

A Geochemical Report on the KRYPTOS Property
submitted as Representation Work

Work performed on:
KRYPTOS 39, 43, 45, 47-50,53-60, 61-80
YE90245, 249, 251,253-256, 259-266, YE93631-650

Work applied to:
KRYPTOS 15-80
YE90221-YE90266, YE93631-650
Mayo Mining District

Owner: Gordon Richards

Location
115P/01 & 02
Camp on claims at
UTM 427,700E, 7,005,135N, Elev 945 m
NAD 83, UTM Zone 8

Field work performed by
Gordon Richards & Jeff Mieras
During the period August 1-12,2019

Report written by Gordon Richards
October 1, 2019

INTRODUCTION.

The general area of the KRYPTOS claims was prospected with the aid of YMEP grants awarded to G Richards in 2016 and to Jeff Mieras in 2017. The property is located on gentle to moderate slopes across the Klondyke Highway about 25 km south Stewart Crossing within NTS map sheets 115P01 & 02. Access was made by helicopter to a camp in an open meadow in the east side of the property as shown on Figures 4 to 11 from where soil sampling traverses were made.

The geology of the area has been described on Canadian Geoscience Map 7 of southwestern McQuesten and parts of northern Carmacks by Ryan, J.J., Colpron, M., and Hayward, N., 2010. Figure 3. The area is shown on that map to be underlain by the Early Mississippian aged Reid Lakes Batholith that is a weakly Kspar-porphyritic, medium-grained granite to quartz monzonite intruding its own volcanic pile in the west portion of the claims in contact with metasedimentary rocks of the Finlayson Assemblage (?) in the east portion of the claims. Loess, about 25 cm thick, blankets most slopes. The claims lie entirely within Reid glaciated terrain with the possible occurrence of pre-Reid glaciated terrain along ridge tops.

Regional Geochemical Data (RGS) is available and provides geochemical data for numerous elements of stream sediments collected throughout the area including three creeks draining the general area of the claims. The RGS samples were collected in 1986 (OF 1650) and re-analyzed in 2011 using more sophisticated analytical techniques and released in Open File 2012-09. Releveling of the RGS data over a portion of 115P that included an area including pre-Reid glaciation over Yukon Tanana Terrain was done to recalculate thresholds for 70th, 80th, 90th, 95th and 98th percentiles for a number of elements. Using these recalculated threshold values, anomalous results for Cu, Au and other elements were seen to occur in two RGS samples, one draining the claims area (RGS 3230) and one draining a valley to the south of the claims (RGS 3231). A third RGS sample (RGS 3288) is located down-ice from the claims and contained anomalous Mo and Sb. A fourth RGS sample (RGS 3229) draining the same valley south of the claims as RGS 3229 contained no anomalous values.

The RGS results were the reason for prospecting the general area in 2016. Results of soil sampling identified four sizeable targets with porphyry geochemical signatures.

In 2017 the KRYPTOS 1-60 claims were staked June 12 to 14 and recorded June 14 to cover known anomalous zones identified from the 2016 work and their extensions. An MMI soil and black spruce twig sampling prospecting program was undertaken on the claims June 16 to 22 and July 1, 2017 to define the extent of known geochemically anomalous zones and search for additional targets.

Results of the field work were successful in defining four pronounced multi-element anomalous zones in the MMI soil results that have porphyry geochemical signatures. The largest measures 1600m long by 300 to 500m wide and crosses the Klondyke Highway. Other zones measure 600m by 600m, 900m by 300m and 900m by 500m open to the north. All of these zones are characterized by MMI samples having high response ratios for Cu. Response ratios for Au are high in over half the samples within the Cu zones. A few high Mo response ratios occur in samples within two of the Cu zones. High Pb response ratios occur in samples peripheral to the Cu zones. Ti has consistently low response ratios from samples within the Cu zones possibly due to destruction of illmenite by hydrothermal alteration associated with porphyry mineralization. Several other elements have low response ratios within the Cu zone as well.

A poorly defined new zone of anomalous metal values occurred in the southeastern third of the claims. It is characterized by consistently very high response ratios for As, Sb, W, and Mn and numerous high response ratios for Au, Bi, Tl, Fe, Zn, Ti and Cs. Bedrock throughout this zone may be metasediments as one outcrop of micaceous quartzite was noted during the soil sampling and the area is roughly within the area of metasediments described in Geoscience Map 7

In 2019 the KRYPTOS 61-80 claims were staked August 1, and recorded in Dawson Aug 2, 2019. A camp was set out by Fireweed Helicopters on Aug 2 and demobbed Aug 9. MMI soil sampling over the new claims and part of the old claims was carried out during this period.

Results show two patterns of anomalous gold measuring two km long and one km long and up to 400 m wide encompassed within nearly identical sized and coincident patterns of anomalous As, Sb, W, and Bi all defined by response ratios

in excess of 5. 38 small (0.06 to 0.24 kg) rock chip samples were collected and most assayed. Results contained low values of gold and other pathfinder elements leaving the source of the anomalous gold and other elements unexplained.

Recommended work includes digging numerous pits near and around highly anomalous metal values in soils in order to find and sample mineralized float that would explain the cause of the anomalous metals and help with planning future exploration on the property.

HISTORY.

Previous exploration activity occurred in the 1980's by a Mr Jim Carson with the staking of both quartz and placer claims. Two of these previous claim blocks are the MEGALURUS labelled on the figures and extending over much of the area sampled in 2019 and the FIRELORD which is a small claim block along the Crooked Creek at the northeast end of the MEGALURUS claim block. Other claims staked by Carson occur north of the KRYPTOS claims along Crooked Creek.

