Report By:

Scott Casselman B.Sc., P. Geo.
CASSELMAN GEOLOGICAL SERVICES Ltd.
33 Firth Road, Whitehorse, Yukon Y1A 4R5

For:

Gary Lee and Robert Scott
Whitehorse, Yukon

Location: 62^{o} 00' N, 128^{o} 30' W
NTS: 105H15, 16, 105I01, 02
Mining District: Watson Lake, Yukon
Date: December, 2010

SUMMARY

The Little Hyland Project is located approximately 205 kilometres north of the community of Watson Lake and 10 kilometres west of the mining community of Tungsten in the Northwest Territories. The property is within the Little Hyland River Valley in the Watson Lake Mining District, in southeast Yukon. The property consists of 203 contiguous quartz mining claims that are variably co-owned by Mr. Gary Lee, Mr. Robert Scott, and Mr Ron Stack.

The property is primarily a precious metals target with gold and lesser silver, in quartz veins. It also contains arsenopyrite-pyrite, +/-chalcopyrite, +/- galena+/- sphalerite mineralization.

Between July 23 and September 2, 2010, Gary Lee and Bob Scott conducted an exploration program with a focus on precious metal mineralization and precious metals bearing structures. The 2010 program consisted of the collection of 23 rock samples, 46 soil samples and 40 stream sediment samples. As well, 760 m of grid was established and surveyed for magnetics and VLF-EM.

The 2010 work resulted in the identification of a region with significant arsenic enrichment as defined by stream sediment anomalies. This region is also anomalous in gold.

Work on the Culvert claims in 2009 identified gold in the phyllites which was postulated to represent a mesothermal gold-quartz vein style occurrence. Also known as shear-hosted gold, this deposit type occurs in any of a variety of greenschist-grade rocks, and occurs in proximity to steep faults or sutures of ancient continental margin collision zones. Gold, pyrite, and arsenopyrite are essential minerals of this deposit type occurring chiefly in quartz veins deposited within faults and joint systems. In the process of vein emplacement, wallrock is silicified, pyritized and/or sericitized inside a broad halo of carbonitization.

Detailed work at the Road Showing returned significant gold values associated with massive arsenopyrite and quartz-pyrite-arsenopyrite veining. The Rubus area returned abundant arsenic-in stream sediment anomalies far to the northern end of the property. This extends the mineralized trend from the southern edge of the Culvert claims through the property to the northern part of the Rubus claims, a distance of 15 kilometres.

The arsenic and gold stream sediment anomalies and mineralization in rock samples is, in general proximal to the March Fault and/or proximal to the contact between the Vampire Formation and Narchilla Formation of the Hyland Group.

A follow-up program consisting of geologic mapping, prospecting, soil sampling, infilling and expanding on VLF-EM and magnetic surveys and trenching is recommended. This would be followed by diamond drilling should the results warrant.

APPENDICES

1.0 INTRODUCTION

The Little Hyland Project is located approximately 205 kilometres north of the community of Watson Lake and 10 kilometres west of the mining community of Tungsten in the Northwest Territories. The property is within the Little Hyland River Valley in the Watson Lake Mining District, in southeast Yukon.

The property consists of 203 contiguous quartz mining claims that are variably co-owned by Mr. Gary Lee, Mr. Robert Scott, and Mr Ron Stack, all of Whitehorse, Yukon. The property is primarily a precious metals target with gold and lesser silver, in quartz veins. It also contains arsenopyrite-pyrite, +/-chalcopyrite, +/- galena+/- sphalerite mineralization, as well as placer gold occurrences and numerous gold and arsenic anomalies in stream sediments and soils. Mineralization consisting of gold, arsenic and copper occurs in quartz veins and enveloping country rock. The quartz veins are hosted in grey-green phyllites, presumed to be of the Vampire Group volcano-sedimentary package of rocks.

Exploration work in 2009 focused on the Culvert Claims, while work in 2010 focused primarily on the Rubus, Sheer, LH and Swag claims. Between July 23 and September 2, 2010, Gary Lee and Bob Scott conducted a reconnaissance exploration program throughout the claim area with a focus on precious metal mineralization and precious metals bearing structures. The 2010 program consisted of the collection of 23 rock samples, 46 soil samples and 40 stream sediment samples. As well, 760 m of grid was established and surveyed for magnetics and VLF-EM.

This assessment report summarizes the known geology, mineralization, and exploration potential for a contiguous set of mineral claims known as the Little Hyland Project. All information was supplied by Mr. Lee. Original analytical certificates used in the report were provided by ALS Chemex. Other information used in the preparation of the report includes government publications and assessment reports in the public domain. The author, Scott G. Casselman, P.Geo., of Casselman Geological Services Ltd. of Whitehorse, was retained to complete this report. The author has not visited the property.

While reasonable care has been taken in the preparation of this report, the author cannot guarantee the accuracy or completeness of all supporting documentation. The interpretation, conclusions, and recommendations expressed herein are those of the author and may or may not reflect the views of Mr. Lee or Mr. Scott. It is believed that the information contained in this document is reliable under the conditions and subject to the limitations of this document.

2.0 PROPERTY LOCATION and ACCESS

The Little Hyland Project is located approximately 205 kilometres north of the community of Watson Lake (Figure 1) and 10 kilometres west of the mining community of Tungsten in the Northwest Territories. The property is centred at 62^{o} 00' N latitude and 128^{o} 30' W longitude on NTS map sheets 105H15, 16, 105I01 and 02 in the Little Hyland River valley.

The property is most easily accessed via the all-season, gravel surface, Nahanni Range Road from kilometre 110 of the Robert Campbell Highway. The property straddles the Nahanni Range Road, and at kilometre 165, an ATV trail leaves the road to gain access to the southeastern portion of the property. The Howards' Pass winter trail runs along the southwestern margin of the Rubus claims and provides ATV access in this region. A temporary exploration camp was situated in the central part of the property on the LH 37 claim.

The nearest community is Watson Lake, which has a population of approximately 1,200 people and lies on Highway 3 (Alaska Highway). Watson Lake is the main supply centre for the region.

3.0 CLAIM INFORMATION

The Golden Culvert property consists of 203 unsurveyed quartz claims staked in accordance with the Yukon Quartz Mining Act in the Watson Lake Mining District. Claim ownership is variable and as listed in Table 2. Claim details are listed in the Table 1, below, and are shown in Figure 2.

