SUMMARY & RECOMMENDATIONS

The program on the Indian River Dunite covered by DUN 1 to 24 consisted of hand trenching and minor sampling, along with a geophysical survey that covered the center of the intrusion. The sampling showed elevated levels of chromium but only trace amounts of PGEs along left limit or west side of Bishop Cr. The 2000 sampling program identified anomalous PGE values on the right limit or east side of Bishop Cr going into the thicker section of the intrusive. The geophysics identified some gradient anomalies within along side the magnetic anomalies. The VLF survey showed a mildly conductive zone coincidental with a gradient anomaly and local mag high running off the edge of the ultramafic. This was on L 102+00E @ 93+12.5N to L 101+50E @ 93+75N and over to L 101+00E @ 93+75N. Another mild conductor was on L 101+00E @ 99+00N on the edge of a magnetic high which is most likely the edge of the ultramafic. The Cutler VLF station was used as the transmitter for L 102+00E & L 101+50E. This transmitter could not be picked up the next day and the Seattle station was used. This station signal was a strong signal but a weaker dip needle response was recorded. The null was recorded facing SW for the Cutler station and facing E for the Seattle station.

The gradient showed some intense swings within the ultramafic (as identified with the mag), which signifies segregations of magnetic material. This signature is highly suspect of a layered ultramafic. The most intense gradient anomaly in the magnetic anomaly of the ultramafic is, starting at L 100+00E @ 91+00N to L 100+50E @ 90+87.5N to L 101+00E @ 90+62.5N. Another is at L 102+00E @ 96+00N to L 101+50E @ 96+12.5N. The drill and Cat will be now used for exposing and sampling these anomalies and others. More geophysics is also warranted to close off and delineate the extensions of the ultramafic and the anomalies within it.

Location and Access to Indian River Dunite

The Indian River Dunite prospect is covered by Dun 1 to 24 and is located approximately 45 km by road south and east from Dawson City. It is on map sheet 115-O-11 in the Dawson Mining District. The prospect is accessed from Dawson City via the Hunker or Bonanza Creek roads off the Klondike Highway east of Dawson City. Either of these roads are taken 20 km to Quartz Cr. turn off to the south. The Quartz Cr. Road is followed 12 km downstream to the mouth of Quartz Cr. to the old sunken dredge. The road takes off here to the left and goes upstream along the Indian River 9 km to the Indian River Hay Farm. From here one travels south along a cat trail 1.5 km to edge of the Dun claims at Bishop Cr. by ATV 4 wheeler. The 4 wheeler trail is followed another 1.5 km up the right limit of Bishop Cr. through the geophysics grid done this year.

