Summary

The RC Property (the "Property") consists of 132 quartz mining claims (RC, BEE and BOP claim groups) located in the Dawson and Mayo Mining Districts. A newly constructed gravel access road to Big Creek has significantly improved access to the southern portion of the Property.

The Property lies within the Tombstone Gold Belt where Fort Knox style mineralization is known to be associated with Tombstone Suite intrusions (Hart, et.al. 2002). The headwaters of Clear Creek a historically significant placer gold bearing creek, and Big Creek drain from the property. Recent prospecting (Coe, 2020) has discovered gold mineralization in quartz veins related to the Big Creek Stock, within the Property. The Property is underlain by metasedimentary rocks of the Yusezyu Formation of the Upper Proterozoic to Cambrian Hyland Group. These have been intruded by the Tombstone-aged (Mid-Cretaceous) Big Creek diorite stock. The area also covers the drainage of a historic Minfile occurrence where mineralized samples collected by Murphy and Heon assayed 377 ppb Au and 478 ppm Mn from a quartz vein, 435 ppb Au, 72 ppm Bi, 88 ppm As, 15.3 ppm Ag, 242 ppm Pb and 303 ppm W from a vein and associated disseminated mineralization and 20 ppb Au and 789 ppm As from a breccia sample (Minfile occurrence 115 061, BIG).

In 2017, Pacific Ridge Resources optioned the Property and carried out a program of prospecting, mapping, soil sampling and a small geophysical program. The program defined four priority target areas defined by multi-element soil geochemical anomalies supported locally by mineralized grab samples of float and bedrock (Carlson, 2017). In 2018, Pacific Ridge carried out a program of prospecting, mapping, soil sampling and a small geophysical program. The program further defined the four priority target areas identified by multi-element soil geochemical anomalies supported locally by mineralized grab samples of float and bedrock in 2017 (Carlson, 2018). Pacific Ridge terminated its option on the Property in December, 2018.

Sitka Gold Corp. optioned the Property in mid-2019 and conducted further soil sampling, geological mapping, prospecting and extended the geophysics IP survey lines done in 2018. The IP surveys, supported by surface mapping and sampling, suggests that the Far Grid and Big Creek anomaly could represent intrusive related gold mineralization associated with sheeted veins and stockworks adjacent to the Rhosgobel and Big Creek stocks (Carlson, G., 2018; Coe, C., 2020).

The 2020 work program described in this report includes 2 helicopter supported diamond drill holes totaling 394 meters, which tested previously defined targets at: the Far Grid Au-in-soil and IP anomaly; and the Big Creek Stock (Mann Vein), as well as a LiDAR survey flown by Mcelhanney Ltd over the western portion of the the Project.

Additional prospecting, mapping and infill soil sampling should be completed prior to mechanical work which should include trail construction and trenching, followed by additional diamond drilling if the targets warrant the expenditure.

Introduction

The RC Project (the "Property") consists of the 100 RC quartz mining claims and the 24 BEE quartz mining claims located in the Dawson Mining District and the 8 BOP quartz mining claims located in the Mayo Mining District. This report discusses the results of a surface exploration program carried out on the Property during August 2018.

The Property covers a target area that includes the Big Creek Stock and historic plus recent anomalous gold occurrences. In 2017, Pacific Ridge Exploration Ltd. ("Pacific Ridge") optioned the RC claims from Fox Exploration Ltd. At the same time, Pacific Ridge optioned the adjoining BEE and BOP claims from Mr. William Mann. The Property has seen relatively little documented exploration activity, yet it adjoins two other highly explored properties: Clear Creek (Contact zone), now owned by Victoria Gold Corp. lies on the west and Mahtin, which was purchased by Sitka Gold Corp in January 2020 from Strikepoint Gold Inc., lies on the east. In 2017 and 2018, Pacific Ridge completed a preliminary prospecting, geological mapping and soil geochemical program on the Property. In late 2018, Pacific Ridge terminated its option on the RC Property.

In 2019, Sitka Gold Corp. ("Sitka") optioned the RC Property from the underlying owners and conducted a follow-up exploration program including additional geological mapping, prospecting and soil geochemical sampling, plus a 2.2 km reconnaissance IP program that extended the IP lines completed in 2018.

The 2020 work program, described in this report, included 2 helicopter supported diamond drill holes totaling 394 meters, which tested previously defined targets at: the Far Grid Au-in-soil and IP anomaly; and the Mann Vein located in the Big Creek Stock, as well as a LiDAR survey flown by Mcellhaney over the western portion of the the Project.

The following report describes and interprets the 2020 field program. Drilling was carried out between August 20th and August 30th 2020, while the LiDAR survey was flown on September 23rd 2020. Total expenditures for the program are $407,395.95. The work was supported by YMEP grant number 20-042

Location, Property Information, and Access

The RC and BEE claim groups, comprising the majority of the RC Property, are in the Dawson Mining District in the Yukon, approximately 120 kilometres east of Dawson City. The property is located on NTS map sheet 115P14 and centered at latitude 63o 50' 00" N and longitude 137o 00' 45" W, or UTM coordinates 401,000 E and 7,080,000 N (NAD 83, Zone 8) (Figure 1).

Figure 1 - RC Gold Project location

Access to the Property is via Highway 2, the Klondike Highway, for 425 km north and west from Whitehorse or 100 kilometers east from Dawson to the Clear Creek road. At this point, turn to the northeast along Clear Creek road for 33 km where the road meets the Left Fork of Clear Creek. To the right, follow the Left Fork of Clear Creek downstream and then upstream on the Right Fork to the southern part of the Property along the new Big Creek road. The camp site used in the 2020 field program is located up the Left Fork of Clear Creek (with permission from Victoria Gold Corp., on whose claims the camp site lies), is a further 10 km, just beyond the placer camp of Nels Harper. Roads beyond the 2020 camp provide access to within 250 m of the western edge of the Property (see Figure 2, 4 & 9).

The Property consists of three contiguous claim groups acquired under two option agreements, including the RC 1 to 100 claims in the Dawson Mining District owned by Fox Exploration Ltd., the BEE 1 to 24 claims

in the Dawson Mining District owned by William Mann ("Mann") and the BOP 1 to 8 claims in the Mayo Mining District owned by Mann (Table 1 and Figure 2).

The Company has the right to acquire a 100% interest in the BEE and BOP claims from William Mann, a veteran geologist with a lifetime of experience working and prospecting in the Yukon, by paying $100,000, issuing 500,000 Sitka shares and completing $630,000 in exploration work over 5.5 years. Sitka will pay an additional bonus of $250,000 in cash, shares or any combination thereof, at Sitka's option, upon receiving a resource calculation of at least 1.0 million ounces of gold in any category within the RC Gold Property. The BEE and BOP claims are subject to a 2% NSR, half of which can be purchased for $2,000,000.

The Company has the right to acquire a 100% interest in the RC claims from Fox Exploration Ltd. ("Fox") by paying $300,000, issuing 1,500,000 shares and completing $1,870,000 in exploration work over 5.5 years. Sitka will pay an additional bonus of $250,000 in cash, shares, or any combination thereof, at Sitka's option, upon receiving a resource calculation of at least 1.0 million ounces of gold in any category within the RC Gold Property. The RC Claims are subject to a 2% NSR, half of which can be purchased for $2,000,000.

The Company staked 28 claims that are contiguous with the claim block and cover additional highly prospective ground. This brings the total number of claims at the RC Gold Property to 132 covering an area of approximately 2600 hectares (6425 acres).

