi-Parameter Scan (considered acceptable as per OMOE & CCME). |
| MS-B | Matrix Spike recovery could not be accurately calculated due to high analyte background in sample. |

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|--|--------|--|---------------------------------------|
| ALK-TITR-VA | Water | Alkalinity Species by Titration | APHA 2320 Alkalinity |
| This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values. | | | |
| ANIONS-N+N-CALC-VA | Water | Nitrite & Nitrate in Water (Calculation) | EPA 300.0 |
| Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N). | | | |
| BE-D-L-CCMS-VA | Water | Diss. Be (low) in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| BE-T-L-CCMS-VA | Water | Total Be (Low) in Water by CRC ICPMS | EPA 200.2/6020A (mod) |
| Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS. | | | |
| CARBONS-DOC-VA | Water | Dissolved organic carbon by combustion | APHA 5310B TOTAL ORGANIC CARBON (TOC) |
| This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis. | | | |
| CL-IC-N-VA | Water | Chloride in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |

Reference Information

| | | | |
|---|-------|--|---|
| EC-PCT-VA | Water | Conductivity (Automated) | APHA 2510 Auto. Conduc. |
| This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode. | | | |
| EC-SCREEN-VA | Water | Conductivity Screen (Internal Use Only) | APHA 2510 |
| Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc. | | | |
| HARDNESS-CALC-VA | Water | Hardness | APHA 2340B |
| Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO ₃ equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation. | | | |
| HG-D-CVAA-VA | Water | Diss. Mercury in Water by CVAAS or CVAFS | APHA 3030B/EPA 1631E (mod) |
| Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | | | |
| HG-T-CVAA-VA | Water | Total Mercury in Water by CVAAS or CVAFS | EPA 1631E (mod) |
| Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | | | |
| IONBALANCE-VA | Water | Ion Balance Calculation | APHA 1030E |
| Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero. | | | |
| Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as: | | | |
| Ion Balance (%) = [Cation Sum-Anion Sum] / [Cation Sum+Anion Sum] | | | |
| MET-D-CCMS-VA | Water | Dissolved Metals in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| MET-T-CCMS-VA | Water | Total Metals in Water by CRC ICPMS | EPA 200.2/6020A (mod) |
| Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| NH3-F-VA | Water | Ammonia in Water by Fluorescence | J. ENVIRON. MONIT., 2005, 7, 37-42, RSC |
| This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al. | | | |
| NO2-L-IC-N-VA | Water | Nitrite in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| NO3-L-IC-N-VA | Water | Nitrate in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| PH-PCT-VA | Water | pH by Meter (Automated) | APHA 4500-H pH Value |
| This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode | | | |
| It is recommended that this analysis be conducted in the field. | | | |
| SO4-IC-N-VA | Water | Sulfate in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| TDS-CALC-VA | Water | TDS (Calculated) | APHA 1030E (20TH EDITION) |
| This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses". The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample. | | | |
| TSS-VA | Water | Total Suspended Solids by Gravimetric | APHA 2540 D - GRAVIMETRIC |
| This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples. | | | |

Reference Information

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location |
|----------------------------|---|
| VA | ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA |

Chain of Custody Numbers:

2017-12-13 A

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Reference Information

QC Samples with Qualifiers & Comments:

| QC Type Description | Parameter | Qualifier | Applies to Sample Number(s) |
|---------------------|---|-----------|------------------------------------|
| Method Blank | Alkalinity, Total (as CaCO ₃) | B | L2037961-1, -2, -3, -4, -5, -6, -7 |
| Method Blank | Manganese (Mn)-Dissolved | MB-LOR | L2037961-2 |
| Matrix Spike | Dissolved Organic Carbon | MS-B | L2037961-1, -2, -3 |
| Matrix Spike | Sulfate (SO ₄) | MS-B | L2037961-7 |

Qualifiers for Individual Parameters Listed:

| Qualifier | Description |
|-----------|--|
| B | Method Blank exceeds ALS DQO. Associated sample results which are < Limit of Reporting or > 5 times blank level are considered reliable. |
| DLA | Detection Limit adjusted for required dilution |
| DLM | Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity). |
| HTD | Hold time exceeded for re-analysis or dilution, but initial testing was conducted within hold time. |
| MB-LOR | Method Blank exceeds ALS DQO. Limits of Reporting have been adjusted for samples with positive hits below 5x blank level. |
| MS-B | Matrix Spike recovery could not be accurately calculated due to high analyte background in sample. |

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|---|--------|--|---------------------------------------|
| ALK-TITR-VA | Water | Alkalinity Species by Titration | APHA 2320 Alkalinity |
| This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values. | | | |
| ANIONS-N+N-CALC-VA | Water | Nitrite & Nitrate in Water (Calculation) | EPA 300.0 |
| Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N). | | | |
| BE-D-L-CCMS-VA | Water | Diss. Be (low) in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| BE-T-L-CCMS-VA | Water | Total Be (Low) in Water by CRC ICPMS | EPA 200.2/6020A (mod) |
| Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS. | | | |
| CARBONS-DOC-VA | Water | Dissolved organic carbon by combustion | APHA 5310B TOTAL ORGANIC CARBON (TOC) |
| This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis. | | | |
| CL-IC-N-VA | Water | Chloride in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| EC-PCT-VA | Water | Conductivity (Automated) | APHA 2510 Auto. Conduc. |
| This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode. | | | |
| EC-SCREEN-VA | Water | Conductivity Screen (Internal Use Only) | APHA 2510 |
| Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc. | | | |
| HARDNESS-CALC-VA | Water | Hardness | APHA 2340B |
| Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO ₃ equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation. | | | |
| HG-D-CVAA-VA | Water | Diss. Mercury in Water by CVAAS or CVAFS | APHA 3030B/EPA 1631E (mod) |
| Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | | | |
| HG-T-CVAA-VA | Water | Total Mercury in Water by CVAAS or CVAFS | EPA 1631E (mod) |
| Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | | | |
| IONBALANCE-VA | Water | Ion Balance Calculation | APHA 1030E |
| Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero. | | | |

Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are

Reference Information

included where data is present. Ion Balance is calculated as:

$$\text{Ion Balance (\%)} = \frac{[\text{Cation Sum} - \text{Anion Sum}]}{[\text{Cation Sum} + \text{Anion Sum}]}$$

MET-D-CCMS-VA Water Dissolved Metals in Water by CRC ICPMS APHA 3030B/6020A (mod)

Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

MET-T-CCMS-VA Water Total Metals in Water by CRC ICPMS EPA 200.2/6020A (mod)

Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

NH3-F-VA Water Ammonia in Water by Fluorescence J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NO2-L-IC-N-VA Water Nitrite in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO3-L-IC-N-VA Water Nitrate in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

SO4-IC-N-VA Water Sulfate in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

TDS-CALC-VA Water TDS (Calculated) APHA 1030E (20TH EDITION)

This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses".

The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample.

TSS-VA Water Total Suspended Solids by Gravimetric APHA 2540 D - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius.

Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location |
|----------------------------|---------------------|
|----------------------------|---------------------|

| | |
|----|---|
| VA | ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA |
|----|---|

Chain of Custody Numbers:

2017-12-20 B

Reference Information

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Reference Information

QC Samples with Qualifiers & Comments:

| QC Type Description | Parameter | Qualifier | Applies to Sample Number(s) |
|---------------------|--------------------------|-----------|-----------------------------|
| Method Blank | Manganese (Mn)-Dissolved | B | L2039348-1, -2, -3, -4 |
| Matrix Spike | Dissolved Organic Carbon | MS-B | L2039348-1, -2, -4 |
| Matrix Spike | Sulfate (SO4) | MS-B | L2039348-2, -4 |

Qualifiers for Individual Parameters Listed:

| Qualifier | Description |
|-----------|--|
| B | Method Blank exceeds ALS DQO. Associated sample results which are < Limit of Reporting or > 5 times blank level are considered reliable. |
| DLM | Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity). |
| MS-B | Matrix Spike recovery could not be accurately calculated due to high analyte background in sample. |

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|---|--------|--|---------------------------------------|
| ALK-TITR-VA | Water | Alkalinity Species by Titration | APHA 2320 Alkalinity |
| This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values. | | | |
| ANIONS-N+N-CALC-VA | Water | Nitrite & Nitrate in Water (Calculation) | EPA 300.0 |
| Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N). | | | |
| BE-D-L-CCMS-VA | Water | Diss. Be (low) in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| BE-T-L-CCMS-VA | Water | Total Be (Low) in Water by CRC ICPMS | EPA 200.2/6020A (mod) |
| Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS. | | | |
| CARBONS-DOC-VA | Water | Dissolved organic carbon by combustion | APHA 5310B TOTAL ORGANIC CARBON (TOC) |
| This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis. | | | |
| CL-IC-N-VA | Water | Chloride in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| EC-PCT-VA | Water | Conductivity (Automated) | APHA 2510 Auto. Conduc. |
| This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode. | | | |
| EC-SCREEN-VA | Water | Conductivity Screen (Internal Use Only) | APHA 2510 |
| Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc. | | | |
| HARDNESS-CALC-VA | Water | Hardness | APHA 2340B |
| Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation. | | | |
| HG-D-CVAA-VA | Water | Diss. Mercury in Water by CVAAS or CVAFS | APHA 3030B/EPA 1631E (mod) |
| Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | | | |
| HG-T-CVAA-VA | Water | Total Mercury in Water by CVAAS or CVAFS | EPA 1631E (mod) |
| Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | | | |
| IONBALANCE-VA | Water | Ion Balance Calculation | APHA 1030E |
| Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero. | | | |
| Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as: | | | |
| Ion Balance (%) = [Cation Sum-Anion Sum] / [Cation Sum+Anion Sum] | | | |
| MET-D-CCMS-VA | Water | Dissolved Metals in Water by CRC ICPMS | APHA 3030B/6020A (mod) |

Reference Information

Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

MET-T-CCMS-VA Water Total Metals in Water by CRC ICPMS EPA 200.2/6020A (mod)

Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

NH3-F-VA Water Ammonia in Water by Fluorescence J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NO2-L-IC-N-VA Water Nitrite in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO3-L-IC-N-VA Water Nitrate in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

SO4-IC-N-VA Water Sulfate in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

TDS-CALC-VA Water TDS (Calculated) APHA 1030E (20TH EDITION)

This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses". The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample.

TSS-VA Water Total Suspended Solids by Gravimetric APHA 2540 D - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location |
|----------------------------|---|
| VA | ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA |

Chain of Custody Numbers:

2017-12-27 A

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

EXECUTIVE SUMMARY

The Minto Mine, operated by the Capstone Mining Corporation, is an open pit copper/gold/silver mine located approximately 240 km northwest of Whitehorse in the Yukon Territory. The mine is located in the upper reaches of the Minto Creek watershed approximately 10 km west of the Minto Creek confluence with the Yukon River. Commercial production at the Minto Mine commenced in October 2007 and the mine is projected to run to 2020. Milling (concentrating) is done on site and tailings are stored in a dry stack Tailings Storage Facility (TSF; now closed) and in mined-out open pits (active). Site water is ultimately managed in a Water Storage Pond located approximately 1.5 kilometers to the east (down-gradient) of the mill. The Minto Mine has one point of effluent discharge to Minto Creek from the Water Storage Pond, and discharge is intermittent as needed. The Minto Mine is required to undertake Environmental Effects Monitoring (EEM) under the federal Metal Mining Effluent Regulations (MMER). The current phase of EEM (Phase 4) is a “biological monitoring study to assess effects” following the completion of a “biological monitoring study to investigate confirmed effects” in Phase 3. The Minto Mine Phase 4 EEM was completed between June and September 2016, and provided sublethal toxicity testing of Minto Mine effluent, an assessment of the influence of Minto Mine effluent discharge on water chemistry and benthic invertebrate community condition of Minto Creek relative to reference sites, and an assessment of the controlled exposure of a sentinel fish (kokanee as a surrogate for chinook salmon) to Minto Mine effluent.

Effluent sublethal toxicity tests conducted by the mine from 2015 to present (the Phase 4 EEM period) showed no effects to the survival of rainbow trout embryos, the survival or reproduction of *Ceriodaphnia dubia* (a cladoceran invertebrate often referred to as a water flea), nor to the growth of *Pseudokirchneriella subcapitata* (a green algae) or *Lemna minor* (a plant). This suggests a low probability of toxicity in the receiving environment.

Routine water quality monitoring indicated an influence of the Minto Mine on Minto Creek evident in conductivity, hardness, nitrate, aluminum, arsenic, iron, and selenium that were greater than reference. Of these, concentrations of nitrate were most strongly associated with the release of water from the Water Storage Pond, but remained below the Canadian Water Quality Guideline for the protection of aquatic life (CWQG). Aluminum and arsenic had mean concentrations greater CWQG, but this occurred at both the effluent-exposed and reference stations. During the Phase 4 EEM benthic survey (in September 2016) water of upper Minto Creek had concentrations of nitrate, total Kjeldahl nitrogen, total phosphorus, copper, and molybdenum greater than the range of reference concentrations. Of these, only copper was present at a concentration greater than the CWQG, but did not exceed the applicable site-specific water quality objective (SSWQO). Of the analytes identified as elevated relative to reference in routine water quality monitoring or

during the EEM benthic survey (conductivity, hardness, nitrate, phosphorus, aluminum, arsenic, copper, iron, molybdenum, and selenium), all except for aluminum and arsenic increased in the fish exposure vessels in proportion to effluent concentration.

The benthic invertebrate community of Minto Creek was evaluated using two approaches: a reference condition approach (RCA) that evaluates individual sites relative to a range of reference (based on ten reference sites) and a control-impact (CI) comparison of the exposed area mean against the reference mean. The latter, completed at the request of Environment and Climate Change Canada (ECCC), assumes that within-area variability (upper Minto Creek) and among-area variability (reference sites) are comparable, which may not be true. Mine-exposed benthic invertebrate communities of upper Minto Creek were within reference condition for all four primary EEM metrics (density, taxon richness, Simpson's evenness, and Bray Curtis [BC] distance [also known as the BC index of dissimilarity]). Evaluation by control-impact comparison indicated that mean taxon richness, mean Simpson's evenness, and mean BC distance did not differ from the reference means, whereas mean density of the effluent-exposed upper Minto Creek area was significantly lower than reference. The difference in density was at a magnitude of -1.2 standard deviations, which is below the Critical Effect Size (CES) of ± 2 standard deviations and therefore may not be ecologically meaningful. Supplementary examination of taxon proportions indicated lower relative abundances of EPT taxa (Ephemeroptera, Plecoptera, and Trichoptera; mayflies, stoneflies, and caddisflies) at effluent-exposed upper Minto Creek than reference, which was primarily due to lower relative abundance of Plecoptera (individually), and also indicated higher relative abundances of Trichoptera and oligochaetes. As Plecoptera and Trichoptera are considered to be sensitive organisms and oligochaetes are considered to be tolerant organisms, these results are equivocal with respect to a potential effluent-related influence. Correlation analysis indicated negative relationships between benthic invertebrate density and water quality, and a negative relationship between the proportion of oligochaetes and dissolved oxygen.

Fish population health was evaluated using an on-site laboratory exposure to Minto Mine effluent at two concentrations (14% and 25%) in comparison to Yukon River reference water. The fish survey indicated that fish exposed to the higher effluent concentration (25%) for 47 days were slightly larger and of better condition than those exposed to reference water. Fish exposed to the lower effluent concentration (14%) for 47 days did not differ from reference on the basis of size, but had slightly lower condition than reference fish. In all cases, the magnitudes of the observed differences were very small, and were presumably detected due to the high power associated with large sample size (minimum 152 fish) and uniform fish size. In the case of condition (fish weight-at-length) - the key effect endpoint evaluated in this fish survey - the magnitudes of difference (-2.7% and +2.3% for 14% effluent and 25% effluent, respectively) were well below the CES of 10%. These differences are therefore not considered to be ecologically meaningful.

The results of the Phase 4 EEM were generally consistent with those of the previous EEM (i.e., the Phase 3 benthic invertebrate community survey and the Phase 2 fish survey). Specifically, the results of the Phase 4 EEM benthic invertebrate community survey were consistent with the results of the Phase 3 EEM - RCA analysis in two consecutive EEM Phases has indicated no effect. A supporting CI comparison in this study (Phase 4) suggested lower density at the effluent-exposed area, but this result was opposite from the apparent greater density observed at one of three sites evaluated by RCA in Phase 3. The results of the Phase 4 EEM fish study were similar to those of the Phase 2 EEM fish study (no fish study was completed in association with the Phase 3 Investigation of Cause study of differences in benthic invertebrate communities). These two consecutive EEM Phases have indicated slightly greater fish size and condition associated with effluent exposure. However, the associated magnitudes of difference for the EEM-effect endpoint (condition) was less than 3%, well below the CES of 10%.

1 INTRODUCTION

1.1 Site Description

The Minto Mine is a high grade copper mine located within Selkirk First Nation (SFN) Category A Settlement Land Parcel R-6A approximately 240 km northwest of Whitehorse, Yukon Territory (62° 37' N latitude and 137 °15' W longitude; Figure 1.1). It is owned and operated by the Minto Explorations Ltd. a wholly owned subsidiary of Capstone Mining Corporation. Development of the mine was initiated in 1997, commercial operations started in October 2007, and the currently anticipated operating life is to 2020. The Minto Mine is permitted to conduct open pit and underground mining, and to mill the copper/gold/silver ore at a rate of 4,200 tonnes of per day. In 2016 (the most recent year of record), the Minto Mine produced 69.3 million pounds of copper from milling approximately 1.49 million tones or ore.

In addition to open pit mines, underground mines, and the mill, the Minto Mine site includes a number of waste rock dumps, a concentrate storage shed, a tailings storage facility (TSF), a water retention dam with a water storage pond (WSP), a water treatment plant, administrative offices, an airstrip, and a camp (Figure 1.2). Mill tailings are stored in a dry stack TSF and in mined-out open pits. Mine-impacted seepage from the TSF and under the Mill Valley Fill (MVF) is collected at the toe of the MVF in sump W62 and is pumped to the main pit (Figure 1.2). Non-impacted water and treated mine-impacted water are collected in the WSP (Figure 1.2). Effluent from the WSP is periodically discharged to Minto Creek under conditions specified in Water Use Licence (WUL) QZ14-031 (August 2015). Minto Creek, in turn, discharges to the Yukon River approximately 7.7 km south-east of the WSP (Figure 1.2).

1.2 Regulatory Context

Federal effluent regulations for the metal mining industry (Metal Mining Effluent Regulations; MMER) were most recently amended in September 2017 (Government of Canada 2017a). These regulations, administered under the federal *Fisheries Act*, apply to mining and milling operations that have discharged effluent at a rate greater than 50 m³/day and therefore apply to the Minto Mine. The MMER outline requirements for routine effluent monitoring, acute lethality testing, and Environmental Effects Monitoring (EEM). The objective of EEM is to determine whether mine effluent discharge is causing an effect on fish, benthic invertebrate communities, and/or the use of fisheries resources. The Minto Mine triggered the MMER on July 10th 2006.

1.3 Background

In accordance with the MMER, the Minto Mine has completed three phases of EEM (Minnow and Access 2009, 2012; Minnow 2015) and is presently in Phase 4. The Phase 3 EEM

Date December 2017
 Project 157202.0087

Figure 1.2

biological study was an Investigation of Cause (IOC) study (or “biological monitoring study to investigate confirmed effects”; Environment Canada 2012). The requirement for IOC was triggered by a finding of consistent differences in the structure of the benthic invertebrate community of Minto Creek compared to reference (as indicated by the Bray-Curtis Index of Dissimilarity) through the first two phases of EEM. The IOC indicated that the differences were likely due to comparison to too few reference areas (limited characterization of the range of reference conditions) and that the benthic invertebrate community of Minto Creek was within reference condition defined by a larger group of physically comparable reference sites. Accordingly, the Phase 4 EEM returned to periodic monitoring (or “biological monitoring studies to assess effects”; Environment Canada 2012). A study design for the Minto Mine Phase 4 EEM was prepared and submitted to Environment and Climate Change Canada (ECCC) in February 2016 (Minnow 2016). Some adjustments to the study design were made following discussion with ECCC in July 2016. Biological monitoring was implemented between June and September 2016 and the study results are presented and interpreted in this report. Briefly, the Phase 4 EEM included a benthic invertebrate community study of Minto Creek using the Reference Condition Approach (RCA), *in situ* fishing at lower Minto Creek and reference, an on-site laboratory based fish exposure study of Minto Mine effluent and reference water mixtures, and supporting physical, chemical and biological measures (described in detail in Section 2.0).

1.4 Effluent Discharge and Quality

Minto Mine final effluent is discharged to Minto Creek via a control structure located at monitoring Station W3 (Figure 1.2). This location captures effluent discharged from the WSP as well as surface and groundwater inputs to the section of Minto Creek between the toe of the WSP and Station W3 (Figure 1.2). A total of 576,734 m³ of effluent was discharged to Minto Creek at Station W3 over the period from 2015 to end of August 2017 (the Phase 4 EEM period for which data were available; 328,526 m³ in 59 discharge days in 2015, 166,897 m³ in 167 discharge days in 2016, and 81,311 m³ in 72 discharge days in 2017; Appendix Table A.1). Highest rates of discharge in 2015 and 2016 were in April during freshet whereas the highest rate in 2017 was mid-June (Figure 1.3). Maximum daily rates of discharge in 2015, 2016, and 2017 were 12,614 m³/d in 2015, 2,253 m³/d in 2016, and 4,411 m³/d in 2017 (Figure 1.3). The Minto Mine targets an effluent concentration in lower Minto Creek of no more than 25% effluent (1 part effluent to 3 parts creek water). Concurrent monitoring of effluent discharge rates and water flow rates in lower Minto Creek in 2016 and 2017 (not completed in 2015) documented an average of 17.7% effluent on days when the mine was discharging (Appendix Figure A.1).

Minto Mine effluent quality met all limits specified under the MMER over the period from 2015 to end of August 2017 (Appendix Table A.2). No acute toxicity to rainbow trout or to *Daphnia magna*

Figure 1.3: Daily Minto Mine Effluent Discharge Volume, 2015 to August 2017

were observed over this period (Appendix Table A.3). Lastly, routine effluent quality monitoring (Appendix Table A.2) and effluent characterization (conducted four times per year; Appendix Table A.4) indicate that effluent has been of consistent quality through the Phase 4 EEM period.

2 METHODS

2.1 Overview

The Phase 4 EEM study for the Minto Mine consisted of the following components: 1) effluent sublethal toxicity testing; 2) receiving water quality monitoring; 3) a benthic invertebrate community survey; 4) *in situ* fish collection and measurement; and 5) a fish exposure study implemented at an on-site laboratory. A fish tissue (mercury) assessment was not required because mercury concentrations in final effluent have not exceeded 0.0001 mg/L (Appendix Table A.4; Environment Canada 2012).

The benthic invertebrate community survey, supported by physical measures and water quality, was conducted from September 22nd to 25th, 2016. The benthic survey included an evaluation of upper Minto Creek (5 replicate sites) using a Reference Condition Approach (RCA) that included 10 reference sites (Table 2.1; Figure 2.1). At the request of Environment and Climate Change Canada (ECCC), additional evaluation of the upper Minto Creek was completed using a Control-Impact (CI) approach¹. The fish survey was comprised of two parts. An *in situ* non-lethal survey in lower Minto Creek with lower Big Creek serving as reference was attempted, with monthly sampling from June to September 2016 (Minto 2017; Table 2.1; Figure 2.1). However, because the abundance of fish in Minto Creek is typically too low to support a statistically meaningful *in situ* fish survey (i.e., per Environment Canada 2012), an on-site laboratory exposure study was completed at the Minto Mine site from August 7th to September 22nd 2016 (Table 2.1; Figure 2.1).

2.2 Effluent Sublethal Toxicity

Under the MMER, the Minto Mine implements sublethal toxicity testing of final effluent on an annual frequency. Sublethal toxicity samples were collected into 20 litre plastic containers. Following collection, samples were placed on ice inside coolers and shipped to Nautilus Environmental via ALS Environmental Laboratory (Burnaby BC) where they arrived within 48 hours. Sample appearance, odour, temperature, and hardness were recorded upon arrival at the laboratory. Tests were conducted using rainbow trout (*Oncorhynchus mykiss*) embryos, the invertebrate *Ceriodaphnia dubia*, the green algae *Pseudokirchneriella subcapitata* and the plant *Lemna minor* using Environment Canada test methods (1998, 2007a,b,c). Sublethal toxicity data were subsequently reported to ECCC as part of Minto Mine annual reports and are synthesized in this report.

¹ It is noted that this requested comparison assumes that within-area variability (upper Minto Creek) and among-area variability (reference sites) are comparable, which may not be true.

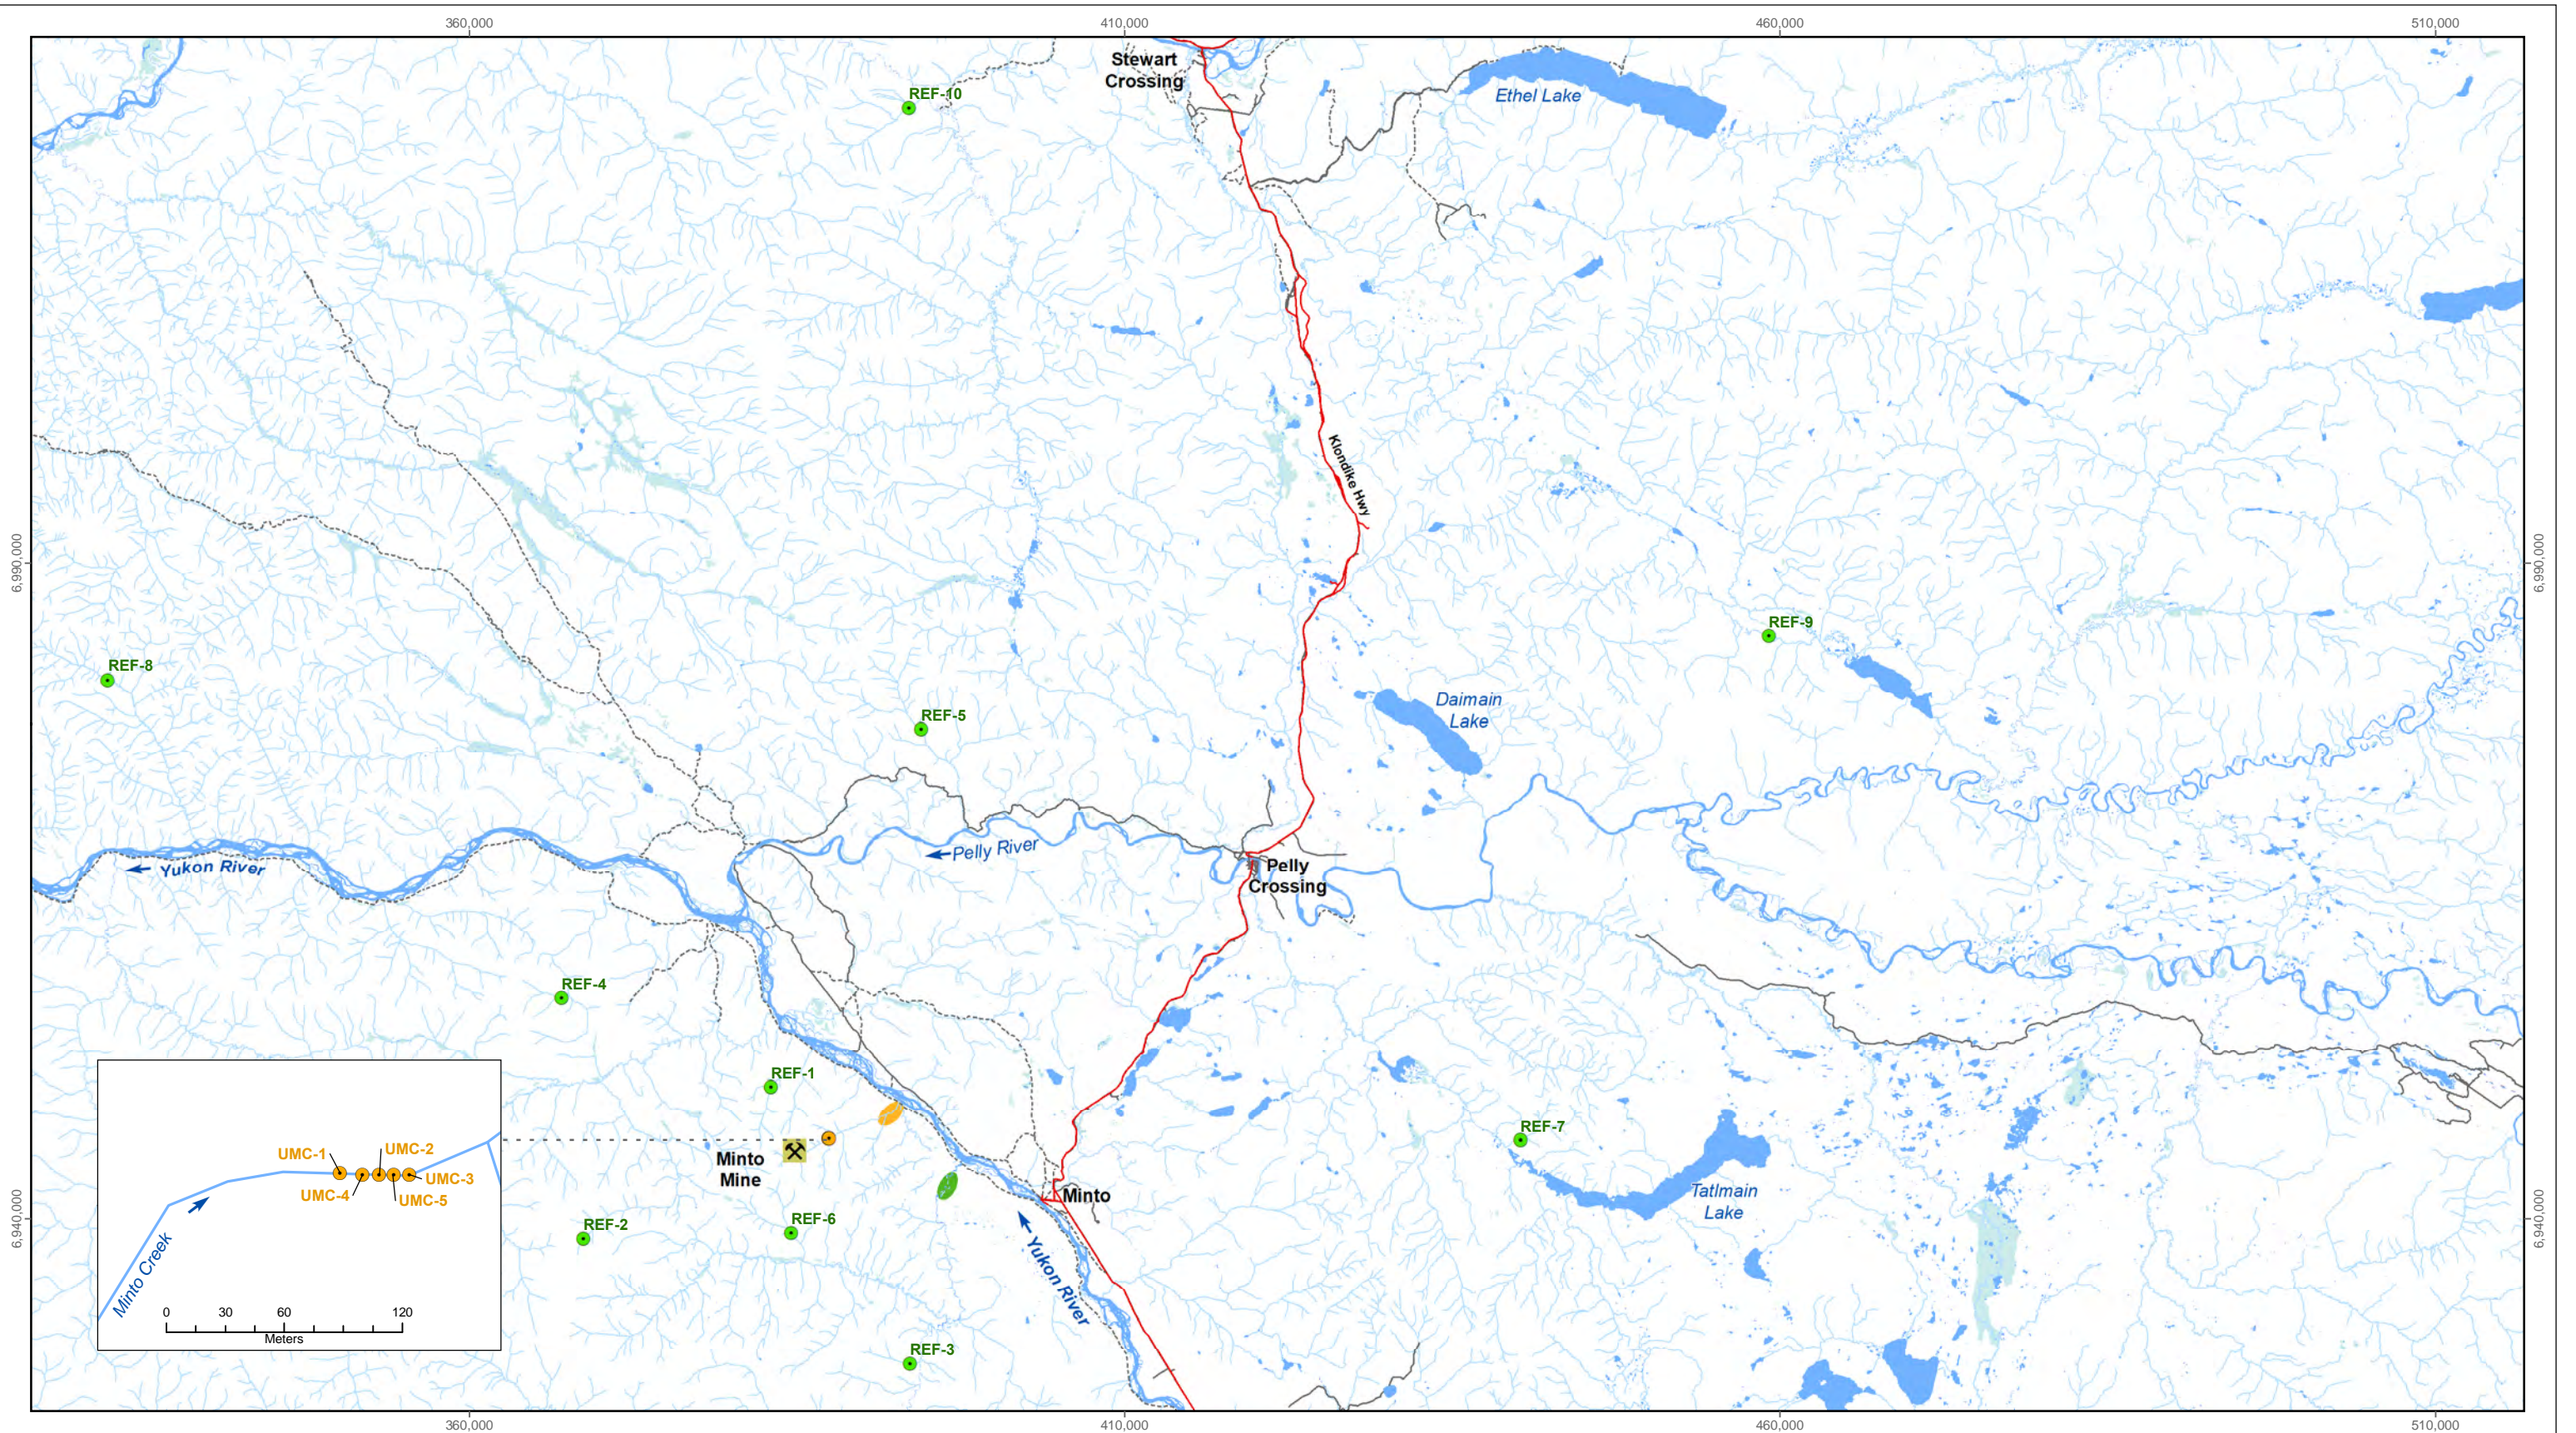

Table 2.1: Overview of the Minto Mine Phase 4 EEM Study Design for Biological Monitoring

| Area | Benthic Invertebrate Survey | | Fish Survey | |
|---------------------------------------|---|--|---|--|
| | Overview | Supporting Data | Overview | Supporting Data |
| Effluent-Exposed Areas | | | | |
| Minto Creek - Upper | Reference Condition Approach (RCA) conducted in September 2016 ¹ . Erosional habitat, five replicate stations. Figure 2.1

2.3 Water Quality

Under the MMER, the Minto Mine monitors receiving water quality at a frequency of four times per year. Monitoring is conducted at lower Minto Creek (Station W2) and a north-flowing tributary to Minto Creek (Station W7), representing mine-exposed and reference conditions, respectively (Figure 2.2). In addition to routine water quality monitoring, water samples were collected to support the EEM biological surveys, including one sample at each benthic invertebrate sampling site (September 22nd to 25th 2016) and samples collected from each of the fish exposure vessels at weekly intervals (seven samples between August 8th and September 19th 2016). Results from both the routine monitoring and the EEM water quality monitoring were incorporated into the overall assessment of receiving water quality.

