Attention: Journey Paulus, Manager, Environment

Dear Journey:

Subject: 2021 Q1 (January - March) Groundwater AMP Events

The Minto Mine Operational Adaptive Management Plan was updated in 2018 for groundwater monitoring, with the review frequency for groundwater triggers changed from monthly to quarterly, at the recommendation of SRK Consulting (SRK) who is the qualified professional (QP). As per AMP2017-02, all data concerning trigger exceedances are sent to the QP within a week of discovery and included in the subsequent review.

- As part of the Minto Mine Operational Adaptive Management Plan, Minto Mine has collected and reviewed groundwater quality data. Minto completed an initial review of data collected at the McGinty Creek groundwater monitoring station (MW09-03) and Minto Creek groundwater monitoring stations MW12-05 and MW12-06 for the first quarter of 2021 (January - March) and compared results to specific performance thresholds (SPT) defined in the Minto Mine Operations Adaptive Management Plan (MEL, 2017-02). McGinty Creek monitoring stations are required to be sampled monthly while the Minto Creek stations are sampled quarterly. Due to issues with sampling equipment and the presence of glycol in some sampling ports, samples were not obtained in January in MW09-03-01 or MW09-03-02, in March in MW09-03-02 and in Q1 for MW12-06-03 and MW12-06-05. For Minto Creek and McGinty Creek, MEL identified exceedances of certain thresholds for sampling rounds conducted in January, February, and March of 2021 and, as per the plan, has contracted a QP to review those data and provide recommendations. SRK Consulting (Canada) Inc. was contacted by Minto environmental staff to provide QP review. This letter presents results of that review and recommendations.

SRK compared data against the 2017-02 AMP thresholds, historical data, and data from surface water at station MN4.5 in lower McGinty Creek and surface water stations W3 and MC1 in Minto Creek. Table 1 summarizes exceedances, observations on the data, interpretation, and recommendations. Figures are included with this review to illustrate the current physical (i.e., water level) setting compared to the Minto North pit. Graphs are included for each parameter exceeding thresholds and includes the full range of data collected to date.

Key conclusions and recommendations are summarized below. Table 1 summarizes observations and recommendations for all parameters.

For MW09-03 (McGinty Creek):

- The Minto North Pit is not a source of water to the groundwater monitored at this station; water levels in the monitoring well are higher than the pit water level. Water levels in the pit have been increasing slowly but remain well below the monitoring well water levels. These data continue to show no hydraulic gradient from the pit towards the monitoring well.
- Water levels at this station have been affected by the mining of Minto North, but the groundwater divide between Minto North and McGinty Creek remains, somewhere in the vicinity of MW09-03.
- Water levels in MW17-11 are generally lower than in MW09-03, with the exception of zone 5, which is screened shallower than zones 1 and 2 in MW09-03 and has higher water levels than all other monitoring points. Water levels in MW17-11 and MW09-03 indicate an overall downward gradient between the shallow-most zone and the remaining deeper zones. Differences in water level between deep zones are less pronounced, and a vertical gradient is not clear.
    - Recommendation: continue collecting water level/pressure profiles at this well according to the routine schedule.
- Concentrations of dissolved arsenic at MW09-03-01 have consistently exceeded SPT 1 since summer of 2016, and inconsistently exceeded thresholds in MW-09-02 in the same period. High variability is observed, but relatively recent data in MW09-03-01 exceeds thresholds more frequently than in the past. Anomalous values were detected in October 2018, September 2019, and June 2020 at nearly an order of magnitude more than recent average concentrations. In between the anomalous events, concentrations decreased to the historic range, suggesting these values are outliers. High concentrations do not correlate exactly with seasonal changes in groundwater level but may indicate an influence from seasonal variation (in recharge, flow, etc.). Vertical profiles and timing of peak concentrations suggest increased loading may be occurring during low flow periods or freshet, possibly suggesting greater mobilization of trace elements when higher volumes of water could infiltrate through the unsaturated zone and mobilize trace elements. Loading calculations included in the Minto Mine - 2019 Groundwater Review and Summary of OAMP SPT Exceedances (SRK 2020) indicate arsenic concentrations would need to increase by at least one order of magnitude for an exceedance in McGinty Creek at MN-4.5 to be observed. While there is some seasonal variability in McGinty Creek chemistry, surface water concentrations are not increasing and remain in the range of baseline data at MN-4.5.
- Concentrations of dissolved cadmium at MW09-03-01 and MW09-03-02 have inconsistently exceeded SPT 1 in he past with high variability in the observed data. Cadmium data exceed thresholds more frequently since 2017 and while average concentrations have increased beginning in 2017, there is no consistent increasing trend with many values in the last two years below the threshold. Seasonal variability seems to be present, with highest concentrations occurring in Q1 and Q2, potentially related to freshet. Cadmium concentrations in McGinty Creek remain low and stable, showing no impact from the groundwater and loading calculations presented in SRK 2020 indicate

groundwater concentrations would need to increase by at least one order of magnitude for an exceedance in McGinty Creek at MN-4.5 to be observed.

- Concentrations of dissolved zinc at MW09-03-01 and MW09-03-02 have inconsistently exceeded SPT 1 and SPT 2 thresholds since the summer of 2016. High variability is observed in the data, but relatively recent data exceeds thresholds more frequently than in the past, MW09-03-02 appeared to show a potential year-to-year increasing trend but values in 2021 and Q1 of 2021 have been lower than the previous two years. High concentrations do not correlate exactly with seasonal changes in groundwater level but may indicate an influence from seasonal variation. Vertical profiles and timing of peak concentrations suggest increased loading may be occurring during freshet when higher volumes of water infiltrate through the unsaturated zone and mobilize trace elements. While there is some seasonal variability in McGinty Creek chemistry, surface water concentrations are not increasing and remain in the range of baseline data. Loading calculations presented in SRK 2020 indicate groundwater concentrations would need to increase by at least one order of magnitude for an exceedance in McGinty Creek at MN-4.5 to be observed.
    - Recommendations: due to the low potential loading of groundwater into McGinty Creek limited action is recommended at this time. Continue monitoring as per routine schedule. Continue to look for opportunities to collect samples from surface seeps emanating from haul road.
    - The load and accretion study, as recommended in the 2019 Review of OAMP Exceedances, was not conducted in 2021 due to unfavorable conditions with surface water flows which created conditions that would make loading from groundwater undetectable. It is recommended that the load and accretion study be conducted in 2022 if the conditions are appropriate.
- Concentrations of dissolved nitrate at MW09-03-02 have exceeded SPT 2 since the fall of 2016. Concentrations have shown a consistent increasing trend since October 2016 with potential seasonal effects producing higher concentrations in Q4 of each year. Loading calculations presented in SRK 2020 indicate groundwater concentrations would need to increase by a factor of 2 from the highest measurement for an exceedance in McGinty Creek at MN-4.5 to be observed. As the nitrate is likely sourced from blast rock used to construct the haul road, load is expected to flush over time and the increasing trend is not expected to persist indefinitely. Concentrations will continue to be closely monitored. A more detailed review of nitrate behavior is provided in the 2020 Review of OAMP Exceedances. While there is some seasonal variability in McGinty Creek chemistry, surface water concentrations are not increasing and remain in the range of baseline data.
    - Recommendation: due to the low potential loading of groundwater into McGinty Creek limited action is recommended at this time. Continue monitoring as per schedule. Continue to look for seeps from the haul road that can be used for comparison. Compare vertical concentration profiles in MW09-03 and MW17-11 as more annual data becomes available from MW17-11. Conduct load accretion study as recommended in the 2019 Review of OAMP Exceedances, when conditions are appropriate to do so.

For MW12-05 and MW12-06 (Minto Creek):

- Water level data in the deepest zone of MW12-06 decreased sharply between November 2017 and March 2018, which coincides with development of the Minto East underground. Water levels in the

deepest zone increased again between May and August 2018, when development of the underground stopped. More recently, the water level in the deepest zone, MW12-06-01, decreased between Q2 and Q4 2019 which changed the overall vertical gradient from upwards to downwards and then increased again in Q1 2020 reversing the gradient once again. The decrease in water level coincides with the re-start of underground development in September 2019, and while dewatering was continued throughout the temporary underground closure, the increased activity could potentially have influenced the deep groundwater levels. The same trend was not observed in MW12-05 or MW17-12, suggesting these wells are currently outside the area of groundwater affected by the development of the underground. Consistent vertical gradients cannot be identified and there exists a complex multidirectional vertical gradient between other zones. Seasonal fluctuations are apparent in MW12-05, with peak water levels occurring in Q2 of the past 2 years.

  - Recommendation: continue collecting water level/pressure profiles at this well according to the routine schedule. Continue to monitor changes in groundwater pressure as system equilibrates following the cessation of Minto East underground development. Continue to monitor complex multidirectional vertical gradient in MW12-06.

- Concentrations of dissolved selenium in MW12-05 and MW12-06 are mostly below thresholds with only sporadic exceedances occurring since 2016. The highest concentrations in the previous four years in MW12-05 have been observed in Q2, suggesting the elevated values are due to seasonal fluctuations, potentially regarding freshet. No observable trends exist in MW12-06 that can be related to seasonal variation. The Q1 2021 sampling event in MW12-06-01 exceeded SPT 2 for the first time since Q3 2019. Concentrations in this (the deepest) zone have been variable and higher than other zones but no clear increasing trend is present. Surface water concentrations are not increasing and remain in the range of baseline data suggesting no impacts related to groundwater concentrations are being observed.

  - Recommendation: continue monitoring as per routine schedule. Assess sources of potential contaminants and include in the 2021 Review of OAMP Exceedances.

- Concentrations of sulphate at MW12-05-01 and MW12-05-02 continue to be elevated above SPT 2. Concentrations at MW12-05-01 and MW12-05-02 were increasing historically but show signs of stabilization after August 2017. While concentrations are still increasing, data do not show the same rate of increase as was observed prior to 2017, with the exception of the Q4 2019 observation in MW12-05-02, which had a measured concentration of 2400 mg/L, nearly double the previous sampling event. As this magnitude of concentration is isolated to one sampling event, and values have since decreased to be consistent with previous trends, the datapoint is considered an outlier. Previous investigations into the source of elevated sulphate in deep groundwater as observed at MW12-05 conclude it is unrelated to mining activities. Sulphate concentrations in MW17-12 exhibit an increasing gradient with depth but no increasing trend temporally. Minto Creek continues to indicate no trends in sulphate concentration that can clearly be related to changes in groundwater concentrations.

  - Recommendation: continue monitoring as per schedule and review/update investigations as to potential sources of SO_4 as part of the overall review of site groundwater quality.

- Concentrations of dissolved chromium in MW12-06-01 have exceeded SPT 3 since October 2016 and while they are variable, average concentrations increased between Q4 2016 and Q1 2020. Concentrations decreased throughout 2020 with the two most recent values near SPT 2. Elevated Cr-D is isolated to MW12-06-01, the deepest zone in this well (142.3 meters below ground surface). While there may be seasonal trends in Minto Creek, variability within the data is very low and shows no trends that can be clearly related to groundwater concentrations.
    - Recommendation: review potential Cr sources and update risk assessment of Cr loading to Minto Creek in the 2021 Review of OAMP Exceedances.

Sincerely,

SRK Consulting (Canada) Inc.

Appendix A: Tables

Table 1. Summary of Groundwater Quality Data, AMP Thresholds, Observations and Recommendations

Location	Month	Parameter & Concentration Data		Threshold Exceeded	Observations	Trends	Risk Narrative	Recommendation
McGinty Creek Catchment								
MW09-03-01 Figure A-1, A-2		As-D	mg/L		**Water Level (Figure A-1):** Water levels in MW09-03 Zone 1 and Zone 2 started declining when mining started in Minto North. Declining trend decreased about 6 months after mining completed. Water levels remain higher than pit bottom. Water levels increased between July and September 2016 before returning to previous trend. Similar trend occurred in 2017 when water levels increased between April and September, declined until May 2018 and increased again until September. Water levels increased in Q3 2020, consistent with previous seasonal trends. Peak water levels in 2020 were higher than previous four years. Minto North pit continues to act as a hydraulic sink, and has lowered groundwater levels. Water levels at MW09-03 suggest the presence of a groundwater divide somewhere north of the pit. Seasonal fluctuations indicate some influence from recharge. Loading to McGinty Creek could only occur from haul road material along the pit perimeter **Water Quality (Figure A-2):** Seasonal variations appear to be present, with highest values occurring in Q2 or Q3 (with the exception of outliers). Values during Q1 2021 are in the range of historic data very near SPT 2. As-D values for MN-4.5 in McGinty Creek have been stable in the historic range.	While data from late summer 2015 to August 2017 showed signs of an increasing trend, values exhibit significant variability throughout the year. Peak values during Q2 and Q3 suggest a seasonal trend related to freshet may be present. Elevated values are isolated to October 2018, September 2019 and June 2020 and appear to be outliers. Concentrations from 2016 to 2018 showed potential seasonal variability, becoming relatively stable in 2019. Concentrations from 2016 thru 2020 remained relatively steady.	Lack of any clear upwards trend in McGinty Creek, as measured at MN-4.5, suggests currently no impact. Minto North represents only 0.4% of the McGinty Creek total watershed. Assuming that groundwater flows are proportional to surface water flows (load can only be coming from haul road, not pit leakage) groundwater concentrations would need to be at least 10x higher to result in MN-4.5 As concentrations reaching MN-4.5 SPT1. Overall risk of arsenic loading to McGinty Creek from groundwater is low at this time.	Limited action at this time. Continue monitoring as per routine schedule. Continue to look for opportunities to collect samples from surface seeps emanating from haul road. Conduct load and accretion survey of McGinty Creek as recommended in the 2019 GW Review (when conditions are suitable).

MW09-03-01 Figure A-1, A-2		Cd-D	mg/L		**Water Level (Figure A-1):** see previous section. **Water Quality (Figure A-2):** Concentrations beginning in 2019 have been more sporadic than the past, with the highest concentration measured in September 2019. While most recent data points exceed thresholds, concentrations are in the historical range. Cd-D values have been stable in the historic range for MN-4.5 in McGinty Creek.	Highest concentrations measured to date have been in Q3 of 2019, but are not increasing consistently year-over-year, and show potential seasonal variability. While there is no consistent increasing trend, and variability is high, annual averages increased between 2016 and 2019.	Lack of any upwards trend in McGinty Creek, as measured at MN-4.5, suggests no current impact to surface water. Load study done as part of the 2019 annual groundwater review indicates concentrations need to be at least an order of magnitude higher for threshold exceedances to occur at MN-4.5.	Limited action at this time. Continue monitoring as per routine schedule. Continue to look for opportunities to collect samples from surface seeps emanating from haul road. Conduct load and accretion survey of McGinty Creek as recommended in the 2019 GW Review (when conditions are suitable).

	March	N/A	N/A	N/A				
MW09-03-02 Figure A-1, A-3		Cd-D	mg/L		**Water Level (Figure A-1):** see previous section. **Water Quality (Figure A-2):** Concentrations beginning in 2019 have been more sporadic than the past, with the highest concentration measured in September 2019. While most recent data points exceed thresholds, concentrations are lower in 2021 compared to previous years. Cd-D values have been stable in the historic range for MN-4.5 in McGinty Creek.	Highest concentrations measured to date have been in Q3 of 2019, but are not increasing consistently year-over-year, and show potential seasonal variability. While there is no consistent increasing trend, and variability is high, annual averages increased between 2016 and 2019.	Lack of any upwards trend in McGinty Creek, as measured at MN-4.5, suggests no current impact to surface water. Load study done as part of the 2019 annual groundwater review indicates concentrations need to be at least an order of magnitude higher for threshold exceedances to occur at MN-4.5.	Limited action at this time. Continue monitoring as per routine schedule. Continue to look for opportunities to collect samples from surface seeps emanating from haul road. Conduct load and accretion survey of McGinty Creek as recommended in the 2019 GW Review (when conditions are suitable).

MW09-03-02 Figure A-1, A-3		Zn-D	mg/L		**Water Level (Figure A-1):** see previous section. **Water Quality (Figure A-4):** Increased variability in measurements starting in August 2015. Concentrations in Q1 2021 are lower than the majority of sampling events in 2020. Zn-D values have been stable in the historic range for MN-4.5 in McGinty Creek.	Concentrations in Q1 are all above SPT 2 but on average lower than observations from the preceeding two years. Peak concentrations during late Q1 and early Q2 suggest a seasonal trend related to freshet may be present.	Lack of any upwards trend in McGinty Creek, as measured at MN-4.5, suggests no current impact to surface water. Groundwater flux in this zone expected to be low based on low K. Load study done as part of the 2019 annual groundwater review indicates concentrations need to be at least an order of magnitude higher for threshold exceedances to occur at MN-4.5.	Limited action at this time. Continue monitoring as per routine schedule. Continue to look for opportunities to collect samples from surface seeps emanating from haul road. Conduct load and accretion survey of McGinty Creek as recommended in the 2019 GW Review (when conditions are suitable).
	January	N/A	N/A	N/A				
	February	2021-02-27	0.0225	0.015 (SPT 2)				
	March	2021-03-21	0.0271	0.015 (SPT 2)				
MW09-03-02 Figure A-1, A-3		NO_3-D	mg/L		**Water Level (Figure A-1):** see previous section. **Water Quality (Figure A-5):** Overall increasing trend is present beginning in 2017. Variability increased drastically in Q3 2019 with sporadic elevated concentrations occuring outside the historic trend. NO_3-D values have been stable in the historic range for MN-4.5 in McGinty Creek.	Clear upward trend from May 2015-Dec 2020. Higher variability beginning in 2018, with highest value recorded occurring in October 2019. Overall trend is increasing but values in Q1 2021 were lower than the previous sampling events.	McGinty Creek, as observed at MN-4.5, does not show increasing or decreasing trends similar to MW09-03-02. Considering the small catchment area for MW09-03-02, even if the well is affected by local recharge, potential loading to McGinty Creek via this groundwater is potentially low. Nitrate is expected to flush from the haul road construction material over time and not increase continuously.	Limited action at this time. Continue monitoring as per routine schedule, continue to look for opportunities to collect samples from surface seeps emanating from haul road and continue to compare data from MW09-03-02 and MN-4.5 to confirm low nitrate concentrations persist in McGinty Creek. Conduct load and accretion survey of McGinty Creek as recommended in the 2019 GW Review (when conditions are suitable).

Table 1. Summary of Groundwater Quality Data, AMP Thresholds, Observations and Recommendations

Location	Month	Parameter & Concentration Data		Threshold Exceeded	Observations	Trends	Risk Narrative	Recommendation
Minto Creek Catchment								
MW12-05-01 Figure B-1, B-2		SO_4^{2-}-D	mg/L		**Water Level (Figure B-1):** Water levels show increasing trends in the fall to late winter seasons, followed by a decrease throughout the summer. These trends have occurred for four consecutive years and are likely due to a seasonal fluctuation. Overall vertical gradient remains downward. **Water Quality (Figure B-1):** Concentrations linearly increased until August 2017, stabilizing between 1200 and 1500 mg/L beginning in 2018. SO_4^{2-}-D values have been stable in the historic range at W3 and MC1 in Minto Creek.	Previously observed upwards trend shows signs of stabilization after August 2017 with a slight increase again since Q4 2018. Concentrations have been consistent throughout the last year, suggesting concentrations are continuing to stabilize. No upwards trend observed in Minto Creek. Seasonal variation evident at W8A, but much lower concentration than, and not considered likely to be connected to groundwater at MW12-05 as high concentrations at MW12-05 are at significant depth while W8A was a shallow DSTF monitoring point.	Minto Creek, as observed at W3 and MC1, do not show any upwards trend similar to MW12-05. Downwards gradient in MW12-05 and low flux (low hydraulic conductivity) suggest groundwater discharge not currently reaching creek or groundwater load small compared to surface water load.	No further action at this time. Continue monitoring as per routine schedule. Continue investigation into sulphate source and causes.

	February	N/A	N/A	N/A				
	March	2021-03-20	1420	1000 (SPT 2)				
MW12-05-02 Figure B-1		Se-D	mg/L		**Water Level (Figure B-1):** see previous section. **Water Quality (Figure B-1):** Selenium values have been mostly below thresholds with isolated exceedances in the past. Concentrations are variable but low. The Q1 value exceeded SPT 1, indicating a major change from the previous sampling event. The concentration was within the range of historic seasonal observations.	Concentrations have been variable in the past but no consistent increasing or decreasing trend is present. The most recent value is within the range of historic concentrations.	Concentrations in Minto Creek, as observed at W3 and MC1, are within the range of background data with no variability. Downwards gradient in MW12-05 and low flux (low hydraulic conductivity) suggest groundwater discharge not currently reaching creek or groundwater load small compared to surface water load.	No further action at this time. Continue monitoring as per routine schedule.

MW12-05-02 Figure B-1, B-2		SO_4^{2-}-D	mg/L		**Water Level (Figure B-1):** see previous section. **Water Quality (Figure B-1):** Concentrations linearly increased until August 2017, and have since stabilized around 1200 mg/L. SO_4^{2-}-D values have been stable in the historic range at W3 and MC1 in Minto Creek.	Previously observed upwards trend shows signs of stabilization after August 2017 with higher variability since Q1 2018. One value from Q4 2019 was considerably higher (2400 mg/L) but has not occurred since, suggesting it was an outlier. No upwards trend observed in Minto Creek. Seasonal variation evident at W8A, but not likely connected to groundwater at MW12-05.	Minto Creek, as observed at W3 and MC1, do not show any upwards trend similar to MW12-05. Downwards gradient in MW12-05 and low flux (low hydraulic conductivity) suggest groundwater discharge not currently reaching creek or groundwater load small compared to surface water load.	No further action at this time. Continue monitoring as per routine schedule. Continue investigation into sulphate source and causes.
	January	N/A	N/A	N/A				
	February	N/A	N/A	N/A				
	March	2021-03-20	1220	1000 (SPT 2)				
MW12-06-01 Figure C-1, C-2		Cr-D	mg/L		**Water Level (Figure C-1):** Water level data show overall decreasing trend since March 2014. Deepest zone (1) shows steeper decrease in water level between November 2017 and March 2018. This drop is consistent with a decrease in water level in MW12-07 which coincides with development of the Minto East underground. Water level in the deepest zone, MW12-06-01, decreased between Q2 and Q4 2019 but instreased again in Q1 2020. Complex multi-directional gradient is present. **Water Quality (Figure B-1):** Values at other depths in this well are near or below detection. Sampling in zone 1 only began in Oct 2016 but samples have consistently been above SPT 3 with an overall increasing trend until 2020, where values decreased throughout the year. The concentration measured in Q1 2020 is approaching the threshold. Cr-D values have been stable in the historic range at W3 and MC1 in Minto Creek.	Since the fall of 2016 elevated concentrations have been observed in MW12-06-01 and, to a lesser extent, W8A. Concentrations since 2020 have been decreasing, with the Q4 2020 concentration the lowest since recorded to date. Concentration during winter low flow period has increased over last two years.	While elevated concentrations of Cr-D have been continually detected in MW12-06-01, they have been isolated to the deepest zone and elevated concentrations have not been detected in the receiving environment (Minto Creek, down gradient wells, etc.). In addition, elevated Cr-D has not been detected in the mine pits, the underground dewatering pond or any other major sources of contaminated water on site. Currently, the risk posed by elevated Cr-D in MW12-06 is considered low.	No further action at this time. Continue monitoring as per routine schedule.
	January	N/A	N/A					
	February	N/A	N/A					
	March	2021-03-22	0.00262	0.002 (SPT 2)				
MW12-06-01 Figure C-1, C-2		Se-D	mg/L		**Water Level (Figure C-1):** see previous section. **Water Quality (Figure B-1):** Concentrations that exceed the thresholds are isolated, with only two recorded to date. The highest point was observed in Q1 2021 but the majority of observations are below SPT 2. Se-D values have been stable in the historic range at W3 and MC1 in Minto Creek.	Concentrations have been sporadic since 2017 but most remain at low concentrations well below SPT 2. Exceedances have been isolated to 2 events and no clear increasing trend is present.	Exceedances are isolated, and no impacts are observed at monitoring stations in Minto Creek.	No further action at this time. Continue monitoring as per routine schedule.

Whitehorse, YT Y1A 5X9

Attention: Journey Paulus, Manager, Environment

Dear Journey:

Subject: 2021 Q2 (April – June) Groundwater AMP Events

The Minto Mine Operational Adaptive Management Plan was updated in 2018 for groundwater monitoring, with the review frequency for groundwater triggers changed from monthly to quarterly, at the recommendation of SRK Consulting (SRK) who is the qualified professional (QP). As per AMP2017-02, all data concerning trigger exceedances are sent to the QP within a week of discovery and included in the subsequent review.

As part of the Minto Mine Operational Adaptive Management Plan, Minto Mine has collected and reviewed groundwater quality data. Minto completed an initial review of data collected at the McGinty Creek groundwater monitoring station (MW09-03) and Minto Creek groundwater monitoring stations MW12-05 and MW12-06 for the second quarter of 2021 (April - June) and compared results to specific performance thresholds (SPT) defined in the Minto Mine Operations Adaptive Management Plan (MEL, 2017-02). McGinty Creek monitoring stations are required to be sampled monthly while the Minto Creek stations are sampled quarterly. For Minto Creek and McGinty Creek, MEL identified exceedances of certain thresholds for sampling rounds conducted in April, May, and June of 2021 and, as per the plan, has contracted a QP to review those data and provide recommendations. SRK Consulting (Canada) Inc. was contacted by Minto environmental staff to provide QP review. This letter presents results of that review and recommendations.

SRK compared data against the 2017-02 AMP thresholds, historical data, and data from surface water at station MN4.5 in lower McGinty Creek and surface water stations W3 and MC1 in Minto Creek. Table 1 summarizes exceedances, observations on the data, interpretation, and recommendations. Figures are included with this review to illustrate the current physical (i.e., water level) setting compared to the Minto North pit. Graphs are included for each parameter exceeding thresholds and includes the full range of data collected to date.

Key conclusions and recommendations are summarized below. Table 1 summarizes observations and recommendations for all parameters.

For MW09-03 (McGinty Creek):

- The Minto North Pit is not a source of water to the groundwater monitored at this station; water levels in the monitoring well are higher than the pit water level. Water levels in the pit have been increasing slowly but remain well below the monitoring well water levels. These data continue to show no hydraulic gradient from the pit towards the monitoring well.
- Water levels at this station have been affected by the mining of Minto North, but the groundwater divide between Minto North and McGinty Creek remains, somewhere in the vicinity of MW09-03.
- Water levels in MW17-11 are generally lower than in MW09-03, with the exception of zone 5, which is screened shallower than zones 1 and 2 in MW09-03 and has higher water level than all other monitoring points. Water levels in MW17-11 and MW09-03 indicate an overall downward gradient between the shallow-most zone and the remaining deeper zones. Differences in water level between deep zones are less pronounced, and a vertical gradient is not clear.
    - Recommendation: continue collecting water level/pressure profiles at this well according to the routine schedule.
- Concentrations of dissolved arsenic at MW09-03-01 have consistently exceeded SPT 1 since summer of 2016, and inconsistently exceeded thresholds in MW-09-02 in the same period. High variability is observed, but relatively recent data in MW09-03-01 exceeds thresholds more frequently than in the past. Anomalous values were detected in October 2018, September 2019, and June 2020 at nearly an order of magnitude more than recent average concentrations. In between the anomalous events, concentrations decreased to the historic range, suggesting these values are outliers. High concentrations do not correlate exactly with seasonal changes in groundwater level but may indicate an influence from seasonal variation (in recharge, flow, etc.). Vertical profiles and timing of peak concentrations suggest increased loading may be occurring during low flow periods or freshet, possibly suggesting greater mobilization of trace elements when higher volumes of water could infiltrate through the unsaturated zone and mobilize trace elements. Loading calculations included in the Minto Mine - 2019 Groundwater Review and Summary of OAMP SPT Exceedances (SRK 2020) indicate arsenic concentrations would need to increase by at least one order of magnitude for an exceedance in McGinty Creek at MN-4.5 to be observed. While there is some seasonal variability in McGinty Creek chemistry, surface water concentrations are not increasing and remain in the range of baseline data at MN-4.5.
- Concentrations of dissolved cadmium at MW09-03-01 and MW09-03-02 have inconsistently exceeded SPT 1 in he past with high variability in the observed data. Cadmium data exceed thresholds more frequently since 2017 and while average concentrations have increased beginning in 2017, there is no consistent increasing trend with many values in the last two years below the threshold. Seasonal variability seems to be present, with highest concentrations occurring in Q1 and Q2, potentially related to freshet. Cadmium concentrations in McGinty Creek remain low and stable, showing no impact from the groundwater and loading calculations presented in SRK 2020 indicate groundwater concentrations would need to increase by at least one order of magnitude for an exceedance in McGinty Creek at MN-4.5 to be observed.

- Concentrations of dissolved selenium in MW09-03-01 and MW09-03-02 have exceeded thresholds sporadically in the last few years, with increased variability in the data beginning in 2017. Average annual concentrations in MW09-03-02 have been higher in 2018 and 2019 than past years, but do not demonstrate a consistent increasing trend. Only one monitoring event in Q2 exceeded thresholds in MW09-03-01 and none in MW09-03-02. Peak concentrations in Q1 and Q2 of these years indicate a season variation may be present. Loading calculations presented in SRK 2020 are not applicable to selenium, as elevated concentrations are already being observed in McGinty Creek at MN-4.5. In a memo prepared by Minnow Environmental in 2019 (*Evaluation of Dissolved Copper and Selenium AMP Threshold Exceedances in McGinty Creek*) it was concluded that the source of elevated selenium concentrations was unrelated to the Minto Mine and values were consistent with historical concentrations before the Minto North Pit was operational.

- Concentrations of dissolved zinc at MW09-03-01 and MW09-03-02 have inconsistently exceeded SPT 1 and SPT 2 thresholds since the summer of 2016. High variability is observed in the data, but relatively recent data exceeds thresholds more frequently than in the past, MW09-03-02 appeared to show a potential year-to-year increasing trend but values in 2020 have been lower than the previous two years. High concentrations do not correlate exactly with seasonal changes in groundwater level but may indicate an influence from seasonal variation. Vertical profiles and timing of peak concentrations suggest increased loading may be occurring during freshet when higher volumes of water infiltrate through the unsaturated zone and mobilize trace elements. While there is some seasonal variability in McGinty Creek chemistry, surface water concentrations are not increasing and remain in the range of baseline data. Loading calculations presented in SRK 2020 indicate groundwater concentrations would need to increase by at least one order of magnitude for an exceedance in McGinty Creek at MN-4.5 to be observed.

    - Recommendations: due to the low potential loading of groundwater into McGinty Creek limited action is recommended at this time. Continue monitoring as per routine schedule. Continue to look for opportunities to collect samples from surface seeps emanating from haul road.

    - The load and accretion study, as recommended in the 2019 Review of OAMP Exceedances, was not conducted in 2021 due to unfavorable conditions with surface water flows which created conditions that would make loading from groundwater undetectable. It is recommended that the load and accretion study be conducted in 2022 if the conditions are appropriate.

- Concentrations of dissolved nitrate at MW09-03-02 have exceeded SPT 2 since the fall of 2016. Concentrations have shown a consistent increasing trend since October 2016 with potential seasonal effects producing higher concentrations in Q4 of each year. Loading calculations presented in SRK 2020 indicate groundwater concentrations would need to increase by a factor of 2 from the highest measurement for an exceedance in McGinty Creek at MN-4.5 to be observed. As the nitrate is likely sourced from blast rock used to construct the haul road, load is expected to flush over time and the increasing trend is not expected to persist indefinitely. Concentrations will continue to be closely monitored. A more detailed review of nitrate behavior is provided in the 2020 Review of OAMP Exceedances. While there is some seasonal variability in McGinty Creek chemistry, surface water concentrations are not increasing and remain in the range of baseline data.

    - Recommendation: due to the low potential loading of groundwater into McGinty Creek limited action is recommended at this time. Continue monitoring as per schedule. Continue to look for

seeps from the haul road that can be used for comparison. Compare vertical concentration profiles in MW09-03 and MW17-11 as more annual data becomes available from MW17-11. Conduct load accretion study as recommended in the 2019 Review of OAMP Exceedances, when conditions are appropriate to do so.

For MW12-05 and MW12-06 (Minto Creek):

- Water level data in the deepest zone of MW12-06 decreased sharply between November 2017 and March 2018, which coincides with development of the Minto East underground. Water levels in the deepest zone increased again between May and August 2018, when development of the underground stopped. More recently, the water level in the deepest zone, MW12-06-01, decreased between Q2 and Q4 2019 which changed the overall vertical gradient from upwards to downwards and then increased again in Q1 2020 reversing the gradient once again. The decrease in water level coincides with the re-start of underground development in September 2019, and while dewatering was continued throughout the temporary underground closure, the increased activity could potentially have influenced the deep groundwater levels. The same trend was not observed in MW12-05 or MW17-12, suggesting these wells are currently outside the area of groundwater affected by the development of the underground. Consistent vertical gradients cannot be identified and there exists a complex multidirectional vertical gradient between other zones. Seasonal fluctuations are apparent in MW12-05, with peak water levels occurring in Q2 of the past 2 years.
    - Recommendation: continue collecting water level/pressure profiles at this well according to the routine schedule. Continue to monitor changes in groundwater pressure as system equilibrates following the cessation of Minto East underground development. Continue to monitor complex multidirectional vertical gradient in MW12-06.
- Concentrations of dissolved chromium in MW12-06-01 have exceeded SPT 3 since October 2016 and while they are variable, average concentrations increased between Q4 2016 and Q1 2020. Concentrations have decreased throughout 2020 with the most recent sampling event below SPT 2 (the first time since monitoring began). Elevated Cr-D is isolated to MW12-06-01, the deepest zone in this well (142.3 meters below ground surface).

  In Q2 2021, MW12-05-02 triggered SPT 1, indicating a significant change had occurred since the previous monitoring event. The exceedance is isolated, well below SPT 2 and do not demonstrate an increasing trend. While there may be seasonal trends in Minto Creek, variability within the data is very low and shows no trends that can be clearly related to groundwater concentrations.
    - Recommendation: review potential Cr sources and update risk assessment of Cr loading to Minto Creek in the 2021 Review of OAMP Exceedances.
- Concentrations of dissolved selenium in MW12-05 and MW12-06 are mostly below thresholds with only sporadic exceedances occurring since 2016. The highest concentrations in the previous four years in MW12-05 have been observed in Q2, suggesting the elevated values are due to seasonal fluctuations, potentially regarding freshet. No observable trends exist in MW12-06 that can be related to seasonal variation. Concentrations in the deepest zone of MW12-06 have been variable and higher than other zones but no clear increasing trend is present. Surface water concentrations are not

increasing and remain in the range of baseline data suggesting no impacts related to groundwater concentrations are being observed.

- Concentrations of dissolved zinc have been stable below thresholds in MW12-06 in the past with some slight variability in the shallowest zone. The only exceedance to SPT 2 occurred in the most recent sampling event in MW12-06-06 but is well outside the range of historic conditions and may be an outlier. More data are required to assess the significance of this increase and determine if a trend is present.
    - Recommendation: continue monitoring as per routine schedule. Assess sources of potential contaminants and include in the 2021 Review of OAMP Exceedances.
- Concentrations of sulphate at MW12-05-01 and MW12-05-02 continue to be elevated above SPT 2. Concentrations at MW12-05-01 and MW12-05-02 were increasing historically but show signs of stabilization after August 2017. While concentrations are still increasing, data do not show the same rate of increase as was observed prior to 2017, with the exception of the Q4 2019 observation in MW12-05-02, which had a measured concentration of 2400 mg/L, nearly double the previous sampling event. As this magnitude of concentration is isolated to one sampling event, and values have since decreased to be consistent with previous trends, the datapoint is considered an outlier.

  Sulphate concentrations in MW12-06-01 have been increasing since Q1 2020 with the most recent events approaching SPT 2. These concentrations are isolated to the deepest zone in MW12-06, which has shown evidence of disruption (in water levels and chemical equilibrium) related to underground mining in the past. The cause of increasing sulphate concentrations in MW12-06-01 is unclear at this time, but trends will continue to be closely monitored.

  Previous investigations into the source of elevated sulphate in deep groundwater as observed at MW12-05 conclude it is unrelated to mining activities. Sulphate concentrations in MW17-12 exhibit an increasing gradient with depth but no increasing trend temporally. Minto Creek continues to indicate no trends in sulphate concentration that can clearly be related to changes in groundwater concentrations.
    - Recommendation: continue monitoring as per schedule and review/update investigations as to potential sources of SO_4 as part of the overall review of site groundwater quality.

Sincerely,

SRK Consulting (Canada) Inc.

Appendix A: Tables

Table 1. Summary of Groundwater Quality Data, AMP Thresholds, Observations and Recommendations

Location	Month	Parameter & Concentration Data		Threshold Exceeded	Observations	Trends	Risk Narrative	Recommendation
McGinty Creek Catchment								
MW09-03-01		As-D	mg/L		**Water Level (Figure A-1): Water levels in MW09-03 Zone 1 and Zone 2 started declining when mining started in Minto North. Declining trend decreased about 6 months after mining completed. Water levels remain higher than pit bottom. Water levels increased between July and September 2016 before returning to previous trend. Similar trend occurred in 2017 when water levels increased between April and September, declined until May 2018 and increased again until September. Water levels increased in Q3 2020, consistent with previous seasonal trends. Peak water levels in 2020 were higher than previous four years.** Minto North pit continues to act as a hydraulic sink, and has lowered groundwater levels. Water levels at MW09-03 suggest the presence of a groundwater divide somewhere north of the pit. Seasonal fluctuations indicate some influence from recharge. Loading to McGinty Creek could only occur from haul road material along the pit perimeter **Water Quality (Figure A-2):** Seasonal variations appear to be present, with highest values occurring in Q2 or Q3 (with the exception of outliers). Values during Q2 are in the range of historic data very near SPT 2. As-D values for MN-4.5 in McGinty Creek have been stable in the historic range.	While data from late summer 2015 to August 2017 showed signs of an increasing trend, values exhibit significant variability throughout the year. Peak values during Q2 and Q3 suggest a seasonal trend related to freshet may be present. Elevated values are isolated to October 2018, September 2019 and June 2020 and appear to be outliers. Concentrations from 2016 to 2018 showed potential seasonal variability, becoming relatively stable in 2019. Concentrations from 2016 thru 2020 remained relatively steady.	Lack of any clear upwards trend in McGinty Creek, as measured at MN-4.5, suggests currently no impact. Minto North represents only 0.4% of the McGinty Creek total watershed. Assuming that groundwater flows are proportional to surface water flows (load can only be coming from haul road, not pit leakage) groundwater concentrations would need to be at least 10x higher to result in MN-4.5 As concentrations reaching MN-4.5 SPT1.	Limited action at this time. Continue monitoring as per routine schedule. Continue to look for opportunities to collect samples from surface seeps emanating from haul road. Conduct load and accretion survey of McGinty Creek as recommended in the 2019 GW Review (when conditions are suitable).
Figure A-1, A-2	April	2021-04-24	0.00089	0.00081 (SPT 2)				
	May	2021-05-12	0.00093	0.00081 (SPT 2)				
	June	2021-06-13	0.00093	0.00081 (SPT 2)				
MW09-03-01		Cd-D	mg/L		**Water Level (Figure A-1):** see previous section. Water Quality (Figure A-2): Concentrations beginning in 2019 have been more sporadic than the past, with the highest concentration measured in September 2020. Sampling events sporadically exceed thresholds, with the most recent measurement well below and in the range of baseline concentrations. Cd-D values have been stable in the historic range for MN-4.5 in McGinty Creek.	Highest concentrations measured to date have been in Q3 of 2020, but are not increasing consistently year-over-year, and show potential seasonal variability. While there is no consistent increasing trend, and variability is high, annual averages increased between 2016 and 2019.	Lack of any upwards trend in McGinty Creek, as measured at MN-4.5, suggests no current impact to surface water. Load study done as part of the 2019 annual groundwater review indicates concentrations need to be at least an order of magnitude higher for threshold exceedances to occur at MN-4.5.	Limited action at this time. Continue monitoring as per routine schedule. Continue to look for opportunities to collect samples from surface seeps emanating from haul road. Conduct load and accretion survey of McGinty Creek as recommended in the 2019 GW Review (when conditions are suitable).
Figure A-1, A-2	April	2021-04-24	0.000187	0.000031 (SPT 1)				
	May	2021-05-12	0.0000574	0.000031 (SPT 1)				
	June	2021-06-13	--	--				
MW09-03-01		Se-D	mg/L		**Water Level (Figure A-1):** see previous section. **Water Quality (Figure A-2):** Concentrations have high seasonal variability with the majority of values below the threshold and in the range of baseline conditions. Se-D values have been stable in the historic range for MN-4.5 in McGinty Creek.	There is no increasing trend in Se-D values. Exceedances are isolated and measurements have seasonal variability throughout each year. The majority of data are in the range of baseline conditions.	Lack of any upwards trend in McGinty Creek, as measured at MN-4.5, suggests no current impact to surface water.	Limited action at this time. Continue monitoring as per routine schedule. Continue to look for opportunities to collect samples from surface seeps emanating from haul road. Conduct load and accretion survey of McGinty Creek as recommended in the 2019 GW Review (when conditions are suitable).
Figure A-1, A-3	April	2021-04-24	--	--				
	May	2021-05-12	0.000139	0.0001 (SPT 1)				
	June	2021-06-13	--	--				
MW09-03-01		Zn-D	mg/L		**Water Level (Figure A-1):** see previous section. **Water Quality (Figure A-4):** Increased variability in measurements starting in August 2015. Majority of the data are below SPT 2 and seasonality appears to be present. Zn-D values have been stable in the historic range for MN-4.5 in McGinty Creek.	Concentrations are consistent with previous observations and while there is high variability seasonally throughout each year no increasing trend is present. Peak concentrations during late Q1 and early Q2 suggest a seasonal trend related to freshet may be present.	Lack of any upwards trend in McGinty Creek, as measured at MN-4.5, suggests no current impact to surface water. Groundwater flux in this zone expected to be low based on low K. Load study done as part of the 2019 annual groundwater review indicates concentrations need to be at least an order of magnitude higher for threshold exceedances to occur at MN-4.5.	Limited action at this time. Continue monitoring as per routine schedule. Continue to look for opportunities to collect samples from surface seeps emanating from haul road. Conduct load and accretion survey of McGinty Creek as recommended in the 2019 GW Review (when conditions are suitable).
Figure A-1, A-3	April	2021-04-24	0.0958	0.013 (SPT 1)				
	May	2021-05-12	0.033	0.013 (SPT 1)				
	June	2021-06-13	0.0801	0.013 (SPT 1)				
MW09-03-02		Cd-D	mg/L		**Water Level (Figure A-1):** see previous section. **Water Quality (Figure A-2):** Concentrations beginning in 2019 have been more sporadic than the past, with the highest concentration measured in September 2019. While most recent data points exceed thresholds, concentrations are lower in the last year as compared to previous years. Cd-D values have been stable in the historic range for MN-4.5 in McGinty Creek.	Highest concentrations measured to date have been in Q3 of 2019, but are not increasing consistently year-over-year, and show potential seasonal variability. While there is no consistent increasing trend, and variability is high, annual averages increased between 2016 and 2019 but have since seemed to decrease.	Lack of any upwards trend in McGinty Creek, as measured at MN-4.5, suggests no current impact to surface water. Load study done as part of the 2019 annual groundwater review indicates concentrations need to be at least an order of magnitude higher for threshold exceedances to occur at MN-4.5.	Limited action at this time. Continue monitoring as per routine schedule. Continue to look for opportunities to collect samples from surface seeps emanating from haul road. Conduct load and accretion survey of McGinty Creek as recommended in the 2019 GW Review (when conditions are suitable).

	May	2021-05-12	0.000429	0.000031 (SPT 1)				
	June	2021-06-13	--	--				
MW09-03-02		Zn-D	mg/L		**Water Level (Figure A-1):** see previous section. **Water Quality (Figure A-4):** Increased variability in measurements starting in August 2015. Concentrations in Q4 are lower than Q1 and the 2020 average value is lower than the previous two years. Values in Q2 2021 are in the range of observed values from the previous years. Zn-D values have been stable in the historic range for MN-4.5 in McGinty Creek.	Concentrations in Q2 are all above SPT 2 but on average but with no increasing trend over time. Peak concentrations during late Q1 and early Q2 suggest a seasonal trend related to freshet may be present.	Lack of any upwards trend in McGinty Creek, as measured at MN-4.5, suggests no current impact to surface water. Groundwater flux in this zone expected to be low based on low K. Load study done as part of the 2019 annual groundwater review indicates concentrations need to be at least an order of magnitude higher for threshold exceedances to occur at MN-4.5.	Limited action at this time. Continue monitoring as per routine schedule. Continue to look for opportunities to collect samples from surface seeps emanating from haul road. Conduct load and accretion survey of McGinty Creek as recommended in the 2019 GW Review (when conditions are suitable).
Figure A-1, A-3	April	2021-04-24	0.0528	0.015 (SPT 2)				
	May	2021-05-12	0.0408	0.015 (SPT 2)				
	June	2021-06-13	0.0428	0.015 (SPT 2)				
MW09-03-02		NO_3-D	mg/L		**Water Level (Figure A-1):** see previous section. Water Quality (Figure A-5): Overall increasing trend is present beginning in 2017. Variability increased drastically in Q3 2019 with sporadic elevated concentrations occuring outside the historic trend. While the May 2021 sampling event was the highest recorded, subseqent monitoring events were lower. NO_3-D values have been stable in the historic range for MN-4.5 in McGinty Creek.	Clear upward trend from May 2015-December 2020. Higher variability beginning in 2018, with highest value recorded occurring in May 2021. Overall trend is increasing.	McGinty Creek, as observed at MN-4.5, does not show increasing or decreasing trends similar to MW09-03-02. Considering the small catchment area for MW09-03-02, even if the well is affected by local recharge, potential loading to McGinty Creek via this groundwater is potentially low. Nitrate is expected to flush from the haul road construction material over time and not increase continuously.	Limited action at this time. Continue monitoring as per routine schedule, continue to look for opportunities to collect samples from surface seeps emanating from haul road and continue to compare data from MW09-03-02 and MN-4.5 to confirm low nitrate concentrations persist in McGinty Creek. Conduct load and accretion survey of McGinty Creek as recommended in the 2019 GW Review (when conditions are suitable).

Table 1. Summary of Groundwater Quality Data, AMP Thresholds, Observations and Recommendations

Location	Month	Parameter & Concentration Data		Threshold Exceeded	Observations	Trends	Risk Narrative	Recommendation
Minto Creek Catchment								
MW12-05-01		SO_4^{2-}-D	mg/L		**Water Level (Figure B-1): Water levels show increasing trends in the fall to late winter seasons, followed by a decrease throughout the summer. These trends have occurred for four consecutive years and are likely due to a seasonal fluctuation. Overall vertical gradient remains downward.**	Previously observed upwards trend shows signs of stabilization after August 2017 with a slight increase again since Q4 2018. Concentrations have been consistent throughout 2020, suggesting concentrations are continuing to stabilize.	Minto Creek, as observed at W3 and MC1, do not show any upwards trend similar to MW12-05.	No further action at this time.
Figure B-1, B-2	April	N/A	N/A	N/A				
	May	N/A	N/A	N/A				Continue monitoring as per routine schedule.
	June	2021-06-06	1400	1000 (SPT 2)			Downwards gradient in MW12-05 and low flux (low hydraulic conductivity) suggest groundwater discharge not currently reaching creek or groundwater load small compared to surface water load.	Continue investigation into sulphate source and causes.
					Water Quality (Figure B-1): Concentrations linearly increased until August 2017, stabilizing between 1200 and 1500 mg/L beginning in 2018.	No upwards trend observed in Minto Creek. Seasonal variation evident at W8A, but much lower concentration than, and not considered likely to be connected to groundwater at MW12-05 as high concentrations at MW12-05 are at significant depth while W8A was a shallow DSTF monitoring point.		
					SO_4^{2-}-D values have been stable in the historic range at W3 and MC1 in Minto Creek.			
MW12-05-02		Cr-D	mg/L		**Water Level (Figure B-1): s**ee previous section.	Concentrations have been variablity in the past but no consistent increasing or decreasing trend is present. The most recent value is within the range of baseline conditions.	Minto Creek, as observed at W3 and MC1 so increased variability but no consistent upwards trend.	No further action at this time.
Figure B-1	April	N/A	N/A	N/A				
	May	N/A	N/A	N/A	**Water Quality (Figure B-1):** Chromium has consistently been below threholds in MW12-05 with isolated exceedances to SPT 1. While the Q2 concentration increased from the last monitoring event, it is within the range of baseline conditions and no increasing trend is present. Concentrations are still well below SPT 2.			Continue monitoring as per routine schedule.
	June	2021-06-06	0.001	0.25 (SPT 1)			Downwards gradient in MW12-05 and low flux (low hydraulic conductivity) suggest groundwater discharge not currently reaching creek or groundwater load small compared to surface water load.	
					Cr-D values are in the historic range at W3 and MC1 in Minto Creek. Some values in Q2 and Q3 2020 were elevated above groundwater concentrations, which is therefore not likely the source.	Increased variability in Minto Creek at MC1 and W3 has been present in 2020, but values at MC1 exceed those in groundwater, which is therefore not likely the cause of the observed variability.		
MW12-05-02		SO_4^{2-}-D	mg/L		**Water Level (Figure B-1): s**ee previous section.	Previously observed upwards trend shows signs of stabilization after August 2017 with higher varibaility since Q1 2018. One value from Q4 2019 was considerably higher (2400 mg/L) but has not occurred since, suggesting it was an outlier.	Minto Creek, as observed at W3 and MC1, do not show any upwards trend similar to MW12-05.	No further action at this time.
Figure B-1, B-2	April	N/A	N/A	N/A				
	May	N/A	N/A	N/A	**Water Quality (Figure B-1):** Concentrations linearly increased until August 2017, and have since stabilized around 1200 mg/L.			Continue monitoring as per routine schedule.
	June	2021-06-06	1260	1000 (SPT 2)			Downwards gradient in MW12-05 and low flux (low hydraulic conductivity) suggest groundwater discharge not currently reaching creek or groundwater load small compared to surface water load.	Continue investigation into sulphate source and causes.
						No upwards trend observed in Minto Creek. Seasonal variation evident at W8A, but not likely connected to groundwater at MW12-05.		
					SO_4^{2-}-D values have been stable in the historic range at W3 and MC1 in Minto Creek.			
MW12-05-03		SO_4^{2-}-D	mg/L		**Water Level (Figure B-1): s**ee previous section.	Previously observed upwards trend shows signs of stabilization after August 2017 with higher varibaility since Q1 2018. Seasonal trend may be present with highest concentrations in Q3 and Q4.	Minto Creek, as observed at W3 and MC1, do not show any upwards trend similar to MW12-05.	No further action at this time.
Figure B-1, B-2	April	N/A	N/A	N/A				
	May	N/A	N/A	N/A	**Water Quality (Figure B-1):** Concentrations linearly increased until August 2017, and have since stabilized around 700 mg/L. While the Q2 concentration increased from the previous monitoring event, it is still within the range of previously observed data.			Continue monitoring as per routine schedule.
	June	2021-06-06	863	1.0 (SPT 1)			Downwards gradient in MW12-05 and low flux (low hydraulic conductivity) suggest groundwater discharge not currently reaching creek or groundwater load small compared to surface water load.	Continue investigation into sulphate source and causes.
						No upwards trend observed in Minto Creek. Seasonal variation evident at W8A, but not likely connected to groundwater at MW12-05.		
					SO_4^{2-}-D values have been stable in the historic range at W3 and MC1 in Minto Creek.			
MW12-06-01		SO_4^{2-}-D	mg/L		**Water Level (Figure C-1):**Water Level (Figure C-1): Water level data show overall decreasing trend since March 2014. Deepest zone (1) shows steeper decrease in water level between November 2017 and March 2018. This drop is consistent with a decrease in water level in MW12-07 which coincides with development of the Minto East underground. Water level in the deepest zone, MW12-06-01, decreased between Q2 and Q4 2019 but instreased again in Q1 2020. Complex multi-directional gradient is present.	Concentrations were stable until Q2 2020 when they began to increase at a high rate. The increase is steady, although still at concentrations below SPT 2.	No exceedances to SPT 2 have been observed yet, but the rate of increase will need to be monitored.	No further action at this time.
Figure C-1, C-3	April	N/A	N/A					
	May	2021-05-29	612	0.374 (SPT 1)				Continue monitoring as per routine schedule.
	June	N/A	N/A					
					Water Quality (Figure B-1): Sulphate concentrations have been increasing in the deepest zone of MW12-06 since Q3 2020. Increases have been significant, but are still below SPT 2.			
					SO4-D values have been stable in the historic range at W3 and MC1 in Minto Creek.			
MW12-06-03		Se-D	mg/L		**Water Level (Figure C-1):** see previous section.	Concentrations have been stable at low concentrations with only isolated exceedances to SPT 1. No increasing trend is present.	Exceedances are isolated, concentrations are wel below SPT 2 and no impacts are observed at monitoring stations in Minto Creek.	No further action at this time.
Figure C-1, C-3	April	N/A	N/A					
	May	2021-05-29	0.00314	1.058 (SPT 1)	**Water Quality (Figure B-1):** Concentrations have consistently been below thresholds in the past with only isolated exceedances to SPT 1. No increasing trend is present and values are below SPT 2.			Continue monitoring as per routine schedule.
	June	N/A	N/A					
					Se-D values have been stable in the historic range at W3 and MC1 in Minto Creek.			
MW12-06-06		Zn-D	mg/L		**Water Level (Figure C-1):** see previous section.	Concentrations have been stable at low concentrations with only isolated exceedances to SPT 1 and the current exceedance to SPT 3. No increasing trend is present.	Exceedances are isolated and no impacts are observed at monitoring stations in Minto Creek.	No further action at this time.
Figure C-1, C-2	April	N/A	N/A					
	May	2021-05-29	0.189	0.13 (SPT 3)	**Water Quality (Figure B-1):** Concentrations have consistently been below thresholds in the past with only isolated exceedances to SPT 1. The most recent value exceeds SPT 3, but may be an outlier. More data are required to confirm.			Continue monitoring as per routine schedule.
	June	N/A	N/A					
					Zn-D values have been stable in the historic range at W3 and MC1 in Minto Creek.			

Notes:
'N/A' indicates no sample was taken for that month
'-' indicates value for that month did not trigger a response

Attention: Journey Paulus, Manager, Environment

Dear Journey:

Subject: 2021 Q3 (July - September) Groundwater AMP Events

The Minto Mine Operational Adaptive Management Plan was updated in 2018 for groundwater monitoring, with the review frequency for groundwater triggers changed from monthly to quarterly, at the recommendation of SRK Consulting (SRK) who is the qualified professional (QP). As per AMP2017-02, all data concerning trigger exceedances are sent to the QP within a week of discovery and included in the subsequent review.

As part of the Minto Mine Operational Adaptive Management Plan, Minto Mine has collected and reviewed groundwater quality data. Minto completed an initial review of data collected at the McGinty Creek groundwater monitoring station (MW09-03) and Minto Creek groundwater monitoring stations MW12-05 and MW12-06 for the third quarter of 2021 (July - September) and compared results to specific performance thresholds (SPT) defined in the Minto Mine Operations Adaptive Management Plan (MEL, 2017-02). McGinty Creek monitoring stations are required to be sampled monthly while the Minto Creek stations are sampled quarterly. Due to issues with sampling equipment and the presence of glycol in some sampling ports, samples were not obtained in Q3 in MW12-05-06, MW12-05-07 and MW12-06-01. For Minto Creek and McGinty Creek, MEL identified exceedances of certain thresholds for sampling rounds conducted in July, August, and September of 2021 and, as per the plan, has contracted a QP to review those data and provide recommendations. SRK Consulting (Canada) Inc. was contacted by Minto environmental staff to provide QP review. This letter presents results of that review and recommendations.

SRK compared data against the 2017-02 AMP thresholds, historical data, and data from surface water at station MN4.5 in lower McGinty Creek and surface water stations W3 and MC1 in Minto Creek. Table 1 summarizes exceedances, observations on the data, interpretation, and recommendations. Figures are included with this review to illustrate the current physical (i.e., water level) setting compared to the Minto North pit. Graphs are included for each parameter exceeding thresholds and includes the full range of data collected to date.

Key conclusions and recommendations are summarized below. Table 1 summarizes observations and recommendations for all parameters.

For MW09-03 (McGinty Creek):

- The Minto North Pit is not a source of water to the groundwater monitored at this station; water levels in the monitoring well are higher than the pit water level. Water levels in the pit have been increasing slowly but remain well below the monitoring well water levels. These data continue to show no hydraulic gradient from the pit towards the monitoring well.
- Water levels at this station have been affected by the mining of Minto North, but the groundwater divide between Minto North and McGinty Creek remains, somewhere in the vicinity of MW09-03.
- Water levels in MW17-11 are generally lower than in MW09-03, with the exception of zone 5, which is screened shallower than zones 1 and 2 in MW09-03 and has higher water levels than all other monitoring zones. Water levels in MW17-11 and MW09-03 indicate an overall downward gradient between the shallow-most zone and the remaining deeper zones. Differences in water level between deep zones are less pronounced, and a vertical gradient is not clear.
    - Recommendation: continue collecting water level/pressure profiles at this well according to the routine schedule.
- Concentrations of dissolved aluminum at MW09-03 have been generally stable and below SPT 1 since 2016. The value measured at MW09-03-02 in Q3 exceeded SPT 2 but was isolated as it was the only recorded exceedance in 2021. While variability has been present in the data, concentrations are consistently below thresholds. Concentrations in McGinty Creek at MN-4.5 are variable and often higher than groundwater concentrations with no increasing trend.
- Concentrations of dissolved silver at MW09-03 have been extremely stable below the laboratory detection limit. In Q3 2021, the laboratory had a higher detection limit (0.00002 mg/L), which exceeded STP 1. The measured concentration was still below laboratory detection. Concentrations in McGinty Creek at MN-4.5 are variable and often higher than groundwater concentrations with no increasing trend.
- Concentrations of dissolved arsenic at MW09-03-01 have consistently exceeded SPT 1 since summer of 2016, and inconsistently exceeded thresholds in MW-09-02 in the same period. High variability is observed, but relatively recent data in MW09-03-01 exceeds thresholds more frequently than in the past. Anomalous values were detected in October 2018, September 2019, and June 2020 at nearly an order of magnitude more than recent average concentrations. In between the anomalous events, concentrations decreased to the historic range, suggesting these values are outliers. High concentrations do not correlate exactly with seasonal changes in groundwater level but may indicate an influence from seasonal variation (in recharge, flow, etc.). Vertical profiles and timing of peak concentrations suggest increased loading may be occurring during low flow periods or freshet, possibly suggesting greater mobilization of trace elements when higher volumes of water could infiltrate through the unsaturated zone and mobilize trace elements. Loading calculations included in the Minto Mine - 2019 Groundwater Review and Summary of OAMP SPT Exceedances (SRK 2020) indicate arsenic concentrations would need to increase by at least one order of magnitude for an exceedance in McGinty Creek at MN-4.5 to be observed. While there is some seasonal variability in McGinty Creek chemistry, surface water concentrations are not increasing and remain in the range of baseline data at MN-4.5.

- Concentrations of dissolved cadmium at MW09-03-01 and MW09-03-02 have inconsistently exceeded SPT 1 in he past with high variability in the observed data. Cadmium data exceed thresholds more frequently since 2017 and while average concentrations have increased beginning in 2017, there is no consistent increasing trend with many values in the last two years below the threshold. Seasonal variability seems to be present, with highest concentrations occurring in Q1 and Q2, potentially related to freshet. Cadmium concentrations in McGinty Creek remain low and stable, showing no impact from the groundwater and loading calculations presented in SRK 2020 indicate groundwater concentrations would need to increase by at least one order of magnitude for an exceedance in McGinty Creek at MN-4.5 to be observed.

- Concentrations of dissolved copper have exceeded SPT 1 sporadically in MW09-03-02 since late 2016. One monitoring event exceeded thresholds in Q3 2021 but appears to be related to seasonal variation, as peak concentrations occur historically in Q2 or Q3. Dissolved copper values in McGinty Creek remain in the range of historic data, no evidence of surface water impacts are present and loading calculations presented in SRK 2020 indicate groundwater concentrations would need to increase by at least one order of magnitude for an exceedance in McGinty Creek at MN-4.5 to be observed.

- Concentrations of dissolved selenium in MW09-03-01 and MW09-03-02 have exceeded thresholds sporadically in the last few years, with increased variability in the data beginning in 2017. Average annual concentrations in MW09-03-02 have been higher in 2018 and 2019 than past years, but do not demonstrate a consistent increasing trend. Only one monitoring event in Q2 exceeded thresholds in MW09-03-01 and two in MW09-03-02. Peak concentrations in Q1 and Q2 of these years indicate a season variation may be present. Loading calculations presented in SRK 2020 are not applicable to selenium, as elevated concentrations are already being observed in McGinty Creek at MN-4.5. In a memo prepared by Minnow Environmental in 2019 (*Evaluation of Dissolved Copper and Selenium AMP Threshold Exceedances in McGinty Creek*) it was concluded that the source of elevated selenium concentrations was unrelated to the Minto Mine and values were consistent with historical concentrations before the Minto North Pit was operational.

- Concentrations of dissolved sulphate have been decreasing in MW09-03-01 and MW09-03-02 since 2016. The most recent concentrations measured in MW09-03-02 exceeded SPT 2 but are within the range of values observed in previous years. Sulfate appears to vary seasonally, with concentrations reaching their peak in the summer months each year. Sulphate concentrations in McGinty Creek are variable, but remain in the range of historic data, with no evidence of surface water impacts present.

- Concentrations of dissolved zinc at MW09-03-01 and MW09-03-02 have inconsistently exceeded SPT 1 and SPT 2 thresholds since the summer of 2016. High variability is observed in the data, but relatively recent data exceeds thresholds more frequently than in the past, MW09-03-02 appeared to show a potential year-to-year increasing trend but values in 2021 have been lower than the previous two years. High concentrations do not correlate exactly with seasonal changes in groundwater level but may indicate an influence from seasonal variation. Vertical profiles and timing of peak concentrations suggest increased loading may be occurring during freshet when higher volumes of water infiltrate through the unsaturated zone and mobilize trace elements. While there is some seasonal variability in McGinty Creek chemistry, surface water concentrations are not increasing and remain in the range of baseline data. Loading calculations presented in SRK 2020 indicate

groundwater concentrations would need to increase by at least one order of magnitude for an exceedance in McGinty Creek at MN-4.5 to be observed.

  - Recommendations: due to the low potential loading of groundwater into McGinty Creek limited action is recommended at this time. Continue monitoring as per routine schedule. Continue to look for opportunities to collect samples from surface seeps emanating from haul road.

  - The load and accretion study, as recommended in the 2019 Review of OAMP Exceedances, was not conducted in 2021 due to unfavorable conditions with surface water flows which created conditions that would make loading from groundwater undetectable. It is recommended that the load and accretion study be conducted in 2022 if the conditions are appropriate.

- Concentrations of dissolved nitrate at MW09-03-02 have exceeded SPT 2 since the fall of 2016. Concentrations have shown a consistent increasing trend since October 2016 with potential seasonal effects producing higher concentrations in Q4 of each year. Loading calculations presented in SRK 2020 indicate groundwater concentrations would need to increase by a factor of 2 from the highest measurement for an exceedance in McGinty Creek at MN-4.5 to be observed. As the nitrate is likely sourced from blast rock used to construct the haul road, load is expected to flush over time and the increasing trend is not expected to persist indefinitely. Concentrations will continue to be closely monitored. A more detailed review of nitrate behavior is provided in the 2020 Review of OAMP Exceedances. While there is some seasonal variability in McGinty Creek chemistry, surface water concentrations are not increasing and remain in the range of baseline data.

  - Recommendation: due to the low potential loading of groundwater into McGinty Creek limited action is recommended at this time. Continue monitoring as per schedule. Continue to look for seeps from the haul road that can be used for comparison. Compare vertical concentration profiles in MW09-03 and MW17-11 as more annual data becomes available from MW17-11. Conduct load accretion study as recommended in the 2019 Review of OAMP Exceedances, when conditions are appropriate to do so.

For MW12-05 and MW12-06 (Minto Creek):

- Water level data in the deepest zone of MW12-06 decreased sharply between November 2017 and March 2018, which coincides with development of the Minto East underground. Water levels in the deepest zone increased again between May and August 2018, when development of the underground stopped. More recently, the water level in the deepest zone, MW12-06-01, decreased between Q2 and Q4 2019 which changed the overall vertical gradient from upwards to downwards and then increased again in Q1 2020 reversing the gradient once again. The decrease in water level coincides with the re-start of underground development in September 2019, and while dewatering was continued throughout the temporary underground closure, the increased activity could potentially have influenced the deep groundwater levels. The same trend was not observed in MW12-05 or MW17-12, suggesting these wells are currently outside the area of groundwater affected by the development of the underground. Consistent vertical gradients cannot be identified and there exists a complex multidirectional vertical gradient between other zones. Seasonal fluctuations are apparent in MW12-05, with peak water levels occurring in Q2 of the past 2 years.

  - Recommendation: continue collecting water level/pressure profiles at this well according to the routine schedule. Continue to monitor changes in groundwater pressure as system equilibrates following the cessation of Minto East underground development. Continue to monitor complex multidirectional vertical gradient in MW12-06.

- Concentrations of dissolved selenium in MW12-05 and MW12-06 are mostly below thresholds with only sporadic exceedances occurring since 2016. The highest concentrations in the previous four years in MW12-05 have been observed in Q2, suggesting the elevated values are due to seasonal fluctuations, potentially regarding freshet. Only one monitoring event in MW12-05-04 exceeded SPT 1 in Q3 but concentrations are still well below STP 2. Surface water concentrations are not increasing and remain in the range of baseline data suggesting no impacts related to groundwater concentrations are being observed.

- Concentrations of dissolved zinc have been stable below thresholds in MW12-05 in the past with some slight variability. The only exceedance to SPT 1 occurred in the most recent sampling event in MW12-05-03 but is within the range of historic concentrations. Surface water concentrations are not increasing and remain in the range of baseline data suggesting no impacts related to groundwater concentrations are being observed.

  - Recommendation: continue monitoring as per routine schedule. Assess sources of potential contaminants and include in the 2021 Review of OAMP Exceedances.

- Concentrations of sulphate at MW12-05-01 and MW12-05-02 continue to be elevated above SPT 2. Concentrations at MW12-05-01 and MW12-05-02 were increasing historically but show signs of stabilization after August 2017. While concentrations are still increasing, data do not show the same rate of increase as was observed prior to 2017, with the exception of the Q4 2019 observation in MW12-05-02, which had a measured concentration of 2400 mg/L, nearly double the previous sampling event. As this magnitude of concentration is isolated to one sampling event, and values have since decreased to be consistent with previous trends, the datapoint is considered an outlier.

  Sulphate concentrations in MW12-06-01 have been increasing since Q1 2020 with the most recent events approaching SPT 2. These concentrations are isolated to the deepest zone in MW12-06, which has shown evidence of disruption (in water levels and chemical equilibrium) related to underground mining in the past. A sample was not obtained from MW12-06-01 in Q3 so additional data are needed to assess the trend. The cause of increasing sulphate concentrations in MW12-06-01 is unclear at this time, but trends will continue to be closely monitored.

  Previous investigations into the source of elevated sulphate in deep groundwater as observed at MW12-05 conclude it is unrelated to mining activities. Sulphate concentrations in MW17-12 exhibit an increasing gradient with depth but no increasing trend temporally. Minto Creek continues to indicate no trends in sulphate concentration that can clearly be related to changes in groundwater concentrations.

  - Recommendation: continue monitoring as per schedule and review/update investigations as to potential sources of SO_4 as part of the overall review of site groundwater quality.

Sincerely,

SRK Consulting (Canada) Inc.

Appendix A: Tables

Table 1. Summary of Groundwater Quality Data, AMP Thresholds, Observations and Recommendations

Location	Month	Parameter & Concentration Data		Threshold Exceeded	Observations	Trends	Risk Narrative	Recommendation
McGinty Creek Catchment								
MW09-03-01		As-D	mg/L		**Water Level (Figure A-1):** see previous section. Water levels in MW09-03 Zone 1 and Zone 2 started declining when mining started in Minto North. Declining trend decreased about 6 months after mining completed. Water levels remain higher than pit bottom. Water levels increased between July and September 2016 before returning to previous trend. Similar trend occurred in 2017 when water levels increased between April and September, declined until May 2018 and increased again until September. Water levels increased in Q3 2020, consistent with previous seasonal trends. Peak water levels in 2020 were higher than previous four years. Minto North pit continues to act as a hydraulic sink, and has lowered groundwater levels. Water levels at MW09-03 suggest the presence of a groundwater divide somewhere north of the pit. Seasonal fluctuations indicate some influence from recharge. Loading to McGinty Creek could only occur from haul road material along the pit perimeter **Water Quality (Figure A-2):** Seasonal variations appear to be present, with highest values occurring the summer months the last 2 years (with the exception of outliers). Values during Q3 are in the range of historic data very near SPT 2. As-D values for MN-4.5 in McGinty Creek have been stable in the historic range.	While data from late summer 2015 to August 2017 showed signs of an increasing trend, values have since stabilized. Peak values during Q2 and Q3 suggest a seasonal trend related to freshet may be present. Elevated values are isolated to October 2018, September 2019 and June 2020 and appear to be outliers. Concentrations from 2016 to 2018 showed potential seasonal variability, becoming relatively stable in 2019. Concentrations from 2019 thru 2020 remained relatively steady.	Lack of any clear upwards trend in McGinty Creek, as measured at MN-4.5, suggests currently no impact. Minto North represents only 0.4% of the McGinty Creek total watershed. Assuming that groundwater flows are proportional to surface water flows (load can only be coming from haul road, not pit leakage) groundwater concentrations would need to be at least 10x higher to result in MN-4.5 As concentrations reaching MN-4.5 SPT1. Overall risk of arsenic loading to McGinty Creek from groundwater is low at this time.	Limited action at this time. Continue monitoring as per routine schedule. Continue to look for opportunities to collect samples from surface seeps emanating from haul road. Conduct load and accretion survey of McGinty Creek as recommended in the 2019 GW Review (when conditions are suitable).
Figure A-1, A-3	July	2021-07-05	0.00097	0.00081 (SPT 2)				
	August	2021-08-13	0.00087	0.00081 (SPT 2)				
	September	2021-09-24	0.00095	0.00081 (SPT 2)				
MW09-03-01		Ag-D	mg/L		**Water Level (Figure A-1):** see previous section. **Water Quality (Figure A-4):** The concentration exceeds SPT 2, however this is caused by an increased detection limit of 0.00002 for this sampling event. The concentration is below the laboratory detection limit. Ag-D values have been stable in the historic range for MN-4.5 in McGinty Creek.	Concentrations are stable and below laboratory detection limits.	Lack of any upwards trend in McGinty Creek, as measured at MN-4.5, suggests no current impact to surface water. Groundwater flux in this zone expected to be low based on low K. Load study done as part of the 2019 annual groundwater review indicates concentrations need to be at least an order of magnitude higher for threshold exceedances to occur at MN-4.5.	Limited action at this time. Continue monitoring as per routine schedule. Continue to look for opportunities to collect samples from surface seeps emanating from haul road. Conduct load and accretion survey of McGinty Creek as recommended in the 2019 GW Review (when conditions are suitable).
Figure A-1, A-2	July	2021-07-05	-	-

	September	2021-09-24	-	-				
MW09-03-01		Se-D	mg/L		**Water Level (Figure A-1):** see previous section. **Water Quality (Figure A-4):** Increased variability observed beginning in 2017 with sporadic exceedances to SPT 1. The majority of values are below thresholds and within the range of background conditions. Q1 and Q2 values are higher than has been observed in the past, but may be outliers. Se-D values have been stable in the historic range for MN-4.5 in McGinty Creek.	Exceedances to SPT 1 occur during the peak concentrations of seasonal trends normally in Q1 or Q2 of each year. Peak concentrations during late Q1 and early Q2 suggest a seasonal trend related to freshet may be present.	Lack of any upwards trend in McGinty Creek, as measured at MN-4.5, suggests no current impact to surface water. Groundwater flux in this zone expected to be low based on low K.	Limited action at this time. Continue monitoring as per routine schedule. Continue to look for opportunities to collect samples from surface seeps emanating from haul road. Conduct load and accretion survey of McGinty Creek as recommended in the 2019 GW Review (when conditions are suitable).

MW09-03-01		Zn-D	mg/L		**Water Level (Figure A-1):** see previous section. **Water Quality (Figure A-4):** Increased variability in measurements starting in August 2015. Approximately half the data points fall below SPT 1 and exceedances occur seasonally. Zn-D values have been stable in the historic range for MN-4.5 in McGinty Creek.	Concentrations are consistent with previous observations with a high degree of seasonality. Peak concentrations during late Q1 and early Q2 suggest a seasonal trend related to freshet may be present.	Lack of any upwards trend in McGinty Creek, as measured at MN-4.5, suggests no current impact to surface water. Groundwater flux in this zone expected to be low based on low K. Load study done as part of the 2019 annual groundwater review indicates concentrations need to be at least an order of magnitude higher for threshold exceedances to occur at MN-4.5.	Limited action at this time. Continue monitoring as per routine schedule. Continue to look for opportunities to collect samples from surface seeps emanating from haul road. Conduct load and accretion survey of McGinty Creek as recommended in the 2019 GW Review (when conditions are suitable).
Figure A-1, A-5	July	2021-07-05	0.0556	0.022 (SPT2)

	September	2021-09-24	0.0156	0.013 (SPT1)				
MW09-03-01		NO_3-D	mg/L		**Water Level (Figure A-1):** see previous section. **Water Quality (Figure A-4):** Concentrations have been consistently below thresholds. The exceedance in Q3 2021 is isoalted and still at a low concentration. NO3-D values have been stable in the historic range for MN-4.5 in McGinty Creek.	Q3 2021 exceedance only slightly above previous measurements and has not occurred since 2013. No increasing trend present.	Lack of any upwards trend in McGinty Creek, as measured at MN-4.5, suggests no current impact to surface water. Groundwater flux in this zone expected to be low based on low K.	Limited action at this time. Continue monitoring as per routine schedule. Continue to look for opportunities to collect samples from surface seeps emanating from haul road. Conduct load and accretion survey of McGinty Creek as recommended in the 2019 GW Review (when conditions are suitable).