Table 1: Claim Information

Grant #	Claim Name	Claim Ownership	ExpiryDate
YC29100	CULVERT 1	Gary Lee - 50%, Robert R. Scott - 50%	22/07/2021
YC31957	CULVERT 2	Gary Lee - 50%, Robert R. Scott - 50%	11/09/2020
YC31958 - YC31960	CULVERT 4 - 6	Gary Lee - 50%, Robert R. Scott - 50%	11/09/2020
YC31961–YC31964	CULVERT 9 - 12	Gary Lee - 50%, Robert R. Scott - 50%	11/09/2020
YC71979	CULVERT 3	Gary Lee - 50%, Robert R. Scott - 50%	17/09/2021

YD29576 - YD31310	RUBUS 1 - 60	Gary Lee - 100%	10/08/2011

The land in which the mineral claims are situated is Crown Land and falls under the jurisdiction of the Yukon Government.

Mssrs' Lee, Stack and Scott are also joint owners of the Red Bluff 1-4 claims, the Zanzibar 1-4 claims and the RE 1 and 2 claims located south of the Little Hyland Project area. These claims are not contiguous with the Little Hyland Project claims. No work was done on the Red Bluff or Zanzibar claims in 2010. The RE claims were staked in 2010 and subsequently 2 rock samples were collected. A map showing the locations of the seven samples is included in this report, although this work has not been filed for assessment work as of the date of writing.

4.0 PHYSIOGRAPHY, VEGETATION and CLIMATE

The property is located in the Logan Mountains of the eastern Yukon. The topography in the area is broad, U-shaped valleys between steep mountains. Elevations on the property range from 1200 to 1750 metres above sea level. The lower elevations are covered with spruce and pine forests grading upwards to willows, dwarf birch, grasses, moss and lichens. Steeper slopes are covered by talus and felsenmeer.

The area receives generally high annual precipitation (approximately 450 millimetres) as compared to the Yukon average. Snow generally begins accumulating in alpine areas in late September, while the snow pack starts to recede in late April to early May, allowing fieldwork to commence at lower elevations in mid-May. Temperatures range from $+30^{o}$, in the summer months, to -50^{o} Celsius, in the winter months.

5.0 EXPLORATION HISTORY

The region has a long history of exploration beginning with the discovery of the Tungsten Mine in 1954 and the initiation of production in 1962. The Little Hyland Project Area, however, does not have a considerable documented history of exploration, prior to the activities of Mr. Lee and Mr. Scott.

The Yukon Minfile (DIAND, 2002) lists one mineral occurrence within 5 km of the property; the Ricardo Showing. It occurs approximately 3 km south of the project area and is described as an unmineralized ferricrete gossan occurring within an area underlain by Cretaceous granodiorite that intrudes Cambrian slates and phyllites. The gossan was originally staked by Canada Tungsten Mining Corporation Ltd in 1961. There is no record of Canada Tungsten doing any additional work on the property and it was later allowed to lapse.

The Ricardo Showing was later re-staked by Mr. A. Black, in 1980, as the Kay claims, then in 1981 as the Lynx claims by Mr. E. Broadhagen. In each case there is no record of work being performed on the property and the claims were allowed to lapse.

The most significant exploration activity in the area has been at the Tuna property, located 12 km southeast of the project area. It was originally staked in 1981 by Union Carbide Exploration Ltd and has been explored for placer gold, skarn-type tungsten, and lode gold. The property is underlain by a Cretaceous granodiorite stock that intrudes Cambrian slates, phyllites and siltstones of the Hyland Formation. Union Carbide performed stream sediment sampling, rock and soil sampling, geological mapping and prospecting on the property in 1982. This work identified numerous scheelite, molybdenite and chalcopyrite mineralized occurrences, often associated with quartz-tourmaline veins. However, Union Carbide later allowed the claims to lapse.

In 1989, Noranda Exploration Canada Limited re-staked the Tuna property but did not perform any work. These claims were also allowed to lapse. The property was subsequently staked by Kokanee Explorations Ltd in 1991. Kokanee conducted a program of prospecting, mapping and sampling in 1992. The company changed its' name to Consolidated Ramrod Gold Corporation later that year. In 1993, Consolidated Ramrod performed a limited amount of lithogeochemical and stream sediment sampling, which returned weak to moderately anomalous gold results.

Gold was first discovered by Robert Scott while panning in the creek at the culvert on the Nahanni Range road in 1984. The first Golden Culvert claims were staked in September of 2005 and added on to in 2006, 2008, 2009 and 2010. In 2006, 2007, 2008 and 2009 Mr. Lee conducted exploration programs predominantly on the Culvert claims consisting of prospecting, stream sediment, soil and rock sampling. This work returned anomalous gold and arsenic values.

6.0 GEOLOGICAL SETTING

The following text is reprinted from recent assessment reports on the property, originally sourced from regional geological maps by Gordey et al, 2000 and descriptions by Heon, 2007, and Hart and Lewis, 2005. The description of the property geology reports on the limited number of hand samples submitted to the author for evaluation and offers possible deposit types for the occurrence of gold on the property.

6.1 Regional Geological Setting

The Little Hyland Project area is located in the Selwyn Basin in the eastern Yukon. The Selwyn Basin is part of the cordilleran miogeocline and is characterized by thick accumulations of clastic sediments, with a significant component of deepwater black shales and cherts (Heon, 2007). These basinal rocks interfinger with and are bound by shallower-water platformal carbonates (Figure 3). The Selwyn Basin is bound to the north by the Dawson Fault, grades into platformal facies to the east (Mackenzie Platform) and southwest (Cassiar Platform), may be bound by a Mesozoic thrust fault separating it from Yukon-Tanana Terrane in the Anvil district, and is offset to the southwest by the Tintina Fault. The sediments range in age from Precambrian to Jurassic (Heon, 2007) and lie within the Omineca Belt of the Northern Cordillera (Hart, 2002).

The eastern part of the Little Hyland Project area is underlain by Upper Proterozoic to Lower Cambrian dark brown, fine-grained and thinly-bedded, argillaceous sandstone and siltstone with minor, interbedded, medium- to coarse grained, white to light grey orthoquartzite, phyllite, slate and argillite of the Vampire Formation (uPCV). The western part of the property is underlain by thinly to thickly bedded brown to pale green shales, fine- to coarse-grained quartz-rich sandstones, quartz-pebble conglomerates, minor argillaceous limestones, phyllites, quartzo-feldspathic and micaceous psammites, gritty psammites, and minor marbles of the Upper Proterozoic to Lower Cambrian Narchilla Formation of the Hyland Group (PCHn) (Gordey, et. al., 2000).