2.3.1 Sample Collection

During the EEM field survey, *in situ* measures of water temperature, dissolved oxygen (DO) concentration and saturation, pH, and specific conductance were collected at each benthic invertebrate community sampling site. *In situ* measurements were taken using a YSI 650MDS hand held field meter equipped with a YSI 600XLM sonde (Yellow Springs, OH) that was checked against standards daily and calibrated as required. One water sample was collected at each benthic site during the benthic invertebrate community survey. Samples were collected into pre-labelled sample bottles. All samples were maintained in coolers with ice packs during transportation or at 4°C in an on-site refrigerator until submitted to ALS Environmental (ALS; Whitehorse, Yukon).

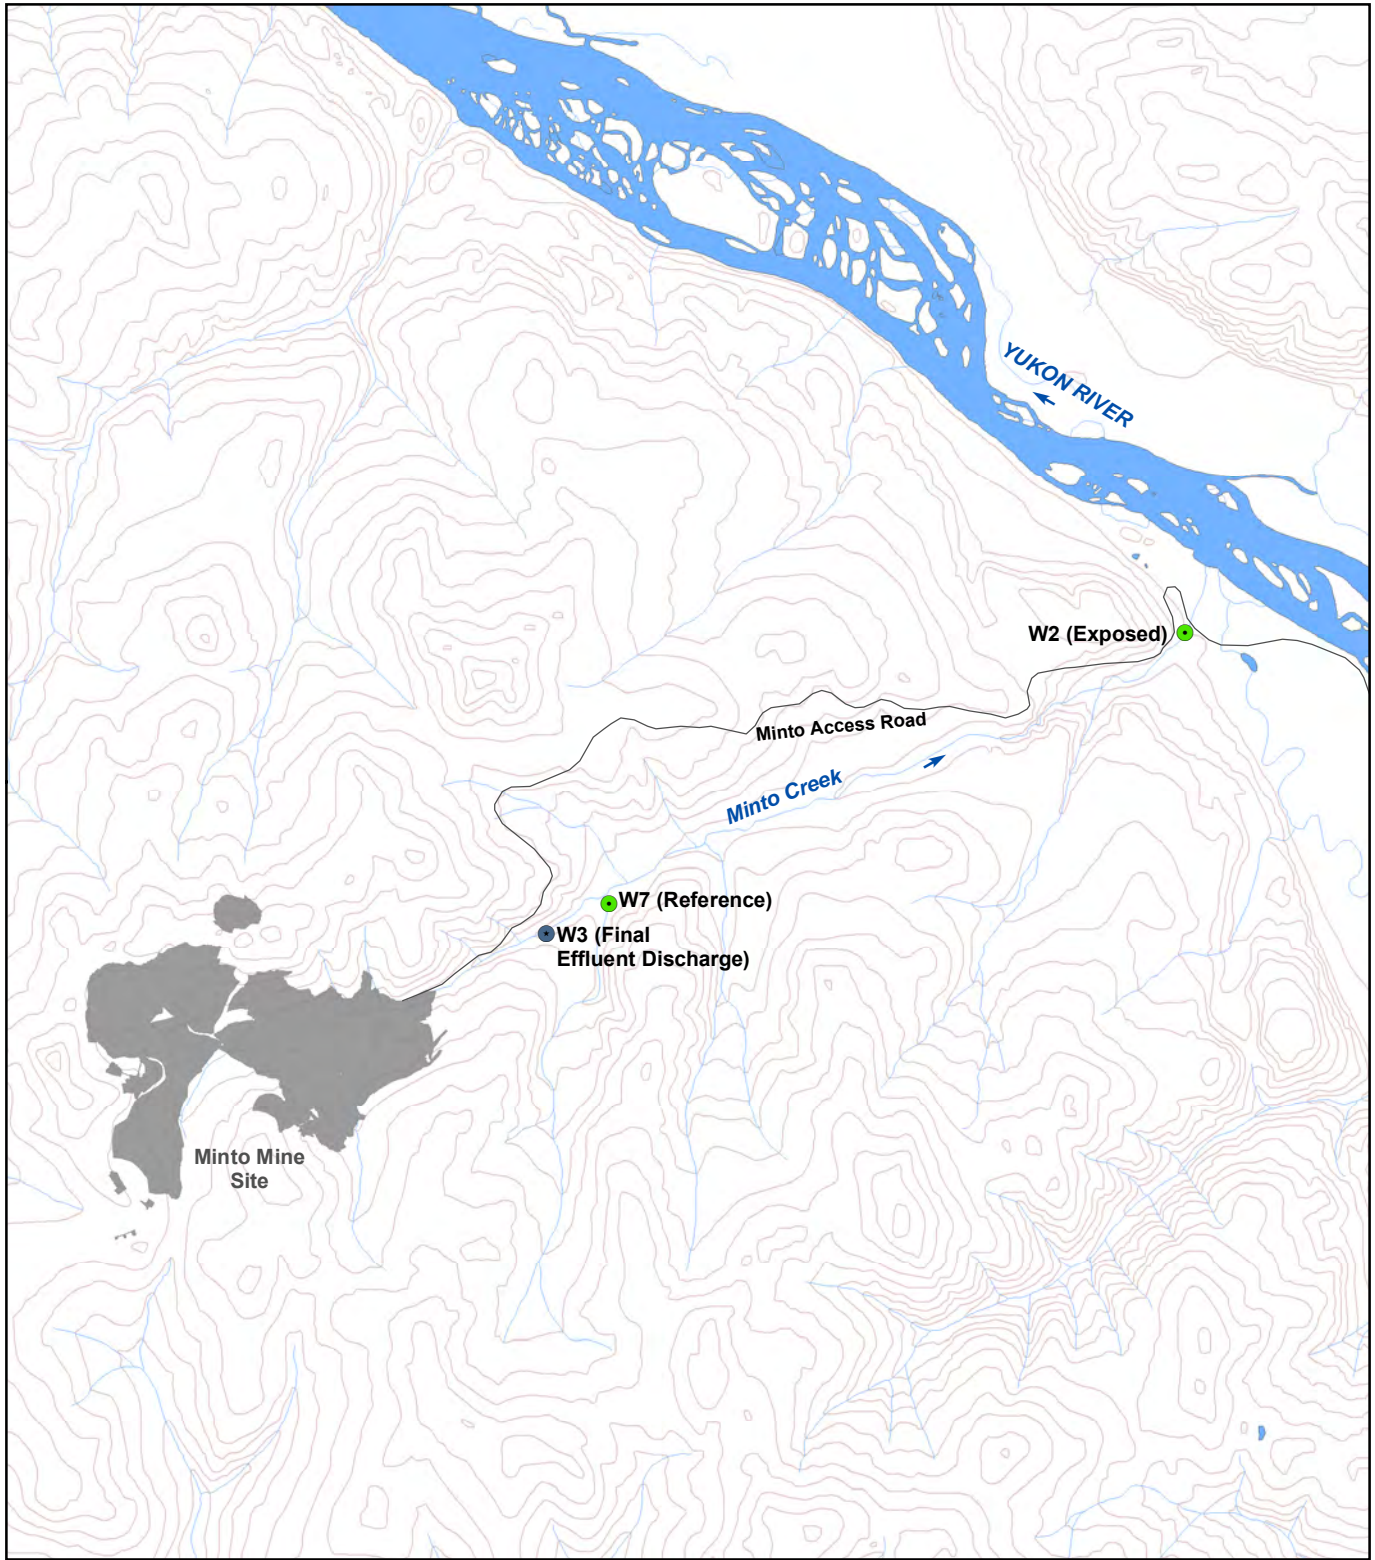

2.3.2 Laboratory Analyses

At ALS, water samples were analyzed for the analytes required under EEM (hardness, alkalinity, aluminum, arsenic, cadmium, copper, iron, lead, mercury, molybdenum, nickel, selenium, zinc, total suspended solids, ammonia, and nitrate; Environment Canada 2012) and for a number of additional analytes (dissolved organic carbon, total Kjeldahl nitrogen, and total phosphorus). Briefly, alkalinity was determined by potentiometric titration, anions by ion chromatography, metals by collision reaction cell ICP-MS (inductively coupled plasma - mass spectrometry) or ICP-OES (inductively coupled plasma - optical emission spectrophotometry), mercury by CVAFS (cold vapour atomic fluorescence spectrophotometry), dissolved organic carbon by combustion, ammonia and total Kjeldahl nitrogen by fluorescence, and phosphorus by colour. Hardness was calculated from calcium and magnesium concentrations.

2.3.3 Data Analysis

Water quality data were subject to a Data Quality Review, including the evaluation of laboratory blank results, laboratory spikes and laboratory duplicates (Appendix B). Water quality data were

Figure 2.2

evaluated relative to Canadian Water Quality Guidelines for the protection of aquatic life (CWQG; CCME 1999). Water quality of Minto Creek was also evaluated relative to reference areas. As part of the benthic invertebrate community data interpretation, Principal Components Analysis (PCA) was used to reduce the supporting water quality dataset for correlation analysis against benthic metrics. Analytes for which more than 90% of the available data were below laboratory method detection limits (MDL) were excluded from the data matrix. Principal component axes were then generated from the remaining data matrix.

For analytes that were present at greater concentrations in Minto Creek than reference, and/or analytes present at concentrations greater than CWQG, data analysis was enhanced by examining additional water quality data collected by the Minto Mine under their Water Use Licence (WUL). Specifically, data from the Phase 4 EEM period (2015-2017) were plotted with periods of discharge highlighted in order to further identify and interpret the influence of the Minto Mine on the water quality of Minto Creek.

2.4 Benthic Invertebrate Community

The benthic invertebrate community survey included an evaluation of upper Minto Creek using a Reference Condition Approach (RCA) that included 10 reference sites. The reference sites were selected based on their similarity to upper Minto Creek as determined through a combination of GIS analysis (Minnow 2014, 2015), key habitat variables measured during previous EEM (Minnow 2015), and benthic invertebrate community characteristics measured during previous EEM (Minnow 2015). Of the 10 reference sites identified in this manner (Minnow 2015), only one could not be accessed (NRC-7; the helicopter could not land nearby) and a backup site was sampled instead. Although not part of the original study design (Minnow 2015), ECCC requested a control-impact comparison of upper Minto Creek to the reference sites, which was also completed.

2.4.1 Sample Collection

Benthic invertebrate samples were collected from each of the study sites using a one-foot square (0.093 m²) Surber sampler equipped with a 500-µm mesh collection net. The Surber sampler was used after attempts to use the 0.1 m² Hess sampler (as proposed in the study design; Minnow 2015) failed due to low water depths in the exposed area. One sample was collected at each site (five sites in upper Minto Creek and 10 reference sites) with each sample representing a composite of three-grabs to ensure that the sample was representative of the station (0.279 m² in total). Each sub-sample was collected by carefully placing the base of the Surber sampler onto the substrate and pushing the sampler into the substrate after which gravel and cobble contained within the base of the sampler were carefully washed using a scrub brush while allowing the

current to carry dislodged organisms into the mesh collection net. After the area within the sampler was completely washed, any organisms adhering to the mesh were rinsed into the collection net using creek water. At that point, the sampler was moved to the next sub-sampling location and the procedure repeated. After collection of the third sub-sample, all organisms were carefully rinsed to the end of the mesh collection net and carefully transferred into a one-litre, wide-mouth plastic jar labelled with the project number, sample location and collection date. Internal labels were also used to ensure correct identification if the external labelling were to become illegible due to wear. Benthic samples were preserved with buffered formalin to a nominal concentration of 10%. Preservation occurred within six hours of collection to eliminate the potential effects of within-sample predation that could affect abundance estimates. All samples were maintained in coolers or totes at the Minto Mine until submitted to Cordillera Consulting (Summerland, British Columbia).

2.4.2 Laboratory Processing

At Cordillera, samples were analyzed following standard sorting methods and incorporating recommended Environment Canada (2012) QA/QC procedures for assessing organism recovery and sub-sampling error. Upon arrival at the laboratory, a biological stain was added to each benthic invertebrate community sample to facilitate greater sorting accuracy. The samples were washed free of formalin in a 500 µm sieve and the remaining sample material was then examined under a stereomicroscope at a magnification of at least ten times by a technician. All benthic invertebrates were removed from the sample debris and placed into vials containing a 70% ethanol solution according to major taxonomic groups (e.g., phyla, orders). A senior taxonomist later enumerated and identified the benthic organisms to the lowest practical level (typically to genus or species) using up-to-date taxonomic keys. Following identification and enumeration of benthic organisms, representative specimens of each new taxon were preserved in 75% ethanol (with 3% glycerol) in separately-labelled vials and added to the Minto Mine benthic invertebrate voucher collection. As required by Environment Canada, 10% of samples were re-sorted to verify that fewer than 10% of total organisms were missed, and 10% of the sub-samples were evaluated against a second sub-sample to verify that sub-sampling error was lower than 20% (Glozier et al. 2002; Environment Canada 2012).

2.4.3 Data Analysis – Reference Condition Approach

Benthic invertebrate community data were subject to a Data Quality Review (DQR), which included an evaluation of sorting efficiency and sub-sampling error (Appendix B). The RCA was initiated by evaluating the appropriateness of the reference sites for defining the reference condition. Indirect correlation of environmental variables with site scores derived from a reference Correspondence Analysis (CA) was used to identify the strongest (Pearson correlation with

$p < 0.10$) environmental predictors of reference benthic invertebrate community structure. Principal components analysis (PCA) of all reference sites and the exposed sites was then conducted using the significant environmental variable predictors of reference community structure to ensure that the range of 'natural' environmental conditions found at the mine-exposed sites was encompassed by the reference sites.

Benthic invertebrate communities were evaluated at the family level of taxonomy (as recommended by Environment Canada 2012) using EEM primary metrics of mean invertebrate density (organisms per m^2), mean taxon richness, Simpson's Evenness Index (calculated as in Smith and Wilson 1996; Environment Canada 2012) and the Bray-Curtis Index of Dissimilarity (calculated as in Bray and Curtis 1957). These endpoints were calculated following the exclusion of Collembola, Ostracods, Copepods, Nemata, and Turbellaria from the analysis as these taxa are either non-benthic or are generally smaller than 500 μm in size. The relative proportions of the most abundant taxa were also computed (calculated as the abundance of each respective dominant/indicator taxon relative to the total number of organisms in the sample). Dominant/indicator taxon groups were defined as those groups representing more than 5% of total organism abundance or any groups considered to be important indicators of environmental stress. All required and supplementary endpoints were summarized by reporting mean, median, minimum, maximum, standard deviation, standard error, and sample size for each sampling site.

Correspondence analysis (CA) was also used to assess benthic invertebrate community structure of mine-exposed and reference stations. CA is a multivariate technique, which is used to create synthetic species prevalence axes extracted in a sequential manner. Each score (number) on a CA axis is the sum of a weighted vector of species proportion. Species with correlated proportions vary together and will have similar weights and scores on a CA axis. When depicted in two-dimensional plots, taxa that tend to co-occur plot together, while those that rarely co-occur plot farther apart. Similarly, stations sharing many taxa plot closest to one another, while those with little in common plot farthest apart. The greatest variation among either taxa or stations is explained by the first axis, with other axes accounting for progressively less variation. This type of multivariate analysis describes not only which stations have distinct benthic communities but also how these benthic communities differ among stations (i.e., which particular taxa differ). Prior to CA, the data were screened for rare taxa, as these can distort results. Taxa occurring at 5% or fewer of the stations were removed. After screening and data reduction, a proportional data matrix was used to conduct a CA using Minitab 17 (Minitab 2015). Scores for both taxa and stations were calculated and plotted to evaluate the associations of organisms and stations.

The RCA experimental design evaluates individual mine-exposed sites against a reference condition, which is comprised of multiple reference sites (10 in this study). Therefore, a traditional

ANOVA evaluation cannot be used in an RCA design. When testing for statistical differences between a single exposed site (test site) and multiple reference sites, two non-central tests can be used; a one-sample, non-central, equivalence test; and a one-sample, non-central, interval test (Kilgour et al. 1998). Determination that a test site is different from the reference condition (i.e., outside the range of reference values) is assessed using a critical effect size of 1.96 reference standard deviations and tested using two null hypotheses: H_{01} – the absolute value of the reference mean minus the test site value is ≥ 1.96 reference standard deviations (equivalence test), and H_{02} – the absolute value of the reference mean minus the test site value is ≤ 1.96 reference standard deviations (interval test). This testing results in three possible outcomes: a non-central p-value (ncP) < 0.1 (interval test) that indicates a community endpoint is outside of the reference condition; a ncP > 0.9 (equivalence test) that indicates a community endpoint is within the reference condition; and a ncP-value between 0.1 and 0.9 that is inconclusive with respect to potential difference from the reference condition (Kilgour et al. 1998). The interval and equivalence tests can also be conducted and presented graphically using tolerance limits (Kilgour et al. 2017). The tolerance limits can be interpreted as confidence limits on the percentiles of the reference site distribution. Using an effect size of 1.96 standard deviations and an alpha of 0.1, the interval and equivalence tests are the same as comparing a value from an exposed site to the 90% one-sided confidence limits on the 2.5th and 97.5th percentiles of the reference site data set. Any exposed sites found to be statistically outside the range of reference condition (exposed value below the 90% lower limit of the 2.5th percentile or above the 90% upper limit of the 97.5th percentile) were further evaluated through inspection of the raw data and taxonomic proportions. Data were transformed and assumptions of normality were assessed prior to calculating the tolerance limits. Calculations were conducted using the RealStats add-in (Zaiontz 2017) in Microsoft Excel®. Ecological requirements and pollution sensitivity or tolerance of the dominant taxa were assessed using standard references (Edmunds et al. 1976; Clarke 1981; Chapman et al. 1982; Weiderholm 1983; Kiffney and Clements 1994; Wiggins 1996; Resh et al. 1996; Rosenberg and Resh 1996; Taylor and Bailey 1997; Barbour et al. 1999; Bode et al. 2002; Mandaville 2002; Merritt et al. 2008) in order to consider the statistical results of the benthic invertebrate community survey in the context of ecological requirements and pollution sensitivity or tolerance.

2.4.4 Data Analysis – Control-Impact

Although not part of the original study design (Minnow 2015), a control-impact comparison was also completed at the request of ECCC. Specifically, the exposed area of upper Minto Creek (replicated with 5 stations) was compared to reference (10 sites). As previously indicated, this comparison assumes that within-area variability (upper Minto Creek) and among-area variability (reference sites) are comparable, which may not be true. The CI comparisons were made on the

basis of mean values of the same metrics as used for the RCA design. Benthic metrics were plotted to explore spatial patterns in the benthic community data. T-tests were used to test for differences in mean benthic metrics between “areas” (effluent-exposed upper Minto Creek and the population of 10 reference sites). Data were transformed as necessary to satisfy assumptions of normality and homogeneity of variance. In instances where variances could not be homogenized by transformation, the t-test for unequal variances was used. When assumptions of normality could not be met, the non-parametric Mann-Whitney test was used. Statistical tests were conducted using the RealStats add-in (Zaiontz 2017) in Microsoft Excel© and plots were generated using Microsoft Excel©. Interpretation of benthic invertebrate community metrics was enhanced by inspection of raw data and taxonomic proportions to detect patterns of ecologically relevant differences between the exposed area and reference. Ecological requirements and pollution sensitivity or tolerance of the dominant taxa were assessed using standard references (Edmunds et al. 1976; Clarke 1981; Chapman et al. 1982; Weiderholm 1983; Kiffney and Clements 1994; Wiggins 1996; Resh et al. 1996; Rosenberg and Resh 1996; Taylor and Bailey 1997; Barbour et al. 1999; Bode et al. 2002; Mandaville 2002; Merritt et al. 2008).

In instances when a significant difference between effluent-exposed and reference area means was detected using ANOVA, the magnitude of the difference was calculated for that metric. The magnitude of the difference was calculated to reflect the number of reference standard deviations (SDs) as follows:

$$(\text{exposure mean} - \text{reference mean}) / \text{reference SD}$$

The reference SD was estimated as the pooled SD in the t-test or the reference areas SD when the mine-exposed and reference areas SDs were significantly different. The design had $n = 5$ mine effluent-exposed stations and $n = 10$ reference sites. This design has a power of 0.96 to detect a two SD change in the exposed mean relative to the mean of the reference areas.

2.4.5 Additional Supporting Measures

In addition to *in situ* water quality measurements and the water chemistry data collected as described above, supporting information collected at each benthic invertebrate community station included global positioning system (GPS) coordinates recorded in latitude and longitude using WGS 1984 map datum, water velocity, sampling depth, stream gradient, stream wetted width, stream bankfull width, percent cobble/gravel/sand, median intermediate pebble axis length, and median embeddedness. Additional data collected to characterize each benthic invertebrate sampling station included: water appearance, creek morphology, bank condition, instream cover, residual pool depth, instream features, overhead canopy, aquatic vegetation, riparian vegetation, surrounding land use, anthropogenic disturbance, and photographs.

GPS coordinates were recorded using a Garmin Oregon 300 handheld GPS. Water velocity was measured using a Marsh-McBirney Flo-Mate 2000 portable flow meter and depth was measured using a meter stick. Stream gradient was measured using a Suunto clinometer. Wetted and bankfull widths were measured at each sampling site using a tape measure. Percent cobble/gravel/sand was estimated visually. The intermediate axis length of 100 rocks that were washed in the Surber sampler at each station were measured and recorded. In addition, the percent embeddedness of ten rocks was evaluated and recorded. This type of substrate characterization is similar to the Canadian Aquatic Biomonitoring Network (CABIN) protocol (CABIN 2012) for characterizing benthic invertebrate habitat and provided additional information to assess and standardize habitat conditions among sampling sites. Summary statistics of intermediate axis lengths and embeddedness were calculated for each station/site per CABIN protocol.

2.4.6 Correlation Analysis

Potential relationships between benthic invertebrate community metrics and physical/chemical conditions of the study sites were explored using correlation analysis as part of causal assessment (Suter et al. 2015). In order to reduce the number of comparisons made, benthic invertebrate community metrics were compared to a reduced set of physical and chemical variables (e.g., meter measures, water velocity, water depth, median substrate size, key water chemistry analytes identified in the water quality data evaluation, water chemistry PCA axes, and habitat PCA axes). Any significant correlations found at a p-value of 0.05 were further investigated using scatter plots to determine if a continuous distribution of data was realized (possible causal relationships) or if these relationships were “leveraged” by outlying points (or groups of points). The effects of leverage were carefully considered because any difference in benthic community attributes of the effluent-exposed sites relative to reference might be correlated with mine-related differences in water quality regardless of cause. Significant correlations, coupled with careful examination of scatterplots, were used to identify the factors that most contribute to variability in benthic invertebrate community endpoints. The causative merit of these factors were then considered in light of known physical and chemical influences on benthic invertebrate communities (e.g., stimulation by nutrient enrichment, toxicity by exposure to high metal concentrations).

2.5 Supporting Field-Based Fish Study

The Minto Phase 4 EEM fish survey consisted of a field-laboratory exposure study (described in the next section) and a supporting field-based fishing effort. The field-based fishing was implemented by the Minto Mine, and focussed on lower Minto Creek with lower Big Creek serving as the reference area (Capstone 2017a).

2.5.1 Fish Collection

Fish communities of lower Minto Creek and lower Big Creek were sampled on June 8-9, July 6-7, August 5-6, and Sept 22-23, 2016 (Capstone 2017a). Fish were collected using minnow traps set in lower Minto Creek (17 to 20 traps per sampling event) between the mouth and just above of a natural fish barrier located approximately 1.2 km upstream (Figure 2.3). Similar habitat was sampled at Big Creek (Figure 2.3) using the same methodology as for lower Minto Creek (but four traps per sampling event). Fish were sampled using ¼" mesh cylindrical minnow traps baited with Yukon River Chinook salmon roe and set on the bottom for approximately 24 hours. Supporting information recorded for each minnow trap set included sampling effort (set duration based on deployment and retrieval date and time) and GPS coordinates in latitude and longitude. All captured fish were identified to species and enumerated to characterize the fish community. Juvenile chinook salmon were briefly retained in buckets prior to being processed on shore near the capture location.

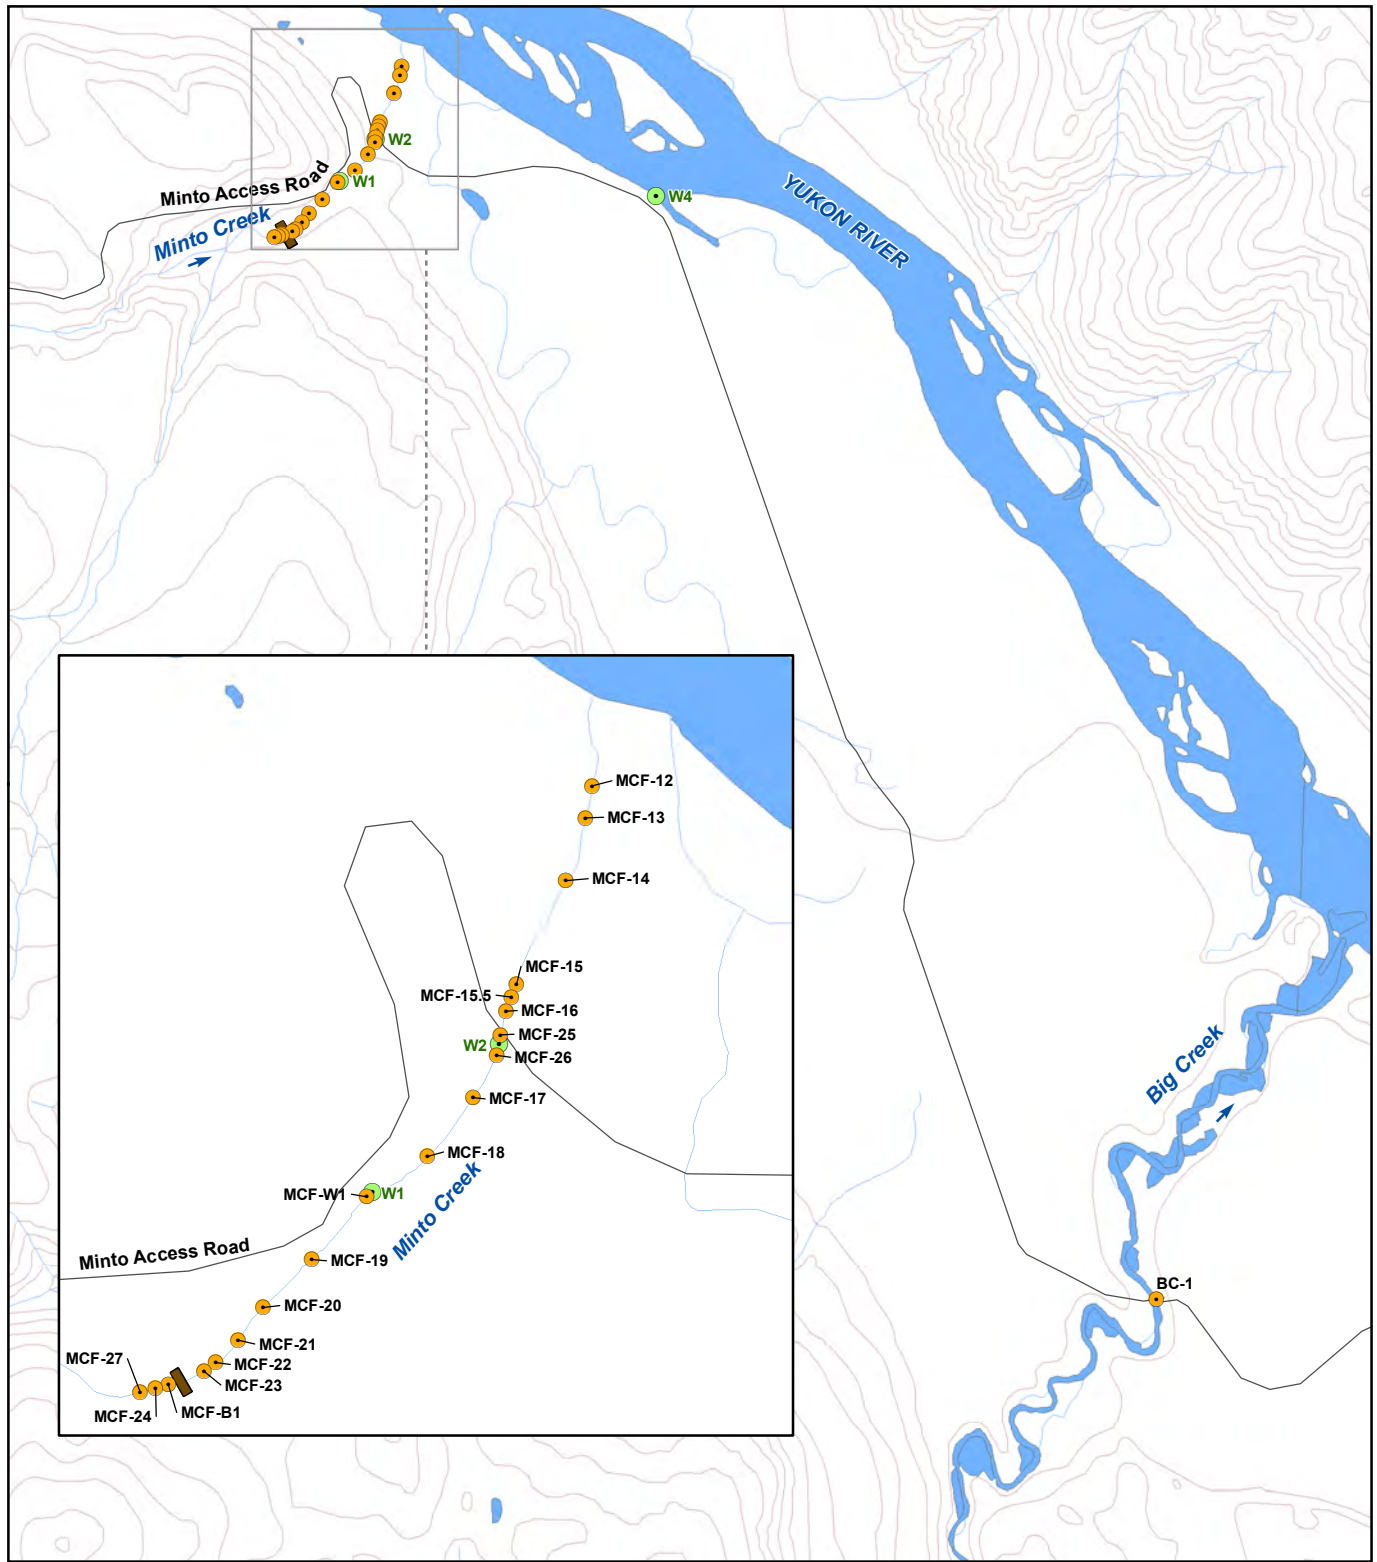

2.5.2 Fish Processing

All juvenile chinook salmon were measured for fork length using electronic calipers (± 1 mm precision) and for weight to the nearest 0.01 g (with $\pm 1\%$ precision) using a Scout-Pro Balance (Model HS-120; Ohaus Corp., Pine Brook, NJ). The presence of any external lesions, tumours, parasites or other abnormalities was also noted. Following processing, all fish were released near their capture location.

