INTRODUCTION

The Dan Man property is located in western Yukon and is owned 100% by ATAC Resources Ltd. subject to an option agreement with Arcus Development Group Inc. It covers probable source areas for silt and soil samples that returned weakly to moderately anomalous gold and arsenic values, reported in a non-public domain database made accessible to ATAC by Archer, Cathro & Associates (1981) Limited. The property lies within the same favourable lithological package as the nearby White Gold occurrences, which are being explored by Underworld Resources Ltd, and the Coffee showings, which are under exploration by Kaminak Gold Corporation.

This report describes an exploration program that was conducted by a three person crew working from two fly camps on the Dan Man property between June 17 and July 2, 2009. The work was done by Archer Cathro on behalf of ATAC and Arcus. The program consisted of geochemical sampling and prospecting. The author participated in and directed the program, and her Statement of Qualifications is in Appendix I.

PROPERTY LOCATION, CLAIM DATA AND ACCESS

The Dan Man property comprises 100 contiguous mineral claims in the drainages of Dan Man and Halfway creeks, two kilometres west of Yukon River. The claims lie at latitude 62°55'N and longitude 139°23'W on NTS map sheet 115J/14 as shown on Figure 1. They are registered with the Whitehorse Mining Recorder in the name of Archer Cathro, which holds them in trust for ATAC. Claim data are listed below while the locations of individual claims are illustrated on Figure 2.

<u>Claim Name</u>	<u>Grant Number</u>	<u>Expiry Date*</u>
DM 1-6	YC83307-YC83312	April 29, 2014
DM 21-114	YC83327-YC83420	April 29, 2014

*Expiry date includes 2009 work that has been filed for assessment credit but not yet accepted.

Camp 1 was situated along the north side of Dan Man Creek in the western part of the property while Camp 2 was on a small bench immediately south of Halfway Creek in the eastern part of the property. Access to the claims, camp moves and supply trips were performed by a Bell 206B helicopter owned by Fireweed Helicopters Ltd. from a year-round base in Dawson City. Mobilization was from the Shamrock property where a one week exploration program had just been conducted and demobilization was to the Green Gulch property. A Bell 206L4 helicopter operated by Fireweed from a temporary base at the White Gold property was also used to set out a crew, which cleared the site for Camp 2 prior to the camp move.

If future work programs on the property are not done in conjunction with work on nearby properties, access should be by one of the following methods. The first method would utilize a temporary staging area located at kilometre 91 on the South Klondike Road. This road is an extension of the Hunker Creek road system, which leaves the Klondike Highway 20 km east of Dawson City. It is usually suitable for two-wheel drive vehicles during summer and fall. this staging area a helicopter would fly the camp and crew to the property. The other method would involve a small fixed wing aeroplane based at the Dawson City Airport flying to one of two airstrips (Thistle or Kirkman) located about 15 km northeast of the property, and then using a helicopter to transfer gear and personnel from there to the property.

HISTORY

There is no public record of previous mineral exploration in the area covered by the Dan Man property; however, reconnaissance-scale exploration has been done by various parties. ATAC staked the property in September 2008 and optioned it to Arcus in early summer 2009.

GEOMORPHOLOGY

The claims overlie an area of gentle to moderate relief two kilometres west of Yukon River. Local elevations range from 500 to 1250 m above sea level. The higher parts of the property are vegetated with scattered deciduous and evergreen trees, scrub brush and a thin moss cover. Lower elevations support a mixture of deciduous and evergreen forest with thick buckbrush-, willow- and moss- covered slopes. No part of the property is above treeline.

There is little outcrop on the property, except in the easternmost part where bedrock exposures are found on steep, north-facing slopes flanking Halfway Creek. Elsewhere, outcrops are confined to ridge tops.

The two main creeks draining the property flow directly into the Yukon River. Flow rates in both creeks are excellent and could support diamond drilling, if exploration on the property reaches that level of activity.

REGIONAL GEOLOGY

The Dan Man property lies within the Yukon-Tanana Terrane approximately 110 km southwest of the Tintina Fault (Figure 3). Table I contains a brief summary of the main lithologies in the area. Figure 4 illustrates the distribution of those lithologies.

Table I - Regional Lithologies (After Gordey and Makepeace, 1999)

DMN3	Devonian, Mississippian and older (?)	Nasina Assemblage (3): Quartzite, micaceous quartzite, quartz-muscovite schist, and minor metaconglomerate and metagrit. May locally include significant Nisling Assemblage.

PROPERTY GEOLOGY

Due to the relative lack of bedrock exposure on the claims, no detailed mapping was completed during the 2009 work program and no property-scale geology map has been compiled. All observed bedrock on the property belongs to the highly strained Nasina Assemblage (DMN3). Exposures comprise quartzite, micaceous quartzite and quartz-muscovite schist.

REGIONAL MINERALIZATION

Numerous mineral occurrences and showings are hosted within unit DMN3 in the vicinity of the Dan Man property. The two most noteworthy examples are the Golden Saddle Zone on the White Gold property and the Supremo Showing on the Coffee property.

Golden Saddle Zone lies 25 km north of the Dan Man property. Underworld reports multiple styles of gold mineralization but most is hosted within quartz-albite-carbonate breccias with minor disseminated pyrite. The following table lists highlights from Underworld's 2009 drill program at Golden Saddle.

**Table II: 2009 Drilling Highlights from Golden Saddle Zone, White Gold Property

Supremo Showing lies four kilometres south of the Dan Man property. Kaminak reports high gold values associated with heavily bleached and weathered rock composed primarily of sericite and quartz. The following table lists highlights from Kaminak's 2009 trenching at Supremo.

Forty six rock samples were taken during the 2009 program (Figure 5). Individual sample descriptions are located in Appendix II. Multi-element analyses (Au-ICP21 and ME-ICP41) for rock samples were carried out at ALS Chemex in North Vancouver, B.C. Each sample was dried, fine crushed to better than 70% passing -2 mm and then a 250 g split was pulverized to better than 85% passing 75 micron. The fine fraction was then analyzed for gold using fire assay followed by atomic absorption (AA) finish and for 34 other elements using a nitric acid-aqua regia digestion and ICP analysis. Certificates of Analysis are provided in Appendix III while thematic values for gold and arsenic are illustrated on Figures 6 and 7.

Most rock samples returned low values for gold and its pathfinder elements including arsenic and antimony; however, one specimen yielded strongly anomalous gold (1.68 g/t) with moderate arsenic support. This sample was a brown to tan weathering, altered quartz-mica schist with relict pyrite grains and rusty pits. It was taken from a large, partially moss covered, talus slope. The bedrock source was not identified but is inferred to be nearby, based on the lack of glaciation in the region.

SOIL GEOCHEMISTRY

A total of 617 soil samples were taken during the program. Most were collected at 100 m intervals along lines spaced 900 m apart; however, tighter spaced sampling was done on two grids (Grids A and B) and in other areas on a series of in-fill or contour lines. Many locations could not be sampled due to frozen ground. All soil sample sites were located by means of compass and hip chain surveys with frequent checks using handheld GPS units. Sample locations were marked with half-metre wooden pickets affixed with aluminum tags on which the corresponding sample numbers were inscribed. The top of each picket was wrapped with orange flagging tape. Soil samples were taken from the bottoms of 25 to 60 cm deep holes that were dug using hand held augers. Sample material was then placed into individual pre-numbered kraft paper bags. A pebble sized rock fragment was also collected from the bottom of each soil auger hole. These fragments were placed in coin envelopes labelled with the appropriate sample numbers. They may be examined at a later date to determine local lithologies. Soil sample locations are illustrated on Figure 8.

Multi-element analyses (Au-ICP21 and ME-ICP41) for soil samples were carried out at ALS Chemex in North Vancouver, B.C. Soil samples were dried and sieved to -80 mesh. The fine fraction was then analyzed for gold and 34 other elements by the same techniques used for rock samples. Certificates of Analysis are in Appendix III while thematic values for gold, arsenic and antimony are shown on Figures 9, 10 and 11. The following table lists the threshold values used to interpret soil sample results from the property.

Table IV - Thresholds for Soil Values

Grid A is located in the south-central part of the property in an area of gentle topographic relief. This grid covers a 700 m long by 800 m wide area that was sampled at 50 by 100 m spacings. It hosts Anomaly A, a 600 m long by up to 200 m wide zone of moderately to strongly anomalous gold-, arsenic- and antimony-in-soil values and includes the highest gold value of 132 ppb. One rock sample was collected from within this anomaly. It returned moderate arsenic but low gold values.

Grid B is located in the southwestern corner of the property. It covers a 400 m by 500 m area that was sampled on 50 by 50 m spacings. It hosts Anomaly B, a 400 m by 100 m, northeast trending zone of coincident moderately to strongly anomalous gold- and arsenic-in-soil values with moderately anomalous antimony-in-soil values. Two rock samples were collected from within Grid B, but both returned background levels for gold and its pathfinder elements.

Sampling elsewhere on the property yielded low values, except for a sample taken on the ridge separating Dan Man and Halfway creeks, which produced a single point anomaly of 188 ppm arsenic with moderate antimony and weak gold support.

DISCUSSION AND CONCLUSIONS

The Dan Man property is underlain by the same lithological unit as the nearby White Gold and Coffee properties, where significant gold occurrences have been discovered.

Based on its favourable geological setting, close proximity to known showings and the encouraging results from the 2009 soil sampling, future work is definitely warranted on the Dan Man property. A two phase program is recommended with additional soil sampling followed by mechanized trenching.

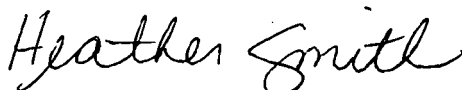

Phase 1 work should include infill sampling on Grids A and B and property-wide coverage at 100 by 100 m spacings. The sampling should be done after mid-summer to minimize frost problems and should use hand held soil augers to test as deep into the soil profile as possible.

Phase 2 work should include mechanized trenching using a helicopter-portable machine. The trenching should be done in late August or September to explore beneath the best soil geochemical anomalies.

Detailed prospecting should be done in conjunction with both the soil sampling and trenching.

Comments: White to brown meta-intrusive schist with distinct laminar planes.

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
C491233	UTM:	579609 E	UTM:	6977070 N	Sample Width:	Abundance:
	Elevation:	m				

Comments: Tan and maroon feldspar-quartz-mica schist with well foliated micas and strong hematite bands.

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
C491234	UTM:	579554 E	UTM:	6977035 N	Sample Width:	Abundance:
	Elevation:	m				

Comments: Bleached feldspar-quartz-mica schist with rare yellow and orange alteration wisps. Minor hematite stain in parallel laminations.

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
C491235	UTM:	580518 E	UTM:	6977157 N	Sample Width:	Abundance:
	Elevation:	m				

Comments: Bleached, white feldspar-quartz-schist with limonite pits. Fracture surfaces and minor brown sulphide. Abundant planes of weakness.

Sample Number:	Grid East:	E	Grid North:	N	Type:	Dimension:
C491236	UTM:	581259 E	UTM:	6977175 N	Sample Width:	Abundance:
	Elevation:	m				

Comments: Tan, feldspar-quartz-mica schist with biotite and chlorite. Quartz floods up to two centimetres. Large vugs, rusty surfaces, quartz stringers through whole rock.

Rock Sample DescriptionsProject: DGProperty: DAN MAN

INTRODUCTION

The Green Gulch property is located in western Yukon in an area that is currently one of Canada's hottest hard rock gold exploration plays. It is owned 100% by ATAC Resources Ltd. subject to an option agreement with Arcus Development Group Inc. The property lies immediately south of Underworld Resources Ltd.'s White Gold property, where highly prospective gold discoveries have recently been made.

This report describes an exploration program that was conducted by a two to three person crew working from two fly camps on the Green Gulch property between July 3 and August 8, 2009. The work was done by Archer, Cathro & Associates (1981) Limited on behalf of ATAC and Arcus. The program consisted of prospecting and soil and rock geochemical sampling. The author participated in and directed the program, and her Statement of Qualifications is in Appendix I.

PROPERTY LOCATION, CLAIM DATA AND ACCESS

The Green Gulch property comprises 66 contiguous mineral claims in the Thistle Creek area. The claims lie at latitude 63°05'N and longitude 139°15'W on NTS map sheet 1150/03 as shown on Figure 1. They are registered with the Dawson Mining Recorder in the name of Archer Cathro, which holds them in trust for ATAC. Claim data are listed below while the locations of individual claims are illustrated on Figure 2.

<u>Claim Name</u>	<u>Grant Number</u>	<u>Expiry Date*</u>
GG 1-66	YC76232-YC76297	April 29, 2014

*Expiry date includes 2009 work that has been filed for assessment credit but not yet accepted.

Both 2009 camp sites were situated on the east side of Green Gulch Creek. Camp 1 was located in the centre of the property while Camp 2 was situated approximately two kilometres south of Camp 1. Mobilization was from the nearby Dan Man property via a Bell 206B helicopter owned by Fireweed Helicopters Ltd. from its year-round base in Dawson City. Supply trips from Dawson City and demobilization to the Touleary property were also done with this helicopter.

During June 2009, Underworld constructed a bulldozer road that extends from a road along Thistle Creek to its White Gold property (Figure 2). The Thistle Creek road connects a barge landing located at the junction of the creek and the Yukon River with the Thistle Creek airstrip, located about three kilometres upstream of the property. The Underworld road parallels the west side of the Green Gulch property and crosses its northwest corner about 3500 m from the Thistle Creek road. A second, overgrown bulldozer road extends from the Thistle Creek road through the southeast corner of the property.

Access for any future work programs on the property could be accomplished by a variety of means. Gear could be flown into the Thistle Creek airstrip by fixed wing aircraft based at the Dawson City Airport, barged from Dawson City to the landing at Thistle Creek, or flown by helicopter directly to the property. Once in the area, camp gear and personnel could be

transferred to the property, using a helicopter or with a Kawasaki 610 Mule, which the project has cached at a placer miner's operation on neighbouring Kirkman Creek.

HISTORY

There is no public record of previous mineral exploration in the area covered by the Green Gulch property; however, reconnaissance-scale exploration has been done by various parties.

No evidence of placer mining was observed on the property but three active placer claims overlap the southwest corner of the claims. Green Gulch Creek drains into the lower reaches of 29 km long Thistle Creek, which is a major gold producing creek. Reported placer gold production from this creek between 1949 and 2006 totalled 81,540 ounces gold (LeBarge, 2007). Fineness of gold is 848 to 895, and coarse jewellery-grade gold is common.

ATAC staked the Green Gulch property in September 2008 and optioned it to Arcus in early summer 2009.

GEOMORPHOLOGY

The property is in an area of gentle to moderate relief two kilometres east of the Yukon River. Local elevations range from 425 to 1030 m above sea level. The higher parts of the property are vegetated with stunted, deciduous and evergreen trees, scrub brush and thin moss cover. Lower elevations support a mixture of deciduous and evergreen forest with thick buckbrush-, willows- and moss-covered slopes. No part of the property is above treeline.

Outcrops are rare and are mostly found along a sparsely vegetated ridge in the northwest corner of the property and on the north side of drainages in its eastern half. Some bedrock is also exposed along road cuts.