Table 1 - RC-BEE Claims Table

Grant No.	Claim Name	Claim Owner	Expiry**

YD61309-YD61332	Bee 1-24	William Mann - 100%	20-Dec-28

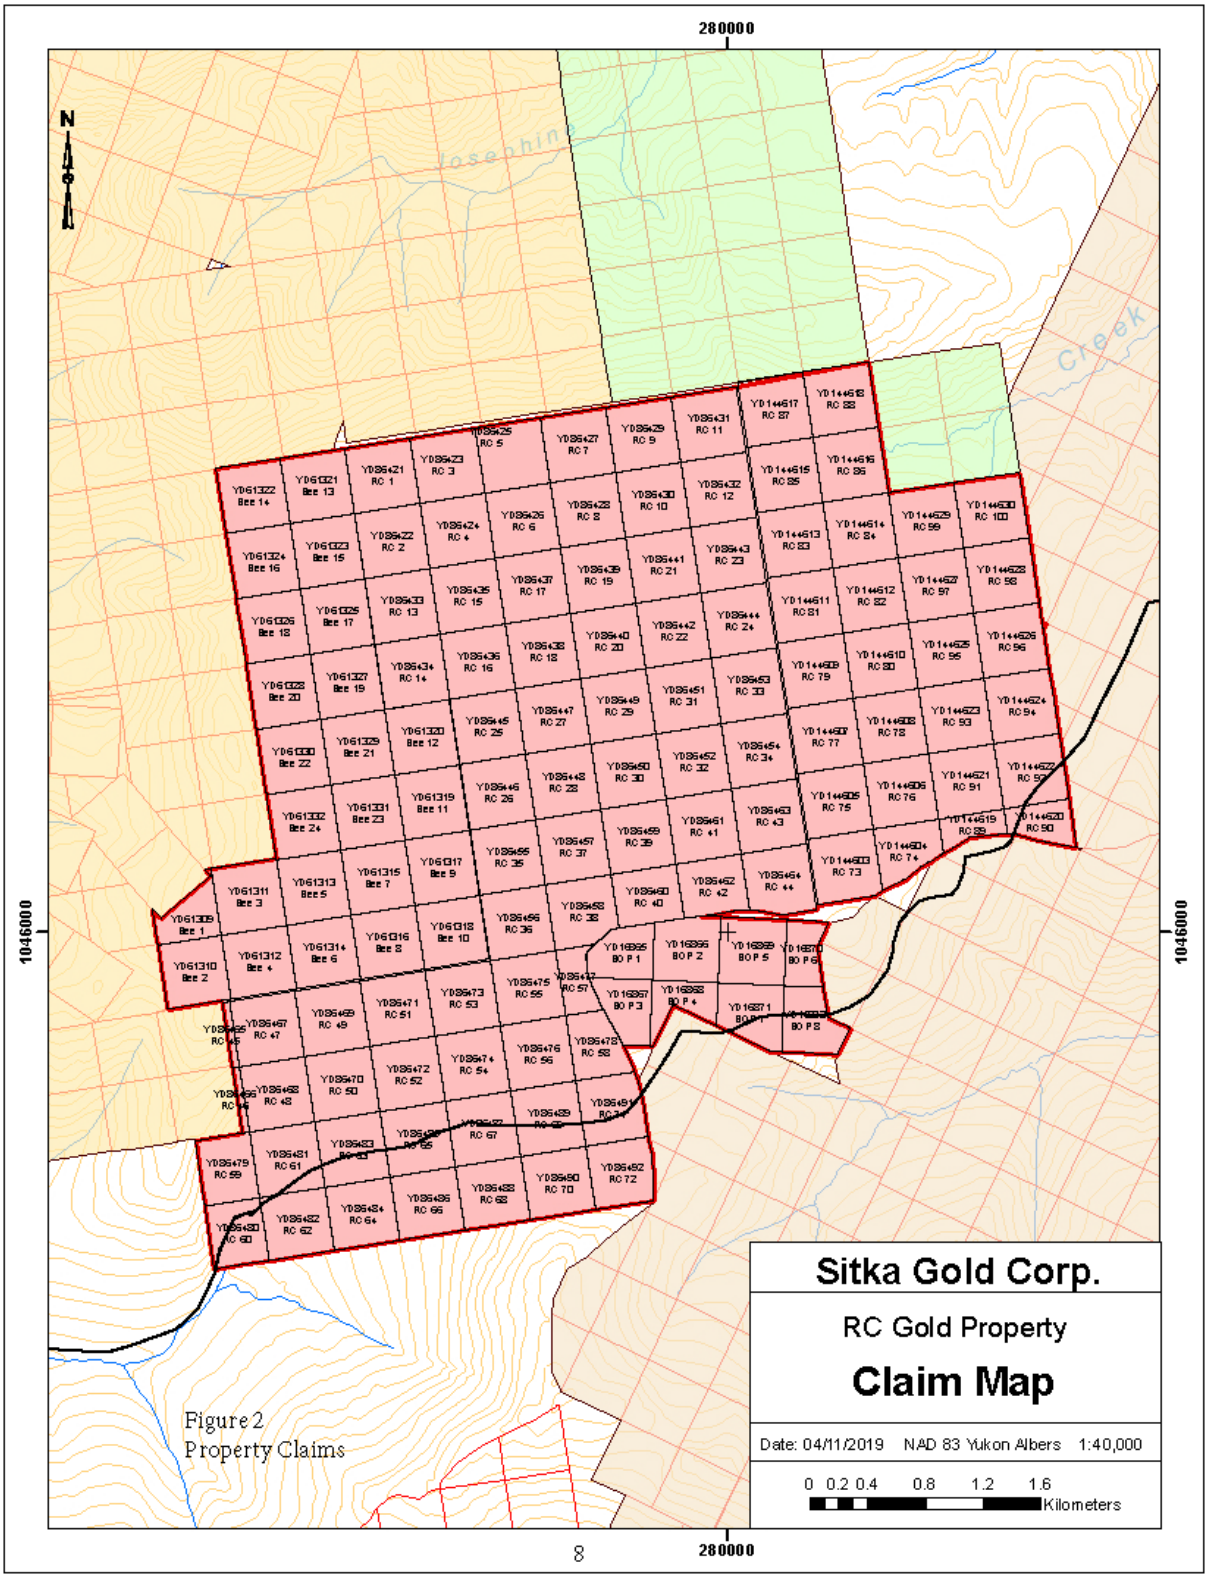

Figure 2 - Claim Map

The Property covers moderate terrain, with elevations ranging from 1200 metres to 1,600 metres. Much of the property extends above tree line and is covered by sparse tundra vegetation; ridgelines are covered by talus and felsenmeer with little vegetation. Forest cover on lower slopes consists mostly of black and white spruce. Loess is observed in many areas can mask geochemical responses from underlying bedrock.

The climate is generally dry during the summer months with most precipitation occurring in July and August. Temperatures range from -45° C in the winter months to 30° C in the summer. Snow accumulation begins generally in late September and is mostly melted by mid-May. The regional area was subject to weak glaciation and the surrounding area is known to have accumulations of loess up to 20 metres thick.

Previous Work

Placer Mining first began on Clear Creek in the late 1800's and the first quartz claims were staked in the early 1900's. Placer mining has continued to the present, with a dredge operating on Clear Creek from 1943 to 1954 and again between 1981 and 1987.

The first modern hard rock exploration in the area took place in the 1970's, targeting silver, tin and tungsten, metals commonly associated with Intrusion Related Gold deposits. High grade gold-silver and silver-lead-zinc veins have also been prospected.

In the 1990's, exploration shifted to bulk tonnage gold after the discovery of the Fort Knox gold deposit in Alaska, in a similar geological environment. Explorers near the Property included Noranda, Ivanhoe Goldfields, Kennecott and Newmont. These companies carried out geological mapping, geochemical and geophysical surveys and several campaigns of drilling. More recently, in the 2000's, Thor Explorations, StrataGold and Golden Predator have explored on the west side of the RC Property, while Ryan Gold (now StrikePoint) explored to the east.

The RC Property area was staked as the Far claims by R. Wongda after a mineralized showing in the area was discovered by Murphy and Heon during 1:50,000 scale geological mapping in 1993. The mineralized samples collected by Murphy and Heon assayed 377 ppb gold and 478 ppm manganese (vein), 435 ppb gold, 72 ppm bismuth, 88 ppm arsenic, 15.3 ppm silver, 242 ppm lead and 303 ppm tungsten (vein, disseminated) and 20 ppb gold and 789 ppm arsenic (breccia) (Minfile occurrence # 115 061; name: BIG).

In 1994, Wongda carried out minor geological mapping and sampling on claims Far 65-70. L. Hart re-staked the showing in December 1994. Thor Explorations Ltd. optioned the Far and other neighbouring claims from Hart. In September 2003 Thor Explorations carried out soil sampling and prospecting on Far claims 31-34, and 51-54 and other neighbouring claims. In 2005 Thor Explorations Ltd carried out an additional reconnaissance exploration program.

In 2010, Bearing Resources acquired the BIG claims centred on the Big Creek Stock and carried out a small soil and rock sampling program. They identified quartz-tourmaline breccia in altered metasediments

within the stock, with one grab sample running 2.91 gpt Au taken from several rusty float boulders with quartz-arsenopyrite veining (Mann, 2011).

In 2014, Mann staked the BEE claims and in 2015 carried out a program of rock and soil sampling. In 2017, he added the BOP claim group on the southeast side of the RC claim group.

In August 2016, Fox took three rock grab samples exposed along the newly constructed Big Creek road that cuts across the south side of the Property, one of which returned 180 ppb gold (Coe, 2017). The RC claims were subsequently staked for Fox to cover a target area that includes the Big Creek Stock and historic plus recent anomalous gold occurrences. Brief reconnaissance prospecting on the property in October 2016, identified quartz monzonite and quartz vein float assaying 115 and 244 ppb gold respectively (Coe, 2017).

In 2017, Pacific Ridge carried out a program of prospecting, geological mapping, soil sampling (564 samples) and three short lines of mag/VLF ground geophysical surveying, supported by YMEP Project 17-026. The 2017 mapping program identified quartz-arsenopyrite veining in the Bee grid area. Three grab samples of quartz vein and breccia material from this area ran 0.317 gpt Au (with 4.6 gpt Ag and 3,383 ppm As), 0.511 gpt Au and 0.257 gpt Au (with 3,292 ppm As). A gossan area corresponding to a calc-silicate altered zone of limy metasedimentary rock occurs within the Big Creek stock (Big Creek Anomaly). A grab sample of rusty quartz breccia ran 3.6 gpt gold with 2.6 gpt Ag and 3,938 ppm As. A second grab of similar quartz breccia assayed 1.919 gpt Au with 3 gpt Ag and 769 ppm As.

The soil survey defined four strong geochemical anomalies. The BEE North Au-As-Sb-Bi anomaly may be related to the nearby Contact Zone on the adjacent Clear Creek property. Three grab samples of vein material assayed 0.511 ppm Au, 0.257 ppm Au and 0.317 ppm Au. The BEE South Au-Ag-Sb-Pb-As anomaly is defined by four adjacent gold soil values ranging from 0.227 to 0.998 ppm Au. The linear nature of the anomaly suggests that this anomaly is reflecting the presence of a subcropping gold-silver vein or shear. The Big Creek Au-As-Ag-Cu-W-Pb-Zn anomaly appears to be related to rusty and altered quartz breccia related to pyrrhotite skarn. Gold values of 3.571 ppm and 1.919 ppm Au were returned from two grab samples. The Far Grid Au-Bi-Cu-W-Ag-As-Sb anomaly correlates with and extends an Au-As-Cu anomaly first defined by Thor Explorations (Lueck, 1995). The anomaly has a strike length of over 1 km and is immediately adjacent to the intrusive hosted Juno sheeted vein zone on the Clear Creek property drilled by Kennecott in 1995. The 2017 RC Gold project exploration program successfully defined four strong targets for follow-up exploration. The 2018 program focused on further defining and expanding the Big Creek and Far Grid targets, as well as filling in a previously unexplored area in the central part of the target area.

In 2018, Pacific Ridge carried out a program of prospecting, mapping, soil sampling and a small geophysical program. The program further defined the four priority target areas identified by multi- element soil geochemical anomalies supported locally by mineralized grab samples of float and bedrock in 2017 (Carlson, 2017). Pacific Ridge terminated its option on the Property in December, 2018.

