

VICTORIA GOLD CORP.

YUKON MINERAL EXPLORATION PROGRAM (YMEP) FINAL REPORT FOR A
TARGET EVALUATION PROGRAM ON THE CLEAR CREEK PROPERTY, YUKON

Located in the Dawson Mining District
7081990N, 398020E (NAD 83, UTM Zone 8N)
NTS Maps: 115P14
Yukon Territory

Prepared for:
Victoria Gold (Yukon) Corporation
Suite 1000 - 1050 West Pender Street
Vancouver, BC
Canada V6E 3S7

Prepared by:
Helena Kuikka, P.Geol., Senior Geologist, Victoria Gold Corp.
Steve Wozniak, Geologist, Victoria Gold Corp.

February 2021

Table of Contents

A.	Project Location.....	2
i)	Name of area.....	2

B. Access

The Property is accessed directly via the Clear Creek road, which turns off the Klondike Highway to the North at km 609. The Clear Creek road leads approximately 45km to the location of the 2010/11 Exploration Camp, which lies about 500m east of Nels Harper's placer camp, via a gravel road. A network of variably maintained trails and 4x4 roads provide additional vehicular access throughout the property.

C. Target Area

i) Property History

The prospecting history dates back to the early 1900s, in the form of hand pits, and short adits, focusing on gold bearing quartz-arsenopyrite-pyrrhotite veins near the Josephine stock area. Modern exploration efforts commenced in the late 1970s with attention focused on the tin-tungsten potential of the area. Several companies had claim holdings in the area during the 1970's including a joint venture

