

1993
YMI P

ABSTRACT

The Malou - Dolor claim area (MAP SHEET 115 H-4) was chosen because

(1) in 1987 I and Rob dal Bianco found and trenched a gold-arsenic vein where the DOLOR #6 is now located

(2) the 1987 claims were optioned by Silverquest / Pezgold and work suggested a significant deposit was present.

(3) after the option lapsed, gold-rich float was found in new areas.

New claims were staked and a soil geochemical survey for Au/As produced encouraging results.

Dates worked were 8 July 93 to 23 JULY 93 and 29 JULY 93 to 15 AUGUST 93. On 20 AUGUST 93, I and Doug Eaton of Alcatro inspected the property. A new and old trench were inspected.

Access was by helicopter, 42 miles north of Haines Junction.

The claims were optioned by Cash Resources, who added more claims.

The Idaho Creek area (MAP SHEET 115 J-10) was chosen because
(1) good soil anomolies were found (assessment report #091821) but not evaluated well. Trenches did not

reach bedrock and no samples were taken (Rinsey Mines Report).
(2) area is under explored
(3) area is close to the Casino project (10 miles east) and beside the planned access road.
(4) - the past float up to 15 gm/ton GOLD and up to 1389 gm/HORN SILVER were found.

20 FAITH claims were staked. 3 silts, 20 soils, 20 trench and 40 float samples were taken. General prospecting was done.

The best trench sample was .108 oz Ag/ton and .63 oz Ag/ton over 9 feet. One rock float ran 2400 ppb Au on the eastern claims.

Reevaluation of old data shows a large MOLYBDENUM anomaly was not plotted. It suggests a leached Cu-Mo-Au porphyry may be present. No copper anomalies were present.

Dates worked were 6 JUNE 93 to 24 JUNE 93 and 26 AUG 93 to 16 SEPT 93.

Access was by helicopter from Carmacks, 83 miles, north-west.

MALOU-DELOR claims

Float up to 3.7 oz Au/Ton has been found on the SHUT claims. In the past a 5000' long Au-As soil anomaly was located along the bottom of SHUT creek. In the past [?] (UKHM) and I had determined the area around the #1 posts of MALOU #1 & #2 had a Au-As anomaly. In 1991 I found a float rock with 2.99 oz Au per ton (VISIBLE GOLD) on MALOU #22 claim.

2 soil survey lines were taken at 75' intervals because of narrow veins or perhaps large areas of "micro" veins. Samples were 0-10 cm deep and mostly B HORIZON. Samples were marked by wooden stakes with aluminum tags.

The F line consisted of 39 samples. F was at the #1 posts of MALOU #1, #2. Samples were taken along the claim line, at 75' intervals. Direction was southwest.

7 samples over 500 were anomalous for Au-As. They are beside the old area of anopholies. The line is not [?] (1) to the float zones. 3-4 other Au-As were found.

The G line consisted of 41 samples. G was at the #1 post of MALOU #1, #2 along a northwest direction along the claim line. The G line was As poor although 8 samples were over

Keep I, My, Me etc out of
25 ppb. Technical Reports

Consider 25 ppb Au, 50 ppb Au,
and 100 ppb Au to be weak, moderate,
and highly anomalous. Consider
100 ppm As to be anomalous.

18 float samples were analysed
for gold.

Low grade gold float (T3, T4) was
found at E + 400 W. ^{samples} They had a blue
tinge to them. T1 was a breccia, T11
was quartz with visible AsPy and a
greenish tinge (.105 oz Au / ton). T1
was .204 oz Au / ton. T13 (.035 oz Au /
ton) was similar to T1.

T8 (.039 oz Au / ton) was schist
with micro veins of quartz. Dennis
Balete of Range Road DIAND saw a
small crystal of As Py in a cut slab
under the microscope. A similar
piece tested by Archer / Cathro was
a little higher. How much? ^{was}

Low grade gold float were found
near E + 1000 F.

