WORK PERFORMED OCTOBER 07 to OCTOBER 12, 2008

DATE OF REPORT JANUARY 15, 2009

TABLE OF CONTENT

1.0 SUMMARY

The Bridget 2008 field exploration program consists of a five man crew, all employees of Ryanwood Exploration Inc. The crew mobilized to the claim block on October 07, 2007 and demobilized on October 12, 2007. The 2008 field work consists of running 38 kilometers of magnetic survey plus gathering 595 soils.

2.0 INTRODUCTION

The Bridget Project had 595 soil collected and 38 kilometers of a magnetic survey completed over one large grid that measured 2kilometers by 2 kilometers. The objective was to expand a soil anomaly uncovered during a regional 2006 soil survey.

3.0 LOCATION

The Bridget Project is located at the headwaters of Scroggie Creek; it's in Dawson Mining Division, on NTS # 115 J / 15-16. The latitude 62°56'N and longitude 138°31'W.

The Bridget Claims are located 130 kilometers south East of Dawson City or 148 kilometers north - west of Carmacks.

4.0 ACCESS

The Bridget claims can be reached via helicopter from Dawson City or Carmacks.

5.0 REGIONAL AND PROPERTY GEOLOGY

5.1 REGIONAL GEOLOGY

(Excerpts from Assessment report 019906, Silver Standard Mines)

The general Scroggie Creek geology is described by D.D. Cairnes in his 1917 report on Scroggie, Barker,Thistle , and Kirkman Creeks, Yukon Territory ", Memoir 97. He describes the rocks along Scroggie and Mariposa Creeks as mainly mica gneisses and schists. Granites and pegmatites also occur, and locally, may he garnetiferous. Occasional semi-basic t o basic dikes occur, grading from andesite to diabase in composition.

Outcrop a t the Scroggie Creek property ('C ' claims) is extremely rare . Reconnaissance mapping of the showings in 1971 indicated that the mineral occurs in highly siliceous medium-grained quartz-feldspar porphyry. Both biotite schist and rhyolite occur as a knoll immediately north of the porphyry occurrence. A small capping of epidote-rich skarn was also observed on the property.

5.2 PROPERTY GEOLOGY

(Excerpts from Assessment report 090668, Amax)

General Statement

Due t o the lack of outcrop within the property, it was necessary to map outside the claims in order t o evaluate this area geologically. Generally, outcrop was restricted to ridge tops and flanks with minor subcrop and float exposed in the valleys and stream beds.

Rock Units

The predominant lithology 'recognized in this is area was found t o be a thinly laminated felsic to intermediate biotite schist to gneiss with a west-northwest strike and steep northeast dip (Figures 3a and 3b). The metasediments were found on occasion t o grade imperceptibly in t o both hornblende and garnet bearing gneisses. Along the western boundary of the property, these same pelitic schist and gneisses appear t o have undergone intense hydrothermal alteration on transforming them in to epidote schist and locally epidosites. This alteration may have been produced by the numerous igneous intrusive scattered through the map-area. Massive microporphyritic rhyolites and medium t o coarse grained quartz-feldspar porphyries pervade, a s flows and small discontinuous dykes repectively, within and around schist outcrops.

