SUMMARY

This report summarizes work carried out by Pacific Ridge under Yukon Government YMEP agreement number16-060. The work carried out included four days of geological mapping and rock sampling by JP Exploration Services Inc. of Whitehorse and four days of soil sampling (671 samples) by Ground Truth Exploration Inc. of Dawson.

The Eureka Dome project area has received gold exploration attention since placer gold was first discovered in Eureka Creek in 1896. Modern exploration dates to the 1980's, when the GSC published a strongly anomalous gold silt geochemical result from Eureka Creek. However, this work has been restricted to relatively small surface prospecting and sampling programs. No drilling is recorded on the property.

The 2016 program included mapping of the northern portion of the claim group and soil sampling on a grid with 50 m spaced samples on 100 m spaced lines in the northwestern corner of the property. The mapping program identified surface alteration and mineralization related to local zones of silicification and brecciation. Mineralization and alteration appears to be structurally controlled. The breccias and veins with limonite contain anomalous As, Hg and Sb, with Se, Te and Ag ±Bi. The best gold value of 472.5 ppb was obtained from variably silicified limonitic biotite-quartz-feldspar schist with limonitic fracture fillings and oxidized cubic pyrite from a saddle area.

The gold soil geochemical results show a weak to moderate and discontinuous gold anomaly, trending along the top and northeast side of the main ridge. This anomaly does not correlate with any of the other elements in the survey. Anomalous silver, antimony, copper, molybdenum and zinc values all show a good correlation along a northeasterly trend, southeast of an apparent east-northeast trending structure. While the reasons for these trends are not clear, it is speculated that the anomalous gold values could be related to a northwest trending structure paralleling the main ridge, while the silver-antimony-base metal trend may be associated with intrusive activity and related hydrothermal activity.

It is recommended that the geological mapping, sampling and soil geochemical survey be continued to the south, to cover the area of the number one anomaly. Detailed mapping, prospecting and hand trenching should be carried out along the anomalous gold soil trend and within the two Ag-Sb-base metal soil anomalies to determine their cause.

INTRODUCTION

Placer mining activity in Eureka Creek dates to the 1896 gold rush. Original claims in the area were staked to cover the probable source area of an anomalous GSC reconnaissance stream sediment sample containing 89 ppb Au, 38 ppm As, 0.8 ppm Sb and 110 ppb Hg collected from the headwaters of Eureka Creek.

Pacific Ridge staked the EU and Moose claims in 2009 and carried out an exploration program consisting of prospecting, geological mapping and rock sampling. During the summer of 2011, Pacific Ridge completed a ridge and spur reconnaissance, auger soil sampling program on the Property, collection of 988 soil samples. These programs indicated the potential for a high level epithermal style alteration system with anomalous arsenic, mercury, barium, antimony and gold values occurring within silicified and brecciated metasedimentary rocks (Norman, 2010; Ash, 2010; Heberlein, 2012).

No further work was carried out on the property until 2016 when Pacific Ridge applied for and received YMEP support (16-060) from the Yukon Government. The work carried out included four days of geological mapping and rock sampling by JP Exploration Services Inc. of Whitehorse and four days of soil sampling (671 samples) by Ground Truth Exploration Inc. of Dawson. Results of this work are described below. Expenditures for the program amounted to $38,709.24.

TARGET

Placer gold occurrences have been documented in most of the creeks draining all sides of Eureka Dome since the 1898 Klondike gold rush. More recently, Fine Gold Resources (Mike Heisey) has been mining near the headwaters of Eureka Creek, just outside the boundaries of the Eureka Dome claim block, with good production (Jeff Bond, pers. comm.). The target for the current program is the bedrock source for this placer gold; potentially a structurally controlled gold deposit such as those being delineated in the White Gold District.

PROJECT LOCATION

The Eureka Dome property is located approximately 70 km south–southeast of Dawson City, 366 km northwest of Whitehorse and approximately 55 km north of the White Gold discovery in Yukon's Stewart River-Klondike goldfield area. The Property covers Eureka Dome.

ACCESS

The property is accessible during the summer to fall months, via the Hunker Creek – South Klondike road system and more locally by the rough Black Hills mining road, or by helicopter from Dawson City. Most parts of the property are accessible by truck and ATV but the Moose claims require a helicopter for access.

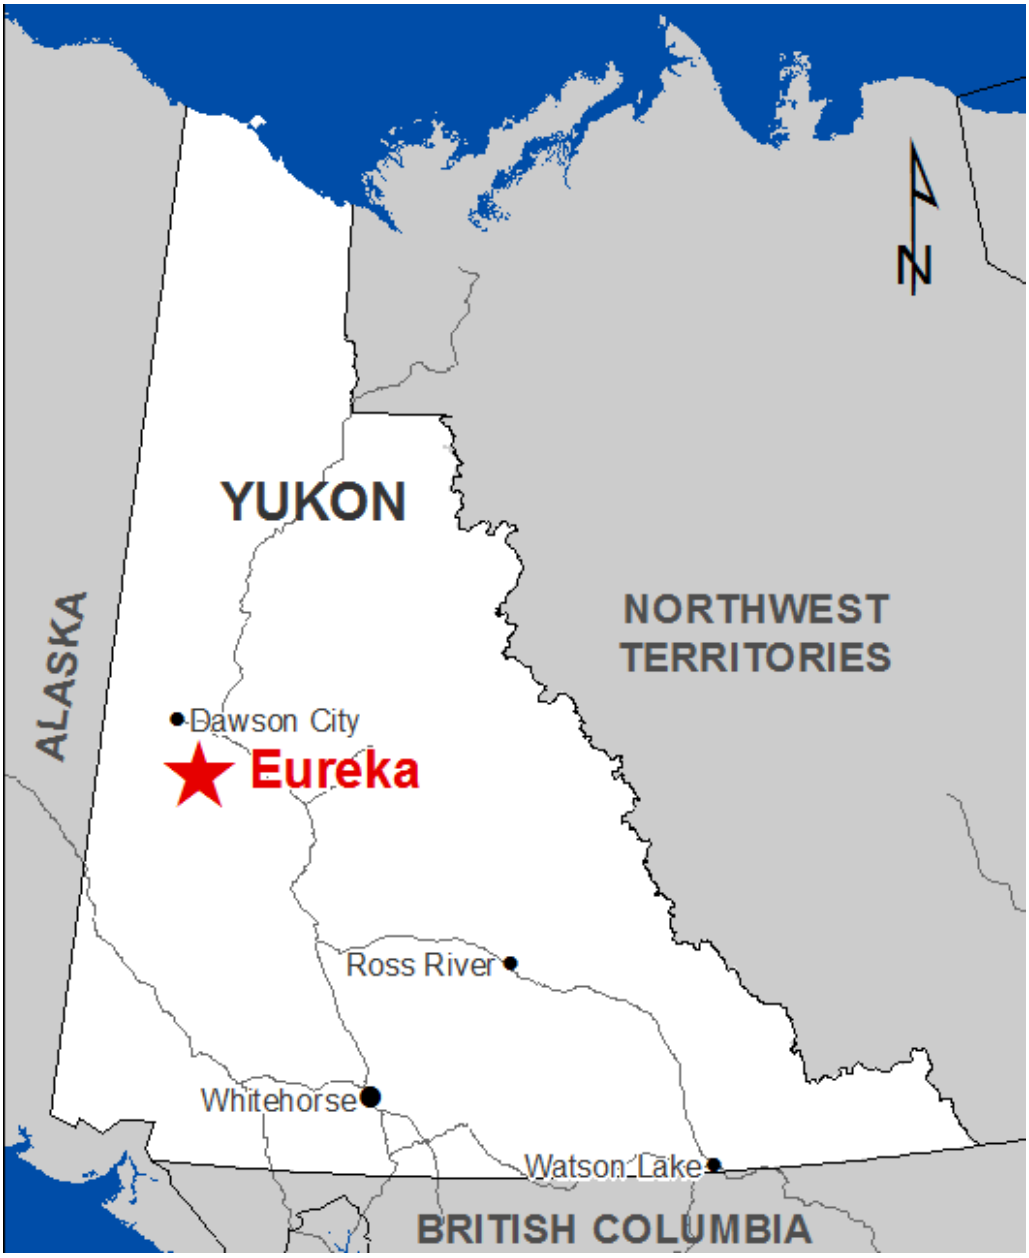

Figure 1 – Eureka Dome project location.

PROJECT DESCRIPTION

Pacific Ridge Exploration Ltd. ("Pacific Ridge") holds a 100% interest in 156 Moose and EU quartz claims, covering approximately 32 km^2 (Table I). The Property is located within the Dawson Mining District. Figure 2 shows the current Pacific Ridge claim holdings for the Property.

Table I – Pacific Ridge claim groups: EU and Moose claims.

Claim Names	Grant Number	Expiry Date
Moose 1 to 48	YC94189 to 94236	4-Mar-2017
EU 1 to 108	YC94237 to YC94344	4-Mar-2017

The Property was staked to cover an area that contains the headwaters of some of the major placer gold bearing creeks within the southern part of the Klondike gold field, including Eureka Creek and Black Hills Creek.

