Location – The Sulphur Project is located in the Dawson Mining District along the north edge of NTS map sheet 115-O-10 and southern edge of 115-O-15, at approximately 63° 44’ north and 138° 52’ east. The area evaluated occurs within the Sulphur Creek drainage basin in the vicinity of left limit tributaries Friday Gulch and Brimstone Gulch. A total of 94 claims comprise the project and are detailed in the following table:

Name	Grant Number	Expiry Date	Owner
Fri 1-8	YC61144-51	2012/09/25 *	Bernard Kreft
Fri 9-10	YC61156-57	2012/09/25 *	Bernard Kreft

Fri 11-16	YD62827-32	2013/04/14 *	Bernard Kreft

* Pending acceptance of this report by the Dawson Mining Recorder *

Access – Access was achieved by truck from Dawson City via the Bonanza Creek road and the Sulphur Creek road, a one way distance of about 48 kilometers with a travel time of about 40 minutes.

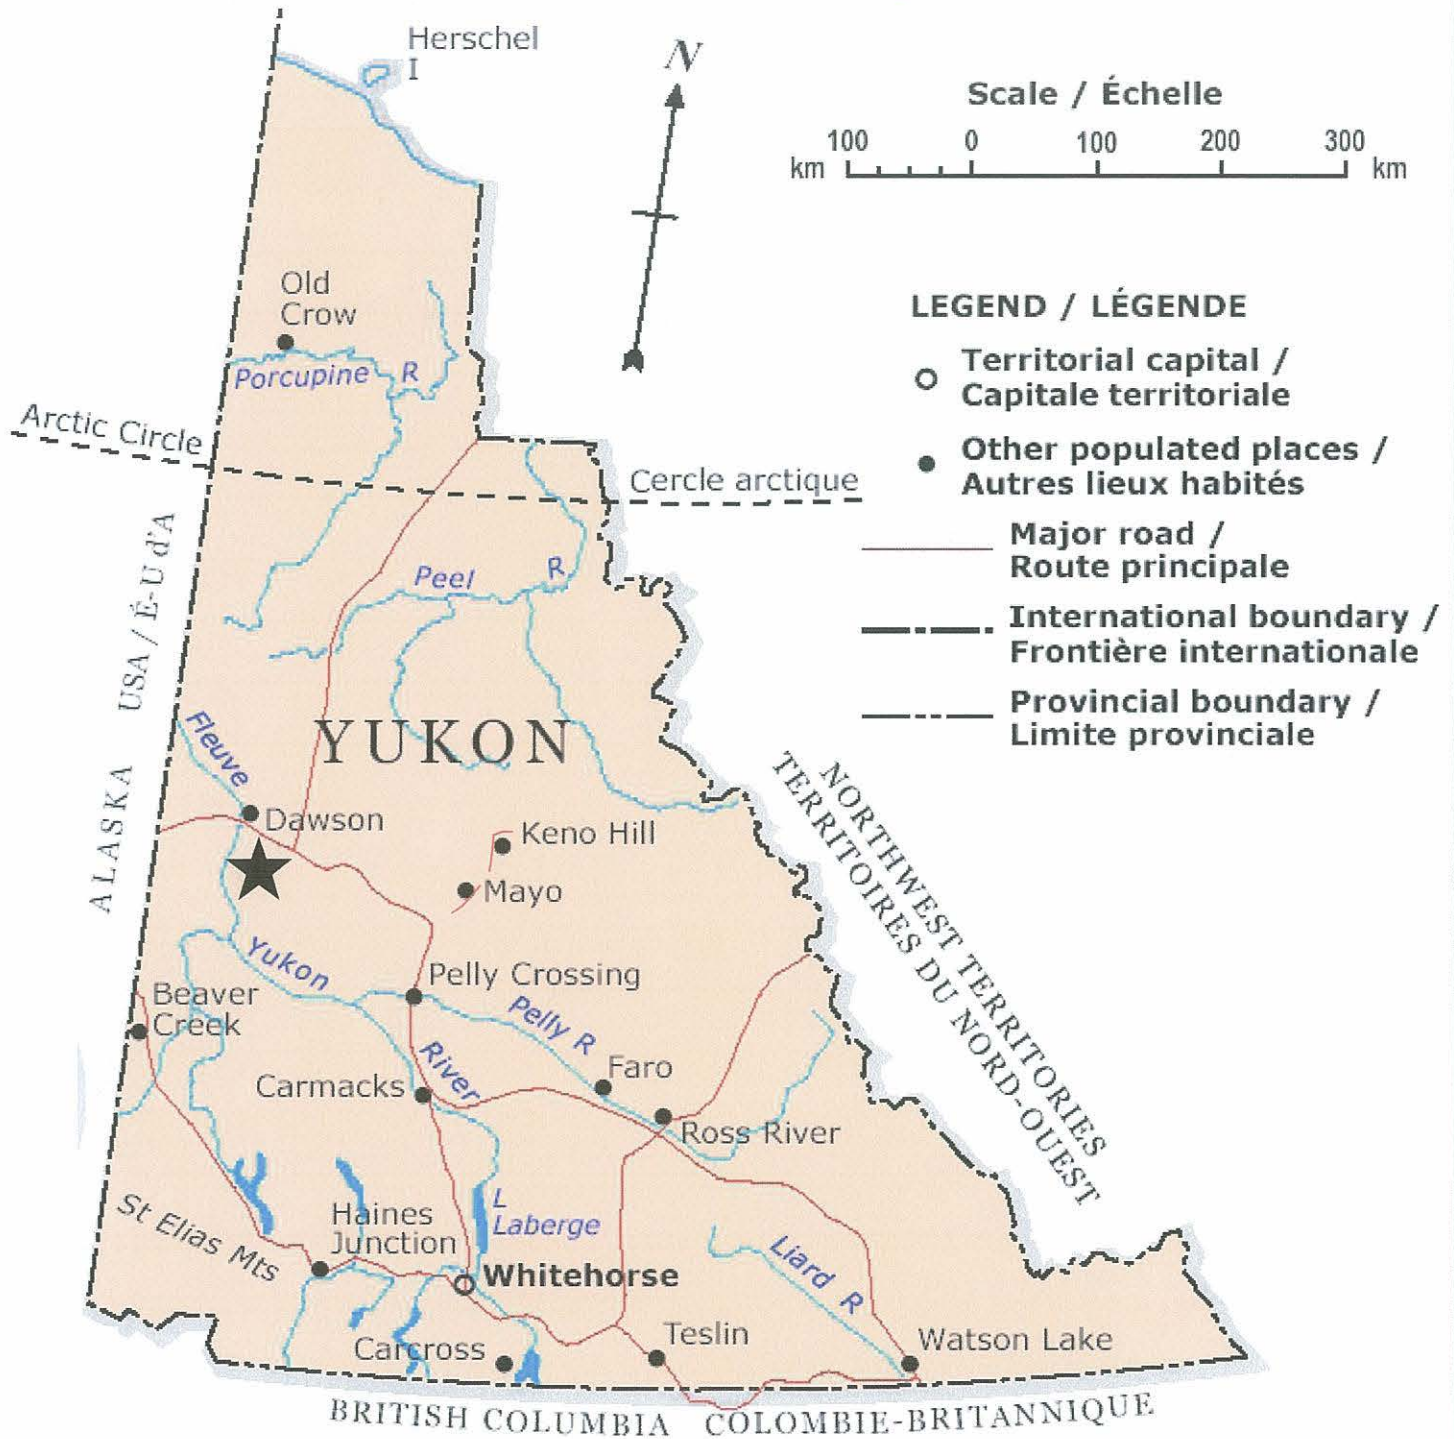

Topography And Vegetation – The property lies within the un-glaciated Klondike Plateau, which is characterized by low rolling hills dissected by deeply incised stream valleys. This region experienced strong surficial weathering during the early to mid-Tertiary; as a result natural bedrock exposures are rare and generally restricted to steep slopes, with the effects of surface weathering extending to depths of as much as 80 metres or more. Overburden and eluvial-regolithic material appears to average approximately 1.0 metre in thickness, but is certainly deeper in areas along the lower slope of the east bank of Sulphur Creek. South facing slopes are generally snow free from early May, with frost leaving the ground by the middle to end of May. North facing slopes are generally free of snow by mid to end of May, with permafrost often remaining year-round. The property is below tree line, with vegetative cover consisting of variable amounts of spruce, poplar, alder and brush, with brush and stunted spruce trees predominating on north facing slopes, higher elevations and in areas of permafrost or poor drainage, while south facing slopes are generally covered by more mature stands of spruce or poplar.

The Sulphur Creek and Friday Gulch valley bottoms are covered by recent placer mining tailings dating from 1950’s era dredging and mechanized mining efforts from 1978 onwards. Placer mining within the claims area is ongoing as of the date of this report.