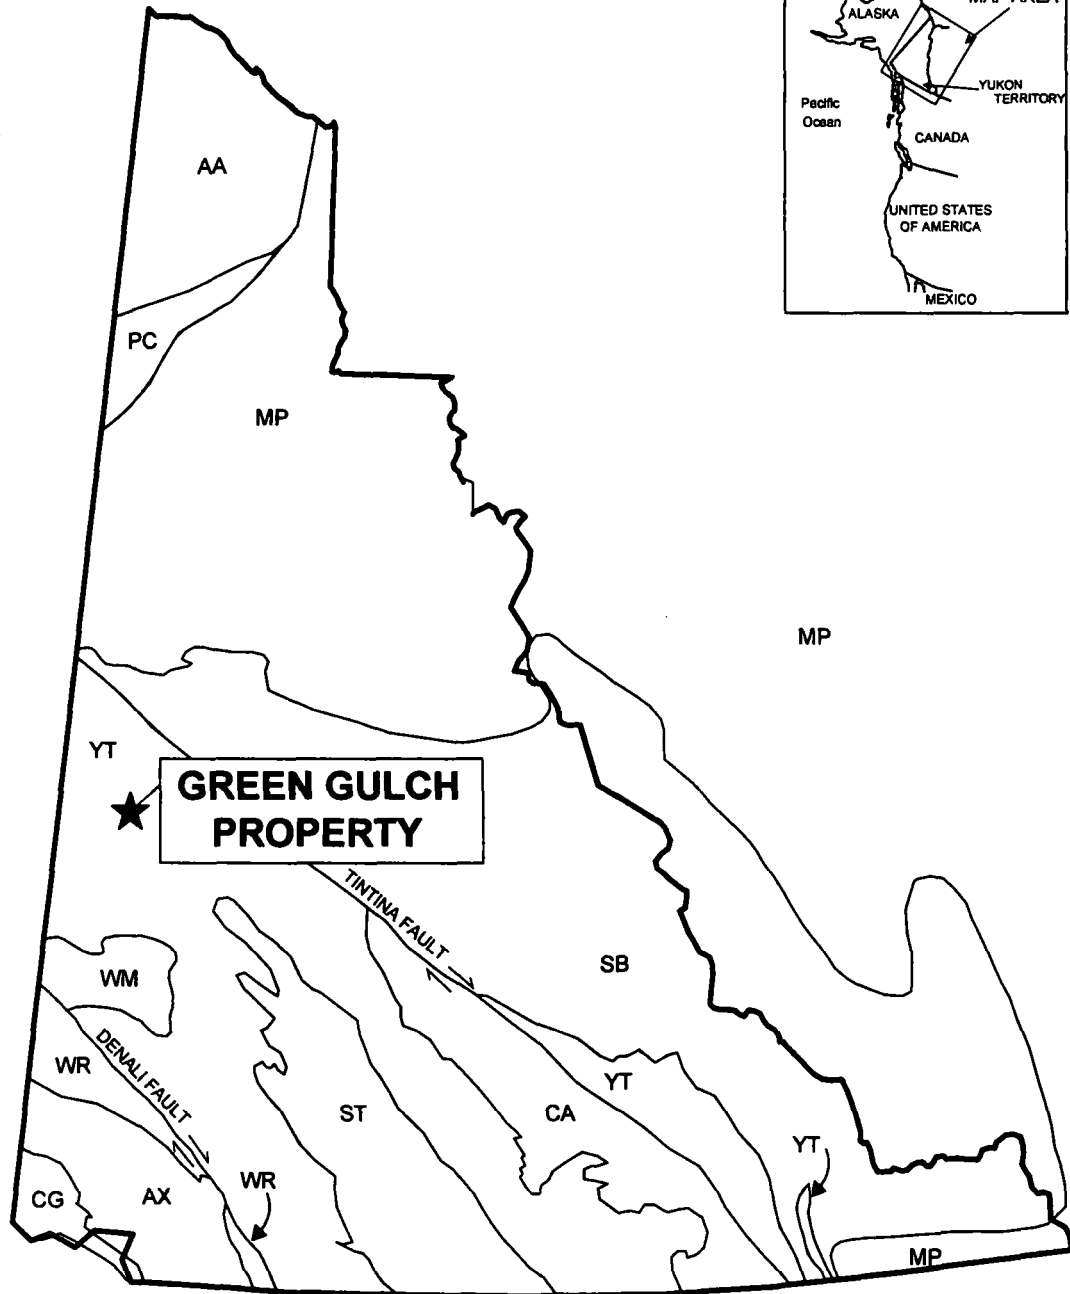

The property is drained by Green Gulch Creek, which flows into Thistle Creek and then into the Yukon River.

REGIONAL GEOLOGY

The Green Gulch property lies within the Yukon-Tanana Terrane approximately 80 km southwest of the Tintina Fault (Figure 3). Table I contains a brief summary of the main lithologies in the area. Figure 4 illustrates the distribution of those lithologies.

PROPERTY GEOLOGY

In 2009, orientation-scale geological mapping was done during prospecting traverses conducted over a five day period. Mapping was confined to the Underworld road, the overgrown bulldozer road in the southeast corner of the claims and steep drainages on the eastern half of the property (Figure 5). Observed bedrock on the property belongs to the Pelly Gneiss Suite (DMqPW) or the highly strained Nasina Assemblage (DMN3).

DMN3 is the main unit mapped on the property and is typically a well foliated, fine grained biotite-chlorite-quartz schist. Foliation measurements consistently strike between 020° and 040° and dip from 22° to 44° toward the east. Muscovite schist locally forms 3 to 20 m thick layers within the mafic schist. Fine grained pyrite occasionally occurs along foliation planes in both types of schist.

Three subunits have been identified within DMqPW, in the north-central and northeast parts of the property. The first subunit is a fine grained, biotite-chlorite amphibolite; the second subunit is highly baked and bleached, potassium feldspar rich gneiss; and, the final subunit is a well foliated, brown to tan quartz-mica schist. Abundant limonitic patches and fine grained grey to black sulphides occur in the altered gneiss subunit. No reliable structural orientations were observed in any of the subunits. The contact between DMqPW and DMN3 appears to strike northwesterly where it crosses the Underworld road, but on the eastern side of the property it veers easterly, paralleling a steep drainage.

Fine to medium grained ultramafic (unit DMum) was observed in talus near the Underworld road. This unit is thought to be derived from ultramafic sill's equivalent to similar intrusives that occurs in the Finlayson district of southeastern Yukon.

REGIONAL MINERALIZATION

Although a number of historical mineral occurrences are located in the vicinity of the Green Gulch property, published descriptions provide few insights regarding the current gold exploration activities (see Yukon Minfile for information regarding those occurrences). The following paragraph describes recent discoveries on the adjacent White Gold property, which have direct bearing on exploration at Green Gulch and which are not yet documented in Yukon Minfile.

All mineral occurrences and showings on the White Gold property are hosted within units DMN3 and DMqPW. The two most noteworthy occurrences in respect to work at the Green Gulch property are the Golden Saddle Zone and the McKinnon Zone.

Golden Saddle Zone lies three kilometres northwest of the Green Gulch property. Although Underworld reports multiple styles of mineralization at Golden Saddle, most of the gold is hosted in quartz-albite-carbonate breccias with minor disseminated pyrite. The following table lists highlights from Underworld's 2009 drill program at Golden Saddle.

**Table II - 2009 Drilling Highlights from Golden Saddle Zone,
White Gold Property (Underworld, 2009)**

Location	Length (m)	Grade (g/t Au)
WD09-29	60.5	3.89
WD09-31	104.0	3.39
WD09-47	31.1	9.20
WD09-64	100.4	3.13
WD09-69	76.9	3.40
WD09-72	49.5	3.49
WD09-91	91.28	3.69
WD09-101	48.75	3.67
WD09-102	41.72	4.36
WD09-103	25.38	4.48
WD09-106	25.50	2.97

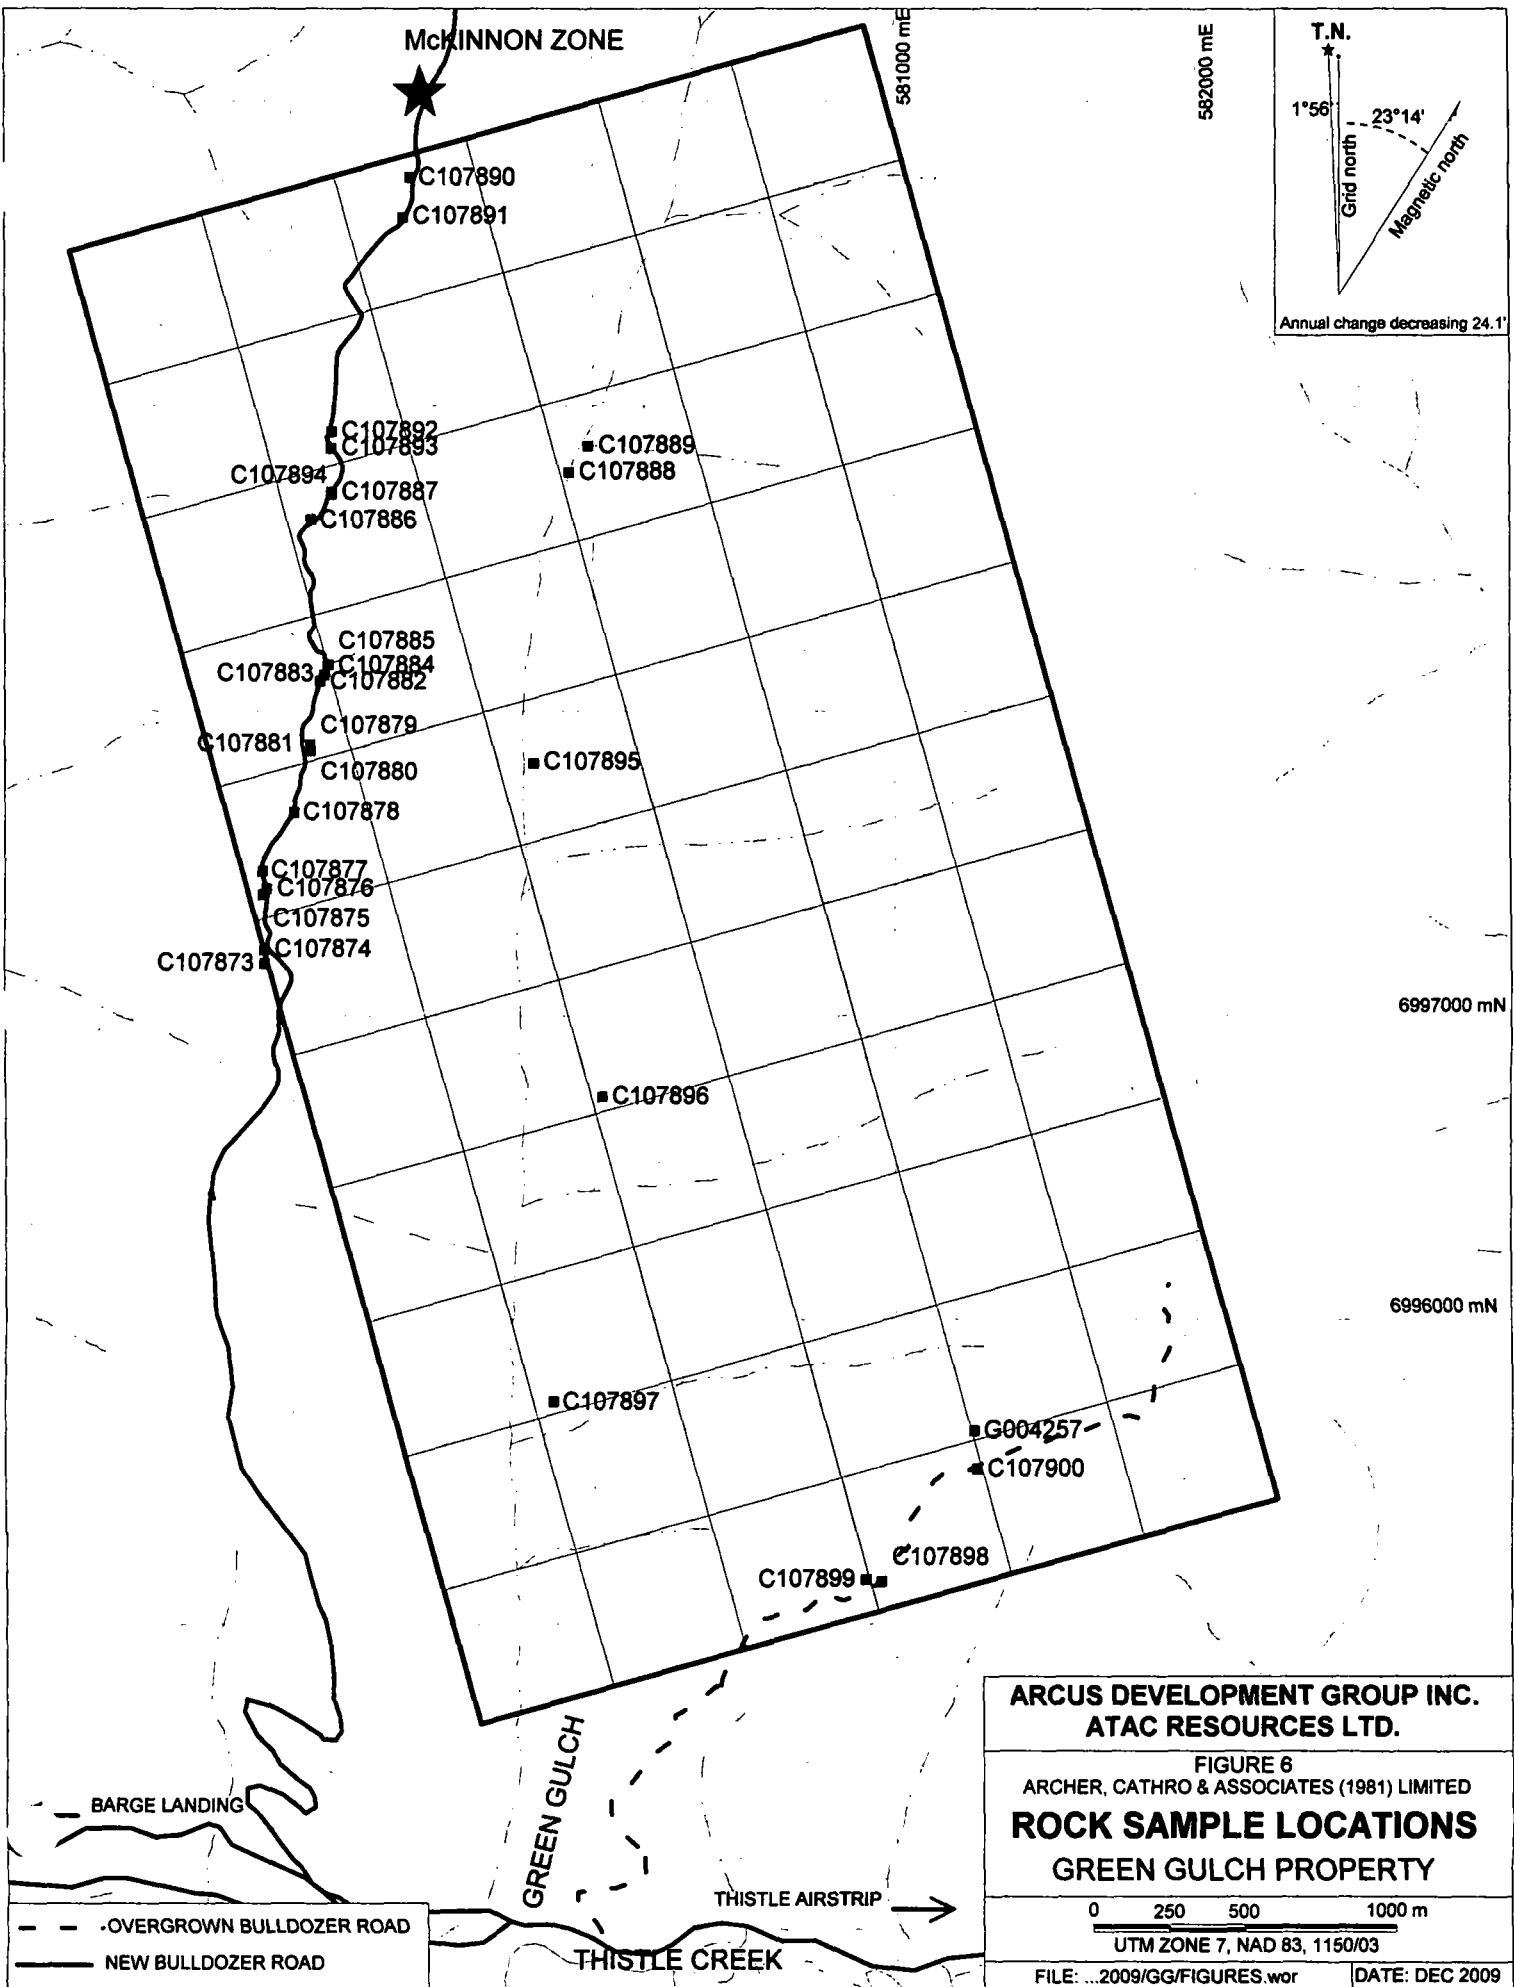

McKinnon Zone lies 100 m northwest of the Green Gulch property. This zone reportedly hosts visible gold within altered and quartz veined meta-intrusive rocks of the Pelly Gneiss Suite (Underworld, 2009).

