Minto Mine

Water Licence QZ14-031

Quartz Mining Licence QML-0001

2021 Annual Report

Prepared by:
Minto Metals Corp.
Minto Mine
March 31, 2022

Table of Contents

1 Introduction 1
2 Site Activities 8
2.1 Exploration 8
2.1.1 In-Fill Drilling 8
2.1.2 Delineation drilling 10
2.2 Maintenance, Infrastructure and Construction Projects 11
2.3 Mining Activities 11
2.3.1 Open Pit Mining 11
2.3.2 Underground Mining 11
2.3.3 Waste Rock Management 11
2.3.4 Tailings Management 12
2.3.5 Ore Stockpiles 14
2.3.6 Operating Results 17
2.3.7 Concentrate Shipments 18
2.4 Mine Access Road 18
2.4.1 Traffic 18
2.4.2 Access Control Issues 18
2.4.3 Planned Access Road Maintenance for 2022 18
2.5 Accidents and Incidents 19
2.5.1 Incidents 19
2.5.2 Wildlife Incidents 19
2.5.3 Reportable Spills 19
2.5.4 Non-reportable Spills 20
2.5.5 Spill Contingency Plan Review 21
3 Proposed Mining for 2022 22
3.1 Proposed Open Pit Mining for 2022 22
3.2 Proposed Underground Mining for 2022 22
4 Mineral Resources and Reserves 23
5 Surface Water Quality Monitoring 25
5.1 Surface Water Quality Program 25
5.1.1 Water Quality Monitoring Conformance 27
5.1.2 Quality Assurance and Quality Control Program 30
5.2 Compliance 32
5.2.1 Discharge Compliance – WQ Effluent Standards 32

5.2.2 Discharge Compliance – Bioassays 34
5.2.3 Discharge Compliance – RO 34
5.2.4 Water Quality Objectives Compliance – Minto Creek 37
5.3 Surface Water Quality Surveillance Stations 42
5.3.1 W2 – Minto Creek at Lower Road Crossing Water Quality 42
5.3.2 W3 – Minto Creek, at the Federal (MDMER) Compliance Point 42
5.3.3 W4 – Yukon River, upstream of the confluence with Minto Creek 45
5.3.4 W5 – Yukon River, Downstream of the Confluence with Minto Creek 46
5.3.5 W6 – Tributary on the North side of Minto Creek 47
5.3.6 W7 – North Flowing Tributary to Minto Creek 48
5.3.7 W8A – Eastern Collection Sump from DSTSF 49
5.3.8 W10 – Minto Creek Headwaters (South-West Fork) 50
5.3.9 W12 – Water in the Main Pit 51
5.3.10 W12A – Discharge from the Main Pit 51
5.3.11 W14 – Tailings Thickener Overflow 52
5.3.12 W15 – Upper Minto Creek Stormwater Collection Point 53
5.3.13 W16 – Water Storage Pond 55
5.3.14 W17 – Water Storage Pond Dam Seepage 57
5.3.15 W30 – Headwaters Minto Creek (northwest fork) 57
5.3.16 W33/W33s – Above Tailings Diversion Ditches 59
5.3.17 W35 – Storm Water Collection Point – South Diversion Ditch 60
5.3.18 W36 – Minto Creek Detention Structure Pond 63
5.3.19 W37 – 100 m downstream of MCDS (W37 Collection Sump) and upstream of Water Storage Pond 63
5.3.20 W45– Area 2 Pit 63
5.3.21 W46 – Minto Creek, Downstream of W7 and W6 63
5.3.22 W47 – Area 118 Pit Water 64
5.3.23 W50 – Minto Creek, 50m Downstream of the Toe of the WSP Dam 64
5.3.24 W51 – Area 2 Stage 3 Pit 64
5.3.25 W52 – Ridgetop North Pit 65
5.3.26 W53 – Ridgetop South Pit 65
5.3.27 W54 – Main Pit Dam Seepage 66
5.3.28 W55 – Tailings Diversion Ditch 66
5.3.29 W62 – Mill Valley Fill Extension Phase 2 Collection Sump 67
5.3.30 MC-1 – Minto Creek Upstream of Canyon near Km 8 on Mine Access Road 68
5.3.31 WTP and RO – Treated Water 68

5.3.32 C4 – Tributary on the south side of Minto Creek 69
5.3.33 C10 – Tributary on the south side of Minto Creek 70
5.3.34 MN – Minto North Pit Water 71
5.3.35 MN-0.2 – Upper West Arm of McGinty Creek 72
5.3.36 MN-0.5 – West Arm of McGinty Creek 73
5.3.37 MN-1.5 – Upper East Arm of McGinty Creek 74
5.3.38 MN-2.5 – East Arm of McGinty Creek 75
5.3.39 MN-4.5 – McGinty Creek near confluence with Yukon River 76
5.3.40 UG1 – Minto South Underground Mine Dewatering 77
5.3.41 UG2 – Wildfire Underground Mine Dewatering 77
5.3.42 UG3 – Copper Keel Underground Mine Dewatering 78
5.3.43 UG4 – Minto East Underground Mine Dewatering 78
6 Groundwater Monitoring Program 79
6.1 Groundwater Quality Monitoring Conformance 79
6.2 Groundwater Quality Control and Assurance 83
6.3 Groundwater Monitoring Stations 83
6.3.1 MW09-03 85
6.3.2 MW12-DP1 86
6.3.3 MW12-DP2 87
6.3.4 MW12-DP3 87
6.3.5 MW12-05 87
6.3.6 MW12-06 93
6.3.7 MW12-07 99
6.3.8 MW17-08 101
6.3.9 MW17-09 106
6.3.10 MW17-10 106
6.3.11 MW17-11 111
6.3.12 MW17-12 116
6.4 Vibrating Wire Piezometers 123
6.4.1 DSTSF Piezometers 125
6.4.2 Southwest Dump Piezometers 127
6.4.3 Water Storage Pond Dam Piezometers 128
6.5 Ground Temperature Cables 128
6.5.1 A2 Pit Thermistor 130
6.5.2 Dry Stack Thermistors 130
6.5.3 Ridgetop Thermistors 133
6.5.4 Southwest Dump Thermistors 133

6.5.5 Water Storage Pond Dam Thermistors 135
7 Seepage Water Quality Monitoring Program 140
7.1 Southwest Dump 143
7.2 Reclamation Overburden Dump (ROD) 154
7.3 Main Waste Dump 154
7.4 Main Pit and SAT Dump 155
7.5 Minto North 155
7.6 Pit Walls 156
7.7 Ridgetop Road 156
7.8 Ore Stockpiles 161
7.9 Dry Stack Tailings Storage Facility (DSTSF) 161
7.10 Mill Valley Fill 161
7.10.1 Mill Valley Fill Water Quality Monitoring Stations 161
7.10.2 Mill Valley Fill Seepage Monitoring Locations 171
7.11 Water Storage Pond Dam Seep 171
7.12 Camp Area 175
8 Water Management 180
8.1 Water Storage and Conveyance Network 180
8.2 Water Storage Volumes Movement and Tracking 183
8.2.1 Water Conveyance Tracking 185
8.2.2 Water Storage Tracking 186
8.2.3 Water Conveyance Construction 188
8.2.4 Water Balance and Water Quality Predictions Modeling 189
8.3 Water Treatment 189
8.3.1 Operations Overview 190
8.4 Water Discharge 190
8.4.1 Discharge Volumes at WQO 190
8.4.2 Discharge Volumes at EQS (Clause 6) 190
8.5 Hydrology 191
8.5.1 Minto Creek Hydrology 191
8.5.2 McGinty Creek Hydrology 192
8.5.3 Hydrology QA/QC 192
9 Physical Monitoring Program 193
9.1 Physical Deformation Monitoring Instrumentation 195
9.1.1 Survey Hubs 195
9.1.2 Inclinometers 202
9.2 Engineer's Annual Physical Inspection Reports 206

10 Adaptive Management Plan - Operations 209
10.1 Surface Water Quality – Minto Creek 209
10.1.1 Minto Creek – W2 209
10.1.2 Minto Creek – W50 211
10.2 Surface Water Quality – McGinty Creek 211
10.3 Groundwater Quality – Minto Creek 212
10.4 Groundwater Quality - McGinty Creek 212
10.5 Water Management AMP 213
10.6 Physical Monitoring Program AMP 214
11 Aquatic Environmental Monitoring Program 218
11.1 Metal and Diamond Mining Effluent Regulations Monitoring Programs 218
11.1.1 Effluent Monitoring Program 218
11.1.2 Environmental Effects Monitoring Water Quality Monitoring 219
11.1.3 Environmental Effects Monitoring Biological Monitoring 219
11.2 Biological Monitoring Program 219
11.2.1 Sediment Monitoring Program 220
5.7.1 Periphyton Monitoring 226
5.7.2 Benthic Invertebrate Community Monitoring 228
11.2.2 Fisheries Monitoring Program 233
12 Meteorological Monitoring Program 233
12.1 Climate Monitoring Program 233
12.2 Snow Survey Program 238
12.3 Meteorology QA/QC 239
13 Geochemistry 240
13.1 Waste Rock Verification Program 240
13.2 Acid-Base Accounting Program 241
13.3 Leach Pads 242
14 Terrestrial Monitoring Programs 242
14.1 Wildlife Monitoring Program 242
14.2 Erosion and Sedimentation Monitoring Program 244
14.3 Invasive Plant Species Monitoring Program 244
14.3.1 Survey Methods 245
14.3.1.1 Meander Survey 245
14.3.1.2 Access Road Survey 246
14.3.1.3 Long Term Photo Monitoring 246
14.3.2 Results 246
14.3.3 Actions 250

14.3.4 Recommendations 250
14.4 Vegetation Metal Uptake Program 251
15 Site Characterization Report 251
16 Reclamation 251
16.1 Cumulative Land Status 252
16.2 Current Year Reclamation 254
16.3 Next Reporting Year Reclamation 256
16.4 2021 Reclamation Research and Monitoring 256
17 Socio-Economic Monitoring Program 257
18 Closure 257
References 258

1 Introduction

In Q4 of 2021 Minto Explorations Ltd. became a publicly traded company on the Toronto Stock Exchange (TSX) Venture Exchange (TSX-V) as Minto Metals Corp. (Minto). The company and the Minto Mine site have rebranded to reflect this change. Minto is in the process of changing the Quartz Mining Licence and Water Use Licence from Minto Exploration Ltd.

The 2021 Annual Report has been prepared by Minto, as required by Type A Water Use Licence (WUL) QZ14-031-01 and Quartz Mining Licence (QML) QML-0001. The specific requirements for the Annual Report, as outlined in the respective licences, are summarized in Table 1-1 below.

This report provides a summary of 2021 activities at the Minto Mine and includes production summaries, construction activities, environmental monitoring studies, physical stability monitoring, water management, and progressive reclamation.

Table 1-1: Reporting Requirements as per WUL and QML (2021)

Licence	Licence Section	Clause	Requirement	Annual Report Section
WUL QZ14-031				
WUL QZ14-031	4.3	16	Summary review of the *Spill Contingency Plan* including any changes needed.	2.5.5 App. B
	4.3	18	Summary list of all spills for 2021.	2.5.3 2.5.4
	4.5	26	The Licensee shall submit Annual Reports to the Board no later than March 31 of the year following the reporting period. The reporting period is January 1 to December 31 of each year.	All
		26, a	Summary of all data collected as per the EMSRP, including analysis and interpretation by a qualified party and a discussion of any variances from baseline conditions, from previous years' data, and from expected performance.	5-8 11-14
		26, b	Summary of actions as per the Operations Adaptive Management Plan, including analysis and interpretation by a qualified party and a discussion of any variances from baseline conditions, from previous years' data, and from expected performance.	10 App. G, H, I
		26, c	A record of any major maintenance carried out on any physical works.	2.2

Licence	Licence Section	Clause	Requirement	Annual Report Section
WUL QZ14-031	4.5	26, d	Detailed data on the volume of water used during the year including water withdrawal from each water source, water routed around and through the site as part of the water conveyance system, water diverted around the site, water routed for storage in the pits, water deposited with mine wastes in waste storage facilities, water routed to the Water Storage Pond, water routed to the treatment plant and water discharged to Minto Creek.	8
		26, e	Detailed data on tailings deposition in each of the tailings management facilities, including volume and tonnage of tailings slurry deposited, cumulative volume of tailings solids stored in the pits, tailings solids surface elevation and pit water elevation.	2.3.4
		26, f	Details of updates to the Water Balance and Water Quality Model.	8.2.4 App. E
		26, g	Results and interpretations of the QA/QC Program.	5.1.2
		26, h	Any other reports that are required to be submitted as part of the Annual Report by this Licence.	See Below
	5.7	70	The Licensee shall monitor, sample, and report on the maintenance and performance of the Mill Water Pond, in accordance with the procedures that are detailed in the Physical Monitoring Program, and include in the Annual Report	9
	5.1.1	86	The Licensee shall include data relating to the Surface Water Surveillance Program in the Monthly and Annual Reports.	5.3
	5.1.2	88	The Licensee shall complete a MMER Biological Monitoring Study including a site characterization, fish population survey, fish tissue sampling and benthic invertebrate sampling.	11.2
	5.1.2	89	The results of these studies and programs in clauses 87 and 88 shall be submitted to the Board as part of the Annual Report along with and any additional studies or revisions to studies required under the MDMER.	11 App. J
	5.1.4	93	The results of the seepage program shall be compared to the source terms used in the Water Balance and Water Quality Model Report and summarized in the Annual Report.	7 App. E
	5.1.5	94	The Licensee shall implement the updated Geochemical Monitoring Program, including the Waste Rock Verification Program, and the results from this program are to be included in the Annual Report.	13 App. L
WUL QZ14-031	5.1.7	97, h	Reporting of all data obtained using physical monitoring instrumentation as a part of the Physical Monitoring Program in Monthly and Annual Reports.	9

Licence	Licence Section	Clause	Requirement	Annual Report Section
		98	The Physical Monitoring Program shall be updated annually to reflect the installation of new instrumentation, replacement of damaged instrumentation, and changes in monitoring methods and procedures. The updated Physical Monitoring Program shall be provided as part of the Annual Report, along with a summary table outlining revisions to the plan from previous versions.	9
		99, b	The Licensee shall submit these Geotechnical Engineer's Inspection and Data Reviews as part of the Annual Report.	9.2 App. P
		100, f	For each operating year, the following information shall be provided as part of the Annual Report for the Physical Monitoring Program: i. interpretation of physical monitoring data, and summary of the stability, integrity, and status of all the inspected structures, works, and installations inspected by the Professional Engineer; ii. a list of each of the Professional Engineer's recommendations for remedial action; iii. an explanation of how and when each recommendation was addressed, including supporting documentation, and iv. a list of outstanding recommendations (including previous inspection reports) and associated approach and timelines to address them.	9.1 9.2
	5.1.8	102	The Licensee shall review and evaluate the Aquatic Environmental Monitoring Program design every three (3) years and submit the findings to the Board, along with any recommendations for further refinements, as part of the Annual Report, starting in 2016.	2020 see 2019 Annual Report
	5.1.9	104	Results and interpretations of the QA/QC program shall be provided in the Annual Report.	5.1.2
		108, a	The Licensee shall submit an updated Water Balance and Water Quality Model as part of the Annual Report. The updated models shall include without limitation all model assumptions.	App. E
		108, b	Updated site data collected as per the EMSRP including: i. water quality results and water levels from all groundwater monitoring wells; ii. the most current climatic, environmental, and operational conditions and data; iii. surface water quality and quantity data; iv. seepage monitoring quality and quantity data, and v. geochemical source terms from tailings and waste rock.	6 12 5.3 7 App. E

Licence	Licence Section	Clause	Requirement	Annual Report Section
WUL QZ14-031	5.1.9	108, c	A comparison of the updated geochemistry for Phase V/VI tailings and waste rock with that of previously produced tailings and waste rock, and a comparison of model source term chemistry with equivalent operation monitoring results.	13 App. L App. E
		108, d	Updated predictions for operations and Permanent Closure water quality, including discussion of any variances identified and associated implications on site water management.	App. E
		109	Specifications for the Annual Report to include but not be limited to: i. activities undertaken in relation to the Adaptive Management Plan, ii. trend analysis and water levels in Minto and McGinty creeks, iii. proposed updates and revisions to the Adaptive Management Plan, and iv. any other revisions necessary to comply with the conditions of this Licence.	10 8.5 App. H, I Through out
	6.2	114, a	Annual reporting on reclamation research activities.	16
QML-0001				
QML-0001	13.5		On or before March 31 of each year of the term of this License, the Licensee must submit an annual report, in writing, containing the information set out in Schedule D, covering the period of January 1 to December 31 of the prior year	This Report
	Schedule D	a	Summary of construction activities associated with the Undertaking	2.2
		b	Summary of mining activities	2.3
		c	Map showing the status of all structures, works, and installations associated with the Undertaking	Fig 1-1
		d	total amount of ore and waste removed from the underground workings and open pits for the year and for the life of the Undertaking	2.3.
		e	Total amount and the average head grade of ore milled	2.3.6
QML-0001	Schedule D – Site Activities	f	Total amount of concentrate produced and removed from the Undertaking	2.3.6
		g	Total amount of tailings deposited in each of the tailings facilities	2.3.4
		h	Total amount of waste rock removed from the mine and the amount deposited into each deposit location	2.3.3
		i	Total amount of waste rock stored in each waste rock storage facility;	2.3.3
		j	Details respecting any action taken as a result of the recommendations made by the engineer in relation to the inspection referred to in 13.2 of QML -0001	9.2

Licence	Licence Section	Clause	Requirement	Annual Report Section
		k	Summary of any updates to estimates of ore reserves and the life of the mine, including reserve category, tonnage, and grade	4
		l	Total amount and the average grade of each ore stockpiled	2.3.5
		m	Remaining reserve life of the mine	4
	Schedule D - As-built Drawings	a	as-built drawings of the open pit and underground mines and of all engineered structures, works, and installations constructed or altered at the Undertaking during the year	2.2 App. A
		b	as-built drawing report of the 220-kW vertical stirred mill rougher/scavenger concentrate regrinding system the year following the installation	N/A
	Schedule D - Environmental Monitoring	a	Summary of the programs undertaken for environmental monitoring and surveillance as outlined in the *Environmental Monitoring, Surveillance and Reporting Plan* and the 2014 Wildlife Protection Plan, including an analysis of these data and any action taken or adaptive management strategies implemented to monitor or address any changes in environmental performance	5-9 11-14 10
		b	any update to the *Site Characterization Report* referred to in 13.1 of QML-0001	15
		c	summary of invasive plants that have been identified on site and measures taken to control or remove invasive plants	14.3 App. Q
		d	summary of spills and accidents that occurred at the site and measures taken respond to any spills or accidents	2.5
		e	summary of the level of traffic, access control issues, wildlife incidents and other accidents, and any upgrade or maintenance work planned for the upcoming year	2.4
QML-0001	Schedule D - Environmental Monitoring	f	summary of any site improvements undertaken to address sediment and erosion control	14.2
	Schedule D – Physical Monitoring	a	summary of any underground stability incidents	2.3.2
		b	summary of data collected to date as part of the Physical Monitoring Program	9
		c	details of results, including data collected, for the physical monitoring program	9
	Schedule D - Reclamation and Closure	a	any temporary closure or permanent closure that has occurred during the year	16
		b	summary of activities related to care and maintenance of the Undertaking, including any temporary closure activities if applicable	16
		c	summary of progressive and ongoing reclamation activities	16
		d	summary of proposed development and production and reclamation activities for the coming year	3 16.3

Licence	Licence Section	Clause	Requirement	Annual Report Section
		e	summary of reclamation research and results	16.2
	Schedule D - Socio-Economic Monitoring	a	summary of action taken by the Licensee with respect to implementation of "Minto Socio-Economic Monitoring Program Framework" (the "Framework')	17 App. O
		b	a copy of the annual report prepared by Minto Explorations Ltd., identified in paragraph 6.1 of the Framework	App. O
		c	a summary of action taken by the Licensee with respect to implementing an approved socio-economic adjustment measures plan, as identified in the Framework	App. O

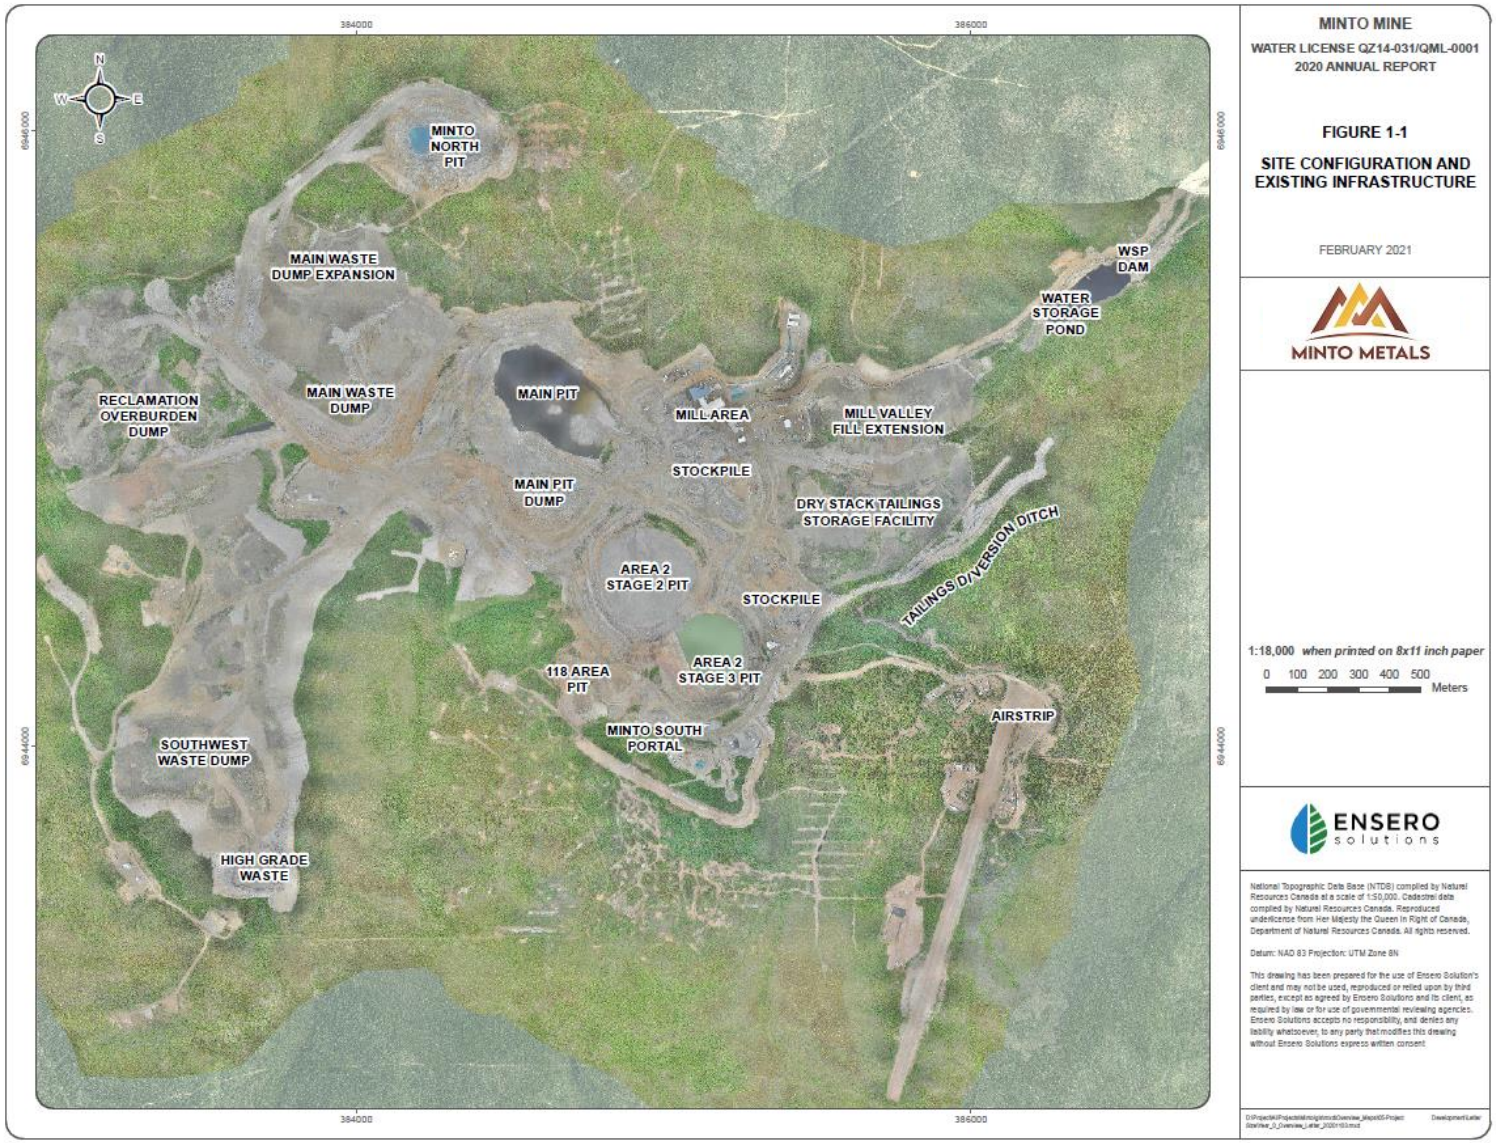

Figure 1-1: Site Layout (2021)

2 Site Activities

During the 2021 production period, operations produced 24.31 million pounds (Mlb) of copper from the milling of 903,498 tonnes (dmt) of ore.

In 2021, underground mining took place in the Minto East zone as well as the Copper Keel ore zone.

Waste rock produced from mining activities was hauled to surface for use as construction grade material and ramp repair. Potentially acid generating waste rock was placed in the Main Pit Buttress dump. Milling included run-of-mine ore from underground operations, as well as ore stockpiled from previous mining.

Tailings produced from the milling process were deposited into the Area 2 Pit Tailings Management Facility as per the licensed Tailings Management Plan.

2.1 Exploration

2.1.1 In-Fill Drilling

During 2021, drilling included six (6) surface NQ diameter diamond drill holes (totaling 2,951.5 meters) to the Minto East orebody and thirty-nine (39) drill holes (totaling 5,309.5 meters) in to the A2 Zone from underground day bays.

The Minto East deposit is located east from the Minto North open pit. The main purpose of the 2021 drill program was to the confidence in the orebody's Indicated level resources by better defining location and grade. Drilling occurred between October and November of 2021. All six (6) drill holes were drilled from one drill pad located immediately east of the warehouse area at Minto Mine (Figure 2-1).

The A2 Zone, Lens 115 is a mineralized lens of the Area 2 beneath the former open pit (Figure 2-1). Confirmatory infill drilling was performed to better define and increase confidence in the location and grade prior to mine planning for this area.

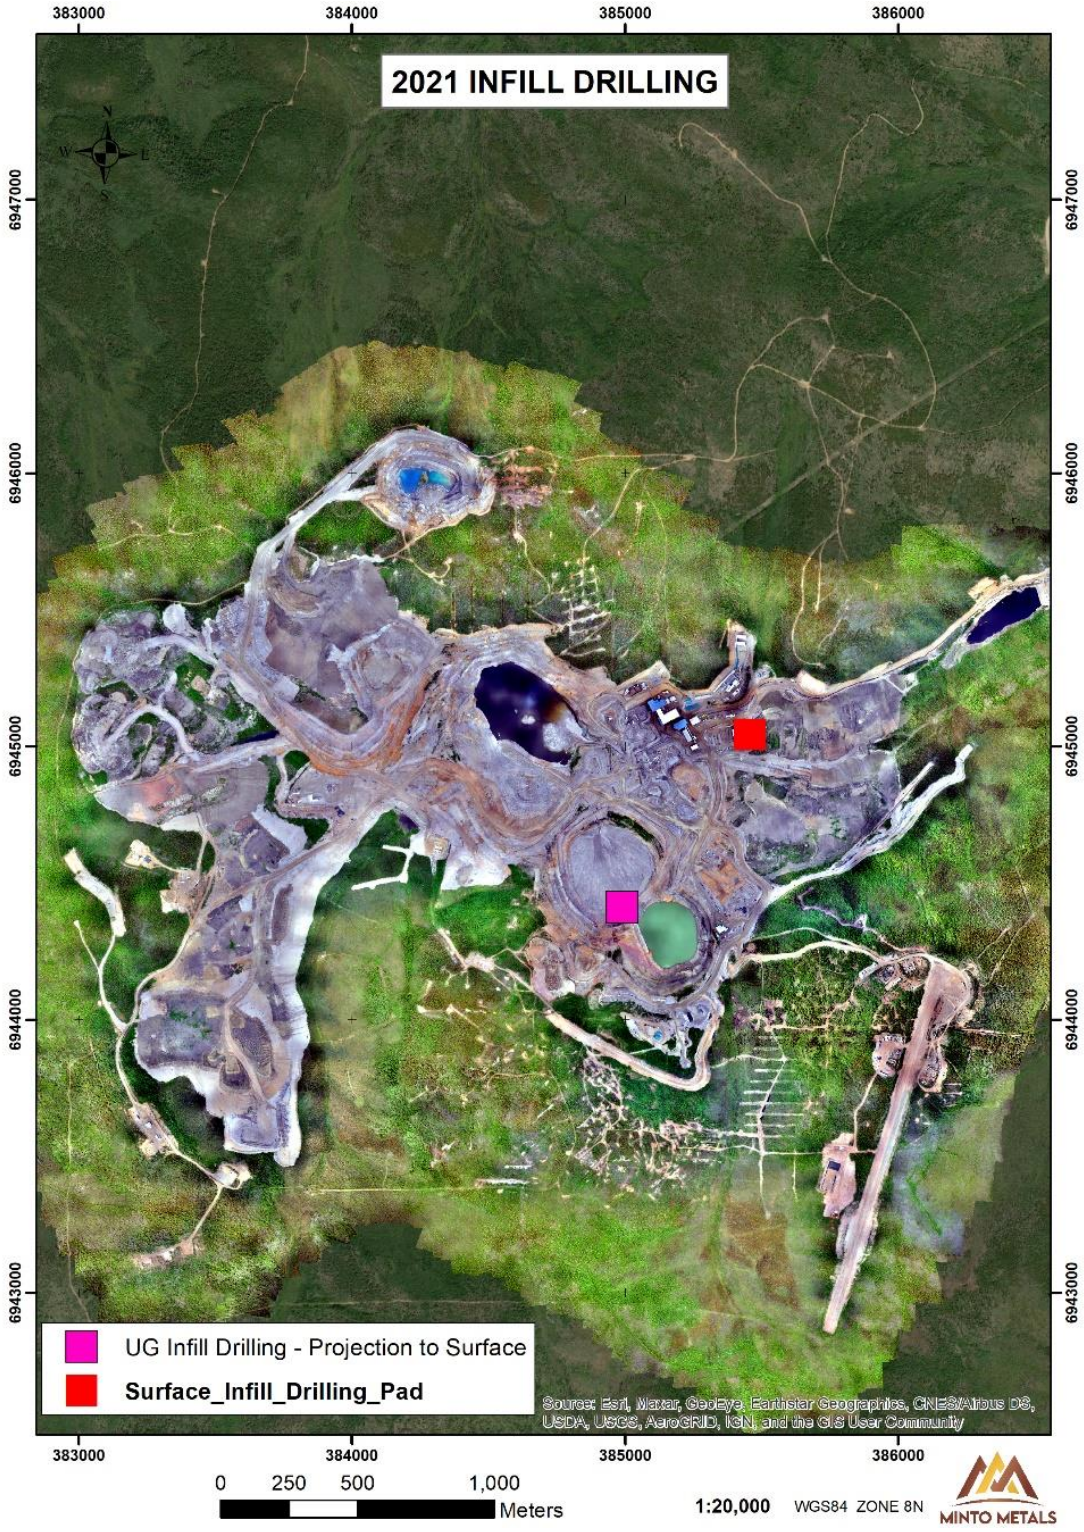

Figure 2-1: 2021 Infill Drilling

***Underground drilling in A2 projected to surface (violet) and surface drill pad location for drilling Minto East**

2.1.2 Delineation drilling

Exploration at the mine focused on extensions of the licensed orebodies of Minto North and Minto East. Sixteen (16) holes were drilled, totaling 8,642 meters (Figure 2-2).

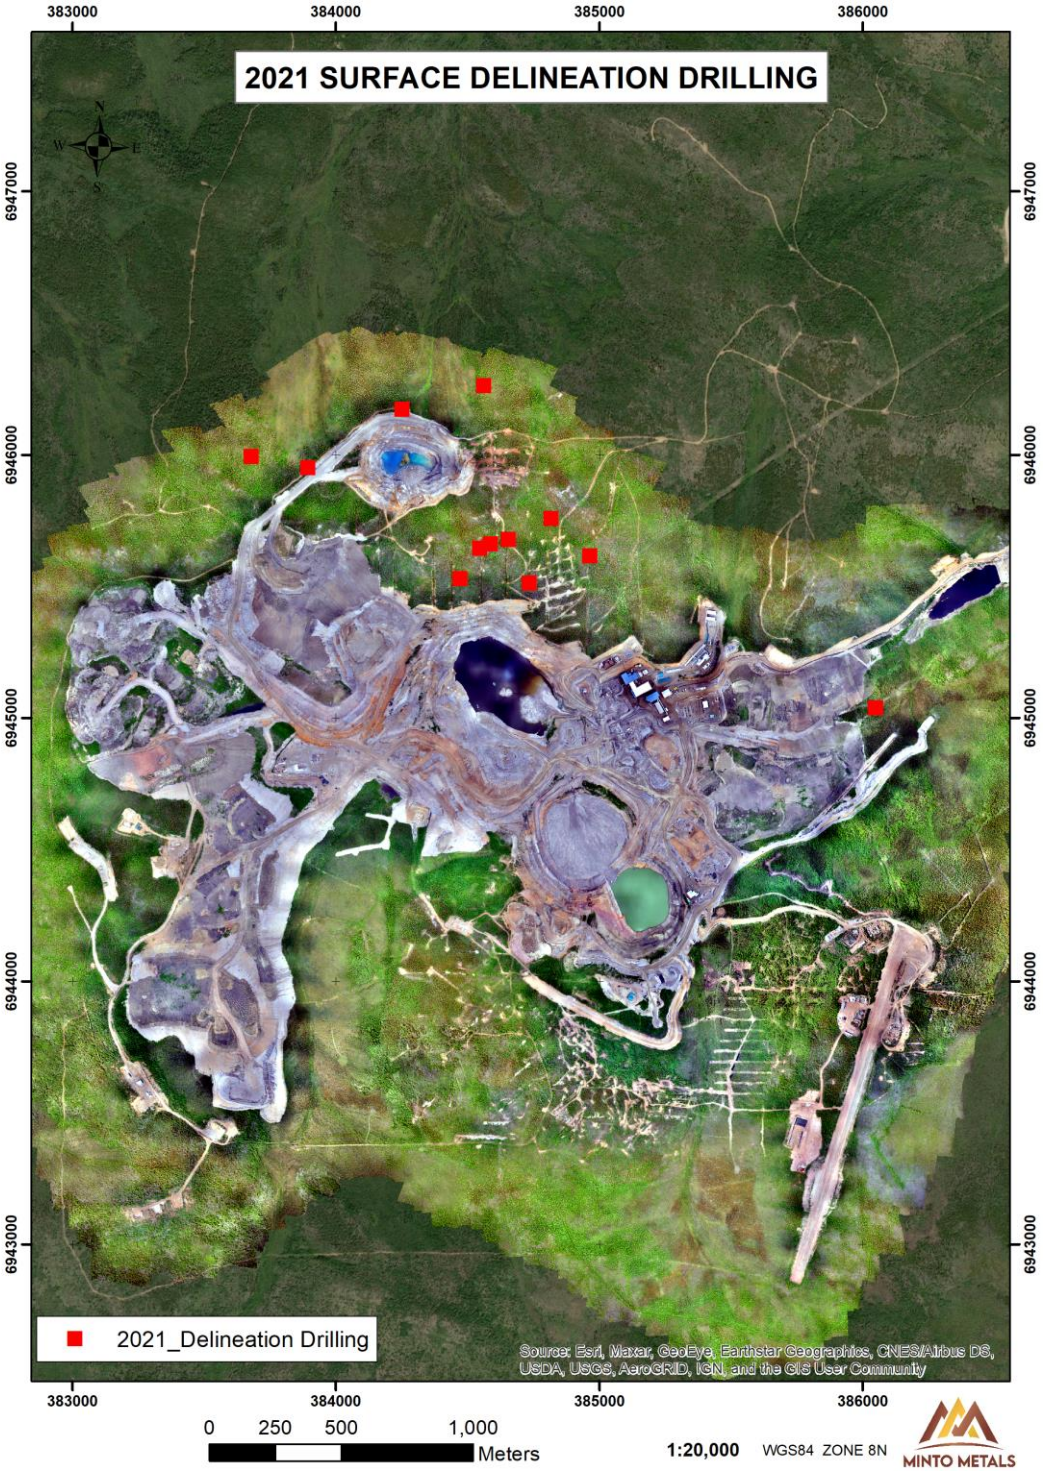

Figure 2-2: 2021 Delineation Drilling – Drillhole & Collar Location

2.2 Maintenance, Infrastructure and Construction Projects

There were no major maintenance activities conducted in 2021 on the physical works.

2.3 Mining Activities

The following sections discuss the mining activities for 2021 including open pit and underground mining, waste rock and tailings management, ore stockpiles, operating results, and concentrate shipments.

2.3.1 Open Pit Mining

There was no Open Pit Mining conducted in 2021.

2.3.2 Underground Mining

Copper Keel was where most of the mining took place in 2021. Development was continuous throughout the year in Copper Keel with ore development continuing in the Main zone and a capital expansion to the West and South zones. Production mining in Copper Keel took place primarily in the main zone of Copper Keel with a couple stopes coming online in the West and South zones in Q4. Production mining was completed in Minto East in Q1 2021.

A total of 3,320 metres of development was completed in Copper Keel. This included the capital development of an underground fuel station and a secondary egress in Copper Keel South to safely bring the area into production.

In 2021 the mine produced 866,805 tonnes of ore (between the Copper Keel and Minto East deposits) and hauled 122,797 tonnes of waste rock to surface. See Appendix A for the underground development maps.

2.3.3 Waste Rock Management

Waste rock dump development continued in 2021, as per the *Minto Mine Waste Rock and Overburden Management Plan*. Table 2-1 summarizes the waste materials and ultimate destinations, and the volumes deposited. Current waste rock inventory in the various waste rock and overburden dumps at the Minto Mine site are summarized in Table 2-2.

Table 2-1: Waste Rock Destination and Volumes – Unreconciled truck counts (2021)

Material Type	Destination	In Situ (m3))
Waste – Construction Grade	Roads/Ramps	0
Waste – Construction Grade	Tailings Diversion Ditch	0
Waste	Main Pit Dump	0
Waste	Main Waste Dump	55,000
Waste Rock – SAT	Main Pit Buttress	6,300
Waste Rock – SAT	A2S2 In Pit	0
Total		61,300

Table 2-2: Waste Dump Location and Storage Volumes (2021)

Dump Location	Quantity Stored as of December 31, 2021 (m^3)
Main Pit Buttress	4,236,300
A2S2 In – Pit	75,320
Main Pit Dump	1, 608,100*
South West Dump	12,120,000
Mill Valley Fill Extension	1,440,000
Reclamation Overburden Dump	4,300,000
Main Waste Dump	8,360,000
Main Waste Dump Expansion	3,810,000
Mill Valley Fill Extension 2	1,360,000
Total Waste Dumped	**37,278,670**

*Main Pit Dump volume updated from 2021 scan compared to baseline

2.3.4 Tailings Management

All tailings produced in 2021 were deposited in the Area 2 Pit Tailings Management Facility (A2PTMF). Table 2-3 lists the deposition schedule.

Table 2-3: Tailings Deposition Schedule in 2021

Tailings Management Facility	Date Range	Quantity Deposited (dry metric tonnes)
A2PTMF	January	82,096
A2PTMF	February	58,394
A2PTMF	March	65,479
A2PTMF	April	70,409

A2PTMF	May	79,527
A2PTMF	June	73,858
A2PTMF	July	67,759
A2PTMF	August	53,856
A2PTMF	September	70,020
A2PTMF	October	75,934
A2PTMF	November	85,262
A2PTMF	December	89,839
Total 2021 Tailings		**872,433**

A total of 872,433 dry metric tonnes (dmt) of tailings were discharged to the A2PTMF in 2021. Since November 2012, the Main Pit Tailings Management Facility (MPTMF) has received 3,346,606 tonnes of tailings. Since March 2015, the Area 2 Pit has received 6,212,691 tonnes of tailings.

From January to August tailings were deposited to the A2PTMF from a point at the northeast corner of the pit. A discharge line runs from the pit crest at the 806m elevation to a point on the highwall past the overburden contact, at 787m: this ensures that the tailings stream runs down solid rock and does not cause erosion. From September to December, sub-aqueous deposition was adopted, moving the discharge point from northeast corner to around center of the stage 3/4 pond at the A2PTMF. This will avoid ice entrainment during winter and is expected to reduce potential seepage from the pond to underground. Since September 2021, all tailings are water covered because the sub-aquatic disposal. This allowed tailings to reach the bottom of the pond while the water level increased. The highest point of the tailings beach before it became submerged was 789.5m. As of December 31st, 2021, the water level in A2PTMF was 792.5m.

Deposition in the MPTMF is possible; however, no tailings were deposited in MPTMF in 2021. The highest point of the tailings beach is at 787.5m elevation. At year-end, the water level was measured at 785.0m.

The pipeline and pump which transfers supernatant water from A2PTMF to MPTMF, where the mill's process water intake is located, was re-established in 2020. This was

done when the Area 2 Stage 3/4 water levels rose to a suitable elevation for the dewatering barge to be safely installed.

As in previous years, tailings were not observed to remain ponded on the ice surface of either tailings management facility during the winter months. The relatively high tailings temperature, combined with the erosive effect of the tailings stream, melts through the ice at the discharge point.

2.3.5 Ore Stockpiles

Seven ore stockpiles exist on the property. Immediate to the milling complex are three stockpiles described below:

1. Mill Pond Pad and Live pile– Blended and crushed material for immediate mill feed
2. ROM Pad hosting the ROM and East Stockpiles –Sulphide and partially oxidized run of mine (ROM) ore stockpiles
3. South Stockpile –Partially oxidized run-of-mine (ROM) ore stockpiles

Further away from the mill complex is Top of the World (TOTW) Stockpile, lying West of the Main Pit, adjacent to the Main Waste Dump. This stockpile consists of partially oxidized run-of-mine (ROM) included in the low-grade POX inventory.

The stockpile areas are displayed in Figure 2-3.

Ore is segregated by copper grade and percentage of acid-soluble copper as shown in Table 2-4.

Table 2-4: Ore Stockpiles

Material Type	Copper Grade Range	Soluble Copper
Blue Sulfide Ore	0.50 – 1.00% Cu	<15.0%
Green Sulfide Ore	1.00 – 2.00% Cu	<15.0%
Yellow Sulfide Ore	>2.00% Cu	<15.0%
Partially Oxidized Ore (POX)	>1.50% Cu	>15.0%
Low-Grade Partially Oxidized Ore (LG POX)	0.80 – 1.50% Cu	>15.0%

The higher-grade ores are fed to the mill as they are mined to maintain the highest possible head grade while mining ore. The lower-grade and partially oxidized stockpiles are depleted gradually and are used to supplement mill feed.

Table 2-5: Stockpile Inventory

	December 31, 2021			
	Mass (tonnes)	**Cu (%)**	**Mass (tonnes)**	**Cu (%)**
Red	0	0	0	0.00
Yellow	0	0	0	0.00
Green	0	0	0	0.00
Blue	0	0	0	0.00
POX	202,908	0.91	202,908	0.91
LG POX	132,737	0.66	132,737	0.66
Portal Ore Pad	41,432	1.2	588	1.90
Live Pile	0	0	6,960	1.01
Total Ore	**377,077**	**0.86**	**343,193**	**0.82**

Table 2-6: Stockpile by Geographic Location

Location	Tonnes	Cu (%)	Dominant Material
ROM A2S3	132,737	0.66	POX
ROM UG ore	7,548	1.08	Green
South SP	181, 106	0.93	POX
TOTW SP	21,802	0.81	POX
SWD*	79,192	0.40	HGW

*The South West Dump contains a pile of High-Grade Waste which is not currently classified as ore.

Figure 2-3: Ore Stockpiles - 2022

2.3.6 Operating Results

Ore processing and metal production results for the 2021 calendar year are summarized in Table 2-7 below.

Table 2-7: Operating Results (2021)

Metal Production	Quantity
Copper (dmt)	11,804.82
Gold (kg)	366.49
Silver (kg)	4,209.99
Ore Milled	
Ore processed (t)	903,498
Copper grade (%)	1.4
Gold grade (g/t)	0.55
Silver grade (g/t)	5.6
Recoveries	
Copper (%)	93.2
Gold (%)	74
Silver (%)	83.1
Concentrates Produced	
Copper concentrate (dmt)	31,064.65
Copper (%)	38
Gold (g/t)	11.8
Silver (g/t)	135.52

2.3.7 Concentrate Shipments

Minto produced and shipped 29,235 wet metric tonnes of concentrate at 8.29% moisture content, which corresponds to 26,810 dmt. The average concentrate grades are listed in Table 2-7 above. 627 truckloads of concentrate were shipped from Minto in 2021: 239 via the winter ice bridge and 388 during the summer barge season.

2.4 Mine Access Road

2.4.1 Traffic

From January 6th to April 15th, 2021, access across the Yukon River was over an ice bridge during which heavy trucks made 319 round trips, medium trucks made 103 round trips and light vehicles made 134.5 round trips to the Minto Mine via the mine access road.

Between April 15th and June 5th, 2021, there was no land access to the mine site. On June 5th, 2021, the summer tug and barge operation started for the season. During the barge operating season, heavy trucks made 986 round trips, medium trucks made 160 round trips, and light vehicles made 552 round trips to the Minto Mine via the mine access road. The barge operating season ended November 12th, 2021, with the barge being removed from the river on that date. Construction of the 2022 ice bridge started in December 2021.

2.4.2 Access Control Issues

No access control issues were experienced in 2021.

2.4.3 Planned Access Road Maintenance for 2022

There are no major projects or upgrades planned for the access road in 2022. Routine maintenance will be completed to maintain road condition and drainage.

2.5 Accidents and Incidents

2.5.1 Incidents

For the calendar year of 2021, the Minto Mine site experienced 147 incidents that required follow-up investigation. Three of these incidents were considered serious and were reported to Yukon Workers Compensation Health and Safety Board as required. A full breakdown of the types of incidents is as follows:

- 1 Lost Time Incidents (LTI)
- 2 Medical aids (MA)
- 15 First Aids (FA)
- 29 Property Damage (PD)
- 13 Near Misses (NM)
- 1 Business Interruptions

Minto maintains a Mine Emergency Response Plan supported by complement emergency response personnel trained and certified in advanced first aid, firefighting, and mine rescue, along with equipment required for all response types. In addition, reporting and investigation of incidents is standard practice at the site.

2.5.2 Wildlife Incidents

No reportable wildlife incidents occurred on site for 2021.

2.5.3 Reportable Spills

There was one reportable spill that occurred at Minto Mine during 2021. The volume and causes of the spill are summarized below in Table 2-8.

Table 2-8: Reportable Spill (2021)

Date	Amount	Substance	Cause and clean up
15-Jun	16 L	Hydrochloric Acid	A faulty pallet did not adequately support the acid contained in bottles. The bottles were punctured as a result of the loader trying to adjust the pallet of acid

			for safe transport. Approximately 2 m3 of acid impacted overburden was excavated from the spill area and contained in plastic totes which were then removed from site for treatment/disposal.

The spill in Table 2-8 was reported as per the Spills Regulations of the Yukon Environment Act (YG Spill Line File # 21-063). The follow up spill report was submitted within 10-days of the occurrence. Additionally, non-reportable spills were tracked internally as per the WUL. A total of twenty-seven (27) non-reportable spills occurred in 2021. Spills on site were cleaned up with a variety of methods including, but not limited to, absorbent spills pads, soil excavation, soil treatment in the LTF, and disposal in the Main Pit dump

2.5.4 Non-reportable Spills

In 2021 there were 27 non-reportable spills reported. These spills are tracked internally, assigned EIR numbers and communicated to site via Spill Flash Reports. Contaminated soil is sampled and if necessary deposited in the Land Treatment Facility for further monitoring and treatment.

The volumes and contents are summarized below in Table 2-9.

Table 2-9: Non-reportable Spills (2021)

Date	Amount	Substance
12-Jan	1000L	Glycerine
21-Jan	<200L	Liquid Hydrocarbons
25-Jan	30L	Gear Oil
30-Jan	<25L	Coolant
8- Apr	75L	Diesel
12-Apr	3kg	Powdered Lime
16-Apr	8L	Hydraulic Oil
10-May	12L	Oil

10-May	3L	Oil
26-May	20L	Glycerin
14-Jun	100L	Diesel
27-Jun	50L	Diesel
28-Jun	1L	Hydraulic Oil
28-Jul	<200L	Hydrocarbon Staining
31-Jul	151L	Hydraulic Oil
10-Aug	20L	Diesel
11-Aug	10L	Hydraulic Oil
23-Sep	20L	Gear Oil
23-Sep	20L	Diesel
29-Sep	55L	Transformer Oil
4-Oct	10L	Diluted HCL Acid
7-Oct	160L	Hydraulic Oil
27-Nov	40L	Oil
28-Nov	<0.5L	Hydraulic Oil
5-Dec	3L	Gear Oil
6-Dec	2L	Coolant
29-Dec	10L	Transmission Oil

2.5.5 Spill Contingency Plan Review

A review and update to the Minto Mine Spill Contingency Plan is required annually as part of the Annual Report and the updated 2022 Minto Mine Spill Contingency Plan is provided in Appendix B.

3 Proposed Mining for 2022

Section 3 discusses the proposed mining for 2022 at the Minto Mine.

3.1 Proposed Open Pit Mining for 2022

There is no Open Pit mining planned for 2022. Open pit planning will occur throughout 2022 for the Ridgetop Open pit with a goal to start mining in 2023.

3.2 Proposed Underground Mining for 2022

Development of the Minto East Exploration drift is planned to commence in Q2 from the bottom of the current Minto East ramp. Minto East extension and Minto East 2 development is expected to start upon permit approval.

Area 2 expansion development is expected to start at the end of Q1. 2022 development activities will include the main ramp development with egress for flow through ventilation as well as a refuge station and truck load out. Once infrastructure is complete, production stoping is expected to start in Q4.

Copper Keel mining continues all year in 2022 with production stopping in the Main (zone 57), West (zone 56), and South (zone 62) lenses.

Development of the Minto North Underground is also planned to start in Q3 of 2022 or as soon as approved. This will occur via establishing a portal into the existing Minto North Open pit. Production in Minto North Underground is scheduled to commence in 2023.

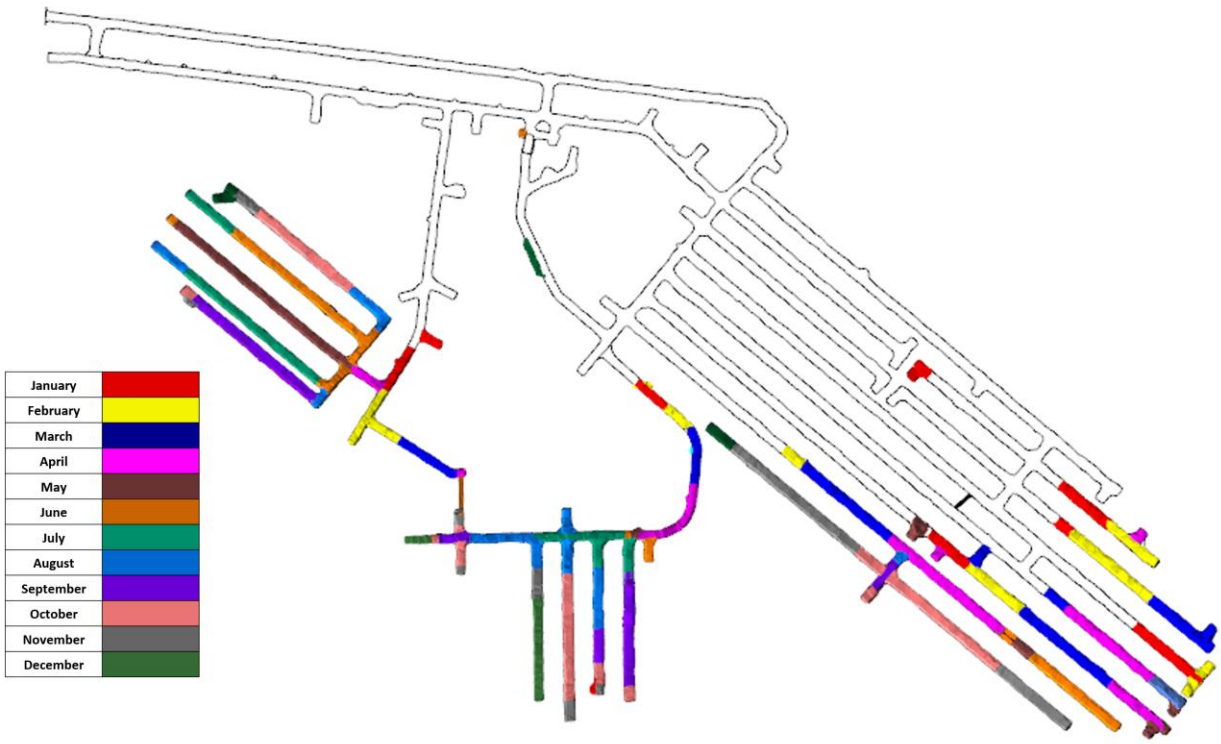

Figure 3-1: 2021 Copper Keel Development Map

4 Mineral Resources and Reserves

Minto Mine's updated Mineral Resources are provided in Tables 4-1 and 4-2 below. The most recent update is from the 43-101 Technical Report published in 2021. Minto did not report Mineral Reserves in this update.

Table 4-1: Minto Mineral Resource Estimate - Indicated

Type	Cut-off	Area	ROM	In situ Grades					Metal		
	(CA$)		tonnes	NSR (CA$/t)	Cu (%)	Au (gpt)	Ag (gpt)	Ox Ratio	Cu (000lbs)	Au (oz)	Ag (oz)

5 Surface Water Quality Monitoring

Environmental monitoring programs are outlined in the *Environmental Monitoring, Surveillance and Reporting Plan* (EMSRP 2018-01). The results for the surface water quality monitoring conducted in 2021 are provided in this section. Where possible, the 2021 results have been compared to historical results to identify trends and compare 2021 values with previous values.

5.1 Surface Water Quality Program

Details of the Surface Water Surveillance Program, including sampling station locations and monitoring frequency, are outlined in the EMSRP 2018-01 and the results are presented in this section for water quality stations outlined in the Water Use Licence (WUL). Water quality result statistics including the mean, minimum and maximum are presented in summary tables. For the purposes of graphing results, values less than the detection limit were taken to be half of the detection limit.

The WUL Effluent Quality Standards (EQS) were compared to the water quality result statistic summaries at stations W16, W16A, W17, W50 and WTP/RO. The WUL Water Quality Objectives (WQO) were compared to the water quality result statistic summary at station W2, and at W50 when W35 and W15 are frozen.

As water quality stations, may be adjusted from year-to-year because of environmental changes or modifications to infrastructure, an update to the water quality station locations listed in the WUL is provided in Table 5-1 below. All surveillance monitoring sites in use in 2021 are confirmed with a Global Positioning System (GPS) unit to determine current UTM coordinates. Coordinates presented in Table 5-1 are associated with the World Geodetic System 1984 (WGS 84) coordinate system.

Table 5-1: Water Quality Site Descriptions and UTM Coordinates

Station	Description	UTM Coordinates – Zone 8	
		Easting	Northing
W1	Lower Reach of Minto Creek	392445	6948251
W2	Minto Creek, upstream of the Minto Creek/Yukon River confluence where the access road crosses Minto Creek	392584	6948402
W3	Minto Creek, at the federal MMER compliance point	387000	6945778
W4	Yukon River, upstream of the confluence with Minto Creek	394070	6948203
W5	Yukon River, downstream of the confluence with Minto Creek	392583	6949119
W6	Tributary on the North side of Minto Creek	387583	6946392
W7	Mouth of the tributary on the south side of Minto Creek, approximately 0.8 km downstream of W3	387546	6946034
W8	Western collection sump from the DSTSF	385629	6945076
W8A	Eastern collection sump from the DSTSF	385716	6945012
W10	Headwaters of Minto Creek (south-west fork at headwaters)	383855	6943364
W12	Main Pit and Main Pit Tailings Management Facility	384544	6945137
W12A	Discharge from Main pit	*	*
W14	Tailings thickener overflow	385223	6945089
W15	Upper Minto Creek storm water collection sump, downstream of the overburden dump, just upstream of Main Pit	384181	6944708
W16	Water Storage Pond	386402	6945559
W16A	Discharge from the Water Storage Pond	386679	6945664
W17	Water Storage Pond dam seepage	386679	6945664
W30	Headwaters Minto Creek (north-west fork)	383693	6945026
W33	Up-gradient of South Diversion Ditch	385351	6944072
W35	South Diversion Ditch	385223	6944427
W36	Minto Creek detention structure (MCDS) – Decommissioned in 2015	385892	6945191
W37	100 m downstream of MCDS (W36 collection sump) and upstream of Water Storage Pond – Decommissioned in 2015	386180	6945294
W45	Area 2 Pit and Area 2 Pit Tailings Management Facility	384912	6944068
W46	Minto Creek, downstream of W7 and W6 tributaries	387873	6946301
W47	Area 118 Pit water	384775	6944153
W50	Minto Creek, approximately 50 m downstream of the toe of the Water Storage Pond Dam and downstream of the inflow of the treated water	386747	6945682

Station	Description	UTM Coordinates – Zone 8	
		Easting	Northing
MC-1	Minto Creek upstream of Canyon	390967	6947528
WTP	Treated water from water treatment plant when RO not operating	385126	6945154
RO	Treated water from RO	385126	6945154
W51	Area 2 Stage 3 Pit	385160	6944240
W52	Ridgetop North Pit and Ridgetop North Pit Tailings Management Facility	*	*
W53	Ridgetop South Pit	*	*
W54	Main Dam seepage	*	*

W62	MVFES2 Collection Sump	386079	6945335
C4	Tributary on the south side of Minto Creek, downstream of W3	388407	6946571
C10	Tributary on the south side of Minto Creek, downstream of W3	391868	6947914
MN	Minto North pit water	384342	6946090
MN-0.2	Upper west arm of McGinty Creek (Reference Station)	382267	6947299
MN-0.5	West arm of McGinty Creek just upstream of the confluence with the east arm	385251	6951262
MN-1.5	Upper east arm of McGinty Creek downstream of the Minto North deposit	384473	6947055
MN-2.5	East arm of McGinty Creek just upstream of confluence with the west arm	385493	6950788
MN-4.5	Lower mainstream McGinty Creek near confluence with Yukon River	386231	6952851
UG 1	Minto South underground mine dewatering	384916	6944098
UG 2	Wildfire underground mine dewatering	*	*
UG 3	Copper Keel underground mine dewatering**	*	*
UG 4	Minto East underground mine dewatering	384961	6945020

*Water quality sites not developed

** Copper keel dewatering is currently co-mingled with Minto South dewatering and reports to surface via UG1 sump

5.1.1 Water Quality Monitoring Conformance

2021 conformance with the external water sampling requirements is summarized in Table 5-2 below. Flow monitoring at water quality surveillance sites is highly variable because of site and seasonal conditions and is not presented in Table 5-2, however, full details were provided in the Monthly Reports submitted to the Yukon Water Board

(YWB). Additionally, the specifics of any non-conformance in relation to external and internal water sampling requirements are included in the Monthly Reports. Quality Assurance and Quality Control (QA/QC) sampling is not included in sampling events described in Table 5-2 but is provided in Section 5.1.2 below.

Table 5-2: Water Quality Sampling Monitoring Conformance Summary (2021)

Site Name	2021 WQ sampling events	2021 Reason(s) for non-conformance events
W1	N/A	N/A
W2	28	Site was frozen during first quarter, intermittently dry from April through August, and frozen as of October 17th.
W3	60	Sampled as per schedule.
W4	10	Site frozen in Q1.
W5	7	Site frozen in Q1.
W6	6	Site frozen for 6 months of the year.
W7	23	Site frozen for 6 months of the year.
W8	0	Site destroyed in 2017.
W8A	0	Site was dry throughout 2021.
W10	6	Site frozen for 6 months of the year.
W12	13	Sampled as per schedule.
W12A	0	No discharge from W12A in 2021.
W14	12	Sampled as per schedule.
W15	32	Site frozen for 5 months of 2021.
W16	41	Sampled as per schedule.
W16A	0	No discharge from W16A in 2021
W17	54	Sampled as per schedule.
W30	7	Site was frozen from January-March and November-December.
W33	0	Site destroyed in 2017, replaced with W33s.
W33s	6	Site was frozen from January-April and November-December.
W35	7	Site frozen from January-April and November-December.
W36	0	Decommissioned in 2015.
W37	0	Decommissioned in 2015.
W45	0	Water in Area 2 Stages 1 and 2 merged with water in Stages 3 and 4 in September 2020. Water quality for the Area 2 Pit Complex will be sampled from W51 going forward.
W46	7	Site frozen from January-March and November-December.
W47	0	Decommissioned and backfilled in 2017.
W50	36	Site frozen from January-April
MC-1	26	Site frozen through first quarter, and November-December.
WTP	0	All water discharged from the Water Treatment Plant in 2021 was run through the RO units, therefore sampling WTP discharge was not required.
RO	4	Sampled as per schedule.
W51	12	Sampled as per schedule.

Site Name	2021 WQ sampling events	2021 Reason(s) for non-conformance events
W52	0	Site not established.
W53	0	Site not established.
W54	0	Site not established.
W55	6	Site frozen through first quarter, and frozen/dry through third and fourth quarters.
W62	12	Sampled as per schedule.
C4	6	Site frozen from January-April and November-December.
C10	2	Site frozen or dry except in April and May 2021.
MN	7	Site frozen from January through April and in December.
MN-0.2	4	Site frozen from January-May and October-December
MN-0.5	5	Site frozen from January-April and October-December
MN-1.5	5	Site frozen from January-April and October-December
MN-2.5	5	Site frozen from January-April and October-December
MN-4.5	5	Site frozen from January-April and October-December
UG1	12	Sampled as per schedule.
UG4	12	Sampled as per schedule.

5.1.2 Quality Assurance and Quality Control Program

As required by Clause 104 of the WUL, Minto is required to submit the results and interpretations of the Quality Assurance and Quality Control Program (QA/QC Program). The QA/QC program is directed through the EMSRP. Implementation of the Minto QA/QC Program occurred since November 2012.

The primary objective of the QA/QC Program is to ensure that data collected, analyzed, and evaluated through the environmental monitoring programs at Minto are representative of the environmental conditions present at the time of sample collection.

The QA/QC Program has been developed using recognized QA/QC protocols. Specific procedures for data collection at the Minto Mine are detailed in Standard Operating Procedures (SOPs). SOPs are internal documents to the Minto Mine that may be updated as required.

The main components of the QA/QC Program presented in the following sections include QA/QC with regards to water quality monitoring, external and on-site laboratory reporting, and environmental programs monitoring.

5.1.2.1 Water Quality QA/QC

Procedures for water quality monitoring at the Minto Mine are described in the EMSRP and further detailed in the Minto Mine Surface Water Quality Monitoring Standard Operating Procedure. The SOP is reviewed at the start of each field season and signed off by Minto Environment department staff to help ensure consistency in sampling procedures.

In 2021, 623 water quality samples (surface and groundwater) were collected for the water quality monitoring programs. At total of 77 duplicate samples were taken, representing 12% of the total number of samples collected in 2021. 12 monthly field blanks and 4 quarterly trip blanks were taken, as per schedule. The Minto Mine Surface Water Quality Monitoring Standard Operating Procedure describes a 1:10 quality control to routine sampling ratio and this ratio was achieved in 2021.

5.1.2.2 External Laboratory QA/QC

The 2021 external laboratory water quality analysis were performed by ALS Environmental in Burnaby, BC. As described in the EMSRP, all results provided by the external laboratory were accompanied by a Quality Control Report. If procedural deviations or exceedances in standard holding time occurred, the details of such nonconformities were included in each report. Additionally, each report contained QC batch numbers to facilitate sample result traceability.

5.1.2.3 On-site Laboratory QA/QC

Procedures for analyzing water samples at the on-site laboratory are detailed in a variety of SOPs such as, but not limited to: The Laboratory QA/QC Guidelines SOP; Preparation of Dissolved and Total Metals (Cu, Al, Cd) SOP; Preparation of Dissolved and Total Selenium SOP; and Total Dissolved Solids SOP. All on-site laboratory equipment was calibrated per the manufacturer's specifications in 2021.

On-site laboratory analysis of water quality samples occurred at W2, W3, W16, W16a and W50 as per the WUL Schedule 1 – Part 2 monitoring requirements, as environmental conditions allowed. No internal samples were provided to the internal

laboratory from W8 as the site was destroyed in 2017. W8A was found dry throughout 2021. Additionally, the on-site laboratory analyzed water from sites W15 and W35 during freshet to determine where best to route the run-off water.

The 2021 QC procedures performed by the on-site laboratory included spiked blanks and calibration checks. If two or more QC failures occurred, the 2021 QC procedures involved re-analyzing the entire batch of samples. Additionally, one replicate sample is analyzed for each batch analysis. In the event the replicate sample results do not match; the entire batch is reanalyzed.

QA/QC results such as duplicates, field splits, trip blanks and field blanks are verified monthly. Results are compared and reported internally to improve on sampling and analysis.

5.2 Compliance

5.2.1 Discharge Compliance – WQ Effluent Standards

5.2.1.1 W16A – EQS Compliance Point

No effluent was discharged from the WSP via W16A in 2021.

5.2.1.2 W50 – EQS Compliance Point

The EQS were applied and met at W50 during active discharge from October 8th to 15th, 2021. The water quality results for this period are presented Table 5-3 below. A detailed summary of all samples collected at W50 during 2021 is presented in Section 5.2.4.2.

Table 5-3: W50 Water Quality Results During Active Discharge Period, 2021

W50	Effluent Quality Standard (WUL Clause 9)	2021 Samples During Active Discharge			
Parameters		**25-May-21**	**31-May-21**	**20-Sep-21**	**23-Sep-21**
pH	6.0-9.0	6.86	6.89	7.28	7.53

***Based on measured hardness at WQO Station (W2)**

****Based on measured DOC at WQO Station (W2)**

5.2.1.3 W17 – EQS Compliance Point

During 2021, there was no water discharged from W17 to Minto Creek, therefore EQS were not applied to this station.

5.2.1.4 WTP – EQS Compliance Point

While the Water Treatment Plant (WTP) did operate in 2021, all water was run through the Reverse Osmosis (RO) units before being discharged to Minto Creek. Therefore, EQS were not applied to this station. RO compliance is discussed in Section 5.2.3, below.

5.2.2 Discharge Compliance – Bioassays

Monthly and quarterly bioassays are conducted at several surface water quality sites, as per WUL requirements. These tests are to ensure the water is not toxic for aquatic organisms.

All quarterly LC50, 72-hour algae growth and Ra226 tests were conducted, and passed, at W3 during 2021. Quarterly lab results were submitted with the monthly reports in which they were received. Annual MDMER sub-lethal tests were conducted in October. Both tests passed and the results were included in the December monthly report. 48- and 96-hour LT50 samples were collected during active discharge in October and both tests passed.

At W2 station, bioassay sampling was not completed in the first quarter of 2021, as the water quality station was frozen until April. CA-72A and CD-7 day were completed and passed for Quarters 2, 3 and 4. CT-30-day tests were completed and passed in Quarters 2 and 3 but could not be completed in Quarter 4 due to the station freezing over on October 17th.

Due to lack of water, monthly bioassay testing at W50 could only be completed in July, August, September, and October. The 48- and 96-hour LT50, and Cd-7d tests all passed during this period.

48- and 96-hour LT50 samples were collected at W3, W16A, and W50 during active discharge in October and all tests passed. Results were included with the November monthly report

5.2.3 Discharge Compliance – RO

Minto discharged directly to Minto Creek from the Water Treatment Plant (WTP) RO train from May 25th to June 1st, September 20-25th and again on September 29th. On all three occasions, discharge was halted due to exceedances of WQO in RO product

water. External and internal water quality results for station RO are presented in Tables 5-4 and 5-5, respectively.

5.2.4 Water Quality Objectives Compliance – Minto Creek

5.2.4.1 W2 – WQO Compliance Point

Water Quality Objectives (WQO) (Clause 11 of the WUL) were applied at W2 during the period between April 20th and October 17th, 2021. As of April 20th, W15 and W35 were no longer frozen and W2 became the WQO station until the site froze on October 17th. Apart from dissolved aluminum, which exceeded the WQO on May 5th, all other parameters met the WQO's for 2021. Elevated concentrations of both dissolved aluminum and copper are common during freshet; no active discharge was taking place and mine loading was not considered to be a factor. The 2021 water quality statistics for W2 are summarized below in Table 5-6. Dissolved copper and aluminum at W2 are illustrated in Figure 5-1, and dissolved cadmium and selenium in Figure 5-2, below.

Table 5-6: W2 Water Quality Results Summary (2007-2021)

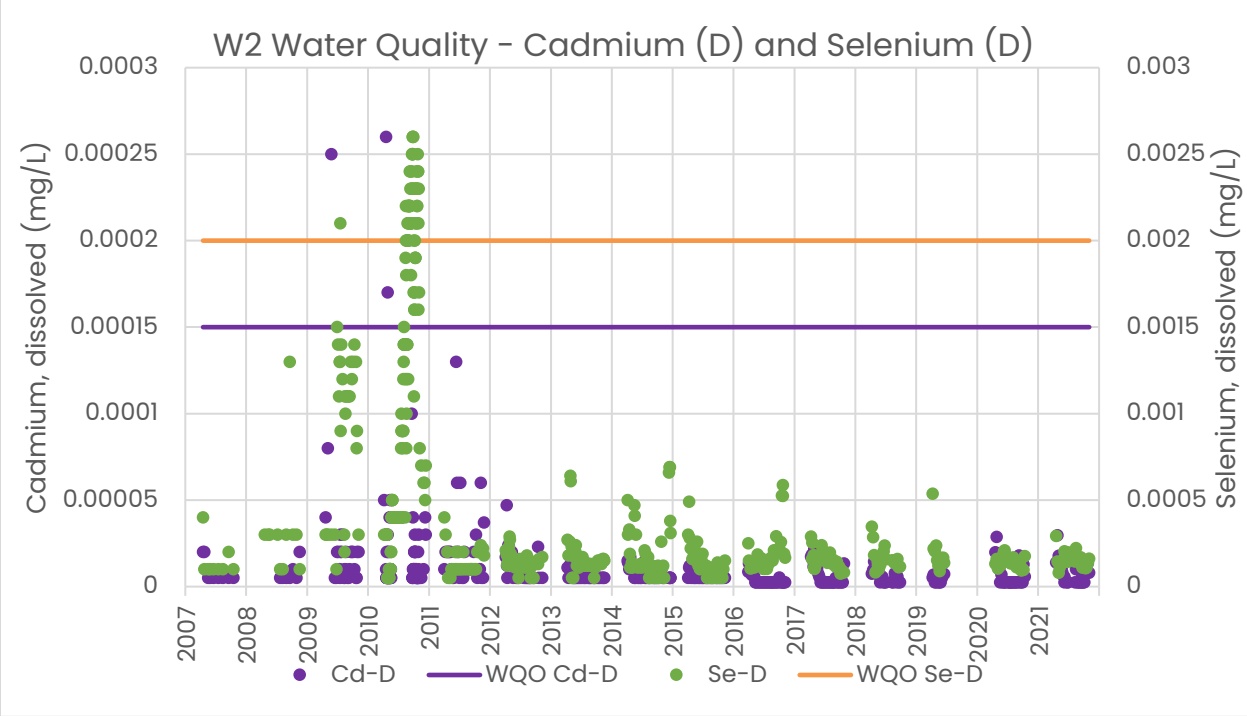

Figure 5-2: W2 Cadmium and Selenium Concentrations (2007-2021)

5.2.4.2 W50 – WQO Compliance Point

As per Clause 5 of the WUL, W50 was the designated WQO station during the first quarter when W15 and W35 were frozen; no samples were taken as W50 was frozen as well. As of April 20th, W15 and W35 were no longer frozen and W2 became the WQO station until W15 and W35 froze again on October 17th, 2021. W50 became the WQO station at this time and was sampled until it was discovered frozen on December 21st, 2021. No exceedances of the WQO occurred when W50 was the designated WQO station.

The 2021 water quality statistics for W50 are summarized below in Table 5-7. Dissolved copper and aluminum at W50 are illustrated in Figure 5-3, and dissolved cadmium and selenium in Figure 5-4 below.

Table 5-7: W50 Water Quality Results Summary (2009-2021)

5.3.6 W7 – North Flowing Tributary to Minto Creek

Water quality statistics for W7 from 2017 to 2021 are summarized below in Table 5-12. A total of 23 routine samples were collected from station W7 during the 2021 monitoring period. The monitoring schedule was changed from monthly to weekly in August 2020 as part of a QP Adaptive Management Plan recommendation.

Table 5-12: W7 Water Quality Results Summary (2005-2021)

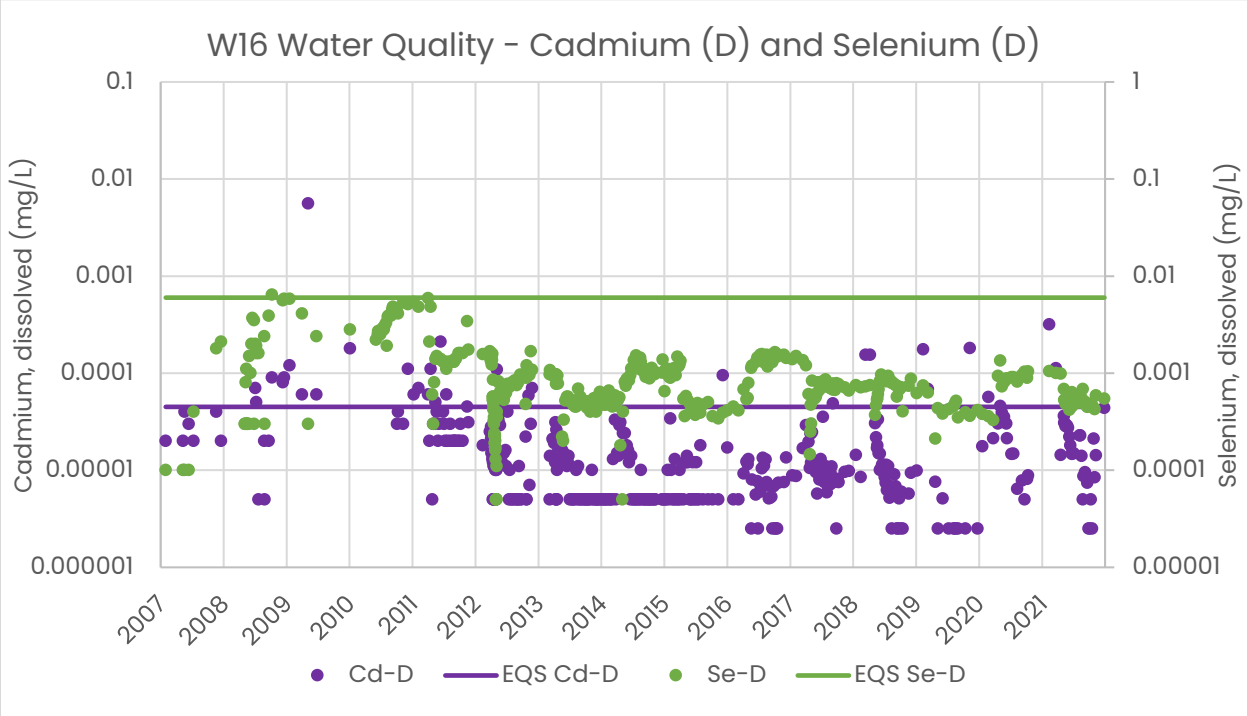

Figure 5-10: W16 Cadmium and Selenium Concentrations (2017-2021)

5.3.14 W17 – Water Storage Pond Dam Seepage

The summary results for this station are presented in the seepage Section 7.11 along with trend analyses for dissolved copper, aluminum, cadmium, and selenium concentrations throughout the years. A total of 54 samples were collected at this station during the 2021 monitoring period. The sample on January 21st could not be taken as the sump was fully frozen.

5.3.15 W30 – Headwaters Minto Creek (northwest fork)

The water quality statistics for W30 from 2010 to 2021 are summarized below in Table 5-19. A total of six routine samples were collected from station W30 during the 2021 monitoring period.

Table 5-19: W30 Water Quality Results Summary (2010-2021)

5.3.16 W33/W33s – Above Tailings Diversion Ditches

W33 was buried during construction at the end of December 2017. In 2018, the water was found seeping out of the road construction about 50 meters north of the original site and the samples were collected from that site onward. Water quality statistics for W33s from 2018 to 2021 are summarized below in Table 5-20. A total of six routine samples were collected from station W33s during the 2021 monitoring period.

Table 5-20: W33s Water Quality Results Summary (2018-2021)

5.3.17 W35 – Storm Water Collection Point – South Diversion Ditch

The water quality statistics for W35 from 2012 to 2021 are summarized below in Table 5-21. It should be noted that the location of W35 changed in 2017, with the construction of the Tailings Diversion Ditch intake structure. The water reporting to W35 also changed from a primarily unimpacted water to water potentially impacted from blast residues from the new Fresh Air Raise access road, as well as water running off the portal access road.

A total of seven routine samples were collected from station W35 during the 2021 monitoring period. The results for dissolved copper, dissolved aluminum, dissolved cadmium, and dissolved selenium for W35 from 2017 to 2021 are also presented in Figure 5-11 and Figure 5-12 below. Depending on water quality the water is re-routed to the TDD or to the A2 Pit. The elevated TSS values from 2021 were due to re-grading of the haul road allowing run-off to enter the South diversion ditch. The engineering work necessary to keep road run-off and unimpacted water separate is underway.

Table 5-21: W35 Water Quality Results Summary (2012-2021)

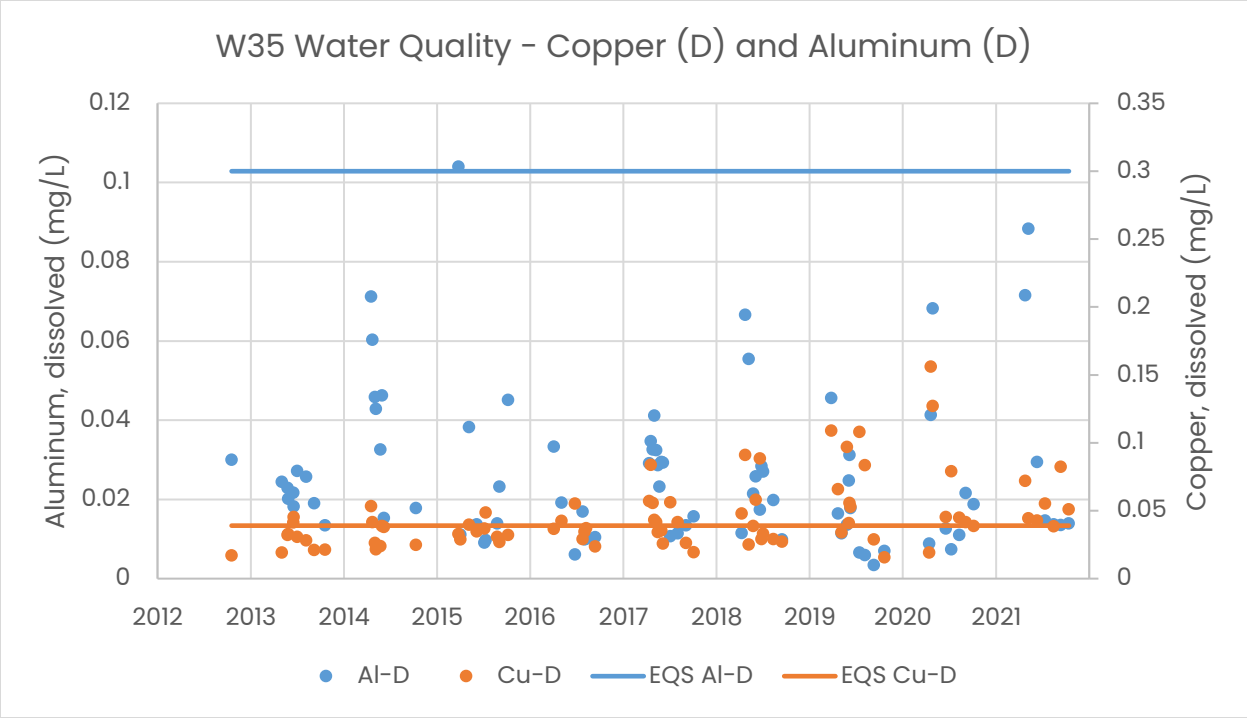

Figure 5-11: W35 Copper and Aluminum Concentrations (2012-2021)

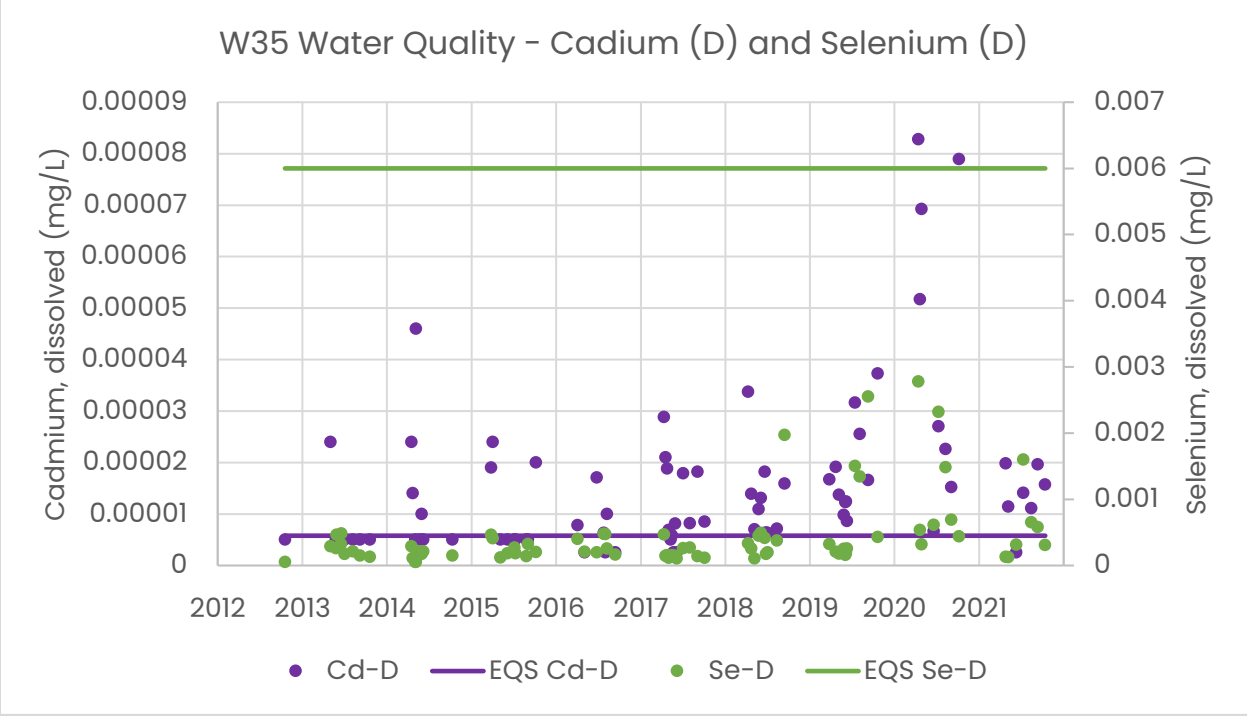

Figure 5-12: W35 Cadmium and Selenium Concentrations (2012-2021)

5.3.18 W36 – Minto Creek Detention Structure Pond

W36 was decommissioned during the construction of the Mill Valley Fill Extension Phase 2 (MVFE2) in 2015. As such, no samples were taken in 2021.

5.3.19 W37 – 100 m downstream of MCDS (W37 Collection Sump) and upstream of Water Storage Pond

W37 was decommissioned during the construction of the Mill Valley Fill Extension Phase 2 (MVFE2) in 2015 and replaced by W62. As such, no samples were taken in 2021.

5.3.20 W45– Area 2 Pit

W45 was the water quality monitoring station for the Stage 1 and 2 reservoirs in the Area 2 Pit complex. In 2020, Area 2 Stage 1 and 2 was filled with tailings. Water quality for the Area 2 Pit complex is now monitored at station W51.

5.3.21 W46 – Minto Creek, Downstream of W7 and W6

The water quality statistics for W46 from 2012 to 2021 are summarized below in Table 5-22. A total of seven routine samples were collected from station W46 during the 2021 monitoring period.

Table 5-22: W46 Water Quality Results Summary (2012-2021)

5.3.22 W47 – Area 118 Pit Water

W47 was decommissioned and backfilled during the construction of the Area 2 Stage 3 pit in January 2017. As such, no samples were taken in 2021.

5.3.23 W50 – Minto Creek, 50m Downstream of the Toe of the WSP Dam

The water quality statistics for W50 are presented in Section 5.2.1.2 above.

5.3.24 W51 – Area 2 Stage 3 Pit

The water quality statistics for W51 from 2017 to 2021 are summarized below in Table 5-23. W51 was established in 2017 with the mining activities in the Area 2 Stage 3 pit. A total of twelve routine samples were collected from station W51 during the 2021 monitoring period.

Table 5-23: W51 Water Quality Results Summary (2017-2021)

5.3.31 WTP and RO – Treated Water

The WTP was operational for part of 2021. Minto discharged directly to Minto Creek from the RO train from May 25th to June 1st, September 20th to 25th, and once more on

September 29th. Results from samples taken during these periods are presented in Section 5.2.3 above.

5.3.32 C4 – Tributary on the south side of Minto Creek

The water quality statistics for C4 from 2012 to 2021 are summarized below in Table 5-27. A total of six routine samples were collected from station C4 during the 2021 monitoring period. The July sample was not taken; sampling was deemed unsafe due to high bear activity in the area.

Table 5-27: C4 Water Quality Results Summary (2012-2021)

5.3.41 UG2 – Wildfire Underground Mine Dewatering

This station was not established in 2021.

5.3.42 UG3 – Copper Keel Underground Mine Dewatering

This station was not established in 2021, and dewatering water from Copper Keel is comingled with Minto South water and pumped to surface via UG1.

5.3.43 UG4 – Minto East Underground Mine Dewatering

This station was established in 2018, and a total of twelve routine samples were collected in 2021. Water quality statistics from 2018 to 2021 are summarized in Table 5-36 below.

6 Groundwater Monitoring Program

Groundwater monitoring program details are provided in Section 2.2 of the Minto Mine Environmental Monitoring, Surveillance and Reporting Plan. The primary monitoring objective of the groundwater monitoring program is to identify potential impacts on groundwater from Minto Mine.

Mine facilities monitored for groundwater impacts include, but are not limited to, the DSTSF, Mill area, Main Pit, Area 2 Pit, Minto North Pit, waste rock dumps, and the Water Storage Pond (WSP). The Groundwater (GW) Monitoring Program is comprised of operational and baseline monitoring. Water quality samples for the program are collected per standard procedures such as those summarized in the ASTM (2007) *Standard Guide for Sampling Ground-Water Monitoring Wells*. The main components of the groundwater monitoring program include groundwater quality, vibrating wire piezometers, and ground temperature cable monitoring.

6.1 Groundwater Quality Monitoring Conformance

Minto's 2021 conformance with groundwater sampling requirements is summarized in Table 6-1 below. Quality Assurance and Quality Control (QA/QC) sampling is described in Section 6-2.

Wells and drive point sampling was conducted as per the EMSRP and GW Plan 2018-01 requirements and the AMP for groundwater as monthly or quarterly frequency. Groundwater AMP exceedances are discussed in Sections 10.3 and 10.4 of this report.