A ~~May~~ ^{not} 1991 float sample (2.99 oz Au /
ton - visible gold, the 5000' Au As
anomaly, a Cathro's 3.7 oz Au / ton, my
93 soil anomaly of 500' wide,
T1-T8-T11-T13 all are vaguely
in line. Distance is 3000 feet plus
^{between}
^{about}

T8 shows the possibility of
low grade wall rock around the
veins. IN WHAT WAY

One old trench was cleaned out
(on the #6 DECOR claim). One new

Sentence does not
make sense

trench was dug. Samples were marked by wooden stakes with aluminum tags. Samples were taken over 419 inches or 35 feet. 8 samples.

In the new trench were many small veins and a 1 meter wide vein. Also ^{numerous} many micro veins were present. e.g.

~~Almost no float~~ rare SCHIST |||
~~was found over~~ Brown ORANGE DIRT.
this shallow Some rough mineralized zone. quartz pieces present

In the past this area was thought to have long, narrow erratic gold veins according to -

T8 (my) new trench, my 93 soil lines at 6800' (an anomalous area of 500' wide) suggest the possibility of a ^{large} BULK tonnage gold deposit. Based on what

Cash Resources has optioned the claim.

* I plan to do work areas that are similar.

STATESIDE ENERGY CORP. [SSE-V]

ALBERTA WELL CASED - Peter J. Boswell, president, Stateside Energy Corp., reports the Nisku/Leduc test well known as Rangeland Stateside Haynes 16-3-38-24W4M has been drilled and cased as potential Nisku oil well. Stateside participated for its 35% working interest in this well. Completion and production testing will start immediately. The well is an offset to the Rangeland Statewide Haynes 1-10-38-24W4M Nisku oil discovery (SEE GCNL NO 209, 1Nov93, P 4 FOR OTHER PROJECT INFORMATION)

CHARLIM EXPLORATIONS LTD. [CHO-V]**WRIGHTBAR MINES LTD. [WRB-M]**

QUEBEC GOLD CLAIMS OPTIONED - Guy Goulet, president, reports Charlum Explorations Ltd agreed to earn a 50% interest in Wrightbar Mines Ltd.'s gold-bearing property in Boulamque township, Quebec. To date, over \$13,000,000 has been spent on the property, and 305,000 tons of ore grading 0.222 oz. gold/ton have been proven. To earn the 50% interest, Charlum must spend \$500,000 on exploration annually during the next four years and make staged cash payments totalling \$50,000 over this period. Charlum will earn 12.5% interest for each \$500,000 segment until 50% has been reached. Following that, Charlum and Wrightbar will be equal joint venture partners in this project. Wrightbar holds 1,500,000 shares of Charlum Explorations.

Charlum is currently arranging a \$750,000 flow-through financing with \$500,000 of this to be spent on the Wrightbar gold property and over \$100,000 earmarked for the Lac Mobián lithium property.

In another development, a till geochemical sampling program is presently underway on the Temiscamingue property with gold/diamond potential to locate diamond indicator minerals in the neighbourhood of magnetic circular anomalies identified in previous surveys. Results will be available soon. Detailed geophysics will follow up. **KWG RESOURCES INC. [KGW-M]** can earn a 50% interest in the property by spending \$400,000 in exploration on it. (SEE GCNL NO 176, 14Sep93, P 5 FOR OTHER PROJECT INFORMATION)

CANADIAN COMSTOCK EXPLORATIONS LTD. [CKX-V]
TWO GARNET PROPERTIES ACQUIRED - Richard Pearson, director, reports Canadian Comstock Explorations Ltd has agreed to acquire an assignment from Cariboo Highland Metals Inc of a lease on two garnet properties, referred to as the Petro Garnet property, comprising six claims, located about 22 miles southeast of Barstow, California, and the Chesco Garnet property, comprising 12 claims, located about 70 miles west of Tonopah, Nevada. In consideration, the company will assume the underlying lease obligations, make a cash payment of \$15,000 to Cariboo, and issue 100,000 shares to Cariboo at a deemed price of 30¢ per share. In addition, the company has granted Cariboo a 5% production royalty from the properties.