CLEAR CREEK YMEP REPORT

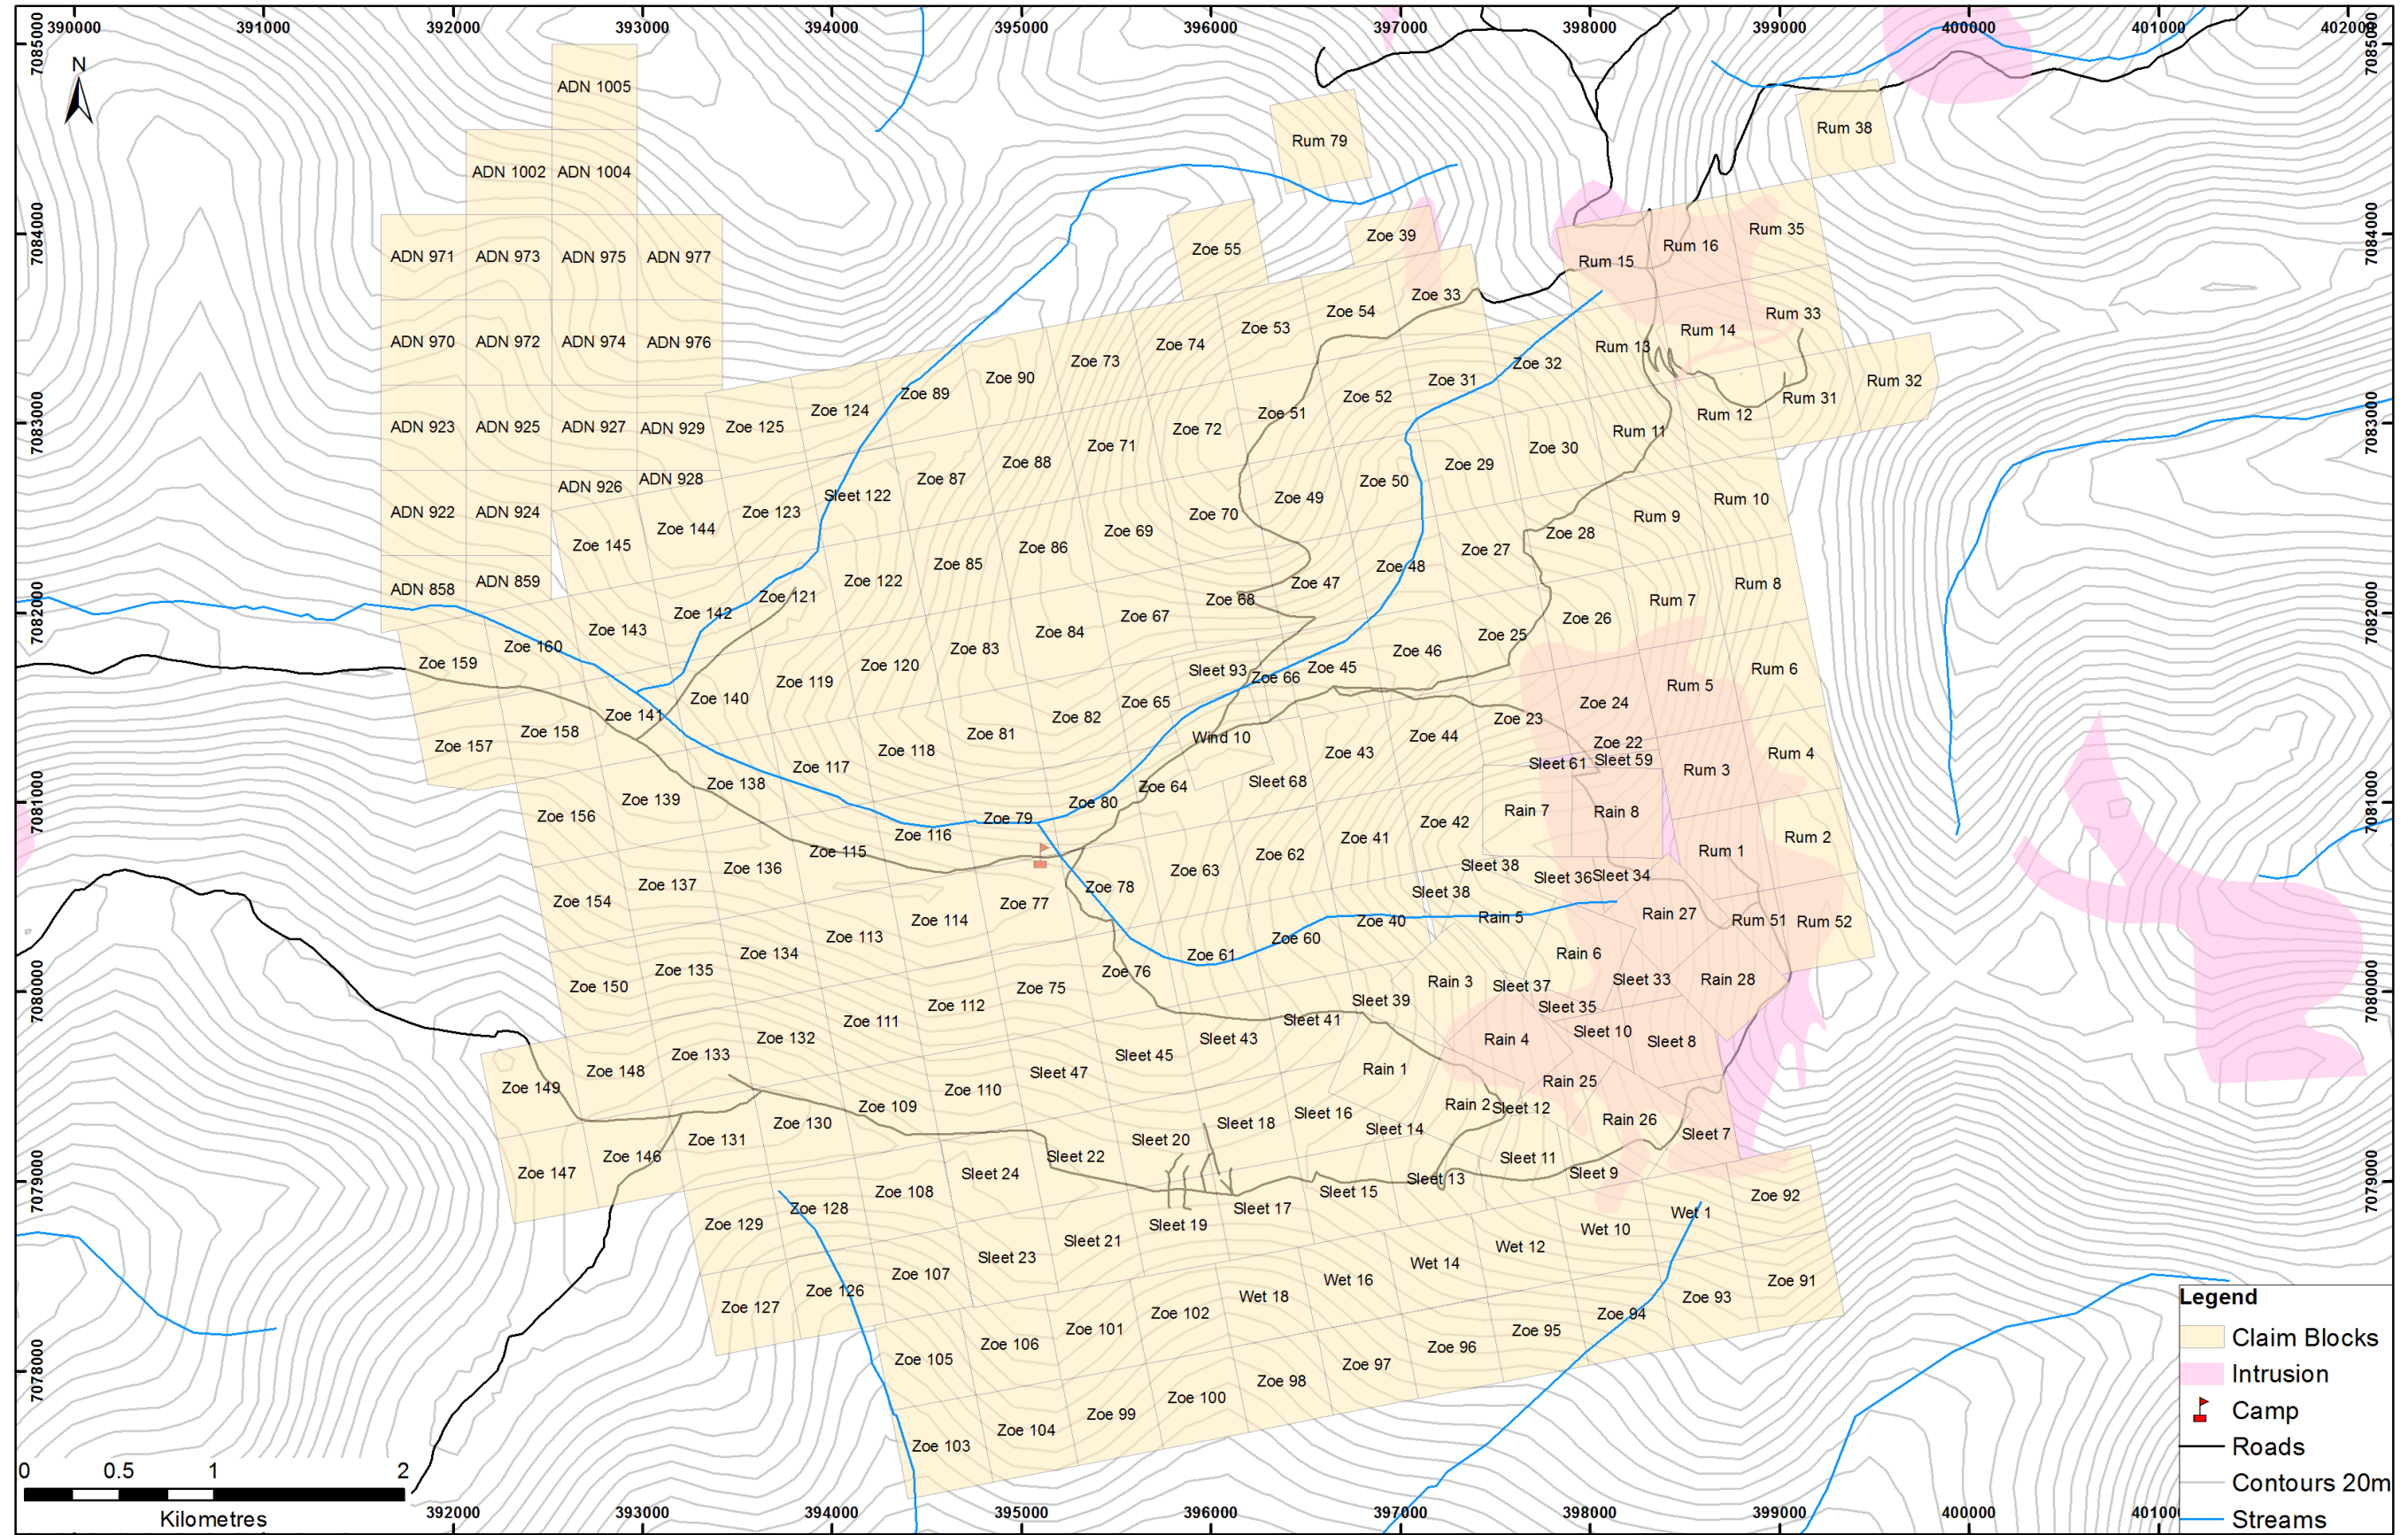

Figure 1- Clear Creek claim locations.

CLEAR CREEK YMEP REPORT

between Canada Tungsten Mining Corp and Standard Oil Corp. of B.C., United Keno Hill Mining, the Cortin Project, and Asarco. There is little information available from their work.

Bema Industries, working on contract from Canada Tungsten Corporation, was the first company to recognize potentially significant gold mineralization in 1978. Cantung acquired most of the areas claims in 1980. From 1980-81 tin-tungsten exploration consisting of mapping, stream and soil sampling on the skarns was conducted. Some samples were also analyzed for gold and the potential for intrusive hosted gold bearing quartz veins at the Rhosgobel stock was recognized. Cantung dropped the property in 1982 due to the lack of tin mineralization and declining tungsten prices.

