SUMMARY

The Mariposa Property (the “Property”) was acquired in September 2009, by way of an option agreement with the Tintina Syndicate that, granted Pacific Ridge the right to earn a 100% interest in the Property subject to a 2% NSR through making cash and shares payments. With the success of the 2010 YMIP supported exploration program, Pacific Ridge expanded the property to comprise 967 claims covering a 30 x 10 km area, or approximately 265 km².

The property is located 120 kilometres southeast of Dawson City, Yukon. It is also 15 kilometres southeast of the Underworld/Kinross White Gold discovery and 12 kilometres east-northeast of Newmont-Goldcorp’s Coffee property. The Property lies within a regional major northwest trending structural corridor which hosts numerous gold and copper deposits.

The local geological setting of the Mariposa Property is similar to the White Gold and Coffee properties in terms of the host lithologies, the structural controls and brittle style of deformation and the style of gold mineralization. Prior exploration identified an open-ended 7 kilometres long horizon of altered sulphide bearing quartz mica schist in the Skookum Zone area of the Property. This unit is locally flanked by intrusive and mafic rock units, a setting favorable for hosting a gold-mineralizing system.

The history of gold exploration within the Property dates to 1898, when gold was first discovered in Scroggie and Mariposa Creeks. The first mechanized mining began in the mid 1950’s, while large scale mechanized mining began in 1980 and has continued uninterrupted up until the present. It has been estimated that approximately 100,000 ounces of gold with a fineness of 905 has been produced from Mariposa and Scroggie Creeks.

The first lode gold exploration in the area was reported in 1917, when claims were staked over a reported quartz vein occurrence in the area of the Mariposa Creek placer workings in the general vicinity of the current Skookum Jim anomaly. Interest in lode gold exploration picked up in the early 1970’s, with the porphyry copper exploration boom in the Dawson Range, but, it is only during the past 12 years that a sustained exploration effort has been carried out on the Property, including ridge and spur prospecting and geochemical sampling (rock, soil and silt) and, more recently with several localized soil grids throughout the claims.

The Property is located within the central Dawson Range, southwest-central Yukon, where it forms part of a regionally extensive, northwest-southeast trending polymetallic mineral belt associated with Early Jurassic to latest Cretaceous magmatism. It lies entirely within the Yukon-Tanana Terrane (YTT), an accreted terrane separated from the Selwyn Basin and associated carbonate platforms strata of the ancestral North American margin by the NW-SE trending Tintina Fault. The YTT consists of a belt of Late Devonian to Late Permian metamorphic rocks, including various metasedimentary and metavolcanic assemblages, and up to four distinct suites of calc-alkaline metaplutonic rocks (Mortensen, 1996; Colpron et al., 2006). In the Dawson Range, the YTT typically includes intercalated packages of metasedimentary and metavolcanic rock sequences predominantly composed of quartz-mica schist and diorite gneiss. The magmatic episodes are associated with penetrative deformation and metamorphic events ranging in age from late Paleozoic to Tertiary.

The Property is underlain by a polydeformed sequence of Permian through to Jurassic age metasedimentary and metaplutonic rocks that have been intruded by (i) discontinuous bodies of mafic – ultramafic intrusions, (ii) Cretaceous quartz monzonite and granite intrusions, and (iii) feldspar porphyry dykes and small intrusive plugs. The Permian – Jurassic rocks are considered to be ‘basement’ and host gold mineralization on the Mariposa property where they form a NW-striking, variably NE-dipping homoclinal sequence.

Pacific Ridge acquired the Property in 2009 and carried out an initial program of prospecting, soil sampling and trenching, identifying and partially defining the main Skookum Jim target. A total of 2952 auger soil samples were collected. The survey defined a strong gold anomaly approximately 600 m by 1100 with peak gold values to 1570 ppb that was open to the north and west. To the east of Skookum Jim, locally elevated gold results were detected in areas of sporadic permafrost. Soil samples in the Hackly Gold, Maisy May and Big Alex areas also returned elevated gold results. Also, in 2010, with the assistance of a YMIP grant, Richards staked the 128 claim AC claim group in the Alberta Creek area and then carried out a geochemical survey, including 202 soil samples, two silt samples and 11 rock chip samples. Several of the soil samples reported moderately anomalous Au values (20 to 134 ppb) with supporting anomalous Mo, Pb, As and Sb. The claims were subsequently optioned to Pacific Ridge.

In 2011, the program accelerated significantly with the collection of over 8,000 soil samples, ground and airborne magnetic surveys and the completion of 41 drill holes for 6,000 m. Drill highlights from the Skookum Main zone included 2.44 g/t Au over 38.9 m, 1.13 g/t Au over 19.8 m, 0.63 g/t Au over 45.3 m and 1.67 g/t Au over 12 m. Work continued in 2012, with an additional 3,500 soil samples, additional ground magnetics, 1,850 m of trenching in 16 trenches and 2,450 m of drilling in 14 core holes.

In 2013, a small program of soil sampling, with the collection of 134 samples in a gap within the Alberta Creek anomaly, was followed by a high-resolution IP/resistivity survey and a deep penetrating Geoprobe soil survey over the Skookum and Alberta Creek targets. This work was supported by YMIP grant 13-074.

In 2015, Pacific Ridge completed a RAB drill program of 655.3 m in 12 holes (Carlson, 2015). The program, supported by YMEP grant 15-014, successfully defined the orientation of the Skookum Main gold zone with a strike of approximately 060° and a dip of approximately 50° to the southeast. Within the broad, low grade zone, with a thickness of in excess of 100 m, are two and possibly three higher grade zones. Grades ranged 0.5 to 4.96 gpt Au over widths from 1.5 m to over 40 m. The correlation of gold values is generally good from hole to hole, both along strike and in cross section.

In 2016, the Property was optioned to Eureka Dome Gold Inc. (name changed to Four Nines Gold Inc.) (“Four Nines”). In 2016 Four Nines completed a program of mapping, prospecting, review of select core and evaluation of the main showings (Pautler 2016), and five trenches totaling 734 metres. In 2017, Four Nines completed 15 additional trenches at Hackly (trenches 4 to 7), Skookum Main (trenches 1 to 5 and 8 to 12) and Skookum West (trenches 13 to 15). The Property was returned to Pacific Ridge early in 2019.

During the 2019 field season, supported by YMEP 19-039, Pacific Ridge completed a program of mapping of the Four Nines trenches, which hadn’t been previously mapped, sampling of previously unsampled portions of the Four Nines trenches and some additional surface prospecting and sampling in the Hackly area. The Company also completed some additional sampling of Pacific Ridge’s 2012 trenches. Total expenditures of this program amounted to \$19,667.87.

INTRODUCTION

The Mariposa Property (the “Property”) was acquired in September 2009, by way of an option agreement with the Tintina Syndicate that, granted Pacific Ridge the right to earn a 100% interest in the Property subject to a 2% NSR through making cash and shares payments. With the success of the 2010 YMIP supported exploration program, Pacific Ridge expanded the property to comprise 967 claims covering a 30 x 10 km area, or approximately 265 km².

The Property, now comprising 1,311 claims, is located 120 kilometres southeast of Dawson City, Yukon. It is also 15 kilometres southeast of the Underworld/Kinross White Gold discovery and 12 kilometres east-northeast of Newmont Goldcorp’s Coffee property. The Property lies within a regional major northwest trending structural corridor which hosts numerous gold and copper deposits.

The local geological setting of the Mariposa Property is similar to the White Gold and Coffee properties in terms of the host lithologies, the structural controls and brittle style of deformation and the style of gold mineralization. Prior exploration identified an open-ended 7 kilometres long horizon of altered sulphide bearing quartz mica schist in the Skookum Zone area of the Property. This unit is locally flanked by intrusive and mafic rock units, a setting favorable for hosting a gold-mineralizing system.