2.5.3 Data Analysis

All raw field data were transcribed from field sheets into an electronic spreadsheet and were checked for potential data entry errors as part of routine QA/QC procedures. Minnow trapping catch-per-unit-effort (CPUE) was calculated as the number of fish captured per minnow trap-day for each area and fish species. Consistent with EEM Technical Guidance (Environment Canada 2012), summary statistics including mean, median, minimum, maximum, standard deviation, standard error and sample size were calculated for length and weight of juvenile chinook salmon captured in lower Minto Creek and lower Big Creek. The field study provided confirmation of the appropriate life stage to use in the on-site laboratory exposure (i.e., 0+ age fry) and that the duration of the exposure study was sufficient to represent the short duration that chinook salmon fry spend in lower Minto Creek.

2.6 Laboratory Fish Exposure Study

2.6.1 Sentinel Fish Species

As described in the Phase 4 Study Design (Minnow 2016), naturally limited fish use of Minto Creek make a conventional EEM fish survey unfeasible (i.e., numbers are too low to support robust statistical contrasts). Therefore, an alternative approach - a controlled fish exposure study - was applied. Specifically, an on-site laboratory exposure was used to determine if combinations of Minto Mine effluent and reference water cause differences in survival, growth, and/or condition of fish reared over a 47-day period. This approach was similar to that applied in Phase 2 (Minnow and Access 2012), with some differences:

1. Kokanee salmon (*Oncorhynchus nerka*) were used as the sentinel species rather than Yukon River chinook salmon (*O. tshawytscha*) as the latter were unavailable.
2. The study was implemented at the Minto Mine rather than at a hatchery facility in Whitehorse.
3. Two concentrations of mine effluent were evaluated (i.e., two exposure groups) as opposed to just one (1 part effluent to 3 parts reference water [25% effluent] and 1 part effluent to 6 parts reference water [14% effluent]).
4. Yukon River water was used as reference water rather than Minto Creek water because Minto Creek flows were extremely low in 2016 (Capstone 2017b) and could not be relied upon as a water supply.

Because chinook salmon were not available from Yukon hatchery facilities in 2016, kokanee salmon (fry) were chosen as the surrogate sentinel species. Although kokanee salmon are not native to the Yukon River, they are native to the Yukon. Rationale for the selection of kokanee salmon for this exposure study included:

- Kokanee salmon are reared locally in the Yukon and were available in sufficient quantity for the study.
- The kokanee are from a group indigenous to the Yukon (Kathleen River system, Kluane National Park) and are fourth generation hatchery stock. Therefore, they are well adapted to artificial rearing systems and their behaviour and nutritional requirements are well known.
- The kokanee rearing program involves annual disease screening which indicates that the Whitehorse Rapids hatchery population is free of certain pathogens that are known to occur in other kokanee stocks.

- The Yukon reared kokanee have relatively high growth rates in cold water as they have adapted to cold water conditions in both their natural and hatchery environments. Therefore, it can be expected that their metabolic rate will be higher in colder creek water than might be the case for another surrogate species such as rainbow trout (and thus are more similar to chinook salmon).
- The kokanee present a very consistent growth rate among individuals.
- Kokanee are not aggressive towards each other in artificial rearing vessels and thus do not inflict harm on each other which could otherwise influence growth rates and overall fish health.

2.6.2 Exposure Facility and Conditions Overview

The rearing infrastructure for the exposure study was assembled inside the water treatment building at the Minto Mine site (Figure 2.4). The use of a shelter allowed for better control of critical variables such as temperature and light, and sheltered the system from wind and precipitation. The rearing infrastructure (Figure 2.4) consisted of three circular fibreglass rearing tanks 1.47 m in diameter and 0.30 m deep fitted with a centre stand-pipe system which provided a water depth of 0.225 m and approximately 0.38 m³ of wetted rearing volume. All three rearing tanks were configured identically and included an air stone connected to a supply of pure oxygen (compressed oxygen in 100 pound cylinders), a water re-circulator/aerator and a water supply inlet with a flow control valve. A plastic (polyethylene) cover was kept on top of each tank to avoid airborne contamination and to minimise visual disturbance to the fish (see photos in Appendix F).

Rearing tanks received water from three individual water supply tanks with a circular diameter of 2.2 m, height of 1.85 m providing a total volume of 5.0 m³ per tank. The water supply tanks were situated just outside of the water treatment facility and placed on top of a sand berm at a height that allowed water to gravity feed, via 2.5 cm (1") diameter polyvinyl chloride (PVC) and polyethylene pipe to the rearing tanks inside the building. The water supply tanks were wrapped in insulated tarps to reduce solar heating of the water stored in them (see photos in Appendix F).

As it was imperative that all fish groups were exposed to exactly the same water temperatures throughout the study, a passive heat exchange system was constructed to equalize water temperatures among the tanks and maintain cool temperatures independent from ambient air temperature. The exchanger consisted of an 8.0 metre long x 20 cm (8") diameter PVC pipe fitted internally with 3 runs of 2.5 cm (1") diameter PVC pipe and enclosed on both ends except for a water inlet and outlet at either end (see Figure 2.4). The three 2.5 cm pipes inside the larger pipe extended beyond both ends of the larger pipe allowing it to be connected to supply water, and allowing water to pass through the exchanger and then be delivered to the rearing tanks. CONCEPTUAL DRAWING; FEATURES ARE NOT TO SCALE

water for the exchanger was supplied by a groundwater well (approximately 3°C) which flowed through the larger pipe continuously in a counter-current direction to the fish rearing water. This allowed for cooling and equilibration of the fish rearing water while being isolated from mixing with the water being delivered to the fish tanks.

Water temperature was monitored continuously every hour in each rearing tank using Tidbit temperature loggers. Temperatures were also taken manually twice/day using a mercury thermometer and/or a handheld water quality meter (YSI).

2.6.3 Fish Processing

On August 4th (pre-exposure) at the Whitehorse Rapids Fish Hatchery (located in Whitehorse, Yukon) 480 kokanee salmon fry were sedated in a dilute solution of MS222, measured (total length and fork length) using electronic calipers (to the nearest 0.01 mm), weighed to the nearest 0.01 g with a Mettler Toledo Balance (Model JS4002G), assessed for abnormalities, and divided into three groups (C [control], E6 [1 part effluent to 6 parts reference water] and E3 [1 part effluent to 3 parts reference water]) of 160 fish each. Fish were held until August 7th and then transported to the Minto Mine site. Fish were transported in 20 litre collapsible potable water jugs filled to one-third of capacity. After placing fish in each jug, the containers were collapsed by compressing the containers, forcing the air out of the top two-thirds of the container. This space was then filled with pure oxygen to ensure that fish were not oxygen deprived during their transport to site. Sealed jugs with fish, water, and pure oxygen were then placed in an insulated fish tote (approximately 1 m³ in volume) with approximately 10 centimeters of ice-water to keep containers and fish cool for transport to site. Fish were transported to the Minto Mine site on August 7th and then transferred to their respective rearing tanks for the study (Day 1 of exposure). Transit time from loading fish into the transport jugs to transfer to their rearing tanks was approximately five hours. One mortality occurred during the holding period subsequent to processing on August 4th. This mortality was part of the control group. Thus rearing at the mine site was initiated with 159 fish in the Control group (C) and 160 fish in each of the two exposure groups (E6 and E3).

At the approximate mid-point to of the exposure (September 1st 2016; Day 26), sub-samples of 50 fry were randomly collected from each tank, sedated in a dilute solution of MS222, measured (total length and fork length) and weighed as outlined above (with the exception that an A&D Balance [Model E5-610] was used at the Minto Mine site), and examined for abnormalities. All measurements and additional observations were recorded on data sheets and later transcribed to a spreadsheet which was cross-checked for accuracy. Following initial and mid-point processing, fish were placed in a recovery container (20 litre pail with 10 litres of water and aeration) and placed back in their respective tank once fully recovered. The average weight of the fish in each group was then used to adjust feed rations which are determined by water

temperature and biomass of fish in each tank. On the last day of the exposure (September 22nd 2016; Day 47), fish were removed from each tank and were exposed to a lethal dose of MS222 followed by measurement, weighing, and abnormality examination as described above. All carcasses were disposed of by incineration afterwards.

2.6.4 Water Quality and Flow Monitoring

Water was supplied to each tank at a flow rate ranging between 0.6 to 1.7 litres per minute, with higher flows required as the exposure study advanced in order to maintain dissolved oxygen (DO) concentrations and to manage ammonia concentrations². Water flow was measured twice daily using a graduated cylinder and stop-watch and adjusted when required. Dissolved oxygen levels were kept at 6.0 mg/L or higher (as recommended for salmonid hatcheries; Sigma 1983) by increasing flow rates, by aeration, and/or by direct input of oxygen. Aeration of the rearing tanks occurred from day one and continued throughout the study. When it was determined that water temperatures (and accompanying fish consumption of oxygen) were going to be higher than anticipated and that increasing flow rates and aeration would not keep DO levels in each tank above 6.0 mg/L, pure oxygen (bottled) was delivered to each rearing tank using air lines and stones.

Ammonia concentrations typically do not present an issue with flow-through fish rearing systems. However, because DO levels were not exclusively maintained by flow (i.e., were partially maintained by aeration and injection of pure oxygen to reduce demand on water supply), ammonia levels were monitored closely (daily) using a HACH spectrophotometer. When ammonia levels approached those that could potentially compromise fish health (Sigma 1983), water flows were increased. The toxicity of ammonia increases with increasing temperature and pH, which were both monitored closely along with ammonia. Flow rates were increased if ammonia levels started to approach those that could compromise the health of the fish (Sigma 1983). DO (mg/L and percent saturation), temperature, specific conductivity, and pH were monitored twice daily over the course of the exposures using a YSI Professional Plus field meter. Temperature was also measured and digitally recorded every hour with submersible TidbiT temperature loggers (Onset) UTBI-001.

Water from the Yukon River was delivered to the water supply tanks about once per week during the first part of the study. Delivery frequency increased to about once every two to three days towards the end of the study as flow rates to the rearing tanks were increased to manage DO and

² Ammonia, an excretion product, can become toxic to fish at high concentrations and was therefore carefully monitored, with water flow adjusted as required to maintain ammonia concentrations below those that could be harmful to salmonids (per Sigma 1983).

ammonia as outlined above. Concurrent with each water delivery from the Yukon River, effluent was also collected from the water storage pond. Rearing tank water was sampled weekly, for chemical analysis at a ALS Environmental (Burnaby BC). A total of seven samples were collected over the course of study starting on August 8th with the final sampling occurring on September 19th. Water quality samples were collected and handled as described in Section 2.3 and were analysed for required EEM analytes and additional supporting analytes as also described in Section 2.3.

2.6.5 Data Analysis

Raw laboratory data were transcribed from bench sheets into electronic spreadsheets and were checked by a separate individual for potential entry errors as part of routine QA/QC procedures. Scatterplots of body weight vs. fork length were used to identify potential measurement or recording errors. Summary statistics (mean, median, minimum, maximum, standard deviation, standard error, and sample size) were calculated for fork length, total length, and fresh body weight by exposure group.

Data were subject to detailed analyses required to satisfy the requirements of a non-lethal EEM fish population survey, with steps undertaken as follows. Body weight and fork length were plotted using boxplots by species and study area. The boxplots were defined using the minimum value, the first quartile (Q1), the median, the third quartile (Q3), and the maximum value. Extreme values in the boxplots were plotted as individual values and the whiskers of the box were truncated to the next value in the data set. Extreme values were defined as values more than 1.5 times the height of the box beyond Q1 or Q3 (i.e., less than $Q1 - 1.5(Q3 - Q1)$ or greater than $Q3 + 1.5(Q3 - Q1)$). Length-frequency distributions were plotted by exposure group using histograms. Scatterplots and linear regressions of body weight on fork length (both axes log₁₀-scaled) were also generated by exposure group. These plots were used to support the statistical analyses.

Detailed statistical analyses were performed using Minitab 17 software on fish endpoints representing three response categories: survival (length-frequency distribution), energy use (fork length and body weight), and energy storage (condition). The statistical analyses were consistent with procedures outlined in the Technical Guidance Document (Environment Canada 2012). Statistical analyses were conducted by comparing the effluent-exposed groups to reference separately (i.e., by pairwise comparison).

Length-frequency distributions were compared among exposures using two-sample Kolmogorov-Smirnov (K-S) tests. The K-S test is a non-parametric test of potential differences between two distributions (Zar 1984). The test is conducted as a comparison of the cumulative relative distribution functions of the two samples. The maximum difference in the cumulative relative

distributions at any given fish length is computed and tested to determine whether it is large enough to suggest that the two samples were generated from different statistical populations. The maximum difference in the cumulative relative distributions was reported as a measure of the magnitude of difference between the length frequency distributions between exposures. For example, if the maximum difference in the cumulative relative distribution functions between exposures was 0.25 at a fish length of 15 cm, then one exposure had 25% fewer fish smaller than 15 cm compared to the other exposure. A negative sign was applied to the magnitude of difference when the effluent-exposed fish were smaller than reference (e.g., when there were more fish < 15 cm) and a positive sign was applied to the magnitude of difference when the effluent-exposed fish were larger than reference (i.e., fewer fish < 15 cm).

Body weight and fork length were compared among exposures using two-sample t-tests or the non-parametric equivalent (Mann-Whitney test). The residuals from the tests were tested for normality (Shapiro-Wilks test, $\alpha = 0.05$) and equality of variances (Levene's test, $\alpha = 0.05$). When the assumptions of normality were not met, a log₁₀-transformation was conducted and the assumptions assessed again. When normality could not be achieved, the Mann-Whitney test was used. When the assumption of equal variances could not be achieved, the two-sample t-test for unequal variances was used.

Fish condition was compared among exposures using analysis of covariance (ANCOVA) with log₁₀(body weight) as the response variable and log₁₀(fork length) as the covariate. The ANCOVA was conducted by fitting a regression model with exposure, covariate, and the interaction between exposure and covariate as predictor variables (the interaction ANCOVA model). If the covariate term is significant, then the covariate is a significant predictor of the response variable and the ANCOVA analysis is needed. If the covariate term is not significant, then the analysis can proceed as an ANOVA (or t-test) on the response variable among exposures. Testing the significance of the interaction term (exposure×covariate) is equivalent to testing whether the regression slopes between exposures are equal. If the interaction term is not significant, then it can be dropped from the model and the ANCOVA can proceed using the parallel slope ANCOVA model (using only exposure and the covariate as predictor variables). In this case, a test for a difference in body weight among exposures (adjusted for fork length) is conducted by testing the significance of the exposure term in the parallel slope ANCOVA model. This test is equivalent to testing whether the intercepts between the two parallel slope regression lines are equal. The tests for significance of the covariate and interaction terms were conducted using $\alpha = 0.05$ and the tests for differences between exposures were conducted using $\alpha = 0.1$, consistent with the recommendations of Environment Canada (2012).

When regression slopes were not parallel (i.e., there was a significant interaction in the ANCOVA model), the scatterplots were examined to assess whether the regression lines appeared to be parallel. When there is low variability (i.e., high R^2 value), very small differences in regression slopes can be detected as being significant although the slopes are practically the same. To assess whether the difference in slopes is small enough to consider them to be parallel, the R^2 value of the interaction ANCOVA model was compared to the R^2 value of the parallel slope ANCOVA model. When the difference in R^2 between models was less than 2%, the ANCOVA proceeded assuming that the slopes are practically parallel (Environment Canada 2012).

Observations with studentized residuals of magnitude greater than four were removed from parametric tests (t-test and ANCOVA; Environment Canada 2012). The magnitude of difference for body weight, fork length, and condition among the exposures were calculated using the appropriate measure of central tendency depending on the statistical test used. The measure of central tendency was selected as the mean for t-test, geometric mean (i.e., mean on log₁₀-scale) when a log₁₀-transformation was used for a t-test, the median for the Mann-Whitney test, and the adjusted mean for an ANCOVA. The adjusted means for an ANCOVA are the predicted values on the parallel slope regression lines for each exposure at the average value of the covariate (i.e., the adjusted body weights at the average fish fork length). The ANCOVAs were conducted using log₁₀-transformed data so the adjusted means were back-transformed to the original data scale (i.e., antilogged). The magnitude of difference was calculated as a difference between the exposures (e.g., effluent-exposed and reference), expressed as a percentage of the reference area as:

$$\text{Magnitude of Difference} = \frac{Exp_{MCT} - Ref_{MCT}}{Ref_{MCT}} \times 100\%,$$

where MCT = measure of central tendency.

The magnitude of difference was compared to Critical Effect Sizes (CES) of 10% for condition and 25% for the other endpoints and was used to help identify statistically significant differences that may (or may not) be biologically meaningful.

When there was no significant difference detected between exposures, the minimum detectable difference (MDD) was estimated as a percent difference from the reference mean for ANOVA, or adjusted reference mean for ANCOVA. The MDD was estimated using the observed measure of variability (standard deviation of residuals), the average sample size between exposures, and assuming that differences in body weight and fork length would be tested using a t-test on log₁₀-transformed data (even if tested using another test). The probability of type I error (α) was set equal to the probability of Type II error (β) for the estimate of the MDD. The MDD was computed on the log₁₀-scale and transformed to a percent difference relative to reference in the

original data units. The MDD estimates were generated using the sample size and power calculator in Minitab 17.

3 EFFLUENT SUBLETHAL TOXICITY

Effluent sublethal toxicity tests conducted by the mine in 2015 and 2016 (data for 2017 have not yet been reported by the testing laboratory) showed no effects to the survival of rainbow trout embryos, the survival or reproduction of *Ceriodaphnia dubia* (a cladoceran invertebrate often referred to as a water flea), nor to the growth of *Pseudokirchneriella subcapitata* (a green algae) or *Lemna minor* (a plant; Table 3.1). This suggests a low probability of toxicity in the receiving environment, which is consistent with previous EEM Phases (Table 3.1).

4 WATER QUALITY AND SUPPORTING MEASURES

Water quality has been routinely monitored by the Minto Mine at lower Minto Creek (Station W2) and a reference tributary (Station W7; Figure 2.2). Water quality was also characterized during the benthic invertebrate community survey in September 2016, when *in situ* measurements of water quality, water samples for laboratory chemical analysis, and supporting physical and biological measures were collected at all benthic invertebrate community sampling sites (Figure 2.1). Lastly, water quality samples were collected weekly from each of the on-site laboratory fish exposure tanks to characterize exposure conditions.

4.1 Routine Water Quality Monitoring

Water quality at effluent-exposed lower Minto Creek (Station W2) differed from reference (Station W7; Figure 2.2) primarily on the basis of conductivity, hardness, nitrate, total aluminum, total arsenic, total iron, and total selenium, which were the only analytes with mean concentrations in 2015, 2016, or 2017 greater than the upper 95% confidence limit of the reference mean (Table 4.1; Appendix Table C.1). Plots of these analytes indicate that nitrate was the only analyte with a clear pattern of higher concentrations at Station W2 during periods of discharge (including when discharge was under non-freshet conditions; Appendix Figure C.1). Of the analytes elevated in lower Minto Creek relative to reference, total aluminum and total iron occurred at mean concentrations greater than Canadian Water Quality Guidelines (CWQG) at the effluent-exposed area and the reference area (Table 4.1). Concentrations of copper were also greater than CWQG at the effluent-exposed and reference areas, but were not elevated at the effluent-exposed area to greater than the upper 95% confidence limit of the reference mean and did not exceed the site-specific water quality objective (SSWQO) of 0.013 mg/L applicable when dissolved organic carbon (DOC) is lower than 10 mg/L (Table 4.1). Concentrations of total aluminum, total iron, and total copper were positively related to concentrations of total suspended solids (TSS; Appendix Figure C.2), and dissolved concentrations of these metals (which better represent the bioavailable fraction and for which the SSWQO apply) were typically elevated only during freshet (Appendix Figure C.3).

4.2 Water Quality and Supporting Measures Collected during the Benthic Survey

4.2.1 *In situ* Water Quality Measures

During the Phase 4 EEM benthic survey, the mean temperature of upper Minto Creek (8.6 °C) was notably higher than at the reference creeks (mean 0.99 °C; Figure 4.1; Appendix Table C.2), presumably due to effluent discharge at the time of sampling. *In situ* dissolved oxygen concentrations measured at Minto Creek during the benthic invertebrate community survey were

 Out of reference range.

Bold font Concentration greater than the lowest guideline or SSWQO.

^a If greater than 50% of samples were less than method detection limit, the mean was presented with a less than symbol (i.e., <).

^b Water quality guidelines for the protection of aquatic life (CCME 1999 with updates). Guideline for dissolved oxygen is for "Other life stages" of coldwater biota.

^c Site-specific water quality objectives for Station W2 per the Minto Mine Water Use Licence. For metals, the SSWQO are applicable on a dissolved basis.

^d Reference values are the 95th percentile of the 2015-2017 mean (Appendix Table C.1). Temperature, dissolved oxygen and pH are ranges from the 5th to 95th percentile.

^e At temperature 5°C and pH 8.5; values which are inclusive of all temperature and pH data recorded in this time period (maximum temperature = 4.5°C, maximum pH = 8.13; see Appendix Table C.1).

^f Maximum increase of 25 mg/L from background for short-term exposures (e.g., 24-h period) and maximum increase of 5 mg/L from background for longer term exposures.

^g At pH 8.5 (slightly conservative conditions).

^h At hardness of 100 mg/L (slightly conservative conditions).

ⁱ 0.013 mg/L copper at a dissolved organic carbon (DOC) concentration ≤10 mg/L and 0.02 mg/L copper at a DOC concentration >10 mg/L.

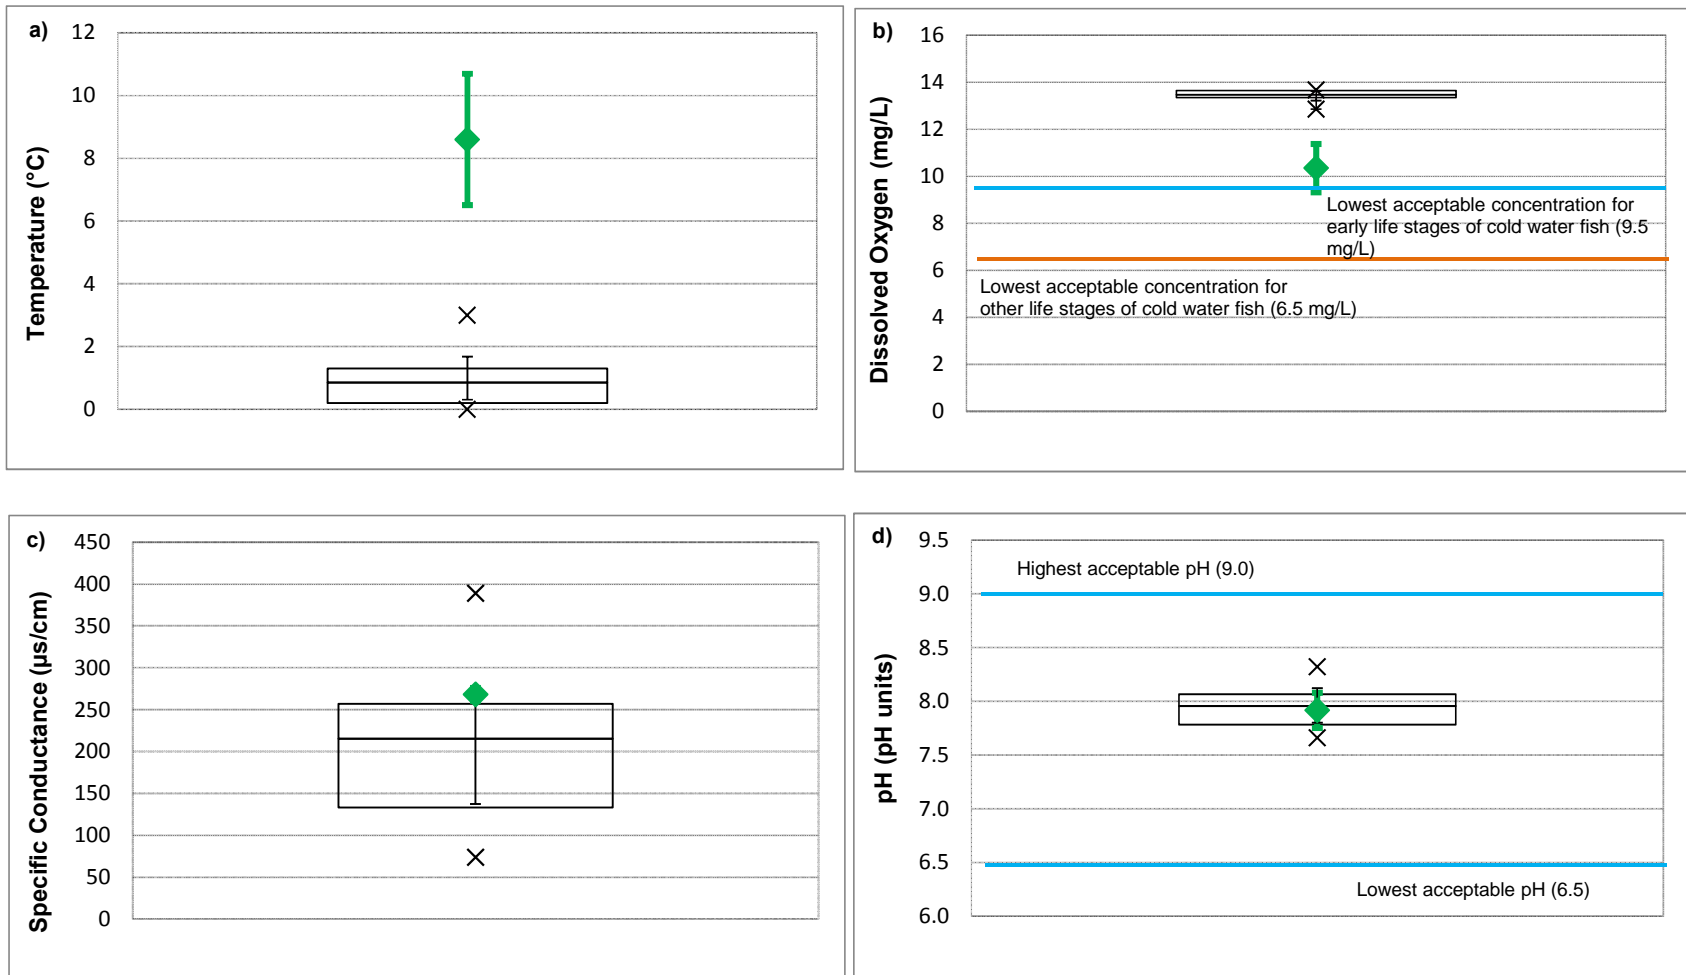

Figure 4.1: Supporting *In situ* Water Quality Measures, Minto Mine Phase 4 EEM, September 2016^a

a - box-and-whisker plot of reference site data (n=10; quartiles, 95% confidence limits of the mean, minimum, maximum) in black. Mean and 95% confidence limits of effluent exposed sites in green.

above the CWQG (i.e., within an acceptable range specified in the CWQG; mean 10.4 mg/L), but lower than at reference areas (Figure 4.1 and Appendix Table C.2). Specific conductance of upper Minto Creek (mean 268 $\mu\text{S}/\text{cm}$) was greater than at most reference sites (Figure 4.1), but lower than the highest specific conductance reported at a reference site (389 $\mu\text{S}/\text{cm}$; Figure 4.1 and Appendix Table C.2). Lastly, mean pH of Minto Creek was slightly alkaline (mean 7.96), but was similar to pH observed at the reference sites and was within the acceptable range specified in the CWQG (6.5 to 9.0; Figure 4.1).

4.2.2 Analytical Laboratory Measures

A Data Quality Review (DQR) indicated that the laboratory analytical data collected as part of the Phase 4 EEM benthic survey were of good quality and suitable for addressing the objectives of this study (Appendix B). During the survey, a total of five analytes in upper Minto Creek were present at concentrations outside the range of reference (nitrate, total Kjeldahl nitrogen [TKN], total phosphorus, copper, and molybdenum; Table 4.2). Of the analytes outside the range of reference, only copper was present at a concentration greater than CWQG. However, copper concentrations did not exceed the SSWQO of 0.013 mg/L applicable when DOC is lower than 10 mg/L (Table 4.2).

4.2.3 Other Supporting Measures

Water velocity and depth at the effluent-exposed upper Minto Creek sampling sites and at the reference sites had similar mean values and overlapping ranges (Figure 4.2; Appendix Table C.2). Median intermediate axis length of pebbles/cobbles cleaned for benthic invertebrate community sampling in upper Minto Creek (3.9 cm) was similar to reference (4.3 cm), as was the overall distribution of pebble/cobble size (Figure 4.2; Appendix Table C.3).

4.3 Water Quality Measures Collected During the Fish Exposures

4.3.1 *In situ* Water Quality Measures

During the on-site laboratory fish exposures, supporting measures were consistent among the exposure tanks, with only slightly greater dissolved oxygen, specific conductance, and ammonia in the exposure tanks than in the reference tank (Table 4.3). Dissolved oxygen (DO) levels were successfully maintained above 6.0 mg/L (as recommended for salmonid hatcheries; Sigma 1983) for most of the study, except for very slight excursions below this target for the effluent-exposed groups (5.94 mg/L for groups E6 [14% effluent; one part effluent to 6 parts reference water] and E3 [25% effluent; one part effluent to three parts reference water]; Table 4.3; Appendix Table C.4). Ammonia concentrations were successfully maintained below the threshold that would compromise fish health (Sigma 1983). Temperature data logging at hourly intervals throughout the exposures indicated that temperatures in the rearing tanks were

Bold text Concentration greater than the lowest guideline or SSWQO.

Out reference range.

^b Site-specific water quality objectives for Station W2 per the Minto Mine Water Use Licence. For metals, the SSWQO are applicable on a dissolved basis.

^c If greater than 50% of samples were less than method detection limit than the mean was presented with a less than symbol.

^d At temperature 10°C and pH 8.5; values that are inclusive of *in situ* temperature and pH data associated with these water samples (maximum temperature = 9.1°C, maximum pH = 8.32; see Appendix Table C.2).

^e Maximum increase of 25 mg/L from background for short-term exposures (e.g., 24-h period) and maximum increase of 5 mg/L from background for longer term exposures.

^f 30-day median ± 20% of median background concentration.

^g At pH 8.5 (slightly conservative conditions).

^h At hardness of 100 mg/L (conservative conditions for Minto Creek).

ⁱ 0.001 for hexavalent chromium (CrVI); 0.009 for trivalent chromium (CrIII).

^j 0.013 mg/L copper at a dissolved organic carbon (DOC) concentration ≤10 mg/L and 0.02 mg/L copper at a DOC concentration >10 mg/L.

Table 4.2: Water Quality Data Collected during the Minto Mine EEM Phase 4, September 2016

^a based on a minimum of 94 measurements, with the exception of ammonia, which was based on a minimum of 43 measurements.

^b E6 = 1 part effluent to 6 parts reference water.

^c E3 = 1 part effluent to 3 parts reference water.

maintained at an average of 10.6 °C for the three groups, fluctuating between a minimum temperature of 7.7 °C and maximum temperature of 14.4 °C (Figure 4.3).

