1 EXECUTIVE SUMMARY

In June of 2014, Aurora Geosciences Ltd. was commissioned by Carlincore Resources Ltd. to conduct detailed geochemical soil sampling, mapping and prospecting surveys on the HJ and CL properties in the Yukon Territory. This report describes geochemical soil sampling conducted from June 16th to July 6th, 2014, and the geological mapping and prospecting conducted between June 16th and September 3rd, 2014. This program consisted of detailed soil sampling in areas identified as anomalous during the 2013 stream sampling survey along with reconnaissance scale mapping of the properties in order to identify prospective lithologies and structure, along with potential sources of the geochemical trends. Coincidental and follow-up prospecting was also conducted in order to identify mineralization and related alteration exposed on surface and determine the source of the gold and path-finder elements identified during the preceding geochemical surveys.

The CL and HJ properties include 913 Quartz claims recorded in the Mayo Mining District, and were staked by the current owner, Carlincore Resources Ltd., in 2012 and 2014. They are located at 64°15'17" N 132° 44'12" W and 64°12'34" N 132° 25'45" W, respectively, and are situated approximately 185 km northwest of Mayo, Yukon Territory. The properties are accessible by helicopter.

Regional geology transitions from slope and basinal facies carbonates and siliciclastic rocks of the Selwyn Basin south of the property to the shallow water platformal carbonate units of the Mackenzie Platform to the north. The area is also at the intersection of three structural domains: the Richardson fault array, the Mackenzie fold belt and the Selwyn fold belt. The Dawson and Kalthleen Lake faults are located approximately six km to the south of the properties.

In 2012 and 2013, Carlincore Resources Ltd. conducted a detailed geochemical stream sampling and prospecting surveys on the HJ and CL properties in the Yukon Territory. The programs consisted of stream sediment sampling and prospecting all significant drainages, and produced a number of gold and path-finder element (As, Hg, Sn, Te, Tl) anomalies. No additional historical work has been recorded on the DJ and HJ claim blocks; however, there have been numerous gold discoveries directly to the south. In 2010, the Nadaleen Trend was discovered by ATAC Resources Ltd. Subsequent exploration in the area produced numerous gold showings, including the Anubis, Osiris, Conrad and Pharaoh zones. These showings occur in the foot wall of north-verging thrust faults.

The results of the 2014 soil sampling program identify a number of areas anomalous in gold and trace elements associated with Carlin-type mineralization (As, Cu, Hg, Sb, Tl and Te). Assay results include gold values up to 311 ppb in soil. Property reconnaissance mapping has identified calcareous lithologies and structural features favourable to host Carlin-type gold mineralization. However, no mineralization or alteration has been observed at surface during the mapping and prospecting programs. Based on these results, a work program consisting of additional detailed prospecting is recommended.

2 INTRODUCTION

In June of 2014, Aurora Geosciences Ltd. was commissioned by Carlincore Resources Ltd. to conduct detailed geochemical soil sampling, mapping and prospecting surveys on the HJ and CL properties in the Yukon Territory. The work was completed between June 16th and September 3rd, 2014, and targeted geochemically anomalous areas based on the 2013 stream sampling program results. This report describes the work program and results.

All geographic locations in this report are relative to North American Datum 1983. Non-geodetic coordinates are expressed in Universal Transverse Mercator Zone 8N metric coordinates. All measurements are expressed in the metric system unless they are measurements quoted from historic reports expressed in other units of measure. All geophysical data units are in the metric SI system. Angles of azimuth are expressed relative to true north unless otherwise stated.

3 LOCATION & ACCESS

The CL property is located at 64°15'17" N 132° 44'12" W on NTS 106C\02 and 106C\07, and the HJ property is located at 64°12'34" N 132° 25'45" W on NTS 106C\01 & \02, in the Mayo Mining District (Figure 1). The properties are located 185 km northeast of Mayo, Yukon Territory, and are currently only accessible by helicopter.

4 PROPERTY DESCRIPTION

The CL property consists of 501 Quartz claims and the HJ property consists of 412 Quartz claims recorded in the Mayo Mining District (Figure 2 and 3 respectively). Claim information is summarized in Appendix II. The claims comprising each property may be retained in good standing by performing assessment work in the amount of $100 per claim per year, or paying the same amount in lieu of assessment work.

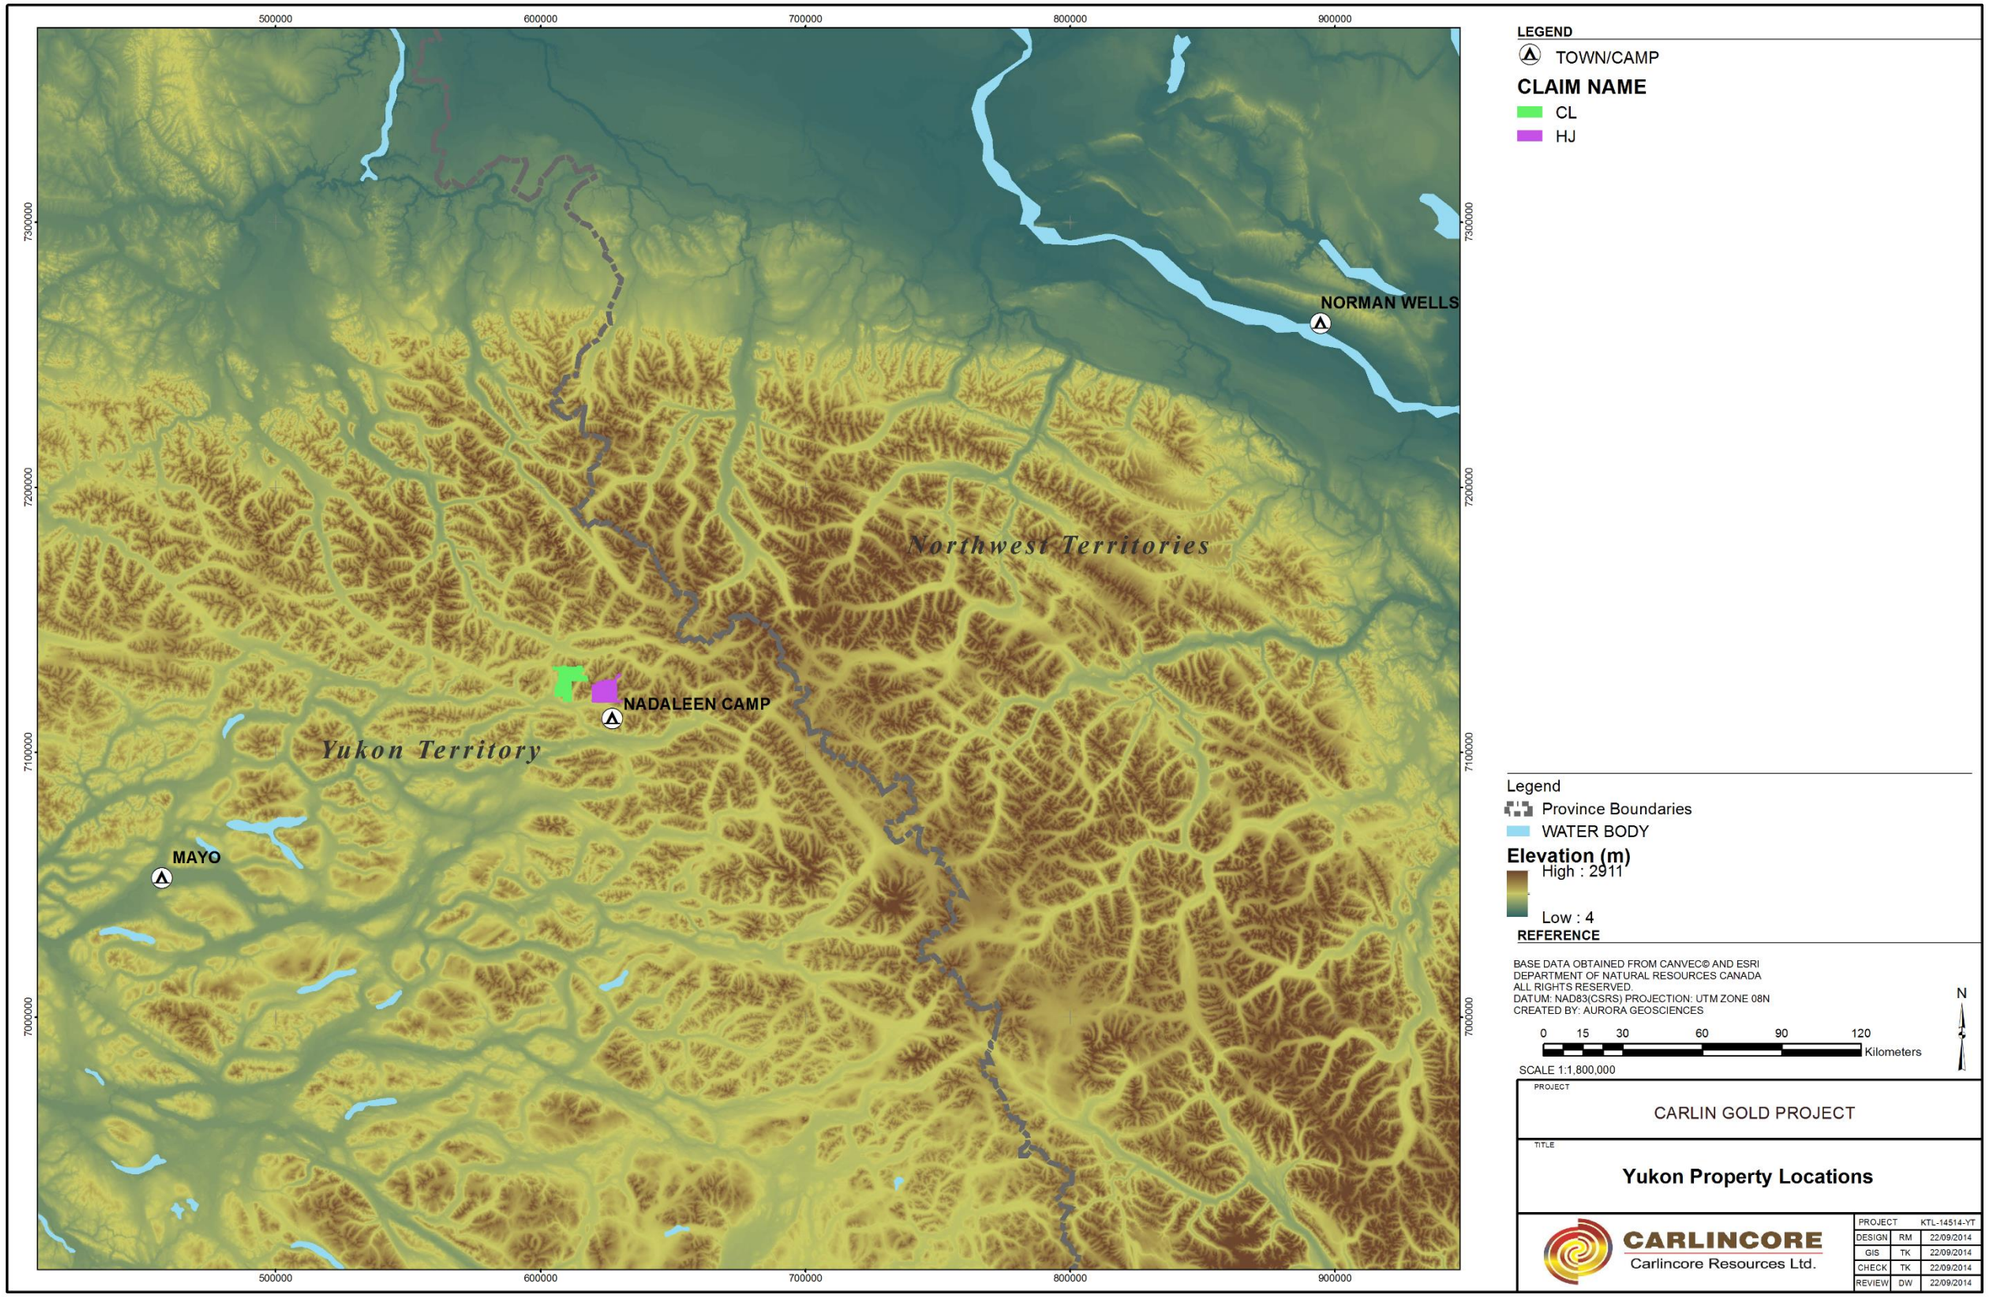

Figure 1. Property Location Map

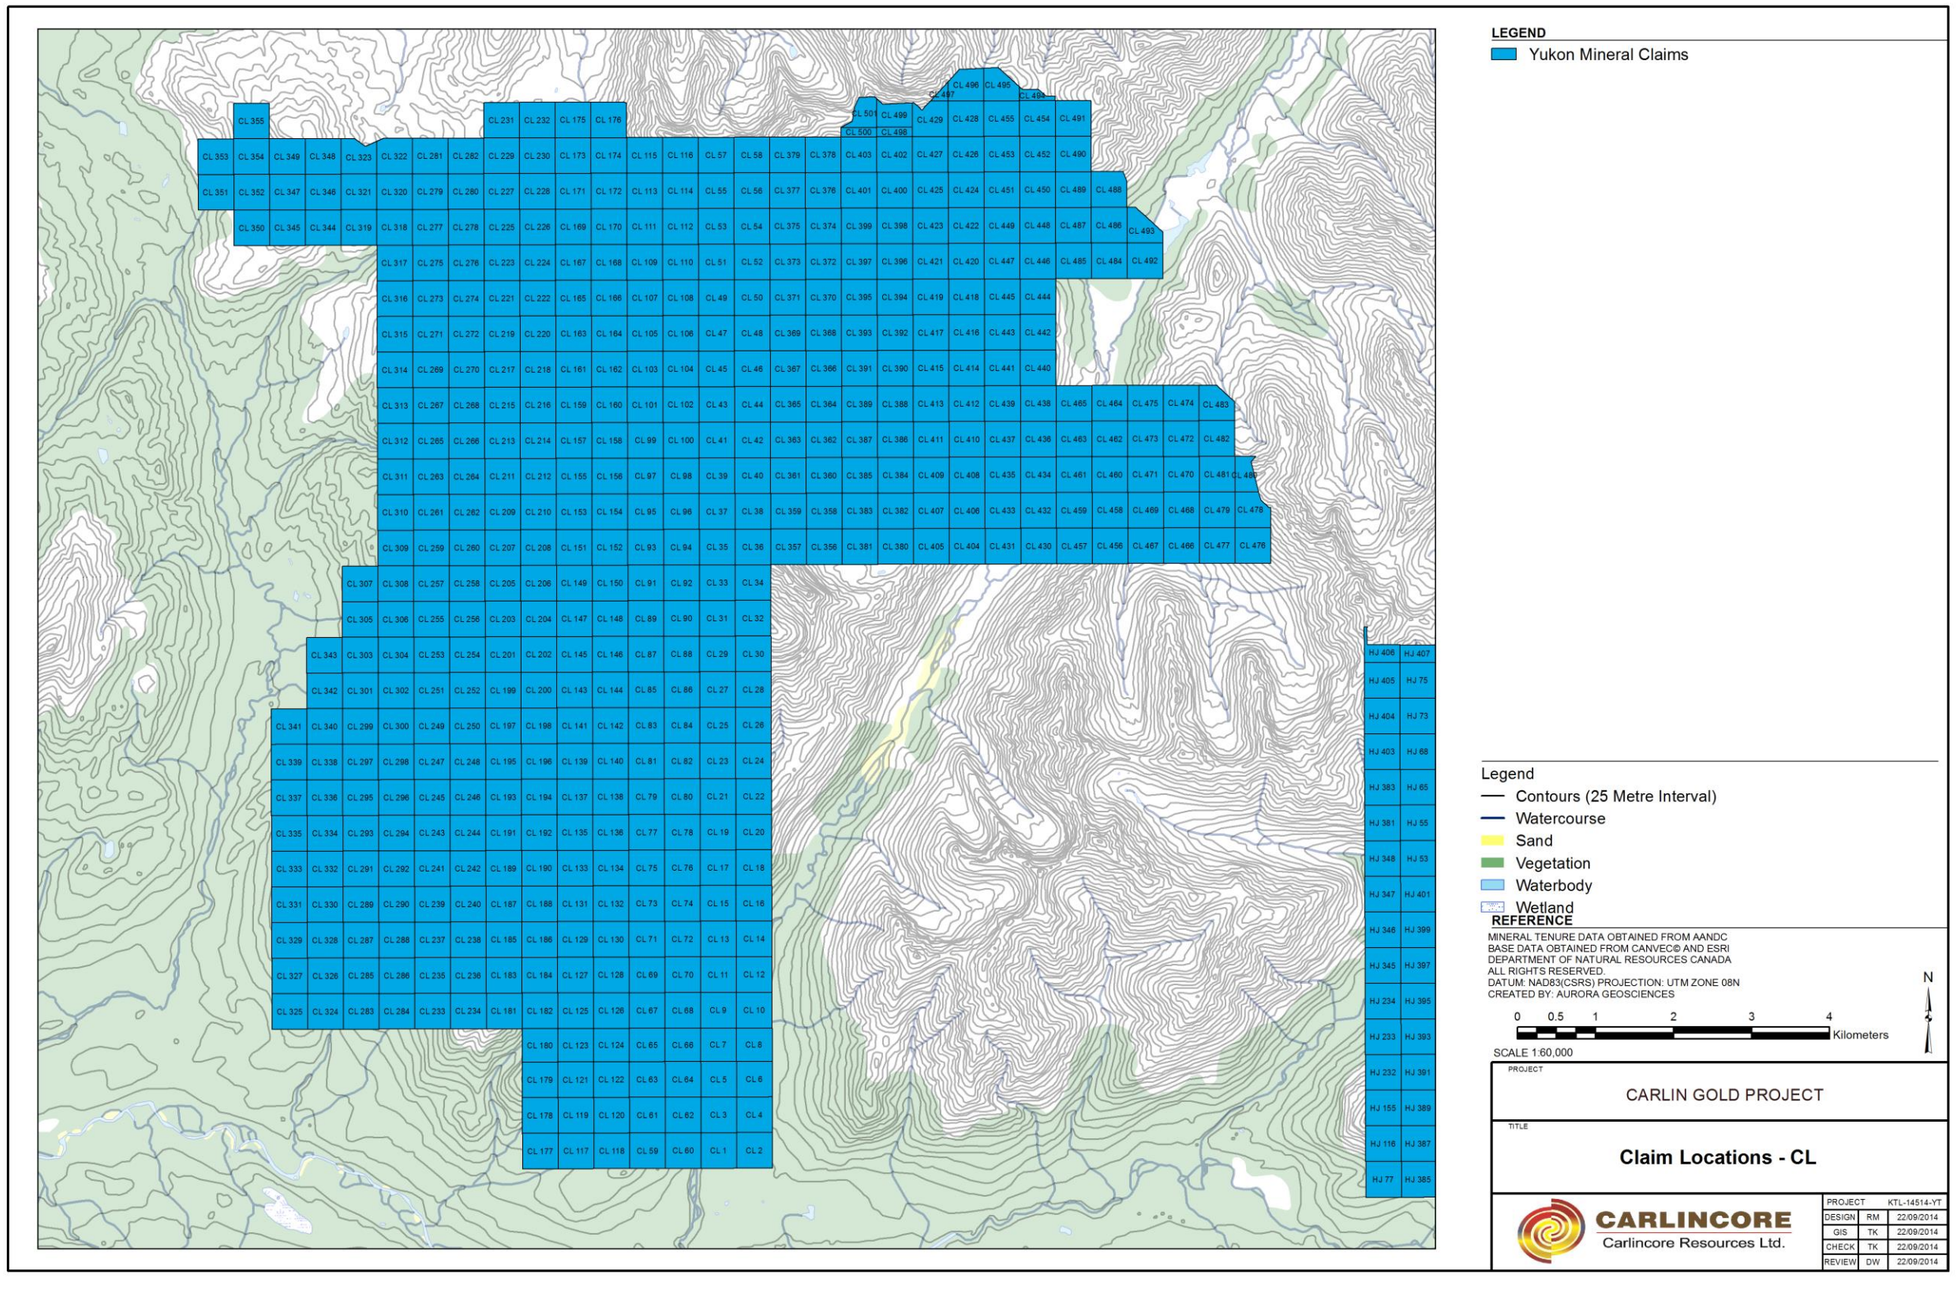

Figure 2. CL Property Quartz claims

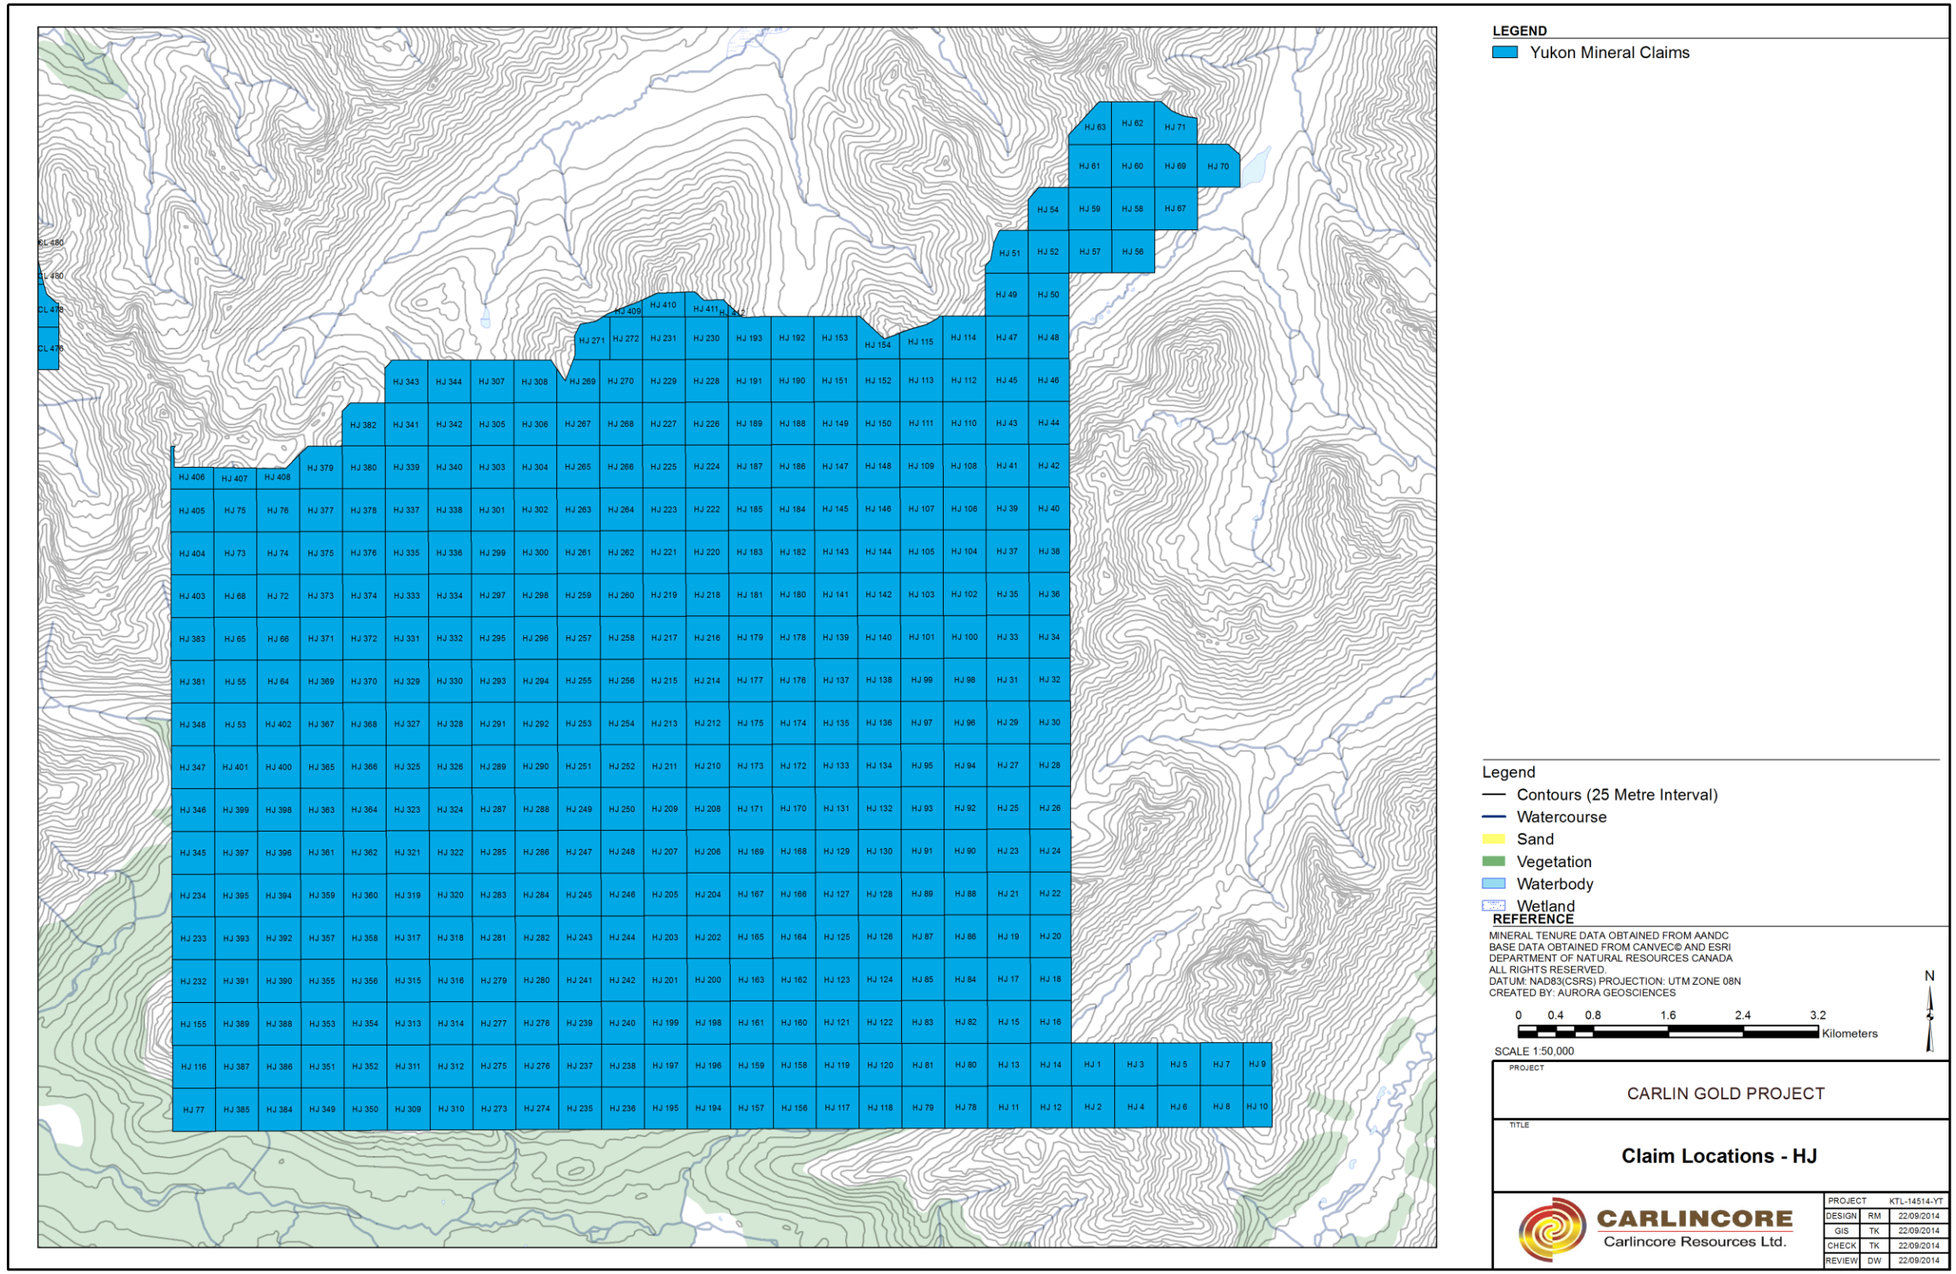

Figure 3. HJ Property Quartz claims

5 CLIMATE & PHYSIOGRAPHY

The climate and physiography section has been modified after Ecological Stratification Working Group (1995).

The three properties belong to the Taiga Cordillera Eco-zone and the Selwyn Mountain Eco-region. Climate in the region is marked by cool summers and cold winters. The mean annual temperature is -4.5°C. The mean summer temperature is 11°C and the mean winter temperature is -19.5°C. On average the region experience an average of 600 – 750 mm in precipitation.

Topographically, the properties lie in steep mountainous terrain that consists of sharply etched ridges and narrow valleys. Majority of the region is covered with colluvial debris with good outcrop exposure. At higher elevations the eco-region is characterized by alpine tundra vegetation and at lower elevations subalpine open woodland vegetation. Vegetation consists of crustose lichens, dwarf willows, mountainous avens, dwarf willow and shrubs. Subalpine vegetation consists of stunted white spruce, occasional fir, pine, willows, dwarf birch and Labrador tea.

There is a plethora of wildlife in the region. Characteristic mammals include Dall sheep, woodland / barren land caribou, moose, mountain goat, black and grizzly bear, wolf, lynx, arctic ground squirrel, American pika, hoary marmot and wolverine. Wildlife of the avian variety includes falcon, ptarmigan and waterfowl.

6 EXPLORATION HISTORY

In 2012 and 2013, Carlincore Resources Ltd. conducted a detailed geochemical stream sampling and prospecting survey on the HJ and CL properties in the Yukon Territory. The program consisted of sampling all significant drainages along with coincidental prospecting, and produced a number of gold and path-finder element (As, Hg, Sn, Te, Tl) anomalous target areas.

There has not been any historical work conducted where the current claims are located prior to 2012. However, there has been substantial historical work conducted in proximity to the current claims. Numerous companies have explored for base metals such as lead and zinc as well as precious metals such as gold. McIntyre Mines Ltd. conducted an extensive prospecting and geochemistry program directly west of the CL property in 1975. Late in the 1975 season, a drill program went ahead and completed 2436 ft of BQWL core in three “BBS 1” holes and 243 feet of EXT core in five “Winkie” holes (Birkland, 1976). The McIntyre Mines geochemistry program consisted of 1515 soil samples collected over 51 line miles.

