## 2000 Hard rock Exploration D.C.K. Claims

### LOCATION

The D.C.K. claim block is located approximately 50 miles north-northwest of Mayo, Yukon. It is accessible by a 4-wheel drive road which branches off the South McQuesten road and follows upstream on Ross Creek.(see fig. 1)

### GEOLOGY

Recent 1:50 000 scale mapping by Murphey and Heon (1995) shows that the property lies in the immediate hanging wall of the Robert Service Thrust Fault, which has emplaced phyllite and meta-quartzite of the late Proterozoic-Early Cambrian Highland group over Keno Hill Quartzite of Mississippian age. (see fig.5)

All of the rocks on the property are mapped as Highland Group. They lie on the south limb of the east, north-east trending Anticline, the axis of which runs along the McQuesten River Valley 8.5 km north of the property. Foliation strikes generally east, north-east, parallel to the McQuesten Anticline. Discordant foliations and several strong air photo lineaments indicate that the property is cut by north south faults or fracture zones which may have localised mineralising fluids.

The western property boundary lies approximately 1.3 km east of the Morrison Creek stock, a biotite granite body of Cretaceous age. Results of a regional aeromagnetic survey suggest that a buried intrusion or associated hornfels zone may extend beneath the south part of the property. (see fig. 4+5)

### WORK PERFORMED 2000

Trenching on the DCK claim block was performed between May 1, 1999 and Oct. 31 1999 with the assistance of the Yukon mining incentive program. Utilising a D8k+D9H Cat Bulldozer Trenching commenced in the spring on the access and progressed intermittently through out the summer and fall.( see fig. 2)

### TRENCHING CENTRAL RIDGE 2000

A trench approximately 2 km. in length was excavated on the lower west side of the central ridge. The exploration trench was excavated to a depth of 4 to 6 feet deep intersecting frozen gravel through out approximately 95% of the over all length. The remaining 5% of trench exposed large jagged edged bedrock boulders locked in a frozen gravel-mud matrix.

## PAN SAMPLING

Pan samples were taken at 100 m. intervals where gravel had thawed . Very fine gold and black sand was recovered from locations #6,8,9+10 ( see fig. 2)

## SOILS SAMPLING CENTRAL RIDGE

A one and one half inch iedleman auger was used to collected 65 soil samples at depths ranging from half a meter to a meter deep. Soils ranged in colour red , orange, yellow to grey.(see fig 3 )

## INTERPRETATION OF DATA COLLECTED 2000

The 2000 geochemical soils sampling program out lined another anomalous area approximately half a km. in length. Soils sampling carried out approximately 100 M. below and parallel to this line during a previous exploration program proved to be anomalous as well. At the time there was some concern that these geochem numbers may have been washed downstream from another gold arsenic antimony and bismuth anomaly located over the west spur ridge. The MJ2000 geochem soils line indicates that gold mineralisation occurs for 2 km. in a north south direction and over 2 km. on a south west trend on the DCK Block .The geochemistry seems to suggest that the east to west gold mineralisation is structurally related to the Heon showing situated on the Copper Ridge property a few km. to the south west. It is quite possible that this mineralised system runs south west for many km. possibly all the way to Sheelite dome.(see fig3,4+5)

The MK2000 samples line on top of the central ridge produced only a couple of slightly anomalous readings which suggests that the gold mineralisation does not extended to the surface on the north end of the ridge. The geochemical work that has been accomplished over the years has roughly out lined an area 2 square km. anomalous in gold arsenic antimony and bismuth.

Pan samples that were washed seem to confirm these geochem numbers, however, the gold that was recovered was almost microscopic. (see fig 2).

Many targets have not been examined from previous exploration . The 2 km x 2 km mineralisation that has been outlined by the soil geochemistry, leaves much exploration to be done in the future.