In this area, prior geochemical soil sampling at the western exposed end of the quartz-mica schist has defined an open ended, two-kilometer-long gold-in-soil anomaly containing values above 20 ppb gold and ranging up to 1300 ppb gold. Additional soil sampling by Tintina also outlined a second open-ended gold target, measuring a kilometer square and overlying nearby intrusive rocks. Samples collected from bedrock exposed by placer mining along Scroggie Creek have returned gold values up to 3 gpt from sulphide-bearing rocks.

The major streams draining the Property are known to contain placer gold, of which Scroggie Creek has had over 100 years of placer gold production which continues today. The placer miners recovered rough, pristine gold nuggets (“hackly gold”) near the headwaters of Mariposa Creek. This suggests the presence of nearby lode gold sources.

The Property has undergone sporadic prospecting efforts over the years looking for the bedrock source of the placer gold. However, it is only during the past 12 years that a sustained exploration effort has been carried out, including ridge and spur prospecting and geochemical sampling (rock, soil and silt) and, more recently with several localized soil grids throughout the claims.

A comprehensive, \$6 million exploration program by Pacific Ridge, including 8,450 m of core drilling in 65 holes, resulted in the discovery of a number of significant gold mineralized zones over a 5 by 12 km area. The best intersection was in drill hole 11MP-01 in the Skookum Main zone that encountered 2.44 gpt Au over 38.9 m, including 6.51 gpt Au over 3.2 m. Subsequent sampling and structural interpretation suggest that this intersection remained open along strike. The 2015 program, utilizing a track portable rotary air blast (RAB) drill from Ground Truth Exploration of Dawson was designed with close spaced holes to test the potential strike extension of this zone, to a depth of approximately 30 m, along an ENE-WSW (60°) trend.

The 2019 exploration program consisted of twelve man-days of trench mapping, sampling and minor prospecting by Morgan Fraughton and Jean Pautler, P. Geo., from July 4 to 9, 2019. Room and board were

obtained at BCM Gold's placer camp on Scroggie Creek. Access was obtained by a fixed wing aircraft, using Great River Air, from Dawson City airport to the Scroggie airstrip. Due to smoke conditions during demobilization, a Trans North helicopter from Thistle Creek was utilized to depart Scroggie and meet the fixed wing from Dawson City at the Black Hills airstrip further north. Subsequently, On September 26, 2019, Jean Pautler spent a day on the Property to examine some the higher-grade portions of the 2012 trenches and to evaluate the requirements for reclaiming these trenches.

The 2019 program was supported by YMEP 19-039. The total expenditures were \$19,667.87.

Figure 1. Yukon Location Sketch.

LOCATION, ACCESS AND PHYSIOGRAPHY

The Mariposa Property is located 120 km south of the Dawson City, Yukon, and is within four 1:50,000 NTS topographic map sheets: 115O/1 & 2, 110J/15 &16 (Figure 1). The property is accessible by helicopter or fixed-wing aircraft from Dawson City or Whitehorse, to a 750 m airstrip located within the Scroggie Creek valley, in the west-central portion of the Property. The Property is also accessible in summer by ATV from Pelly Farm on the north side of Pelly River, 40 km west of Pelly Crossing, a total distance of approximately 70 km. Within the Property, access by ATV is possible along existing placer mining roads which flank Scroggie and Mariposa Creeks. More distant parts of the Property are accessed by helicopter.

For the current program, access was obtained by a fixed wing aircraft, using Great River Air, from Dawson City airport to the Scroggie airstrip. Due to smoke conditions during demobilization, a Trans North helicopter from Thistle Creek was utilized to exit Scroggie and meet the fixed wing from Dawson City at the Black Hills airstrip further north.

The property lies within an unglaciated portion of the Yukon Plateau. The topography is moderate, with low sinuous plateaus cut by narrow valleys and creeks that drain into the broader flat-bottomed valleys of Scroggie and Mariposa Creeks. These drainages are lined with gravels of past and present placer mining workings. Elevations in the area range from 900 m to 1150 m above sea level. Spruce and poplar trees are found on south-facing slopes while the north-facing slopes are sparsely treed with dwarf spruce. Permafrost is intermittent and is limited to north-facing slopes and valley bottoms. Much of the property was burned during a 2009 forest fire.

There is less than 5% outcrop exposed on the property. In the areas of drilling, overburden in the Mariposa Grid area has been shown to range from 2 to 6 m in depth. Much of the central Yukon is covered by a thin blanket of volcanic ash and tephra that resulted from recent eruptions in Alaska.

CLAIM STATUS

The Mariposa Property consists of 1,311 quartz claims within the Dawson Mining District (the “Property”). The claims are owned 100% by Pacific Ridge and are subject to a 2% Net Smelter Royalty. The claims are shown in Figure 2 and a full list of claims is included in Appendix I.

Figure 2. Mariposa Property Claim Map.

PROPERTY HISTORY

The history of gold exploration within the Property dates to 1898, when gold was first discovered in Scroggie and Mariposa Creeks. The first mechanized mining began in the mid 1950's, while large scale mechanized mining began in 1980 and has continued uninterrupted up until the present. It has been estimated that approximately 100,000 ounces of gold with a fineness of 905 has been produced from Mariposa and Scroggie Creeks (Richards, 2005).

The first lode gold exploration in the area was reported in 1917, when claims were staked over a reported quartz vein occurrence in the area of the Mariposa Creek placer workings in the general vicinity of the current Skookum Jim anomaly.

In 1971 and 1972, Silver Standard Mines Limited and American Smelting & Refining Company prospected a copper-molybdenum porphyry occurrence in the Scroggie Creek area (McMichael, 1973), located south of Scroggie Creek and just outside the Property boundary. Sparse mineralization observed related to a siliceous, medium-grained quartz-feldspar porphyry included finely disseminated chalcopyrite and pyrite. Finely disseminated molybdenite occurs as quartz vein fracture coatings in a quartz-rich breccia, approximately 130 m wide and unknown strike length. Soil sampling outlined a 1,000 m by 300 m plus 100 ppm Cu anomaly and a coincident 1,000 m by 250 plus 60 ppm Mo anomaly. McMichael concluded that Mo appeared to be the primary metal of interest in the system.

In 1980, Amax of Canada Limited (Booth et. al., 1980) completed additional soil sampling and confirmed the Cu-Mo soil anomaly and completed an IP geophysical survey which outlined a weak (1% sulphide content) chargeability anomaly beneath the soil anomaly. In addition to the Cu and Mo mineralization, one speck of native gold was observed in a schist specimen. Gold in soils was typically low, 10 ppb (detection limit), with a few samples in the 30 to 40 ppb range.

In 1986, Kerr Addison Mines Ltd. staked the SIZZLER showing, now within a third-party claim inside the eastern portion of the Mariposa property. The area of interest includes quartz stringers, stringer stockworks and silicified breccias over a 1.7 km diameter area (Pautler, 1986). Soil geochemistry failed to locate a significant gold anomaly, but two rock samples from the southwest margin of the silicified area assayed 1,050 and 400 ppb Au.

In 1986, Doron Exploration Inc. staked the Pyroxene Mountain claims, located just to the north of the Mariposa property (Wallis, 1987). The property was acquired in order to examine the potential for platinum group mineralization associated with the ultramafic rock units that underlie Pyroxene Mountain. Previous workers had noticed that placer gold in creeks with their headwaters on Pyroxene Mountain contained appreciable amounts of platinum group minerals. Work in 1987 (Waugh, 1988) included the collection of 1596 soil samples and 22 rock samples along 101 km of survey line. The survey outlined two Pt-Pd soil anomalies as well as several other single point anomalies and one rock sample that assayed 0.444 opt Au.