More recent work in the area occurs directly south of the properties. ATAC Resources Ltd. discovered the Nadaleen Trend in the summer of 2010 and have done extensive exploration work consisting of prospecting, mapping and sampling in the search for Carlin-type gold deposits. In 2013, six new Carlin-type zones were identified surrounding the Anubis discovery situated less than 7 km south of the HJ

property. Drilling at the Conrad zone, a similar distance away, produced results of 4.23 g/t gold over 68.58 m and 5.40 g/t over 33.86 m (Atac Resources, 2013).

A regional stream sediment survey was conducted in the area in 1976 and 1977 at an average density of one sample per 13 square kilometers (Hornbrook et al., 1990). The results of this survey indicate that anomalous levels of gold and Carlin-type associated trace elements are present in or proximal to Carlincore Resources' properties (Figure 4).

A regional aeromagnetic survey was flown by Fugro Airborne Surveys for the Yukon Geological Survey and the Geological Survey of Canada during 2006 and 2007. The nominal traverse and control line spacings were , 800 m and 2,600 m, respectively, and the aircraft flew at a nominal terrain clearance of 250 m with the traverse lines oriented N30˚E (Kiss et al., 2008). This survey identified a large magnetic high anomaly centered roughly on the CL property, possibly representing an underlying intrusive body. Figure 4 shows the results of the aeromagnetic and the regional stream sediment survey over the CL and HJ properties.

7 REGIONAL GEOLOGY

The regional geology of the area has been described by Abbot et al., 1986, Mair et al., 2006, Colpron et al., 2013, and Tucker et al., 2012.

Geologic environments of the Selwyn basin and Mackenzie platform are mapped in the region (Figure 5). Selwyn basin strata proximal to the property consist predominantly of rocks belonging to the Neoproterozoic to Lower Cambrian Hyland Group and the Devonian to Mississippian Earn Group. The Hyland Group includes thick sections of coarse sandstone and shale (Yusezyu Fm), and abundant carbonate turbidite, local debris flow units (Algae Fm), and maroon shale (Narchilla Fm), and is unconformably underlain by shale, chert and sandstone of the Earn Group (Colpron et al., 2013). The Mackenzie platform, consisting of the Proterozoic formations such as the Backbone Ranges and Mount Kindle, is dominated by shallow water platformal carbonates (Abbott et al., 1986).

Tectonic events recorded in the region extend back to the Proterozoic and Paleozoic. The events thought to be related to rifting which caused extensional and strike-slip faulting. These faults were then reactivated during the Mesozoic northeast directed compression which produced the Selwyn fold and thrust belt, the Richardson fault array, and the Mackenzie fold belt (Li, 2013).

The two dominating structures in the region are the Dawson thrust fault and the Kathaleen Lakes fault. The Dawson thrust fault marks the abrupt change in facies from the Selwyn Basin to the Mackenzie Platform, and is believed to be a reactivated Neoproterozoic normal fault (Mair et al., 2006). The kinematics of the Kathaleen Lakes fault are uncertain, but may have also begun as a Neoproterozoic normal fault that has subsequently been reactivated (Colpron et al., 2013). The Kathaleen Lakes fault roughly marks the boundary between the Mackenzie and Selwyn fold belts. The Carlincore Resources' properties are located north of the Kathleen Lakes and the Dawson thrust faults (Figure 5).

8 WORK PROGRAM

This section describes the work program conducted on the CL and HJ property blocks in 2014. A soil sediment geochemical survey, geological mapping, and prospecting were conducted on the properties and this work is described in the following section. Appendix III contains a project log and Appendix IV contains a summary of expenditures.

8.1 Geochemical soil sediment survey

A soil sediment geochemical survey was conducted on the properties from June 16th to July 2nd, 2014. The purpose of the survey was to locate and constrain any mineralization within the geochemically anomalous areas identified by the stream sediment survey conducted in 2013. Coincident with the geochemical sampling, prospecting was conducted along the traverse lines in order to discover and collect grab samples on the property of any rock units that displayed alteration and mineralization, and is described in section 8.2 of this report.

8.1.1 Personnel & equipment

The work program was conducted by the following personnel:

Crew chief:	Tomasz Kalkowski
Samplers:	Matthew Ford
	Alex Cassidy
	Mike Walsh

The crew was equipped with the following instruments and equipment:

Instruments:	4 – Garmin non-differential GPS receivers
	4 – Trimble Juno w/ GPS receivers running GeoJot+
Equipment:	4 – Radios
	4 – Digital cameras
	2 – Iridium satellite phone
	Sample shovels
	Mattocks
	Kraft bags
	Plastic sample bags
	Plastic pails
	Rice bags
	Flagging
	Permanent markers
	Field binders

8.1.2 Soil sediment sample specifications

Soil sediment sampling was conducted according to the following specifications:

Mapping Datum:	NAD83 UTM Zone 8N
Location recording:	Non-differential GPS receivers, averaging readings a minimum of 15 times.
Marking:	Soil sample locations were marked with orange and blue flagging.
Sampling:	Soil samples were collected predominantly from the C horizon. B horizon was occasionally sampled in the lower lying grids due to thick organic cover and underlying talus boulders.
Traverses:	Recorded with non-differential GPS receivers. 50 m spacing between sample locations along traverse lines.
Records:	Information on the location, date, elevation, tag number, station, sample depth, horizon sampled, depth within sampled horizon, sample colour, angled clasts percentage, organics percentage, gravel percentage, sand percentage, silt percentage, clay percentage, parent material, moisture content, vegetation and topographic position. Two photographs of the sample and location were also taken and are included in the digital archive.

8.2 Prospecting

A prospecting survey was conducted on the properties from August 23rd to August 27th, August 31st to September 1st, and on September 3rd, 2014. The purpose of the survey is to locate and identify mineralization and related alteration exposed on surface and determine the source of the gold and path-finder elements identified in the soil sampling survey conducted on June 16th to July 2nd, 2014.

8.2.1 Personnel & equipment

The work program was conducted by the following personnel:

Crew chief:	Tomasz Kalkowski
Geologists:	Joyia Chakungal
	Kel Sax
	Laurence Gagnon

The crew was equipped with the following instruments and equipment:

Instruments:	4 – Garmin non-differential GPS receivers
Equipment:	4 – Radios 4 – Digital cameras 2 – Iridium satellite phone Mattocks Hand lenses 5 and 10% HCl acid droppers Magnetic scribers Plastic sample bags Rice bags Flagging Permanent markers Field binders Metal tags

8.2.2 Rock sample specifications

Geological prospecting was conducted according to the following specifications:

Mapping Datum:	NAD83 UTM Zone 8N
Location recording:	Non-differential GPS receivers, averaging readings a minimum of 15 times.
Marking:	All sample locations were marked with orange flagging and metal tags.
Records	Information on the location, sampler, sample number, date and description were recorded for each grab sample collected. Two photographs of the sample and location were also taken and are included in the digital archive.

8.3 Mapping

Geological mapping was conducted on the HJ and CL properties from June 16th to July 4th, August 23rd to August 27th, and from August 31st to September 1st, 2014. The purpose of this work is to identify source(s) for geochemical trends highlighted in the soil and stream geochemical data and create a detailed geology map.

8.3.1 Personnel & equipment

The work program was conducted by the following personnel:

Mapping Geologist:	Joyia Chakungal

The geologist was equipped with the following instruments and equipment:

Instruments:	Garmin non-differential GPS receiver
Equipment:	Radio Digital camera Iridium satellite phone Mattock Hand lenses 5 and 10% HCl acid droppers Magnetic scribers Plastic sample bags Rice bags Flagging Permanent markers Field binders

8.3.2 Mapping station specifications

Geological mapping was conducted according to the following specifications:

Mapping Datum:	NAD83 UTM Zone 8N
Station Spacing:	Stating spacing was on average 200 m along chosen ridge lines and stream beds. Additional stations were recorded where bedrock lithology changed or there was other features of note such as the presence of structural features.
Location recording:	Non-differential GPS receivers, averaging readings a minimum of 15 times.
Marking:	Geological stations were unmarked in the field.
Records	Information on the location, photos, exposure type, samples and sample comments, structure type, dip direction, strike, azimuth, dip/plunge and general station and structure notes were collected at each station. At least one photograph was also taken and are included in the digital archive.

8.4 Data products

Field data is contained in the following appendices to this report:

Appendix VI	Soil sample descriptions

Appendix VII	Rock sample descriptions
Appendix VIII	Rock geochemical analysis certificates
Appendix IX	Soil geochemical assay certificates

Data is plotted in the following maps included in this report in Appendix V:

CL Soil Sample Results – As
CL Soil Sample Results – Au
CL Soil Sample Results – Cu
CL Soil Sample Results – Hg
CL Soil Sample Results – Sb
CL Soil Sample Results – Te
CL Soil Sample Results – Tl
HJ Soil Sample Results – As
HJ Soil Sample Results – Au
HJ Soil Sample Results – Cu
HJ Soil Sample Results – Hg
HJ Soil Sample Results – Sb
HJ Soil Sample Results – Te
HJ Soil Sample Results – Tl
Yukon Rock Sample Results - Au

Digital data on the data stick in this report includes:

Sample data	08 Appendix VIII\ – Rock Assay Certificates
Geological data	09 Appendix IX\ – Soil Assay Certificates

9 SAMPLE COLLECTION, SECURITY, PREPARATION & ANALYSIS

This section describes principles and procedures used in the collection, security, preparation and chemical analysis of rock and soil samples collected during the program. All samples collected during the program were sealed in rice bags or tamper-proof plastic pails for transportation to the analytical laboratory. Security tags were affixed to the bags and pails. Samples were retained in the custody of Aurora personnel throughout transportation to the laboratory or were conveyed by a commercial carrier with a conveyance and security form attached.

9.1 Rock samples

Grab samples were collected during the work program to determine the range and grade of economic mineralization on the properties. The samples were predominantly collected within streams, talus slopes or in outcrop. They comprise mainly clastic or carbonate sedimentary or meta-sedimentary rocks containing variable iron and manganese oxide, epidote and silica alteration and chalcopyrite, bornite and pyrite mineralization.

At the laboratory, rock samples were prepared and analyzed as follows (AGAT Labs method codes in parenthesis):

1. Dry <5kg, crush to 75% passing 2mm split to 250-g and pulverize to 85% passing 75 µm (200-001)
2. Metals Package by Aqua Regia Digest ICP / ICPMS Finish (201-074)
3. Trace Au at 0.001-10 ppm by Fire Assay / ICP Finish (50g) (202-552)

9.2 Soil samples

Soil samples were collected predominantly from the C horizon on the HJ and CL properties. B horizon was occasionally sampled where C horizon was unavailable due to thick organic cover and underlying talus boulders. Samples were collected in Kraft paper bags and filled to the limit to ensure a sufficient weight of sample was collected for analytical processing.

At the laboratory, soil samples were prepared and analyzed as follows (AGAT Labs method codes in parenthesis):

1. Dry samples <5kg, 60C (224-006)
2. Dry excessively wet samples (224-008)
3. Screen soils or stream sediments – 80, <2kg (224-012)
4. Metals Package by Aqua Regia Digest ICP/ICPMS Finish (201-074)
5. Trace Au at 0.001-10 ppm by Fire Assay / ICP Finish (50g) (202-552)

10 PROPERTY GEOLOGY & ECONOMIC MINERALIZATION

This section describes the geology underlying the CL and HJ properties based on the geological mapping conducted in 2014 by Joyia Chakungal (Map Pocket). The economic mineralization potential is also covered in this section based on the geochemical sampling and prospecting programs completed in 2014.

10.1 Rock units

The following rock units are present on the CL and HJ properties, based on field observation by Chakungal (2014):

0	Very dark grey/black, coarsely crystalline limestone. Often associated with beds of polymict floatstone containing clasts of orange weathering dolostone, limestone, rounded quartz pebbles and minor shale, particularly near base of the unit where it overlies unit #2. 'Beef' textured calcite layers common. Related to Algae Formation? On YGS map, classified as PNl, PNBl and PSs.
2	Well sorted, coarse grained, quartz arenite, quartz granular sandstone - pebble conglomerate interbedded with varing amounts of dark grey siltstone. On YGS map, classified as PNq.
3	Green-grey siltstone and shale interbedded rhythmically bedded with fine- to medium-grained sandstone, lesser calcaerous sandstone, minor limestone and limestone debrites. On YGS map, classified as PNl and PNq.
17	Polymictic, pebble/ boulder conglomerate, predominantly matrix supported. Clasts vary from centimetre - metre scale and comprise limestone, dolostone, siltstone and shale. Limestone/dolostone and siltstone clasts look to have been sourced from units #11 ad #10. Horizons could be interpreted as debrites interbedded with unit #3. Matrix comprises calcareous sandstone and/or limestone. On YGS map, classified as PSs?
14	Finely laminated, dark grey limestone interbedded with 'beef' textured calcite and grey siltstone, particularly proximal to contact with overlying unit #3. Unconformably overlies unit #12, while contact with unit #11 appears to be conformable. On YGS map, classified as PSc and PNc.
11	Well bedded, tan and grey limestones preserving sedimentary structures (i.e. climbing ripples; cross-bedding). Monolithic, intraclast rudstones common throughout unit particularly in basal sections. Where in contact with underlying maroon siltstones, unit is characteristically orangy-tan weathering dolostone and weakly calcareous sandstone. Top of section is characterized by variably thick limestone and dolostone debrite. On YGS map, classified as PSc.
10	Maroon and green, rhythmically bedded siltstone and fine sandstone. On YGS map, classified as PNu.
16	Dark grey-black shale, minor silstone and orange-brown weathering dolostone.
13	Orange-brown weathering, well bedded, fine- to coarse-grained calcareous sandstone interbedded with polymictic cobble/boulder conglomerate with calcareous matrix. Clasts in conglomerate include quartzite, limestone, dolostone, siltstone and shale. Interbedded and tightly folded with unit #12. On YGS map, classified as PNu.
12	Chlorite green siltstone and shale interbedded with unit #13. Polydeformed with well developed cleavage. On YGS map, classified as PNu.

10.2 Bedrock Geology

The following bedrock geology description is based on field observations made by Chakungal (2014) during the 2014 geological mapping program.

The oldest rocks – units 12 and 13, appear to underlie much of the CL block and comprise dark green, locally mauve and sometimes even chloritic green weathering, siltstone, shale and fine grained sandstone that is in places characterized by the presence of small, subhedral quarts grains (Unit 12), which differs from the interpretation of Colpron et al. (2013) who have classified the unit as PNu – one of the younger units in their interpretation. Unit 12 rocks are interbedded and tight – to isoclinally folded with very orange-brown weathering, well bedded, fine to coarse grained calcareous sandstone and limestone interbedded with thick intervals of polymictic cobble/boulder conglomerate (Unit 13). Composition of clasts in the conglomerates include well rounded quartzite, limestone, dolostone, siltstone and shale in a medium to coarse calcareous sandstone matrix.

The oldest rocks underlying the HJ block comprise a thick package of dark grey mudstone and siltstone interbedded with fine grained sandstone (Unit 10). At the top of this package, roughly 20 to 30 m below its contact with the overlying limestone/dolostone package (Unit 11), fine grained siliciclastic rocks are

characterized by a distinct green and maroon colour. The base of Unit #11, at the contact with underlying maroon and green siliciclastics, is marked by medium to coarse grained sandstone interbedded with dolostone. Up-section of the contact, dolostone becomes interbedded with light grey weathering, micritic limestone and rudstone. The top of Unit 11 is marked by a limestone/dolostone debrite of varying thickness (> 2 m).

Nowhere between the CL and HJ blocks has the contact between Unit 12/13 and Unit 11 been observed. Thus, the relative age of the units as interpreted and presented is speculative.

In the west part of the CL block, thrust onto Units 12 and 13 is a horizon of very dark grey-black shale and siltstone interbedded and tightly folded with bright orange weathering dolostone (Unit 16). Further to the west, overlying this unit is a variably thick package of dark grey, crystalline limestone interbedded with dark grey mudstone and siltstone containing variable beef calcite (Unit 14). In the HJ block, rocks that show a marked similarity to Unit 14 overlie light grey-beige limestone and dolomite rocks of Unit 11, suggesting the limestones of Unit 14 unconformably overlie Units 12, 13 and 11.

Overlying Unit 14 on both claim blocks is a thick package characterized at its base by rhythmically bedded, light greenish-grey siltstone and fine sandstone (Unit 3). In the HJ block, this interval is interbedded at its base with variably thick debrite horizons (Unit 17) containing rounded limestone, dolostone and siltstone cobbles and boulders that were sourced from Unit 11 and possibly Unit 10. Further up-section, fine grained lithologies grade into and are interbedded with coarser quartz granular sandstone and 'grits' (Unit 2), and locally, thick intervals of dark grey, crystalline limestone interbedded with coarse grained wackstone and packstone containing variable beef calcite (Unit 0). Packstone and wackstone commonly includes angular clasts of dark grey limestone, orange brown dolostone and siltstone clasts in a matrix of millimetric intraclasts and/or cortoids.

10.3 Structure

In the CL block, preservation of tight-isoclinal folds trending north-northeast/south-southwest in Units 12 and 13 indicate east-west oriented shortening of unknown age. North-northeast and south striking thrusted contacts between units on both the CL and HJ prospects are also indicative of this east-west shortening event. Preservation of a variably developed secondary cleavage in all rock packages exposed in both claim blocks indicates subsequent deformation to produce east to northeast trending open folds, perhaps related to north-northeast directed shortening during the Mesozoic (Chakungal, 2014).

Also preserved in outcrop is evidence for slip that has taken place along foliation planes (in shales/phyllites) and bedding planes (coarser grained siliciclastics and limestones), in addition to brittle faulting along fracture planes that appear to cross-cut bedding in the more competent siliciclastic and limestone units (Chakungal, 2014).

Regionally, tectonic events extend back to the Proterozoic and Paleozoic. The events are thought to be mainly extensional and strike-slip faulting. These faults were then reactivated during Mesozoic compression in the northwest-trending fold thrust belt of the Selwyn basin, the Richardson fault array, and the Mackenzie fold belt (Li, 2013).

10.4 Mineralization

This section describes results of the geochemical, mapping and prospecting surveys performed on the property in 2014. A total of 1,920 soil samples and 254 rock samples were collected on the GY and CL properties for geochemical analysis.

10.4.1 Prospecting surveys

Rock samples were collected proximal to structural features such as faults and fold hinges and prospective lithological units such as limestone and dolostone known to host gold deposits in the area. Any alteration such as silicification, decarbonatization, iron or manganese oxidation, epidote and/or brecciation as well as mineralization such as extensive pyrite were sampled where observed. Float and outcrop grab samples within or proximal to anomalously high soil sample locations were collected. Sample locations and descriptions are detailed in Appendix VII.

10.4.2 Geochemical surveys

Soil samples were collected predominantly from the C horizon. B horizon was occasionally sampled in the lower lying grids due to thick organic cover and underlying talus boulders. Samples were collected in Kraft paper bags and filled to the limit to ensure a sufficient weight of sample was collected for analytical processing. Sample locations and descriptions are detailed in Appendix VI.

10.4.3 Assay Results

Statistical analysis of geochemical data consisted of the following procedures and is applied to all analyzed elements:

1. Analyses below the detection limit are assigned a value of half the lower detection limit.

2. Minimum, maximum, mean and standard deviation is calculated for elements of possible interest.

3. Data are normalized to log10 base to simplify the plotting and interpretation of univariate statistics.

4. Correlation matrices (Pearson (n)) are prepared in order to analyze elemental trends and associations. This statistical analysis was performed using XLSTAT© plugin package for Microsoft Excel®.

Appendices VIII and IX contain the laboratory analytical results and Appendix X contains the element correlation matrices.

There is a moderate to strong positive correlation between Au and Ag, Hg, Te and Cu in both rock and soil samples collected on the HJ and CL properties. Au also correlates positively with a host of other elements, including Fe, Ni, Co and Pb. A negative correlation is observed between Au and Ca in both rock and soil samples.

Additionally, the results have been reviewed using a geological-statistical analysis developed by Colin Godwin of Godwin Consultants Ltd., called Relative Value Discrimination Factor Systematics (RvDfS). The methodology and interpretations resulting from this statistical analysis are contained in Appendix XI.

Tables 1 and 2 summarize the univeriate statistics for elements of interest for all samples collected in 2014, organized by type of sample collected. Any assay result above mean plus two standard deviations is considered anomalous.

Table 1. Summary of soil sample statistics from the CL and HJ property (1920 Samples)

Element	Minimum	Maximum	Mean	Standard Deviation	Mean + 2 Std Dev
Ag (ppm)	0.01	3.47	0.182042	0.182007	0.546056
As (ppm)	1.1	353	21.6901	20.43436	62.55882
Ba (ppm)	8	1590	157.4698	160.9678	479.4055
Be (ppm)	0.12	7.89	1.007453	0.63918	2.285814

Maps included in Appendix V show the results of geochemical analysis for the primary elements of interest in Carlin-type gold systems as described by Muntean et al. (2011): As, Au, Cu, Hg, Sb, Te and Tl.

10.4.3.1 HJ Property

There are at least three areas that have been identified as areas of interest resulting from soil geochemistry assay results on the HJ Property (Figure 6). Area '1' and '2' have been identified as precious metal deposit signature anomalous using RvDfS, and are highly anomalous in Hg and Tl, and moderately to highly anomalous in As, Cu and Sb locally.

Area '3' shows highly anomalous Ag, As, Pb and Te values, and moderately anomalous Sb. Anomalous samples within this area have been identified to be Carlin and/or precious metal deposit signature anomalous using RvDfS (Godwin, 2014).

Additionally, areas 'A', 'B' and 'C' identifies anomalous Au samples which range between 63 and 97 ppb. However, these sample areas do not contain elevated values in any gold pathfinder elements.

Rock sample E5578262 collected at location 'D' has been observed to have undergone decalcification. Assay results for this sample returned 2560 ppm As and elevated Pb and Zn values. No other rock samples collected on the HJ property during the duration of the program are anomalous in any precious or pathfinder elements.

Prospecting in areas '1', '2' and 'C' did not identify any significant alteration or mineralization at surface. There was no follow-up prospecting conducted in areas '3', 'A', 'B' and 'D' due to late-season environmental conditions.

In areas '1' and '2' reconnaissance mapping has identified the presence of grey-brownish, medium grained, weakly calcareous sandstone interbedded and folded with non-calcarious silt- and mudstone (Chakungal, 2014). Area '3' is dominated by very dark grey/black, coarsely crystalline limestone, often associated with beds of polymict floatstone containing clasts of orange weathering dolostone, limestone, rounded quartz pebbles and minor shale.

10.4.3.2 CL Property

There are at least five areas that have been identified as areas of interest resulting from soil geochemistry assay results on the CL property (Figure 7). Area '1' has been identified as precious metal deposit and Carlin signature anomalous using RvDfS, and contains elevated levels of Sb, Cu, Hg, Au and Te in the west, and elevated As in the east.

Area '2' contains sample sites identified as Carlin signature anomalous using RvDfS. This area contains a number of significant gold anomalies, including values up to 106 ppb. It also shows moderately anomalous values for Sb and Cu. The west margin of Area '2' is identified as a strong Hg and Tl anomalous area.

Area '3' is identified as Carlin and precious metal deposit signature anomalous using RvDfS. It is highly anomalous in As and Tl, and moderately anomalous in Sb.

Areas '4' and '5' contain a number of highly anomalous soil assay results, including seven samples returning Au values between 70 and 311 ppb. There are also a number of samples that are pathfinder element anomalous, including As, Hg, Sb and Te. All the anomalous sample locations are dispersed within the areas of interest, and no discernable pattern is observed.

Prospecting to follow up soil assay results in all areas of interest did not identify any significant alteration or mineralization at surface. No rock samples collected on the CL property during the duration of the program are anomalous in any precious or pathfinder elements.

The areas of interest are associated with orange-brown weathering, fine- to coarse-grained calcareous sandstone and limestone that is commonly observed proximal, and often interbedded with molymictic cobble/boulder conglomerate. Enriched Au values could be associated with lithology or a combination of favourable chemistry in proximity to subtle, small scale structures not noted in the reconnaissance mapping. The abundance of polymictic conglomerate with well-rounded cobbles and bnoulders in the area suggests a possible paleo-placer source for the anomalous gold values (Chakungal, 2014).

