## INTRODUCTION

### THE ROSALINE DEMARCO, DIAMOND HAWK CLAIM GROUP

Diamond Hawk Claim Group is located on the south side slope of Quartz and Canyon Creeks, Dawson Mining District. N.T.S. sheet 145-O-14 approximate latitude 63° 48'N and longitude 139° 02'W. Access to the claim groups from Dawson City is 25 miles via the Bonanza - Eldorado - Calder - Quartz Creeks road. The property is adjacent to or overlays the Quartz Creek road (refer to claims location plan), Figure "1".

Rosaline Demarco, 819 Balmoral Street S.E., Medicine Hat, Alberta is the registered owner of the Diamond Hawk claims. The property owner has conducted the work requirements during the field season of 1995.

<u>Claims</u>	<u>Area</u>	<u>Grant No.</u>	<u>Date</u>
1-50			
Diamond Hawk	Quartz Creek	YB47828-59	Oct. 25, 1993
1-100			
Diamond Hawk	Quartz Creek	YB47860 YB47926	Nov. 20, 1993

The Diamond Hawk claim group is situated within an area of gold mineralization extending from the Buckland and Lone Star shear zones, Figure "2".

Regional Geology

The Ogilvie map area, containing the Klondike Gold Field, has not been glaciated. The ridge tops are rounded, of similar elevation, and contain no plateaus. This area includes long ridges with steep sides and narrow V-shaped valleys. The terrain in the Ogilvie area is described by H. S. Bostock as being at accordant summit level is defined as a level surface indicating that the hill tops or mountain summits, over a region, have approximately the same elevation. In a region of high topographic relief this suggests that the summits are remnants of an erosional plain formed in a previous erosion cycle. Also, the area can be described as being a summit concordance which is equal or nearly equal in elevation of ridge tops or mountain summits over the region. The concordance is thought to indicate the existence of an ancient erosional plain of which only scattered patches are preserved. The Tertiary period spans between 65 million years - Paleocene through to the Pliocene of 2 to 3 million years. The ancient Tertiary surface has since been cut to depths of 2,000 feet by the main drainage system. Outcrops are scarce in the area and are usually confined to ridge tops, stream-cut banks, stream beds and south-facing slopes. In places, rock fragments in the soil suggest the type of the underlying rock.

The quartz stringers and veins that occur in the metamorphic igneous or sedimentary source rocks of the Yukon Group are considered as the source of the gold in the Klondike, Sixtymile, Indian River, and Scroggie districts (W.E. Cockfield, 1921). The quartz stringers and veins that carried gold would probably be of different ages and not all quartz veins carried gold. The possible source of the veins could be from Permian (?) and/or Triassic (?) age granitic and ultra-mafic intrusives. The gold was concentrated in the creek and bench gravels by the disintegration, weathering and erosional process into the valley bottoms since the Tertiary time period 65 million years ago.

The oldest rocks in the area (Table of Formations) are Precambrian and later in age and consist of the Yukon Group - limestone, gneiss, quartzite, schist and slate - and the Klondike schist which contains sericite schist and minor chlorite schist. The aforementioned rocks are intruded by gneissic granite and ultra-mafic intrusives in part. Paleozoic, Mesozoic and Cenozoic aged sedimentary intrusive and extrusive rock types occur throughout the Ogilvie map area. Tertiary/Modern gravel stream deposits and Modern/Recent stream deposits are the source of the placer gold deposits within the Klondike district.

The older Yukon Group (Unit E-Bostock, 1942) (Schist Gneiss - D. J. Tempelman-Kluit, 1974) of rock consists mainly of mica schists, hornblende schists, chloritic schists, actin gneisses, cyanite schists, greenstone schists, schistose quartzites, schistose amphibolites, mica gneisses, hornblende gneisses, gneissoid quartzites, and crystalline limestone that is in parts dolomitic.

Several of the schistose rock types have been metamorphosed gradually and pass into corresponding gneissoid varieties. Particularly there is a transition between a mica and hornblende schist into mica hornblende gneisses. The schistose and gneissoid rocks are reported by D. P. Cairnes to be mainly of sedimentary derivation, but that some of the rocks may be of igneous origin.

Because of the folding, faulting, contortion and high degree of metamorphism of the origin source rocks, the original sedimentary and igneous rock types are indistinguishable in the field. The schistose rocks are associated gneissoid rocks and crystalline limestone are similar to the schistose rocks of the Klondike and in other of the more important gold producing districts of Yukon and Alaska. These Schist Gneiss group of rocks underlie the Indian River and Scroggie gold-bearing districts.

