## 1. Introduction

This report describes the results of the 2020 Target Evaluation YMEP supported exploration program on the SSD and NTS quartz claims (“Nitra Property”). The objective of the 2020 exploration program on the Nitra Property was to follow up on historic ridge and spur soil survey lines by carrying out a soil grid based geochemical survey and evaluate the mineralized trends for future work.

The 2020 exploration program was successful in completing this objective and culminated with the collection and XRF-analysis of 4,287 soil samples. From the resulting anomalous As, Pb and Zn trends 590 samples were selected for laboratory multi-element ICP analysis.

The Nitra Property represents an early stage highly prospective intrusion-related gold target located within the Seattle Creek Map area (115 P/16) of the McQuesten River Region. The Nitra Property is located approximately 30 km northwest of the Village of Mayo, YT within the Mayo Mining District. The property was staked in 2019, by Banyan Gold Corporation (“Banyan”), after the area was identified as an underexplored region with potential host similar styles of mineralization as seen on the AurMac Property.

The McQuesten River Region has numerous mineral occurrences, a long history of mining and mineral exploration and good potential for further discoveries. Known mineral deposit types include: 1) syngenetic stratabound barite mineralization of the Earn Group; 2) magmatic-hydrothermal veins; skarn replacement; country-rock-hosted veins, breccias, structurally controlled alteration zones and Elsa-Keno Hill vein-faults thought to be genetically associated with the Tombstone intrusions; 3) skarns, breccias, and veins thought to be genetically associated with the McQuesten intrusions; and 4) breccias of unknown age and association.

Regional scale bedrock mapping of the Seattle Creek Map areas compiled by Murphy and Heon (1996) and Murphy (1996) indicates that the ground covered by the Nitra Property is underlain by Late Precambrian to Middle Jurassic rocks that were deposited in a deep-water, offshelf depositional environment during the formation of the northern Cordilleran continental margin. The sequences of sedimentary rocks, deposited from the Late Cambrian to Middle Devonian, are known as the Selwyn Basin succession. The oldest strata of the Selwyn Basin, the Hyland Group (Late Proterozoic to Cambrian), are turbiditic siliciclastic sedimentary rocks with minor limestone and maroon argillite, overlain by a Cambrian to Middle Devonian succession of dark colored siltstone (Gull Lake Formation), thin discontinuous white limestone (Rabbitkettle Formation), dark siltstone, argillite and chert (Duo Lake Formation) and green cherty argillite (Steel Formation). Dark clastic and rare felsic metavolcanic rocks of the Devonian-Mississippian Earn Group unconformably overlie rocks of the Selwyn Basin and are overlain by the Mississippian Keno Hill Quartzite. These moderately to highly strained sedimentary rocks are exposed in two overlapping thrust sheets in the McQuesten River Region. The more southerly Robert Service Thrust sheet juxtaposes the older Hyland Group rocks of the Selwyn Basin over the much younger Keno Hill Quartzites of the northerly Tombstone thrust sheet. The thrust sheets formed during northward and northwestward displacement of more southerly hanging wall rocks between the Late Jurassic and early Late Cretaceous. Four episodes of plutonism can be distinguished in the area: 1) Early Paleozoic bodies are typically meter-scale, fine grained diabase dykes and sills intruding rocks of the Hyland Group; 2) Mid-Triassic diorite to gabbro occurs in discontinuous pods of various sizes, primarily in the Tombstone Thrust sheet where they intrude Devonian and Mississippian rocks; 3) The most voluminous and widespread granitic rocks are the early Late Cretaceous Tombstone intrusions (91 – 94 Ma); and 4) The latest episode of granitic magmatism, the McQuesten intrusions (63-67 Ma).