	August	2021-08-13	-	-				
	September	2021-09-24	0.205	0.13 (SPT1)				
MW09-03-02		Al-D	mg/L		**Water Level (Figure A-1):** see previous section. Water Quality (Figure A-2): Concentrations have been more sporadic since the beginnig of 2018 with intermittent exceedances to SPT 2. The majority of sampling events are well below SPT 1, with exceedances sporadic and potential outliers. Al-D values have been stable in the historic range for MN-4.5 in McGinty Creek.	Potential, though inconsistent, seasonal trend related to increased loading due to either high infiltration and trace element mobilizing during freshet or low flow periods (Q1-Q2). Most recent data point is the highest recorded, but more data are needed to assess the presence of a trend.	Lack of any upwards trend in McGinty Creek, as measured at MN-4.5, suggests no current impact to surface water. Load study done as part of the 2019 annual groundwater review indicates concentrations need to be at least an order of magnitude higher for threshold exceedances to occur at MN-4.5.	Limited action at this time. Continue monitoring as per routine schedule. Continue to look for opportunities to collect samples from surface seeps emanating from haul road. Conduct load and accretion survey of McGinty Creek as recommended in the 2019 GW Review (when conditions are suitable).

Table 1. Summary of Groundwater Quality Data, AMP Thresholds, Observations and Recommendations

Location	Month	Parameter & Concentration Data		Threshold Exceeded	Observations	Trends	Risk Narrative	Recommendation
MW09-03-02		Cd-D	mg/L		**Water Level (Figure A-1):** see previous section.	Highest concentrations measured to date have been in Q3 of 2019, but are not increasing consistently year-over-year, and show potential seasonal variability.	Lack of any upwards trend in McGinty Creek, as measured at MN-4.5, suggests no current impact to surface water.	Limited action at this time.
Figure A-1, A-3	July	2021-07-05	-	-	**Water Quality (Figure A-2):** Concentrations beginning in 2019 have been more sporadic than the past, with the highest concentration measured in September 2019. While most recent data points exceed thresholds, concentrations are lower than the previous year.	While there is no consistent increasing trend, and variability is high, annual averages increased between 2016 and 2019.	Load study done as part of the 2019 annual groundwater review indicates concentrations need to be at least an order of magnitude higher for threshold exceedances to occur at MN-4.5.	Continue monitoring as per routine schedule. Continue to look for opportunities to collect samples from surface seeps emanating from haul road.
	August	2021-08-13	0.00011	0.000031 (SPT 1)				Conduct load and accretion survey of McGinty Creek as recommended in the 2019 GW Review (when conditions are suitable).
	September	2021-09-24	0.0000745	0.000031 (SPT 1)	Cd-D values have been stable in the historic range for MN-4.5 in McGinty Creek.			
MW09-03-02		Cu-D	mg/L		**Water Level (Figure A-1):** see previous section.	No consistent trend in Cu-D. Highest values were detected in the first half of 2018 and have been consistently lower since with the exception of Q3 and Q4 of 2019 and the Q1 datapoint from 2020.	Lack of any upwards trend in McGinty Creek, as measured at MN-4.5, suggests no current impact to surface water.	Limited action at this time.
Figure A-1, A-4	July	2021-07-05	-	-	Water Quality (Figure A-4): Concentrations have been sporadically exceeding SPT 1 since late 2016. The March 2020 concentration was the highest recorded to date, but is currently isolated and may be an outlier. Concentrations in 2019 were lower on average than the previous year and more data are required to assess the presence of a trend.		Groundwater flux in this zone expected to be low based on low K.	Continue monitoring as per routine schedule. Continue to look for opportunities to collect samples from surface seeps emanating from haul road.
	August	2021-08-13	-	-			Load study done as part of the 2019 annual groundwater review indicates concentrations need to be at least an order of magnitude higher for threshold exceedances to occur at MN-4.5.	Conduct load and accretion survey of McGinty Creek as recommended in the 2019 GW Review (when conditions are suitable).
	September	2021-09-24	0.00328	0.00263 (SPT1)	Cu-D values have been stable in the historic range for MN-4.5 in McGinty Creek.			
MW09-03-02		Se-D	mg/L		**Water Level (Figure A-1):** see previous section.	Concentrations in 2021 are less variable than previous years with no increasing trend. Exceedances of SPT 1 are not consistent. Elevated concentrations in Q2 suggest a seasonal trend related to freshet may be present.	Lack of any upwards trend in McGinty Creek, as measured at MN-4.5, suggests no current impact to surface water.	Limited action at this time.
Figure A-1, A-4	July	2021-07-05	-	-	Water Quality (Figure A-4): Exceedances to SPT 1 have been occurring sporadically since 2016. Concentrations have been less variable in 2020 and 2021 compared to previous years.		Groundwater flux in this zone expected to be low based on low K.	Continue monitoring as per routine schedule. Continue to look for opportunities to collect samples from surface seeps emanating from haul road.
	August	2021-08-13	0.00141	0.0005 (SPT1)				Conduct load and accretion survey of McGinty Creek as recommended in the 2019 GW Review (when conditions are suitable).
	September	2021-09-24	0.000745	0.0005 (SPT1)	Se-D values have been stable in the historic range for MN-4.5 in McGinty Creek.			
MW09-03-02		Zn-D	mg/L		**Water Level (Figure A-1):** see previous section.	Concentrations in Q4 are all above SPT 2 but are not increasing compared to previous years.	Lack of any upwards trend in McGinty Creek, as measured at MN-4.5, suggests no current impact to surface water.	Limited action at this time.
Figure A-1, A-5	July	2021-07-05	0.0329	0.015 (SPT 2)	**Water Quality (Figure A-4):** Increased variability in measurements starting in August 2015. Concentrations are on average higher in 2021 than 2020, but vary seasonaly and show no increasing trend.	Peak concentrations during late Q1 and early Q2 suggest a seasonal trend related to freshet may be present.	Groundwater flux in this zone expected to be low based on low K.	Continue monitoring as per routine schedule. Continue to look for opportunities to collect samples from surface seeps emanating from haul road.
	August	2021-08-13	0.0429	0.015 (SPT 2)				
	September	2021-09-24	0.0537	0.015 (SPT 2)			Load study done as part of the 2019 annual groundwater review indicates concentrations need to be at least an order of magnitude higher for threshold exceedances to occur at MN-4.5.	Conduct load and accretion survey of McGinty Creek as recommended in the 2019 GW Review (when conditions are suitable).
					Zn-D values have been stable in the historic range for MN-4.5 in McGinty Creek.			
MW09-03-02		SO_4^{2-}-D	mg/L		**Water Level (Figure A-1):** see previous section.	Concentrations in Q4 are all above SPT 1, but are potentially outliers. More data are needed to assess a trend.	Lack of any upwards trend in McGinty Creek, as measured at MN-4.5, suggests no current impact to surface water.	Limited action at this time.
Figure A-1, A-5	July	2021-07-05	-	-	Water Quality (Figure A-4): Sulphate concentrations have been decreasing overall since 2017. The most recent sampling events exceeded SPT 1, but are the only points to do so in the last 2 years. More data are needed to assess the trend.	Peak concentrations in the first half of each year suggest a seasonal trend is present related to freshet.	Groundwater flux in this zone expected to be low based on low K.	Continue monitoring as per routine schedule. Continue to look for opportunities to collect samples from surface seeps emanating from haul road.
	August	2021-08-13	10.4	7 (SPT1)				Conduct load and accretion survey of McGinty Creek as recommended in the 2019 GW Review (when conditions are suitable).
	September	2021-09-24	8.73	7 (SPT1)	SO4-D values have been stable in the historic range for MN-4.5 in McGinty Creek.			
MW09-03-02		NO_3^--D	mg/L		**Water Level (Figure A-1):** see previous section.	Clear upward trend from May 2015-December 2020. Higher variability beginning in 2018, with highest value recorded occurring in October 2019. Overall trend is increasing.	McGinty Creek, as observed at MN-4.5, does not show increasing or decreasing trends similar to MW09-03-02.	Limited action at this time.
Figure A-1, A-6	July	2021-07-05	8.09	0.07 (SPT 2)	**Water Quality (Figure A-5):** Overall increasing trend is present beginning in 2017. Variability increased drastically in Q3 2019 with sporadic elevated concentrations occuring outside the historic trend.		Considering the small catchment area for MW09-03-02, even if the well is affected by local recharge, potential loading to McGinty Creek via this groundwater is potentially low.	Continue monitoring as per routine schedule, continue to look for opportunities to collect samples from surface seeps emanating from haul road and continue to compare data from MW09-03-02 and MN-4.5 to confirm low nitrate concentrations persist in McGinty Creek.
	August	2021-08-13	7.11	0.07 (SPT 2)				
	September	2021-09-24	11.3	0.07 (SPT 2)	NO_3^--D values have been stable in the historic range for MN-4.5 in McGinty Creek.		Nitrate is expected to flush from the haul road construction material over time and not increase continuously.	Conduct load and accretion survey of McGinty Creek as recommended in the 2019 GW Review (when conditions are
Minto Creek Catchment								
MW12-05-01		SO_4^{2-}-D	mg/L		**Water Level (Figure B-1):** Water levels show increasing trends in the fall to late winter seasons, followed by a decrease throughout the summer. Water levels in Q3 are similar to levels at the same time of year in previous years. While more data is needed to be certain, the trends are likely due to a seasonal fluctuation. Overall vertical gradient remains downward.	Previously observed upwards trend shows signs of stabilization after August 2017 with a slight increase again since Q4 2018. Concentrations have been consistent throughout 2020, suggesting concentrations are continuing to stabilize.	Minto Creek, as observed at W3 and MC1, do not show any upwards trend similar to MW12-05.	No further action at this time.
Figure B-1, B-2	July	N/A	N/A				Downwards gradient in MW12-05 and low flux (low hydraulic conductivity) suggest groundwater discharge not currently reaching creek or groundwater load small compared to surface water load.	Continue monitoring as per routine schedule. Continue investigation into sulphate source and causes.
	August	2021-08-21	1390	1000 (SPT 2)	**Water Quality (Figure B-1):** Concentrations linearly increased until August 2017, stabilizing between 1200 and 1500 mg/L beginning in 2018.	No upwards trend observed in Minto Creek. Seasonal variation evident at W8A, but much lower concentration than, and not considered likely to be connected to groundwater at MW12-05 as high concentrations at MW12-05 are at significant depth while W8A was a shallow DSTF monitoring point.		
	September	N/A	N/A		SO_4^{2-}-D values have been stable in the historic range at W3 and MC1 in Minto Creek.			
MW12-05-02		SO_4^{2-}-D	mg/L		**Water Level (Figure B-1):** see previous section.	Previously observed upwards trend shows signs of stabilization after August 2017 with higher varibality since Q1 2018. One value from Q4 2019 was considerably higher (2400 mg/L) but has not occurred since, suggesting it was an outlier.	Minto Creek, as observed at W3 and MC1, do not show any upwards trend similar to MW12-05.	No further action at this time.
Figure B-1, B-2	July	N/A	N/A		**Water Quality (Figure B-1):** Concentrations linearly increased until August 2017, and have since stabilized around 1200 mg/L.		Downwards gradient in MW12-05 and low flux (low hydraulic conductivity) suggest groundwater discharge not currently reaching creek or groundwater load small compared to surface water load.	Continue monitoring as per routine schedule. Continue investigation into sulphate source and causes.
	August	2021-08-21	1220	1000 (SPT 2)				
	September	N/A	N/A		SO_4^{2-}-D values have been stable in the historic range at W3 and MC1 in Minto Creek.	No upwards trend observed in Minto Creek. Seasonal variation evident at W8A, but not likely connected to groundwater at MW12-05.		
MW12-05-04		Se-D	mg/L		**Water Level (Figure B-1):** see previous section.	Concentrations have been variablity in the past but no consistent increasing or decreasing trend is present. The most recent value is within the range of baseline conditions.	Minto Creek, as observed at W3 and MC1 so increased variability but no consistent upwards trend.	No further action at this time.
Figure B-1	July	N/A	N/A		**Water Quality (Figure B-1):** Selenium concentrations are consistently below SPT 2, with some variablity throughout each year. While the Q3 sampling event was higher than previous, triggering SPT 1, concentrations are still low and within the range of historic data.		Downwards gradient in MW12-05 and low flux (low hydraulic conductivity) suggest groundwater discharge not currently reaching creek or groundwater load small compared to surface water load.	Continue monitoring as per routine schedule.
	August	2021-08-23	0.00196	0.391 (SPT1)				
	September	N/A	N/A		Se-D values have been more variable in 2020 but generally in the historic range at W3 and MC1 in Minto Creek.	No upwards trend observed in Minto Creek. Seasonal variation evident at W8A, but not likely connected to groundwater at MW12-05.		
MW12-05-03		Zn-D	mg/L		**Water Level (Figure B-1):** see previous section.	Exceedances to SPT 1 have been isolated and sporadic in the past. No increasing trend is present.	Minto Creek, as observed at W3 and MC1 has no increasing trend or variability.	No further action at this time.
Figure B-1, B-2	July	N/A	N/A		**Water Quality (Figure B-1):** Zinc concentratoins have been low historically, with only sporadic exceedances to SPT 1. The Q3 concentration is well below SPT 2.			
	August	2021-08-23	0.0175	0.2166 (SPT1)			Downwards gradient in MW12-05 and	Continue monitoring as per routine schedule.
	September	N/A	N/A					

Table 1. Summary of Groundwater Quality Data, AMP Thresholds, Observations and Recommendations

Location	Month	Parameter & Concentration Data		Threshold Exceeded	Observations	Trends	Risk Narrative	Recommendation
					Zn-D values have been stable in the historic range at W3 and MC1 in Minto Creek.	No upwards trend observed in Minto Creek. Seasonal variation evident at W8A, but not likely connected to groundwater at MW12-05.	low flux (low hydraulic conductivity) suggest groundwater discharge not currently reaching creek or groundwater load small compared to surface water load.	

Notes:
'N/A' indicates no sample was taken for that month
'-' indicates value for that month did not trigger a response
Zones with no data or no exceedances: MW09-03-03 (dry), MW12-05-05, MW12-05-06, MW12-05-07,MW12-06-01, MW12-06-02, MW12-06-03, MW12-06-04, MW12-06-05, MW12-06-06

Attention: Journey Paulus, Manager, Environment

Dear Journey:

Subject: 2021 Q4 (October - December) Groundwater AMP Events

The Minto Mine Operational Adaptive Management Plan was updated in 2018 for groundwater monitoring, with the review frequency for groundwater triggers changed from monthly to quarterly, at the recommendation of SRK Consulting (SRK) who is the qualified professional (QP). As per AMP2017-02, all data concerning trigger exceedances are sent to the QP within a week of discovery and included in the subsequent review.

As part of the Minto Mine Operational Adaptive Management Plan, Minto Mine has collected and reviewed groundwater quality data. Minto completed an initial review of data collected at the McGinty Creek groundwater monitoring station (MW09-03) and Minto Creek groundwater monitoring stations MW12-05 and MW12-06 for the fourth quarter of 2021 (October - December) and compared results to specific performance thresholds (SPT) defined in the Minto Mine Operations Adaptive Management Plan (MEL, 2017-02). McGinty Creek monitoring stations are required to be sampled monthly while the Minto Creek stations are sampled quarterly. Due to issues with sampling equipment and the presence of glycol in some sampling ports, samples were not obtained in Q4 in MW12-05-04 and MW12-06-01. For Minto Creek and McGinty Creek, MEL identified exceedances of certain thresholds for sampling rounds conducted in October, November, and December of 2021 and, as per the plan, has contracted a QP to review those data and provide recommendations. SRK Consulting (Canada) Inc. was contacted by Minto environmental staff to provide QP review. This letter presents results of that review and recommendations.

SRK compared data against the 2017-02 AMP thresholds, historical data, and data from surface water at station MN4.5 in lower McGinty Creek and surface water stations W3 and MC1 in Minto Creek. Table 1 summarizes exceedances, observations on the data, interpretation, and recommendations. Figures are included with this review to illustrate the current physical (i.e., water level) setting compared to the Minto North pit. Graphs are included for each parameter exceeding thresholds and includes the full range of data collected to date.

Key conclusions and recommendations are summarized below. Table 1 summarizes observations and recommendations for all parameters.

For MW09-03 (McGinty Creek):

- The Minto North Pit is not a source of water to the groundwater monitored at this station; water levels in the monitoring well are higher than the pit water level. Water levels in the pit have been increasing slowly but remain well below the monitoring well water levels. These data continue to show no hydraulic gradient from the pit towards the monitoring well.
- Water levels at this station have been affected by the mining of Minto North, but the groundwater divide between Minto North and McGinty Creek remains, somewhere in the vicinity of MW09-03.
- Water levels in MW17-11 are generally lower than in MW09-03, with the exception of zone 5, which is screened shallower than zones 1 and 2 in MW09-03 and has higher water levels than the other monitoring zones. Water levels in MW17-11 and MW09-03 indicate an overall downward gradient between the shallow-most zone and the remaining deeper zones. Differences in water level between deep zones are less pronounced, and a vertical gradient is not clear.
    - Recommendation: continue collecting water level/pressure profiles at this well according to the routine schedule.
- Concentrations of dissolved aluminum at MW09-03 have been generally stable and below SPT 1 since 2016. The value measured at MW09-03-01 in Q4 exceeded SPT 1 but is out of the range of most values and may be an outlier. While variability has been present in the data, concentrations are consistently below thresholds. Concentrations in McGinty Creek at MN-4.5 are variable and often higher than groundwater concentrations with no increasing trend.
- Concentrations of dissolved arsenic at MW09-03-01 have consistently exceeded SPT 1 since summer of 2016, and inconsistently exceeded thresholds in MW-09-02 in the same period. High variability is observed, but relatively recent data in MW09-03-01 exceeds thresholds more frequently than in the past. Anomalous values were detected in October 2018, September 2019, and June 2020 at nearly an order of magnitude more than recent average concentrations. In between the anomalous events, concentrations decreased to the historic range, suggesting these values are outliers. High concentrations do not correlate exactly with seasonal changes in groundwater level but may indicate an influence from seasonal variation (in recharge, flow, etc.). Vertical profiles and timing of peak concentrations suggest increased loading may be occurring during low flow periods or freshet, possibly suggesting greater mobilization of trace elements when higher volumes of water could infiltrate through the unsaturated zone and mobilize trace elements. Loading calculations included in the Minto Mine - 2019 Groundwater Review and Summary of OAMP SPT Exceedances (SRK 2020) indicate arsenic concentrations would need to increase by at least one order of magnitude for an exceedance in McGinty Creek at MN-4.5 to be observed. While there is some seasonal variability in McGinty Creek chemistry, surface water concentrations are not increasing and remain in the range of baseline data at MN-4.5.
- Concentrations of dissolved cadmium at MW09-03-01 and MW09-03-02 have inconsistently exceeded SPT 1 in he past with high variability in the observed data. Cadmium data exceed thresholds more frequently since 2017 and while average concentrations have increased beginning in 2017, there is no consistent increasing trend with many values in the last two years below the threshold. Seasonal variability seems to be present, with highest concentrations occurring in Q1 and

Q2, potentially related to freshet. Cadmium concentrations in McGinty Creek remain low and stable, showing no impact from the groundwater and loading calculations presented in SRK 2020 indicate groundwater concentrations would need to increase by at least one order of magnitude for an exceedance in McGinty Creek at MN-4.5 to be observed.

- Concentrations of dissolved copper have exceeded SPT 1 sporadically in MW09-03-02 since late 2016. One monitoring event exceeded thresholds in Q4 2021 but appears to be related to seasonal variation, as peak concentrations occur historically in Q2 or Q3. Dissolved copper values in McGinty Creek remain in the range of historic data, no evidence of surface water impacts are present and loading calculations presented in SRK 2020 indicate groundwater concentrations would need to increase by at least one order of magnitude for an exceedance in McGinty Creek at MN-4.5 to be observed.

- Concentrations of dissolved selenium in MW09-03-01 and MW09-03-02 have exceeded thresholds sporadically in the last few years, with increased variability in the data beginning in 2017. Average annual concentrations in MW09-03-02 have been higher since 2018 than past years, but do not demonstrate a consistent increasing trend. Peak concentrations in Q1 and Q2 of these years indicate a season variation may be present. Loading calculations presented in SRK 2020 are not applicable to selenium, as elevated concentrations are already being observed in McGinty Creek at MN-4.5. In a memo prepared by Minnow Environmental in 2019 (*Evaluation of Dissolved Copper and Selenium AMP Threshold Exceedances in McGinty Creek*) it was concluded that the source of elevated selenium concentrations was unrelated to the Minto Mine and values were consistent with historical concentrations before the Minto North Pit was operational.

- Concentrations of dissolved sulphate have been decreasing in MW09-03-01 and MW09-03-02 since 2016. The most recent concentrations measured in MW09-03-02 exceeded SPT 2 but are within the range of values observed in previous years. Sulfate appears to vary seasonally, with concentrations reaching their peak in the summer months each year. While peak values in 2021 are higher than previous three years, concentrations are decreasing during Q4 similar to previous seasonal trends. Sulphate concentrations in McGinty Creek are variable, but remain in the range of historic data, with no evidence of surface water impacts present.

- Concentrations of dissolved zinc at MW09-03-01 and MW09-03-02 have inconsistently exceeded SPT 1 and SPT 2 thresholds since the summer of 2016. High variability is observed in the data, but relatively recent data exceeds thresholds more frequently than in the past, MW09-03-02 appeared to show a potential year-to-year increasing trend but values in 2021 have been lower than the previous two years. High concentrations do not correlate exactly with seasonal changes in groundwater level but may indicate an influence from seasonal variation. Vertical profiles and timing of peak concentrations suggest increased loading may be occurring during freshet when higher volumes of water infiltrate through the unsaturated zone and mobilize trace elements. While there is some seasonal variability in McGinty Creek chemistry, surface water concentrations are not increasing and remain in the range of baseline data. Loading calculations presented in SRK 2020 indicate groundwater concentrations would need to increase by at least one order of magnitude for an exceedance in McGinty Creek at MN-4.5 to be observed.

- Recommendations: due to the low potential loading of groundwater into McGinty Creek limited action is recommended at this time. Continue monitoring as per routine schedule. Continue to look for opportunities to collect samples from surface seeps emanating from haul road.

- The load and accretion study, as recommended in the 2019 Review of OAMP Exceedances, was not conducted in 2021 due to unfavorable conditions with surface water flows which created conditions that would make loading from groundwater undetectable. It is recommended that the load and accretion study be conducted in 2022 if the conditions are appropriate.

- Concentrations of dissolved nitrate at MW09-03-02 have exceeded SPT 2 since the fall of 2016. Concentrations have shown a consistent increasing trend since October 2016 with potential seasonal effects producing higher concentrations in Q4 of each year. Loading calculations presented in SRK 2020 indicate groundwater concentrations would need to increase by a factor of 2 from the most recent measurement for an exceedance in McGinty Creek at MN-4.5 to be observed. As the nitrate is likely sourced from blast rock used to construct the haul road, load is expected to flush over time and the increasing trend is not expected to persist indefinitely. Concentrations will continue to be closely monitored. A more detailed review of nitrate behavior is provided in the 2020 Review of OAMP Exceedances. While there is some seasonal variability in McGinty Creek chemistry, surface water concentrations are not increasing and remain in the range of baseline data.

  - Recommendation: due to the low potential loading of groundwater into McGinty Creek limited action is recommended at this time. Continue monitoring as per schedule. Continue to look for seeps from the haul road that can be used for comparison. Compare vertical concentration profiles in MW09-03 and MW17-11 as more annual data becomes available from MW17-11. Conduct load accretion study as recommended in the 2019 Review of OAMP Exceedances, when conditions are appropriate to do so.

For MW12-05 and MW12-06 (Minto Creek):

- Water level data in the deepest zone of MW12-06 decreased sharply between November 2017 and March 2018, which coincides with development of the Minto East underground. Water levels in the deepest zone increased again between May and August 2018, when development of the underground stopped. More recently, the water level in the deepest zone, MW12-06-01, decreased between Q2 and Q4 2019 which changed the overall vertical gradient from upwards to downwards and then increased again in Q1 2020 reversing the gradient once again. The decrease in water level coincides with the re-start of underground development in September 2019, and while dewatering was continued throughout the temporary underground closure, the increased activity could potentially have influenced the deep groundwater levels. The same trend was not observed in MW12-05 or MW17-12, suggesting these wells are currently outside the area of groundwater affected by the development of the underground. Consistent vertical gradients cannot be identified and there exists a complex multidirectional vertical gradient between other zones. Seasonal fluctuations are apparent in MW12-05, with peak water levels occurring in Q2 of the past 2 years.

  - Recommendation: continue collecting water level/pressure profiles at this well according to the routine schedule. Continue to monitor changes in groundwater pressure as system equilibrates following the cessation of Minto East underground development. Continue to monitor complex multidirectional vertical gradient in MW12-06.

- Concentrations of dissolved zinc have been stable below thresholds in MW12-05 in the past with some slight variability. The only exceedance to SPT 1 occurred in the most recent sampling event in MW12-05-06 but is within the range of historic concentrations. Surface water concentrations are not increasing and remain in the range of baseline data suggesting no impacts related to groundwater concentrations are being observed.

    - Recommendation: continue monitoring as per routine schedule. Assess sources of potential contaminants and include in the 2021 Review of OAMP Exceedances.

- Concentrations of sulphate at MW12-05-01 and MW12-05-02 continue to be elevated above SPT 2. Concentrations at MW12-05-01 and MW12-05-02 were increasing historically but show signs of stabilization after August 2017. While concentrations are still increasing, data do not show the same rate of increase as was observed prior to 2017, with the exception of the Q4 2019 observation in MW12-05-02, which had a measured concentration of 2400 mg/L, nearly double the previous sampling event. As this magnitude of concentration is isolated to one sampling event, and values have since decreased to be consistent with previous trends, the datapoint is considered an outlier.

  Sulphate concentrations in MW12-06-01 have been increasing since Q1 2020 with the most recent events approaching SPT 2. These concentrations are isolated to the deepest zone in MW12-06, which has shown evidence of disruption (in water levels and chemical equilibrium) related to underground mining in the past. A sample was not obtained from MW12-06-01 in Q4 so additional data are needed to assess the trend. The cause of increasing sulphate concentrations in MW12-06-01 is unclear at this time, but trends will continue to be closely monitored.

  Previous investigations into the source of elevated sulphate in deep groundwater as observed at MW12-05 conclude it is unrelated to mining activities. Sulphate concentrations in MW17-12 exhibit an increasing gradient with depth but no increasing trend temporally. Minto Creek continues to indicate no trends in sulphate concentration that can clearly be related to changes in groundwater concentrations.

    - Recommendation: continue monitoring as per schedule and review/update investigations as to potential sources of SO_4 as part of the overall review of site groundwater quality.

Sincerely,

SRK Consulting (Canada) Inc.

Appendix A: Tables

Table 1. Summary of Groundwater Quality Data, AMP Thresholds, Observations and Recommendations

Location	Month	Parameter & Concentration Data		Threshold Exceeded	Observations	Trends	Risk Narrative	Recommendation
McGinty Creek Catchment								
MW09-03-01		As-D	mg/L		**Water Level (Figure A-1): see previous section.see previous section.** Water levels in MW09-03 Zone 1 and Zone 2 started declining when mining started in Minto North. Declining trend decreased about 6 months after mining completed. Water levels remain higher than pit bottom. Water levels increased between July and September 2016 before returning to previous trend. Similar trend occurred in 2017 when water levels increased between April and September, declined until May 2018 and increased again until September. Water levels increased in Q3 2020, consistent with previous seasonal trends. Peak water levels in 2020 were higher than previous four years. Minto North pit continues to act as a hydraulic sink, and has lowered groundwater levels. Water levels at MW09-03 suggest the presence of a groundwater divide somewhere north of the pit. Seasonal fluctuations indicate some influence from recharge. Loading to McGinty Creek could only occur from haul road material along the pit perimeter **Water Quality (Figure A-2):** Seasonal variations appear to be present, with highest values occurring the summer months (with the exception of outliers). Values during Q4 are in the range of historic data very near SPT 2. As-D values for MN-4.5 in McGinty Creek have been stable in the historic range.	While data from late summer 2015 to August 2017 showed signs of an increasing trend, values exhibit significant variability throughout the year. Peak values during Q2 and Q3 suggest a seasonal trend related to freshet may be present. Elevated values are isolated to October 2018, September 2019 and June 2020 and appear to be outliers. Concentrations from 2016 to 2018 showed potential seasonal variability, becoming relatively stable in 2019. Concentrations from 2016 thru 2020 remained relatively steady.	Lack of any clear upwards trend in McGinty Creek, as measured at MN-4.5, suggests currently no impact. Minto North represents only 0.4% of the McGinty Creek total watershed. Assuming that groundwater flows are proportional to surface water flows (load can only be coming from haul road, not pit leakage) groundwater concentrations would need to be at least 10x higher to result in MN-4.5 As concentrations reaching MN-4.5 SPT1. Overall risk of arsenic loading to McGinty Creek from groundwater is low at this time.	Limited action at this time. Continue monitoring as per routine schedule. Continue to look for opportunities to collect samples from surface seeps emanating from haul road. Conduct load and accretion survey of McGinty Creek as recommended in the 2019 GW Review (when conditions are suitable).

MW09-03-01		Cd-D	mg/L		**Water Level (Figure A-1):** see previous section.	Highest concentrations measured to date have been in Q3 of 2020, but are not increasing consistently year-over-year, and show potential seasonal variability. While there is no consistent increasing trend, and variability is high, annual averages increased between 2016 and 2019.	Lack of any upwards trend in McGinty Creek, as measured at MN-4.5, suggests no current impact to surface water. Load study done as part of the 2019 annual groundwater review indicates concentrations need to be at least an order of magnitude higher for threshold exceedances to occur at MN-4.5.	Limited action at this time. Continue monitoring as per routine schedule. Continue to look for opportunities to collect samples from surface seeps emanating from haul road. Conduct load and accretion survey of McGinty Creek as recommended in the 2019 GW Review (when conditions are suitable).
Figure A-1, A-3	October	2021-10-10	0.0001	0.000075 (SPT 1)	**Water Quality (Figure A-2):** Concentrations beginning in 2019 have been more sporadic than the past, with the highest concentration measured in September 2020. Sampling events sporadically exceed thresholds, with the most recent measurement well below and in the range of baseline concentrations. Cd-D values have been stable in the historic range for MN-4.5 in McGinty Creek.			
	November	2021-11-07	-	-				
	December	2021-12-27	-	-				
MW09-03-01		Zn-D	mg/L		**Water Level (Figure A-1):** see previous section.	Concentrations are consistent with previous observations with high variability throughout each year. Peak concentrations during late Q1 and early Q2 suggest a seasonal trend related to freshet may be present.	Lack of any upwards trend in McGinty Creek, as measured at MN-4.5, suggests no current impact to surface water. Groundwater flux in this zone expected to be low based on low K. Load study done as part of the 2019 annual groundwater review indicates concentrations need to be at least an order of magnitude higher for threshold exceedances to occur at MN-4.5.	Limited action at this time. Continue monitoring as per routine schedule. Continue to look for opportunities to collect samples from surface seeps emanating from haul road. Conduct load and accretion survey of McGinty Creek as recommended in the 2019 GW Review (when conditions are suitable).

Table 1. Summary of Groundwater Quality Data, AMP Thresholds, Observations and Recommendations

Location	Month	Parameter & Concentration Data		Threshold Exceeded	Observations	Trends	Risk Narrative	Recommendation
	November	2021-11-07	0.000708	0.0005 (SPT1)	consistently higher than in previous years.	unclear if a consistent, increasing trend is present at this point.	waste.	for opportunities to collect samples from surface seeps emanating from haul road.
	December	2021-12-27	0.000589	0.0005 (SPT1)			Groundwater flux in this zone expected to be low based on low K.	Conduct load and accretion survey of McGinty Creek as recommended in the 2019 GW Review (when conditions are suitable).
					Se-D values have been stable in the historic range for MN-4.5 in McGinty Creek.	Elevated concentrations in Q2 suggest a seasonal trend related to freshet may be present.		
MW09-03-02		Zn-D	mg/L		**Water Level (Figure A-1):** see previous section.	Concentrations in Q4 are all above SPT 2 but within the range of historic concentrations.	Lack of any upwards trend in McGinty Creek, as measured at MN-4.5, suggests no current impact to surface water.	Limited action at this time.
Figure A-1, A-4	October	2021-10-10	0.0859	0.015 (SPT 2)	**Water Quality (Figure A-4):** Increased variability in measurements starting in August 2015. Concentrations in 2021 are higher than 2020, but in the range of previous four years.	Peak concentrations during late Q1 and early Q2 suggest a seasonal trend related to freshet may be present.	Groundwater flux in this zone expected to be low based on low K.	Continue monitoring as per routine schedule. Continue to look for opportunities to collect samples from surface seeps emanating from haul road.
	November	2021-11-07	0.0925	0.015 (SPT 2)			Load study done as part of the 2019 annual groundwater review indicates concentrations need to be at least an order of magnitude higher for threshold exceedances to occur at MN-4.5.	Conduct load and accretion survey of McGinty Creek as recommended in the 2019 GW Review (when conditions are suitable).
	December	2021-12-27	0.0984	0.015 (SPT 2)				
					Zn-D values have been stable in the historic range for MN-4.5 in McGinty Creek.			
MW09-03-02		SO_4^{2-}-D	mg/L		**Water Level (Figure A-1):** see previous section.	Concentrations in Q4 are all above SPT 1, but are potentially outliers. More data are needed to assess a trend.	McGinty Creek, as observed at MN-4.5, does not show increasing or decreasing trends similar to MW09-03-02.	Limited action at this time.
Figure A-1, A-5	October	2021-10-10	7.95	7 (SPT1)				Continue monitoring as per routine schedule, continue to look for opportunities to collect samples from surface seeps emanating from haul road.
	November	2021-11-07	7.68	7 (SPT1)	**Water Quality (Figure A-5):** Sulphate concentrations have been decreasing overall since 2017. The most recent sampling events exceeded SPT 1, but are the only points to do so in the last 2 years. More data are needed to assess the trend.	Peak concentrations in the first half of each year suggest a seasonal trend is present related to freshet.	Considering the small catchment area for MW09-03-02, even if the well is affected by local recharge, potential loading to McGinty Creek via this groundwater is potentially low.	
	December	2021-12-27	7.54	7 (SPT1)				Conduct load and accretion survey of McGinty Creek as recommended in the 2019 GW Review (when conditions are suitable).
					$SO4^{-}$-D values have been stable in the historic range for MN-4.5 in McGinty Creek.			
MW09-03-02		NO_3^--D	mg/L		**Water Level (Figure A-1):** see previous section.	Clear upward trend from May 2015-December 2021. Higher variability beginning in 2018, with highest value recorded occurring in October 2019. Overall trend is increasing.	McGinty Creek, as observed at MN-4.5, does not show increasing or decreasing trends similar to MW09-03-02.	Limited action at this time.
Figure A-1, A-5	October	2021-10-10	9.32	0.07 (SPT 2)				Continue monitoring as per routine schedule, continue to look for opportunities to collect samples from surface seeps emanating from haul road and continue to compare data from MW09-03-02 and MN-4.5 to confirm low nitrate concentrations persist in McGinty Creek.
	November	2021-11-07	11.5	0.07 (SPT 2)	**Water Quality (Figure A-5):** Overall increasing trend is present beginning in 2017. Variability increased drastically in Q3 2019 with sporadic elevated concentrations occuring outside the historic trend.		Considering the small catchment area for MW09-03-02, even if the well is affected by local recharge, potential loading to McGinty Creek via this groundwater is low.	
	December	2021-12-27	10.1	0.07 (SPT 2)				
					NO_3^--D values have been stable in the historic range for MN-4.5 in McGinty Creek.		Nitrate is expected to flush from the haul road construction material over time and not increase continuously.	Conduct load and accretion survey of McGinty Creek as recommended in the 2019 GW Review (when conditions are suitable).
Minto Creek Catchment								
MW12-05-01		SO_4^{2-}-D	mg/L		**Water Level (Figure B-1):** Water levels show increasing trends in the fall to late winter seasons, followed by a decrease throughout the summer. These trends have occurred for four consecutive years and are likely due to a seasonal fluctuation. Overall vertical gradient remains downward.	Previously observed upwards trend shows signs of stabilization after August 2017 with a slight increase again since Q4 2018. Concentrations have been consistent throughout 2020, suggesting concentrations are continuing to stabilize.	Minto Creek, as observed at W3 and MC1, do not show any upwards trend similar to MW12-05.	No further action at this time.
Figure B-1	October	N/A	N/A				Downwards gradient in MW12-05 and low flux (low hydraulic conductivity) suggest groundwater discharge not currently reaching creek or groundwater load small compared to surface water load.	Continue monitoring as per routine schedule.
	November	2021-11-15	1360	1000 (SPT 2)				Continue investigation into sulphate source and causes.
	December	N/A	N/A					
					Water Quality (Figure B-1): Concentrations linearly increased until August 2017, stabilizing between 1200 and 1500 mg/L beginning in 2018.	No upwards trend observed in Minto Creek. Seasonal variation evident at W8A, but much lower concentration than, and not considered likely to be connected to groundwater at MW12-05 as high concentrations at MW12-05 are at significant depth while W8A was a shallow DSTF monitoring point.		
					SO_4^{2-}-D values have been stable in the historic range at W3 and MC1 in Minto Creek.			
MW12-05-02		SO_4^{2-}-D	mg/L		**Water Level (Figure B-1):** see previous section.	Previously observed upwards trend shows signs of stabilization after August 2017 with higher varibaility since Q1 2018. One value from Q4 2019 was considerably higher (2400 mg/L) but has not occurred since, suggesting it was an outlier.	Minto Creek, as observed at W3 and MC1, do not show any upwards trend similar to MW12-05.	No further action at this time.
Figure B-1	October	N/A	N/A				Downwards gradient in MW12-05 and low flux (low hydraulic conductivity) suggest groundwater discharge not currently reaching creek or groundwater load small compared to surface water load.	Continue monitoring as per routine schedule. Continue investigation into sulphate source and causes.
	November	2021-11-15	1230	1000 (SPT 2)	**Water Quality (Figure B-1):** Concentrations linearly increased until August 2017, and have since stabilized around 1200 mg/L.			
	December	N/A	N/A					
					SO_4^{2-}-D values have been stable in the historic range at W3 and MC1 in Minto Creek.	No upwards trend observed in Minto Creek. Seasonal variation evident at W8A, but not likely connected to groundwater at MW12-05.		
MW12-06-06		Zn-D	mg/L		**Water Level (Figure C-1):** see previous section.	Concentrations have been stable at low concentrations with only isolated exceedances to SPT 1. No increasing trend is present.	Exceedances are isolated, concentrations are wel below SPT 2 and no impacts are observed at monitoring stations in Minto Creek.	No further action at this time.
Figure C-1, C-2	October	N/A	N/A		**Water Quality (Figure B-1):** Concentrations have consistently been below thresholds in the past with only isolated exceedances to SPT 1. No increasing trend is present and values are well below SPT 2.			Continue monitoring as per routine schedule.
	November	N/A	N/A					
	December	2021-12-29	0.0364	0.263 (SPT1)				
					Zn-D values have been stable in the historic range at W3 and MC1 in Minto Creek.

1 INTRODUCTION

1.1 Site Description

The Minto Mine is a high-grade copper mine owned and operated by Minto Metals Corp. and is located within Selkirk First Nation (SFN) Category A Settlement Land Parcel R-6A approximately 240 km northwest of Whitehorse, Yukon Territory (62°37'N latitude and 137°15'W longitude; Figure 1.1). Development of the Minto Mine was initiated in 1997 and commercial operations started in October 2007. The mine was in continuous production from October 2007 to October 2018 when it was placed on temporary care and maintenance. Operations recommenced in October 2019. The facility was permitted to conduct open pit and underground mining with milling at a rate of 4,200 tonnes per day of copper/gold/silver ore. Minto Mine produced 26.0 million pounds of copper in 2021. Copper reserves are approximately 15 million tonnes (measured and indicated). Mill tailings are stored in the Main Pit, Area 2 Pit, and the Dry Stack Tailing Storage Facility (DSTSF; Figure 1.2). Mine-impacted seepage from the DSTSF and under the Mill Valley Fill Extension (MVFE) is collected at the toe of the MVFE and pumped to the Main Pit (Figure 1.2). Non-impacted water and treated mine-impacted water are collected in a Water Storage Pond (WSP; Figure 1.2).

Effluent from the WSP is periodically discharged to Minto Creek under conditions specified in Water Use Licence (WUL; QZ14-031; Yukon Water Board 2015). Minto Creek, in turn, discharges to the Yukon River approximately 7.7 km south-east of the WSP (Figure 1.2).

1.2 Overview of Aquatic Environmental Monitoring

Under Minto Mine's WUL, the Minto Mine implements an Environmental Monitoring, Surveillance, and Reporting Plan (EMSRP). The EMSRP is completed by the mine and includes routine water quality monitoring during the ice-free period (typically from April to October or November) in Minto Creek and reference tributaries at sampling frequencies varying from weekly to monthly.

In accordance with the WUL, the Minto Mine submits water quality data to the Yukon Water Board as original laboratory reports and monthly summary reports within 30 days of month end. In addition to effluent discharge limits and volumes, the WUL includes site specific water quality objectives (SSWQO) which were developed for Minto Creek based on background geological conditions, bioavailability considerations, and behavioral impact studies (Minnow 2009; Kennedy et al. 2012). These SSWQO are used to evaluate water quality from the EMSRP and the Aquatic Effects Monitoring Program (AEMP), and act as triggers under the operational Adaptive Management Plan (AMP).

Biological monitoring is implemented under the EMSRP and includes the AEMP and Environmental Effects Monitoring (EEM) which is required under the federal *Fisheries Act*. The AEMP evaluates potential mine-related effects to Minto Creek, with sampling areas located in upper Minto Creek and lower Minto Creek. These Minto Creek areas are evaluated in comparison to matching reference areas: upper McGinty Creek as reference for upper Minto Creek and lower Wolverine Creek and lower Big Creek as references for lower Minto Creek. The annual AEMP includes monitoring of water, sediment, periphyton, benthic invertebrates, fish, and fish habitat[1]. Data from 1994 (baseline; HKP 1994) and 2006 to 2020 have been reported previously, including annually since 2006 (e.g., Minnow 2021a), with some program modifications over time.

EEM is required by the mine under the federal Metal and Diamond Mining Effluent Regulations (MDMER; Environment Canada 2012) and includes effluent characterization, sublethal toxicity testing and additional biological monitoring in Minto Creek. Biological monitoring under EEM is implemented every three years. Monitoring associated with the Phase 5 EEM was completed in the fall of 2019, with an Interpretive Report submitted in January 2021 (Minnow 2021b). Monitoring for the Phase 6 EEM is scheduled for late August or early September 2022.

1.3 Overview of Previous Findings

The Minto Mine has implemented the AEMP annually since 2006. Under the most recent AEMP report (Minnow 2021a), Minnow collected the following samples: water quality (*in situ* field measures and water chemistry), sediment quality (chemistry and toxicity testing), periphyton (chlorophyll-a productivity [indicator of primary productivity], community, and tissue chemistry), and benthic invertebrates (community and tissue chemistry). These samples were collected from Minto Creek and reference creeks for evaluation of Minto Creek relative to reference and previous data.

In September 2020, water quality was noted as good in Minto Creek. As observed in previous years, higher specific conductance, and pH at Minto Creek compared to reference suggested a potential influence of Minto Mine effluent. All water quality measures met WUL objectives and Canadian Water Quality Guidelines for the protection of aquatic life (CWQG; CCME 1999) except for total copper. Total copper exceeded the short-term CWQG guideline for both upper Minto and lower Minto creeks and all reference areas, except lower Big Creek. Concentrations of total copper in water at upper Minto Creek were higher than concentrations in water at the upper McGinty Creek reference while total copper concentrations in water at lower Minto Creek were higher than concentrations in water at the lower Big Creek reference but lower than

[1] Fish and fish habitat monitoring is conducted by Minto Mine. Results are reported under a different cover.

concentrations in water at the lower Wolverine Creek reference. Concentrations of dissolved copper in water remained below the SSWQO[2] in all water samples, as observed in all previous years of monitoring. Based on concentrations of chlorophyll-a, Minto Creek was classified as oligotrophic in 2020, which differed from 2018 when it was classified as mesotrophic (Minnow 2021a).

Concentrations of metals in upper Minto Creek sediments were generally higher than those in upper McGinty Creek sediment but lower than the SQGs for the protection of aquatic life (CCME 1999). Exceptions were arsenic which exceeded the Interim Sediment Quality Guideline (ISQG) and copper which exceeded the ISQG and the Probable Effect Level (PEL) in three samples. Metal concentrations in lower Minto Creek sediments were generally similar to those in lower Wolverine Creek with the exception of arsenic, copper, and manganese (of which arsenic and copper were greater than ISQG but lower than PEL). Concentration of copper in sediments from Minto Creek have consistently been greater than guidelines and those measured in sediments from reference areas (including occasional exceedance of the PEL), but concentrations have been stable over time (Minnow 2021a). Sediment toxicity testing in 2020 indicated that survival of *Hyalella azteca* was adversely affected by exposure to sediment from Minto Creek, but the effect varied spatially, with > 60% morality observed in sediments collected from two of the five lower Minto Creek stations, and no morality observed at the remaining three stations. There was a lack of effects on *H. azteca* growth or the survival and growth of *Chironomus dilutus*.

A lower density and biomass of periphyton was observed in lower Minto Creek compared to lower Wolverine Creek in 2020. Substantial temporal variability has been observed in periphyton community composition in both creeks, but the differences were within the range of natural variability and do not provide resolution of potential mine influence (Minnow 2021a). Benthic invertebrate community structure at lower Minto Creek differed from both reference communities (lower Wolverine and Big creeks) on the basis of Bray-Curtis index and percent Ephemeroptera only, indicating only subtle differences in community composition, namely higher proportion of chironomids and a lower proportion of EPT (Ephemeroptera [mayflies], Plecoptera [stoneflies], Trichoptera [caddisflies]) taxa. High temporal variability in benthic invertebrate community density, richness, and composition has been observed at the exposed and reference areas, presumably due to inter-annual variability in environmental conditions (e.g., flow, ice scour, water levels; Minnow 2021a). Benthic invertebrate densities in 2020 were the highest they have been over the 2012 to 2020 period. There was a significant increase since

[2] SSWQO for dissolved copper are modified by dissolved organic carbon. For DOC > 10 mg/L, SSWQO is 0.02 mg/L. For DOC ≤ 10, SSWQO is 0.013 mg/L.

2018 in chironomid proportion and decrease in EPT proportion at lower Minto Creek. This community shift could be a residual effect of the dry conditions at lower Minto Creek in 2019. As the mine had not discharged since 2018 and water quality was correspondingly good in 2019 and 2020, differences in community composition were considered to be the result of other factors (i.e., not mine influence).

Concentrations of copper and selenium in periphyton tissue samples collected from lower Minto Creek were significantly higher than samples collected from both reference areas. The same was not observed in benthic invertebrate tissue. Furthermore, selenium concentrations in benthic invertebrate tissue were lower than the British Columbia water quality guideline for the protection of aquatic life (BCMOE 2014) indicating that no associated effects would be expected.

2 METHODS

2.1 Aquatic Effects Monitoring Program Components and Objectives

The AEMP implemented by Minto Mine on an annual basis is more comprehensive than the requirements identified under the WUL (QZ14-031; August 2015). In 2020, a review of the AEMP was conducted in accordance with Clause 102 of the WUL, during which Minnow was asked to provide Minto Mine with recommendations. As a result of those recommendations, periphyton community monitoring was dropped completely from the AEMP[3] and the frequency of sediment toxicity sampling was reduced from annually to once every three years, with the next sampling event scheduled to occur in 2023[4].

Minnow Environmental Inc. (Minnow) conducts the following monitoring as part of the AEMP (as reported herein):

1. sediment quality;
2. periphyton (chlorophyll-a and tissue chemistry); and,
3. benthic invertebrate (community and tissue chemistry).

This program is conducted annually in September. Samples (i.e., *in situ* water quality, water chemistry samples, depth, flow, and habitat observations) and the supporting measures described in Section 2.2 are collected from all sampling areas (Figure 2.1, Table 2.1). Under the WUL, the AEMP program design is reviewed every three years and refined through annual recommendations. Separate monitoring of the use of Minto Creek (and a reference creek) by fish is completed by the Minto Mine.

The objectives of this AEMP study and report are to characterize and interpret current (2021) sediment quality, benthic invertebrate community structure, and tissue chemistry (periphyton and benthic invertebrates) samples from Minto Creek relative to those from nearby reference areas, and relative to results from and previous surveys.

The Minto Creek AEMP was implemented from September 9 to 15, 2021. At the time of the sampling, Minto Mine was not discharging. The last date of discharge was June 1, 2021, and the mine did not resume discharging until September 20, 2021. The study was completed in

[3] Recommendation made based on the highly variable nature of periphyton community results and their ineffectiveness in determining potential mine-related effects.

[4] Recommendation that sediment toxicity testing be completed at a three-year frequency or in response to meaningful increase in concentrations of copper (or other mine-related analytes) identified in annual reporting.

Notes: AEMP = Aquatic Environmental Monitoring Program. ✓ = included in monitoring program, - = not included in monitoring program. Following recommendations from the 2020 AEMP, periphyton community sampling was discontinued and sediment toxicity sampling frequency was reduced to every 3 years.

[a] Top 2 centimeters collected; minimum 3-grab composite.

[b] Top 2 centimeters collected; 3-grab composite.

[c] Productivity permitting; in some cases, replication (of 5) may not be achieved with reasonable effort.

[d] 500 µm mesh; 3-grab composite.

accordance with specifications of the Minto Mine WUL (QZ14 031; Table 2.1, Figure 2.1). Sediment sampling was undertaken in upper and lower Minto Creek and corresponding reference areas. Benthic invertebrate (community and tissue) and periphyton (chlorophyll-a and tissue) sampling were undertaken in erosional habitat of lower Minto Creek and their corresponding reference areas in lower Wolverine Creek and lower Big Creek. Supporting measures (i.e*., in situ* water quality measurements, water chemistry samples, depth, flow, and habitat observations) were collected from all biological sampling areas. Hydrology data (staff gage height, flows) was collected by the Minto Mine staff from ice-off (April 25, 2021) to freeze up (October 12, 2021; Figure 2.1; Minto Mine 2021b).[5]

2.2 Supporting Measures

2.2.1 Field Collection

Supporting measures collected concurrent with sediment sampling (i.e., at depositional areas) included core penetration depth (lower creek areas only), sample texture, and the presence or absence of organic detritus. *In situ* water quality measurements including temperature, dissolved oxygen, specific conductance, and pH were taken at each station using a YSI field meter (Yellow Springs Instruments, Yellow Springs, OH). The location of each station was recorded using a handheld Global Positioning System (GPS) with coordinates recorded in Universal Transverse Mercator (UTM) units, using the North American Datum of 1983 (NAD83).

At periphyton and benthic invertebrate sampling stations, *in situ* water quality measurements (by field meter as described above), water depth (by meter stick) and water velocity (by HACH handheld flow meter [HACH Company, Loveland, CO]) were measured. Habitat was characterized at each periphyton and benthic invertebrate sampling area and included documentation of gradient (clinometer), creek wetted and bankfull widths (by tape measure or range finder), depth (cm), geomorphic type, water appearance, creek morphology, bank condition, substrate texture, instream cover and features, overhead canopy, aquatic vegetation, riparian vegetation, and surrounding land use.

Water samples for chemical analysis were collected at each sampling area (Table 2.1, Figure 2.1). Samples were collected using a master bottle from which the collected water was poured into pre-labeled sample bottles and preservatives were added, as required. A field duplicate was collected from one area using a split sample method; water from the master bottle was poured into one bottle and then into a duplicate bottle. Water samples for dissolved

[5] Hydrology data was first included in the 2019 AEMP report (Minnow 2020), following dry conditions at lower Minto Creek. Supporting meteorological data (precipitation, temperature) and flow data help provide context for biological results.

organic carbon (DOC) and for dissolved metals were filtered in the field using 0.45 micrometre (µm) polypropylene filters. One field blank sample was collected to assess contamination from field conditions. The same collection methods (filtration, sampling location, sampling time) were applied, but the bottle set was filled with distilled water instead of creek water. Immediately after collection, water samples were placed in a cooler with ice packs and refrigerated at approximately 4 degrees Celsius (°C) until submission to ALS Environmental in Whitehorse, YT, for analysis (refer to Appendix C for analytical methods).

The productivity of lower Minto and lower Wolverine creeks was evaluated using measurements of chlorophyll-a in periphyton. Five stations from each sampling area were sampled and from each station, a total of five rocks having representative periphyton coverage were selected. The sampling area was standardized by positioning a thin acetate template, with a 2x2 cm (4 cm²) opening, in the middle of each selected rock. The periphyton was scraped off the rock using a stainless-steel razor blade or scalpel. Sample material from each rock was transferred from the razor blade or scalpel to a Whatman Mixed Cellulose Ester (MCE) filter paper until a single composite sample was obtained per station. All samples were maintained in coolers with ice packs during transport and then kept frozen until submission to ALS Environmental (Whitehorse, YT).

2.2.2 Data Analysis

A formal data quality review (DQR) was completed to assess data quality and by extension, the confidence with which the data can be used to derive conclusions relative to the program objectives (Appendix A). The DQR included an examination of data completeness, the laboratory reporting limits (LRLs) achieved, and field blank results (water samples only). The quality of the data was evaluated by comparing LRLs to applicable federal/provincial guidelines, and SSWQOs (where applicable), observing relative percent differences of field duplicates, and reviewing field blanks for potential contamination during sampling or transport. The accredited laboratory conducted their own Quality Assurance/Quality Control (QA/QC) analysis, including method blanks, laboratory duplicates, matrix spikes, and spiked blanks.

Water quality from Minto Creek was evaluated relative to applicable Canadian Water Quality Guidelines (CWQG; CCME 1999), WUL SSWQOs, concentrations measured at reference areas, and historical water quality conditions. Sample-specific toxicity modifying factors, such as hardness, alkalinity, pH, DOC and temperature were used to calculate environmental quality guidelines for the protection of aquatic health where required. Seasonal summary statistics for mine related indicators in upper Minto Creek were also reviewed for context.

Periphyton chlorophyll-a (mg/m^2) from Minto Creek was evaluated relative to British Columbia Water Quality Guideline (BC WQG) for streams (100 mg/m^2; BCMOE 1985), as well as concentrations measured at reference areas and historical chlorophyll-a concentrations.

2.2.2.1 Water Chemistry

Supporting *in situ* measures (temperature, dissolved oxygen, pH, specific conductance, mean depth, and mean velocity) collected at sediment sampling locations at upper Minto Creek and reference (upper McGinty Creek), and lower Minto Creek and reference (lower Wolverine Creek). The assumption of normality was assessed using the Shapiro Wilks' test (α = 0.05) and homogeneity of variance was assessed using Levene's Test (α = 0.05). If variances were unequal, then the two-sample t-test for unequal variances was conducted (Ruxton 2006). Data that could not be normalized were $\log_{10}$-transformed. If data could not be normalized after transformation, a nonparametric Mann-Whitney test was applied. Statistical comparisons were conducted using R (R Core Team 2020). A magnitude of difference (MOD) was calculated for each metric as:

$$MOD = \frac{\left(MCT_{Exp} - MCT_{Ref}\right)}{MCT_{Ref}} \times 100\%$$

Where the measures of central tendency (MCT) were means (untransformed), geometric means ($\log_{10}$-transformed), or medians (Mann-Whitney test).

In cases where there was a value below the reported detection limit, the value was replaced with the detection limit and a non-parametric Mann-Whitney test was conducted. If all values for a parameter were below the detection limit, no statistical analysis was conducted.

Supporting *in situ* measures (temperature, dissolved oxygen, pH, specific conductance, mean depth, and mean velocity) collected at benthic invertebrate monitoring locations were tested for differences between lower Minto Creek and reference areas (lower Wolverine and lower Big creeks) using a one-way ANOVA. The assumption of normality was assessed using the Shapiro Wilks' test (α = 0.05) and homogeneity of variance was assessed using Levene's Test (α = 0.05). Data were $\log_{10}$-transformed when required to meet the assumption of normality. When the assumption of normality could not be met, a non-parametric Kruskal-Wallis test was used. A significance level (α) of 0.05 was used for all statistical tests. *Post hoc* pairwise contrasts were conducted to compare each area, using Tukey's honestly significant differences to correct for multiple comparisons. Statistical comparisons were conducted in R Studio version 1.2.5001 (2020). A magnitude of difference (MOD) was reported for statistical comparisons that were significant as:

$$MOD = \frac{(MCT_{Exp} - MCT_{Ref})}{MCT_{Ref}} \times 100\%$$

where *MCT* is the measure of central tendency (i.e., mean for untransformed data, median for log_{10}-transformed data and median for rank transformed data).

Summary statistics (means and standard deviations) were calculated using R and the Kaplan-Meier (K-M) method to accommodate analytes with values at the LRL value (non-detections). This method was applied to avoid bias introduced by substitution methods (Helsel 2012, Lee 2017). The K-M method involves transforming the left censored (i.e., < value) dataset to a right censored (i.e., > value) dataset, and then using the K-M estimator (used to estimate the mean survival time in survival analysis) to estimate the mean. The calculation was conducted using the survfit function in the survival package (Therneau 2017) in R and involves calculating the area under the K-M survival curve. The K-M method is non-parametric and can accommodate multiple LRLs. This method of estimating the mean is equivalent to using the distribution of detectable values below the LRL to represent values that are < LRL. When a standard deviation could not be estimated (e.g., when all data were below the LRL), it was not reported. When a value was reported below a poor LRL (defined as a LRL that exceeded the maximum detected value), it was removed from the dataset.

2.2.2.2 Chlorophyll-a

Chlorophyll-a in periphyton was compared to the British Columbia Water Quality Guideline for streams. Statistical analyses were conducted using chlorophyll-a (mg/m^2) from lower Minto Creek (exposed) and the reference area, lower Wolverine Creek. Analyses were used to determine whether chlorophyll-a (mg/m^2), an indicator of primary productivity, have changed at these areas over time and/or the differences from reference have changed over time. Spatial and temporal statistical comparisons were conducted using Analysis of Variance (ANOVA) with factors *Year* and *Area* and their interaction. ANOVA analyses were assessed using a significance level ($\alpha = 0.1$). Residuals of the ANOVA were tested for normality using the Shapiro Wilks' test ($\alpha = 0.05$) and homogeneity of variance was assessed using a Levene's Test ($\alpha = 0.05$). Periphyton chlorophyll-a (mg/m^2) were log_{10}-transformed as required to meet the assumptions of normality and homogeneity of variances or rank-transformed when these assumptions could not be met. The significance of the main effects and interaction terms were assessed, and the results determined the *post hoc* comparisons that were conducted.

When the interaction between *Year* and *Area* was significant, it suggested that the differences between the stations changed in each year and *post hoc* comparisons were conducted to test for differences between the first year of sampling and all other years for both stations individually, and test for differences between the stations in each year.

When the interaction between *Year* and *Area* was insignificant, it suggested that differences between the stations were consistent among years and *post hoc* comparisons were conducted to:

1. to test for differences between the first year of sampling and all other years for both stations combined; and
2. to test for differences between the stations for all years combined

Post hoc comparisons were corrected for the number of comparisons using Tukey's honestly significant differences method. For all significant comparisons between reference and exposed stations, a magnitude of difference (MOD) was calculated as:

$$MOD = \frac{\left(MCT_{Exp} - MCT_{Ref}\right)}{MCT_{Ref}} \times 100\%$$

where MCT is back-transformed estimated marginal means (or medians for rank-transformation).

2.3 Sediment Quality

2.3.1 Sample Collection and Laboratory Analysis

Sediment samples were collected for particle size and chemical analysis at depositional areas within Minto Creek and reference creeks (Figure 2.1, Table 2.1,). At upper Minto and upper McGinty creeks, sediment deposits were rare and typically very shallow (i.e., deposits were less than 1 centimeter in depth). Sediment was therefore collected using a stainless-steel spoon instead of a ponar or coring equipment and only one composite sample was collected for particle size analysis (versus five samples for all other analytes). At locations of sediment deposition, surficial sediment was carefully collected by slowly spooning the sediment into pre-labeled plastic bags, with care taken to avoid the loss of fine material. In order to be as consistent as possible with the sediment collected in the lower creek areas, samples included no more than the top 2 cm of deposited sediment.

Prior to sampling in 2020, sediment samples at lower Minto Creek had been collected using a petite ponar and hand coring equipment. Due to relatively shallow sediment deposits in 2020, sediment collection was completed using a stainless-steel spoon (the same sampling technique applied to the upper creek areas). Sampling in 2021 was conducted using the same methods used in 2020. Low flow conditions in 2021 resulted in stagnant (standing) water and dried out sections of the creek in locations that had previously been identified as sediment sampling stations. Sediment sampling locations were moved further upstream to sections of the creek that had visible and continuous flow in order to sample locations where sediment chemistry and particle size would be more representative of sediment transport and deposition in Minto Creek.

At lower Wolverine Creek, sediment samples for particle size analysis were collected using a 15.24 centimetre (cm) x 15.24 cm (6 inches [“] x 6”) stainless steel petite ponar grab sampler (0.023 square metres [m^2] sampling area). A composite sample was created by collecting the surficial 2 cm of sediment from each of three acceptable grabs (i.e., full to each edge of the sampler) using a stainless-steel spoon. Each sample that formed the composite was added to a plastic bin and mixed together. The mixed composite samples were placed into pre-labeled glass sampling jars. Sediment samples for chemical analyses were collected by carefully inserting a 4.7 cm (2”; inside diameter) Lexan™ core tube into sediment deposits, capping the end with a fitted plastic cap, and retrieving by hand. From each acceptable core (i.e., each core containing an intact, representative sediment-water interface), the surficial 2 cm of sediment was manually extruded upwards into a graded core collar, cut with a stainless-steel core knife, and placed into a pre-labeled glass sampling jar. Samples from three cores were composited to form a single sample from each station.

Immediately after collection, sediment samples were placed in a cooler with ice packs and later into a refrigerator at approximately 4°C. They were later submitted to ALS Environmental in Whitehorse, YT for analysis of particle size by dry and wet sieving, followed by the pipette sedimentation method, total organic carbon and loss on ignition by combustion, inorganic carbon derived from a calculation, metals by collision/reaction cell inductively coupled plasma mass spectrometry (CRC ICP-MS), mercury by Cold Vapor Generation Atomic Fluorescence Spectrometry (CVAFS), total Kjeldahl nitrogen by colorimetric analysis, and pH by probe (refer to Appendix C for methods, laboratory certificates, and field notes).

2.3.2 Data Analysis

A formal DQR was completed to assess sediment data quality (Appendix A),which included an examination of data completeness and the LRLs achieved relative to applicable provincial/ federal guidelines. In addition, laboratory precision, and laboratory accuracy were assessed relative to laboratory DQOs. A field duplicate was collected and compared to its parent sample to assess the relative percent difference as a measure of field precision. Laboratory QA/QC analysis included method blanks, laboratory duplicates, spiked blanks, and certified reference materials (Appendix A).

Sediment chemistry data were summarized by reporting mean, standard deviation, minimum, and maximum for each area. Sediment quality data were evaluated relative to sediment quality guidelines (SQGs) for the protection of aquatic life (e.g., CCME 1999) and reference concentrations to identify metals with the potential to adversely affect aquatic life and/or that could be elevated due to mine activity. Sediment chemistry data were also compared to historical data for analytes of interest (1994, and 2006 to 2019). Interpretation was focused on results using the

whole sediment data collection methods (described above in Section 2.3.1) used in the program from 2010 to 2020 and SQGs for the protection of aquatic life (e.g., CCME 1999) apply to whole sediment. Sediment collection methods prior to 2010 were either not specified (1994) or only focused on the fraction of sediment that passed through a mesh sieve (< 63 µm; silt and clay).

2.3.2.1 2021 Spatial Comparisons

Differences between sediment samples from Minto Creek and reference areas were tested using a two-sample t-test, with a p-value < 0.05. The assumption of normality was assessed using the Shapiro Wilks' test (α = 0.05) and homogeneity of variance was assessed using Levene's Test (α = 0.05). If variances were unequal, then the two-sample t-test for unequal variances was conducted (Ruxton 2006). Data that could not be normalized were $\log_{10}$-transformed. If data could not be normalized after transformation, a nonparametric Mann-Whitney test was applied. Statistical comparisons were conducted using R (R Core Team 2020). A magnitude of difference (MOD) was calculated for each metric as:

$$MOD = \frac{(MCT_{Exp} - MCT_{Ref})}{MCT_{Ref}} \times 100\%$$

Where the measures of central tendency (MCT) were means (untransformed), geometric means ($\log_{10}$-transformed), or medians (Mann-Whitney test).

In cases where there was a value below the LRL, the value was replaced with the LRL and a non-parametric Mann-Whitney test was conducted. If all values for a parameter were below the LRL, no statistical analysis was conducted.

2.3.2.2 Temporal Comparisons

Statistical analyses of sediments from upper Minto Creek (exposed) and upper McGinty Creek (reference) areas, as well as lower Minto Creek (exposed) and lower Wolverine Creek (reference) areas, were conducted to evaluate whether concentrations of copper, an analyte of interest, have changed at these areas over time and/or the differences from reference have changed over time. Spatial and temporal statistical comparisons were conducted using Analysis of Variance (ANOVA) with factors *Year* and *Area* and their interaction and *post hoc* comparisons using the same approach as described for Chlorophyll-a in Section 2.2.2.2, with the minor change of α = 0.05. For all significant spatial comparisons, a magnitude of difference (MOD) was calculated a percent difference to reference MCT using the same approach as described for Chlorophyll-a in Section 2.2.2.2.

2.4 Benthic Invertebrate Community

2.4.1 Sample Collection and Laboratory Analysis

Benthic invertebrate community samples were collected in erosional habitat of lower Minto, lower Wolverine, and lower Big creeks (Figure 2.1, Table 2.1). Benthic invertebrate community samples were collected from riffle/run habitat with cobble and gravel substrate using a Surber sampler (0.093 m^2) outfitted with 500 µm mesh. Three grab composites (0.279 m^2 area in total) were collected at five replicate stations within each sampling area. For each grab, the substrate within the sampler was disturbed and scrubbed (by hand rake and nail brush) with care taken to ensure that all dislodged organic material was swept into the sampler collection net. The substrate was disturbed to a depth of approximately 3 cm over a period of approximately four to seven minutes. This procedure was repeated at new subsampling locations for the second and third grab, following which all of the material contained in the collection net was carefully transferred to a pre-labeled 1 litre (L) wide-mouth plastic jar using a stainless-steel spoon and a wash bottle while working over a plastic bin to avoid any potential loss of organisms. Any organisms that adhered to the sieve bag were removed by hand and added to the sample. All samples were labeled internally (using wooden sticks) and externally with the station number, area identifier, Minnow project number, date, and field personnel in order to ensure correct identification at the laboratory. Samples were preserved within six hours of collection using buffered formalin solution to a nominal concentration of 10% in ambient water.

Taxonomic identification of the benthic invertebrate community samples was completed by Cordillera Consulting (lead taxonomist Scott Finlayson), in Summerland BC, using standard methods that incorporate QA/QC measures (e.g., Environment Canada 2012b, 2014). Each sample was elutriated to remove sand, gravel, and clay. The remaining organic material was preserved in 70% ethanol. Elutriate was examined for any mollusc or Trichoptera cases, then each sample was examined to estimate the total number of invertebrates. If the estimated number of organisms was greater than 600 and the sample was fine and non-clumping, a subsample was taken using a Folsom Plankton Splitter (Motodo 1959, Van Guelpen et al. 1982). Empty snail or bivalve shells, empty caddisfly cases, and invertebrate fragments such as legs, gills, antennae etc. were kept but excluded from the count. When organism fragments were encountered, only the heads were counted towards the total. Larval and pupal exuviae were excluded while terrestrial stages and terrestrial drop-ins were indicated as such but excluded from the total counts. Organisms were identified to the lowest practicable level (LPL; which in most cases was genus) and counted. Following identification and counting, representative specimens of each new taxon were preserved in a museum quality vial with a polyseal lid and added to the

Minto Mine voucher collection. Internal labels were used to identify the taxa, the client, date collected, site code, and the project.

Laboratory QA/QC included an assessment of sub-sampling error, sorting efficiency, and taxonomic quality control on at least 10% of the samples (Environment Canada 2012b, 2014). Data were entered into proprietary software (INSTAR1), which was also used to calculate benthic invertebrate community metrics and to generate the taxonomic report. Data were provided to Minnow as a Microsoft Excel spreadsheet along with a methods and QA/QC report as an Adobe Acrobat PDF file (Appendix C).

2.4.2 Data Analysis

A formal DQR was completed to assess the benthic invertebrate community data quality (Appendix A). Laboratory QA/QC included an assessment of sub-sampling error and sorting efficiency on at least 10% of the samples (Appendix A). Benthic invertebrate communities were evaluated using summary metrics, including invertebrate density (number of organisms per m^2, calculated based on a sample area of 0.279 m^2), number of taxa, Simpson's Diversity and Evenness, and Bray-Curtis index.

One consequence of the LPL of taxonomic resolution is that the "species list" from any site contains a mixture of taxonomic resolutions, some as low as species, others at the family, order or class level, resulting in some redundant or "ambiguous" taxa. Redundant or "ambiguous" taxa occur when the same taxon is identified to different levels of resolution, for instance, some specimens may be identified to a higher or *parent* level (e.g., *Baetis*) while others are identified to a lower or child level (e.g., *Baetis tricaudatus*). Such instances can occur when complete taxonomic keys only exist for certain life stages, damaged specimens are present, or when limited resources result in only a subset of a sample being fully identified to species. The presence of these ambiguous taxa may result in inflated estimates of richness or distorted patterns of diversity across sites (Cuffney et al. 2007, Meredith et al. 2019). If ambiguous taxa are not resolved, then the coarser-resolution taxon (i.e., the parent, *Baetis*) is counted as a unique taxon when it may actually be the same species as one of the lower-level taxa (i.e., the child, *B. tricaudatus*). Two commonly applied solutions for dealing with ambiguous taxa are:

1. apportion them among the identified organisms according to the ratio of abundances (i.e., distribute parent taxa among children); or
2. sum them to the lowest consistently identified taxon (i.e., merge children with parent taxa).

The preferred option for analysis depends on the distribution of the organisms among taxa. For instance, with option two, *B. tricaudatus* and *B. bicaudatus* might be lumped together and analyzed as *Baetis*. If identified specimens in the two species constitute only 10% of the total

abundance, it may be most appropriate to lump them together with the other 90% in the unidentified *Baetis*. Conversely, if 90% of the identified organisms fall into the two species, it is more parsimonious to apportion the remainder among them. A decision key was implemented for resolving ambiguously identified taxa that uses abundance and richness criteria for when options 1 (roll-down) and 2 (roll-up) are applied for each level in the taxonomic hierarchy. This method preserves as much detailed taxonomic information as possible, while addressing issues of taxonomic ambiguities. The decision key was modified from Weakland et al. (2018).

Total organism density (individuals/m^2) were calculated for benthic invertebrate community samples. The diversity metric "number of taxa" (also known as taxon richness) included all separate taxa identified to the LPL. Simpson's Diversity and Evenness indices were computed according to formulae presented by Smith and Wilson (1996) and recommended by Environment Canada (2012). These indices consider the relative abundance of taxa and number of taxa, with values ranging from 0 (low diversity or evenness) to 1 (high diversity or evenness). The Bray-Curtis index was also calculated according to Borcard and Legendre (2013). This metric considers the abundance of each taxon at each station compared to the median reference abundance (in this case, lower Wolverine Creek), to compute an index of the relative "dissimilarity" of each station from the hypothetical reference median station. Larger Bray-Curtis index values indicate greater dissimilarity from reference. It was noted that in previous years, the calculated total organism density did not always properly account for area sampled (2013 to 2017).[6] All density samples were re-calculated to include area and total organism density now represents individuals/m^2. Bray-Curtis dissimilarity was compared against each reference area at the LPL using Mantel and distance-based Redundancy Analysis (dbRDA), as outlined in Borcard and Legendre (2013).

The relative proportions of the most abundant taxa were calculated relative to the total number of organisms in the sample. Dominant taxon groups were defined as groups representing greater than 10% of total organism abundance in one or more areas or any groups considered important indicators of environmental stress. In this study, relative proportions of the major groups, such as chironomids, EPT taxa, and Oligochaetes (worms) were examined. It is often possible to relate low relative abundance of sensitive taxonomic groups (e.g., EPT taxa) to environmental stress (e.g., Taylor and Bailey 1997). Similarly, high relative abundance of tolerant taxonomic groups (e.g., oligochaetes) may also indicate higher environmental stress (Chapman et al. 1982a,b).

[6] Area sampled was recorded when collecting benthic invertebrate community samples, but the area-based densities were not calculated until a later date.

