INTRODUCTION

The Byng property covers high-grade epithermal style gold-silver mineralization and soil geochemical anomalies located in the McClintock Lakes area of south-central Yukon. The property is wholly owned by Strategic Metals Ltd.

This report describes a program of geological mapping, prospecting and soil geochemical sampling, which was conducted between July 24 and August 4 from two camps. The author supervised the exploration program and interpreted all resulting data. The author's Statement of Qualifications is provided in Appendix I, and a Statement of Expenditures follows in Appendix II.

PROPERTY LOCATION, CLAIM DATA AND ACCESS

The Byng property consists of 90 contiguous mineral claims, which are located on NTS map sheet 105D/16 at latitude 60°55' north and longitude 134°21' west (Figure 1). The property covers an area of approximately 1,800 ha (18 km²). The claims are registered with the Whitehorse Mining Recorder in the name of Archer Cathro, which holds them in trust for Strategic Metals. Specifics concerning claim registration are given below, while the locations of individual claims are shown on Figure 2.

<u>Claim Name</u>	<u>Grant Number</u>	<u>Expiry Date*</u>
Byng 1-20	YC40951-YC40970	March 1, 2024
Byng 21-42	YD113299-YD113329	March 1, 2024
Byng 43-50	YC93973-YC93980	March 1, 2024
Byng 51-90	YF47861-YF47900	March 1, 2024

* Expiry dates include 2018 work which has been filed for assessment credit, but has not yet been accepted.

The property is situated approximately 45 km northeast of Whitehorse, the largest city in Yukon and closest supply centre. It lies wholly within the traditional territories of the Kwanlin Dun and Ta'an Kwäch'än First Nations, and the eastern half of the claim block overlaps with the traditional territory of the Teslin Tlingit First Nation. All three first nations have concluded land claim agreements with Canada and Yukon.

HISTORY AND PREVIOUS WORK

In 1961, the Geological Survey of Canada (GSC) released a 1:253,400 scale map of the Whitehorse Area (Wheeler, 1961).

In 1981, Dupont Canada Exploration Ltd. staked the Utshig claims approximately two kilometres to the west of the current property, to cover anomalous results from a regional reconnaissance exploration program. Follow-up work done on the Utshig claims in 1982 yielded up to 1.5 ppm

meters

In 1985, the GSC conducted a regional stream survey on NTS map sheet 105D. The survey identified weakly anomalous gold values in the Mt. Byng area (Carlyle, 1987).

In 1986, Aurum Geological Consultants Inc. staked the historical Byng claim group and, later that year, conducted geological mapping along with rock, soil and silt sampling. Samples collected from the program returned low gold values, but mapping identified major faults and dykes on the claims (Doherty, 1986).

Also in 1986, the BM claims were staked roughly three kilometres north of Mt. Byng by Larry Carlyle and Drew MacDonald. A program of blast trenching, prospecting and soil sampling was performed. Grab samples taken from a vuggy quartz showing, the Main Zone, returned up to 33.15 g/t gold, 140 g/t silver and 6.5% copper. Soil sampling in the vicinity of blast trenches returned up to 15,100 ppb gold, 35 ppm silver and 1535 ppm copper (Figure 3) (Carlyle, 1986). A rock sample collected off the claims along the north side of Mt. Byng returned 58.3 g/t gold and this area was subsequently named the R-Zone.

In 1987, two claims were added to the BM claim group.