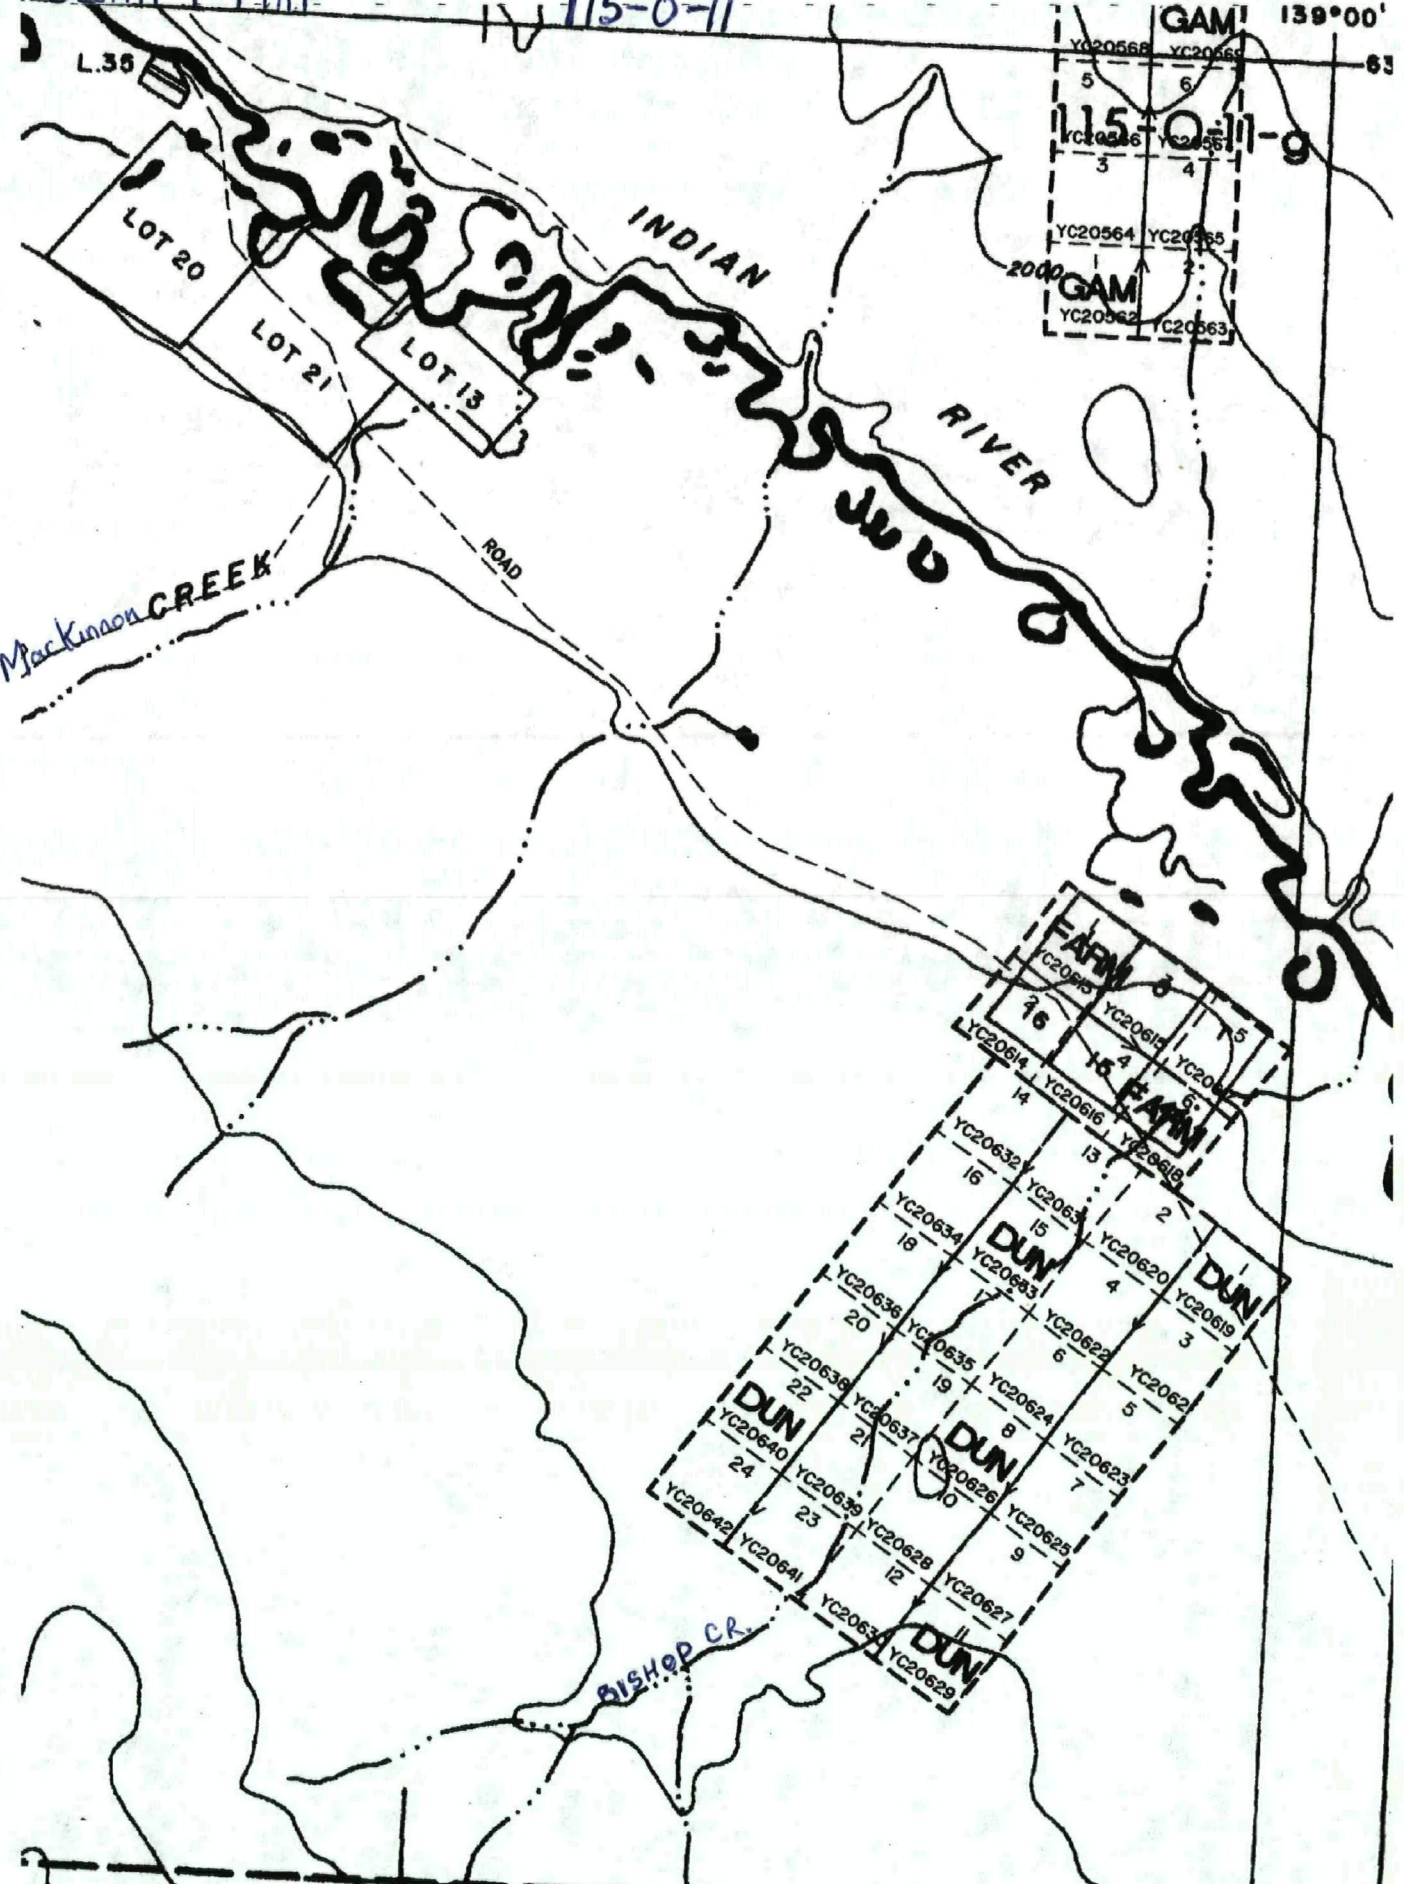

SUMMARY OF WORK DONE

The work on the Indian River Dunite covered by claims DUN 1 to 24 consisted of hand trenching and blasting 8 sample sites over a three-day period in June and a geophysical survey over a 12-day period in January. The drilling and trenching part of the program could not be completed due to time constraints. This follow up part of the program on the identified anomalies will be completed as soon as time allows, since we have the use of the drill for the next couple months. The geophysics program was broken up into 8 days of line cutting, and picketing and 4 days of running the geophysical equipment. During this time 9.4 km of grid was put in, 8.4 km of mag / gradient was run and 4.5 km of VLF was run. The grid had lines coming off a baseline every 50 m, with stations marked every 25 m. The mag / gradient survey had readings taken every 12.5 m along the line while the VLF had readings taken every 25 m on these lines. Due to the extremely dense bush and time constraints only the center portion of the intrusion complex, identified through the aeromag, was covered by grid and the resulting geophysics. The grid work was performed by Vern Matkovich, Carl Jonas, and Tom Morgan, and the mag / gradient survey was completed by Shawn Ryan with his Scintrex mag / gradient instrument. Tom Morgan put in the VLF survey with the Geophonics dip needle unit. Shawn and Vern spent a day defining target anomalies between lines and stations after everything had been plotted. The ground survey worked well for showing detail within the ultramafic that the aeromag blended together in an amalgamated high. Some cross lines need to be run to see if the orientation of the lines are giving a proper VLF profile of a conductor cross over. More grid work and geophysics is needed on this intrusion and its edges, to be followed up by drilling and maybe trenching to see if correlations do exist.