Sitka Gold Corp. optioned the Property in mid-2019 and conducted two lines of reconnaissance Induced Polarization (IP) geophysical surveying that extended the 2018 IP lines, along with collecting 288 soil

samples and 16 additional prospecting and geological mapping to infill between the two gold-in-soil anomalies identified from the 2018 work at the Far Grid and Big Creek zones.

Geology and Mineralization

The Clear Creek property is located within the Selwyn Basin, a sequence of shelf and off-shelf sedimentary and lesser volcanic strata along the margin of the Mackenzie Platform to the northeast (Gordey and Anderson, 1993), deposited from late Precambrian to Triassic time. The environment was predominantly subaqueous, with some episodes of uplift. In the Cretaceous, the Selwyn Basin strata were intruded by the 92 Ma Tombstone Plutonic Suite, forming an arcuate belt of intrusions extending east- southeast from the Fairbanks area across the Yukon. A second intrusive suite, the Late Cretaceous - early Tertiary McQuesten suite, extends east-west along the southern margins of the Clear Creek area.

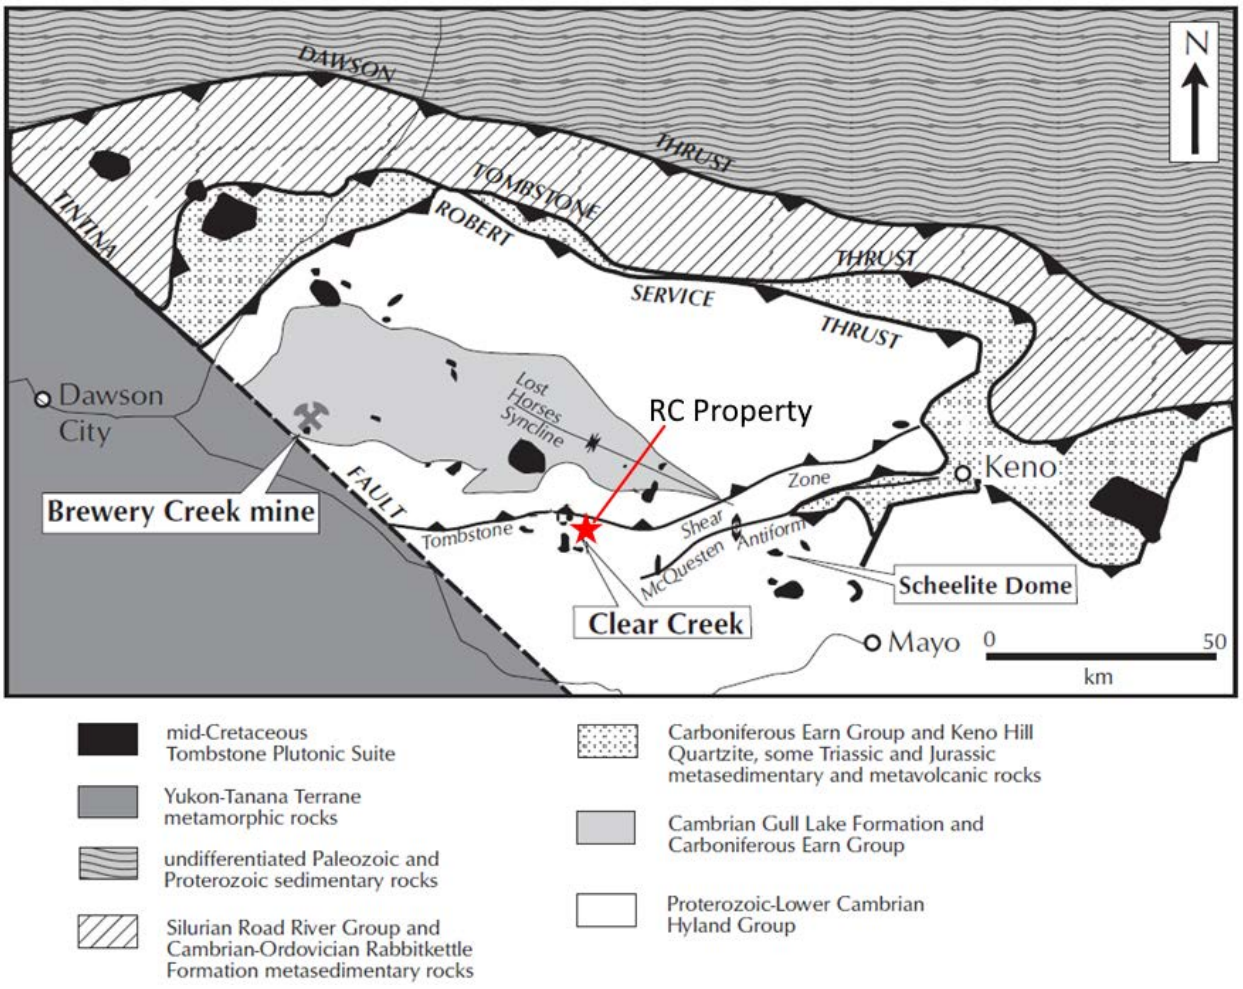

Figure 3 - Geology of the western Selwyn Basin (Modified from Stephens, 2000)

The Clear Creek area is underlain by basal Selwyn Basin strata belonging to the Yusezyu Formation of the Upper Proterozoic to Lower Cambrian Hyland Group. Yusezyu Formation sediments consist largely of pelites, psammites, coarse clastic "grits" and quartzites, with lesser limestone and marble, calcareous elastic sediments and chemical and elastic sediments. The "Tombstone Strain Zone", a broad zone of complex deformation, resulting in multi- episodic folding and prominent foliation and lineation development within the sediments, extends roughly east-west just north of the project area (Murphy and Heon, 1996).

Tombstone Suite stocks in the area include the Rhosgobel, Big Creek, Pukelman, Josephine and Eiger stocks (see Figure 4 – Josephine and Eiger stocks are just off the map to the north). The Josephine and Big Creek stocks are dioritic, the Eiger stock is granodiorite and the Rhosgobel and Pukelman stocks are quartz monzonite to granite. The intrusions are surrounded by a broad zone of hornfels. The McQuesten Suite intrusions, including the Vancouver Creek stock, are mostly of biotite-muscovite granite to quartz monzonite, medium to coarse grained and locally porphyritic.

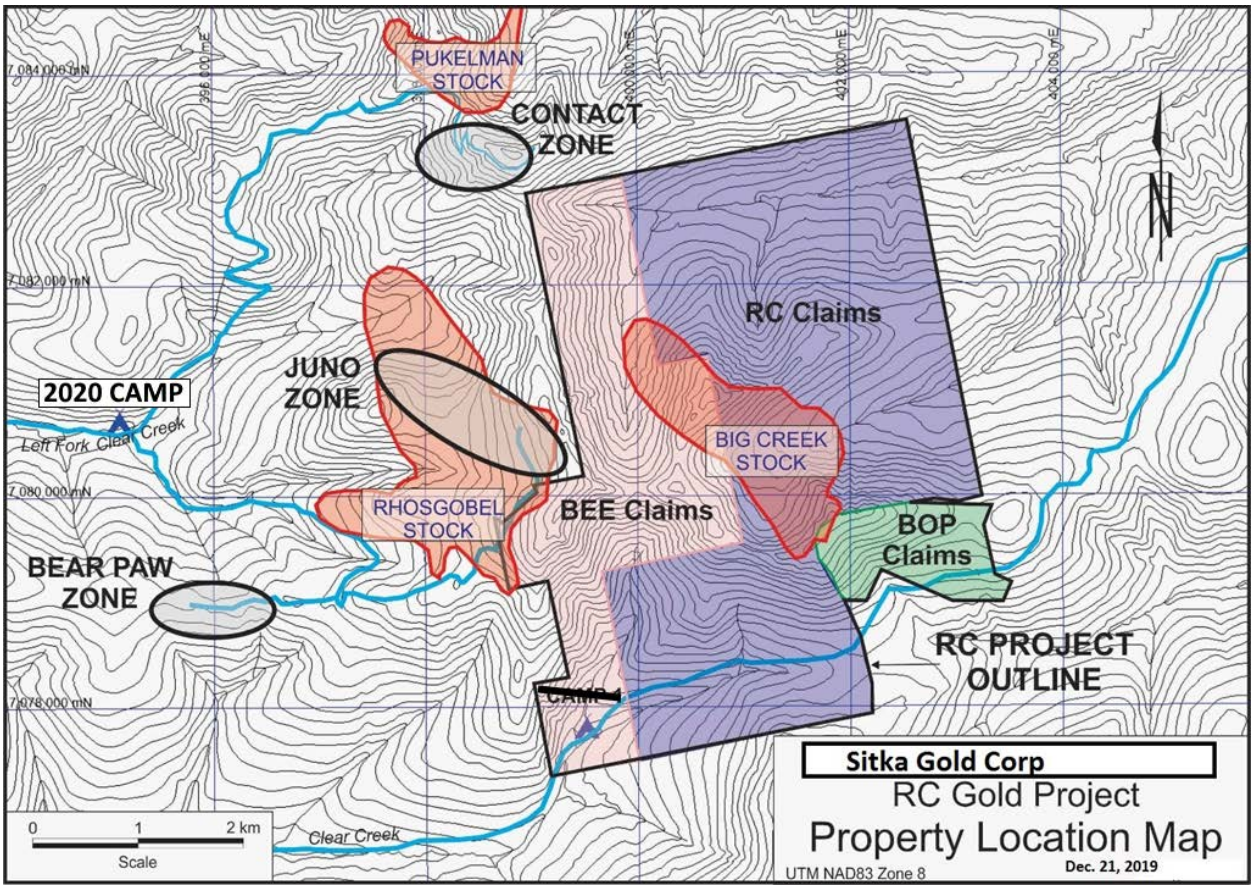

Figure 4 - RC Gold property map showing Tombstone-aged intrusions (red outlines) and mineralized zones (Contact, Juno and Bear Paw) on the adjacent Clear Creek property

The Property is underlain mostly by Yusezyu Formation metasedimentary rocks exhibiting multi-episodic deformation that results in a pervasive foliation and locally several styles of folding. Areas proximal to the Clear Creek intrusions exhibit hornfelsing and contact metamorphic and metasomatic fabrics. Stephens et. al. (2003) have divided the hornfels aureole into two zones: an inner aureole of contact metasomatism

with skarn development, strong foliation and a strong contact metamorphic overprint of biotite-andalusite; and an outer aureole characterized by a contact metamorphic overprint of biotite and andalusite.