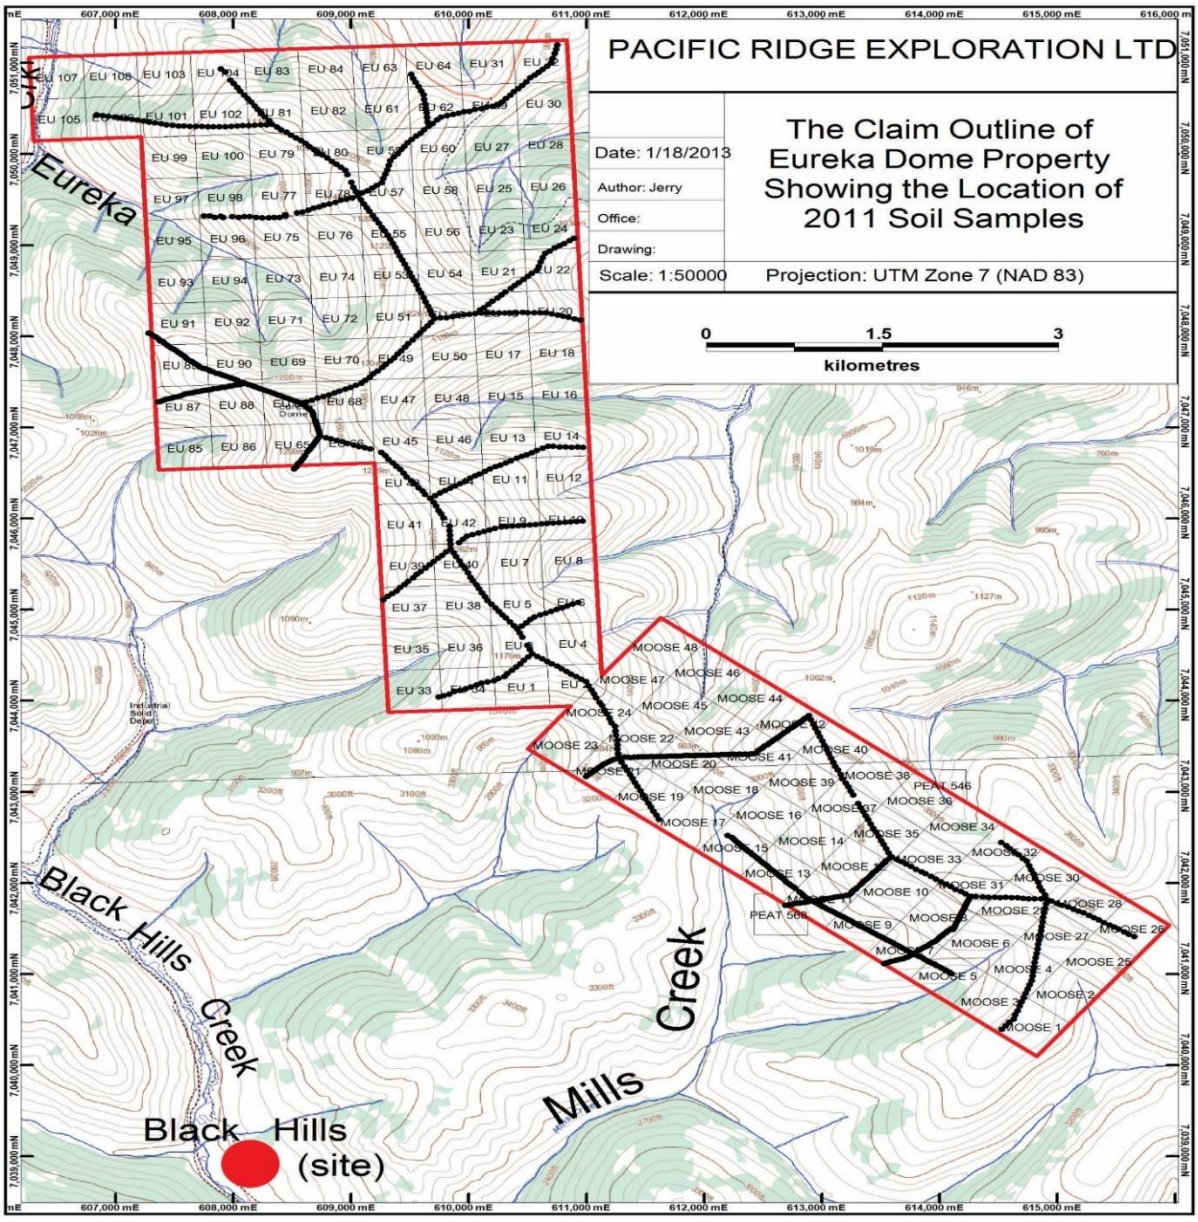

Figure 2. Eureka Dome claim map.

The property lies between the elevations of 488 and 1524 m above sea level at the top of Eureka Dome. It runs along a northwest trending ridge line which is for the most part above tree line and is well-drained by tributaries of Black Hills Creek to the southwest, Eureka Creek to the north, Steel Creek to the northwest and Wounded Moose Creek to the east.

Permafrost is common on north slopes, as well as drainage floors. Ridge tops, and south facing slopes are generally devoid of any permafrost. In 2004, the Eureka area was burned extensively. Where vegetation is mature, poplar is dominant in the valley bottoms which give way to black spruce and willows. Ridge tops are generally buck brush, willow and juniper.

PROJECT HISTORY

The Property lies between the well explored and geologically complex Klondike gold field to the north and the Stewart River area to the south. Placer mining activity in Eureka Creek dates back to the 1896 gold rush. During the period 1978-82, Eureka was the first-ranked placer creek in Yukon. The reported historical placer production from Eureka & Black Hills Creeks is estimated to be greater than 140,000 oz. Au (Yukon Placer database, 1978-1982).

Original claims in the area, just west of the Property in an area now known as the Eureka Claims, were staked to cover the probable source area of an anomalous GSC reconnaissance stream sediment sample containing 89 ppb Au, 38 ppm As, 0.8 ppm Sb and 110 ppb Hg collected from the headwaters of Eureka Creek (Minfile Occurrence 115O 057). Exploration work in 1988 by Dawson Eldorado Mines Ltd. and Wealth Resources Inc. defined three target areas consisting of north to northwest-trending fractures and breccias zones. This northwest-trending feature intersects both forks of Eureka Creek in areas of coarse placer gold mineralization and coincides with gold–in–soil anomalies with values up to 496 ppb. Samples across the central breccia zone returned values up to 520 ppm As and 180 ppb Au. Soil samples adjacent to the easternmost lineament returned values up to 155 ppb Au (Van Angeren, 1988).

Pearl Petroleum Corporation Ltd. re-staked the property as the Clara claim group in 1992 and performed preliminary geological mapping as well as soil and rock sampling. The program identified several gold–in–soil anomalies, the best of which strikes north-northeast and is at least 1.25 km long with an average width of 110 metres (Southam, 1993).

In 1993, prospector Jim Christie completed a reconnaissance work on the EG (now EU) and BP claims (Christie, 1994). Anomalous gold values were returned from silt samples collected from the head waters of Eureka Creek within the central portion of the EU claim block. Anomalous silt values include 900 ppb Au and 48 ppm Pb; 2190 ppb Au and 66 ppm Pb; 360 ppb Au and 76 ppm Pb. Approximately 600 m up–slope from the anomalous silts samples, anomalous values in soil and float samples returned up to 3390 ppm As, 17 ppm Hg and 72 ppm Sb. To the south, in Barite Pup and Childs Creek which drains the southern flank of the EU claims, a silt sample returned 170 ppb Au while soil samples returned 2390 ppb Au, 365 ppb Au and 340 ppb Au. A float sample up–slope from the silt location returned 0.414 opt Au (Christie, 1994).

In the fall of 1993 Wealth Resources Ltd. and Pacific Mariner Exploration Ltd. conducted limited soil sampling and minor trenching focusing on the north trending breccia fault zones near the headwaters of Eureka Creek within the Eureka Claims. The best soil sample returned 556 ppb Au and 0.3 ppm Ag. Ground geophysical surveying and deep trenching, utilizing bulldozers and excavators, was conducted in 1995 across selected areas with gold–in–soil anomalies and/or VLF–EM conductors. Assay result from the program returned up to 640 ppb Au over 2.0 m (Southam, 1995).

In 1999, Archer Cathro completed a comprehensive study of placer gold from Eureka Creek and Childs Gulch that suggested a local gold source. A silt sampling survey identified the area drained by upper Eureka Creek as a primary exploration target with 12 out of 16 samples returning values > 10 ppb Au with a peak value of 70 ppb Au (Wengzynowski, 2000).

The Eureka Joint Venture (Nordac Resources Ltd. and Expatriate Resources Ltd.) re-staked the Eureka Claims property in 1999. The joint venture carried out stream sediment, soil and rock sampling programs later in the year (Wengzynowski, 2000).

In 2002, Viceroy Resources completed a 380 m RC drill program on the Eureka Claims with two holes on the Allen showing and one hole on the Wealth showing.

J.P Ross (2000) conducted exploration in 2000 through the Yukon Mining Incentive program. He collected float and bedrock samples, silt samples and heavy concentrates through panning of stream sediments. Most of the silt samples collected returned anomalous values of gold, antimony and mercury.

Strategic Metals explored Wealth and Childs showings on the Eureka Claims in the summer of 2006. Exploration consisted of 1,151 m of excavator trenching, and 823 m of RC drilling. Five trenches across the Wealth showing exposed quartz breccias with alteration halos. Subsequent drilling focused on the breccias of the Wealth showing. Three trenches were excavated at the Childs showing designed to test gold-bearing zones exposed in a previous bulldozer trench. Results yielded weakly elevated gold content.

In 2009 Strategic Metals completed a soil sampling grid consisting of 3,609 soil samples at 50x100m spacing throughout the central part of the Eureka Claims. Eighteen trenches totaling approximately 4,200 meters were completed: Four trenches at the Allen showing, three at the Childs showing, and eleven trenches in areas with no previous showings. The best result from the 2009 trenching program was 17.90 m grading 0.97 g/t Au in TR-09-01.

Pacific Ridge carried out an exploration program on the EU and Moose claims in 2009 consisting of prospecting, geological mapping and rock sampling. The program indicated the potential for a high level epithermal style alteration system with anomalous arsenic, mercury, barium, antimony and gold values occurring within silicified and brecciated metasedimentary rocks (Norman, 2010; Ash, 2010).

In 2010, Golden Predator completed a 27-hole reverse circulation drilling program totaling 2,961 meters on the Wealth and Childs showings (Bourne and Marino, 2011). The drilling was designed to test the down-dip continuity and a possible north-south extension of mineralized breccia systems exposed by trenching in 1999 and 2006 at the Wealth showing; and to follow-up on anomalous drilling and trenching results at the Childs showing. The 2010 drilling program on the Wealth Showing consisted of 23 reverse circulation holes (EU-10- 01RC to EU-10-22RC, and EU-10-27RC), totaling 2,423 meters. Significant intersections from the Wealth showing are shown in Table III.

During the summer of 2011, Pacific Ridge completed a ridge and spur reconnaissance, auger soil sampling program on the Property, collection of 988 soil samples (Figure 2). Results are discussed below.

Also in 2011, Golden Predator completed an exploration program on the Eureka claim group. The program included prospecting of all the roads, trails and active placer areas and channel sampling near a quartz vein exposed in placer workings in Childs Gulch. A second phase included drilling of eight HQ3 diameter holes for a total of 1,188.11 m. Drilling focused on the Allen (one hole), north end of Wealth (2 holes) and Childs Gulch (5 holes) showings (Table V).

PROPERTY GEOLOGY

The Property is located in the Stewart River-Klondike goldfield area within the extensive Yukon-Tanana Terrane (YTT). The region is underlain by sequence of imbricated thrust panels consisting of polydeformed, late–Paleozoic aged metavolcanic and metasedimentary rocks which form part of the YTT on the southwest side of the Tintina Trench. The interlayered metasedimentary and metavolcanic rocks are stratigraphically transposed and are intruded by a variety of deformed metaplutonic rocks.

The Klondike Series is represented in the area by Klondike schist, which includes chlorite schist, felsic schist, quartz-feldspar augen schist and orthogneiss, derived from both volcanic and plutonic meta-igneous rocks of middle Permian age. The Yukon Group is represented by the Nasina series, consisting of thick, well foliated and schistose quartzite, micaceous quartzite, quartz-muscovite schist, and minor meta-conglomerate and meta-grit and marble.