2.4.2.1 2021 Spatial Comparisons

Differences between lower Minto Creek (exposed) and two reference areas lower Wolverine and Lower Big creeks were tested using ANOVA with α = 0.1 as per EEM guidelines (Environment Canada 2012). Prior to ANOVA, all data were log_{10}-transformed as necessary to meet assumptions of normality (Shapiro Wilks' test; α = 0.05) and homogeneity of variance (Levene's test; α = 0.05). If values of zero were present in the data set, a value of 1 was added before taking the logarithm. If these assumptions were not met, a non-parametric Kruskal-Wallis test was conducted. *Post hoc* contrasts following the ANOVA were conducted between the exposed area and each reference area using the contrast methods described in Oehlert (2010). Contrasts following the Kruskal-Wallis test were conducted using Dunn's test using the *dunn.test* package in R (Dinno 2017, R Core Team 2020). A magnitude of difference (MOD) was calculated for each community metric as:

$$MOD = \frac{\left(MCT_{Exp} - MCT_{Ref}\right)}{SD}$$

where MCT is the mean for untransformed data, geometric mean log_{10}-transformed, and median for rank-transformed data. The SD is an estimate of the pooled reference standard deviation (pooled SD) for untransformed and log_{10}-transformed data, or the pooled median absolute deviation (pooled MAD) for rank transformation. The MAD is calculated as the median of the absolute values of the differences between each observation and the median observation for that area (and corrected by a factor of 1.4826 to scale the MAD to the magnitude to the SD). A study design with three areas and n = 5 samples per area has an approximate power of 0.9 to detect a two standard deviation difference between areas using α = 0.1 (Environment Canada 2012).

Correspondence Analyses (CA; a multivariate ordination method) was used to further examine the 2021 benthic invertebrate community structure at the lower areas. CA is a multivariate ordination method that is used to reduce complex multivariate data into a smaller number of independent variables (Gauch 1984, Pielou 1984). The analysis extracts theoretical values (CA axis scores) that capture the variation in the abundance of benthic taxa. The CA ordination produces axis scores for each station. Taxa scores are also produced as the sum of weighted averages of their abundances across stations. The structure of the data can then be depicted in scatter plots of one CA axis against another, showing both taxa and station scores. Taxa that tend to co-occur plot together and those that rarely co-occur plot farther apart. Thus, CA can be used to describe which benthic invertebrate taxa best account for observed differences in the overall benthic invertebrate community between stations. The CA analysis was conducted at the LPL of taxonomic organization using $ln_{(x+1)}$-transformed density data. CA is sensitive to the

presence of rare taxa (Legendre and Legendre 1983, Poos and Jackson 2012). Therefore, taxa occurring in two or fewer samples or those that made up less than 15% of the total abundance of the dataset were excluded from the analysis (Dolédec and Chessel 1991). The ordination was conducted using the cca() function in the vegan package (Oksanen et al. 2020) of R statistical software (R Core Team 2020). Results of the CA were summarized by sampling area in 2021. Taxa with the highest magnitude weights on the CA axes were identified and used in interpretation of the separation of areas on the CA axes.

Spearman rank correlations were conducted between benthic invertebrate community endpoints that differed among areas and *in situ* habitat conditions that differed among areas. Benthic community endpoints of density, % EPT, % Ephemeroptera, % Plecoptera, % Chironomidae, % Oligochaeta, CA1, and CA2 were evaluated relative to *in situ* parameters of water depth, % cobble, % gravel, temperature, specific conductivity, and dissolved oxygen (mg/L). Significance was determined by comparing p-values against an unadjusted p-value (p=0.05) and a Bonferroni-corrected p-value for 48 tests (p= 0.00104).

2.4.2.2 Temporal Comparisons

Benthic invertebrate community data were also evaluated in comparison to results obtained in previous years of sampling (2012 to 2018, 2020 and 2021). Statistical analyses were conducted on benthic community endpoints from lower Minto Creek and reference areas lower Wolverine Creek and lower Big Creek to evaluate whether community composition has changed at these areas over time and/or the differences from reference have changed over time. Spatial and temporal statistical comparisons were conducted using Analysis of Variance (ANOVA) with factors *Year* and *Area* and their interaction using the same approach as described for chlorophyll-a in Section 2.2.2.2. For all significant comparisons, a magnitude of difference (MOD) was calculated in number of reference standard deviations using:

$$MOD = \frac{\left(MCT_{Exp} - MCT_{Ref}\right)}{SD}$$

where MCTs were back-transformed estimated marginal means when data was untransformed or $\log_{10}$-transformed, or medians when data was rank transformed. The SD is an estimate of the reference area standard deviation, or MAD for rank transformation.

2.5 Tissue Chemistry

2.5.1 Sample Collection and Laboratory Analysis

Periphyton and benthic invertebrate tissue samples were collected from lower Minto Creek and lower Wolverine Creek and lower Big creeks reference areas (Figure 2.1, Table 2.1).

Periphyton samples were collected by scraping submerged cobble-size rocks with a stainless-steel razor blade. Benthic invertebrate tissue samples were collected in areas with cobble substrate using a kick-net, and by overturning rocks and collecting organisms by hand. Periphyton and benthic invertebrate tissue samples were placed into pre-labeled Nalgene™ cryovials. A total of five periphyton and five benthic invertebrate tissue samples were collected at each area. One duplicate sample was collected for each tissue type, using the same methods as above. For the benthic tissue samples, efforts were made to split taxa evenly among the parent and duplicate samples whenever possible. For periphyton tissue samples, both the original and duplicate samples were collected from the same rocks. Immediately after collection, all tissue samples were placed in a cooler with ice packs, and later in a freezer until they were submitted to ALS Environmental in Whitehorse, YT for analysis of metals by CRC-ICP-MS (USEPA Method 6020B; USEPA 2014), mercury by CVAAS (USEPA Method 245.7; USEPA 2005), and moisture content.

2.5.2 Data Analysis

A formal DQR was completed to assess tissue chemistry data quality (Appendix A) which included an examination of data completeness and the LRLs achieved relative to applicable provincial/ federal guidelines. In addition, laboratory precision, and laboratory accuracy were assessed relative to laboratory DQOs.

Summary statistics were calculated for each metal by area and tissue type (periphyton and benthic invertebrates). The following summary statistics were reported: sample size, percent of values below the LRL, mean, standard deviation, minimum value, median, and maximum value. Commonly used substitution methods (e.g., substituting values < LRL with half the LRL) for censored data introduces bias in summary statistics (Helsel 2012). Means and standard deviations were therefore estimated used the Kaplan-Meier (K-M) method. This method involves transforming the left censored (i.e., < value) dataset to a right censored (i.e., > value) dataset, and then using the K-M estimator (used to estimate the mean survival time in survival analysis) to estimate the mean. The calculation was conducted using the *survfit* function in the *survival* package (Therneau 2017) in R and involves calculating the area under the K-M survival curve. The K-M method is non-parametric and can accommodate multiple LRLs. When a standard deviation could not be estimated (e.g., when all data were below the LRL), it was not reported. When a value was reported below a poor LRL (defined as a LRL that exceeded the maximum detected value), the value was removed from the dataset.

2.5.2.1 2021 Spatial Comparisons

The primary objective of tissue collection was to support a selenium assessment reported under separate cover. Accordingly, data are reported herein for future reference with limited interpretation. Tissue metal concentrations for periphyton and benthic invertebrates from lower Minto Creek (exposed) were compared to lower Wolverine and lower Big Creeks, reference areas using analysis of variance (ANOVA) with α = 0.05 on untransformed or log_{10}-transformed data (whichever best fit the data identified using Shapiro Wilk's test). When assumptions of normality and homogeneity of variances were not met (Shapiro Wilk's test and Levene's test on the median, respectively), the Kruskal-Wallis test was used. *Post hoc* contrasts following the ANOVA were conducted between the exposed area and each reference area using the contrast methods described in Oehlert (2010). *Post hoc* contrasts following the Kruskal-Wallis test were conducted using Dunn's test using the *dunn.test* package in R (Dinno 2017, R Core Team 2020). *Post hoc* p-values for the contrasts were corrected for the number of comparisons using Tukey's honestly significant differences method.

A magnitude of difference (MOD) was reported for statistical comparisons that were significant as:

$$MOD = \frac{(MCT_{Exp} - MCT_{Ref})}{MCT_{Ref}} \times 100\%$$

where MCT is the measure of central tendency (i.e., mean for untransformed data, geometric mean for log_{10}-transformed data, and median for rank transformation). In cases where there was a value below the reported detection limit, the value was replaced with the detection limit and a non-parametric Mann-Whitney test was conducted.

2.5.2.2 Temporal Comparisons

Statistical analyses of metal concentrations in tissue samples collected at lower Minto Creek (exposed) and reference areas, lower Wolverine Creek and lower Big Creek, were conducted to evaluate whether concentrations of copper and selenium have changed at these areas over time and/or become more similar to reference over time. Spatial and temporal statistical comparisons were conducted using Analysis of Variance (ANOVA) with factors *Year* and *Area* and their interaction using the same approach as described for Chlorophyll-a in Section 2.2.2.2, with the minor change of α = 0.05. For all significant spatial comparisons, a magnitude of difference (MOD) was calculated a percent difference to reference MCT using the same approach as described for Chlorophyll-a in Section 2.2.2.2.

3 SUPPORTING MEASURES

3.1 Hydrology and Climate

Flow and gauge height decreased significantly at Station W1 (Figure 2.1) after spring freshet, with a maximum of 0.893 m^3/s on May 4, 2021, which had dropped to 0.178 m^3/s by May 31, 2021 (Appendix Table B.1). Flow was intermittent between July 4 and July 25, 2021, and between August 16, 2021 (0.0108 m^3/s) and October 12, 2021 (0.0154 m^3/s), there were small fluctuations in flow. Water levels and flows were low during the sampling completed in September 2021. Compared to the Climate Normals collected from 1981 to 2010 (Government of Canada 2022), 2021 temperatures were similar except for January, which was much milder than Climate Normals (Appendix Table B.2a). Precipitation in 2021 was generally lower than Climate Normals from June to September, and November (Figure 3.1; Appendix Table B.2b). Relatively low precipitation preceding the September 2021 field campaign may have contributed to lower flows and noticeably low water levels at several of the sampling areas, but especially at lower Minto Creek.

3.2 Field Measures

In support of benthic invertebrate community sampling, habitat characterization and supporting information documenting conditions at the time of sample collection were recorded (Table B.3 and B.4, respectively). Mean specific conductance and temperature at the sediment sampling area of upper Minto Creek (469 microSiemens per centimeter [µS/cm] and 3.6 degrees Celsius [°C], respectively) was significantly higher than in upper McGinty Creek (143 µS/cm and 1.8 °C). Mean pH and dissolved oxygen were not statistically different between upper Minto Creek and upper McGinty Creek (Figure 3.2, Table 3.1; Appendix Table B.5).

Mean temperature at the sediment sampling area of lower Minto Creek (5.58°C) was significantly lower than in lower Wolverine Creek (7.22°C; Figure 3.2, Table 3.2; Appendix Table B.5). Specific conductance and pH at lower Minto Creek (314 µS/cm, 7.69) were significantly higher compared to lower Wolverine Creek (226 µS/cm, 7.27). Mean dissolved oxygen at the sediment sampling area of lower Minto Creek (85.5% saturation and 10.8 mg/L) was also significantly higher compared to lower Wolverine Creek (31.3% saturation and 3.78 mg/L; Figure 3.2, Table 3.2; Appendix Table B.5). Lower dissolved oxygen at lower Wolverine Creek could be attributed to sampling in side-channel areas, which were the only areas that support sediment deposition (but receive less flow and have consequent lower dissolved oxygen concentrations). Differences in temperature could be attributed to the time of day that sampling was conducted and volume / size of watercourse and are therefore not considered biologically relevant.

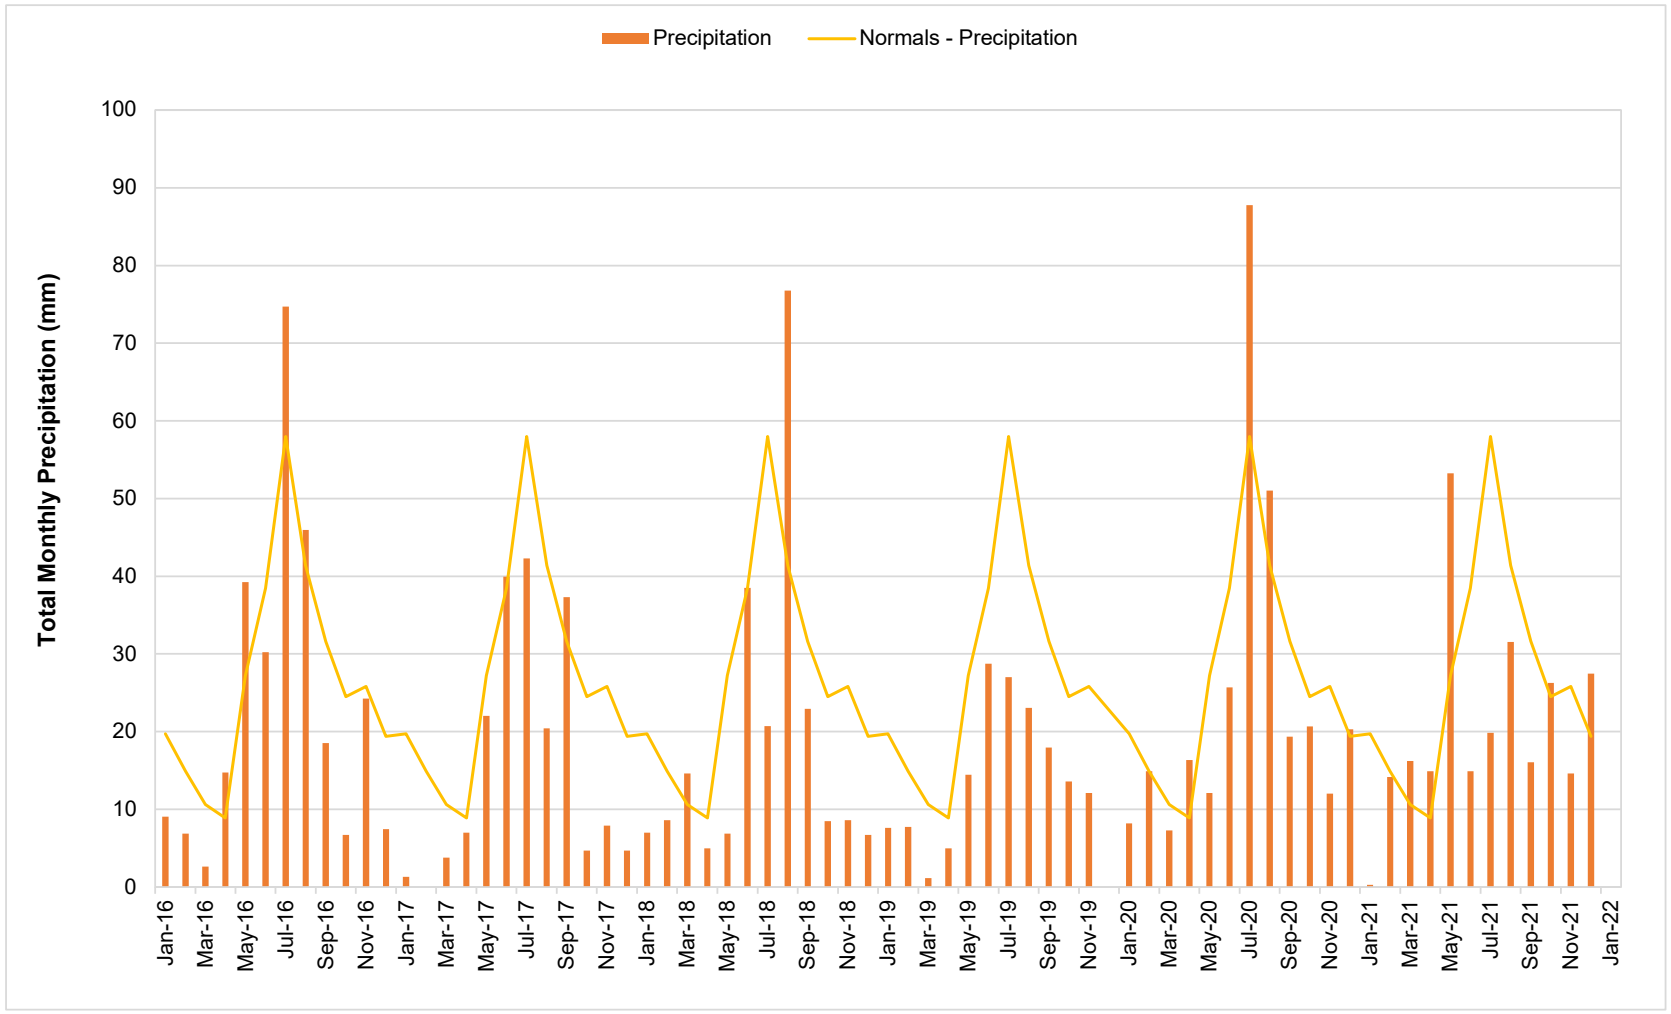

Figure 3.1: Total Monthly Precipitation at Minto Mine Compared to Canada Climate Normals, 2012 to 2021

Notes: Canada Climate Normals from 1981 to 2010 (Government of Canada 2022). Climate normals are from the Pelly Ranch weather station.

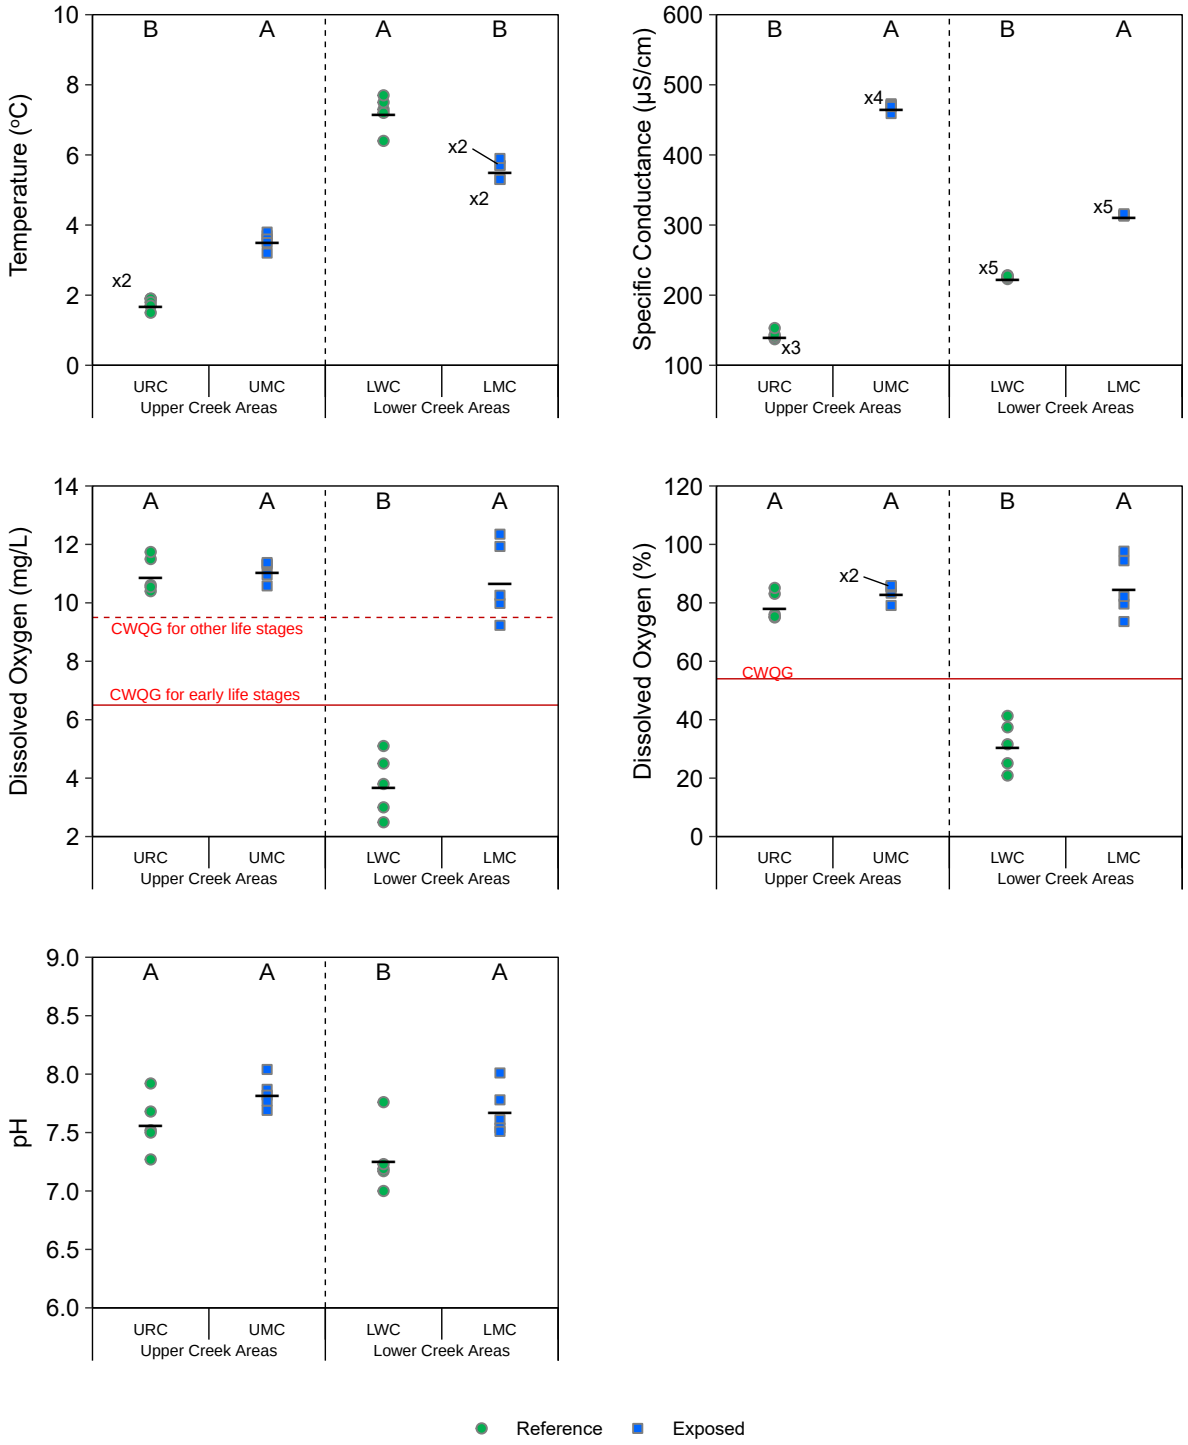

Figure 3.2: Physico−chemical Measurements in Sediment Sampling Areas of Upper and Lower Minto Creek Relative to Reference Areas, Minto Mine AEMP, 2021

Notes: Different letters indicate areas are significantly different ($p < 0.05$) between exposed and reference areas. Horizontal bars indicate the measure of central tendency (MCT). MCT is the mean for parameters where statistics were conducted on the raw scale, the geometric mean when statistics were $\log_{10}$ transformed to meet the assumptions of normality, and the median when rank transformed. Numbers indicate the number of overlapping points. URC = upper McGinty Creek. UMC = upper Minto Creek. LWC = lower Wolverine Creek. LMC = lower Minto Creek. CWQG = Canadian Water Quality Guidelines (CCME 1999).

[a] Measure of Central Tendency (MCT) is the mean for parameters where statistics were conducted on the raw scale, the geometric mean when statistics were $\log_{10}$ transformed to meet the assumptions of normality, and the median when rank transformed.

[b] MOD= magnitude of difference. MOD = $(MCT_{exp} - MCT_{ref})/MCT_{ref}*100$.

Physico-chemical measurements were also taken in erosional areas of lower Minto, lower Wolverine, and lower Big creeks in support of benthic invertebrate community sampling. Mean temperature and sampling depth were significantly lower at lower Minto Creek (3.60°C, 7.24 cm) compared to both reference areas, lower Wolverine (5.82°C, 9.28 cm) and lower Big Creek (6.94°C, 8.68 cm; Figure 3.3, Table 3.3; Appendix Table B.6). Specific conductance at lower Minto Creek (314 µS/cm) was significantly higher compared to lower Wolverine Creek (230 µS/cm) and lower Big Creek (215 µS/cm). Mean dissolved oxygen (mg/L) was significantly higher at lower Minto Creek (11.9 mg/L) compared to lower Wolverine Creek (11.1 mg/L), but not lower Big Creek (11.6 mg/L). No significant differences were observed between lower Minto Creek and reference creeks for dissolved oxygen percent saturation (Figure 3.3, Table 3.3). Condition at all benthic invertebrate sampling areas were within the range of the CWQG guidelines and WUL objectives for mean pH and mean dissolved oxygen (mg/L).

3.3 Water Chemistry and Periphyton Chlorophyll-a

The quality of water chemistry data was assessed prior to data analysis and interpretation and was judged as good based on good analyte detectability, precision, and accuracy, and an absence of contamination (Appendix A). All analytes were below the CWQGs except for fluoride, which also exceeded the CWQG during baseline sampling (HKP 1994).[7] All analytes were well below the SSWQO as set out in the WUL (Table 3.4; Appendix Table B.8). Chloride and fluoride concentrations at Minto Creek were greater than 2x higher than corresponding reference areas and total alkalinity was greater than 2x higher at upper Minto Creek compared to upper McGinty reference (Table 3.4; Appendix Table B.8).

Hardness and total dissolved solids were generally higher in upper Minto Creek than in Upper McGinty Creek (Table 3.4). This was also true for lower Minto Creek compared to both lower Wolverine Creek and lower Big Creek reference areas. Dissolved organic carbon (DOC) ranged from 7.21 to 14.3 mg/L across areas. Hardness, DOC, and alkalinity can modify (reduce) the toxicity of certain metals (e.g., copper).

Chlorophyll-a data quality was assessed prior to data analysis and interpretation and was judged as good based on good analyte detectability, precision, and accuracy, and an absence of contamination (Appendix A). Chlorophyll-a is the primary photosynthetic pigment of all oxygen evolving photosynthetic organisms (Wetzel 2001) and therefore provides an indicator of the standing stock of photosynthetic organisms representing the lowest trophic level. Minto Creek is a lotic system, so measuring chlorophyll-a in periphyton is more representative of productivity

[7] See Table B.7 for details on guideline values that are dependent on physicochemical modifiers.

Exceeds CCME long-term Water Quality Guideline.
Exceeds CCME short-term Water Quality Guideline.
Exceeds Water Use Licence objective.
Exceeds both Water Quality Guideline (short- or long-term) and Water Use Licence objectives.

Notes: "-" = no guideline available / no data available.

[a] CCME (Canadian Council of Ministers of the Environment; 1999). See Appendix Table B.7 for values and explanatory notes on selected water quality guidelines.

[b] Total chromium guideline is for hexavalent chromium, Cr(VI).

than measuring chlorophyll-a in water. In 2021, mean periphyton chlorophyll-a (mg/m^2) were significantly higher at lower Minto Creek (45.8 mg/m^2) than at lower Wolverine Creek (20.1 mg/m^2; Appendix Figure B.1, Appendix Tables B.9 and B.10).

When comparing periphyton chlorophyll-a (mg/m^2) over the years, lower Minto Creek had significantly higher chlorophyll-a than lower Wolverine Creek in 2014, 2015, 2017, 2018, and 2021, while results were not significantly different in 2013 and 2016 (Appendix Table B.10). Since monitoring commenced in 2012, periphyton chlorophyll-a has been statistically lower at Minto Creek than Wolverine Creek in only two years: 2012 and 2020 (Appendix Table B.10). Overall, the absence of consistent differences over time suggests no mine-related influence beyond natural variability.

In 2021 periphyton chlorophyll-a (mg/m^2) at lower Minto Creek was higher than in 2020 results and were well below the BCWQG of 100 mg/m^2 for the protection of aquatic life (BCMOE 1985), except for one sample at lower Minto Creek (106 mg/m^2 at LMC-5; Appendix Table B.9). The classification system laid out in Dodds et al. (1998) sets the trophic status of lower Minto Creek (mean; 45.8 mg/m^2) and lower Wolverine Creek (mean; 20.1 mg/m^2) as mesotrophic.

3.4 Summary

Precipitation from June to September 2021 was slightly lower than long-term normal. Relatively low precipitation preceding the September 2021 field campaign likely have contributed to lower flows and noticeable low water levels at several of the sampling areas, but especially at lower Minto Creek.

Supporting measures collected in September 2021 indicated good water quality in Minto Creek. Influence of the Minto Mine was evident through higher specific conductance and pH in Minto Creek in comparison to in the reference creeks. Water quality met CWQGs and SSWQOs, except for fluoride, which exceeded the CWQG at all areas and was greater than CWQG during baseline sampling. Total copper and dissolved copper concentrations have historically exceeded the CWQG, but were below the CWQG at all sites in 2021, with dissolved copper concentrations falling below the SSWQO as well.

Mean periphyton chlorophyll-a (mg/m^2) was significantly different between areas and were below BCWQG except for one sample at lower Minto Creek. Temporal variability in chlorophyll-a was evident among samples taken from Minto Creek and the reference. Historically, periphyton chlorophyll-a (mg/m^2) values have been below the BCWQG of 100 mg/m^2 and results have been (generally) higher at Minto Creek than the reference. Chlorophyll-a (mg/m^2) in 2021 was higher than 2020. Production classification at both lower Minto Creek (exposed) and lower Wolverine Creek (reference) was mesotrophic.

4 SEDIMENT QUALITY

4.1 Sediment Particle Size and Chemistry

Sediment data quality was assessed prior to data analysis and interpretation and was judged as good based on analyte detectability, precision, and accuracy for metals and other analytes (Appendix A). For lower creek areas, particle size composition is expressed as the mean of five replicates. At upper creek areas, particle size composition is expressed as a single composite sample.

Sediments collected in 2021 were largely composed of sand at the upper areas (>45%) and fine particles of silt/clay at the lower areas (>60%; Figure 4.1; Appendix Table C.1). There were relatively more fine particles (silt and clay category) at the upper Minto Creek depositional area than at the upper reference area, upper McGinty Creek (54.6% vs. 40.6%; Figure 4.1; Appendix Table C.1). Lower Minto Creek and lower Wolverine Creek reference area had similar mean proportions of fine particles (63.5% vs. 60.6%; Figure 4.1; Appendix Table C.1).

Mean total organic carbon (TOC) content, loss on ignition (LOI), and total carbon content of sediment collected from upper Minto Creek were slightly lower than at the upper McGinty Creek reference area, but the differences were not significant (Table 4.1).

Concentrations of several metals were significantly higher in upper Minto Creek than in upper McGinty Creek sediments (Table 4.1). Sediment concentrations of copper, potassium, and nickel had the highest magnitude of difference between the upper creeks (583%, 91%, and 69%, respectively; Table 4.1).

Mean arsenic concentration in upper Minto Creek was above the Interim Sediment Quality Guideline (ISQG; 5.9 mg/kg) but below the Probable Effect Level (PEL; 17 mg/kg) and lower than 2x the mean at upper McGinty Creek reference area (Table 4.1). Mean copper concentration in upper Minto Creek was above the ISQG (36 mg/kg) and 2x times higher than reference but below the PEL (197 mg/kg). One of the five sediment samples collected at upper Minto Creek had a copper concentration above the PEL (Table 4.1; Appendix Table C.1); the PEL is considered a level above which adverse biological effects are likely to occur.[8] However, due to the predominantly erosional habitat in upper Minto Creek, there are few areas of deposited sediment which may have only occurred in small quantities that likely washed away each year during freshet. Therefore, elevated copper in fine sediment in the upper reaches of Minto Creek may be of limited importance in terms of exposure and potential effects to biota

[8] It is recognized that guideline exceedances, even of probable effect levels, can occur naturally in highly mineralized areas.

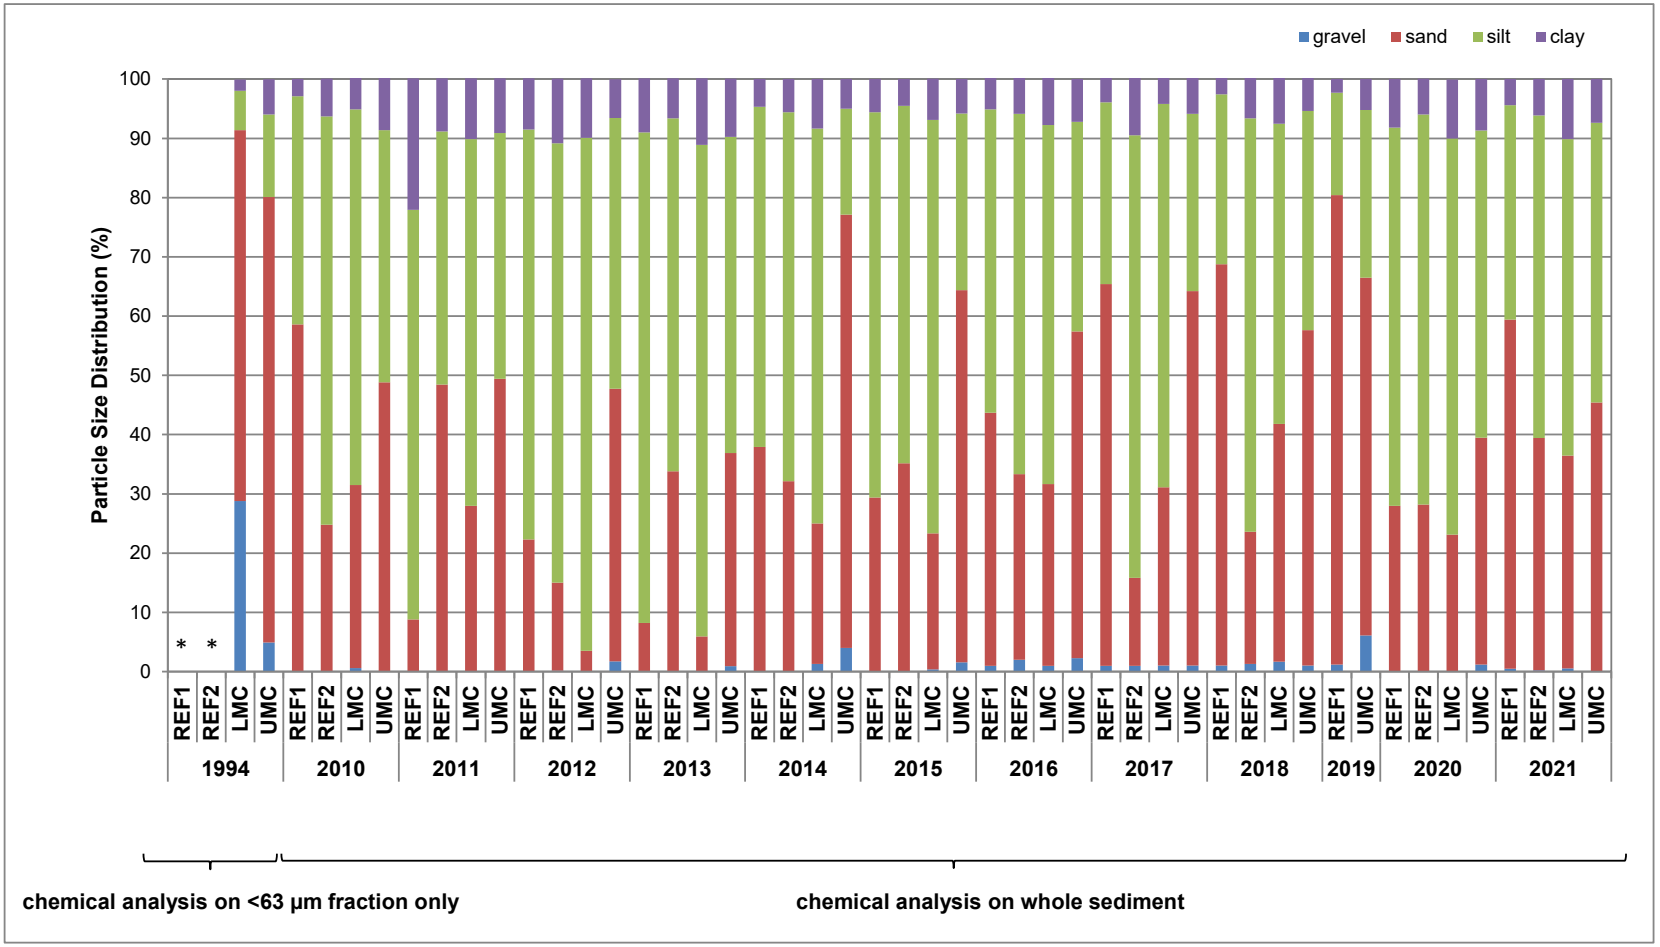

Figure 4.1: Particle Size Distribution of Sediment Collected in Minto Creek and Reference Locations, 1994 to 2021[a,b]

Notes: Methods used in 1994 were not specified, fine sediment was collected in triplicate in the mainstem of Minto Creek (HKP 1994), * = no data. No sampling was conducted in lower areas in 2019, as lower Minto Creek was dry.

[a] REF1 = Station W6 (south-flowing tributary) in 2006 to 2008 and McGinty Creek in 2010 to 2021; UMC = Upper Minto Creek.

[b] REF2 = Station W7 (north-flowing tributary) in 2006 to 2009 and Wolverine Creek in 2010 to 2021; LMC = Lower Minto Creek.

P-value < 0.05.
Magnitude of Difference (MOD) > 0.
Magnitude of Difference (MOD) < 0.
Indicates sediment concentration exceeding CSQG ISQG.
Indicates sediment concentration exceeding CSQG PEL.

Notes: ns = non-significant.

[a] Canadian Sediment Quality Guidelines: ISQG = interim sediment quality guideline; PEL = probable effect level (CCME 2014)

[b] Measure of Central Tendency is the mean for parameters where statistics were conducted on the raw scale, the geometric mean when statistics were log_{10} transformed to meet the assumptions of normality, and the median when rank transformed.

[c] MOD = magnitude of difference = $(MCT_{exp}-MCT_{ref})/MCT_{ref}*100\%$.

(i.e., sediment copper is of limited importance as an exposure route in this erosional environment where sediment is sparsely distributed).

Mean TOC content, LOI, and total carbon content of sediment collected from lower Minto Creek were slightly lower TOC, LOI, and total carbon than the lower Wolverine Creek reference area but the difference was not significant (Table 4.2).

Concentrations of several metals were found to be significantly higher in lower Minto Creek than lower Wolverine Creek sediments (Table 4.2). Sediment concentrations of manganese, copper, and arsenic had the highest magnitude of difference between the upper creeks (168%, 139%, and 39%, respectively).

Mean arsenic and copper concentrations in lower Minto Creek were above the ISQG but below the Probable Effect Level (PEL). Mean concentrations of arsenic in lower Minto Creek were less than 2x the mean at lower Wolverine Creek but mean copper concentration in sediment was 2x higher at lower Minto Creek compared to lower Wolverine Creek (Table 4.2). In lower Minto Creek, fine sediment deposits were somewhat more common (compared to upper Minto Creek) and therefore more relevant to aquatic life.

With progression from upper to lower Minto Creek, sediment copper concentrations decreased from a mean of 172 to 59 milligram per kilogram (mg/kg), respectively, indicating improvement with distance downstream. As aforementioned, fine sediment deposits were considered of limited importance as a route for exposure and potential effects of mine-related metals to biota, and more relevant to aquatic life at lower Minto Creek, where sediment deposits were somewhat more common.

4.2 Temporal Comparisons

Particle size distribution in 2021 indicated similar proportions of fine particles in the silt and clay category compared to previous years and higher proportions of sand than 2020 (Figure 4.1). Sand was generally the dominant particle size in upper Minto Creek as observed over the more recent historical data (post-2010). Particle size distribution observed from 2010 onwards was notably different from data collected prior to 2010, which employed different sampling methodology (described in Minnow 2019a). Upper McGinty particle distribution is noticeably more variable in clay and sand percentages (Figure 4.1), perhaps reflecting the very sparse distribution and heterogeneity of sediment in this system.

Mean concentrations of copper at upper Minto Creek have not changed significantly since 2011 but has been significantly higher than upper McGinty Creek since 2011 (Figure 4.2, Table 4.3). The magnitude of difference between upper Minto Creek and upper McGinty Creek in 2021 was the lowest it has been since 2015, and results were within the range observed since 2011

					2021	ABC	A	583

P-value < 0.05.
Magnitude of Difference (MOD) > 0.
Magnitude of Difference (MOD) < 0.

Notes: ANOVA = analysis of variance, URC = upper McGinty Creek, UMC = upper Minto Creek, MOD = magnitude of difference.

[a] Years that do not share a letter were significantly different in a Tukey's Honestly Significant Difference post-hoc test (α = 0.05).

[b] MOD = $(MCT_{UMC}-MCT_{URC})/MCT_{URC}$ *100; where the measures of central tendency (MCT) were geometric means because the data was log_{10} transformed.

(Figure 4.2, Table 4.3).

Mean concentrations of copper in lower Minto Creek have fluctuated over the years but have not changed significantly since 2013. Concentrations in lower Wolverine Creek have not changed significantly since 2011 (Figure 4.3, Table 4.4). The mean concentration of copper at lower Minto Creek has been significantly higher than lower Wolverine Creek since 2013, except in 2018 (Figure 4.3, Table 4.4). The highest magnitude of difference (MOD) between lower Minto and lower Wolverine was observed in 2016.

Though copper concentrations in 2021 were high relative to reference concentrations and CSQGs, they were within historic range for both upper and lower Minto Creek sediments (Figures 4.2 and 4.3; Minnow 2019a). Mean copper concentrations have been historically greater than the ISGQ in lower Minto Creek sediment in all years since 2011 (Figures 4.2 and 4.3, Table 4.1) and have generally been stable since 2011. Mean copper concentrations in upper Minto Creek last exceeded the PEL in 2016, while mean copper concentrations at lower Minto Creek have never exceeded the PEL (Figures 4.2 and 4.3, Table 4.1).

4.3 Summary

Overall, the mean concentrations of metals in upper Minto Creek sediments were generally higher than those in McGinty Creek but were only significantly higher for a small subset of metals. Mean metal concentrations were lower than the SQGs for the protection of aquatic life (CCME 1999), except for arsenic and copper, which exceeded ISQG. Copper also exceeded the PEL for one sample. Copper at upper Minto Creek also exceeded the reference mean concentration by more than two times.

Overall, the mean concentrations of metals in lower Minto Creek sediments were generally similar to those in lower Wolverine Creek with the exception of arsenic, copper, and manganese (of which arsenic and copper were greater than ISQG but lower than PEL). Copper at lower Minto Creek also exceeded the reference mean concentration by more than two times.

Copper concentrations at both upper Minto and lower Minto Creek have been statistically higher than their respective reference areas since 2011 and 2013, respectively (there was no significant differences between lower Minto and lower Wolverine creeks in 2018). Although concentrations of arsenic and copper in both upper and lower Minto Creek exceeded sediment quality guidelines, temporal analyses of copper concentrations since 2011 indicate that there has not been a significant increase in copper over the years at either upper or lower Minto Creek. This suggests that the Minto Mine has not adversely influenced sediment copper concentrations over this time frame. However, definite evaluation of the potential mine influence is impaired by the absence of good baseline data.

Table 4.4: Statistical Comparison of Sediment Copper Concentrations Over Time in Lower Creek Areas, Minto Mine AEMP, 2011 to 2021

Magnitude of Difference (MOD) < 0

Notes: ANOVA = analysis of variance, LWC = lower Wolverine Creek, LMC = lower Minto Creek, MOD = magnitude of difference, ns = non-significant post-hoc contrast.

[a] Years that do not share a letter were significantly different in a Tukey's Honestly Significant Difference post-hoc test ($\alpha = 0.05$)

[b] MOD = $(MCT_{LMC}-MCT_{LWC})/MCT_{LWC}$ *100; where the measures of central tendency (MCT) were geometric means because the data was $\log_{10}$ transformed.

5 BENTHIC INVERTEBRATE COMMUNITY

5.1 Primary Metrics and Community

Benthic invertebrate density was significantly lower at lower Minto Creek compared to lower Wolverine Creek reference area but not lower Big Creek reference area (Table 5.1). There were no significant differences in richness (number of taxa), Simpson's Evenness, or Simpson's Diversity among areas (Table 5.1). Bray-Curtis index was the only primary metric that differed significantly for the benthic invertebrate community from lower Minto Creek relative to those from the reference areas (Table 5.2; Appendix Figure D.1).

The dominant taxonomic group at all stations in lower Minto Creek was Chironomidae (chironomids; non-biting midges; Appendix Table D.1). The dominant taxonomic group was variable across stations in lower Wolverine Creek, with Oligochaetes, chironomids, and Plecoptera (stoneflies), while the dominant taxonomic group in lower Big Creek was Plecoptera (Appendix Table D.1). Percent chironomids was significantly higher in lower Minto Creek than both lower Wolverine Creek and lower Big Creek reference areas, while the opposite was true for percent EPT and percent Plecoptera (Table 5.1). Percent Ephemeroptera (mayflies) was lower at lower Minto Creek compared to lower Wolverine Creek but not lower Big Creek. Higher percent chironomids and lower percent EPT in the benthic invertebrate community of lower Minto Creek may be indicative of mine influence (Chapman et al. 1982b, Rosenberg and Resh 1993, Taylor and Bailey 1997). However, low flow conditions in July 2021 may also have influenced the differences in benthic invertebrate community in lower Minto Creek.

Correspondence Analysis (CA) explained 59.0% of the total community variance in the first two CA axes (Appendix Table D.2). The first CA axis explained 40.9% of the total variation in the original benthic abundance data and significantly separated lower Minto Creek from lower Wolverine and lower Big creeks (Figure 5.1; Appendix Table D.2). Lower Minto Creek stations had negative scores on CA Axis-1 and stations were separated from lower Wolverine and lower Big creeks by *Nemoura* and *Ostrocerca* (both stoneflies), Tubificinae (Family Naididae; oligochaete), *Limnophyes*, and *Eukiefferiella* (both Family Chironomidae; Figure 5.1, Appendix Tables D.2 and D.3). The two reference areas, lower Wolverine and lower Big creeks, had strong positive CA Axis-1 scores that were separated from lower Minto Creek by *Isoperla* (stonefly), *Rhyacophila* (caddisfly), *Zapada cinctipes* (stonefly), Perlodidae (stonefly), and *Baetis* (mayfly; Figure 5.1; Appendix Tables D.2 and D.3). Lower reference areas were separated on CA Axis-2 (which explained 18.1% of the total variation) and lower Minto Creek had significantly lower CA Axis-2 scores compared to lower Big Creek but significantly higher scores compared to lower

P-Value < 0.1

Notes: LWC = lower Wolverine Creek (Reference), LMC = lower Minto Creek (Exposed), LBC = lower Big Creek (Reference), dbRDA = distance-based redundancy analysis. See Section 2.5.2 for statistical analysis details.

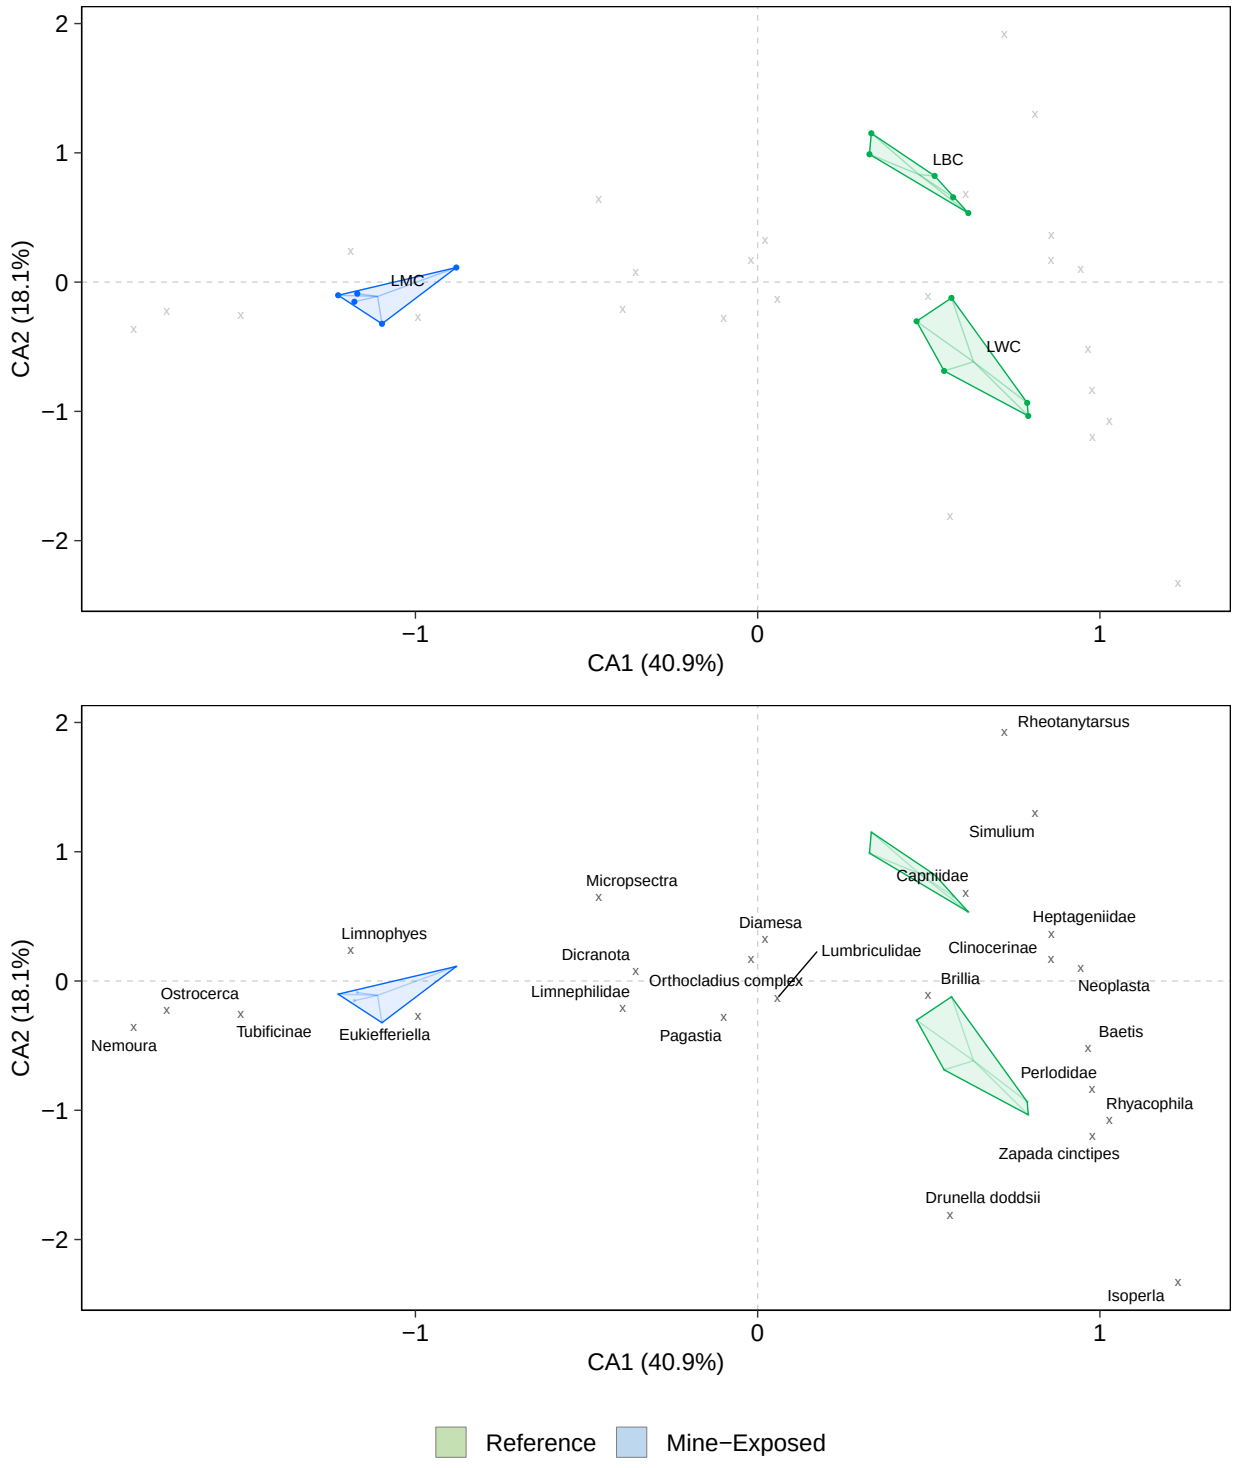

Figure 5.1: Correspondence Analysis (CA) Scatterplot for Benthic Invertebrate Relative Densities at Lower Minto Creek and Associated Reference Areas, Minto Mine AEMP, 2021

Notes: LWC = lower Wolverine Creek (reference), LBC = lower Big Creek (reference), LMC = lower Minto Creek (exposed). Taxa densities were $\ln_{(x+1)}$−transformed before CA calculations. Taxa present at two or fewer samples or accounted for less than 15% of the total abundance at any station were removed from the analysis.

Wolverine Creek (Table 5.1). The CA does not always reflect taxa abundance, so much as presence/absence. For example, both lower Minto Creek and lower Wolverine Creek had Nemourid stoneflies, but the genera found in each area were distinct. As previously indicated, chironomids are considered to be tolerant taxa, while family Nemouridae (stonefly) is considered to be sensitive (Mandaville 2002).

5.2 Correlation Analysis

Correlation analysis between eight benthic invertebrate community indices and six supporting physical and chemical measurements (those for which significant differences among areas were observed) resulted in 19 significant correlations at a p-level of 0.05 and an r-value of > 0.6 (Table 5.3). It is important to note that correlation between two variables does not necessarily imply a cause-and-effect relationship, although it may be considered a basis for further investigation and consideration of known biological responses to environmental differences.

Of the 19 significant correlations, six were associated with the proportion of cobble and gravel in the substrate[9] (Table 5.3). Positive relationships were observed between percent cobble and the proportion of EPT taxa, Ephemeroptera, Plecoptera, and CA Axis-1 (Table 5.3; Appendix Figure D.2). These relationships are generally consistent with the preference of EPT taxa for cobble substrate. Negative relationships were found between percent cobble and percent chironomids, as well as percent gravel and percent Ephemeroptera (Table 5.3; Appendix Figure D.2). Positive relationships were observed between water depth and percent Ephemeroptera and CA Axis 1, whereas a negative relationship was apparent between water depth and percent chironomids (Table 5.3; Appendix Figure D.2). Positive correlations were also observed between water temperature and percent EPT, percent Ephemeroptera, and percent Plecoptera, while a negative relationship was found relative to percent chironomids (Table 5.3; Appendix Figure D.2). The opposite was observed for specific conductivity in water which had a positive relationship with percent chironomids, and a negative relationship with percent EPT, percent Ephemeroptera, and percent Plecoptera (Table 5.3; Appendix Figure D.2). Finally, a positive relationship was observed between the concentration of dissolved oxygen in water and organism density, while a negative relationship was found between dissolved oxygen and percent Ephemeroptera (Table 5.3; Appendix Figure D.2). The relationships between specific conductivity and both percent chironomid and EPT could possibly be attributed to mine influence; however, the differences in community composition appear to be more strongly associated with habitat condition and substrate than specific conductivity. Overall, it appears that habitat quality

[9] See Appendix Table D.4 and Appendix Figure D.3 for details on the substrate count data collected in support of benthic invertebrate monitoring stations.

abs(r_s) > 0.6.

Note: Correlations only conducted with endpoints and physiochemical parameters that were significantly different among areas.

(independent of mine influence) may be contributing to observed differences in benthic invertebrate community structure among the study areas.

5.3 Temporal Comparisons

Mean benthic organism density in lower Minto Creek in 2021 was the second highest observed over the 2012 to 2021 period (the highest density was observed in 2020). Densities have remained similar at lower Minto Creek since 2017 (Figure 5.2, Table 5.4). Mean organism density lower Wolverine Creek increased from 2018 to 2020 but remained similar between 2020 and 2021. Organism densities in lower Big Creek have remained similar since 2017 (Figure 5.2, Table 5.4). Mean richness, Simpson's Evenness, and Simpson's Diversity in lower Minto Creek have not changed significantly over the 2012 to 2021 period. Richness has not differed significantly between lower Minto Creek and lower Wolverine Creek since 2012. Simpson's Evenness and Diversity have not differed significantly between lower Minto Creek and either reference area since 2015 (except for lower Big Creek in 2018; Figure 5.2, Table 5.4).

Percent EPT increased at all areas in 2021 compared to 2020. However, this increase was not significant in lower Minto Creek but was significant in both reference creeks (Figure 5.3, Table 5.4). Historically, percent EPT in lower Minto Creek has not been significantly different compared to both reference creeks. Percent EPT at lower Minto Creek compared to lower Big Creek either did not differ (2015 to 2018) or was significantly lower (2020 and 2021). Percent EPT at lower Minto Creek compared to lower Wolverine Creek either did not differ (2012, 2015, 2016, 2020) or was significantly higher (2013, 2014, 2017, 2018) except in 2021 (Figure 5.3, Table 5.4). Though percent EPT in lower Minto Creek did not change between 2020 and 2021, percent Plecoptera in lower Minto Creek increased significantly from 2020 (Figure 5.3, Table 5.4).

Mean percent chironomids remained similar in lower Minto Creek between 2020 and 2021, and was similar to historical observations values in 2012, 2013, and 2016 (Figure 5.3, Table 5.4). The proportion of chironomids in lower Big Creek has remained similar since 2015, while the proportion of chironomids in lower Wolverine Creek in 2021 was the lowest it has been since 2017 (Figure 5.3, Table 5.4).

5.4 Summary

The 2021 benthic invertebrate community at lower Minto Creek showed no significant difference in richness (number of taxa), Simpson's Evenness, or Simpson's Diversity when compared to either lower Wolverine Creek or lower Big Creek. Density at lower Minto Creek was significantly higher compared to lower Wolverine Creek but there was no significant difference between lower Minto Creek and lower Big Creek. Bray-Curtis index was the only primary endpoint that differed significantly between the lower Minto Creek and both reference areas. Community composition

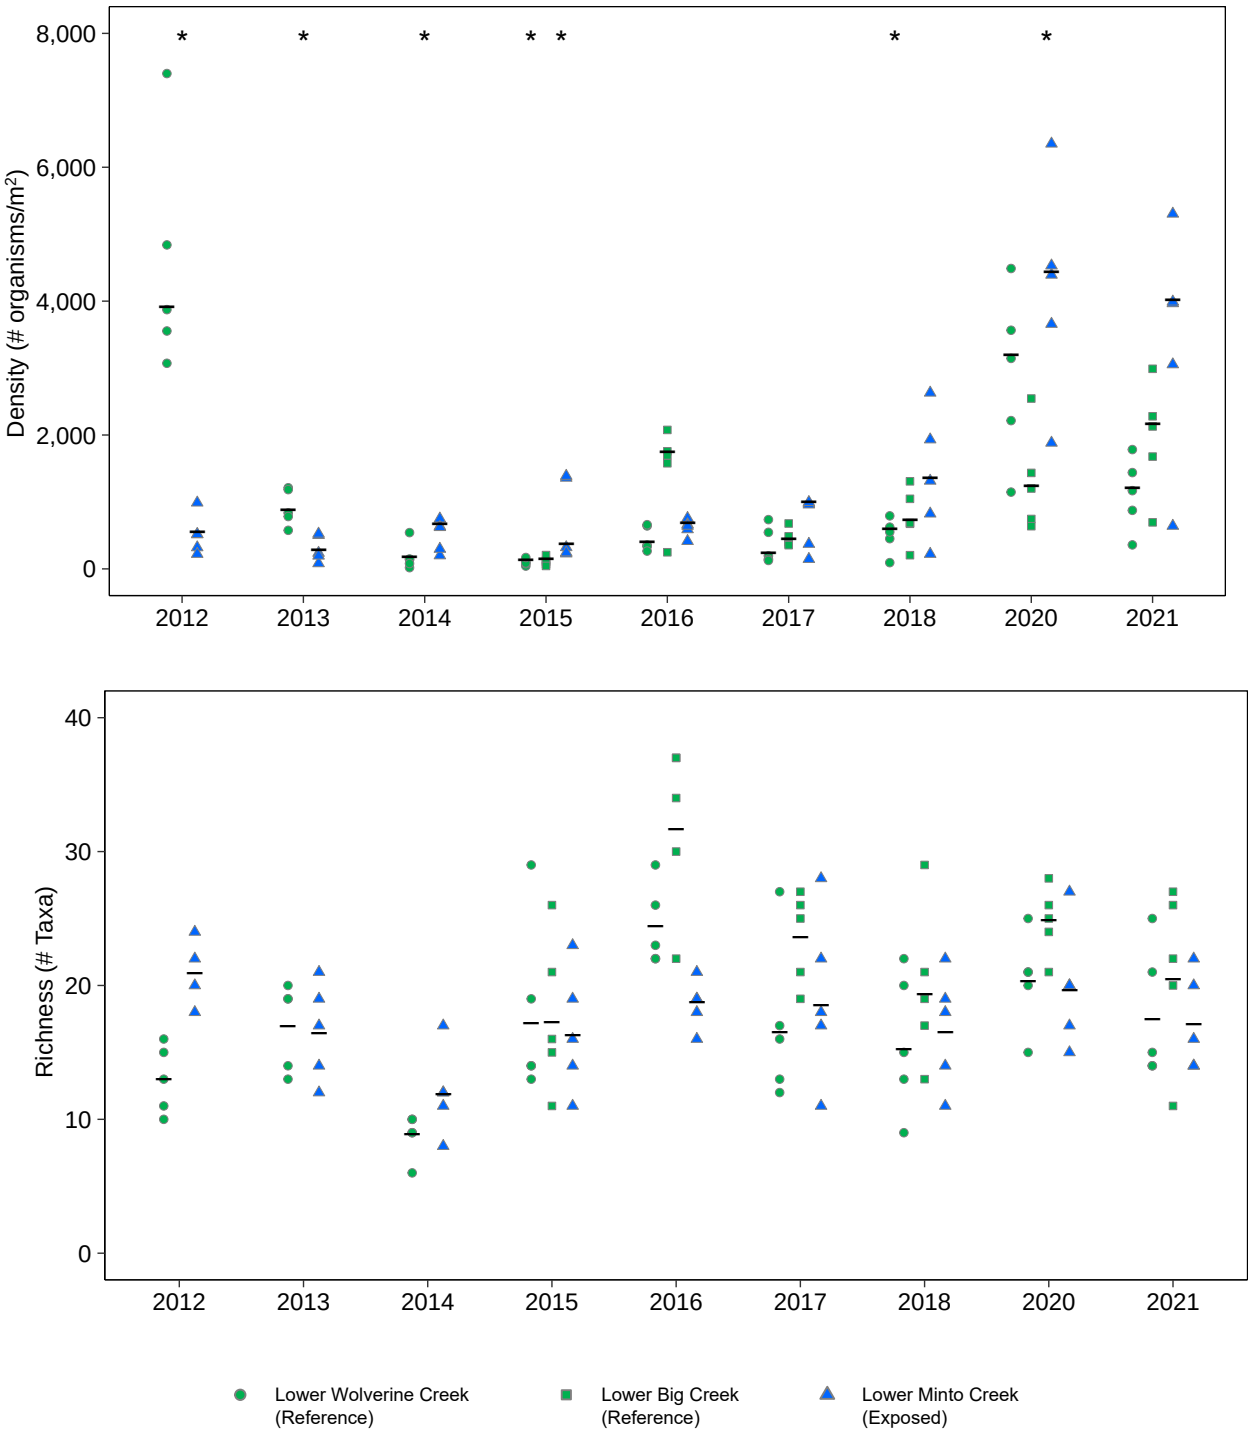

Figure 5.2: Benthic Invertebrate Community Primary Endpoints at Lower Minto Creek and Reference Areas, 2012 to 2021

Notes: Black horizontal bars indicate the Measure of Central Tendency (MCT). The MCT is the mean for non−transformed data, geometric mean for log−10 transformed data and median for rank transformed data. An * indicates the reference station was significantly different from the exposed station for that year. All endpoints were calculated at the lowest practicable level (LPL).

[a] Sampling not conducted in 2019 due to dry conditions.

P-value < 0.1
Magnitude of Difference (MOD) <-2
Magnitude of Difference (MOD) >2

Notes: "-" indicates no data for comparison, "ns" indicates a non-significant post-hoc contrast.

[a] Years that do not share a letter were significantly different in a Tukey's Honestly Significant Difference post-hoc test ($\alpha = 0.05$).

[b] MOD = $(MCT_{EXP}-MCT_{REF})/SD_{REF}$; where the measure of central tendency (MCT) were back-transformed least estimated marginal-squares means (untransformed), geometric means (log10 transformed), or medians (rank transformation) and the SD is an estimate of the reference area standard deviation, or MAD for rank transformations.

[c] MOD was positive but the magnitude could not be calculated as the standard deviation for the reference area was 0.

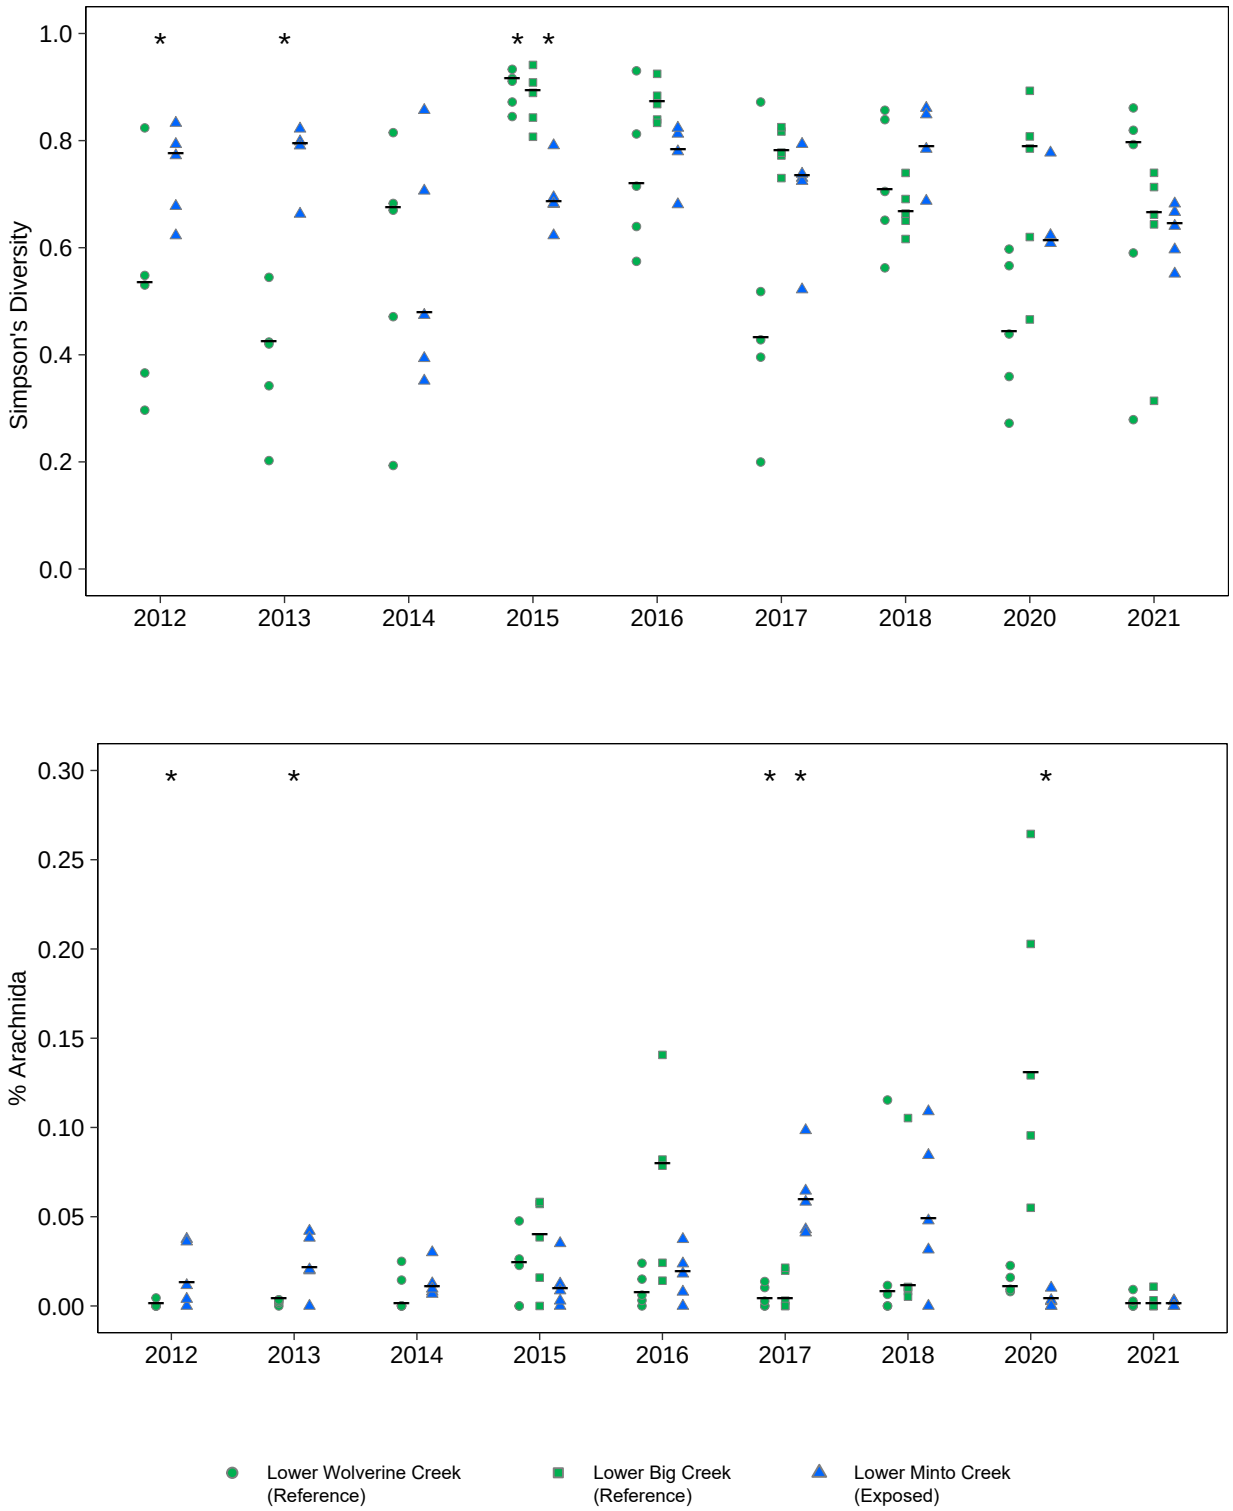

Figure 5.3: Benthic Invertebrate Community Supporting Endpoints at Lower Minto Creek and Reference Areas, 2012 to 2021

Notes: Black horizontal bars indicate the Measure of Central Tendency (MCT). The MCT is the mean for non−transformed data, geometric mean for log_{10}-transformed data and median for rank transformed data. An * indicates the reference station was significantly different from the exposed station for that year. All metrics were calculated at the lowest practicable level (LPL).

at lower Minto Creek was dominated by chironomids, while lower Wolverine Creek dominance was variable, and lower Big Creek was dominated by Plecoptera. Percent chironomids in 2021 was significantly higher at lower Minto Creek compared to both reference areas, while the opposite was seen for percent EPT, and percent Plecoptera. Lower Minto Creek had significantly lower percent Ephemeroptera compared to lower Big Creek, but not lower Wolverine Creek.

Correlation analysis indicated a relationship between specific conductivity and both percent chironomid and EPT, and a relationship between substrate size) and percent chironomid and EPT. These relationships suggested that community composition could be more likely influenced by habitat condition and substrate than specific conductivity. The fact that the last date of discharge was June 1, 2021 and that water quality met CWQGs and SSWQOs (except for fluoride which was greater than CWQG at all areas and in Minto Creek during baseline sampling) further suggests that differences may not have been related to the mine.

High temporal variability in benthic invertebrate community density, richness, and composition has been observed at the exposed and reference areas, presumably due to inter-annual variability in environmental conditions (e.g., flow, ice scour, water levels). Benthic invertebrate densities in 2021 at lower Minto Creek and lower Big Creek were some of the highest they have been over the 2012 to 2021 period. Chironomid proportion in 2021 at lower Minto Creek remained high compared to previous years but was not significantly different from 2020. Percent EPT at lower Minto Creek remained low compared to prior years and was higher than in 2020. Overall, the benthic invertebrate community of lower Minto Creek was generally similar to reference in 2021 (based on density, richness, Simpson's Evenness, and Simpson's diversity). However, the high proportion of chironomids and low proportion of EPT taxa at lower Minto Creek relative to reference and previous years suggests subtle mine influence may have occurred over time in combination with habitat conditions and low water flows.

6 TISSUE CHEMISTRY

6.1 Overview

As indicated in Section 2.6, tissue chemistry data are provided here simply to report the ancillary data collected along with the selenium data reported separately. Data interpretation was therefore limited to basic comparisons of metal concentrations in tissue collected at the exposure area (lower Minto Creek) to those collected at reference creeks (lower Wolverine and lower Big creeks).

6.2 Periphyton Tissue

The quality of periphyton tissue chemistry data, assessed prior to data analysis and interpretation, was assessed as good based on analyte detectability, precision, and accuracy (Appendix A). Concentrations of selenium were significantly greater at lower Minto Creek than at lower Wolverine Creek and lower Big Creek reference areas (Figure 6.1, Table 6.1; Appendix Table C.2). Concentrations of copper and manganese were significantly greater at lower Minto Creek than lower Wolverine Creek but not lower Big Creek (Table 6.1; Appendix Table C.2). Beryllium, vanadium, and zirconium were significantly lower at Minto Creek compared to both reference areas.