History And Previous Work - Exploration for the source of the placer gold in the Klondike has been of an ebb and flow nature since 1898. Although numerous significant discoveries such as Lone Star and Hunker Dome have been made, the source of the majority of the placer gold remains an enigma. This is due to thick overburden, abundant vegetative cover and a variable thickness of eluvial-regolithic material rendering historical methods of prospecting of limited use and effect. Exploration in the beds of placer mined streams is even more difficult due to the presence of thick layers of disturbed gravel and muck rendering silt and soil sampling ineffective, groundwater flow issues limiting the effectiveness of trenching, as well as a constantly changing surficial environment as placer mining weaves up and down the valleys. This has led to a situation where almost all of the known hardrock showings are located on ridge crests or hilltops even though streambeds are a logical place to explore for a gold source.

Sulphur Project ★

To Accompany: 2011 Sulphur Project Report

January 30th, 2011

By: Bernie Kreft

Figure 1

Regional Map - Sulphur Project ★
 Fig.2

Scale approx. 1:600,000

During 1985 United Keno Hill Mines conducted a wide-ranging exploration program for gold in the Klondike. They staked a large block of claims along the length of Sulphur Creek and explored with three lines of percussion drilling: one near the mouth, one about 2.0 kilometers below Brimstone Gulch and one at the mouth of Green Gulch, about 4.2 kilometers upstream of Friday Gulch. Although these lines were chosen strictly on the basis of assessment requirements as opposed to any form of exploration target, significant mineralization grading greater than 10,000 ppb Au over 3.0 meters was located in the vicinity of Green Gulch. The intersection was in saprolitic pyritic and veined chlorite sericite schist near its contact with less altered schist and occurred within a 21 meter interval with common values in the 1000-1500 ppb Au range (assessment report 091946). Although the results were significant, it was thought that the gold values represented placer contamination from surficial material at the collar, and only limited follow-up work was completed.