There is very little outcrop on the Property, but preliminary mapping by Archer Cathro (Smith, 2009) concluded that the Property is dominated by a relatively flat-lying succession of siliciclastic metasedimentary rocks. These are Nasina Series rocks, including schist, quartzite and phyllite (DMN3) and lesser marble (DMN2), with a local occurrence of mafic volcanic Carmacks Group (uKC1), as shown in Figure 3.

Alteration and Mineralization

Within the White Gold district, ridge and spur sampling has been demonstrated to be an efficient and effective method for doing a first pass examination of the potential for mineralization on a property. Figure 3 shows an interpretation of the ridge and spur sampling program completed by Dave Heberlein, Geochemical Consultant (REF.). The targets outlined by the areas of red hatch marks outline epithermal gold target areas, with a gold-mercury-molybdenum-arsenic signature.

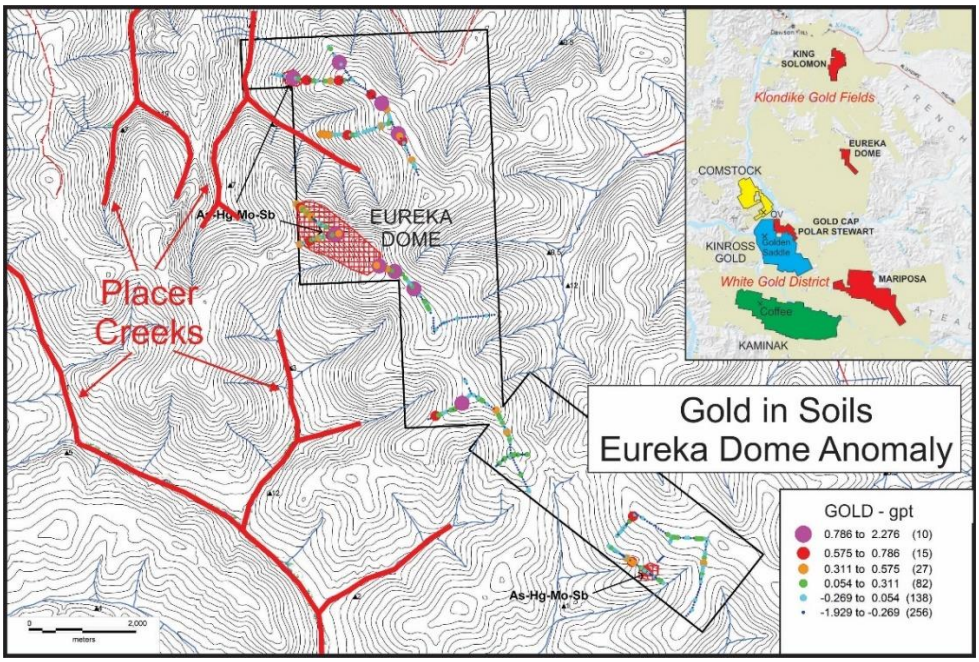

Figure 3. Ridge and spur gold anomalies and epithermal alteration zone.

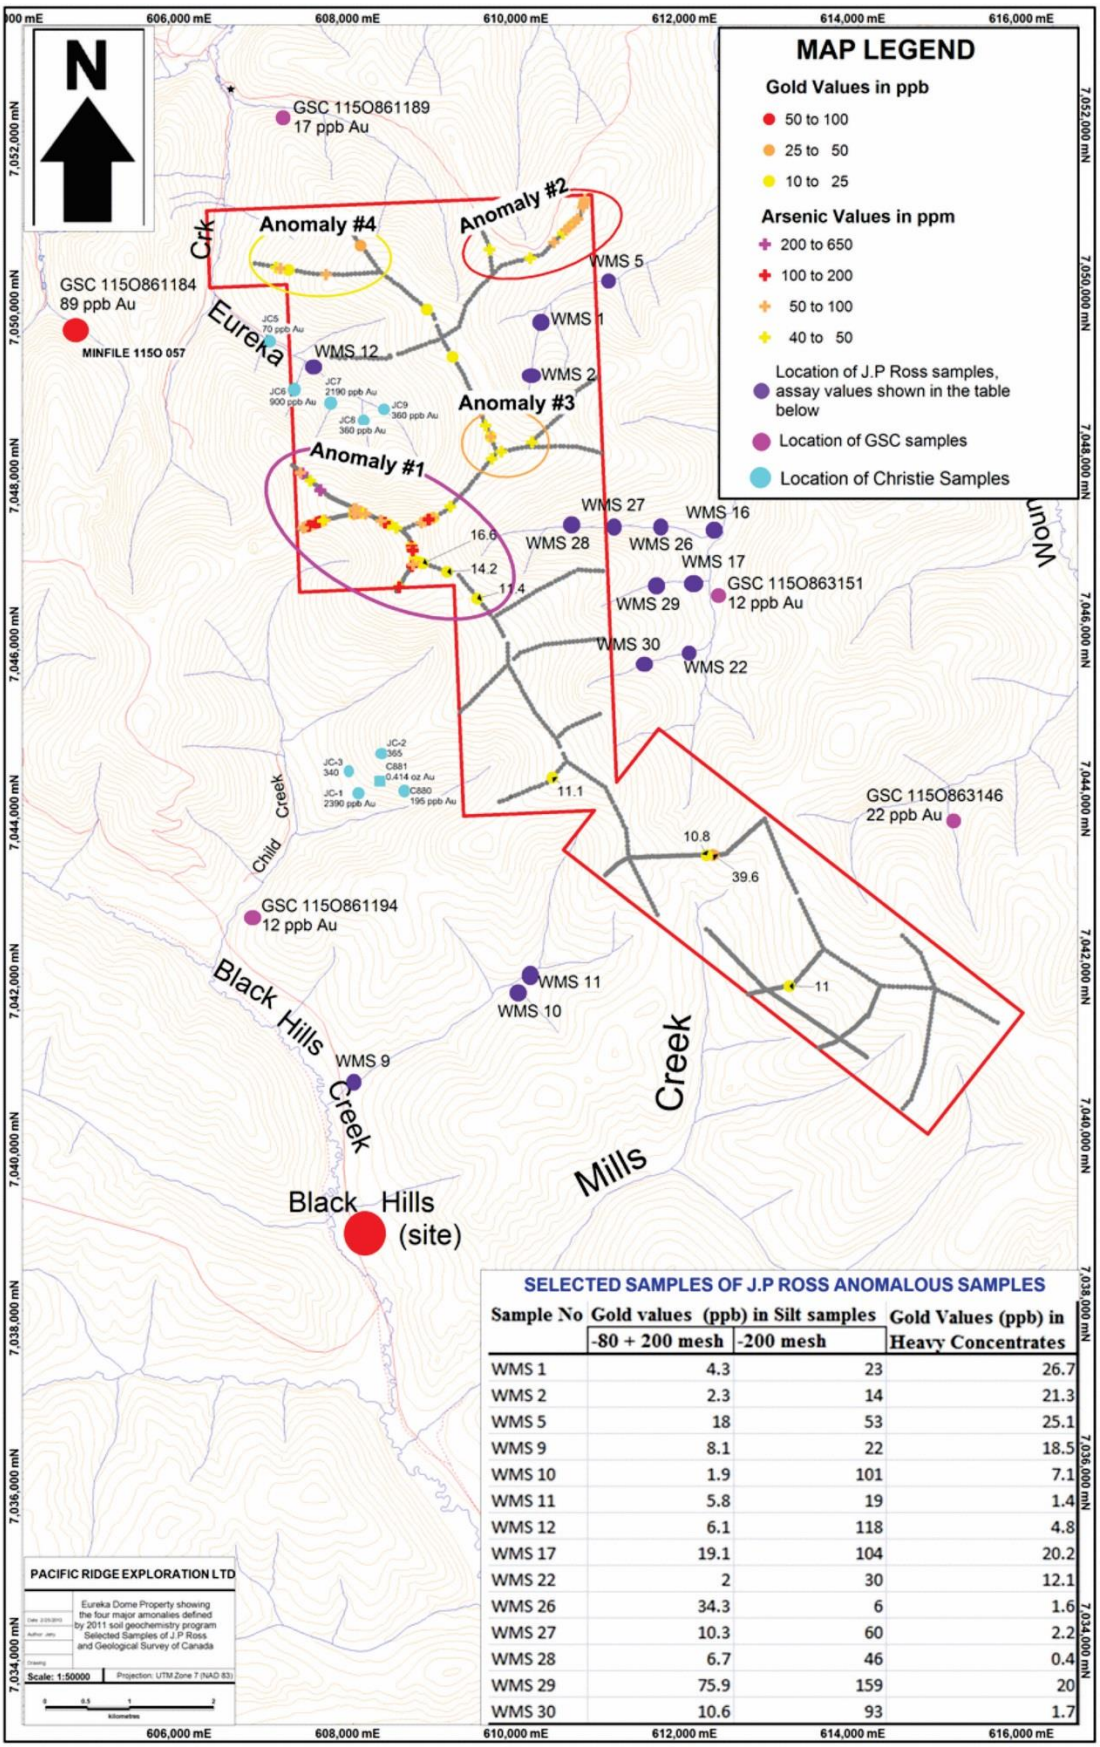
Figure 4 is a summary plot showing the four main anomalies, with gold and arsenic values plotted in order to best define the zones. The locations of selected anomalous samples of J.P Ross (2000) are also shown on the map and the assay values in the table at the right hand corner of the map. Selected anomalous samples of the Geological Survey of Canada are also shown. Selected anomalous samples from the work of Christie (1994) are shown with gold values.

Anomaly #1 is the highest priority and coincides with Heberlein's main anomaly. It is defined by the coincidence of precious metals, base metals and pathfinder elements, including Au, Ag, Cu, Pb, As, Mo, Sb and Bi (Solomon, 2013). The anomaly spans over 2.0 km based on the 2011 soil geochemical results. The true extent and orientation of the anomaly is not yet known due to the limited distribution of the samples. Several silt samples collected from the headwaters of Eureka Creek, which drains the northern flank of the anomaly, returned anomalous gold values ranging from 70 to 2,190 ppb. Soil and silt samples collected from the vicinity of Childs Creek, which drains the southern part of the anomaly, returned anomalous gold values ranging from 195 to 2390 ppb. A float sample collected in the area returned 0.414 opt Au. Many of the samples collected by J.P Ross are anomalous in gold. The most important of these are shown Figure 7.

Anomaly #2 is defined by the coincidence of As, Cu, Ag, Sb, Mo, Zn and few points of anomalous gold. This anomaly extends for approximately 1.5 km along the 2011 soil line. Historical sampling from the area of this anomaly has also indicated anomalous results (Ross, 2000).

Anomaly #3 is defined by the coincidence of anomalous Sb, As, Mo and spotty gold. The extent and orientation of the anomaly is not known but the ridge and spur geochemical result suggests that it could be a broad zone.