Selenium concentrations in periphyton tissue in 2021 were lower than those in 2020 at lower Minto Creek. Over the 2013 to 2021 period, periphyton selenium concentrations were significantly greater than both reference areas for all years except for 2013 (greater than lower Wolverine Creek only) and 2017 (greater than lower Big Creek only; Figure 6.1, Table 6.2). Selenium concentrations in periphyton tissue have varied over the years but have not changed significantly since 2013 for lower Minto Creek and 2017 for lower Wolverine Creek (Table 6.2). Significantly higher concentrations of selenium at lower Minto Creek compared to both reference areas over the last three years could suggest an influence of the mine on Minto Creek. However, the last discharge from the mine was June 1, 2021 (i.e., over three months before the AEMP field campaign), and benthic invertebrate tissue metals analysis did not reflect the same effects. This suggests that selenium concentrations in periphyton tissue are likely influenced by other factors.

6.3 Benthic Invertebrate Tissue

Benthic invertebrate tissue data quality, assessed prior to data analysis and interpretation, were judged to be of good quality based on analyte detectability, precision, and accuracy (Appendix A). Rubidium, selenium, and zinc concentrations were significantly lower at Minto Creek than lower Wolverine and Big creeks. Calcium was significantly higher at lower Minto Creek than lower Wolverine Creek, but not lower Big Creek (Table 6.1, Appendix Table C.3). Concentrations of

P-value < 0.05.
MOD > 0.
MOD < 0.

Notes: "-" indicates analysis was not completed because all data was below the LRL. ns = not significant. ANOVA = analysis of variance. K-W = Kruskal-Wallis test. All values are expressed in mg/kg dry weight. LWC = lower Wolverine Creek, LBC = lower Big Creek, LMC = lower Minto Creek.

[a] Measure of Central Tendency is the mean for parameters where statistics were conducted on the raw scale, the geometric mean when statistics were $\log_{10}$ transformed to meet the assumptions of normality, and the median when rank transformed.

[b] Magnitude of difference (MOD) = $(MCT_{EXP}-MCT_{REF})/MCT_{REF}$ *100.

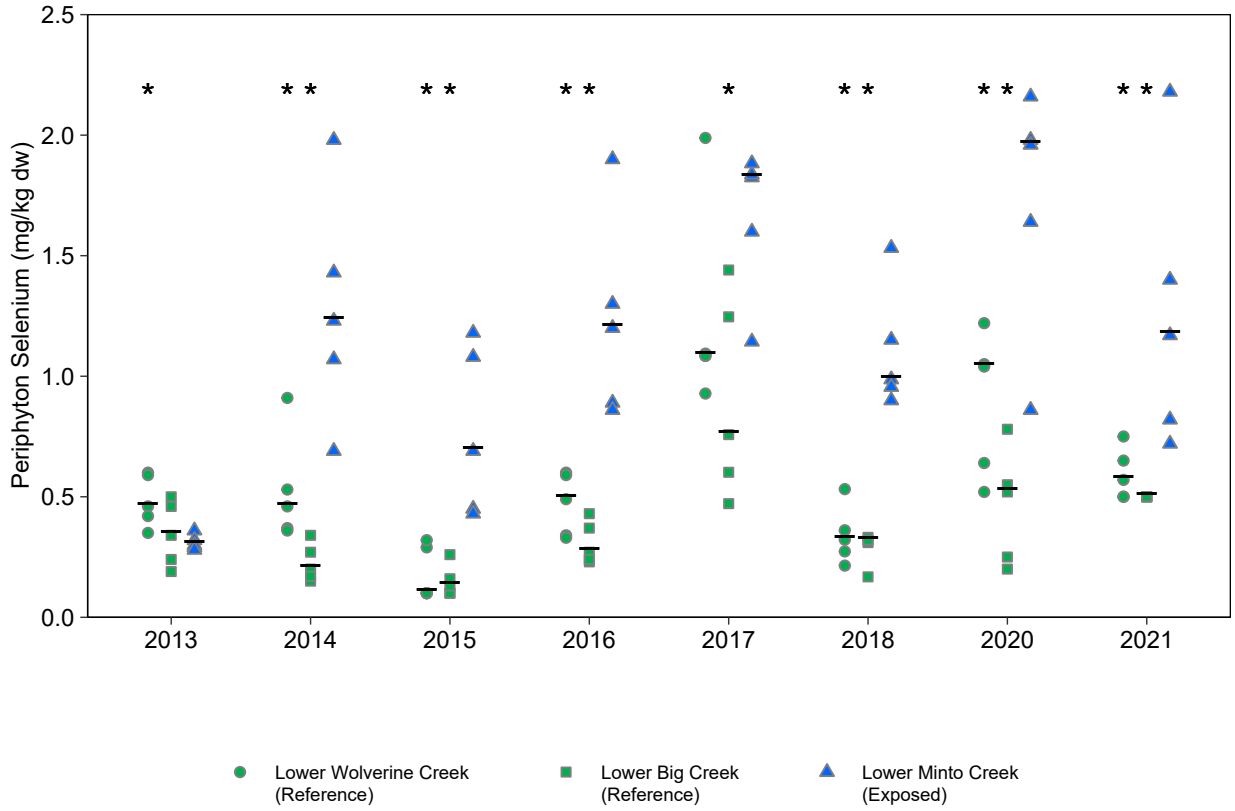

Figure 6.1: Periphyton Tissue Selenium Concentrations Over Time, Minto Mine AEMP, 2013 to 2021[a]

Notes: dw = dry weight. Black horizontal bars indicate the Measure of Central Tendency (MCT). The MCT is the mean for non-transformed data, geometric mean for $\log_{10}$ transformed data and median for rank transformed data. An * indicates the reference station was significantly different from the exposed station for that year. All 2021 results at Lower Big Creek were below the laboratory reporting limit (0.5 mg/kg).

[a] Due to dry conditions at lower Minto Creek in 2019, sampling was not conducted.

P-value < 0.05.
Magnitude of Difference (MOD) > 0.
Magnitude of Difference (MOD) < 0.

Notes: "-" indicates no data for comparison, "ns" indicates a non-significant contrast.

[a] Years that do not share a letter were significantly different in a Tukey's Honestly Significant Difference post-hoc test ($\alpha = 0.05$).

[b] MOD = $(MCT_{LMC}-MCT_{LWC})/MCT_{LWC}$ *100; where the measures of central tendency (MCT) were medians for rank-transformed and back-transformed estimated marginal means for log_{10} transformed data.

copper, another analyte of interest, were significantly lower at lower Minto Creek compared to concentrations at lower Big Creek in 2021 (Table 6.1).

Selenium concentrations at the reference areas were higher in 2021 than those in 2018 (Figure 6.2, Appendix Table C.3), but not significantly different than those in 2020 (Table 6.2). Over the 2013 to 2021 period, selenium concentrations in benthic invertebrate tissue at lower Minto Creek have not changed significantly, with the exception of higher concentrations in 2020. Historically, selenium concentrations at lower Minto Creek have been significantly higher than lower Big Creek, with the exception of 2014 and 2020, when there were no significant differences between lower Minto Creek and lower Big Creek. Concentrations of selenium in benthic invertebrate tissue from lower Minto Creek have only been statistically different than selenium concentrations in lower Wolverine Creek from 2015 to 2017 and 2021 (Figure 6.2, Table 6.2). With the exception of one sample (LWC-4), selenium concentrations were below the interim guideline (4 mg/kg dry weight; BCMOE 2014). Since concentrations of selenium in benthic invertebrate tissue collected from lower Minto Creek were lower than at both reference areas, and were below the BCMOE interim guideline, mine influence, if any, is limited and not ecologically meaningful.

In 2021, the mean copper concentration in benthic invertebrate tissue from lower Minto Creek was not significantly different from that at lower Wolverine Creek and was significantly lower when compared to lower Big Creek (Figure 6.2, Table 6.1). Since 2013, mean copper concentrations at lower Minto Creek have varied, with the highest result in 2017 and lowest value in 2021. Copper concentrations in 2021 were similar to those in 2016, 2018, and 2020. Copper concentrations at lower Wolverine have not changed significantly since 2013, while concentrations at lower Big Creek have decreased from since 2020 but remain comparable to results in 2013, 2014, and 2016 to 2018 (Figure 6.2, Table 6.2). Variability in concentrations of copper in benthic invertebrate tissue has been high over the years. In 2013 and 2015 to 2017, copper was significantly higher in benthic invertebrates from lower Minto Creek compared to lower Wolverine Creek. However, in 2014 and 2018 to 2021, copper was not significantly different between areas (Figure 6.2, Table 6.2). Copper concentrations at lower Minto Creek compared to lower Big Creek were significantly lower in 2014, 2015, 2020, and 2021, significantly higher in 2017, and nonsignificant in 2013, 2016, and 2018 (Figure 6.2). This lack of consistency suggests that observed differences primarily represent natural variability.

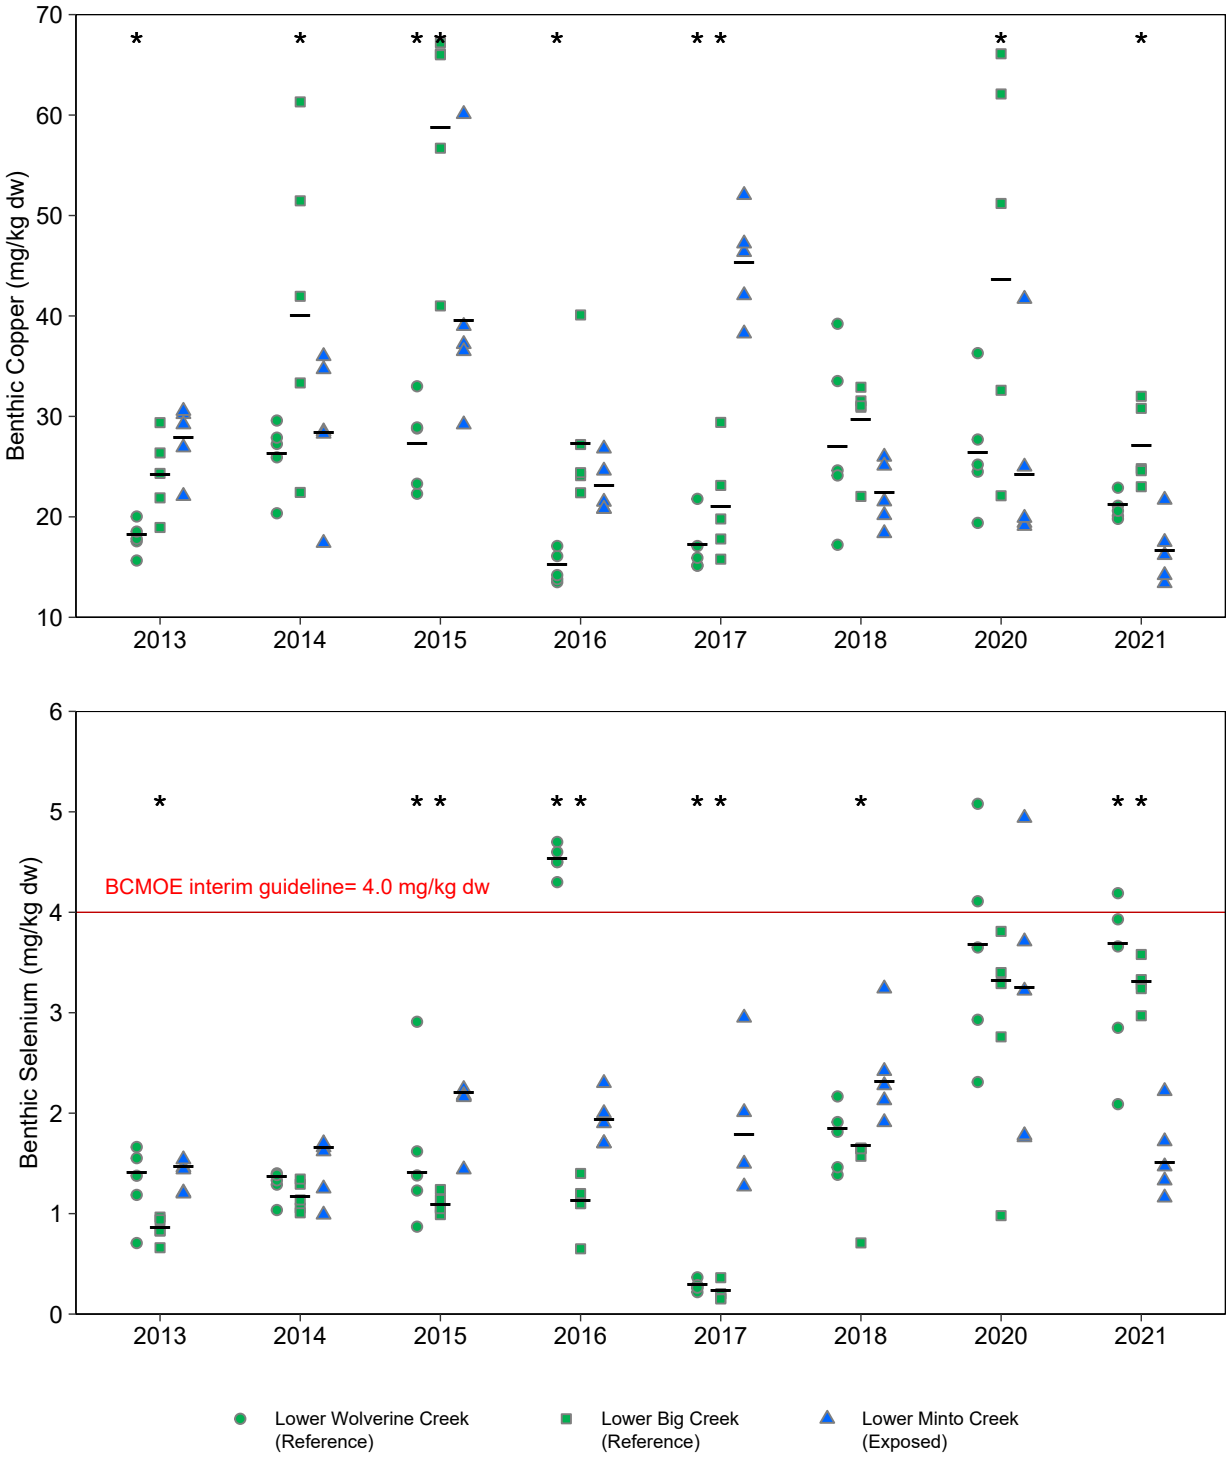

Figure 6.2: Benthic Tissue Copper and Selenium Concentrations, Minto Mine AEMP, 2013 to 2021[a]

Notes: dw = dry weight. British Columbia (BC) Benthic Invertebrate Tissue Guideline for Selenium is shown with a red line (4 µg/g dw BCMOE 2014). Black horizontal bars indicate the Measure of Central Tendency (MCT). The MCT is the mean for non−transformed data, geometric mean for log_{10} transformed data and median for rank transformed data. An * indicates the reference station was significantly different from the exposed station for that year.

[a] Due to dry conditions at lower Minto Creek in 2019, sampling was not conducted.

7 CONCLUSIONS AND RECOMMENDATIONS

7.1 Conclusions

The Sediment, Periphyton, and Benthic Assessment component of the Minto Mine AEMP evaluated potential mine related effects to Minto Creek. Water quality (field measures and chemistry), sediment quality (chemistry), periphyton tissue chemistry, and benthic invertebrates (community and tissue chemistry) of Minto Creek were evaluated relative to reference creeks and previous data.

Supporting *in situ* field measures collected in September 2021 indicated relatively good Minto Creek water quality. Higher conductance and pH values were observed in Minto Creek compared to reference areas, suggesting a minor influence from the Minto Mine not associated with active discharge. All water quality measures met CWQGs and WUL objectives for the protection of aquatic life except for fluoride. Fluoride was above the CCME long term water quality guideline at all areas and was also higher at the exposed areas relative to reference areas. Alkalinity and chloride concentrations at exposed areas were more than 2x the concentrations found in reference areas. Total copper, which has historically exceeded the CWQG at upper and lower exposed areas (upper Minto Creek and lower Minto Creek) and at two of three reference areas (upper McGinty Creek and lower Wolverine Creek, but not lower Big Creek), was below the CWQG in 2021. Copper concentrations decreased with distance from the mine (from upper Minto Creek to lower Minto Creek). Dissolved copper concentrations were well below the WUL SSWQO, as observed in all previous years of monitoring.

In 2021, both lower Minto Creek and lower Wolverine Creek were mesotrophic based on periphyton chlorophyll-a (mg/m^2; Dodds et al. 1998). Trophic status has varied between oligotrophic and mesotrophic over time at both lower Minto Creek and lower Wolverine Creek (Minnow 2019a, Minnow 2021a).

Concentrations of metals in upper Minto Creek sediments were generally higher than those in McGinty Creek sediments but lower than the SQGs for the protection of aquatic life (CCME 1999), with the exception of arsenic (which exceeded ISQG) and copper (which exceeded ISQG [and PEL for one sample]). Copper concentrations at upper Minto Creek remained less than 2x the concentration at Upper McGinty Creek. Metal concentrations in lower Minto Creek sediments were generally similar to those in lower Wolverine Creek with the exception of arsenic, copper, and manganese (of which arsenic and copper were greater than ISQG but lower than PEL). Copper concentrations at both upper Minto and lower Minto Creek have been statistically higher than their respective reference areas since 2011 and 2013, respectively. Although concentrations of arsenic and copper in both upper and lower Minto Creek exceeded

sediment quality guidelines, temporal analyses of copper concentrations indicate that there has not been a significant increase in copper over the years at either upper or lower Minto Creek.

The erosional benthic invertebrate community of lower Minto Creek showed no significant difference in richness (number of taxa), Simpson's Evenness, or Simpson's Diversity when compared to either lower Wolverine Creek or lower Big Creek. Density at lower Minto Creek was significantly higher compared to lower Wolverine Creek but there was no significant difference between lower Minto Creek and lower Big Creek. Bray-Curtis index was the only primary endpoint that differed significantly between lower Minto Creek and both reference areas. Examination of taxon proportions indicated significant differences in percent chironomids (higher), percent EPT (lower), and percent Plecoptera (lower) of Minto Creek relative to reference. Although there were differences in the proportions of chironomids and EPT taxa between lower Minto Creek and both reference areas, correlation analysis suggested that this was likely due to a combination of factors, including habitat differences among areas and Minto Mine influence on water quality, and possibly low flow conditions in July (that would have affected lower Minto Creek more than the larger reference creeks).

High temporal variability in benthic invertebrate community density, richness, and composition has been observed at the exposed and reference areas, presumably due to inter-annual variability in environmental conditions (e.g., flow, ice scour, water levels). Benthic invertebrate densities in 2021 at lower Minto Creek and lower Big Creek were some of the highest over the 2012 to 2021 period. Chironomid proportion in 2021 at lower Minto Creek remained high compared to previous years but was not significantly different from 2020. Percent EPT at lower Minto Creek remained low compared to prior years and was higher than in 2020. Overall, the benthic invertebrate community of lower Minto Creek was generally similar to reference in 2021 (based on density, richness, Simpson's Evenness, and Simpson's diversity). However, the high proportion of chironomids and low proportion of EPT taxa at lower Minto Creek relative to reference and previous years suggests a subtle mine influence in combination with an influence of habitat conditions and low water flows.

Mean concentrations of selenium in periphyton tissue collected at lower Minto Creek were significantly higher than at both reference areas while mean concentrations of copper were only significantly higher compared to lower Wolverine Creek. Selenium concentrations in benthic invertebrate tissue at lower Minto Creek were lower than both reference areas, while mean copper concentrations were lower than lower Big Creek and not significantly different than lower Wolverine Creek. All benthic invertebrate tissue selenium results were below the guideline for the protection of aquatic life, except for one sample at Lower Wolverine Creek reference. Since concentrations of selenium in benthic invertebrate tissue collected from lower Minto Creek

were lower than at both reference areas and were below the BCMOE interim guideline, mine influence, if any, is limited and not ecologically meaningful.

7.2 Recommendations

Based on the results and conclusions of the 2021 Minto Mine Sediment, Periphyton, and Benthic Assessment, it is recommended that the program is repeated in 2022. It is also recommended that flow conditions are monitored and communicated prior to fall field work such that program adjustment can be made as early as possible if drying is observed (as in 2019).

A1 INTRODUCTION

A1.1 Background

A variety of factors can influence the physical, chemical, and biological measurements made in an environmental study and thus affect the accuracy and/or precision of the data. Depending on their magnitude, both inaccuracy and imprecision have the potential to affect the reliability of conclusions made from the data. Therefore, it is important to ensure that programs incorporate appropriate steps to control the non-natural sources of data variability (i.e., minimize the variability that does not reflect natural spatial and/or temporal variability in the environment).

Data quality, as a concept, is meaningful only when it relates to the intended use of the data. That is, one must know the context in which the data will be interpreted to establish a relevant basis for judging whether the data set is adequate. A Data Quality Review (DQR) involves comparisons of field and laboratory measurement performance to Data Quality Objectives (DQOs) established for a particular study, such as evaluation of Laboratory Reporting Limits (LRLs), blank sample data, data precision (based on field and laboratory duplicate samples), and data accuracy (based on matrix spike recoveries and/or analysis of standards or certified reference materials [CRM]).

Trusted analytical laboratories certified by Canadian Association for Laboratory Accreditation (CALA) with a rigorous internal quality assurance program were selected to ensure the highest possible data quality. DQOs were established *a priori* to reflect reasonable and achievable performance expectations. Programs involving many samples and analytes often yield some results that exceed DQOs. This is particularly so for multi-element scans because the analytical conditions are not necessarily optimal for every element included in the scan.

This DQR was conducted on laboratory data reported in 2021 for samples collected in support of the 2021 Minto Aquatic Effects Monitoring Program (AEMP). The objective of the DQR was to define the overall quality of the data, and, by extension, the confidence with which the data can be used to derive conclusions. The intent of the DQR is not to reject measurements that did not meet a DQO, but to ensure that questionable data received more scrutiny to determine what effects, if any, were had on interpretation of results within the context of the project.

A1.2 Laboratory Reporting Limits

A LRL is the lowest concentration of an analyte that can be reported with a reasonable degree of accuracy and precision and is ideally synonymous with the lower limit of quantitation (LLOQ). The LLOQ is the lowest concentration of an analyte that can be reliably measured within specific limits of precision and accuracy during routine operating conditions, as opposed to being detected

which, in most cases, is the lowest concentration on the calibration curve. The LRL is typically three to ten times the method detection limit (MDL); however, some guidelines are so low the LRL is equal to the MDL to meet the guideline. Achieving satisfactory LRLs is important when comparing concentrations to guidelines for that medium. If the LRL is above the guideline, the data cannot be accurately interpreted. Consistency is also important for LRLs when taking consecutive samples. Changes in LRLs between laboratory reports can affect summary calculations and introduce confounding factors when assessing trends. For the present study, LRLs were screened against guidelines as appropriate.

A1.3 Quality Control Samples

Typically, a DQR involves the examination of analytical results associated with several types of Quality Control (QC) samples collected (or prepared) in the field and laboratory. Quality control samples collected for this project, and a description of each QC sample type, are as follows:

- **Blanks** are samples of de-ionized water and/or appropriate reagent(s) that are handled and analyzed in the same way as regular samples. These samples reflect contamination of samples occurring in the field (in the case of field or travel blanks) or in the laboratory (in the case of laboratory or method blanks). Concentrations of analytes should be below the LRL.
- **Laboratory Duplicates** are replicate sub-samples created in the laboratory from randomly selected field samples which are sub-sampled and then analyzed independently using identical analytical methods. The laboratory duplicate sample results reflect variability introduced during laboratory sample handling and analysis and thus provide a measure of laboratory precision.
- **Field Duplicates** are samples collected from a randomly selected field station that are homogenized to the extent possible, split, and analyzed separately in the laboratory. The duplicate samples are handled and analyzed in an identical manner in the laboratory. These samples reflect variability introduced during the handling of field samples (e.g., during homogenization), both in the field and laboratory, and therefore provide a measure of field sampling and laboratory precision.
- **Matrix Spike Recovery Samples (MS)** are created in the laboratory by adding a known amount/concentration of a given analyte (or mixture of analytes) to a randomly selected field sample previously divided to create two sub-samples. The spiked and regular sub-samples are then analyzed in an identical manner. The spike recovery represents the difference between the measured spike amount (total amount in the spiked sample minus the amount in the original sample) relative to the known spike amount

(as a percentage). The analysis of spiked samples provides an indication of the accuracy of analytical results.

- **RM** are commercially-prepared (or commercially-homogenized) reference materials containing known chemical concentrations that are processed and analyzed along with batches of environmental samples. The sample results are then compared to target results to provide a measure of analytical accuracy. The results are reported as the percent of the known concentration that was recovered in the analysis.
- **LCS** are laboratory control samples created in the laboratory to have a known analyte concentration in a matrix free of interferences, such as deionized water or reference sand, and processed in a method identical to test samples. The sample results are compared to the target results to confirm that the analytical method is accurate in a purified reference sample. The results are reported as the percent of the known concentration that was recovered in the analysis.
- **Organism Recovery Checks** for benthic invertebrate community samples involves the reprocessing of previously sorted material from a randomly selected sample to determine the number of invertebrates that were not recovered during the original sample processing. The reprocessing is conducted by an analyst not involved during the original processing to reduce bias. This check allows the determination of accuracy through assessment of recovery efficiency.
- **Sub-sampling error** is assessed for studies in which benthic invertebrate community samples require sub-sampling (due to excessive sample volume and/or invertebrate density). By comparing the numbers of benthic invertebrates recovered between at least two sub-samples, this measure provides an evaluation of how effective the sub-sampling method was in evenly dividing the original sample. Therefore, sub-sampling error provides a measure of analytical accuracy and precision. The processing of entire benthic invertebrate community samples in representative sample fractions also allows an evaluation of sub-sampling accuracy.

A2 WATER CHEMISTRY

A2.1 Laboratory Reporting Limits

The analytical reports for water chemistry from ALS Environmental (ALS; see laboratory report WR2101263 in Appendix C) were examined to assess LRLs relative to analyte concentrations and applicable guidelines (Table A.1). The LRLs for water quality analytes were assessed relative to Canadian Council of Ministers of the Environment Water Quality Guidelines (CCME 1999) and Water Use License (WUL) Objectives.

Several analytes were reported at concentrations below the LRL in 100% of samples (Table A.1). For those analytes with one or more results below the LRL, achieved LRLs were consistently lower than the CCME water quality guidelines and WUL Objectives. Overall, the achieved LRLs were appropriate for this study.

A2.2 Laboratory and Field Blanks

A total of 17 method blank samples for water chemistry were analyzed by ALS (see laboratory report WR2101263 in Appendix C). Of the 96 individual analyte results, all were below the LRL except for conductivity and total alkalinity. Conductivity was within ALS' DQO and was considered acceptable. Total alkalinity exceeded the ALS DQO, but associated samples were considered acceptable as they were > 5x blank levels (1.5 mg/L).

One field blank sample was submitted for water chemistry analyses to assess the potential for field sampling contamination (Table A.2). The same DQOs that were used for laboratory blanks were also used for field blanks (i.e., concentrations should be < LRL). Analyte results for the field blank were below the LRL except for total aluminum, barium, iron, magnesium, manganese, and strontium (Table A.2). The laboratory verified these results with repeat analysis and results that were greater than the LRL were less than 5-times the LRL (except for manganese [less than 10-times]), suggesting minimal field contamination of samples.

A2.3 Data Accuracy and Precision

Data accuracy for water chemistry analyses were evaluated based on results for 18 laboratory control samples (LCS), four matrix spike (MS) samples, and one reference material (RM) sample (see laboratory report WR2101263 in Appendix C). All 99 LCS individual analyte results, 82 (of 93) MS analyte results (out of 93), and all (1) RM result met the laboratory DQO. Eleven MS results could be determined due to background levels >= 1x spike level for the following analytes: total organic carbon, total inorganic carbon, dissolved organic carbon, and total barium, calcium, magnesium, manganese, potassium, sodium, strontium, and sulfur.

Notes: One field blank sample was collected in 2021. LRL = Laboratory Reporting Limit.

None of the analytes that were non-detect in the MS were analytes of concern. Therefore, the overall accuracy achieved by the laboratory was considered suitable for the project.

Analytical precision of water chemistry analyses was evaluated by examining a total of 17 laboratory duplicate samples for a total of 100 comparisons (see laboratory report WR2101263 in Appendix C). For all paired samples, concentration comparisons were within the DQO set by the analytical laboratory.

One set of field duplicate samples was collected to assess field sampling precision of water chemistry (Table A.3). Relative percent differences (RPDs) between field duplicate samples for most analytes (95.0%) was below 30%. RPDs between samples for dissolved phosphorus, total cadmium and phosphorus, and dissolved selenium and titanium were greater than 30%. In the cases of total cadmium and phosphorus and dissolved titanium, higher RPDs between paired results were due to one concentration being below the LRL, where greater variability among paired results is anticipated. However, neither concentration for dissolved selenium was below the LRL, suggesting significant variability in dissolved selenium concentrations between samples that could be compensated for in future studies by a greater degree of replication. Overall, as only 5.0% of all sample RPDs exceeded 30%, field sampling precision for water chemistry was considered acceptable for the purposes of this study.

A2.4 Hold Times

Recommended hold times for pH were exceeded for all water chemistry samples prior to receipt of samples by ALS (see laboratory report WR2101263 in Appendix C) but was expected as the hold times was 0.25 h which is not feasible to meet while working in the field. Field measures of pH were used in all analyses, so hold time exceedances does not affect the interpretability of results. The recommended hold times for turbidity, nitrate, and nitrite were exceeded in two samples (URC and LWC) by one day. Exceedances for hold times for this subset of constituents is not expected to affect data interpretation. All other recommended hold times were met for all samples.

A2.5 Data Quality Statement

Water chemistry data collected for the 2021 Minto AEMP were of acceptable quality as characterized by good detectability, concentrations were below LRLs in a majority of method blank samples, good laboratory precision and accuracy, and acceptable field sampling precision. Recommended hold times were met for most analytes in most samples. Therefore, the associated data are considered acceptable for this study.

Table A.3: Field Duplicate Results for Water Chemistry Analyses

Indicates RPD exceeded 30%.

Notes: RPD = relative percent difference. LRL = laboratory reporting limits. Where one of the values was <LRL, the RPD was calculated using the value of the LRL. The RPD was not calculated if both results were < LRL. "-" = no data/not calculated.

A3 SEDIMENT CHEMISTRY

A3.1 Laboratory Reporting Limits

The analytical reports for sediment chemistry from ALS (see laboratory report WR2101265 in Appendix C) were examined to assess LRLs relative to applicable guidelines (Table A.4). The LRLs for these analytes were assessed relative to existing Canadian Sediment Quality Guidelines (CCME 1999). The LRL for zirconium in one sample was raised due to sample matrix effects, such as chemical interference. Three analytes were reported below the LRL in 100% of samples (bismuth, tin, and tungsten; Table A.4). However, there are no applicable guidelines for sediment quality for the three analytes listed above (CCME 1999). For analytes with applicable guidelines, all LRLs were below guidelines. Therefore, LRLs were overall appropriate for the present study.

A3.2 Laboratory Blanks

A total of 10 method blank samples for sediment chemistry were analyzed by ALS (see laboratory report WR2101265 in Appendix C), consisting of 78 individual analyte results. All reported method blank results were within the laboratory DQO. Thus, the method blank results for this study indicated no inadvertent contamination of sediment samples within the laboratory during analysis.

A3.3 Data Accuracy and Precision

Data accuracy for sediment chemistry analyses completed by ALS was evaluated based on the analysis of 10 RM samples and 10 LCS samples (see laboratory report WR2101265 in Appendix C). All 68 RM and 78 LCS results met the laboratory DQO. Therefore, the accuracy achieved by the laboratory was considered excellent.

Analytical precision of sediment chemistry analyses completed by ALS was evaluated by examining two laboratory duplicate samples for metals and four laboratory duplicate samples for physical tests and organic/inorganic carbon (see laboratory report WR2101265 in Appendix C). Relative percent differences (RPDs) between laboratory duplicate samples failed to meet the laboratory DQO in 20% of samples due to sample heterogeneity. As ALS believed the significant differences between laboratory duplicates were due to sample heterogeneity rather than differences in analytical precision in recovery, laboratory precision was considered good.

One set of field duplicate samples was collected to assess the precision of field sampling of sediment chemistry (Table A.5). Samples were collected as split samples (i.e., a larger sample was homogenized and then split into two duplicate sub-samples), and as such some variability

Table A.4: Laboratory Reporting Limit (LRL) for Sediment Chemistry Analyses

Parameter	Units	CSQG		No. LRLs > ISQG	No. LRLs > PEL	Range of LRLs	No. Sample Results < LRL
		ISQG	PEL				
Physical Tests							
% Gravel (>2mm)	%	-	-	-	-	1.0	11 (92%)
Total Metals							
Bismuth	mg/kg	-	-	-	-	0.20	20 (100%)
Boron	mg/kg	-	-	-	-	5.0	19 (95%)
Selenium	mg/kg	-	-	-	-	0.20	1 (5%)
Silver	mg/kg	-	-	-	-	0.10	15 (75%)
Sulphur	mg/kg	-	-	-	-	1000	18 (90%)
Thallium	mg/kg	-	-	-	-	0.050	1 (5%)
Tin	mg/kg	-	-	-	-	2.0	20 (100%)
Tungsten	mg/kg	-	-	-	-	0.50	20 (100%)
Zirconium	mg/kg	-	-	-	-	1.0 to 2.0	1 (5%)

Notes: Only analytes with one or more sample results < LRLs or with an LRL greater than guidelines are displayed. The total number of samples was n = 20, except particle size (% gravel), which was n = 5. CSQG = Canadian Sediment Quality Guidelines; ISQG = interim sediment quality guideline; PEL = probable effect level (CCME 2014). LRL = Laboratory Reporting Limit; "-" = no applicable guideline exists.

Table A.5: Field Duplicate Results for Sediment Chemistry Analyses

Parameter	Units	LWC-3	LWC-3X	RPD (%)

Indicates RPD exceeded 30%.

Notes: RPD = relative percent difference. LRL = laboratory reporting limits. Where one of the values was <LRL, the RPD was calculated using the value of the LRL. The RPD was not calculated if both results were < LRL. "-" = no data/not calculated.

was expected based on the inherent heterogeneity of sediments. Relative percent differences (RPDs) were greater than 30% for 8.2% of comparisons (loss on ignition, total carbon, total organic carbon, and organic matter). Where the RPD exceeded 30%, the laboratory reporting limit was not a cause (i.e., all results were above the LRL). Disagreement between these samples could be a resultant of clumps of organic matter that were not split evenly between the two field samples. Additionally, the transfer of sample material from one container (i.e., the bin in which the samples were homogenized) to another (i.e., the sample jar or bag) may introduce variability (Weiner 2013). Overall, the overall precision of field sampling was considered good.

A3.4 Hold Times

Recommended hold times were met for all sediment samples.

A3.5 Data Quality Statement

Sediment chemistry data collected for the present study were of acceptable quality as characterized by appropriate LRLs, negligible analyte concentrations in method blanks, good laboratory precision and accuracy, and good field sampling precision. Overall, the associated data were considered acceptable for this study.

A4 BENTHIC INVERTEBRATE COMMUNITY

A4.1 Sub-sampling

The analytical laboratory reports for benthic invertebrate community structure from Cordillera Consulting Inc. (see Appendix D for laboratory reports) were examined to assess sub-sampling accuracy. Canadian Aquatic Biomonitoring Network (CABIN) protocols were followed for sub-sampling (i.e., a minimum count of 300 invertebrates). Five benthic invertebrate community structure samples were analyzed in entirety. The remaining 10 benthic invertebrate community samples were subsampled, with percent of total sample volume subsampled ranging from 25 to 75% (Table A.6).

A4.2 Organism Sorting Efficiency

To measure the effectiveness of the sorters, at least 10% of samples were selected at random for resorting analysis by a different sorter (n = 2). Sorting efficiency (i.e., percent recovery) of benthic invertebrate samples was excellent, achieving an average of 95.5% for the community structure samples assessed (Table A.7). Recovery in quality control samples was above the laboratory's DQO (≥ 90%), so organism sorting efficiency was considered good.

A4.3 Subsampling Precision and Accuracy

One sample was randomly chosen for sub-sample assessment to evaluate the consistency of organism recovery between subsamples. Both the precision and accuracy of the sub-sample met the DQO in all cases (< 20% average divergence in organism counts between subsamples; Table A.8). Thus, the precision and accuracy for sub-sampling of the benthic invertebrate community samples was considered good.

A4.4 Taxonomic Identification Accuracy

The laboratory performed an internal audit of taxonomic identification for roughly 10% of all samples (n = 2; Table A.9). The analysts reported total identification error rate (TIR) of 0% in both samples, percent difference in enumeration (PDE) of 0.117 to 0.204%, percent taxonomic disagreement (PTD) of 0.408 to 0.468%, and Bray Curtis Dissimilarity Index (BCDI, a measure of the differences in identifications between different analysts) of 0.002 to 0.004; Table A.9). The laboratory DQO was based on TIR as per CABIN laboratory methods (< 5% TIR; Environment Canada 2014). Since TIR was below 5% for all samples, the taxonomic accuracy of the analysis was considered excellent.

Table A.6: Sub-Sampling Percentages and Total Organism Recovery for Benthic Invertebrate Community Samples

Sample ID	Date	Laboratory ID	% Sampled	# Invertebrates
LMC-1	10-Sep-21	CC221139	50.0	426
LMC-2	9-Sep-21	CC221140	30.0	332
LMC-3	9-Sep-21	CC221141	31.3	348
LMC-4	9-Sep-21	CC221142	100	179
LMC-5	9-Sep-21	CC221143	25.0	370
LWC-1	12-Sep-21	CC221144	100	244
LWC-2	12-Sep-21	CC221145	100	100
LWC-3	12-Sep-21	CC221146	75.0	301
LWC-4	12-Sep-21	CC221147	100	326
LWC-5	11-Sep-21	CC221148	75.0	373

LBC-5	14-Sep-21	CC221153	50.0	417

Table A.7: Organism Recovery Results for Benthic Invertebrate Community Samples

Sample ID	Laboratory ID	Number of Organisms Recovered (Initial Sort)	Taxon	Number of Organisms in Re-sort	% Efficiency
LBC-2	CC221150	351	Chironomidae	4	95.0
			Ephemeroptera	4	
			Diptera	1	
			Plecoptera	3	
			Trichoptera	2	
			Oligochaeta	2	
LMC-4	CC221142	179	Plecoptera	1	96.0
			Chironomidae	6	
				Average Recovery	**95.5**

Notes: As sorting progressed, 10% of samples were randomly chosen by senior members of the sorting team for resorting. All sorters working on a project had at least one sample resorted by another sorter. An efficiency of 90% was expected. If 90/ 95% efficiency was not met, samples from that sorter were re-sorted. To calculate sorting efficiency the following formula was used: (# organisms missed / total organisms found) x 100.

Table A.8: Sub-sampling Precision and Accuracy Error for Benthic Invertebrate Community Samples

Laboratory ID	Sample ID	# of Organisms in Subsample		Total # of Organisms	Precision Error (%)	Accuracy Error (%)
Subsample #		1	2			
CC221139	LMC-1	416	428	844	2.80	1.42

Table A.9: Taxonomic Quality Control Results for Benthic Invertebrate Community Samples[a]

Sample ID	Laboratory ID	Taxa Identified	TIR	PDE	PTD	BCDI
LMC-1	CC221139	427	0	0.117	0.468	0.004
LWC-1	CC221144	245	0	0.204	0.408	0.002

Notes: TIR = Total Identification Error Rate, PDE = Percent Difference in Enumeration, PTD = Percent Taxonomic Disagreement, BCDI = Bray Curtis Dissimilarity Index to quantify differences in identifications.

[a] For error rationale and calculations, refer to laboratory report (Appendix D).

A4.5 Data Quality Statement

Benthic invertebrate community structure data were of acceptable quality as characterized by good sorting efficiency, subsampling precision and accuracy, and excellent taxonomic identification accuracy. Therefore, the associated data can be used with a high level of confidence in the derivation of conclusions.

A5 BENTHIC INVERTEBRATE TISSUE CHEMISTRY

A5.1 Laboratory Reporting Limits

Analytical reports of benthic invertebrate tissue moisture and metal concentrations from ALS (see laboratory report WR2101266 in Appendix C) were examined to provide an inventory of analyte results below the LRL and to compare LRLs available benchmarks (Table A.10). Six analytes had results below the LRL including antimony, bismuth, boron, lithium, tellurium, and tin. Only tellurium and tin (dry and wet weight) were below detection in all samples. However, the only analyte with a guideline, selenium (BCMOE 2014), was detectable in all samples. Therefore, despite some results being below the LRL, LRLs were overall appropriate for the present study.

A5.2 Laboratory Blanks

Two method blank samples for benthic invertebrate tissue chemistry were analyzed by ALS (see laboratory report WR2101266 in Appendix C), consisting of 69 individual analyte results. All reported method blank results were within the laboratory DQO. Thus, the method blank results for this study indicated no inadvertent contamination of sediment samples within the laboratory during analysis.

A5.3 Data Accuracy and Precision

Data accuracy and precision were evaluated based on the analysis of one RM sample and two LCS samples (see laboratory report WR2101266 in Appendix C). All 56 results for the RM sample and 69 results for LCS samples met the laboratory DQO. Therefore, laboratory accuracy and precision can be considered excellent.

One set of field duplicate samples was collected to assess the precision of field sampling of benthic invertebrate tissue chemistry (Table A.11). Relative percent differences (RPDs) were greater than 30% for 59.3% of all dry weight comparisons. Lithium was the only comparison that had one concentration below the LRL, where greater variability among paired results is anticipated. These differences are likely due to heterogeneity in sampling and highlight the need for replication at a sampling location.

A5.4 Hold Times

Recommended hold times were met for all benthic invertebrate tissue samples.

Table A.10: Laboratory Reporting Limit (LRL) Evaluation for Benthic Invertebrate Tissue Chemistry Analyses

Parameter	Units	Range of LRLs	No. Sample Results < LRL
Metals			
Antimony	mg/kg dw	0.02	1 (6.67%)
Bismuth	mg/kg dw	0.01	10 (66.7%)
Boron	mg/kg dw	1	3 (20%)
Lithium	mg/kg dw	0.5	6 (40%)
Tellurium	mg/kg dw	0.02	15 (100%)
Tin	mg/kg dw	0.1	15 (100%)

Notes: LRL = Laboratory Reporting Limit. mg/kg dw = milligrams per killogram dry weight. Only analytes with one or more sample results < LRL are displayed. The total number of samples analyzed (n) was 15. LRLs were below applicable guidelines for selenium.

Table A.11: Field Duplicate Results for Benthic Invertebrate Tissue Analyses

Parameter	Units	LWC-3-BIT	LWC-3X-BIT	RPD (%)
Physical Tests				
Moisture	%	87.5	85.2	2.70
Metals				
Aluminum	mg/kg dw	436	1030	81.0
Antimony	mg/kg dw	0.022	0.04	58.1
Arsenic	mg/kg dw	0.909	1.66	58.5
Barium	mg/kg dw	19.6	62.9	105
Beryllium	mg/kg dw	0.026	0.084	105
Bismuth	mg/kg dw	<0.010	<0.010	-
Boron	mg/kg dw	1	1.5	40.0
Cadmium	mg/kg dw	0.668	0.539	21.4
Calcium	mg/kg dw	1290	1590	20.8
Cesium	mg/kg dw	0.0484	0.106	74.6
Chromium	mg/kg dw	2.41	6.18	87.8
Cobalt	mg/kg dw	1.22	2.62	72.9
Copper	mg/kg dw	19.8	21.1	6.4
Iron	mg/kg dw	952	2880	101
Lead	mg/kg dw	0.169	0.433	87.7
Lithium	mg/kg dw	<0.50	0.74	38.7
Magnesium	mg/kg dw	1370	2520	59.1
Manganese	mg/kg dw	158	294	60.2
Mercury	mg/kg dw	0.027	0.025	7.69
Molybdenum	mg/kg dw	0.942	1.02	7.95
Nickel	mg/kg dw	4.29	11	87.8
Phosphorus	mg/kg dw	9950	9290	6.86
Potassium	mg/kg dw	8970	9540	6.16
Rubidium	mg/kg dw	5.28	4.82	9.11
Selenium	mg/kg dw	3.93	3.12	23.0
Sodium	mg/kg dw	3770	3160	17.6
Strontium	mg/kg dw	15.6	18.1	14.8
Tellurium	mg/kg dw	<0.020	<0.020	-
Thallium	mg/kg dw	0.0076	0.011	36.6
Tin	mg/kg dw	<0.10	<0.10	-
Uranium	mg/kg dw	0.099	0.464	130
Vanadium	mg/kg dw	2.05	5.22	87.2
Zinc	mg/kg dw	98.8	102	3.19
Zirconium	mg/kg dw	0.64	1.92	100

Indicates RPD exceeded 30%.

Notes: RPD = relative percent difference. LRL = laboratory reporting limits. mg/kg dw = milligrams per kilogram dry weight. Where one of the values was <LRL, the RPD was calculated using the value of the LRL. The RPD was not calculated if both results were < LRL. "-" = no data/not calculated.

A5.5 Data Quality Statement

Benthic invertebrate tissue data collected for the present study were of good quality as characterized by good detectability, appropriate LRLs, no inadvertent contamination, and good laboratory precision and accuracy. The poor field sampling precision observed in the differences between one set of duplicate samples was likely compensated for by replication of field samples. Overall, the associated data can be used with a good level of confidence in the derivation of conclusions for this study.

A6 PERIPHYTON TISSUE CHEMISTRY

A6.1 Laboratory Reporting Limits

Analytical reports from ALS of periphyton tissue metal and moisture concentrations, as well as chlorophyll-a content (see laboratory reports WR2101264 and WR2101267 in Appendix C) were examined to provide an inventory of analyte results below the LRL (Table A.12). All chlorophyll-a results were above the LRL and below the BC guideline of 100 mg/m^2. Several periphyton tissue metal concentrations were below detection in several samples. Guidelines do not exist for any analytes in periphyton tissue, and none of the analytes had results that were below detection in 100% of samples. Despite some results being below the LRL, LRLs were overall appropriate for the present study.

A6.2 Laboratory Blanks

Four method blank samples for periphyton tissue moisture and metals, and one method blank sample for periphyton tissue chlorophyll-a content were analyzed by ALS (see laboratory report WR2101264 and WR2101267 in Appendix C). These samples resulted in 140 individual analyte results, all of which were within the laboratory DQO. Thus, the method blank results for this study indicated no inadvertent contamination of sediment samples within the laboratory during analysis.

A6.3 Data Accuracy and Precision

Laboratory accuracy was evaluated based on the analysis of two RM samples for metals, four LCS samples for moisture and metals, and one LCS sample for chlorophyll-a content (see laboratory reports WR2101264and WR2101267 in Appendix C). All 109 individual analyte results for RM samples and 139 individual analyte results for LCS samples met the laboratory DQO. Analytical precision of periphyton tissue chemistry analyses was evaluated by examining one laboratory duplicate sample for moisture and metals (see laboratory report WR2101264 in Appendix C). The RPDs between laboratory duplicate samples met the laboratory DQO for all 33 individual analyte comparisons. Laboratory duplicate samples were not analyzed for periphyton chlorophyll-a content. Overall, laboratory accuracy and precision were considered excellent.

One set of field duplicate samples for each periphyton tissue chemistry and chlorophyll-a to assess the precision of field sampling (Tables A.13 and A.14). Relative percent differences (RPDs) were greater than 30% for 2.9% of all dry weight comparisons. Where the RPD exceeded 30%, the laboratory reporting limit was not a cause (i.e., all results were above the LRL). Overall, analysis of field duplicates for periphyton tissue chemistry indicates good field sampling precision.

Table A.12: Laboratory Reporting Limit (LRL) Evaluation for Periphyton Tissue Chemistry Analyses

Parameter	Units	Range of LRLs	No. Sample Results < LRL
Metals			
Antimony	mg/kg	0.01 to 0.1	5 (33.3%)
Boron	mg/kg	1 to 5	5 (33.3%)
Selenium	mg/kg	0.1 to 0.5	7 (46.7%)
Tellurium	mg/kg	0.02 to 0.1	14 (93.3%)
Tin	mg/kg	0.1 to 0.5	13 (86.7%)

Notes: LRL = Laboratory Reporting Limit. mg/kg dw = milligrams per kilogram dry weight. Only analytes with one or more sample results < LRL are displayed. The total number of samples analyzed was n=15.

Table A.13: Field Duplicate Results for Periphyton Tissue Analyses

Parameter	Units	LMC-5-PERT	LMC-5-PERT-X	RPD (%)
Physical Tests				
Moisture	%	87.7	83.5	4.91
Metals				
Aluminum	mg/kg dw	10,200	9,570	6.37

Phosphorus	mg/kg dw	2,640	2,250	16.0
Potassium	mg/kg dw	8,860	5,190	52.2
Rubidium	mg/kg dw	13.8	13.7	0.727
Selenium	mg/kg dw	1.40	1.07	26.7
Sodium	mg/kg dw	306	326	6.33
Strontium	mg/kg dw	98.7	83.0	17.3
Tellurium	mg/kg dw	0.0240	0.0230	4.26
Thallium	mg/kg dw	0.101	0.0943	6.86
Tin	mg/kg dw	0.300	0.350	15.4
Uranium	mg/kg dw	0.807	0.745	7.99
Vanadium	mg/kg dw	44.1	44.6	1.13
Zinc	mg/kg dw	64.2	56.0	13.6
Zirconium	mg/kg dw	7.25	7.01	3.37

Indicates RPD exceeded 30%.

Notes: RPD = relative percent difference. LRL = laboratory reporting limits. mg/kg dw = milligrams per kilogram dry weight. Where one of the values was <LRL, the RPD was calculated using the value of the LRL. The RPD was not calculated if both results were < LRL.

Table A.14: Field Duplicate Results for Periphyton Tissue Chlorophyll-a Analyses

Parameter	Units	LMC-1	LMC-1X	RPD (%)
Plant Pigments				
Chlorophyll a	µg	131	80.4	47.9

Indicates RPD exceeded 30%.

Notes: RPD = relative percent difference. LRL = laboratory reporting limits. Where one of the values was <LRL, the RPD was calculated using the value of the LRL. The RPD was not calculated if both results were < LRL.

A6.4 Hold Times

Recommended hold times were met for all periphyton tissue samples.

A6.5 Data Quality Statement

Periphyton tissue metal, moisture, and chlorophyll-a data collected for the 2021 Minto AEMP were of good quality as characterized by good detectability, appropriate LRLs, no inadvertent contamination, and excellent laboratory precision and accuracy, good field sampling precision, and appropriate hold times. Overall, the associated data can be used with a good level of confidence in the derivation of conclusions for this study.

A7 DATA QUALITY STATEMENT

Overall, the quality of the data collected for this project was considered acceptable for the derivation of conclusions associated with the objectives of the 2021 Minto AEMP.

Table B.3: Habitat Characteristics for Benthic Invertebrate Areas, Minto Mine AEMP, September 2021

Characteristics		Lower Wolverine Creek (Reference)	Lower Big Creek (Reference)	Lower Minto Creek (Exposed)
UTM (NAD83, Zone 8V)	Easting	382475	396414	392261
	Northing	6954829	6942225	6948065
Approximate Length of Reach Assessed (m)		174	75	11
Gradient (%)		2.5	1.0	2.0
Velocity (m/s)	Mean (min-max)	0.347 (0.300 - 0.403)	0.342 (0.295 - 0.403)	0.354 (0.297 - 0.411)
Depth (cm)	Mean	27	23	6
	Maximum	73	28	37
Width (m)	Wetted	9	28	1.70
	Bankfull	17	42	1.9
General Morphology	% pool	5	0	10
	% riffle	40	50	40
	% run	55	50	50
Bank Condition		Moderate	Moderate. More erosion on left upstream bank.	Moderate
Substrate Coverage	% bedrock	0	0	0
	% boulder	0	0	0
	% cobble	75	85	70
	% gravel	15	10	20
	% sand and finer	10	5	10
Instream Cover (% total surface)	undercut banks	5	20	30
	boulder	0	0	0
	woody debris	10	10	20
	deep pool	5	0	10
	macrophytes	0	0	0
	other	0	0	0
Overhead Canopy (% surface)	Dense	0	0	95
	Partially Open	2	0	5
	Open	98	100	0
Aquatic Vegetation (% areal coverage)	Emergent	0	0	0
	Submergent	0	0	0
	Floating	0	0	0
	Attached Algae	0	0	0
Riparian vegetation		Willow, poplar, spruce, grasses	Willow, poplar, spruce	Poplar, alder, grasses
Surrounding Land Use		Forest	Mining access road downstream (upstream of LBC-4 and LBC-5)	Mine
Evidence of Anthropogenic Disturbance		None	None. Any evidence of disturbance is downstream of area assessed.	Access road nearby. Mine has cleared trees compared to previous years and there are more rose bushes

	LMC-4	3.0	315.5	11.39	84.6	7.38	8.3	0.330
	LMC-5	2.7	316.2	11.98	88.4	7.46	5.2	1.521
	Mean	3.6	314.1	11.91	90.6	7.74	7.2	0.581
	Standard Deviation	0.78	4.0	0.46	5.1	0.43	1.246	0.526

Value does not meet the water quality guideline.

Note: CCME = Canadian Council of Ministers of the Environment (1999). "-" = no applicable guideline.

[a] Range for the Water Use Licence is 6.0 to 9.0.

Table B.7: Explanatory Notes for Selected Water Quality Guidelines, Minto Mine AEMP, 2021

				Upper McGinty Creek	Upper Minto Creek	Lower Wolverine Creek	Lower Big Creek	Lower Minto Creek
			Area					
			Station ID	**URC-3**	**UMC-1**	**LWC-4**	**LBC-3**	**LMC-1[a]**
			Exposure Type	**Reference**	**Exposed**	**Reference**	**Reference**	**Exposed**
Modifying Parameters			**Field Temperature (°C)**	1.8	1.2	4.0	4.5	2.5
			Hardness (mg/L $CaCO_3$)	73.4	270	120	108	189
			Field pH (pH units)	7.50	7.70	7.89	7.94	7.70
			Dissolved Organic Carbon (DOC; mg/L)	14.3	8.2	13.9	7.2	9.3
Analyte		**Guideline Type**	**Equation**	**Guideline Values (mg/L)**				
Nutrients	Total Ammonia	CWQG long-term guideline	Long-term guideline is calculated using CCME look-up table. The CCME guideline table displays guidelines for the ammonia ion, which is converted to Ammonia (as N) by multiplying by 0.8224.	6.02	1.92	1.27	1.27	1.92
Total Metals	Aluminum	CWQG long-term guideline	pH < 6.5 = 5 µg/L and if pH ≥ 6 = 100 µg/L	0.100				
	Cadmium	CWQG long-term guideline	At hardness ≥ 17 to ≤ 280 mg/L $CaCO_3$, the equation is CWQG (µg/L) = $10^{\{0.83(\log[\text{hardness}]) - 2.46\}}$	0.123	0.361	0.184	0.169	0.269
		CWQG short-term guideline	At hardness ≥ 5.3 to ≤ 360 mg/L $CaCO_3$ the equation is CWQG (µg/L) = $10^{\{1.016(\log[\text{hardness}]) - 1.71\}}$	0.00153	0.00576	0.00253	0.00227	0.00401
	Copper	CWQG long-term guideline	CWQG (µg/L) = $0.2 \times e^{\{0.8545[\ln(\text{hardness})]-1.465\}}$	2.0	4.0	0.00276	0.00253	4.0
	Lead	CWQG long-term guideline	At hardness 0 to ≤ 60 mg/L $CaCO_3$, the CWQG is 1 µg/L. At hardness ≥ 60 to ≤ 180 mg/L the equation is CWQG (µg/L)= $e^{[(1.273\{\ln[\text{hardness}]\}-4.705)]}$. At hardness >180 mg/L $CaCO_3$, the CWQG is 7 µg/L	0.00215	0.00700	0.00401	0.00351	0.00700
	Nickel	CWQG long-term guideline	At hardness 0 to ≤ 60 mg/L $CaCO_3$ the CWQG is 25 µg/L. At hardness > 60 to ≤ 180 mg/L $CaCO_3$ the CWQG is calculated using the equation CWQG (µg/L) = $e^{\{0.76[\ln(\text{hardness})]+1.06\}}$. At hardness >180 mg/L $CaCO_3$, the CWQG is 150 µg/L.	0.0756	0.150	0.110	0.101	0.150
Dissolved Metals	Cadmium	WUL Objective	WUL objective = $e^{(0.736(\ln(\text{hardness}))-4.943).}$	0.168	0.439	0.242	0.224	0.338
	Copper	WUL Objective	DOC is > 10 mg/L, objective is 0.02 mg/L Cu. If DOC ≤ 10 mg/L, objective is 0.013 mg/L Cu	0.020	0.013	0.020	0.013	0.013
	Manganese	CWQG long-term guideline	Long-term guideline is calculated using CCME benchmark calculator or look-up table. Values dependent on hardness and field pH	0.43	0.56	0.37	0.37	0.54
		CWQG short-term guideline	CWQG (µg/L) = $e^{(0.878[\ln(\text{hardness})] + 4.76)}$	5.07	15.9	7.81	7.12	11.6
	Zinc	CWQG long-term guideline	For hardness 23.4 to 399 mg/L $CaCO_3$, pH 6.5 to 8.13, and DOC 0.3 to 22.9 mg/L, the equation is CWQG (µg/L) = $e^{(0.947[\ln(\text{hardness mg/L})] - 0.815[\text{pH}] + 0.398[\ln(\text{DOC mg/L})] + 4.625)}$	0.0381	0.089	0.0436	0.0292	0.0668
		CWQG short-term guideline[b]	For hardness 13.8 to 250.5 mg/L $CaCO_3$ and DOC 0.3 and 17.3 mg/L, the equation is CWQG (µg/L) = $e^{(0.833[\ln(\text{hardness mg/L})] + 0.240[\ln(\text{DOC mg/L})] + 0.526)}$	0.115	0.279	0.172	0.134	0.228

Notes: CWQG = Canadian Water Quality Guideline. CCME = Canadian Council of Ministers of the Environment. WUL = water use licence.

[a] Water quality sample at lower Minto Creek was collected close the sediment station LMC-1.

[b] Hardness at upper Minto Creek was outside of the validity range for calculation of dissolved zinc long-term guideline. As such, the maximum value for the guideline equation were applied (hardness of 250.5 mg/L $CaCO_{3).}$

Water quality guideline not met.

Water use licence objectives not met.

Notes: "-" = no guideline available / no data available, WUL = Water Use Licence. CCME guideline ranges reflect both 2020 and 2021. For guidelines from 2020, see Minnow 2021a. For guidelines for 2021, see Appendix Table B.7.

[a] Guidelines derived from the Canadian Council of Ministers of the Environment (CCME; 1999) outlined in Appendix Table B.7.

[b] Total chromium guideline is for hexavalent chromium, Cr(VI).

Table B.9: Periphyton Chlorophyll-a (mg/m^2) Collected at Benthic Stations in Lower Minto Creek (LMC; exposed) and Lower Wolverine Creek (LWC; reference) , Minto Mine AEMP, 2021

Lower Wolverine Creek (Reference)		Lower Minto Creek (Exposed)	
Station	**mg/m^2**	**Station**	**mg/m^2**
LWC-1	15.6	LMC-1	65.5
LWC-2	6.85	LMC-2	34.4
LWC-3	4.94	LMC-3	12.5
LWC-4	67.0	LMC-4	11.0
LWC-5	6.35	LMC-5	106
Mean	20.1	Mean	45.8
Standard Deviation	26.5	Standard Deviation	40.0
Standard Error	11.9	Standard Error	17.9

Chlorophyll-a exceeded the BCWQG of 100 mg/m^2.

Table B.10: Statistical Comparison on Periphyton Chlorophyll-a (mg/m^2), Minto Mine AEMP, 2012 to 2021[a]

Endpoint	ANOVA Model				Year	Do Endpoints Differ Between Years For Each Area?[b]		Do Endpoints Differ Between Areas?
	Transformation	Area	Year	Area x Year		LWC (Reference)	LMC (Exposed)	MOD (%)[c]
Chlorophyll-a	rank	<0.001	<0.001	<0.001	2012	BC	DE	-97
					2013	D	E	ns
					2014	CD	BC	1,473
					2015	D	CD	8,352
					2016	A	A	ns
					2017	ABC	A	311
					2018	ABC	A	478
					2020	AB	BC	-52
					2021	BC	AB	402

P-value < 0.1

Magnitude of Difference (MOD) < 0

Magnitude of Difference (MOD) > 0

Notes: "ns" indicates a non-significant contrast, LWC = lower Wolverine Creek (reference), LMC = lower Minto Creek (exposed).

[a] Sampling was not completed in 2019 due to dry conditions.

[b] Years that do not share a letter were significantly different from each other in a Tukey's Honestly Significant Difference post-hoc test (α = 0.1).

[c] MOD = $(MCT_{LMC}-MCT_{LWC})/MCT_{LWC}*100$; where the measures of central tendency (MCT) were medians because data were rank-transformed.

CERTIFICATE OF ANALYSIS

Work Order	: **WR2101263**	Page	: 1 of 10
Amendment	: **1**		
Client	: **Minnow Environmental Inc.**	Laboratory	: Whitehorse - Environmental
Contact	: Pierre Stecko	Account Manager	: Can Dang
Address	: 204 – 1006 Fort Street Victoria BC Canada V8V 3K4	Address	: #12 151 Industrial Road Whitehorse YT Canada Y1A 2V3
Telephone	: 250 595 1627	Telephone	: +1 867 668 6689
Project	: Minnow Environmental Inc Project for Minto MInes WUL Program	Date Samples Received	: 15-Sep-2021 15:15
PO	: AEMP is 21-92	Date Analysis Commenced	: 17-Sep-2021
C-O-C number	: ----	Issue Date	: 07-Oct-2021 11:57
Sampler	: LBO, SLA		
Site	: ----		
Quote number	: Q79833 - Minnow/Minto		
No. of samples received	: 7		
No. of samples analysed	: 7		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Angela Ren	Team Leader - Metals	Metals, Burnaby, British Columbia
Jay Jang	Lab Assistant	Metals, Burnaby, British Columbia
Lindsay Gung	Supervisor - Water Chemistry	Inorganics, Burnaby, British Columbia
Owen Cheng		Metals, Burnaby, British Columbia
Robin Weeks	Team Leader - Metals	Metals, Burnaby, British Columbia
Shaneel Dayal	Analyst	Metals, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
µS/cm	Microsiemens per centimetre
mg/L	milligrams per litre
NTU	nephelometric turbidity units
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Workorder Comments

Amendment (07/10/2021): This report has been amended as a result of changes to the billing account and contacts for the distribution of the report. All analysis results are as per the previous report.

Qualifiers

Qualifier	*Description*
DLM	*Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).*
RRV	*Reported result verified by repeat analysis.*

PO	: AEMP is 21-92	Issue Date	: 07-Oct-2021 11:57
C-O-C number	: ----		
Sampler	: LBO, SLA		
Site	: ----		
Quote number	: Q79833 - Minnow/Minto		
No. of samples received	: 7		
No. of samples analysed	: 7		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Summary of Outliers

Outliers : Quality Control Samples

- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- Method Blank value outliers occur - please see following pages for full details.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **Water**

Analyte Group	Laboratory sample ID	Client/Ref Sample ID	Analyte	CAS Number	Method	Result	Limits	Comment
Method Blank (MB) Values								
Physical Tests	QC-MRG2-2947450 01	----	alkalinity, total (as CaCO3)	----	E290	1.5 mg/L [B]	1.5 mg/L	Blank result exceeds permitted value

Result Qualifiers

Qualifier	Description
B	*Method Blank exceeds ALS DQO. Associated sample results which are < Limit of Reporting or > 5 times blank level are considered reliable.*

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 00:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 00:00 is used for calculation purposes.

Legend & Qualifier Definitions

EHTR-FM: Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended

EHT: Exceeded ALS recommended hold time prior to analysis.

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Water**

Evaluation: × = QC frequency outside specification; ✓ = QC frequency within specification.

Quality Control Sample Type			Count		Frequency (%)		
Analytical Methods	*Method*	*QC Lot #*	*QC*	*Regular*	*Actual*	*Expected*	*Evaluation*
Laboratory Duplicates (DUP)							
Alkalinity Species by Titration	E290	294746	1	7	14.2	5.0	✓

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Conductivity in Water	E100 Vancouver - Environmental	Water	APHA 2510 (mod)	Conductivity, also known as Electrical Conductivity (EC) or Specific Conductance, is measured by immersion of a conductivity cell with platinum electrodes into a water sample. Conductivity measurements are temperature-compensated to 25°C.
pH by Meter	E108 Vancouver - Environmental	Water	APHA 4500-H (mod)	pH is determined by potentiometric measurement with a pH electrode, and is conducted at ambient laboratory temperature (normally 20 ± 5°C). For high accuracy test results, pH should be measured in the field within the recommended 15 minute hold time.
Turbidity by Nephelometry	E121 Vancouver - Environmental	Water	APHA 2130 B (mod)	Turbidity is measured by the nephelometric method, by measuring the intensity of light scatter under defined conditions.
TSS by Gravimetry	E160-H Vancouver - Environmental	Water	APHA 2540 D (mod)	Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, following by drying of the filter at 104 ± 1°C, with gravimetric measurement of the filtered solids. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.
TDS by Gravimetry	E162 Vancouver - Environmental	Water	APHA 2540 C (mod)	Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, with evaporation of the filtrate at 180 ± 2°C for 16 hours or to constant weight, with gravimetric measurement of the residue.
Bromide in Water by IC (Low Level)	E235.Br-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Chloride in Water by IC	E235.Cl Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Fluoride in Water by IC	E235.F Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrite in Water by IC (Low Level)	E235.NO2-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrate in Water by IC (Low Level)	E235.NO3-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Sulfate in Water by IC	E235.SO4 Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Alkalinity Species by Titration	E290 Vancouver - Environmental	Water	APHA 2320 B (mod)	Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.
Ammonia by Fluorescence	E298 Vancouver - Environmental	Water	J. Environ. Monit., 2005, 7, 37-42 (mod)	Ammonia in water is analyzed by flow-injection analysis with fluorescence detection after reaction with orthophthaldialdehyde (OPA).
Total Inorganic Carbon by Combustion (Low Level)	E354-L Vancouver - Environmental	Water	APHA 5310 B (mod)	Total Inorganic Carbon is determined by the high temperature combustion method with measurement by an infrared detector, where the sample is acidified in a reaction chamber to convert all inorganic carbons (carbonates) to carbon dioxide for analysis.
Total Organic Carbon (Non-Purgeable) by Combustion (Low Level)	E355-L Vancouver - Environmental	Water	APHA 5310 B (mod)	Total Organic Carbon (Non-Purgeable), also known as NPOC (total), is a direct measurement of TOC after an acidified sample has been purged to remove inorganic carbon (IC). Analysis is by high temperature combustion with infrared detection of CO_2. NPOC does not include volatile organic species that are purged off with IC. For samples where the majority of total carbon (TC) is comprised of IC (which is common), this method is more accurate and more reliable than the TOC by subtraction method (i.e. TC minus TIC).
Dissolved Organic Carbon by Combustion (Low Level)	E358-L Vancouver - Environmental	Water	APHA 5310 B (mod)	Dissolved Organic Carbon (Non-Purgeable), also known as NPOC (dissolved), is a direct measurement of DOC after a filtered (0.45 micron) sample has been acidified and purged to remove inorganic carbon (IC). Analysis is by high temperature combustion with infrared detection of CO_2. NPOC does not include volatile organic species that are purged off with IC. For samples where the majority of DC (dissolved carbon) is comprised of IC (which is common), this method is more accurate and more reliable than the DOC by subtraction method (i.e. DC minus DIC).
Total Phosphorus by Colourimetry (Ultra Trace)	E372-U Vancouver - Environmental	Water	APHA 4500-P E (mod).	Total Phosphorus is determined colourimetrically using a discrete analyzer after heated persulfate digestion of the sample.
Total Dissolved Phosphorus by Colourimetry (Trace Level)	E375-T Vancouver - Environmental	Water	APHA 4500-P E (mod).	Total Dissolved Phosphorus is determined colourimetrically using a discrete analyzer after filtration through a 0.45 micron filter followed by heated persulfate digestion of the sample.
Total Metals in Water by CRC ICPMS	E420 Vancouver - Environmental	Water	EPA 200.2/6020B (mod)	Water samples are digested with nitric and hydrochloric acids, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Dissolved Metals in Water by CRC ICPMS	E421 Vancouver - Environmental	Water	APHA 3030B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.
Total Mercury in Water by CVAAS	E508 Vancouver - Environmental	Water	EPA 1631E (mod)	Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS
Dissolved Mercury in Water by CVAAS	E509 Vancouver - Environmental	Water	APHA 3030B/EPA 1631E (mod)	Water samples are filtered (0.45 um), preserved with HCl, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS.
Dissolved Hardness (Calculated)	EC100 Vancouver - Environmental	Water	APHA 2340B	"Hardness (as CaCO3), dissolved" is calculated from the sum of dissolved Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. "Total Hardness" refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations.
Hardness (Calculated) from Total Ca/Mg	EC100A Vancouver - Environmental	Water	APHA 2340B	"Hardness (as CaCO3), from total Ca/Mg" is calculated from the sum of total Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. "Total Hardness" refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations. Hardness from total Ca/Mg is normally comparable to Dissolved Hardness in non-turbid waters.

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Preparation for Ammonia	EP298 Vancouver - Environmental	Water		Sample preparation for Preserved Nutrients Water Quality Analysis.
Preparation for Total Organic Carbon by Combustion	EP355 Vancouver - Environmental	Water		Preparation for Total Organic Carbon by Combustion
Preparation for Dissolved Organic Carbon for Combustion	EP358 Vancouver - Environmental	Water	APHA 5310 B (mod)	Preparation for Dissolved Organic Carbon
Digestion for Total Phosphorus in water	EP372 Vancouver - Environmental	Water	APHA 4500-P E (mod).	Samples are heated with a persulfate digestion reagent.
Digestion for Dissolved Phosphorus in water	EP375 Vancouver - Environmental	Water	APHA 4500-P E (mod).	Samples are filtered through a 0.45 micron membrane filter and then heated with a persulfate digestion reagent.

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Dissolved Metals Water Filtration	EP421 Vancouver - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HNO3.
Dissolved Mercury Water Filtration	EP509 Vancouver - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HCl.

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits
- Reference Material (RM) Report; Recovery and Acceptance Limits
- Method Blank (MB) Report; Recovery and Acceptance Limits
- Laboratory Control Sample (LCS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*

Shaneel Dayal	Analyst	Metals, Burnaby, British Columbia

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percentage Difference
# = Indicates a QC result that did not meet the ALS DQO.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test specific).

Sub-Matrix: **Water**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Qualifiers

Qualifier	Description
B	*Method Blank exceeds ALS DQO. Associated sample results which are < Limit of Reporting or > 5 times blank level are considered reliable.*

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Water**

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Sub-Matrix: **Water**

Reference Material (RM) Report

A Reference Material (RM) is a homogenous material with known and well-established analyte concentrations. RMs are processed in an identical manner to test samples, and are used to monitor and control the accuracy and precision of a test method for a typical sample matrix. RM results are expressed as percent recovery of the target analyte concentration. RM targets may be certified target concentrations provided by the RM supplier, or may be ALS long-term mean values (for empirical test methods).

Sub-Matrix: **Water**

PO	: AEMP is 21-92	Date Analysis Commenced	: 23-Sep-2021
C-O-C number	: ----	Issue Date	: 07-Oct-2021 12:03
Sampler	: LBO, SLA		
Site	: ----		
Quote number	: Q79833 - Minnow/Minto		
No. of samples received	: 11		
No. of samples analysed	: 11		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Lindsay Gung	Supervisor - Water Chemistry	Inorganics, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
µg	micrograms

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Workorder Comments

Amendment (07/10/2021): This report has been amended as a result of changes to the billing account and contacts for the distribution of the report. All analysis results are as per the previous report.

Quote number	: Q79833 - Minnow/Minto		
No. of samples received	: 11		
No. of samples analysed	: 11		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- No Analysis Holding Time Outliers exist.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 00:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 00:00 is used for calculation purposes.

Legend & Qualifier Definitions

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Biota**

Evaluation: × = *QC frequency outside specification*; ✓ = *QC frequency within specification.*

Quality Control Sample Type			Count		Frequency (%)		
Analytical Methods	*Method*	*QC Lot #*	*QC*	*Regular*	*Actual*	*Expected*	*Evaluation*
Laboratory Control Samples (LCS)							
Chlorophyll-a by Fluorometry	E870	300842	1	11	9.0	5.0	✓
Method Blanks (MB)							
Chlorophyll-a by Fluorometry	E870	300842	1	11	9.0	5.0	✓

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Chlorophyll-a by Fluorometry	E870 Vancouver - Environmental	Biota	EPA 445.0 (mod)	Chlorophyll-a is determined by solvent extraction followed with analysis by fluorometry using the non-acidification procedure.

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Chlorophyll-a Extraction	EP870 Vancouver - Environmental	Biota	EPA 445.0 (mod)	Chlorophyll-a solvent extraction.

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percentage Difference
# = Indicates a QC result that did not meet the ALS DQO.