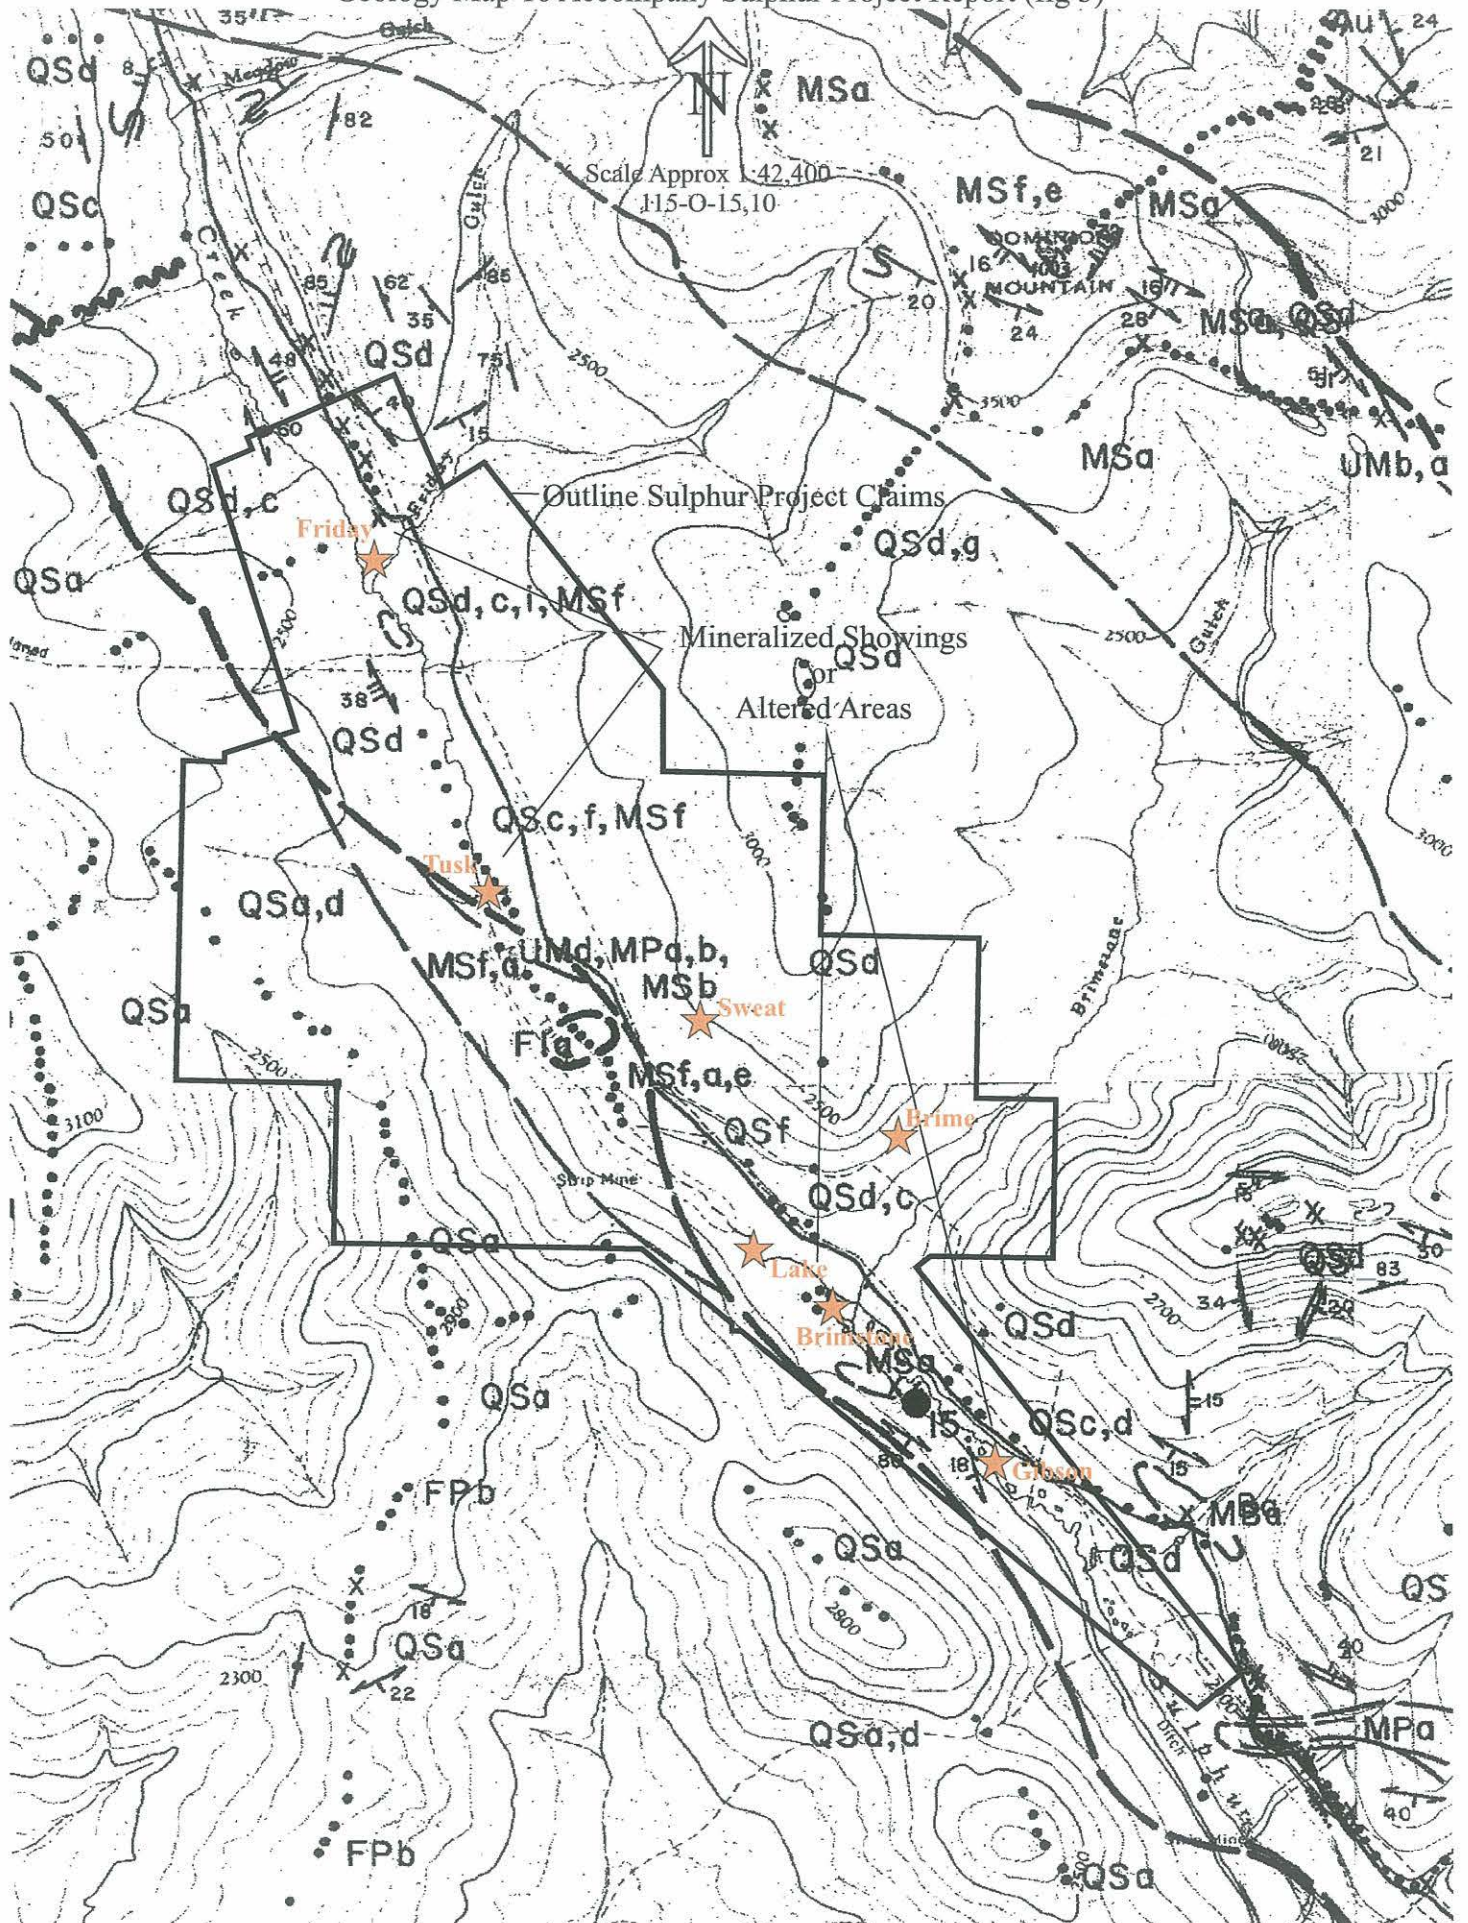

During the spring of 2006 the author conducted a literature search of recent placer mining efforts along Sulphur Creek, with a view towards assessing whether any of the data would be helpful in directing hardrock exploration. Reported gold production from Sulphur Creek for the period 1978-2002 totaled 116,000 ounces, with Sulphur often ranking as one of the top 5 gold producers in the Klondike. This work also detailed operations located at the mouth of Friday Gulch which were recovering gold in an area of decomposed bedrock (YPMI 78-82 p.140) as well as operations at the mouth of Brimstone Gulch which were recovering jagged gold with quartz attached (YPME 85-88 P.72). This information was thought to be suggestive of a gold source being located on Sulphur in the area of Friday Gulch as well as Brimstone Gulch, and a one-day trip was planned to prospect this area.

Prospecting of tailings at the mouth of Friday Gulch (Friday) encountered abundant variably pyritic carbonate altered occasionally silicified veined schist. A total of 8 grab samples were taken, 4 returning values ranging from 210-634 ppb Au along with anomalous arsenic. Follow-up at Friday Gulch consisted of auger drilling in an attempt to sample bedrock beneath the tailings. This work resulted in 7 auger holes, 2 of which (2007-03; 2007-06) encountered heavily decomposed schist with moderate amounts of pyrite (3-5%) and several fragments with quartz-carbonate veinlets and fuchsite. Gouge samples were weakly anomalous in arsenic to 42 ppm and gold to 24 ppb. A 12.5m step-out north from the gouge area (2007-07) encountered hard grey (silicified?) schist anomalous in arsenic to 75 ppm and gold to 58 ppb. All other auger hole samples returned less than 14 ppm arsenic and 5 ppb gold.

Prospecting in the vicinity of Brimstone Gulch encountered numerous areas of heavily decomposed bedrock, listwanite alteration, quartz-carbonate veining, pyrite and arsenopyrite mineralization with sampling of these areas returning numerous anomalous values including a 1.5 metre channel sample of grey-blue pyritic saprolite (hydrothermally altered?) grading 2280 ppb Au (Lake Showing), as well as a channel sample of heavily decomposed pyritic and veined, carbonate and fuchsite altered schist returning 513 ppb Au over 9.4m (Brimstone Showing). Distinct similarities between these discoveries and the setting of the UKHM discovery at Green Gulch were noted. Follow-up work was hampered by the presence of active mining operations, with the Brimstone Showing now covered by 5 metres of recent tailings, and the Lake Showing in the middle of an active haul road.