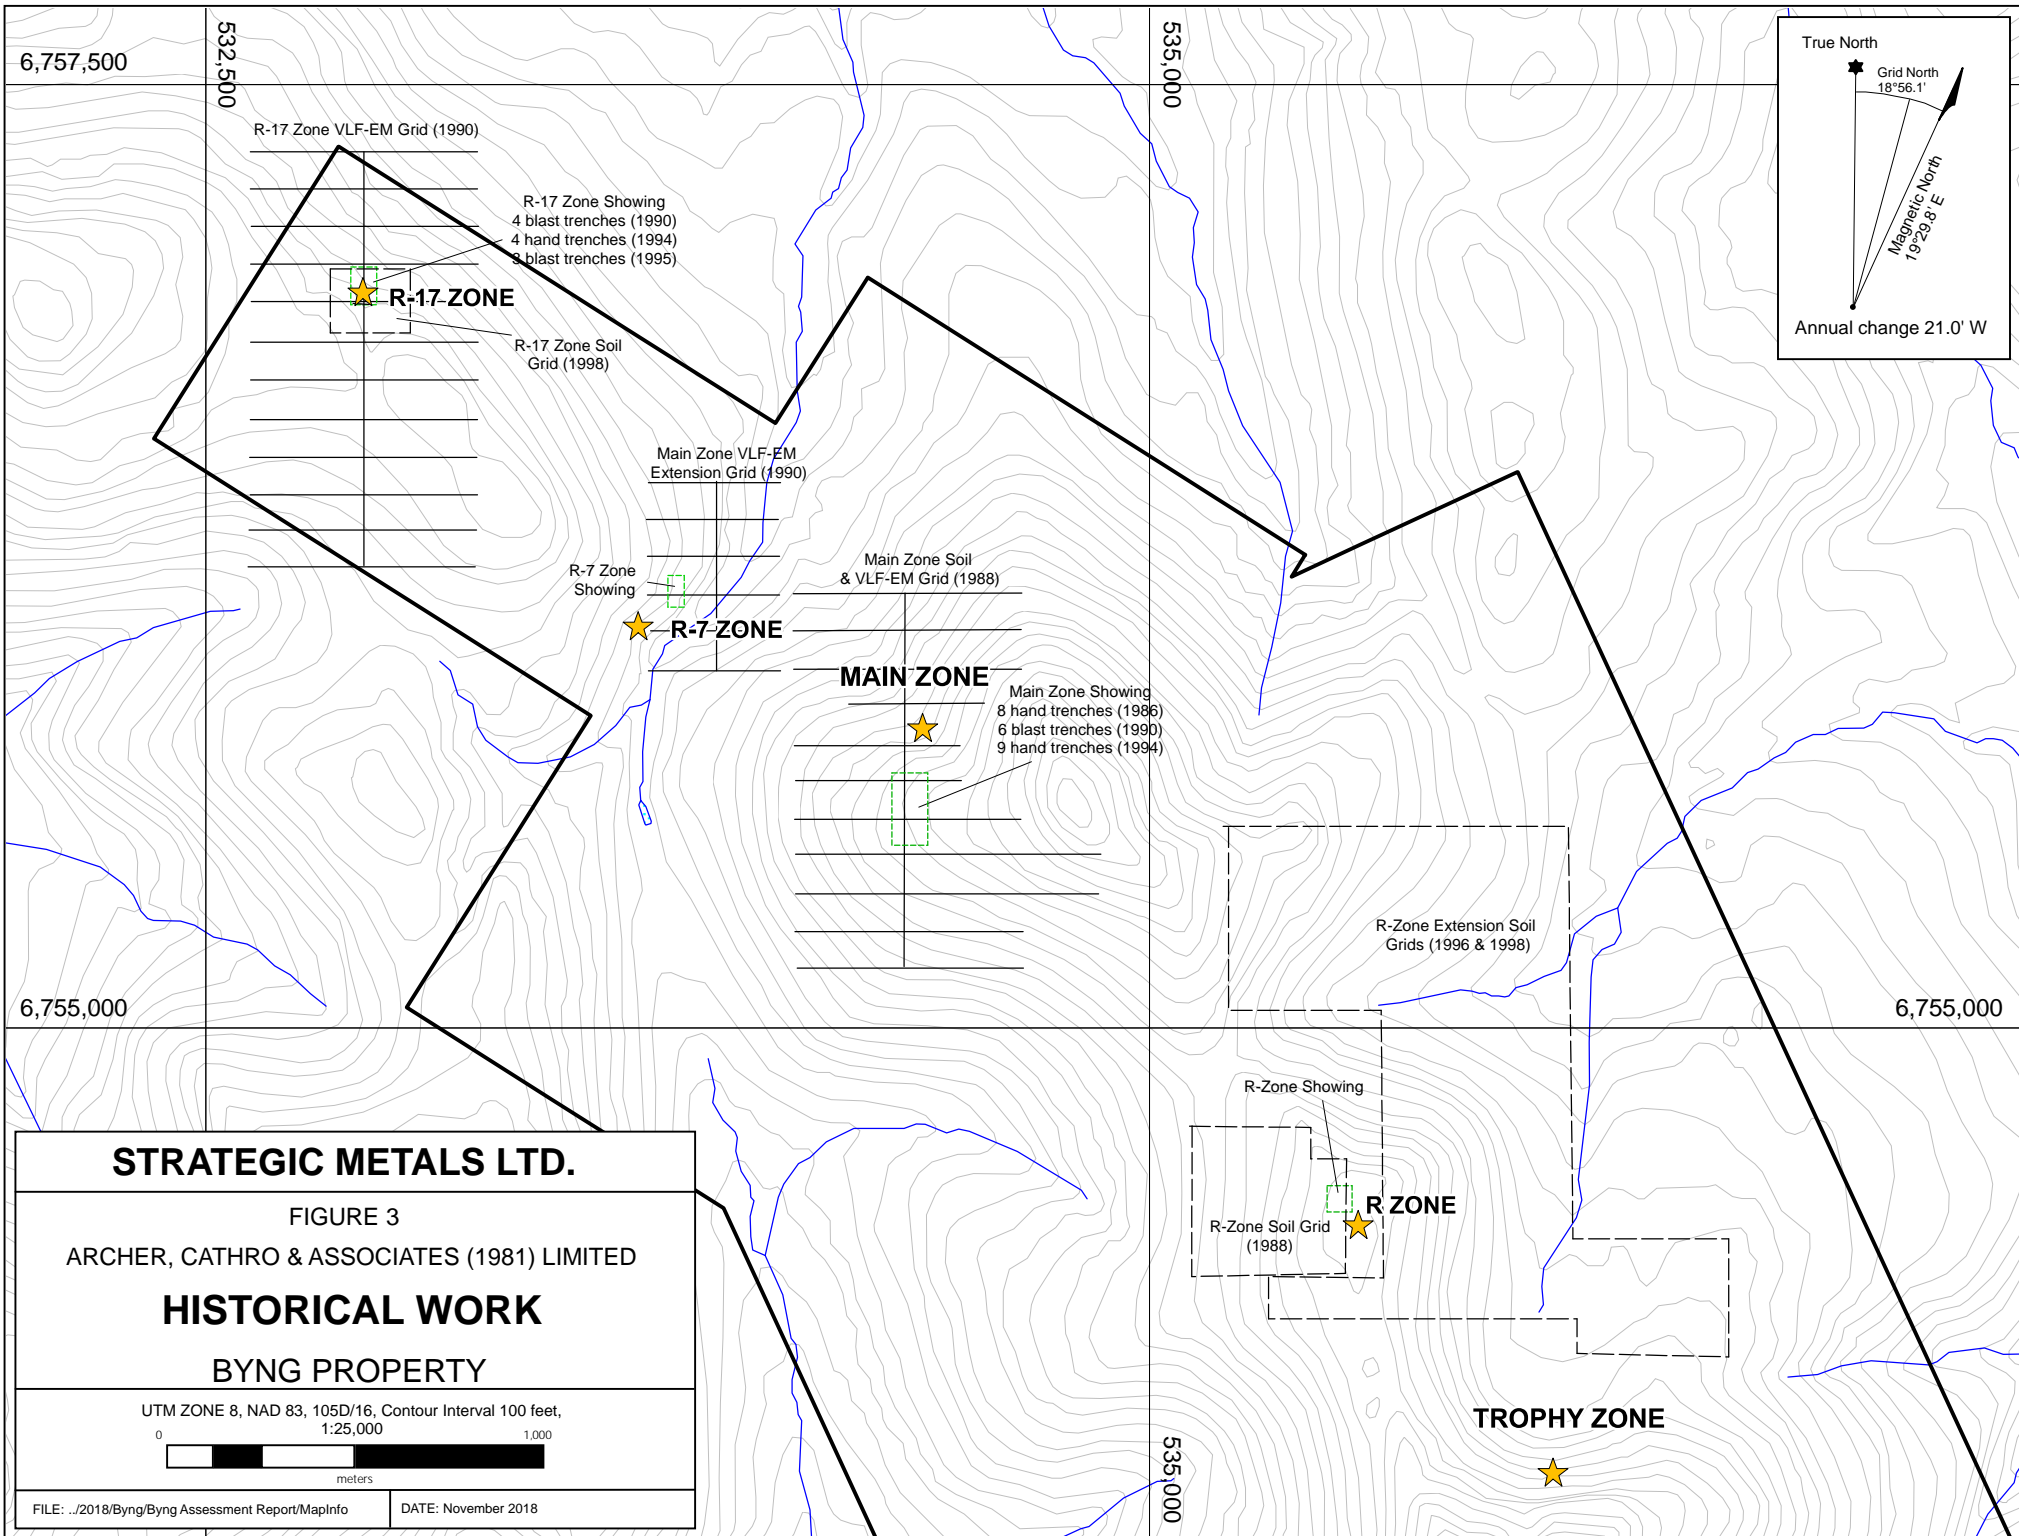

In 1988, Carlyle and MacDonald staked 37 additional claims and conducted geological mapping, hand and blast trenching, soil sampling and VLF-EM surveys. The best rock sample from the Main Zone graded 80.7 g/t gold and 70.6 g/t silver, while soil sampling returned up to 1660 ppb gold and 1018 ppm arsenic (Carlyle, 1989). During this program, the R-17 and R-7 Zones were discovered to the northwest of the Main Zone.

In 1989, Trevor Bremner, a mineral deposits geologist with the Division of Indian Affairs and Northern Development (DIAND) performed geological mapping on the BM claims and collected samples for K/Ar age dating (Carlyle, 1991).

In 1990, the BM claims were optioned to Aurora Gold Ltd., which conducted prospecting, blast trenching and soil sampling around the Main and R-17 Zones, along with a VLF-EM survey at the R-17 Zone. Grab samples from shallow trenches at the Main Zone returned values up to 126.9 g/t gold and 164.5 g/t silver. Soil samples collected from the claims were never sent for analysis and the exploration data was lost (Carlyle, 1991).

In 1994, Aurora dropped its option and the BM claims were consolidated into a single group of 16 claims. After the option expired, Carlyle and MacDonald resumed work, completing a hand trenching program at the R-17 and Main Zones. Trenching did not reach bedrock at either of these areas. Two float samples taken from the Main Zone yielded greater than 6.67 g/t gold, but overlimit analyses were never completed (Carlyle, 1994).

In 1995, Carlyle conducted prospecting, blast trenching and soil sampling around the R-17 and Main Zones. Trenching did not reach bedrock at the R-17 Zone, but a single trench at the Main Zone exposed in-situ vein material. A rock sample from the vein returned 6.721 g/t gold and 372 ppm arsenic. Soil sampling yielded a maximum of 42 ppb gold (Carlyle, 1995). Following this program, Carlyle added the BC claims to the southeast, to cover the Creek Showing and recover the R-Zone.

HISTORICAL WORK

BYNG PROPERTY

UTM ZONE 8, NAD 83, 105D/16, Contour Interval 100 feet,
1:25,000

Additionally in 1995, the Exploration and Geological Services Division of DIAND conducted 1:50,000 geological mapping of NTS map sheet 105D/16 (Hart, 1997).

In 1996, Carlyle and MacDonald performed blast trenching and soil geochemical sampling on the BM claims. Eight trenches were started along VLF-EM and soil geochemical anomalies north of the Main Zone, but only one trench reached bedrock, where a rock sample returned 307 ppb gold and 645 ppm arsenic. Soil sampling yielded weakly anomalous values for copper, up to 113 ppm (Carlyle, 1996a). On the BC claims, soil sampling, geological mapping and a ground magnetometer survey were completed near the R-Zone and Creek Showing. Soil sampling returned up to 65 ppb gold, 602 ppm arsenic and 226 ppm copper around the R-Zone (Carlyle, 1996b).

In 1998, Carlyle conducted soil sampling and magnetometer surveys across parts of the BC and BM claims. Soil samples returned up to 346 ppb gold at the R-17 Zone and 166 ppb gold at the R-Zone (Carlyle, 1998). Equipment failure during the magnetometer survey prevented completion of the project. No further work was done by Carlyle on the BC and BM claims, and they were subsequently allowed to expire.

In 2005, ATAC Resources Ltd. staked the current Byng 1-20 claims to cover zones identified by previous work.

In 2006, the property was optioned to New Shoshoni Ventures Ltd., which that year conducted helicopter-borne magnetic and VTEM geophysical surveys on the claim block. New Shoshoni later dropped its option.

In 2010, ATAC Resources sold the Byng property to Strategic Metals. Following the sale, the Byng 21-42 claims were staked.

In 2011, the property was optioned to Alix Resources Corp., but no work was completed.

Also in 2011, Golden Predator Mining Corp. staked claims along the eastern side of the current Byng property. No record of work has been found, and the claims expired in 2013.

In 2012, Alix Resources dropped its option on the property. Later in the year, Strategic Metals conducted a soil and rock sampling program. A rock sample taken from a historical trench at the Main Zone returned 13.45 g/t gold, 35.8 g/t silver, 2080 ppm arsenic, 635 ppm copper and 1000 ppm lead. Soil sampling returned up to 1770 ppb gold from the bottom of an old trench (Drechsler, 2012).

In 2015, Strategic Metals conducted a LiDAR survey over the Byng property.

In 2016, Strategic Metals staked the Byng 43-90 claims and compiled exploration data onto LiDAR images in order to identify prospective areas for future programs (Willms, 2016).

In 2017, Strategic Metals conducted a one-day property tour. Four rock samples were collected from the Main Zone, which returned peak values of 17.6 g/t gold, 22.1 g/t silver, 898 ppm arsenic, 14.3 ppm bismuth, greater than 2.32% copper and 801 ppm antimony.

GEOMORPHOLOGY AND CLIMATE

The Byng property covers ridges and valleys surrounding Mt. Byng, which is part of the Big Salmon Range of the Pelly Mountains. Mt. Byng is located approximately eight kilometres east of the McClintock Lakes. Two major creeks drain the property: Byng Creek and its tributaries, which drain westward into the McClintock River; and Sheldon Creek, which flows east to join the Teslin River. All of the streams are part of the Yukon River watershed.

Mt. Byng, which lies near the center of the property, dominates local topography and is flanked by a system of ridges and creek gullies. The rest of the property covers subsidiary peaks and ridges. Elevations range from approximately 1400 to 2100 m above sea level. Outcrop and talus are locally abundant along ridgetops and on steep slopes. Treeline lies at about 1550 m. Below treeline, sparse poplar and spruce trees are mixed with an understory of buckbrush, moss and grasses. Above treeline, lichen, moss and low brush are interspersed with talus slopes and felsensmeer fields.

During the Late Pleistocene, the area was heavily glaciated, with ice sheets migrating northwards joining with larger northwesterly migrating glaciation (Duk-Rodkin, 1999).

REGIONAL GEOLOGY

The Byng property is located near the northern end of the Stikinia Terrane (STT) as shown on Figure 4. The STT comprises a variety of Paleozoic to Mesozoic metavolcanic, metasedimentary and metaplutonic rocks formed in arc environments (Israel et al., 2016). It represents an accretionary arc that developed along the ancient Pacific margin of North America. A sedimentary basin, known as the Whitehorse Trough, overlaps the STT. This fault-bound trough is composed of fore-arc basin metasediments.

The Yukon Geological Survey (YGS) maintains a website illustrating regional geology based on mapping done by the Geological Survey of Canada and YGS, recent thesis work and a comprehensive compilation done by Gordey and Makepeace in 2003. This interactive map is periodically updated when new information becomes available (YGS, 2016). The main lithological units are described below in Table I, while regional geology is shown on Figure 5. Figure 6 is a cross section of regional geology.

Table I – Lithological Units (after Gordey and Makepeace, 2003)

Unit Name	Age	Map Name	Description
Mount Nansen Group	Early to Late Cretaceous	mKN	Massive aphyric or feldspar-phyric andesite to dacite flows, breccia and tuff; massive, heterolithic, quartz and feldspar-phyric, felsic lapilli tuff; flow-banded quartz-phyric rhyolite and quartz-feldspar porphyry plugs, dykes, sills and breccia (Byng Creek Volcanics).
Whitehorse Suite	Early Cretaceous	mKqW	Grey, medium to coarse-grained, generally equigranular felsic rocks – biotite quartz-monzonite, biotite granite and leucogranite, pink granophyric quartz monzonite, porphyritic biotite leucogranite, locally porphyritic (K-feldspar) hornblende monzonite to syenite, and locally porphyritic leucocratic quartz monzonite.
Teslin Suite	Early Cretaceous	EKgT	Leucocratic, fine to coarse-grained, equigranular, hornblende-biotite granite, granodiorite, quartz monzonite and quartz monzodiorite, locally with sparse grey and pink potassium feldspar phenocrysts; associated aplitic phases with dykes (Deadman Creek Batholith).
Laberge Group	Early to middle Jurassic	JL1	Predominantly turbiditic sandstone-siltstone-mudstone – well-bedded, turbiditic sandstone-siltstone-mudstone; dark weathering, massive to finely laminated mudstone and limy mudstone; thick-bedded to massive lenses of polymictic cobble to boulder conglomerate; lithic sandstone; minor limestone.
Aksala Formation (Lewes Group)	Late Triassic	uTrAK1	Mixed clastic-carbonate assemblage divisible into three dominant facies including calcareous greywacke – brown shale, black and minor red siltstone, greenish, calcareous greywacke and interbedded bioclastic, argillaceous limestone; igneous or limestone-clast pebble and cobble conglomerate; lahar debris flows; rare feldspar-augite porphyry flows (Casca Member).
Joe Mountain Formation	Late Triassic	mTrJ	Basalt – massive basalt flows; fine to locally medium-grained feldspar and pyroxene (?) -phyric, pillowed andesite; variably altered massive microdiorite; heterolithic diamictite (Joe Mountain Formation).
		mTrdJ	Subvolcanic mafic intrusion – coarse-grained and locally pegmatitic, hornblende gabbro and diorite.