Northeast of the property, in the area of the Tungsten Mine, younger sedimentary rocks of the Lower Cambrian Sekwi Formation (lCS), the Lower Cambrian Gull Lake Formation (lCG), the Upper Cambrian to Ordovician Rabbitkettle Formation (COR) and the Ordovician to Lower Devonian Road River Formation (ODR) occur. The Sekwi Formation consists of limestone conglomerates, massive grey dolostones, medium- to thickly-bedded quartz sandstones, purple siltstones with bright orange weathering, and finely-crystalline dolostones. The Gull Lake Formation consists of shales, siltstones and mudstones; minor quartz sandstones; rare green-grey cherts; local basal limestone and limestone conglomerates; and phyllites to quartz-muscovite-biotite schists. These units are overlain by thinly-bedded, wavy, banded, silty limestones and grey lustrous calcareous phyllites; limestone; intraclast breccias and conglomerates; massive to laminated, grey quartzose siltstones and cherts; rare black slates; and local mafic flows, breccias, and tuffs of the Rabbitkettle Formation. The Rabbitkettle Formation is, in turn, overlain by black-, gun-blue-, or silvery-white-weathering of black graptolitic shales and

cherts; resistant grey weathering of medium to thinly-bedded, light grey to black, greenish grey, or turquoise cherts; and minor argillaceous limestones of the Road River Formation.

This package of sedimentary rocks is intruded by resistant, blocky, fine to coarse grained, equigranular to K-feldspar porphyritic, biotite-quartz monzonite and granodiorite; minor quartz diorite; minor leuco-quartz monzonite; and syenite of the mid-Cretaceous Selwyn Plutonic Suite. It is often contended that these intrusions have driven gold-bearing mineralizing fluids to the area of the Little Hyland Project but the intrusions have not been discovered in the immediate are of the property to date. However, the northwest-trending thrust faults that dominate the structural pattern in the region contain sutures that may play host to gold mineralization under a Mesozoic gold model. The March Fault is a thrust fault that runs along the western part of the Little Hyland Project area and may be form a structural control for precious metals mineralization.

The most significant mineralization in the area are the ore bodies of the Tungsten Mine. The ore was formed in carbonate-bearing sedimentary rocks by tungsten-bearing fluids of mid-Cretaceous Selwyn Suite intrusions. The result was tungsten-rich, pyrrhotite skarns along the margins of the intrusions. The original, pre-production resource at the Tungsten Mine was 9 Mt with a grade of 1.42% WO_3.

At the Tuna property, molybdenite, scheelite, arsenopyrite, bismuthinite, chalcopyrite, chalcocite, pyrrhotite, gold and silver occur in quartz and quartz-tourmaline veins and in small skarn alteration zones along the margins of the Hyland Intrusion (Doherty and vanRanden, 1994).

6.2 Property Geology and Mineralization

The Little Hyland Project area has not been geologically mapped in any detail. According to the regional geology of the area it is underlain predominantly by sedimentary rocks of the Vampire Formation (uPCV) to the east and Narchilla Formation (PCHn) rocks to the west. Regional airborne magnetic survey maps show moderately-strong, northwest-trending magnetic features that transect the property; the cause of the features are postulated to be either from a buried intrusion, a regional structure, a lithologic change, or broad alteration assemblages. Any of these causes, or a combination of these causes could be factors in mineralizing events in the area.

Rock types reported to exist on the property are phyllitic to schistose argillite and siltstone. Historically, significant gold mineralization was noted to occur primarily in quartz veins within these rocks. Representative rock samples collected during the 2009 and 2010 exploration program have been provided by Mr. Lee for examination.

Hand samples of sericite-phyllite contained as much as 5% combined pyrite and arsenopyrite, both occurring in the host rock as well as in veins. Typically, pyrite is medium- to coarse-grained and euhedral, suggesting it is late in the paragenetic sequence. However, in one instance pyrite was overgrown by arsenopyrite. The mode of occurrence of arsenopyrite ranges from semi-massive (sample RS-14), fine-grained fracture fillings and medium-grained disseminations within quartz veins (sample RS-44), to locally-clustered masses of euhedral needles and coarser grains within the host. Although no chalcopyrite was seen in hand-sample, malachite staining is reported to exist on the property.

Most quartz veins were seen to be sub-parallel to phyllite foliation but had clearly experienced early ductile folding and boudinaging prior to late-stage brittle offset. At least two crosscutting vein sets orthogonal to schistocity, exhibited in sample RS-53, as well as a strongly-lineated structure shown in sample RS-55, imply a poly-deformational history to these rocks. A relatively undeformed, late tension vein, lacking sulphides is the latest veining event noted. A deeper understanding the structural history of these rocks, as it relates to vein mineralization, should be a focus of future exploration at the site.

Alteration in these rocks was noted as predominantly sericitic. Fine-grained muscovite is formed in phyllic alteration, along with minor quartz, chlorite, and pyrite. Calcite and iron-carbonate was also noted in veins, indicating carbonitization as a minor alteration assemblage.

Geologists from Rimfire Minerals Ltd. visited the Main Showing on the Culvert claims and collected two samples, G071512 and G071513, which assayed 22.8 g/t and 8.91 g/t gold (respectively). These samples were described as:

G071512

A well developed, 1 metre thick, (strike 252, dip 78), white sugary to granular (recrystallized) quartz vein with sharp margins, discordant to cleavage. Arsenopyrite as medium, crystalline to fine-grained bands. Pyrite is disseminated in cubes and local crystal aggregates.

G071513

White quartz vein (60 centimetres thick, strike 112, dip vertical) with very fine-grained arsenopyrite bands, scorodite developed, possible sericite alteration of siltstone, and trace arsenopyrite needles in siltstone. Some quartz is sugary (recrystallized).

Rimfire also noted slightly-discordant stringers, ranging from 3 millimetres to 2 centimetres, in the acute angle formed by the veins sampled.

Although the highest gold assays have historically originated from samples take from quartz veins, country rock on the property has been shown to be mineralized. Sample RS-57, collected in 2009 on the Culvert Claims, from immediately southeast of the main showing assayed 1.285 g/t gold from an almost 2.5 metre chip sample of host rock material adjacent to a mineralized vein.

7.0 2009 EXPLORATION PROGRAM

Between July 23 and September 2 of 2010, Gary Lee and Bob Scott conducted an exploration program on the Little Hyland Project claims. The 2010 program consisted of prospecting and the collection of 23 rock samples, 46 soil samples and 40 stream sediment samples. As well, 760 m of grid was established and surveyed for magnetics and VLF-EM. The program covered a large area, which is shown on the Work Index Map, Figure 4.