Since this initial effort, various companies have conducted limited campaigns including programs by Gold Rite Mining Corp., Noranda Exploration Ltd., Ivanhoe Goldfields Ltd. /First Dynasty Mines Ltd., Kennecott Canada Inc., Newmont Exploration Limited, Redstar Resources Corporation, and StrataGold Corporation (now Victoria Gold Corp.). Following up on results by previous explorers, Noranda Exploration Ltd. conducted extensive soil and rock chip sampling, ground geophysical surveys, trenching, road building, and a six-hole reverse circulation ("RC") drilling program in 1991 and 1992. Two holes drilled on each of the Eiger, Saddle, and Pukelman stocks for a total of 654 m.

In 1995, Kennecott Canada Inc. completed drilling, soil sampling and 320 m of bulldozer trenching. The 27-hole (1971 m) RC program on the Rhosgobel stock identified an east-west trending zone 1200 m long, 200 m wide and 65 m deep. The average grade of the Au mineralization in this 40 Mt zone is at least 300 ppb Au, with a higher-grade core zone of approximately 1.5-2.0 Mt grading from 0.75-1.25 g/t Au (Coombes, 1995). The size and grade estimate are conceptual in nature, as there has been insufficient exploration to define a mineral resource. In 1998, Newmont Exploration Limited conducted magnetic and radiometric airborne geophysical surveys. Interpretation of the data by Newmont suggests that the Eiger, Saddle, Josephine and Pukelman stocks may be part of a single larger intrusive body, and the Rhosgobel and Far stocks are themselves a separate body.

Historic drilling by Redstar Resources Corporation on the Bear Paw Breccia Zone included two diamond drill holes totaling 219 m in 1999; and nine HQ-diameter diamond drill holes totaling 1211 m in 2000. The best result of the Bear Paw Breccia zone was 2.3 g/t Au over 31.8 m in Hole BP00-10. In 2006, StrataGold Corporation (now a subsidiary of Victoria Gold Corp.) conducted a detailed trenching and soil sampling program on the Bear Paw Breccia and Contact zone (and also the Barney zone which lies west of the current claim configuration). In addition, infill sampling was conducted to follow-up on geophysical and historical gold anomalies identified by previous explorers.

Golden Predator Canada Corp. conducted an exploration program in 2010 which included drilling 42 holes for a total of 3,662.4 m. Holes CC10-01 to CC10-04 were HQ diameter oriented core totaling 1,053.7 m. CC10-05 to CC10-42 were reverse circulation holes totaling 2,588.91 m. Golden Predator also staked 168 'Zoe' quartz claims in May 2010 to supplement the property's holdings and compiled a GIS database of all available historical data.