4.3.2 Analytical Laboratory Measures

A Data Quality Review (DQR) indicated that the laboratory analytical data collected as part of the fish exposures were of good quality and suitable for addressing the objectives of this study (Appendix B). Water quality of the exposure tanks confirmed the expected greater concentrations of mine-related analytes with greater effluent concentrations (Table 4.4; Appendix Table C.5). Of the analytes identified as elevated relative to reference in routine water quality monitoring or during the EEM benthic survey (conductivity, hardness, nitrate, phosphorus, aluminum, arsenic, copper, iron, molybdenum, and selenium), all except for aluminum and arsenic increased in proportion to effluent concentration (Table 4.4). Mean water quality of the exposure tanks met CWQGs and SSWQOs for all analytes except for ammonia, copper, and chromium (Table 4.4). Ammonia, which was elevated due to fish excretion rather than mine-effluent, was present at concentrations slightly greater than the SSWQO, and was higher in the 25% effluent exposure (E3) than in the 14% effluent exposure (E6) and the reference exposure (Table 4.4; Appendix Table C.5). However, although average ammonia concentrations were greater than the conservative CWQG used to screen mean concentrations (based on the highest individual temperature and pH values observed through the exposures), no ammonia concentrations exceeded CWQG based on concurrent temperature and pH values (Appendix Table C.5).

Notes: Means are represented with a "<" symbol if greater than 50% of data used in their calculation were below the Method Detection Limit (MDL).

Mean concentration greater than the lowest guideline or SSWQO (lower in the case of dissolved oxygen, or outside the guideline or SSWQO range in the case of pH).

^a Water quality guidelines for the protection of aquatic life. Black text are Canadian Environmental Quality Guidelines (CCME 2017); blue text are BC Water Quality Guidelines (BCMOE 2017a,b). Guideline for dissolved oxygen is for "Other life stages" of coldwater biota.

^b At hardness of 100 mg/L (conservative conditions for Minto Creek).

^c At temperature 10°C and pH 8.5; values that are inclusive of all *in situ* temperature and pH data associated with these water samples (maximum temperature = 14.5°C, maximum pH = 8.28; see Appendix Table C.4).

^d Maximum increase of 25 mg/L from background for short-term exposures (e.g., 24-h period) and maximum increase of 5 mg/L from background for longer term exposures.

^e At pH 8.5 (slightly conservative conditions).

^f 0.001 for hexavalent chromium (CrVI); 0.009 for trivalent chromium (CrIII).

^g 0.013 mg/L copper at a dissolved organic carbon (DOC) concentration ≤10 mg/L and 0.02 mg/L copper at a DOC concentration >10 mg/L.

5 BENTHIC INVERTEBRATE COMMUNITY

Benthic invertebrate community samples were collected at five upper Minto Creek effluent-exposed sites and 10 reference sites (Figure 2.1). The effluent-exposed sites were evaluated relative to reference using a Reference Condition Approach (RCA). At the request of ECCC, the effluent-exposed area mean was also evaluated using a Control-Impact (CI) approach³. All benthic invertebrate samples were collected using a Surber sampler outfitted with a 500- μ m mesh net. In the laboratory, samples were identified and enumerated to the lowest practical level; however, this evaluation is based on family level taxonomic results (Appendix Tables D.1 to D.4). Benthic invertebrate community data were subject to a Data Quality Review and were of good quality (Appendix B).

5.1 Primary EEM Metrics

The benthic invertebrate community of the mine-exposed sites on upper Minto Creek was compared to the reference condition (defined by 10 reference sites) for the four primary EEM metrics: density, taxon richness, Simpson's evenness, and Bray-Curtis (BC) distance. All effluent exposed sites (UMC-1 to UMC-5) were within reference condition ($ncP > 0.9$) for all four primary metrics (Figure 5.1; Appendix Table D.5; Appendix Figure D.1). Based on CI comparison, mean density at the effluent-exposed area (990 organisms/m²) was lower than the reference mean (2,671 organisms/m²), whereas mean taxon richness, Simpson's evenness, and Bray-Curtis (BC) distance did not differ significantly from the reference mean (Table 5.1; Figure 5.2; Appendix Table D.6). Despite statistical significance, the difference in density was modest (-1.2 standard deviations) and below the ± 2 standard deviation Critical Effect Size (CES⁴) for benthic invertebrate density.

5.2 Community Composition

The average reference community was composed of 45% Chironomidae (non-biting midge larvae), 39% EPT taxa (Ephemeroptera, Plecoptera, and Trichoptera or mayflies, stoneflies, and caddisflies), 11% Diptera (true flies) excluding Chironomidae, and 4% oligochaetae (worms; Figure 5.3; Appendix Table D.4). Proportions of Chironomidae and EPT were within reference condition ($ncP > 0.9$) at all effluent-exposed sites except for UMC-4 which had a slightly lower proportion of EPT taxa than the other effluent-exposed sites and was within a range that was inconclusive with respect to potential difference from reference condition (i.e., $0.1 < ncP < 0.9$;

³ It is noted that this requested comparison assumes that within-area variability (upper Minto Creek) and among-area variability (reference sites) are comparable, which may not be true.

⁴ The critical effect size is a threshold above which an effect may be indicative of a higher risk to the environment (Environment Canada 2012).

Figure 5.1: Individual Value Plot of Primary EEM Benthic Invertebrate Community Endpoints for Exposed Sites (n = 5) Relative to the Reference Condition (n = 10), September 2016

Notes: solid lines = 2.5th and 97.5th percentiles, dashed lines = 90% confidence limits on the percentiles.
 green shading = within reference condition; pink shading = out of reference condition; no shading = inconclusive

Table 5.1: Summary of Statistical Comparisons in Benthic Invertebrate Community Endpoints between Reference (n = 10) and Exposed (n = 5) Sites, 2016

| Endpoint | Data Transformation | Test | Test P-value | Mean or Median ¹ | | Observed ES ² (Exposed - Reference)/SD |

* Diptera excluding Chironomidae.

Figure 5.4; Appendix Figure D.1). Proportions of Ephemeroptera, Plecoptera, and Trichoptera, evaluated individually, were within reference condition at all effluent-exposed sites (Figure 5.4; Appendix Table D.5). Similarly, the proportion of Diptera (excluding Chironomidae) was within reference condition at all effluent-exposed sites (Figure 5.4). The proportion of oligochaetes (worms) was in reference condition at two of the five effluent-exposed sites, and at the remaining three (UMC-1, UMC-3, and UMC-5), was within a range that was inconclusive with respect to potential difference from reference condition (i.e., $0.1 < nCP < 0.9$; Figure 5.4).

Based on CI comparison, the effluent-exposed area differed significantly from reference on the basis of lower mean relative abundances of EPT taxa and Plecoptera, and higher mean relative abundances of Trichoptera and oligochaetes (Table 5.1; Figure 5.5; Appendix Figure D.2). Effect sizes associated with these significant differences were modest in all cases (from 1.3 to 1.9 reference standard deviations; Table 5.1). Ephemeroptera, Plecoptera, and Trichoptera are generally considered to be sensitive taxa (e.g., Kiffney and Clements 1994; Resh et al. 1996; Rosenberg and Resh 1996; Taylor and Bailey 1997; Barbour et al. 1999; Mandaville 2002) and oligochaetes are typically considered to be tolerant taxa (e.g., Chapman et al. 1982; Taylor and Bailey 1997; Barbour et al. 1999; Mandaville 2002). The lower abundance of Plecoptera (stoneflies) at the effluent-exposed area was associated with the absence of the families *Leuctridae*, *Perlodidae*, and *Taeniopterygidae*, and the notably lower abundance of *Nemouridae* (Appendix Table D.2). All of these stoneflies are considered pollution sensitive (Resh et al. 1996). The greater abundance of Trichoptera at the effluent-exposed area was associated with *Lemnephilidae* (Appendix Table D.2), which are also considered to be pollution sensitive (Resh et al. 1996; Barbour et al. 1999). Lastly, the greater abundance of oligochaetes at the effluent-exposed area was associated with *Lumbriculidae* (Appendix Table D.2), which are considered to be pollution tolerant (Barbour et al. 1999; Bode et al. 2002). Symmetric representation of Correspondence Analysis (CA) results confirm the association of *Lumbriculidae* with effluent-exposed sites and the lack of association of *Nemouridae* with effluent-exposed sites (Appendix Figure D.3).

5.3 Correlation Analysis

Correlation analysis was applied to evaluate potential causes of differences in effluent-exposed and reference benthic invertebrate communities. Correlations included all *in situ* measures of water and habitat quality, water quality analytes identified as elevated at effluent-exposed sites relative to reference (Section 4), and other supporting water quality and habitat data. The latter (other supporting water quality and habitat data) were first reduced by Principal Component Analysis (PCA) to extract the main gradients of site separation (Appendix Tables D.7 to D.11; Appendix Figures D.4 and D.5). Consideration of the benthic invertebrate community metrics that

Notes: solid lines = 2.5th and 97.5th percentiles, dashed lines = 90% confidence limits on the percentiles.
 green shading = within reference condition; pink shading = out of reference condition; no shading = inconclusive

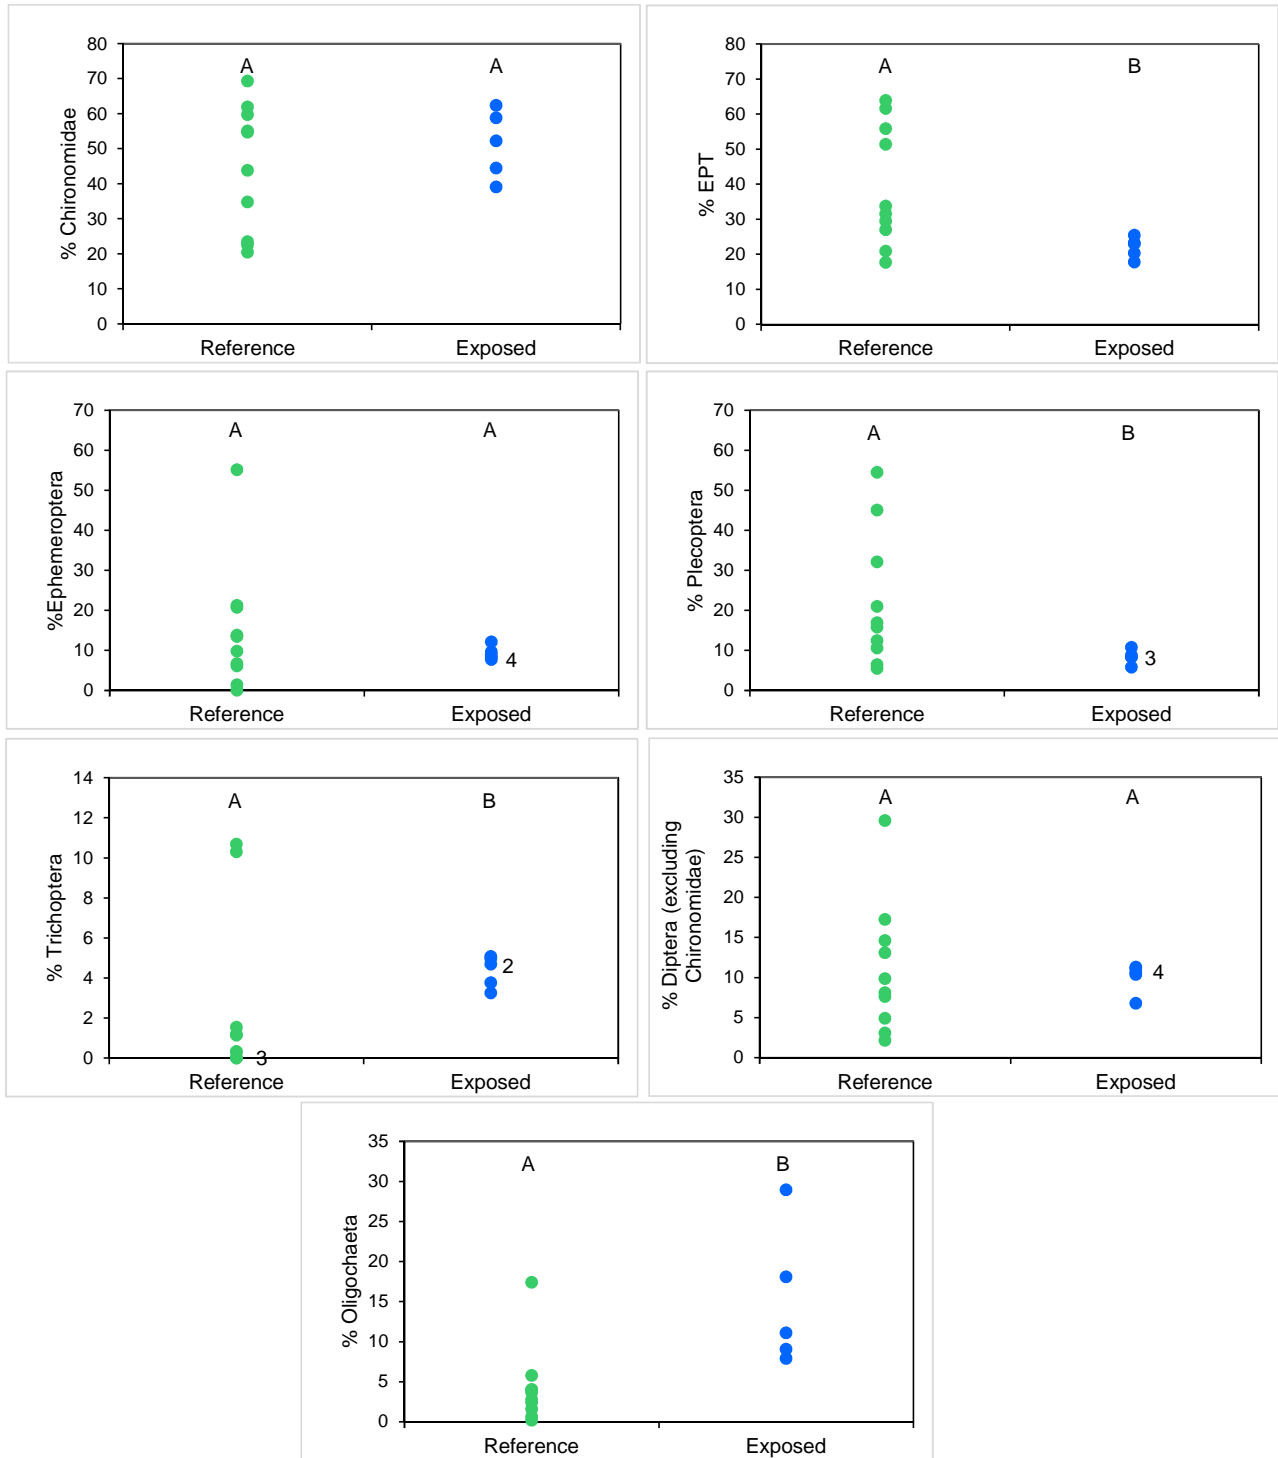

Figure 5.5: Individual Value Plot of Benthic Invertebrate Community Taxon Proportions for Reference (n = 10) and Exposed (n = 5) Sites, 2016

Notes: The letter B above the exposed group indicates a significant difference relative to reference (A) $\alpha = 0.1$. The letter A above the exposed group indicates no significant difference relative to reference (A) $\alpha = 0.1$.

Numbers next to individual points represent the number of overlapping points at that value.

were either out of reference condition (none) or inconclusive with respect to reference condition (RCA), or had effluent-exposed area means that differed significantly from reference (CI comparison), indicated 12 statistically significant correlations at $p < 0.05$ and $r > 0.6$ (Table 5.2; correlations with all benthic invertebrate community metrics are provided in Appendix Table D.12). Benthic invertebrate density was positively related to median cobble size and negatively related to several analytes that were elevated in Minto Creek relative to reference (total Kjeldahl nitrogen, phosphorus, aluminum, copper, and water quality PC-2; Table 5.2; Appendix Figure D.6). The consistent negative correlations with water chemistry suggest a mine-related influence of benthic invertebrate density and one of the relationships (a negative relationship between density and total Kjeldahl nitrogen) was observed previously (Minnow 2015). In addition to the relationships with benthic invertebrate density, the proportion of Plecoptera (stoneflies) was negatively correlated with hardness and nitrate, the proportion of Trichoptera (caddisflies) was negatively correlated with dissolved oxygen and positively correlated with selenium, and the proportion of oligochaetes was negatively correlated with dissolved oxygen and positively correlated with copper (Table 5.2). Plots of these relationships are leveraged or inconsistent with typical response mechanisms (e.g., a decrease in Trichoptera would not be expected with increasing dissolved oxygen and an increase in Trichoptera would not be expected with increasing selenium concentration; Appendix Figure D.6). However, a negative relationship between dissolved oxygen and percent oligochaetes (Appendix Figure D.6) is a typical response (e.g., Chapman et al. 1982; Brinkhurst et al. 1983; Reynoldson 1987), and suggests that the greater proportion of oligochaetes observed at the effluent-exposed sites may be related to moderately lower dissolved oxygen than at the reference sites (which, in turn, may be related to the higher temperature at the effluent-exposed sites).

5.4 Summary and Comparison to Previous EEM

In summary, mine-exposed benthic invertebrate communities of upper Minto Creek were within reference condition for all four primary EEM metrics (density, taxon richness, Simpson's evenness, and BC distance). Evaluation by control-impact comparison indicated that mean taxon richness, mean Simpson's evenness, and mean BC distance did not differ from the reference mean, whereas mean density at effluent-exposed upper Minto Creek area was significantly lower than reference, but at a magnitude lower than the CES of ± 2 standard deviations (which suggests that the difference may not be ecologically meaningful). Examination of taxon proportions indicated lower relative abundances of EPT taxa and Plecoptera, and higher relative abundances of Trichoptera and oligochaetes at effluent-exposed upper Minto Creek. As Plecoptera and Trichoptera are considered to be sensitive organisms, and oligochaetes are considered to be tolerant organisms, these results are equivocal with respect to a potential effluent-related influence. Correlation analysis indicated a negative relationship between benthic invertebrate

statistically significant correlation at a p-value < 0.05.

strong relationship at r > 0.6 or r < -0.6.

* = benthic invertebrate community endpoint that was one or more of: 1) out of reference condition (no instances); 2) inconclusive with respect to the reference condition; and/or 3) statistically different from reference following the Control-Impact comparison.

Notes: All correlations were calculated using data < Method Detection Limit (MDL) at the MDL value. N = 13 for all analyses of water quality (n = 10 for reference, n = 3 for exposed). N = 14 for all habitat analyses (n = 9 for reference due to exclusion of REF-1 and n = 5 for the effluent-exposed area).

density and water quality, and a negative relationship between the proportion of oligochaetes and dissolved oxygen.

The results of the Phase 4 EEM, as evaluated using the RCA approach, were consistent with the result of the Phase 3 EEM (Minnow 2015). In Phase 3, two of three effluent exposed sites were within reference condition for all EEM effect metrics (density, taxon richness, Simpson's evenness, and BC distance), with the one remaining site having higher density than reference condition and a BC distance that could not be categorized as either within reference condition or out of reference condition (i.e., $0.1 < nCP < 0.9$). Thus, RCA analysis in two consecutive EEM Phases has indicated no effect. However, a supporting CI comparison in this study (Phase 4) suggested lower density at the effluent-exposed area, but this result was opposite from the apparent greater density observed at one of three sites evaluated by RCA in Phase 3. In terms of the supporting metrics, a greater proportion of Trichoptera and lower proportion of Plecoptera was observed in Phase 3 and in Phase 4, whereas other differences observed in Phases 3 and/or 4 (e.g., lower EPT taxa, more oligochaetes, and more diptera excluding chironomidae) were not consistent between phases. As Trichoptera and Plecoptera are both considered to be sensitive taxa, the opposite differences in their proportions (i.e., more Trichoptera and fewer Plecoptera) at effluent-exposed areas, as observed in successive EEM Phases, are equivocal with respect to an effluent-related influence.

6 SUPPORTING FIELD-BASED FISH STUDY

6.1 Fish Community

Fish sampling was conducted monthly during the Phase 4 EEM from June through September 2016 in order to verify fish presence, abundance, and life-stage in lower Minto Creek and to relate this information to the on-site laboratory study. The only fish species captured in lower Minto Creek was chinook salmon (*Oncorhynchus tshawytscha*), all captures (6 fish) occurred in September, and all were juveniles (Table 6.1). This result is consistent with results from previous EEM (Minnow and Access 2012) and confirms the limited usage of lower Minto Creek by fish and the fact that a conventional EEM fish survey was not practicable (e.g., a non-lethal survey requires 100 individuals from each exposed and reference area). No fish were captured upstream of a small cascade located approximately 1.2 km upstream of the Minto Creek confluence with the Yukon River (Figure 2.3), indicating that this structure continues to be a barrier to upstream fish movement in Minto Creek (Capstone 2017a). In lower Big Creek (reference), juvenile chinook salmon were captured in all months (June to September) and at higher catch-per-unit-effort (CPUE) than in lower Minto Creek (Table 6.1). Slimy sculpin (*Cottus cognatus*) were also captured in lower Big Creek at lower CPUE than juvenile chinook salmon, and only in June and July (Table 6.1).

6.2 Fish Population Data

Chinook salmon captured in lower Minto Creek in September 2016 were all 0+ fry. Mean fork length was 72.8 ± 9.5 mm and mean body weight was 4.73 ± 1.57 g, which was similar to those captured in lower Big Creek (Figure 6.1; Appendix Tables E.1 and E.2). No statistically significant differences were observed in fork length or body weight of the juvenile chinook salmon captured in lower Minto Creek and lower Big Creek in September 2016, and weight-length relationships overlapped (Figure 6.1).

Table 6.1: Summary of Minnow Trapping in Minto Creek (Exposed) and Big Creek (Reference) in 2016

A) Minto Creek

| Month | Effort (trap-hours) | Effort(trap-days) | Juvenile Chinook Salmon (<i>Onchoryhnchus tshawytscha</i>) | |
|--------------|---------------------|-------------------|--|-------------------|

7 LABORATORY FISH EXPOSURE STUDY

7.1 Fish Population Health

A total of 160 kokanee fry were used for each of the on-site laboratory exposures (reference water, E6 [14% effluent; one part effluent to 6 parts reference water], and E3 [25% effluent; one part effluent to 3 parts reference water]). Very few mortalities occurred over the course of the field laboratory exposure study. One mortality occurred in the reference group just prior to transport to site and another was recorded approximately two weeks after the study was initiated. No additional mortalities were observed in any of the groups. However, a small number of fish could not be accounted for at the end of the study (and presumably escaped over the side of the exposure vessel or down the stand-pipe to the sump). Thus, meristic data from a total of 153, 156, and 159 kokanee fry from reference, E6 and E3, respectively (Appendix Tables E.3 to E.6), were used for the analysis of population health.

No statistically significant differences between the fish assigned to the two exposure groups and reference were observed pre-exposure (Appendix Table E.7; Appendix Figures E.1 and E.2). At the termination of the exposure (Day 47), kokanee fry exposed to the highest effluent concentration (25% effluent) differed from the reference group on the basis of length-frequency distribution, with a slightly greater proportion of larger fish (Table 7.1; Figure 7.1). The maximum difference from reference was evident for fish with fork length of less than approximately 9.8 cm, which made up 17% less of the highest exposure group than reference. This is consistent with greater mean fork length and mean body weight of kokanee in the highest exposure group relative to reference (Table 7.1; Figure 7.2). Despite statistical significance, the differences in fork length and body weight were very small (1.6% and 6.9%, respectively; Table 7.1). Kokanee exposed to the lower effluent concentration (14% effluent) did not differ from reference on the basis of length-frequency distribution, mean fork length, or mean body weight (Table 7.1; Figure 7.1, and Figure 7.2). Condition (weight-at-length) differed from reference in both exposure groups, with the lower exposure group (14% effluent) having a slightly lower condition than reference and the higher exposure group (25% effluent) having a slightly greater condition than reference (Table 7.1; Figure 7.2). Despite statistical significance, the differences in condition were small (-2.7% and +2.3%, respectively) and were well below the 10% Critical Effect Size (CES⁵) for fish condition.

⁵ The critical effect size is a threshold above which an effect may be indicative of a higher risk to the environment (Environment Canada 2012).

Figure 7.2: Boxplots of Fork Length, Body Weight, and Regression (Body Weight on Fork Length) for Day 47 Kokanee in Control, E6, and E3 Treatments, Minto Mine Fish Hatchery Exposure, August 2016

Note: Boxplots for body weight and regressions are plotted on a log scale.

7.2 Summary and Comparison to Previous EEM

In summary, the on-site laboratory exposure study indicated that fish exposed to the highest effluent concentration (25%) for 47 days were slightly larger and of better condition than those exposed to reference water. Fish exposed to the lower effluent concentration (14%) for 47 days did not differ on the basis of size, but had slightly lower condition than reference fish. In all cases, the magnitudes of the observed differences were very small, and were presumably detected due to the high power associated with large sample size (minimum 152 fish) and uniform fish size. In the case of the condition - the key effect endpoint evaluated in this fish survey - the magnitudes of difference (-2.7% and +2.3% for 14% effluent and 25% effluent, respectively) were well below the CES of 10%. These differences are therefore not considered to be ecologically meaningful.

The results of the Phase 4 EEM fish study were similar to those of the Phase 2 EEM fish study (no fish study was completed in association with the Phase 3 Investigation of Cause of differences in benthic invertebrate communities). Specifically, the Phase 2 fish study (hatchery-based exposure of juvenile chinook salmon) also documented slight increase in size (maximum 5%) and condition (maximum 3%) in association with effluent exposure. Thus, the difference in condition through two consecutive EEM Phases is a confirmed response, albeit at magnitudes well below the CES.

8 CONCLUSIONS

The Minto Mine Phase 4 EEM conducted between June and September 2016 provided sublethal toxicity testing of Minto Mine effluent, an assessment of the influence of Minto Mine effluent discharge on water chemistry and benthic invertebrate community condition of Minto Creek relative to reference sites, and an assessment of the controlled exposure of a sentinel fish (kokanee as a surrogate for chinook salmon) to Minto Mine effluent. Conclusions of this EEM, by monitoring component, are provided below.

Effluent sublethal toxicity tests conducted by the Minto Mine in 2015 and 2016 (data for 2017 have not yet been reported) showed no effects to rainbow trout embryos, the invertebrate *Ceriodaphnia dubia*, the green alga *Pseudokirchneriella subcapitata*, or the plant *Lemna minor*.

Routine water quality monitoring indicated an influence of the Minto Mine on Minto Creek evident in conductivity, hardness, nitrate, aluminum, arsenic, iron, and selenium that were greater than reference. Of these, concentrations of nitrate were most strongly associated with release of water from the water storage pond, but remained below the CWQG. Aluminum and arsenic had mean concentrations greater CWQG, but this occurred at both the effluent-exposed and reference stations. During the Phase 4 EEM benthic survey (in September 2016) water of upper Minto Creek had concentrations of nitrate, total Kjeldahl nitrogen, total phosphorus, copper, and molybdenum greater than the range of reference. Of these, only copper was present at a concentration greater than CWQG, but did not exceed the applicable SSWQO. Of the analytes identified as elevated relative to reference in routine water quality monitoring or during the EEM benthic survey (conductivity, hardness, nitrate, phosphorus, aluminum, arsenic, copper, iron, molybdenum, and selenium), all except for aluminum and arsenic increased in proportion to effluent concentration in the fish exposure vessels.

Mine-exposed benthic invertebrate communities of upper Minto Creek were within reference condition for all four primary EEM metrics (density, taxon richness, Simpson's evenness, and BC distance). Evaluation by control-impact comparison indicated that mean taxon richness, mean Simpson's evenness, and mean BC distance did not differ from the reference mean, whereas mean density of the effluent-exposed upper Minto Creek area was significantly lower than reference. The difference in density was at a magnitude of -1.2 standard deviations, which is below the CES of ± 2 standard deviations and therefore may not be ecologically meaningful. Supplementary examination of taxon proportions indicated lower relative abundances of EPT taxa (Ephemeroptera, Plecoptera, and Trichoptera; mayflies, stoneflies, and caddisflies) at effluent-exposed upper Minto Creek than reference, which was primarily due to lower relative abundance of Plecoptera (individually), and also indicated higher relative abundances of Trichoptera and

oligochaetes. As Plecoptera and Trichoptera are considered to be sensitive organisms and oligochaetes are considered to be tolerant organisms, these results are equivocal with respect to a potential effluent-related influence. Correlation analysis indicated negative relationships between benthic invertebrate density and water quality, and a negative relationship between the proportion of oligochaetes and dissolved oxygen.

The fish survey (an on-site laboratory exposure) indicated that fish exposed to the highest effluent concentration (25%) for 47 days were slightly larger and of better condition than those exposed to reference water. Fish exposed to a lower effluent concentration (14%) for 47 days did not differ on the basis of size, but had slightly lower condition than reference fish. In all cases, the magnitudes of the observed differences were very small, and were presumably detected due to the high power associated with large sample size (minimum 152 fish) and uniform fish size. In the case of the condition - the key effect endpoint evaluated in this fish survey - the magnitudes of difference (-2.7% and +2.3% for 14% effluent and 25% effluent, respectively) were well below the CES of 10%. These differences are therefore not considered to be ecologically meaningful.

The results of the Phase 4 EEM were generally consistent with those of the previous EEM (i.e., the Phase 3 benthic invertebrate community survey and the Phase 2 fish survey). Specifically, the results of the Phase 4 EEM benthic invertebrate community survey were consistent with the results of the Phase 3 EEM - RCA analysis in two consecutive EEM Phases has indicated no effect. A supporting CI comparison in this study (Phase 4) suggested lower density at the effluent-exposed area, but this result was opposite from the apparent greater density observed at one of three sites evaluated by RCA in Phase 3. The results of the Phase 4 EEM fish study were similar to those of the Phase 2 EEM fish study (no fish study was completed in association with the Phase 3 Investigation of Cause study of differences in benthic invertebrate communities). These two consecutive EEM Phases have indicated slightly greater fish size and condition associated with effluent exposure. However, the associated magnitudes of difference for the EEM-effect endpoint (condition) was less than 3%, well below the CES of 10%.

Based on the findings of the Phase 4 EEM and the prescribed EEM frequency under the MMER, the Minto Mine will be required to submit a fifth EEM interpretive report in three years (January 10th 2021). A Phase 5 EEM Study Design, informed by the results of this Phase 4 EEM, must be submitted to Environment and Climate Change Canada (ECCC) no later than six months prior to implementing field collections in 2019 or 2020. Under the current EEM framework (Environment Canada 2012), the next phase of biological monitoring (Phase 5) will require an investigation of confirmed effects to fish. However, proposed amendments to the MMER (ECCC 2016; Government of Canada 2017b) could alter the framework, particularly in cases where observed differences are below applicable CES as observed in this Minto Phase 4 EEM.

 Highlight indicates a result greater than the applicable MMER limit.

¹ If greater than 50% of samples were less than method detection limit than the mean was presented with a less than symbol.

 Highlight indicates a result greater than the applicable MMER limit.

¹ If greater than 50% of samples were less than method detection limit than the mean was presented with a less than symbol.

Table A.2: Minto Mine Weekly MMER Effluent Quality Data, 2015-2017

B1 INTRODUCTION

B1.1 Background

Data Quality Review (DQR) was conducted on data collected as part of the Minto Mine Phase 4 Environmental Effects Monitoring (EEM) to define the overall quality of the data collected for the program, and by extension, the confidence with which the data can be used to derive conclusions. A variety of factors can influence the physical, chemical and biological measurements made in an environmental study and thus affect the accuracy and/or precision of the data. Depending on the magnitude of these influences, inaccuracy or imprecision have the potential to affect the reliability of any conclusions made from the data. Therefore, it is important to ensure that programs incorporate appropriate steps to control the non-natural sources of data variability (i.e., minimize the variability that does not reflect natural spatial and temporal variability in the environment) and thus assure the quality of the data.

Data quality as a concept is meaningful only when it relates to the intended use of the data. That is, the context in which the data will be interpreted must be known in order to establish a relevant basis for judging whether or not the data set is adequate. The Minto Mine Phase 4 EEM DQR involved comparison of field performance to generic data quality objectives (DQOs) established for the field components of environmental studies, including those for field blanks, field duplicates, data precision, and data accuracy. DQOs were established a-priori to reflect reasonable and achievable performance expectations. Overall, the intent of comparing data to DQOs was not to reject any measurement that did not meet the DQO, but rather to evaluate whether, based on the available data and using a weight-of-evidence approach, the field and/or analytical sample data adequately reflected actual conditions and can therefore be used with confidence to derive conclusions. Thus, questionable data, if any, receive more scrutiny to determine what effect, if any, they had on interpretation of results within the context of this project.