Only minimal hand trenching was recorded. All of this hand trenching was on narrow quartz veins within schist and micaceous quartzites of the Finlayson Assemblage done north and east of the KRYPTOS claim block along steep slopes into Crooked Creek. Work is summarized in Minfile Report 115P 038. Assessment Report 019539 provides some detail to the sampling. Samples submitted by Carson report grades up to 0.36 oz/T Au from selected samples but reports by personnel working for Curragh Resources, Erickson Gold Mining Corp., and Noranda Exploration Company, Limited all reported no gold from samples collected over greater widths. One claim block, the FIREDEVIL staked in 1987 covers the biggest porphyry target defined by the 2016/2017 surveys although no outcrop is known to exist in this area.

Placer claims were staked over two or three km along the small creek flowing west immediately south of the KRYPTOS claims. No placer production was recorded or evident along the creek that was staked.

YMEP grants 16-056 awarded to Richards and 17-001 awarded to Jeff Mieras.

Work in 2016 by the writer and Mieras and funded by YMEP grant 16-056, awarded to Richards located five poorly defined patterns of strong multi-element geochemical anomalies in MMI soil samples with porphyry mineralization signatures. Work in 2017 by the writer and Mieras and funded by YMEP grant 17-001 awarded to Mieras provided more definition to these anomalous zones. The KRYPTOS 1-60 claims were recorded June 14, 2017 and the KRYPTOS 60-80 recorded Aug 2, 2019. MMI soil sampling done from Aug 2 to Aug 11, 2019 over the Au-As-Sb-W-Bi anomalous zones provides the basis of this report.

CLAIMS.

Table 1 is a list of all claims forming the property. The claims lie in the Mayo and Dawson Mining District with the Klondyke Highway forming the boundary between the districts. The Registered Owner is Gordon G Richards. The work described in this report was funded largely by Richards.

Table 1. Claim Status

Claim Name	Grant No.	Expiry Date	Mining District
KRYPTOS 1-14	YE90207-YE90220	2025/06/15	Dawson
KRYPTOS 15-60	YE90221-YE90266	2021/06/14	Mayo
KRYPTOS 61-80	YE93631-YE93650	2020/08/02	Mayo

Certificate of Work is to be filed on all of the KRYPTOS claims lying within the Mayo District based on work described in this report.

Apply 4 years to KRYPTOS 15-60: 40 cl X 4yrs X \$100/cl-yr = \$16,000.

Apply 5 years to KRYPTOS 61-80: 20 cl X 5yrs X \$100/cl-yr = \$10,000.

GEOLOGY.

Bedrock geology is best described on Canadian Geoscience Map 7 of *Southwestern McQuesten and Parts of Northern Carmacks* by Ryan, J.J., Colpron, M., and Hayward, N., 2010. Figures 3 is a portion of that map covering the general area of the property. The claims area is shown on that map to be underlain by the Early Mississippian aged Reid Lakes Batholith in the west portion of the claims in

fault contact with metasedimentary rocks of the Finlayson Assemblage (?) in the east portion of the claims.

The Reid Lakes Batholith is an 80 km long unmetamorphosed Early Mississippian aged batholith that intrudes its own volcanic pile. It is a weakly Kspar-porphyritic, medium-grained granite to quartz monzonite.

The Finlayson Assemblage is a Late Devonian to Early Mississippian metavolcanic and metasedimentary assemblage. The metasediments such as occur on the property are described as carbonaceous quartzite to mica-quartz schist, black to white quartzite, with schist and garnet schist interlayers; and rare black phyllite, possibly equivalent to Nasina Formation, or simply a carbonaceous member of the Snowcap Assemblage. Two closely spaced outcrops of the metasedimentary rocks were located in 2017 along the most north-easterly sample line. They were both dark grey micaceous quartzite. In August 2019 three more outcrops were located. An outcrop of quartz monzonite occurs on a small knoll at the west end of the recently staked claims near sample Y140. Two other outcrops of micaceous quartzite were located, one along a creek bank near sample site P124 and the other on the north facing hillside near sample site Y83. All three metasedimentary outcrops had near flat to very gently dipping schistosity.

Glaciation in the area of the property is described as Reid in age on several government maps although pre-Reid glaciation may have occurred on the ridge top in the western half of the recently staked claims. Pre-Reid glaciation is possibly older than 500,000 years (Jeff Bond, personal communication, 2012). Reid glaciation began 200,000 years ago and ended about 50,000 years ago. Younger McConnell Glaciation which lies further east of the claims ended about 20,000 years ago.

Uppermost soil is an organic soil from almost absent to less than one cm thick on dryer slopes and in excess of 10 cm thick over gentle poorly drained slopes. Loess occurs on all slopes, generally about 20 to 30 cm thick beneath the organic soil. This loess is believed to have formed in late stages or soon after the end of McConnell Glaciation. Till is commonly found beneath the loess on the north facing and east facing slopes containing well rounded cobbles and smaller rocks of foreign origin. In these areas a few subround to round pebbles do occur

in the loess and have probably worked themselves up into the loess from underlying till. At higher elevations along the ridgeline till does occur beneath the loess but angular rock fragments believed to be of local origin are common in many soil pits and in a few pits are very abundant.

GEOCHEMICAL SURVEY.

SURVEY METHODS.

General.

G. Richards drove from Dawson to the project area on July 31 and staked the KRYPTOS 61-80quartz August 1. He drove to Mayo August 2 recorded the claims, bought supplies and then drove to meet Mieras along the Klondyke Highway on the property where they met a Fireweed Helicopter to mob a camp into a meadow in the centre of the area to be sampled. They collected samples until August 10 when they demobbed the camp to their vehicles. Richards drove to Whitehorse to return rented radios, sort and ship samples, pay invoices, and clean and store camping gear.

	Mob/demob	Staking	Sampling
Richards	Aug 1, 11	Aug 2	Aug 3-10
Mieras	Aug 2		Aug 3-10
TOTAL	3 man-days	1 man-day	16 man-days

Sixteen man-days were spent collecting samples on the project by Mieras and Richards from August 3 to 10, 2019 collecting **320 MMI soil samples** and **38 rock chip samples of which 34 were assayed**. One man-day was spent demobbing from the property. Mobbing time was done prior to recording the claims and therefore can not be used in the statement of work for assessment purposes.