Quartz veins are abundant in the metamorphic rocks of the Yukon Group, they consist of the Pelly Gneiss, Schist Gneiss, Klondike Schist, Nasina Quartzite and a Foliated Biotite Granodiorite (D.J. Tempelman-Kluit, 1974). The Klondike gold is thought to have been derived from the Klondike Schists. The Sixtymile gold source appears to be derived from the Nasina Quartzite and the gold source in the Indian River and Scroggie districts appear to be from a Schist Gneiss rock type that includes rocks of the Klondike Schists and Pelly Gneiss that are undifferentiated. Consequently, any of the members of the Yukon Group; Schist Gneiss, Klondike Schist or the Nasina Quartzite; probably contribute to the source of the placer gold, if gold carrying quartz veins have been injected into planes of foliation of the host rock. These Yukon Groups of rocks are a common factor in the Klondike and surrounding placer gold districts. The quartz veins are probably of different ages and possibly the vein material was injected into the host rocks from Permian (?) and/or Triassic (?) aged granitic or ultr-mafic intrusives.

Local Geology Quartz Creek

The Diamond Hawk claim group overlay Early Cretaceous and/or older Klondike Schist (Debicki OF Report 1985).

Bedrock described in the Quartz Creek and claims area, by Debicki, consists of the following units:

(Refer to Bedrock Geology and Mineralization of the Klondike Area (West), 115 O 14, 15, and 116, B2 and 3.

By R. L. Debicki.

QS - Quartzofeldspatic Schistose Rocks

QSc - Buff weathering well foliated muscovite - feldspar - quartz schist, with quartz porphyoclasts

QSD - buff weathering well foliated muscovite - feldspar - quartz schist.

MS - Mafic Schistose Rocks

MSa - light to medium green and buff weathering chlorite - quartz schist

The lineation, foliation, jointing, dip and strike of the units are not apparent and require to be determined within the area.

Buckland/Lonestar Shear Zones

The Buckland and Lonestar shear zones (Arbor Resources) are two parallel zones that have been reported to occur in upper Eldorado Creek and Clader Summit areas. The shear zones and gold bearing and the gold-pyrite mineralization is possible related to lamprohyre rock types. The shear zones stike S E and possible cross Quartz Creek near the confluence of Little Blanche Creek.

ROCK TYPES EXPOSED IN TRENCHES

**Mafic Schistose Rocks:**

Light to medium green and buff weathering quartz-chlorite schist to gneiss.

Dark green weathering chlorite schist.

Silvery green weathering actinlite chlorite schist.

Grey-brown weathering quartz - amphibole schist.

**Quartz of Olospathic Schistose Rocks:**

Buff to pale green weathering well foliated muscovite, felspar - quartz schist with quartz and felspar porphyroclasts and lithic fragments.

Also encountered in #3 Trench a quartz vein 60' wide.

Some quartz veins were encountered at depths of 15 feet to 90 feet.

ROCK SAMPLE DESCRIPTIONS

Grab rock samples taken from #5 Trench:

Light grey quartz-muscovite schist, rusty, tr-1% fine-grained weathered-out pyrite. Taken from east end of lower pit.

Black mica schist w/ white to light grey quartz along foliation and 1 - 2% fine to medium grained pyrite. Sample is mostly decomposed, consisting of loose dirt and chunks of rock. Taken from south wall of pit at the east end just above the edge of the tailings. Black mica schist contains some gold.

Very light greenish grey quartz-muscovite schist w/1% fine to medium grained pyrite as blebs. Taken from center of the pit.

Same as R2, but rusty, mostly quartz w/ minor greenish black mica. Taken from the west end of the pit in the north wall.

Light grey quartz vein in a rusty greenish grey quartz-muscovite schist w/1 - 2% pyrite along foliation. Taken from bedrock exposed above and north of main pit.

Greenish grey rusty muscovite-chlorite-quartz schist w/ 5 - 10% weathered out pyrite. From main pit?

TRENCHING WORK DONE 1995

Trenching locations are shown on Figure #3

Number 3 trench was excavated in 1994 exploration.

(YMIP Report 1994)

Number 4 trench (size 300'L. X 16'W. X 12'D.) was dug following the zone to the North East. Drilling was attempted in this trench, but due to the high water level of 20 feet in this trench. This trench is approximately 300 feet North East of trench #3.

Number 5 trench (size 100'L. X 16'W. X 6'D.). Samples were taken and assayed.

Number 6 trench (size 100'L. X 16'W. X 6'D.) A water pond beside the trench made it impossible to drill, however mineralization on top of the bedrock was excellent. Number 6 trench was approximately 500' to the South West of trench #3.