8.0 GEOCHEMICAL ANALYTICAL PROCEDURE

Samples from the 2010 program were sent to ALS Chemex Labs in North Vancouver. The soil and stream sediment samples were handled in the same manner. The samples were sieved in a 180 um sieve then analysed for 48 elements by four acid digestion with Inductively Coupled Plasma Mass Spectroscopy (ICP-MS) according to the ME-ICP41 procedure. As well, each sample was analysed for gold by fire assay with atomic absorption finish according to the Au-ICP21 procedure.

Rock samples were processed by crushing to 70% < 2 mm and pulverizing 200 grams of the < 2 mm material to 85% < 75 um according to the Prep 21 lab procedure. The pulverized material was then analysed by ME-ICP41 for 48 elements and for gold by Au-ICP21 as for the soil and stream sediments.

Analytical certificates are included in Appendix III and plots of sample locations, gold and arsenic results are included with samples collected from previous years in Figures 4 through 12 and Figures 15 through 17.

9.0 RESULTS

9.1 Regional Stream Sediment Sampling Results (Figures 5 and 6)

Figures 5 and 6 show project wide stream sediment sampling results and plot samples collected in 2009 and 2010 along with samples collected by the Regional Geochemical Survey (RGS) samples collected by the Geological Survey of Canada. The statistics were calculated using all the 2009 and 2010 values plus the RGS values in the immediate Selwyn Basin area for NTS sheets 105H and 105I. The population of the data set was 662 samples. All samples were plotted using the same percentile ranges as shown on the map. The data for gold and arsenic was plotted with the values below the 90^{th} percentile being considered not anomalous; values between the 90^{th} and 95^{th} percentile are considered mildly anomalous; values between the 95^{th} and 99^{th} percentile are considered moderately anomalous; and values greater than the 99^{th} percentile are considered highly anomalous.

The plot for gold, Figure 5, illustrates that anomalous gold occurs in stream sediments samples along the length of the property, with a few anomalous samples south of the property, in the area of the Red Bluff, Zanzibar and RE claims. The RGS samples collected from outside of the project area help to illustrate the significance of the gold anomalies on and around the claims area.

The plot for arsenic, Figure 6, illustrates a similar pattern to the gold plot, but it shows particularly consistent anomalous results in the northern part of the claim block on the Rubus claims and strong arsenic anomalies south of the claims.

9.2 Rubus Area Results

Figures 7, 8 and 9 are detailed sample maps of the Rubus Area. Figure 7 shows the distribution of rock, soil and stream sediment samples. Figures 8 and 9 show, in detail the stream sediment dot plots for gold and arsenic, respectively. Also listed on these maps is the one rock sample that was anomalous for arsenic (5060 ppm) and gold (315 ppb). The soil samples collected in the Rubus Area (5 samples) did not return any anomalous values.

The Rubus Area stands out as being significantly anomalous for arsenic (Figure 9). Of the 40 stream sediment samples collected in the Rubus Area, 17 were anomalous. Of these, two streams in the central part of the claim block were anomalous for significant stretches of the stream. This would indicate that there is a significant source of arsenic (arsenopyrite?) in the central portion of the Rubus claim block.

Gold values from stream sediments in the Rubus Area returned a few scattered anomalous along the trend. The anomalous gold values are weakly correlatable with arsenic, however, there is not a strong direct correlation.

9.3 Road Showing Results

The work conducted on the Road Showing was a follow-up to work conducted there in 2009. In 2009, a number of samples were collected in a pit bank along the side of the road. They include massive arsenopyrite float (sample RS14); pyrite-arsenopyrite-quartz vein float (sample RS-44); and quartz-pyrite-galena float (sample RS-43). These samples returned 0.365 ppm gold, 0.442 ppm gold, and 0.748 ppm gold, respectively. Another float sample from 2009 (sample RS23) returned 4.03% lead with 24.4 g/t silver and sample RS43 returned 0.95% lead, 0.78% zinc and 20.2 g/t silver. Also of potential significance, sample RS44 was of a quartz pebble conglomerate. Regionally this rock type is attributed to the Yusezyu Formation of the Hyland Group. This unit has been reported to be significant at gold occurrences in the region, such as at the 3 Ace Property of Northern Tiger Resources.

The 2010 program attempted to locate the bedrock source of these anomalous samples. Two parallel lines of soil samples were established. These were spaced 75 metres apart and oriented across the regional strike of major structures. As well, a VLF-EM electromagnetic survey and Field Magnetic Survey were performed on these lines.

Figure 10 shows the location of 2009 and 2010 stream sediment, soil and rock samples from the Road Showing area and shows the location of the geophysical survey lines. Figures 11 and 12 are dot plots of the gold and arsenic in soil samples, respectively. Figure 13 is a plot of the magnetic survey results and Figure 14 shows the VLF-EM survey data.

The soil sample results show a distinct strong arsenic anomaly at the western side of the grid. This anomaly is in the same area that the massive sulphide float boulder, RS 14, was discovered. This area is also moderately anomalous for gold.

The magnetic field survey was of limited scope, but is does indicate a magnetic gradient perpendicular to the grid line orientation with a break in magnetic field strength at the approximate location of the soil anomalies.

The VLF-EM survey was also limited in scope, but did identify two sub-parallel conductors that are marked by In Phase/Quadrature crossovers on each of the two survey lines. The western-most conductor corresponds well with the area of anomalous gold and arsenic in soil samples and the location of the arsenopyrite float samples.

The coincidence of the gold and arsenic in soil, the magnetic anomaly and VLF-EM conductors indicate that the source of the massive arsenopyrite float boulders may be local.

9.4 Culvert Road Area Results

A series of 13 soil samples and one rock sample were collected on the Culvert claims near the road (Figure 15). This line of samples was collected to test the area where the March Fault is projected to occur and where there is a break in the magnetic field. One soil sample returned a moderately anomalous value of 0.021 ppm gold. But all other values were less than 0.003 ppm gold. Arsenic values were all quite low. The rock sample was not anomalous for gold or arsenic.

This area is in the valley bottom and is underlain by significant valley fill. Thus soil sampling in this area may be hampered by significant accumulations of culluvium.

9.5 Culvert East Area Results

A series of 8 soil samples an two rock samples were collected in the Culvert East area (Figure 16). The soil sampling program returned a number of samples anomalous for gold (0.025 to 0.076 ppm) and arsenic (63 to 1700 ppm) at the western edge of the line. Rock sample GL1OC returned 0.526 ppm gold and 2570 ppm arsenic. For the limited amount of work in this area these results are significant.

The soil anomaly is open to the west and should be followed up with an expansion of the grid westward and with parallel lines to the north and south. Additional prospecting and mapping in the area may help to locate the source of the gold mineralization.

