REPORT BY B. SCOTT AND B. CARTER DEC. 29 2002

SUMMARY

In spring 2002, we were able to secure a copy of a previously unavailable report titled “Jubilee Mt. Property - Report on Geochemical and Geophysical Surveys – Ft. Lauderdale Resources – D. and V. Cukor - Mar. 1988”. [1] This report describes a \$32,000 exploration program completed on the Jubilee Mt. property by the previous claimholders in 1987. Soil geochemistry and geophysics [VLF-EM] surveys were conducted on the 8 core claims [Jubilee 1-6, JM 31-32]. The authors concluded that “The 1987 survey indicates that the mineralized shear zone extends beyond the area surveyed so far. It accomplished good correlation between geology, EM- conductivity and geochemical anomalies. The geochemical silver and VLF-EM anomalies show exceptionally good correlation.” The authors recommended further work along strike of the known structure.

With this in mind, the current owners conducted a soil geochemistry program during summer 2002, extending the 1987 grid 400 metres to the east along the presumed extension of the known mineralized shear zone. A total of 106 soil samples were collected and analysed. Results were disappointing, with best values of 41 PPB Au, and .9 PPM Ag. Ten rock samples collected during limited prospecting over the same general area also yielded disappointing results, returning a best value of 24 PPB Au.

FIG. 2

INTRODUCTION

1

The Jubilee Mt. property is located 80 km. southeast of Whitehorse Yukon, on NTS mapsheet 105D – 1 at latitude 60° 14'N. longitude 134° 07'W. in the Whitehorse Mining District. The property comprises sixteen contiguous claims jointly owned by B. Scott and B. Carter.

<u>CLAIM</u>	<u>CLAIM NO.</u>	<u>RENEWAL DATE</u>
<u>JUBE 1- 6</u>	YCO8041 – YCO8046	2002/10/14
<u>HARRY 1-6</u>	YCO9123 - YCO9128	2002/10/14
<u>HARRY 7-8</u>	YC15299 – YC15300	2002/10/14.
<u>HARRY 9 – 10</u>	YC19546 – YC19547	2003/06/24

Access to the property from Whitehorse is 80 km. south on the Alaska Hwy. to Jake's Corner, then 22 km. west on the Tagish road, then 7 km. south on the Tagish fire tower road. From here, an 8 km. cat trail, negotiable by ATV, leads south to the eastern end of the Jubilee Mt. claim block.

The property is situated on the northern end of Jubilee Mt., at elevations between 3700' and 5200'. Treeline is at approximately 4400' and creek valleys below this level are thickly vegetated. The area enjoys a typical northern climate. The exploration season normally extends from June to October .

The soil geochemistry program undertaken during the 2002 field season followed up on previous soil geo.chem surveys on the property [1982, 1987], which had been successful in outlining several gold, copper and silver anomalies. The old grid used in the earlier efforts was re-established and extended 400 metres to the east. Cross lines were at 100 metre intervals, except for line 9+45 E, which followed the western boundary of the Harry 9 & 10 claims. Our line 10 E duplicated line 10 E of the 1987 survey, which had returned numerous anomalous gold and silver values. We sampled at 50 metre intervals for a total of 106 soil samples. Cross lines were intended to extend 500 metres north and south of the baseline, but several ended short to the south in outcrop.

Limited prospecting was carried out along grid lines and around a granitic intrusive located slightly off-claim to the north of Harry 9. A total of 13 grab samples from outcrop were collected and are described as follows:

<u>SAMPLE #</u>	<u>LOCATION</u>	<u>DESCRIPTION</u>
02-R-01	L9+45E 4+50 N	greenish andesite, fractured, re-healed with quartz veinlets
02-R-02	L9+45E 2+60 S	.5 metre shear striking 265° dark grey meta-andesite less than .5% disseminated pyrrhotite less than .5% disseminated pyrite
02-R-03 not assayed	25 metres west of L10E 2+ 00N	6 metre wide shear striking 260° meta-andesite fractured and chloritized less than 1% disseminated pyrite