Four sample series are shown on Figure 4. “C” and “T” sample series were collected in 2016; “R” and “K” sample series were collected in 2017; and P and Y sample series were collected in August 2019.

The 2019 MMI soil sampling program was conducted across the KRYPTOS 61-80 claims and those KRYPTOS claims containing anomalous patterns of Au-As-Sb-W-Bi to find the limits of these anomalous patterns and collect rock samples

for assaying in the hopes of finding mineralized float and outcrop that would explain the anomalous metal patterns. All the rock chip samples were collected from angular float in soil pits except for the two outcrops of quartzite found near soil pits. Sample interval was 100 m along sample lines spaced 200 m apart. A 50 m sample interval and 100 m spaced lines was done in a small area near samples collected in 2017 that contained the highest gold values. Sample locations were recorded on Garmin GPSmap 60Cx handheld units and later downloaded and moved into sample result tables.

All soil geochemical results are provided in digital form with NAD 83 Zone 8 UTM co-ordinates provided for all samples. Response ratios calculated for selected elements of all MMI samples are provided in Table 3 in digital form. Geochemical analysis results of 34 rock chips are provided in Table 4 and descriptions of these rock chips are provided in Table 5.

MMI Soil Sampling.

MMI analysis uses a weak partial extraction to improve the conventional geochemical response over buried ore deposits. The process measures the mobile metal ions from mineralization, which have moved toward the surface and are loosely attached to the surfaces of soil particles. Its effectiveness has been documented in over 1000 case histories on six continents and includes numerous commercial successes. The anomalies are sharply bounded and in most cases directly overlie and define the extent of the surface projection of buried primary mineralized zones. The MMI process is a proprietary method developed by Wamtech of Australia. SGS Minerals Services in Toronto purchased all rights to the method and provides analyses in Canada.

Watch and ring were removed prior to sampling. Pits were dug by shovel to a depth of 30 cm in order to expose the soil profile for sampling. The profile was scraped clean with a plastic scoop to remove any metal effect from the digging shovel. A continuous strip of soil was collected by plastic scoop over the interval of 10 to 20 cm below the top of true soil, placed in a pre-numbered zip lock baggie and placed in an 11 inch by 20 inch 2 mil plastic bag. Loess was present at nearly all sample sites and was the sample medium for most samples with a

minor contribution from underlying till in some samples. Samples were kept cool until they were shipped to SGS Minerals Services in Vancouver for analyses.

In the SGS Lab, samples are not dried or prepared in any way. The MMI process includes analyses of an unscreened 50-g sample using multi-component extractants. Metals are determined by ICP-MS in the parts per billion range.

Response Ratios were calculated for Ag, As, Au, Bi, Ca, Cu, Eu, Fe, Gd, K, La, Mg, Ni, Pb, Sb, Sc, Sr, Ti, Tl, W, and Zn. Response ratios for Au, As, Sb, W, Bi, Ca, and Eu are provided graphically in Figures 5-11. To calculate the response ratios first the average value for results of the lower quartile was calculated for each element and used as background value. One-half of detection limit was used for those samples with values reported as less than detection limit. Then each result was divided by the lower quartile average to obtain its response ratio. A response ratio of 10 or more is considered very significant for indicating underlying mineralization. Lesser values of 5 to 10 can also be important particularly where more than one element has such a value. Response ratios can best be thought of as a multiple of background in interpreting results.

SURVEY RESULTS.

Results of the 200 m by 100 m MMI soil and sample grid over the target area on the KRYPTOS claims is provided in Tables 3 to 5. MMI soil sample results are shown graphically on Figures 5 to 11. Results of the 2017 survey provide a small portion of the data shown on these maps in order to provide a complete picture of the targets.

Three unmineralized outcrops found on the soil lines in 2019 and one outcrop found in 2017 are shown on Figure 4. One was of unaltered granodiorite of the Reid Lakes Batholith at three were of micaceous quartzite of the Finlayson Assemblage. They are shown on the figure by black triangles. The contact between these two rock types is twofold. A fault shown on Figure 3 by a NNW-EW black line in the centre of the map and labelled Carson Fault is one contact. The other is an intrusive contact shown on Figures 5-11 as a black hatched line in the western portion of the survey area and described in the legend.

A large zone of anomalous metal values in MMI soils occurs in the eastern half of the KRYPTOS claims. An irregular horseshoe shaped zone of anomalous Au three km long and up to 300 m wide occurs in the centre of the survey area. Figure 5. The anomalous zone is defined by Au response ratios (RRs) in excess of 5 with highs of 227 at Y38 and 76 at Y29. A second anomalous Au zone one km long and up to 400 m wide defined by MMI soils with RRs of >5 occurs in the northern portion of the survey area.

Both of these anomalous Au zones occur within a larger roughly circular pattern of nearly coincident anomalous As (RR>8), Sb (RR>5), W (RR>5), and slightly less well-defined Bi (RR>5). Other elements that are not plotted on the figures but form nearly coincident patterns of anomalous RRs of >5 in order of diminishing correlation include, Ti, Tl, Zn, Eu and other rare earth elements and Mn. Together they define a footprint of multi-element anomalous geochemistry that surrounds and envelops the anomalous Au zones.

38 small (0.06 to 0.24 kg) rock chip samples were collected and 34 of them assayed. Results contained low values of gold and other pathfinder elements leaving the source of the anomalous gold and other elements unexplained. See Figure 3. The highest gold value was 15.9 ppb with 51 ppm As , 5.1 ppm Sb, <0.1 ppm W, and 0.1 ppm Bi from sample Y87 located in the centre of the horseshoe shaped anomalous MMI gold pattern. It is described on Table 5 as subangular phyllite/schist with limonitic vuggy irregular fractures with some quartz and being darker than other nearby samples. This sample may be the only sample suggestive of a cause of the anomalous soil patterns although of all the elements analyzed, only As and Sb were moderately anomalous. The micaceous quartzite outcrop sampled in 2017 at soil site K138 assayed moderately anomalous values were As-95ppm and Sb-20ppm. They provide some indication of what to look for in future exploration of the property.

