## Summary

The DUN project, initially consisting of 235 quartz claims around Fourth of July Creek and its surrounding tributaries in the Ruby Range of southwestern Yukon, was downsized to 140 claims in 2014. The claims lie approximately 50 km northwest of the community of Haines Junction, situated in the area between Kluane Lake and Aishihik Lake. The DUN claims cover the gold-producing creeks Fourth of July and Twelfth of July, which are tributaries of the Jarvis River. This area has long been a target for exploration, with ~25,000 oz of placer gold previously recovered from Fourth of July Creek alone. However, since the rush in this area began in 1903, subsequent exploration history is limited with only several recorded occurrences. Work on the DUN project ventures to find the source of placer gold in the surrounding drainages.

Sampling and prospecting during the 2014 field season were focused around a tributary of Larose Creek, nicknamed "Rabbit Creek" (formerly referred to as Tributary 1), as well as Larose and Twelfth of July Creeks. A focused contour soils program was carried out to provide more data coverage of the target area, and to hopefully define additional potential targets within this portion of the claim block which yielded the majority of significant assay results in soils and stream sediments collected during the 2011-2013 field programs. A total of 197 soils and 13 rocks were collected, and roughly 3 yards of fluvial sediment was moved by hand and fed through a 4-foot powered sluice to test for placer potential. Soils returned some highly anomalous Au results throughout the target area, coinciding with significant As results which seem to be widespread within the area as well.

## Introduction

The DUN project consists of 140 quartz claims around Fourth of July Creek and its surrounding tributaries. The claims lie approximately 50 km northwest of the community of Haines Junction, situated in the area between Kluane Lake and Aishihik Lake. The DUN claims cover the gold-producing creeks Fourth of July and Twelfth of July, which are tributaries of the Jarvis River. This area has long been a target for exploration, and has recently been a focus of recent claim staking in the Ruby Range. The DUN claims lie in the same regional geology as the nearby Topaz claims owned by RyanGold Corp., the majority claim holder in the area. Work on the DUN project will attempt to locate the source of placer gold in the area.

The main obstacle to prospecting in the area is the lack of rock outcrop. The DUN claims are underlain by late Cretaceous Kluane schist, with large northwest and northeast-trending structures in nearby valleys. The gold mineralization is likely structurally-controlled in faults or shears paralleling larger scale structures in the nearby area. In addition, based on work done on occurrence 115H 047, various samples show evidence of skarned limestone. Field work on the DUN property will target structurally-controlled gold mineralization.

## Location

The DUN claims are located in the Ruby Range in the region between Kluane Lake and Aishihik Lake (Figure 1). The claim block (Figure 2) is approximately 200 km west of the City of Whitehorse, and 50 km northwest of the community of Haines Junction. The DUN claims are centered on latitude of 61°9' N and longitude of 137°58' W in NTS Map Sheets 115H 03 and 115H 04.

Claim Number	Claim Owner	Grant Number	Expiry Date
DUN 1-16	E. Charles Long	YD32721 - YD32736	12/31/2015
DUN 41-48	E. Charles Long	YD32761 - YD32768	12/31/2015
DUN 57-68	E. Charles Long	YD32777 - YD32788	12/31/2015
DUN 70-74	E. Charles Long	YD32790 - YD32794	12/31/2015
DUN 85-100	E. Charles Long	YD32805 - YD32820	12/31/2015
DUN 101-104	E. Charles Long	YD72507 - YD72510	12/31/2015
DUN 121-183	Edward (Ed) Long	YE62909 - YE62971	6/28/2015
DUN 220-235	E. Charles Long	YE54932 - YE54947	12/31/2015

## Access

The DUN claims can be accessed by following the Alaska Highway for 56 km northwest of Haines Junction, and an additional 38 km by 4x4 along the Cultus Lake Road, east of Kluane Lake. There is road access on the property from a local placer mining operation. Alternative access is by helicopter, which is a 50 km flight from Haines Junction. There is also an airstrip at the south end of the property, which could easily be cleared and repaired to working condition.