In 2009, a trenching program was undertaken by Underworld at the McKinnon Zone. The best chip sample results graded 1.40 g/t gold over 1.50 m and 1.63 g/t gold over 1.51 m. Assays from three rock samples of well mineralized quartz-breccia material averaged 60.2 g/t gold and 354 g/t silver (Underworld, 2009).

The McKinnon Zone was visited by the author during a property tour in August 2009 and the following observations were made. The zone strikes northwest and has been traced by trenching for a length of 100 m. It is composed of sucrosic multi-episodal quartz with abundant ankerite and quartz-breccia stockwork, which both host visible gold and pyrite. The pyrite is primarily present on foliation planes where it has replaced biotite. The siliceous zones are hosted in completely altered, potassium feldspar-rich gneiss (DMqPW).

PROPERTY MINERALIZATION AND ROCK GEOCHEMISTRY

Prospecting was done before soil geochemical results were available and was limited to a few traverses on road cuts and up drainages. Twenty-nine rock samples were taken during the 2009 program. Sample locations are plotted on Figure 6 while sample descriptions are in Appendix II. Multi-element analyses (Au-ICP21 and ME-ICP41) for rock samples were carried out at ALS Chemex in North Vancouver, B.C. Each sample was dried, fine crushed to better than 70% passing -2 mm and then a 250 g split was pulverized to better than 85% passing 75 micron. The fine fraction was then analyzed for gold using fire assay followed by atomic absorption and for 35 other elements using a nitric acid-aqua regia digestion and inductively coupled plasma-atomic emission spectroscopy analysis. Certificates of Analysis are copied in Appendix III while thematic values for gold, arsenic and copper are illustrated on Figures 7, 8 and 9.

Analyses did not return any high gold values; however, they did yield some elevated results for arsenic and copper. Three showings were identified on the Underworld road, as described in the following paragraphs.

Showing A is located in the northern part of the property, 400 m south of the McKinnon Zone. It is composed of a highly altered, dark grey-maroon-yellow-orange quartz vein with abundant limonitic pits and subtle dark grey to black sulphides. A sample of this material contained 405 ppm arsenic.

Showing B lies 1500 m south of Showing A. It is an area of silicified grey quartz with rusty pits and pyrite cubes. A composite sample consisting of two rocks taken three metres apart returned 1020 ppm copper.

Showing C was discovered 1000 m south of Showing B. A rock specimen of crystalline quartz with subtle chlorite-epidote-clay alteration, dark grey laminar sulphides and conspicuous malachite graded 2840 ppm copper and 53 ppb gold, which is the highest gold-in-rock value from 2009 work.

SOIL GEOCHEMISTRY

A total of 2,370 soil samples were taken during the 2009 program. In most areas on the property, samples were collected at 50 m intervals along lines spaced 100 m apart, but in the northwestern corner two small grids were sampled at 25 by 25 m spacings. At some locations, samples could not be taken due to frozen ground. All soil sample sites were located by means of compass and hip chain surveys with frequent checks using handheld GPS units. Sample locations were marked with half-metre wooden pickets affixed with aluminum tags on which the corresponding sample numbers were inscribed. The top of each picket was wrapped with orange flagging tape. Soil samples were taken from the bottoms of 25 to 60 cm deep holes that were dug using hand-held augers. Sample material was then placed into individually pre-numbered kraft paper bags. A pebble sized rock fragment was also collected from the bottom of each soil auger hole. These fragments were placed in coin envelopes labelled with the appropriate sample numbers. They may be examined at a later date to determine local lithologies. Soil sample locations are illustrated on Figure 10.

Multi-element analyses (Au-ICP21 and ME-ICP41) for soil samples were carried out at ALS Chemex in North Vancouver, B.C. Soil samples were dried and sieved to -80 mesh. The fine fraction was then analyzed for gold and 35 other elements by the same techniques used for rock samples. Certificates of Analysis are in Appendix III while thematic values for gold, arsenic and copper are shown on Figures 11, 12 and 13. The following table lists the threshold values used to interpret soil sample results from the property.

Table III - Thresholds for Soil Values

Element	Thresholds			Peak Value
	Weak	Moderate	Strong	
Gold	≥ 10 < 20 ppb	≥ 20 < 50 ppb	≥ 50 ppb	251 ppb
Arsenic	≥ 10 < 20 ppm	≥ 20 < 50 ppm	Not applicable	50 ppm
Copper	≥ 50 < 100 ppm	≥ 100 < 200 ppm	≥ 200 ppm	238 ppm

In general, soil sampling results yielded somewhat erratic distribution of high values and poor correlation between gold, arsenic and copper anomalies.

Most gold results are low, mostly less than 10 ppb, and there is no clustering of moderately to strongly anomalous values. The two highest values, 176 and 251 ppb gold, lie about 800 m along strike to the southeast of the McKinnon Zone. Other samples collected along this trend returned background to moderate values. No prospecting has been done in this area. Four other strongly anomalous gold values were obtained elsewhere on the property, but they are not correlated with known showings or other elements. None of the samples taken near the known showings yielded elevated gold-in-soil values.

Ninety-nine percent of the soil samples returned background to weak arsenic values. Most of the higher values lie in the northwestern corner of the property where a consecutive string of four samples yielded between 31 and 50 ppm. Two samples collected near Showing A returned moderately anomalous values.

Copper-in-soil response includes many weakly to moderately anomalous values. The significance of this signature is uncertain, but it could be due to elevated backgrounds in chlorite-biotite schists, which could represent metamorphosed mafic volcanics. Copper response is weak near all of the showings.

DISCUSSION AND CONCLUSIONS

The Green Gulch property directly adjoins the White Gold property where Underworld Resources has made important gold discoveries.

Future work is definitely warranted on the Green Gulch property based on the favourable geological setting, its close proximity to known gold showings and spotty but positive geochemical results obtained from the 2009 exploration program. The 2010 exploration program should include mechanized trenching coupled with detailed mapping and prospecting.

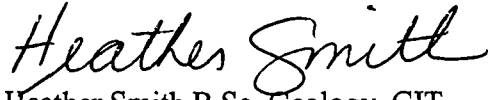

Mechanized trenching should be done using either a helicopter-portable excavator or a larger machine that could be rented from a local placer miner or barged into the area. The significant gold-in-soil values south of the McKinnon Showing should be easily accessible for trenching via the Underworld road.

Detailed mapping and prospecting should be carried out in conjunction with the trenching. They should primarily focus on the projection of the McKinnon Zone and geochemically anomalous

areas. This work will likely require deep hand pits to provide bedrock exposures. Rock specimens collected from 2009 soil sample sites should be examined before the program begins to prepare a preliminary map of the lithologies.

INTRODUCTION

The Shamrock property is located in western Yukon and is owned 100% by ATAC Resources Ltd. subject to an option agreement with Arcus Development Group Inc. It covers the projected extension of a geological package that hosts a recent gold discovery at the White Gold property, four kilometres to the southeast. The White Gold property is owned by Underworld Resources Ltd.

This report describes an exploration program that was conducted from June 10 to 17, 2009. All work was done by Archer, Cathro & Associates (1981) Limited on behalf of ATAC and Arcus. The program consisted of geochemical sampling and prospecting. The author participated in and directed the program, and her Statement of Qualifications is in Appendix I.

PROPERTY LOCATION, CLAIM DATA AND ACCESS

The Shamrock property comprises 72 contiguous mineral claims located two kilometres north of the confluence of White and Yukon rivers. The claims lie at latitude 63°14'N and longitude 139°38'W on NTS map sheets 1150/04 and 1150/05, as shown on Figure 1. They are registered with the Dawson Mining Recorder in the name of Archer Cathro, which holds them in trust for ATAC. Claim data are listed below while the locations of individual claims are illustrated on Figure 2.

<u>Claim Name</u>	<u>Grant Number</u>	<u>Expiry Date</u>
SH 1-72	YC93676-YC93747	April 29, 2010*

*Expiry date does not include 2009 work that has not yet been filed for assessment credit.

The work program was done from a fly camp situated on a tributary of Shamrock Creek in the western part of the property. Access to the claims was by a Bell 206B helicopter owned by Fireweed Helicopters Ltd. from a year-round base in Dawson City. Mobilization was conducted from a temporary staging area located at kilometre 91 on the South Klondike Road. This road is an extension of the Hunker Creek road system, which leaves the Klondike Highway 20 km east of Dawson City. It is usually suitable for two-wheel drive vehicles during summer and fall.

The same Bell 206B helicopter later moved the crew to the Dan Man property when work at Shamrock was finished. A Hughes 500D helicopter operated by Fireweed from a temporary base at the White Gold property was used for one day to set out the crew at the eastern edge of the property, which was too far from camp to efficiently reach on foot.

HISTORY

There is no recorded work in the area covered by the Shamrock property. ATAC staked the property in April 2009 and shortly thereafter optioned it to Arcus.

GEOMORPHOLOGY

The claims overlie an area of gentle to moderate relief immediately west of Yukon River. Local elevations range from 360 to 1100 m above sea level. The higher parts of the property are vegetated with scattered deciduous and evergreen trees, scrub brush and a thin moss cover. Lower elevations support a mixture of dense deciduous and evergreen forest with thick buckbrush, willows and moss covered slopes. No part of the property is above tree line.

There is little outcrop on the property except in the easternmost part where cliffs form the bank of the Yukon River flood plane. Elsewhere, outcrops are confined to ridge tops and a few steep slopes alongside creeks.

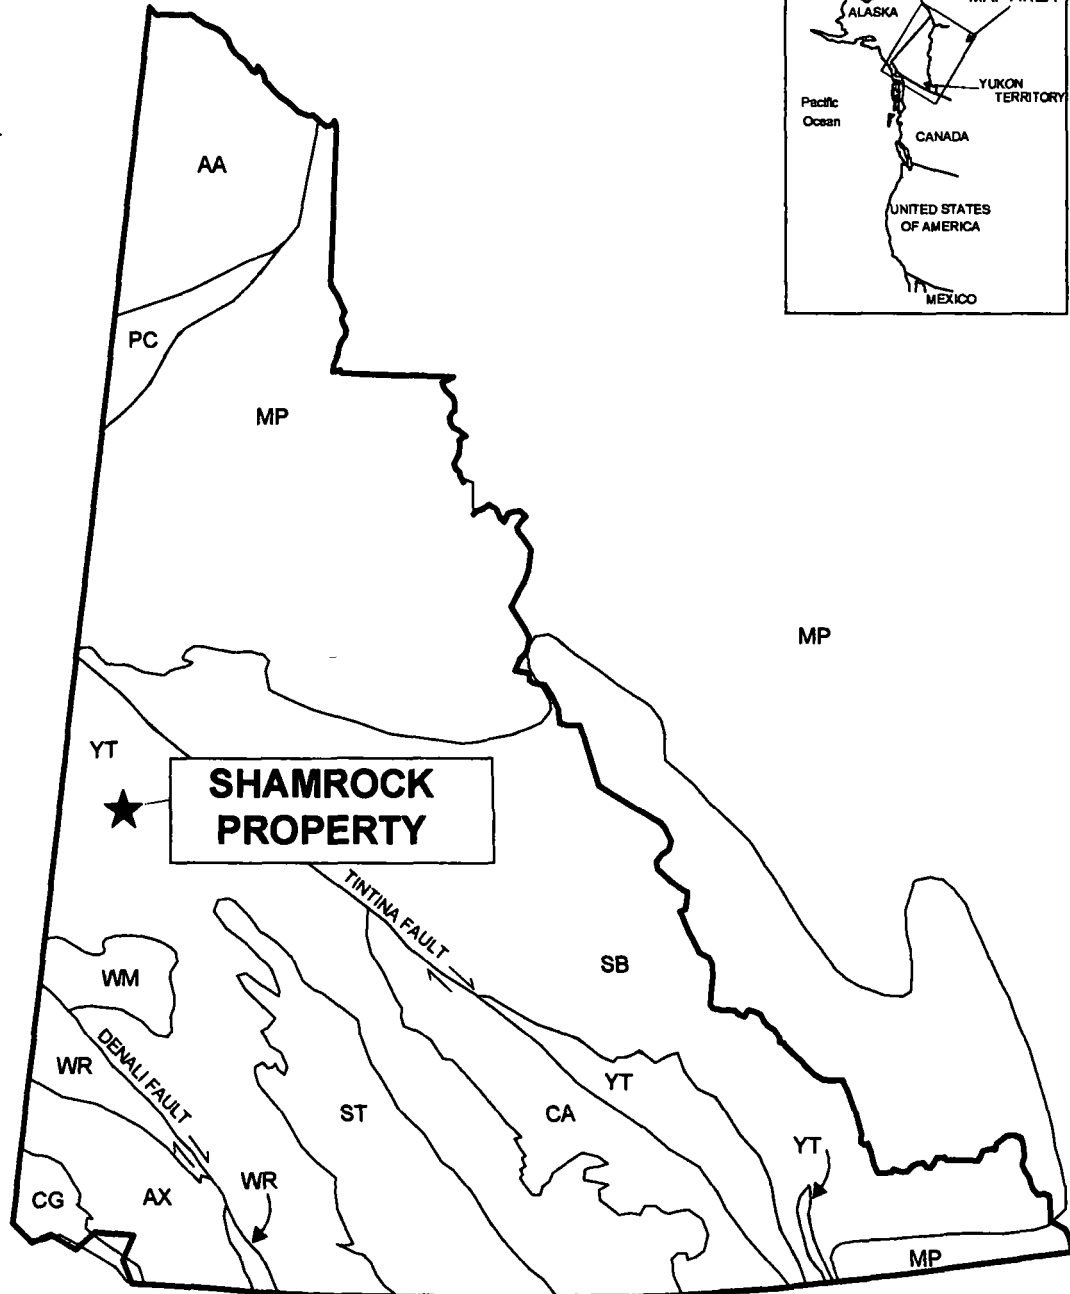

Four streams drain the property, two of which are forks of Shamrock Creek. During the work program only these forks contained flowing water. All four streams drain directly into the Yukon River.

REGIONAL GEOLOGY

The Shamrock property lies within the Yukon Tanana Terrane approximately 100 km southwest of the Tintina Fault (Figure 3). Table I contains a brief summary of the main lithologies in the area. Figure 4 illustrates the distribution of those lithologies.