A technical report has recently been completed by James J. McDougall, P. Eng., in regards to both properties. Mr. McDougall states in the report, referring to the Petro Garnet property, "a high grade garnet area as exposed, is at least 100 metres long and averaging 20 metres wide, suggesting a tonnage factor of about 2,000 tons per vertical foot or 200,000 tons if this section of the deposit averages 100 feet in thickness. Possible reserves of high grade could be tripled if the garnet zone continues to overlie a shallow-dipping intrusive contact to the south".

Mr. McDougall further states that in regards to the Chesco Garnet property, "many million tons of garnet are obviously present on the property, ie at least 5,000,000 tons on the main deposit (given 1,000 feet in depth). However, to command a fair price, the material must be efficiently upgraded by crushing, screening and (possibly) sorting based on gravity". With respect to upgrading tests on a bulk sample, Mr. McDougall visited a metallurgical lab experienced in garnet, in Boise Idaho. Although tests have yet to be completed, work done to date suggests a higher percentage of garnet present than anticipated, and upgrading appears not to be required for initial production.

The California air quality board testing labs have recently outlawed the use of silica as an acceptable sand blast material. As a result, a large market has opened up for the company's garnet material. Los Angeles' industrial area is within 90 miles of the Petro Garnet property, the company's primary target end user. Price ranges for the garnet are not quoted, but the most common grind (30 - 60 mesh) sells for \$200 to \$400 per ton, with some specialty grinds commanding \$1,500 per ton.

Canadian Comstock further reports it entered an employment agreement with R.H. (Dick) Lonsdale who will be responsible for the management and operation of both the Petro and Chesco garnet properties. Mr. Lonsdale has 25 years experience in the mining industry in a variety of responsible positions. (SEE GCNL NO.203, Oct.22/93, P.2 FOR OTHER PROJECT INFORMATION)

ASIA PACIFIC RESOURCES LTD. APQ-V

POTASH DRILLING CONTINUES - Gerald D. Wright, president, reports

Asia Pacific Resources has now completed the second and third diamond drill holes of the 1993 exploration program for the Udon Thani potash project in NE Thailand. While assay results are awaited, visual examination of drill core together with downhole gamma log information has confirmed the presence of high grade sylvinites at each location. Both major potash ores, sylvite and carnallite, are present in each of the boreholes drilled to date. Sylvite, in its pure form, contains about four times the potassium content of pure carnallite and is, therefore, a much more economically viable potash ore. As such, it is the focus of the exploration program.

Information from the drilling program to date indicates economic sylvite grades and seam thicknesses at each drilling location, drill holes being completed on a 500-meter grid pattern. The recently completed borehole (93APP-03) contains some 40 metres of high grade sylvite, whereas borehole 93APP-02 contained over 20 metres of high grade sylvite. The fourth borehole of the eight-hole program has now been drilled to a depth of 150 metres. Total planned depth is about 320 metres.

The Saskatchewan potash mines are the world's most significant producers and exporters. Typically, these mines operate on ore grades of about 24% K₂O and seam thicknesses of 2 to 3 metres at depths of 1,100 metres. Results from the Udon Thani project indicate the prevalence of similar conditions in northeast Thailand, although the deposits are located within 300 metres of the surface. Potash is a major constituent of chemical fertilizers. Asia Pacific holds a 75% interest in the Udon Thani project. The potash concession, the only privately-held concession in Thailand, covers an area of 2,333 square km. (SEE GCNL 199, Oct.18/93, P.3 FOR PREVIOUS INFORMATION)

CASH RESOURCES LTD. [KSH-V]

YUKON PROPERTY EXPANDED - James M. Stephen, president, reports Cash Resources Ltd's Killer gold property has been expanded by additional staking and optioning of 36 adjoining claims from local prospector P. Ross. The properties lie 52 km north of Haines Junction, Yukon Territory, and now consist of 75 claims covering about 10 sq. km. Preliminary prospecting, soil sampling and hand trenching have located a number of in-situ and float gold occurrences plus widespread geochemical anomalies. Samples of quartz with minor arsenopyrite from two sites 3,000 meters apart returned 123.4 and 102.5 grams gold/tonne (3.60 and 2.99 oz/ton) while arsenopyrite-rich specimen from a series of veins located 3,500 meters to the east assayed up to 300 grams gold/tonne (0.88 oz/ton). Most of the property has been glaciated and this, coupled with blocky talus in unglaciated areas, makes traditional prospecting difficult. The property has never been drilled or trenched with mechanized equipment.