Cause of the anomalous elements may be some style of epithermal gold mineralization given the anomalous Au and the number of traditional Au pathfinder elements included in this anomalous suite. These pathfinder elements include As, Sb, Bi, Tl, and W.

CONCLUSIONS.

Sampling in 2019 on the KRYPTOS claims defined two zones of anomalous gold in MMI soils, one measuring 3 km long by up to 300 m wide forming a horseshoe shape and the other one km long by up to 400 m wide all contained within three km diameter patterns of nearly coincident anomalous As, Sb, W, Bi and other elements.

Bedrock throughout this zone is certainly metasediments based on three outcrops and abundant similar angular chips in soil pits. The target area lies within metasediments of the Finlayson Assemblage described on Geoscience Map 7. No strongly mineralized samples were found although one sample, Y87, of phyllite/schist with weakly quartz bearing fractures yielded 15.9 ppb Au with moderately anomalous As and Sb but no anomalous values in any of the other pathfinder elements.

Epithermal gold mineralization may be present within the target area given the anomalous Au in soils and the number of traditional Au pathfinder elements included in this anomalous suite.

RECOMMENDATIONS.

It is recommended that soil pits be dug on and around some of the soil sample locations with the highest gold values in an attempt to find strongly mineralized outcrop and/or angular float. Success could lead to trenching or drilling.

Apply 5 years to KRYPTOS 61-80: 20 cl X 5yrs X \$100/cl-yr = \$10,000.