<u>SAMPLE#</u>	<u>LOCATION</u>	<u>DESCRIPTION</u>	<u>3</u>
02-R-04	57 metres east of L10E 2+ 00N	grayish green fine grained cherty siltstone fractured re-healed with quartz veinlets less than 1% disseminated sulphides	
02-R-05	L11E 4+ 50N	same as 02-R-04 except darker green	
02-R-06	L11E	same as 02-R-05	
02-R-07	4+60N		
not assayed			
02-R-08			
not assayed			
02-R-09	north of grid at UTM 550510E 677525N	granite greenish white siliceous feldspar porphyry 3-5 mm.rounded [partly absorbed] feldspar crystals 30-40% and rarer gray quartz phenos in siliceous white matrix 1-2% disseminated hornblende and chloritized hornblende	
02-R-10	same location as		
02-R-11	02-R-09	white fine grained cherty siltstone fractured and re-healed with quartz veinlets limonite on fractures 1% disseminated sulphides	
02-R-12	same location as		
02-R-13	02-R-09	buff coloured chert fractured re-healed with quartz veinlets some fractures filled with sulphides limonite staining	

Previous mapping in the area is limited to Map 1093A , included in GSC Memoir 312 , by J.O. Wheeler [2]. In the vicinity of Jubilee Mt., Wheeler has mapped: Cretaceous rocks , including Coast Intrusions [8b: leucocratic granite, biotite granite 8d: hornblende diorite] and 6: peridotite, dunite, serpentinite, pyroxenite , as well as Pennsylvanian[?] and Permian rocks of the Taku Group [2c: limestone, limestone breccia 2ds: metamorphosed volcanic rocks containing numerous serpentine bodies.]

PROPERTY GEOLOGY

At property scale, Wheeler's map 1093A shows the entire property underlain by an ultrabasic intrusive . However, investigation by previous operators [Cukor] and the authors of this report have found the mineralized shear zone to be hosted in interbedded volcanics and chert. Yukon Minfile # 105D-157 summarizes as follows: " The property is underlain by Cretaceous Taku Group andesite flows, pyroclastic rocks and intercalated cherts that form a roof pendant above, or embayment into a large dunite intrusion. Gold-bearing arsenopyrite occurs with chalcopyrite, minor pyrrhotite, pyrite and quartz-calcite gangue in a 1 to 2 metre wide vein and stockwork zone in a 10 to 25 metre wide east-west, vertically dipping shear zone that has an indicated strike length exceeding 1600 metres. The average grade of 7 trenches was 9.3 g/t Au, 27.4 g/t Ag and 1% Cu across 1.5 metres. Drilling showed that the mineralization is erratically distributed but locally more widespread than indicated by surface work. Four of 11 holes intersected significant mineralization. Best results were from Hole J82-1, which averaged .69 g/t Au

6.9 g/t Ag and .35 % Cu over 21.8 metres". Work on the property by the current claimholders in 1999, discovered a new shear zone 600 metres to the south which returned values of 4.5 g/t and 3.6 g/t Au from 2 grab samples.

SOIL GEOCHEMISTRY

Soil samples were collected using a stainless steel soil auger, as deep as possible to a maximum depth of about 100 centimetres. This was sufficient to adequately sample the "B" or possibly the "C" soil horizon. Samples were placed in kraft soil bags, labelled and air-dried before shipment to Acme Analytical Labs in Vancouver B.C. Analysis consisted of 30 element ICP-ES and fire geo-chem for Au, Pt, and Pd.

We utilized an anomalous threshold of greater than 40 PPB for Au, while any value greater than .9 PPM Ag was considered anomalous. These values were consistent with those employed during the earlier soil geo-chem surveys [1982, 1987].

Results were disappointing with only 2 samples returning anomalous values. Sample L10-6 was 41 PPB Au, and sample L10-17 was .9 PPM Ag.