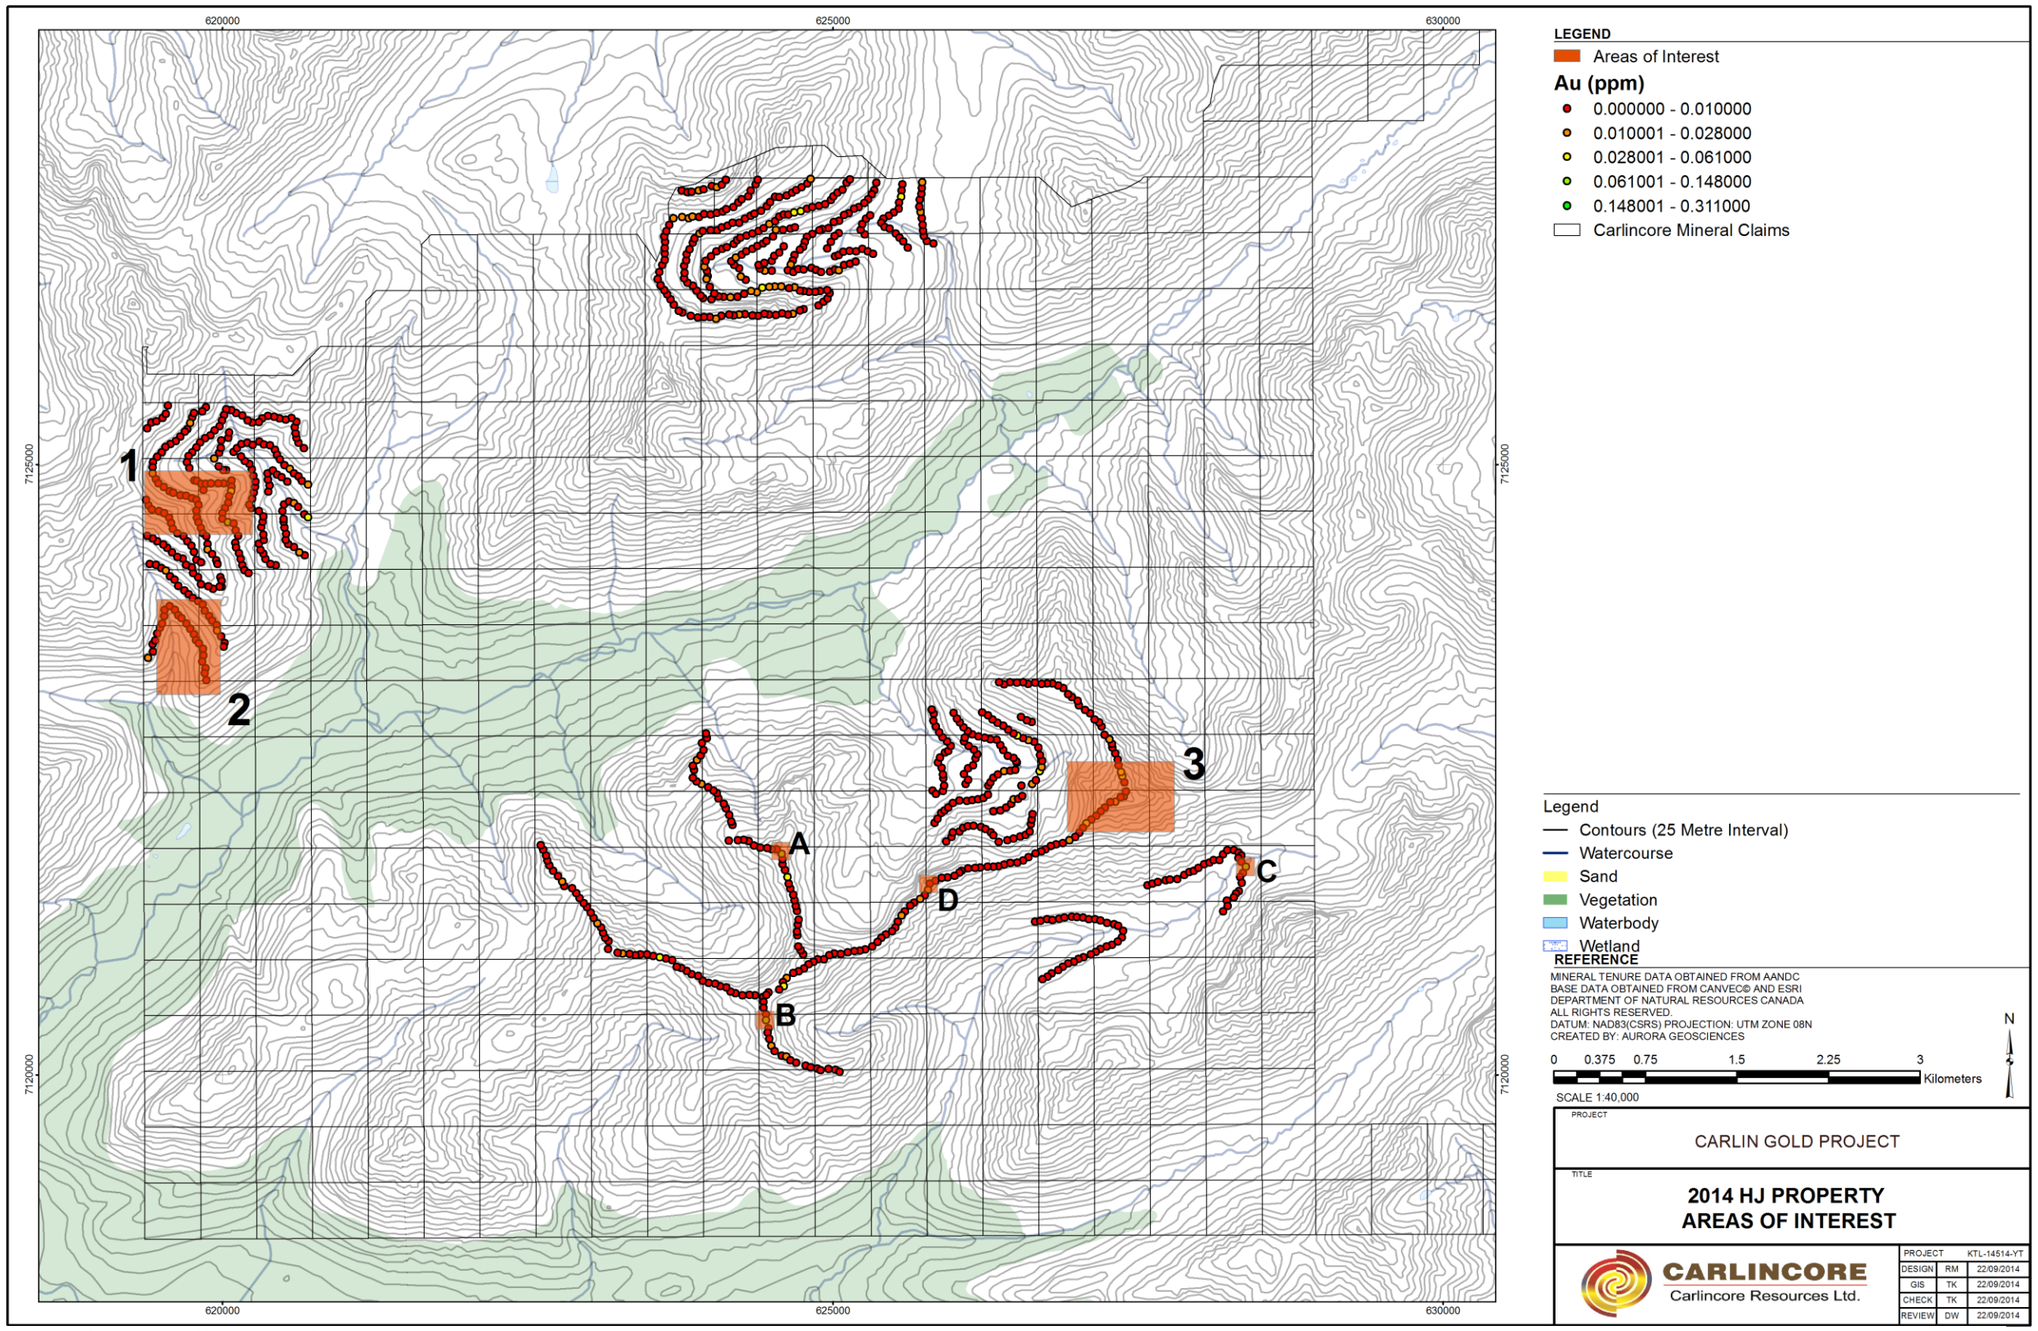

Figure 6. Anomalous areas of interest on the HJ property

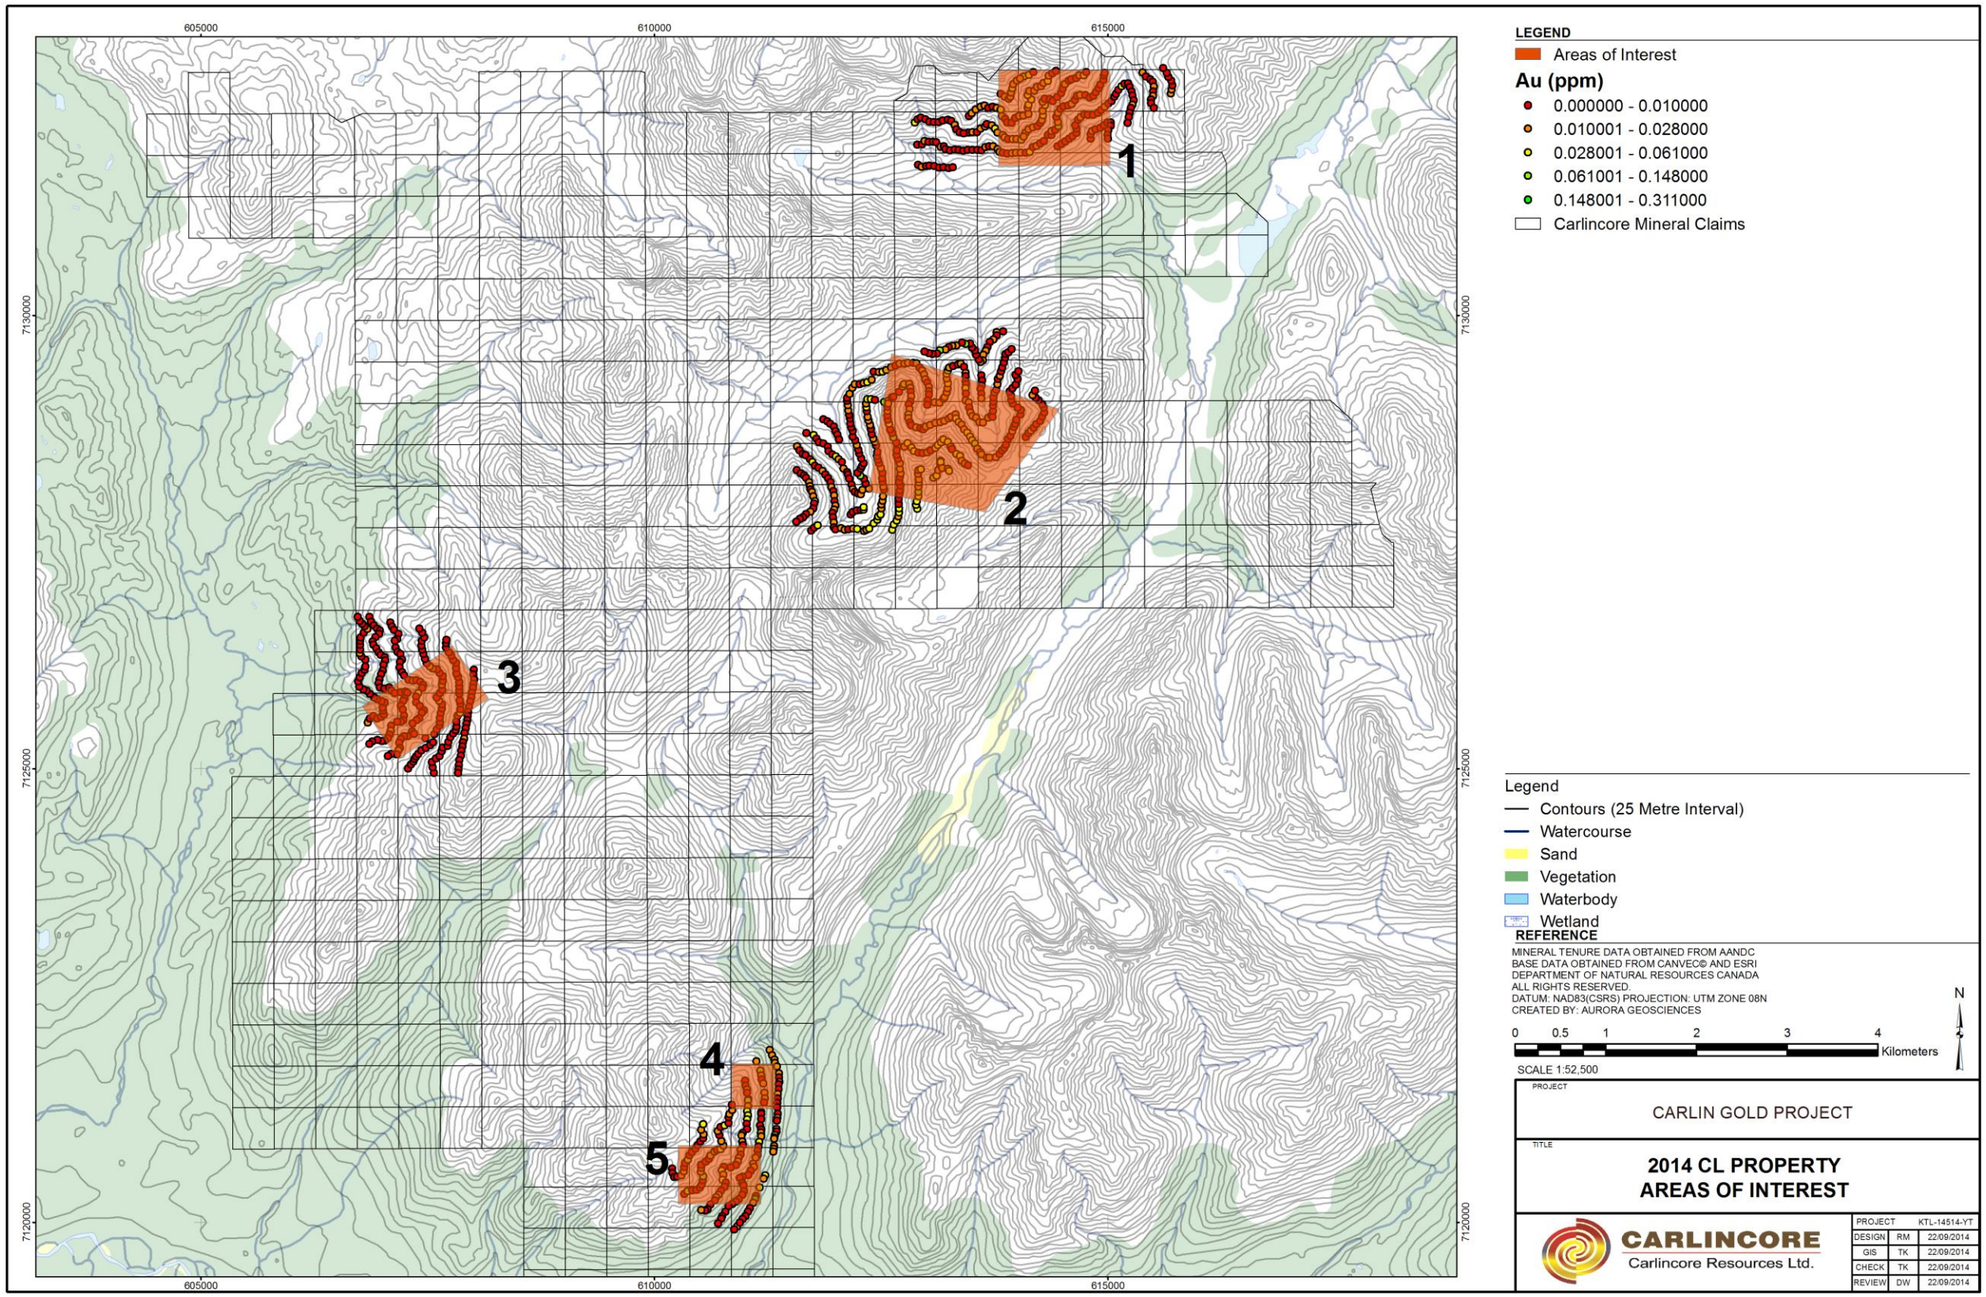

Figure 7. Anomalous areas of interest on the CL property

11 INTERPRETATION AND CONCLUSIONS

The results of geophysical, geological and geochemical surveys conducted on the CL and HJ properties to date support the following conclusions:

1. A correlation between Au and the a number of elements indicative of a trace metal enrichments associated with Carlin-type gold deposits (Hg, Cu, Te) has been observed when statistically analyzing the geochemical datasets. However, Ca is negatively correlated to Au in both rock and soil samples, which suggests that the Au is not hosted in calcareous rocks or is associated with decalcification of the host unit.

2. The RvDfS geostatistical analysis has identified Carlin and precious metal deposit anomalous samples in all current areas of interest.

3. There are a number of areas within the property boundaries that display anomalous values in Au and/or associated elements.

4. Property reconnaissance mapping has identified a number of property- to regional-scale thrust faults on both the HJ and CL properties. Additionally, favourable calcareous lithologies, similar to that hosting known Carlin-type gold mineralization to the south, have been identified. No mineralization or alteration has been observed at surface during the mapping and prospecting programs to date.

5. A regionally mapped magnetic high centered approximately under the CL property may represent an underlying intrusive body that is the source of heat and hydrothermal fluids corresponding to anomalous mineralization found regionally.

12 RECOMMENDATIONS

The conclusions of this report support the following recommendations:

1. Follow-up prospecting in the ‘3’, ‘A’, ‘B’ and ‘D’ areas of interest to locate and identify any altered and/or mineralized lithology.

2. Reprocessing existing aeromagnetic data in order to better define any structures and intrusive bodies on or near the properties.

Appendix I

Statement of Qualifications

STATEMENT OF QUALIFICATIONS

I, Tomasz Kalkowski, do hereby certify that:

1. At the time I worked on the Carlincore Resources Ltd. properties, located 185km ENE of Mayo, Y.T., my business address was 3506 McDonald Drive, Yellowknife, X1A 2H1.

2. I am a graduate of the University of Ottawa, having graduated in 2012 with an Honours Bachelor of Science with Specialization in Geology-Physics.

3. Since 2011, I have worked on numerous projects with Aurora Geosciences, assisting in and conducting both geological and geophysical surveys. My experience includes all aspects of geological surveying, including prospecting, mapping, geochemical sampling and drill target acquisition.

4. I assisted in the planning and preparation of the program, and was the crew chief during the prospecting and sampling portions of the exploration program at the CL and HJ properties between June 16th and September 3rd, 2014.

5. I have not received, nor do I expect to receive, any direct or indirect interest in the CL or HJ property or the securities of Carlincore Resources Ltd.

Dated this December 22, 2014 in Yellowknife, Northwest Territories.

_____

Respectfully Submitted,
Tomasz Kalkowski, B.Sc.(Hons), G.I.T.

Appendix IV

Statement of Expenditures

Phase 1	***Cost***		
June 16th – July 6th, 2014	Total Program Cost	$236,120.00	
	HJ Consulting and management (Gongbo Li)	$50,000.00	
	Extra Helicopter Time (6.5hrs)	$9,912.50	
	Extra Meals and Accommodations (19 days)	$3,325.00	
	Extra Rock Sample Assay Cost	$3,641.48	
	Soil Samples outside the property block (3)	($568.99)	
	Rock Samples outside the property block (3)	($121.38)	
		$302,308.61	$302,308.61
Phase 2	***Field Operations***		
August 23rd – September 3rd, 2014	Supplies and Equipment	$416.42	
	Program Preparation Costs	$2,342.86	
	Mobe/Demobe/Standby	$1,400.00	
	Field Work	$22,285.71	
	Expediting	$291.43	
	Project Management	$2,057.14	
	Truck and Driver	$457.14	
		$29,250.70	$29,250.70
	Service & support		
	Helicopter	$25,393.78	
	Fixed Wing	$3,402.46	
	Cargo	$66.54	
	Commercial Airfare	$692.87	
	Fuel	$150.64	
	Consulting Fees (Transterritorial Inc.)	$2,217.86	
	Consulting Fees (Colin Godwin, UBC)	$3,360.00	
	Meals & Accommodations	$8,679.51	
		$43,963.66	$43.963.66
	Assays & reports		
	Assays	$8,109.80	
	Logistics Report	$457.14	
		$8,566.94	$8,566.94
	Costs incurred outside the property block		
	Rock Samples (1)	($498.67)	
		($498.67)	($498.67)
	Total expenditures		$383,591.24

I certify that this statement of expenditures is complete and true to the best of my knowledge.

Tomasz Kalkowski, B.Sc.(Hons), G.I.T.

Appendix VII

Rock Sample Descriptions

2014 CL and HJ Rock Sample Descriptions

Date	Tag Number	Sampler	UTME	UTMN	Elevation	Description
6/18/2014	E5544510	MW	615416	7132717	1523	Midslope, alpine vegetation, float. Predominant lithology of area is mudstone (slate), unaltered. Some nearby slates show stong silicification. Sample is fist sized + 2 smaller rocks of the same lithology. Sample is heavily altered slate. Redish brown alteration coating outside 1mm of the sample. Interior shows that sample is also strongly silicified. Calcite veining is pervasive throughout sample
6/21/2014	E5544511	MW	610953	7120953	1267	Midslope streambed (dried up), float. Altered slate, unknows green altleration. Calcite vein 3cm wide running through sample
6/21/2014	E5544512	MW	610953	7120953	1267	Midslope streambed (dried up), float. Conglomerate, heavily oxidized. Clasts 1mm-40mm of slate, quartzite. 1cm wide qtz vein
6/28/2014	E5544513	MW	613422	7129361	1453	Midslope talus fan. Silstone, moderately oxidized. Extensive discordant qtz and calcite veining comprises 70% of sample
6/28/2014	E5544514	MW	613430	7129381	1440	Midslope talus fan. Siltstone, with moderate red hematite alteration. Thin calcite vein (3 mm wide) is heavily oxidized, showing an orange color
6/17/2014	E5577410	AC	614967	7132676	1570	Brown/white (veined). Limestone. M.g to f.g. Unknown matrix, shows evidence of decalcification with high porostiy, vugs also present, no rxn w/HCl in wall rock. Veins are calcite from Hcl rxn, composed of coarser grained calcite. The veins are up to 1cm in diameter. Some minor oxidization patches.
6/22/2014	E5577411	AC	624444	7121846	1830	Brown with patches of orange staiing, speckled with small black grains. Limestone. Fine grained. Calcite matrix composing majority of the sample. The f.g. dark grains are of unknown composition, possible weathered py from weak cubic form seen in some. Sample is pervasively veined w/calcite veins up to 1mm in size. Orange staining appears to be weakly associated with the veins, but not restricted to them. The stain patches scratch to a white/yellow colour. Found with many other similar fragments along ridge top.
6/17/2014	E5577560	MF	614968	7132676	1559	Quatz veins 1cm thick, with weathered pyrite grains
6/17/2014	E5577561	MF	614870	7132468	1562	Black and white speckling 1-2mm, outcrop is highly foliated roughly 280/60 some surfaces have orange and green alteration
7/21/2014	E5577562	MF	611202	7121265	1368	Red and orange discoluration throughout possibly railgar, uncompetent from alteration, from float.
7/27/2014	E5577564	MF	613718	7128866	1460	Quartz veining of 1-2 cm throughout, orange oxidation on weathered surfaces, from float.
6/19/2014	E5578260	TK	619717	7124995	1532	Rusty orange-beige fresh and weathered conglomerate/breccia, contains clasts of quartz (white) silicious mudstone (white-yellow), evident flow texture, found in float, possible cubic vugs, possible orange-purple surface manganese alteration, rusty orange vfg matrix
6/23/2014	E5578261	TK	625783	7121528	1856	Rusty orange brown fresh and weathered, manganese oxide purple-brown staining, foliated (wavy) with dark grey vitrous mineral, possibly qtz, following foliation in 1-2mm bands, highly altered/oxidized rock, found in float, vf grained
6/23/2014	E5578262	TK	625782	7121556	1859	light (weight) rock, possible de-calcification, found in outcrop of 20cm thick band transecting ridgeline, rusty pale-orange, sugary texture, vf grained
6/26/2014	E5578263	TK	623953	7127340	1614	dark grey silty limestone, possible malachite (teal-green sufrace mineralization on one corner, <1%), weakly foliated
6/26/2014	E5578264	TK	623977	7127325		Same unit as above, found in float, thinly calcite (white) veined, possible vfg sulphides <1%
6/26/2014	E5578265	TK	623977	7127325		Same unit as above, found in float, wavy foliation, possible sulfides vfg disseminated <1%
6/26/2014	E5578266	TK	623977	7127325		Same unit as above, found in float, interbedded with vfg limestone
6/26/2014	E5578267	TK	623977	7127325		Same unit as above, found in float, thinly calcite (white) veined, possible vfg sulphides <1%
6/25/2014	E5578268	TK	610978	7120938		Float in creekbed, vuggy light grey siltstone conglomerate, weakly rusty
6/25/2014	E5578269	TK	610978	7120938		float found in creekbed, blue-grey siltstone, weakly foliated, weakly rusty
6/25/2014	E5578270	TK	610978	7120938		float found in creekbed, blue-grey siltstone with white (silicious?) veining 2-3mm thick
6/25/2014	E5578271	TK	610978	7120938		orange-grey very silty rock, weakly foliated, found in creekbed
7/2/2014	E5578272	TK	611945	7127572	1550	blue-grey siltstone, moderately rusty on weathered surface, contains fibrous veings, white-yellow, up to 1.5 cm thick, <1% chalcopyrite and bornite within veins, veins weakly calcitic
6/30/2014	E5578610	Morgan Li	624022	7126388	1675	silty shale collected in float
6/30/2014	E5578611	Morgan Li	624180	7126458	1654	crenulated limestone collected in float
6/30/2014	E5578612	Morgan Li	624203	7126441	1648	light grey coloured limestone, from float
6/30/2014	E5578613	Morgan Li	624250	7126462	1640	light grey coloured limestone, from float
6/30/2014	E5578614	Morgan Li	624299	7126492	1630	light grey coloured limestone, from float

Date	Tag Number	Sampler	UTME	UTMN	Elevation	Description
6/30/2014	E5578615	Morgan Li	624350	7126493	1626	light grey coloured limestone, from float
6/30/2014	E5578616	Morgan Li	624460	7126513	1622	light grey coloured limestone - rudstone, from float
6/30/2014	E5578617	Morgan Li	624530	7126500	1626	light grey coloured limestone, from float
6/30/2014	E5578618	Morgan Li	624598	7126550	1620	light grey coloured limestone, from float
6/30/2014	E5578619	Morgan Li	624586	7126450	1620	light grey coloured limestone- rudstone, from float
6/30/2014	E5578620	Morgan Li	624903	7126500	1543	siltstone rhythmically interbedded with sandstone, from float
6/30/2014	E5578621	Morgan Li	624000	7126366	1680	siltstone from float
7/2/2014	E5578622	Morgan Li	607850	7126326	1651	siltstone rhythmically interbedded with sandstone, from float
7/2/2014	E5578623	Morgan Li	607861	7126319	1651	siltstone collected from outcrop
7/2/2014	E5578624	Morgan Li	608122	7126092	1712	Quartzite? Collected from outcrop
7/2/2014	E5578625	Morgan Li	607860	7126217	1640	siltstone collected from outcrop
7/2/2014	E5578626	Morgan Li	607753	7126230	1574	siltstone collected from outcrop
7/2/2014	E5578627	Morgan Li	607623	7125902	1411	carbonaceous shale collected from outcrop
7/2/2014	E5578628	Morgan Li	607901	7125468	1617	siltstone interbedded with sandstone, from outcrop
7/2/2014	E5578629	Morgan Li	607872	7125154	1662	fine grained sandstone collected from outcrop
7/2/2014	E5578630	Morgan Li	607848	7125088	1676	calcareous sandstone, from outcrop
7/2/2014	E5578631	Morgan Li	607639	7124986	1608	packstone with calcareous matrix and clasts of limestone, from outcrop
6/17/2014	E5578960	J.Chakungal	615764	7132501	1693	samples are what look to be brecciated, slightly altered, medium grained sandstone intruded with quartz-calcite vein material.
6/17/2014	E5578961	J.Chakungal	615764	7132501	1693	samples are what look to be brecciated, slightly altered, medium grained sandstone intruded with quartz-calcite vein material.
6/17/2014	E5578962	J.Chakungal	615710	7132606	1669	looks to be brecciated and intensely iron oxidized. Not exactly sure what lithology might be.
6/17/2014	E5578963	J.Chakungal	614874	7132744	1620	strongly iron oxidized material.
6/18/2014	E5578964	J.Chakungal	612802	7132529	1865	Iron oxidized, decalcified limestone?
6/18/2014	E5578965	J.Chakungal	612802	7132529	1865	slightly altered calcareous sandstone.
6/18/2014	E5578966	J.Chakungal	612058	7132395	1978	iron oxidized, brecciated material.
6/18/2014	E5578967	J.Chakungal	611636	7132142	1866	Beefy calcite that looks to have reaction hallows developed in enveloping greenish siltstone. Sampled at UTM E0611674, N7132157)
6/18/2014	E5578968	J.Chakungal	611636	7132142	1866	fault gouge material sampled at station location.
6/19/2014	E5578969	J.Chakungal	614459	7131156	1463	fault gouge material sampled at W0614391, N7131143.
6/19/2014	E5578970	J.Chakungal	613234	7130896	1722	Brecciated, quartz veined, very green, medium grained sandstone.
6/19/2014	E5578971	J.Chakungal	612225	7130881	1872	quartzite cobble eroded from conglomerate with abundant sulphides.
6/19/2014	E5578972	J.Chakungal	611326	7131104	1439	very dark grey-black talus at contact between siltstone rich interval (east) with crystalline limestone (west).
6/20/2014	E5578973	J.Chakungal	619360	7124662	1753	very bleached, almost clay altered looking silty material. Looks to be enriched with disseminated sulphides.
6/20/2014	E5578974	J.Chakungal	619360	7124662	1753	intensely oxidized shale?
6/20/2014	E5578975	J.Chakungal	619360	7124662	1753	sulphide rich, carbonaceous shale.
6/20/2014	E5578976	J.Chakungal	619577	7124932	1602	fault breccia with angular coasts of grey weathering siltstone.
6/20/2014	E5578977	J.Chakungal	619889	7125011	1502	Carbonaceous siltstone likely with abundant disseminated sulphides.
6/18/2014	E5578978	Morgan Li	612061	7131319	1570	piece of breccia, or piece of conglomerate, or piece of brecciated conglomerate collected in valley bottom in float. With lots of iron oxide and calcite lined vugs.
6/22/2014	E5578979	J.Chakungal	620605	7125478	1575	brecciated quartz vein material with abundant iron oxide alteration.
6/22/2014	E5578980	J.Chakungal	620573	7125566	1616	steel grey weathering, carbonaceous shale with arsenic oxide staining on foliation/bedding surfaces.
6/22/2014	E5578981	J.Chakungal	620573	7125566	1616	fault gouge material.
6/22/2014	E5578982	J.Chakungal	620573	7125566	1616	iron oxide of some kind.
6/22/2014	E5578983	J.Chakungal	620573	7125566	1616	brecciated carbonaceous shale with arsenic oxide along foliation surfaces. Sample found in gulley ~ 10m north of wpt.
6/22/2014	E5578984	J.Chakungal	620443	7126000	1774	random dolostone boulder found in float. Looks to be quite vuggy. Vugs are lined with calcite.
6/22/2014	E5578985	Morgan Li	624123	7120726	1785	siltstone deformed with 'beef' calcite horizon.
6/22/2014	E5578986	Morgan Li	623585	7121344	1783	quartz veining with some sulphide mineralization. possibly pyrite?