CLEAR CREEK YMEP REPORT

CLEAR CREEK YMEP REPORT

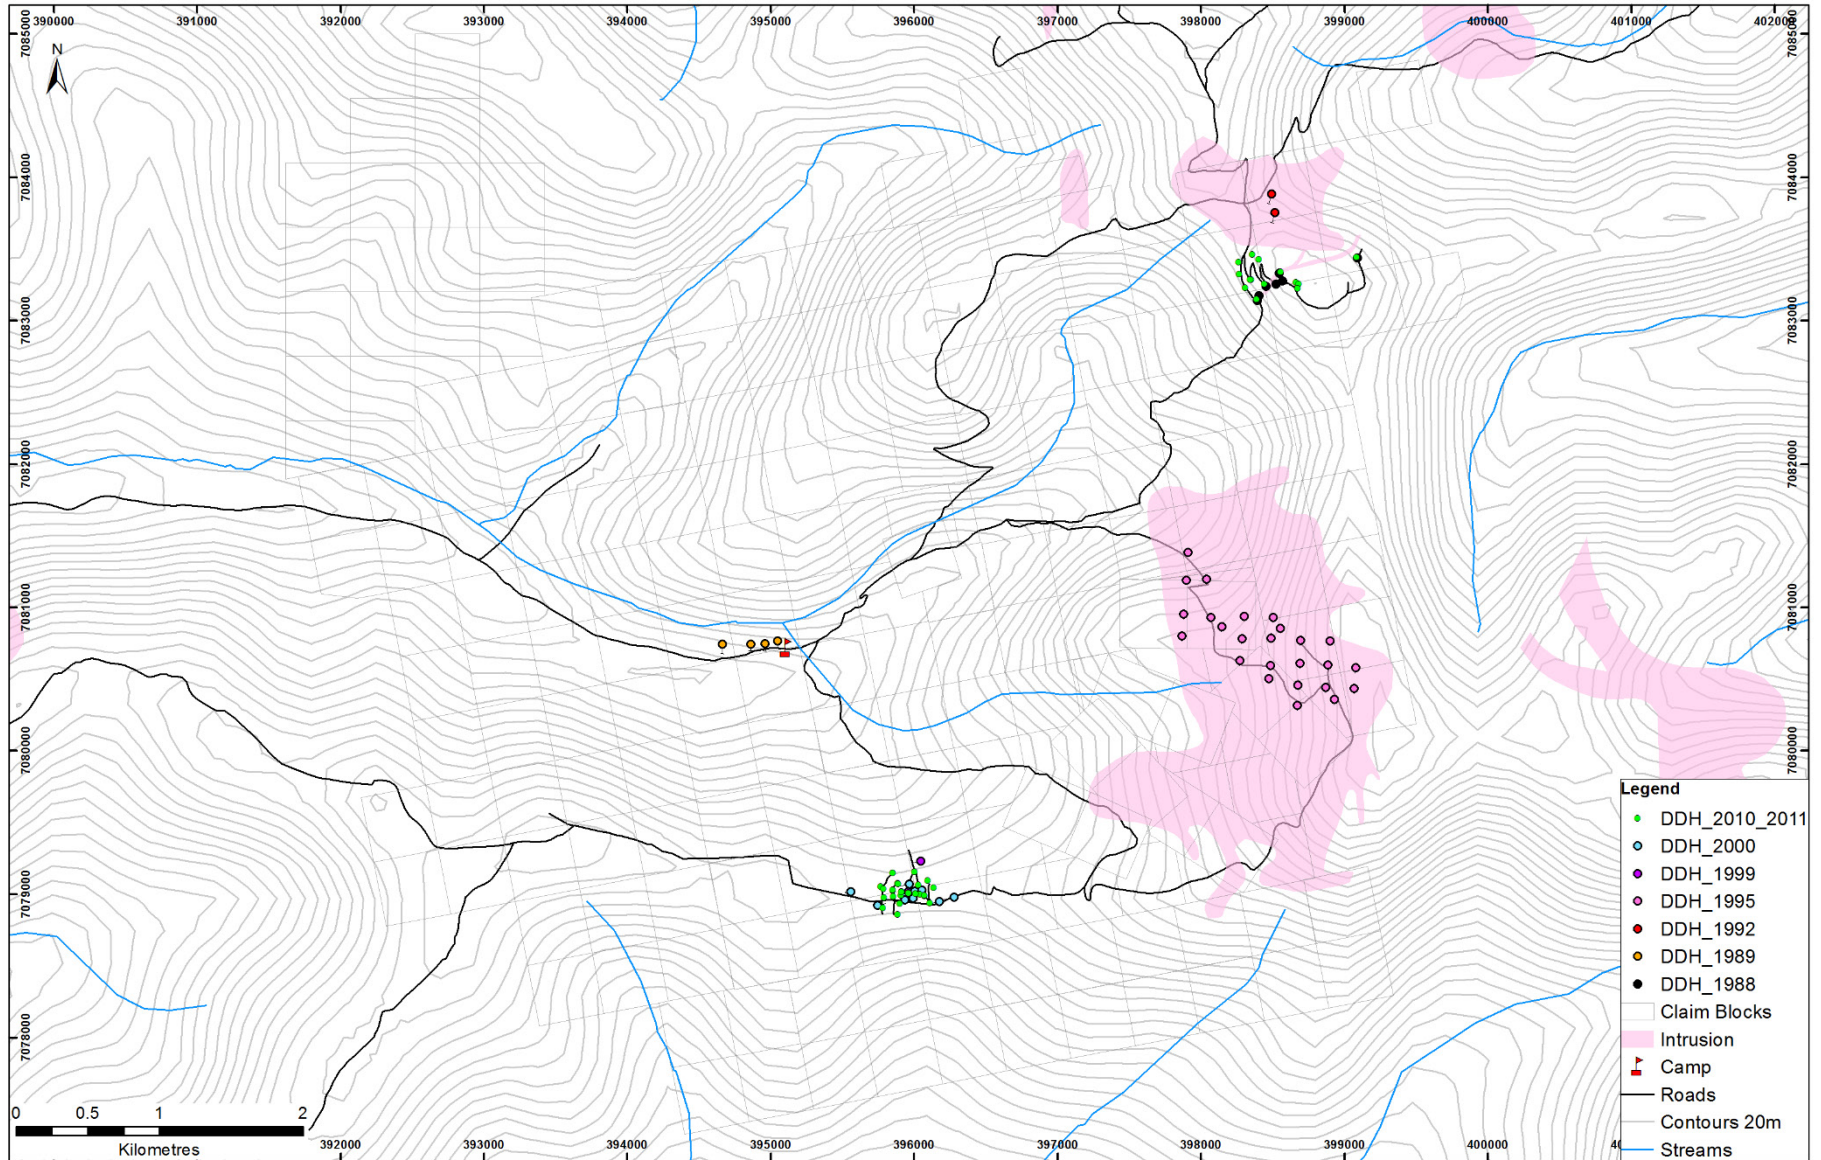

Figure 3- Diamond and RC drillhole locations.

CLEAR CREEK YMEP REPORT

In 2011 Golden Predator completed 18 HQ diamond drill holes for a total of 3,629.4m to test the Contact and Bear Paw areas with the objective to collect sufficient drill data to support an initial resource estimation at Bear Paw. A soil sampling program consisting of 1,026 samples was also undertaken in the northern part of the property.

The Clear Creek property returned to StrataGold Corporation in 2012.

In 2015 StrataGold conducted an exploration program which consisted of 504 soil samples, 52 rock chip samples, and re-logging of the diamond drill core from 2011. The core re-logging established that the majority of high values were returned from intervals containing one or more widely spaced quartz-arsenopyrite veins, locally sheeted, ranging from <1 cm to 5 cm in width. Several specks of gold are visible in some veins.

In 2017 StrataGold conducted a LiDAR, air photo, and airborne mag and radiometric survey over the claim block.

ii) Regional Geology

The Clear Creek claim area resides within upper Proterozoic Hyland Group rocks, which are part of the western Selwyn Basin, an epicratonic basin developed in a divergent margin setting established as the result of neo-Proterozoic rifting along the North American margin (Ross, 1991; Colpron et al., 2002). The Selwyn Basin is bounded on the south by the Tintina Fault (and the Intermontane Superterrane) and bounded on the north by the Dawson Thrust Fault (and the North American Shelf; Figure 5-1, from Gordey and Makepeace, 2001). The Teslin Suture is the zone of deformation between the accreted terrain and the ancient shelf.

CLEAR CREEK YMEP REPORT

Jurassic convergence between the North American and Farallon plates led to the collision of outboard terranes with the continental margin, which resulted in northward thrusting and low-grade metamorphism of Selwyn Basin strata (Monger, 1993). In the region, the Jurassic-Cretaceous Dawson, Tombstone and Robert Service thrusts (Murphy and Héon, 1995), juxtapose Hyland Group rocks against Mississippian shelf units and Devonian to Jurassic clastic units.

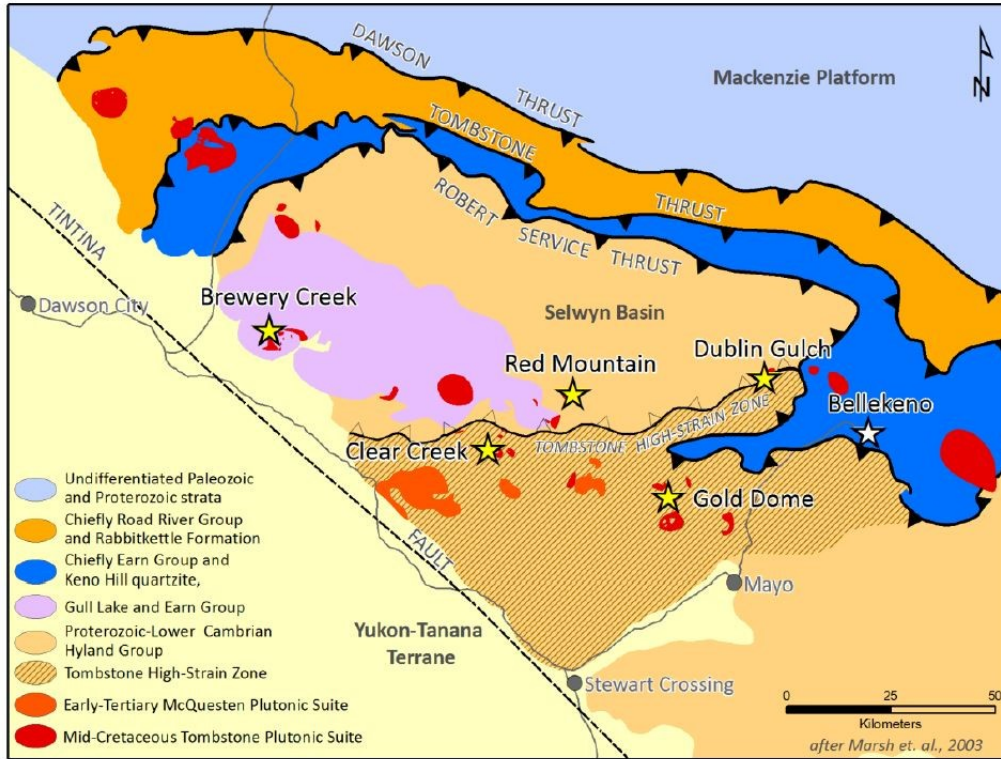

Figure 4- Generalized regional geology (after Marsh et al., 2003).