Table 6-1: Groundwater Quality Monitoring Conformance Summary (2021)

Mine Project Component	Monitoring Installation	Quality	Level	Monitoring Frequency	2020 Groundwater Compliance
Up-gradient of Mine Activities	MW17-08-01	X	X	Quarterly	2 of 4 collected. Site inaccessible in Q1 due to heavy snowfall. Westbay equipment off-site for repair in Q3.
	MW17-08-02	X	X	Quarterly	2 of 4 collected. Site inaccessible in Q1 due to heavy snowfall. Westbay equipment off-site for repair in Q3.
	MW17-08-03	X	X	Quarterly	2 of 4 collected. Site inaccessible in Q1 due to heavy snowfall.

					Westbay equipment off-site for repair in Q3.
	MW17-08-04	X	X	Quarterly	2 of 4 collected. Site inaccessible in Q1 due to heavy snowfall. Westbay equipment off-site for repair in Q3.
Southwest Waste Dump	MW12-DP1	X	X	Quarterly	No samples collected. Destroyed in August 2017.
	MW12-DP2	X	X	Quarterly	No samples collected. DP obsolete.
	MW12-DP3	X	X	Quarterly	No samples collected. DP obsolete.
	MW17-09-01	X	X	Quarterly	No samples collected. Well is damaged and no longer operational. Westbay probe cannot reach ports.
Main Waste Dump	MW09-01-01	X	X	Quarterly	Since MW09-01 has been dry since October 2014, it was replaced by MW17-10.
	MW09-01-02	X	X	Quarterly	Since MW09-01 has been dry since October 2014, it was replaced by MW17-10.
	MW09-01-03	X	X	Quarterly	Since MW09-01 has been dry since October 2014, it was replaced by MW17-10.
	MW17-10-01	X	X	Quarterly	4 of 4 collected. Sampled as per schedule.
	MW17-10-02	X	X	Quarterly	4 of 4 collected. Sampled as per schedule.
	MW17-10-03	X	X	Quarterly	4 of 4 collected. Sampled as per schedule.
	MW17-10-04	X	X	Quarterly	3 of 4 collected. Port was found dry in Q3.
Dry Stack Tailings Storage Facility and Mill Valley Fill Expansion	MW12-06-01		X	Quarterly	2 of 4 collected. Samples contaminated with glycol in Q1, Q3 & Q4.
	MW12-06-02	X	X	Quarterly	4 of 4 collected. Sampled as per schedule.
	MW12-06-03		X	Quarterly	4 of 4 collected. Sampled as per AMP schedule.
	MW12-06-04	X	X	Quarterly	4 of 4 collected. Sampled as per schedule.
	MW12-06-05		X	Quarterly	4 of 4 collected. Sampled as per AMP schedule.
	MW12-06-06	X	X	Quarterly	4 of 4 collected. Sampled as per schedule.

Main Pit	MW12-07-01	X	X	Quarterly	3 of 4 samples collected. Port is likely damaged, as all samples contaminated with glycol. Westbay equipment off-site for repair in Q3.
	MW12-07-02	X	X	Quarterly	3 of 4 samples collected. Westbay equipment off-site for repair in Q3.
	MW12-07-03		X	Quarterly	3 of 4 samples collected. Westbay equipment off-site for repair in Q3.
	MW17-DP01	X	X	Quarterly	0 of 4 collected. Site frozen in Q1 and inaccessible in Q2, Q3, & Q4 due to safety concerns.
	MW17-DP02	X	X	Quarterly	0 of 4 collected. Site frozen in Q1 and inaccessible in Q2, Q3, & Q4 due to safety concerns.
	MW17-DP03	X	X	Quarterly	0 of 4 collected. Site frozen in Q1 and inaccessible in Q2, Q3, & Q4 due to safety concerns caused by high water in Main Pit.
Minto North Pit	MW09-03-01	X	X	Monthly	11 of 12 collected. Westbay equipment off-site for calibration in January.
	MW09-03-02	X	X	Monthly	11 of 12 collected. Westbay equipment off-site for calibration in January.
	MW09-03-03	X	X	Monthly	No samples were collected. Port found dry throughout 2021.
	MW17-11-01	X	X	Quarterly	4 of 4 collected. Sampled as per schedule.
	MW17-11-02	X	X	Quarterly	4 of 4 collected. Sampled as per schedule.
	MW17-11-03	X	X	Quarterly	4 of 4 collected. Sampled as per schedule.
	MW17-11-04	X	X	Quarterly	1 of 4 collected. Port found dry in all quarters except Q3.
	MW17-11-05	X	X	Quarterly	0 of 4 collected. Port found dry in all quarters.
Water Storage Pond	MW12-05-01	X	X	Quarterly	4 of 4 collected. Sampled as per schedule.
	MW12-05-02	X	X	Quarterly	4 of 4 collected. Sampled as per schedule.
	MW12-05-03	X	X	Quarterly	4 of 4 collected. Sampled as per schedule.

	MW12-05-04	X	X	Quarterly	3 of 4 collected. No sample obtained in Q4 due to glycol contamination.
	MW12-05-05	X	X	Quarterly	4 of 4 collected. Sampled as per schedule.
	MW12-05-06	X	X	Quarterly	3 of 4 collected. No sample obtained in Q3 due to equipment malfunction.
	MW12-05-07	X	X	Quarterly	3 of 4 collected. No sample obtained in Q3 due to equipment malfunction.
	MW17-12-01	X	X	Quarterly	4 of 4 collected. Sampled as per schedule.
	MW17-12-02	X	X	Quarterly	4 of 4 collected. Sampled as per schedule.
	MW17-12-03	X	X	Quarterly	4 of 4 collected. Sampled as per schedule.
	MW17-12-04	X	X	Quarterly	4 of 4 collected. Sampled as per schedule.
	MW17-12-05	X	X	Quarterly	4 of 4 collected. Sampled as per schedule.
	MW17-12-06	X	X	Quarterly	4 of 4 collected. Sampled as per schedule.
	MW17-12-07	X	X	Quarterly	4 of 4 collected. Sampled as per schedule.
	MW17-12-08	X	X	Quarterly	4 of 4 collected. Sampled as per schedule.

6.2 Groundwater Quality Control and Assurance

In 2021, 139 groundwater samples were taken at Minto. A total of 34 duplicate QC samples were taken from groundwater sampling sites, representing 24.46% of the total number of samples collected in 2021.

The EMSRP recommends field duplicate sampling be conducted at a frequency of one field duplicate sample per ten groundwater monitoring samples. The recommended rate of field duplicate sampling was achieved in 2021.

6.3 Groundwater Monitoring Stations

The EMSRP details the groundwater wells at the Minto Mine, including operative and inoperative wells. Figure 6-1 shows a location map of the operative wells. Stations collected more than twice in 2021 have results presented as follows: Mean, Minimum and Maximum values and are compared to their historical results from the date of the well installation to 2020

Results for the 2021 Groundwater Monitoring Program groundwater wells were submitted in Monthly Reports.

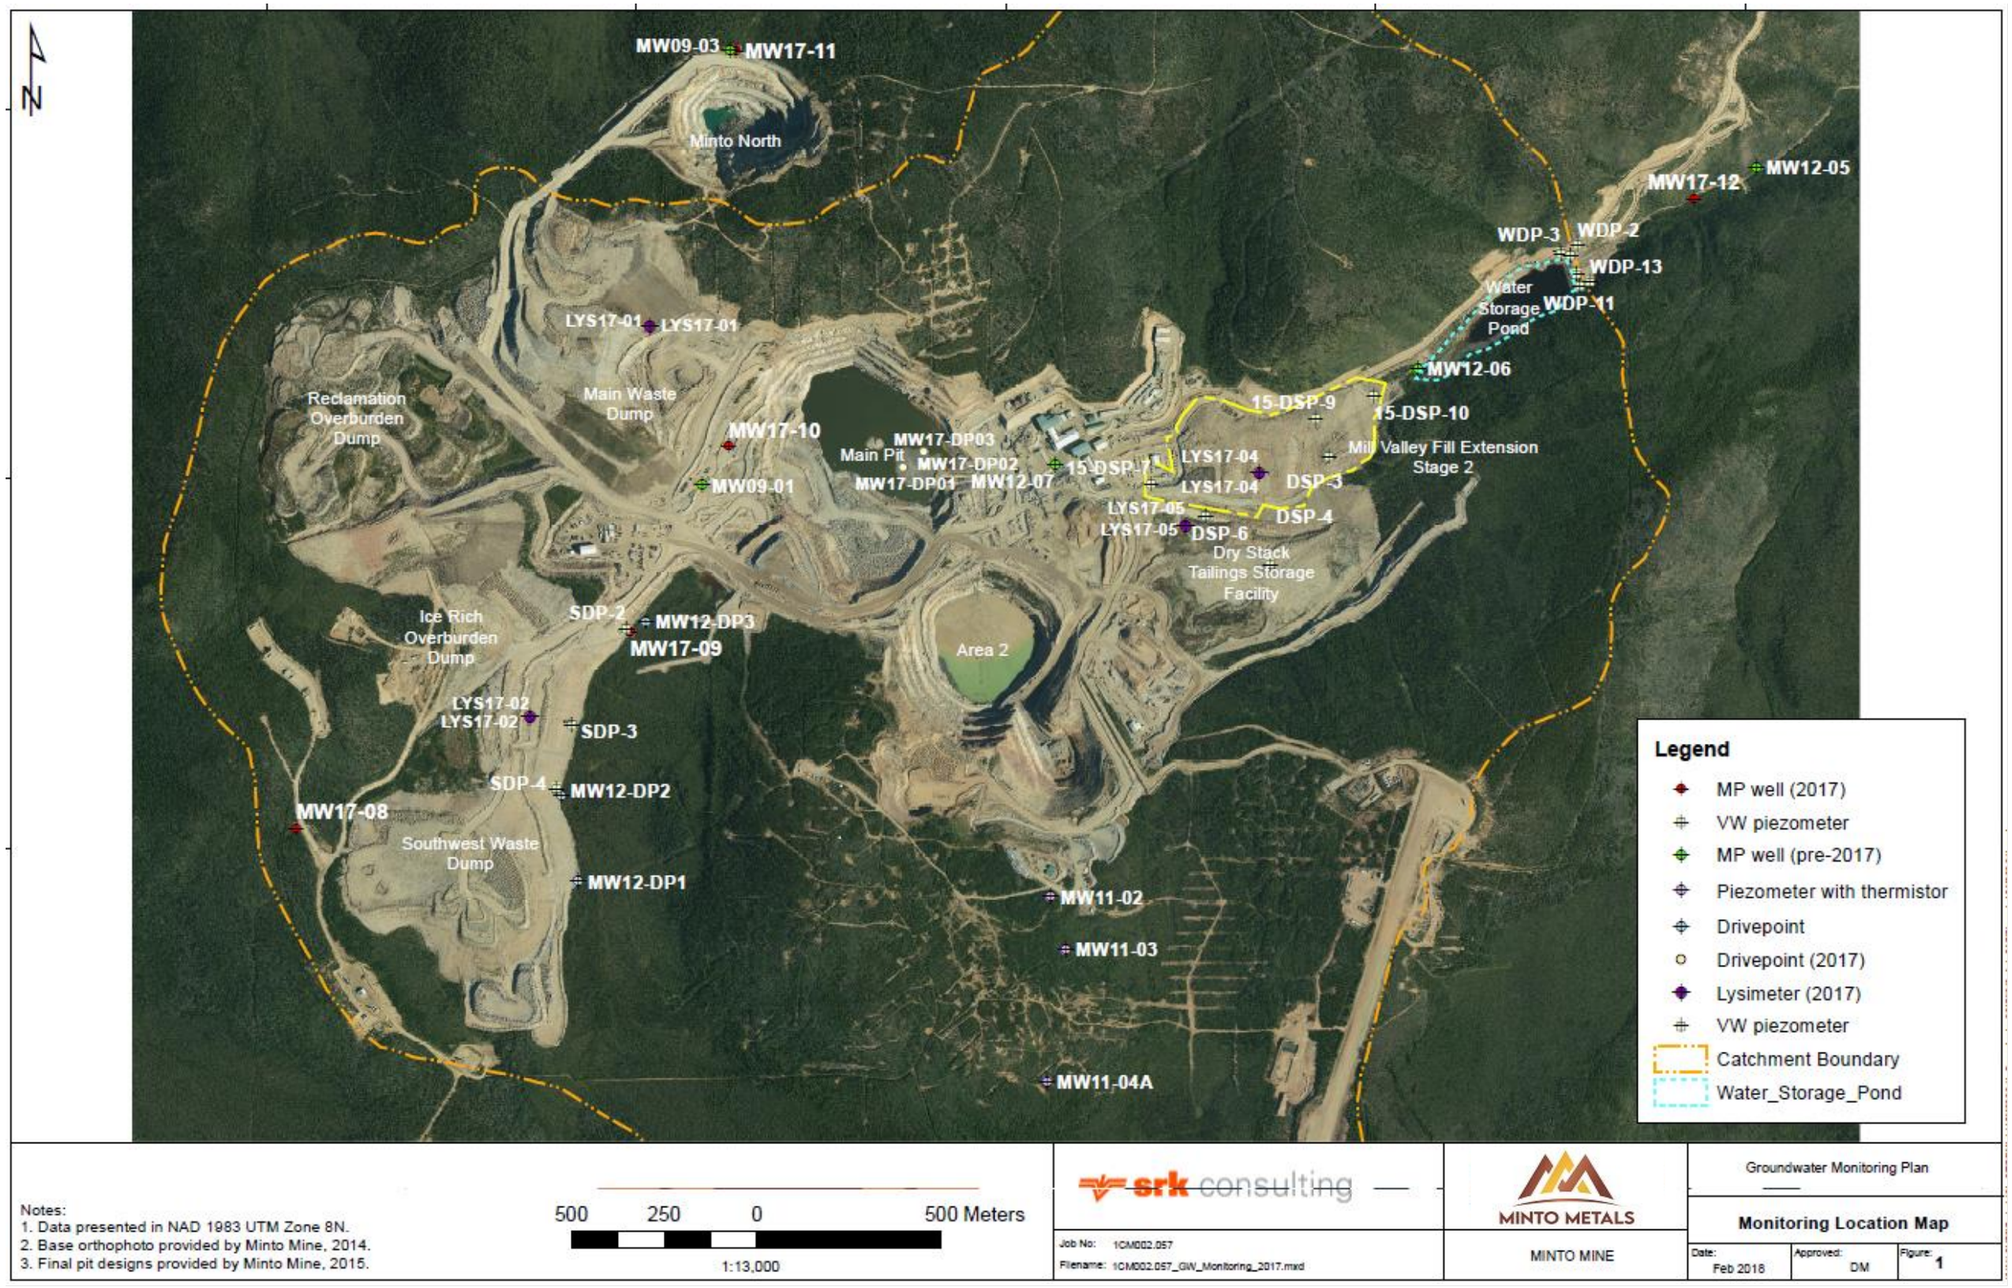

Figure 6-1: Minto Mine Groundwater Well Locations 2021

6.3.1 MW09-03

Groundwater well MW09-03 water quality results from 2021 are summarized in Table 6-2 and Table 6-3 and compared to historical data. MW09-03 produced results from sampling zones 01 and 02, while zone 03 produced no water during 2021. As such, only results for zones 01 and 02 are presented below. Per the AMP, this well is sampled monthly. The well was not sampled in January as the sampling equipment was off-site for calibration and maintenance.

6.3.2 MW12-DP1

MW12-DP1 was destroyed in August 2017 when the permafrost into which the well had been installed, degraded, compromising the ground integrity and the well. As such, water quality results are not presented.

6.3.3 MW12-DP2

MW12-DP2 was dry or frozen during the 2021 sampling events, thus water quality results are not presented.

6.3.4 MW12-DP3

MW12-DP3 was dry or frozen during the 2021 sampling events, thus water quality results are not presented.

6.3.5 MW12-05

Groundwater well MW12-05 water quality results from 2021 are summarized in Table 6-4 through Table 6-10 and compared to historical data. Zones 01 to 07 were sampled and analyzed during 2021 under the Groundwater Monitoring Plan. Ongoing AMP results are discussed in Sections 10.3 and 10.4.

6.3.6 MW12-06

Groundwater well MW12-06 water quality results from 2021 are summarized in Table 6-11 through Table 6-16 and compared to historical data. Zones 02, 04, and 06 were sampled and analyzed during 2021 under the Groundwater Monitoring Plan, while Zones 01, 03, and 05 were also sampled in response to the Adaptive Management Plan.

6.3.7 MW12-07

Groundwater obtained from Zone 1 (01) was contaminated with glycol from the Westbay well casing during all sampling sessions in 2021, indicating a possible damaged sampling port. One clean sample was obtained for Zone 1 in 2021 and water quality results were produced for SO_4-D, N-NH_3, N-$N0_2$, AND N-$N0_3$. Historic groundwater

results from 2012 to 2020 for Zone 1 are summarized in Table 6-17 alongside the limited water quality results from 2021.

Groundwater quality results for Zone 2 (02) from 2012 to 2021 are summarized in Table 6-18.

6.3.8 MW17-08

This well was installed in July 2017 to monitor the background groundwater quality up-gradient of the Southwest Waste Dump and other mine activities. Four zones were sampled and analyzed in 2021, the results are summarized in Table 6-19 to 6-22 below

alongside historical results. The shallowest zone, MW17-08-04, has been found dry in 2019 and 2020; however, two (2) samples were obtained in 2021. Table 6-22 compares 2017-2018 water quality results with 2021 results.

6.3.9 MW17-09

This well was installed in July 2017 to monitor groundwater down-gradient of the Southwest Waste Dump. One zone was identified below an ice-rich layer, it was sampled and analyzed once in 2017. In 2018 the well was frozen in Q1 and Q2 and was found dry during the Q3 and Q4 sampling events. In 2019, 2020 and 2021, the groundwater probe could not reach the sampling port. It is likely that the well has been destroyed.

6.3.10 MW17-10

This well was installed in July 2017 to monitor groundwater down-gradient of the Main Waste Dump. All four ports were sampled in 2021, the results are summarized in Table 6-23 to 6-26 below alongside historical results. The shallowest zone, MW17-10-04 (04), has been found dry since installation; however, results were obtained in Q1, Q2, & Q4 of 2021. Table 6-23 below summarizes water quality results from Zone 4 in 2021.

6.3.11 MW17-11

This well was installed in July 2017 to monitor groundwater down-gradient of the Minto North Pit. Quarterly samples were collected from zones 01, 02, and 03. Port 04 was sampled once in Q3 and found dry in Q1, Q2 and Q4, and port 05 was found dry in all quarters. The results are summarized in Table 6-27 to 6-30 below.

6.3.12 MW17-12

This well was installed in July 2017 to monitor groundwater down-gradient of the Dry Stack Tailing Storage Facility (DSTSF) and all other mine activities. All eight zones were sampled and analyzed in 2021, the results are summarized in Table 6-31 to 6-38 below alongside historical results.

6.4 Vibrating Wire Piezometers

At the end of 2021, there were 20 operating vibrating wire piezometers installed on site, listed in Table 6-39. SDP-4 became inoperative in late 2019 and DSP-8 became

inoperative in 2020. Summaries of data collected from each piezometer are provided in the following sections.

Table 6-39: Vibrating Wire Piezometer Summary

Vibrating Wire Piezometer	Location	Operational Status
DSP-5	DSTSF	Operational but suspect readings: 5B Inoperative: 5A (2019)
DSP-6	DSTSF	Operational
DSP-7	DSTSF	Operational but suspect readings: 1, 2, 3, 4 Inoperative: 5 and 6 (2020)
DSP-8	DSTSF	Inoperative: 2020
SDP-2	Southwest Dump	Operational: 2A Inoperative: 2B (2018)
SDP-3	Southwest Dump	Operational
SDP-4	Southwest Dump	Inoperative (2019)
WDP-2	Water Storage Pond Dam	Operational

WDP-12	Water Storage Pond Dam	Operational
WDP-13	Water Storage Pond Dam	Operational

6.4.1 DSTSF Piezometers

Data collected from DSTSF vibrating wire piezometers are presented in Figure 6-2 to 6-4. Sensor DSP-6A is included since 2021 reading was positive. Prior to 2021 this device was reading negative pressures and has not been included in the figure.

Pore water pressures in DSP-5 and DSP-7 A and DSP-5B have been gradually increasing since installation in 2013. Temperature readings at these locations indicate frozen ground conditions and it is suspected that the sensors are damaged due to the ice formation. Analysis carried out by SRK Consulting in 2015 and 2018 to consider the increasing pressures indicated high FOS values (FOS>2) even without consideration of the constructed MVFE2. The analysis also considered a review of survey hub data in the piezometer locations that indicated no accelerations or stability concerns and as a result, replacement of the damaged piezometers was not recommended. Geotechnical Inspection carried on by SRK during summer 2021 did not have any concerns related to the readings from the DSP piezometers.

DSTSF piezometer readings are collected quarterly.

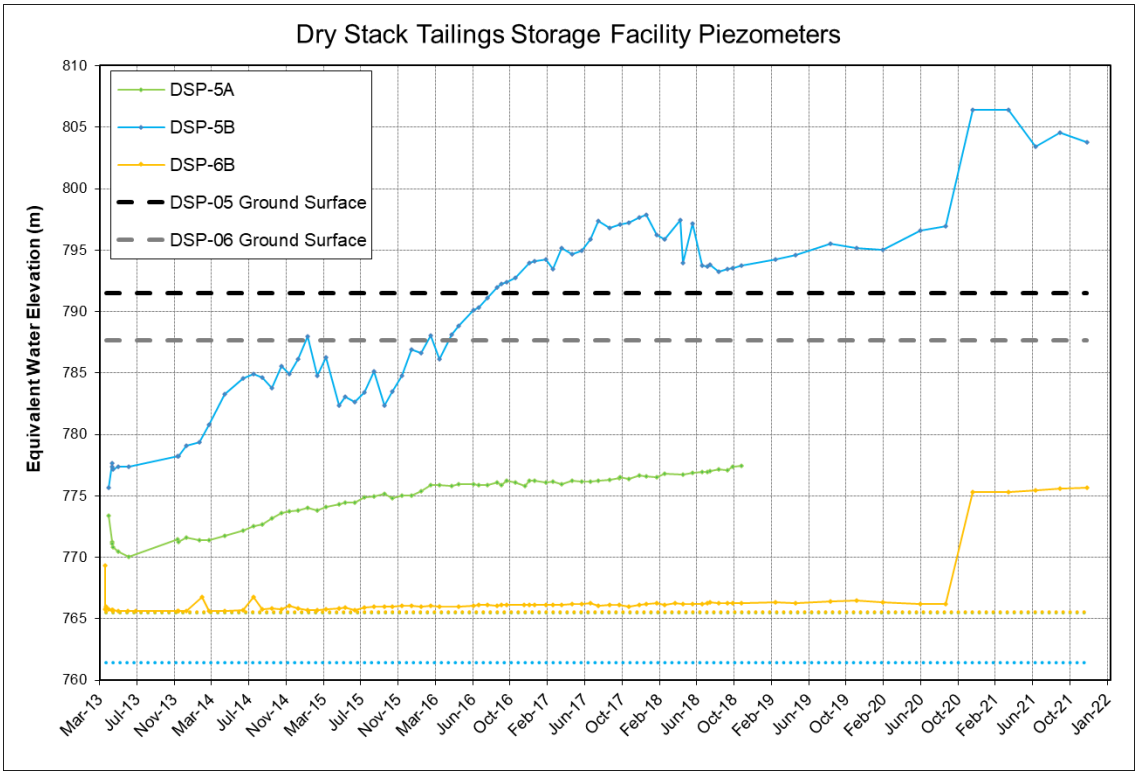

Figure 6-2: DSTSF Piezometer Data – DSP-05 and DSP-06 (2013-2021)

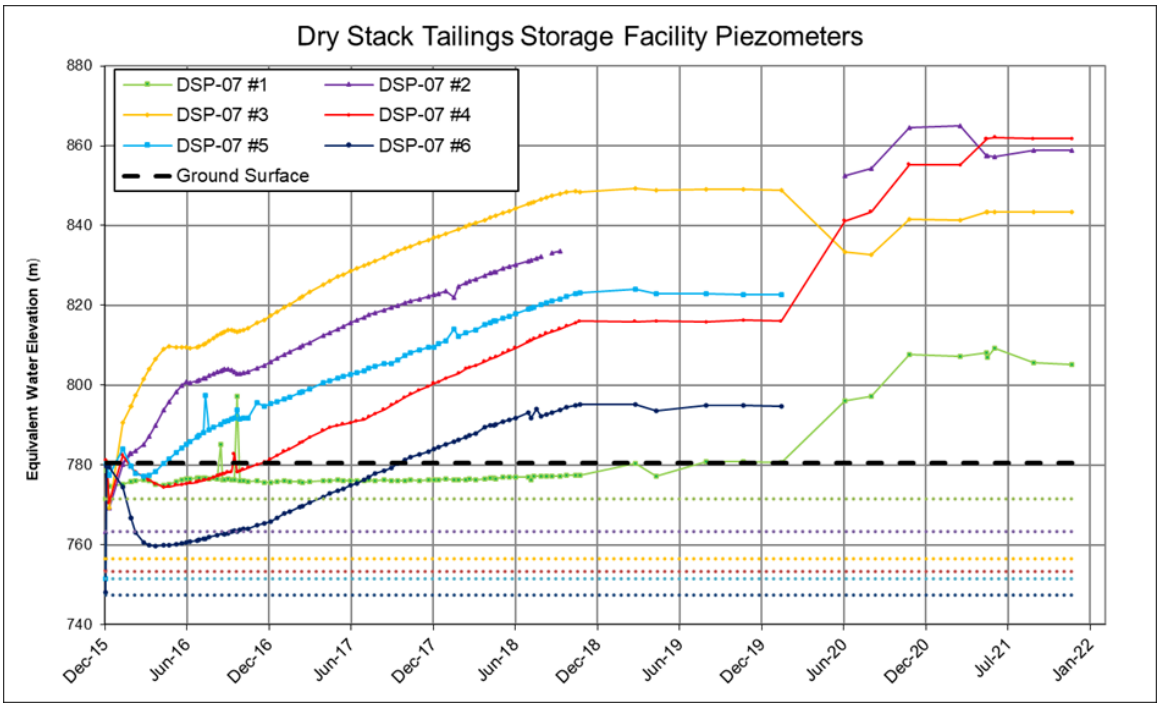

Figure 6-3: DSTSF Piezometer Data – DSP-07 (2015-2021)

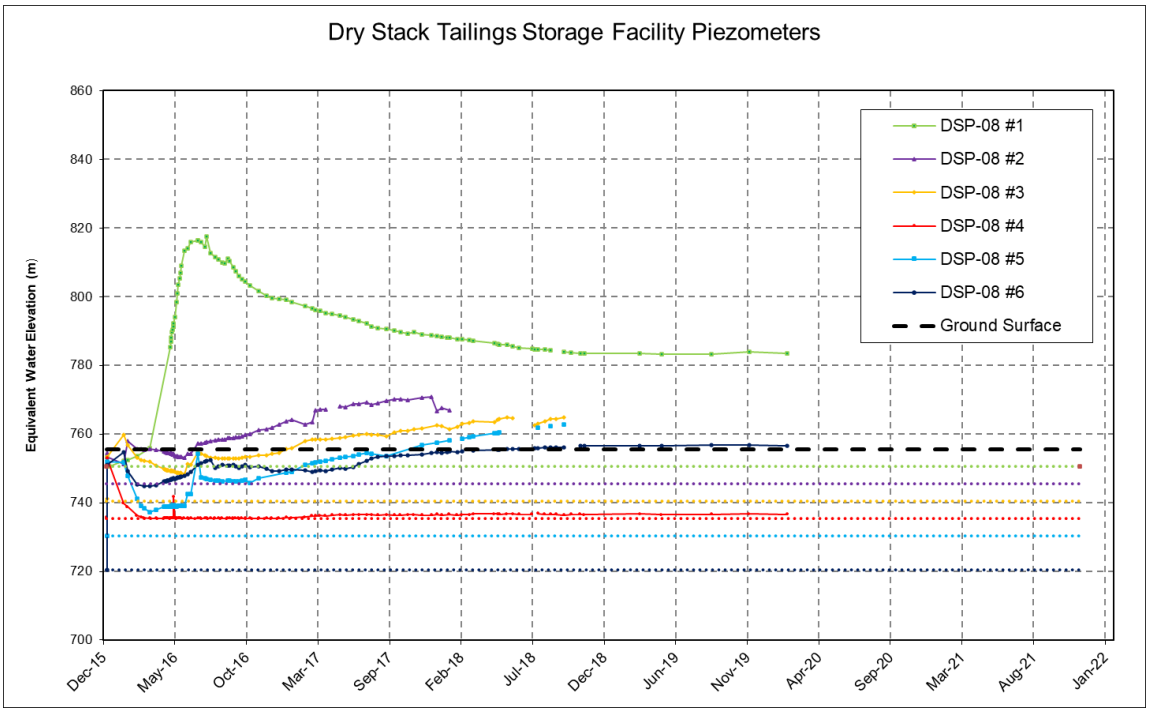

Figure 6-4: DSTSF Piezometer Data – DSP-08 (2015-2021)

6.4.2 Southwest Dump Piezometers

Data collected from Southwest Dump vibrating wire piezometers are presented in Figure 6-5. Sensors SDP-3A and SDP-3B are reading negative pressures and have not been included in the figure. Data are collected quarterly. Data indicates stable conditions with some seasonal changes in pore pressure. Abnormal November 2021 readings from SDP-3B, SDP-4A and SPD-4B, not presented in this figure. SPD-2B non-functional since 2018.

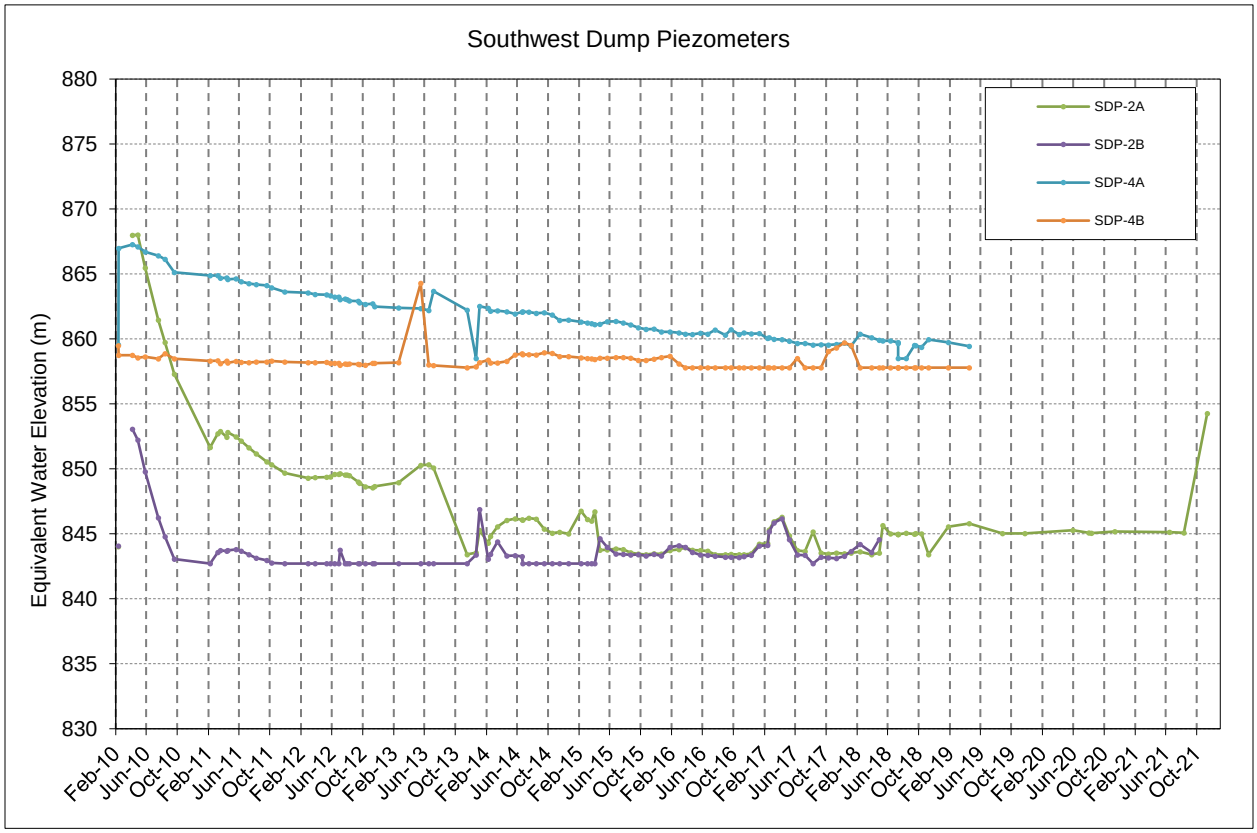

Figure 6-5: Southwest Dump Piezometer Data (2010-2021)

6.4.3 Water Storage Pond Dam Piezometers

Data collected from WSP Dam vibrating wire piezometers are presented in Figure 6-6. WDP-2, WDP-3, WDP-5, and WDP-11 have some readings at negative. Figure 6-6 only represents positive readings. Data are collected monthly. Pressures in 2021 reflect an increase since the pond was filled up to 712.5 m elevation. Water content shows an elevation of 712.9m at the end of 2021.

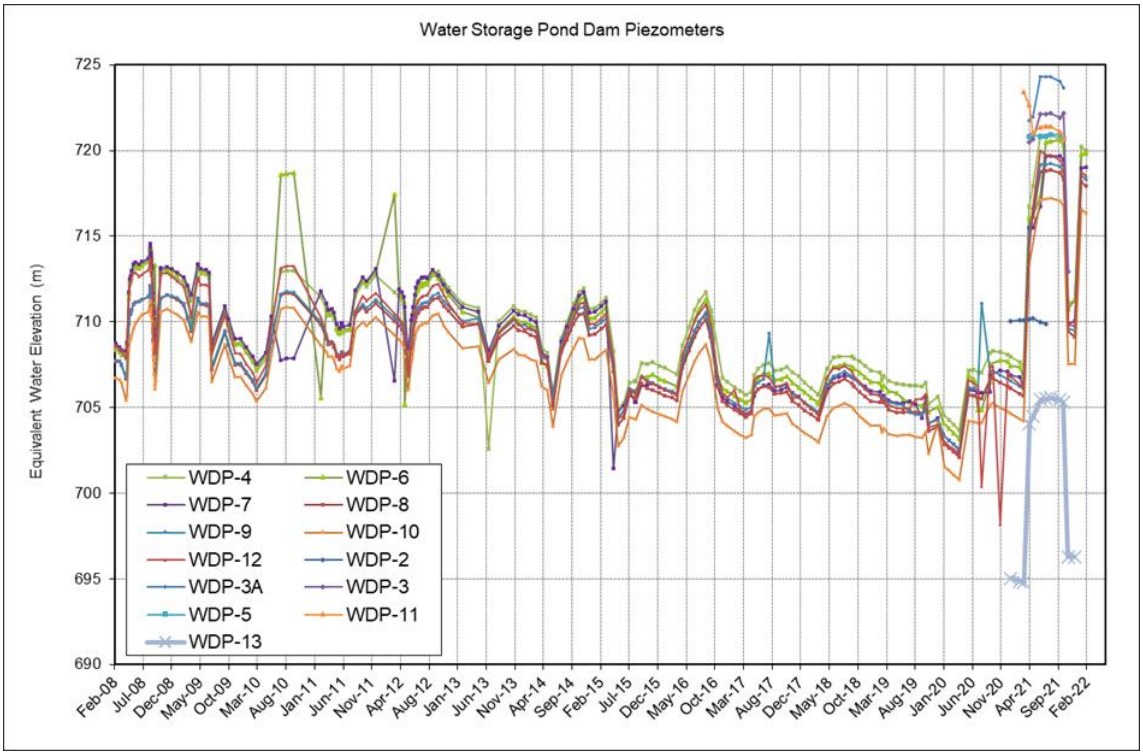

Figure 6-6: WSP Dam Piezometer Data (2008-2021)

6.5 Ground Temperature Cables

There are currently 19 operating thermistors (ground temperature cables) installed on site, listed in Table 6-40. There were no changes to the operational status of any of the existing thermistors in 2021. Summaries of data collected from each thermistor are contained in the following sections.

Table 6-40: Thermistor Summary (2021)

Thermistor	Location	Operational Status
A2T-1	A2PTSF	Operational
DST-10	DSTSF	Operational
DST-11	DSTSF	Operational
DST-13	DSTSF	Operational

6.5.1 A2 Pit Thermistor

Data collected from A2TSF thermistor are presented in Figure 6-7. Data are collected quarterly. No major changes to ground temperatures at the A2PTSF were observed in 2021. Nodes 7, 8, 9 and 15 had non reliable readings below –10 C.

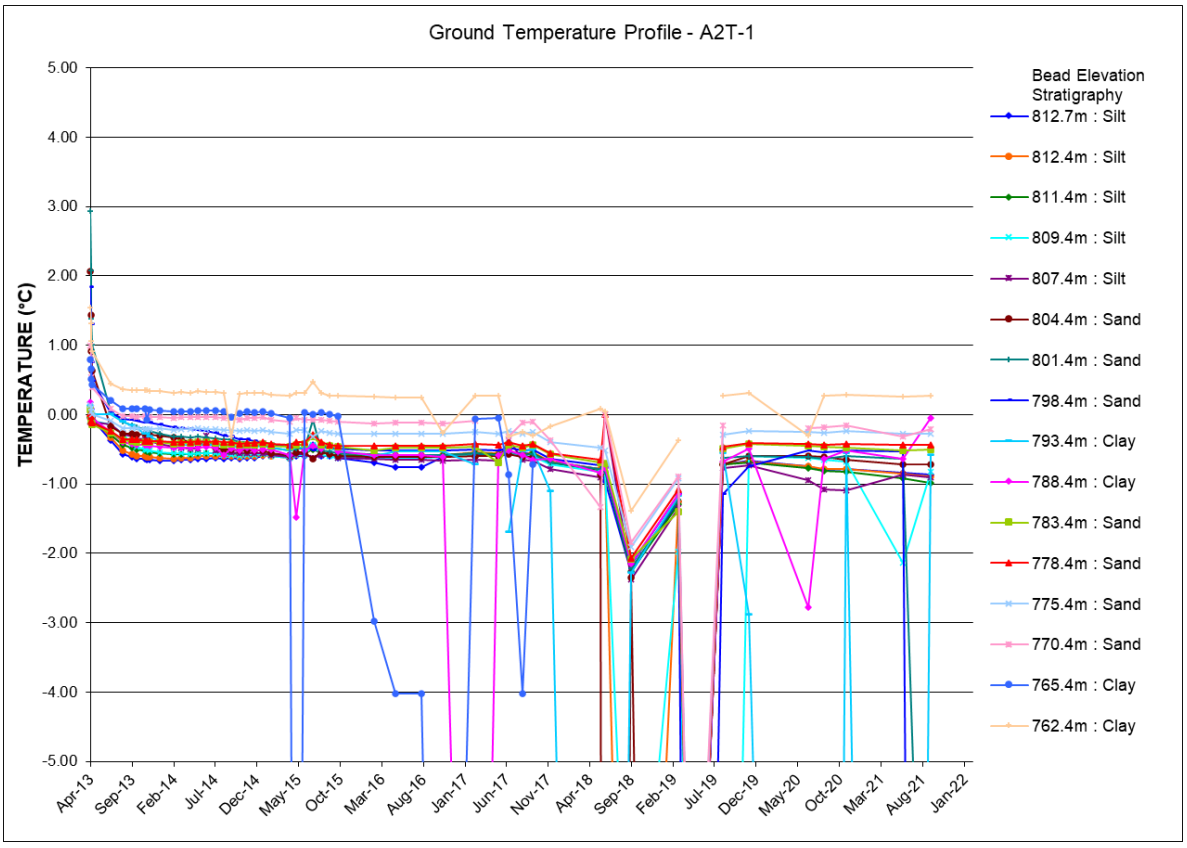

Figure 6-7: Thermistor A2T-1 (2013-2021)

6.5.2 Dry Stack Thermistors

Data collected from DSTSF thermistors are presented in Figures 6-8 through 6-12. Data are collected quarterly. No major changes to ground temperatures at the DSTSF were observed in 2021.

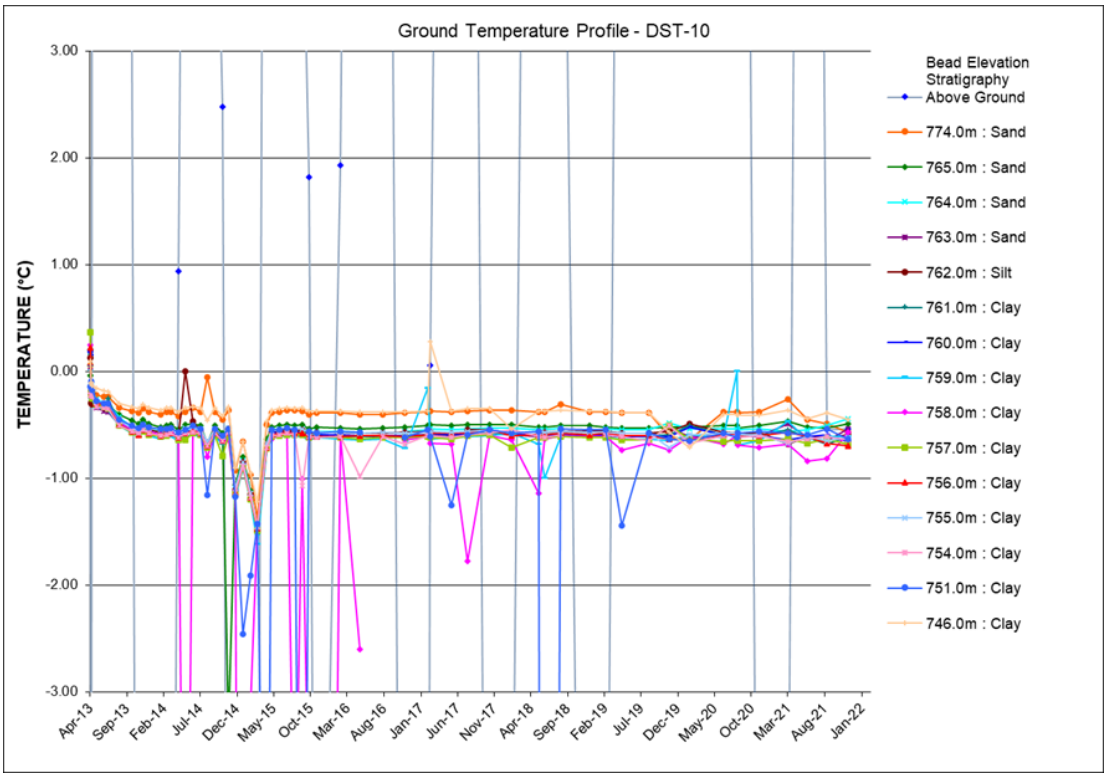

Figure 6-8: Thermistor DST-10 (2013-2021)

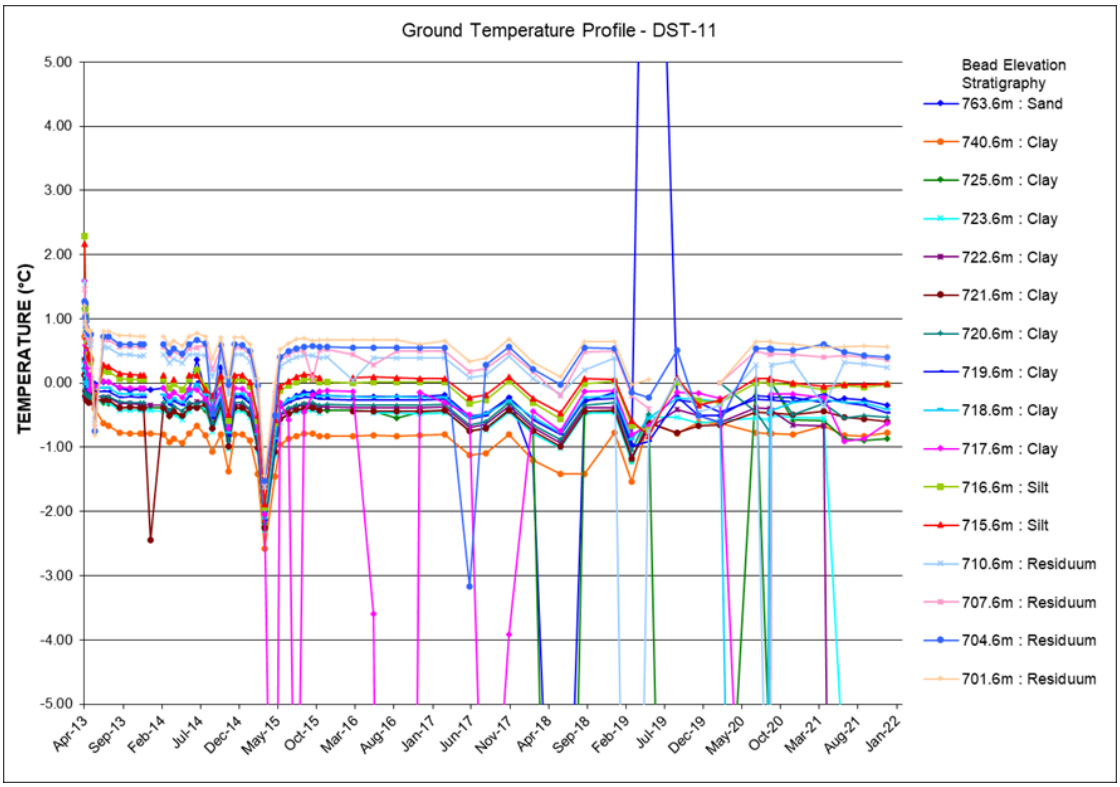

Figure 6-9: Thermistor DST-11 (2013-2021)

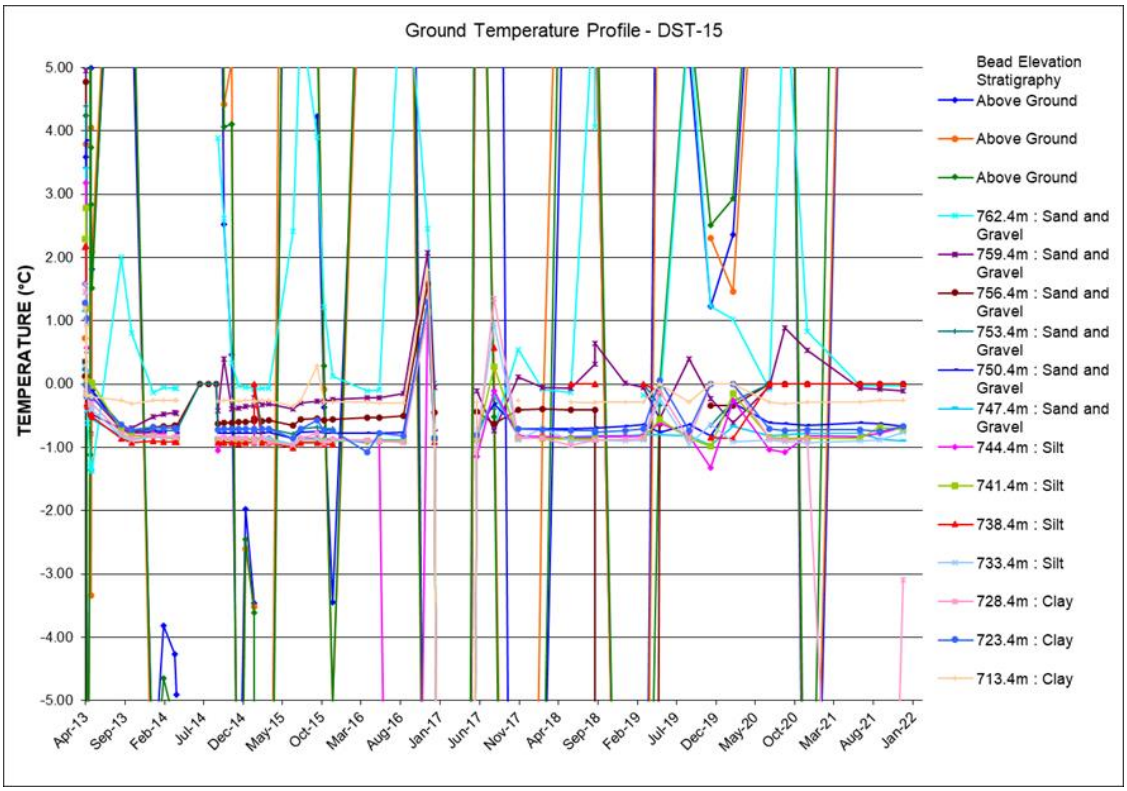

Figure 6-12: Thermistor DST-15 (2013-2021)

6.5.3 Ridgetop Thermistors

Data collection has been reduced to annually for Ridgetop thermistor. No major changes to ground temperatures at the Ridgetop were observed in 2021.

6.5.4 Southwest Dump Thermistors

Data collected from SWD thermistors are presented in Figures 6-13 through 6-15. Data are collected quarterly. No major changes to ground temperatures at the SWD were observed in 2021.

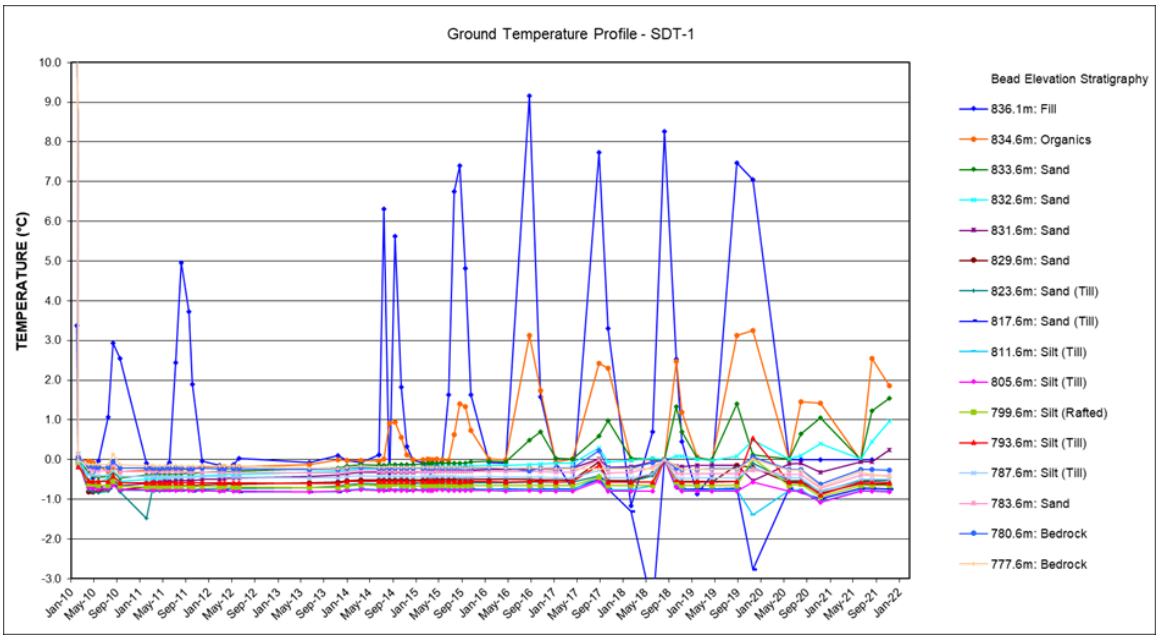

Figure 6-13: Thermistor SDT-1 (2015-2021)

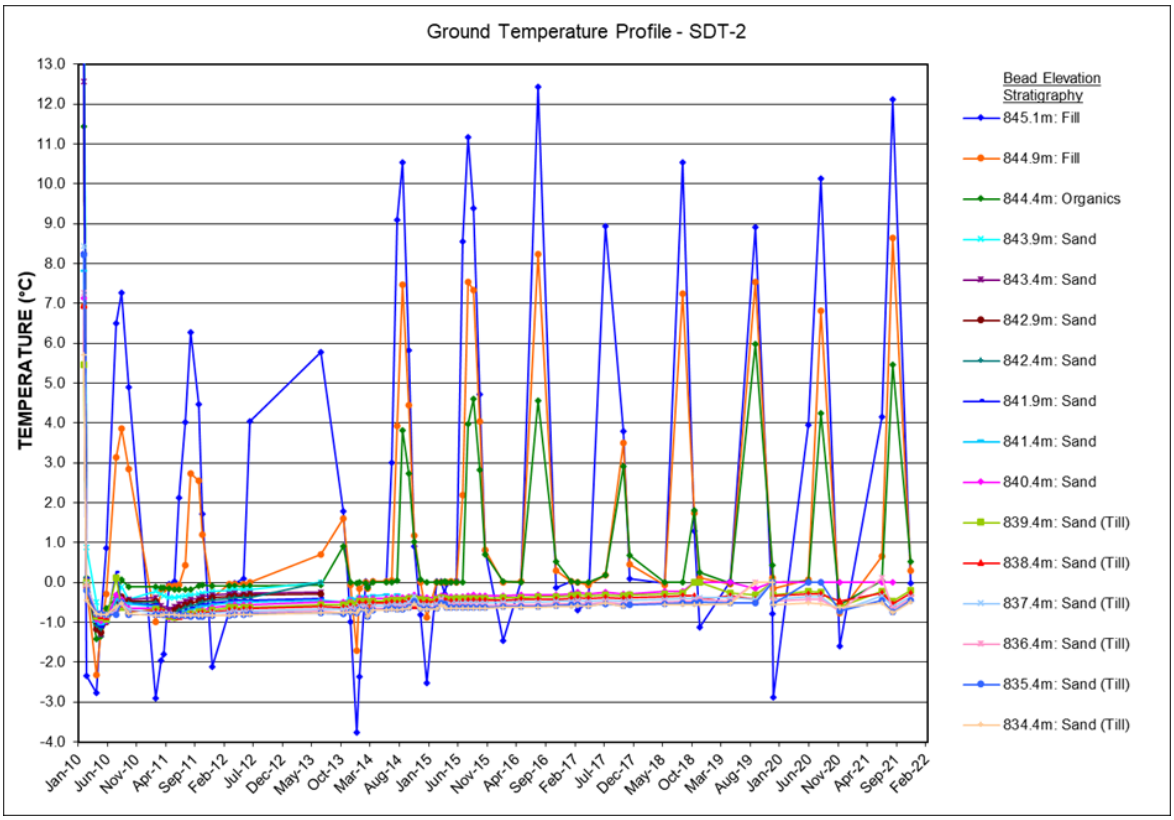

Figure 6-14: Thermistor SDT-2 (2015-2021)

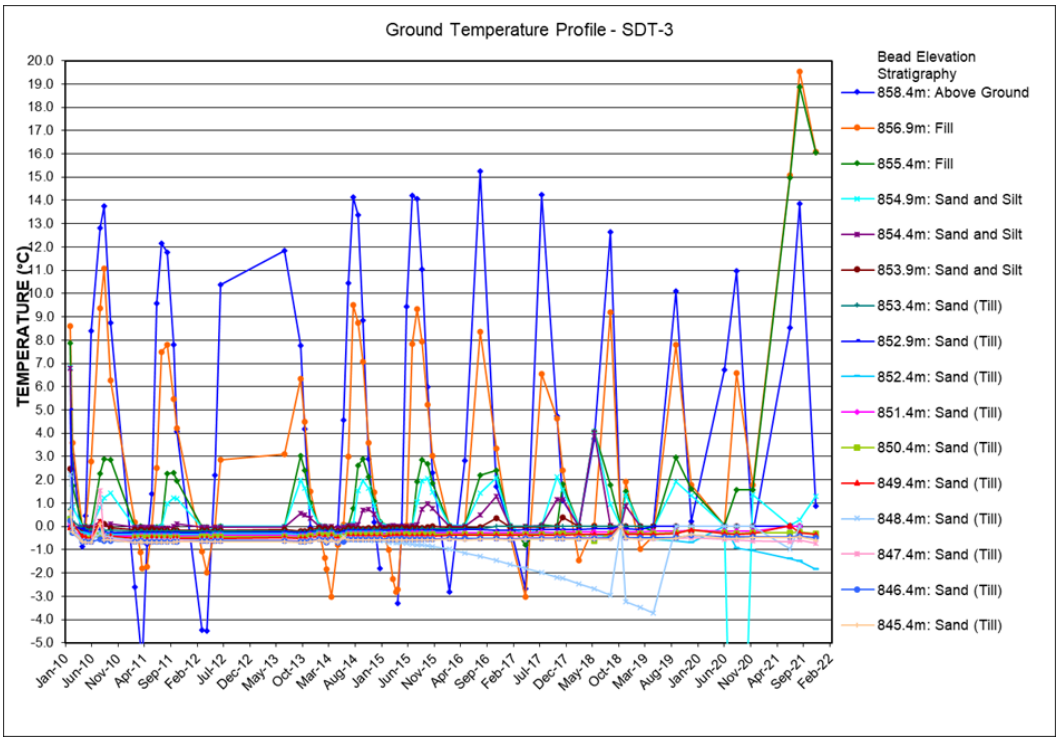

Figure 6-15: Thermistor SDT-3 (2015-2021)

Note: Bead 9 (852.4 m: Silty Sand) appears to be damaged with readings drifting colder in temperature.

6.5.5 Water Storage Pond Dam Thermistors

Data are collected monthly from all water retention dam thermistors. All thermistors continue to show temperatures well above zero since installation.

7 Seepage Water Quality Monitoring Program

Minto Mine implements a Seepage Monitoring Plan (SMP) to assess acid rock drainage and metal leaching conditions from several sources, including pit wall seepage, ore stockpile areas, overburden dumps, waste rock dumps, DSTSF, Mill Valley Fill Extension 1 and 2, the mill area and other seepage locations. Analysis of seepage results and water quality analysis assists in improving understanding of water chemistry, load, and water balance issuing from waste dumps, overburden dumps, ore stockpiles, and tailings facilities.

Seepage monitoring conducted in 2021 was carried out in accordance with the EMSRP. The EMSRP states that seepage surveys will be conducted twice a year, during spring runoff and in early fall, by walking the toe of each waste dump, stockpile, or other areas of interest. The survey routes and sampling locations for each seepage monitoring event are recorded using GPS data. Samples are taken within ±5m of the original GPS point. If there is no seepage within the 5m buffer, the site is considered dry during that sampling session. Observations from past seepage surveys indicate that many identified seepage sites are seasonally variable. It has also been observed that weather patterns have an impact, where snow melt or rain contribute to observable flows that are absent during warm, dry weather. A map showing the 2021 survey routes and monitoring locations can be found in Figure 7-1.

WUL QZ14-031 identifies a Surface Water Surveillance Program which requires regular monitoring of seepage at several permanent seepage water quality stations. These stations include: W8 (Destroyed in 2017), W8A, W17, (W36, W37 – destroyed in 2016), and W62. The water quality results for these permanent seepage quality stations are additionally reported to the Yukon Water Board (YWB) monthly. Prior to WUL QZ14-031, Minto operated under WUL QZ96-006 which included seepage monitoring sites W32, W38, W39 and W40 in the Surface Water Surveillance Program.

Constituents of concern, namely dissolved copper, dissolved cadmium, dissolved iron, dissolved selenium, ammonia, nitrate, and nitrite have been graphed below for each site sampled. In the event of results below the detection limit (DL), the limit is plotted, and the results are presented as 0.5*DL. In cases where a graph's trend is skewed due to visual outliers (i.e., data points that are larger than the mean by an order of

magnitude), a second graph with outliers removed is provided. All lab results for 2020 spring and fall seepage monitoring programs are provided in Appendix D.

Per current EMSRP, field data and observations including coordinates, weather, field measurements (pH, conductivity, and temperature), a sketch of the location, water conditions and color of sediment and number of filters used. The original field sheets are presented with the pictures that were obtained at each site in Appendix D.

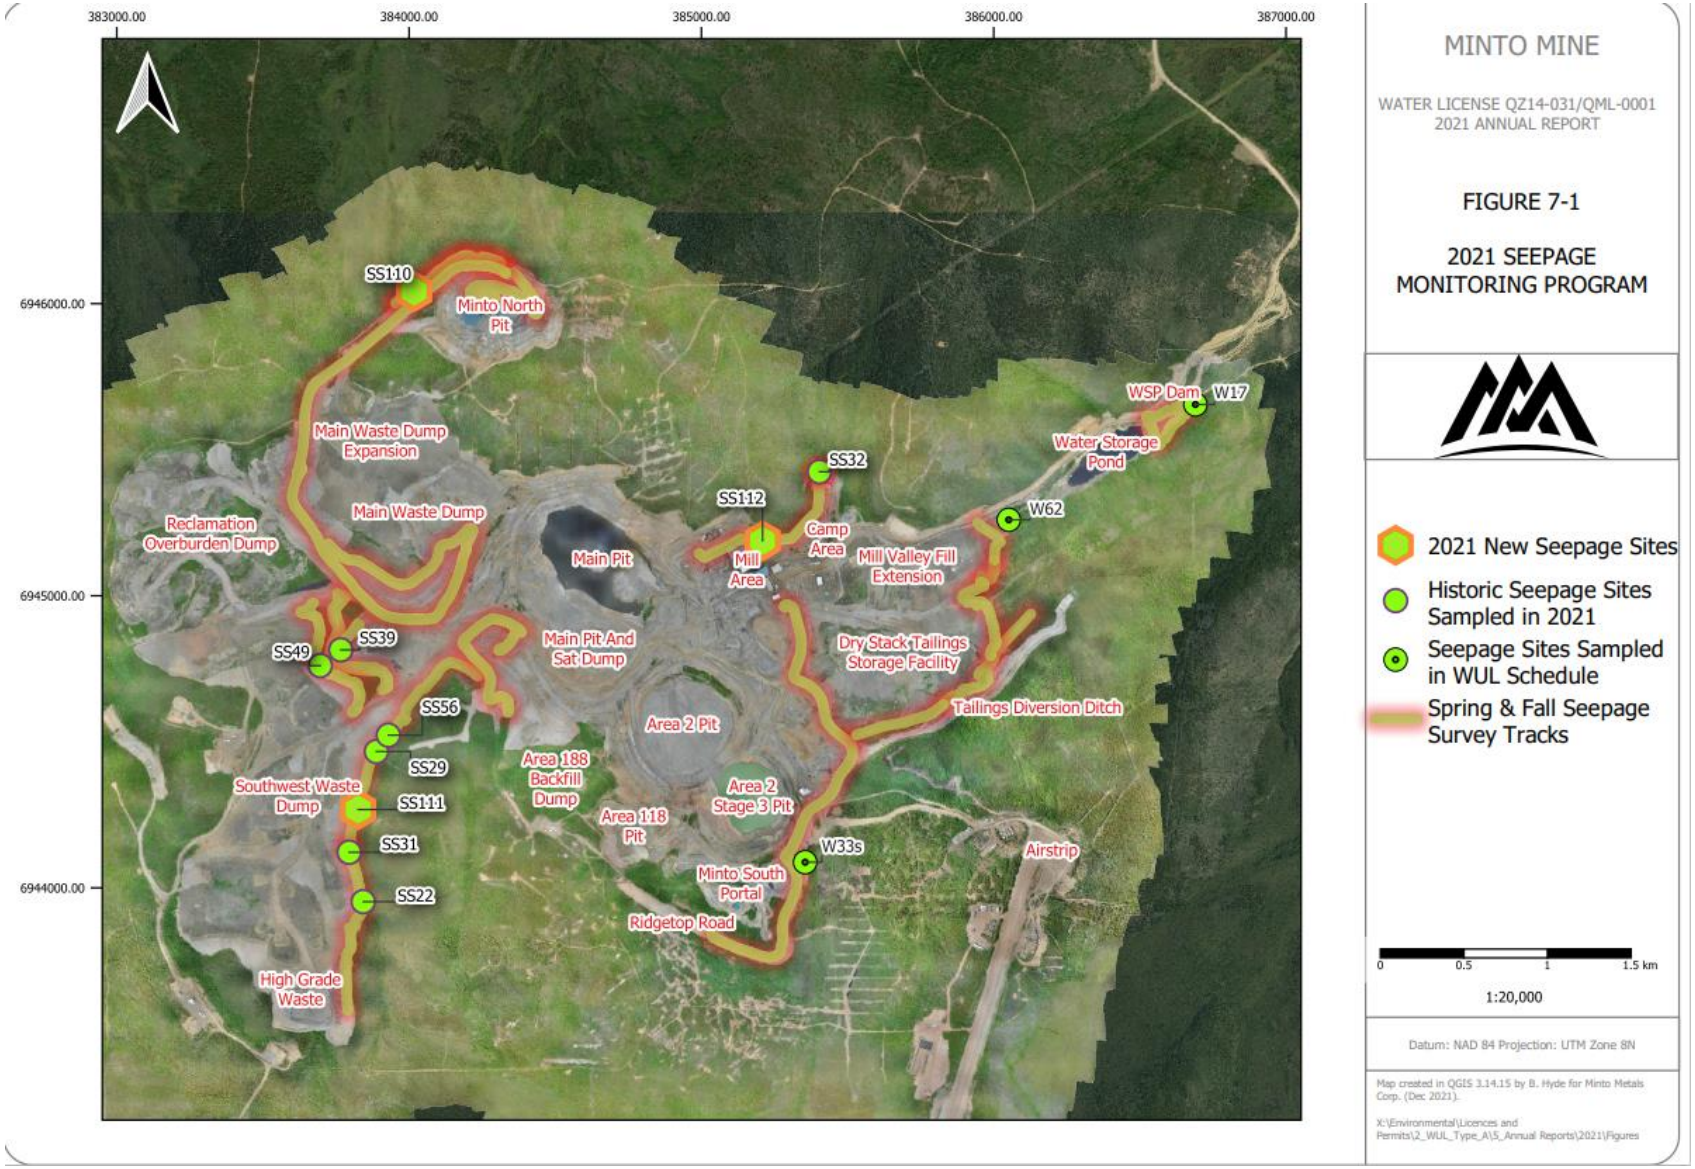

Figure 7-1: 2021 Seepage Monitoring Program

7.1 Southwest Dump

Seepage samples were collected from the Southwest Waste Dump (SWD) area at sites SS29, SS31 and SS56 during the spring survey. A new seep was discovered at SS111, during the spring survey. Sites SS22 and SS31 were sampled in the fall seepage survey. The ice-rich overburden dump (IROD) area of the SWD was also surveyed and historic sites SS39 and SS49 were sampled during the spring survey. SS39 was sampled during the fall survey.

Historical data and 2021 seepage water quality results for the SWD are presented in Figures 7-2 through 7-22. Data has been separated into three locations within the SWD: SWD North (Figures 7-2 to 7-8), SWD South (Figures 7-9 to 7-15) and IROB (Figures 16-22). The figures include water quality results for dissolved copper, dissolved cadmium, dissolved iron, dissolved selenium, and nutrient levels for ammonia, nitrite, and nitrate.

7.2 Reclamation Overburden Dump (ROD)

All sites along the ROD were observed to be dry during the 2014, 2015, 2016 and 2017 surveys. The survey for the ROD was proposed to be canceled and therefore, in 2018 and 2019 the ROD was not surveyed.

The ROD was surveyed in the fall of 2020 to confirm the absence of seeps. No seeps were discovered, and this area will not be surveyed until further reclamation work is completed.

7.3 Main Waste Dump

No recurring seeps in the Main Waste Dump (MWD) area were observed during the 2021 seepage surveys. Only two seeps have been identified in this area since 2013. The first, SS12, was last recorded flowing in 2015 and the second, SS102, was sampled twice during September 2018 and once in September 2019. Due to the limited dataset, and the lack of any new seeps, historical data for the MWD will not be presented in this report. Minto staff will continue to monitor the area for seepage in future surveys.

7.4 Main Pit and SAT Dump

The Main Pit and SAT Dump contained no seepage sites in 2021. SS107, discovered in 2020 was confirmed dry in 2021. As there is no historic data to compare, results for SS107 and SS109 are displayed in Table 7-1, below.

Table 7-1: Main Pit and SAT Dump Seeps, 2020

Station	SS107	SS109
Sample Date	12-Jun-20	8-Sep-20
Dissolved Metals (mg/L)		
Cu-D	0.0317	0.185
Cd-D	<0.000025	0.000248
Fe-D	<0.01	<0.01

Nutrients (mg/L)		
N-NH3	0.0598	0.0312
N-NO2	0.413	0.0075
N-NO3	5.27	22.7

7.5 Minto North

Until 2021, only one recurring seep, SS101, had been observed in the Minto North area. In spring 2021 a new seep, SS110 was sampled ~25m N of SS101 along the northern edge of the Minto North haul road. SS110 was dry during the fall survey. Although it was checked frequently, it was only discovered flowing on one occasion in June 2021. The results of these samples are presented with historic water quality results for dissolved copper, dissolved cadmium, dissolved iron, dissolved selenium, and nutrient levels for ammonia, nitrite, and nitrate in Table 7-2 below.

Table 7-2: Minto North Seepage, 2018-2021

Station	SS101				SS110
Sample Date	19-May-18	24-May-19	24-May-19	25-May-20	21-June-21
Dissolved Metals (mg/L)

N-NO3	0.205	4.08	4.45	1.88	15.9

7.6 Pit Walls

Seepage monitoring could not be conducted at the pit walls of the Main Pit, Area 2 Pit, and Minto North Pit; all pits were unsafe to access during the 2021 surveys due to geotechnical instability.

7.7 Ridgetop Road

A survey was conducted along the bottom toe of the Ridgetop Road, at the top of which is the ore transfer pad where ore is deposited from underground before being transported to the crusher pad. Seeps in this area are monitored to ensure that leachates from the ore are not impacting a neighbouring stream which flows into a downstream collection point where it is directed to the Water Storage Pond if it meets effluent standards. No new seeps were identified in 2021. The nearby WQS W33s was sampled monthly throughout the open-water season. The results for dissolved copper, dissolved cadmium, dissolved iron, dissolved selenium, and nutrient levels for ammonia, nitrite, and nitrate are displayed in Figure 7-23 through Figure 7-29.

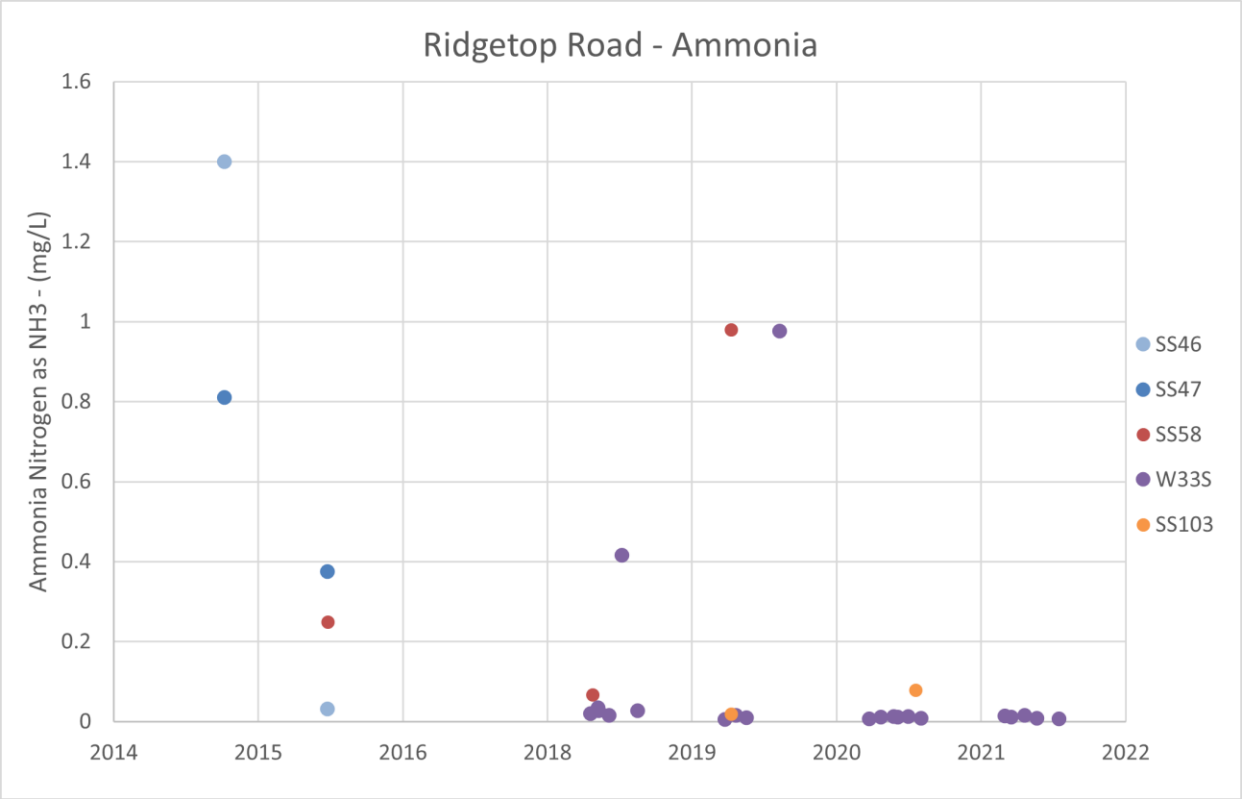

Figure 7-27: Ridgetop Road Sites – Ammonia

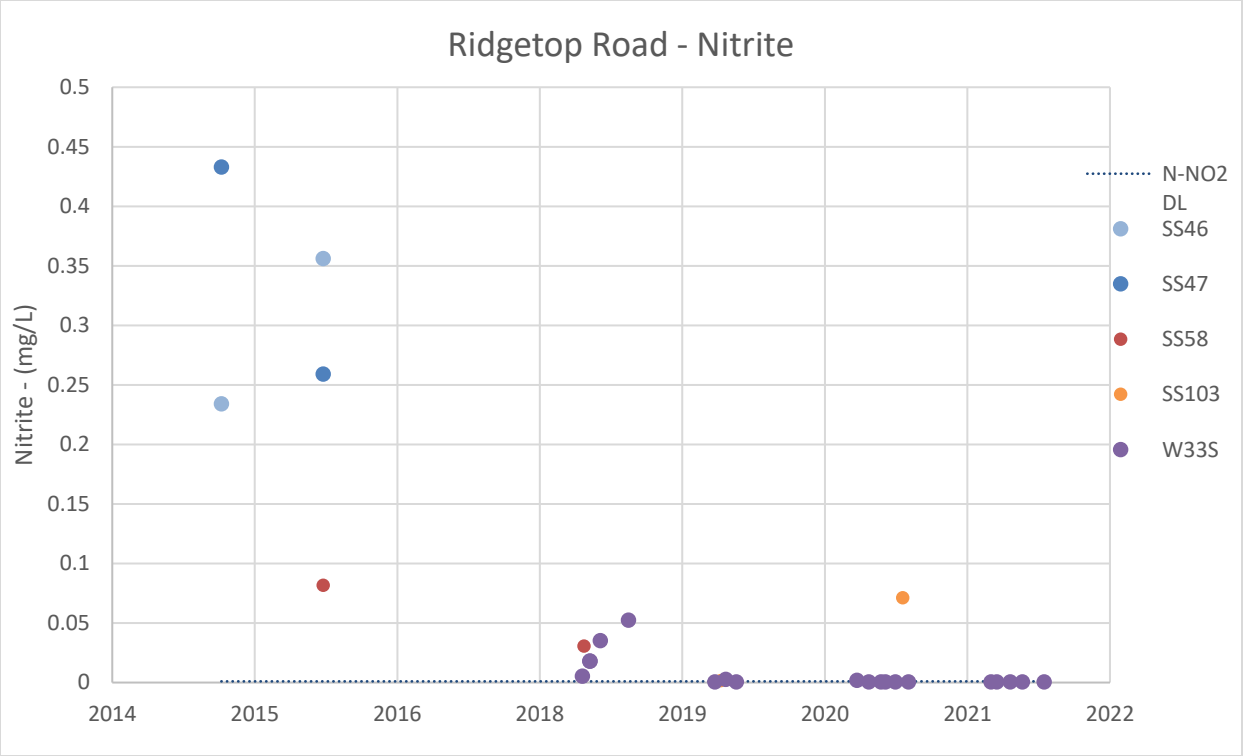

Figure 7-28: Ridgetop Road Site - Nitrite

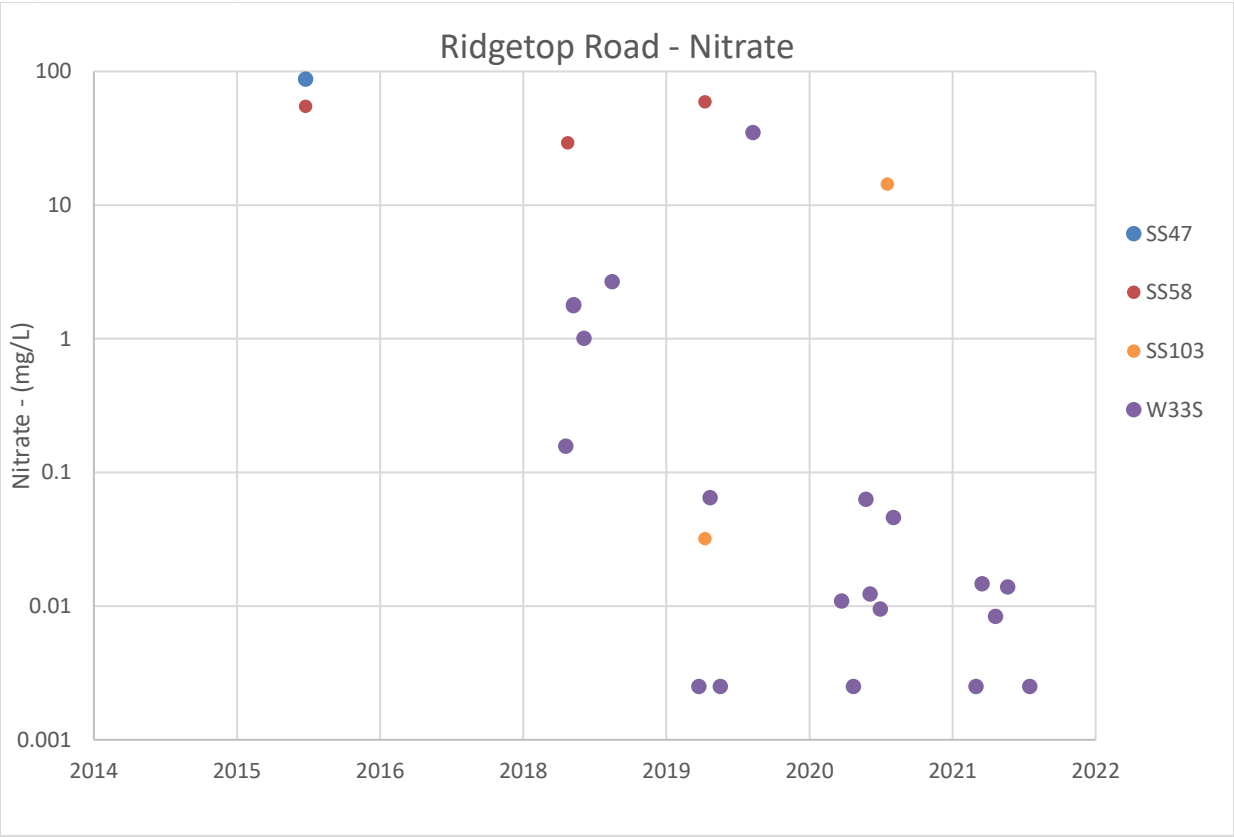

Figure 7-29: Ridgetop Road Sites – Nitrate, Outliers Removed

7.8 Ore Stockpiles

Surface seepage runs along the toe of the west ore stockpile and into the ditch parallel to the heavy vehicle road. All seeps in this area drain into the west ore stockpile sump and are pumped to the Main pit. No seeps were identified in 2021. Ore stockpiles will continue to be monitored for seeps in 2022.

7.9 Dry Stack Tailings Storage Facility (DSTSF)

No seeps were identified on the DSTF during the 2021 survey. Areas where standing water was encountered were determined to not be seeps and likely surface runoff. The DSTF will continued to be monitored for seeps in 2022.

7.10 Mill Valley Fill

7.10.1 Mill Valley Fill Water Quality Monitoring Stations

The first phase of the Mill Valley Fill (MVF) was completed in 2012 and vertical culverts were installed at both W8 and W8A to enable water quality monitoring at these locations. Obtaining water samples at W8 has been sporadic since the installation of the vertical culvert. The last time this station produced water was in late 2013. The second phase of the Mill Valley Fill Extension (MVFE) was completed in early 2016. Additional extensions were added to the vertical culverts of W8 and W8A to preserve the sampling stations. In fall 2017, W8 culvert was covered during reclamation operations and could no longer be accessed. W8A samples were collected until March 2019 and has since been dry ever since.

The Mill Valley Fill Extension Stage 2 (MVFE2) collection sump (W62) was constructed during the period of November 9, 2015, to February 7, 2016, as a replacement for the Minto Creek Detention Structure (W37) used prior to 2016. W37 was decommissioned and buried in February 2016 as part of the MVFE2 construction. W62 is approximately 30m downslope from W37 and collects runoff and seepage from the Dry Stack Tailing Storage Facility and the Mill Valley Fill. W62 is collected on a monthly frequency as part of the WUL. Water collected at W62 is pumped to the Main Pit.

Water quality results for W8, W8A, W37 and W62 are outlined in Figure 7-30 through Figure 7-46 and include results for dissolved copper, dissolved cadmium, dissolved

iron, dissolved selenium, and nutrient levels for ammonia, nitrite, and nitrate. For comparison, results for W62 are presented with the obsolete sites and separately, for trend analysis, as it is the final collection point for MVF seepage and run-off. In general, analyte concentration shows a decreasing trend; concentrations were highest during and after construction of the MVF and gradually decrease over time. Concentrations at W62 are much lower but do show a gradual increasing trend of cadmium, selenium, nitrate and iron, and a decreasing of copper, ammonia, and nitrite.

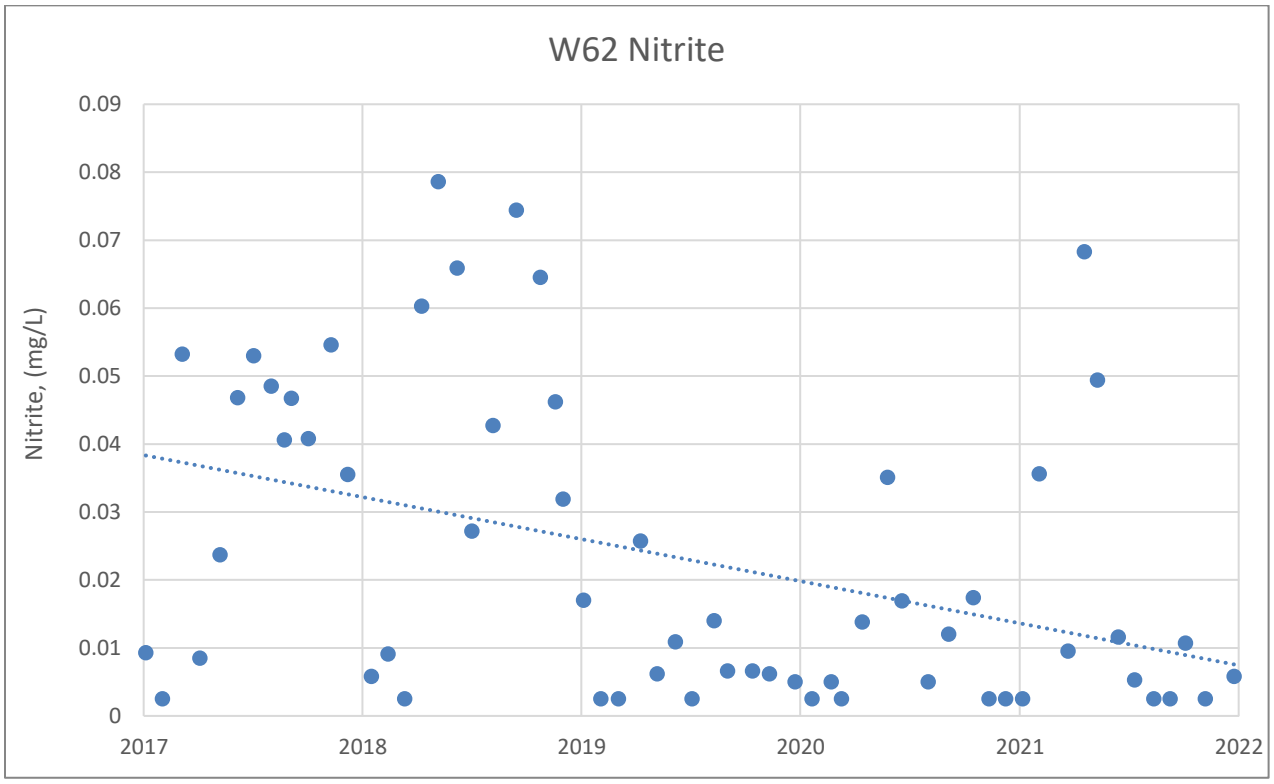

Figure 7-44: W62 Nitrite

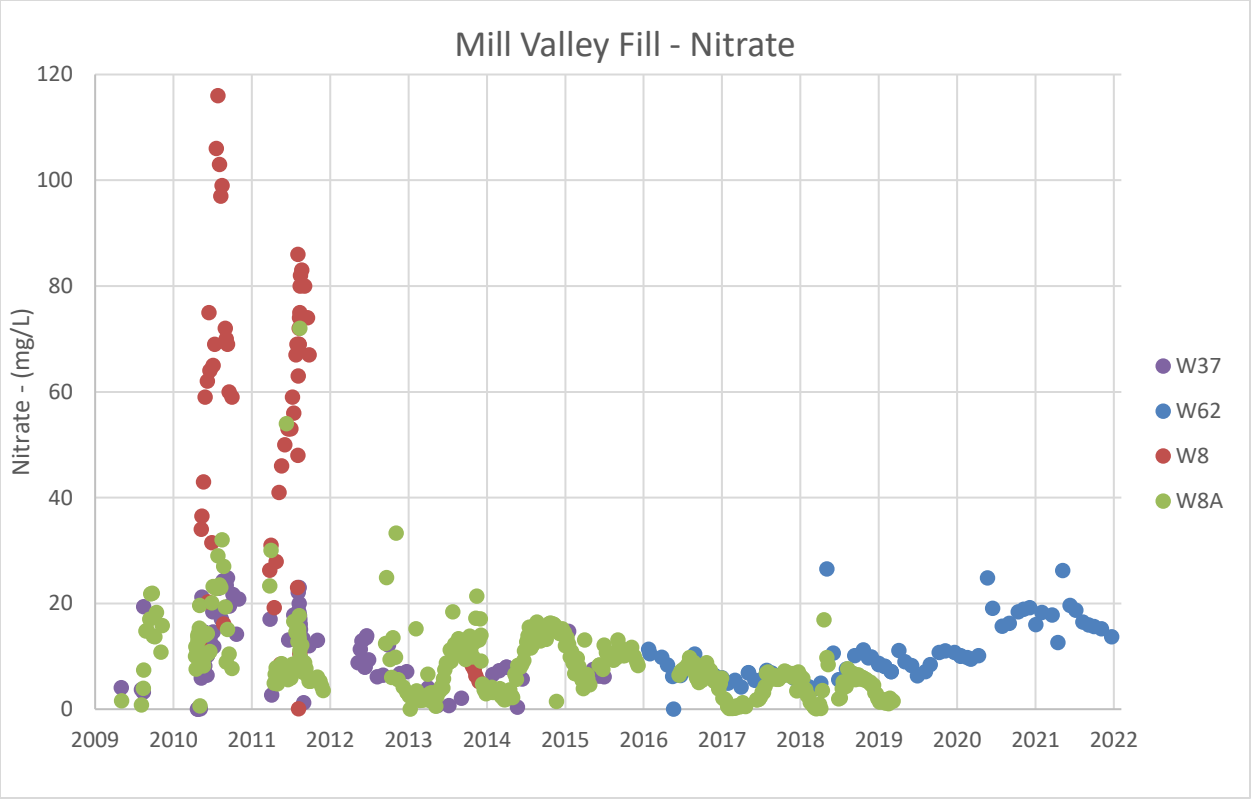

Figure 7-45: Mill Valley Fill WQS Nitrate

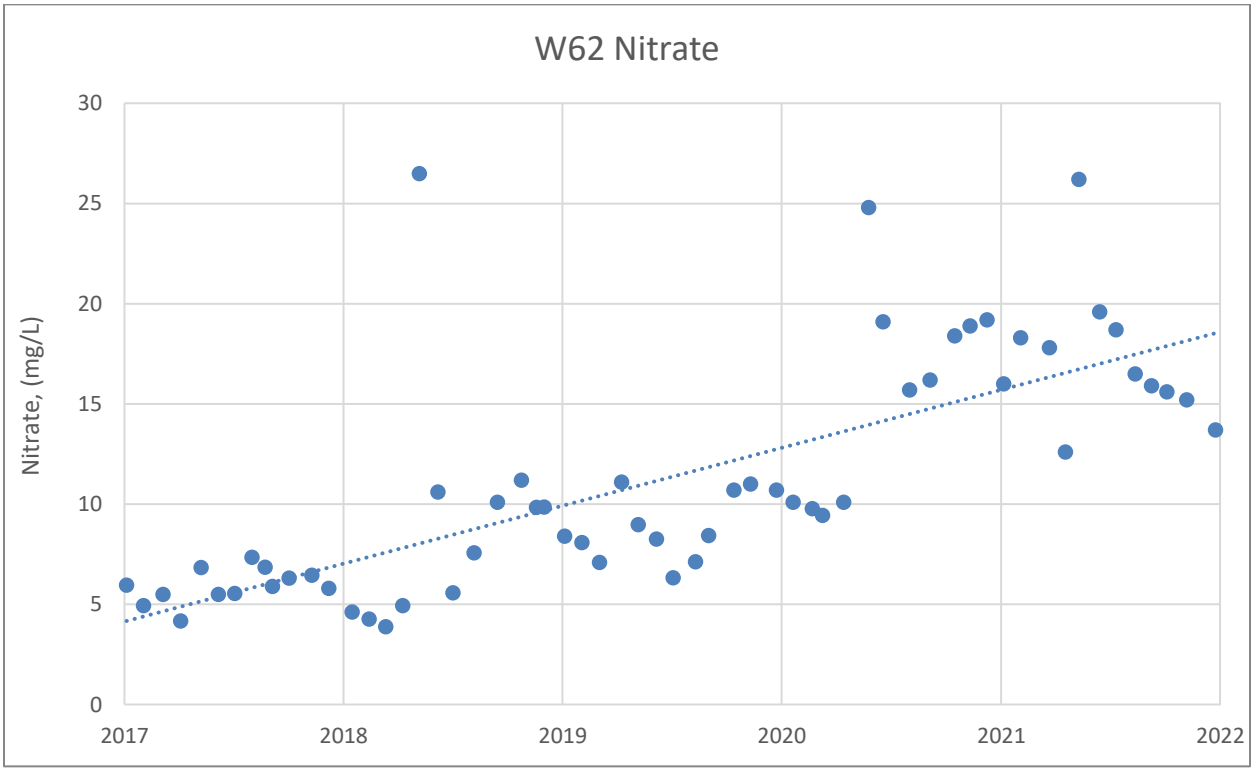

Figure 7-46: W62 Nitrate

7.10.2 Mill Valley Fill Seepage Monitoring Locations

In addition to permanent water quality monitoring stations, the Mill Valley Fill (MVF) is surveyed in the spring and fall of each year for sporadic seeps. Nine recurring seeps have been identified in previous surveys, but no seeps have been discovered or sampled since 2018. There is a possibility that historic samples were not accurately identified as seepage, this area will continue to be monitored in 2022.