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Sub-Matrix: **Biota**

Analyte	CAS Number	Method	LOR	Unit	Result	Qualifier
Plant Pigments (QCLot: 300842)						
chlorophyll a	479-61-8	E870	0.01	µg	<0.010	----

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Biota**

					Laboratory Control Sample (LCS) Report

Indicates sediment concentration exceeding CSQG ISQG.

Indicates sediment concentration exceeding CSQG PEL.

Notes: "-" = no data available. Only one composite particle size sample was collected at upper creek areas due to limited deposition.

[a] Canadian Sediment Quality Guidelines: ISQG = interim sediment quality guideline; PEL = probable effect level (CCME 1999).

Indicates periphyton tissue concentration exceeding the higher reference mean by more than two times.

Notes: "-" = standard deviation not calculated, as all results were below the laboratory reporting limit. mg/kg dw = milligrams per kilogram dry weight.

Table C.3: Benthic Tissue Chemistry Results at lower Minto Creek and Reference Areas, Minto Mine AEMP, 2021

Indicates benthic tissue concentration exceeding the higher reference mean by more than two times.

Indicates benthic tissue concentration exceeding the British Columbia guideline for selenium (4 mg/kg dw; BCMOE 2014).

Notes: "-" = not applicable. Standard deviation was not calculated as all values were below the laboratory reporting limit (LRL). mg/kg dw = milligrams per kilogram dry weight.

CERTIFICATE OF ANALYSIS

Work Order	: **WR2101264**	Page	: 1 of 16
Client	: **Minnow Environmental Inc.**	Laboratory	: Whitehorse - Environmental
Contact	: Pierre Stecko	Account Manager	: Can Dang
Address	: 204 – 1006 Fort Street Victoria BC Canada V8V 3K4	Address	: #12 151 Industrial Road Whitehorse YT Canada Y1A 2V3
Telephone	: 250 595 1627	Telephone	: +1 867 668 6689
Project	: Minnow Environmental Inc Project for Minto MInes WUL Program	Date Samples Received	: 15-Sep-2021 15:14
PO	: ----	Date Analysis Commenced	: 12-Nov-2021
C-O-C number	: ----	Issue Date	: 09-Dec-2021 12:59
Sampler	: LBO, SLA		
Site	: ----		
Quote number	: Q79833 - Minnow/Minto		
No. of samples received	: 16		
No. of samples analysed	: 16		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Caleb Deroche	Lab Analyst	Metals, Burnaby, British Columbia
Kevin Duarte	Supervisor - Metals ICP Instrumentation	Metals, Burnaby, British Columbia
Ragini Saini	Lab Assistant	Metals, Burnaby, British Columbia
Robin Weeks	Team Leader - Metals	Metals, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
%	percent
mg/kg	milligrams per kilogram
mg/kg wwt	milligrams per kilogram wet weight

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Qualifiers

Qualifier	*Description*
DLA	*Detection Limit adjusted for required dilution.*

QUALITY CONTROL INTERPRETIVE REPORT

Work Order	: **WR2101264**	Page	: 1 of 14
Client	: **Minnow Environmental Inc.**	Laboratory	: Whitehorse - Environmental
Contact	: Pierre Stecko	Account Manager	: Can Dang
Address	: 204 – 1006 Fort Street Victoria BC Canada V8V 3K4	Address	: #12 151 Industrial Road Whitehorse, Yukon Canada Y1A 2V3
Telephone	: ----	Telephone	: +1 867 668 6689
Project	: Minnow Environmental Inc Project for Minto MInes WUL Program	Date Samples Received	: 15-Sep-2021 15:14
PO	: ----	Issue Date	: 09-Dec-2021 12:59
C-O-C number	: ----		
Sampler	: LBO, SLA		
Site	: ----		
Quote number	: Q79833 - Minnow/Minto		
No. of samples received	: 16		
No. of samples analysed	: 16		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- No Analysis Holding Time Outliers exist.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 00:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 00:00 is used for calculation purposes.

Legend & Qualifier Definitions

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Biota**

Evaluation: × = *QC frequency outside specification*; ✓ = *QC frequency within specification.*

Quality Control Sample Type			Count		Frequency (%)

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Moisture Content by Gravimetry (Biopsy)	E144A Vancouver - Environmental	Biota	Puget Sound Water Quality Authority/CCME PHC in Soil - Tier 1	This analysis is carried out gravimetrically by drying the sample at < 60 deg. C for a minimum of three days.
Moisture Content by Gravimetry (Micro)	E144-H Vancouver - Environmental	Biota	Puget Sound Water Quality Authority/BC MOE Lab Manual	Moisture is measured gravimetrically by drying the sample at < 60°C for a minimum of 3 days to constant weight. Moisture content is calculated as the weight loss (due to water) divided by the wet weight of soil, expressed as a percentage.
Metals in Biota by CRC ICPMS (DRY units, Micro)	E472 Vancouver - Environmental	Biota	EPA 200.3/6020B (mod)	Tissue samples are homogenized and sub-sampled prior to hotblock digestion with HNO3, HCl, and H2O2. Analysis is by Collision/Reaction Cell ICPMS. Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.
Metals in Biota by CRC ICPMS (WET units, Micro)	E472A Vancouver - Environmental	Biota	EPA 200.3/6020B (mod)	Tissue samples are homogenized and sub-sampled prior to hotblock digestion with HNO3, HCl, and H2O2. Analysis is by Collision/Reaction Cell ICPMS. Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.
Metals by CRC ICPMS (DRY units, Biopsy)	E475 Vancouver - Environmental	Biota	EPA 200.3/6020B (mod)	Samples are digested with nitric acid, hydrochloric acid, and hydrogen peroxide. Analysis is by Collision/Reaction Cell ICPMS: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.
Metals in Biota by CRC ICPMS (WET units, Biopsy)	E475A Vancouver - Environmental	Biota	EPA 200.3/6020B (mod)	Samples are digested with nitric acid, hydrochloric acid, and hydrogen peroxide. Analysis is by Collision/Reaction Cell ICPMS. Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.
Mercury in Biota by CVAAS (DRY units, Micro)	E511 Vancouver - Environmental	Biota	EPA 200.3/1631E (mod)	Samples are homogenized and sub-sampled prior to hotblock digestion with nitric acid, hydrochloric acid, and hydrogen peroxide. Analysis is by CVAAS.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Mercury in Biota by CVAAS (WET units, Micro)	E511A Vancouver - Environmental	Biota	EPA 200.3/1631E (mod)	Samples are homogenized and sub-sampled prior to hotblock digestion with nitric acid, hydrochloric acid, and hydrogen peroxide. Analysis is by CVAAS.
Mercury in Biota by CVAAS (DRY units, Biopsy)	E512 Vancouver - Environmental	Biota	EPA 200.3/1631E (mod)	Samples are digested with nitric acid, hydrochloric acid, and hydrogen peroxide. Analysis is by CVAAS.
Mercury in Biota by CVAAS (WET units, Biopsy)	E512A Vancouver - Environmental	Biota	EPA 200.3/1631E (mod)	Samples are homogenized digested with nitric acid, hydrochloric acid, and hydrogen peroxide. Analysis is by CVAAS.

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Metals and Mercury Biota Digestion (Micro)	EP472 Vancouver - Environmental	Biota	EPA 200.3	This method, designed for small sample amounts, uses a heated strong acid digestion with HNO3, HCl, and H2O2 and is intended to provide a conservative estimate of bio-available metals.
Metals and Mercury Biota Digestion (Biopsy)	EP475 Vancouver - Environmental	Biota	EPA 200.3/200.8 (mod)	Samples are digested with nitric acid, hydrochloric acid, and hydrogen peroxide. Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits
- Reference Material (RM) Report; Recovery and Acceptance Limits
- Method Blank (MB) Report; Recovery and Acceptance Limits
- Laboratory Control Sample (LCS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Robin Weeks	Team Leader - Metals	Metals, Burnaby, British Columbia

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percentage Difference
# = Indicates a QC result that did not meet the ALS DQO.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test specific).

Sub-Matrix: **Biota**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Biota**

Reference Material (RM) Report

A Reference Material (RM) is a homogenous material with known and well-established analyte concentrations. RMs are processed in an identical manner to test samples, and are used to monitor and control the accuracy and precision of a test method for a typical sample matrix. RM results are expressed as percent recovery of the target analyte concentration. RM targets may be certified target concentrations provided by the RM supplier, or may be ALS long-term mean values (for empirical test methods).

Sub-Matrix: **Biota**

CERTIFICATE OF ANALYSIS

Work Order	: **WR2101265**	Page	: 1 of 16
Client	: **Minnow Environmental Inc.**	Laboratory	: Whitehorse - Environmental
Contact	: Pierre Stecko	Account Manager	: Can Dang
Address	: 204 – 1006 Fort Street Victoria BC Canada V8V 3K4	Address	: #12 151 Industrial Road Whitehorse YT Canada Y1A 2V3
Telephone	: 250 595 1627	Telephone	: +1 867 668 6689
Project	: Minnow Environmental Inc Project for Minto MInes WUL Program	Date Samples Received	: 15-Sep-2021 15:15
PO	: Minto AEMP - 21-92	Date Analysis Commenced	: 18-Sep-2021
C-O-C number	: ----	Issue Date	: 07-Oct-2021 12:52
Sampler	: LBO, SLA		
Site	: ----		
Quote number	: Q79833 - Minnow/Minto		
No. of samples received	: 34		
No. of samples analysed	: 34		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Dee Lee	Analyst	Metals, Burnaby, British Columbia
Hedy Lai	Team Leader - Inorganics	Inorganics, Saskatoon, Saskatchewan
Jwan Abdalla	Laboratory Analyst	Inorganics, Saskatoon, Saskatchewan
Kevin Duarte	Supervisor - Metals ICP Instrumentation	Metals, Burnaby, British Columbia
Kim Jensen	Department Manager - Metals	Metals, Burnaby, British Columbia
Melissa Houseman	Team Leader - Inorganics	Inorganics, Saskatoon, Saskatchewan
Nancy Cruse	Laboratory _ Supervisor	Inorganics, Saskatoon, Saskatchewan
Ophelia Chiu	Department Manager - Organics	Organics, Burnaby, British Columbia
Xihua Yao	Laboratory Analyst	Inorganics, Saskatoon, Saskatchewan

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
%	percent
mg/kg	milligrams per kilogram
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Qualifiers

Qualifier	*Description*
DLM	*Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).*

QUALITY CONTROL INTERPRETIVE REPORT

Work Order	: **WR2101265**	Page	: 1 of 23
Client	: **Minnow Environmental Inc.**	Laboratory	: Whitehorse - Environmental
Contact	: Pierre Stecko	Account Manager	: Can Dang
Address	: 204 – 1006 Fort Street Victoria BC Canada V8V 3K4	Address	: #12 151 Industrial Road Whitehorse, Yukon Canada Y1A 2V3
Telephone	: ----	Telephone	: +1 867 668 6689
Project	: Minnow Environmental Inc Project for Minto MInes WUL Program	Date Samples Received	: 15-Sep-2021 15:15
PO	: Minto AEMP - 21-92	Issue Date	: 07-Oct-2021 12:52
C-O-C number	: ----		
Sampler	: LBO, SLA		
Site	: ----		
Quote number	: Q79833 - Minnow/Minto		
No. of samples received	: 34		
No. of samples analysed	: 34		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- Duplicate outliers occur - please see following pages for full details.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- No Analysis Holding Time Outliers exist.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **Soil/Solid**

Analyte Group	Laboratory sample ID	Client/Ref Sample ID	Analyte	CAS Number	Method	Result	Limits	Comment
Duplicate (DUP) RPDs								
Metals	Anonymous	Anonymous	antimony	7440-36-0	E440	0.96 % DUP-H, J	Diff <2x LOR	Low Level DUP DQO exceeded (difference > 2 LOR).
Metals	Anonymous	Anonymous	barium	7440-39-3	E440	60.6 % DUP-H	40%	Duplicate RPD does not meet the DQO for this test.
Metals	Anonymous	Anonymous	calcium	7440-70-2	E440	45.3 % DUP-H	30%	Duplicate RPD does not meet the DQO for this test.
Metals	Anonymous	Anonymous	chromium	7440-47-3	E440	61.9 % DUP-H	30%	Duplicate RPD does not meet the DQO for this test.
Metals	Anonymous	Anonymous	cobalt	7440-48-4	E440	59.3 % DUP-H	30%	Duplicate RPD does not meet the DQO for this test.

Metals	Anonymous	Anonymous	molybdenum	7439-98-7	E440	0.34 % DUP-H, J	Diff <2x LOR	Low Level DUP DQO exceeded (difference > 2 LOR).
Metals	Anonymous	Anonymous	nickel	7440-02-0	E440	70.8 % DUP-H	30%	Duplicate RPD does not meet the DQO for this test.
Metals	Anonymous	Anonymous	potassium	7440-09-7	E440	46.1 % DUP-H	40%	Duplicate RPD does not meet the DQO for this test.
Metals	Anonymous	Anonymous	sodium	7440-23-5	E440	45.4 % DUP-H	40%	Duplicate RPD does not meet the DQO for this test.
Metals	Anonymous	Anonymous	strontium	7440-24-6	E440	48.8 % DUP-H	40%	Duplicate RPD does not meet the DQO for this test.
Metals	Anonymous	Anonymous	tin	7440-31-5	E440	183 % DUP-H	40%	Duplicate RPD does not meet the DQO for this test.
Metals	Anonymous	Anonymous	vanadium	7440-62-2	E440	31.2 % DUP-H	30%	Duplicate RPD does not meet the DQO for this test.
Metals	Anonymous	Anonymous	zinc	7440-66-6	E440	156 % DUP-H	30%	Duplicate RPD does not meet the DQO for this test.

Result Qualifiers

Qualifier	*Description*

Matrix: **Soil/Solid**

Analyte Group	Laboratory sample ID	Client/Ref Sample ID	Analyte	CAS Number	Method	Result	Limits	Comment
DUP-H	*Duplicate results outside ALS DQO, due to sample heterogeneity.*							
J	*Duplicate results and limits are expressed in terms of absolute difference.*							

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 00:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 00:00 is used for calculation purposes.

Matrix: **Soil/Solid**

Evaluation: × = Holding time exceedance ; ✓ = Within Holding Time

Legend & Qualifier Definitions

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Soil/Solid**

Evaluation: × = *QC frequency outside specification*; ✓ = *QC frequency within specification.*

Quality Control Sample Type			Count		Frequency (%)		
Analytical Methods	*Method*	*QC Lot #*	*QC*	*Regular*	*Actual*	*Expected*	*Evaluation*
Laboratory Duplicates (DUP)							
Loss On Ignition (420°C)	E205C	296314	2	21	9.5	5.0	✓
Mercury in Soil/Solid by CVAAS	E510	301141	2	23	8.7	5.0	✓

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
pH by Meter (1:2 Soil:Water Extraction)	E108 Vancouver - Environmental	Soil/Solid	BC Lab Manual	pH is determined by potentiometric measurement with a pH electrode at ambient laboratory temperature (normally 20 ± 5°C), and is carried out in accordance with procedures described in the BC Lab Manual (prescriptive method). The procedure involves mixing the dried (at <60 ºC) and sieved (10mesh/2mm) sample with ultra pure water at a 1:2 ratio of sediment to water. The pH is then measured by a standard pH probe.
Loss On Ignition (420°C)	E205C Saskatoon - Environmental	Soil/Solid	CSSS (1978) 3.81 (mod)	Loss On Ignition (LOI) is determined by drying a portion of an air dried and ground sampld at 105°C, then igniting at 420°C for 2 hours. The weight loss after ignition is reported as % loss on ignition. LOI is reported on a dry weight basis. LOI at 420°C can be considered an estimation of Organic Matter Content according to Alberta Agriculture (1988).
Total Kjeldahl Nitrogen by Colourimetry	E319 Saskatoon - Environmental	Soil/Solid	CSSS (2008) 22.2.3	The soil is digested with sulfuric acid in the presence of $CuSO_4$ and K_2SO_4 catalysts. Ammonia in the soil extract is determined colrimetrically at 660 nm.
Total Carbon by Combustion	E351 Saskatoon - Environmental	Soil/Solid	CSSS (2008) 21.2 (mod)	Total Carbon is determined by the high temperature combustion method with measurement by an infrared detector.
Total Inorganic Carbon by Acetic Acid pH Standard Curve	E354 Saskatoon - Environmental	Soil/Solid	CSSS (2008) 20.2	Total Inorganic Carbon is determined by acetic acid pH standard curve, where a known quantity of acetic acid is consumed by reaction with carbonates in the soil. The pH of the resulting solution is measured and compared against a standard curve relating pH to weight of carbonate.
Metals in Soil/Solid by CRC ICPMS	E440 Vancouver - Environmental	Soil/Solid	EPA 6020B (mod)	This method is intended to liberate metals that may be environmentally available. Samples are dried, then sieved through a 2 mm sieve, and digested with HNO_3 and HCl. Dependent on sample matrix, some metals may be only partially recovered, including Al, Ba, Be, Cr, Sr, Ti, Tl, V, W, and Zr. Silicate minerals are not solubilized. Volatile forms of sulfur (including sulfide) may not be captured, as they may be lost during sampling, storage, or digestion. Elemental Sulfur may be poorly recovered by this method. Analysis is by Collision/Reaction Cell ICPMS.
Mercury in Soil/Solid by CVAAS	E510 Vancouver - Environmental	Soil/Solid	EPA 200.2/1631 Appendix (mod)	Samples are dried, then sieved through a 2 mm sieve, and digested with HNO_3 and HCl, followed by CVAAS analysis.
Particle Size Analysis (Pipette) - MMER Classification	EC184E Saskatoon - Environmental	Soil/Solid	Metal Mining Technical Guidance for Environmental Effects Monitoring (2012)	The particle size determination is performed by various methods to generate a Grain Size curve. The data from the curve is then used to produce particle size ranges based on the Metal Mining Effluent Regulations (MMER) classification system for Environmental Effects Monitoring.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Total Organic Carbon (Calculated) in soil	EC356 Saskatoon - Environmental	Soil/Solid	CSSS (2008) 21.2	Total Organic Carbon (TOC) is calculated by the difference between total carbon (TC) and total inorganic carbon (TIC).

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Leach 1:2 Soil:Water for pH/EC	EP108 Vancouver - Environmental	Soil/Solid	BC WLAP METHOD: PH, ELECTROMETRIC, SOIL	The procedure involves mixing the dried (at <60°C) and sieved (No. 10 / 2mm) sample with deionized/distilled water at a 1:2 ratio of sediment to water.
Kjeldahl Digestion for soils	EP319 Saskatoon - Environmental	Soil/Solid	CSSS (2008) 22.2.3	The soil is digested with sulfuric acid in the presence of CuSO4 and K2SO4 catalysts.
Digestion for Metals and Mercury	EP440 Vancouver - Environmental	Soil/Solid	EPA 200.2 (mod)	Samples are dried, then sieved through a 2 mm sieve, and digested with HNO3 and HCl. This method is intended to liberate metals that may be environmentally available.
Dry and Grind	EPP442 Saskatoon - Environmental	Soil/Solid	Soil Sampling and Methods of Analysis, Carter 2008	After removal of any coarse fragments and reservation of wet subsamples a portion of homogenized sample is set in a tray and dried at less than 60°C until dry. The sample is then particle size reduced with an automated crusher or mortar and pestle, typically to <2 mm. Further size reduction may be needed for particular tests.

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percentage Difference
# = Indicates a QC result that did not meet the ALS DQO.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test specific).

Sub-Matrix: **Soil/Solid**

Qualifiers

Qualifier	*Description*
DUP-H	*Duplicate results outside ALS DQO, due to sample heterogeneity.*
J	*Duplicate results and limits are expressed in terms of absolute difference.*

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Soil/Solid**

Reference Material (RM) Report

A Reference Material (RM) is a homogenous material with known and well-established analyte concentrations. RMs are processed in an identical manner to test samples, and are used to monitor and control the accuracy and precision of a test method for a typical sample matrix. RM results are expressed as percent recovery of the target analyte concentration. RM targets may be certified target concentrations provided by the RM supplier, or may be ALS long-term mean values (for empirical test methods).

Sub-Matrix: **Soil/Solid**

CERTIFICATE OF ANALYSIS

Work Order	: **WR2101266**	Page	: 1 of 14
Client	: **Minnow Environmental Inc.**	Laboratory	: Whitehorse - Environmental
Contact	: Pierre Stecko	Account Manager	: Can Dang
Address	: 204 – 1006 Fort Street Victoria BC Canada V8V 3K4	Address	: #12 151 Industrial Road Whitehorse YT Canada Y1A 2V3
Telephone	: 250 595 1627	Telephone	: +1 867 668 6689
Project	: Minnow Environmental Inc Project for Minto MInes WUL Program	Date Samples Received	: 15-Sep-2021 15:14
PO	: ----	Date Analysis Commenced	: 12-Nov-2021
C-O-C number	: ----	Issue Date	: 03-Dec-2021 14:33
Sampler	: LBO, SLA		
Site	: ----		
Quote number	: Q79833 - Minnow/Minto		
No. of samples received	: 16		
No. of samples analysed	: 16		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Caleb Deroche	Lab Analyst	Metals, Burnaby, British Columbia
Ragini Saini	Lab Assistant	Metals, Burnaby, British Columbia
Robin Weeks	Team Leader - Metals	Metals, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
%	percent
mg/kg	milligrams per kilogram
mg/kg wwt	milligrams per kilogram wet weight

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

QUALITY CONTROL INTERPRETIVE REPORT

Work Order	: **WR2101266**	Page	: 1 of 13
Client	: **Minnow Environmental Inc.**	Laboratory	: Whitehorse - Environmental
Contact	: Pierre Stecko	Account Manager	: Can Dang
Address	: 204 – 1006 Fort Street Victoria BC Canada V8V 3K4	Address	: #12 151 Industrial Road Whitehorse, Yukon Canada Y1A 2V3
Telephone	: ----	Telephone	: +1 867 668 6689
Project	: Minnow Environmental Inc Project for Minto MInes WUL Program	Date Samples Received	: 15-Sep-2021 15:14
PO	: ----	Issue Date	: 03-Dec-2021 14:33
C-O-C number	: ----		
Sampler	: LBO, SLA		
Site	: ----		
Quote number	: Q79833 - Minnow/Minto		
No. of samples received	: 16		
No. of samples analysed	: 16		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- No Analysis Holding Time Outliers exist.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 00:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 00:00 is used for calculation purposes.

Legend & Qualifier Definitions

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Biota**

Evaluation: × = *QC frequency outside specification*; ✓ = *QC frequency within specification.*

Quality Control Sample Type			Count		Frequency (%)		
Analytical Methods	*Method*	*QC Lot #*	*QC*	*Regular*	*Actual*	*Expected*	*Evaluation*

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Moisture Content by Gravimetry (Biopsy)	E144A Vancouver - Environmental	Biota	Puget Sound Water Quality Authority/CCME PHC in Soil - Tier 1	This analysis is carried out gravimetrically by drying the sample at < 60 deg. C for a minimum of three days.
Metals by CRC ICPMS (DRY units, Biopsy)	E475 Vancouver - Environmental	Biota	EPA 200.3/6020B (mod)	Samples are digested with nitric acid, hydrochloric acid, and hydrogen peroxide. Analysis is by Collision/Reaction Cell ICPMS: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.
Metals in Biota by CRC ICPMS (WET units, Biopsy)	E475A Vancouver - Environmental	Biota	EPA 200.3/6020B (mod)	Samples are digested with nitric acid, hydrochloric acid, and hydrogen peroxide. Analysis is by Collision/Reaction Cell ICPMS. Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.
Mercury in Biota by CVAAS (DRY units, Biopsy)	E512 Vancouver - Environmental	Biota	EPA 200.3/1631E (mod)	Samples are digested with nitric acid, hydrochloric acid, and hydrogen peroxide. Analysis is by CVAAS.
Mercury in Biota by CVAAS (WET units, Biopsy)	E512A Vancouver - Environmental	Biota	EPA 200.3/1631E (mod)	Samples are homogenized digested with nitric acid, hydrochloric acid, and hydrogen peroxide. Analysis is by CVAAS.

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Metals and Mercury Biota Digestion (Biopsy)	EP475 Vancouver - Environmental	Biota	EPA 200.3/200.8 (mod)	Samples are digested with nitric acid, hydrochloric acid, and hydrogen peroxide. Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits
- Reference Material (RM) Report; Recovery and Acceptance Limits
- Method Blank (MB) Report; Recovery and Acceptance Limits
- Laboratory Control Sample (LCS) Report; Recovery and Acceptance Limits

Ragini Saini	Lab Assistant	Metals, Burnaby, British Columbia
Robin Weeks	Team Leader - Metals	Metals, Burnaby, British Columbia

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percentage Difference
# = Indicates a QC result that did not meet the ALS DQO.

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Sub-Matrix: **Biota**

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Biota**

Reference Material (RM) Report

A Reference Material (RM) is a homogenous material with known and well-established analyte concentrations. RMs are processed in an identical manner to test samples, and are used to monitor and control the accuracy and precision of a test method for a typical sample matrix. RM results are expressed as percent recovery of the target analyte concentration. RM targets may be certified target concentrations provided by the RM supplier, or may be ALS long-term mean values (for empirical test methods).

Sub-Matrix: **Biota**

APPENDIX D

BENTHIC INVERTEBRATE COMMUNITY DATA

Tables & Figures

Figure D.1: Heatmap of Lowest Practical Level Benthic Invertebrate Bray-Curtis Dissimilarity among Lower Minto Creek and Reference Areas, Minto Mine AEMP, 2021

Notes: LWC = lower Wolverine Creek (reference), LBC = lower Big Creek (reference), LMC = Lower Minto Creek (exposed).

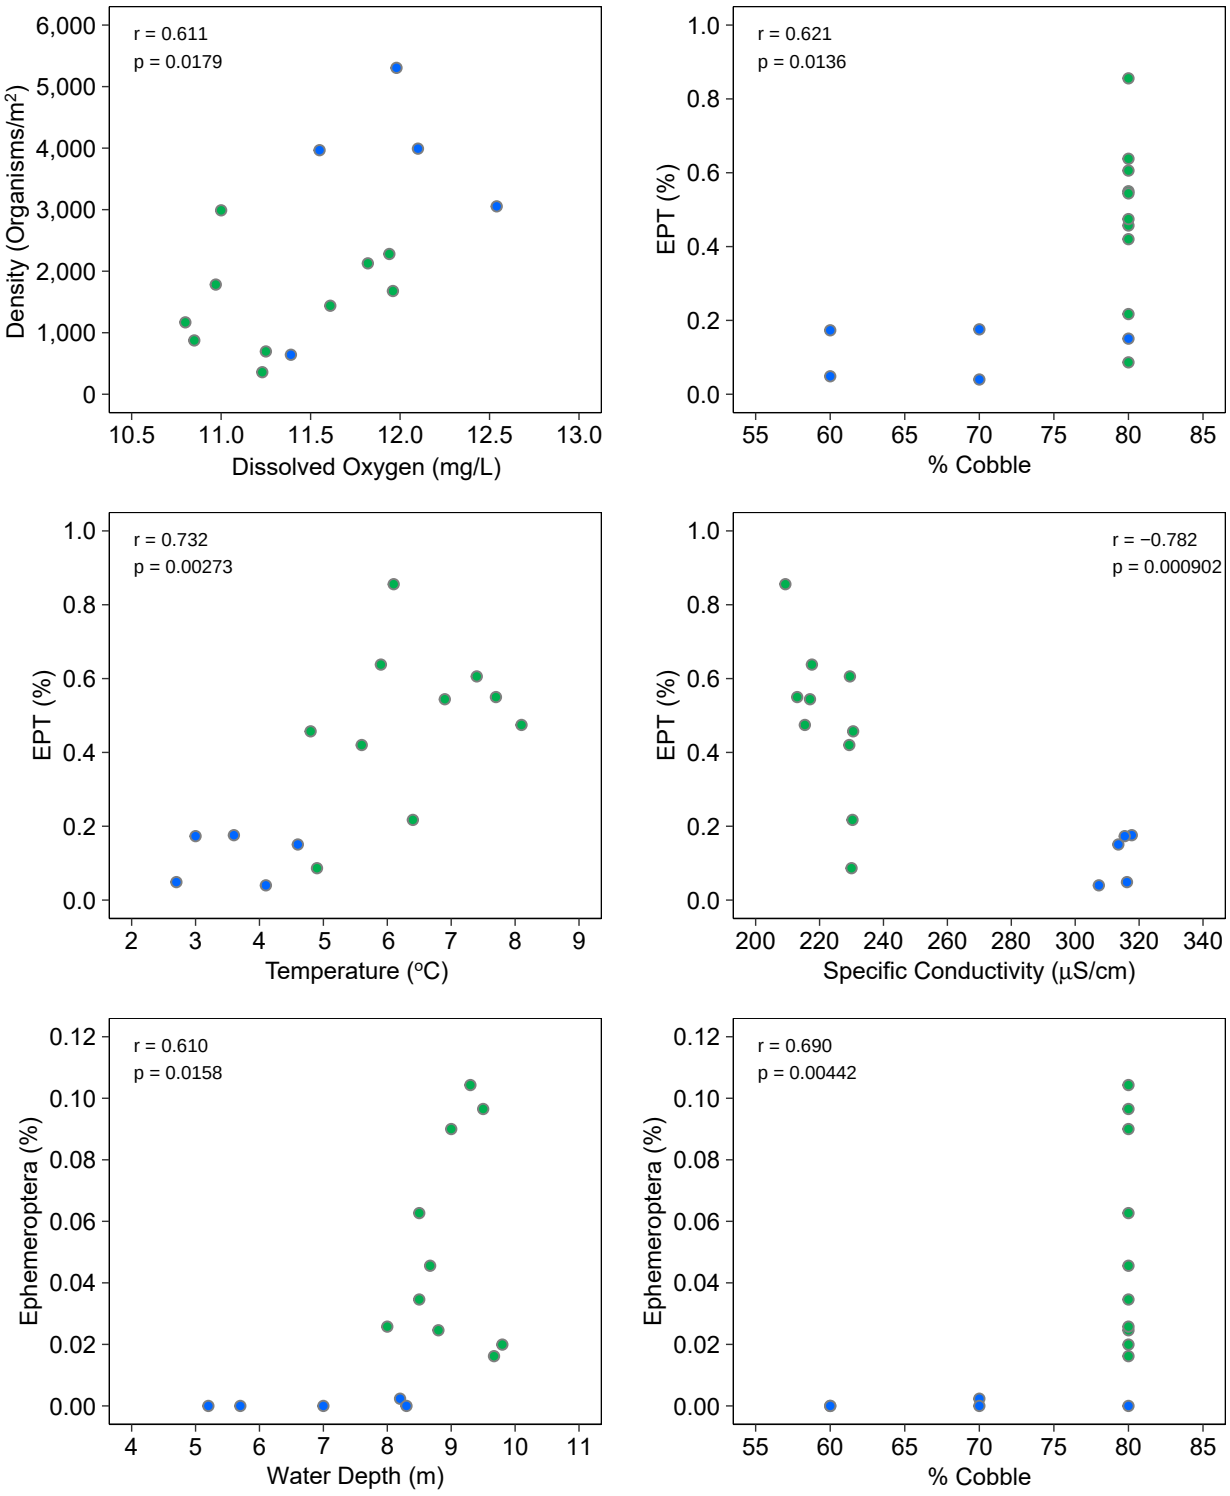

Figure D.2: Scatterplots of Significant Spearman's Correlation Relationships Between Benthic Invertebrate Environmental Measurements and Biological Endpoints, Minto Mine AEMP, 2021

Notes: Green dots represent reference stations (LWC, LBC) and blue dots represent mine−exposed stations (LMC). EPT = Ephemeroptera, Plecoptera, Trichoptera. Correlations that were significantly different (p−value <0.05) and strongly correlated between environmental measures and biological endpoints (rs >= 0.6 or <=−0.6) were presented.)

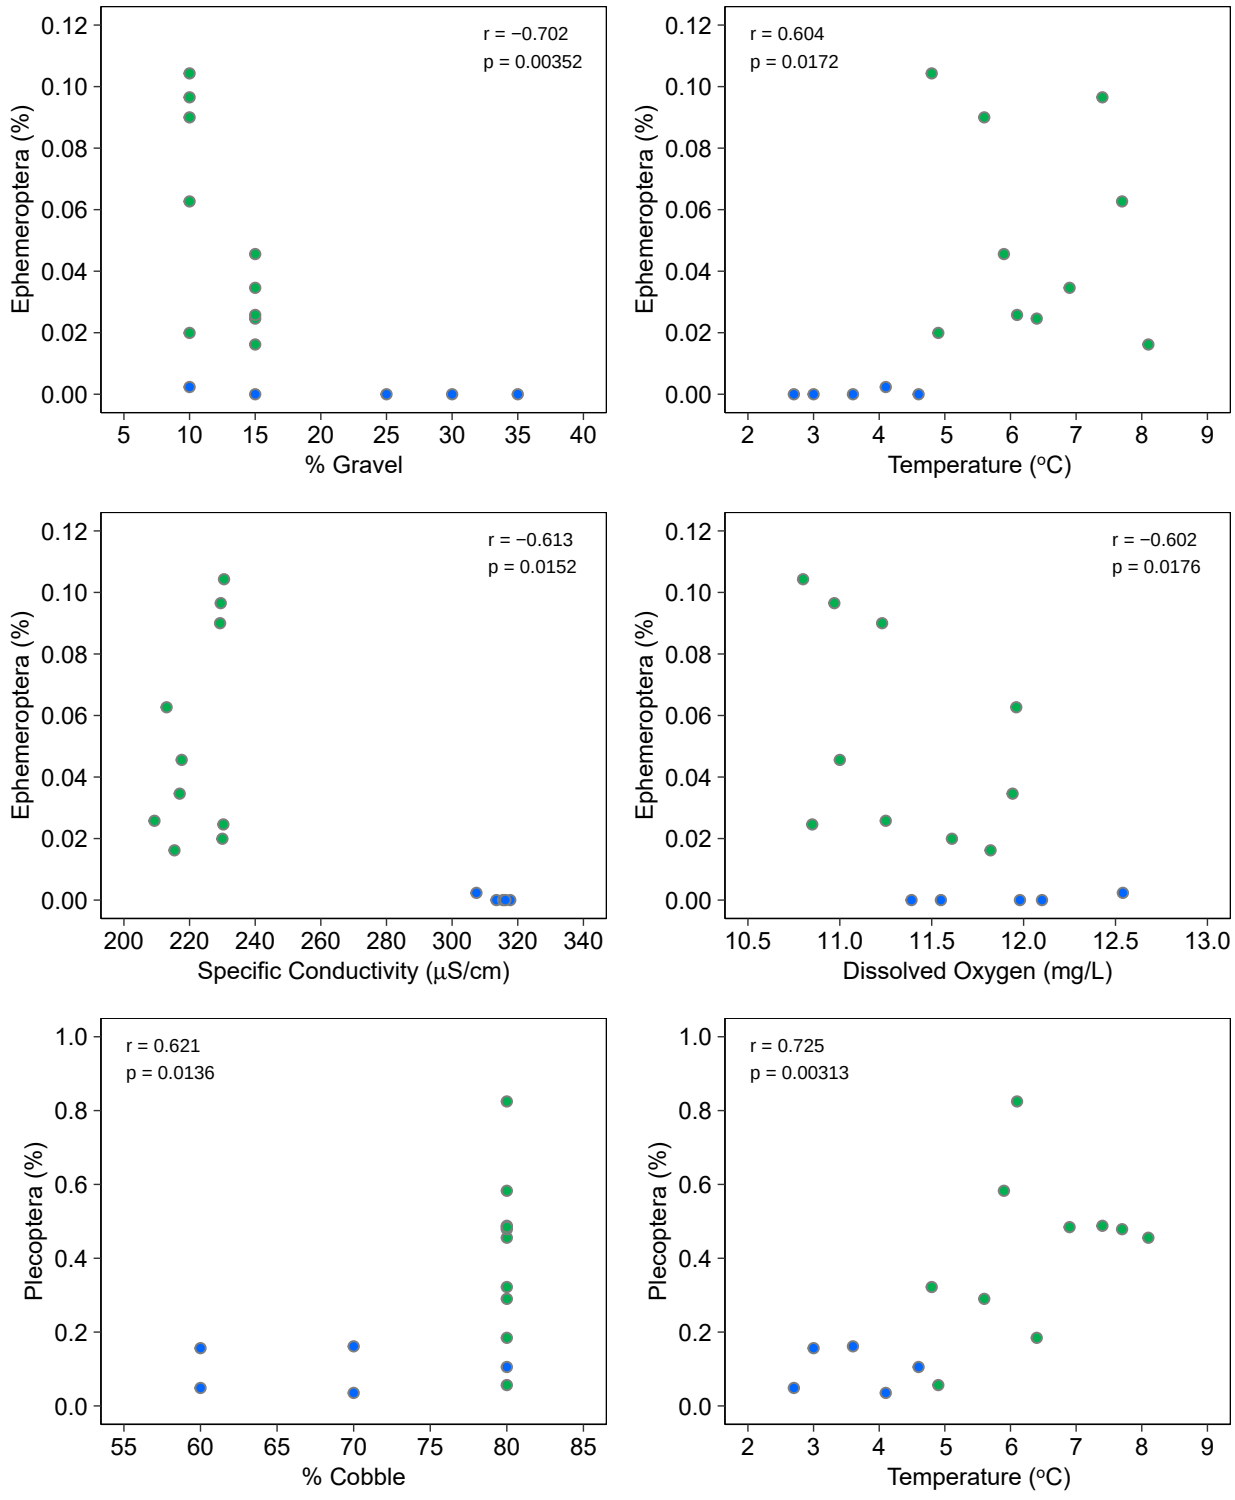

Figure D.2: Scatterplots of Significant Spearman's Correlation Relationships Between Benthic Invertebrate Environmental Measurements and Biological Endpoints, Minto Mine AEMP, 2021

Notes: Green dots represent reference stations (LWC, LBC) and blue dots represent mine−exposed stations (LMC). EPT = Ephemeroptera, Plecoptera, Trichoptera. Correlations that were significantly different (p−value <0.05) and strongly correlated between environmental measures and biological endpoints (rs >= 0.6 or <=−0.6) were presented.)

Notes: Intermediate axis length is the second longest axis on a cobble. Embeddedness refers to how deeply the cobble is surrounded or buried by other substrate. Embeddedness was measured for every 10th (n=10) cobble.

Sample Reception

On September 22, 2021, Cordillera Consulting received 15 benthic samples from Minnow Environmental. When samples arrived to Cordillera Consulting, exterior packaging was initially inspected for damage or wet spots that would have indicated damage to the interior containers.

Samples were logged into a proprietary software database (INSTAR1) where the clients assigned sample name was recorded along with a Cordillera Consulting (CC) number for cross-reference. Each sample was checked to ensure that all sites and replicates recorded on field sheets or packing lists were delivered intact and with adequate preservative. Any missing, mislabelled or extra samples were reported to the client immediately to confirm the total numbers and correct names on the sample jars. The client representative was notified of the arrival of the shipment and provided a sample inventory once intake was completed.
See table below for sample inventory:

Table 1: Summary of sample information including Cordillera Consulting (CC) number

Site	Sample	CC#	Date	Size	# of Jars

Sample Sorting

- Using a gridded Petri dish, fine forceps and a low power stereo-microscope (Olympus, Nikon, Leica) the sorting technicians removed the invertebrates and sorted them into family/orders.
- The sorting technician kept a running tally of total numbers excluding organisms from Porifera, Nemata, Platyhelminthes, Ostracoda, Copepoda, Cladocera and terrestrial drop-ins such as aphids. These organisms were marked for their presence

(given a value of 1) only and left in the sample. They were not included towards the 300-organism subsample count.

- Where specimens are broken or damaged, only heads were counted.
- Subsampling was conducted with the use of a Marchant Box.
- When using the Marchant box, cells were extracted at the same time in the order indicated by a random number table. If the 300th organism was found part way into sorting a cell then the balance of that cell was sorted. If the organism count had not reached 300 by the 50th cell then the entire sample was sorted.
- The total number of cells sorted and the number of organisms removed were recorded manually on a bench sheet and then recorded into INSTAR1
- Organisms were stored in vials containing 80% ethanol and an interior label indicating the site names, date of sampling, site code numbers and portion subsampled. This information was also recorded on the laboratory bench sheet and on INSTAR1.
- The sorted portion of the debris was preserved and labeled separately from the unsorted portion and was tested for sorting efficiency (Sorting Quality Control – Sorting Efficiency). The unsorted portion was also labeled and preserved in separate jars.

Percent sub-sampled and total countable invertebrates pulled from the samples were summarized in the table below.

Table 2: Percent sub-sample and invertebrate count for each sample

Site	Sample	Date	CC#	500 micron fraction	
				% Sampled	# Invertebrates
LMC	Rep 1	10-Sep-21	CC221139	50%	426

Sorting Quality Control - Sorting Efficiency

As a part of Cordillera's laboratory policy, all projects undergo sorting efficiency checks.

- As sorting progresses, 10% of samples were randomly chosen by senior members of the sorting team for resorting.
- All sorters working on a project had at least 1 sample resorted by another sorter.
- An efficiency of 90 % was expected (95% for CABIN samples).
- If 90/95% efficiency was not met, samples from that sorter were resorted.
- To calculated sorting efficiency the following formula was used:

$$\frac{\#OrganismsMissed}{TotalOrganismsFound} * 100 = \%OM$$

Table 3 Summary of sorting efficiency

			Total from Sample	Percent Efficiency
Site - QC, Sample - QC 1, CC# - CC221142, Percent sampled = 100%, Sieve size = 500				
Plecoptera		1		
Chironomidae		6		
	Total:	**7**	**179**	**96%**
Site - QC, Sample - QC 2, CC# - CC221150, Percent sampled = 75%, Sieve size = 500				
Chironomidae		5		
Ephemeroptera		4		
Diptera		1		
Plecoptera		3		
Trichoptera		2		
Oligochaeta		2		
	Total:	**17**	**351**	**95%**

Sorting Quality Control - Sub-Sampling QC

Certain Provincial and Mining projects require additional sorting checks in the form of sub-sampling QC, (Environmental Effects Monitoring (EEM) protocol). This ensured that

any fraction of the total sample that was examined was actually an accurate representation of the number of total organisms. Organisms from the additional sub-samples were not identified; rather total organism count only was compared.

Sub-Sampling efficiency was measured on 10% of the number of sub-sampled samples in the project. Ex. In a project where 50 of 100 total samples were processed through subsampling using a Marchant box, then 10% of 50; or 5 samples were used for sub sampling efficiency.

Sub-Sampling efficiency was performed by fractioning the entire sample into sub-sample percentages. On each sub-sampled portion, a total organism count was recorded and compared to the rest of the sub-samples. In order to pass, all fractions were required to be within 20% of total organism count.

Example: If 300 organisms are found in 10% of the sample, the sorter will continue to sample in 10% fractions until the entire sample is separated. They will then count the total number of organisms in each of the 10 fractions of 10% and compare the organism count.

When divergence is >20% the sorting manager examines for the source of the problem and takes steps to correct it. With the Marchant box, the problem typically rested with how the box is flipped back to the upright position. For this reason, subsampling was performed by experienced employees only. Another common source of error would be the type of debris in the sample. Samples with algae or heavy with periphyton have a higher incident of failure due to clumping than clear samples.

Table 4 Summary of Sub Sample efficiency

Station ID		Organisms in Subsample																				Sorter		Actual Total	Precision		Accuracy	
CC#	Sample Name	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	By	Time		Percent Range		Min	Max
221139	LMC - Rep 1	416	428																			HY	90	844	2.80	2.80	1.42	1.42

Taxonomic Effort

The next procedure was the identification to genus-species level where possible of all the organisms in the sample.

- Identifications were made at the genus/species level for all insect organisms found including Chironomidae (Based on CABIN protocol).
- Non-insect organisms (except those not included in CABIN count) were identified to genus/species where possible and to a minimum of family level with intact and mature specimens.
- The Standard Taxonomic Effort lists compiled by the CABIN manual[1], SAFIT[2] , and PNAMP[3] were used as a guide line for what level of identification to achieve where the condition and maturity of the organism enabled.
- Organisms from the same families/order were kept in separate vials with 80% ethanol and an interior label of printed laser paper.
- Chironomidae was identified to genus/species level where possible and was aided by slide mounts. CMC-10 was used to clear and mount the slide.
- Oligochaetes was identified to family/genus level with the aid of slide mounts. CMC-10 was used to clear and mount the slide.
- Other Annelida (leeches, polychaetes) were identified to the family/genus/species level with undamaged, mature specimens.
- Mollusca was identified to family and genus/species where possible
- Decapoda, Amphipoda and Isopoda were identified at family/genus/species level where possible.
- Bryozoans and Nemata remained at the phylum level
- Hydrachnidae and Cnidaria were identified at the family/genus level where possible.
- When requested, reference collections were made containing at least one individual from each taxa listed. Organisms represented will have been identified to the lowest practical level.
- Reference collection specimens were stored in 55 mm glass vials with screw-cap lids with polyseal inserts (museum quality). They were labeled with taxa name, site code, date identified and taxonomist name. The same information was applied to labels on the slide mounts.

Taxonomists

The taxonomists for this project were certified by the Society of Freshwater Science (SFS) Taxonomic Certification Program at level 2 which is the required certification for CABIN projects:

Scott Finlayson: Group 1 General Arthropods (East/West); Group 2 EPT (East/West); Group 3 Chironomidae (East/West); Group 4 Oligochaeta

Adam Bliss: Group 1 General Arthropods (East/West); Group 2 EPT (East/West); Group 3 Chironomidae
Rita Avery: Group 1 General Arthropods (East/West); Group 2 EPT (East/West)

Taxonomic QC

Taxonomic QC was performed in house by someone other than the original taxonomist.

- Quality control protocol involved complete, blind re-identification and re-enumeration of at least 10% of samples by a second SFS-certified taxonomist.
- Samples for taxonomic quality control were randomly selected and quality control procedures were conducted as the project progresses through the laboratories.

- The second (QC) taxonomist will calculate and record four types of errors:
    1. Misidentification error
    2. Enumeration error
    3. Questionable taxonomic resolution error
    4. Insufficient taxonomic resolution error

The QC coordinator then calculates the following estimates of taxonomic precision.

1. The percent total identification error rate is calculated as:

$$\frac{Sum\ of\ incorrect\ identifications}{total\ organisms\ counted\ in\ audit} * (100)$$

The average total identification error rate of audited samples did not exceed 5%. All samples that exceed a 5% error rate were re-evaluated to determine whether repeated errors or patterns in error contributed.

2. The percent difference in enumeration (PDE) to quantify the consistency of specimen counts.

$$PDE = \frac{|n_1 - n_2|}{n_1 + n_2} x100$$

3. The percent taxonomic disagreement (PTD) to quantify the shared precision between two sets of identifications.

$$PTD = \left(1 - \left[\frac{a}{N}\right]\right) x100$$

4. Bray Curtis dissimilarity Index to quantify the differences in identifications.

$$BC_{ij} = 1 - \frac{2C_{ij}}{S_j + S_i}$$

Error Summary

All samples report errors within the acceptable limits for CABIN Laboratory methods (less than 5% error).

Table 5 Summary of taxonomic error following QC

Site	Taxa Identified	% Error	PDE	PTD	Bray - Curtis Dissimilarity index
Site - LMC, Sample - Rep 1, CC# - CC221139, Percent sampled = 50%, Sieve size = 500	427	0.00	0.11723329	0.46838407	0.003517
Site - LWC, Sample - Rep 1, CC# - CC221144, Percent sampled = 100%, Sieve size = 500	245	0.00	0.20449898	0.40816327	0.00204499

There will always be disagreements between taxonomists regarding the degree of taxonomic resolution in immature specimens and when laboratories make use of different keys for certain groups (Mollusks is an especially disputed group). It is always possible that some taxa found by the original taxonomist were overlooked in QC.

All of the Taxonomic QC samples that were observed passed testing according to the CABIN misidentification protocols. See the tables below for results from taxonomic QC audit.

Error Rationale

Site - LMC, Sample - Rep 1, CC# - CC221139, Percent sampled = 50%, Sieve size = 500	Laboratory Count	QC Audit Count	Agreement	Misidentification	Questionable Taxonomic Resolution	Enumeration	Insufficient Taxonomic Resolution	Comments

Taxonomic Keys

Below is a reference list of taxonomic keys utilized by taxonomists at Cordillera Consulting. Cordillera taxonomists routinely seek out new literature to ensure the most accurate identification keys are being utilized. This is not reflective of the exhaustive list of resources that we use for identification. A more complete list of taxonomic resources can be found at Southwest Association of Freshwater Invertebrate Taxonomists. (2015).

Client	: **Minto Explorations Ltd.**	Laboratory	: Whitehorse - Environmental
Contact	: Laura Battsion	Account Manager	: Heather McKenzie
Address	: 4838 Richard Rd. SW, Suite 300 Calgary AB Canada T3E 6L1	Address	: #12 151 Industrial Road Whitehorse YT Canada Y1A 2V3
Telephone	: ----	Telephone	: +1 867 668 6689
Project	: Minto Mine - WRMP	Date Samples Received	: 05-Jan-2021 09:00
PO	: ----	Date Analysis Commenced	: 08-Mar-2021
C-O-C number	: ----	Issue Date	: 15-Mar-2021 16:50
Sampler	: ----		
Site	: ----		
Quote number	: Q78311		
No. of samples received	: 10		
No. of samples analysed	: 10		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Erin Gatdula	Account Manager Assistant	Internal Subcontracting, North Vancouver, British Columbia
Kaitlyn Gardner	Account Manager Assistant	Internal Subcontracting, North Vancouver, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
%	percent
kg	kilograms
pH units	pH units
ppm	parts per million
tCaCO3/kt	tons CaCO3 per kiloton

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

PO	: ----	Date Analysis Commenced	: 28-Feb-2021
C-O-C number	: ----	Issue Date	: 01-Mar-2021 17:52
Sampler	: ----		
Site	: ----		
Quote number	: Q78311		
No. of samples received	: 4		
No. of samples analysed	: 4		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Erin Gatdula	Account Manager Assistant	Internal Subcontracting, North Vancouver, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
%	percent
kg	kilograms
pH units	pH units
ppm	parts per million
tCaCO3/kt	tons CaCO3 per kiloton

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical results in reports identified as "Preliminary Report" are considered authorized for use.

Analytical Results

CERTIFICATE VA21009437

Project: WR2100022

This report is for 4 samples of Other submitted to our lab in Vancouver, BC, Canada on 13-JAN-2021.

The following have access to data associated with this certificate:

ALSE VANCOUVER WEBTRIEVE SOFTWARE DEVELOPMENT GROUP	ALSEV DATASUBLET	HEATHER MCKENZIE

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
DISP-01	Disposal of all sample fractions
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize up to 250g 85% <75 um

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
OA-VOL08m	Modified NP	
S-IR08	Total Sulphur (IR Spectroscopy)	LECO
OA-ELE07	Paste pH	
S-GRA06	Sulfate Sulfur-carbonate leach	WST-SEQ
S-CAL06	Sufide Sulfur (calculated)	LECO
C-GAS05	Inorganic Carbon (CO2)	
S-GRA06a	Sulfate Sulfur (HCl leachable)	WST-SEQ
ME-MS41	Ultra Trace Aqua Regia ICP-MS	

This is the Final Report and supersedes any preliminary report with this certificate number.Results apply to samples as submitted.All pages of this report have been checked and approved for release.

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Erin Gatdula	Account Manager Assistant	Internal Subcontracting, North Vancouver, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
%	percent
kg	kilograms
pH units	pH units
ppm	parts per million
tCaCO3/kt	tons CaCO3 per kiloton

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

No. of samples analysed	: 1		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 15:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 15:00 is used for calculation purposes.

Matrix: **Soil/Solid**

Evaluation: × = Holding time exceedance ; ✓ = Within Holding Time

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

- **No Quality Control data available for this section.**

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Inorganic Carbon by Coulometer	C-GAS05 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals C-GAS05	Determine Total Inorganic Carbon (TIC) by using diluted perchloric acid to react with metal carbonate and yield carbon dioxide. Concentration of CO_2 is determined by coulometer.
51 Elements by Aqua Regia digestion and ICP-AES/MS	ME-MS41 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals ME-MS41	A prepared sample is digested with aqua regia in a graphite heating block. After cooling, the resulting solution is diluted to with deionized water, mixed and analyzed by ICP-AES. Samples are then analyzed by ICP-MS for the remaining suite of elements.
Saturated Paste pH	OA-ELE07 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals OA-ELE07	Sample mix with water in 1:1 ratio to make a paste, pH is then determined.
Acid Base Accounting (Modified Sobek)	OA-VOL08m ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals OA-VOL08m	Determine the acid generation power of a sample as tonne $CaCO_3$ per kilo-tonne using modified Sobek method
Sulfide S (as S) Calc. (Total-S - SO4-S)	S-CAL06 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals S-CAL06	Sulfide Sulfur (as S) is calculated by subtracting the Carbonate Leachable Sulfate Sulfur (as S) from the Total Sulfur (as S) obtained from combustion.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Sulfates by NaCO3 Leaching and Gravimetry	S-GRA06 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals S-GRA06	A preppared sample is heated with diluted Na□CO□ and then filtered. The sulfate in the filtrate is precipitated with BaCl2 in a dilute HCl. The BaSO4 precipitate is filtered, ignited, weighed and the Sulfate Sulfur is determined (as S).
Sulfates by HCl Leaching and Gravimetry	S-GRA06A ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals S-GRA06A	A prepared sample is heated with dilute HCl and then filtered. The sulfate in the filtrate is precipitated with BaCl2 in a dilute HCl. The BaSO4 precipitate is filtered, ignited, weighed and the Sulfate Sulfur is determined (as S).
Total Sulfur by Combustion and IR	S-IR08 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals S-IR08	A prepared sample is heated to approximately 1350°C in an induction furnace with oxygen stream. Sulfur dioxide released from the sample are measured by IR (Leco analyzer) and the Total Sulfur result is provided.
Received Sample Weight	WEI-21 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals WEI-21	Weigh out sample received.

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percentage Difference
# = Indicates a QC result that did not meet the ALS DQO.

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
%	percent
kg	kilograms
pH units	pH units
ppm	parts per million
tCaCO3/kt	tons CaCO3 per kiloton

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

No. of samples analysed	: 1		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 00:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 00:00 is used for calculation purposes.

Matrix: **Soil/Solid**

Evaluation: × = Holding time exceedance ; ✓ = Within Holding Time

- **No Quality Control data available for this section.**

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Inorganic Carbon by Coulometer	C-GAS05 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals C-GAS05	Determine Total Inorganic Carbon (TIC) by using diluted perchloric acid to react with metal carbonate and yield carbon dioxide. Concentration of CO_2 is determined by coulometer.
51 Elements by Aqua Regia digestion and ICP-AES/MS	ME-MS41 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals ME-MS41	A prepared sample is digested with aqua regia in a graphite heating block. After cooling, the resulting solution is diluted to with deionized water, mixed and analyzed by ICP-AES. Samples are then analyzed by ICP-MS for the remaining suite of elements.
Saturated Paste pH	OA-ELE07 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals OA-ELE07	Sample mix with water in 1:1 ratio to make a paste, pH is then determined.
Acid Base Accounting (Modified Sobek)	OA-VOL08m ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals OA-VOL08m	Determine the acid generation power of a sample as tonne $CaCO_3$ per kilo-tonne using modified Sobek method
Sulfide S (as S) Calc. (Total-S - SO4-S)	S-CAL06 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals S-CAL06	Sulfide Sulfur (as S) is calculated by subtracting the Carbonate Leachable Sulfate Sulfur (as S) from the Total Sulfur (as S) obtained from combustion.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Sulfates by NaCO3 Leaching and Gravimetry	S-GRA06 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals S-GRA06	A preppared sample is heated with diluted Na□CO□ and then filtered. The sulfate in the filtrate is precipitated with BaCl2 in a dilute HCl. The BaSO4 precipitate is filtered, ignited, weighed and the Sulfate Sulfur is determined (as S).
Sulfates by HCl Leaching and Gravimetry	S-GRA06A ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals S-GRA06A	A prepared sample is heated with dilute HCl and then filtered. The sulfate in the filtrate is precipitated with BaCl2 in a dilute HCl. The BaSO4 precipitate is filtered, ignited, weighed and the Sulfate Sulfur is determined (as S).
Total Sulfur by Combustion and IR	S-IR08 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals S-IR08	A prepared sample is heated to approximately 1350°C in an induction furnace with oxygen stream. Sulfur dioxide released from the sample are measured by IR (Leco analyzer) and the Total Sulfur result is provided.
Received Sample Weight	WEI-21 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals WEI-21	Weigh out sample received.

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits
- Reference Material (RM) Report; Recovery and Acceptance Limits
- Method Blank (MB) Report; Recovery and Acceptance Limits
- Laboratory Control Sample (LCS) Report; Recovery and Acceptance Limits

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percentage Difference
# = Indicates a QC result that did not meet the ALS DQO.

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Kaitlyn Gardner	Account Manager Assistant	Internal Subcontracting, North Vancouver, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
%	percent
kg	kilograms
pH units	pH units
ppm	parts per million
tCaCO3/kt	tons CaCO3 per kiloton

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Kaitlyn Gardner	Account Manager Assistant	Internal Subcontracting, North Vancouver, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
%	percent
kg	kilograms
pH units	pH units
ppm	parts per million
tCaCO3/kt	tons CaCO3 per kiloton

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Sampler	: ----		
Site	: ----		
Quote number	: Q54721-Standing Offer		
No. of samples received	: 4		
No. of samples analysed	: 4		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 00:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 00:00 is used for calculation purposes.

Matrix: **Soil/Solid**

Evaluation: × = Holding time exceedance ; ✓ = Within Holding Time

Quality Control Parameter Frequency Compliance

- **No Quality Control data available for this section.**

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Inorganic Carbon by Coulometer	C-GAS05 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals C-GAS05	Determine Total Inorganic Carbon (TIC) by using diluted perchloric acid to react with metal carbonate and yield carbon dioxide. Concentration of CO_2 is determined by coulometer.
51 Elements by Aqua Regia digestion and ICP-AES/MS	ME-MS41 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals ME-MS41	A prepared sample is digested with aqua regia in a graphite heating block. After cooling, the resulting solution is diluted to with deionized water, mixed and analyzed by ICP-AES. Samples are then analyzed by ICP-MS for the remaining suite of elements.
Saturated Paste pH	OA-ELE07 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals OA-ELE07	Sample mix with water in 1:1 ratio to make a paste, pH is then determined.
Acid Base Accounting (Modified Sobek)	OA-VOL08m ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals OA-VOL08m	Determine the acid generation power of a sample as tonne $CaCO_3$ per kilo-tonne using modified Sobek method
Sulfide S (as S) Calc. (Total-S - SO4-S)	S-CAL06 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals S-CAL06	Sulfide Sulfur (as S) is calculated by subtracting the Carbonate Leachable Sulfate Sulfur (as S) from the Total Sulfur (as S) obtained from combustion.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Sulfates by NaCO3 Leaching and Gravimetry	S-GRA06 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals S-GRA06	A preppared sample is heated with diluted Na□CO□ and then filtered. The sulfate in the filtrate is precipitated with BaCl2 in a dilute HCl. The BaSO4 precipitate is filtered, ignited, weighed and the Sulfate Sulfur is determined (as S).
Sulfates by HCl Leaching and Gravimetry	S-GRA06A ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals S-GRA06A	A prepared sample is heated with dilute HCl and then filtered. The sulfate in the filtrate is precipitated with BaCl2 in a dilute HCl. The BaSO4 precipitate is filtered, ignited, weighed and the Sulfate Sulfur is determined (as S).
Total Sulfur by Combustion and IR	S-IR08 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals S-IR08	A prepared sample is heated to approximately 1350°C in an induction furnace with oxygen stream. Sulfur dioxide released from the sample are measured by IR (Leco analyzer) and the Total Sulfur result is provided.
Received Sample Weight	WEI-21 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals WEI-21	Weigh out sample received.

No. of samples received	: 4		
No. of samples analysed	: 4		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits
- Reference Material (RM) Report; Recovery and Acceptance Limits
- Method Blank (MB) Report; Recovery and Acceptance Limits
- Laboratory Control Sample (LCS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Kaitlyn Gardner	Account Manager Assistant	Internal Subcontracting, North Vancouver, British Columbia

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percentage Difference
# = Indicates a QC result that did not meet the ALS DQO.

CERTIFICATE VA21096661

Project: WR2100333

This report is for 4 samples of Crushed Rock submitted to our lab in Vancouver, BC, Canada on 20-APR-2021.

The following have access to data associated with this certificate:

ALSE VANCOUVER WEBTRIEVE SOFTWARE DEVELOPMENT GROUP	ALSEV DATASUBLET	HEATHER MCKENZIE

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21	Sample logging - ClientBarCode
PUL-31	Pulverize up to 250g 85% <75 um
DISP-01	Disposal of all sample fractions
SPL-21	Split sample - riffle splitter

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
ME-MS41	Ultra Trace Aqua Regia ICP-MS	
OA-VOL08m	Modified NP	
S-IR08	Total Sulphur (IR Spectroscopy)	LECO
OA-ELE07	Paste pH	
S-GRA06	Sulfate Sulfur-carbonate leach	WST-SEQ
S-CAL06	Sufide Sulfur (calculated)	LECO
C-GAS05	Inorganic Carbon (CO2)	
S-GRA06a	Sulfate Sulfur (HCl leachable)	WST-SEQ

This is the Final Report and supersedes any preliminary report with this certificate number.Results apply to samples as submitted.All pages of this report have been checked and approved for release.

CERTIFICATE OF ANALYSIS VA21096661

CERTIFICATE COMMENTS

ANALYTICAL COMMENTS

Applies to Method: Gold determinations by this method are semi-quantitative due to the small sample weight used (0.5g).
ME-MS41

LABORATORY ADDRESSES

Applies to Method: Processed at ALS Vancouver located at 2103 Dollarton Hwy, North Vancouver, BC, Canada.

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Kaitlyn Gardner	Account Manager Assistant	Internal Subcontracting, North Vancouver, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
%	percent
kg	kilograms
pH units	pH units
ppm	parts per million
tCaCO3/kt	tons CaCO3 per kiloton

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

No. of samples received	: 1		
No. of samples analysed	: 1		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 00:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 00:00 is used for calculation purposes.

Matrix: **Soil/Solid**

Evaluation: × = Holding time exceedance ; ✓ = Within Holding Time

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Inorganic Carbon by Coulometer	C-GAS05 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals C-GAS05	Determine Total Inorganic Carbon (TIC) by using diluted perchloric acid to react with metal carbonate and yield carbon dioxide. Concentration of CO_2 is determined by coulometer.
51 Elements by Aqua Regia digestion and ICP-AES/MS	ME-MS41 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals ME-MS41	A prepared sample is digested with aqua regia in a graphite heating block. After cooling, the resulting solution is diluted to with deionized water, mixed and analyzed by ICP-AES. Samples are then analyzed by ICP-MS for the remaining suite of elements.
Saturated Paste pH	OA-ELE07 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals OA-ELE07	Sample mix with water in 1:1 ratio to make a paste, pH is then determined.
Acid Base Accounting (Modified Sobek)	OA-VOL08m ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals OA-VOL08m	Determine the acid generation power of a sample as tonne $CaCO_3$ per kilo-tonne using modified Sobek method
Sulfide S (as S) Calc. (Total-S - SO4-S)	S-CAL06 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals S-CAL06	Sulfide Sulfur (as S) is calculated by subtracting the Carbonate Leachable Sulfate Sulfur (as S) from the Total Sulfur (as S) obtained from combustion.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Sulfates by NaCO3 Leaching and Gravimetry	S-GRA06 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals S-GRA06	A preppared sample is heated with diluted Na□CO□ and then filtered. The sulfate in the filtrate is precipitated with BaCl2 in a dilute HCl. The BaSO4 precipitate is filtered, ignited, weighed and the Sulfate Sulfur is determined (as S).
Sulfates by HCl Leaching and Gravimetry	S-GRA06A ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals S-GRA06A	A prepared sample is heated with dilute HCl and then filtered. The sulfate in the filtrate is precipitated with BaCl2 in a dilute HCl. The BaSO4 precipitate is filtered, ignited, weighed and the Sulfate Sulfur is determined (as S).
Total Sulfur by Combustion and IR	S-IR08 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals S-IR08	A prepared sample is heated to approximately 1350°C in an induction furnace with oxygen stream. Sulfur dioxide released from the sample are measured by IR (Leco analyzer) and the Total Sulfur result is provided.
Received Sample Weight	WEI-21 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals WEI-21	Weigh out sample received.

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percentage Difference
# = Indicates a QC result that did not meet the ALS DQO.

CERTIFICATE VA21099843

Project: WR2100353

This report is for 1 sample of Other submitted to our lab in Vancouver, BC, Canada on 22-APR-2021.

The following have access to data associated with this certificate:

ALSE VANCOUVER WEBTRIEVE SOFTWARE DEVELOPMENT GROUP	ALSEV DATASUBLET	HEATHER MCKENZIE

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
DISP-01	Disposal of all sample fractions
LOG-21	Sample logging - ClientBarCode
PUL-31	Pulverize up to 250g 85% <75 um
SPL-21	Split sample - riffle splitter

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
OA-VOL08m	Modified NP	
S-IR08	Total Sulphur (IR Spectroscopy)	LECO
OA-ELE07	Paste pH	
S-GRA06	Sulfate Sulfur-carbonate leach	WST-SEQ
S-CAL06	Sufide Sulfur (calculated)	LECO
C-GAS05	Inorganic Carbon (CO2)	
S-GRA06a	Sulfate Sulfur (HCl leachable)	WST-SEQ
ME-MS41	Ultra Trace Aqua Regia ICP-MS	

This is the Final Report and supersedes any preliminary report with this certificate number.Results apply to samples as submitted.All pages of this report have been checked and approved for release.

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Kaitlyn Gardner	Account Manager Assistant	Internal Subcontracting, North Vancouver, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
%	percent
kg	kilograms
pH units	pH units
ppm	parts per million
tCaCO3/kt	tons CaCO3 per kiloton

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

No. of samples received	: 4		
No. of samples analysed	: 4		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 00:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 00:00 is used for calculation purposes.

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Inorganic Carbon by Coulometer	C-GAS05 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals C-GAS05	Determine Total Inorganic Carbon (TIC) by using diluted perchloric acid to react with metal carbonate and yield carbon dioxide. Concentration of CO_2 is determined by coulometer.
51 Elements by Aqua Regia digestion and ICP-AES/MS	ME-MS41 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals ME-MS41	A prepared sample is digested with aqua regia in a graphite heating block. After cooling, the resulting solution is diluted to with deionized water, mixed and analyzed by ICP-AES. Samples are then analyzed by ICP-MS for the remaining suite of elements.
Saturated Paste pH	OA-ELE07 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals OA-ELE07	Sample mix with water in 1:1 ratio to make a paste, pH is then determined.
Acid Base Accounting (Modified Sobek)	OA-VOL08m ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals OA-VOL08m	Determine the acid generation power of a sample as tonne $CaCO_3$ per kilo-tonne using modified Sobek method
Sulfide S (as S) Calc. (Total-S - SO4-S)	S-CAL06 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals S-CAL06	Sulfide Sulfur (as S) is calculated by subtracting the Carbonate Leachable Sulfate Sulfur (as S) from the Total Sulfur (as S) obtained from combustion.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Sulfates by NaCO3 Leaching and Gravimetry	S-GRA06 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals S-GRA06	A preppared sample is heated with diluted Na□CO□ and then filtered. The sulfate in the filtrate is precipitated with BaCl2 in a dilute HCl. The BaSO4 precipitate is filtered, ignited, weighed and the Sulfate Sulfur is determined (as S).
Sulfates by HCl Leaching and Gravimetry	S-GRA06A ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals S-GRA06A	A prepared sample is heated with dilute HCl and then filtered. The sulfate in the filtrate is precipitated with BaCl2 in a dilute HCl. The BaSO4 precipitate is filtered, ignited, weighed and the Sulfate Sulfur is determined (as S).
Total Sulfur by Combustion and IR	S-IR08 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals S-IR08	A prepared sample is heated to approximately 1350°C in an induction furnace with oxygen stream. Sulfur dioxide released from the sample are measured by IR (Leco analyzer) and the Total Sulfur result is provided.
Received Sample Weight	WEI-21 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals WEI-21	Weigh out sample received.

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percentage Difference
# = Indicates a QC result that did not meet the ALS DQO.

CERTIFICATE VA21149199

Project: WR2100574

This report is for 4 samples of Crushed Rock submitted to our lab in Vancouver, BC, Canada on 11-JUN-2021.

The following have access to data associated with this certificate:

ALSE VANCOUVER WEBTRIEVE SOFTWARE DEVELOPMENT GROUP	ALSEV DATASUBLET	HEATHER MCKENZIE

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
DISP-01	Disposal of all sample fractions
LOG-21	Sample logging - ClientBarCode
PUL-31	Pulverize up to 250g 85% <75 um
SPL-21	Split sample - riffle splitter

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
OA-VOL08m	Modified NP	
S-IR08	Total Sulphur (IR Spectroscopy)	LECO
OA-ELE07	Paste pH	
S-GRA06	Sulfate Sulfur-carbonate leach	WST-SEQ
S-CAL06	Sufide Sulfur (calculated)	LECO
C-GAS05	Inorganic Carbon (CO2)	
S-GRA06a	Sulfate Sulfur (HCl leachable)	WST-SEQ
ME-MS41	Ultra Trace Aqua Regia ICP-MS	

This is the Final Report and supersedes any preliminary report with this certificate number.Results apply to samples as submitted.All pages of this report have been checked and approved for release.

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Kaitlyn Gardner	Account Manager Assistant	Internal Subcontracting, North Vancouver, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
%	percent
kg	kilograms
pH units	pH units
ppm	parts per million
tCaCO3/kt	tons CaCO3 per kiloton

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Quote number	: Q54721-Standing Offer		
No. of samples received	: 2		
No. of samples analysed	: 2		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 00:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 00:00 is used for calculation purposes.

Matrix: **Soil/Solid**

Evaluation: × = Holding time exceedance ; ✓ = Within Holding Time

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

- **No Quality Control data available for this section.**

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Inorganic Carbon by Coulometer	C-GAS05 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals C-GAS05	Determine Total Inorganic Carbon (TIC) by using diluted perchloric acid to react with metal carbonate and yield carbon dioxide. Concentration of CO_2 is determined by coulometer.
Total Carbon (TC) by Combustion-IR	C-IR07 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals C-IR07	Sample is heated to 1350ºC in an induction furnace with oxygen stream. Carbon dioxide released from the sample are measured by an IR detection system (Leco analyzer).
51 Elements by Aqua Regia digestion and ICP-AES/MS	ME-MS41 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals ME-MS41	A prepared sample is digested with aqua regia in a graphite heating block. After cooling, the resulting solution is diluted to with deionized water, mixed and analyzed by ICP-AES. Samples are then analyzed by ICP-MS for the remaining suite of elements.
Saturated Paste pH	OA-ELE07 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals OA-ELE07	Sample mix with water in 1:1 ratio to make a paste, pH is then determined.
Acid Base Accounting (MEND 1991)	OA-VOL08mn ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals OA-VOL08mn	Determine the acid generation power of a sample as tonne $CaCO_3$ per kilo-tonne using MEND 1991 method.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Sulfide S (as S) Calc. (Total-S - SO4-S)	S-CAL06 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals S-CAL06	Sulfide Sulfur (as S) is calculated by subtracting the Carbonate Leachable Sulfate Sulfur (as S) from the Total Sulfur (as S) obtained from combustion.
Sulfates by NaCO3 Leaching and Gravimetry	S-GRA06 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals S-GRA06	A preppared sample is heated with diluted Na□CO□ and then filtered. The sulfate in the filtrate is precipitated with BaCl2 in a dilute HCl. The BaSO4 precipitate is filtered, ignited, weighed and the Sulfate Sulfur is determined (as S).
Sulfates by HCl Leaching and Gravimetry	S-GRA06A ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals S-GRA06A	A prepared sample is heated with dilute HCl and then filtered. The sulfate in the filtrate is precipitated with BaCl2 in a dilute HCl. The BaSO4 precipitate is filtered, ignited, weighed and the Sulfate Sulfur is determined (as S).
Total Sulfur by Combustion and IR	S-IR08 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals S-IR08	A prepared sample is heated to approximately 1350°C in an induction furnace with oxygen stream. Sulfur dioxide released from the sample are measured by IR (Leco analyzer) and the Total Sulfur result is provided.
Received Sample Weight	WEI-21 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals WEI-21	Weigh out sample received.

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percentage Difference
# = Indicates a QC result that did not meet the ALS DQO.

OCTOBER 2015 FRONT

Failure to complete all portions of this form may delay analysis. Please fill in this form LEGIBLY. By the use of this form the user acknowledges and agrees with the Terms and Conditions as specified on the back page of the white - report copy.

1. If any water samples are taken from a **Regulated Drinking Water (DW) System**, please submit using an **Authorized DW COC form**.

ALS Environmental

CERTIFICATE OF ANALYSIS

Work Order	: **WR2101033**	Page	: 1 of 5
Client	: **Minto Explorations Ltd.**	Laboratory	: Whitehorse - Environmental
Contact	: Minto Environment - Coordinator	Account Manager	: Heather McKenzie
Address	: 4838 Richard Rd. SW, Suite 300 Calgary AB Canada T3E 6L1	Address	: #12 151 Industrial Road Whitehorse YT Canada Y1A 2V3
Telephone	: ----	Telephone	: +1 867 668 6689
Project	: Minto Mine - WRMP	Date Samples Received	: 12-Aug-2021 14:00
PO	: ----	Date Analysis Commenced	: 23-Sep-2021
C-O-C number	: ----	Issue Date	: 01-Oct-2021 17:44
Sampler	: ----		
Site	: ----		
Quote number	: Q54721-Standing Offer		
No. of samples received	: 3		
No. of samples analysed	: 3		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Kaitlyn Gardner	Account Manager Assistant	Internal Subcontracting, North Vancouver, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
%	percent
kg	kilograms
pH units	pH units
ppm	parts per million
tCaCO3/kt	tons CaCO3 per kiloton

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Analytical Results

No. of samples analysed	: 3		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 00:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 00:00 is used for calculation purposes.