The Big Creek Stock underlies much of the southern portion of the RC claim block (Figure 4). A hornfels zone extends more than 200 m from the intrusive contact. Minor limonitic granitic dykes extend up to 500 metres from the stock (Schulze, 2005). It has been suggested that and adjacent intrusions such as Rhosgobel and Pukelman may be related as variously fractionated magma from a single parent source at depth, as they are approximately the same age and occur within a single large halo of hornfels (Schulze, 2005).

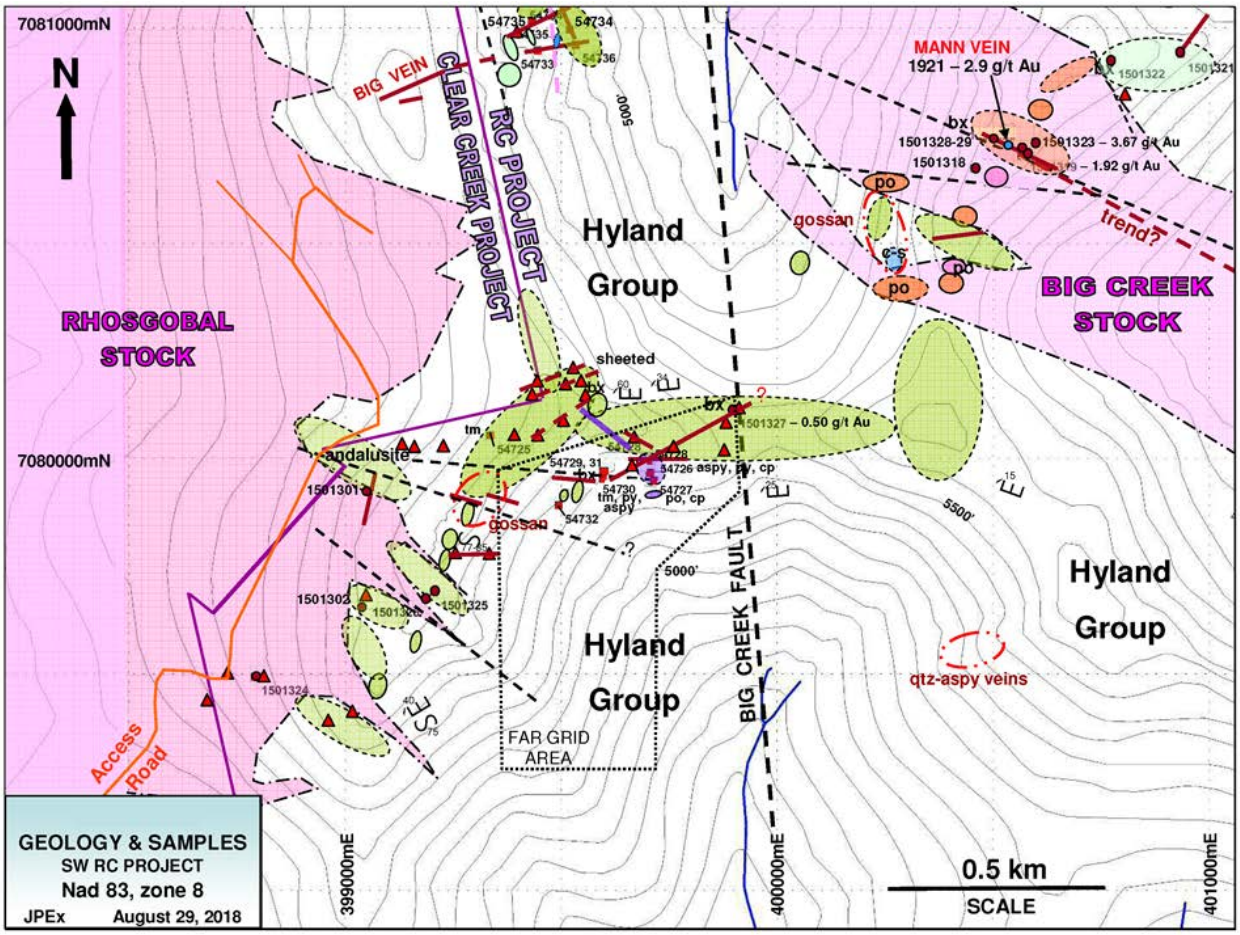

Figure 5 - 2018 Geological Mapping RC Project (Carlson, 2018).

The target at RC Gold is an Intrusion Related Gold deposit like Eagle Gold (Victoria Gold), Brewery Creek (Golden Predator) and Red Mountain in Yukon and Fort Knox, True North, Pogo and Donlin Creek in Alaska.

Coombes (1995) reports three styles of mineralization on the adjoining Clear Creek property, including gold-bearing stockwork to sheeted vein zones hosted by felsic to intermediate intrusions and adjacent hornfels zones; auriferous pyrite within fault zones cutting metasedimentary rocks; and scheelite-bearing calc-silicate skarns. The mineralization at Bear Paw on the Clear Creek property (see Figure 2) is mainly

breccia hosted with only minor felsic dikes and may be in the cupola zone of an intrusion at shallow depth below the known mineralized zone.

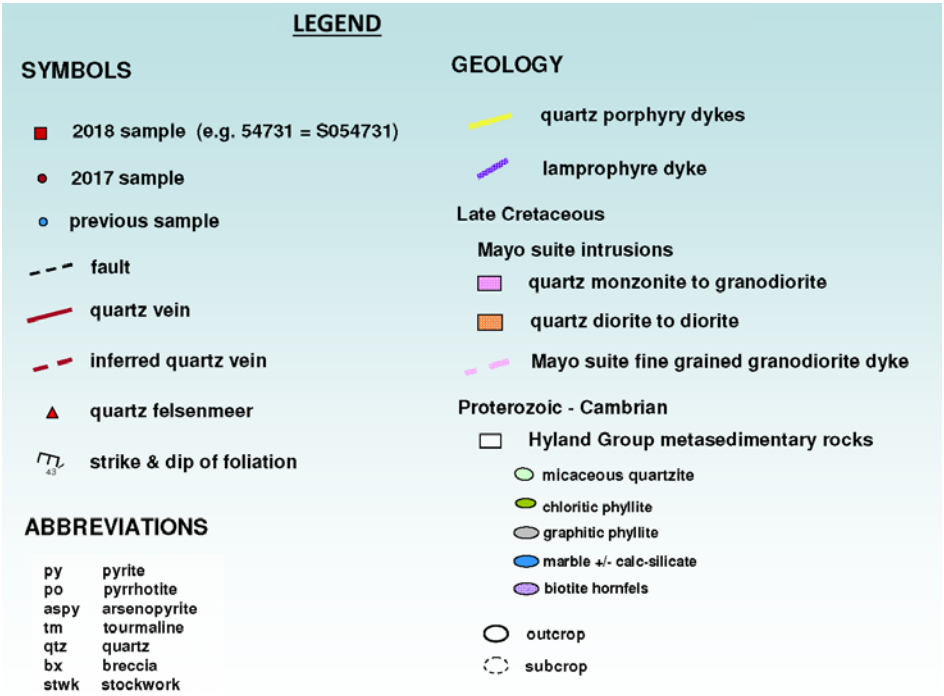

Figure 6 - Geology legend for figure 5

On the Property, a sample of quartz-arsenopyrite veining within brecciated phyllite returning a value of 1.112 opt (3.48 g/tonne) gold was obtained by Bema Industries Ltd. in 1981 near the eastern boundary of the claim block (Schulze, 2005). In the same general area, Murphy and Heon (2006) report a breccia zone where mineralized samples assayed 377 ppb gold, now known as the BIG Minfile occurrence (115 061). Coe (2017) reported quartz vein float along the new Big Creek road with gold values ranging from 115 to 244 ppb.

During the 2017 mapping program, quartz-arsenopyrite veining was observed in the Bee grid area. Three grab samples of quartz vein and breccia material from this area ran 0.317 gpt Au (with 4.6 gpt Ag and 3,383 ppm As), 0.511 gpt Au and 0.257 gpt Au (with 3,292 ppm As). A gossan area corresponding to a calc-silicate altered zone of limy metasedimentary rock occurs within the Big Creek stock (Big Creek Anomaly). A grab sample of rusty quartz breccia ran 3.6 gpt gold with 2.6 gpt Ag and 3,938 ppm As. A second grab of similar quartz breccia assayed 1.919 gpt Au with 3 gpt Ag and 769 ppm As (Carlson, G., 2018).

Deposit Model

More recent exploration on the Property has been focused on identifying an intrusion related gold system ("IRGS") which have many similarities to orogenic gold deposits. The project area lies in an underexplored part of the loosely defined Tintina Gold Province (Figure 7). This metallurgical province has past production of 29.9 million ounces and 39.3 million ounces of resources for total gold resources of 69.2 million ounces. The property is part of the Tombstone Gold Belt (pink shading in Figure XX1) which is the prominent host to IRGS in Yukon and Alaska, notable deposits from the belt include low grade, high tonnage examples such as: Fort Knox in Alaska with 117.09 million tonnes at a gold grade of 0.86 g/t (4.1 million ounces; Fairbanks Gold Mining Inc.) and Eagle Gold with 116 million tonnes at a diluted grade of 0.66 g/t Au (Dublin Gulch; Victoria Gold, 2018) and similar to Brewery Creek epizonal deposit with 17.172 million tonnes at a gold grade of 1.45 g/t (0.726 million ounces; Barr, 2013).