Anomaly #4 is defined by the coincidence of a strong Pb anomaly with associated Zn, As, Au and Hg. The anomalous samples extend for over 1.1 km. Single point anomalies in ridge and spur geochemical surveys can turn to a significant anomaly with detail gridded geochemical survey. Therefore, the several single point gold anomalies in this area require follow-up sampling.



SELECTED SAMPLES OF J.P ROSS ANOMALOUS SAMPLES

Sample No	Gold values (ppb) in Silt samples		Gold Values (ppb) in Heavy Concentrates
	-80 + 200 mesh	-200 mesh	
WMS 1	4.3	23	26.7
WMS 2	2.3	14	21.3
WMS 5	18	53	25.1
WMS 9	8.1	22	18.5
WMS 10	1.9	101	7.1
WMS 11	5.8	19	1.4

WMS 29	75.9	159	20
WMS 30	10.6	93	1.7

Figure 4. Eureka Dome target areas map.

2016 FIELD PROGRAM

The 2016 field program focused on the northwestern corner of the property, in the vicinity of anomalies 1, 2 and 3 (Figure 4). During the period August 20 to 22, 2016, Jean Pautler, contract geologist, mapped this portion of the Property. During the program, she collected 20 rock samples and 2 silt samples. Her report and map are included in Appendix I to this report, and are summarized below.

During the period August 19 to 23, 2016, a crew of 5 samplers from Ground Truth Exploration of Dawson collected 671 soil samples on a grid with 50 m spaced samples on 100 m spaced lines. Results of this survey are described below. Summary analytical results are included in Appendix II while analytical certificates are in Appendix III

Mapping and Sampling

Mapping by Pautler is shown below in Figure 5. Exposure is poor through the area, generally confined to ridge tops, road and placer cuts. The property is underlain by Devonian and older metasedimentary rocks of the Snowcap assemblage, with local marble horizons, intruded by felsic, commonly potassium feldspar augen bearing, orthogneiss of the Permian Sulphur Creek plutonic suite. The Snowcap assemblage primarily consists of quartzite, commonly graphitic, with minor biotite schist. Fine grained, thinly foliated chlorite schist underlies a folded section of quartzite in the northeast property area. The Permian orthogneiss primarily occurs at higher elevations on the property, underlying Eureka Dome itself and the ridge to the east, and also occurs as northerly bands further west. These bands appear to be offset along a major sinistral strike slip fault along the upper Left Fork of Eureka Creek, with about 500m of displacement.

Mineralization consists of silicified metasedimentary rocks and breccias, commonly with limonite fracture fillings and cement. Locally the breccias include abundant quartz fragments, possibly of metamorphic origin. Quartz veins also occur with limonite fracture fillings. Alteration includes silicification, quartz veins ±sheeted, ±oxidized cubic pyrite, hematite, minor ankerite, and occasionally late clay. Mineralization and alteration appears to be structurally controlled.

The breccias and veins with limonite contain anomalous As, Hg and Sb, with Se, Te and Ag ±Bi. The best gold value of 472.5 ppb was obtained from variably silicified limonitic biotite-quartz-feldspar schist with limonitic fracture fillings and oxidized cubic pyrite from a saddle area (1353619) and was accompanied by elevated mercury and selenium. The highest silver value was 8.3 ppm, accompanied by anomalous Sb, Bi and Te, from brecciated white quartz with vague remnant angular silicified graphitic quartzite clasts, thin limonite fracture fillings, and fine silvery needles that may be a silver-antimony-bismuth mineral. Arsenic and antimony values with elevated selenium and locally high mercury are common in the breccias with values typically a couple of hundred ppm As with anomalous Sb and commonly Se (see Appendix I).

Pautler concludes that rock and soil geochemistry on the Eureka Dome property shows a concentration of the high-level pathfinder elements As, Hg and Sb, with Se, and Te. At Eureka Dome, a 2,190 ppb Au in silt value drains a tributary on the south side of the upper Left Fork of Eureka Creek. There is potential for exposure on the west bank here, but the source is probably proximal to the upper Left Fork. Potential for bedrock gold mineralization exists proximal to structures at lower elevations within the Property.

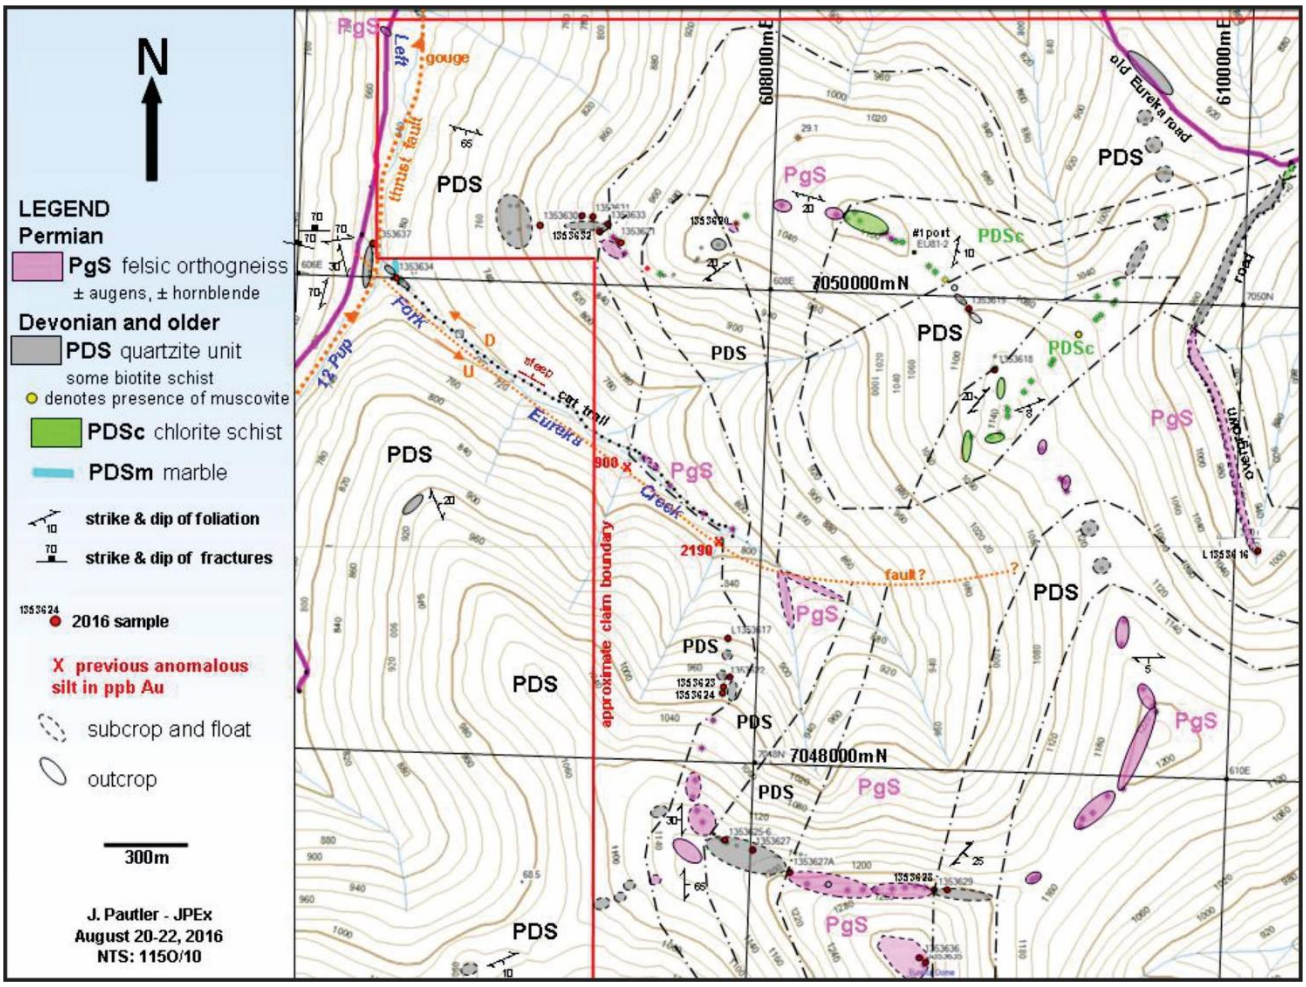

Figure 5. Eureka property geology, northwest corner.

Soil Geochemistry

Sampling Protocol and Data Handling Procedures

Field technicians navigate to sample site using handheld GPS units. A C-Horizon sample is collected using an Eijklcamp brand hand auger at a depth of between 20cm and 110cm. Where necessary, in rocky or frozen ground, a mattock is used to obtain the sample. Photos are taken of the sample site 5m from sample hole with auger inserted. Typically, 400 to 500 g of soil is placed in a pre-labeled bag. An aluminum metal tag inscribed with the sample identification number is attached to a rock or branch in a visible area at the sample site along with a length of pink flagging tape. A field duplicate sample is taken once for every 25 samples.

The GPS location of the sample site is recorded with a Garmin GPSMap 60cx or 76cx GPS device in UTM NAD 83 format, and the waypoint is labeled with the project name and the sample identification number.

A weather-proof handheld device equipped with a barcode scanner is used in the field to record the descriptive attributes of the sample collected, including sample identification number, soil colour, soil horizon, slope, sample depth, ground and tree vegetation and sample quality and any other relevant information.

Each night in the field, the GPS and Palm PDA devices are downloaded to a laptop computer. The data is verified and mapped on a sampler-by-sampler basis in proprietary database auditing and mapping software. At the end of each day, the crew boss inspects all samples for size and consistency as a quality check. Each sampler then repackages all samples for shipping- barcode scanning them as they are placed into a rice bag which is sealed with a barcoded security zip tie. Samples are shipped from the field to the lab and tracked by the unique ID on each security seal.

A backup of the sample data is made, copied onto a USB memory stick and kept in a separate location from the laptop computer until job completion. Where possible, a backup is also sent via e-mail.

Soil Sample Results

In each of the plots below, bubble plot threshold values are the 98th, 95th, 90th and 70th percentile values for each element shown. The gold soil results show a weak to moderate and discontinuous gold anomaly, trending along the top and northeast side of the main ridge (Figure 6). The top 8 values in this anomaly range from 11 to 100 ppb Au. The gold soil geochemistry does not correlate with any of the other elements in the survey.