Regional-scale mapping shows the Byng property is underlain by an amalgamation of faulted and deformed lithologies. The units primarily consist of basalt flows and a gabbro stock of the Joe Mountain Formation, and overlying Aksala Formation clastic and carbonate sediments. This basement package is intruded by a centrally located stock of hornblende-biotite granite (previously referred to as felsite) belonging to the Teslin Suite. Other Teslin and Whitehorse Suite plutons are exposed along the southern edge of the property.

Faulting is extensive on the property and occurred in three main episodes (Hart, 1997). The first is characterized by steeply dipping faults with easterly strikes. Following this, faulting transitioned into steep, northerly striking structures. The final set of faults trends northwesterly and have been traced over several kilometres. Faults on the property exhibit dextral strike-slip movement and vertical offset. Upright folds are associated with the northerly and northwesterly fault episodes.

PROPERTY GEOLOGY

Property-scale mapping has been conducted intermittently on the property since 1986. Carlyle and MacDonald performed geological mapping on parts of the historical BM and BC claims blocks between 1986 and 1998. In 1989, Trevor Bremner, a DIAND geologist, performed four days of geological mapping on the BM property and collected samples for age dating (Bremner, 1990 and Carlyle, 1991). In 2018, Strategic Metals conducted geological mapping to expand on and confirm pre-existing mapping work. The following geological descriptions are compiled from this work. Property geology from this compilation is shown on Figure 7.

The Byng property is mostly underlain by Joe Mountain Formation volcanics, which are subdivided into two main groups: 1) a thick unit of basaltic volcanic rocks; and 2) intrusions of coarse grained pyroxene-anorthosite gabbro. Whole rock sampling from the main gabbroic stock in the northern part of the property returned a K-Ar age date of 168 ± 6 Ma (Bremner, 1990), which is likely younger than the age of formation. Throughout the property, variably sized gossanous quartz-carbonate breccia or sinter exposures are present within the volcanics.

Mount Byng Felsite, which occurs in a stock within the central portion of the property, is composed of fine-grained to porphyritic, feldspar-hornblende felsite and hornblende granodiorite. These rocks were likely emplaced during faulting (Carlyle, 1998). Dating of granodiorite collected from the stock returned a K-Ar hornblende age of 121 ± 5 Ma (Bremner, 1990).

Rhyolite intrusions belonging to the Byng Creek volcanic complex cut all units on the property. They consist of locally flow-banded quartz-phyric rhyolite and quartz-feldspar porphyry plugs, dykes, sills and breccias. Where the rhyolites intrude sediments, local hornfelsing is documented (Carlyle, 1998). A K/Ar whole rock age of 104 ± 4 Ma was obtained from a rhyolite dyke in the northern part of the property (Bremner, 1990).

The youngest igneous phase on the property is a small diatreme of heterolithic breccia containing angular fragments of all of the major rock types found in the area, which have been welded by granodiorite porphyry (Bremner, 1990). This diatreme lies within the Mount Byng Felsite stock. Two major northerly trending strike-slip faults are mapped on the property. This fault set may

partially control mineralization on the property (Carlyle, 1998). Another set of faults, which strikes northwesterly, cuts the northerly trending faults.

MINERALIZATION

The Byng property hosts gold- and silver-bearing epithermal-style mineralization that occurs within vuggy to banded quartz veins and quartz-carbonate breccias. Five prospective zones have been identified on the property to date: the R-17, R-7, Main, R and Trophy Zones. Gold- and silver-bearing veins on the property are hosted in mafic volcanic rocks belonging to the Joe Mountain Formation, and are typically associated with rhyolite dykes.