Gold mineralization on the Clear Creek intrusions share strong similarities with the Eagle Gold deposit and the Fort Knox deposit in Alaska, including sheeted quartz vein systems hosted within intrusions, anomalous bismuth, tungsten, and arsenic as well as mineralized metasediments adjacent to the intrusive bodies.

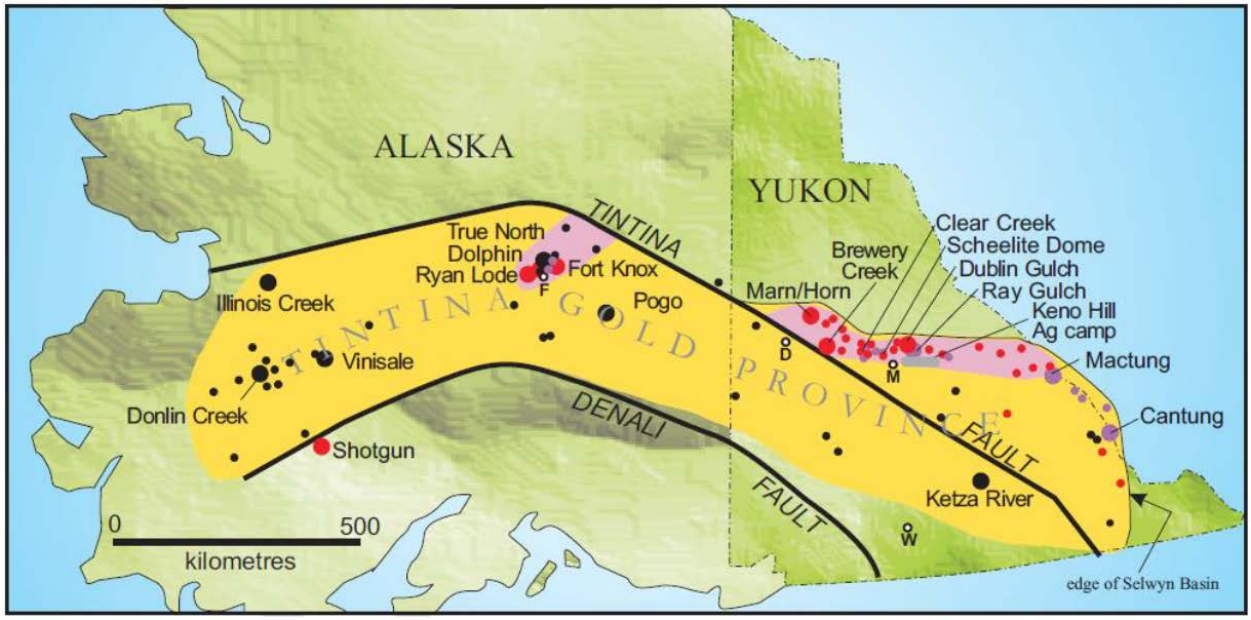

Figure 7 - Map of Tintina Gold Province and Deposits (Taken from Kirk, 2016; modified from Hart, 2007)

Hart (2005) describes the most common characteristics for IRGS deposits which include: 1) metaluminous to peraluminous, sub-alkalic to alkalic, volatile-rich plutons which are intermediate to felsic, 2) tectonic setting, in deformed shelf sequences well inboard of convergent plate boundaries, 3) gold associations variably with elevated W, Bi, As, Mo, Te and Sn, 4) Zoning of sulphide concentrations, low sulphide within igneous bodies increased through skarn to rich base metal veins distally (Figure 8), 5) gold mineralization emplaced post-deformation, 6) low gold grades in sheeted quartz veins within pluton and 7) typically in areas formally known for tungsten or tin deposits.

Gold mineralization in IRGS is hosted by millimeter to metre wide sheeted quartz veins and stockworks in equigranular to porphyritic granitic intrusions and adjacent country rock (hornfels). Native gold is associated with pyrite, arsenopyrite, pyrrhotite, scheelite and bismuth as well as telluride minerals. A number of deposits have late and/or peripheral arsenopyrite, stibnite or galena veins.

Intrusion related deposits and occurrences within the Tombstone Gold belt are associated with mid- to late-Cretaceous intrusions hosted by the intrusions and/or the older basement rocks. There is typically a strong correlation between gold and bismuth with low and reduced sulfide mineralogy (Hart, 2007).

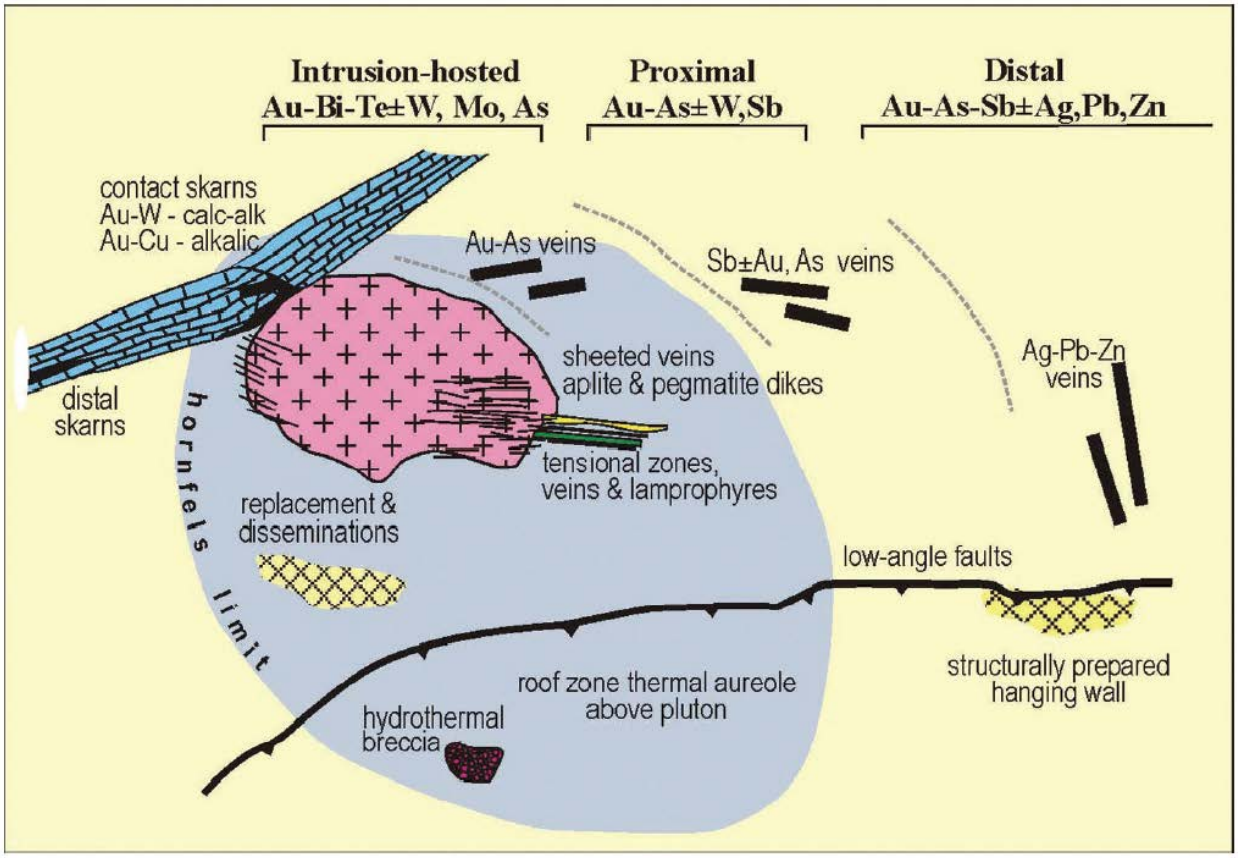

Figure 8 - Plan model of IRGS from the Tintina Gold Province (Taken from Hart, 2005)

2020 Exploration

The 2020 exploration program (the "Program") on the RC Property included 394 meters of helicopter supported diamond drilling in 2 holes, and a LiDAR survey covering approximately 16.5 km^2 of the western portion of the Project. A road accessible tent camp was constructed on the north bank of Left Clear Creek (Fig 9), approximately 5 km west of the drill sites, to accommodate work crews for the Program (as well as Sitka operated programs on their adjoining Clear Creek claims and nearby Barney Ridge Project). Sitka contracted Fox Exploration to provide camp facilities and support staff, and to act as general contractor for the program. New Age Drilling Solutions of Whitehorse, YT was contracted to complete the diamond drilling; McElhanney Ltd of Vancouver, BC was contracted to complete the LiDAR survey; Vision Quest Drilling and Exploration of Whitehorse constructed the 3 drill pads; and helicopter support, supplying a Bell206L4 Long Ranger was from Fireweed Helicopters Ltd of Dawson. Analytical work was completed by ALS Canada Ltd. ("ALS") with final analytical results received between October 6 and October 9, 2020. Certificates of Analysis from ALS can be found in Appendix 1. The Authors compiled the field data into digital maps and wrote this Report up to January 28, 2021.