B1.2 Types of Quality Control Samples

Field Quality Control (QC) samples assessed for the Minto Mine Phase 4 EEM included one water field duplicate and one water trip blank. Laboratory QC samples included laboratory duplicates, method blanks, certified reference material (CRM) samples, laboratory control samples (LCS), and matrix spike (MS) samples for water, and the verification of the accuracy of sub-sampling and organism recovery for the benthic invertebrate component. These QC samples are defined as follows:

- **Field Duplicates** are sub-sample pairs collected from a randomly selected field station using identical collection and handling methods that are then analyzed separately in the laboratory. The duplicate samples are handled and analyzed in an identical manner in the laboratory. The data from field duplicate samples reflect natural variability, as well as the variability associated with sample collection methods, and therefore provide a measure of field precision.
- **Laboratory Duplicates** are sub-sample pairs which are split from a sample in the laboratory and then analyzed separately in an identical manner. The data from laboratory duplicate samples provide a measure of laboratory precision.
- **Blanks** are samples of de-ionized water, rinsate of sampling devices, and/or appropriate reagent(s) that are handled and analyzed the same way as regular samples. These samples will reflect any contamination that occurred in the field (in the case of field or trip blanks) or the laboratory (in the case of laboratory or method blanks). Analyte concentrations should be non-detectable, although a data quality objective of twice the method detection limit allows for slight “noise” around the detection limit.
- **CRM, LCS, and MS** are standardized samples of a particular matrix with a known concentration of analyte. They are used by the laboratory for calibrating instruments as well as for checking the quality of analytical results.
- **Sub-Sampling Checks** are performed on benthic invertebrate community samples when high sample volume and/or organism density results in only a fraction of the original sample being analyzed. By comparing the numbers of benthic invertebrates recovered between at least two sub-samples, this measure provides an evaluation of how effective the sub-sampling method was in evenly dividing the original sample, providing a measure of sub-sampling precision. Sub-sampling accuracy can be evaluated by processing an entire sample in representative fractions, and comparing the organism count in each of these fractions (multiplied by the number of fractions) to the total organism count of the entire sample.
- **Organism Recovery Checks** for benthic invertebrate community samples involve the re-processing of previously sorted material from a randomly selected sample to determine the number of invertebrates that were not recovered during the original sample processing. The reprocessing is conducted by an analyst not involved during the original processing to reduce any bias. This check allows the determination of accuracy through assessment of recovery efficiency.

B2 WATER SAMPLES

B2.1 Detection Limits

Method detection limits (MDLs) achieved by ALS Environmental for the thirty six supporting water samples from eight separate lab reports, one of which pertains to field Benthic Invertebrate Community sampling (L1834209), and seven which pertain to the Laboratory Fish Exposure study L1811593, L1813894, L1818233, L1822573, L1825883, L1829581, and L1831166; see Appendix C) were examined and assessed in all cases where sample results were reported as less than the MDL. For analytes for which a water quality guideline for the protection of aquatic life and/or a site-specific water quality objective (SSWQO) is available, the MDL should be lower than the available guideline and SSWQO values (Table B.1). Reported MDLs for all analytes with the exception of total beryllium and total chromium were lower than the applicable guideline values (Table B.1). For total beryllium, the MDL of 15 of the 36 samples (42%) exceeded the guideline, whereas for total chromium the MDL was equal to the guideline for all results. Beryllium is not of particular concern for the present monitoring program and chromium is a regionally-elevated analyte. Therefore, although the MDLs for these two analytes should be considered in data analysis, the impact on data interpretation will be very limited.

B2.2 Blank Sample Analysis

B2.2.1 Laboratory Blanks

The majority of laboratory blank results reported for the eight ALS Environmental laboratory reports (101 samples, 630 results) were non-detectable for the parameters reported (Appendix C; total and dissolved metals, total alkalinity, total ammonia, total and dissolved organic carbon, chloride, conductivity, nitrate, nitrite, total Kjeldahl nitrogen, total phosphorus, pH, total suspended and dissolved solids, and sulphate). Two blank results (one result for each of total alkalinity and total thallium) did not meet the laboratory criteria (representing 0.3% of results). For one of these results (total alkalinity), all associated sample results were > 5 times higher than the blank result, therefore data quality was not affected. For the second result (total thallium), limits of reporting were adjusted for all results within 5 times of the reported blank concentration of this sample. Overall, this indicates negligible contamination of samples within the laboratory during analysis.

B2.2.2 Trip Blanks

One unopened trip blank accompanied a shipment of water samples from the field sampling site to the laboratory, and was submitted for analysis (Appendix C). All results for this sample

Maximum MDLs that are greater or equal to Guideline or SSWQO values are highlighted.

Note: Only parameters with one or more results < MDL were included in the comparison to Guidelines and SSWQO.

^a Water quality guidelines for the protection of aquatic life. Black text are Canadian Environmental Quality Guidelines (CCME 2017); blue text are BC Water Quality Guidelines (BCMOE 2017a,b).

^b Site-specific water quality objectives for Station W2 per the Minto Mine Water Use Licence. For metals, the SSWQO are applicable on a dissolved basis.

^c At temperature 5°C and pH 8.5 (slightly conservative conditions).

^d Maximum increase of 25 mg/L from background for short-term exposures (e.g., 24-h period) and maximum increase of 5 mg/L from background for longer term exposures.

^e At pH 8.5 (slightly conservative conditions).

^f At hardness of 100 mg/L (conservative conditions for Minto Creek).

^g 0.001 for hexavalent chromium (CrVI); 0.009 for trivalent chromium (CrIII).

^h 0.013 mg/L copper at a dissolved organic carbon (DOC) concentration ≤10 mg/L and 0.02 mg/L copper at a DOC concentration >10 mg/L.

were below the laboratory MDLs, therefore indicating no contamination of samples during transport to and from the field sampling site or laboratory.

B2.3 Data Precision

B2.3.1 Field Duplicate Samples

One duplicate water sample was collected in the field. The duplicates showed excellent agreement in concentrations of all analytes except for total phosphorus, which had a relative percent difference (RPD) between the duplicates of 76% (Table B.2). Although the data quality objective of a RPD of $\leq 25\%$ was not met for this analyte, it had low reported concentrations. Consequently, although the absolute difference was small (0.0042 mg/L) the relative percent difference exceeded the DQO (Table B.2). Overall, the field duplicate sampling did not indicate any inconsistencies in sampling technique nor issues that could impair data interpretability.

B2.3.2 Laboratory Duplicate Samples

All laboratory duplicate results evaluated (14 samples, 139 results) in the eight laboratory reports met ALS Environmental's data quality objectives (generally $< 20\%$ RPD) for the parameters reported (Appendix C; total and dissolved metals, total alkalinity, total ammonia, chloride, conductivity, nitrate, nitrite, total Kjeldahl nitrogen, total phosphorus, pH, and sulphate). Therefore, the laboratory precision achieved in this study is considered good.

B2.4 Data Accuracy

The accuracy of laboratory data from the eight laboratory reports was assessed based on the results of certified reference materials (CRM), laboratory control samples (LCS) and matrix spike samples (MS; Appendix C). Specifically, twenty five CRM samples were used among the laboratory reports to assess the accuracy of total alkalinity, conductivity, total phosphorus, and pH analyses (Appendix C), and all results of these CRM samples (25 results) met laboratory quality control criteria. Eighty four LCS samples were used to evaluate the accuracy of total and dissolved metals, as well as physical, anion, and nutrient parameters (total alkalinity, total ammonia, chloride, conductivity, nitrate, nitrite, total Kjeldahl nitrogen, total and dissolved organic carbon, pH, total dissolved and suspended solids, and sulphate). All LCS results (626 results) met the laboratory quality control criteria for these samples. Finally, thirteen MS samples were also used to assess the accuracy of multiple parameters (total and dissolved metals, total ammonia, chloride, nitrate, nitrite, total Kjeldahl nitrogen, dissolved organic carbon, total phosphorus, and sulphate). The majority of MS results met the laboratory quality control criteria for these samples, however 10 of the 76 reported results (13%) could not be accurately calculated due to high analyte background concentration in the sample

Table B.2: Field Duplicate Results for Analysis of Water Quality Samples, Minto Mine Phase 4 EEM, 2016

Calculated Relative Percent Difference (RPD) did not meet the Data Quality Objective (DQO) of ≤ 25% RPD.

^a RPD was calculated using < Method Detection Limit (MDL) results at 1x MDL if one result in a duplicate pair was below the MDL and one was above the MDL. RPD was not calculated if both results were < MDL.

(parameters included dissolved organic carbon, total aluminum, barium, manganese, silicon, sodium, and strontium, and dissolved barium, silicon, sodium, and strontium). All CRM, LCS, and MS results met ALS Environmental's data quality objectives for accuracy (Appendix C), with the exception of MS results that could not be calculated due to analyte concentrations in the spiked sample. Thus, laboratory accuracy associated with water samples in this study is considered excellent.

B2.5 Holding Time and General Laboratory Flags

A number of hold time exceedances were reported in the eight laboratory reports (Appendix C) due to the combination of short optimal hold times and remote sampling (sample shipment from Minto Mine, YT site to Burnaby, BC), factors which cannot readily be changed. Specifically, pH exceeded recommended hold times (15-minute hold times) in all 21 samples submitted in support of the Laboratory Fish Exposure study (L1811593, L1813894, L1818233, L1822573, L1825883, L1829581, and L1831166). However, the similarity of these laboratory pH data to corresponding *in situ* measures indicate these results are likely not highly impacted by this hold time exceedance. Additionally, the recommended hold times for nitrate and total alkalinity were each exceeded by one day in three samples, the former for samples UMC-1 to UMC-3 collected in support of the field Benthic Invertebrate Community sampling (laboratory report L1834209; Appendix C), and the latter for samples collected on August 29th, 2016 in support of the Laboratory Fish Exposure study (laboratory report L1822573; Appendix C). The hold time for total alkalinity in these samples was exceeded despite receipt of samples at the laboratory within the recommended hold time (laboratory report L1822573; Appendix C). Finally, recommended hold times for both nitrate and nitrite (3 days) were each exceeded by 4 days in three samples collected in support of the Laboratory Fish Exposure study on September 12th, 2016 (laboratory report L1829581; Appendix C). The exceedance of the nitrite hold time in particular may result in inaccurate results due to sample oxidation. These hold time exceedances should be considered during data interpretation, in particular for nitrite.

B3 BENTHIC INVERTEBRATE COMMUNITY SAMPLES

B3.1 Organism Recovery

Sorting efficiency (i.e., percent recovery) of the benthic invertebrate samples was high, achieving 98% for each of the two samples evaluated (Table B.3). Sorting efficiency for these samples achieved the DQO of $\geq 90\%$ recovery, and therefore the benthic invertebrate community sample recovery was acceptable.

B3.2 Subsampling Accuracy

The entire sample was sorted for eight of the fifteen benthic invertebrate community samples analysed, and between 6% and 75% of the remaining 7 samples was sorted (Table B.4). The precision and accuracy of the one benthic invertebrate sample evaluated for sub-sampling precision (4.4%) met the DQO of $\leq 20\%$ (Table B.5). Overall, this indicated that precision and accuracy for sub-sampling of the benthic invertebrate community samples was acceptable. It should be noted that measures of sub-sampling precision and accuracy did not meet the DQO for the first two samples that were examined by the laboratory, due to an issue with the sub-sampling device (Appendix D). As a result, analysis all of the sub-sampled samples was repeated after resolving the issue. The sub-sampling results presented (Table B.5) reflect the quality control results following the resolution of the issue.

Table B.3: Benthic Invertebrate Community Organism Recovery, Minto Mine Phase 4 EEM, 2016

| Sample ID | Number of Organisms Recovered (Initial Sort) | Number of Organisms in Re-sort | Percent Recovery |
|-----------|--|--------------------------------|------------------|
| UMC-2 | 180 | 4 | 98% |
| UMC-3 | 264 | 6 | 98% |

Highlighted values did not meet the Data Quality Objective (DQO) for sorting efficiencies of $\geq 90\%$.

Table B.4: Percent of Benthic Invertebrate Community Sample Sorted and Total Number of Invertebrate Recovered from Sampled Fraction (500 μm), Minto Mine Phase 4 EEM, 2016

| Sample ID | Date | % Sampled | # Invertebrates |
|-----------|-----------|-----------|-----------------|
| UMC-1 | 25-Sep-16 | 100% | 301 |
| UMC-2 | 22-Sep-16 | 100% | 180 |
| UMC-3 | 22-Sep-16 | 100% | 264 |
| UMC-4 | 25-Sep-16 | 100% | 435 |
| UMC-5 | 22-Sep-16 | 100% | 267 |
| REF-1 | 25-Sep-16 | 75% | 370 |
| REF-2 | 24-Sep-16 | 25% | 332 |
| REF-3 | 24-Sep-16 | 50% | 351 |
| REF-4 | 24-Sep-16 | 100% | 145 |
| REF-5 | 23-Sep-16 | 50% | 381 |
| REF-6 | 24-Sep-16 | 100% | 354 |
| REF-7 | 24-Sep-16 | 100% | 357 |
| REF-8 | 25-Sep-16 | 50% | 328 |
| REF-9 | 23-Sep-16 | 6% | 324 |
| REF-10 | 23-Sep-16 | 25% | 597 |

Table B.5: Benthic Invertebrate Community Sub-Sampling Precision, Minto Mine Phase 4 EEM, 2016

| Sample ID | Organisms in Subsample Fraction | | Actual Density | Precision | | Accuracy | |
|-----------|---------------------------------|-----|----------------|-----------|---------|----------|---------|
| | 1 | 2 | | Min (%) | Max (%) | Min (%) | Max (%) |
| REF-8 | 326 | 341 | 667 | 4.4 | 4.4 | 2.3 | 2.3 |

Highlighted values did not meet the Data Quality Objective (DQO) for sub-sampling error of $\leq 20\%$.

B4 DATA QUALITY STATEMENT

Data collected for the Minto Mine Phase 4 EEM was of good quality as characterized by good detectability, negligible analyte concentrations in method blanks, good field and laboratory precision, and good laboratory accuracy. The recommended hold times were exceeded for nitrate in a subset of supporting samples collected for the field Benthic Invertebrate Community sampling, and for pH, total alkalinity, nitrate, and nitrite in a subset of supporting samples collected for the Laboratory Fish Exposure study. These hold time exceedances were due to the combination of short optimal hold times and remote sampling (factors which cannot readily be changed), however the hold time exceedances for these analytes should be considered during data interpretation. Overall, the supporting water quality and benthic invertebrate community data reviewed can be used with a good level of confidence in the derivation of conclusions.

APPENDIX C
WATER QUALITY DATA

CONTENTS OF APPENDIX C: WATER QUALITY DATA

PART 1: ALS Water Quality Laboratory Reports

Part 1A: ALS Lab Report L1811593 (Finalized August 23, 2016)

Part 1B: ALS Lab Report L1813894 (Finalized August 26, 2016)

Part 1C: ALS Lab Report L1818233 (Finalized September 7, 2016)

Part 1D: ALS Lab Report L1822573 (Finalized September 19, 2016)

Part 1E: ALS Lab Report L1825883 (Finalized September 19, 2016)

Part 1F: ALS Lab Report L1829581 (Finalized September 27, 2016)

Part 1G: ALS Lab Report L1831166 (Finalized October 3, 2016)

Part 1H: ALS Lab Report L1834209 (Finalized October 6, 2016)

PART 2: Water Quality Figure and Tables

Figure C.1: Concentrations of Key Analytes of Routine Water Quality Monitoring under MMER at Lower Minto Creek (Station W2) and the Reference Tributary (Station W7), 2015 – 2017

Figure C.2: Regression of Total Metal Concentrations (mg/L) relative to Total Suspended Solids (mg/L) in Routine Water Quality Monitoring Samples under MMER at Lower Minto Creek (Station W2) and the Reference Tributary (Station W7), 2015-2017

Qualifiers for Individual Parameters Listed:

| Qualifier | Description |
|-----------|--|
| MS-B | Matrix Spike recovery could not be accurately calculated due to high analyte background in sample. |

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|--|--------|--------------------------------------|------------------------|
| ALK-TITR-VA | Water | Alkalinity Species by Titration | APHA 2320 Alkalinity |
| This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values. | | | |
| ANIONS-N+N-CALC-WR | Water | Nitrite & Nitrate Nitrogen | EPA 300.1 |
| Nitrate and Nitrite Nitrogen is determined by calculation from the individual Nitrate and Nitrite Nitrogen analyses by Ion Chromatography with UV absorbance. | | | |
| BE-D-L-CCMS-VA | Water | Diss. Be (low) in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| BE-T-L-CCMS-VA | Water | Total Be (Low) in Water by CRC ICPMS | EPA 200.2/6020A (mod) |
| Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS. | | | |

Reference Information

| | | | |
|---|-------|--|---|
| CL-IC-N-WR | Water | Chloride in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| EC-PCT-VA | Water | Conductivity (Automated) | APHA 2510 Auto. Conduc. |
| This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode. | | | |
| HARDNESS-CALC-VA | Water | Hardness | APHA 2340B |
| Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO ₃ equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation. | | | |
| HG-D-CVAA-VA | Water | Diss. Mercury in Water by CVAAS or CVAFS | APHA 3030B/EPA 1631E (mod) |
| Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | | | |
| HG-T-CVAA-VA | Water | Total Mercury in Water by CVAAS or CVAFS | EPA 1631E (mod) |
| Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | | | |
| IONBALANCE-VA | Water | Ion Balance Calculation | APHA 1030E |
| Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero. | | | |
| Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as: | | | |
| Ion Balance (%) = [Cation Sum-Anion Sum] / [Cation Sum+Anion Sum] | | | |
| MET-D-CCMS-VA | Water | Dissolved Metals in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| MET-DIS-LOW-ICP-VA | Water | Dissolved Metals in Water by ICPOES | EPA 3005A/6010B |
| This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedure involves filtration (EPA Method 3005A) and analysis by inductively coupled plasma - optical emission spectrophotometry (EPA Method 6010B). | | | |
| MET-T-CCMS-VA | Water | Total Metals in Water by CRC ICPMS | EPA 200.2/6020A (mod) |
| Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| MET-TOT-LOW-ICP-VA | Water | Total Metals in Water by ICPOES | EPA 3005A/6010B |
| This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedures may involve preliminary sample treatment by acid digestion, using either hotblock or microwave oven (EPA Method 3005A). Instrumental analysis is by inductively coupled plasma - optical emission spectrophotometry (EPA Method 6010B). | | | |
| NH3-F-VA | Water | Ammonia in Water by Fluorescence | J. ENVIRON. MONIT., 2005, 7, 37-42, RSC |
| This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al. | | | |
| NO2-L-IC-N-WR | Water | Nitrite in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| NO3-L-IC-N-WR | Water | Nitrate in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| PH-PCT-VA | Water | pH by Meter (Automated) | APHA 4500-H pH Value |
| This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode | | | |
| It is recommended that this analysis be conducted in the field. | | | |

Reference Information

S-DIS-ICP-VA Water Dissolved Sulfur in Water by ICPOES EPA SW-846 3005A/6010B

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedures may involve preliminary sample treatment by acid digestion, using either hotblock or microwave oven, or filtration (EPA Method 3005A). Instrumental analysis is by inductively coupled plasma - optical emission spectrophotometry (EPA Method 6010B).

Method Limitation: This method will not give total sulfur results for all samples. Sulfide or other volatile forms of sulfur that may be present in submitted samples, is often lost during the sampling, preservation and analysis process. The data reported as total and/or dissolved sulfur represents all non-volatile forms of sulfur present in a particular sample.

S-TOT-ICP-VA Water Total Sulfur in Water by ICPOES EPA SW-846 3005A/6010B

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedures may involve preliminary sample treatment by acid digestion, using either hotblock or microwave oven, or filtration (EPA Method 3005A). Instrumental analysis is by inductively coupled plasma - optical emission spectrophotometry (EPA Method 6010B).

Method Limitation: This method will not give total sulfur results for all samples. Sulfide or other volatile forms of sulfur that may be present in submitted samples, is often lost during the sampling, preservation and analysis process. The data reported as total and/or dissolved sulfur represents all non-volatile forms of sulfur present in a particular sample.

SO4-IC-N-WR Water Sulfate in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

TDS-CALC-VA Water TDS (Calculated) APHA 1030E (20TH EDITION)

This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses". The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample.

TSS-MAN-WR Water Total Suspended Solids by Gravimetric APHA 2540 D

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids are determined by filtering a sample through a glass fibre filter and drying the filter at 104 degrees celsius.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location |
|----------------------------|---|
| WR | ALS ENVIRONMENTAL - WHITEHORSE, YUKON, CANADA |
| VA | ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA |

Chain of Custody Numbers:

2016-08-10 B

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Quality Control Report

Workorder: L1811593

Report Date: 20-DEC-17

Page 8 of 8

Hold Time Exceedances:

| ALS Product Description | Sample ID | Sampling Date | Date Processed | Rec. HT | Actual HT | Units | Qualifier |
|-------------------------|-----------|-----------------|-----------------|---------|-----------|-------|-----------|
| Physical Tests | | | | | | | |
| pH by Meter (Automated) | | | | | | | |
| | 1 | 08-AUG-16 10:25 | 20-AUG-16 09:55 | 0.25 | 288 | hours | EHTR-FM |
| | 2 | 08-AUG-16 10:30 | 20-AUG-16 09:55 | 0.25 | 288 | hours | EHTR-FM |
| | 3 | 08-AUG-16 10:35 | 20-AUG-16 09:55 | 0.25 | 287 | hours | EHTR-FM |

Legend & Qualifier Definitions:

| | |
|----------|---|
| EHTR-FM: | Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended. |
| EHTR: | Exceeded ALS recommended hold time prior to sample receipt. |
| EHTL: | Exceeded ALS recommended hold time prior to analysis. Sample was received less than 24 hours prior to expiry. |
| EHT: | Exceeded ALS recommended hold time prior to analysis. |
| Rec. HT: | ALS recommended hold time (see units). |

Notes*:

Where actual sampling date is not provided to ALS, the date (& time) of receipt is used for calculation purposes.
Where actual sampling time is not provided to ALS, the earlier of 12 noon on the sampling date or the time (& date) of receipt is used for calculation purposes. Samples for L1811593 were received on 10-AUG-16 15:45.

ALS recommended hold times may vary by province. They are assigned to meet known provincial and/or federal government requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by the US EPA, APHA Standard Methods, or Environment Canada (where available). For more information, please contact ALS.

The ALS Quality Control Report is provided to ALS clients upon request. ALS includes comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against pre-determined data quality objectives to provide confidence in the accuracy of associated test results.

Please note that this report may contain QC results from anonymous Sample Duplicates and Matrix Spikes that do not originate from this Work Order.

* Please refer to the Reference Information section for an explanation of any qualifiers detected.

Reference Information

QC Samples with Qualifiers & Comments:

| QC Type Description | Parameter | Qualifier | Applies to Sample Number(s) |
|---------------------|---------------------------|-----------|-----------------------------|
| Matrix Spike | Aluminum (Al)-Dissolved | MS-B | L1813894-1, -2, -3 |
| Matrix Spike | Antimony (Sb)-Dissolved | MS-B | L1813894-1, -2, -3 |
| Matrix Spike | Arsenic (As)-Dissolved | MS-B | L1813894-1, -2, -3 |
| Matrix Spike | Barium (Ba)-Dissolved | MS-B | L1813894-1, -2, -3 |
| Matrix Spike | Barium (Ba)-Dissolved | MS-B | L1813894-1, -2, -3 |
| Matrix Spike | Barium (Ba)-Dissolved | MS-B | L1813894-1, -2, -3 |
| Matrix Spike | Manganese (Mn)-Dissolved | MS-B | L1813894-1, -2, -3 |
| Matrix Spike | Manganese (Mn)-Dissolved | MS-B | L1813894-1, -2, -3 |
| Matrix Spike | Molybdenum (Mo)-Dissolved | MS-B | L1813894-1, -2, -3 |
| Matrix Spike | Sodium (Na)-Dissolved | MS-B | L1813894-1, -2, -3 |
| Matrix Spike | Sodium (Na)-Dissolved | MS-B | L1813894-1, -2, -3 |
| Matrix Spike | Sodium (Na)-Dissolved | MS-B | L1813894-1, -2, -3 |
| Matrix Spike | Strontium (Sr)-Dissolved | MS-B | L1813894-1, -2, -3 |
| Matrix Spike | Strontium (Sr)-Dissolved | MS-B | L1813894-1, -2, -3 |
| Matrix Spike | Strontium (Sr)-Dissolved | MS-B | L1813894-1, -2, -3 |
| Matrix Spike | Strontium (Sr)-Dissolved | MS-B | L1813894-1, -2, -3 |
| Matrix Spike | Strontium (Sr)-Dissolved | MS-B | L1813894-1, -2, -3 |
| Matrix Spike | Strontium (Sr)-Dissolved | MS-B | L1813894-1, -2, -3 |
| Matrix Spike | Uranium (U)-Dissolved | MS-B | L1813894-1, -2, -3 |
| Matrix Spike | Calcium (Ca)-Dissolved | MS-B | L1813894-1, -2, -3 |
| Matrix Spike | Calcium (Ca)-Dissolved | MS-B | L1813894-1, -2, -3 |
| Matrix Spike | Magnesium (Mg)-Dissolved | MS-B | L1813894-1, -2, -3 |
| Matrix Spike | Silicon (Si)-Dissolved | MS-B | L1813894-1, -2, -3 |
| Matrix Spike | Silicon (Si)-Dissolved | MS-B | L1813894-1, -2, -3 |
| Matrix Spike | Sulfur (S)-Dissolved | MS-B | L1813894-1, -2, -3 |

Qualifiers for Individual Parameters Listed:

| Qualifier | Description |
|-----------|--|
| DLB | Detection Limit Raised. Analyte detected at comparable level in Method Blank. |
| MS-B | Matrix Spike recovery could not be accurately calculated due to high analyte background in sample. |

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|--|--------|--------------------------------------|-------------------------|
| ALK-TITR-VA | Water | Alkalinity Species by Titration | APHA 2320 Alkalinity |
| This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values. | | | |
| ANIONS-N+N-CALC-WR | Water | Nitrite & Nitrate Nitrogen | EPA 300.1 |
| Nitrate and Nitrite Nitrogen is determined by calculation from the individual Nitrate and Nitrite Nitrogen analyses by Ion Chromatography with UV absorbance. | | | |
| BE-D-L-CCMS-VA | Water | Diss. Be (low) in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| BE-T-L-CCMS-VA | Water | Total Be (Low) in Water by CRC ICPMS | EPA 200.2/6020A (mod) |
| Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS. | | | |
| CL-IC-N-WR | Water | Chloride in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| EC-PCT-VA | Water | Conductivity (Automated) | APHA 2510 Auto. Conduc. |
| This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode. | | | |
| HARDNESS-CALC-VA | Water | Hardness | APHA 2340B |
| Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation. | | | |

Reference Information

| | | | |
|--|-------|--|---|
| HG-D-CVAA-VA | Water | Diss. Mercury in Water by CVAAS or CVAFS | APHA 3030B/EPA 1631E (mod) |
| Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | | | |
| HG-T-CVAA-VA | Water | Total Mercury in Water by CVAAS or CVAFS | EPA 1631E (mod) |
| Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | | | |
| IONBALANCE-VA | Water | Ion Balance Calculation | APHA 1030E |
| Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero. | | | |
| Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as: | | | |
| Ion Balance (%) = [Cation Sum-Anion Sum] / [Cation Sum+Anion Sum] | | | |
| MET-D-CCMS-VA | Water | Dissolved Metals in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| MET-DIS-LOW-ICP-VA | Water | Dissolved Metals in Water by ICPOES | EPA 3005A/6010B |
| This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedure involves filtration (EPA Method 3005A) and analysis by inductively coupled plasma - optical emission spectrophotometry (EPA Method 6010B). | | | |
| MET-T-CCMS-VA | Water | Total Metals in Water by CRC ICPMS | EPA 200.2/6020A (mod) |
| Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| MET-TOT-LOW-ICP-VA | Water | Total Metals in Water by ICPOES | EPA 3005A/6010B |
| This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedures may involve preliminary sample treatment by acid digestion, using either hotblock or microwave oven (EPA Method 3005A). Instrumental analysis is by inductively coupled plasma - optical emission spectrophotometry (EPA Method 6010B). | | | |
| NH3-F-VA | Water | Ammonia in Water by Fluorescence | J. ENVIRON. MONIT., 2005, 7, 37-42, RSC |
| This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al. | | | |
| NO2-L-IC-N-WR | Water | Nitrite in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| NO3-L-IC-N-WR | Water | Nitrate in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| PH-PCT-VA | Water | pH by Meter (Automated) | APHA 4500-H pH Value |
| This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode | | | |
| It is recommended that this analysis be conducted in the field. | | | |
| S-DIS-ICP-VA | Water | Dissolved Sulfur in Water by ICPOES | EPA SW-846 3005A/6010B |
| This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedures may involve preliminary sample treatment by acid digestion, using either hotblock or microwave oven, or filtration (EPA Method 3005A). Instrumental analysis is by inductively coupled plasma - optical emission spectrophotometry (EPA Method 6010B). | | | |
| Method Limitation: This method will not give total sulfur results for all samples. Sulfide or other volatile forms of sulfur that may be present in submitted samples, is often lost during the sampling, preservation and analysis process. The data reported as total and/or dissolved sulfur represents all non-volatile forms of sulfur present in a particular sample. | | | |
| S-TOT-ICP-VA | Water | Total Sulfur in Water by ICPOES | EPA SW-846 3005A/6010B |

Reference Information

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedures may involve preliminary sample treatment by acid digestion, using either hotblock or microwave oven, or filtration (EPA Method 3005A). Instrumental analysis is by inductively coupled plasma - optical emission spectrophotometry (EPA Method 6010B).

Method Limitation: This method will not give total sulfur results for all samples. Sulfide or other volatile forms of sulfur that may be present in submitted samples, is often lost during the sampling, preservation and analysis process. The data reported as total and/or dissolved sulfur represents all non-volatile forms of sulfur present in a particular sample.

SO4-IC-N-WR Water Sulfate in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

TDS-CALC-VA Water TDS (Calculated) APHA 1030E (20TH EDITION)

This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses". The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample.

TSS-MAN-WR Water Total Suspended Solids by Gravimetric APHA 2540 D

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids are determined by filtering a sample through a glass fibre filter and drying the filter at 104 degrees celsius.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location |
|----------------------------|---|
| WR | ALS ENVIRONMENTAL - WHITEHORSE, YUKON, CANADA |
| VA | ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA |

Chain of Custody Numbers:

2016-08-15 B

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Quality Control Report

Workorder: L1813894

Report Date: 20-DEC-17

Page 10 of 10

Hold Time Exceedances:

| ALS Product Description | Sample ID | Sampling Date | Date Processed | Rec. HT | Actual HT | Units | Qualifier |
|-------------------------|-----------|-----------------|-----------------|---------|-----------|-------|-----------|
| Physical Tests | | | | | | | |
| pH by Meter (Automated) | | | | | | | |
| | 1 | 15-AUG-16 08:10 | 22-AUG-16 08:42 | 0.25 | 168 | hours | EHTR-FM |
| | 2 | 15-AUG-16 08:38 | 22-AUG-16 08:42 | 0.25 | 168 | hours | EHTR-FM |
| | 3 | 15-AUG-16 07:30 | 22-AUG-16 08:42 | 0.25 | 169 | hours | EHTR-FM |

Legend & Qualifier Definitions:

| | |
|----------|---|
| EHTR-FM: | Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended. |
| EHTR: | Exceeded ALS recommended hold time prior to sample receipt. |
| EHTL: | Exceeded ALS recommended hold time prior to analysis. Sample was received less than 24 hours prior to expiry. |
| EHT: | Exceeded ALS recommended hold time prior to analysis. |
| Rec. HT: | ALS recommended hold time (see units). |

Notes*:

Where actual sampling date is not provided to ALS, the date (& time) of receipt is used for calculation purposes.
Where actual sampling time is not provided to ALS, the earlier of 12 noon on the sampling date or the time (& date) of receipt is used for calculation purposes. Samples for L1813894 were received on 16-AUG-16 10:05.

ALS recommended hold times may vary by province. They are assigned to meet known provincial and/or federal government requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by the US EPA, APHA Standard Methods, or Environment Canada (where available). For more information, please contact ALS.

The ALS Quality Control Report is provided to ALS clients upon request. ALS includes comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against pre-determined data quality objectives to provide confidence in the accuracy of associated test results.

Please note that this report may contain QC results from anonymous Sample Duplicates and Matrix Spikes that do not originate from this Work Order.