Geology - The project is situated on the southwest side of the Tintina Fault, within Yukon Tanana Terrane strata. The Y.T.T. has proven to be an under-explored, yet highly prospective belt of rocks, as witnessed by the recent world-class discoveries at Wolverine, Kudz Ze Kayah and Pogo. The potential for Pogo type occurrences (along with other bulk-tonnage gold targets) has been recognized in the Yukon portion of the Y.T.T., with the area from Dawson, west to Alaska, receiving considerable attention during 1993-2004 from numerous companies, including Newmont, Teck, Kennecott and Phelps Dodge. The 2008 discovery by Underworld Resources at the White Gold project further highlights the under-explored nature of this belt of rocks.

Geology Map To Accompany Sulphur Project Report (fig 3)

LEGEND

LATE CRÉTACEOUS TO EARLY TERTIARY

FI	Felsic intrusive and volcanic rocks
FIa	light coloured quartz-feldspar rhyolite porphyry and rhyolite
FIb	tan coloured latite and biotite-quartz latite porphyry
FIc	latitic lapilli tuff
FId	monolithic rhyolite
FIe	heterolithic rhyolite breccia

Intermediate intrusive and volcanic rocks, and associated sedimentary rocks

II	IIa massive dark grey weathering intrusive andesite
	IIb massive chocolate brown weathering extrusive andesite
	IIc andesitic lapilli tuff
	II d siltstone, greywacke, and conglomerate
	II e tan coloured dacite and amphibole-feldspar latite porphyry

EARLY CRÉTACEOUS AND / OR OLDER

DD	Diabase dykes
	DD dark brown diabase

TRIASSIC OR OLDER

Rocks of varying metamorphic grade and degree and style of deformation

FP,QS	Felsic plutonic rocks
FPa	foliated equigranular biotite granodiorite
FPb	foliated coarse grained granodiorite
QSa	blocky weathering light grey to pinkish feldspar-quartz schist
QSh	pink and green banded muscovite-feldspar-quartz gneiss
FPc	porphyritic quartz monzonite and augen gneiss
FPd	foliated fine to coarse grained quartz monzonite

Intermediate plutonic rocks

IP	IPa weakly foliated chlorite metadiorite
	IPb strongly foliated chlorite metadiorite

Mafic plutonic rocks

MP	MPa weakly foliated amphibolite
	MPb strongly foliated amphibolite

Quartzofeldspathic schistose rocks

QS	QSa buff to pale green weathering well foliated muscovite-feldspar-quartz schist with quartz and feldspar porphyroclasts, and lithic fragments
	QSc buff weathering well foliated muscovite-feldspar-quartz schist with quartz porphyroclasts
	QSD buff weathering well foliated muscovite-feldspar-quartz schist
	QSe light green weathering hornblende/muscovite-feldspar-quartz schist
	Q Sf silvery grey weathering sericite-quartz schist
	Q Sg buff to khaki weathering massive muscovite-feldspar-quartz cataclasite
	Q Sj white to dark grey weathering well foliated feldspar-quartz mylonite with or without quartz porphyroblasts
	Q S j muscovite-quartz schist with more than 5% garnet, and with or without chlorite
	Q Sk biotite-quartz schist, with or without calcite
	Q Sl quartzite
	Q Sm kyanite-garnet-muscovite-quartz schist