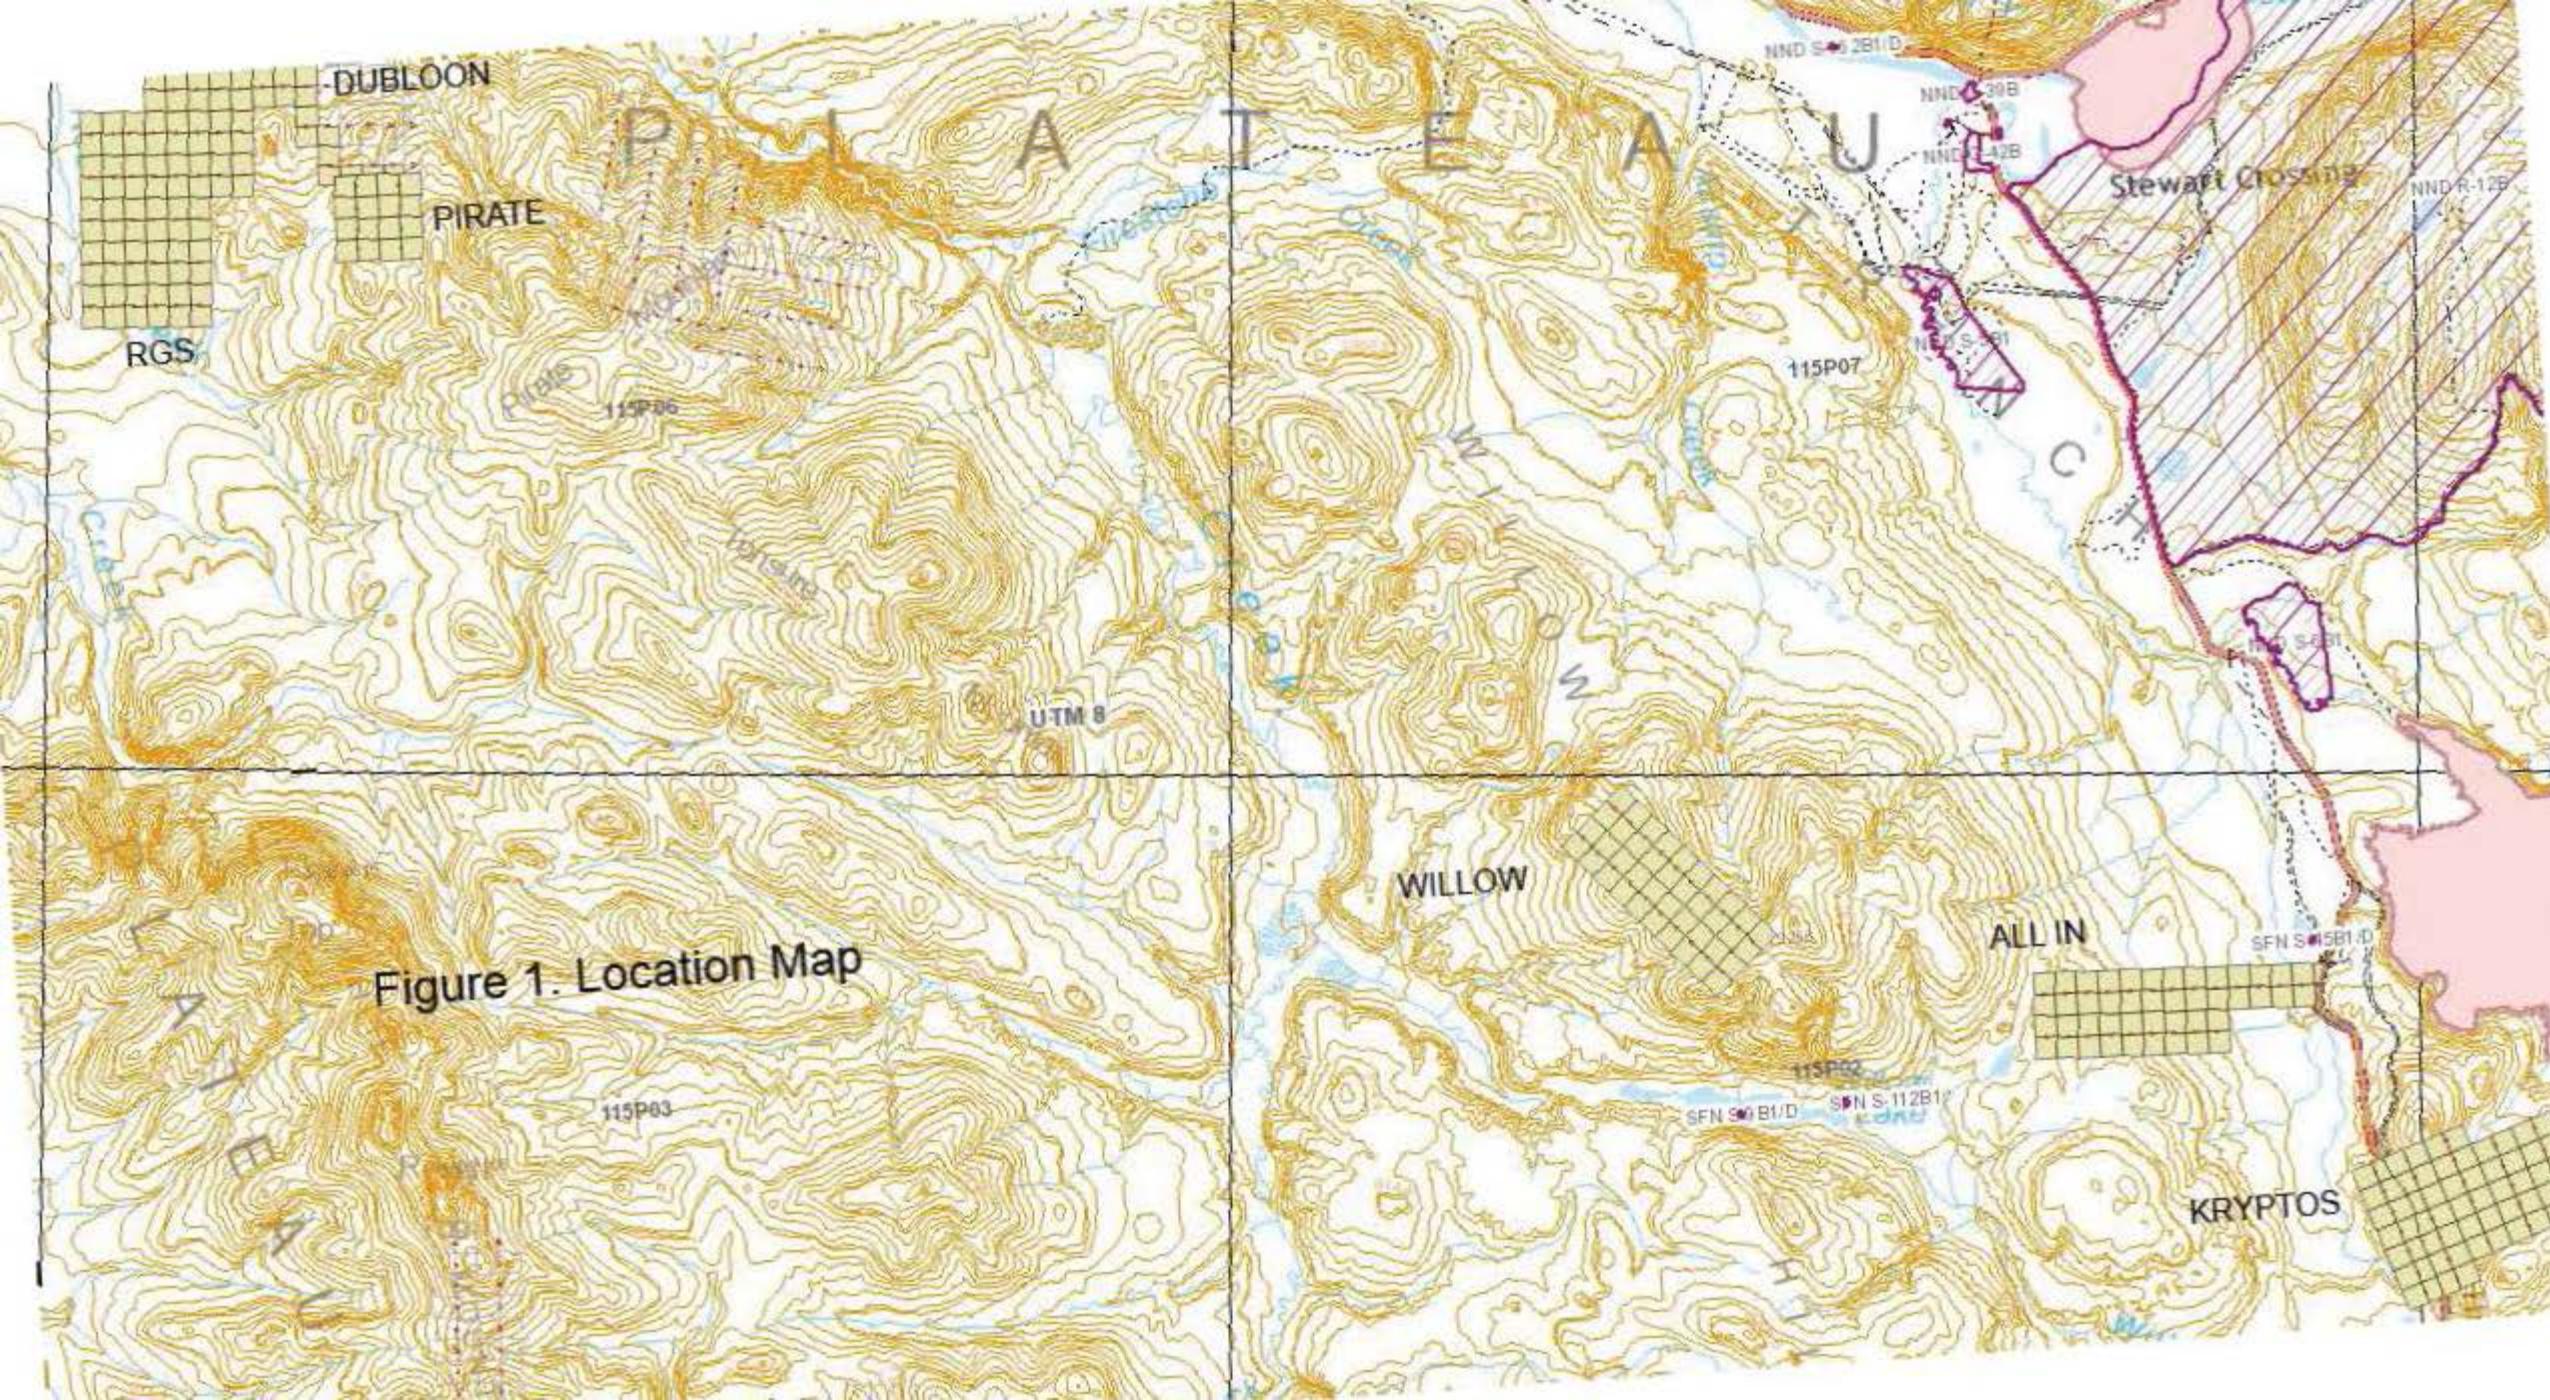

STATEMENT OF QUALIFICATIONS.

I, Gordon G Richards, with business address at 6410 Holly Park Drive, B.C., V4K 4W6, do hereby certify that:

1. I hold a B.A.Sc. (1968) in Geology from The University of British Columbia, and an M.A.Sc. (1974) in Geology from The University of British Columbia.
2. I have been practicing my profession as a geologist for over 40 years and as a consulting geological engineer from 1985 to 2018. I have work experience in western areas of the United States, Alaska, Canada, Mexico and Africa.
3. I have based this report on my own field work and supervision of field work by Jeff Mieras during the period of August 3 to 11 and on the results generated by that field work.