Reference Information

QC Samples with Qualifiers & Comments:

| QC Type Description | Parameter | Qualifier | Applies to Sample Number(s) |
|---------------------|--------------------------|-----------|-----------------------------|
| Matrix Spike | Aluminum (Al)-Dissolved | MS-B | L1818233-1, -2, -3 |
| Matrix Spike | Barium (Ba)-Dissolved | MS-B | L1818233-1, -2, -3 |
| Matrix Spike | Barium (Ba)-Dissolved | MS-B | L1818233-1, -2, -3 |
| Matrix Spike | Manganese (Mn)-Dissolved | MS-B | L1818233-1, -2, -3 |
| Matrix Spike | Sodium (Na)-Dissolved | MS-B | L1818233-1, -2, -3 |
| Matrix Spike | Sodium (Na)-Dissolved | MS-B | L1818233-1, -2, -3 |
| Matrix Spike | Sodium (Na)-Dissolved | MS-B | L1818233-1, -2, -3 |
| Matrix Spike | Strontium (Sr)-Dissolved | MS-B | L1818233-1, -2, -3 |
| Matrix Spike | Strontium (Sr)-Dissolved | MS-B | L1818233-1, -2, -3 |
| Matrix Spike | Strontium (Sr)-Dissolved | MS-B | L1818233-1, -2, -3 |
| Matrix Spike | Strontium (Sr)-Dissolved | MS-B | L1818233-1, -2, -3 |
| Matrix Spike | Nitrate (as N) | MS-B | L1818233-1, -2, -3 |

Qualifiers for Individual Parameters Listed:

| Qualifier | Description |
|-----------|--|
| MS-B | Matrix Spike recovery could not be accurately calculated due to high analyte background in sample. |

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|---|--------|--|----------------------------|
| ALK-TITR-VA | Water | Alkalinity Species by Titration | APHA 2320 Alkalinity |
| This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values. | | | |
| ANIONS-N+N-CALC-WR | Water | Nitrite & Nitrate Nitrogen | EPA 300.1 |
| Nitrate and Nitrite Nitrogen is determined by calculation from the individual Nitrate and Nitrite Nitrogen analyses by Ion Chromatography with UV absorbance. | | | |
| BE-D-L-CCMS-VA | Water | Diss. Be (low) in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| BE-T-L-CCMS-VA | Water | Total Be (Low) in Water by CRC ICPMS | EPA 200.2/6020A (mod) |
| Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS. | | | |
| CL-IC-N-WR | Water | Chloride in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| EC-PCT-VA | Water | Conductivity (Automated) | APHA 2510 Auto. Conduc. |
| This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode. | | | |
| HARDNESS-CALC-VA | Water | Hardness | APHA 2340B |
| Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation. | | | |
| HG-D-CVAA-VA | Water | Diss. Mercury in Water by CVAAS or CVAFS | APHA 3030B/EPA 1631E (mod) |
| Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | | | |
| HG-T-CVAA-VA | Water | Total Mercury in Water by CVAAS or CVAFS | EPA 1631E (mod) |
| Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | | | |
| IONBALANCE-VA | Water | Ion Balance Calculation | APHA 1030E |
| Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero. | | | |
| Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as: | | | |
| Ion Balance (%) = [Cation Sum-Anion Sum] / [Cation Sum+Anion Sum] | | | |
| MET-D-CCMS-VA | Water | Dissolved Metals in Water by CRC ICPMS | APHA 3030B/6020A (mod) |

Reference Information

Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

MET-DIS-LOW-ICP-VA Water Dissolved Metals in Water by ICPOES EPA 3005A/6010B

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedure involves filtration (EPA Method 3005A) and analysis by inductively coupled plasma - optical emission spectrophotometry (EPA Method 6010B).

MET-T-CCMS-VA Water Total Metals in Water by CRC ICPMS EPA 200.2/6020A (mod)

Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

MET-TOT-LOW-ICP-VA Water Total Metals in Water by ICPOES EPA 3005A/6010B

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedures may involve preliminary sample treatment by acid digestion, using either hotblock or microwave oven (EPA Method 3005A). Instrumental analysis is by inductively coupled plasma - optical emission spectrophotometry (EPA Method 6010B).

NH3-F-VA Water Ammonia in Water by Fluorescence J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NO2-L-IC-N-WR Water Nitrite in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO3-L-IC-N-WR Water Nitrate in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

S-DIS-ICP-VA Water Dissolved Sulfur in Water by ICPOES EPA SW-846 3005A/6010B

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedures may involve preliminary sample treatment by acid digestion, using either hotblock or microwave oven, or filtration (EPA Method 3005A). Instrumental analysis is by inductively coupled plasma - optical emission spectrophotometry (EPA Method 6010B).

Method Limitation: This method will not give total sulfur results for all samples. Sulfide or other volatile forms of sulfur that may be present in submitted samples, is often lost during the sampling, preservation and analysis process. The data reported as total and/or dissolved sulfur represents all non-volatile forms of sulfur present in a particular sample.

S-TOT-ICP-VA Water Total Sulfur in Water by ICPOES EPA SW-846 3005A/6010B

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedures may involve preliminary sample treatment by acid digestion, using either hotblock or microwave oven, or filtration (EPA Method 3005A). Instrumental analysis is by inductively coupled plasma - optical emission spectrophotometry (EPA Method 6010B).

Method Limitation: This method will not give total sulfur results for all samples. Sulfide or other volatile forms of sulfur that may be present in submitted samples, is often lost during the sampling, preservation and analysis process. The data reported as total and/or dissolved sulfur represents all non-volatile forms of sulfur present in a particular sample.

SO4-IC-N-WR Water Sulfate in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

TDS-CALC-VA Water TDS (Calculated) APHA 1030E (20TH EDITION)

This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses". The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample.

TSS-MAN-WR Water Total Suspended Solids by Gravimetric APHA 2540 D

Reference Information

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids are determined by filtering a sample through a glass fibre filter and drying the filter at 104 degrees celsius.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location |
|----------------------------|---|
| WR | ALS ENVIRONMENTAL - WHITEHORSE, YUKON, CANADA |
| VA | ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA |

Chain of Custody Numbers:

2016-08-23 B

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

| RPD-NA | Relative Percent Difference Not Available due to result(s) being less than detection limit. |

Quality Control Report

Workorder: L1818233

Report Date: 20-DEC-17

Page 10 of 10

Hold Time Exceedances:

| ALS Product Description | Sample ID | Sampling Date | Date Processed | Rec. HT | Actual HT | Units | Qualifier |
|-------------------------|-----------|-----------------|-----------------|---------|-----------|-------|-----------|
| Physical Tests | | | | | | | |
| pH by Meter (Automated) | | | | | | | |
| | 1 | 22-AUG-16 07:50 | 31-AUG-16 08:49 | 0.25 | 217 | hours | EHTR-FM |
| | 2 | 22-AUG-16 08:25 | 31-AUG-16 08:49 | 0.25 | 216 | hours | EHTR-FM |
| | 3 | 22-AUG-16 08:50 | 31-AUG-16 08:49 | 0.25 | 216 | hours | EHTR-FM |

Legend & Qualifier Definitions:

| | |
|----------|---|
| EHTR-FM: | Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended. |
| EHTR: | Exceeded ALS recommended hold time prior to sample receipt. |
| EHTL: | Exceeded ALS recommended hold time prior to analysis. Sample was received less than 24 hours prior to expiry. |
| EHT: | Exceeded ALS recommended hold time prior to analysis. |
| Rec. HT: | ALS recommended hold time (see units). |

Notes*:

Where actual sampling date is not provided to ALS, the date (& time) of receipt is used for calculation purposes.
Where actual sampling time is not provided to ALS, the earlier of 12 noon on the sampling date or the time (& date) of receipt is used for calculation purposes. Samples for L1818233 were received on 24-AUG-16 10:25.

ALS recommended hold times may vary by province. They are assigned to meet known provincial and/or federal government requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by the US EPA, APHA Standard Methods, or Environment Canada (where available). For more information, please contact ALS.

The ALS Quality Control Report is provided to ALS clients upon request. ALS includes comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against pre-determined data quality objectives to provide confidence in the accuracy of associated test results.

Please note that this report may contain QC results from anonymous Sample Duplicates and Matrix Spikes that do not originate from this Work Order.

| Matrix Spike | Strontium (Sr)-Total | MS-B | L1822573-1, -2, -3 |
| Matrix Spike | Nitrate (as N) | MS-B | L1822573-1, -2, -3 |

Qualifiers for Individual Parameters Listed:

| Qualifier | Description |
|-----------|--|
| MS-B | Matrix Spike recovery could not be accurately calculated due to high analyte background in sample. |

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|---|--------|------------------------------------|--------------------|
| ALK-CO3-CALC-WP | Water | Alkalinity, Carbonate (as CaCO3) | CALCULATION |
| <p>The Alkalinity of water is a measure of its acid neutralizing capacity. Alkalinity is imparted by bicarbonate, carbonate and hydroxide components of water. The fraction of alkalinity contributed by carbonate is calculated and reported as mg/L CaCO3.</p> | | | |
| ALK-HCO3-CALC-WP | Water | Alkalinity, Bicarbonate (as CaCO3) | CALCULATION |
| <p>The Alkalinity of water is a measure of its acid neutralizing capacity. Alkalinity is imparted by bicarbonate, carbonate and hydroxide components of water. The fraction of alkalinity contributed by bicarbonate is calculated and reported as mg/L CaCO3.</p> | | | |
| ALK-OH-CALC-WP | Water | Alkalinity, Hydroxide (as CaCO3) | CALCULATION |
| <p>The Alkalinity of water is a measure of its acid neutralizing capacity. Alkalinity is imparted by bicarbonate, carbonate and hydroxide components of water. The fraction of alkalinity contributed by hydroxide is calculated and reported as mg/L CaCO3.</p> | | | |
| ALK-TITR-WP | Water | Alkalinity, Total (as CaCO3) | APHA 2320B |
| <p>The Alkalinity of water is a measure of its acid neutralizing capacity. Alkalinity is imparted by bicarbonate, carbonate and hydroxide components of water. Total alkalinity is determined by titration with a strong standard mineral acid to the successive HCO3- and H2CO3 endpoints indicated electrometrically.</p> | | | |
| ANIONS-N+N-CALC-WR | Water | Nitrite & Nitrate Nitrogen | EPA 300.1 |
| <p>Nitrate and Nitrite Nitrogen is determined by calculation from the individual Nitrate and Nitrite Nitrogen analyses by Ion Chromatography with UV absorbance.</p> | | | |

Reference Information

| | | | |
|---|-------|--|---|
| BE-D-L-CCMS-VA | Water | Diss. Be (low) in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| BE-T-L-CCMS-VA | Water | Total Be (Low) in Water by CRC ICPMS | EPA 200.2/6020A (mod) |
| Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS. | | | |
| CL-IC-N-WR | Water | Chloride in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| EC-WP | Water | Conductivity | APHA 2510B |
| Conductivity of an aqueous solution refers to its ability to carry an electric current. Conductance of a solution is measured between two spatially fixed and chemically inert electrodes. | | | |
| HARDNESS-CALC-VA | Water | Hardness | APHA 2340B |
| Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO ₃ equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation. | | | |
| HG-D-CVAA-VA | Water | Diss. Mercury in Water by CVAAS or CVAFS | APHA 3030B/EPA 1631E (mod) |
| Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | | | |
| HG-T-CVAA-VA | Water | Total Mercury in Water by CVAAS or CVAFS | EPA 1631E (mod) |
| Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | | | |
| IONBALANCE-VA | Water | Ion Balance Calculation | APHA 1030E |
| Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero. | | | |
| Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as: | | | |
| Ion Balance (%) = [Cation Sum-Anion Sum] / [Cation Sum+Anion Sum] | | | |
| MET-D-CCMS-VA | Water | Dissolved Metals in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| MET-DIS-LOW-ICP-VA | Water | Dissolved Metals in Water by ICPOES | EPA 3005A/6010B |
| This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedure involves filtration (EPA Method 3005A) and analysis by inductively coupled plasma - optical emission spectrophotometry (EPA Method 6010B). | | | |
| MET-T-CCMS-VA | Water | Total Metals in Water by CRC ICPMS | EPA 200.2/6020A (mod) |
| Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| MET-TOT-LOW-ICP-VA | Water | Total Metals in Water by ICPOES | EPA 3005A/6010B |
| This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedures may involve preliminary sample treatment by acid digestion, using either hotblock or microwave oven (EPA Method 3005A). Instrumental analysis is by inductively coupled plasma - optical emission spectrophotometry (EPA Method 6010B). | | | |
| NH3-F-VA | Water | Ammonia in Water by Fluorescence | J. ENVIRON. MONIT., 2005, 7, 37-42, RSC |
| This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al. | | | |
| NO2-L-IC-N-WR | Water | Nitrite in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |

Reference Information

NO3-L-IC-N-WR Water Nitrate in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

PH-WP Water pH APHA 4500H

The pH of a sample is the determination of the activity of the hydrogen ions by potentiometric measurement using a standard hydrogen electrode and a reference electrode.

S-DIS-ICP-VA Water Dissolved Sulfur in Water by ICPOES EPA SW-846 3005A/6010B

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedures may involve preliminary sample treatment by acid digestion, using either hotblock or microwave oven, or filtration (EPA Method 3005A). Instrumental analysis is by inductively coupled plasma - optical emission spectrophotometry (EPA Method 6010B).

Method Limitation: This method will not give total sulfur results for all samples. Sulfide or other volatile forms of sulfur that may be present in submitted samples, is often lost during the sampling, preservation and analysis process. The data reported as total and/or dissolved sulfur represents all non-volatile forms of sulfur present in a particular sample.

S-TOT-ICP-VA Water Total Sulfur in Water by ICPOES EPA SW-846 3005A/6010B

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedures may involve preliminary sample treatment by acid digestion, using either hotblock or microwave oven, or filtration (EPA Method 3005A). Instrumental analysis is by inductively coupled plasma - optical emission spectrophotometry (EPA Method 6010B).

Method Limitation: This method will not give total sulfur results for all samples. Sulfide or other volatile forms of sulfur that may be present in submitted samples, is often lost during the sampling, preservation and analysis process. The data reported as total and/or dissolved sulfur represents all non-volatile forms of sulfur present in a particular sample.

SO4-IC-N-WR Water Sulfate in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

TDS-CALC-VA Water TDS (Calculated) APHA 1030E (20TH EDITION)

This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses". The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample.

TSS-MAN-WR Water Total Suspended Solids by Gravimetric APHA 2540 D

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids are determined by filtering a sample through a glass fibre filter and drying the filter at 104 degrees celsius.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location |
|----------------------------|---|
| WR | ALS ENVIRONMENTAL - WHITEHORSE, YUKON, CANADA |
| WP | ALS ENVIRONMENTAL - WINNIPEG, MANITOBA, CANADA |
| VA | ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA |

Chain of Custody Numbers:

2016-08-31 E

Reference Information

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

| Alkalinity, Total (as CaCO3) | 1 | 29-AUG-16 09:20 | 13-SEP-16 12:45 | 14 | 15 | days | EHT |
| | 2 | 29-AUG-16 09:15 | 13-SEP-16 12:45 | 14 | 15 | days | EHT |
| | 3 | 29-AUG-16 09:10 | 13-SEP-16 12:45 | 14 | 15 | days | EHT |

Legend & Qualifier Definitions:

- EHTR-FM: Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended.
EHTR: Exceeded ALS recommended hold time prior to sample receipt.
EHTL: Exceeded ALS recommended hold time prior to analysis. Sample was received less than 24 hours prior to expiry.
EHT: Exceeded ALS recommended hold time prior to analysis.
Rec. HT: ALS recommended hold time (see units).

Notes*:

Where actual sampling date is not provided to ALS, the date (& time) of receipt is used for calculation purposes.
Where actual sampling time is not provided to ALS, the earlier of 12 noon on the sampling date or the time (& date) of receipt is used for calculation purposes. Samples for L1822573 were received on 31-AUG-16 16:00.

ALS recommended hold times may vary by province. They are assigned to meet known provincial and/or federal government requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by the US EPA, APHA Standard Methods, or Environment Canada (where available). For more information, please contact ALS.

The ALS Quality Control Report is provided to ALS clients upon request. ALS includes comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against pre-determined data quality objectives to provide confidence in the accuracy of associated test results.

Please note that this report may contain QC results from anonymous Sample Duplicates and Matrix Spikes that do not originate from this Work Order.

| Matrix Spike | Sulfate (SO4) | MS-B | L1825883-1, -2, -3 |

Qualifiers for Individual Parameters Listed:

| Qualifier | Description |
|-----------|--|
| DTC | Dissolved concentration exceeds total. Results were confirmed by re-analysis. |
| MS-B | Matrix Spike recovery could not be accurately calculated due to high analyte background in sample. |

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|--|--------|--|----------------------------|
| ALK-TITR-VA | Water | Alkalinity Species by Titration | APHA 2320 Alkalinity |
| This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values. | | | |
| ANIONS-N+N-CALC-WR | Water | Nitrite & Nitrate Nitrogen | EPA 300.1 |
| Nitrate and Nitrite Nitrogen is determined by calculation from the individual Nitrate and Nitrite Nitrogen analyses by Ion Chromatography with UV absorbance. | | | |
| BE-D-L-CCMS-VA | Water | Diss. Be (low) in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| BE-T-L-CCMS-VA | Water | Total Be (Low) in Water by CRC ICPMS | EPA 200.2/6020A (mod) |
| Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS. | | | |
| CL-IC-N-WR | Water | Chloride in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| EC-PCT-VA | Water | Conductivity (Automated) | APHA 2510 Auto. Conduc. |
| This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode. | | | |
| HARDNESS-CALC-VA | Water | Hardness | APHA 2340B |
| Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation. | | | |
| HG-D-CVAA-VA | Water | Diss. Mercury in Water by CVAAS or CVAFS | APHA 3030B/EPA 1631E (mod) |

Reference Information

Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.

HG-T-CVAA-VA Water Total Mercury in Water by CVAAS or CVAFS EPA 1631E (mod)

Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS.

IONBALANCE-VA Water Ion Balance Calculation APHA 1030E

Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero.

Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as:

$$\text{Ion Balance (\%)} = \frac{[\text{Cation Sum} - \text{Anion Sum}]}{[\text{Cation Sum} + \text{Anion Sum}]}$$

MET-D-CCMS-VA Water Dissolved Metals in Water by CRC ICPMS APHA 3030B/6020A (mod)

Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

MET-DIS-LOW-ICP-VA Water Dissolved Metals in Water by ICPOES EPA 3005A/6010B

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedure involves filtration (EPA Method 3005A) and analysis by inductively coupled plasma - optical emission spectrophotometry (EPA Method 6010B).

MET-T-CCMS-VA Water Total Metals in Water by CRC ICPMS EPA 200.2/6020A (mod)

Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

MET-TOT-LOW-ICP-VA Water Total Metals in Water by ICPOES EPA 3005A/6010B

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedures may involve preliminary sample treatment by acid digestion, using either hotblock or microwave oven (EPA Method 3005A). Instrumental analysis is by inductively coupled plasma - optical emission spectrophotometry (EPA Method 6010B).

NH3-F-VA Water Ammonia in Water by Fluorescence J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NO2-L-IC-N-WR Water Nitrite in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO3-L-IC-N-WR Water Nitrate in Water by IC (Low Level) EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

S-DIS-ICP-VA Water Dissolved Sulfur in Water by ICPOES EPA SW-846 3005A/6010B

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedures may involve preliminary sample treatment by acid digestion, using either hotblock or microwave oven, or filtration (EPA Method 3005A). Instrumental analysis is by inductively coupled plasma - optical emission spectrophotometry (EPA Method 6010B).

Method Limitation: This method will not give total sulfur results for all samples. Sulfide or other volatile forms of sulfur that may be present in submitted samples, is often lost during the sampling, preservation and analysis process. The data reported as total and/or dissolved sulfur represents all non-volatile forms of sulfur present in a particular sample.

S-TOT-ICP-VA Water Total Sulfur in Water by ICPOES EPA SW-846 3005A/6010B

Reference Information

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedures may involve preliminary sample treatment by acid digestion, using either hotblock or microwave oven, or filtration (EPA Method 3005A). Instrumental analysis is by inductively coupled plasma - optical emission spectrophotometry (EPA Method 6010B).

Method Limitation: This method will not give total sulfur results for all samples. Sulfide or other volatile forms of sulfur that may be present in submitted samples, is often lost during the sampling, preservation and analysis process. The data reported as total and/or dissolved sulfur represents all non-volatile forms of sulfur present in a particular sample.

SO4-IC-N-WR Water Sulfate in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

TDS-CALC-VA Water TDS (Calculated) APHA 1030E (20TH EDITION)

This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses".

The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample.

TSS-VA Water Total Suspended Solids by Gravimetric APHA 2540 D - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius.

Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location |
|----------------------------|---|
| WR | ALS ENVIRONMENTAL - WHITEHORSE, YUKON, CANADA |
| VA | ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA |

Chain of Custody Numbers:

2016-09-07 B

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Report Date: 20-DEC-17

Page 10 of 10

Hold Time Exceedances:

| ALS Product Description | Sample ID | Sampling Date | Date Processed | Rec. HT | Actual HT | Units | Qualifier |
|-------------------------|-----------|-----------------|-----------------|---------|-----------|-------|-----------|
| Physical Tests | | | | | | | |
| pH by Meter (Automated) | | | | | | | |
| | 1 | 05-SEP-16 07:40 | 18-SEP-16 10:25 | 0.25 | 315 | hours | EHTR-FM |
| | 2 | 05-SEP-16 07:55 | 18-SEP-16 10:25 | 0.25 | 314 | hours | EHTR-FM |
| | 3 | 05-SEP-16 08:10 | 18-SEP-16 10:25 | 0.25 | 314 | hours | EHTR-FM |

Legend & Qualifier Definitions:

| | |
|----------|---|
| EHTR-FM: | Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended. |
| EHTR: | Exceeded ALS recommended hold time prior to sample receipt. |
| EHTL: | Exceeded ALS recommended hold time prior to analysis. Sample was received less than 24 hours prior to expiry. |
| EHT: | Exceeded ALS recommended hold time prior to analysis. |
| Rec. HT: | ALS recommended hold time (see units). |

Notes*:

Where actual sampling date is not provided to ALS, the date (& time) of receipt is used for calculation purposes.
Where actual sampling time is not provided to ALS, the earlier of 12 noon on the sampling date or the time (& date) of receipt is used for calculation purposes. Samples for L1825883 were received on 07-SEP-16 15:20.

ALS recommended hold times may vary by province. They are assigned to meet known provincial and/or federal government requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by the US EPA, APHA Standard Methods, or Environment Canada (where available). For more information, please contact ALS.

The ALS Quality Control Report is provided to ALS clients upon request. ALS includes comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against pre-determined data quality objectives to provide confidence in the accuracy of associated test results.

Please note that this report may contain QC results from anonymous Sample Duplicates and Matrix Spikes that do not originate from this Work Order.

Reference Information

QC Samples with Qualifiers & Comments:

| QC Type Description | Parameter | Qualifier | Applies to Sample Number(s) |
|---------------------|------------------------------|-----------|-----------------------------|
| Method Blank | Alkalinity, Total (as CaCO3) | B | L1829581-1, -2, -3 |
| Matrix Spike | Aluminum (Al)-Dissolved | MS-B | L1829581-1, -2, -3 |
| Matrix Spike | Barium (Ba)-Dissolved | MS-B | L1829581-1, -2, -3 |
| Matrix Spike | Barium (Ba)-Dissolved | MS-B | L1829581-1, -2, -3 |
| Matrix Spike | Barium (Ba)-Dissolved | MS-B | L1829581-1, -2, -3 |
| Matrix Spike | Barium (Ba)-Dissolved | MS-B | L1829581-1, -2, -3 |
| Matrix Spike | Boron (B)-Dissolved | MS-B | L1829581-1, -2, -3 |
| Matrix Spike | Manganese (Mn)-Dissolved | MS-B | L1829581-1, -2, -3 |
| Matrix Spike | Manganese (Mn)-Dissolved | MS-B | L1829581-1, -2, -3 |
| Matrix Spike | Sodium (Na)-Dissolved | MS-B | L1829581-1, -2, -3 |
| Matrix Spike | Sodium (Na)-Dissolved | MS-B | L1829581-1, -2, -3 |
| Matrix Spike | Sodium (Na)-Dissolved | MS-B | L1829581-1, -2, -3 |
| Matrix Spike | Sodium (Na)-Dissolved | MS-B | L1829581-1, -2, -3 |
| Matrix Spike | Strontium (Sr)-Dissolved | MS-B | L1829581-1, -2, -3 |
| Matrix Spike | Strontium (Sr)-Dissolved | MS-B | L1829581-1, -2, -3 |
| Matrix Spike | Strontium (Sr)-Dissolved | MS-B | L1829581-1, -2, -3 |
| Matrix Spike | Strontium (Sr)-Dissolved | MS-B | L1829581-1, -2, -3 |
| Matrix Spike | Calcium (Ca)-Dissolved | MS-B | L1829581-1, -2, -3 |
| Matrix Spike | Silicon (Si)-Dissolved | MS-B | L1829581-1, -2, -3 |
| Matrix Spike | Barium (Ba)-Total | MS-B | L1829581-1, -2, -3 |
| Matrix Spike | Sodium (Na)-Total | MS-B | L1829581-1, -2, -3 |
| Matrix Spike | Strontium (Sr)-Total | MS-B | L1829581-1, -2, -3 |
| Matrix Spike | Silicon (Si)-Total | MS-B | L1829581-1, -2, -3 |
| Matrix Spike | Sulfur (S)-Dissolved | MS-B | L1829581-1, -2, -3 |

Qualifiers for Individual Parameters Listed:

| Qualifier | Description |
|-----------|--|
| B | Method Blank exceeds ALS DQO. Associated sample results which are < Limit of Reporting or > 5 times blank level are considered reliable. |
| DTC | Dissolved concentration exceeds total. Results were confirmed by re-analysis. |
| MS-B | Matrix Spike recovery could not be accurately calculated due to high analyte background in sample. |

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|--|--------|--|-------------------------|
| ALK-TITR-VA | Water | Alkalinity Species by Titration | APHA 2320 Alkalinity |
| This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values. | | | |
| ANIONS-N+N-CALC-VA | Water | Nitrite & Nitrate in Water (Calculation) | EPA 300.0 |
| Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N). | | | |
| BE-D-L-CCMS-VA | Water | Diss. Be (low) in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| BE-T-L-CCMS-VA | Water | Total Be (Low) in Water by CRC ICPMS | EPA 200.2/6020A (mod) |
| Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS. | | | |
| CL-IC-N-VA | Water | Chloride in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| EC-PCT-VA | Water | Conductivity (Automated) | APHA 2510 Auto. Conduc. |
| This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode. | | | |

Reference Information

| | | | |
|--|-------|--|---|
| HARDNESS-CALC-VA | Water | Hardness | APHA 2340B |
| Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO ₃ equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation. | | | |
| HG-D-CVAA-VA | Water | Diss. Mercury in Water by CVAAS or CVAFS | APHA 3030B/EPA 1631E (mod) |
| Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | | | |
| HG-T-CVAA-VA | Water | Total Mercury in Water by CVAAS or CVAFS | EPA 1631E (mod) |
| Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | | | |
| IONBALANCE-VA | Water | Ion Balance Calculation | APHA 1030E |
| Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero. | | | |
| Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as: | | | |
| $\text{Ion Balance (\%)} = \frac{[\text{Cation Sum} - \text{Anion Sum}]}{[\text{Cation Sum} + \text{Anion Sum}]}$ | | | |
| MET-D-CCMS-VA | Water | Dissolved Metals in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| MET-DIS-LOW-ICP-VA | Water | Dissolved Metals in Water by ICPOES | EPA 3005A/6010B |
| This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedure involves filtration (EPA Method 3005A) and analysis by inductively coupled plasma - optical emission spectrophotometry (EPA Method 6010B). | | | |
| MET-T-CCMS-VA | Water | Total Metals in Water by CRC ICPMS | EPA 200.2/6020A (mod) |
| Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| MET-TOT-LOW-ICP-VA | Water | Total Metals in Water by ICPOES | EPA 3005A/6010B |
| This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedures may involve preliminary sample treatment by acid digestion, using either hotblock or microwave oven (EPA Method 3005A). Instrumental analysis is by inductively coupled plasma - optical emission spectrophotometry (EPA Method 6010B). | | | |
| NH3-F-VA | Water | Ammonia in Water by Fluorescence | J. ENVIRON. MONIT., 2005, 7, 37-42, RSC |
| This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al. | | | |
| NO2-L-IC-N-VA | Water | Nitrite in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| NO3-L-IC-N-VA | Water | Nitrate in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| PH-PCT-VA | Water | pH by Meter (Automated) | APHA 4500-H pH Value |
| This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode | | | |
| It is recommended that this analysis be conducted in the field. | | | |
| S-DIS-ICP-VA | Water | Dissolved Sulfur in Water by ICPOES | EPA SW-846 3005A/6010B |
| This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedures may involve preliminary sample treatment by acid digestion, using either hotblock or microwave oven, or filtration (EPA Method 3005A). Instrumental analysis is by inductively coupled plasma - optical emission spectrophotometry (EPA Method 6010B). | | | |

Reference Information

Method Limitation: This method will not give total sulfur results for all samples. Sulfide or other volatile forms of sulfur that may be present in submitted samples, is often lost during the sampling, preservation and analysis process. The data reported as total and/or dissolved sulfur represents all non-volatile forms of sulfur present in a particular sample.

S-TOT-ICP-VA Water Total Sulfur in Water by ICPOES EPA SW-846 3005A/6010B

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedures may involve preliminary sample treatment by acid digestion, using either hotblock or microwave oven, or filtration (EPA Method 3005A). Instrumental analysis is by inductively coupled plasma - optical emission spectrophotometry (EPA Method 6010B).

Method Limitation: This method will not give total sulfur results for all samples. Sulfide or other volatile forms of sulfur that may be present in submitted samples, is often lost during the sampling, preservation and analysis process. The data reported as total and/or dissolved sulfur represents all non-volatile forms of sulfur present in a particular sample.

SO4-IC-N-VA Water Sulfate in Water by IC EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

TDS-CALC-VA Water TDS (Calculated) APHA 1030E (20TH EDITION)

This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses". The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample.

TSS-VA Water Total Suspended Solids by Gravimetric APHA 2540 D - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location |
|----------------------------|---|
| VA | ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA |

Chain of Custody Numbers:

2016-09-13 C

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

- mg/kg - milligrams per kilogram based on dry weight of sample.*
- mg/kg wwt - milligrams per kilogram based on wet weight of sample.*
- mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.*
- mg/L - milligrams per litre.*

- < - Less than.*
- D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).*
- N/A - Result not available. Refer to qualifier code and definition for explanation.*

*Test results reported relate only to the samples as received by the laboratory.
 UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
 Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.*

Quality Control Report

Workorder: L1829581

Report Date: 20-DEC-17

Page 12 of 13

Legend:

| | |
|-------|---|
| Limit | ALS Control Limit (Data Quality Objectives) |
| DUP | Duplicate |
| RPD | Relative Percent Difference |
| N/A | Not Available |
| LCS | Laboratory Control Sample |
| SRM | Standard Reference Material |
| MS | Matrix Spike |
| MSD | Matrix Spike Duplicate |
| ADE | Average Desorption Efficiency |
| MB | Method Blank |
| IRM | Internal Reference Material |
| CRM | Certified Reference Material |
| CCV | Continuing Calibration Verification |
| CVS | Calibration Verification Standard |
| LCSD | Laboratory Control Sample Duplicate |

Sample Parameter Qualifier Definitions:

| Qualifier | Description |
|-----------|--|
| B | Method Blank exceeds ALS DQO. Associated sample results which are < Limit of Reporting or > 5 times blank level are considered reliable. |
| J | Duplicate results and limits are expressed in terms of absolute difference. |
| MS-B | Matrix Spike recovery could not be accurately calculated due to high analyte background in sample. |
| RPD-NA | Relative Percent Difference Not Available due to result(s) being less than detection limit. |

| | 3 | 12-SEP-16 09:15 | 19-SEP-16 07:13 | 3 | 7 | days | EHTR |

Legend & Qualifier Definitions:

- EHTR-FM: Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended.
- EHTR: Exceeded ALS recommended hold time prior to sample receipt.
- EHTL: Exceeded ALS recommended hold time prior to analysis. Sample was received less than 24 hours prior to expiry.
- EHT: Exceeded ALS recommended hold time prior to analysis.
- Rec. HT: ALS recommended hold time (see units).

Notes*:

Where actual sampling date is not provided to ALS, the date (& time) of receipt is used for calculation purposes.
Where actual sampling time is not provided to ALS, the earlier of 12 noon on the sampling date or the time (& date) of receipt is used for calculation purposes. Samples for L1829581 were received on 15-SEP-16 12:45.

ALS recommended hold times may vary by province. They are assigned to meet known provincial and/or federal government requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by the US EPA, APHA Standard Methods, or Environment Canada (where available). For more information, please contact ALS.

The ALS Quality Control Report is provided to ALS clients upon request. ALS includes comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against pre-determined data quality objectives to provide confidence in the accuracy of associated test results.

Please note that this report may contain QC results from anonymous Sample Duplicates and Matrix Spikes that do not originate from this Work Order.