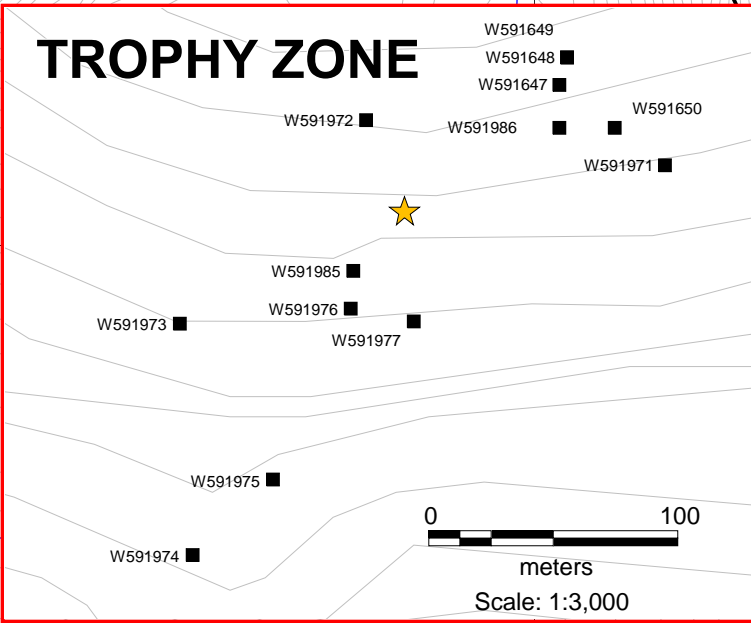

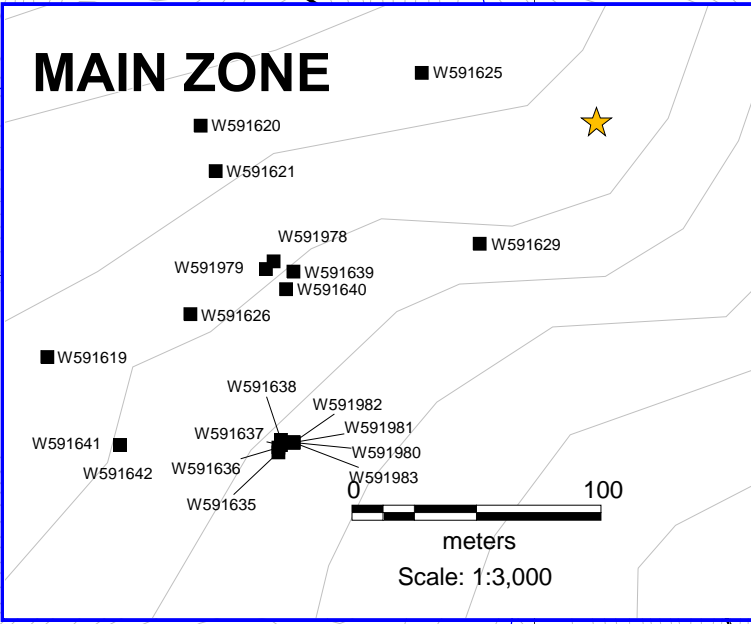

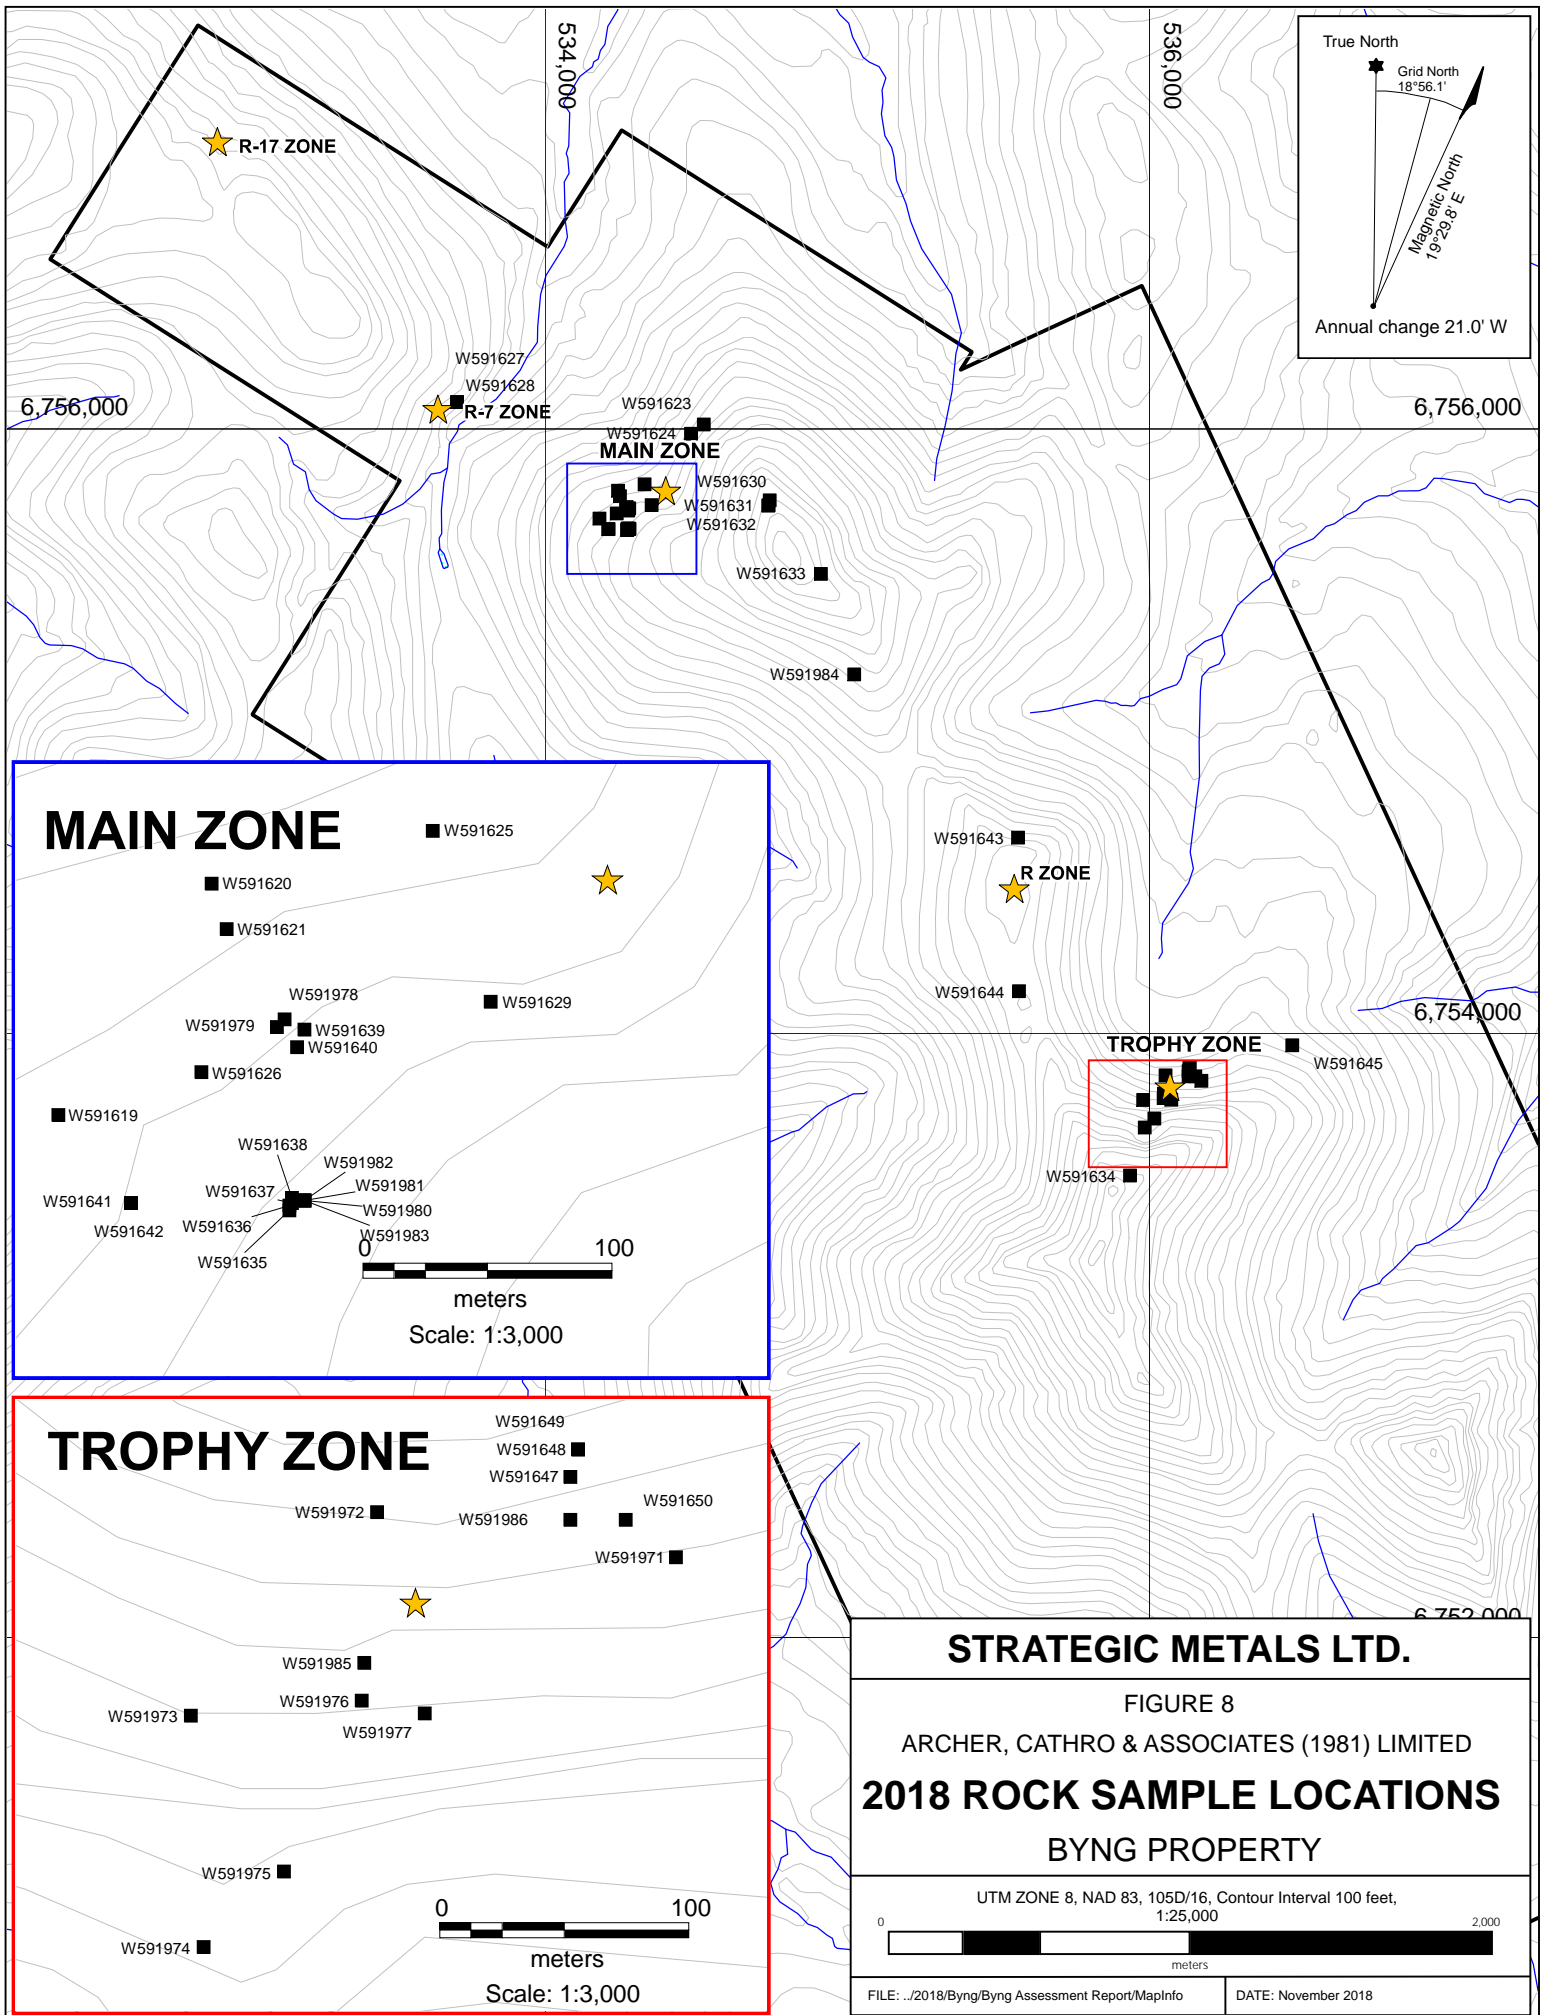

In 2018, Strategic Metals collected 23 rock samples from the property. Rock sample locations are shown on Figure 8. Thematic results for gold, silver, arsenic, bismuth and antimony, where available, are shown on Figures 9 to 13, respectively.

The 2018 rock sample sites were marked with orange flagging tape labelled with the sample number. The location of each sample was determined using a handheld GPS unit. Sample preparation and multi-element analyses for 2018 rock samples were carried out at ALS Minerals' laboratories in Whitehorse, Yukon and North Vancouver, BC, respectively. Each sample was dried and fine crushed to better than 70% passing 2 mm, and then a 250 g split was pulverized to better than 85% passing 75 microns. The fine fraction was analyzed for 51 elements using an aqua regia digestion followed by inductively coupled plasma combined with mass spectroscopy and atomic emission spectroscopy (ME-MS41). For all of the samples, an additional 30 g charge was further analyzed for gold by fire assay with inductively coupled plasma and atomic emission spectroscopy finish (Au-ICP21). Further overlimit values for gold were determined by 30 g fire assay with atomic absorption spectroscopy (Au-AA25, Au-AA25D) and gravimetric finish (Au-GRA21). Additionally, 21 samples were screened to 100 microns for coarse gold (Au-SCR21). Overlimit values for arsenic were determined by inductively coupled plasma-atomic emission spectroscopy (As-OG46). Overlimit values for antimony were determined by KCLO3/HCL digestion and atomic absorption spectroscopy (Sb-AA08). Rock Sample Descriptions and Certificates of Analysis are provided in Appendices III and IV, respectively.

Rock sampling in 2018 was conducted during prospecting traverses and detailed re-evaluation of historical workings at the Main Zone. All trenches at the Main Zone were accurately located, and four trenches were re-opened, deepened and sampled. Prospecting identified a new area of significant precious metal mineralization, the Trophy Zone, in the central part of the property. The showings on the Byng property are described in the following paragraphs.

The **R-17 Zone** is a gossanous area, which is situated along a north-trending fault gully in the northern part of the property. It comprises a 100 m in diameter, silicified chalcedony breccia/vein system hosted by Joe Mountain gabbro. Historical rock sampling and blast trenching at the R-17 Zone largely failed to reach bedrock. The best rock sample returned less than 100 ppb gold.

The **R-7 Zone**, located 1100 m southeast of the R-17 Zone, lies near an intersection between northerly and northwesterly trending faults that juxtapose Joe Mountain gabbro and Mount Byng

Felsite granodiorite. Due to the lack of exposed bedrock, little work has been done in the area. Historical rock sampling has returned values up to 840 ppb gold.

In 2018, the precise location of the R-7 Zone could not be established. Rock samples collected from an exposure in the area returned up to 136 ppb gold and 135.5 ppm arsenic.

The **Main Zone** lies approximately 850 m southeast of the R-7 Zone, on a west-facing slope located 2800 m to the north of Mt. Byng. This zone comprises a series of northwesterly trending, shallowly dipping, brecciated and vuggy quartz and quartz-carbonate veins. These veins follow the strike of a late-stage northwesterly trending fault identified by Carlyle in 1998, and lie within a swarm of northerly trending rhyolite dykes that cut pyroxene-anorthosite gabbro. Mineralization is characterized by varying amounts of pyrite, chalcopyrite, tetrahedrite, malachite and azurite, which carry concomitant gold and silver with strongly associated arsenic, bismuth and antimony and varying amounts of copper. Historical blast-trenching and prospecting returned up to 126.9 g/t gold, 164.5 g/t silver and 6.5% copper from vein material.

In 2018, prospecting at the Main Zone outlined a 210 by 180 m area of mineralized quartz and quartz-carbonate veining. Chip samples of altered rhyolite and intensely oxidized and vuggy quartz hosting weathered sulphides, which were taken from a re-opened historical blast-trench, averaged 38.8 g/t gold, 32.3 g/t silver, 1550 ppm arsenic, 41.2 ppm bismuth, 676 ppm antimony and 432 ppm copper over 2.0 m. The best grab sample, a piece of intensely oxidized and vuggy quartz hosting weathered sulphides, yielded 89 g/t gold 52 g/t silver, 3020 ppm arsenic, 115 ppm bismuth, and 1540 ppm antimony. Statistical analysis of rocks taken from the Main Zone shows that gold and silver values commonly share a nearly 1:1 ratio, while Pearson correlation is very strong (0.859). Table II compiles the most significant assay reported results from the Main Zone.

The **R-Zone** is situated roughly 1900 m southeast of the Main Zone, along a northerly trending ridge adjoining Mt. Byng. It is made up of three east-southeast trending rhyolite dykes, found along the ridge, and gossanous quartz-carbonate breccia on the adjacent north-facing slope. The dykes and breccia are hosted within Joe Mountain basalts, near a contact with pyroxene±anorthosite gabbro. The dykes are largely masked by volcanic talus and felsemeer. The R-Zone hosts a range of sulphide minerals, including pyrite, arsenopyrite, chalcopyrite, molybdenite and pyrrhotite. Due to limited exposure at the R-Zone, no systematic prospecting has been completed. A historical rock sample of brecciated quartz-carbonate vein material with strong limonite weathering returned 58.3 g/t gold. In 2018, two rock samples were collected from the northern and central parts of the ridge and returned slightly elevated gold and silver values. Table III compiles assay results from the R-Zone.

Table III - Significant Rock Results - R-Zone

Type	Sample	Year	Au (g/t)	Ag (g/t)	As (ppm)	Bi (ppm)	Sb (ppm)	Cu (ppm)

The **Trophy Zone** is located 700 m southeast of the R-Zone, on the northern flank of Mt. Byng. This zone is about 120 m wide and contains two distinct sets of veins hosted within gabbroic volcanics that texturally resemble rocks at the Main Zone.

The first set of veins includes three northwesterly trending, shallowly to moderately dipping, banded quartz veins. They range from 8 to 30 cm wide and have been intermittently traced in subcrop and float over a 200 m strike length. The veins host abundant, coarse grained stibnite that has been weathered to cervantite on surface exposures. No precious metals are present within these veins. Seven samples of vein material returned greater than 1% antimony, with peak values of 44.3 % antimony and 3770 ppm arsenic.