In 1987, Ron McPhee staked the Wine and Fish claims, located within the current Property boundary, along the north side of Scroggie and Mariposa Creeks and in the area of Pacific Ridge's Skookum Jim anomaly (Minfile 1150-075). Initial exploration work defined a weak gold in soils anomaly north of upper Mariposa Creek.

Figure 3. Mariposa Property showing historical placer workings and main target areas.

In 1988, D. Waugh (1989) completed a program of prospecting and the collection of 174 rock samples on the Fish and Wine claims. Most of the work was completed on the Fish 94 claim in an area at the intersection of two structural lineaments. Assay results were disappointing, mostly below 30 ppb, with the exception of three samples that ran 3.1 gpt, 2.6 gpt and 2.0 gpt Au.

During the 1988 placer mining season, Richards (2005) reports that mining cuts along Scroggie Creek downstream from Stevens Creek yielded abundant arsenopyrite crystals in the sluice concentrates over about 300 meters of workings. No source for the arsenopyrite was ever found during the course of excavation for placer mining.

Richards (2005) also reports that in 1990 a black sand sluice concentrate, containing coarse gold, was anomalous for several elements including Au, Ag, Bi, Pb, W and Sn. He concluded that this suite of elements could be indicative of an intrusion-related gold deposit. Pt and Pd values were also anomalous.

In 1990, Ron McPhee carried out an additional work program on the Irish and Kip claims on Pyroxene Mountain (Richards, 1991). The work included a VLF-EM survey and soil sampling. The soils were moderately anomalous in Cr, Ni and Cu. A VLF was defined conductor that correlates with a significant linear magnetic anomaly, interpreted to be caused by massive magnetite, conductive sulphides or serpentinization.

In 1996, Newmont Exploration Limited completed a one-day property examination of the Bos and Stock claims on Pyroxene Mountain (Stammers, 1996). The examination was carried out in the area of the previous best results. However, these results could not be duplicated.

In 1999, Shawn Ryan staked the Scroggie 1-16 claims, along the east side of Scroggie Creek adjacent to the Rum Run claim group and completed a program of prospecting and sampling. Ryan reported two

anomalous silt samples of 77 ppb and 378 ppb, the latter near an occurrence of pegmatite. In 2000, Ryan added the Scroggie 17-24 claims.

Gordon Richards began prospecting the area in 1999 and staked the RUM RUN 1-20 quartz claims. In June 2000, Richards added the RUM RUN 21-50 and 53-59 claims. Initial work involved prospecting and limited soil sampling (Richards, 2001). The Pegmatite Zone, along Scroggie Creek on the Rum Run 1-20 claims, is defined by a gold-in-soil anomaly approximately 1 km in diameter, with associated moderate anomalies of Mo, Pb and Sb. Rock outcrops with anomalous gold values, up to 3,020 ppb, are associated with quartz stockwork in pegmatitic units. In July and August 2001, he completed a program of geochemical sampling, including 95 soils, 15 rock chips and 4 silt samples, mapping and a VLF-EM geophysical survey in an effort to locate the Scroggie fault.

During 2000, Morgan (2001) completed prospecting and geochemical sampling (11 soils, 5 rocks and 4 stream sediments) on the Wolf 1-42 and Pyrex 1-4 claims, adjoining the Rum Run claims along Scroggie Creek to the east. The highest gold value, from a soil sample, was 111 ppb Au.

Richards (2004) reported that in 2001, gold-quartz pebbles with angular gold were obtained from a localized area of placer workings along Scroggie Creek, with a gold-in soil anomaly identified on the slope above this occurrence. He believed that this occurrence could indicate the possible importance of the Scroggie Fault or related splays in controlling bedrock gold mineralization. However, no bedrock gold source has yet been found in this area.

In July and August of 2003 Richards (2004) completed magnetometer surveys and limited geochemical sampling over the Pegmatite, QMS and East Zones. The magnetic surveys over the Pegmatite and QMS zones were generally featureless. Over the East Zone, linear highs trending southwesterly probably reflect mafic layers, parallel to the metamorphic foliation.

In 2005, Richards completed a magnetometer survey near the south end of the Scroggie airstrip and another magnetic survey on the east side of the property (Richards, 2005; Richards 2005 YMIP). The purpose of the surveys was to fill in areas between previous surveys in an effort to tie down the location of the Scroggie Fault. Richards suggests that a weak magnetic low along Scroggie Creek could be related to the fault. A strong mag high is associated with the contact between metamorphic rocks and the younger granodiorite. In addition, 8.5 km of VLF-EM surveying was carried out along 200 m spaced lines. No significant anomalies were detected.

In 2005, Richards (2006A) completed a program of mapping, sampling and a magnetometer survey on his East Zone. Of 42 soil samples collected, only a weak gold anomaly was defined with associated Bi-Pb-Te-As-Ag values. The magnetic survey detected linear trends reflecting compositional layering in metamorphic rocks.

During the 2006 field season, Richards completed an orientation mobile metal ion ("MMI") soil survey along selected lines throughout the property and dug a tractor trench along Scroggie Creek. Initial results from the MMI work were encouraging, with anomalous values in Au and Ag supported by anomalous Zn, Mo and Pb, providing more discrete targets than conventional soil sampling. The trenching failed to locate mineralization related to the Scroggie Fault. Much of this exploration work was completed with the assistance of YMIP grubstake and target evaluation grants (Richards, 2006B).

In 2008, Richards (2009) completed a program of bedrock sampling from recent mining cuts along Scroggie Creek and MMI sampling along the base of slope west of the mining cuts on the Cigar claims, contiguous with the north end of the Rum Run claim block. Pyrite and pyrrhotite were noted in many of the rock samples, along with minor disseminated chalcopyrite. The samples contained weakly anomalous values of Cu and Mo, but not Au. The MMI samples showed only a weak Cu anomaly. The zone of potential copper mineralization is open to the north.

In 2008 and 2009, Richards added the Toluamide claims to the claim group.

In 2009, Richards completed a program of geochemical soil sampling and rock sampling over selected areas within the Toluamide claim group. In September 2009, Richards optioned the Mariposa claim group, including 203 mineral claims, to Pacific Ridge.

Pacific Ridge's 2010 exploration program included prospecting, rock sampling, grid soil sampling and trenching in the area of the newly discovered Skookum Jim anomaly (now Skookum Main) and staked an additional 40 AP claims to the north. A total of 2,952 auger soil samples were collected. The survey defined a strong gold anomaly approximately 600 m by 1,100 with peak gold values to 1,570 ppb that was open to the north and west. To the east of Skookum Jim, locally elevated gold results were detected in areas of sporadic permafrost. Soil samples in the Hackly Gold, Maisy May and Big Alex areas also returned elevated gold results. Five trenches were completed for a total of 1,605 m of trenches in the area of the Skookum Main zone.

Also, in 2010, with the assistance of a YMIP grant, Richards (2010) staked the 128 claim AC claim group in the Alberta Creek area and then carried out a geochemical survey, including 202 soil samples, two silt samples and 11 rock chip samples. Several of the soil samples reported moderately anomalous Au values (20 to 134 ppb) with supporting anomalous Mo, Pb, As and Sb. The claims were subsequently optioned to Pacific Ridge.