Carbonaceous rocks

CS	CSa massive to foliated dark grey to black carbonaceous quartzite and muscovite-quartz schist
	CSb black carbonaceous marble and carbonaceous muscovite-quartz-calcite schist
	CSc muscovite-feldspar-quartz schist with carbonaceous wisps
	CSd silty carbonaceous schist with mafic tuffaceous component

MB	Marble
	MBa cream and grey banded marble, with or without minor quartz, muscovite, and garnet
	MBb massive cream to light grey marble
	MBc marble with more than 5% garnets
	MBd grey to dark grey muscovite-quartz-calcite schist, with or without garnet

MV	Mafic metavolcanic rocks
	MVa andesitic tuff to tuff breccia
	MVb massive andesitic greenstone
	MVc foliated andesitic greenstone

MS	Mafic schistose rocks
	MSa light to medium green and buff weathering chlorite-quartz schist
	MSb dark green weathering chlorite schist
	MSc silvery green weathering actinolite-chlorite schist
	MSd grey-brown weathering quartz-amphibole schist
	MSe light to medium green and buff weathering calcareous chlorite-quartz schist; calcite may be disseminated, in thin layers, or as small pink blebs
	MSf silvery green weathering muscovite-chlorite-quartz schist with bluish quartz porphyroclasts
	MSg garnet-feldspar-chlorite schist
	MS h garnet-feldspar-amphibole schist
	MSi mottled green and black biotite-epidote schist

UM	Ultramafic rocks
	UMa massive dark green serpentinite
	UMb foliated dark green serpentinite
	UMc foliated weakly altered serpentinite with or without chrysotile
	UMd foliated strongly altered serpentinite, including talc schist and listwanite
	UMe coarsely crystalline rusty weathering white marble

Sulphur Project Claim Map

- ★ = showing discussed in text
- = outline of detail work map
- = heavily placer mined areas
- - - = areas with placer potential