Number 7 trench (size 100'L. X 16'W. X 6'D.) Mineralization was good, but water was hit at 30 feet. Three holes were drilled in this trench, water was hit in all three holes at 30 feet.

Number 8 trench (size 100'L. X 16'W. X 6'D.). A granite stringer was found while crosscutting this trench. This trench was drilled 100' North and 100' West of trench #1.

Number 9 trench (size 100'L. X 16"W. X 6"D.).

Number 10 trench (size 100'L. X 16'W. X 6'D.).

Number 11 trench (size 100'L. X 16'W. X 6'D.).

Trenches 9, 10, & 11 were dug approximately 200' East and 200' North of trench #8. These were dug on the South side of the main road. Samples taken for assay.

Number 12 trench (size 100'L. X 16'W. X 6'D.). This trench was dug at the junction of no-name gulch and Quartz Creek on the bench above the creek. Creek run-off and Placer Miner's settling pond was encountered below this bench and overburden above was deep.

An attempt was made to get the D8 to the circle target by way of this area, but due to the softness of the ground were unable to get to the target, "The Circle", with the 20' high tuft ring around it. This is on claim #76, Diamond Hawk. (See Figure #3).

### Drilling and Assaying

Drilling was done by a Rotary Air Drill which drilled a 3 1/2" hole to a depth of 100' where possible. However, when water was encountered the hole had to be abandoned. Samples were taken at 5 foot intervals and sent to Activation laboratories in Ancaster, Ontario for assaying.

Trenches numbers 3, 4, 5, & 7 were drilled to varying depths.

#### Trenches drilled:

#3 Main 94/95 - Hole #1 - 95 feet.

Samples assayed every 5 feet.

94/95 - Hole #2 - 80 feet.

Samples assayed every 5 feet.

94/95 - Hole #3 - 80 feet.

Samples assayed every 5 feet.

94/95 - Hole #4 - 80 feet.

Samples assayed every 5 feet.

94/95 - Hole #5 - 80 feet.

Samples assayed every 5 feet.

#4 Trench - 2 holes and water at 20 feet - abandoned.

#5 Trench - Hole #1 - 80 feet.

Samples taken at various depths.

Hole #2 - 30 feet.

Hole #4 - 35 feet.

Hole #6 - 10 feet.

Samples taken and assayed from holes #2, 3, 6, 7.

#7 Trench - 3 holes drilled to 30 feet, water encountered - some samples taken and assayed.

Drilling sheet attached.

Specimens also sent for assaying from N.A.L.

- #1 Taken at No-name Creek.
- #2 Green rock from Trench #3.
- #3 Black graphite rock - main trench.
- #4 White Quartz - main trench.
- #5 Surface sample - trench #4.
- #6 Quartz rock - trench #12.
- #7 From upper trench #4 - rock with pyrites.
- #8 Trench #12.
- #9 Specimen from junction of No-name.

STATEMENT OF COSTS

Work performed on Diamond Hawk claims for the year 1995.

DBK	\$19,470.00
Rotary Drill	17,200.00
Main Prospector	4,500.00
D. Living	1,654.50
Vehicle	1,440.00
Main Prospector	4,500.00
D. Living	1,709.65
Postage	31.87
Assays	1,436.88
Report Y.M.I.P.	<u>1,000.00</u>
TOTAL	\$52,942.90

Rosaline A. DeMarco  
Diamond Hawk Claims

#### RESULTS AND RECOMMENDATIONS

From the drilling results it appears this property may contain a massive gold bearing sulphide zone, which is open to the north-east, the south-west and open at depth.

The second target, "The Circle", with the 20 foot tuft ring around it, was impossible to reach due to the softness of the top soil. The top soil was soggy because of rain and heavy run-off from the surrounding hills.

From assay results on the samples taken from the weathered tuft ring, it also indicates that this is another gold bearing zone.

The assays taken at No-name and Quartz Creek also indicates a gold bearing zone.

Conclusions at this time, after 2 years of exploration, drilling and trenching with fair assay results and 13 trenches prepared for deep core drilling, it may appear attractive to a major mining company who have the expertise, resources and knowledge to develop this property.

The drilling, trenching and assay results indicate low-grade gold bearing zones on the Diamond Hawk Claims

An effort is being made to option the property. The owner would prefer further drilling and assaying and hope to do so independently in the future.

However, to date, approximately 14 files have been sent to major mining companies. Some files have been returned, but there is an interest.

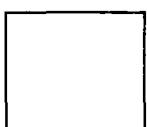

Of course, a commitment cannot be made until the property is viewed in the spring.

More files will be sent to junior companies if necessary.