With waning deformation across the orogen by the mid-Cretaceous, emplacement of a series of northwardly-younging, orogen-parallel, felsic to intermediate plutonic suites occurred between 112 and 90 Ma (Mortensen, 2000). The Tombstone Plutonic Suite (TPS) is the most cratonward and youngest of the mid- Cretaceous plutonic belts emplaced into deformed Selwyn Basin strata. It extends in excess of 500 kilometers in an east-west direction, from the Yukon-Northwest Territory border to Dawson City, where it is truncated by the Tintina Fault Zone; a Cretaceous-Tertiary strike-slip fault with an estimated 450 kilometers of displacement. The TPS intrusions are typically <5 km in diameter and occur as composite plutons or as isolated pluton and dyke clusters. Compositionally they are predominantly monzogranite to quartz monzonite, with smaller volumes of later monzonite to quartz monzodiorite (Mortensen et al., 2000; Hart et al., 2004). They are weakly reduced to weakly oxidized and metaluminous to weakly peraluminous. Minor porphyritic, aplitic and calc-alkaline lamprophyre dykes (Mair et al., 2003) cross-cut and intrude the main stocks.

iii) Property Geology

Highly deformed metasedimentary rocks of the Yusezyu Formation underlie the Clear Creek property. The metasedimentary strata are part of the Neoproterozoic to Early Cambrian Hyland Group. They are comprised of predominantly highly deformed and folded phyllite, schist, quartzite, sandstone, fine quartz-pebble conglomerate with rare limestone. The Hyland Group rocks have been intruded by Tombstone Plutonic Suite diorite, granodiorite, quartz monzonite and granitoid stocks, including, from south to north, the Rhosgobel, Big Creek, Pukelman, Josephine and Eiger stocks. The Bear Paw breccia is spatially and likely-temporally related to the intrusive rocks. The Tombstone strain zone, a broad zone of complex deformation exhibited as multi-episodic folding and prominent foliation and lineation development within the sedimentary sequence extends roughly east-west to the north of the Josephine stock. Alteration is fairly localized to near the contacts with the intrusive bodies and include metasediments altered to quartz-biotite hornfels and rare calc-silicate skarn. Schistosity strikes west - northwest with gentle to moderate north-east dips (Weekes and Fall, 2001).

iv) Deposit Type and Mineralization

Regionally, the Tombstone Plutonic Suite is spatially and possibly also genetically associated with a range of precious and base-metal occurrences. These include: intrusion-hosted sheeted vein systems (Fort Knox, Dublin Gulch, Sheeted Zone at Scheelite Dome), metasediment-hosted sheeted veins (Harvey-Rudolph Zone at Scheelite Dome), intrusion-hosted disseminations and stringers (Brewery Creek), skarns (Marn, Wolf tungsten), hornfels-hosted sulfide veins, sediment-hosted stratabound sulfide replacement and disseminated, stringer and breccia-hosted mineralization external to the hornfels. The characteristic metal association of TPS related deposits comprises Au-W-Bi-As-Sb-Te- Mo±Cu±Pb±Sn.