The second set of veins comprises two gold-bearing veins. They range from 12 to 30 cm wide and have been traced for 10 to 35 m before projecting beneath talus. These veins, which are obliquely oriented relative to the first set, display patches of intense oxidation on weathered surfaces and are characterized by nearly massive arsenopyrite with lesser pyrite and chalcopyrite. Disseminated arsenopyrite is also found locally in quartz vein float and the surrounding gabbroic wallrocks. Rock samples from these veins returned up to 10.9 g/t gold, 430,000 ppm arsenic, 359 ppm antimony and 142 ppm bismuth. Table IV compiles the most significant gold results from the Trophy Zone.

SOIL GEOCHEMISTRY

Soil geochemical surveys were conducted within the area now covered by the Byng property in 1986, 1988, 1990, 1995, 1996, 1998, 2012 and 2018. Most soil samples collected before 2012 were only analyzed for gold.

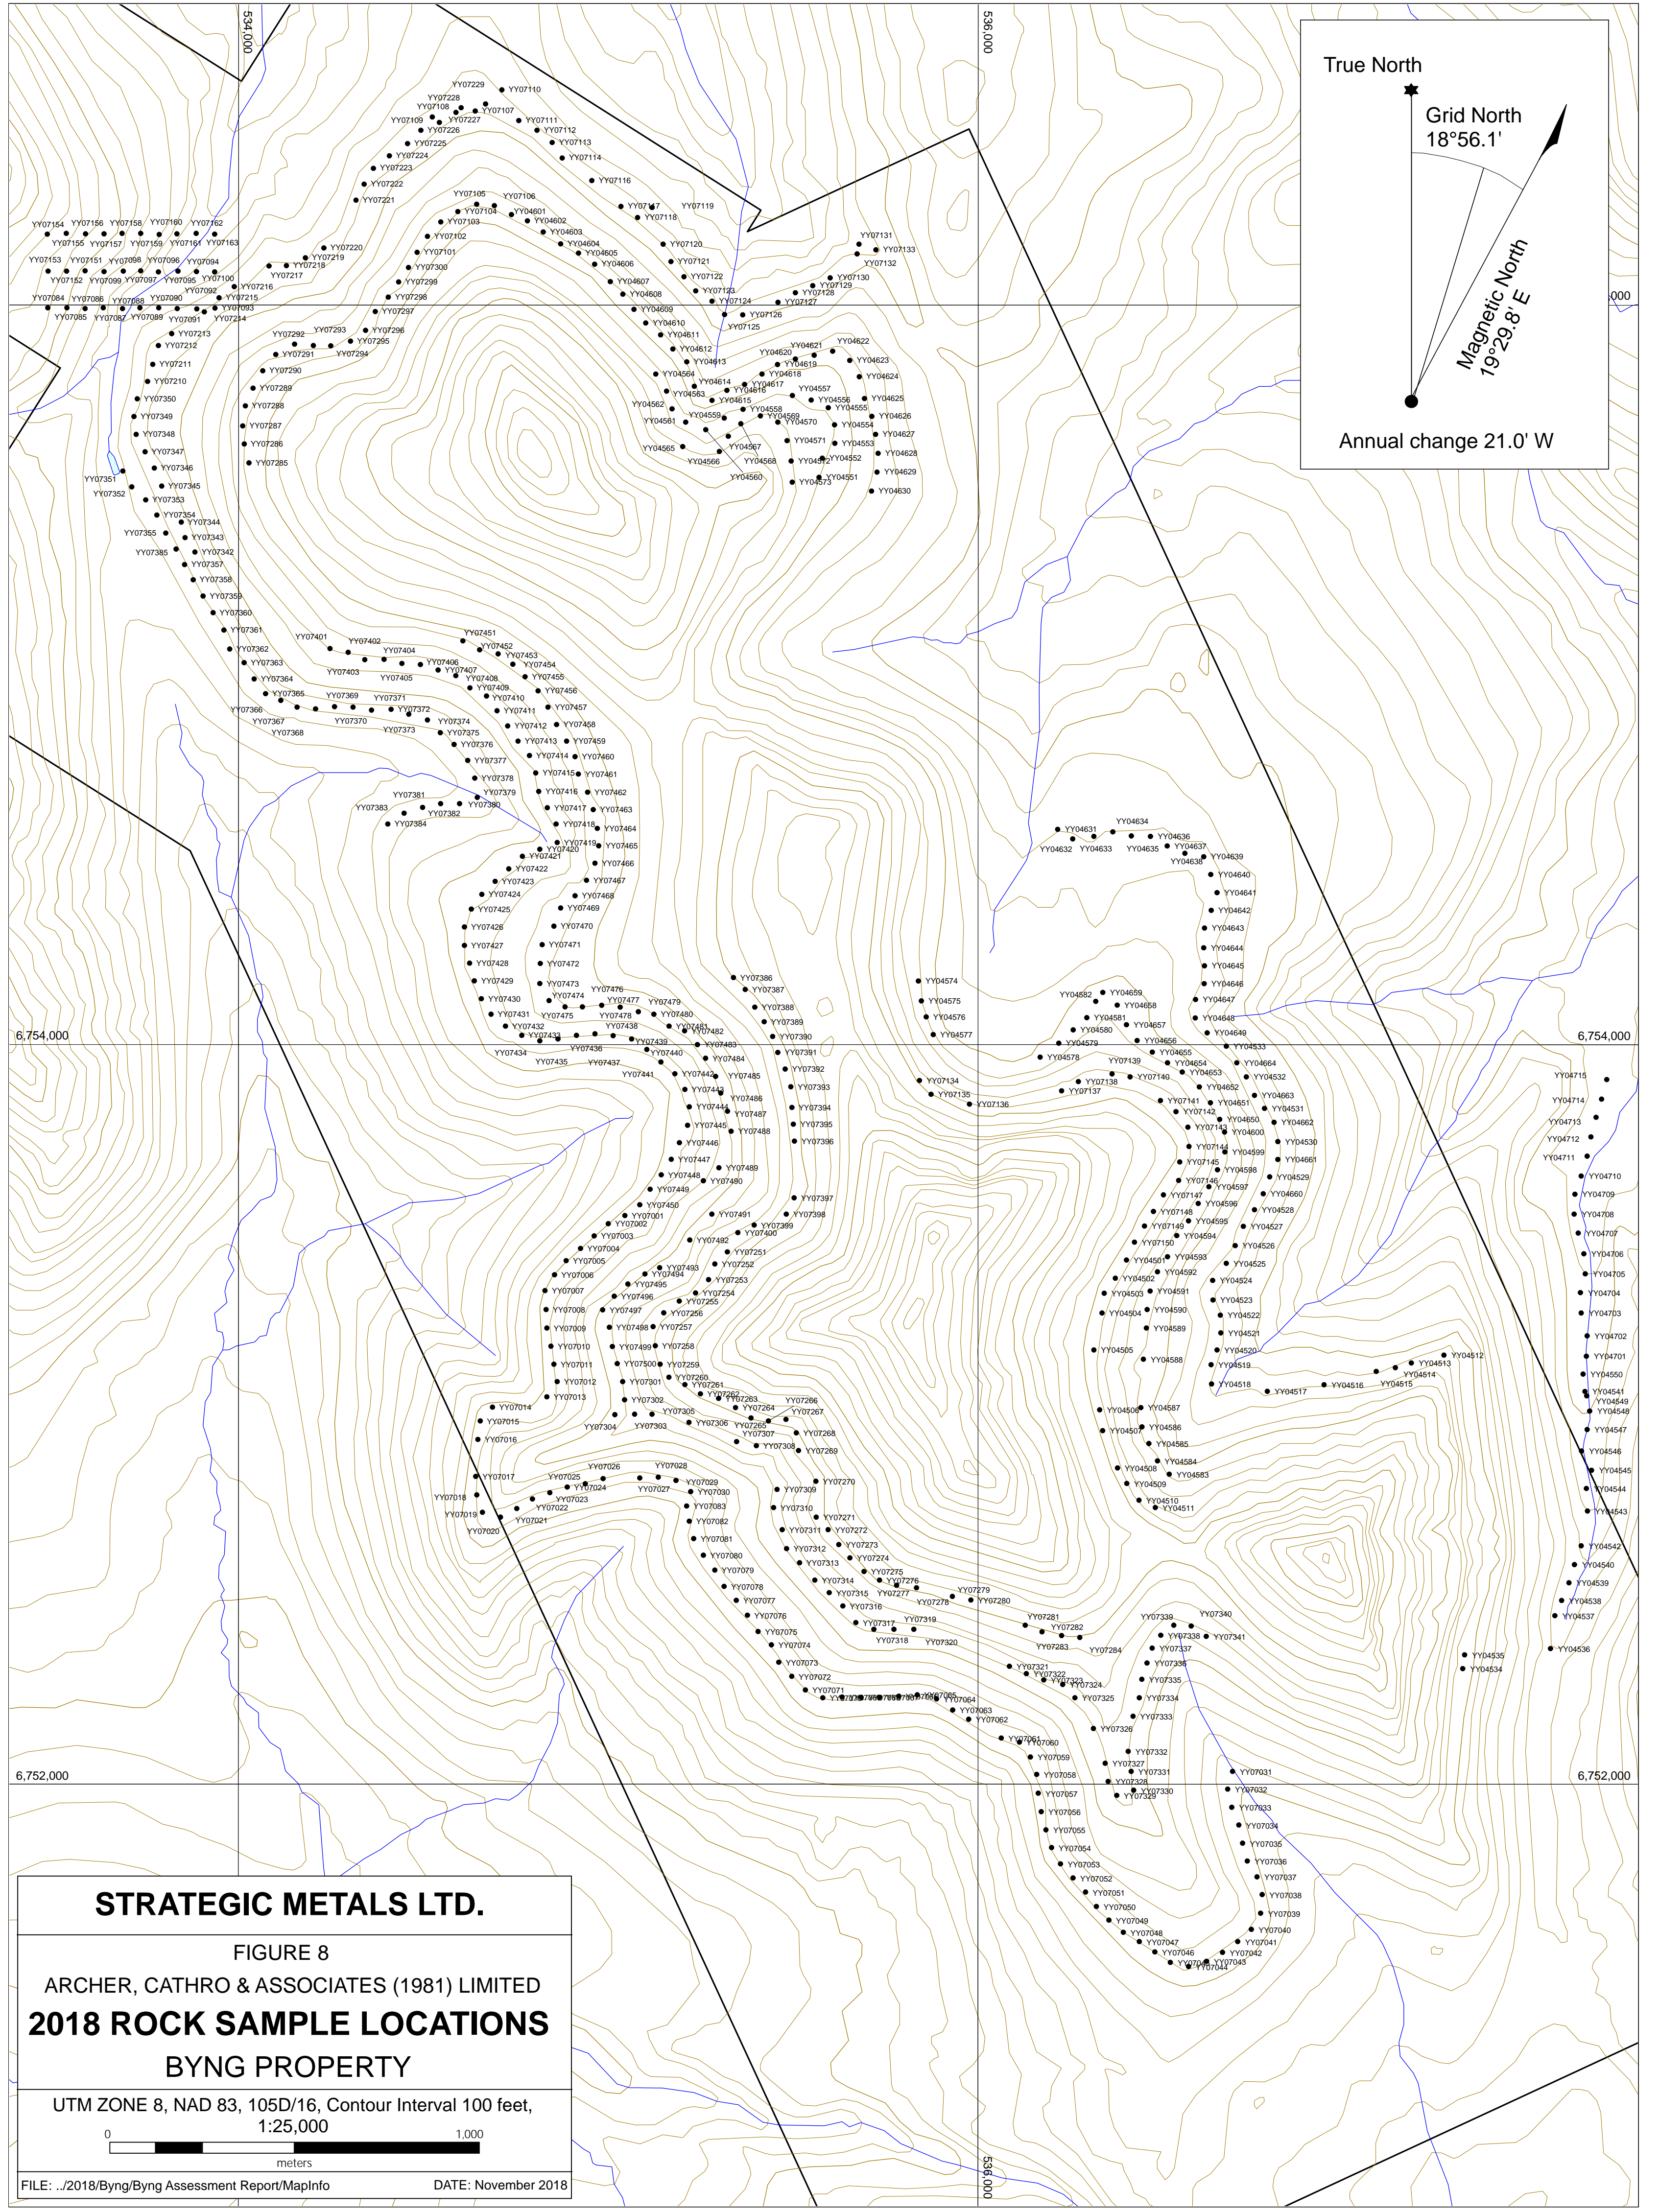

In 2018, Strategic Metals collected 611 contour and grid soil samples in order to evaluate untested parts of the property and extend geochemical coverage around known areas of interest. Sample locations are plotted in Figure 14, while results from all programs for gold, arsenic, silver and antimony, where available, are plotted on Figures 15 to 18, respectively. Anomalous thresholds and peak values for metals of interest are listed in Table V.