ROCK GEOCHEMISTRY

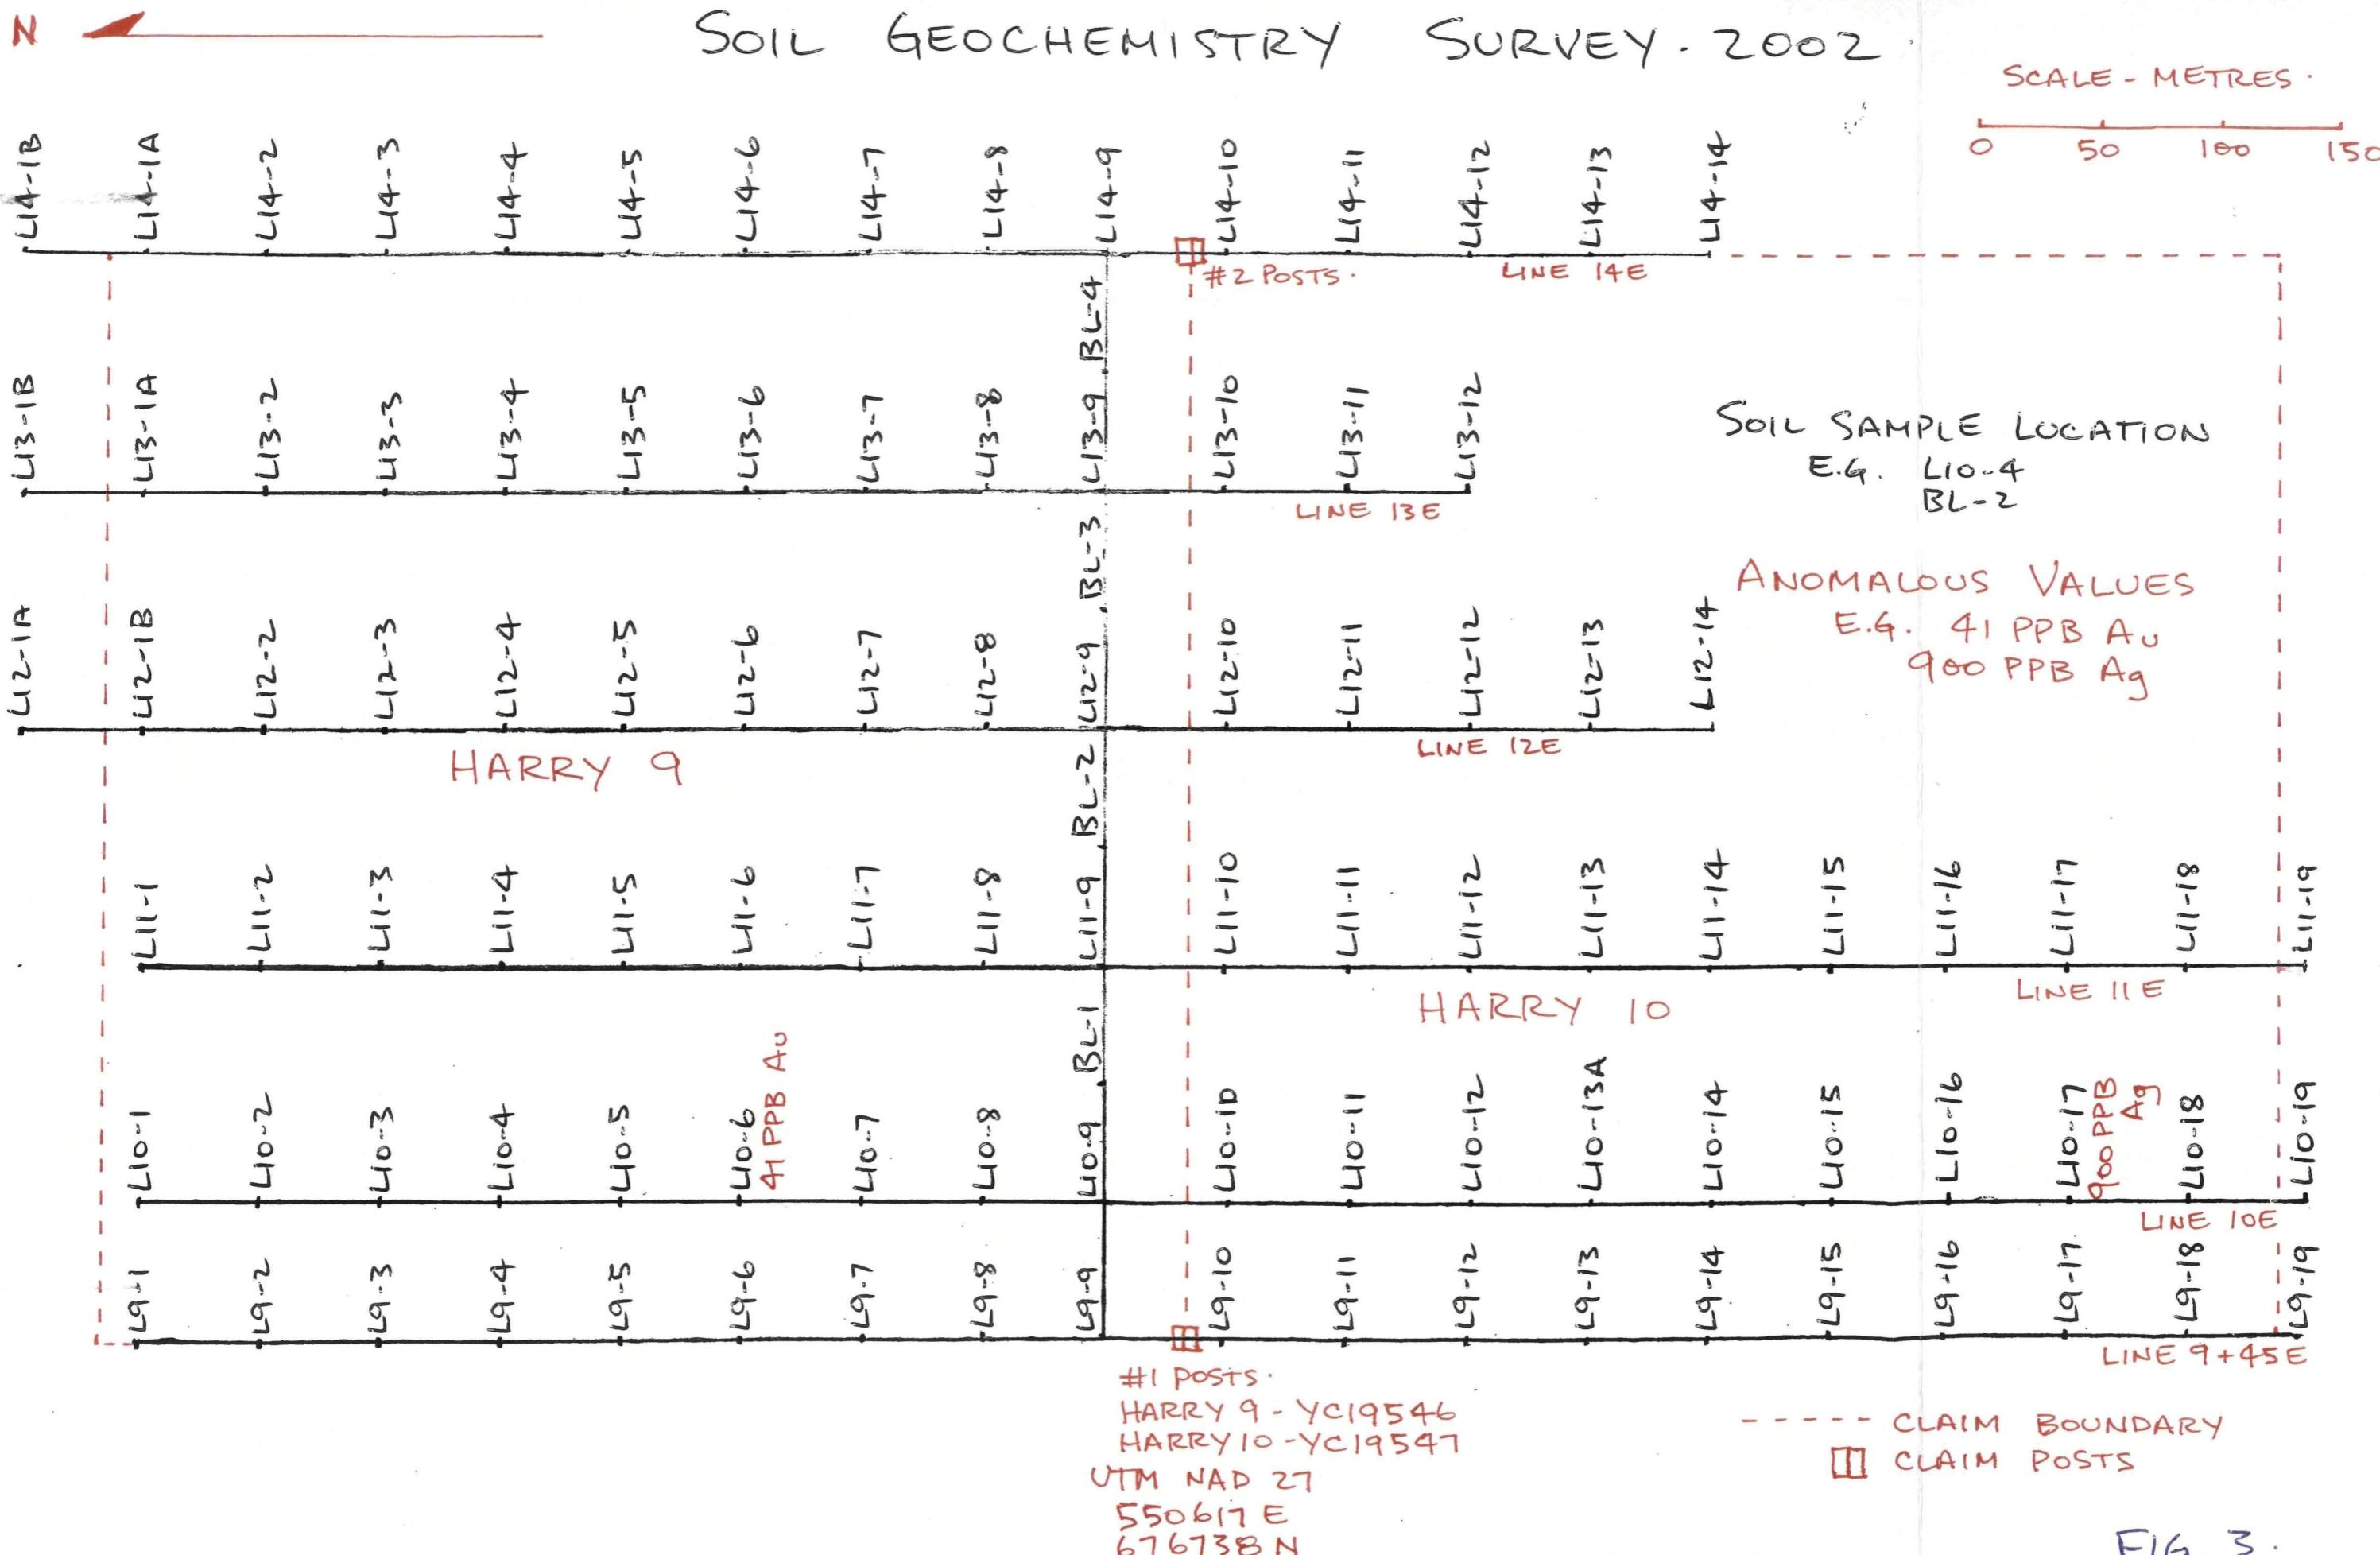

All rock samples were chip samples from outcrop. They were bagged, labelled and shipped to Acme Analytical Labs-Vancouver. Analysis consisted of 30 element ICP-ES, with Au, Pt, and Pd by fire assay and ICP-ES. Again results were disappointing. The best values returned were sample 02-R12 and sample 02-R13, which were 23 PPB Au and 24 PPB Au respectively.

CONCLUSION AND RECOMMENDATIONS

6

The 2002 fieldwork was unable to confirm that the known mineralized shear zone continues