Date	Tag Number	Sampler	UTME	UTMN	Elevation	Description
6/22/2014	E5578987	Morgan Li	624429	7120607	1862	Highly deformed limestone or 'beef' calcite.
6/26/2014	E5578988	J.Chakungal	623577	7125865	1896	sulphide bearing dolostone,
6/26/2014	E5578989	J.Chakungal	623577	7125865	1896	very dark grey-black siltstone or shale at contact, likely with disseminated sulphides.
6/26/2014	E5578990	J.Chakungal	623657	7126169	1879	arsenic oxide on foliation surface of siltstone-mudstone?
6/26/2014	E5578991	J.Chakungal	623664	7126360	1877	bright orange-red weathering siltstone with disseminated sulphide.
6/27/2014	E5578992	J.Chakungal	614388	7129193	1714	steel grey weathering, very carbonaceous looking shale with disseminated sulphides. Possible fault zone within finer grained lithology of this package?
6/27/2014	E5578993	J.Chakungal	612898	7128305	1871	intensely oxidized sandstone.
6/29/2014	E5578994	J.Chakungal	612189	7127876	1457	polymictic conglomerate with pyrite nodules. Not likely to yield much, but testing geochemistry.
6/29/2014	E5578995	J.Chakungal	612189	7127876	1457	green siltstone with abundant euhedral pyrite. Again, sampled to get an idea for what chemistry looks like.
6/29/2014	E5578996	J.Chakungal	612333	7128047	1441	altered coarse grained sandstone? or some kind of fault gouge?
6/29/2014	E5578997	J.Chakungal	611746	7128669	1392	Quartzite pebble within disseminated sulphides and possibly magnetite.
6/27/2014	E5578998	Morgan Li	614334	7128985	1702	Quartz vein in green siltstone
6/27/2014	E5578999	Morgan Li	613726	7128232	1668	Quartz veined siltstone.
6/29/2014	E5579000	Morgan Li	611755	7127735		Quartzite?
6/29/2014	E5579001	Morgan Li	612154	7127846	1459	Limestone
7/3/2014	E5579002	J.Chakungal	609950	7120270	1519	brecciated and altered calcareous sandstone with calcite filled vugs.
7/3/2014	E5579003	J.Chakungal	609099	7122363	1618	chloritic green siltstone and sandstone intruded with quartz-calcite veins and with pyrite ± chalcopyrite.
23-08-2014	E5667710	Laurence Gagnon	619395	7124697	1754	Float, Rusty shale, clust of fine grain pyrite 2% Heavy iron oxyde on fracture planes 30x30x30 cm
23-08-2014	E5667711	Laurence Gagnon	619693	7124727	1656	Float, Dark shale, large ring of pyrite (4-5 cm circonference) 40x20x5 cm
23-08-2014	E5667712	Laurence Gagnon	619694	7124729	1656	Float, Dark shale, pyrite 30x20x5 cm
23-08-2014	E5667713	Laurence Gagnon	620043	7124500	1550	Float, Shale with clasts, nodules of pyrite
23-08-2014	E5667714	Laurence Gagnon	620063	7124459	1579	Outcrop, Channel sampling (over 3m^2), rusty bedded limestone, mineralization in nodules and disseminated
24-08-2014	E5667715	Laurence Gagnon	613466	7128602	1576	Outcrop, Dark-grey shale, lots of carbonaceous veins, some pyrite (mainly next to the veins), rusty on weathered surface
24-08-2014	E5667716	Laurence Gagnon	613329	7128473	1733	Outcrop, Dark-grey shale mudstone, lots of clasts up to cm scale (most are carbonaceous), 1 grain of pyrite, couldn't find more in the
24-08-2014	E5667717	Laurence Gagnon	612746	7128528	1783	Boulder, Iron oxydized sandstone with very big crystals of calcite 50x50x50 cm
25-08-2014	E5667718	Laurence Gagnon	607488	7124250	1341	Float, from the talus, sandstone to mudstone with millimetric clasts, few pyrite grains 20x20x10 cm
25-08-2014	E5667719	Laurence Gagnon	607537	7124285	1379	Float, from the talus, sandstone to mudstone with millimetric clasts, few pyrite grains 20x10x5 cm
25-08-2014	E5667720	Laurence Gagnon	607562	7124287	1394	Float, from the talus, black shale with ripples, orange lichen in planes of weakness, 20x20x2 cm
25-08-2014	E5667721	Laurence Gagnon	607587	7124298	1405	Float, from the talus, sandstone to mudstone with millimetric clasts, pyrite grains 30x30x10 cm
25-08-2014	E5667722	Laurence Gagnon	607711	7124415	1492	Float, from the talus, sandstone to mudstone with millimetric clasts, very rusty weathered surface, one big pyrite agregate with halo
25-08-2014	E5667723	Laurence Gagnon	607710	7124411	1500	Float, from the talus, dark sandstone, lots of orange alteration (iron oxyde) with silvery sulfides in 2x2 cm zone, might be the same
25-08-2014	E5667724	Laurence Gagnon	607713	7124428	1508	Boulder, granular limestone, weathered surface has tints of green-yellow alteration (along with iron oxyde), 50x50x30 cm
25-08-2014	E5667725	Laurence Gagnon	607749	7124500	1571	Very smal floats (under 5 cm), lots of bright red alteration (iron oxydes), pyrite mineralization (over 1cm^2). Not enough material to
25-08-2014	E5667726	Laurence Gagnon	607770	7124500	1568	Float, dark mudstone, lots of yellow-red alteration (iron oxyde-limonite), cubic pyrite with some that have been altered (red)
25-08-2014	E5667727	Laurence Gagnon	607774	7124523	1581	Small float, red and orange alteration (iron oxyde, limonite) lots of small pyrite, not enough material to make a sample replicate
25-08-2014	E5667728	Laurence Gagnon	607746	7124794	1623	Float, blue-grey sandstone with rim of intense weathering up to half a cm (orange, iron oxyde), big nodules of pyrite (almost
25-08-2014	E5667729	Laurence Gagnon	607796	7124845	1672	Big outcrop extending over 100m, striking north, diping west, blue-grey sandstone with rim of intense weathering (orange, iron
25-08-2014	E5667730	Laurence Gagnon	607731	7124791	1616	Sub outcrop, blue-grey sandstone with rim of intense weathering (orange, iron oxyde), big nodules of pyrite with orange halo
26-08-2014	E5667731	Laurence Gagnon	611166	7121671	1155	open hole (depth 30 cm) at target 920, on steep east facing slope with mature spruces, willows, buck brush & alders. Very silicified
26-08-2014	E5667732	Laurence Gagnon	611026	7121357	1297	Float, picked up from steep talus up from target CL 886, purple silstone with orange and green alteration. Lightly reactive to HCL
26-08-2014	E5667733	Laurence Gagnon	611019	7121182	1289	Float, very reactive to HCl, sandstone with calcite in veining and big crystals found next to an outcrop of similar sandstone 20x20x5
26-08-2014	E5667734	Laurence Gagnon	610797	7120990	1375	Float, Massive piece of big calcite crystals and veining, found in the middle of a valley, iron oxydation in the vicinity of the veining
26-08-2014	E5667735	Laurence Gagnon	610567	7120791	1476	Float, Massive calcite, big crystals, taken close to target 868, fairly weathered on one side and fresh cut on the other
26-08-2014	E5667736	Laurence Gagnon	610550	7120771	1494	Outcrop, sandstone right at the contact with the conglomerate unit, grains of pyrite, signs of alteration (red and white), veins of
26-08-2014	E5667737	Laurence Gagnon	610545	7120777	1495	Outcrop, sandstone right at the contact with the conglomerate unit, grains of pyrite, signs of white alteration, sandstone reacts
27-08-2014	E5667738	Laurence Gagnon	607591	7125229	1464	Outcrop, black shale, 265N 50 degrees, sample of a large calcite vein with a bit of green on (weathering?), the outcrop is mudstone
27-08-2014	E5667739	Laurence Gagnon	607609	7125242	1469	Float, blue-grey mudstone, react moderatly to HCl, agregates of pyrite of millimetric scale, from a talus down big outcrop 40x30x10
27-08-2014	E5667740	Laurence Gagnon	607629	7125239	1484	Float, very small and considerably weathered (iron oxydation), lots of pyrite grains
27-08-2014	E5667741	Laurence Gagnon	607663	7125231	1505	Float, conglomerate with lots of agregates of pyrite, clasts & veins reacting to HCl, found exactly at target 785, many similar

Date	Tag Number	Sampler	UTME	UTMN	Elevation	Description
27-08-2014	E5667742	Laurence Gagnon	607674	7125244	1522	Sub outcrop, blue grey fine sandstone with minor agregates of pyrite, dark veins and few calcite veins
27-08-2014	E5667743	Laurence Gagnon	607049	7126210	1231	Outcrop, black shale, 190N 38 degrees, intense iron oxydation weathering, grains of sulfides present, very fine and distributed on
8/23/2014	E5667760	J.Chakungal	619344	7124641	1685	brecciated siltstone and shale with quite a bit of iron oxide.
8/23/2014	E5667761	J.Chakungal	619431	7124251	1571	Steel grey and pencil weathering, carbonaceous shales likely with disseminated sulphides?
8/23/2014	E5667762	J.Chakungal	619567	7124078	1527	Quartz vein material in siltstone and fine grained sandstone.
8/23/2014	E5667763	J.Chakungal	619567	7124078	1527	Calcareous siltstone and fine sandstone with pyrite nodules.
8/23/2014	E5667764	J.Chakungal	619710	7123874	1471	Disseminated sulphide rich horizon in very coarse grained quartz granular sandstone. 208/53 = strike/dip of cleavage in sandstone.
8/24/2014	E5667765	J.Chakungal	614850	7132006	1297	Small cobble of orange-brown weathering, coarse, weakly calcareous sandstone collected in float amidst green siltstone and fine sandstone. Extremely difficult to break, could it have been silicified?
8/24/2014	E5667766	J.Chakungal	614452	7132078	1550	Quartz-carbonate veining in green-mauve siltstone and fine sandstone unit. Where intruded by vein material, sediments almost appear to be metamorphosed, quite schistose and chlorite rich.
8/24/2014	E5667767	J.Chakungal	614248	7132142	1668	Quartz-carbonate veining in siltstone.
8/24/2014	E5667768	J.Chakungal	614265	7132308	1685	Sandstone nodules picked up in float. Looks to contain euhedral pyrite grains. Foliation in green-mauve siltstone-sandstone unit here strikes 164/70
8/24/2014	E5667769	J.Chakungal	614338	7132583	1786	medium grained calcareous sandstone veined with calcite. Sampled from outcrop immediately adjacent to soil CL165
8/24/2014	E5667770	J.Chakungal	614072	7132622	1911	Quartz-carbonate veining in green-mauve siltstone and fine sandstone unit. Foliation in siltstone-sandstone unit here strikes 124/62
8/24/2014	E5667771	J.Chakungal	614027	7132630	1926	decalcified, calcareous sandstone?
8/25/2014	E5667772	J.Chakungal	608157	7127442	1279	very dark grey, fine grained sandstone (may be weakly calcareous with pyrite nodules.
8/25/2014	E5667773	J.Chakungal	608174	7127369	1296	siltstone with framboidal pyrite 'nodules'.
8/25/2014	E5667774	J.Chakungal	608116	7127123	1355	Coarse grained sandstone with quartz granules and very large composite pyrite nodules.
8/25/2014	E5667775	J.Chakungal	608119	7126529	1436	very rusty weathering sandstone ± siltstone.
8/25/2014	E5667776	J.Chakungal	608119	7126529	1436	very rusty weathering shale with pyrite.
8/25/2014	E5667777	J.Chakungal	608175	7125364	1505	very rusty weathering, dark grey siltstone.
8/27/2014	E5667778	J.Chakungal	609515	7122135	1440	Rusty orange weathering siltstone-fine sandstone with clast of blue-grey weathering medium grained sandstone.
8/27/2014	E5667779	J.Chakungal	609453	7122414	1373	Green mudstone with a band of light greenish alteration that is concentrated with euhedral pyrite.
8/27/2014	E5667780	J.Chakungal	609790	7122778	1256	coarse grained sandstone with some pyrite. characterized by iron oxide weathering rind.
31-08-2014	E5668027	Laurence Gagnon	625886	7126860	1375	Float, broken down shale nice cube of pyrite with pale yellow-green alteration around it (doesn't react with HCl) 30x20x10 cm
31-08-2014	E5668028	Laurence Gagnon	624815	7126625	1525	Float, black limestone with carbonate veins 10x10x5 cm
31-08-2014	E5668029	Laurence Gagnon	624639	7126574	1556	10x5x5 cm
31-08-2014	E5668030	Laurence Gagnon	624042	7126592	1647	surfaces 30x20x20 cm
31-08-2014	E5668031	Laurence Gagnon	624605	7126586	1566	is vertical striking 260, the rock weathered surface is intensly orange, probably because of the waterfall over it
31-08-2014	E5668032	Laurence Gagnon	625398	7126962	1472	Outcrop, dark grey sandstone with some reddish clast that react with HCl
1/9/2014	E5668033	Laurence Gagnon	625645	7120239	1437	Outcrop, grey dolostone, black on weathered surface
1/9/2014	E5668035	Laurence Gagnon	625590	7120264	1477	(centimetric scale) are present throughout the area, perfectly cubic
1/9/2014	E5668036	Laurence Gagnon	625571	7120423	1489	Float from a talus surrounded by outcrops and cliffs, siltstone with pyrite in small nodules and grains 20x20x4 cm
1/9/2014	E5668037	Laurence Gagnon	625680	7120539	1378	Boulder, limestone breccia with white grey clasts of centrimetric scale in darker grey matrix over 50x50x50 cm
1/9/2014	E5668038	Laurence Gagnon	626002	7120353	1267	Boulder, crystaline sandstone (sugary texture), with some carbonate veining and big cubic pyrite crystal (5mm) 40x40x40 cm
1/9/2014	E5668039	Laurence Gagnon	626018	7120331	1266	Outcrop, grey limestone in the creek near the gold stream anomaly
3/9/2014	E5668041	Laurence Gagnon	626933	7121075	1374	Outcrop, grey slightly carbonaceous (react with HCl once scratched) breccia, some orange alteration (iron oxydation)
3/9/2014	E5668042	Laurence Gagnon	626783	7121084	1365	Boulder, grey breccia, carbonaceous, veins of calcite, green (on weathered surface) and orange alteration 100x60x60 cm
3/9/2014	E5668043	Laurence Gagnon	626810	7120931	1392	deformation (folding of layers)
3/9/2014	E5668044	Laurence Gagnon	626878	7120775	1444	Outcrop, grey siltstone, some darker layers within
3/9/2014	E5668045	Laurence Gagnon	627023	7120752	1468	Outcrop, grey shale with some layer of red sand within, 300N85degrees,

Date	Tag Number	Sampler	UTME	UTMN	Elevation	Description
8/31/2014	E5670172	TK	625958	7126686	1350	Quartz-carbonate vein/crystallization dominated rock with brecciated fragments of green-grey siltstone, 70% yellow-white course grained calcite with 30% white quartz, rusty angular/bladed vitreous minerals found in quartz, jagged and altered looking weathered surface, found in float by stream.
8/31/2014	E5670173	TK	625549	7125913	1339	Quartz vein 30mm thick, crystalline, host rock appears to be a green-grey mudstone or siltstone, thin rusty linear features running perpendicular to vein direction are calcitic, silvery mineral, very sparse and fine grained observed within rusty linear feature (may be arsenopyrite?), found in float near stream.
8/31/2014	E5670174	TK	625227	7125771	1401	Limestone, rusty weathered, dark grey fresh, heavily quartz-carbonate veined irregular 30% of rock and 1-7mm thick, heavy altered/weathered surface (vuggy and iron stained), found in float in stream.
8/31/2014	E5670175	TK	624701	7125596	1491	As E5670174, but likely a calcified sandstone and containing 1-2% disseminated fine grained pyrite, found in float by stream.
8/31/2014	E5670176	TK	623863	7125859	1712	Heavily silicified green-grey brown mudstone/siltstone, fragmented/brecciated, weakly reactive to HCl predominantly in fractures, unknown deep green vitreous 1-3mm mineral 1-2% associated with quartz, found in float.
8/31/2014	E5670177	TK	624227	7126224	1910	Limestone, medium grained to crystalline, rusty grey buff weathered and grey fresh, course grained crystalline white calcite in patches, disseminated pyrite <1% ~1mm, found in small saddle near lithological contact and near weak soil gold anomaly, surrounding outcrops are unaltered.
9/1/2014	E5670179	TK	628382	7121711	1540	Siltstone, brown grey weathered, dark to medium grey fresh, 3-6cm beds, foliated, moderately brittle, found in 1x2m boulder in talus.
9/1/2014	E5670180	TK	628386	7121704	1547	Silty shale, brown-grey weathered, med to dark grey fresh, slight iron oxidation, found in 1x1m boulder in talus.
9/1/2014	E5670181	TK	628323	7121782	1533	Fine to very fine grained Limestone, 3-5mm pale white calcite veining present, slight iron staining, found in talus float.
9/1/2014	E5670182	TK	628076	7121410	1482	Siltstone, rusty purple-orange-grey weathered, green-grey fresh, very iron oxidized and limonitic alteration, weak foliation, found in float near stream.
9/1/2014	E5670183	TK	627773	7121686	1580	Limestone, rusty orange weathered, grey fresh, sandy iron oxidized surface, feels slightly lighter (decacified?), limestone is medium grained sandy fresh with 40% of grains on fresh surface iron oxidized, found in talus slope.
9/1/2014	E5670184	TK	627764	7121708	1591	course grained sandstone (1-3mm clasts with calcitic rusty cement), pale rusty grey weathered and fresh, 5-10% of grains are iron oxidized, majority of grains are quartz angular and crystalline, found in talus float.
9/1/2014	E5670185	TK	627846	7121292	1449	Altered siltstone, rusty orange brown fresh and weathered, rounded boulder found in stream.
9/3/2014	E5670188	TK	627685	7120799	1515	Siltstone, dark grey rusty fresh and weathered wet, moderately brittle, found in folded outcrop.
9/3/2014	E5670189	TK	627708	7120720	1565	Siltstone, heavily iron oxidized to the point of being powdery, rusty orange weathered, grey-orange fresh, found in outcrop.
9/1/2014	E5670210	Kel Sax	626456	7120948	1330	Major creek downstream of high Au stream sed anomaly: canyon outcrop. Buff wx, pale green grey, moderately bedded shale, with curved faults/joint set, minor clay and siliceous alteration, and hairline qtz-carbonate cross cutting stringers.
9/3/2014	E5670217	Kel Sax	626849	7121099	1363	Outcrop in creek: dark grey, fine grained lst 300-50, cross cut by ankerite veinlet which in turn forms en echelon veinlets about 000-90.
9/3/2014	E5670218	Kel Sax	626905	7121088	1362	Float in creek: calcareous qtz arenite, medium grey, medium grained, massive, with hairline qtz and py fracture fill, and clots very fine grained py +- aspy, to 2%.
9/3/2014	E5670219	Kel Sax	627016	7121132	1380	Float from lateral moraine N side of creek: either a rotten calcareous sandstone interbedded with siltstone, or a cataclasite with iron oxide stains and evidence of strain in the siltstone.
9/3/2014	E5670220	Kel Sax	627016	7121132	1380	Same location as above. Weakly carbonaceous, black argillite, with iron oxide stains on bent bedding and foliation surfaces. Other rock types in area; dolostone, siltstone, limestone, argillite.
8/23/2014	E5670610	TK	619386	7124528	1730	Silicious siltstone, brown-grey fresh and weathered, brittle, limonitic/iron/manganese altered, contains 5% 1-3mm rounded silicious clasts within silty matrix, found proximal to outcrop
8/23/2014	E5670611	TK	619684	7124083	1581	Quartz dominated sandstone/siltstone, dark grey to rusty and some 2-5mm veinlets, 3cm pale white quartz vein within, found in float.
8/23/2014	E5670612	TK	619926	7123509	1460	Rusty white grey, heavily silicified white veined throughout, thin lenses of dark green grey mudstone, rusty irregular spaced 1-2mm lenses, brittle, slightly vuggy, large 60cm boulder found in float
8/23/2014	E5670613	TK	619937	7123394	1449	Mudstone, brown-grey weathered, blue-grey-white fresh, calcitic (reactive with HCl), slightly sericitize/clay altered and minor iron staining, found in outcrop

Date	Tag Number	Sampler	UTME	UTMN	Elevation	Description
8/23/2014	E5670614	TK	619830	7123349	1432	limestone, tan/buff weathered, grey fresh, fine grained, 5mm crysts of pyrite within 1-2%, little to no iron staining or other alteration, found in boulder on top of ridge.
8/23/2014	E5670615	TK	619769	7123292	1396	Mudstone, green-grey with 2-5% semi-rounded grey mudstone clasts, with powdery calcite found on surface and in fractures, found in 25m+ outcrop.
8/23/2014	E5670616	TK	619644	7123333	1287	Matrix-supported conglomerate, green-grey, fine grained to very fine grained matrix, mudstone/sandstone rounded 1-25mm clasts, some pyrite in dark mudstone clast 5-10% 1mm, <1% fine pyrite grains disseminated within, found in boulder field.
8/24/2014	E5670617	TK	615034	7132097	1310	Sandstone, rusty pale grey throughout, minor vuggs, non-reactive with HCl, found in float.
8/24/2014	E5670618	TK	615183	7132393	1376	Mudstone, green-blue-grey, sparse rusty surfaces/fractures, silicified somewhat brecciated quartz pale white veining within vuggy up to 2cm thick, found as float.
8/24/2014	E5670619	TK	615017	7132440	1472	Siltstone, sandy, brittle, rusty-orange-buff throughout, slightly calcitic likely in cement, lower specific gravity, moderately altered, found in float but common throughout area.
8/24/2014	E5670620	TK	614927	7132448	1520	Calcitic siltstone, rusty pale orange throughout, faulted area displacement of calcitic quartz veins (pale white-grey, 1-2cm thick) of up to 15cm observed, moderately veined, found in outcrop 10x5m.
8/24/2014	E5670621	TK	614663	7132457	1550	Mudstone, rusty orange-grey weathered, green-grey-red-white fresh, nodules of pyrite (fine grained, 1-2cm dia, 2.5%) following roughly bedding, non-reactive with HCl, minor vugs, found dispersed in float.
8/24/2014	E5670622	TK	614392	7132108	1591	Mudstone, rusty orange to pale blue-grey, irregular patches/nodules (2-20mm) weathered sulphides likely pyrite (yellow green rusty centers with orange red oxidized halos), unreactive to HCl, found in float but abundant in area.
8/24/2014	E5670623	TK	614284	7132072	1614	Mudstone, maroon, 2cm thick calcite vein within with 90 degree cleavage and pale white colour, green-blue mudstone 1-3mm around vein as well as thin lenses within vein, minor vuggs in vein, minor iron oxidation on surfaces, found in boulder at the base of outcrop.
8/24/2014	E5670624	TK	614193	7132020	1626	Sandstone, brown-grey, rusted out rounded 1-4mm clasts within, <1% disseminated pyrite fine grained, found in 1x1m outcrop.
8/24/2014	E5670625	TK	614122	7132020	1652	Mudstone, blue-green with 10cm+ thick white quartz vein within, green mudstone and possibly epidote within the vein, minor sericite and/or calcite, minor iron staining, 320-85 orientation of mudstone foliation, 10m+ outcrop.
8/24/2014	E5670626	TK	613891	7132115	1764	Mudstone, green-grey, sugary quartz vein with brick red hue, found in float.
8/24/2014	E5670627	TK	613921	7132599	1957	Mudstone, blue-green with irregular pale white quartz veining, light brown-grey powdery fine grained calcite extensively present throughout, minor vuggs, outcrop in stream bed along possible fault
8/24/2014	E5670628	TK	613931	7132613	1963	Mudstone, rusty orange-tan thoughout, strongly altered, iron oxidized, brittle, trace evidence of sulphides, weakly bedded, vuggy with some vugs cubic shaped, unit trending 120 degrees, non-reactive with HCl, found in float in stream bed along possible fault.
8/25/2014	E5670629	TK	608353	7127485	1309	Interbedded sandstone/siltstone, 5-20cm beds locally, thicker within 50m, brown-grey weathered, grey fresh, tightly folded, silicified 1-100mm quartz veins pale white/grey roughly following bedding, fold hinge orientation is 005-28, calcitic reaction within fractures and in browned powdery areas, sandstone portion irregularly veined with quartz 1-5mm veinlets, sample taken from 100m+ outcrop at major fault hinge
8/25/2014	E5670630	TK	608530	7127442	1353	Mudstone, grey to dark grey rusty, moderate to minor iron staining, two episodes of quartz veining observed crosscutting one another, 260-70 orientation of the main thick evin (2-10cm thick, wavy, following weak bedding), secondary veins slightly sheared suggesting faulting, sample taken from 100m+ outcrop.
8/25/2014	E5670631	TK	608572	7127400	1375	Limestone, rusty brown grey weathered grey fresh, fine to med fine grained, calcite veined 1-5mm thick white and irregular, <1% disseminated fine cubic pyrite, found in outcrop at the contact with the mudstone/shale unit.
8/25/2014	E5670632	TK	608662	7127193	1465	Limestone, brown-grey weathered grey fresh, irregular calcite veined 1-5mm thick common (1 per 5cm or less), folded with syncline orientated at 020-28, along fractures and proximal within limestone is an unknown green alteration (possibly epidote) clay to crystalline olive to deep green, clay alteration on surfaces and within fractures, taken from 1x3m outcrop at hinge.
8/25/2014	E5670633	TK	608757	7126304	1767	Limestone, gray-pale rusty dark grey fresh, irregularly veined with calcite 1-100mm thick, similar to E5670632, green discolouration (epidote?) on some surfaces, taken from 20m+ outcrop on ridgetop.
8/25/2014	E5670634	TK	608807	7125974	1663	Limestone, same as E5670633, taken from outcrop with clear slicken-slide texture on surface (faulting), possible fault fracture orientated at 120-85.

Date	Tag Number	Sampler	UTME	UTMN	Elevation	Description
8/26/2014	E5670635	TK	610976	7121903	1114	Conglomerate, green grey rusty, clasts semi-rounded sandstone siltstone and mudstone 2mm+ but as large as 50cm observed nearby, calcite veined pale white 5mm to 2cm thick, taken from outcrop in stream bed
8/26/2014	E5670636	TK	610880	7121370	1380	Mudstone/siltstone, rusty orange, little to no alteration other than possible weak iron oxidation, taken from outcrop in small draw midslope
8/26/2014	E5670637	TK	610664	7121096	1444	Conglomerate, rusty brown-grey throughout, 2-60mm clasts of mudstone siltstone and sandstone as well as some sulphide dominated clasts (pyrite), 40% clast composition, matrix supported, found in float train just below outcrop.
8/26/2014	E5670638	TK	610387	7120498	1509	Mudstone, orange brown, 1-3mm sparse calcite veining, found in outcrop on ridgetop
8/26/2014	E5670639	TK	610398	7120509	1507	Conglomerate, orange-brown, calcite veined, matrix supported rounded 2-20mm clasts, slightly clay altered, found in 10x5m outcrop.
8/26/2014	E5670640	TK	610535	7120509	1459	Mudstone, green-blue-grey, weakly calcitic along some fractures, outcrop 2x10m near weakly anomalous sample CL861.
8/26/2014	E5670641	TK	610689	7120490	1361	Mudstone, olive green-grey, found in float.
8/26/2014	E5670642	TK	610689	7120490	1361	Sandstone, rusty orange, rounded boulder found in float, unreactive to HCl
8/26/2014	E5670643	TK	610848	7120411	1257	Sandstone, rusty brown weathered blue-grey fresh, 3-5cm rusty nodules possibly weathered pyrite 5%, cubic vugs present throughout 1-2%, found in float.
8/26/2014	E5670644	TK	610981	7120409	1168	Sandstone, rusty orange brown fresh and weathered, calcite veinlets and irregular small masses 1-5mm within pale white, iron oxidized, found in float but common in area.
8/27/2014	E5670646	TK	609545	7121921	1536	Siltstone, rusty orange, iron oxidized, weakly brecciated, white calcite infilling some fracture/pore spaces, minor vuggs, found in float.
8/27/2014	E5670647	TK	609599	7122575	1391	Conglomerate, brown grey rusty, matrix supported 40% rounded 2-20 mm clasts, moderate vuggs, iron oxidized, found in 2m boulder in float.
8/27/2014	E5670648	TK	609472	7122501	1351	Sandstone, brown weatherred blue-grey fresh, crystalline, 1% disseminated pyrite plus 20mm nodules, calcite cement present, found in float on the side of a ridge.
8/27/2014	E5670649	TK	609289	7122864	1355	Conglomerate, orange brown weathered brown-grey fresh, 30% clasts semi rounded 3-20mm in size, tightly folded rock, calcarious cement and clay-like brown and white fracture coating, found in outcrop.
8/27/2014	E5670650	TK	609818	7123197	1388	Intermixed siltstone and mudstone, purple-grey mudstone green-grey siltstone, brown-green-grey weathered, wavy/folded 2-6mm pale pink/white clacite veins within making up 20% of the sampled rock, brown calcite cement along fractures, found in float near outcrop.
8/23/2014	E5670660	Kel Sax	620040	7124526	1532	HJ 109 soil anomaly: talus slope 020-40, grey brown wx, blue black siltstone, massive to weakly bedded with dark brown mm size laminations of coarser silt. Rock sample from soil pit: clots of med grained, 1-2mm sub to euhedral py 3% with finer grained aspy trace to 1%.
8/23/2014	E5670661	Kel Sax	620039	7124513	1533	talus float above previous sample: dark steel blue grey, well bedded siltstone with slightly coarser grained orange brown, weakly calcareous laminations.
8/23/2014	E5670662	Kel Sax	620045	7124524	1535	talus float above previous sample: iron oxide rich siltstone(?)
8/23/2014	E5670663	Kel Sax	620032	7124510	1547	talus float above previous sample: weakly calcareous and silicified, very fine grained steel grey mudstone, contorted laminations, with iron oxide staining on fractures and foliations.
8/24/2014	E5670664	Kel Sax	614293	7128975	1644	CL 617 soil anomaly: fine talus slope 244-28, trains of mosses and grasses. Float grab from soil pit: brown wx, very fine grained black mudstone, contorted, iron oxide stains on fractures and foliations. White quartz veinlet, 2mm.
8/24/2014	E5670665	Kel Sax	614301	7128987	1689	above previous sample. As E5670664, with white vuggy quartz-carbonate veinlet swarms with minor iron oxide staining.
8/24/2014	E5670666	Kel Sax	613156	7128342	1907	Float grab. Polymictic comglomerate, rusty silt/sand matrix which is otherwise pale green.
8/24/2014	E5670667	Kel Sax	613320	7128200	1863	Float in conglomerate boulder talus. Dull orange to pale blue green wx thin rind, massive brick red, weakly calcareous dolo(?) with trace very fine grained dissem py, cut by white qtz-carb veinlets. Possibly a very large cobble from within the conglomerate.
8/24/2014	E5670668	Kel Sax	613725	7128201	1670	Float in saddle: blotchy yellow and rusty wx, pale blue grey siltstone with weak interbeds sandstone. Very fine grained dissem trace py. Moderate rust on fractures. In talus of dull orange to pale blue grey wx silt/mud/sandstone.
8/24/2014	E5670669	Kel Sax	613911	7128370	1662	Float in talus. Scattered cobbles of iron oxide wad with minor boxwork after py, sheared and altered siltstone(?). In talus of light green brown, friable and rodded siltstone, erratically crenulated.
8/25/2014	E5670670	Kel Sax	607297	7124331	1303	Outcrops E side creek. Grey brown wx, interbedded silt and sandstone, rare qtz grains up to gravel size, very fine grained disseminated trace py, convoluted structures: fold nose and/or faults. Major foliation 214-52.