9.6 RE Claims Results

Seven rock samples were collected in the area of the RE 1 and 2 claims in 2009 (5 samples) and 2010 (2 samples). The most significant result was 0.205 ppm gold with 119 ppm arsenic from 2009 sample RS18. This result is weak and would be classified as a low priority target for follow-up work.

10.0 CONCLUSIONS and RECOMMENDATIONS

Work conducted during the 2010 field season resulted in the identification of a region with significant arsenic enrichment as defined by stream sediment results. This region is also anomalous in gold.

Work on the Culvert claims in 2009 identified gold in the phyllites which was postulated to represent a mesothermal gold-quartz vein style occurence. Also known as shear-hosted gold, this deposit type occurs in any of a variety of greenschist-grade rocks, and occurs in proximity to steep faults or sutures of ancient continental margin collision zones. Gold, pyrite, and arsenopyrite are essential minerals of this deposit type occurring chiefly in quartz veins deposited within faults and joint systems. In the process of vein emplacement, wallrock is silicified, pyritized and/or sericitized inside a broad halo of carbonitization.

The more detailed work at the Road Showing returned results that confirm the presence of anomalous gold associated with massive arsenopyrite and quartz-pyrite-arsenopyrite veining. The Rubus area returned abundant arsenic-in stream sediment anomalies far to the northern end of the property. This extends the mineralized trend from the southern edge of the Culvert claims through the property to the northern part of the Rubus claims, a distance of 15 kilometres.

The arsenic and gold stream sediment anomalies and mineralization in rock samples is, in general proximal to the March Fault and/or proximal to the contact between the Vampire Formation and Narchilla Formation of the Hyland Group. This relationship is believed to be important. Also important may be the proximity of Cretaceous Intrusions, however this has not been observed by direct relationships on the property to date.

Arsenic is a significant path finder element for Mesothermal Gold deposits and is significantly more mobile than gold. For this reason, all arsenic anomalies are significant and should be followed-up, regardless of whether there is gold associated with any individual sample. Also the mineralized structures that form the hosts for this style of mineralization will be variably mineralized with arsenic, gold and other pathfinder minerals. One can expect that certain areas will be weaker, while other a stronger in metal concentration. For this reason, explorers must remain encouraged and follow-up any concentrations of precious metals or pathfinder elements along the mineralized trend.

Recommendations for future work on the property include:

i) Follow up the significant arsenic and gold stream sediment sample results from throughout the area and expand the stream sediment sampling pattern northwards.
ii) Expand the survey grid at the Road Showing with more soil samples and more VLF-Em and Magnetic Surveying.
iii) Trenching at the Road Showing to look for the source of the massive arsenopyrite, the arsenopyrite-pyrite quartz veins and the lead-zinc-silver mineralization.
iv) Prospecting has proven effective at locating gold-bearing quartz veins at high elevations, where overburden is thinner and should be continued.
v) Property-wide geologic and alteration mapping, focussing on detailed structural measurements and interpretation, which may be helpful in locating vein sets and predicting mineralization.
vi) Induced Polarization geophysics to delineate chargeable sulphide-bearing and clay altered zones and to delineate resistive silica-flooded zones.
vii) If results from this work continue to be encouraging a diamond drill program would be warranted.

STATEMENT OF QUALIFICATIONS

STATEMENT OF QUALIFICATIONS

I, Scott Casselman, of 33 Firth Road, Whitehorse, Yukon Territory, certify that

1) I am a geologist employed by Casselman Geological Services Ltd. of Whitehorse, Yukon Territory.

2) I graduated from Carleton University in Ottawa, Ontario with a Bachelor of Science Degree in Geology in 1985 and have worked as a geologist since that time

3) I am a Professional Geoscientist registered with the Association of Professional Engineers and Geoscientists of British Columbia, Registration No. 20032.

4) I am responsible for preparation of this report based on information provided to me by Mr. Gary Lee and on original analytical certificates provided by ALS Chemex laboratories Ltd.

5) I have not visited the Little Hyland Project area.

RUFL 8	524618	6878893	Float	Rusty fine grained grey rock with pyrite, minor quartz and yellowish green scordite stain in mini slide	0.315
RUFL 9	524163	6879673	Float	Brown & yellowish rusty quartz in vuggy shaley phyllite	0.002
RUFL 10	524375	6879296	Float	Rusty brown quartz vuggy from creek	0.002
RUFL 11	523892	6877664	Float	Large quartz exposure, rusty brown patches plus green specs @ base of esker	0.001
RUFL 12	523869	6877732	Float	4 ft.x 5 ft. mafic black boulder, rusty, brownish black, may be ultra mafic	<0.001
RUFL 13	523501	6880342	Float	Rusty quartz (5 inch diameter)	<0.001
RUFL 14	523803	6880380	Float	Rusty quartz from creek	<0.001
RUFL 15	525373	6876789	Float	Rusty grey quartz boulder (2 ft x 3 ft) with pyrite	0.004
RUFL 16	525565	6876573	Float	Rusty quartz boulder (8 inch diameter)	<0.001
RUFL 17	522197	6880287	Float	Rusty folded quartz bands	0.002
GL6RF	531720	6868427	Float	Rusty quartz – Golden culvert (73)	0.002
GL7RF	526097	6875646	Float	Rusty quartz conglomerate (line 1 geophysics)	0.001
GL8RF	529639	6868037	Float	Rusty quartz with large pyrite crystals on west side of road (km 166) opposite picket L17+00W, 5 + 50 N	0.001
GL9RF	534593	6862052	Float	Rusty & yellow partially decomposed quartz occurrence with 1 inch black bands on RE 2 claim opposite km 158 Nahanni Range Road (NRR)	0.038
GL20C	534652	6862073	Outcrop	Red stained rock (red bluffs) with yellow, grey, black and quartz bands on RE 2 claim opposite km 158 NRR.	0.005
GL10C	531106	6868887	Outcrop	Green phyllite with arsenopyrite needles beside creek near main golden culvert showing. 2 metres from main quartz outcrop in phyllitic	0.526