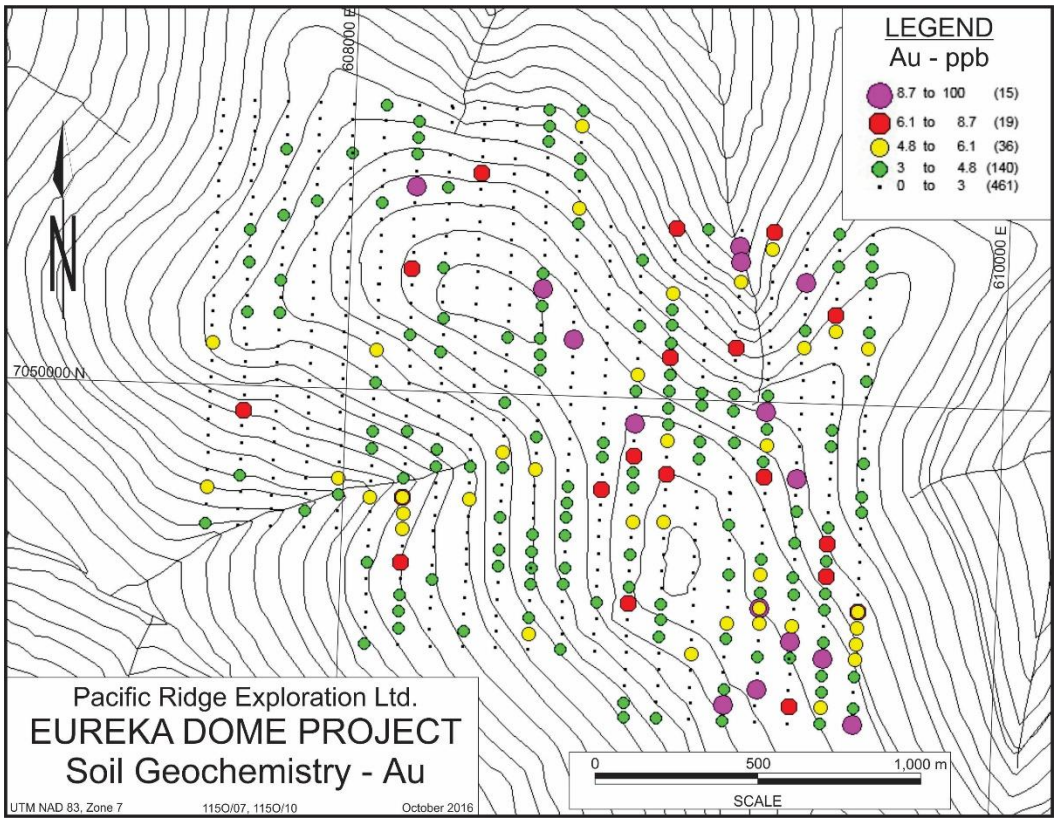

Figure 6. Gold soil geochemistry map.

Arsenic, bismuth and lead show a similar pattern (Figures 7 to 9) with anomalous values in the northwestern corner of the grid, although they do not show a strong correlation with gold.

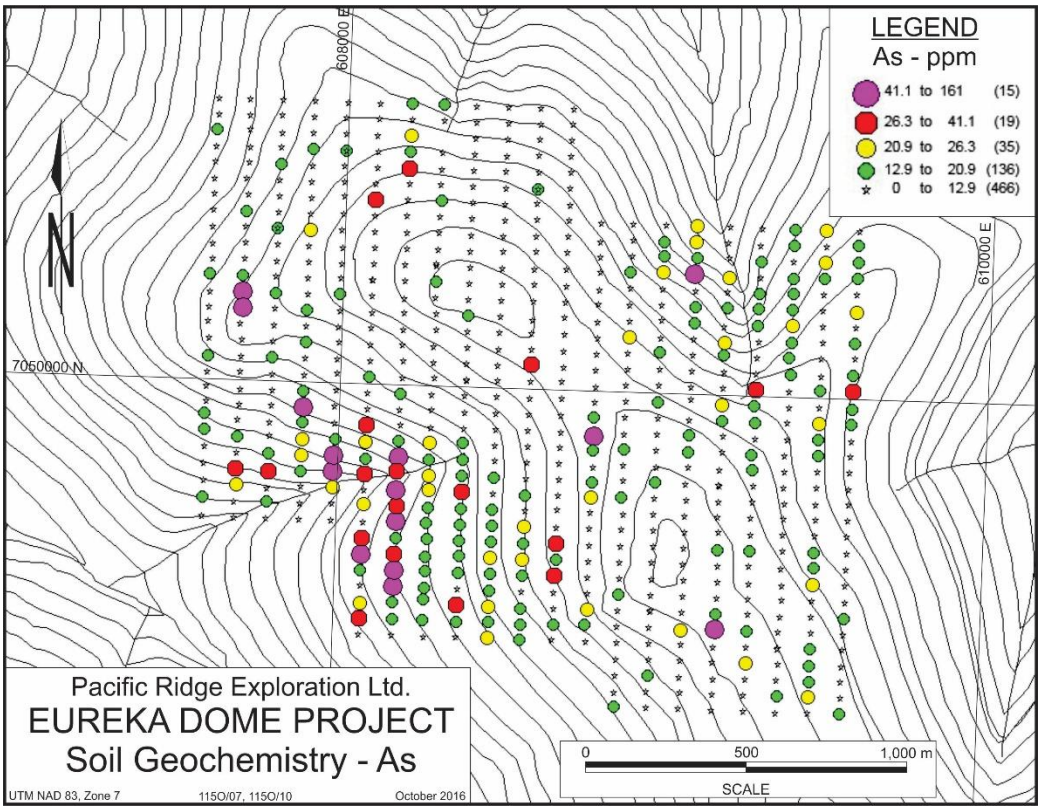

Figure 7. Arsenic soil geochemistry map.

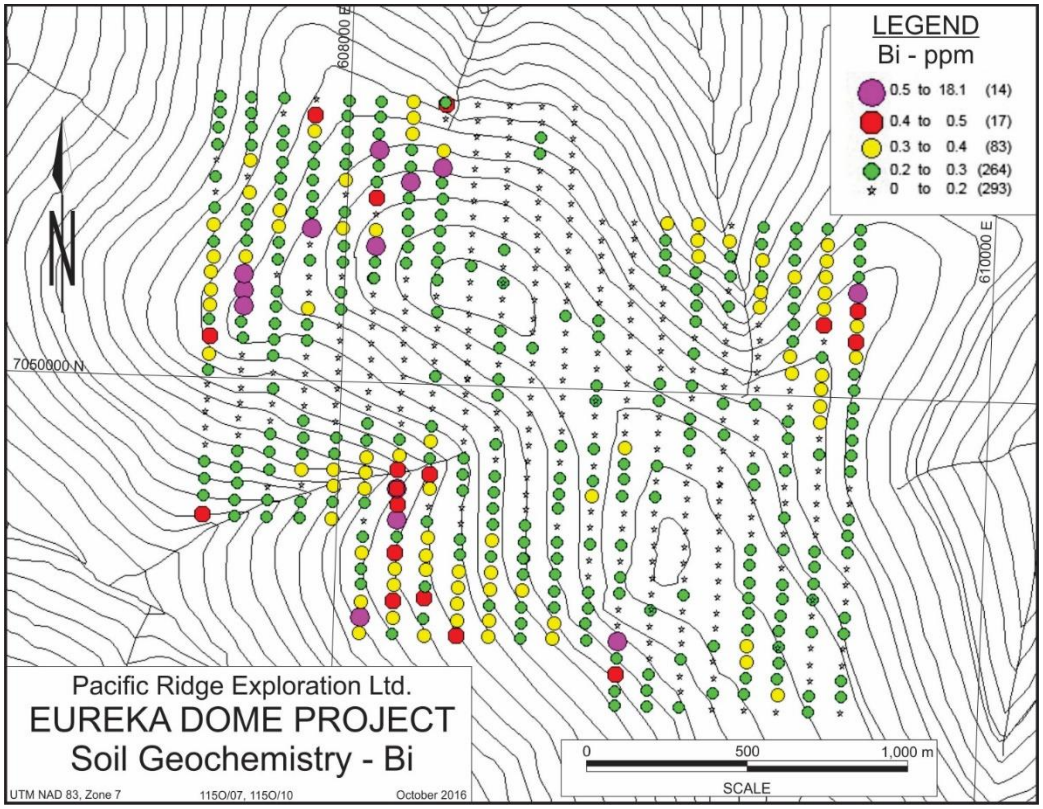

Figure 8. Bismuth soil geochemistry map.

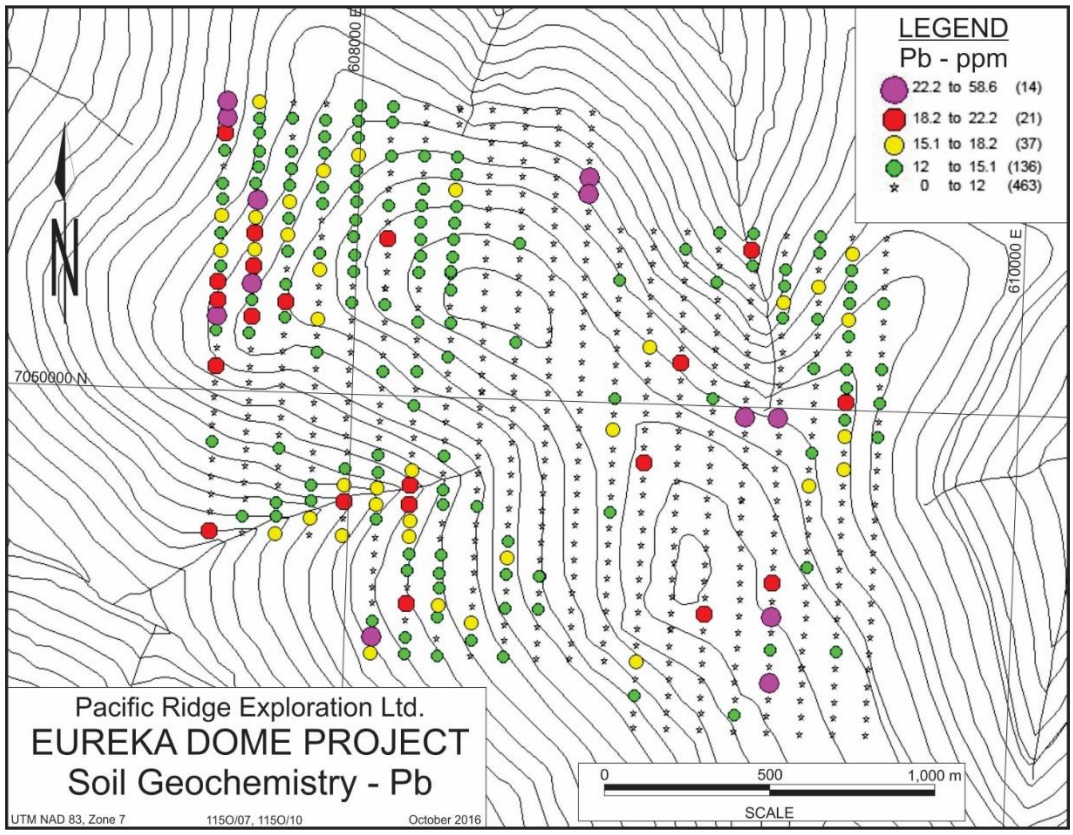

Figure 9. Lead soil geochemistry map.