Date	Tag Number	Sampler	UTME	UTMN	Elevation	Description
8/25/2014	E5670671	Kel Sax	607286	7124344	1310	Toe of talus slope E side of creek. Rusty and pale yellow qtz-carb breccia
8/25/2014	E5670672	Kel Sax	607268	7124454	1345	Tributary from E. Rusty float boulder with stockwork qtz-carb veinlets/breccia, in coarse grained lithic sandstone.
8/25/2014	E5670673	Kel Sax	607290	7124524	1362	Boulder in tributary from N. Dull brown wx, weakly bedded dull grey brown on fresh, dirty med grained sandstone, cut by variably rusty, vuggy qtz carb veinlets with perfect clear qtz crystals.
8/25/2014	E5670674	Kel Sax	607290	7124524	1362	Same location as above. Boulder of siltstone and sandstone breccia, white to clear quartz matrix supported, with some clasts altered to clay.
8/25/2014	E5670675	Kel Sax	607656	7125187	1515	Dip slope sandstone at soil anomaly CL784. Talus sample of rusty qtz carb alteration of sandstone/conglomerate.
8/26/2014	E5670676	Kel Sax	611115	7120257	1047	Soil anomaly CL993: multiple soil pits so rock samples of most likely mineralization taken from each. Calcite with minor qtz veins, veinlets, and stringers with variable but weak iron oxide staining in maroon, brown, and green claystones. Steep E facing slope, moss over pencilled talus.
8/26/2014	E5670677	Kel Sax	611113	7120254	1051	Soil anomaly CL993: multiple soil pits so rock samples of most likely mineralization taken from each. Calcite with minor qtz veins, veinlets, and stringers with variable but weak iron oxide staining in maroon, brown, and green claystones. Steep E facing slope, moss over pencilled talus.
8/26/2014	E5670678	Kel Sax	611121	7120256	1049	Soil anomaly CL993: multiple soil pits so rock samples of most likely mineralization taken from each. Calcite with minor qtz veins, veinlets, and stringers with variable but weak iron oxide staining in maroon, brown, and green claystones. Steep E facing slope, moss over pencilled talus.
8/26/2014	E5670679	Kel Sax	611126	7120253	1042	Soil anomaly CL993: multiple soil pits so rock samples of most likely mineralization taken from each. Calcite with minor qtz veins, veinlets, and stringers with variable but weak iron oxide staining in maroon, brown, and green claystones. Steep E facing slope, moss over pencilled talus.
8/27/2014	E5670680	Kel Sax	607451	7125641	1334	Soil anomaly CL725: moderate NW slope, subalpine buckbrush. Soil sample taken in small talus train of black and brown shale. Trenched down 30cm to subcrop; rusty, finely bedded black and light grey shale with multiple foliations and strong FeOx on fractures and foliations. Tr blebs and dissem dusty aspy.
8/27/2014	E5670681	Kel Sax	607396	7125832	1310	Soil anomaly CL721: moderate NW slope, buckbrush and few scattered spruce. Soil pit profile has creep layers. Black and light blue grey , finely interbedded shales, weak to moderate FeOx on fractures and foliations. No obvious explanation for the anomaly.
8/27/2014	E5670682	Kel Sax	607437	7125880	1306	Soil anomaly CL720: steep NW slope, talus and rotten outcrops of previous shales. Rock sample very rusty on fractures and multiple foliations, trace dusty aspy and CuOx or specular hematite staining.
8/27/2014	E5670683	Kel Sax	607296	7125634	1255	Subcrop: moderate S slope, below notch in ridge spur (fault trace?) Sample of folded and crenulated remnant shale, mostly rust now. Dominant foliation 214-34
8/27/2014	E5670684	Kel Sax	607020	7125590	1122	Soil anomaly CL628: soil taken below cliffs and above creek junction; both creeks with heavy sulphate(?) precipitation and minor rust staining. NW steep slope. Previous shales, strong FeOx and specular hematite on foliation slips. Cupped foliation 256-20, Dip slope foliation 240-54. Strong joint set 140-90.
8/31/2014	E5670703	Kel Sax	625931	7126863	1372	Outcrop above creek junction and anomalous stream sed sample. Well bedded argillite, dark to medium grey, hairline dolomite stringers along bedding, rarely cross-cutting. S0 176-70, L1 204>56, Sx 102-90, Sy 156-90.
8/31/2014	E5670704	Kel Sax	625931	7126863	1372	Same location as above. Calcic and dolomitic vein about 5mm wide along bedding, bent by Sy. Open synform at base of outcrop, fold axis about 264>50.
8/31/2014	E5670705	Kel Sax	625926	7126865	1382	Outcrop: qtz-calcite-dolomite vein about 30cm wide, splay veinlets in HW, black coarse grained crystalline limestone. FW foliated argillite.
8/31/2014	E5670706	Kel Sax	625983	7126910	1385	Outcrop above creek junction. Rusty and bleached shear? Sinestral compressive fault with about 15 cm displacement; 300-78, in very thinly foliated mudstone. General outcrop geology includes thinly bedded black micrite, green grey siltstone, and dark grey argillite. S0 240-54, S1 272-72, L1 320>44.
8/31/2014	E5670707	Kel Sax	626151	7126942	1423	Outcrop. Conglomerate / coarse grained qtz lithic arenite, dolomitic matrix, massive, few erratic qtz vein stringers, trace stibnite?
8/31/2014	E5670708	Kel Sax	625952	7126812	1358	Creek float; about 5m above strong Au stream sed anomaly. Dull orange wx, white and cream carbonate and qtz vein boulder, with fragments foliated argillite?
8/31/2014	E5670709	Kel Sax	625958	7126830	1365	Talus below steep outcrops E side of creek, about 10m above strong Au stream sed anomaly. Dull grey wx, medium grey and dull brown crenulated calcic siltstone with minor iron oxide staining, and trace scorodite?

AGAT WORK ORDER: 14Y886496

SOLID ANALYSIS REVIEWED BY: Yufei Chen, Lab Co-ordinator

DATE REPORTED: Oct 14, 2014

PAGES (INCLUDING COVER): 55

Should you require any information regarding this analysis please contact your client services representative at (905) 501-9998

*NOTES
VERSION 1:Version 2: Revised Zinc overlimits

All samples are stored at no charge for 90 days. Please contact the lab if you require additional sample storage time.

Method Summary

CLIENT NAME: AURORA GEOSCIENCES

AGAT WORK ORDER: 14Y861105

PROJECT NO: KTL-14514-YT

ATTENTION TO: DAVE WHITE, GABE FORTIN

PARAMETER	AGAT S.O.P	LITERATURE REFERENCE	ANALYTICAL TECHNIQUE
Zn	MIN-200-12017		ICP-MS
Zr	MIN-200-12017		ICP-MS
Ni-OL	MIN-200-12002/12020		ICP/OES
Ni-OL	MIN-200-12033		AA
Au	MIN-200-12006	BUGBEE, E: A Textbook of Fire Assaying	ICP-OES

PROJECT NO: KTL-14514-YT

AGAT WORK ORDER: 14Y861107

SOLID ANALYSIS REVIEWED BY: Yufei Chen, Lab Co-ordinator

DATE REPORTED: Jul 28, 2014

PAGES (INCLUDING COVER): 55

Should you require any information regarding this analysis please contact your client services representative at (905) 501-9998

*NOTES

All samples are stored at no charge for 90 days. Please contact the lab if you require additional sample storage time.

Certificate of Analysis

AGAT WORK ORDER: 14Y861877
PROJECT NO: KTL-14514-YT

CLIENT NAME: AURORA GEOSCIENCES

ATTENTION TO: DAVE WHITE, GABE FORTIN

(202-552) Fire Assay - Trace Au, ICP-OES finish (50g charge) (ppm)

DATE SAMPLED: Jul 10, 2014 | DATE RECEIVED: Jul 10, 2014 | DATE REPORTED: Jul 29, 2014 | SAMPLE TYPE: Soil

Analyte:	Sample Login Weight	Au
Unit:	kg	ppm
Sample ID (AGAT ID) RDL:	0.01	0.001
E5578879 (5558304)	0.36	0.003
E5578880 (5558305)	0.35	0.003
E5578881 (5558306)	0.35	0.003

Comments: RDL - Reported Detection Limit

Contents

INTRODUCTION

Soil geochemical data for portions of the Rackla Belt of east-central Yukon was submitted by Morgan Li of Carlincore Resources Limited. The evaluation below is based on a new geological-statistical approach developed by the writer called RvDfS or Relative Value Discrimination Factor Systematics. This technique is outlined in Appendix 1.

OVERALL SUMMARY

Anomalous Area 390kEast is judged to be the most significant of areas examined in this report. Anomalous Area 1 is also important. Anomalous Area 4 might rank next, especially if additional assays in the area turn out to be significant. All other areas are of lessor significance based on sampling to date.

It is recommended that immediate work be focused on: Anomalous Area 390kEast, and Anomalous Area 1. Anomalous Area 4 should be followed up pending additional results. If additional results are not available additional recce soil sampling in Anomalous Area 4 is justified.

Work should begin by prospecting of those sample sites with the highest "Sum" numbers. Presence of the minerals quartz, orpiment and realgar should be looked for, noted and sampled because of their obvious significance to discovery of Carlin type mineralization. Discovery of such indicators should be used to guide and prioritize soil sampling on systematic grids.

IDENTIFICATION OF ANOMALOUS AREAS ON GEOLOGICAL MAP PROVIDED

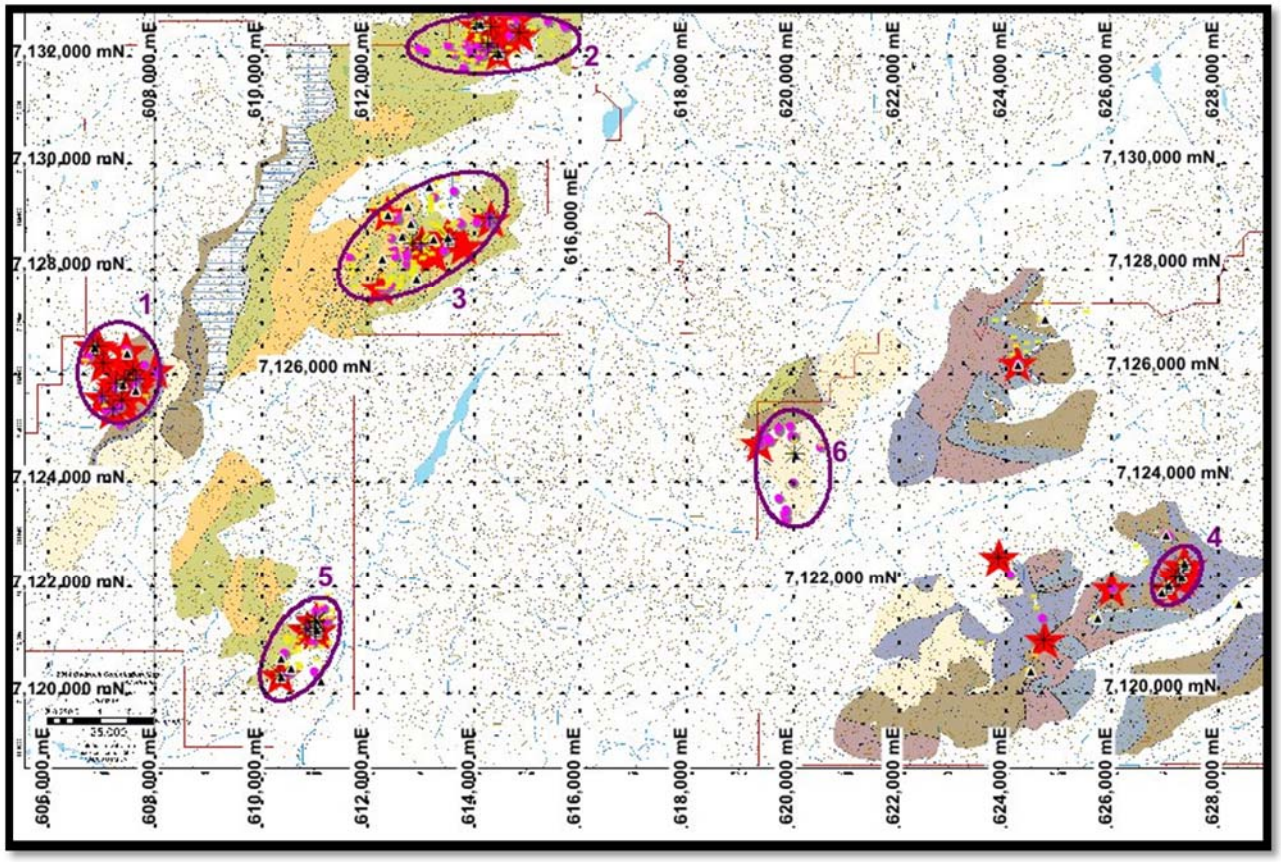

Figure 1. Main project area with identification of six significant anomalous areas (in order of interest from 1 through 6).

Colored symbols represent anomalous samples as follows: red stars = Carlin signature anomalous, black up-triangles = gold plus silver anomalous, purple dots = mercury plus thallium anomalous, yellow dots = Precious metal deposit signature anomalous.

Additional to Figure 1 there are two other areas with anomalous samples. These are called: (i) 390kEast (386,000E to 392,000E and 7,188,000N to 7,196,000N), and (ii) 490kEast (482,000E to 498,000E and 7,245,000E and 7,256,000E).

The best results for all Anomalous Areas are summarized in Table 1. The sample sites are in decreasing order of "Sum", which is a summary of a number of factors related to Carlin type precious metal deposits. Only samples considered to be anomalous (i.e., Value >= 40) are presented. Samples with Value >= 50 are markedly anomalous.

TABLE 1. Values for samples that have sum-totals (R&D added) greater than 40 (anomalous samples); sum-totals greater than 50 are particularly significant.

Overall results are summarized in Table 2. Because the emphasis is on identifying Carlin type silver-gold precious metal deposits those **R**-values and **D**-factors that are the most relevant are outlined in red. These all reflect elements commonly associated with Carlin deposits and are specifically: **RAuCi** = **R**-value for fire assay gold, **RAuBest** = **R**-value for the best gold in either INNA or fire assay analysis**, DAgAu** = **D**-factor for silver plus gold, **DAsSb** = **D**-factor for arsenic plus antimony, **DHgTl** = **D**-factor for mercury plus thallium, **DSSe** = **D**-factor for sulfur plus selenium, **DCarl** = **D**-factor for Carlin type deposits and **DPrec** = **D**-factor for precious metal type deposits. The formulas used for these factors are in Appendix A. The other entries in Table 2, also detailed in Appendix A, represent **D**-factors for rock types and major deposit types. Interpretation of the Value categories are as follows: **R** >=7 records the number of samples that are extremely anomalous; **R** >= 4 records the number of samples that are anomalous; and **R** >=3 records the number of samples that are marginally anomalous.

The summaries below are comments on each of the Anomalous Areas detailed in the figures that follow. Anomalous Areas 1 to 6 are located generally in Figure 1. The areas in Figure 1 are presented in order of apparent interest—Anomalous Area 1 being of the most interest. Some data from Anomalous Area 4 is apparently missing, consequently, review of additional data from this area could enhance its relative significance among the Anomalous Areas. Anomalous Areas 390kEast and 490kEast are outside of Figure 1; only detailed maps are presented for these areas.

SUMMARY: ANOMALOUS AREA 1

Anomalous Area 1 (Figs. 1-6, Table 2) is apparently has the best Carlin type precious metal deposit targets within Figure 1. Follow-up of this area requires, first of all, prospecting of all anomalous sample sites in Table 1. Results of this could dictate where sample grids would be best located. However, a detailed soil grid in the area of the rectangle in Anomalous Area 1 area is justified. Grid sampling must be done with a consistent sampling method and the field presence of quartz, pyrite, orpiment and realgar should be systematically recorded when found.

SUMMARY: ANOMALOUS AREA 2

Follow-up of Anomalous Area 2 requires, first of all, prospecting of all ten sample sites in Table 4. Results of this could dictate where sample grids would be best located. However, a detailed soil grid in the areas of the two rectangles in the Anomalous Area 2 is justified. Grid sampling must be done with a consistent sampling method and the field presence of quartz, pyrite, orpiment and realgar should be systematically recorded when found.

SUMMARY: ANOMALOUS AREA 3

Follow-up of Anomalous Area 3 requires, first of all, prospecting of all seven sample sites in Table 3. Results of this could dictate where sample grids would be best located. However, a detailed soil grid in the areas of the two rectangles in the Anomalous Area 2 is marginally justified.

SUMMARY: ANOMALOUS AREA 4

Follow-up of Anomalous Area 4 requires, first of all, obtaining all data. Following this, prospecting of all seven sample sites in Table 6 (and other anomalous samples as determined from additional data) should be carried out. Results of this could dictate where sample grids would be best located.

SUMMARY: ANOMALOUS AREA 5

Follow-up of Anomalous Area 5 requires, first of all, prospecting of the five sample sites in Table 7. Results of this could dictate where sample grids would be best located. However, a detailed soil grid in the areas of the two rectangles in the Anomalous Area 5 is marginally justified.

SUMMARY: ANOMALOUS AREA 6

Follow-up of Anomalous Area 6 requires, first of all, prospecting of all nine sample sites in Table 8. Results of this could dictate where sample grids would be best located. However, a detailed soil grid in the areas of the two rectangles in the Anomalous Area 5 is marginally justified.

SUMMARY: ANOMALOUS AREA 390KEAST

Follow-up of Anomalous Area 390kEast is of the highest priority on the areas examined in the report. Prospecting of the sample sites in Table 9 could dictate where sample grids should first be extended. In fact, a detailed soil grid over as much of the property as possible is probably justified.

SUMMARY: ANOMALOUS AREA 490KEAST

This area is of the least interest in the areas examined in this report. Follow-up of Anomalous Area 490kEast requires, first of all, prospecting of the one sample site in Table 10. Results of this could dictate whether or not a sample grid is justified.

ANOMALOUS AREA 1 MAPS AND PROFILES

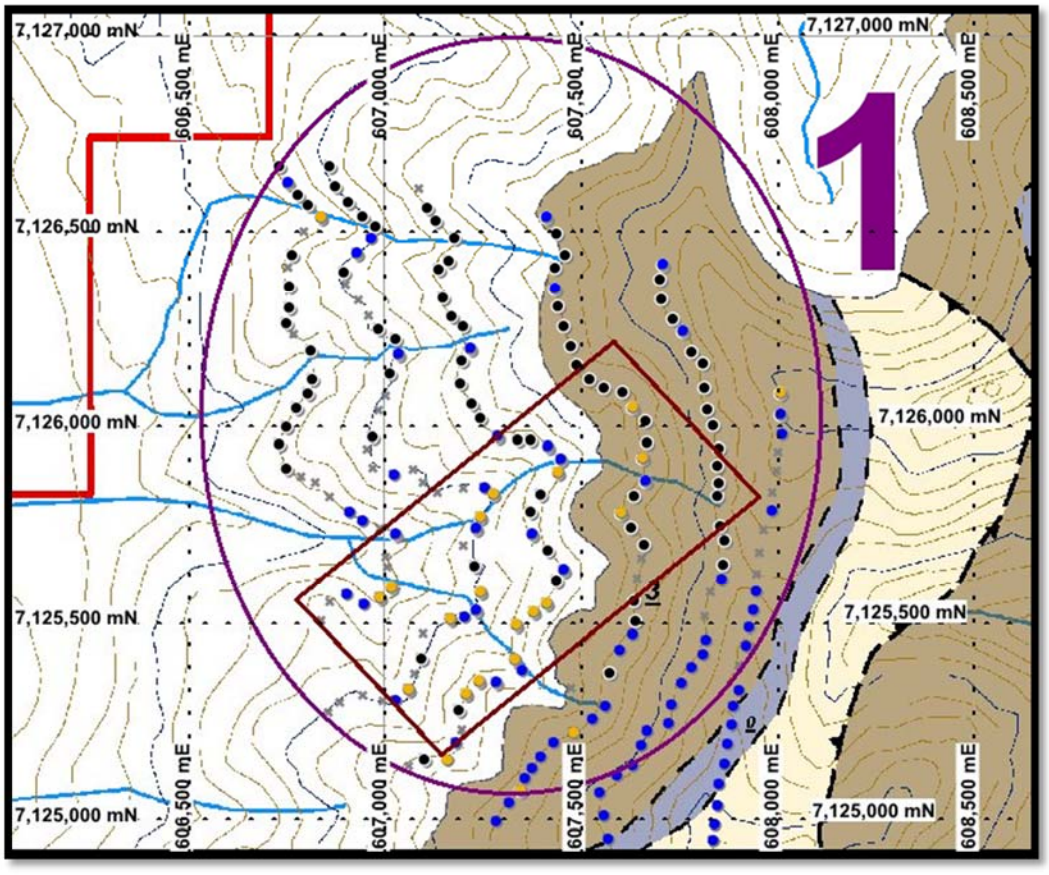

Figure 2. Anomalous Area 1 with rock interpretation from geochemical data at each sample site.

Colored dots indicate potential underlying rock type as follows: black dots = shale signature, blue dots = carbonate signature, yellow-orange dots = possible felsic rock signature. Grey crosses represent other sample points.

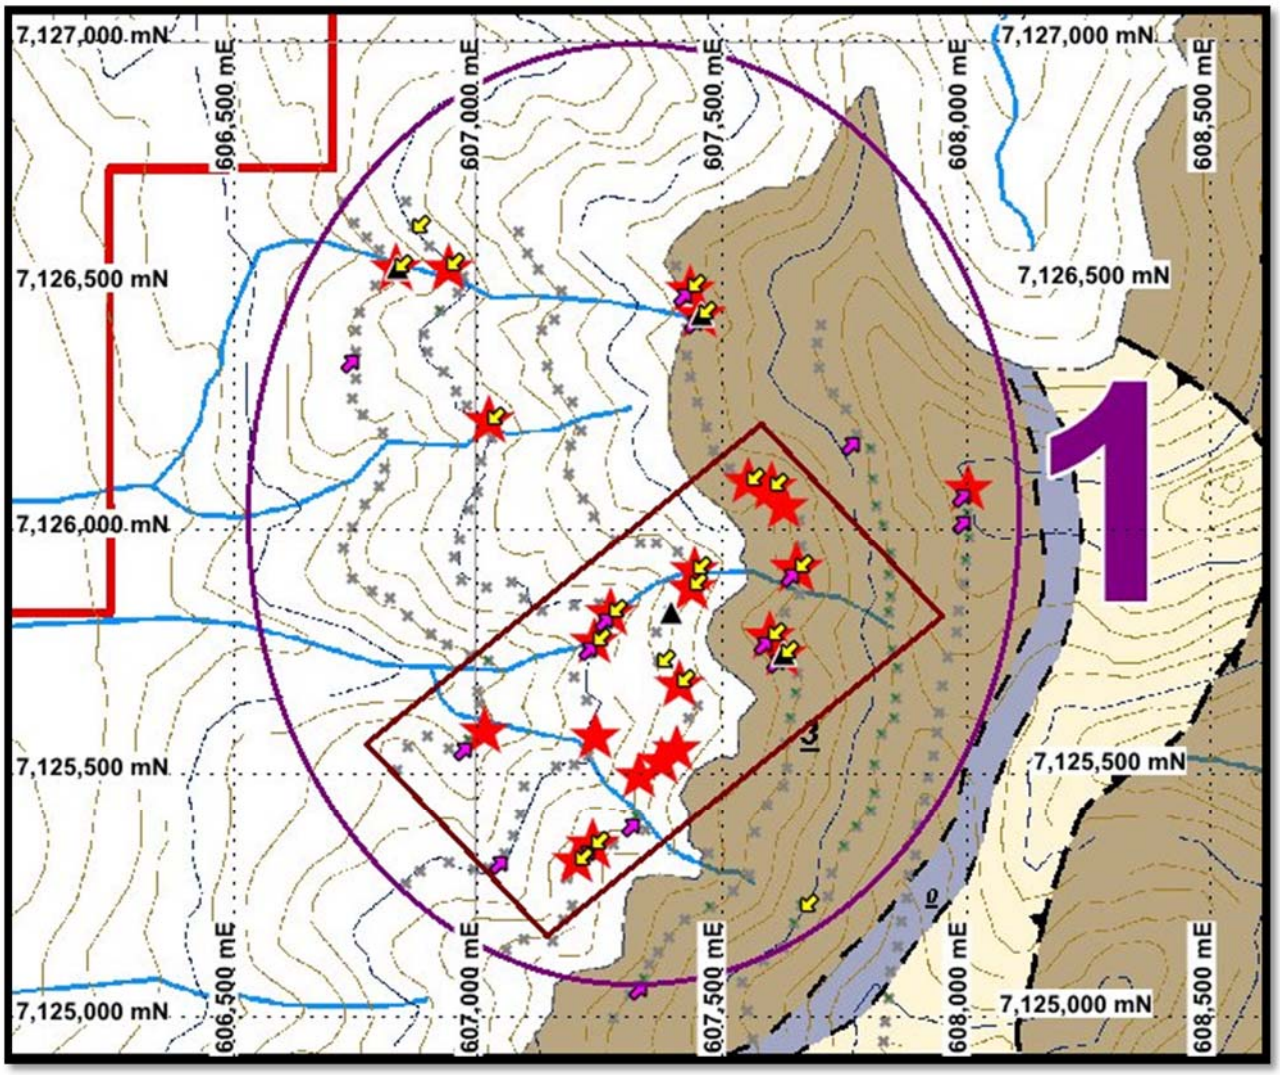

Figure 3. Anomalous Area 1 with symbols representing precious metal related (silver and gold related) factors based on geochemical data at each sample site.

Colored symbols represent anomalous samples as follows: red stars = Carlin signature anomalous, black up-triangles = gold plus silver anomalous, purple northeast pointing arrows = mercury plus thallium anomalous, yellow southwest pointing arrows = precious metal deposit signature anomalous. Grey crosses represent other sample points.

Three samples have value total peaks greater than 40.

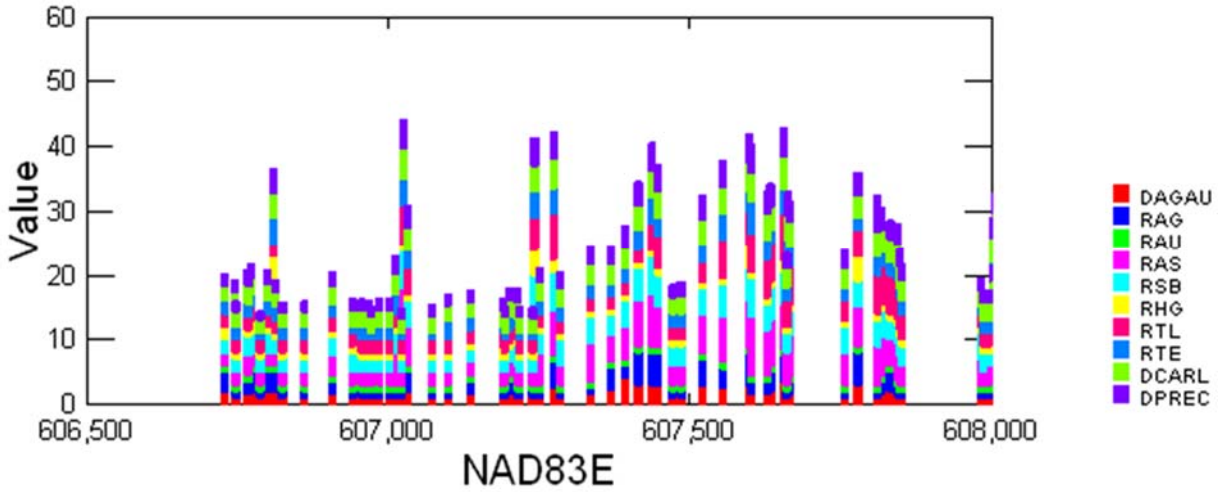

Figure 7. Anomalous Area 1: Profile 7126250N-7125750N

Seven samples have value total peaks greater than 40.

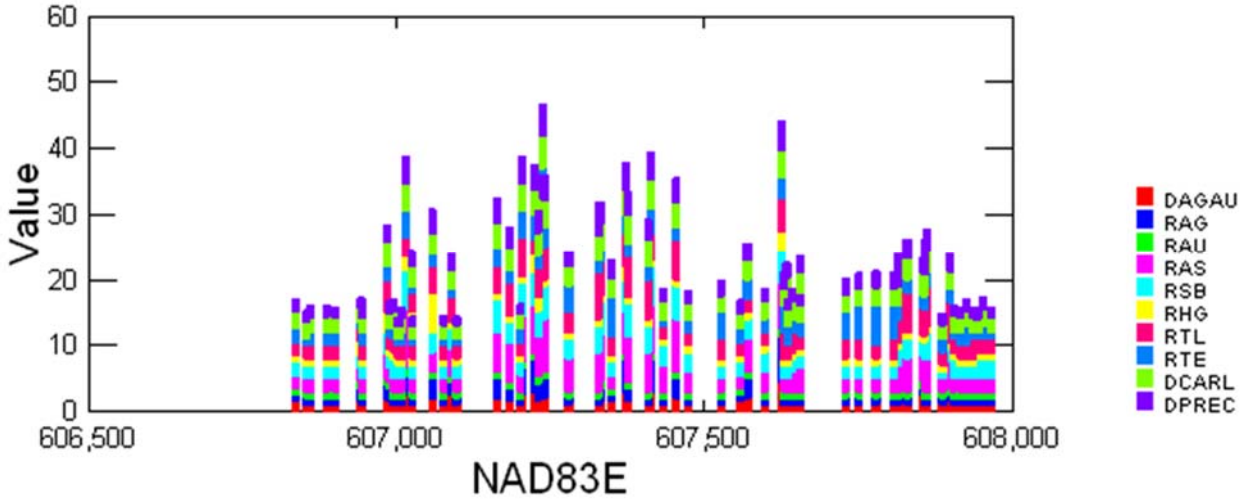

Figure 8. Anomalous Area 1: Profile 7125750N-7125250N

Two samples have value total peaks greater than 40.

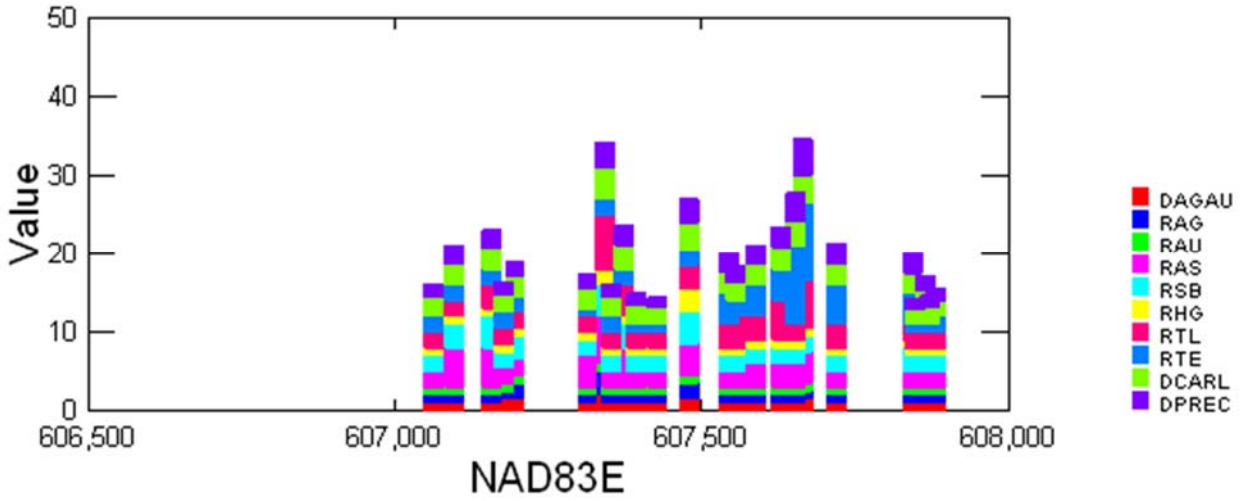

Figure 9. Anomalous Area 1: Profile 7125250N-7124750N

No samples have peaks with a value total greater than 40.