to the east. Only 2 soil samples, out of a total of 106, returned slightly anomalous Au or Ag values. The best Au value from 10 rock chip samples was 24 PPB. Any future work on the property should be focused:

- [1] To the west of the known mineralized zone where previous geophysics [1987] has outlined several good EM-16 conductors.
- [2] On the new shear zone discovered in 1999 about 600 metres south of main mineralized zone.
- [3] Around the granitic intrusives located to the northeast and southeast of the current claim block.

GROUP 1D - 0.50 GM SAMPLE LEACHED WITH 3 ML 2-2-2 HCL-HNO3-H2O AT 95 DEG. C FOR ONE HOUR, DILUTED TO 10 ML, ANALYSED BY ICP-ES.
 UPPER LIMITS - AG, AU, HG, W = 100 PPM; MO, CO, CD, SB, BI, TH, U & B = 2,000 PPM; CU, PB, ZN, NI, MN, AS, V, LA, CR = 10,000 PPM.
 - SAMPLE TYPE: SOIL SS80 60C AU** PT** PD** GROUP 3B BY FIRE ASSAY & ANALYSIS BY ICP-ES. (15/30 gm)
Samples beginning 'RE' are Reruns and 'RRE' are Reject Reruns.

DATE RECEIVED: DEC 4 2002 DATE REPORT MAILED: Dec 16/02 SIGNED BY: C.L. TOYE, C.LEONG, J. WANG; CERTIFIED B.C. ASSAYERS