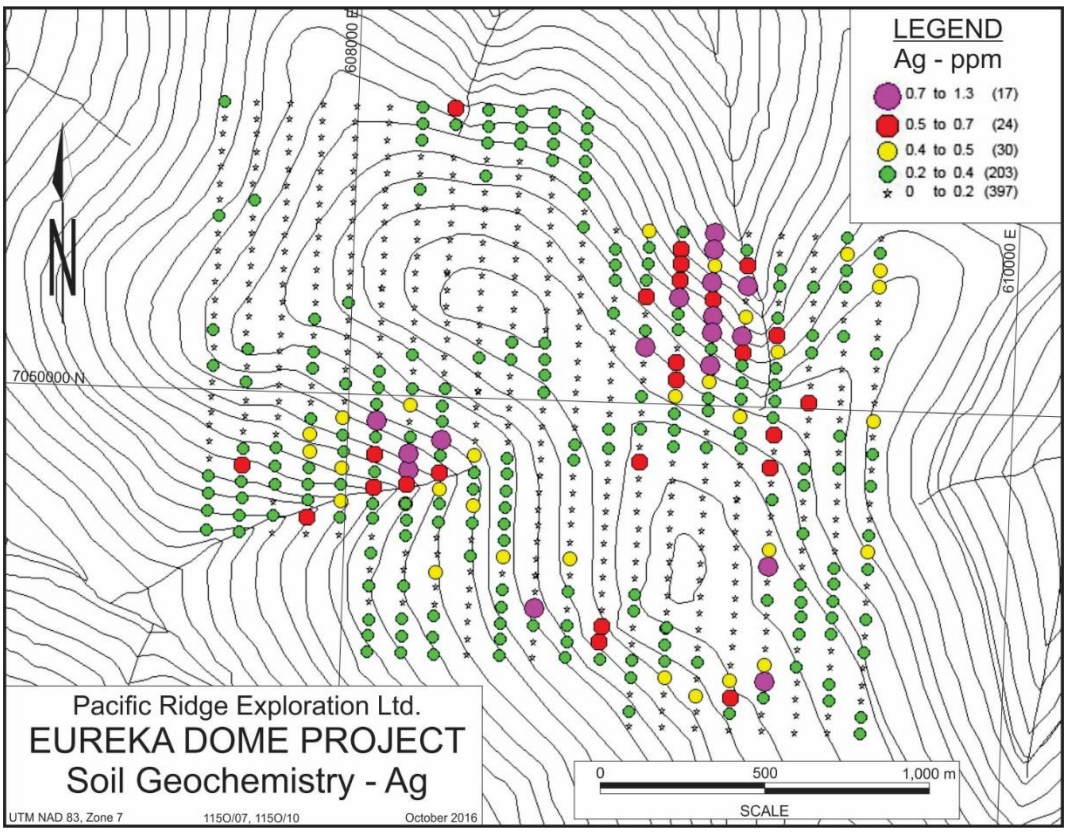

Figure 10. Silver soil geochemistry map.

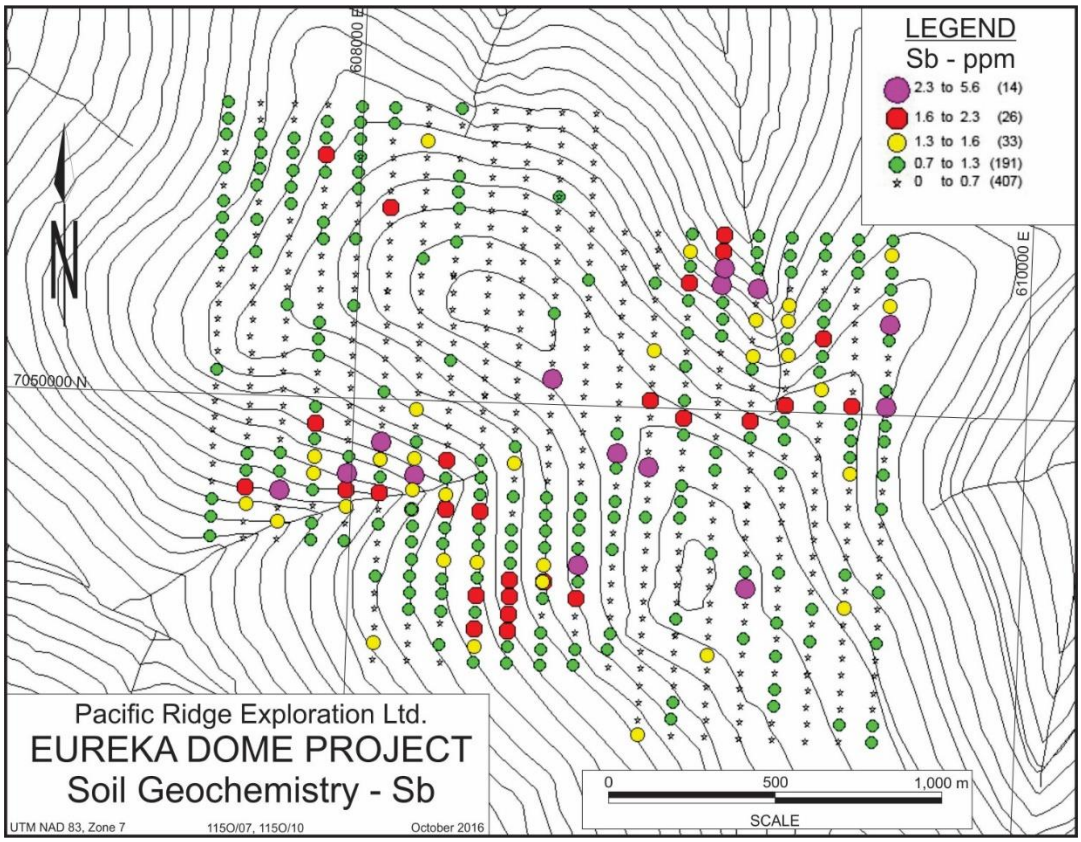

Figure 11. Antimony soil geochemistry map.

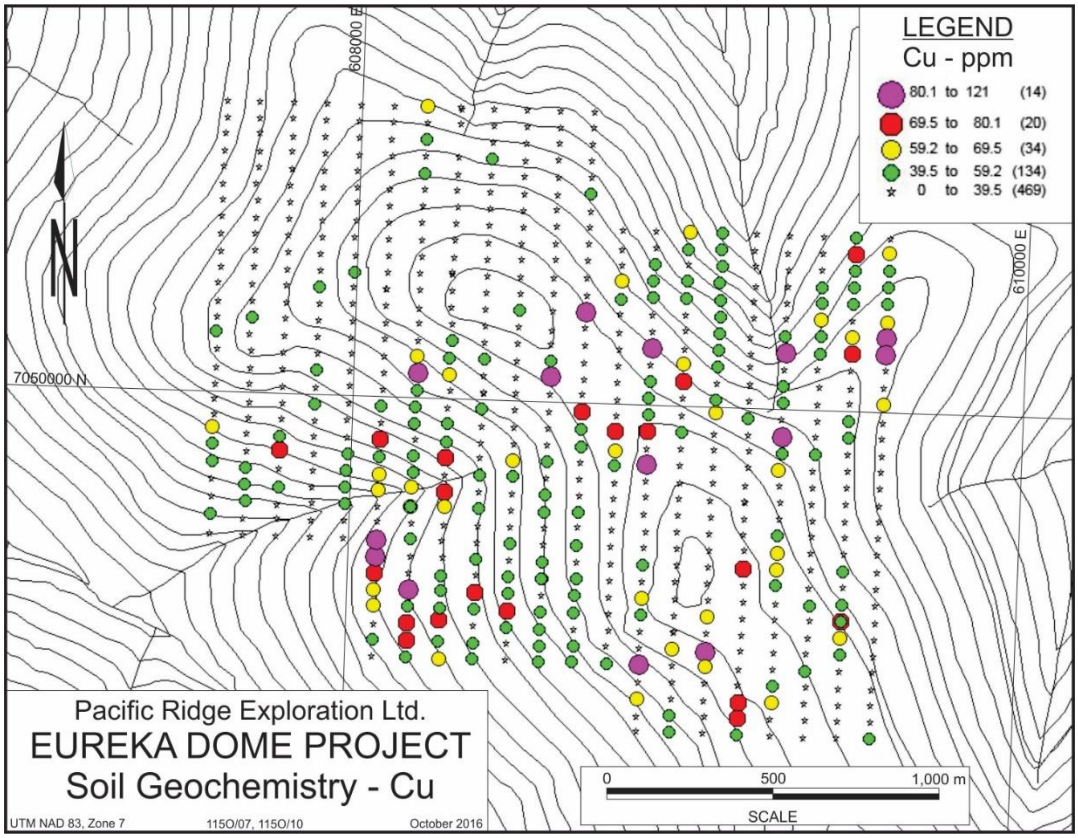

Figure 12. Copper soil geochemistry map.

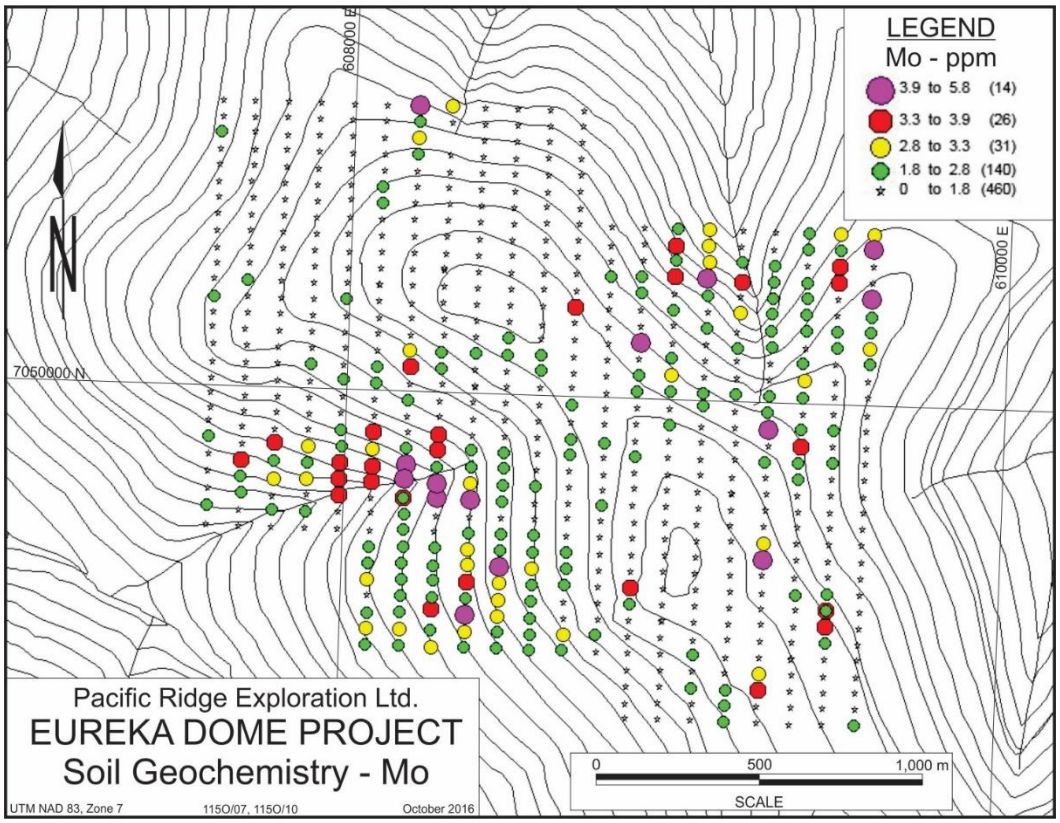

Figure 13. Molybdenum soil geochemistry map.