In April 2011, the Company completed a high-resolution aeromagnetic survey over the Skookum Zone and adjacent areas, in the west central part of the Property, by Precision GeoSurveys Inc. of Vancouver, BC, using a helicopter-mounted cesium vapor magnetometer (Fingler, 2011). A total of 900-line kilometers were flown along 100 metre spaced lines and 1000 metre spaced tie lines. The survey was successful in providing high resolution definition of both stratigraphy and structural discontinuities.

In June 2011, The Company added an additional 387 claims by staking, to bring the total to over 1400 claims covering 262 contiguous km².

In 2011, (Carlson, 2013) the program accelerated significantly with the collection of over 8,000 soil samples, ground and airborne magnetic surveys and the completion of 41 drill holes for 6,000 m. Drill highlights from the Skookum Main zone included 2.44 g/t Au over 38.9 m, 1.13 g/t Au over 19.8 m, 0.63 g/t Au over 45.3 m and 1.67 g/t Au over 12 m. Work continued in 2012, with an additional 3,500 soil samples, additional ground magnetics, 1,850 m of trenching in 16 trenches and 2,450 m of drilling in 14 core holes. Drill results from the 2011 and 2012 programs are summarized in Tables i and ii.

Table i. 2011 Drill Highlights.

| Hole | From | To | Width | Au | Zone |

In 2013, a small program of soil sampling, with the collection of 134 samples in a gap within the Alberta Creek anomaly, was followed by a high-resolution IP/resistivity survey and a deep penetrating Geoprobe soil survey over the Skookum and Alberta Creek targets (Carlson, 2014). This work was supported by YMIP grant 13-074. Results from this program led to the recommendation for a RAB drill program to test

In 2015, Pacific Ridge completed a RAB drill program of 655.3m in 12 holes over a 125m strike length on the Skookum Main showing. This drilling confirmed a 060-070°55°SE trend to mineralization (Carlson, 2015). The most significant results were 0.619 g/t Au over the entire 41.15m in 15MPR-11, 0.841 g/t Au over 28.96m in hole 15MPR-07, and 0.586 g/t Au over 24.38m in hole 15MPR-10 (Carlson, 2015).

In 2016, the Property was optioned to Eureka Dome Gold Inc. (name changed to Four Nines Gold Inc.) (“Four Nines”). In 2016 Four Nines completed a program of mapping, prospecting, review of select core and evaluation of the main showings (Pautler 2016), producing a property geology map. A sample

containing 102.9 g/t Au was collected from quartz vein float with galena, similar to the Hackly breccia mineralization, near upper Mariposa Creek. Five new trenches totaling 734 m were excavated and sampled; two on the Hackly target and three on the Skookum West target. Summary results are shown in the table below.

Table iii. Four Nines 2016 Trench Sample Highlights

In 2017, Four Nines completed 15 additional trenches at Hackly (trenches 4 to 7), Skookum Main (trenches 1 to 5 and 8 to 12) and Skookum West (trenches 13 to 15). The focus of the trenching was to create deeper bedrock exposure, to better define controls on mineralization and trends of mineralization. Summary results are shown in the table below.

REGIONAL GEOLOGY

The Property is located within the central Dawson Range, southwest-central Yukon, where it forms part of a regionally extensive, northwest-southeast trending polymetallic mineral belt associated with Early Jurassic to latest Cretaceous magmatism.

The Property lies entirely within the Yukon-Tanana Terrane (YTT), an accreted terrane separated from the Selwyn Basin and associated carbonate platforms strata of the ancestral North American margin by the NW-SE trending Tintina Fault. The NW-SE trending Denali or Shakwak Fault, located approximately 190 km to the southwest, forms the southwestern boundary of the YTT (Gordey and Makepeace, 1999).

The YTT consists of a belt of Late Devonian to Late Permian metamorphic rocks, including various metasedimentary and metavolcanic assemblages, and up to four distinct suites of calc-alkaline metaplutonic rocks (Mortensen, 1992; Colpron et al., 2006). In the Dawson Range, the YTT typically includes intercalated packages of metasedimentary and metavolcanic rock sequences predominantly composed of quartz-mica schist and diorite gneiss. The magmatic episodes are associated with penetrative deformation and metamorphic events ranging in age from late Paleozoic to Tertiary.

According to Colpron (2006), the Yukon Tanana Terrane consists of four unconformity-bounded tectonic assemblages: the basal siliciclastic Snowcap Assemblage, and three volcanic and volcanioclastic sequences including the Upper Devonian to Upper Mississippian Finlayson Assemblage, the Mid Mississippian to Lower Permian Klinit Assemblage and the Mid to Upper Permian Klondike Assemblage. A coeval oceanic sequence of chert, argillite and mafic volcanic rocks of the Slide Mountain Terrane is preserved discontinuously along the eastern margin of the YTT. A sequence of immature fine-grained clastic rocks and polymictic conglomerate of Permian to late Triassic age overlie the strata of the YTT and adjacent Slide Mountain Terrane, as well as the Selwyn basin to the east.

Plutonic rocks of the mid-Cretaceous Dawson Range batholith intrude the Yukon-Tanana terrane over vast areas and consist of large bodies of granodiorite and quartz monzonite, and smaller high-level felsic porphyry plugs and sills. The Property is underlain by one of the larger bodies of this unit.

Locally, narrow ultramafic units of unknown age have been emplaced along major structures within the Yukon-Tanana terrane. Pyroxene Mountain, located immediately to the northeast of the Property, is cored by this ultramafic unit.

Figure 4. Mariposa property regional geology.

PROPERTY GEOLOGY

The Mariposa property is located 120km south of Dawson City and 315km northwest of Whitehorse (Fig. 5). The property lies within the central Dawson Range, SW central Yukon, where it forms part of the regionally extensive, NW-SE trending polymetallic mineral belt associated with Early Jurassic to latest Cretaceous magmatism.

The Mariposa property, which occurs entirely within the Yukon-Tanana terrane, is underlain by a polydeformed sequence of Permian through to Jurassic age metasedimentary and metaplutonic rocks that have been intruded by (i) discontinuous bodies of mafic – ultramafic intrusions, (ii) Cretaceous quartz monzonite and granite intrusions, and (iii) feldspar porphyry dykes and small intrusive plugs. The Permian – Jurassic rocks are considered to be ‘basement’ and host gold mineralization on the Mariposa property where they form a NW-striking, variably NE-dipping homoclinal sequence. Polyphase ductile deformation is responsible for the intercalation of Permian gneiss and schist packages of diverse compositions, in addition to foliation development within Jurassic intrusions that occur within the basement terrain. Metamorphism associated with ductile deformation attained at least mid- Amphibolite facies as evidenced by the kyanite-muscovite \pm garnet, \pm magnetite \pm staurolite assemblage that has been reported on both sides of Scroggie Creek at the south end of the airstrip (Richards, 2005). At least two episodes of brittle faulting have been observed to post-date the ductile deformation on the Mariposa property, the older of the two brittle events is associated with gold mineralization. A geological map with significant gold zones for the Mariposa property is presented in Figure 6. The map represents integration of field traverses by Pacific Ridge Exploration Ltd. staff in the Skookum West and Skookum Main zones, historical mapping by Gordon Richards (property vendor), fault and lineament interpretations derived from high resolution aeromagnetic data flown for the property and available regional government geological mapping.