CLEAR CREEK YMEP REPORT

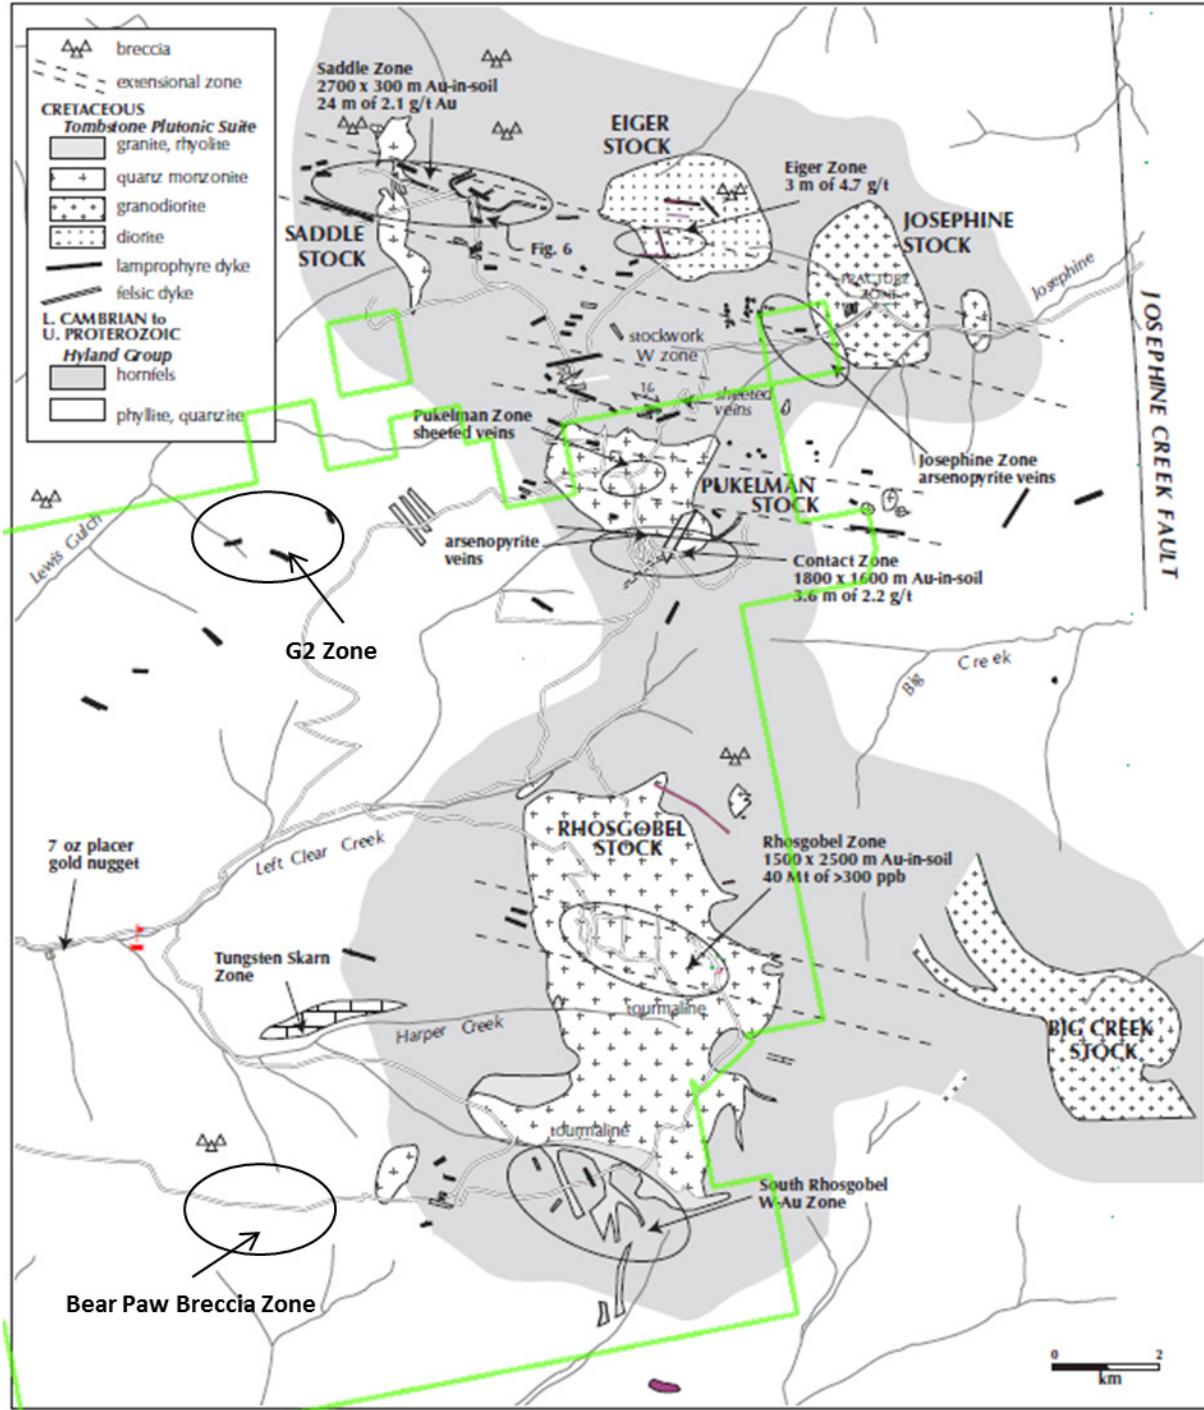

Figure 5- General Geology modified from Marsh et. al, 1999.

Mineralization on the Clear Creek property consists of gold bearing stockwork to sheeted vein zones hosted by felsic to intermediate intrusions, auriferous pyrite within fault zones cutting metasedimentary rocks, and scheelite bearing calc-silicate skarns. The stockwork and sheeted gold veins are considered to

CLEAR CREEK YMEP REPORT

have the most economic potential. They vary from white quartz–tourmaline-carbonate with trace sulphides in Rhosgobel to predominately pyrite-arsenopyrite-quartz in the Pukelman and Contact zones.

The following is a summary of mineralization on the property from the Minfile records:

Mineralization in the Rhosgobel skarn specimens assayed up to 1.3% tungsten oxide (WO₃), but the overall grade of the stockwork zone was estimated to be less than 0.05% tungsten oxide (WO₃). Quartz vein specimens assayed up to 45 ppb gold and 46 ppb silver. Minor cassiterite occurs in greisen breccias above a granitic cupola.

The Jub Jub claims were staked on silver geochemical anomalies. The 1981 sampling outlined three anomalies, including a gold anomaly averaging 300 ppb that extends for over 800 m in the hornfels zone south of the Pukelman stock (Minfile Occurrence #115P 013) located to the north. Specimens of quartz with arsenopyrite from a stockwork in the hornfels zone assayed up to 45.0 g/t gold and 46 g/t silver. The Wind claims were staked to cover two showings of apparently stratabound pyrite mineralization in quartz-rich schist and phyllite discovered at the bottom of placer working in Clear Creek. Channel sampling in 1987 returned values ranging from 0.2 g/t to 9.2 g/t gold over widths of 0.6 to 1.2 m across pyritic beds. Significant arsenic values (up to 2%) occur with the higher gold values and variably and locally anomalous values for silver (to 4.3 ppm), lead (to 591 ppm), zinc (to 2 413 ppm) and antimony (to 280 ppm).

In the central part of the grid, a strong northeast-trending tungsten-gold anomaly covers an area 1 000 x 400 m underlain by porphyritic quartz monzonite, and an east-trending tungsten anomaly (40 to 560 ppm tungsten) coincides with the south contact of the Rhosgobel stock. Soil sampling in 1988 returned several values up to 408 ppb gold, and a specimen of quartz vein float assayed 1 141 ppb gold. Murphy et al. (1993) noted a strong correlation between gold, bismuth and tungsten on the Rhosgobel property. Four specimens of quartz vein material contained between 2 330 and 15 000 ppb gold, 26 to 318 ppm bismuth and 55 ppm to 0.2% tungsten. Kennecott's drilling on the Rhosgobel stock tested a 1.5 by 2.5 km area of anomalous gold geochemistry associated with sheeted quartz veins in the stock. The drilling program delineated a zone about 1 200 m by 200 m by 65 m deep (about 40 million tonnes) with a potential average gold grade greater than 300 ppb. This zone contains a higher grade core with a potential for about 2 million tonnes grading >1 gram per tonne gold. Kennecott also constructed access roads and collected two lines of soil samples south of the Rhosgobel stock. None of the samples returned anomalous values.

Farallon Resources Ltd collected 8 rock and 15 soil samples on their two visits to the Far property. The soil samples returned a high of 50 ppb gold while the rock samples returned a high of 341 ppb gold. Lueck's 1994 detailed soil sample survey was centered over a portion of the Rhosgobel Pluton believed to have potential for an intrusive hosted gold deposit. A widespread northwest trending gold in soil anomaly was outlined with several zones returning values in excess of 100 ppb gold.

CLEAR CREEK YMEP REPORT

Thor Explorations' 2003 program identified a 100 m long gold soil anomaly within Far cl 33 and 34 which cover the southeast corner of the Rhosgobel Stock. The anomaly ranged in value from 0.067 to 0.194 g/t gold and was associated with anomalous arsenic and tungsten values averaging 420 ppm and 125 ppm respectively. Soil sampling on the TP claims uncovered a single station anomaly of 0.033 g/t gold on TP cl 2 and second single station anomaly of 0.326 g/t gold on TP cl 8. Sampling was carried out on 100 m centers. The 2005 reconnaissance program returned numerous single site rock and soil anomalies but given the reconnaissance nature of the program no new areas of mineralization or potential mineralization were identified.

Newmont's sampling confirmed anomalous gold values reported by previous operators and outlined existing areas of anomalous gold and arsenic geochemistry. Magnetic data from the airborne survey defined dominant structural trends in the area and partially outlined some of the intrusive stocks in the area. Radiometric data suggests that Rhosgobel and Big Creek stocks are part of a single intrusive body.

In the Bear Paw zone, placer operations encountered nearly massive pyrite-sericite mineralization on both sides of a steeply dipping east-trending gouge-filled fault in the creek bed just west of this occurrence location. Massive pyrite bands up to 1 m thick contain 50 to 80% pyrite in a quartz gangue and dip 20° north, parallel to bedding in the host sericite-biotite phyllite. Samples contained up to 9.22 g/t Au across 1.0 m. The area of interest coincides with a 500 x 200 m IP anomaly, but VLF response is flat. All of the 1989 drillholes encountered thick sections of graphitic argillite with pyrite along the schistosity. Drillholes RWS-89-1 and 89-4 intersected the fault zone. Hole 89-1 returned 18.71 g/t Au over 0.49 m of pyrite-sericite-quartz-clay gouge in the fault. No evidence of stratabound mineralization was seen in the drillholes.

Newmont's sampling confirmed anomalous gold values reported by previous operators and outlined existing areas of anomalous gold and arsenic geochemistry. Magnetic data from the airborne survey defined dominant structural trends in the area and partially outlined some of the intrusive stocks. Other nearby areas of radiometric highs are observed and possibly represent the expression of unmapped intrusive bodies and/or possible occurrences of potassic alteration.