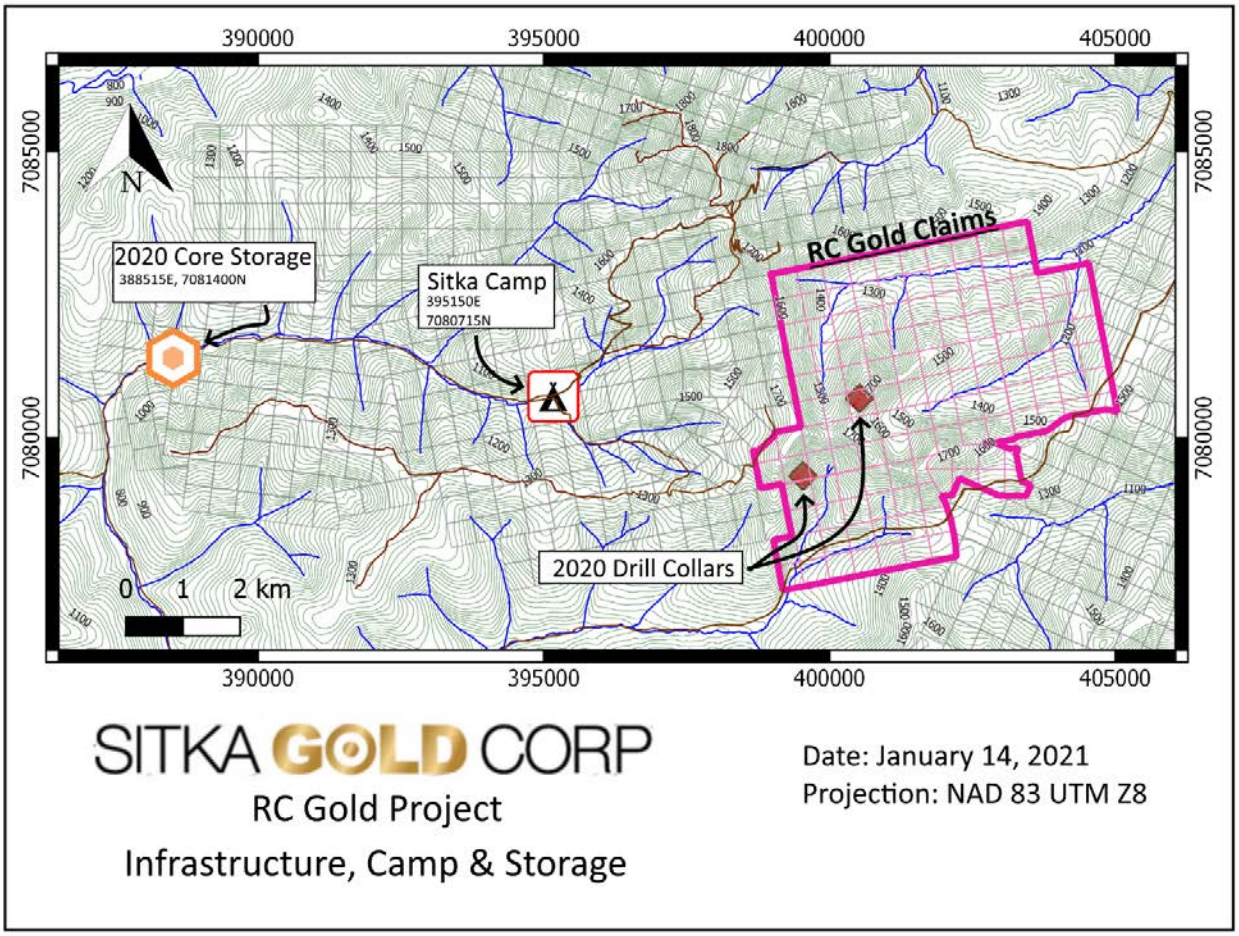

Figure 9 - RC Gold Project Camp and Core Storage Location

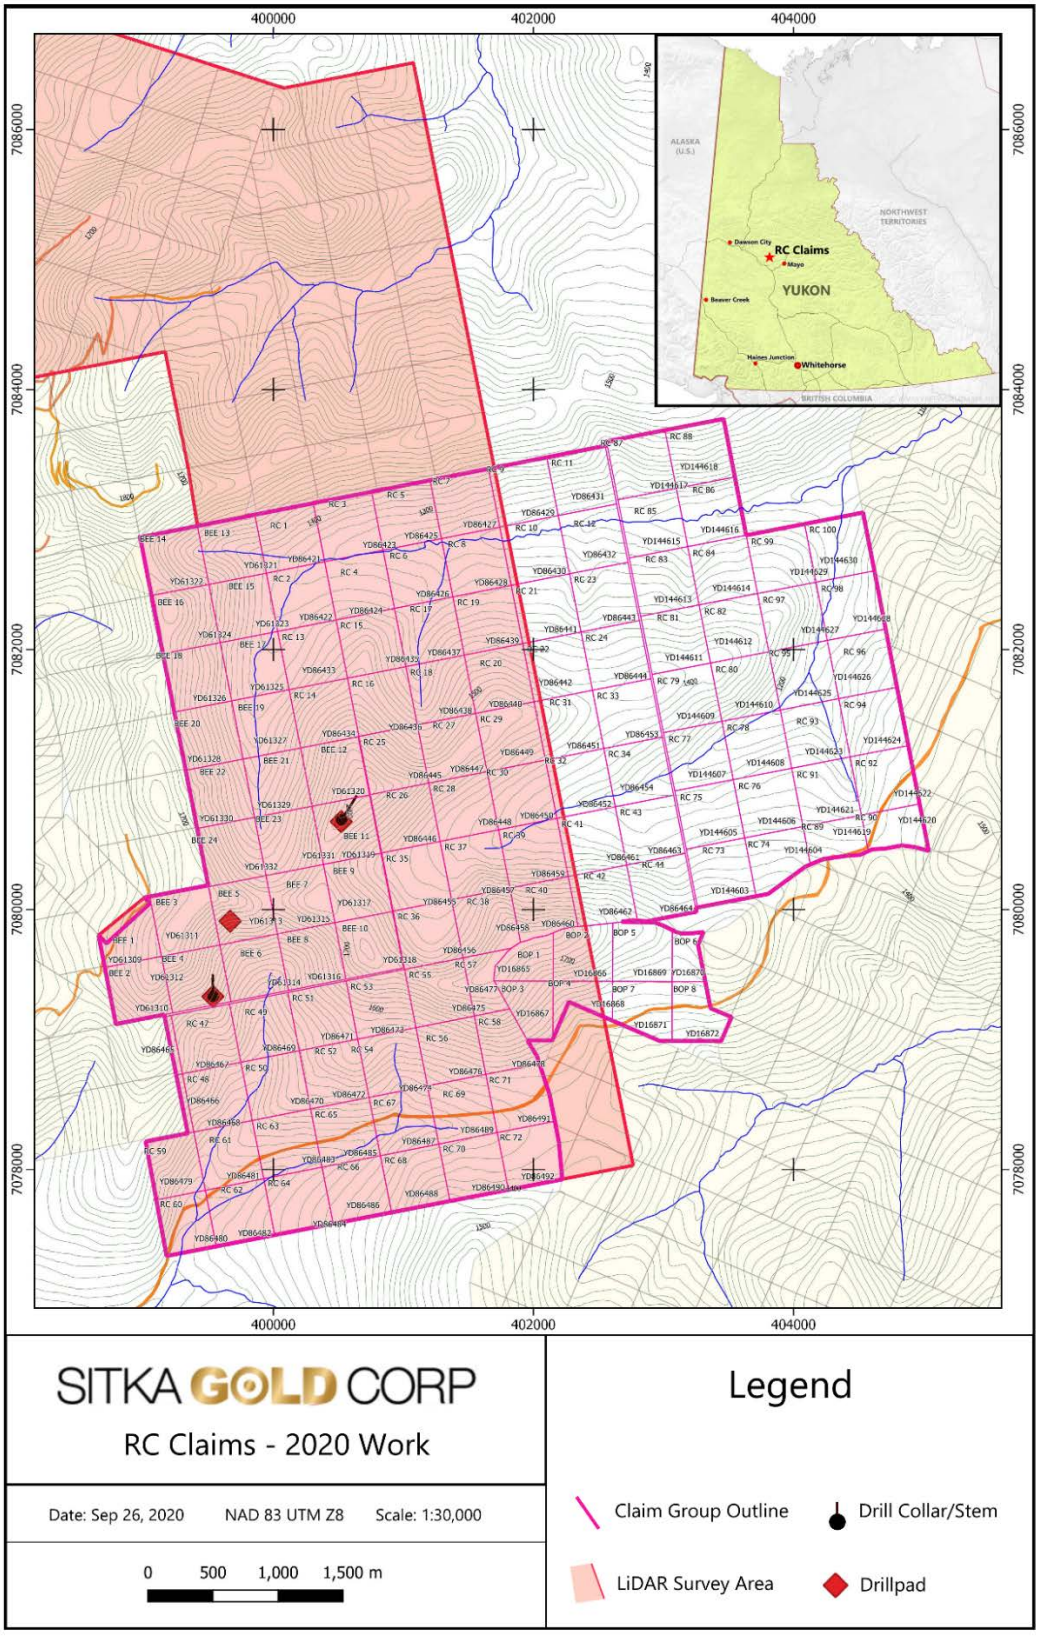

Figure 10 - 2020 Work Locations on RC Gold Project

Diamond Drilling

A total of 394 meters of NQ size diamond drilling was completed between two holes (DDRCRC-20-005 & DDRCRC-20-006) targeting mineralization at the Far Grid and the Big Creek Stock (Mann Vein). Drilling was carried out by New Age Drilling Solutions ("New Age") of Whitehorse. 3 timbered drill pads were constructed by Vision Quest Drilling and Exploration of Whitehorse (the 3rd pad was not used in this program) to accommodate drill setups. Drill moves and support were provided by a Bell206L4 Long Ranger from Fireweed Helicopters Ltd of Dawson. Work by New Age was carried out between Aug 20th and Aug 30th 2020. The drill was demobbed from site on August 30th.

A table of drillhole collar locations and orientations is presented below (table 2) for the 2 holes completed at the Project in 2020. Figure 10 presents the location of the drillhole collars along with surface projections of the drill stems. No downhole surveys were conducted during the Program. Drill logs and assay certificates are presented in Appendix I.