Devono – Mississippian Basement

Several schist and gneiss units have been mapped on the Mariposa property where they form part of the Devono – Mississippian Yukon-Tanana terrane basement. Mappable units of surface and recognized in drill core include:

- ↗ Mafic-intermediate hornblende gneiss – Compositionally banded gneiss package varying from locally ultramafic (hornblendite) to pegmatitic granitic-granodioritic horizons. The mafic-intermediate gneiss package is transitional into a banded quartz diorite gneiss.
- ↗ Banded quartz diorite gneiss is comprised cm-scale layered felsic, intermediate and mafic (biotite-rich) intervals but is often dominated by the presence of a moderately foliated quartz-diorite (McIntosh, 2012). Locally, narrow bands of fine (≤ 2 mm) pink garnets have been noted in unit and mafic bands may show (sometimes intense) epidote alteration \pm secondary biotite and minor chalcopyrite (McIntosh, 2012).
- ↗ Granodioritic biotite gneiss is characterized by textures that vary from gneissose to weak to moderately foliated and is a medium grained, leucocratic rock. The granodioritic gneiss is intimately interleaved with biotite rich mafic-intermediate hornblende gneiss unit. The

granodiorite often exhibits distinctive sericite alteration clots when in the sericite alteration zone (McIntosh, 2012).

- Biotite Gneiss - Strongly foliated, melanocratic, fine-grained biotite-rich unit with variable biotite content but 40% - 50% is common. Biotite gneiss is often banded, with leucocratic units of foliated granodiorite.
- Granitic gneiss
- Felsic gneiss – quartz-sericite+/- talc gneiss unit exhibiting granoblastic textures and locally hosting early stage chalcopyrite-pyrite mineralization. The bleached colour of the gneiss package distinguishes it from other gneisses on the property.
- Quartz-muscovite-garnet schist – Strongly foliated, silvery- grey quartz muscovite schist with garnet porphyroblasts up to 2cm in diameter. This schist unit occurs immediate south of the Skookum West target and is associated with multi-element soil anomalies
- Marble – occurs as discontinuous lenses within felsic gneiss in the Alberta Creek target area

Of these map units, the granodioritic biotite gneiss to foliated biotite granodiorite represents the most important host lithology for gold mineralization.

Jurassic Intrusives

Jurassic intrusive rocks occur north of the Skookum main and east of the Big Alex targets and vary from monzonitic to granitic in composition. Pegmatite is common and perthite is often observed. Jurassic intrusions are locally observed to cut Devono-Mississippian basement rocks; however, they have also undergone penetrative deformation and have variably developed mineral fabrics. These intrusions are not an important host to gold mineralization. A minor amount of gabbro variable to pyroxenite occurs at the eastern boundary of the property. The unit is continuous with exposures of ultramafic rocks that constitute Pyroxene Mountain. The age of this map unit is currently not known, however, weak to moderately developed mineral fabrics in the unit imply they pre-date at least some phase of ductile deformation.

Cretaceous and Younger Intrusives

Several small plugs of Cretaceous quartz monzonite to granodiorite are illustrated on the geological map of the Mariposa property, however their occurrence needs to be verified. Quartz feldspar porphyry dykes and small intrusive bodies are located towards the eastern end of the property, in close proximity to the Sizzler target. In the vicinity of the Sizzler target, a NNW-trending dyke swarm is locally associated with anomalous gold. Dykes occurring in the swarm range from fine-grained, equigranular dacite with 1-2% disseminated pyrite to localized rhyolitic breccia.

Figure 5. Mariposa property geology.

Structure

Ductile deformation of basement lithologies is expressed as planar and linear metamorphic mineral fabric alignment (both schist and gneissose lithological units), leucosome formation and alkali feldspar augen development in more porphyroclastic units. The general geometry of the metamorphic basement rocks consists of a NW-striking, variable NE dipping homoclinal sequence, which is readily identified in the high-resolution aeromagnetic data.

At least two episodes of brittle faulting are recognized to post-date ductile deformation on the Mariposa property, including an ENE-trending sinistral fault system associated with gold mineralization, and a NE to NNE striking fault set that may offset the mineralized structures. A more detailed examination of gold mineralizing structures in the Skookum West and Skookum Main zones indicates that two primary orientations of structures are present and include N- to NNW and E- to ENE trending fault structures. This geometry is replicated on the Coffee property and also within the Golden Saddle deposit. Brittle faults are expressed as fault breccia, gouge and cataclasite development associated with sericite-alkali feldspar-pyrite and quartz alteration.

2019 EXPLORATION PROGRAM

The 2019 exploration program on the Mariposa Project consisted of twelve man-days of trench mapping, sampling and prospecting by Morgan Fraughton and Jean Pautler, P. Geo., from July 4 to 9, 2019. Access from the Scroggie placer camp was obtained by ATV along existing access roads/trails. The main road up the hill from the Mariposa placer camp to the trenches required a few hours of clearing with a chain saw to allow for ATV access to the top of the hill due to blow down through the 2009 burn on the hillside. ATV rental was obtained from Aquila Mining at the Mariposa placer camp.

Table v. 2012 Trench Locations.

| Trench | From | | To | | Length (m) | Az (°) |
|--------------|---------|----------|---------|----------|---------------|-----------|
| | Easting | Northing | Easting | Northing | | |
| SWTR12-2 | 622940 | 6988863 | 622975 | 6988776 | 99 | 160 |

| TOTAL | | | | | 982 | |

Subsequently, On September 26, 2019, Jean Pautler spent a day on the Property to examine the higher-grade portions of the 2012 trenches and to evaluate the requirements for reclaiming these trenches. Access was via a fixed wing aircraft, using Great River Air, from Dawson City airport to the Scroggie airstrip. Seven samples were collected from a number of the 2012 trenches.

The locations of trenches from 2012 are shown in Table v while Table vi details the location of all trenches sampled and the number of samples from each trench.

Table vi. 2019 Summary of 2012 and 2017 trenches mapped and sampled.

| Trench No. | Zone | Easting | Northing | Samples |
|----------------------|--------------|---------|----------|-----------|
| TR12-03 | Skookum West | 622923 | 6988803 | 1 |

Samples were collected in poly sample bags. Each bag was labelled with a unique 7-digit number and a tag bearing the same number was also inserted in the bag. Each sample site was marked with a similar tag tied by flagging tape to a nearby tree or bush. Samples were then collected in rice bags labelled with the hole number and sample sequence and each rice bag was sealed with uniquely numbered rice bag.

Samples from the July 2019 field work were sent to the Bureau Veritas preparation facility in Whitehorse, Yukon. Pulp samples were prepared in Whitehorse and then sent to the BV facility in Vancouver for analysis. Samples were prepared using the PRP70-250 method which involves crushing the material to 2 mm and then splitting off and pulverizing up to 250 grams to 75 microns. The resulting pulp was analyzed by the AQ200 method, which involves dissolving 0.5 g of material in a hot Aqua Regia solution and determining the concentration of 36 elements of the resulting analyte by the ICP-MS technique plus fire assay of a 30 g sample using method FA430.

Samples from the September 26, 2019 field work were sent to the ALS Minerals facility in Whitehorse, Yukon. Preparation was conducted on a larger sample size to adjust for the inhomogeneity of the mineralization; 90% was crushed to <2 mm and 500 g split, using method Prep-31H. The samples were analysed by fire assay for gold with an atomic absorption finish on a 30 g aliquot with method Au-AA-23 and multi-element analysis by inductively coupled plasma techniques with method ME-ICP-41.

Assay certificates are in Appendix II.

Figure 6. Trench location map.

Program Results

2012 Trench Mapping and Sampling

Jean Pautler (2019A) completed a one-day evaluation of the 2012 trenches and the requirements for their reclamation. The trenches were photographed to document their condition and to aid in assessing the reclamation procedure. The locations were confirmed (table 6) and seven grab samples were collected to aid in evaluating their potential. Sample descriptions and locations are shown in Table vii and Figures 6 and 7.

The following notes are quoted from Pautler (2019A), who observed that there was little detail to see in the 2012 trenches due to slumping.