7.11 Water Storage Pond Dam Seep

Seepage water quality at the Water Storage Pond Dam is represented by station W17. Water quality at station W17 is relatively consistent due to its being fed at a single source at the WSP (Water Storage Pond). Data shows an increasing trend for analytes except for nitrate. The WSP on the other hand is susceptible to being fed by Mill Valley Fill runoff and freshet water sources. In 2021 the sump around W62 was expanded and improved to collect more seepage and runoff from the Mill Valley Fill.

All dam seepage is collected in a vertical culvert and pumped back to the WSP via a 4" insulated heat traced pipe. A total of 56 W17 samples were collected in the 2021 monitoring period. Water quality results for W17 are further outlined in Figure 7-47 through Figure 7-53 and include historic water quality results for dissolved copper, dissolved cadmium, dissolved iron, dissolved selenium, and nutrient levels for ammonia, nitrite, and nitrate. W17 will continue to be monitored and sampled on a weekly basis in 2022.

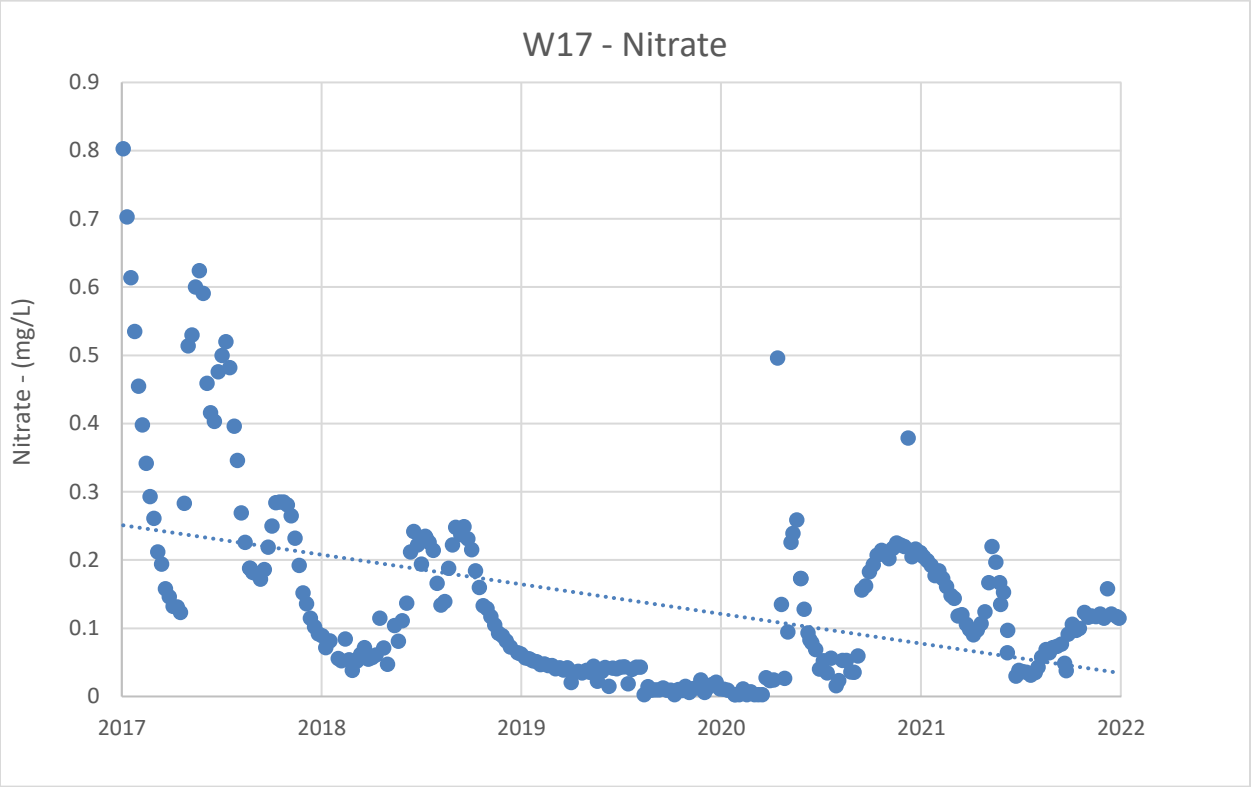

Figure 7-53: W17 Dissolved Nitrate

7.12 Camp Area

There are two seep monitoring seeps behind camp, SS32 and SS112. SS112 was discovered in spring 2021 approximately 200m south of SS32, water was flowing from behind camp and creating small washouts, the water was routed into a culvert and directed away from camp. SS32 was discovered in 2014 behind the camp along the mill area survey route. Results for dissolved copper, dissolved cadmium, dissolved iron, dissolved selenium, and nutrient levels for ammonia, nitrite, and nitrate are displayed in Figure 7-54 through Figure 7-60 along with historical results. SS32 and SS112 may be a useful reference as it originates in an area that is relatively undisturbed by mining activity. No other seeps were identified along the toe of the north ridge behind the camp and mill.

8 Water Management

The water balance for the Minto Mine forms the basis of the water management strategy at the site. The water management strategy at the site is for conveyance structures to either divert or release clean surface water or direct impacted water to the Main Pit and eventually treatment. The primary objective of Minto's water management strategy is to ensure that sufficient volumes of water can be released from site in a manner that protects the water quality in Minto Creek. The Minto Mine generally has a positive water balance, meaning that the site-wide annual runoff is greater than the volume of water required to operate the mine. Therefore, it is necessary to release water to Minto Creek. In the event surface runoff does not meet the discharge limits stipulated in the WUL, Minto Mine has the ability to treat and release water using a combination of active treatment, conveyance structures and water storage features. In October of 2021 Minto concluded that the Operations Adaptive Management Plan (AMP) 1,000,000 m^3 surge capacity threshold for water storage would be exceeded before the end of the year. Minto provided formal notification of the exceedance to EMR in December, with a summary of the issue and an outline of the short-term water management strategy. An AMP Specific Threshold 2 (SPT2) Action Plan was submitted to Yukon Government, Yukon Water Board and SFN as part of the required follow-up. Minto has submitted a revision to the Water Management Plan (WMP) to the Yukon Government and will be submitted to the Yukon Water Board.

The following sections will summarize water treatment, conveyance, and storage during the reporting period.

8.1 Water Storage and Conveyance Network

There were no major changes to Minto's conveyance structures in 2021. Maintenance and repair work is summarized in Section 8.2.3 Water Conveyance Construction.

The strategy for managing the mine water inventory, pursuant to the Water Management Plan, can be summarized as follows:

- The site water balance is used to define mine water inventory targets and targets for volumes to be released to Minto Creek. Minto's WUL requires at least

1 million cubic meters of available storage capacity as of October 31st each year, and its corresponding Adaptive Management Plan (AMP) will be triggered if capacity drops below this level at any time. Regular tracking of the mine water inventory allows the mine operations to determine if the inventory is on target and if and when water must be released from site.

- Runoff from developed mine areas and water from dewatering underground (mine water) is collected and stored in the Main Pit Tailings Management Facility (MPTMF) and the Area 2 Pit Tailings Management Facility (A2PTMF). Mine water is used for ore processing and slurry tailings production.
- The preferred method for controlling and limiting the inventory of mine water on site is to collect and divert discharge-compliant (clean) runoff to the water storage pond (WSP) and from there to Minto Creek as natural creek flow allows. If collection, diversion, and release of clean water is not sufficient for meeting mine water inventory targets then Minto has the option of treating and releasing mine water.
- Minto has the ability to treat the water from the WSP, Main Pit or Area 2 Pit via the water treatment plant and releasing that water either directly to Minto Creek or to the WSP.

The water and tailings volume summary for 2021 is presented in Section 8.2

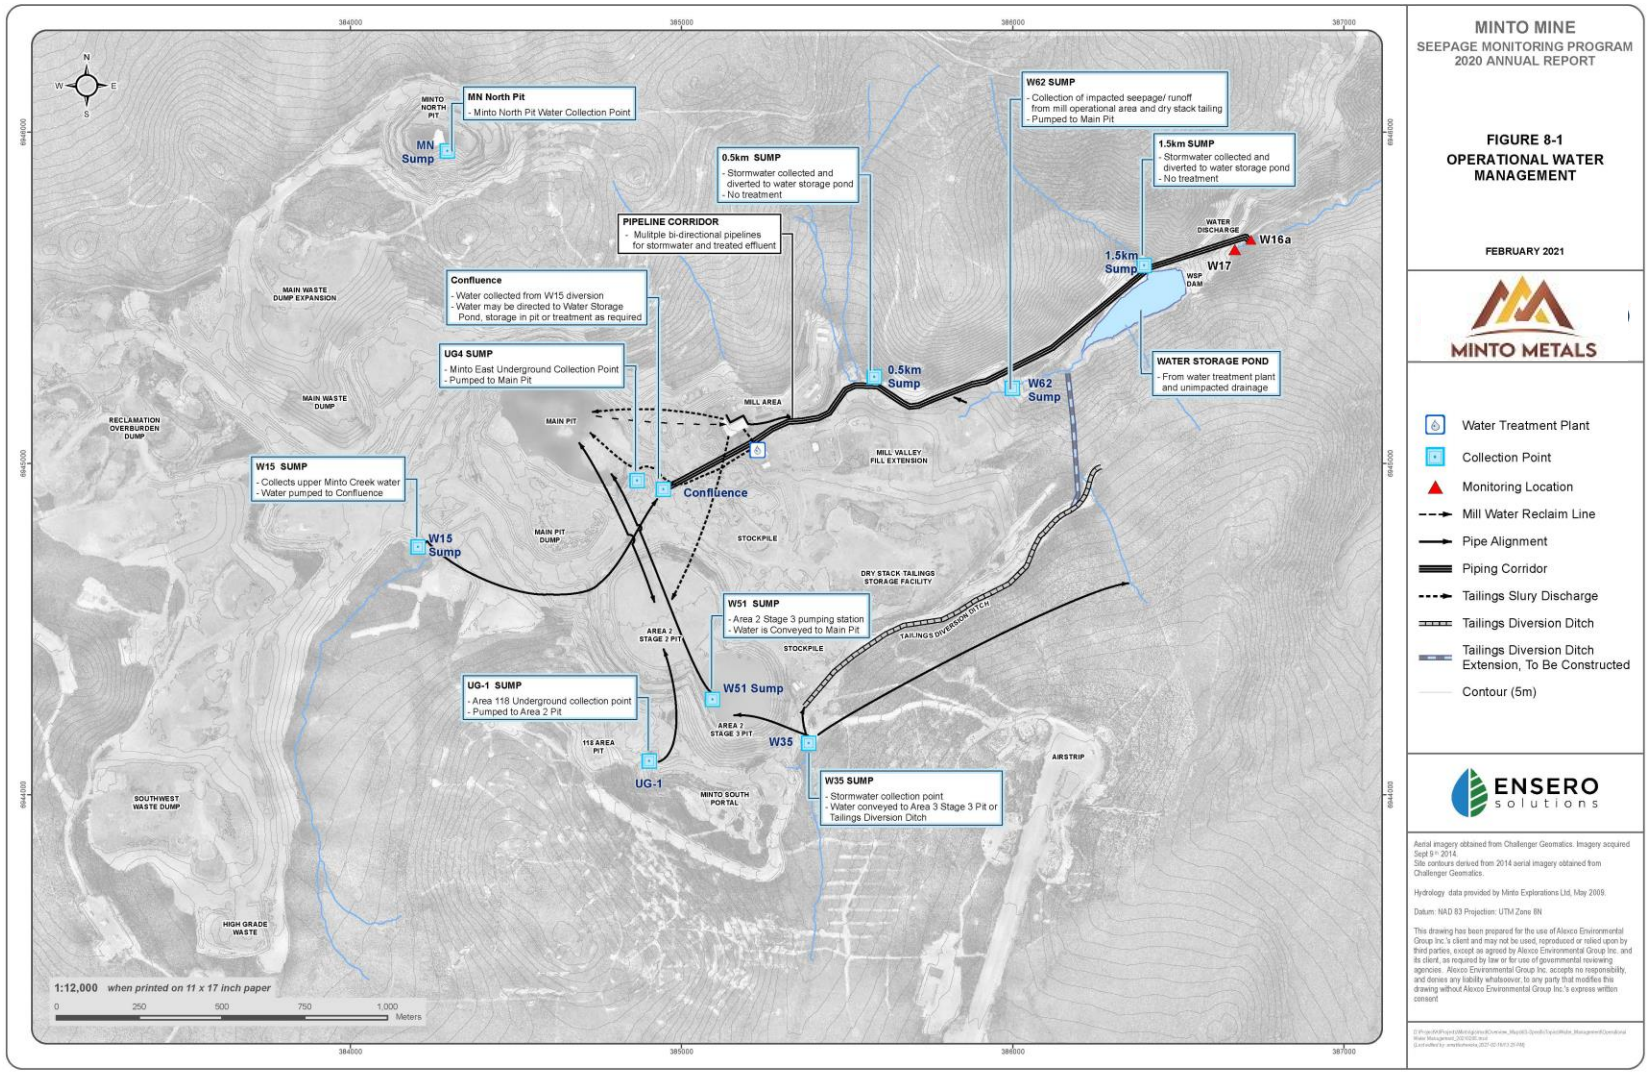

Figure 8-1: Minto Mine Water Conveyance Network (2021)

8.2 Water Storage Volumes Movement and Tracking

Water movement is tracked with flow meters on site, monitored and inspected on a weekly basis. Table 8-1 to 8-5 provide a summary of water volumes moved by conveyance structures around site in 2021. Please note that the total and net volume for each facility (WSP, MPTMF, A2PTMF) in the following tables only account for flow meter totals and do not account for evaporation and other losses/inputs. The Water Treatment Plant was brought back into operation in 2021 with limited periods of discharging water to Minto Creek or WSP.

Table 8-1: Water Storage Pond (WSP) Conveyance for 2021

WSP		
Input Volume (m^3)		**Total**
W15	19,000	117,000
W35	0	
WTP	25,000	
W17	73,000	
Output Volume (m^3)		**Total**
WTP	45,000	118,000
Minto Creek (Environment)	0	
W17 seepage	73,000	
Net		-1,000

Table 8-2: Main Pit Conveyance for 2021

Main Pit

Wells		Total (m2)
Camp	12,700	12,700
ERT	13	

8.2.1 Water Conveyance Tracking

Diversion of W35 water (TDD): Water was diverted from the south catchment (collected at station W35) to the Area 2 Stage 3 pit. An estimated total of 38,000 m³ moved through W35 to the A2S3 Pit in 2021 as measured by a Mace FloSeries® 3 open pipe flow measuring device.

Diversion of W15 water: The W15 sump collects surface runoff from adjacent undisturbed catchments, the SWD and part of the MWD. A total of 104,000 m³ was

conveyed through the W15 conveyance structure in 2021. 19,000 m^3 was directed to the WSP from April 29th to May 7th, and 85,000 m^3 was directed to the Main Pit between May 7th and September 29th. W15 flows were measured and recorded using a Seametrics® mag flow meter with digital head relay module.

Pump Back of W62 water (MVFES2 Sump): Water collected downstream of the mill area, ore stockpiles and DSTSF is collected at the MVFES2 Sump (which replaced the MCDS in 2016) and pumped back to the Main Pit for treatment. A total of 133,000 m^3 was conveyed through this structure in 2021. The flow volumes were measured and recorded using a Seametrics® mag flow meter with digital head relay module.

Pump Back of Yellow Stockpile Sump: Surface runoff and groundwater seepage from the ditch between the main road leading from camp to the mine workings and the ore stockpile is collected at the Yellow Stockpile Sump and pumped back to the Main Pit for treatment. A total of 19,000 m^3 was conveyed through this structure in 2021. The flow volumes were measured and recorded using a Siemens® mag flow meter.

Pump Back of WSP Seepage (W17 Sump): Seepage from WSP is collected and pumped back to the WSP via the W17 Sump/pump system. A total of 73,000 m^3 was conveyed through this system in 2021.

Underground De-watering (UG1 and UG4 Sumps): Groundwater in the underground workings is collected and pumped to surface via two main sumps, UG1 and UG4. UG1 collects water from the Area 118 Underground Sump and deposits it in the Area 2 Pit Complex. A total of 231,000 m^3 was conveyed from UG1 in 2021. UG4 collects water from the Minto East Underground Sump and pumps it to the Main Pit. 515,000 m^3 were conveyed through UG4 in 2021.

8.2.2 Water Storage Tracking

Water storage on site is monitored for Minto reservoirs which include the Main Pit, the Area 2 Pit, their respective tailings management facilities, the Water Storage Pond (WSP), and the Minto North Pit. Appendix E provides a more comprehensive analysis of water movement, but presented below, Tables 8-6 provides a summary of the site-wide water yield.

Table 8-6: 2021 Water Inventory Change and Site Yield

Month[A]	Change in MPTMF Water Inventory	Tailings Solids Deposition in MPTMF	Change in A2PTMF Water and Tailings Inventory	Tailings Solids Deposition in A2PTMF	Change in WSP Water Inventory	Discharged to Minto Creek
Year	m^3/month	BCM/month	m^3/month	BCM/month	m^3/month	m^3/month

Notes: **A** – on the first day of the month.
Source: https://srk-my.sharepoint.com/personal/sjensen_srk_com/Documents/Desktop/Minto 2021 Update/2021 Water Balance Update\2021 Water Balance Update REV01 SRJ.xlsx

Bathymetric surveys of the Main Pit and Area 2 pits were conducted in July 2021. The water storage volumes changed significantly with the new bathymetry survey. Minto completed an investigation to better understand the discrepancies between surveys but has been unable to determine which survey is more accurate. As a result, Minto will re-survey the water storage volumes in 2022 during open water season. In the interim, Minto will continue to utilize the 2021 bathymetry volumes, which are more conservative and indicate less remaining water storage capacity.

Main Pit: The Main Pit was used as a reservoir to support the following: water use for the Mill process; collection of impacted run-off; supply feed water to the water treatment plant; and received water from Area 2 Pit and underground de-watering. A total of 463,000 m^3 of water was stored in the Main Pit as of January 1st, 2022.

Area 2 Pit: The Area 2 Pit was used to support the following: supplemental water supply to the Mill via the Main Pit; collection of impacted site water; receiving water from underground de-watering; receiving water/tailings from the Mill. A total of 1,872,000 m^3 of free water was stored in the Area 2 Pit as of January 1st, 2022.

WSP: As 2021 was a relatively wet year, the WSP saw a significant increase in storage inventory. WSP water quality rose above the effluent quality standard for copper following freshet in May but returned to below EQS concentration by mid-August. A brief active discharge period took place between October 7th and 14th. A total of 196,000 m^3 of water was stored in the Area 2 Pit as of January 1st, 2022.

Table 8-7 summarizes the Minto Mine Site Water Balance for 2021.

Table 8-7: Water Balance Summary of the Minto Mine Site, 2021 (Rounded, Jan to Dec)

	Units	Main Pit TMF	Area 2 Pit TMF	WSP
Volume Change 2021 (water + tailings)	m^3	70,000	1,020,000	90,000
Tailings Deposited, Total Bank Volume[A]	BCM	-	323,000	-
Bulk Volume of Tailings Deposited[B]	m^3		671,000	
Water Volume Change 2021	m^3	70,000	697,000	90,000
Estimated Groundwater Inflow	m^3	30,000		
Total Water Inventory Increase in 2021	**m^3**	857,000		
Total Water Discharged to Minto Creek	m^3	13,000		
Total Site-Wide Yield in 2021	**m^3**	**844,000**		

Notes:
[A] – the bank volume is the volume of competent solids, which equals the water volume displaced when tailings are inundated.
[B] – the bulk volume is the volume occupied by the tailings in the tailings management facilities.

8.2.3 Water Conveyance Construction

Maintenance activities consisted of routine maintenance on water conveyance structures. In 2021 Minto completed maintenance and repair work on the following locations:

- Removed sediment from W35 Sump and the berm upstream of the sump on the haul road (that directs run-off from the road) was replaced with coarse NAG rock material in August of 2021. Further drainage work on the haul road in this area is planned in 2022.

- Sediment cleaned up from an area where an overflow occurred on the north side of W15 catchment in September of 2021. The associated erosion was repaired, the road was graded to direct flow to a catchment point and a spillway was constructed in the location that the overflow occurred previously. Coarse rock was installed in the catchment point and spillway.
- In September 2021 a pre-settling cell was constructed upstream of the W62 coarse rock sump cell. The pre-settling cell will facilitate settling of fine sediment from freshet run-off, mitigating potential sedimentation issues in the coarse rock sump.

8.2.4 Water Balance and Water Quality Predictions Modeling

As per the WUL Clause 108, Minto is required to update the Water Balance and Water Quality Model. Minto retained SRK Consulting to complete a 2021 site water balance and water quality prediction model update. An updated 2021 Water Balance and Water Quality Model Summary for the Minto Mine is provided by SRK Consulting in Appendix E.

8.3 Water Treatment

Water treatment may be required if:

- Water stored in the WSP does not meet water quality limits prescribed in the water licence or
- Mine water stored in the MPTMF or the A2PTMF is to be released to Minto Creek and the water does not meet water quality limits prescribed in the water licence.

Minto's water treatment plant can be operated in three general configurations:

1. **Clarification and filtration:** this process configuration removes TSS. Coagulant and flocculant solutions are added to the feed water, which is pumped to a ballasted lamella clarifier and a filter. The by-product of the process is a sludge that is pumped to the MPTMF or A2PTMF.

2. **Sulphide precipitation, clarification, and filtration:** this process configuration can remove dissolved copper, cadmium, zinc, nickel, cobalt, and lead, in addition to TSS. Dissolved metals are removed by adding an organo-sulphide reagent that binds to dissolved metals and forms precipitates. The by-product of the process is a sludge that is pumped to the MPTMF or A2PTMF.
3. **Reverse Osmosis:** this process removes 95 to 99% of all constituents in the feed water. The feed water for the RO unit is the effluent from the clarification and filtration unit, which is operated as a pre-treatment step. The RO unit produces a clean effluent stream that consists of approximately 65-75% of the feed water (the RO permeate). The by-product of the process is a brine stream, which consists of about 25% of the feed water and 95 to 99% of constituent loadings. The brine stream is pumped to the MPTFM or A2PTMF.

Upgrades to the water treatment plant and a microfiltration unit is being brought to site in 2022.

8.3.1 Operations Overview

The Water Treatment Plant discharged to the Water Storage Pond and to Minto Creek in 2021. A total of 17,000 m^3 was released from the WTP to the WSP as it met EQS specifications.

8.4 Water Discharge

8.4.1 Discharge Volumes at WQO

Minto mine discharged approximately 7900 m^3 of Main Pit water treated via RO units in May and June, and 5600 m^3 of WSP water treated through the clarification/filtration process in September.

8.4.2 Discharge Volumes at EQS (Clause 6)

As per WUL Clause 6 the rate of water discharge to Minto Creek is calculated based on daily creek flow measurements. No volume was discharged pursuant to clause 6 in 2021 as the WSP water quality never met EQS while there was sufficient flow in Minto Creek to release water.

8.5 Hydrology

In 2021, as part of the EMSRP, Minto monitored hydrological conditions at water quality stations including the following: stations within the operational mine area; stations downstream from the mine operational area that are influenced by mine effluent discharge; and reference stations downstream from the mine operational area that are not exposed to effluent. Hydrological monitoring is performed using a variety of methods including manual discrete discharge measurements with combinations of flow meters, continuous stage measurements through the deployment of Solinst Level Loggers and Barometric Loggers and monitoring of an engineered flume.

The 2021 open water season was characterized by above average flows during freshet, a dry spell during July which saw W1 dry up completely, followed by average flows sustained by regular precipitation events in late summer and early fall. A brief period of active mine discharge, from the Water Treatment Plant (RO), occurred from May 25th to June 1st and again from September 20th to September 25th. A single day of discharge occurred on September 29th.

8.5.1 Minto Creek Hydrology

Hydrological monitoring on Minto Creek is conducted in accordance with the requirements outlined in the WUL. During the 2021 monitoring period, Minto Mine maintained and collected data from the following four hydrometric stations along Minto Creek.

- W3: Flume downstream of the Water Storage Pond (WSP)
- MC-1: Located in Minto Canyon – mid-catchment
- W1: Located approximately 1 km upstream of Yukon River – lower catchment
- W7: Tributary on the south side of Minto Creek.

At the hydrometric stations, Solinst Level Loggers and Barometric Loggers were used in conjunction with staff gauge readings and manual flow measurements to produce volumetric flow rates.

For details on the 2021 results of Minto Creek hydrology see the *Summary of Minto and McGinty Creek 2021 Surface Hydrology Memo* in Appendix F.

8.5.2 McGinty Creek Hydrology

In 2021, hydrological monitoring on McGinty Creek was conducted as per the schedule outlined in the EMSRP. In 2018, Minto Mine added a hydrometric station at MN-1.5. During the 2021 monitoring period, Minto Mine maintained and collected data from the following four hydrometric stations along McGinty Creek.

- MN-0.5: West Tributary of McGinty Creek
- MN-1.5: Upper East arm of McGinty Creek
- MN-2.5: East Tributary of McGinty Creek
- MN-4.5: McGinty Creek near the Mouth

At the hydrometric stations, Solinst Level Loggers and Barometric Loggers were used in conjunction with staff gauge readings and manual flow measurements to produce volumetric flow rates.

For details on the 2021 results of McGinty Creek hydrology see the *Summary of Minto and McGinty Creek 2021 Surface Hydrology* in Appendix F.

8.5.3 Hydrology QA/QC

Detailed procedures for hydrology monitoring at the Minto Mine are detailed in the *Minto Mine Surface Water Hydrology* SOP. Few changes were made in the hydrology SOP, to ensure duplicate measurements were done on a 1:10 ratio as well as some changes to staff gauge measurements that would ensure consistency between users.

9 Physical Monitoring Program

Minto's physical monitoring program consists of a combination of instrumentation and visual inspections. Site wide inspections are carried out semi-annually - May/June post thaw and September pre- freeze-up. Normally, the Q2 inspection must be completed by an external geotechnical engineering consultant in accordance with Clause 13.2 of the QML. In 2021, due to COVID travel quarantine requirements in the Yukon in June, the Q2 inspection was completed by Minto and the external geotechnical inspection was completed in September. As specified in the WUL and *Minto Physical Monitoring Plan*, the following additional inspections are also performed:

- Static waste rock and overburden dumps – semi-annually
- Static open pits – semi-annually
- Diversion ditch – semi-annually (daily during water conveyance)
- Dry Stack Tailings Storage Facility, Mill Valley Fill Extension and Mill Valley Fill Extension 2 – quarterly
- Main Pit and Area 2 Pit tailings storage facilities – quarterly
- Water Storage Pond Dam – weekly (seepage), monthly (stability)

Deformation monitoring instrumentation includes survey hubs and borehole inclinometers, described in the following sections. A layout of physical monitoring instrumentation is provided in Figure 9-1, below. There were no changes to the *Physical Monitoring Program* (PMP) in 2021 besides increasing the frequency for certain survey hubs as noted in Table 9-1.

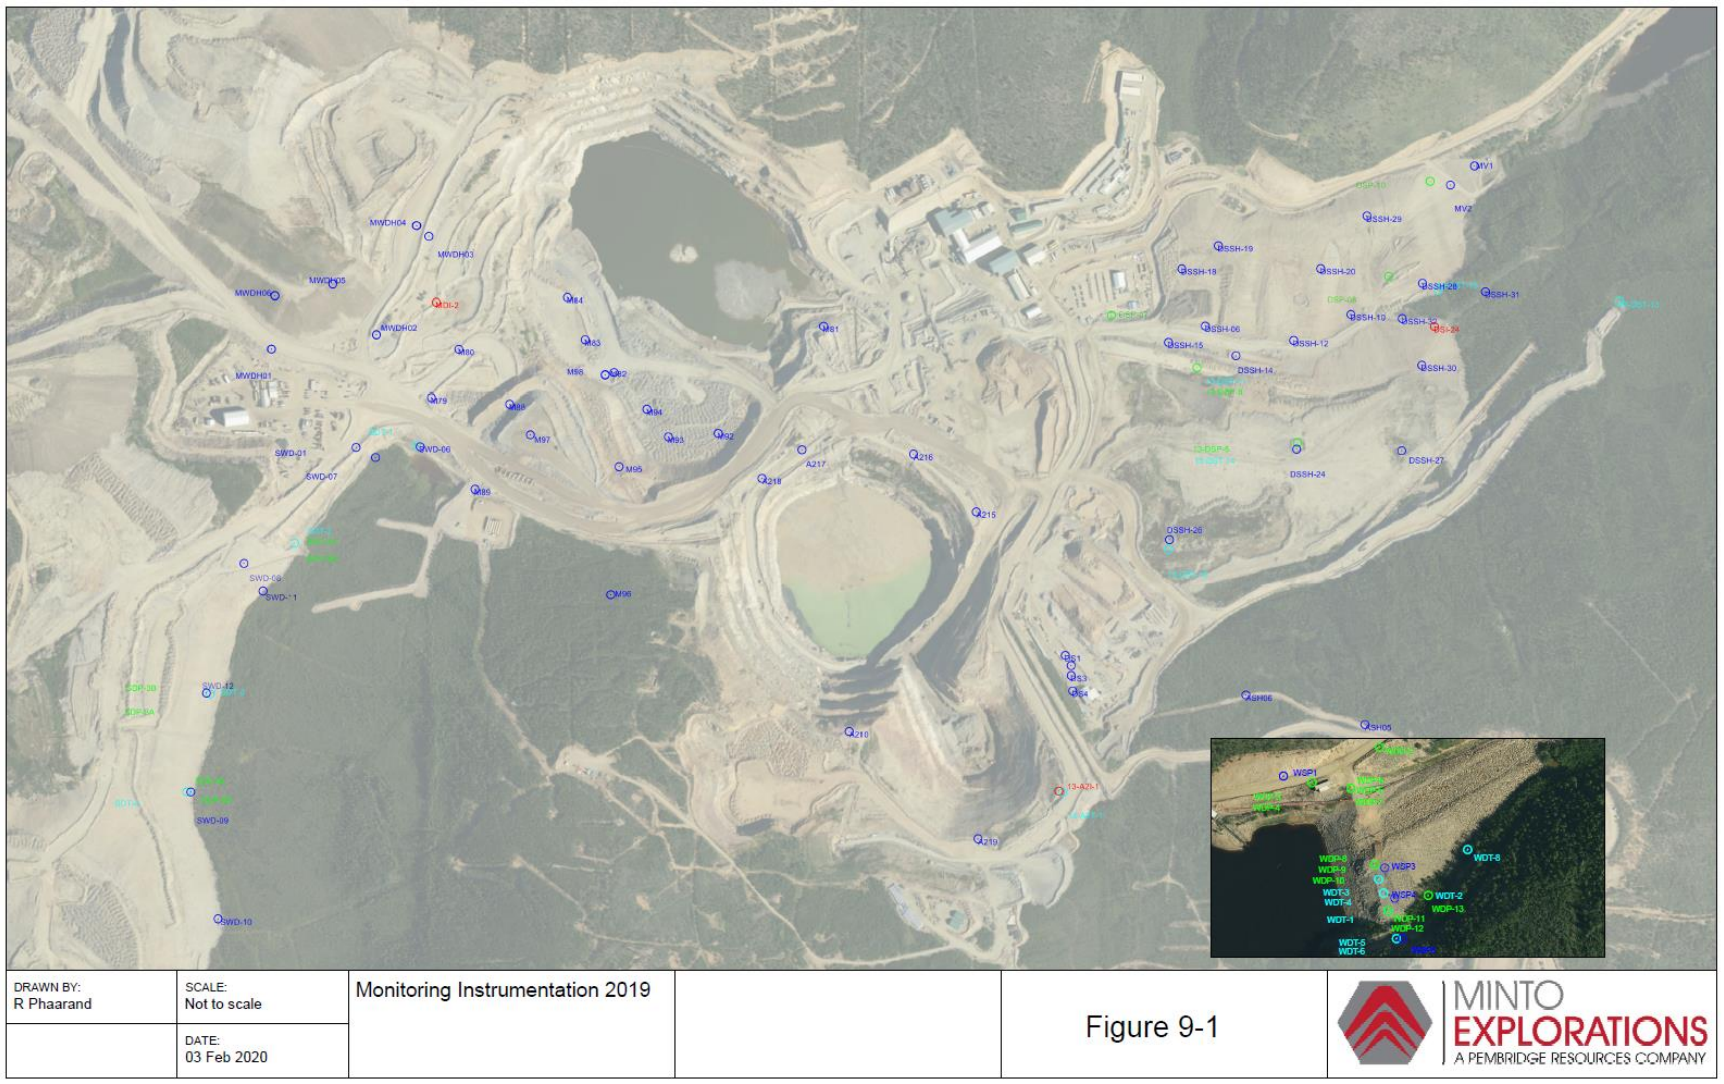

Figure 9-1: Physical Monitoring Program Installations (2021)

9.1 Physical Deformation Monitoring Instrumentation

9.1.1 Survey Hubs

Survey hubs are present at the Main Pit, Area 2 Pit, DSTSF, SWD, MWD Wrap, and WSP Dam to monitor physical deformation. Table 9-1 summarizes the data collection frequencies for each facility. The monitoring results are summarized in the following subsections.

Table 9-1: Survey Hub Data Collection Frequency (2021)

Facility	Reading Frequency	Survey Hub
Main Pit/South Wall Buttress	Monthly	M83, M88, M98, M97
	Quarterly	M82, M84, M93, M94, M95, M79, M80, M92, M96
Area 2 Pit	Weekly (during operations)	DS01, DS02, DS03, DS04
	Quarterly	A210, A215, A216, A217, A218, A219
DSTSF	Monthly	DSSH06, DSSH12, DSSH28
	Quarterly	DSSH19, DSSH20, DSSH24, DSSH26, DSSH27, MV2, DSSH10, DSSH14, DSSH15, DSSH18, DSSH29, DSSH31, DSSH32, MV1
SWD	Quarterly	SWD01, SWD06, SWD07, SWD08, SWD09, SWD10, SWD11, SWD12
MWD Wrap	Quarterly	MWDH01, MWDH02, MWDH03, MWDH04
WSP Dam	Monthly	WSP1, WSP3, WSP4, WSP5

Note: The data collection frequency was updated in 2022 with the annually read hubs now read quarterly.

9.1.1.1 Main Pit/South Wall Buttress Survey Hubs

There are currently 13 operating survey hubs on the Main Pit south wall buttress with the Data collected presented in Figure 9-2.

In February 2017, construction of the Main Pit Dump (MPD) began over areas of the south wall of the Main Pit that do not contain SAT. Placement of waste in the MPD occurred intermittently throughout the 2017 and 2018, with a large volume of material placed in the fall of 2017 and over the winter of 2017-18. MPD construction stopped following the completion of the Area 2 Stage 3 Pit in the Spring of 2018.

Survey hub movement data for the Main Pit Dump are presented in Figures 1 to 14 of Appendix P of the 2021 Geotechnical Annual Review, with the footprints of the MPD are

provided in Figure 1 of Appendix P of the 2021 Geotechnical Annual Review. All hubs show either no significant changes in horizontal movement, or a decelerating movement trend. The highest movement rate of 1.3 mm/day occurs at hub M97, which is located at the top of the MPD, and has decreased from a rate of 1.6 mm/day in July 2020.

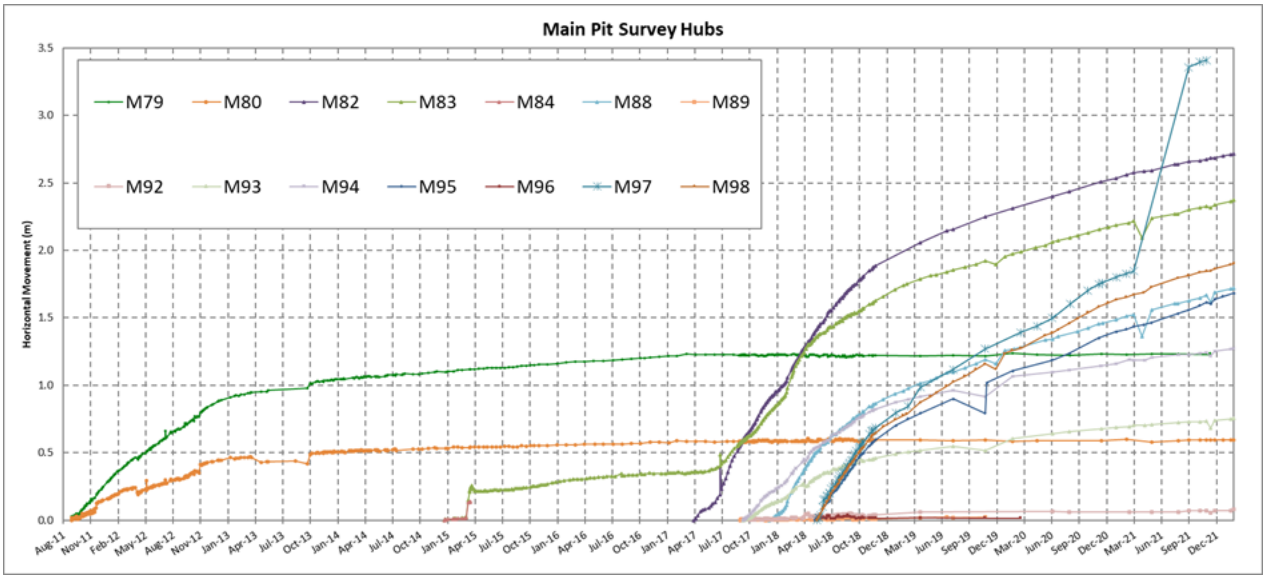

Figure 9-2: Main Pit/South Wall Buttress Survey Hub Data (2011-2021)

9.1.1.2 Area 2 Pit

There are currently 9 operating survey hubs located around the perimeter of the Area 2 Pit.

Four survey hubs (DS01 through DS04) are located near the Underground Shop along the east crest of the pit that are monitored weekly because of their proximity to the Underground Shop (Figure 9-3). Data from these hubs show steady and decreasing movement rates that range between 0.03 and 0.3 mm/day. No signs of additional cracking or deformation were noted in the area. The movement is likely due to mining of the Area 2 Stage 3 Pit and changes to the thermal ground regime resulting in thawing of permafrost soils. The other survey hubs (A210 through A18) on the west and northern portion of the Area 2 Pit also show steady or decreasing movement rates ranging from 0.01 mm/day to 0.11 mm/day (Figure 9-4).

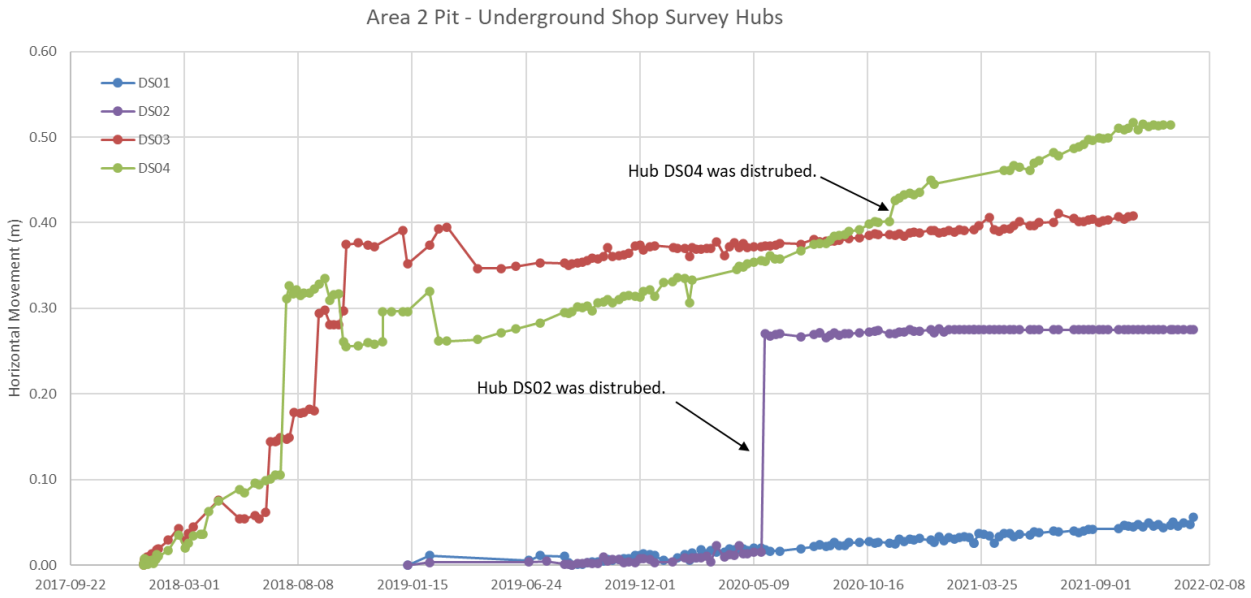

Figure 9-3: Area 2 Pit Survey Hubs associated with the UG shop

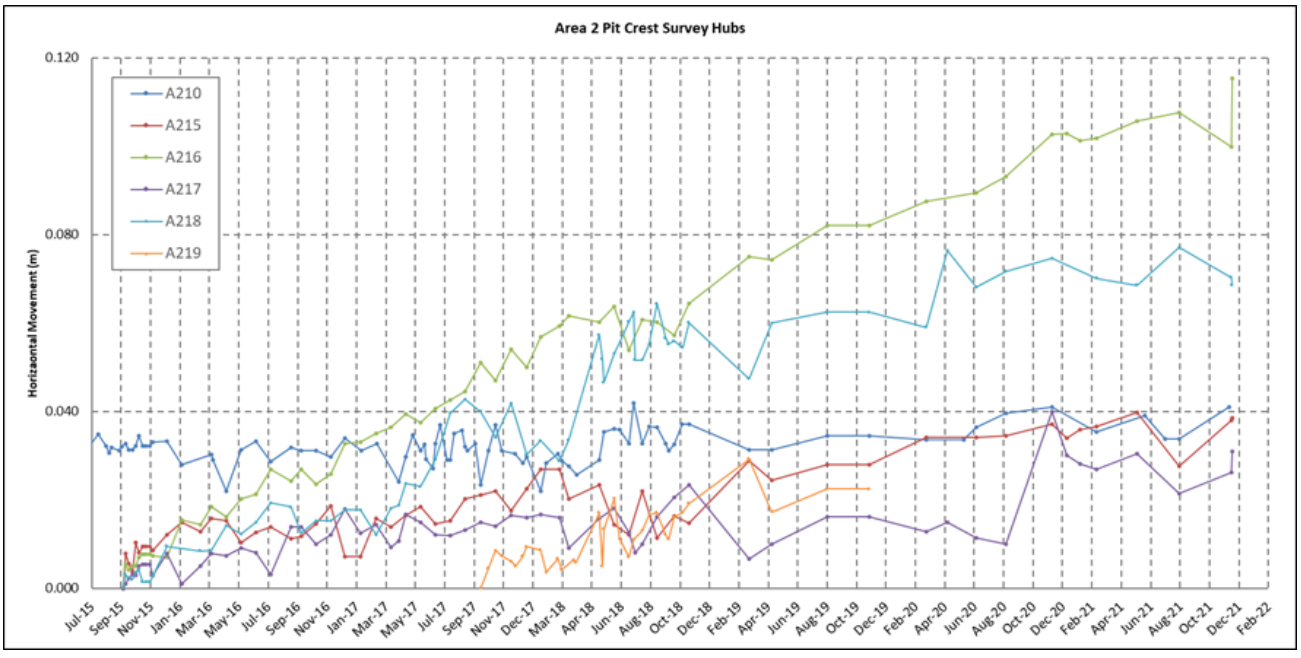

Figure 9-4: Remaining Area 2 Pit Survey Hub Data (2011-2021)

9.1.1.3 Dry Stack Tailings Storage Facility/Mill Valley Fill Survey Hubs

There are currently 17 operating survey hubs on the DSTSF and MVFE2. Following construction of the MVFE Stage 2, the survey hubs were expected to slow with the movement rates asymptotically approaching zero. The timing for when no movement is expected is uncertain. The hubs have generally been performing as expected since the construction of the MVFE Stage 2. Rates of movement within the DSTSF are substantially lower compared to before the construction of the MVFE Stage 2 with most survey hubs continuing to show a decelerating trend with the rate of deceleration decreasing in the past year. Several hubs show steady movement, but additional time is needed to evaluate if deceleration has stopped. Two survey hubs show possible acceleration trends:

DSSH12 shows an apparent acceleration in the last reading on July 31, 2021, with the horizontal movement rate increasing from 0.13 mm/day to 0.4 mm/day. Additional readings are needed to confirm the trend. A seasonal increase in movement was also observed in 2019 with the hub subsequently continuing to decelerate.

DSSH26 shows an apparent acceleration in the last reading on May 31, 2021, with the horizontal movement rate increasing from 0.07 mm/day to 0.25 mm/day. Additional readings are needed to confirm the trend because the hub may have shifted because of the spring thaw and settlement of the cover beneath the hub. This hub has previous shown a deceleration trend since its installation in 2015.

Data collected have been separated into two figures, Figure 9-5 and 9-6, as DSSH14 showed significantly more movement than other hubs prior to the completion of MVFE2 in 2016.

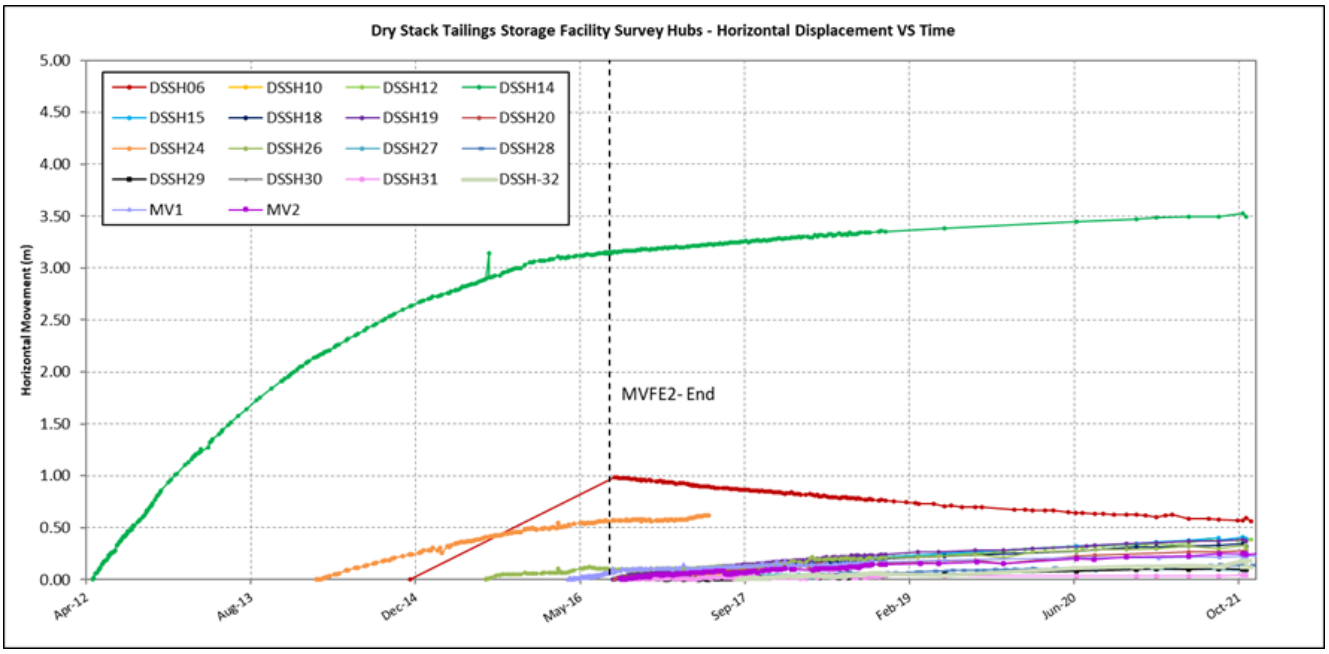

Figure 9-5: DSTSF Survey Hub Data (2012-2021)

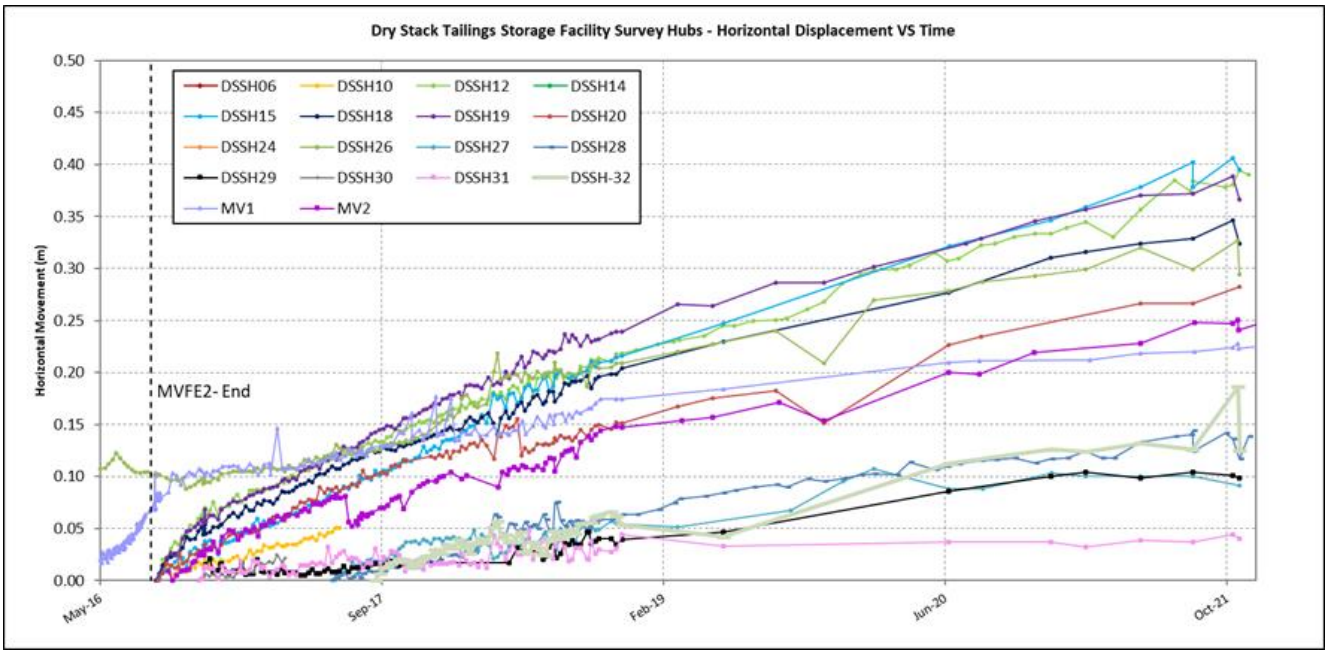

Figure 9-6: DSTSF Survey Hub Data (2016-2021)

9.1.1.4 Southwest Dump Survey Hubs

There are currently 8 operating survey hubs on the SWD. Data collected are presented in Figure 9-7. Survey hubs SWD12 and SWD09 are located downslope of the longitudinal crack observed during site inspection. The movement of these hubs may be due creep or thawing of ice-rich soils present beneath the lower portions of the dump near the valley bottom (east side). In addition, the stockpiled cover material downslope of the crack likely contributes a driving force to the movement. The future spreading of the cover will likely reduce the driving force and movement rate. The foundation soils the upper (western) portion of the dump consists of colluvial soils with low ice content (EBA 2008). The survey hub movement direction is perpendicular to the dump crest with no indication of down valley movement (towards the Main Pit). The crack location was plotted overtop of an interpreted overburden isopach plan. The isopach indicates that the overburden is generally thin in the in the area of the crack and downslope; however, this is based on one drillhole in the vicinity of the crack and the accuracy of that borehole was unable to be confirmed at this time. The survey hubs are recommended to continue to be monitored at a quarterly basis. See Appendix P (2021 Geotechnical Annual Review) for more information.

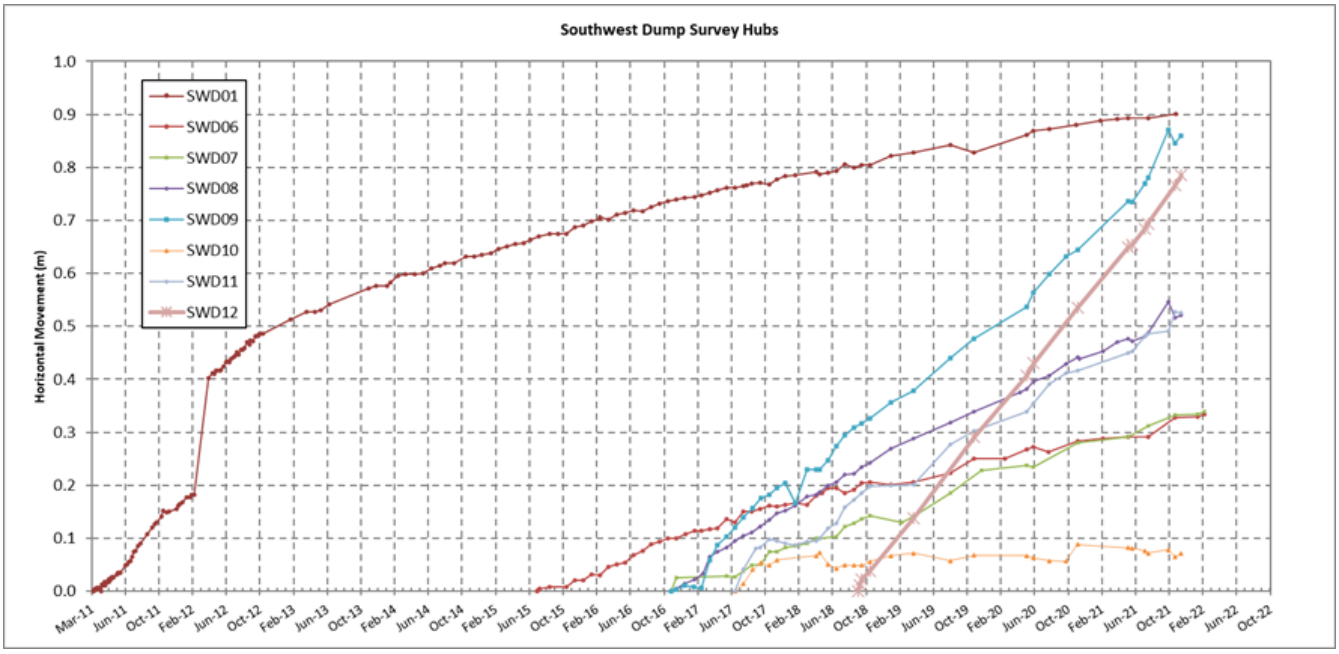

Figure 9-7: SWD Survey Hub Data (2011-2021)

9.1.1.5 Main Waste Dump Wrap Survey Hubs

Six survey hubs were installed on the Main Waste Dump Wrap in August 2018. Data collected are presented in Figure 9-8. Hubs MWDH05 and MWD06 were destroyed in 2020 because of re-sloping of the waste rock dump. The hubs have shown no movement, or a decrease in movement rate since the construction of the dump was completed.

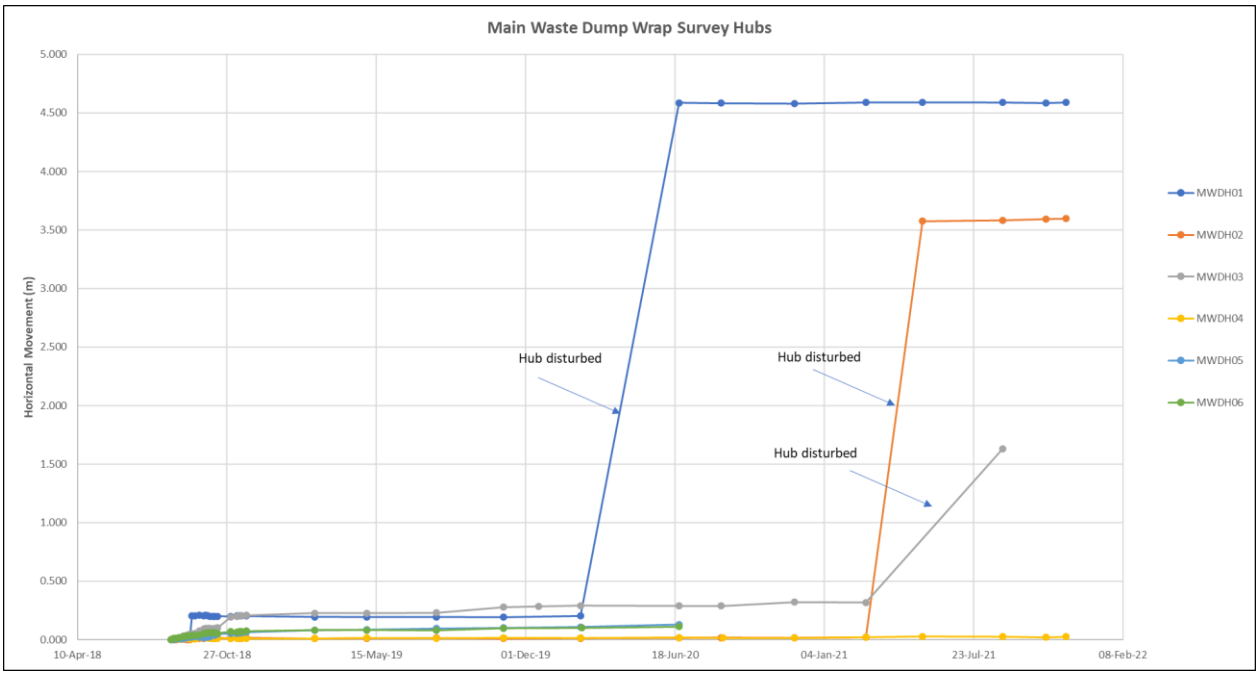

Figure 9-8: Main Waste Dump Survey Hub Data (2018-2021)

9.1.1.6 Water Storage Pond Dam Survey Hubs

There are currently four operating survey hubs on the WSP dam. There was no change to the operational status of any the hubs in 2021. Data collected are presented in Figure 9-9. Data continues to indicate no movement. Some non-reliable readings with extremely high peaks were reported, this is likely due to operator error.

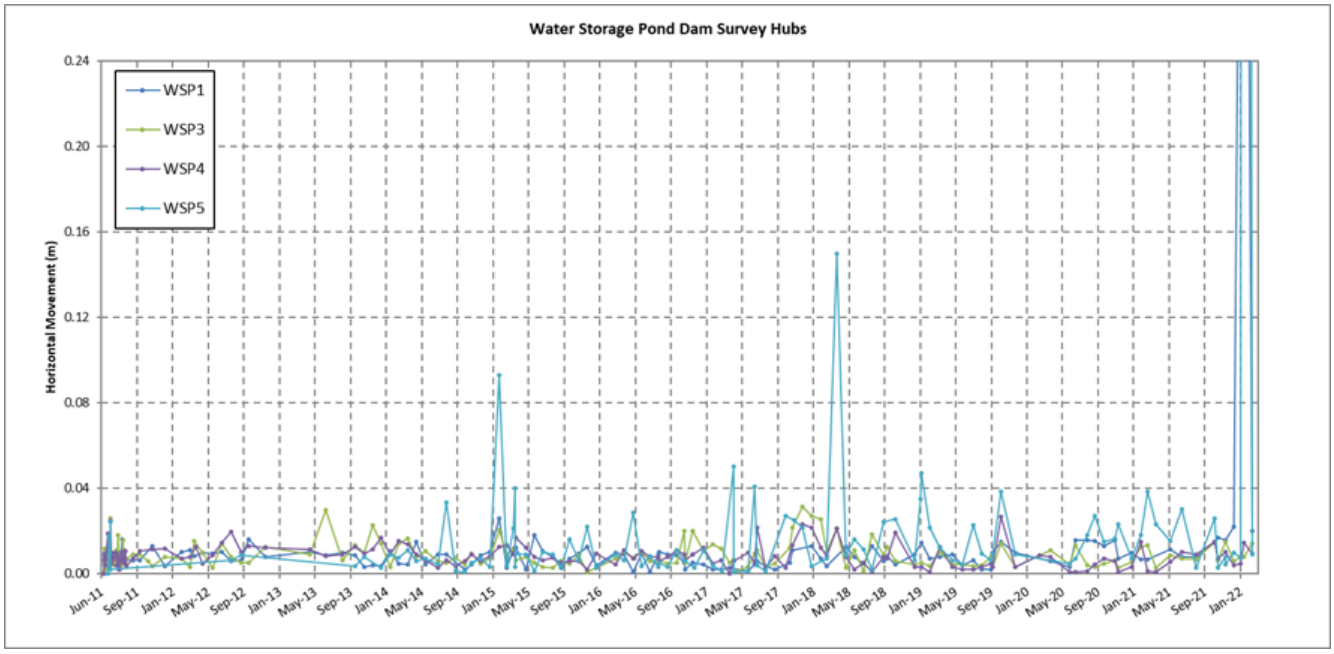

Figure 9-9: Water Storage Pond Dam Survey Hub Data (2011-2021)

9.1.2 Inclinometers

Physical deformation monitoring consists of monitoring of inclinometers at the DSTSF, Area 2 Stage 3 Pit and Main Pit. The monitoring results are summarized below.

9.1.2.1 DSTSF Inclinometer

There is one operating inclinometer (DSI-24) in the DSTSF area. DSI-24 is monitored quarterly, and the cumulative displacement data collected is presented in Figure 9-10. The inclinometer is located between the MVFES2 and the DSTSF. The profile plot indicates a main shear zone at depths of 45 m and 53 m. The last reading collected on June 19, 2021, shows an increase in the movement rate (0.19 mm/day), which had previously shown a deceleration trend with an average movement rate of 0.055 mm/day in 2021. Additional readings are needed to confirm if the acceleration is real, or due to variability, or is an erroneous reading.

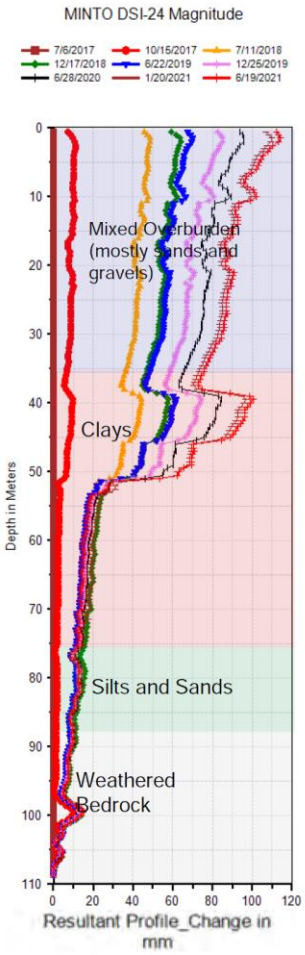

Figure 9-10: DSTSF Inclinometer DSI-24 (2017-2021)

9.1.2.2 Area 2 Stage 3 Inclinometer

There is one inclinometer (A2I-1) in the Area 2 Stage 3 Pit area that was installed in 2013 prior to development of the Area 2 Stage 3 Pit. A2I-1 is monitored quarterly with the cumulative displacement data presented in Figure 9-11. The displacement rate increased during mining of the pit in late 2017 and early 2018. Since completion of the pit, the movement rate has slowed and is not considered to be a stability concern. 2021 data shows a shear zone developing between depths of 36 m and 50 m starting in the fall of 2017, which corresponds to the mining of the Area 2 Stage 3 Pit. The observed shear zone includes multiple discrete zones between 36 and 50 m. The movement rate then slowed, and since 2019 shows a slight acceleration trend that has increased the movement rate from approximately 0.1 mm/day in 2019 to 0.15 mm/day in 2021.

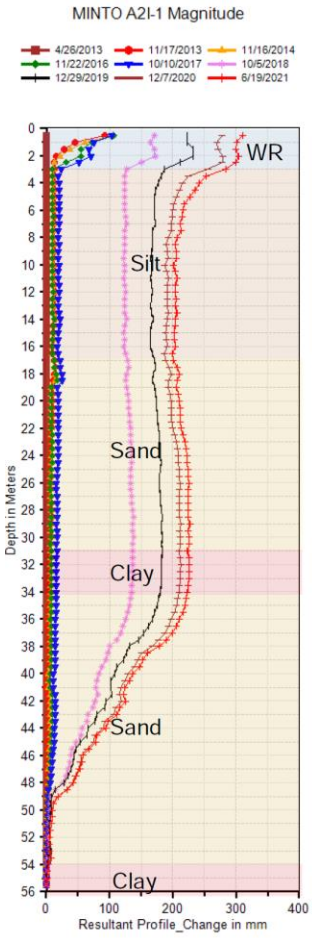

Figure 9-11: Area 2 Stage 3 Pit Inclinometer A2I-1 (2013-2021)

9.1.2.3 Main Pit Inclinometer

There is one operating inclinometer (MDI-2) in the Main Pit west wall area. Readings have been collected since 2010. Data are collected quarterly. Data collected are presented in Figure 9-12. Displacements in MDI-2 increased during the winter of 2017-18, with a movement rate of approximately 0.07 mm/day primarily occurring between the depths of 22 and 28 m below ground surface. The displacement is likely related to the construction of the MWD Wrap which occurred during the same time period. The movement rate has slowed since completion of the dump, with a rate <0.02 mm/day in 2021.

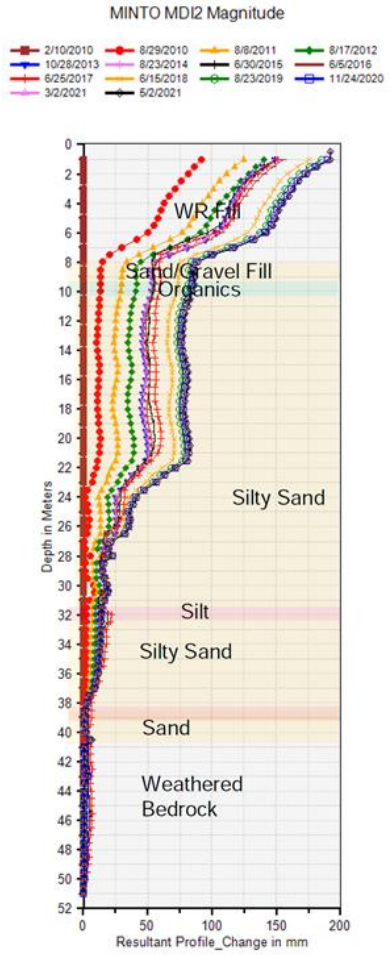

Figure 9-12: Main Pit Inclinometer MDI-2 (2010-2021)

9.2 Engineer's Annual Physical Inspection Reports

As required by the WUL and QML, the following structures are inspected semi-annually by Minto's geotechnical engineer and annually by an external geotechnical engineering consultant:

- Dry Stack Tailings Storage Facility (DSTSF) and Mill Valley Fill Extension (MVFE) (Stage 1 and 2)
- Tailings Diversion Ditch (TDD)
- Main Waste Dump (MWD), including Main Waste Dump Expansion, and Main Waste Dump Wrap
- Southwest Waste Dump (SWD)
- Reclamation Overburden Dump
- Ore stockpiles
- Mill and camp site
- Fuel containment facility
- Water Storage Pond (WSP) Dam
- Big Creek Bridge
- Main Pit Dump
- Main Pit including South Wall Buttress, In-Pit Dump, and SAT Dump
- Area 2 Pit
- Area 118 Pit and Backfill Dump
- Minto North Pit

Table 9-2 summarizes the recommendations from the most recent external inspection conducted September 2-3, 2021, and the associated planned actions.

Table 9-2: Annual Physical Inspection Report Summary (2021)

Area	Recommendation	Action
General	Several instrumentation cables and PVC pipes were observed to be exposed with no protective covers. Minto staff responsible for obtaining readings should be reminded to replace the cover following readings to prevent water ingress and damage due to freeze thaw.	Corrective action taken already.
	The 2020 inspection recommended an InSAR satellite survey study to be completed to increase the understanding of movement of the various waste facilities at site (DSTSF, SWD, and Main Pit Dump). At this time of this inspection, Minto has proceeded with the study that is being undertaken by SRK and 3VGeomatics, but the study results are not yet available for consideration in this report.	Planned to be completed in time for 2022 Report
DSTSF and MVFE	As part of the routine visual inspections, continue to monitor the following for any changes in condition: – the cracking present at the south end of the DSTSF, as well as – erosion gullies observed in the cover material on the northern and eastern slopes.	Ongoing Monitoring
	Implement upgrades to the TDD Intake Structure to prevent future sedimentation accumulation within the channel next freshet. The upgrades should be completed in a manner that meets the design objectives documented in the SRK design memo and should consider the following: – Raising the elevation of the TDD intake pipes to prevent sediments from entering the pipes. – Regrading of the Underground Access Road to prevent sedimentation from entering the intake structure. Runoff from the road should be directed to the opposite side of the road and conveyed into the Area 2 Pit (via a sump/pipeline system, lined channel/slope, or equivalent). – Flows that exceeds the capacity of the TDD Intake Structure will flow down the Underground Access Road to the north. Either a berm should be constructed along the	Construction will be implemented as soon as practical in 2022

Area	Recommendation	Action
	access road to prevent this water from flowing onto the DSTSF cover, or the Underground Access Road should be regraded to direct overtopping flows to the Area 2 Pit.	
MWD Wrap	Complete the regrading of MWD Wrap to grade over the over-steepened slope at the toe of the dump. In its current state, there is a higher risk of surficial slope failures and rockfall. Coarse rock is present at the base of the slope that acts as a small barrier to rockfall, but until the wrap has been regraded, traffic should be restricted near the toe.	Construction will be completed as part of construction of the Main Pit Dam and until construction is complete traffic will be restricted near the toe
SWD	Continue to monitor the cracking upslope of the cover soil stockpiles as part of the routine inspections specified in the PMP.	Ongoing
Fuel Containment Facility	**An investigation is needed to inspect the condition of the geotextile and liner in the area along the new rutting in the facility.** The inspection should be completed using hand shovels to carefully expose the geosynthetics to allow for a thorough assessment of the condition of the geosynthetic materials. All areas of damaged geosynthetics should be repaired by a qualified professional and new sand material should be used to fill in the ruts after the repairs have been made.	Will be completed in 2022
WSP	Continue to monitor the identified potential sinkhole located 5 m NW of WDT-08 as part of the routine visual inspections for any change in condition. Photographs records should be maintained to aid in monitoring. Deadfall/logs should be removed from the upstream face of the dam. Should any extreme precipitation event occur, the deadfall could plug/reduce the conveyance capacity of the spillway resulting in uncontrolled overtopping of the dam.	Ongoing monitoring and removal of deadfall/logs will be done in 2022
Main Pit, SAT Dump & In-Pit Dumps	Waste rock materials being processed for construction material should be excavated from the northern edge of the top bench instead of the south end as observed during the inspection to assist in unloading of the dump in the area currently experiencing movement.	Ongoing

Area	Recommendation	Action
	The sinkhole north of the W15 Sump should be filled and the erosion channel graded to minimize infiltration into the pit in the event of any future overtopping of the sump.	Completed
Area 2 Pit	Continue to monitor the crests and slopes as part of the monthly visual inspection for signs of worsening cracking to determine if any slope stabilization measures are required.	Ongoing

10 Adaptive Management Plan - Operations

The Operations Adaptive Management Plan has been in use since WUL QZ14-031 became active. Adaptive Management Plan 2017-01 (AMP 2017-01) is currently approved by Energy, Mines and Resources (EMR) under the current Quartz Mining License (QML-0001); while the Adaptive Management Plan 2017-02 (AMP 2017-02) is approved under by the Yukon Water Board under the current Water Use Licence (QZ41-031). Minto has submitted version 2020-01; however, neither regulator has approved this version. This section includes the assessment to the AMP of 2017-02 specific thresholds.

The comparative tables and associated trigger levels for the adaptive management stations and the required trend analyses are included in the monthly WUL reports.

A summary of the AMP 2017-02 exceedances is included in the sections below. Not all threshold concentration exceedances result in the triggering of AMP responses, as determined by the AMP2017-02.

10.1 Surface Water Quality – Minto Creek

In 2021, AMP thresholds were triggered between April and September with exceedances either being related to freshet or previously investigated non-mine loading exceedances related to Se or one sampling/lab error.

10.1.1 Minto Creek – W2

A summary of the W2 exceedances of the AMP is discussed below in Table 10-1. Trend analysis, evaluations and data has been presented in the monthly reports.

Table 10-1: Minto Creek Surface Water threshold exceedances, Station W2

Date	Parameter	Exceedance Threshold Triggered	Context
26-Apr-21	Cu-D	SPT1	Cu and Cd are linked to freshet peaks in concentrations
26-Apr-21	Cd-D	SPT1	
4-May-21	Cu-D, Al-D	SPT2/SPT3	Al, Cu, Fe and Ni are all linked to freshet peaks in concentrations as is evidenced by no exceedances in June after freshet.
11- May- 21	Al-D	SPT2	
18-May-21	Cu-D	SPT1	
25-May-21	Al-D, Ni-D, Fe-D	SPT1/SPT3 (Ni/Fe)	
26-May-21	Ni-D	SPT3	
23-Sept-21	NH3	SPT1	Likely sampling or lab error as day before was below detection and several days later it was again below combined with upstream and downstream results not indicative of exceedance.

Ongoing events are addressed specifically as follows:

The exceedances above expected or worst-case maximum predictions for dissolved aluminum, copper, and molybdenum were not mine-related. Instead, exceedances in dissolved aluminum and copper concentrations were more likely associated with elevated concentrations in tributaries that influence water quality at stations W2 and W3.

Dissolved aluminum concentrations exceeded the guideline protective of aquatic life for one sampling event only, and this event was followed by a sharp decline to well below the guideline, however given that the aluminum exceedance was not mine-related, no further action was recommended.

The exceedance observed for dissolved cadmium may have been mine-related, however the exceedance occurred over one sampling event only, and has since decreased. In addition, trend analyses showed that in general, cadmium concentrations at station W2 have been decreasing.

It is recommended that sampling continue as scheduled at stations W2 and W3 since concentrations are not expected to affect aquatic life. Increased monitoring frequency is not required at this time at stations W2 and W3.

10.1.2 Minto Creek – W50

Minto monitored the specific performance thresholds for surface water quality in Minto Creek at WQO station W50 from May 10th to December 28th, 2021; the site was frozen until May 10th and therefore no samples collected before this time. No adaptive management was required.

10.2 Surface Water Quality – McGinty Creek

Minto monitored the specific performance thresholds for surface water quality in McGinty Creek.

A summary of the MN-4.5 exceedances of the AMP is discussed below. Trend analysis and data has been presented in the monthly reports.

Not all threshold concentration exceedances result in the triggering of AMP responses.

Table 10-2: McGinty Creek Surface Water threshold exceedances, MN-4.5

Date	Parameter	Exceedance Threshold Triggered	Context
19-May-21	Al-D, Cu-D, Ni-D, Se-D	SPT1 for Al, SPT2 for Cu, NI, Se	Al, Cu, Fe and Ni are all linked to freshet peaks in concentrations while Se-D loading has been investigated and is not caused by mine loading.
13-June-21	Se-D	SPT2	Se-D loading has been investigated by Minnow in 2019 Annual Report and is not caused by mine loading.
17-Jul-21	Se-D	SPT2	Se-D loading has been investigated by Minnow in 2019 Annual Report and is not caused by mine loading.
22-Aug-21	Se-D	SPT2	Se-D loading has been investigated by Minnow in 2019 Annual Report and is not caused by mine loading.
25-Sept-21	Se-D	SPT2	Se-D loading has been investigated by Minnow in 2019 Annual Report and is not caused by mine loading.

Ongoing events are addressed specifically as follows:

Dissolved aluminum, copper, nickel, and selenium exceeded the ST-2 objectives at MN-4.5, but the source was unrelated to the Minto Mine and consistent with historical concentrations before the Minto North Pit was operational. Dissolved aluminum,

copper, nickel, and selenium were well below Minto's SSWQO, so effects to aquatic life would not be expected.

Three investigations show that dissolved selenium consistently triggers either the ST-2 or the ST-3 objective but that exceedances were unrelated to the mine. These consistent exceedances could be due to the appropriateness of using MN-4.5 as the station which thresholds are based on. Station MN-4.5 receives influence from a mix of the west and the east arms. Station MN-0.5 would be more appropriate to use as the basis for the thresholds as it is influenced by a greater proportion of the west arm (reference arm) and would serve as a good comparison to MN-2.5 which is influenced by most of the east arm. It is recommended that the development of Specific Thresholds using station MN-0.5 should be considered. Accordingly, draft thresholds were developed for MN-0.5 (for all analytes) using the same methodology as current thresholds and based on all available data from 2009 to 2018. Data for MN-0.5 was used to develop ST-1 (0.23 μg/L), ST-2 (0.26 μg/L), and ST-3 (0.21 μg/L) selenium thresholds. Draft selenium thresholds were evaluated against raw data and 12-month rolling average calculations. This interpretation is discussed in greater detail in Appendix F.

It is recommended that sampling continue as scheduled since the exceedance of dissolved aluminum, copper, nickel, and selenium were unrelated to the mine. It is recommended that Minto Mine seek approval to use the draft thresholds. Increased monitoring frequency is not required at this time.

10.3 Groundwater Quality – Minto Creek

Various exceedances of AMP levels triggered a review of the groundwater data by the qualified professional. All groundwater data was forwarded to SRK Consulting for review and recommendations. See Appendix H, *Minto Annual Groundwater Review 2021,* and Appendix I*, Quarterly Groundwater AMP Exceedance Reviews,* for groundwater quality data results.

10.4 Groundwater Quality - McGinty Creek

Minto monitored the specific performance thresholds for McGinty Creek groundwater. Various exceedances of AMP levels triggered a review of the groundwater data by the

qualified professional. All groundwater data was forwarded to SRK Consulting for review and recommendations. See Appendices H and I for details. The Annual Review of AMP Exceedances for 2021 will include a comprehensive water and load balance for McGinty Creek and is expected later in the year and will be submitted separately.

10.5 Water Management AMP

Water storage capacity in the Main Pit Tailings Management Facility and the Area 2 Pit Tailings Management Facility was below 1,000,000 m^3 as of December 2021. As such, Minto notified SFN and YG and initiated a management response plan including bringing additional water treatment capacity to site. The key elements of the plan include:

- Additional capacity via a mobile microfiltration unit that is set up at the WSP to treat non-mine impacted water;
- Snowmakers to slow down the melt and improve water quality by reducing nitrogen loading in the manufactured snow/ice;
- Evaporators for use in the summer months; and
- Upgrades to the WTP to increase certainty of achieving WQOs by adding a polishing stage of ion exchange vessels and increasing capacity in the WTP to at least maximize the use of the RO units.

An amendment to the Water Management Plan to implement the elements of the management response plan has been partially approved by YG and is anticipated to be submitted in March to the Yukon Water Board.

Table 10-3, below, presents site-side water and tailings storage volumes and remaining capacity as of January 1st, 2022.

Table 10-3: Water and Tailings Storage Volumes and Capacity as of January 1st, 2022

Site	Volume Tailings and Water (m^3)	Maximum Volume	Remaining Capacity
Main Pit	463,412	510,446	47,034
WSP	196,200	294,939	98,739
Area 2 Pit Complex	2,212,648	2,985,601	772,953
Total	2,872,260	5,023,345	918,726

10.6 Physical Monitoring Program AMP

The results of the Physical Monitoring Program are compared to the thresholds set out in the 2018 Adaptive Management Plan (AMP). Table 10-4 and 10-5 below, summarize the threshold statuses for the Category 1 and Category 2 facilities. Please note that the table also includes historical context for some Thresholds.

Category 1 facilities are those found in areas of ice-rich periglacial foundations that have previously experienced deep-seated foundation movement and include the Dry Stack Tailings Storage Facility, Mill Valley Fill Extension (Stages 1 and 2), Southwest Waste Dump, and South Wall Buttress/Main Pit Dump. Category 2 facilities are all other waste rock dumps, including the Main Waste Dump and Main Waste Dump Expansion, Reclamation Overburden Dump, and Ice-rich Overburden Dump.

Table 10-4: Category 1 Facilities – Threshold Status, December 2021

Specific Performance Thresholds	Thresholds Exceeded	Response
Specific Threshold 1 • Observation of unusual occurrence including: • tension cracks, settlement, or sloughing; • a seismic event that exceeds the 1:475 return period event[1]; • abnormal seepage from any area of the slopes; • increased turbidity from seepage; • Physical damage.	SWD Cracking	**Sept. 2021:** Increased cracking observed on the former main road of the dump just south of the former IROD. The crack is oriented parallel to the crest, is approximately 200 m long and has a maximum width of 35 cm. The cracking was observed in June 2019. Survey hub data below the cracking was reviewed (Hubs SWD09, 11, and 12) and hubs SWD09 and 11 show a slight acceleration trend, but movement rates are like those observed in 2018. The cracking is believed to be related to the long-term movement of the SWD.

[1] This size of a seismic event would be felt by most people on site. It would shake buildings, and rattle or break dishes, hanging objects, etc. Earthquake information may also be found online at: http://www.earthquakescanada.nrcan.gc.ca/index-eng.php

Specific Performance Thresholds	Thresholds Exceeded	Response
		Area is to continue to be monitored for changes as part of routine inspections. In response to the cracking, the survey hub frequency of hubs SWD 9, 10, 11, and 12 was increased to monthly. **Current Conditions:** Movement rates have since slowed with no indication of instability.
Specific Threshold 2 • One survey hub or inclinometer reading indicating an increase in the movement rate greater than the long-term trend and outside the range of instrumentation error.	DS04	**November 2021**: Apparent acceleration trend with a displacement of 2.3 cm between two weekly readings. The following reading resulted in a movement rate that was like the proceeding readings indicating potential hub disturbance. December 2021: Three readings collected in past month indicate no change in movement following the disturbance. Issue considered **CLOSED**.
	M95	**November 2021**: Apparent acceleration trend increasing from 0.7 mm/day to 1.1 mm/day. Retake reading to confirm trend. **December 2021:** Subsequent reading confirmed the 1.1 mm/day rate and no further acceleration noted. The 1.1mm/day rate is within the typical seasonal range observed in 2019-20 and will continue to be monitored.
Specific Threshold 3 • For DSTSF and MVFE piezometers 13-DSP-05a, 13-DSP-06, 15-DSP-07, and 15-DSP-08, an increase in piezometric pressures under	None	N/A

Specific Performance Thresholds	Thresholds Exceeded	Response
unfrozen or thawing conditions such that Ru[2] exceeds 0.40. • For MVFE2 piezometer 15-DSP-10, an increase in piezometric pressures under unfrozen or thawing conditions such that the equivalent water elevation is 3 m above the original ground surface. Or Temperature greater than zero at a depth of 2 m below original ground *(all SWD ground temperature cables, and DSTSF ground temperature cables DST-10, DST-11, and DST-14 only)*		
Specific Threshold 4 • For DSTSF and MVFE piezometers 13-DSP-05, 13-DSP-06, 15-DSP-07, and 15-DSP-08, an increase in piezometric pressures under unfrozen or thawing conditions such that Ru exceeds 0.6. • For MVFE2 piezometer 15-DSP-10, an increase in piezometric pressures under unfrozen or thawing conditions such that the equivalent water elevation is 10 m above the original ground surface.	None	N/A
Specific Threshold 5 • Three consecutive survey hub or inclinometer readings indicating an increase in the movement rate movement greater than the long-term trend. Or • Three consecutive survey hub readings indicating a change in horizontal direction of movement	None	N/A

[2] Ru is the pore water pressure coefficient which is the ratio of piezometric pressure to the overburden pressure. A pore water pressure ratio of 0.5 would be similar to the effect of a groundwater table at surface. Conversions from Ru to equivalent water elevation are contained in Table 2-15 of the AMP.

Specific Performance Thresholds	Thresholds Exceeded	Response
greater than 15 degrees from the long-term trend.		

Table 10-5: Category 2 Facilities – Threshold Status, December 2021

Specific Performance Thresholds	Thresholds Exceeded	Response
Specific Threshold 1 • Observation of unusual occurrence including: • tension cracks, settlement, or sloughing; • a seismic event that exceeds the 1:475 return period event; • abnormal seepage from any area of the slopes; • increased turbidity from seepage; • physical damage.	None	N/A
Specific Threshold 2 **WSP Dam:** • One survey hub reading indicating an increase of movement outside range of instrumentation error. **All other Category 2 Facilities:** • Survey hub cumulative displacements between 150 mm and 500 mm.	None	N/A
Specific Threshold 3 **WSP Dam:** • One piezometer reading outside of its long-term trend (in comparison to the reservoir pond elevation). **All other Category 2 Facilities:** • Survey hub cumulative displacements greater than 500 mm.	None	N/A

Specific Threshold 4 **WSP Dam:** • Three consecutive survey hub readings indicating increase in movement outside range of instrumentation error.	None	N/A

11 Aquatic Environmental Monitoring Program

The Aquatic Environmental Monitoring Program (AEMP) is composed of Minto's requirements under the MMER and biological monitoring of sediment, benthic invertebrates, fish, and fish habitat. Monitoring under the MMER is presented in Section 11.1 and the biological monitoring of sediment, benthic invertebrates, fish, and fish habitat is presented in Section 11.2.

11.1 Metal and Diamond Mining Effluent Regulations Monitoring Programs

The Metal and Diamond Mining Effluent Regulations (MDMER) outline requirements for monitoring and reporting of discharged effluent volume and quality under the MDMER to Environment Canada. Details of the Metal and Diamond Mining Effluent Program, including sampling station locations and monitoring frequency, are outlined in the EMSRP and the results are submitted on a quarterly and annual basis to Environment Canada.