Reference Information

QC Samples with Qualifiers & Comments:

| QC Type Description | Parameter | Qualifier | Applies to Sample Number(s) |
|---------------------|---------------------------|-----------|-----------------------------|
| Matrix Spike | Aluminum (Al)-Dissolved | MS-B | L1831166-1, -2, -3 |
| Matrix Spike | Arsenic (As)-Dissolved | MS-B | L1831166-1, -2, -3 |
| Matrix Spike | Arsenic (As)-Dissolved | MS-B | L1831166-1, -2, -3 |
| Matrix Spike | Barium (Ba)-Dissolved | MS-B | L1831166-1, -2, -3 |
| Matrix Spike | Barium (Ba)-Dissolved | MS-B | L1831166-1, -2, -3 |
| Matrix Spike | Barium (Ba)-Dissolved | MS-B | L1831166-1, -2, -3 |
| Matrix Spike | Calcium (Ca)-Dissolved | MS-B | L1831166-1, -2, -3 |
| Matrix Spike | Calcium (Ca)-Dissolved | MS-B | L1831166-1, -2, -3 |
| Matrix Spike | Calcium (Ca)-Dissolved | MS-B | L1831166-1, -2, -3 |
| Matrix Spike | Calcium (Ca)-Dissolved | MS-B | L1831166-1, -2, -3 |
| Matrix Spike | Calcium (Ca)-Dissolved | MS-B | L1831166-1, -2, -3 |
| Matrix Spike | Magnesium (Mg)-Dissolved | MS-B | L1831166-1, -2, -3 |
| Matrix Spike | Magnesium (Mg)-Dissolved | MS-B | L1831166-1, -2, -3 |
| Matrix Spike | Magnesium (Mg)-Dissolved | MS-B | L1831166-1, -2, -3 |
| Matrix Spike | Magnesium (Mg)-Dissolved | MS-B | L1831166-1, -2, -3 |
| Matrix Spike | Magnesium (Mg)-Dissolved | MS-B | L1831166-1, -2, -3 |
| Matrix Spike | Magnesium (Mg)-Dissolved | MS-B | L1831166-1, -2, -3 |
| Matrix Spike | Magnesium (Mg)-Dissolved | MS-B | L1831166-1, -2, -3 |
| Matrix Spike | Manganese (Mn)-Dissolved | MS-B | L1831166-1, -2, -3 |
| Matrix Spike | Manganese (Mn)-Dissolved | MS-B | L1831166-1, -2, -3 |
| Matrix Spike | Manganese (Mn)-Dissolved | MS-B | L1831166-1, -2, -3 |
| Matrix Spike | Manganese (Mn)-Dissolved | MS-B | L1831166-1, -2, -3 |
| Matrix Spike | Manganese (Mn)-Dissolved | MS-B | L1831166-1, -2, -3 |
| Matrix Spike | Molybdenum (Mo)-Dissolved | MS-B | L1831166-1, -2, -3 |
| Matrix Spike | Potassium (K)-Dissolved | MS-B | L1831166-1, -2, -3 |
| Matrix Spike | Silicon (Si)-Dissolved | MS-B | L1831166-1, -2, -3 |
| Matrix Spike | Sodium (Na)-Dissolved | MS-B | L1831166-1, -2, -3 |
| Matrix Spike | Sodium (Na)-Dissolved | MS-B | L1831166-1, -2, -3 |
| Matrix Spike | Sodium (Na)-Dissolved | MS-B | L1831166-1, -2, -3 |
| Matrix Spike | Sodium (Na)-Dissolved | MS-B | L1831166-1, -2, -3 |
| Matrix Spike | Sodium (Na)-Dissolved | MS-B | L1831166-1, -2, -3 |
| Matrix Spike | Strontium (Sr)-Dissolved | MS-B | L1831166-1, -2, -3 |
| Matrix Spike | Strontium (Sr)-Dissolved | MS-B | L1831166-1, -2, -3 |
| Matrix Spike | Strontium (Sr)-Dissolved | MS-B | L1831166-1, -2, -3 |
| Matrix Spike | Strontium (Sr)-Dissolved | MS-B | L1831166-1, -2, -3 |
| Matrix Spike | Strontium (Sr)-Dissolved | MS-B | L1831166-1, -2, -3 |
| Matrix Spike | Sulfur (S)-Dissolved | MS-B | L1831166-1, -2, -3 |

Qualifiers for Individual Parameters Listed:

| Qualifier | Description |
|-----------|--|
| MS-B | Matrix Spike recovery could not be accurately calculated due to high analyte background in sample. |

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|--|--------|--------------------------------------|------------------------|
| ALK-TITR-VA | Water | Alkalinity Species by Titration | APHA 2320 Alkalinity |
| This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values. | | | |
| ANIONS-N+N-CALC-WR | Water | Nitrite & Nitrate Nitrogen | EPA 300.1 |
| Nitrate and Nitrite Nitrogen is determined by calculation from the individual Nitrate and Nitrite Nitrogen analyses by Ion Chromatography with UV absorbance. | | | |
| BE-D-L-CCMS-VA | Water | Diss. Be (low) in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| BE-T-L-CCMS-VA | Water | Total Be (Low) in Water by CRC ICPMS | EPA 200.2/6020A (mod) |
| Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS. | | | |

Reference Information

| | | | |
|---|-------|--|---|
| CL-IC-N-WR | Water | Chloride in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| EC-PCT-VA | Water | Conductivity (Automated) | APHA 2510 Auto. Conduc. |
| This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode. | | | |
| HARDNESS-CALC-VA | Water | Hardness | APHA 2340B |
| Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO ₃ equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation. | | | |
| HG-D-CVAA-VA | Water | Diss. Mercury in Water by CVAAS or CVAFS | APHA 3030B/EPA 1631E (mod) |
| Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | | | |
| HG-T-CVAA-VA | Water | Total Mercury in Water by CVAAS or CVAFS | EPA 1631E (mod) |
| Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | | | |
| IONBALANCE-VA | Water | Ion Balance Calculation | APHA 1030E |
| Cation Sum, Anion Sum, and Ion Balance (as % difference) are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Because all aqueous solutions are electrically neutral, the calculated ion balance (% difference of cations minus anions) should be near-zero. | | | |
| Cation and Anion Sums are the total meq/L concentration of major cations and anions. Dissolved species are used where available. Minor ions are included where data is present. Ion Balance is calculated as: | | | |
| Ion Balance (%) = [Cation Sum-Anion Sum] / [Cation Sum+Anion Sum] | | | |
| MET-D-CCMS-VA | Water | Dissolved Metals in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| MET-T-CCMS-VA | Water | Total Metals in Water by CRC ICPMS | EPA 200.2/6020A (mod) |
| Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| NH3-F-VA | Water | Ammonia in Water by Fluorescence | J. ENVIRON. MONIT., 2005, 7, 37-42, RSC |
| This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al. | | | |
| NO2-L-IC-N-WR | Water | Nitrite in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| NO3-L-IC-N-WR | Water | Nitrate in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| PH-PCT-VA | Water | pH by Meter (Automated) | APHA 4500-H pH Value |
| This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode | | | |
| It is recommended that this analysis be conducted in the field. | | | |
| SO4-IC-N-WR | Water | Sulfate in Water by IC | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| TDS-CALC-VA | Water | TDS (Calculated) | APHA 1030E (20TH EDITION) |
| This analysis is carried out using procedures adapted from APHA 1030E "Checking Correctness of Analyses". The Total Dissolved Solids result is calculated from measured concentrations of anions and cations in the sample. | | | |
| TSS-MAN-WR | Water | Total Suspended Solids by Gravimetric | APHA 2540 D |
| This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids are determined by filtering a sample through a glass fibre filter and drying the filter at 104 degrees celsius. | | | |

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

Reference Information

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location |
|----------------------------|---|
| WR | ALS ENVIRONMENTAL - WHITEHORSE, YUKON, CANADA |
| VA | ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA |

Chain of Custody Numbers:

2016-09-14 D

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Legend:

| | |
|-------|---|
| Limit | ALS Control Limit (Data Quality Objectives) |
| DUP | Duplicate |
| RPD | Relative Percent Difference |
| N/A | Not Available |
| LCS | Laboratory Control Sample |
| SRM | Standard Reference Material |
| MS | Matrix Spike |
| MSD | Matrix Spike Duplicate |
| ADE | Average Desorption Efficiency |
| MB | Method Blank |
| IRM | Internal Reference Material |
| CRM | Certified Reference Material |
| CCV | Continuing Calibration Verification |
| CVS | Calibration Verification Standard |
| LCSD | Laboratory Control Sample Duplicate |

Quality Control Report

Workorder: L1831166

Report Date: 20-DEC-17

Page 9 of 9

Hold Time Exceedances:

| ALS Product Description | Sample ID | Sampling Date | Date Processed | Rec. HT | Actual HT | Units | Qualifier |
|-------------------------|-----------|-----------------|-----------------|---------|-----------|-------|-----------|
| Physical Tests | | | | | | | |
| pH by Meter (Automated) | | | | | | | |
| | 1 | 19-SEP-16 08:15 | 30-SEP-16 06:50 | 0.25 | 263 | hours | EHTR-FM |
| | 2 | 19-SEP-16 08:25 | 30-SEP-16 06:50 | 0.25 | 262 | hours | EHTR-FM |
| | 3 | 19-SEP-16 08:40 | 30-SEP-16 06:50 | 0.25 | 262 | hours | EHTR-FM |

Legend & Qualifier Definitions:

| | |
|----------|---|
| EHTR-FM: | Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended. |
| EHTR: | Exceeded ALS recommended hold time prior to sample receipt. |
| EHTL: | Exceeded ALS recommended hold time prior to analysis. Sample was received less than 24 hours prior to expiry. |
| EHT: | Exceeded ALS recommended hold time prior to analysis. |
| Rec. HT: | ALS recommended hold time (see units). |

Notes*:

Where actual sampling date is not provided to ALS, the date (& time) of receipt is used for calculation purposes.
Where actual sampling time is not provided to ALS, the earlier of 12 noon on the sampling date or the time (& date) of receipt is used for calculation purposes. Samples for L1831166 were received on 20-SEP-16 09:00.

ALS recommended hold times may vary by province. They are assigned to meet known provincial and/or federal government requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by the US EPA, APHA Standard Methods, or Environment Canada (where available). For more information, please contact ALS.

The ALS Quality Control Report is provided to ALS clients upon request. ALS includes comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against pre-determined data quality objectives to provide confidence in the accuracy of associated test results.

Please note that this report may contain QC results from anonymous Sample Duplicates and Matrix Spikes that do not originate from this Work Order.

| Matrix Spike | Zinc (Zn)-Dissolved | MS-B | L1834209-1, -10, -11, -12, -13, -14, -2, -3, -4, -5, -6, -7, -8, -9 |
| Matrix Spike | Zinc (Zn)-Dissolved | MS-B | L1834209-1, -10, -11, -12, -13, -14, -2, -3, -4, -5, -6, -7, -8, -9 |
| Matrix Spike | Aluminum (Al)-Total | MS-B | L1834209-1, -10, -11, -12, -13, -14, -15, -2, -3, -4, -5, -6, -7, -8, -9 |
| Matrix Spike | Manganese (Mn)-Total | MS-B | L1834209-1, -10, -11, -12, -13, -14, -15, -2, -3, -4, -5, -6, -7, -8, -9 |
| Matrix Spike | Phosphorus (P)-Total | MS-B | L1834209-15 |
| Matrix Spike | Phosphorus (P)-Total | MS-B | L1834209-14 |

Qualifiers for Individual Parameters Listed:

| Qualifier | Description |
|-----------|--|
| HTC | Hardness was calculated from Total Ca and/or Mg concentrations and may be biased high (dissolved Ca/Mg results unavailable). |
| MB-LOR | Method Blank exceeds ALS DQO. Limits of Reporting have been adjusted for samples with positive hits below 5x blank level. |
| MS-B | Matrix Spike recovery could not be accurately calculated due to high analyte background in sample. |

Test Method References:

| ALS Test Code | Matrix | Test Description | Method Reference** |
|---|--------|--|---------------------------------------|
| ALK-COL-VA | Water | Alkalinity by Colourimetric (Automated) | EPA 310.2 |
| This analysis is carried out using procedures adapted from EPA Method 310.2 "Alkalinity". Total Alkalinity is determined using the methyl orange colourimetric method. | | | |
| CARBONS-DOC-VA | Water | Dissolved organic carbon by combustion | APHA 5310B TOTAL ORGANIC CARBON (TOC) |
| This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis. | | | |
| CARBONS-TOC-VA | Water | Total organic carbon by combustion | APHA 5310B TOTAL ORGANIC CARBON (TOC) |
| This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". | | | |
| HARDNESS-CALC-VA | Water | Hardness | APHA 2340B |
| Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO ₃ equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation. | | | |
| HG-D-CVAA-VA | Water | Diss. Mercury in Water by CVAAS or CVAFS | APHA 3030B/EPA 1631E (mod) |
| Water samples are filtered (0.45 um), preserved with hydrochloric acid, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | | | |
| HG-T-CVAA-VA | Water | Total Mercury in Water by CVAAS or CVAFS | EPA 1631E (mod) |
| Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS or CVAFS. | | | |
| MET-D-CCMS-VA | Water | Dissolved Metals in Water by CRC ICPMS | APHA 3030B/6020A (mod) |
| Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |
| MET-DIS-ICP-VA | Water | Dissolved Metals in Water by ICPOES | EPA SW-846 3005A/6010B |
| This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedure involves filtration (EPA Method 3005A) and analysis by inductively coupled plasma - optical emission spectrophotometry (EPA Method 6010B). | | | |
| MET-T-CCMS-VA | Water | Total Metals in Water by CRC ICPMS | EPA 200.2/6020A (mod) |
| Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS. | | | |
| Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method. | | | |

Reference Information

| | | | |
|---|-------|---------------------------------------|---|
| MET-TOT-ICP-VA | Water | Total Metals in Water by ICPOES | EPA SW-846 3005A/6010B |
| This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedures may involve preliminary sample treatment by acid digestion, using either hotblock or microwave oven (EPA Method 3005A). Instrumental analysis is by inductively coupled plasma - optical emission spectrophotometry (EPA Method 6010B). | | | |
| NH3-F-VA | Water | Ammonia in Water by Fluorescence | J. ENVIRON. MONIT., 2005, 7, 37-42, RSC |
| This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al. | | | |
| NO3-L-IC-N-VA | Water | Nitrate in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| NO3-L-IC-N-WR | Water | Nitrate in Water by IC (Low Level) | EPA 300.1 (mod) |
| Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection. | | | |
| P-T-PRES-COL-VA | Water | Total P in Water by Colour | APHA 4500-P Phosphorus |
| This analysis is carried out using procedures adapted from APHA Method 4500-P "Phosphorus". Total Phosphorus is determined colourimetrically after persulphate digestion of the sample. Samples with very high dissolved solids (i.e. seawaters, brackish waters) may produce a negative bias by this method. Alternate methods are available for these types of samples. Arsenic (5+), at elevated levels, is a positive interference on colourimetric phosphate analysis. | | | |
| TDS-VA | Water | Total Dissolved Solids by Gravimetric | APHA 2540 C - GRAVIMETRIC |
| This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, TDS is determined by evaporating the filtrate to dryness at 180 degrees celsius. | | | |
| TKN-F-VA | Water | TKN in Water by Fluorescence | APHA 4500-NORG D. |
| This analysis is carried out using procedures adapted from APHA Method 4500-Norg D. "Block Digestion and Flow Injection Analysis". Total Kjeldahl Nitrogen is determined using block digestion followed by Flow-injection analysis with fluorescence detection. | | | |
| TSS-VA | Water | Total Suspended Solids by Gravimetric | APHA 2540 D - GRAVIMETRIC |
| This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples. | | | |

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

| Laboratory Definition Code | Laboratory Location |
|----------------------------|---|
| WR | ALS ENVIRONMENTAL - WHITEHORSE, YUKON, CANADA |
| VA | ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA |

Chain of Custody Numbers:

1 2

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

mg/kg - milligrams per kilogram based on dry weight of sample.

mg/kg wwt - milligrams per kilogram based on wet weight of sample.

mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.

mg/L - milligrams per litre.

< - Less than.

D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).

N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Legend:

| | |
|-------|---|
| Limit | ALS Control Limit (Data Quality Objectives) |
| DUP | Duplicate |
| RPD | Relative Percent Difference |
| N/A | Not Available |
| LCS | Laboratory Control Sample |
| SRM | Standard Reference Material |
| MS | Matrix Spike |
| MSD | Matrix Spike Duplicate |
| ADE | Average Desorption Efficiency |
| MB | Method Blank |
| IRM | Internal Reference Material |
| CRM | Certified Reference Material |
| CCV | Continuing Calibration Verification |
| CVS | Calibration Verification Standard |
| LCSD | Laboratory Control Sample Duplicate |

Sample Parameter Qualifier Definitions:

| Qualifier | Description |
|-----------|---|
| MB-LOR | Method Blank exceeds ALS DQO. Limits of Reporting have been adjusted for samples with positive hits below 5x blank level. |
| MS-B | Matrix Spike recovery could not be accurately calculated due to high analyte background in sample. |
| RPD-NA | Relative Percent Difference Not Available due to result(s) being less than detection limit. |

Quality Control Report

Workorder: L1834209

Report Date: 20-DEC-17

Page 15 of 15

Hold Time Exceedances:

| ALS Product Description | Sample ID | Sampling Date | Date Processed | Rec. HT | Actual HT | Units | Qualifier |
|------------------------------------|-----------|---------------|-----------------|---------|-----------|-------|-----------|
| Anions and Nutrients | | | | | | | |
| Nitrate in Water by IC (Low Level) | | | | | | | |
| | 1 | 22-SEP-16 | 26-SEP-16 14:02 | 3 | 4 | days | EHTR |
| | 2 | 22-SEP-16 | 26-SEP-16 14:02 | 3 | 4 | days | EHTR |
| | 3 | 22-SEP-16 | 26-SEP-16 14:02 | 3 | 4 | days | EHTR |

Legend & Qualifier Definitions:

| | |
|----------|---|
| EHTR-FM: | Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended. |
| EHTR: | Exceeded ALS recommended hold time prior to sample receipt. |
| EHTL: | Exceeded ALS recommended hold time prior to analysis. Sample was received less than 24 hours prior to expiry. |
| EHT: | Exceeded ALS recommended hold time prior to analysis. |
| Rec. HT: | ALS recommended hold time (see units). |

Notes*:

Where actual sampling date is not provided to ALS, the date (& time) of receipt is used for calculation purposes.
Where actual sampling time is not provided to ALS, the earlier of 12 noon on the sampling date or the time (& date) of receipt is used for calculation purposes. Samples for L1834209 were received on 26-SEP-16 09:55.

ALS recommended hold times may vary by province. They are assigned to meet known provincial and/or federal government requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by the US EPA, APHA Standard Methods, or Environment Canada (where available). For more information, please contact ALS.

The ALS Quality Control Report is provided to ALS clients upon request. ALS includes comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against pre-determined data quality objectives to provide confidence in the accuracy of associated test results.

Please note that this report may contain QC results from anonymous Sample Duplicates and Matrix Spikes that do not originate from this Work Order.

Figure C.1: Concentrations of Key Analytes of Routine Water Quality Monitoring under MMER at Lower Minto Creek (Station W2) and the Reference Tributary (Station W7), 2015 - 2017

Notes: Grey shading indicates periods of Water Storage Pond discharge.

Symbols that are unfilled are less than method detection limits.

Red line represents water quality (WQ) guidelines (CCME 1999 with updates). For total aluminum and arsenic, this line represents both WQ guidelines and site-specific water quality objectives (SSWQ).

Orange line represents SSWQ for Station W2 per the Minto Mine Water Use Licence. The SSWQ are applicable on a dissolved basis only for metals

Figure C.2: Regression of Total Metal Concentrations (mg/L) relative to Total Suspended Solids (mg/L) in Routine Water Quality Monitoring Samples under MMER at Lower Minto Creek (Station W2) and the Reference Tributary (Station W7), 2015-2017

Figure C.3: Concentrations of Dissolved Metals of Routine Water Quality Monitoring under MMER at Lower Minto Creek (Station W2) and the Reference Tributary (Station W7), 2015 - 2017

Notes: Grey shading indicates periods of Water Storage Pond discharge.

Symbols that are unfilled are less than method detection limits.

Red line represents water quality (WQ) guidelines (CCME 1999 with updates). For dissolved aluminum, this line represents both WQ guidelines and site-specific water quality objectives (SSWQO). WQ guidelines are applicable on a total basis only for metals.

Orange line represents SSWQO for Station W2 per the Minto Mine Water Use Licence.

Sample Reception

On October 8, 2016, Cordillera Consulting received 15 benthic samples from Minnow Environmental on behalf of Minto Mines, Minto Explorations Ltd. When samples arrived to Cordillera Consulting, exterior packaging was initially inspected for damage or wet spots that would have indicated damage to the interior containers.

Next, samples were logged into a proprietary software database (INSTAR1) where the clients assigned sample name was recorded along with a Cordillera Consulting (CC) number for cross-reference. Each sample was checked to ensure that all sites and replicates recorded on field sheets or packing lists were delivered intact and with adequate preservative. Any missing, mislabelled or extra samples were reported to the client immediately to confirm the total numbers and correct names on the sample jars. The client representative was notified of the arrival of the shipment and provided a sample inventory once intake was completed.

See table below for sample inventory:

Table 1: Summary of sample information including Cordillera Consulting (CC) number

| Sample | CC# | Date | Size | # of Jars |
|--------|----------|-----------|-------|-----------|
| UMC-1 | CC171138 | 9/25/2016 | 500µM | 1 |
| UMC-2 | CC171139 | 9/22/2016 | 500µM | 1 |

Sample Sorting

- Using a gridded Petri dish, fine forceps and a low power stereo-microscope (Olympus, Nikon, Leica) the sorting technicians removed the invertebrates and sorted them into family/orders.
- The sorting technician kept a running tally of total numbers excluding organisms from Porifera, Nemata, Platyhelminthes, Ostracoda, Copepoda, Cladocera and terrestrial drop-ins such as aphids. These organisms were marked for their presence (value of 1) and left in the sample. They were not included towards the 300-organism subsample count.
- Where specimens are broken or damaged, only heads were counted.
- Subsampling was conducted with the use of a Marchant Box.
- Cells were extracted at the same time in the order indicated by a random number table.
- If the 300th organism was found part way into sorting a cell then the balance of that cell was sorted. If the organism count had not reached 300 by the 50th cell then the entire sample was sorted.
- The total number of cells sorted and the number of organisms removed were recorded manually on a bench sheet and then recorded into INSTAR1
- Organisms were stored in vials containing 80% ethanol and an interior label indicating the site names, date of sampling, site code numbers and portion subsampled. This information was also recorded on the laboratory bench sheet and on INSTAR1.
- The sorted portion of the debris was preserved and labeled separately from the unsorted portion and was tested for sorting efficiency (Sorting Quality Control – Sorting Efficiency). The unsorted portion was also labeled and preserved in separate jars.

Percent sub-sampled and total countable invertebrates pulled from the samples were summarized in the table below.

Table 2: Percent sub-sample and invertebrate count for each sample

| Sample | Date | CC# | 500 micron fraction | |
|--------|-----------|----------|---------------------|-----------------|
| | | | % Sampled | # Invertebrates |
| UMC-1 | 25-Sep-16 | CC171138 | 100% | 301 |
| UMC-2 | 22-Sep-16 | CC171139 | 100% | 180 |
| UMC-3 | 22-Sep-16 | CC171140 | 100% | 264 |
| UMC-4 | 25-Sep-16 | CC171141 | 100% | 435 |
| UMC-5 | 22-Sep-16 | CC171142 | 100% | 267 |
| REF-1 | 25-Sep-16 | CC171143 | 75% | 370 |
| REF-2 | 24-Sep-16 | CC171144 | 25% | 332 |
| REF-3 | 24-Sep-16 | CC171145 | 50% | 351 |
| REF-4 | 24-Sep-16 | CC171146 | 100% | 145 |

| | | | | |
|--------|-----------|----------|------|-----|
| REF-5 | 23-Sep-16 | CC171147 | 50% | 381 |

| REF-10 | 23-Sep-16 | CC171152 | 25% | 597 |

Sorting Quality Control - Sorting Efficiency

As a part of Cordillera's laboratory policy, all projects undergo sorting efficiency checks.

- As sorting progresses, 10% of samples were randomly chosen by senior members of the sorting team for resorting.
- All sorters working on a project had at least 1 sample resorted by another sorter.
- An efficiency of 90 % was expected (95% for CABIN samples).
- If 90/95% efficiency was not met, samples from that sorter were resorted.
- To calculate sorting efficiency the following formula was used:

$$\frac{\#OrganismsMissed}{TotalOrganismsFound} * 100 = \% OM$$

Table 3: Summary of sorting efficiency

| CC # | Number of Organisms Recovered (initial sort) | Number of Organisms in Re-sort | Percent Recovery |
|------------------|--|--------------------------------|------------------|
| CC171139 | 180 | 4 | 98% |
| CC171140 | 264 | 6 | 98% |
| Average Recovery | | | 98% |

Sorting Quality Control - Sub-Sampling QC

Certain Provincial and Mining projects require additional sorting checks in the form of sub-sampling QC, (Environmental Effects Monitoring (EEM) protocol). This ensured that any fraction of the total sample that was examined was actually an accurate representation of the number of total organisms. Organisms from the additional sub-samples were not identified; rather total organism count only was compared.

Sub-Sampling efficiency was measured on 10% of the number of sub-sampled samples in the project. Ex. In a project where 50 of 100 total samples were processed through subsampling using a Marchant box, then 10% of 50; or 5 samples were used for sub sampling efficiency.

Sub-Sampling efficiency was performed by fractioning the entire sample into sub-sample percentages. On each sub-sampled portion, a total organism count was recorded and

compared to the rest of the sub-samples. In order to pass, all fractions were required to be within 20% of total organism count.

Example: If 300 organisms are found in 10% of the sample, the sorter will continue to sample in 10% fractions until the entire sample is separated. They will then count the total number of organisms in each of the 10 fractions of 10% and compare the organism count.

When divergence is >20% the sorting manager examines for the source of the problem and takes steps to correct it. With the Marchant box, the problem typically rested with how the box is flipped back to the upright position. For this reason subsampling was performed by experienced employees only. Another common source of error would be the type of debris in the sample. Samples with algae or heavy with periphyton have a higher incident of failure due to clumping than clear samples.

NOTE: A single member of our staff sorted this entire project. This experienced staff member upon conducting sub-sampling QC failed the first 2 QC samples that were examined. We recognized a problem with the sub-sampling device, and repeated all of the sub-sampled samples from this project. The results below are from the repeated QAQC after fixing our equipment.

Taxonomic Effort

The next procedure was the identification to genus-species level where possible of all the organisms in the sample.

- Identifications were made at the genus/species level for all insect organisms found including Chironomidae (Based on CABIN protocol).
- Non-insect organisms (except those not included in CABIN count) were identified to genus/species where possible and to a minimum of family level with intact and mature specimens.
- The Standard Taxonomic Effort lists compiled by the CABIN manual¹, SAFIT², and PNAMP³ were used as a guide line for what level of identification to achieve where the condition and maturity of the organism enabled.
- Organisms from the same families/order were kept in separate vials with 80% ethanol and an interior label of printed laser paper.
- Chironomidae was identified to genus/species level where possible and was aided by slide mounts. CMC-10 was used to clear and mount the slide.
- Oligochaetes was identified to family/genus level with the aid of slide mounts. CMC-10 was used to clear and mount the slide.
- Other Annelida (leeches, polychaetes) were identified to the family/genus/species level with undamaged, mature specimens.
- Mollusca was identified to family and genus/species where possible
- Decapoda, Amphipoda and Isopoda were identified at family/genus/species level where possible.
- Bryozoans and Nemata remained at the phylum level
- Hydrachnidae and Cnidaria were identified at the family/genus level where possible.
- When requested, reference collections were made containing at least one individual from each taxa listed. Organisms represented will have been identified to the lowest practical level.
- Reference collection specimens were stored in 55 mm glass vials with screw-cap lids with polyseal inserts (museum quality). They were labeled with taxa name, site code, date identified and taxonomist name. The same information was applied to labels on the slide mounts.

Taxonomy Staff

The taxonomists for this project were certified by the Society of Freshwater Science (SFS) Taxonomic Certification Program at level 2 which is the required certification for CABIN projects:

Sue Salter: Group 1 General Arthropods (West); Group 2 EPT (East/West); Group 3 Chironomidae (East/West); Group 4 Oligochaeta

Scott Finlayson: Group 1 General Arthropods (East/West); Group 2 EPT (East/West); Group 3 Chironomidae (East/West); Group 4 Oligochaeta

Adam Bliss: Group 1 General Arthropods (East/West); Group 2 EPT (East/West);
Group 3 Chironomidae
Rita Avery: Group 1 General Arthropods (East/West); Group 2 EPT (East/West)
Qi Liu: Group 3 Chironomid (East/West)

Taxonomic Keys

Below is a reference list of taxonomic keys utilized by taxonomists at Cordillera Consulting. Cordillera taxonomists routinely seek out new literature to ensure the most accurate identification keys are being utilized. This is not reflective of the exhaustive list of resources that we use for identification. A more complete list of taxonomic resources can be found at Southwest Association of Freshwater Invertebrate Taxonomists. Notes: Samples processed in the lab using a 500 µm sieve. The numbers provided at higher levels of taxonomy (order, class, sub-phylum, or phylum) do not represent totals for that level of taxonomy. Rather, if a number other than zero is provided at a higher level of taxonomy, it represents any organism(s) within that taxonomic group that could not be assigned to a lower level of taxonomy.

Value less than the lower 90% confidence limit on the 2.5th percentile or greater than the upper 90% confidence limit on the 97.5th percentile (i.e., out of reference condition).

Value greater than the upper 90% confidence limit on the 2.5th percentile or less than the lower 90% confidence limit on the 97.5th percentile (i.e., within reference condition).

Value within the 90% confidence limits on the 2.5th percentile or within the 90% confidence limits on the 97.5th percentile (i.e., inconclusive).

^a Value was negative and truncated to zero.