## NITRA PROPERTY 2020 FINAL REPORT

Earliest documented exploration on the ground covered by the Nitra Property is from placer exploration on the upper end of Seattle Creek for placer gold. During the 1980's Paydirt Holdings Ltd. tested the upper end of Seattle Creek for placer gold. The gold that was recovered by Paydirt Holdings Ltd. was not sufficient to support an eight-man camp with frequent use of helicopter due to lack of access to this area. From the early 1990's to early 2000's Dan Klippert significantly improved access to the Seattle Creek area and its tributaries and found erratically deposited coarse gold (up to a 7¼ ounce nugget). Concurrently (1996 to 1999) with Dan Klippert's placer exploration work he staked the DCK quartz claims and carried out four (4) YMEP assisted soil surveys and trench programs. These programs successfully found significant Au-in-soil anomalies and multiple rock samples with significant gold mineralization. One notable sample had a grade of >10 g/t Au, >100 g/t Ag and As >10,000 ppm.

In 2012, Breakaway Exploration collected soil samples from several ridge-and-spur reconnaissance lines, on ground now covered by the Nitra property. This work was never published but was referred to in other assessment filings and was shown to have several Au-in-soil and As-in-soil anomalies.

In 2020, Banyan carried out its inaugural exploration on the Nitra Property. The 2020 exploration program culminated with the collection and XRF-analysis of 4,287 soil samples. From the resulting anomalous As, Pb and Zn trends 590 samples were selected for laboratory multi-element ICP analysis. Gold-in-soil highlights include:

## 1. Project Location

### Refer to Figure 1 – Property Location Map

#### 1.1. Name of area

The SSD and NTR quartz claims which make up the Nitra Property were staked by Banyan Gold in 2019 and 2020. The Nitra Property covers: 1) a significant proportion of the Seattle Creek drainage and part of the headwaters to Ross creek; 2) most of the ground previously staked as the DCK (Dan Klippert’s) claim block; 3) placers claims currently owned by Travis Moman (Morrison Creek), Reno Contracting Ltd. (Seattle Creek, Gary Williams) and Yukon Mining Ventures Ltd. (Ross Creek).

Banyan selected the name Nitra to honour the First Nation of Nacho Nyak Dun, within whose Traditional Territory the Nitra Property is located. The word “Nitra” is from the Northern Tutchone language, the ancestral language of the First Nation of Nacho Nyak Dun and means “respect”.

#### 1.2. Project location identification

The Nitra Property is located in the Seattle Creek Map Sheet (115 P/16). Seattle Creek is a north-flowing tributary to the McQuesten River, east of Scheelite Dome and Morrison Creek is its main tributary (Figure 1). The centre of the property is at approximately 444,800 East and 7,078,800 North (Datum: NAD83 Zone 8).

## 2. Claims

### Refer to Figure 2 – Claims Map Displaying Grant Numbers

In 2019 Banyan staked a contiguous block of 375 quartz claims covering an area of approximately 73.2 hectares (Table 2 and Figure 2). As of 2020, Banyan staked an additional 218 claims to expand the Nitra Property to comprise of 593 claims and 117 square kilometers. All claims are 100% owned and operated by Banyan Gold Corporation and are currently in good standing from 2022-10-07 to 2023-12-31 (Table 1). For a complete list of claims see Appendix A.

### 3. Access

The Nitra property is in central Yukon, 55 kilometres by road northwest of Mayo Silver Trail Highway. A 4X4 road heads west from the highway 19km to the west to access the claims. Placer mining and exploration activities have resulted in roads and trails of various quality that allow for access to much of the claims.

### 4. Property History

#### **Refer to Figures 3 to Figure 6 – Location of Historic Sampling**

Exploration on the Nitra Property dates from the 1900s when Placer gold claims were staked and prospected. Documented exploration on the ground now covered by the Nitra Property includes: placer testing, soil sampling and trenching by Dan Klippert (Hard Rock Exploration) and Breakaway Exploration. Exploration by these two operators is briefly summarized below.