The anomalous intercept of 0.886 g/t Au over 20m, including 1.8 g/t Au over 5m, in SWTR12-9, with a proximal anomalous gold in Geoprobe value, occurs within stockwork veining with strong limonite fracture fillings and specular hematite at the augen gneiss/hornblende gneiss contact and lies approximately 150m at 240° from a quartz-ankerite vein exposed as 20 cm blocks in SWTR12-8 with abundant limonite fractures and minor chalcopyrite and pyrite. Elevated values were obtained between the two trenches in TR16-3 and in SWTR12-10 another 150 along strike to the SSW, although no significant results were obtained in TR16-4, located between SWTR12-9 and -10. Chalcopyrite also occurs within a vein in TR17-11 within the Main zone, trending 120°/72°S, and at the Hackly zone trending 080°/080-88°S.

The above vein system may continue through SWTR-5 (630m at 240° from SWTR-9) where it returned 1.5 g/t Au over 4m. Mineralization is similar to that observed in SWTR12-9 with strong limonitic fractures and quartz stockwork. Specular hematite oxidized cubic pyrite and potassic haloes were also observed. Fractures measured within the trench suggest possible 070° and 080° trends, both dipping at 90°. The slight curvature of the vein may suggest an overall slight northerly dip and be missed by diamond drill holes 11MP-34 and -35. SWTR12-4 did not extend far enough to the south. The intercepts in SWTR12-2 (1.06 g/t Au over 10m) and -3 (0.7 g/t Au over 10m) lie 400 and 430m at 240° from SWTR12-5. DDH 11MP-36 and -38 were collared proximal to the vein. DDH MP-38 was drilled away from the vein and DDH 11MP-36 was almost sub-parallel to the vein and would have intersected it near the collar but within the 6.1m of casing.

The intercept in SWTR12-11 (1.4 g/t Au over 40m) corresponds to an extensive zone of quartz veining. The trend here is unknown but could be 280-300°/N, which may explain the miss in DDH 11MP-33. Follow up detailed soils may help define the structure.

Elevated gold occurs further north in SWTR12-9, with a coincident anomalous gold in Geoprobe, along trend of a 3m wide quartz-ankerite vein system exposed in TR17-15, which continues another 30m to TR17-14, and possibly another 70m to TR17-13 (but the vein here may trend 120°/70SW°). Results from TR17-14 and -15 were <0.5 g/t Au, but TR17-13 yielded 1.68 g/t Au over 4.5m, including 4.05 g/t Au over 1.5m. The vein system may continue another 150m through to the start of SWTR12-10 where 3-4 cm quartz pieces were exposed, but no anomalous gold values were obtained. The vein may continue to the north of SWTR12-10.

Table vii. 2019 Rock Sampling from 2012 Trenches.

| 2019 09 26 Rock Sample Descriptions | | | | | MARIPOSA PROJECT | | | | | | |
|-------------------------------------|----------|---------------|----------|-------|------------------|---|--|-------|------|------|-----|
| SAMPLE | GENERAL | NAD 83 Zone 7 | | ELEV. | | | | Au | Ag | Pb | Cu |
| NUMBER | LOCATION | EASTING | NORTHING | (ft) | TYPE | DESCRIPTION | | ppm | ppm | ppm | ppm |
| 1813285 | TR12-08 | 624013 | 6989322 | 3275 | grab | quartz - ankerite vein float with limonite as fracture fillings and vuggy infilling, minor Mn fracture fillings, minor pyrite, chalcopyrite, malachite in quartz, some grey patches | | 3.940 | 1.6 | 1065 | 92 |
| 1813286 | TR12-09 | 623889 | 6989241 | 3329 | grab | silicified, sericite altered orthogneiss with strong quartz-limonite ±Mn fracture fillings, quartz veins to 1 cm and fine crosscutting quartz veinlets, dark limonite infilling vugs in quartz | | 0.028 | <0.2 | 5 | 2 |
| 1813287 | TR12-05 | 623293 | 6989027 | 3349 | grab | quartz veinlets to 0.5 cm with Kspar haloes, some irregular limonite, Mn & specular hematite on fractures, 3% oxidized cubic pyrite, strong fine limonite veinlets to stockwork of fractures cutting sericite altered orthogneiss; possible trends 070/90, 080/90 | | 5.980 | 0.8 | 39 | 7 |
| 1813288 | TR12-03 | 622923 | 6988803 | 3215 | grab | quartz vein with ankerite, cut by limonite fractures and infilling vugs, other crosscutting fine (few mm wide quartz - ankerite veinlets | | 3.470 | 1.3 | 15 | 7 |
| 1813289 | TR12-11 | 623451 | 6988805 | 3094 | grab | vuggy to drusy quartz from centre of trench with limonite ±Mn fracture fillings and limonite infilling vugs, some banding with grey quartz, other crosscutting quartz veinlets | | 6.980 | 0.2 | 9 | 9 |
| 1813290 | TR12-06 | 623571 | 6988790 | 3093 | grab | white quartz veins to 20 cm with crystalline vugs, limonite-ankerite ±Mn fracture fillings | | 1.540 | <0.2 | 20 | 24 |
| 1813291 | TR12-05 | 623302 | 6989020 | 3340 | grab | strong limonite fracture fillings and infilling vugs and red, earthy hematite, and quartz veins to 5 cm | | 0.241 | <0.2 | 25 | 3 |

Figure 7. Re-sample results, 2012 Skookum West Trenches.

Regarding the Hackly boulders (TR17-04 to -07), some alteration was encountered upslope at sample 2377900 (628810-20mE, 6988925-35mN). Although no significant gold values were obtained, the area may be prospective. Quartz-sericite schist also occurs at the top of TR16-01, which may represent a large fault zone; a fault is associated with a similar vein through trenches 16-02, 17-05, 17-06, 16-01 and 17-07.

2017 Trench Mapping and Sampling

The 2017 trenches of Four Nines Gold were sampled but not mapped (Mustard, 2018). In 2019, these trenches were mapped, with some additional sampling in both the 2012 and 2019 trenches. The following section is quoted from Pautler (2019A):

Detailed trench maps are shown in Appendix III, Figures 1 to 10. Trench locations are shown in Figure 6. Summary results of the sampling are shown in Table viii, while analytical certificates are included in Appendix II.

Three of the 2017 trenches (TR17-13 to -15, from east to west) were excavated on the Skookum West target. Lithologies include hornblende-feldspar gneiss (meta-intermediate to mafic volcanic rocks) and metasedimentary rocks. Foliations in TR17-13 to -14 are 070°/15-30°S, but trend 340°/70°E in TR17-15.

TR17-13 consists of hornfelsed foliated to gneissic metasedimentary rocks which are cut by a 0.8m wide quartz vein. Incompletely exposed contacts suggest a 120°/70SW° trend, but veins intersected in other trenches, including TR17-14 to -15, suggest a 070°-075° trend. The direct footwall of the TR17-13 vein is silicified and ankerite alteration occurs further into the footwall. The vein and adjacent wall rock on both sides yielded 1.68 g/t Au over 4.5m, including 4.05 g/t Au over 1.5m.

TR17-14 and -15 are primarily underlain by hornblende-feldspar gneiss, with minor paragneiss primarily at the southern ends. A 1.5m wide vein is centrally exposed in TR17-14, approximately 70m at 250°-255° from the TR17-13 vein. A 2.75m wide quartz vein system is exposed in TR17-15, 30m at 255° from TR17-14. Results from TR17-14 and -15 were <0.5 g/t Au. Ankerite alteration and fracture fillings are ubiquitous through TR17-15 and pinkification (hematite-Kspar alteration) occur at the north end of the trench. The vein system may continue another 150m through to the start of SWTR12-10 where 3-4 cm quartz pieces were exposed, but no anomalous gold values were obtained. The vein possibly continues to the north of SWTR12-10.