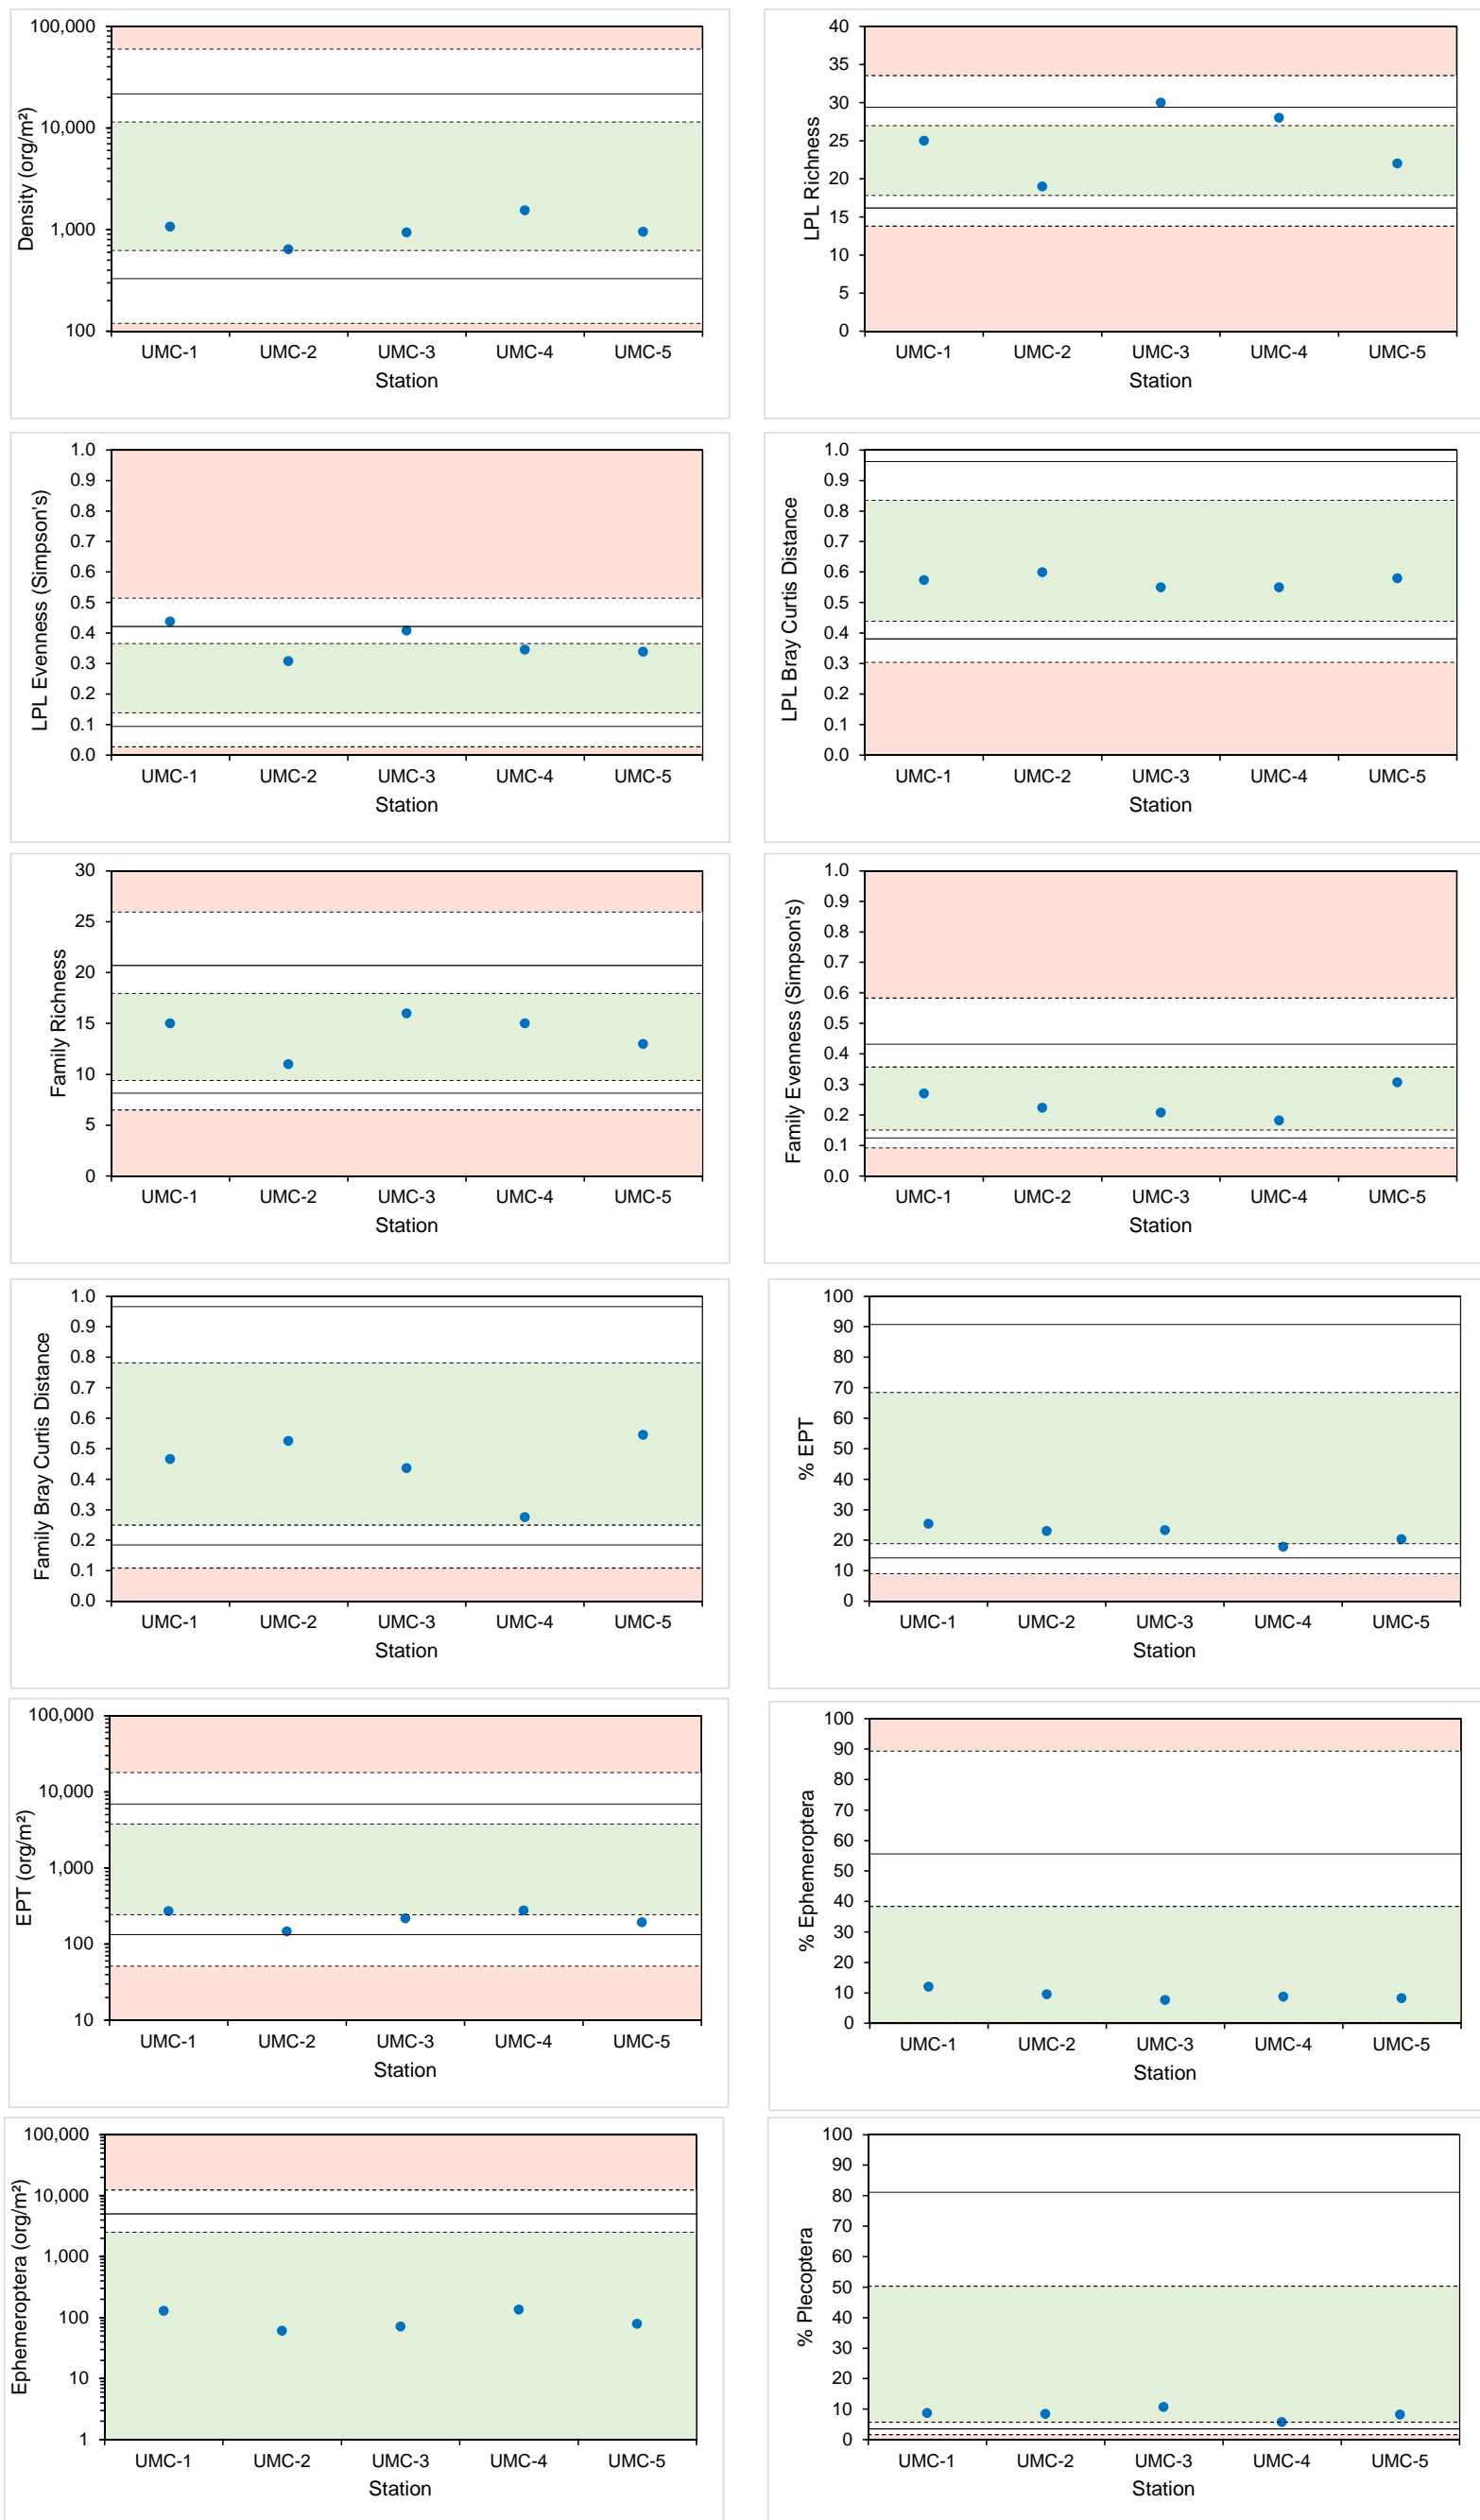

Figure D.1: Individual Value Plot of Benthic Invertebrate Community Endpoints for Exposed Sites (n = 5), Relative to the Reference Condition (n = 10), 2017

Notes: solid lines = 2.5th and 97.5th percentiles, dashed lines = 90% confidence limits on the percentiles.

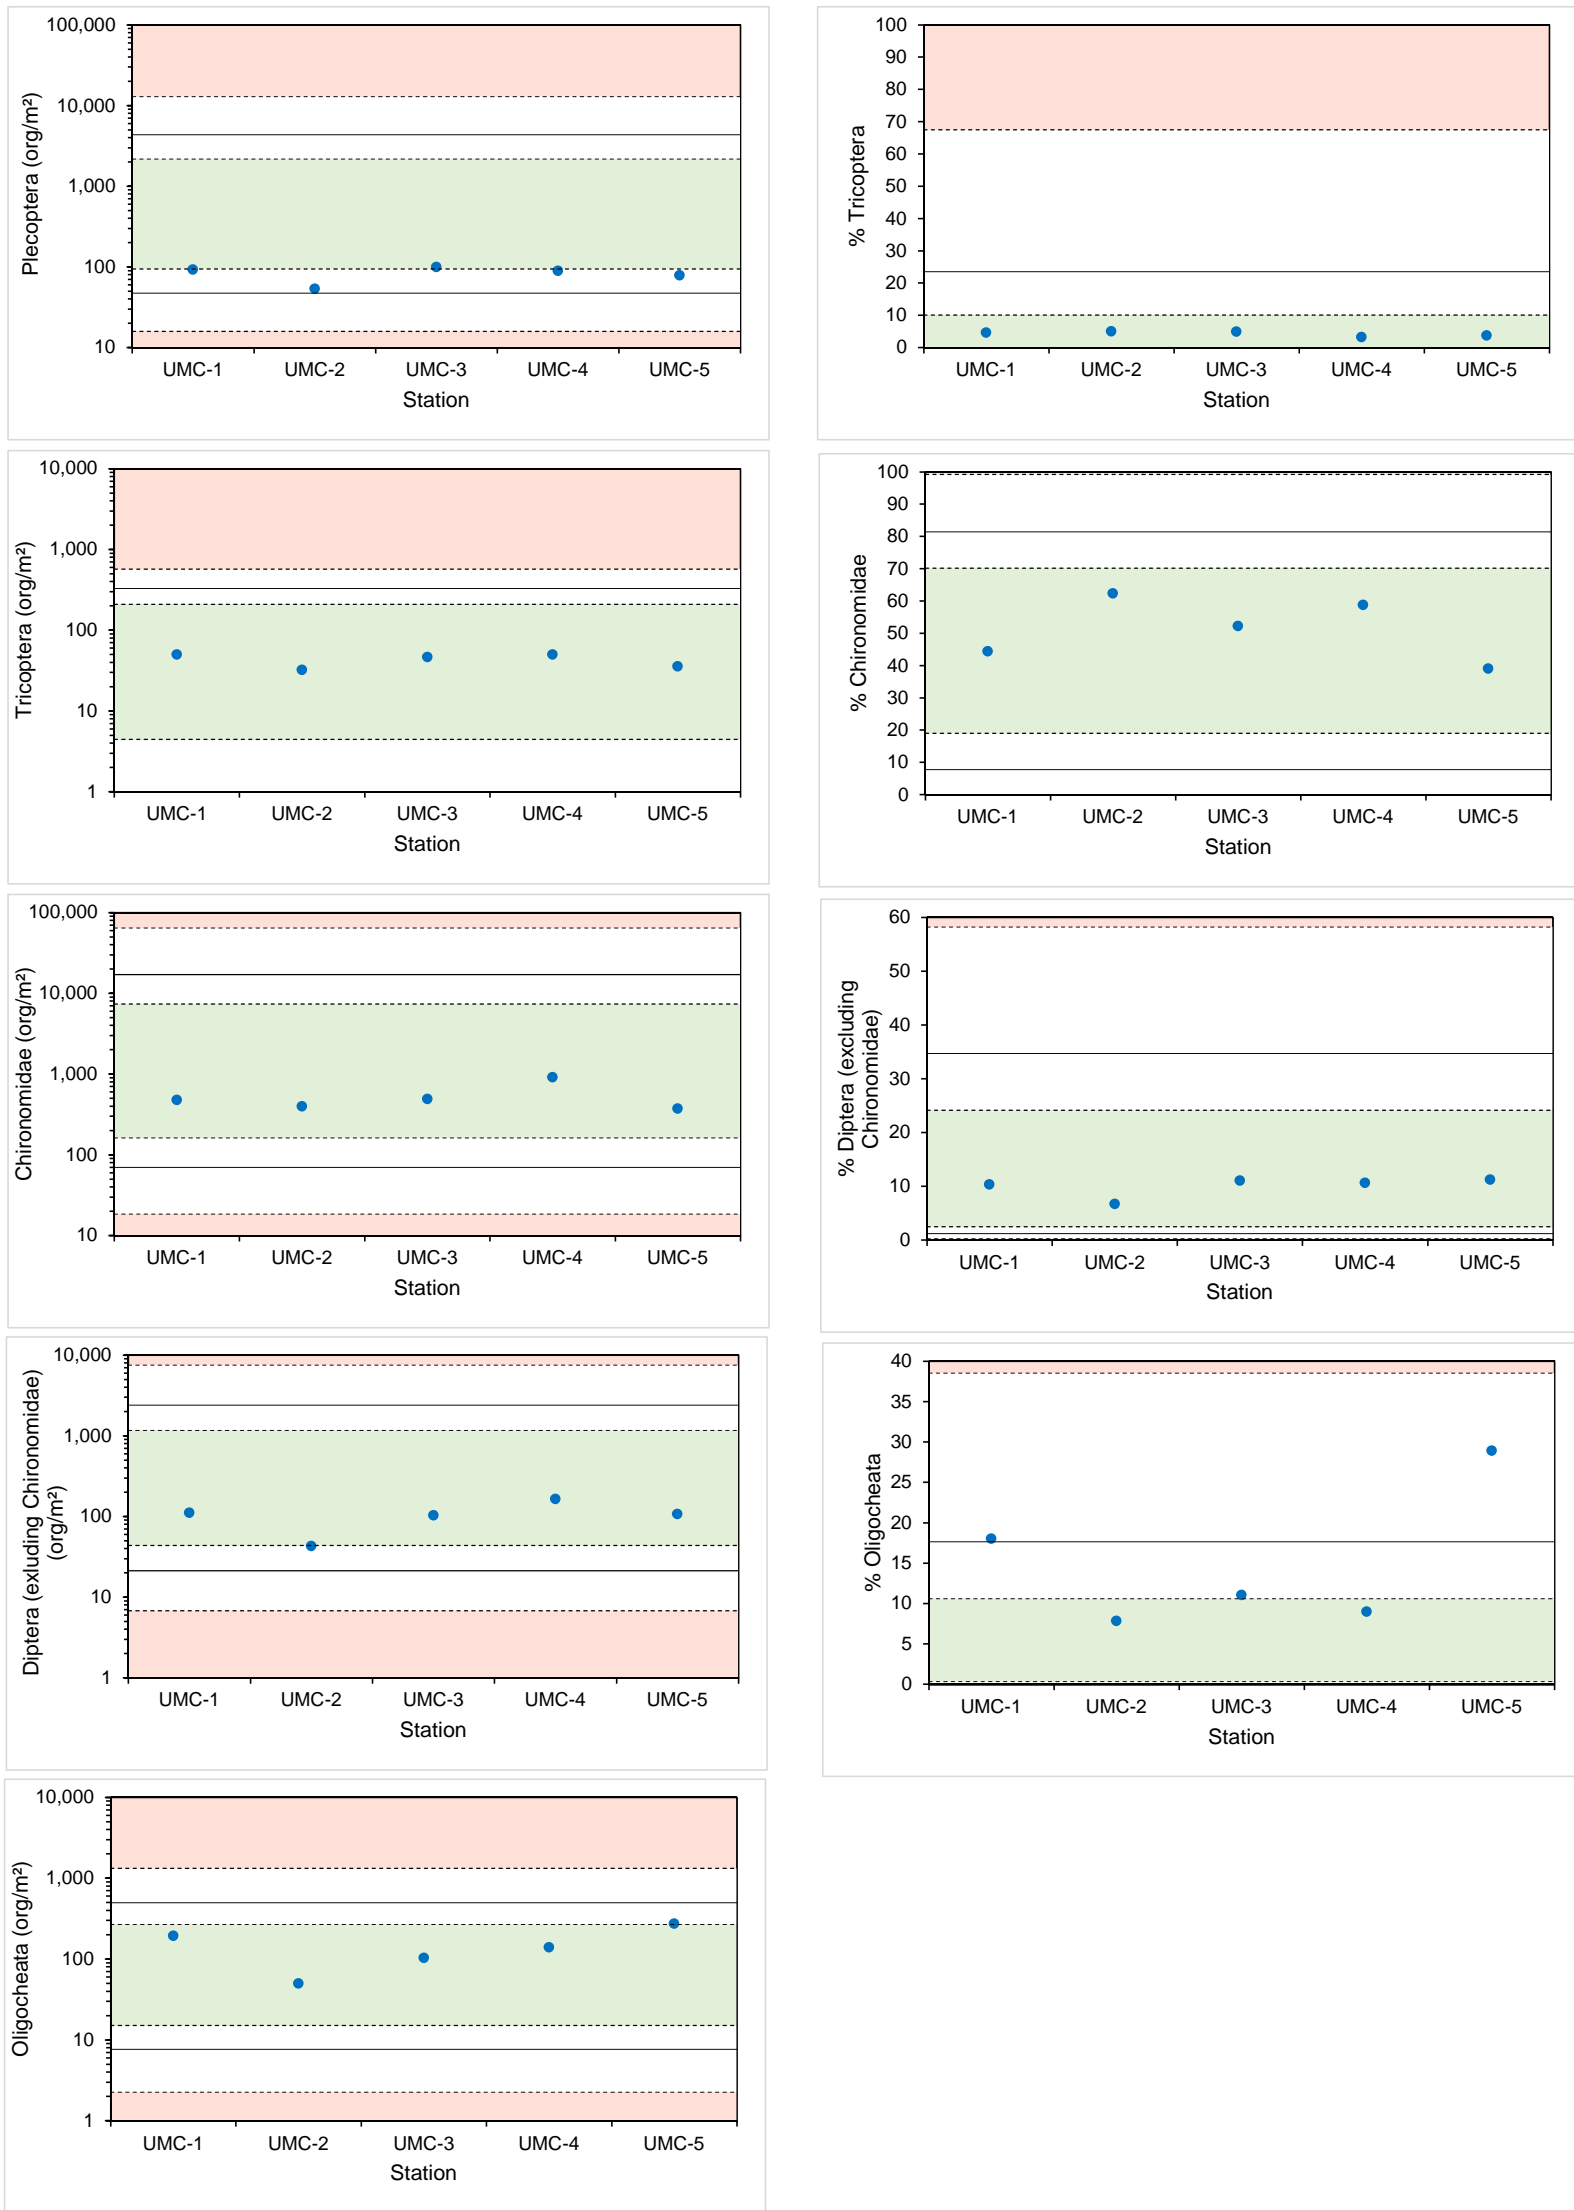

Figure D.1: Individual Value Plot of Benthic Invertebrate Community Endpoints for Exposed Sites (n = 5), Relative to the Reference Condition (n = 10), 2017

Notes: solid lines = 2.5th and 97.5th percentiles, dashed lines = 90% confidence limits on the percentiles.

Table D.6: Summary of Statistical Comparisons of Benthic Invertebrate Community Endpoints Between Reference (n = 10) and Exposed (n = 5) Sites, 2016

| Endpoint | | Data Transformation | Test | Test P-value | Mean or Median ^a | | Observed ES ^b (Exposed - Reference)/SD |
|------------------------|------------------------------------|---------------------|----------|--------------|-----------------------------|---------|--|
| | | | | | Reference | Exposed | |
| Density | | log | T | 0.059 | 2,671 | 990 | -1.2 |
| Lowest Practical Level | Richness | none | T | 0.215 | 22 | 25 | 0.74 |
| | Evenness (Simpson's) | fourth root | T | 0.016 | 0.24 | 0.37 | 1.6 |
| | Bray-Curtis Distance | log | T | 0.577 | 0.61 | 0.57 | -0.32 |
| Family Level | Richness | log | T | 0.567 | 13 | 14 | 0.33 |
| | Evenness (Simpson's) | log | T | 0.955 | 0.23 | 0.23 | 0.033 |
| | BC Distance | square root | T | 0.795 | 0.47 | 0.44 | -0.15 |
| Relative Density | % EPT | fourth root | Tunequal | 0.009 | 37 | 22 | -1.3 |
| | % Ephemeroptera | log(X+1) | T | 0.942 | 9.8 | 10 | 0.042 |
| | % Plecoptera | log | Tunequal | 0.018 | 17 | 8.2 | -1.2 |
| | % Trichoptera | fourth root | Tunequal | 0.019 | 0.47 | 4.3 | 1.1 |
| | % Chironomidae | none | T | 0.451 | 45 | 51 | 0.44 |
| | % Diptera (excluding Chironomidae) | fourth root | Tunequal | 0.746 | 9.1 | 9.9 | 0.14 |
| | % Oligochaeta | fourth root | T | 0.006 | 2.8 | 14 | 1.9 |
| Density | EPT | log | T | 0.006 | 959 | 3 | -1.9 |
| | Ephemeroptera | rank | MW | 0.066 | 258 | 219 | - |
| | Plecoptera | log | Tunequal | <0.001 | 453 | 81 | -1.9 |
| | Trichoptera | square root | Tunequal | 0.854 | 38 | 43 | 0.075 |
| | Chironomidae | log | Tunequal | 0.117 | 1,089 | 502 | -0.70 |
| | Diptera (excluding Chironomidae) | log | T | 0.153 | 225 | 98 | -0.86 |
| | Oligochaeta | log | T | 0.178 | 64 | 131 | 0.81 |

 P-value < 0.1.

^a For transformed data, the mean was calculated on the transformed scale, and back-transformed to original data units; the median is reported for the Mann-Whitney test.

^b The observed effect size is calculated on the transformed scale when the data were transformed for analysis. An effect size is not reported when the data were analyzed using the Mann-Whitney test.

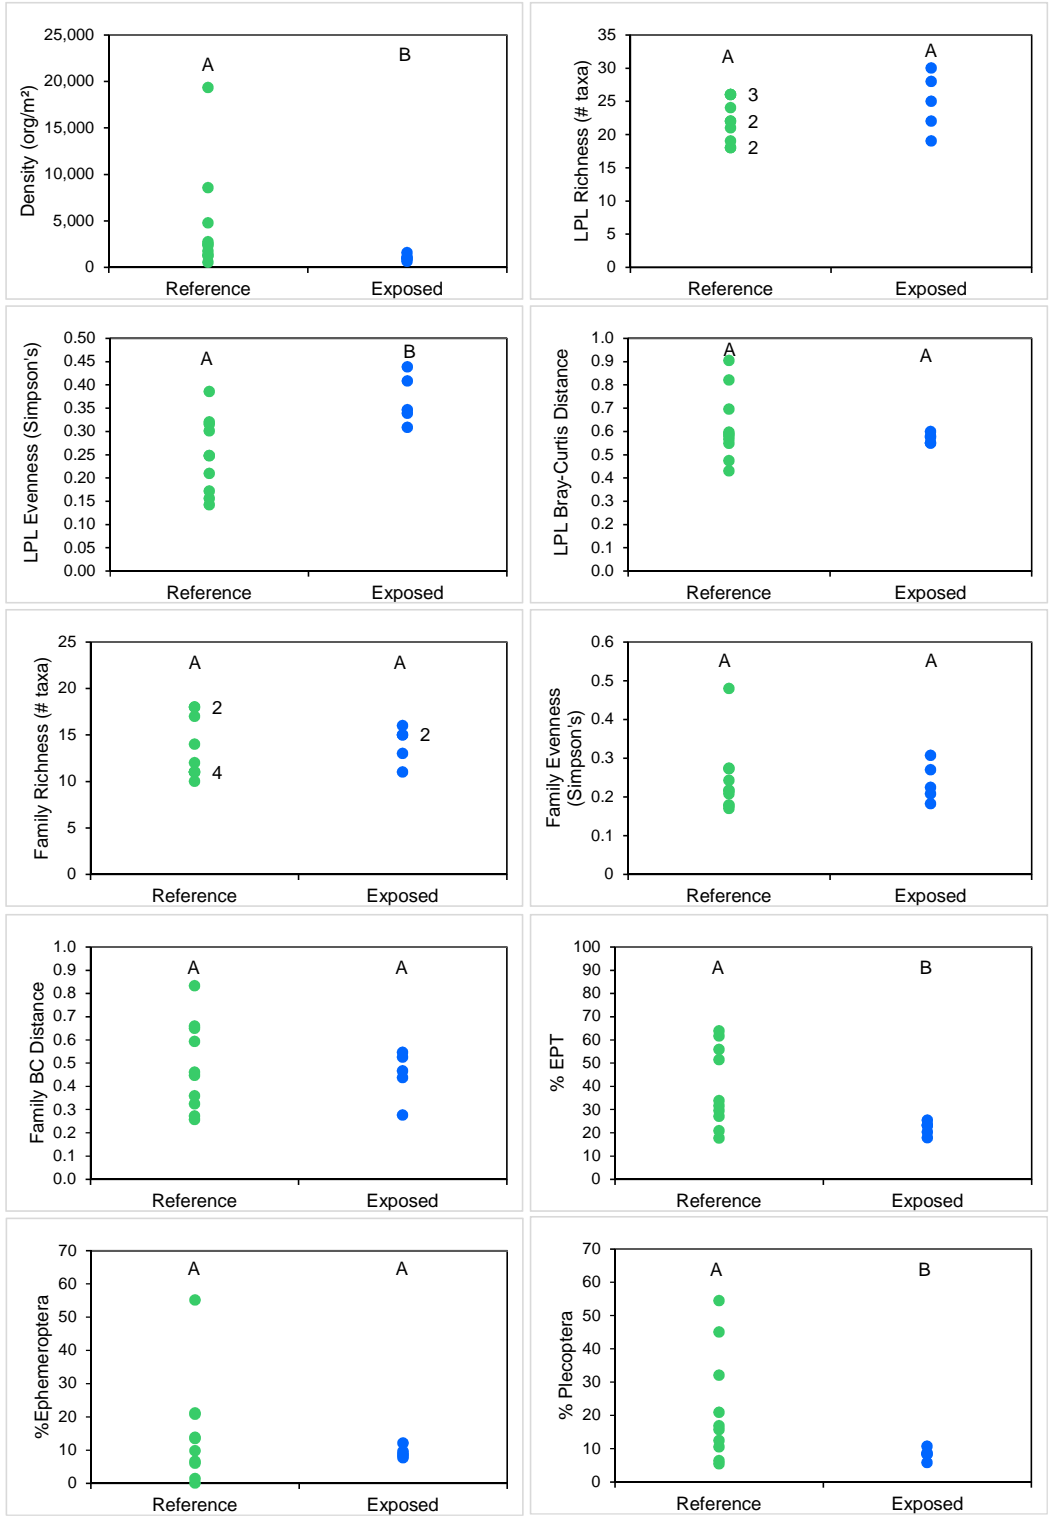

Figure D.2: Individual Value Plot of Benthic Invertebrate Community Taxon Proportions for Reference (n = 10) and Exposed (n = 5) Sites, 2017

Notes: The letter B above the exposed group indicates a significant difference relative to reference (A) $\alpha = 0.1$. The letter A above the exposed group indicates no significant difference relative to reference (A) $\alpha = 0.1$. Numbers next to individual points represent the number of overlapping points at that value.

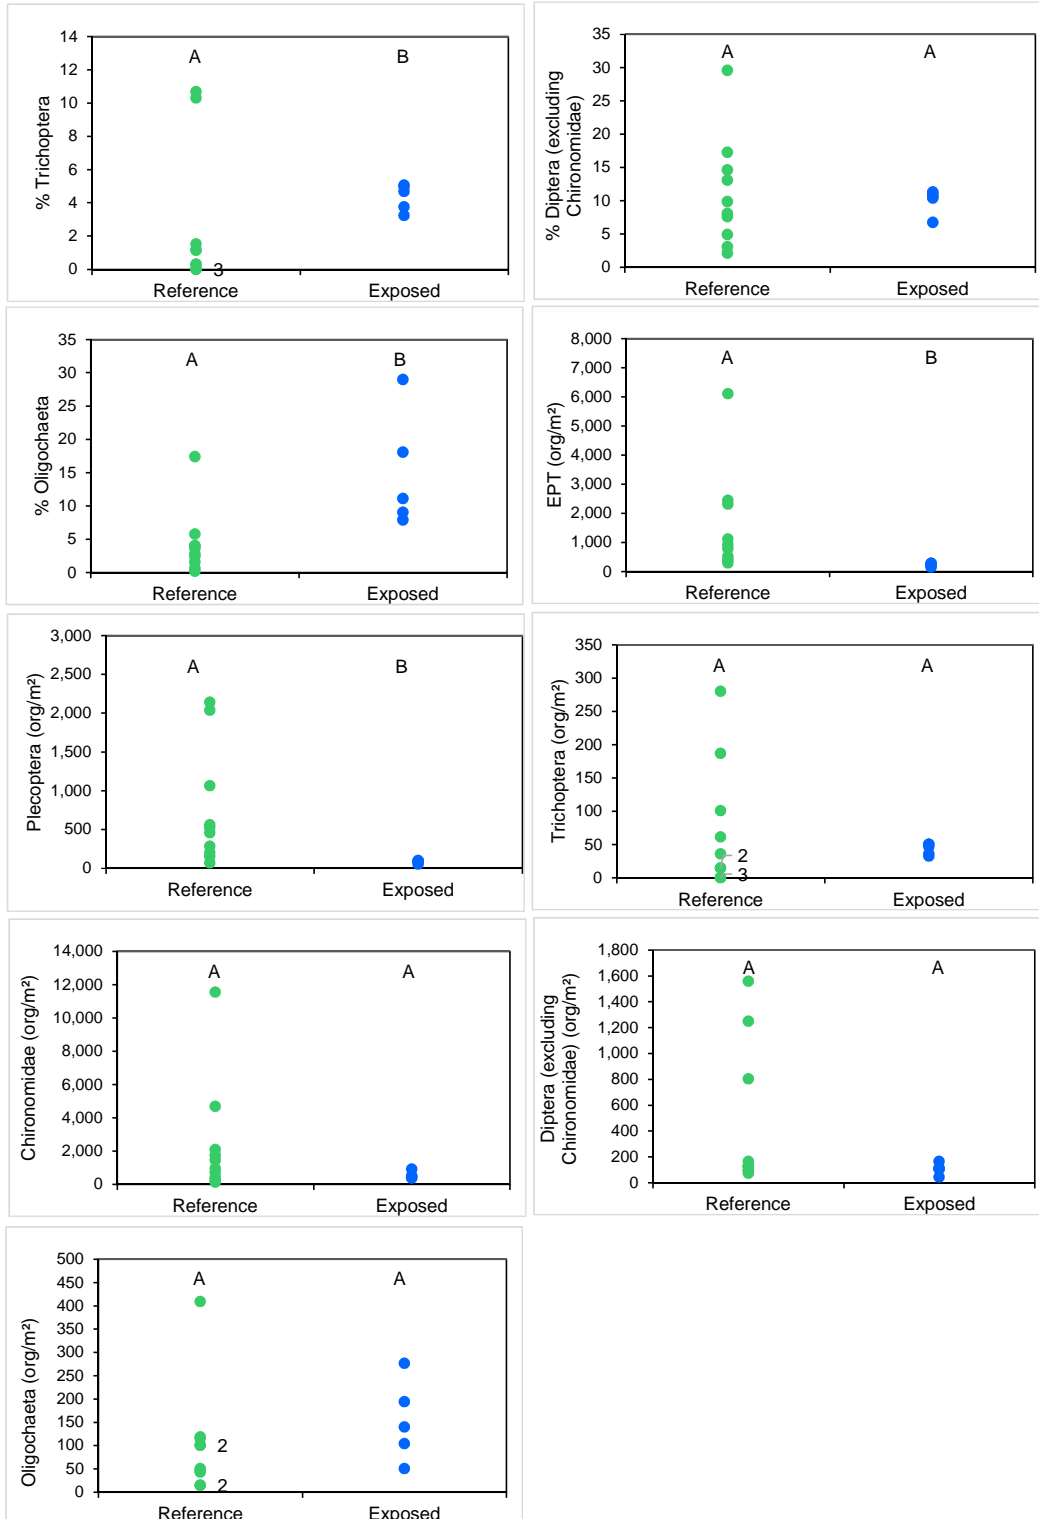

Figure D.2: Individual Value Plot of Benthic Invertebrate Community Taxon Proportions for Reference (n = 10) and Exposed (n = 5) Sites, 2017

Notes: The letter B above the exposed group indicates a significant difference relative to reference (A) $\alpha = 0.1$. The letter A above the exposed group indicates no significant difference relative to reference (A) $\alpha = 0.1$. Numbers next to individual points represent the number of overlapping points at that value.

Table D.7: Symmetric Component Coefficients for Each Taxa and Each Area for the First Two Components (C-1 and C-2) of a Correspondance Analysis for the Relative Abundance of 19 Taxa for Reference (n = 10) and Mine-exposed (n = 5) Areas, 2016

| Taxa | Symmetric Component Coefficients | |
|------------------|----------------------------------|----------------|
| | C-1 (27.8%) | C-2 (23.3%) |
| Collembola | 0.0105 | 0.2057 |