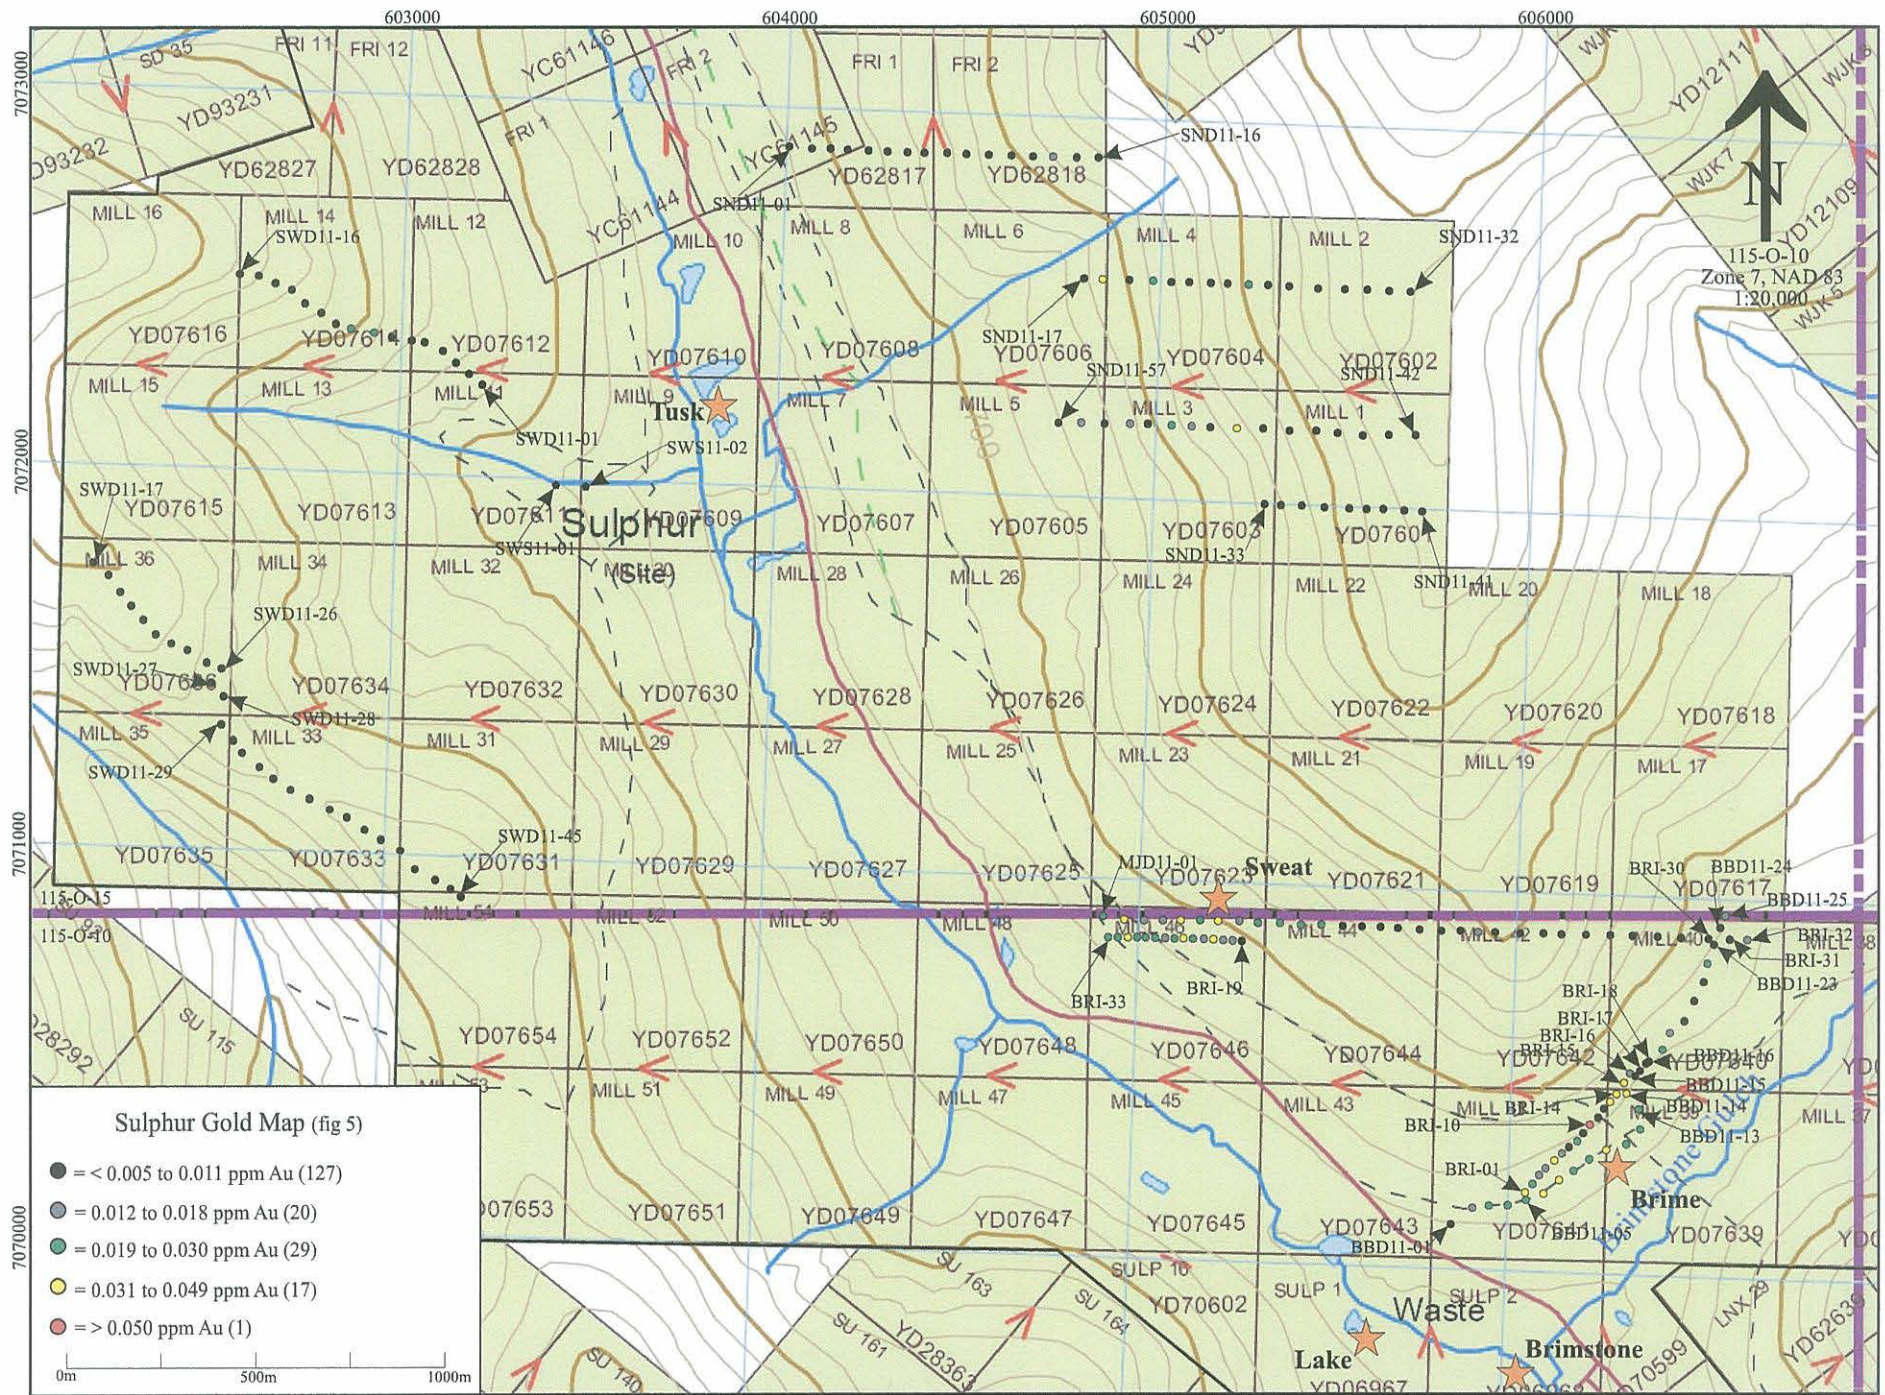

0m 500m 1000m 2000m
1:50,000 or 1cm=500m fig 4

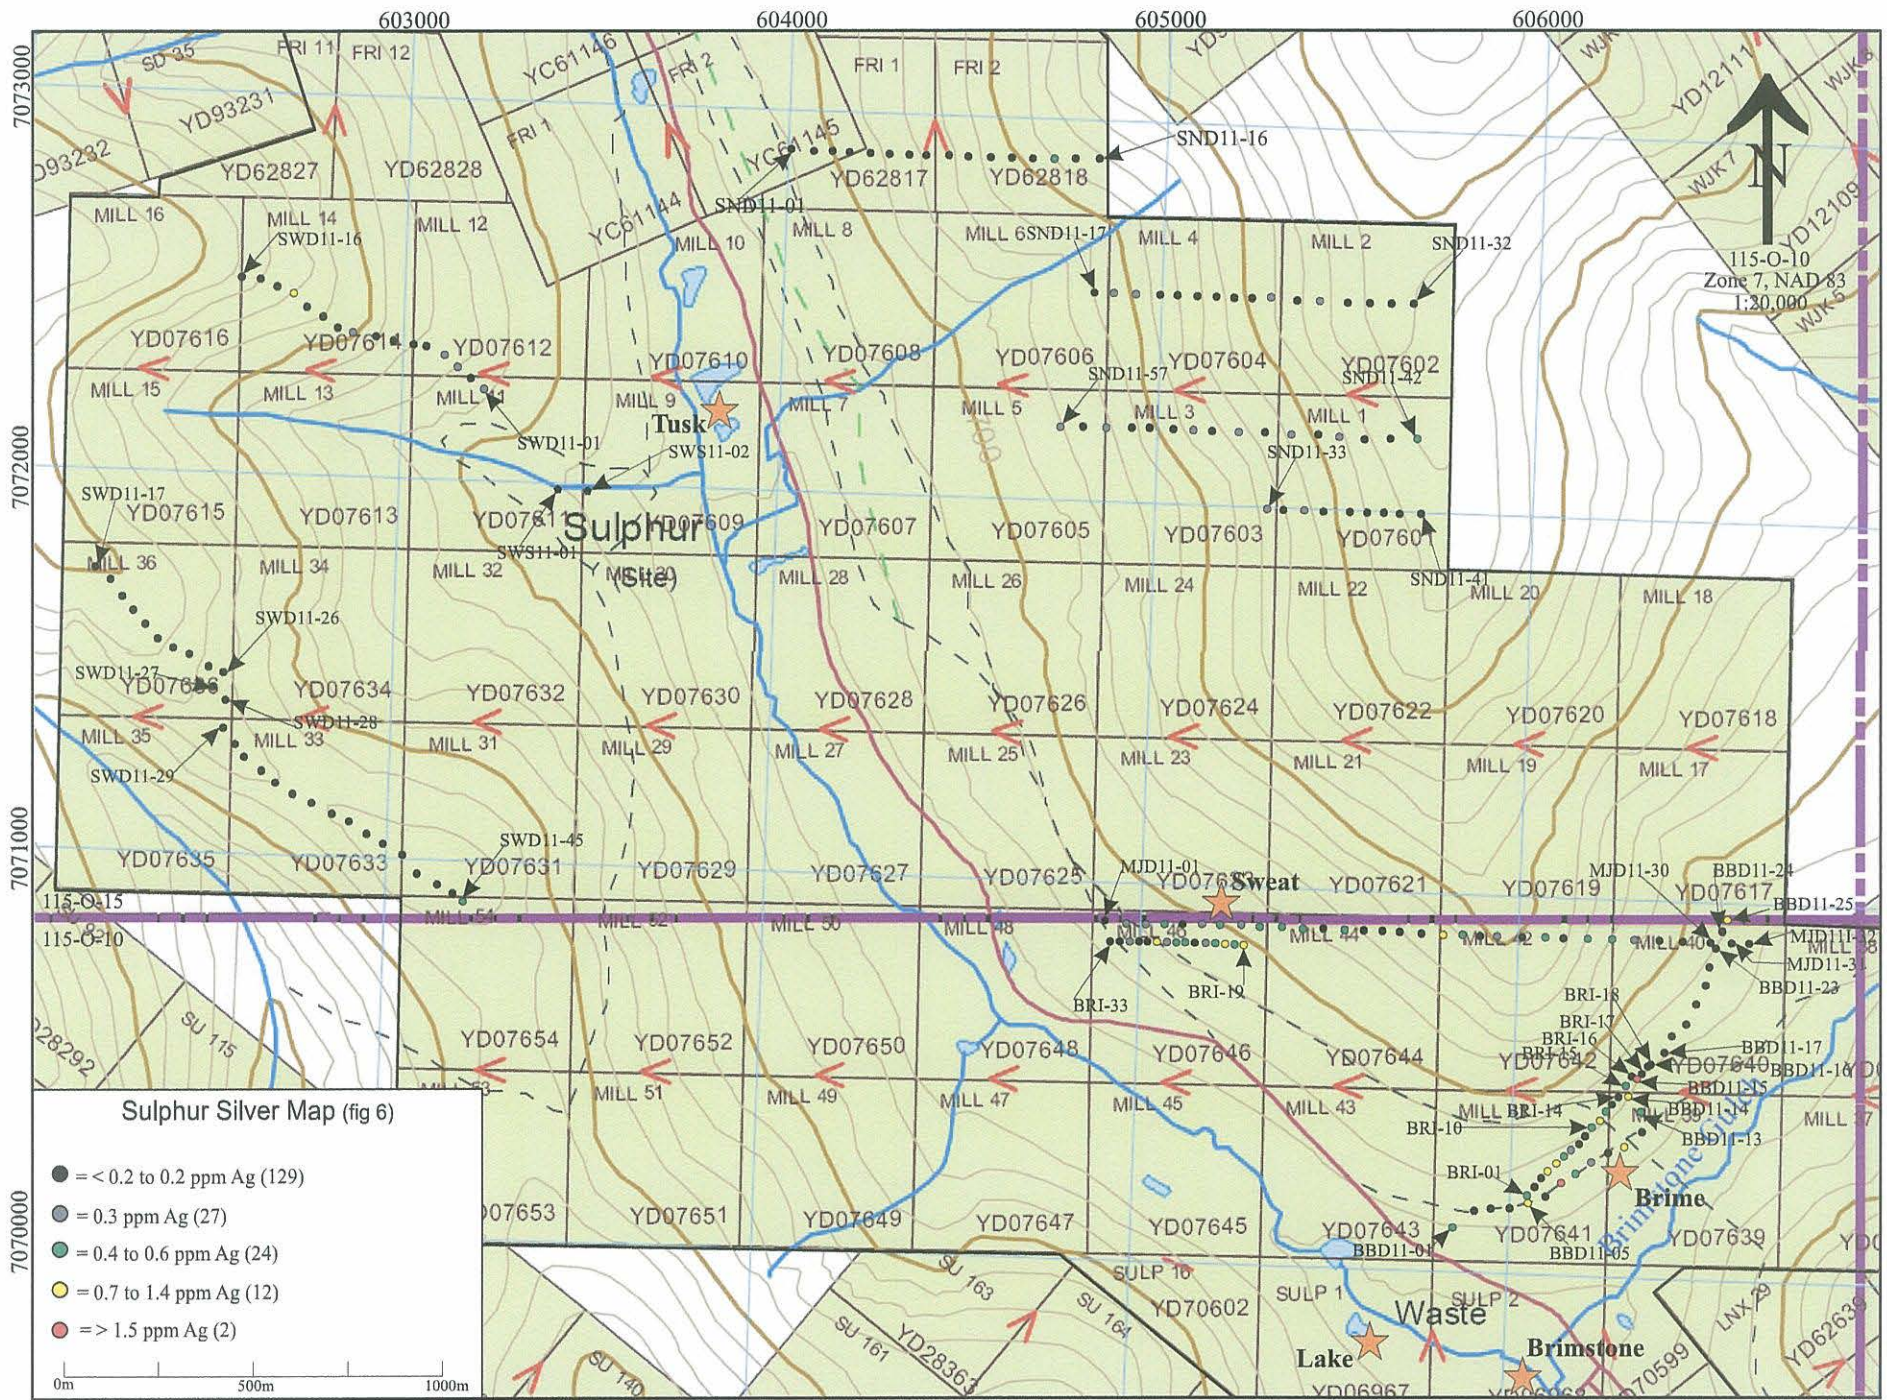

The vast majority of Sulphur Creek valley bottom is covered in a 2-15 metre thick blanket of tailings from placer mining, with the only bedrock exposures found within the bottom of active placer mining pits. The common practice is for miners to expose bedrock while mining, and then to backfill these exposures with waste from subsequent operations; therefore the exposures often only occur during a short window and are subsequently covered. Due to the paucity of outcrop much of the “mapping” and prospecting relies on angular tailings likely representing material scraped from bedrock during placer mining. Given that mining commonly proceeds in an upstream direction, it would be expected that the movement of tailings would result in their current resting place being downstream (generally within 100 metres) of their actual source. Mining methods employed in the Sulphur Creek basin include recent efforts using bulldozers and excavators, as well as historical bucket-line dredging operations. Dredge tailings are moss covered, have poor to moderate re-growth, and have a distinctive repetitive somewhat cylindrical shape. Recent mining efforts are variably re-grown and have no common shape characteristics. Common practice was for the dredges to excavate through the gravel and into the underlying bedrock as much as 6-8 metres depending on its hardness (Lance Gibson pers. comm.), while recent operations are more selective and commonly only process 1-2 metres of bedrock irrespective of its hardness. These differences result in dredge tailings often containing large amounts of bedrock material suitable for “mapping” and prospecting, while recent tailings have only very limited use in this respect due to their lack of common structure and reduced amounts of bedrock material.

Based on mapping and prospecting, it appears that Sulphur Creek valley bottom is underlain by schist consisting of variable amounts of muscovite, quartz, chlorite and sericite with occasional quartz porphyroclasts. Minor amounts of amphibolite and serpentinite have also been noted. Based on geological studies by others in the Klondike (Debicki: 1984; Mortenson and Ash: recent) it is postulated that the serpentinite units noted by Debicki represent the surface trace of a