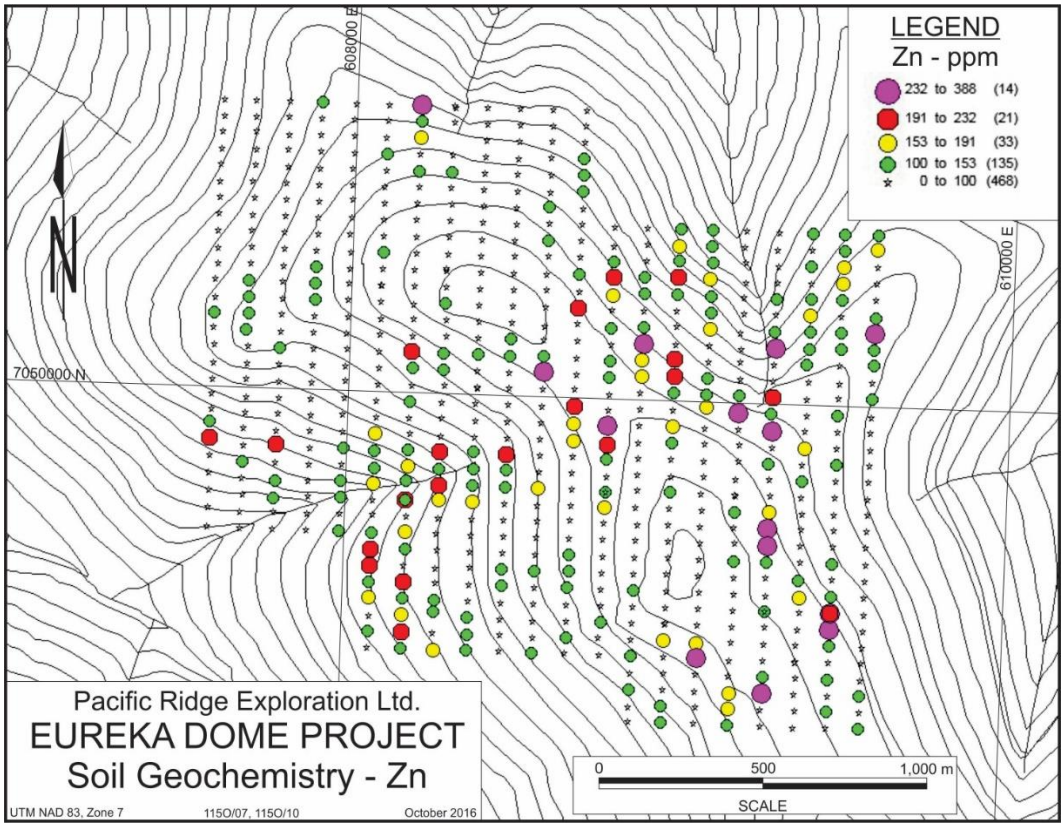

Figure 14. Zinc soil geochemistry map.

Anomalous silver, antimony, copper, molybdenum and zinc values (Figures 10 to 14) all show a fairly good correlation with a northeasterly trend, southeast of an apparent east-northeast trending structure. There are two specific zones of anomalous results, one in the northeast and one in the southwest portion of the survey area.

While the reasons for these differences are not clear, it is speculated that the anomalous gold values could be related to a northwest trending structure paralleling the main ridge, while the silver-antimony-base metal trend may be associated with intrusive activity and related hydrothermal activity.

CONCLUSIONS

The 2016 mapping and sampling program identified surface alteration and mineralization related to local zones of silicification and brecciation. Locally the breccias include abundant quartz fragments, possibly of metamorphic origin. Quartz veins also occur with limonite fracture fillings. Alteration includes silicification, quartz veins ±sheeted, ±oxidized cubic pyrite, hematite, minor ankerite, and occasionally late clay. Mineralization and alteration appears to be structurally controlled.

The breccias and veins with limonite contain anomalous As, Hg and Sb, with Se, Te and Ag ±Bi. The best gold value of 472.5 ppb was obtained from variably silicified limonitic biotite-quartz-feldspar schist with limonitic fracture fillings and oxidized cubic pyrite from a saddle area. The highest silver value was 8.3 ppm, accompanied by anomalous Sb, Bi and Te, from brecciated white quartz with vague remnant angular silicified graphitic quartzite clasts, thin limonite fracture fillings, and fine silvery needles that may be a silver-antimony-bismuth mineral.

In conclusion, rocks collected during the survey show a concentration of the high-level pathfinder elements As, Hg and Sb, with Se, and Te. At Eureka Dome, a 2,190 ppb Au in silt value drains a tributary on the south side of the upper Left Fork of Eureka Creek. There is potential for exposure on the west bank here, but the source is probably proximal to the upper Left Fork. Potential for bedrock gold mineralization exists proximal to structures at lower elevations within the Property.

The gold soil geochemical results show a weak to moderate and discontinuous gold anomaly, trending along the top and northeast side of the main ridge. This anomaly does not correlate with any of the other elements in the survey. Anomalous silver, antimony, copper, molybdenum and zinc values all show a good correlation along a northeasterly trend, southeast of an apparent east-northeast trending structure. While the reasons for these differences are not clear, it is speculated that the anomalous gold values could be related to a northwest trending structure paralleling the main ridge, while the silver-antimony-base metal trend may be associated with intrusive activity and related hydrothermal activity.

RECOMMENDATIONS

It is recommended that the geological mapping, sampling and soil geochemical survey be continued to the south, to cover the area of the number one anomaly (see Figure 4). Detailed mapping, prospecting and hand trenching should be carried out along the anomalous gold soil trend and within the two Ag-Sb-base metal soil anomalies to determine their cause.

PROJECT EXPENDITURES

Project expenditures include project mapping by JP Exploration Services, soil sampling by Ground Truth Exploration and analytical services by Bureau Veritas, as detailed below in Table II. Invoices are included in Appendix IV.

Table II – 2016 Project Expenditures

Date	Description	GST	Amount
5-Sep-16	JP Exploration Services	$ 145.50	$ 3,475.50
9-Sep-16	GroundTruth Exploration Inc.	$ 830.76	$ 17,446.01
19-Sep-16	Bureau Veritas - VANI259755 - Silt	$ 2.08	$ 43.64
20-Sep-16	Bureau Veritas - VANI259871 - Rocks	$ 34.35	$ 721.35
22-Sep-16	Bureau Veritas - VANI260110 - Soil	$ 331.63	$ 6,964.27
27-Sep-16	Bureau Veritas - VANI260439 - Soil	$ 364.69	$ 7,658.47
5-Nov-16	Report Preparation		$ 2,400.00
	Total		**$ 38,709.24**

EUREKA DOME PROPERTY MAPPING AND PROSPECTING MEMO

Jean Pautler

MEMORANDUM

TO: GERRY CARLSON, PRESIDENT & CEO, PACIFIC RIDGE EXPLORATION LTD.

FROM: JEAN PAUTLER, P. GEO.

SUBJECT: **EUREKA DOME PROPERTY MAPPING & PROSPECTING**

DATE: 11/10/2016

CC:

1.0 INTRODUCTION

This memo summarizes 3 man days of mapping and prospecting on the northern portion of the Eureka Dome property of Pacific Ridge Exploration Ltd. on NTS map sheet 115O/10. Work was completed by Jean Pautler from August 20 to 22, 2016 from a road accessible camp situated at 606508 mE, 7052541 mN, Nad 83, zone 7, with mobilization on August 19 and demobilization on August 22. A total of 20 rock and 2 silt samples were collected from the property. Sample descriptions with locations and select results are shown in Table 1, with geology and sample locations shown in Figure 1. Control was provided by GPS and reported in Nad 83, zone 7 projection.

2.0 GEOLOGY

2.1 Regional Setting

The Eureka Dome Project occurs within the unglaciated Yukon Plateau portion of the Paleozoic Yukon-Tanana terrane, southwest of the Tintina Fault and northeast of the Denali faults.

Economically the Eureka Dome property is located within the White Gold district, just south of the Klondike district. Orogenic gold-bearing mineralization in the Klondike and White Gold districts share common characteristics; they are controlled by a brittle to brittle-ductile D4 deformation event and have been dated as Middle to Late Jurassic, corresponding to the age of regional exhumation and cooling in the region *(Allan et al., 2012).* Epizonal features (breccias, rapid crystallization textures) are more prevalent in the White Gold district and mesozonal features (quartz veins with aqueous-carbonic fluid inclusions) are more common in the Klondike district *(Allen et al., 2013*). Gold is commonly associated with oxidized cubic pyrite. Most gold prospects in the White Gold district share a common relationship with small-displacement, easterly trending, sinistral strike-slip faults *(Allen et al., 2013*).

Eureka Dome lies 55 km northeast of the Golden Saddle deposit of Kinross Gold Corporation, which has a NI 43-101 compliant Indicated Resource as of December 31, 2013 of 9,788,000 tonnes grading 2.7 g/t Au, primarily mineable by open pit methods,

with an additional 2,166,000 tonnes Inferred grading 1.8 g/t Au *(www.kinross.com, 2014)*. The Eureka Dome property is also situated 75 km northeast of Kaminak Gold Corp.'s orogenic gold Coffee deposit (subject of a recently announced acquisition agreement by Goldcorp Inc.). Mineralization at Coffee is hosted by metamorphosed Paleozoic basement rocks of the Yukon-Tanana terrane (primarily a felsic orthogneiss) and the mid Cretaceous Coffee Creek pluton, part of the Dawson Range batholith, with a strong structural control. Coffee has an Indicated Resource of 63.7 million tonnes grading 1.45 g/t Au and an Inferred Resource of 52.4 million tonnes grading 1.31 g/t Au *(www.kaminak.com, 2016)*.

