

92-081

FINAL REPORT

The 1992 field season outside of the Whitehorse area turned out not to be what we had hoped although we did find a few good prospects. First we tried to get into the head waters of the Snake River to locate some aminites but we were unable to line up with the large helicopter being used by Northwestel on the Dempster and had to put our trip off until next year. In the Burwash Tatamagouch Creek area we did locate some good looking black gabbro some with white, pegmatite in it. This site needs to be looked at more closely and access is poor but the stone looks good. This area is staked and we would have to make arrangements with claim holders to use this site.

Along side of the White River about 1/2 mile upstream from the road we found an orange and yellow striped marble. This is a great looking marble that could have great value on the world market. We have no idea (yet) where this piece comes from.

In the Miester River area there is a deposit of graphic granite on the Logan property. A sample brought to us by a federal geologist looked good. We tried to access the property by an old cat road but it was washed out due to lack of maintenance. This site is remote but the stone is very nice to look at if there were large enough pieces it could be quarried in the winter and hauled out by cat train down old road.

Along side of the Haines Road around Vand Creek there are lots of large hard competent whitish grey boulders with some good outcrops about 1/2 - 3/4 mile upstream. We could quarry there and not be seen from the highway. Cut samples show a brownish crystal among the black grey and white. (maybe potassium feldspar). Sample sawed and polished good but is a little plain.

FINAL REPORT

There is also some schist along the side of the road 12 miles south of Teslin. I didn't find any out crops other than the one cut in the side of the highway but this type of stone has potential for cheap building facing and could also be exported south.