ANOMALOUS AREA 1: SUMMARY INTERPRETATION

The area of principal interest in Anomalous Area 1 is outlined by a rectangle in Figures 1 to 5. Several anomalous areas exist at the northern end of the data in the northwestern and north-central part of these figures. Both of these areas have a rock-geochemical signature that has felsic characteristics. The nine samples judged to be the most significant (Sum = **R**Ag + **R**Au + **R**As + **R**Hg + **R**S + **R**Sb + **R**Tl + **R**Te + **D**AgAu + **D**Carl + **D**Prec) are in Table 3. These Value sums that are greater than 40 potentially mark significant gold and silver mineralization. Silver and gold values are contoured in Figures 4 and 5, and detailed east-west stacked-bar profiles are in Figures 6 to 9. Anomalous areas in all of the above figures clearly define follow-up areas. Note that the absolute values of silver (AgPpm) and gold by fire assay (AuPpm) are low in absolute terms. The best silver is 2 grams per tonne and gold does not approach half a gram per tonne.

These moderate silver and gold values might be a reflection of the soil sample medium collected in the field.

TABLE 3. Anomalous Area 1: best samples with sum-totals (R&D added) greater than 40; sum-totals greater than 50 are particularly significant.

Follow-up of Anomalous Area 1 requires, first of all, prospecting of all anomalous sample sites in Table 3. Results of this could dictate where sample grids would be best located. However, a detailed soil grid in the area of the rectangle in Anomalous Area 1 area is justified. Grid sampling must be done with a

consistent sampling method and the field presence of quartz, pyrite, orpiment and realgar should be systematically recorded when found.

ANOMALOUS AREA 2 MAPS AND PROFILES

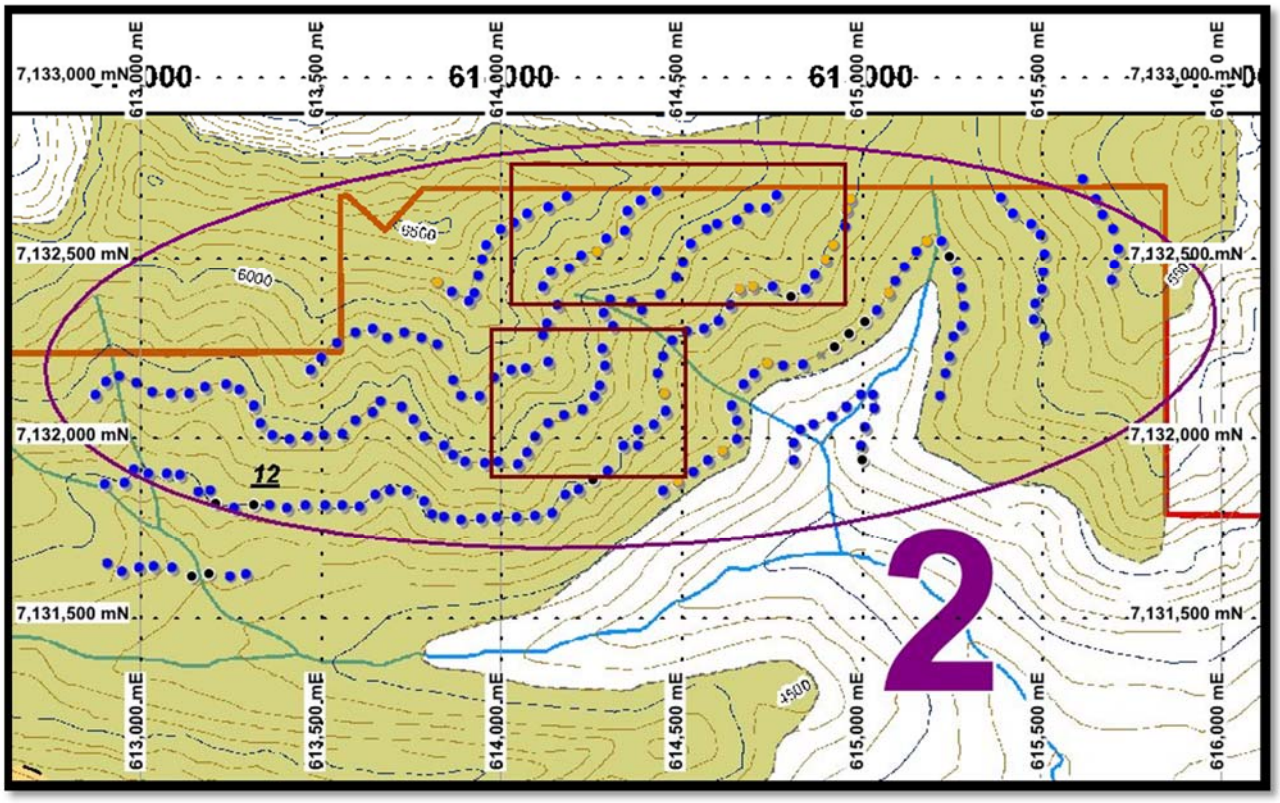

Figure 10. Anomalous Area 2 with rock interpretation from geochemical data at each sample site. Colored dots indicate potential underlying rock type as follows: black dots = shale signature, blue dots = carbonate signature, yellow-orange dots = possible felsic rock signature.

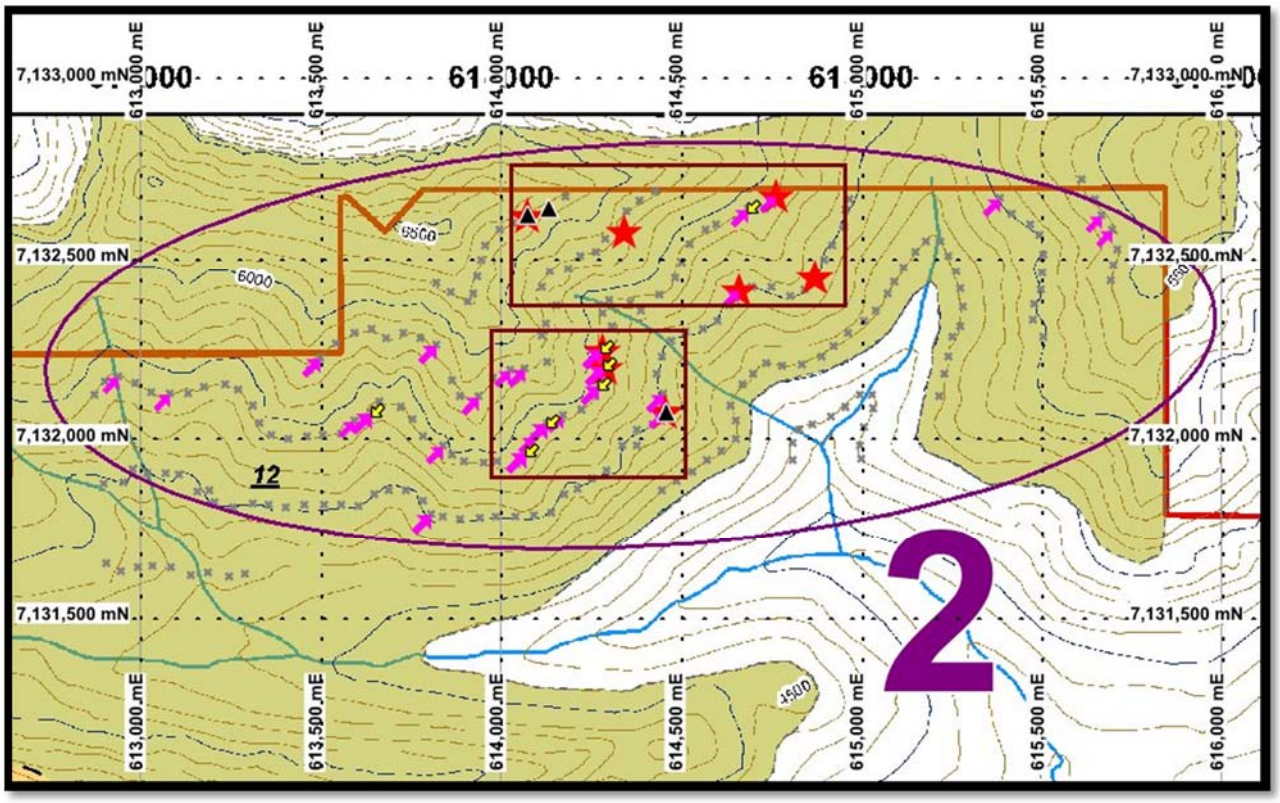

Figure 11. Anomalous Area 2 with symbols representing precious metal related (silver and gold related) factors based on geochemical data at each sample site.

Colored symbols represent anomalous samples as follows: red stars = Carlin signature anomalous, black up-triangles = gold plus silver anomalous, purple northeast pointing arrows = mercury plus thallium anomalous, yellow southwest pointing arrows = precious metal deposit signature anomalous. Grey crosses represent other sample points.

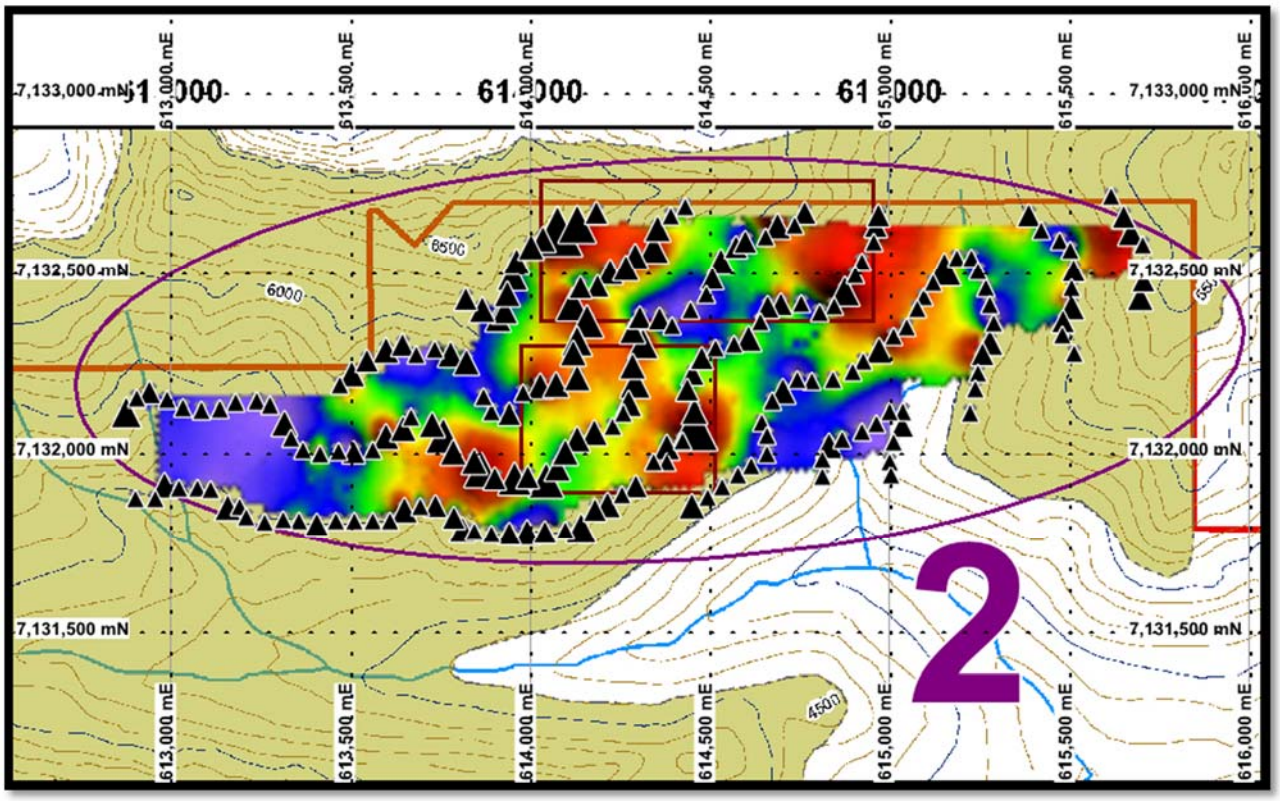

Figure 12. Anomalous Area 2 contoured (inverse distance, rainbow red high) for silver (AgPpmAi); the size of the black triangles are proportional to combined silver and gold (bubble plot for DAgAu).

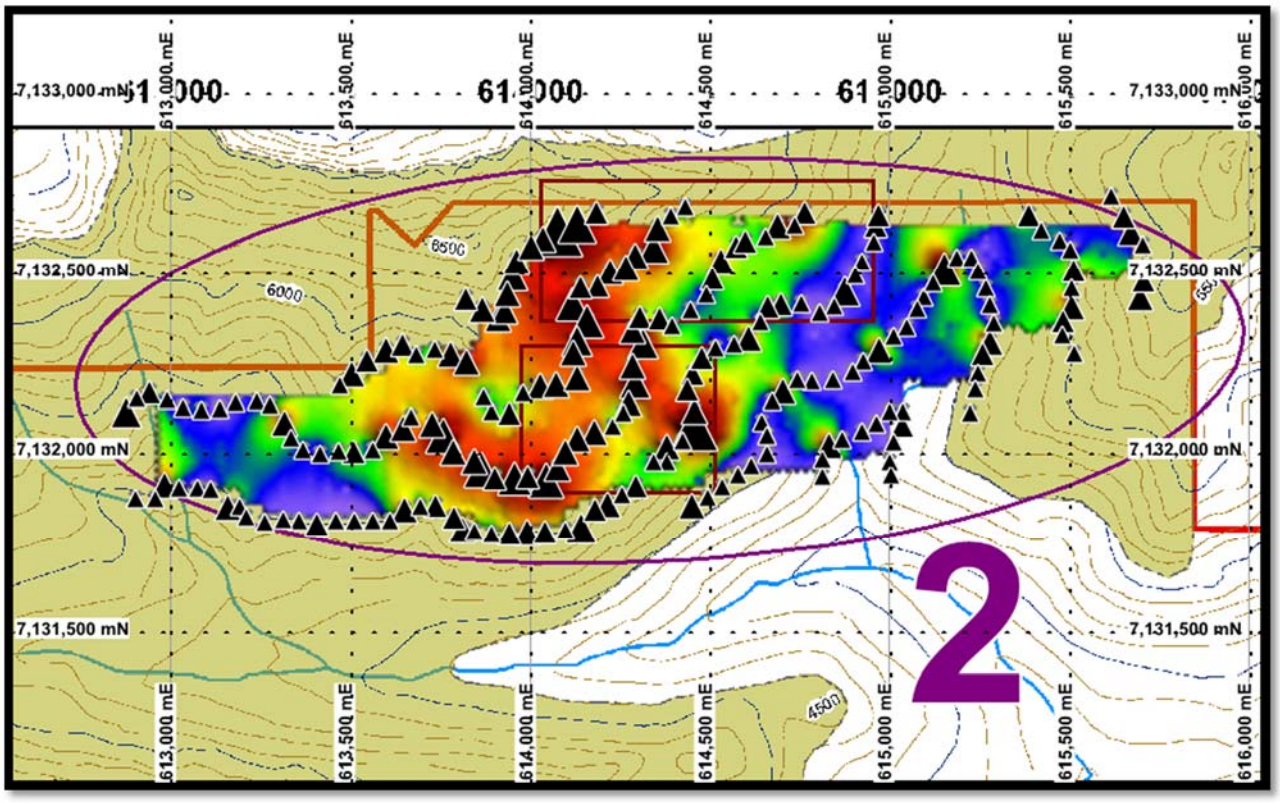

Figure 13. Anomalous Area 2 contoured (inverse distance, rainbow red high) for gold (fire assay: AuPpmCi); the size of the black triangles are proportional to combined silver and gold (bubble plot for DAgAu).

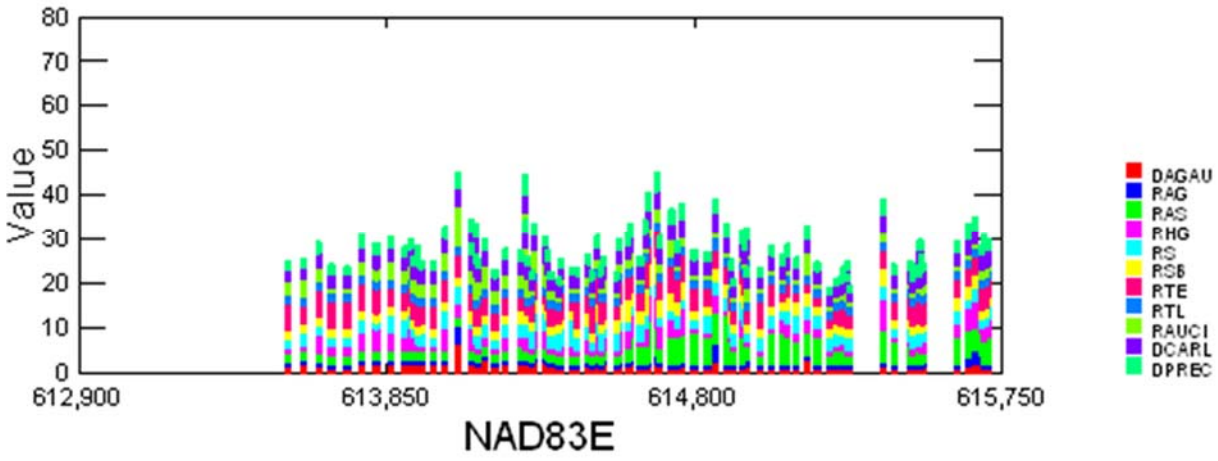

Figure 14. Anomalous Area 2: Profile 7132750N-7132250N

Three peaks have Value greater than 40.

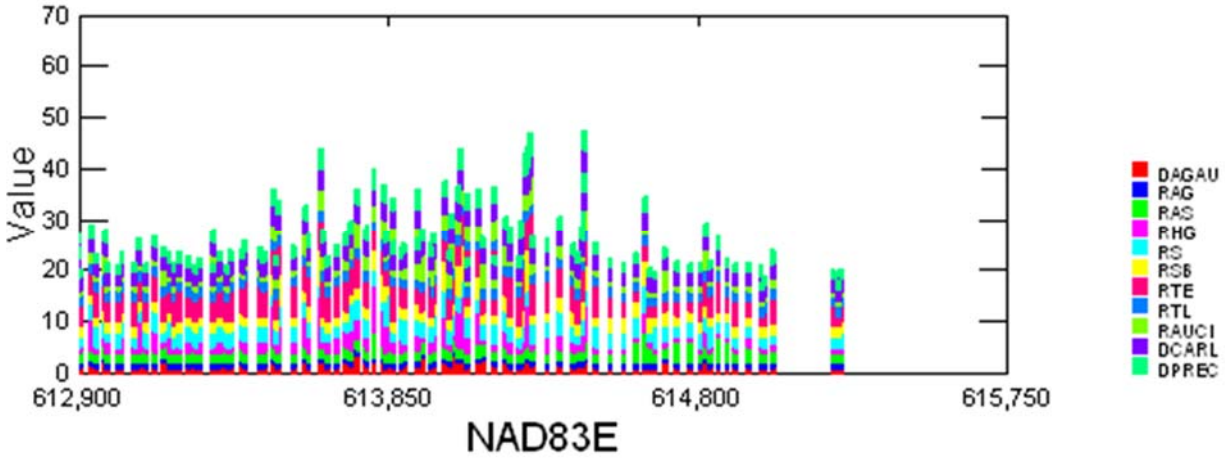

Figure 15. Anomalous Area 2: Profile 7132250N-7131750

Five peaks have Value greater than 40.

ANOMALOUS AREA 2: SUMMARY INTERPRETATION

The area of principal interest in Anomalous Area 1 is outlined by the two rectangles in Figures 10 to 13. The nine samples judged to be the most significant (Sum = **R**Ag + **R**Au + **R**As + **R**Hg + **R**S + **R**Sb + **R**Tl + **R**Te + **D**AgAu + **D**Carl + **D**Prec) are in Table 2 (see also stacked-bar profiles of Figs. 14 & 15). These Value sums that are greater than 40 potentially mark significant gold and silver mineralization, but note that these values are less than those associated with Anomalous Area 1 (Table 3). Note that the absolute values of silver (AgPpm) and gold by fire assay (AuPpm) are low in absolute terms. The best silver is a little less than half a gram per tonne and gold does not approach half a gram per tonne. These moderate silver-gold results might be a reflection of the soil sample medium collected in the field.

Follow-up of Anomalous Area 2 requires, first of all, prospecting of all ten sample sites in Table 4. Results of this could dictate where sample grids would be best located. However, a detailed soil grid in the areas of the two rectangles in the Anomalous Area 2 is justified. Grid sampling must be done with a consistent

sampling method and the field presence of quartz, pyrite, orpiment and realgar should be systematically recorded when found.

ANOMALOUS AREA 3 MAPS

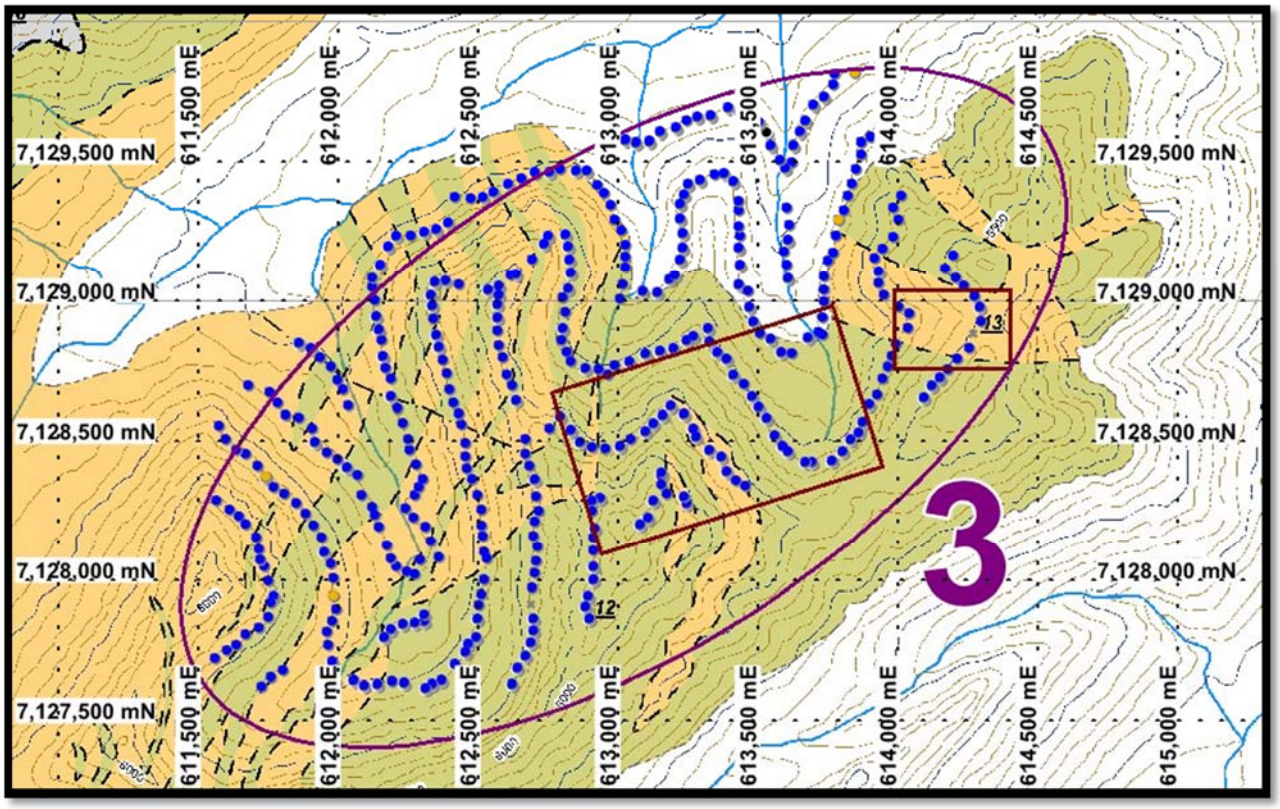

Figure 16. Anomalous Area 3 with rock interpretation from geochemical data at each sample site. Colored dots indicate potential underlying rock type as follows: black dots = shale signature, blue dots = carbonate signature, yellow-orange dots = possible felsic rock signature.

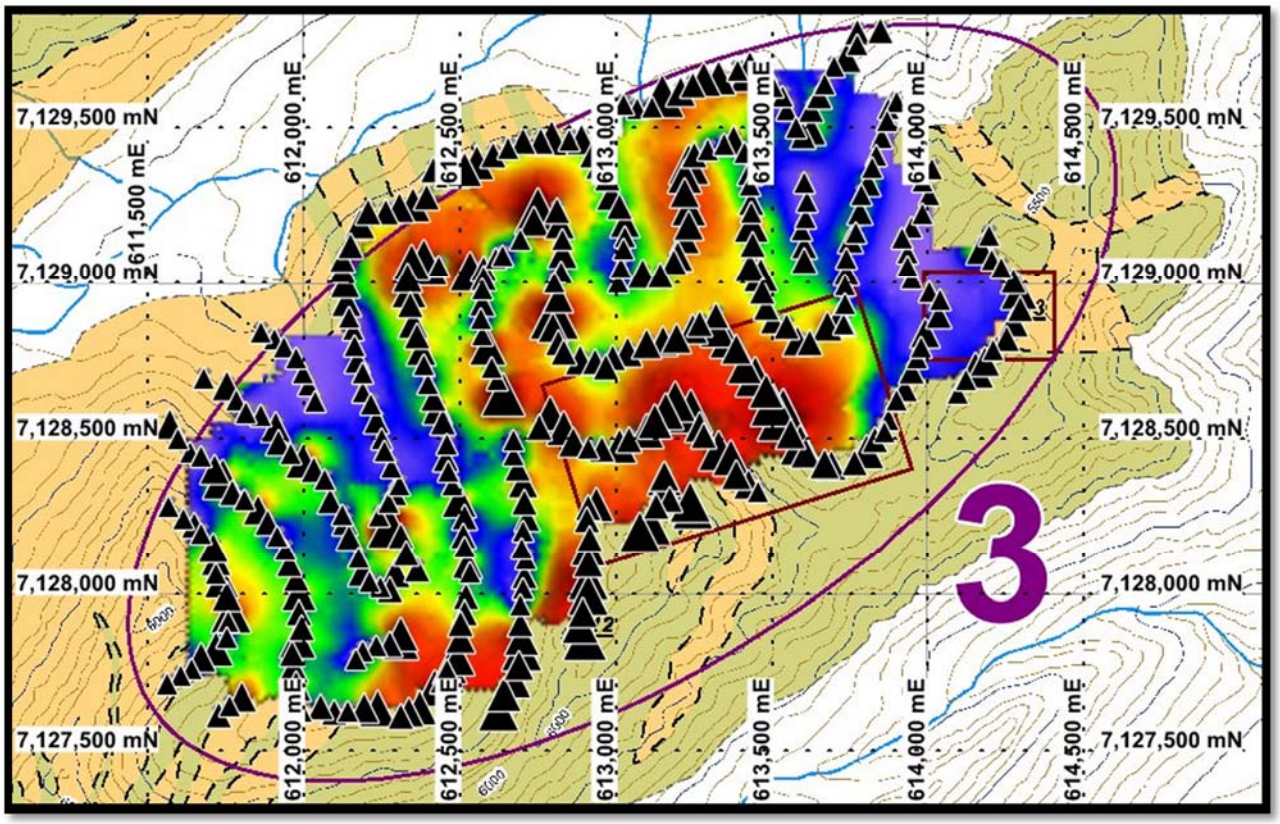

Figure 19. Anomalous Area 3 contoured (inverse distance, rainbow red high) for gold (fire assay: AuPpmCi); the size of the black triangles are proportional to combined silver and gold (bubble plot for **D**AgAu).

ANOMALOUS AREA 3: SUMMARY INTERPRETATION

The area of principal interest in Anomalous Area 3 is outlined by a rectangle in Figures 16 and 17. A smaller anomaly exists at the central-northern boundary of the area. The anomalous samples are generally sparsely distributed throughout this area. The seven samples judged to be the most significant (Sum = **R**Ag + **R**Au + **R**As + **R**Hg + **R**S + **R**Sb + **R**Tl + **R**Te + **D**AgAu + **D**Carl + **D**Prec) are in Table 5. These Value sums that are greater than 40 potentially mark significant gold and silver mineralization. Note that the absolute values of silver (AgPpm) and gold by fire assay (AuPpm) are low in absolute terms. The best silver is less than half a gram per tonne and gold does not approach half a gram per tonne. These moderate values might be a reflection of the soil sample medium collected in the field.

Follow-up of Anomalous Area 3 requires, first of all, prospecting of all seven sample sites in Table 5. Results of this could dictate where sample grids would be best located. However, a detailed soil grid in the areas of the two rectangles in the Anomalous Area 2 is marginally justified. Grid sampling must be done with a consistent sampling method and the field presence of quartz, pyrite, orpiment and realgar should be systematically recorded when found.