2.2 Property Geology

Exposure is poor through the area, generally confined to ridge tops, road and placer cuts. The property is underlain by Devonian and older metasedimentary rocks of the Snowcap assemblage, with local marble horizons, intruded by felsic, commonly potassium feldspar augen bearing, orthogneiss of the Permian Sulphur Creek plutonic suite. Metasedimentary xenoliths commonly occur within the northeastern property area. Foliation is highly variable with fold interference patterns evident indicating at least two phases of folding, one plunging north-northwest and another northeast (dipping to the south.

The Snowcap assemblage primarily consists of quartzite, commonly graphitic, with minor biotite schist. Fine grained, thinly foliated chlorite schist underlies a folded section of quartzite in the northeast property area. The Permian orthogneiss primarily occurs at higher elevations on the property, underlying Eureka Dome itself and the ridge to the east, and also occurs as northerly bands further west. These bands appear to be offset along a major sinistral strike slip fault along the upper Left Fork of Eureka Creek, with about 500m of displacement. Induced polarization resistivity profiles across the creek by the local placer operation confirm the fault and suggest a steep dip to the north. This fault and/or subsidiary faults are observed at the junction of Left Fork with 12 Pup also indicating normal movement with the northern side down-dropped *(Photo 1)*. Brecciation is common within the graphitic quartzite unit near the western contact with the orthogneiss and within the northerly bands of quartzite, proximal to the orthogneiss.

Photo 1: Upper Left Fork Fault view looking westerly

A southerly trending thrust fault is evident along lower Left Fork Eureka Creek, dipping to the west, and extends south along its tributary, 12 Pup. It is best observed near the junction of the Left Fork and Right Forks of Eureka Creek.

2.3 Mineralization

Mineralization consists of silicified metasedimentary rocks and breccias, commonly with limonite fracture fillings and cement. Locally the breccias include abundant quartz fragments, possibly of metamorphic origin. Quartz veins also occur with limonite fracture fillings. Alteration includes silicification, quartz veins ±sheeted, ±oxidized cubic pyrite, hematite, minor ankerite, and occasionally late clay. Mineralization and alteration appears to be structurally controlled.

The breccias and veins with limonite contain anomalous As, Hg and Sb, with Se, Te and Ag ±Bi. Maximum values obtained were 472.5 ppb Au, 8.3 ppm Ag, 3508 ppm As, 138.4 Sb ppm, 10.7 ppm Bi, 5.46 ppm Hg, 3.5 ppm Se, 1.6 ppm Te and 15% Fe. The best gold value of 472.5 ppb was obtained from variably silicified limonitic biotite-quartz-feldspar schist with limonitic fracture fillings and oxidized cubic pyrite from a saddle area (1353619 - *Photo 2, below)* and was accompanied by elevated mercury (0.66 ppm) and selenium (1 ppm). The highest silver value was 8.3 ppm, accompanied by 10.8 ppm Sb, 2.6 ppm Bi and 1.1 ppm Te, from brecciated white quartz with vague remnant angular silicified graphitic quartzite clasts, thin limonite fracture fillings, and fine silvery needles that may be a silver-antimony-bismuth mineral. Similar geochemistry was obtained from highly silicified quartzite cut by sheeted quartz veinlets with 10.7 ppm Bi, 3.9 ppm Ag and 1.6 ppm Te *(Photo 3 to right)*.

Photo 3: Sample 1353629

Photo 2: Sample 1353619 – 472.5 ppb Au

Arsenic and antimony values with elevated selenium and locally high mercury (5.46 ppm) are common in the breccias with values typically a couple of hundred ppm As (182.5 – 3508 ppm) with >10 ppm Sb (10.8 – 138.4) and commonly >1 ppm Se *(Photos 4-5)*.

Photo 4: Sample 1353625 – 3508 ppm As, 67.7 ppm Sb, 5.46 ppm Hg, 2.6 ppm Se, 15% Fe ⟶

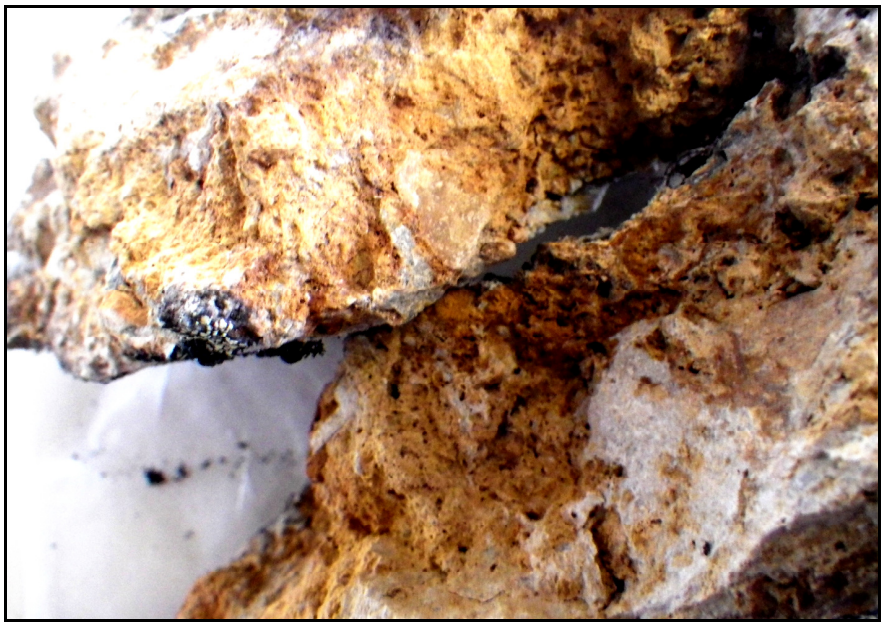

Photo 5: Sample 1353636 – 850.9 ppm As, 138.4 ppm Sb, 3.94 ppm Hg, 3.5 ppm Se

3.0 INTERPRETATION AND CONCLUSIONS

Rock and soil geochemistry on the Eureka Dome property and on the adjoining Whiskey property to the south, formerly of Smash Minerals Corp., show a concentration of the high level pathfinder elements As, Hg and Sb, with Se, and Te. On the Whiskey property higher gold values were obtained at lower elevations, proximal to the creeks, associated with northeast and later north-northwesterly structures[1]. On Strategic Metal Ltd.'s Eureka Project, to the east of Eureka Dome, gold is associated with northerly trending breccia zones and veins with better values obtained at lower elevations along the creeks. At Eureka Dome a 2190 ppb Au in silt value drains a tributary on the south side of the upper Left Fork of Eureka Creek. There is potential for exposure on the west bank here, but the source is probably proximal to the upper Left Fork. Potential exists proximal to structures at lower elevations.

Appendix III

SILT, ROCK AND SOIL ANALYTICAL CERTIFICATES

BUREAU VERITAS MINERAL LABORATORIES Canada

www.bureauveritas.com/um

Bureau Veritas Commodities Canada Ltd.
9050 Shaughnessy St Vancouver British Columbia V6P 6E5 Canada
PHONE (604) 253-3158

Client: **Pacific Ridge Exploration Ltd.**
Suite 1100, 1111 Melville St,
Vancouver British Columbia V6E 3V6 Canada

Submitted By: Gerry Carlson
Receiving Lab: Canada-Whitehorse
Received: September 01, 2016
Report Date: September 19, 2016
Page: 1 of 2

CERTIFICATE OF ANALYSIS WHI16000241.1

CLIENT JOB INFORMATION

Project: Eureka Dome
Shipment ID:
P.O. Number
Number of Samples: 20

SAMPLE DISPOSAL

DISP-PLP Dispose of Pulp After 90 days
DISP-RJT Dispose of Reject After 90 days

Bureau Veritas does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

SAMPLE PREPARATION AND ANALYTICAL PROCEDURES

Procedure Code	Number of Samples	Code Description	Test Wgt (g)	Report Status	Lab
PRP70-250	20	Crush, split and pulverize 250 g rock to 200 mesh			WHI
FA430	20	Lead Collection Fire - Assay Fusion - AAS Finish	30	Completed	VAN
AQ200	20	1:1:1 Aqua Regia digestion ICP-MS analysis	0.5	Completed	VAN
SHP01	20	Per sample shipping charges for branch shipments			VAN

ADDITIONAL COMMENTS

Invoice To: Pacific Ridge Exploration Ltd.
Suite 1100, 1111 Melville St,
Vancouver British Columbia V6E 3V6
Canada

CC: Jean Pautler

This report supersedes all previous preliminary and final reports with this file number dated prior to the date on this certificate. Signature indicates final approval; preliminary reports are unsigned and should be used for reference only.
All results are considered the confidential property of the client. Bureau Veritas assumes the liabilities for actual cost of analysis only. Results apply to samples as submitted.
"*" asterisk indicates that an analytical result could not be provided due to unusually high levels of interference from other elements.

CERTIFICATE OF ANALYSIS WHI16000260.1

CLIENT JOB INFORMATION

Project: None Given
Shipment ID: ERK2016-09-02-Rock
P.O. Number
Number of Samples: 320

SAMPLE DISPOSAL

DISP-PLP Dispose of Pulp After 90 days
DISP-RJT-SOIL Immediate Disposal of Soil Reject

Bureau Veritas does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

SAMPLE PREPARATION AND ANALYTICAL PROCEDURES

Procedure Code	Number of Samples	Code Description	Test Wgt (g)	Report Status	Lab
Dry at 60C	320	Dry at 60C			WHI
SS80	320	Dry at 60C sieve 100g to -80 mesh			WHI
AQ201	319	1:1:1 Aqua Regia digestion ICP-MS analysis	15	Completed	VAN
SHP01	320	Per sample shipping charges for branch shipments			VAN

This report supersedes all previous preliminary and final reports with this file number dated prior to the date on this certificate. Signature indicates final approval; preliminary reports are unsigned and should be used for reference only.
All results are considered the confidential property of the client. Bureau Veritas assumes the liabilities for actual cost of analysis only. Results apply to samples as submitted.
"*" asterisk indicates that an analytical result could not be provided due to unusually high levels of interference from other elements.

CERTIFICATE OF ANALYSIS WHI16000261.1

CLIENT JOB INFORMATION

Project: None Given
Shipment ID: ERK2016-09-02-Rock
P.O. Number
Number of Samples: 351

SAMPLE DISPOSAL

DISP-PLP Dispose of Pulp After 90 days
DISP-RJT-SOIL Immediate Disposal of Soil Reject

Bureau Veritas does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

SAMPLE PREPARATION AND ANALYTICAL PROCEDURES

Procedure Code	Number of Samples	Code Description	Test Wgt (g)	Report Status	Lab
Dry at 60C	351	Dry at 60C			WHI
SS80	351	Dry at 60C sieve 100g to -80 mesh			WHI
AQ201	351	1:1:1 Aqua Regia digestion ICP-MS analysis	15	Completed	VAN
SHP01	351	Per sample shipping charges for branch shipments			VAN