## History

On July 4<sup>th</sup>, 1903, the first discovery claim in the area was staked by “Tagish” Charlie on Fourth of July Creek upon discovering gold. This initiated a large rush to the Kluane area which would last for several years to come. Tagish Charlie’s find in 1903 was the first payable placer gold found in the Kluane district. Tagish Charlie, together with George Carmack and Skookum Jim Mason, had discovered placer gold on Bonanza Creek in 1896 which started the Klondike Gold Rush.

More recently, the most notable work has been done in the area surrounding Minfile occurrences 115H 047 and 115H 055 (Figure 4), also known as the Killermun Lake property which is owned by Rockhaven Resources. The majority of work done here was in the late 80’s until present. On occurrence 115H 047, the most significant work was carried out by Cash Minerals which included over 300m of diamond drilling, soil sampling and trenching. The interest in this area was fuelled by assay results for quartz-carbonate vein material in float, which returned 126.9 g/t Au. With extensive sampling and trenching, a peak value of 193.57 g/t was returned. Through drilling and trenching, mineralized structures were well defined laterally and vertically; however, this mineralization was variable ranging from 0.01g/t to over 100g/t Au.

Occurrence 115H 055 has had over 2000 m of diamond drilling done, in addition to various amounts of trenching, soil sampling and geophysics. In one location, a vein system 50 to 100 m wide was traced horizontally for 350 m and vertically for 245 m. The grades range from 3g/t to 50g/t Au with a peak value of 123g/t Au from a grab sample, and a drill intersection of 2.83 g/t Au over 6.80 m.

Both of the cited Minfile occurrences lay in the range of ~10km east of the claim block. The mineralization consists of arsenopyrite and native gold in quartz-carbonate vein material. At each occurrence, topographical lineations were identified correlating to vein material in float.

Mineralization is structurally controlled and well-defined laterally and vertically, but with variable grade.

## **Sampling Techniques**

Soil samples were collected from the B or C soil horizon using a 5 ft. Dutch auger. Each sample was then put into a kraft soil sample bag, each sample weighing approximately 2 lbs. At each station, the soil sampler took notes and recorded the geographical coordinates of the location where the sample was collected. Each soil station was marked with fluorescent orange flagging. The soil preparation procedure was done by Acme Analytical Laboratories Ltd. in Whitehorse, which consists of drying the soil samples, then sieving them to -80 mesh.

All samples were sent to Acme Analytical Laboratories Ltd. in Whitehorse for sample preparation, then sent down to Vancouver to be assayed. The soils were tested using 30 Element, Aqua Regia, ICP, and Au fire assay.

## **Past Field Work & Prospecting**

The 2010 and 2011 soil sampling program was developed to look for anomalous gold in soils and to try to locate the source of placer gold in Fourth of July Creek. October 2010 soil samples were collected at 450 m intervals along the staking grid, with 900 m spacing between lines. The June 2011 program was ridge and spur soils at 250 m intervals in the southeast corner of the claim block. The August 2011 soil sampling program was also ridge and spur soils, done at 150 m intervals. The September 2011 soil sampling program infilled areas of anomalous gold values from soils collected in October 2010. This was done on the west side of claim block. No significant gold mineralization was located; however, there were a handful of soil samples that appeared to produce anomalous results, ranging from 30 ppb to 70 ppb Au. The gold anomalies seemed to coincide with arsenic anomalies.

During the 2012 field season, a more detailed and extensive ridge and spur soils program was carried out to further define potential targets within the claim block on which to focus future work. In addition, regional stream sediment samples were collected in the majority of creeks and major tributaries, and some prospecting was completed. A total of 333 soils and 16 stream sediment samples were collected in 2012. Soils returned several anomalous Au results (peaking at 79 ppb),

which coincided with significant As results (peaking at 215 ppm). Stream sediment samples from Larose Creek and some its tributaries in the eastern part of the claim block returned several anomalous Au values which correlated with high Au values in soils from the same area (peaking at 39 ppb Au). Also, a highly anomalous Au value of 796 ppb was returned from a silt collected below a canyon on Twelfth of July Creek before it merges with Fourth of July Creek. It was decided that this spot would be re-sampled in 2013 to confirm the anomaly. Given the size of the eastern portion of the claim block and the limited sampling done here, it was also decided that more sampling was needed to define a clearer target within this part of the claim block.