Rock and soil sampling carried out by Redstar identified anomalous gold, arsenic and bismuth geochemistry coincident with an area of radiometric highs that straddles the ridge crest between upper Left Clear and Clear Creek. The zone, subsequently named the Bear Paw (breccia) zone was the focus of exploration efforts in 2000. Gold mineralization occurs in hydrothermal breccias with stockwork quartz + potassium-feldspar + sulfide veins that overprint earlier intrusives and tectonic breccias. Drilling in 1999 returned a significant intersection of 2 g/t Au over 26.7 m including 3.35 g/t Au over 10.5 m, while definition drilling of the zone in 2000 intersected varying amounts of breccia with a best result of 2.3 g/t Au over 31.8 m in hole BP00-10. Significant intersection from Golden Predator's drilling in 2010 in the Bear Paw zone include 35m at 1.03 g/t Au, 9.15m at 5.64 g/t Au, and 10.02m at 1.74 g/t Au. All holes drilled in 2011 intersected gold mineralization as well.

CLEAR CREEK YMEP REPORT

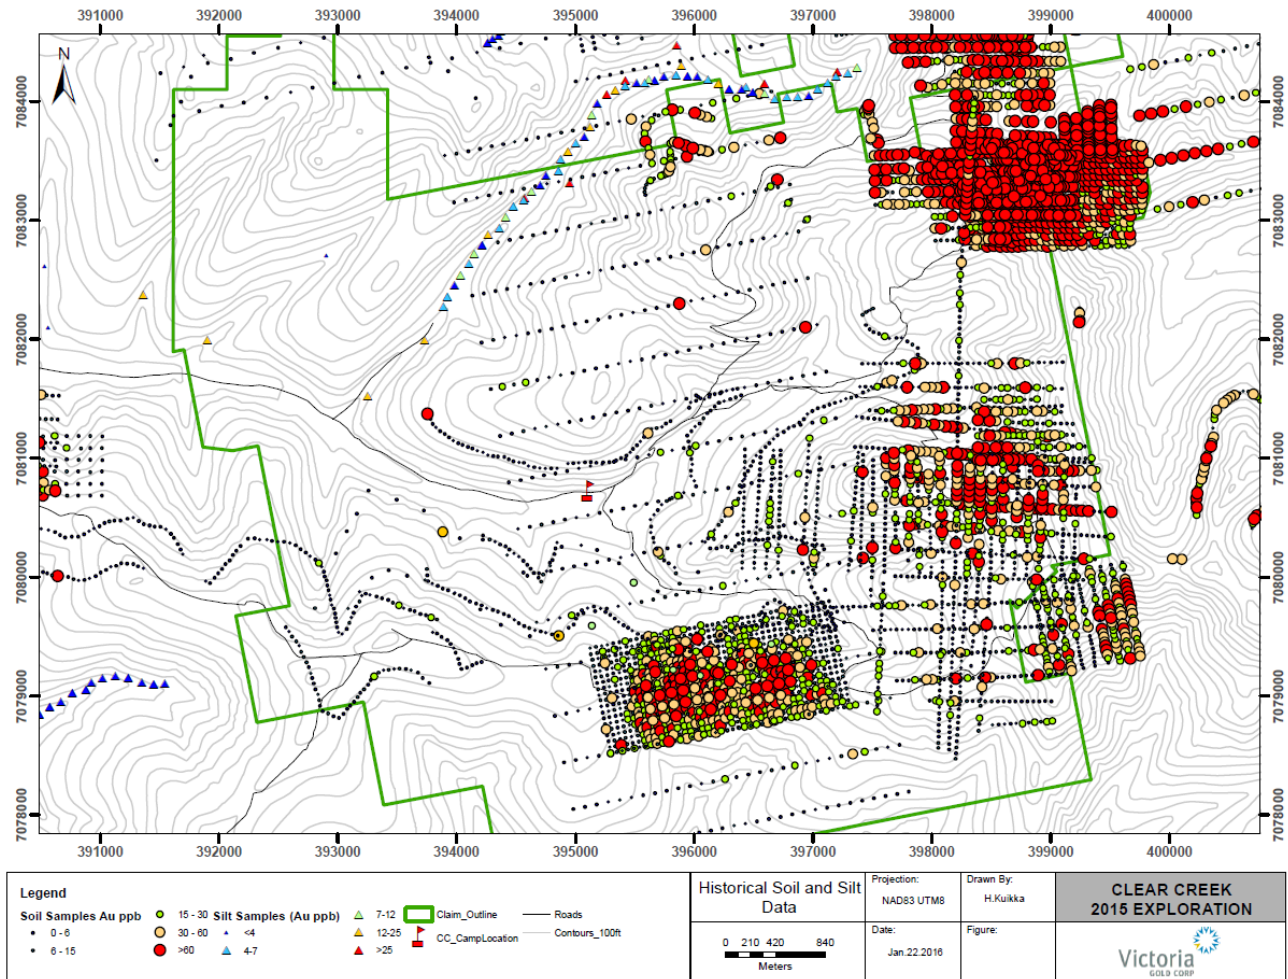

Figure 6- Historic soil and silt data.

D. Target Rationale

The Clear Creek Property was targeted for exploration efforts based on a combination of the results of Golden Predator’s 2010/2011 exploration campaigns and Victoria Gold’s 2015 and 2017 programs. Clear Creek became a primary target for mineral exploration activities as mineralized stocks have been mapped on surface with soils, rock chips, diamond and RC drilling efforts identifying anomalous Au and As. The Bear Paw Zone was targeted for the 2020 program due to favourable access and the high potential of the expansion of the mineralized zone along strike to the east and west.

E. 2020 Exploration Program

The 2020 exploration program at Clear Creek operated during August 4-11, 2020. A temporary camp was set up within the historical Clear Creek Camp. This camp area was also being used by Sitka Exploration on their claim areas. Prior to work commencing, a washout on the Bear Paw Breccia road was fixed using available heavy equipment. Data collected during the short program included 652 soil samples. A second phase program was planned for September consisting of ground geophysical surveys performed by Aurora Geosciences and move into site commenced. However, due to poor weather conditions impeding access into the site via the Clear Creek road, this program was cancelled. Aurora Geoscience subsequently donated the pre-purchased food supplies to the Whitehorse foodbank.

All soil samples were assayed via ICP-MS analysis at Bureau Veritas labs using the methodology below.

Table 1- Bureau Veritas sample analysis method.

Analysis		
Type	Method Description	Code
Soil	Dry at 60C sieve 100g to -80 mesh	SS80
Soil	1:1:1 Aqua Regia digestion ICP-MS analysis	AQ200

i) Soil Sample Results

Soil sample sites were selected based on access, soil quality, and gaps in the previous data set. For all soil samples the B horizon was targeted, depending on soil development this sometimes included some C horizon material. No organic or A horizon material was collected. Samples were collected using soil augers and geotools, sieved when possible, and placed in labelled kraft paper bags with a sample tag to be dried. Sample locations were captured using a handheld GPS unit. Soil samples near roads were collected from the undisturbed soil profile on the high bank side.