11.1.1 Effluent Monitoring Program

The MDMER Program requires effluent monitoring and sampling at the final discharge point (FDP) station W3, downstream of the end of pipe discharge. The W3 sampling station is collected when there is a discharge of water at W3; testing occurs weekly for deleterious substances.

Weekly effluent monitoring samples are tested for the deleterious substances as described in the MDMER including total metals (arsenic, copper, lead, nickel, and zinc), total suspended solids (TSS), and pH. Weekly samples are collected at least 24 hours apart and not more than 7 days apart. Minto is striving for consistency and has internally scheduled MDMER sampling to occur on Tuesdays.

Radium 226 and acute lethality tests are conducted quarterly due to the reduced frequency guidelines outlined in the MDMER.

The Effluent Monitoring Program results are submitted to Environment Canada quarterly.

11.1.2 Environmental Effects Monitoring Water Quality Monitoring

The EEM Water Quality Monitoring Program is designed to characterize water quality at the exposure area, the receiving environment and in reference (un-impacted) area. Water quality samples must be collected four times a year, not less than one month apart, while the mine is discharging effluent at the Final Discharge Point (FDP) of W3. Samples are collected at the exposure area (W3), receiving environment station (W2) and reference station (W7). Effluent toxicity testing is required annually using a total of four tests: one each of a fish, invertebrate, algae, and plant species.

The EEM Water Quality Monitoring Program results submitted to Environment Canada annually.

11.1.3 Environmental Effects Monitoring Biological Monitoring

The EEM Biological Monitoring Program outlines fish population, fish tissue and benthic invertebrate tests conducted under Schedule 5, Part 2 of the MDMER. See Appendix J *Minto Creek Sediment, Periphyton and Benthic Invertebrate Community Assessment – 2021 by Minnow,* for details.

11.2 Biological Monitoring Program

Clause 101 of the WUL requires an Annual Biological Monitoring Program (also known as the Aquatic Effects Monitoring Program or AEMP) that includes monitoring of sediment, periphyton, benthic invertebrates, fish, and fish habitat.

The following sections summarize the monitoring program results, and the more detailed primary reports can be found in Appendix J, which contains data and associated analysis and interpretation of sediment, periphyton, and benthic invertebrate monitoring.

11.2.1 Sediment Monitoring Program

Sediment quality results at upper Minto Creek and lower Minto Creek were summarized and compared to upper McGinty Creek and lower Wolverine Creek reference areas, respectively, in order to evaluate any potential mine-related influence.

Sediments collected in 2021 were largely composed of sand at the upper areas (>45%) and fine particles of silt/clay at the lower areas (Figure 11-1). Due to the predominantly erosional habitat in upper Minto Creek, there were relatively few areas of sediment deposition. In areas that did have deposition, sediment deposits were small and likely wash away each year during freshet. Therefore, fine sediment in the upper reaches of Minto Creek may be of limited importance in terms of exposure and potential effects of metals to biota. In lower Minto Creek, fine sediment deposits are somewhat more common and therefore more relevant to aquatic life.

Mean total organic carbon (TOC) content of sediment collected from upper Minto Creek (3.52%) was slightly lower (but not significantly so) than at the upper McGinty Creek reference area (4.71%; Table 11-1). Lower Minto Creek had lower (but not significantly) TOC (2.60%) than the lower Wolverine Creek reference area (5.22%; Table 11-2). Arsenic and copper were the only analytes with mean concentrations greater than Interim Sediment Quality Guidelines (ISQG) for the protection of aquatic life (CCME 1999) in an effluent-exposed area (Tables 11-1 and 11-2). Mean arsenic concentration in upper Minto Creek exceeded the ISQG and was lower, though not significantly so, than at the upper McGinty Creek reference area (Table 11-1). Mean arsenic concentration in lower Minto Creek exceeded the ISQG and was significantly higher than at the lower Wolverine Creek reference area (Table 11-2). Concentrations of arsenic in Minto Creek sediments have been stable since 2013.

Mean copper concentrations in upper Minto Creek and lower Minto Creek remained below the Probable Effect Level (PEL), except for one sample from upper Minto Creek. Mean concentrations of copper at upper McGinty Creek and lower Wolverine Creek reference areas remained below the ISQG (Figure 11-2). Both upper and lower Minto Creek had significantly higher copper concentrations than their respective reference areas, but concentrations have been stable since 2013. With progression from upper to lower Minto Creek, sediment copper concentrations decreased from a mean of 172

to 59 milligrams per kilogram (mg/kg), respectively, indicating improvement with distance downstream. As aforementioned, fine sediment deposits were considered of limited importance as a route for exposure and potential effects of mine-related metals to biota in upper Minto Creek, and more relevant to aquatic life at lower Minto Creek, where sediment deposits were somewhat more common. Sediment deposits in lower Minto Creek were less common than in previous years (as also observed in 2020), potentially due to lower precipitation and low flow conditions.

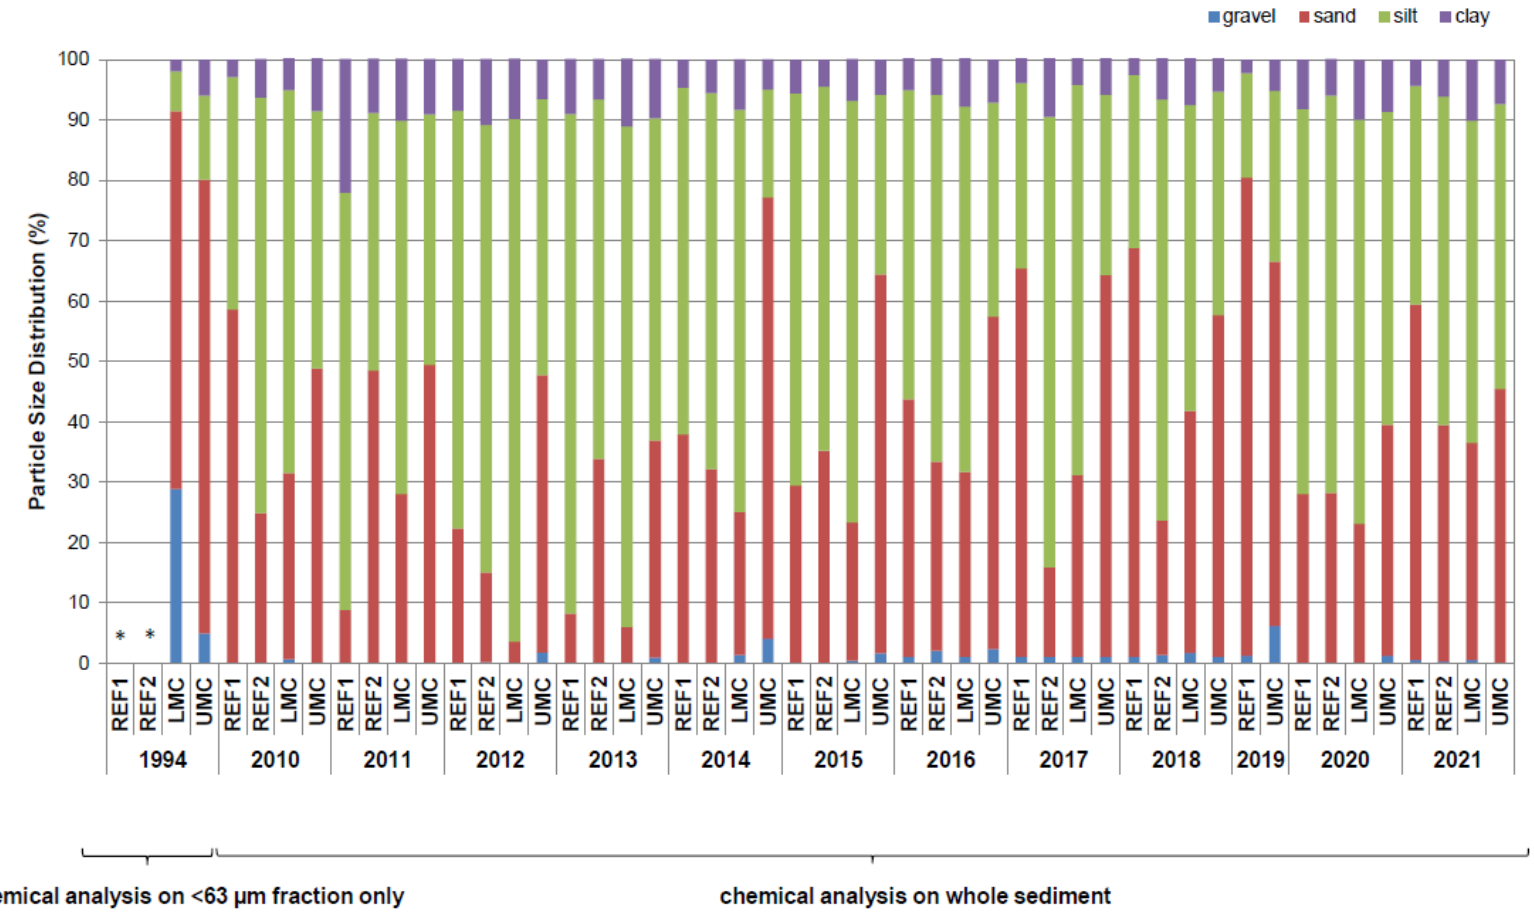

Figure 11-1: Particle Size Distribution of Sediment Collected in Minto Creek and Reference Locations, 1994 to 2021a,b

Notes: Methods used in 1994 were not specified, fine sediment was collected in triplicate in the mainstem of Minto Creek (HKP 1994), * = no data. No sampling was conducted in lower areas in 2019, as lower Minto Creek was dry.

[a] REF1 = Station W6 (south-flowing tributary) in 2006 to 2008 and McGinty Creek in 2010 to 2021; UMC = Upper Minto Creek

[b] REF2 = Station W7 (north-flowing tributary) in 2006 to 2009 and Wolverine Creek in 2010 to 2021; LMC = Lower Minto Creek.

Table 11-1: Statistical Comparisons Between Upper McGinty Creek (Reference) and Upper Minto Creek (Mine-Exposed) Sediment Chemistry, Minto Mine AEMP, 2021

Analyte	CSQG[a]		Upper McGinty Creek (Reference)				Upper Minto Creek (Exposed)				Statistical Test

Magnitude of Difference (MOD) < 0.
Indicates sediment concentration exceeding CSQG ISQG.
Indicates sediment concentration exceeding CSQG PEL.

Note: ns = non-significant.

[a] Canadian Sediment Quality Guidelines: ISQG = interim sediment quality guideline; PEL = probable effect level (CCME 2014).
[a] Measure of Central Tendency is the mean for parameters where statistics were conducted on the raw scale, the geometric mean when statistics were $\log_{10}$ transformed to meet the assumptions of normality, and the median when rank transformed.
[b] MOD = magnitude of difference = $(MCT_{exp}-MCT_{ref})/MCT_{ref}*100\%$.

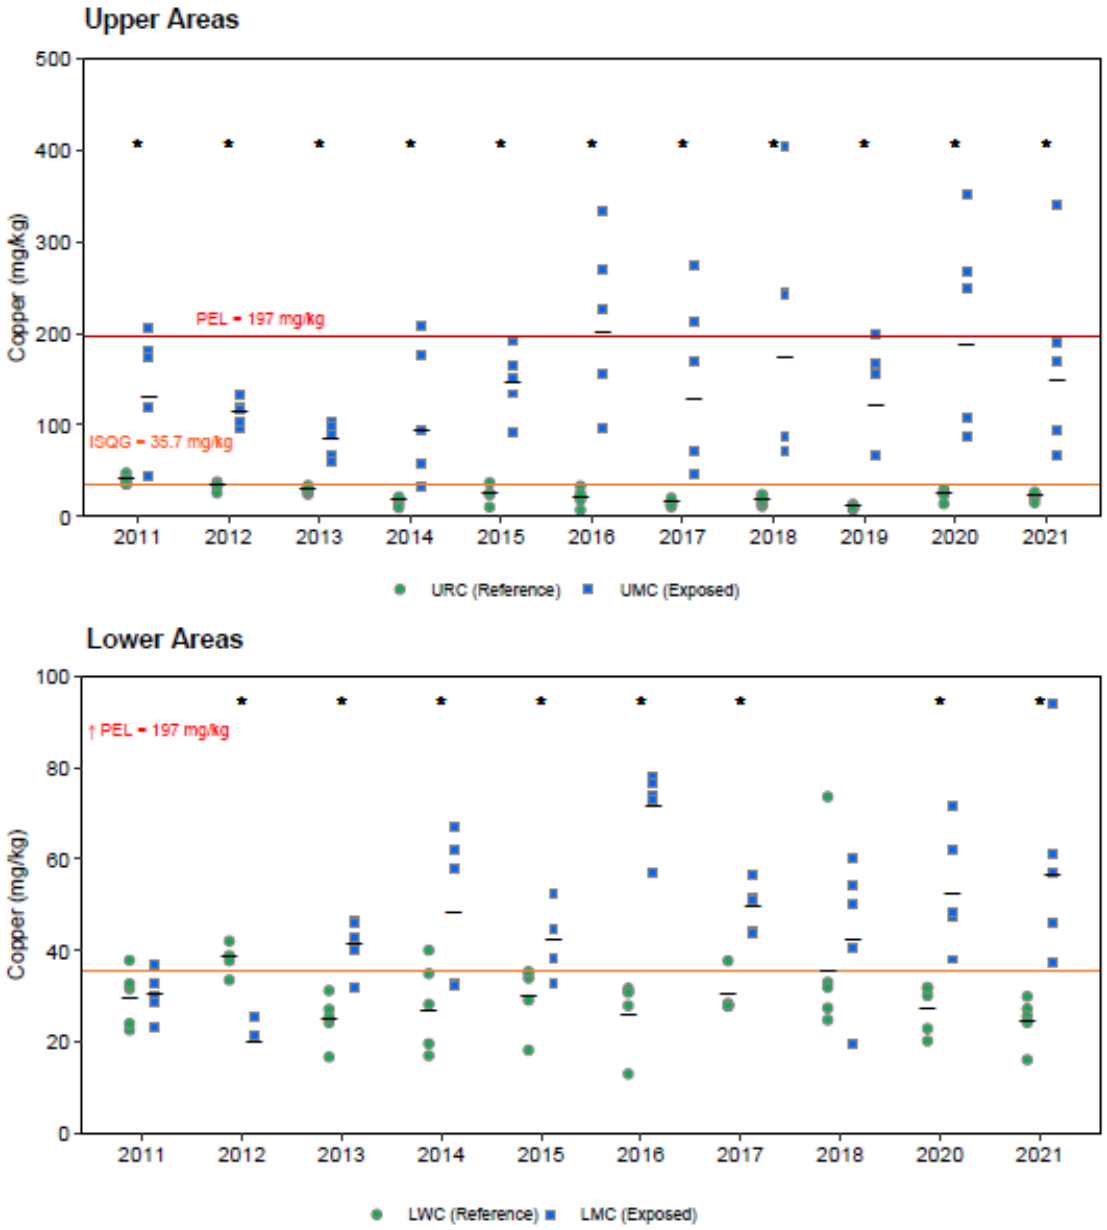

Figure 11-2: Sediment Copper Concentrations Over Time for Upper Areas, 2011 to 2021

Notes: URC = upper McGinty Creek, UMC = upper Minto Creek, LWC = lower Wolverine Creek, LMC = lower Minto Creek. Black horizontal bars indicate the Measure of Central Tendency (MCT). The MCT is the mean for non- transformed data, geometric mean for log10 transformed data and median for rank transformed data. An * indicates stations were significantly different for that year. Interim Sediment Quality Guideline (ISQG) = 35.7 mg/kg is shown in orange and Probable Effect Limit (PEL) = 197 mg/kg is shown in red.

5.7.1 Periphyton Monitoring

Periphyton chlorophyll-a results at lower Minto Creek were summarized and compared to lower Wolverine Creek reference in order to evaluate any potential mine-related effects.

Mean periphyton chlorophyll-a (mg/m^2) was significantly higher at lower Minto Creek (45.8 mg/m^2) compared to the lower Wolverine Creek reference area (20.1 mg/m^2) but was below the British Columbia Water Quality Guideline (BCWQG) of 100 mg/m^2 for the protection of aquatic life (BCMOE 1985) except for one sample at lower Minto Creek (106 mg/m^2 at LMC-5; Figure 11-3). Production was classified as mesotrophic based on the system of Dodds et al. (1998), which sets the oligotrophic-mesotrophic boundary for benthic chlorophyll-a at 20 mg/m^2 and the mesotrophic-eutrophic boundary at 70 mg/m^2. Productivity classification has varied over the years for both areas. For example, both creeks were classified as mesotrophic in 2018 but lower Minto Creek was classified as oligotrophic in 2020.

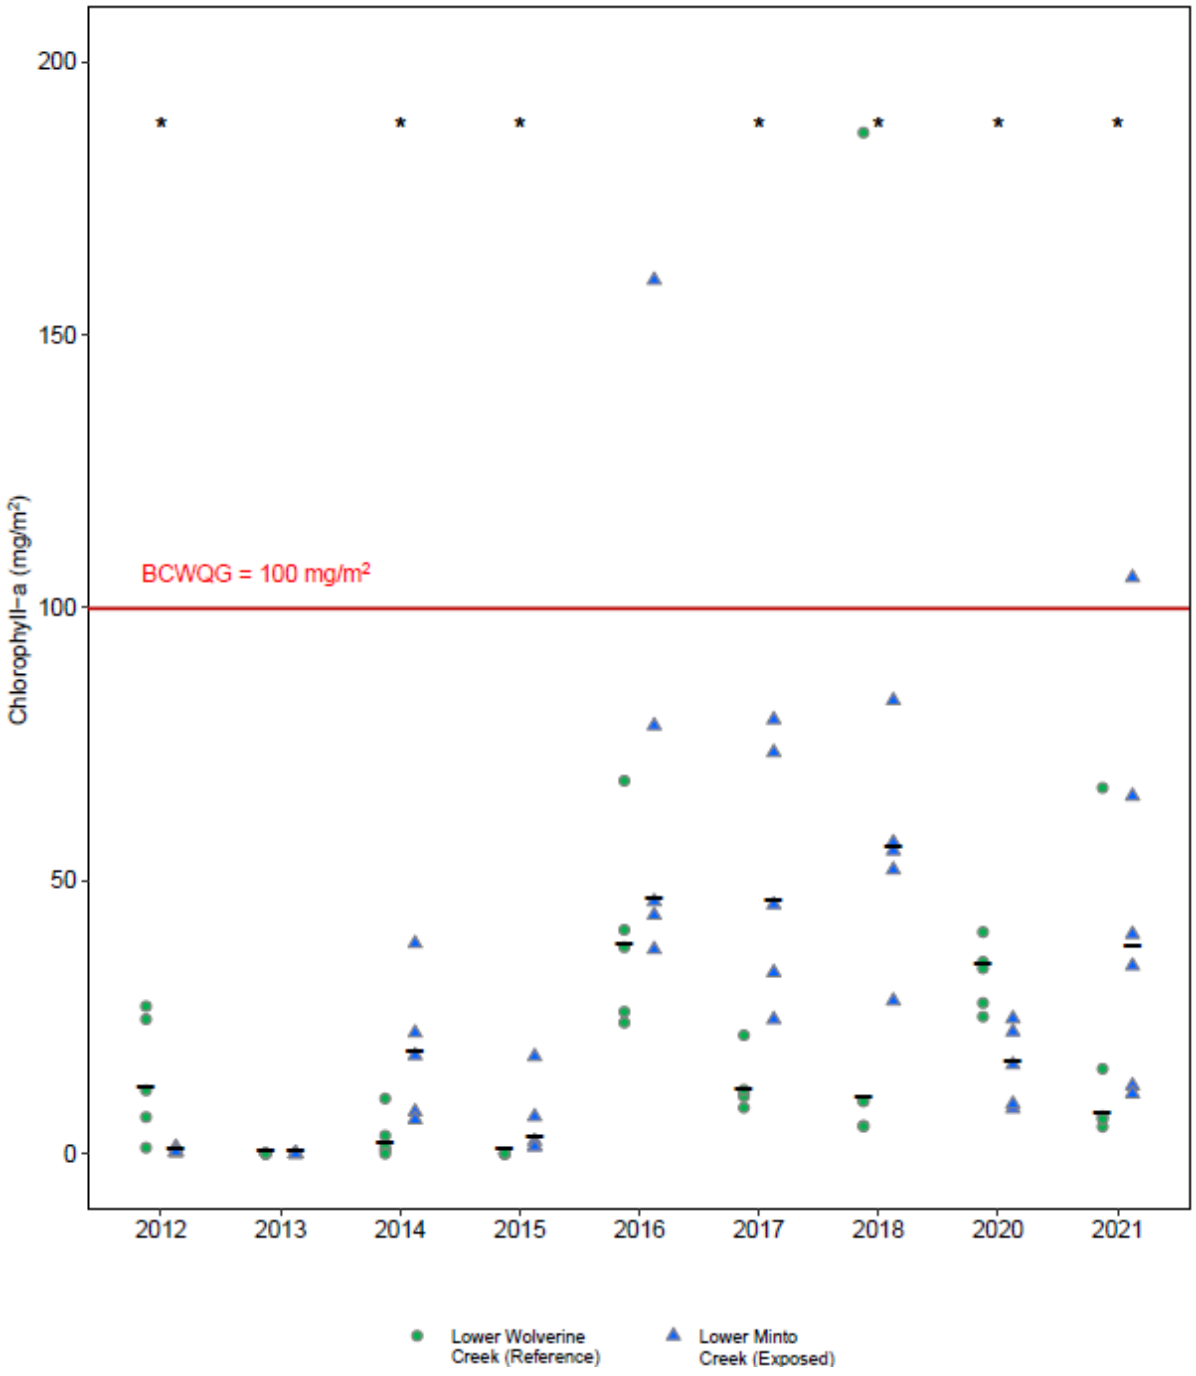

Figure 11-3: Periphyton Chlorophyll-a Measured in Lower Minto Creek and Lower Wolverine Creek (Reference), Minto AEMP, 2012 to 2021a

Notes: Black horizontal bars indicate the Measure of Central Tendency (MCT). The MCT is the mean for non- transformed data, geometric mean for log_{10}-transformed data and median for rank transformed data. An * indicates stations were significantly different for that year[a] Sampling was not completed in 2019 due to dry conditions at lower Minto Creek.

[a] Sampling was not completed in 2019 due to dry conditions at Lower Minto Creek.

5.7.2 Benthic Invertebrate Community Monitoring

Benthic invertebrate communities at erosional areas of lower Minto Creek were summarized and compared to erosional areas of lower Wolverine Creek and lower Big Creek in order to evaluate any potential mine-related effects.

Of the five primary benthic invertebrate community metrics, only the Bray-Curtis index of dissimilarity was significantly different between lower Minto Creek and both reference areas (Table 11-3). There were no significant differences for taxa richness (number of taxa), Simpson's Evenness, or Simpson's Diversity between lower Minto Creek and either lower Wolverine Creek or lower Big Creek reference areas. Density was significantly higher at lower Minto Creek compared to lower Wolverine Creek but there was no significant difference between density at lower Minto Creek and lower Big Creek (Table 11-4). Interpretation of primary metrics alone suggest a limited mine influence. Consideration of specific taxon groups indicated some community composition (expanding on what was detected by the Bray-Curtis index). Specifically, percent chironomids (non-biting midges) were significantly higher at lower Minto Creek compared to both reference areas, while percent EPT (Ephemeroptera [mayflies], Plecoptera [stoneflies], and Trichoptera [caddisflies]) as well as percent Plecoptera alone were significantly lower at lower Minto Creek compared to both reference areas (Table 11-4). The significantly higher proportion of chironomids and lower proportion of EPT is typically indicative of a degraded benthic invertebrate community (Chapman et al. 1982a,b, Rosenberg and Resh 1993, Taylor and Bailey 1997). However, correlation analysis suggested that the observed differences in percent chironomids and percent EPT taxa were likely due to a combination of factors that cannot be fully distinguished, including habitat differences among areas, a limited Minto Mine influence on water quality, and possibly low flow conditions in July (that would have affected lower Minto Creek more than the larger reference creeks; Table 11-5).

Benthic invertebrate community condition has been temporally variable at Minto Creek and reference areas, perhaps in association with winter glaciation and occasional dry conditions. Nonetheless, mean benthic invertebrate density in lower Minto Creek in 2021 was the second highest observed over the 2012 to 2021 period and has not changed significantly since 2017 (Figure 11-4). Mean richness, Simpson's

Evenness, and Simpson's Diversity in lower Minto Creek have not changed significantly over the 2012 to 2021 period (Figure 11-4). Richness has not differed significantly between lower Minto Creek and lower Wolverine Creek since 2012 and Simpson's Evenness and Diversity have not differed significantly from either reference area since 2015 (with the one exception being the difference relative to lower Big Creek in 2018: Figure 11-4).

Table 11-3: Statistical Comparison of Bray-Curtis Index for Lower Minto Creek and Reference Areas, Minto Mine AEMP, 2020

Comparison	Sample Size		Betadisper P-Value	Mantel Test			dbRDA			
	Reference	Exposed		r	R^2	P-Value	F-Value	R^2	R^2_{adj}	P-Value
LMC vs LWC	5	5	0.577	0.932	0.868	0.008	0.566	0.512	10.4	0.008
LMC vs LBC	5	5	0.217	0.918	0.842	0.008	0.532	0.473	9.09	0.002

P-Value < 0.1

Notes: LWC = lower Wolverine Creek (Reference), LMC = lower Minto Creek (Exposed), LBC = lower Big Creek (Reference), dbRDA = distance-based redundancy analysis. See Section 2.5.2 for statistical analysis details.

Table 11-4: Statistical Comparisons of Benthic Invertebrate Community Characteristics Among Areas, Minto Mine AEMP, 2021

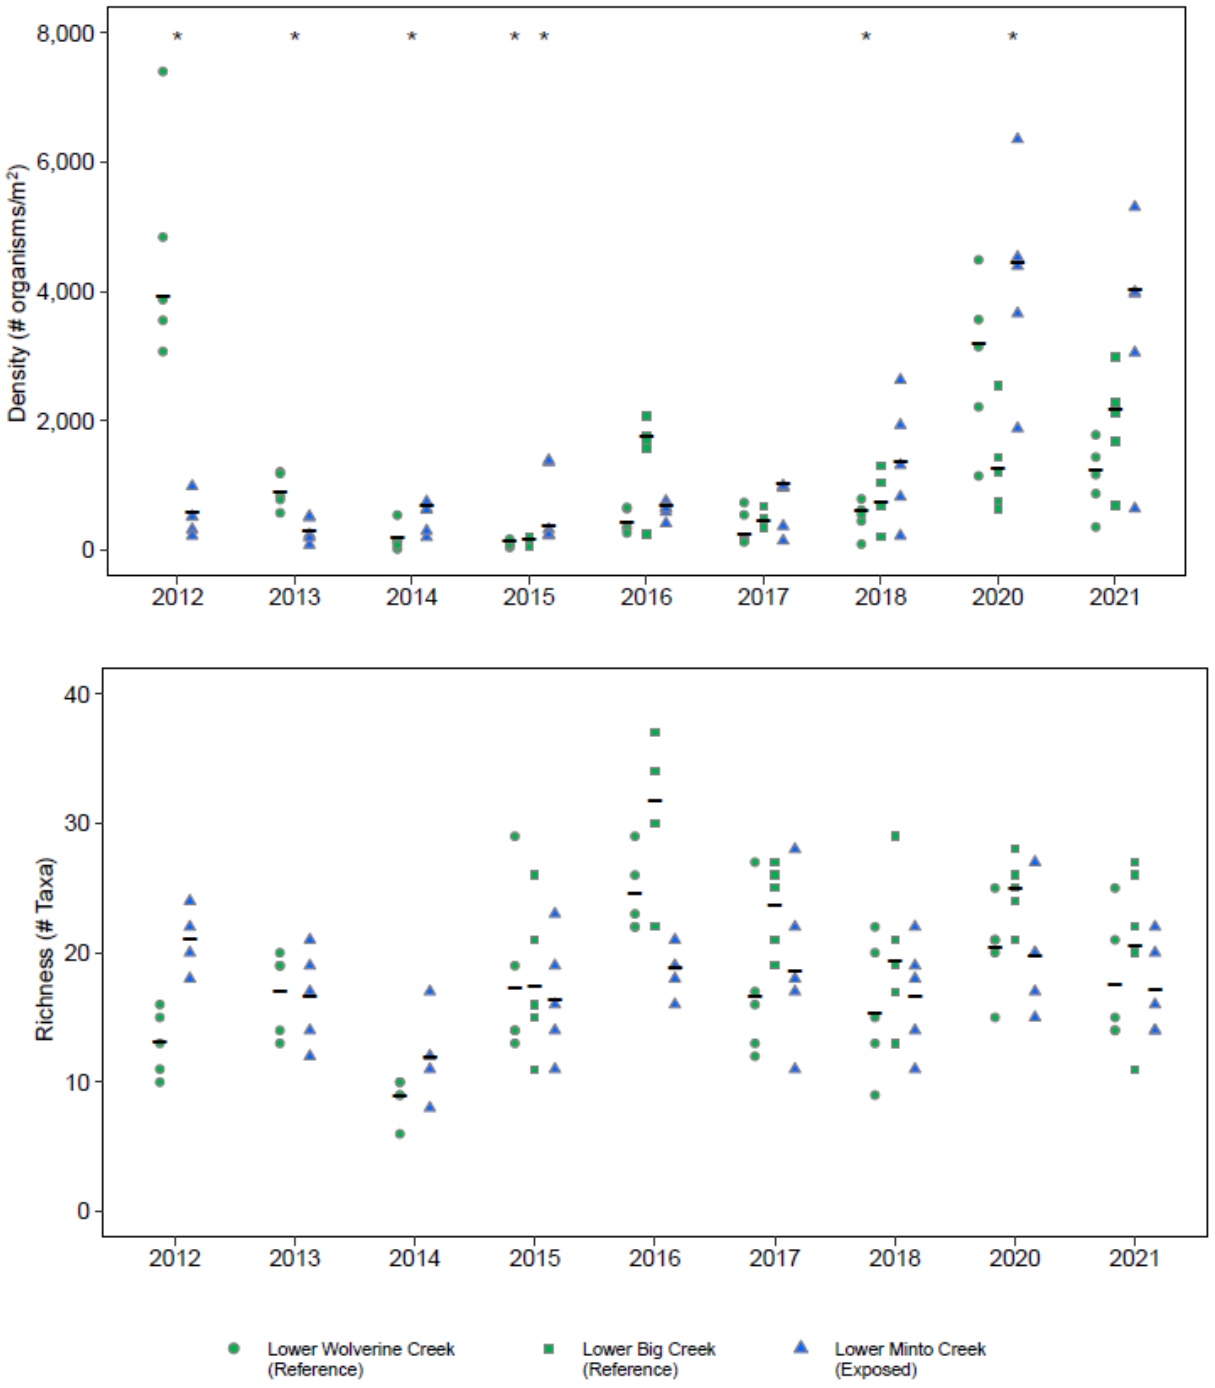

Figure 11-4: Benthic Invertebrate Community Primary Endpoints at Lower Minto Creek and Reference Areas, 2012 to 2021

Notes: Black horizontal bars indicate the Measure of Central Tendency (MCT). The MCT is the mean for non- transformed data, geometric mean for log-10 transformed data and median for rank

transformed data. An * indicates the reference station was significantly different from the exposed station for that year. All endpoints were calculated at the lowest practicable level (LPL).

[a] Sampling not conducted in 2019 due to dry conditions.

11.2.2 Fisheries Monitoring Program

An evaluation of the Fisheries Monitoring Program was conducted by Minnow Environmental Ltd in 2021, which recommended that fisheries monitoring in Minto Creek be conducted once every three years to coincide with Environmental Effects Monitoring, rather than annually, unless flows continuously exceed 0.1 m/s, temperatures exceed 10°C or there is emergency discharge. As none of these conditions occurred in 2021, no fisheries monitoring was conducted. The next EEM cycle study and concurrent fisheries monitoring program is scheduled for 2022.

12 Meteorological Monitoring Program

Meteorological monitoring at the Minto Mine consists of data collection for the following parameters: rainfall, snowfall, temperature, evaporation, wind speed and direction, barometric pressure, relative humidity, and solar radiation (incoming and reflected). The Meteorological Monitoring Program includes the Climate Monitoring Program (EMSRP Section 4.1) and the Snow Survey Program (EMSRP Section 4.2).

Data collected under the Meteorological Monitoring Program, along with baseline climatic data, provides input for the following mine projects:

- Site water management.
- Prediction for yearly water events (e.g., freshet)
- Design of water storage, conveyance, and discharge system
- Design of flood control structures on the road network.

12.1 Climate Monitoring Program

The 2021 Climate Monitoring Program data is presented below in Figure 12-1 through Figure 12-7. During 2021, Minto Mine had one meteorological station located approximately 70 m northeast of the north end of the airstrip, in an area that allows

ample meteorological exposure from all directions. Trees are cleared for a radius of 30 m from the meteorology station and beyond that radius is a sparse growth of 2 m tall conifers.

The meteorology station is a research grade Campbell Scientific station that records the following parameters: maximum wind speed, minimum wind speed, average wind speed, wind direction, precipitation (rain and snow), temperature, relative humidity, pan evaporation, barometric pressure, solar radiation, and calculated evapotranspiration. Data are averaged over the one-hour archiving period and then saved to the datalogger. The Geonor precipitation gauge was installed in November 2014 but stopped working in 2017. Troubleshooting was ongoing from that time, but the gauge did not become operational again until September 2021. To ensure accuracy, results are being compared to Minto's tipping bucket gauge and the Carmacks weather station and will be presented in the 2022 Annual Report.

The evaporation pan was in operation from June 20th through to September 18th.

12.2 Snow Survey Program

As required by the WUL Clause 96 and as part of the EMSRP, Minto collects snow data at the mine. The objective of the Snow Survey Program is to collect data used for

calculating the snow water equivalent at the Minto Mine site. Snow water equivalents are inputs for the Minto Mine Site Water Balance models. Four courses are surveyed during the first week of February, March & April each year. If conditions permit, Minto will additionally survey the snow courses in May. These courses are East-facing (near the Dyno compound), North-facing (near the airstrip), South-facing (above the Tank Farm) and flat (Dry Stack Tailings), as detailed in Table 12-1. Along each course, ten stations are sampled using a machined core tube with cutting end and scale assembly. The parameters collected during the surveys include snow depth, core length, core weight, snow density, weather, site conditions, snowpack conditions, crust layers, and snow temperature. Multi-year results to 2021 (averaged across the four snow courses) are presented in Appendix E – 2021 Water Balance and Water Quality Model Summary for the Minto Mine.

Table 12-1: Snow Survey Course Locations

Course Location	Description	Aspect	UTM	
			Easting	Northing
Dyno	East of the Dyno compound on an east facing slope along a cut line surrounded by moderately densely tree area.	East Facing	8V 383 594	694 3377
Fuel Farm	North of the Minto Mine fuel farm on a south facing slope in a sparse to moderately densely treed area.	South Facing	8V 385 061	694 5318
Airstrip	Northeast of the Minto Mine airstrip on a north facing slope in a sparsely treed area.	North Facing	8V 386 255	694 4284
Dry Stack Tailings Facility	Directly on top of the Dry Stack Tailings Storage Facility.	Flat	8V 385 525	694 4786

12.3 Meteorology QA/QC

Procedures for meteorology monitoring at the Minto Mine are detailed in the Meteorology Station Standard Operating Procedures. Minto has installed a satellite connection to the Met Station 2 to enable real time viewing of the weather station data. The meteorology data is downloaded and reviewed twice monthly by Environmental

Department staff and routine visual inspections of the monitoring stations occur on a weekly basis.

The Geonor precipitation gauge is operational as of September 2021 after not functioning properly since 2017. The Geonor will be monitored throughout 2022 and will be compared to precipitation results generated by the tipping bucket gauge.

13 Geochemistry

13.1 Waste Rock Verification Program

The Waste Rock Verification Program was initiated in 2014 to support and monitor waste rock handling procedures at the Minto Mine. The program was developed to address Clause 95 of the WUL, with the results of the program to be included in the Annual Report. The program consists of detailed record keeping on the type and quantity of waste rock placed at each location and monitoring and verification of the characteristics of the waste rock stored at each location as per the Waste Rock and Overburden Management Plan.

Minto's Technical Services Department tracks all waste dispatched between the source and the destination using the mine's computer database system. The dispatch data are based on load count sheets compiled by the mining contractor.

Samples are taken by Minto geology personnel on dump crests that had been active in the 30 kT stockpile lifts as determined by the production tracking database. The grab sample consists of 5 kg sample collected along a 25 me transect with material being collected at one-meter intervals over the distance of the recently placed waste. Particles greater than a pebble (64-80 mm) in size are manually rejected, the sample is then labelled and delivered to Minto's onsite assay lab.

Each sample is analyzed for total copper (Cu (T)), total sulfur (S (T)), and total carbon (C (T)) content using an Eltra CS-800 induction furnace. S (T) and C (T) values are converted into equivalent Acid Potential (AP-S (T)) and Neutralization Potential (NP-C (T)) values, and NP-C (T): AP-S (T) ratios (NP/AP) are calculated for each sample. The resulting (NP-C (T)): (AP-C (T)) ratios are compared to the segregation criteria and assigned "pass" or "fail" designations, which is a 3:1 ratio at Minto.

Most of the underground mine development occurring in 2021 was in the ore zones. A minimal amount of SAT in the underground development was encountered and this material was deposited in the Main pit. Consequently during 2021; 7 samples were collected from the Main Waste Rock Dump.

Of the seven samples taken from the berm of the Main Pit Waste Dump – two samples failed in isolation. Two of five passing samples contained less than 0.1% Cu, and 0.3% Sulphur, meeting clean construction material classifications and/or NPR NAG waste rock classifications. Resampling is scheduled to occur spring of 2022 when snow has melted away from this area of the Main Pit Waste Dump. See Table 13-1 below.

Table 13-1: Waste Rock Management Verification Program Summary (2021)

Average ABA Parameter Values: Year by Location								
Location	**Tonnes**	**Waste Type**	**Cu%**	**C% (Tot)**	**S% (Tot)**	**NP**	**AP**	**NP/AP**
Berm	147,400	WST	0.02	0.09	0.04	7.48	1.09	6.86

13.2 Acid-Base Accounting Program

The EMSRP commits to the submission of results of the ABA Program that was conducted during the reporting year. The ABA program determines the Neutralizing Potential Ratio ((defined as Neutralizing Potential divided by Acid Potential [NP/AP]) (NPR)) for overburden and waste rock to confirm that the NPR is greater than three. An NPR value of three or greater is generally considered indication of non-acid generating material. A separate, parallel program was initiated to determine the NPR of the tailings solids.

A total of 26 waste rock samples were collected from the Copper Keel Underground (CK UG) and sent to an accredited laboratory (ALS Minerals) during the 2021 monitoring period. The samples were analyzed according to the MEND Modified NP Method as noted in the EMSRP.

The mean NP:AP results for waste rock samples was 16.7 for the duration of the monitoring period. No samples during the 2021 monitoring period were below the NPR threshold of 3 for waste rock. The mean paste pH values for all samples tested in 2021 was 8.36. The mean sulfide sulfur (S(S-2)) content for waste rock samples during the 2021 monitoring period was 0.055%. In 2021, no samples exceeded the S(S-2) content threshold of 0.30% for construction grade waste rock.

A total of 11 composite tailings samples were collected in 2021. The mean NP:AP results for tailings samples was 15.8 for the duration of the monitoring period. The mean paste pH values for all tailings samples tested in 2021 was 8.27. The mean sulfide sulfur (S(S-2)) content for waste rock samples during the 2021 monitoring period was 0.06%.

A full report containing lab results and analyses can be found in Appendix K.

13.3 Leach Pads

In 2017, two field scale leach pads were constructed and filled with Partially Oxidized Ore (POX – Leach Pad #1) and Low-Grade Sulfide Ore (Green sulfide ore – Leach Pad #2), as per the EMSRP. The Pads were constructed in October 2017, and the first leachate samples were collected in May 2018. In 2021, samples were collected monthly when water was available, resulting in 7 sampling events through the non-frozen months of 2021. Results from the leach pad samples are provided in the monthly reports. A summary report is included in Appendix L; sampling methodology and sample results of the 2021 sampling season are included in Appendix M.

14 Terrestrial Monitoring Programs

14.1 Wildlife Monitoring Program

The *Minto Mine Wildlife Protection Plan* (a component of the EMSRP) establishes guidelines for minimizing wildlife disturbance at the Minto Mine site and along the development corridor and includes a monitoring program to yield information about wildlife use in the area. The 2021 activities under the Wildlife Monitoring Program including the area and frequency of monitoring, are summarized in Table 14-1, below. There were no notable Wildlife incidents in 2021 as previously outlined in Section 2.5.2.

Table 14-1: Wildlife Monitoring Activities (2021)

Area Monitored	Monitoring Activities	Frequency
Wildlife Monitoring	Wildlife monitoring consists of maintaining a wildlife observation log onsite and reporting wildlife encounters, as per the Wildlife Act. Environmental personnel on site will monitor project activities and modify operations to address wildlife concerns.	Ongoing
Migratory Birds	Monitoring to determine if waterfowl and shorebirds settle on impacted water bodies, such as the Main or Area 2 Pits. Environmental personnel on site will monitor project activities and modify operations to address wildlife concerns.	Seasonal, Daily during migratory periods
Species at risk/ of concern	Any caribou observations will be reported to the Conservation Officer in Carmacks. Bank swallows have been observed to nest in residuum piles in the summer months, in which case these piles are cordoned off and left undisturbed until after the late summer migration or re-sloped prior to nesting season to deter nesting.	As necessary

In addition to the Wildlife Monitoring Activities listed in Table 14-1, the Minto Environmental Department gathered observations from mine site staff with Wildlife Observation forms. These forms were posted at many accessible locations around site and employees were encouraged to record all wildlife observations. The forms were collected periodically, and the sightings entered in a wildlife tracking sheet, which is included as Appendix N.

In 2021, 80 wildlife sightings were recorded, with 47 sightings involving bears (44 Black Bear and 3 Grizzly), 14 foxes, 8 deer, one lynx, and two wolves. Other animals that have historically been observed on site include but are not limited to, hares, ermine, grouse, ptarmigan, sheep, dunlin, eagles, ducks, porcupine, coyote, cougar, sandhill cranes and geese.

The most active month of the year for wildlife observations was May, with 32 reportable sightings. Active hazing was most frequent in May as well.

Additional activities that took place on site included occasional information broadcasting known as Safety Flashes concerning the prevention of wildlife habituation to all staff working on site.

14.2 Erosion and Sedimentation Monitoring Program

As part of the EMSRP, Minto has developed and implemented a *Sediment and Erosion Control Plan* (SECP). The objective of the SECP is to minimize local site impacts from erosion and prevent sedimentation to the receiving environment of Minto Creek. The 2021 activities associated with the Erosion and Sedimentation Monitoring Program are identified in Table 14-2, below.

Table 14-2: Erosion and Sedimentation Monitoring Activities (2021)

Activity	Location	Frequency
Visual inspections	Bottoms of slopes and depressions of large structures.	As needed following heavy rain events, and during freshet.
	Road routes: ditches and outlets of culverts and pipes.	As needed following heavy rain events, and during freshet.
Water quality monitoring for total suspended solids (TSS)	Water quality monitoring stations W2, W3, W50 and W17	Weekly and during heavy runoff periods.
Physical inspection of surface facilities by a Yukon registered Engineer.	Water Storage Pond Dam, Mill Water Pond, all waste rock and overburden dumps, all water diversion and conveyance structures and the dry stack tailings storage facility.	After the spring thaw period in May/June of each year and again prior to the on-set of winter in September of each year

14.3 Invasive Plant Species Monitoring Program

As part of the EMSRP, Minto developed an Invasive Species Monitoring Standard Operating Procedure (SOP) in 2015. The Invasive Species Monitoring Plan, created in 2014, was the basis for the SOP. The SOP details how the monitoring program will be conducted.

The 2021 Invasive Plant Monitoring Program began on June 27 and was completed on June 30, 2021. The program consisted of surveys and long-term photo documentation in high traffic areas onsite, such as the Waste Management Area, the Dry Stack Tailing Facility (DSTF), the Propane Farm, the Dyno call road, and Pelly Yard. Areas with lower visitor traffic including the Southwest Dump, Minto North, and the W15 wetland area, and the length of the Access Road from the mine site to the barge landing were documented as well.

The survey focused on the high-risk species as listed by the Yukon Invasive Species Council (YISC) (Table 14-3), but also identified lower risk invasive species, such as foxtail barley (*Hordum jubatum*). High-risk species identified during the 2021 survey included narrowleaf hawksbeard, sweet clover (yellow and white) and smooth brome. As per the EMSRP, the observed high-risk species were reported to the YISC Spotter's Network.

Table 14-3: Common and scientific names of Yukon invasive plant species.

Common Name	Latin Name	Common Name	Latin Name
Common tansy	*Tanacetum vulgare*	Smooth brome	*Bromus inermis*
Creeping thistle	*Cirsium arvense*	Spotted knapweed	*Centaurea stoebe*
Dalmatian toadflax	*Linaria dalmatica*	Scentless chamomile	*Tripleurospermum perforata*
Great butter and eggs	*Linaria vulgaris*	Foxtail barley	*Hordeum jubatum*
Hawkweeds	*Crepis tectorum*	Altai wild rye	*Leymus angustus*
Leafy spurge	*Euphorbia esula*	Crested wheat grass	*Agropyron cristatum*
Oxeye daisy	*Leucanthemum vulgare*	Quackgrass	*Elymus repens*
Perennial sow-thistle	*Sonchus arvensis*	Reed canary grass	*Phalaris arundinacea*
Sweetclover	*Melilotus alba (white) officinale (ellow)*	Bird vetch	*Vicia cracca*
		Lucerne	*Medicago falcata*

14.3.1 Survey Methods

The invasive species monitoring program included two types of surveys focused on different areas, including a meander survey for numerous areas on-site and a visual survey of the access road from a vehicle.

14.3.1.1 Meander Survey

Meander surveys were traversed on foot and instances of invasive species were documented. Invasive species were identified, photographed, and located using new

or pre-existing waypoints with a GPS. In addition, the coverage, distribution, and density of invasive species at each survey location was documented and long-term monitoring photos were taken at locations consistent with previous years.

14.3.1.2 Access Road Survey

For this survey, Minto Environment staff drove the length of the Access Road (27 km) at low speed to document any invasive species growing along the roadside. Photos were taken several points, including the barge landing (km 27), the Big Creek bridge (km 19), and the gravel pit (km 12.5) to support long-term monitoring efforts.

14.3.1.3 Long Term Photo Monitoring

Monitoring locations were consistent with previous years' surveys and served to document the change over time occurring at the various sites susceptible to invasive species introduction. Four photos were taken at each location facing different directions, roughly north, east, south, and west. These photos enable staff to track the movement of invasive plant species across the landscape and the rate at which species of concern can advance.

14.3.2 Results

The findings of the meander survey for each area are found in 14-4 below. The results generally found widespread narrowleaf hawksbeard (NLHB), instances of foxtail barley (FTB) and isolated patches of sweet clover (SC). Soil texture was found to be coarse at all locations.

Density is an estimate of plants per square meter on a scale of 1 to 4, where 1 is one or fewer plants per square meter and 4 is more than ten. Distribution (Dist.) refers to how plants are grouped in an area on a scale of 1 (a single plant) to 10 (continuous).

Table 14-4: Meander Survey Results

Area	Way Point	Invasive Species	% Coverage	Dist.	Density	Comments
Minto North	WP1	NLHB	25	6	3	
	WP2	NLHB	10	2	1	
	WP3	FTB	10	2	2	
Camp Area	WP36	FTB	1	8	3	Selkirk Towers
		NLHB	>1	2	2	Sporadic throughout
Propane Farm		NLHB	5	2	1	East side
WMA		NLHB	5	2	1	Along roadside
		FTB	5	1	1	Along roadside
	WP17	NLHB	50	2	1	
	WP15	NLHB	2	1	1	
Active Rec Area	WP33	NLHB	5	2	1	
		FTB	5	1	1	
Dyno Road		NLHB	25	7	2	Along roadside
		FTB	10	5	1	Along roadside
	WP9	NLHB	60	6	2	
Dry Stack Tailing Facility		NLHB	>1	1	1	
		FTB	2	1	1	
	WP21	NLHB	80	7	3	
Mill Valley Fill	WP23	NLHB	80	7	3	
		FTB	25	3	2	
W15 Wetland	WP34	NLHB	5	1	1	
		SC	5	2	1	On hillside near road
Pelly Yard	WP3	SC	5	2	1	
		NLHB	5	2	1	
	WP11	SC	5	2	1	
		NLHB	5	2	1	
IROB	WP7	NLHB	50	8	3	
		FTB	5	1	1	
SWD		NLHB	20	3	3	
		FTB	>1	1	1	Scattered individuals
		SC	5	2	2	Occasional patches

The results of the Access Road survey can be viewed in Table 14-5. The abundance of observed infestations was based on three predefined classes: continuous (plants form a continuous mat along highway), sporadic (scattered patches), or rare (a single occurrence).

Table 14-5: Access Road Survey Results

KM	Invasive Species	Abundance	Comments
Barge	SC	Sporadic	
	FTB	Rare	
	NLHB	Continuous	
25	NLHB	Sporadic	
23	SC	Rare	
18	SC	Sporadic	
	NLHB	Continuous	
	SB	Rare	KM 18 -> KM 19
17.5	SC	Continuous	
17	NLHB	Sporadic	
15	SC	Sporadic	
14	SC	Rare	
	NLHB	Rare	
13	NLHB	Sporadic	
12.5 Gravel Pit	FTB	Sporadic	

Narrowleaf hawksbeard (NLHB) were visible throughout the length of the road in single plants, and instances of smooth brome (SB) were found near Minto Creek and Big Creek. White sweet clover was sporadic from kilometre 14 to 27, with continuous dense patches between kilometres 15 and 18. Foxtail barley was rare, occurring as sparse individual plants from the barge to the kilometre 12.5 gravel pit.

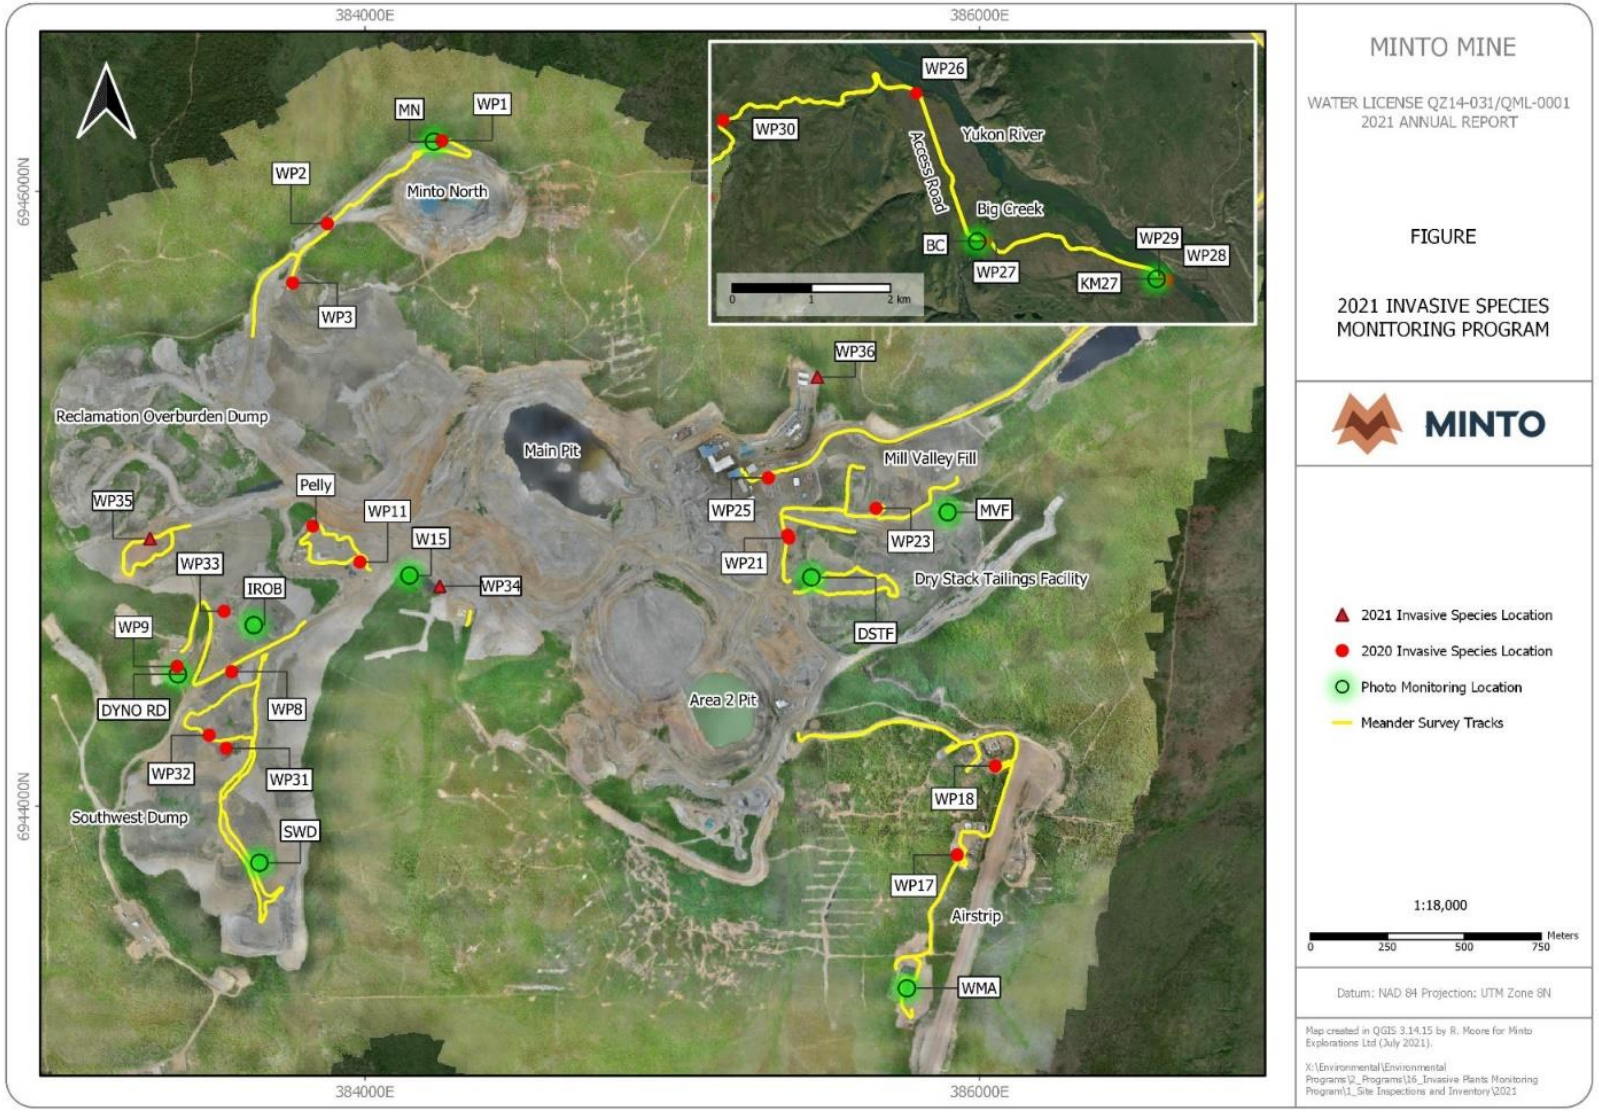

Figure 14-1: Invasive Plant Survey 2021

14.3.3 Actions

The limited occurrence of smooth brome was removed completely from the Big Creek bridge. The patches of sweet clover growing in the Pelly Yard and near the W15 wetland were hand-pulled, while more substantial patches near Selkirk Towers, the warehouse and the Southwest Dump were cut with the brush saw. Photos of removal efforts can be viewed in Appendix Q.

After re-visiting areas where removal efforts were completed (roughly one month later), it was found that most of the patches of sweet clover were able to recover, flower and go to seed, despite being mowed with the brush saw.

14.3.4 Recommendations

In accordance with the EMSRP, invasive plant surveys will continue in 2022, particularly along invasive species pathways such as roads with high visitor traffic, recently exposed areas, and areas that have been recently reclaimed.

It is recommended that the invasive species surveys continue to be conducted earlier in the summer months, as previously, the study had been completed in August-September, which caused difficulty identifying some species after they had gone to seed. Early/mid-July is recommended for identifying sweet clover, as it begins to flower during this time. Environmental staff should track incidental observations of invasive species throughout the growing season.

Control measures should be considered for areas in proximity to active reclamation, such as the Pelly Yard. Manual controls such as hand-pulling can be utilized for small infestations, while mowing can be applied to the larger infestations to slow the spread into more vulnerable areas. Any sweet clover removal efforts should be closely monitored and repeated throughout the growing season due to the plant's ability to regenerate and flower after mowing. Sweet clover has a two-year life cycle and thus will require several years of removal efforts to completely remove a population. If sweet clover becomes established in newly or sparsely revegetated areas, it could have detrimental impacts to reclamation success.

Any vehicles or equipment entering the site should be cleaned and inspected to ensure they are not transporting additional unwanted species to site.

14.4 Vegetation Metal Uptake Program

The Minto VMU (Vegetation Metal Uptake) program was initiated in 2016, when sixteen exposure sites and five control sites were established. Samples were collected from key soil horizons and key plant species that could be vectors to humans or wildlife (blueberry, horsetail, Labrador tea, lichen, and willow). These monitoring sites were sampled again in 2019, and a comprehensive report was included in the 2019 Annual Report. The next iteration of this program will occur in 2022.

15 Site Characterization Report

The previous Site Characterization Report was submitted to EMR and the Yukon Water Board (YWB) in January 2018. As per Clause 13.1 of the QML, the report must be updated every three years from the effective date of the licence. A request for a delay until October 31, 2021, from December 2020 was granted by EMR. Minto submitted an updated Site Characterization Report to EMR on October 31st, 2021.

16 Reclamation

Throughout 2021, Minto has continued to refine terrestrial reclamation practices to meet closure objectives and stakeholder expectations. Key practices include:

1) The continued salvage, stockpiling and replacement of topsoil and woody debris following soil conservation best practices;
2) Using surface preparation techniques and woody debris placement following coversoil and topsoil placement; and
3) Reliance on natural revegetation, supplemented with some seeding on slopes and woody species planting.

Minto plans to use a variety of reclamation best practices to achieve land use objectives established for the Minto Mine through consultation with Selkirk First Nation, regulators, and other stakeholders throughout the mine life. Ongoing engagement and consultation will continue to refine and focus land use objectives.

16.1 Cumulative Land Status

The Minto Mine occupies approximately 426 hectares of land. Facilities in the mine disturbance footprint have been divided into four categories, providing an overview of cumulative land status, described below:

- *Active Operation* - Disturbed land that is currently used to support production and mining activities.
- *Ready for Reclamation* - Areas that are no longer required to support production and mining activities and are available for reclamation but where reclamation activities have not yet commenced.
- *Permanent Reclamation Activities* - Includes activities that support permanent land reclamation such as recontouring, soil placement and revegetation.
- *Reclaimed* - contouring, soil placement and revegetation has taken place.

Table 16-1 presents cumulative land status areas as shown in Figure .

Table 16-1: Cumulative Land Status of the Minto Mine in 2021

Land Status	Area (ha)
Active Operation	287.9
Ready for Reclamation	28.2
Active Reclamation	100.7
Reclaimed	9.4
Total	**426.2**

Note: total does not include the Access Road

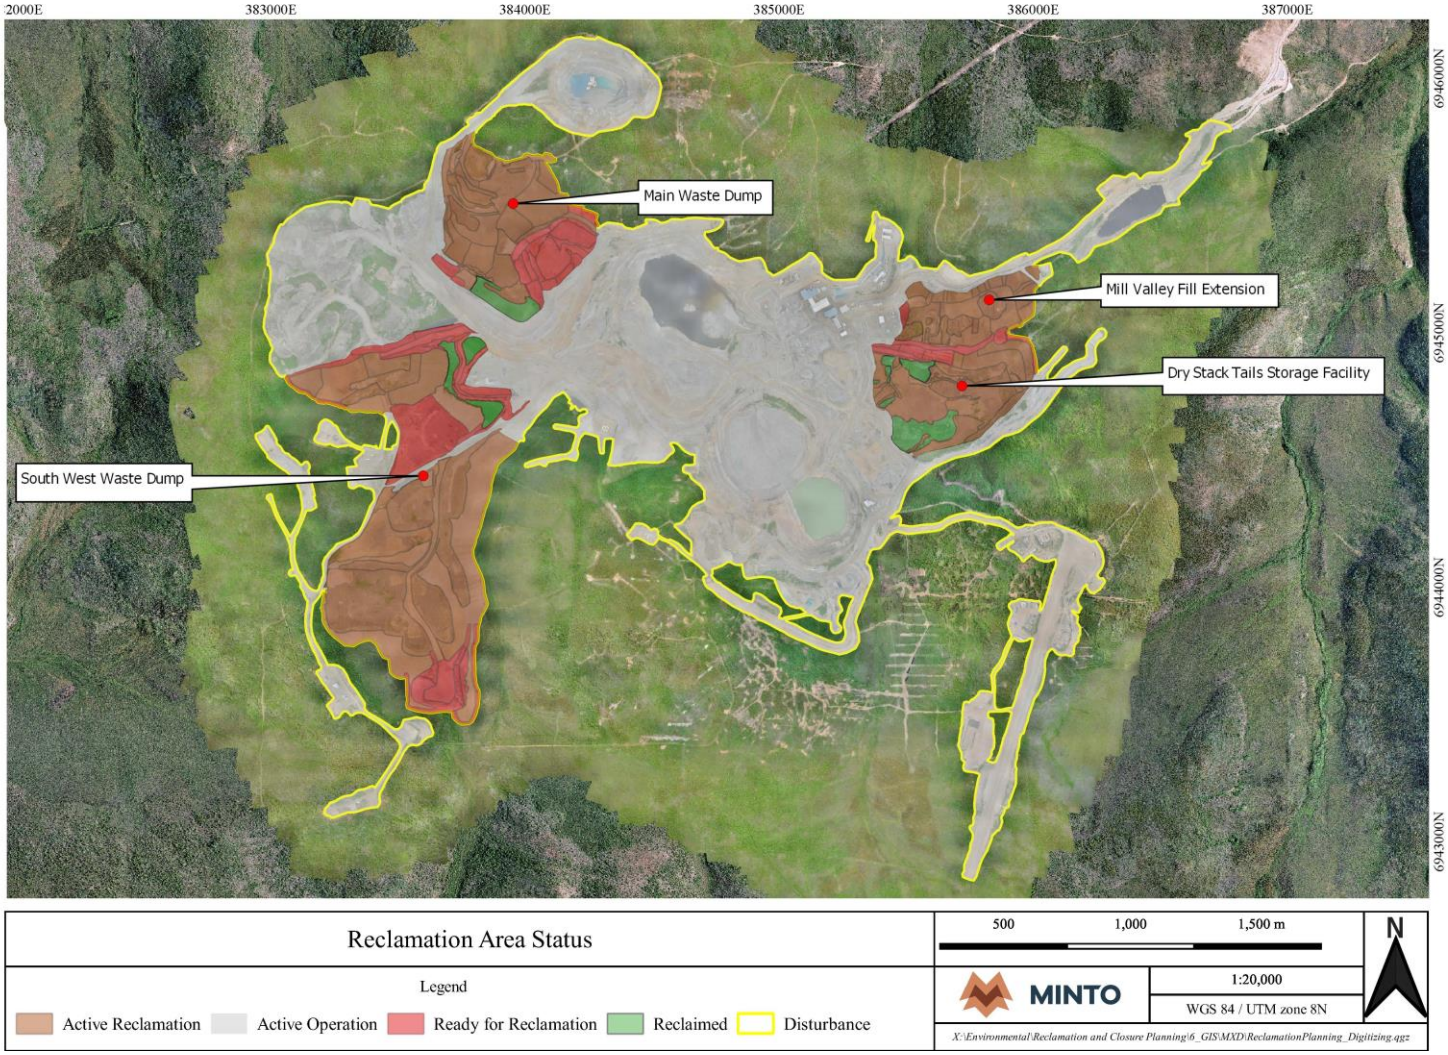

Figure 16-1: Cumulative Land Status of the Minto Mine in 2022

16.2 Current Year Reclamation

In the summer of 2021, reclamation activities continued at Minto Mine. In June, a total of 39,169 trees were planted in areas that were previously contoured and had 50cm of coversoil placed. The following facilities were partially planted:

- Mill Valley Fill Extension;
- Dry Stack Tailings Storage Facility;
- Main Waste Dump; and
- South West Waste Dump.

Lodgepole pine (*Pinus contorta*), white spruce (*Picea glauca*) and aspen (*Populus tremuloides*) were planted at a density of approximately 3,000 stems per hectare (st/ha). Planting composition varied based on planting block aspects, as site characteristic that influences soil moisture. On northern and western aspects having mesic soil moisture regimes, an even density of tree species was planted at 1,000 st/ha. On southern and eastern aspects having submesic to subxeric moisture regimes, a higher density of lodgepole pine were planted at 2,000 st/ha, with lesser amounts of white spruce and aspen planted at 500 st/ha. Figure presents the planting locations.

Figure 16-2 Tree Planting Locations at the Minto Mine in 2021

16.3 Next Reporting Year Reclamation

In 2022, Minto plans to complete reclamation activities on the Dry Stack Tailings Storage Facility (DSTSF) and the Mill Valley Fill Extension (MVFE). Reclamation activities will include completing contouring, placing coversoil in areas that do not meet coversoil capping criteria, constructing drainage channels, creating microtopography using surficial preparation techniques and placing woody debris.

16.4 2021 Reclamation Research and Monitoring

In 2021, Minto facilitated reclamation research, conducted by Yukon University in the northern most lift of the Southwest Waste Dump. The study is looking at how natural and synthetic barriers on the reclaimed landscape influence soil moisture, plant available nitrogen and seed dispersion. In 2021, the study site was prepared with heavy equipment, meteorological equipment deployed, soil probes installed, soil samples taken, green alder planted (natural barrier) and snow fence set up (synthetic barrier). The study will continue for another three years.

Minto has sponsored a MSc student at Yukon University/Centre Eau Terre and Environment to conduct research on semi-passive treatment to remove nitrate from mine-impacted waters. The project will assess biological water treatment technologies to remove nitrogen compounds in cold climate from mine impacted waters at Minto mine, with inoculum from the mine site (sampled in fall 2021).

17 Socio-Economic Monitoring Program

The Minto Mine Socio-Economic Monitoring Program defines the framework for monitoring direct and indirect socio-economic effects from the Minto Mine. The 2016 to 2018 Report was published in 2021. A digital version is being produced for the 2019 and 2020 Annual Reports and will be published in 2022.

In 2021, Minto tracked and collected administrative data and other information relating to the mine's direct employment, training, and procurement; worker safety; and Minto's contributions to cultural well-being and community wellness. This information is presented in Appendix O, *2021 Minto Socio-Economic Report*.

18 Closure

Minto trusts this document fulfills the 2021 annual reporting requirements of Minto Mine's WUL and QML.

1 Introduction

This Spill Contingency Plan (SCP) is an update to the previous SCP, published in January 2021. The content of this SCP is derived from the *Plan Requirement Guidance for Quartz Mining Projects* (Yukon Government, 2013). The SCP has been updated annually and submitted as part of Minto's Water Use Licence and Quartz Mining Licence annual reports.

The purpose of the SCP is to establish guidelines for staff, contractors, and suppliers working at the site with a formal framework of actions to be taken when responding to spills during mine operation. The SCP includes practices and planning of future efforts to further reduce the potential for environmental contamination and other spill-related impacts. The SCP describes the following:

- fuels, chemicals, and other materials used at the Minto Mine;
- reporting thresholds for those materials;
- a spill action plan for responding to unintentional spills of those materials;
- reporting sequences and forms;
- training requirements;
- spill prevention activities;
- routine monitoring and maintenance.

1.1 Project Description

Minto Metals Corp. (Minto), owns and operates the Minto Mine Project located 240 km (150 miles) northwest of Whitehorse, Yukon. Operations started in October 2007. The mineral deposits mined at the site were identified during exploration programs occurring in the area in the 1970's; exploration activities occurred sporadically since that time until construction of the mine and related facilities began in earnest in 2006.

The Project area encompasses the Minto Creek Valley which collects and drains into the Yukon River (Figure 1-1). An overview of major infrastructure at the Minto Mine is shown on Figure 1-2 below.

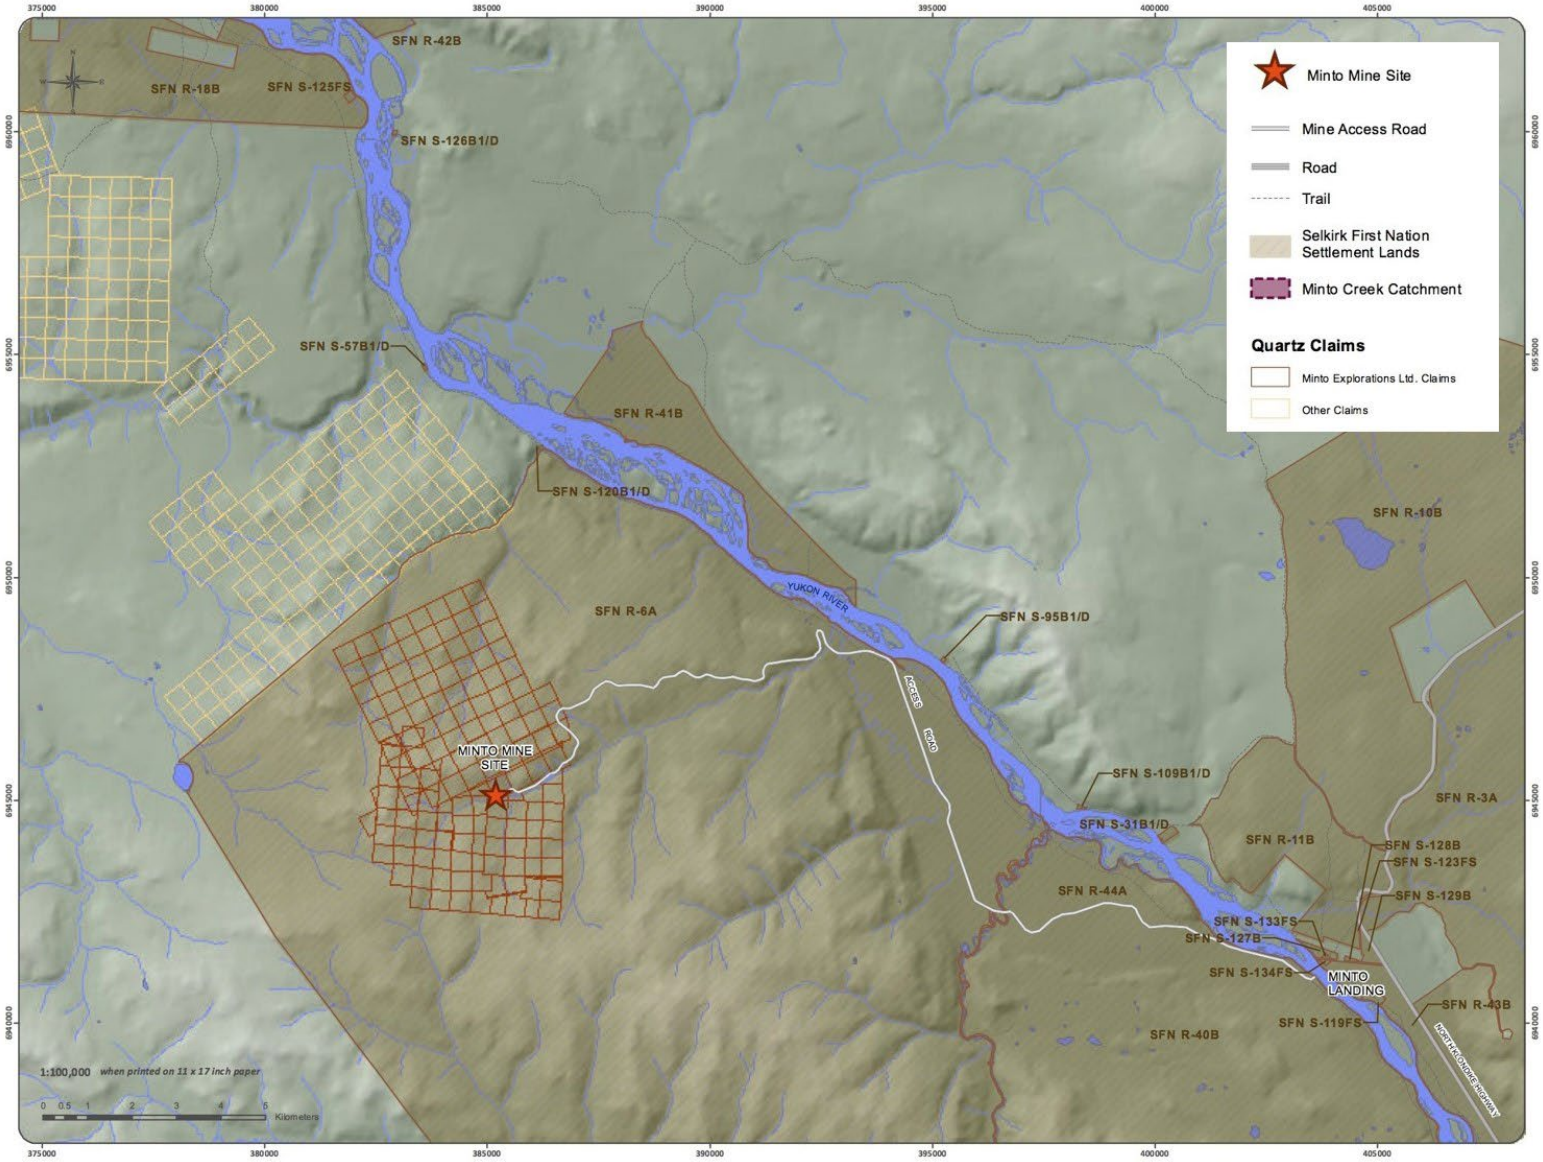

Figure 1-1: Minto Mine Area Overview

Figure 1-2: Minto Mine Area Overview – Existing Infrastructure

2 Definitions

The following definitions apply to the components of the SCP outlined herein.

Dangerous Good - A product, substance, or organism included by its nature or by the regulations in any of the classes listed in the schedule to the act (*Yukon Transportation of Dangerous Goods Act)*.

Deposit out of the normal course of events - A deposit that can reasonably be expected to occur at the mine and that can reasonably be expected to result in damage or danger to fish habitat or fish or the use by man of fish, and the identification of the damage or danger (*Metal Mining Effluent Regulations, Part 3, SOR/2002-222)*.

Discoverer - The person that discovers an incident that could possibly result in a spill or has resulted in a spill.

Spill - A release of a substance into the natural environment that is abnormal in quantity or quality in light of all circumstances of the release; or is in excess of an amount specified in the regulations (*Yukon Environment Act, Part 11*):

> **Emergency Spill -** A release of a hazardous product where there is potential for that product to enter a waterway or cause significant danger to life, health or environment.
>
> **Non-Emergency Spill -** All spills that do not meet criteria of an *emergency spill* and that the responsible party is competent to manage safely and efficiently in terms of assessment, prevention, containment and clean-up.

Substance - A hazardous substance, pesticide, contaminant or special waste often referred to as a "**deleterious substance".**

3 Purpose and Scope

Minto will ensure that all requirements related to Spill Response and reporting within these documents are implemented throughout the property for the life of the mine. If statutory and regulatory responsibilities change over time, the plan will be updated accordingly.

This SCP is prepared in support of:

- Minto's Type "A" Water Use License QZ14-031 (WUL) and Type "B" Water Use License MS15-094, which state that:

  "The Licensee shall apply the relevant procedures in the Spill Contingency Plan. The Licensee shall review the spill contingency plan annually and shall provide a summary of that review, including any revisions to the plan, as a component of the annual report."

- *Part 3 – Unauthorized Deposits*, Section 30 of the *Metal and Diamond Mining Effluent Regulations* (MDMER), which indicates that:

  "The owner or operator of a mine shall prepare an emergency response that describes the measures to be taken in respect of a deleterious substance within the meaning of subsection 34(1) of the Act to prevent any unauthorized deposits of such a substance or to mitigate the effects of such a deposit."

- *Part 7 – Emergency Response Assistance Plans and Security Plans of* the *Transportation of Dangerous Goods Act*:

  "*No person shall import, offer for transport, handle or transport dangerous goods in a quantity or concentration that is specified by regulation — or that is within a range of quantities or concentrations that is specified by regulation — unless the person has an emergency response assistance plan that is approved under this section."*

- Satisfying the requirements of the Quartz Mining License QML-0001 Schedule B, that requires:

  "A *plan that describes the measures designed to minimize the potential impact to the environment following a fuel or chemical spill."*

The SCP will apply to Minto Mine and the main access route for one year, whereby the owner or operator shall update and test the SCP to ensure it continues to meet the requirements of both the WUL, subsection 30(2) of the MDMER, and the QML.

3.1 Purpose

The purpose of the SCP is to outline a general set of procedures to be followed to assess, prevent, contain and clean-up a spill at the Minto Mine. For procedures to be effective, Minto must ensure that employees and contractors, through experience and training, possess the skills necessary to safely assess, prevent,

contain and clean-up a spill or potential spill. These procedures are necessary to ensure continuity and develop the foundation for a robust and effective SCP. The SCP is also designed to establish clear reporting and clean-up procedures as they apply to emergency and non-emergency spills and incidents.

This document also addresses opportunities to improve spill preparedness, response, and mitigation for deposits out of the normal course of events that have the potential to impact the Yukon River and its tributaries within the project site.

All Minto employees and contract staff must be familiar with the general spill reporting procedures outlined in this document and will be introduced to them as part of their site orientation.

3.2 Scope

The objectives of the SCP are to:

- identify potentially hazardous materials located on site;
- identify spill prevention measures;
- establish a high order of preparedness if a spill occurs;
- ensure an orderly and timely decision-making, response and reporting process; and
- describe current and planned protective measures for all areas of the Mine Site

The *Minto Mine Emergency Response Plan* (Minto, 2020) contains other information that relates to Emergency spill procedures. The Emergency Response Team (ERT) and members of the Environmental Department have been trained on responding to Hazmat Spills. It is beyond the scope of this document to define the specific Spill Response Procedures and decision loops involved in an ERT response. Any details pertaining to a response from ERT to assess, prevent, contain and clean-up a spill at a spill incident is the responsibility of the Site Safety Lead. General procedures for spill response procedures to emergency spills will be detailed herein.

3.2.1 Hardcopy Locations

Copies of the SCP are kept on-site in the following locations:

- Site Safety Office/ERT Building;
- Environmental Office
- Site Manager's Office

- Copper Queen Tug.

Contact information is provided in Table 4.2

4 Communication and Spill Reporting

Any spill that occurs at the Minto Mine site must be reported through the internal reporting chain of command and follow the procedures for assessment, prevention, containment and clean-up and reporting. Should a spill exceed the thresholds set by the Yukon Government (Table 4-1) then it must be reported to external authorities.

A spill that is in excess of the thresholds outlined in Table 4-1 or any spill that is abnormal in quality or quantity is considered a "reportable spill" under the *Yukon Spill Regulations* (O.I.C. 1996/193), pursuant to the *Environment Act*.

Table 4-1: Reportable Spill Thresholds

Product	TDG[1.] Code	Threshold Quantity
Explosives	1	Any amount
Flammable gases	2.1	> 100 litres
Non-flammable gases	2.2	> 100 litres
Poisonous gases	2.3	Any amount
Corrosive gases	2.4	Any amount
Flammable liquids	3	> 200 litres
Flammable solids	4	> 25 kg
Spontaneously combustibles	4	> 25 kg
Dangerous when wet	4	> 25 kg
Oxidizers	5.1	> 50 kg or 50 litres
Organic peroxides	5.2	> 1 kg or 1 litre
Poisonous substances	6.1	> 5 kg or 5 litres
Corrosive materials	8	> 5 kg or 5 litres
Miscellaneous Dangerous Goods	9.1	> 50 kg or 50 litres
Special wastes	9.3	> 5 kg or 5 litres

1. TDG = *Transportation of Dangerous Goods Regulations* (Government of Canada, 1985)

4.1 Internal Reporting (All Spills)

All spills (whether externally reportable or not) must be reported by the discoverer to their immediate supervisor and then to the Environmental Department by radio or telephone following assessment of the scene. The supervisor of the responsible department will issue an Environmental Incident Notification, with assistance from the Environment department, to notify the site and its directors, including senior management. This typically occurs concurrently with spill response (prevention, containment, and clean-up) activities.

Following the spill response, responsible department supervisors are required to document the spill on an Environmental Incident Report, available through the Environmental Department, and provided in Appendix A. The report requires inclusion of photos, a description of clean-up activities, subsequent actions, and identifies the root cause and determines any necessary corrective actions.

4.2 External Reporting (Reportable Spills Only)

Under federal and territorial regulations, the environmental lead will call the 24-hour Yukon Spill Report line should a spill of a reportable quantity occur (Table 4-1). Although several government agencies at

the federal, territorial and municipal levels may ultimately be informed, only the Yukon 24-Hour Spill Report line is required for reporting purposes. The environmental lead will ensure that the appropriate information is collected before reporting to the Spill Report line and the report will be filed within 24 hours.

Any spill of an amount greater than those listed in Table 4-1 or a spill of any amount that enters the Yukon River or a tributary of the river is a "reportable spill".

The following information should be provided to the 24-Hour Spill Report line:

- Name
- Phone number
- Product spilled
- Quantity spilled
- Quality of product (thin, viscous etc.)
- Location of spill
- Distance to water
- Distance to drinking water wells
- What happened
- Responsible party
- Actions to contain the spill

When reporting the spill to the Spill Report Line, the environment lead will obtain the Environment Yukon Spill Reporting Number and first/last name of the person whom the report has been made to (in the event of a reporting discrepancy).

Minto will also contact: the Selkirk First Nation Lands Director; and Energy Mines and Resources Client Services and Inspections via email or phone after discovery of a reportable spill. Should the spill enter a waterway or be categorized as a major spill, Minto will also contact Environment Canada. A detailed written report will be submitted to the regulatory authorities within 10 days after the event. The contact information for the various Minto employees, emergency response and external reporting personnel is provided in Table 4-2 below.

5 Spill Action Plan

Implementation of the spill action plan requires knowledge of spill response supplies and locations, spill response procedures (Sections 5.1 and 5.2) and clean-up protocols (Section 5.3). In addition to the internal and external reporting requirements, spills must further be categorized as “emergency” or “non-emergency” incidents as the action plans and reporting requirements will differ according to the type of spill.

5.1 Spill Response Procedures: Non-Emergency

The majority of spills that are likely to occur on the Minto Mine Site will include a simple stepwise process initiated by the discoverer. If the safety at the scene is in doubt, then it is imperative that the Site Safety Lead is notified immediately. A “non-emergency” spill is defined as a spill of any product that the discoverer, or other personnel within proximity of the incident can competently, safely, and efficiently manage in terms of assessment, prevention, containment, and clean-up. This typically includes fuels, blasting agents, oils, lubricants or coolants, and many of the reagents involved in mill operations. Once the scene is assessed for safety by the discoverer or supervisor and deemed a non-emergency, they will prevent, contain, and clean-up the spill, while also contacting the environmental team as soon as practical. If assistance is required to deal with the incident, the environmental team is to be notified by radio/telephone immediately. All small spills and drips discovered as part of vehicle pre-operation checks are to be cleaned up and reported for tracking purposes to the environment team. Specialized spill clean-up totes have been distributed around site in parking areas for this purpose. Specific instructions are located on the totes. Full totes are to be brought to the LTF for placement into the contaminated soils staging area.

A complete inventory of Dangerous Goods stored and used at the Minto Mine, including details on material handling and clean-up, reporting thresholds, special precautions, PPE requirements, and disposal methods is provided for reference during spill response activities (Appendix B).

5.2 Spill Response Procedures: Emergency

An “emergency spill” is a release of a hazardous product where there is potential for that product to enter a waterway or cause significant danger to life, health or environment. When a spill is discovered, the first

step is to assess the scene for safety and, **if safe to do so,** immediately control and contain the spill by any means necessary. If the discoverer or other personnel within close proximity of the incident do not have the required training, resources, or equipment to deal with the incident then the individual must report a "Code 1" callout. This protocol will initiate response of the Safety Lead, Environmental Lead, and the Emergency Response Team. The Emergency Spill Response Command Structure and General Spill Procedure are detailed in Figure 5-1 and Figure 5-2, respectively. If the scene is safe and the discoverer and the immediate supervisor have the means necessary to control, contain, and recover the spill then they should proceed as such.

Once called via a "Code 1" the Safety Lead will respond to the scene and conduct an initial assessment and assume command of the scene. If the Safety Lead/Medic is required to treat patients, command is transferred to the Emergency Response Team Captain. Unified Command Structure will be initiated once the Site Manager or Environmental Lead is on scene. The Unified Command Structure is a cooperative effort command between the Site Manager, Health and Safety Lead, and the Environmental Lead. Transfer of command includes a detailed verbal report of the incident and activities conducted and underway.

A "Code 1" Protocol initiated by an emergency spill will trigger the specific spill response procedure based on the product type, quantity and environmental and safety conditions.

Initial spill response will be conducted in accordance to *Transport Canada's 2016 Emergency Response Guidebook* (Transport Canada, 2016). This Guidebook will assist Incident Command with information to identify the material, use the guide to reference potential hazards, public safety and emergency response information. The *Table of Initial Isolation and Protective Action Distances* will be used to dictate isolation and protection for both large and small spills. However, this is not a comprehensive spill mitigation and response document and will only assist responders in making initial decisions upon arriving at the scene of a dangerous goods incident. It should not be considered as a substitute for emergency response training, knowledge, or sound judgment. The *Emergency Response Guidebook* does not address all possible circumstances that may be associated with a dangerous goods incident. The 2019 *Minto Mine Emergency Response Plan* has additional specific procedures for responding to the most commonly transported and hazardous materials including Nitric Acid, Gasoline, Diesel, Ammonium Nitrate, Sodium Sulfide, and Propane.

In addition to on-site response Minto, through its carriers of dangerous goods, has contracts in place with spill responders. These are full-service response agencies that have commitments to mobilize fully trained emergency response teams and equipment 24 hours a day, 7 days a week.

5.2.1 CANUTEC Transport Canada

In the event that a spill requires additional technical resources Minto is registered with CANUTEC, a division of Transport Canada, for 24-hour Spill Response support and information to deal with emergency situations. If a spill occurs beyond the boundaries of the Minto property, the owner of the transportation firm and the owner or consignor of the dangerous goods will communicate with the regulators. For incidents that occur on the Minto property, the Environmental Department will ensure reporting to regulators is performed accordingly.

5.2.2 Surrounding and Downstream Communities

Notification of downstream water users of a spill, if required, is the responsibility of the Yukon Government Environmental Protection Branch. Minto will additionally notify the authorities including police and fire departments and the Selkirk First Nation community of Pelly Crossing.

5.2.3 Public Relations

The Site Manager is the designated spokesperson for Minto. The Site Manager may delegate their responsibility for public relations if required to do so by the scale of the incident.