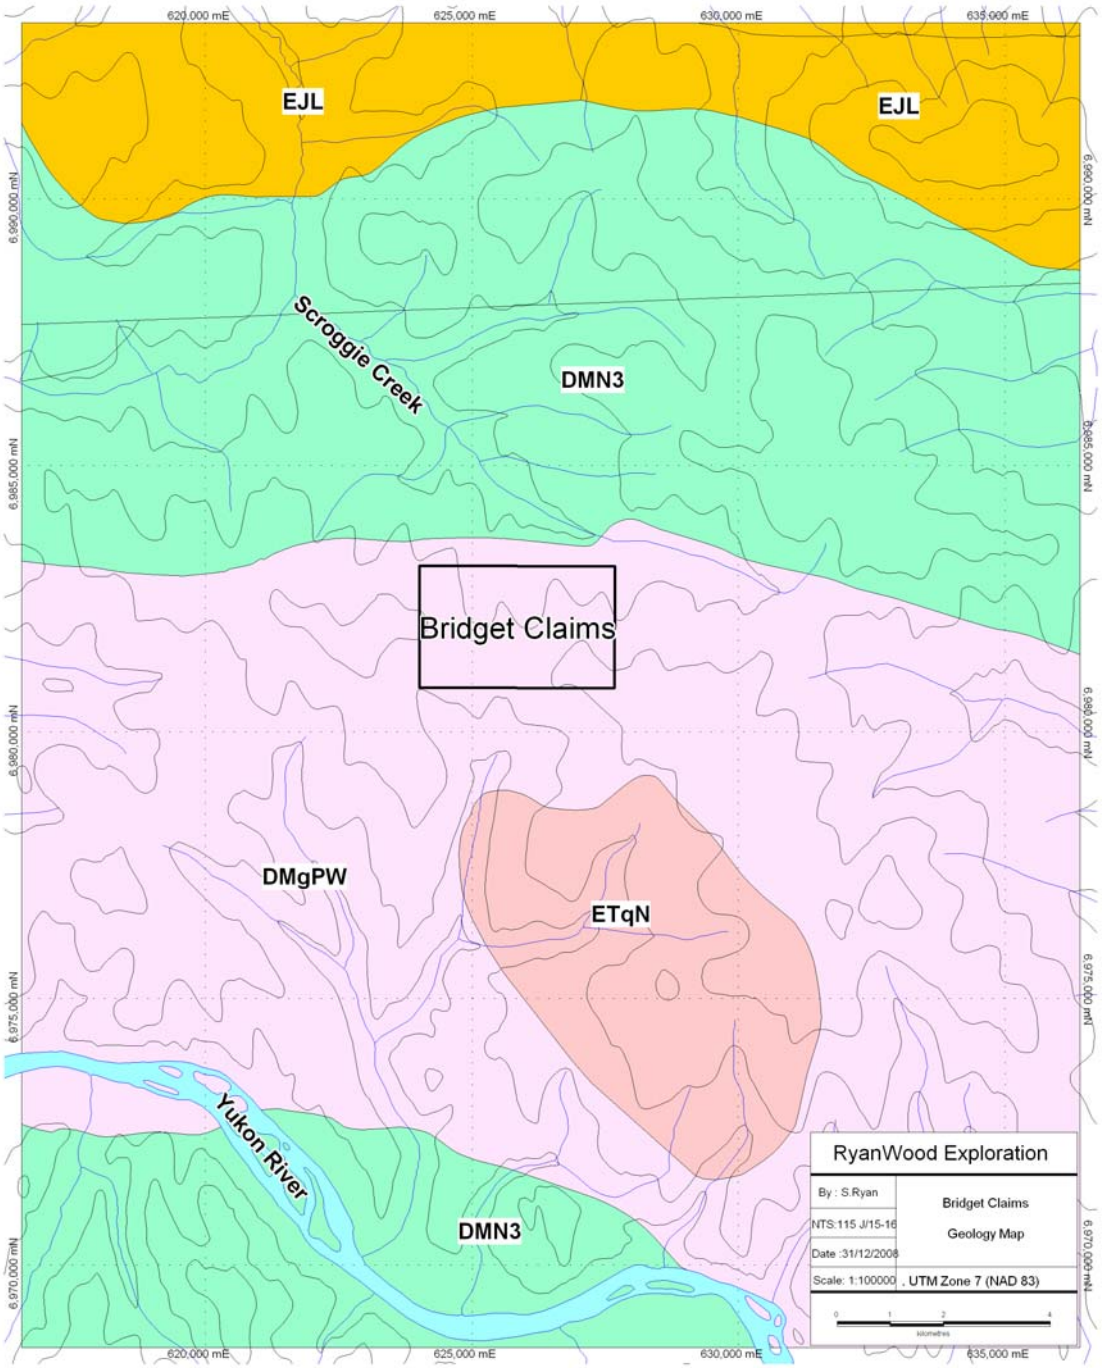
From their positions relative to one another, particularly, as exposed in those outcrops bordering on the eastern half of L4N, it would appear that these coarser porphyries are essentially intrusive equivalents of the volcanics. It should also be mentioned that while no stockwork of any kind exists within these younger igneous lithologies intense silicification of contiguous country rock is frequently in evidence in those zones cross-cut by numerous dykes. The only remaining unit exposed within t h e map-area is a variably skarned siliceous limestone-marble, discovered in strongly disjointed felsenmeer zones and less frequently as boulders on scattered ridge tops.