Table I - Regional Lithologies (After Gordey and Makepeace, 1999)

Unit	Period	Description
ETqN	Early Tertiary	Nisling Range Suite: Series of felsic intrusives ranging in composition from granodiorite to mafic-poor granite.
uKC1	Upper Cretaceous	Carmacks Group (1): Volcanic succession dominantly olivine basalt and breccia; hornblende-feldspar porphyry and andesite and dacite flows with minor sandy tuff, granite boulder conglomerate, agglomerate and associated epiclastic rocks.
uKC3	Upper Cretaceous	Carmacks Group (3): Medium bedded, poorly sorted, coarse- to fine-grained sandstone, pebble conglomerate, shale, tuff and coal; massive to thick bedded locally derived granite or quartzite pebble to boulder conglomerate.
mKgW	Mid-Cretaceous	Whitehorse Suite: Felsic intrusives ranging in composition from quartz monzonite to leucogranite.
EJgA	Early Jurassic	Aishihik Suite: Medium to coarse grained, foliated biotite-hornblende granodiorite; biotite rich gneiss; foliated hornblende diorite to monzodiorite with local potassium-feldspar megacrysts.
EJqL	Early Jurassic	Long Lake Suite: Felsic, massive to weakly foliated, fine to coarse grained biotite, biotite-muscovite and biotite-hornblende quartz monzonite to granite.

DMN3	Devonian, Mississippian and older (?)	Nasina Assemblage (3): Quartzite, micaceous quartzite, quartz-muscovite schist, and minor metaconglomerate and metagrit. May locally include significant Nisling Assemblage.

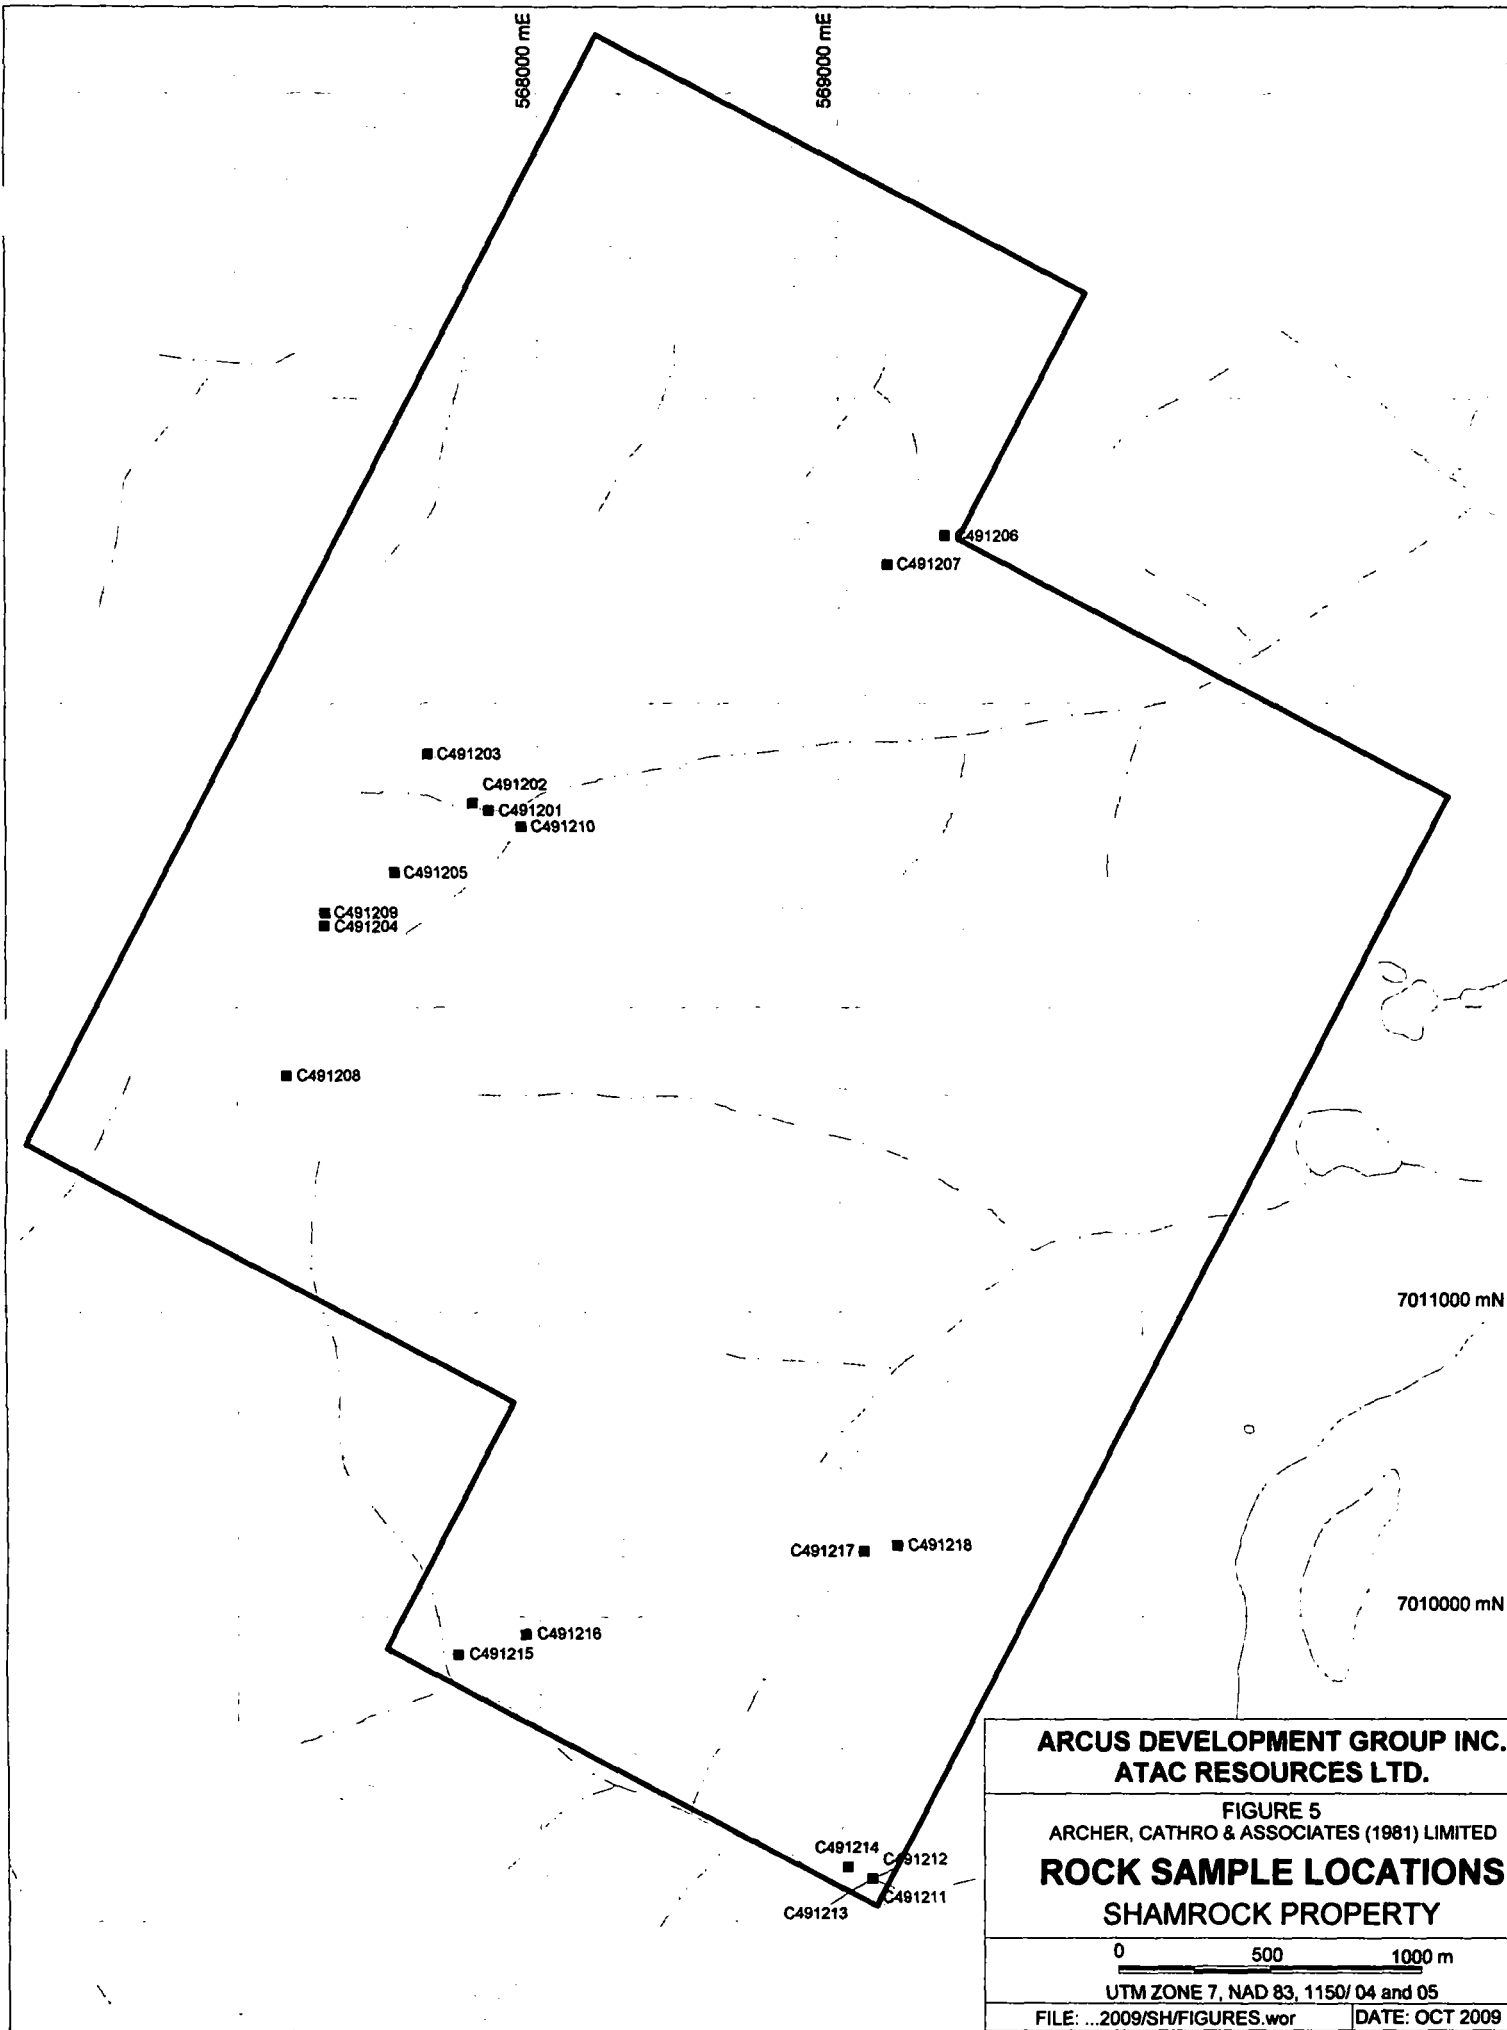

PROPERTY GEOLOGY

Due to time constraints and lack of exposure on the claims, no detail mapping was completed during the 2009 work program. Bedrock on the property belongs to the highly strained Nasina Assemblage. All exposures comprise quartzite, micaceous quartzite and quartz-muscovite schist (DMN3).

MINERALIZATION AND ROCK GEOCHEMISTRY

There are no historic mineral occurrences on the property and no showings were discovered in 2009.

Eighteen rock samples were taken during the 2009 program (Figure 5). Individual sample descriptions are located in Appendix II. Multi-element determinations (Au-ICP21 and ME-ICP41) for rock samples were carried out at ALS Chemex in North Vancouver, B.C. Each sample was dried, fine crushed to better than 70% passing -2 mm and then a 250 g split was pulverized to better than 85% passing 75 micron. The fine fraction was then analyzed for gold using fire assay followed by atomic absorption (AA) finish and for 34 other elements using a

nitric acid-aqua regia digestion and ICP analysis. Certificates of Analysis are provided in Appendix III.

All rock samples returned low values for gold and its pathfinder elements including arsenic and antimony.

SOIL GEOCHEMISTRY

A total of 141 soil samples were collected at 50 to 100 m spacing along lines positioned 900 m apart. In some areas, no samples were taken due to permafrost. All soil sample sites were located by means of compass and hip chain surveys with frequent checks using handheld GPS units. Sample locations were marked with half-metre wooden pickets affixed with aluminum tags on which the corresponding sample numbers were inscribed. The top of each picket was wrapped with orange flagging tape. Soil samples were taken from the bottoms of 25 to 60 cm deep holes that were dug using hand held augers. Sample material was then placed into individual pre-numbered kraft paper bags. A pebble sized rock fragment was also collected from the bottom of each soil auger hole. These fragments were placed in coin envelopes labelled with the appropriate sample numbers. They may be examined at a later date to determine local lithologies. Soil sample locations are illustrated on Figure 6.

Multi-element determinations (Au-ICP21 and ME-ICP41) for soil samples were carried out at ALS Chemex in North Vancouver, B.C. Soil samples were dried and sieved to -80 mesh. The fine fraction was then analyzed for gold and 34 other elements by the same techniques used for rock samples. Certificates of Analysis are provided in Appendix III while thematic values for gold and arsenic are shown on Figures 7 and 8.