Note: GL10C was mislabeled on assay report as G210C

2009 Rock Sample Descriptions

Sample	East	North	Type	Description	Au (ppm)
GL1RF	533832	6862737	float	Orangish tan, porous rock with quartz pebbles and boulders to 50cm.	0.001
GL2RF	531657	6865596	float	Quartzite grit, fine grain pyrite and quartz, minor rust.	0.001
GL3RF	526009	6875662	float	Quartz pebble conglomerate - float from Borrow Pit, east of hwy.	0.001
GL4RF	526123	6875915	float	Rusty quartz pebble conglomerate. Hard.	0.003
GL5RF	535160	6859792	float	Quartz float below quartz vein that can be seen from	0.001
RS1	531145	6876657	outcrop	Quartz vein. Rusty, cooked, brecciated with fine grain	0.005
RS2	529014	6877572	outcrop	Rusty quartz vein in shale.	0.001
RS3	529112	6877189	outcrop	Rusty quartz vein (2ft wide) in black shale.	0.006
RS4	528212	6878269	outcrop	Rusty quartz vein.	0.001
RS5	527042	6872442	outcrop	Quartz pebble conglomerate - rusty, bedded in phyllites	0.001
RS6	527625	6872702	outcrop	Quartz/calcite lens in pale green phyllite. Chalcopyrite & hematite.	0.003
RS7	527951	6873184	outcrop	Quartz vein, 2ft wide, rusty.	0.001
RS8A	528074	6872961	outcrop	Quartz vein (1m wide) with broken-up, scattered	0.027
RS8B	528074	6872961	outcrop	Pale green, intrusive dyke.	0.001
RS9	528808	6871621	outcrop	Sheared quartz vein, altered phyllite, Cu staining (malachite) + chalcopyrite.	0.005
RS10A	529316	6871803	float	Quartz + arsenopyrite float in 20ft shear	0.139
RS10B	529316	6871803	outcrop	Arsenopyrite in altered phyllite.	0.004
RS11	534212	6864096	outcrop	Rusty quartz vein (1m wide, 6m long?), strike 340 deg.	0.005
RS12	532734	6866960	outcrop	Rusty quartz vein, 2 inches wide, in green green phyllite + arsenopyrite	0.008
RS13	532734	6866958	float	Sheared green phyllite in quartz vein.	0.086
RS14	526002	6875668	float	Massive arsenopyrite float with quartz in Borrow Pit east of road.	0.365
RS15	526729	6877002	float	Massive pyrrhotite boulder with quartz.	0.107
RS16	527353	6877163	outcrop	Quartz stringers in black shale cutting across bedding.	0.003
RS17	534333	6864493	outcrop	Quartz veins in sheared green slate 1-2 inches wide, 40ft	0.001
RS18	534590	6862139	outcrop	Brittle quartz vein with yellow staining, 30 ft from contact.	0.205
RS19	534592	6862113	outcrop	Small, dense, black vein (0.5 inch) in altered intrusive.	0.005
RS20	534594	6862090	float	Rusty quartz float with minor pyrite. Dense.	0.003
RS21	534664	6862036	outcrop	Contact between phyllite and intrusives. Rusty red and	0.004
RS22	534715	6861963	outcrop	Quartz vein - 20ft wide by 150ft long.	0.005
RS23	526420	6875134	float	Quartz float in gray slate talus (8ft wide). Galena and minor pyrite.	0.005
RS24	527004	6875185	outcrop	Chip across 2ft quartz vein in gray phyllite.	0.002
RS25	526942	6875226	float	Quartz float, rusty, arsenopyrite.	0.067
RS26	536729	6858502	outcrop	Pyrite, pyrrhotite skarn in phyllite (8 inches by 40 inches)	0.001
RS27	536856	6858796	outcrop	Rusty shale, dense (30ft thick).	0.002
RS28	536607	6858444	outcrop	Rusty quartz vein (1-3ft wide, 60ft long)	0.001
RS29	536546	6858343	outcrop	Quartz flooded knob (120x50ft) with cross-cutting veins (1-3ft). Quartz breccia?	0.001
RS30	536360	6859394	outcrop	Quartz stringers in gray mudstone. Dense, 2ft wide in gully near intrusive.	0.001
RS31	536349	6859369	outcrop	Dense, fine grained black rock in quartz vein (REE?)	0.001
RS32	536322	6859384	outcrop	Chip sample across 4ft quartz vein in intrusive. Rusty	0.002
RS33	538075	6855953	outcrop	Altered intrusive with veins of tourmaline or black tin (cassiterite?) in slide rock. Tuna Stock.	0.001
RS34	526411	6869457	float	Quartz boulder with green phyllite fragments (3ft).	0.001

RS35	527108	6875352	float	Arsenopyrite in quartz float downhill in talus for 120m. Sample of quartz in angular boulder (2ft). Arsenopyrite +	0.924
RS36	527324	6875253	outcrop	1ft chip across shear in green slate, clay gouge + quartz veinlets + pyrite.	1.485
RS43	525978	6875650	float	Qtz-Py-Galena float, rusty. Conglomerate zone near Hwy.	0.748
RS44	526013	6875654	outcrop	Quartz pebble conglomerate, 1/8 inch vein with galena + pyrite float. Conglomerate zone near Hwy.	0.442
RS45	526002	6875615	float	Quartz float, 6 inch, angular quartz with arsenopyrite. Conglomerate zone near Hwy.	0.025
RS48	526670	6876924		1.5m chip on rusty quartz vein in black shale + silicified wall rock.	0.001
RS49	527274	6877126		Angular gabbro boulders - Cu stained and fine grain. Chalcopyrite - 45m NE Ron's plug (Intrusive at bend in Cantung road 50m from road. Gabbro? Pyroxenite?	0.001
RS51	527505	6876664	float	Net texture sulphides in rusty Gabbro. Pyrrhotite, Cu, magnetite in boulder field above little round lake.	0.001
RS52	527441	6876473		Black chert with fine grain calc	0.001
RS61A	529461	6871970	outcrop	4 quartz veins in folded phyllite, 10inches to 2ft wide. Altered wall rock has As. Total width of ABCD is apx 35ft.	0.43
RS61B	529461	6871970	outcrop	4 quartz veins in folded phyllite, 10inches to 2ft wide. Altered wall rock has As. Total width of ABCD is apx 35ft.	0.265
RS61C	529461	6871970	outcrop	4 quartz veins in folded phyllite, 10inches to 2ft wide. Altered wall rock has As. Total width of ABCD is apx 35ft.	0.266
RS61D	529461	6871970	outcrop	4 quartz veins in folded phyllite, 10inches to 2ft wide. Altered wall rock has As. Total width of ABCD is apx 35ft.	0.083
RS62	529966	6872606	float	Intrusive - Rusty pyrite, pyrrhotite float near quartz knob.	0.011
RS63	529494	6872051	float	Quartz boulder 2ft x 3ft, angular + phyllite, arsenopyrite + pyrite	0.877
RS70	527870	6875967	?Outcro	Rusty, intrusive. Quartz + Pyrite + Chalcopyrite??	0.033
RS72	526779	6878375	outcrop	Black intrusive/volcanics? Rock- soft. Cpy - fine grained. 6ft dyke? Sill? In granite. Strike 213 deg, dip 90 deg.	0.004
RS73	526706	6878230	outcrop	Quartz vein (15 inches wide) with azurite + Cpy + Tetrahedrite. Strike 44 deg.	0.005
RS74	526714	6878218	outcrop	Quartz vein in shear on NW side of intrusion on contact with shale vein 2ft wide, dipping NW. Chip across 2ft. Patchy Cpy + Azurite (selective sample).	0.009
RS75	526725	6878222	float	Black mafic volcanic or pyroxenite float. Sulphides disseminated (source from cliff face 30m up).	0.001
RS76	526894	6878142	float	Fine grained Intrusive with 5% sulphides. Float on Swag Mountain slope.	0.001