MINERALIZATION

In general most visible signs of mineralization noted within the Scroggie Creek claim group showed some spatial association with late stage quartz veining. The most intensely mineralized specimens were taken from Trench #1 in the northern portion of the grid. Here copper and iron sulphides along with magnetite and minor molybdenite were seen concentrated in silicified biotite schist, some of the mineralization occurring as disseminations within the quartz veins. In other sections of the property where quartz veins are less abundant, mineralized samples are difficult to find.

Along with copper and molybdenum enrichment in this area, some minor samples containing visible gold and sizeable grains of sheelite were also found, once again, within quartz veins.

The only apparent exception to this established association appears to lie with the felsic igneous rocks, in particular the extrusive end members of this unit. Pyrite, pyrrhotite (3%) and rarely chalcopyrite can all be seen within these microporphyyritic felsites.



Yukon Geology Map

YTG Geology Description

EARLY TERTIARY

ETN

ETN: NISLING RANGE SUITE
medium to coarse grained equigranular to porphyritic rocks of intermediate composition (g), fine to coarse grained, equigranular and porphyritic granitic rocks of felsic composition (q) and felsic dyke rocks (f)

q. leucocratic, biotite granite; miarolitic alaskite; saccharoidal textured, mafic-poor biotite granite; biotite-hornblende granite to leucocratic granodiorite with sparse, white, alkali feldspar phenocrysts; biotite quartz monzonite **(Nisling Range Suite, Nisling Range Alaskite, Coffee Creek Granite, Annie Ned Granite)**

EARLY JURASSIC

EJL

EJL: LONG LAKE SUITE
mostly felsic granitic rocks (q) but locally grading to syenitic (y)

y. resistant, dark weathering, massive, coarse- to very coarse-grained and porphyritic, mesocratic hornblende syenite; locally sheared, commonly fractured and saussuritized; locally has well developed layering of aligned pink K-feldspar tablets **(Big Creek Syenite)**

q. massive to weakly foliated, fine to coarse grained biotite, biotite-muscovite and biotite-hornblende quartz monzonite to granite, including abundant pegmatite and aplite phases; commonly K-feldspar megacrystic **(Long Lake Suite)**

LATE DEVONIAN TO MISSISSIPPIAN

DMPW

DMPW: PELLY GNEISS SUITE - SOUTHWEST
variably deformed granitic rocks of predominantly felsic (q) to intermediate composition (g) southwest of Tintina Fault

g. foliated medium grained, homogeneous biotite granite gneiss to biotite or hornblende granodiorite gneiss; massive to strongly foliated dioritic to granodioritic gneiss; includes interfoliated amphibolite, quartz-mica schist and phyllite **(Selwyn Gneiss, Pelly Gneiss, N. Fiftymile Batholith, Moose Creek Orthogneiss)**

DEVONIAN, MISSISSIPPIAN AND(?) OLDER

DMN

DMN2

DMN: NASINA
graphitic quartzite and muscovite quartz-rich schist (1), (3)-(5), and(?) (6) with interspersed marble (2) and probable correlative successions (7) - (9)

3. quartzite, micaceous quartzite, quartz muscovite (+/-chlorite; +/- feldspar augen) schist, and minor metaconglomerate and metagrit as in (1), but may locally include significant Nisling Assemblage

6.0 WORK PERFORMED / METHODS

6.1 Soil Survey

The Bridget Project had 22 man days of soil work collecting 595 soils.

All soil sample where collected with one meter soil probes and sometime with a prospector pick. We carried both instruments on rocky talus slope. Soil sample location where marked on the ground with orange flagging and recorded in Garmin GPS. About 400-500 grams of soil was collected and place in pre marked kraft soil bags.

All samples where brought out to Dawson and air dried repacked in rice bags and sent to Acme Labs in Vancouver. Sample where process with Aqua Regia ICP-MS for 36 elements (Acme Labs 1DX-15 gram Assay).

.

The GPS where downloaded every night and store in a personal computer.

6.2 Magnetic Survey

The magnetic survey was conducted across the entire grid. The survey uses two GEM proton precessions GSM – 19 T magnetometers. One is the portable field unit and the second is a base station magnetometer that records reading every 15 seconds at a stationary position for the entire survey. The base station monitors the earth daily magnetic drift. At the end of each daily survey both the field and base station magnetometers are plugged in together and the daily drift is corrected out of the field magnetometer.