regional scale thrust fault occurring along Sulphur Creek valley bottom for much of its length. The effects of hydrothermal alteration are common and include: variable carbonate alteration and associated quartz carbonate veining, as well as areas of silica alteration. Alteration is occasionally intense enough to obliterate primary rock characteristics and produce “gouge” zones extending a minimum of 6-8 metres into bedrock. Fuchsite a/o mariposite has been noted in numerous areas, commonly within or near either carbonate or talc altered zones, or associated with more mafic units. Mineralization commonly consists of pyrite, with the presence of arsenopyrite inferred from geochemical results. The highly carbonate and silica-carbonate altered areas are occasionally gold and arsenic enriched, and are likely correlative with the area of “pyritic saprolite” with highly anomalous gold values discovered at Green Gulch by United Keno Hill Mines.

Current Work And Results - The 2011 field program consisted of reconnaissance soil lines on the east and west slopes of Sulphur Creek in the vicinity of the Tusk, Lake and Brimstone anomalies. A total of 192 soil samples were taken at 25m to 50m intervals along with 2 silt samples. Sampled material was taken from the C horizon, found at a depth of from 45-150 centimetres, using hand held augers. Soil sampling conditions were good, apart from several areas of very deep overburden along the east slope of the creek. All sample sites were marked in the field using flagging inscribed with the sample code, with sample medium placed in industry standard soil sample envelopes. Samples were analyzed by Chemex using their Au-AA23 method (30g fire assay) and their ME-ICP41 (35 element aqua regia) package.

Gold in soil results from the northwest side of Brimstone Gulch returned 4 anomalous zones (Brime Anomaly) over a 450m width, with values ranging between 0.019 ppm and 0.047 ppm Au with a spot high of 0.117 ppm Au. Based on pathfinder geochemistry (As-Sb) these zones appear to have a northerly trend but with significant decreasing values Au values in that direction. Maximum pathfinder values include 566 ppm As, 16 ppm Sb and 1.6 ppm Ag.

- = > 8 ppm Sb (2)

0m 500m 1000m

Zone 7, NAD 83
1:20,000