Under the option agreement, Cash can earn a 100% interest subject to a 2% net smelter royalty, half of which can be bought out for \$1,000,000. The agreement requires cash payments totalling \$115,000 by 1May97 and advances against net smelter returns totalling \$250,000 by 1Jan2002. Geologist W. Douglas Eaton has been appointed a director of the company. (SEE GCNL NO 203, Oct.22/93, P 1 FOR OTHER PROJECT INFORMATION)

BEAUFIELD CONSOLIDATED RESOURCES INC. [BFD-V]

QUEBEC GOLD CLAIMS ACQUIRED - George S. Sightham, president, reports Beaufield Cons. Resources Inc has acquired, subject to regulatory approval, a gold project, in Pascale Township, Quebec. The property consists of five claims and is situated north of 2 known gold deposits, the old Ferron Mine and the New Pascale Mine. Consideration was 100,000 shares and a 2% NSR to the vendor. (SEE GCNL 202, Oct.21/93, P.3 FOR OTHER DATA)

PRIMO GOLD LTD. [PRI-V]

PETROLEUM INTERESTS LEASED - Kenneth Cabianca, president, Primo Gold Ltd, reports that through the Kennesee Joint Venture and its partner, Buckeye Exploration, it has acquired three significant lease positions located less than one mile north of Livingston, Tennessee. The first lease is situated 200 feet from a recent oil discovery which is producing 900 barrels of oil per day. Pending title opinion and survey, Primo plans to start drilling, by November 10, an offset well located about 400 feet from the discovery well.

Primo Gold will hold a 12.5% working interest in the lease and well. The second lease is located 400 feet south of the discovery well. Primo will hold 25% WI. A third lease is located 1,200 feet south of the discovery well and 250 feet north of a well called the Doc Rowe which had an initial flow rate of 1,000 barrels of oil per day. Primo will hold 25% WI. Negotiations are in progress on several additional leases. (SEE GCNL NO 188, 30Sep93, P 2 FOR PREVIOUS DATA)

FAITH Claims

In the past placer mining has taken place on Idaho and Issac Creeks. Recorded production ^{was low because} remote ness hindered exploration and production. In 1969 the area was staked during the CASINO staking rush. No serious work was done. In 1980 the NAT found streams to be anomalous in Au, Ag, As, Pb, Zn, Sb. In 3 years no source was found. In 1985 Chevron and Alcatros staked the FAH claims.

091828 assessment report was issued. Geological mapping, prospecting and 2300 m x 5500 m grid was done. An anomalous area 1000 m wide was found. It consisted of A, B, C, D anomalies aligned NE.

Au up to 15 gm in a float, up to 6550 ppm in soil was found!

Ag up to 1389 gm/ton in a float, up to 122 ppm in soil was found.

Targets are an E-NE feldspar porphyry dyke with chalcocite and in the S+west are veins with wall rocks fractured and argillised.

2 float in a hand pit ran

- .43 oz Au/ton, 11.80 oz Ag/ton, .81% Pb
- .28 oz Au/ton, 40,4600 oz Ag/ton, 2.78% Pb

According to Rob Carles, trenches were attempted but no samples were taken. 7 + trenches were attempted.
(1) PROJECT over budget

(2) permafrost

(3) trenches full of water

The soils were taken on a 50m x
100m grid. Mo and Cu were not plotted.
A anomaly = 1200 m x 600 m

= anomalous Au Ag As Pb Zn Sb

B anomaly = 1000 m x 400 m

= anomalous Au Ag As Pb Zn

C anomaly = 800 m x 400 m

= 2 or more clusters

= anomalous in Au As (Pb Zn Ag)

D anomaly = 1000 m x 300 m

= scattered clusters

= anomalous in Au As (Pb Zn Ag)

The anomalies seem to stop at
swamps, permafrost, etc. This
suggests the anomalies are larger.
Most of the anomalies are matched by
mineralized float. And some min-
float occurs where no anomalies
are present.