Soil sample locations were recorded using hand-held GPS units. Sample sites are marked by aluminum tags inscribed with the sample numbers and affixed to 0.5 m wooden lath that were driven into the ground. Soil samples were collected from 10 to 100 cm deep holes dug by handheld auger. The soil samples were sent to ALS Minerals in Whitehorse, where they were dried and screened to -180 microns. The fine fractions were then shipped to ALS Minerals in North Vancouver where they were analyzed for 51 elements using an aqua regia digestion followed by inductively coupled plasma combined with mass spectroscopy and atomic emission spectroscopy (ME-MS41). An additional 30 g charge was further analyzed for gold by fire assay with inductively coupled plasma and atomic emission spectroscopy finish (Au-ICP21). Certificates of Analysis for 2018 samples are provided in Appendix IV

Table V – Soil Geochemical Thresholds

Element	Weak	Moderate	Strong	Peak	2018 Peak
Gold (ppb)	≥ 20 < 50	≥ 50 < 100	≥ 100	1770	786
Arsenic (ppm)	≥ 50 < 100	≥ 100 < 200	≥ 200	3420	1135
Silver (ppm)	≥ 1 < 2	≥ 2 < 5	≥ 5	30	2.33
Antimony (ppm)	≥ 1 < 5	≥ 5 < 10	≥ 10	353	353

Soil geochemical results highlight three major areas in the northern and central parts of the property, which are anomalous for gold, arsenic, silver and antimony. These anomalies encompass the Main, R and Trophy Zones and extend beyond the current bounds of known mineralization. Scattered clusters of elevated gold are also present elsewhere on the property.

The strongest soil geochemical response lies in the north-central part of the property, and is a 1200 by 1000 m area of high gold-arsenic±antimony values, centered 400 m to the east of the Main Zone. It is characterized by two distinct signatures. The first signature encompasses the Main Zone and is a 450 by 400 m area with strongly anomalous gold (up to 1770 ppb), arsenic (up to 877 ppm), silver (up to 3.9 ppm) and antimony (up to 157.5 ppm) values. This signature transitions towards the east to a broad arsenic anomaly (up to 896 ppm) with clusters of strong gold (up to 156 ppb), silver (up to 3.4 ppm) and antimony (up to 35.8 ppm) values.

On the northern edge of the R-Zone, elevated gold-arsenic-antimony response closely follows the trend of rhyolite dykes and gossanous quartz-carbonate breccia. Soil samples taken at the base of the ridge returned up to 156 ppb gold, 732 ppm arsenic and 12.35 ppm antimony.

Soil sampling on the southern edge of the R-Zone and along the base of the talus slope at the Trophy Zone has delineated a linear, easterly to southeasterly trending area characterized by strong gold (up to 505 ppb), arsenic (up to 1725 ppm) and antimony (up to 353 ppm) response. This linear trend is oriented subparallel to gold-bearing veins and rhyolite dykes at the R- and Trophy Zones.

GEOPHYSICS

In 1988 and 1990, Fraser-filtered VLF surveys were conducted over the Main Zone, R-Zone and R-17 Zone. VLF data from the Main Zone shows a strong north-trending conductor along the eastern edge of the showing, which appears in Figure 13. The R-Zone also has strong northerly conductors, but they could not be digitized due to missing baseline information. VLF response at the R-17 Zone was not significant.

In 2006, New Shoshoni commissioned Geotech Ltd. of Aurora, Ontario to fly a helicopter-borne VTEM and magnetic survey over the Byng 1 to 20 claims, and surrounding area. Figures 15 to 18 illustrate the magnetic data along with differing soil geochemical results, while Figure 19 illustrates VTEM results.