Sample Descriptions DUN 2001

June 8

DUN-21-R-001

Composite grab sample over 1.0 m from blasted, hand dug pit 1.0 m below moss in a decayed slightly serpentized dunite. This sample pit is on the left limit of Bishop Cr. in the south west extension of dunite intrusion at a UTM reading of 07V 0597584
7064398

DUN-21-R-002

0.5 m sample of subcrop material taken on top of permafrost at 1m deep, 30 m down slope or east of R-001. Dunite is a blocky uniform grained intrusive.

June 9

DUN-21-R-003

Sample pit in a recessively decaying creek bank blasted and dug approximately 60 m NE along creek bank slope from R-002. Rust stained slightly serpentized dunite material from 1.5 m deep over a 0.5 m long sample section from pit bottom. UTM reading of 07V 0597652
7064404

DUN-21-R-004

Sample pit is at 35 m NE from R-003 at base of the slope. The sample is in a hard blocky fine-grained dark dunite that was taken across 1 m from a depth of 1 m.

DUN-21-R-005

Sample pit is located 30 m upslope from R-004. The dunite here is decayed and serpentized and was sampled over 0.5 m in subcrop 1 m below surface.

DUN-21-R-006

Channel sample of subcrop material taken from a black, fractured dunite with clay infillings (serpentized), over 1 m, at a depth of 1 m. UTM 07V 0597711
7064538

June 10

DUN-21-R-007

Channel sample in subcrop on edge of NE extension of dunite just before it becomes covered by gravel beds. Sample section is over 0.75 m at a 1 m depth. This sample is the same material as R-006 and is 30 m from it.

DUN-21-R-008

1 m chip sample of hard dark green dunite outcrop on right limit bank of Bishop Cr. Which is below Pin Hill.

This map was compiled from data acquired during an airborne geophysical survey (gamma ray spectrometer, magnetometer and VLF EM) carried out by Fugro utilizing an Aerospatiale AS350B2 helicopter (registration C FZTA). The survey operations were carried out from July 29 2000 to September 21 2000.

Flight path was recovered using a post flight differential Global Positioning System. A vertically mounted video camera was used for verification of the flight path. The average traverse line spacing was 500 m with control lines flown at 3.5 km intervals. Helicopter flight height was maintained at an average ground clearance of 120 m.

The gamma ray spectrometry data were recorded at a 1.0 second sample rate into 256 channel main and radon spectra using an Exploranium GR820 spectrometry system. The volume of NaI in the two detectors comprising the system were main detector 33.4L radon detector 8.4L. Counts from the main detector were recorded in five windows corresponding to thorium (2410-2810 keV) uranium (1660-1860 keV) potassium (1370-1570 keV) total radioactivity (400-2815 keV) and cosmic radiation (3000- >6000 keV). Counts from the radon detector were recorded in the radon window (1660-1860 keV). The radon detection system was calibrated following methods outlined in AGSO 1995/60. After removal of the background, the data were corrected for spectral interferences, changes in temperature, pressure and departures from the 120 m planned survey elevation. The data were then converted to standard concentration units and ratios which were interpolated to a 125 m square grid for display as colour interval maps.

The aeromagnetic data were recorded at a 0.1 second sample rate using a 0.01 nT sensitivity split beam cesium vapour magnetometer suspended 23 m below the helicopter. The control line and traverse line magnetic data were corrected for variations in the magnetic field using the magnetic ground station magnetometer data. After editing the survey data, the intersections of traverse and control lines were established and the differences in the magnetic values were computer analysed to obtain the levelling network. The levelled total field values were interpolated to a 125 m square grid. Global Positioning System data were used to calculate the grid of International Geomagnetic Reference Field data circa 2000.7 which was subtracted from the total magnetic field grid. The resulting residual magnetic field grid presented as a colour interval map. The grid of the first vertical derivative of the magnetic field was then computed from the residual magnetic field and is presented as a colour interval map.