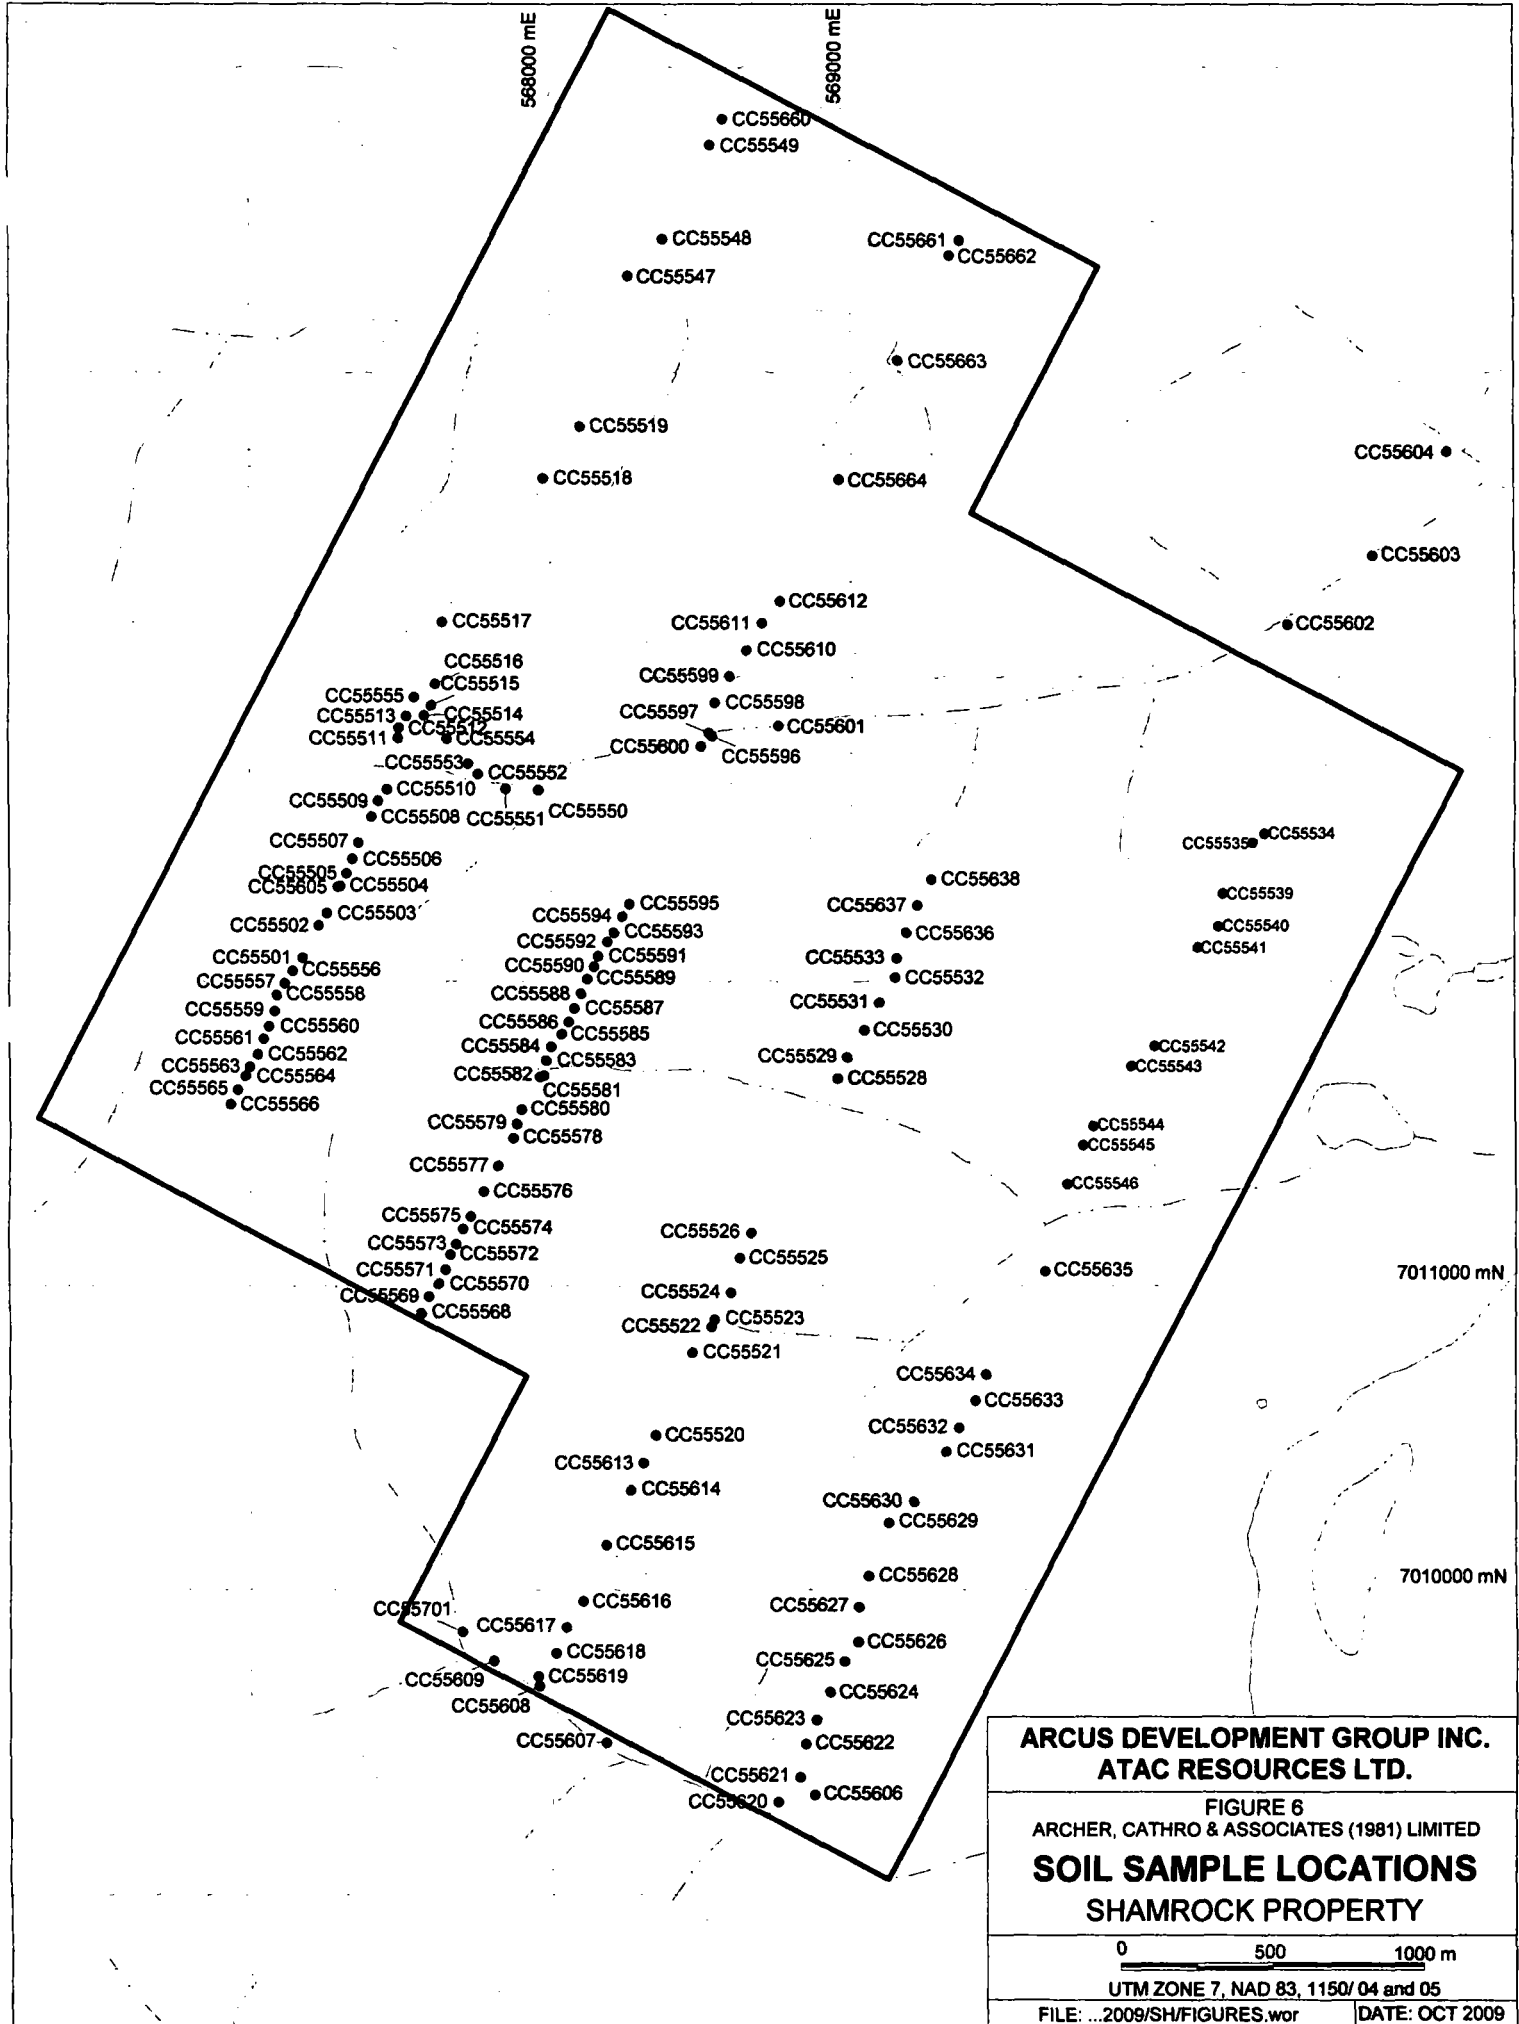

Results from soil geochemistry were generally low; however, considering the deep weathering regime in the region and the low sample density, the reconnaissance-scale sampling done during this program did yield some encouraging results. Peak values for gold and arsenic were 32 ppb and 242 ppm, respectively. No rock samples were taken in the vicinity of the anomalous soil samples.

CONCLUSIONS AND RECOMMENDATIONS

The Shamrock property is favourably situated within the same lithological package as the nearby White Gold occurrences.

Due to the short length of the 2009 program and sampling problems caused by frozen ground, only reconnaissance-level data is available. In spite of the limited coverage, the work did identify some anomalous soil sample values, and additional work is recommended. The proposed work should commence in late summer to ensure that frozen ground does not seriously hinder soil sample collection.

The next phase of work should include three types of soil sampling. The first type should fill-in sampling along the 2009 sample lines at 50 m intervals. The second type should consist of new

lines spaced 450 m apart between the existing soil lines. The final type should be done at 50 m by 50 m intervals on a grid positioned in the northwest corner of the property in the vicinity of the anomalous gold and arsenic soil sample sites.

Pending positive results from the above soil sampling program, tightly spaced grid soil sampling should also be done in other anomalous areas and deep hand pits should be dug at the most anomalous sites so that, if possible, bedrock samples can be collected.

INTRODUCTION

The Touleary property is located in western Yukon and is owned 100% by ATAC Resources Ltd. subject to an option agreement with Arcus Development Group Inc. The property is located in the headwaters of three creeks that host historical and active placer gold operations. These creeks are in the southern part of the prolific Klondike Goldfields. The property also lies within the same favourable lithological package as the nearby White Gold and Black Fox hard rock gold discoveries, which are being explored by Underworld Resources Ltd.

This report describes an exploration program that was conducted by a two to three person crew working from a fly camp on the Touleary property between August 9 and September 11, 2009. The work was done by Archer, Cathro & Associates (1981) Limited on behalf of ATAC and Arcus. The program consisted of prospecting and soil and rock geochemical sampling. The author participated in and directed the program, and her Statement of Qualifications is in Appendix I.

PROPERTY LOCATION, CLAIM DATA AND ACCESS

The Touleary property comprises 183 contiguous mineral claims in the Thistle Mountain area. The claims lie at latitude 63°00'N and longitude 139°08'W on NTS map sheets 115O/03 and 115J/14 as shown on Figure 1. They are registered with the Dawson Mining Recorder in the name of Archer Cathro, which holds them in trust for ATAC. Claim data are listed below while the locations of individual claims are illustrated on Figure 2.

<u>Claim Name</u>	<u>Grant Number</u>	<u>Expiry Date*</u>

TL 110-183	YC93602-YC93675	April 29, 2014

* Expiry date includes 2009 work that has been filed for assessment credit but not yet accepted.

The 2009 camp was situated beside a four wheel-drive road between the left and right forks of Kirkman Creek in the western part of the property. Mobilization was from the nearby Green Gulch property via a Bell 206B helicopter owned by Fireweed Helicopters Ltd. from its year-round base in Dawson City. Supply trips and most of the demobilization were done from the Kirkman airstrip, which is located about five kilometres from the property, using a Cessna 206 operated by Great River Aviation Ltd. from its year-round base at the Dawson City Airport. During demobilization one load of gear was also flown to Dawson City via a BN-2A-27 Islander owned by Sifton Air. During the program the crew used a Kawasaki 610 Mule all-terrain vehicle to drive along existing roads to access many parts of the property. The Mule is currently stored at a placer operation on Kirkman Creek, which is owned by Fell Hawk Placers Ltd.

If future work programs on the property are not done in conjunction with work on nearby properties, access should be by one of the following methods. The first method would involve a Cessna 206 or a BN-2A-27 Islander based at the Dawson City Airport flying to Kirkman airstrip, from where camp gear and personnel would be transferred to the property using the Mule. The other method would utilize a commercial barge from Dawson City to transport gear and

personnel to a landing at the confluence of Yukon River and Kirkman Creek. From the barge landing, either a helicopter or the Mule would be used to complete the move to the property.

HISTORY

The Thistle Mountain area has a rich placer gold mining history dating back to 1898, while recorded hard rock exploration in the area started in 1936. Work histories for both types of exploration are detailed below. ATAC staked the property in April 2009 and optioned it to Arcus in early summer 2009.

Placer History

Thistle, Kirkman and Sparkling creeks are significant placer gold producers that drain areas covered by the Touleary property (Figure 2). In addition, Touleary Creek, which lies immediately south of the property, is listed as a watercourse with past placer activity but it is not currently staked. A 1.06 ounce gold nugget was reportedly recovered by panning on Touleary Creek in the early 1980's (pers. comm., J. Stephen).

In 1898, the first claim was staked on Thistle Creek, but the first reported work was in 1945. A significant amount of placer exploration and mining have been done since then. Data from 2006 to present have not been publicly released; however, production from this creek between 1949 and 2006 totalled 81,540 ounces gold (LeBarge, 2007). Fineness of gold is 848 to 895, and coarse jewellery-grade gold is common. Thistle Creek is 29 km long and its headwaters flow through the eastern part of the Touleary property.

Gold was discovered on Kirkman Creek in 1898, but no mining occurred until 1914. Extensive mining was performed during the years 1914-1920, 1934-1941, 1953 and 1957-1961. Fell Hawk has intermittently mined on this creek since 1990. Total production from 1914 to 2006 is reported to be 13,943 ounces gold (LeBarge, 2007). Data from 2006 to present has not been released publicly. Production in summer 2009 included a 0.64 ounce gold nugget (pers. comm., W. Fellers, 2009). Fineness of the gold from this creek ranges from 860 to 896. Kirkman Creek sources from the west-southwest slope of Thistle Mountain and both of its headwaters forks are covered by the Touleary property.

Sparkling Creek drains the southeast corner of the Touleary property. Placer mining on this creek was performed between 1978 and 1994 and between 1997 and 2002. Reported production data are incomplete but during 1997 to 1998 it totalled 2,761 ounces gold. Fineness of gold from Sparkling Creek is 880 (LeBarge, 2007). Although the placer claims covering Sparkling Creek are currently described as active, no work has been reported since 2002.

Hard Rock History

Three historical mineral occurrences lies just off the Touleary property (Ballarat -115J 061, Black Fox -115O 014 and Touleary -115J 060). These occurrences are described in the following paragraphs, and their locations are shown on Figure 2.

The Ballarat Occurrence is located on the west side of Ballarat Creek, 700 m east of the property. It was originally staked in 1936. Those claims were allowed to lapse and no further work was until 1990, when Sparkling Minerals Incorporated performed prospecting, geological mapping and geochemical sampling. In 1990, Sparkling Minerals identified two styles of quartz veining at this occurrence. The first style is inferred to be epithermal and consists of massive interlocking white quartz crystals with occasional fine grained disseminated pyrite and specular hematite. The other style originated from a mesothermal system and features quartz with feldspar. The epithermal veins are up to two metres wide and have vertical dips. Limonite forms up to 3% of these veins as fracture coatings and veinlets, while specular hematite makes up approximately 5%. Sparkling Minerals reported that a quartz vein sample with 1% galena yielded 31.71 g/t gold, 75.43 g/t silver and 1.5 % lead and that soil sampling returned up to 811 ppb (Andersen, 1991). In 1993, a small trenching program was completed and in 1998, additional soil and stream sediment sampling program was performed. The highest gold-in-soil value from this work was 65 ppb (Andersen, 1999). No mineralization or geochemical anomalies are reported from the mesothermal veins.

The Black Fox Occurrence lies 1000 m north of the property on Lulu Creek, a tributary of Thistle Creek. It was originally staked in 1901 and was restaked in 1910 and again in 1914. From 1970 to 1995, a number of companies staked claims and explored within the area surrounding this occurrence. The most noteworthy results were from a VLF-EM geophysical survey that Faith Mines Ltd. performed in 1995. This survey identified several linear conductors oriented parallel to a large fault (Southam, 1995a), but follow-up soil sampling, which was done at 25 m intervals on lines spaced 200 m apart over the VLF-EM conductors, returned only background values (Southam, 1995b).

The Touleary Occurrence is located 650 m south of the property on Touleary Creek. The Minfile database speculates that quartz claims were staked based on previous placer activity. There is no record of any assessment reports having ever been filed for this occurrence.