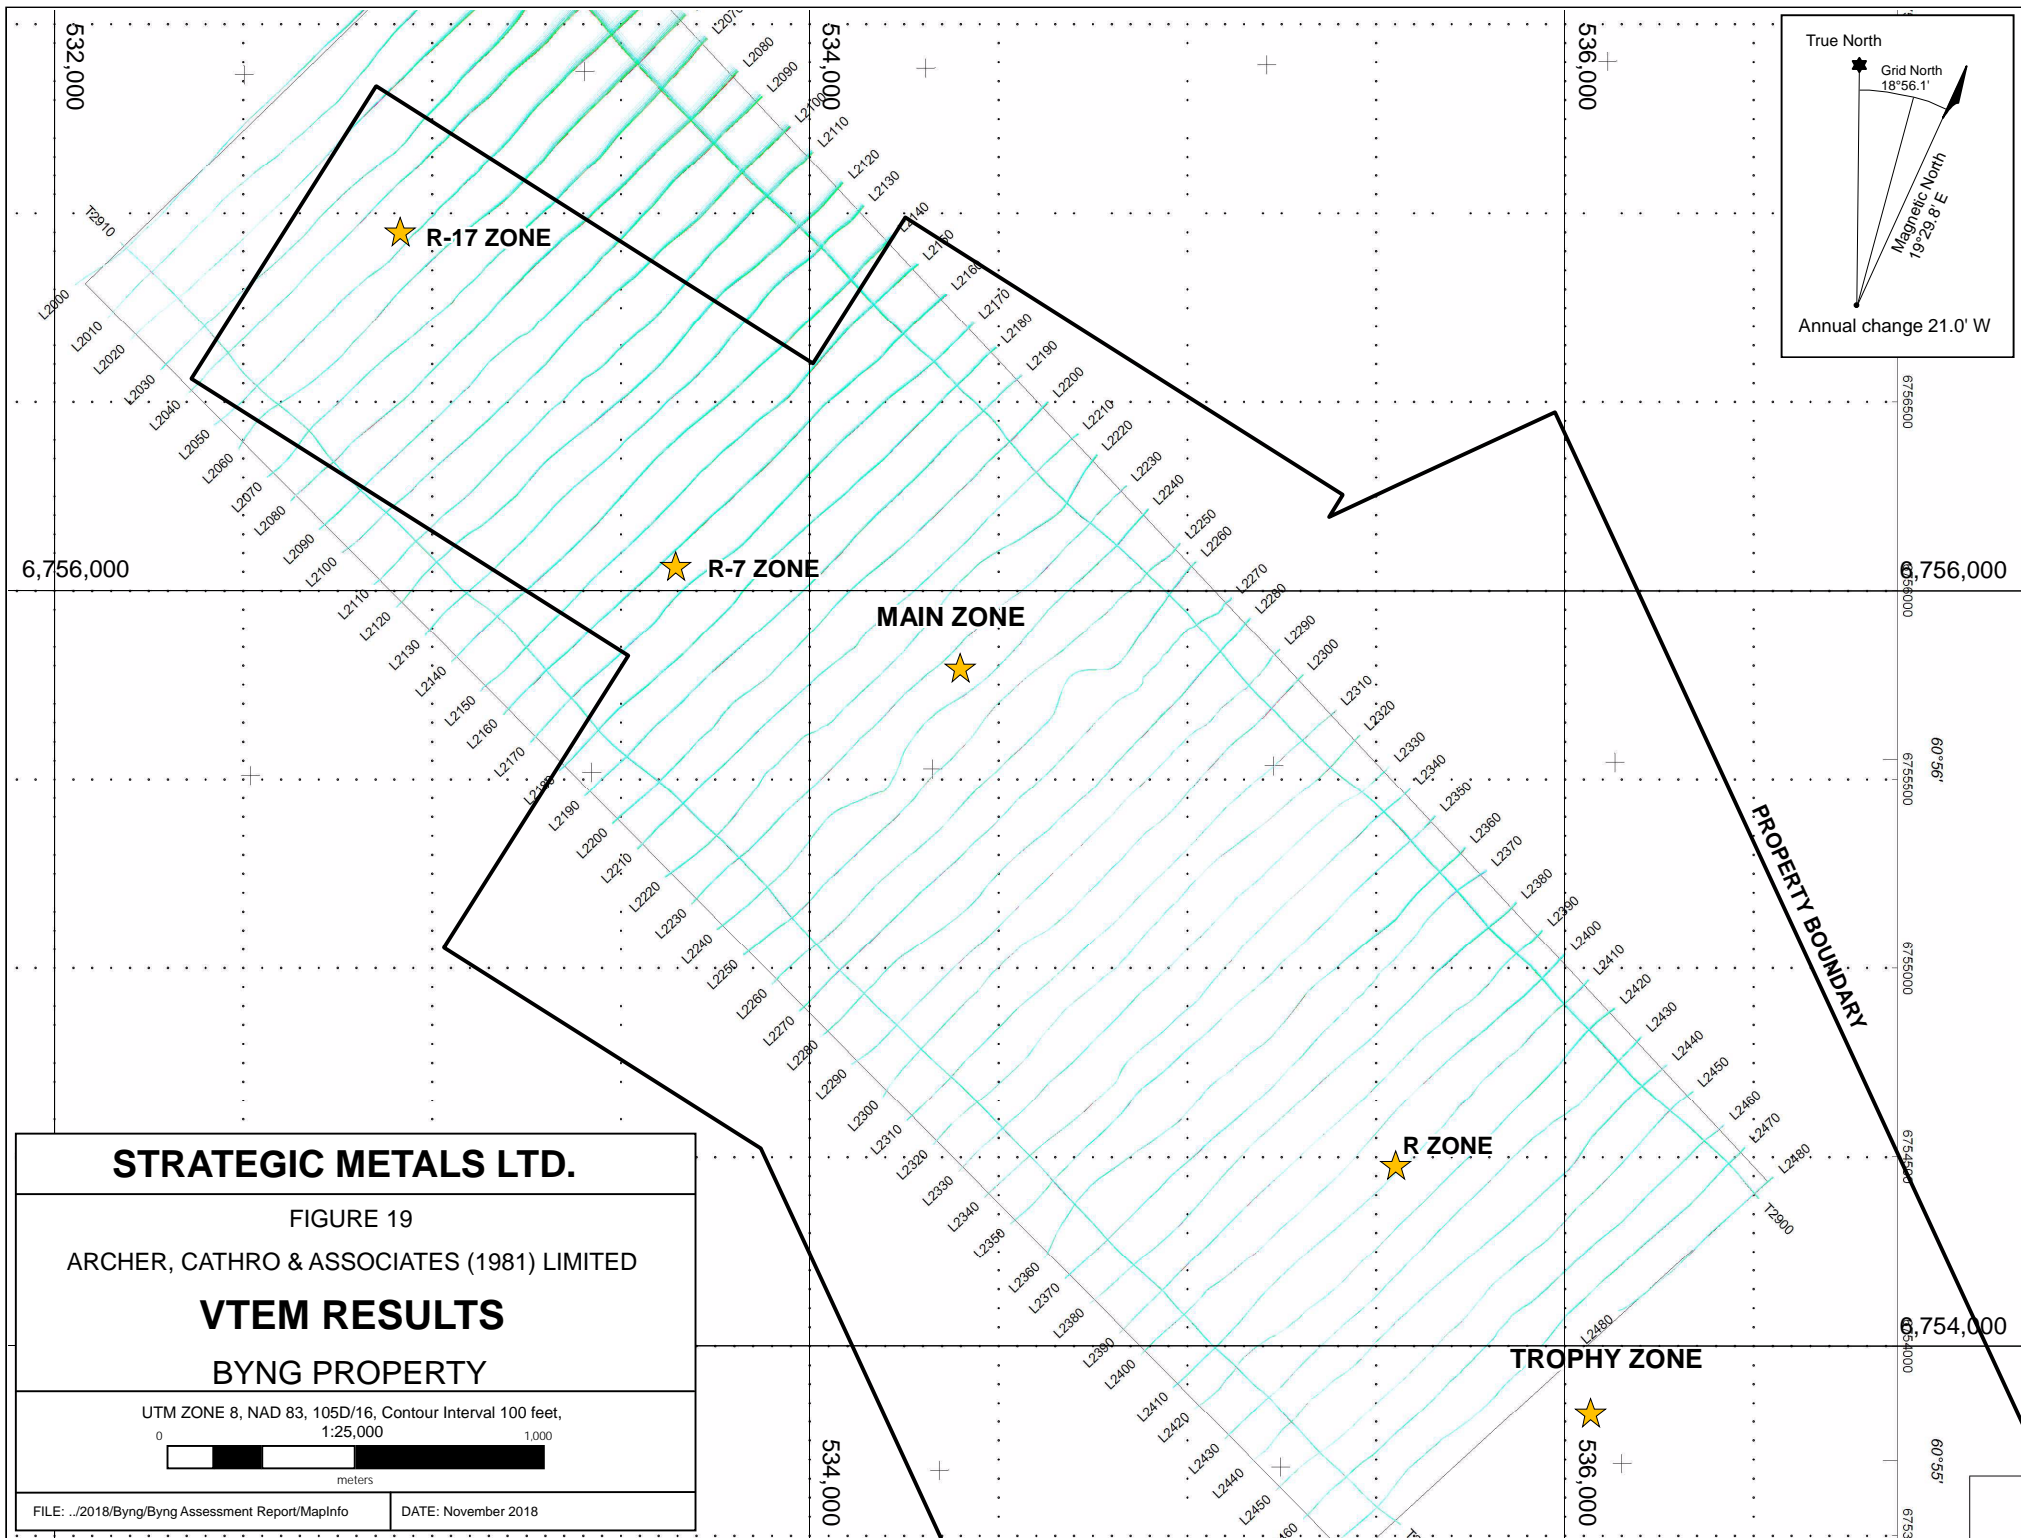

The magnetic data is strongly influenced by topography. Magnetic highs coincide with topographic highs while magnetic lows overlap topographic lows. There is no definitive correlation between magnetic susceptibility and mapped lithological units or structures; however, northerly and northwesterly trending faults around the R-17 Zone locally correspond to magnetic lows and anorthosite bodies are coincident with discrete magnetic highs.

The VTEM response is relatively flat across the property.

LiDAR SURVEY

In 2015, Eagle Mapping Ltd. flew a helicopter-borne LiDAR survey over the Byng property. This survey produced elevation contours, a digital elevation model and digital surface model at one metre resolution, along with a LiDAR intensity map. Full survey details can be found in Burrell, 2015.

LiDAR imagery, along with compiled historical mapping, outlines prospective lineaments on the

Byng property that represent faults or vein structures. Figure 20 shows these trends on the LiDAR image.

Lineament A is situated approximately 100 m west of the Main Zone and coincides with a cluster of strong geochemical anomalies. This cluster follows the trace of a west-northwesterly trending lineament that adjoins the fault that crosses the Main Zone. Northerly and easterly trending rhyolite dykes underlie the anomalous cluster. These intrusions may follow fault planes created prior to late sequence northwesterly faulting.

Lineament Zone B is on the southern flank of Mt. Byng. Several east-trending lineaments, ranging from 200 to 500 m long, splay off a northwesterly fault. Geochemical sampling around these lineaments returned weakly to moderately anomalous gold (up to 50 ppb) and arsenic (up to 200 ppm).

Lineament Zone C lies roughly 120 m east of the Lineament A. A northerly trending structure splits into three separate splays, eventually projecting into a creek channel. Sampling around this feature shows background levels in the south, but increasingly anomalous values toward the north.

DISCUSSION AND CONCLUSIONS

The Byng property covers a series of fault-controlled, gold- and silver-bearing epithermal veins located within volcanic and high level intrusive rocks that are cut by late dykes and regional-scale faults. The volcanic package is part of the Stikinia Terrane, which hosts significant epithermal gold-silver deposits, notably those of the “Golden Triangle” in northern British Columbia.

Soil sampling done in 2018 successfully expanded on previous geochemical coverage, and identified three strong targets, which encompass some of the known mineralization.

Prospecting at the Main Zone, which has been sporadically explored since 1986, yielded high-grade gold and silver values from re-opened trenches and newly discovered float trains. Prospecting in the central part of the property discovered a new zone, the Trophy Zone, which is a wide band of sub-parallel structures that include gold-rich arsenopyrite veins and barren stibnite veins.

The Byng property shows multiple characteristics that are consistent with high level epithermal systems, including: 1) multiple stages of regional-scale faulting, which likely acting as conduits for rhyolite dykes that are associated with mineralization; 2) vuggy quartz and quartz-carbonate breccia veins which yield high-grade gold, silver, arsenic, bismuth and antimony values in close proximity to mapped faults; 3) massive stibnite mineralization, which is frequently found at high levels or in distal parts of hydrothermal systems; and 4) the presence of gossanous ‘vent breccia’ or sinter zones throughout the northern and central parts of the property.

The Byng property definitely warrants additional work because of its prospective geological setting, wide-spread high-grade showings and strong geochemical characteristics. Future work

should include: 1) continued geological mapping, prospecting and soil sampling to discover more veins and better understand mineralization controls; 2) systematic hand trenching at the Main and Trophy Zones; and 3) ground VLF-EM surveys in mineralized or geochemical anomalous parts of the property.

Respectfully submitted,

ROCK SAMPLE DESCRIPTIONS

Rock Sample DescriptionsProperty: Byng

Sample Number: W591619 UTM: 534181 mE Nad83, Zone 8

Elevation: 6969 m UTM: 6755703 mN

Comments: Coarse quartz-carbonate vein float taken from green/white gabbro boulder field (in-situ). Disseminated pyrite (<1%), malachite (<1%) and lesser black sulphide (?) present. Veining has very vuggy and irregular surface

Sample Number: W591620 UTM: 534242 mE Nad83, Zone 8

Elevation: 6969 m UTM: 6755795 mN

Comments: Intensely oxidized and rusty quartz vein taken from vein boulder float. Vein is eakly vuggy (not nearly as vuggy as quartz seen in trenches), but has patches of intense limonite throughout. Quartz is both euhedral and crystalline, and hosts coarse black weathered cubes of pyrite (? - could be sulphosalt?). Appears associated with rhyolite dykes

Sample Number: W591621 UTM: 534248 mE Nad83, Zone 8

Elevation: 6969 m UTM: 6755777 mN

Comments: Milky white vuggy quartz with limonite filled cavities within, and coarse vugs throughout. Quartz resembles quartz seen in trenches. Hosts disseminated pyrite, malachite, manganese and lesser black sulphide (sulphosalt?)

Sample Number: W591623 UTM: 534526 mE Nad83, Zone 8

Elevation: 6969 m UTM: 6756015 mN

Comments: White and green gabbro boulder train with 5-15 cm coarsely crystalline quartz veins with immense limonite filled vugs. Quartz found in float with fragments of rhyolite dyke nearby.

Sample Number: W591624 UTM: 534484 mE Nad83, Zone 8

Elevation: 6969 m UTM: 6755984 mN

Comments: Limonitic quartz breccia vein. Quartz brecciates heavily overprinted bleached gabbro(?), causing green propylitic alteration along vein selvages. Taken from within cluster of high gold-in-soil values.

Rock Sample DescriptionsProperty: Byng

Sample Number: W591625 UTM: 534330 mE Nad83, Zone 8

Elevation: 6969 m UTM: 6755816 mN

Comments: Roughly 25 cm wide slab of intensely vuggy and limonitic +- scoridite weathered quartz vein. Vein has weathered out pyrite cavities throughout that have been filled with limonite, and hosts blebs of black sulphide (sulphosalt?) (similar to W591626) bands within. Found in gabbro dominated talus gully, near quartz stockwork veining.

Sample Number: W591626 UTM: 534238 mE Nad83, Zone 8

Elevation: 6969 m UTM: 6755720 mN

Comments: Intensely oxidized and vuggy sheeted quartz vein with limonite filled cavities throughout. Weathered pyrite pits are present within quartz (slightly smaller than 1 cm size), Black sulphide (sulphosalt?) present in bands throughout the quartz vein, and as large masses. Very heavy!! Taken approximately 20 m from trench 8 on unsampled talus slope.

Sample Number: W591627 UTM: 533709 mE Nad83, Zone 8

Elevation: 6969 m UTM: 6756089 mN

Comments: Rusty carbonate vent breccia veins (vent breccia texture) within hydrothermally altered gabbro. (R7 Zone?)

Sample Number: W591628 UTM: 533709 mE Nad83, Zone 8

Elevation: 6969 m UTM: 6756089 mN

Comments: Pyroxene gabbro with stockwork carbonate veinlets throughout. Unaltered. R7 Zone(?)

Sample Number: W591629 UTM: 534353 mE Nad83, Zone 8

Elevation: 6969 m UTM: 6755748 mN

Comments: Tan weathered, bleached porphyritic rhyolite dyke with minor quartz veinlets throughout. Dyke hosts disseminated magnetite within.

Sample Number: W591630 UTM: 534744 mE Nad83, Zone 8

Elevation: 6969 m UTM: 6755763 mN

Comments: Fine grained, black to dark green mafic volcanics (Joe Mountain Volcanics) within outcrop boulders of pyroxene gabbro. Volcanics display strong surficial oxidation (purple to orange), but is unaltered within.