A second area (Sweat Anomaly) with anomalous Au in soil values is located approximately 1.2km NW of Brime Anomaly and just east of the Tusk Anomaly. The sweat Anomaly is characterized by a Au only signature with values ranging from 0.030 to 0.043 ppm Au. A faint increase in chromium and arsenic exists, but it can only be considered weakly anomalous at best. These zones appear to have a northerly trend, occur over a 300m width, and are open in both strike directions. Overburden depth is significantly greater than in other areas of the property and this may have muted geochemical results from the Sweat Anomalies.

Sporadic single point anomalies occur, and may be worth follow up, but will not be discussed in this text due to their currently limited exploration potential.

Conclusions – Previous work has encountered significant Au values associated with alteration zones located in the valley bottom. Although controls on Au mineralization are poorly understood, it appears that better Au values commonly occur within heavily carbonate or silica-carbonate altered rock at the contact with less altered rock, and are invariably associated with anomalous arsenic and antimony. The Au +/- Ag, As, Sb signature noted within soils at Brime Anomaly has the same signature that has been found associated with bedrock Au values beneath the tailings in the valley bottom suggesting the possibility that the Brime Anomaly is controlled by a splay off of the main Sulphur Creek fault which is thought to control the Au-As-Sb mineralization previously located in the valley bottom. The Sweat anomalies are distinct from the Au-As-Sb areas and potentially represent a new target type.

Recommendations – Further work should consist of excavator trenching, grid soil sampling and prospecting around the various Au in soil anomalies along the east bank of Sulphur Creek. Further reconnaissance soil lines should also be conducted surrounding the single point anomalies as well as within untested areas on the east Bank of Sulphur.

Statement Of Qualifications

I, Bernie Kreft, conducted the exploration work described herein.

I have over 23 years prospecting experience in the Yukon.

This report is based on fieldwork conducted or witnessed by myself, and includes information from various publicly available assessment reports.

This report is based on fieldwork completed during the 2010 field season.

This report is based on fieldwork completed on the Sulphur Property in the Dawson Goldfields.

Respectfully Submitted,

Bernie Kreft