#### 5.1 Dan Klippert 1994-2002

From 1994 to early 2000's Dan Klippert developed the access to the Seattle Creek area and tested two unnamed tributaries to Seattle Creek. Testing found that gold distribution is erratic, however, the presence of coarse gold pockets with nuggets up to 7¼ ounces substantially improves the risk of mining erratic gold deposition. Klippert's placer testing indicates that the bulk of the gold in the pay streak ranges from 0.25 to 0.37 grams per yard and that when in the pay-streak there is little difference in grade when testing 1 yard or 100 yards (Klippert, 1997; Klippert, 2001; Klippert, 2002; Klippert, 2003). Grades can be improved to 0.54 to 2.3 grams of gold per yard when test sizes reach 1,000 yards or greater (Klippert, 1995).

Concurrently to the placer exploration, Dan Klippert was also looking for the hard rock source to the placer gold that he was finding in the tested unnamed tributaries to Seattle Creek. The DCK claim block was subsequently staked to cover the potential source rocks to these gold-bearing unnamed tributaries.

From 1996 to 2000, Dan Klippert explored the DCK quartz claims with soil surveys followed up with trenching and bedrock sampling. A total of 382 soils were collected and identified numerous Au-in-soil anomalies. Eleven (11) of the soil samples ranged from greater than 75ppb up to 170ppb Au. A total of 42 rocks were sampled, one notable rock sample assayed 10.6 g/t Au, 246 g/t Ag, 21.2%Pb, Sb >10,000 ppm and As >10,000 ppm.

A summary of the placer testing carried out by Dan Klippert is given in Table 3. A summary of the quartz claim exploration carried out by Dan Klippert is given in Table 4. The location of the DCK quartz claims, soil locations are shown in Figure 3. Gold-in-soil anomalies are shown in Figure 4 and arsenic anomalies are shown in Figure 5.

This work was never published but the locations of the soil samples were referred to by Fekete (2013) and reported to have identified multiple Au-in-soil anomalies.

The location of the soil samples collected are shown in Figure 6.

## 5. Regional Geology

### **Refer to Figure 7 – Regional Geology Map with active operators in the area**

The Nitra property lies in the western Selwyn Basin an epicratonic basin developed in a divergent margin setting established as the result of the neo-Proterozoic rifting along the North American margin (Ross, 1991; Colpron et al., 2002). The major stratigraphic units making up the Selwyn Basin in the McQuesten River area are the Late Proterozoic to Cambrian Hyland Group, the Devonian to Mississippian Earn Group and the Mississippian Keno Hill Quartzite (Murphy, 1997; Mair et al., 2006). The Earn Group and Keno Hill Quartzite were in turn intruded by a number of originally laterally-continuous mafic sills of metre-scale to hundred-metre-scale thickness (Murphy, 1997). Murphy (1997) estimates the age of these sills to be contemporaneous with the mid-Triassic Ogilvie Mountain sills of Mortensen and Thompson (1990).

Jurassic convergence between the North American and Farallon plates led to the collision of outboard terranes with the continental margin, which resulted in northward thrusting and low-grade metamorphism of Selwyn Basin strata (Monger, 1993). In the Mayo region, the Jurassic-Cretaceous Robert Service thrust (RST) (Murphy and Héon, 1995) juxtaposes Hyland Group rocks against the Keno Hill Quartzite and the underlying Earn Group rocks. North of the Robert Service thrust, but of roughly the same age, the Tombstone thrust sheet was thrust northward and protrudes structurally beneath the RST (Roots, 1997; McTaggart, 1960). Both these structures were in turn folded by a period of transpressional deformation creating the McQuestern Antiform, which plunges to the southwest (Mair et al., 2006; Murphy, 1997). With waning deformation across the orogen by the mid-Cretaceous, emplacement of a series of northwardly-younging, orogen-parallel, felsic to intermediate plutonic suites occurred between 112 and 90 Ma (Mortensen, 2000). A second suite of intrusive rocks, the McQuesten intrusions of 64-67 Ma locally exploited the existing structural weakness in the axis of the McQuesten antiform (Murphy, 1997).

## 6. Property Geology

No significant detailed mapping has occurred on the property.

## 7. Deposit Type and Mineralization

There are several styles of mineralization observed on or near the claim block (Figure 7). All of the following deposits can be expected to occur on the Nitra Property.