?

Q (cathro) raised the anomalous
values. () typical Dawson Range

In 1993?

3 silt samples were taken. Results were low and the gold mesh samples were lost. According to NAL, the samples were mostly plant and humus.

19 float samples were taken. R2, R4, R7, R24, R25, R27, R28, R30, R34 were taken in the #7 trench. R25 was a funny brown-white and after cut by a diamond saw showed small grain quartz and minute sulfides. By mistake NAL did a 15 gm + 30 gm test. weighted average. $\frac{1200}{2900}$

R25 = 2400 Au ppb

2.2 Ag ppm

29 As

6 Sb

17 Bi

8 float samples which looked mineralized were assayed for Au + Ag. R19 was thin 1-10th wide, had Mn and minute sulphides and was located in an area of no soil anomaly.

At trench #7, seven samples were taken. Locations were not exact due to the past caterpillar's excavating. R10, 21, 22, 23 are heavy, black and full of sulphides and taken at the western end of #7 trench.

Au up to .294 oz Au / ton

Ag up to 10.65 oz / ton

Cu up to 216 ppm

Pb up to 16,146 ppm

Zn up to 6,419 ppm

As up to 3350 ppm

Sb up to 9049 ppm

Mn up to 21%

R12, R14 were bleached, yellow-brown - slight green with some chalcedony.

Au up to .358 oz Au/ton

As up to 6053 ppm

low in Ag, Cu, Pb, Zn, Sb

Mn up to 1203 ppm

R18 is a combination of bleached areas and black sulphide areas, or a boundary zone.

I wanted to see which rocks held which minerals before sampling a trench.

Who cares? Where?

On the second trip 13 float samples were found and analysed. P-3 was 1" wide and orange-brown. Limonitic. Trench #7 was soil sampled to see if the anomaly was larger. Results were poor.