GEOMORPHOLOGY

The claims overlie an area of moderate relief sixteen kilometres east of Yukon River. Local elevations range from 730 to 1480 m above sea level. Treeline in the area is approximately 1400 m. Higher elevations are lightly vegetated with moss and scrub brush while lower elevations support a mixture of deciduous and evergreen forest with thick buckbrush-, willow- and moss-covered slopes. Bedrock is exposed along ridges and spines at higher elevations and in road cuts at lower elevations.

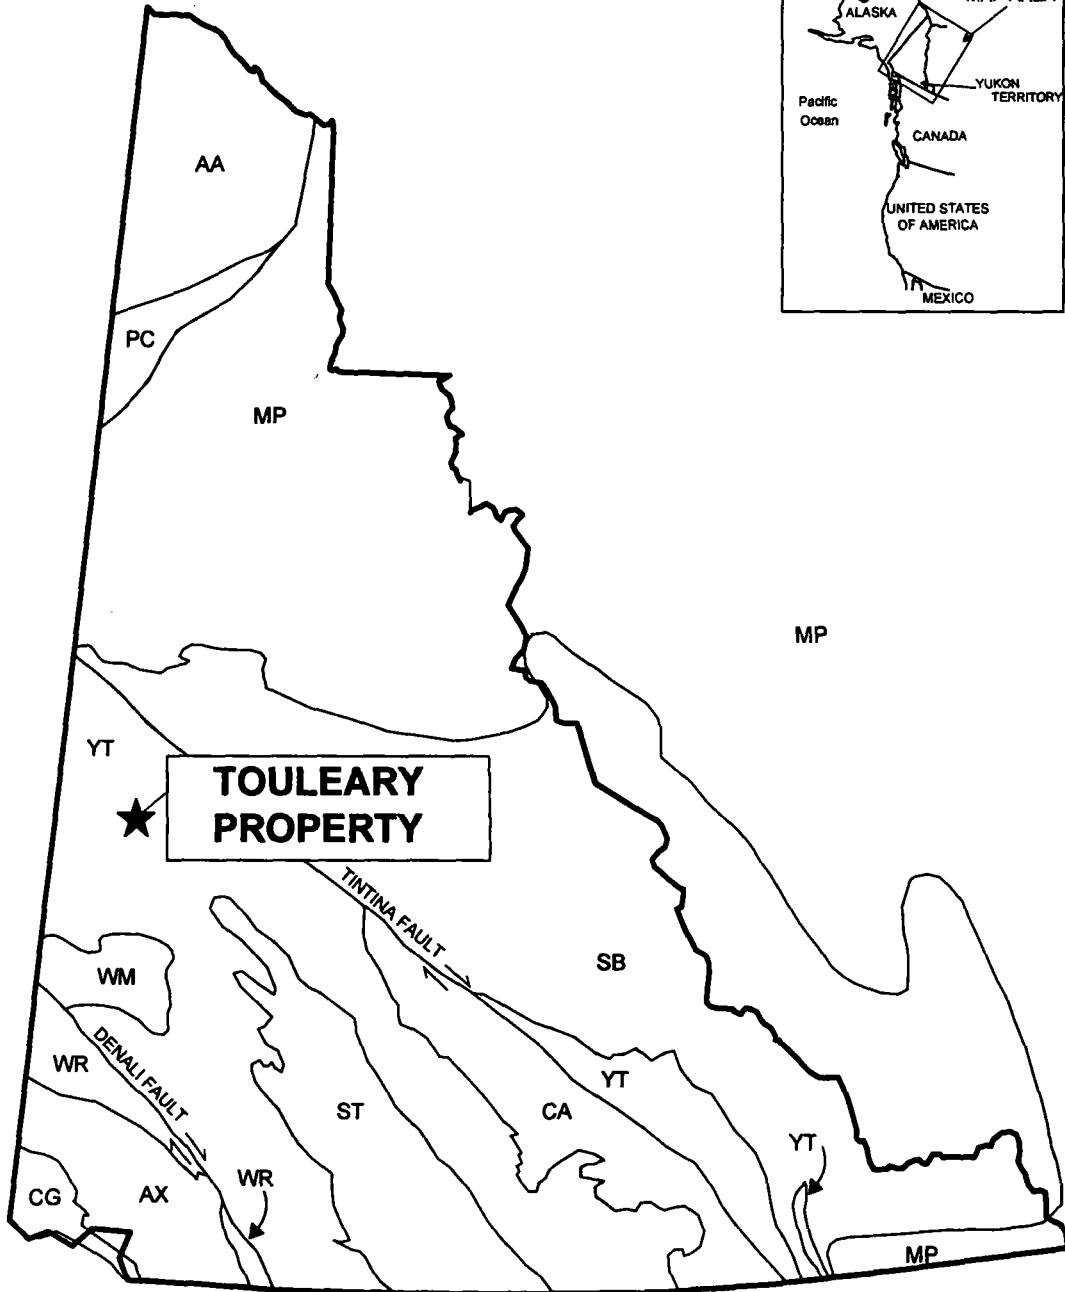

The west and central parts of the property are drained by numerous creeks that flow directly to the Yukon River. The eastern part of the property is drained by two main creeks that flow to the Stewart River, a major tributary of the Yukon River.

REGIONAL GEOLOGY

The Touleary property lies within the Yukon Tanana Terrane approximately 80 km southwest of the Tintina Fault (Figure 3). Table I contains a brief summary of the main lithologies in the area. Figure 4 illustrates the distribution of those lithologies.

PROPERTY GEOLOGY

In 2009, property-scale geological orientation was done during prospecting traverses conducted over a four day period. The orientation was confined to areas where bedrock exposures were expected to occur, such as ridges, spines and access roads. All observed bedrock on the property belongs to either the Pelly Gneiss Suite (DMqPW) or the highly strained Nasina Assemblage (DMN3). No property-scale map has been generated.

REGIONAL MINERALIZATION

Numerous mineral occurrences and showings are hosted within unit DMN3 in the vicinity of the Touleary property. The two most noteworthy examples are the Golden Saddle Zone on the White Gold property and the Thistle Vein on the Black Fox property.

Golden Saddle Zone lies 25 km northwest of the Touleary property. Underworld reports multiple styles of gold mineralization at Golden Saddle; however, most of the gold is hosted within quartz-albite-carbonate breccias with minor disseminated pyrite. The following table lists highlights from Underworld's 2009 drill program at Golden Saddle.

**Table II - 2009 Drilling Highlights from Golden Saddle Zone, White Gold Property
(Underworld, 2009)**

WD09-31	104.0	3.39
WD09-47	31.1	9.20
WD09-64	100.4	3.13
WD09-69	76.9	3.40
WD09-72	49.5	3.49
WD09-91	91.28	3.69
WD09-101	48.75	3.67

The Thistle Vein lies on Underworld's Black Fox property, which is mostly surrounded by the Touleary property. Underworld describes the Thistle Vein as a 0.4 to 1.0 m thick quartz vein

hosting visible gold. Mechanical trenching has reportedly exposed the vein over a 250 m strike length. Grab samples from the vein returned grades ranging from 0.6 to 10 g/t gold (Underworld, 2009). A sample from a 30 cm thick, sulphide rich, foliation-parallel offshoot of the Thistle Vein assayed 9.7 g/t gold; while samples taken from wallrock of the vein returned 17.7 and 0.5 g/t gold (Underworld, 2009). The Thistle Vein is open along strike to the east and west. Its surface trace projects toward the Touleary property, about 1800 m to the southwest and 2400 m to the northeast (Figure 2).