The main focus of the 2013 field program (August 9-11, September 18-22, October 8-12) was to carry out more focused ridge and contour soils in the eastern portion of the claim block around Larose Creek, which yielded the majority of significant assay results in soils and stream sediments collected during the 2012 field program. In addition, an extensive stream sediment sampling program was carried out in this area along Larose Creek and its tributaries where 2012 stream sediments assayed as high as 70 ppb Au. A total of 122 soils and 18 stream sediment samples were collected. Soils returned anomalous Au results which coincide with significant As results, as was seen with the 2012 assay results. The peak Au value in soil was collected on a ridge (between Larose Creek and Tributary 1 which yielded a number of significant Au values in silts) and assayed 112.9 ppb Au, with 25.4 ppm As (sample 11518). A handful of somewhat anomalous soils also came from this area and are between 10 and 20 ppb Au. Overall, the Au and As background values in soil are much higher in this area than in any other portion of the claim block.

Stream sediments returned some highly anomalous Au values along Larose Creek and its tributaries. A peak value of 6506.3 ppb Au was returned from a sample collected on Rabbit Creek (Tributary 1), which connects lower down on Larose Creek shortly before it merges with Twelfth of July Creek. This sample (sample 226) also produced a significant As value of 37.5 ppm. Out of the ten samples collected along this tributary, five are between 10 and 30 ppb Au. These samples also assayed between 25 and 45 ppm As. Interestingly, soil sample 11518 lies to the south, directly above Tributary 1. In addition, two other highly anomalous samples came from higher up on Larose Creek. One was collected where two forks converge at the top of the creek, taken from the north fork (sample 11765). This sample returned a value of 2584.4 ppb Au and 21.2 ppm As. Another sample about 1.5 km further down Larose Creek (sample 11767) assayed 391.9 ppb Au and 16.5 ppm As.

Another very strong Au value came from a silt collected in about the same spot where a 2012 sample assayed 796 ppb. This sample (sample 11769) was collected just below a canyon on Twelfth of July Creek before it merges with Fourth of July Creek, and yielded 3331.9 ppb Au.

## **2014 Field Work**

It had been shown in past soils results that the most anomalous Au and As numbers were mainly clustered in the eastern portion of the property in the southern portion of Twelfth of July Creek, eastern portion of Larose Creek and in the lower Rabbit Creek drainage. While some soils were collected on the slopes east of Larose and north of Twelfth of July Creeks, the majority of sampling and prospecting during the 2014 field season was focused within and on the margins of a tributary of Larose Creek, nicknamed Rabbit Creek (formerly referred to as Tributary 1), where a number of silts and soils produced significant Au and As values. A more focused contour soils program was carried out to provide more data coverage of this area, and to hopefully define additional potential targets within this portion of the claim block. A total of 197 soils and 13 rocks were collected, and roughly 3 yards of coarse fluvial sediment was moved by hand and fed through a 4-foot powered sluice to test for placer potential. For 2014 soil sample locations, see Figure 9.

2014 soils further proved that the highest Au and As values on the DUN property are within the Larose Creek area. A peak value of 660.3 ppb Au was returned from a soil collected on the south side of Rabbit Creek, and is now the highest Au value from a soil collected on the DUN property to date. In addition, a small cluster of highly anomalous As results just above the sluicing area returned a new peak value of 292.4 ppm As, with surrounding values of 175, 186, 196 and 292 ppm As (Figure 7). Test sluicing on Rabbit Creek revealed that the gravel at the test area is very boulder and cobble rich and clast supported, with little finer matrix material. Although 3 yards of material was moved, it was 90% boulders and rocks. A small amount of very coarse gold was recovered; however, the successful recovery rate of the sluice is unknown. Additionally, a geological contact between Kluane Schist and an intrusive granite was discovered while prospecting on the last day of field work on the property. This contact and the surrounding area will be further explored in 2015 during a detailed geological mapping program on the property.

Spatial distribution of assay values for Au, As and Cu in soils for both the entire property and the Rabbit Creek Area are shown in Figures 3 to 8.