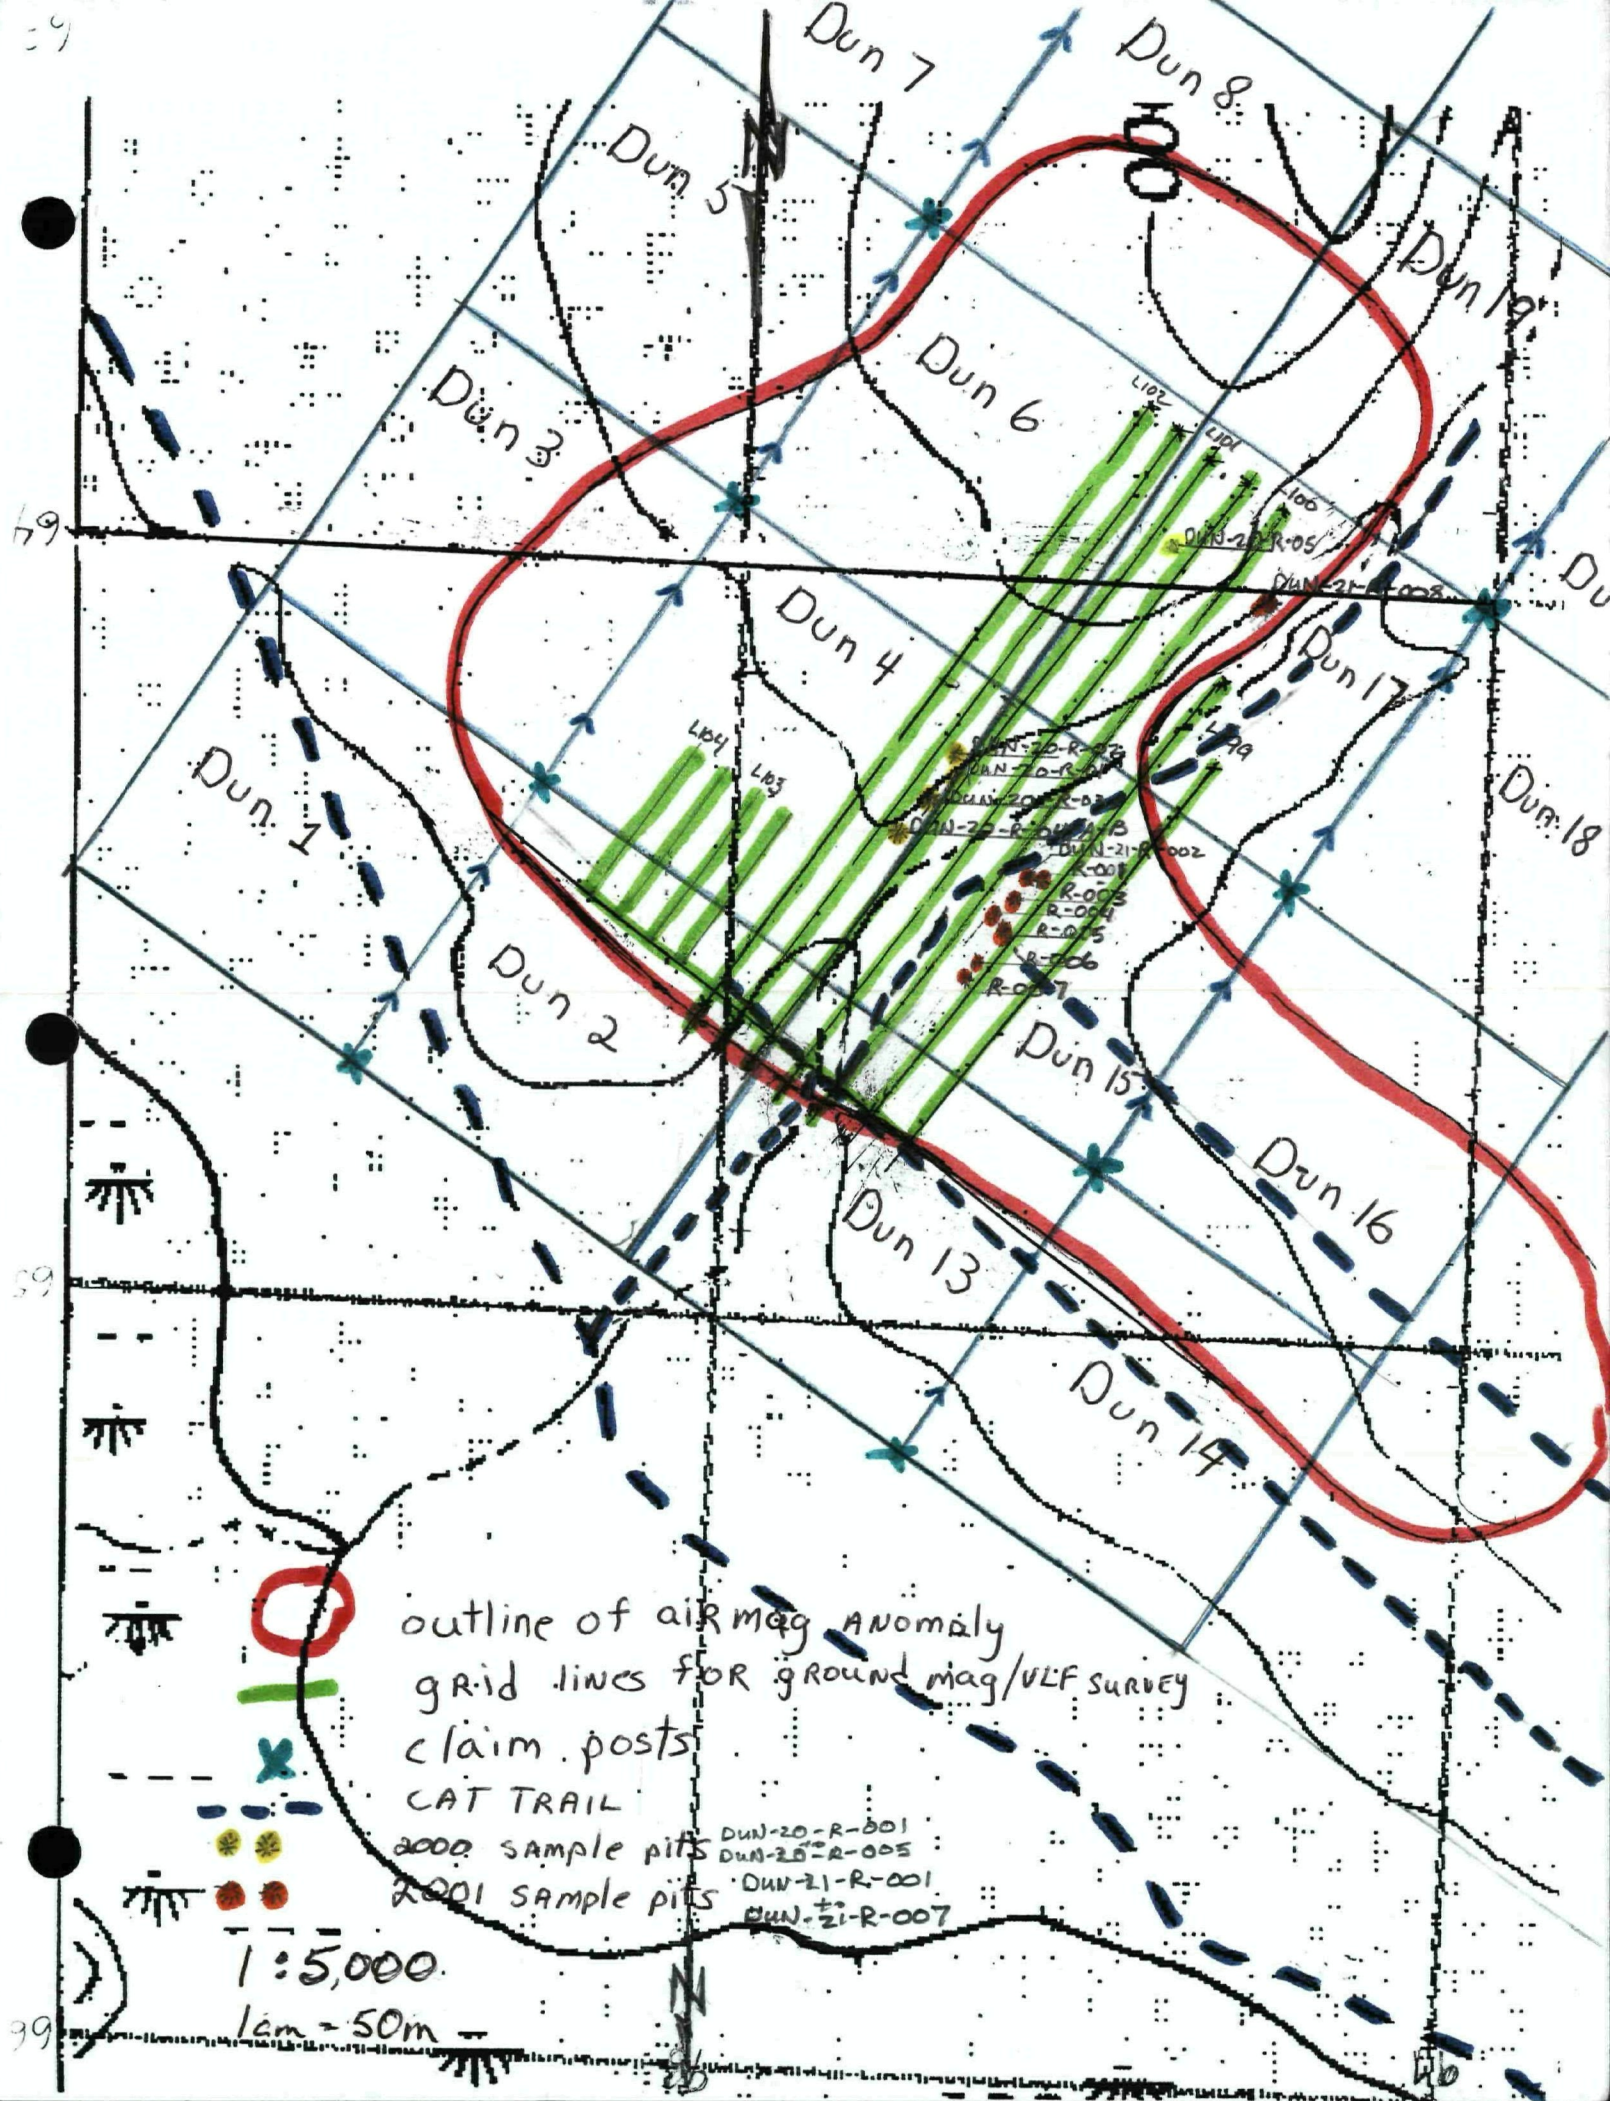

VLF total field and quadrature components for two frequencies were recorded using a Herz Totem 2A system. The line station was tuned to station NAA at Cutler MA transmitting at 24.0 kHz. The ortho station was tuned to the 24.8 kHz station NLK at Seattle WA. VLF data were recorded 4 times per second. VLF data will only be made available with the digital data.

The base map was reproduced by Geological Survey of Canada Pacific from digital topographic files provided by Geomatics Canada.

Les données utilisées pour la compilation de cette carte ont été enregistrées au cours d'un levé