Matrix: **Soil/Solid**

Evaluation: × = Holding time exceedance ; ✓ = Within Holding Time

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Inorganic Carbon by Coulometer	C-GAS05 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals C-GAS05	Determine Total Inorganic Carbon (TIC) by using diluted perchloric acid to react with metal carbonate and yield carbon dioxide. Concentration of CO_2 is determined by coulometer.
51 Elements by Aqua Regia digestion and ICP-AES/MS	ME-MS41 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals ME-MS41	A prepared sample is digested with aqua regia in a graphite heating block. After cooling, the resulting solution is diluted to with deionized water, mixed and analyzed by ICP-AES. Samples are then analyzed by ICP-MS for the remaining suite of elements.
Saturated Paste pH	OA-ELE07 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals OA-ELE07	Sample mix with water in 1:1 ratio to make a paste, pH is then determined.
Acid Base Accounting (Regular Sobek)	OA-VOL08 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals OA-VOL08	Determine the acid generation power of a sample as tonne $CaCO_3$ per kilo-tonne.
Sulfide S (as S) Calc. (Total-S - SO4-S)	S-CAL06 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals S-CAL06	Sulfide Sulfur (as S) is calculated by subtracting the Carbonate Leachable Sulfate Sulfur (as S) from the Total Sulfur (as S) obtained from combustion.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Sulfates by NaCO3 Leaching and Gravimetry	S-GRA06 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals S-GRA06	A preppared sample is heated with diluted Na□CO□ and then filtered. The sulfate in the filtrate is precipitated with BaCl2 in a dilute HCl. The BaSO4 precipitate is filtered, ignited, weighed and the Sulfate Sulfur is determined (as S).
Sulfates by HCl Leaching and Gravimetry	S-GRA06A ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals S-GRA06A	A prepared sample is heated with dilute HCl and then filtered. The sulfate in the filtrate is precipitated with BaCl2 in a dilute HCl. The BaSO4 precipitate is filtered, ignited, weighed and the Sulfate Sulfur is determined (as S).
Total Sulfur by Combustion and IR	S-IR08 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals S-IR08	A prepared sample is heated to approximately 1350°C in an induction furnace with oxygen stream. Sulfur dioxide released from the sample are measured by IR (Leco analyzer) and the Total Sulfur result is provided.
Received Sample Weight	WEI-21 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals WEI-21	Weigh out sample received.

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percentage Difference
# = Indicates a QC result that did not meet the ALS DQO.

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
%	percent
kg	kilograms
pH units	pH units
ppm	parts per million
tCaCO3/kt	tons CaCO3 per kiloton

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

No. of samples analysed	: 4		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 00:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 00:00 is used for calculation purposes.

Legend & Qualifier Definitions

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

- **No Quality Control data available for this section.**

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Inorganic Carbon by Coulometer	C-GAS05 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals C-GAS05	Determine Total Inorganic Carbon (TIC) by using diluted perchloric acid to react with metal carbonate and yield carbon dioxide. Concentration of CO_2 is determined by coulometer.
51 Elements by Aqua Regia digestion and ICP-AES/MS	ME-MS41 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals ME-MS41	A prepared sample is digested with aqua regia in a graphite heating block. After cooling, the resulting solution is diluted to with deionized water, mixed and analyzed by ICP-AES. Samples are then analyzed by ICP-MS for the remaining suite of elements.
Saturated Paste pH	OA-ELE07 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals OA-ELE07	Sample mix with water in 1:1 ratio to make a paste, pH is then determined.
Acid Base Accounting (Modified Sobek)	OA-VOL08m ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals OA-VOL08m	Determine the acid generation power of a sample as tonne $CaCO_3$ per kilo-tonne using modified Sobek method
Sulfide S (as S) Calc. (Total-S - SO4-S)	S-CAL06 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals S-CAL06	Sulfide Sulfur (as S) is calculated by subtracting the Carbonate Leachable Sulfate Sulfur (as S) from the Total Sulfur (as S) obtained from combustion.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Sulfates by NaCO3 Leaching and Gravimetry	S-GRA06 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals S-GRA06	A preppared sample is heated with diluted Na□CO□ and then filtered. The sulfate in the filtrate is precipitated with BaCl2 in a dilute HCl. The BaSO4 precipitate is filtered, ignited, weighed and the Sulfate Sulfur is determined (as S).
Sulfates by HCl Leaching and Gravimetry	S-GRA06A ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals S-GRA06A	A prepared sample is heated with dilute HCl and then filtered. The sulfate in the filtrate is precipitated with BaCl2 in a dilute HCl. The BaSO4 precipitate is filtered, ignited, weighed and the Sulfate Sulfur is determined (as S).
Total Sulfur by Combustion and IR	S-IR08 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals S-IR08	A prepared sample is heated to approximately 1350°C in an induction furnace with oxygen stream. Sulfur dioxide released from the sample are measured by IR (Leco analyzer) and the Total Sulfur result is provided.
Received Sample Weight	WEI-21 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals WEI-21	Weigh out sample received.

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percentage Difference
# = Indicates a QC result that did not meet the ALS DQO.

CERTIFICATE VA21310559

Project: WR2101612

This report is for 4 samples of Tailings submitted to our lab in Vancouver, BC, Canada on 12-NOV-2021.

The following have access to data associated with this certificate:

ALSE VANCOUVER WEBTRIEVE SOFTWARE DEVELOPMENT GROUP	ALSEV DATASUBLET	HEATHER MCKENZIE

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
DISP-01	Disposal of all sample fractions
LOG-21	Sample logging - ClientBarCode
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize up to 250g 85% <75 um

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
OA-VOL08m	Modified NP	
S-IR08	Total Sulphur (IR Spectroscopy)	LECO
OA-ELE07	Paste pH	
S-GRA06	Sulfate Sulfur-carbonate leach	WST-SEQ
S-CAL06	Sufide Sulfur (calculated)	LECO
C-GAS05	Inorganic Carbon (CO2)	
S-GRA06a	Sulfate Sulfur (HCl leachable)	WST-SEQ
ME-MS41	Ultra Trace Aqua Regia ICP-MS	

This is the Final Report and supersedes any preliminary report with this certificate number.Results apply to samples as submitted.All pages of this report have been checked and approved for release.

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Kaitlyn Gardner	Account Manager Assistant	Internal Subcontracting, North Vancouver, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
%	percent
kg	kilograms
pH units	pH units
ppm	parts per million
tCaCO3/kt	tons CaCO3 per kiloton

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Workorder Comments

Discrepancy in sample identification.

QUALITY CONTROL INTERPRETIVE REPORT

Work Order	: **WR2101769**	Page	: 1 of 13
Client	: **Minto Explorations Ltd.**	Laboratory	: Whitehorse - Environmental
Contact	: Minto Environment - Coordinator	Account Manager	: Heather McKenzie
Address	: 4838 Richard Rd. SW, Suite 300 Calgary AB Canada T3E 6L1	Address	: #12 151 Industrial Road Whitehorse, Yukon Canada Y1A 2V3
Telephone	: ----	Telephone	: +1 867 668 6689
Project	: Minto Mine Monitoring	Date Samples Received	: 13-Dec-2021 10:45
PO	: TBD	Issue Date	: 07-Feb-2022 17:28
C-O-C number	: 2021-12-11 C		
Sampler	: ----		
Site	: ----		
Quote number	: Q54721-Standing Offer		
No. of samples received	: 8		
No. of samples analysed	: 8		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 00:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 00:00 is used for calculation purposes.

Matrix: **Soil/Solid**

Evaluation: × = Holding time exceedance ; ✓ = Within Holding Time

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Inorganic Carbon by Coulometer	C-GAS05 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals C-GAS05	Determine Total Inorganic Carbon (TIC) by using diluted perchloric acid to react with metal carbonate and yield carbon dioxide. Concentration of CO_2 is determined by coulometer.
51 Elements by Aqua Regia digestion and ICP-AES/MS	ME-MS41 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals ME-MS41	A prepared sample is digested with aqua regia in a graphite heating block. After cooling, the resulting solution is diluted to with deionized water, mixed and analyzed by ICP-AES. Samples are then analyzed by ICP-MS for the remaining suite of elements.
Saturated Paste pH	OA-ELE07 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals OA-ELE07	Sample mix with water in 1:1 ratio to make a paste, pH is then determined.
Acid Base Accounting (Modified Sobek)	OA-VOL08m ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals OA-VOL08m	Determine the acid generation power of a sample as tonne $CaCO_3$ per kilo-tonne using modified Sobek method
Sulfide S (as S) Calc. (Total-S - SO4-S)	S-CAL06 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals S-CAL06	Sulfide Sulfur (as S) is calculated by subtracting the Carbonate Leachable Sulfate Sulfur (as S) from the Total Sulfur (as S) obtained from combustion.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Sulfates by NaCO3 Leaching and Gravimetry	S-GRA06 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals S-GRA06	A preppared sample is heated with diluted Na□CO□ and then filtered. The sulfate in the filtrate is precipitated with BaCl2 in a dilute HCl. The BaSO4 precipitate is filtered, ignited, weighed and the Sulfate Sulfur is determined (as S).
Sulfates by HCl Leaching and Gravimetry	S-GRA06A ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals S-GRA06A	A prepared sample is heated with dilute HCl and then filtered. The sulfate in the filtrate is precipitated with BaCl2 in a dilute HCl. The BaSO4 precipitate is filtered, ignited, weighed and the Sulfate Sulfur is determined (as S).
Total Sulfur by Combustion and IR	S-IR08 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals S-IR08	A prepared sample is heated to approximately 1350°C in an induction furnace with oxygen stream. Sulfur dioxide released from the sample are measured by IR (Leco analyzer) and the Total Sulfur result is provided.
Received Sample Weight	WEI-21 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals WEI-21	Weigh out sample received.

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits
- Reference Material (RM) Report; Recovery and Acceptance Limits
- Method Blank (MB) Report; Recovery and Acceptance Limits
- Laboratory Control Sample (LCS) Report; Recovery and Acceptance Limits

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percentage Difference
# = Indicates a QC result that did not meet the ALS DQO.

CERTIFICATE VA21345672

Project: WR2101769

This report is for 8 samples of Other submitted to our lab in Vancouver, BC, Canada on 16-DEC-2021.

The following have access to data associated with this certificate:

ALSE VANCOUVER WEBTRIEVE SOFTWARE DEVELOPMENT GROUP	ALSEV DATASUBLET	HEATHER MCKENZIE

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
DISP-01	Disposal of all sample fractions
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize up to 250g 85% <75 um

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
OA-VOL08m	Modified NP	
S-IR08	Total Sulphur (IR Spectroscopy)	LECO
OA-ELE07	Paste pH	
S-GRA06	Sulfate Sulfur-carbonate leach	WST-SEQ
S-CAL06	Sufide Sulfur (calculated)	LECO
C-GAS05	Inorganic Carbon (CO2)	
S-GRA06a	Sulfate Sulfur (HCl leachable)	WST-SEQ
ME-MS41	Ultra Trace Aqua Regia ICP-MS	

This is the Final Report and supersedes any preliminary report with this certificate number.Results apply to samples as submitted.All pages of this report have been checked and approved for release.

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Kaitlyn Gardner	Account Manager Assistant	Internal Subcontracting, North Vancouver, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
%	percent
kg	kilograms
pH units	pH units
ppm	parts per million
tCaCO3/kt	tons CaCO3 per kiloton

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Project	: Minto Mine Monitoring	Date Samples Received	: 13-Dec-2021 10:45
PO	: TBD	Issue Date	: 18-Feb-2022 17:46
C-O-C number	: 2021-12-11 D		
Sampler	: ----		
Site	: ----		
Quote number	: Q54721-Standing Offer		
No. of samples received	: 1		
No. of samples analysed	: 1		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 00:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 00:00 is used for calculation purposes.

Matrix: **Soil/Solid**

Evaluation: × = Holding time exceedance ; ✓ = Within Holding Time

Analyte Group / Container / Client Sample ID(s)	Method	Sampling Date	Extraction / Preparation				Analysis			
			Preparation Date	Holding Times Rec	Holding Times Actual	Eval	Analysis Date	Holding Times Rec	Holding Times Actual	Eval

Legend & Qualifier Definitions

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

- **No Quality Control data available for this section.**

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Inorganic Carbon by Coulometer	C-GAS05 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals C-GAS05	Determine Total Inorganic Carbon (TIC) by using diluted perchloric acid to react with metal carbonate and yield carbon dioxide. Concentration of CO_2 is determined by coulometer.
51 Elements by Aqua Regia digestion and ICP-AES/MS	ME-MS41 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals ME-MS41	A prepared sample is digested with aqua regia in a graphite heating block. After cooling, the resulting solution is diluted to with deionized water, mixed and analyzed by ICP-AES. Samples are then analyzed by ICP-MS for the remaining suite of elements.
Saturated Paste pH	OA-ELE07 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals OA-ELE07	Sample mix with water in 1:1 ratio to make a paste, pH is then determined.
Acid Base Accounting (Modified Sobek)	OA-VOL08m ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals OA-VOL08m	Determine the acid generation power of a sample as tonne $CaCO_3$ per kilo-tonne using modified Sobek method
Sulfide S (as S) Calc. (Total-S - SO4-S)	S-CAL06 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals S-CAL06	Sulfide Sulfur (as S) is calculated by subtracting the Carbonate Leachable Sulfate Sulfur (as S) from the Total Sulfur (as S) obtained from combustion.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Sulfates by NaCO3 Leaching and Gravimetry	S-GRA06 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals S-GRA06	A preppared sample is heated with diluted Na□CO□ and then filtered. The sulfate in the filtrate is precipitated with BaCl2 in a dilute HCl. The BaSO4 precipitate is filtered, ignited, weighed and the Sulfate Sulfur is determined (as S).
Sulfates by HCl Leaching and Gravimetry	S-GRA06A ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals S-GRA06A	A prepared sample is heated with dilute HCl and then filtered. The sulfate in the filtrate is precipitated with BaCl2 in a dilute HCl. The BaSO4 precipitate is filtered, ignited, weighed and the Sulfate Sulfur is determined (as S).
Total Sulfur by Combustion and IR	S-IR08 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals S-IR08	A prepared sample is heated to approximately 1350°C in an induction furnace with oxygen stream. Sulfur dioxide released from the sample are measured by IR (Leco analyzer) and the Total Sulfur result is provided.
Received Sample Weight	WEI-21 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals WEI-21	Weigh out sample received.

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percentage Difference
# = Indicates a QC result that did not meet the ALS DQO.

Project: WR2101770

This report is for 1 sample of Tailings submitted to our lab in Vancouver, BC, Canada on 16-DEC-2021.

The following have access to data associated with this certificate:

ALSE VANCOUVER WEBTRIEVE SOFTWARE DEVELOPMENT GROUP	ALSEV DATASUBLET	HEATHER MCKENZIE

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
DISP-01	Disposal of all sample fractions
LOG-21	Sample logging - ClientBarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize up to 250g 85% <75 um

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
OA-VOL08m	Modified NP	
S-IR08	Total Sulphur (IR Spectroscopy)	LECO
OA-ELE07	Paste pH	
S-GRA06	Sulfate Sulfur-carbonate leach	WST-SEQ
S-CAL06	Sufide Sulfur (calculated)	LECO
C-GAS05	Inorganic Carbon (CO2)	
S-GRA06a	Sulfate Sulfur (HCl leachable)	WST-SEQ
ME-MS41	Ultra Trace Aqua Regia ICP-MS	

This is the Final Report and supersedes any preliminary report with this certificate number.Results apply to samples as submitted.All pages of this report have been checked and approved for release.

Site	: ----		
Quote number	: Q54721-Standing Offer		
No. of samples received	: 1		
No. of samples analysed	: 1		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Paolo Obillo	Account Manager Assistant	Internal Subcontracting, North Vancouver, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
%	percent
kg	kilograms
pH units	pH units
ppm	parts per million
tCaCO3/kt	tons CaCO3 per kiloton

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Quote number	: Q54721-Standing Offer		
No. of samples received	: 1		
No. of samples analysed	: 1		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 00:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 00:00 is used for calculation purposes.

Matrix: **Soil/Solid**

Evaluation: × = Holding time exceedance ; ✓ = Within Holding Time

Analyte Group / Container / Client Sample ID(s)	Method	Sampling Date	Extraction / Preparation				Analysis

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Inorganic Carbon by Coulometer	C-GAS05 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals C-GAS05	Determine Total Inorganic Carbon (TIC) by using diluted perchloric acid to react with metal carbonate and yield carbon dioxide. Concentration of CO_2 is determined by coulometer.
51 Elements by Aqua Regia digestion and ICP-AES/MS	ME-MS41 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals ME-MS41	A prepared sample is digested with aqua regia in a graphite heating block. After cooling, the resulting solution is diluted to with deionized water, mixed and analyzed by ICP-AES. Samples are then analyzed by ICP-MS for the remaining suite of elements.
Saturated Paste pH	OA-ELE07 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals OA-ELE07	Sample mix with water in 1:1 ratio to make a paste, pH is then determined.
Acid Base Accounting (Modified Sobek)	OA-VOL08m ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals OA-VOL08m	Determine the acid generation power of a sample as tonne $CaCO_3$ per kilo-tonne using modified Sobek method
Sulfide S (as S) Calc. (Total-S - SO4-S)	S-CAL06 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals S-CAL06	Sulfide Sulfur (as S) is calculated by subtracting the Carbonate Leachable Sulfate Sulfur (as S) from the Total Sulfur (as S) obtained from combustion.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Sulfates by NaCO3 Leaching and Gravimetry	S-GRA06 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals S-GRA06	A preppared sample is heated with diluted Na□CO□ and then filtered. The sulfate in the filtrate is precipitated with BaCl2 in a dilute HCl. The BaSO4 precipitate is filtered, ignited, weighed and the Sulfate Sulfur is determined (as S).
Sulfates by HCl Leaching and Gravimetry	S-GRA06A ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals S-GRA06A	A prepared sample is heated with dilute HCl and then filtered. The sulfate in the filtrate is precipitated with BaCl2 in a dilute HCl. The BaSO4 precipitate is filtered, ignited, weighed and the Sulfate Sulfur is determined (as S).
Total Sulfur by Combustion and IR	S-IR08 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals S-IR08	A prepared sample is heated to approximately 1350°C in an induction furnace with oxygen stream. Sulfur dioxide released from the sample are measured by IR (Leco analyzer) and the Total Sulfur result is provided.
Received Sample Weight	WEI-21 ALS Minerals (Vancouver) - 2103 Dollarton Hwy North Vancouver British Columbia Canada V7H 0A7	Soil/Solid	ALS Minerals WEI-21	Weigh out sample received.

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percentage Difference
# = Indicates a QC result that did not meet the ALS DQO.

Appendix L – 2021 Leach Pad Sampling Program Report

Minto Metals Corp.

Leach Pad Sampling Summary Report

2018 - 2021

Prepared by:
Minto Metals Corp.
Minto Mine
March 31, 2022

1 Introduction

The following report presents a summary of the construction for the Leach Pads, constructed from August 2017 to March 2018, and the subsequent monitoring of the leachate produced from March 2018 to October 2021.

1.1 Background

The Geochemical Monitoring Program detailed in the Water Use Licence QZ14-031 includes as one of the conditions the requirement for geochemical characterization of waste, including leachate quality (Section 5.1.5, Article 94):

> *"The Licensee shall update the Geochemical Monitoring Program to include a monitoring and geochemical characterization program that will produce detailed metals leaching characterization from the low-grade ore and oxide ore."*

Implementation of a monitoring program that satisfies this condition was included in the Environmental Monitoring, Surveillance, and Reporting Plan (EMSRP). The plan included construction of the leach pads in the summer of 2017 and sampling of the leachate for one year, starting in September 2017.

2 Construction Activities

Details of the Construction Activities are included in Appendix LPS-A.

3 Sampling Methodology

Samples were collected from the Leach pads beginning in May 2018, and continued until October 2021. It should be noted that this is longer than the 12-month sampling requirement identified in the EMSRP. Water quality parameters chosen for analysis were the same as those used for groundwater monitoring at Minto.

A detailed SOP for Leach Pad sample collection is included in Appendix LPS-B.

4 Sampling results and analysis

The following Table 4.1 outlines the sampling effort and success for the Leach Pads over the 41-month period from May 2018 to October 2021.

Table 4-1: Leach Pad Sampling Effort, 2018 - 2021

Month	Leach Pad 1 Samples	Leach Pad 2 Samples
2018-May	1	1
2018-Jun	2	2

5 Results Presentation and Discussion

The data presented in Table 4.2 above has been presented in the following figures for ease of interpretation, along with comments regarding apparent trends. Green dotted lines represent Minto's Effluent Release Limits, while blue dotted lines represent the trend line.

5.1 pH

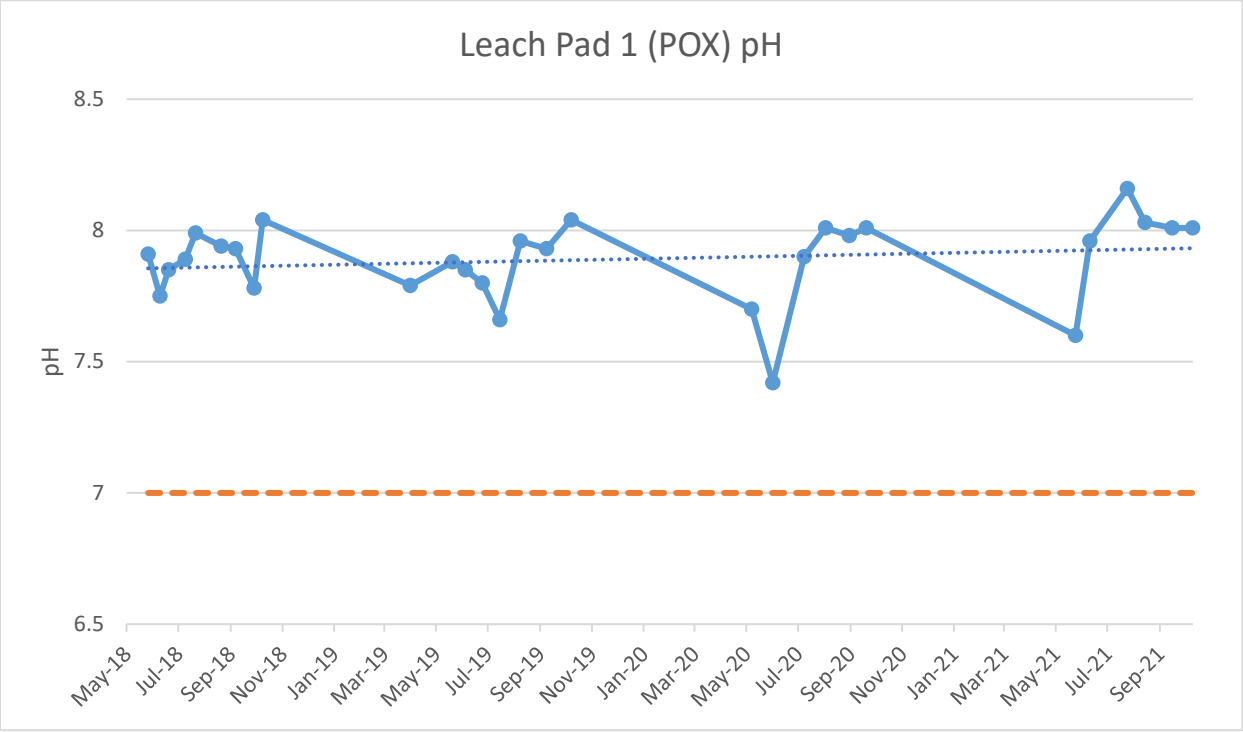

Figure 5-1: Leach Pad 1 pH
(orange dotted line represents neutral pH)

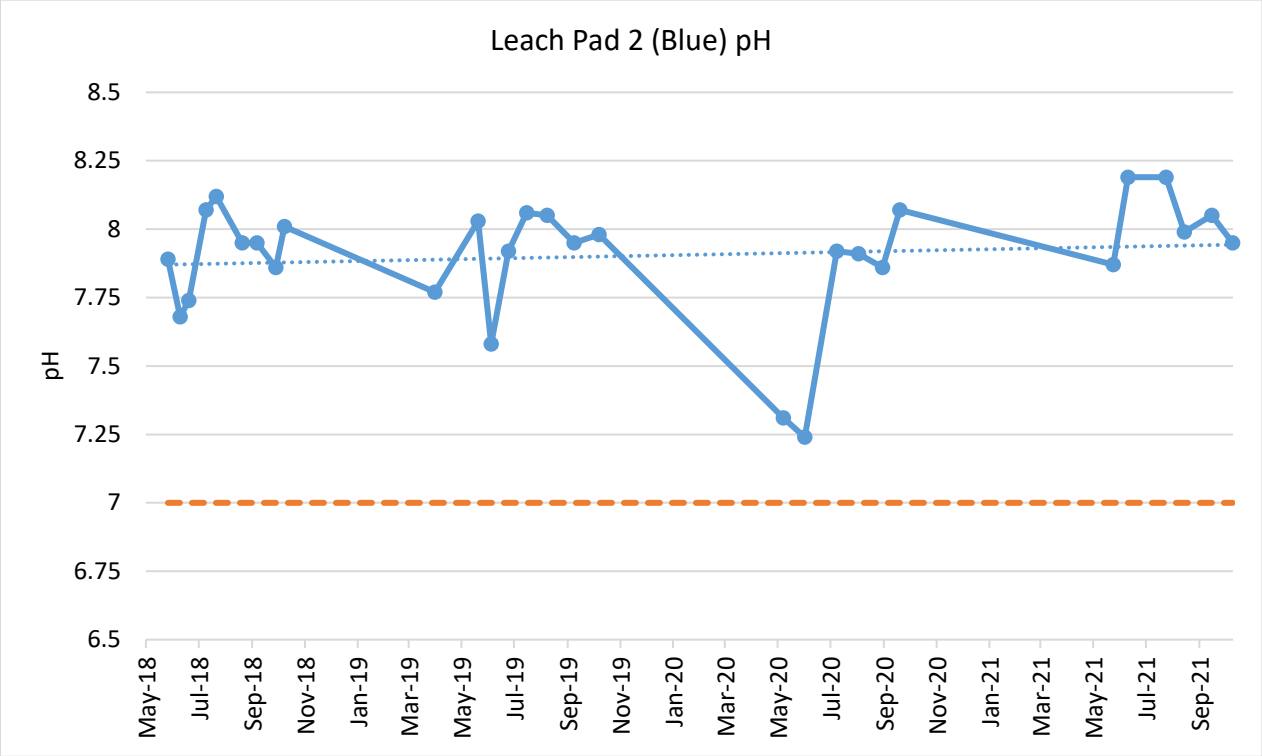

Figure 5-2: Leach Pad 2 pH
(orange dotted line represents neutral pH)

The pH of leachate from both leach pads was well above neutral, indicating they are both currently non-acid-generating, with trends indicating a stable neutralizing potential.

16 Samples of rock were collected from the leach pads as they were constructed, and analyzed for percent copper, Silver concentration in grams/tonne, percent carbon, percent sulfur, and Neutralizing potential and acid generating potential.

The results of these samples are presented in table 5-1, below.

These results indicate that the POX material, sourced from the Top of the World POX pile, are clearly Non-Acid Generating with and Average NP:AP of well over the cut-off value of 3.0 (Mean of 5.41). The Blue Ore pile, however, while still not currently acid generating, are Potentially Acid Generating with an average NP:AP below the 3.0 cut-off (mean of 1.50).

6 Conclusions and Recommendations

Overall, the Contaminants of Potential Concern (COPC's) are at, near, or below the effluent release limits from both leachate sources, with the one exception of Selenium. This seems to indicate at closure, that the leachate from POX material on surface may have a slight increasing influence on other runoff waters reporting to the pits, however based on these findings, elevated selenium may be the only contaminant of concern.

The blue ore pile's NP:AP indicates this material either requires milling or aqueous disposal within the pits.

Further testing and analysis by other Qualified Professionals is recommended over the next few years, to assess differing trends from dry vs. wet years.

1 Introduction

The following report presents a record of construction for the Leach Pads, constructed from August 2017 to March 2018. The Geochemical Monitoring Program detailed in the Water Use Licence QZ14-031 includes as one of the conditions the requirement for geochemical characterization of waste, including leachate quality (Section 5.1.5, Article 94):

> *The Licensee shall update the Geochemical Monitoring Program to include a monitoring and geochemical characterization program that will produce detailed metals leaching characterization from the low-grade ore and oxide ore.*

Implementation of a monitoring program that satisfies this condition was included in the Environmental Monitoring, Surveillance, and Reporting Plan (EMSRP). The plan included construction of the leach pads in the summer of 2017 and sampling of the leachate for one year, starting in September 2017.

2 Construction Activities

The Design drawings for the construction of the Leach Pads were provided by SRK in late July, and construction began in August and September, proceeding intermittently due to high competitive demand for the necessary equipment during aggressive production mining activity in the Area 2 Phase 4 Pit.

2.1 Work Site Preparation

Work site preparation began with the initial excavation of the ground surface for the placement of residuum for the base construction and shaping, and was undertaken in August of 2017. Construction of outfall channels and the placement of 100 mm HDPE leachate collection pipes in the bottom of the pads was completed prior to the placement and shaping of residuum base material to the design dimensions from the design drawings provided by SRK (See Figure 1).

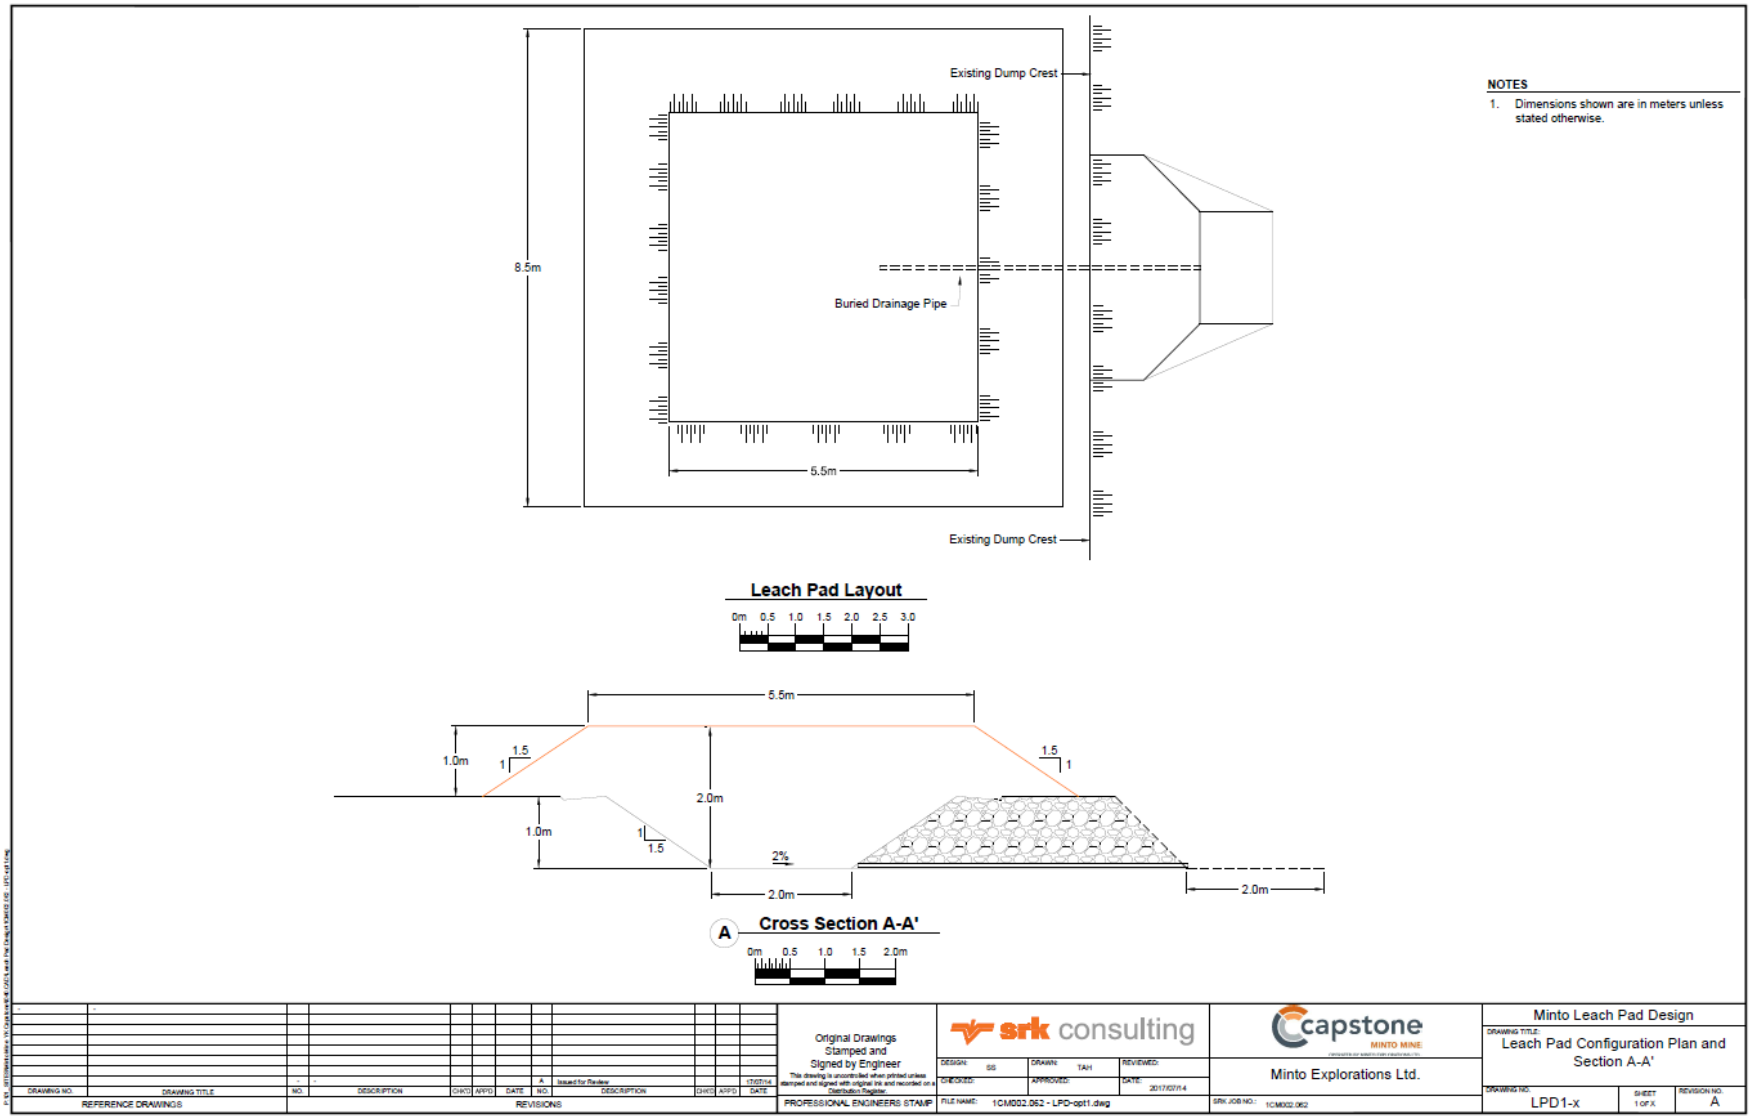

Figure 1: Leach Pad Design Drawing

Photo 1: Pad #2 under construction using Residuum. Pad 1 in Foreground – looking southeast

The initial Shaping of Pad #1 was completed in it's entirety before Pad #2 construction began. Placement of Residuum and shaping of the berms prior to liner installation was completed on October 6th (See Photos 1&2).

Photo 2: Leach Pad #1 residuum placement completed. Pipe in bottom visible

Photo 3: Outfall for leachate collection pipe placement

2.2 Liner Placement

A 4.0 mm Bituminous Geomebrane Liner (BGM Liner) was selected for the Leach Pads due to relative ease of installation, requiring no specialized tools or skills to weld the seams. A liner installation plan was supplied by SRK (See Figure 2), however it was not deemed practical for field installation due to the difficulty in installing the largest piece of liner by hand due to it's weight, as well as the number of seams requiring sealing and the propensity for smaller liner pieces to shift and move while being walked on. Each liner was installed in 5 pieces; one for the bottom, and one for each of the sides. All liner pieces overlapped the next piece by at least 150 mm as per the manufacturers recommendations. The installed liners are shown in Photos 4, 5, and 6.

All seams were welded using a "tiger torch", with pressure applied to the seams ensuring full bonding of both layers. Quality Control was completed during seam welding on at least 10% of each seam and in random locations following completion of each weld. Particular attention was paid to areas where three layers converged, ensuring a strong, water tight bond between all layers.

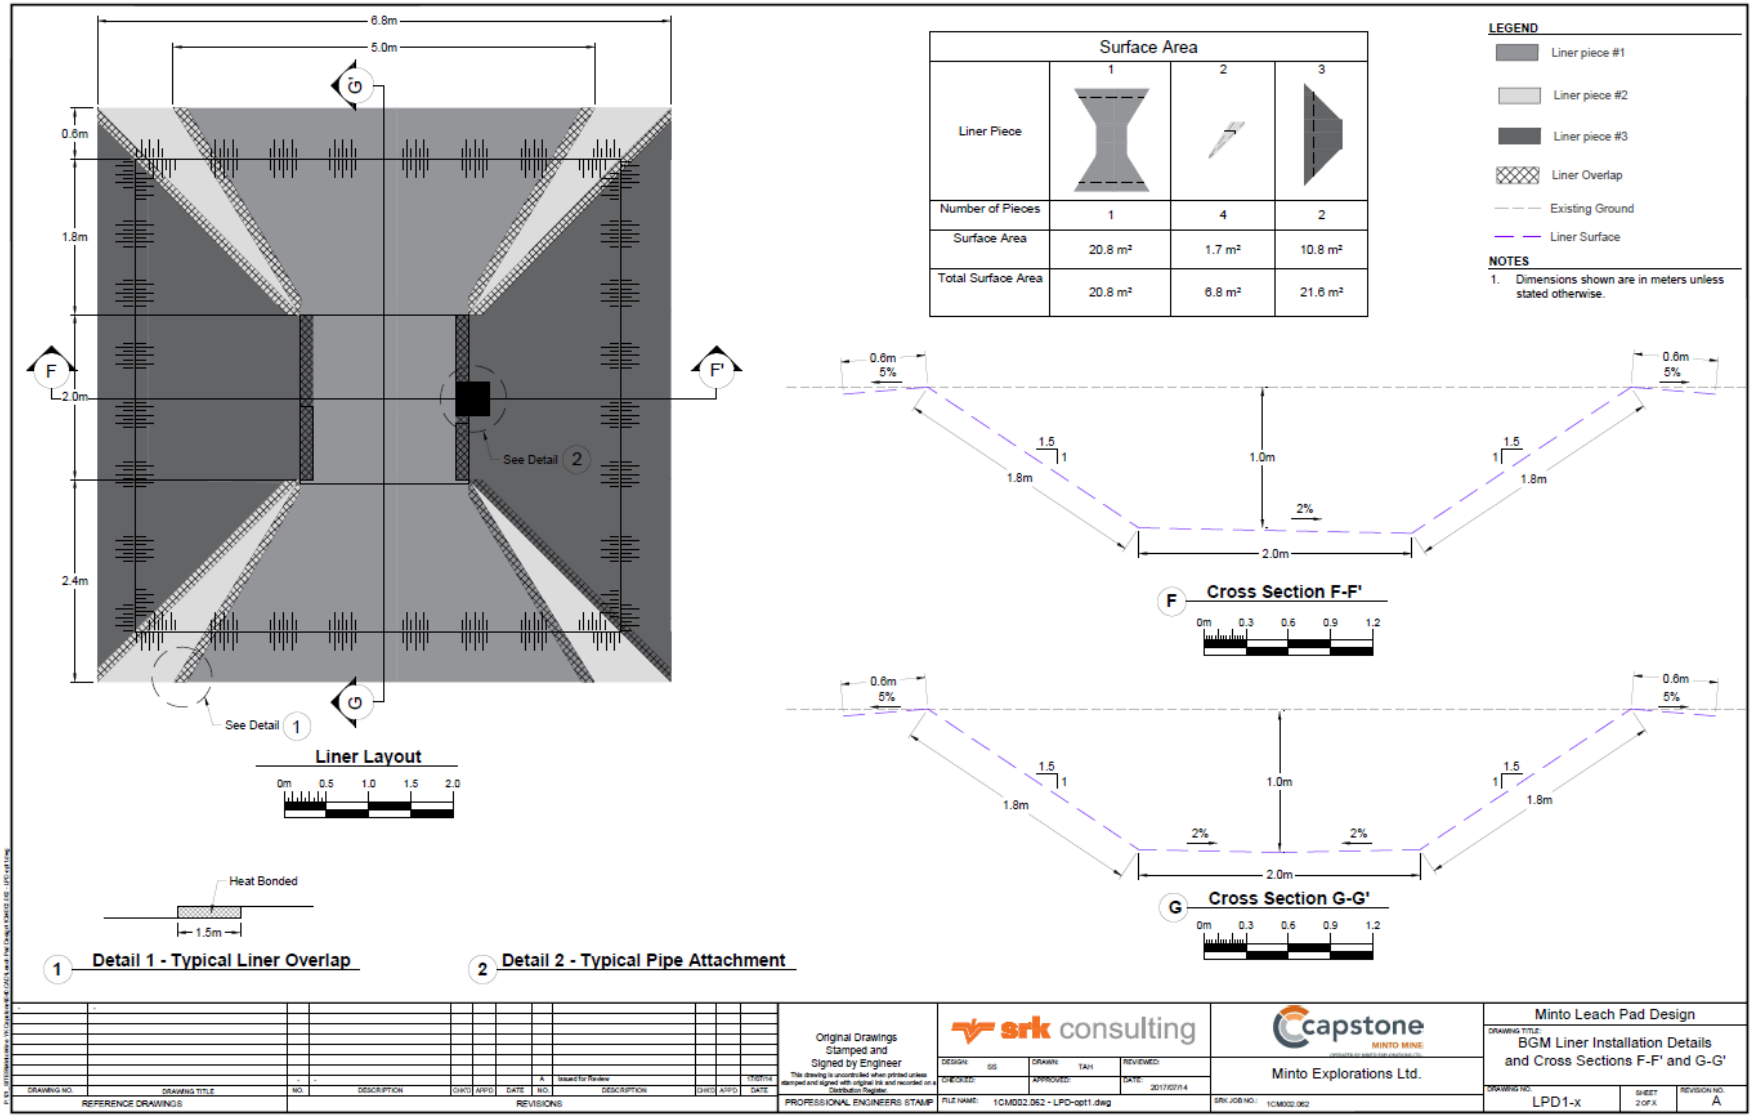

Figure 2: Liner Installation Design Drawings

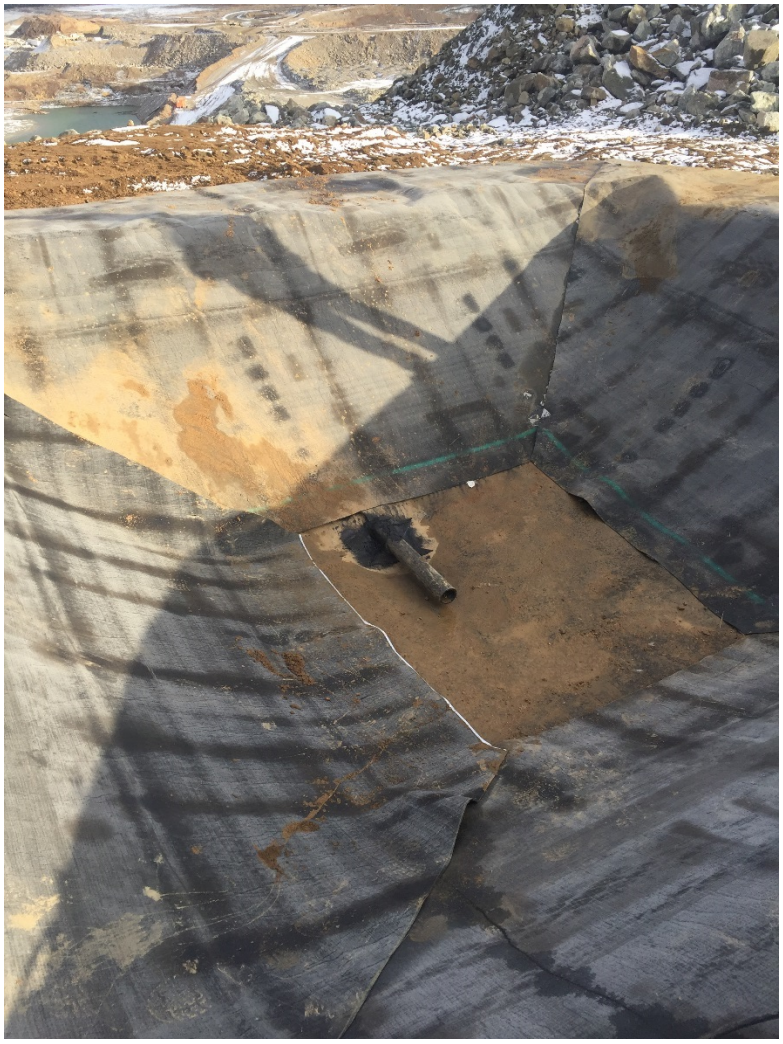

Photo 4: BGM liner install: bottom not yet sealed

Photo 5: Leachate collection pipe boot seal detail

2.3 Pad Filling

The Leach pads were designed to be filled with a nominal depth of 2.0 meters of ore. Pad #1 was to be filled with Partially Oxidized Ore (POX), and Pad #2 was to be filled with Low Grade Sulphide (Blue) Ore. SRK provided fill design plans (See Figure 3), and these were roughly adhered to in the field resulting in a nominal depth of 2.5 meters of POX on Pad #1, and a nominal depth of 2.1 meters of Blue Ore on Pad #2. The final measured volume of material placed on Pad 1 was 143 m3, and on Pad 2 was 126 m3. Because placement of both materials occurred during the winter, the pads had to be cleared of snow before the ore could be placed. This activity and the completed placement of ore can be seen in Photos 6 -8.

Photo 7: Leach Pad #1 filled with POX

Photo 8: Leach Pads #1 and #2 Completed (Spring 2018 photo)

Figure 4 shows Survey scans of the completed Leach Pads before and after placement of materials in plan view. Figure 5 shows a cross-section of each leach pad as-constructed in the field.

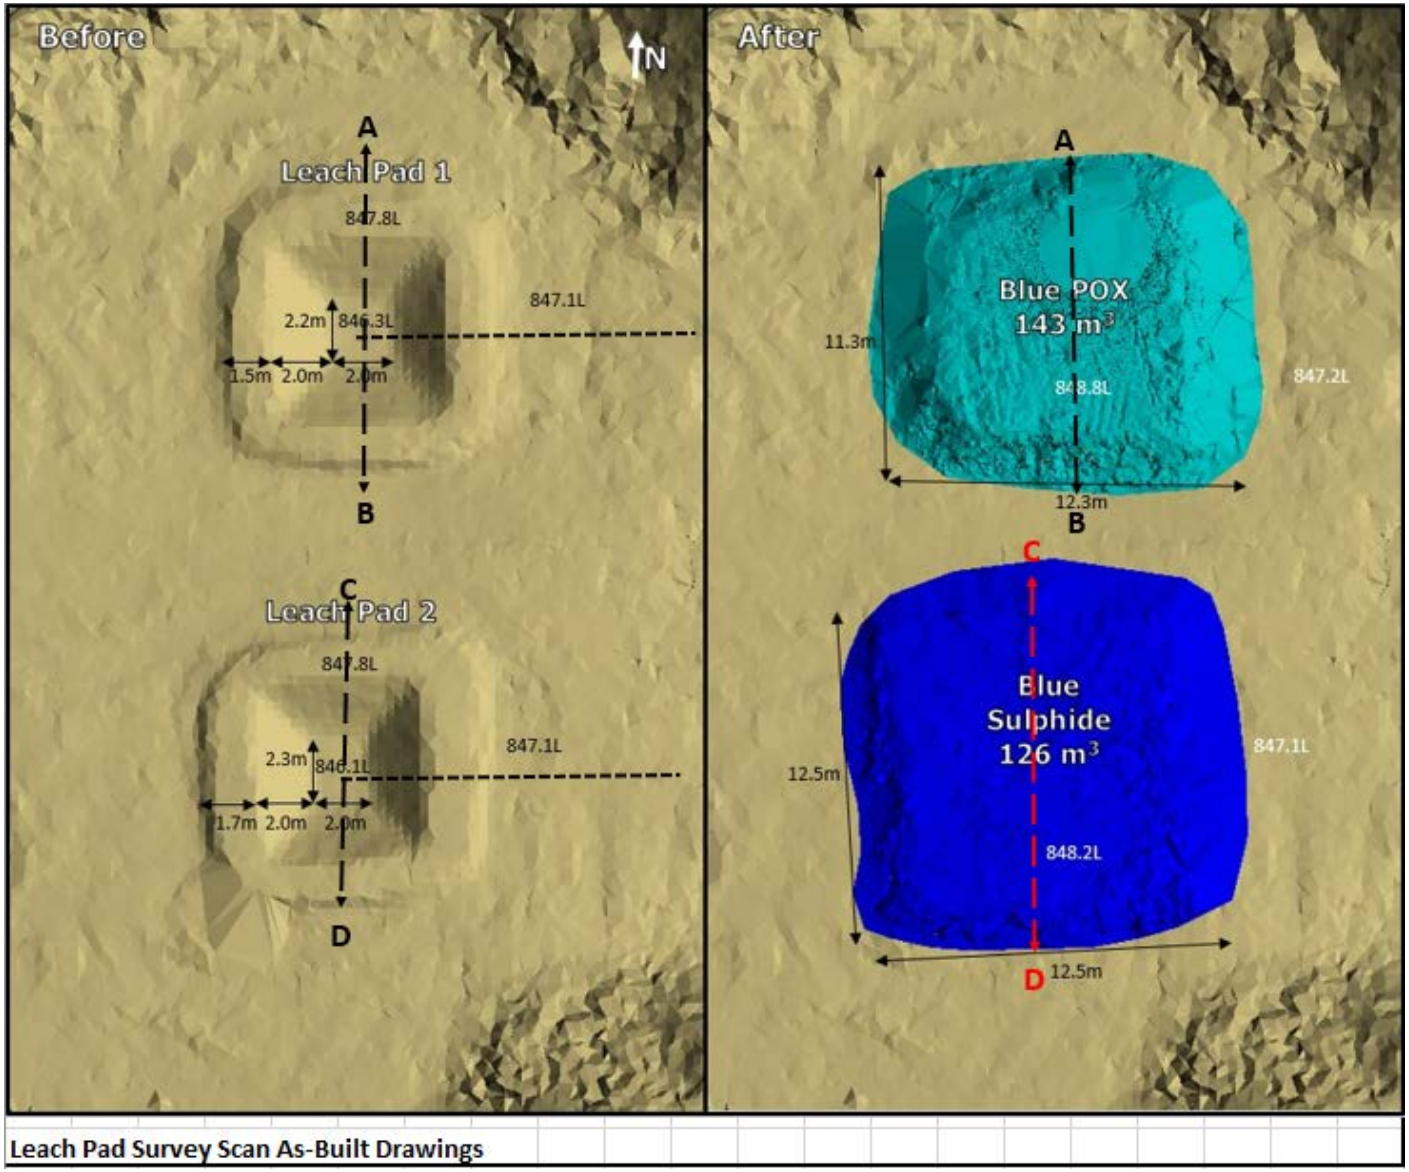

Figure 4 – Plan View of Pads before and after material placement

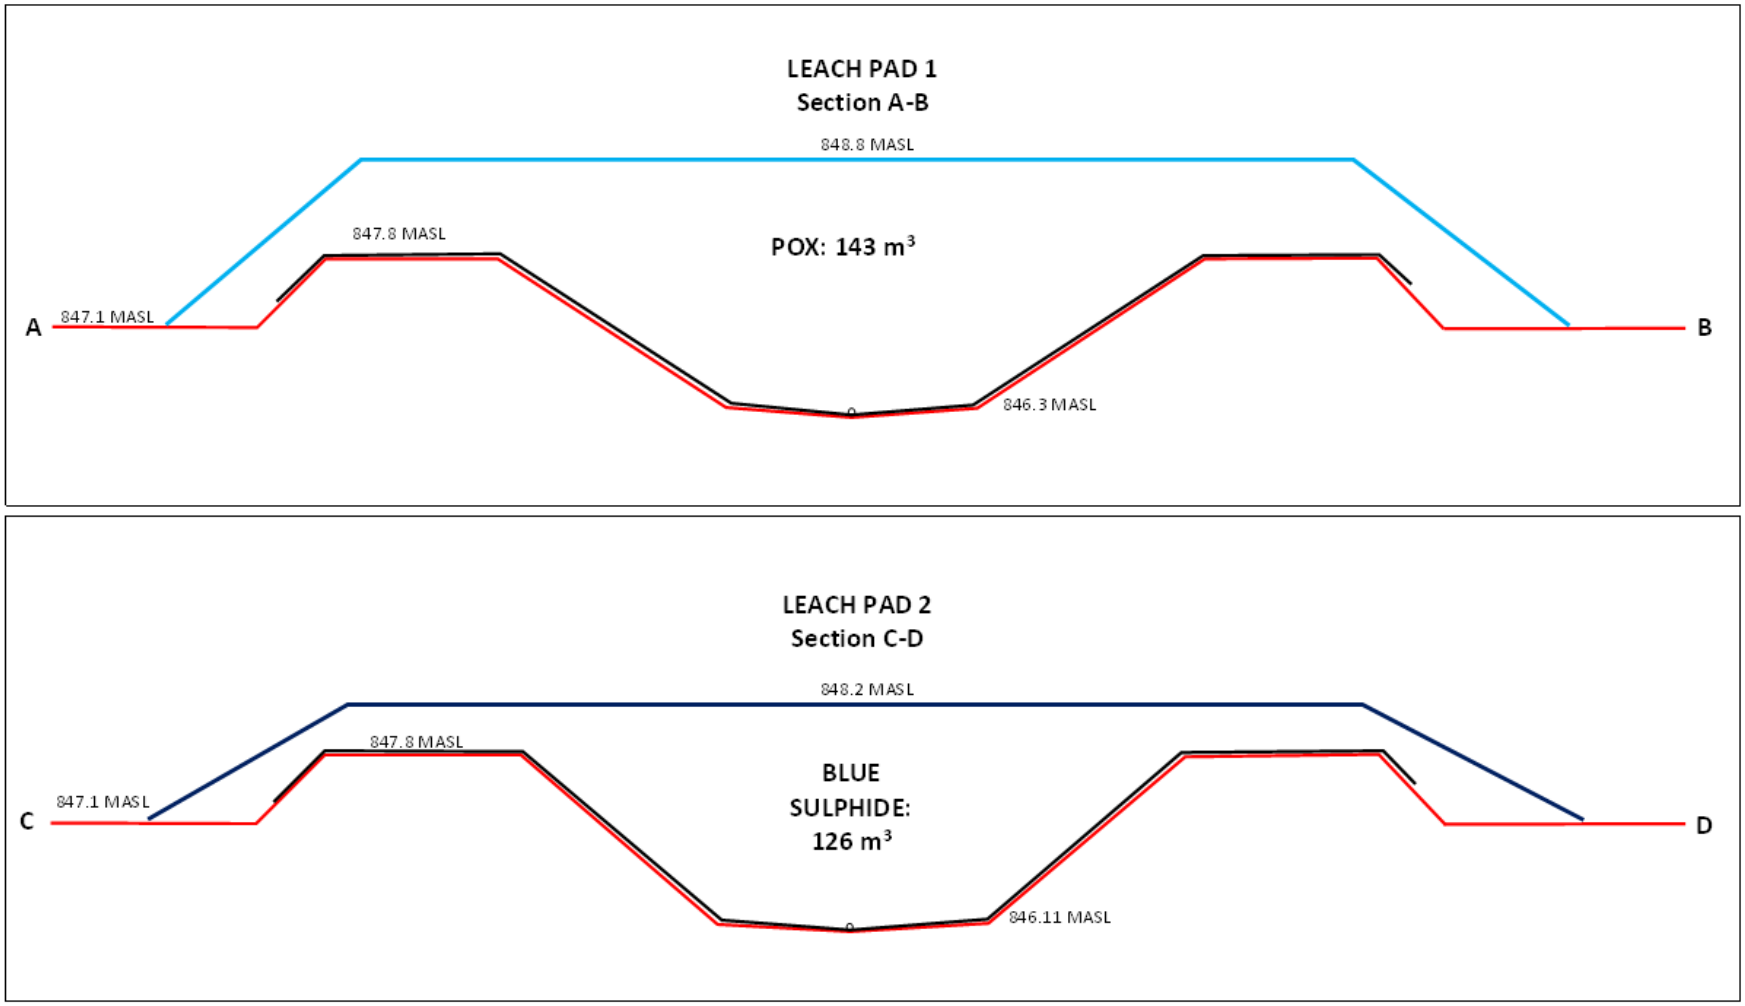

Figure 5: Cross Sections A-B and C-D of Pads 1 and 2.

3 Conclusion

This report has been prepared to satisfy the as-built construction report for the metals leaching characterization test pads as per Article 34 of Water Licence QZ14-031.

Appendix LPS B – Sampling Methodology

Background

The collection of leachate samples from two Leach Characterization Testing Pads (Leach Pads) at Minto Mine (Minto) was first required by the approved 2017-02 EMSRP. Leach Pad 1 is filled with POX material. Leach Pad 2 is filled with blue ore. Water quality samples are required monthly from both leach pads.

Field staff are responsible for coordinating all sampling events in accordance with the requirements of the current EMSRP, including sampling locations, sampling frequency, and parameter requirements.

All sampling and documentation must be conducted in accordance with the Surface WQ Sampling SOP and the QA/QC protocols.

Preparation for Leach Pad sampling must also include provision for quality control samples. Due to the short term of this sampling project, a duplicate sample will be collected from one of the Leach Pads each month.

Safety Precautions

It is particularly important for employees to be aware they are working in proximity to a sheer rock face. It is important they remain aware of where they are, stay as far away from the cliff face as possible, and remain conscious of their footing when approaching the sampling sites.

Leach Pad water quality sampling and related tasks can be carried out by an employee working alone.

Equipment

- Sample bottles, labels, and seepage WQ field forms
- pH Pen
- Nitrile gloves
- Syringes and filters
- Sample preservatives
- Cooler and sufficient ice packs

Procedure

1. Clearly label all sample bottles with station name (LP1 or LP2), date, time (24-hour clock). See Figure 1 below for the location of the leach pads.
2. Put on clean nitrile gloves prior to collecting the sample.
3. For each leach pad, shown in Figure 1, collect a WQ sample as listed in Table 1 and send to ALS Environmental labs.

Table 1: Leach Pad WQ Sample Requirements

Analysis Name	Parameters (not inclusive)	Bottle	Filter	Preservative
Physical Parameters (General)	pH, Conductivity, TSS, TDS, Alkalinity, Anions	500 mL (Plastic)	Not required	Not required
Dissolved Metals	Metals	125 mL (Plastic)	Required	Required
Ammonia/Phosphorus	P, NH_3	125 mL (Glass)	Not Required	Required

4. All bottles will be triple-rinsed.
    a. Ensure that samples requiring filtering are rinsed with filtered water only.
5. Collect water directly from the sampling bucket using a syringe.
6. Use new syringes and filters for every station
7. Filter and add preservatives to the required samples as soon as possible after sample collection and filtering, at the sampling location.
8. **COLLECT A DUPLICATE sample from one of the Leach Pads every sampling event.**
    a. If sufficient water is available, collect the duplicate from Pad #1 on odd numbered months, and from Pad #2 on even numbered months.
    b. Alternatively collect the duplicate from whichever pad collection sump (bucket) has the most water present.
9. Field measurements can be made either in situ (in the water bucket) or using a sub-sample taken in a separate container which is discarded once the measurements are recorded.

a. Sub-samples are not used for further chemical analyses, and must be taken after the sample collection has been completed.

b. Instrumentation must display stable in-situ parameters before field staff record parameters.

10. Once Sampling is complete, the buckets should be tipped over and drained, allowing for new leachate to enter the bucket for the next sampling session, and ensuring the same leachate water is not being sampled twice.

11. Complete the seepage field form at the station, including

    a. Station Name (LP1 or LP2)

    b. Date and time of sample collection;

    c. Weather at time of sample collection;

    d. Field measurements of pH, conductivity, temperature;

    e. Water colour, turbidity, and presence of any precipitates or mineral staining; and

    f. Record the quantity of filters used and the colour of the sediment contained, photograph the filters.

12. Enter the sample data into the water quality tracking sheet (WQTS) and file the field form.

13. Ship the samples to ALS Environmental at the earliest opportunity, as per the regular shipping process.

CERTIFICATE OF ANALYSIS

Work Order	: **WR2100496**	Page	: 1 of 4
Client	: **Minto Explorations Ltd.**	Laboratory	: Whitehorse - Environmental
Contact	: Minto Environment - Coordinator	Account Manager	: Heather McKenzie
Address	: 4838 Richard Rd. SW, Suite 300 Calgary AB Canada T3E 6L1	Address	: #12 151 Industrial Road Whitehorse YT Canada Y1A 2V3
Telephone	: ----	Telephone	: +1 867 668 6689
Project	: Minto Mine Monitoring	Date Samples Received	: 26-May-2021 13:30
PO	: 2857 (Seepage) - 10-8103-07050	Date Analysis Commenced	: 31-May-2021
C-O-C number	: 2021-05-25 G	Issue Date	: 07-Jun-2021 16:04
Sampler	: ----		
Site	: ----		
Quote number	: Q54721-Standing Offer		
No. of samples received	: 3		
No. of samples analysed	: 3		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Clarie Tejano	Laboratory Assistant	Metals, Burnaby, British Columbia
Kevin Duarte	Supervisor - Metals ICP Instrumentation	Metals, Burnaby, British Columbia
Lindsay Gung	Supervisor - Water Chemistry	Inorganics, Burnaby, British Columbia
Owen Cheng		Metals, Burnaby, British Columbia
Sristika Chand	Lab Analyst	Metals, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
µS/cm	Microsiemens per centimetre
mg/L	milligrams per litre
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Qualifiers

Qualifier	*Description*
DLM	*Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).*

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Matrix Spike outliers occur.
- Laboratory Control Sample (LCS) outliers occur - please see following pages for full details.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- Quality Control Sample Frequency Outliers occur - please see following pages for full details.

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **Water**

Analyte Group	Laboratory sample ID	Client/Ref Sample ID	Analyte	CAS Number	Method	Result	Limits	Comment
Laboratory Control Sample (LCS) Recoveries								
Physical Tests	QC-212356-002	----	alkalinity, phenolphthalein (as CaCO3)	----	E290	69.8 % LCS-L	75.0-125%	Recovery less than lower control limit

Result Qualifiers

Qualifier	Description
LCS-L	*Lab Control Sample recovery was below ALS DQO. Reference Material and/or Matrix Spike results were acceptable. Non-detected sample results are considered reliable. Other results, if reported, have been qualified.*

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 00:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 00:00 is used for calculation purposes.

HDPE LP2	E160-L	24-May-2021	----	----	----		31-May-2021	7 days	8 days	✓

Legend & Qualifier Definitions

EHTR-FM: Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended

EHT: Exceeded ALS recommended hold time prior to analysis.

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Water**

Evaluation: ✗ = QC frequency outside specification; ✓ = QC frequency within specification.

Quality Control Sample Type			Count		Frequency (%)		
Analytical Methods	*Method*	*QC Lot #*	*QC*	*Regular*	*Actual*	*Expected*	*Evaluation*
Laboratory Duplicates (DUP)							
Alkalinity Species by Titration	E290	212356	1	17	5.8	5.0	✓
Ammonia by Fluorescence	E298	211867	1	14	7.1	5.0	✓
Chloride in Water by IC (Low Level)	E235.Cl-L	212353	1	5	20.0	5.0	✓

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Conductivity in Water	E100 Vancouver - Environmental	Water	APHA 2510 (mod)	Conductivity, also known as Electrical Conductivity (EC) or Specific Conductance, is measured by immersion of a conductivity cell with platinum electrodes into a water sample. Conductivity measurements are temperature-compensated to 25°C.
pH by Meter	E108 Vancouver - Environmental	Water	APHA 4500-H (mod)	pH is determined by potentiometric measurement with a pH electrode, and is conducted at ambient laboratory temperature (normally 20 ± 5°C). For high accuracy test results, pH should be measured in the field within the recommended 15 minute hold time.
TSS by Gravimetry (Low Level)	E160-L Vancouver - Environmental	Water	APHA 2540 D (mod)	Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, following by drying of the filter at 104 ± 1°C, with gravimetric measurement of the filtered solids. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.
Chloride in Water by IC (Low Level)	E235.Cl-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrite in Water by IC (Low Level)	E235.NO2-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrate in Water by IC (Low Level)	E235.NO3-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Sulfate in Water by IC	E235.SO4 Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Alkalinity Species by Titration	E290 Vancouver - Environmental	Water	APHA 2320 B (mod)	Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.
Ammonia by Fluorescence	E298 Vancouver - Environmental	Water	J. Environ. Monit., 2005, 7, 37-42 (mod)	Ammonia in water is analyzed by flow-injection analysis with fluorescence detection after reaction with orthophthaldialdehyde (OPA).

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Dissolved Metals in Water by CRC ICPMS	E421 Vancouver - Environmental	Water	APHA 3030B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.
Dissolved Mercury in Water by CVAAS	E509 Vancouver - Environmental	Water	APHA 3030B/EPA 1631E (mod)	Water samples are filtered (0.45 um), preserved with HCl, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS.
Dissolved Hardness (Calculated)	EC100 Vancouver - Environmental	Water	APHA 2340B	"Hardness (as CaCO3), dissolved" is calculated from the sum of dissolved Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. "Total Hardness" refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations.
TDS in Water (Calculation)	EC103 Vancouver - Environmental	Water	APHA 1030E (mod)	Total Dissolved Solids is calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Dissolved species are used where available. Minor ions are included where data is present.
Nitrate and Nitrite (as N) (Calculation)	EC235.N+N Vancouver - Environmental	Water	EPA 300.0	Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N).

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Preparation for Ammonia	EP298 Vancouver - Environmental	Water		Sample preparation for Preserved Nutrients Water Quality Analysis.
Dissolved Metals Water Filtration	EP421 Vancouver - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HNO3.
Dissolved Mercury Water Filtration	EP509 Vancouver - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HCl.

Owen Cheng		Metals, Burnaby, British Columbia
Sristika Chand	Lab Analyst	Metals, Burnaby, British Columbia

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percentage Difference
# = Indicates a QC result that did not meet the ALS DQO.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test specific).

Sub-Matrix: **Water**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Water**

Qualifiers

Qualifier	Description
LCS-L	*Lab Control Sample recovery was below ALS DQO. Reference Material and/or Matrix Spike results were acceptable. Non-detected sample results are considered reliable. Other results, if reported, have been qualified.*

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Sub-Matrix: **Water**

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Dee Lee	Analyst	Metals, Burnaby, British Columbia
Ilnaz Badbezanchi	Team Leader - Metals preparation	Metals, Burnaby, British Columbia
Jashan Kaur	Lab Assistant	Metals, Burnaby, British Columbia
Kevin Duarte	Supervisor - Metals ICP Instrumentation	Metals, Burnaby, British Columbia
Lindsay Gung	Supervisor - Water Chemistry	Inorganics, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
%	percent
µS/cm	Microsiemens per centimetre
meq/L	milliequivalents per litre
mg/L	milligrams per litre
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Qualifiers

Qualifier	*Description*
DLB	*Detection Limit Raised. Analyte detected at comparable level in Method Blank.*
DLM	*Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).*

No. of samples received	: 6		
No. of samples analysed	: 6		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Summary of Outliers

Outliers : Quality Control Samples

- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- Method Blank value outliers occur - please see following pages for full details.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **Water**

Analyte Group	Laboratory sample ID	Client/Ref Sample ID	Analyte	CAS Number	Method	Result	Limits	Comment
Method Blank (MB) Values								
Dissolved Metals	QC-227099-001	----	aluminum, dissolved	7429-90-5	E421	0.0010 MB-LOR mg/L	0.001 mg/L	Blank result exceeds permitted value

Result Qualifiers

Qualifier	Description
MB-LOR	*Method Blank exceeds ALS DQO. Limits of Reporting have been adjusted for samples with positive hits below 5x blank level.*

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 00:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 00:00 is used for calculation purposes.

Legend & Qualifier Definitions

EHTR-FM: Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended

EHTR: Exceeded ALS recommended hold time prior to sample receipt.

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Water**

Evaluation: × = QC frequency outside specification; ✓ = QC frequency within specification.

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Conductivity in Water	E100 Vancouver - Environmental	Water	APHA 2510 (mod)	Conductivity, also known as Electrical Conductivity (EC) or Specific Conductance, is measured by immersion of a conductivity cell with platinum electrodes into a water sample. Conductivity measurements are temperature-compensated to 25°C.
pH by Meter	E108 Vancouver - Environmental	Water	APHA 4500-H (mod)	pH is determined by potentiometric measurement with a pH electrode, and is conducted at ambient laboratory temperature (normally 20 ± 5°C). For high accuracy test results, pH should be measured in the field within the recommended 15 minute hold time.
TSS by Gravimetry	E160-H Vancouver - Environmental	Water	APHA 2540 D (mod)	Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, following by drying of the filter at 104 ± 1°C, with gravimetric measurement of the filtered solids. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.
Chloride in Water by IC (Low Level)	E235.Cl-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrite in Water by IC (Low Level)	E235.NO2-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrate in Water by IC (Low Level)	E235.NO3-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Sulfate in Water by IC	E235.SO4 Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Alkalinity Species by Titration	E290 Vancouver - Environmental	Water	APHA 2320 B (mod)	Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.
Ammonia by Fluorescence	E298 Vancouver - Environmental	Water	J. Environ. Monit., 2005, 7, 37-42 (mod)	Ammonia in water is analyzed by flow-injection analysis with fluorescence detection after reaction with orthophthaldialdehyde (OPA).

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Dissolved Metals in Water by CRC ICPMS	E421 Vancouver - Environmental	Water	APHA 3030B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.
Dissolved Mercury in Water by CVAAS	E509 Vancouver - Environmental	Water	APHA 3030B/EPA 1631E (mod)	Water samples are filtered (0.45 um), preserved with HCl, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS.
Dissolved Hardness (Calculated)	EC100 Vancouver - Environmental	Water	APHA 2340B	"Hardness (as CaCO3), dissolved" is calculated from the sum of dissolved Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. "Total Hardness" refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations.
Ion Balance using Dissolved Metals	EC101 Vancouver - Environmental	Water	APHA 1030E	Cation Sum, Anion Sum, and Ion Balance are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Dissolved species are used where available. Minor ions are included where data is present. Ion Balance cannot be calculated accurately for waters with very low electrical conductivity (EC).
TDS in Water (Calculation)	EC103 Vancouver - Environmental	Water	APHA 1030E (mod)	Total Dissolved Solids is calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Dissolved species are used where available. Minor ions are included where data is present.
Nitrate and Nitrite (as N) (Calculation)	EC235.N+N Vancouver - Environmental	Water	EPA 300.0	Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N).

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Preparation for Ammonia	EP298 Vancouver - Environmental	Water		Sample preparation for Preserved Nutrients Water Quality Analysis.
Dissolved Metals Water Filtration	EP421 Vancouver - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HNO3.
Dissolved Mercury Water Filtration	EP509 Vancouver - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HCl.

Sampler	: CR/BK/SS		
Site	: ----		
Quote number	: Q54721-Standing Offer		
No. of samples received	: 6		
No. of samples analysed	: 6		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits
- Reference Material (RM) Report; Recovery and Acceptance Limits
- Method Blank (MB) Report; Recovery and Acceptance Limits
- Laboratory Control Sample (LCS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Dee Lee	Analyst	Metals, Burnaby, British Columbia
Ilnaz Badbezanchi	Team Leader - Metals preparation	Metals, Burnaby, British Columbia
Jashan Kaur	Lab Assistant	Metals, Burnaby, British Columbia

Lindsay Gung	Supervisor - Water Chemistry	Inorganics, Burnaby, British Columbia

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percentage Difference
# = Indicates a QC result that did not meet the ALS DQO.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test specific).

Sub-Matrix: **Water**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Water**

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Sub-Matrix: **Water**

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Dee Lee	Analyst	Metals, Burnaby, British Columbia
Kevin Duarte	Supervisor - Metals ICP Instrumentation	Metals, Burnaby, British Columbia
Lindsay Gung	Supervisor - Water Chemistry	Inorganics, Burnaby, British Columbia
Ruby Pham	Lab Assistant	Metals, Burnaby, British Columbia
Sristika Chand	Lab Analyst	Metals, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
%	percent
µS/cm	Microsiemens per centimetre
meq/L	milliequivalents per litre
mg/L	milligrams per litre
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Qualifiers

Qualifier	*Description*
DLM	*Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).*

No. of samples analysed	: 3		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 00:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 00:00 is used for calculation purposes.

Legend & Qualifier Definitions

EHTR-FM: Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended

EHTR: Exceeded ALS recommended hold time prior to sample receipt.

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Water**

Evaluation: × = QC frequency outside specification; ✓ = QC frequency within specification.