ANOMALOUS AREA 4 MAPS

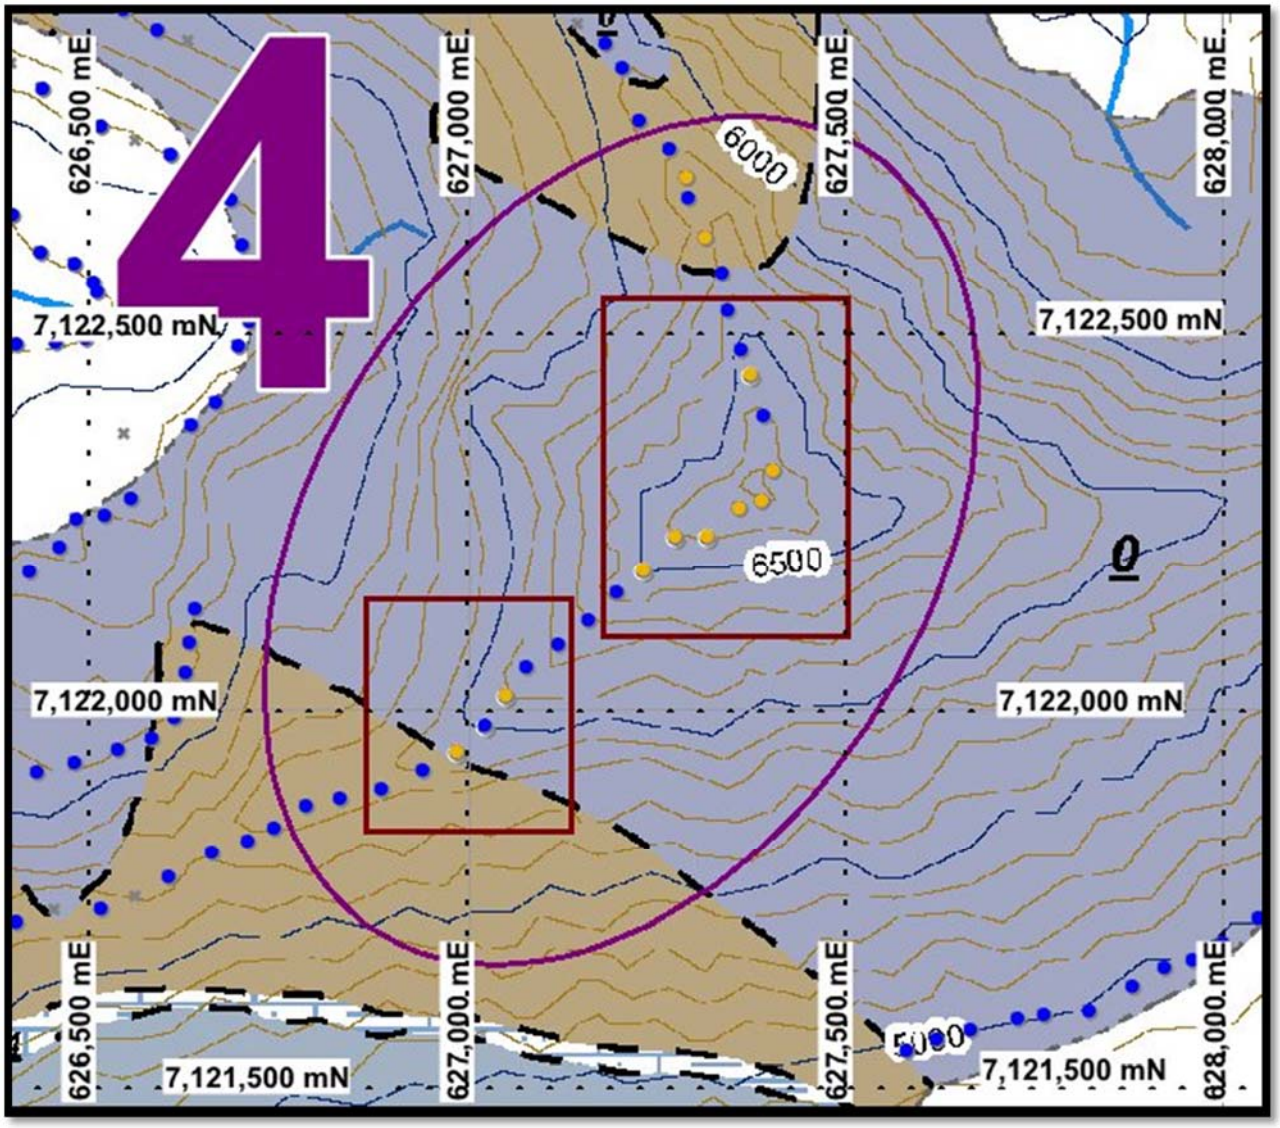

Figure 20. Anomalous Area 4 with rock interpretation from geochemical data at each sample site. Colored dots indicate potential underlying rock type as follows: black dots = shale signature, blue dots = carbonate signature, yellow-orange dots = possible felsic rock signature. Grey crosses represent other sample points.

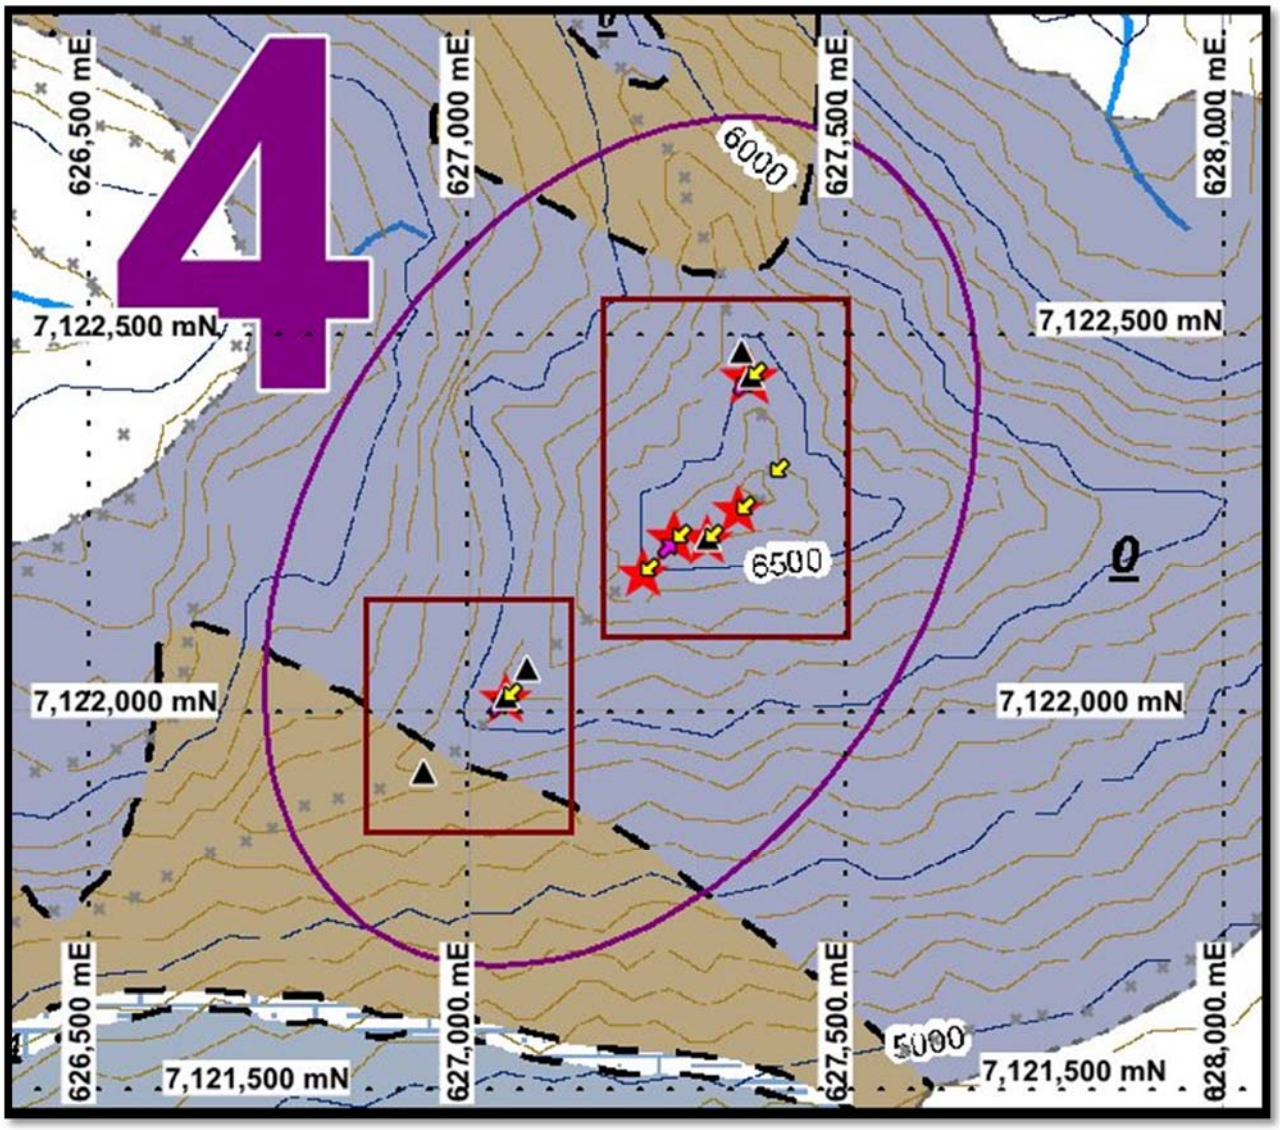

Figure 21. Anomalous Area 4 with symbols representing precious metal related (silver and gold related) factors based on geochemical data at each sample site.

Colored symbols represent anomalous samples as follows: red stars = Carlin signature anomalous, black up-triangles = gold plus silver anomalous, purple northeast pointing arrows = mercury plus thallium anomalous, yellow southwest pointing arrows = precious metal deposit signature anomalous. Grey crosses represent other sample points.

ANOMALOUS AREA 4: SUMMARY INTERPRETATION

The area of principal interest in Anomalous Area is outlined by a rectangle in Figures 20 and 21. The anomalous samples are concentrated in one part of the line samples. Other maps (Li, pers. comm, 14-08-12) show that there are additional lines—four of which are in the area of the rectangle. Assay values for these lines are not known and this data is critical to overall evaluation of this area. However, for the data at hand, the seven samples judged to be the most significant (Sum = **R**Ag + **R**Au + **R**As + **R**Hg + **R**S + **R**Sb +

RTl + **R**Te + **D**AgAu + **D**Carl + **D**Prec) are in Table 6. These Value sums that are greater than 40 potentially mark significant gold and silver mineralization. Note that the absolute values of silver (AgPpm) and gold by fire assay (AuPpm) are low in absolute terms. The best silver is about 3 grams per tonne and gold does not approach half a gram per tonne. These moderate values might be a reflection of the soil sample medium collected in the field.

Follow-up of Anomalous Area 4 requires, first of all, obtaining all data. Following this, prospecting of all seven sample sites in Table 6 (and other anomalous samples as determined from additional data) should be carried out. Results of this could dictate where sample grids would be best located. Grid sampling must be done with a consistent sampling method and the field presence of quartz, pyrite, orpiment and realgar should be systematically recorded when found.

TABLE 6. Anomalous Area 4: best samples with sum-totals (R&D added) greater than 40; sum-totals greater than 50 are particularly significant.

ANOMALOUS AREA 5 MAPS

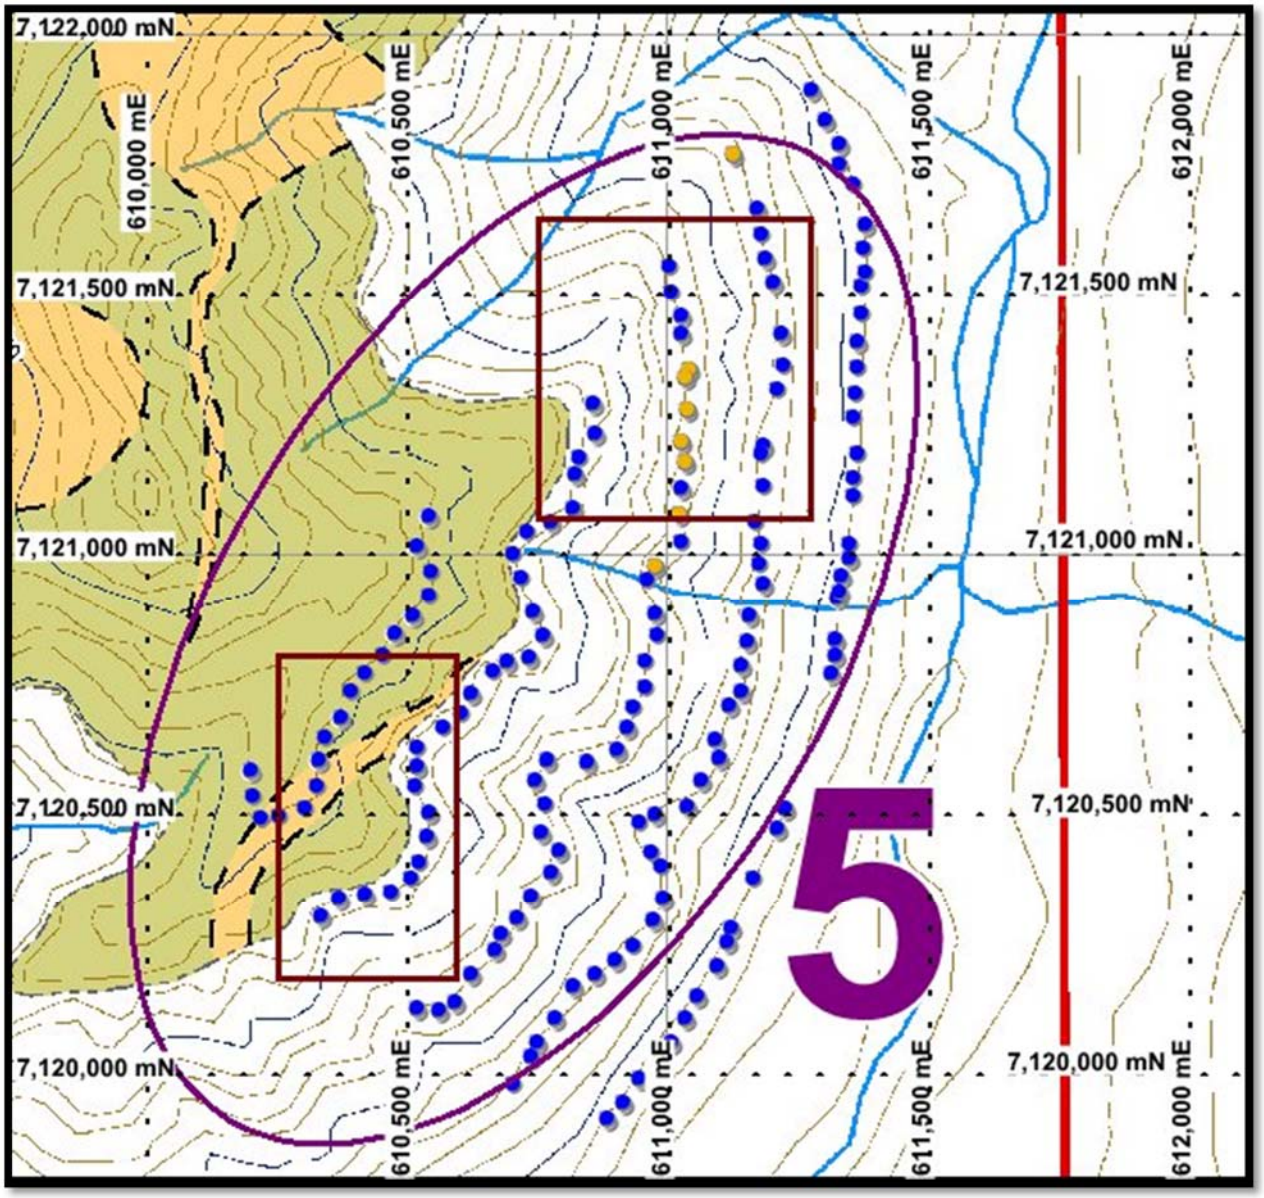

Figure 22. Anomalous Area 5 with rock interpretation from geochemical data at each sample site. Colored dots indicate potential underlying rock type as follows: black dots = shale signature, blue dots = carbonate signature, yellow-orange dots = possible felsic rock signature.

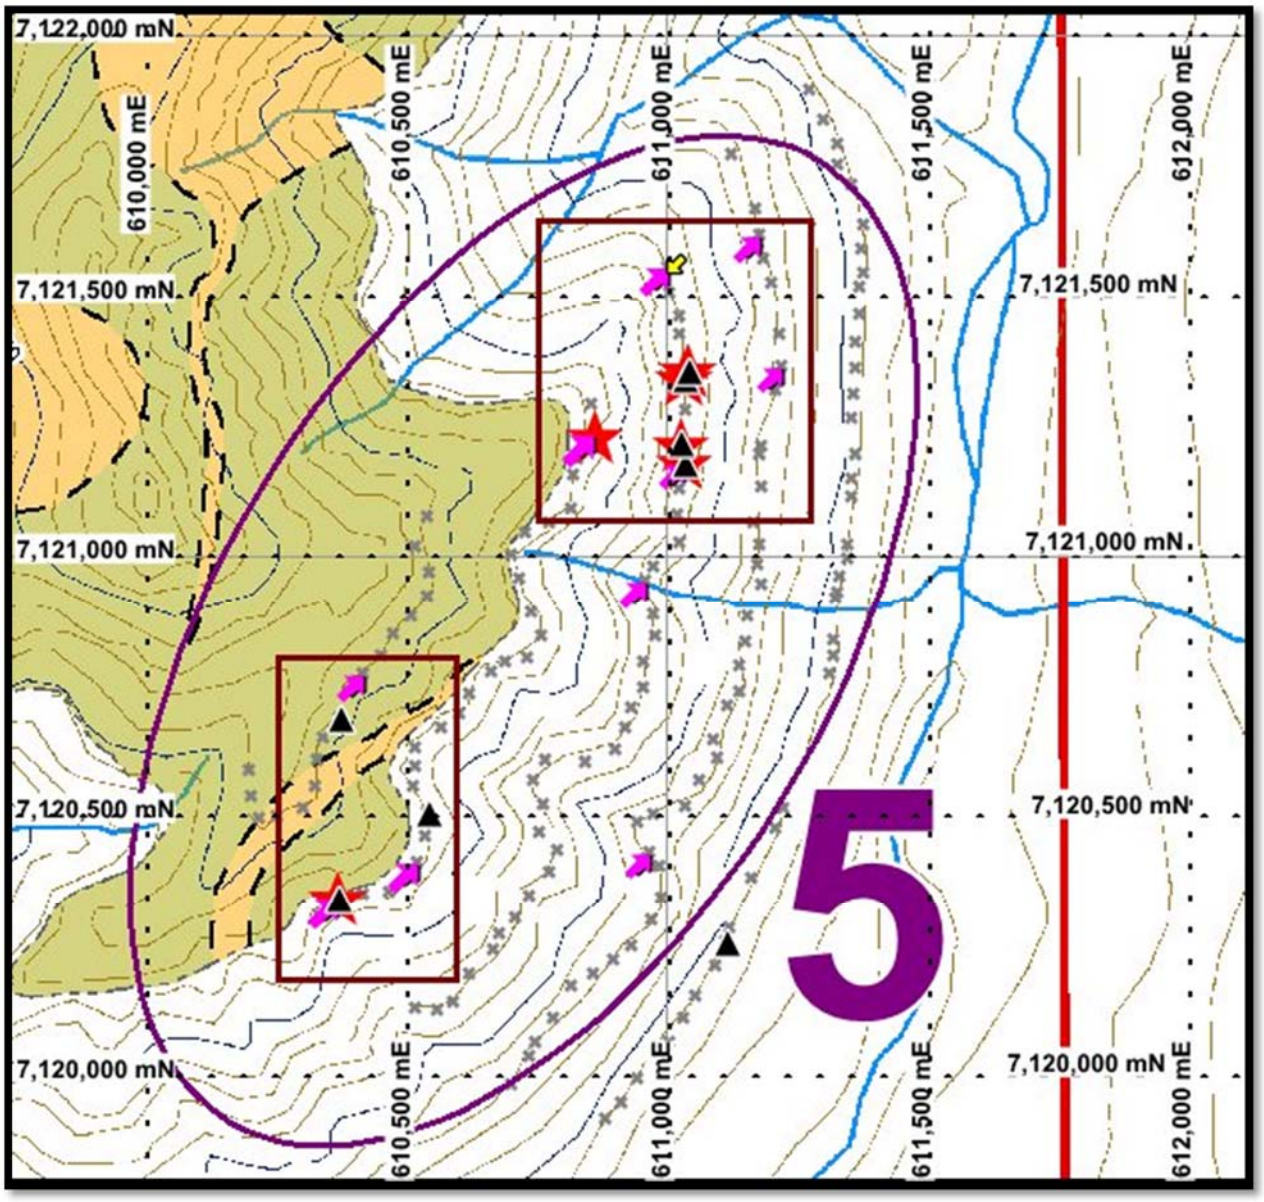

Figure 23. Anomalous Area 5 with symbols representing precious metal related (silver and gold related) factors based on geochemical data at each sample site.

Colored symbols represent anomalous samples as follows: red stars = Carlin signature anomalous, black up-triangles = gold plus silver anomalous, purple northeast pointing arrows = mercury plus thallium anomalous, yellow southwest pointing arrows = precious metal deposit signature anomalous. Grey crosses represent other sample points.

ANOMALOUS AREA 5: SUMMARY INTERPRETATION

The area of principal interest in Anomalous Area 5 is outlined by a rectangle in Figures 22 and 23. The anomalous samples are sparsely distributed throughout this area. The five samples judged to be the most significant (Sum = **R**Ag + **R**Au + **R**As + **R**Hg + **R**S + **R**Sb + **R**Tl + **R**Te + **D**AgAu + **D**Carl + **D**Prec) are in Table 7.

Those sum-totals sums that are greater than 40 potentially mark significant gold and silver mineralization. Note that the absolute values of silver (AgPpm) and gold by fire assay (AuPpm) are low in absolute terms. The best silver is about half a gram per tonne and gold does not approach half a gram per tonne. This is not encouraging, but might be a reflection of the soil sample medium collected in the field.

Follow-up of Anomalous Area 5 requires, first of all, prospecting of the five sample sites in Table 7. Results of this could dictate where sample grids would be best located. However, a detailed soil grid in the areas of the two rectangles in the Anomalous Area 5 is marginally justified. Grid sampling must be done with a consistent sampling method and the field presence of quartz, pyrite, orpiment and realgar should be systematically recorded when found.

ANOMALOUS AREA 6 MAPS

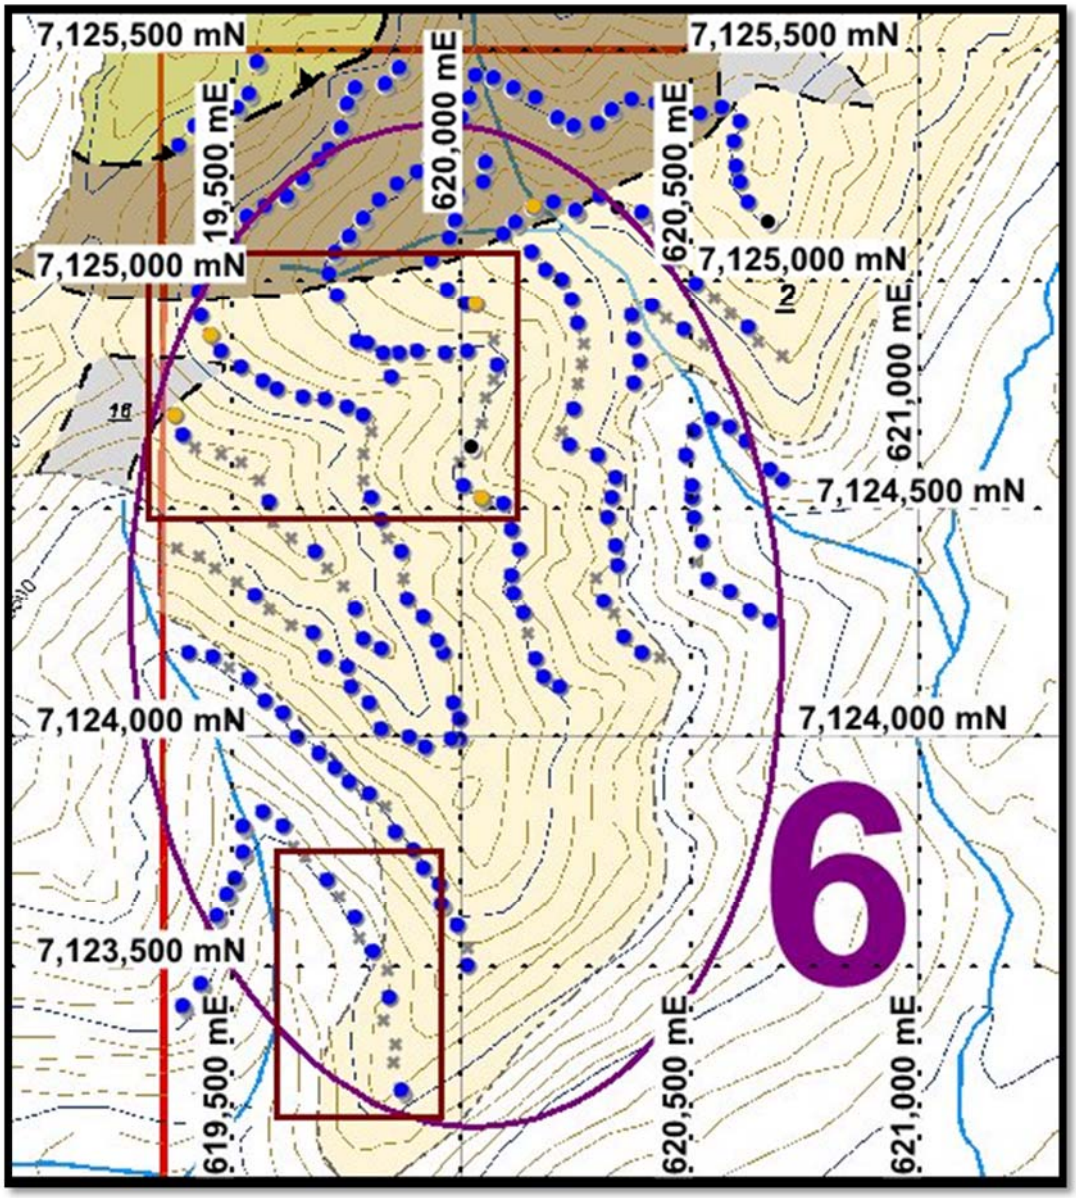

Figure 24. Anomalous Area 6 with rock interpretation from geochemical data at each sample site. Colored dots indicate potential underlying rock type as follows: black dots = shale signature, blue dots = carbonate signature, yellow-orange dots = possible felsic rock signature.

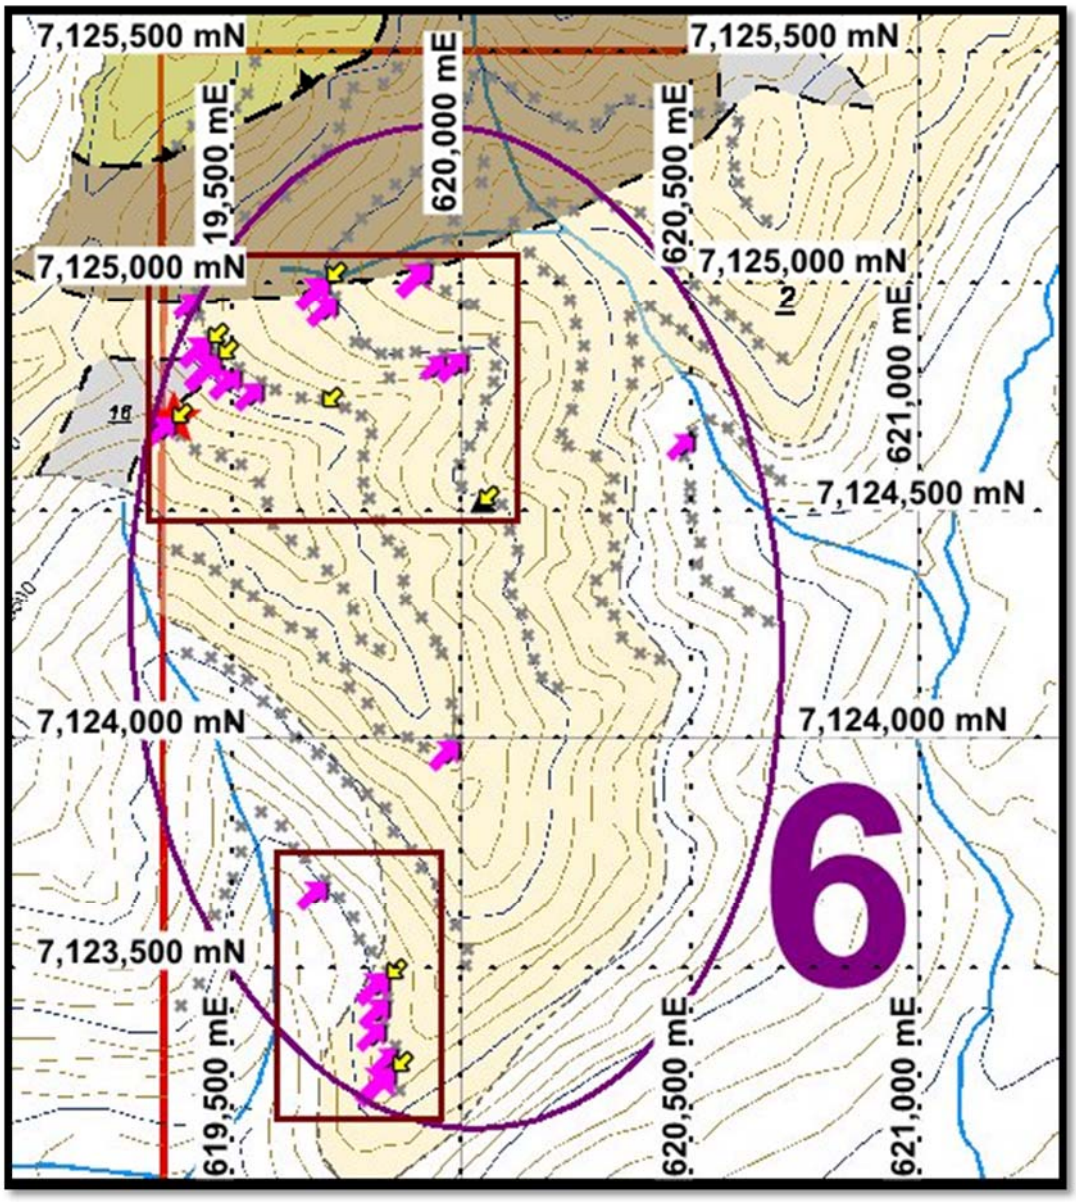

Figure 25. Anomalous Area 6 with symbols representing precious metal related (silver and gold related) factors based on geochemical data at each sample site.

Colored symbols represent anomalous samples as follows: red stars = Carlin signature anomalous, black up-triangles = gold plus silver anomalous, purple northeast pointing arrows = mercury plus thallium anomalous, yellow southwest pointing arrows = precious metal deposit signature anomalous. Grey crosses represent other sample points.