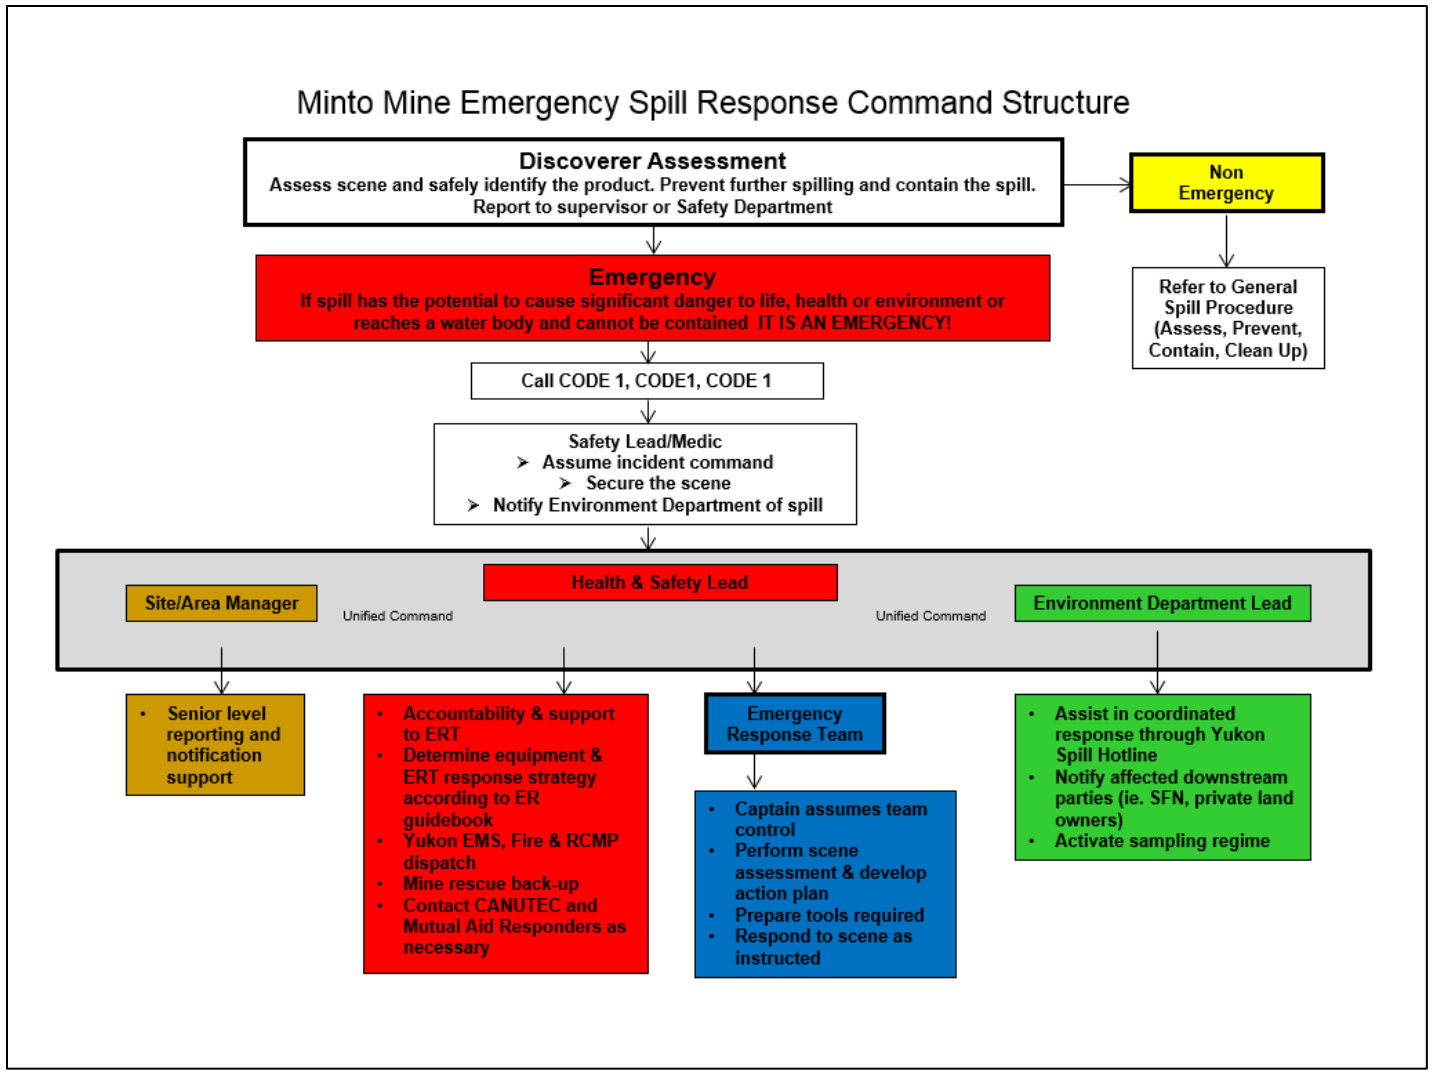

Figure 5-1: Minto Mine Emergency Spill Response Command Structure

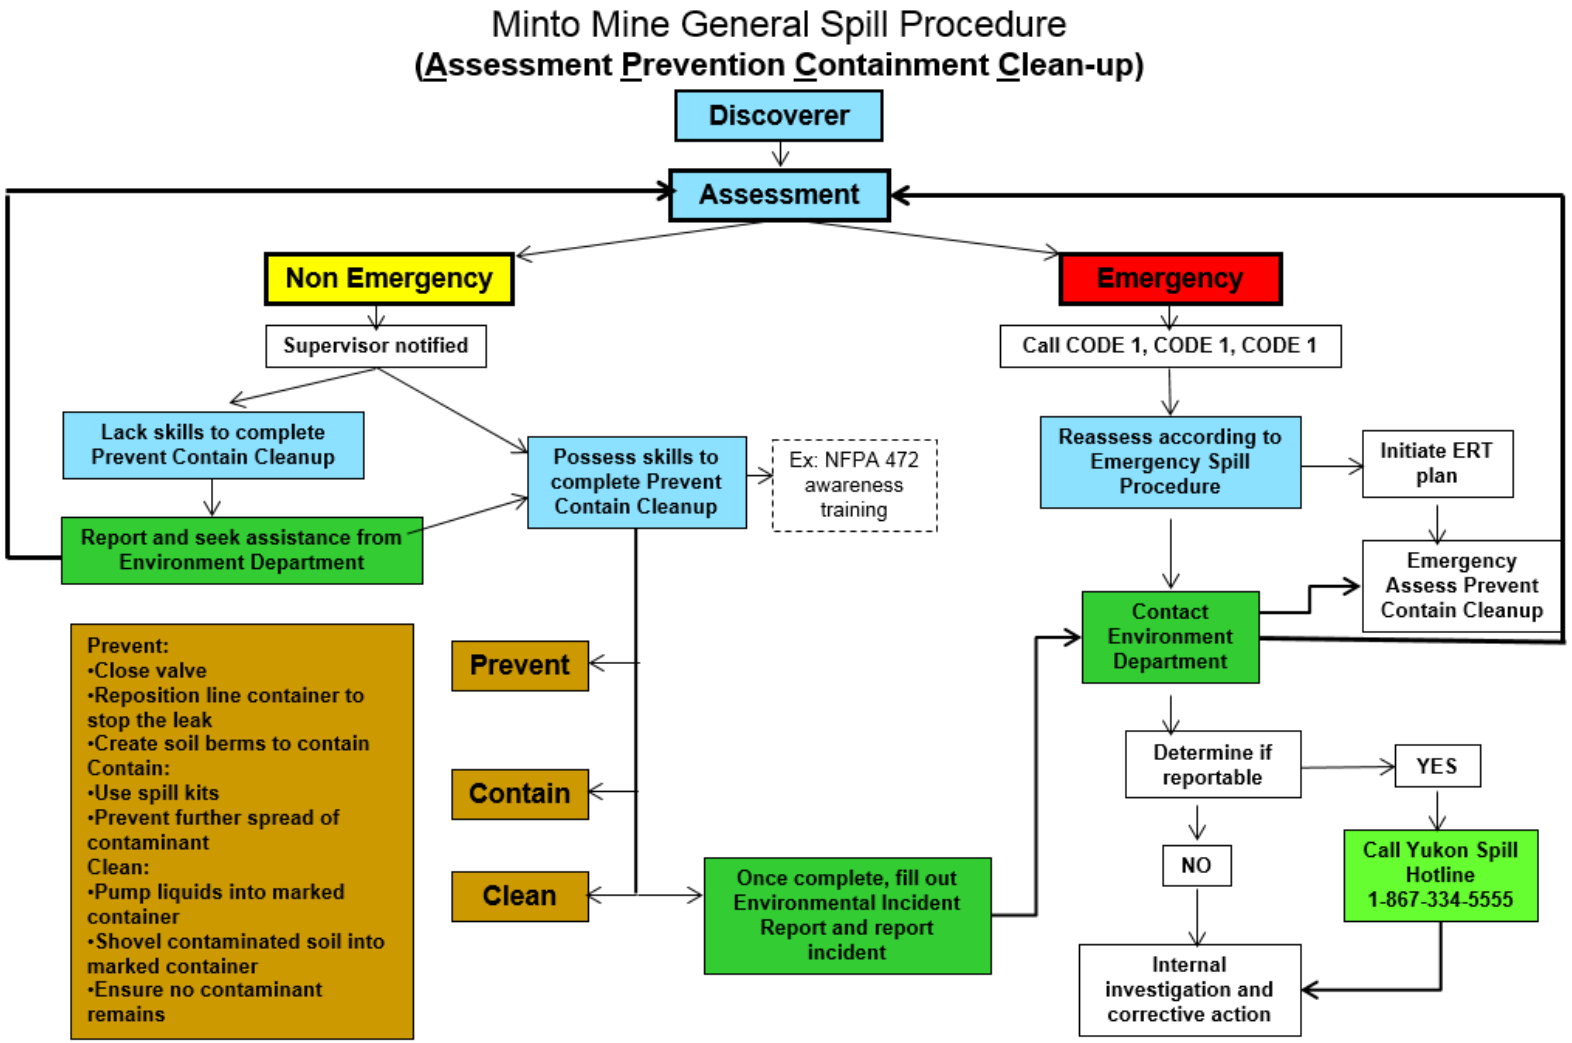

Figure 5-2: Minto Mine General Spill Procedure

5.3 Disposal and clean-up

Disposal and treatment methods of contaminated material are outlined below and are further detailed in the *Minto Mine Spill Response Procedure: Non-emergency spills on soil* and the *Minto Mine Land Treatment Facility Standard Operating Procedure* documents. The Minto Mine Site has a Land Treatment Facility to accept incoming contaminated material from petroleum hydrocarbon and ethylene glycol spills. Depending on the state and substrate of the surface material, the clean-up and disposal location will differ. Brief practical descriptions of the clean-up procedures are summarized in Table 5-1.

Table 5-1: Disposal and Movement of Contaminated Material from Spill Sites

WASTE TYPE	DESCRIPTION	MOVEMENT OF MATERIAL FROM SPILLS
Oil or Glycol Contaminated Soil	Soil, Organics, and granular material (avoid coarse rock) contaminated as a result of a hydrocarbon or glycol spill	Contaminated soil will be transferred to the Land Treatment Facility. Contaminated soil will first be placed in the staging cell and labelled to be later categorized and treated. Contact Environment dept. before dropping off material in the Land Treatment Facility. Small spills will be stored in a composite pile in the staging area. Larger spills will be stored separately in staging while waiting for lab results.
Oil or Glycol Contaminated Rock	Blasted rock and coarse material and/or bedrock, contaminated as result of a hydrocarbon spill or glycol spill	If blasted rock contains ore and has been cleared by Mill operations ore will be processed through the mill. Non-ore containing rock will be placed in the main pit and in-situ bioremediation will be applied to the pile.
Oil or Glycol Contaminated Snow/ Ice/Water	Snow, Ice, and/or Water that has been contaminated as a result of a hydrocarbon spill or glycol spill	Contaminated snow/water will be transferred to the Land Treatment Facility. The contaminated product will be placed in a separate pile in the cell.

**** Any amount of material that has more than 30,000 ppm oil or glycol is considered special waste and must be disposed of off-site to a Special Waste Facility**

6 Spill Response Supplies

Spill kits (yellow Enpac-95 and Enpac-20 drums) are located throughout the Minto Mine Property at locations indicated in Figure 6-1. Additionally, there are two blue 55 gallon drums located at the km 12 gravel pit, Big Creek and at the east and west terminals of Minto Landing. The contents of the spill kits are summarized in Table 6-1. Spill kits are also supplied for each heavy and light truck at the Minto Mine. Contractor supervisor trucks have spill kits permanently affixed to the truck body. All contract trucking agencies travelling to the mine are required to carry spill kits within or affixed to the truck. Spill kits are loaned to short term visitors if required.

Table 6-1: Spill Kit Contents

Spill Kit Item	Enpac-95	Poly-55	Enpac-20	Yellow Truck Bag	Loaner Spill Kit (20 L Pail)
Tyvek splash suits	2	2			
Chemical master gloves	2	2	2	1	2
Splash Goggles	2	2			
Garbage bags with ties	10	10	5	3	1
Oil only booms (5” x 10’)	4	8		1	
Oil only mats (16” x 20”)	100	100	20		10
Universal sorbent mats	50	50	15	10	5
Universal Pillows	4	4	2		
Sorbent socks	4	4	2		1
Tarp	1	1			
Duct tape	1	1			
Utility knife	1	1	1		
Absorb-all Pellet Bags	2	1	1	1	1
Shovel	1	1			
Rake	1	1			

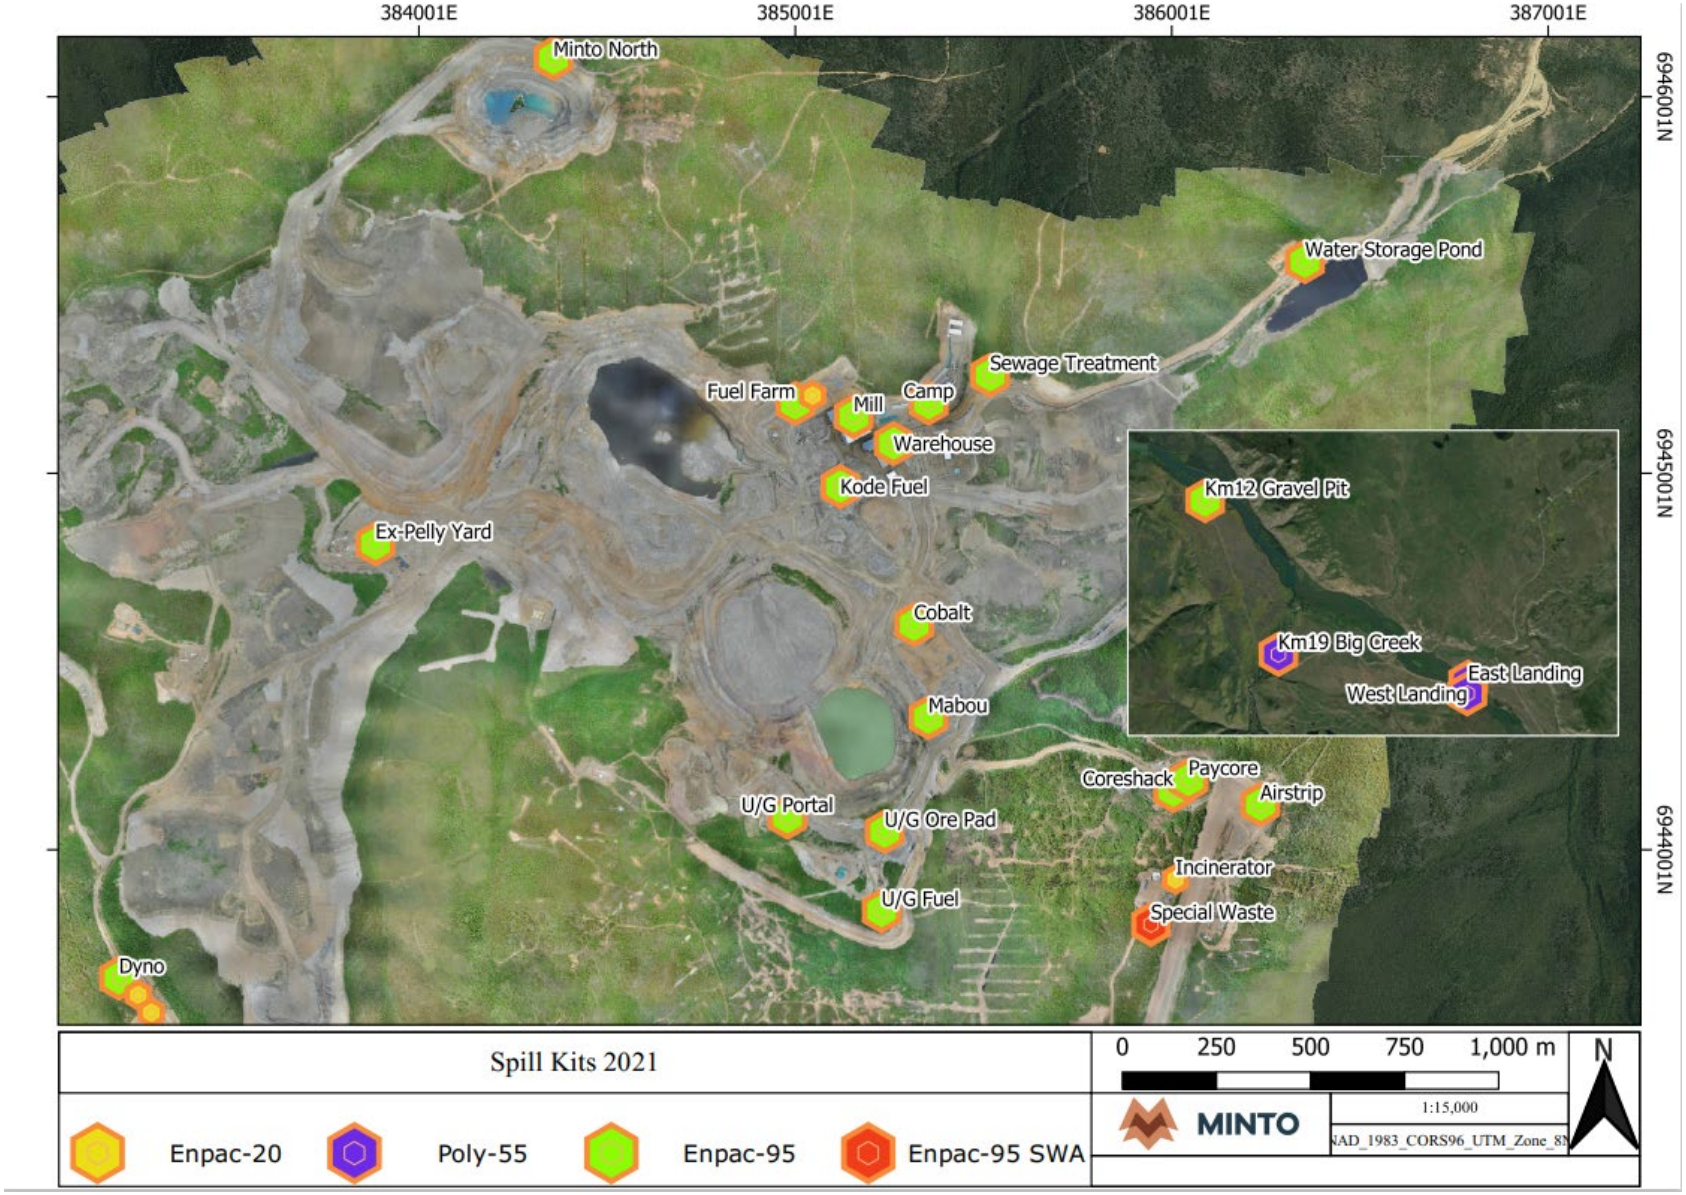

Figure 6-1: Minto Mine Area Overview – Spill Supplies

Heavy machinery at the mine site is available for use in spill response and clean-up, as required under contract. Additionally, Minto has a 1991 Chevrolet Top Kick Fire truck with a 3200 litre/minute pump with a 3800-litre supply tank and a 3000-litre drop tank. This truck can support all spill response activities with SCBA, Class A and B foam capabilities, decontamination needs, as well as fire suppression/protection tools and equipment common to a truck of this nature. All ERT members are competent with the operation of this fire truck and related equipment in accordance with NFPA standards.

In 2013, Minto, on advice from Emergency Response Action Plan providers, procured a 20-foot Hazmat trailer and a helicopter-portable In-Viro-Drum vacuum unit (Figure 6-2) capable of being transported to locations not reachable with a vacuum truck. It has a liquid cooled three-cylinder Kubota diesel engine and 250 CFM non-sparking blower, which makes it safe to vacuum flammable liquids and solids from water or dry land. It comes with a Double Port Vac Drum that allows for transfer of product from the drum to one of our 9500 litre bladders, while the drum continues to be filled. This system allows for quick, efficient and effective clean-up of hazardous products from hard to reach locations.

In 2016, Minto purchased a S.S. Alpha Adjustable Folding Weir Skimmer. Weir skimmers float on the surface of water and are designed to remove pollutants from the surface of calm or sheltered waters and shoreline areas. Connected to a shore-based portable pump (e.g. Honda), contaminants can be removed from the water surface and transferred to a drum or another container for proper disposal.

Figure 6-2: In-Viro Drum and vacuum unit, 24' Packman vessel, and Alpha Skimmer for spill response operations.

Minto Mine also acquired a 24-foot Packman man boat, which is described, further in the "Barge Emergency Contingency Plan" (Appendix D).

Spill contingency equipment and earth moving equipment located at Minto Mine are listed in Table 6-2. Contractor Reclamation and Revegetation equipment is available for use in spills and clean-up operations.

Table 6-2: Spill contingency equipment located at Minto Mine

Quantity of Units	Equipment		Quantity of Units	Equipment
1	430 Backhoe		1	Assorted Wooden Plugs
1	3800 Litre Vacuum Truck		1	Large Haul Truck
Various	Dozers, Excavator, Loaders		1	Hazmat trailer 20'
1	In-Viro Drum Portable Vacuum unit		1	Top Kick fire truck
2	9500 Litre bladders		500'	Sorbent Boom (various sizes)
1	24' Packman Response Vessel		1	Storage Sea Can at Landing
1	Roll Over Kit		3	Trash pumps
1	Pipe Plug kit		1	S.S. Alpha Adjustable Folding Weir Skimmer Pump

7 Spill Prevention and Response Training

Education and training are critical to the success of any site-wide initiative, and the most important tool to ensuring the success of the SCP. Minto has comprehensive training initiatives that ensures all workers and supervisors are aware of their responsibilities and the practices that personnel and contractors must adhere to. Records are kept of the names of all employees or contractors that receive training, tracked though a centralized training matrix. Annual re-training will be scheduled for all Minto employees.

7.1 Existing Spill Prevention and Response Training

Employees are trained to understand the potentially hazardous situations that spills can create with respect to the health and safety of workers and the environment. They are trained to understand responsibilities as employees to Assess, Prevent, Contain, Clean-up, and Report any spills. The SCP is made available to all employees and employees will be advised of revisions or changes to the SCP.

7.1.1 Orientation

Employees and visitors are required to sign off on the environmental policy as part of the employee, contractor, and visitor orientations that include a summary of the response required when a spill has occurred. The orientation has a strong focus on ensuring proper reporting of spills, so that the appropriate response and clean-up can occur.

7.1.2 "Big 7" Training

As part of the orientation, all Minto employees and major contractors receive training that is a computer-based PowerPoint presentation, followed by a written test. The "Big 7" package focuses on some of the most common safety training required for site, which includes WHMIS (Workplace Hazardous Material Information System), fall protection, confined spaces, lock out, hot work, Explosives awareness training, and Environmental Awareness. The Environmental Awareness portion of the training is comprised of four modules, with one module dedicated specifically to Spill Response, covering the reporting and basic steps for assessing, preventing, containing, and cleaning up of spills.

7.1.3 Targeted Practical Training

Training sessions are put on by the Environmental Department, and efforts are made to tailor the training to the attending group (i.e. underground miners, surface contractors, site services, etc.). Smaller groups are identified and targeted for specialised spill prevention training that is more job specific. These include but are not be limited to; maintenance personnel (mechanics), waste and water truck operators, fuelling personnel, and warehouse workers. Training in smaller groups focusses on specific spill prevention techniques.

7.1.4 Training for Fuel Handling Employees

Currently there are Safe Work Practices (SWP) designed for bulk fueling at the fuel farm and for fueling of equipment in the field. These SWPs include descriptions of the stepwise procedure for safely performing the task and includes steps to take for emergency shut-off. Both the procedure and the equipment are audited during Workplace Inspections and Planned Job Observations by immediate supervisors and the Environmental Department.

7.1.5 ERT Training

An Emergency Response Team (ERT) has been established to, among other duties, respond to emergency spills. The Emergency Response Team periodically receives training to the National Fire Protection Association (NFPA) 472 Hazardous Material awareness level, and are required to thoroughly understand this document in order to respond to spills or incidents of a specific nature. This training is required as a foundation to develop site specific contingency planning for response tactics in areas specific to the Minto Mine associated activities that present a risk to the Yukon River and its tributaries.

7.1.6 Emergency Spill Response Drills

Tabletop exercises and/or field drills will help to prepare the ERT and other mine staff to respond to a major spill safely by identifying any deficiencies in the equipment or processes in place.

On November 7, 2018, a tabletop exercise was conducted to assess the SCP's response to a large propane leak.

The scenario was as follows:

- A cloud of vapour was seen by employee conducting daily propane checks at the underground mine-heater propane farm.

The table-top exercise identified ready-made responses in keeping with the information from the Canutec Emergency Response Guidebook. Items for discussion and follow-up included:

- While the SCP/E2 plan calls for ground monitor water fog to dissipate a vapour cloud, there is insufficient water volume on the truck to effectively do so.
- There is an LEL alarm and nitrogen switch that will shut off gas supply in the event of a large gas leak, therefore it is important to ensure this switch is maintained and tested regularly (confirmed with propane supplier).

On October 26th, 2014, a combined field and tabletop exercise took place with the following objectives:

- Help individuals become more knowledgeable with the ERP and SCP;
- Identify gaps in the plan;
- Improve communication between stakeholders and departments; and
- Learn new ways and better ways to execute the plan.

The announced exercise was initiated to test part of the Emergency Response Plan as it applies to Spills and the SCP. It focused on the crisis, interaction and escalation of problems within:

- Administrative;
- Operational;
- Managerial; and
- Facilities.

The scenario was as follows:

- A tanker truck with pup and trailer of diesel overturns on Oct 26th on icy roads at 3:20pm at south end of Big Creek. It is still dark, and it is a Sunday and roads are icy and snowing lightly.

The exercise lasted approximately 2 hours and involved management staff onsite and offsite, the ERT, major contractors, The Yukon Spill Hotline, CANUTEC, Transnorth Helicopters, WCB, Parkland Fuel, and

Quantum Murray. A post–incident debrief revealed both opportunities and successes at the field operations and management level.

8 Routine Maintenance and Monitoring

The Fuel Farm is visually inspected weekly for any leakages. An overfill protection system is installed on the two main diesel tanks using a visual indicator and a relay to the control room that will alarm on the HMI to alert maintenance personnel. The area also receives inspections by a qualified engineer and recommendations are recorded and deficiencies corrected as per the *CCME Environmental Code of Practice for Aboveground and Underground Storage Tank Systems Containing Petroleum and Allied Petroleum Products* (Canadian Council of Ministers of the Environment, 2003).

The tug and barge receive frequent inventory inspections for spill equipment and have had major overhauls in the last few years to ensure that the operation is continually improving. Maintenance activities are also carried out regularly and systems are inspected as per Transport Canada Regulations. The daily start-up procedure includes checking for leaks and ensuring all systems are performing to specifications. Annual maintenance activities have included the following: propeller repairs, controls work, system checks and repairs. Substantive refits have included: cylinder heads, exhaust manifold seals, motor mounts, transmission mounts and replacement of water pumps. A new transmission, propulsion seals and propellers have been installed and aligned. Other improvements have included welding reinforcements on the bow of the barge for landings, electrical upgrades, and the installation of an anchor with hawser.

All fuel trucks receive a daily walk-around inspection to ensure emergency shutoffs and hatches and tank valves are operating properly and are free of leaks. These are recorded daily.

The Environment Department is directly responsible for the administration, compliance, and procedures associated with the management of waste. They are also responsible for providing education, support, and any necessary assistance required to prepare shipments for backhauling, and to ensure the Waste Management Area (WMA) is maintained in accordance with the Commercial Dump Permit (# 81-005).

The WMA is inspected weekly by Environment staff to ensure employees and contractors are following the site protocols for waste segregation, incineration, special waste handling, and landfilling. Any issues regarding these protocols are brought to the attention of all involved staff and/or contractors and the Environment Department has the right and ability to limit all access to the WMA if issues persist after they have been discussed.

Appendix B: Reporting Threshold, Special Precautions, PPE Requirements, and Cleanup and Disposal Methods

Minto Mine - Inventory of Dangerous Goods

Reporting Threshold, Special Precautions, PPE Requirements, and Cleanup and Disposal Methods

Common Name (Synonyms)	Chemical Name	Manufacture / Supplier	Phase	TDG Class	WHMIS Class	NFPA Rating	Reporting Threshold	Use	Special Precautions	PPE Required	Special Cleanup and Disposal Info
Acetone	2-Propanone	Anachemia	Liquid	3	B-2, D-2B	1, 3, 0	200 L	Solvent	Extremely Flammable	Goggles, gloves. SCBA if in confined space	Eliminate all sources of ignition. Ventilate area if required. Use absorbent. In case of fire, use dry chemical, CO_2, Alcohol-resistant foam. Do not allow into waterway or drains. Contain spread of spill and soak up with absorb all, absorbant pads. Clear up using non-sparking tools. Place liquid and absorbents into tighly sealed container, label clearly and dispose of as hazardous waste offsite.
Acetylene	C_2H_2	AIRGAS INC	Pressurized gas dissolved	2.1	A, B-1, F	1, 4, 3	any if container larger than 100 L	Welding/cutting gas	Extremely flammable, pressurized gas dissolved in an extremely flammable liquid (Acetone)	Goggles, gloves. Respirator or SCBA if in confined space	Eliminate all sources of ignition, if possible without risk, shut off bottles. If bottle is ruptured after the gas has been expelled, the bottle will release the Acetone. At that point treat as an Acetone spill.
AERO 6493 Promoter	Alkyl hydroxamate	Cytec Canada	Liquid above 15C	9		2, 1, 2	5 L	Metal flotation in mill			Soak up with absorbent (do NOT use sawdust. Use PLASTIC tools). In case of fire, use dry chemical, CO_2, Alcohol-resistant Foam or water spray. Place recovered spilt liquid in labelled drums for disposal as Special waste. Incinerate used absorbent pads.
AERO MX-5149	Modified Thionocarbamate 15-40%Xanthate esther 40-70%	Cytec Canada	Liquid	3	B3, D-1B, D-2B	3,2,0	200 L	Metal flotation in mill	Flammable	Closed system, safety glasses, gloves	Remove sources of ignition. Cover spills with some inert absorbent material; sweep up and place in a waste disposal container. Flush spill area with water.
Aerodri 100 Dewatering Agent		Cytec Canada	Liquid	3	B3, B-2, D-2A	2, 3, 0	200 L		Avoid contact with strong oxidizers or acids.	Safety Glasses, Gloves	Eliminate all sources of ignition. Ventilate area if required. Use absorbent. In case of fire, use dry chemical, CO_2, Alcohol-resistant Foam or water spray. Incinerate waste. Soak up with absorbent materials and dispose of offsite in clearly labeled containers
Alconox		Anachemia	solid	not regulated	D-2B	1, 0, 0	50 kg			Safety Glasses, Gloves	Clean up uncontaminated material for reuse. Incinerate waste.
ALIQUAT 336	Methytrioctyl-ammonium Chloride	Sigma-Aldrich Canada	Liquid	6	D-2B	2, 1, 1	5 kg		Toxic if swallowed. Very corrosive. Will burn skin and eyes. Avoid contact with strong oxidizers. Hygroscopic: avoid contact with moist air.	Safety Glasses, Gloves	Eliminate all sources of ignition. Ventilate area if required. Use absorbent. In case of fire, use dry chemical, CO_2, Alcohol-resistant Foam or water spray. Incinerate waste.
AlphaSolve II	>50% Sodium Hydroxide <50% Silicate	Alpha Resources	Solid						Avoid contact with strong oxidizers.	Safety Glasses, Impervious Gloves.	Highly caustic. Will produce heat and steam on contact with water. May boil and spatter. May generate hydrogen gas on contact with metals. Sweep or vaccum and, if not re-useable, send offsite as hazardous waste, in tightly closed, well labeled containers.
Aluminex 5	Aluminum Chloride Hydroxide Sulphate 15%	NALCO	Liquid	8	E		5 L	Coagulant		Safety Glasses, Gloves	Soak up with absorbent materials. These can be incinerated. Any remaining spilt liquid should be stored in closed container, labelled and disposed of off-site as Special Waste.
Aluminum Standard - AA		Anachemia	Liquid	8	E	4, 0, 0	5 L		Dilute Nitric Acid <5%	Safety Glasses, Gloves	Neutralize with soda ash or lime. Contain spill, **do not** allow un-neutralized acid to enter water systems. Neutralized spill can be pumped to the pit or tailings system.
AM28 Flotation Reagent	Mixture of Potassium Hydroxide Alkyl hydroxamate	Axis House (Pty) Ltd.	Liquid	not regulated	D-2B	2,1,0		Floatation Reagent	corrosive solid.	Safety Glasses, Gloves	Soak up with absorbent (do NOT use sawdust. Use PLASTIC tools). In case of fire, use dry chemical, CO_2, Alcohol-resistant Foam or water spray. Place recovered spilt liquid in labelled drums for disposal as Special waste. Incinerate used absorbent pads.
Amco Clear Turbidity Standard		GFS Chemicals	Liquid	not regulated	not regulated					Safety Glasses, Gloves	Contain spill. Incinerate waste or place in landfill
Ammonia, Refrigerant	Ammonia, Anhydrous	GT&S, INC	Liquefied Gas	2.3, 8	does not appear classified??	3, 0, 0	any amount		Liquefied gas, will produce extreme cold when released. Death has occurred at 5000ppm exposure for 5 minutes. Evacuate release area upwind and avoid low areas.	Goggles, gloves. SCBA.	Toxic gas and will react with a large number of substances, many in a violent manner, Gas will dissipate quickly in air. Small spills can be dissolved in water at ratio of 1:10 Not very flammable. Do not attempt to neutralise.

Minto Mine - Inventory of Dangerous Goods

Reporting Threshold, Special Precautions, PPE Requirements, and Cleanup and Disposal Methods

Common Name (Synonyms)	Chemical Name	Manufacture / Supplier	Phase	TDG Class	WHMIS Class	NFPA Rating	Reporting Threshold	Use	Special Precautions	PPE Required	Special Cleanup and Disposal Info
Ammonium Nitrate prill	Ammonium Nitrate	Agrium	solid	5.1	C, D-2B	1.0.3	50 kg		Oxidizing material, does not burn but may contribute to combustion of materials that can burn	Safety Glasses, Gloves	In case of fire, cool containing vessels with water jet in order to prevent pressure build-up/explosion. Use flooding quantities of water. Evacuate surrounding area. If fumes or gases present, fire fighters should wear self-contained breathing apparatus. In event of spill, prevent from entering waterways. Will dissolve and disperse in water.
Ammonium Nitrate Emulsion	Ammonium Nitrate Emulsion	on-site	Liquid	5.1		2,0,3	50 kg	Explosive	Oxidizing material, does not burn but may contribute to combustion of materials that can burn	Safety Glasses, Gloves, chemical suits, SCBA may be required	In case of fire, cool containing vessels with water jet in order to prevent pressure build-up/explosion. Use flooding quantities of water. Evacuate surrounding area. If fumes or gases present, fire fighters should wear self-contained breathing apparatus. In event of spill, prevent from entering waterways. Use non-combustible material to soak up.
Arsenic Standard - AA		Anachemia	Liquid	8	D-2A, E	4, 0, 0	5 L		Dilute Nitric Acid <5%	Safety Glasses, Gloves	Neutralize with soda ash or lime. Contain spill, **do not** allow un-neutralized acid to enter water systems. Neutralized spill can be pumped to the pit or tailings system.
Ascorbic Acid	L-Ascorbic Acid (Vitamin C)	Anachemia	solid	not regulated	not regulated	1, 1, 1	5 kg		also known as Vitamin C	Safety Glasses, Gloves	Contain spill. Incinerate waste or place in landfill
Brake & Electrical Parts Kleen	CO_2 aerosol of Heptane and Isopropyl alcohol	Kleen-Flo Tumbler Industries	aerosol	Limited quantity	Consumer commodity; A, B5, D2-B	1, 3, 0			Highly flammable	Safety Glasses, Gloves	Eliminate all sources of ignition. Ventilate area if required. Use absorbent. In case of fire, use dry chemical, CO2, Alcohol-resistant Foam or water spray. Incinerate waste.
Buffer Solution pH 10		Anachemia	Liquid	not regulated	D-2A	1, 0, 0		Analytical Lab use	Dilute Sodium Hydroxide	Safety Glasses, Gloves	Contain spill. Absorb with sand, vermiculite or sorbal. Incinerate waste.
Buffer Solution pH 4		Anachemia	Liquid	not regulated	not regulated	1, 0, 0		Analytical Lab use		Safety Glasses, Gloves	Contain spill. Absorb with sand, vermiculite or sorbal. Incinerate waste.
Buffer Solution pH 7		Anachemia	Liquid	not regulated	not regulated	1, 0, 0		Analytical Lab use		Safety Glasses, Gloves	Contain spill. Absorb with sand, vermiculite or sorbal. Incinerate waste.
Cadmium Standard - AA		Anachemia	Liquid	8	D-2A, E	4, 0, 0	5 L		Dilute Nitric Acid <5%	Safety Glasses, Gloves	Eliminate all sources of ignition. Ventilate area if required. Use absorbent. In case of fire, use flooding quantities of water. Contributes to combustion of other materials. Neutralize with soda ash or lime. Contain spill, keep from entering ground water. Neutralized spill can be pumped to the pit or tailings system.
Calcium Chloride		J.T. Baker	solid	not regulated	D-2B	1, 0, 2, 3	any amount		Road Salt, will corrode metals	Safety Glasses, Gloves	Sweep up spilled material and it my be deposed of in dilute form to the pit or tailings system. In case of fire use appropriate measures for surrounding fire.
Carbon Dioxide in Argon		Mittler Supply Inc.	Pressurized gas	2.2	A, D-2B	1, 0, 0	any if container larger then 100 L		Non-Flammable but will replace the O_2 in confined space	Goggles, gloves. SCBA if in confined space	close valve if possible without risk, or allow the vent. In case of fire use any media suitable for surrounding fire. Use water spray to cool fire exposed containers.
Caustic Soda (solid)	Sodium Hydroxide	Fisher Scientific	solid	8	E	3, 0, 1	5 kg		very corrosive solid	Safety Glasses, Gloves	Sweep up spilled material for reuse. In case of fire use appropriate measures for the surrounding fire. Minimise direct water spray on material. This material melts and 318^{o}C and when molten reacts violently with water. Neutralize the residue with a dilute solution of acetic acid. Neutralized solution can be disposed of in the pit or tailings system.
Caustic Soda (solution)		DOW	Liquid	8	E	3, 0, 1	5 L		very corrosive liquid	Safety Glasses, Gloves	Contain spill and pump to plastic barrel for re-use. In case of fire use appropriate measures for the surrounding fire. Neutralize the residue with a dilute solution of acetic acid. Neutralized solution can be disposed of in the pit or tailings system.
Caustic Potash	Potassium Hydroxide	Brenntag Canada	Solid	8	D-1B, E	3,0,1	5 kg		water reactive, contact with metals may evolve flammable hydrogen gas.	Safety Glasses, Gloves, fume hood	Sweep up or vacuum spillage, collect in suitable container for disposal. Avoid dust formation.
Chevron 2-Cycle Oil		Chevron Lubricants Canada	Liquid	not regulated	B-3	1, 2, 0	100 L		flammable oil for 2-storke fuel	Safety Glasses, Gloves	contain spill and use absorbent and incinerate waste
Chevron ATF+3 Automatic Transmission Fluid		Chevron Lubricants Canada	Liquid	not regulated	not regulated	1, 1, 0	100 L			Safety Glasses, Gloves	contain spill. Small amounts can use absorbent and incinerate waste. Larger material pumped into plastic drums and used in a waste oil heating system.
Chevron Automatic Transmission Fluid MD-3		Chevron Lubricants Canada	Liquid	not regulated	not regulated	1, 1, 0	100 L			Safety Glasses, Gloves	contain spill. Small amounts can use absorbent and incinerate waste. Larger material pumped into plastic drums and used in a waste oil heating system.

Minto Mine - Inventory of Dangerous Goods

Reporting Threshold, Special Precautions, PPE Requirements, and Cleanup and Disposal Methods

Common Name (Synonyms)	Chemical Name	Manufacture / Supplier	Phase	TDG Class	WHMIS Class	NFPA Rating	Reporting Threshold	Use	Special Precautions	PPE Required	Special Cleanup and Disposal Info
Chevron Clarity Synthetic Machine Oil		Chevron Lubricants Canada	Liquid	not regulated	not regulated	1, 1, 0	100 L			Safety Glasses, Gloves	contain spill. Small amounts can use absorbent and incinerate waste. Larger material pumped into plastic drums and used in a waste oil heating system.
Chevron Compressor Oil 260		Chevron Lubricants Canada	Liquid	not regulated	not regulated	1, 1, 0	100 L			Safety Glasses, Gloves	contain spill. Small amounts can use absorbent and incinerate waste. Larger material pumped into plastic drums and used in a waste oil heating system.
Chevron Coupling Grease	Grease	Chevron Lubricants Canada	Semi-Solid	not regulated	not regulated	1, 1, 0	100 L or 100 kg			Safety Glasses, Gloves	contain spill. Small amounts can use absorbent and incinerate waste. Larger absorbent material in plastic drums and shipped off site for disposal.
Chevron Delo 300 Motor Oil		Chevron Lubricants Canada	Liquid	not regulated	not regulated	1, 1, 0	100 L			Safety Glasses, Gloves	contain spill. Small amounts can use absorbent and incinerate waste. Larger material pumped into plastic drums and used in a waste oil heating system.
Chevron Delo Grease EP	Grease	Chevron Lubricants Canada	Semi-Solid	not regulated	not regulated	1, 1, 0	100 L or 100 kg			Safety Glasses, Gloves	contain spill. Small amounts can use absorbent and incinerate waste. Larger absorbent material in plastic drums and shipped off site for disposal.
Chevron Diesel Engine Oil Delo 6170 CFO		Chevron Lubricants Canada	Liquid	not regulated	not regulated	1, 1, 0	100 L			Safety Glasses, Gloves	contain spill. Small amounts can use absorbent and incinerate waste. Larger material pumped into plastic drums and used in a waste oil heating system.
Chevron Drive Train Fluid HD		Chevron Lubricants Canada	Liquid	not regulated	not regulated	1, 1, 0	100 L			Safety Glasses, Gloves	contain spill. Small amounts can use absorbent and incinerate waste. Larger material pumped into plastic drums and used in a waste oil heating system.
Chevron ECO Hydraulic Oil AW		Chevron Lubricants Canada	Liquid	not regulated	not regulated	0, 1, 0	100 L			Safety Glasses, Gloves	contain spill. Small amounts can use absorbent and incinerate waste. Larger material pumped into plastic drums and used in a waste oil heating system.
Chevron Gas Engine Oil 930 and 940		Chevron Lubricants Canada	Liquid	not regulated	not regulated	0, 1, 0	100 L			Safety Glasses, Gloves	contain spill. Small amounts can use absorbent and incinerate waste. Larger material pumped into plastic drums and used in a waste oil heating system.
Chevron Mid-grade unleaded gasoline		Chevron Products	Liquid	3	B-2, D-2A, D-2B	2, 3, 0	200 L		Extremely Flammable, Vapours are harmful and they may be explosive. Non-sparking tools required. Vapours will collect in low areas and travel along the ground to an ignition source.	Goggles, gloves. Respirator or SCBA if in confined space	Eliminate all sources of ignition. Ventilate area if required. Dike the spill and pump to containers for recycling. Use absorbent. In case of fire, use dry chemical, CO2, Alcohol-resistant Foam or water spray. Allow waste absorbent to evaporate and then Incinerate waste.
Chevron NWS Manual Transmission Fluid 6044GR		Chevron Lubricants Canada	Liquid	not regulated	not regulated	1, 1, 0	100 L			Safety Glasses, Gloves	contain spill. Small amounts can use absorbent and incinerate waste. Larger material pumped into plastic drums and used in a waste oil heating system.
Chevron RPM Universal Gear Lubricant		Chevron Lubricants Canada	Liquid	not regulated	not regulated	1, 1, 0	100 L			Safety Glasses, Gloves	contain spill. Small amounts can use absorbent and incinerate waste. Larger material pumped into plastic drums and used in a waste oil heating system.
Chevron Supreme Antifreeze/Coolant	Ethylene Glycol	Chevron Lubricants Canada	Liquid	not regulated under 5000 lb.	D-2A	1, 1, 0	25 L		may be fatal by ingestion	Safety Glasses, Gloves	contain spill. Can be pumped, filtered and reused. Small amounts can use absorbent and incinerate waste. Larger absorbent material in plastic drums and shipped off site for disposal.
Chevron Ulti-Plex® Grease EP		Chevron Lubricants Canada	Semi-Solid	not regulated	not regulated	1, 1, 0	100 L			Safety Glasses, Gloves	contain spill. Small amounts can use absorbent and incinerate waste. Larger absorbent material in plastic drums and shipped off site for disposal.
Chloramine T	Chloramine-T trihydrate	Fisher	solid	8	D-2A, E	3, 1, 1	5 kg		Container may explode under fire conditions. Will release toxic fumes with fire or when mixed with strong oxidizers or acids	Goggles, gloves. SCBA if in confined space	Eliminate all sources of ignition. Ventilate area if required. In case of fire. Material by itself is non-flammable, may decompose violently >100^{o}C, use dry chemical, CO_2 foam or water spray. DISPOSAL mix with flammable solvent and incinerate.
Chromium Standard - AA		Anachemia	Liquid	8	D-2A, E	3, 0, 0	5 L		Dilute Nitric Acid <5%	Safety Glasses, Gloves	Neutralize with soda ash or lime. Contain spill, **do not** allow un-neutralized acid to enter water systems. Neutralized spill can be pumped to the pit or tailings system.
Citric Acid	Citric Acid, Monohydrate	Anachemia	solid	not regulated	E	2, 1, 0	5 L		Will cause severe eye damage. Avoid oxidizers, acids, bases and bleach.	Safety Glasses, Gloves	Eliminate all sources of ignition. Ventilate area if required. In case of fire, use flooding quantities of water. Will decompose at high temperatures and emit acrid smoke and fumes.
Copper Standard - AA		Anachemia	Liquid	8	E	4, 0, 0	5 L		Dilute Nitric Acid <5%	Safety Glasses, Gloves	Neutralize with soda ash or lime. Contain spill, **do not** allow un-neutralized acid to enter water systems. Neutralized spill can be pumped to the pit or tailings system.

Minto Mine - Inventory of Dangerous Goods

Reporting Threshold, Special Precautions, PPE Requirements, and Cleanup and Disposal Methods

Common Name (Synonyms)	Chemical Name	Manufacture / Supplier	Phase	TDG Class	WHMIS Class	NFPA Rating	Reporting Threshold	Use	Special Precautions	PPE Required	Special Cleanup and Disposal Info
Crystal 78	Sodium Silicate	Quadra Chemicals	Liquid	not regulated	D-2B		25 L		Caustic solution. Avoid mixing with strong acids. Contact with metals such as aluminum, tin, lead and zinc generates hydrogen gas.	Goggles, gloves. Respirator	solution can be pumped into plastic drum and possibly recycled in mill circuit, or shipped off site. In case of fire use appropriate measures for surrounding fire.
Cyquest DP-6	Sodium polyacrylate in water	Cytec Canada	Liquid	not regulated	not regulated	1,1,0		Mill reagent	Slippery	Goggles, Impervious gloves	Soak up with absorbent materials. These can be incinerated. Any remaining spilt liquid should be stored in closed container, labelled and disposed of off-site as Special Waste.
Delo Diesel Fuel System Cleaner		Chevron Lubricants Canada	Liquid	3	B-3, D-2A, D-2B		200 L			Safety Glasses, Gloves	Eliminate all sources of ignition. Ventilate area if required. Use absorbent. In case of fire, use dry chemical, CO2, Alcohol-resistant Foam or water spray. Incinerate waste.
Diesel Fuel No. 2		Chevron Products Company	Liquid	3	B-3, D-2A, D-2B	0, 2, 0	200 L			Safety Glasses, Gloves	contain spill. Small amounts can use absorbent and incinerate waste. Larger material pumped into plastic drums and used in a waste oil heating system.
DIISOBUTYL KETONE	2,6-Dimethyl-4-heptanone	J.T. Baker	Liquid	3	B-2, D-2A	2, 2, 0	200 L		Avoid contact with strong oxidizers or acids.	Safety Glasses, Gloves	Eliminate all sources of ignition. Ventilate area if required. Use absorbent. In case of fire, use dry chemical, CO2, Alcohol-resistant Foam or water spray. Incinerate waste.
Drierite, indicating		Anachemia	solid	not regulated	D-2A	1, 0, 1				Safety Glasses, Gloves	Eliminate all sources of ignition. In case of fire use measures dictated by surrounding fire. Will decompose at 1450^{o}C liberating Cl_2 and SO_2. This product can be dried and reused, recycled.
Envirobind KFZ		Power Chemicals Ltd.	Liquid	not regulated	not regulated	1, 0, 0		Dust Suppression	Avoid contact with oxidizing agents or strong acids.	Goggles, Gloves	Do not use absorbents. Contain spill using noncombustible materials such as vermiculite, earth or sand.
Envirobind KTF		Power Chemicals Ltd.	Liquid	not regulated	not regulated	1, 0, 0		Dust Suppression	Avoid contact with oxidizing agents or strong acids.	Goggles/Glasses, Gloves	Do not use absorbents. Contain spill using noncombustible materials such as vermiculite, earth or sand.
Envirobind PCW		Power Chemicals Ltd.	Liquid	not regulated	not regulated	1, 0, 0		Dust Suppression	Avoid contact with strong oxidizing materials.	Goggles/Glasses, Gloves	Dike or contain. Absorb irrecoverable material onto inert oil absorbent medium, package, and label for legal disposal. Wash hard surfaces with water. Contaminated absorbent material may be disposed of in an approved landfill
FLEET CHARGE 50/50 Antifreeze	Ethylene Glycol	OLD WORLD INDUSTRIES	Liquid	9	D-2A	1, 1, 0	25 L		may be fatal by ingestion	Safety Glasses, Gloves	contain spill. Can be pumped, filtered and reused. Small amounts can use absorbent and incinerate waste. Larger absorbent material in plastic drums and shipped off site for disposal.
Fleet Charge PG Antifreeze/Coolant	Propylene Glycol	OLD WORLD INDUSTRIES	Liquid	not regulated	not regulated	0, 1, 0	25 L			Safety Glasses, Gloves	contain spill. Can be pumped, filtered and reused. Small amounts can use absorbent and incinerate waste. Larger absorbent material in plastic drums and shipped off site for disposal.
Flomin C 3505 Collector	Potassium amyl xanthate (PAX)	Flomin Inc.	solid	4	not regulated	2, 2, 1	25 kg		Product is spontaneously combustible. Avoid contact with heat, moist air, and water.	Safety Glasses, Gloves	Sweep up spilled material and place in closed container for reuse. Solutions of product my be deposed of on the pit or tailings system. In case of fire use appropriate measures for surrounding fire.
Flomin F 500 Frother	4-METHYL-2-PENTANOL (Methyl isobutyl carbinol - MIBC)	Flomin Inc.	Liquid	3	B-2, D-2B	2, 2, 0	200 L		Acids, acid chlorides, alkalis, oxidizing agents. Will attack some forms of plastics, rubber and coatings	Goggles, gloves. Respirator or SCBA if in confined space	Eliminate all sources of ignition. Ventilate area if required. Use absorbent. In case of fire, use dry chemical, CO2, Alcohol-resistant Foam or water spray. Incinerate waste.
Floran Catalyst	Proprietary Inorganic Peroxide Blend	Floran Technologies	Liquid	5	C, D-2B	2, 0, 1, OX	50 L		Non-Flammable but will aid combustion of other materials	Safety Glasses, Gloves	Eliminate all sources of ignition. Ventilate area if required. Use absorbent. In case of fire, use flooding quantities of water. Contributes to combustion of other materials. Contain spill, keep from entering ground water. Absorbed pill can be disposed in the pit or tailings system.
Frost Killer (Tannergas)	Methyl alcohol	TANNER SYSTEMS, INC.	Liquid	3, 6.1	B-2, D-1B, D-2A,D-2B	1, 3, 0	200 L		Extremely Flammable, Vapours are harmful and solution is poisonous	Goggles, gloves. Respirator or SCBA if in confined space	Eliminate all sources of ignition. Ventilate area if required. Use absorbent. In case of fire, use dry chemical, CO2, Alcohol-resistant Foam or water spray. Incinerate waste.
FUEL INJECTOR CLEANER		Radiator Specialty Co	Liquid	3	B-3, D-2A, D-2B		200 L			Safety Glasses, Gloves	Eliminate all sources of ignition. Ventilate area if required. Use absorbent. In case of fire, use dry chemical, CO2, Alcohol-resistant Foam or water spray. Incinerate waste.
Gasoline, Unleaded		Petro-Canada	Liquid	3	B-2, D-2A, D-2B	2, 3, 0	200 L		Extremely Flammable, Vapours are harmful and they may be explosive. Non-sparking tools required. Vapours will collect in low areas and travel along the ground to an ignition source.	Goggles, gloves. Respirator or SCBA if in confined space	Eliminate all sources of ignition. Ventilate area if required. Dike the spill and pump to containers for recycling. Use absorbent. In case of fire, use dry chemical, CO2, Alcohol-resistant Foam or water spray. Allow waste absorbent to evaporate and then Incinerate waste.

Minto Mine - Inventory of Dangerous Goods

Reporting Threshold, Special Precautions, PPE Requirements, and Cleanup and Disposal Methods

Common Name (Synonyms)	Chemical Name	Manufacture / Supplier	Phase	TDG Class	WHMIS Class	NFPA Rating	Reporting Threshold	Use	Special Precautions	PPE Required	Special Cleanup and Disposal Info
Glycerin	IPAC	Power Chemicals Ltd.	Liquid	Not regulated	Not regulated				Avoid contact with reducing agents and oxidizing agents.	Goggles, gloves.	Dike spilled product to prevent runoff
Havoline DEX-COOL Extended Life 50/50 Anti-Freeze/Coolant	Ethylene Glycol	Chevron Lubricants Canada	Liquid	not regulated	D-1b, D-2A	2, 0, 0	25 L		may be fatal by ingestion	Safety Glasses, Gloves	contain spill. Can be pumped, filtered and reused. Small amounts can use absorbent and incinerate waste. Larger absorbent material in plastic drums and shipped off site for disposal.
HAVOLINE DEX-COOL extended life anti-freeze/coolant-B	Ethylene Glycol	Chevron Lubricants Canada	Liquid	not regulated	D-1b, D-2A	2, 1, 0	25 L		may be fatal by ingestion	Safety Glasses, Gloves	contain spill. Can be pumped, filtered and reused. Small amounts can use absorbent and incinerate waste. Larger absorbent material in plastic drums and shipped off site for disposal.
Havoline Power Steering Fluid		Chevron Products	Liquid	not regulated	not regulated	0, 1, 0				Safety Glasses, Gloves	contain spill. Small amounts can use absorbent and incinerate waste. Larger material pumped into plastic drums and used in a waste oil heating system.
Hot 4-in-1 Heating Oil Treatment	Proprietary Blend	FPPF Chemical Company, Inc.	Liquid	3	B-3, D-1A, D-2A, D-2B	3, 2, 0	200 L		Fuel Additive, fumes will collect in low area's.	Safety Glasses, Gloves	Eliminate all sources of ignition. Ventilate area if required. Use absorbent. In case of fire, use dry chemical, CO2, Alcohol-resistant Foam or water spray. Incinerate waste.
Hydrated Lime	$Ca(OH)_2$	Chemical Lime Company of Canada Inc.	Solid	not regulated	D-2A, E				Will cause severe caustic burns. Avoid strong acids, and aluminum	Safety Glasses, Gloves	sweep up uncontaminated material for reuse. Neutralize with dilute acid and may be disposed of in pit or tailings system.
Hydraulic Oil SAE 10W		EXXON MOBIL	Liquid	not regulated	not regulated	0, 1, 0	200 L			Safety Glasses, Gloves	Eliminate all sources of ignition. Ventilate area if required. Use absorbent. In case of fire, use dry chemical, CO2, Alcohol-resistant Foam or water spray. Incinerate waste.
Hydrex 3223		Veolia	Liquid	8	E	1, 0, 0	5kg or 5L	Coagulant in the WTP		Safety glasses with side shields or goggles, face shield, chemical resistant gloves. Suitable respiratory equipment in poorly ventilated areas.	Contain spill. Ventilate area if required. Use absorbent. Place contaminated materials in sealed container for disposal and dispose of via a licensed waste disposal contractor.
Hydrex 6186		Veolia	Solid	not regulated	not regulated	0, 1, 0		Flocculant in the WTP		Safety glasses with side shields or goggles.	Sweep or vacuum spilled material. Do not get water on spilled material. Flush area with water after product recovery. Place recovered material in sealed container and dispose of via a licensed waste disposal contractor.
Hydrochloric Acid		Anachemia	Liquid	8	D-1A, E	3, 0, 1	5 L		Concentrated acid, Extremely corrosive. Ventilate or stay upwind	Goggles, gloves. Respirator or SCBA if in confined space	Neutralize with soda ash or lime. Contain spill, **do not** allow un-neutralized acid to enter water systems. Neutralized spill can be pumped to the pit or tailings system.
Hydrofluoric acid, 47 - 51%		Fisher	Liquid	8, 6.1	D-1A, D-2A, E	4, 0, 1	5 L		**Extremely corrosive and Toxic acid. Causes very severe acid burns with symptoms being delayed. Skin contact of <10% can be fatal from cardio-pulmonary problems. IMMEDIATE medical attention is required for all exposures.**	**Goggles, gloves. Respirator or SCBA if in confined space (Actually SCBA should be used anywhere unless spill is in a fumehood)**	Neutralize with soda ash. Contain spill, **do not** allow un-neutralized acid to enter water systems. Neutralized spill can be pumped to a plastic barrel and then disposed of in the pit or tailings system.
IPAC 6832		Quadra Chemicals	Liquid	not regulated	not regulated				water soluble	Safety Glasses, Gloves	No special clean up procedures,
Iron Standard - AA		Anachemia	Liquid	8	E	1, 0, 0	5 L		Dilute Nitric Acid <5%	Safety Glasses, Gloves	Neutralize with soda ash or lime. Contain spill, **do not** allow un-neutralized acid to enter water systems. Neutralized spill can be pumped to the pit or tailings system.
Isopropylxanthic acid sodium salt (SIPX)		Quadra Chemicals Ltd.	Solid	4.2	B-6, D-1B, D-2B		25 kg	Collector in Mill	Keep away from water - contact with water liberates extremely flammable gases. Keep away from heat, sparks and flame - fine dust clouds may form explosive mixtures with air. Use only with adequate ventilation.	Goggles, Gloves, Respirator (air-purifying or air-fed)	Move containers from spill area. Avoid allowing the spilled material to get wet or using water to clean up spillages or residues, unless the quantity remaining is very small. Vacuum or sweep up material and place in a designated, labeled waste container. Use spark-proof tools and explosion-proof equipment. Dispose of via a licensed waste disposal contractor.
Javex Liquid Bleach	NaOCl	Colgate Palmolive	Liquid	not regulated	E, D-2B, C				Self heating and may catch fire.	Safety Glasses, Gloves, SCBA	Ventilate area and allow qualified personnel to stop/control spill. Small spills: flush area with plenty of water and mop up. Large spills: dike the ingredient and transfer to appropiate containers. Consult Federal, Provincial and Municipal regulations for disposal. May be neutralized with sodium bisulphite or dilute hydrogen preoxide.

Minto Mine - Inventory of Dangerous Goods

Reporting Threshold, Special Precautions, PPE Requirements, and Cleanup and Disposal Methods

Common Name (Synonyms)	Chemical Name	Manufacture / Supplier	Phase	TDG Class	WHMIS Class	NFPA Rating	Reporting Threshold	Use	Special Precautions	PPE Required	Special Cleanup and Disposal Info
KAX 51	Proprietary Blend (mix of isoamyl alohol, potassium amyl xanthate, and potassium hydroxide)	Prospec Chemicals	Solid	4.2	B-6, D-1B, E		25 kg	Collector in Mill		Safety Glasses. Face Shield, Gloves, SCBA	If in the liquid state: Stop spill at source. Contain any spilled material to prevent discharge into the environment. Eliminate all sources of ignition. Persons not wearing protective equipment should be excluded from the area. Absorb with inert dry material. Put into an approved metal salvage drum for disposal. If in the solid state: Eliminate all sources of ignition. Restrict access to area until completion of clean-up. Ensure clean-up is conducted by trained personnel only. Do not touch spilled material. Do not use water on spilled material as heat will be generated. Put spilled material into approved salvage drums for disposal. Flush cleaned area with water, making sure no water enters xanthate containers.
KOPR-KOTE	Graphite, Cu & MoS_2 mixture	Jet-Lube of Canada	paste	not regulated	not regulated	1,1,1				Safety Glasses, Gloves	Wipe up spill with rages and incinerate waste.
Lead Standard - AA		Anachemia	Liquid	8	D-2A, E	4, 0, 0	5 L		Dilute Nitric Acid <5%	Safety Glasses, Gloves	Neutralize with soda ash or lime. Contain spill, **do not** allow un-neutralized acid to enter water systems. Neutralized spill can be pumped to the pit or tailings system.
Lime		Chemical Lime Company of Canada Inc.	powder	not regulated	E	3, 0, 1			Will cause severe caustic burns. Avoid strong acids, and aluminum	Safety Glasses, Gloves	sweep up uncontaminated material for reuse. Neutralize with dilute acid and may be disposed of in pit or tailings system.
Liquid Nitrogen	Nitrogen	Praxair Canada Inc.	Liquefied Gas	2.2 Non-flammable gas	A	3, 0, 2	any if container larger then 100 L		Use air supplied respirator when working in confined space, Loose-fitting cryogenic gloves, Metatarsal shoes for cylinder handling. Protective clothing where needed. Cuff less trousers should be worn outside of shoes	Extremely cold liquefied gas, Will cause severe frost bite Use SCBA when working in confined space,	Evacuate all personnel from danger area. Allow spilled liquid to evaporate. Use self-contained breathing apparatus where needed. Shut off flow if you can do so without risk. Ventilate area or move cylinder to a well-ventilated area. Test for sufficient oxygen, especially in confined spaces, before allowing re-entry
LIQUID WRENCH SUPER LUBRICANT (AEROSOL)	Proprietary Blend	Radiator Specialty Co	aerosol	2.1	A, B5, D-1A, D2-B		any if container larger then 100 L		containers may rupture if exposed to high temperatures.	Safety Glasses, Gloves	Allow container to completely discharge while eliminating ignitions sources. Wipe up spill with rages and incinerate waste.
Loctite Belt Dressing	Proprietary Blend t	Henkel Canada, Inc.	aerosol	2.2	A, D-2A, D-2B		any if container larger then 100 L		containers may rupture if exposed to high temperatures.	Safety Glasses, Gloves	Allow container to completely discharge Wipe up spill with rags and incinerate waste.
LPS 2 Spray Lubricant	Proprietary Blend	LPS Laboratories	aerosol	2.2	A, D-2A, D-2B		any if container larger then 100 L		containers may rupture if exposed to high temperatures.	Safety Glasses, Gloves	Allow container to completely discharge Wipe up spill with rages and incinerate waste.
Magnesium Nitrate Matrix Modifier		Spex CertiPrep	Liquid	8	D-2A, E	3, 0, 0	5 L		Dilute Nitric Acid <5%	Safety Glasses, Gloves	Neutralize with soda ash or lime. Contain spill, **do not** allow un-neutralized acid to enter water systems. Neutralized spill can be pumped to the pit or tailings system.
MAXGOLD™ 900 Promoter	Proprietary Blend	Cytec Canada	Liquid	3	B-3, D-2A	3, 2, 0	200 L		slightly yellow liquid that has a slight sulphur smell. In confined space use respirator with organic vapour cartridges	Goggles, gloves. Respirator or SCBA if in confined space	eliminate ignition sources, use absorbent on small spills, for large spill pump to plastic drum for shipment off site. In case of fire use dry chemical extinguisher, CO_2 or foam. Water likely not effective.
MERCSORB Mercury Amalgamation Powder		NPS Corporation	solid	4		0, 1, 1	25 kg		Dry zinc dust will not ignite spontaneously, but once ignited, it may burn readily in air	Safety Glasses, Gloves	Sweep up spilled material and place in closed container for reuse. In case of fire use appropriate measures for surrounding fire.
Mercury Indicator Powder	Proprietary Blend	NPS Corporation	solid	not regulated		2, 1, 0			Odorless, yellowish-tan to gray powder. Dust may form a flammable or explosive mixture in air. When heated to decomposition, toxic fumes of sulfur oxides are produced	Safety Glasses, Gloves	Sweep up spilled material and place in closed container for reuse. In case of fire use appropriate measures for surrounding fire. This product in itself is considered to be non-hazardous.
Mercury Standard - AA		Anachemia	Liquid	8	D-2A, E	3, 0, 0	5 L		Dilute Nitric Acid <5%	Safety Glasses, Gloves	Neutralize with soda ash or lime. Contain spill, **do not** allow un-neutralized acid to enter water systems. Neutralized spill can be pumped to the pit or tailings system.
Mercury Vapor Suppressor	Proprietary Blend	NPS Corporation	solid	not regulated		2, 1, 0			Odorless, black, irregular, dry granular solid. Wet activated carbon removes oxygen from the air causing a severe hazard to workers in confined space.	Safety Glasses, Gloves	Sweep up spilled material and place in closed container for reuse. Contaminated waste can be incinerated. In case of fire use appropriate measures for surrounding fire. This product in itself is considered to be non-hazardous.
Methanol		Anachemia	Liquid	3, 6.1	B-2, D-1B, D-2A,D-2B	1, 3, 0	200 L		Extremely Flammable, Vapours are harmful and solution is poisonous	Goggles, gloves. Respirator or SCBA if in confined space	Eliminate all sources of ignition. Ventilate area if required. Use absorbent. In case of fire, use dry chemical, CO2, Alcohol-resistant Foam or water spray. Incinerate waste.

Minto Mine - Inventory of Dangerous Goods

Reporting Threshold, Special Precautions, PPE Requirements, and Cleanup and Disposal Methods

Common Name (Synonyms)	Chemical Name	Manufacture / Supplier	Phase	TDG Class	WHMIS Class	NFPA Rating	Reporting Threshold	Use	Special Precautions	PPE Required	Special Cleanup and Disposal Info
MIBC	Methyl Isobutyl Carbinol	Flomin Inc.	Liquid	3		2, 2, 0	200 L	Frother in Mill	Product liquid and vapor are flammable. Keep away from heat and sources of ignition. Product vapors or mist may be irritating to eyes and respiratory system. Product liquid may cause eye and skin burns. Harmful if swallowed.	Googles or Face Shield, Gloves, Respirator (NIOSH/MSA)	Dike spill and collect for disposal or reuse. Use adsorbents on residual material. Flush spill area with water. Keep flush material out of waterways. Dispose of cleanup material in an approved manner.
MIBK	4-Methyl-2-pentanone	Fisher Scientific	Liquid	3	B-2	2, 3, 0	200 L		clear liquid that has a slightly sweet smell. In confined space use respirator with organic vapour cartridges	Safety Glasses, Gloves	Clear liquid that is immiscible with water. Use absorbent for small spills and incinerate waste. Large spills, eliminate ignitions sources and pump to plastic drum for shipment off site.
Molybdenum Standard - AA		Anachemia	Liquid	not regulated	not regulated	0, 0, 0				Safety Glasses, Gloves	Contain spill. Incinerate waste or place in landfill
Mucasol universal detergent		Sigma-Aldrich Canada	Liquid	not regulated	D-2B	2, 0, 0				Safety Glasses, Gloves	
Nickel Standard - AA		Anachemia	Liquid	8	D-2A, E	1, 0, 0	5 L		Dilute Nitric Acid <5%	Safety Glasses, Gloves	Neutralize with soda ash or lime. Contain spill, **do not** allow un-neutralized acid to enter water systems. Neutralized spill can be pumped to the pit or tailings system.
Nitric Acid		Anachemia	Liquid	8	C, D-1A, E	4, 0, 0, OX	5 L		Concentrated acid, Extremely corrosive. Ventilate or stay upwind. **Strong Oxidizer**	Goggles, gloves. Respirator or SCBA if in confined space	Neutralize with soda ash or lime. Contain spill, **do not** allow un-neutralized acid to enter water systems. Neutralized spill can be pumped to the pit or tailings system.
Nitric Acid 40%		Quadra Chemicals	Liquid	8	C, D-1A, E	4, 0, 0, OX	5 L		Concentrated acid, Extremely corrosive. Ventilate or stay upwind. **Strong Oxidizer**	Goggles, gloves. Respirator or SCBA if in confined space	Neutralize with soda ash or lime. Contain spill, **do not** allow un-neutralized acid to enter water systems. Neutralized spill can be pumped to the pit or tailings system.
Oxygen		BOC Canada Limited (Linde)	Pressurized gas	2.2	A, C	0, 3, 0, OX	any if container larger then 100 L		Strong Oxidizer will Contribute to combustion of other materials.	Safety Glasses, Gloves	close valve if possible without risk, or allow the vent. In case of fire use any media suitable for surrounding fire. Use water spray to cool fire exposed containers.
Oxygen Refrigerant		Air Liquide Canada	Liquefied Gas	2.2	A, C	0, 3, 0, OX	any if container larger then 100 L		Strong Oxidizer will Contribute to combustion of other materials. Liquefied gas, will produce extreme cold when released.	Safety Glasses, Gloves	close valve if possible without risk, or allow the vent. In case of fire use any media suitable for surrounding fire. Use water spray to cool fire exposed containers.
Palladium Nitrate Matrix Modifier		Spex CertiPrep	Liquid	8	D-2A, E	3, 0, 0	5 L		Dilute Nitric Acid <5%	Safety Glasses, Gloves	Neutralize with soda ash or lime. Contain spill, **do not** allow un-neutralized acid to enter water systems. Neutralized spill can be pumped to the pit or tailings system.
Phosphoric acid		Sigma-Aldrich Canada	Liquid	8	D-1A, D-2B, E		5 L		Concentrated acid, Extremely corrosive. Ventilate or stay upwind.	Goggles, gloves. Respirator	Neutralize with soda ash or lime. Contain spill, **do not** allow un-neutralized acid to enter water systems. Neutralized spill can be pumped to the pit or tailings system.
Pine Oil (Terpene SW Blend)		Quadra Chemicals Ltd.	Liquid	not regulated	B-3, D-2B			Frother in Mill	Combustible liquid and vapor. Causes respiratory tract, eye and skin irritation. Use only with adequate ventilation. Keep container tightly closed and sealed until ready for use. Wash thoroughly after handling. Avoid oxidizing materials.	Goggles, Gloves, Respirator (air-purifying or air-fed)	Stop leak if without risk. Move containers from spill area. Dilute with water and mop up if water-soluble or absorb with an inert dry material and place in an appropriate waste disposal container. Use spark-proof tools and explosion-proof equipment. Dispose of via a licensed waste disposal contractor.
PAX	Potassium Amyl Xanthate	Quadra Chemicals Ltd.	Solid	4.2	B-6, D-2B		25 kg	Collector in Mill	Keep away from water - contact with water liberates extremely flammable gases. Keep away from heat, sparks and flame - fine dust clouds may form explosive mixtures with air. Use only with adequate ventilation.	Goggles, Gloves, Respirator (air-purifying or air-fed)	Move containers from spill area. Avoid allowing the spilled material to get wet or using water to clean up spillages or residues, unless the quantity remaining is very small. Vacuum or sweep up material and place in a designated, labeled waste container. Use spark-proof tools and explosion-proof equipment. Dispose of via a licensed waste disposal contractor.
Polyclear A2501		Quadra Chemicals Ltd.	Solid	not regulated	not regulated			Tailings thickener flocculant	Keep away from heat, sparks and flame - fine dust clouds may form explosive mixtures with air. Take precautionary measures against electrostatic discharges.Use only with adequate ventilation. Avoid oxidizing materials.	Safety Glasses, Gloves	Move containers from spill area. Vacuum or sweep up material and place in a designated, labeled waste container. Use spark-proof tools and explosion-proof equipment. In case of fire use appropriate measures for surrounding fire. Place in sealed container and dispose of via a licensed waste disposal contractor.
Polyclear 2528	Polyclear Floc	Quadra Chemicals Ltd.	solid	not regulated	not regulated				concentrated solution is extremely slippery, use caution	Safety Glasses, Gloves, respiratory equipment if risk assesment deems necesarry	Sweep up spilled material and it my be deposed of in dilute form to the pit or tailings system. In case of fire use appropriate measures for surrounding fire.
Polyclear 31080C		Quadra Chemicals Ltd.	Liquid	9	D-2B			Dewatering Aid in Mill	Use only with adequate ventilation. Avoid contact with strong oxidizers or halogens	Goggles, Gloves, Respirator (air-purifying or air-fed)	Stop leak if without risk. Move containers from spill area. Dilute with water and mop up if water-soluble or absorb with an inert dry material and place in an appropriate waste disposal container. Dispose of via a licensed waste disposal contractor.

Minto Mine - Inventory of Dangerous Goods

Reporting Threshold, Special Precautions, PPE Requirements, and Cleanup and Disposal Methods

Common Name (Synonyms)	Chemical Name	Manufacture / Supplier	Phase	TDG Class	WHMIS Class	NFPA Rating	Reporting Threshold	Use	Special Precautions	PPE Required	Special Cleanup and Disposal Info
Polyfroth W31		Quadra Chemicals Ltd.	Liquid	not regulated	not regulated			Frother in Mill	Harmful or fatal if swallowed. Can enter lungs and cause damage. May cause target organ damage	Goggles, Gloves, Respirator (air-purifying or air-fed)	Stop leak if without risk. Move containers from spill area. Dilute with water and mop up if water-soluble or absorb with an inert dry material and place in an appropriate waste disposal container. Dispose of via a licensed waste disposal contractor.
Potassium hydroxide	KOH	Science lab	Solid	8	D-1B	3, 0, 1	5 kg		very corrosive solid	Safety Glasses, Gloves	Use appropriate tools to put the spilled solid in a convenient waste disposal container. If necessary: Neutralize the residue with a dilute solution of acetic acid.
Potassium Iodide		Anachemia	solid	not regulated	D-2A	1, 1, 1			light and water exposure will cause breakdown	Safety Glasses, Gloves	Eliminate all sources of ignition. In case of fire use measures dictated by surrounding fire. Will decompose at high temperatures and emit toxic I_2 fumes. Use appropriate SCBA.
Potassium permanganate		CAIROX	Solid	5.1	C, E	1, 0, 0, OX	50 kg		corrosive solid. Oxidizing solid	Safety Glasses, Gloves	Sweep up solid spill for possible reuse. If necessary reduce material in aqueous solution with sodium thiosulfate (hypo), In case of fire use flooding quantities of water, material will contribute to combustion.
Propane		Superior Propane	Liquefied Gas	2.1	A, B-1		any if container larger then 100 L		Extremely flammable. Liquefied gas, will produce extreme cold when released.	Goggles, gloves. SCBA if in confined space	close valve if possible without risk, or allow the vent. In case of fire use any media suitable for surrounding fire. Use water spray to cool fire exposed containers.
Selenium Standard - AA		Anachemia	Liquid	8	E	1, 0, 0	5 L		Dilute Nitric Acid <5%	Safety Glasses, Gloves	Neutralize with soda ash or lime. Contain spill, **do not** allow un-neutralized acid to enter water systems. Neutralized spill can be pumped to the pit or tailings system.
Sodium Borohydride		Anachemia	solid	4.3	B-6, B-4, D-1B, E	3, 1, 2	25 kg		Flammable solid. Reacts violently with water and acids to produce flammable H_2 gas. Strong reducing agent.	Safety Glasses, Gloves	Eliminate ignition sources, sweep up dry material. In case of fire use only dry chemical extinguisher, DO NOT USE WATER OR CO_2
Sodium Hydroxide Solutions (various strengths)	NaOH (The Anachemia MSDS is current, treat all solutions in the same manner regardless of strength.)	Various Suppliers	Liquid	8	E	3, 0, 1	5 L		Caustic solution. Avoid mixing with strong acids. Contact with metals such as aluminum, tin, lead and zinc generates hydrogen gas.	Safety Glasses, Gloves	Neutralize the residue with a dilute solution of acetic acid. Neutralized solution can be disposed of in the pit or tailings system.
Sodium Nitrite		Anachemia	solid	5.1, 6.1	C, D-1B, D-2A	3, 0, 2, OX	50 kg		**Strong Oxidizer** will Contribute to combustion of other materials.	Safety Glasses, Gloves	Eliminate all sources of ignition. In case of fire, use flooding quantities of water. Will decompose at high temperatures and emit acrid smoke. Strong oxidizer, may form compound that are sensitive to shock, friction. Sweep up solid spill for disposal. Dispose of contaminated solution in the pit or tailings system.
sodium sulphide Flakes	Sodium sulphide Hydrated	Quadra Chemicals	solid	8	D-1B, E		5 kg		caustic, very corrosive solid	Goggles, gloves. And a respirator, avoid creating dust and avoid any acids. Contact with acids liberate toxic H_2S	Sweep up spilled material an place in plastic sealed container for shipment off site.
TMT 15%	trisodium salt	Quadra Chemicals	Liquid	not regulated (treated as Cl. 9 Miscellaneous)	D-2B		25 L		water soluble	Safety Glasses, Gloves	No special clean up procedures, treated as Class 9 Miscellaneous as product does not meet Class 6 Toxicity standards but is an environmental hazard.
Urea	Carbamide	Anachemia	solid	not regulated	not regulated	1, 0, 0			Avoid contact with strong oxidizers. In fire conditions it can produce oxides of nitrogen. Also ammonia, and HCN	Safety Glasses, Gloves	Sweep up spilled material and it my be deposed of in dilute form to the pit or tailings system. In case of fire use appropriate measures for surrounding fire.
Vitec 7000		Avista Technologies	Liquid	not regulated	2A	1, 0, 0		Antiscalant in WTP	Avoid mixing with strong bases, strong oxidizers, very strong acids, water reactive materials	SCBA or SABA in confined space, Safety goggles/glasses, Chemical impervious gloves	Soak up or wet vacuum spilled liquid. Neutralize residue with sodium bicarbonate or other neutralizing agent for very dilute acids.Decontaminate the area thoroughly. Place all spill residues in suitable container and dispose of via a licensed waste disposal contractor.
VARSOL 3139 SOLVENT	Petroleum Hydrocarbons	Imperial Oil Chemicals	Liquid	3	B-3, D-2B	1, 2, 0	200 L		Flammable solvent	Safety Glasses, Gloves	Clean up uncontaminated material for reuse. Incinerate waste.
VoltEsso 35		Imperial Oil Chemicals	Liquid	not regulated	not regulated	1, 1, 0			electrical insulating oil	Safety Glasses, Gloves	Clean up uncontaminated material for reuse. Incinerate waste.
Zinc Standard - AA		Anachemia	Liquid	8	E	1, 0, 0	5 L		Dilute Nitric Acid <5%	Safety Glasses, Gloves	Neutralize with soda ash or lime. Contain spill, **do not** allow un-neutralized acid to enter water systems. Neutralized spill can be pumped to the pit or tailings system.

1.0 Overall HAZMAT Response Procedures

1.1 Site Management and Control

Initial responders will :

- Approach the scene from uphill and upwind.
- Establish command uphill and upwind of spill at an appropriate distance.
- Establish 2 isolation perimeters: one that separates the hot zone from the warm zone and another that separates the warm zone from the cold zone. Emergency Response Guide or Canutec shall be referenced for perimeter size.
- Evacuate affected area or 'protect in place', as req'd. Emergency Response Guide or Canutec shall be referenced for evacuation zone.
- Identify contaminated persons and ensure they remain isolated until they can be decontaminated.
- Establish a staging area.
- Designate an information officer.
- Possible unification of command.

1.2 Identification of the problem

I/C will identify the:

- Spilled product, as per witness testimony, placards, labels, bill of lading, type of container, etc. If product cannot be identified from command position, then a recon team will be tasked with identification.
- Size of container.
- Size and nature of release.
- Conditions and # of victims at accident site.
- Topography of area, and exposures threatened.

1.3 Hazard &Risk Evaluation

A risk evaluation will be conducted, taking into consideration:

- Product hazards
- Access & Egress
- Size of Spill
- Condition of container
- Proximity of exposures
- Personnel available to perform operations, and their level of training/experience
- Information from MSDS, ERG, Canutec, etc., minimum 3 sources

1.4 Personal Protective Equipment

PPE will be selected for Ops, RIT, and Decon teams, considering:

- Flammability/explosiveness of product
- Toxicity of product
- Route of entry of product
- Permeation rate of PPE
- Breakthrough time of PPE
- Availability of PPE
- Visibility and workability while wearing PPE

1.5 Information Management and Resource Coordination

The information officer will begin to gather information about the product once it has been identified. The information officer can use the MSDS, ERG, Canutec, or many other resources to gather information, such as:

- Properties of the product
- Hazards of the product
- Expected travel of product released
- Populations/ environment in jeopardy
- PPE req'd by responders
- Decontamination requirements

Command will prioritize the information and ensure that the correct people receive the correct information.

1.6 Implementing Response Objectives

Command will develop an overall strategy, which may be offensive (entry of hot zone to gain quick control), defensive (contain from the cold zone to prevent spread), or passive (isolate only, and wait for incident to run its course), considering:

- Life safety
- Incident stabilization
- Environmental protection
- Property salvage

Command will delegate tactics to operations teams, such as:

- Reconnaissance for unknown product
- Evacuation for toxic gas leak, fire, or explosive hazard
- Fire control for flammable gas, flammable liquid, or oxidizer
- Search and rescue
- Leak control
- Neutralization of corrosives
- Deployment of boom, drain covers, etc.
- Building of dams, dykes, etc.

To follow: specific tactic options will be discussed in more detail, pertaining to hazardous materials that are commonly found in large quantities at the Minto Mine.

Entry teams will enter with a clear objective, but must assess for the next team's objective. For example, the 1st entry team may be tasked with rescuing the driver of a fuel truck that rolled down a bank and is spilling fuel. Although their objective is to rescue, while they are on scene they should observe where the leak is, consider what could be used to stop it, where the fuel is going, and what is needed to contain it. They should bring a camera, so that pictures can be brought back to command. This will give command crucial information and better prepare the next team for their task.

1.7 Decontamination

Considerations for decontamination should begin at the outset of the incident. A decontamination construct will exist in the warm zone prior to any team entering the hot zone. It will typically consist of a large berm fashioned out of a large chemical resistant tarp, wrapped over a charged 2 ½" hose-line. There will be a charged 1 ½" hose-line nearby for emergency decontamination. Within the berm, there will be a series of smaller berms, in which, personnel will stand while being decontaminated. Personnel conducting the decontamination will be wearing the appropriate PPE (typically 1 class below ops) and will use detergent and water to gently scrub and rinse ops personnel and rescuees as they exit the hot zone. Tools and anything else exiting the hot zone will be decontaminated as well.

Once decontamination is complete, all product collected by the berms, will be handled as per the MSDS.

1.8 Termination

Once emergency operations are complete, the scene will be handed over to clean-up & recovery operations. Command will ensure that the hand-off includes all pertinent information about the spilled product:

- Properties
- Hazards
- Location
- Safe-handling
- Exposure signs and symptoms
- Req'd PPE
- Disposal procedures

Command will conduct an on-site debrief. As well, a more formal debrief will be conducted, with all parties involved, at a later time. The incident will be documented, including exposure records for all personnel that entered the warm and/or hot zones.

2.0 Specific Chemical Responses

2.1 Emulsion

Site management and control

- Consider initial perimeter of 800m.
- Command, staging, & decon shall be positioned upwind.
- Eliminate sources of ignition.
- Unify command with Safety Superintendent, Mine Manager, Environmental Dept, Dyno Nobel, product carrier (if spill occurs during delivery to mine).

Identification

- UN# 0332.
- Viscous liquid.
- Pink, opaque.
- Slight fuel oil odour.
- Shipped in bulk by tanker truck.

Hazard & risk evaluation

- Emulsion explosives.
- Stable under normal conditions.
- May explode under fire conditions.
- Eye & skin irritant.
- Slight ingestion & inhalation hazard.
- Avoid contact with corrosives.
- Is there threat to a stream?

PPE

- Class C suit with long sleeves.
- Standard PPE

Information management and resource coordination

- See MSDS for product information.
- Work closely with Dyno.

- Standard decon set-up will be constructed.
- Have tools cribbed for entry teams.
- Ensure there is enough PPE at the site to complete the task.
- Ensure there is drinking water for responders.
- Have hazmat trailer, ambulance & fire truck in staging area, as req'd
- Have Site Services staged for digging, damming, product extraction, as req'd.

Implementing Response Objectives

- Rescue injured personnel.
- Fire-fighting: If fire reaches cargo, DO NOT ATTEMPT TO FIGHT FIRE. Cargo may explode. Evacuate in all directions for 1600m.
- Prevent from entering streams.
- If possible, stop anymore product from being spilled.
- Follow Dyno's recommendations for recovery and clean-up of product.

Decontamination

Standard decon set-up will be utilized in warm zone:

- Large berm fashioned out of large chemical resistant tarp, wrapped over charged 2 ½" hose-line, 2 small berms, will be in series, within the large berm.
- Decon personnel shall don class C suits without need for respiratory or splash protection, other than safety glasses.
- Ensure all personnel that entered hot zone are properly decontaminated.
- Ensure that all tools that entered the hot zone are properly decontaminated.

Termination

- Once operation complete, clean out berms under direction of Dyno.
- Safe and proper disposal of all spent PPE.
- Transition of command.
- Debrief.

2.2 Diesel, Kerosene, CFE 150

Note: LEL sensor will not detect presence of long-chain hydrocarbon vapour. Photo-ionization detector (PID) should be used, if available.

Site management and control

- Set up perimeter with at least 50m radius.
- Command, staging, & decon shall be positioned uphill and upwind.
- Eliminate sources of ignition.
- Unify command with Safety Superintendent, Mine Manager, Environmental Dept, Dyno Nobel (if spilled product is CFE 150), product carrier (if spill occurs during delivery to mine).

Identification

- UN# 1202.
- Liquid state.
- Colour varies.
- Petroleum odour.
- Transported by B-train, tidy-tanks.
- Stored in 5 large tanks at fuel farm (total volume of 3,282,000 L), one 70,000 l Tank by UG portal, and one tank at Dyno (45,000 L).
- What is downhill from spill??
- Is there threat to life?
- Is there threat to a stream?

Hazard & risk evaluation

- Combustible liquid.
- Vapour could be ignited by any source of ignition.
- Extraction methods could create static if not bonded/grounded, and serve as an ignition source.
- Ambient temperature relevant.
- Irritant to eyes and skin
- Ingestion and inhalation hazard
- Toxic to aquatic life.

PPE

- If there is a fire situation, PPE will consist of full turn-out gear with SCBA.
  Otherwise
- For offensive strategies, such as rescue or plugging, full turn-out gear with SCBA
- For defensive strategies, such as diverting, damming, booming, diking, class B suit.

- Respirator with OV cartridges.
- Oil resistant gloves & boots

Information management and resource coordination

- See MSDS for product information.
- Know the product's route of travel.
- Standard decon set-up will be constructed.
- Ensure tools are cribbed for entry teams.
- Ensure there is enough PPE at the site to complete the task.
- Ensure there is drinking water for responders.
- Have hazmat trailer, ambulance & fire truck in staging area, as req'd.
- Have Site Services staged for digging, damming, product extraction, as req'd.

Implementing Response Objectives

- Rescue injured personnel.
- Consider using fog stream to protect rescuers.
- Fire-fighting: Use dry chemical, CO2, Class B foam, or water with fog pattern.
- If using fog, considering increased run-off hazard
- Prevent from entering streams.
- If possible, stop the leak: close valves, use plugs, plug n' dyke, gaskets, straps, jacks, cribbing, etc.
- Containment berm at source, 'Surrey Condom'.
- If possible, contain by covering drains/culverts, diking, diverting to a berm, absorbing, etc.
- If product has entered a stream, use booms, hydrocarbon-only absorbent socks and pads, under-flow dams, diversion-booms, skimmers to contain and extract, as per instructions found later in this document.
- If transfer of product req'd, ensure entire system is bonded/grounded.
- Use non-sparking tools, such as pneumatics.
- Site Services Vac-truck is an option for cleaning up product.