PROPERTY MINERALIZATION AND ROCK GEOCHEMISTRY

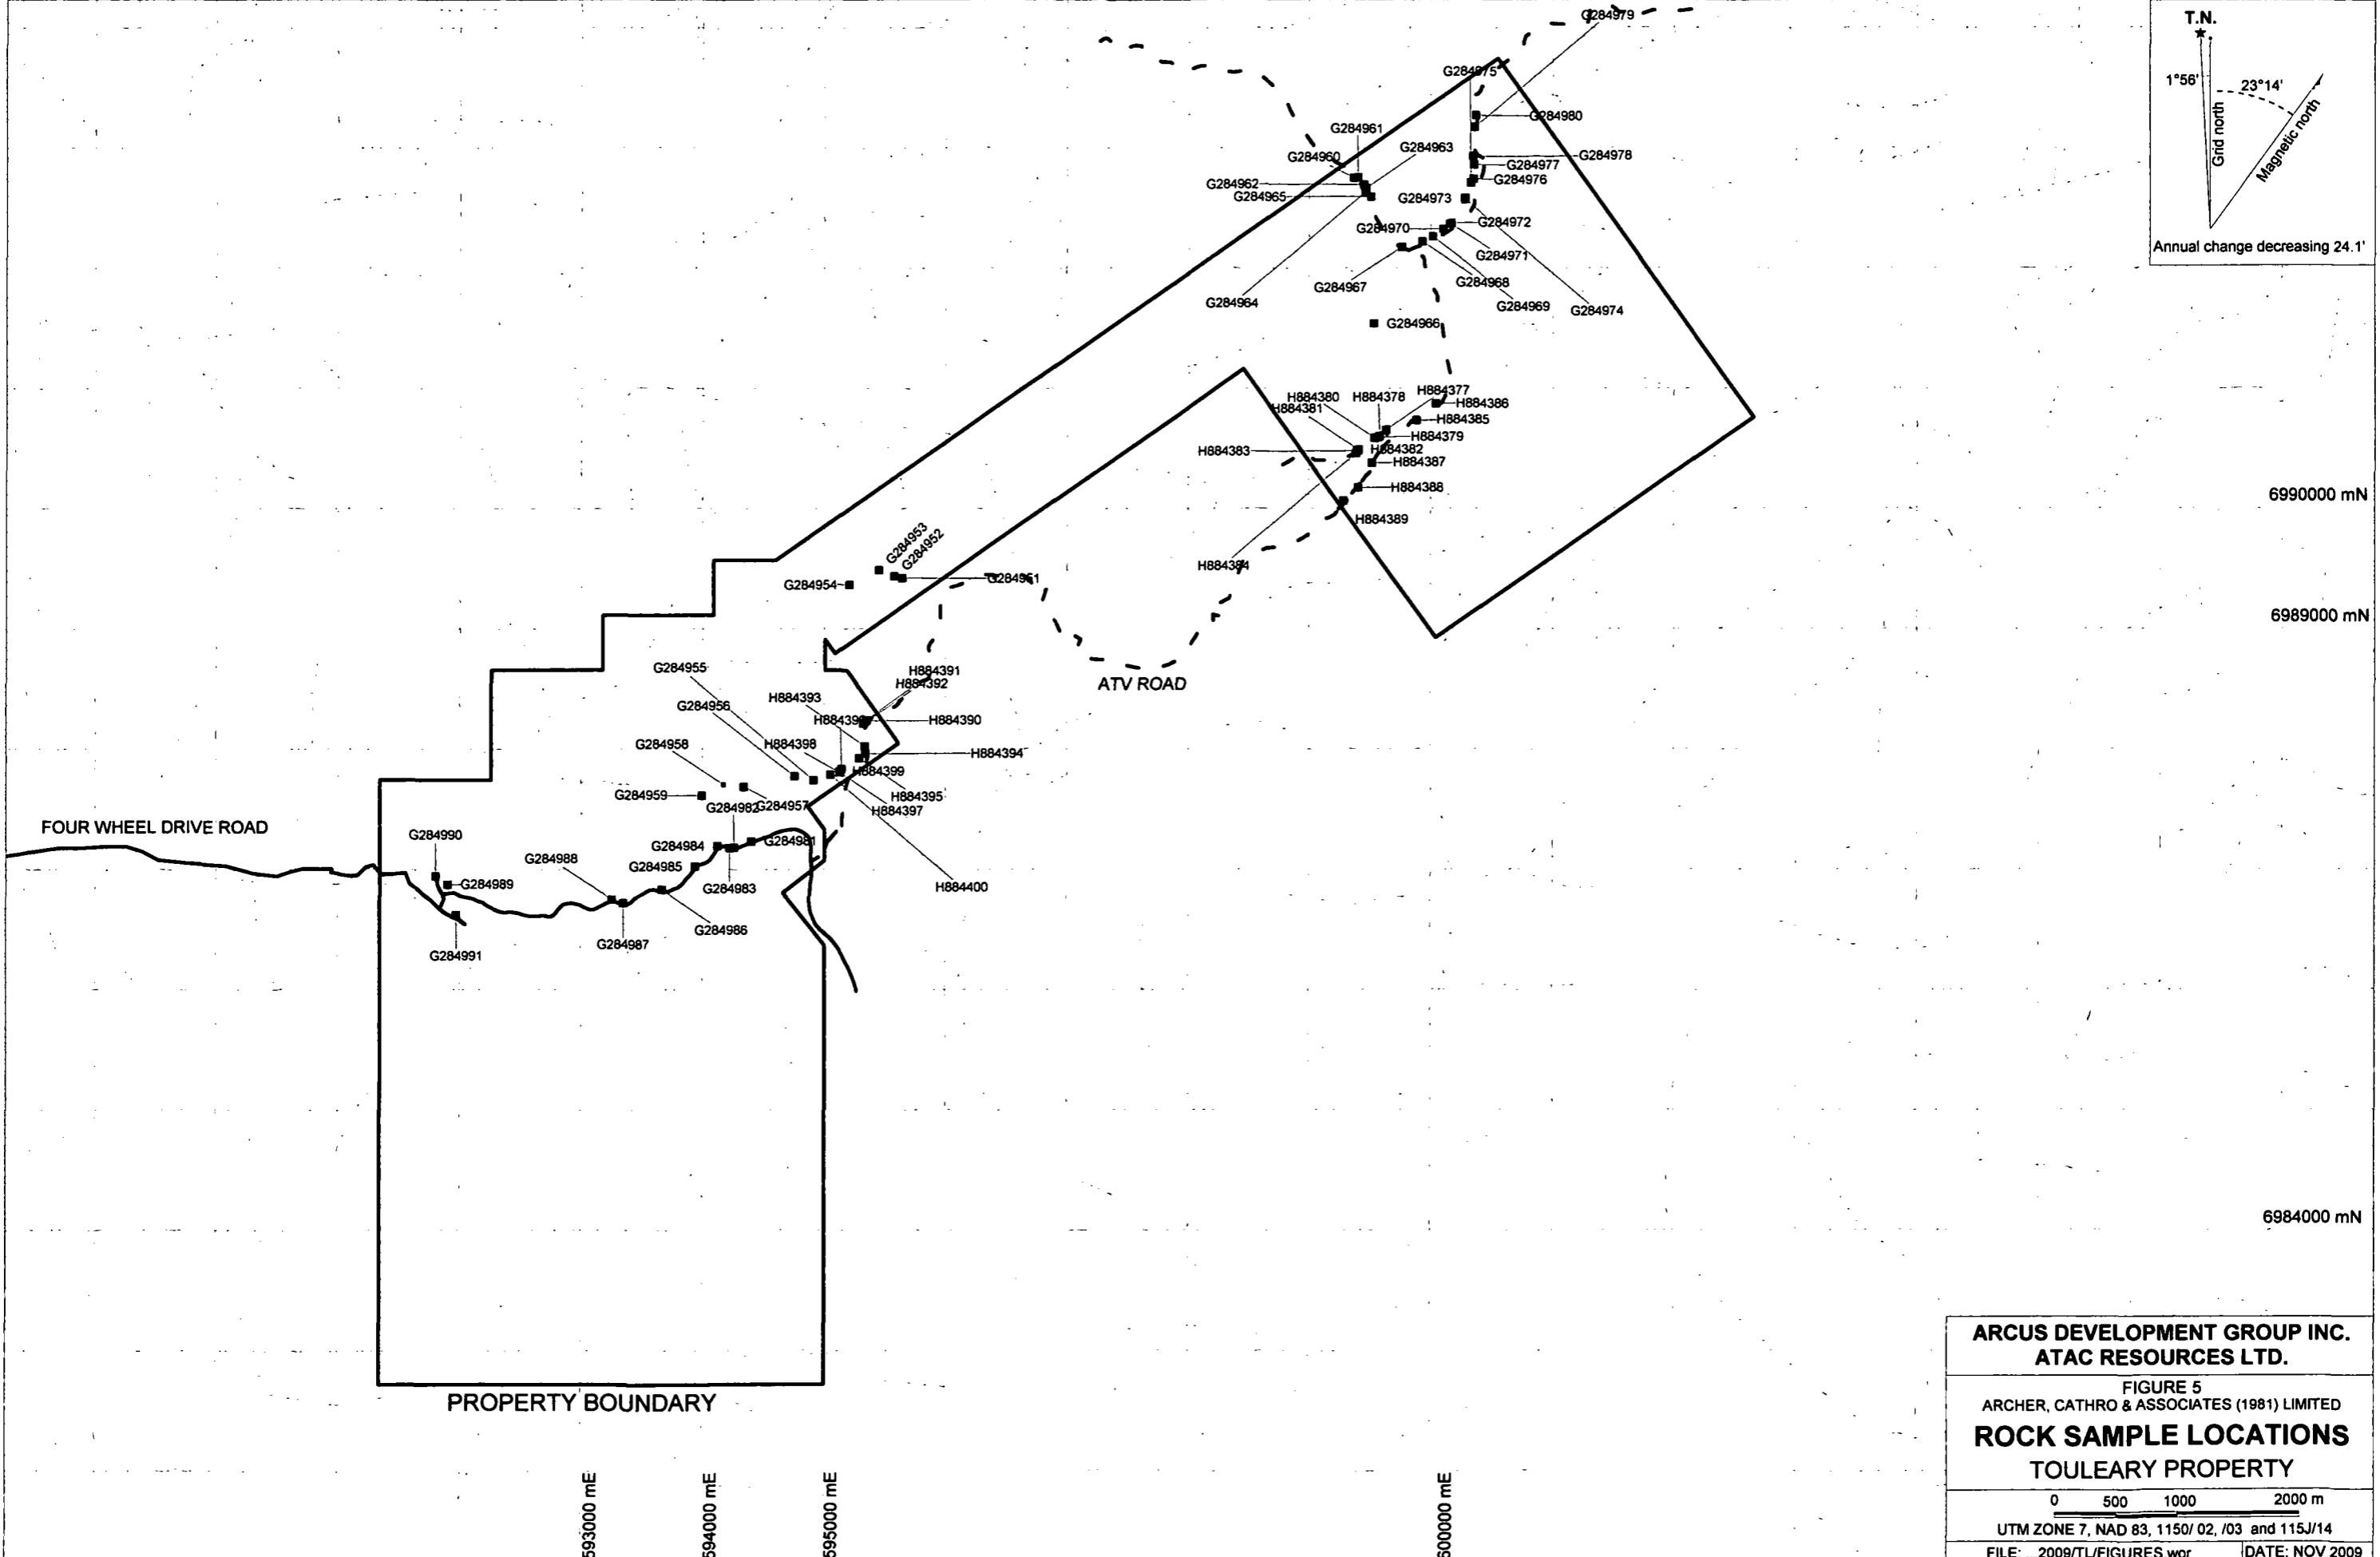

Prospecting was done before soil geochemical results were available and was limited to a few traverses along ridge tops and road cuts. Sixty-five rock samples were taken during the 2009 program. Sample locations are plotted on Figure 5 while sample descriptions are located in Appendix II. Multi-element analyses (Au-ICP21 and ME-ICP41) for rock samples were carried out at ALS Chemex in North Vancouver, B.C. Each sample was dried, fine crushed to better than 70% passing -2 mm and then a 250 g split was pulverized to better than 85% passing 75 micron. The fine fraction was then analyzed for gold using fire assay followed by atomic absorption (AA) finish and for 34 other elements using a nitric acid-aqua regia digestion and ICP analysis. Certificates of Analysis are provided in Appendix III while thematic values for gold and arsenic are illustrated on Figures 6 and 7. Two showings were discovered, and they are described in the following paragraphs.

Showing 1 is a specimen of limonitic quartz vein with dark grey metallic sulphide patches and rare chalcopyrite blebs. It assayed 2.8 g/t gold. The sample was collected from a road cut near the top of Thistle Mountain. Showing 1 lies along strike from mineralization and soil geochemical anomalies associated with the Thistle Vein.

Showing 2 is situated about 1600 m southwest of Showing 1, further along the projected extension of the Thistle Vein. A sample of moderately banded limonite boxwork from a road cut 400 m upslope of the south fork of Kirkman Creek returned 1.58 g/t gold.

SOIL GEOCHEMISTRY

A total of 2166 soil samples were taken during the 2009 program. In most areas on the property, samples were collected at 50 m intervals along lines spaced 200 m apart, but in the north eastern part of the claim block, samples were taken at 50 m spacings on lines approximately 300 m apart. Two areas on the property were not sampled for various reasons. The southern part of the claim block, which is drained by Touleary and Sparkling creeks, was not sampled because it was too difficult to access from the 2009 camp. The easternmost part of the property was not sampled due to time constraints. At some locations, samples could not be taken due to frozen ground. All soil sample sites were located by means of compass and hip chain surveys with frequent checks using handheld GPS units. Sample locations were marked with half-metre wooden pickets affixed with aluminum tags on which the corresponding sample numbers were inscribed. The top of each picket was wrapped with orange flagging tape. Soil samples were taken from the bottoms of 25 to 60 cm deep holes that were dug using hand held augers. Sample material was then placed into individual pre-numbered kraft paper bags. A pebble sized rock

fragment was also collected from the bottom of each soil auger hole. These fragments were placed in coin envelopes labelled with the appropriate sample numbers. They may be examined at a later date to determine local lithologies. Soil sample locations are illustrated on Figure 8.

Multi-element analyses (Au-ICP21 and ME-ICP41) for soil samples were carried out at ALS Chemex in North Vancouver, B.C. Soil samples were dried and sieved to -80 mesh. The fine fraction was then analyzed for gold and 34 other elements by the same techniques used for rock samples. Certificates of Analysis are in Appendix III while thematic values for gold and arsenic are shown on Figures 9 and 10. The following table lists the threshold values used to interpret soil sample results from the property.

Table III - Thresholds for Soil Values

Element	Thresholds			Peak Value
	Weak	Moderate	Strong	
Gold	≥ 10 < 20 ppb	≥ 20 < 50 ppb	≥ 50 ppb	304 ppb
Arsenic	≥ 20 < 50 ppm	≥ 50 < 100 ppm	≥ 100 ppm	324 ppm

One gold anomaly and two arsenic anomalies were identified. There is no apparent correlation between gold, arsenic or any of its other pathfinder elements. Values for other elements on the property were generally low.

Anomaly A is characterized by moderately to strongly elevated gold values within a 1600 by 150 m, northeasterly elongate zone. Typical samples within this anomaly returned between 20 and 304 ppb gold. Showing 1 was discovered in a road cut 300 m east of Anomaly A.

Anomaly B is features strong arsenic values within a 400 m long by up to 200 m wide area. Most samples within this anomaly returned between 20 and 324 ppm arsenic but only background gold values. No rock samples were collected from within this zone.