**Skarn:** Gold has been discovered in bedrock at the southern edge of the property in calcareous units. The rock sample analyzed was veined with sulphide integrated with a “yellow-green”, quartz laden decomposed material. The sample was analyzed to be arsenopyrite and returned a value of greater than 10 grams of gold per ton and 7.9 ozs. Of silver per ton. A rock sample taken approximately 40 feet away in this same area produced 2.34 grams per ton gold.

**Jaybe showing (115P 001):** Is located on the property and is described as a Vein Polymetallic Ag-Pb-Zn+/-Au. Paleozoic? Metamorphic rocks near a faulted contact with quartzite that could be a western extension of the Mississippian Keno Hill quartzite. Galena float, with a 34 g/t Ag to 1% Pb ratio, was found in the area but the source was not located.

**Seattle Showing (115P 002):** Located just NE of the property is described as a Vein Polymetallic Ag-Pb-Zn+/-Au Galena float assaying 40.3% Pb and 1556.5 g/t Ag was found in an area of quartzite which could be a western extension of the Mississippian Keno Hill quartzite formation. Trenching defined a poorly mineralized northeast trending vein fault. Mineralization is along strike to Nitra.

**Scheelite Dome:** Described as pluton related Au occurrence. The mineralization occurs in a Cretaceous aged intrusion southwest of the claims. Similar aged intrusions have been mapped on Nitra property. Regional magnetic data suggests that other intrusives occur on the property that either does not outcrop or are unmapped.

## 8. 2020 Exploration Program

The 2020 exploration program was carried out over 20 days with a 5 person crew. The crew mobilized daily from the AurMac base camp at km 1 of Victoria Gold Access Road to the Nitra property.

The 2020 program was a target evaluation partially funded through the Yukon Mineral Exploration Program (YMEP) on the Nitra Property. The objective of the 2020 exploration program was to follow up on historic ridge and spur soil survey lines by carrying out a grid-based soil geochemical survey and evaluate the mineralized trends for future work. Work completed during this single-phase program included the collection of 4,287 soil samples over approximately 107 line-kilometers. The survey lines cover approximately 12km<sup>2</sup>.

The program focused upstream of the historic placer operation in the central part of the Nitra property where previous exploration has shown the potential for anomalous As and Au values and/or gold mineralization at surface.

8.1. Soil Sampling

Refer to Figure 8 to 11 – Location of soil samples on and near the Nitra Property

8.1.1. XRF Results

A total of 4,287 soil samples were collected from approximately 107 line-kilometers (Figure 8). Soil lines were oriented north-south with a 25-meter station spacing. Soil lines were spaced 100 meters apart. Samples were collected from the B/C horizon with hand augers where depths averaged 15-30 centimeters by Mammoth Exploration. Locations of all collected soil sample stations were determined using a Garmin GPS (Garmin GPSmap 64) and can be found in Appendix B. No organic or A horizon material was collected. Samples were collected using soils augers and geotools and placed in kraft paper bags with UTM coordinates directly on the bag to be dried. Once dried samples were transferred into a thin plastic bag (fold top sandwich bag) and analyzed with a portable XRF (Niton XL5). XRF analysis was with a 4-beam SOIL setting of 30:30:30:30. Contoured XRF results for As, Pb and Zn are shown in Figures 9, 10 and 11 with complete results in Appendix B. Statistics for the XRF results are given in Table 6.