Decontamination

Standard decon set-up will be utilized in warm zone:

- Large berm fashioned out of large chemical resistant tarp, wrapped over charged 2 ½" hose-line, 2 small berms, will be in series, within the large berm.
- Decon personnel shall don class C suits without need for respiratory or splash protection, other than safety glasses.
- Ensure all personnel that entered hot zone are properly decontaminated.
- Ensure that all tools that entered the hot zone are properly decontaminated.

Termination

- Once operation complete, vac-truck can be utilized to clean up solution contained with the decon berms.
- Safe and proper disposal of all spent PPE.
- Transition of command.
- Debrief

2.3 Gasoline

Note: Minto gas detectors are calibrated to pentane and are suitable for use during gasoline spill mitigation

Site management and control

- Set up perimeter. Consider radius up to 800m depending on amount of product and level of explosion hazard.
- Command, staging, & decon shall be positioned uphill and upwind.
- Eliminate sources of ignition.
- Unify command with Safety Superintendent, Mine Manager, Environmental Dept., product carrier (if spill occurs during delivery to mine).

Identification

- UN# 1203.
- Liquid state.
- Colourless to slightly yellow.
- Recognizable odour.
- Transported by B-train, tidy-tanks.
- Stored in 2 tank at fuel farm (34,150 L combined).
- What is downhill from spill??
- Is there threat to life?
- Is there threat to a stream?

Hazard & risk evaluation

- Flammable liquid. Extremely flammable in presence of ignition source, at nearly any temperature.
- Vapour could be ignited by any source of ignition.
- Vapour is heavier than air and may travel considerable distance to an ignition source, and flash back.
- Product extraction methods could create static if not bonded/grounded, and serve as an ignition source.
- Explosion hazard where flame impingement on tank.
- Irritant to eyes.
- Ingestion and inhalation hazard
- Toxic to aquatic life.

PPE

- If there is a fire situation, PPE will consist of full turn-out gear with SCBA.
  Otherwise
- For offensive strategies, such as rescue or plugging, full turn-out gear with SCBA
- For defensive strategies, such as diverting, damming, booming, diking, fire resistant class B suit.
- Respirator with OV cartridges, only if LEL's are being monitored, otherwise, do not dampen sense of smell. Rather, move upwind of product vapour.

Information management and resource coordination

- See MSDS for product information.
- Know the product's route of travel.
- Standard decon set-up will be constructed.
- Ensure tools are cribbed for entry teams.
- Ensure there is enough PPE at the site to complete the task.
- Ensure there is drinking water for responders.
- Have hazmat trailer, ambulance & fire truck in staging area, as req'd
- Have Site Services staged for digging, damming, product extraction, as req'd.

Implementing Response Objectives

- Offensive tactics for rescue of injured personnel only.
- Consider blanketing affected area with class B foam, prior to rescuers entering hot zone.
- Use fog stream to suppress vapours and protect rescuers.
- Rescuers will carry intrinsically-safe radios and gas-detector.
- Prevent from entering streams
- If possible, stop the leak.
- If possible, contain by covering drains/culverts, diking, diverting to a berm, absorbing, etc.
- If product can or has has entered a stream, use booms, hydrocarbon-only absorbent socks and pads, under-flow dams, diversion-booms, as per instructions found later in this document.
- Safe handling and disposal of all waste product.

Decontamination

Standard decon set-up will be utilized in warm zone:

- Large berm fashioned out of large chemical resistant tarp, wrapped over charged 2 ½" hose-line, 2 small berms, will be in series, within the large berm.
- Decon personnel shall don class C suits without need for respiratory or splash protection, other than safety glasses.
- Ensure all personnel that entered hot zone are properly decontaminated.
- Ensure that all tools that entered the hot zone are properly decontaminated.

Termination

- Once operation complete, safe disposal of decon berm contents
- Safe and proper disposal of all spent PPE
- Hand-over command of operation to Environmental Dept.
- Debrief

2.4 LPG (Propane)

Note: Minto gas detectors are calibrated to pentane, and require no correction prior to use during propane leak mitigation.

Site management and control

- Set up initial perimeter of at least 100m. For large tank where there is fire, set up perimeter of at least 1600m.
- Command, staging, & decon shall be positioned uphill and upwind.
- Eliminate sources of ignition.
- Unify command with Safety Superintendent, Mine Manager, Environmental Dept., product carrier (if spill occurs during delivery to mine).

Identification

- UN# 1075
- Colourless liquid and vapour while stored under pressure.
- Colourless and odourless gas in natural state at any concentration.
- Commercial propane has an odorant added which is commonly ethyl.
- Transported by tanker truck.
- Stored in 6 113,000L tanks West of the Main Pit, One 12,000L tank at the refill station near the airport, twin 3,000L tanks at Pelly, and twin 18,000L tanks at Km 0 of the access road.
- What is downhill from spill?
- Is there threat to life?
- Is there threat to a stream?

Hazard & risk evaluation

- Extremely flammable gas.
- Vapour could be ignited by any source of ignition.
- Vapour is heavier than air and may travel considerable distance to an ignition source, and flash back.
- Stored under pressure, as a liquid.
- Product extraction methods could create static if not bonded/grounded, and serve as an ignition source.
- Massive explosion hazard where flame impingement on tank.

PPE

- Full turn-out gear with SCBA.

Information management and resource coordination

- See SDS for product information.
- Consider contacting Canutec.
- Know the product's route of travel.
- Ensure tools are cribbed for entry teams.
- Have fire truck at scene and ambulance in staging area, as req'd

Implementing Response Objectives Leak in an enclosed space

- Evacuate structure.
- Close supply valve remotely if possible.
- Eliminate any source of ignition.
- Use positive pressure to ventilate space, ensure that it is exhausting to safe location.

If no remote isolation valve:

- Entry team (2 ERT members) & RIT team (2 ERT members) will don full turn-out gear & SCBA.
- Any electronic equipment being carried, such as radio or gas detector, must be intrinsically safe.
- Entry team will enter with charged 1 ½" hose-line and gas detector equipped with LEL sensor, while RIT stages in the cold zone .
- Once entry team is at 'reach of stream' distance from the leak, the nozzleman (Entry member 1) will set-up, with nozzle fixed on Entry member 2. Entry member 2 will continue toward valve, with gas detector.

If LEL sensor rises above 20%, entry team will retreat until ventilation can be made adequate.

- Once Entry member 2 reaches the valve, he will close the valve, then back away until he reaches entry member 1.
- Entry team will exit the structure, until it has been adequately ventilated.
- Once adequately ventilated, ERT members, wearing appropriate PPE, will sweep the structure with gas detector(s), to ensure there are no pockets of gas, before deeming the structure 'safe to enter'.

****** If no remote shut-off is available or accessible, the main propane lines can be shut off by cutting the Underground Power feed in the Tailings Building.***

2.5.1 LPG line on fire, with no impingement

Note: a propane leak that is burning is safer than one that is not burning, as long as there is no impingement on a tank or structure. Therefore, in this scenario, gas will be allowed to burn until the valve can be shut off.

- Evacuate immediate area.
- If possible, close isolation valve from remote location.

If no remote isolation valve:

- Eliminate any further source of ignition.
- 2 or more ERT members in full turn-out gear & SCBA will be on 1 ½" hose-line.
- Nozzle will be turned to full fog, which will create a water-curtain between the fire and the fire fighters.
- The fire team will approach the isolation valve, keeping the water-curtain between themselves and the fire at all times, being careful not to put the fire out with the stream
- When the valve is reached by the team, the 2nd member on the line will let go of the hose and approach the valve, while the nozzleman maintains the water-curtain between the fire and the valve/fire team.
- The 2nd member will close the valve then back away from the fire until he regains his position on the hose.
- The team will maintain the water-curtain while they back away from the damaged gas-line.
- Once the team is at a safe distance, a 45 degree pattern can be fixed on the broken gas-line to cool it, and disperse any residual gases.

2.5.2 LPG leak, not enclosed, not on fire

Note: LPG has a very high vapour pressure (1013 kPa) so it wants to be a gas, a high vapour density (1.52) so it's heavier than air, and a low flash point (-103.4 C). This combination means that it can form an explosive gas cloud that will stay close to the ground, may linger in incident area, or migrate downwind and/or downhill, possibly settling in low lying areas.

- Evacuate immediate area as well as areas downwind/downhill as per ERG recommendations.
- If possible, close isolation valve from remote location.
- From 'reach of stream', set up ground monitor and fix a 45 degree fog pattern on area of concern. This will push gas cloud away from area and disperse it. Be sure to push it to a safe location.

If no remote isolation valve:

- Entry team (2 ERT members) & RIT team (2 ERT members) will don full turn-out gear & SCBA.
- Any electronic equipment being carried, such as radio or gas detector, must be intrinsically safe.
- Entry team will enter with charged 1 ½" hose-line and gas detector equipped with LEL sensor, while RIT stages in the cold zone.
- While ground monitor continues to 'make it rain' in the hot zone, nozzleman (entry member 1) will fix nozzle on entry member 2, as entry member 2 approaches the isolation valve, with gas detector.

If LEL sensor rises above 20%, entry team will retreat until water stream can be made more effective

- Once Entry member 2 reaches the valve, he will close the valve, then back away until he reaches entry member 1.
- Entry team will retreat to the cold zone until gases are adequately dispersed
- Once the gas is adequately dispersed, ERT members, wearing appropriate PPE, will sweep the area with gas detector(s), including low-lying areas where gas may have migrated to, before deeming the area 'safe to enter'.

2.5.3 Fire where there is flame impingement on LPG tank

- Evacuate all non-ERT members for at least 1,800 m where there is flame impingement on either the 12,000 L tank or the tandem 18,000 L tanks.
- Command will know and understand the signs of imminent BLEVE.
- If Command witnesses signs of imminent BLEVE from an upright tank, there shall be no attempt made to cool tanks, rather, all focus shall be on a rapid evacuation of all personnel, at least 1,800m.
- If tank has been knocked over, there may be little or no warning signs of BLEVE, therefore no attempt shall be made to cool, rather, all focus shall be on a rapid evacuation of all personnel, at least 1,800m.
- If a BLEVE is not imminent, an attempt will be made to connect a ground monitor to the stand-pipe at the Tailings bldg.
- A narrow fog stream will be fixed on the tank at the area of flame impingement.
- The monitor will be left unmanned and the remaining ERT will evacuate at least 1,800m.

Where a tanker truck carrying propane has over-turned on the access road, causing damage to the tank trailer and subsequent rapid release of propane, the strategy for the hazmat portion of the incident response, will be passive and conducted from an upwind/uphill location, at a safe distance, as per the ERG. Transfer of residual product for the scenario, will be conducted by outside resource.

Decontamination

- 1 ½" charged hose-line, as emergency decon

Termination

- Debrief

BW GasAlert Micro 5 is intrinsically safe, as per: *http://directories.csa-international.org/xml_transform.asp?xml=certxml%5C080259_0_000-4828-82.xml&xsl=xsl/certrec.xsl*

- GasAlert Micro 5 Portable Gas Detector, Model M5-xwt1t2-r-p-d-a-b-cc & M5PID-xwt1t2-r-p-d-a-b-cc; utilizing electrochemical, catalytic bead and photo-ionization sensors; Intrinsically Safe when powered by one of the following AA Size Batteries / Battery Pack
  - Duracell MN1500; T-Code T4; Ambient -20 to +40°C; T-Code 139.8°C (T3C); Ambient -20 to +50°C
  - Energizer E91; T-Code 153°C(T3C); Ambient -20 to +40°C; T-Code 163°C (T3B); Ambient -20 to +50°C
  - NiMH Rechargeable Battery Pack "M5-BAT01"; T-code T4; Ambient -20 to +50°C
  - Lithium Polymer Rechargeable Battery pack "M5-BAT07B"; T-Code T4; Ambient -20 to +50°C

2.5 Nitric Acid 40%

Note: when it comes to corrosives such as Nitric Acid, the solution to pollution is NOT dilution. For a spill of 1 45 gal drum, it would take over 450,000 gal of pure water to make the solution habitable for fish. It would take over 45,000,000 gal of pure water to neutralize it.

Site management and control

- Set up perimeter with at least 50m radius.
- Command, staging, & decon shall be positioned uphill.
- Unify command with Safety Superintendent, Mine Manager, Environmental Dept., product Carrier (if spill occurs during delivery to mine).

Identification

- UN# 2031
- Liquid state
- Colourless to yellow
- Transported in 45 gallon drums
- # of 45 gal drums possibly damaged will help estimate size of spill.
- What is downhill from spill? Could acid reach a stream?

Hazard & risk evaluation

- Strong acid, very corrosive.
- Severely hazardous to eyes and skin
- Ingestion could cause death
- Inhalation hazard, although low vapour pressure 1.3kPa (wants to be a liquid).
- Could be devastating to stream life.
- Strong oxidizer, could have explosive reaction with organic or combustible materials

PPE

- If there is a fire situation, PPE will consist of full turn-out gear and SCBA.
  Otherwise
- Know and heed permeability rate and breakthrough times of all PPE.
- Acid resistant, class B suit with hood.
- Full-face respirator with appropriate chemical cartridges.
- Chemical resistant gloves & boots
- Chemical resistant tape used to seal between boots/suit, gloves/suit, and mask/hood.

Information management and resource coordination

- See MSDS for product information.
- Know the product's route of travel.
- Was anyone exposed?
- Will non-human life be exposed?
- Standard decon set-up will be constructed.
- Have tools cribbed for entry teams.
- Ensure there is enough PPE at the site to complete the task.
- Ensure there is enough neutralizing agent at the site to complete the task. ***See below for chart***
- Ensure there is drinking water for responders.
- Have hazmat trailer, ambulance & fire truck in staging area, as req'd
- Have Site Services staged for digging, damming, product extraction, as req'd.

Implementing Response Objectives

- Rescue injured/exposed personnel.
- Prevent from entering streams
- Prevent from contacting combustibles and organics.
- If possible, stop the leak.
- If possible, contain by covering drains/culverts, damming, diverting to a berm, etc.
- Use over-pack to contain leaking drums that still contain product.
- Neutralize spilled product with weak caustic – primary neutralizing agent is Ansul Spill X-A, alternatively hydrated lime or baking soda (if available). Be cautious of chemical reaction.
- Use Litmus paper to test for pH when neutralizing with lime or baking soda.
- Site Services Vac-truck is an option for cleaning up product before or after neutralized, as necessary.

Decontamination

Standard decon set-up will be utilized in warm zone:

- Large berm fashioned out of large chemical resistant tarp, wrapped over charged 2 ½" hose-line, 2 small berms, will be in series, within the large berm.
- Decon personnel shall don class C suits without need for respiratory or splash protection, other than safety glasses.
- Ensure all personnel that entered hot zone are properly decontaminated.
- Ensure that all tools that entered the hot zone are properly decontaminated.

Termination

- Once operation complete, vac-truck can be utilized to clean up solution contained with the decon berms.
- Safe and proper disposal of all spent PPE.
- Transition of command.
- Debrief

2.5.1 Chart for Estimating Caustic Req'd to Neutralize 40% Nitric Acid

For **Spill X-A**, use 1:1 ratio by volume, or 10lbs Spill X-A per 1 gal Nitric Acid.

Amount of Nitric Acid Spilled (in Gal.)	Amount of Baking Soda Req'd (in Lbs.)
1	5.6
2	11
5	28
10	56
20	110
45	252
90	504
135	756
180	1,008

Amount of Nitric Acid Spilled (in Gal.)	Amount of Lime Req'd (in Lbs.)
1	2.4
2	4.8
5	12
10	24
20	48
45	108
90	216
135	324
180	432

Charts derived from formulas below

Specific Gravity Nitric Acid: 1.2455

Concentration: 40%

1 gal HNO_3 x 1.24 x 8.34 lbs/gal x 0.40 = 4.14 lbs HNO_3

$HNO_3 + NaHCO_3 \rightarrow NaNO_3 + H_2O + CO_2$ Therefore 1 mol Nitric Acid per 1 mol Sodium Bicarb (Baking Soda)

$2HNO_3 + Ca(OH)_2 \rightarrow Ca(NO_3)_2 + 2H_2O$ Therefore 2 mol Nitric Acid per 1 mol Calcium Hydroxide (Lime)

HNO_3 = 63 amu

$NaHCO_3$ = 85 amu

$Ca(NO_3)_2$ = 74 amu

(4.14 lbs HNO_3/63 amu-HNO_3) x 85 amu-$NaHCO_3$ = 5.6 lbs $NaHCO_3$

Therefore 1 gallon of Nitric Acid req's 5.6 lbs of baking soda

(4.14 lbs HNO_3/2(63) amu-HNO_3) x 74 amu-$Ca(OH)_2$ = 2.4lbs $Ca(NO_3)_2$

Neutralization Formulas and Quick Access Charts Formulas

The key to effective and efficient neutralization, is knowing how to use the following formulas.

1. The first formula indicates how much acid is spilled in weight.

Step #1- Determine the quantity of acid spilled, usually in gallons.
Step #2- Determine the specific gravity of the acid usually provided in MSDS.
Step #3- Determine the concentration of the acid spilled usually in %.
Step #4- The weight of water is 8.34 pounds per gallon.

After the above figures are known plug them into the following formula:

Quantity of spill X specific gravity X weight of water X concentration
= weight of the spill

Example:
One gallon of sulfuric X 1.84 X 8.34 X 98% = 15.04 pounds of sulfuric

2. The second formula will determine the quantity of the neutralizer needed. The type of neutralizer needs to be selected based on costs and availability. Plug numbers into the following formula:

Weight of the acid spilled X number in the chart for the selected neutralizer.

Example :

15.04 pounds of sulfuric X 1.06 for Soda Ash = 15.94 pounds of Soda Ash

Determination through Chemistry

To calculate the amount of neutralization agent needed the balanced chemical reaction must be written and the equivalent weights of acid and base determined.

Example: 1,000 gallons of 38% hydrochloric acid will be neutralized with lime.

Step #1 – Write the complete balanced neutralization reaction:
$2HCl + CaO \rightarrow CaCl_2 + H_2O$
This equation shows that 2 moles of HCl are required in the reaction with one mole of calcium oxide (lime).

Step #2 – Calculate the molecular weight of each compound:
HCl – H = 1, Cl = 35.5, Total = 36.5 amu
CaO – Ca = 40, O = 16, Total = 56

Step #3 – Calculate the weight of the HCl spill:
1,000 gallons X 1.20 X 8.34 X 0.38 = 3,803.04 pounds of HCl
Step #4 – Calculate the amount of neutralizer needed:
From Step #1 it was found that 2 moles of HCl are needed to react with 1 mole of CaO. From Step #2 it was found that 1 mole of HCl weighs 36.5 amu's so 2 moles weigh 73.0 amu's. The formula is**; weight of acid/formula weight of acid X formula weight of base = pounds of the neutralizer needed.**
3,803.04/73 X 56 = 2,917.4 pounds of lime

Finer Points
The final amount is an approximation and in actual practice more neutralizing agent should be obtained. The neutralization process needs to be checked at several spots to assure pH levels are acceptable and uniform.

Neutralization Precautions
Remember, the neutralization process is exothermic and it may involve splashing of product. Safety is paramount and proper protective equipment is very important. Also, the neutralizer is hazardous in its own right and needs to be handled with care. Consider expense and availability in selecting neutralizer. Other weak bases that may be used and their molecular weights are; sodium bicarbonate ($NaHCO_3$)- 85, and magnesium hydroxide ($Mg(OH)_2$)-58.

Neutralization Chart Information
Acids

Hydrochloric Acid, HCl, MW = 36.5, density/specific gravity is 1.19, weight of a gallon is 3.77 pounds at 38% concentration. Synonyms are chlorohydric acid and muriatic acid.

Nitric Acid, HNO_3, MW = 63, density/specific gravity is 1.41, weight of a gallon is 8.23 pounds at 70% concentration. Synonyms are Aqua Fortis and Azotic Acid. (Aqua Regia is a mixture of nitric and hydrochloric acids).

Phosphoric Acid, H_3PO_4, MW = 98, density/specific gravity is 1.69, weight of a gallon is 11.98 pounds at 85% concentration. Synonyms are orthophosphoric acid.

Sulfuric Acid, H_2SO_4, MW = 98, density/specific gravity is 1.84, weight of a gallon is 15.04 pounds at 98% concentration. Synonyms are Oil of vitriol and "oleum" is fuming sulfuric acid.

Bases

Ammonium hydroxide, NH_4OH, MW = 35, clear solution, synonyms are ammonia solution and aqua ammonia. Strong ammonia odor evolves from liquid. High vapor pressure.
Calcium carbonate, $CaCO_3$, MW = 100, white powder, synonyms are crushed limestone and dolomite. Low heat of reaction that gives off carbon dioxide gas.
Calcium hydroxide, $Ca(OH)_2$, MW = 74, white powder, synonyms are slaked lime, hydrated lime, and calcium hydrate.
Calcium oxide, CaO, MW = 56, white powder, synonyms are quicklime, lime, and unslaked lime. Most economical, lowest cost, neutralizer. **Best choice!** Maximum pH is 12.45 at 25C.
Magnesium carbonate, $MgCO_3$, MW = 84, synonyms are magnesia alba and carbonate magnesium.
Magnesium hydroxide, $Mg(OH)_2$, MW = 58, white powder, synonyms are milk of magnesia and magnesia hydrate. Good neutralization agent. Maximum pH is 10.6 at 25C.
Potassium hydroxide, KOH, MW = 56, white flakes, synonyms are caustic potash. High heat of reaction with toxic fumes. Maximum pH is 14 at 25C.
Sodium bicarbonate, $NaHCO_3$, MW = 85, white powder, synonyms are baking soda and sodium acid carbonate. Low heat of reaction with carbon dioxide gas evolution.
Sodium Carbonate, Na_2CO_3, MW = 106, white powder, synonyms are soda ash. **Second most economical neutralization agent next to lime.** Maximum pH is approximately 11 at 25C.
Sodium hydroxide, NaOH, MW = 40, white powder, synonyms are caustic soda, soda lye, caustic, and lye. High heat of reaction with toxic fumes. Maximum pH is 14 at 25C.

2.5.2 Quick Access Charts for Neutralizing Various Acids with Baking Soda

2.5.2.1 Sulfuric Acid neutralization using Baking Soda (Sodium Bicarbonate)

Amount of Sulfuric Acid spilled	Amount of Baking Soda needed in pounds
1 gallon	25.6
2 gallons	51.2
3 gallons	76.8
4 gallons	102.4
5 gallons	128.0
10 gallons	256.0
50 gallons	1280.0
55 gallons	1408.0
100 gallons	2560.0

2.5.2.2 Hydrochloric Acid neutralization using Baking Soda

Amount of Hydrochloric Acid spilled	Amount of Baking Soda needed in pounds
1 gallon	5.5
2 gallons	11.0
3 gallons	16.5
4 gallons	22.0
5 gallons	27.5
10 gallons	55.0
50 gallons	275.0
55 gallons	302.5
100 gallons	550.0

2.5.2.3 Nitric Acid neutralization using Baking Soda

Amount of Nitric Acid spilled	Amount of Baking Soda needed in pounds
1 gallon	7.4
2 gallons	14.8
3 gallons	22.2
4 gallons	29.6
5 gallons	37.0
10 gallons	74.0
50 gallons	370.0
55 gallons	407.0
100 gallons	740.0

2.6 Sodium Sulphide

Site management and control

- Set up perimeter with at least 50m radius if water introduced, or 25m if solid.
- Command, staging, & decon shall be position upwind and uphill.
- Unify command with Safety Superintendent, Mine Manager, Environmental Dept., product carrier (if spill occurs during delivery to mine).

Identification

- UN# 1849
- Solid state
- Yellow
- Smell sulfurous or like rotten eggs with introduction of moisture.
- Transported in 1000 Kg 'Super-Sacks'.
- # of super-sacks possibly damaged, will help estimate size of spill.
- Is water being introduced to the spill? If so, what is downhill form the spill? Could run-off reach a stream?
- Are corrosives being introduced to spill? If so, what is downwind?

Hazard & risk evaluation

- Strong caustic.
- Severely corrosive to digestive tract, respiratory system, eyes, and skin.
- Dust is powerful systemic poison. Inhalation could cause headache, dizziness, unconsciousness, pulmonary edema, asphyxiation, death.
- Contact with acid releases toxic and flammable Hydrogen Sulfide.
- Routes of entry include absorption, inhalation, and ingestion.
- Keep spilled product dry
- If water introduced, avoid run-off, contact with soil, waterways.

PPE

- If there is a fire situation, PPE will consist of full turn-out gear and SCBA.
  Otherwise
- Know and heed permeability rate and breakthrough times of all PPE.
- SCBA if significant H2S release, otherwise, full-face respirator & OV cartridges with pre-filter.
- Corrosive resistant, class B suit with hood.
- Chemical resistant gloves & boots
- Chemical resistant tape used to seal between boots/suit, gloves/suit, and mask/suit.

Information management and resource coordination

- See MSDS for product information.
- Was anyone exposed?
- Will non-human life be exposed?
- Standard decon set-up will be constructed.
- Have tools cribbed for entry team.
- Ensure there is enough PPE at the site to complete the task.
- Ensure there is drinking water for responders.
- Have hazmat trailer, ambulance & fire truck in staging area, as req'd
- Have Site Services staged for digging, damming, product extraction, as req'd.

Implementing Response Objectives

- Rescue injured/exposed personnel.
- Keep product dry.
- Monitor atmosphere for H2S and SO2.
- If water introduced, contain run-off by covering drains/culverts, damming, diverting to a berm, etc. Solution collected can be mixed with oxidizing agent, such as hydrogen peroxide or sodium hypochlorite to prevent evolution of H2S.
- If product has entered a stream, consider using over-flow dams to contain product, for extraction.
- Vacuum or sweep up dry product
- Disposal as per Environmental Dept. recommendations

Decontamination

Standard decon set-up will be utilized in warm zone:

- Large berm fashioned out of large chemical resistant tarp, wrapped over charged 2 ½" hose-line, 2 small berms, will be in series, within the large berm.
- Decon personnel shall don class C suits without need for respiratory or splash protection, other than safety glasses.
- Ensure all personnel that entered hot zone are properly decontaminated.
- Ensure that all tools that entered the hot zone are properly decontaminated.

Termination

- Once operation complete, solution in decon berms to be disposed of, as per Environmental recommendations.
- Safe and proper disposal of all spent PPE.
- Transition of command.
- Debrief

Appendix D: Tug and Barge Emergency Contingency Plan

Minto Mine

Tug and Barge Emergency Contingency Plan

2022-01

List of Appendices

Appendix A: Man Boat Specifications

Appendix B: Safe Job Procedure for Loading and Unloading the Barge.

1 Introduction

Minto Mine (Minto), is pleased to submit the following contingency plan (plan) as per requirements of the Selkirk First Nation Access and Land Use Permit "Minto Landing Ice Bridge and Marshalling Area and West Side Barge Landing and Marshalling Area" (the permit). It is Minto's intention that this plan will fulfill the requirement as stated in Schedule 2, Section 9.0 Contingency Plan of the permit. It is not Minto's objective for this plan to mitigate all possible accidents or malfunction in regards to the in-stream operation of the Copper Queen tug and barge.

The plan, as prepared, is adaptive and will be amended as is practicable. This plan is intended to deliver the best possible means of mitigating an accident or malfunction of the loading/unloading or in-stream operation of the tug and barge with the resources available at Minto. Preventing such an occurrence requires a combination of procedural and engineering controls, based on an awareness of at risk conditions. These documents exist in the form of the Spill Contingency Plan, Emergency Response Plan, and any procedures or plans on the tug or barge from Site Services. This document serves as a contingency plan in the event that an accident or malfunction occurs when loading, unloading, and during in-stream operations of the Copper Queen tug and barge (CQTB).

2 General Procedures

Any response to an emergency condition will be based on a priority sequence of Life, Environment, and Property. Every event will be regarded with these priorities in mind. Initial on scene assessment of the accident or malfunction will be called out on channel one as a "Code 1". The Emergency Response Team (ERT) will be dispatched, communication established, and the barge operator and deckhand will respond to control the scene.

Deckhands will mitigate all emergencies on the barge to the best of their ability given the resources available. The general procedure in the event of an emergency would have the barge move to the west landing if possible or practical, unless otherwise communicated to the barge captain. To mitigate an emergency in offloading or loading vehicles onto the barge the deckhand will utilize the anchor points on both landings. Slack will be left in the rope to ensure the barge captain can maneuver when docked at the

landing. Tying off to the anchor points will mitigate complete catastrophe if the barge loses power during loading and offloading and will be discussed further under the specific procedures section of this plan.

3 Specific Procedures

Below is a list of the current on-site procedures for dealing with various emergencies in regards to the CQTB at Minto Mine.

- Emergency Response to Sinking
- Emergency Response to Loss of Power or Control
- Emergency Response to Fire Onboard
- Emergency Response to Man Overboard
- Emergency Response to Freight or Vehicle Overboard
- Emergency Response to Medical Emergency on Board of the Barge
- Emergency Response to Spill Response

3.1 Emergency Response to Sinking of CQTB

1. The activation of Emergency Protocols onboard the CQTB, starting with calling “Code 1” to initiate an ERT response.
2. The Captain and deckhand will deploy Canadian Coast Guard approved life rafts.
3. As per the Emergency Response Plan, Incident Command (IC) will communicate with the deckhand by radio to determine any further details of events, number of injured or trapped people, and any risks to property and environment.
4. IC will respond to the scene in an emergency vehicle ahead of remaining ERT members. IC will, upon arrival, provide initial scene assessment and gather any additional information available. A minimum ERT response will include; a full ERT member compliment, an environmental lead, the hazardous materials response trailer, the fire truck, the ambulance, and all associated equipment. All ERT operations will be under the control of the ERT Captain. Additional response needs based on initial assessment and evaluation by IC will be communicated to the Emergency Communications Center (ECC), as per the Emergency Response Plan.

5. Incident Accountability will be established and adhered to throughout the operation.
6. IC will determine the need for necessary rescue of people downstream. The option to deploy rescue ropes via launcher will be considered for KM 12.
7. Alternate access to river will be determined by the nature of the incident (KM 20 provides a second potential access point). All other access would require trail cutting, which is possible, but would take more time.
8. The IC, ERT Captain, and Environmental Lead (Unified Incident Command Support) will assess the ongoing situation and potential need for additional resources.
9. The alternate Man-boat (see Appendix A for details on Man-boat) will be deployed from the landing as needed to support rescue and/or to gain more information regarding the location of the sunken vessel and determine a possible plan for retrieval/securing of the vessel. The Man-boat operator will work under the direction of IC.
10. Once rescued, all patients will be treated as per OFA3/EMR protocols, transported as per Yukon EMS dispatch, and confirmation will be aligned with the Minto Emergency Response Plan.

3.2 Emergency Response to Loss of Power or Control of CQTB

The tug operates on two engines so a total loss of power is unlikely; however, it is still possible and below is the emergency procedure that would be activated in the event that the total loss of control of the CQTB was to occur.

1. The activation of Emergency Protocols on board the CQTB, starting with calling a “Code 1” to initiate an ERT response. The Captain will also communicate freight details and passenger numbers on board.
2. Passengers and crew will follow instructions from the Captain and will remain on board if deemed safe to do so. The Captain and deckhand will follow MED protocol in decision making, in regards to passenger safety.
3. The Captain and deckhand will deploy Canadian Coast Guard approved life rafts if the Captain deems it unsafe to stay on board.

4. IC will respond to the scene (or as close to it as possible) in an emergency vehicle ahead of the remaining ERT members. IC will, upon arrival to scene, provide initial scene assessment and gather any additional information available. A minimum ERT response will include a full ERT member compliment, an Environmental Lead, the Hazardous materials response trailer, the fire truck, the ambulance, and all associated equipment. The ERT operations will be under the control of the ERT Captain. Any additional response needs, necessary downstream communications, and reporting requirements will be based on the initial assessment and evaluation by the IC and will be communicated to the Emergency Communications Center (ECC), as per the Emergency Response Plan.
5. Incident Accountability will be established and adhered to throughout the operation.
6. The Captain will navigate, to the best of their ability, to the safest downstream location possible.
7. The Captain will communicate the location and condition of the vessel and people, and will assist in determining plans for further action.
8. Once the vessel is secured to shore (or where landed in river), the Man boat will be deployed to assist with additional securing and the removal of non-essential people to a location where they can be transferred back to site or to an alternate safe location.
9. A plan for retrieval will be based on the conditions and location of the vessel. The plan will be developed cooperatively between the Barge Captain, Minto ECC, and Mutual Aid resources. Equipment and additional resources will be sourced through the ECC, as per the Minto Emergency Response Plan.

3.3 Emergency Response to Fire on the CQTB

1. The activation of Emergency Protocols onboard CQTB, starting with calling a “Code 1” to initiate an ERT response.
2. If safe to do so, the deckhand will attempt to supress the fire using equipment on board following the Marine Emergency Duty (MED) protocol.

3. The Captain and deckhand will deploy Canadian Coast Guard approved life rafts if vessel in immediate danger. If possible and practical, the Captain will position barge so that the wind is blowing port to starboard, attempting to keep smoke/flames away from the life raft.
4. If possible, the Barge will cross to the West Bank of crossing and continue to use barge supplied fire suppression equipment. All passengers will disembark under direction of the deckhand.
5. The IC will respond to the scene in an emergency vehicle ahead of the remaining ERT members. IC will, upon arrival to scene, provide initial scene assessment and gather any additional information available. A minimum ERT response will include a full ERT member compliment, an Environmental Lead, the Hazardous materials response trailer, the fire truck, the ambulance, and all associated equipment. ERT operations are to be under the control of the ERT Captain. Additional response needs based on the initial assessment and evaluation by the IC will be communicated to the Emergency Communications Center (ECC), as per the Emergency Response Plan.
6. Incident Accountability will be established and adhered to throughout the operation.
7. Once IC is on scene and the vessel is safely secured, fire suppression will be conducted under the direction of the IC, following NFPA 1081 standards (Industrial Fire Brigade).
8. The consideration of environmental sensitivity will be considered by IC in cooperation with the Environmental Lead (unified incident command support).
9. Defensive spill containment methods will be utilized to control run off and any releases from firefighting operations. This may include (but are not limited to) tactics such as extinguishing agent selection, damming and/or berming on the barge, the placement of a boom around the vessel, and the removal of burning equipment once the fire is controlled, etc.

3.4 Emergency Response to Man Overboard

1. The activation of the Emergency Protocol onboard CQTB, beginning with calling “Code 1” to initiate an ERT response.

2. The Captain and deckhand will throw out provided Canadian Coast Guard approved life-rings to all personnel overboard. The response from the barge crew will conducted as per their MED training.
3. If able to successfully rescue person overboard, the deckhand will treat person(s) based on marine first aid protocols, awaiting response by the ERT and site Medic.
4. If unable to successfully achieve a rescue, the vessel will continue to the West landing and the Man boat will be deployed for a downstream rescue (Communication to IC on Radio Channel 1 must be available at all times). The Man boat operation will be conducted under the direction of the IC, once in place.
5. The Captain will communicate to IC of any possible downstream rescue requirement.
6. IC will instruct the ERT to stage at KM 12, with the option to deploy rescue ropes via launcher considered.
7. Incident Accountability will be established and adhered to throughout the operation.
8. IC will stage the ambulance for patient pick up.
9. IC will communicate the need for mutual aid to ECC, who will follow the Minto ERP by contacting local agencies for assistance on the East side of the river.
10. Once rescued, all patients will be treated as per OFA3/EMR protocols and transported, as per Yukon EMS dispatch confirmation, aligning with the Minto Emergency Response Plan.

3.5 Emergency Response to Freight or Vehicle Overboard of the CQTB

1. The activation of Emergency Protocols onboard CQTB, starting with calling a “Code 1” to initiate an ERT response. The Captain will also communicate freight details and passenger numbers on board.
2. Passengers and crew will follow instructions from the Captain (the Captain will respond as per MED training) and will remain on board, if deemed safe to do so.
3. The Captain and deckhand will deploy Canadian Coast Guard approved life rafts if it is deemed unsafe to stay on board, and passengers will be offloaded to a safe location on shore.

4. IC will respond to the scene (or as close to it as possible) in an emergency vehicle, ahead of the remaining ERT members. IC will, upon arrival, provide initial scene assessment and gather any additional information available. A minimum ERT response will include a full ERT member compliment, an environmental lead, the hazardous materials response trailer, the fire truck, the ambulance, and all associated equipment. Any ERT operations will be under the control of the ERT Captain. Additional response needs, downstream communications, and reporting requirements based on the initial assessment and evaluation by the IC will be communicated to the Emergency Communications Center (ECC), as per the Emergency Response Plan.
5. Incident Accountability will be established and adhered to throughout the operation.
6. The captain will navigate, to the best of their ability, to the landing (preferably the west landing).
7. Once the vessel is secured to shore, the man boat will be deployed by the deckhand or ERT members to assist with any additional securing of the vessel/freight and for the deployment of containment booms, which are located at the landing and on the vessel itself. All Man boat operation will be under the direction of the IC, once in place.
8. A plan for retrieval of freight will be determined appropriate to the condition and location of freight. The plan will be developed cooperatively by the Barge Captain, Minto ECC, and Mutual Aid resources.
9. Equipment and additional resources will be sourced through the ECC, as per the Minto Emergency Response Plan, including (but not limited to) manpower, expertise, and heavy equipment.
10. Additional external support in the event of an incident occurring on the East side of the river will include (but is not limited to) Yukon Emergency Measures Organization, local first responders, and alternate equipment operation contractors.

3.6 Emergency Response to Medical Emergency on board CQTB

1. The activation of the Emergency Protocols onboard the CQTB, starting with calling a “Code 1” to initiate an ERT response.
2. For a serious injury, as defined in the ERP, Yukon EMS will be notified immediately.
3. The deckhand will treat the patient per Marine Emergency First Aid protocols.

4. The Captain will navigate the barge to the west bank of the Yukon River (if possible) and all vehicles will offload on west bank, giving clear passage for Ambulance.
5. An ERT response will include the medic, ambulance, fire truck and a full compliment of team members to assist with any necessary patient transfer and packaging.
6. Incident Accountability will be established and adhered to throughout the operation.
7. Yukon EMS dispatch will be updated of situation once history and assessment is confirmed.
8. Upon arrival, the Minto Medic will take control of the scene and advise the ERT Captain of resources needed on scene.
9. Upon assessment, the patient will be treated, packaged, and transported, as per Yukon EMS dispatch confirmation, aligned with the Minto Emergency Response Plan.

3.7 Emergency Response to a Spill

1. The activation of the Emergency Protocol onboard the CQTB, starting with calling a “Code 1” to initiate an ERT response.
2. The deckhand will attempt to contain the spill using the onboard spill kit to prevent the spill from entering the Yukon River.
3. IC will respond to the scene in an emergency vehicle, ahead of the remaining ERT members. IC will, upon arrival, provide initial scene assessment and gather any additional information available. A minimum ERT response will include a full ERT member compliment, an Environmental Lead, the Hazardous materials response trailer, the fire truck, the ambulance, and all associated equipment. All ERT operations will be under the control of the ERT Captain. Additional response needs, downstream communication, communication with CANUTEC, and reporting requirements based on initial assessment and evaluation by IC will be communicated to the ECC, as per the Emergency Response Plan and Spill Contingency Plan.
4. Incident Accountability will be established and adhered to throughout the operation.
5. If practical, the barge captain will navigate the barge to the west landing.
6. All passengers will disembark vessel.

7. All vehicles and machinery that are not in the spill zone will also disembark.
8. The deckhand and ERT members, under the direction of IC, will use the Man boat to deploy the containment booms around the barge.
9. IC, with advice from the Environment Lead, will develop and implement the SCP for stopping the spill if possible.
10. If the spill cannot be stopped, a plan to mitigate the quantity of contaminant that reaches the environment will be developed and implemented.
11. If safe and practical to do so, the Environment Lead will deploy environment staff to sample downstream of spill to measure the contamination.
12. IC, with advice from the Environment Lead, will oversee cleanup of the spill.

Appendix A: Man Boat Specifications

Brand/Model: Munson Packman Landing Craft

- **Hull Length:** 24 feet (7.3 meters)
- **Beam:** 8 feet 6 inches (2.6 meters)
- **Hull Type:** Packman mono hull
- **Power:** Twin Yamaha 150hp
- **Propulsion:** Outboard (25” shaft)
- **Outfitting:** 52” bow door

Appendix B: Safe Work Procedure for Loading and Unloading the Barge.

REVISION LOG

VER #	DATE	DESCRIPTION OF CHANGE

GENERAL INFORMATION	
Purpose:	Provide a safe procedure for move the Copper Transporter (Barge) in and out of the water.
Scope:	Pertains to all Minto employees and Contractors that are involved with putting the tug in or taking it out of the water.
Responsibilities:	**Senior Director of Operations:** • Ensures that all operational areas of the Mine site have assigned managers who are responsible, competent and capable of overseeing the work scope and activities within their area. • Provide adequate resources for the effective operation and management of each area of the mine. **Director HST:** • Monitor conformance with all company procedures. • Monitor and report all conformance, compliance and performance regulations in relation to the scope of activities taking place at the Mine site to the Senior Director of Operations and various Department Directors. **Department Directors & Superintendents:** • Ensure operational areas and activities are managed in conformance to all company procedures. • Manage their areas of responsibility to ensure compliance with all regulatory and other requirements as defined by Federal, Territorial, and Regional regulations. • Appoint competent, skilled, and qualified Supervisors and/or Leads to provide direction and guidance to employees in their tasks and scope of work. • Ensure this SOP is in alignment with Yukon Occupational Health and Safety regulations as well as all site policies and procedures. **Supervisors:** • Plan and assign day to day operational tasks to subordinates. • Ensure workers who have been assigned tasks are adequately trained and competent.

Responsibilities:	• Evaluate the performance of team members and determine training needs. • Provide additional equipment such as slings, rigging and Personal Flotation Devices (PFDs) required to perform this task safely.
Responsibilities:	**Workers:** • Understand and follow all procedures and policies. • Perform field level risk assessments using the 5-Point Safety Card and address hazards that pose a risk to themselves and/or their fellow workers. • Communicate to Safety and Supervision when a hazard cannot be immediately addressed and mitigated in a safe manner.

PERSONAL PROTECTIVE EQUIPMENT – REQUIREMENTS FOR THIS PROCEDURE

Review the Personal Protection Equipment Procedure. Ensure you have the following:

☒ Hard Hat ☒ Safety Glasses ☒ High Visibility clothing ☒ Hearing Protection ☒ Safety Footwear ☒ Work Gloves ☐ Self-rescuer

Additional task-specific PPE requirements:

Respirator Type:	☐ ½ Face Respirator ☐ Full Face Respirator ☐ Powered Air Purifying Respirator ☐ Other:
	Cartridge Type:
Fall Protection:	☐ Fall Arrest ☐ Fall Restraint
Dermal Protection:	☐ Chemical Resistant Gloves Type: _____ ☐ Chemical Suit Type: _____
Eye and Face:	☐ Face Shield ☐ Googles ☐ Welding Helmet ☐ Other
Notes or Additional:	Personal Flotation Devices (PDFs) for workers.

- 5 Point Card

EQUIPMENT AND MATERIALS

- 330 excavator
- 990 loader
- D-9 dozer
- Slings and rigging equipment
- Man Boat or Life Boat
- Life Ring

DEFINITION

PDF: Personal Flotation Device

SFN: Selkirk First Nations

PROCEDURE

1. Permitting and Authorization

1.1 Supervisors, contractors and the Environment Team and Healthy and Safety will arrange for a planning meeting a couple of days prior to either the removal or entry of the Barge into the river.

1.2 Once the date is agreed upon, the Environment team will notify SFN.

2. Mobilize equipment to the River

2.1 Be sure all equipment has been cleaned and is free of grease, oils, etc. as well as verifying all machinery are free of leaks (hoses, fittings, etc.).

2.2 Follow all road protocols when moving equipment to the river.

3. 5 Point Card Completed before starting task of both pulling the Barge in and out of water when reviewing this SOP with workers.

3.1 Cobalt and Site Services Supervisor to review the SOP with all workers associated with the task before starting.

4. Move Barge into Water

4.1 Cobalt supervisor will direct this operation.

4.2 Both Cobalt and Site Service supervisors or designate will remain present for the entire operation.

4.3 PFDs will be worn by workers and operators when working near or over the water. Refer to MNTO-SOP-02-016 Working Near or Over Open Water.

4.4 Use the 330 excavator to adjust the shoreline to the appropriate angle for pushing the barge in the water.

4.5 All steel slings and rigging must have appropriate rating for pulling the barge. Attach steel slings to the pulling points on the front corners of the barge.

4.6 Pull the stern of the barge using the 330 excavator and 990 loader (one on each corner lifting together and walking the bow towards the water). This may require more than one setup. Connect equipment to appropriate pulling points on Barge.

4.7 Once the barge is lined up and headed for the river, attach slings to the lifting points located on both sides at the bow of the barge.

4.8 Connect the sling on one side to the D-9 dozer and either the 990 loader or 330 excavator to the sling on the other side. They will then pull simultaneously towards the water until the machines reach the water's edge.

4.9 Disconnect from the barge and attach a rope or sling from the front of the barge to the bucket of the 330 excavator.

4.10 Position the D-9 and the 330 excavator (one on each corner) at the bow of the barge and push it in the water, should it be required.

4.11 Use the 330-excavator attached to the barge to guide the barge out past the landing and tie it off along the rip-rap in the main stream. This will leave room at the landing for launching the tug. Be sure to use the permanent tie off cable at the landing.

5. Moving the Barge out of the Water

5.1 Cobalt supervisor will direct this operation.

5.2 Both Cobalt and Site Services supervisors or designate will remain present for the entire operation.

5.3 PFDs must be worn by workers and operators when working near or over the water. Refer to MNTO-SOP-02-016 **Working Near or Over Open Water**.

5.4 Use the 330 excavator to adjust the shoreline to the appropriate angle for pulling the barge out of the water.

5.5 The tracks of heavy equipment are prohibited from entering the "Wetted Perimeter" or water level present while the work is taking place.

5.5.1 Environment Team will monitor silt levels in the water when adjusting the shoreline as per the WUL Permit.

5.6 Attach a rope to the bucket of the 330 excavator and the bow of the barge.

5.7 Use the 330 excavator to push the barge off from the landing and guide the barge to the shore with the rope, where it will be pulled out. If the tug is still in the water, the tug will be used to direct the barge to where it will be pulled out.

5.8 Attach slings to the two lifting points on the bow of the barge (one on each side).

5.9 Attach the D-9 Dozer to one sling and either the 990 loader or 330 excavator to the other sling and simultaneously pull the barge from the water, up the landing to the tree line where it will be stored.

5.10 All slings and rigging must have appropriate rating for the lifting and pulling. Attach steel slings to the corners of the barge.

5.11 Lift the stern of the barge using both the 330 excavator and 990 dozer (one on each corner lifting together and walking the stern towards the tree line). This may require more than one setup.

5.12 Once positioned where it will be stored for the season, Cobalt supervisor will direct the appropriate piece(s) of equipment to required locations to lift the barge and install blocking for leveling and ensuring the barge is not on the ground.

5.13 Under the direction of Cobalt and Site Services supervisors, blocking will be placed under the barge. Use extreme caution when placing blocking and at no time place your hand(s) between the barge and the blocking or the blocking and the ground.

Keep hands on the sides of the blocking and use a bar or piece of 2X4 wood to slide blocking in when possible.

5.13 Clean up site and reshape the shoreline.

Appendix A

- Yukon Occupational Health and Safety Regulations – Part 1 – Section 1.34:

  Each worker shall be provided with and be required to use an appropriate personal flotation device with the required buoyancy where a worker is employed in a situation where there is a risk of drowning.

Lindsay Gung	Supervisor - Water Chemistry	Inorganics, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
%	percent
µS/cm	Microsiemens per centimetre
meq/L	milliequivalents per litre
mg/L	milligrams per litre
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Qualifiers

Qualifier	*Description*
DLM	*Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).*

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 00:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 00:00 is used for calculation purposes.

Legend & Qualifier Definitions

EHTR-FM: Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended

EHTL: Exceeded ALS recommended hold time prior to analysis. Sample was received less than 24 hours prior to expiry.

EHT: Exceeded ALS recommended hold time prior to analysis.

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Water**

Evaluation: × = QC frequency outside specification; ✓ = QC frequency within specification.

Quality Control Sample Type			Count		Frequency (%)		
Analytical Methods	*Method*	*QC Lot #*	*QC*	*Regular*	*Actual*	*Expected*	*Evaluation*
Laboratory Duplicates (DUP)							
Alkalinity Species by Titration	E290	231350	1	20	5.0	5.0	✓
Ammonia by Fluorescence	E298	236578	1	20	5.0	5.0	✓
Chloride in Water by IC (Low Level)	E235.Cl-L	231358	1	9	11.1	5.0	✓
Conductivity in Water	E100	231349	1	17	5.8	5.0	✓
Dissolved Mercury in Water by CVAAS	E509	231998	1	20	5.0	5.0	✓

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Conductivity in Water	E100 Vancouver - Environmental	Water	APHA 2510 (mod)	Conductivity, also known as Electrical Conductivity (EC) or Specific Conductance, is measured by immersion of a conductivity cell with platinum electrodes into a water sample. Conductivity measurements are temperature-compensated to 25°C.
pH by Meter	E108 Vancouver - Environmental	Water	APHA 4500-H (mod)	pH is determined by potentiometric measurement with a pH electrode, and is conducted at ambient laboratory temperature (normally 20 ± 5°C). For high accuracy test results, pH should be measured in the field within the recommended 15 minute hold time.
TSS by Gravimetry (Low Level)	E160-L Vancouver - Environmental	Water	APHA 2540 D (mod)	Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, following by drying of the filter at 104 ± 1°C, with gravimetric measurement of the filtered solids. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.
Chloride in Water by IC (Low Level)	E235.Cl-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrite in Water by IC (Low Level)	E235.NO2-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrate in Water by IC (Low Level)	E235.NO3-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Sulfate in Water by IC	E235.SO4 Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Alkalinity Species by Titration	E290 Vancouver - Environmental	Water	APHA 2320 B (mod)	Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.
Ammonia by Fluorescence	E298 Vancouver - Environmental	Water	J. Environ. Monit., 2005, 7, 37-42 (mod)	Ammonia in water is analyzed by flow-injection analysis with fluorescence detection after reaction with orthophthaldialdehyde (OPA).

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Dissolved Metals in Water by CRC ICPMS	E421 Vancouver - Environmental	Water	APHA 3030B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.
Dissolved Mercury in Water by CVAAS	E509 Vancouver - Environmental	Water	APHA 3030B/EPA 1631E (mod)	Water samples are filtered (0.45 um), preserved with HCl, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS.
Dissolved Hardness (Calculated)	EC100 Vancouver - Environmental	Water	APHA 2340B	"Hardness (as CaCO3), dissolved" is calculated from the sum of dissolved Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. "Total Hardness" refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations.
Ion Balance using Dissolved Metals	EC101 Vancouver - Environmental	Water	APHA 1030E	Cation Sum, Anion Sum, and Ion Balance are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Dissolved species are used where available. Minor ions are included where data is present. Ion Balance cannot be calculated accurately for waters with very low electrical conductivity (EC).
TDS in Water (Calculation)	EC103 Vancouver - Environmental	Water	APHA 1030E (mod)	Total Dissolved Solids is calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Dissolved species are used where available. Minor ions are included where data is present.
Nitrate and Nitrite (as N) (Calculation)	EC235.N+N Vancouver - Environmental	Water	EPA 300.0	Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N).

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Preparation for Ammonia	EP298 Vancouver - Environmental	Water		Sample preparation for Preserved Nutrients Water Quality Analysis.
Dissolved Metals Water Filtration	EP421 Vancouver - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HNO3.
Dissolved Mercury Water Filtration	EP509 Vancouver - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HCl.

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percentage Difference
# = Indicates a QC result that did not meet the ALS DQO.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test specific).

Sub-Matrix: **Water**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Water**

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

CERTIFICATE OF ANALYSIS

Work Order	: **WR2100743**	Page	: 1 of 6
Client	: **Minto Explorations Ltd.**	Laboratory	: Whitehorse - Environmental
Contact	: Minto Environment - Coordinator	Account Manager	: Heather McKenzie
Address	: 4838 Richard Rd. SW, Suite 300 Calgary AB Canada T3E 6L1	Address	: #12 151 Industrial Road Whitehorse YT Canada Y1A 2V3
Telephone	: ----	Telephone	: +1 867 668 6689
Project	: Minto Mine Monitoring	Date Samples Received	: 02-Jul-2021 11:58
PO	: PO2857(Seepage)- 10-8103-07050	Date Analysis Commenced	: 05-Jul-2021
C-O-C number	: 2021-06-30 A	Issue Date	: 09-Jul-2021 16:38
Sampler	: ----		
Site	: ----		
Quote number	: Q54721-Standing Offer		
No. of samples received	: 7		
No. of samples analysed	: 7		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Annabelle Prasad	Analyst	Metals, Burnaby, British Columbia
Kevin Duarte	Supervisor - Metals ICP Instrumentation	Metals, Burnaby, British Columbia
Kim Jensen	Department Manager - Metals	Metals, Burnaby, British Columbia
Miles Gropen	Department Manager - Inorganics	Inorganics, Burnaby, British Columbia
Sristika Chand	Lab Analyst	Metals, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
µS/cm	Microsiemens per centimetre
mg/L	milligrams per litre
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Qualifiers

Qualifier	*Description*
DLDS	*Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity.*
DLM	*Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).*

QUALITY CONTROL INTERPRETIVE REPORT

Work Order	: **WR2100743**	Page	: 1 of 17
Client	: **Minto Explorations Ltd.**	Laboratory	: Whitehorse - Environmental
Contact	: Minto Environment - Coordinator	Account Manager	: Heather McKenzie
Address	: 4838 Richard Rd. SW, Suite 300 Calgary AB Canada T3E 6L1	Address	: #12 151 Industrial Road Whitehorse, Yukon Canada Y1A 2V3
Telephone	: ----	Telephone	: +1 867 668 6689
Project	: Minto Mine Monitoring	Date Samples Received	: 02-Jul-2021 11:58
PO	: PO2857(Seepage)- 10-8103-07050	Issue Date	: 09-Jul-2021 16:34
C-O-C number	: 2021-06-30 A		
Sampler	: ----		
Site	: ----		
Quote number	: Q54721-Standing Offer		
No. of samples received	: 7		
No. of samples analysed	: 7		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 00:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 00:00 is used for calculation purposes.

Legend & Qualifier Definitions

EHTR-FM: Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended

EHTR: Exceeded ALS recommended hold time prior to sample receipt.

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Water**

Evaluation: × = QC frequency outside specification; ✓ = QC frequency within specification.

Quality Control Sample Type			Count		Frequency (%)		
Analytical Methods	*Method*	*QC Lot #*	*QC*	*Regular*	*Actual*	*Expected*	*Evaluation*
Laboratory Duplicates (DUP)							
Alkalinity Species by Titration	E290	236603	1	20	5.0	5.0	✓
Ammonia by Fluorescence	E298	239197	1	18	5.5	5.0	✓

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Conductivity in Water	E100 Vancouver - Environmental	Water	APHA 2510 (mod)	Conductivity, also known as Electrical Conductivity (EC) or Specific Conductance, is measured by immersion of a conductivity cell with platinum electrodes into a water sample. Conductivity measurements are temperature-compensated to 25°C.
pH by Meter	E108 Vancouver - Environmental	Water	APHA 4500-H (mod)	pH is determined by potentiometric measurement with a pH electrode, and is conducted at ambient laboratory temperature (normally 20 ± 5°C). For high accuracy test results, pH should be measured in the field within the recommended 15 minute hold time.
TSS by Gravimetry	E160-H Vancouver - Environmental	Water	APHA 2540 D (mod)	Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, following by drying of the filter at 104 ± 1°C, with gravimetric measurement of the filtered solids. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.
TDS by Gravimetry	E162 Vancouver - Environmental	Water	APHA 2540 C (mod)	Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, with evaporation of the filtrate at 180 ± 2°C for 16 hours or to constant weight, with gravimetric measurement of the residue.
Bromide in Water by IC (Low Level)	E235.Br-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Chloride in Water by IC	E235.Cl Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Fluoride in Water by IC	E235.F Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrite in Water by IC (Low Level)	E235.NO2-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrate in Water by IC (Low Level)	E235.NO3-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Sulfate in Water by IC	E235.SO4 Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Alkalinity Species by Titration	E290 Vancouver - Environmental	Water	APHA 2320 B (mod)	Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.
Ammonia by Fluorescence	E298 Vancouver - Environmental	Water	J. Environ. Monit., 2005, 7, 37-42 (mod)	Ammonia in water is analyzed by flow-injection analysis with fluorescence detection after reaction with orthophthaldialdehyde (OPA).
Dissolved Metals in Water by CRC ICPMS	E421 Vancouver - Environmental	Water	APHA 3030B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.
Dissolved Mercury in Water by CVAAS	E509 Vancouver - Environmental	Water	APHA 3030B/EPA 1631E (mod)	Water samples are filtered (0.45 um), preserved with HCl, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS.
Dissolved Hardness (Calculated)	EC100 Vancouver - Environmental	Water	APHA 2340B	“Hardness (as CaCO3), dissolved” is calculated from the sum of dissolved Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. “Total Hardness” refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations.

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Preparation for Ammonia	EP298 Vancouver - Environmental	Water		Sample preparation for Preserved Nutrients Water Quality Analysis.
Dissolved Metals Water Filtration	EP421 Vancouver - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HNO3.
Dissolved Mercury Water Filtration	EP509 Vancouver - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HCl.

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percentage Difference
# = Indicates a QC result that did not meet the ALS DQO.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test specific).

Sub-Matrix: **Water**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Sub-Matrix: **Water**

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Water**

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Sub-Matrix: **Water**

					Matrix Spike (MS) Report

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Dion Chan	Lab Assistant	Metals, Burnaby, British Columbia
Ilnaz Badbezanchi	Team Leader - Metals preparation	Metals, Burnaby, British Columbia
Kim Jensen	Department Manager - Metals	Metals, Burnaby, British Columbia
Miles Gropen	Department Manager - Inorganics	Inorganics, Burnaby, British Columbia
Owen Cheng		Metals, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
µS/cm	Microsiemens per centimetre
mg/L	milligrams per litre
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

No. of samples analysed	: 4		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 00:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 00:00 is used for calculation purposes.

Legend & Qualifier Definitions

EHTR-FM: Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended

EHTR: Exceeded ALS recommended hold time prior to sample receipt.

EHT: Exceeded ALS recommended hold time prior to analysis.

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Water**

Evaluation: × = QC frequency outside specification; ✓ = QC frequency within specification.

Quality Control Sample Type			Count		Frequency (%)		
Analytical Methods	*Method*	*QC Lot #*	*QC*	*Regular*	*Actual*	*Expected*	*Evaluation*

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Conductivity in Water	E100 Vancouver - Environmental	Water	APHA 2510 (mod)	Conductivity, also known as Electrical Conductivity (EC) or Specific Conductance, is measured by immersion of a conductivity cell with platinum electrodes into a water sample. Conductivity measurements are temperature-compensated to 25°C.
pH by Meter	E108 Vancouver - Environmental	Water	APHA 4500-H (mod)	pH is determined by potentiometric measurement with a pH electrode, and is conducted at ambient laboratory temperature (normally 20 ± 5°C). For high accuracy test results, pH should be measured in the field within the recommended 15 minute hold time.
TSS by Gravimetry (Low Level)	E160-L Vancouver - Environmental	Water	APHA 2540 D (mod)	Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, following by drying of the filter at 104 ± 1°C, with gravimetric measurement of the filtered solids. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.
Chloride in Water by IC (Low Level)	E235.Cl-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrite in Water by IC (Low Level)	E235.NO2-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrate in Water by IC (Low Level)	E235.NO3-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Sulfate in Water by IC	E235.SO4 Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Alkalinity Species by Titration	E290 Vancouver - Environmental	Water	APHA 2320 B (mod)	Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.
Ammonia by Fluorescence	E298 Vancouver - Environmental	Water	J. Environ. Monit., 2005, 7, 37-42 (mod)	Ammonia in water is analyzed by flow-injection analysis with fluorescence detection after reaction with orthophthaldialdehyde (OPA).

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Dissolved Metals in Water by CRC ICPMS	E421 Vancouver - Environmental	Water	APHA 3030B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.
Dissolved Mercury in Water by CVAAS	E509 Vancouver - Environmental	Water	APHA 3030B/EPA 1631E (mod)	Water samples are filtered (0.45 um), preserved with HCl, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS.
Dissolved Hardness (Calculated)	EC100 Vancouver - Environmental	Water	APHA 2340B	"Hardness (as CaCO3), dissolved" is calculated from the sum of dissolved Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. "Total Hardness" refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations.
TDS in Water (Calculation)	EC103 Vancouver - Environmental	Water	APHA 1030E (mod)	Total Dissolved Solids is calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Dissolved species are used where available. Minor ions are included where data is present.
Nitrate and Nitrite (as N) (Calculation)	EC235.N+N Vancouver - Environmental	Water	EPA 300.0	Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N).

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Preparation for Ammonia	EP298 Vancouver - Environmental	Water		Sample preparation for Preserved Nutrients Water Quality Analysis.
Dissolved Metals Water Filtration	EP421 Vancouver - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HNO3.
Dissolved Mercury Water Filtration	EP509 Vancouver - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HCl.

Owen Cheng		Metals, Burnaby, British Columbia

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percentage Difference
# = Indicates a QC result that did not meet the ALS DQO.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test specific).

Sub-Matrix: **Water**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Water**

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Sub-Matrix: **Water**

Memo

To:	Ian Smith, Journey Paulus	**Client:**	Minto Explorations Ltd.
From:	Soren Jensen	**Project No:**	1CM002.065
Cc:	Dylan MacGregor	**Date:**	March 31, 2022
Subject:	2021 Water Balance and Water Quality Model Summary for the Minto Mine Site		

1 Introduction and Background

This memorandum provides a summary of the 2021 water balance and water quality model updates for the Minto Mine site. The update covers the period January 1, 2021, through December 31, 2021.

The water balance update includes a review and summary of precipitation, flow, and water inventory data for the Mine site. Geochemical source term and the site-wide water balance and water quality model for Minto was updated in late 2021. The updated water and load balance model report is provided as an attachment to this memo.

2 Water Balance Update

2.1 Precipitation

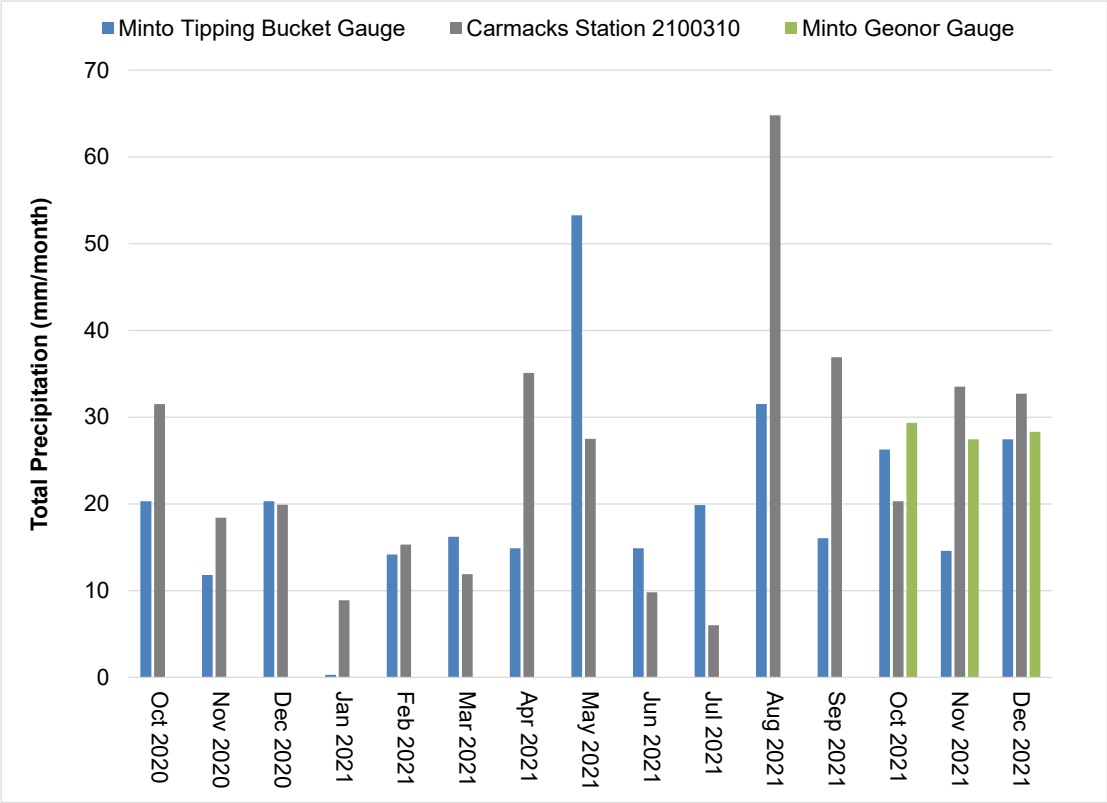
Table 1 shows a summary of monthly precipitation measured at the Mine site between October 2020 and December 2021 along with precipitation data from the regional station at Carmacks, YT (Climate ID: 2100301)[1], which is located 77 km Southwest of the Minto Mine. In the past, the meteorological station at Pelly Ranch (Climate ID 2100880)[1] located 25 km north of Minto was used as a regional reference station. However, the published data record from Pelly Ranch ends in March 2017 so the Carmacks Station was used instead.

Minto's Campbell Scientific meteorological station measures total precipitation using a Geonor gauge and a tipping bucket rain gauge. From October through May, the tipping bucket is equipped with a snowfall conversion adaptor, which allows it to measure snowfall as snow water equivalent. The Geonor precipitation gauge collects precipitation in a bucket and records precipitation by measuring the weight of the bucket. In the winter months, the bucket is partially filled with an antifreeze solution that melts any snow collected. In 2021, the total precipitation measurement collected by the Geonor gauge were functional but the analogue signal from the

[1] Data obtained from Meteorological Service of Canada, Environment Canada.

vibrating wire load cells were unreliable. However, on September 18, 2021, the gauge was repaired and reliable precipitation measurements were collected from then on.

Figure 1 and Table 1 show monthly total precipitation values recorded by Minto's tipping bucket and Geonor gauges and by the regional station at Carmacks.



https://...Minto 2021 Update/2021 Water Balance Update\2021 Met Station Data Summary.xlsx

Figure 1: 2021 Total Precipitation Measurements at Minto and at Carmacks

In past years the total precipitation measurements recorded at Minto have correlated reasonably well with precipitation measured at the Carmacks station. Total precipitation recorded by the Geonor gauge and at Carmacks in October, November and December 2021 are comparable, as were 2020 precipitation measurements (Figure 2). However, from January to September 2021 the measurements were not well correlated and the tipping bucket measurements appear to have gaps (such as in January 2021). Total annual precipitation recorded by the tipping bucket gauge was about 249 mm while the station at Carmacks reported 303 mm (Table 1). As discussed above, the Geonor data collected prior to October 2021 were unreliable. It is not known whether the mis-match between total precipitation measurements are due to actual variability in precipitation between the two sites or if the tipping bucket measurements at Minto may have been unreliable.

In any event, a total annual precipitation in the range of 250 to 300 mm at the Minto Mine site in the 2021 hydrological year is below the average annual precipitation of 329 mm and similar to the estimated precipitation in 2020 (300 mm) but greater than annual precipitation measured in 2019 (230 mm), 2018 (192 mm) and in 2017 (210 mm).

2.2 Snow Course Data

Snow course surveys were completed at four snow survey stations at the mine site in 2021 in February, March, and April. Table 2 shows a summary of the snow survey data (*i.e.* an average of the results from the four stations) from 2009 to 2021.

The snowpack was slightly below average (of the 13 years recoded) in February, slightly greater than average in March and the highest on record in April (162 mm snow water equivalent compared to an average of 102 mm). The greater snowpack resulted in a higher catchment yield in May 2021 compared to the year before (Figure 3).

Table 2: Summary of Snow Survey Data for the Minto Mine Site

Year	February	March	April
	Water Equivalent (mm)	Water Equivalent (mm)	Water Equivalent (mm)
2009	92.7	110.0	150.7
2010	107.7	120.7	56.0
2011	106.0	141.7	111.7
2012	111.0	127.0	132.7

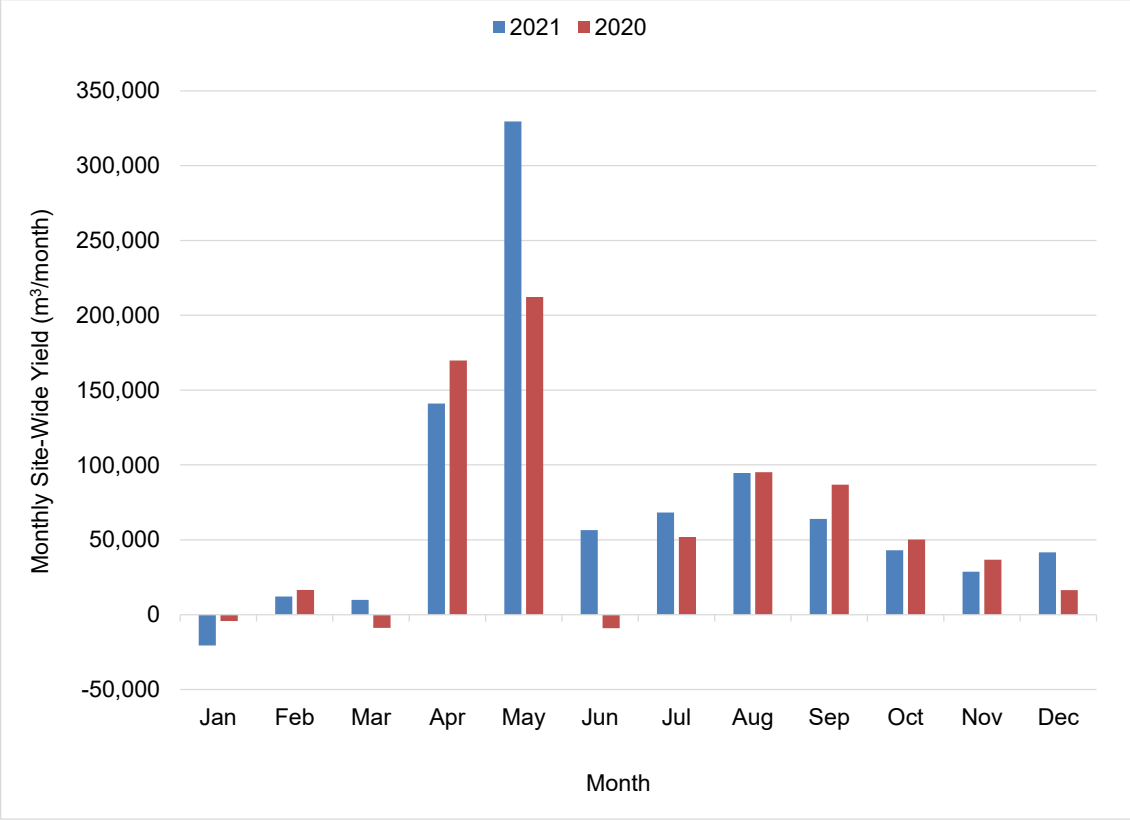

Figure 3 Estimate Monthly Site-Wide Catchment Yield at Minto in 2021

2.3 Water Management

Water that can be diverted away from the active mine site and meets the Effluent Quality Standards (EQS) is conveyed to the Water Storage Pond (WSP), while water collected from active mine areas is routed to the Main Pit Tailings Management Facility (MPTMF) or the Area 2 Pit Tailings Management Facility (A2PTMF). Between November 2012 and June 2015, the MPTMF was also used for subaqueous deposition of tailings. Deposition of mine water and tailings (subaqueous) to the A2PTMF commenced in April 2015 and is ongoing.

Other water management features on the Mine site include:

- WSP: reservoir for water that meets discharge criteria and is destined for discharge to Minto Creek.
- W15 sump: collects surface runoff and seepage from:
  - The Southwest Waste Dump;
  - Part of the Main Waste Dump; and
  - Adjacent undisturbed catchments.

  In 2021, approximately 19,000 m^3 of water collected at W15 was routed to the WSP in April and in part of May. From May through September, the W15 water was routed to the MPTMF because the water quality did not meet the EQS (approximately 85,000 m^3).
- W35 sump: collects surface runoff from the minimally disturbed southern catchments. Water collected at W35 in 2021 was piped to the Area 2 Pit TMF from April until October when the sump dried up (approximately 40,000 m^3).
- W62 sump: collects surface runoff and seepage from the mill valley, including contributions from the Dry Stack Tailings Storage Facility. Water collected at the W62 sump is pumped to the MPTMF. In 2021, water was pumped from W62 to the MPTMF year-round (approximately 133,000 m^3 in 2021).

2.4 2021 Water Balance

Table 3 summarizes the monthly water and tailings inventory in Minto's MPTMF and A2PTMF as well as water inventory in the WSP. The water inventory in the MPTMF increased modestly by about 70,000 m^3 in 2021, while the tailings and water inventory in the A2PTMF increased by approximately 1.0 Mm^3.

Table 4 shows a summary of the 2021 water balance for the Mine site. Volume estimates were rounded to the nearest 1,000 m^3 in accordance with the presumed precision of the estimates. In 2021, the calculated overall site yield was approximately 844,000 m^3. This yield represents all runoff and seepage collected across the site, which must be managed by the operations. The total catchment upstream of the Water Storage Dam measures approximately 1,040 ha. A runoff volume of 844,000 m^3 from 1,040 ha gives a unit yield of approximately 81 mm/year.

The site-wide runoff coefficient is calculated based on the total precipitation estimates, which ranged from 249 mm/year (tipping bucket) to 303 mm/year (based on precipitation measurements at Carmacks). The two precipitation estimates give the following site-wide runoff coefficients

Carmacks:

Annual Yield/ Total Annual Precipitation = Runoff Coefficient → 81mm/303mm = ***0.27***

Tipping Bucket at Minto:

Annual Yield/ Total Annual Precipitation = Runoff Coefficient → 81mm/249mm = ***0.32***

As discussed above, the total precipitation measured in Carmacks is likely a more reliable estimate for site precipitation than the tipping bucket measurements. 4 shows annual yields vs. annual total precipitation along with lines that indicate the site-wide yield coefficients.

Table 3: 2021 Water Inventory Change and Site Yield

3 Water Quality Model Update

Water quality model source terms and the site-wide water and load balance model were updated in 2021 (SRK, 2021). A detailed description of the modelling approach, methodology, inputs, and model results are provided in the model report.

Monitoring data collected in 2021 were used to calibrate the water balance and water quality model. The agreement between model results and monitoring data for 2021 was therefore dictated by the extent to which the model calibration was able to reproduce historical water quality trends. Comparisons of water quality monitoring data and model results in the coming years will be a meaningful basis for evaluating the skill of the model.

4 Closing

The summary of the updated water balance and water quality model for the Minto Mine was prepared in support of annual reporting. SRK would be pleased to address any questions or comments.

1 Introduction

In 2021, as part of the EMSRP, Minto monitored hydrological conditions at water quality stations including the following: stations within the operational mine area; stations downstream from the mine operational area that are influenced by mine effluent discharge; and reference stations downstream from the mine operational area that are not exposed to effluent. Hydrological monitoring is performed using a variety of methods including: manual discrete discharge measurements with combinations of flow meters, continuous stage measurements through the deployment of Solinst Level Loggers and Barometric Loggers and monitoring of an engineered flume.

Minto maintained and monitored 8 hydrometric stations located on Minto Creek and McGinty Creek as listed below and shown in Figure 1.

- Minto Creek
    1. W3: Flume downstream of the Water Storage Pond (WSP)
    2. MC1: Located in Minto Canyon – mid-catchment
    3. W1: Located approximately 1 km upstream of Yukon River – lower catchment
    4. W7: Tributary on the south side of Minto Creek
- McGinty Creek
    5. MN-0.5: West Tributary of McGinty Creek
    6. MN-1.5: Upper East Arm of McGinty Creek
    7. MN-2.5: East Tributary of McGinty Creek
    8. MN-4.5: McGinty Creek near the Mouth

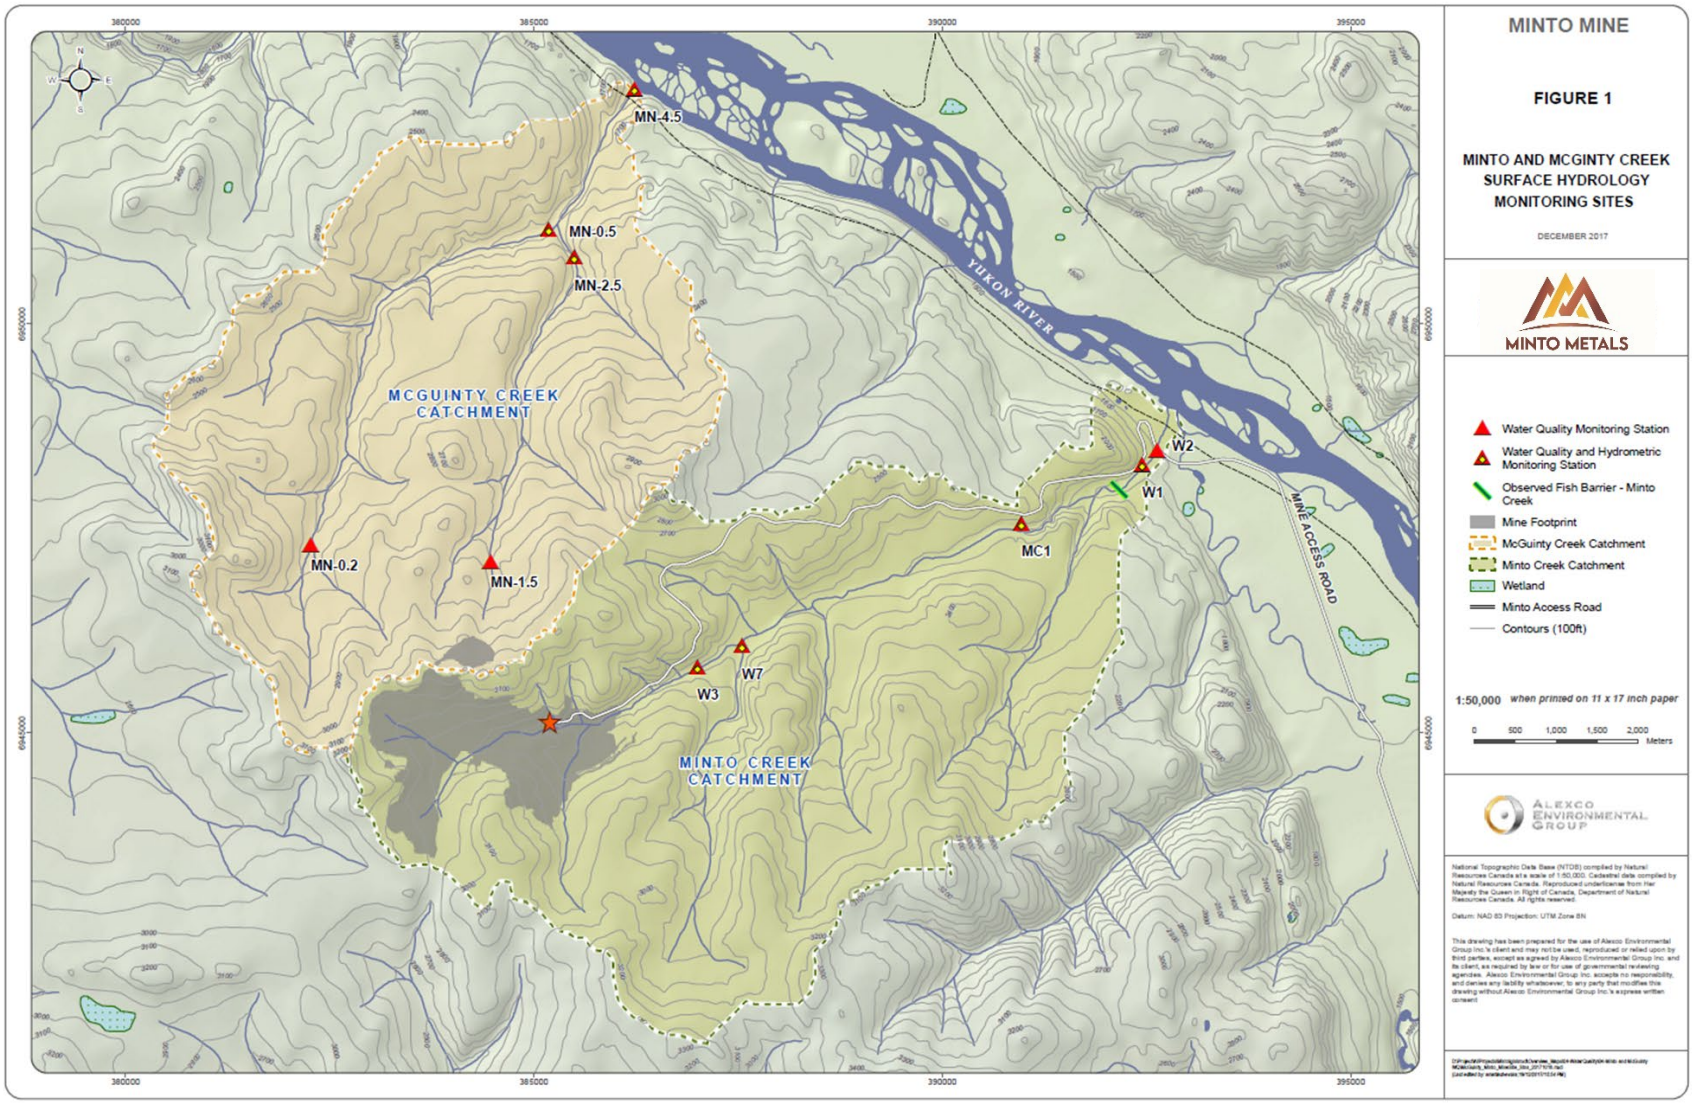

Figure 1: Minto and McGinty Creek Hydrology Surface Map

The 2021 open water season was characterized by above average flows during freshet, a dry spell during July which saw W1 dry up completely, followed by average flows sustained by regular precipitation events in late summer and early fall. A brief period of active mine discharge, from the Water Treatment Plant (RO), occurred from May 25th to June 1st and again from September 20th to September 25th. A single day of discharge occurred on September 29th.

The following sections will present the methods used to measure flow at the hydrometric program, the summary of each station's hydrometric program and recommendations for future monitoring.

2 Methods

Minto personnel conduct regular discrete discharge measurements and maintenance at the stations listed below. Additionally, these stations are equipped with Solinst Level Logger and Barometric Logger for continuous measurements. In 2021 updated Solinst Leveloggers and Barologgers were launched at all McGinty Creek sites, this hardware proved more reliable than the hardware used in Minto Creek and in 2022 all new Solinst hardware will be deployed at Minto Creek sites. In 2021, W7's frequency of monitoring increased from monthly to weekly. Table 2-1 provides an overview of instrumentation available and discrete measurement frequency at these stations.

Table 2-1: Summary of Hydrometric Program

Station	Watershed	Years Monitored	Frequency of Discrete Measurement	Instrumentation Available
W3	Minto Creek	2012-2021	Weekly	Flume, Data Logger
MC1	Minto Creek	2012-2021	Weekly	Staff Gauge, Data Logger
W1	Minto Creek	2012-2021	Weekly	Staff Gauge, Data Logger
W7	Minto Creek	2013-2021	Weekly	Staff Gauge, Data Logger
MN-0.5	McGinty Creek	2014-2021	Monthly	Staff Gauge, Data Logger
MN-1.5	McGinty Creek	2018-2021	Monthly	Staff Gauge, Data Logger
MN-2.5	McGinty Creek	2014-2021	Monthly	Staff Gauge, Data Logger
MN-4.5	McGinty Creek	2011-2021	Monthly	Staff Gauge, Data Logger

Stream-gauge data is collected and managed throughout the open water season by the Minto personnel. Velocities are measured using a Hach FH950 handheld electromagnetic flowmeter. Velocity and water depth measurements are converted to flows using the area-velocity relationship methods. All hydrometric data, calculated flows and the time-series of recorded water levels and temperature data from the loggers were processed by Minto personnel under AEG guidance.

Levelogger data was compared to the staff gauge readings as logger records for water level may have shifted over the course of the season due to repositioning, and data was corrected to match staff gauge measurements.

Stage-discharge relationships (rating curves) were created with discrete flow measurements and staff gauge readings. Ice affected readings or readings that were far outliers that could not be confirmed by photography may have been removed from the stage-discharge curves.

3 Minto Creek

3.1 Station W3 – Flume below the Water Storage Pond Dam

W3 is located about 500 meters downstream of the water storage pond dam where Minto Creek flows through an engineered flume inside a heated structure that allows for year-round flow. Solinst loggers record water levels and atmospheric pressure every 30 minutes, and water levels at the flume are recorded weekly. Early in 2021 the flume area had begun to freeze and back-up, causing the water level within the flume to rise and stop flowing, making accurate flow measurement impossible. Ice blockage was dislodged and water began to flow freely through the flume in May 2021. Flow measurements from November 16th to December 31st is based on averages calculated by flume readings due to malfunctioning logger equipment.

A summary of the level and flow data recorded at W3 are presented in Figure 2 to Figure 4. Figure 2 presents recorded water level and temperature for 2021. This data is collected using a pressure transducer and is corrected/calibrated using the stage-discharge relationship presented in Figure 3. The stage-discharge relationship is based on discrete measurements of the staff gauge within the engineered flume from 2013 to 2021. Figure 4 presents calculated flow rates based on transducer data and flow rates from discrete measurements of the flume staff gauge.