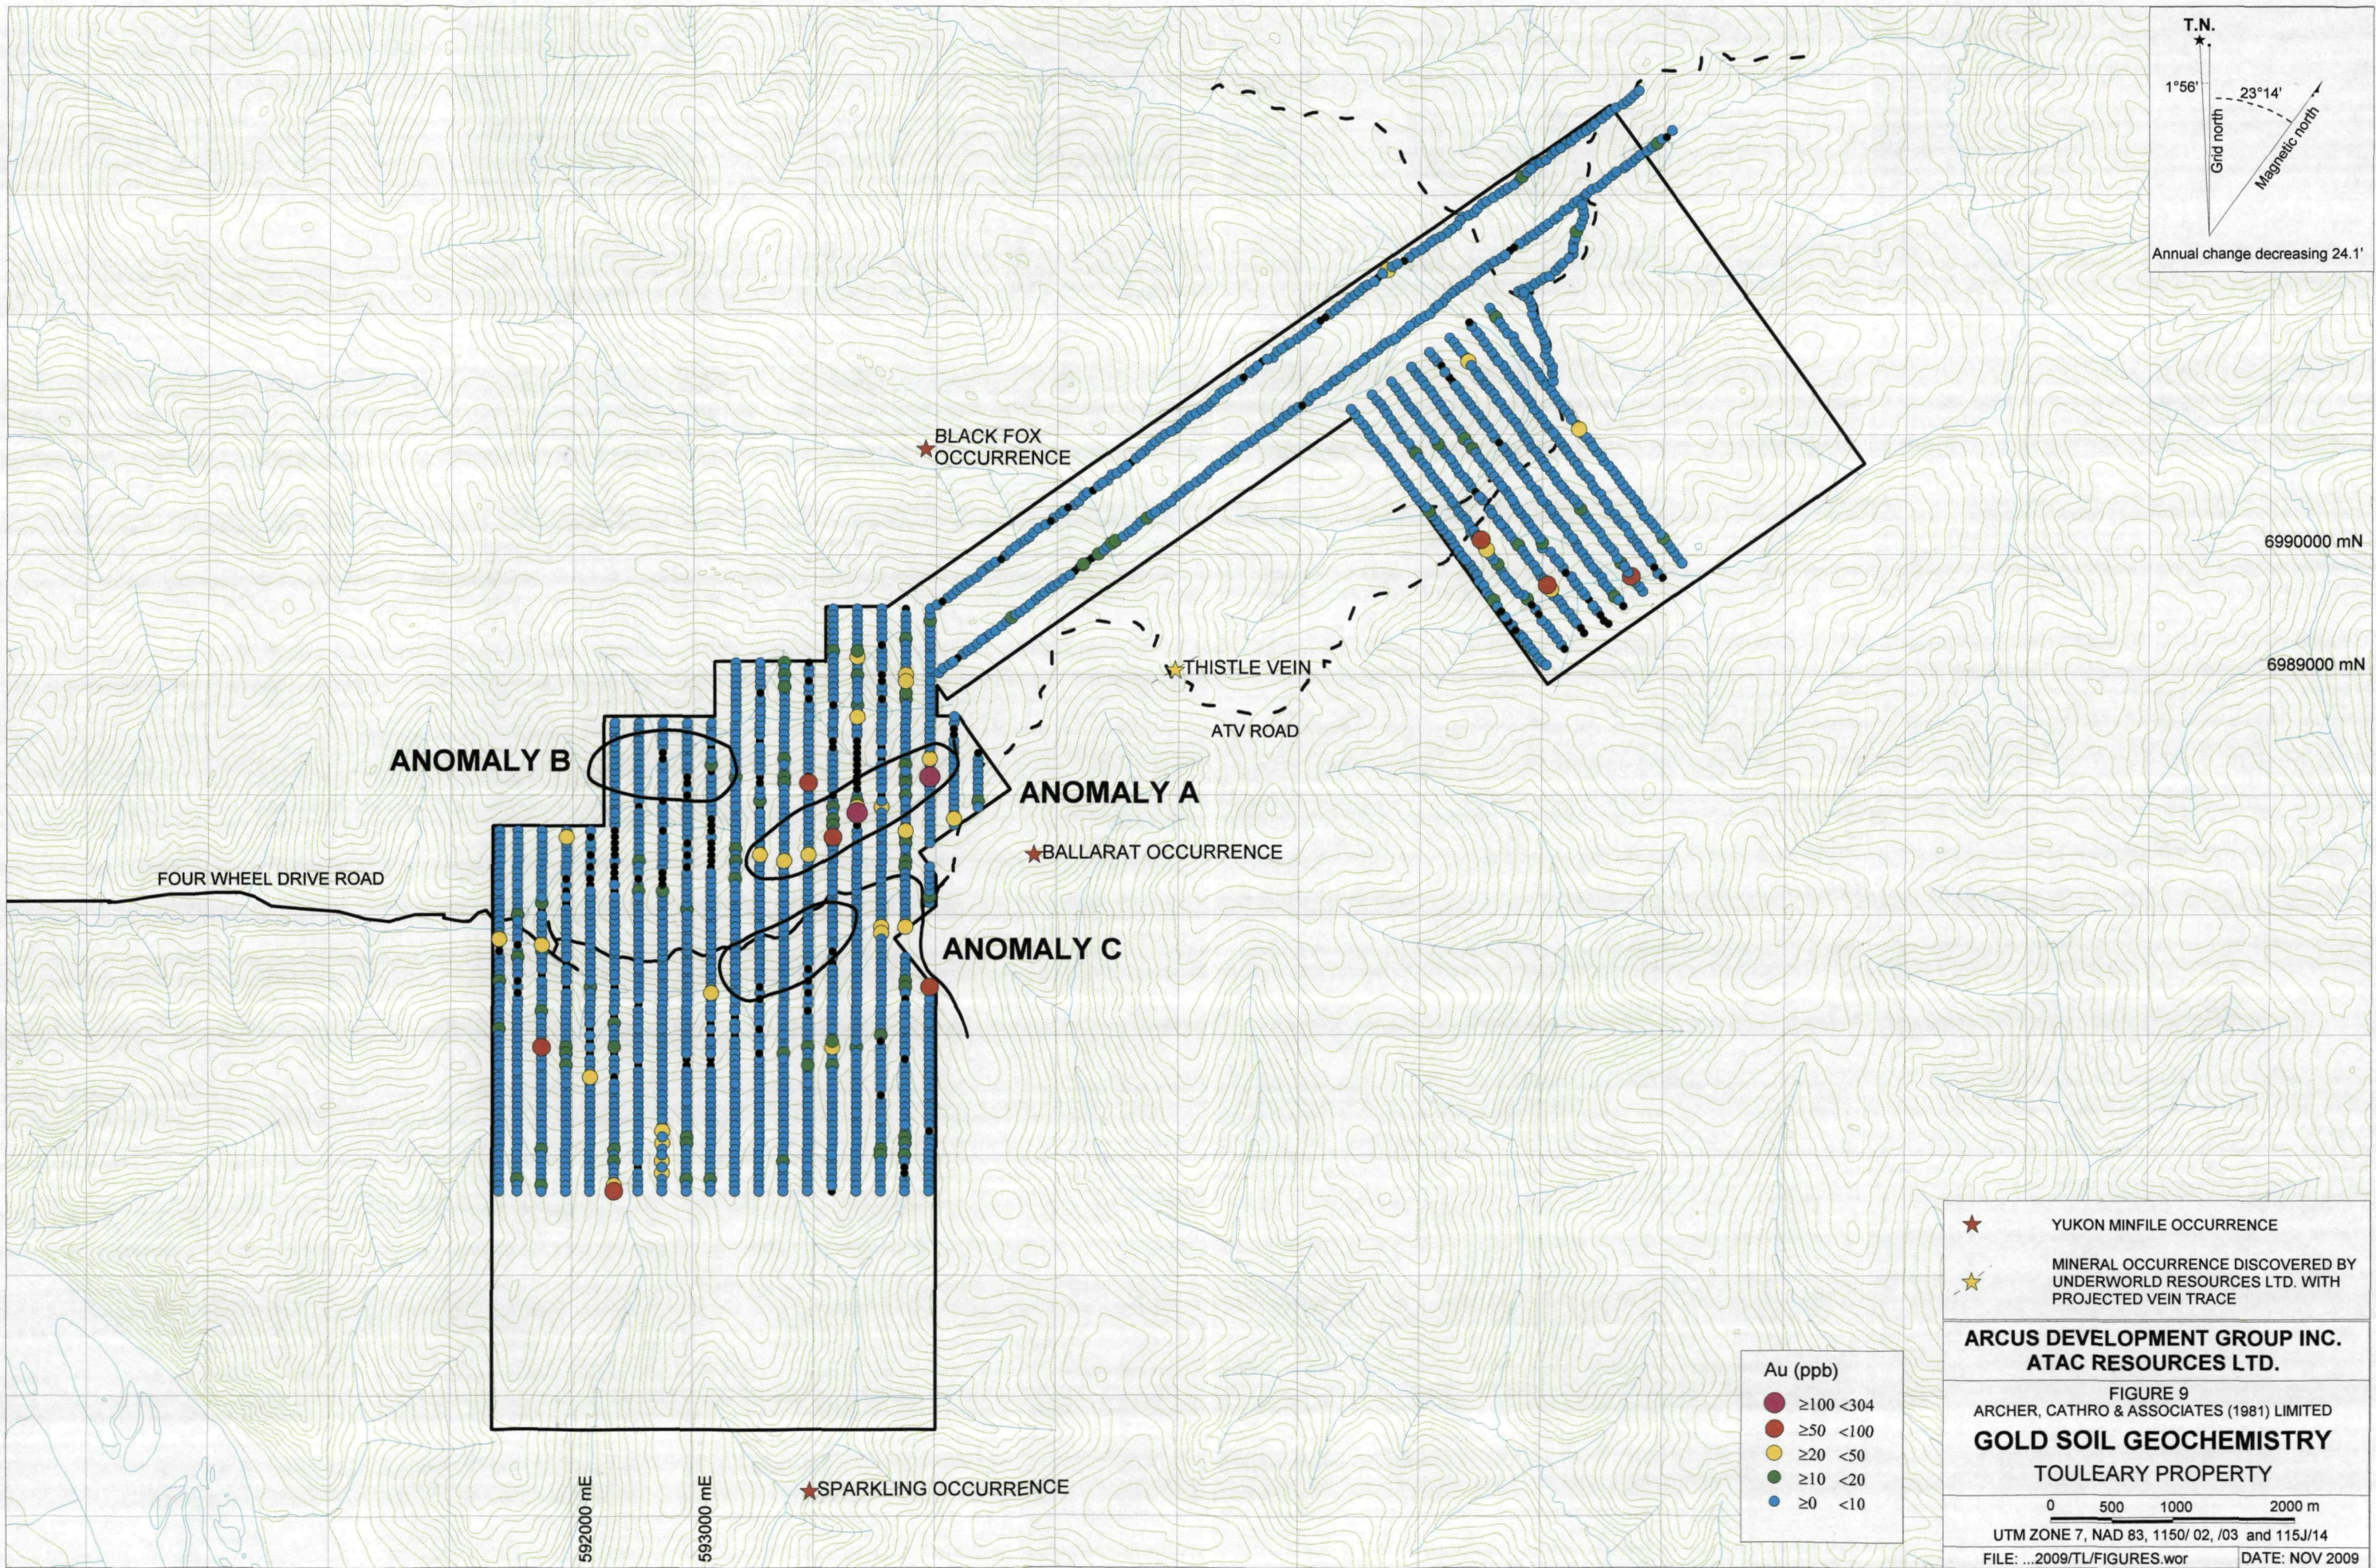

Anomaly C is consists of weak to moderate arsenic values within a 1000 by 400 m area. Typical samples within this anomaly returned between 20 and 89 ppm arsenic with background gold values. This anomaly lies immediately down slope from Showing 2.

Sampling elsewhere on the property generally yielded low values for all elements, except for a few isolated values ranging from 54 to 75 ppb gold.

DISCUSSION AND CONCLUSIONS

The Touleary property is well situated in the southern part of the most productive placer gold mining district in Canada. The area is currently one of the country's hottest gold exploration plays because of hard rock discoveries announced by Underworld Resources.

Future work is definitely warranted on the Touleary property, based on the favourable geological setting, its close proximity to known gold showings and encouraging results obtained from the

2009 exploration program. A two phase program is recommended for 2010, with additional soil sampling followed by mechanized trenching.

Phase 1 work should comprise additional soil sampling with three main focuses. First, soil sample density should be increased to 50 by 50 m spacings within and along strike of Anomalies A, B and C and around Showings 1 and 2. Second, reconnaissance-scale sampling should be done at 50 by 200 m spacings in the southern and eastern parts of the property, which were not sampled in 2009. Finally, sampling should be done in the central part of the property, where a series of lines spaced 400 m apart should be sampled at 50 m intervals. These lines should be orientated perpendicular to previously sampled lines in that area. Most soil sampling can be done in early to mid-summer, but sampling on north-facing slopes should wait until after mid-summer to minimize frost problems. Hand-held soil augers should be used to test as deep in the soil profile as possible.

Phase 2 work should include mechanized trenching, possibly using either a helicopter-portable excavator or a larger machine that could be rented from a local placer miner. The trenching should be done in late summer or fall to explore beneath soil geochemical anomalies and showings, starting with Anomaly A and Showing 1.

Prior to the start of the season, rock chips collected from soil pits should be logged to prepare a preliminary geology map. Detailed prospecting and geological mapping should be done in conjunction with both soil sampling and trenching.

Respectfully Submitted,

STATEMENT OF QUALIFICATIONS

STATEMENT OF QUALIFICATIONS

I, Heather Smith, geologist, with business addresses in Vancouver, British Columbia and Whitehorse, Yukon Territory and residential address at #604-175 West 1 Street, North Vancouver, British Columbia, V7M 3N9 do hereby certify that:

1. I graduated from the University of British Columbia in 2006 with a B. Sc in Geological Sciences.
2. From 2004 to present, I have been actively engaged in mineral exploration in the Yukon Territory, British Columbia and Northwest Territories.
3. I am a Geoscientist in Training (GIT) with the Association of Professional Engineers and Geoscientists of British Columbia (Member Number 150000).
4. I have personally participated in the fieldwork reported herein and have interpreted all data resulting from this work.

H884389	UTM:	599289 E	UTM:	6990066 N	Sample Width:	Abundance:
TL 149	Elevation:	m				

Comments: Float sample within fine grained, dark grey to green, sometimes augen-rich gneiss. Could be fine grained amphibolite... Altered gneiss or medium to coarse grained intrusive. Biotite is weakly altered to chlorite. Hosts a distinct red, shiny mineral. As-rich?

Sample Number:	Grid East:	E	Grid North:	N	Type: Specimen	Dimension: 10 by 20 cm
H884390	UTM:	595346 E	UTM:	6988236 N	Sample Width:	Abundance: Rare
TL 1	Elevation:	m				

Comments: Rare float sample of medium grained, almost dioritic-like intrusive dyke. Four pieces in total. Blebby chalcopyrite mineralization throughout and a shiny black mineral (?) one surface/side is extremely limonitic. A three centimetre white quartz vein cuts through the dyke (late stage).

Sample Number:	Grid East:	E	Grid North:	N	Type: Specimen	Dimension:
H884391	UTM:	595352 E	UTM:	6988241 N	Sample Width:	Abundance: rare
TL 1	Elevation:	m				

Comments: Float. Fine grained, dark (ultramafic) moderately foliated lamprophre dyke (?). Hosts blebby, disseminated pyrite and pyrrhotite.

Sample Number:	Grid East:	E	Grid North:	N	Type: Specimen	Dimension:
H884392	UTM:	595325 E	UTM:	6988211 N	Sample Width:	Abundance:
TL 1	Elevation:	m				

Comments: Float from within fine grained amphibolite/greenstone unit. Sample is of a rare cobble of quartz-limonite vein. Hosts pale to dark green rock selvages. Specimen was extremely tough-only shards were broken off to keep as a rep. Mineralization: grey, metallic patches (fine grained galena?-appears darker than galena usually is). Also hosts rare blebs of chalcopyrite.

Sample Number:	Grid East:	E	Grid North:	N	Type: Specimen	Dimension:
H884393	UTM:	595335 E	UTM:	6988025 N	Sample Width:	Abundance: weak to moderate
TL 1	Elevation:	m				

Comments: Float within felsic quartz-muscovite-biotite schist unit. White to yellow quartz vein with muscovite (bronze) and mariposite (green) mica varieties. Rare 1 cm cubic areas filled with limonite and trace chalcopyrite.

Sample Number:	Grid East:	E	Grid North:	N	Type: Specimen	Dimension: 10 by 20 by 6 cm
H884394	UTM:	595342 E	UTM:	6987963 N	Sample Width:	Abundance:
TL 1	Elevation:	m				

Comments: Float sample of 'meta' diorite dyke with 2 cm quartz wide cross cutting quartz vein. Limonitic, blebby zones and disseminated sulphide mineralization. Sulphide is a silvery to black mineral. Overall the specimen is moderately siliceous.

Sample Number:	Grid East:	E	Grid North:	N	Type: Chip	Dimension:
H884395	UTM:	595290 E	UTM:	6987927 N	Sample Width: 0.5 m	Abundance:
TL 1	Elevation:	m				

Comments: Old sample site. Chip sample across a 0.25 to 2.0 m wide bull white to pink to orange quartz vein. Foliation parallel to host rock. Minor mariposite

mica (green) within vein. No visible mineralization.

Sample Number:	Grid East:	E	Grid North:	N	Type: Outcrop	Dimension:
H884396	UTM:	595146 E	UTM:	6987835 N	Sample Width: 1 foot	Abundance: abundant
TL 2	Elevation:	m				

Comments: Sample over 1' across an outcrop of siliceous, almost chert-like, pale green to tan, gneiss/quartzite? Hosts oxidized pyrite cubes, chalcopyrite rimmed by a black mineral (? Tarnished ___?) and trace malachite.

Sample Number:	Grid East:	E	Grid North:	N	Type: Pseudo chip	Dimension:
H884397	UTM:	595131 E	UTM:	6987808 N	Sample Width: 0.75 m	Abundance:
TL 2	Elevation:	m				

Comments: Pseudo-chip sample over 0.75 m. White quartz vein with chalcopyrite (rare-blebby), black sulphide (tarnished pyrite?) and malachite. Possibly visible gold-definitely not definitive.

Sample Number:	Grid East:	E	Grid North:	N	Type: Chip	Dimension:
H884398	UTM:	595125 E	UTM:	6987805 N	Sample Width: 0.5 m	Abundance: abundant
TL 2	Elevation:	m				

Comments: Up/down vein from -397. Chip sample across 0.5 m. White quartz vein PLUS adjacent host rock. Biotite-altered, biotite/chlorite-potassium feldspar gneiss with trace chalcopyrite and moderate malachite.

Sample Number:	Grid East:	E	Grid North:	N	Type: composite chip	Dimension:
H884399	UTM:	595130 E	UTM:	6987812 N	Sample Width: 2 m	Abundance: abundant over 2 m
TL 2	Elevation:	m				

Comments: Grab sample from the eastern end of the quartz vein sampled by '397 and '398. Adjacent to fault. White quartz vein with black, tarnished pyrite stringers and weak malachite.

Sample Number:	Grid East:	E	Grid North:	N	Type: Specimen	Dimension:
H884400	UTM:	595051 E	UTM:	6987786 N	Sample Width:	Abundance: rare
TL 28	Elevation:	m				

Comments: Shattered and broken white to yellow quartz vein as felsenmeener within felsic quartz-muscovite schist. No visible sulphides. Abundant fracture surfaces with subtle orange alteration surfaces.

Comments: Float below outcrop quartz vein. Crystalline bull white quartz with abundant red fracture coatings and rare stringers. Unusual iridescent, pale blue mineral (rectangular) in shape. Rare grey blebs.

G284954 Grid East: E Grid North: N Type: Specimen Dimension:
UTM: 595207 E UTM: 6989368 N Sample Width: Abundance:

TL 112 Elevation: m

Comments: 0.25 by 1 m quartz vein blowout. Relict pyrite blocks/pits. Minor orange fracture coating. Hairline fractures.

G284955 Grid East: E Grid North: N Type: Outcrop Dimension: 12 "
UTM: 594914 E UTM: 6987739 N Sample Width: Abundance:

TL 113 Elevation: m

Comments: Sample 12" across a 1.5 m wide pale green to grey lamprophyrye dyke. Hosts magnetite crystals and 2-4 mm long actinolite crystals. Fine grained rock.

G284956 Grid East: E Grid North: N Type: Outcrop Dimension:
UTM: 594757 E UTM: 6987773 N Sample Width: Abundance:

TL 113 Elevation: m

Comments: From a 20 cm thick quartz vein. White, crystalline bull quartz with rare calcium carbonate pits/zones. Irregular and unique stringers with limonite coat. Possibly pyrite bands? Rare yellow and green surface coat.

G284957 Grid East: E Grid North: N Type: Outcrop Dimension: 12 cm
UTM: 594342 E UTM: 6987685 N Sample Width: Abundance: moderate

TL 25 Elevation: m

Comments: Quartz vein, 12 cm. White to yellow quartz with trace pyrite, minor dark brown to black stringers, red-shiny speckled mineral. Foliation parallel.

G284958 Grid East: E Grid North: N Type: Specimen Dimension:
UTM: 594173 E UTM: 6987705 N Sample Width: Abundance: rare in mossy area

TL 27 Elevation: m

Comments: Specimen sample from a subtle recessive linear. Low, low profile. Quartz with iron and manganese oxide stain. Distinct relict pyrite pits and moderately glassy limonite.

Comments: Specimen sample of quartz vein with orange limonite fractures and abundant black manganese oxide dendrites. Rare disseminated black sulphide (?).

Sample Number:	Grid East:	E	Grid North:	N	Type: Chip	Dimension:
G284986	UTM:	593669 E	UTM:	6986832 N	Sample Width: over 1 m	Abundance:
TL 52	Elevation:	m				

Comments: Fine grained, silicified intrusive dyke. Minor disseminated pyrite.

Sample Number:	Grid East:	E	Grid North:	N	Type: Grab	Dimension:
G284987	UTM:	593350 E	UTM:	6986717 N	Sample Width: 3 m	Abundance:
TL 52	Elevation:	m				

Comments: Grab sample over three metres. Dark blue, sucrosic, fine grained quartzite (meta sed). Abundant carbonate fractures, limonite and rusty bands.

Sample Number:	Grid East:	E	Grid North:	N	Type: Specimen	Dimension:
G284988	UTM:	593256 E	UTM:	6986748 N	Sample Width:	Abundance:
TL 51	Elevation:	m				

Comments: One piece of quartz vein with ankerite, manganese oxide and secondary iron oxide mineralization. Abundant bugs and trace pyrite. Very fine black sulphide. Interesting specimen.

Sample Number:	Grid East:	E	Grid North:	N	Type: Chip	Dimension:
G284989	UTM:	591901 E	UTM:	6986875 N	Sample Width: 0.5 m	Abundance:
TL 78	Elevation:	m				

Comments: Chip sample over 0.5 m in situ quartz vein with abundant limonite and ankerite. Hairline fractures within clear to grey crystalline quartz.

Sample Number:	Grid East:	E	Grid North:	N	Type: Grab	Dimension:
G284990	UTM:	591801 E	UTM:	6986945 N	Sample Width: 5 pc/ 2 m	Abundance: rare.
TL 105	Elevation:	m				

Comments: Grab sample from push pile on switchback corner. Epidote-garnet assemblage. Minor black sulphide and rusty maroon pits. Layers of chlorite altered biotite cut through sample.

Sample Number:	Grid East:	E	Grid North:	N	Type: Specimen	Dimension: 10 by 20 by 6 cm
G284991	UTM:	591973 E	UTM:	6986621 N	Sample Width:	Abundance: rare
TL 104	Elevation:	m				

Comments: Rare specimen of red to maroon stained/coated white quartz vein with abundant fractures. Dark sulphides. Unique piece of vein material.