Respectfully submitted,

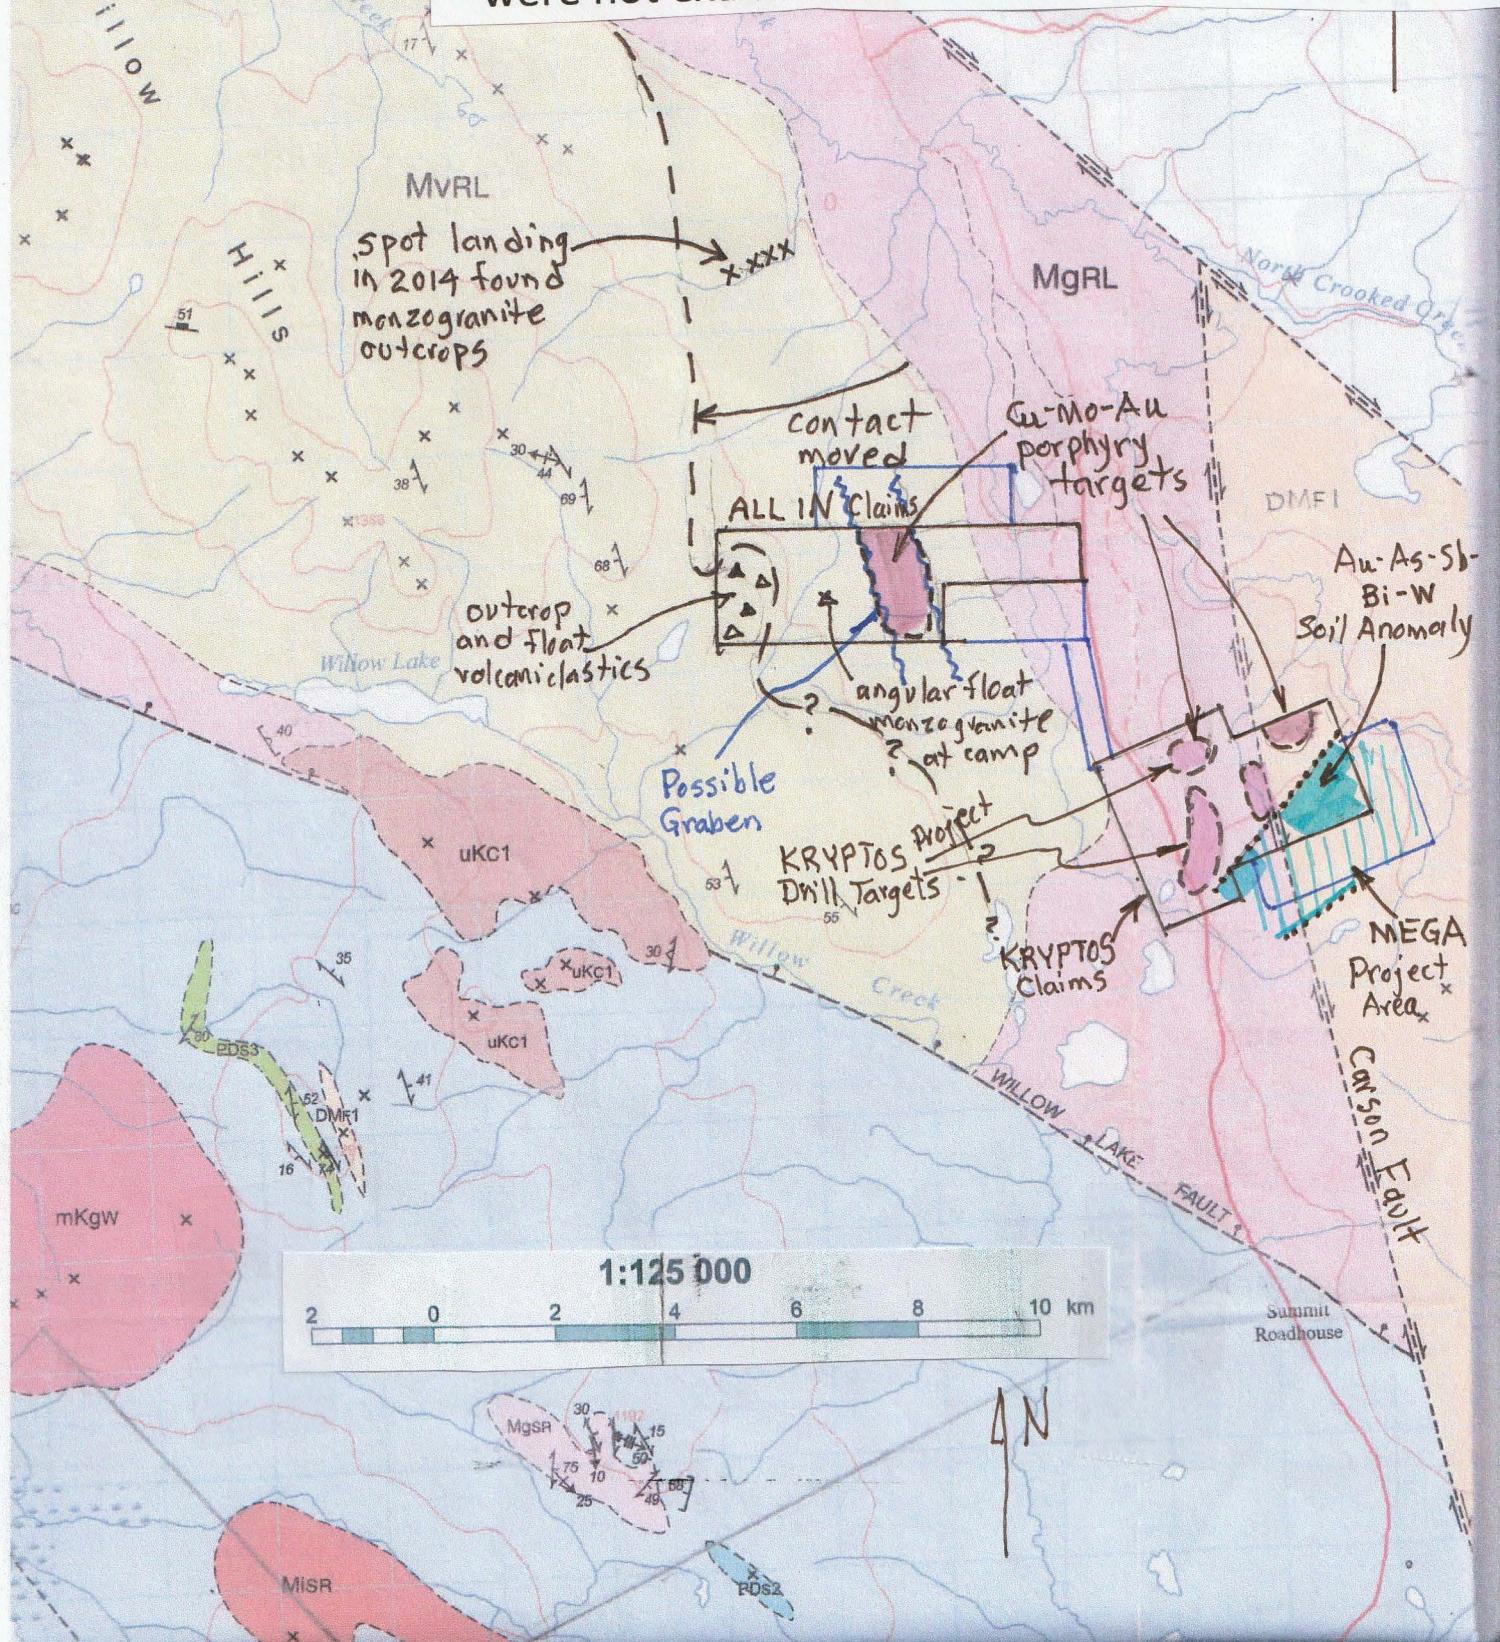

Gordon G Richards

www.yukonminingrecorder.ca/PDFs/115/115P01.pdf

Figure 3. Local Geology of Mega Project within Kryptos Claims. Au-As-Sb-Bi-W anomalous zone was the target that was evaluated. It occurs within schists, quartzites, and phyllite of the DMF1 unit east of a northerly fault. Porphyry Cu-Au targets were not examined. See Table 2 for Legend.

EARLY JURASSIC

STIKINIA/QUESNELIA

EJgA

Aishihik suite: granodiorite to monzogranite (\pm quartz monzonite and quartz monzodiorite); commonly K-feldspar porphyritic and hornblende-bearing; common biotite \pm chlorite alteration with secondary epidote; prominent magmatic epidote; intrudes Stikinia and Yukon Tanana terranes; generally undeformed but locally foliated plutons and/or dykes.

PERMIAN

Metaplutonic and metavolcanic rocks of the Klondike arc

PgSC

Sulphur Creek suite: quartz and K-feldspar porphyritic to augen monzogranite; strain varies from moderately foliated to gneissic (including porphyroclastic straight gneiss); biotite bearing; locally is the protolith to felsic Klondike Schist.

Klondike Schist (Pk1, Pk2)

Pk2

Metafelsite, commonly porphyritic or augen-textured; possibly derived from felsic volcanic rocks or hypabyssal intrusions; locally derived from equigranular to augen monzogranite; locally exhibits decussate amphiboles pseudomorphed to chlorite-biotite; local coarse porphyroblastic garnet.

Pk1

Intermediate to mafic, light-green, pyrite-chlorite schist; commonly exhibits a pitted surface indicative of coarse pyrite cubes having weathered out; primary volcanic textures locally preserved.

EARLY MISSISSIPPIAN

Reid Lakes complex (MgbRL, MgRL, MqRL, MvRL)

MgRL

Reid Lake batholith: polyphase; undeformed to weakly foliated monzogranite, granodiorite and quartz monzonite; typically biotite-bearing and exhibiting abundant blebby to porphyritic smokey quartz; fresh magmatic hornblende and K-feldspar phenocrysts common in eastern extent; slightly foliated adjacent to Willow Lake fault; easily confused with undeformed post-Triassic intrusions.