2009 Stream Sediment Sample Descriptions

Sample	East	North	Description	Au (ppm)	As (ppm)
GL1STM	531094	6876506	In tight valley with no glacial debris, north of Tungsten Rd. (-14 MESH)	0.015	29
GL2STM	531023	6876489	In tight valley with no glacial debris, north of Tungsten Rd. (-14 MESH)	0.006	50
GL3STM	530677	6876453	In tight valley with no glacial debris, north of Tungsten Rd. (-14 MESH)	0.003	29
GL4STM	528943	6876954	In tight valley with no glacial debris, north of Tungsten Rd. (-14 MESH)	0.045	37
GL5STM	529037	6877056	In tight valley with no glacial debris, north of Tungsten Rd. (-14 MESH)	0.005	34
GL6STM	528272	6877283	Drainages north of Tungsten Rd. Creek has jumped out of original	0.002	44
GL7STM	528427	6877567	Drainages north of Tungsten Rd. On upper part of fan - reflects	0.002	38
GL8STM	528028	6878180	Drainages north of Tungsten Rd. In steep-walled valley.	0.009	52
GL9STM	527882	6877858	Drainages north of Tungsten Rd. Side channel gravel and sand	0.006	51
GL10ST	527370	6878105	Drainages north of Tungsten Rd. On big drainage-side channel	0.005	59
GL11ST	527342	6877859	Drainages north of Tungsten Rd. Placer gravel behind big boulder	0.005	61
GL12ST	527032	6872621	Drainage east of Tungsten Rd. Washed gravel/sand out of moss - creek	NSS	80
GL13ST	527164	6872709	Drainage east of Tungsten Rd. Upstream of above in gravel.	0.004	88
GL14ST	527260	6871909	Drainage east of Tungsten Rd. Creek gravel where creek narrows.	0.002	21
GL15ST	527425	6872152	Drainage east of Tungsten Rd. Creek gravel at gentle bend.	0.01	45
GL16ST	528264	6872528	Drainage east of Tungsten Rd. Creek gravel below fork.	0.008	19
GL17ST	528238	6872539	Drainage east of Tungsten Rd. Creek gravel - underground stream	0.005	16
GL18ST	528641	6871832	Drainage east of Tungsten Rd. Creek gravel above junction of	0.05	128
GL19ST	528038	6871479	Drainage east of Tungsten Rd. Creek gravel.	0.006	74
GL20ST	527725	6870844	Drainage east of Tungsten Rd. Creek gravel above culvert.	0.085	64
GL21A ST	529303	6870543	Large Creek. Active sand bar 6 inches underwater, inside	0.001	13
GL21B ST	529303	6870543	Creek gravel.	0.003	12
GL22ST	533575	6863127	Creek bottom, rocky, sieved -14 sand from bottom of creek pool.	0.002	36
GL23ST	533721	6863430	Creek gravel/sand from bottom of pool. Panned minor black	0.003	27
GL24ST	532792	6862812	Creek gravel east of hwy.	0.001	21
GL25ST	531784	6865854	Creek gravel + moss (-12). Panned Au (10x).	0.002	11
GL26ST	531700	6866180	Creek gravel (-12). Panned Au (10x).	0.001	12
GL27ST	532095	6866703	Creek gravel and moss at bend (march trend).	0.015	40
GL28ST	532263	6866248	Creek gravel (underground stream 4.70m) -12.	0.001	16
GL29ST	532325	6866052	Creek gravel.	0.004	20
GL30ST	531813	6865732	Moss and mud in trees.	0.003	10
GL31ST	528411	6877091	Little Hyland River 30m north of culvert. Creek gravel - bar.	0.007	20
GL32ST	528183	6877132	Creek gravel north of culvert. Panned minor black sand + 2 Au	0.016	35
GL33ST	526618	6876702	Small creek, gravel east of road.	0.001	28
GL34ST	526496	6876376	Same as above - main creek.	0.002	24
GL35ST	532868	6865674	Creek gravel/sand in big creek from east.	0.005	86
GL36ST	533018	6865685	Creek sand bar (Big creek from east).	0.359	93
GL37ST	533985	6865776	Creek gravel - big creek from east.	0.003	116
GL38ST	535962	6862128	Point bar, big creek, rusty rocks,	0.013	20
GL39ST	535506	6861936	Creek gravel, large creek, panned black sand.	0.002	21
GL40ST	534934	6861470	Creek gravel, large creek, panned black sand.	0.001	23
GL41ST	526452	6876312	Water flowing into east side of Rd (ditch). Mo-W Hill.	0.003	40
GL42ST	526259	6876099	Stream gravel in ditch at culvert. Mo-W Hill.	0.004	54
GL43ST	526123	6875915	Stream gravel in ditch at culvert. Pan Au? 10x.	0.006	70
GL44ST	525919	6875468	Stream in ditch at culvert.	0.003	88
GL45ST	537146	6857599	Black muck and gravel Willows.	0.003	25
GL46ST	538467	6857987	Rusty creek gravel, buckbrush, willows.	0.002	18
GL47ST	538436	6857900	Sand among boulders, large creek.	0.002	22
GL48ST	537935	6857667	Coarse gravel, fe fines, large creek.	0.007	22
GL49ST	537562	6857445	Sand bar above water, large creek.	0.006	28
GL50ST	535539	6858810	Creek gravel among moss covered boulders.	0.001	22
GL51ST	535489	6858585	Washed, submerged moss, grit	0.002	41