Rock Sample DescriptionsProperty: Byng

Sample Number: W591631 UTM: 534740 mE Nad83, Zone 8

Elevation: 6969 m UTM: 6755746 mN

Comments: Fragments of vuggy quartz vein within siliceous to epidote-K-spar altered gabbro (float). At site of 250 ppb gold-in-soil.

Sample Number: W591632 UTM: 534740 mE Nad83, Zone 8

Elevation: 6969 m UTM: 6755746 mN

Comments: Gabbro outcrop to boulders ranging from unaltered pyroxene gabbro to slightly siliceous to locally epidote-K-spar altered gabbro.

Sample Number: W591633 UTM: 534913 mE Nad83, Zone 8

Elevation: 6969 m UTM: 6755520 mN

Comments: Carbonate vein vent breccia within hydrothermally altered gabbro. Quartz-carbonate is banded with carbonate along the outer selveges (8cm wide). Disseminated pyrite hosted within viens.

Sample Number: W591634 UTM: 535937 mE Nad83, Zone 8

Elevation: 6969 m UTM: 6753529 mN

Comments: Bleached white porphyritic rhyolite dyke hosting milky quartz (found in float) within.

Sample Number: W591635 UTM: 534273 mE Nad83, Zone 8

Elevation: 6969 m UTM: 6755665 mN

Comments: 1 m trench chip sample. Rusty carbonate vein breccia along gabbro and rhyolite dyke. No difinitive sulphide

Sample Number: W591636 UTM: 534273 mE Nad83, Zone 8

Elevation: 6969 m UTM: 6755667 mN

Comments: Tan weathered to weakly oxidized porphyritic rhyolite dyke with sporadic quartz veining. Small 3 cm quartz vein present hosting blebby pyrite and sulphosalt bands.

Rock Sample Descriptions

Property: Byng

Sample Number: W591637 UTM: 534274 mE Nad83, Zone 8
Elevation: 6969 m UTM: 6755668 mN

Comments: Trench sample 2-3m. Interval hosts sheeted quartz veins up to 8 cm, which hosts disseminated and banded pyrite and sulphosalts.

Sample Number: W591638 UTM: 534274 mE Nad83, Zone 8
Elevation: 6969 m UTM: 6755670 mN

Comments: Trench chip sample 3-4 m. Hosts sheeted quartz with black pyrite and banded sulphosalts within siliceous porphyritic rhyolite and quartz veins.

Sample Number: W591639 UTM: 534279 mE Nad83, Zone 8
Elevation: 6969 m UTM: 6755737 mN

Comments: 40 cm trench chip sample. Oxidized quartz vein and oxidized vein breccia within rhyolite. Pyrite, malachite stain and disseminated sulphosalt (<2%) present.

Sample Number: W591640 UTM: 534276 mE Nad83, Zone 8
Elevation: 6969 m UTM: 6755730 mN

Comments: 35 cm quartz vein (very coarse grained) with intense limonite throughout. Black weathered sulphosalts and pyrite as fine disseminations within.

Sample Number: W591641 UTM: 534210 mE Nad83, Zone 8
Elevation: 6969 m UTM: 6755668 mN

Comments: Historical trench. 1.2 m chip sample. Volcanics with minor barren milky quartz veinlets within.

Sample Number: W591642 UTM: 534210 mE Nad83, Zone 8
Elevation: 6969 m UTM: 6755668 mN

Comments: Historical trench chip sample. 1.2 - 2.4m. Gabbro to rhyolite with minor quartz veining throughout. Quartz veins host pyrite, malachite and blebby sulphosalt (disseminated blebs).

CERTIFICATE WH18185470

Project: Byng

This report is for 142 Soil samples submitted to our lab in Whitehorse, YT, Canada on 31-JUL-2018.

The following have access to data associated with this certificate:

HEATHER BURRELL SCOTT NEWMAN	ANDREW CARNE	JACK MORTON
---------------------------------	--------------	-------------

SAMPLE PREPARATION	
ALS CODE	DESCRIPTION
WEI- 21	Received Sample Weight
LOG- 22	Sample login - Rcd w/o BarCode
SCR- 41	Screen to - 180um and save both

ANALYTICAL PROCEDURES		
ALS CODE	DESCRIPTION	INSTRUMENT
Au- ICP21	Au 30g FA ICP- AES Finish	ICP- AES
ME- MS41	Ultra Trace Aqua Regia ICP- MS	

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.

CERTIFICATE OF ANALYSIS WH18185470

CERTIFICATE COMMENTS

ANALYTICAL COMMENTS

Applies to Method: Gold determinations by this method are semi- quantitative due to the small sample weight used (0.5g).
ME- MS41

LABORATORY ADDRESSES

Applies to Method: Processed at ALS Whitehorse located at 78 Mt. Sima Rd, Whitehorse, YT, Canada.
LOG- 22 SCR- 41 WEI- 21

Applies to Method: Processed at ALS Vancouver located at 2103 Dollarton Hwy, North Vancouver, BC, Canada.
Au- ICP21 ME- MS41

CERTIFICATE WH18185471

Project: Byng

This report is for 250 Soil samples submitted to our lab in Whitehorse, YT, Canada on 31-JUL-2018.

The following have access to data associated with this certificate:

HEATHER BURRELL SCOTT NEWMAN	ANDREW CARNE	JACK MORTON
---------------------------------	--------------	-------------

SAMPLE PREPARATION	
ALS CODE	DESCRIPTION
WEI- 21	Received Sample Weight
LOG- 22	Sample login - Rcd w/o BarCode
SCR- 41	Screen to - 180um and save both

ANALYTICAL PROCEDURES		
ALS CODE	DESCRIPTION	INSTRUMENT
Au- ICP21	Au 30g FA ICP- AES Finish	ICP- AES
ME- MS41	Ultra Trace Aqua Regia ICP- MS	

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.

***** See Appendix Page for comments regarding this certificate *****

CERTIFICATE OF ANALYSIS WH18185471

CERTIFICATE COMMENTS

ANALYTICAL COMMENTS

Applies to Method: Gold determinations by this method are semi- quantitative due to the small sample weight used (0.5g).
ME- MS41

LABORATORY ADDRESSES

Applies to Method: Processed at ALS Whitehorse located at 78 Mt. Sima Rd, Whitehorse, YT, Canada.
LOG- 22 SCR- 41 WEI- 21

Applies to Method: Processed at ALS Vancouver located at 2103 Dollarton Hwy, North Vancouver, BC, Canada.

CERTIFICATE WH18185481

Project: Byng

This report is for 23 Rock samples submitted to our lab in Whitehorse, YT, Canada on 31-JUL-2018.

The following have access to data associated with this certificate:

HEATHER BURRELL SCOTT NEWMAN	ANDREW CARNE	JACK MORTON
---------------------------------	--------------	-------------

SAMPLE PREPARATION	
ALS CODE	DESCRIPTION
WEI- 21	Received Sample Weight
LOG- 21	Sample logging - ClientBarCode
CRU- QC	Crushing QC Test
PUL- QC	Pulverizing QC Test
CRU- 31	Fine crushing - 70% <2mm
SPL- 21	Split sample - riffle splitter
PUL- 31	Pulverize split to 85% < 75 um

ANALYTICAL PROCEDURES		
ALS CODE	DESCRIPTION	INSTRUMENT
Au- ICP21	Au 30g FA ICP- AES Finish	ICP- AES
Au- GRA21	Au 30g FA- GRAV finish	WST- SIM
ME- MS41	Ultra Trace Aqua Regia ICP- MS	

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.

CERTIFICATE WH18191194

Project: Byng

This report is for 221 Soil samples submitted to our lab in Whitehorse, YT, Canada on 6- AUG- 2018.

The following have access to data associated with this certificate:

HEATHER BURRELL SCOTT NEWMAN	ANDREW CARNE	JACK MORTON
---------------------------------	--------------	-------------

SAMPLE PREPARATION	
ALS CODE	DESCRIPTION
WEI- 21	Received Sample Weight
LOG- 22	Sample login - Rcd w/o BarCode
SCR- 41	Screen to - 180um and save both

ANALYTICAL PROCEDURES		
ALS CODE	DESCRIPTION	INSTRUMENT
Au- ICP21	Au 30g FA ICP- AES Finish	ICP- AES
ME- MS41	Ultra Trace Aqua Regia ICP- MS	

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.

***** See Appendix Page for comments regarding this certificate *****

CERTIFICATE OF ANALYSIS WH18191194

CERTIFICATE COMMENTS

ANALYTICAL COMMENTS

Applies to Method: NSS is non- sufficient sample.
ALL METHODS

Applies to Method: Gold determinations by this method are semi- quantitative due to the small sample weight used (0.5g).
ME- MS41

LABORATORY ADDRESSES

Applies to Method: Processed at ALS Whitehorse located at 78 Mt. Sima Rd, Whitehorse, YT, Canada.
LOG- 22 SCR- 41 WEI- 21

Applies to Method: Processed at ALS Vancouver located at 2103 Dollarton Hwy, North Vancouver, BC, Canada.

CERTIFICATE WH18195350

Project: Byng

This report is for 21 Reject samples submitted to our lab in Whitehorse, YT, Canada on 10- AUG- 2018.

The following have access to data associated with this certificate:

HEATHER BURRELL SCOTT NEWMAN	ANDREW CARNE	JACK MORTON
---------------------------------	--------------	-------------

SAMPLE PREPARATION	
ALS CODE	DESCRIPTION
FND- 03	Find Reject for Addn Analysis
SCR- 21	Screen1kg to 106 to 106um
PUL- QC	Pulverizing QC Test
SPL- 21	Split sample - riffle splitter
LOG- 21	Sample logging - ClientBarCode
PUL- 32	Pulverize 1000g to 85% < 75 um
BAG- 01	Bulk Master for Storage

ANALYTICAL PROCEDURES		
ALS CODE	DESCRIPTION	INSTRUMENT
Au- SCR21	Au Screen Fire Assay - 100 to 106 um	WST- SIM
Au- AA25	Ore Grade Au 30g FA AA finish	AAS
Au- AA25D	Ore Grade Au 30g FA AA Dup	AAS

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.

CERTIFICATE WH18197451

Project: BYNG

This report is for 12 Rock samples submitted to our lab in Whitehorse, YT, Canada on 6- AUG- 2018.

The following have access to data associated with this certificate:

HEATHER BURRELL SCOTT NEWMAN	ANDREW CARNE	JACK MORTON
---------------------------------	--------------	-------------

SAMPLE PREPARATION	
ALS CODE	DESCRIPTION
WEI- 21	Received Sample Weight
LOG- 22	Sample login - Rcd w/o BarCode
DRY- 22	Drying - Maximum Temp 60C
CRU- 32	Fine Crushing 90% <2mm
SPL- 21	Split sample - riffle splitter
PUL- 32	Pulverize 1000g to 85% < 75 um
BAG- 01	Bulk Master for Storage
CRU- QC	Crushing QC Test
PUL- QC	Pulverizing QC Test

ANALYTICAL PROCEDURES		
ALS CODE	DESCRIPTION	INSTRUMENT
Au- ICP21	Au 30g FA ICP- AES Finish	ICP- AES
Au- GRA21	Au 30g FA- GRAV finish	WST- SIM
ME- MS41	Ultra Trace Aqua Regia ICP- MS	

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.