LATE DEVONIAN - EARLY MISSISSIPPIAN

Moderately to strongly foliated (orthogneissic) plutonic rocks

Simpson Range suite (MgSR, MisR, MagsR)

MgSR

Monzogranite to granodiorite; equigranular; pink to orange; generally biotite-bearing (after hornblende?); homogeneous to layered.

MisR

Intermediate to mafic granitoid (tonalite to diorite) sheets; intermediate to dark colour; homogeneous to layered.

Metavolcanic and metasedimentary rocks

Finlayson Assemblage? (DMF1, DMF2)

DMF2

Greenstone - greenschist facies metabasite; chlorite-actinolite schist; preserves relict volcanic and volcanoclastic textures when viewed perpendicular to the stretching lineation; commonly medium green; possibly lower grade equivalent of the garnet-amphibolites assigned to the Snowcap Assemblage.

DMF1

Carbonaceous quartzite to mica-quartz schist; black to white quartzite, with schist and garnet schist interlayers; and rare black phyllite; possibly equivalent to Nasina formation, or simply a carbonaceous member of the Snowcap assemblage.

LATE DEVONIAN AND OLDER

Snowcap assemblage (PDS1, PDS2, PDS3)

PDS3

Amphibolite schist to garnet-amphibolite; metabasite; usually garnet-hornblende-plagioclase or hornblende-plagioclase, with local chorite-biotite; probably derived from mafic volcanic to volcanoclastic rocks; some layers that are internally homogeneous may be mafic sills; more intermediate varieties can have rosettes of decussate, larger hornblende.

PDS1

Quartzite to quartz-mica schist; banded to massive, grey to white in colour; locally conglomeratic; commonly contains beds of micaceous quartz arenite; clastic in origin; quartz-muscovite-biotite schist is possibly derived from siliceous siltstone; commonly finely interlayered with garnet-metapelitic.

Table 1 Legend for Figure 3 taken from: Ryan,J.J., Colpron, M., and Hayward, N., 2010. Geology, southwestern McQuesten and parts of northern Carmacks, Yukon; Geological Survey of Canada, Canadian Geoscience Map 7 (preliminary version), scale 1:125,000.

Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein. Any holder of this document is advised that information contained hereon reflects the Company's findings at the time of its intervention only and within the limits of Client's instructions, if any. The Company's sole responsibility is to its Client and this document does not exonerate parties to a transaction from exercising all their rights and obligations under the transaction documents. Any unauthorized alteration, forgery or falsification of the content or appearance of this document is unlawful and offenders may be prosecuted to the fullest extent of the law.

WARNING: The sample(s) to which the findings recorded herein (the "Findings") relate was(were) drawn and / or provided by the Client or by a third party acting at the Client's direction. The Findings constitute no warranty of the sample's representativeness of any goods and strictly relate to the sample(s). The Company accepts no liability with regard to the origin or source from which the sample(s) is/are said to be extracted. The findings report on the samples provided by the client and are not intended for commercial or contractual settlement purposes.

This document is issued by the Company under its General Conditions of Service accessible at <http://www.sgs.com/en/Terms-and-Conditions.aspx>. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein. Any holder of this document is advised that information contained hereon reflects the Company's findings at the time of its intervention only and within the limits of Client's instructions, if any. The Company's sole responsibility is to its Client and this document does not exonerate parties to a transaction from exercising all their rights and obligations under the transaction documents. Any unauthorized alteration, forgery or falsification of the content or appearance of this document is unlawful and offenders may be prosecuted to the fullest extent of the law.

WARNING: The sample(s) to which the findings recorded herein (the "Findings") relate was(were) drawn and / or provided by the Client or by a third party acting at the Client's direction. The Findings constitute no warranty of the sample's representativeness of any goods and strictly relate to the sample(s). The Company accepts no liability with regard to the origin or source from which the sample(s) is/are said to be extracted. The findings report on the samples provided by the client and are not intended for commercial or contractual settlement purposes.

This document is issued by the Company under its General Conditions of Service accessible at <http://www.sgs.com/en/Terms-and-Conditions.aspx>. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein. Any holder of this document is advised that information contained hereon reflects the Company's findings at the time of its intervention only and within the limits of Client's instructions, if any. The Company's sole responsibility is to its Client and this document does not exonerate parties to a transaction from exercising all their rights and obligations under the transaction documents. Any unauthorized alteration, forgery or falsification of the content or appearance of this document is unlawful and offenders may be prosecuted to the fullest extent of the law.

WARNING: The sample(s) to which the findings recorded herein (the "Findings") relate was(were) drawn and / or provided by the Client or by a third party acting at the Client's direction. The Findings constitute no warranty of the sample's representativeness of any goods and strictly relate to the sample(s). The Company accepts no liability with regard to the origin or source from which the sample(s) is/are said to be extracted. The findings report on the samples provided by the client and are not intended for commercial or contractual settlement purposes.

CERTIFICATE OF ANALYSIS

VAN19002333.1

CLIENT JOB INFORMATION

Project: Mega
Shipment ID:
P.O. Number
Number of Samples: 38

SAMPLE PREPARATION AND ANALYTICAL PROCEDURES

Procedure Code	Number of Samples	Code Description	Test Wgt (g)	Report Status	Lab
PRP70-250	38	Crush, split and pulverize 250 g rock to 200 mesh			VAN
AQ201	38	1:1:1 Aqua Regia digestion ICP-MS analysis	15	Completed	VAN

SAMPLE DISPOSAL

PICKUP-PLP Client to Pickup Pulps
PICKUP-RJT Client to Pickup Rejects

ADDITIONAL COMMENTS

Bureau Veritas does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

Invoice To: Ruanco Enterprises Ltd.