Quality Control Sample Type			Count		Frequency (%)		
Analytical Methods	*Method*	*QC Lot #*	*QC*	*Regular*	*Actual*	*Expected*	*Evaluation*

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Conductivity in Water	E100 Vancouver - Environmental	Water	APHA 2510 (mod)	Conductivity, also known as Electrical Conductivity (EC) or Specific Conductance, is measured by immersion of a conductivity cell with platinum electrodes into a water sample. Conductivity measurements are temperature-compensated to 25°C.
pH by Meter	E108 Vancouver - Environmental	Water	APHA 4500-H (mod)	pH is determined by potentiometric measurement with a pH electrode, and is conducted at ambient laboratory temperature (normally 20 ± 5°C). For high accuracy test results, pH should be measured in the field within the recommended 15 minute hold time.
TSS by Gravimetry (Low Level)	E160-L Vancouver - Environmental	Water	APHA 2540 D (mod)	Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, following by drying of the filter at 104 ± 1°C, with gravimetric measurement of the filtered solids. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.
Chloride in Water by IC (Low Level)	E235.Cl-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrite in Water by IC (Low Level)	E235.NO2-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrate in Water by IC (Low Level)	E235.NO3-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Sulfate in Water by IC	E235.SO4 Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Alkalinity Species by Titration	E290 Vancouver - Environmental	Water	APHA 2320 B (mod)	Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.
Ammonia by Fluorescence	E298 Vancouver - Environmental	Water	J. Environ. Monit., 2005, 7, 37-42 (mod)	Ammonia in water is analyzed by flow-injection analysis with fluorescence detection after reaction with orthophthaldialdehyde (OPA).

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Dissolved Metals in Water by CRC ICPMS	E421 Vancouver - Environmental	Water	APHA 3030B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.
Dissolved Mercury in Water by CVAAS	E509 Vancouver - Environmental	Water	APHA 3030B/EPA 1631E (mod)	Water samples are filtered (0.45 um), preserved with HCl, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS.
Dissolved Hardness (Calculated)	EC100 Vancouver - Environmental	Water	APHA 2340B	"Hardness (as CaCO3), dissolved" is calculated from the sum of dissolved Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. "Total Hardness" refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations.
Ion Balance using Dissolved Metals	EC101 Vancouver - Environmental	Water	APHA 1030E	Cation Sum, Anion Sum, and Ion Balance are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Dissolved species are used where available. Minor ions are included where data is present. Ion Balance cannot be calculated accurately for waters with very low electrical conductivity (EC).
TDS in Water (Calculation)	EC103 Vancouver - Environmental	Water	APHA 1030E (mod)	Total Dissolved Solids is calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Dissolved species are used where available. Minor ions are included where data is present.
Nitrate and Nitrite (as N) (Calculation)	EC235.N+N Vancouver - Environmental	Water	EPA 300.0	Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N).

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Preparation for Ammonia	EP298 Vancouver - Environmental	Water		Sample preparation for Preserved Nutrients Water Quality Analysis.
Dissolved Metals Water Filtration	EP421 Vancouver - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HNO3.
Dissolved Mercury Water Filtration	EP509 Vancouver - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HCl.

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits
- Reference Material (RM) Report; Recovery and Acceptance Limits
- Method Blank (MB) Report; Recovery and Acceptance Limits
- Laboratory Control Sample (LCS) Report; Recovery and Acceptance Limits

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percentage Difference
# = Indicates a QC result that did not meet the ALS DQO.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test specific).

Sub-Matrix: **Water**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Water**

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Sub-Matrix: **Water**

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Dee Lee	Analyst	Metals, Burnaby, British Columbia
Kevin Duarte	Supervisor - Metals ICP Instrumentation	Metals, Burnaby, British Columbia
Ruby Pham	Lab Assistant	Metals, Burnaby, British Columbia
Sristika Chand	Lab Analyst	Metals, Burnaby, British Columbia
Tracy Harley	Supervisor - Water Quality Instrumentation	Inorganics, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
µS/cm	Microsiemens per centimetre
mg/L	milligrams per litre
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Qualifiers

Qualifier	*Description*
DLDS	*Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity.*
DLM	*Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).*

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 00:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 00:00 is used for calculation purposes.

Legend & Qualifier Definitions

EHTR-FM: Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended

EHTR: Exceeded ALS recommended hold time prior to sample receipt.

EHT: Exceeded ALS recommended hold time prior to analysis.

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Water**

Evaluation: × = QC frequency outside specification; ✓ = QC frequency within specification.

Quality Control Sample Type			Count		Frequency (%)		
Analytical Methods	*Method*	*QC Lot #*	*QC*	*Regular*	*Actual*	*Expected*	*Evaluation*

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Conductivity in Water	E100 Vancouver - Environmental	Water	APHA 2510 (mod)	Conductivity, also known as Electrical Conductivity (EC) or Specific Conductance, is measured by immersion of a conductivity cell with platinum electrodes into a water sample. Conductivity measurements are temperature-compensated to 25°C.
pH by Meter	E108 Vancouver - Environmental	Water	APHA 4500-H (mod)	pH is determined by potentiometric measurement with a pH electrode, and is conducted at ambient laboratory temperature (normally 20 ± 5°C). For high accuracy test results, pH should be measured in the field within the recommended 15 minute hold time.
TSS by Gravimetry (Low Level)	E160-L Vancouver - Environmental	Water	APHA 2540 D (mod)	Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, following by drying of the filter at 104 ± 1°C, with gravimetric measurement of the filtered solids. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.
Chloride in Water by IC (Low Level)	E235.Cl-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrite in Water by IC (Low Level)	E235.NO2-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrate in Water by IC (Low Level)	E235.NO3-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Sulfate in Water by IC	E235.SO4 Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Alkalinity Species by Titration	E290 Vancouver - Environmental	Water	APHA 2320 B (mod)	Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.
Ammonia by Fluorescence	E298 Vancouver - Environmental	Water	J. Environ. Monit., 2005, 7, 37-42 (mod)	Ammonia in water is analyzed by flow-injection analysis with fluorescence detection after reaction with orthophthaldialdehyde (OPA).

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Dissolved Metals in Water by CRC ICPMS	E421 Vancouver - Environmental	Water	APHA 3030B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.
Dissolved Mercury in Water by CVAAS	E509 Vancouver - Environmental	Water	APHA 3030B/EPA 1631E (mod)	Water samples are filtered (0.45 um), preserved with HCl, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS.
Dissolved Hardness (Calculated)	EC100 Vancouver - Environmental	Water	APHA 2340B	"Hardness (as CaCO3), dissolved" is calculated from the sum of dissolved Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. "Total Hardness" refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations.
TDS in Water (Calculation)	EC103 Vancouver - Environmental	Water	APHA 1030E (mod)	Total Dissolved Solids is calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Dissolved species are used where available. Minor ions are included where data is present.
Nitrate and Nitrite (as N) (Calculation)	EC235.N+N Vancouver - Environmental	Water	EPA 300.0	Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N).

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Preparation for Ammonia	EP298 Vancouver - Environmental	Water		Sample preparation for Preserved Nutrients Water Quality Analysis.
Dissolved Metals Water Filtration	EP421 Vancouver - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HNO3.
Dissolved Mercury Water Filtration	EP509 Vancouver - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HCl.

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits
- Reference Material (RM) Report; Recovery and Acceptance Limits
- Method Blank (MB) Report; Recovery and Acceptance Limits
- Laboratory Control Sample (LCS) Report; Recovery and Acceptance Limits

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percentage Difference
# = Indicates a QC result that did not meet the ALS DQO.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test specific).

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Water**

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Sub-Matrix: **Water**

No. of samples analysed	: 3		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Caleb Deroche	Lab Analyst	Metals, Burnaby, British Columbia
Dion Chan	Lab Assistant	Metals, Burnaby, British Columbia
Jay Jang	Lab Assistant	Metals, Burnaby, British Columbia
Kevin Duarte	Supervisor - Metals ICP Instrumentation	Metals, Burnaby, British Columbia
Lindsay Gung	Supervisor - Water Chemistry	Inorganics, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
%	percent
µS/cm	Microsiemens per centimetre
meq/L	milliequivalents per litre
mg/L	milligrams per litre
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Qualifiers

Qualifier	*Description*
DLDS	*Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity.*

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 00:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 00:00 is used for calculation purposes.

Legend & Qualifier Definitions

EHTR-FM: Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended

EHTR: Exceeded ALS recommended hold time prior to sample receipt.

EHT: Exceeded ALS recommended hold time prior to analysis.

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Water**

Evaluation: × = QC frequency outside specification; ✓ = QC frequency within specification.

Quality Control Sample Type			Count		Frequency (%)		
Analytical Methods	*Method*	*QC Lot #*	*QC*	*Regular*	*Actual*	*Expected*	*Evaluation*
Laboratory Duplicates (DUP)							
Alkalinity Species by Titration	E290	323664	1	15	6.6	5.0	✓
Ammonia by Fluorescence	E298	329636	1	12	8.3	5.0	✓

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Conductivity in Water	E100 Vancouver - Environmental	Water	APHA 2510 (mod)	Conductivity, also known as Electrical Conductivity (EC) or Specific Conductance, is measured by immersion of a conductivity cell with platinum electrodes into a water sample. Conductivity measurements are temperature-compensated to 25°C.
pH by Meter	E108 Vancouver - Environmental	Water	APHA 4500-H (mod)	pH is determined by potentiometric measurement with a pH electrode, and is conducted at ambient laboratory temperature (normally 20 ± 5°C). For high accuracy test results, pH should be measured in the field within the recommended 15 minute hold time.
TSS by Gravimetry (Low Level)	E160-L Vancouver - Environmental	Water	APHA 2540 D (mod)	Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, following by drying of the filter at 104 ± 1°C, with gravimetric measurement of the filtered solids. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.
Chloride in Water by IC (Low Level)	E235.Cl-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrite in Water by IC (Low Level)	E235.NO2-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrate in Water by IC (Low Level)	E235.NO3-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Sulfate in Water by IC	E235.SO4 Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Alkalinity Species by Titration	E290 Vancouver - Environmental	Water	APHA 2320 B (mod)	Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.
Ammonia by Fluorescence	E298 Vancouver - Environmental	Water	J. Environ. Monit., 2005, 7, 37-42 (mod)	Ammonia in water is analyzed by flow-injection analysis with fluorescence detection after reaction with orthophthaldialdehyde (OPA).

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Dissolved Metals in Water by CRC ICPMS	E421 Vancouver - Environmental	Water	APHA 3030B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.
Dissolved Mercury in Water by CVAAS	E509 Vancouver - Environmental	Water	APHA 3030B/EPA 1631E (mod)	Water samples are filtered (0.45 um), preserved with HCl, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS.
Dissolved Hardness (Calculated)	EC100 Vancouver - Environmental	Water	APHA 2340B	"Hardness (as CaCO3), dissolved" is calculated from the sum of dissolved Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. "Total Hardness" refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations.
Ion Balance using Dissolved Metals	EC101 Vancouver - Environmental	Water	APHA 1030E	Cation Sum, Anion Sum, and Ion Balance are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Dissolved species are used where available. Minor ions are included where data is present. Ion Balance cannot be calculated accurately for waters with very low electrical conductivity (EC).
TDS in Water (Calculation)	EC103 Vancouver - Environmental	Water	APHA 1030E (mod)	Total Dissolved Solids is calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Dissolved species are used where available. Minor ions are included where data is present.
Nitrate and Nitrite (as N) (Calculation)	EC235.N+N Vancouver - Environmental	Water	EPA 300.0	Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N).

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Preparation for Ammonia	EP298 Vancouver - Environmental	Water		Sample preparation for Preserved Nutrients Water Quality Analysis.
Dissolved Metals Water Filtration	EP421 Vancouver - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HNO3.
Dissolved Mercury Water Filtration	EP509 Vancouver - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HCl.

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percentage Difference
# = Indicates a QC result that did not meet the ALS DQO.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test specific).

Sub-Matrix: **Water**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Water**

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Sub-Matrix: **Water**

					Matrix Spike (MS) Report					
					Spike		Recovery (%)	Recovery Limits (%)

Appendix N – Wildlife and Hazing Tracking Report

Date	Time	Type of Animal	Number of Animals	Location	Description: Size/Color/Markings and Additional Notes	Reported By (Name)	Was the animal hazed?	What hazing technique was used?	What was the animal's response?	Who performed the hazing?	Has this animal been hazed in 2021?	Reportable Incident (Yes/No)	Notes
24-Feb-21	10:30	Fox	1	Back of Kitchen	Red. Looks very healthy.	Walker Griffin	No	N/A	N/A	N/A	N/A	No	
8-Mar-21	15:45	Lynx	1	Dyno access road		Chris W	No	N/A	N/A	N/A	N/A	No	
13-Mar-21	16:00	Wolf	1	Access road. km 24		Brian Hyde	No	N/A	N/A	N/A	N/A	No	
15-Mar-21	16:30	Wolf	1	Access road. km 15.5		Brian Hyde	No	N/A	N/A	N/A	N/A	No	
27-Mar-21	14:00	Chipmunk	1	Near Gym	Mild outside	I. McAllen ?	No	N/A	N/A	N/A	N/A	No	
27-Mar-21	14:45	Fox	1	A2 Pit Saddle	All black, a bit scruffy.	Ian S	No	N/A	N/A	N/A	N/A	No	Came over the hill by flowmeter as I was walking up. Was nice to see that it was spooked and not comfortable with people.
5-Apr-21	7:00	Fox	1	Pit 1 Barge	healthy adult	Andrew Ward	No	N/A	N/A	N/A	N/A	N/A	
7-Apr-21	16:15	Moose	1	Between km 18 & 19 on the access road		Brian Hyde	No	N/A	N/A	N/A	N/A	No	
19-Apr-21	6:00	Fox	1	By Site Service Office	Red. Looks very healthy.	Hank Schmidt	No	N/A	N/A	N/A	N/A	No	Walked between Site services and gym buildings heading towards the back of Capstone Building.
23-Apr-21	14:00	Bear	1	On hill off km 2	Brown		No	N/A					
1-May-21	13:00	Fox	1	Behind Capstone	Big Healthy Black fox	I. McAllen ?	No	N/A	N/A	N/A	N/A	No	
8-May-21	18:20	Bear	1	Dry Stack	Brown Black Bear	Mike E.	No	N/A	N/A				
8-May-21	9:30	Spruce Grouse	1	WSO on road		Scott M	No	N/A	N/A	N/A	N/A	No	
9-May-21	11:00	Bear	2	Water Storage Pond, km2	Black bear sow, with brown cub	Chris W	No	N/A	N/A				
9-May-21	17:50	Bear	2	Water storage Pond Dam	Black bear sow, with brown cub	Chris W	No	N/A	N/A				
10-May-21	13:30	Bear	1	WS2	Brown Black Bear	Mike E.	No	N/A	N/A	N/A	N/A	No	
11-May-21	8:29	Bear	1	Landfill	small Black Bear	Eric M	No	N/A	N/A	N/A	N/A	No	
13-May-21	14:30	Bear	2	Access Road Km2	Black bear sow, with brown cub	Corey R	Yes	Horn on Truck	Ran away	Corey R	No	No	Ran down into Minto Creek Valley
13-May-21	16:30	Bear	2	Selkirk North	Black bear sow, with brown cub	Eric M	No	N/A	N/A	N/A	N/A	Yes	Ran up hill away from camp
14-May-21	9:30	Bear	1	Access Road Km3	Black bear	Corey R	No	N/A	N/A	N/A	No	No	
16-May-21	16:30	Fox	1	Along A2 ridge	Medium size, Yellow, Unafraid of Humans	Brandon K	Yes	Horn on Truck	Run away	Samantha Stachiw	No	No	Encounter occurred near centre of mine site but the fox was hazed towards Minto north.
16-May-21	18:00	Bear	1	Dry stack by W 36 access road		Brown Black Bear	Scott M	Yes	Bear banners, horn on truck	Corey R/Sean D	Yes	No	slowly moved south on dry stack
17-May-21	9:30	Bear	1	Dry Stack by Haul road		Brown Black Bear	Scott M	Yes	Truck horn	Corey R/Brandon K	Yes	No	
18-May-21	10:00	Bear	1	Access Road by warehouse laydown		Brown Black Bear	Robert M	Yes	Rubber bullet, Cracker shell, Truck horn	Moved off into the bush after a second rubber bullet	Sean D	Yes	No	Took two rubber bullets and a cracker shell to move it away from camp
18-May-21	11:00	Bear	1	Access Road Km6		Black Bear	Doug H	No	N/A	N/A	N/A	N/A	No	On hill be Km6
18-May-21	12:00	Bear	1	WSP Dam		Brown Black Bear	Doug H	No	N/A	N/A	N/A	Yes	No	Walkine on Dam
18-May-21	9:30	Bear	2	Access Road km10		Grizzly	Doug H	No	N/A	N/A	N/A	No	No	
20-May-21	8:30	Bear	1	Outside shop door		Bie	J.M.	N/A	N/A	N/A	N/A	N/A	No	
20-May-21	6:45	Bear	1	STP		Black Bear	Eric M	Yes	Cracker shells					
21-May-21	14:30	Bear	1	Haul Rd		Black Bear	N/A	No	N/A	N/A	N/A	N	No	Was alerted on CH1 while in Minto N, drove to area but no sign of bear
23-May-21	7:45	Bear	1	KM 11 Access Road		Black Bear	Brian H.	No	N/A	N/A	N/A	N	No	Black Bear crossed road towards Yukon R., possible young bear
23-May-21	8:00	Bear	1	KM 12 Access Road		Black Bear	Brian H.	No	N/A	N/A	N/A	N	No	Black Bear crossed road towards Yukon R. believed to be a different bear from 15min earlier, larger
23-May-21	12:00	Bear	1	KM 0.5		Bear	Unknown	No	N/A	N/A	N/A	N	No	Bear reported, Samantha S. went to check but only found a fox
25-May-21	14:30	Bear	2	KM 6		Black bear, 1 cub	Brian H	No	N/A	N/A	N/A	N	No	Bear spotted on road, went into bushes towards creek
27-May-21	9:30	Bear	1	Near Dyno call sign		Brown coloured black bear	Ben (SS)	Yes	honking horn	left area	Ben	Unknown	No	Ben called in bear sighting, bear last seen in SW dump between Dyno and fuel farm. Brian went to investigate but couldn't locate bear
27-May-21	14:00	Bear	1	SW dump		brown coloured bear, could not ID	Brian	No	N/A	N/A	N/A	Unknown	No	Bear spotted from Top of the World, bear eventually disappered into bushes
28-May-21	9:00	Fox	1	Mabou Yards		Red, Fat and looks healthy	Gillian	No	NA	Appears habituated. Not afraid of humans; actual approached worker.				
30-May-21	10:00	Bear	1	Selkirk Tower		Black bear	Todd. E	No	NA					
30-May-21	1:35	Moose & Calf	2	WMA	Moose and calf	Brian H	No	N/A	Was travelling through treeline	N/A	No	No	Moose and calf seen walking through WMA area
30-May-21	5:30	Bear	1	Dry Stack off access road	Youne and small black bear	Rob P.	No	Na		N/A	Possibly	No	
31-May-21	12:15	Bear	1	Between Waste Haul Rd and A2	Black Bear	Kirby	No	N/A	N/A	N/A	Unknown	No	animal last seen in shrubs off road
31-May-21	13:00	Bear	1	Dry Stack near WS5	Black Bear	Unknown	Yes	Banners from 12ea.	Eventually left area headine E	Brad. Tyler	Unknown	No	
1-Jun-21	9:00	Bear	1	KM6	Black Bear	Kirby	No	N/A	N/A	N/A	Unknown	No	
1-Jun-21	13:30	Bear	1	Dyno	Black Bear (brown in colour)	Unknown	no	N/A (was gone when we got there)	N/A	N/A	Unknown	No	N/A
1-Jun-21	14:40	Wood Frogs	2+	W1S	Frequent calls throughout wetland area	Reanna M	No	N/A	N/A	N/A	Unknown	No	
4-Jun-21	6:30	Bear	1	Airport Road access at haul road	Black bear	Unknown	No	N/A	N/A	N/A	Unknown	No	
6-Jun-21	12:30	Bear	3	Airport Road access at haul road	Black bear and two cubs	Eric M	No	N/A	N/A	N/A	Unknown	No	
7-Jun-21	14:30	Bear	1	KM 1.5 on access road	Brown Black Bear, Young	Brandon K	Yes	honking horn	Slowly backed away. Was gone 1 hr later when spot was checked again	Corey	Possibly	No	Possibly same juvenile bear that has caused problems recently.
7-Jun-21	14:30	Bear	1	KM 3 on access road	Brown Black Bear	Brandon K	Yes	honkine horn	Started slowly walkine in oaposite direction	Corey	Unknown	No	
7-Jul-21	19:00	Bear	1	Mill live pile	Brown Black Bear	Heather W.	No	N/A	N/A	N/A	Possibly	No	Heading away from Camp
9-Jul-21	14:04	Deer	2	west side of Caestone trailer	Deer	Ian C	No	N/A	N/A	N/A	No	No	headine north
10-Jun-21	10:50	Bear	1	KM 8 access road	Healthy adult	Brandon K	No	N/A	N/A	N/A	No	No	
12-Jul-21	15:00	Deer	1	KM 15 access road	Adult male with velvet on antlers	Brandon K	No	N/A	N/A	N/A	Unknown	No	
12-Jun-21	6:00	Bear	1	Diversion Ditch	Black Bear	Sean D	Yes	Bear banners, horn on truck	Started slowly walkine in oaposite direction	Sean D	Possibly	No	
12-Jun-21	10:30	Bear	1	Airport Road access at haul road	Brown Black bear	Sean D	No	N/A	N/A	N/A	Possibly	No	Same bie brown coloured black bear
13-Jul-21	10:00	Bear	1	Off KM 2 access road	Brown bear cub. Mother bear wasn't found	Brandon K	Yes	Truck horn	Run away	Corey	No	No	
13-Jun-21	8:00	Bear	1	SW dump	Brown Black Bear	Scott M	No	N/A	Just walked throuah area headine North	N/A	Possibly	No	Same bie brown coloured black bear
14-Jun-21	8:10	Bear	1	SW dump	Brown Black Bear	Eric M	No	N/A	Just walked through area heading North	N/A	Possibly	No	Same big brown coloured black bear
14-Jun-21	8:00	Hare	1	W3	Dark brown	Brandon K	No	N/A	N/A	N/A	N/A	No	
20-Jun-21	11:30	Deer	1	Warehouse	Deer	Reanna M	No	Followed with the truck to make sure it was leavine	Left the area across the dry stacks	N/A	No	No	
26-Jun-21	16:30	Bear	1	W46 trail	3-4 year old grizzly, dark brown	Reanna M	Yes	Shouting and clapping, bear was not deterred	We retreated slowly, bear continued to follow us for several minutes before losing interest	Brian H and myself	Unknown	No	Bear seemed curious; not aggressive. Not scared of humans
16-Jul-21	8:30	Deer	3	MN access road	Adult female with two fawns	Reanna M	No	N/A	Retreated slowly down road towards mine	N/A	Unknown	No	
20-Jul-21	10:00	Bear	1	KM 7.5 access road	Brown black bear	Reanna M	No	N/A	N/A	N/A	Unknown	No	
23-Jul-21	12:00	Deer	3	KM 0.5 access road	Adult female with two fawns	Reanna M	No	N/A	N/A	N/A	Unknown	No	
1-Aug-21	16:00	Bear	1	Across from wetlands, on the bank	Mid size, black bear	Mike, Brandon K	Yes	Truck horn	Bear frieghtened by recreational walker and truck horn. Ran north towards forrest/selkirk towers				
18-Aug-21	9:00	Bear	1	Crossed haul road and accessed Portal & Pads	Brown Black Bear	Aaron B. (Colbalt)	Yes	Truck horn	Bear snooping around Portal & Pads waste recipticles and frightened by horn. Ran up near Portals and disappeared into bushes.	Brian H	Unknown	No	
18-Aug-21	20:20	Bear	1	Minto North drill site near groundwater	Grizzly	Monika Dyl (Geologist)	No	N/A	N/A	N/A	Unknown	No	Radio'd Channel 15 to alert ENV but afterhours so ENV was on Channel 1 - ENV did not receive notice until following morning - Bear left on its own accord as per the drillers.
19-Aug-21	9:30	Bear	1	Air Strip heading towards Paycore laydown	Brown Black Bear	Max (Exploration)	No	N/A	N/A	N/A	Unknown	No	No sign of bear
19-Aug-21	10:30	Bear	1	KM 0.5 access road, heading towards camp	Brown Black Bear	Freight Truck Driver	No	N/A	N/A	N/A	Unknown	No	No sign of bear
17-Sep-21	8:30	Moose	1	Drill water tanks	Young	Cory	No	N/A	N/A	N/A	N/A	No	
24-Sep-21	12:30	Fox	1	Behind Kitchen	Red Fox	John Teuscher	No	N/A	N/A	N/A	Unknown	No	
24-Sep-21	14:30	Fox	1	Electrical behind Mill	Red Fox	Brian Hyde	Yes	Honked horn	went underneath Electrical building	Brian Hyde	Unown	No	black in colour
2-Oct-21	13:30	Fox	1	Mill Entry	Red Fox	Doug H	Yes

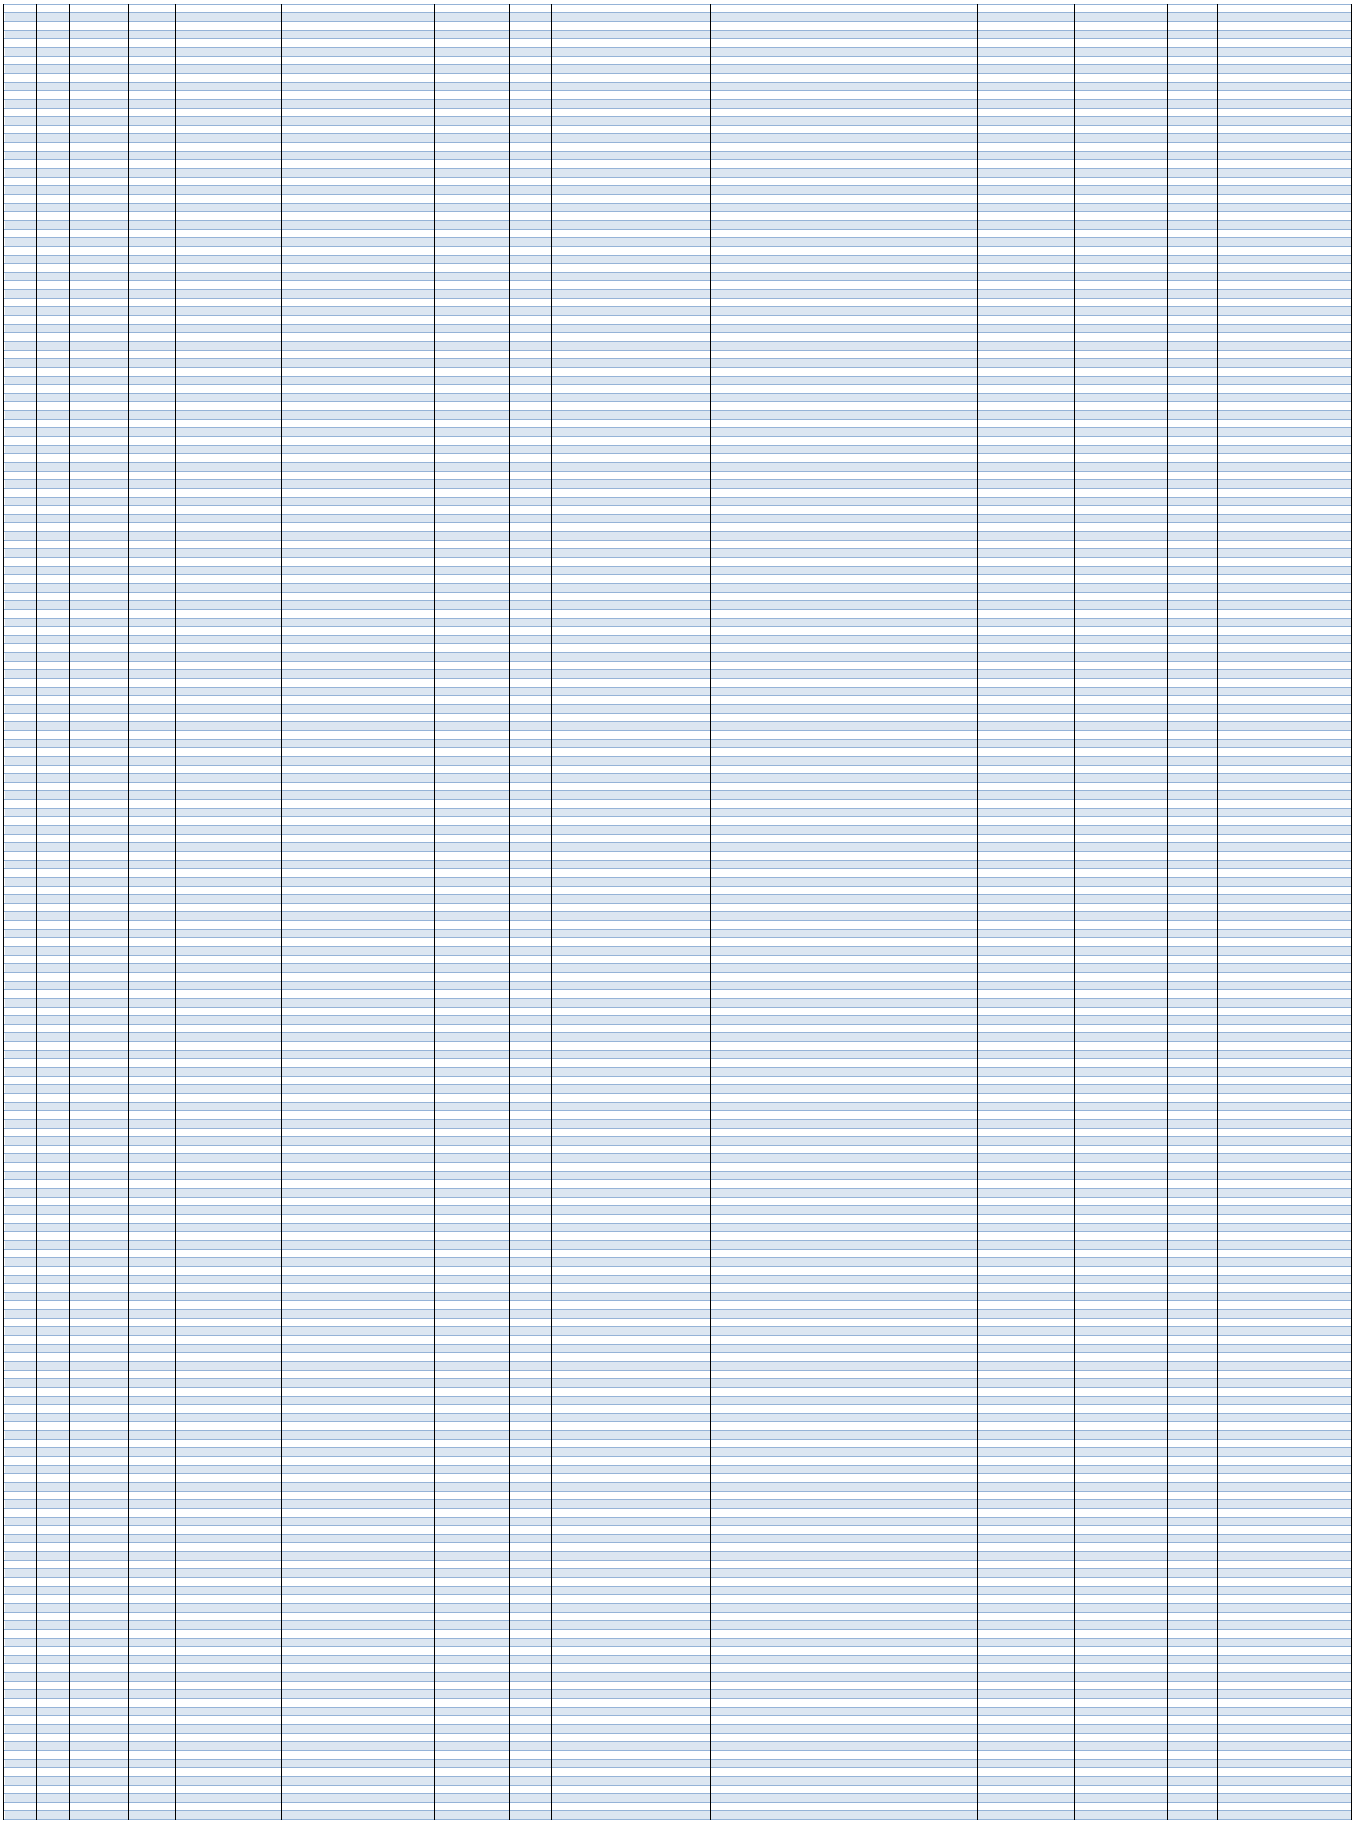
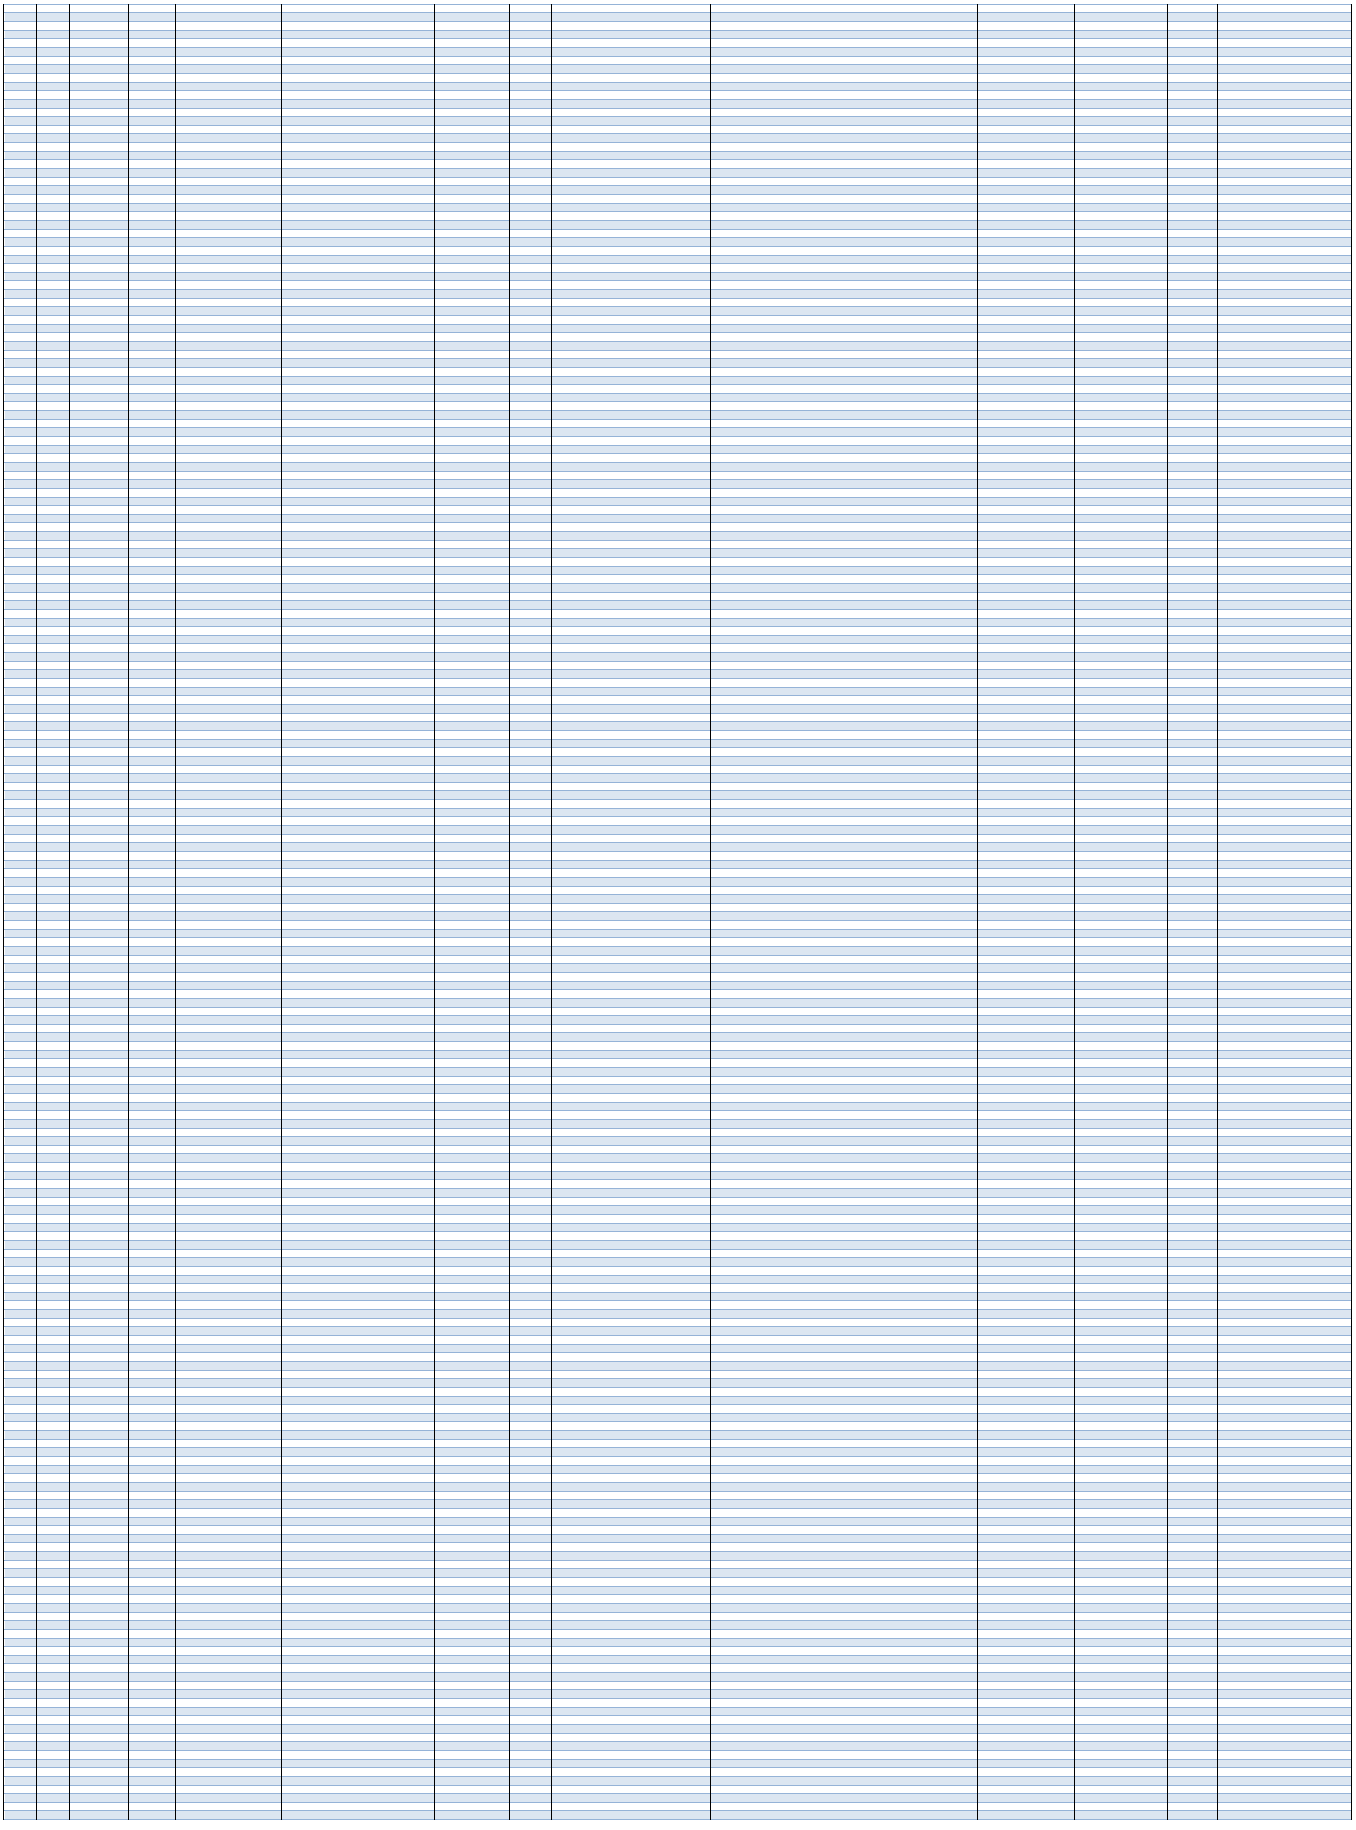
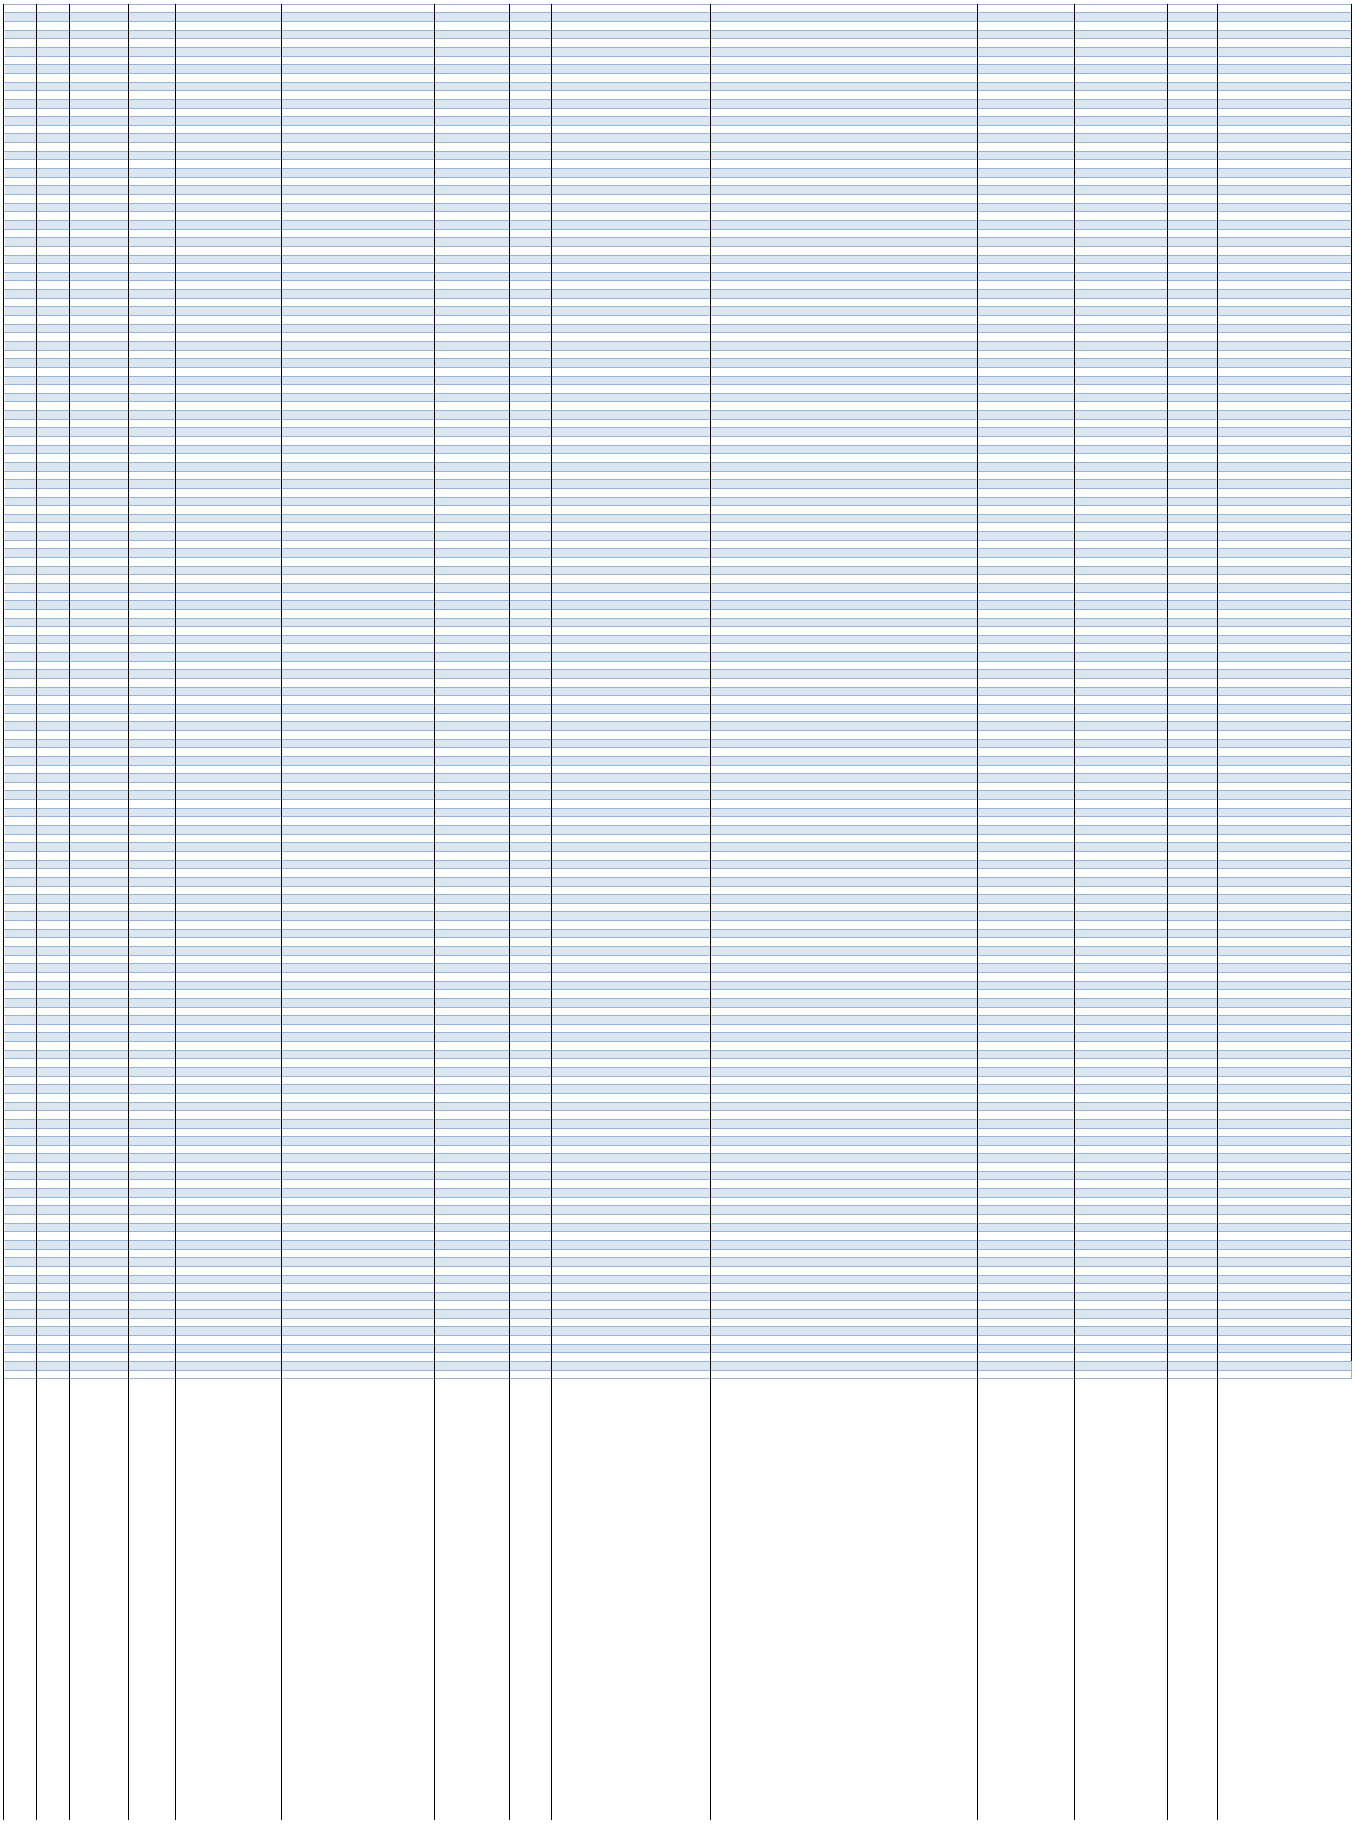
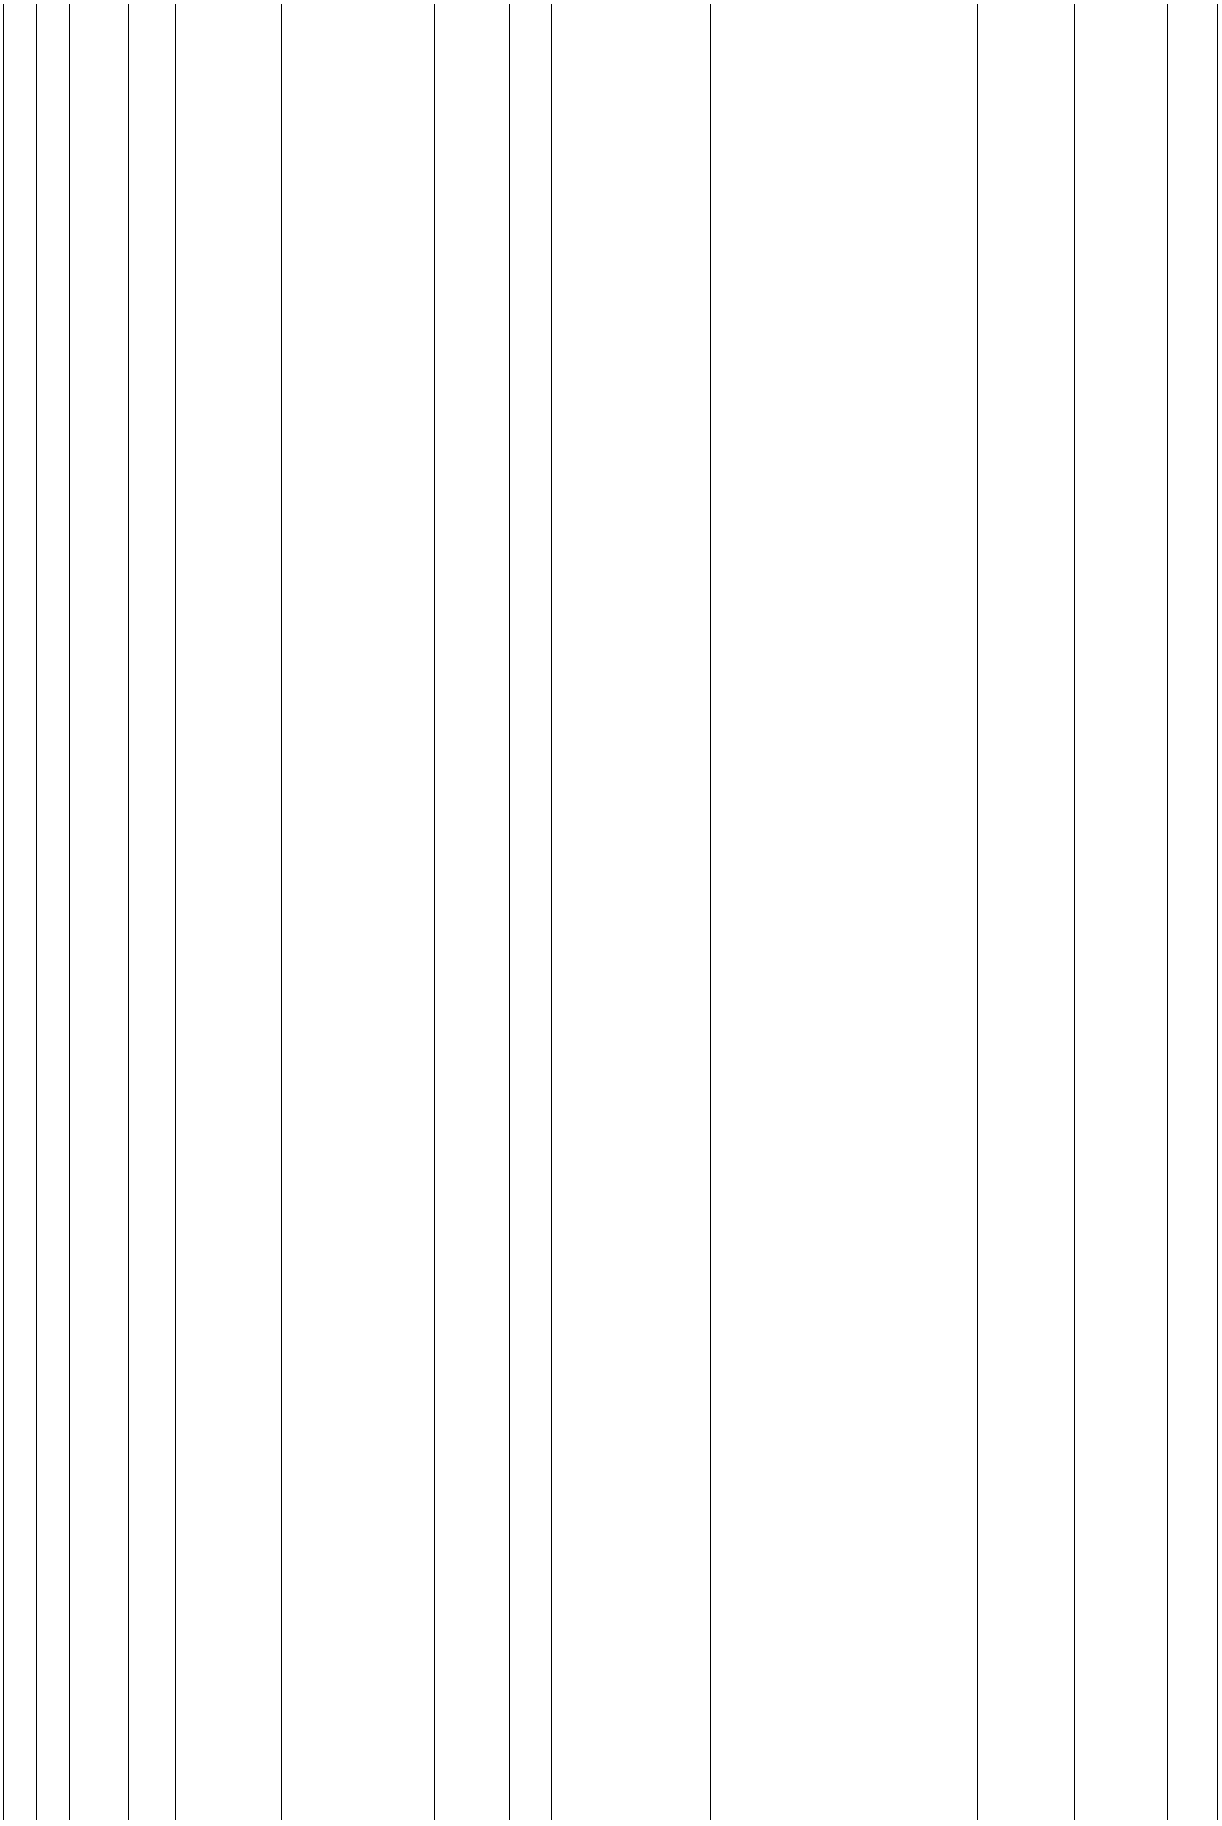
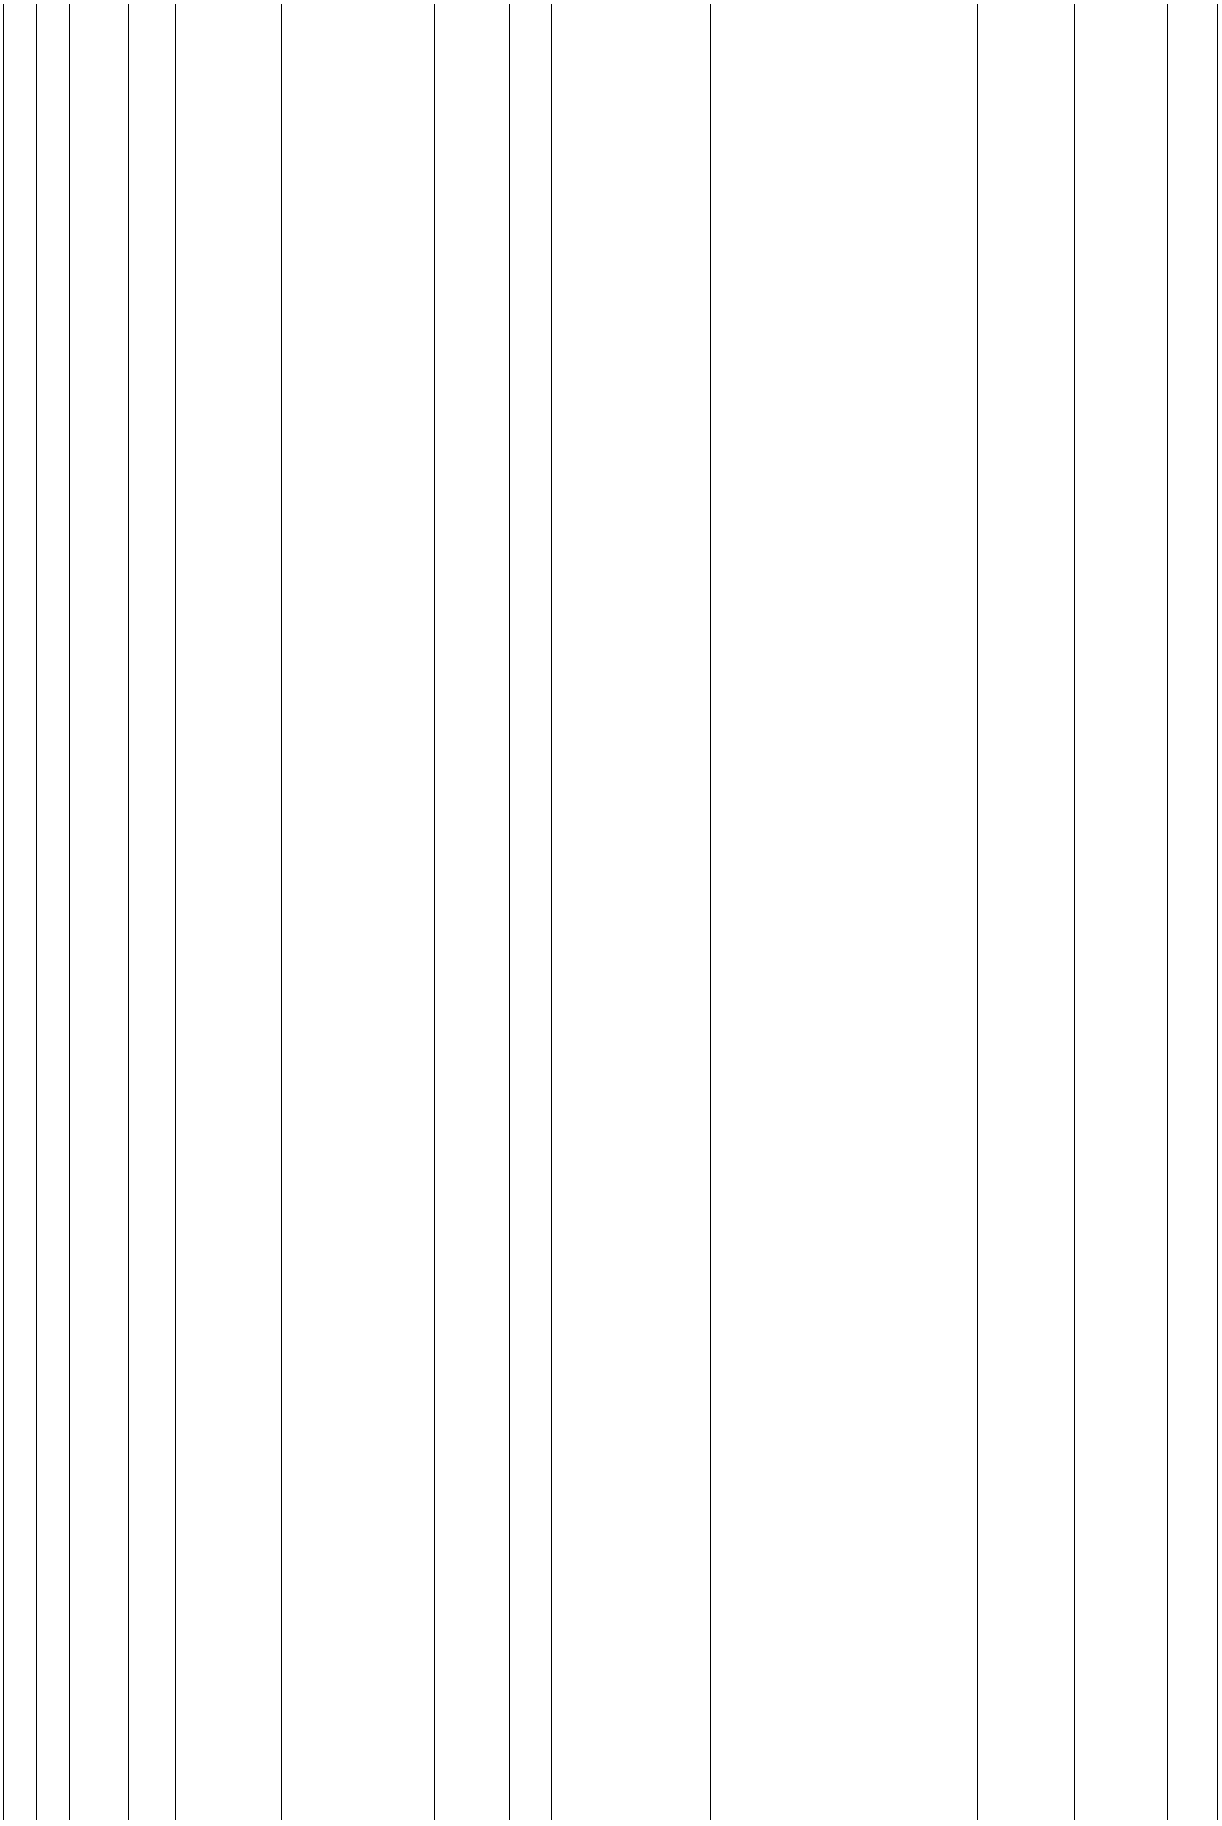
8-Nov-21	9:20	Fox	1	left side of road going up to Mabou Shop	black in colour	Chris Ronay, Mina Gouony	No	N/A	N/A	N/A	N/A	N/A	
10-Nov-21	9:00	Fox	1	South Tower	good condition	N/A	No	N/A	N/A	N/A	N/A	N/A	
11-Nov-21	13:45	Fox	1	Minto North Road - off the road & down the sloped rocks on the left hand side across fr. Main Pit road	black in colour	Dani Thorne	No	N/A	N/A	N/A	N/A	N/A	surfaced from under a large boulder - possible den?

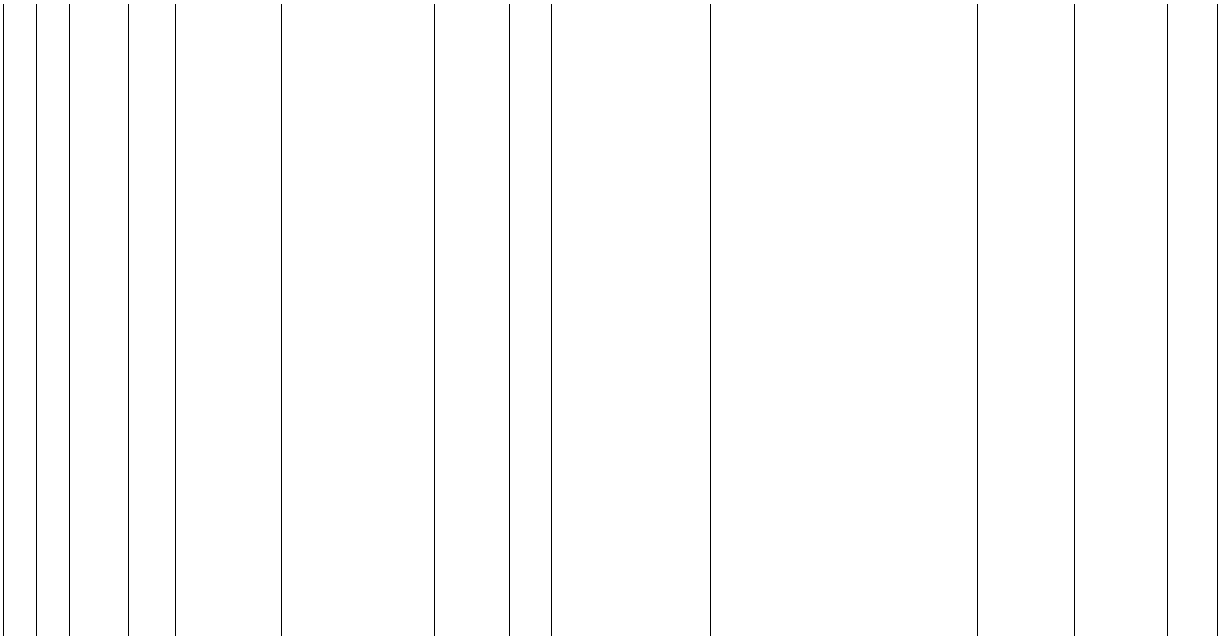












Appendix O – 2021 Socio-Economic Report

2021 Socio-economic Report

Prepared by:
Minto Metals Corp.
March 2022

1.0 Introduction

This report has been prepared by Minto Metals Corp. (formerly Minto Explorations Ltd.) in regard to the Minto Mine, located in central Yukon. The following report summarizes the results of the available socio-economic data at Minto Mine (Minto) during 2021, as required by the Socio-economic Monitoring Program framework.

The Minto Mine Socio-economic Monitoring Program (2014) was developed in conjunction with Selkirk First Nation (SFN) and the Government of Yukon (YG) to monitor the socio-economic effects of Minto Mine's construction, operation, and closure phases on the peoples and communities affected by the development of the mine. The program has two components to meet this purpose: a socio-economic baseline and ongoing monitoring to assess baseline results. Specific data collected and reported for the program includes Yukon census data, Minto-based data relating to all employees (e.g., employment and income), the Selkirk First Nation Household Survey, and Pelly Crossing-specific community-level data. The information from the components above is then used to compile an annual report.

1.1 Selkirk First Nation

The community of Pelly Crossing is home to the Selkirk First Nation. In 2020, the total number of Selkirk First Nation citizens residing within and outside Yukon was 728 (Selkirk First Nation 2020). Pelly Crossing had a population of 396 in 2021 and is the community where most of the Yukon-based Selkirk First Nation citizens reside. The total number of Indigenous citizens living in Pelly Crossing in 2021 was 341, just over 86 percent (%) of the population of Pelly Crossing (Yukon Bureau of Statistics 2021). The 2015 median total individual income of the population aged 15 years and over in Pelly Crossing is $24,576, with the average house price being $265,909 (2016 Stats Can census). The average population age of Pelly Crossing is 37 years of age (2016 Stats Can census).

The Minto Mine is an underground copper mine located 240 km southwest of Pelly Crossing. The mine is situated on Selkirk First Nation Category "A" Settlement Land, over which SFN has ownership of both surface and subsurface rights (including minerals and oil and gas) and exclusive fish and wildlife harvesting rights. An initial *Cooperation Agreement* (CA) between Selkirk First Nation and Minto was agreed upon and signed in 1997 and was later amended in 2009. The agreement serves as a formal document covering governance, business partnerships, training and employment, and royalties of the Minto Mine on Selkirk First Nations land.

1.2. Socio-economic Factors of Yukon

In general, the post-secondary and advanced education and training opportunities available in Yukon and the territories are fewer than those of other Canadian provinces. As per the 2016 Canada Census, 78.3% of the adult population with postsecondary qualifications in Yukon completed their education elsewhere, the highest percentage in any province or territory of the census period, which indicates that many graduates were drawn to the Yukon for job opportunities. The lack of post-secondary and advanced education and training opportunities in Yukon contributes to a shortage of available professional and skilled workers from the territory and not other parts of Canada. Furthermore, the amount of Yukon citizens with mining career-related experience and educational backgrounds would be considered even fewer.

The 2021 Canada Census data indicates that Yukon has a higher population growth than other provinces or territories. Comparing March 31, 2021, to March 31, 2011, the population of Yukon increased by 7,687 people, or 21.8%. Jobs are thought to be the key driving factor for Yukon's population boom. In July 2021, Yukon's unemployment rate was 6.1%, the lowest in the country. The Yukon's population growth and the low unemployment rate could indicate that Yukon citizens have a wider selection of employment opportunities to choose from, and that competition between employers for skilled labor is increasing, which means that employees are outsourced from out of the Territory.

1.3 Socio-economic Factors of Minto

Multiple factors may be contributing to socio-economic impacts at Minto over the past years and into the future, including:

- Implementation of the Socio-economic Monitoring Program (2014), and
- The new role of the Vice President, Environment Social Governance (2021),
- Permitting and regulatory delays,
- Fluctuating copper prices,
- Mine life uncertainty, and
- The news of the sale of the Minto Mine was announced in June 2019.

On October 11, 2018, previous ownership put Minto on temporary care and maintenance while exploring the sale of the property. Mining operations ceased immediately, followed by milling, and the property was then carefully mothballed. As a result, the number of Minto employees dropped significantly (from 182 in 2018 to 76 in 2016). The number of contractors also declined during this time. The decrease was most apparent among semi-skilled, skilled, and professional employees. In June 2019, Minto was sold. The mine was announced to be re-opening on June 6, 2019 and the first day of mining was September 2, 2019. Since then, overall Minto employee counts have increased since the end of the temporary closure. Minto employees outside Yukon have reached levels similar to pre-closure; however, the number of employees residing in Whitehorse, Pelly Crossing, and other Yukon communities remains low.

Before the temporary closure, the number of Yukon employees had an upward trend and represented more than 55% of total employees in 2018. After the re-opening and throughout the COVID-19 pandemic, the proportion of Yukoner employees has remained below 25%.

2.0 Minto and Contractors Safety Statistics

The below table (**Table 2.1**) summarizes the safety statistics for Minto employees and site contractors in 2021. The total incidents include minor first aid treatment at the site, any property damage, near-misses that could have resulted in an incident, medical aid (where treatment is required off-site), business interruptions, and lost-time accidents where a worker could not return to their duties resulting in missed work. There were two lost-time accidents in 2021.

Incident Type	Total Incidents	Minto	Contractors
First Aid	36	15	21
Medical Aid	6	2	4
Property Damage	59	29	30
Near Miss	37	13	24
Lost Time	2	1	1
Business Interruptions	2	1	1
Total	142	61	81

3.0 Employment

As outlined in the CA with SFN, Minto utilizes a preferential hiring recruitment approach. The preferential hiring process requires vacant positions at Minto to be first advertised and offered to candidates in the following consecutive order of priority: SFN, Northern Tutchone (NTC), Pelly Crossing, other First Nation, Yukon, and Western Canada.

3.1.1 Average employment income by residency for Minto employees ($/hour)

Minto	Pelly Crossing	Whitehorse	Yukon	Rest of Canada
As of December 31, 2020	30.13	39.86	38.30	51.61
As of December 31, 2021	36.00	43.74	43.02	49.28

3.1 Employment Income and Distribution

Table 3.1.1 above demonstrates that salaries remain higher for Minto employees residing outside of Yukon; however, average employment income in 2021 increased for Pelly Crossing, Whitehorse, and Yukon residents and decreased for residents from the rest of Canada.

Salaries remain higher for Minto employees residing outside of Yukon for multiple reasons. At the end of 2021, 79% of management positions, 89% of professional jobs, and 75% of skilled posts were held by employees outside of Yukon, indicating that Minto employees outside Yukon primarily have higher-paid positions. Additionally, there are significantly more underground than above-ground contractors at Minto, and underground mining positions typically garnish higher wages than many other above-ground mine sectors. Most underground workers come from outside Yukon.

Multiple factors may be contributing to a lower level of potential skilled, professional, and management Yukon candidates for employment at Minto in Yukon. After a temporary closure, Minto transitioned from surface to underground mining, which relies heavily on specialized, skilled underground workers from elsewhere in Canada due to a lack of necessary skills and experience in the Yukon workforce. There are fewer available skilled labor resources (including underground expertise) in Yukon, and the post-secondary education requirements for these roles cannot be obtained within the territory.

Additionally, Minto's remote location and access dictate a fly-in/fly-out (FIFO) camp operation, which is attractive to candidates who can stay in their current residence and not relocate to the Territory for employment. This approach has become standard practice for the mining industry in Western Canada, and Minto operates to be competitive in this market. Employees expect a FIFO camp model in remote mining locations. Census data from 2006 and 2016 indicate that only 6-7% of the total Yukon population is employed in the mining sector, with the largest Yukon employment category being 'public administration'.

Currently, Minto is focusing efforts on enhancing the skills and employment of Yukon residents through various partnerships with organizations that include SFN, Yukon Mine Training Association, and Yukon University. **Section 5.0** of this report (below) provides additional information regarding these skills and training partnerships.

It should be noted that as operations only re-commenced in late 2019, significant hiring was done in 2020. The number of new hires will decrease in 2021 and onwards.