Four of the 2017 trenches (TR17-04, 17-05, 17-06, and 17-07, from west to east) were excavated on the Hackly target with one further west (TR17-03) on a gold soil anomaly (Anomaly C) thought to be related to Hackly. The trenches are entirely underlain by biotite-quartz-feldspar (felsic) orthogneiss, except for the north end of TR17-07 which intersected hornblende-feldspar gneiss. An 080° trending vein, ranging from 40 to 70 cm wide (I see a mistake on my trench map here; 2377897 in TR17-04 should read 0.4m not 0.4 cm), lies just south of, and appears associated with, an 080° trending fault through trenches 16-02, 17-05, 17-06 and 16-01. The fault continues through TR17-07, but not the vein, probably related to the presence of the more incompetent hornblende-feldspar gneiss as opposed to the competent felsic orthogneiss. The fault shows an apparent 50m of sinistral displacement of the hornblende-feldspar gneiss.

The fault and associated vein through trenches 16-02, 17-05, 17-06 and 16-01 lies downhill of the Hackly quartz vein boulders; the latter occur in an area of incompetent hornblende-feldspar gneiss. The source of the boulders, which contain 1.87g/t Au over 60 cm, 2.08 over 60 cm and 2.81 g/t Au over 55 cm, with 11.7

and 9.75 g/t Au from grab samples, has not been found. Follow up in 2017 encountered sericite altered felsic orthogneiss with limonite-hematite-quartz fracture fillings upslope at sample 2377900 (628810-20mE, 6988925-35mN). Although no significant gold values were obtained, there is little exposure and the area may be prospective. In addition, quartz-sericite schist with some quartz veins occurs upslope of the boulders at the top of TR16-01 and may represent significant alteration.

TR17-03 over soil anomaly C primarily consists of felsic orthogneiss with minor hornblende-feldspar gneiss in the central trench area and a 10m wide easterly trending fault zone just to the north of this. Alteration consists of minor vuggy quartz-limonite-Mn fracture fillings primarily at the north end of the trench, with potassic (hematite-Kspar and some sericite) alteration evident within the orthogneiss near the centre. No significant gold values were obtained.

Seven trenches were excavated on the Skookum Main target to evaluate the highly anomalous trench intercept in TR10-SJ-02, which returned 1.25 g/t Au over 30m within a broader interval of 0.67 g/t Au over 105m from shallow small excavator (CanDig) trenching, which exposed rubbly subcrop but not bedrock. All of the Skookum Main trenches are underlain by the felsic orthogneiss.

TR17-01 bisected TR10-SJ-02 just south of the 1.25 g/t Au over 30m intercept, but yielded only 1.61 g/t Au over 4.5m (N zone) with a second zone 35m to the south returning 0.92 g/t Au over 9m (S zone), apparently associated with only minor quartz veinlets, limonite fracture fillings, pyrite and patchy sericite. The latter zone occurs within an interval of 0.47 g/t Au over 25.5m, which extends south of the 9m intercept. A vein zone at the south end of this, covering a 50 cm vein with sheeted quartz veinlets in the footwall, trends 065°/40°S and yielded 1.34 g/t Au over 1.5m.

The N zone in TR17-01 exhibits quartz-sericite-limonite ±pyrite alteration and occurs within the northern portion of a 120°/20°?SW fault zone, which exhibits limonite, Mn, hematite fracture fillings, silification and sericite alteration, and includes some breccia clasts of pyritic quartz. The hanging wall of this 15m wide fault is silicified followed by pinkification, with minor quartz veinlets, pyrite and patchy sericite. The S zone lies about 3-5m into the hanging wall of the fault, assuming a shallow dip. The fault appears to post-date mineralization. Another 7m wide limonitic fault zone, trending 045°/45° to 055°/70°, occurs near the north end of TR17-01 and exhibits brecciation. It continues through TR17-08 to the southwest, passing just north of TR17-02.

The N zone appears to trend 20m to the southwest of TR17-01 at 250° through TR17-02, where it contains 0.80 g/t Au over 6.0m, including 2.27 g/t Au over 1.5m from quartz veinlets with oxidized cubic pyrite and pyrite aggregates. The zone is not evident in TR17-08, about 10m further southwest, possibly truncated by the northernmost fault.

The S zone, which lies at about 35-45m in TR17-01 and -03 and at 45-55m in TR17-02, trends about 070°/70°S in TR17-02 & -08, but more easterly to TR17-01. The zone contains 0.88 g/t Au over 10.5m in TR17-02 with two zones in TR17-08 containing 0.81 g/t Au over 10.5m and 0.88 g/t Au over 3m, separated by about 5m. The S zone in TR17-02 and TR17-08 consists of quartz veins (to 20 cm wide) and stockwork mineralization, ±brecciation, oxidized cubic pyrite and galena. The 15m wide southeasterly fault zone may cut off the main part of the zone in TR17-01, substantiated by silicification, quartz veinlets, pyritization and pinkification within and proximal to the southern portion of the fault.

Table viii. 2019 Sampling of 2017 Trenches and summary results.

Figure 8. 2019 Hackly grab samples and results.

TR17-09 and -10 would not have intersected the N zone or the main part of the S zone. TR17-09 did intersect the southern portion of the S zone with quartz veins to 5 cm and 10% specular hematite over 3m but did not return significant results. TR17-10 returned 0.64 g/t Au over 10.5m, including 2.02 g/t Au over 3m from minor grey quartz veins (to 4 cm wide), with K-spar haloes, stockwork, silicification, minor pyritization and pinkification near the north end. Similar mineralization was encountered at the north end of TR17-01 at a 250° trend from TR17-10, with oxidized cubic pyrite, but did not return significant gold values.

A 20 cm wide 110-120°/70-75°S trending quartz vein, with 0.5% galena, and trace chalcopyrite and malachite, was encountered in TR17-11 with a maximum value of 1.68 g/t Au over 1.5m collected along the vein. The vein is hosted by sericite altered and locally silicified felsic orthogneiss with some stockwork in the footwall. The vein appears to continue 50m at 100° to TR17-12 where a 1.5m wide zone of quartz vein float to 10 cm, with galena, and stockwork veining and silicification trends about 120°, dipping S, and yielded 0.72 g/t Au over the 1.5m. The zone is hosted by pinkified felsic orthogneiss. This vein orientation was not observed in TR17-01 to-03.

Hackly Zone Prospecting and sampling

Ten samples collected from float of quartz vein and stockwork material at the Hackly Zone averaged 2.50 gpt Au and 5.67 gpt Ag, with the highest, 9.75 gpt Au and 15.7 gpt Ag from a hematite-rich sample of quartz vein (see Table iv, Figure 8). All samples were collected upslope from historical trenching, suggesting an undiscovered structurally controlled gold source at Hackly. The Hackly Zone occurs immediately above a particularly productive placer mining area on Mariposa Creek, noted for pristine nuggets that appear to be close to their bedrock source.

DISCUSSION

Very limited drilling in 2012 at Skookum West, in the vicinity of the 2012 trenches, failed to encounter significant mineralization. However, sampling of those trenches produced some excellent results, including 40 m of 1.834 g/t Au in SWTR12-11, 10 m of 1.494 g/t Au in SWTR12-08, 10 m of 2.451 g/t Au in SWTR12-03 and 10 m of 1.058 g/t Au in SWTR12-02. The information gathered from the 2019 examination of the 2012 trenches will aid in the design of future exploration programs in the search for potential mineralized structures in this area. This work will also assist in the design of a program for the reclamation of the 2012 trenches, planned for the 2020 field season.