ANOMALOUS AREA 6: SUMMARY INTERPRETATION

The area of principal interest in Anomalous Area 6 is outlined by two rectangles in Figures 24 and 25. The anomalous samples are sparsely distributed throughout this area. The nine samples judged to be the most significant (Sum = **R**Ag + **R**Au + **R**As + **R**Hg + **R**S + **R**Sb + **R**Tl + **R**Te + **D**AgAu + **D**Carl + **D**Prec) are in Table 8.

Those sum-totals that are greater than 40 potentially mark significant gold and silver mineralization. Note that the absolute values of silver (AgPpm) and gold by fire assay (AuPpm) are low in absolute terms. The best silver is about one and a half grams per tonne and gold does not approach half a gram per tonne. These moderate silver and gold results might be a reflection of the soil sample medium collected in the field.

Follow-up of Anomalous Area 6 requires, first of all, prospecting of all nine sample sites in Table 8. Results of this could dictate where sample grids would be best located. However, a detailed soil grid in the areas of the two rectangles in the Anomalous Area 5 is marginally justified. Grid sampling must be done with a consistent sampling method and the field presence of quartz, pyrite, orpiment and realgar should be systematically recorded when found.

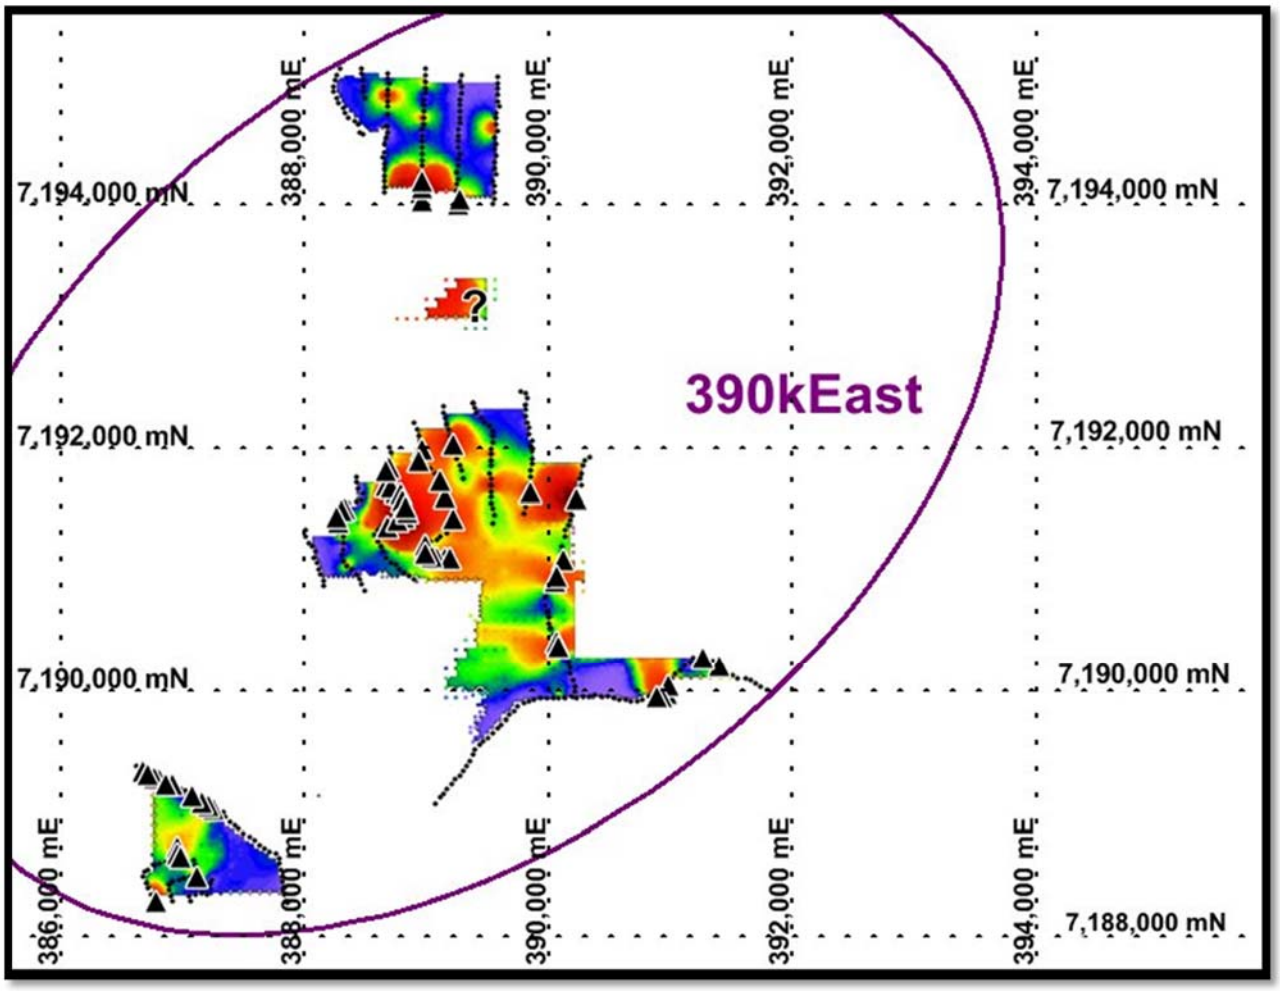

Figure 29. Anomalous Area 390kEast contoured (inverse distance, rainbow red high) for gold (AuPpmCi); the size of the black triangles are proportional to combined silver and gold (bubble plot for DAgAu).

ANOMALOUS AREA 390kEAST: SUMMARY INTERPRETATION

Most of the areas sampled in Anomalous Area 390kEast (Figs. 26 to 29) are of interest. There are a large number of anomalous samples in this area. The thirty-nine samples judged to be the most significant (Sum = **R**Ag + **R**Au + **R**As + **R**Hg + **R**S + **R**Sb + **R**Tl + **R**Te + **D**AgAu + **D**Carl + **D**Prec) are in Table 9. Thse sum-totals that are greater than 40 potentially mark significant gold and silver mineralization. Note that the absolute values of silver (AgPpm) and gold by fire assay (AuPpm) are low in absolute terms. However, the absolute values for two samples have silver (AgPpm) silver values greater than 10 grams per tonne—they are the best silver values encountered in this project. Gold is less than half a gram per tonne. This area has the best results of any area reported here.

Follow-up of Anomalous Area 390kEast is of the highest priority on the areas examined in the report. Prospecting of the sample sites in Table 9 could dictate where sample grids should first be extended. In fact, a detailed soil grid over as much of the property as possible is probably justified. Grid sampling must be done with a consistent sampling method and the field presence of quartz, pyrite, orpiment and realgar should be systematically recorded when found.

ANOMALOUS AREA 490KEAST MAPS

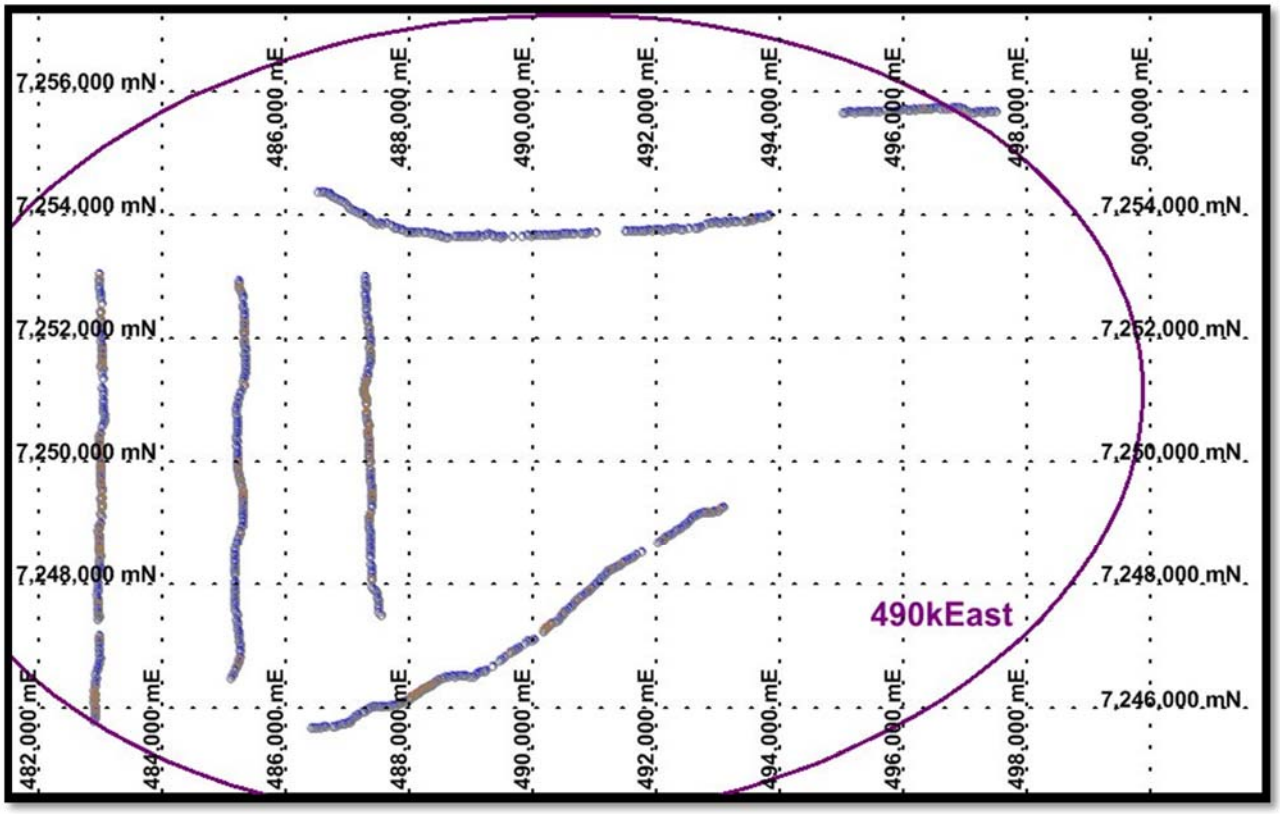

Figure 30. Anomalous Area 490kEast with rock interpretation from geochemical data at each sample site.

Colored dots indicate potential underlying rock type as follows: black dots = shale signature, blue dots = carbonate signature, yellow-orange dots = possible felsic rock signature.

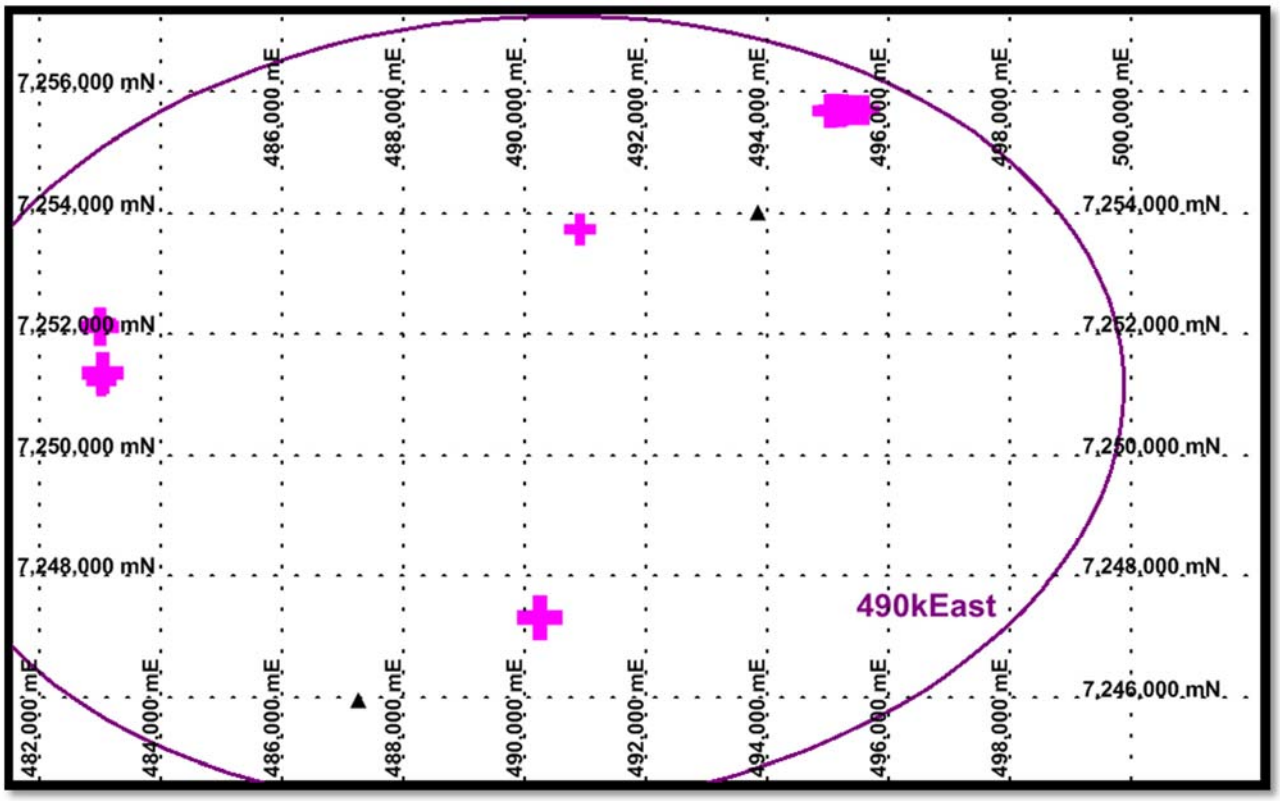

Figure 31. Anomalous Area 490kEast with symbols representing precious metal related (silver and gold related) factors based on geochemical data at each sample site.

Colored symbols represent anomalous samples (**D**-factors >= 4.0) as follows: black up-triangles = gold plus silver, purple thick plus = mercury plus thallium; Carlin and precious metal deposit anomalous signatures are not present.

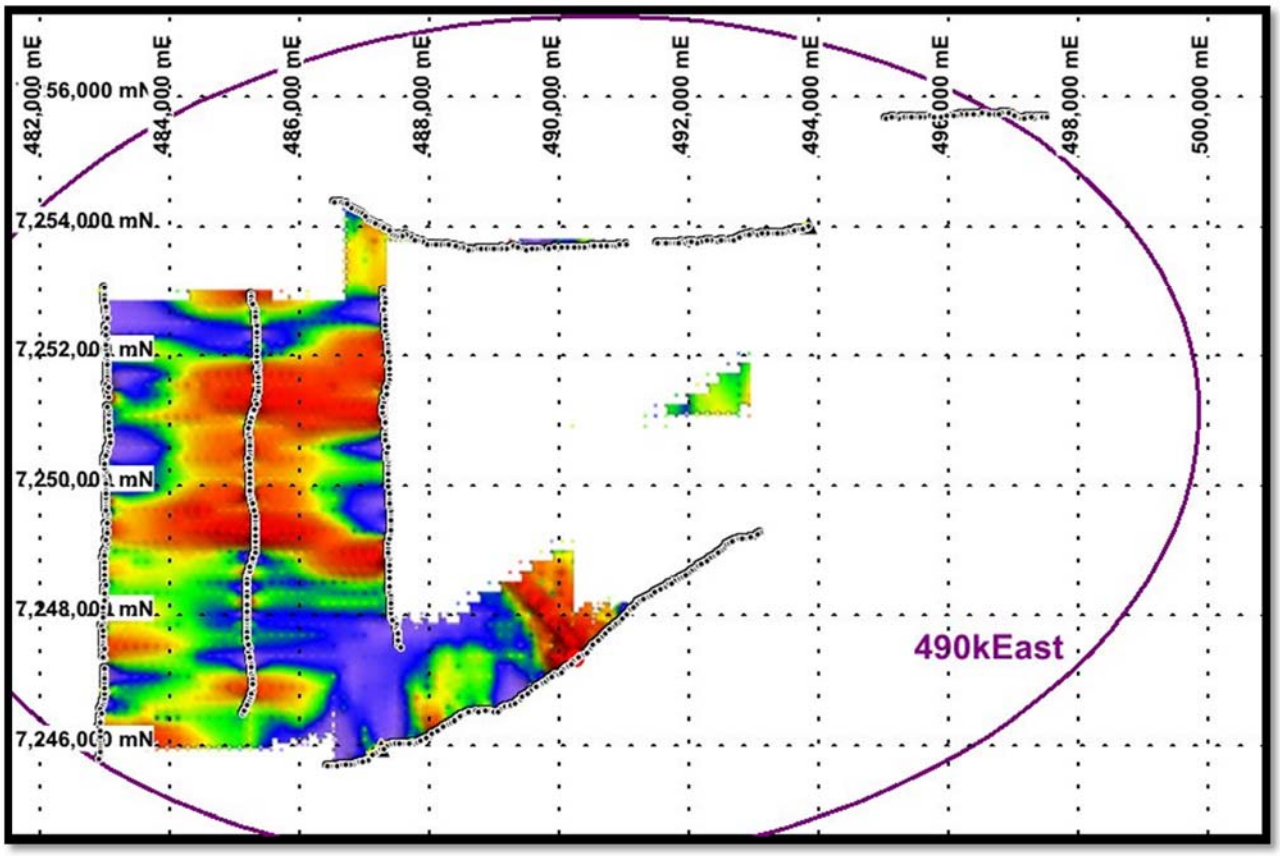

Figure 32. Anomalous Area 390kEast contoured (inverse distance, rainbow red high) for silver (AgPpmAi); black triangle marks anomalous combined silver and gold (DAgAu >= 4.0).

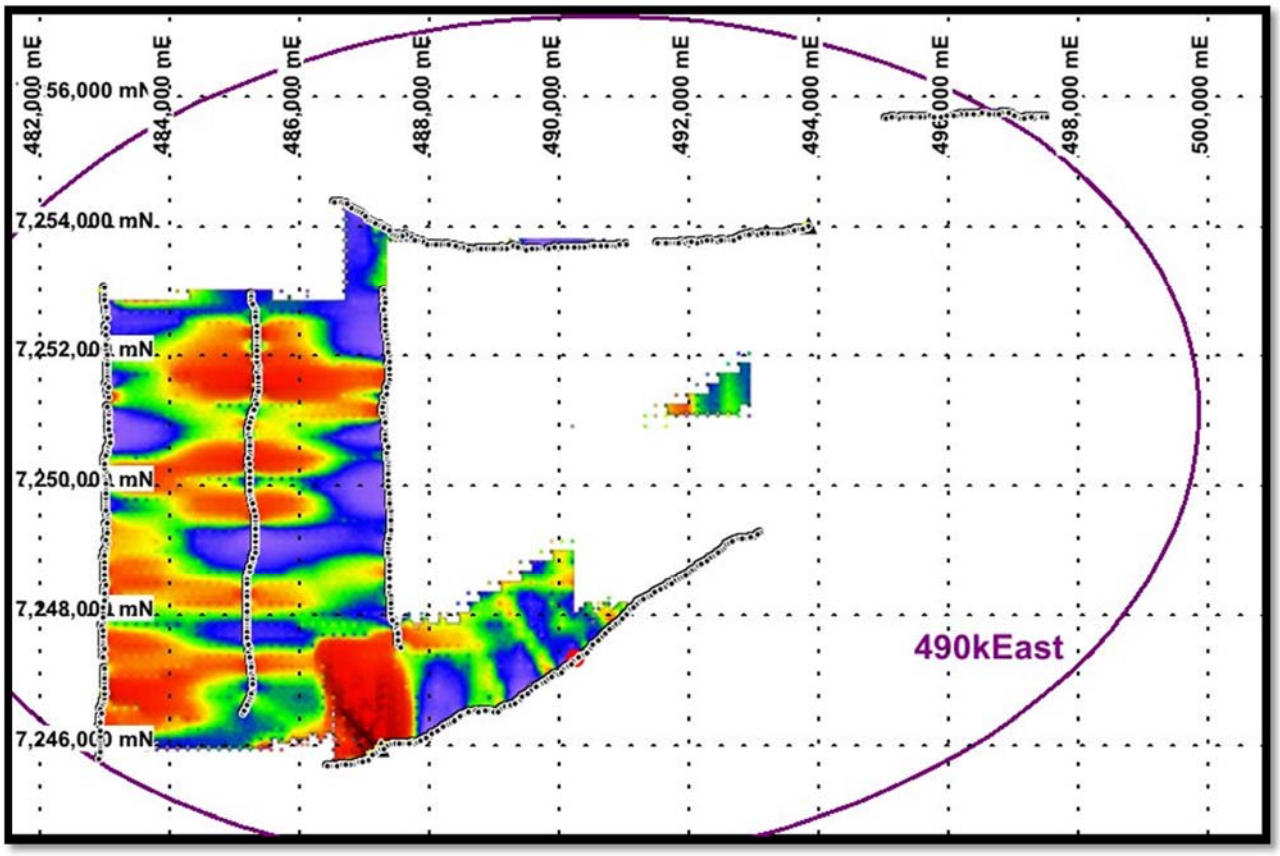

Figure 33. Anomalous Area 390kEast contoured (inverse distance, rainbow red high) for gold (AuPpmCi); black triangle marks anomalous combined silver and gold (DAgAu >= 4.0).

ANOMALOUS AREA 490kEAST: SUMMARY INTERPRETATION

The area of principal interest in Anomalous Area 490kEast is in the southwestern corner of Figures 30 to 33. Strongly anomalous samples are rare. The one samples judged to be significant (Sum = **R**Ag + **R**Au + **R**As + **R**Hg + **R**S + **R**Sb + **R**Tl + **R**Te + **D**AgAu + **D**Carl + **D**Prec) is in Table 10. The one sum-totals greater than 40 potentially marks significant gold and silver mineralization. Note that the absolute values of silver (AgPpm) and gold by fire assay (AuPpm) is low in absolute terms (both much less than half a gram per tonne). This might in part be a reflection of the soil sample medium collected in the field.

This area is of the least interest in the areas examined in this report. Follow-up of Anomalous Area 490kEast requires, first of all, prospecting of the one anomalous sample site identified in Table 10. Results of this could dictate whether or not a sample grid is justified. Any grid sampling must be done with a consistent sampling method and the field presence of quartz, pyrite, orpiment and realgar should be systematically recorded when found.

TABLE 10. Anomalous Area 490kEast: only samples with sum-total greater than 40.

StaNo	Nad83E	Nad83N	Sum	AgPpm	AsPct	HgPpm	SPct	SbPpm	TePpm	TlPpm	AuPpm
686	490249	7247352	49.7	0.25	92.00	0.76	1.97	0.14	0.07	1.05	0.002

CONCLUSIONS

Anomalous Area 390kEast is judged to be the most significant of areas examined in this report. Anomalous Area 1 is also important. Anomalous Area 4 might rank next, especially if additional assays in the area turn out to be significant. All other areas are of lessor significance based on sampling to date.

It is recommended that immediate work be focused on: Anomalous Area 390kEast, and Anomalous Area 1. Anomalous Area 4 should be followed up pending additional results. If additional results are not available additional recce soil sampling in Anomalous Area 4 is justified.

Work should begin by prospecting of those sample sites with the highest "Sum" numbers. Presence of the minerals quartz, orpiment and realgar should be looked for, noted and sampled because of their obvious significance to discovery of Carlin type mineralization. Discovery of such indicators should be used to guide and prioritize soil sampling on systematic grids.

APPENDIX A: RvDfS OVERVIEW

RvDfS—*R*elative *V*alue & *D*iscrimination *F*actor *S*ystematics—enhances discovery opportunities in geochemical analysis. The system is based on the fundamental distinction between background and anomalous populations, which is a fundamental division ignored by most statistical interpretations. Specifically, the technique uses: (i) all available geochemical analyses, (ii) statistical identification of anomalous populations, (iii) simple renumbering of anomalous and background populations to obtain relative values [**R**-values] that are additive, (iv) the addition of **R**-values to form geologically meaningful discrimination factors [**D**-factors], (v) direct application of **D**-factors to the interpretation of extensive, multi-element data sets, and (vi) geologically related multi-element **D**-factors, built from **R**-values, to identify underlying rock types and anomalous signatures for different types of mineral deposits.

Relative factors (**R**) are determined visually from log-probability plots and stem-leaf plots. **R**-values are assigned as follows: **1** = Low Background Population equal to or below the third quartile, **3** = High Background Population that is above the third quartile and up to the Mixed Population, **5** = Mixed Population of mixed High Background and Clearly Anomalous Populations, **7** = Clearly Anomalous Population immediately above the Mixed Population, **9** = Highly Anomalous Population, and **11** = Outliers of Highly Anomalous Population with exceptional concentrations (often equal to or greater than the 99.8th percentile).. Because geochemical elements are changed to numbers with genetic and population significance, those that occur in disparate amounts can be combined without the overshadowing of one element by another. For example, lead with an anomalous concentration of 100 ppm (say, **R** = 9) can be combined with zinc with an anomalous concentration of 2,500 ppm (say, **R** = 7) giving an **R**-value average of 8. Given chemically related elements, the **D**-factor that is the average of the summed **R**-values of related elements is likely to be more robust than the **R**-value for a single element. For example, Ni and Co correlate closely and the **D**-factor that is the combination of the two using averaged **R**-values is likely to be stronger than either element by itself.

Discrimination factors (**D**-factors) are the sum of the **R**-factors divided by the number of **R**-factors summed. Examples are **D**-factors for mafic rocks (**DMafic**) and precious metal deposits (**DPrec**), where: **DMafic** = (**R**Mg + **R**Ti + **R**V + **R**Cr + **R**Fe + **R**Co + **R**Ni)/7, and **DPrec** = (**R**Ag + **R**Au + **R**Hg + **R**Tl + **R**As + **R**Sb + **R**Bi + **R**Te)/8. In both these cases, the associated **R**-values are for elements that provide a geological-association-description of mafic rocks or precious metal deposits. Generally, a **D**-factor of 4 or above represents values that are almost certainly statistically anomalous.

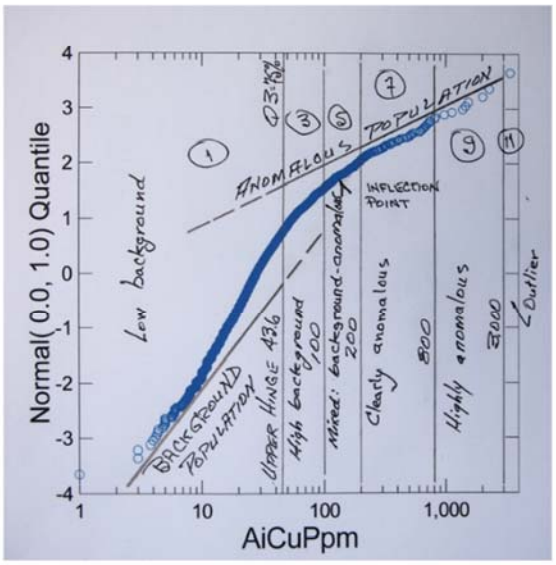
This new methodology, a “geologists’ factor analysis”, allows geological interpretation of data in a way that has genetic significance. And more specifically, where anomalous values exist for two or more elements, **D**-values from addition of **R**-values enhance the reliability of the anomaly—and therein lies their great practical advantage.

This approach, which defines factors using probability statistics, and geological knowledge and experience, complements traditional approaches. **RvDfS** will aid in discovery of mineral deposits from geochemical data sets for regional surveys, detailed soil grids and drill holes. **RvDfS** can also provide zoning vectors for deposit discovery.

Figure A1 demonstrates the methodology for visually assigning **R**-values. Log-probability graphs and stem-leaf diagrams are used together to facilitate decisions on partition values. A number of other graphs, such as histograms, can be helpful, but together the log-probability plot and stem leaf diagram seem to do the trick.

VISUAL R-VALUES: After Sinclair, A.J., 1976. Application of Probability Plots in Mineral Exploration. Spec. V. 4, Association of Applied Geochemists

LOG PROBABILITY PLOT



STEM LEAF DIAGRAM

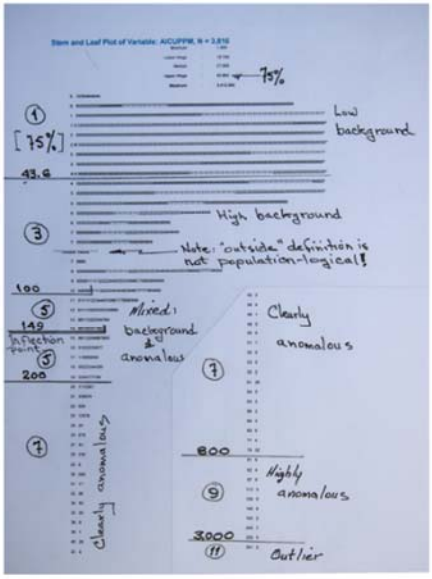


Figure A1. Visual definition of background and anomalous populations.

R <=1 is the 75th percentile. **R** = 5 generally surrounds the visually picked inflection point that is marked by a "V" in the above figure. **R** = 11 marks extreme outliers and commonly is >= the 99.8th percentile. Note that elements associated with rock types (Ca & Sr, K & Rb, Mg, Na, etc.) do not represent bimodal background vs. anomalous distributions. Consequently, these elements are partitioned into broad groups following changes in slope along the log-probability curve.

Main **D**-factors used to evaluate silver gold potential from the Carlincore Resources Limited data are:

DAgAu-Gold & Silver

DAgAu = (**R**Ag + **R**Au)/2 to focus on precious metal deposits.

DHgTl-Mercury & Thallium

DHgTl = (**R**Hg + **R**Tl)/2 to help identify mobile elements related to epithermal and Carlin-type deposits.

DCarb: Carbonate rock factor

DCarb = (**R**Mg + **R**Ca + **R**Sr)/3

DFels: Felsic rock factor

DFels = (**R**Na + **R**K + **R**Rb + **R**Si + **R**Ge)/5

DShal: Shale basin rock factor

DShal = (**R**V + ***RNb*** + **R**Al + **R**Ga + **R**S + **R**Se)/6

DCarl: Carlin deposit factor

DCarl = (**R**Sr + **R**Ba + **R**Ag + **R**Au + **R**Zn + **R**Cd + **R**Hg + **R**Tl + **R**P + **R**As + **R**Sb + **R**Bi+ **R**S + **R**Se + **R**Te)/17

DPrec: Precious metal (Au, Ag) deposit factor

DPrec = (**R**Ag + **R**Au + **R**Hg + **R**Tl + **R**As + **R**Sb + **R**Te)/7