3.1.2 Average employment income in 2021 by residency for Contractors ($/hour not including OT or UG Bonus)

Contractor	Pelly Crossing	Whitehorse	Yukon	Rest of Canada	Average
Kode					**Did not submit**
Cobalt	$32.00	$39.57	$35.42	$45.20	$38.05
Mabou	-	$67.67	$66.50	$66.59	$66.92
Paycore	-	-	-	$45.00	$45.00
Sodexo	$17.58	$17.58	$17.58	$17.58	$17.58
Major Drilling					**Did not submit**

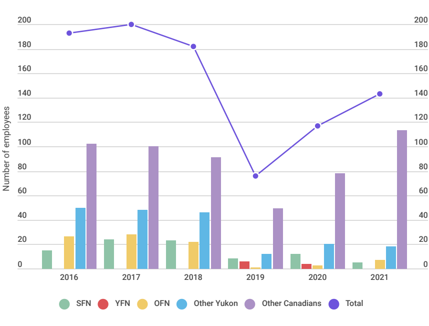
3.1.3 Annual employment income in 2021 for Minto and Contractors

Company	SFN	OFN	YFN	Yukon	Rest of Canada	Average
Minto	$449,542.71	$522,918.47	-	$1,513,336.13	$9,309,929.38	$2,359,145.34
Kode						Did not submit
Cobalt	$3,022.62	$91,295.33	$345,350.62	$829,849.62	$212,312.80	$296,366.20
Mabou	-	$126,120.00	$132,028.00	$122,460.00	$124,485.00	$126,273.25
Paycore	-	$13,163.45	-	-	$590,599.87	$201,254.44
Sodexo	$79,398.36	$1,059,927.92	-	$66,881.63	$150,221.78	$339,107.42
Major Drilling						Did not submit
Total	$531,963.69	$1,813,425.17	$477,378.62	$2,532,527.38	$10,387,548.83	$3,148,568.74

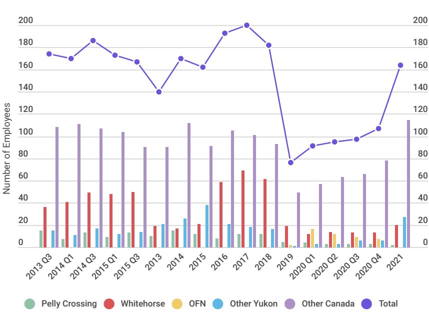
Potential contributing factors to the annual employment income for Minto and contractors, as demonstrated in **Table 3.1.3** above, include:

- Underground mining requires specialized, skilled workers. In 2021, Minto's underground mining contractor was Mabou Mining, located in eastern Canada, which indicates that their hiring pool primarily stemmed from this location.
- Most Sodexo employees are entry-level, non-skilled workers, driving a lower average hourly rate; however, Sodexo committed to hiring from Yukon. Approximately 90% of Sodexo's staff are Yukon residents, and they continue to hire locally with a focus on First Nations employment.

3.1.4 Minto Employment by Group



3.1.5 Minto Employment by Residency



3.1.6 Contractor employment in 2021 by residency

As of December 31, 2021	Pelly Crossing	Whitehorse	Other Yukon	Canada	Total
Kode					**Did not submit**
Cobalt	1	23	8	10	42
Mabou	-	5	11	107	123
Paycore	-	-	-	15	15
Sodexo	8	19	5	1	33
Major Drilling					**Did not submit**
Total	9	47	24	133	213

3.1.7 Minto new hires by group

	SFN	YFN	OFN	Other Yukon	Other Canadians	Total
As of December 31, 2020	14	3	5	26	99	147
As of December 31, 2021	0	0	4	16	98	118

3.1.8 Minto employment by job category and by group

As of December 31, 2021	SFN	YFN	OFN	Other Yukon	Other Canadians	Total
Management	0	0	2	3	19	24
Professional	2	0	0	4	51	57
Skilled	2	0	2	8	37	49
Semi-skilled	1	0	2	2	4	9
Entry level	0	0	1	1	2	4
Total	5	0	7	18	113	143

3.1.9 Contractor employees by group

As of December 31, 2021	SFN	YFN	OFN	Other Yukon	Other Canadians	Total
Kode						Did not submit
Cobalt	1	10	6	19	6	42
Mabou	-	5	4	7	107	123
Paycore	-	-	1	-	14	15
Sodexo	9	-	19	5	-	33
Major Drilling						Did not submit
Total	10	15	30	31	127	213

3.2 Voluntary Exits

There was a total of 53 voluntary exits and turnovers for the 2021 reporting year.

4.0 Business

As part of Minto and SFN's CA, Minto is required to provide SFN with a preferred opportunity notification to negotiate and potentially be awarded a contract to supply the requirement. SFN has developed partnerships with several of Minto's vendors for which the details of financial benefit Minto is not privy to. As such, this section summarizes expenditures by the company that is the primary vendor and does not account for any SFN proportional expenditures resulting from those partnerships.

In 2015, Minto and SFN worked jointly to establish new or maintained contracts to ensure involvement from SFN and support First Nations partners. The contractual arrangements highlighted below represent the majority of the opportunities that SFN and Minto share with service providers. As well as financial gain, SFN also does benefit from employment opportunities on some contracts.

The six procurement rights must be met in selecting such vendor relationships:

- Right Materials (to fill a need)
- Right Place (Yukon preference)
- Right Quantity and Quality (high quality and ability to supply)
- Right Supplier (service, technical and aftermarket support, value-added service)
- Right Moment (product available when needed)
- Right Price (competitive commercial price)

As of March 2022, Minto Mine has active agreements with the following companies:

Company Name	Service Provided
39539 Northwest Joint Venture	Vacuum truck rental
Air North Charter & Training Ltd.	Flights
Alkan Air	Air service
ALX Exploration Services Inc.	Chemicals & supplies
Capital Helicoptors	Helicopter service
Chieftain Energy LP	Fuel haul and lubricants
Cobalt Construction Inc.	Surface mining/road construction/maintenance
Dyno Nobel	Mine explosives
Fountain Tire Mine Service Ltd.	Tire technician and consignment tires
G-P Distributing Inc.	Food services
Hurlburt Enterprises	Water, septic & related supplies
Hy-Tech Drilling Ltd.	Diamond drilling
JDS Energy and Mining Inc.	Underground mining and mechanics
KBL Environmental Ltd.	Waste services
Kode Contracting	Construction services
Lynden	Transportation services/Ore haul
Mabou Mining Inc.	Construction services
Major Drilling Ground International Inc.	Longhole drilling
Minto Exploration Ltd.	Exploration
Multicrete Systems Inc.	Shotcrete & concrete
Pacific Northwest (Yukon)	Freight
Paycore Enterprises Ltd.	Diamond drilling
Quadra Chemicals	Chemicals
Sodexo Canada Ltd.	Food and camp services
Thyssen Mining Construction of Canada Ltd.	Underground construction of chute
Tintina Air	Air service

Minto selects the appropriate local vendors based on vendors that meet selection criteria that support Minto's corporate social responsibility. Such partnerships are built on transparency, human rights and labor compliance, supplier status, financial, geographical, and environmental compliance. The framework for successful local suppliers is based on common shared goals, continuous improvement, and vendors that support Minto's policies and procedures.

Total Spent on Yukon Vendors

Year	Total
2021	$72,123,142.02

In addition to supporting First Nations partners, Minto also strives to support Yukon-based companies and service providers based on their ability to service needs and meet commercial acceptance criteria. Minto follows best practice guidelines and the six procurement rights in selecting potential suppliers in analyzing a business for suitability.

Minto will continue to maintain and increase spending with local suppliers to support the mining industry. Minto is committed to sustainability in developing relationships for long-term mutual benefit.

4.1 Yukon Business Names by Group

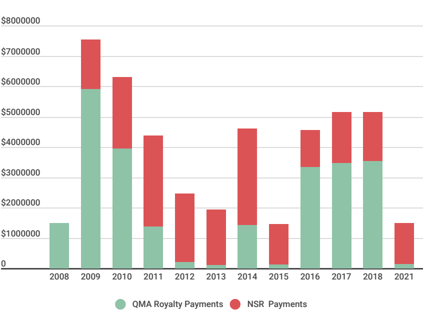
See the attached **Appendix "A"** for a listing of all Yukon business names by group. Not all businesses have been captured due to employee expenditures and reimbursed through expenses, and all contractor purchased items are excluded.

4.2 Minto Capital and Operating Expenditures

4.3 Property Taxes and Other Fees (2021)

	SFN	Yukon	U.S.	Total
Land Leases	74,216.88			74,216.88
Property taxes		283,789.89		283,789.89
Landing fees	30,580.00			30,580.00
Trappers' Compensation	10,000.00			10,000.00
Skagway municipal taxes			39,019.00 USD	39,019.00
Total	114,796.88	283,789.89	39,019.00 USD	437,605.77

4.4. Royalty and Net Smelter Payments



Note: There was no payment of royalties in 2019 or 2020, as operations only recommenced in late 2019. As no concentrate was received at the smelter in 2020, combined with the costs for re-starting the mine, there was no royalty in 2020.

5.0 Capacity, Training, and Education

Minto is dedicated to working with various partners to support capacity building, training, and educational initiatives for the Minto community. Through a combination of "on-the-job" training and mentoring, combined with external training opportunities (e.g., Front Line Supervisor course and Northern Safety Network courses), Minto continues to create a workplace that enhances current employee skills and supports the ongoing development of a more advanced local labor force.

The coronavirus pandemic is a global health issue that challenges our collective ability to live and function as we normally would. During the COVID-19 pandemic, Minto's primary focus was on reducing the potential for the spread of COVID-19 at the Minto Mine site and keeping employees safe and in good health. Due to this, many "non-essential" capacity building, training, and educational initiatives have been postponed to maintain social-distancing standards and other health measures.

In the past, Minto has worked with the Centre for Northern Innovation in Mining (CNIM) on programs that have led directly to increased employment of local Yukon residents. Two specific initiatives include interviewing candidates, supporting recruitment as part of the Introduction to Underground Mining course, and providing a site tour and presentations on recruitment for the Workplace Readiness Course held in Pelly Crossing. Minto has also partnered with Yukon University to host courses in the Environmental Monitoring Certificate Program, where students were hosted for two segments in the Fall of 2020 and will be hosted again in 2022.

Minto has multiple partnerships with Yukon University to support mining sector training programs, including courses on Underground Mine Training, Introduction to Mining, Surface Mine Training, and First Line Supervisor training. Additionally, Minto partnered with the Yukon Northern Mine Remediation Program in 2021 to offer a high school course at Pelly Crossing and has supported offering this course in 2022 due to popular demand.

Currently, Minto is rolling out leadership training to all employees titled "It's My Business" to invest in employees and their skills. The program's focus will be on understanding various learning styles, leadership thinking, accountability, and responsibility.

5.1 Selkirk First Nation and Other First Nation Specific Training

Minto is proud to partner with the community of Pelly Crossing and the Selkirk First Nation to promote education and employment. Minto often invites young people from Pelly Crossing to come and learn about mining in the territory. Minto participates in Yukon University's Workforce Readiness Program in Pelly Crossing and Environmental Monitoring Certificate Program. These programs provide members of SFN with the opportunity to obtain skills and enter or re-enter the workforce.

Due to Minto ramping up and hiring in late-2019, and the hindrance of the COVID-19 pandemic, on-the-job operational training has been primarily focused on ensuring all employees are safely equipped for their roles within the mine. Selkirk First Nation citizens and all staff have been provided with health and safety training for the site-specific to their work area. Safety training ranges from working with hazardous materials and confined spaces to Red Cross first-aid courses and First Line Supervisor Certification by the Yukon Workers' Compensation Health and Safety Board. Much of this skills training is transferable to other mining operations and, more broadly, to other industries.

Minto's approach to community investment is based upon opportunities to further build and maintain the company's social license, maintain good relationships with their partners and maintain a local presence and good reputation in the communities where they operate and where their employees live and work. The goal of the approach is to strengthen accountability and working partnerships with stakeholders while providing a foundation to understand and consider the community's needs, opinions, and interests.

Minto employed several community engagement methods with different levels of involvement from the community and other stakeholders (limited engagement in 2021 due to COVID-19). A Community Engagement Plan (CEP) was developed in 2015 and is currently being updated. The CEP is intended to help guide the company in engaging with stakeholders through various initiatives. The CEP will provide a framework that aligns the engagement activities and sets out targets for future endeavors. It will be reviewed and updated annually to ensure that commitments are being met and to layout future engagement initiatives.

The CEP includes a table of Minto's engagement methods with SFN and the proposed frequency of these engagements. Examples of community and cultural engagement initiatives in 2021 include:

- Christmas turkey distribution,
- Contribution to the Yukon Native Language Centre on behalf of SFN Elder,
- Job fairs, and
- Mine tour with SFN citizens and various Minto departments.

Minto advertised for SFN summer students; however, due to a combination of factors, the program was unsuccessful in hiring SFN students for the 2021 season. Two Yukoners were hired through the program. In 2022, Minto has changed the program to adapt to SFN's recommendations.

Minto arranged for an opportunity for SFN students to have on-site learning related to mine reclamation for two weeks in the summer of 2021; however, due to a spike in COVID numbers, the program was cancelled. Similar to the Northern Mine Remediation course, this program would have offered an opportunity for students to obtain credit at high school. This program will be revisited in the future.

In 2021, Minto contributed $11,500.70 to SFN's cultural and community wellbeing.

TDD	Tailings Diversion Ditch
WSP	Water Storage Pond

1 Introduction

1.1 Purpose of Review

On September 2-3, 2021, SRK Consulting (Canada) Inc. completed a geotechnical inspection of the Minto Mine site. The purpose of the inspection was to document the physical condition of the site based on visual observations and to provide geotechnical assessment, noting potential signs of physical instability such as erosion, differential settlement, sloughing or bulging of material, seepage, etc. The inspection is documented in the photographic compilation provided in Appendix A. This report summarizes the findings and recommendations.

This report is in partial fulfillment of the requirements of Minto Explorations Ltd.'s existing Water License QZ14-031 Clause 100 and Quartz Licence QML-001 Paragraph 13.2 that require the physical stability of all engineered structures, works and installations be inspected by an independent engineer after the spring thaw of each year (by June). In 2021, the June independent engineer inspection by SRK was unable to be completed due to COVID travel restrictions in the Yukon. As a result, the June inspection was completed internally by Minto as part of their routine quarterly inspections and SRK undertook the next scheduled quarterly visual inspection in September 2021.

1.2 Site Conditions

The Minto Mine was in production from July 2007 to late 2018 when the mine was placed in temporary care and maintenance. In 2019, the mine transitioned back into production with underground mining starting on September 2, 2019 and milling on October 10, 2019. Waste rock produced from underground is either disposed of underground or in the SAT Dump in the Main Pit.

The 2021 geotechnical inspection was completed by Peter Mikes, PEng (YK) and Kisa Elmer, PEng (YK), of SRK. SRK staff were accompanied by Klaus Gil, Senior Tailings Engineer with Minto, throughout the visit. Mr. Gil was SRK's primary contact for information while on-site about the activities during the past year and provided background and support during review of the instrumentation data. Weather during the site inspection was partly cloudy with estimated temperatures between 5°C and 20°C with dry ground conditions on site.

1.3 Scope

The following engineered structures, works, and installations were inspected during the site visit:

- Dry Stack Tailings Storage Facility (DSTSF) and Mill Valley Fill Extension (MVFE) (Stage 1 and 2)
- Tailings Diversion Ditch (TDD)
- Main Waste Dump (MWD), including Main Waste Dump Expansion, and Main Waste Dump Wrap
- Southwest Waste Dump (SWD)
- Reclamation Overburden Dump

- Ore stockpiles
- Mill and camp site
- Fuel containment facility
- Water Storage Pond (WSP) Dam
- Big Creek Bridge
- Main Pit Dump
- Main Pit including South Wall Buttress, In-Pit Dump, and SAT Dump
- Area 2 Pit
- Area 118 Pit and Backfill Dump
- Minto North Pit

As a part of the inspection, SRK reviewed, previous year's reports, instrumentation data, design reports and monitoring guidance documents as required to guide the inspections. The instrumentation data was reviewed prior to the inspection to check for indications of unusual performance or change in trends. Section 4 of this report presents a list of data reviewed, including the last data collection date.

2 Site Inspection Observations

A summary of SRK's observations during the site inspection is provided in Table 1. Site observations are listed per each inspection area. A photographic record of the observations is provided in Appendix A.

Table 1: Site Inspection Observations

Area Number	Name	Inspection Observations
1	Dry Stack Tailings Storage Facility (DSTSF)	▪ No observations of global instability. ▪ No signs of further instability of the slump of the cover material observed in 2019 at the south end, near the grade transition point of the old TDD alignment (see Photo 1-2, Appendix A). Slump was observed in 2019 to be approx. 25 m wide with the cracks at the top of the slump appear to be self-healing. ▪ Variable vegetation establishment was observed across the areas of the covered and regraded WR Shell that were seeded in 2019. ▪ Settlement cracking noted in the 2020 inspection the in southern portion of the cover (orientated parallel to the southern crest) was not observed and was obscured by vegetation. ▪ Multiple erosion gullies observed on the north and east slopes of the cover (see Photo 1-7, Appendix A). ▪ The protective cover over Piezometer DSP-06 and Thermistor DST-11 was observed to be displaced during the inspection and the instrumentation exposed. The cover should be replaced following each reading to prevent damage and prevent rain entering the borehole and influencing the thermistor readings.
2	Mill Valley Fill Extension (MVFE)	▪ No observations of global instability. ▪ Multiple erosion gullies within the cover soil observed on the north and east slopes of the cover where runoff concentrates (see Photos 2-3, 2-4, and 2-5, Appendix A). ▪ The excavated slope to the south of the Minto Creek Seepage Collection System (MCSCS) that is excavated into permafrost soils has no observable changes compared to the previous years' inspection. The access road headed down to the MCSCS was upgraded in the past year with an armoured ditch constructed to direct surface runoff away from the MCSCS. ▪ No signs of seepage visible at the toe of the MVFE. The MCSCS appears to be functioning as per design, with no signs of seepage below the system.
3	Tailings Diversion Ditch (TDD)	▪ Construction of the TDD Intake Structure and Overflow Spillway into the Area 2 Stage 3 Pit remains incomplete with construction of the intake channel side-slopes and riprap placement remaining. ▪ Runoff from the Underground Access Road flows into the TDD Intake Structure and has deposited sediments in the basin (Photos 3-1 and 3-2, Appendix A). A berm is also present that prevents use of the overflow spillway into the Area 2 Pit. Any flow that overtops the TDD Intake Structure would be directed down the Underground Access Road to the north. Most of this flow would bypass the DSTSF to the west, but some flow would pass between gaps in the road berm and flow overtop the DSTSF cover. ▪ Conditions in the TDD remain the same as previous inspections with no major obstructions or signs of instability along the TDD were observed. ▪ Minor vegetation was observed in the upper portion of the unarmoured ditch (see Photos 3-3 and 3-4, Appendix A). The vegetation growth will be required to be removed within the next year and should continue to be monitored as part of routine inspections.

Area Number	Name	Inspection Observations
		■ Remaining armoured portion of the ditch was generally free from vegetation (see Photo 3-5, Appendix A). ■ TDD outlet showed no signs of instability or obstructions (see Photo 3-6, Appendix A).
4	Main Waste Dump (MWD)	■ No observations of global instability. ■ Erosion gullies observed in cover material. ■ Trees have been planted in portions of the MWD Expansion area where resloping and cover placement have been completed. ■ The longitudinal crack noted in the 2019 inspection in the resloped area above the former PAG Oxide stockpile (Photo 4-23, Appendix A) was not observed in the 2020 or 2021 inspection. The cracking was approx. 50 m long with the area below the cracks appearing with a concave slope due to potential differential settlement.
5	Main Waste Dump Wrap	■ Differential settlement, cracking and small sinkholes are prevalent on the top bench, likely attributed to snow within the fill during winter construction (Photo 5-1, Appendix A). The condition of the area is consistent with the previous year's inspection. ■ In 2020, the upper lift of the MWD Wrap was partially resloped. Since the 2020 inspection, waste rock has been excavated from the toe of the wrap resulting in an over-excavated slope and a risk of surficial slope failures/rockfall. Coarse rock is present at the base of the slope that acts as a small barrier to rockfall, but until the wrap has been regraded, traffic should be restricted near the toe. (Photo 5-2, Appendix A).
6	Southwest Waste Dump (SWD)	■ A crack approx. 180 m long observed along the access road immediately west (upslope) of areas where overburden stockpiles are present. – The crack was first observed in the 2019 annual inspection. In the past year, the crack has grown in length by approximately 40 m to the south and is up to 40 cm wide (up from 35 cm wide in 2020 annual inspection) and has an approximate 20 cm vertical displacement (up from 10 cm in the 2020 inspection. See Photos 6-3, 6-4, and 6-5, Appendix A. – The crack is located above survey hub SWD12 and any large-scale slope deformation would be expected to be detected by SWD012 located downslope of the crack. The survey hub has shown a steady total displacement rate of 0.65 mm/day in the past year (See Section 3.4), which is a slight deceleration compared to the movement rate at the time of the inspection in 2020 (0.70 mm/day). – The crack should continue to be visually monitored as part of routine inspections for any change in condition.
7	Reclamation Overburden Dump (ROD)	■ Conditions are the same as noted in previous years' inspections. ■ Vegetation has established in many areas the dump area on suitable overburden piles (Photo 7-1 and 7-2, Appendix A). ■ Previous notes include: – Slumping, settlement, and tension cracks are expected in the dump as it is constructed with frozen overburden and thawing is expected – Discontinuous tension cracks and differential settlement have been observed along the perimeter crest – Ground undulation is typically 0.3 m and is prevalent throughout the facility ■ This area was not inspected on foot during the 2021 inspection
8	Ore Stockpiles	■ The ore stockpiles were investigated briefly in passing and appeared to be in good condition. No obvious signs of instability were noted.

Area Number	Name	Inspection Observations
9	Mill Site	▪ No observations of global instability of the highwall north of the mill were observed Minor erosion and spalling of loose rocks is ongoing. A fence was installed at the base of the slope in 2019 as a mitigation with no evidence of fence damage observed due to falling materials
10	Camp Site	▪ Observations were consistent with previous years' inspection. ▪ No signs of instability were observed. ▪ The erosion gully noted in the 2020 inspection was repaired with fill and the camp pad graded to direct runoff to the north (Photo 10-1, Appendix A). ▪ No change was observed to the erosion gullies located between the camp and main access road (Photo 10-4, Appendix A).
11	Fuel Containment Facility	▪ The highwall to the north of the facility did not show signs of global instability. ▪ Significant new rutting that has exposed the base liner between the access ramp and the sump occurred within the past year (Photos 11-2 to 11-5, Appendix A. The rutting also has cause damage to the access ramp. ▪ Several areas of exposed geotextile were observed with one tear in the geotextile found with approximate dimensions of 5 cm x 8 cm (Photo 11-5, Appendix A). No damage to the liner beneath the liner could be felt, however liner damage cannot be ruled out. In addition, there could be other areas along the ruts where damage has occurred but could not be detected due to sloughing of the rut edges that may have covered up liner damage. ▪ An investigation is recommended to assess for potential damage to the liner. The damaged geosynthetics should be repaired and additional sand material should be placed within the facility to fill the ruts. The investigation should be completed carefully using hand shovels to expose the geotextile/liner along the ruts to allow for the condition of the materials to be carefully inspected. ▪ The equipment that caused the rutting appeared to have driven straight down the ramp to the sump, then backed up and turned around at the base of the ramp prior to traveling back up the ramp. Areas where the equipment tires turned over top of the liner would be most susceptible to damage and particular attention should be paid during the investigation in these areas. ▪ No change in condition of the exposed liner on the sides of the facility were observed.
12	Water Storage Pond (WSP) Dam	▪ The water level within the pond (~713.4 m) was approximately 4 m higher compared to the 2020 inspection. Otherwise, observations are consistent with previous years' inspection. ▪ No observations of global instability. ▪ Some deadfall/logs are accumulating on the upstream slope of the dam (Photos 12-5 and 12-6, Appendix A). ▪ Some of the rip rap used to armour the upstream and downstream slopes was observed to be weak and friable. ▪ No change in appearance was noted in the small potential sinkhole or animal burrow observed in 2019 at the downstream slope, near the southern edge and approximately 5 m NW of WDT-8 and approximately 50 m downstream of the crest. Dimensions are approximately 0.3 m diameter and was able to lower measuring tape to about 1.4m below ground surface (Photo 12-5, Appendix A). No action is required to address this feature. If it is an animal burrow, it does not appear to be active and at this location, would not develop deep enough though the embankment or abutment to be able to act as a preferential pathway. ▪ Seepage water downstream of the dam was clear and no accumulation of sediments was observed (Photo 12-8 to 12-10, Appendix A). ▪ Seepage flow at the weir outlet was estimated to be less than 1 L/s however a portion of the flow appeared to be by-passing the weir to the south (Photo 12-9,

Area Number	Name	Inspection Observations
		Appendix A). The seepage then reports to the collection sump at W17 and is pumped back to the WSP.
13	Big Creek Bridge	■ Observations of the bridge are consistent with previous years' inspection ■ The bridge abutments and road approaches are in good condition, with no signs of instability observed. ■ The tree growing in western abutment should be removed as it impedes the inspections and could trap debris/impede flow during a larger flood event.
14	Main Pit Dump, SAT Dump, In-Pit Dumps, and W-15 Sump	■ No observations of global instability. ■ SAT dump showed no signs of cracking or movement (Photo 14-7, Appendix A). ■ The longitudinal cracking on the crest of the In-Pit Dump above the SAT Dump is filling with sediment with no signs of additional movement (see Photo 14-8, Appendix A). ■ The condition of the cracks in the MPD appear to be unchanged compared to the 2020 inspection. ■ Top bench of the Main Pit Dump has an undulating surface with some differential settlement. ■ During the inspection, waste rock material was being excavated from the south side of the top bench of the Main Pit Dump to be processed and used as road construction material. If significant volume of material is expected to be used is it recommended that the north end of the dump be used as the source material as it would reduce the driving force in the area of the dump that is currently moving. ■ Evidence of overtopping of the W15 Sump and pooling on the access road north of the sump was observed. The water appears to have infiltrated through a sinkhole beneath haul road, which would infiltrate into the pit.
15	Area 2 Pit	■ Observations were consistent with previous years' inspection. ■ No observations of global instability. ■ The cracks observed along the access road on the northeast side of the pit rim appears to have widened compared to the previous inspection. This road has been barricaded from use. No signs of instability were observed below the access road from across the pit. ■ The erosion gully in the wall of the Stage 3 pit does not appear to have increased in size (Photo 15-6, Appendix A).
16	Area 118 Pit and Backfill Dump	■ Observations were consistent with previous years' inspection. ■ No observations of global instability.
17	Minto North Pit	■ Observations were consistent with previous years' inspection. ■ Mining at the pit was completed in October 2016. ■ The failure of the south pit wall (Photo 17-1, Appendix A) occurred one day following completion of mining in the pit and removal of all equipment and personnel and was predicted based on pit wall monitoring. No additional pit slope failures have occurred since.

3 Monitoring and Instrumentation Data

Minto's Physical Monitoring Program (PMP) is a component of the Environmental Monitoring, Surveillance and Reporting Plan. The objective of the PMP is to monitor the performance of key mine infrastructure and workings. The PMP consists of two main components: regular geotechnical inspections, and instrumentation to measure ground conditions and deformations. The PMP was last updated in February 2021 and specifies the inspection and monitoring frequencies.

Table 2 lists instrumentation data reviewed as part of the inspection, with the date of the most recent data. Changes to the list of instrumentation compared to the last inspection are listed below the table in the notes. Instrumentation plots are provided in the appendices. Appendix B provides a site-wide summary of the survey hub data indicating the current movement rates and directions for each hub.

Table 2: Summary of Instrumentation Data

Facility	Instrumentation Type	List of Reviewed Instrumentation	Last Reading Date
Area 2 Pit	Survey Hubs	A210, A215, A216, A217, A218, DS01, DS02, DS03, DS04	August 2021
	Inclinometers	A2I-1	June 2021
	Ground Temperature Cables	A2T-1	June 2021
DSTSF and MVFE	Survey Hubs	DSSH06, DSSH10, DSSH12, DSSH14, DSSH15, DSSH18, DSSH19, DSSH20, DSSH24, DSSH26, DSSH27, DSSH28, DSSH29, DSSH31, DSSH32, MV1, MV2.	Varies between May 31 and July 30, 2021
	Inclinometer	DSI-24	June 2021
	Piezometers	**Active:** DSP-05B, DSP-06(A and B), DSP-07 Sensors #1 through 4 **Non-functional[1]**: DSP-05A, DSP-07 Sensors #5 and #6	June 2021
	Ground Temperature Cables	DST-10, DST-11, DST-13, DST-14, DST-15	June 2021
MWD	Survey Hubs	**Active**: MWDH01, MWDH02, MWDH03, MWDH04 **Non-functional[2]**: MWDH05, MWDH06	Varies between Feb. and May 2021
	Inclinometers	MDI-2	May 2021
SWD	Survey Hubs	SWD-01, SWD-06, SWD-07, SWD-08, SWD-09, SWD-10, SWD-11, SWD-12	Varies between June and August 2021
	Piezometers	**Active**: SDP-2 (A and B), SDP-3 (A and B)	June 2021
	Ground Temperature Cables	**Active**: SDT-1, SDT-2, SDT-3	June 2021
Main Pit	Survey Hubs	**Active**: M79, M80, M81, M82, M83, M84, M88, M89, M92, M93, M94, M95, M96, M97, M98 **In-active[3]**: M89, M96	Varies between March and August 2021
WSP	Survey Hubs	WSP-1, WSP-3, WSP-4, WSP-5	August 2021

Facility	Instrumentation Type	List of Reviewed Instrumentation	Last Reading Date
	Piezometers	WDP-2, WDP-3, WDP-3A, WDP-4, WDP-5, WDP-6, WDP-7, WDP-8, WDP-9, WDP-10, WDP-11, WDP-12, WDP-13	August 2021
	Ground Temperature Cables	WDT-1, WDT-2, WDT-3, WDT-4, WDT-5, WDT-6, WDT-7, WDT-8	August 2021

Notes:

[1] Piezometers DSP-7 Sensors 5 and 6 have not produced a successful reading since February 8, 2020. Piezometer DSP-05a has not produced a successful reading since November 11, 2018. Piezometer DSP-06b began to produce successful readings on November 22, 2020 after not producing a reading since November 11, 2018.

[2] Survey hubs MWDH05 and MWDH06 were destroyed in the fall of 2020 because of regrading of the Main Waste Dump Wrap. These two hubs showed some settlement but no significant movement since their installation.

[3] Main Waste Dump Survey hubs M89 and M96 were not monitored in the past year. Since installation, both hubs had not shown any movement and were removed from the monitoring program.

3.1 Area 2 Pit

Area 2 Pit instrumentation data is provided in Appendix C and includes a ground temperature cable (A2T-1) and an inclinometer (A2I-1) that were installed in 2013 in the southeast corner of the planned Area 2 Stage 3 Pit, as well as ten survey hubs installed at various locations around the perimeter of the pit.

The inclinometer data is shown in Figure 1 of Appendix C. The data shows a shear zone developing between depths of 36 m and 50 m starting in the fall of 2017, which corresponds to the mining of the Area 2 Stage 3 Pit. The observed shear zone includes multiple discrete zones between 36 and 50 m. The movement rate then slowed, and since 2019 shows a slight acceleration trend that has increased the movement rate from approximately 0.1 mm/day in 2019 to 0.15 mm/day in 2021.

The ground temperature data is sown in Figure 2 of Appendix C. A2T-1 is measured at the same location as the inclinometer and indicates permafrost conditions are present to an approximate depth of 60 m below ground surface.

Survey hub movement data are presented in Figure 3 of Appendix C. Four survey hubs (DS01 through DS04) are located near the Underground Shop along the east crest of the pit that are monitored weekly because of their proximity to the Underground Shop. Data from these hubs show steady and decreasing movement rates that range between 0.03 and 0.3 mm/day. No signs of additional cracking or deformation were noted in the area during the site inspection (Section 2). The movement is likely due to mining of the Area 2 Stage 3 Pit and changes to the thermal ground regime resulting in thawing of permafrost soils. The other survey hubs on the west and northern portion of the Area 2 Pit also show steady or decreasing movement rates ranging from 0.01 mm/day to 0.11 mm/day.

3.2 Dry Stack Tailings Storage Facility and Mill Valley Fill Extension

Instrumentation data for the DSTSF and MVFE are provided in Appendix D.

Movements in the DSTSF were first identified in early 2009. The MVFE Stage 1 was designed to mitigate the movement with construction of the facility occurring between January 2012 and 2013. The survey hubs used to monitor rates of the DSTSF showed a deceleration ranging from 20 to 60 percent since the start of the MVFE Stage 1 placement. Construction of a second extension (MVFE Stage 2) began in late 2015 and was completed in the summer of 2016. The MVFE Stage 2 doubled the size of the Stage 1 buttress and resulted in further decreases to the movement rates.

Survey Hubs

Survey hub movement data are presented in Figure 1 to 18 of Appendix D. Following construction of the MVFE Stage 2, the survey hubs were expected to slow with the movement rates asymptotically approaching zero. The timing for when no movement is expected is uncertain. The hubs have generally been performing as expected since the construction of the MVFE Stage 2. Rates of movement within the DSTSF are substantially lower compared to before the construction of the MVFE Stage 2 with most survey hubs continuing to show a decelerating trend with the rate of deceleration decreasing in the past year. Several hubs show steady movement, but additional time is needed to evaluate if deceleration has stopped. Two survey hubs show possible acceleration trends:

- DSSH12 (Figure 4) shows an apparent acceleration in the last reading on July 31, 2021, with the horizontal movement rate increasing from 0.13 mm/day to 0.4 mm/day. Additional readings are needed to confirm the trend. A seasonal increase in movement was also observed in 2019 with the hub subsequently continuing to decelerate.
- DSSH26 (Figure 11) shows an apparent acceleration in the last reading on May 31, 2021 with the horizontal movement rate increasing from 0.07 mm/day to 0.25 mm/day. Additional readings are needed to confirm the trend because the hub may have shifted because of the spring thaw and settlement of the cover beneath the hub. This hub has previous shown a deceleration trend since its installation in 2015.

Two additional hubs (ASH05 and ASH06) are located further to the south of the DSTSF on the airport access road (Appendix D, Figure 19). ASH05 shows no significant movement trend. ASH06 showed slight movement in the spring of 2017, which is believed to be the result of disturbance caused by a nearby pipeline installation. The hub showed no significant movement in the past year.

Piezometers

Piezometric data from the DSTSF are presented in Figures 20 to 22 in Appendix D.

DSP-05B (Figure 20, Appendix D) showed an increase in pore pressure that appears to have peaked near the beginning of 2018 and has since fluctuated between 793 m and 798 m. This sensor is located approximately 2 m below the tailings in the foundation. DSP-05A, located approximately 2 m above the base of the tailings continued to show a gradual increase in pore pressure until November 2018 when the sensor became unresponsive. Readings measured at DSP-05A were significantly less than those at DSP-05B. Temperatures at both sensors are approximately at the freezing point of water (less than 0.5°C) and the excess pore pressures are believed to be the result of an increase in the unfrozen water

being unable to dissipate as a result of unfrozen conditions in the surrounding soils. As the survey hubs in the vicinity of the sensor show decelerating movement, no additional action is recommended.

DSP-06 (Figure 21, Appendix D) also includes two vibrating wire piezometers: DSP-06A is 2 m above the base of the tailings and DSP06B is 2 m below the base of the tailings. DSP-06A shows no pore pressure, while DSP-06B showed a gradual increasing pore pressure trend that peaked in February 2019 and has since decreased.

All sensors at DSP-07 (Figure 22, Appendix D) have shown continued increases in pore pressure since their installation in 2015. Readings in 2019 all showed steady pore pressures, but since 2020, the sensors resumed an increasing trend, except for DSP-07-03 that shows a decrease in pore pressures. All sensors are in zones with significant amounts of ground ice with ground temperatures ranging from -1° to -0.6°. Survey hubs in the vicinity of these sensors also show decelerating movement.

Ground Temperature Cables

Ground temperature profiles are provided in Figures 23 to 27 of Appendix D. The profiles indicate that warm permafrost is present at all locations, except in the lower portions of DST-11 and DST-13 that are below the depth of permafrost. DST-11 is located near the crest of the DSTSF, while DST-13 is located approximately 300 m east of the DSTSF in an undisturbed location.

Inclinometers

Inclinometer data from DSI-24 are presented in Figure 28 of Appendix D. The inclinometer is located between the MVFES2 and the DSTSF. The profile plot indicates a main shear zones at depths of 45 m and 53 m. The last reading collected on June 19, 2021 shows an increase in the movement rate (0.19 mm/day), which had previously shown a deceleration trend with an average movement rate of 0.055 mm/day in 2021. Additional readings are needed to confirm if the acceleration is real, or due to variability, or is an erroneous reading.

3.3 Main Waste Dump

The MWD instrumentation data are provided in Appendix E and includes an inclinometer and six survey hubs that were installed in the summer of 2018 following construction of the MWD Wrap.

Displacements in MDI-2 increased during the winter of 2017-18 (likely related to the construction of the MWD Wrap), with a movement rate of approximately 0.07 mm/day primarily occurring between the depths of 22 and 28 m below ground surface. The movement rate has slowed since completion of the dump, with a current rate of 0.01 mm/day over the past year.

Six survey hubs were installed on the MWD Wrap in August 2018. Hubs MWDH01, MWDH02, MWDH03 and MWDH04 show no current movement. Survey hubs MWDH05 and MWDH06 were destroyed in the fall of 2020 during regrading of the Main Waste Dump Wrap. These two hubs showed some settlement but no significant movement during their monitoring period.

3.4 Southwest Waste Dump

Instrumentation data for the SWD are provided in Appendix F.

Survey hub movement data are presented in Figure 1 to 9 of Appendix F. Survey Hub SWD07 shows a possible acceleration trend, SWD10 shows no significant movement, SWD12 shows a steady displacement rate, and the remainder show decreasing movement rates.

Survey hubs SWD12 and SWD09 are located downslope of the longitudinal crack observed during site inspection (See Figure A-4 and Photos 6-3, 6-4 and 6-5 in Appendix A for crack location and photographs). The movement of these hubs may be due creep or thawing of ice-rich soils present beneath the lower portions of the dump near the valley bottom (east side). In addition, the stockpiled cover material downslope of the crack likely contributes a driving force to the movement. The future spreading of the cover will likely reduce the driving force and movement rate. The foundation soils the upper (western) portion of the dump consists of colluvial soils with low ice content (EBA 2008). The survey hub movement direction is perpendicular to the dump crest with no indication of down valley movement (towards the Main Pit). The crack location was plotted overtop of an interpreted overburden isopach plan (Figure 14, Appendix F). The isopach indicates that the overburden is generally thin in the in the area of the crack and downslope; however, this is based on one drillhole in the vicinity of the crack and the accuracy of that borehole was unable to be confirmed at this time. The survey hubs are recommended to continue to be monitored at a quarterly basis.

Ground temperature data for the SWD are presented in Figures 10 to 12 of Appendix F, with the temperature cable locations shown in Figure 1. The profiles indicate that warm permafrost is present at all locations with time graphs generally indicating a warming trend.

Piezometric data for the SWD are presented in Figure 13 of Appendix F. The pore pressures for all piezometers show a decreasing trend.

3.5 Main Pit and Main Pit Dump

The initial indication of movement in the Main Pit south wall was observed in April 2009. A waste rock buttress was subsequently designed and constructed. Substantial completion of the buttress (South Wall Buttress) was completed in 2013. A detailed assessment and history of the physical stability associated with the Main Pit south wall is provided in the letter report “Detailed Review of Foundation Performance at Select Mine Waste Facilities and Main Pit South Wall” (SRK 2012b).

The Main Pit is a disposal location for waste rock with an NP:AP ratio less than 3 (referred to as “SAT” material at Minto) with the material to be placed below the final water elevation of the pit. In addition to the South Wall Buttress, several In-Pit Dumps have been constructed in the pit at various times that did not have the same stringent compaction requirements. The In-Pit Dump noted in Appendix A was end dumped into the pit water with a high dump height and significant cracking and settlement has been observed since. In April 2015, construction of a new dump (SAT Dump) began that will be constructed on top of the tailings and will also buttress the In-Pit Dump.

In February 2017, construction of the Main Pit Dump (MPD) began over areas of the south wall of the Main Pit that do not contain SAT. Placement of waste in the MPD occurred intermittently throughout the 2017 and 2018, with a large volume of material placed in the fall of 2017 and over the winter of 2017-18. MPD construction stopped following the completion of the Area 2 Stage 3 Pit in the Spring of 2018.

Survey hub movement data for the Main Pit Dump are presented in Figures 1 to 14 of Appendix G, with the footprints of the MPD are provided in Figure 1 of Appendix G. All hubs show either no significant changes in horizontal movement, or a decelerating movement trend. The highest movement rate of 1.3 mm/day occurs at hub M97, which is located at the top of the MPD, and has decreased from a rate of 1.6 mm/day in July 2020.

3.6 Water Storage Pond Dam

Instrumentation data for the WSP Dam are provided in Appendix H and consists of eight ground temperature cables, 13 vibrating wire piezometers, and five survey hubs.

Survey hub movement data are presented in Figure 1 and 2 of Appendix H. No significant movement was observed.

Ground temperature data are presented in Figures 3 to 10 of Appendix H. All temperature sensors are above zero and have shown an increasing trend since installation that appears to be stabilizing. Temperatures at depth are typically within the range of observed groundwater temperatures in nearby Westbay monitoring wells MW-12-05 and MW-12-06.

Piezometric data are presented in Figures 11 to 14 of Appendix H. In general, pressures continue to follow historical patterns and fluctuate with the pond water elevation.

4 Recommendations

A summary of the recommendations is provided in Table 4 with the priority rankings (1 to 4) defined by the descriptions in Table 3.

Table 3: General Description of Priority Rankings

Priority	Description
1	A high probability or actual safety issue considered immediately dangerous to life, health or the environment, or a significant regulatory concern.
2	If not corrected, could likely result in safety issues leading to injury, environmental impact or significant regulatory action; or, a repetitive deficiency that demonstrates a systematic breakdown of procedures.
3	Single occurrences of deficiencies or non-conformances that alone would not be expected to result in safety issues.
4	Best Management Practice as a suggestion for continuous improvement towards industry best practices that could further reduce potential risks. This typically includes ongoing construction items within the appropriate construction cycle.

Notes: Based on the Health, Safety and Reclamation Code (HSRC) for Mines in British Columbia.

Table 4: Summary of Recommendations

Area	ID No.	Recommendations	Priority (Table 3)	Recommended Deadline
General	2021-01	▪ The 2020 inspection recommended an InSAR satellite survey study to be completed to increase the understanding of movement of the various waste facilities at site (DSTSF, SWD, and Main Pit Dump). At this time of this inspection, Minto has proceeded with the study that is being undertaken by SRK and 3VGeomatics, but the study results are not yet available for consideration in this report.	4	End of 2021
	2021-02	▪ Several instrumentation cables and PVC pipes were observed to be exposed with no protective covers. Minto staff responsible for obtaining readings should be reminded to replace the cover following readings to prevent water ingress and damage due to freeze thaw.	3	End of 2021
DSTSF and MVFE	2021-03	▪ As part of the routine visual inspections, continue to monitor the following for any changes in condition: – the cracking present at the south end of the DSTSF, as well as – erosion gullies observed in the cover material on the northern and eastern slopes.	4	n/a
TDD	2021-04	▪ Implement upgrades to the TDD Intake Structure to prevent future sedimentation accumulation within the channel next freshet. The upgrades should be completed in a manner that meets the design objectives documented in the SRK design memo and should consider the following: – Raising the elevation of the TDD intake pipes to prevent sediments from entering the pipes. – Regrading of the Underground Access Road to prevent sedimentation from entering the intake structure. Runoff from the road should be directed to the opposite side of the road and conveyed into the Area 2 Pit (via a sump/pipeline system, lined channel/slope, or equivalent). – Flows that exceeds the capacity of the TDD Intake Structure will flow down the Underground Access Road to the north. Either a berm should be constructed along the access road to prevent this water from flowing onto the DSTSF cover, or the Underground Access Road should be regraded to direct overtopping flows to the Area 2 Pit.	2	Construction should be implemented as soon as practical in 2022 (Frozen ground conditions make completion of the investigation in 2021 impractical).
MWD Wrap	2021-05	▪ Complete the regrading of MWD Wrap to grade over the over-steepened slope at the toe of the dump. In its current state, there is a higher risk of surficial slope failures and rockfall. Coarse rock is present at the base of the slope that acts as a small barrier to rockfall, but until the wrap has been regraded, traffic should be restricted near the toe.	3	Measures to ensure that equipment and personnel are kept away from dump toe should be implemented by the end of 2021. There is no recommended deadline for completion of the dump regrading.
SWD	2021-06	▪ Continue to monitor the cracking upslope of the cover soil stockpiles as part of the routine inspections specified in the PMP.	4	n/a

Area	ID No.	Recommendations	Priority (Table 3)	Recommended Deadline
Fuel Containment Facility	**2021-07**	▪ **An investigation is needed to inspect the condition of the geotextile and liner in the area along the new rutting in the facility.** The inspection should be completed using hand shovels to carefully expose the geosynthetics to allow for a thorough assessment of the condition of the geosynthetic materials. All areas of damaged geosynthetics should be repaired by a qualified professional and new sand material should be used to fill in the ruts after the repairs have been made.	**2**	Construction should be implemented as soon as practical in 2022. (Frozen ground conditions make completion of the investigation in 2021 impractical).
WSP	2021-08	▪ Continue to monitor the identified potential sinkhole located 5 m NW of WDT-08 as part of the routine visual inspections for any change in condition. Photographs records should be maintained to aid in monitoring.	4	n/a
	2021-09	▪ Deadfall/logs should be removed from the upstream face of the dam. Should any extreme precipitation event occur, the deadfall could plug/reduce the conveyance capacity of the spillway resulting in uncontrolled overtopping of the dam.	3	Prior to Freshet 2022.
Main Pit Dump, SAT Dump & In-Put Dumps	2021-10	▪ Waste rock materials being processed for construction material should be excavated from the northern edge of the top bench instead of the south end as observed during the inspection to assist in unloading of the dump in the area currently experiencing movement.	4	n/a
	2021-11	▪ The sinkhole north of the W15 Sump should be filled and the erosion channel graded to minimize infiltration into the pit in the event of any future overtopping of the sump.	3	**CLOSED** Sinkhole filled and area graded in October 2021.
Area 2 Pit	2021-12	▪ Continue to monitor the crests and slopes as part of the monthly visual inspection for signs of worsening cracking to determine if any slope stabilization measures are required.	4	n/a

Closure

This report, 2021 Geotechnical Annual Review, was prepared by

Peter Mikes, P.Eng.
Principal Consultant

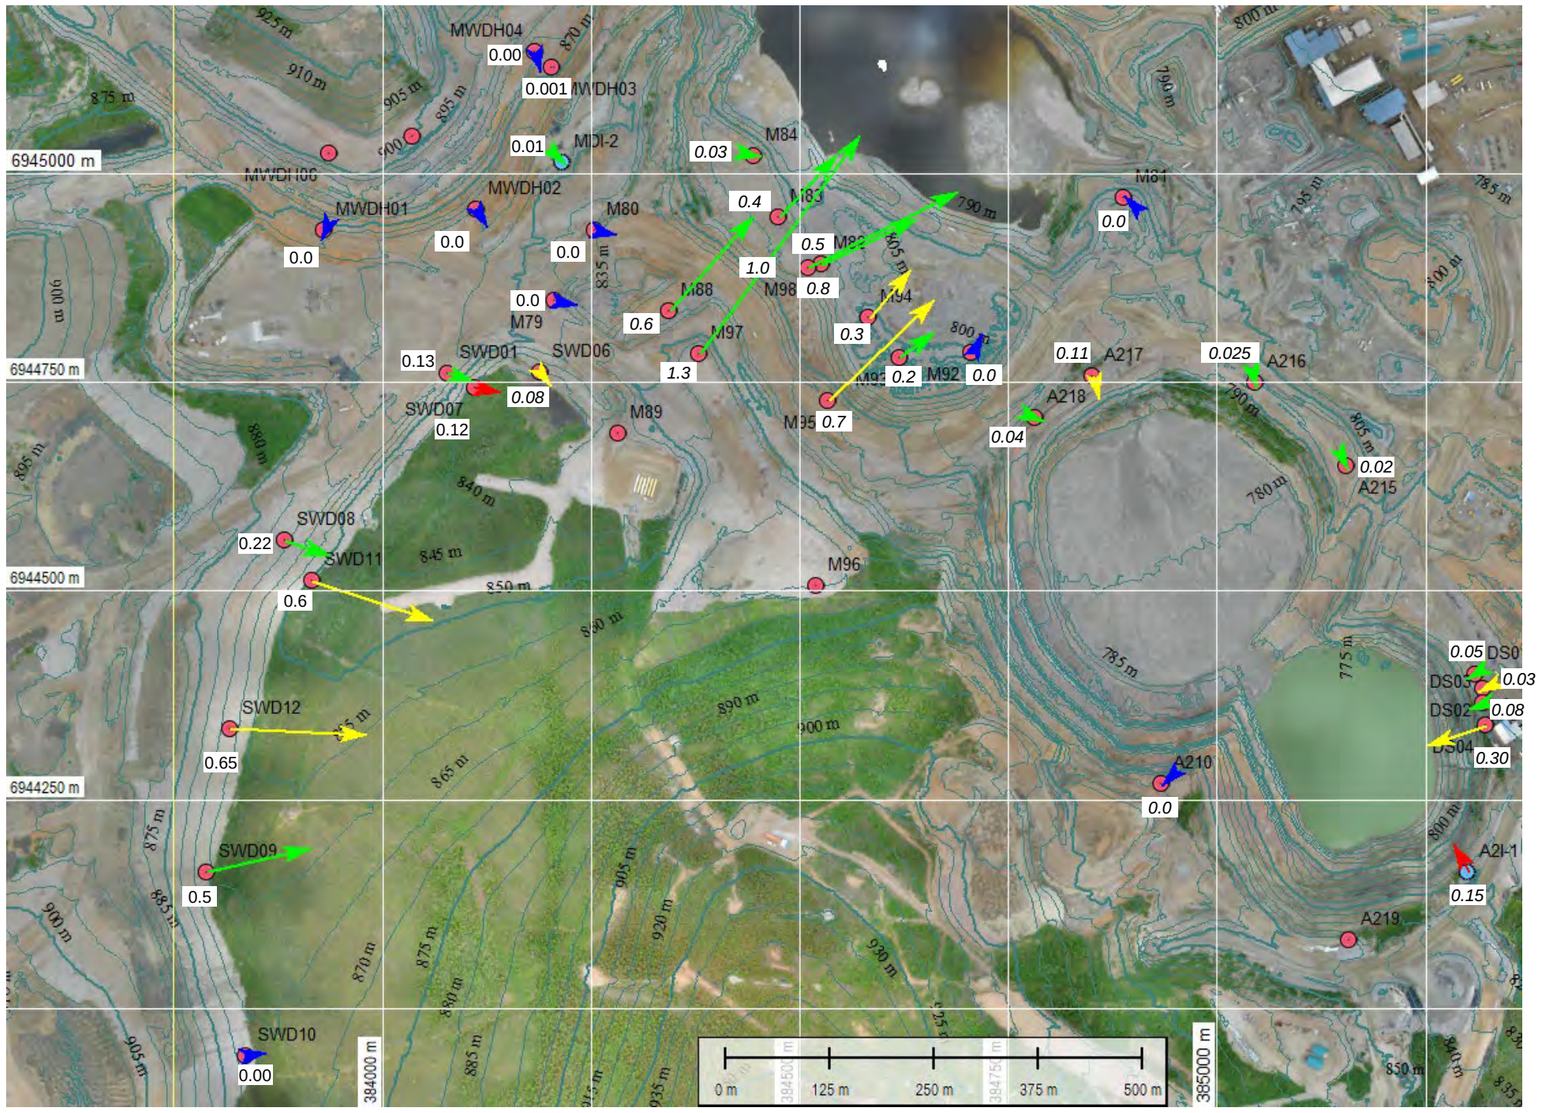
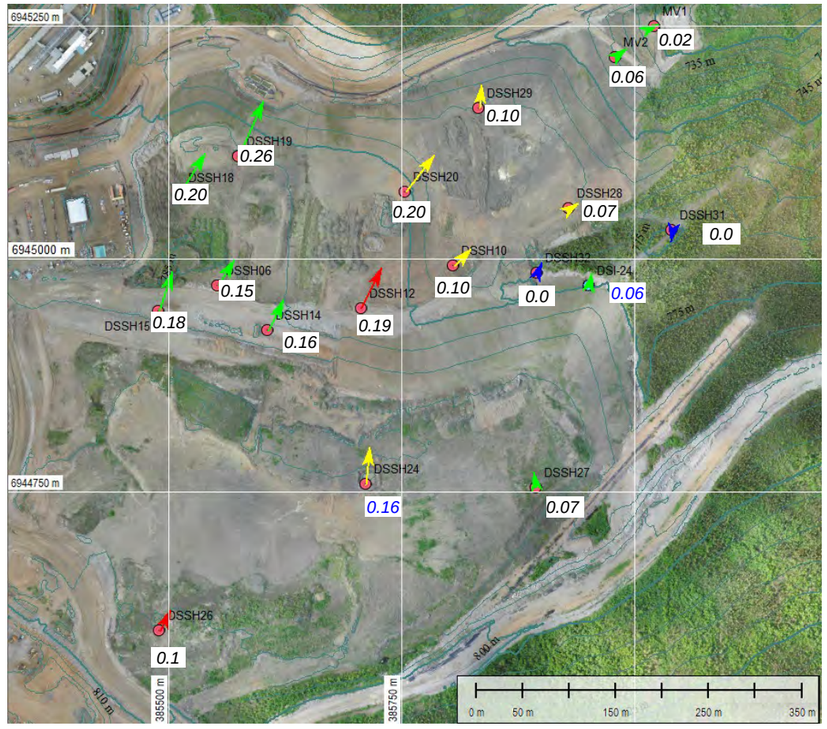
Appendix B Survey Hub Summary



a) Southwest Dump and Main Pit Areas

LEGEND

- Survey Hubs - Active
- Survey Hubs - Destroyed
- 0.5 Total Movement Rate (mm/day)
- 0.5 Horizontal Movement Rate (mm/day)
- Movement Vector - No Current Movement
- Movement Vector - Decelerating Movement
- Movement Vector - Steady Movement
- Movement Vector - Accelerating Movement



b) Dry Stack Tailings Storage Facility

Notes:

1. Movement vectors have been scaled by a factor of 250 (i.e. length equals 250 times the current velocity in mm/day) except for the blue vectors where no current movement is observed. The length of the blue vectors is arbitrary and is included to show the direction of past movement.

Appendix D DSTSF Instrumentation Data

Active Survey Hubs					
Survey Hub	Last Reading	Movement Rate (mm/day)		Bearing (over past year)	Comments
		Current (as of last reading)	One year prior to last reading		
DSSH06	7/30/2021	0.15	0.24	30	Decelerating, movement direction shifting to the east.
DSSH10	5/31/2021	0.10	0.10	42	Steady movement rate for the past two years. No apparent vertical displacement.
DSSH12	7/30/2021	0.19	0.19	26	Possible acceleration trend. Additional readings needed to confirm. Vertical displacement rate continues to show deceleration.
DSSH14	5/31/2021	0.16	0.16	24	Slight deceleration trend observable in the horizontal displacement data. Movement direction shifted towards the east by 2 degrees in past year.
DSSH15	5/31/2021	0.18	0.19	18	Slight deceleration trend observable.
DSSH18	5/31/2021	0.20	0.20	32	Deceleration trend observable in the horizontal displacement graph.
DSSH19	5/31/2021	0.26	0.26	24	Slight deceleration trend observable.
DSSH20	5/31/2021	0.20	0.20	38	Total displacement graph shows an apparent acceleration trend due to an increase in settlement. Horizontal displacement graph shows a deceleration trend. Movement direction shifted towards the east by 6 degrees in past year (likely due to settlement).
DSSH24	5/31/2021	0.16	0.16	5	Steady movement rate in the past year. Less variability in the total displacement graph due to the reduction in the reading frequency in 2019. Rate of settlement is decreasing.
DSSH26	5/31/2021	0.25	0.07	27	Possible acceleration trend in the horizontal displacement graph. Additional readings needed to confirm.
DSSH27	2/2/2021	0.07	0.16	180	Decelerating.
DSSH28	7/30/2021	0.07	0.07	32	Steady movement rate.
DSSH29	5/31/2021	0.10	0.10	6	Vertical settlement has increased in past year, while the horizontal displacement is steady, with the last reading indicating no significant movement.
DSSH31	5/31/2021	0.00	0.00	277	No significant horizontal movement trend
DSSH32	5/31/2021	0.00	0.00	24	No significant horizontal movement trend
MV1	5/31/2021	0.02	0.05	61	Decelerating
MV2	5/31/2021	0.06	0.09	51	Slight deceleration trend observable in the horizontal displacement data.

Notes:
1. See subsequent figures for each survey hub for the interpretations of the movement rates with time.
2. Blue text indicates horizontal movement rates, while the black text are total movement rates.
3. Bearing direction is measured from true north.

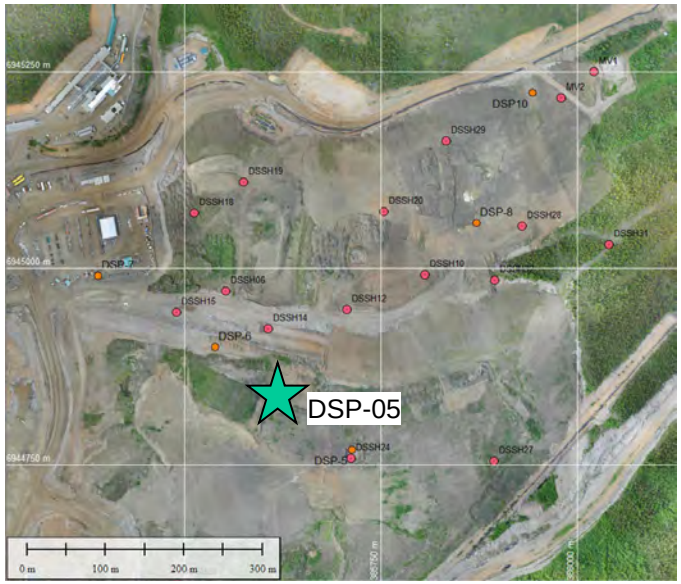
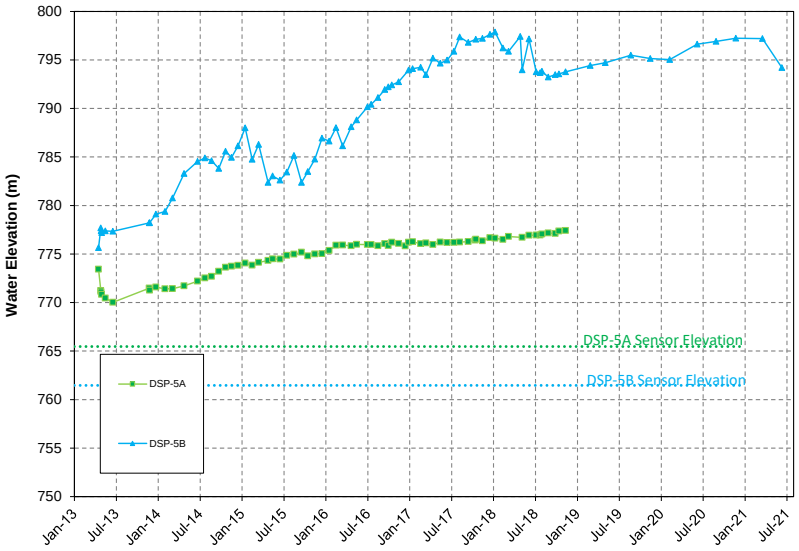
Figure: **19**





Notes:

1. The pore pressure sensors at DSP-05 are located approximately 2 m above original ground in tailings (A) and 2 m below original ground.
2. The bottom sensor at DSP-05 (B) shows an increase in pore pressure that peaked in 2018, and is since fluctuating between 793 and 797 m. The sensor is located in an area of silt with stratified ice lenses and the temperature at the sensor is near the freezing point of water -0.6°. The temperature plot also shows thermistor data from nearby ground temperature cable DST-14 for sensors at similar elevations.
3. Sensors at DSP-05A also shows gradual increasing pore pressure trend, with the sensor becoming malfunctional in February 2019.

Piezometer – DSP-05

Job No: 1CM002.073

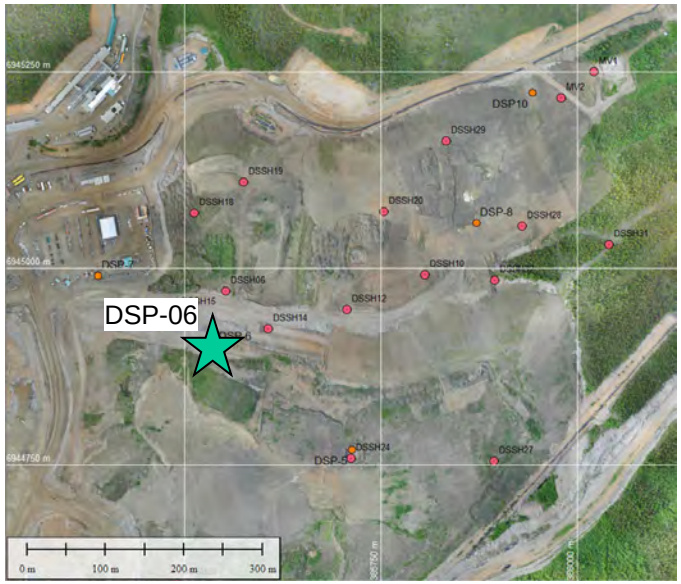
Filename: ApD_2021DSTSFLandscape.pptx

Minto Mine

Date: October 2021

Prepared by PHM

Figure: **20**



Notes:

1. The pore pressure sensors at DSP-06 are located approximately 2 m above original ground in tailings (A) and 2 m below original ground (B).
2. DSP-06A shows no pore pressure (pore pressure equal to the sensor elevation).
3. The bottom sensor at DSP-06B showed a gradual increasing pore pressure trend that peaked in February 2019 and has since decreased.

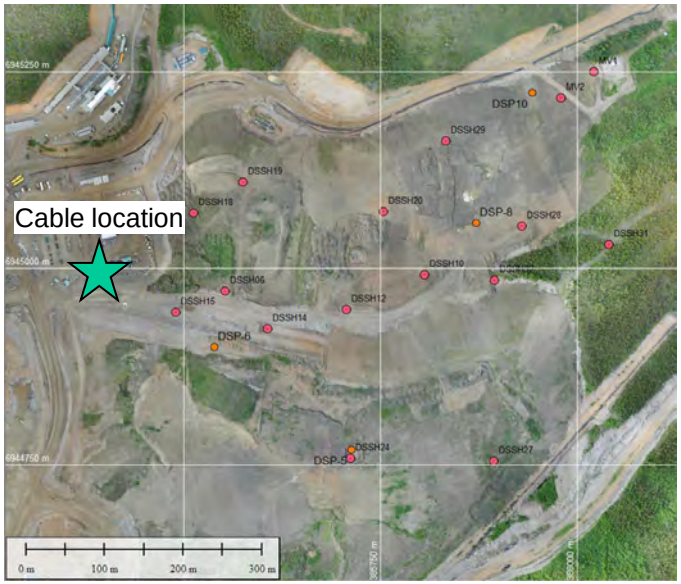
Minto Mine

Date:	Prepared by	Figure:
October 2021	PHM	21



Sensor #	Stratigraphy, Ice Description	Ice Description
1	Silt. Some clay, little sand, trace gravel, soft, wet, medium plastic, varved.	Vr, Ice/moisture content up to 50%.
2	Sand, few gravel, loose, unrounded, no fines.	Vr. Mostly no visible ice, some small random ice lenses up to 1.5 cm thick.
3	Clay, some silt, trace gravel and sand, wet, high plastic. (MC=50%)	Vr; Approx. 50% ice, lenses between 2 and 20 mm thick, parallel and nearly horizontal, interbedded with clay.
4		
5		
6	Weathered Bedrock; Highly weathered granite. Rust staining. Friable.	Nbn. No excess ice.

Notes:

1. Sensors #5 and #6 are no longer operational.

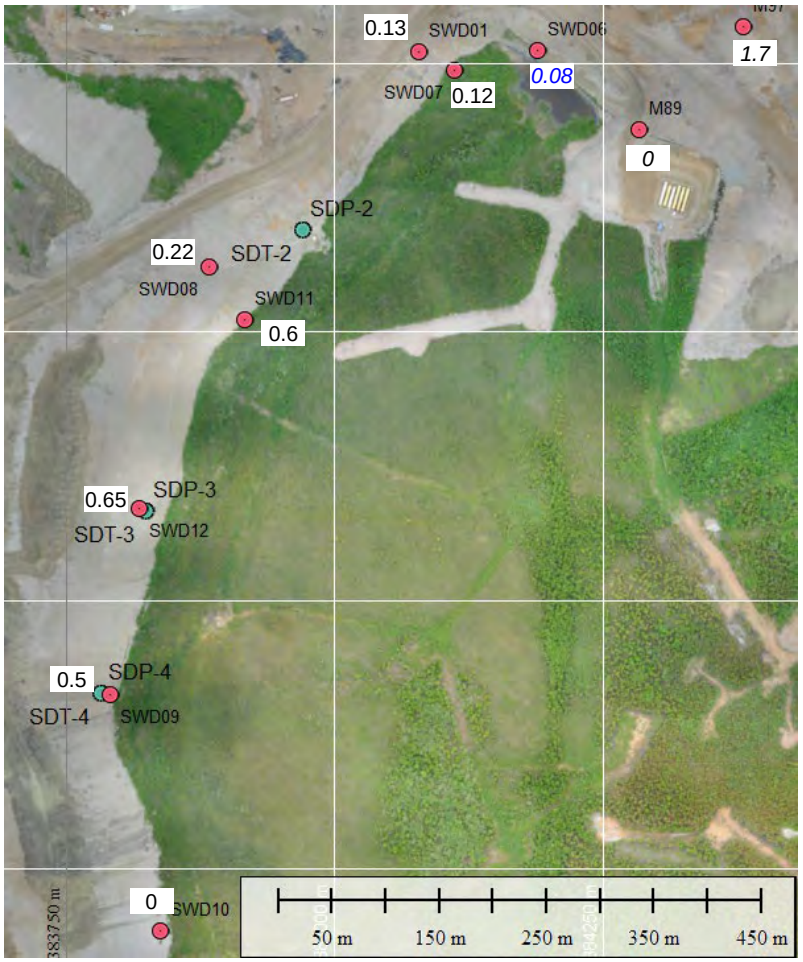
Appendix F SWD Instrumentation Data



Legend/Notes

1. *Values in black are total movement rates in units of mm/day*
2. *Values in blue are horizontal movement rates in mm/day.*
3. *Survey hubs with no movement rates listed have been inactive for over one year.*

South West Dump Active Survey Hubs

Survey Hub	Last Reading	Movement Rate (mm/day)		Bearing (over past year)	Comments
		Current (as of last reading)	One year prior to last reading		
SWD-01	8/11/2021	0.13	0.13	110	Slight decelleration trend observable (horizontal rate reduced from 0.1mm/day to 0.06 mm/day).
SWD-06	8/11/2021	0.08	0.08	143	Horizontal movement rate listed. Similar pattern of seasonal fluctuation due to freeze/thaw of survey hub.
SWD-07	8/11/2021	0.12	0.07	102	Possible acceleration trend. Difficult to determine due to seasonal freeze/thaw fluctuations.
SWD-08	8/11/2021	0.22	0.26	108	Slight decelleration trend observable.
SWD-09	8/11/2021	0.50	0.80	77	Slight decelleration trend observable.
SWD-10	8/11/2021	-	-	-	No significant movement
SWD-11	8/11/2021	0.60	0.60	108	Similar pattern of seasonal fluctuation due to freeze/thaw of survey hub.
SWD-12	6/23/2020	0.65	0.70	93	Steady displacement since installation in Fall 2018

Appendix Q – 2021 Invasive Species Report

Invasive Species Report 2021

The 2021 Invasive Species Monitoring Program began on June 27 and was completed by June 30, 2021. The program consisted of surveys and long-term photo documentation in high traffic areas onsite, such as the Waste Management Area, the Dry Stack Tailing Facility (DSTF), the Propane Farm, the Dyno call road and the Pelly Yard, as well as areas with lower visitor traffic including the Southwest Dump, Minto North, and the W15 wetland area, and the length of the Access Road from the mine site to the barge landing.

The survey focused on the high-risk species as listed by the Yukon Invasive Species Council (YISC) (Table 1), but also identified lower risk invasive species, such as foxtail barley (*Hordum jubatum*). High-risk species identified during the 2021 survey included narrowleaf hawksbeard, sweet clover (yellow and white) and smooth brome (photos in Appendix A). As per the EMSRP, the observed high-risk species were reported to the YISC Spotter's Network.

Table 1. Common and scientific names of Yukon invasive plant species.

Common Name	Latin Name	Common Name	Latin Name
Common tansy	*Tanacetum vulgare*	Smooth brome	*Bromus inermis*
Creeping thistle	*Cirsium arvense*	Spotted knapweed	*Centaurea stoebe*
Dalmatian toadflax	*Linaria dalmatica*	Scentless chamomile	*Tripleurospermum perforata*
Great butter and eggs	*Linaria vulgaris*	Foxtail barley	*Hordeum jubatum*
Hawkweeds	*Crepis tectorum*	Altai wild rye	*Leymus angustus*
Leafy spurge	*Euphorbia esula*	Crested wheat grass	*Agropyron cristatum*
Oxeye daisy	*Leucanthemum vulgare*	Quackgrass	*Elymus repens*
Perennial sow-thistle	*Sonchus arvensis*	Reed canary grass	*Phalaris arundinacea*
Sweetclover	*Melilotus alba (white) officinale (ellow)*	Bird vetch	*Vicia cracca*
		Lucerne	*Medicago falcata*

Survey Methods

The invasive species monitoring program included two types of surveys focused on different areas, including a meander survey for numerous areas on-site and a visual survey of the access road from a vehicle.

Meander Surveys

Meander surveys were traversed on foot and instances of invasive species were documented. Invasive species were identified, photographed, and located using new or pre-existing waypoints with a GPS. The 2021 survey routes, long-term photo sites, and species' locations can be observed in Appendix B. In addition, the coverage, distribution, and density of invasive species at each survey location was documented and long-term monitoring photos were taken at locations consistent with previous years.

Access Road Survey

For this survey, Minto Environment staff drove the length of the Access Road (27 km) at low speed to document any invasive species growing along the roadside. Photos were taken several points, including the barge landing (km 27), the Big Creek bridge (km 19), and the gravel pit (km 12.5) to support long-term monitoring efforts.

Long-term Photo Monitoring

Monitoring locations were consistent with previous years' surveys and served to document the change over time occurring at the various sites susceptible to invasive species introduction. Four photos were taken at each location facing different directions, roughly north, east, south, and west. These photos enable staff to track the movement of invasive plant species across the landscape and the rate at which species of concern can advance.

Results

The findings of the meander survey for each area are found in Table 2 below. The results generally found widespread narrowleaf hawksbeard (NLHB), instances of foxtail barley (FTB) and isolated patches of sweet clover (SC). Soil texture was found to be coarse at all locations.

Density is an estimate of plants per square meter on a scale of 1 to 4, where 1 is one or fewer plants per square meter and 4 is more than ten. Distribution (Dist.) refers to how plants are grouped in an area on a scale of 1 (a single plant) to 10 (continuous).

Table 2: Meander Survey Results

Area	Way Point	Invasive Species	% coverage	Dist.	Density	Comments
Minto North	WP1	NLHB	25	6	3	
	WP2	NLHB	10	2	1

13	NLHB	Sporadic	
12.5 Gravel Pit	FTB	Sporadic	

Narrowleaf hawksbeard (NLHB) were visible throughout the length of the road in single plants, and instances of smooth brome (SB) were found near Minto Creek and Big Creek. White sweet clover was sporadic from kilometre 14 to 27, with continuous dense patches between kilometres 15 and 18. Foxtail barley was rare, occurring as sparse individual plants from the barge to the kilometre 12.5 gravel pit.

Actions

The limited occurrence of smooth brome was removed completely from the Big Creek bridge. The patches of sweet clover growing in the Pelly Yard and near the W15 wetland were hand-pulled, while more substantial patches near Selkirk Towers, the warehouse and the Southwest Dump were cut with the brush saw. Photos of removal efforts can be viewed in Appendix B.

After re-visiting areas where removal efforts were completed (roughly one month later), it was found that most of the patches of sweet clover were able to recover, flower and go to seed, despite being mowed with the brush saw.

Recommendations

In accordance with the EMSRP, invasive plant surveys will continue in 2022, particularly along invasive species pathways such as roads with high visitor traffic, recently exposed areas, and areas that have been recently reclaimed.

It is recommended that the invasive species surveys continue to be conducted earlier in the summer months, as previously, the study had been completed in August-September, which caused difficulty identifying some species after they had gone to seed. Early/mid-July is recommended for identifying sweet clover, as it begins to flower during this time. Environmental staff should track incidental observations of invasive species throughout the growing season.

Control measures should be considered for areas in proximity to active reclamation, such as the Pelly Yard. Manual controls such as hand-pulling can be utilized for small infestations, while mowing can be applied to the larger infestations to slow the spread into more vulnerable areas. Any sweet clover removal efforts should be closely monitored and repeated throughout the growing season due to the plant's ability to regenerate and flower after mowing. Sweet clover has a two-year life cycle and thus will require several years of removal efforts to completely remove a population. If sweet clover becomes established in newly or sparsely revegetated areas, it could have detrimental impacts to reclamation success.

Newly placed overburden should be seeded as soon as possible to prevent invasive species colonization. Any vehicles or equipment entering the site should be cleaned and inspected to ensure they are not transporting additional unwanted species to site.