géophysique aéroporté (spectrométrie gamma, aéromagnétique et VLF EM) effectué par Fugro avec un hélicoptère Aerospatiale AS350B2 Immatricule C FZTA. Le levé a été réalisé du 29 juillet au 21 septembre 2000.

Le recouvrement des lignes de vol s'est fait à l'aide de mesures de système de positionnement global corrigées en mode différentiel après vol. Une caméra vidéo montée verticalement a été utilisée pour la vérification du plan de vol. L'espacement moyen des lignes de vol était de 500 m, maintenues par des lignes de contrôle séparées d'environ 3.5 km les unes des autres. L'hélicoptère a maintenu une altitude moyenne de 120 m au dessus du sol.

Les données spectrométriques des rayons gamma ont été enregistrées selon un taux

Table with columns: CODE, AMOUNT, TYPE, PREPARATION DESCRIPTION, PULP, REJECT. Includes an 'Analytical Summary' section with columns: #, Code, Method, Units, Description, Element, Limit Low, Limit High. Lists elements like Gold, Platinum, Palladium, Silver, Copper, Lead, Zinc, Arsenic, Antimony, Mercury, Molybdenum, Thallium, Bismuth, Cadmium, Cobalt, Nickel, Barium, Tungsten, Chromium, Vanadium, Manganese, Lanthanum, Strontium, Zirconium, Scandium, Titanium, Aluminum, Calcium, Iron, Magnesium, Potassium, Sodium, Phosphorus.