Only the corrected data is used to plot the survey results.

The field survey used a built in GPS that acts as a guiding system as the operator walks threw the bush and also adds a GPS point to every reading taken by the Mag unit. This is very useful when the operator needs to walk around obstacle such as cliff face or ponds. The walking Mag mode takes continuous reading as the operator walks to specified end points using the built in GPS as a guiding unit. Reading are taken every 1.5 seconds which comes out to about a reading every 1-2 meters.

The survey covered an area of 1.9 kilometer by 2 kilometer for a total line kilometer of 38 kilometers.

The magnetic range for the entire survey was a low of 54,000 gammas to a high of 59,200 gammas.

7.0 INTERPRETATION

7.1 Soil Survey

The assay results indicates a nice molybdenum (figure 2), copper (figure 3), bismuth (figure 4) and tungsten (figure 5) soil anomaly. This clearly is demonstrating a nice porphyry type target? The porphyry target seems to be zoned with copper and molybdenum over lapping each other on the south western corner and then molybdenum being the dominated element with minor copper and bismuth in the central zone and tungsten dominating the northern part of the grid.

Past historical worked from Silver Standard and Amax looked at a small area in the south western part of the 2008 grid. The copper and molybdenum values over this historical working indicated a nice coincident anomaly, but better yet the 2008 soil survey (figure 2-3) indicated that the molybdenum and copper anomaly expanded another 1800 meters to the north from the old showing. The soil survey also revealed a nice zoning pattern bismuth and tungsten (figure 11) flanking the molybdenum soil anomaly.

I also plotted the soil anomalies over the ground magnetic data and we can see an interesting pattern with the majority of the molybdenum soil anomaly (figure 7) showing up in the central magnetic low area.

The copper (figure 8) also shows up in this central magnetic low but is more intense in the southern magnetic high zone found over the old Silver Standard and Amax showing.

Bismuth (figure 9) also seems to be found more in the magnetic low zones with anomalous values showing up in the central zone and is also very intense in a mag low on the south side of the southern magnetic high.

The majority of the tungsten (figure 10) soil anomalies are found covering the northern magnetic high zone.

I will also note that the gold values were extremely low with only 11 soil reaching over 14 ppb Au and the highest being 62 ppb Au.

7.2 Magnetic Survey

The magnetic survey revealed two regional northwest- southeast magnetic high trends found at each end of the grid. The magnetic highs are separated by a large magnetic low area.

The southern magnetic high is more intense than the northern one.

The Amax Report (Mineralization section) (page 5 of this Report) gives us a clue to what is causing the southern magnetic high target. Their Report indicates that their geologist found magnetite in silicified biotite schist with copper and molybdenum. This was found on the edge of the southern magnetic high target.

The author also indicated that the only apparent exception to this established association appears to lie with the felsic igneous rocks, in particular the extrusive end members of this unit. Pyrite, pyrrhotite (3%) and rarely chalcopyrite can all be seen within these microporphyyritic felsites. I wonder if this is the kind of geology that is causing the northern magnetic high.

8.0 RECOMMENDATION

I would recommend expanding the soil grid in all direction by 500 meters this would help close off the copper and molybdenum anomaly to the south and west and help close off the tungsten anomaly on the northern and eastern part of the grid.

I would also recommend a small trenching program over three targets. Target one would be over the southern copper and molybdenum soil anomaly. Target two would be over the northern molybdenum soil anomaly and target three would be over the eastern tungsten high soil anomaly. All trenches can be located on the ridge top; this should guarantee good ground for trenching.

11.0 QUALIFICATION

I Shawn Ryan located in Dawson City, Yukon work as a professional prospector. I run a small exploration company located in Dawson City.

I have worked in the exploration business for the last 25 years. I worked the first 12 years as a contractor working on numerous projects in the NWT, Ontario, Quebec and the Yukon. I have worked the last 13 years as a local prospector for myself.

I have overseen the entire Bridget Project.

I own 100% of the Bridget Claims.

Dated this 15 of January 2009 in Dawson City, Yukon.

Respectfully submitted

Shawn Ryan