Mapping of the 2017 trenches, which had not previously been carried out, was completed in anticipation of the reclamation of those trenches. This work will assist in the Company's efforts to complete property-wide geological mapping and in the understanding of the controls on gold mineralization.

During this work, new gold mineralization was discovered upslope of trenching at the Hackly Zone. Three of the seven collected grab samples from quartz vein float assayed 9.75, 2.82 and 2.06 g/t Au (Figure 9). Additional trenching will be required to discover the source of this float. It is planned for this work to be carried out in the upcoming field season, at the same time as the planned 2012 and 2017 trench reclamation program.

CONCLUSIONS AND RECOMMENDATIONS

The Mariposa Property, located 30 kilometres southeast of the White Gold's Golden Saddle deposit and 40 kilometres east-northeast of Newmont-Goldcorp's Coffee property, has a long history of gold exploration and contains two placer creeks with one of the longest histories, over a century, of active mining in the Klondike. The geological setting of the Property is similar to the White Gold, Coffee and QV properties in terms of the host lithologies, the structural controls and brittle style of deformation and the style of gold mineralization. Recent exploration by Pacific Ridge identified an open-ended 7 km long horizon of altered sulphide bearing quartz mica schist in the Skookum Zone area of the Property. This unit is locally flanked by intrusive and mafic rock units, a setting favorable for hosting a gold-mineralizing system.

The history of gold exploration within the Property dates to 1898, when gold was first discovered in Scroggie and Mariposa Creeks. It has been estimated that approximately 100,000 ounces of gold with a fineness of 905 has been produced from Mariposa and Scroggie Creeks.

The first lode gold exploration in the area was reported in 1917 and has continued sporadically to the present. Interest in the lode gold potential around Scroggie Creek intensified in the mid 2000's and reached a climax during the period 2009 to 2012, when the Company spent approximately \$6 million exploring the Property. Soil sampling and trenching led to a core drilling program in 2011 as well as additional soil sampling, an aeromagnetic survey, ground magnetics and VLF surveys. In 2012, additional trenching, drilling and soil sampling surveys were carried out.

Soil geochemical surveys have been effective in defining the main anomalous zones on the Property. The strongest gold anomalies occur at Skookum Main, Skookum West and Alberta Creek. However, due to the effects of mainly mechanical dispersion in the upper soil horizon and the local presence of permafrost, additional targeting criteria are required to define drill targets. Traditionally, trenching and drilling programs have served this purpose.

The 2019 exploration program at Mariposa was designed to re-examine historical trenches from 2012 and 2017. The 2012 trenches had encountered some significant gold values (40 m of 1.834 g/t Au in SWTR12-11, 10 m of 1.494 g/t Au in SWTR12-08, 10 m of 2.451 g/t Au in SWTR12-03 and 10 m of 1.058 g/t Au in SWTR12-02) that weren't reflected in adjacent drill holes. The current program was to investigate possible reasons for this discrepancy, in particular attempting to determine the possible orientation of gold-bearing structures.

The 2017 trenches had not previously been mapped and the samples from three of these trenches were lost in transport and therefore needed re-sampling. During mapping and sampling of these trenches, some new mineralization was encountered at the Hackly Zone (9.75, 2.82 and 2.06 g/t Au in float), upslope from the existing trenches, thus representing a new exploration target.

Both the 2012 and 2017 trenches were examined to determine their requirements for reclamation, planned for the 2020 field season.

Future exploration should include trenching at the new Hackly gold showing to determine the source of the high-grade float. In addition, in-fill soil sampling, at 10 m spacings, plus prospecting should be carried out at Skookum West to define in greater detail targets for subsequent drilling.

STATEMENT OF EXPENDITURES

| Item | Contractor/Supplier | Invoice Date | Description | Amount |
|-----------------------|-------------------------|--------------------|--------------|--------------------|
| Mapping-sampling | JP Exploration Services | August 31, 2019 | J. Pautler | \$5,315.63 |
| Mapping-sampling | JP Exploration Services | October 10, 2019 | J. Pautler | \$1,479.45 |
| Mapping-sampling | JP Exploration Services | November 24, 2019 | J. Pautler | \$630.00 |
| Mapping-sampling | Spere Exploration Inc. | July 13, 2019 | M. Fraughton | \$3,150.00 |
| Fixed Wing | Great River Air | July 9, 2019 | 144 km | \$1,041.60 |
| Helicopter | Trans North | September 16, 2019 | 0.8 hours | \$1,717.80 |
| Fuel | Great River Air | July 9, 2019 | 1 drum | \$250.65 |
| Sample Shipping | Freight Systems | July 12, 2019 | | \$137.67 |
| Analytical | Bureau Veritas | August 7, 2019 | 46 samples | \$2,047.66 |
| Shipping & Analytical | Ground Truth | November 14, 2019 | 7 samples | \$297.41 |
| Report preparation | G. Carlson | | 4.5 days | \$3,600.00 |
| Total | | | | \$19,667.87 |

CERTIFICATE OF QUALIFICATIONS

I, Gerald G. Carlson, hereby certify that:

1. I am a consulting mineral exploration geologist and President and CEO of Pacific Ridge Exploration Ltd., 11th Floor – 1111 Melville St., Vancouver, B.C. V6E 3V6.
2. I am a graduate of the University of Toronto, with a degree in Geological Engineering (B.A.Sc., 1969). I attended graduate school at Michigan Technological University (M.Sc., 1974) and Dartmouth College (Ph.D., 1978). I have been involved in geological mapping, mineral exploration and the management of mineral exploration companies continuously since 1969, with the exception of time between 1972 and 1978 for graduate studies in economic geology.
3. I am a member in good standing of the Association of Professional Engineers and Geoscientists of the Province of British Columbia, Registration No. 12513 and of the Association of Professional Engineers of Yukon, Registration No. 0198.
4. I am the author of this report on the Mariposa Property.
5. The report is based on a literature review, on private company reports and on the 2019 surface exploration program.
6. I am a Director and Officer of Pacific Ridge Exploration Ltd. and I own shares in the company.
7. I was personally involved in the planning, execution and interpretation of the exploration program discussed in this report.

Dated at Vancouver, B.C. this 26th day of November 2019,

Gerald G. Carlson, Ph.D., P. Eng.

QC CERTIFICATE WH19251867

Project: Mariposa (MPA)
P.O. No.: 3330

This report is for 7 Rock samples submitted to our lab in Whitehorse, YT, Canada on 7-OCT-2019.

The following have access to data associated with this certificate:

GERRY CARLSON

GREG DAWSON

JEAN POUTLER

| SAMPLE PREPARATION | |
|--------------------|--------------------------------|
| ALS CODE | DESCRIPTION |
| WEI-21 | Received Sample Weight |
| LOG-21 | Sample logging - ClientBarcode |
| CRU-QC | Crushing QC Test |
| PUL-QC | Pulverizing QC Test |
| SPL-21 | Split sample - riffle splitter |
| CRU-32 | Fine Crushing 90% <2mm |
| PUL-32m | Pulverize 500g - 85%<75um |
| BAG-01 | Bulk Master for Storage |

| ANALYTICAL PROCEDURES | | |
|-----------------------|-------------------------------|------------|
| ALS CODE | DESCRIPTION | INSTRUMENT |
| Au-AA23 | Au 30g FA-AA finish | AAS |
| ME-ICP41 | 35 Element Aqua Regia ICP-AES | ICP-AES |
| ME-MS42 | Up to 34 elements by ICP-MS | ICP-MS |

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.