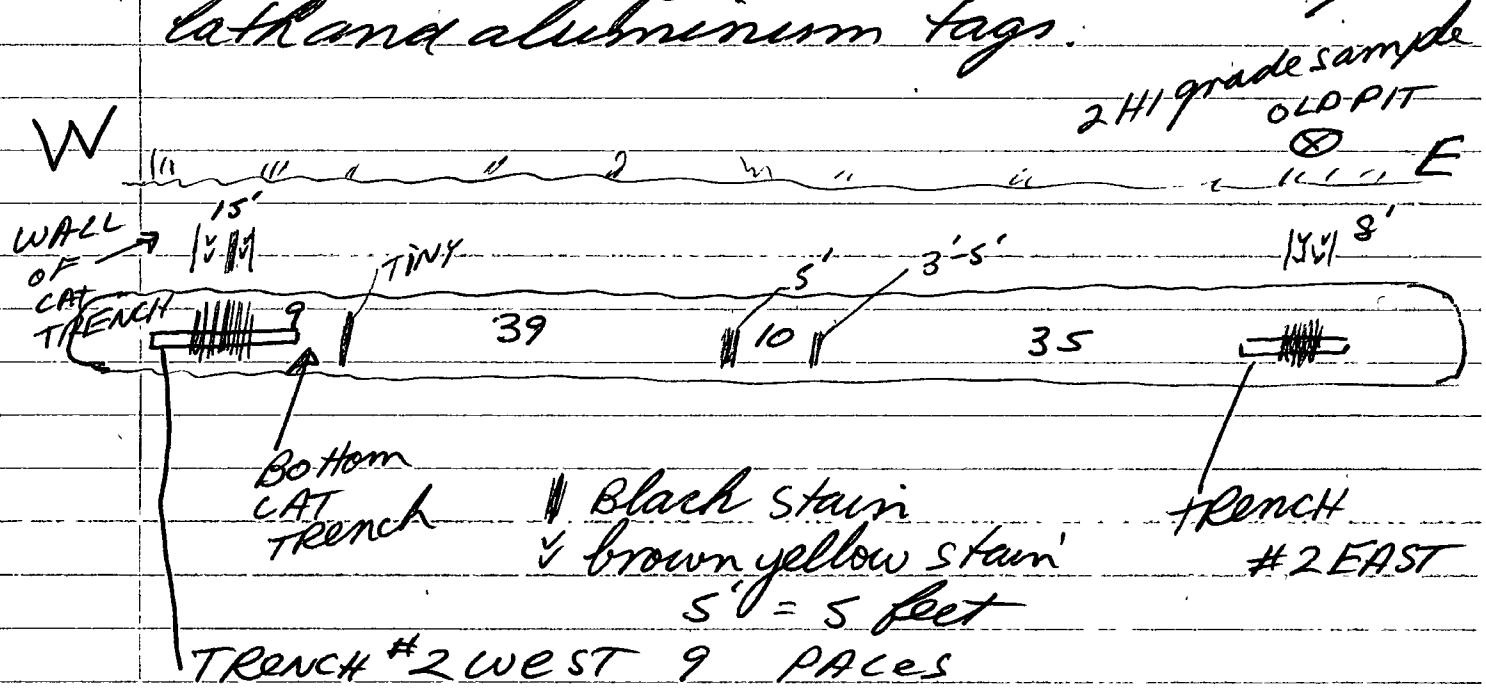

Trench #2 was dug up in 2 places and 1 area was .168 oz Au/ton and .63 oz Ag/ton. over 9 feet wide. The vein is in a northerly direction. The samples (3) over 9 feet wide were mostly orange-yellow brown soft gouge. I found no big rocks similar to R10 or R12 were found in the trenches.

#2 west shows a zone in the cut wall of small black + yellow brown zones.

Showes similar rel as #2 West

#2 east does as well. The 2 high

grade float were found near this area, yet trench #2 east had no significant gold results. The working place. Both trenches were dug by hand and depths were from a few inches to 2 feet. Samples were marked by both and aluminum tags.

The French samples were not as good as I had hoped. But the new plotting of the old molybdenum sulf sample results makes these claims very attractive for a mining company to option.

I would consider 1993 to be my best year so far. Experience and new ideas from this year will help me be successful in years to come!.

STATEMENT OF QUALIFICATIONS

I, John Peter Ross, do hereby certify that I:

1. am a qualified prospector with mailing address;

Box 4842
Whitehorse, Yukon
Canada Y1A 4N8

2. graduated from McGill University in 1970 with a B.Sc. General Science
3. have attended and finished completely the following courses;
1974 - BC & Yukon Chamber of Mines, Prospecting Course
1978 - United Keno Hill Mines Limited, Elsa, Yukon, Prospecting Course
1987 - Yukon Chamber of Mines, Advanced Prospecting Course
4. did all the work and the writing of this report
5. have been on the Yukon Prospectors' Assistance and Yukon Mining Incentive Program 1986 - 1993
6. have been on the British Columbia Prospectors' Assistance Program 1989 - 1990
7. have a 100% interest in the claims described in this report at the present time

John Peter Ross
Nov. 20, 1993

YUKON CHAMBER OF MINES

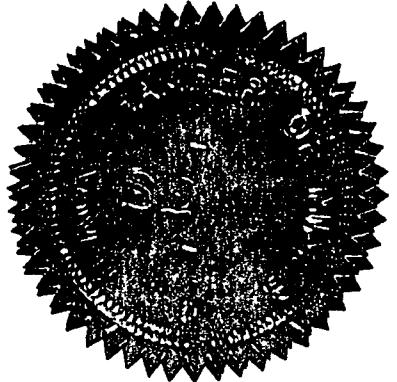

This Certifies That J. PETER ROSS

has completed the