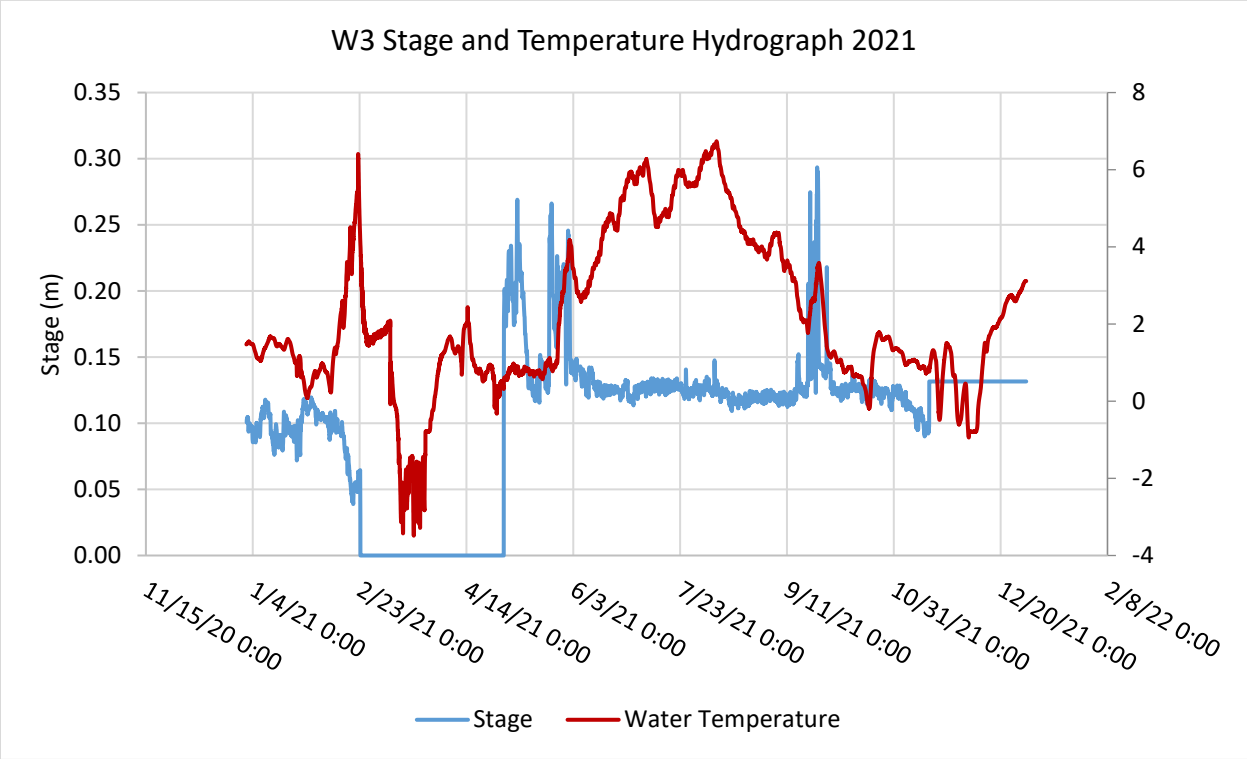

Figure 2: W3 Stage and Temperature Hydrograph 2021

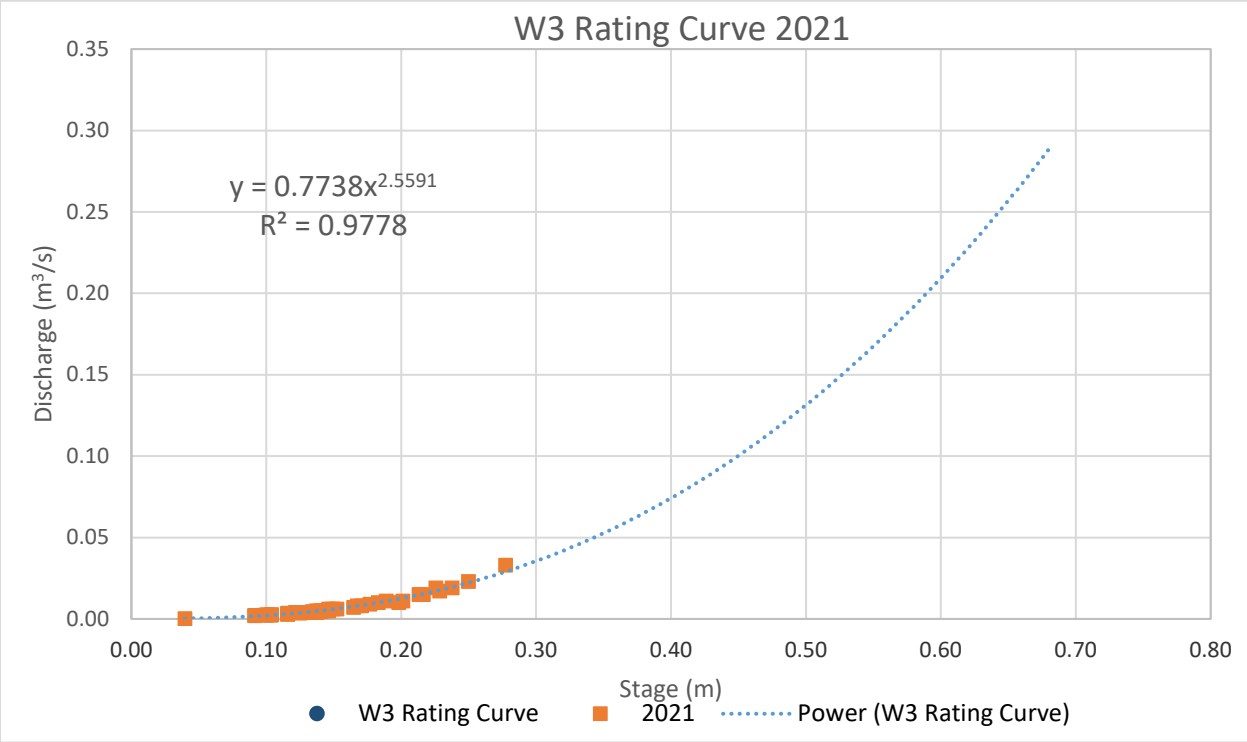

Figure 3: W3 Rating Curve 2021

Figure 4 shows the 2021 hydrograph and discrete flow measurements conducted during the recorded dataset. W3 is directly influenced by discharge from the Water Treatment Plant to Minto Creek. Water level spikes in May and September correlate with discharge from the Water Treatment Plant.

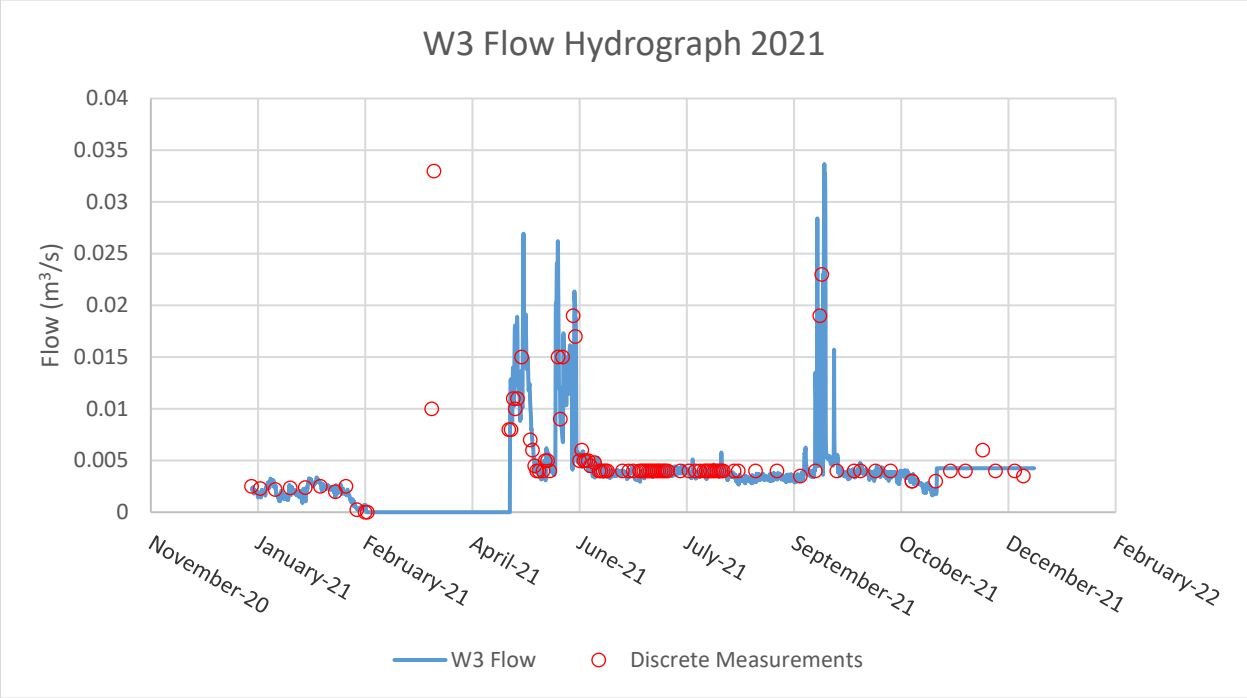

Figure 4. W3 Flow Hydrograph (with discrete measurements) 2021

Table 3-1 provides a summary of the average water temperature, flow and total flow volume in 2021. Table 3-2 summarizes the historical mean monthly flows to previous years of the hydrometric program.

1.2 MC1 - Minto Creek Mid-Catchment

The hydrometric station MC1 on Minto Creek is located downstream of the W3 Flume and immediately upstream of the canyon along Minto Creek. The Solinst loggers installed at this station recorded temperature and water levels at 30-minute intervals from May 5th to September 26th (144 days). Flow Measurements from July 31st to Aug 3rd were calculated using an average of 1 week of readings before and after the gap of missing data due to malfunctioning loggers. The loggers were pre-emptively removed on September 26th due to ice forming on the creek surface. Figure 5 shows water level and temperature data for Minto Creek at MC1 during the open-water season.

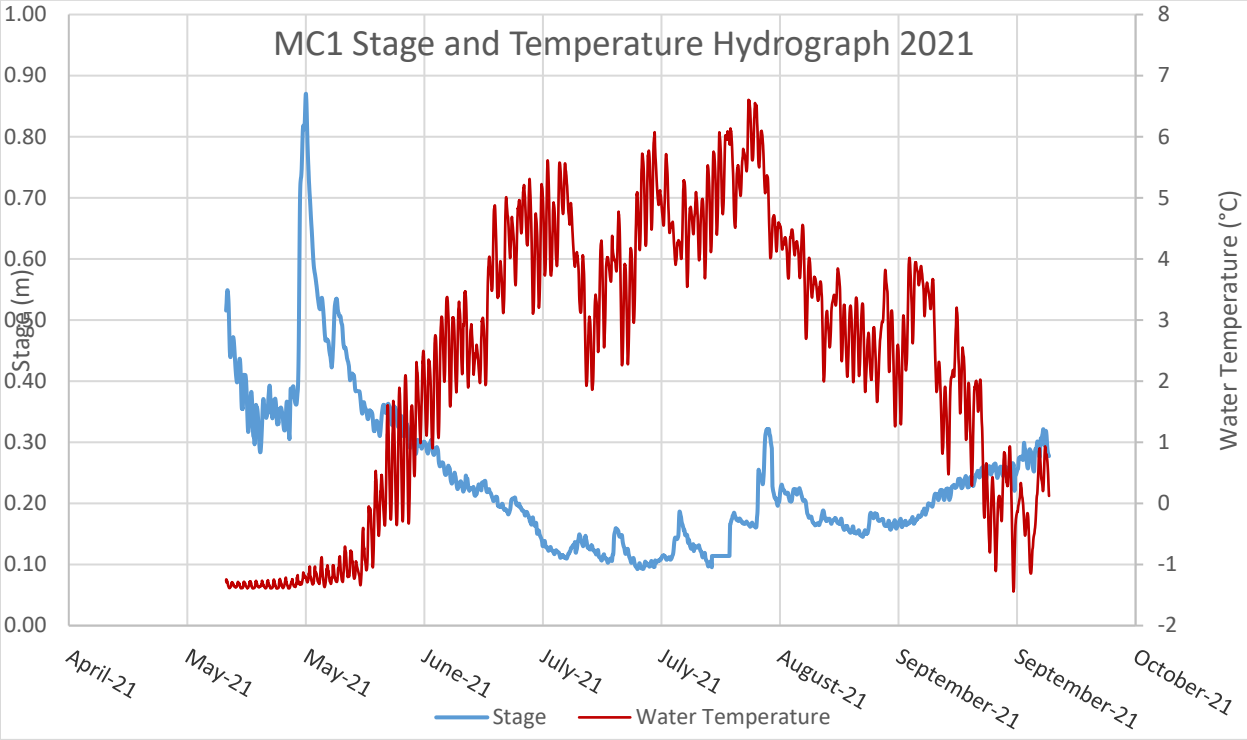

Figure 5: MC1 Stage and Temperature Hydrograph 2021

Over the course of the hydrometric program in 2021, numerous discrete discharge measurements were recorded in conjunction with water level readings recorded by both the logger and the staff gauge. This data provides the information necessary to generate a stage-discharge relationship which enables the computation of creek discharge for the recorded stage data. The stage-discharge relationship is presented in Figure 6.

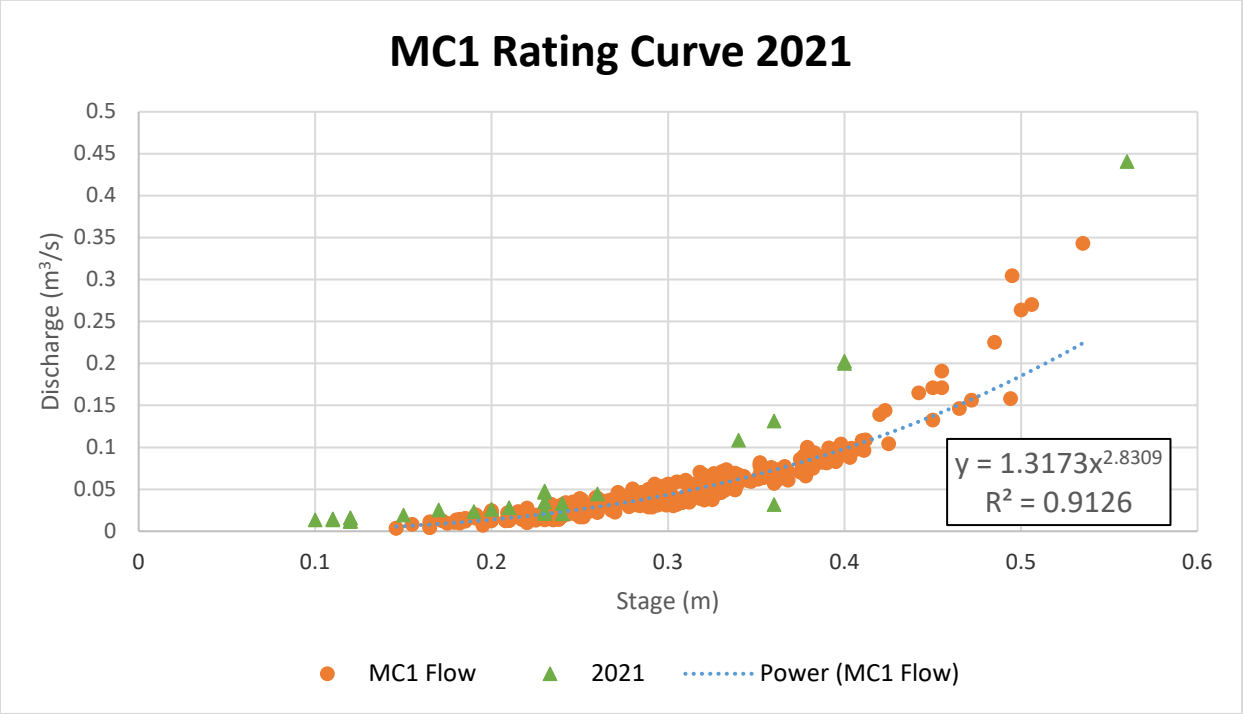

Figure 6: MC1 Rating Curve 2021

The 2021 hydrograph and discrete measurements for MC1 are shown in Figure 7. The maximum measured flow of 0.441 m^3/s occurred on May 25, 2021 during the peak of freshet. As noted above, the pressure transducer was removed on September 26 to avoid freezing damage.

Discrete and calculated flow measurements corresponded reasonably well in 2021, however the degree of variability suggests there may be improvements that can be made to flow measurement procedures at this station. It is likely that stream characteristics at the hydrological station have changed since installation in 2013 due to erosion, sedimentation, and water sampling activities.

In 2021 discrete samples were collected approximately 3m downstream from previous years as it was more representative of the site and didn't have the erosion issues that were identified in the original measurement transect.

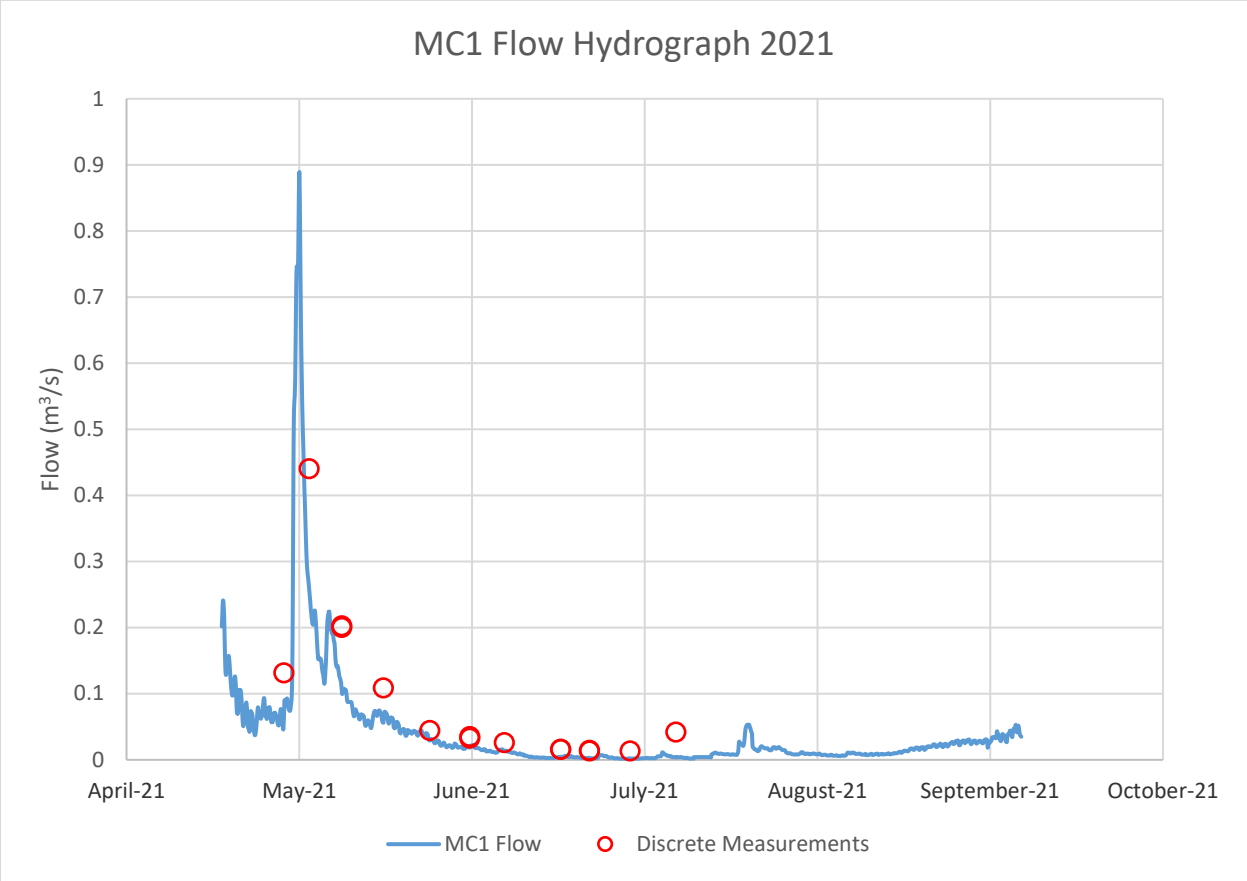

Figure 7: MC1 Discharge and Discrete Measurement Hydrograph 2021

Table 3-3 provides a summary of the average water temperature, flow and total flow volume in 2021.

1.3 W1 – Lower Minto Creek above Road Crossing

W1 station is located on the lower reach of Minto Creek before flowing into the Yukon River. In 2021, water level and temperature data were continuously measured and recorded every 15 minutes by the Solinst Levelogger and Barologger. Figure 9 shows Minto Creek at W1 water level and temperature data for the 139-day record from May 5 to September 26, 2020. The station had little to no flow from July 3r^{d} to 25th but regular precipitation after this period kept it running until freeze-up.. The data logger was removed on September 26t^{h} to avoid ice damage, but discrete measurements continued until October 12th. The Stage and Water temperature hydrograph is presented in Figure 8, below.

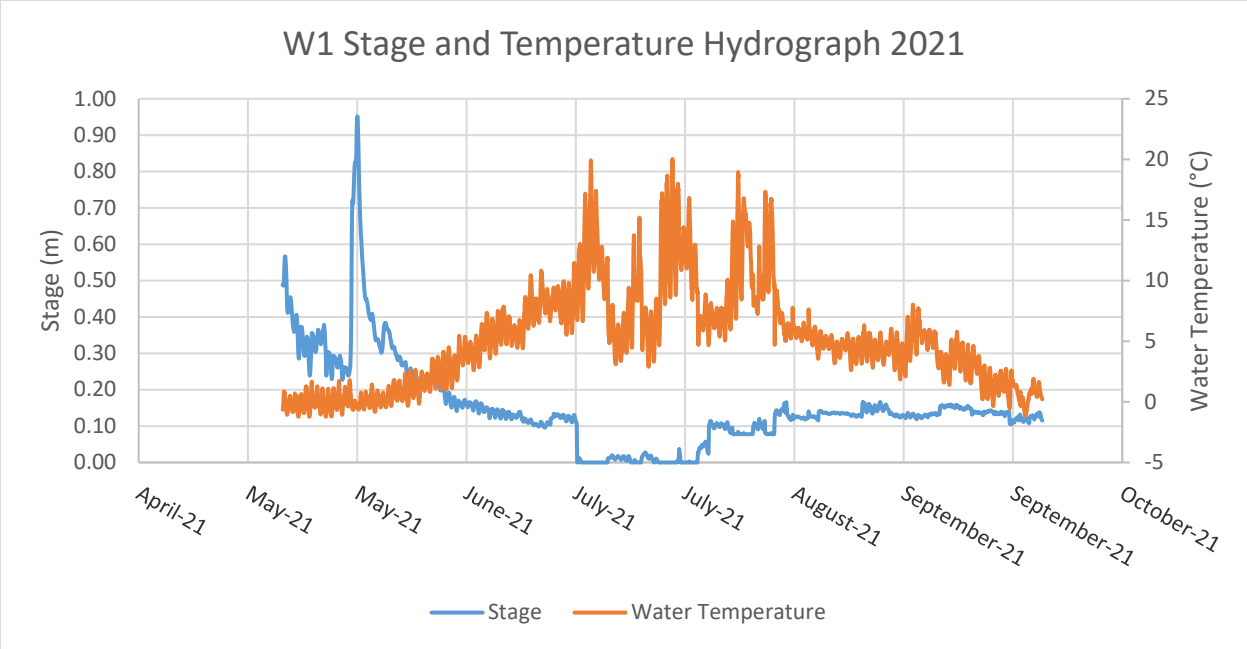

Figure 8: W1 Stage and Temperature Hydrograph 2021

The stage-discharge relationship for W1 is presented in Figure 9. After removing outliers and including 2021 measurements the R^2 is 0.8669. In 2020, the R^2 was 0.8660. Efforts will be made to ensure that future measurements continue to be accurate and representative to further refine the curve.

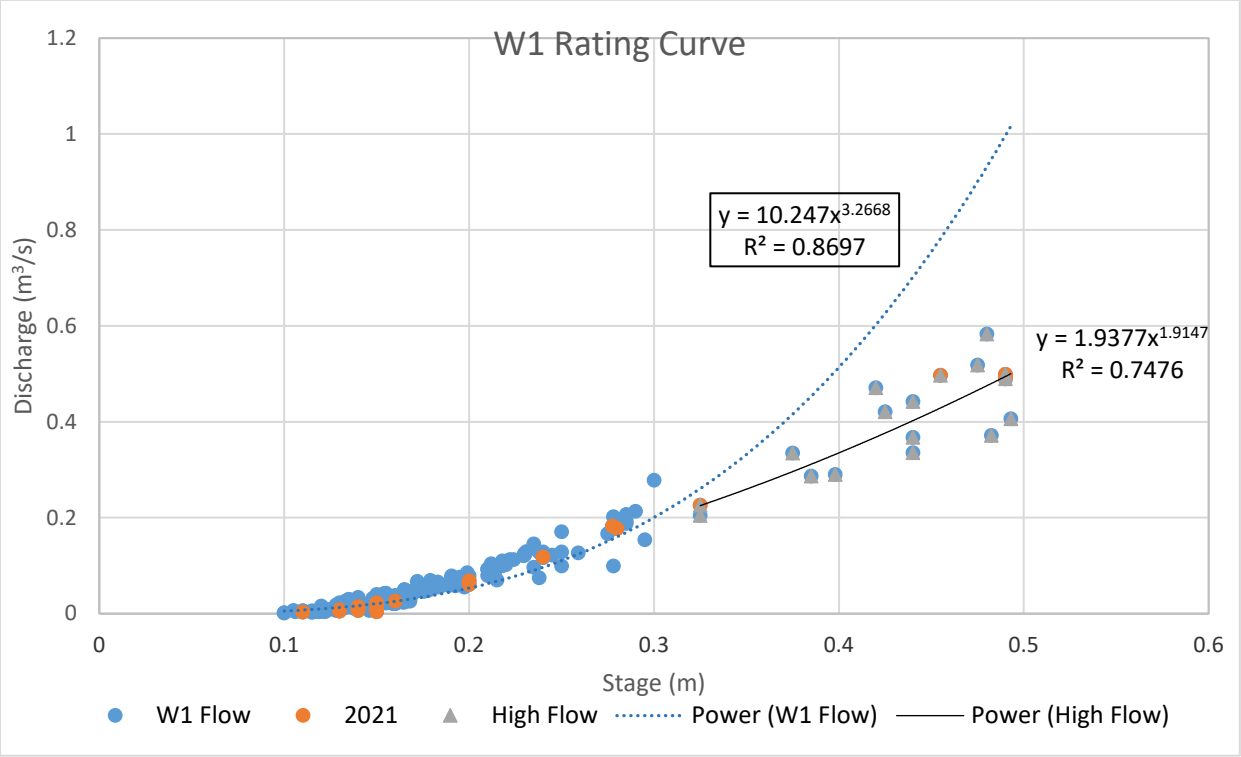

Figure 9: W1 Rating Curve 2021

The 2021 hydrograph and discrete measurements for W1 are shown in Figure 10. In 2021, the maximum measured flow was 0.499m3/s on May 10, during the height of freshet. In 2020 the maximum measured flow was 0.1667 m^3/s on May 12.

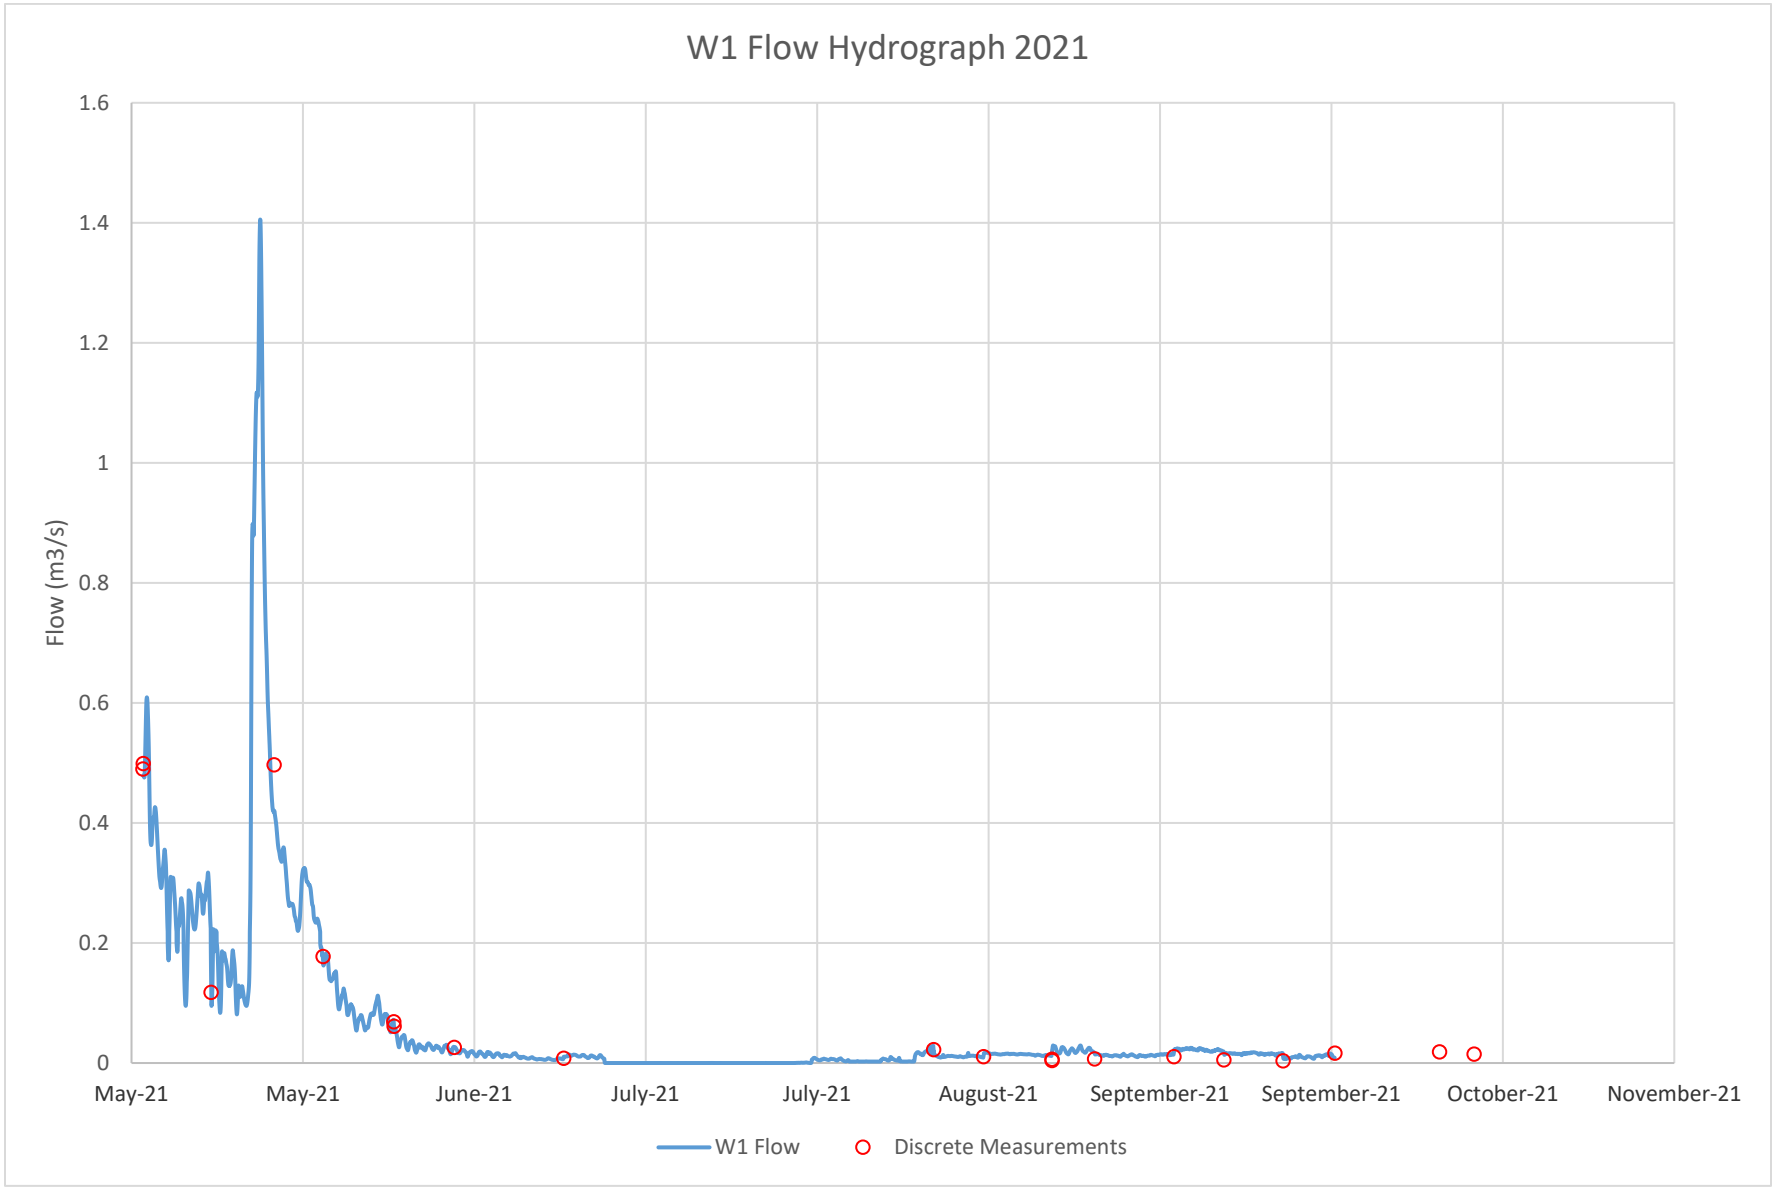

Figure 10: W1 Flow Hydrograph 2021

Figure 11 shows W1 and MC1 flows. W1 is located downstream of MC1 and it is expected that flows would be larger because it has a larger catchment area than MC1, however flows at W1 are consistently lower than those recorded at MC1.. It is believed that some water downstream of MC1 passes through a preferential subterranean pathway and by-passes W1. The placement of the stream flow measuring point at MC1 will be considered in 2022, as changes in the stream character may be impacting the accuracy of measurements since installation.

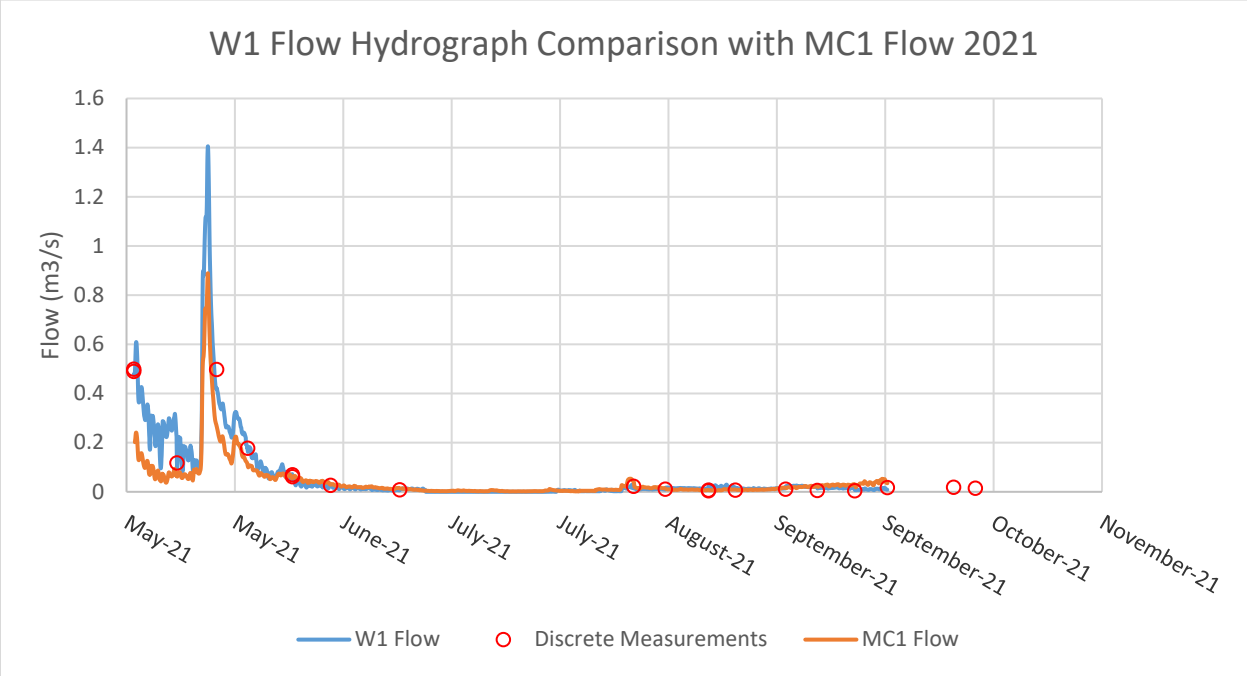

Figure 11: W1 Flow Hydrograph Comparison with MC1 Flow 2021

Table 3-5 provides a summary of the average water temperature, flow and total flow volume in 2021. Table 3-6 summarizes the historical mean monthly flows to previous years of the hydrometric program. The history shows that freeze-up begins in October and that freshet typically occurs in April/May.

1.4 W7 – Tributary of Minto Creek

A staff gauge was installed at this station in the summer of 2013. Before the installation of the staff gauge, this station was regularly monitored for surface water quality. The staff gauge was damaged during the winter 2014 and repaired for the hydrometric program running in 2015. In 2016, no stage measurements were continuously recorded but several discrete discharge measurements were conducted during the open water season. In early June 2017, a staff gauge and loggers were installed at this site.

Continuous water level and water temperature were recorded from June 2, 2021 to September 26, 2021, however the pressure transducer experienced a number of malfunctions from June 28th to July 20th which caused erratic readings. This period of flow was calculated based on an average of 1 week of flow readings before and after the data gap.

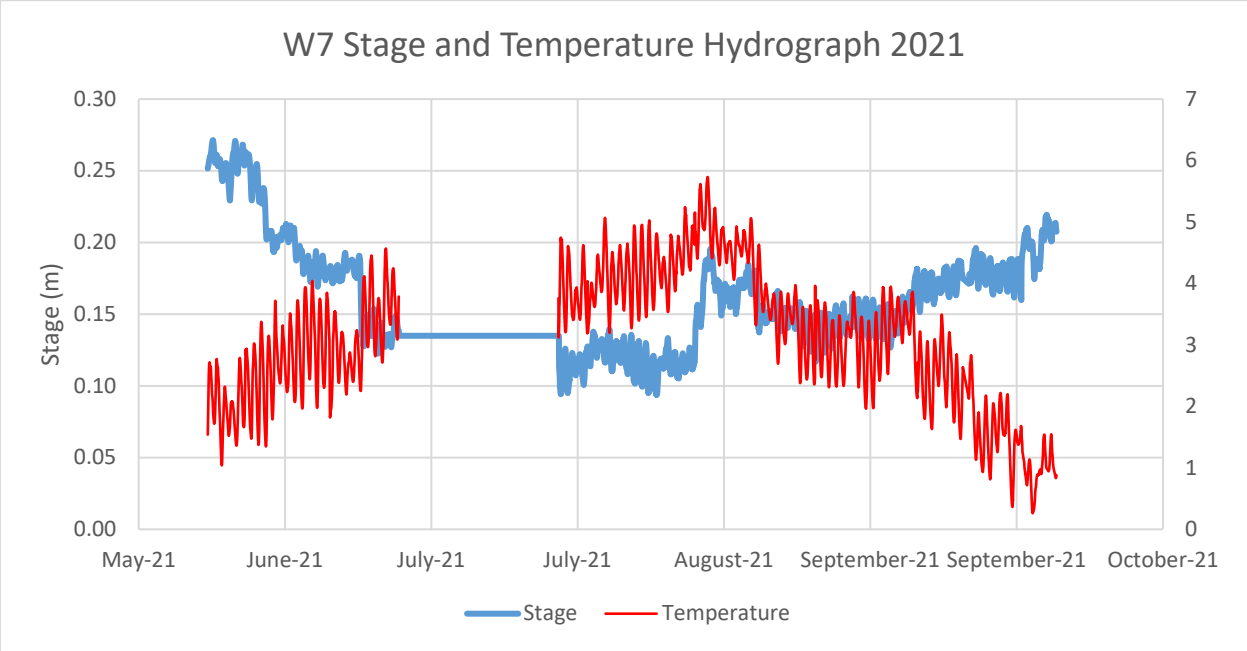

Figure 12: W7 Stage and Temperature Hydrograph 2021

A rating curve (**Figure 13**) was initiated in the 2017 hydrometric season; with limited data points from 2017 to 2019. In 2021 the measurement frequency was increased from monthly to weekly and the correlation between discrete and calculated measurements suggests that the rating curve is developing well.

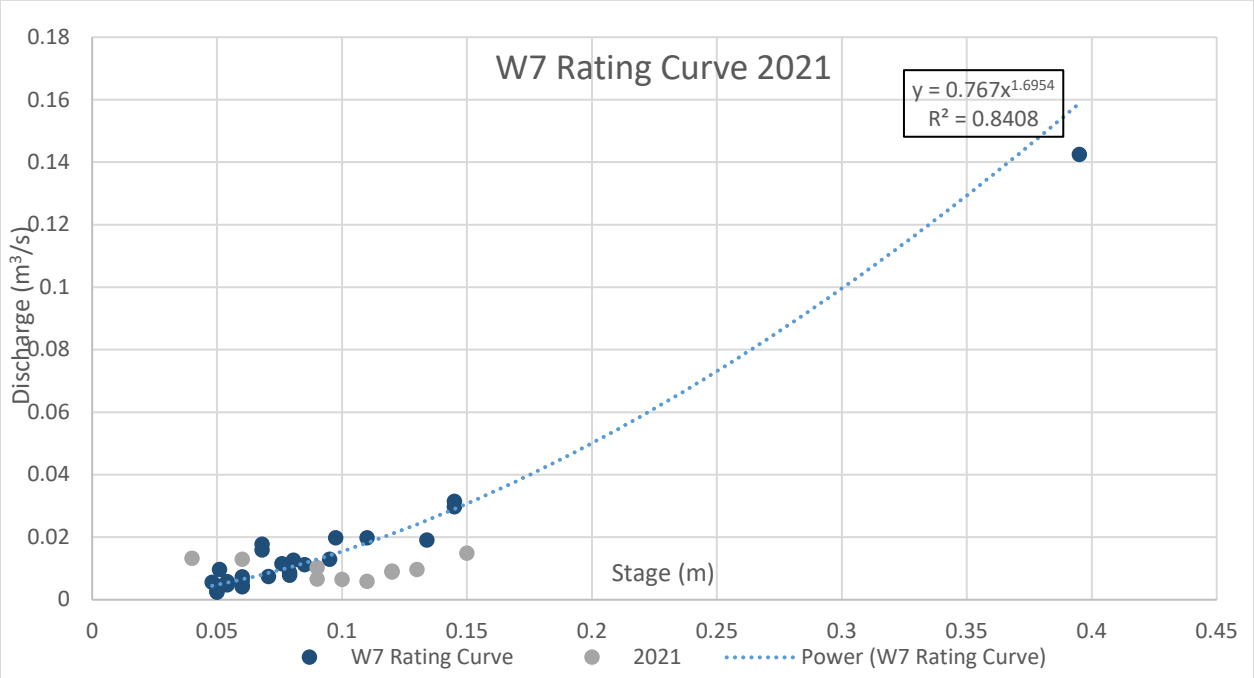

Figure 13: W7 Rating Curve

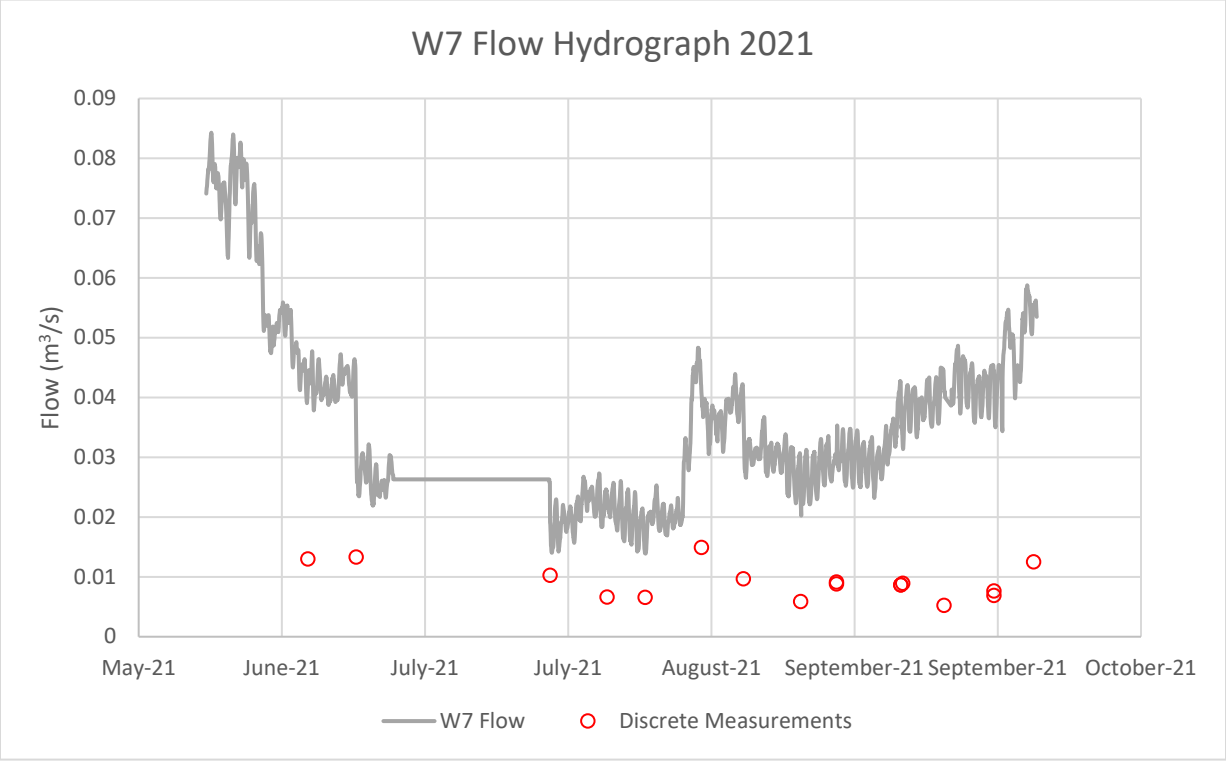

Figure 14: W7 Flow Hydrograph 2021

Table 3-7 provides a summary of the average water temperature, flow and total flow volume in 2021.

4 McGinty Creek Hydrology

In 2021, hydrological monitoring on McGinty Creek was conducted as per the schedule outlined in the EMSRP. Station MN-1.5 was added to the monitoring schedule with continuous measurements. During the 2021 monitoring period, Minto Mine maintained and collected data from the following four hydrometric stations along McGinty Creek: MN-0.5, MN-1.5, MN-2.5, and MN-4.5.

At the hydrometric stations, Solinst Level Loggers and Barometric Loggers were used in conjunction with staff gauge readings and manual flow measurements to produce volumetric flow rates. Manual flow measurements were conducted monthly during flow season unless otherwise noted below.

4.1 Station MN-0.5 – West Tributary of McGinty Creek

MN-0.5 station is located on the upper west stem of McGinty Creek. In 2021, water level and temperature data were continuously measured and recorded every 30 minutes by a pressure transducer/data logger. Figure 15 shows McGinty Creek at MN-0.5 water level and temperature data for the 103-day record from June 14 to September 25, 2021.

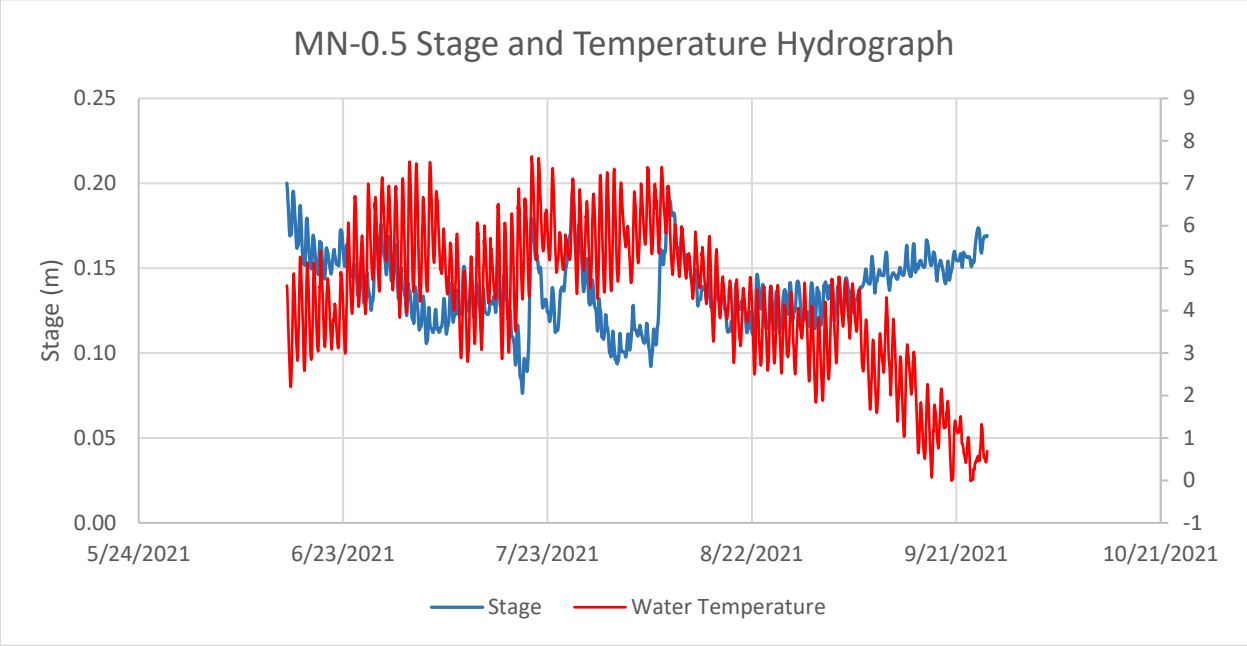

Figure 15: MN-0.5 Stage and Temperature Hydrograph

A stage-discharge relationship was established for MN-0.5 in 2015 but it had limited flow data and corresponding staff gauge readings and was therefore not very accurate. Through investigation of prior years' flow measurements, field notes, and photographs, outliers and unrepresentative readings were identified and either removed from the rating curve or adjusted to reflect changes in stream condition. The updated stage curve is now more accurate and is presented in Figure 16. Further study and continued accurate flow measurement will be required going forward to confirm the curve's accuracy.

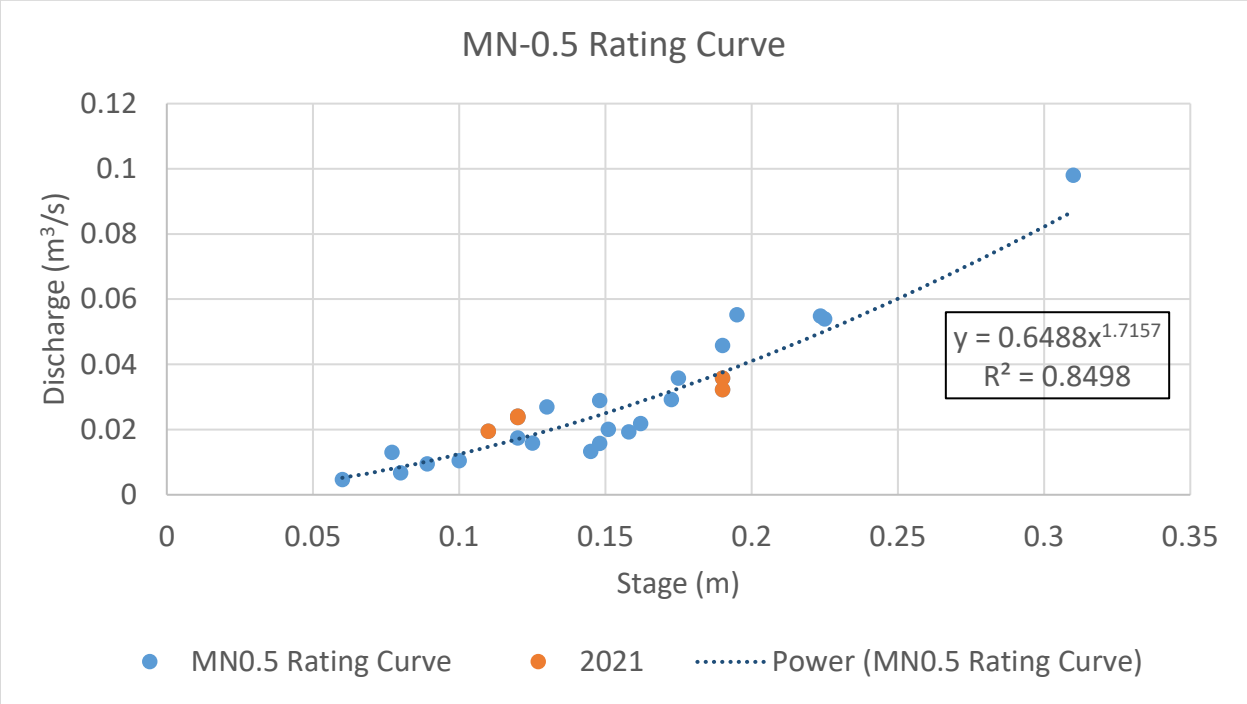

Figure 16: MN-0.5 Rating Curve

Continuous flow measurements, calculated using the above rating curve, are displayed in Figure 17 alongside discrete measurements. The discrepancy between the calculated and measured flows shows that more work is needed to improve the accuracy of this station. An investigation of staff gauge movement and cross-section placement will be conducted in 2022.

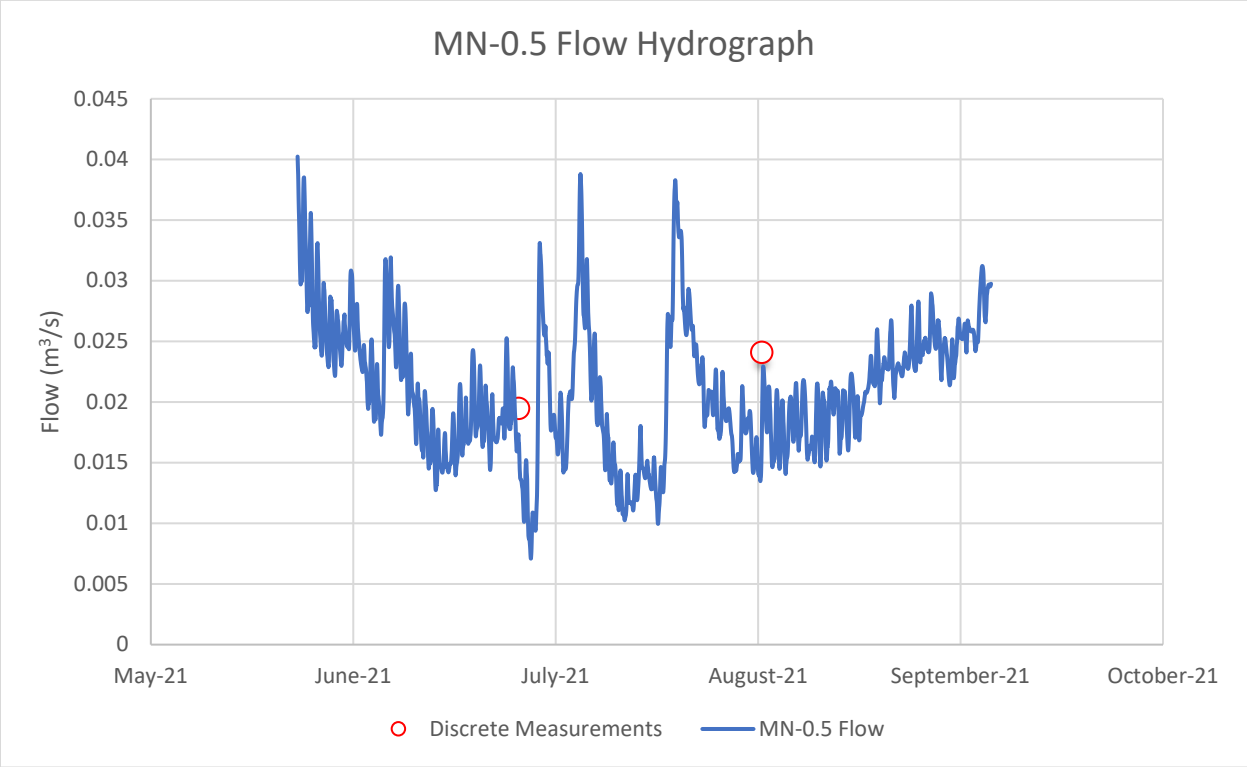

Figure 17: MN-0.5 Flow Hydrograph

Table 4-1 provides a summary of the average water temperature, flow and total flow volume in 2021 while Table 4-2 provides a summary historical measured flows at MN-0.5. Data for years prior to 2020 are based on direct measurements only.

4.2 Station MN-1.5 – Upper East Tributary of McGinty Creek

MN-1.5 is marshy area with a small stream collecting water which flows into the lower stem of McGinty Creek. A staff gauge was installed on July 5, 2018. As a newly established station the rating curve had a large error. The hope was that as monitoring continued and more flow measurements were taken the stage curve would become more accurate. Unfortunately, the stream became less consolidated and more braided over the course of 2019, 2020, and 2021. No representative flow measurements

could be collected during this time. A pressure transducer/logger was installed in 2020, however changes to the stream were so severe that the staff gauge levels were no longer representative of the streams' total flow (Figure 18). As such, no accurate data was collected at MN-1.5 in 2021 and none will be presented here.

Figure 18: MN-1.5 Stream and Staff Gauge, September 22, 2021

If MN-1.5 is to be established as permanent hydrometric station the staff gauge must be re-installed in a more stable section of the stream. The stream is more consolidated both up and downstream of the current location but it is quite narrow, so a location will need to be identified where stream width is sufficient to conduct accurate flow measurements.

Crossing the marshy stream to collect samples and flow measurements, as well as it's placement along an active game trail, likely contributed to the degradation of the current location. A new site should be installed at a location where water quality sampling and flow measurement can be conducted without crossing the stream or disturbing its banks. If a new trail is required, it should avoid existing game trails or creating new potential pathways for large animals, if possible.

Once a new station is installed, increasing flow measurement frequency to bi-weekly could be considered to help establish an accurate rating curve more quickly. MN-1.5 is the closest of the McGinty Creek sampling locations so this option is more feasible than it would be at other locations within the catchment.

4.2 Station MN-2.5 – East Tributary of McGinty Creek

MN-2.5 station is located on the lower stem of McGinty Creek. In 2021, water level and temperature data were continuously measured and recorded every 30 minutes by a pressure transducer/data logger. Figure 19 shows water level and temperature data at MN-2.5 for the 103-day record from June 14th to September 25th, 2021.

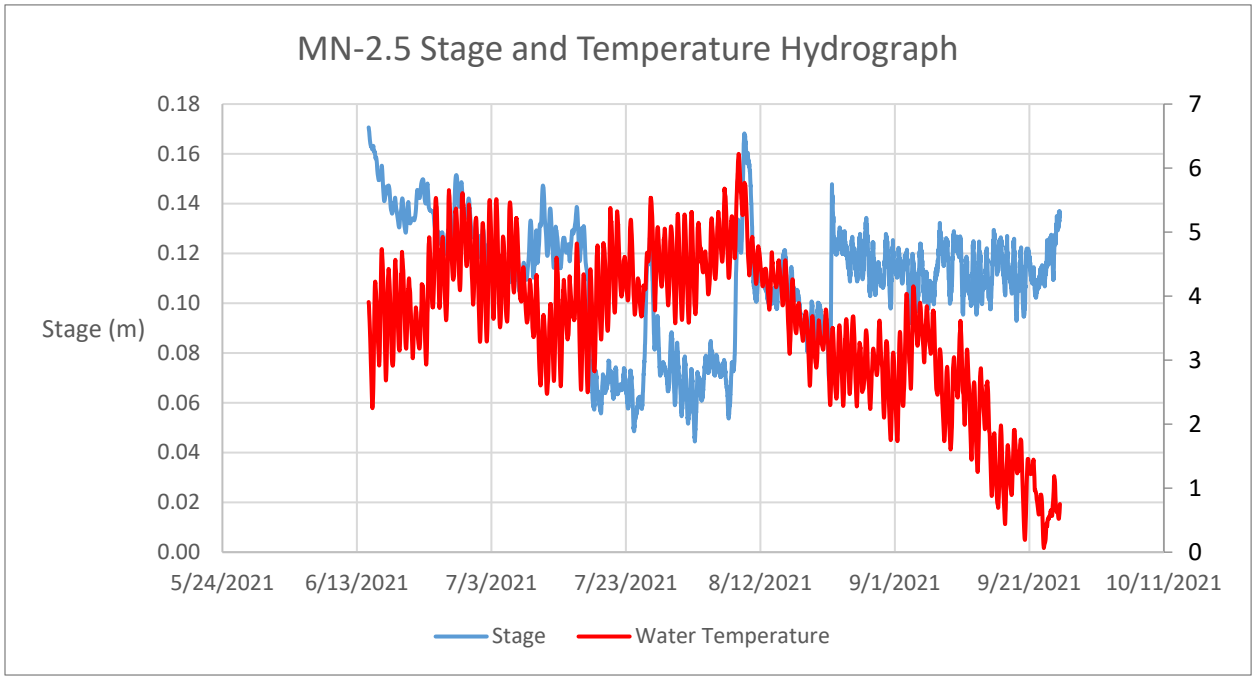

Figure 19: MN-2.5 Stage and Temperature Hydrograph

A stage-discharge relationship was established for MN-2.5 in 2015 but due to limited accurate flow data and corresponding staff gauge readings it was not reliable curve. In 2020, an audit of previous measurements was conducted to identify and remove outliers and adjust staff gauge measurements based on photographic data. This, combined with a relatively large and precise dataset collected in 2020-2021, has produced a more accurate curve. Figure 20 shows the rating curve for the 2021 dataset

as well as the curve for all confirmed accurate measurements from 2015 to present. To reflect historic variability, the combined rating curve was used to calculate continuous flow in 2021 presented in Figure 21 alongside discrete flow measurements.

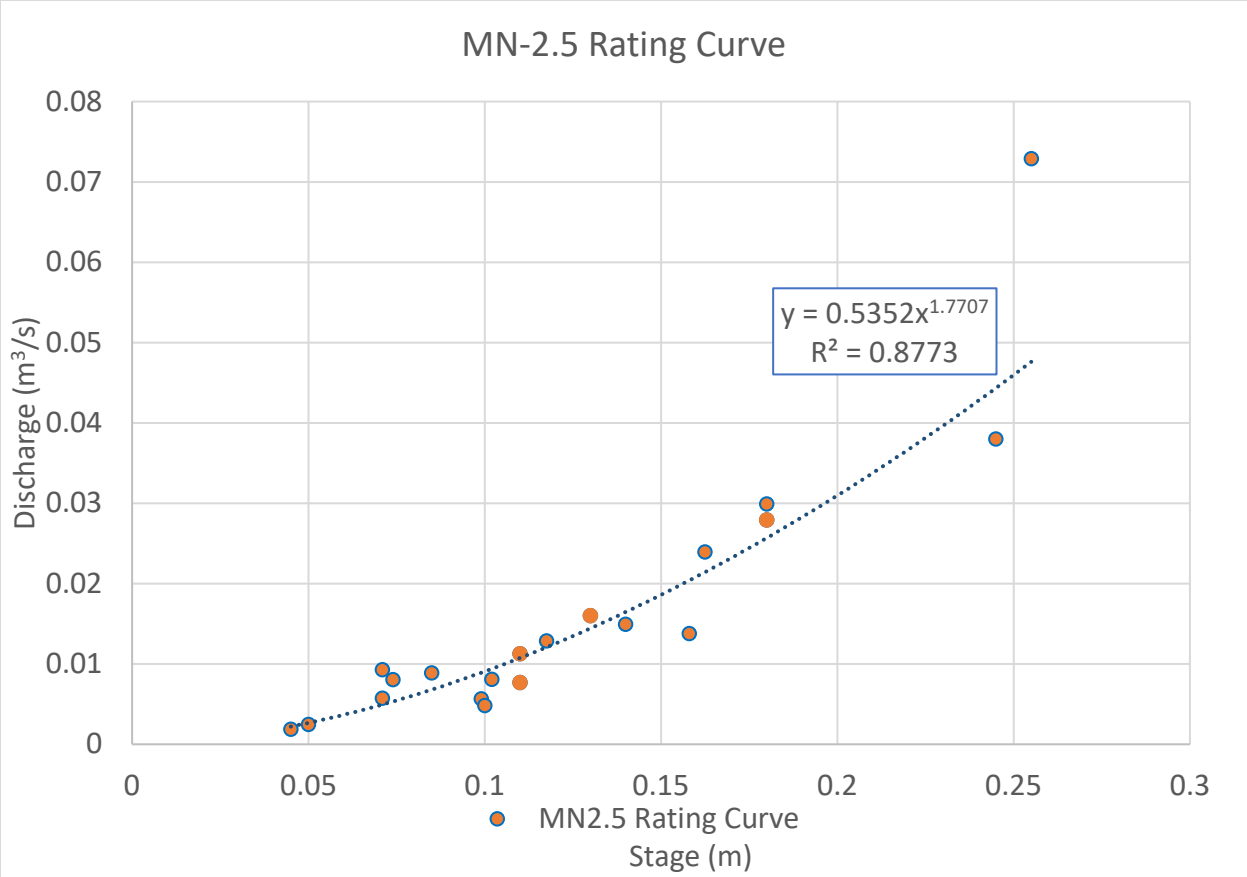

Figure 20: MN-2.5 Rating Curve

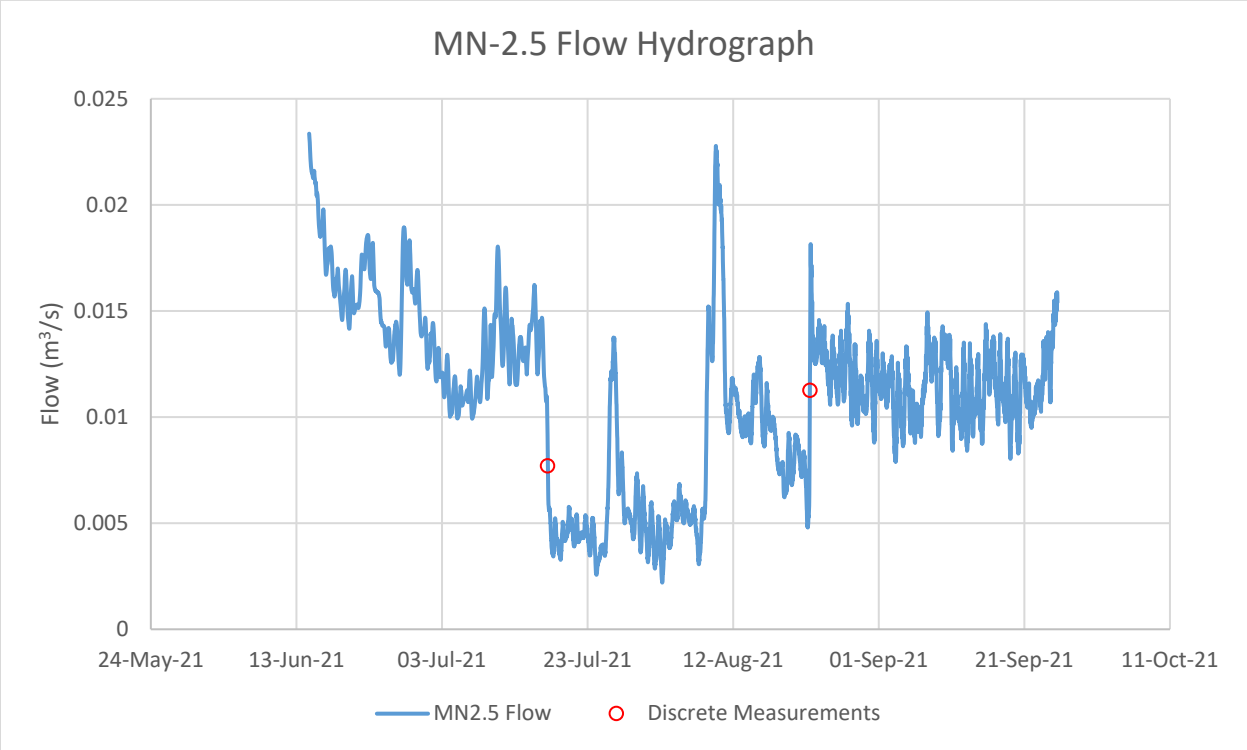

Figure 21: MN-2.5 Flow Hydrograph

Table 4-3 provides a summary of the average water temperature, flow and total flow volume in 2019. Table 4-4 provides a summary of historical measured flows at MN-2.5. These flows are based on discrete measurements until 2016, the pressure loggers were used from 2017 to 2020.

4.3 Station MN-4.5 -McGinty Creek near the Mouth

MN-4.5 station is located on the lower reach of McGinty Creek before flowing into the Yukon River. In 2021, water level and temperature data were continuously measured and recorded every 30 minutes by a pressure transducer/data logger. Figure 22 shows McGinty Creek at MN-4.5 water level and temperature data for the 103-day record from June 14 to September 25, 2021.

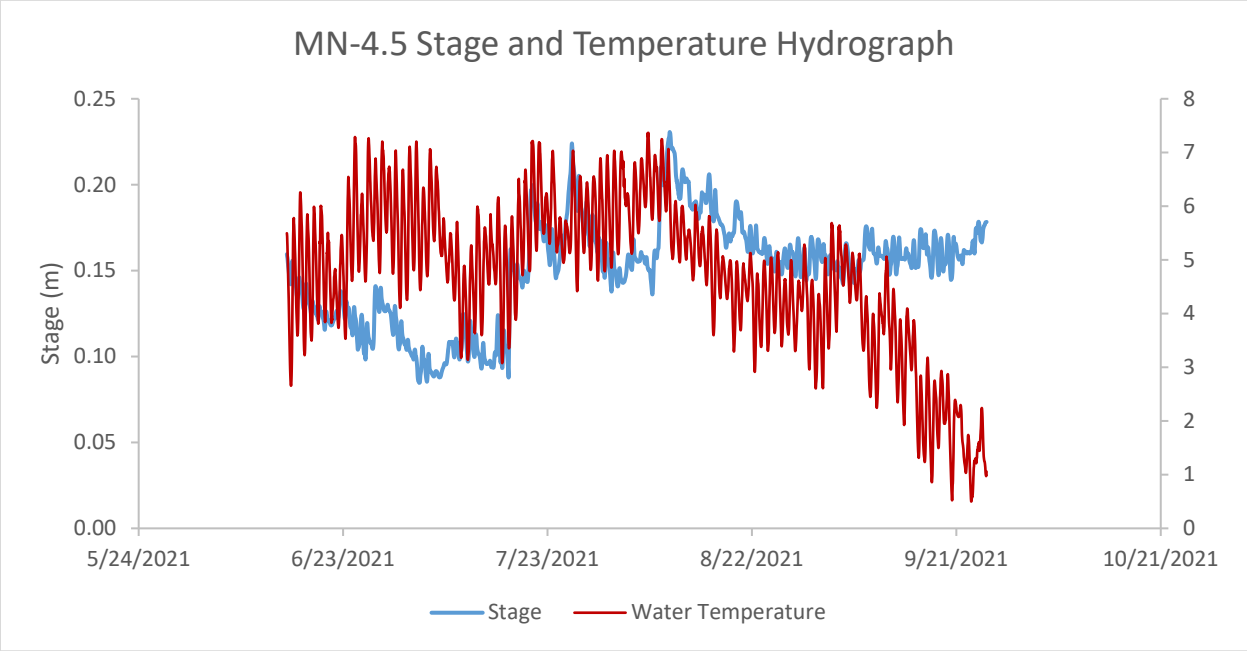

Figure 22: MN-4.5 Stage and Temperature Hydrograph

The stage-discharge relationship for MN-4.5 is presented in Figure 23. The rating curve at MN-4.5 continues to improve year over year, going from an R^2 value of 0.9051 in 2019 to 0.9214 in 2021. The 2021 hydrograph and discrete measurements for MN-4.5 are shown in Figure 24.

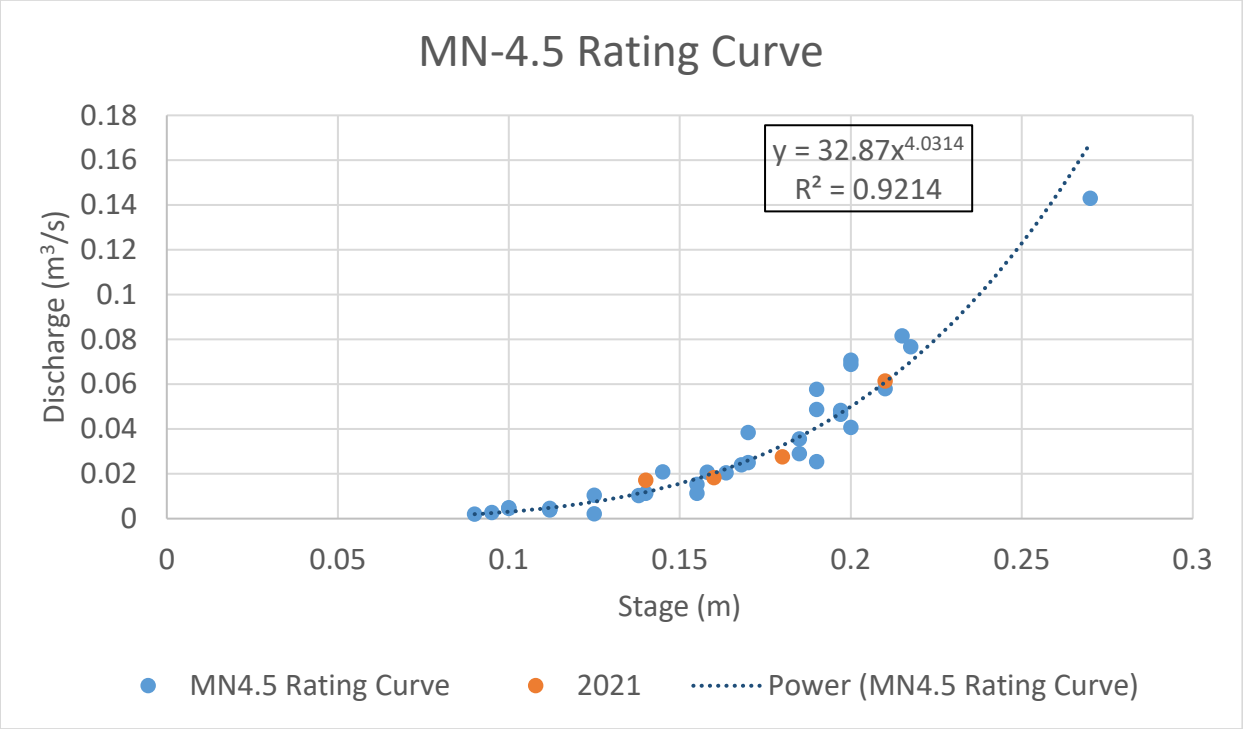

Figure 23: MN-4.5 Rating Curve

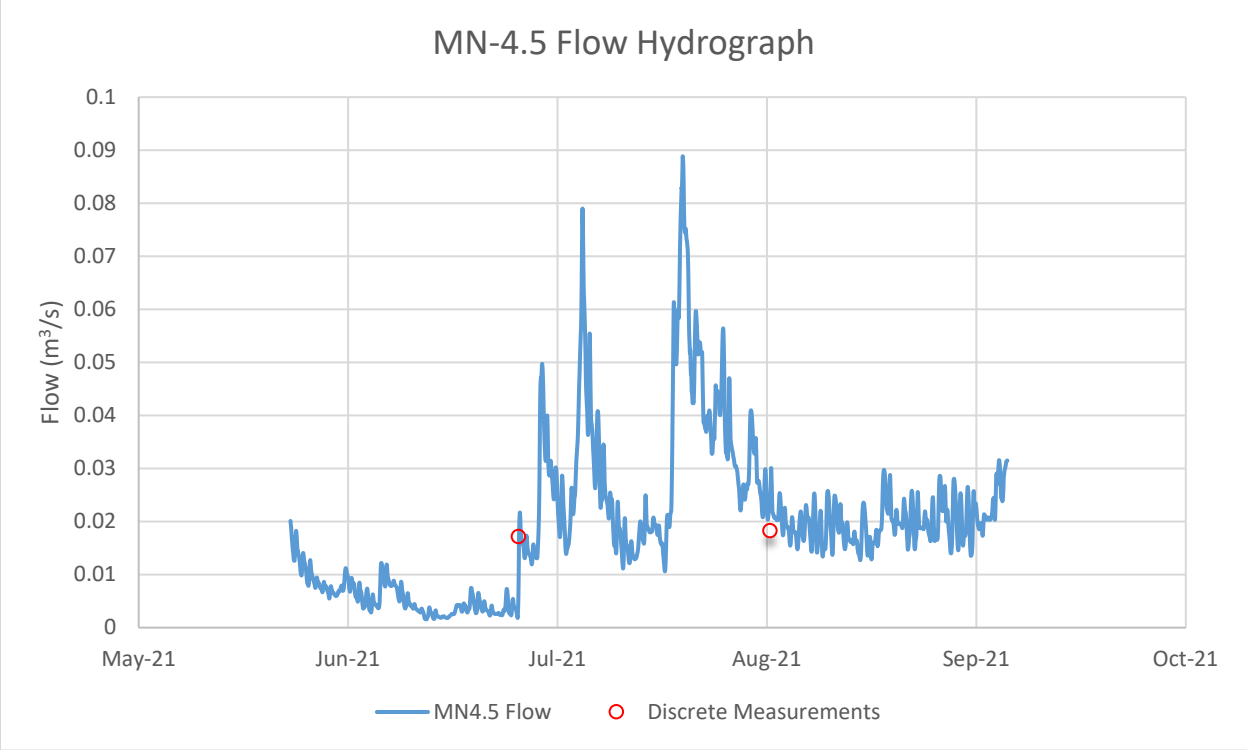

Figure 24: MN-4.5 Flow Hydrograph

Table 4-5 provides a summary of the average water temperature, flow and total flow volume in 2021. Table 4-6 summarizes the historical mean monthly flows to previous years of the hydrometric program.

5 Hydrology QA/QC

Detailed procedures for hydrology monitoring at the Minto Mine are detailed in the *Minto Mine Surface Water Hydrology* SOP. In 2021, Minto environmental staff conducted a duplicate of hydrometric measurements at a random station every week, to reach a 10% QAQC target.

Appendix G – Results of Selenium Monitoring in Minto Creek - 2021

Dear Ms. Paulus,

Re: Results of Selenium Monitoring in Minto Creek - 2021

The Yukon Government's 2011 intervention to the Minto Mine's Water Use Licence (WUL) Amendment Application identified selenium as a parameter of concern. The most recent Minto Mine WUL (QZ14-031, August 2015) includes an effluent quality objective of 0.006 milligrams per litre (mg/L) dissolved selenium and a site-specific water quality objective (SSWQO; applicable at lower Minto Creek) of 0.002 mg/L dissolved selenium (adopted from the British Columbia Water Quality Guidelines; BCWQG; BCMOE 2014). There is substantial evidence that water-based guidelines for selenium are poor predictors of potential adverse effects to aquatic life (e.g., Chapman et al. 2010; DeForest et al. 2012; Janz 2012) and that running water (lotic) environments such as Minto Creek and the Yukon River are less sensitive to selenium than still water (lentic) environments (Orr et al. 2006; Presser and Luoma 2010; Stewart et al. 2010; USEPA 2016; DeForest et al. 2017).

In response to the uncertainty over the application of a generic water-based guideline (the BCWQG; BCMOE 2014) as a water quality objective for selenium, the Minto Mine requested an assessment of selenium in lower Minto Creek. This assessment, implemented by Minnow Environmental Inc. (Minnow) and the Minto Mine includes selenium monitoring in water, sediment, periphyton, and benthic invertebrates (2012 to 2021[1]). Attempts to collect resident fish tissue data were made in 2012 and 2013 by Access Consulting Group (ACG 2013, 2014), but were unsuccessful due to very low abundance of resident fish (slimy sculpin) in lower Minto Creek.

[1] Due to dry conditions at lower Minto Creek in 2019, monitoring in 2019 only included sediment sampling at upper Minto Creek and the reference area, upper McGinty Creek.

Subsequent monitoring of fish presence in lower Minto Creek undertaken by Minto Mine from 2014 to 2019[2] continues to confirm very limited use. To date, fishing efforts have documented extremely low catches of fish other than juvenile chinook salmon (which are present in lower Minto Creek only for short periods of time; ACG 2010) over the 2012 to 2019 period (MEL 2020; Minnow 2020). Accordingly, selenium monitoring in 2021 focused on water, sediment, periphyton, and benthic invertebrates (Figure 1). This brief letter report provides the results of the 2021 monitoring, a brief interpretation of the results, and recommendations for future monitoring and assessment of selenium.

Water Quality

In 2021, water quality data routinely collected by the Minto Mine documented selenium concentrations were well below the SSWQO (0.002 mg/L; Figure 2; Attachment Table A.1). Intermittent discharge of effluent into Minto Creek took place between May and October, with routine water quality sampling at station W2 completed mid-April to the beginning of November.[3] Both the maximum total selenium concentration (0.000305 mg/L) and the maximum dissolved selenium concentration (0.000293 mg/L) were observed in lower Minto Creek in April 2021 (Figure 2, Attachment Table A.1). Throughout the rest of the year, selenium concentrations remained below 0.00025 mg/L (Figure 2). Annual total and dissolved selenium concentrations (mean ± standard deviations [of monthly means]) in lower Minto Creek were 0.000155 ± 0.0000337 mg/L and 0.000158 ± 0.000035 mg/L, respectively (Attachment Table A.1). In September 2021, water samples were also collected during the Aquatic Effects Monitoring Program (AEMP). Total selenium (0.00028 mg/L) was highest at upper McGinty reference, while dissolved selenium (0.000305 mg/L) was highest at upper Minto Creek (0.000305 mg/L; Figure 3; Attachment Table A.2). Lower Minto Creek had higher concentrations of total and dissolved selenium compared to both reference areas (Figure 3; Attachment Table A.2). All concentrations were well below the SSWQO (0.002 mg/L) and the Canadian Water Quality Guideline (CWQG; 0.001 mg/L; CCME 1999).

Sediment Quality

In September 2021, sediment was collected in upper and lower Minto Creek and corresponding reference areas, upper McGinty Creek and lower Wolverine Creek, respectively (Figure 1). Concentrations of selenium in sediment at upper Minto Creek and lower Minto Creek did not differ significantly compared to reference areas (Figure 4; Attachment Table A.2). Mean selenium concentrations at upper Minto Creek were lower compared to the upper McGinty Creek reference

[2] After 2019, the fisheries monitoring component of the AEMP was reduced from annually to once every three years, coinciding with the Environmental Effects Monitoring.

[3] Effluent discharge into Minto Creek took place from May 25 to June 1, September 20 to 25, and September 29, 2021. Due to low flow conditions, water quality sampling was not conducted in July 2021.

area, while mean selenium concentrations at lower Minto Creek were higher compared to the lower Wolverine Creek reference area. All selenium results were below the British Columbia alert concentration for aquatic sediment (BCSQG; 2.0 milligrams per kilograms dry weight [mg/kg dw]; BCMOE 2014) except for one station at upper McGinty Creek.

Since 2016, concentrations of selenium in sediment have been higher at upper Minto Creek compared to upper McGinty Creek reference (except in 2021). However, these differences have not been statistically significant. Concentrations of selenium in sediment have also been higher at lower Minto Creek compared to lower Wolverine Creek reference. These differences have been statistically significant since 2016, except in 2018 and 2021, when differences were not significant (Figure 4; Attachment Tables A.2 to A.6). All selenium concentrations since 2012 have been below the BCSQG for selenium (2 mg/kg dw; BCMOE 2014).

Tissue Quality

Periphyton Tissue

Periphyton has been identified as having an important role in the incorporation of selenium into lotic food chains (e.g., Presser and Luoma 2010; Stewart et al. 2010; Ohlendorf et al. 2011). In 2021, selenium concentrations in periphyton from lower Minto Creek were significantly higher than concentrations at both Lower Wolverine Creek and Lower Big Creek reference areas. This has been observed in previous years (2013 to 2018), except in 2017 when periphyton selenium concentrations in lower Minto Creek were only significantly greater than those from lower Big Creek (Figure 5; Attachment Tables A.2 to A.10).

Benthic Invertebrate Tissue

Benthic invertebrates represent the next trophic level up from periphyton and are important food source for fish. In September 2021, selenium concentrations in benthic invertebrates collected from lower Minto Creek (mean concentration of 1.6 mg/kg dry weight [dw]) were significantly lower than both reference areas (Figure 6). Selenium concentrations in benthic invertebrate tissue have not been significantly higher at lower Minto Creek compared to both reference areas since 2017. The majority of results were below the interim British Columbia guideline for invertebrate tissue (4.0 mg/kg dw; BCMOE 2014), with only one sample from lower Wolverine Creek reference (LWC-1; 4.19 mg/kg dw) exceeding the guideline (Figure 6; Attachment Tables A.2 to A.10).

Conclusions and Recommendations

Selenium concentrations in Minto Creek water and sediment remain well below guidelines for the protection of aquatic life. The 2021 selenium monitoring results indicate fairly low trophic transfer of selenium from periphyton (in which selenium concentrations were moderately higher in lower

Minto Creek than reference) to benthic invertebrates (in which selenium concentrations were moderately lower than reference). Monitoring from 2012 to 2021 has indicated an increase in selenium concentrations in benthic invertebrates at lower Minto Creek. However, similar increases in selenium concentrations were observed at reference areas, suggesting factors other than mine influence. Mean concentrations of selenium in benthic invertebrates have been below the interim British Columbia guideline for invertebrate tissue, but individual sample exceedances were observed over the years in lower Minto Creek and the lower Wolverine Creek reference. In 2021, only one sample from the lower Wolverine Creek reference had selenium concentrations that exceeded the BC interim guideline for invertebrate tissue. Overall, the 2021 selenium monitoring results indicate no selenium-associated risk of adverse effects to aquatic life, particularly in consideration of lower sensitivity of lotic environments and limited exposure to fish.

As in previous years, it is recommended that the separate reporting of selenium concentrations be discontinued and incorporated into the AEMP report with Minto Mine continuing to collect selenium concentration data in water and sediment under the AEMP. Furthermore, it is recommended that sampling of periphyton tissue quality and benthic invertebrate tissue quality is only undertaken if the SSWQO for selenium in water (0.002 mg/L) is exceeded or if the mean concentration of selenium in lower Minto Creek sediment exceeds the alert concentration (2.0 mg/kg dw). If such exceedances occur, it is recommended that they trigger periphyton and benthic invertebrate tissue quality monitoring in association with the next implementation of the AEMP (i.e., the following September).

I trust that this brief letter effectively communicates the results of the 2021 selenium monitoring program and the recommendations for selenium monitoring in 2022. If you have any comments or questions on the content of this letter, I would be pleased to discuss them with you.

Sincerely,

Minnow Environmental Inc.

Sarah Latimer, H.B.Sc

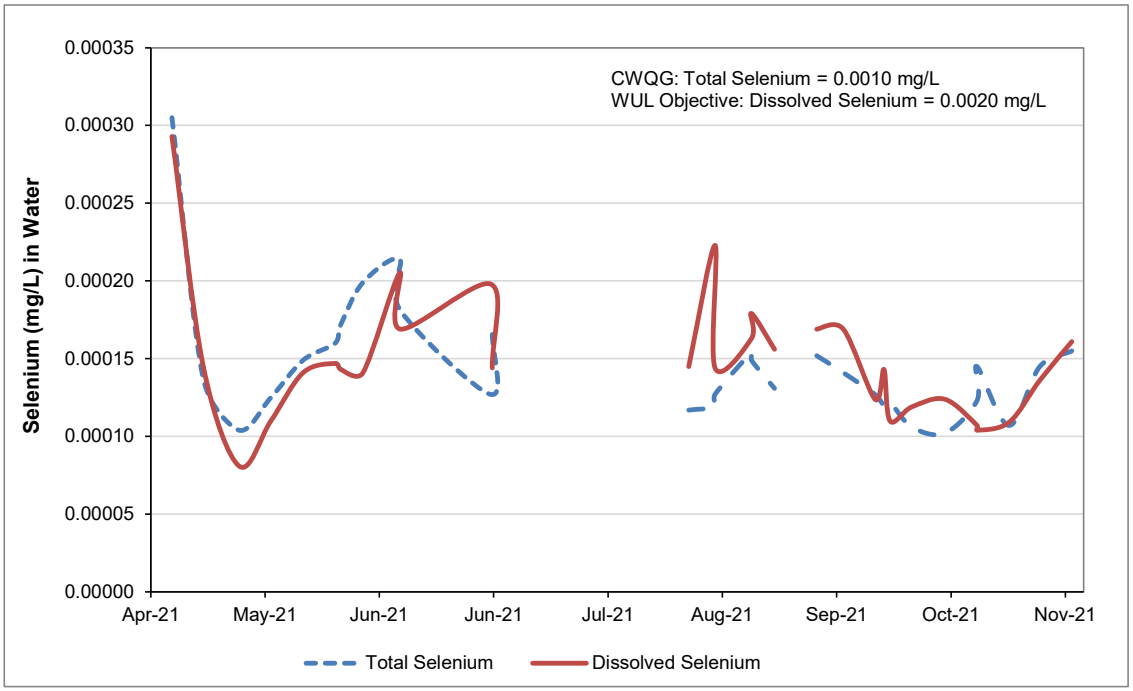

Figure 2: Selenium Concentrations (mg/L) in Water at Minto Mine Routine Monitoring Stations in Lower Minto Creek, 2021

Notes: CWQG = Canadian Water Quality Guidelines; CCME 1999. WUL = water use license. No water quality samples collected in July due to low flows.