Drill core was transported to the logging facilities at the Sika Camp at the end of each drill shift. The core was then teched for recovery, geologically logged, tagged for sampling, and photographed. All recovered core was sampled at site by sawing the core in half with a diamond bladed saw, and placing one half of the cut core in a labelled sample poly bag along with the corresponding portion of the sample tag. The poly bags were then zip tied and packaged in a rice bag with several other samples, which was then closed with a security tag and shipped to ALS in Whitehorse as single-hole-shipments to be prepped for assay. In total 386.2 meters of core was recovered and analyzed as 206 unique samples. In addition to the core samples, standards and blanks were inserted into the sample sequence alternating between a standard and a blank every tenth (10th) sample. Standards inserted in to the sequence were certified reference material ("CRM") provided by CDN Resource Laboratories Inc ("CDN"). CRM's used in this program were CDN-GS-2U and CDN-GS-PJ4 which have stated Au values of 2.12 and 0.479 ppm respectively. Cut drill core for the program herein described is now stored on the neighbouring Barney Ridge property, located approximately 6.5 km to west of the Sitka Camp along the Left Clear Creek access road (Figure 9).

Drillholes DDRCRC-20-005 and DDRCRC-20-006 were prepped and assayed at ALS. Preparation at the ALS lab consisted of fine crushing to 70% < 2mm, followed by splitting to 1 kg and pulverize the subsample to 85% < 75 micrometers. Assays consisted of a 35 element aqua regia digestion ICP-AES (ALS Code ME-ICP41) along with a 30 g fire assay ICP-AES finish for gold (ALS Code Au-ICP21).

Table 2 – Diamond Drillhole Locations/Orientations

Drillhole ID	Easting (UTM Z8)	Northing (UTM Z8)	Elevation (masl)	Azimuth (collar)	Dip (collar)	Length Final (m)
DDRCRC-20-005	399532	7079329	1520	360	-45	173
DDRCRC-20-006	400527	7080687	1753	35	-45	221

DDRCRC-20-005

DDRCCC-20-005 was drilled at an azimuth of 360 degrees and a dip of -45 degrees for a total depth of 173 meters to test a target at the FAR Grid Zone (Figures 5 & 10). This was the first drill hole to test a coincident broad gold geochemical and IP chargeability anomaly outlined from previous exploration work (Coe 2019). The hole encountered hornfelsed metasedimentary units throughout its entire length sporadically mineralized with a low density of sheeted-style quartz veins (generally <1mm, up to 10's of cm). Pyrrhotite was common throughout the hole. Gold grades were generally at or near detection limits, and the weighted average Au grade of the 168.2 meters of recovered core was only 10 ppb. The best intersection was 4 meters between 43 and 47 meters downhole which returned a grade of 86 ppb Au.

Figure 11 - Typical section of hornfesled metasediments with qtz veins from hole 5 (141.45-149.62m)

DDRCRC-20-006

DDRCCC-20-006 was drilled at an azimuth of 35 degrees and a dip of -45 degrees for a total depth of 221 metres to test anomalous soils and the Mann Vein showing at the Big Creek Zone located approximately 1.6 kilometres northeast of DDRCRC-20-005 (see Figures 5 & 10). This was the first drill hole to test a gold geochemical anomaly outlined from previous exploration work conducted over the area. The hole was collared and remained in intrusive diorite of the Big Creek Stock for its entire length. Numerous zones consisting of sheeted-style quartz veins returned anomalous gold values, and a significant quartz-arsenopyrite-tourmaline vein (Mann Vein) was intersected between 142.1 meters and 143.3 meters downhole returning 2.47 g/t gold and 23.2 g/t silver over the 1.2 meter interval.

LiDAR Survey

A LiDAR survey was performed by Mcelhanney Ltd. of Vancouver covering 16.5 km^2 over the western portion of the RC Project on September 23rd, 2020. The survey also included the adjoining Clear Creek claims and the nearby Barney Ridge Project (both operated by Sitka Gold). The survey used an Optech Galaxy system for LiDAR data capture and an on board Camera Phase One iXU-RS1000 RGB for orthophoto capture both mounted on a Piper Navajo fixed wing Aircraft. The mean density of the point cloud (all points) was measured at nominal 18.3 pts/m^2 and the bare earth (ground) point density was measured at nominal 4.5 pts/m^2 and the standard deviation of the airborne GPS solution for using KAR (Kinematics Ambiguity Resolution) was estimated to 0.013 m, 0.013 m and 0.022 m in East, North and height directions, respectively.

Figure 10 above shows the area of interest with respect to the RC Project covered by the survey. The LiDAR survey report from Mcelhanney Ltd along with full scale orthophoto and hillshade image maps can be found in Appendix II.

As of the date of this report no detailed analysis of the LiDAR point cloud data has been undertaken to assist in structural interpretation of this Project.

Data Verification

It is the Author's opinion that the sampling procedures, security measures, sample preparations, and analytical methods applied to the rock samples were diligently followed and are adequate to meet industry standards commonly accepted for this level of exploration. The Author has relied upon the adequacy and accuracy of the analytical results provided by ALS Laboratories the rock samples. Independent verification of those results has not been undertaken. The Author reconciled the field data with the analytical results and found no irregularities.

Interpretation, Conclusions and Recommendations

The 2020 exploration program at RC Gold tested 2 previously defined targets with diamond drilling, and captured LiDAR data over a significant portion of the Property. The drilling results returned no significant assays from the Far Grid target, and only a small interval of significant Au mineralization (1.2 meters returning 2.47 g/t gold and 23.2 g/t silver) at the Big Creek Stock target. However, both holes did encounter locally anomalous (typically in the 10-100 ppb range) Au intervals, and the larger target zones should not be discounted off-hand. The Qtz-Tourmaline-Arsenopyrite bearing Mann vein intersection, which also returned a significant Bi value of 237 ppm, from the Big Creek target lends evidence to there

being a gold-bearing hydrothermal system of intrusion related gold deposit affinity within the Big Creek Stock.

The large number of gold occurrences within the Tombstone Gold Belt clearly shows the highly prospective nature of this setting for gold deposits. Located in the heart of the TGB, intruded by intermediate to felsic intrusions with metasedimentary (hornfels) aureole, previously mapped quartz stockwork and breccias in the thermal aureole, auriferous mineralization within quartz veins and sheeted quartz veins, strong associations with Bi, W, and As, low sulphide content with a reduced mineral assemblage (po-py-aspy) are supportive that this property has continued potential to host an intrusion related gold deposit.

Further detailed structural mapping may significantly assist in delineating additional gold bearing mineralization. A detailed interpretation of the LiDAR data set should be undertaken prior to additional field mapping exercises to assist in targeting zones with a potential for high structural density. The steeply dipping east-west mineralized quartz veins that have been observed and sampled on this and the surrounding properties represent the most favourable vein set orientation for gold mineralization in the area. This is due to the continued development of east-west dilatational vein sets during post tectonic activity which introduced additional mineralized fluids. The intersection of these east-west sets with north-east or north-west trending structures or breaks are prime targets. In particular, investigation of the Big Creek Stock should be pursued to the west near the margin of the stock, and projected intersection of the Mann Vein structure with the mapped Big Creek Fault.

While the Property is located in a relatively isolated part of the Yukon, local placer operations and historic hard rock exploration have resulted in a gravel access road through the southern portion of the property, and a 4X4 road to within 250 meters of the property's western boundary which provide some access to the property which may be possibly developed further prior to additional drill campaigns alleviating the need for helicopters. Dawson City, located approximately 110 kilometres from the Property, offers a wide range of services including equipment, supplies and labor. Reasonable access to the Property and its proximity to a service center certainly improve the project's logistics and relative cost of exploration work.

The RC Project remains highly prospective for the discovery of gold mineralization related to Tombstone Suite Intrusives, and additional prospecting, mapping, and infill soil sampling should be completed prior to additional mechanical work which should include trail construction and trenching prior to drilling.

Certificate of Qualifications

I, Joel Cameron Gillham, do hereby declare that:

1) I am currently working as a consultant out of my home in Vancouver, British Columbia;

2) I graduated with a Bachelor of Science degree from Simon Fraser University in 2007;

3) I have worked as a geological scientist in the mineral exploration continuously since 2005;

4) I am not aware of any material fact or material change with respect to the subject matter of this report, the omission to disclose which makes this report misleading;

5) I have not previously worked on the property that is the subject of this report prior to the work herein disclosed, but have completed an extensive literature search and reviewed all available data to me.

Dated at Vancouver, British Columbia this 28th day of January, 2021

Joel C. Gillham

Statement of Costs

2020 RC Gold: STATEMENT OF EXPENDITURES				
Company	**Invoice Description**	**Invoice Total**	**RC Gold Portion of Invoice**	**Notes**
Fox Exploration Invoices (20103, 20107, 20108)	Project supervision, geological crew, camp w/ support staff, truck and equipment rental, mob/demob…	$558,295.65	$123,912.15	Camp and support staff used for Clear Creek, RC Gold and Barney Ridge work programs. **30% of Fox invoice, less helicopter, pad building & anlytical charges, applied to Clear Creek**
Fireweed Helicopters (Invoice 5507)	Helicopter Support	$29,280.87	$29,280.87	
Horizon Helicopters (5432539)	Helicopter Support	$64,676.48	$64,676.48	
GroundTruth Exploration (10411)	Soil Sampling	$24,585.56	$9,485.01	RC Gold portion of invoice, 218 soil samples collected
McElhenney	LiDAR Survey	$48,000.00	$16,000.00	1/3 applied to RC Gold (1/3 to Barney Ridge; 1/3 to Clear Creek)
Bureau Veritas (VANI370875)	Soil Sampling Analysis	$5,402.04	$5,402.04	218 RC Gold soil samples analysed
ALS Laboratory (5272767, 5279542)	Analytical	$1,982.57	$8,635.39	RC Gold drill core assays
Vision Quest Exploration	Pad Building	$26,565.00	$26,565.00	for heli supported drilling
New Age Invoices (20191021, 20191025)	Diamond Drilling	$365,468.97	$119,438.49	1/3 applied to RC Gold (2/3 applied to Clear Creek,) less Barney Ridge road fixing and trenching
Final Assessment Report		$4,000.00	$4,000.00	invoice pending
TOTAL:			**$407,395.43**	

Supporting documents for the cost statement are included in Appendix II

CERTIFICATE WH20191540

Project: RC Gold

P.O. No.: RC 200829-DD-01

This report is for 99 Drill Core samples submitted to our lab in Whitehorse, YT, Canada on 29-AUG-2020.