Soil samples for the 2020 program were collected on both the western and eastern extents of the Bear Paw Breccia zone. Historical soil sampling in the Bear Paw breccia zone consists of a large 50m x 50m grid over the breccia zone, sporadic contour sampling lines to the west and north-west, and the continuation of the 400m x 100m grid from G2 south. The Bear Paw area was discovered by soil sampling along trails and roads, and continuation of this sampling was done in 2015 to the west as well as north. From previous soil campaigns the Bear Paw Breccia zone shows an au-bismuth correlation but not the typical association with arsenic as in the Rhosgobel and Contact zones.

The 2020 sampling program identified a highly gold anomalous sample on strike from the Bear Paw zone to the west, at 1.426 ppm Au.

F. Discussion

The three main targets on the Clear Creek claims of Contact, Bear Paw, and G2, as well as Rhosgobel, are all part of an “Intrusion-related gold system”, similar in style to the Dublin Gulch area.

The Bear Paw Zone has a distinct rock and soil geochemical signature as well as distinct geological and mineralogical setting to the Contact zone. It is marked by emplacement of a quartz-feldspar-biotite monzonite dyke within the Hyland Group Yusezyu phyllites and quartzite. The rocks are intensely brecciated with dyke fragments and phyllite mixed, suggesting the brittle deformation was syn to post-emplacement. Gold in this area is associated strongly with limonitic quartz veining with local arsenopyrite and pyrite-pyrrhotite +/- chalcopyrite. The previous shallow drilling hasn't yet intersected a larger pluton and a mineralization source. From the airborne geophysical survey completed in 2017, the Bear Paw Breccia zone appears as a magnetic low anomaly on the property (Figure E.3). This low mag zone does not appear to extend directly to the west in the 2020 soil grid area where a high gold value was found. However, continuing further west from the 2020 grid another magnetic low signature appears along trend. This zone warrants further investigation and sampling. It is possible the mag high in between the two areas is a more magnetic cap rock over the breccia zone.

The 2020 Clear Creek Exploration program was partially cut short by weather conditions late in the season. An interesting soil response along strike of the Bear Paw zone to the west warrants further follow up. Completing the proposed ground geophysical survey over the area may also better delineate the gold bearing breccias.

G. Recommendations

Results of the 2020 program have led to a number of recommendations for future exploration work in the area:

- Continued expansion of the soil grid to the West of the 2020 grid area.
- Trench or test pit exploration to focus on the eastern portion with auriferous quartz vein float, and previously identified gold-in-soil anomalies.
- Completion of the planned ground geophysical survey over the Bear Paw zone and extension.

Along with recommendations previously recommended but not yet completed:

- Detailed rock sampling, and/or channel sampling to the east of the drilled area in the Contact Zone. Further soil sampling in this area is not needed but the grid may be extended south towards Rhosgobel.
- Further soil sampling, mapping and pit or trench sampling in the G2 area to follow up on the 2015 results.

Weeks, S. and R. Falls, 2001, 2000 Geological, Geochemical and Diamond Drilling Assessment Report on the Clear Creek Property, Prepared for Redstar Resources Corp. (assessment report 94165).

I. Statement of Qualifications

I, Helena Kristina Kuikka, in the Province of British Columbia, do hereby certify that:

I am a geologist in the mineral exploration industry employed by Victoria Gold Corp.

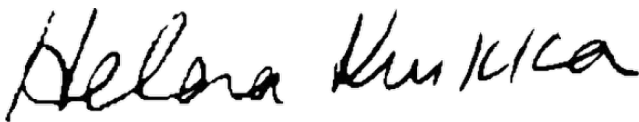

I am an author of the technical report "YUKON MINERAL EXPLORATION PROGRAM (YMEP) FINAL REPORT FOR A TARGET EVALUATION PROGRAM ON THE CLEAR CREEK PROPERTY, YUKON".

I am registered as a professional geologist with the Association of Professional Engineers and Geoscientists of British Columbia.

I am a graduate of Simon Fraser University, Canada, with a Bachelor of Science Degree in Earth Sciences-Geology.

I have actively engaged in the mineral exploration industry since 2008.

Dated this 28th day of February, 2021

A handwritten signature in black ink that reads "Helena Kuikka". The signature is written in a cursive, flowing style.

Helena Kuikka, P.Geo., Senior Geologist

CLEAR CREEK YMEP REPORT

I, Steven Wozniak am a geologist in the Yukon mineral exploration industry employed by Victoria Gold Corp.

I am the author of the technical report titled "YUKON MINERAL EXPLORATION PROGRAM (YMEP) FINAL REPORT FOR A TARGET EVALUATION PROGRAM ON THE CLEAR CREEK PROPERTY, YUKON".

I am a graduate of Mount Royal University, Canada, with a Bachelor of Science Degree in Geology.

I have actively engaged in the mineral exploration industry since 2011.

Dated this 28th day of February, 2021

A handwritten signature in black ink that reads "Steven Wozniak". The signature is written in a cursive style with a large initial 'S'.

Steven Wozniak BSc.

CERTIFICATE OF ANALYSIS

WHI21000024.1

CLIENT JOB INFORMATION

Project: Clear Creek
Shipment ID: VIT-Soils
P.O. Number
Number of Samples: 320

SAMPLE DISPOSAL

DISP-PLP Dispose of Pulp After 90 days
DISP-RJT-SOIL Immediate Disposal of Soil Reject

Bureau Veritas does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

Invoice To: Victoria Gold (Yukon) Corp.
Suite 1000 - 1050 W. Pender St.
Vancouver British Columbia V6E 3S7

Submitted By: Paul Gray
Receiving Lab: Canada-Whitehorse
Received: February 04, 2021
Analysis Start: February 09, 2021
Report Date: February 17, 2021
Page: 1 of 12

CERTIFICATE OF ANALYSIS

WHI21000025.1

CLIENT JOB INFORMATION

Project: Clear Creek
Shipment ID: VIT-Soils
P.O. Number
Number of Samples: 320

SAMPLE DISPOSAL

DISP-PLP Dispose of Pulp After 90 days
DISP-RJT-SOIL Immediate Disposal of Soil Reject

Bureau Veritas does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

Invoice To: Victoria Gold (Yukon) Corp.
Suite 1000 - 1050 W. Pender St.
Vancouver British Columbia V6E 3S7
Canada

CC:

SAMPLE PREPARATION AND ANALYTICAL PROCEDURES

Procedure Code	Number of Samples	Code Description	Test Wgt (g)	Report Status	Lab
SS80	320	Dry at 60C sieve 100g to -80 mesh			WHI
AQ200	320	1:1:1 Aqua Regia digestion ICP-MS analysis	0.5	Completed	VAN
DISPL	320	Disposal of pulps			WHI
SHP01	320	Per sample shipping charges for branch shipments			VAN

CLIENT JOB INFORMATION

Project: Clear Creek
Shipment ID: VIT-Soils
P.O. Number
Number of Samples: 21

SAMPLE DISPOSAL

DISP-PLP Dispose of Pulp After 90 days
DISP-RJT-SOIL Immediate Disposal of Soil Reject

Bureau Veritas does not accept responsibility for samples left at the laboratory after 90 days without prior written instructions for sample storage or return.

Invoice To: Victoria Gold (Yukon) Corp.
Suite 1000 - 1050 W. Pender St.
Vancouver British Columbia V6E 3S7
Canada