GL52ST	535696	6858394	Creek gravel.	0.002	16
GL53ST	535582	6858268	Creek gravel between large boulders.	0.001	15
GL54ST	537417	6855086	Creek gravel, large stream.	0.001	19
GL55ST	537376	6855481	Sand from ground seep.	0.003	16
GL56ST	537284	6855740	Creek gravel, uncharted creek.	0.002	16
GL57ST	537069	6856025	Creek gravel.	0.001	13
GL58ST	536863	6856093	Sand and gravel, dry creek bed	0.001	8
GL59ST	537037	6854370	Gravel below west of culvert.	0.002	13
GL60ST	536545	6855585	Creek gravel above east of culvert.	0.001	24
GL61ST	536265	6855989	Creek gravel below west of culvert.	0.003	20
GL62ST	535306	6858031	Creek gravel above east of culvert.	0.001	17
GL63ST	526399	6869949	Creek gravel, south tributary, small creek, black sand.	0.001	5
GL64ST	526412	6870047	Creek gravel in north tributary, small creek, black sand.	0.002	-2
GL65ST	526556	6870144	Creek gravel downstream of above, black sand.	0.002	4
GL66ST	526952	6870534	Creek gravel, big trib to Little Hyland from west, black sand.	0.048	23
GL67ST	526787	6876188	Creek gravel below west bowl, no black sand.	0.005	65
GL68ST	528100	6876880	Creek gravel, minor black sand, fair sample.	0.003	43
GL69ST	528073	6876454	Creek gravel, minor black sand, good sample.	0.002	52
GL70ST	528502	6876691	Creek gravel, opposite side of road on Little Hyland Rd.	0.001	18
GL71ST	525836	6874759	Creek gravel east (above) culvert.	0.002	84
GL72ST	526173	6873073	Sandy moss, under water.	0.002	23
GL73ST	526063	6873034	Creek gravel above east of culvert.	0.031	35
GL74ST	528646	6869937	Creek gravel, point bar, east of culvert, camp.	0.009	13
GL75ST	529126	6869198	Creek gravel below high arsenic, east of culvert.	0.007	48
GL76ST	529735	6867796	Creek gravel east of culvert, culvert creek.	0.034	50

Account: LEEGAR

CERTIFICATE WH10107987

Project:

P.O. No.:

This report is for 3 Rock samples submitted to our lab in Whitehorse, YT, Canada on 6-AUG-2010.

The following have access to data associated with this certificate:

GARY LEE	BOB SCOTT	

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
CRU-QC	Crushing QC Test
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
ME-ICP41	35 Element Aqua Regia ICP-AES	ICP-AES
Au-ICP21	Au 30g FA ICP-AES Finish	ICP-AES

To: **LEE, GARY**
P.O. BOX 31800
WHITEHORSE YT Y1A 6L3

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.

CERTIFICATE WH10123929

Project:

P.O. No.:

This report is for 19 Rock samples submitted to our lab in Whitehorse, YT, Canada on 3-SEP-2010.

The following have access to data associated with this certificate:

GARY LEE	BOB SCOTT	

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-22	Sample login - Rcd w/o BarCode
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-31	Pulverize split to 85% <75 um
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
ME-MS81	38 element fusion ICP-MS	ICP-MS
Au-ICP21	Au 30g FA ICP-AES Finish	ICP-AES
ME-ICP41	35 Element Aqua Regia ICP-AES	ICP-AES

APPENDIX IV

CREW LOG

Crew Log

Date	Activity	No. of person days	
		Gary Lee	Bob Scott
July 23	Expedite, load gear, mob; Whitehorse to Watson Lake	1	0
July 24	Finish Mob; pick up gear; drive to km 175 Nahanni Range Road – set up camp	1	0
July 25	Stake 2 quartz claims; Phil (Equity) arrived	0	0
July 26	Soil & rock sample south boundary of culvert claims	1	0
July 27	Recon Howard's Pass winter trail for ATV access and staked 2 quartz claims	0	0
July 28	Prepare for helicopter staking – write up & affix tags on 60 posts plus enter drop co-ordinates in GPS	0	0
July 29	Helicopter arrival cancelled due to forest fires; repaired creek crossing for access; plus set up tent for helper	1	0
July 30	No helicopter – staked 4 quartz claims	0	0
July 31	Stream sediment sampled plus prospected and rock sampled	1	0
Aug. 1	Blasted large boulders for access	1	1
Aug. 2	Stream sediment sampled and staked 4 quartz claims	0.5	0
Aug. 3	Helicopter arrived – staked 30 quartz claims plus rock and soil sampled	0	0
Aug. 4	Stream sediment sampled plus completed staking above	0.5	0
Aug. 5	Extended ATV access trail on Howards Pass winter trail – chain saw cut new trail past flooded areas	1	1
Aug. 6	Stream sediment sampled plus blasted new ATV trail past swamp	1	1
Aug. 7	Stream sediment and soil sampled plus new trail around swamp	1	1
Aug. 8	Stream sediment sampled plus staked 6 claims plus repaired mud hole on ATV trail	1	1
Aug. 9	Staked 2 quartz claims plus drive to Watson Lake for supplies and record claims (285 km)	0	0
Aug. 10	Pick up supplies in Watson Lake plus record claims and drive back to camp (285 km)	0	0
Aug. 11	Placer testing	0	0
Aug. 12	Placer testing	0	0
Aug. 13	Blasted extension of main gold showing and sampled for assay	1	1
Aug. 14	Placer testing and Bob demob to Whitehorse in afternoon	0	1
Aug. 15	Stream sediment and rock sampled & prospected	1	0
Aug. 16	Stream sediment, rock & soil sampled & prospected	1	0
Aug. 17	Stream sediment, rock & soil sampled & prospected	1	0

Aug. 18	Stream sediment sampled; pick up firewood; plot up sample locations	1	0
Aug. 19	Prospected and rock sampled	1	0
Aug. 20	Chain and flag line (L1) over high arsenic anomaly @ km 175 Nahanni Range Road plus experimented with VLF (for strike)	1	0
Aug. 21	Stream sediment and rock sampled	1	0
Aug. 22	Read VLF on L1 (km 175) & camp duties	1	0
Aug. 23	Soil sampled L1 (km 175) & finished VLF L1	1	0
Aug. 24	Stream sediment and rock sampling	1	0
Aug. 25	Stream sediment and rock sampling far north end	1	0
Aug. 26	Chain and flag L2 (km 175); soil sampling; read VLF	1	0
Aug. 27	Read mag. on L1 and L2 (km 175)	1	0
Aug. 28	Soil sampling at km 166 (high mag. and VLF)	1	0
Aug. 29	Take down extra tent & stake 2 quartz claims	0	0
Aug. 30	Prospected base of hill above old trail to Howard's Pass plus moved camp 17 km south	1	0
Aug. 31	Prospected, rock sampling and stake RE 1 & 2	0	0
Sept. 1	Demob to Watson Lake, record work on claims – Watson Lake Mining Recorder	1	0
Sept. 2	Sorted samples, demob to Whitehorse	1	0
		29	7
	Total Person Days	36 days