The following have access to data associated with this certificate:

COR COE RYAN COE	RYAN COE GREG DAWSON	COR COE DON PENNER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
BAG-01	Bulk Master for Storage
LOG-24	Pulp Login - Rcd w/o Barcode
LOG-22	Sample login - Rcd w/o BarCode
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-32	Pulverize 1000g to 85% < 75 um

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
Au-ICP21	Au 30g FA ICP-AES Finish	ICP-AES
ME-ICP41	35 Element Aqua Regia ICP-AES	ICP-AES

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.

CERTIFICATE WH20191615

Project: RC Gold

P.O. No.: RC 200831-DD-01

This report is for 130 Drill Core samples submitted to our lab in Whitehorse, YT, Canada on 1-SEP-2020.

The following have access to data associated with this certificate:

COR COE RYAN COE	RYAN COE GREG DAWSON	COR COE DONALD PENNER

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-21	Sample logging - ClientBarCode
CRU-QC	Crushing QC Test
PUL-QC	Pulverizing QC Test
CRU-31	Fine crushing - 70% <2mm
SPL-21	Split sample - riffle splitter
PUL-32	Pulverize 1000g to 85% < 75 um
BAG-01	Bulk Master for Storage
LOG-23	Pulp Login - Rcvd with Barcode

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	INSTRUMENT
ME-ICP41	35 Element Aqua Regia ICP-AES	ICP-AES
Au-ICP21	Au 30g FA ICP-AES Finish	ICP-AES

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.

Table of Contents

List of Figures and Tables

1. Introduction

McElhanney Ltd. performed LiDAR and aerial photography acquisition covering the Barney Ridge, Clear Creek and RC Gold claims. See figure 1.
The sites were flown September 23rd, 2020. This report describes the acquisition, post-processing and quality control methodology used to produce the LiDAR deliverables.

2. Mission Plan

Project: Sitka Yukon LiDAR 2020. McElhanney project 2611-19749-01
Date: 2020-09-23
Location: Central Yukon Territory.
Topography: Rolling hills and mountainous terrain.

Figure 1– LiDAR and Air Photo Survey Sites

3. Equipment

McElhanney utilized the Optech Galaxy system for LiDAR Capture (Figure 2).
For Product Specifications of Optech Galaxy please see

http://www.teledyneoptech.com/index.php/product/optech-altm-galaxy/
The Galaxy was mounted on Piper Navajo fixed wing Aircraft.

Figure 2 – Optech Galaxy components

On Board Camera Phase One iXU-RS1000 RGB simultaneous capture (Figure 3.)

Phase One Industrial – Cameras iXU-RS1000 series

iXU-RS1000 series

Camera Type	iXU-RS1000
Camera Specifications	
Lens type	Rodenstock / Schneider-Kreuznach
Focal length F (mm)	RS lenses: 32, 40, 50, 70, 90, 110, 150 SK lenses: 28, 55, 80, 110, 150, 240
FOV (across line, deg)	86.5 (28mm) – 12.9 (240mm)
FOV (along flight line, deg)	70.3 (28mm) – 9.7 (240mm)
Aperture	f/5.6
Exposure principle	Leaf shutter
Exposure (sec)	1/2000 to 1/125
Image capture rate	1 frame every 0.6 sec
Light Sensitivity (ISO)	50-6400
Dynamic Range (db)	>84
Spectral characteristics	R,G,B
Sensor Specifications	
CMOS pixel size (µm)	4.6
CMOS array (pix)	11,608 x 8,708
Analog-to-digital-conversion (bit)	14
Frame / Image Specifications	
Frame geometry	Central projection
Image size (pixel)	11,608 x 8,708
Image volume (MP)	100
Color	RGB or NIR
Typical image size (MB)	300
Image format	Phase One RAW, TIFF, JPEG
Operational Specifications	
Power Consumption	< 10W
Dimensions (depends on lens)	97.4 x 93 x <218 mm
Weight (depends on lens)	< 2 kg

PHASEONE
Specialty Imaging Solutions

Figure 3 – Phase One Camera Series

5. Data Processing

All GPS and IMU data were processed using PosPac MMS 8.4 software. The laser data was extracted using Teledyne Optech LMS software. The GPS antenna position in the airplane was calculated by post–processing the raw data at 1 second intervals for the entire flight.
We have used Precise Point Positioning (PPP) data for the airborne GPS processing, and the coordinates were calculated in NAD83-CSRS.
The airborne positions were combined with the post–processed platform (aircraft) attitude information to generate a time tagged position and orientation solution.

The standard deviation of the airborne GPS solution for using KAR (Kinematics Ambiguity Resolution) was estimated to 0.013 m, 0.013 m and 0.022 m in East, North and height directions, respectively.

The estimated values for the GPS antenna position were used with the laser ranges and platform angles to compute all the individual X, Y, and Z coordinates for each laser return in each flight line. The result is a processed point cloud containing all measured points.

6. Point Density

Bare earth point density varies with canopy closure, understory density and topographic features. The mean density of the point cloud (all points) was measured at nominal 18.3 pts/m² and the bare earth (ground) point density was measured at nominal 4.5 pts/m².

7. Calibration

System: Optech ALTM Galaxy S/N 5060392
LiDAR Calibration flight:

Calibration Date: March 9th, 2020. Location: Abbotsford, BC.
The LiDAR system calibration was flown over calibration site. The lever arms (offset between GPS antenna IMU and Laser Mirror), were measured as:

Lever Arms
GPS Lever arms in (m):
x: 0.730 y: -0.465 z: -1.173

IMU Lever arms in (m):
x: 0 y: 0 z: 0

There were a total number of 13 flight lines for calibration: 112 basic orthogonal lines for LMS software analysis and 1 redundant line for better accuracy. The lines were planned as follow:

Flight line direction: 6 lines north – south and 6 lines east – west and 1-line NW-SE
All GPS with IMU data was processed using PosPac Applanix software v.8.0. and the laser data was extracted using LMS v.4.3 The GPS antenna position in the airplane was calculated by post–processing the raw data at 1 second intervals for the entire flight.

The calibration values used for this project are as follows:

imu_ex: 0.012695755 **arcsec**
imu_ey: -0.071263279 **arcsec**
imu_ez: -0.128636141**arcsec**

8. Quality Control and Recommendations

The LiDAR data consistencies have been checked between the flight lines using Terrascan software. As the client opted out of establishing ground control the accuracy of LiDAR data is unknown and therefore cannot be reported. On other projects, where LiDAR data has been compared to ground control check points, pre-adjustment accuracy values commonly fall in the range of 0.10 to 0.25 m (RMS), depending in part on the surface roughness that check points were established on. This is a generalization and there are no guarantees that this is the case for this project. If future use of the LiDAR data requires that accuracy be known it is recommended that a minimum of 100 RTK GPS check points be established along the centrelines of various, relatively flat and smooth road surfaces within the project area and that bare-earth LiDAR points be statistically compared to these check points. Ideally, the accuracy of the check points

should be in the approximate range of 2-3 cm. LiDAR accuracy statistics can then be used to assess whether data requires adjustment or is suitable as-is. It is important that LiDAR check points be established on a surface that has not seen more than a few cm of change since the time of LiDAR acquisition.

9. Deliverables

Final output data is provided in NAD83CSRS UTM 8 and the elevations are based on CGVD2013 geoid model. The deliverables include:

- LiDAR data: Bare-Earth, Full-Feature and Model Key Points in LAS format.
- 1m pixel, bare-earth DEM
- LiDAR hillshade imagery in ECW format
- 5m contours in ESRI Shapefile format
- 20 cm orthophoto in TIF (1km tiles) and ECW (overview mosaic) format.
- LiDAR and Airphoto report

APPENDIX III

Supporting Documentation for Cost Statement

2020 RC Gold: STATEMENT OF EXPENDITURES

Company	Invoice Description	Invoice Total	RC Gold Portion of Invoice	Notes
Fox Exploration Invoices (20103, 20107, 20108)	Project supervision, geological crew, camp w/ support staff, truck and equipment rental, mob/demob…	$558,295.65	$123,912.15	Camp and support staff used for Clear Creek, RC Gold and Barney Ridge work programs. **30% of Fox invoice, less helicopter, pad building & anlytical charges, applied to Clear Creek**
Fireweed Helicopters (Invoice 5507)	Helicopter Support	$29,280.87	$29,280.87	
Horizon Helicopters (5432539)	Helicopter Support	$64,676.48	$64,676.48	
GroundTruth Exploration (10411)	Soil Sampling	$24,585.56	$9,485.01	RC Gold portion of invoice, 218 soil samples collected
McElhenney	LiDAR Survey	$48,000.00	$16,000.00	1/3 applied to RC Gold (1/3 to Barney Ridge; 1/3 to Clear Creek)
Bureau Veritas (VANI370875)	Soil Sampling Analysis	$5,402.04	$5,402.04	218 RC Gold soil samples analysed
ALS Laboratory (5272767, 5279542)	Analytical	$1,982.57	$8,635.39	RC Gold drill core assays
Vision Quest Exploration	Pad Building	$26,565.00	$26,565.00	for heli supported drilling
New Age Invoices (20191021, 20191025)	Diamond Drilling	$365,468.97	$119,438.49	1/3 applied to RC Gold (2/3 applied to Clear Creek,) less Barney Ridge road fixing and trenching
Final Assessment Report		$4,000.00	$4,000.00	invoice pending
TOTAL:			**$407,395.43**