## **Conclusion & Recommendations**

Sampling and prospecting during the 2014 field season were focused around a tributary of Larose Creek, nicknamed "Rabbit Creek" (formerly referred to as Tributary 1), as well as Larose and Twelfth of July Creeks. A focused contour soils program was carried out to provide more data coverage of the target area, and to hopefully define additional potential targets within this portion of the claim block which yielded the majority of significant assay results in soils and stream sediments collected during the 2011-2013 field programs. A total of 197 soils and 13 rocks were collected, and roughly 3 yards of gravel was moved by hand and fed through a 4-foot powered sluice to test for placer potential. Soils returned some highly anomalous Au results throughout the target area, coinciding with significant As results which seem to be widespread within the area as well. Anomalous Au samples tend to be isolated, likely the result of narrow vein-hosted gold.

Future work on the DUN Project should follow-up and confirm isolated, yet highly anomalous Au results in soils and more infill contour soil sampling should be completed, especially higher up the Rabbit Creek drainage. Follow up on these likely vein-hosted isolated gold anomalies have definitely help further refine our target area. These sites will be revisited, resampled, and possibly hand trenched in attempt to locate the vein/structural source of these anomalies. Detailed targeted prospecting and detailed geological mapping must also be completed within the target area. In addition, a small extension of claims should be staked in order to cover the remainder of the Rabbit Creek drainage, as well as some of the Twelfth of July Creek drainage.

## Statement of Qualifications

I, Edward C. Long, Prospector, certify that:

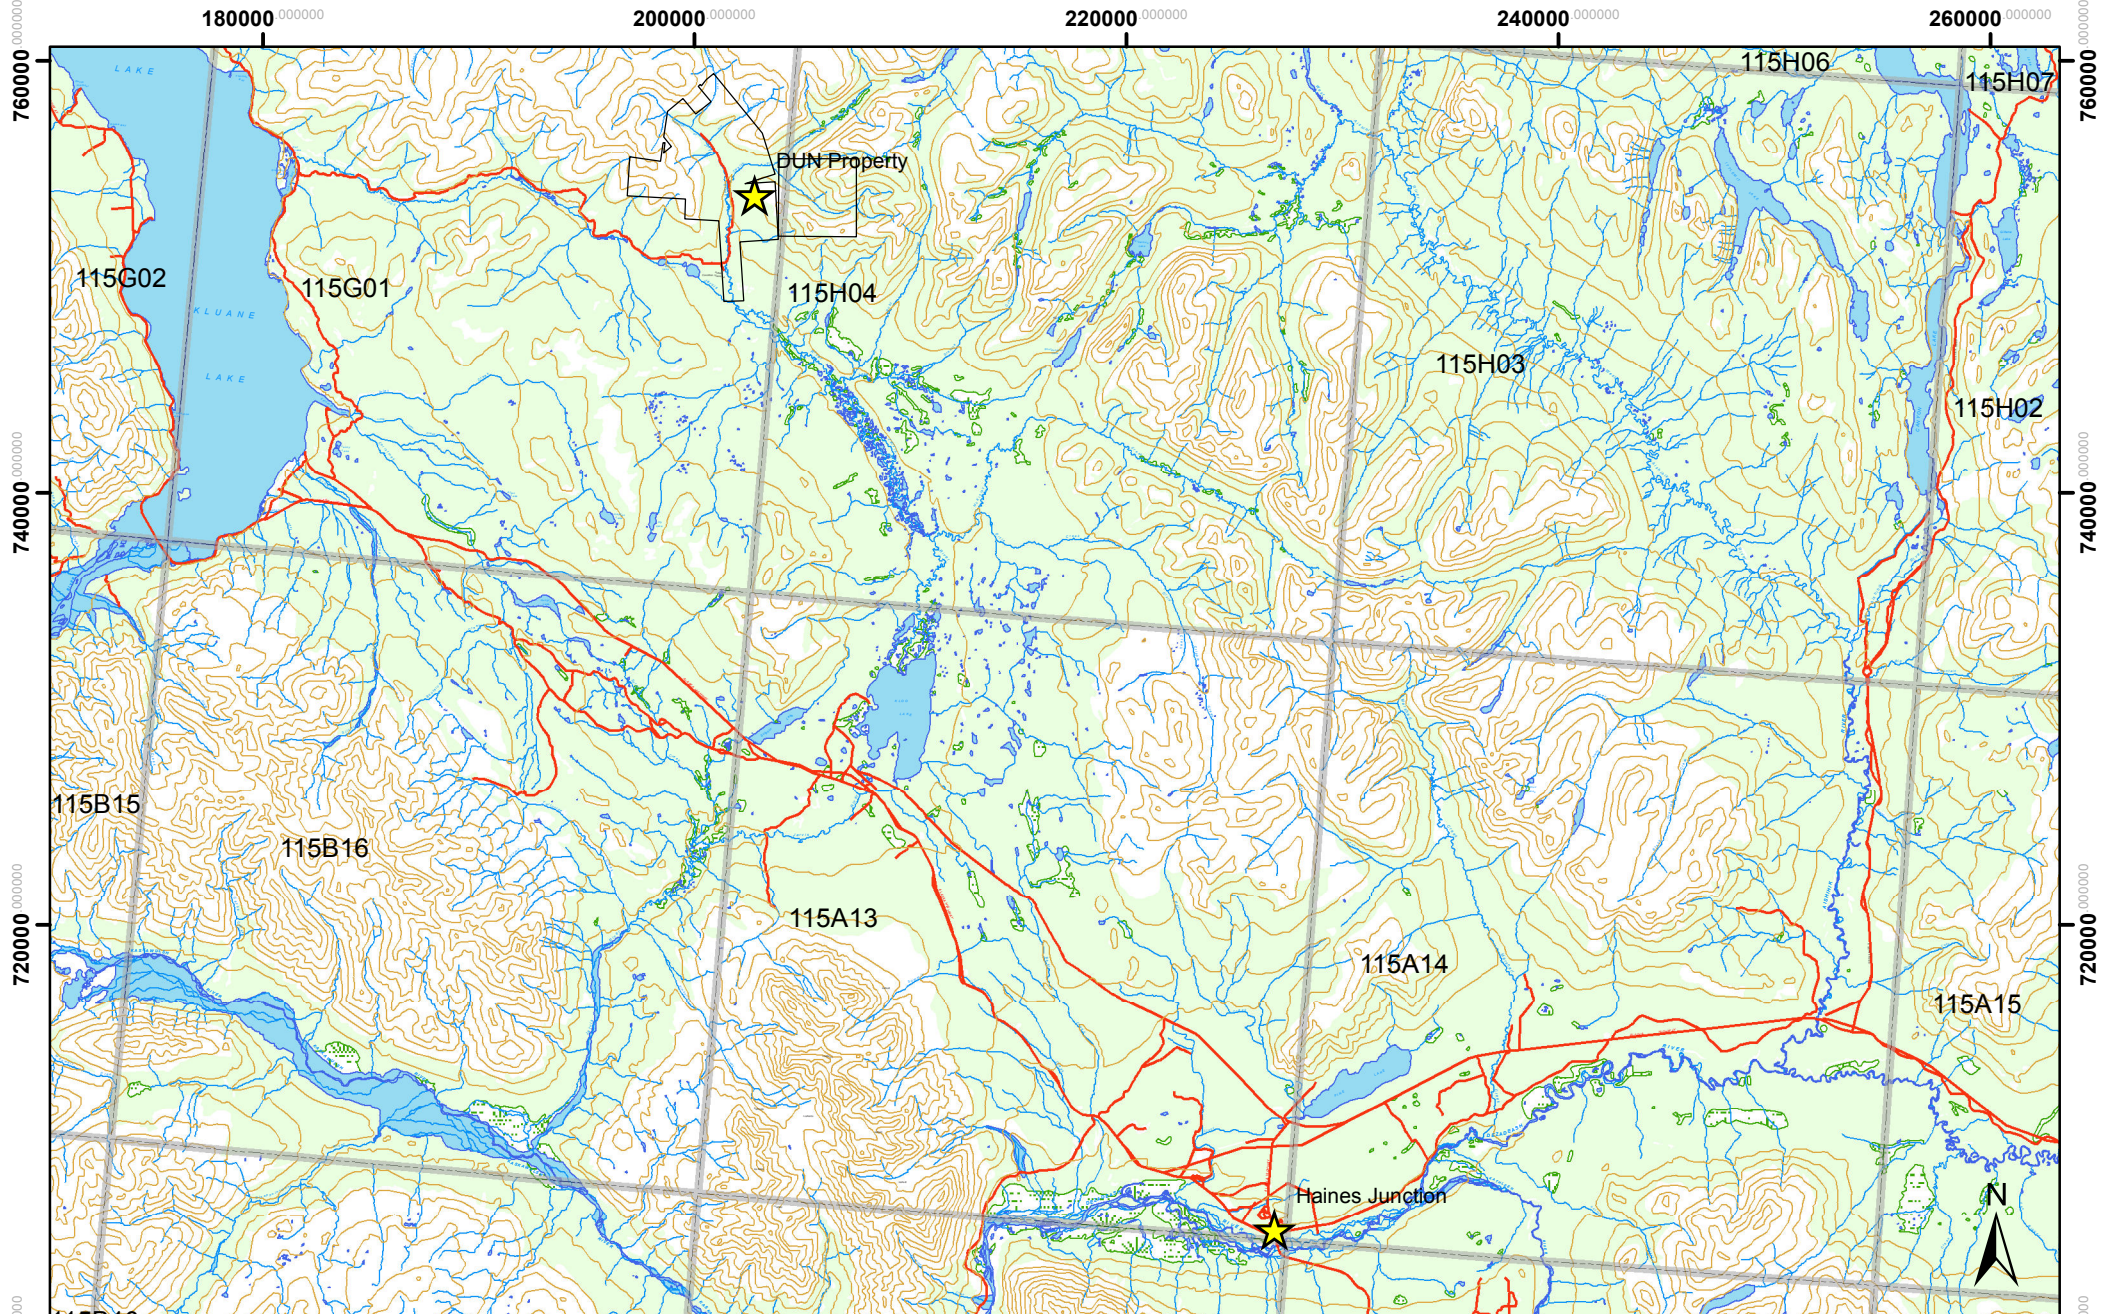

- 1) I reside at 113A Platinum Road, Whitehorse, Yukon, Y1A 5M3.
- 2) I am part owner and employed by All-In Exploration Solutions Inc. of Whitehorse, Yukon.
- 3) I graduated from Northern Alberta Institute of Technology in Edmonton, Alberta in 2009, with a Diploma in Geological Technology.
- 4) I am a member of the Association of Science and Engineering Technologists of Alberta.
- 5) I have spent a great deal of time prospecting and sampling on the property.

Dated this \_\_\_\_\_ day of \_\_\_\_\_ 2015, at Whitehorse, Yukon.

---

Edward C. Long (Prospector)

# CERTIFICATE OF ANALYSIS

WHI15000001.1

## CLIENT JOB INFORMATION

Project: Dun  
Shipment ID:  
P.O. Number  
Number of Samples: 13

## SAMPLE DISPOSAL

PICKUP-PLP Client to Pickup Pulps  
PICKUP-RJT Client to Pickup Rejects

Bureau Veritas does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

Invoice To: All-In Exploration Solutions Inc.  
113A Platinum Rd.  
Whitehorse YT Y1A 5M3  
CANADA

CC:

## SAMPLE PREPARATION AND ANALYTICAL PROCEDURES

Procedure Code	Number of Samples	Code Description	Test Wgt (g)	Report Status	Lab
PRP70-250	13	Crush, split and pulverize 250 g rock to 200 mesh			WHI
FA430	13	Lead Collection Fire - Assay Fusion - AAS Finish	30	Completed	VAN
AQ201	13	1:1:1 Aqua Regia digestion ICP-MS analysis	15	Completed	VAN

## ADDITIONAL COMMENTS

This report supersedes all previous preliminary and final reports with this file number dated prior to the date on this certificate. Signature indicates final approval; preliminary reports are unsigned and should be used for reference only. All results are considered the confidential property of the client. Bureau Veritas assumes the liabilities for actual cost of analysis only. Results apply to samples as submitted.  
\*\*\* asterisk indicates that an analytical result could not be provided due to unusually high levels of interference from other elements.