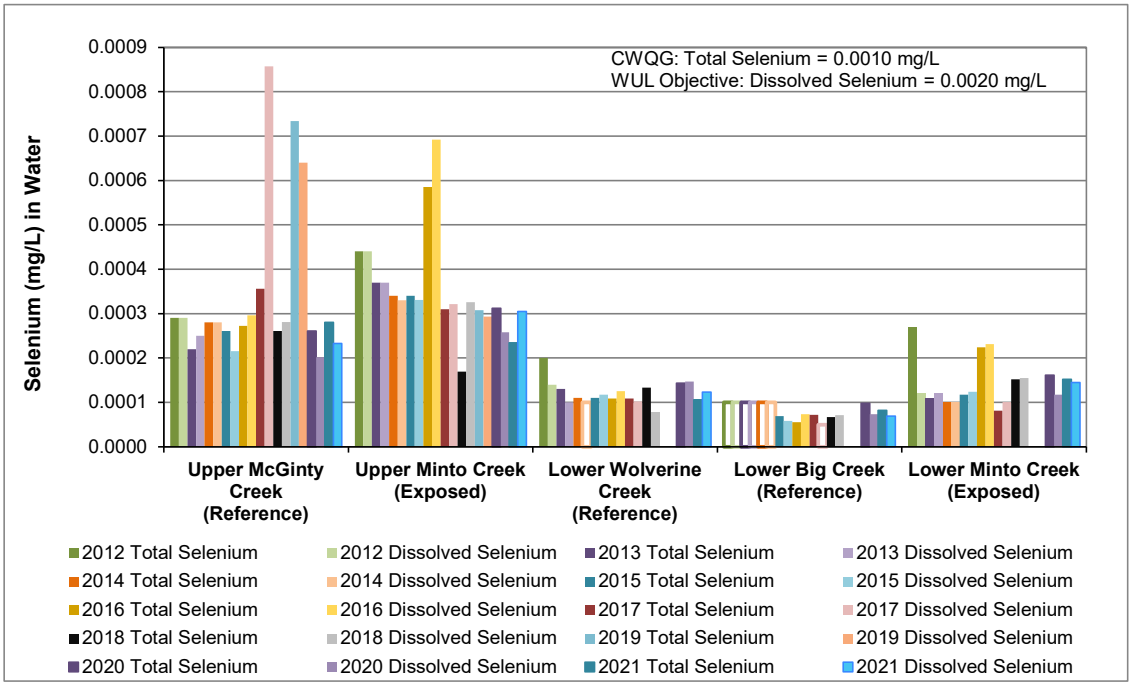

Figure 3: Total and Dissolved Selenium Concentrations (mg/L) in Water at Upper and Lower Minto Creek and Associated Reference Areas, 2012 to 2021[a]

Notes: All unfilled bars were < laboratory reporting limits. CWQG = Canadian Water Quality Guidelines; CCME 1999. Sample size = 1.

[a] Due to dry conditions at lower Minto Creek in 2019, sampling only took place in upper Minto Creek and reference

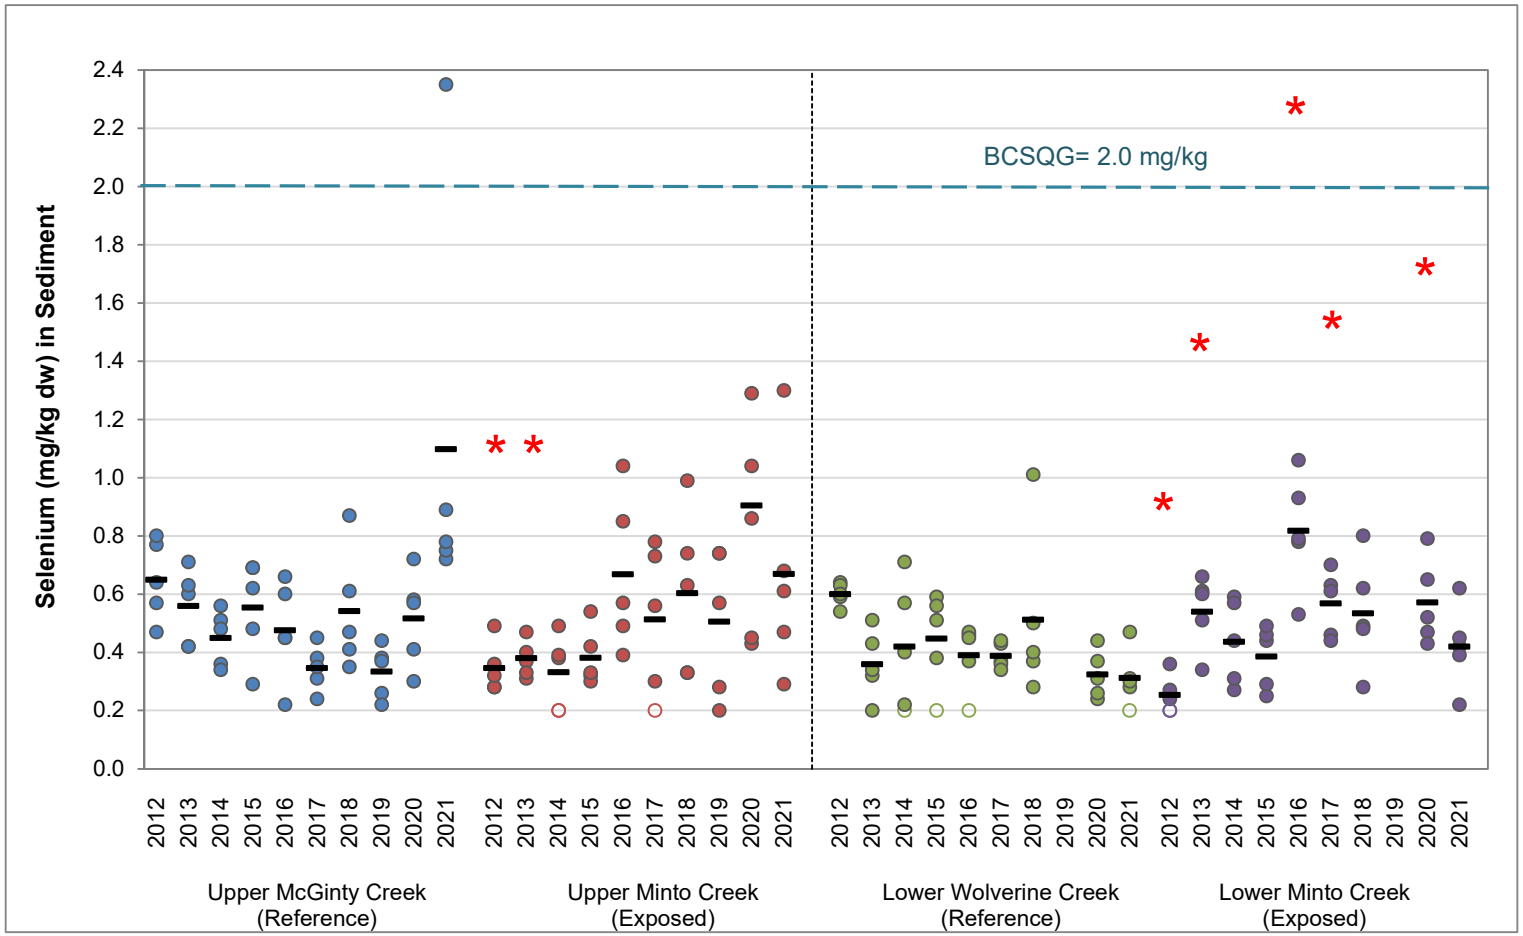

Figure 4: Selenium Concentrations in Sediment at Upper and Lower Minto Creek and Associated Reference Areas, 2012 to 2021[a]

Notes: Mean concentrations at exposed areas that differ significantly ($p < 0.05$) within year from the corresponding reference area (i.e., upper Minto Creek vs. upper McGinty Creek; lower Minto Creek vs. lower Wolverine Creek), are marked with *, n = 5. Unfilled circles represents samples < laboratory detection limits. Means are represented by black dashes. The dashed line separates the upper and lower areas. BCSQG = British Columbia Sediment Quality Guideline.

[a] Due to dry conditions at lower Minto Creek in 2019, sediment sampling only took place in upper Minto Creek and reference.

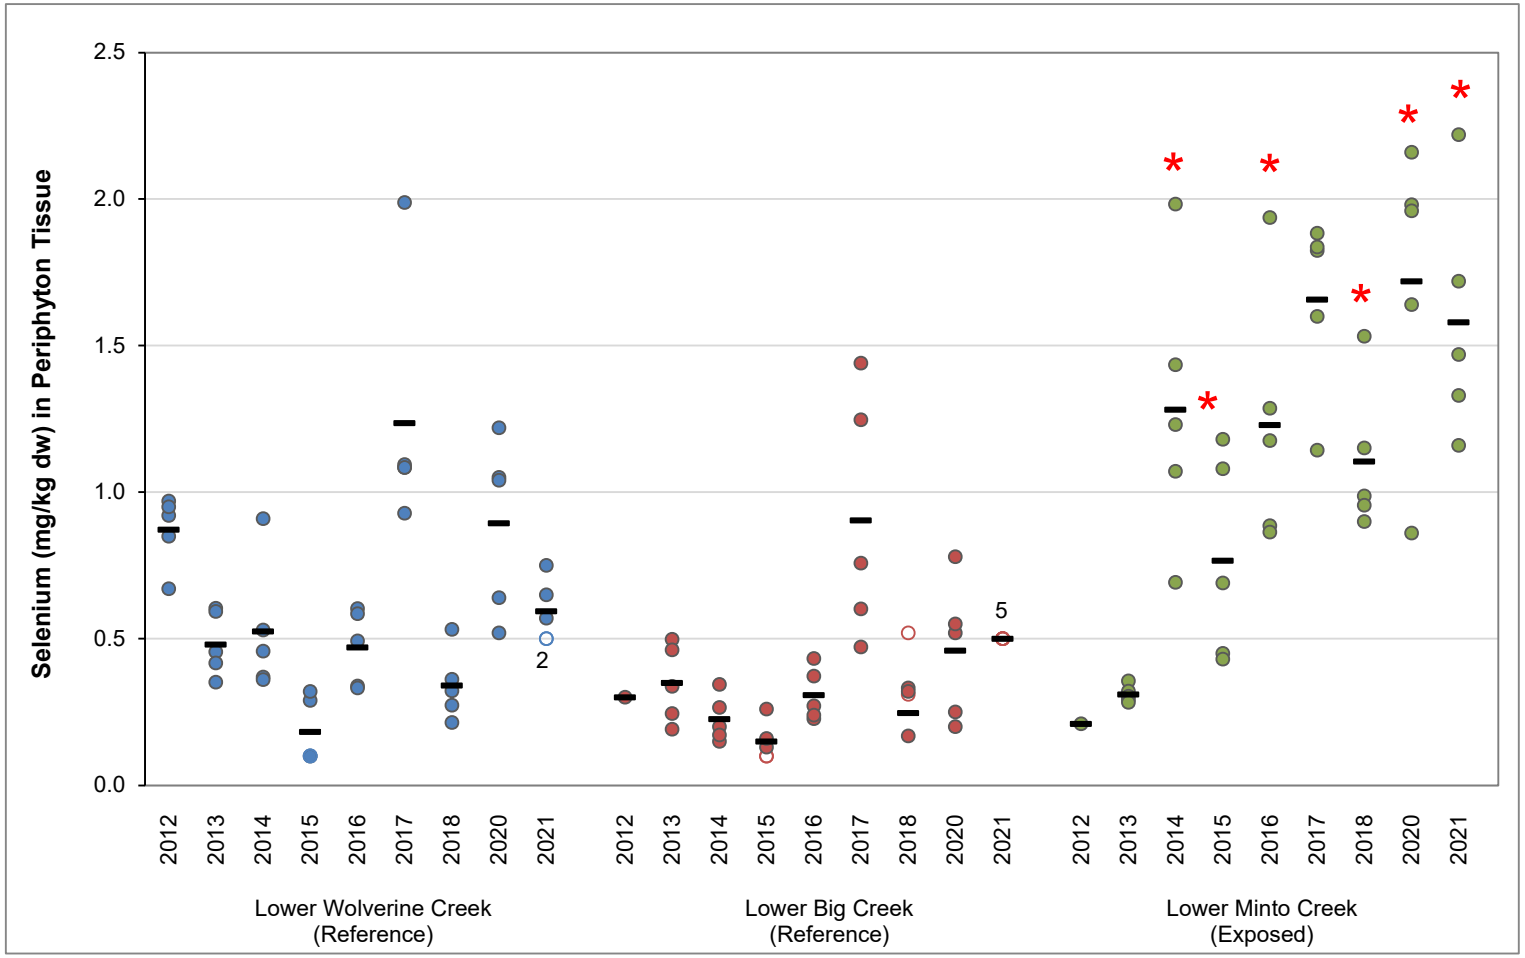

Figure 5: Periphyton Tissue Selenium Concentrations at Lower Minto Creek and Associated Reference Areas, 2012 to 2021[a]

Notes: Mean concentrations that that differ significantly ($p < 0.05$) within year between exposed and **both** reference areas are marked with with *, n = 5, except in lower Minto and lower Big creeks in 2012 (n = 1). Unfilled circles represents samples < laboratory detection limits. Means are represented by black dashes. For 2021 data, numbers near the unfilled circles indicates the number of samples at laboratory detection limit.

[a] Due to dry conditions at lower Minto Creek in 2019, periphyton sampling was not conducted.

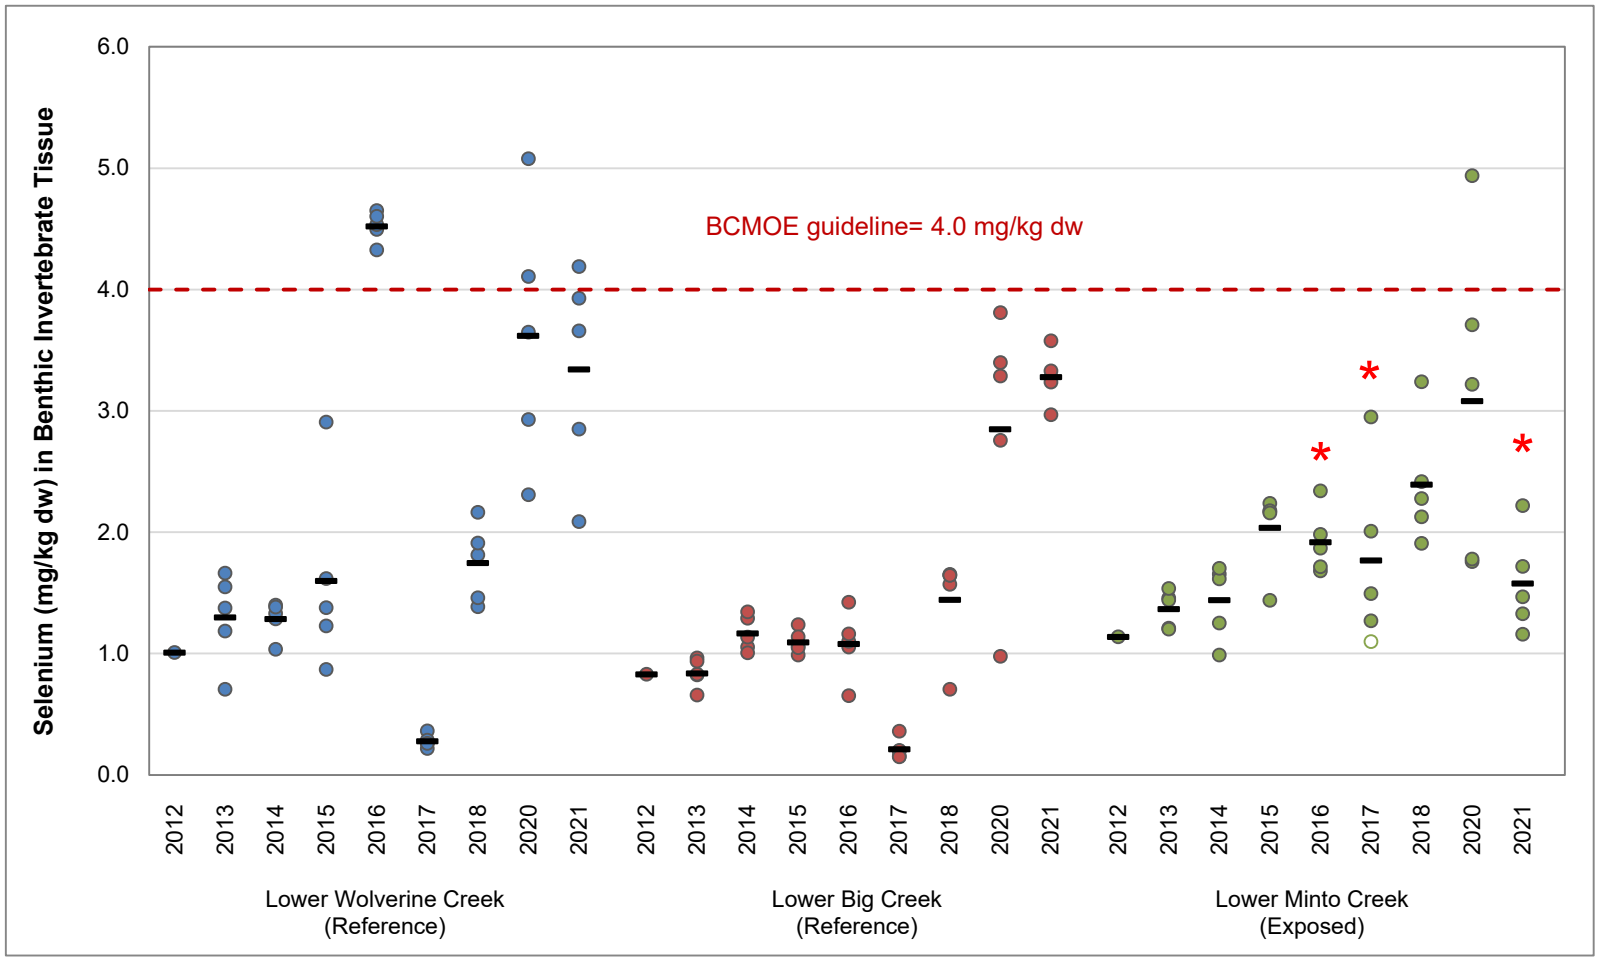

Figure 6: Benthic Invertebrate Tissue Selenium Concentrations at Lower Minto Creek and Associated Reference Areas, 2012 to 2021[a]

Notes: BCMOE = British Columbia Ministry of the Environment. Guideline is for dry weight (dw) selenium concentrations (BCMOE 2014). Mean concentrations that that differ significantly ($p < 0.05$) within year between exposed and **both** reference areas are marked with with *, n = 5, except in 2012 (n = 1). Unfilled circles represents samples < laboratory detection limits. Means are represented by black dashes.

[a] Due to dry conditions at lower Minto Creek in 2019, benthic invertebrate sampling was not conducted.

Executive Summary

SRK Consulting (SRK) was retained by Minto Metals Corp. (Minto) to provide quarterly and annual reporting on groundwater chemistry monitoring in accordance with specific performance threshold (SPT) exceedances as outlined in the Minto Mine Operational Adaptive Management Plan (OAMP; Minto, 2017) and to review overall groundwater quality at the Minto Mine. The purpose of this report is to summarize the 2021 groundwater quality, to expand on findings of the quarterly reporting, and to provide context for the associated risks.

The groundwater monitoring network at Minto includes 10 active multi-level monitoring wells installed between 2009 and 2017 that are used for on-going water quality monitoring. Groundwater is sampled in accordance with the Minto Mine Groundwater Monitoring Plan and a review of the results is carried out as part of the OAMP. There are three SPT levels for groundwater quality defined in the OAMP for the Minto Creek Catchment, and two for the McGinty Creek Catchment. Of the 10 active monitoring wells, only three are compared to the SPT in the AMP: MW12-05 and MW12-06 (Minto Creek Catchment), and MW09-03 (McGinty Creek Catchment).

Groundwater exceedances of the OAMP SPTs in 2021 were limited to a few parameters and consistent SPT exceedance is not widespread; most monitoring zones (~67%) did not exceed more than one OAMP SPT in 2021. A summary of exceedances and relevant discussion points for each catchment is provided below.

Minto Creek Catchment

- Ongoing exceedances include sulphate in MW12-05 and chromium in MW12-06.
- Elevated sulphate concentrations at MW12-05 have been restricted to monitoring zones greater than 85 mbgs. The source of elevated sulphate in the deep groundwater has been investigated in the past and findings do not suggest it is a result of mining activities. As the sulphate concentrations are interpreted to reflect natural conditions, are restricted to the deepest zones, and no effects have been observed in Minto Creek, mitigation actions are not considered necessary at this time.
- Elevated chromium concentrations at MW12-06 have been restricted to only the deepest zone (MW12-06-01) at 142 mbgs and occur simultaneously with lower, sub-SPT, concentration increases in additional trace elements. Changes in chemistry are concurrent with stoppage of the Minto South Underground, and while contact water is not suspected to be the source of chromium, equilibrium conditions in the deep groundwater may be affected by mine activities, resulting in the observed changes in chemistry. As of January 2020, concentrations have been decreasing, with the most recent monitoring event below SPT 2. As chromium is restricted to the deepest zone, and no effects have been observed in Minto Creek, mitigation actions are not considered necessary at this time.
- Sulphate concentrations in MW12-06-01 have been steadily increasing since the beginning of 2020 but have not yet reached SPT 2 (1000 mg/L). The Main Pit has previously been evaluated as a potential source of loading to groundwater in the deep groundwater near

MW12-06, but was not found to be the source. While sulphate at MW12-06-01 is increasing, other conservative parameters associated with pit water (e.g., chloride) are not, suggesting pit infiltration is not responsible for increasing sulphate concentrations in MW12-06-01. While the Dry Stack Tailings Storage Facility (DSTSF) may be considered another potential source, it is not considered responsible for the observed sulphate because concentrations in MW12-06-01 have surpassed concentrations observed in seepage from this facility. There have also been no elevated concentrations of sulphate observed in the shallow groundwater in the vicinity. This monitoring zone has always been unique, with water levels that seemingly respond to underground mining activities and chromium at concentrations not seen at any other monitoring points. The source of increasing sulphate remains under investigation, including a hypothesis that observed concentrations could be related to deeper, naturally high sulphate groundwaters as observed in MW12-05-01 and MW17-12-01, moving upwards towards the underground workings as they advance and are being dewatered, which causes upwards gradients in the deeper groundwater system.

- Concentrations in Minto Creek have remained in the range of observed baseline conditions with no observed changes that reflect any change in influence from mine-affected groundwater.

McGinty Creek Catchment

- Ongoing exceedances in the McGinty Creek catchment include arsenic and zinc in MW09-03-01 and cadmium, nitrate, and zinc in MW09-03-02.
- Minto North Pit acts as a hydraulic sink and migration of pit water towards MW09-03 is not considered to be the cause of elevated concentrations in the groundwater.
- Increases in nitrate concentrations appear to be caused by a shift in redox conditions following mining of the Minto North Pit. The shift in redox conditions may also be indirectly responsible for changes observed in arsenic, cadmium, and zinc, as equilibrium conditions were disrupted.
- Flushing of nitrogen-containing blast residuals from waste rock used to construct the Minto North haul road is another possible source of nitrate load to the groundwater.
- Concentrations in McGinty Creek have remained in the range of observed baseline conditions with no observed changes that reflect an influence from mine-affected groundwater.

Recommendations

- Continue groundwater monitoring as per the Minto Groundwater Monitoring Plan.
- Continue efforts to sample seepage and surface runoff during high precipitation events along the Minto North haul road to better constrain seepage water quality.
- Reduce sampling frequency of Zone 4, Zone 6, and Zone 7 in MW17-12 from quarterly to semi-annually in Q1 and Q3 of each year.

- Conduct opportunistic sampling of deep groundwater to assess sulphate trends with depth during exploratory drilling or from underground workings.
- Conduct a mid to late summer flow and water quality accretion survey along McGinty Creek beginning at the headwaters and extending to MN-2.5 to better understand groundwater – surface water interactions and risk due to groundwater discharge and loading when conditions are appropriate.
    - This was also recommended in the 2020 Groundwater Review, but plans were postponed as conditions were not deemed appropriate.

1 Introduction

The Minto Mine is a high-grade copper mine located approximately 240 kilometers (km) north of Whitehorse in the Yukon Territory. Mining operations began in 2007 and are currently on-going. SRK Consulting (SRK) was retained by Minto Explorations Ltd (Minto Explorations) to provide 2021 quarterly and annual reporting on groundwater monitoring in accordance with specific performance threshold (SPT) exceedances as outlined in the Minto Mine Operational Adaptive Management Plan (OAMP; Minto, 2017). In addition, SRK has completed a review of groundwater chemistry across the whole site to evaluate the potential impacts of mining activities on groundwater. The purpose of this report is to summarize the 2021 groundwater quality, to expand on findings of the quarterly OAMP SPT reporting, and to provide context for the associated risks.

1.1 Scope

The scope of this report includes a summary review of groundwater conditions across the entire project area and specific review of SPT exceedances, with interpretation of cause and/or recommended actions as required. The scope of this work does not include in-depth review of geochemical, hydrological, or climatic conditions, unless specifically pertinent to a groundwater-related question. Recommendations regarding SPT exceedances are included.

2 Background

2.1 Catchment Overview

The Minto Mine is situated in the headwaters of Minto Creek and McGinty Creek, both of which drain northeast to the Yukon River (Figure 1). The Minto Creek catchment is characterized by moderate to steep slopes to the north, south and west. The portion of the catchment occupied by the mine is known as Upper Minto Creek, which covers an area of approximately 1,040 hectares (ha) of the larger 4,100 ha Minto Creek catchment and is defined as the catchment area topographically upgradient of the Water Storage Dam (SRK 2012). The catchment below the Water Storage Dam contains no mine components and is known as Lower Minto Creek.

Minto North Pit, which is a relatively small component of the overall mine, is within the McGinty Creek catchment, which has a total area of approximately 3,400 ha (Figure 1). The Minto North Pit is located in the upper portion of the east tributary of McGinty Creek and itself has a catchment area of approximately 12 ha, including related roads.

2.2 OAMP SPT Overview

Groundwater monitoring is conducted as required by the Minto Mine Groundwater Monitoring Plan (Minto, 2016). Review of groundwater monitoring results is carried out as part of the OAMP. In the OAMP, performance thresholds have been defined to establish changes in concentration and concentration values for specific constituents of concern (CoCs) at which actions may need to be taken by Minto to avoid potential impacts to the environment. Specifically, the OAMP states:

> *"Specific Performance Thresholds (SPTs) are defined for each of the Effluent Quality Standards (EQS) parameters identified in Clause 9 (a), Table 1 of Water Use Licence QZ14-031, with the exception of pH, oil and grease, iron and nitrite."*

There are three SPT levels for groundwater quality defined in the OAMP for the Minto Creek Catchment, and two for the McGinty Creek Catchment. Of the 10 multi-port monitoring wells active in the monitoring network, only three are compared to the SPTs in the OAMP. They are MW12-05 and MW12-06 (Minto Creek Catchment), and MW09-03 (McGinty Creek Catchment). All three of these monitoring wells are located hydraulically or topographically down gradient of certain mine components:

- MW09-03 – topographically down gradient of the Minto North Pit in the McGinty Creek catchment;

- MW12-06 – hydraulically and topographically down gradient of the Main and Area 2 open pits, Dry Stack Tailings Storage Facility (DSTSF) and Mill Valley Fill Extension (MVFE), in the Minto Creek catchment;
- MW12-05 – hydraulically and topographically down gradient of all mine activities in the Minto Creek catchment.

Attachment 1 includes tables of SPT threshold concentrations. SPTs for each catchment are summarized below:

Minto Creek Catchment

1. SPT 1 corresponds to a trend-based assessment designed to flag potential increasing groundwater concentrations that have not yet exceeded concentration-based thresholds.
2. SPT 2 corresponds to the EQS concentrations defined in the OAMP, with the exception of Cr-D, Cu-D, Ni-D, for which SPT-2 is set to 50% of (0.5x) the EQS concentration, and sulphate, for which SPT-2 is set to the Aquatic Life guideline from the Contaminated Sites Regulation Schedule 3.
3. SPT 3 corresponds to the estimated concentrations in groundwater that would be necessary to cause exceedance of the Water Quality Objectives in lower Minto Creek under long term steady state groundwater flow conditions based on results of groundwater modeling.

McGinty Creek Catchment

1. SPT 1 is triggered when there are three consecutive exceedances of the 75th percentile background concentration in a single monitoring port.
2. SPT 2 is triggered when there are three consecutive exceedances of the 95th percentile background concentration in a single monitoring port.

Groundwater monitoring results are reviewed quarterly and, if a SPT is reached or exceeded, data are reviewed, interpretations are made, the risk narrative is assessed (in terms of the receiving environment), and recommendations for additional work or management actions are defined. If an OAMP SPT has not been reached for any parameter at any location, no further action is taken on the assumption that there has been no change of significance from defined baseline conditions. Quarterly OAMP reports are provided to the Yukon Government as per the OAMP.

2.3 Previous and On-going Hydrogeological Studies

In addition to the SPT exceedance reporting under the OAMP, various hydrogeologic studies have been conducted to characterize both the physical and chemical aspects of groundwater at the Minto Mine and contribute to the overall conceptual model of groundwater flow. In addition to the *Minto Groundwater Characterization and Conceptual and Numerical Model Update Report* summarized in Section 2.4, the main studies are summarized as follows:

Minto Mine Phase V/VI Expansion: Hydrogeologic Characterization Report (SRK 2013)

This study presents an early stage hydrogeologic conceptual model that characterizes the groundwater flow regime of the Minto Mine site in order to determine flow paths and where they may discharge into the receiving environment. Existing hydrogeologic knowledge of the site is integrated with site hydrology in context of the proposed plans for mine expansion.

Minto Mine Numerical Groundwater Model (SRK 2014)

This study presents the initial numerical groundwater model developed for the Minto Mine site as specifically required by the Yukon Environmental and Socio-Economic Assessment Board. The objectives of this study were to evaluate the possible extent of a solute plume originating from the mine facilities, identify where groundwater is discharging into Minto Creek and evaluate the effect of the Minto North Pit development on mass loading to McGinty Creek. Modeling included assessment of the potential for geological structures to act as conduits that could transport constituents from the main mining area (Main Pit) to areas close to the property boundary (e.g., MW12-05)

Minto 2015 Groundwater Model Update (SRK 2015)

This study presents an update to the original numerical groundwater model. The report includes a summary of new monitoring data, an update to the hydrogeologic conceptual model, a description of the updated groundwater numerical model and the subsequent results.

Minto Mine Groundwater Monitoring Program – Environmental Tracer Study Results (SRK 2017)

This study presents the results of the environmental tracer study completed as a specific requirement of the Groundwater Monitoring Program under the water license QZ14-031. The objective of the study was to evaluate longitudinal flow paths using non-toxic tracer testing, the results of which were to be ultimately incorporated into the numerical groundwater model. This report presents a succinct summary of the study methods and results. Interpretation of the results are provided in the *Minto Groundwater Characterization and Hydrogeologic Conceptual Model Update Report* (SRK 2018).

Minto Groundwater Characterization and Hydrogeologic Conceptual Model Update Report (SRK 2018)

This report presents pertinent data collected from the site groundwater monitoring network, a summary of current groundwater conditions (quantity and quality) and an updated hydrogeological conceptual mode. This report largely builds upon the conceptual model presented in SRK 2013.

Minto Mine 2019 and 2020 Groundwater Review and Summary of OAMP SPT Exceedances (SRK 2020, 2021a)

These studies are conducted on a yearly basis and summarize OAMP SPT groundwater exceedances that occurred in the previous year, expand upon the conditions which lead to exceedances and provide detailed discussion of associated risks. SRK 2020 provides an evaluation of MW17-08 for use as a background well and loading calculations to assess the risk of groundwater discharge to McGinty Creek.

SRK Memo – Response to YWB's Request for Information (IR5-48) – Sulphate Exceedances in Groundwater (SRK 2021b)

This memo addresses elevated Sulphate concentrations observed in the deep groundwater at MW12-05 on the property boundary near Minto Creek. Evidence from past studies is gathered and presented to support the hypothesis that the elevated Sulphate concentrations are naturally occurring and not a result of mine activities.

2.4 Groundwater Conceptual Model

A detailed hydrogeologic and hydrogeochemical conceptual model is presented in the *Minto Groundwater Characterization, Conceptual and Numerical Model Update Report* (SRK 2021c) and the key points are summarized below:

- There are two hydrostratigraphic units on site: (1) overburden, which is spatially discontinuous but thick along the valley bottoms, and (2) bedrock where hydraulic conductivity is relatively low, and groundwater occurs in secondary permeability along joints and fractures. The majority of flow is expected to occur relatively near to the ground surface, in the absence of permafrost;
- Permafrost can occur within the overburden unit and act as an aquiclude. Permafrost is observed and expected to occur on north-facing slopes and valley bottoms, but the spatial distribution is not well constrained;
- Groundwater flow generally follows topographic gradients overprinted by the effects of open pits or underground development with the overall flow direction towards the Minto and McGinty Creek valleys and ultimately the Yukon River. Vertical gradients across site are variable with upwards, downwards, and complex multi-directional gradients observed in the monitoring wells;

- The Minto North Pit acts as both a hydraulic sink and is not thought to contribute load to the groundwater system, while groundwater flow can enter and exit the flooded Main Pit and Area 2 Pit complex (i.e., flow through);
- Water seeping from waste rock dumps, the flooded pits, and the dry stack tailings storage facility (DSTSF) can be assumed to flow down valley but will be inhibited in overburden due to permafrost and in bedrock by the overall low hydraulic conductivity of the fractured bedrock; and
- The large majority of mine contact water is expected to ultimately discharge to ground surface upgradient of the Water Storage Pond (WSP). Groundwater that does pass the WSP has a limited flow rate and is expected to discharge to Minto Creek with contributions from unaffected catchments increasing progressively downstream.

In addition to the conceptual model, SRK 2021c presents pertinent data collected from the site groundwater monitoring network, a summary of the current groundwater conditions (both physically and chemically) and an update to the numerical groundwater model. SRK 2021c builds upon the conceptual models presented in the *2018 Hydrogeological Characterization Report* (SRK 2018) and the *Minto 2015 Groundwater Model Update (*SRK 2015) reports by incorporating monitoring data gathered since the submission of those reports together with updated mine infrastructure. Newly incorporated data did not fundamentally change interpretations from the previous conceptual models apart from groundwater flow gradients in the vicinity of the Area 2 pit. As water levels in the pit have increased, it no longer acts as a hydraulic sink. The Area 2 pit now acts as a sink for upgradient groundwater, and a source for the downgradient system, similar to the Main pit.

2.5 Groundwater Monitoring Network

The groundwater monitoring network used for on-going water quality monitoring at Minto includes 10 active multi-level monitoring wells that were installed between 2009 and 2017. The monitoring wells are spatially distributed across the site, both outside of the current mining footprint and topographically (and hydraulically) down gradient of mining activities. Monitoring locations are shown on Figure 1 and well installation details can be found in Table 1.

All of these monitoring wells were installed after the start of mining, with the exception of MW09-03 in the Minto North area, which was installed after the main Minto operations began, but before mining at the adjacent Minto North Pit started. Nomenclature of the monitoring wells and their zones is as follows:

- The two numeric digits proceeding MW are the year of installation (i.e., MW12-06 was installed in 2012); and
- Vertical monitoring zones are numbered sequentially from deep to shallow, with Zone 1 being the deepest. Zone numbers are added as a suffix to the well name (i.e. MW12-06-01 is Zone 1, the deepest monitoring point).

The monitoring zones target either overburden, bedrock (weathered or competent) or the contact between the two. MW12-06-06 is the only zone to target exclusively overburden. The following list summarizes the locations of the active monitoring wells:

- MW09-03 and MW17-11: located in the McGinty Creek catchment, topographically downgradient of the Minto North Pit;
- MW17-08: located topographically upgradient of mine activities in the Minto Creek catchment and is considered representative of background conditions near the western limit of the Minto Creek catchment;
- MW09-01 and MW17-10: located within the mine site between the Main Waste Dump and the Main Pit. MW09-01 has been dry since soon after installation;
- MW17-09: located within the mine site east of the Ice-Rick Overburden Dump and the Southwest Waste Dump;
- MW12-07: located down gradient of the Main pit, between the Main Pit and the mill;

- MW12-06: located between the Dry Stack Tailings Storage Facility (DSTSF) and the Water Storage Pond (WSP); and
- MW12-05 and MW17-12: located alongside Minto Creek, east of the WSP and east of all mine activities, at the property boundary.

More details on the groundwater monitoring network can be found in the ***Minto Groundwater Characterization, Conceptual and Numerical Model Update Report***, submitted to Minto Explorations by SRK in October 2021.

2.6 Site Activity

Site activities and mine development have been dynamic since operations began in 2006 and are important to understand the potential influence on the groundwater system. The following points summarize important events and dates of mining and key water management actions over time and a visual representation of the timeline is presented in Figure 2:

- Early 2006 to Mid 2011: Mining of the Main Pit, during which time the pit was dewatered and acted as a hydraulic sink;
- Mid 2011 to Late 2012: Water accumulated in the Main Pit;
- Late 2012 to Early 2015: Tailings and water deposited into the Main Pit;
- Early 2015 to Present: Water pumped from Main Pit to the Area 2 pit and vice versa. In late 2019, Area 2 Stage 2 Pit began overflowing to Stage 3 where pumping now occurs;
- Early 2011 to Mid 2015: Mining of Area 2 Stage 2 Pit, during which time the pit was dewatered and acted as a hydraulic sink;
- Early to Mid 2015: Road was built to access the Minto North Pit, adjacent to MW09-03 and MW17-11;
- Late 2015 to Late 2016: Mining of Minto North Pit to a bottom elevation of 835 meters above sea level (masl);
- Mid 2015 to Present: Tailings and water deposited into Area 2 Stage 2 Pit, in addition to water pumped from the Main Pit;
- 2016 to Present: Minto North Pit accumulates water from runoff and groundwater inflow only;
- Mid 2012 to October 2018; September 2019 to Present: Minto Underground advanced, during which time the underground acted as a hydraulic sink and collected water pumped to Area 2 Pit and Main Pit; and
- Late 2019 to Present: Water from the Main Pit is pumped to the mill and then to the Area 2 Pit as tailings. Water is reclaimed from the Area 2 Stage 4 Pit and pumped back to the Main Pit.

2.7 Groundwater Data and Current Conditions

2.7.1 Water Elevations and Flow

Consistent with the conceptual model, groundwater generally flows in the same direction as surface water, discharging into Minto and McGinty Creeks, and ultimately the Yukon River (Figure 3). Groundwater is expected to be contained within each catchment, with a groundwater divide located along the ridge between Minto North Pit and main site activities in the Minto Creek catchment. Locally, the Minto North Pit acts as hydraulic sink, while the Main Pit and Area 2 Pit act as both a sink and source for groundwater with groundwater entering from the north and west uphill directions and discharging to the east and south towards Minto Creek. The Minto underground acts as a groundwater sink.

Groundwater elevations in the McGinty Creek Catchment range from 893.3 to 903.1 masl in the shallowest monitoring ports of the multi-level wells. The vertical gradient is downwards in MW17-11 and with water levels in both monitoring ports of MW09-03 essentially the same.

Groundwater elevations in the Minto Creek Catchment range from 926.6 masl in MW17-08, located west of the mining activities, to 662.2 masl in MW12-05, located approximately 0.5 km downgradient of the Water Storage Pond along Minto Creek. Vertical gradients are variable within the catchment, with overall upwards gradients in MW17-10 and MW17-12 and downwards gradients in MW17-08, MW12-07 and MW12-05 (Figure 3).

2.7.2 Groundwater Quality

Groundwater quality at the Minto Mine is largely within the range of observed baseline conditions, with a low number of consistent SPT exceedances. While SPTs are not exceeded or applied to specific wells, visual trends (increasing or decreasing) are observed for various parameters. Table 1 summarizes qualitative trends observed in groundwater chemistry at each well with parameters identified that consistently exceed thresholds. The review focused on data from 2016 to present, a period which has a consistent record from all monitoring zones. In addition to Table 1, time series presenting monitoring data for each CoC for each well are provided in Attachment 2 and a discussion of the trends is provided in Section 4.

Table 1: Summary of Qualitative Trends in CoCs and Consistent SPT Exceedances in Active Monitoring Wells

Catchment	Well ID	Monitoring Zone	Visual Trends		Consistent Threshold Exceedances		
			Increasing	Decreasing	SPT 1	SPT 2	SPT 3
Minto Creek	MW12-05	1	SO_4	-	-	SO_4	-

		3	-	-	---	---	---
		4	-	-	---	---	---
		5	-	-	---	---	---

Notes:

'-' No trends or exceedances were identified

'--' Insufficient data to evaluate trends

'---' SPT does not apply to monitoring well or catchment

3 2021 Groundwater AMP SPT Events

Table 2 and Table 3 summarize groundwater locations and parameters for which OAMP SPTs have been reached for the 2021 monitoring year. CoCs at any groundwater monitoring location that are not identified in this table did not have changes of significance in terms of OAMP SPTs. Baseline groundwater conditions are defined in the OAMP based on data from MW09-03 prior to 2015 (start of Minto North mining). MW17-08 was installed upgradient of mine activities with the intention of gathering background chemistry data that could be used to evaluate SPTs with catchment specific data. After a review completed in 2020 however, this location was deemed inappropriate as it represents background conditions at one location, upgradient of the ore body. Baseline chemistry prior to mining activities may be significantly different downgradient of the ore body or deeper in the aquifer so therefore the original SPTs developed using baseline data from MW09-03 are considered the most appropriate (SRK 2020).

The McGinty Creek monitoring wells are required to be sampled monthly, where the Minto Creek monitoring wells are sampled once a quarter. Due to issues with sampling equipment and/or the presence of glycol in the monitoring ports, samples could not be obtained in the McGinty Creek catchment for MW09-03-01 in January or March and in MW09-03-02 in January. In the Minto Creek catchment, samples were not obtained in Q1 for MW12-06-06 and MW12-06-05, in Q3 for MW12-05-06, MW12-05-07 and MW12-06-01 and in Q4 for MW12-05-04 and MW12-06-01.

Figures representing groundwater monitoring data for all CoCs are included in Attachment 2. A complete dataset for all monitoring wells along with key monitoring stations in McGinty Creek, Minto Creek and within the mine operations are provided in Attachment 3 and a description of each monitoring station is provided in Attachment 4.

Table 2: McGinty Creek Catchment Threshold Exceedances

Monitoring Well Zone	Parameter	SPT	Context
MW09-03-01	As	2	10 of 10 samples exceeded threshold concentration
	Ag	2	1 of 10 samples exceeded threshold concentration
	Cd	1	3 of 10 samples exceeded threshold concentration
	Se	1	2 of 10 samples exceeded threshold concentration
	Zn	1	2 of 10 samples exceeded threshold concentration
		2	6 of 10 samples exceeded threshold concentration
	NO_3^-	1	1 of 10 samples exceeded threshold concentration
MW09-03-02	Al	1	1 of 11 samples exceeded threshold concentration
		2	1 of 11 samples exceeded threshold concentration
	Cd	1	7 of 11 samples exceeded threshold concentration
		2	2 of 11 samples exceeded threshold concentration
	Cu	1	2 of 11 samples exceeded threshold concentration
	Se	1	5 of 11 samples exceeded threshold concentration
	Zn	2	11 of 11 samples exceeded threshold concentration
	NO_3^-	2	11 of 11 samples exceeded threshold concentration
	SO_4^{2-}	1	5 of 11 samples exceeded threshold concentration

Table 3: Minto Creek Catchment Threshold Exceedances

Monitoring Well Zone	Parameter	SPT	Context
MW12-05-01	SO_4^{2-}	2	4 of 4 samples exceeded threshold concentration
MW12-05-02	Cr	1	1 of 4 samples exceeded threshold concentration
	Se	1	1 of 4 samples exceeded threshold concentration
	SO_4^{2-}	2	4 of 4 samples exceeded threshold concentration
MW12-05-03	Zn	1	1 of 4 samples exceeded threshold concentration
	SO_4^{2-}	1	1 of 4 samples exceeded threshold concentration
MW12-05-04	Se	1	1 of 3 samples exceeded threshold concentration
MW12-06-01	Cr	2	2 of 2 samples exceeded threshold concentration

MW12-06-03	Se	1	1 of 3 samples exceeded threshold concentration
MW12-06-06	Zn	1	1 of 4 samples exceeded threshold concentration
		3	1 of 4 samples exceeded threshold concentration

4 2021 Discussion Points

4.1 Groundwater Quality in Minto Creek Catchment

4.1.1 SPT Exceedances

Trends in certain parameters within the groundwater monitoring network in the Minto Creek catchment are present, as listed in Table 1; however, only sulphate and chromium have consistently exceeded SPTs. While the other parameters provide useful insight for interpretation of overall conditions at the Project and comparison with previously provided water quality predictions, they are not considered problematic at this time as concentrations remain below OAMP thresholds. Changes in groundwater quality within the mine site are consistent with what is expected during active operations and concentrations in Minto Creek generally remain in the range of baseline conditions. Figures representing groundwater monitoring data for all CoCs are included in Attachment 2. A complete dataset for all monitoring wells along with key monitoring stations in McGinty Creek, Minto Creek and within the mine operations are provided in Attachment 3 and a description of each monitoring station is provided in Attachment 4.

Sulphate

Sulphate SPT exceedances only occur consistently in MW12-05 and have been restricted to the deeper zones (MW12-05-01, MW12-05-02 and MW12-05-03) which monitor depths greater than 85 meters below ground surface (mbgs) Figure 4, Figure 5, & Figure 6 show sulphate concentrations at MW12-05 with MW17-12 and MW12-06 for comparison. Concentrations have been increasing in these three zones at MW12-05, but at a slower rate than previously (Figure 6). Monitoring zones shallower than Zone 3 have also been increasing since installation, but at far lower sulphate concentrations (<100 mg/L) and show signs of stabilization in recent monitoring

events. This trend is characteristic of groundwaters reaching equilibrium following installation, which can take several years in aquifers with low hydraulic conductivity.

Figure 4 presents a cross sectional representation of sulphate concentrations in the Minto Creek catchment and Figure 5 presents the distribution of sulphate concentrations in plan view, with nested diamonds representing multi-level wells and the smallest diamonds as the deepest zones. The highest concentrations are localized to the deepest groundwater furthest downgradient in the catchment, within the Main and Area 2 pits and the underground workings. While many of the wells show increasing sulphate concentrations with depth, MW17-12 is the only other location with concentrations above 1000 mg/L and is the only well to monitor water as deep as MW12-05.

MW12-06 is located in the pre-mining Minto Creek valley bottom, between the water storage pond and the pits, and upgradient of MW17-12 and MW12-05. Sulphate concentrations have been increasing in the deepest zone of MW12-06 since the beginning of 2020 but have not yet reached SPT 2 (1000 mg/L). The highest concentration was recorded in May 2021 at 612 mg/L. Due to equipment malfunction and the presence of glycol in sampling ports, samples were not obtained in Q3 and Q4 of 2021. While sulphate is increasing, other conservative parameters associated with pit water (e.g., chloride) are not, suggesting pit infiltration is not responsible for increasing sulphate concentrations in MW12-06-01. While another potential source may be the DSTSF, it is not considered responsible for the observed sulfate because concentrations in MW12-06-01 have surpassed concentrations observed in seepage from this facility (Figure 7). There have also been no elevated concentrations of sulfate observed in the shallow groundwater in the vicinity. Chromium is concurrently decreasing in this zone, a parameter that has always been unique to the deepest zone in MW12-06. This zone has also been unique in its apparent response to underground mining, showing water levels that have decreased and then rebounded as new areas in the underground workings are advanced. The source of increasing sulphate remains under investigation, including a hypothesis that observed concentrations could be related to deeper, naturally high sulphate groundwaters as observed in MW12-05-01 and MW17-12-01, moving upwards towards the underground workings as they advance and are being dewatered, which causes upwards gradients in the deeper groundwater system.

Elevated sulphate concentrations in groundwaters near sulphide-containing ore bodies are not uncommon due to interaction with sulphur bearing minerals along the groundwater flow paths. Sulphate concentrations have been examined in multiple investigations, all of which suggest elevated concentrations at MW12-05 are not related to mining activities. Details of these investigations can be found in SRK 2021, and a summary of the observations that contribute to this conclusion are provided below.

- Sulphate concentrations at MW12-05 immediately following installation (2012) were higher than any mine source (i.e. Main Pit, DSTSF seepage, etc.);
- The Main Pit acted as a hydraulic sink for groundwater until 2013, one year after the installation of MW12-05 and after the initial increase was observed in MW12-05;
- Chloride, which is only present in high concentrations in mine affected waters, did not increase in MW12-05 concurrent with sulphate (and hasn't increased at all). If MW12-05

was receiving mine affected waters, the chloride would also have been expected to increase, which it did not. In addition, chloride concentrations in MW17-12 are very similar to MW12-05 and have shown no sign of increasing;

- The isotopic signatures of deep groundwater at MW12-05 are not indicative of recent mixing with surface/mine site sources; and
- Measured hydraulic conductivities in the bedrock are very low and there are no mapped structures that would act as a conduit for groundwater flow. Additionally, all solute transport simulations conducted during modelling concluded the observed concentrations are unrelated to mine activities.

While sulphate concentrations have been increasing and exceeding thresholds in the deeper zones, all available evidence suggests they are not related to mine activities and they are considered to be naturally occurring due to interaction with the sulphur-bearing minerals of the ore body.

Chromium

Chromium concentrations consistently exceeded thresholds in the deepest zone of MW12-06 (150 mbgs) in the past but have recently decreased to levels below SPT 2 (Figure 8). Chromium was the only parameter to consistently exceed thresholds in MW12-06 since installation and is not thought to be caused by mine affected waters infiltrating into groundwater.

As chromium is sensitive to changes in redox conditions, the analysis of other redox-sensitive elements is useful to understand possible mechanisms for observed concentrations in MW12-06-01. Manganese and iron, which exist in an aqueous phase under reducing conditions at neutral pH, were stable until late 2018, at which point they suddenly increased (Figure 9). Concentrations of iron have since decreased, following the same trend as chromium (Figure 9). This event coincides with stoppage of active mining in the Minto South Underground. At that time, water levels (pressure) in MW12-06-01 dropped significantly while no other monitoring zones were affected (Figure 10).

The drop in pressure in MW12-06-01 suggests deep groundwaters in the vicinity of the well are affected by underground mining activities which may disrupt the system's equilibrium. The changes in redox sensitive elements are likely a response to this disruption, as hydraulic gradients shift due to pressure changes.

While mine activities may influence the groundwater system equilibrium in the vicinity of MW12-06-01, elevated concentrations are not a direct result of mine water infiltration. These trends are not unexpected near active mining, where the development of pits and underground workings abruptly depressurizes the groundwater system.

Other Parameters

Isolated exceedances of SPT 1 and SPT 2 criteria occurred at multiple locations for a variety of parameters. SPT definitions were provided in Section 2.2. SPT 1 generally identifies significant change in concentration since the previous monitoring event but have not exceeded a

concentration-based threshold. SPT 2 criteria generally identify concentrations that have exceeded a defined baseline or EQS concentration.

- Isolated SPT 1 exceedances in 2021 include: chromium in MW12-05-02; selenium in MW12-05-02, MW12-05-04, MW12-06-01 and MW12-06-03; zinc in MW12-05-02 and MW12-05-06 and sulphate in MW12-05-03.

While the exact cause of these exceedances is uncertain, they occur as sporadic and as isolated events. Continuous trends are not present for these parameters and are therefore not considered a risk at this time.

4.1.2 General Visual Trends

In addition to the exceedances discussed above, some parameters exhibit increasing trends at concentrations that are currently below thresholds, as outlined in Table 1.

While it is important to monitor these trends, they are not unexpected in the vicinity of active mining where the development of pits and underground workings depressurize the system and upset equilibrium conditions, and do not currently pose a risk to Minto Creek water quality.

4.1.3 Risk Context

Elevated concentrations of CoCs in groundwater are assessed to identify and mitigate potential risks to surface water quality in Minto Creek. At this time, elevated concentrations of CoCs in groundwater are not considered a high risk to surface water quality. The following points summarize the rationale for this conclusion:

- Consistent exceedances are not widespread and are limited to only sulphate and chromium;
- Elevated concentrations of sulphate and chromium are isolated to the deepest zones of MW12-05 and MW12-06, with no known conduit connecting groundwater at these depths to Minto Creek at surface;
- Data suggest sulphate concentrations in MW12-05 are not related to mine activities;
- Data suggest chromium concentrations are a result of the groundwater equilibrium being disrupted by depressurization and not direct mine-water infiltration; and
- Concentrations in Minto Creek have remained in the range of observed baseline conditions with no observed changes that reflect an influence from mine-affected groundwater.

The overall risk of mine-affected groundwater contributions to Minto Creek water quality is considered low; mitigation is not considered necessary at this time.

4.2 Groundwater Quality in McGinty Creek Catchment

4.2.1 SPT Exceedances

Trends in certain parameters within the groundwater monitoring network in the McGinty Creek catchment are present, as listed in Table 1; however, only arsenic and zinc in MW09-03-01 and cadmium, nitrate, and zinc in MW09-03-02 have consistently exceeded SPTs. While the other parameters provide useful insight for interpretation of overall conditions at the Project and comparison with previously provided water quality predictions, they are not considered problematic at this time as concentrations remain below OAMP thresholds. Figures representing groundwater monitoring data for all CoCs are included in Attachment 2. A complete dataset for all monitoring wells along with key monitoring stations in McGinty Creek, Minto Creek and within the mine operations are provided in Attachment 3 and a description of each monitoring station is provided in Attachment 4.

For context, in 2020, molybdenum and selenium consistently exceeded thresholds in MW09-03-01. In 2021, concentrations decreased with only two exceedances for selenium and none for molybdenum.

Nitrate

Nitrate concentrations at MW09-03-02 have been increasing since the beginning of 2017 and have consistently exceeded SPT 2. The nitrate concentration of the deeper zone, MW09-03-01, remains stable and below both SPT 1 and SPT 2. Nitrate concentrations of the same magnitude observed at MW09-03-02 are consistently observed in MW17-11-05, which is at a similar elevation and adjacent to MW09-03-02 (Figure 11). Presently, the Minto North Pit acts as a hydraulic sink, with a hydraulic divide possible in the vicinity of MW09-03 and MW-17-11 and gradient towards the pit from both wells. As the pit water level is much lower than water levels in the wells, migration of pit water is not the cause of the nitrate increase observed at MW09-03-02.

The increase in nitrate concentrations do coincide with development of the Minto North Pit, which resulted in a water level decrease in MW09-03 and subsequent changes in redox conditions which can cause an increase in nitrate (discussed below). The development of Minto North involved the construction of a haul road using blasted rock which may also contribute nitrogen load to the groundwater. Observed concentrations in MW09-03-02 may be the result of these two different mechanisms.

Nitrate is sensitive to changes in redox conditions. Other redox-sensitive elements were assessed to understand the observed concentrations in MW09-03. Concentrations of ammonia, iron and manganese decreased significantly and concurrently with an increase in oxidation-reduction potential (ORP) at the same time as the observed water level decrease. These observations suggest conditions in the aquifer changed from reducing to oxidizing, resulting in the formation of iron and manganese oxides/oxyhydroxides and a shift in nitrogen speciation from an ammonia dominated system to nitrate (Figure 12). After the initial increase in nitrate and decrease in ammonia (2016-2017), ammonia concentrations stabilized but nitrate continued to increase. At this time, nitrate also started to exhibit a seasonal trend with highest concentrations

occurring in Q3 of each year and the lowest in the winter months when surface conditions are frozen. Blasted rock was used to construct the Minto North haul road which contains nitrogen compounds as residue from the process. These nitrogen compounds can be mobilized as nitrate by precipitation infiltrating through the blasted material. Seepage from nitrogen-containing blast residuals in the haul road material are likely contributing additional load to the groundwater, which is consistent with the seasonal trends observed since 2018. While the initial nitrate load may have been due a change in redox state, flushing from the haul road is likely responsible for the more recent trends.

While elevated nitrate concentrations are observed in the shallow groundwater, effects have not been observed in McGinty Creek, suggesting the influence is localized. We do not believe that observations suggest mitigation is necessary at this time but continued monitoring and evaluation is warranted to ensure this interpretation does not change.

Arsenic

Arsenic concentrations in MW09-03-01 increased concurrent with the development of the Minto North Pit but appear to have reached equilibrium quickly, as concentrations have since stabilized. Concentrations are consistently above SPT 2 but, as Minto North Pit acts as a hydraulic sink, are not due to pit water infiltration. An inverse trend was observed in MW09-03-02, with an initial decrease followed by stabilization (Figure 13). Concentrations in the deepest zones of MW17-11 have been slowly increasing since installation and may still be approaching equilibrium after development.

Similar to nitrate, arsenic is redox sensitive, and these trends may be attributed to a change in aquifer conditions as water levels dropped in 2015 following the onset of mining at Minto North.

Cadmium and Zinc

Zinc increased in concentration and variability in MW09-03-01 and MW09-03-02, beginning in 2015 when mining of the Minto North pit started (Figure 15). Cadmium showed similar behavior, particularly in MW09-03-02 (Figure 16). The dominant attenuation process for these ions is adsorption, and it is possible with a change in conditions, competition for adsorption sites and the preferential adsorption of other metals caused the increased mobility of zinc and cadmium which have not yet reached equilibrium.

Other Parameters

In addition to the consistent exceedances discussed above, a few other exceedances to thresholds were observed: silver, selenium, and nitrate in MW09-03-01 and aluminum, copper, selenium, and sulfate in MW09-03-02.

While the exact cause of these exceedances is uncertain, they occur sporadically and often as isolated events. Continuous trends are not present for these parameters and are therefore not discussed further at this time.

4.2.2 General Visual Trends

In addition to the exceedances discussed above, some parameters exhibit increasing trends at concentrations that are currently below thresholds, as outlined in Table 1.

While it is important to monitor these trends, they are not unexpected near active mining, where the development of pits abruptly depressurizes the groundwater system and upsets equilibrium conditions, and do not currently pose a risk to McGinty Creek water quality.

4.2.3 Risk Context

Elevated concentrations of CoCs in groundwater are assessed to identify and mitigate potential risks to surface water quality in Minto Creek. At this time, elevated concentrations of CoCs in groundwater are not considered a high risk to surface water quality. The following points summarize the rationale for this conclusion:

- Groundwater levels in all monitoring zones of MW09-03 and MW17-11 are at least 30 m higher than the Minto North Pit, creating a hydraulic barrier preventing pit water from migrating towards McGinty Creek;
- Concentrations in McGinty Creek have remained in the range of observed baseline conditions with no observed changes that reflect an influence from mine-affected groundwater; and
- Loading calculations presented in SRK 2020 indicate groundwater concentrations would have to increase by at least one order of magnitude from the 2019 average to contribute enough load to McGinty Creek for SPT 1 to be exceeded, with the exception of selenium, which has been elevated in baseline data and already exceeds SPT 1 at MN-4.5 (Table 4). Additional context is provided below.

While the required nitrate concentration (37 mg/L) determined by the loading calculations is an order of magnitude higher than the 2019 average (7.9 mg/L), monitoring events during Q2 2021 had concentrations as high as 19.6 mg/L in MW09-03-02 with a 2021 average concentration of 10.4 mg/L. If nitrate continues to increase in MW09-03-02, the loading calculations suggest an impact could be seen in McGinty Creek. It is still uncertain, however, if the groundwater poses the highest risk of loading, or if surficial seeps from the Minto North haul road are more important. The overall estimated percentage of groundwater loading to McGinty Creek, which was calculated using an area percentage of the total McGinty Creek catchment, is low (0.45%) and as the Minto North Pit acts as a hydraulic sink, this is a conservative estimate of groundwater contributions. This method is also considered conservative compared to using observed baseflows presented in the *Minto Mine Numerical Groundwater Model Report* (SRK 2014), which were considerably lower than the flows calculated for use in the loading assessment.

The average concentrations in 2021 were not significantly different than 2019, and even decreased in some cases (Table 4).

The overall risk of mine-affected groundwater contributions to McGinty Creek water quality is considered low; mitigation is not considered necessary at this time.

Table 4: Results of McGinty Creek Loading Calculations

Parameter	Units	Minto Creek SPT 1	2019 Average Concentrations		2021 Average Concentrations		Groundwater Concentration Required to Exceed SPT 1
			Surface Water (MN-4.5)	Groundwater (MW-09-03-02)	Surface Water (MN-4.5)	Groundwater (MW-09-03-02)

Sulphate	mg/L	-	11	5.5	8	6.7	-

Notes:

Red cell indicates surface water concentrations are historically higher than Minto Creek SPTs

"Groundwater concentration required to exceed SPT 1" are based on 2019 average concentrations and details of this calculation can be found in SRK 2020. The 2021 average concentrations are provided for year to year comparison.

5 Review of Sampling Frequency in MW17-12

Table 2-3 in the Minto Mine Environmental Monitoring, Surveillance and Reporting Plan (2018-01) outlines the frequency with which each well is required to be monitored and the rationale for each zone. While MW17-12 is monitored seasonally, three of the zones (4, 6 and 7) may be reduced if concentrations are found to be stable after one year of monitoring. Parameters that exceeded SPTs in the Minto Creek Catchment were plotted for MW17-12 to assess stability and are presented in Figure 17. Apart from the Q3 2021 monitoring event, which appears to be an outlier, concentrations have been stable since sampling began in 2017. As such, it is appropriate to decrease the frequency of monitoring in Zone 4, Zone 6, and Zone 7 of MW17-12 from quarterly to semi-annually, with samples collected in Q1 and Q3 of each year.

6 Conclusions

Groundwater exceedances of the OAMP SPTs in 2021 have been limited to a few parameters and consistent SPT exceedance is not widespread; most monitoring zones (~67%) did not exceed more than one OAMP SPT in 2021. Isolated exceedances are expected due to the range in natural variability within the groundwater system and are therefore not considered a risk at this time.

6.1 Minto Creek

- On-going exceedances in the Minto Creek catchment include sulphate in MW12-05-01 and MW12-05-02 and chromium in MW12-06-01.
- Chromium concentrations in MW12-06-01 have been decreasing since the beginning of 2020 and are now below SPT 2 for the first time since monitoring began.
- Sulphate concentrations exhibit an increasing trend with depth across the site and events have been restricted to the deepest monitoring zones at depths greater than 85 mbgs.
- The source of elevated sulphate in the groundwater has been examined in multiple investigations, all of which suggest elevated concentrations at MW12-05 are not related to mining activities and is instead likely due to interaction with sulphur-bearing minerals in the ore body.
- Sulphate concentrations in MW12-06-01 have been steadily increasing since the beginning of 2020 but have not yet reached SPT 2 (1000 mg/L).
- Changes in water levels and redox sensitive parameters indicate underground mine activities may disrupt the equilibrium conditions of groundwater at MW12-06-01, but elevated chromium concentrations are not a direct result of mine water infiltration.
- Concentrations in Minto Creek have remained in the range of observed baseline conditions with no observed changes that reflect an influence from mine-affected groundwater.

6.2 McGinty Creek

- On-going exceedances in the McGinty Creek catchment include arsenic and zinc in MW09-03-01 and cadmium, nitrate, and zinc in MW09-03-02.
- Minto North Pit acts as a hydraulic sink and the migration of pit water is not responsible for elevated concentrations in groundwater.
- The system experienced a shift in redox conditions following a water level drop concurrent with the development of Minto North. This shift may be responsible in part for observed exceedances as equilibrium conditions were disrupted.
- Flushing of nitrogen-containing blast residuals from waste rock used to construct the Minto North haul road is considered another likely source of loading to the groundwater.
- Results of the groundwater loading calculations indicate most parameters would have to increase beyond current concentrations by at least one order of magnitude to contribute enough load into McGinty Creek for SPT 1 to be exceeded.
- The overall contribution of groundwater to McGinty Creek is low and a hydraulic barrier exists between Minto North Pit and McGinty Creek, preventing seepage from entering the surface water system from the pit itself.

Concentrations in Minto and McGinty Creeks have remained in the range of observed baseline conditions with no observed changes that reflect an influence from mine-affected groundwater. The overall risk of contact water migrating through the groundwater and negatively affecting McGinty and Minto Creeks is considered low and mitigation efforts are not necessary at this time.

7 Recommendations

Groundwater exceedances of the OAMP SPTs do not require mitigation as surface water bodies have not been impacted by elevated groundwater concentrations and several lines of evidence, along with water quality predictions for the overall project, suggest the overall risk of future impacts to surface water quality is low. Groundwater monitoring should continue as per the Minto Mine Groundwater Monitoring Plan, and results should continue to be evaluated against the Operational Adaptive Management Plan SPTs and compared with other studies assessing natural background conditions. The following actions are also recommended to inform future mitigation efforts:

- Continue groundwater monitoring as per the Minto Groundwater Monitoring Plan.
- Continue efforts to sample seepage and surface runoff during high precipitation events along the Minto North haul road to better constrain seepage water quality.
- Reduce sampling frequency of Zone 4, Zone 6, and Zone 7 in MW17-12 from quarterly to semi-annually in Q1 and Q3 of each year.
- Conduct opportunistic sampling of deep groundwater to assess sulphate trends with depth during exploratory drilling or from underground workings.
- Conduct a mid to late summer flow and water quality accretion survey along McGinty Creek beginning at the headwaters and extending to MN-2.5 to better understand groundwater – surface water interactions and risk due to groundwater discharge and loading when conditions are appropriate.
    - This was also recommended in the 2020 Groundwater Review, but plans were postponed as conditions were not deemed appropriate.

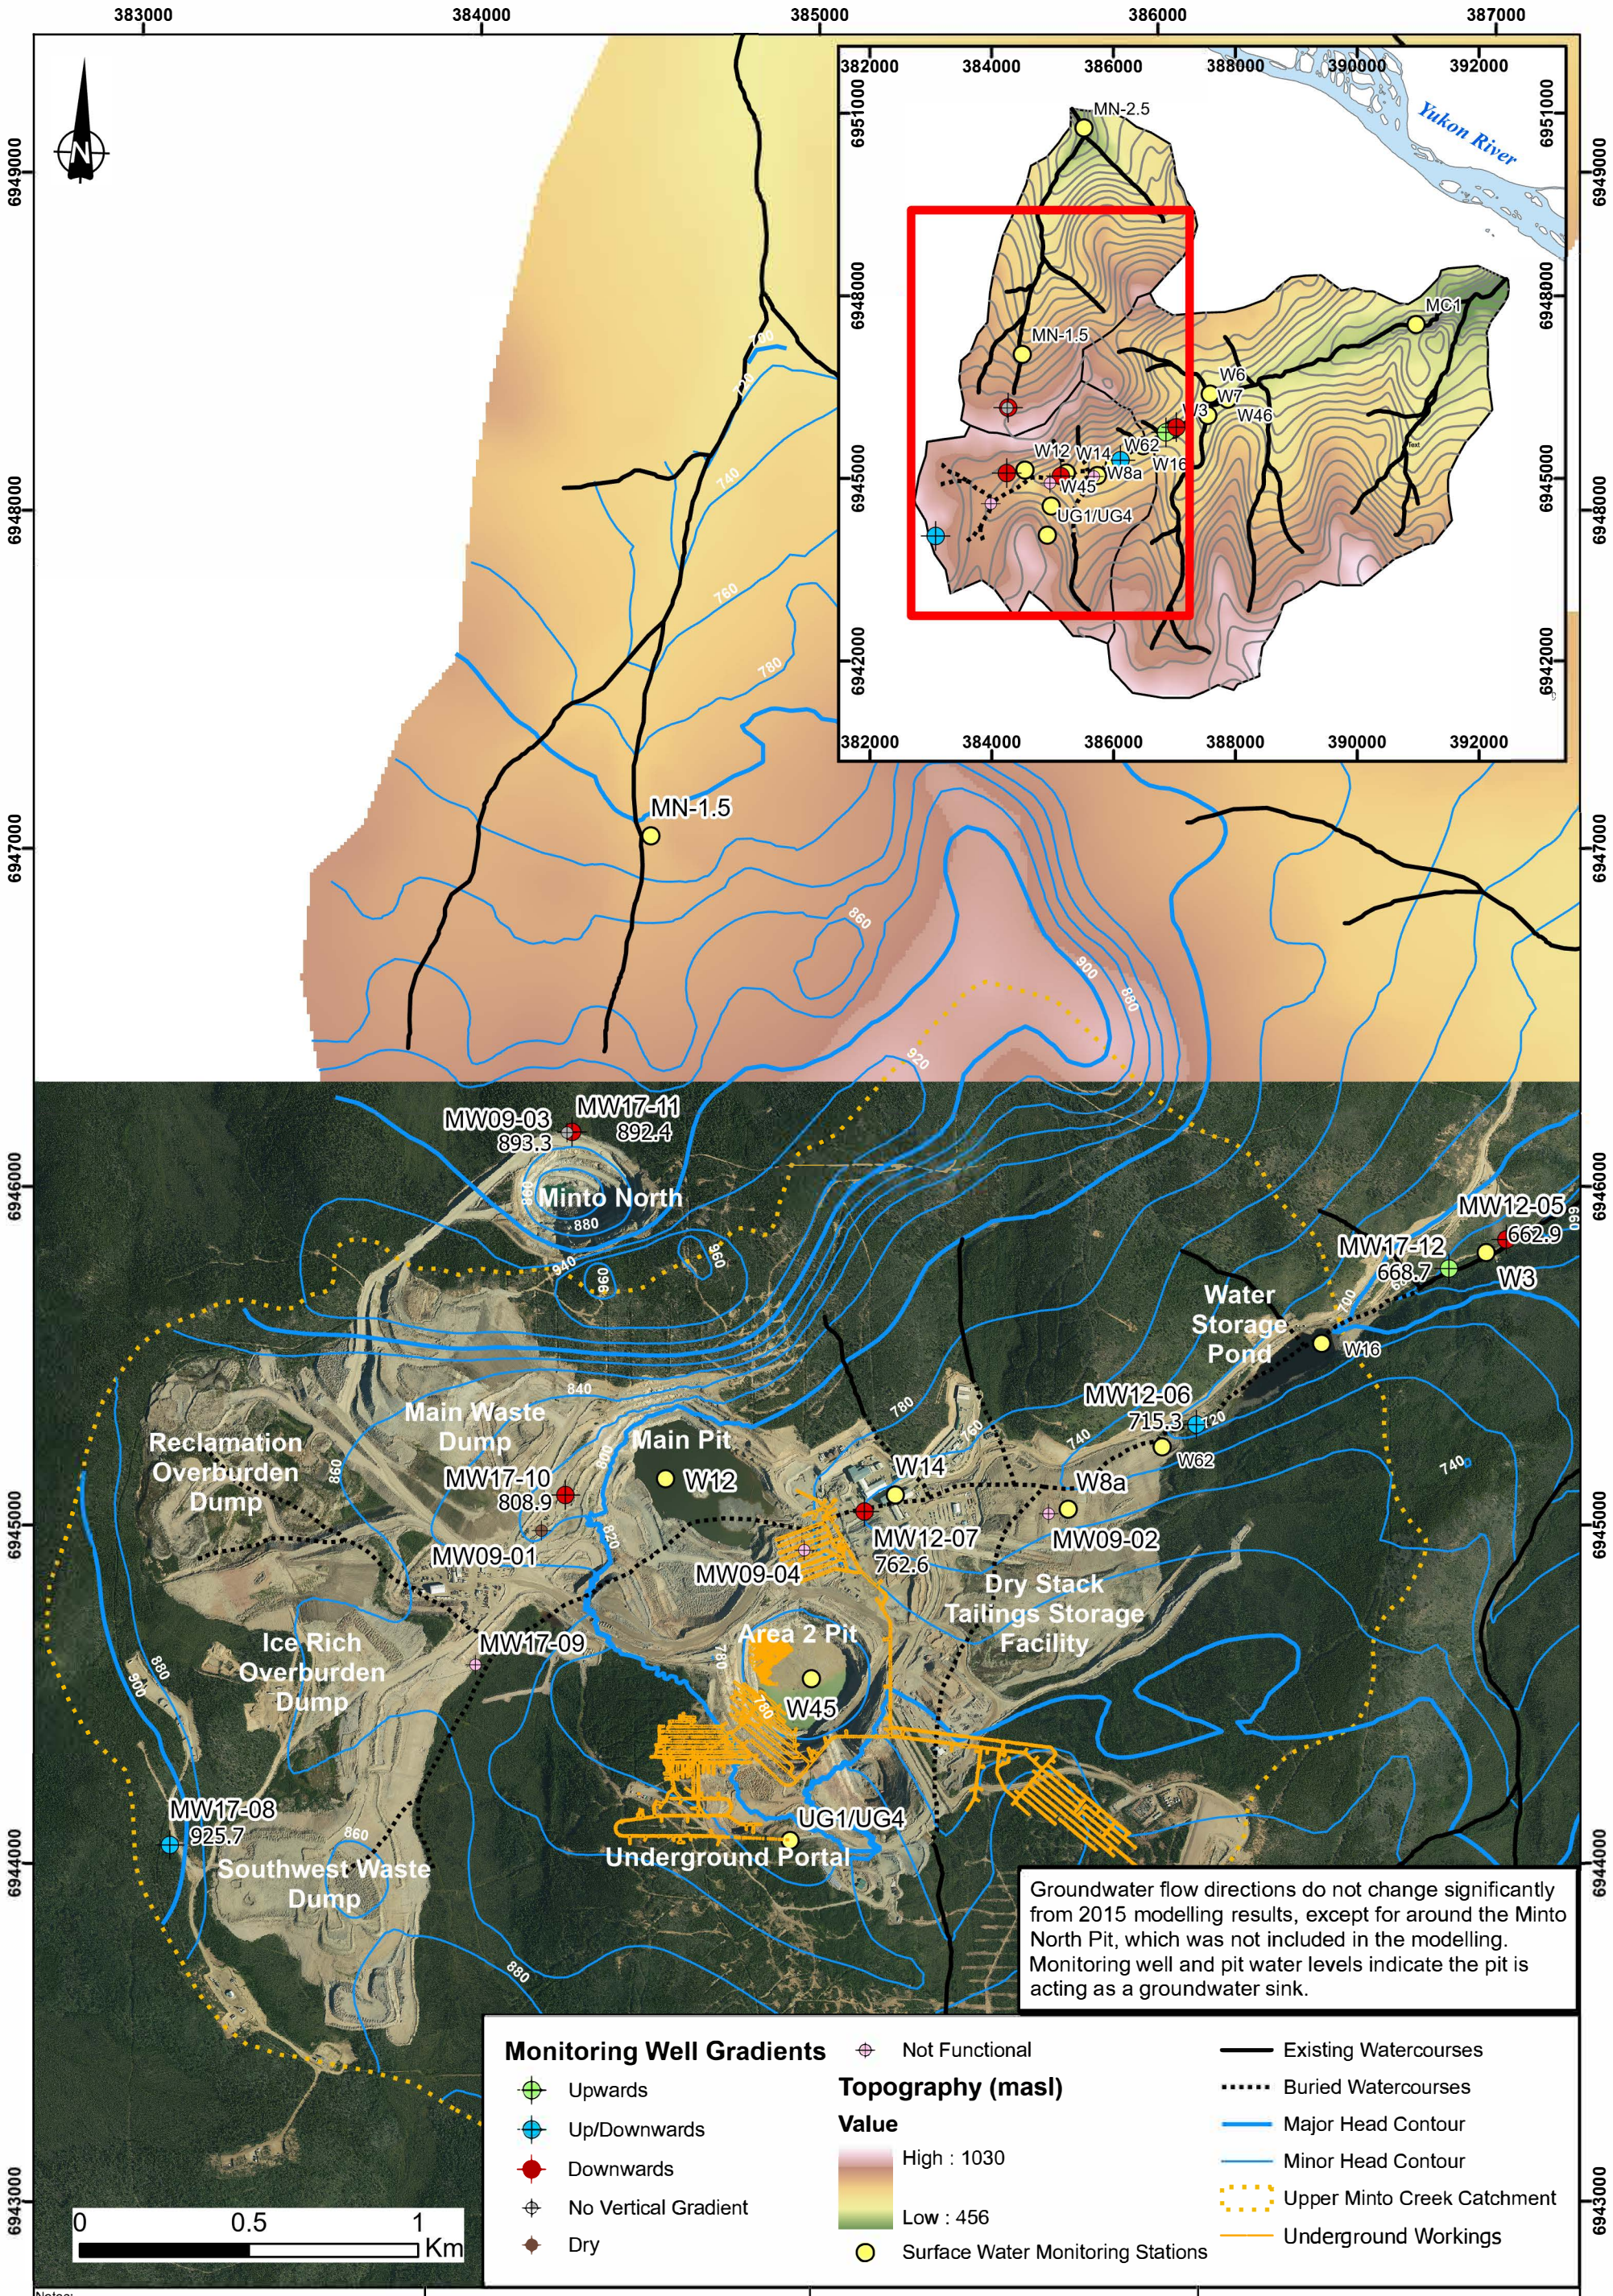
Minto Mine

Minto Mine – 2021 Groundwater Review and Summary of OAMP SPT Exceedances

Timeline of Mine Sequence and Water Management

Date:	Approved:	Figure:
May 2022	LV	2



Notes:
1. Data presented in NAD 1983 UTM Zone 8N.
2. Base orthophoto provided by Minto Mine, 2017.
3. Head contours are in masl with 20 m intervals
4. Water levels based on Q4 2021 measurements. Groundwater contours based on 2015 groundwater model with adjustments to fit current water levels.
5. Groundwater contours reflect near surface groundwater, represented by shallow-most sensors in multi-level monitoring wells unless that sensor is dry, in which case the second shallowest value is reported. Well is marked "Dry" if all sensors are dry.
6. Value below Well ID labels indicate hydraulic head (masl).

2021 Annual Groundwater Review

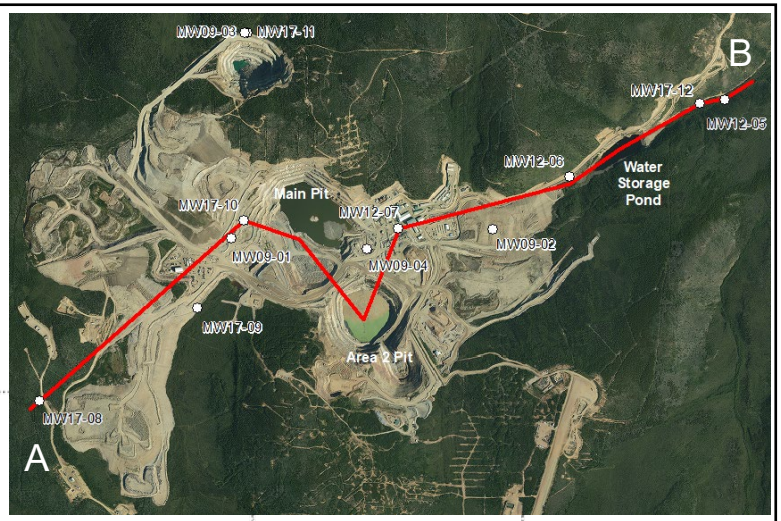
2021 Groundwater Contours and Vertical Gradients

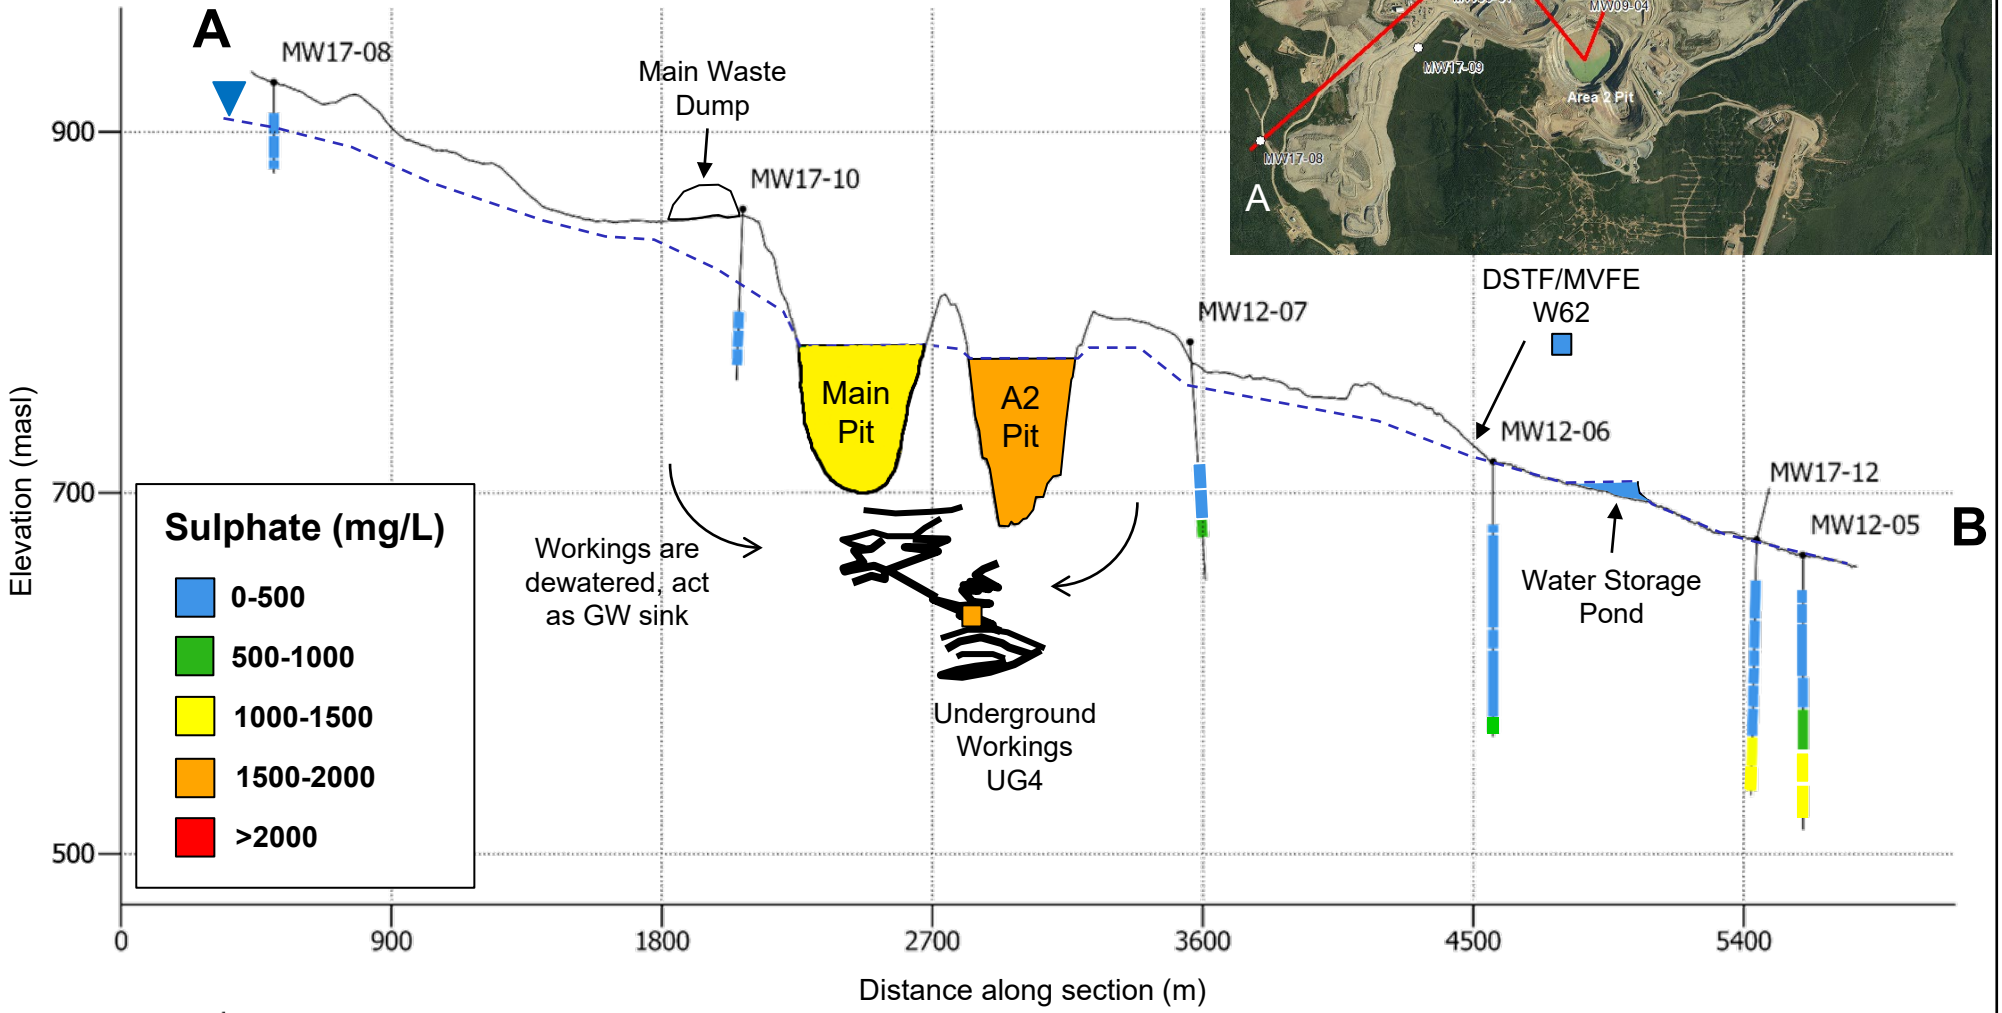
Date:	Approved:	Figure:
March 2022	MSi	3

C:\Users\msimons\Desktop\Minto_GW_Contours.aprx

Notes:

1. Base orthophoto provided by Minto Mine, 2017
2. Water table based on Dec 2021 measurements, combined with 2015 groundwater model results
3. Sulphate concentrations are maximum observed value at a given location in 2021.
4. For most ports, maximum sulphate concentration fell in the same category as the mean concentration throughout 2021. Exceptions to this are UG4 (mean of 1156 mg/L), Main Pit – W12 (mean of 712 mg/L) and A2 Pit – W51 (mean of 1236 mg/L)
5. Main Pit bottom elevation estimated to be 700m.
6. Underground workings location is roughly accurate, but not to scale due to nature of diagram. Workings could not be projected onto section.





Scale: 1:25,000

Vertical exaggeration: 6x

0m 1000m

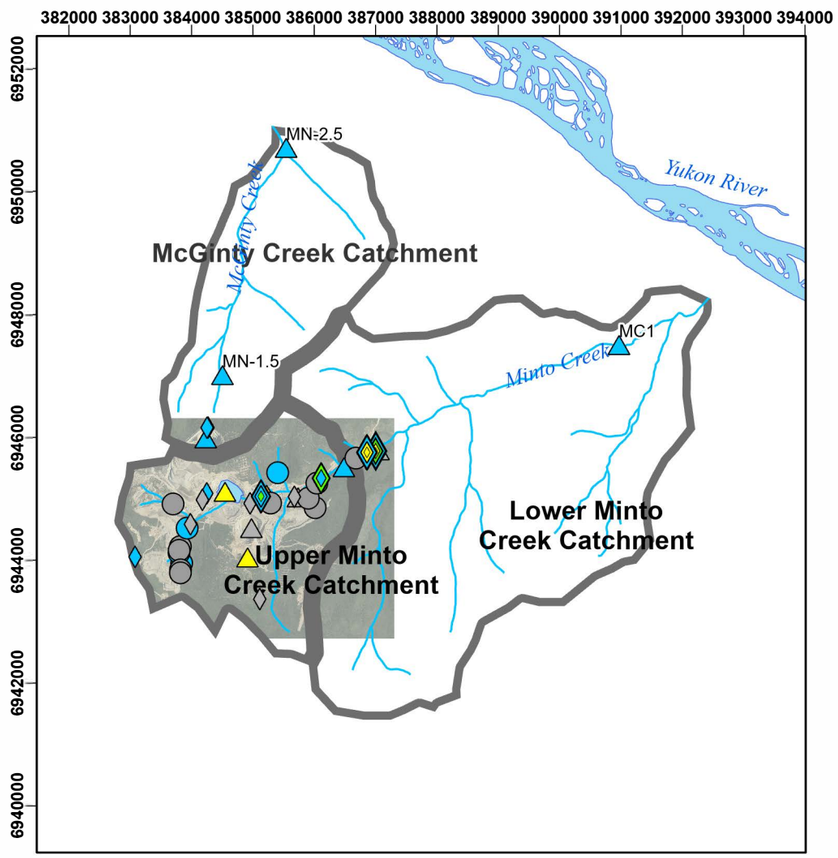
Sulphate (mg/L)

- No 2021 Data
- 0-500
- 500-1000
- 1000-1500
- 1500-2000

- Surface Station
- Groundwater Well
- Seep Station



Notes:
1. Data presented in NAD 1983 UTM Zone 8N.
2. Base orthophoto provided by Minto Mine, 2017.
3. Posted sulphate concentrations are maximum observed at a given location in 2020.
4. Multi-level monitoring wells are presented as nested diamonds only if concentrations are variable between depths.
5. The inside marker in a nested diamond represents the deepest port, with diamond size increasing towards the ground surface.
6. Ports shallower than Zone 4 in MW12-05 have sulphate concentrations <500 mg/L and are not presented on the figure.
7. Ports 2 and 3 in MW12-06 have similar concentrations and have had their symbols combined.
8. In MW17-12, Zones 3 and shallower have concentrations <500 mg/L and have had their symbols combined.