# NITRA PROPERTY 2020 FINAL REPORT

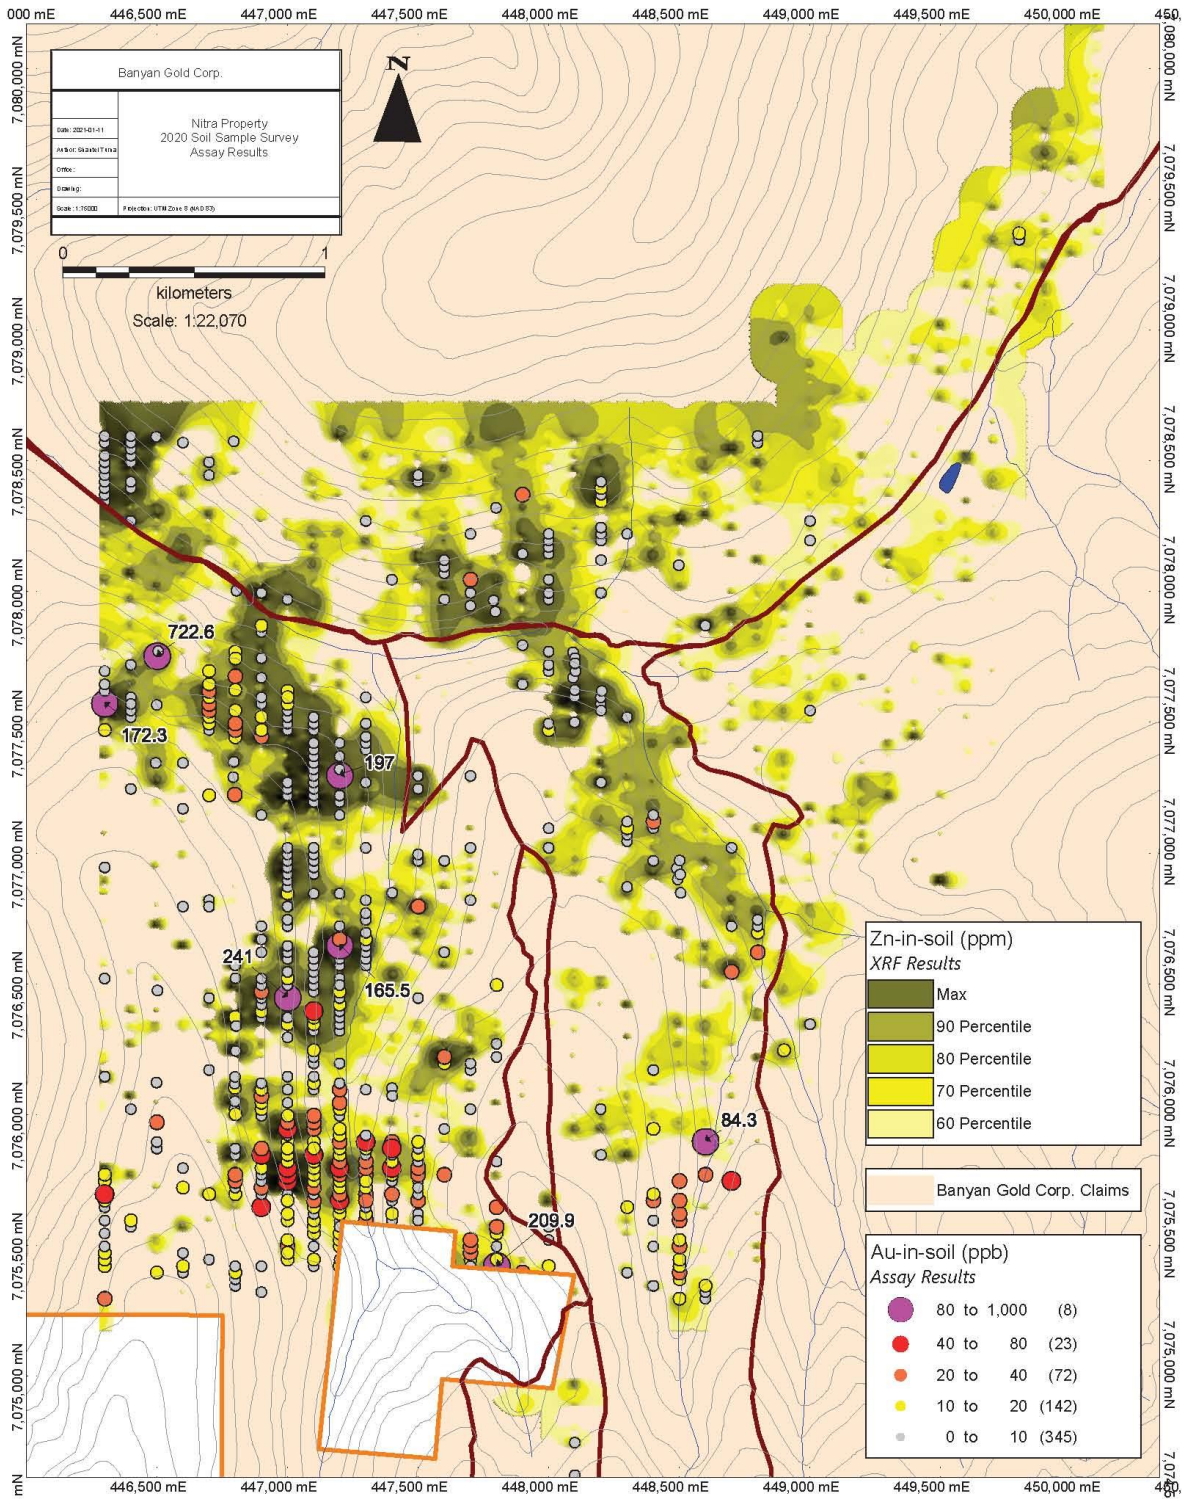

Figure 11 Zn-in-Soil XRF Results with Au-in-Soil Assay Results

## 8.2. Discussion of Results

As-, Pb- and Zn-in-soil XRF results show two large NNW continuous trends within the survey grid (Figures 9 to 11). The western trend strikes approximately 4.5km and is up to 600m wide. The eastern trend strikes approximately 2.3km and is up to 200m wide. Soil samples from these anomalous (>90<sup>th</sup> percentile for As and >95<sup>th</sup> percentile for Pb and Zn) trends were selected for laboratory analysis.

Figure 12 shows scatter plots for LAB and XRF results for As-, Pb- and Zn-in-soils. There are strong linear relationships between LAB and XRF result for As, Pb and Zn. The linear relationships confirm that an anomalous value identified with the XRF will result in an anomalous value from the LAB.

One-hundred-three (103) samples returned assays greater than 20 ppb Au. Of these samples only one sample had an As-in-soil <95 ppm, however, it was anomalous in Pb (113.1ppm). Au-in-soil samples with greater than 10 ppb Au are clustered in three areas along the western As-, Pb- and Zn-in-soil anomaly. With the current sample spacing there are no clear trends in the Au-in-soil clusters.

## 9. Conclusion

In 2020 Banyan Gold carried out its inaugural exploration program on the Nitra Property. The program successfully: 1) collected 4,287 soil samples from a grid-based survey upstream of historic placer workings, and 2) identified several Au-in-soil anomalous clusters from an XRF determined anomalous subset of the soil samples.

## 10. Recommendations

Banyans inaugural exploration program on the Nitra property successfully identified several Au-in-soil anomalous clusters that warrant further investigation. The following recommended to determine the significance of the Au-in-soil anomalous clusters:

- **Additional Lab Submittals** – Submit additional 2020 soil samples for assaying that are situated spatially near samples that returned Au lab results  $\geq 20$  ppb.
- **Infill soil sampling** – Increase sample density around Au lab results  $\geq 20$  ppb.
- **Prospecting** – Within the anomalous Au-in-soil clusters explore for outcrop and/or float that might be the causative source of the multielement anomalies.
- **Trenching** – If infill soil sampling and prospecting merit further investigation, develop access and carry-out a trenching program in the anomalous area.

The effective use of the portable XRF to identify anomalous geochemical trends is an inexpensive and efficient way to discover Au-in-soil anomalies when there is a geochemical relationship between gold and a pathfinder element. It was determined from the 2020 exploration program that As and Pb are effective precious metal pathfinder elements. As such, it is recommended to expand the soil survey to other parts of the property to identify other potential precious metal targets.
